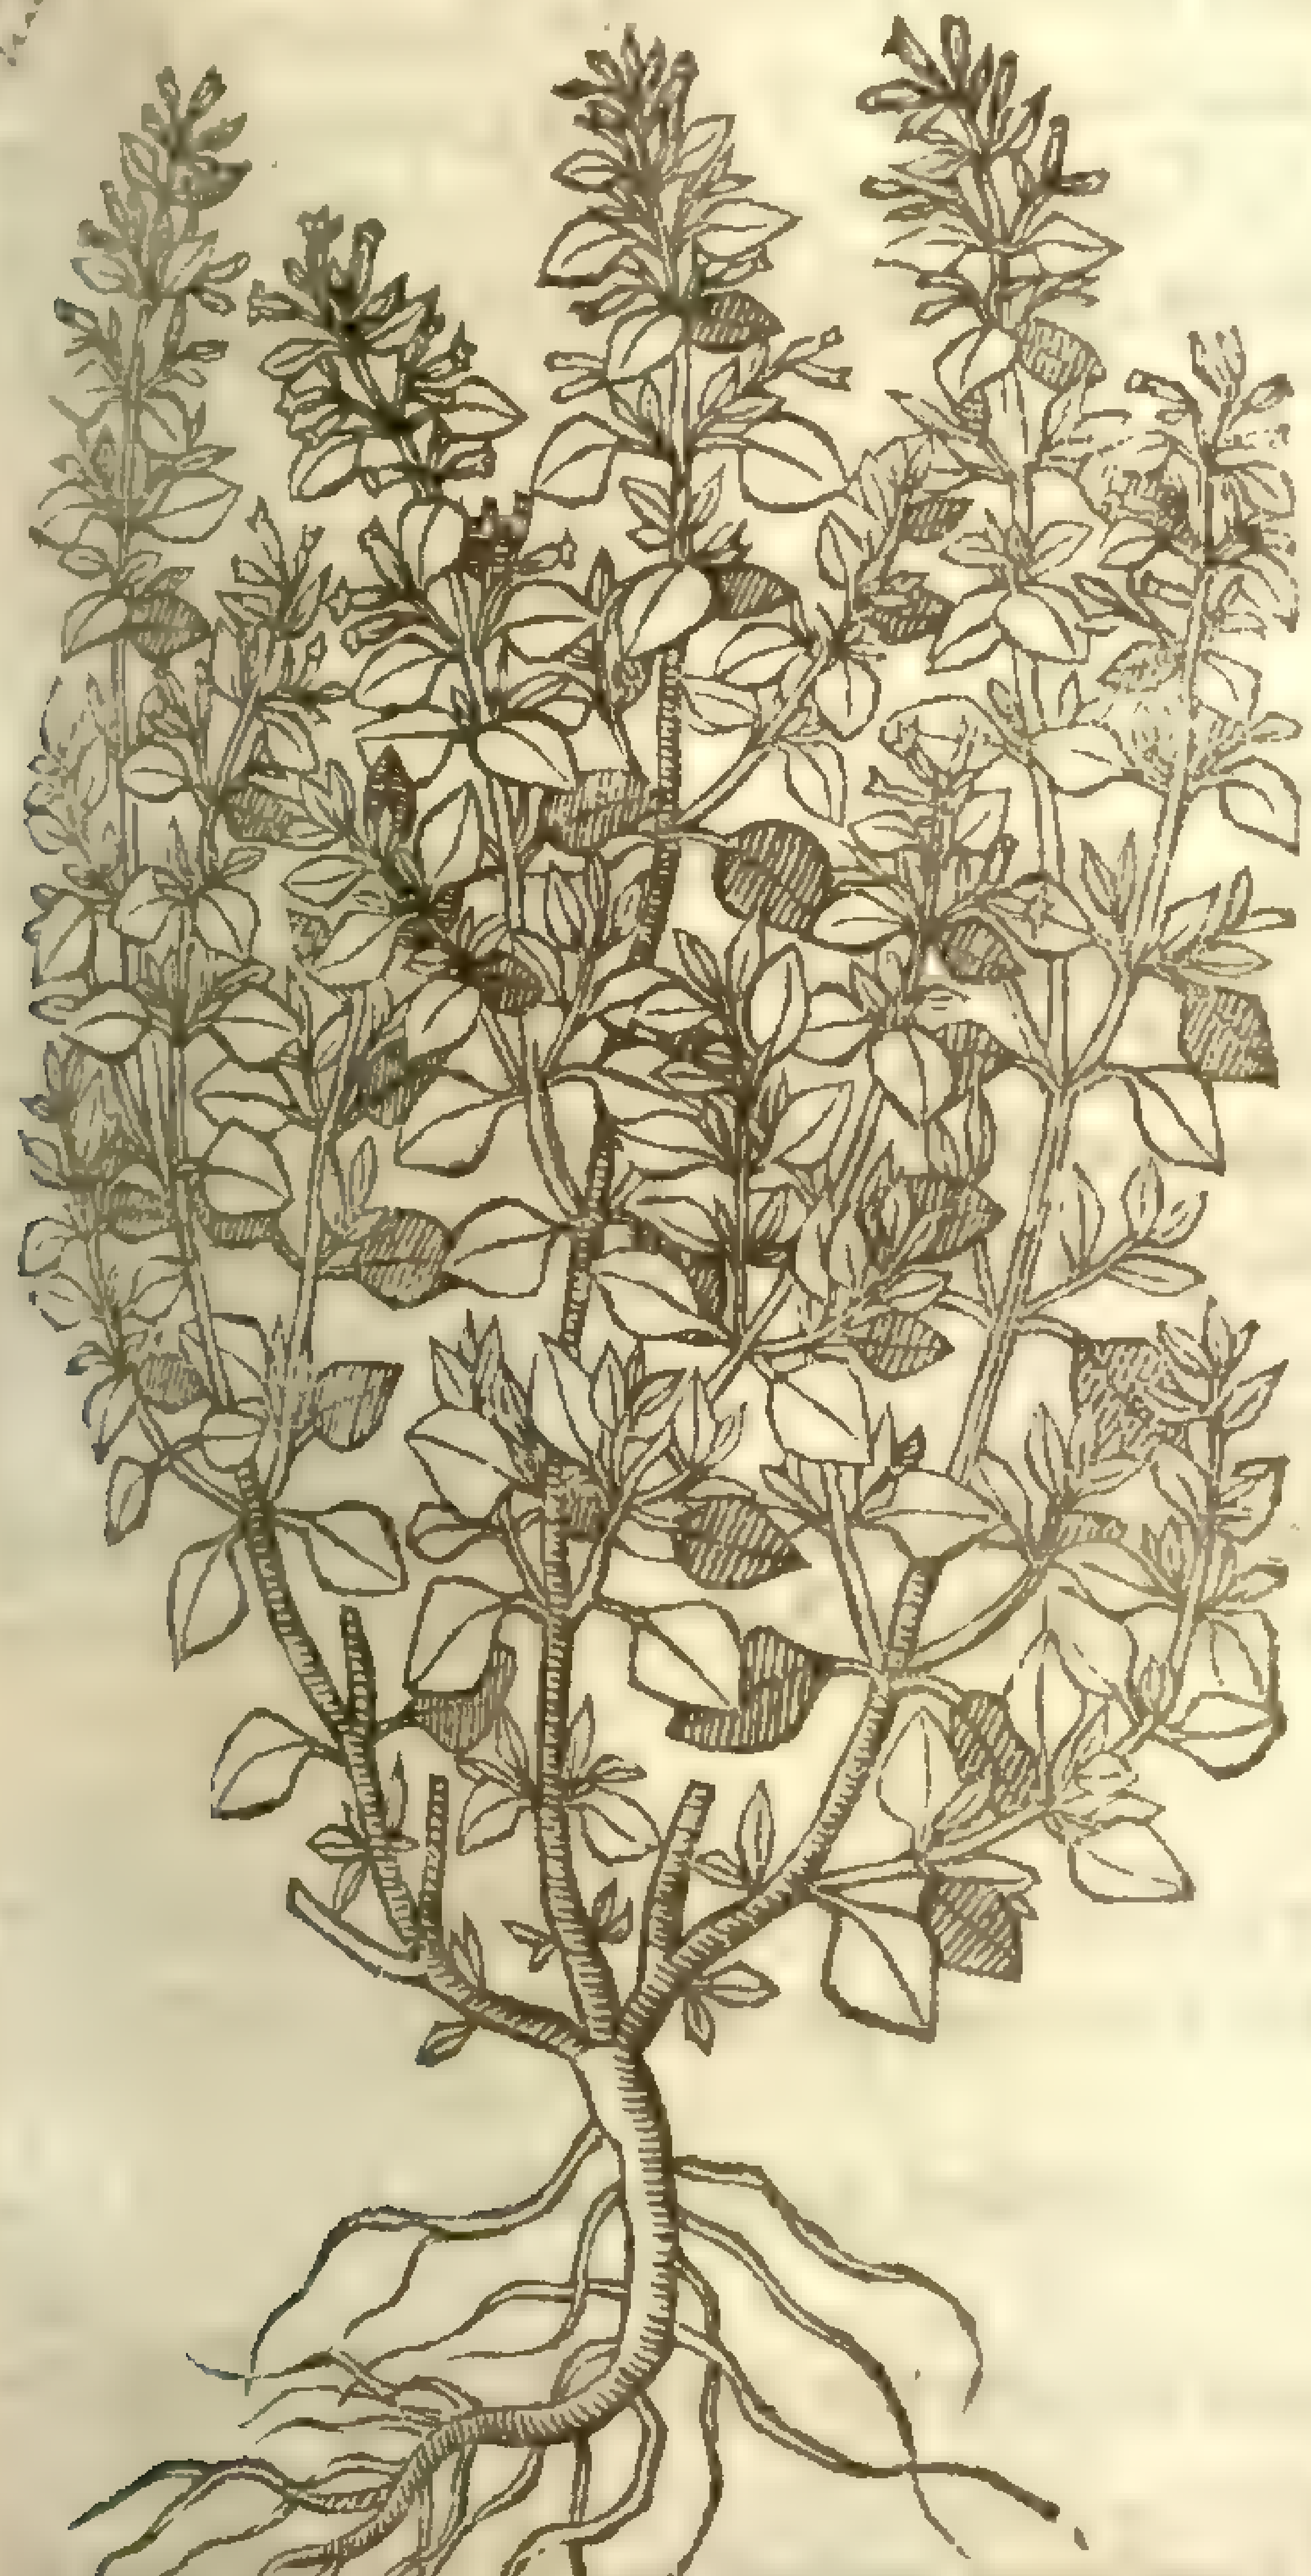
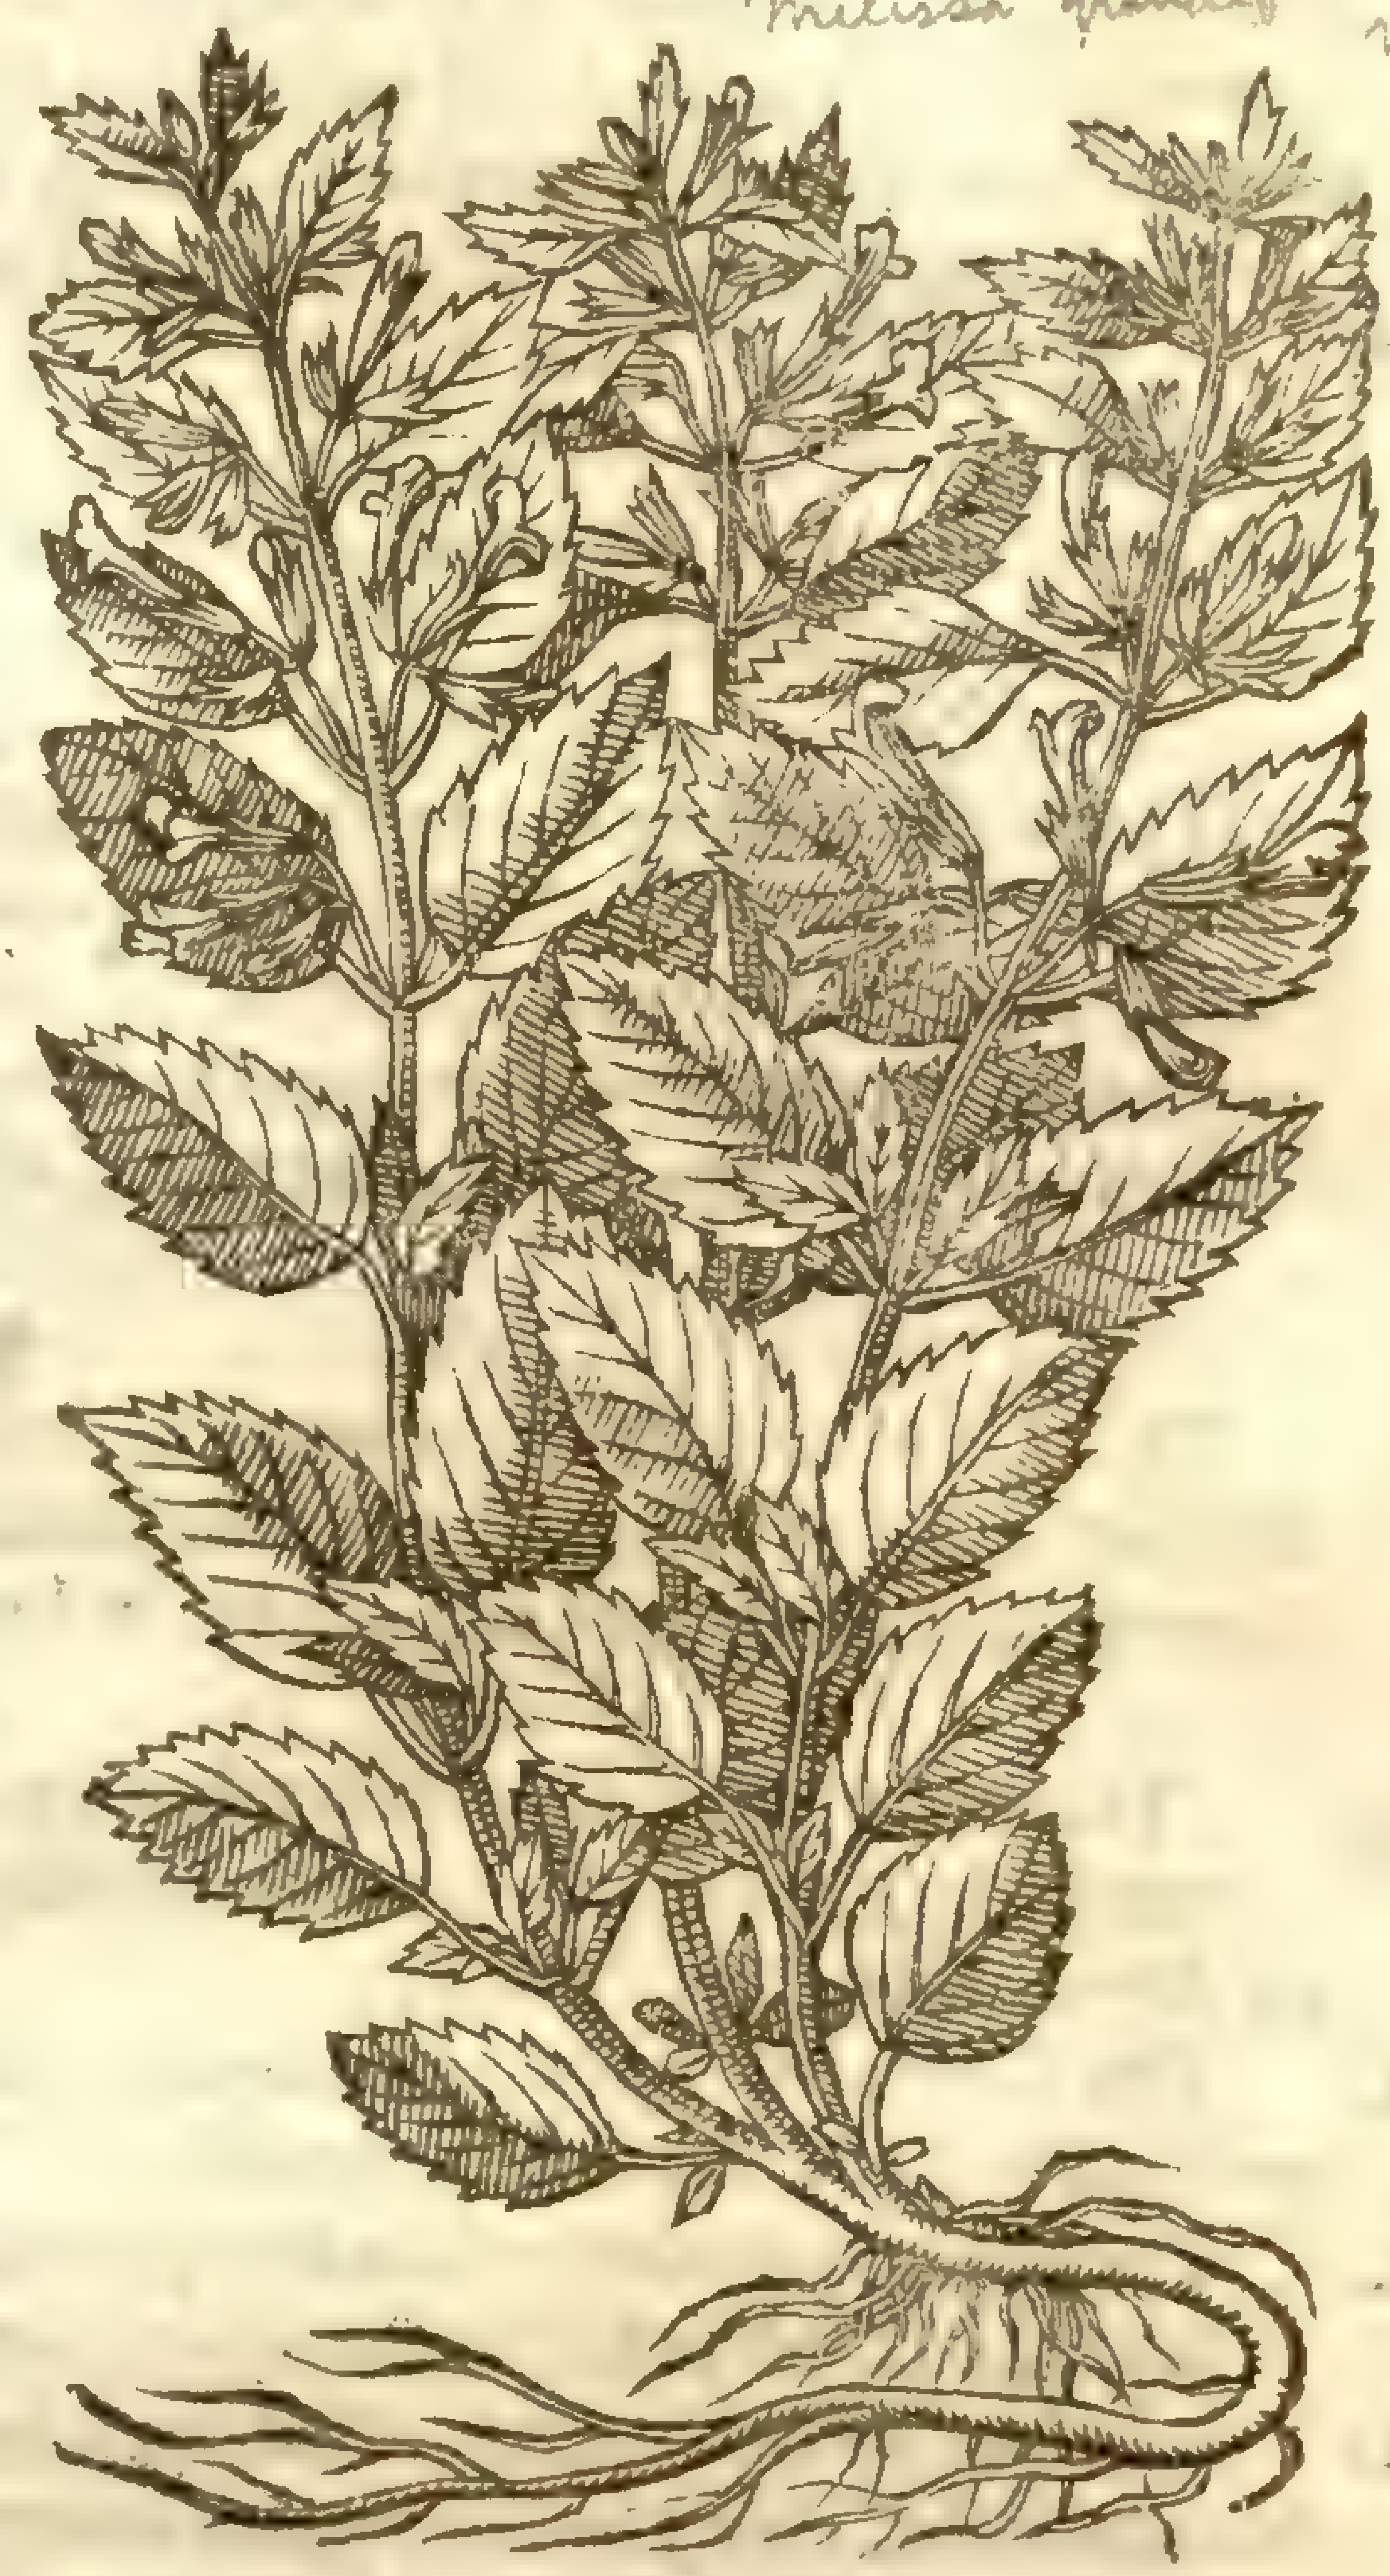
† 4 There is a kinde of ſtrong ſmelling Calamint that hath alſo ſquare ſtalks couered with ſoft cotton, and almoſt creeping by the ground, hauing euermore two leaues ſtanding one againſt another, ſmall and ſoft, not much vnlike the leaues of Penny-Royal, ſauing that they are larger and whiter: the floures grow about the ſtalks like wharles or garlands, of a blewiſh purple colour. The root is ſmall and threddy: the whole plant hath the ſmell of Penny-royal, whence it hath the addition *Pulegij odore.*

1 *Calamintha montana vulgaris.*
Calamint, or mountaine Mint.



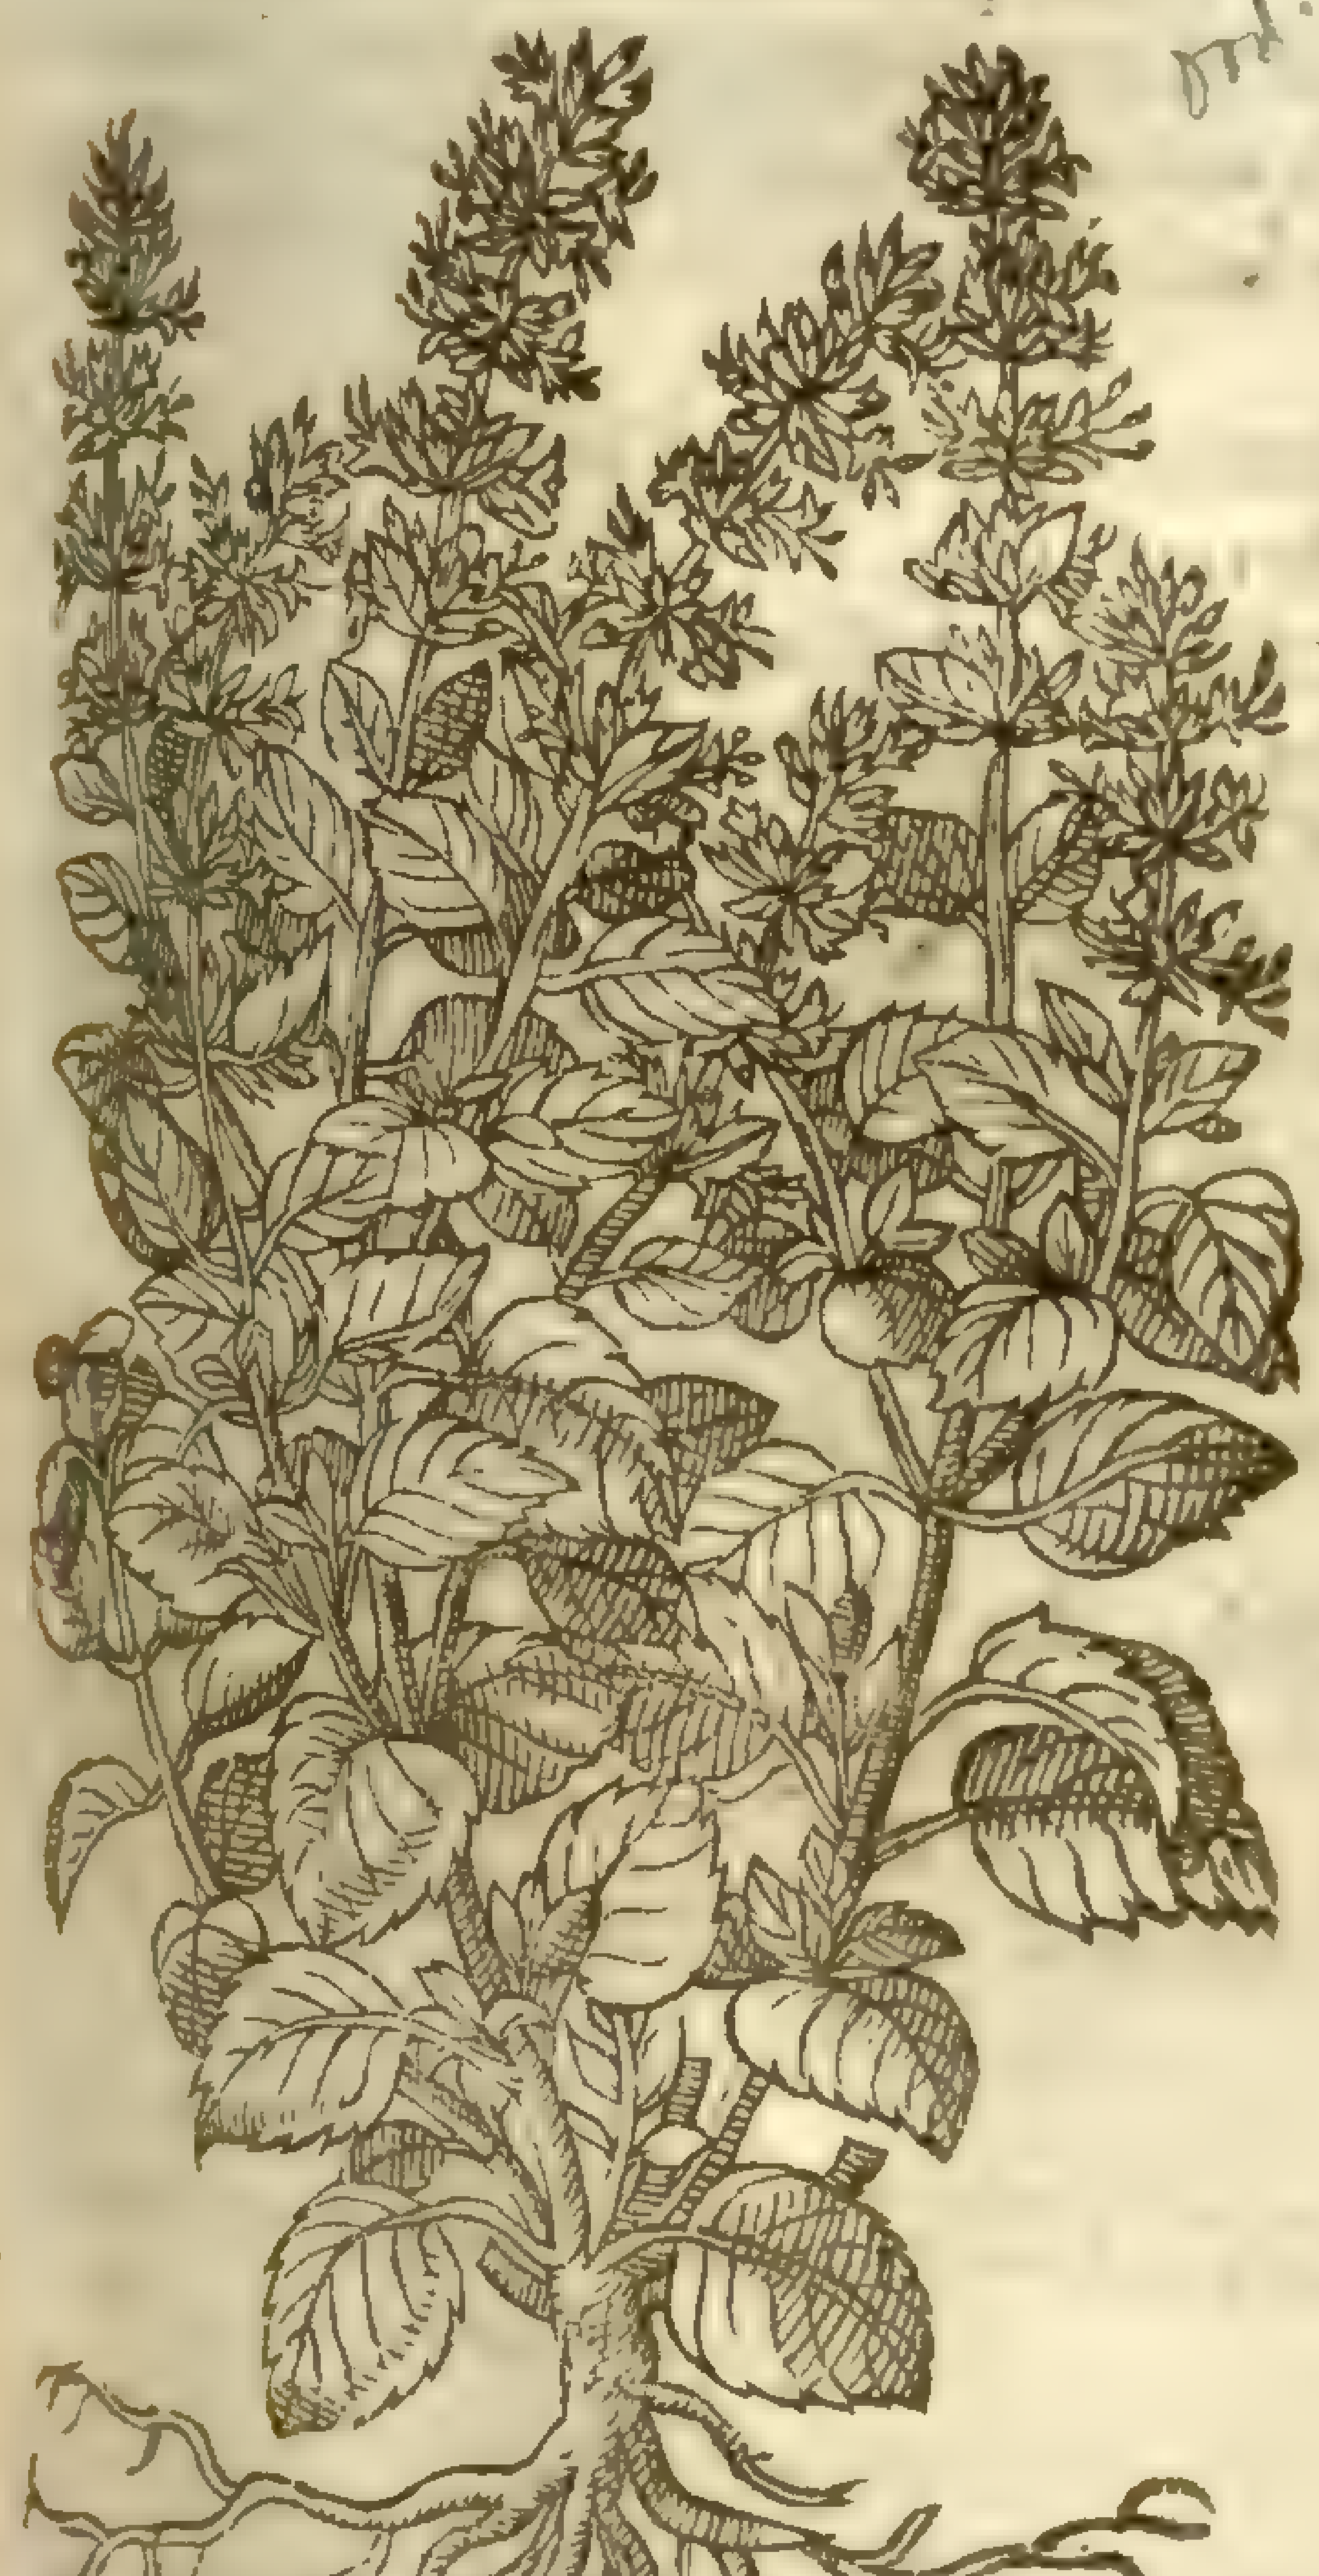
† 2 *Calamintha montana præſtantior.*
The more excellent Calaminth.

Melissa grandiflora, L.



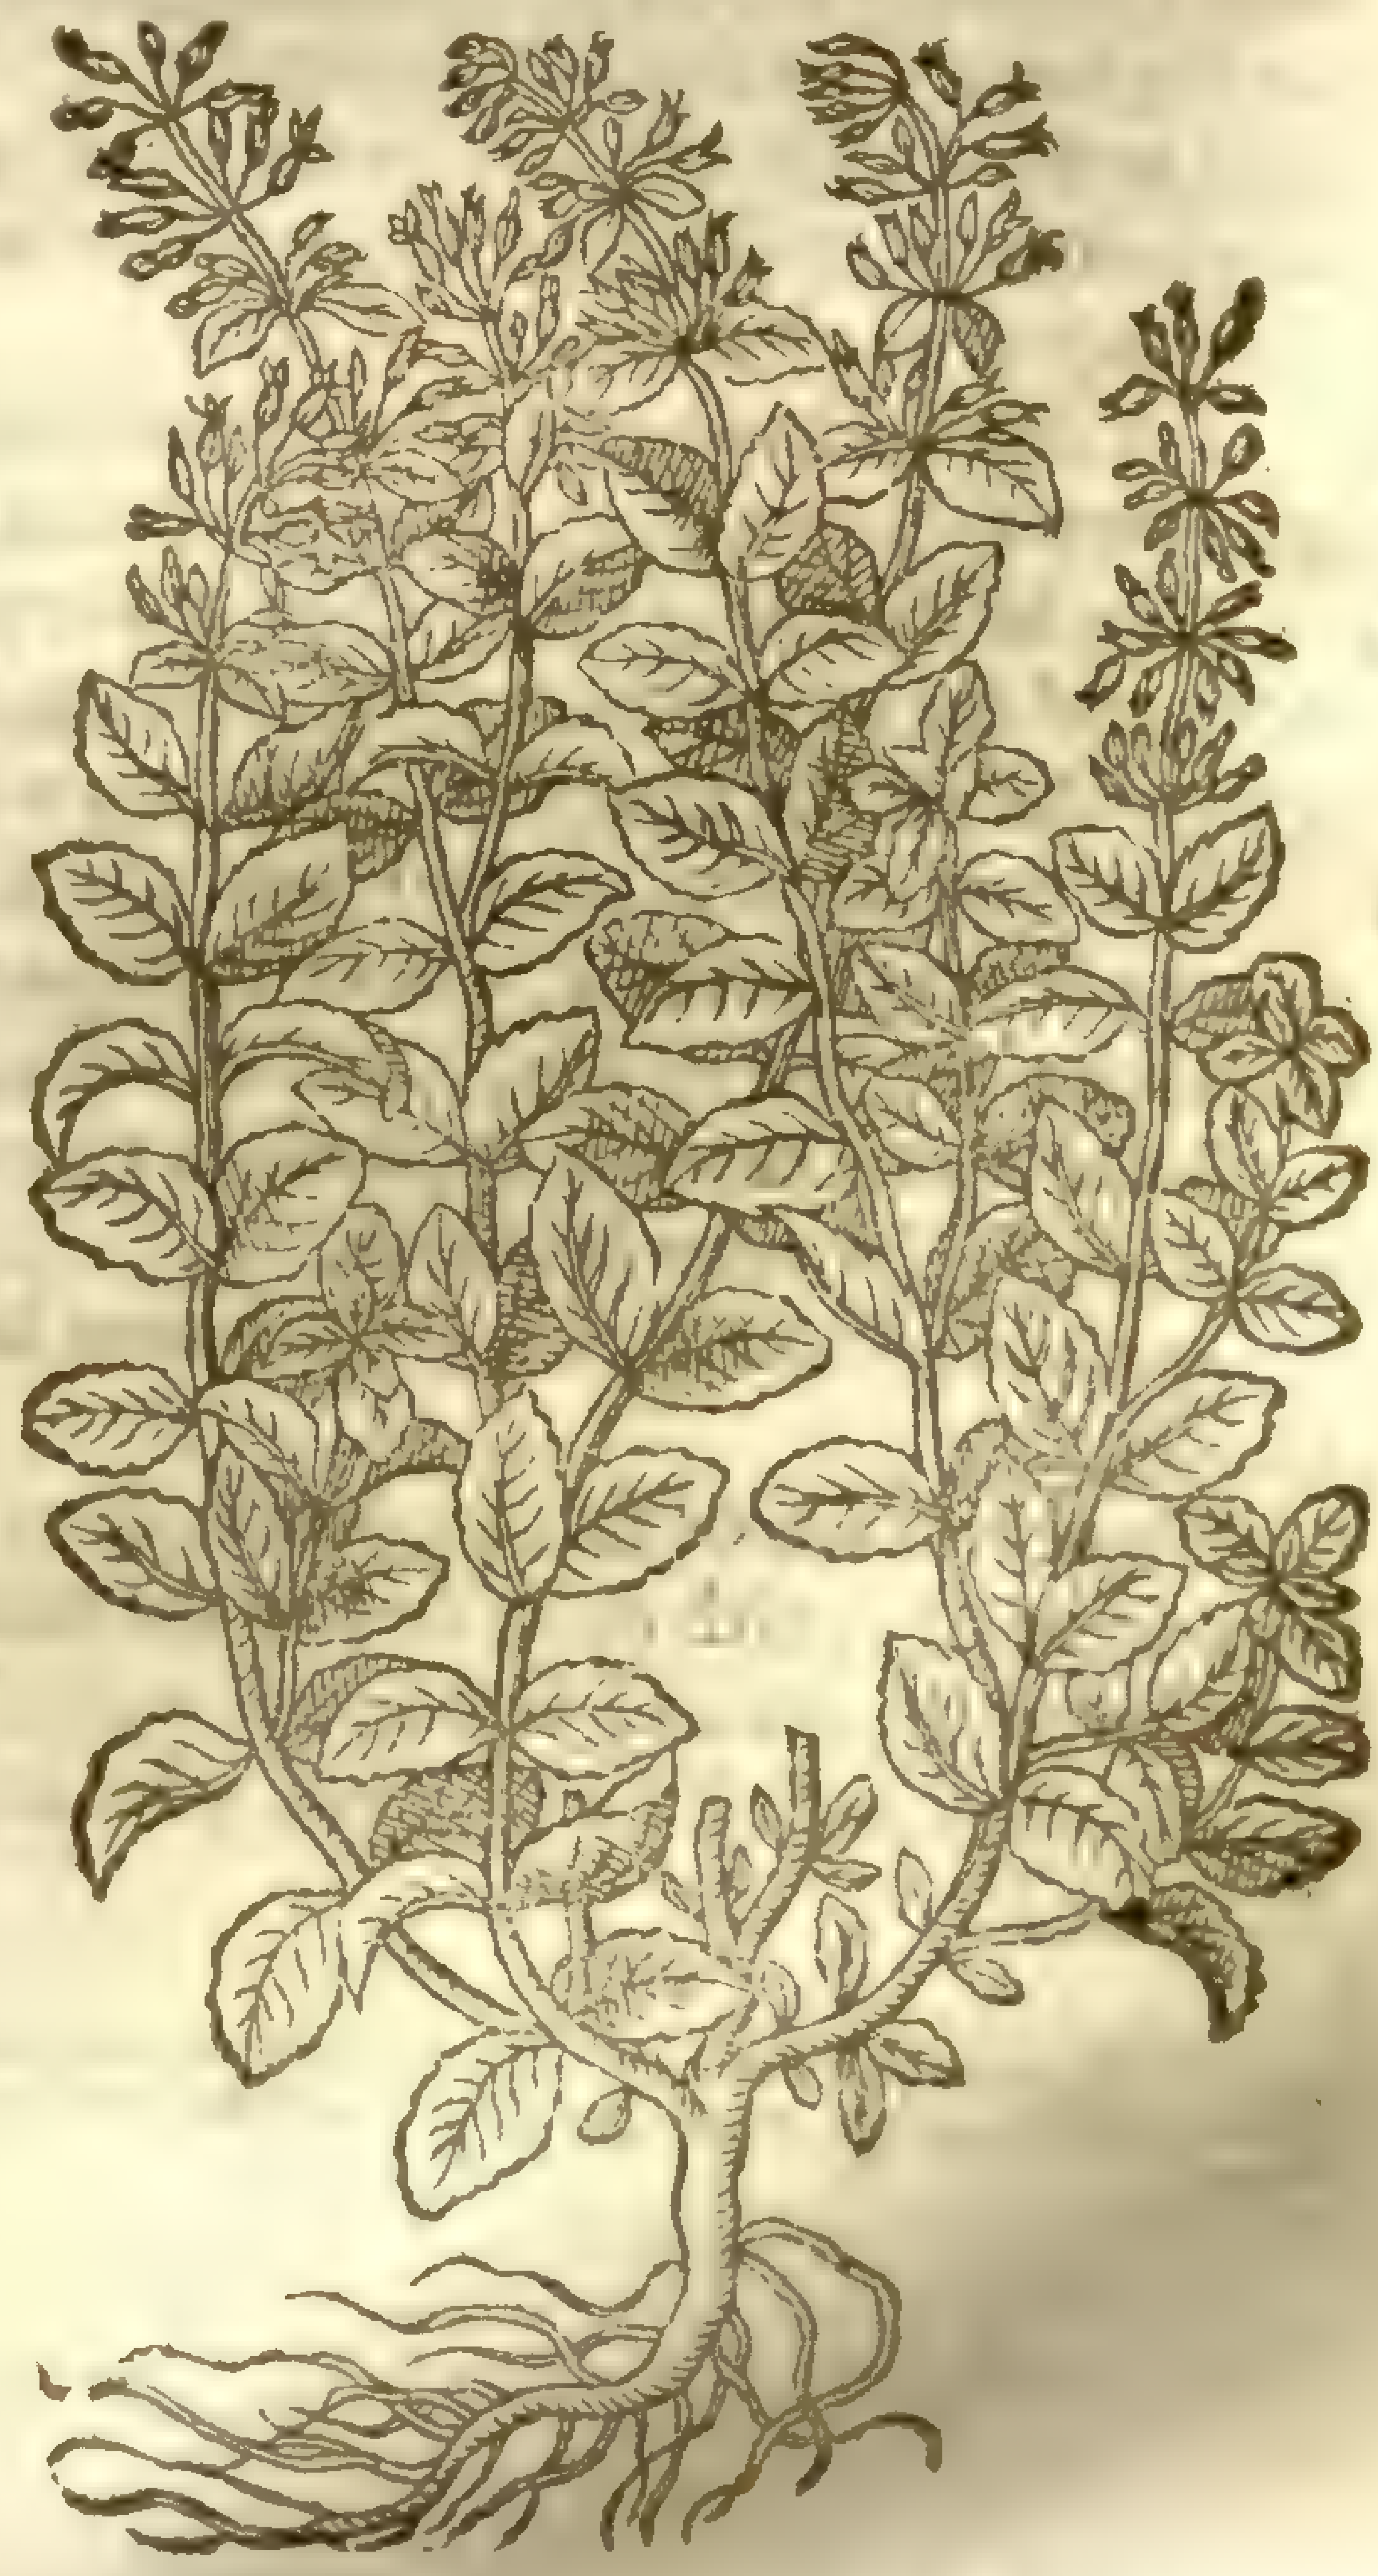
† 3 *Calamintha vulgaris Officinarum.*
Common Calamint.

ord. 98



Melissa calamintha, L.

† 4 *Calamintha odore Pulegij.*
Field Calamint.



Melissa nepeta, L.

¶ *The Place.*

It delighteth to grow in mountaines, and in the ſhadowy and grauelly ſides thereof: it is found in many places of Italy & France, and in other countries: it is brought into gardens, where it proſpereth maruellous wel, and very eaſily ſoweth it ſelfe. I haue found theſe plants growing vpon the chalkie grounds and highwaies leading from Grauesend to Canterbury, in moſt places, or almoſt euery where. ‡ I haue onely obſerued the third and fourth to grow wilde with vs in England. ‡

¶ *The Time.*

It flouriſheth in Summer, and almoſt all the yeare thorough: it bringeth forth floures and ſeed from Iune to Autumne.

¶ *The Names.*

It is called in Greeke Καλαμίνθη, as though you ſhould ſay, *Elegans aut vtilis Mentha*, a gallant or profitable Mint: the Latines keep the name *Calamintha*: *Apuleius* alſo nameth it amiſſe, *Mentaſtrum*, and confoundeth the names one with another: the Apothecaries call it *Montana Calamintha*, *Calamentum*, and ſomtime *Calamentum montanum*: in French, *Calament*: in Engliſh, Mountain Calamint. ‡ The fourth is certainly the ſecond Calamint of *Dioſcorides*, and the true *Nepeta* of the Antients. ‡

¶ *The Temperature.*

This Calamint which groweth in mountaines is of a feruent taſt, and biting, hot, and of a thinne ſubſtance, and dry after a ſort in the third degree, as *Galen* ſaith: it digeſteth or waſteth away thinne humors, it cutteth, and maketh thick humors thin.

¶ *The Vertues.*

A Therefore being inwardly taken by it ſelfe, and alſo with mead or honied water, it manifeſtly heates, prouokes ſweat, and conſumes ſuperfluous humors of the body; it takes away the ſhiuerings of Agues that come by fits.

B The ſame alſo is performed by the ſallet oile in which it is boiled, if the body be anointed and well rubbed and chafed therewith.

C The decoction thereof drunke prouoketh vrine, bringeth downe the monethly ſickneſſe, and expelleth the childe, which alſo it doth being but only applied.

D It helps thoſe that are bruiſed, ſuch as are troubled with cramps and conuulſions, and that canot breathe vnleſſe they hold their necks vpright (that haue the wheeſing of the lungs, ſaith *Galen*) and it is a remedy ſaith *Dioſcorides* for the cholerick paſſion, otherwiſe called the Felony.

E It is good for them that haue the yellow jaundiſe, for that it remoueth the ſtoppings of the liuer and gall, and withal clenſeth: being taken aforehand in wine, it keepes a man from being poiſoned: being inwardly taken, or outwardly applied it cureth them that are bitten of Serpents: being burned or ſtrewed it driues ſerpents away: it takes away black and blew ſpots that come by blowes or dry beatings, making the skinne faire and white; but for ſuch things (ſaith *Galen*) it is better to be laid to greene than dry.

F It killeth all manner of wormes of the belly, if it be drunke with ſalt and honey: the juice dropped into the eares doth in like manner kill the wormes thereof.

G *Pliny* ſaith, that if the juice be conueyed vp into the noſthrils, it ſtancheth the bleeding at the noſe; and the root (which *Dioſcorides* writeth to be good for nothing) helpeth the Squincie, if it be gargariſed, or the throat waſhed therewith, being vſed in Cute, and Myrtle ſeed withall.

H It is applied to thoſe that haue the Sciatica or ache in the huckle bone, for it drawes the humor from the very bottome, and bringeth a comfortable heat to the whole joint: *Paulus Ægineta* ſaith, that for the paine of the haunches or huckle bones it is to be vſed in Clyſters.

I Being much eaten it is good for them that haue the leproſie, ſo that the patient drink whay after it, as *Dioſcorides* witneſſeth.

K *Apuleius* affirmeth, that if the leaues be often eaten, they are a ſure and certaine remedy againſt the leproſie.

L There is made of this an Antidote or compoſition, which *Galen* in his fourth booke of the Gouernment of health deſcribes by the name of *Diacalaminthos*, that doth not only notably digeſt or waſt away crudities, but alſo is maruellous good for young maidens that want their courſes, if their bodies be firſt well purged; for in continuance of time it bringeth them downe very gently without force.

† The figure which formerly was in the ſecond place belonged to the fourth deſcription; and the figure that belonged thereto, was before falſly put for the *Scorodonia* or Wood-ſage. As alſo that which ſhould haue been put in the fourth place was put in the firſt place of the laſt chapter ſaue two, for the Red Garden Mint.

CHAP.

Chap. 229. *Of Bawme.*

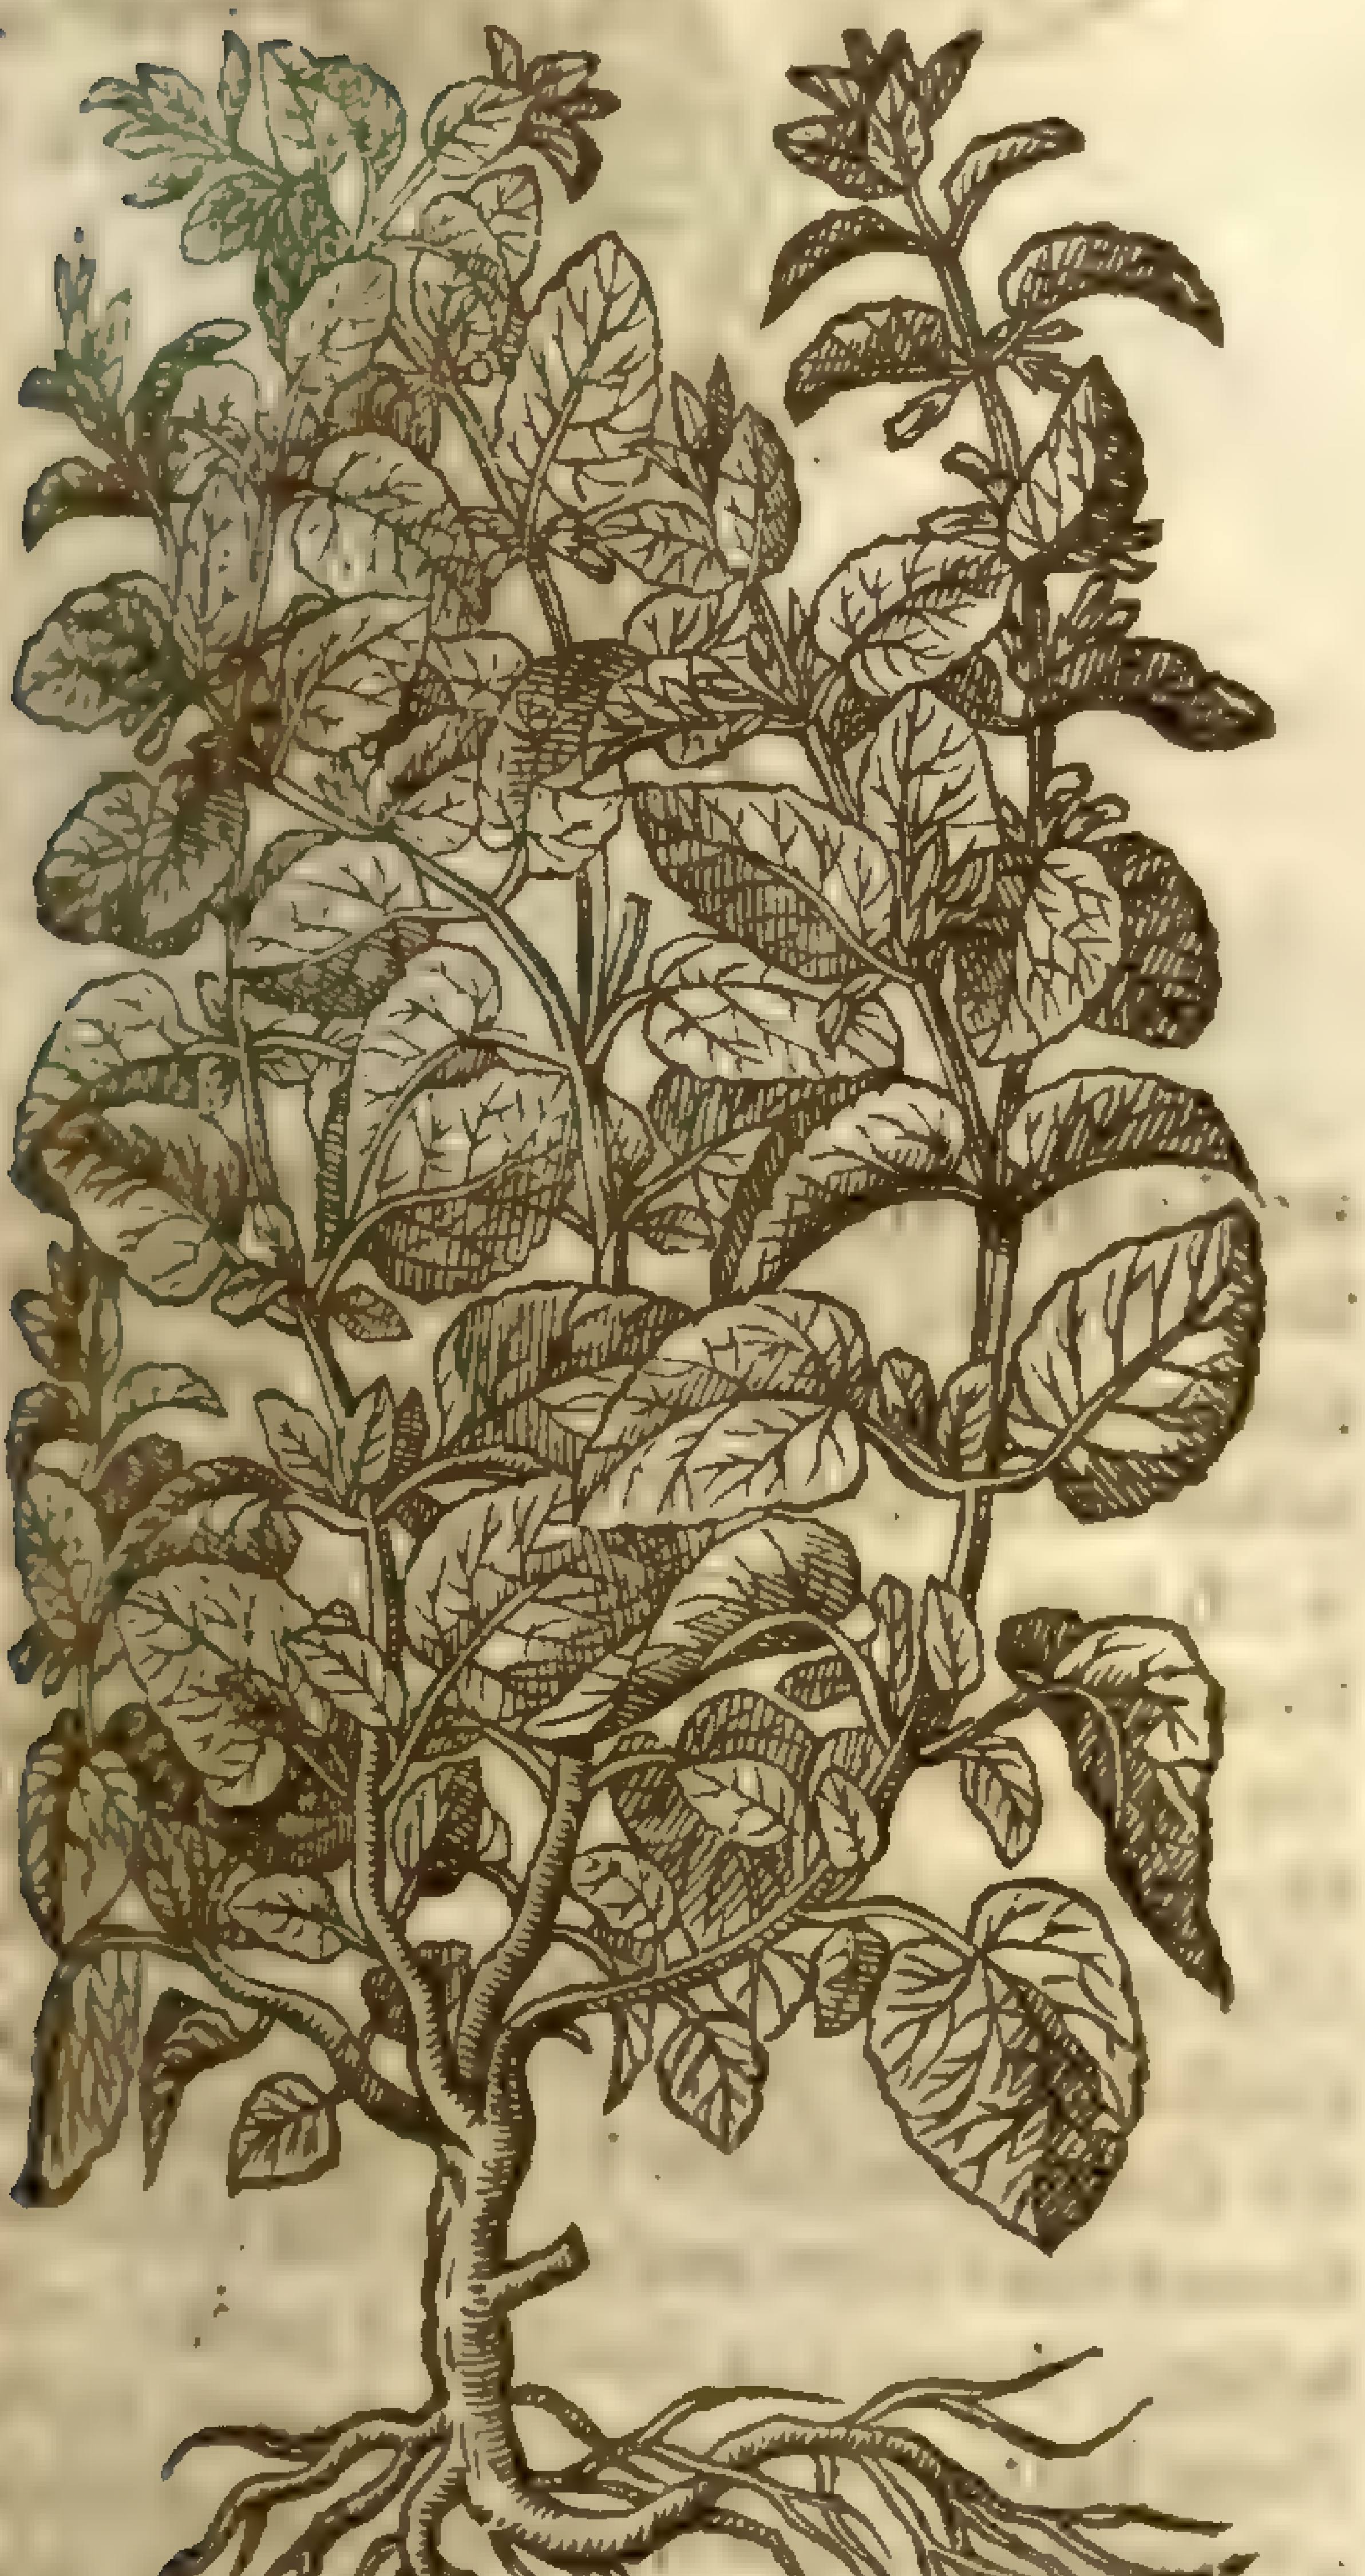
¶ *The Deſcription.*

1 A*Piaſtrum*, or *Meliſſa*, is our common beſt knowne Balme or Bawme, hauing many ſquare ſtalkes and blackiſh leaues like to *Ballote*, or blacke Horehound, but larger, of a pleaſant ſmell, drawing neere in ſmell and ſauour vnto a Citron: the floures are of a Carnation colour; the root of a wooddy ſubſtance.

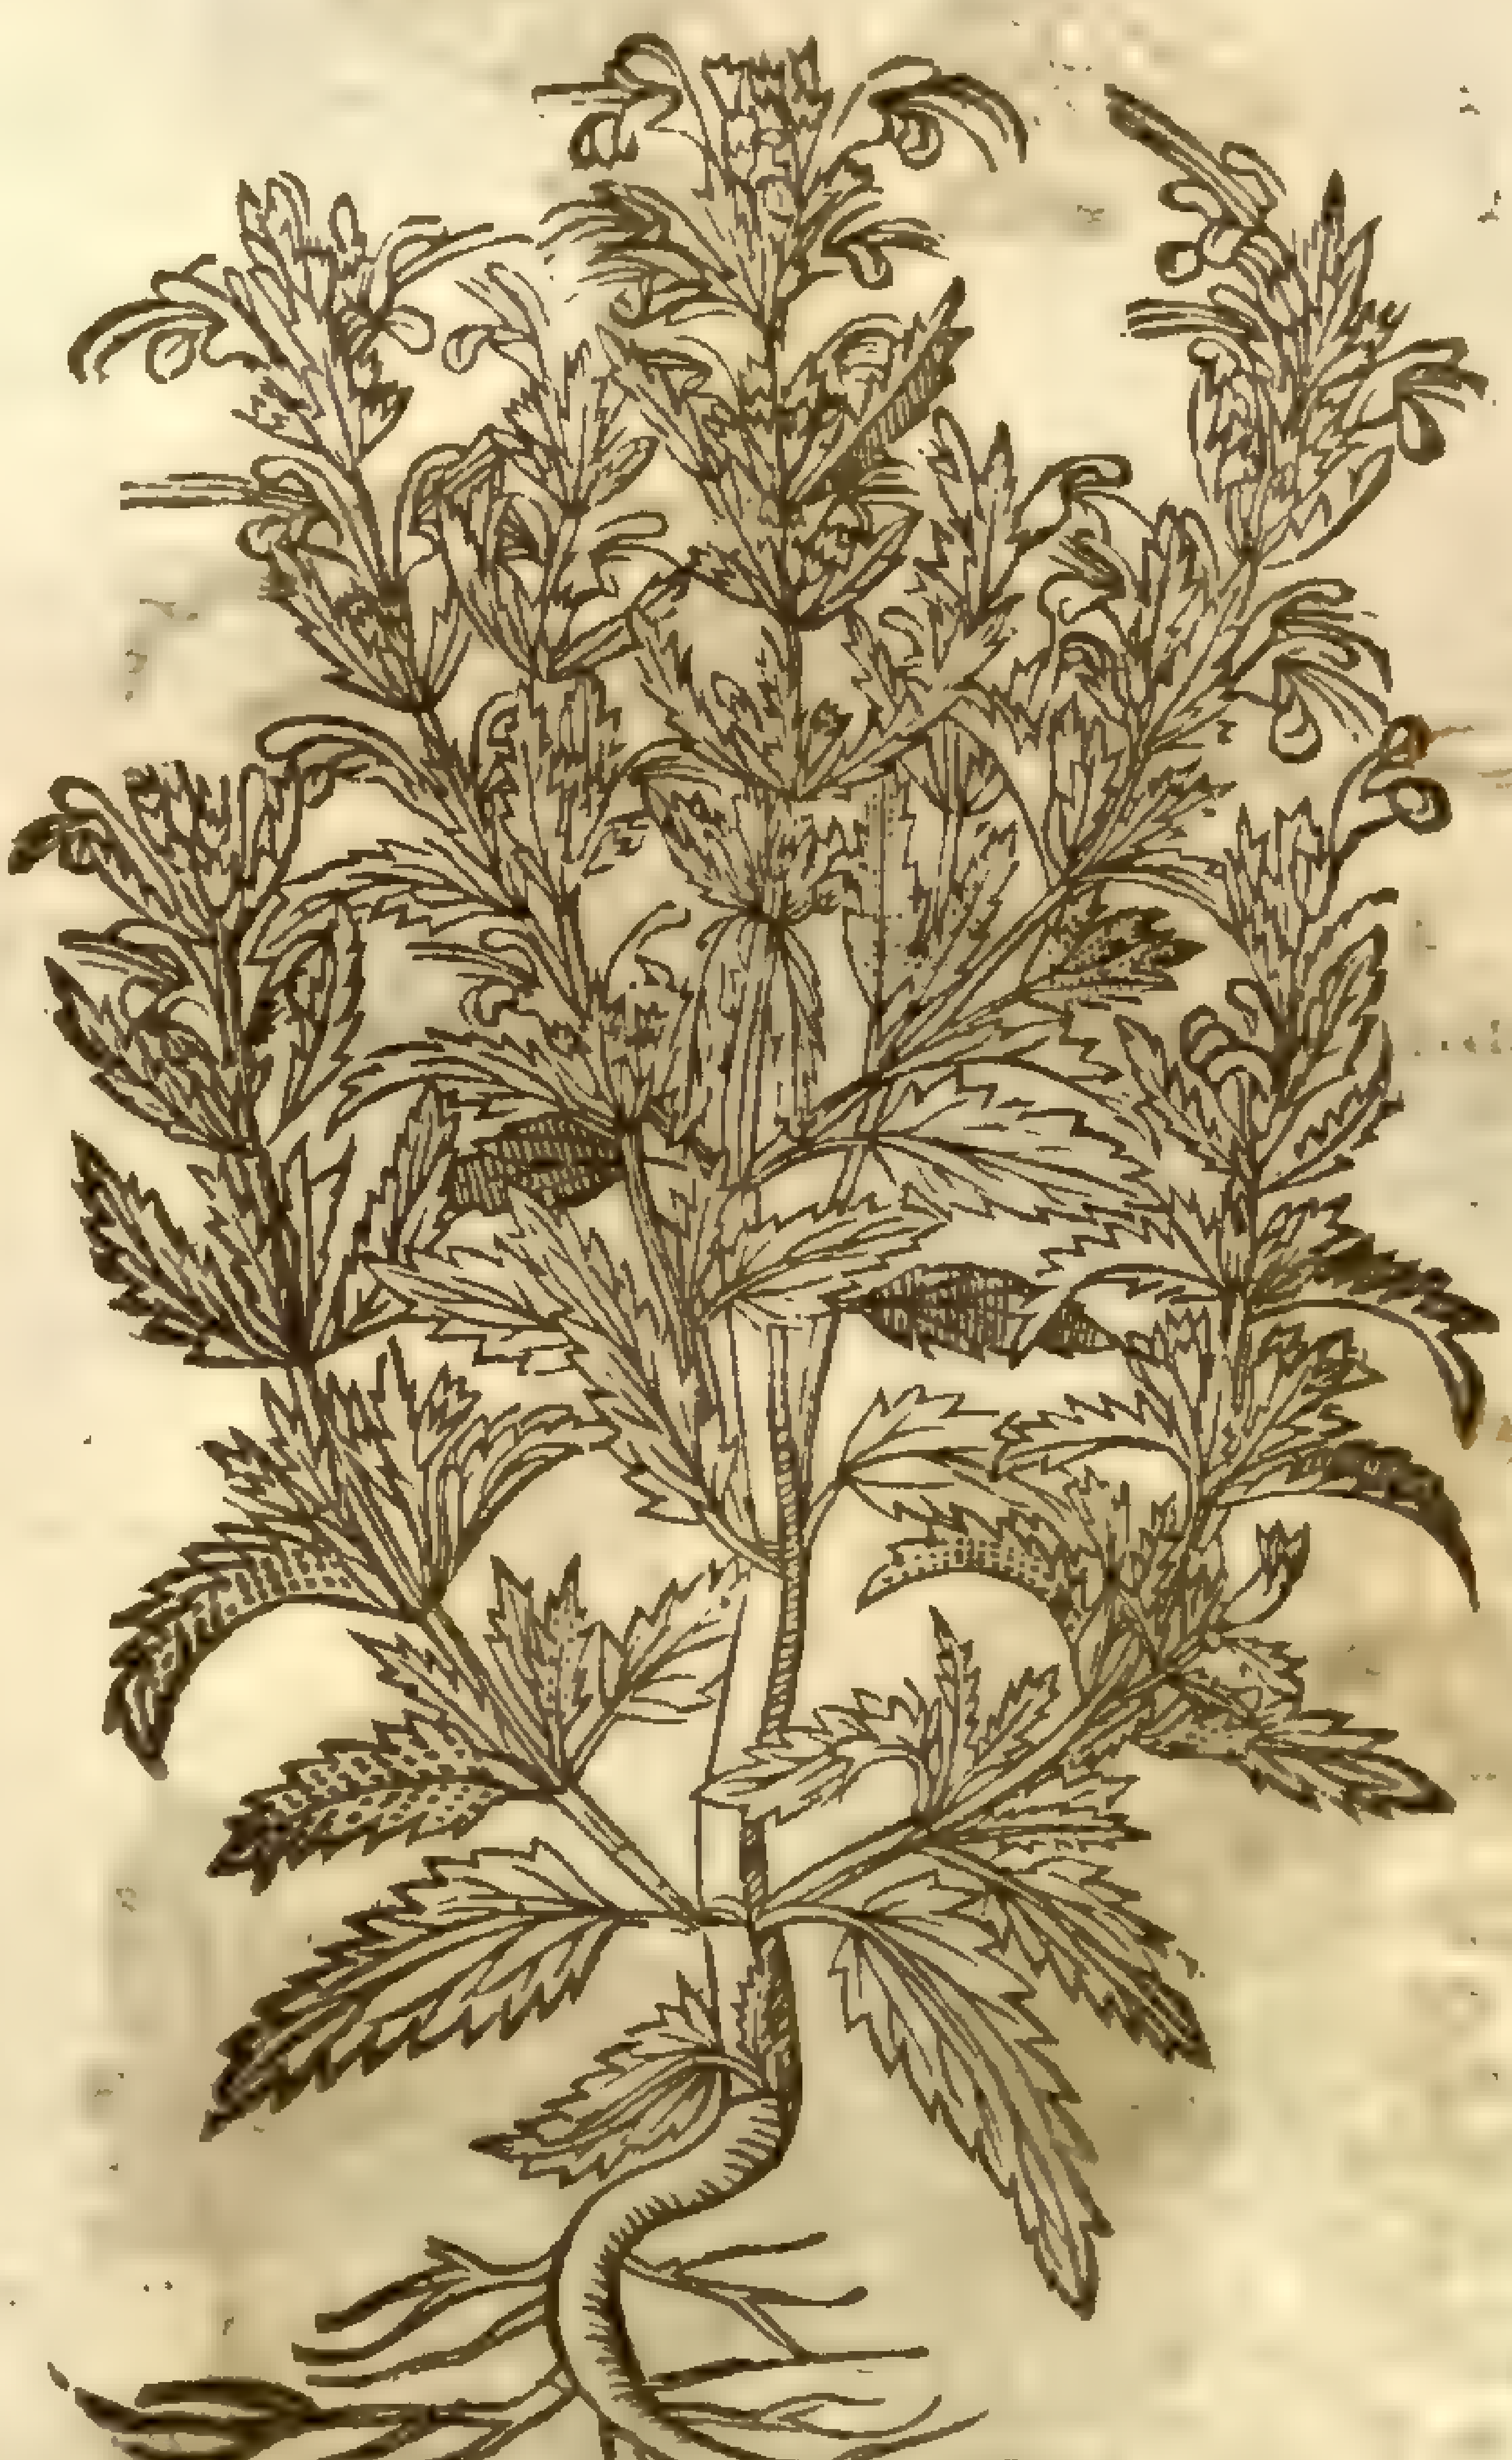
2 The ſecond kinde of Bawme was brought into my garden and others, by his ſeed from the parts of Turky, wherefore we haue called it Turky Balme: it excelleth the reſt of the kindes, if you reſpect the ſweet ſauour and goodly beauty thereof, and deſerueth a more liuely deſcription than my rude pen can deliuer. This rare plant hath ſundry ſmall weake and brittle ſquare ſtalkes and branches, mounting to the height of a cubit and ſomewhat more, beſet with leaues like to Germander or *Scordium*, indented or toothed very bluntly about the edges, but ſomewhat ſharpe pointed at the top. The floures grow in ſmall coronets, of a purpliſh blew colour: the root is ſmall and thready, and dieth at the firſt approch of Winter, and muſt be ſowne anew in the beginning of May, in good and fertill ground.

1 *Meliſſa.*
Bawme.

M officinalis L.
[illegible]



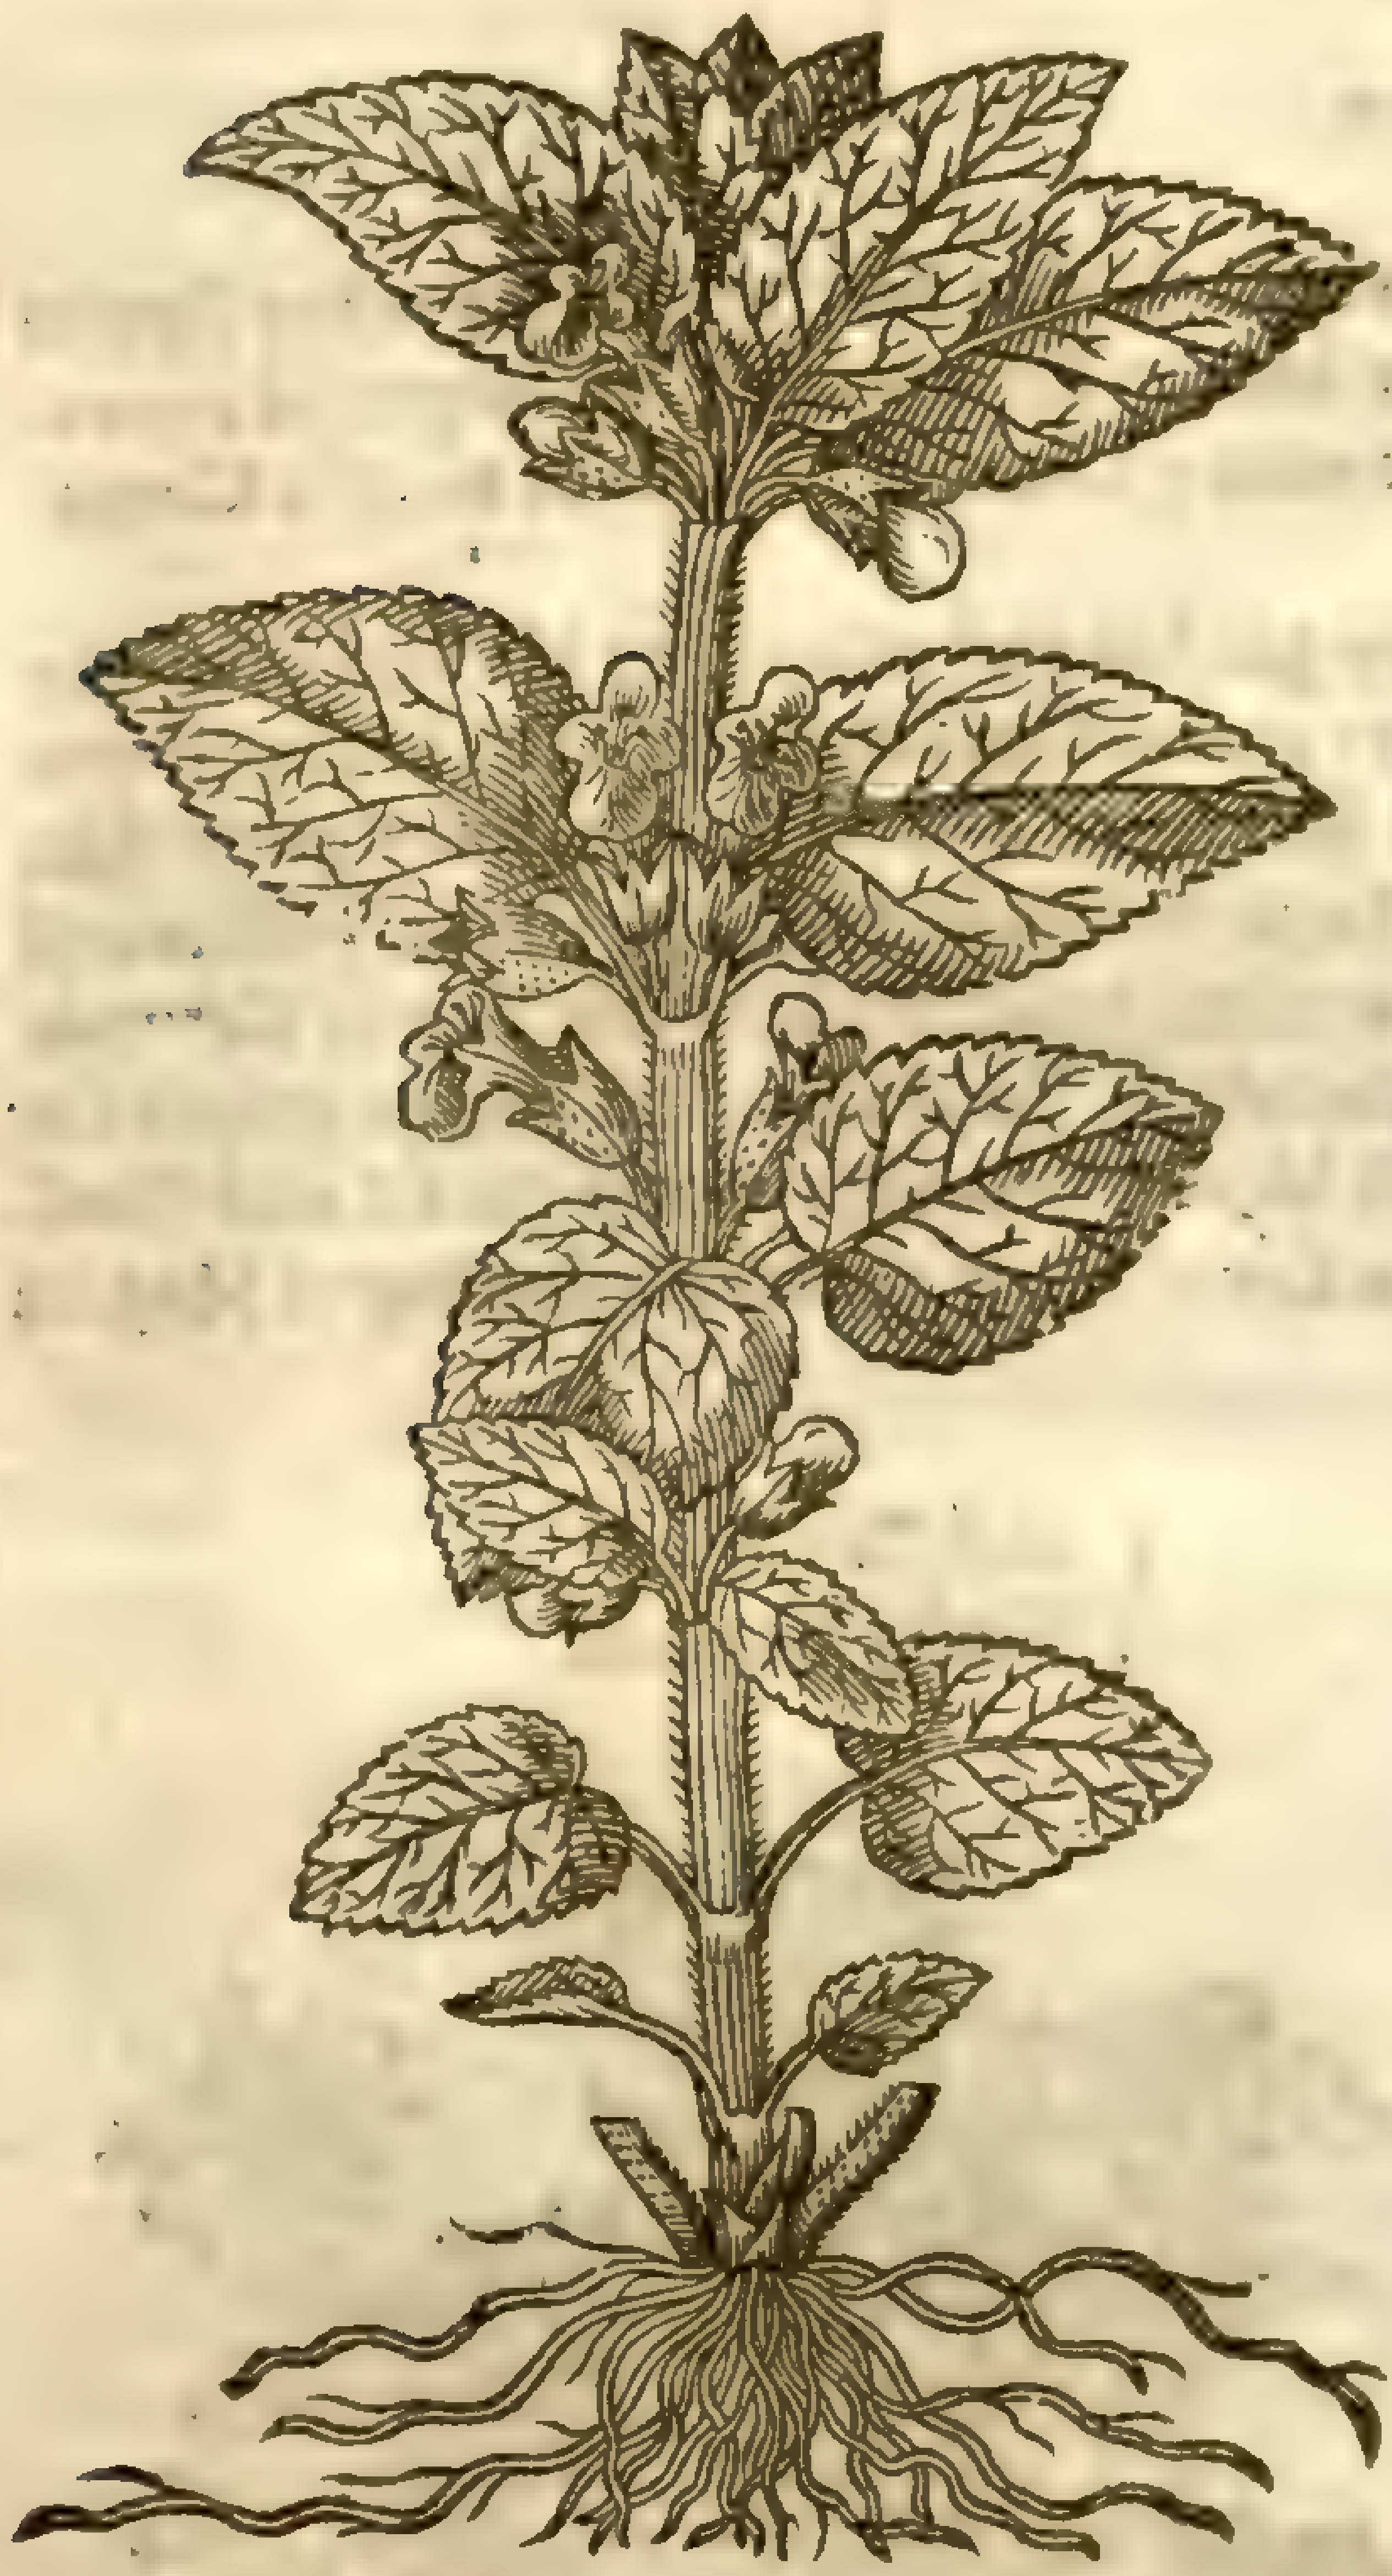
2 *Meliſſa Turcica.*
Turky Bawme.



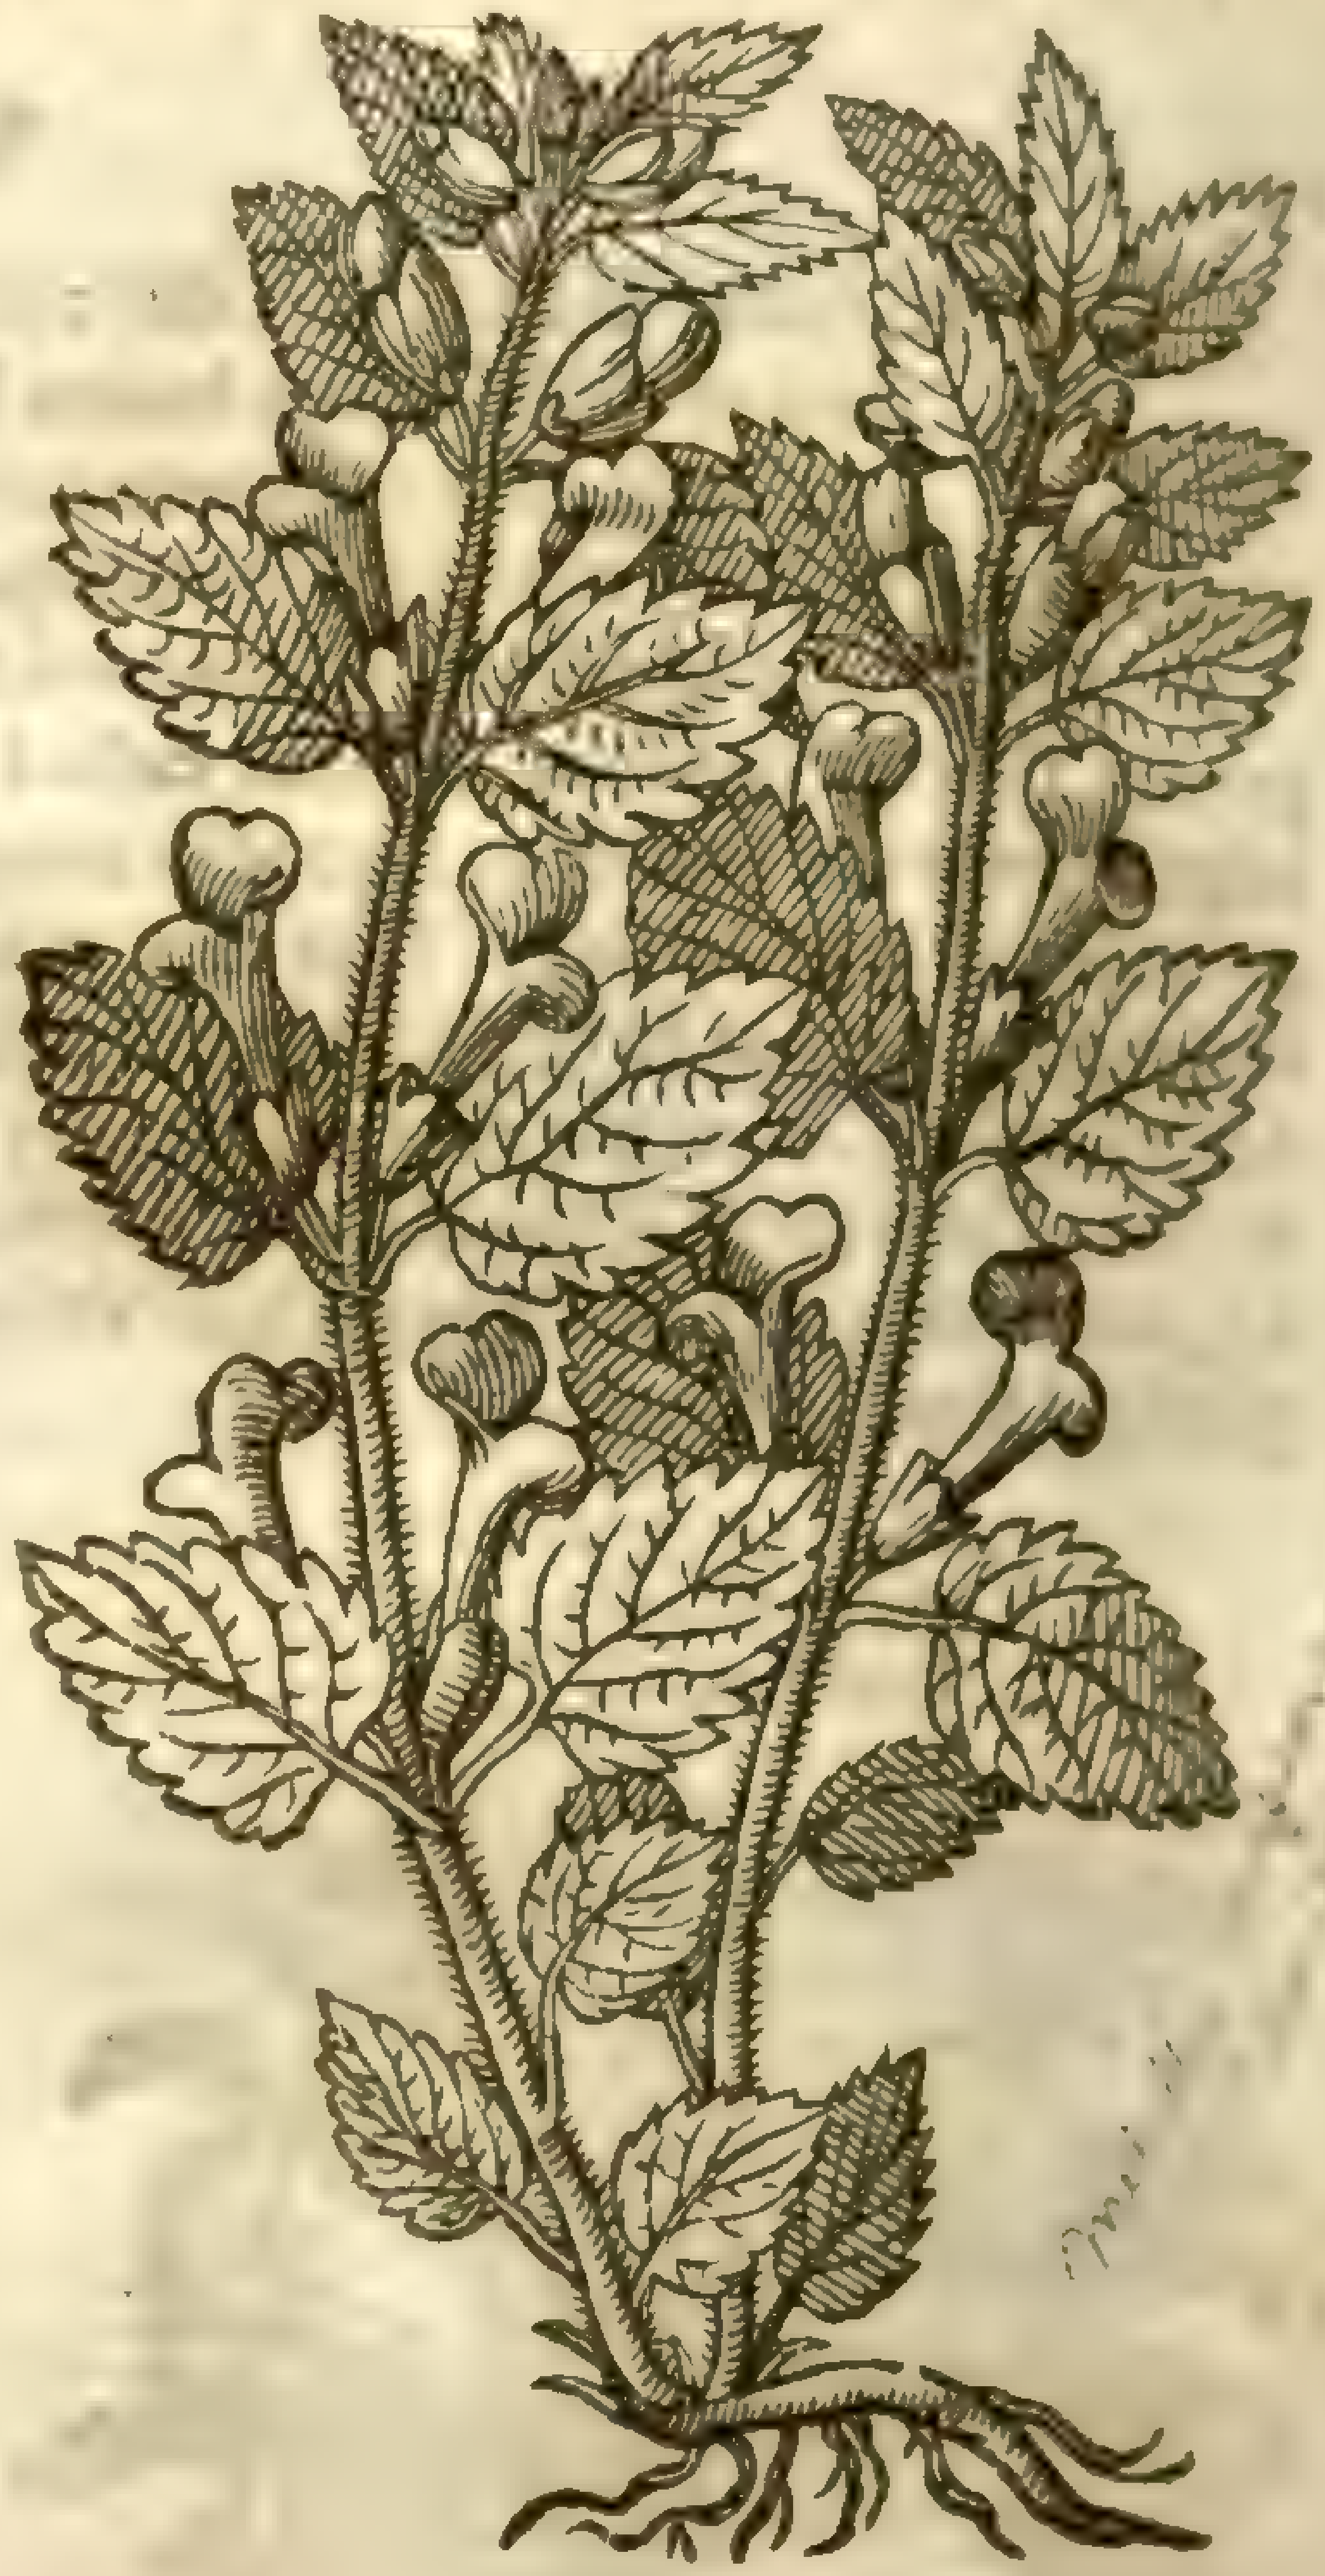
3 *Fuchſius* ſetteth forth a kinde of Bawme hauing a ſquare ſtalke, with leaues like vnto common Bawme, but larger and blacker, and of an euill ſauour; the floures white, and much greater than thoſe of the common Bawme; the root hard, and of a wooddy ſubſtance. ‡ This varies with the leaues ſometimes broader, otherwhiles narrower: alſo the floures are commonly purple, yet ſometimes white, and otherwhiles of diuers colours: the leaues are alſo ſometimes broader, otherwhiles narrower: wherefore I haue giuen you one of the figures of *Cluſius*, and that of *Lobel*, that you may ſee the ſeuerall expreſſions of this plant. *Cluſius*, and after him *Bauhine*, referre it to the *Lamium*, or Arch-angell: and the former calls it *Lamium Pannonicum*: and the later, *Lamium montanum Meliſſafolio.* ‡

4 There is a kinde of Bawme called *Herba Iudaica*, which *Lobel* calls *Tetrahit*, that hath many weake

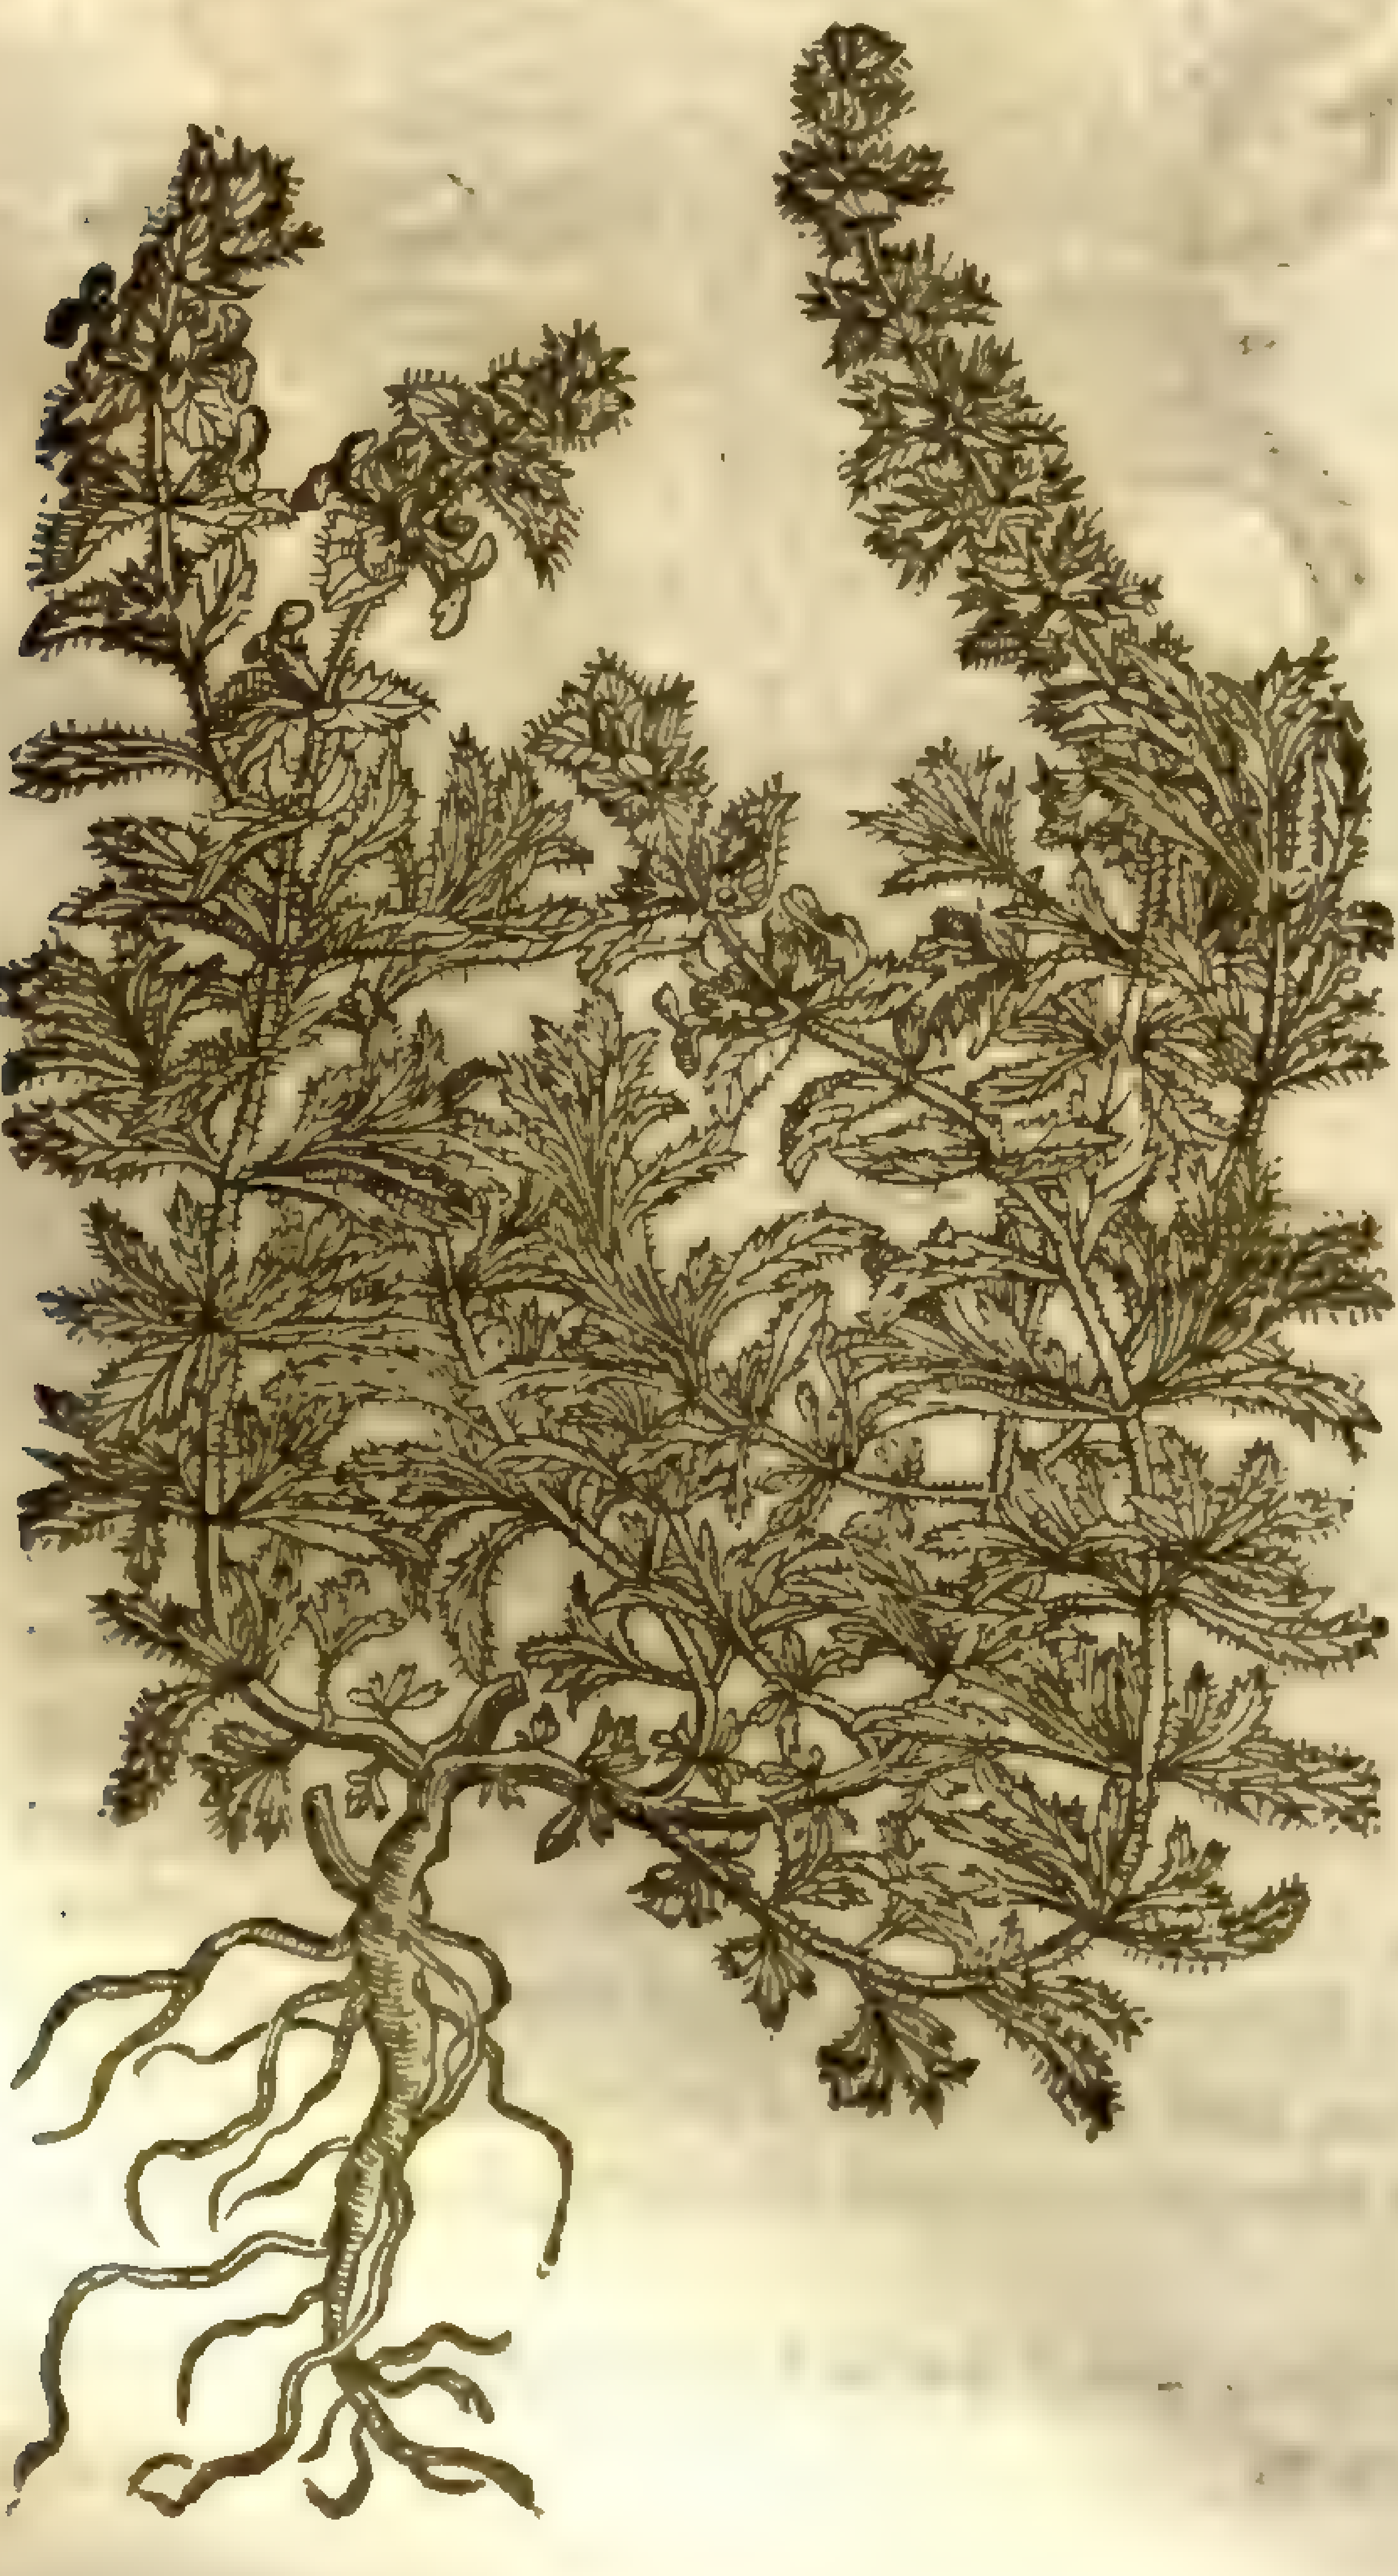
‡ 3 *Meliſſa Fuchſij flore albo.*
Baſtard Bawme with white floures.



‡ 3 *Meliſſa Fuchſij flore purpureo.*
Baſtard Bawme with purple floures.



‡ 4 *Herba Iudaica Lobelij.*
Smiths Bawme, or Iewes All-heale.



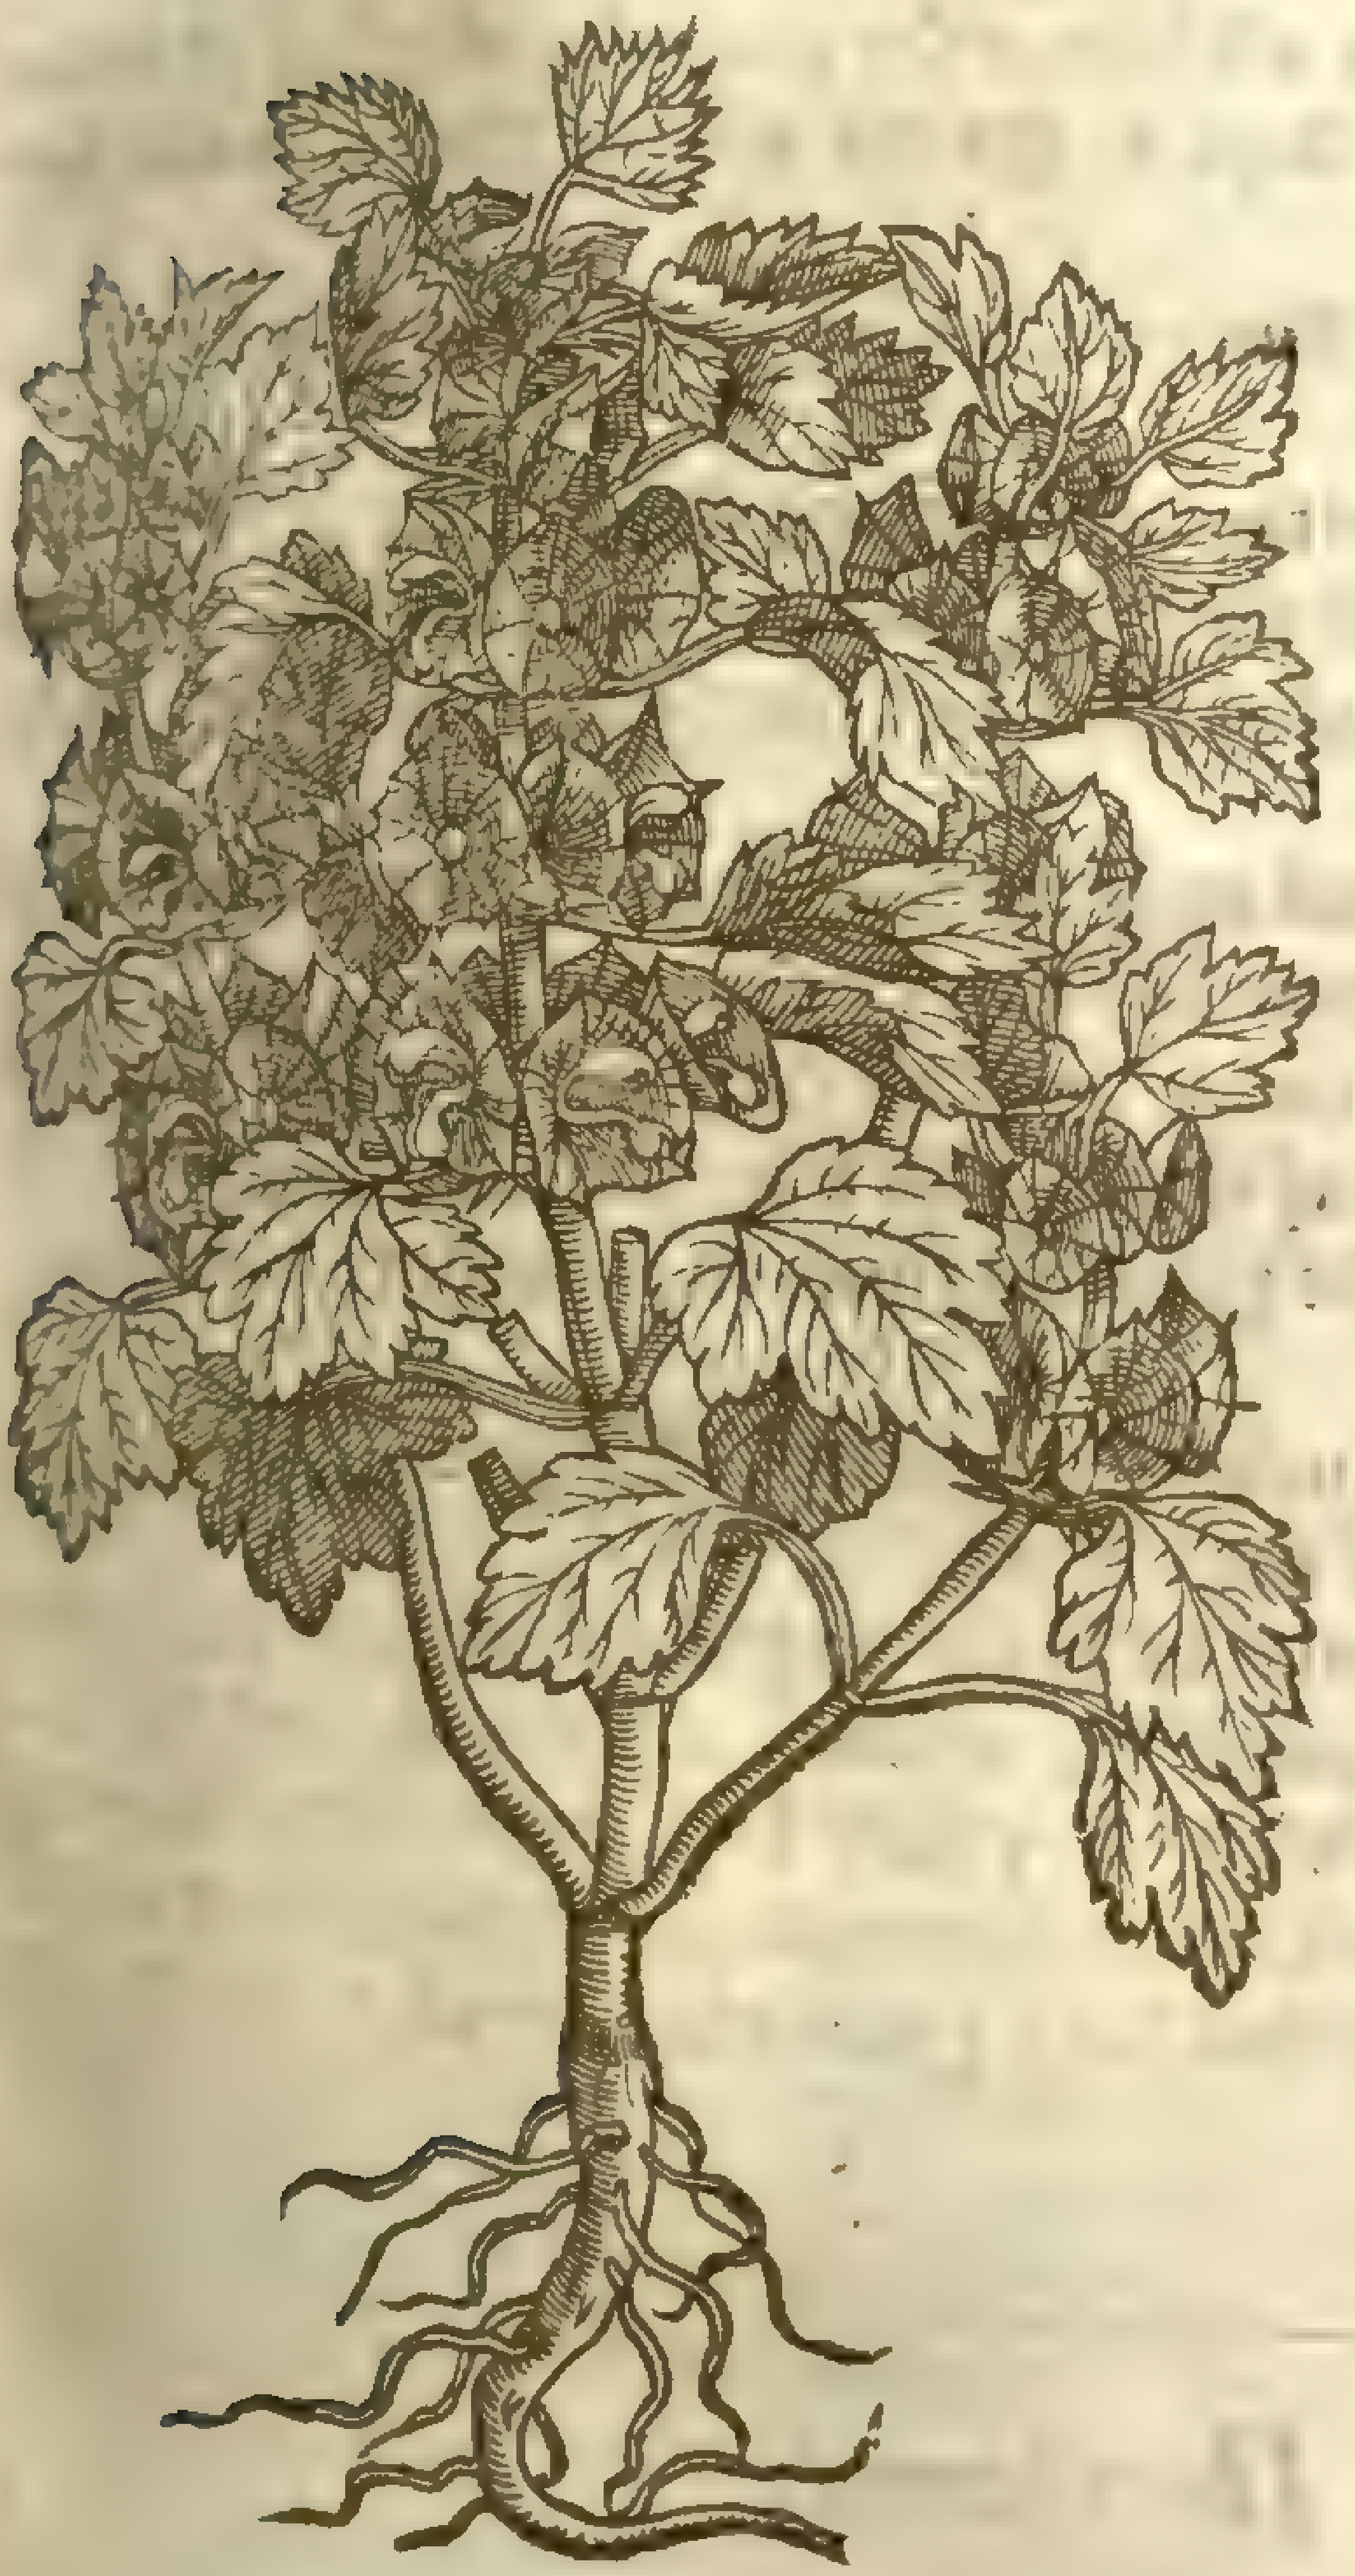
weake and tender ſquare hairie branches; ſome leaning backward, and others turning inward, diuiding themſelues into ſundry other ſmall armes or twigs, which are beſet with long rough leaues dented about, and ſmaller than the leaues of Sage. And growing in another ſoile or clymat, you ſhall ſee the leaues like the oken leaf; in other places like *Marrubium Creticum*, very hoary, which cauſed *Dioſcorides* to deſcribe it with ſo many ſhapes, and alſo the floures, which are ſometimes blew and purple, and oftentimes white: the root is ſmall and crooked, with ſome hairie ſtrings faſtned thereto. All the whole plant draweth to the ſauor of Balme, called *Meliſſa*. ‡ This might much more fitly haue been put to the reſt of the *Sideritides*, but that our Author had thruſt it as by force into this Chapter. ‡

5 There be alſo two other plants comprehended vnder the kindes of Balme, the one very like vnto the other, although not knowne to many Herbariſts, and haue been of ſome called by the title of *Cardiaca*: the firſt kinde *Pena* calleth *Cardiaca Melica*, or *Molucca Syriaca*, ſo called for that it was firſt brought out of Syria: it groweth three

cubits high, and yeelding many ſhoots from a wooddy root, full of many whitiſh ſtrings; the ſtalkes be round, ſomewhat thicke, and of a reddiſh colour, which are hollow within, with certaine obſcure prints or ſmall furrowes along the ſtalkes, with equall ſpaces halfe kneed or knotted, and at euery ſuch knee or joynt ſtand two leaues one againſt another, tufted like *Meliſſa*, but more rough and deeply indented, yet not ſo deeply as our common *Cardiaca*, called Mother-wort, nor ſo ſharpe pointed: about the knees there come forth ſmall little prickles, with ſix or eight ſmall open wide bells, hauing many corners thinne like parchment, and of the ſame colour, ſomewhat ſtiffe and long; and at the top of the edge of the bell it is cornered and pointed with ſharpe prickles, and out of the middle of this prickly bell riſeth a floure ſomewhat purple tending to whiteneſſe, not vnlike our *Lamium* or *Cardiaca*, which bringeth forth a cornered ſeed, the bottome flat, and ſmaller toward the top like a ſteeple: the ſauour of the plant draweth toward the ſent of *Lamium*.

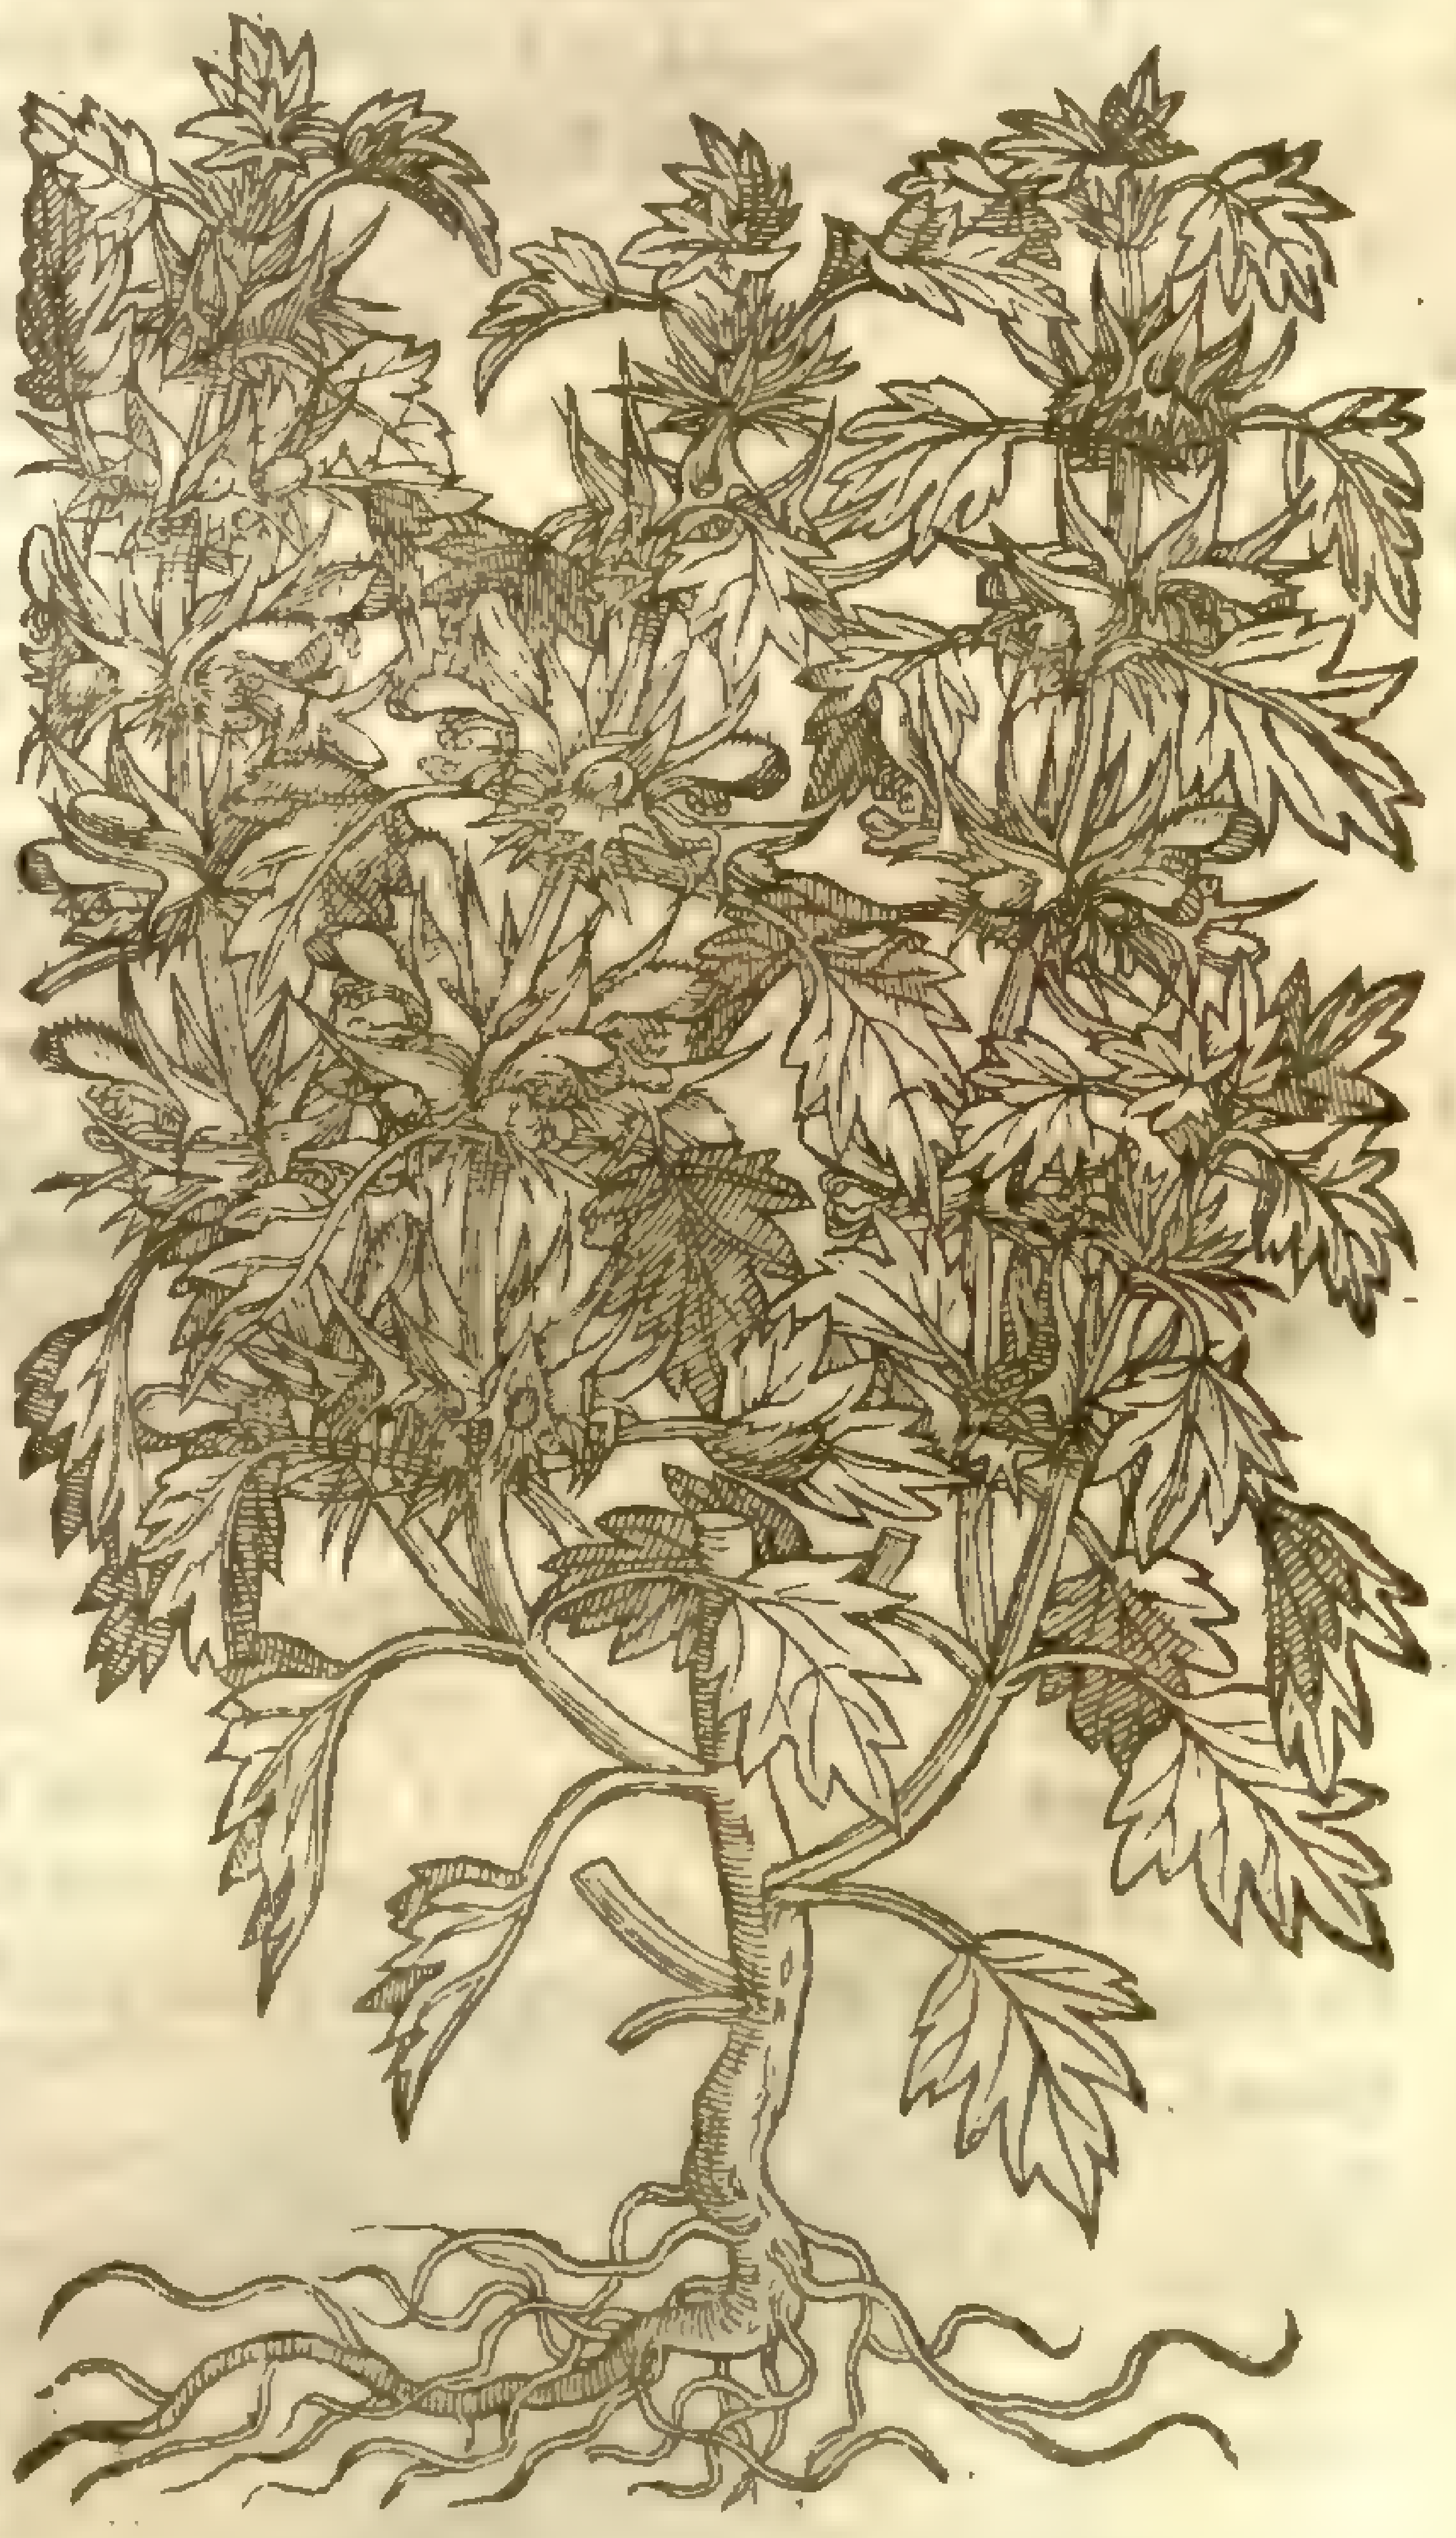
6 The other kinde of *Melica*, otherwiſe called *Molucca aſperior* (whereof *Pena* writeth) differeth from the laſt before mentioned, in that the cups or bells wherein the floures grow are more prickly than the firſt, and much ſharper, longer, and more in number: the ſtalke of this is foure ſquare, lightly hollowed or furrowed; the ſeed three cornered, ſharpe vpward like a wedge; the tunnels of the floures browniſh, and not ſo white as the firſt.

5 *Meliſſa Molucca lævis.*
Smooth Molucca Bawme.



Molucella laevis it mill. dict.

6 *Molucca ſpinoſa.*
Thorny Molucca Bawme.



Molucella spinosa it mill. dict.

¶ *The Place.*

Bawme is much ſowen and ſet in Gardens, and oftentimes it groweth of it ſelfe in Woods and mountaines, and other wilde places: it is profitably planted in Gardens, as *Pliny* writeth, *lib.* 21. *cap.* 12. about places where Bees are kept, becauſe they are delighted with this herbe aboue others, whereupon it hath beene called *Apiaſtrum*: for, ſaith he, when they are ſtraied away, they doe finde their way home againe by it, as *Virgil* writeth in his Georgicks:

——— *Huc tujuſſos aſperge liquores,*
Trita Meliphylla, & Cerinthe ignobile gramen.
——— Here liquors caſt in fitting ſort,
Of bruiſed Bawme and more baſe Honywort.

All theſe I haue in my garden from yeare to yeare.

¶ The

¶ *The Time.*

Bawme floureth in Iune, Iuly, and Auguſt: it withereth in the Winter; but the root remaineth, which in the beginning of the Spring bringeth forth freſh leaues and ſtalkes.

The other ſorts do likewiſe flouriſh in Iune, Iuly, and Auguſt; but they doe periſh when they haue perfected their ſeed.

¶ *The Names.*

Bawme is called in Greeke, μελισσόφυλλον: by *Pliny*, *Melitis*: in Latine, *Meliſſa*, *Apiaſtrum*, and *Citrago*: of ſome, *Meliſſophyllon*, and *Meliphyllon*: in Dutch, **Conſille de greyn**: in French, *Poucyrade, ou Meliſſe*: in Italian, *Cedronella*, and *Arantiata*: in Spaniſh, *Torongil*: in Engliſh, Balme, or Bawme.

¶ *The Temperature.*

Bawme is of temperature hot and dry in the ſecond degree, as *Auicen* ſaith: *Galen* ſaith it is like Horehound in faculty.

¶ *The Vertues.*

A Bawme drunke in wine is good againſt the bitings of venomous beaſts, comforts the heart, and driueth away all melancholy and ſadneſſe.

B Common Bawme is good for women which haue the ſtrangling of the mother, either being eaten or ſmelled vnto.

C The juyce thereof glueth together greene wounds, being put into oyle, vnguent, or Balme, for that purpoſe, and maketh it of greater efficacy.

D The herbe ſtamped, and infuſed in *Aqua vitæ*, may be vſed vnto the purpoſes aforeſaid (I meane the liquour and not the herbe) and is a moſt Cordiall liquor againſt all the diſeaſes before ſpoken of.

E The hiues of Bees being rubbed with the leaues of Bawme, cauſeth the Bees to keep together, and cauſeth others to come vnto them.

F The later age, together with the Arabians and Mauritanians, affirme Balme to be ſingular good for the heart, and to be a remedy againſt the infirmities thereof; for *Auicen* in his booke written of the infirmities of the heart, teacheth that Bawme makes the heart merry and joyfull, and ſtrengtheneth the vitall ſpirits.

G *Serapio* affirmeth it to be comfortable for a moiſt and cold ſtomacke, to ſtir vp concoction, to open the ſtopping of the braine, and to driue away ſorrow and care of the minde.

H *Dioſcorides* writeth, That the leaues drunke with wine, or applied outwardly, are good againſt the ſtingings of venomous beaſts, and the biting of mad dogs: alſo it helpeth the tooth-ache, the mouth being waſhed with the decoction, and is likewiſe good for thoſe that cannot take breath vnleſſe they hold their neckes vpright.

I The leaues being mixed with ſalt (ſaith the ſame Author) helpeth the Kings Euill, or any other hard ſwellings and kernels, and mitigateth the paine of the Gout.

K Smiths Bawme or Carpenters Bawme is moſt ſingular to heale vp greene wounds that are cut with yron; it cureth the rupture in ſhort time; it ſtaieth the whites. *Dioſcorides* and *Pliny* haue attributed like vertues vnto this kinde of Bawme, which they call Iron-wort. The leaues (ſay they) being applied, cloſe vp wounds without any perill of inflammation. *Pliny* ſaith that it is of ſo great vertue, that though it be but tied to his ſword that hath giuen the wound, it ſtancheth the bloud.

Chap. 230. *Of Horehound.*

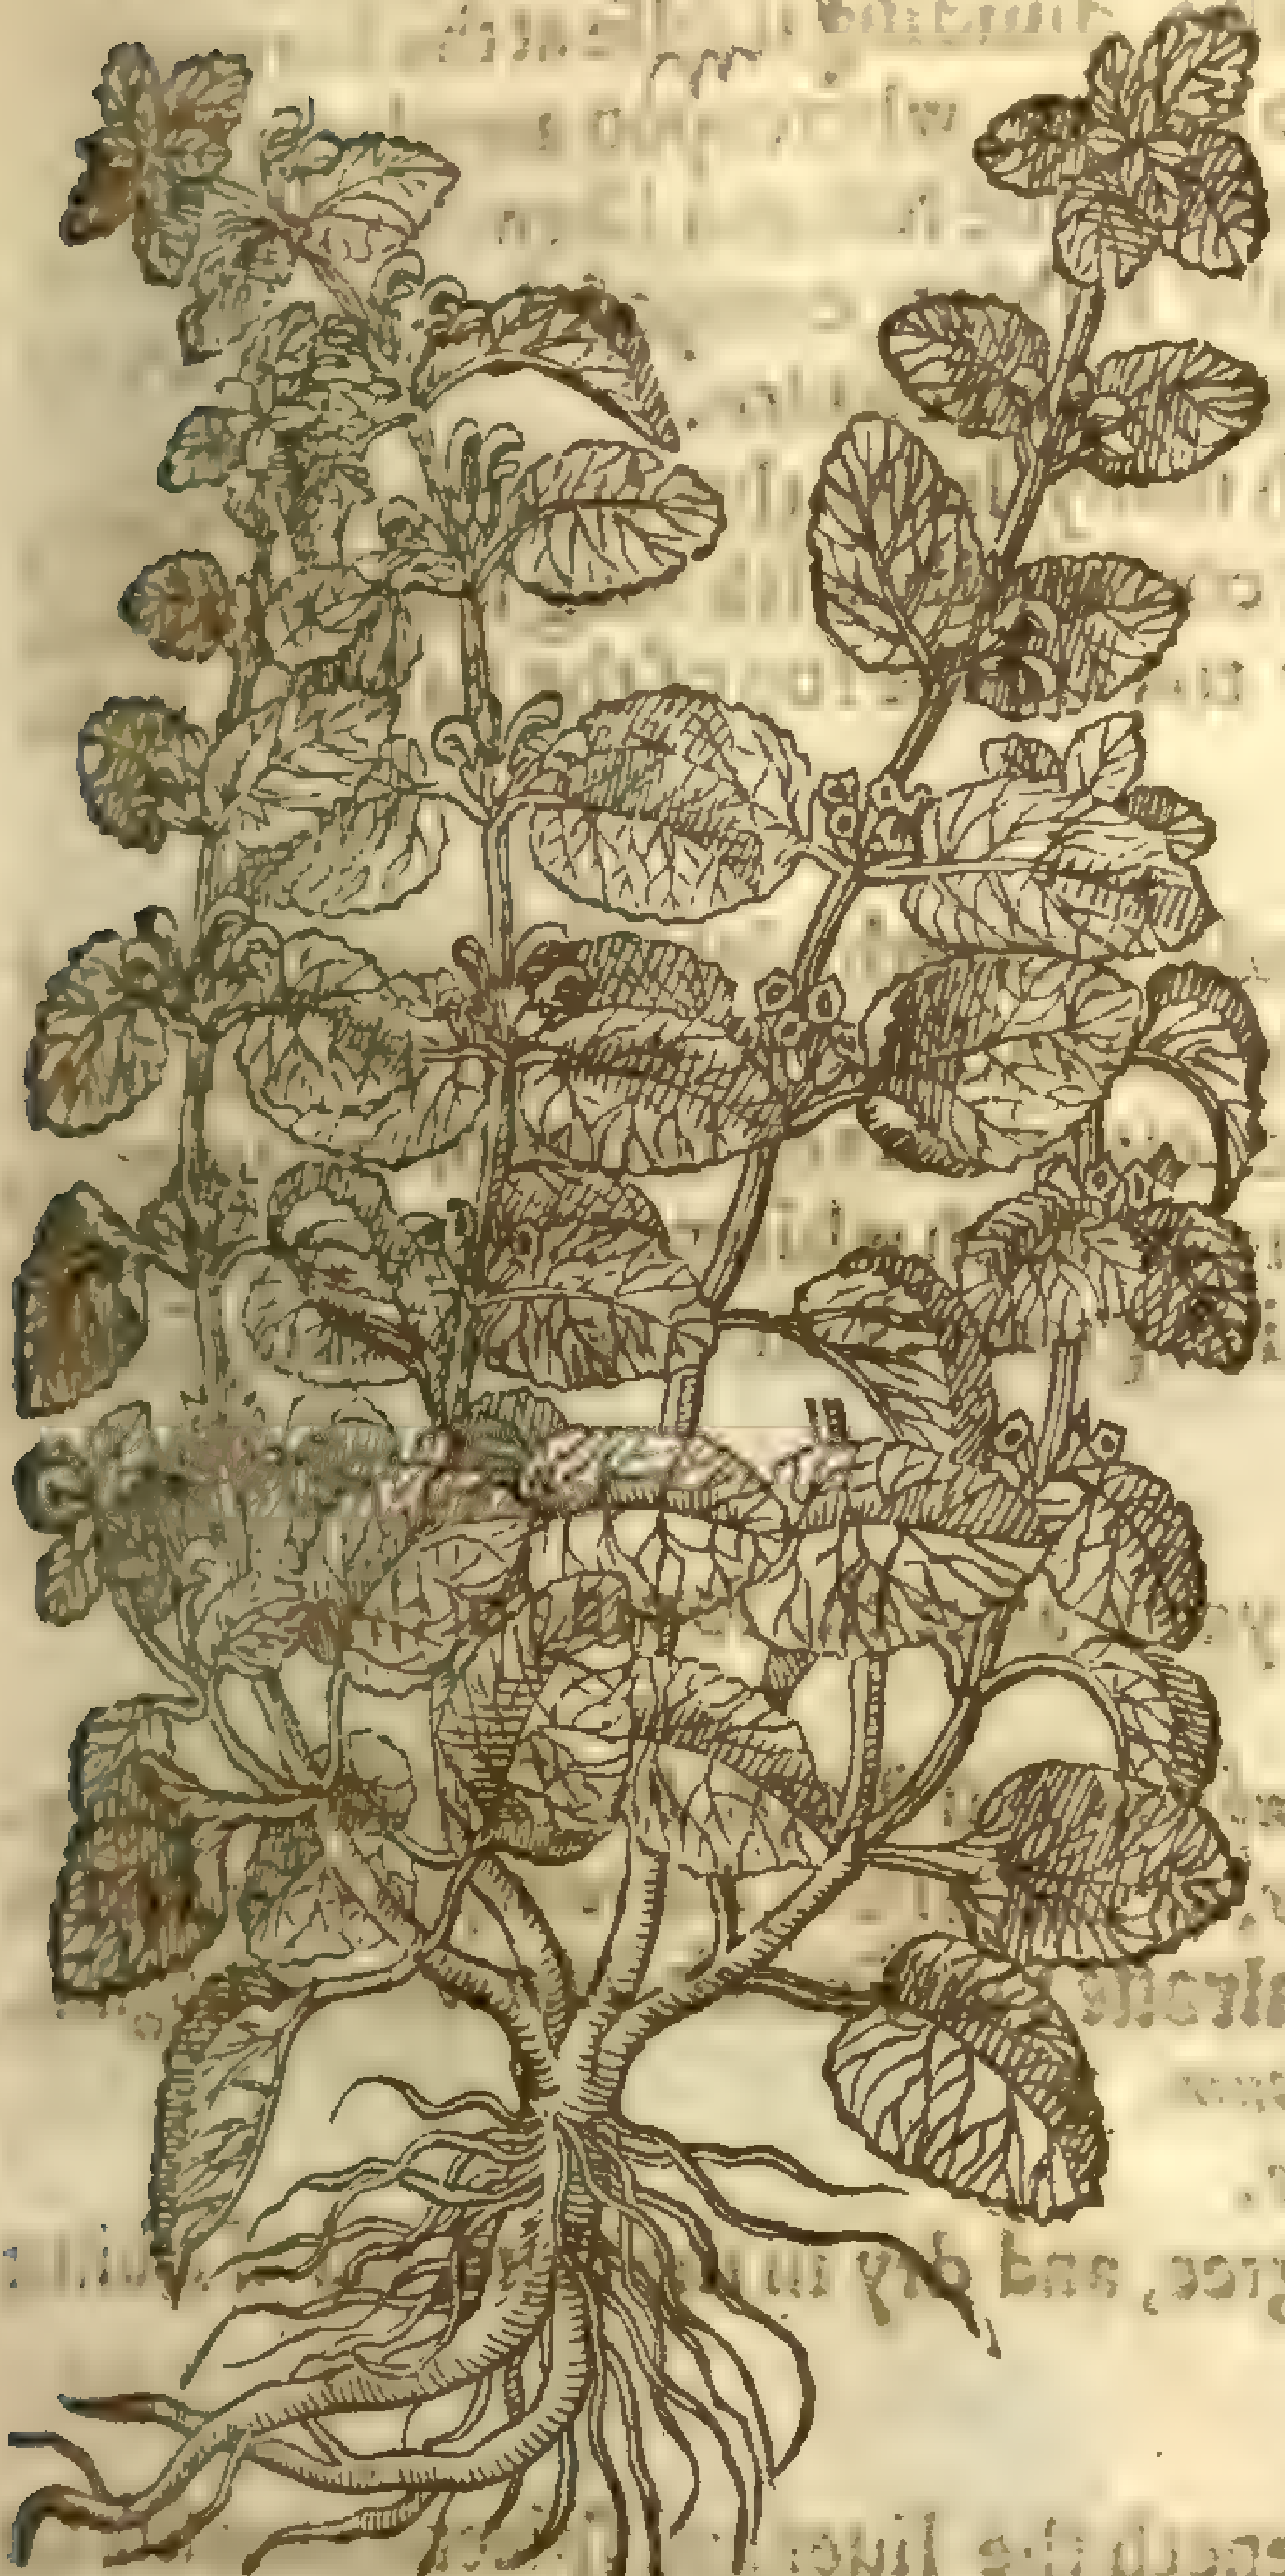
¶ *The Deſcription.*

1 White Horehound bringeth forth very many ſtalkes foure ſquare, a cubit high, couered ouer with a thin whitiſh downineſſe: whereupon are placed by couples at certaine diſtances, thicke whitiſh leaues ſomwhat round, wrinkled and nicked on the edges, and couered ouer with the like downineſſe; from the boſomes of which leaues come forth ſmall floures of a faint purpliſh color, ſet round about the ſtalke in round wharles, which turne into ſharpe prickly husks after the floures be paſt. The whole plant is of a ſtrong ſauor, but not vnpleaſant: the root is threddy.

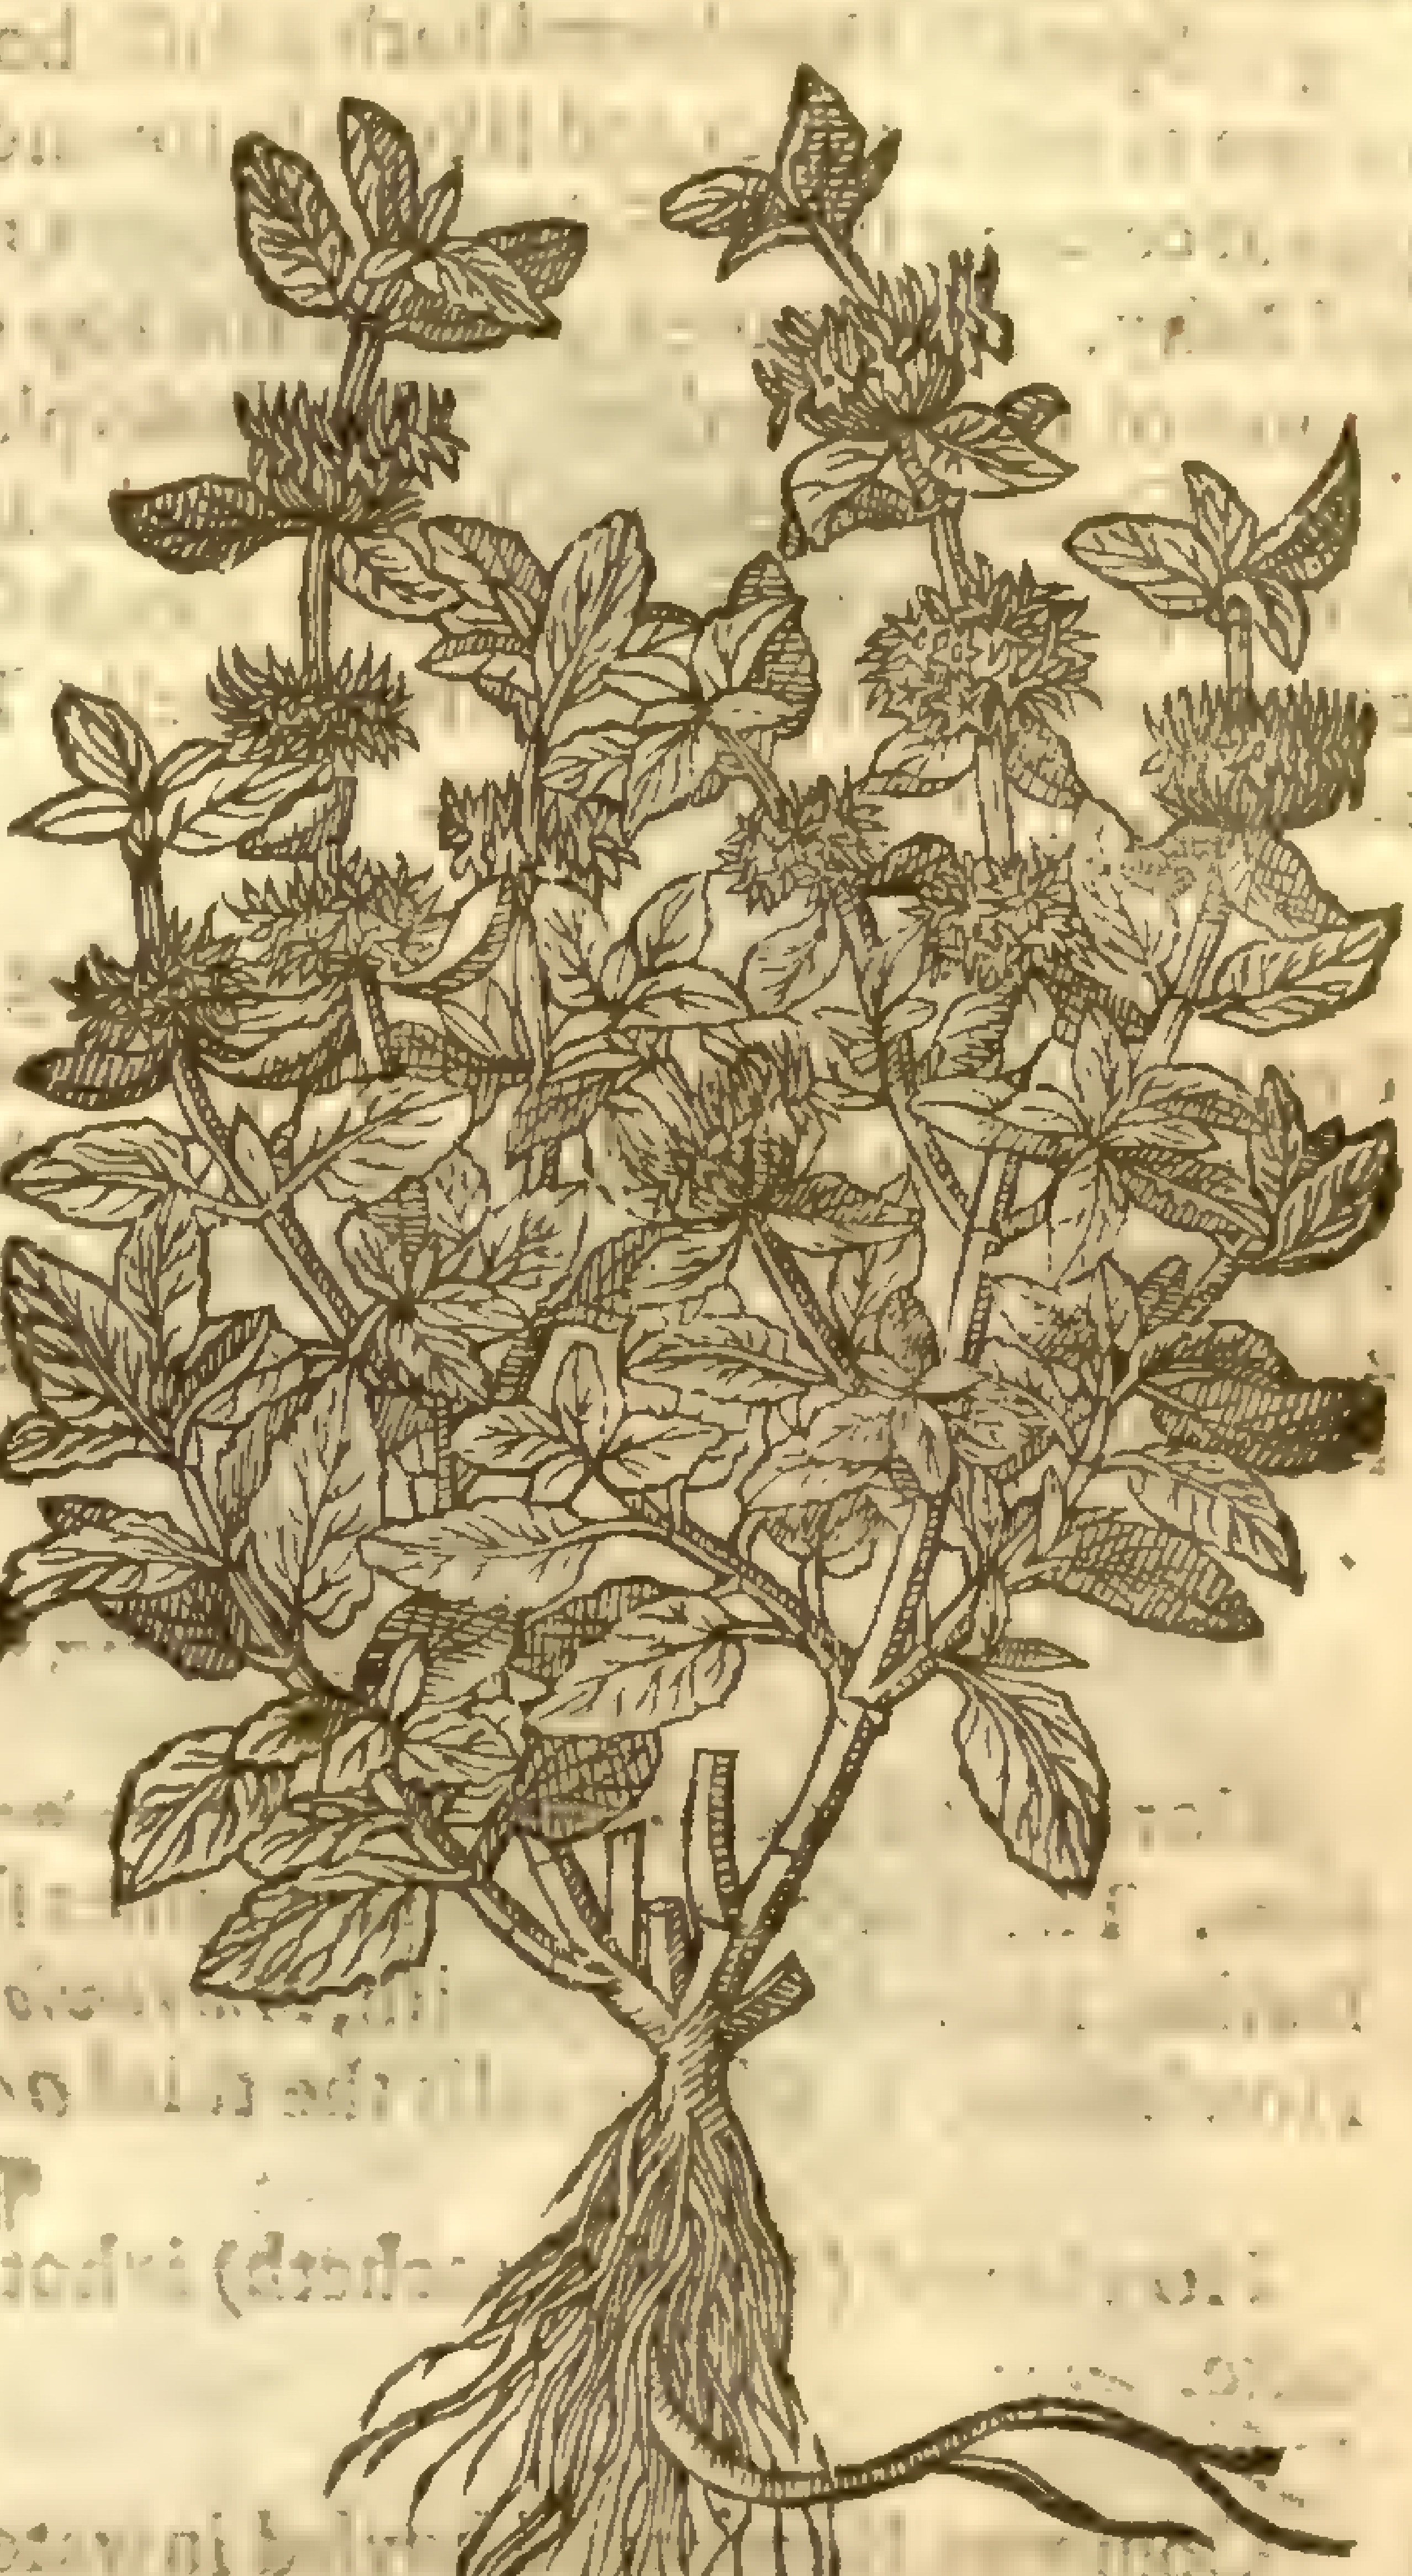
2 The ſecond kinde of Horehound hath ſundry crooked ſlender ſtalkes, diuided into many ſmall branches couered ouer with a white hoarineſſe or cottony downe. The leaues are likewiſe hoary and cottony, longer and narrower than the precedent, lightly indented about the edges, and ſharply pointed like the Turky Bawme, and of the ſame bigneſſe, hauing ſmall wharles of white floures

1 *Marrubium album.*
White Horehound.

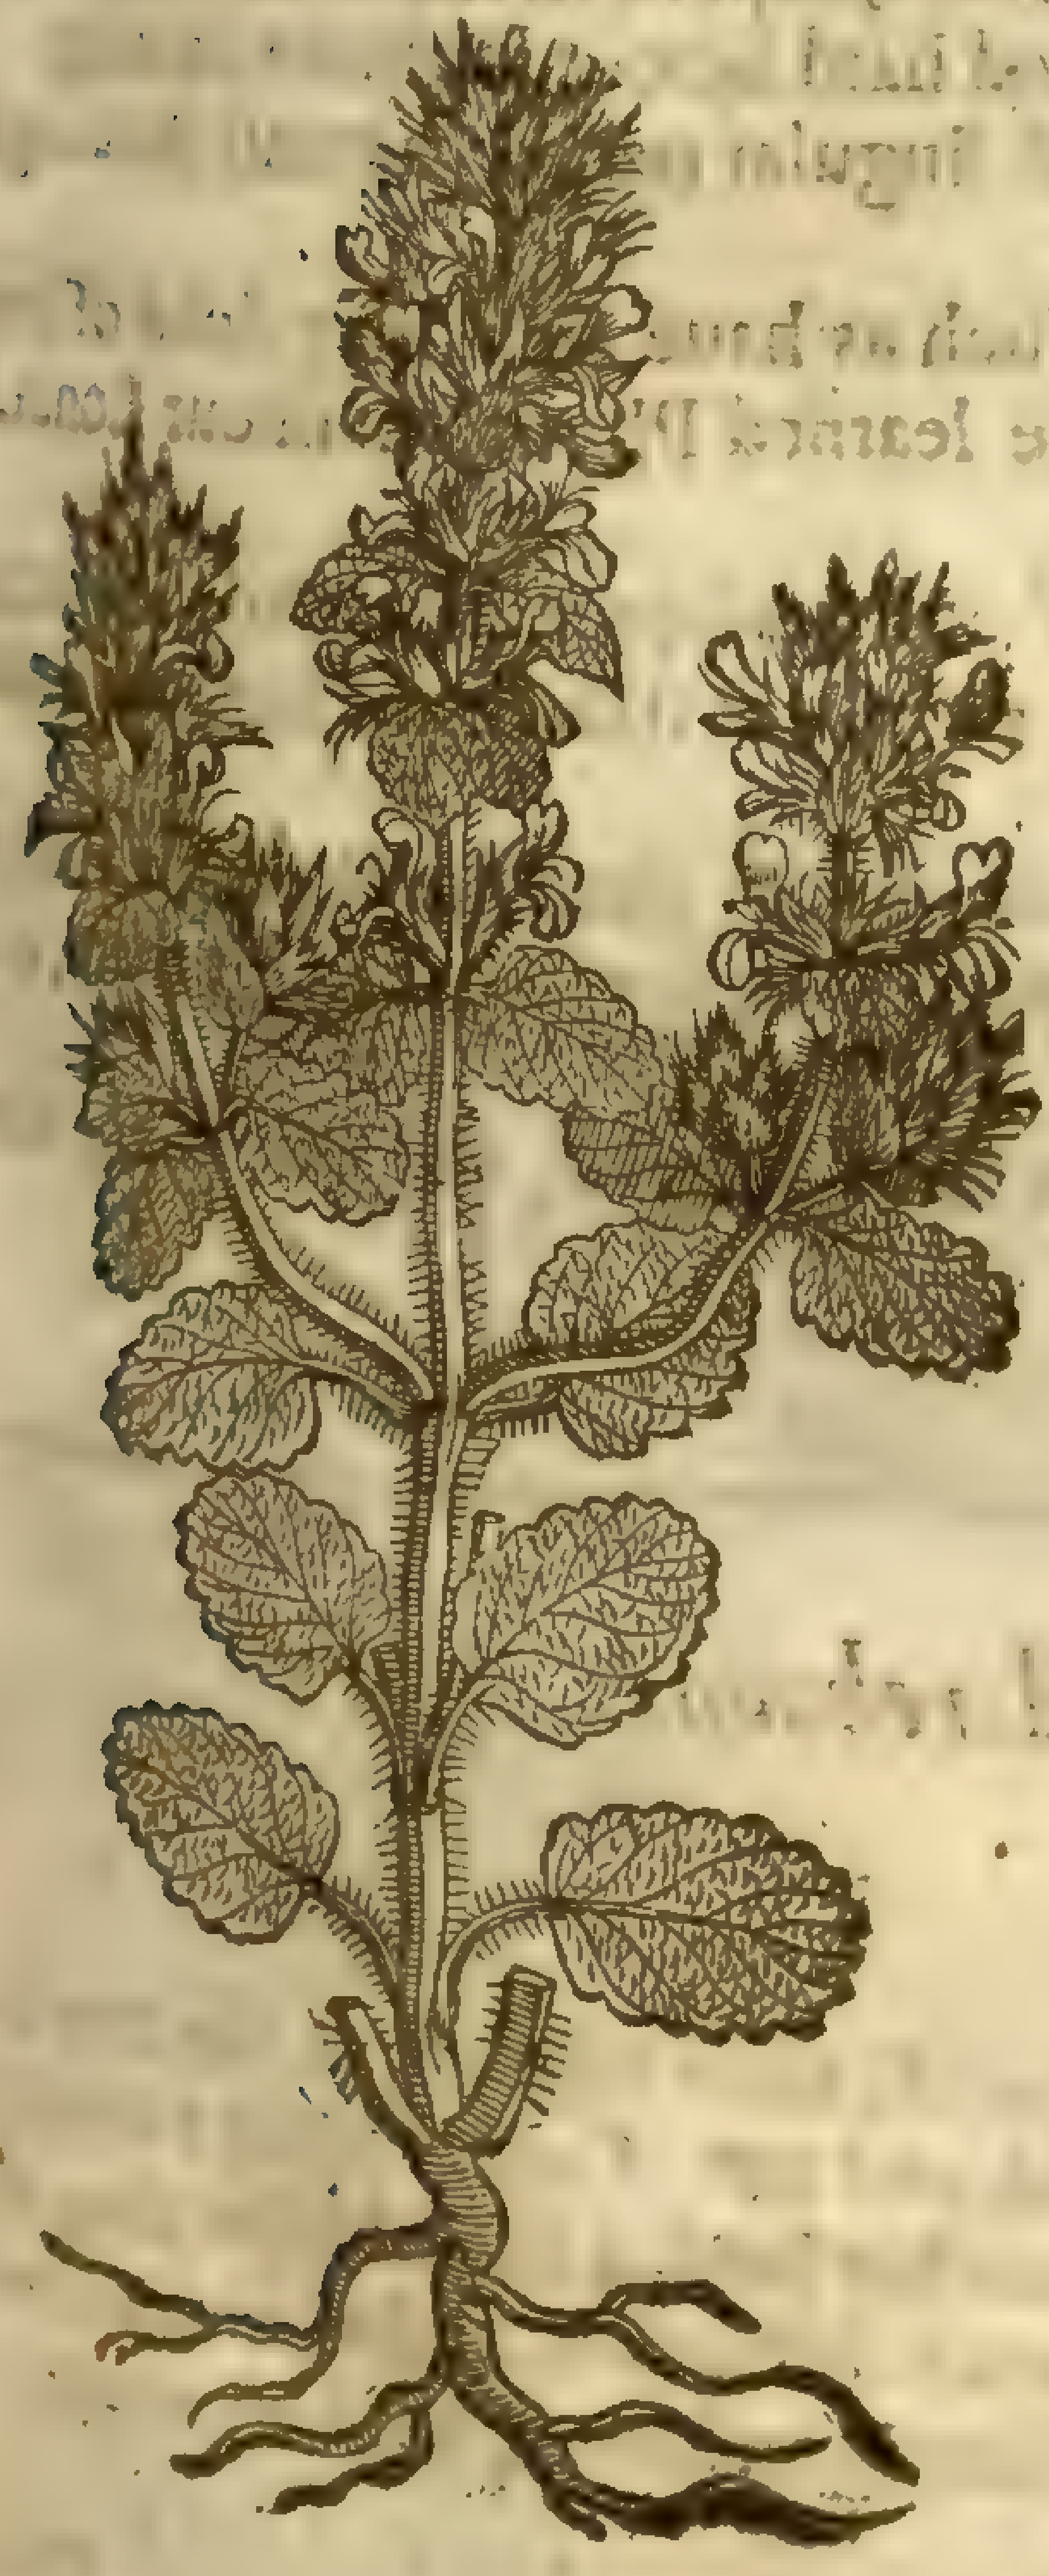
agaynst [illegible]



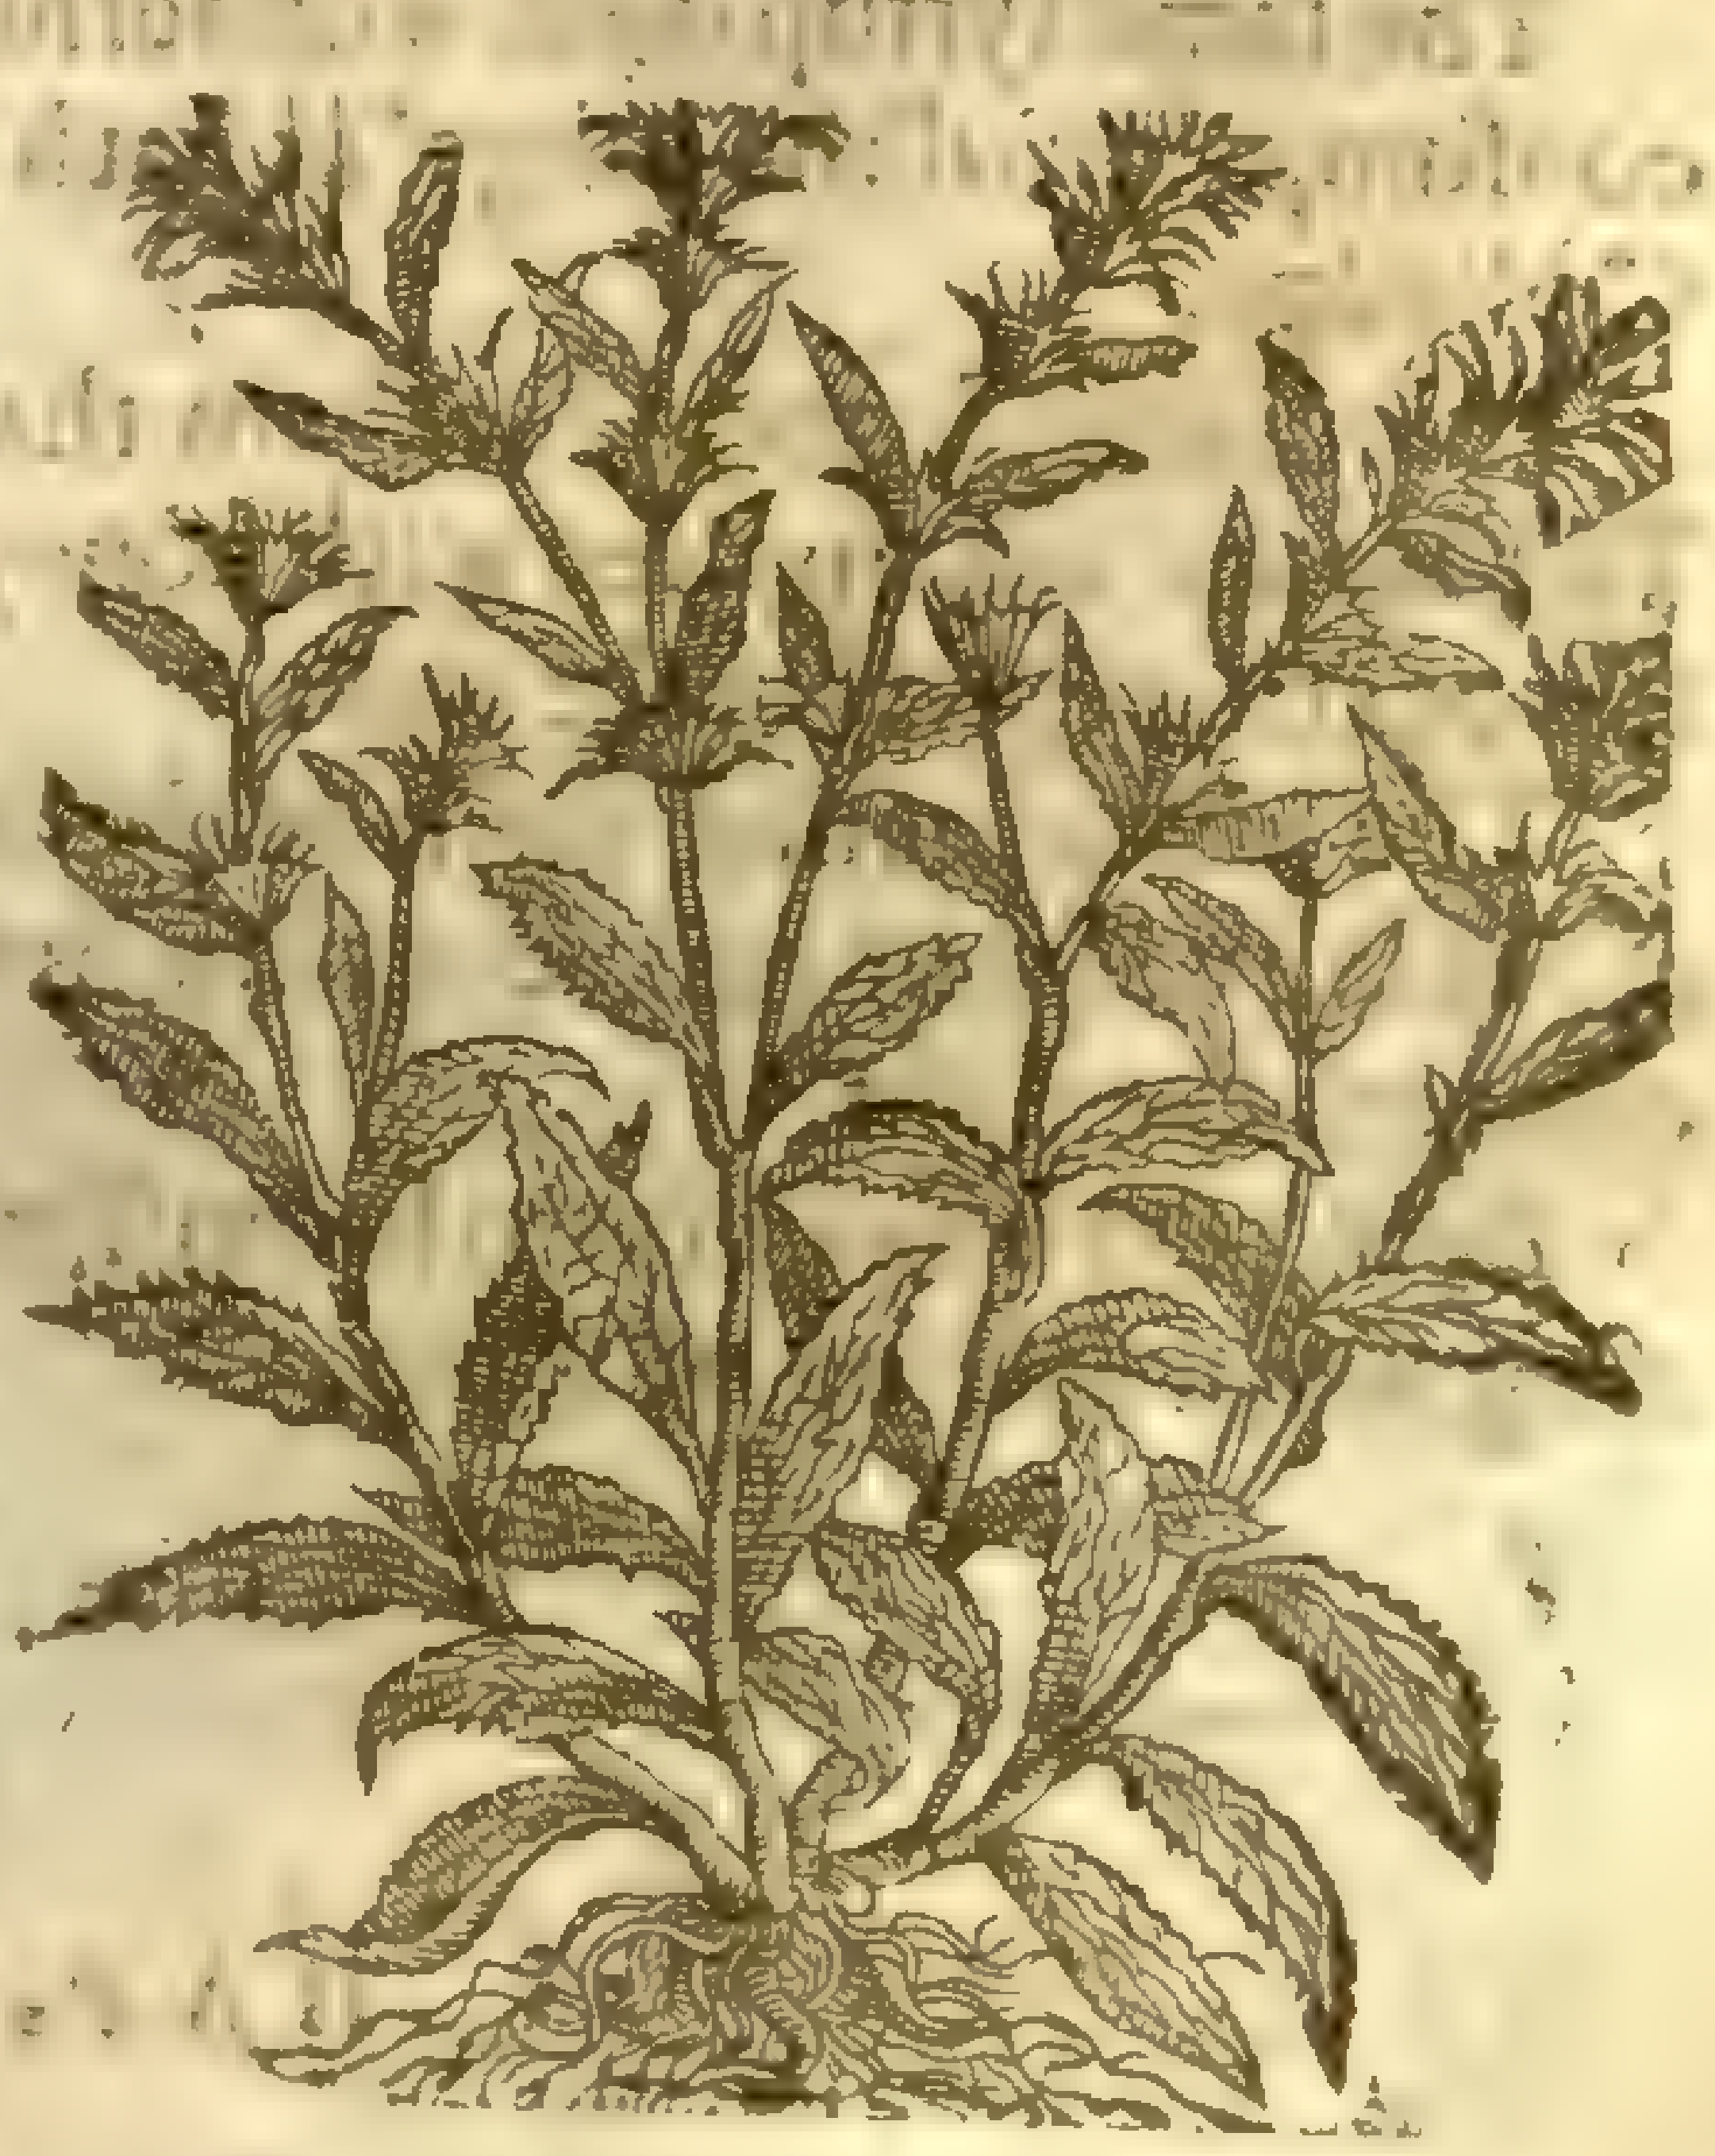
2 *Marrubium candidum.*
Snow white Horehound.



3 *Marrubium Hiſpanicum.*
Spaniſh Horehound.



4 *Marrubium Creticum.*
Candy Horehound.



Marrubium peregrinum, t. β
[illegible] dict

floures, and prickly rundles or ſeed-veſſels ſet about the ſtalke by certaine diſtances. The root is likewiſe threddy.

3 Spaniſh Horehound hath a ſtiffe hoarie and hairy ſtalke, diuiding it ſelfe at the bottome into two or more armes, and likewiſe toward the top into two others; whereupon are placed by couples at certaine ſpaces faire broad leaues, more round than any of the reſt, and likewiſe more woolly and hairy. The floures grow at the top of the ſtalkes, ſpike faſhion, compoſed of ſmall gaping floures of a purple colour. The whole plant hath the ſauour of Stœchados.

4 Candy Horehound hath a thicke and hard root, with many hairy threds faſtned thereunto; from which riſe vp immediately rough ſquare ſtalkes, ſet confuſedly with long leaues of a hoarie colour, of a moſt pleaſant ſtrong ſmell. The floures grow toward the top of the ſtalkes in chaffie rundles, of a whitiſh colour.

¶ *The Place.*

The firſt of theſe Horehounds, being the common kinde, groweth plentifully in all places of England, neere vnto old walls, highwaies, and beaten pathes, in vntilled places. It groweth in all other countries likewiſe, where it altereth according to the ſcituation and nature of the countries; for commonly that which growes in Candy and in Hungary is much whiter, and of a ſweeter ſmell, and the leaues oftentimes narrower and leſſer than that which groweth in England and theſe Northerne Regions.

¶ *The Time.*

They floure in Iuly and Auguſt, and that in the ſecond yeare after the ſowing of them.

¶ *The Names.*

Horehound is called in Greeke, πράσιον: in Latine, *Marrubium*: in ſhops, *Praſſum*, and alſo *Marrubium*. There be certaine baſtard names found in *Apuleius*, as *Mehittena*, *Labeonia*, and *Vlceraria*: in Italian, *Marrubio*: in Spaniſh, *Marruvio*: in Dutch, **Malroue**: in French, *Marubin*: in Engliſh, Horehound. ‡ *Cluſius* calls the third *Ocimaſtrum Valentinum*. ‡

¶ *The Temperature.*

Horehound (as *Galen* teacheth) is hot in the ſecond degree, and dry in the third, and of a bitter taſte.

¶ *The Vertues.*

A Common Horehound boyled in water and drunke, openeth the liuer and ſpleene, cleanſeth the breſt and lungs, and preuailes greatly againſt an old cough, the paine of the ſide, ſpitting of bloud, the Ptyſicke, and vlcerations of the lungs.

B The ſame boyled in wine and drunke, bringeth downe the termes, expelleth the ſecondine, or afterbirth, and dead childe, and alſo eaſeth thoſe that haue ſore and hard labour in childe-bearing.

C Syrrup made of the greene freſh leaues and ſugar, is a moſt ſingular remedy againſt the cough and wheeſing of the lungs.

D The ſame ſyrrup doth wonderfully and aboue credit eaſe ſuch as haue lien long ſicke of any conſumption of the lungs, as hath beene often prooued by the learned Phyſitions of our London Colledge.

E It is likewiſe good for them that haue drunke poyſon, or that haue beene bitten of Serpents. The leaues are applied with honey to cleanſe foule and filthy vlcers. It ſtaieth and keepeth backe the pearle or web in the eies.

F The juyce preſſed forth of the leaues, and hardned in the Sun, is very good for the ſame things, eſpecially if it be mixed with a little wine and hony; and dropped into the eies, it helps them, and cleereth the ſight.

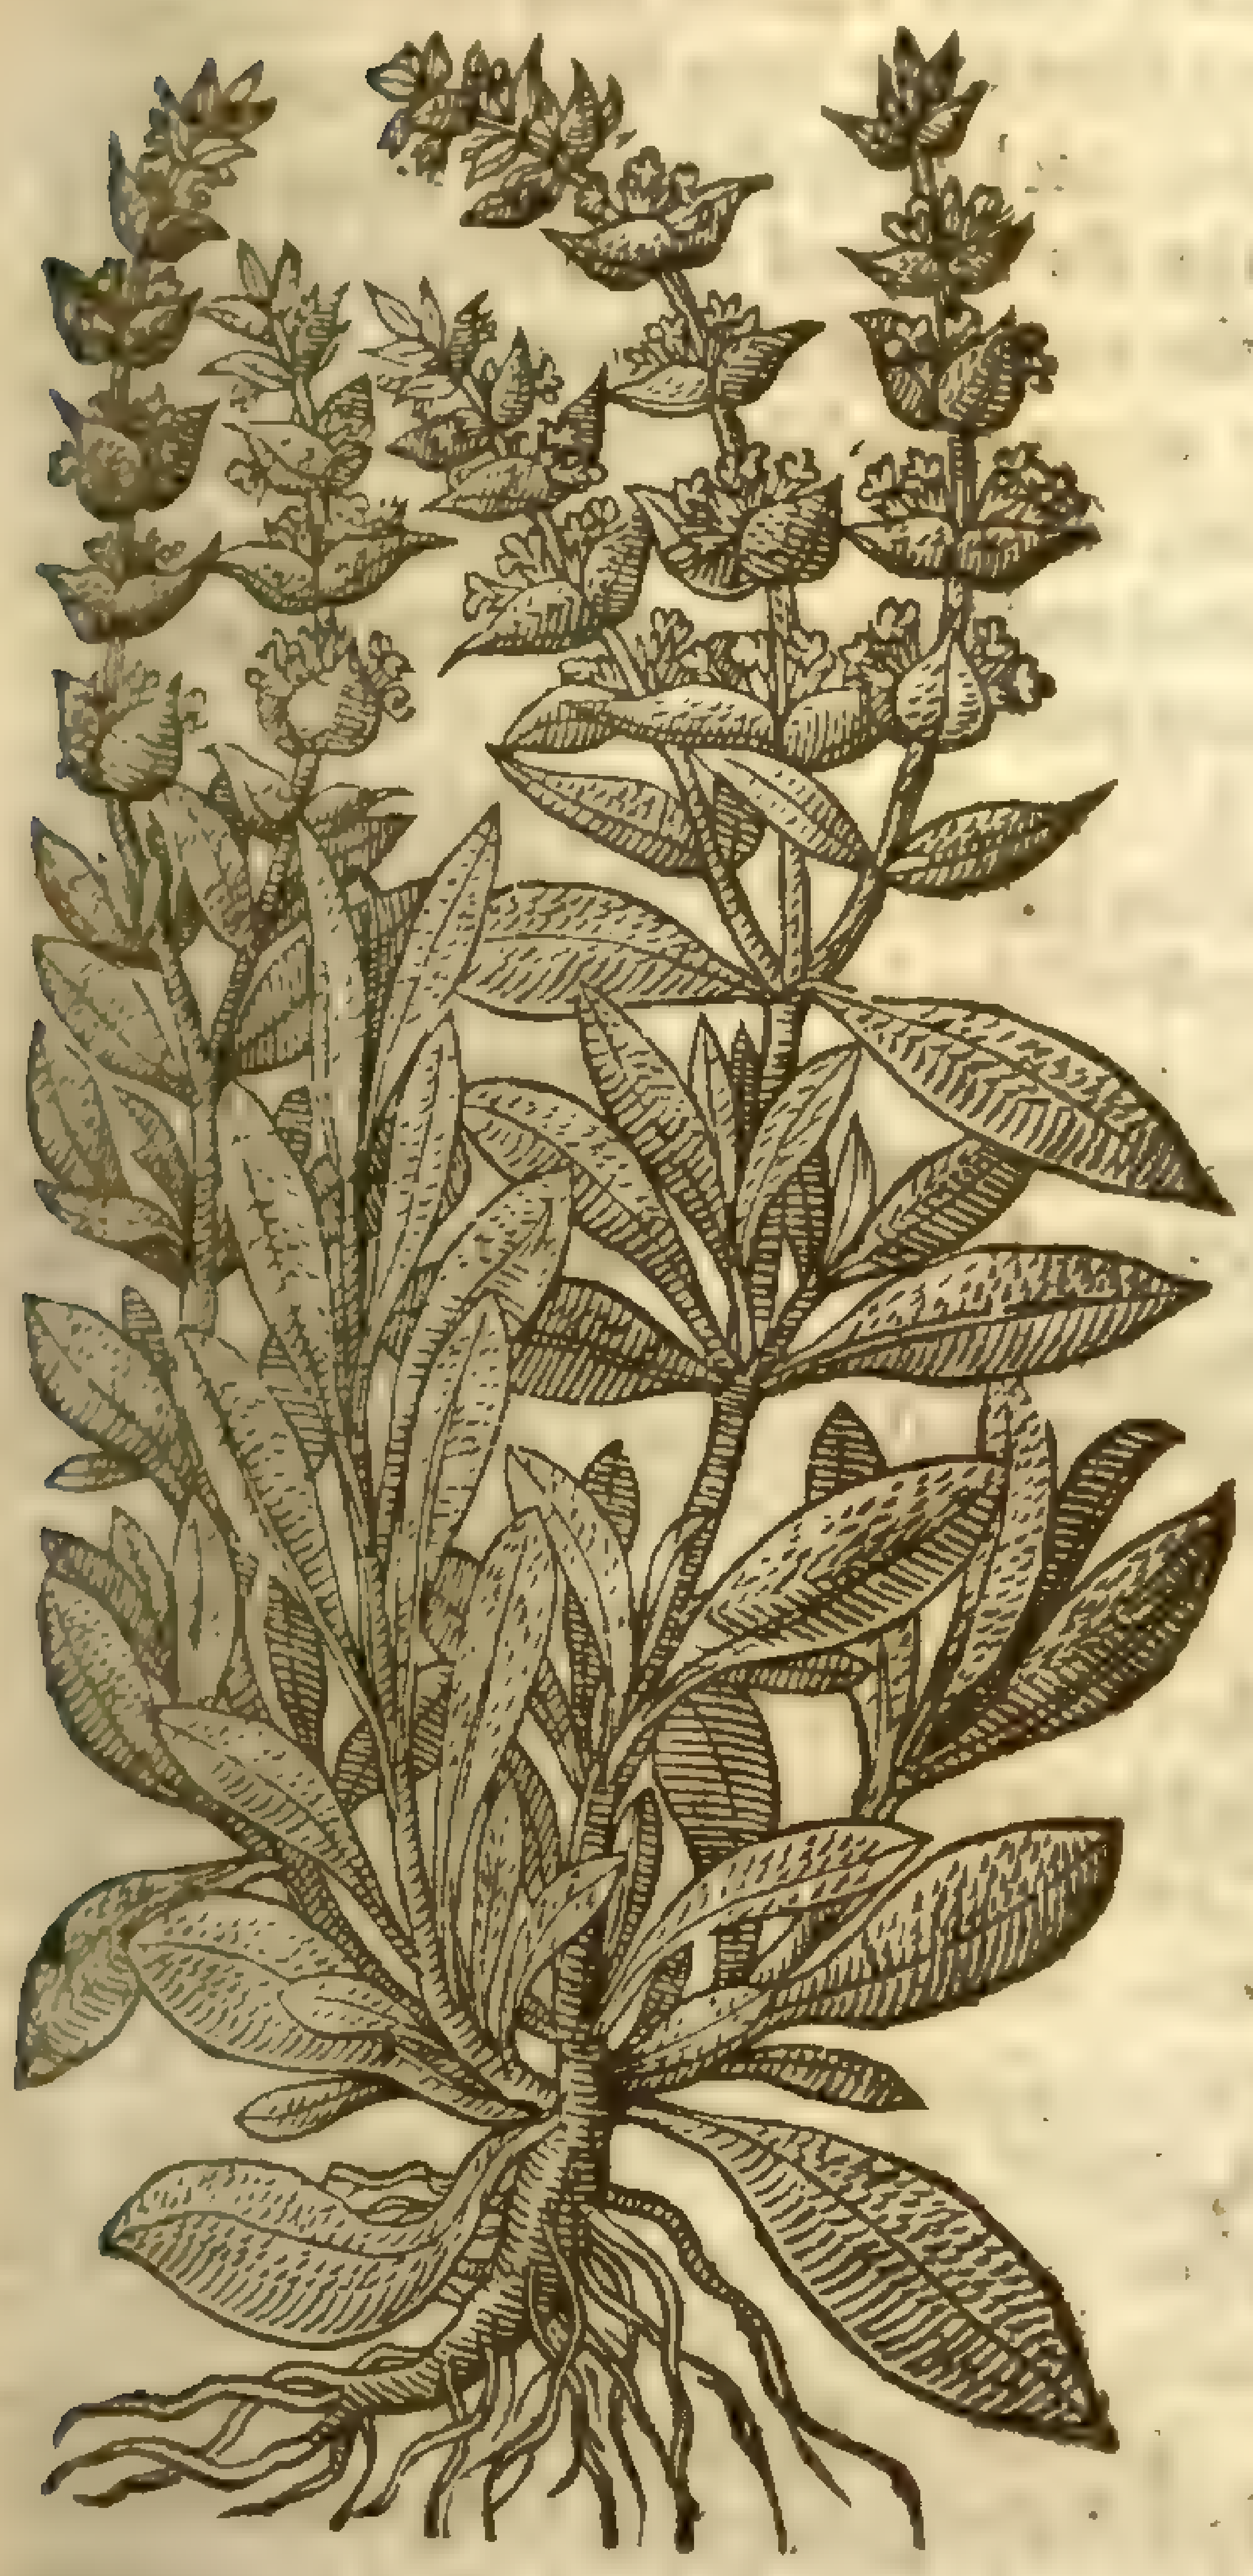
G Being drawne vp into the noſthrils it cleanſeth the yellowneſſe of the eies, and ſtaieth the running and watering of them.

Chap. 231. *Of wilde Horehound.*

¶ *The Deſcription.*

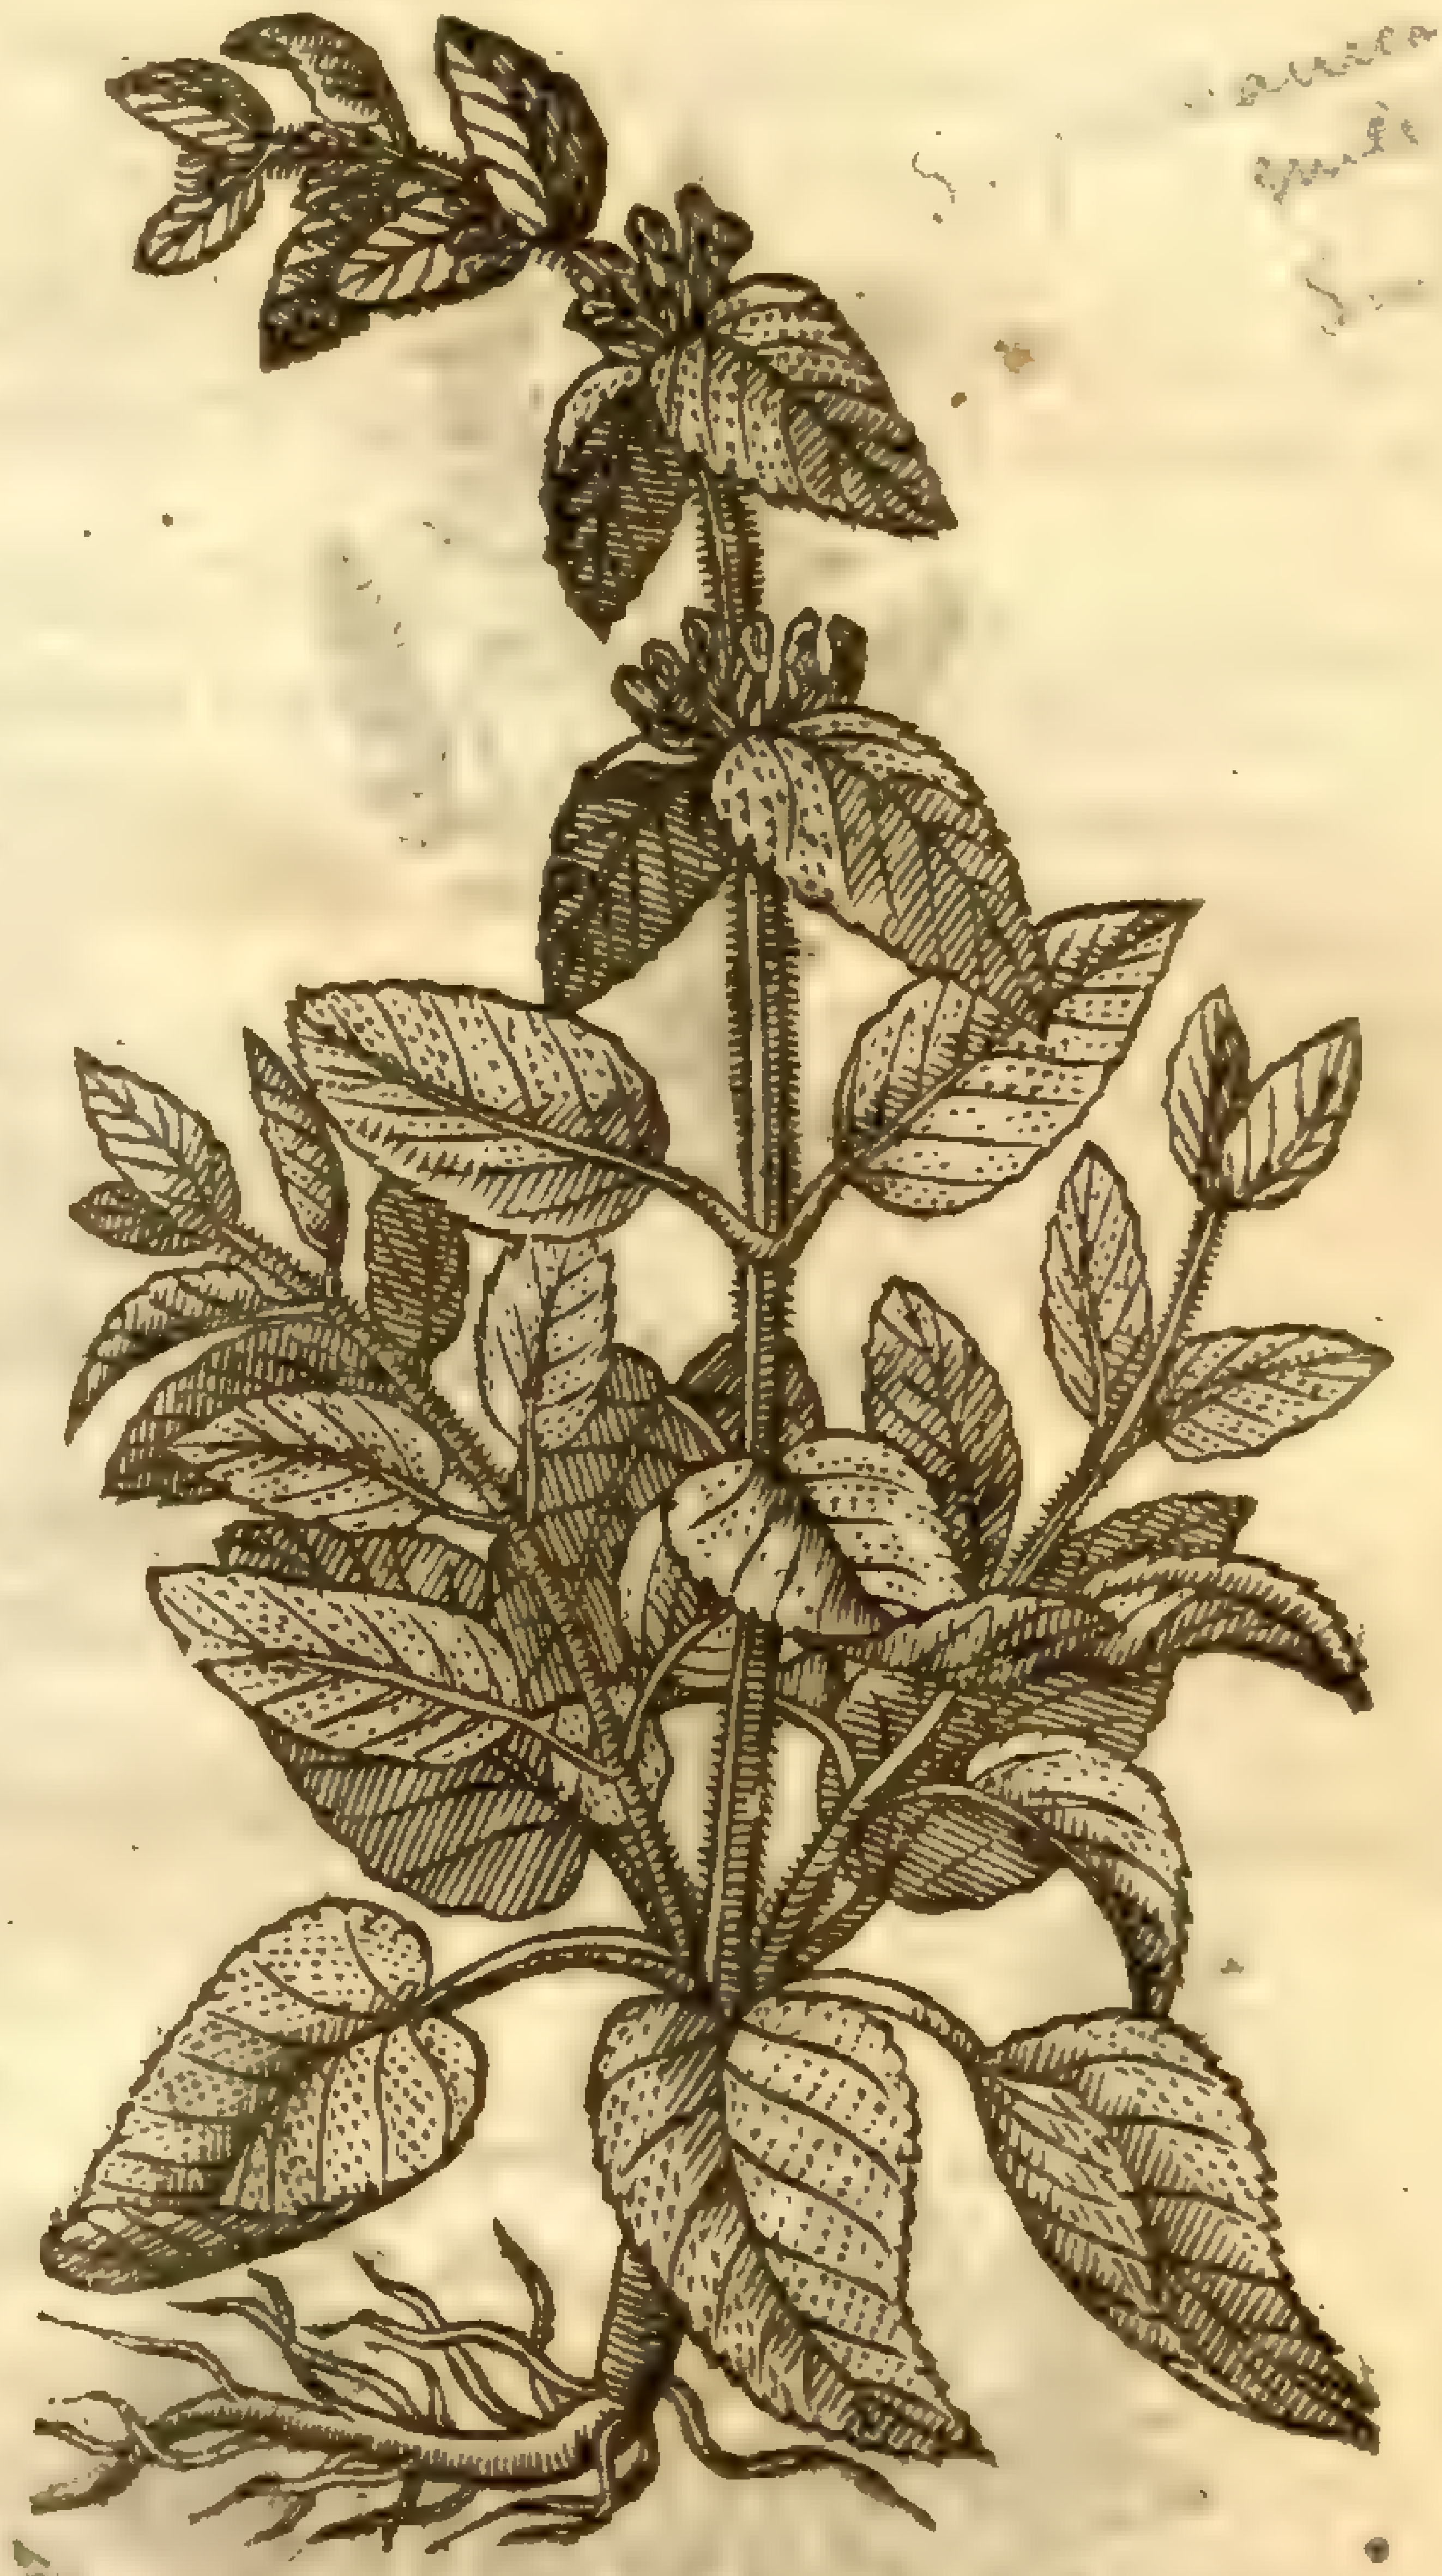
1 Wild Horehound is alſo like to common Horehound: there riſeth from the root hereof a great number of ſtalkes high and joynted, and out of euery joynt a couple of leaues oppoſite, or ſet one againſt another, ſomewhat hard, a little longer than thoſe of common Horehound, and whiter, as alſo the ſtalkes are ſet with ſoft haires, and of a ſweet ſmell: the floures do compaſſe the ſtalke about as thoſe doe of common Horehound, but they are yellow, and the wharles be narrower: the root is wooddy and durable.

1 *Stachys.*
Wilde Horehound.

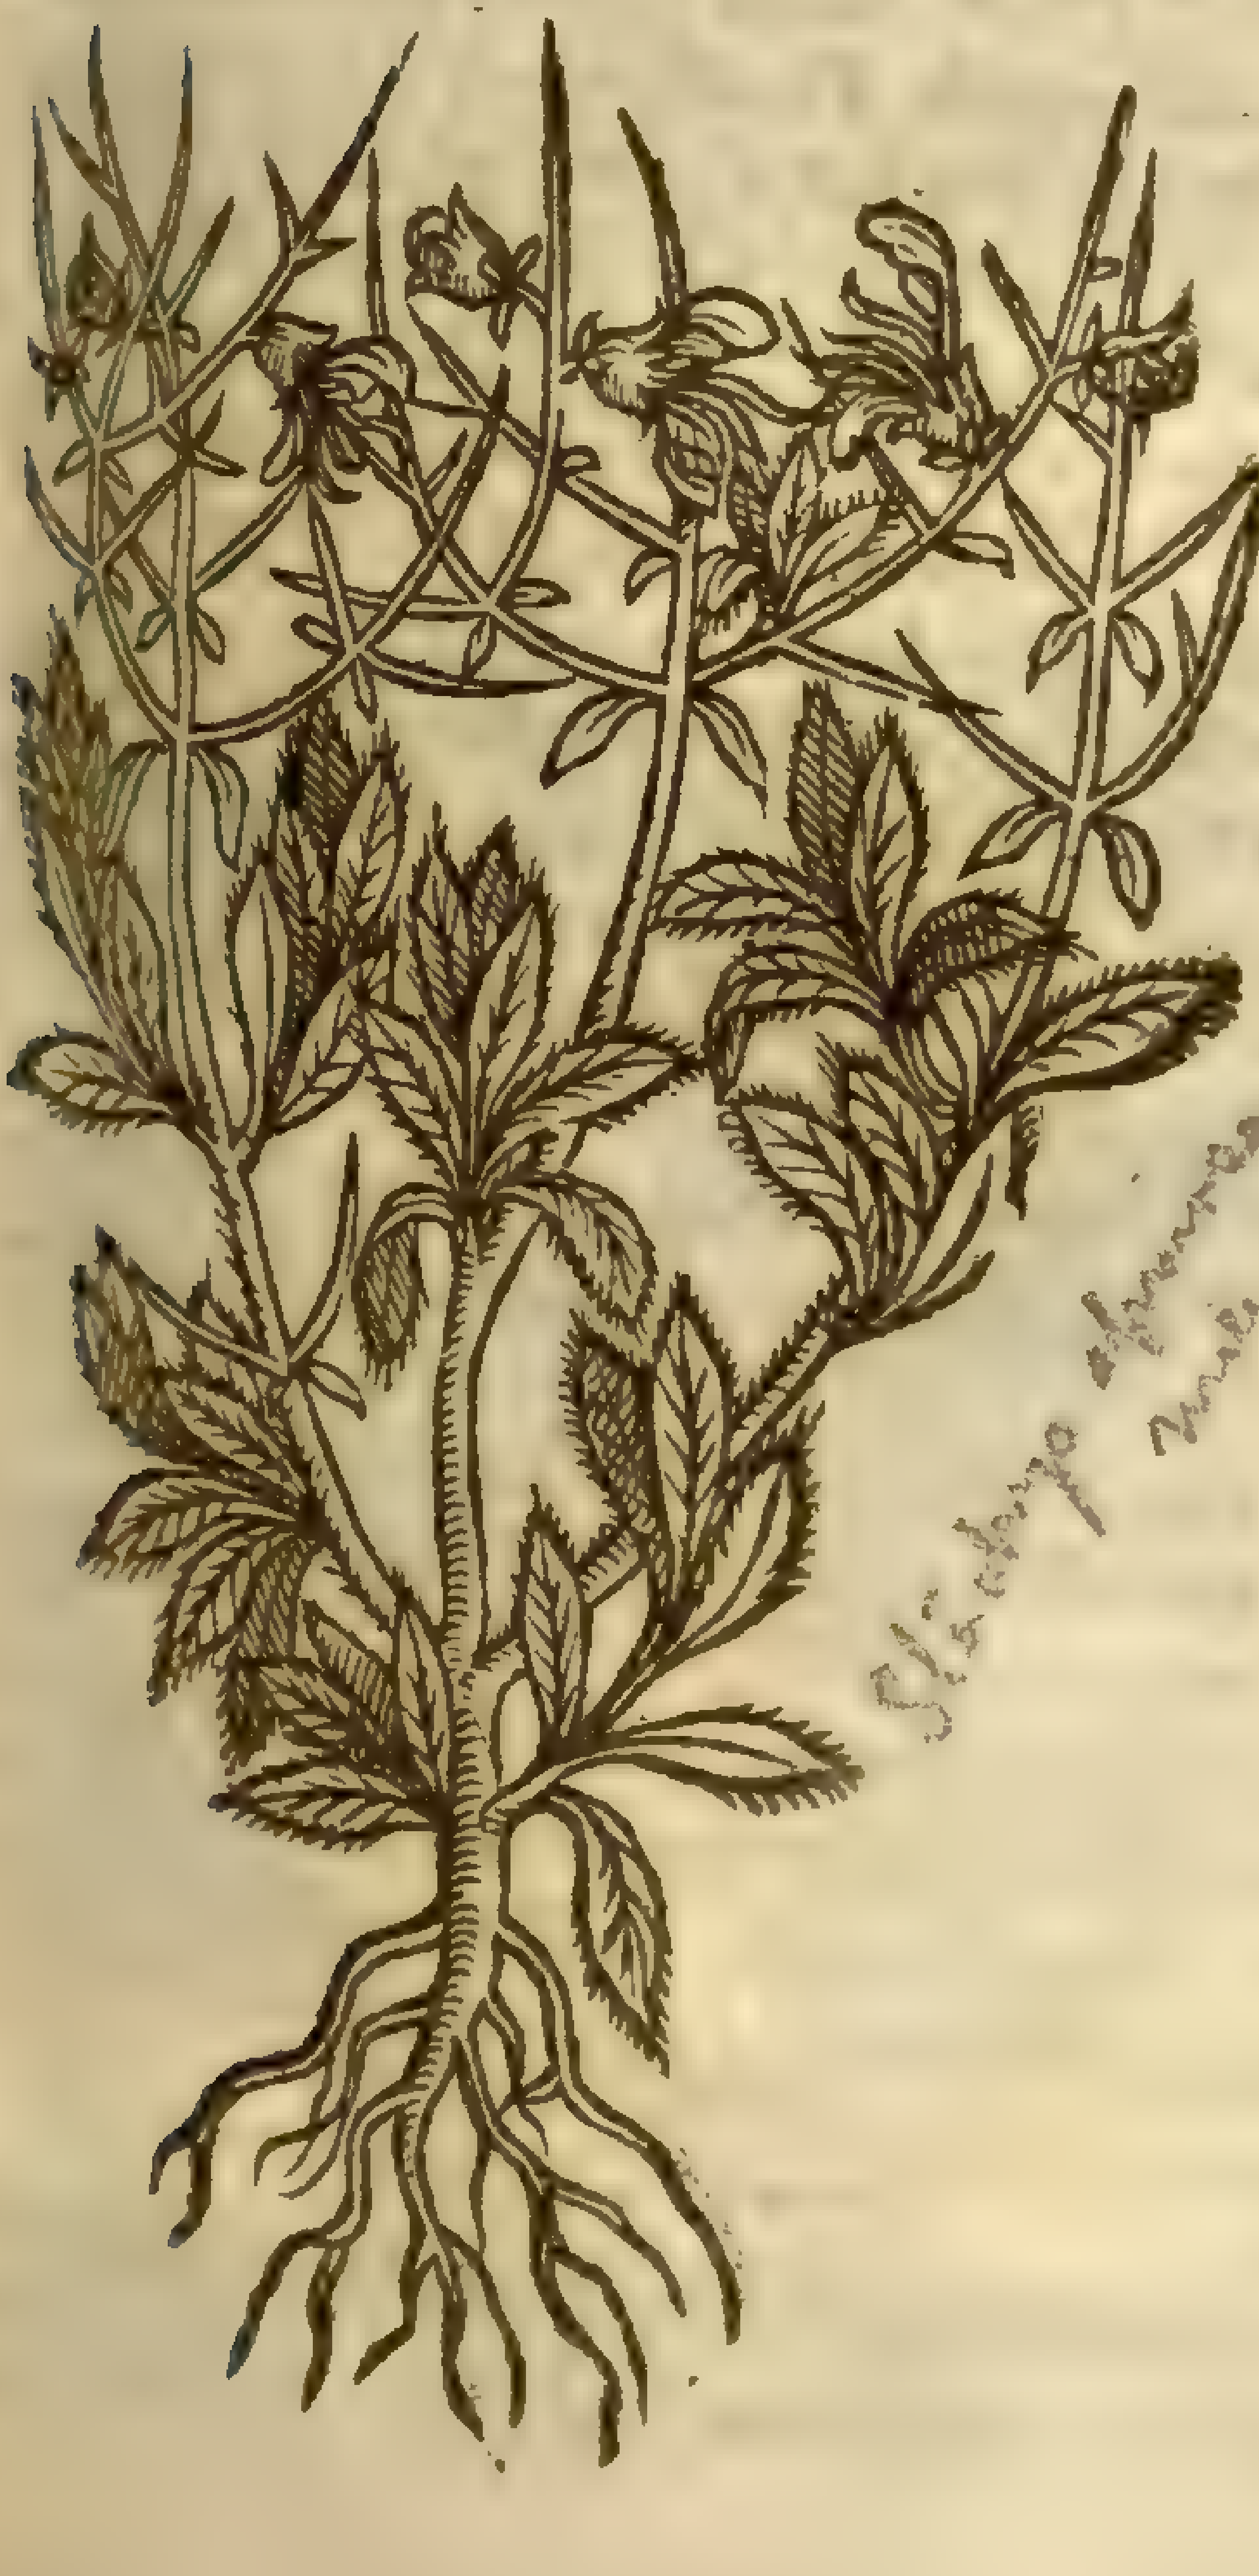


2 *Stathys Fuchſij.*
Wilde ſtinking Horehound.

S. germanica L.
mult. dict.
[illegible]

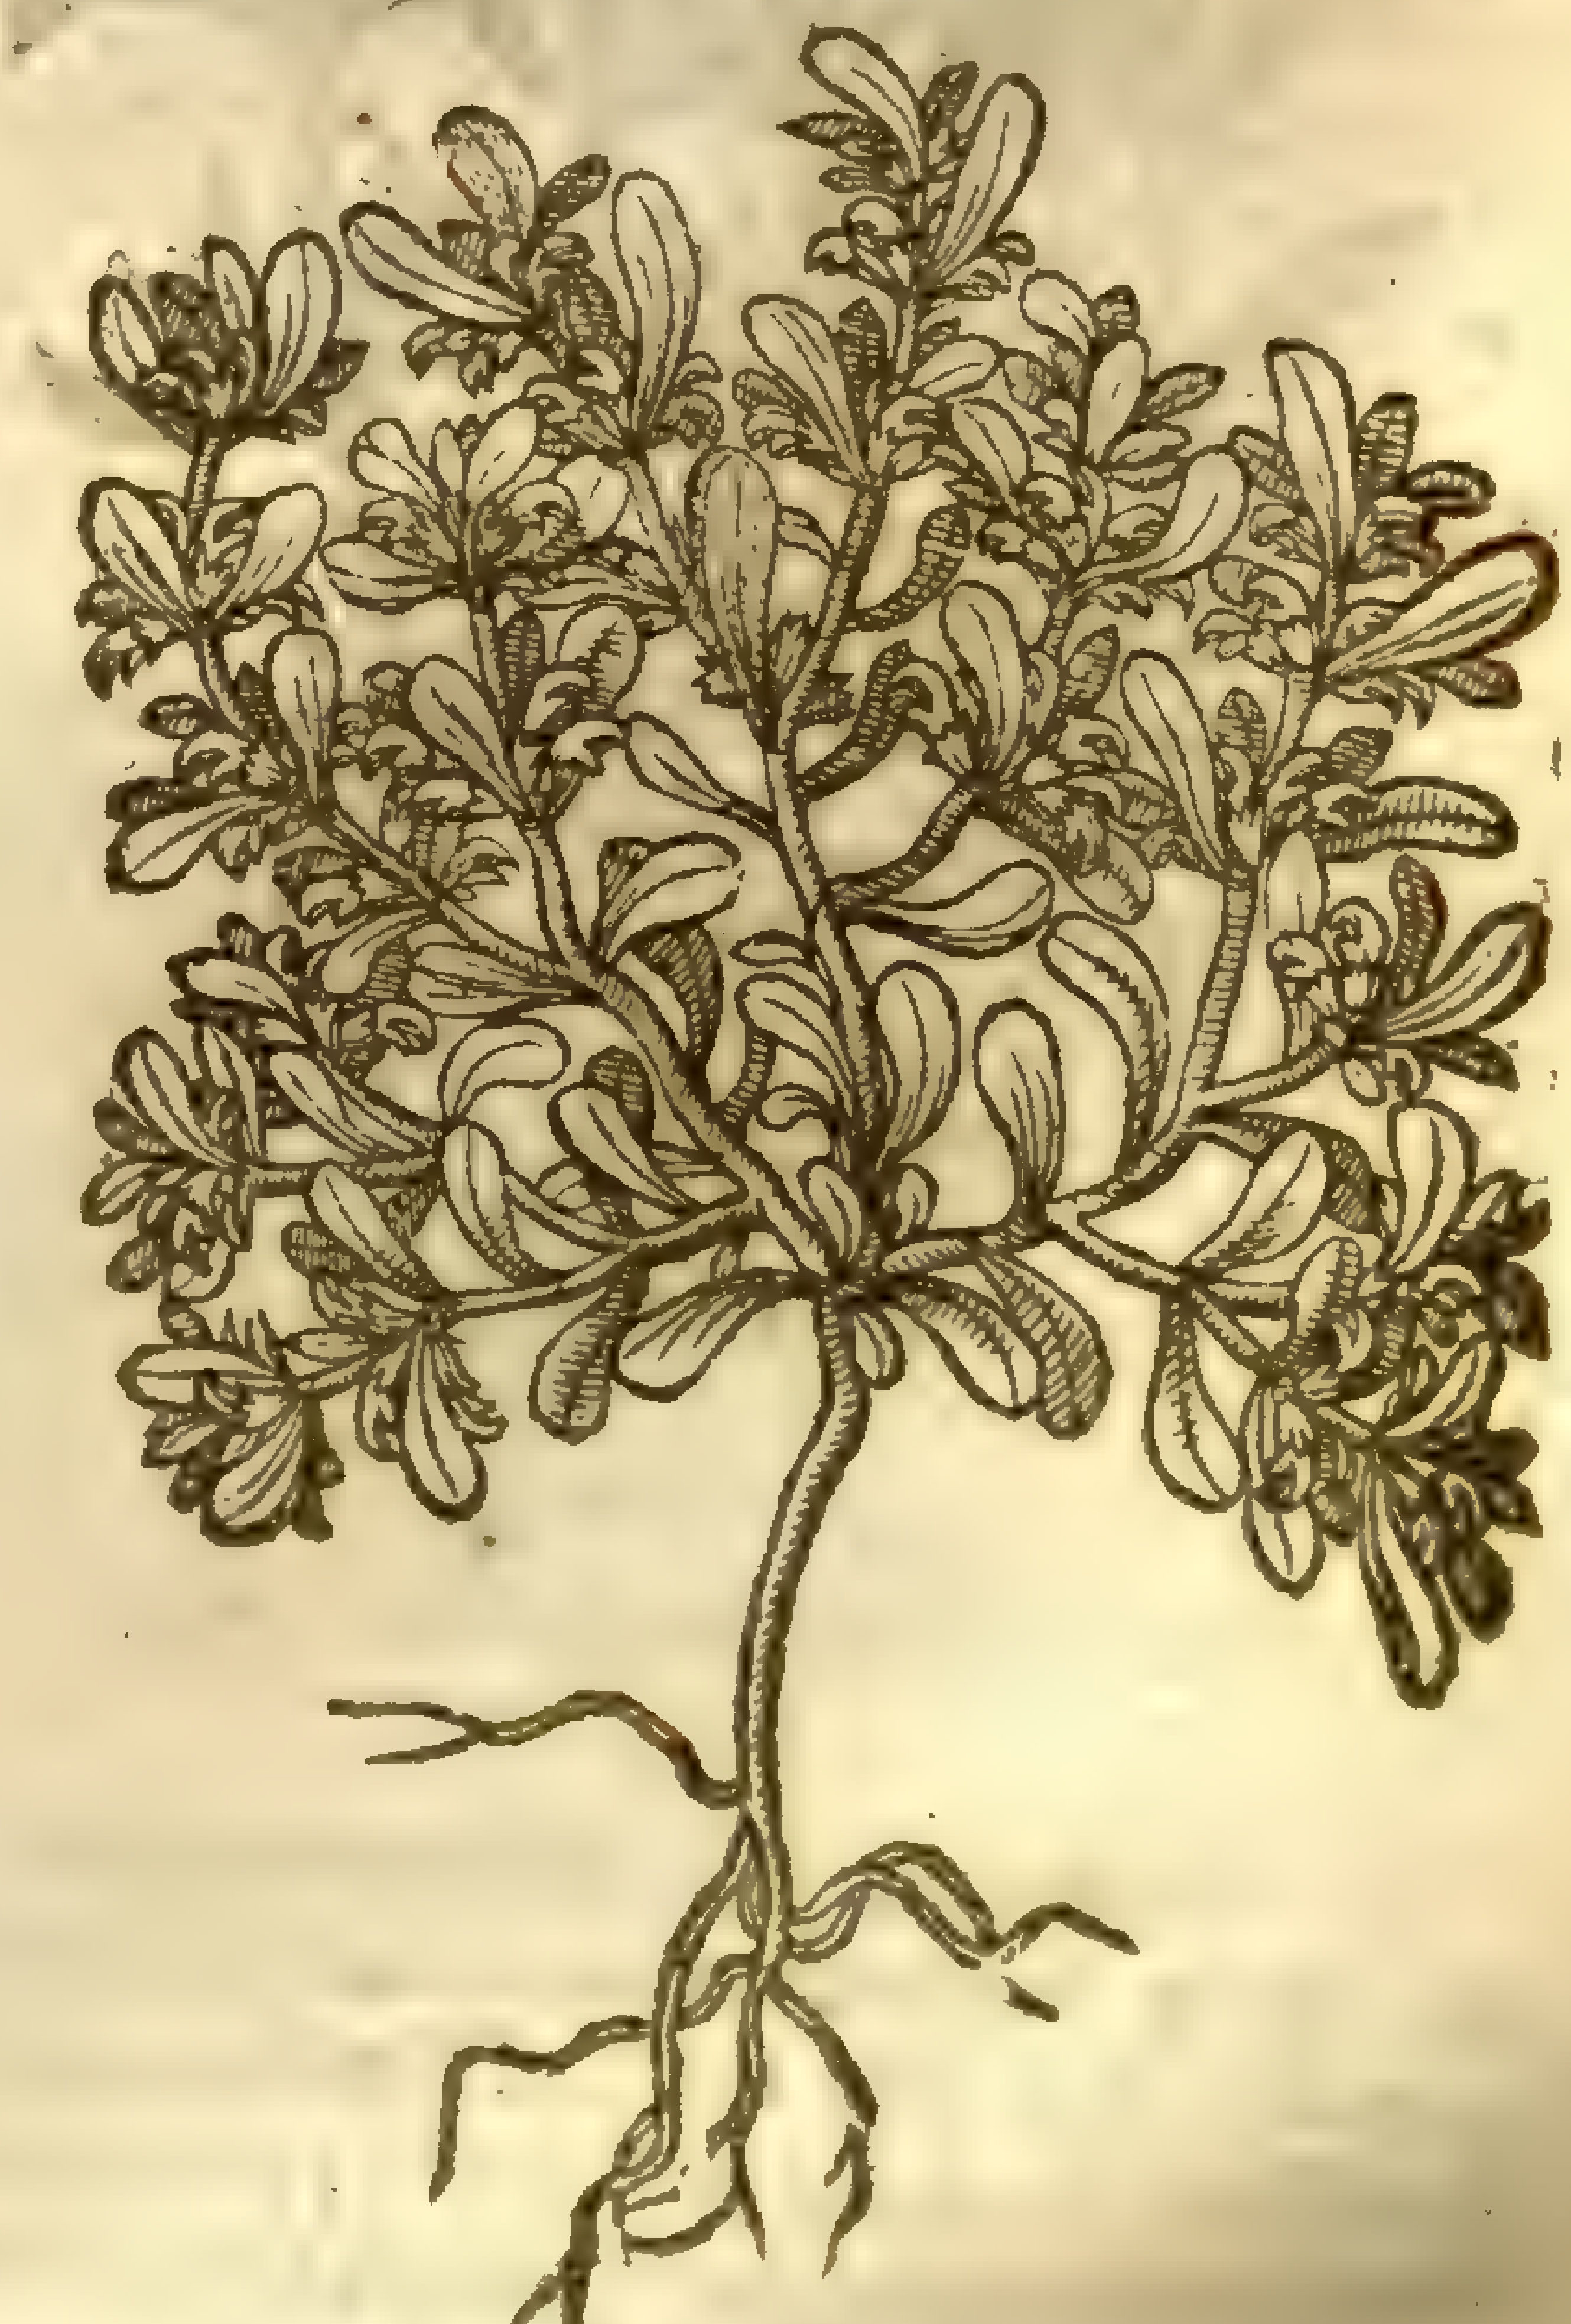


‡ 3 *Stachys ſpinoſa Cretica.*
Thorny Horehound.

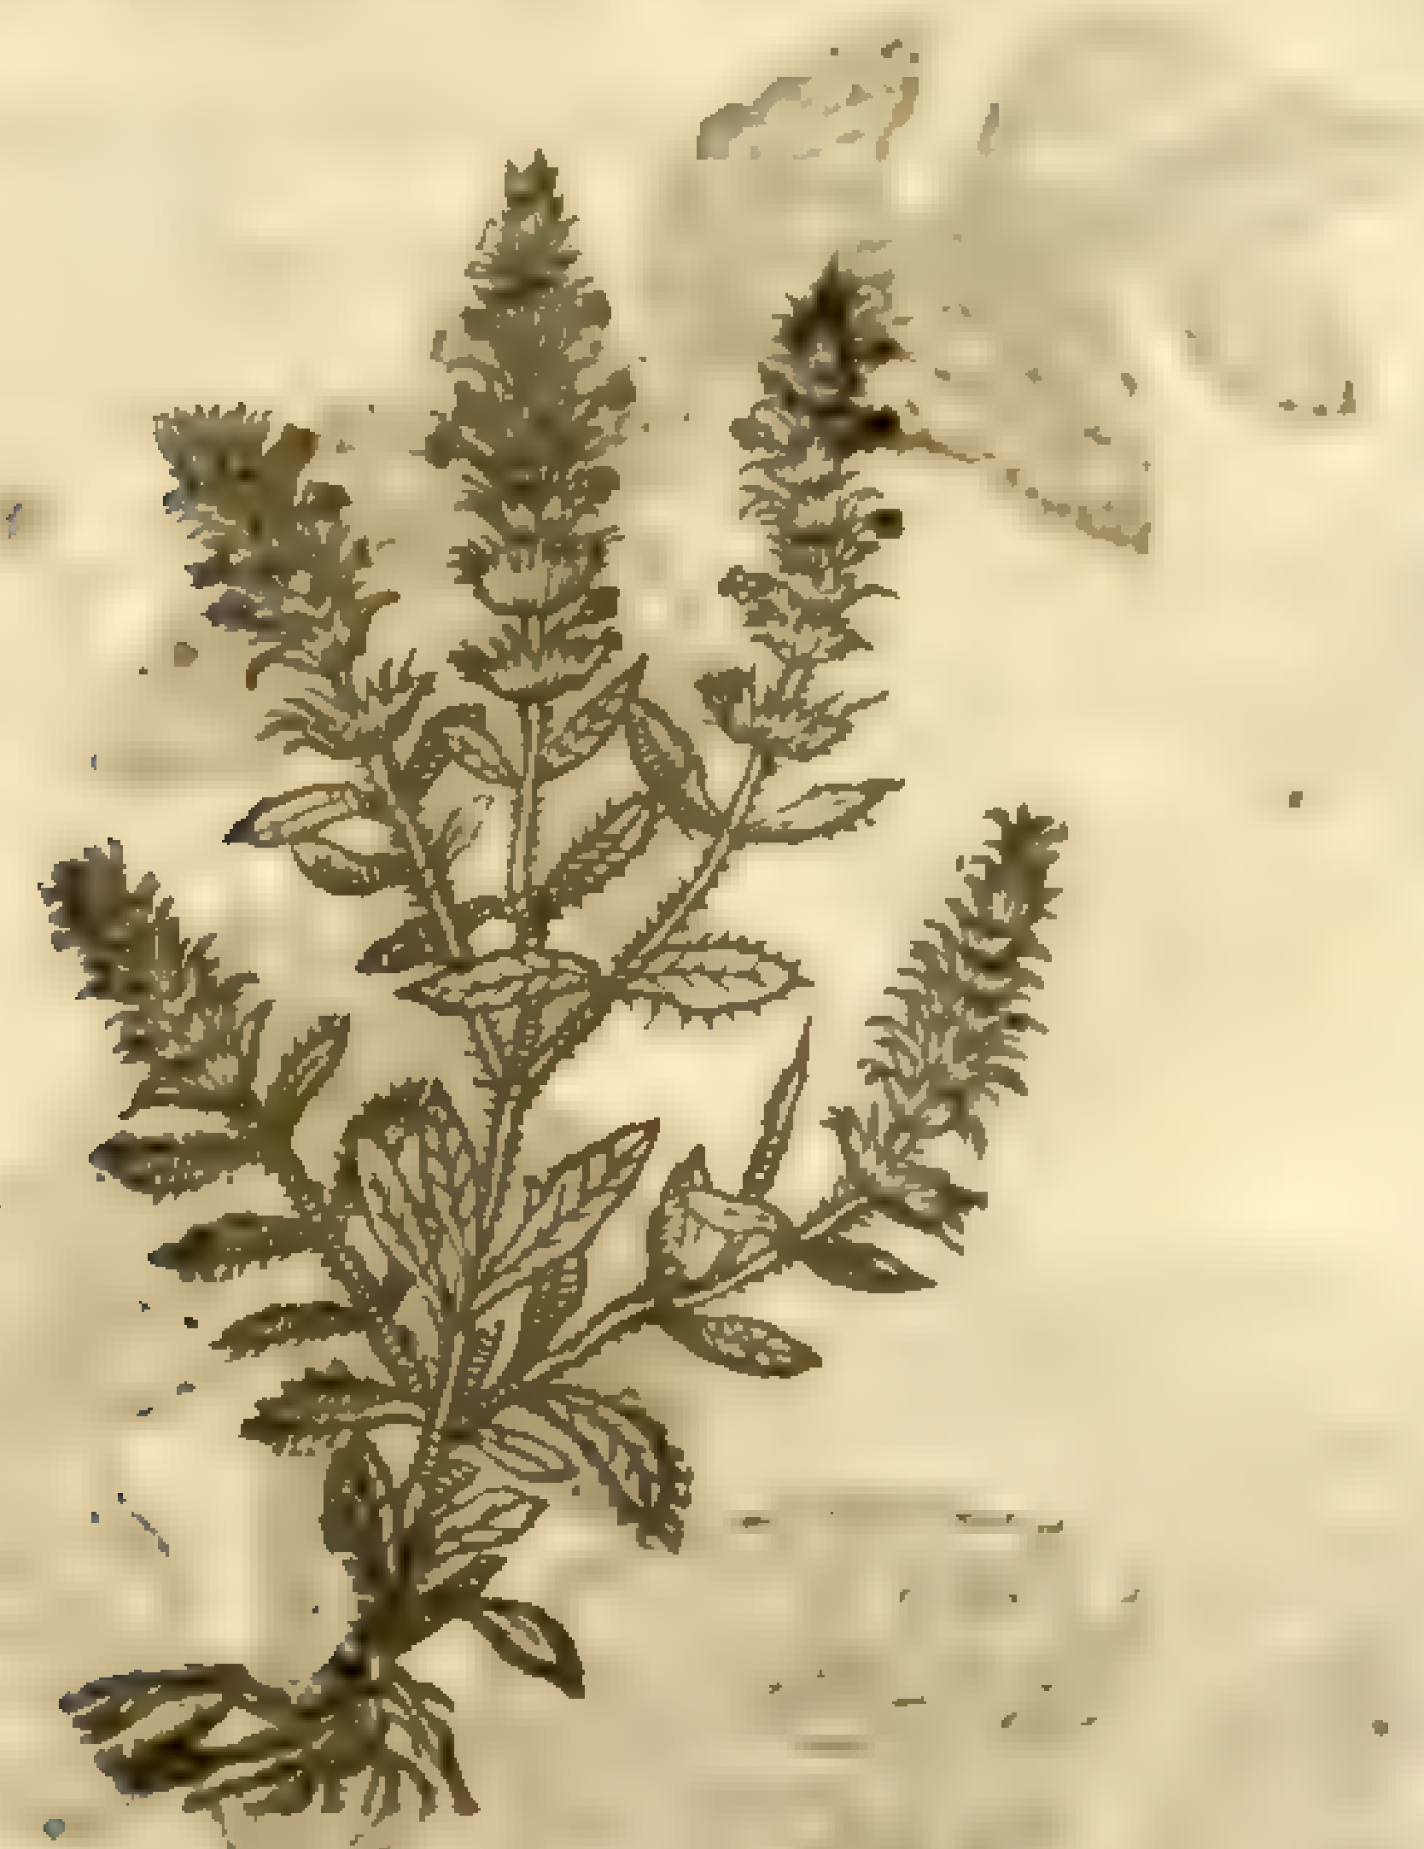


Stachys spinosa L.
mult. dict.

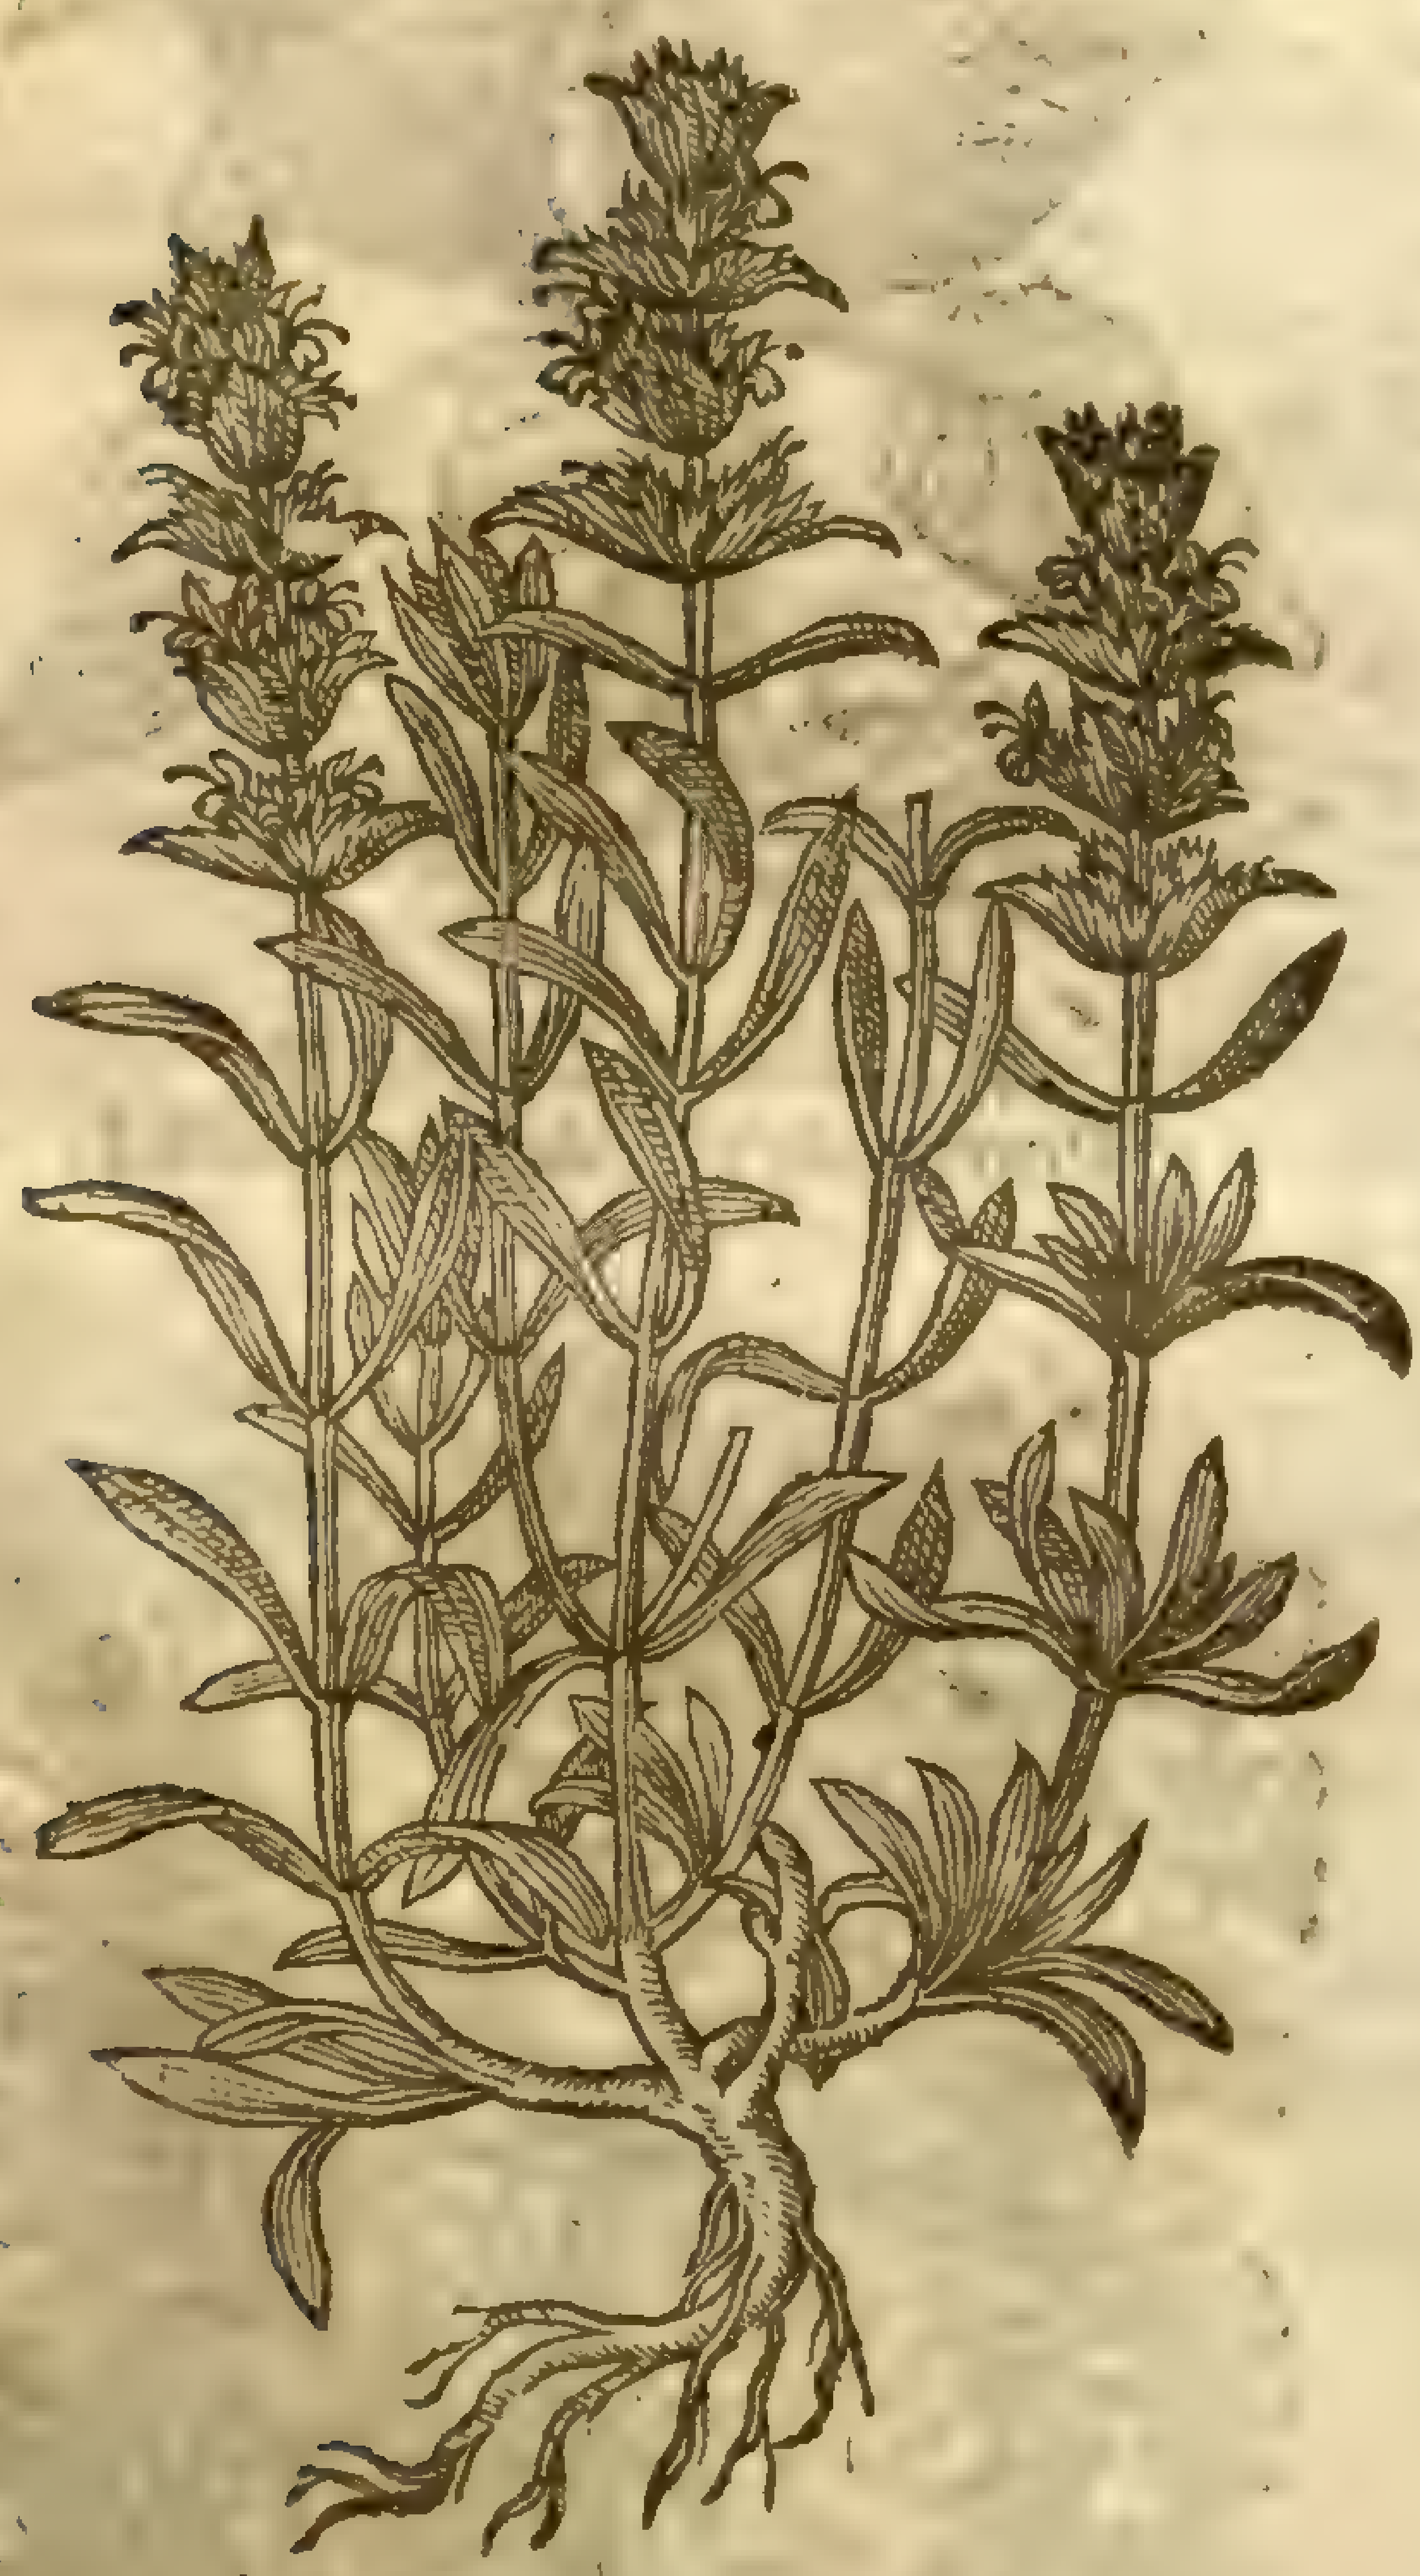
‡ 4 *Stachys Luſitanica.*
Portugall Wilde Horehound.



‡ 5 *Sideritis Scordioides.*
Germander Ironwort.



‡ 6 *Sideritis Alpina Hyſſopifolia.*
Hyſſop leaued Iron-wort.



2 Beſides this there is alſo another deſcribed by *Fuchſius* : the ſtalkes hereof are thicke, foure ſquare, now and then two or three foot long : the leaues be broad, long, hoarie,nicked in the edges, hairie as are alſo the ſtalkes,and much broader than thoſe of the common Horehound : the floures in the whorles which compaſſe the ſtalke about, are of a purple colour ; the ſeede is round and blackiſh : the root hard and ſomthing yellow.

‡ 3 This thorny *Stachys* hath leaues before it comes to ſend forth the ſtalke,like thoſe of the leſſer Sage,but more white and hairie, thoſe that grow vpon the ſtalkes are much narrower : the ſtalkes are ſquare ſome foot high : and at the parting of them into branches grow alwaies two leaues one oppoſit againſt another : the tops of the branches end in long ſharpe thornie prickles : the floures grow about the tops of the branches like thoſe of Sage, but of ſomewhat a lighter colour. This growes naturally in Candy,about a Towne called Larda, where *Honorius Bellus* firſt obſerued it : there it is called *Guidarothymo*,or Aſſes Time,though it agree with Tyme in nothing but the place of growth. *Cluſius* ſets it forth by the name of *Stachys ſpinoſa*.

4 *Lobel* hath giuen vs the figure and firſt deſcription of this by the name of *Stachys Luſitanica*. It hath creeping and downy ſtalkes ſome handfull and halfe high, ſet with little leaues : amongſt which in rundles grow ſmall floures like thoſe of the other wilde Horehounds ; the whole plant is of ſomewhat a gratefull ſmell. ‡

5 There is another wilde Horehound of Mountpelier, called *Sideritis Monſpelliaca Scordioides,ſiue Scordij folio* : being that kind of *Sideritis* or wilde Horehound which is like vnto *Scordium*, or water Germander, which groweth to the height of a handfull and a halfe, with many ſmall branches riſing vpright, of a wooddy ſubſtance, hauing the tops and ſpokie coronets of Hyſſop, but the leaues doe reſemble *Dioſcorides* his *Scordium*, ſaue that they be ſomewhat leſſer, ſtiffer, more wrinkled and curled and hairie,than *Tetrahit*,or the Iudaicall herbe : the floures do reſemble thoſe of the common Sauorie, in taſte bitter, and of an aromaticall ſmell.

6 Mountaine *Sideritis* being alſo of the kindes of Horehound, was firſt found by *Valerandus Donraz*,in the mountains of Sauoy,reſembling very well the laſt deſcribed,but the leaues are much narrower, and like thoſe of Hyſſope : the floures grow in ſmall rough rundles or tufts, pale of colour like *Marrubium* or *Tetrahit* ; the root long and bending, of a wooddy ſubſtance, and purple colour,bitter in taſte,but not vnpleaſant,whoſe vertue is yet vnknowne.

¶ *The Place.*

Theſe herbes are forreiners, they grow in rough and barren places, notwithſtanding I haue them growing in my garden. ‡ My kinde friend Mr *Buckner* an Apothecary of London, the laſt yeere being 1632, found the ſecond of theſe growing wilde in Oxfordſhire in the field joyning to Witney Parke a mile from the Towne. ‡

¶ *The Time.*

They floure in the Summer moneths, and wither towards Winter: the root remaineth aliue a certaine time.

¶ *The Names.*

The former is taken for the right *Stachys*, which is called in Greeke, στάχυς: it is knowne in ſhoppes and euery where: we name it in Engliſh yellow Horehound, and wilde Horehound. ‡ *Lobel* calls it *Stachys Lychnites ſpuria flandrorum*. ‡

The other wilde Horehound, ſeeing it hath no name, is to be called *Stachys ſpuria*; for it is not the right, neither is it *Sphacelus* (as moſt haue ſuſpected) of which *Theophraſtus* hath made mention; it is called in Engliſh, purple Horehound, baſtard wilde Horehound, & *Fuchſius* his wild Horehound. ‡ *Fabius Columna* proues the ſecond to be the *Sideritis Heraclia* of *Dioſcorides* and the Antients. ‡

¶ *The Temperature.*

Theſe herbes are of a biting and bitter taſte, and are hot in the third degree, according to *Galen*. ‡ The *Stachys Fuchſij* and *Sideritides* ſeeme to be hot and dry in the firſt degree. ‡

¶ *The Vertues.*

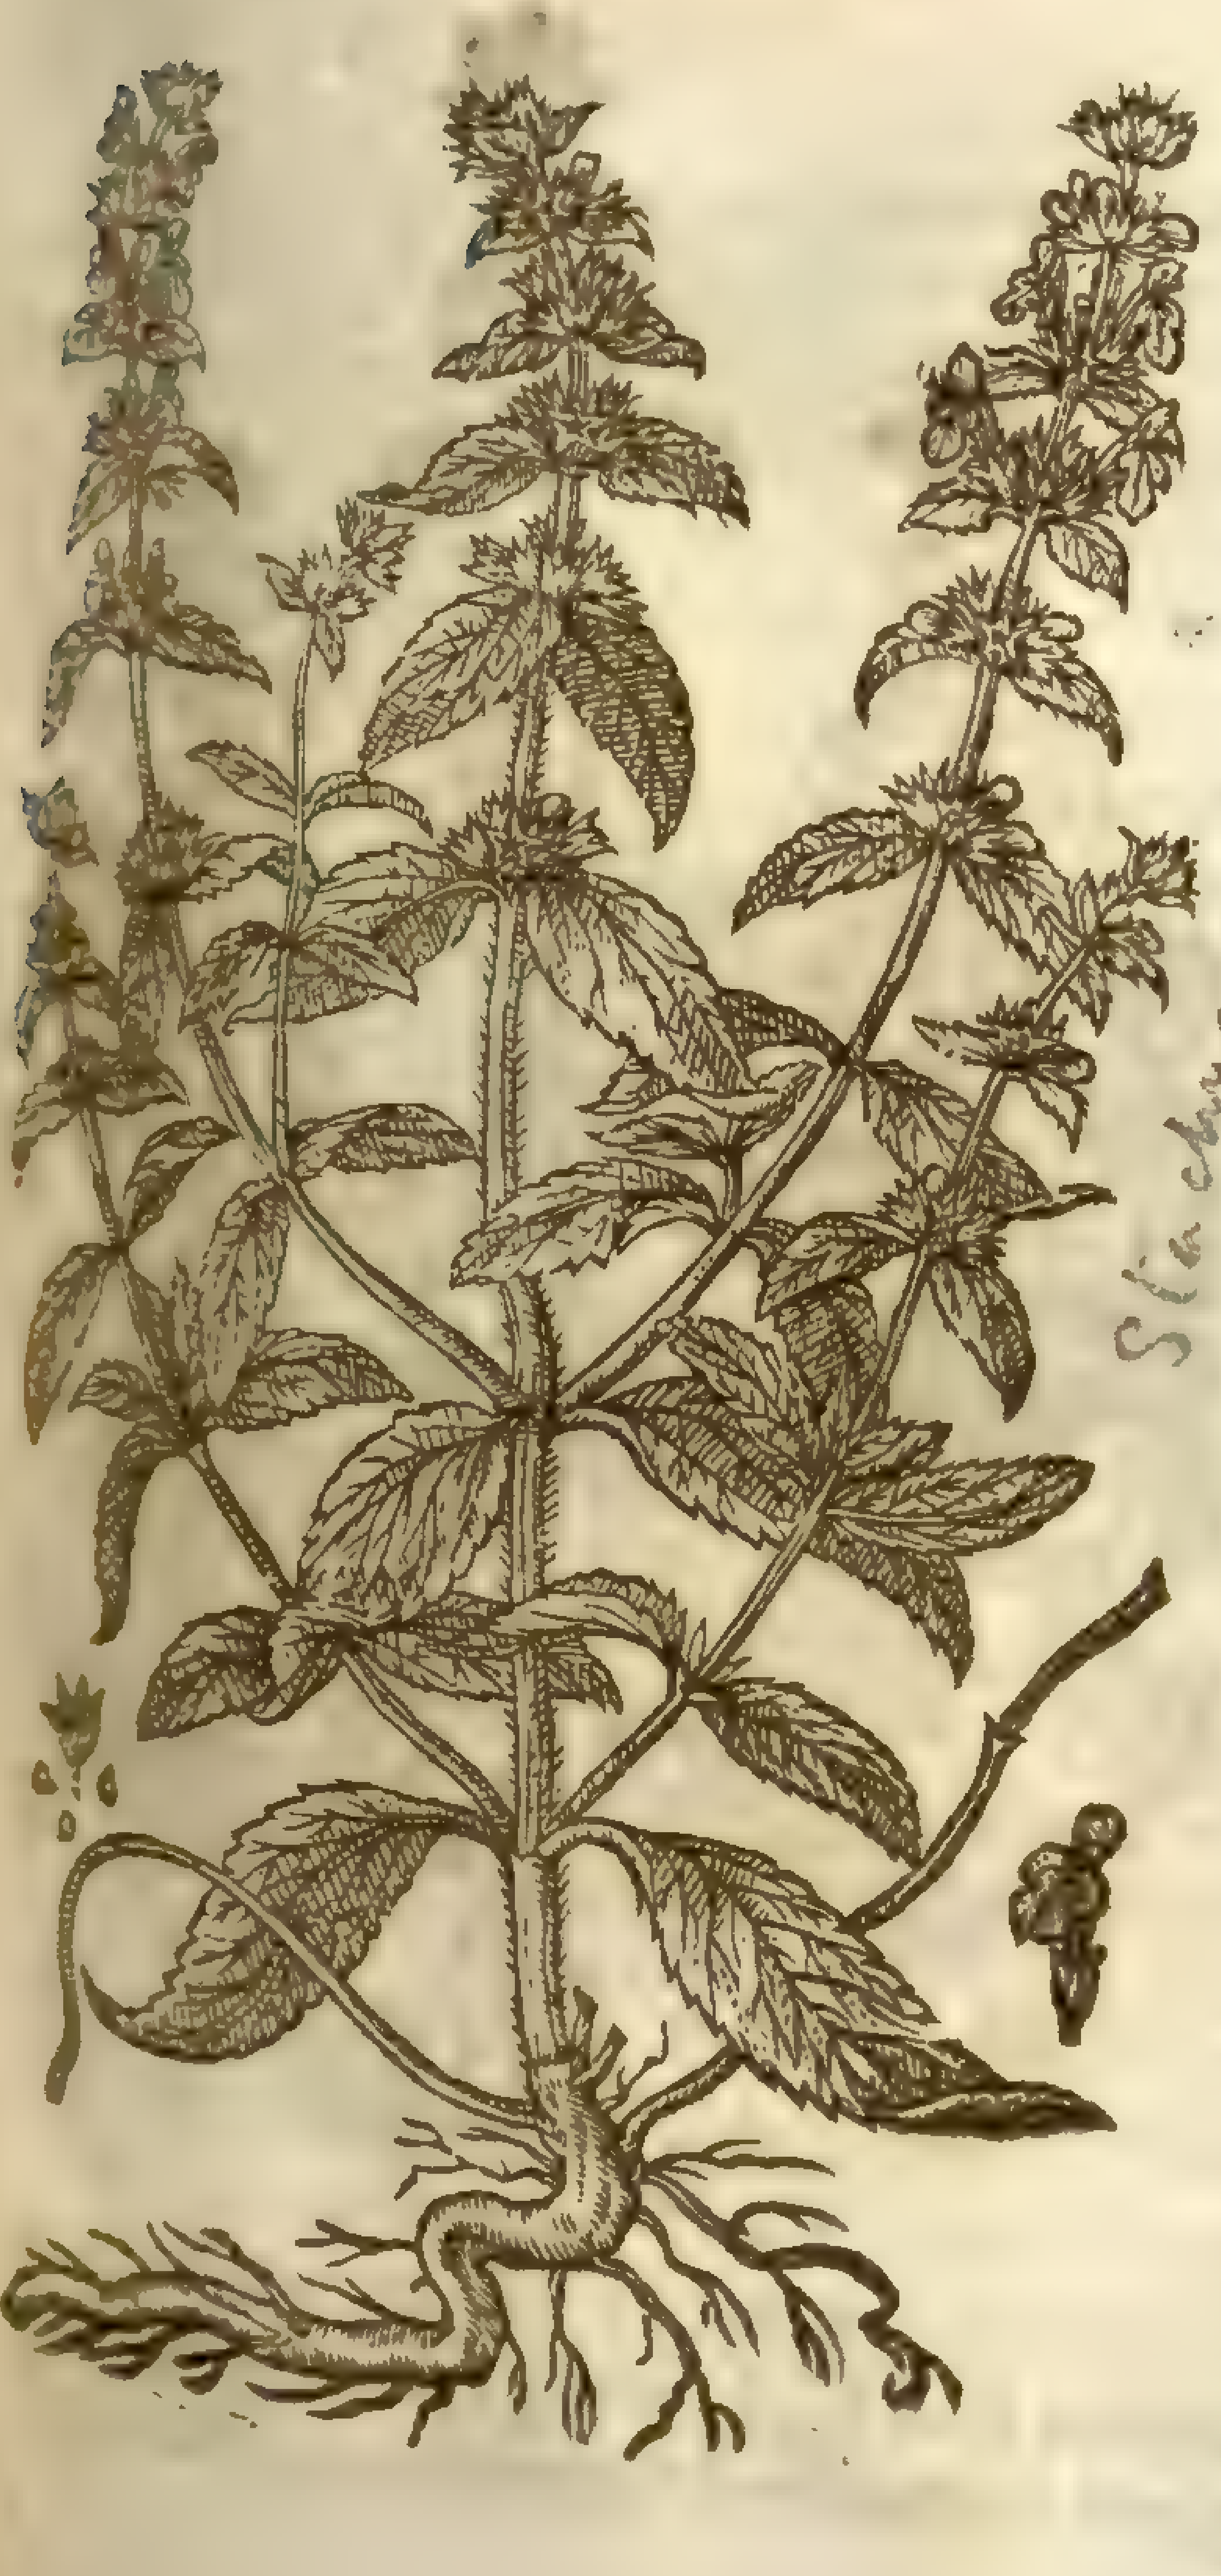
The decoction of the leaues drunke both draw downe the menſes and the ſecondine, as *Dioſcorides* teacheth. A

‡ 2 This is of ſingular vſe (as moſt of the herbes of this kinde are) to keep wounds from inflammation, and ſpeedily to heale them vp, as alſo to ſtay all fluxes and defluctions, hauing a drying and moderate aſtrictiue faculty. B

Aëtius and *Ægineta* commend the vſe of it in medicines vſed in the cure of the biting of a mad Dog. ‡ C

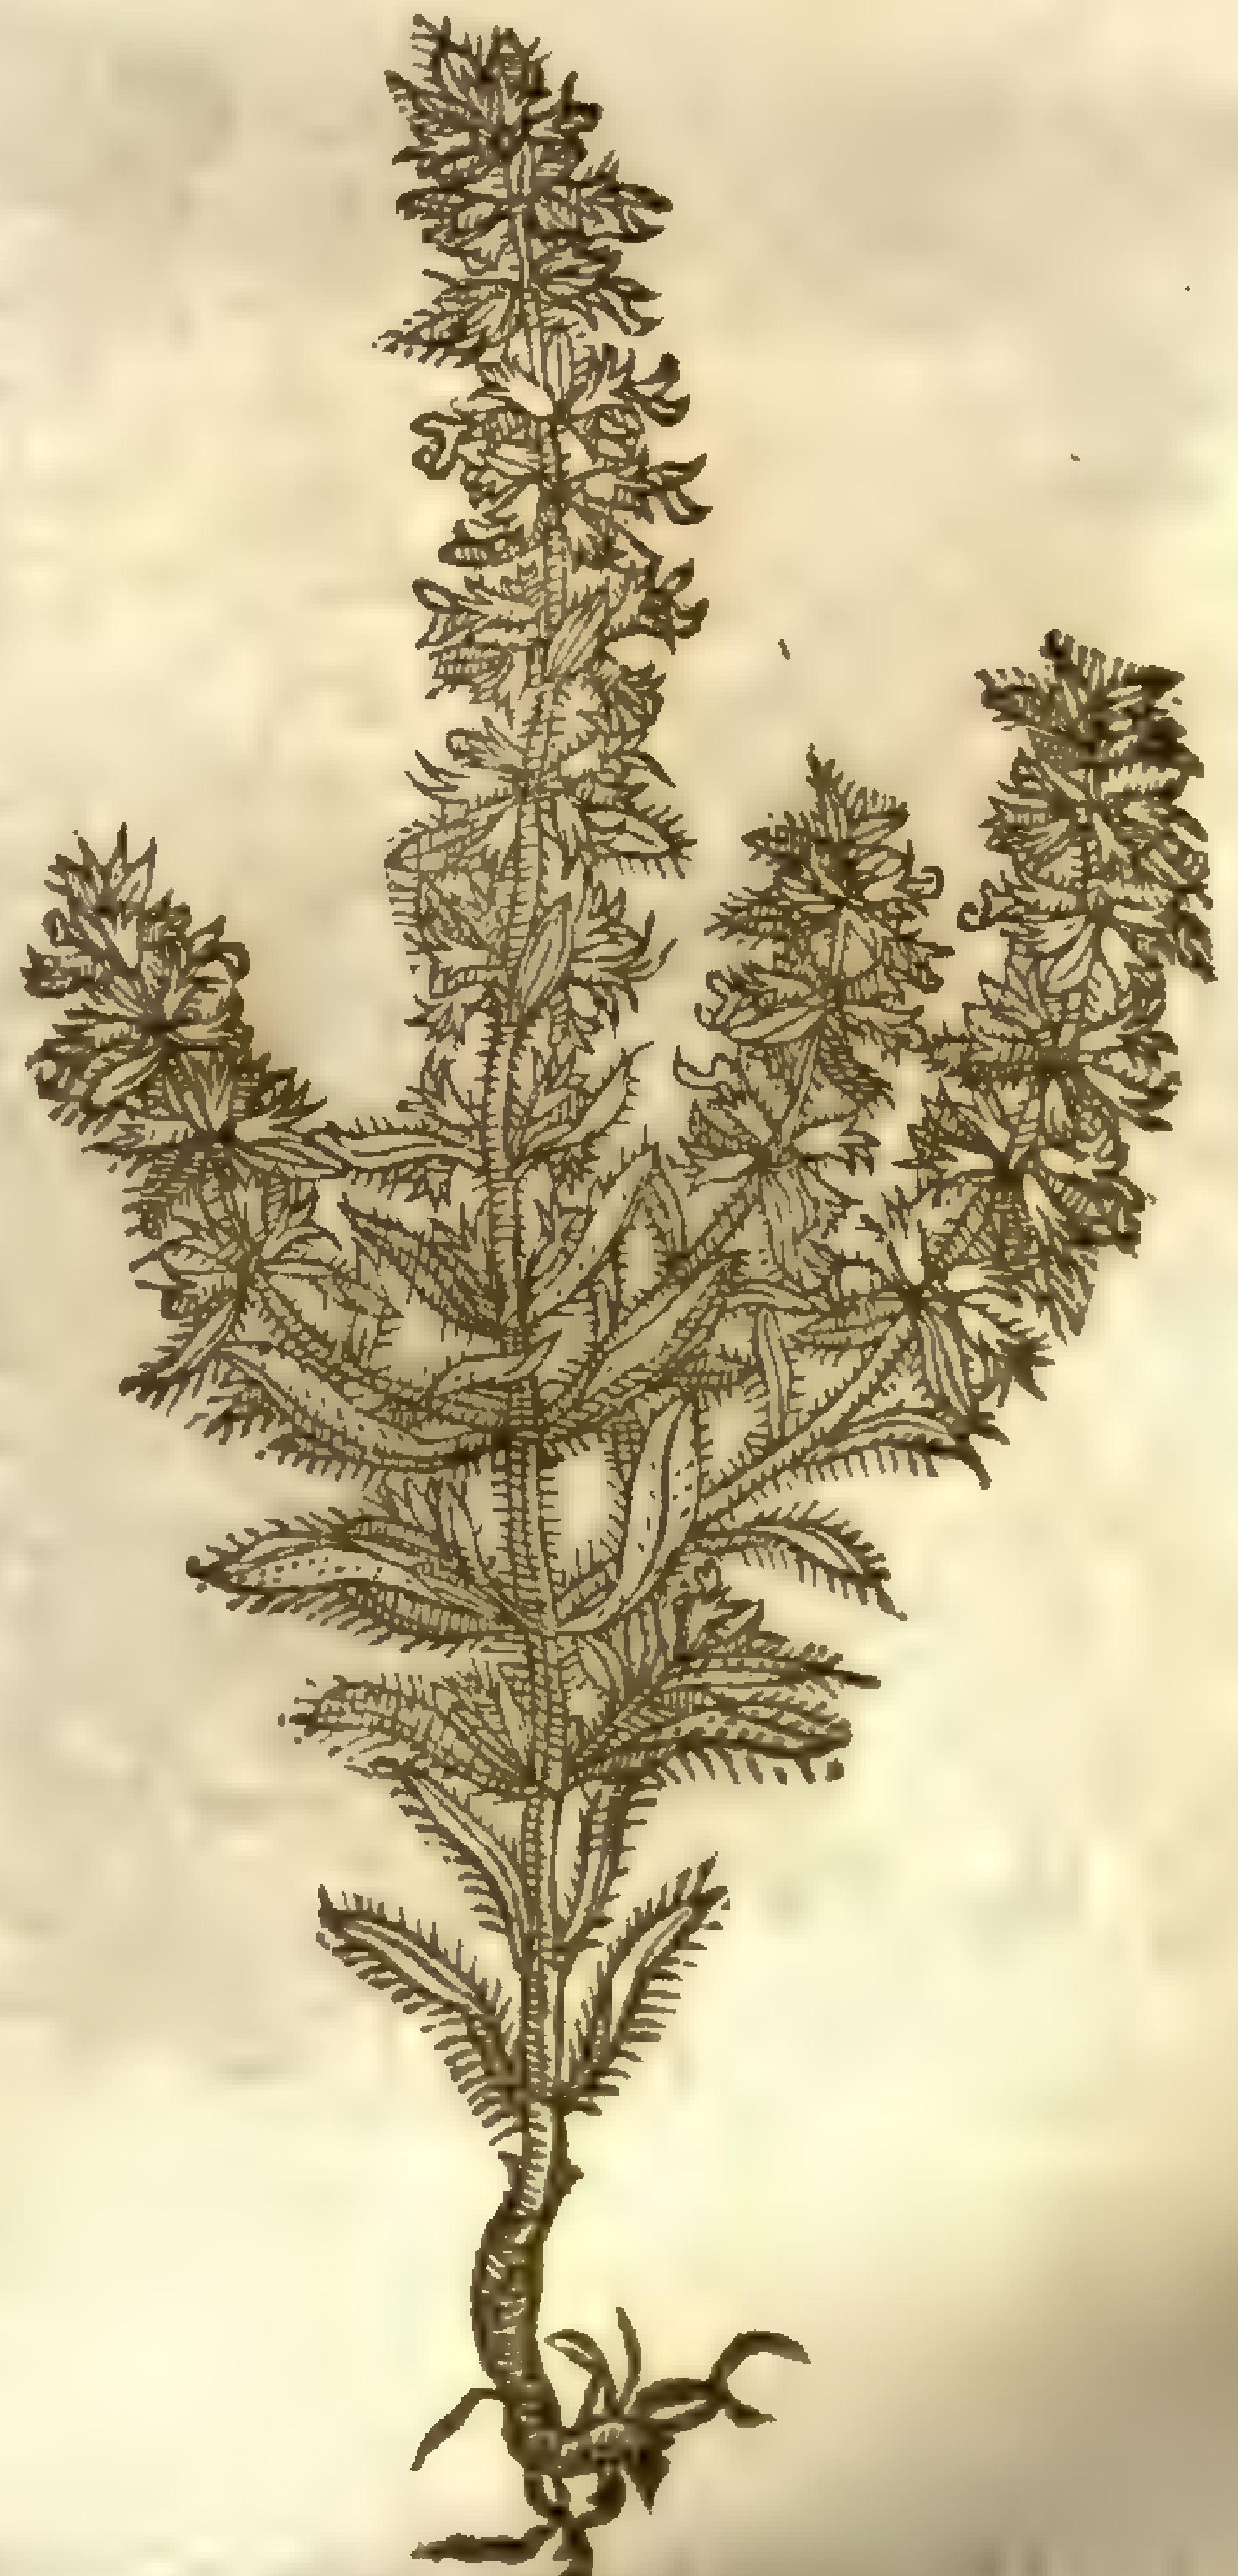
‡ Chap. 232. *Of the Ironworts or All-heales.*

‡ 1 *Sideritis vulgaris.*
Ironwort or All-heale.



Stachys recta, mill. dict.

‡ 2 *Sideritis Anguſtifolia.*
Narrow leaued All-heale.



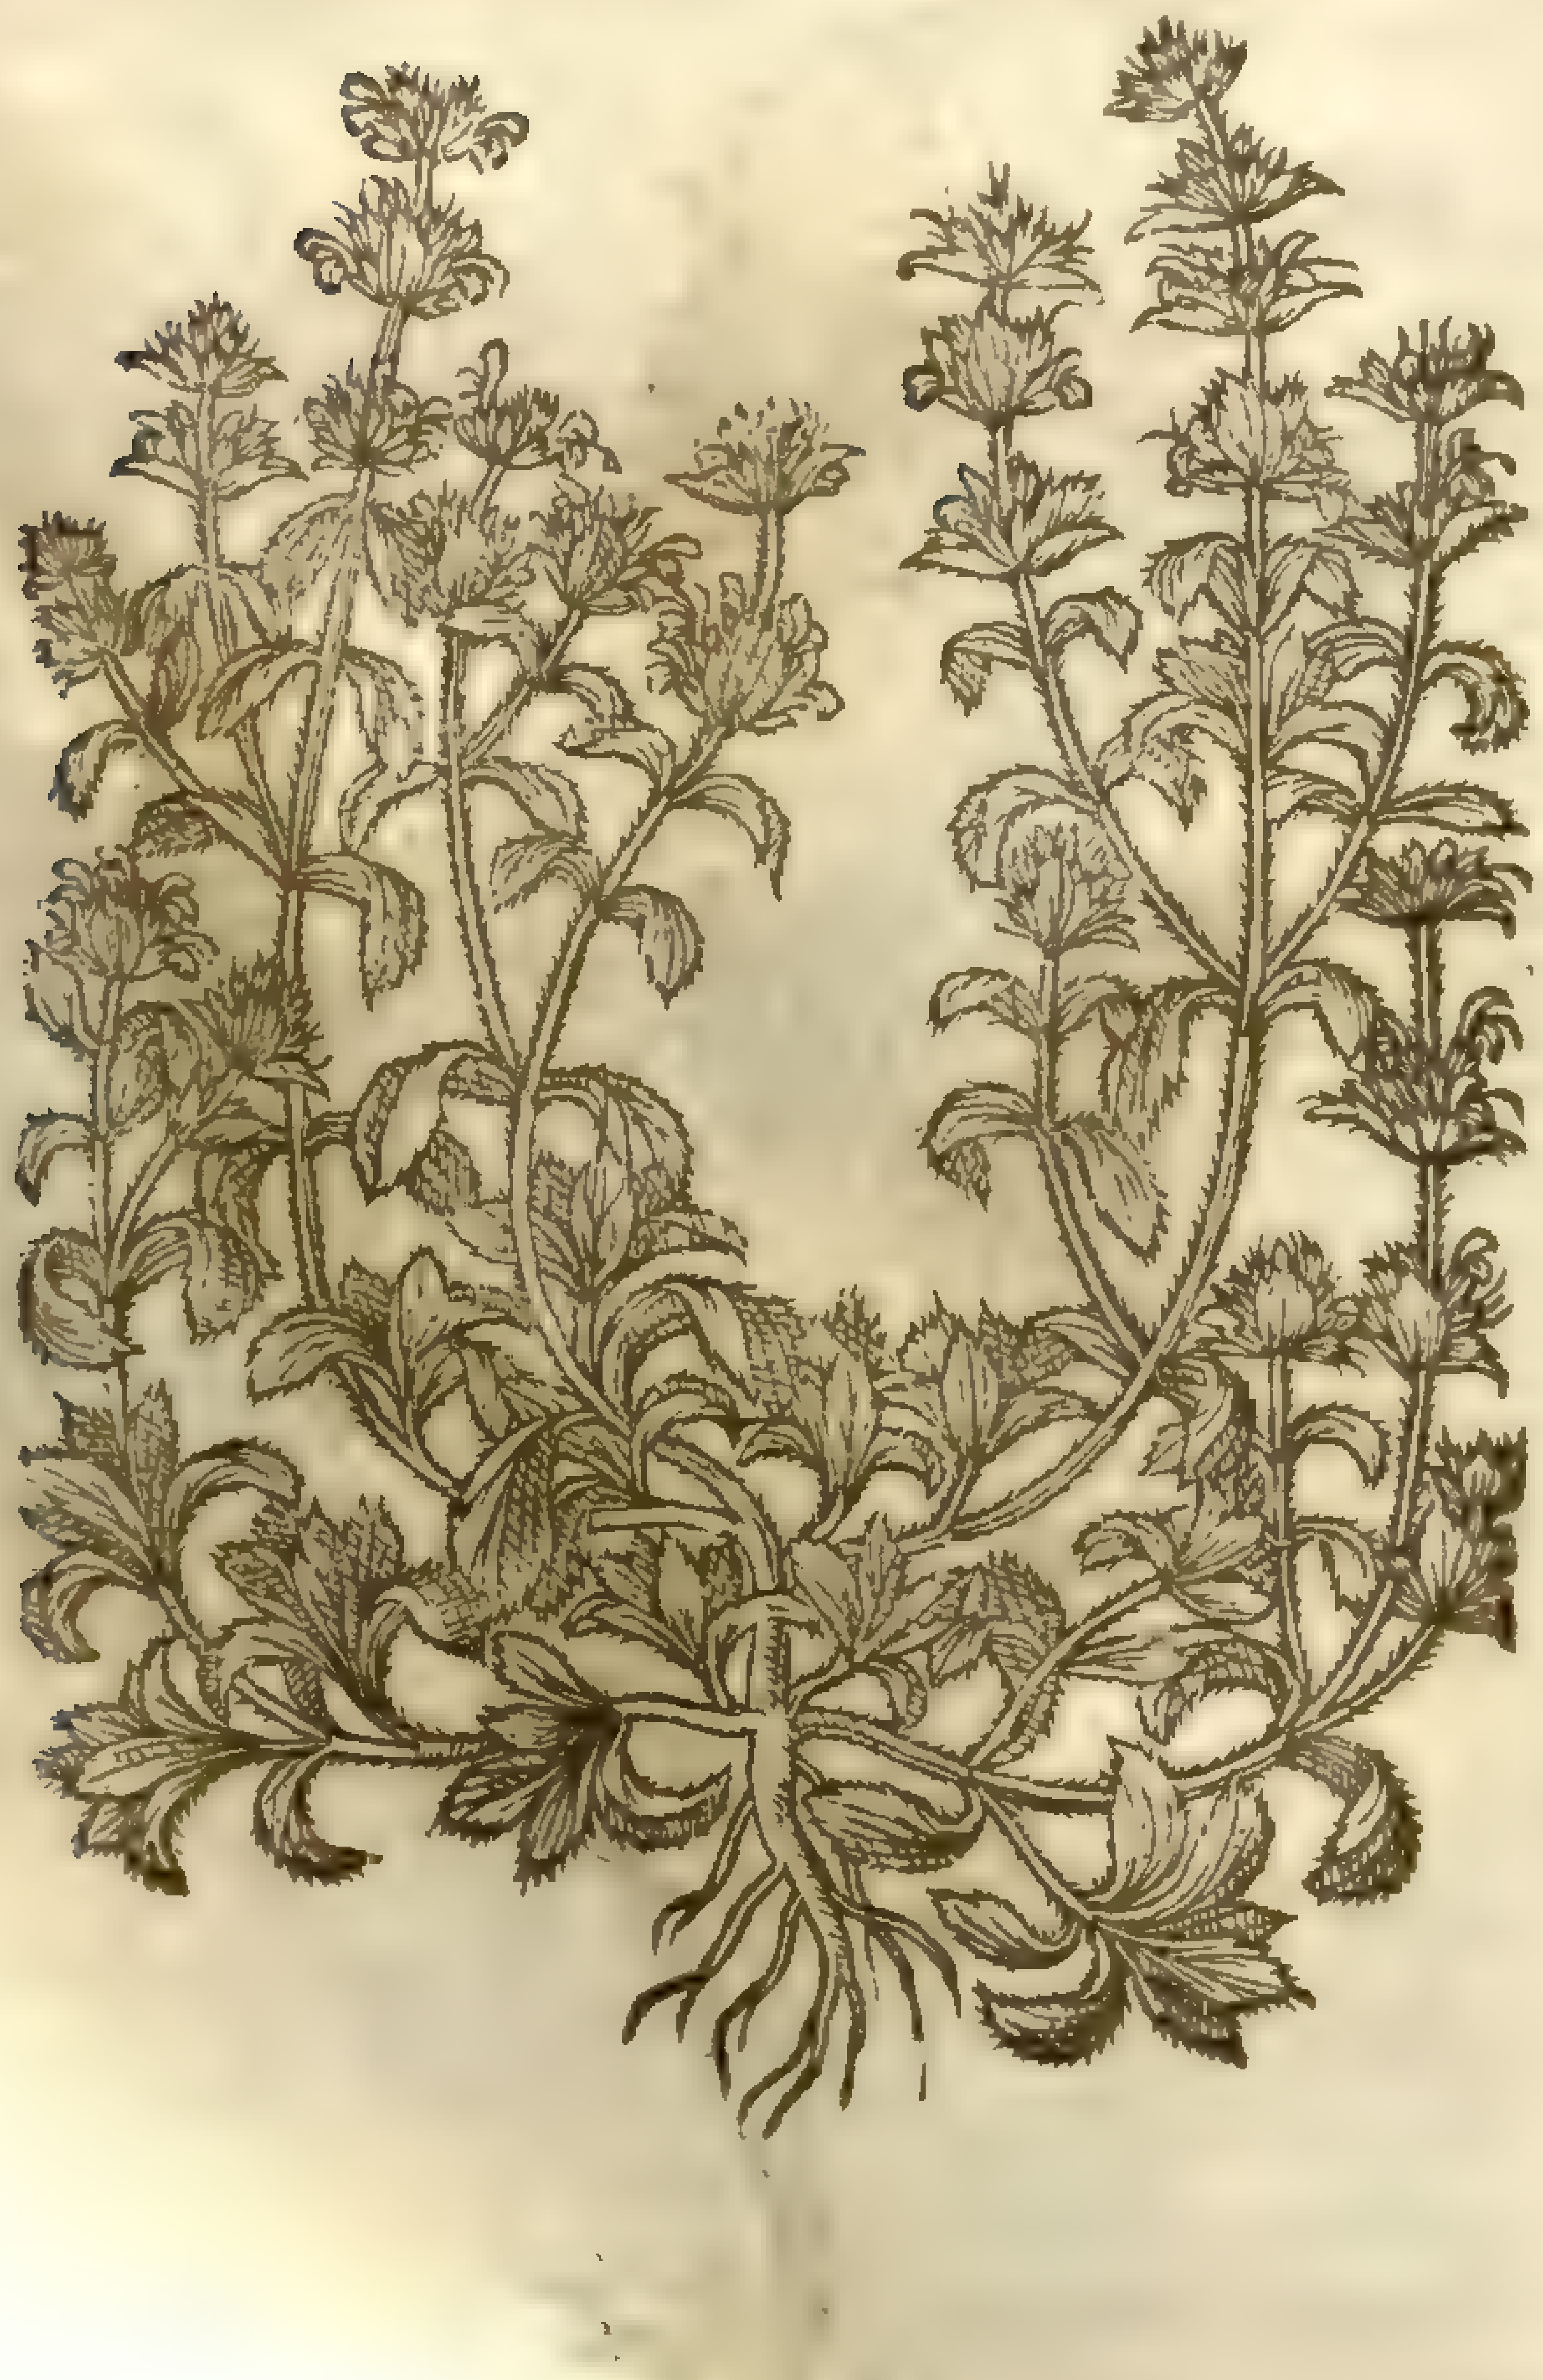
¶ The

¶ *The Kindes.*

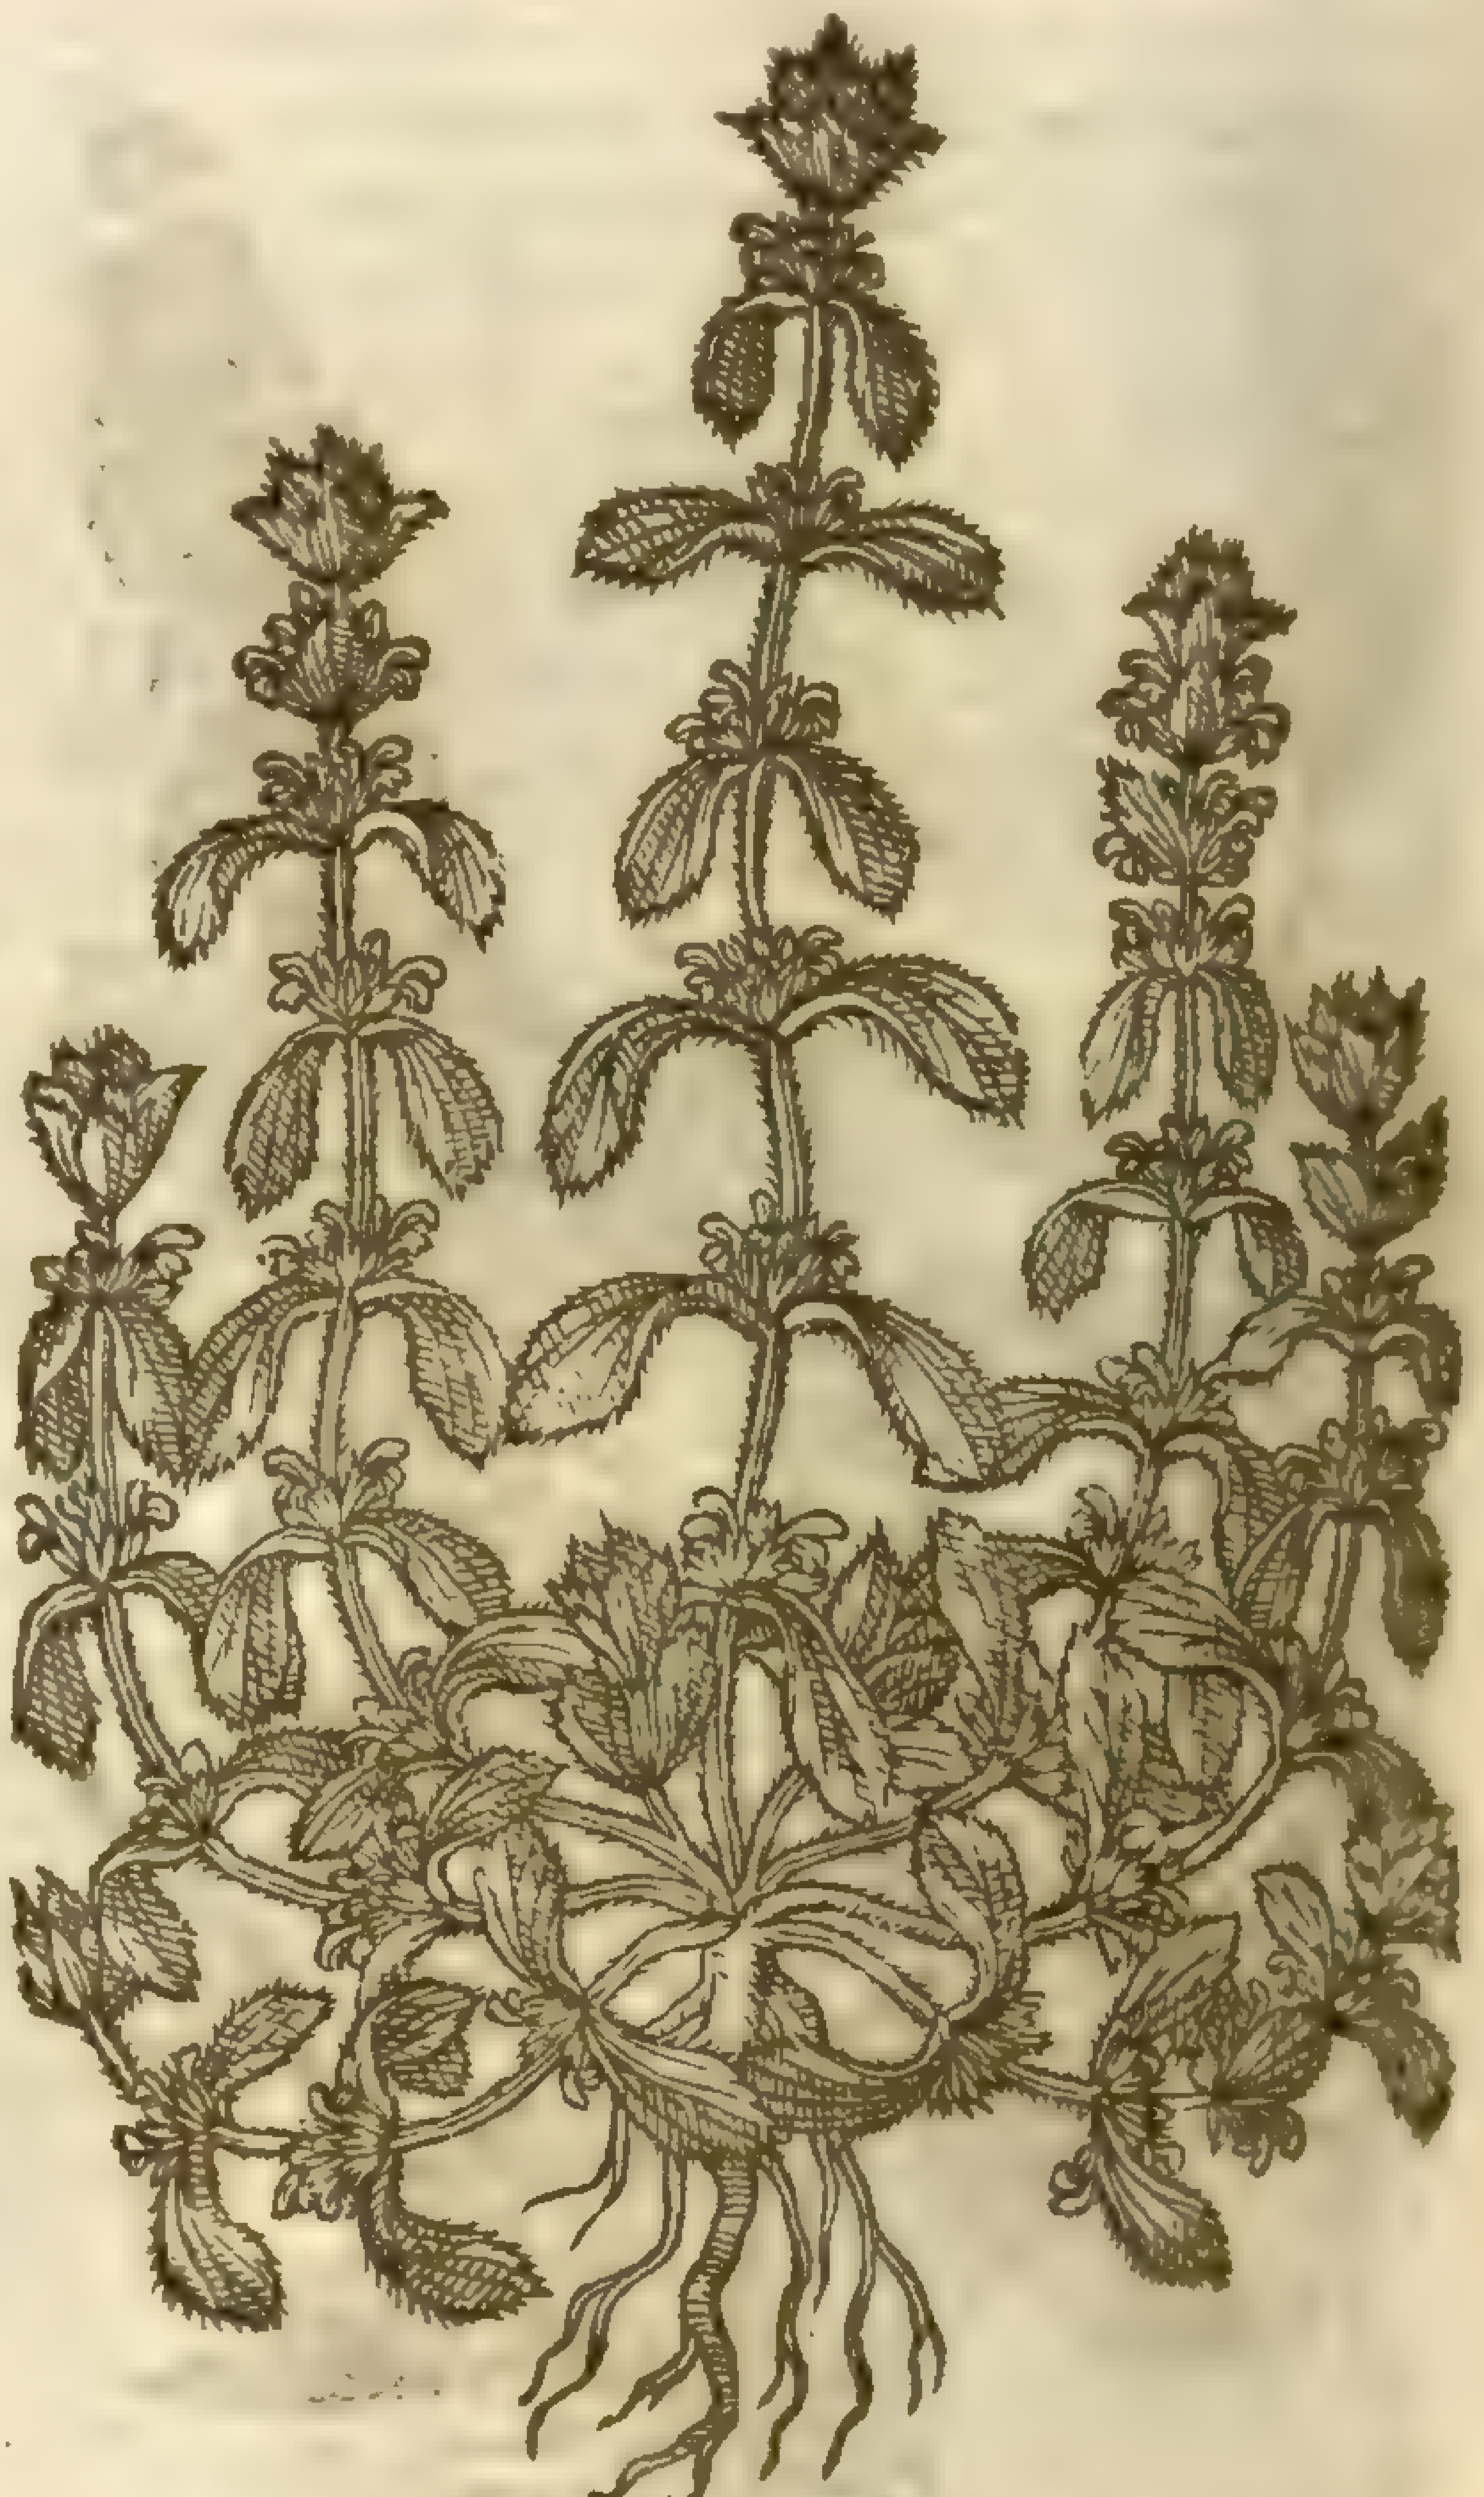
‡ There are many plants that belong to this kindred of the *Sideritides*, or Ironwoorts, and ſome of them are already treated of, though in ſeuerall places, and that not very fitly by our Author; and one of them is alſo ſet forth hereafter by the name of Clownes All-heale: theſe that are formerly handled, and properly belong to this Chapter, are firſt the *Herba Iudaica Lobelij*, being in the fourth place of the 226 Chapter. Secondly, the *Stachys Fuchſij* (being the firſt *Sideritis* of *Dioſcorides*) deſcribed in the ſecond place of the laſt Chapter. Thirdly, the *Sideritis Scordioides* ſet forth in the fifth place; and fourthly the *Sideritis Alpina Hyſſopifolia* ſet forth in the ſixth place of the laſt Chapter. Now beſides all theſe, I will in this Chapter giue you the Deſcriptions of ſome others like to them in face and Vertues, and all of them may be referred to the firſt *Sideritis* of *Dioſcorides* his deſcription.

¶ *The Deſcription.*

1 This hath ſquare ſtalkes ſome cubit high, rough, and joynted with two leaues at each joynt which are wrinkled and hairie, of an indifferent bigneſſe, ſnipt about the edges, of a ſtrong ſmell, and of a bitteriſh and ſomewhat hottiſh taſte: almoſt forth of euery joynt grow branches, ſet with leſſer leaues: the floures which in roundles incompaſſe the tops of the ſtalkes end in a ſpike, being ſomewhat hooded, whitiſh, well ſmelling, and marked on the inſide with ſanguine ſpots. The ſeed is rough and blacke, being contained in fiue cornered ſeed veſſels. The root is hard and wooddy, ſending forth many ſtalkes. This is the *Sideritis prima* of *Fuchſius*, *Cordus*, *Cluſius*, and others; it hath a very great affinitie with the *Panax Coloni*, or Clownes All-heale of our Author, and the difference betweene them certainly is very ſmall.



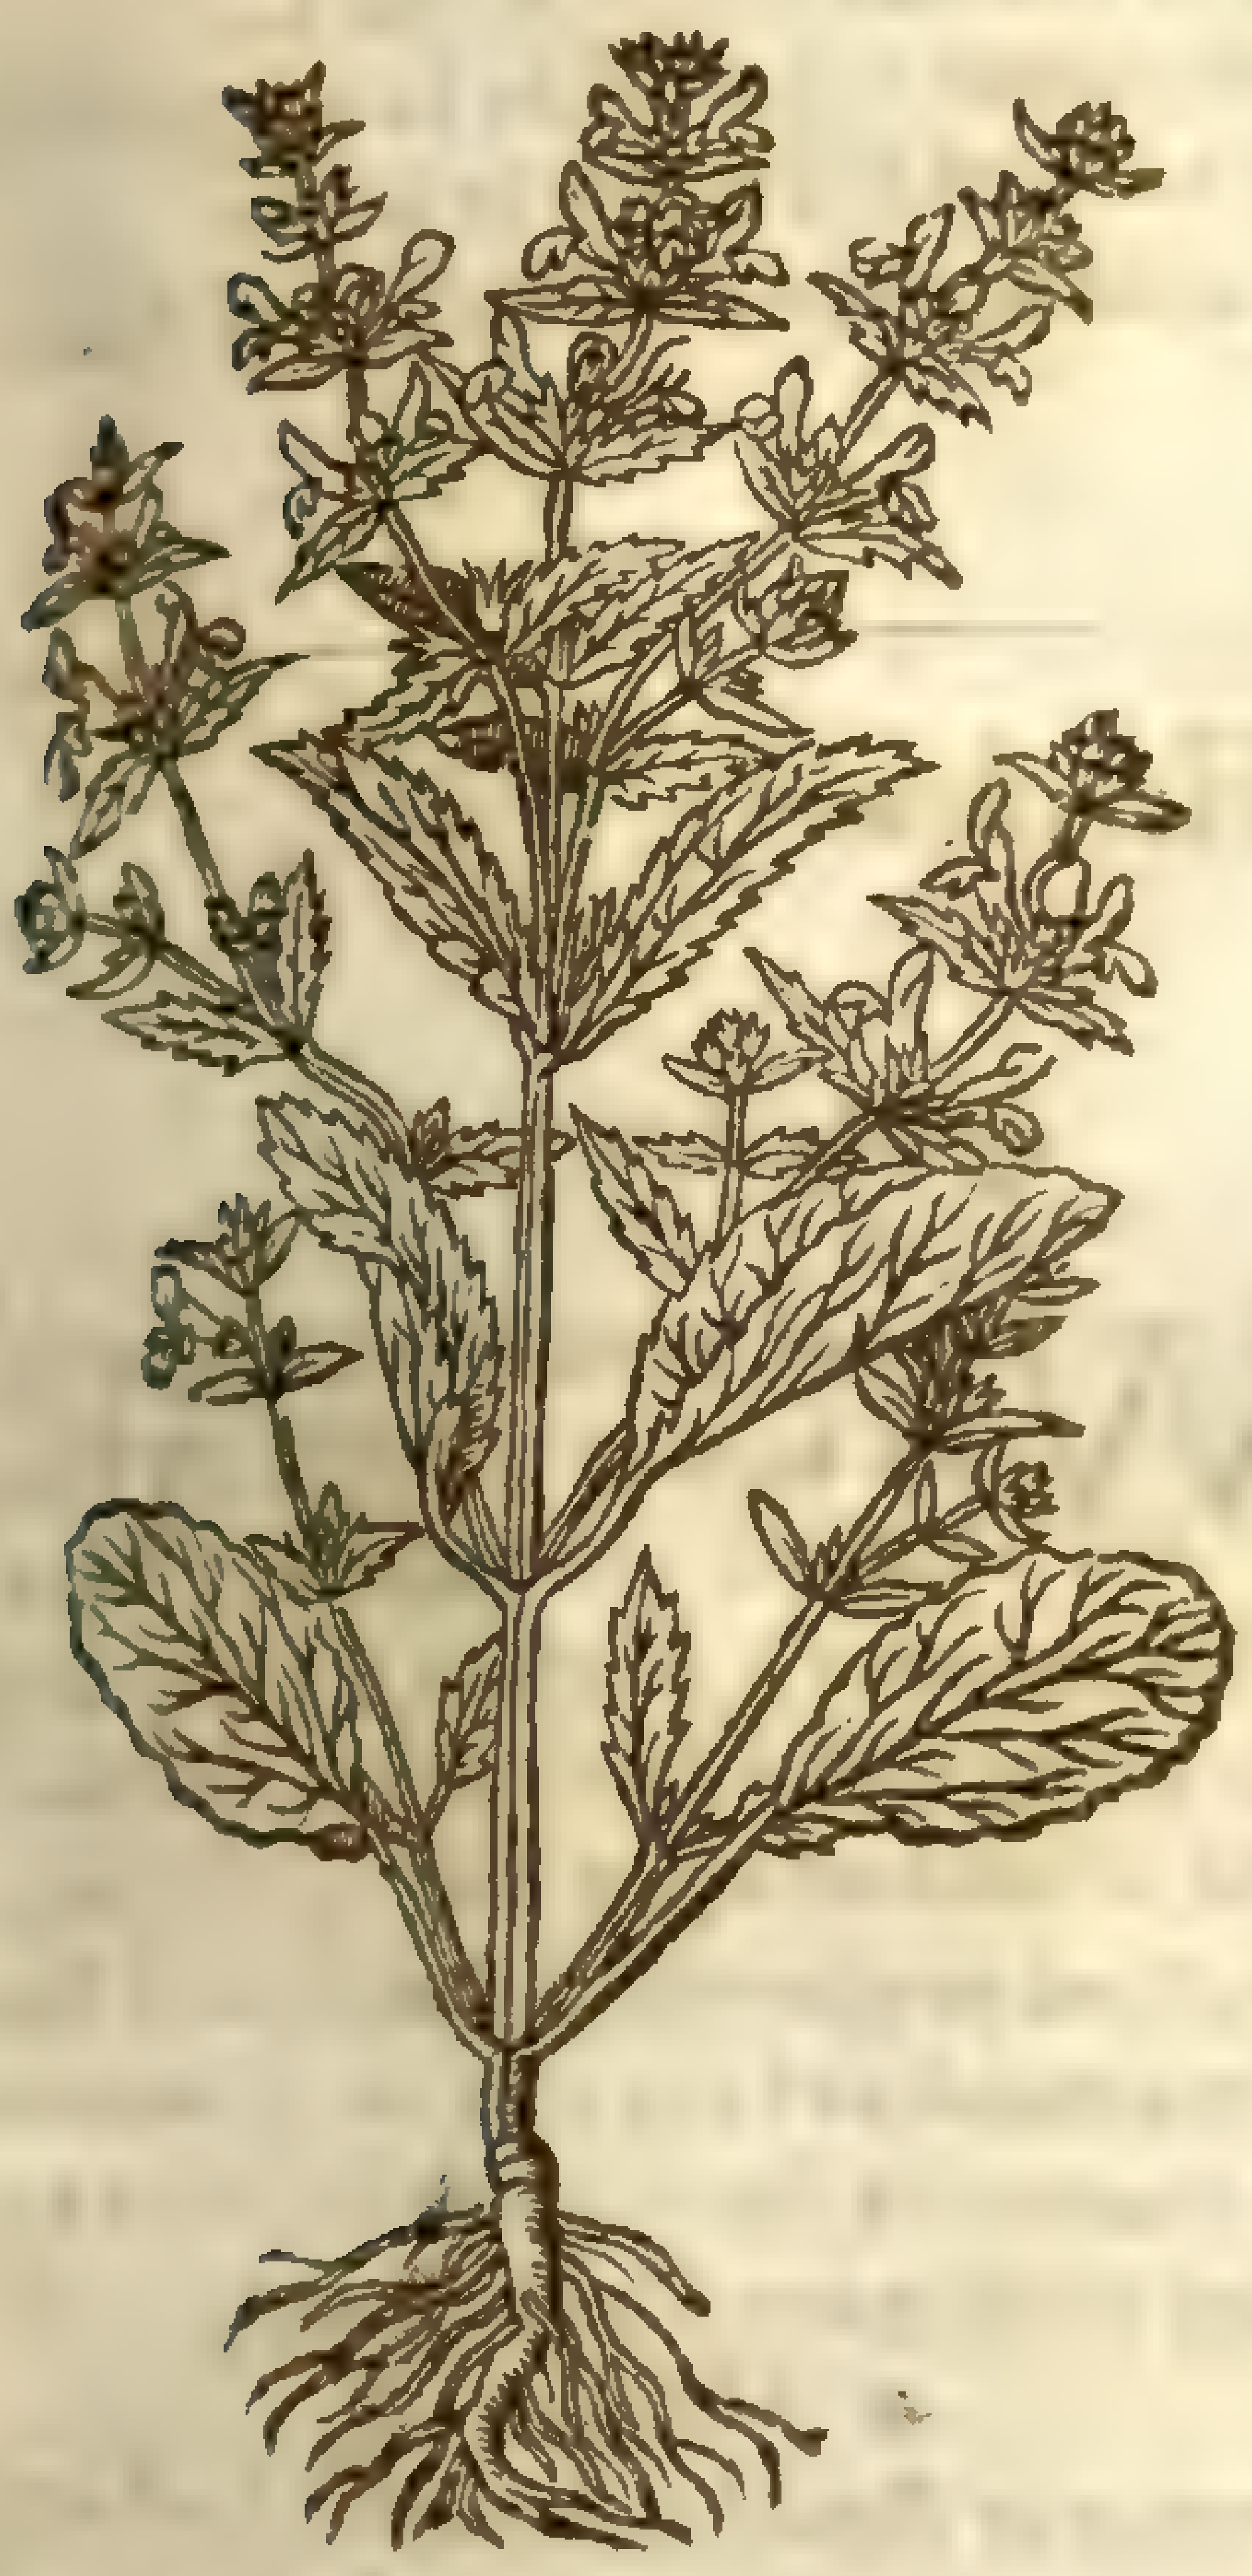
‡ 3 *Sideritis procumbens ramoſa.*
Creeping branched Ironwort.



‡ 4 *Sideritis procumbens non ramoſa.*
Not branched Creeping Ironwort.

2 The foure ſquare ſtalke of this plant is not aboue a foot high, and it is preſently from the root diuided into diuers branches; the leaues are long and narrow with ſome nerues or veines run-

‡ 6 *Sideritis latifolia glabra.*
Smooth broad leafed All-heale.



ning alongſt them, being alſo very hairie, but not ſnipt about the edges: the floures grow alongſt the branches, and vpon the main ſtalke in roundles like thoſe of the firſt mentioned, but leſſer, and of a darke colour, with a yellowiſh ſpot on their inſides: the ſeed is alſo contained in fiue cornered veſſels like as the former. It floures in Iune and Iuly, and growes amongſt the corne in Hungary and Auſtria. This is onely ſet forth by *Cluſius*, and that vnder the name of *Sideritis 6. Pannonica.*

3 This hath ſome branches lying along vpon the ground, ſlender, quadrangular & hairie, which at certaine ſpaces are ſet with leaues growing by couples, almoſt like thoſe of the firſt, but much leſſe, and ſnipt onely from the middle to the end: the floures grow after the manner of the former, and (as *Cluſius* thinkes) are like them as is alſo the ſeed. *Cluſius* hath this by the name of *Sideritis* 4.

4 The ſame Authour hath alſo giuen vs another, which from the top of the root ſends forth many branches, partly lying ſpred on the ground, and partly ſtanding vpright, being hairy, joynted, and ſquare like thoſe of the former, and ſuch alſo are the leaues, but that they are leſſe ſnipt about the edges: and in their boſomes from the bottome of the ſtalkes to the top grow rundles of whitiſh floures ſhaped like others of this kinde. *Cluſius* calls this *Sideritis* 5. He had onely the figures of theſe elegantly drawne by the hand of *Iaques Plateau*, and ſo ſent him.

5 This from a ſmall wooddie root ſends forth a ſquare hairie ſtalke ſome halfe foot high, and ſometimes higher, and this ſtalke moſt commonly ſends forth ſome foure branches, which ſubdiuide themſelues into ſmaller ones, all of them ſometimes lying vpon the ground, and the ſtalke ſtanding vpright; the leaues grow by couples at each joynt, from a broader bottome, ending in an obtuſe point, the lower leaues being ſome inch long, and not much leſſe in breadth: the floures are whitiſh, or light purple, ſmall and hooded, engirting the ſtalkes in roundles, which falling, foure longiſh blacke ſeeds are contained in fiue cornered veſſels. I firſt found it Auguſt 1626 in floure and ſeed amongſt the corne in a field joyning to a wood ſide not far from Greene-hiue in Kent, and I at that time, not finding it to be written of by any, called it *Sideritis humilis lato obtuſo folio*; but ſince I finde that *Bauhine* hath ſet it forth in his *Prodromus* by the name of *Sideritis Alſine Triſſaginis folio.*

6 This (which *Tabernamontanus* calls *Alyſſum Germanicum*, and whoſe figure was formerly giuen with the ſame title by our Author in the 118 Chapter of the former Edition, with a Deſcription nowaies agreeing therewith) growes vp with ſquare ſtalkes ſome cubit high, ſet with pretty large and greene ſmooth leaues ſnipt about the edges: the floures grow in roundles at the tops of the branches, being hooded, and of a pale yellow colour. This growes in the Corne fields in ſome places of Germany and Italy: and it is the *Sideritis* 2. of *Matthiolus* in *Bauhines* opinion, who calls it *Sideritis aruenſis latifolia glabra.*

7 There is another plant that growes frequently in the Corne fields of Kent, and by Purfleet in Eſſex which may fitly be joyned to theſe, for *Camerarius* calls it *Sideritis arvenſis flore rubro*, and in the *Hiſtoria Lugd.* it is named *Tetrahit anguſtifolium*, and thought to be *Ladanum ſegetum* of *Pliny*, mentioned *lib.* 29. *cap.* 8. and *lib.* 26. *cap.* 11. It hath a ſtalke ſome foot or better high, ſet with ſharpe pointed longiſh leaues, hauing two or three nickes on their ſides, and growing by couples; at the top of the branches, and alſo the maine ſtalke it ſelfe, ſtand in one or two roundles faire red hooded floures: the root is ſmall and fibrous, dying euery yeere when it hath perfected his ſeed. It floures in Iuly and Auguſt. This is alſo ſometimes found with a white floure.

¶ *The Place, Time, &c.*

All theſe are ſufficiently deliuered in the deſcriptions.

¶ *The Temperature and Vertues.*

A These plants are dry with little or no heat, and are endued with an aſtrictiue faculty. They conduce much to the healing of greene wounds being beaten and applied, or put in vnguents or plaiſters made for that purpoſe.

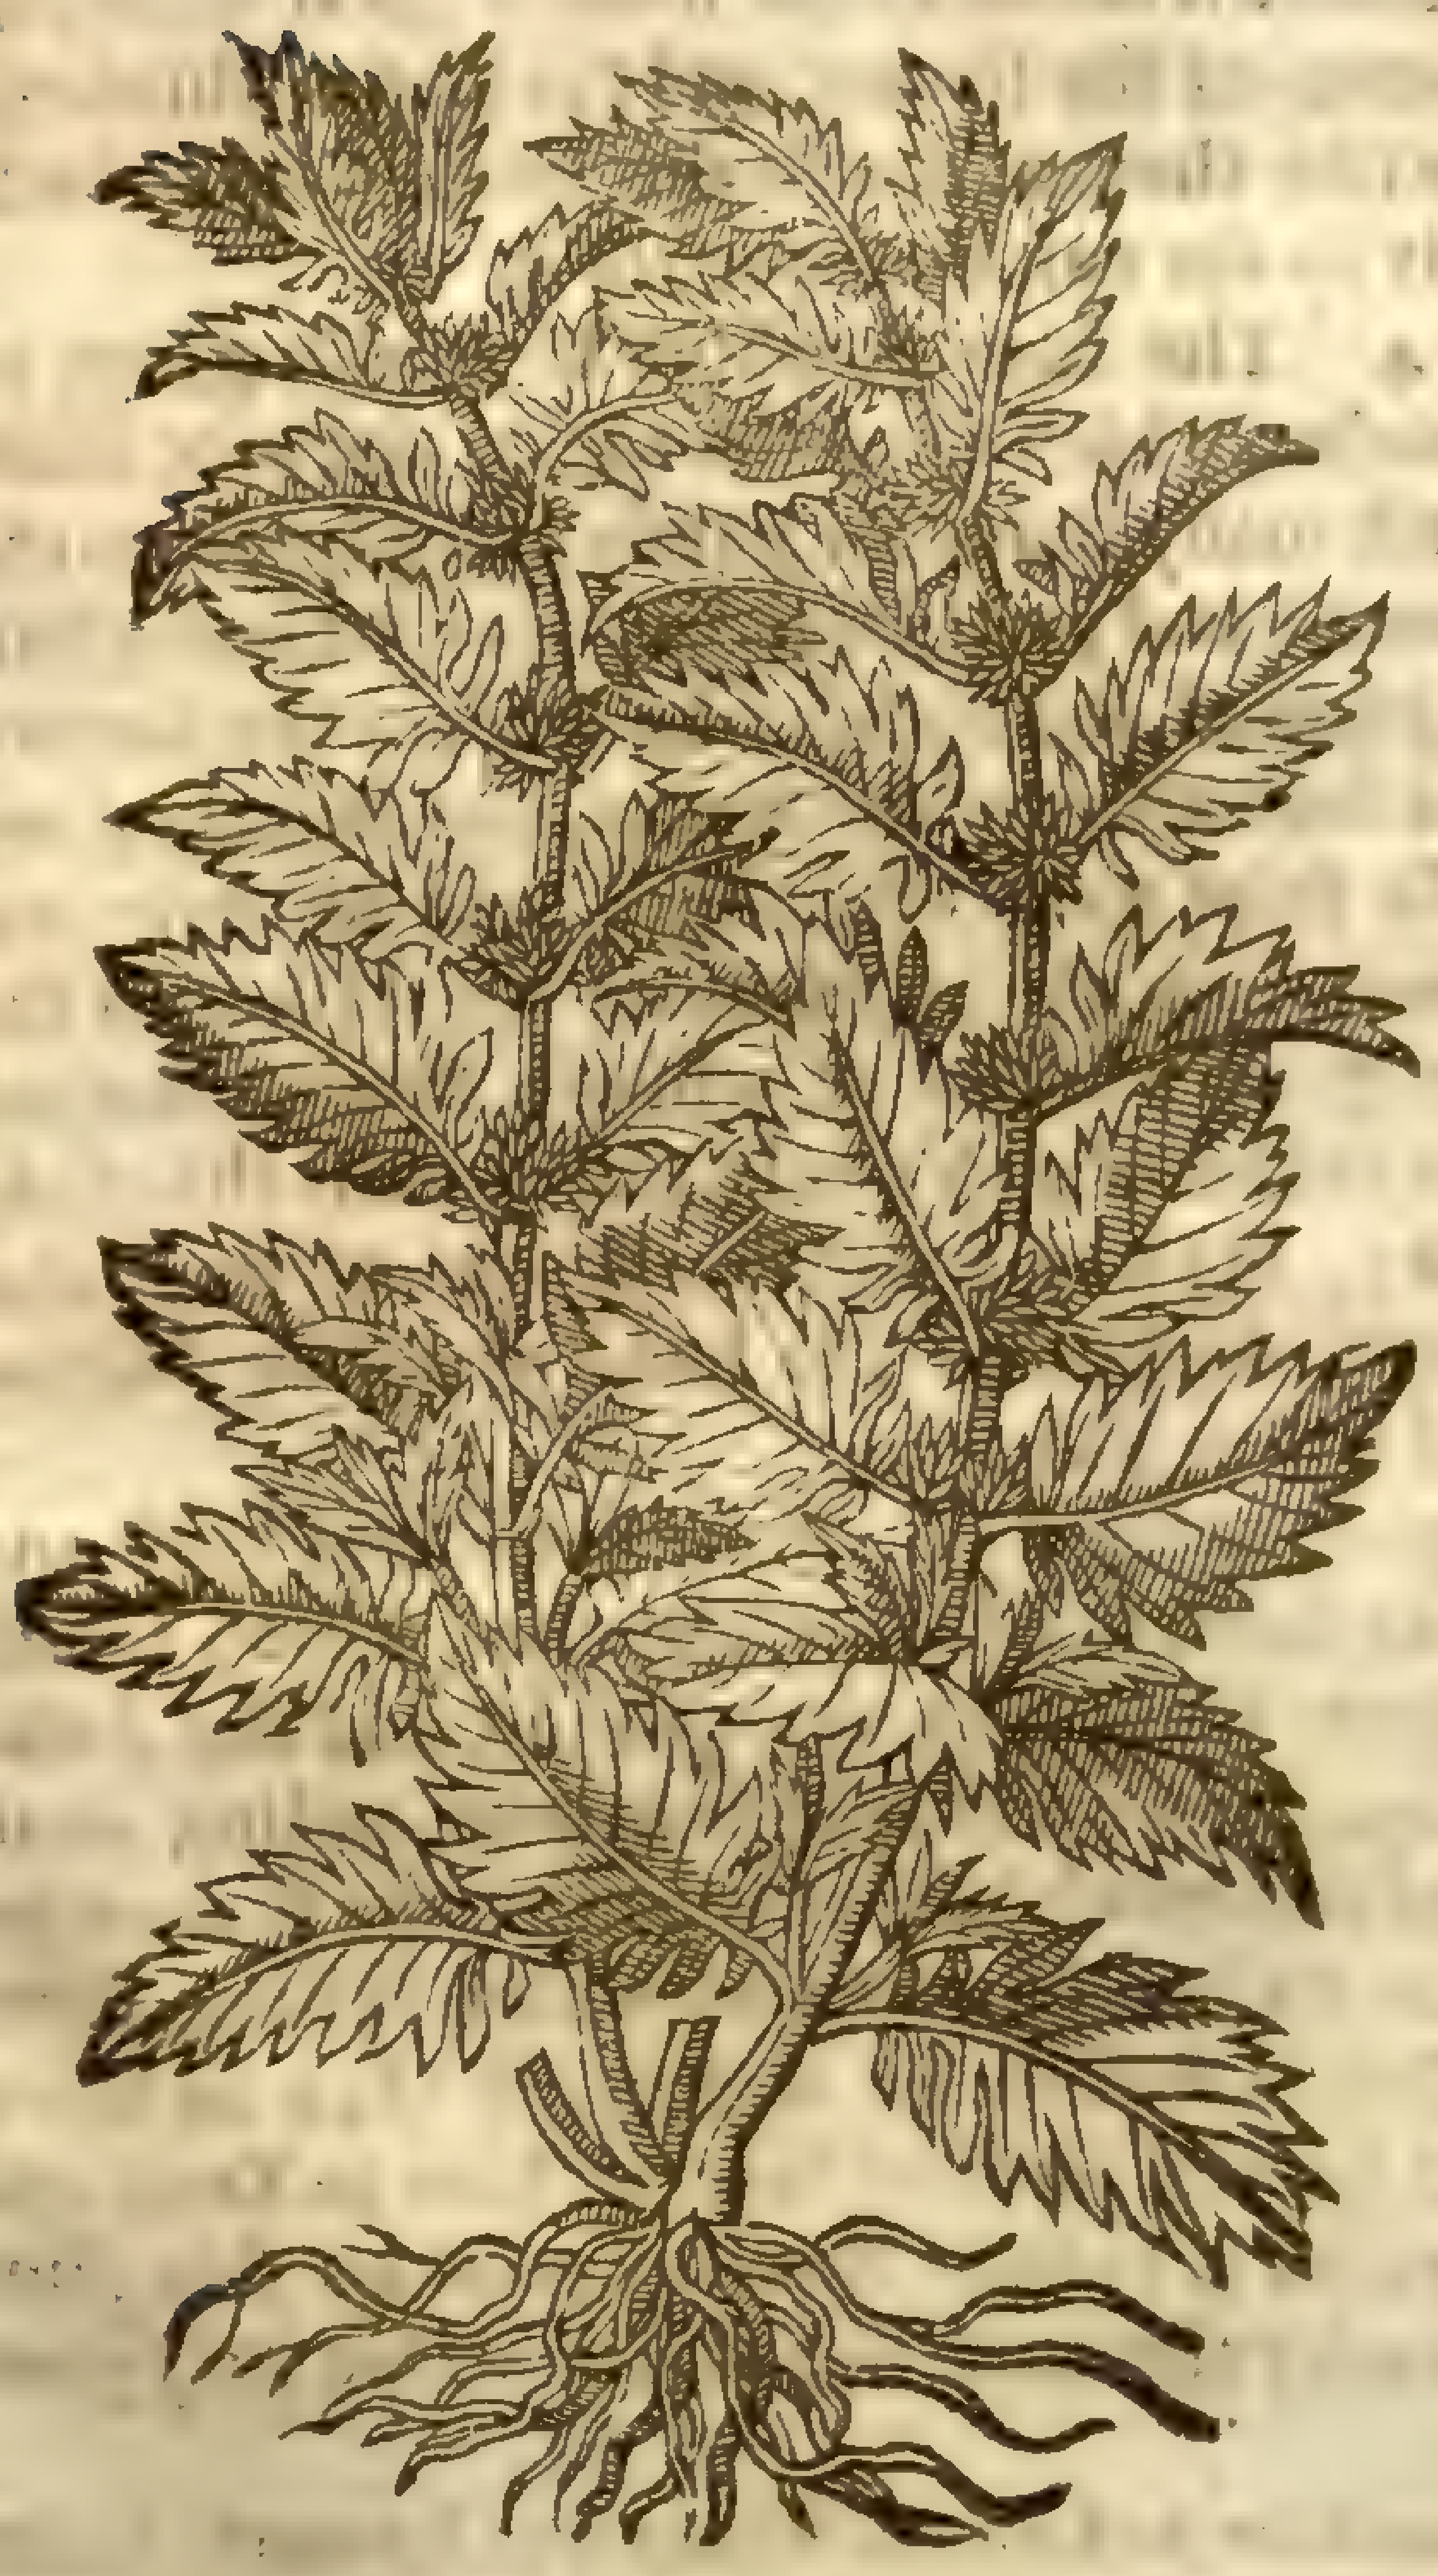
B They are alſo good for thoſe things that are mentioned in the laſt chapter, in B, and C.

C *Cluſius* ſaith, the firſt and ſecond are vſed in Stiria in fomentations, to bathe the head againſt the paines or aches thereof, as alſo againſt the ſtiffeneſſe and wearineſſe of the limbs or joynts.

D And the ſame Author affirmes that he hath knowne the decoction vſed with very good ſucceſſe in curing the inflammations and vlcerations of the legs. ‡

Chap. 233. *Of Water Horehound.*

‡ 1 *Marrubium aquaticum.*
Water Horehound.



Lycopus europaeus, L. mihi, dict. Sm. p. 1, 36

¶ *The Description.*

1 Water Horehound is very like to blacke and ſtinking Horehound in ſtalke and floured cups, which are rough, pricking, & compaſſing the ſtalks round about like garlands: the leaues thereof be alſo blacke, but longer, harder, more deeply gaſhed in the edges than thoſe of ſtinking Horehound, yet not hairy at all, but wrinkled: the floures be ſmall and whitiſh: the root is faſtened with many blacke ſtrings.

¶ *The Place.*

It growes in Brooks on the brinks of water ditches and neere vnto motes, for it requireth ſtore of water, and groweth not in dry places.

¶ *The Time.*

It flouriſhes and floures in the Summer moneths, in Iuly and Auguſt.

¶ *The Names.*

It is called *Aquatile*, and *Paluſtre Marrubium*: In Engliſh, water Horehound. *Matthiolus* taketh it to be *Species prima Sideritidis*; or a kinde of Ironwort, which *Dioſcorides* hath deſcribed in the firſt place; but with this doth better agree that which is called *Herba Iudaica*, or Glidwort; it much leſſe agreeth with *Sideritis ſecunda*, or the ſecond Ironwort, which opinion alſo hath his fauorers, for it is like in leafe to none of the Fernes. Some alſo thinke good to call it *Herba Ægyptia*, becauſe they that feine themſelues Ægyptians (ſuch as many times wander like vagabonds from citie to citie in Germanie and other places) do vſe with this herbe to giue themſelues a ſwart colour, ſuch as the Ægyptians and the people of Affricke are of; for the juyce of this herbe doth die euery thing with this kind of colour, which alſo holdeth ſo faſt, as that it cannot be wiped or waſhed away: inſomuch as linnen cloth being died herewith, doth alwaies keepe that colour.

¶ *The Temperature.*

It ſeemeth to be cold, and withall very aſtringent or binding.

¶ *The Vertues.*

There is little vſe of the water Horehound in Phyſicke.

† The figure that heretofore was in the firſt place was of the *Marrubium nigrum* deſcribed in the next chapter; and the figure and deſcription that were in the ſecond place by the name of *Marrubium aquaticum acutum*, were of the ſo much magnified *Panax Coloni* or Clownes Al-heale of our Author, and therefore here omitted to auoid *Tautologie*.

Chap. 234. *Of blacke or ſtinking Horehound.*

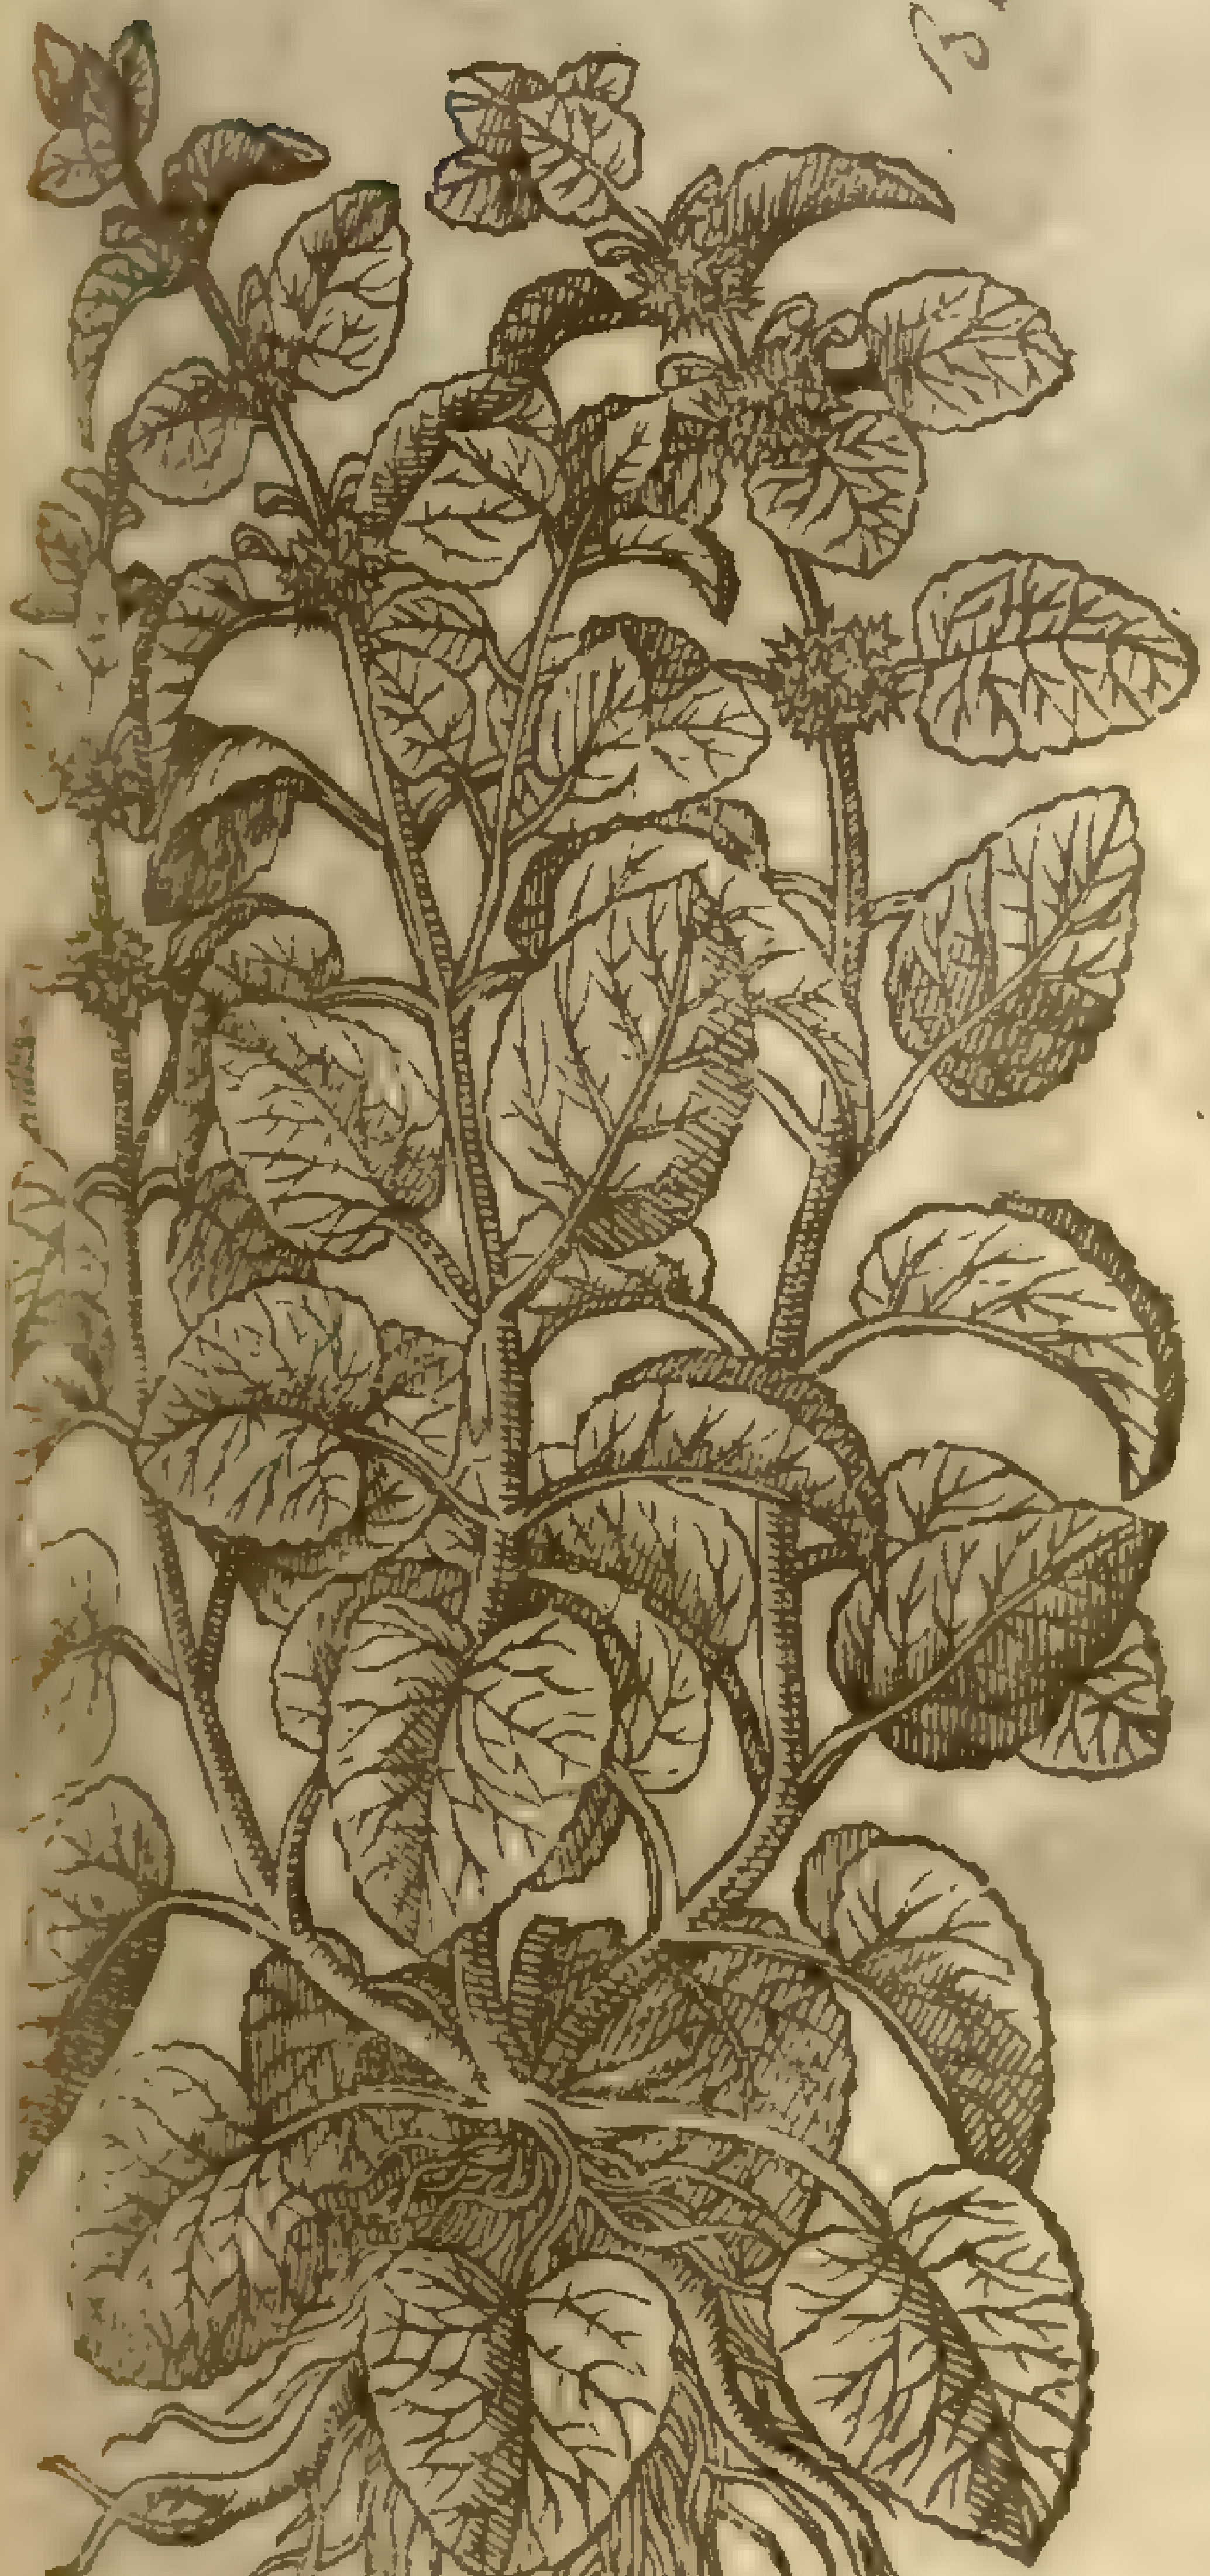
¶ *The Deſcription.*

1 BLacke Horehound is ſomewhat like the white kinde: the ſtalks be alſo ſquare and hairie; the leaues ſomewhat larger, of a darke ſwart or blackiſh colour, ſomewhat like the leaues of Nettles, ſnipt about the edges, of an vnpleaſant and ſtinking ſauor: the floures grow about the ſtalks in certaine ſpaces, of a purple colour, in ſhape like thoſe of Arch-Angell or dead Nettle: the root is ſmall and threddy. ‡ I haue found this alſo with white floures.

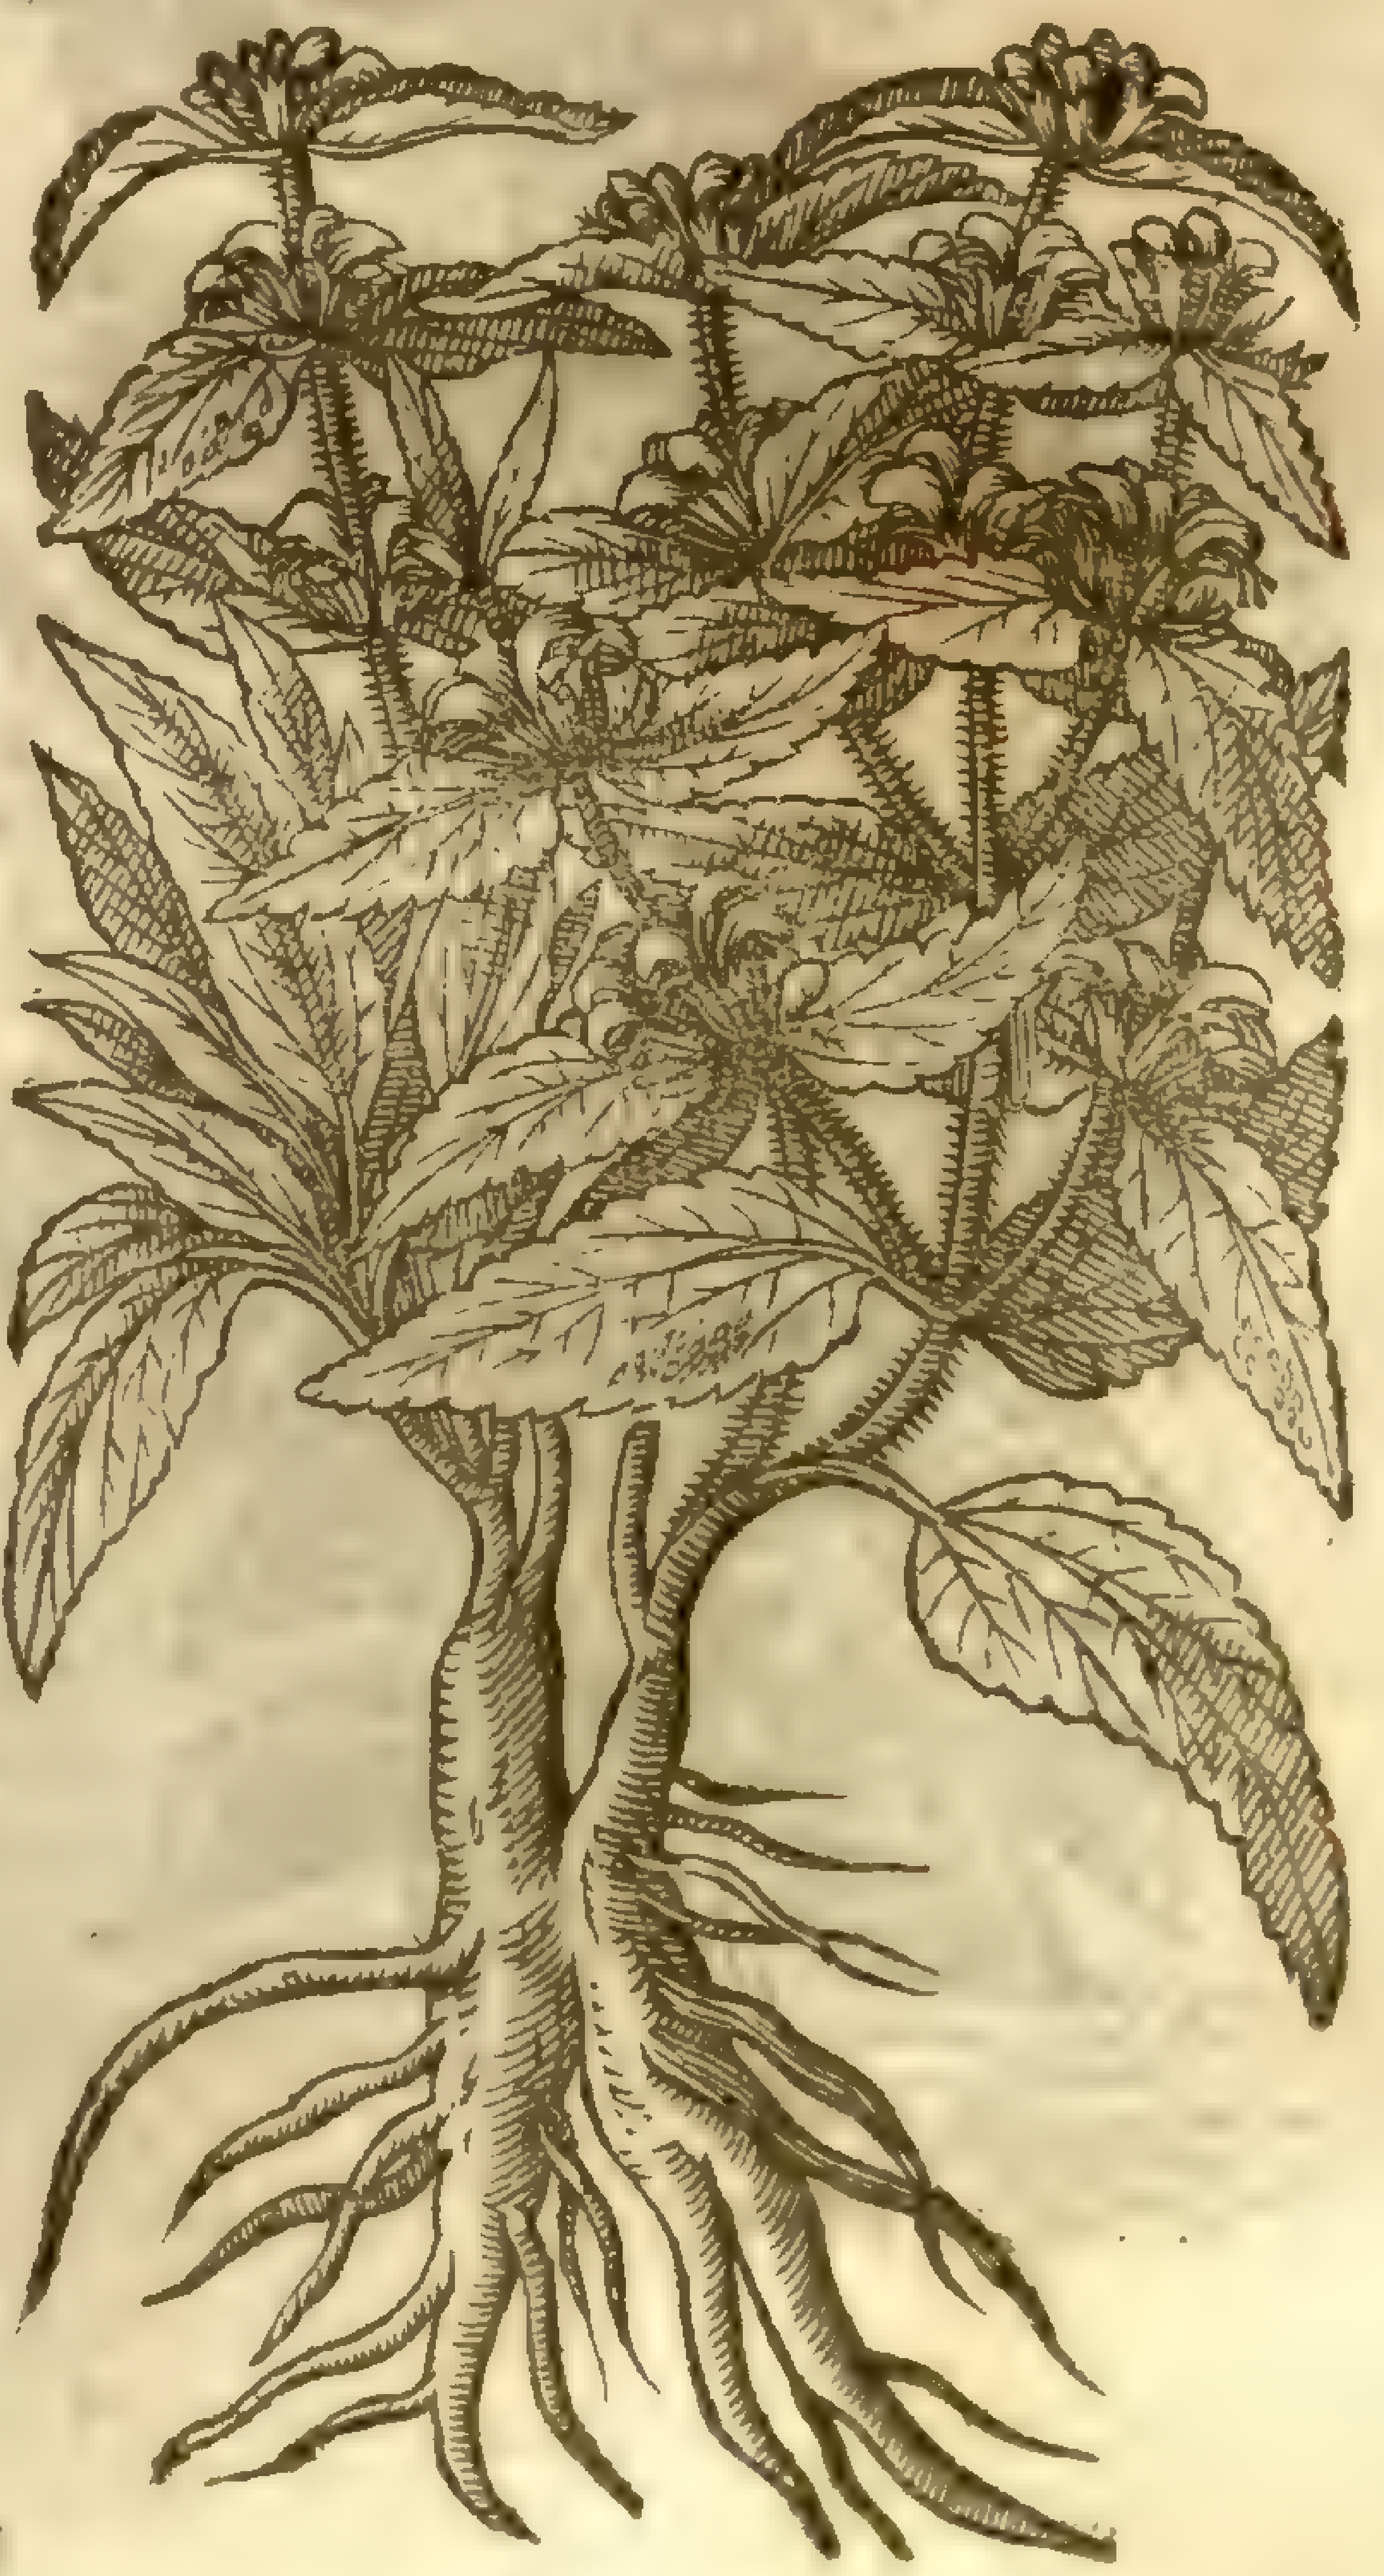
‡ 2 To this may fitly be referred that plant which ſome haue called *Parietaria, Sideritis,* and *Herba venti,* with the additament of *Monſpelienſium* to each of theſe denominations: *Bauhine,* who I herein follow, calls it *Marrubium nigrum longifolium.* It is thus deſcribed: the root is thicke and very fibrous, ſending vp many ſquare rough ſtalks ſome cubit high, ſet at certain ſpaces with leaues longer and broader than Sage, rough alſo, and ſnipt about the edges, and out of their boſoms come floures hooded and purple of colour, engirting the ſtalkes as in other plants of this kinde. Some haue thought this to be the *Othonna* of the Antients, becauſe the leaues not falling off in Winter, are either eaten by the wormes, or waſted by the iniury of the weather to the very nerues or veines that run by them; ſo that by this means they are all perforated and eaſily blowne thorow by each blaſt of winde: which cauſed ſome to giue it alſo the name of *Herba venti.* It growes in the Corne fields about Montpelier. ‡

† 1 *Marrubium nigrum.*
Stinking Horehound.

Ballota nigra [illegible]



‡ 2 *Marrubium nigrum longifolium.*
Long leaued Horehound.



¶ *The Place.*

It is found in gardens amongſt pot herbs, and oft times among ſtones and rubbiſh in dry ſoiles.

¶ *The Time.*

It floureth and flouriſheth when the others do.

¶ *The Names.*

It is called in Greeke Βαλλωτὴ, and μέλαν πράσιον, as *Pliny* teſtifieth, *lib.27.cap.8.* of ſome, *Marrubiaſtrum*, or *Marrubium ſpurium*, or baſtard Horehound: in ſhops, *Praſium fœtidum*, and *Ballote*: in Italian, *Marrubiaſtro*: in Spaniſh, *Marrauio negro*: in French, *Marubin noir & puant*: in Engliſh, ſtinking Horehound.

¶ *The Temperature.*

Stinking Horehound is hot and dry, as *Paulus Ægineta* teacheth, of a ſharp and clenſing faculty.

¶ *The Vertues.*

A Being ſtamped with ſalt and applied, it cureth the biting of a mad dog, againſt which it is of great efficacie, as *Dioſcorides* writeth.

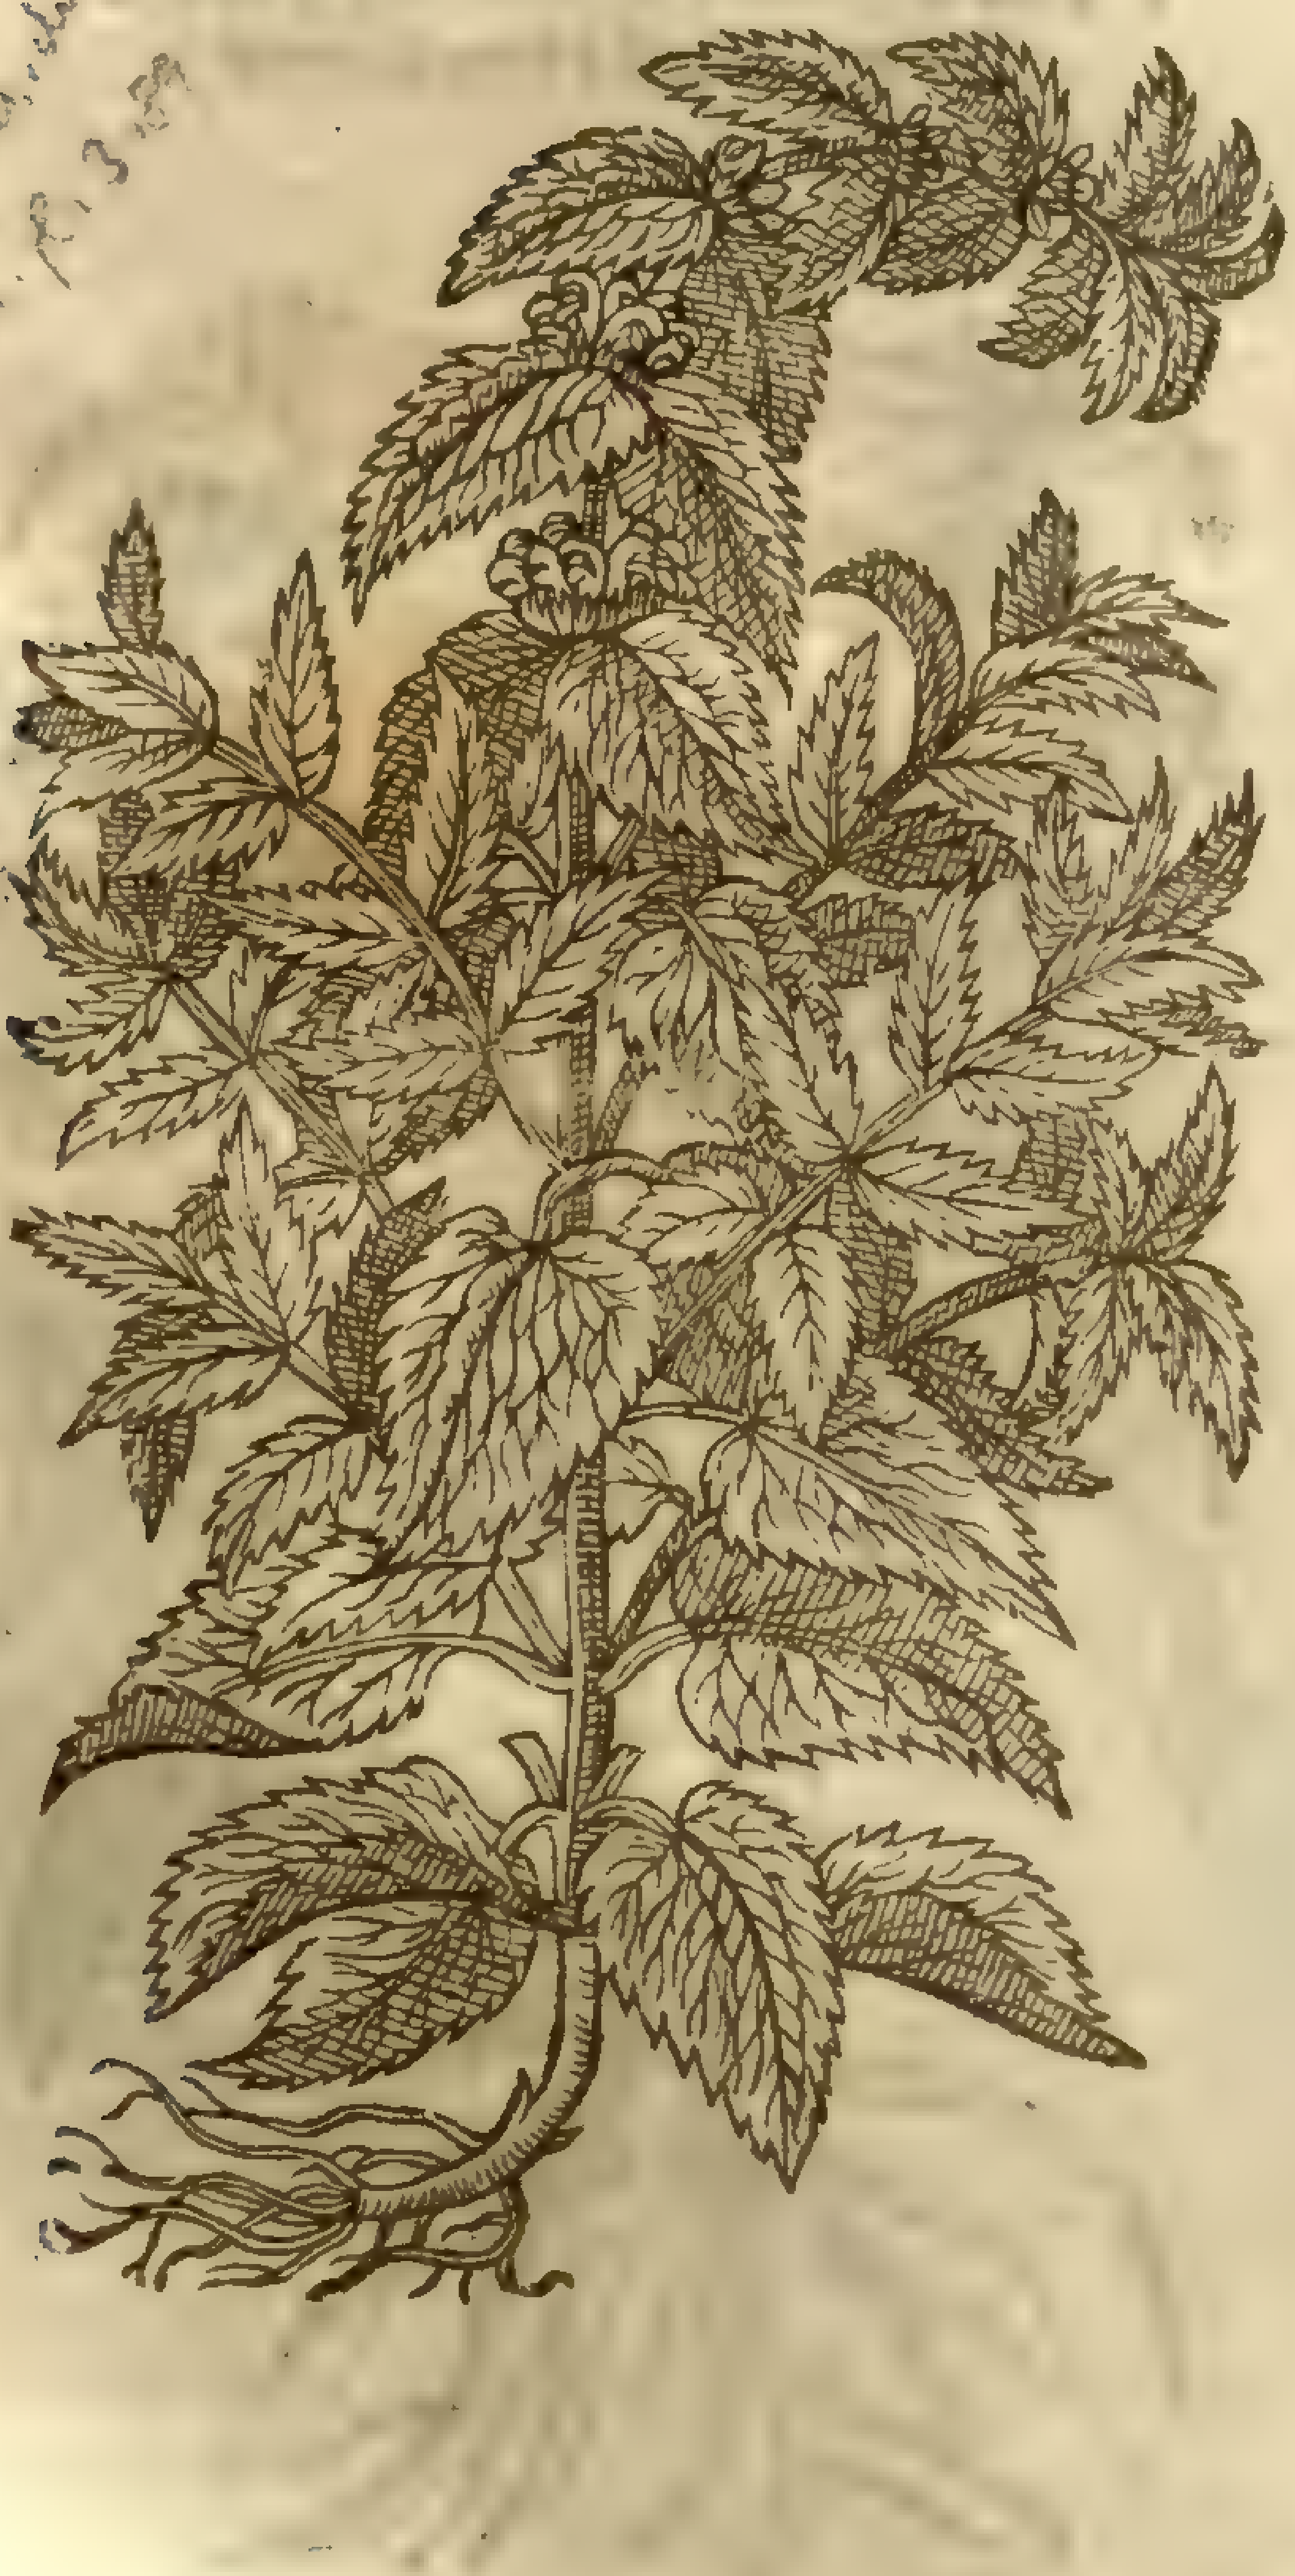
B The leaues roſted in hot embers do waſte or conſume away hard lumps or knots in or about the fundament.

C It alſo clenſeth foule and filthy vlcers, as the ſame Author teacheth.

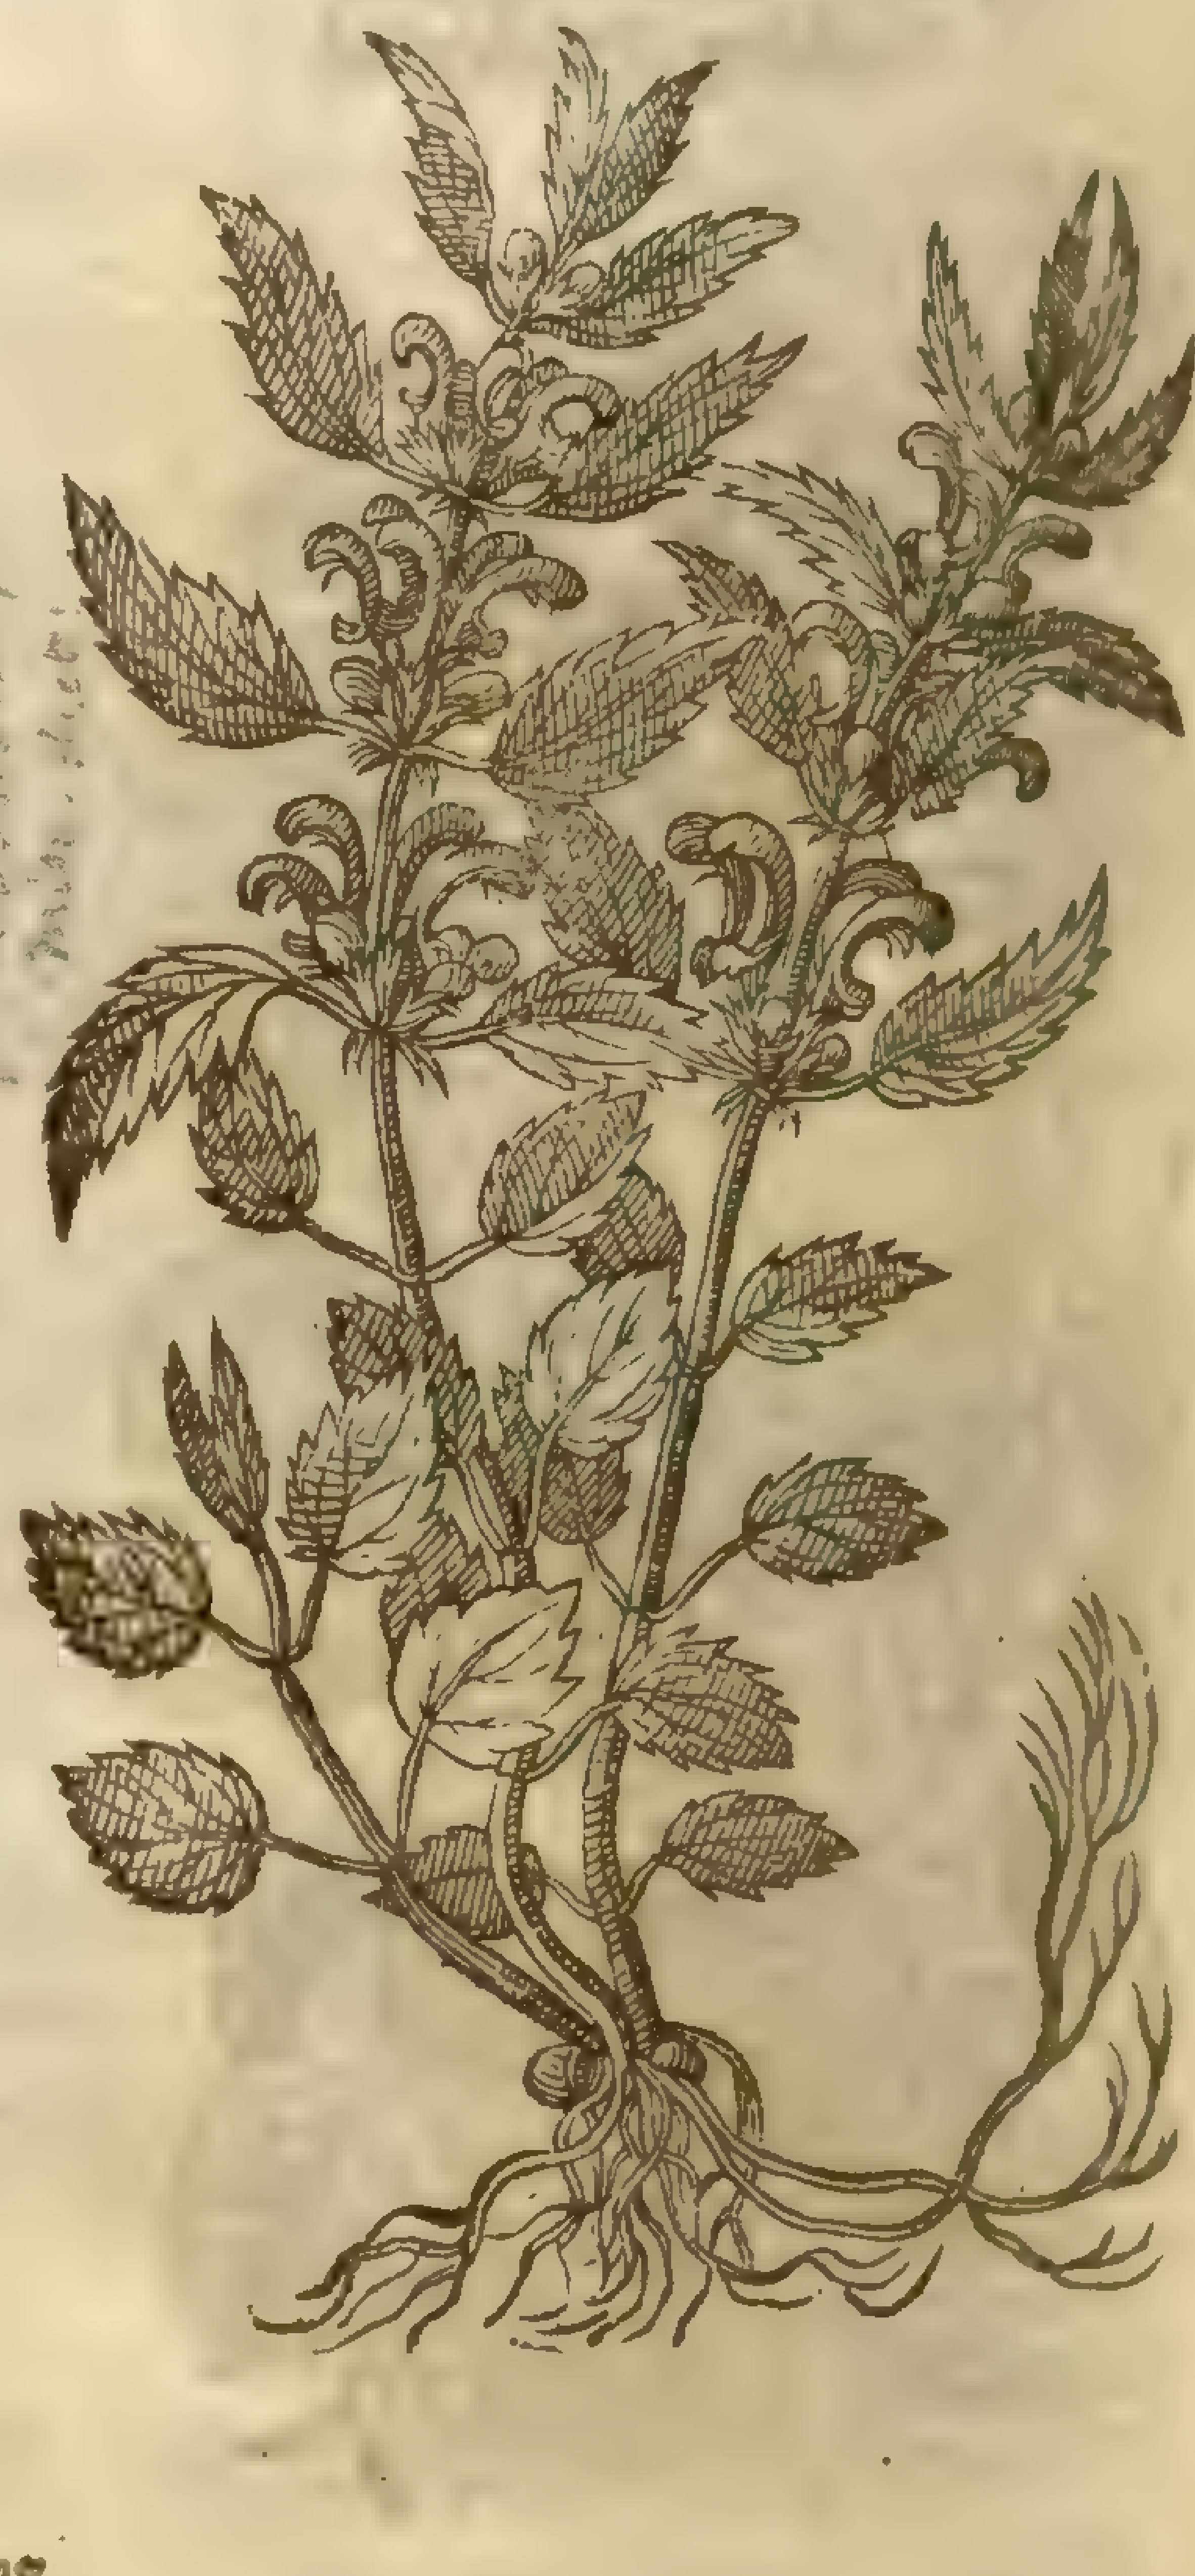
† The figure was of *Lamium album*, or Archangell with the white floure; and the figure that ſhould haue been here was in the former Chapter.

Chap. 235. *Of Archangell or dead Nettle.*

† 1 *Lamium album.*
White Archangell.



2 *Lamium luteum.*
Yellow Archangell.



¶ *The Deſcription.*

1 White Archangell hath foure ſquare ſtalkes a cubit high, leaning this way and that way, by reaſon of the great weight of his ponderous leaues, which are in ſhape like vnto thoſe of Nettles, nicked round about the edges, yet not ſtinging at all,

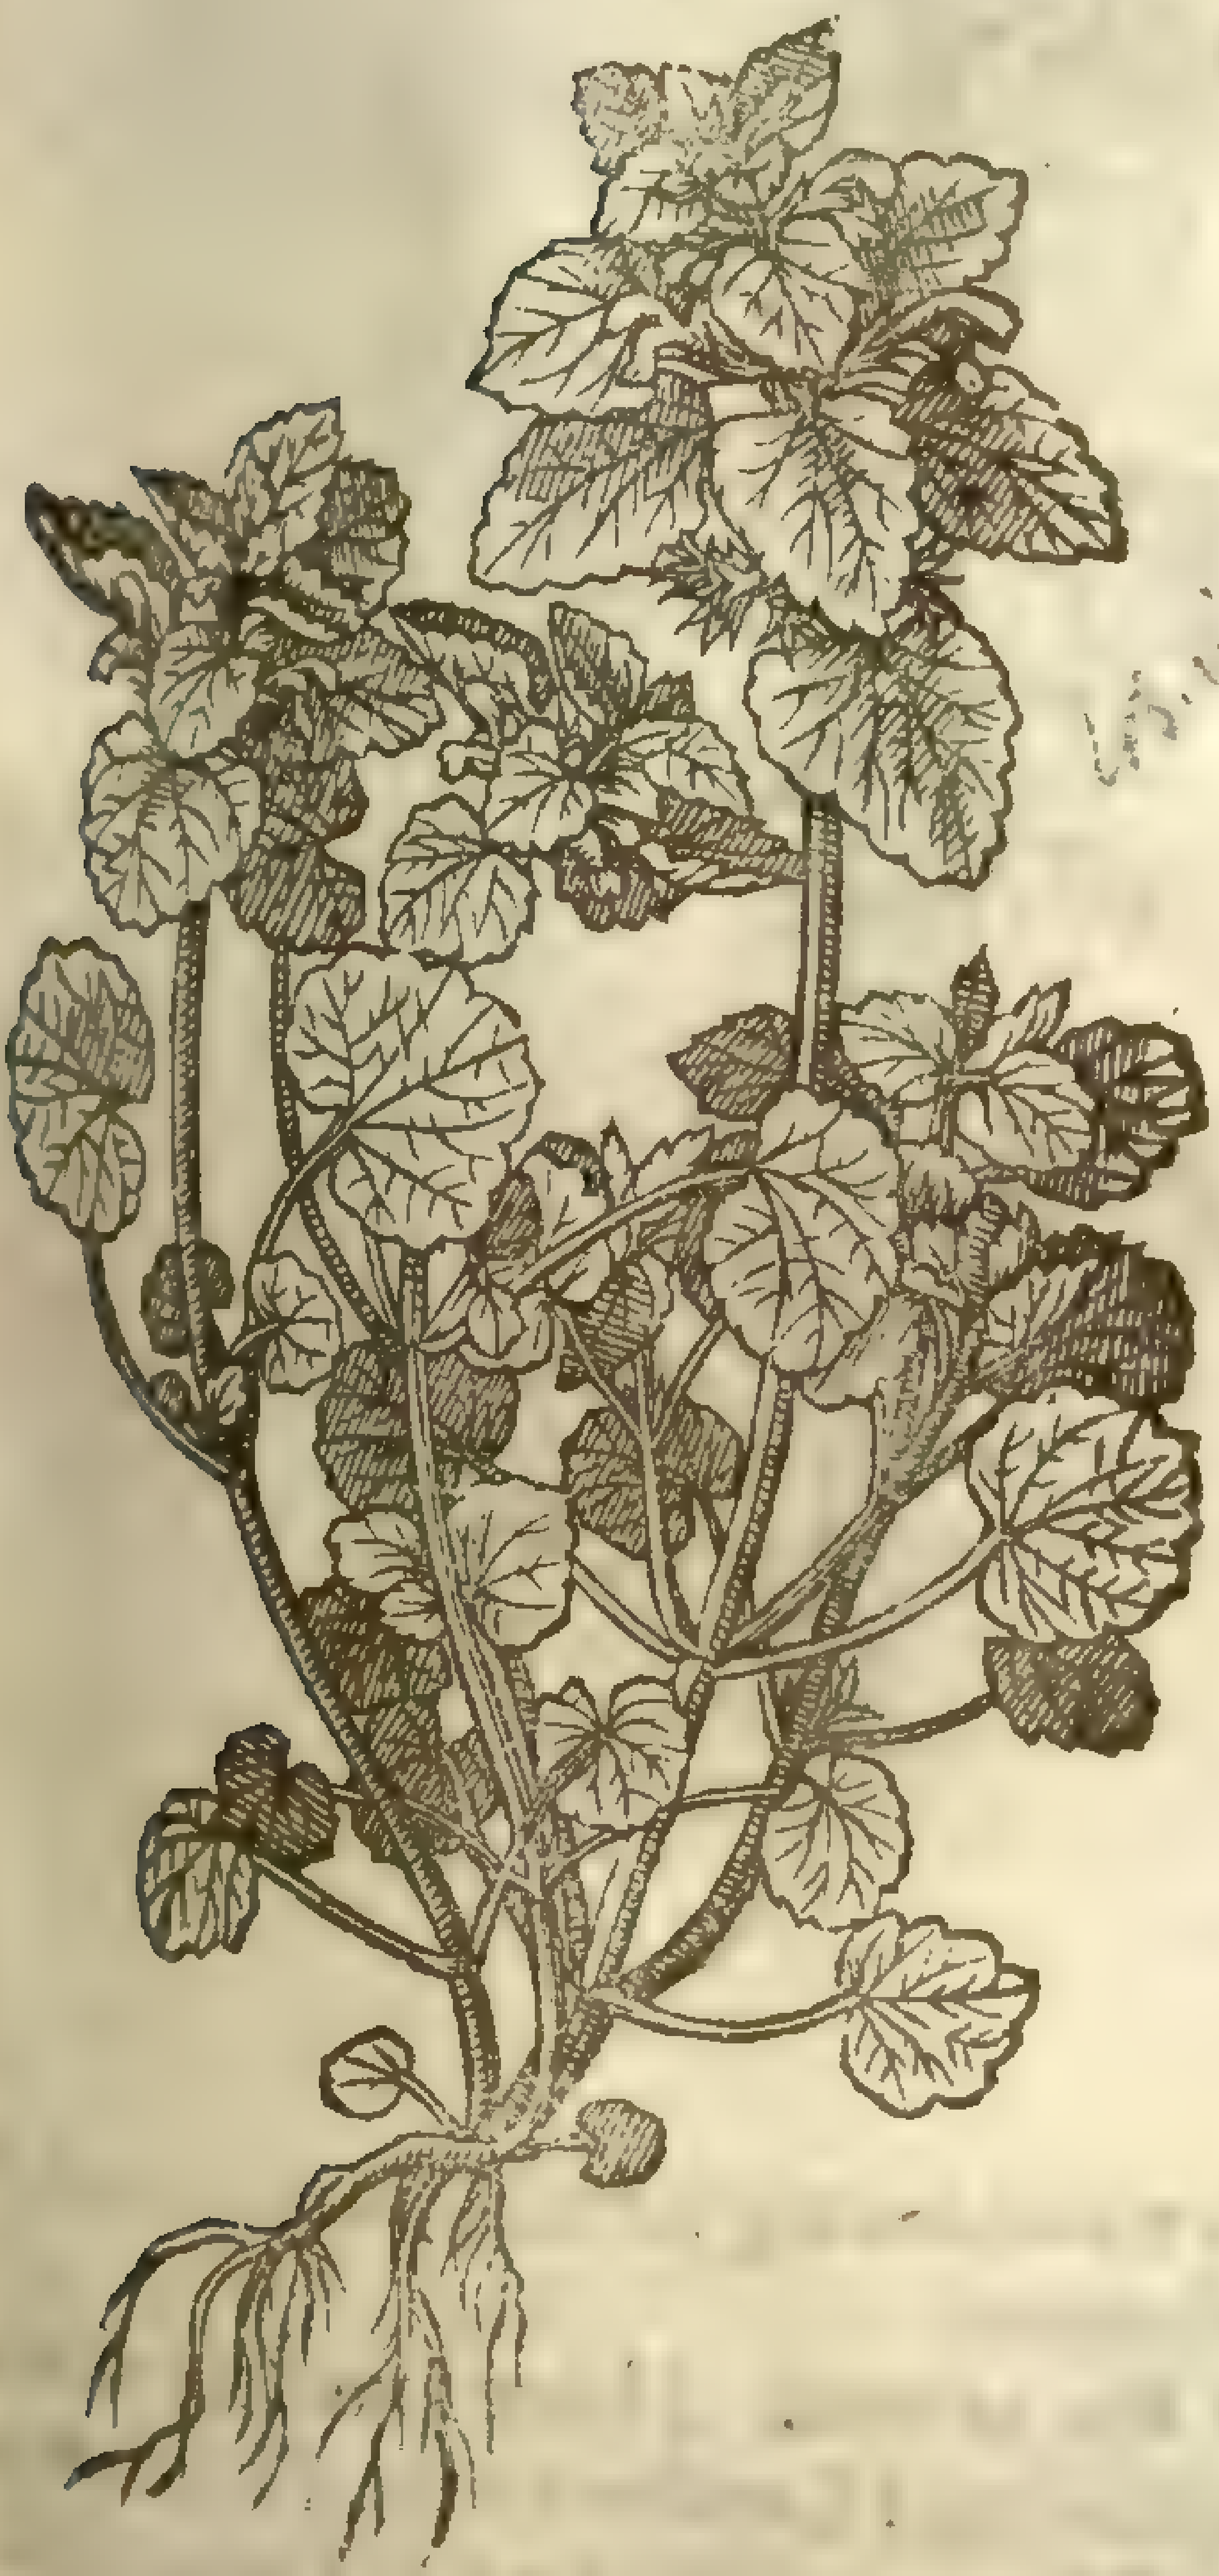
but ſoft and as it were downy: the floures compaſſe the ſtalkes round about at certaine diſtances, euen as thoſe of Horehound do, whereof doubtleſſe this is a kinde, and not of Nettles, as hath bin generally holden; which floures are white of colour, faſhioned like to little gaping hoods or helmets: the root is very threddy. ‡ There is alſo a varietie of this hauing red or purple floures. ‡

2 Yellow Archangell hath ſquare ſtalks riſing from a threddy root, ſet with leaues by couples very much cut or hackt about the edges, and ſharp pointed, the vppermoſt whereof are oftentimes of a faire purple colour: the flours grow among the ſaid leaues, of a gold yellow colour, faſhioned like thoſe of the white Archangell, but greater, and wider gaping open.

3 Red Archangell, being called *Vrtica non mordax*, or dead Nettle, hath many leaues ſpred vpon the ground; among which riſe vp ſtalkes hollow and ſquare, whereupon grow rough leaues of an ouerworne colour, among which come forth purple floures ſet about in round wharles or rundles. The root is ſmall, and periſheth at the firſt approch of winter.

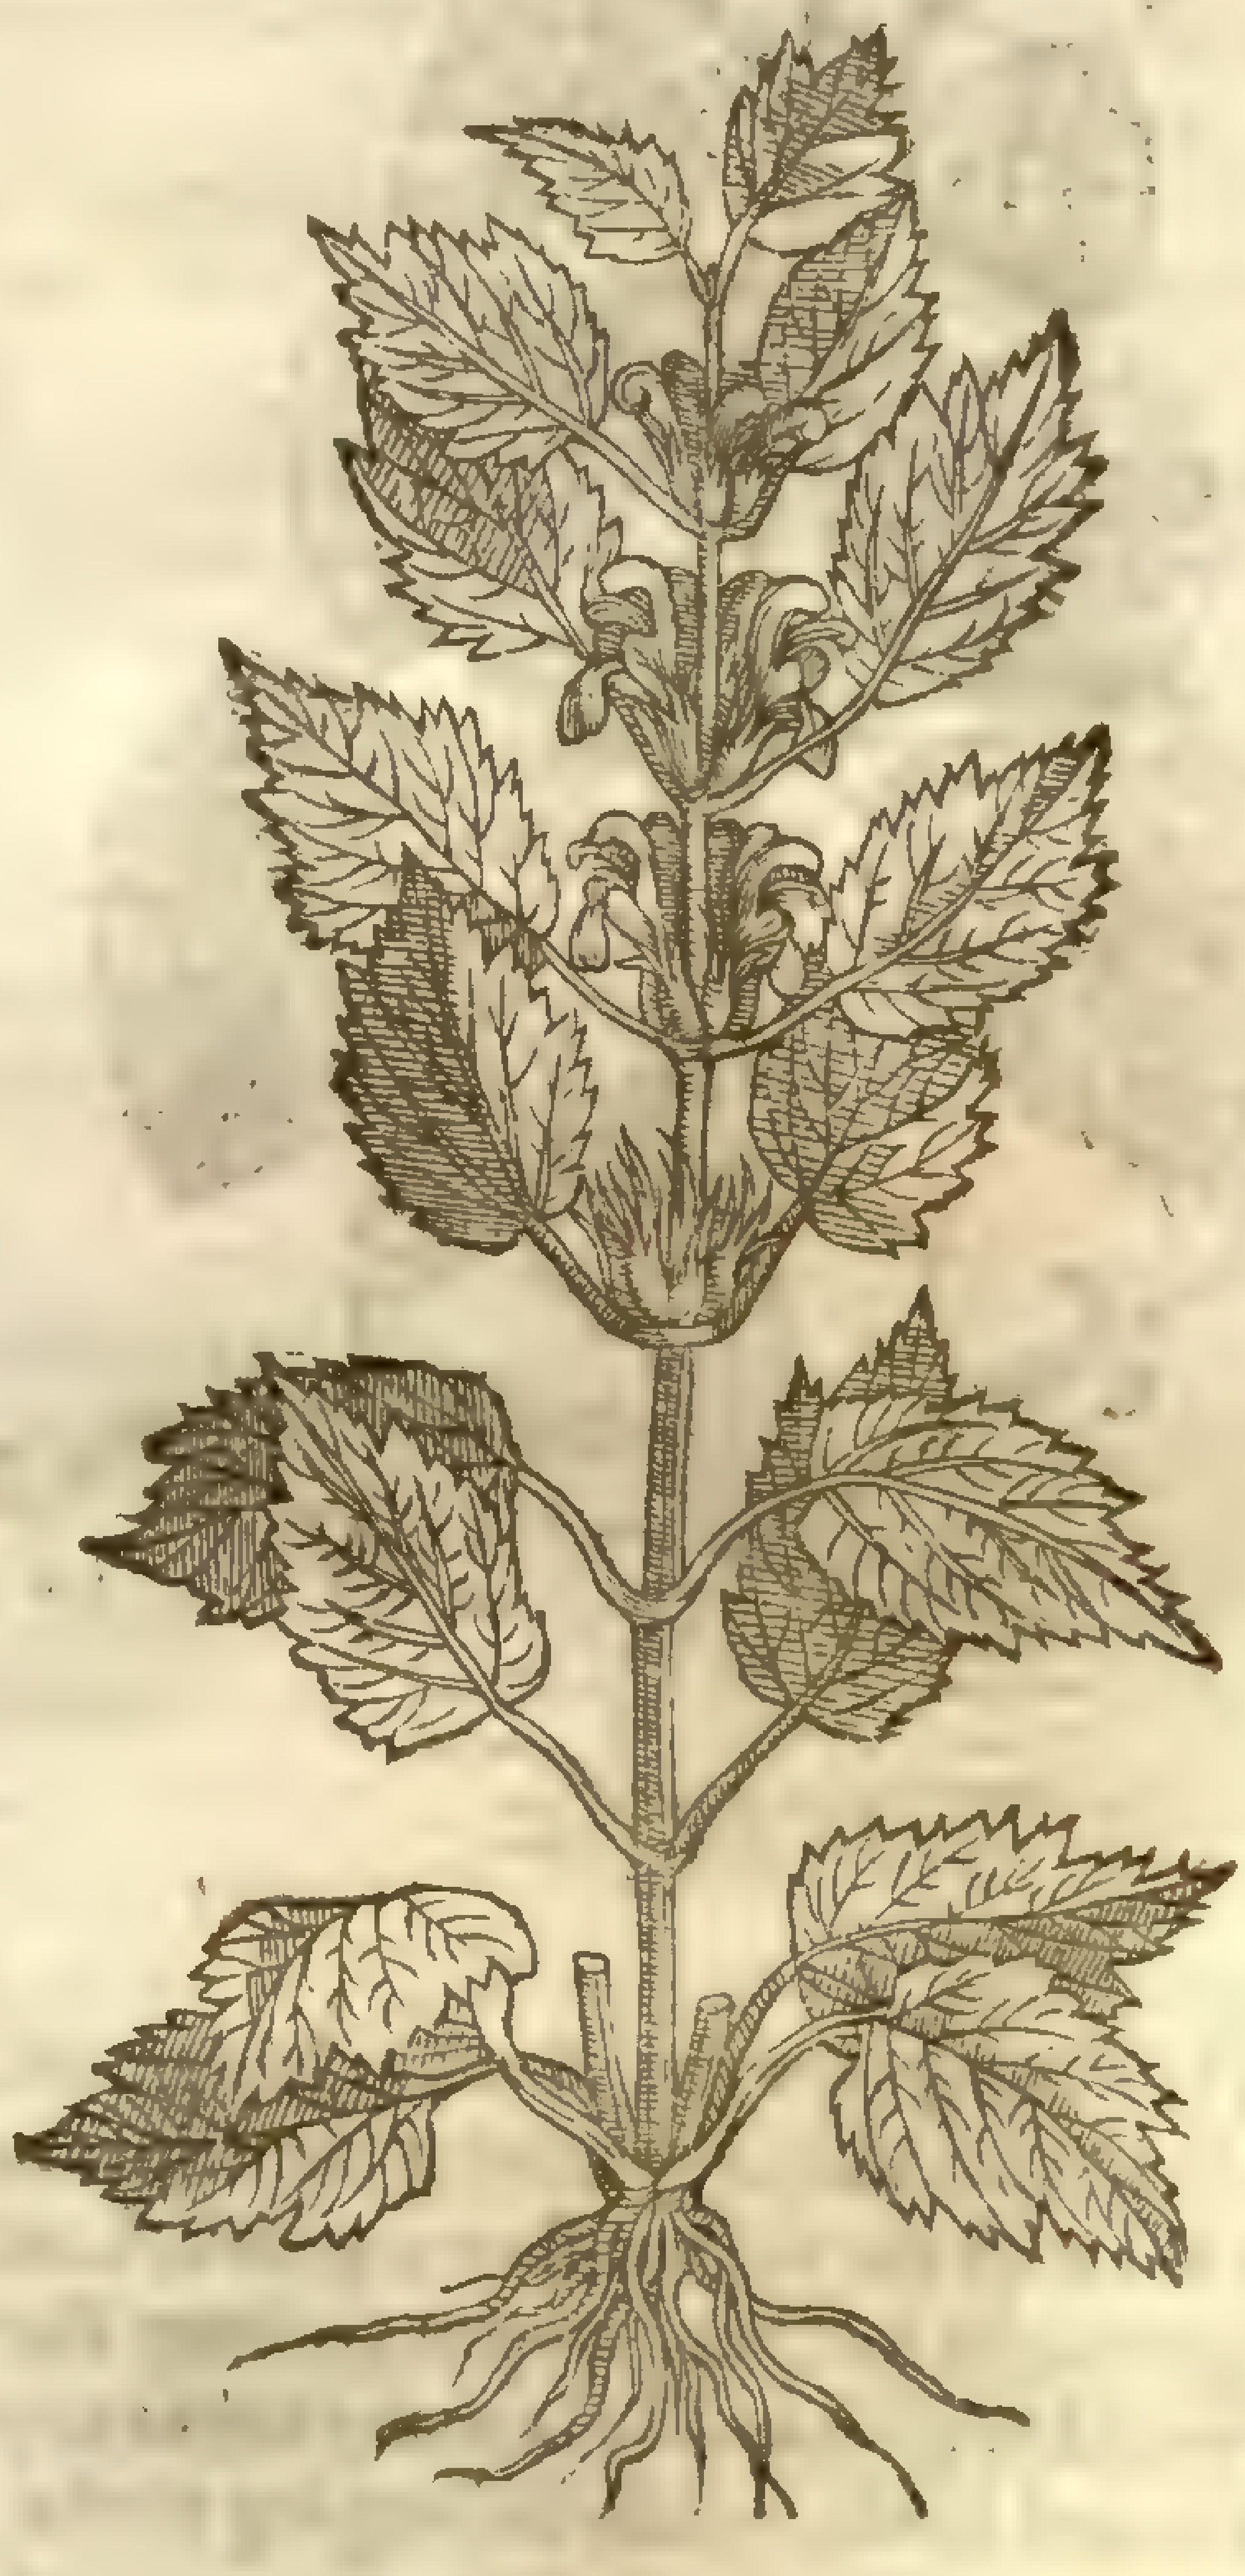
L. purpureum L. multi. dict

† 3 *Lamium rubrum.*
Red Archangell.



L. orvala L. multi. dict

‡ 4 *Lamium Pannonicum, ſiue Galeopſis.*
Hungary dead Nettle.



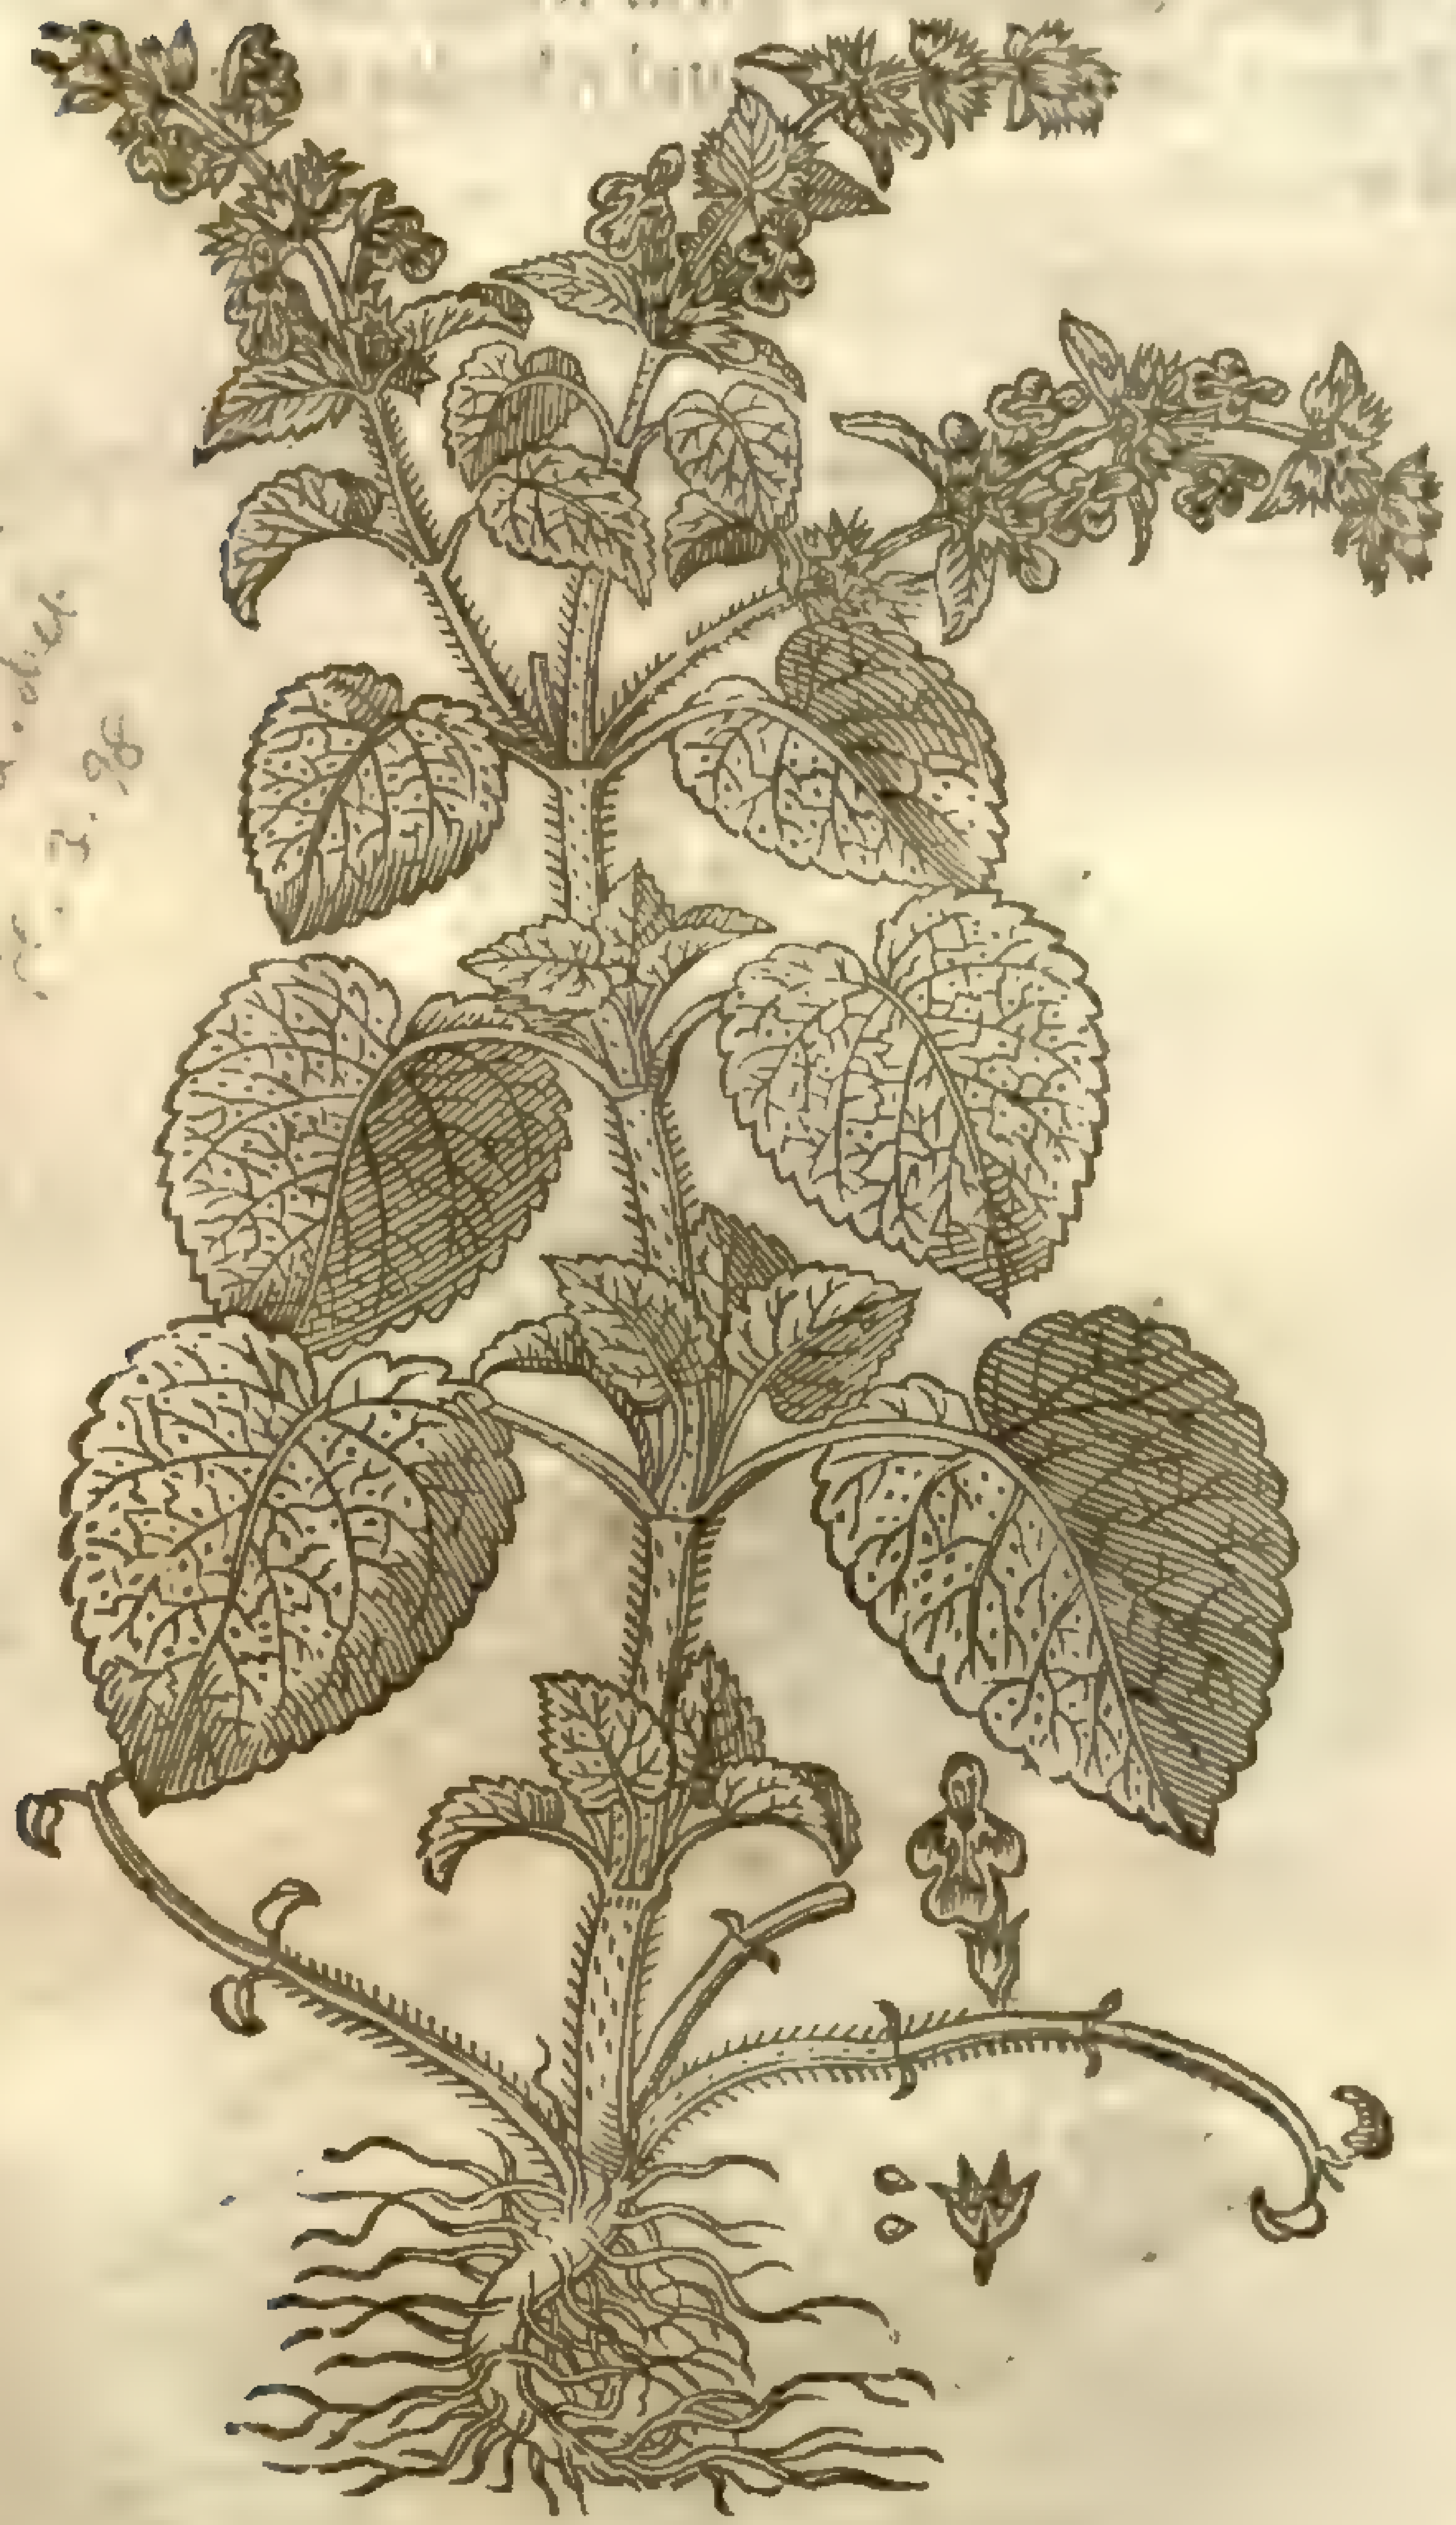
4 Dead Nettle of Hungarie hath many large rough leaues very much curled or crumpled like thoſe of the ſtinging Nettle, of a darke green colour, ſnipt about the edges like the teeth of a Saw, ſet vpon a foure ſquare ſtalke by couples; from the boſome of which leaues come forth the flours cloſe to the ſtalks, of a perfect purple colour, in ſhape like thoſe of the white Archangell, gaping like a dragons mouth, the lower chap wherof is of a bright purple ſpotted with white; which being paſt there followes ſeed incloſed in little round husks, with fine ſharp points ſticking out: the root is thicke, tough, conſiſting of many threds and long ſtrings.

‡ 5 To this of *Cluſius* we may fitly refer two others plant; the firſt of which *Tragus* & others call *Vrtica Heraclea* or *Herculea*, and *Cluſius* iudges it to be the true *Galeopſis* of *Dioſcorides*, as *Tragus* alſo thought before him. The root hereof is fibrous and creeping, ſending forth many foure ſquare ſtalks, vpon which at each ioint grow two leaues vpon long ſtalkes very like thoſe of Nettles, but more ſoft and hairy, not ſtinging: the tops of the branches end as it were in a ſpike made of ſeueral roundles of floures like thoſe of Archangell, but leſſe, and of a purple colour ſpotted with white on their inſides: the ſeeds are contained foure in a veſſell, and are black when they come to be ripe. It growes about hedges in very many places, and floures in Iune and Iuly.

6 This

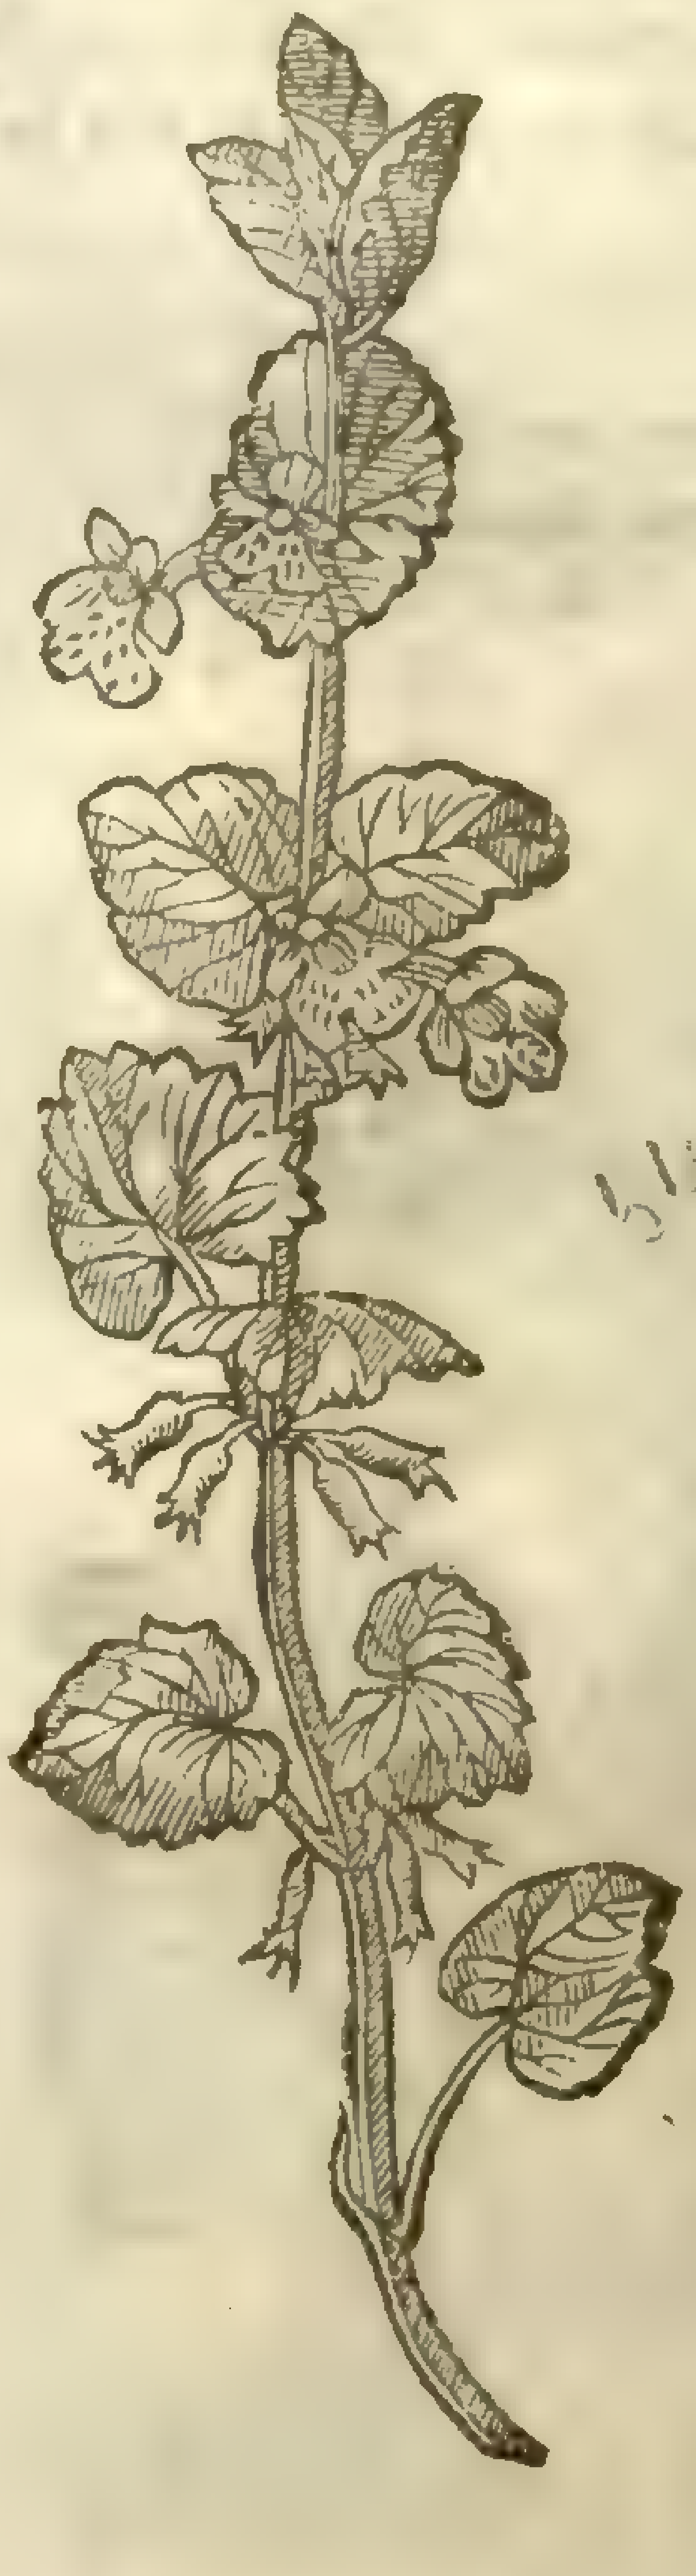
‡ 6 This hath roots like thoſe of the laſt deſcribed, ſending vp alſo ſquare ſtalks a foot high, ſet at each joint with leaues growing vpon long ſtalkes like thoſe of the ſmall dead Nettle, or rather like thoſe of Ale-hoofe: out of the boſoms of thoſe come three or foure ſtalks carying floures like thoſe of Alehoofe, gaping, without a hood, but with a lip turned vp, which is variegated with blew, white, and purple. This hiſtory *Cluſius* (who did not ſee the plant, but an exact figure thereof in colours) giues vs, and he names it as you finde expreſt in the title. ‡

‡ 5 *Galeopſis vera.*
Hedge Nettle.



Stachys sylvatica L. [illegible] mill. dict. Sm. [illegible] 3. 98

6 *Lamium Pannonicum* 3. *Cluſij.*
Hungary Nettle with the variegated floure.



Glechoma hederacea L. β Mill. dict.

¶ *The Place.*

Theſe plants are found vnder hedges, old walls, common waies, among rubbiſh, in the borders of fields, and in earable grounds, oftentimes in gardens ill husbanded.

That with the yellow floure groweth not ſo common as the others. I haue found it vnder the hedge on the left hand as you go from the village of Hampſted neer London to the Church, & in the wood therby, as alſo in many other copſes about Lee in Eſſex, neer Watford & Buſhy in Middleſex, and in the woods belonging to the Lord Cobham in Kent.

¶ *The Time.*

They floure for the moſt part all Summer long, but chiefely in the beginning of May.

¶ *The Names.*

Archangell is called of ſome *Vrtica iners*, and *Mortua*: of ſome, *Lamium*: in Engliſh, Archangell, blinde Nettle, and dead Nettle.

¶ *The Temperature.*

They are hotter and drier than Nettle, approching to the temperature of Horehound.

¶ *The Vertues.*

A Archangel [or rather the hedge Nettle] ſtamped with vineger, and applied in manner of a pultis, taketh away wens and hard ſwellings, the Kings euill, inflammation of the kernels vnder the eares and jawes, and alſo hot fiery inflammations of the kernels of the neck, arm-holes, and flanks.

B It is good to bathe thoſe parts with the decoction of it, as *Dioſcorides* and *Pliny* ſay.

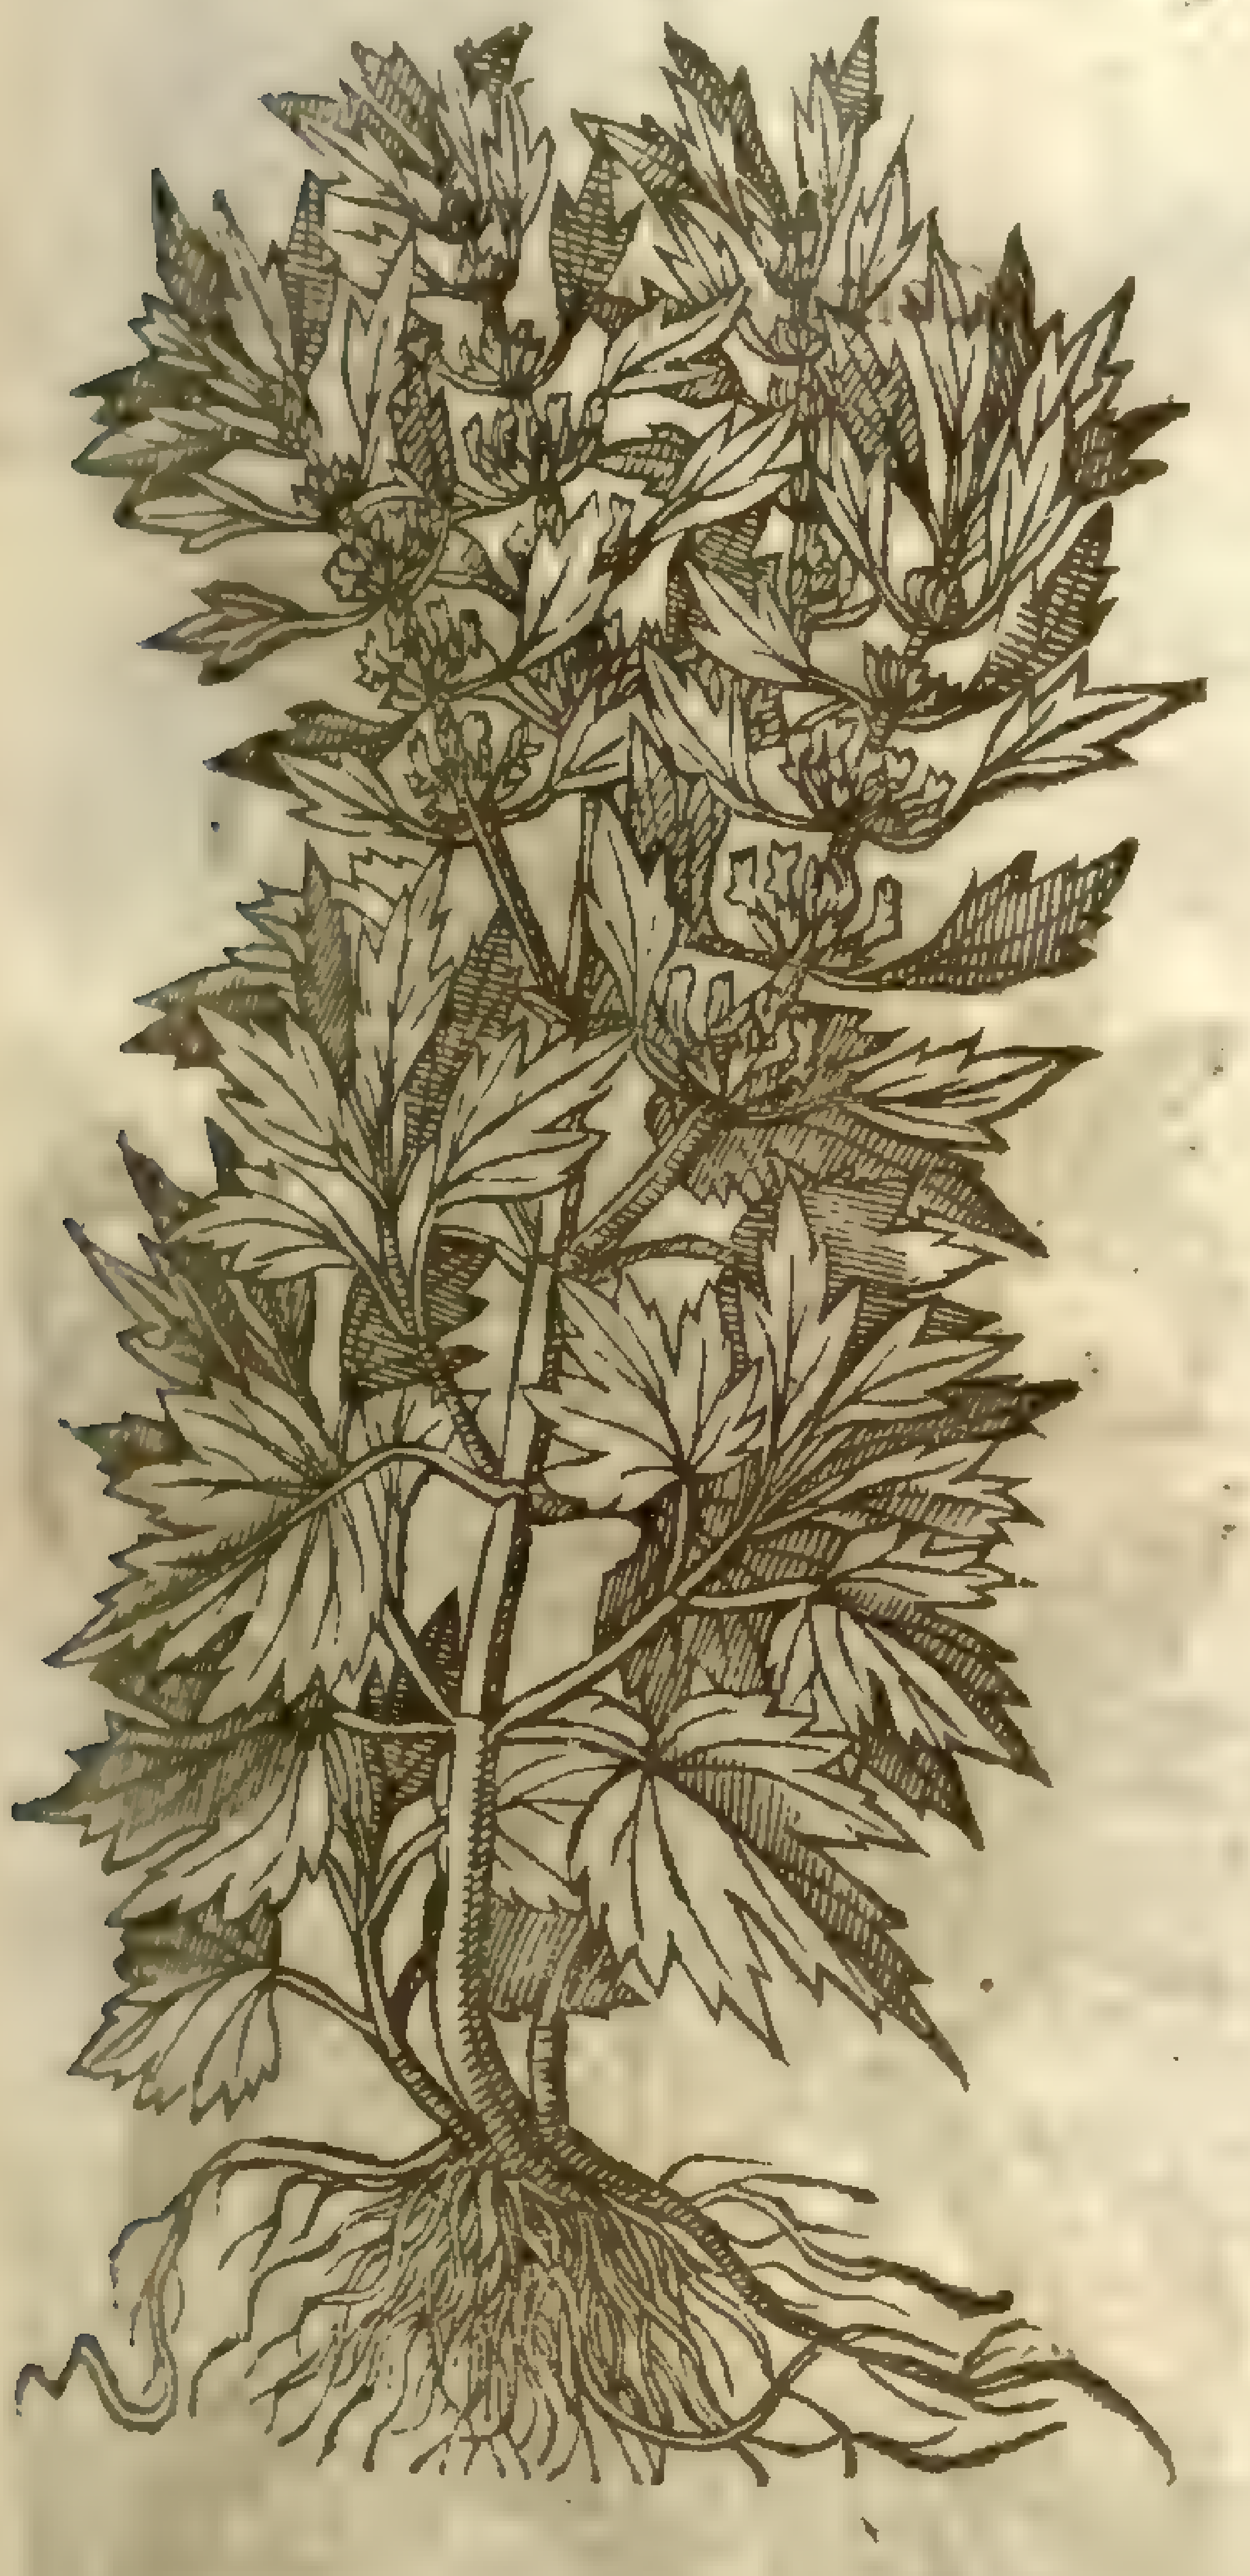
C The later Phyſitions think, that the white floures of Archangel ſtay the whites, and for the ſame purpoſe diuers do make of them a Conſerue, as they call it, of the floures and ſugar, which they appoint to be taken for certaine daies together.

The floures are baked with ſugar as Roſes are, which is called Sugar roſet: as alſo the diſtilled water of them, which is vſed to make the heart merry, to make a good colour in the face, and to refreſh the vitall ſpirits. D

‡ The firſt figure that was formerly in this Chapter was of the *Galeopſis* 1. of *Tabern.* being a kinde of dead Nettle, that hath the leaues ſpotted with white, and ſomewhat ſmaller than the ordinarie one: the figure that ſhould haue been here was in the laſt Chapter; the third was the ſame with the firſt (that ſhould haue been differing only in colour of floures, and that which ſhould haue been in the third place was in the fourth.

Chap. 236. Of Motherwort.

Cardiaca.
Mother-wort.



¶ The Deſcription.

Motherwort brings forth ſtalkes foure ſquare thick, hard, two cubits high, of an obſcure or ouerworne red colour: the leaues are ſomewhat blacke like thoſe of Nettles, but greater and broader than the leaues of Horehound, deepely indented or cut in the edges. The husks are hard and pricking which do compaſſe the ſtalkes about like wharles or little coronets; out of which doe grow purpliſh flours not vnlike thoſe of dead Nettle, but leſſer: the root is compact of many ſmall ſtrings; the whole plant is of a very ranke ſmell and bitter taſte.

¶ The Place.

It ioyeth among rubbiſh in ſtony and other barren and rough places, eſpecially about Oxford: it profiteth well in gardens.

¶ The Time.

It flouriſheth, floureth, and ſeedeth from Iune to September: the leaues and ſtalks periſh in winter, but the root endureth.

¶ The Names.

It is called in our age *Cardiaca*: in high-Dutch, **Hertzgeſpoꝛt**; in low-Dutch, **Hertegeſpan**: in French *Agripaulme*: in Engliſh, Motherwort. Some there be that make it a kinde of Bawme: it ſeemes that it may alſo be referred to *Sideritis Herculana*, or Hercules Ironwort.

¶ The Temperature.

Motherwort is hot and dry in the ſecond degree, by reaſon of the clenſing and binding qualitie that it hath.

¶ The Vertues.

Diuers commend it againſt the infirmities of the heart: it is iudged to be ſo forcible, that it is thought it tooke his name *Cardiaca* of the effect. A

It is alſo reported to cure convulſions, cramps, and palſies, to open the obſtructions or ſtoppings of the intrals, and to kill all kindes of wormes in the belly. B

The pouder of the herbe giuen in wine, prouoketh not only vrine and the monethly courſes, but alſo is good for them that are in hard trauell with childe. C

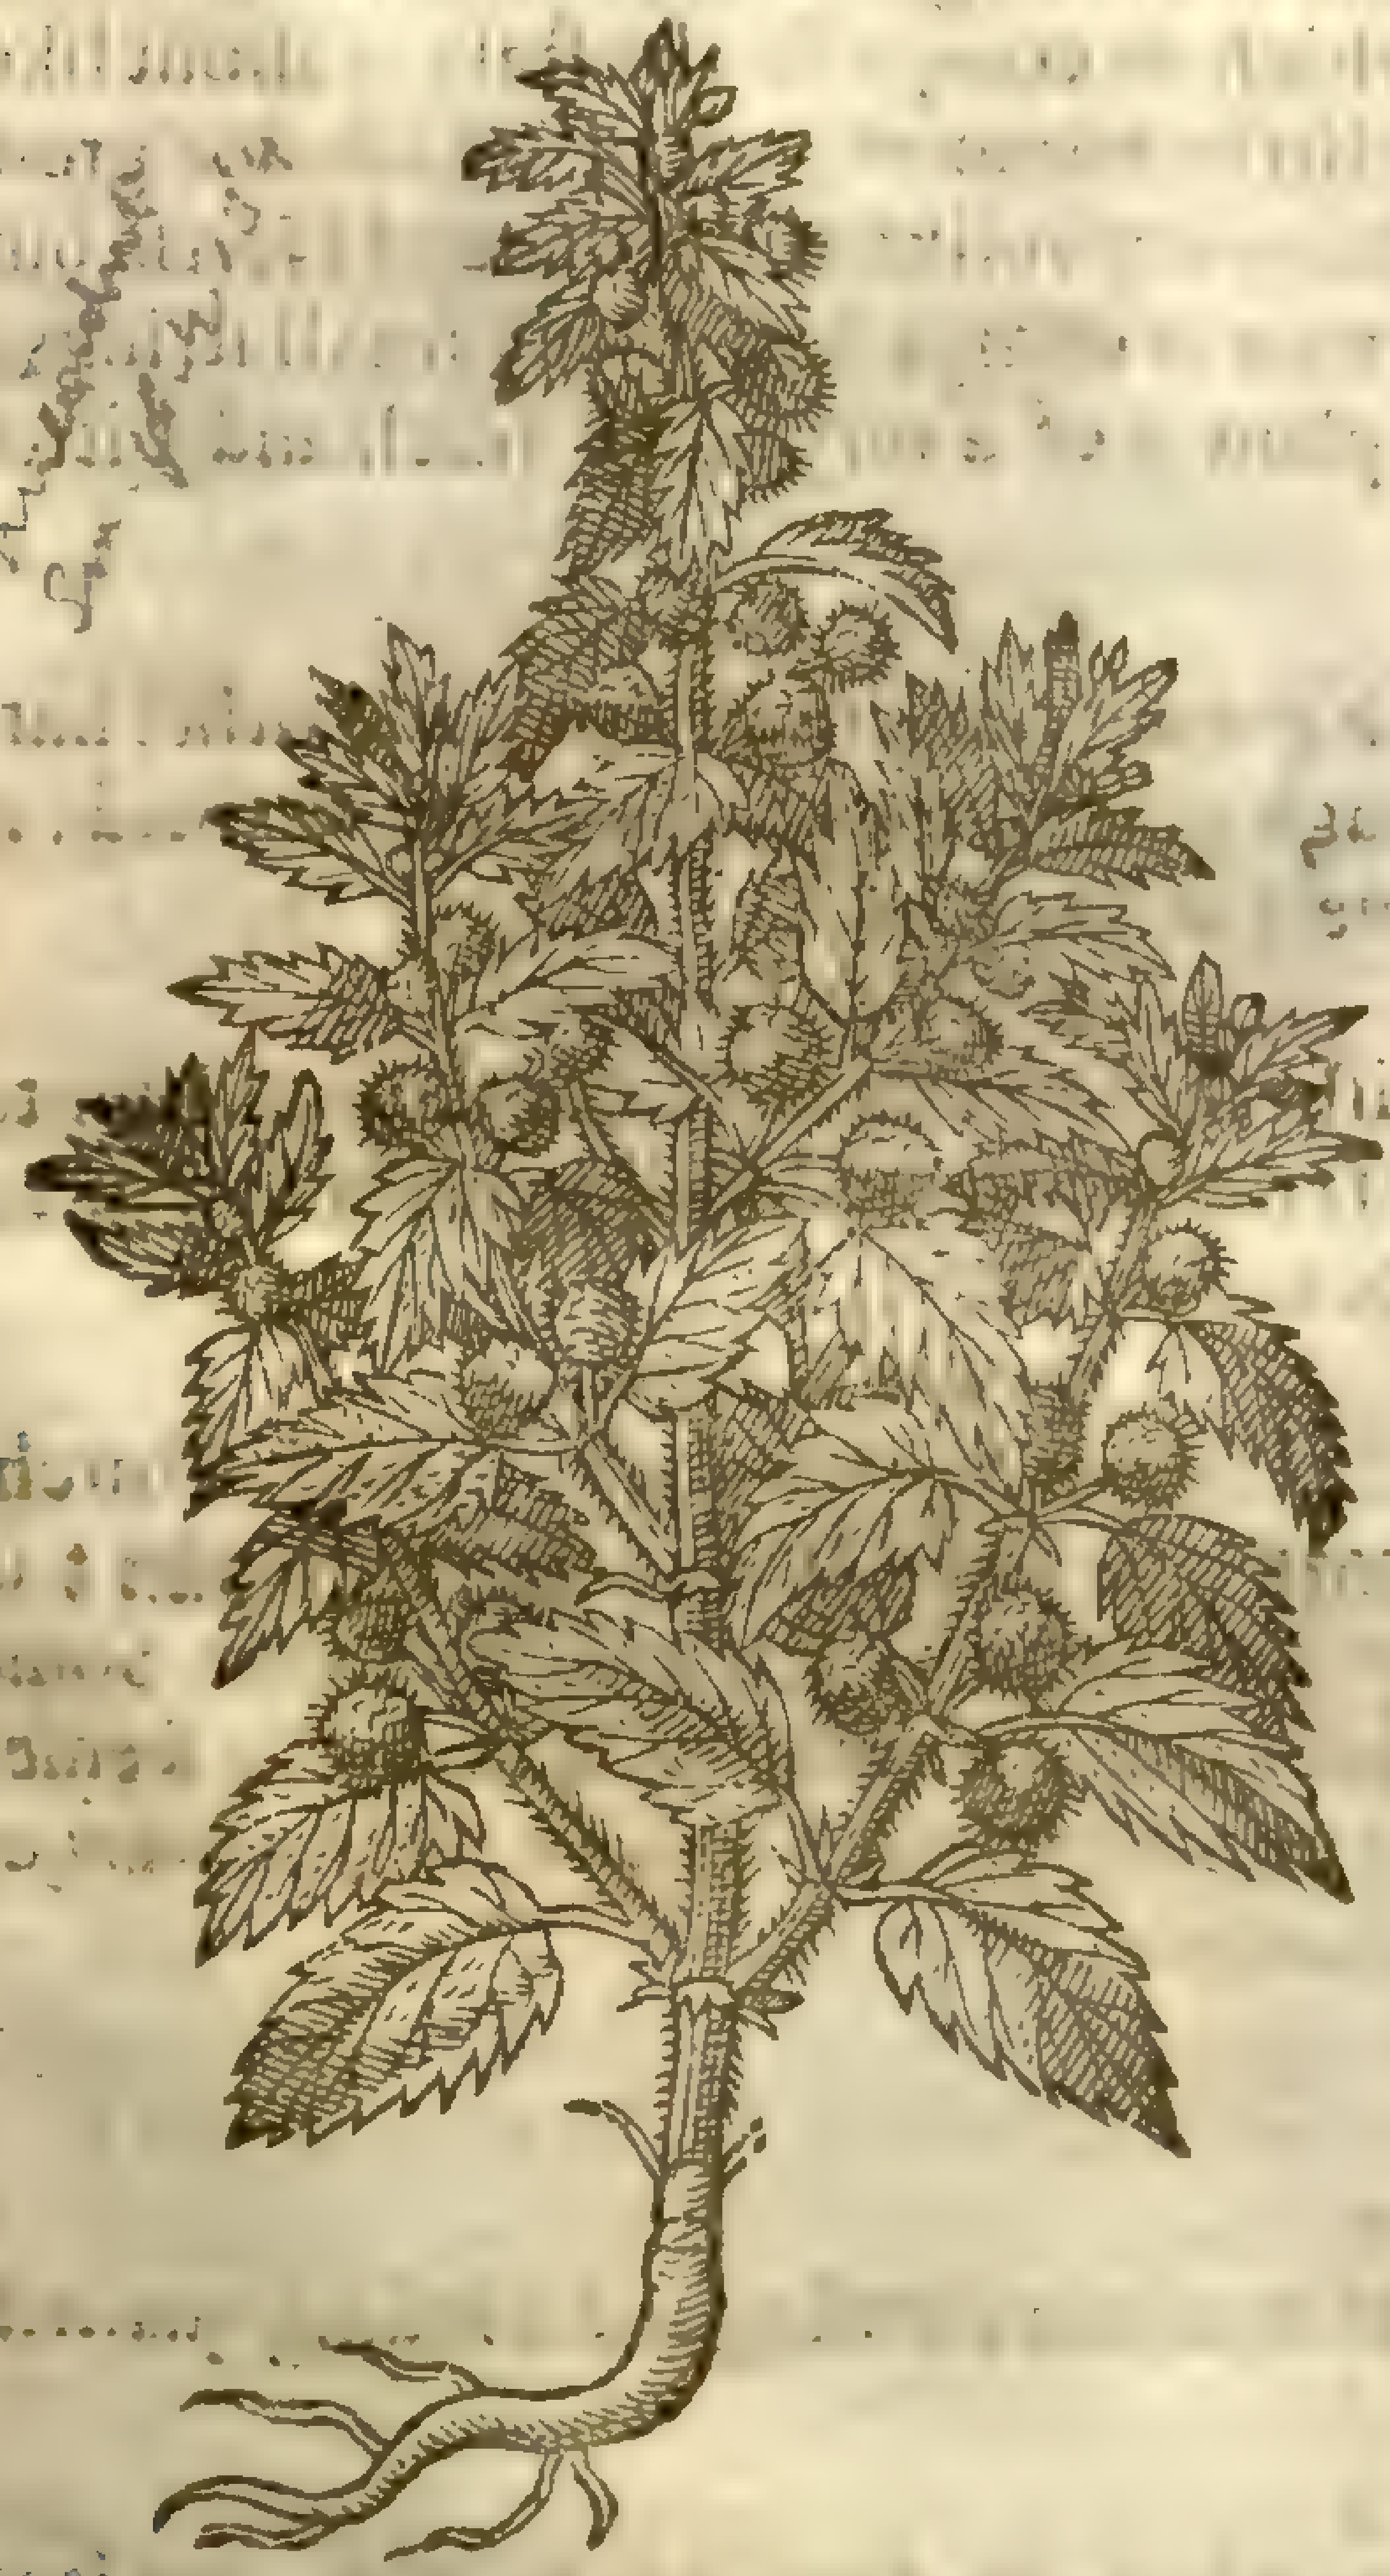
Moreouer, the ſame is commended for green wounds; it is alſo a remedie againſt certain diſeaſes in cattell, as the cough and murren; and for that cauſe diuers husbandmen oftentimes much deſire it. D

Chap. 237. *Of ſtinging Nettle.*

¶ *The Deſcription.*

1 The ſtalks of the firſt be now and then halfe a yard high,round and hollow within : the leaues are broad,ſharp pointed,cut round about like a ſaw,rough on both ſides,and couered with a ſtinging down,which with a light touch only cauſeth a great burning,and raiſeth hard knots in the skin like bliſters,ſomtimes making it red. The ſeed comes from the roots of the leaues in round pellets bigger than peaſe : it is ſlipperie, glittering like Lineſeed, but yet leſſer and rounder : the root is ſet with ſtrings.

1 *Vrtica Romana.*
Romane Nettle.

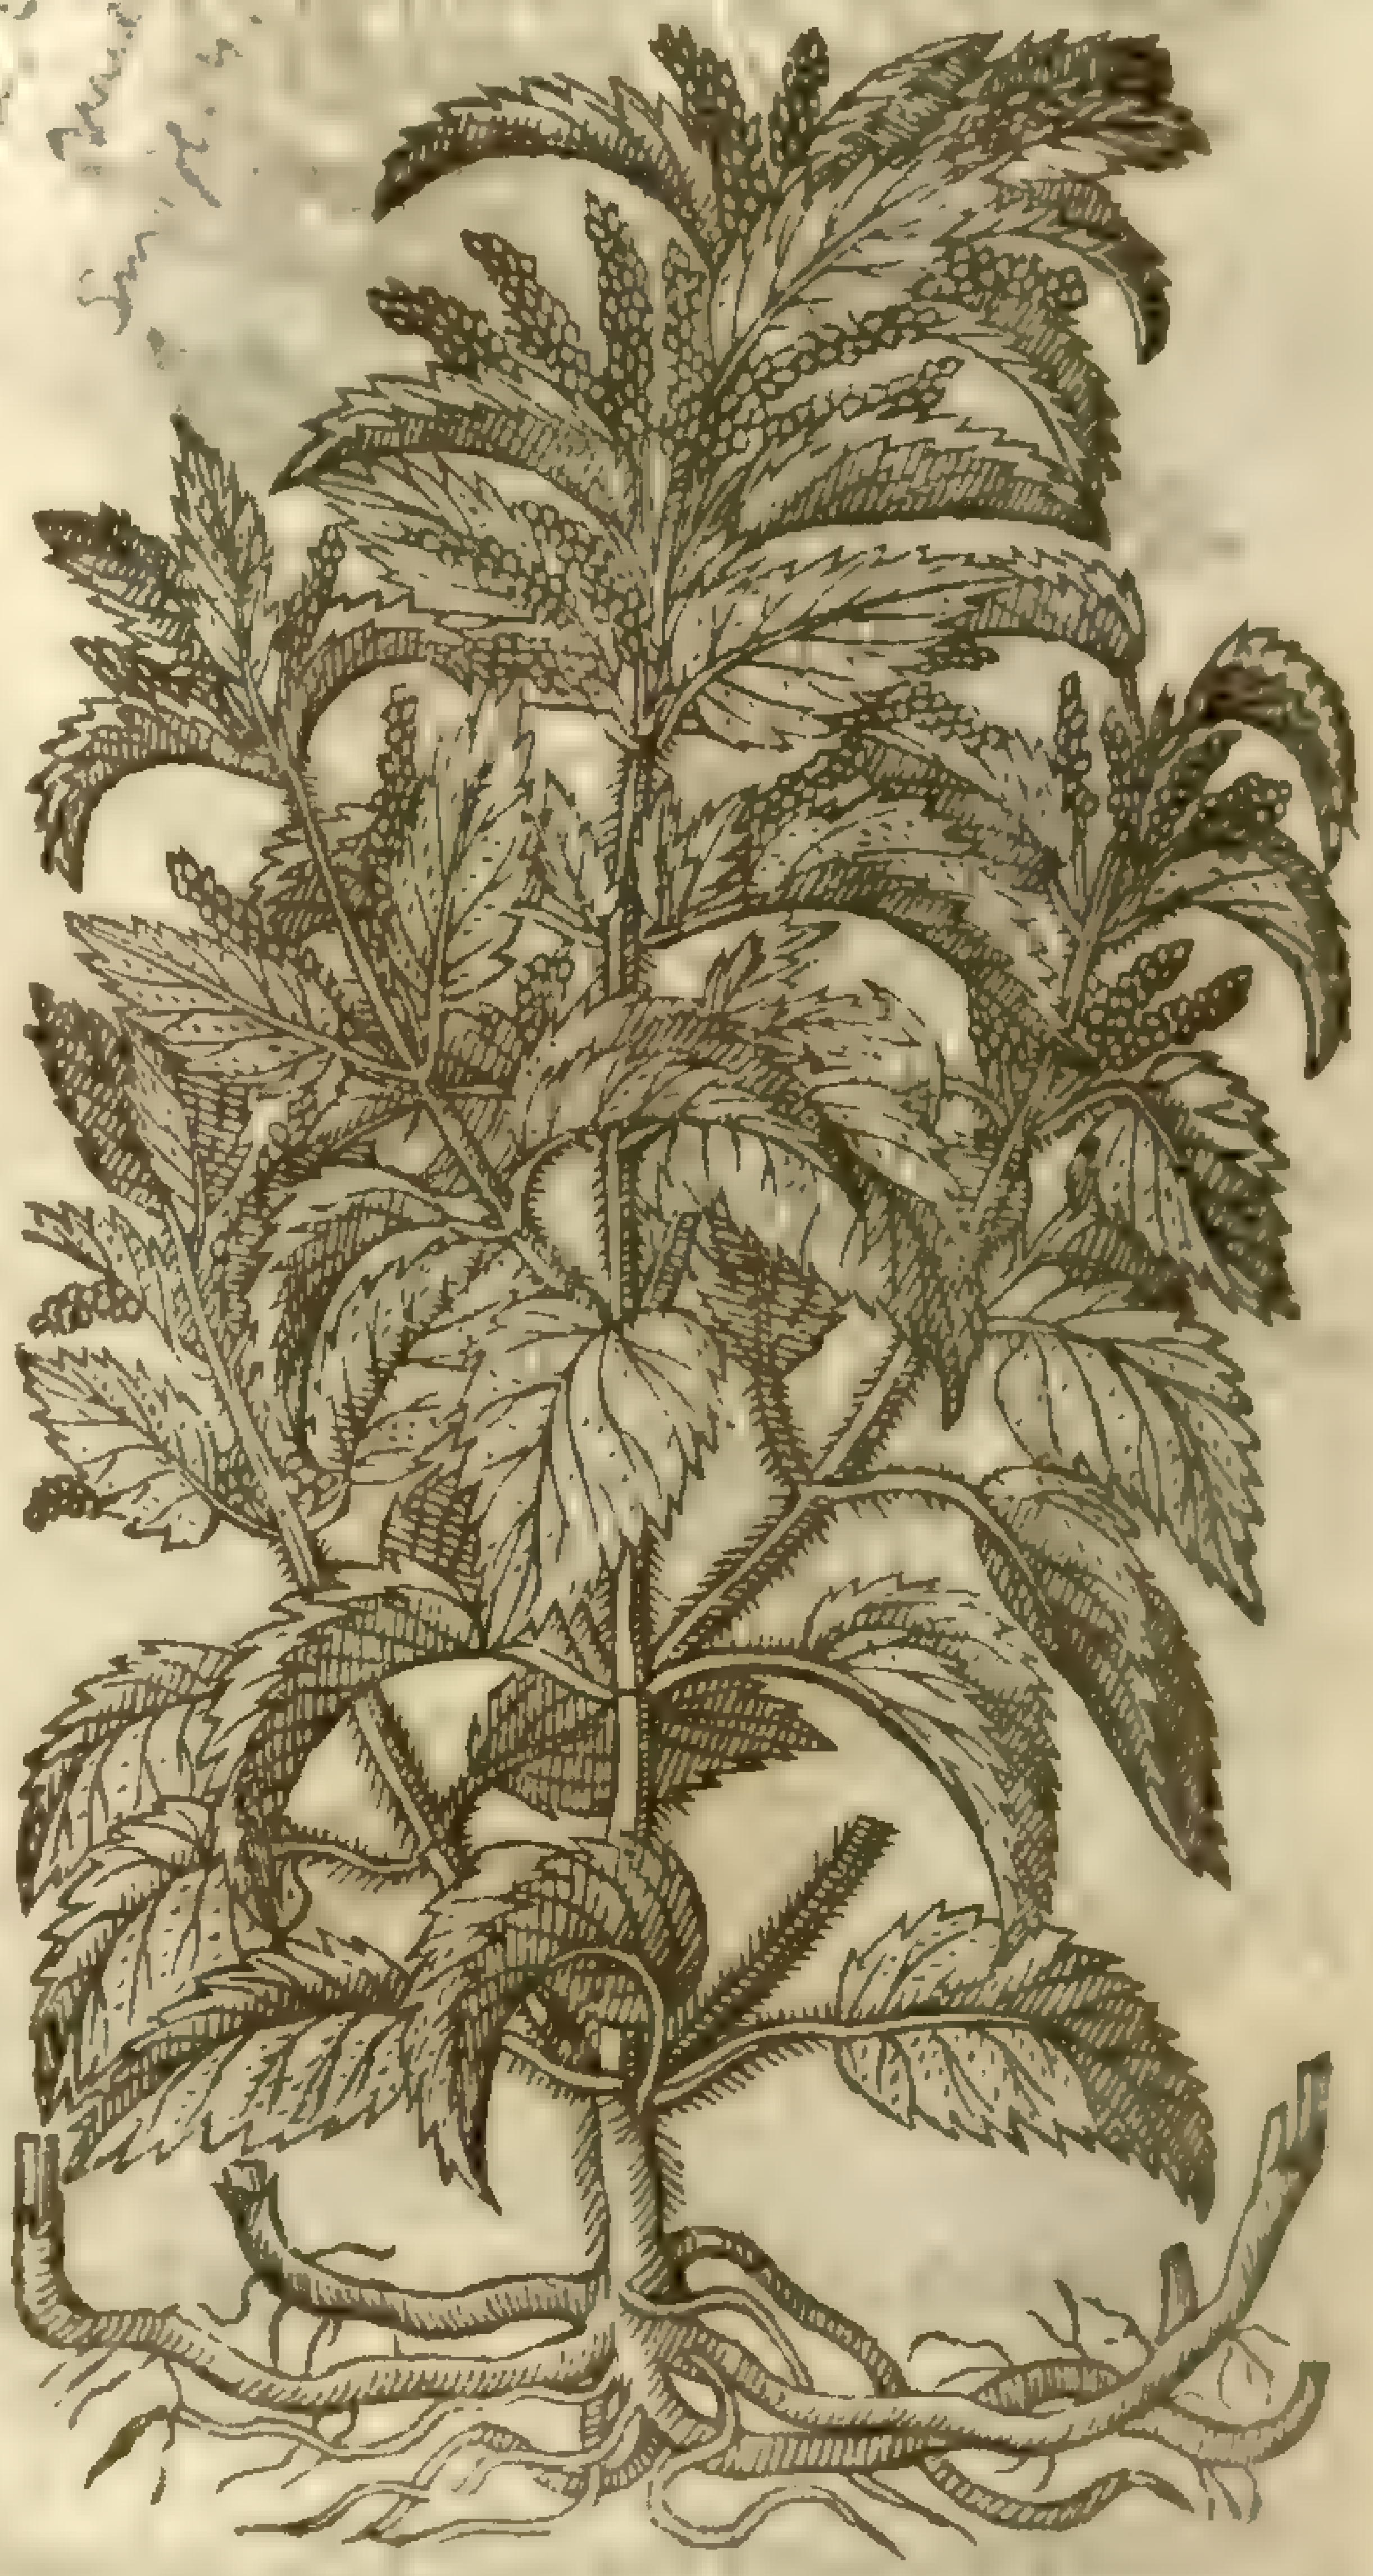


U. pilulifera L.

Lob. ic. 522

2 *Vrtica vrens.*
Common ſtinging Nettle.

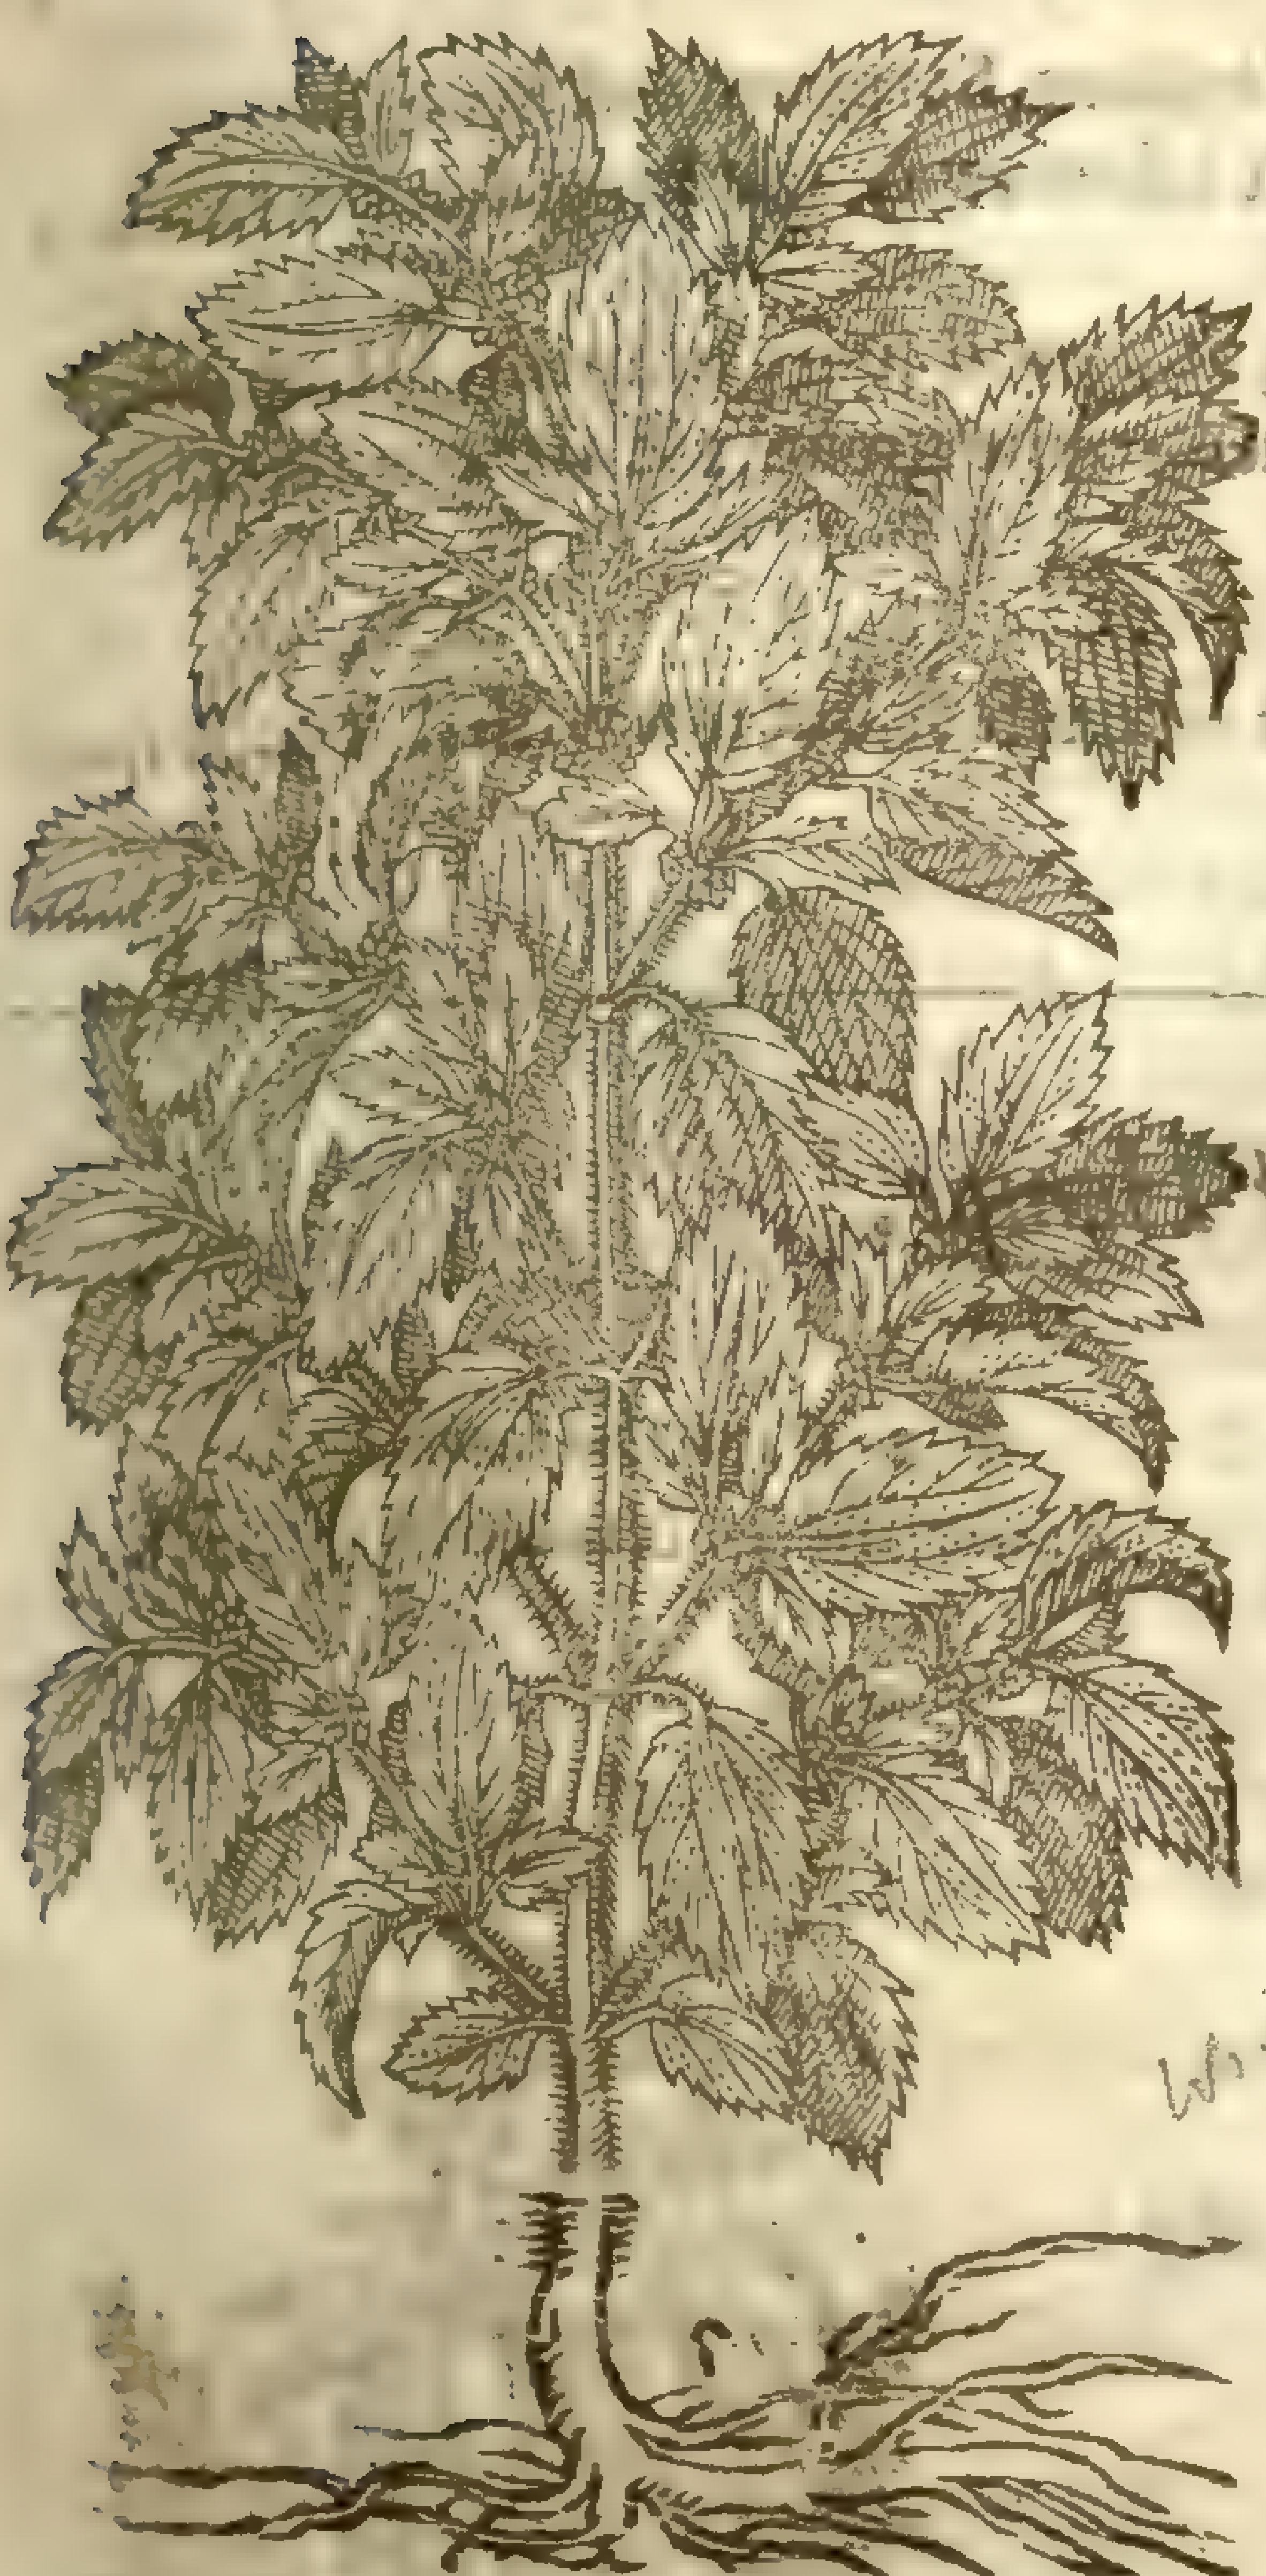
U. dioica



2 The ſecond Nettle being our common Nettle is like to the former in leaues and ſtalks,but yet now and then higher and more full of branches ; it is alſo couered with a downe that ſtingeth and burneth as well as the other : the ſeed hereof is ſmall,and groweth not in round bullets,but on long ſlender ſtrings as it were in cluſters, as thoſe of the female Mercurie, which grow along the ſtalks and branches aboue the leaues,very many. The root is full of ſtrings,of colour ſomthing yellow,and creepeth all about. ‡ This hath the ſtalks and roots ſomtimes a little yellow, whence *Tabernamontanus* and our Author gaue another figure thereof by the name of *Vrtica rubra*, Red Nettle. ‡

3 The third is like to the ſecond in ſtalks,leaues,& ſeed growing by cluſters cloſe to the ſtalks, but leſſe,and commonly fuller of branches of a light green,more burning and ſtinging : the root is ſmall,and not without ſtrings.

3 *Vrtica minor.*
Small Nettle.



¶ *The Place.*

Nettles grow in vntilled places,& the firſt in thicke woods,and is a ſtranger in England,notwithſtanding it groweth in my garden.

The ſecond is more common,and groweth of it ſelfe neere hedges, buſhes, brambles, and old walls almoſt euery where.

The third alſo commeth vp in the ſame places,which notwithſtanding groweth in gardens and moſt earable grounds.

¶ *The Time.*

They all flouriſh in Summer:the ſecond ſuffereth the winters cold: the ſeed is ripe & may be gathered in Iuly and Auguſt.

¶ *The Names.*

It is called in Greeke ἀκαλήφη: in Latine, *Vrtica, ab vrendo*,of his burning and ſtinging qualitie; whereupon *Macer* ſaith,

—nec immerito nomen ſumpſiſſe videtur,
Tacta quod exurat digitos vrtica tenentis.

Neither without deſert his name he ſeemes to git,
As that which quickly burnes the fingers touching it.

And of diuers alſo κνίδη; becauſe it ſtings with his hurtfull downe: in high-Dutch **Neſſel**; in Italian, *Ortica*: in Spaniſh, *Hortiga*: in French, *Ortie*: in Engliſh, Nettle. The firſt is called in low-Dutch **Roomſche Netelen**,that is, *Romana vrtica*,or Roman Nettle: and likewiſe in high-Dutch, **Walſche Neſſelen**,that is,*Italica vrtica*,Italian Nettle,becauſe it is rare,and groweth but in few places, and the ſeed is ſent from other Countries,and ſowne in gardens for his vertues: it is alſo called of diuers *Vrtica mas*; and of *Dioſcorides*, *Vrtica ſylueſtris*,or wilde Nettle,which he ſaith is more rough, with broader and longer leaues, and with the ſeed of flax,but leſſer. *Pliny* maketh the wilde Nettle the male,and *Lib.22. cap.15.* ſaith, that it is milder and gentler. It is called in Engliſh,Romane Nettle,Greeke Nettle,male Nettle. The ſecond is called *Vrtica fœmina*, and oftentimes *Vrtica major*, that it may differ from the third Nettle: in Engliſh,Female Nettle,great Nettle,or common Nettle. The third is named in high-Dutch,**Heyter Neſſel**; in the Brabanders ſpeech,**Heyſte Netelen**,ſo called of the ſtinging qualitie: in Engliſh, Small Nettle, Small burning Nettle: but whether this be that or no which *Pliny* calleth *Cania*,or rather the firſt,let the Studious conſider. There is in the wild Nettle a more ſtinging qualitie,which,ſaith he,is called *Cania*,with a ſtalke more ſtinging,hauing nicked leaues.

¶ *The Temperature.*

Nettle is of temperature dry,a little hot,ſcarſe in the firſt degree: it is of thin and ſubtil parts; for it doth not therefore burne and ſting by reaſon it is extreme hot,but becauſe the downe of it is ſtiffe and hard,piercing like fine little prickles or ſtings, and entring into the skin: for if it be withered or boiled it ſtingeth not at all,by reaſon that the ſtiffeneſſe of the down is fallen away.

¶ *The Vertues.*

Being eaten,as *Dioſcorides* ſaith,boiled with Periwinkles, it maketh the body ſoluble, doing it by a kinde of clenſing facultie: it alſo prouoketh vrine,and expelleth ſtones out of the kidnies:being boiled with barly cream it is thought to bring vp tough humors that ſticke in the cheſt. A

Being ſtamped,and the juice put vp into the noſthrils, it ſtoppeth the bleeding of the noſe: the juice is good againſt the inflammation of the Vvula. B

The ſeed of Nettle ſtirreth vp luſt,eſpecially drunke with Cute: for (ſaith *Galen*) it hath in it a certaine windineſſe. C

It concocteth and draweth out of the cheſt draw humors. D

It is good for them that cannot breathe vnleſſe they hold their necks vpright,and for thoſe that haue the pleuriſie,and for ſuch as be ſick of the inflammation of the lungs,if it be taken in a looch E or licking medicine, and alſo againſt the troubleſome cough that children haue, called the Chincough.

F *Nicander* affirmeth, that it is a remedie againſt the venomous qualitie of Hemlocke, Muſhroms, and Quickſiluer.

G And *Apollodorus* ſaith that it is a counterpoiſon for Henbane, Serpents, and Scorpions.

H *Pliny* ſaith, the ſame Author writeth, that the oile of it takes away the ſting that the Nettle it ſelfe maketh.

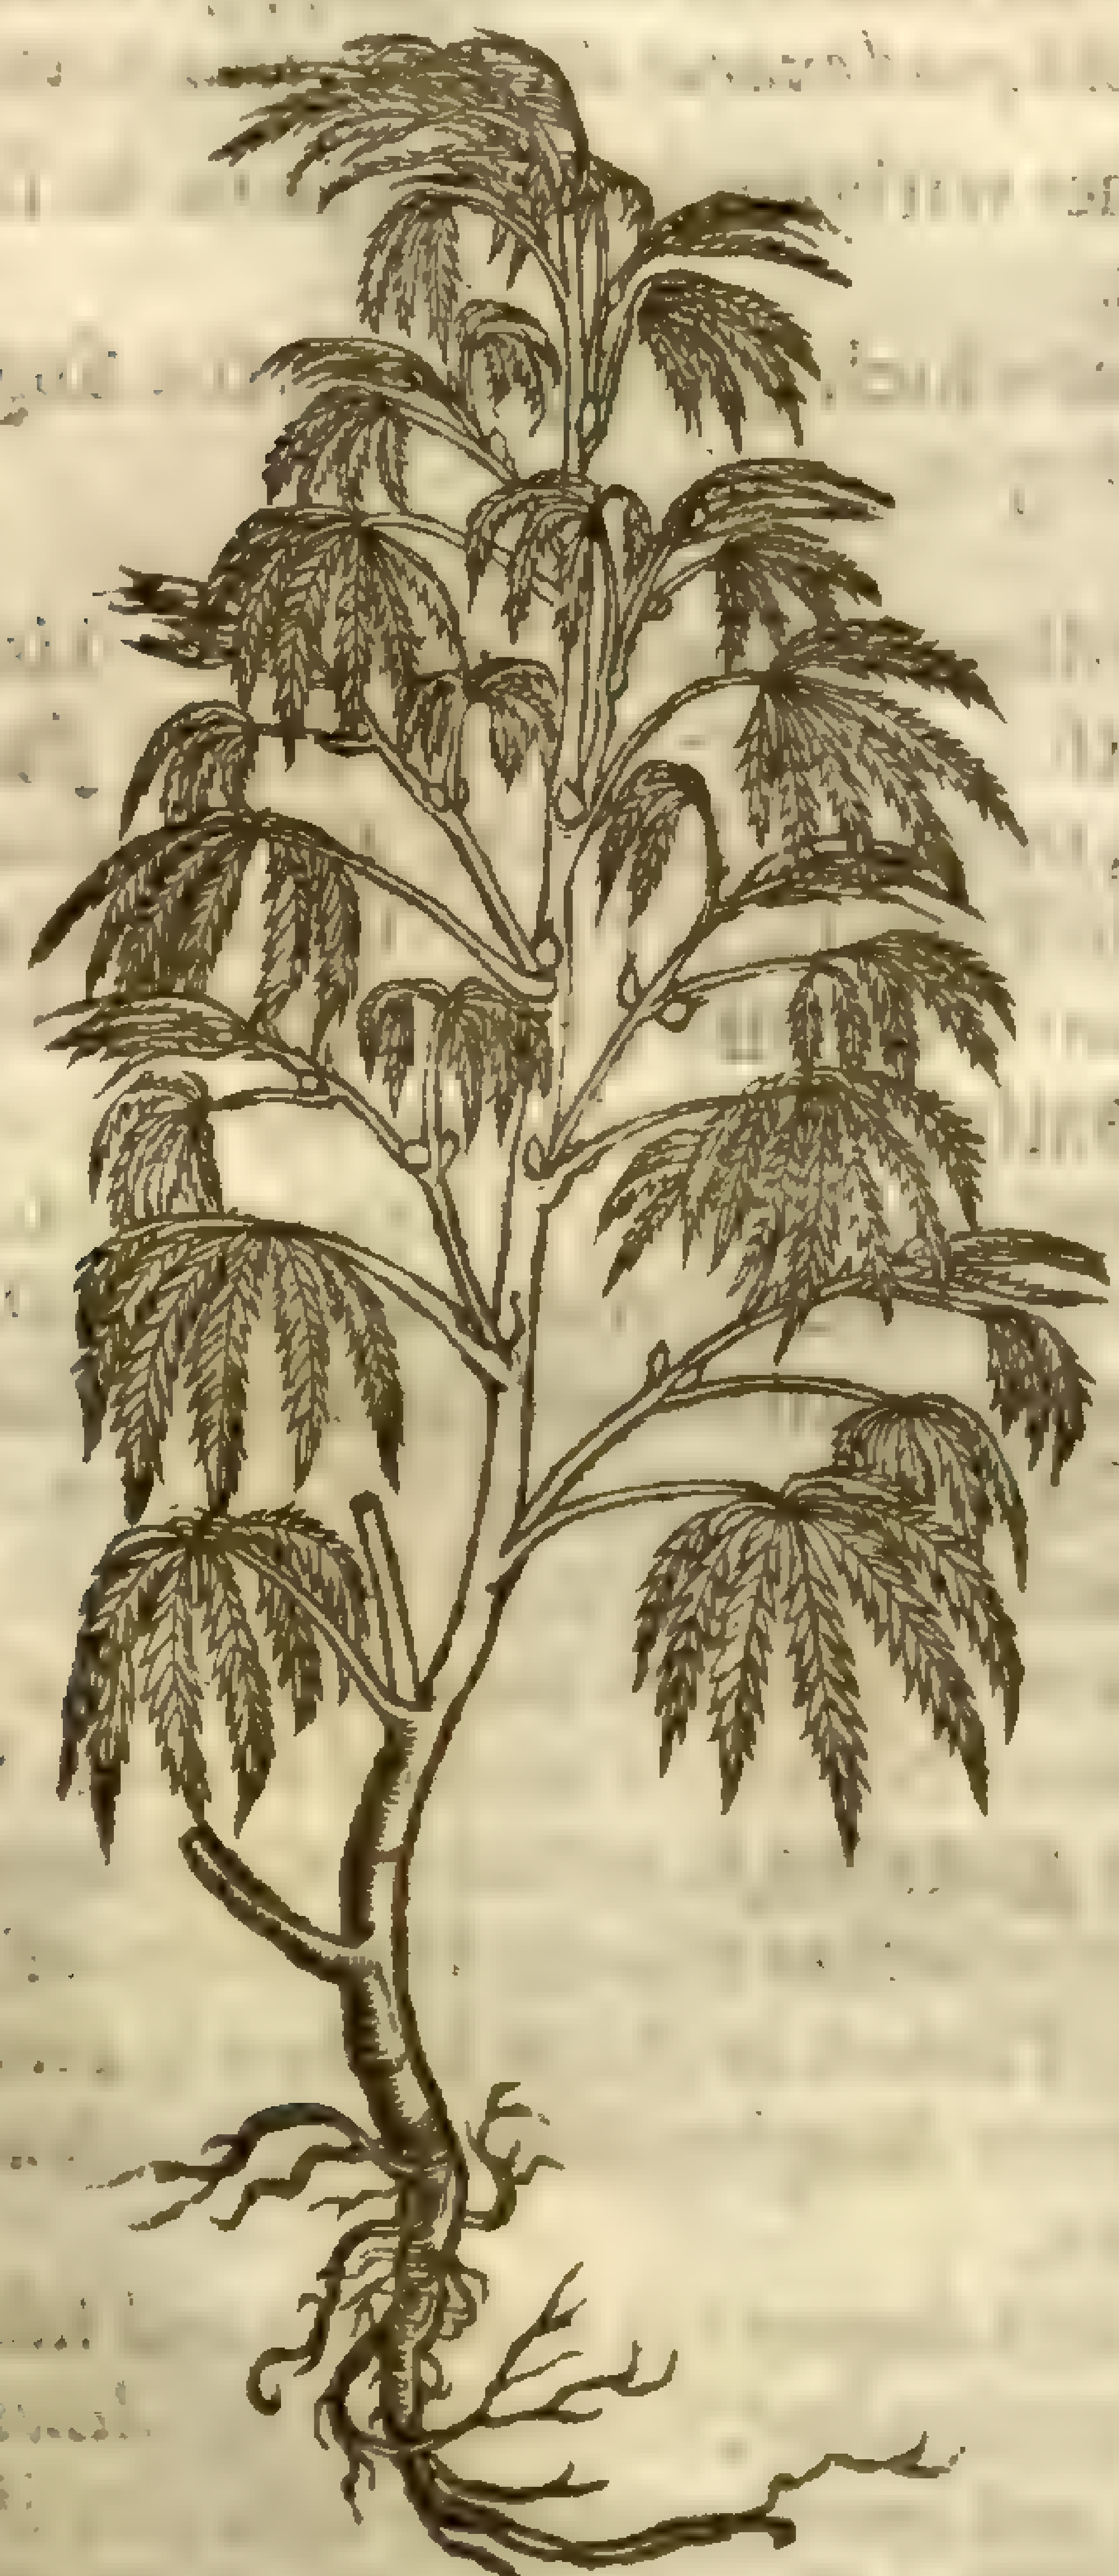
I The ſame groſſely powned and drunke in White wine, is a moſt ſingular medicine againſt the ſtone either in the bladder or reins, as hath bin often proued, to the great eaſe and comfort of thoſe that haue been grieuouſly tormented with that maladie.

K It expelleth grauell, and prouoketh vrine.

L The leaues or ſeeds of any kinde of Nettle do work the like effect, but not with that good ſpeed and ſo aſſured as the Roman Nettle.

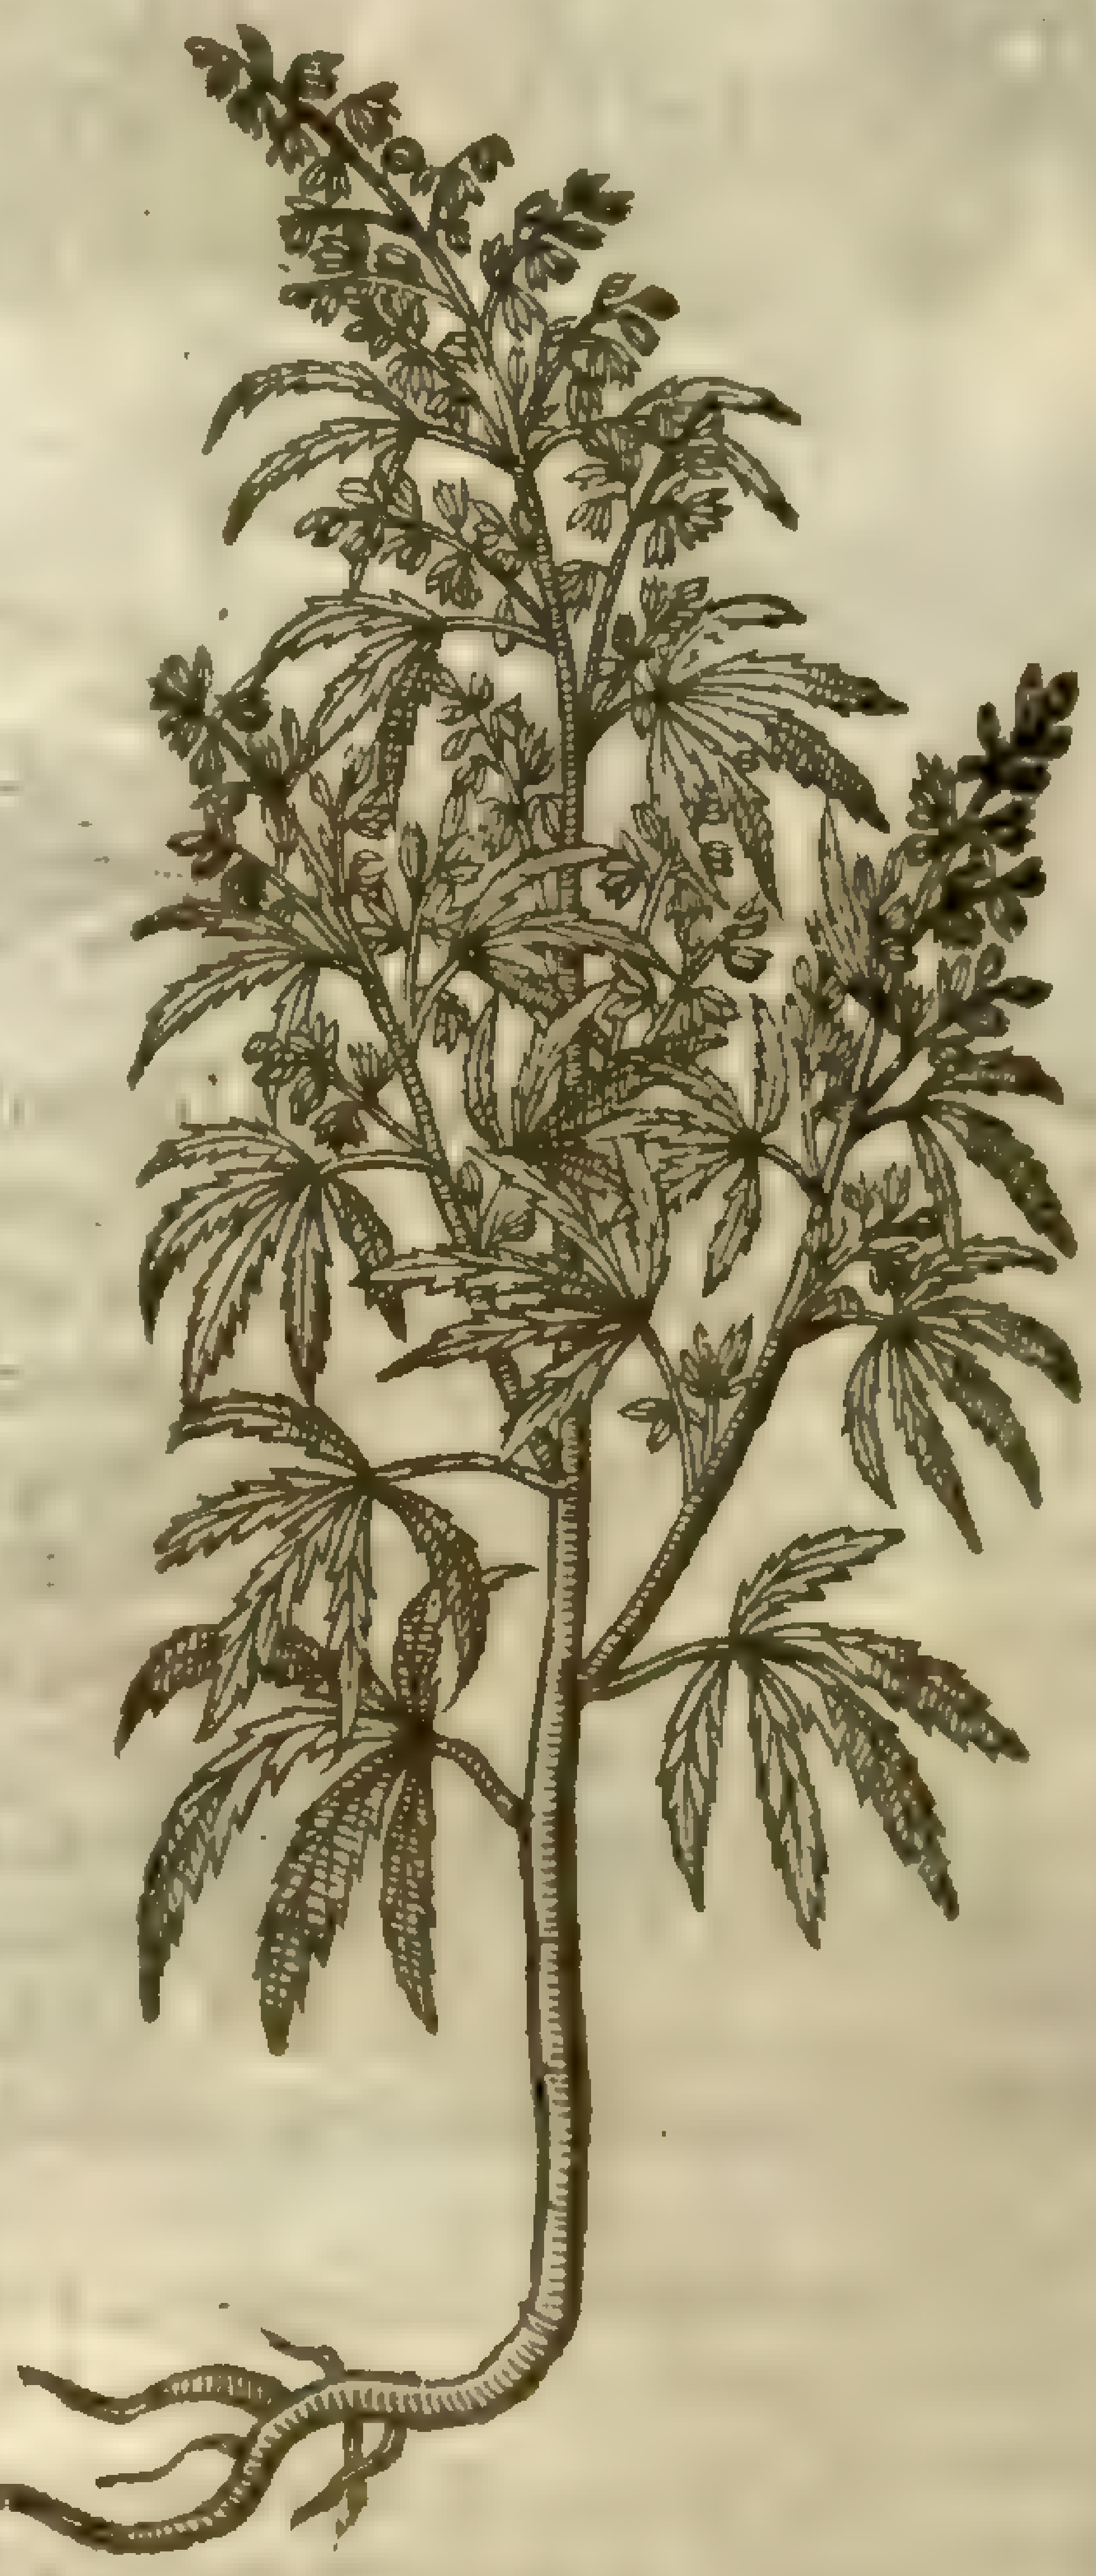
Chap. 238. *Of Hempe.*

1 *Cannabis mas.*
Male or ſteele Hempe.



Cannabis Sativa mas, [illegible]
fœm

‡ 2 *Cannabis fœmina.*
Femeline or female Hempe.



¶ *The Deſcription.*

1 Hempe bringeth forth round ſtalks, ſtraight, hollow, fiue or ſix foot high, full of branches when it groweth wilde of it ſelfe; but when it is ſowne in fields it hath very few or no branches at all. The leaues thereof be hard, tough, ſomewhat blacke, and if they be bruiſed they be of a rank ſmell, made vp of diuers little leaues joined together, euery particular leafe whereof is narrow, long, ſharpe pointed, and nicked in the edges: the ſeeds come forth from the bottoms of the wings and leaues, being round, ſomwhat hard, full of white ſubſtance. the roots haue many ſtrings.

2 There is another, beeing the female Hempe, yet barren and without ſeed, contrarie vnto the

nature of that ſex; which is very like to the other being the male, and one muſt be gathered before the other be ripe, elſe it will wither away and come to no good purpoſe.

¶ *The Place.*

Hempe, as *Columella* writeth, delighteth to grow in a fat dunged and watery ſoile, or plaine and moiſt, and deeply digged.

¶ *The Time.*

Hemp is ſowne in March and Aprill; the firſt is ripe in the end of Auguſt, the other in Iuly.

¶ *The Names.*

This is named of the Grecians κάνναβις: alſo of the Latines *Cannabis*: the Apothecaries keep that name: in high-Dutch **Zamer hanff**: of the Italians *Canape*: of the Spaniards *Canamo*: in French *Chanure*: of the Brabanders **Kemp**: in Engliſh Hemp. The male is called Charle Hemp, and winter Hemp: the female, barren Hemp, and Summer Hemp.

¶ *The Temperature and Vertues.*

The ſeed of Hemp, as *Galen* writeth in his booke of the faculties of ſimple medicines, is hard of digeſtion, hurtful to the ſtomack and head, and containeth in it an ill juice: notwithſtanding ſome do vſe to eat the ſame parched, *cum alijs tragematis*, with other junkets. A

The ſame Author in his ſaid booke addeth, that it conſumes winde, and is ſo great a drier, that it drieth vp the ſeed if too much be eaten of it. B

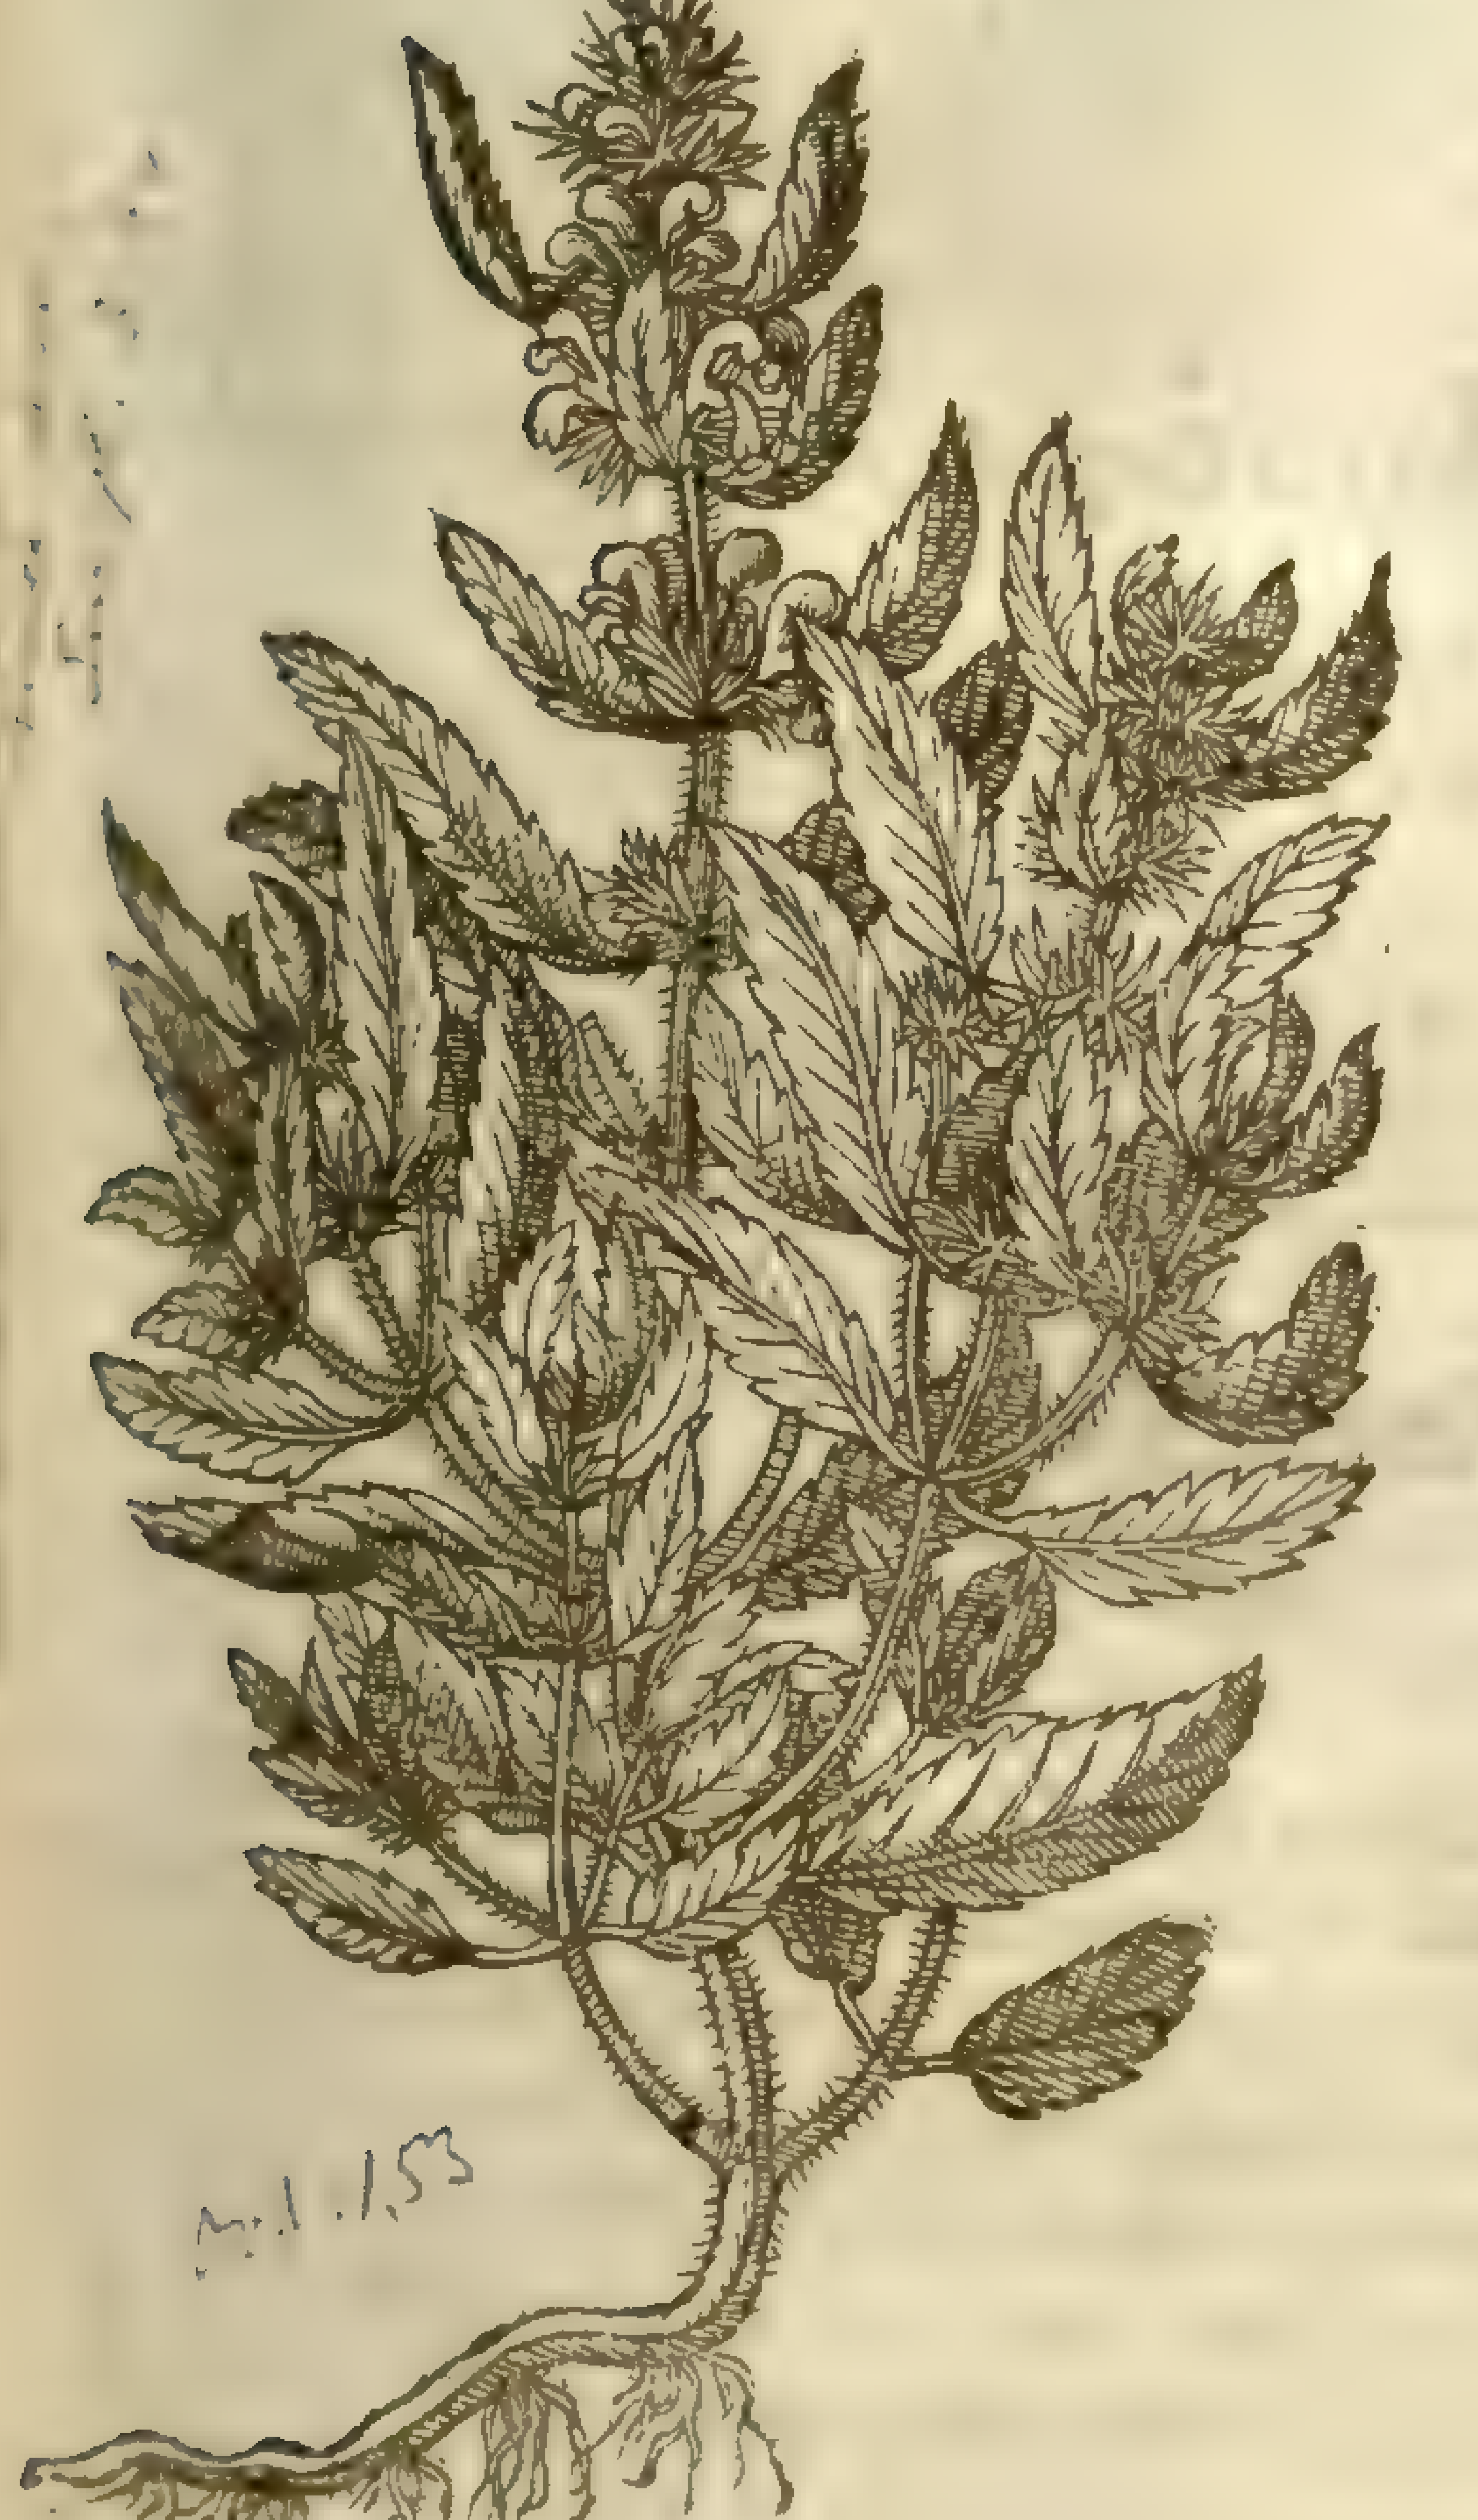
Dioſcorides ſaith, That the juice of the herb dropped into the ears aſſwage their pain, proceeding (as *Galen* addeth) of obſtruction or ſtopping. C

The inner ſubſtance or pulp of the ſeed preſſed out in ſome kind of liquor, is giuen to thoſe that haue the yellow jaundice, when the diſeaſe firſt appeares, and oftentimes with good ſucceſſe, if the diſeaſe come of obſtruction without an ague; for it openeth the paſſage of the gall, and diſperſeth and concocteth the choler through the whole body. D

Matthiolus ſaith, that the ſeed giuen to hens cauſeth them to lay eggs more plentifully. E

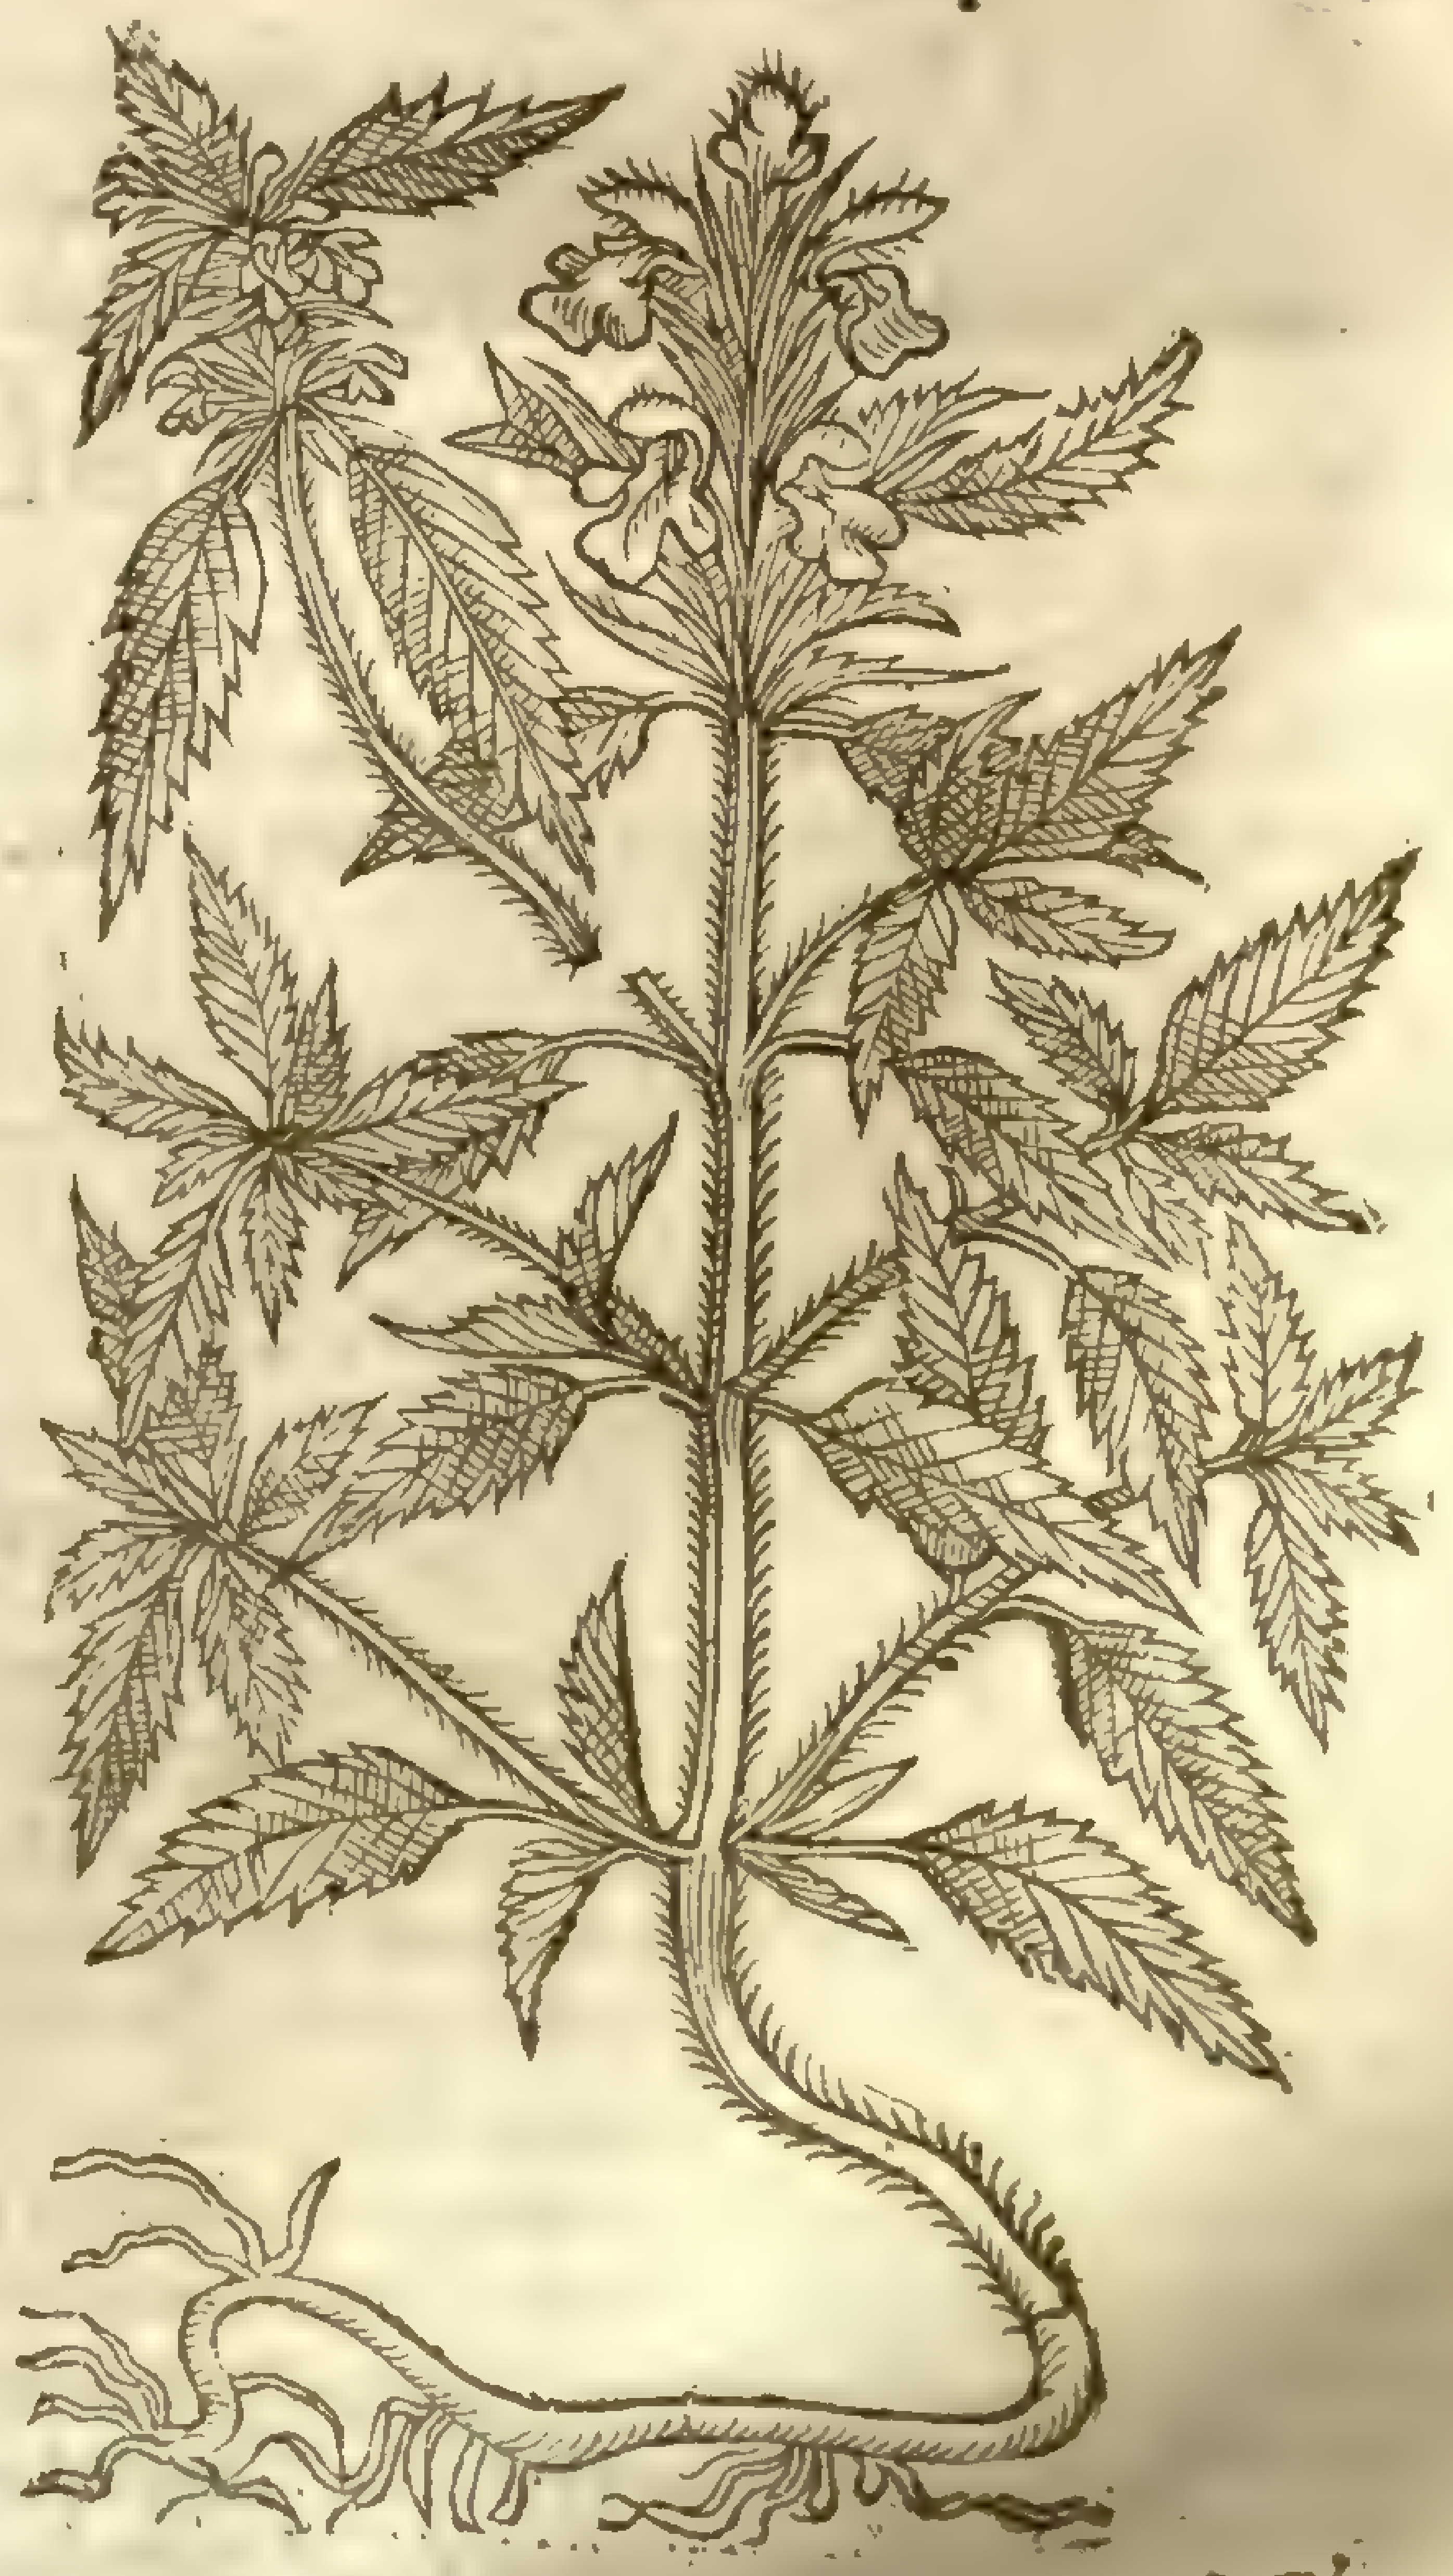
Chap. 239. *Of wilde Hempe.*

1 *Cannabis ſpuria.*
Wilde Hempe.



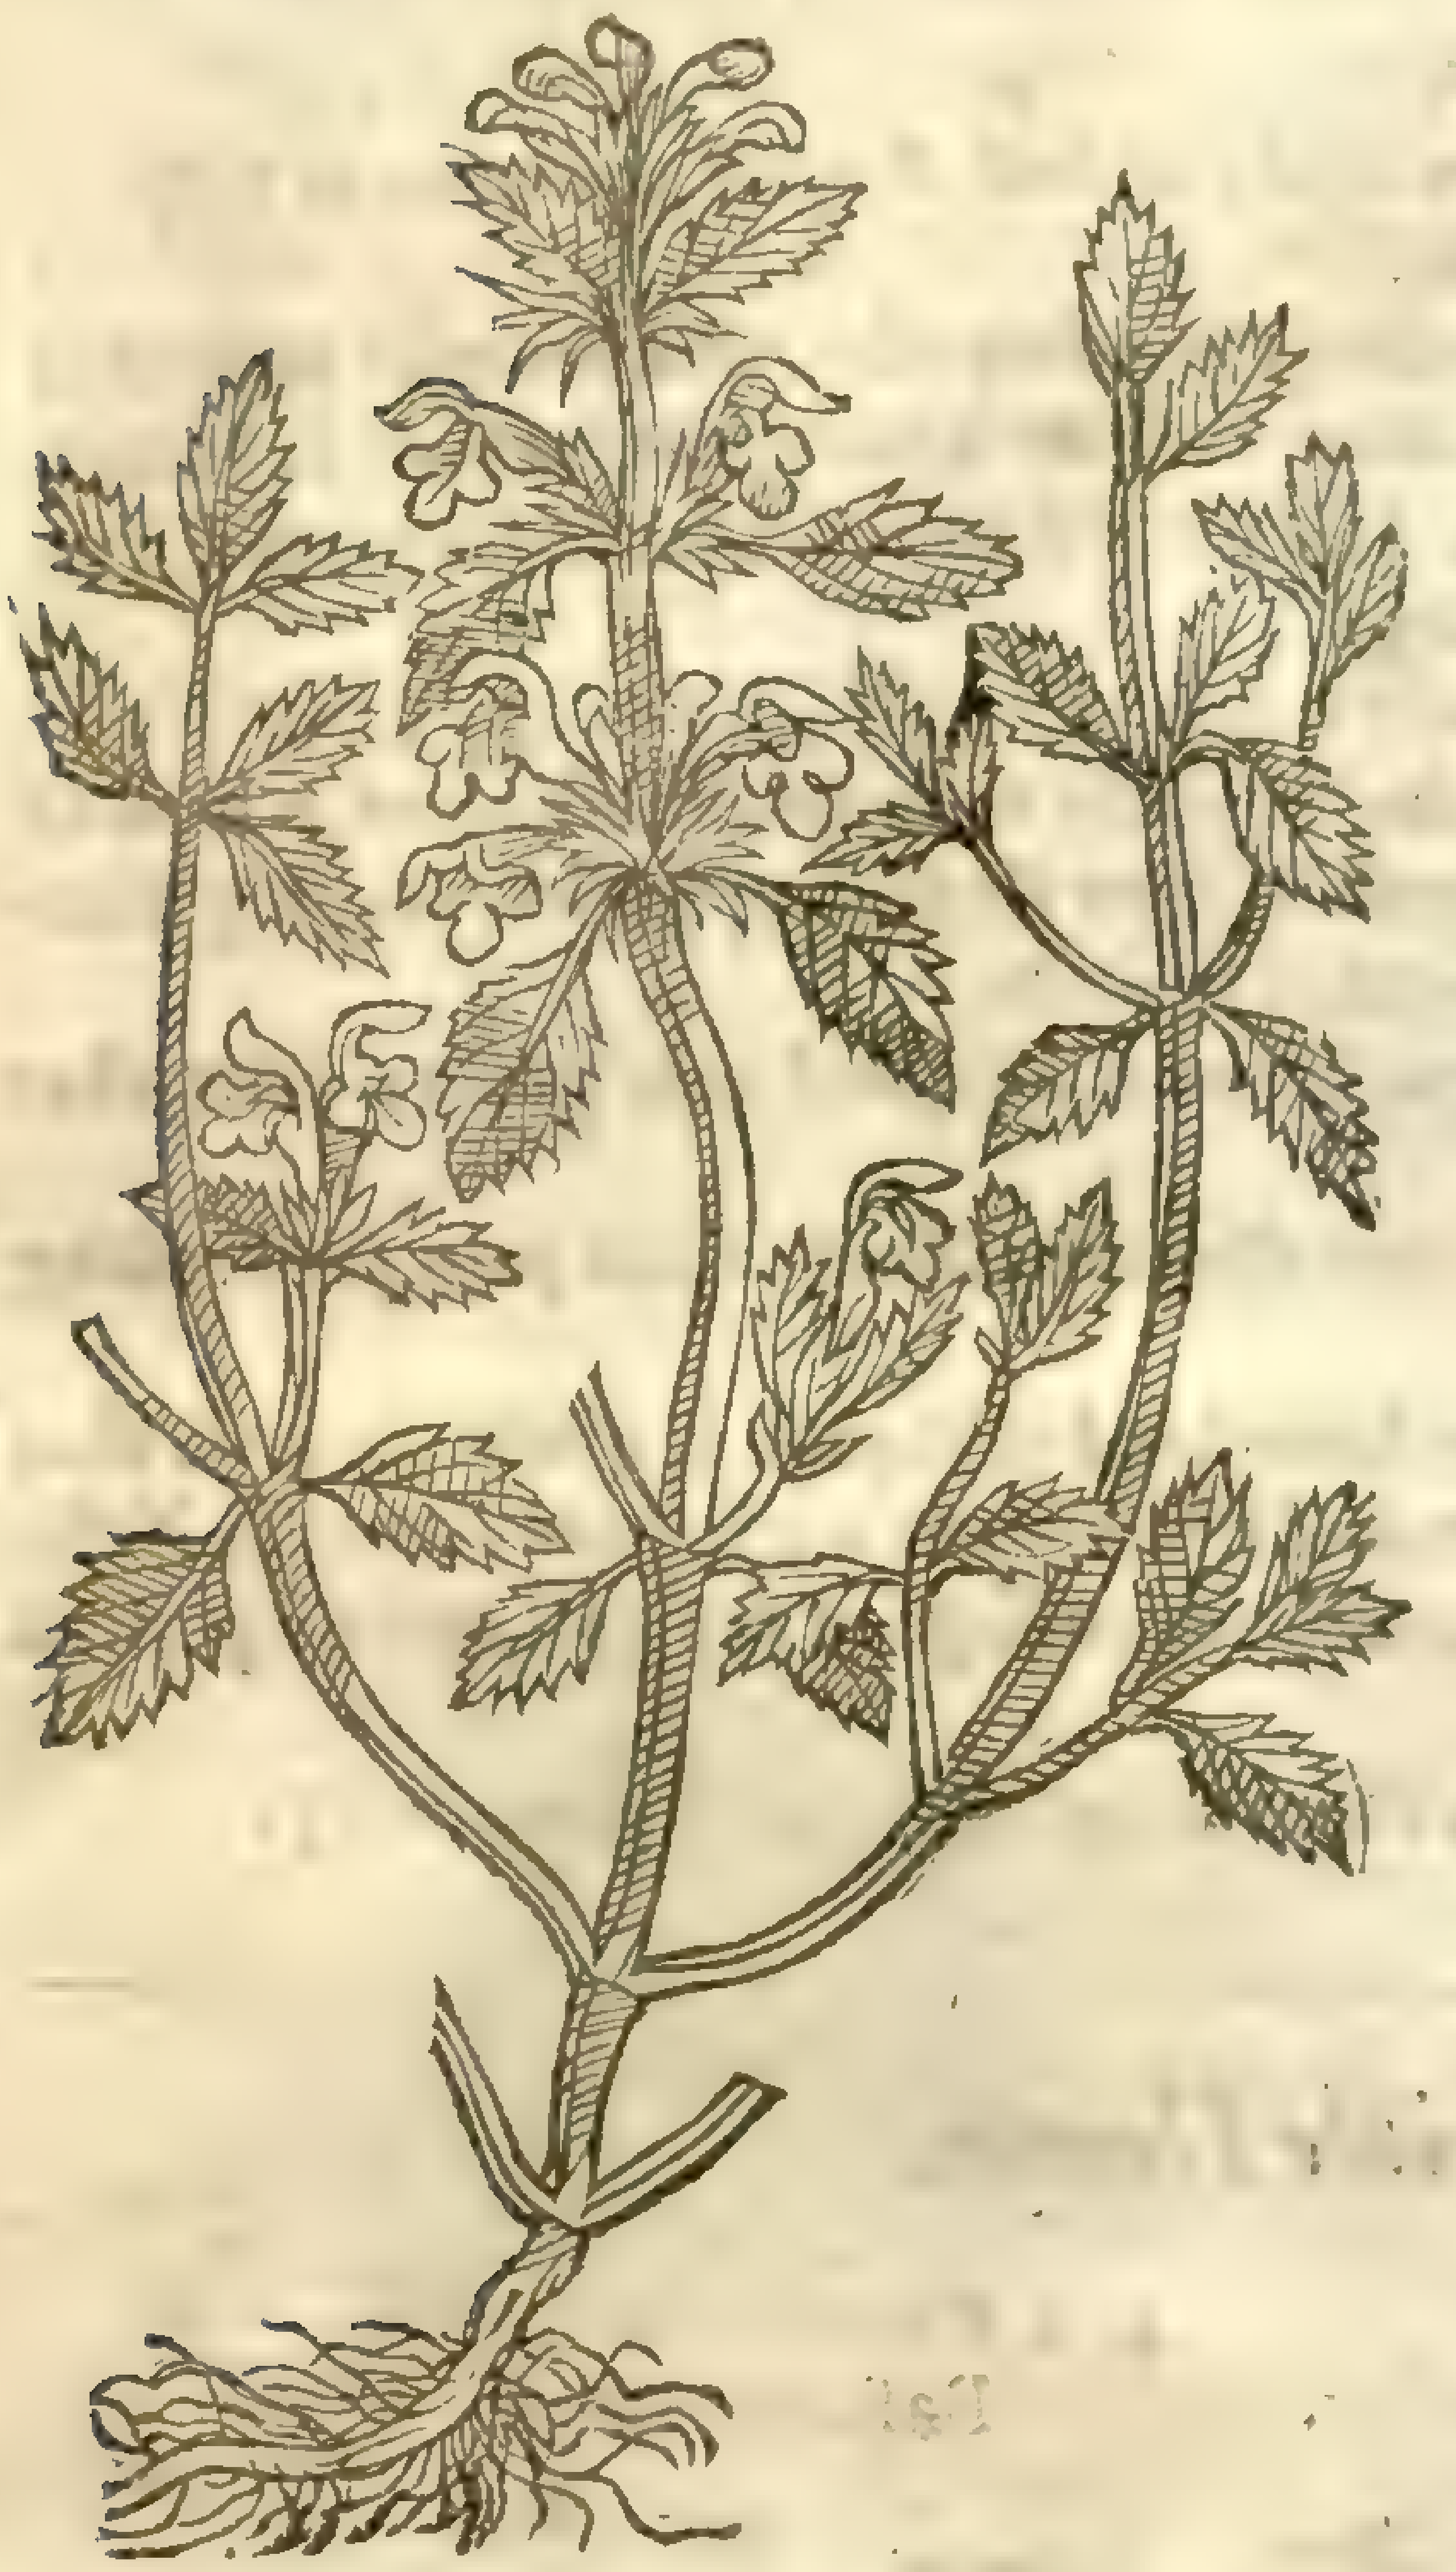
M.1.153

‡ 2 *Cannabis ſpuria altera.*
Baſtard Hemp.



¶ The

‡ 3 *Cannabis ſpuria tertia.*
Small baſtard Hemp.



¶ *The Deſcription.*

1 THe wilde Hemp, called *Cannabis ſpuria*, or baſtard Hemp, hath ſmal ſlender hoary & hairy ſtalks a foot high, beſet at euery joint with two leaues, ſmally indented about the edges ſomewhat like a Nettle. The floures grow in rundles about the ſtalkes, of a purple colour, and ſometimes alſo white: The root is little and threddy.

2 There is likewiſe another kinde of wilde Hempe which hath hairy ſtalkes and leaues like the former, but the floures are greater, gaping wide open like the flours of *Lamium* or dead nettle. The floures are of a cleare and light Carnation colour declining to purple.

3 There is alſo another kinde of wild Hemp like vnto the laſt before mentioned, ſauing that it is ſmaller in each reſpect, and not ſo hairy: the leafe is ſomwhat rounder, the root ſmal & threddie; the floure is larger, beeing purple or white, with a yellow ſpot in the inſide.

¶ *The Place.*

Theſe kindes of wilde or baſtard Hemp grow vpon barren hills and mountaines, eſpecially in earable land, as I haue often ſeene in the corne fields of Kent, as about Graueſend, Southfleet, and in all the tract from thence to Canterburie, and in many places about London.

¶ *The Time.*

Theſe herbs floure from Iuly to the end of Auguſt.

¶ *The Names.*

What hath been ſaid ſhall ſuffice for the Latine names: in Engliſh, wilde Hemp, Nettle hemp, and baſtard Hemp.

¶ *The Nature and Vertues.*

The temperature and faculties are referred to the manured Hemp, notwithſtanding they are not vſed in phyſicke where the other may be had.

CHAP. 240. *Of Water Hempe.*

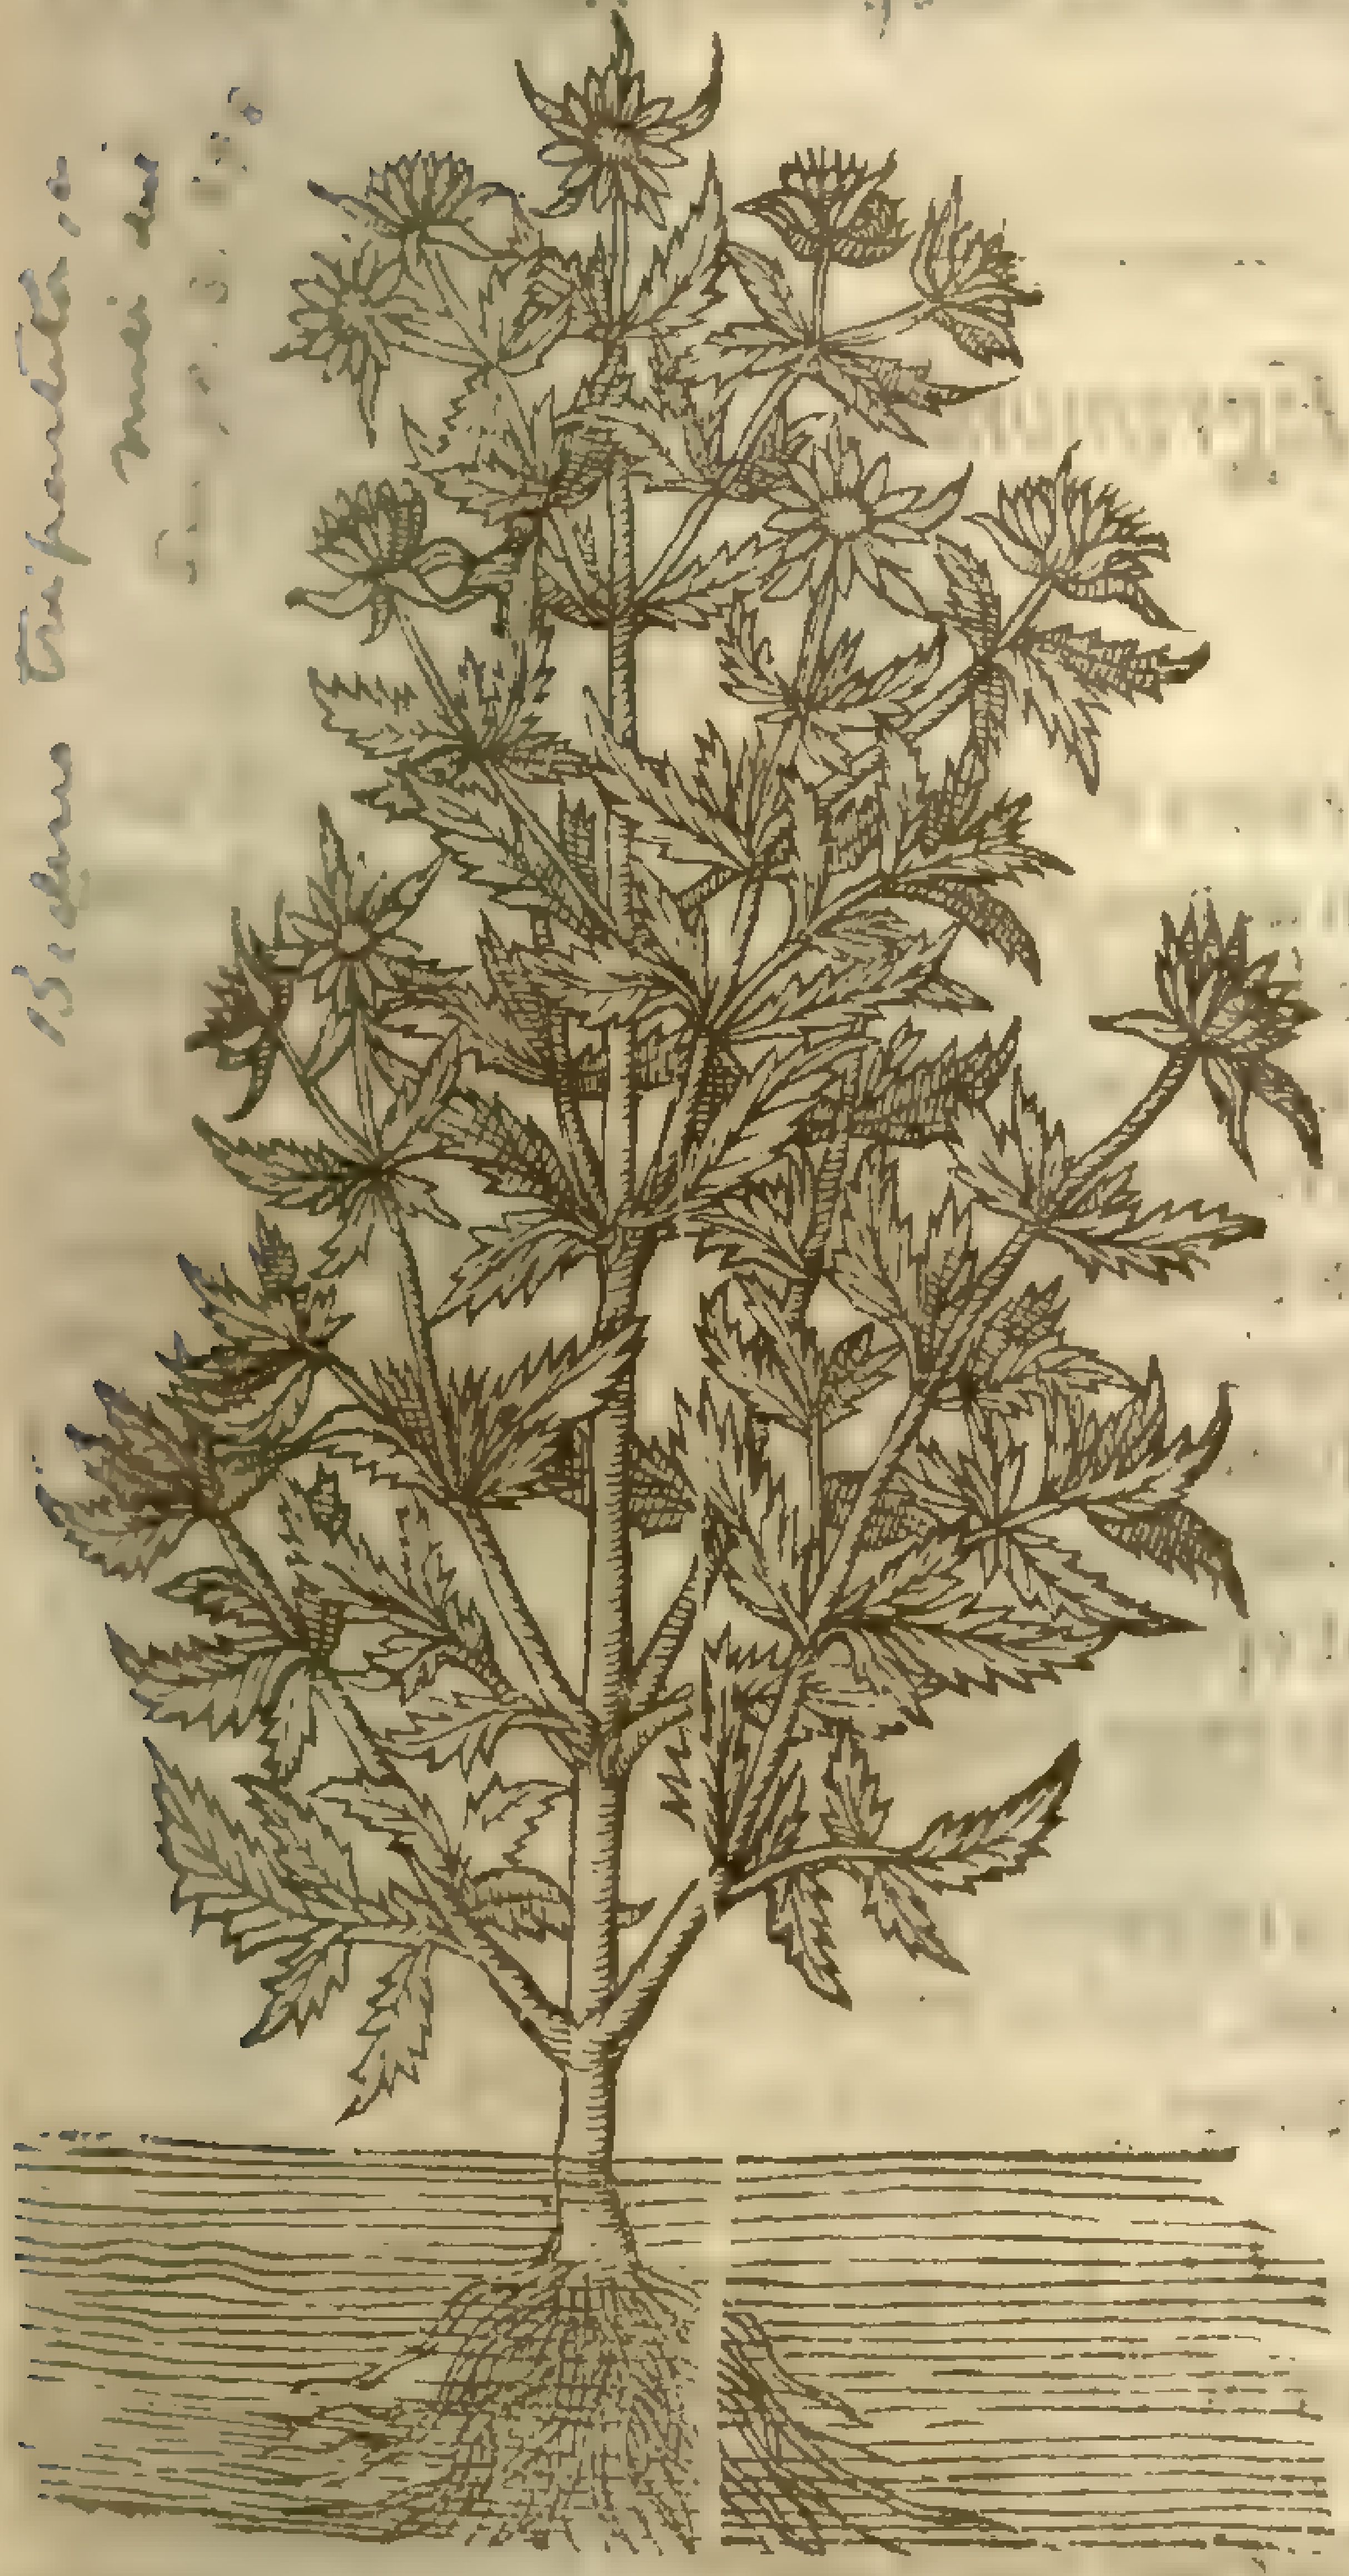
¶ *The Deſcription.*

1 WAter Hemp or water Agrimonie is ſeldome found in hot regions, for which cauſe it is called *Eupatorium Cannibinum fœmina Septentrionalium*, and groweth in the cold Northern countries in moiſt places, and in the midſt of ponds, ſlow running riuers and ditches. The root continues long, hauing long and ſlender ſtrings after the nature of Water herbs: the ſtalks grow a cubit and a halfe high, of a darke purple colour, with many branches ſtanding by diſtances one from another. The leaues are more indented and leſſe hairy than the male kind: the floures grow at the top, of a brown yellow colour, ſpotted with black ſpots like *Aſter Atticus*; which conſiſts of ſuch a ſubſtance as is in the midſt of the Daiſie or Tanſie floure, & is ſet about with ſmall and ſharpe leaues ſuch as are about the Roſe, which cauſeth the whole floure to reſemble a ſtar, & it ſauoureth like Gum *Elemni*, *Roſine*, or Cedar wood when it is burned. The ſeed is long like *Pyrethrum*, cloſely thruſt together, and lightly cleaueth to any woollen garment that it

toucheth by reaſon of his roughneſſe. ‡ This is found with the leaues whole, and alſo with them parted into three parts: the firſt varietie was expreſt by our Authors figure, and the ſecond is expreſt by this we giue you in the place thereof. ‡

2 There is another wilde Hempe growing in the water, whereof there be two ſorts more, delighting to grow in the like ground, in ſhew differing very little. This ſprings vp with long round ſtalks, and ſomewhat reddiſh, about two cubits high, or ſomthing higher: they are beſet with long green leaues indented about the edges, whereof you ſhal commonly ſee fiue or ſeuen of thoſe leaues hanging vpon one ſtem like the leaues of Hemp, but yet ſofter. The floures are little, of a pale reddiſh colour, conſiſting of ſoft round tufts, and ſtand perting vpon the top of the ſprigges, which at length vaniſh away into downe: the root vnderneath is full of threddy ſtrings of a mean bigneſſe.

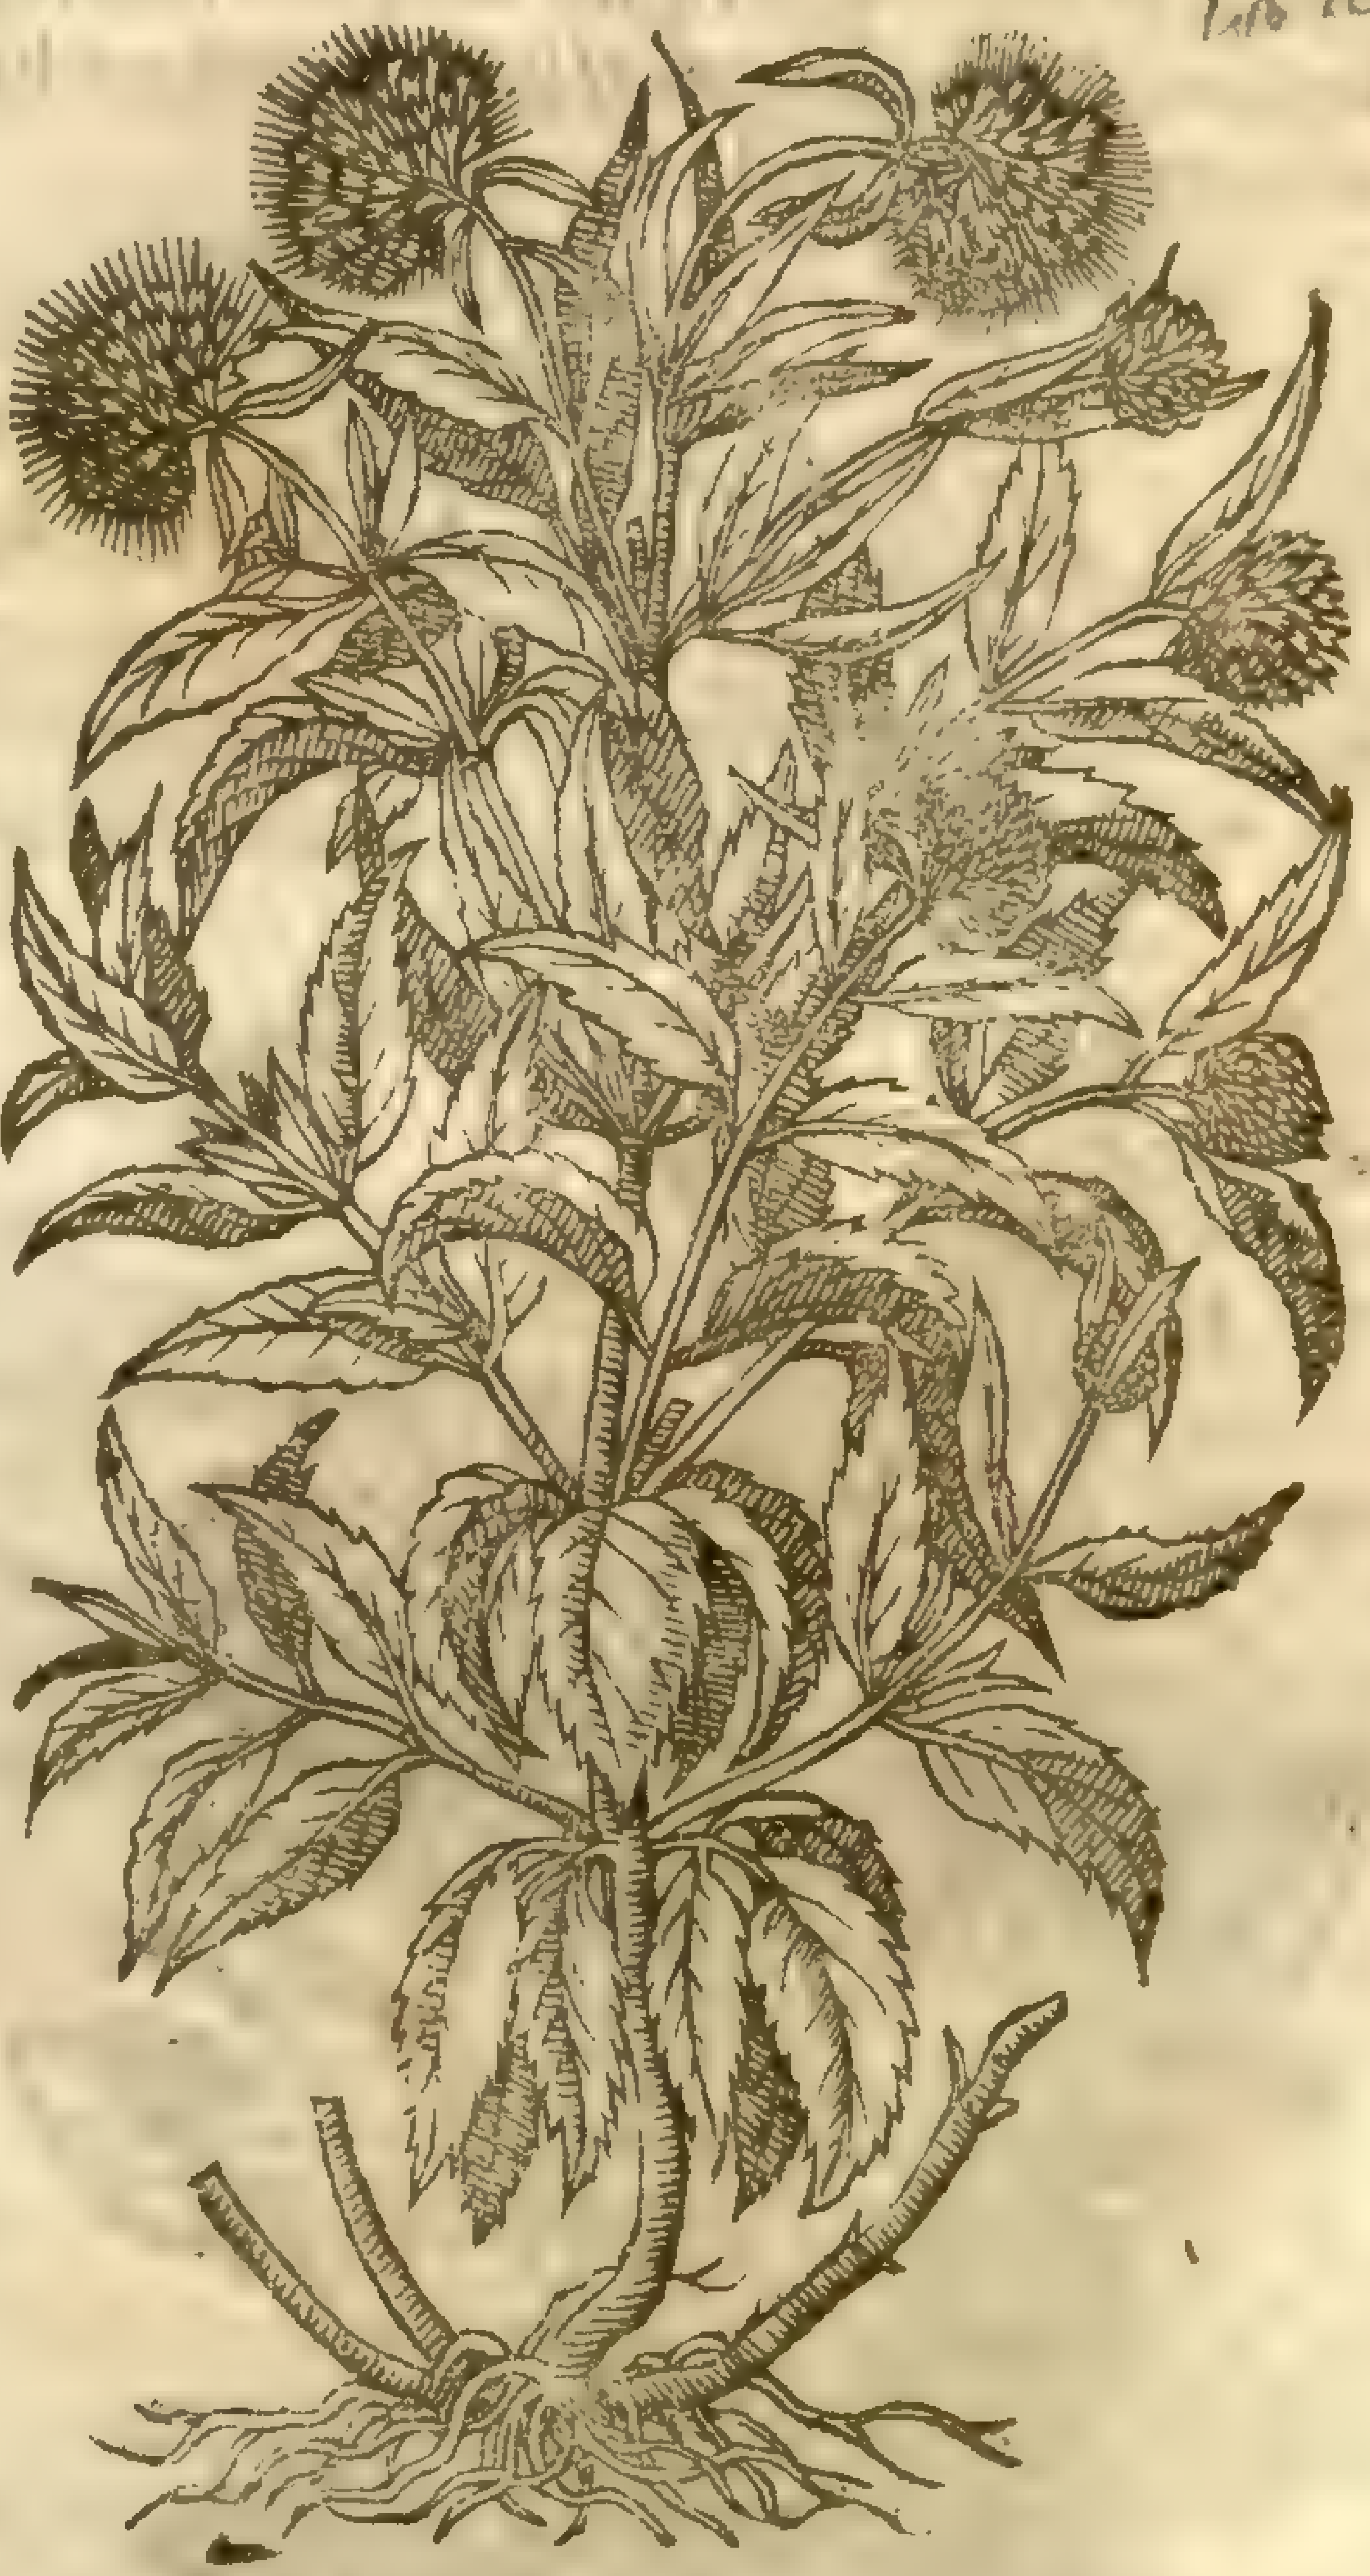
1 *Eupatorium Cannabinum fœmina.*
Water Hemp or water Agrimonie.



Bidens tripartita, [illegible]

‡ 2 *Eupatorium Cannabinum mas.*
Common Dutch Agrimony.

Lob. ic. 524



E. Cannabinum, [illegible] Sm. Fl. 3.401

¶ *The Place.*

They grow about the brinks of ditches, running waters, and ſtanding pooles, and in waterie places almoſt euerie where.

¶ *The Time.*

They floure and flouriſh in Iuly and Auguſt, the root continues, but the ſtalks and leaues wither away in Winter.

¶ *The Names.*

The baſtard or wild Hemps, eſpecially thoſe of the water, are commonly called *Hepatorium Cannabinum*: of diuers alſo *Eupatorium*. *Fuchſius* nameth it *Eupatorium adulterinum*: of moſt, *Cannabina*; of the likeneſſe it hath with the leaues of *Cannabis*, Hemp, and *Eupatorium Auicennæ*. It is thought alſo to be that which *Baptiſta Sardus* termeth *TerZola*: in high Dutch, **S. Kunigund kraut**. That is to ſay in Latine, *Sanctæ Cunigundæ herba*, S. Cunigunds herb: in low-Dutch, **Belkens kruit**: in Engliſh, water Hemp, baſtard and water Agrimonie. It is called *Hepatorium* for that it is good for the liuer.

‡ I haue named the ſecond common Dutch Agrimonie, becauſe it is commonly vſed for Agrimonie in the ſhops of that country. ‡

¶ *The Temperature.*

The leaues and roots of theſe herbs are bitter, alſo hot and dry in the ſecond degree: they haue vertue to ſcoure and open, to attenuat or make thin thicke and groſſe humors, and to expel or driue them forth by vrin: they clenſe and purifie the bloud.

¶ *The Vertues, which chiefely belong to the laſt deſcribed.*

A The decoction hereof is profitably giuen to thoſe that be ſcabbed and haue filthy skinnes, and likewiſe to ſuch as haue their ſpleen and liuer ſtopped or ſwolne; for it takes away the ſtopping of both thoſe intrals, and alſo of the gall: wherefore it is good for them that haue the jaundice, eſpecially ſomewhat after the beginning.

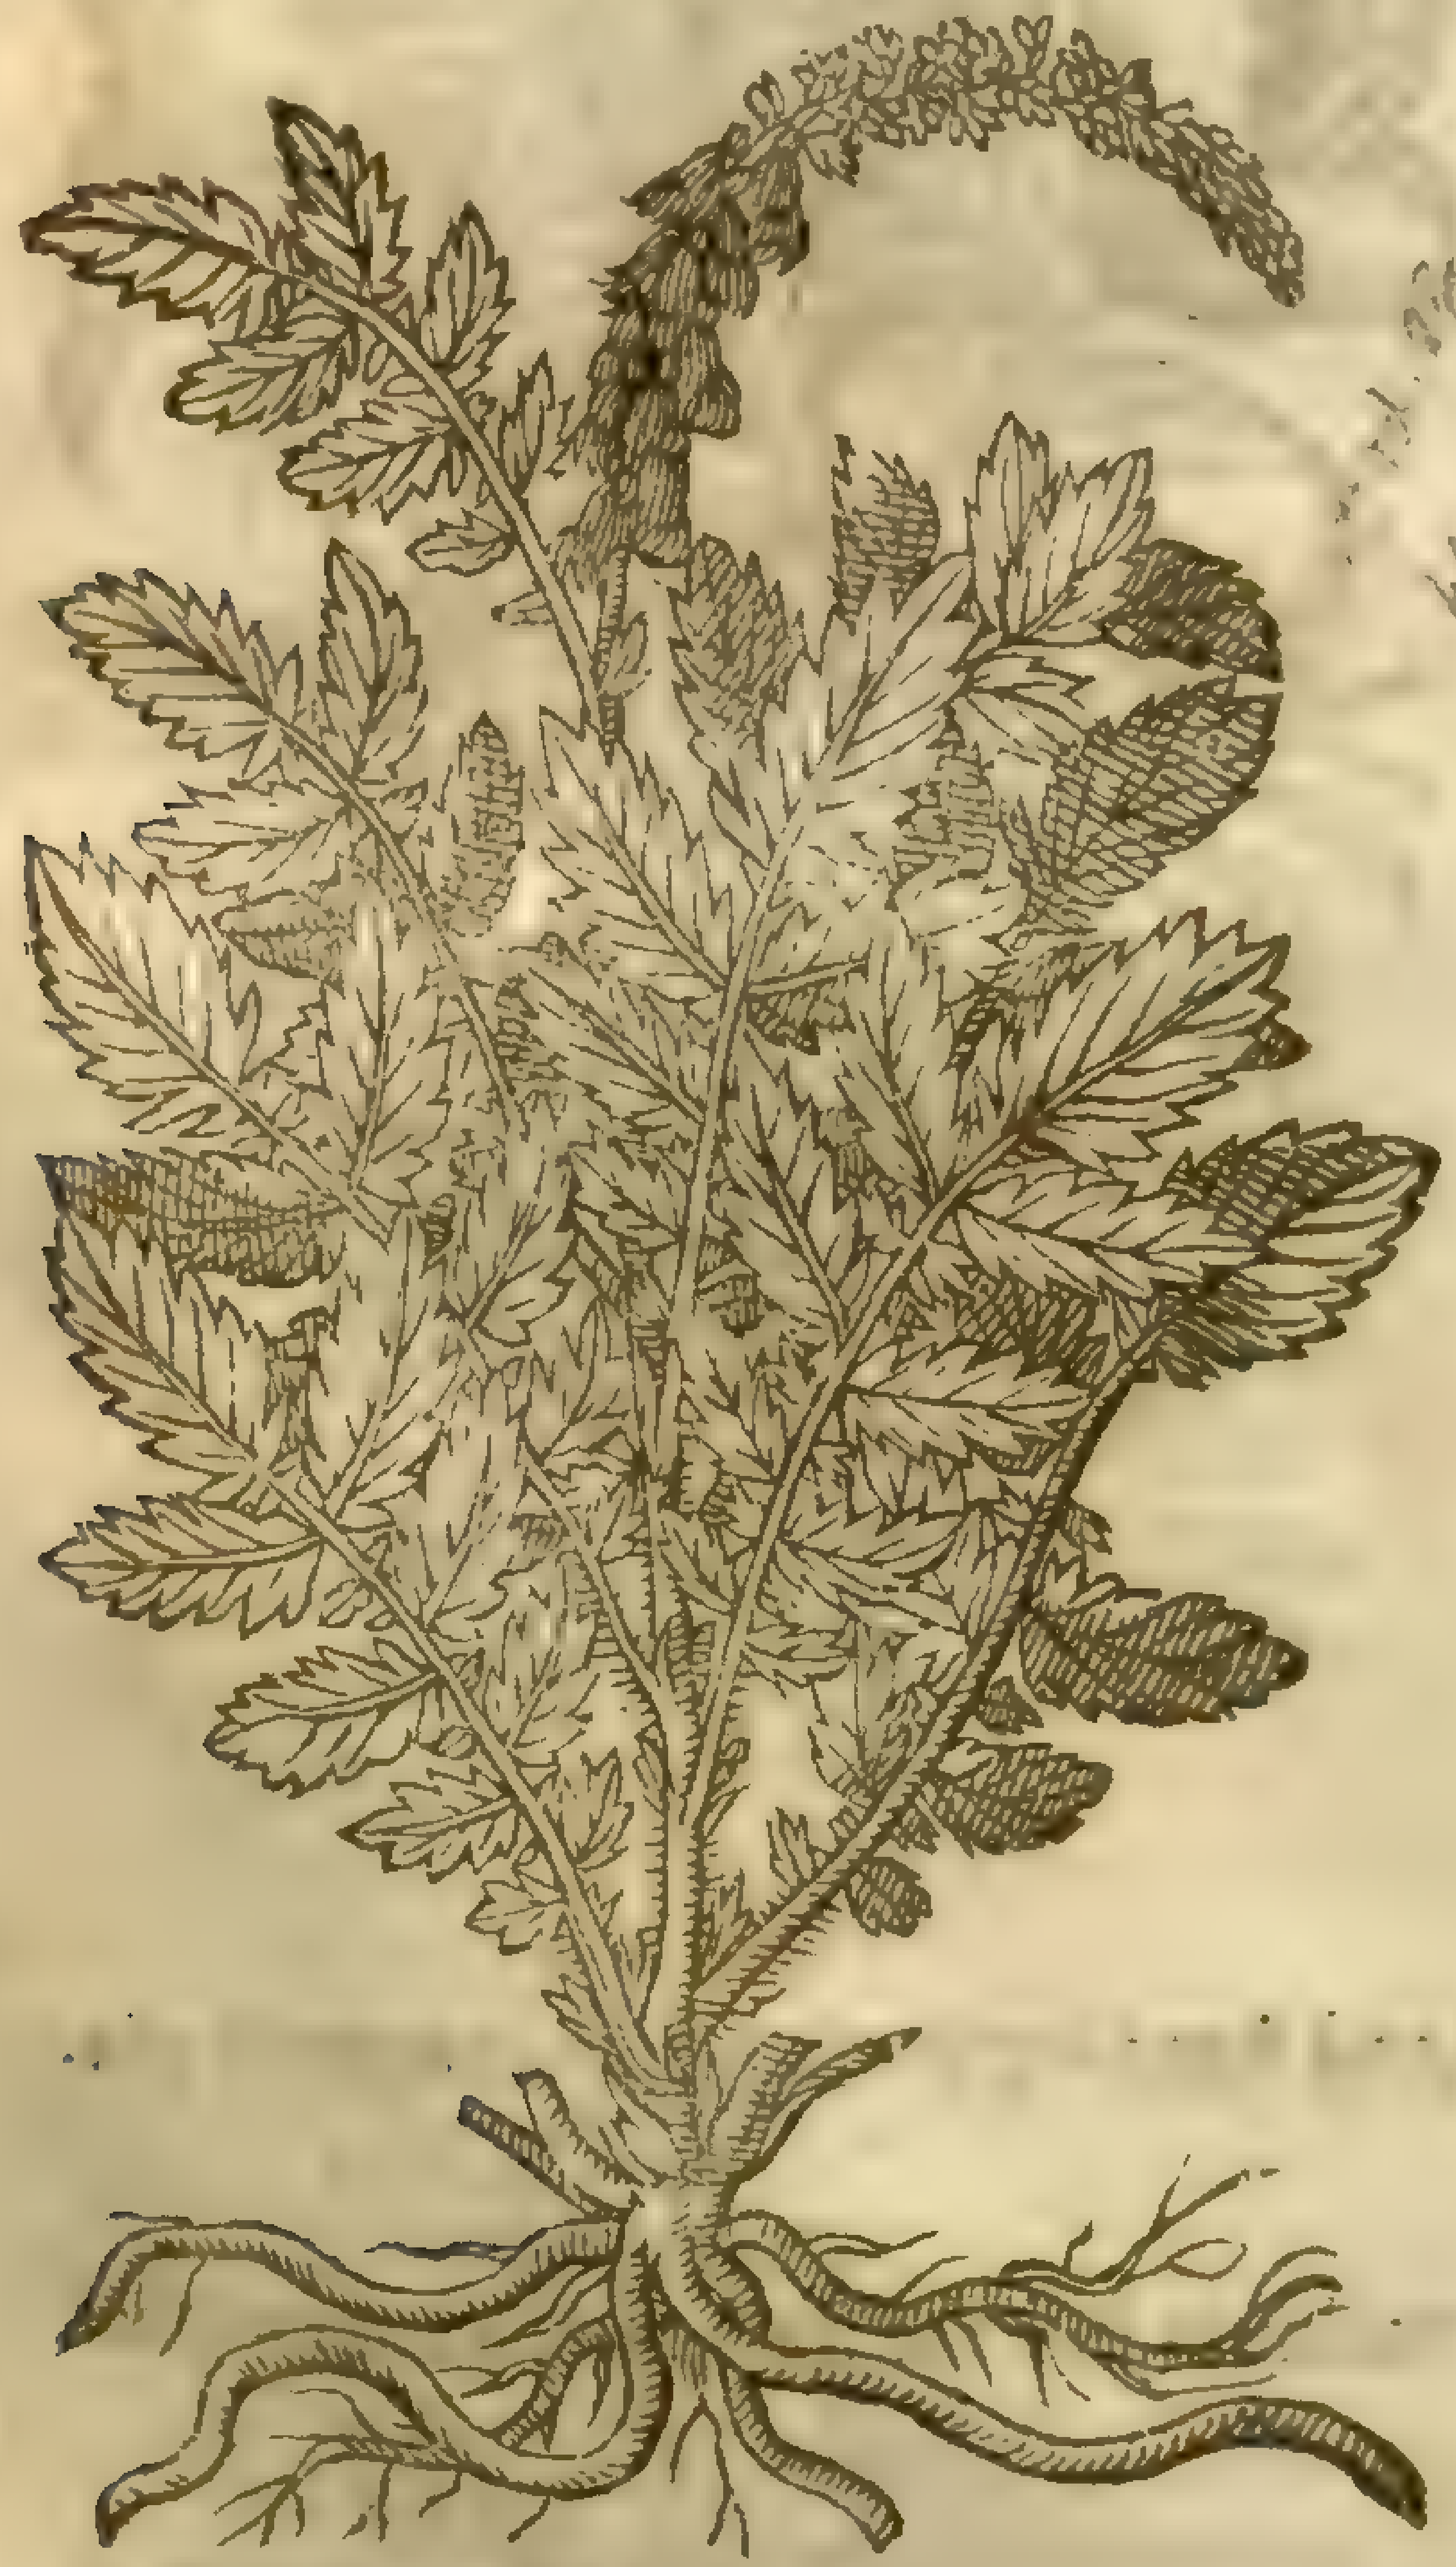
B The herb boiled in wine or water is ſingular good againſt tertian feuers.

C The decoction drunke, and the leaues outwardly applied, do heale all wounds both inward and outward.

D ‡ *Fuchſius* ſaith that the ſecond is very effectuall againſt poiſon. And *Geſner* in his Epiſtles affirmeth, that he boiled about a *pugil* of the fibres of the root of this plant in Wine, and drunke it, which an houre after gaue him one ſtoole, and afterwards twelue vomits, whereby he caſt vp much flegme: ſo that it works (ſaith he) like white Hellebor, but much more eaſily and ſafely, and it did me very much good. ‡

Chap. 241. *Of Egrimonie.*

Agrimonia.
Agrimonie.



¶ *The Deſcription.*

The leaues of Agrimonie are long and hairie, green aboue, and ſomewhat grayiſh vnderneath, parted into diuers other ſmal leaues ſnipt round about the edges, almoſt like the leaues of Hemp: the ſtalke is two foot and a halfe long, rough and hairie; whereupon grow many ſmal yellow flours one aboue another vpwards toward the top: after the flours come the ſeeds ſomwhat long and rough, like to ſmall burs hanging downewards; which when they be ripe doe catch hold vpon peoples garments that paſſe by it. The root is great, long, and blacke.

¶ *The Place.*

It grows in barren places by highwayes, incloſures of medowes, and of corne fields, almoſt euery where, and oftentimes in woods and copſes.

¶ *The Time.*

It floureth in Iune and ſomewhat later, and ſeedeth a great part of Summer after that.

¶ *The Names.*

The Grecians call it εὐπατώριον: and the Latines alſo *Eupatorium*: *Pliny*, *Eupatoria*: yet there is another *Eupatorium* in *Apuleius*, and that is *Marrubium*, Horehound: in like manner the Apothecaries of Germany haue another *Hepatorium* that is there commonly vſed, being deſcribed in the laſt chapter, and may be named *Hepatorium adulterinum*. Agrimonie is named *Lappa inuerſa*: being ſo called, becauſe the ſeeds which are rough like burres, do hang downewards: of ſome, *Philanthropos*, of the cleauing qualitie of the ſeeds hanging to mens garments: the Italians and Spaniards call it *Agramonia*: in high-Dutch, **Odermeng**, **Bruckwurtz**: in low-Dutch, in French, and in Engliſh, Agrimonie, and Egrimonie: *Eupatorium* taketh the name of *Eupator* the finder of it out: and (ſaith *Pliny*) it hath a royal and princely authoritie.

¶ *The Temperature.*

It is hot, and doth moderatly binde, and is of a temperat drineſſe. *Galen* ſaith, that Agrimony is of fine and ſubtill parts, cutting and ſcouring: therefore, ſaith he, it remoues obſtructions or ſtoppings of the liuer, and doth likewiſe ſtrengthen it by reaſon of it's binding qualitie.

¶ *The Vertues.*

The decoction of the leaues of Egrimony is good for them that haue naughty liuers, and for ſuch as piſſe bloud vpon the diſeaſes of the kidnies. A

The ſeed being drunke in wine (as *Pliny* affirmeth) doth helpe the bloudy flix. B

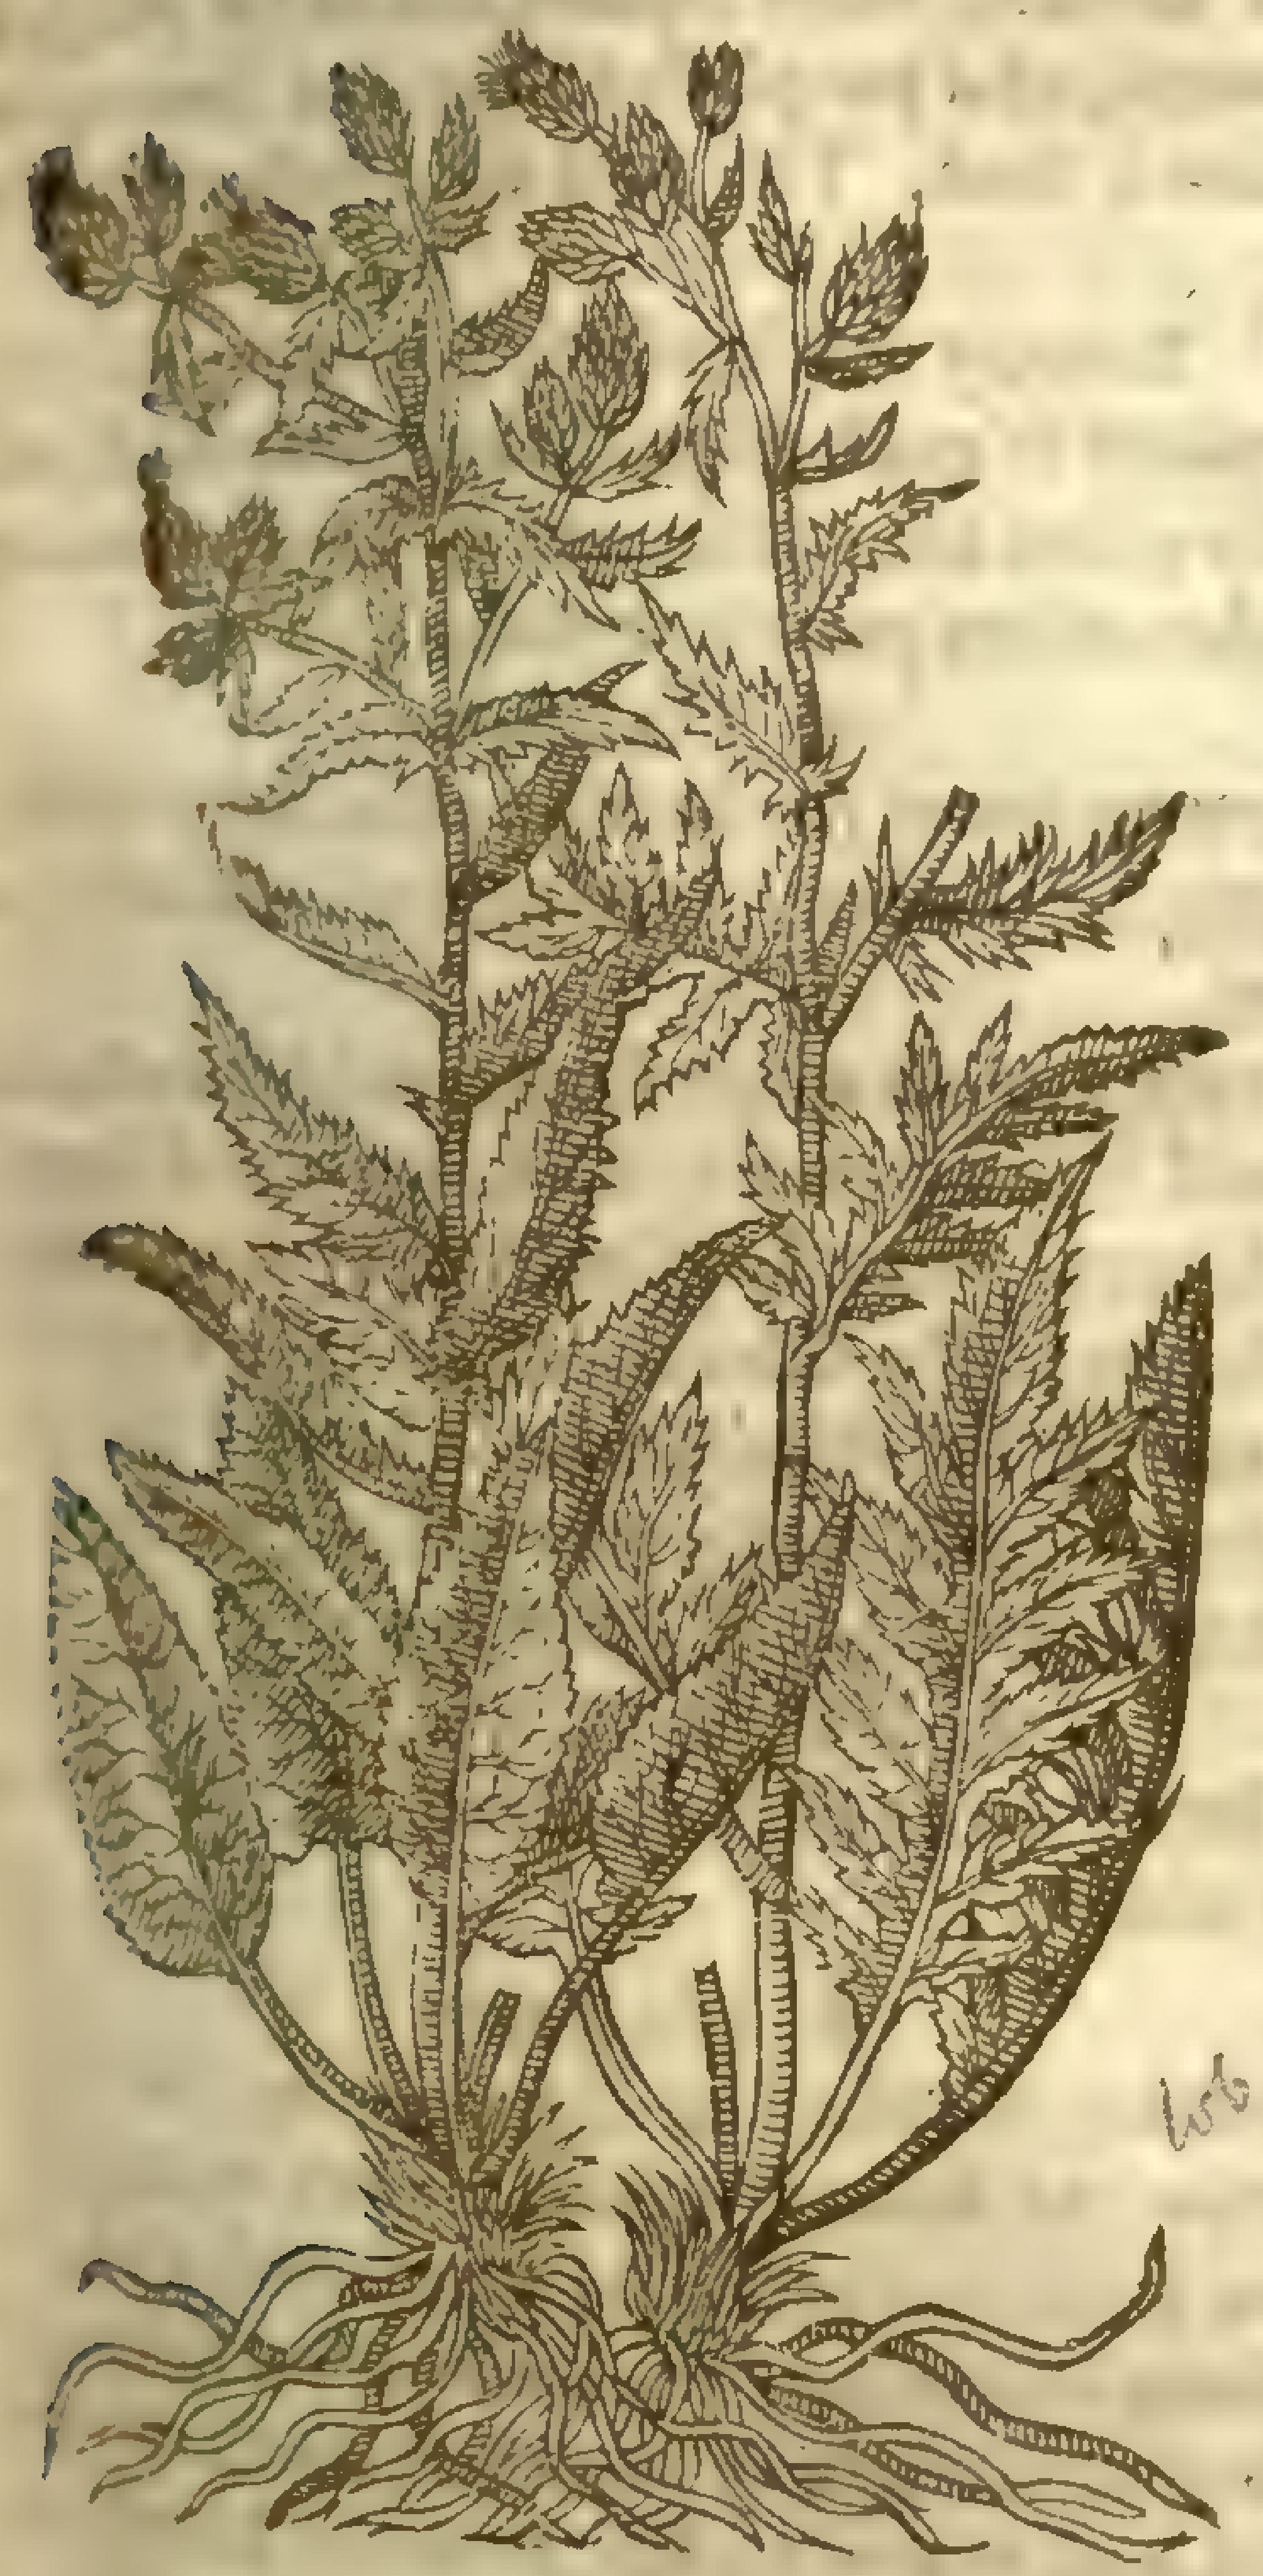
Dioſcorides addeth, that it is a remedy for them that haue bad liuers, and for ſuch as are bitten with ſerpents. C

The leaues being ſtamped with old ſwines greaſe, and applied, cloſe vp vlcers that be hardly healed, as *Dioſcorides* ſaith. D

‡ Agrimony boiled in wine and drunke, helpes inueterate hepaticke fluxes in old people. ‡ E

[illegible]

Chap. 242. Of Saw-wort.



1. 2. *Serratula purpurea, ſiue alba.*
Saw-wort with purple, or white floures.

¶ *The Deſcription.*

1 THe plant which the new Writers haue called *Serratula* differeth from *Betonica*, although the Antients haue ſo called Betony; It hath large leaues ſomewhat ſnipt about the edges like a ſaw (whereof it took his name) riſing immediately from the root: among which come vp ſtalkes of a cubit high, beſet with leaues very deeply cut or jagged euen to the middle of the rib, not much vnlike the male Scabious. The ſtalkes towards the top diuide themſelues into other ſmall branches, at the top whereof they beare floures ſomewhat ſcaly, like the Knapweed, but not ſo great nor hard: at the top of the knap commeth forth a buſhie or thrummy floure, of a purple colour. The root is threddy, and thereby increaſeth and becommeth of a great quantitie.

2 Saw-wort with white floures differeth not from the precedent, but in the colour of the floures: for as the other bringeth forth a buſh of purple floures; in a manner this plant bringeth forth floures of the ſame faſhion, but of a ſnow white colour, wherein conſiſteth the difference.

‡ Our Authour out of *Tabernamontanus* gaue three figures, with as many deſcriptions of this plant, yet made it onely to vary in the colour of the floures, being either purple, white, or red; but he did not touch the difference which *Tabernamontanus* by his figures expreſt, which was, the firſt had all the leaues whole, being onely ſnipt about the edges; the lower leaues of the ſecond were moſt of them whole, and thoſe vpon the ſtalkes deepely cut in, or diuided, and the third had the leaues both below and aboue all cut in or deeply diuided. The figure which we here giue you expreſſes the firſt and third varieties: and if you pleaſe, the one may be with white, and the other with red or purple floures. ‡

¶ *The Place.*

Sawewort groweth in woods and ſhadowie places, and ſometimes in medowes. They grow in Hampſted wood: likewiſe I haue ſeene it growing in great abundance in the wood adjoyning to Iſlington, within halfe a mile from the further end of the towne, and in ſundry places of Eſſex and Suffolke.

¶ *The Time.*

They floure in Iuly and Auguſt.

¶ *The Names.*

The late Writers cal this *Serratula*, and *Serratula tinctoria*, it differeth as we haue ſaid from Betony, which is alſo called *Serratula*: it is called in Engliſh Saw-wort. ‡ *Cæſalpinus* calls it *Cerretta* and *Serretta*; and *Thalius*, *Centauroides*, or *Centaurium majus ſylveſtre Germanicum*. ‡

¶ *The Temperature and Vertues.*

A *Serratula* is wonderfully commended to be moſt ſingular for wounds, ruptures burſtings, and ſuch like: and is referred vnto the temperature of Sanicle.

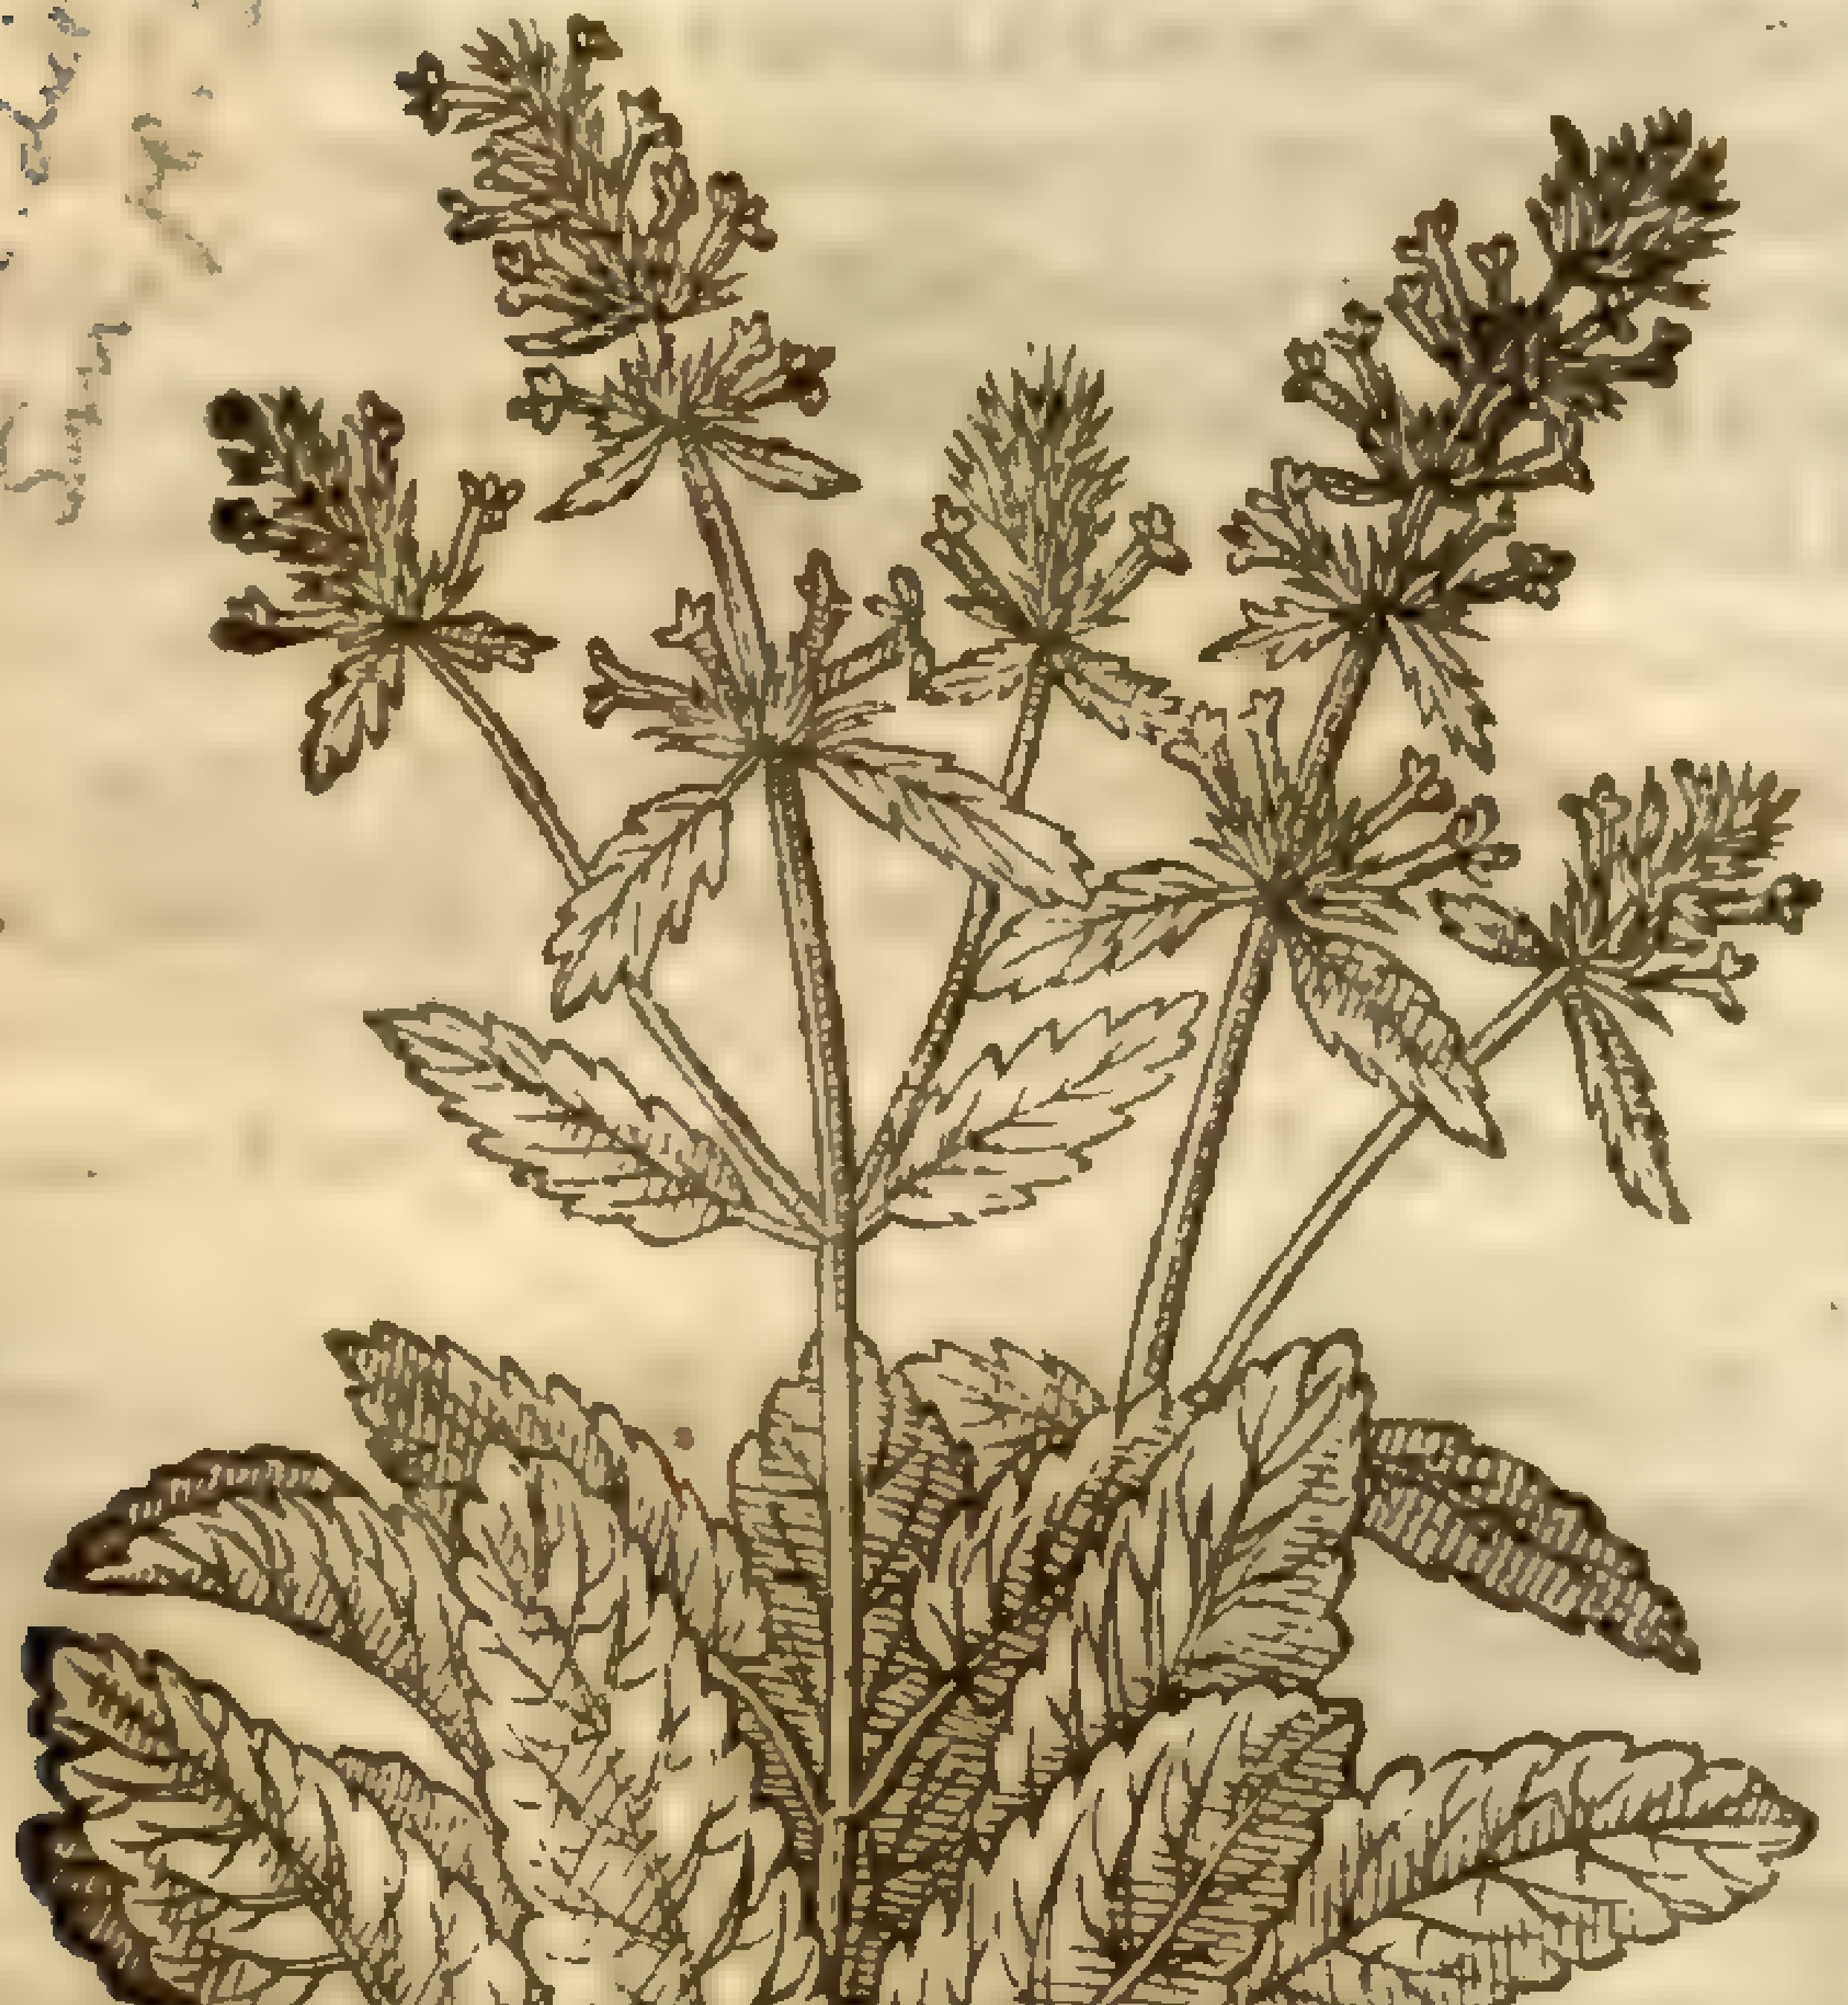
Chap. 243. Of Betony.

¶ *The Deſcription.*

1 Betony groweth vp with long leaues and broad, of a darke greene colour, ſlightly indented about the edges like a ſaw. The ſtalke is ſlender, foure ſquare, ſomewhat rough, a foot high more or leſſe. It beareth eared floures, of a purpliſh colour, and ſometimes reddiſh; after the floures, commeth in place long cornered ſeed. The root conſiſteth of many ſtrings.

1 *Betonica.*
Betony.

B. officinalis, Linn. Syn. p. 238



2 Betony with white floures is like the precedent in each reſpect, ſauing that the flours of this plant are white, and of greater beautie, and the others purple or red as aforeſaid.

¶ *The Place.*

Betony loues ſhadowie woods, hedge-rowes, and copſes, the borders of paſtures, and ſuch like places.

Betony with white floures is ſeldome ſeene. I found it in a wood by a Village called Hampſtead, neere vnto a Worſhipfull Gentlemans houſe, one of the Clerkes of the Queenes counſell called Mr. *Wade*, from whence I brought plants for my Garden, where they flouriſh as in their naturall place of growing.

¶ *The Time.*

They floure and flouriſh for the moſt part in Iune and Iuly.

¶ *The Names.*

Betony is called in Greeke, κέστρον: in Latine, *Betonica*: of diuers, *Vetonica*: but vnproperly. There is likewiſe another *Betonica*, which *Paulus Ægineta* deſcribed; and *Galen* in his firſt booke of the gouernment of health ſheweth that it is called κέστρον, that is to ſay, *Betonica*, Betonie, and alſo *Sarxiphagon*: *Dioſcorides* notwithſtanding doth deſcribe another *Sarxiphagon*.

¶ *The Temperature.*

Betony is hot and dry in the ſecond degree: it hath force to cut, as *Galen* ſaith.

¶ *The Vertues.*

A Betony is good for them that be ſubject to the falling ſickeneſſe, and for thoſe alſo that haue ill heads vpon a cold cauſe.

B It cleanſeth the lungs and cheſt, it taketh away obſtructions or ſtoppings of the liuer, milt, and gall: it is good againſt the yellow jaundiſe.

C It maketh a man to haue a good ſtomacke and appetite to his meate: it preuaileth againſt ſower belchings: it maketh a man piſſe well: it mitigateth paine in the kidnies and bladder: it breaketh ſtones in the kidnies, and driueth them forth.

D It is alſo good for ruptures, cramps, and convulſions: it is a remedy againſt the biting of mad dogs and venomous ſerpents, being drunk, and alſo applied to the hurts, and is moſt ſingular againſt poyſon.

E It is commended againſt the paine of the Sciatica, or ache of the huckle bone.

F There is a conſerue made of the floures and ſugar good for many things, and eſpecially for the head-ache. A dram weight of the root of Betony dried, and taken with meade or honied water, procureth vomit, and bringeth forth groſſe and tough humors, as diuers of our age do report.

G The pouder of the dried leaues drunke in wine is good for them that ſpit or piſſe bloud, and cureth all inward wounds, eſpecially the greene leaues boyled in wine and giuen.

H The pouder taken with meate looſeth the belly very gently, and helpeth them that haue the falling ſickeneſſe with madneſſe and head-ache.

I It is ſingular againſt all paines of the head: it killeth wormes in the belly, helpeth the ague: it cleanſeth the mother, and hath great vertue to heale the body, being hurt within by bruiſing or ſuch like.

Chap. 244. *Of Water-Betony.*

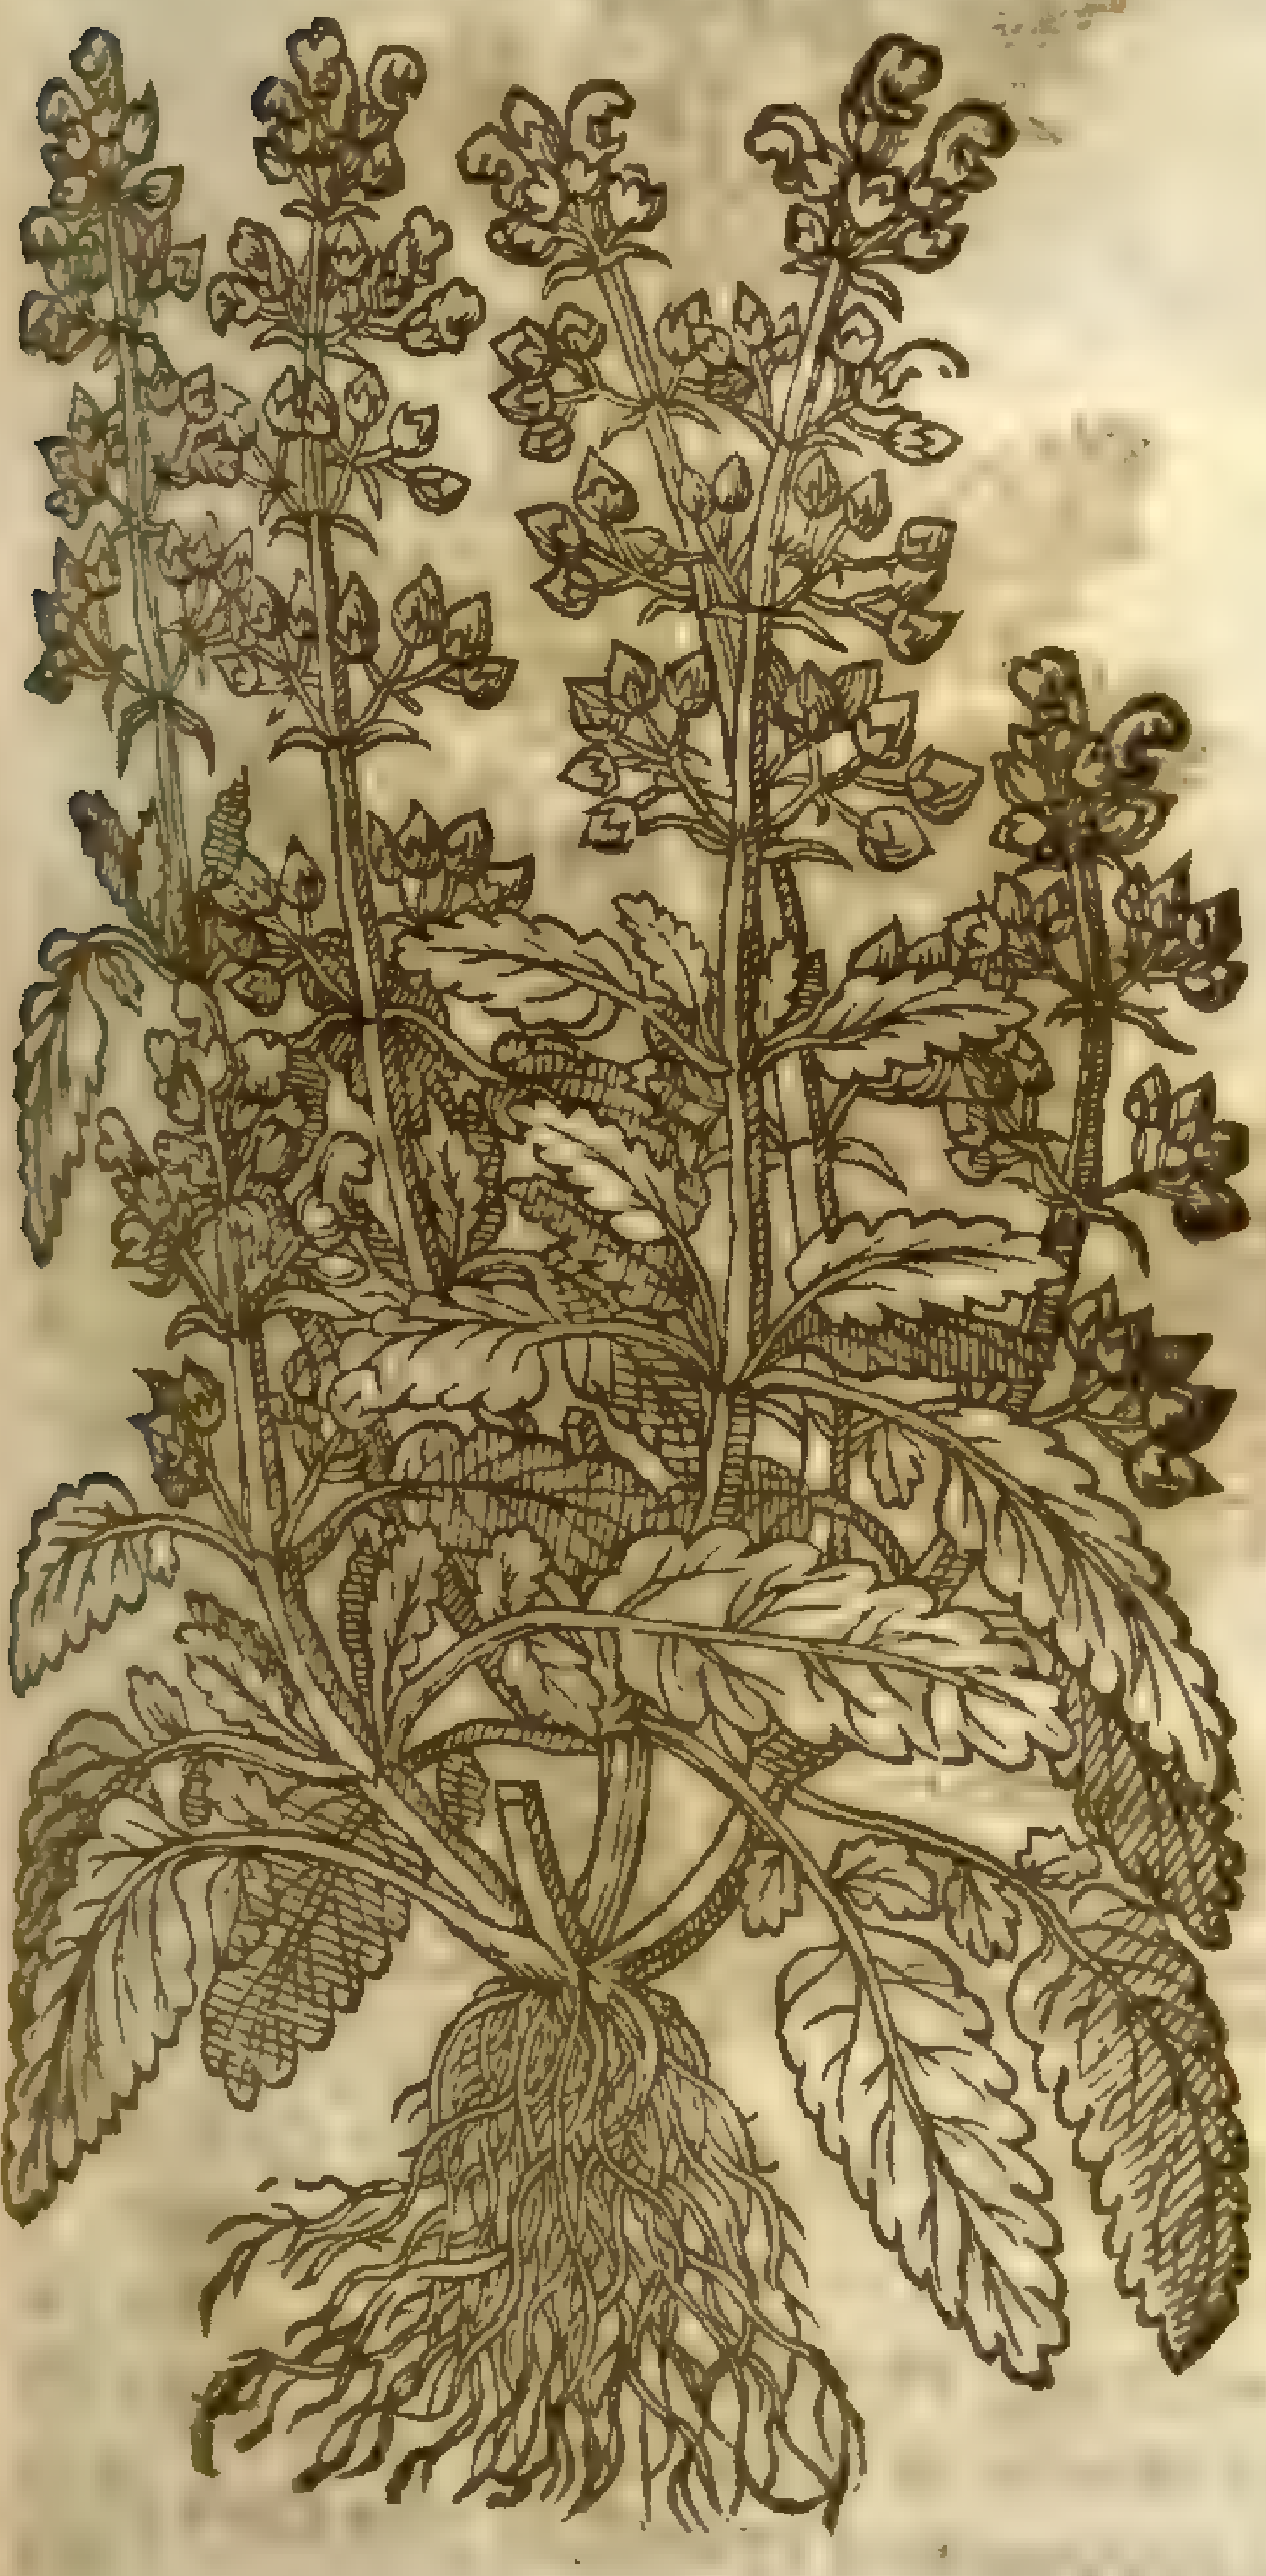
¶ *The Deſcription.*

Water Betony hath great ſquare hollow and brown ſtalks, whereon are ſet very broad leaues notched about the edges like vnto thoſe of Nettles, of a ſwart greene colour, growing for the moſt part by two and two as it were from one joynt, oppoſite or ſtanding one right againſt another. The floures grow at the top of the branches, of a darke purple colour, in ſhape like to little helmets. The ſeed is ſmall, contained in round bullets or buttons. The root is compact of many and infinite ſtrings.

Betonica aquatica.
Water Betony.

Scroph

Sm pl. 3. 138



¶ *The Place.*

It groweth by brookes and running waters, by ditch ſides, and by the brinks of riuers, and is ſeldome found in dry places.

¶ *The Time.*

It floureth in Iuly and Auguſt, and from that time the ſeed waxeth ripe.

¶ *The Names.*

Water Betony is called in Latine *Betonica aquatica*: ſome haue thought it *Dioſcorides* his *Clymenum*: others, his *Galeopſis*: it is *Scrophularia altera* of *Dodonæus*: of *Turner*, *Clymenon*: of ſome, *Seſamoides minus*, but not properly: of others, *Serpentaria*: in Dutch, **S. Antonies crupt**: in Engliſh, Water Betony: and by ſome, Browne-wort: in Yorke-ſhire, Biſhops leaues.

¶ *The Temperature.*

Water Betony is hot and dry.

¶ *The Vertues.*

A The leaues of Water Betony are of a ſcouring or cleanſing quality, and are very good to mundifie foule and ſtinking vlcers, eſpecially the juyce boyled with hony.

B It is reported, if the face be waſhed with the juyce thereof, it taketh away the redneſſe and deformity of it.

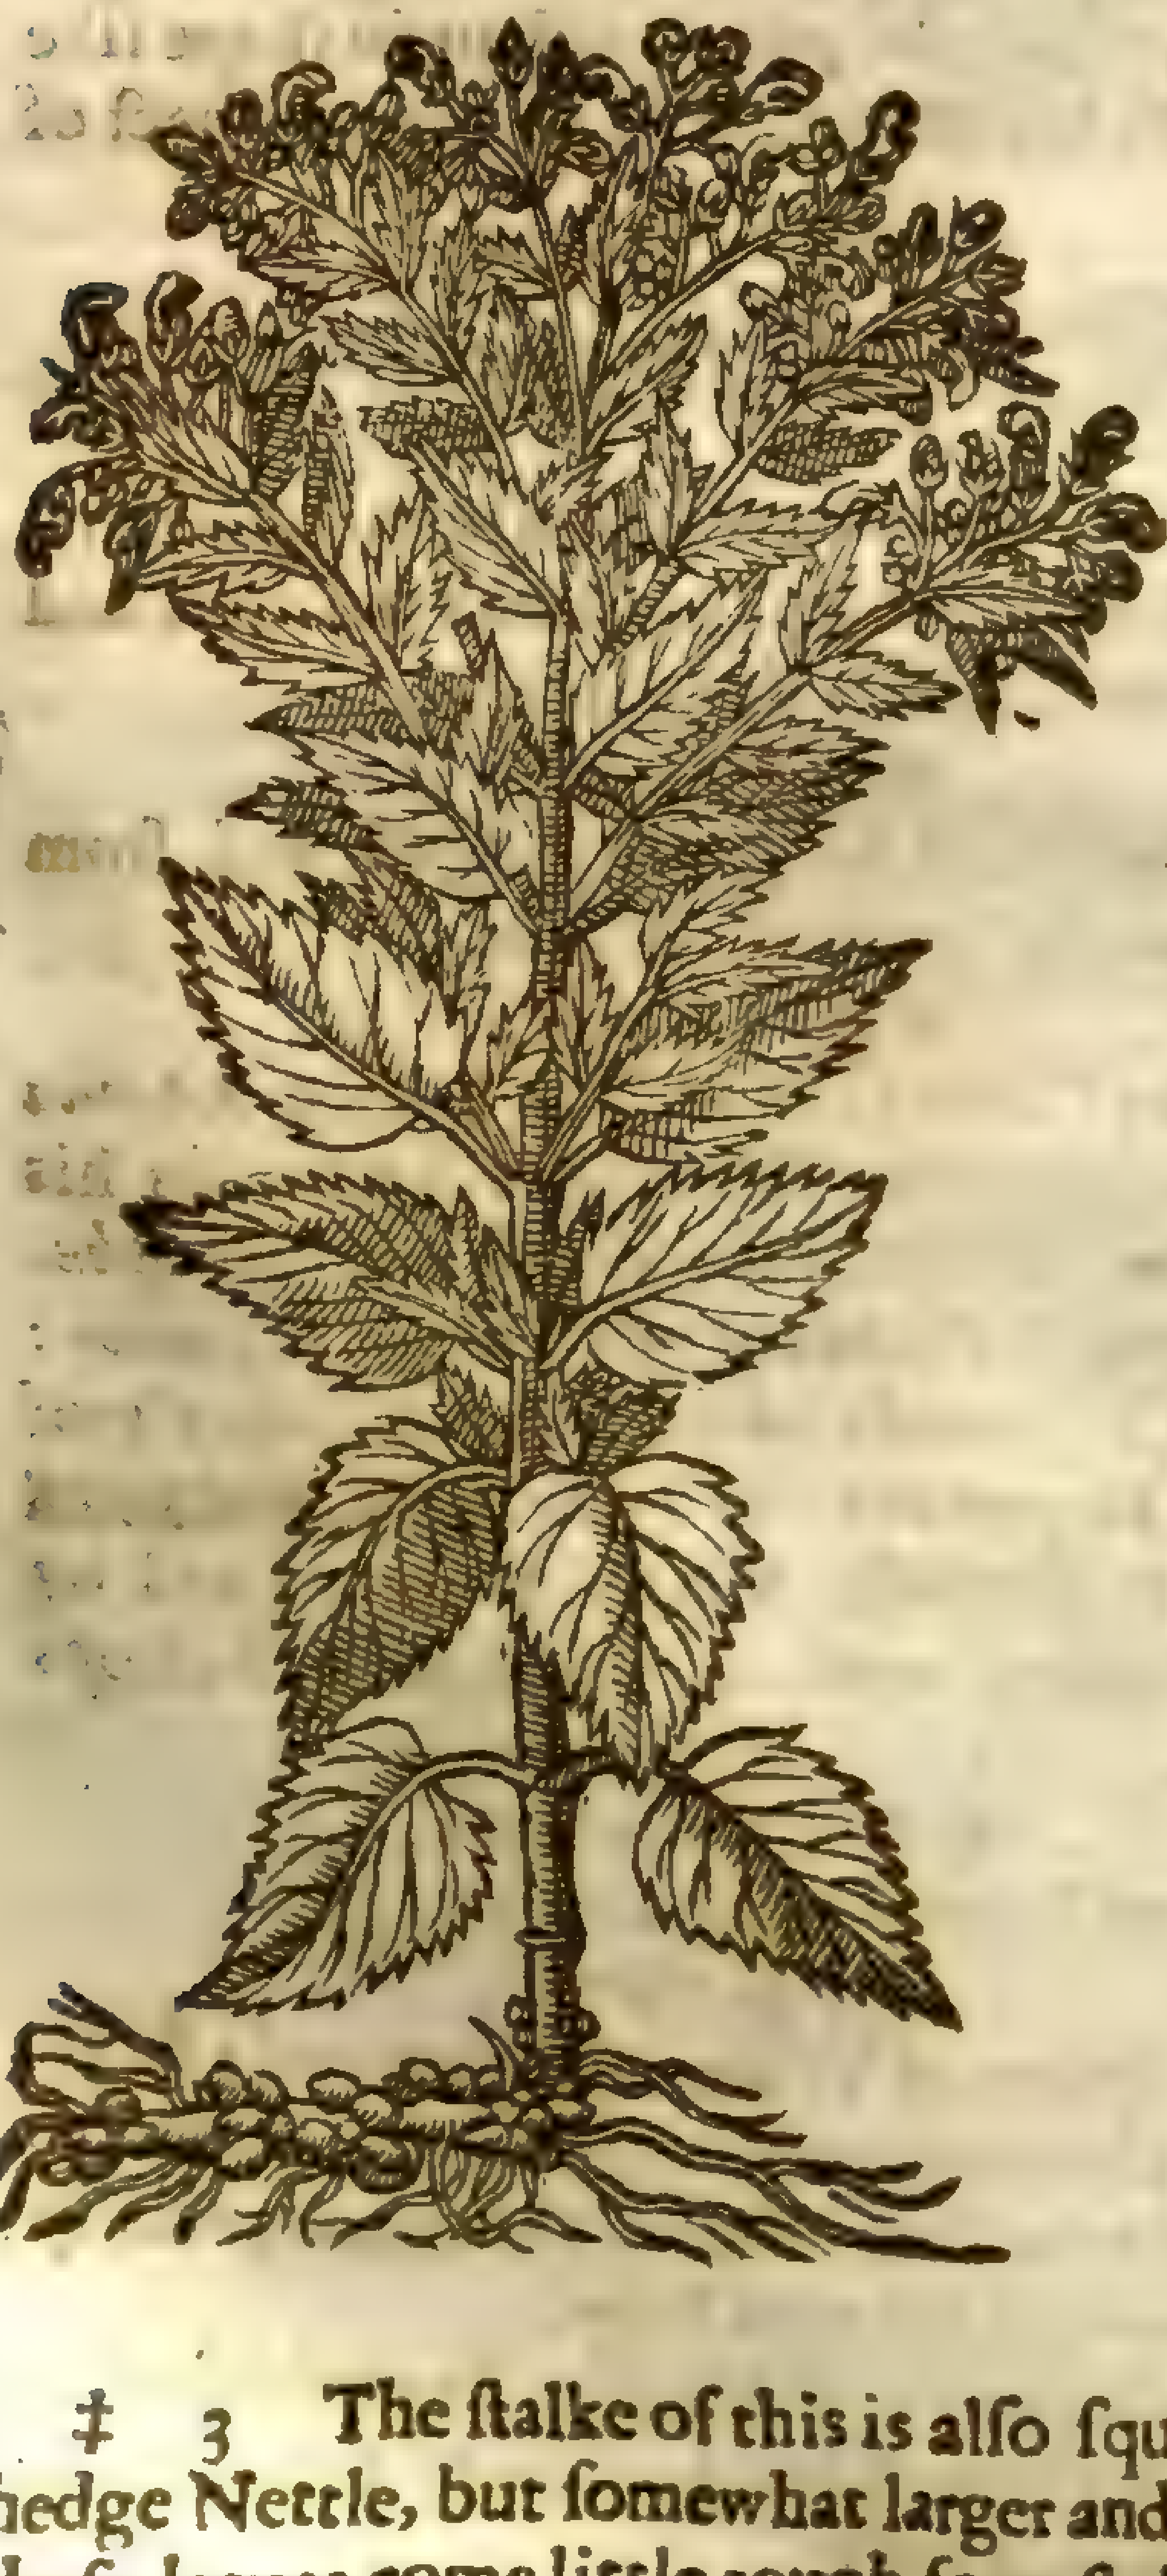
Chap. 245.

Of Great Figge-wort, or Brownewoort.

¶ *The Deſcription.*

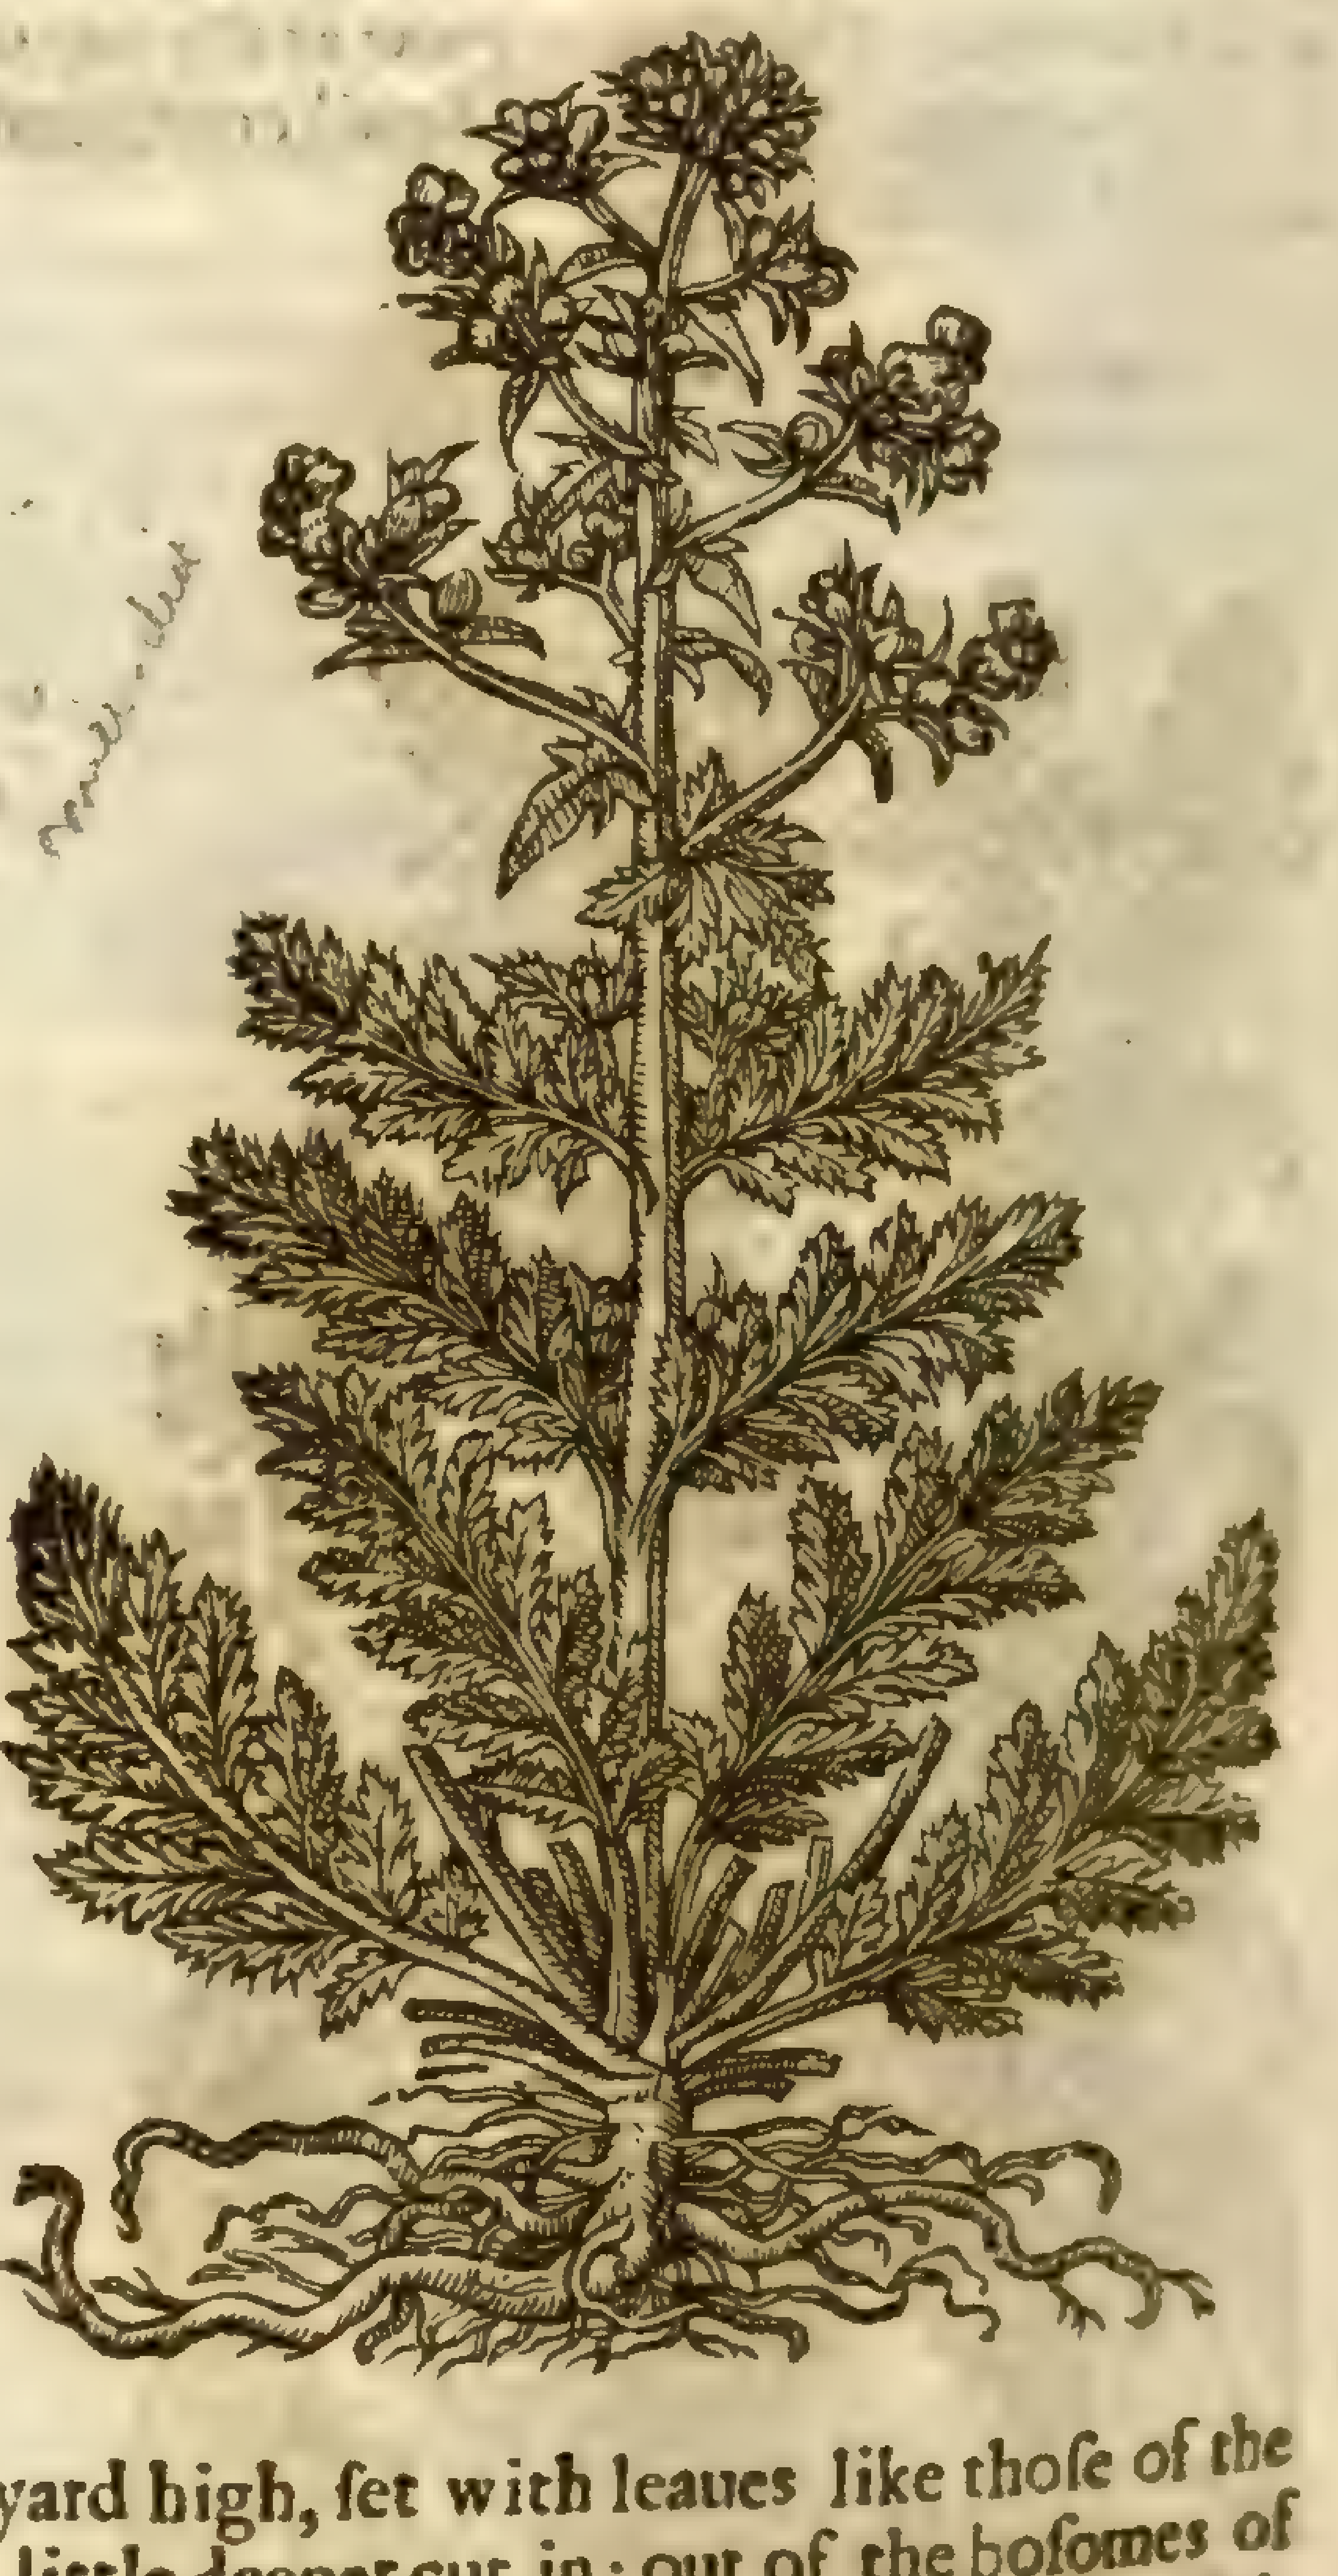
1 The great Fig-wort ſpringeth vp with ſtalkes foure ſquare, two cubits high, of a darke purple colour, and hollow within: the leaues grow alwaies by couples, as it were from one ioynt, oppoſite or ſtanding one right againſt another, broad, ſharpe pointed, ſnipped round about the edges like the leaues of the greater Nettle, but bigger, blacker, and nothing at all ſtinging when they be touched: the floures in the tops of the branches are of a darke purple colour, very like in forme to little helmets: then commeth vp little ſmall ſeed in pretty round buttons, but ſharpe at the end: the root is whitiſh, beſet with little knobs and bunches as it were knots and kernels.

2 There is another Figge-wort called *Scrophularia Indica*, that hath many and great branches trailing here and there vpon the ground, full of leaues, in faſhion like the wilde or common Thiſtle, but altogether without prickes: among the leaues appeare the floures in faſhion like a hood, on the outſide of a feint colour, and within intermixt with purple; which being fallen and withered, there come in place ſmall knops very hard to breake, and ſharpe at the point as a bodkin: which containeth a ſmall ſeed like vnto Time. The whole plant periſheth at the firſt approach of Winter, and muſt be ſowen againe in Aprill, in good and fertile ground. ‡ This is the *Scrophularia Cretica* 1. of *Cluſius*. ‡



1 *Scrophularia major.*
Great Fig-wort.

S. nodosa, L.
Smel. dist.
Sm. p. 3.137



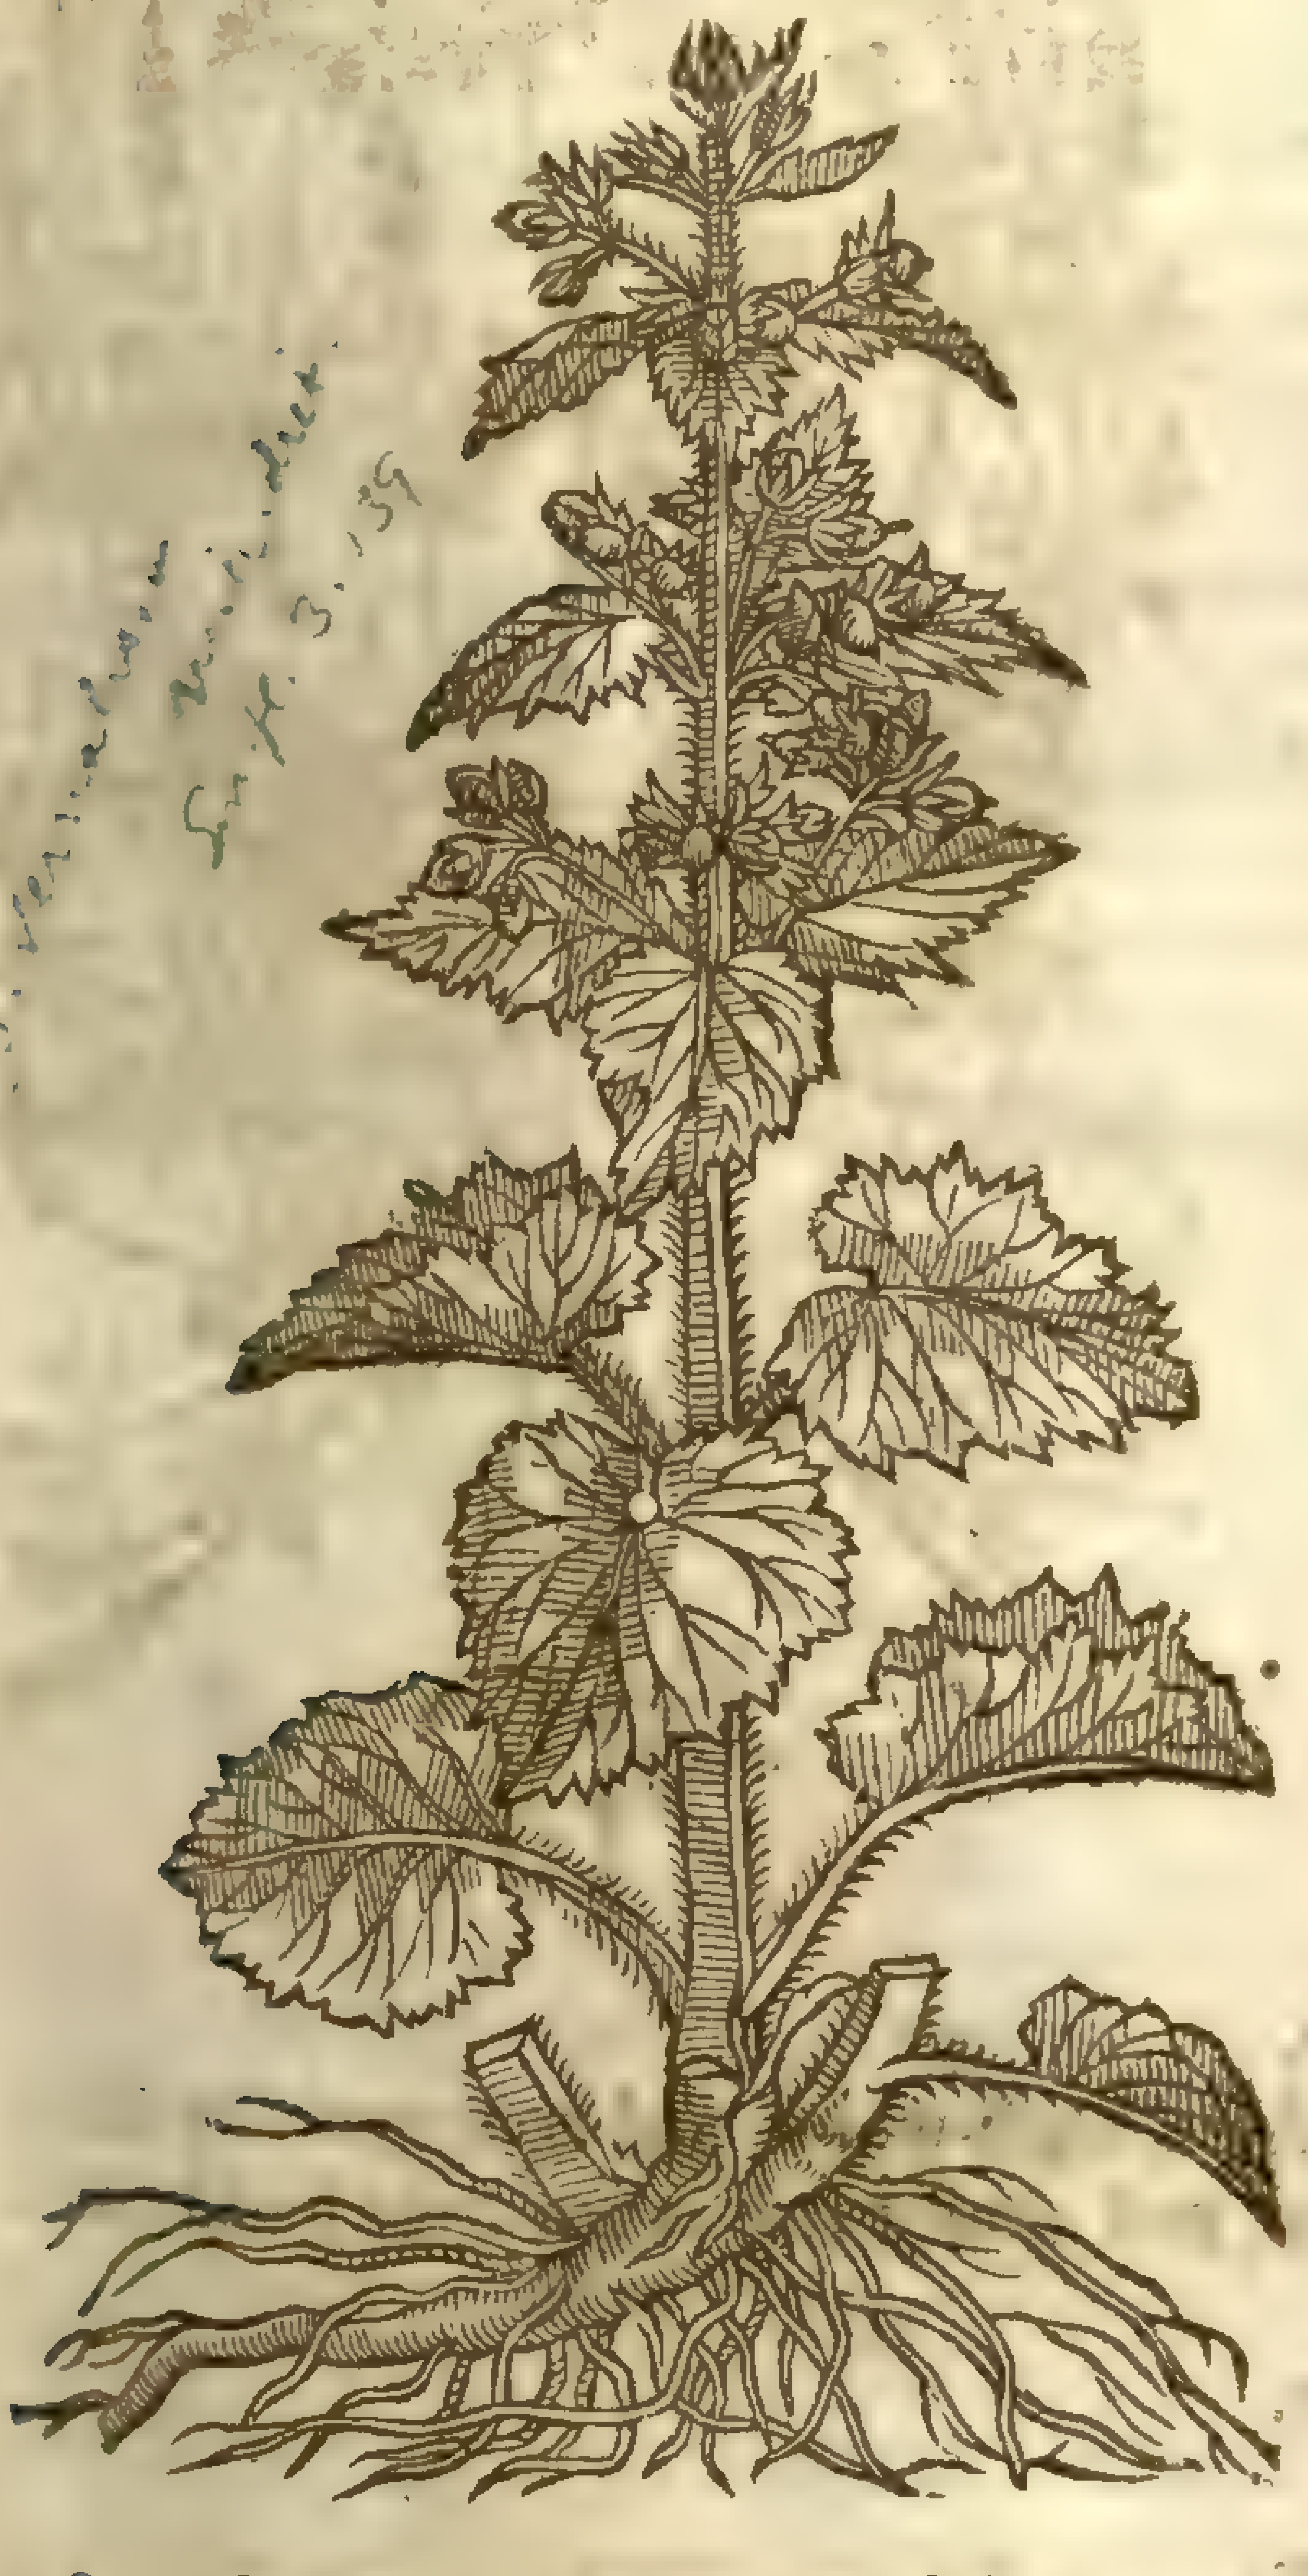
‡ 2 *Scrophularia Indica.*
Indian Fig-wort.

[illegible] smel. dist

‡ 3 The ſtalke of this is alſo ſquare, and ſome yard high, ſet with leaues like thoſe of the hedge Nettle, but ſomewhat larger and thicker, and a little deeper cut in: out of the boſomes of theſe leaues come little rough foot-ſtalkes ſome inch or two long, carrying ſome foure or fiue hollow round floures of a greeniſh yellow colour, with ſome threds in them, being open at the top, and cut in with fiue little gaſhes: the ſeeds are blacke, and contained in veſſels like thoſe of the

firſt deſcribed: the root is like that of the Nettle, and liues many yeares: it floures in May, and the ſeeds are ripe in Iune. I haue not found nor heard of this wilde with vs, but ſeen it flouriſhing in the garden of my kinde friend Mr *Iohn Parkinſon*. *Cluſius* calls it *Lamium 2. Pannonicum exoticum*: and *Bauhine* hath ſet it forth by the name of *Scrophularia flore luteo*: whom in this I follow. ‡

‡ 3 *Scrophularia flore luteo.*
Yellow floured Fig-wort.



S. vernalis [illegible]
[illegible] 3. 159

¶ *The Place.*

The great *Scrophularia* groweth plentifully in ſhadowie Woods, and ſometimes in moiſt medowes, eſpecially in greateſt abundance in a wood as you goe from London to Herneſey, and alſo in Stow wood and Shotouer neere Oxford.

The ſtrange Indian fig-woort was ſent mee from Paris by *Iohn Robin* the Kings Herbariſt, and it now groweth in my Garden.

¶ *The Time.*

They floure in Iune and Iuly.

¶ *The Names.*

Fig-wort or Kernel-wort is called in Latine *Scrophularia major*, that it might differ from the leſſer Celandine, which is likewiſe called *Scrophularia*, with this addition *minor*, the leſſer: it is called of ſome *Millemorbia*, and *Caſtrangula*: in Engliſh, great Fig-wort, or Kernel-wort, but moſt vſually Brown-wort.

¶ *The Vertues.*

A Fig-woort is good againſt the hard kernells which the Græcians call χοιράδας: the Latines, *Strumas*, and commonly *Scrophulas*, that is, the Kings Euill: and it is reported to be a remedy againſt thoſe diſeaſes whereof it tooke his name, as alſo the painefull piles and ſwelling of the hæmorrhoides.

B Diuers do raſhly teach, that if it be hanged about the necke, or elſe carried about one, it keepeth a man in health.

C Some do ſtampe the root with butter, and ſet it in a moiſt ſhadowie place fifteene daies together: then they do boyle it, ſtraine it, and keepe it, wherewith they anoint the hard kernels, and the hæmorroide veines, or the piles which are in the fundament, and that with good ſucceſſe.

CHAP. 246. *Of Veruaine.*

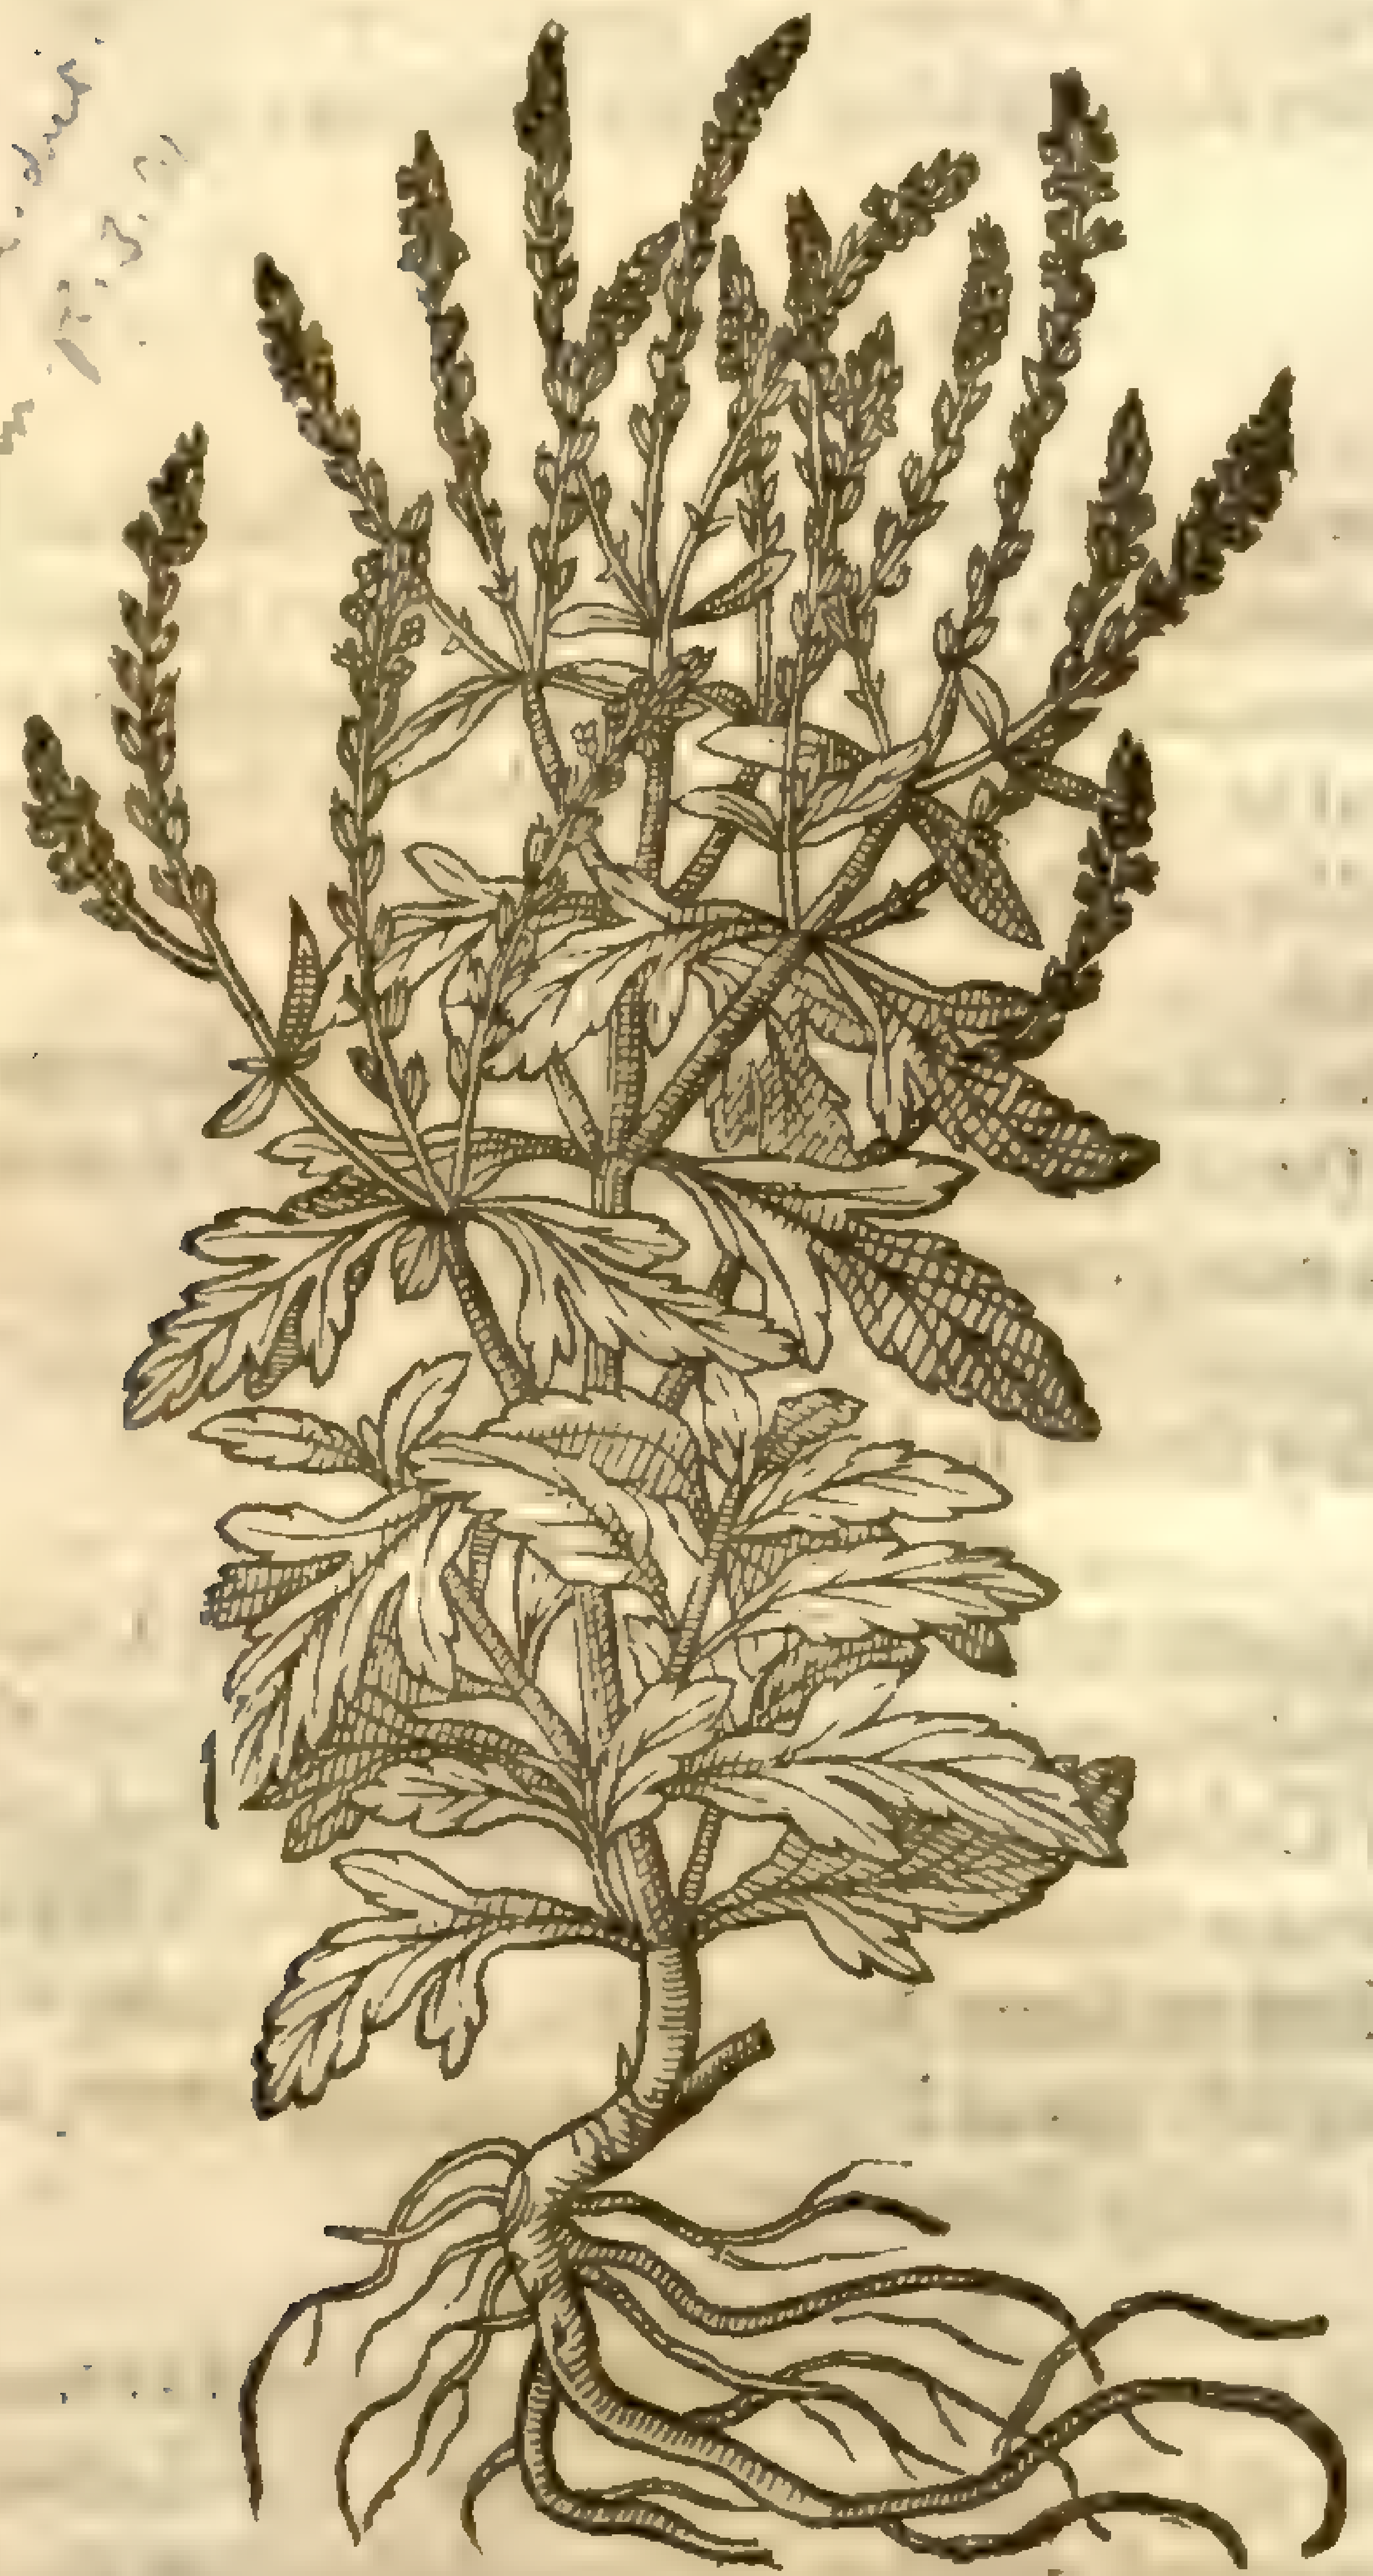
¶ *The Description.*

1 THe ſtalke of vpright Veruaine riſeth from the root ſingle, cornered, a foot high, ſeldome aboue a cubit, and afterwards diuided into many branches. The leaues are long, greater than thoſe of the Oke, but with bigger cuts and deeper: the floures along the ſprigs are little, blew, or white, orderly placed: the root is long, with ſtrings growing on it.

2 Creeping Veruaine ſendeth forth ſtalkes like vnto the former, now and then a cubit long, cornered, more ſlender, for the moſt part lying vpon the ground. The leaues are like the former, but with deeper cuts, and more in number. The floures at the tops of the ſprigs are blew, and purple withall, very ſmall as thoſe of the laſt deſcribed, and placed after the ſame manner and order. The root groweth ſtraight downe, being ſlender and long, as is alſo the root of the former.

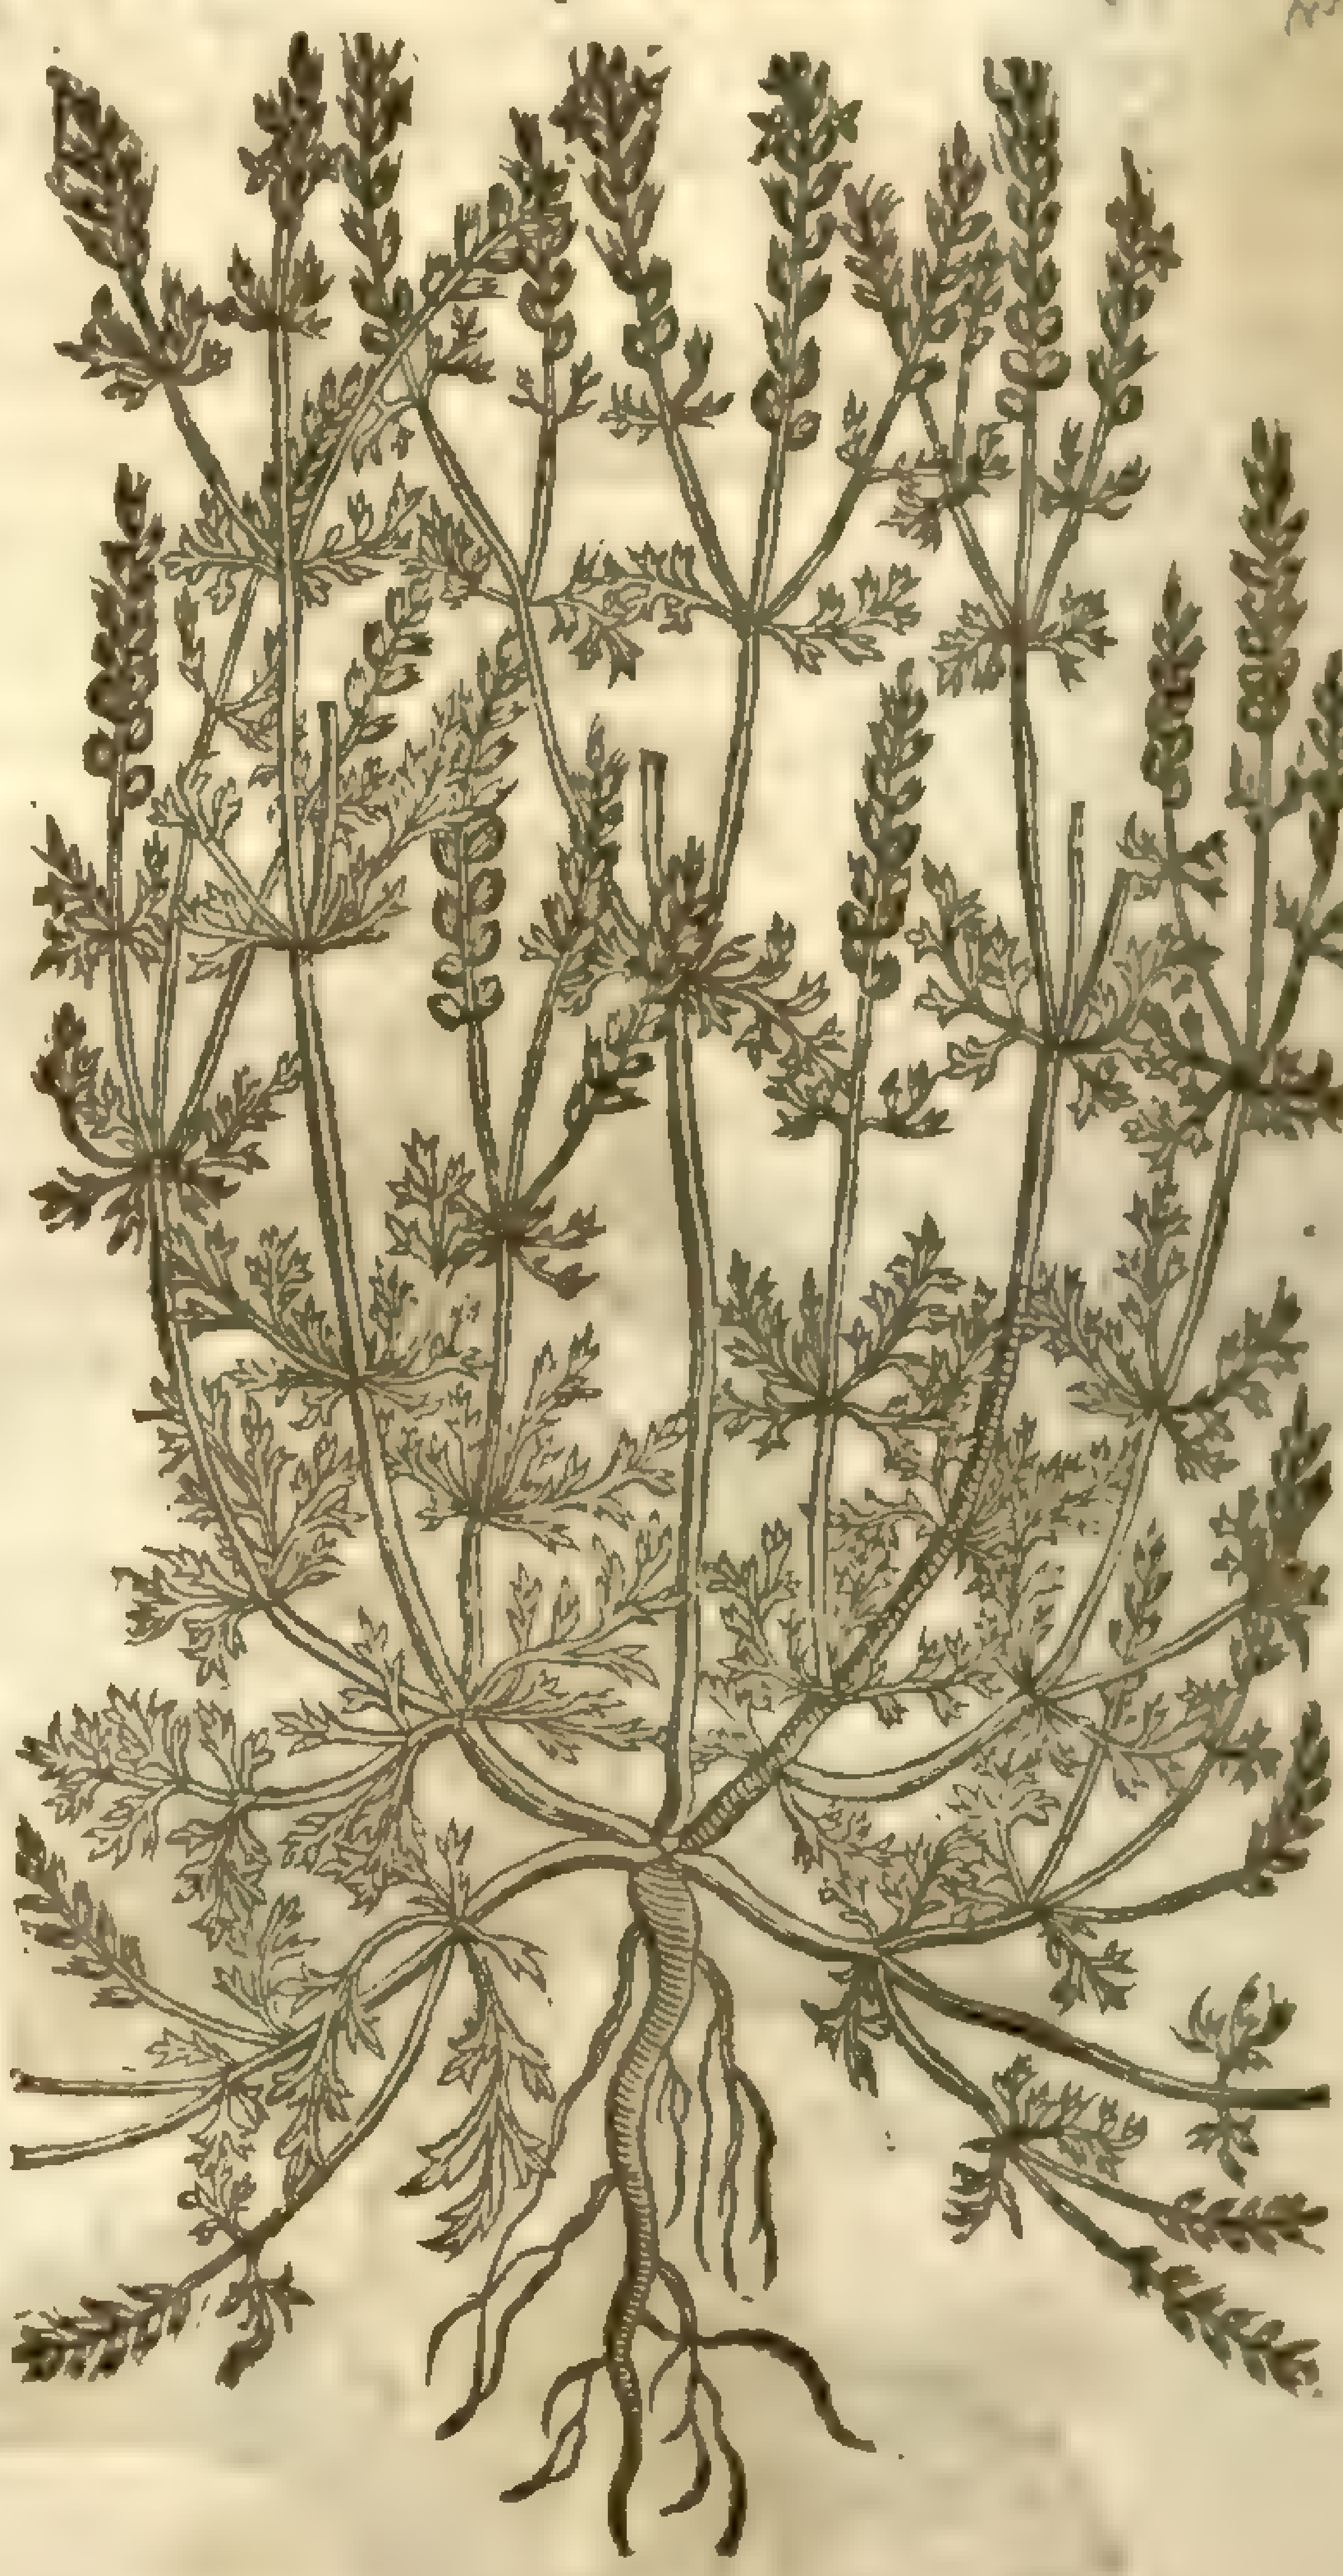
1 *Verbena communis.*
Common Veruaine.

V. officinalis [illegible]



2 *Verbena ſacra.*
Holy Veruaine

V. [illegible]



¶ *The Place.*

Both of them grow in vntilled places neere vnto hedges, high-waies, and commonly by ditches almoſt euery where. ‡ I haue not ſeene the ſecond, and doubt it it is not to be found wilde in England. ‡

¶ *The Time.*

The Veruaines floure in Iuly and Auguſt.

¶ *The Names.*

Veruaine is called in Greeke, περιστερεὼν: in Latine, *Verbena*, and *Verbenaca*, *Herculania*, *Ferraria*, and *Exupera*: of ſome, *Matricalis*, and *Hiera botane*: of others, *Veruena*, and *Sacra herba*: *Verbenæ* are any manner of herbes that were taken from the Altar, or from ſome holy place, which becauſe the Conſull or Pretor did cut vp, they were likewiſe called *Sagmina*, which oftentimes are mentioned in *Liuy* to be graſſie herbes cut vp in the Capitoll. *Pliny* alſo in his two and twentieth booke, and eleuenth Chapter witneſſeth, That *Verbena* and *Sagmina* be all one: and this is manifeſt by that which we reade in *Andræa* in *Terence*: *Ex ara verbenas hinc ſume*; Take herbes here from the Altar: in which place *Terence* did not meane Veruain to be taken from the Altar, but ſome certain herbes: for in *Menander*, out of whom this Comedy was tranſlated, is read μυρσίνη, or Myrtle, as *Donatus* ſaith. In Spaniſh it is called *Vrgebaom*: in Italian, *Verminacula*; in Dutch, **Yſer cruijt**: in French, *Veruaine*: in Engliſh, Iuno's teares, Mercuries moiſt bloud, Holy-herbe; and of ſome, Pigeons graſſe, or Columbine, becauſe pigeons are delighted to be amongſt it, as alſo to eat thereof, as *Apuleius* writeth.

¶ *The Temperature.*

Both the Veruaines are of temperature very dry, and do meanly binde and coole.

¶ *The Vertues.*

A The leaues of Veruaine pound with oyle of Roſes or hogs greaſe, doe mitigate and appeaſe the paines of the mother, being applied thereto.

B The leaues of Veruaine and Roſes ſtamped with a little new hogs greaſe, and emplaiſtered after the manner of a pulteſſe, doe ceaſe the inflammation and grieuous paines of wounds, and ſuffereth them not to come to corruption: and the greene leaues ſtamped with hogs greaſe takes away the ſwelling and paine of hot impoſtumes and tumors, and clenſe corrupt and rotten vlcers.

C It is reported to be of ſingular force againſt the Tertian and Quartaine Feuers: but you muſt obſerue mother *Bombies* rules, to take iuſt ſo many knots or ſprigs, and no more, leſt it fall out ſo that it do you no good, if you catch no harme by it. Many odde old wiues fables are written of Veruaine tending to witchcraft and ſorcery, which you may reade elſewhere, for I am not willing to trouble your eares with reporting ſuch trifles, as honeſt eares abhorre to heare.

D *Archigenes* maketh a garland of Veruaine for the head-ache, when the cauſe of the infirmitie proceedeth of heat.

E The herbe ſtamped with oyle of Roſes and Vinegre, or the decoction of it made in oile of roſes, keepeth the haires from falling, being bathed or annointed therewith.

F It is a remedy againſt putrified vlcers, it healeth vp wounds, and perfectly cureth Fiſtulaes, it waſteth away old ſwellings, and taketh away the heat of inflammations.

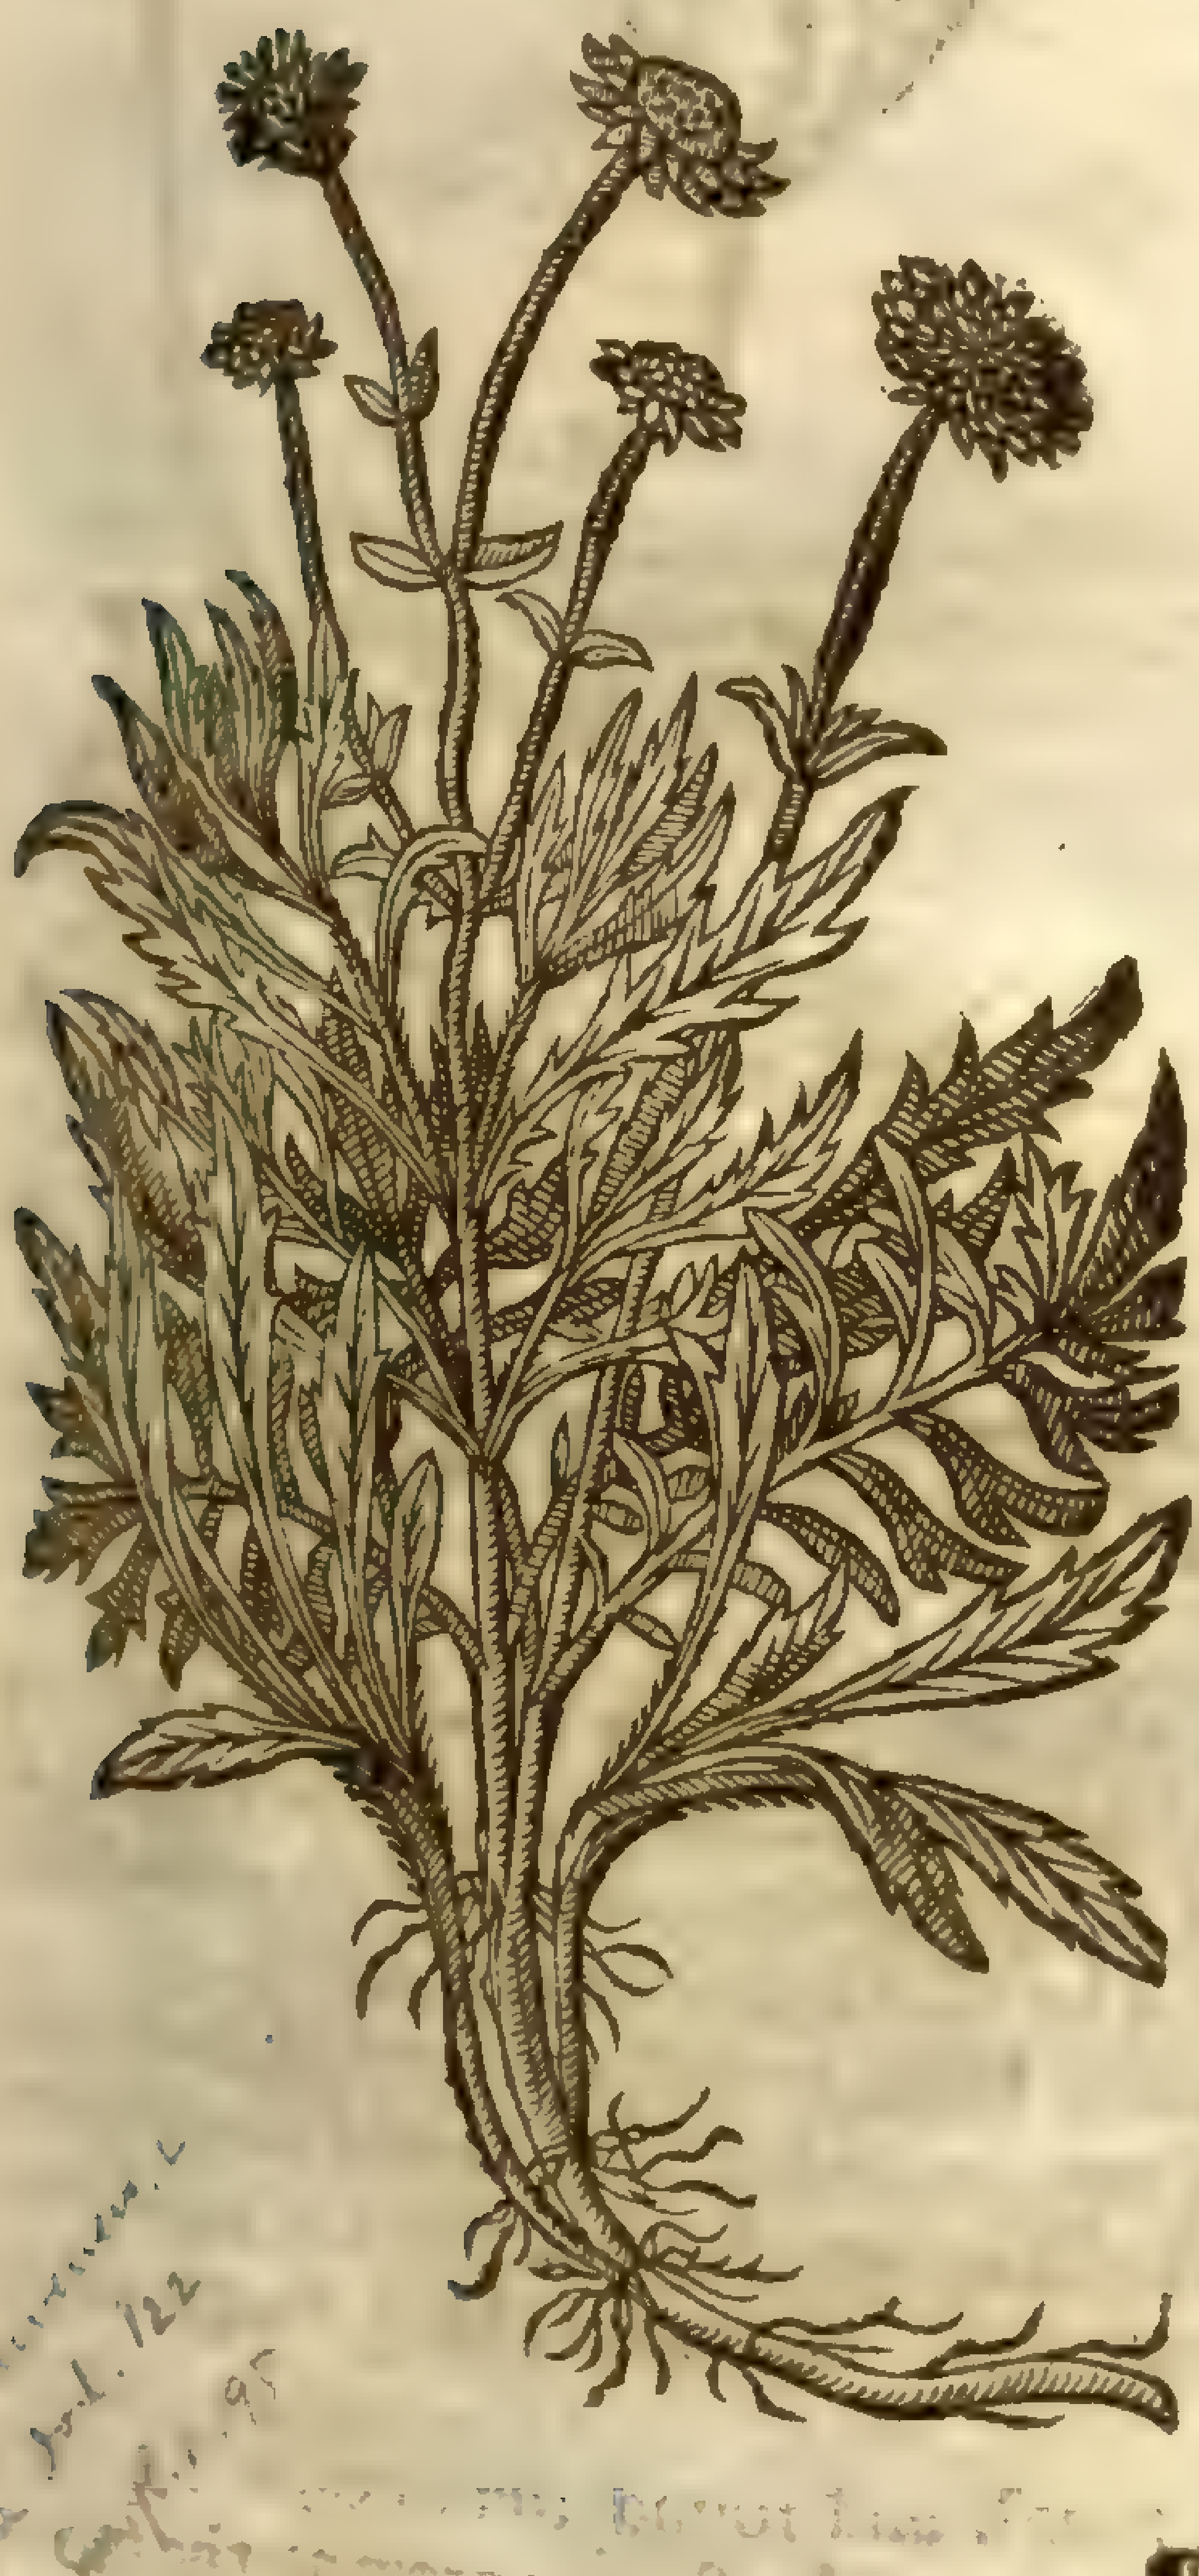
G The decoction of the roots and leaues ſwageth the tooth-ache, and faſteneth them, and healeth the vlcers of the mouth.

H They report, ſaith *Pliny*, that if the dining roome be ſprinkled with water in which the herbe hath beene ſteeped, the gueſts will be the merrier, which alſo *Dioſcorides* mentioneth.

I Moſt of the later Phyſitions do giue the juice or decoction hereof to them that haue the plague: but theſe men are deceiued, not only in that they looke for ſome truth from the father of falſhood and leaſings, but alſo becauſe in ſtead of a good and ſure remedy they miniſter no remedy at all; for it is reported, that the Diuell did reueale it as a ſecret and diuine medicine.

CHAP. 247. *Of Scabious.*

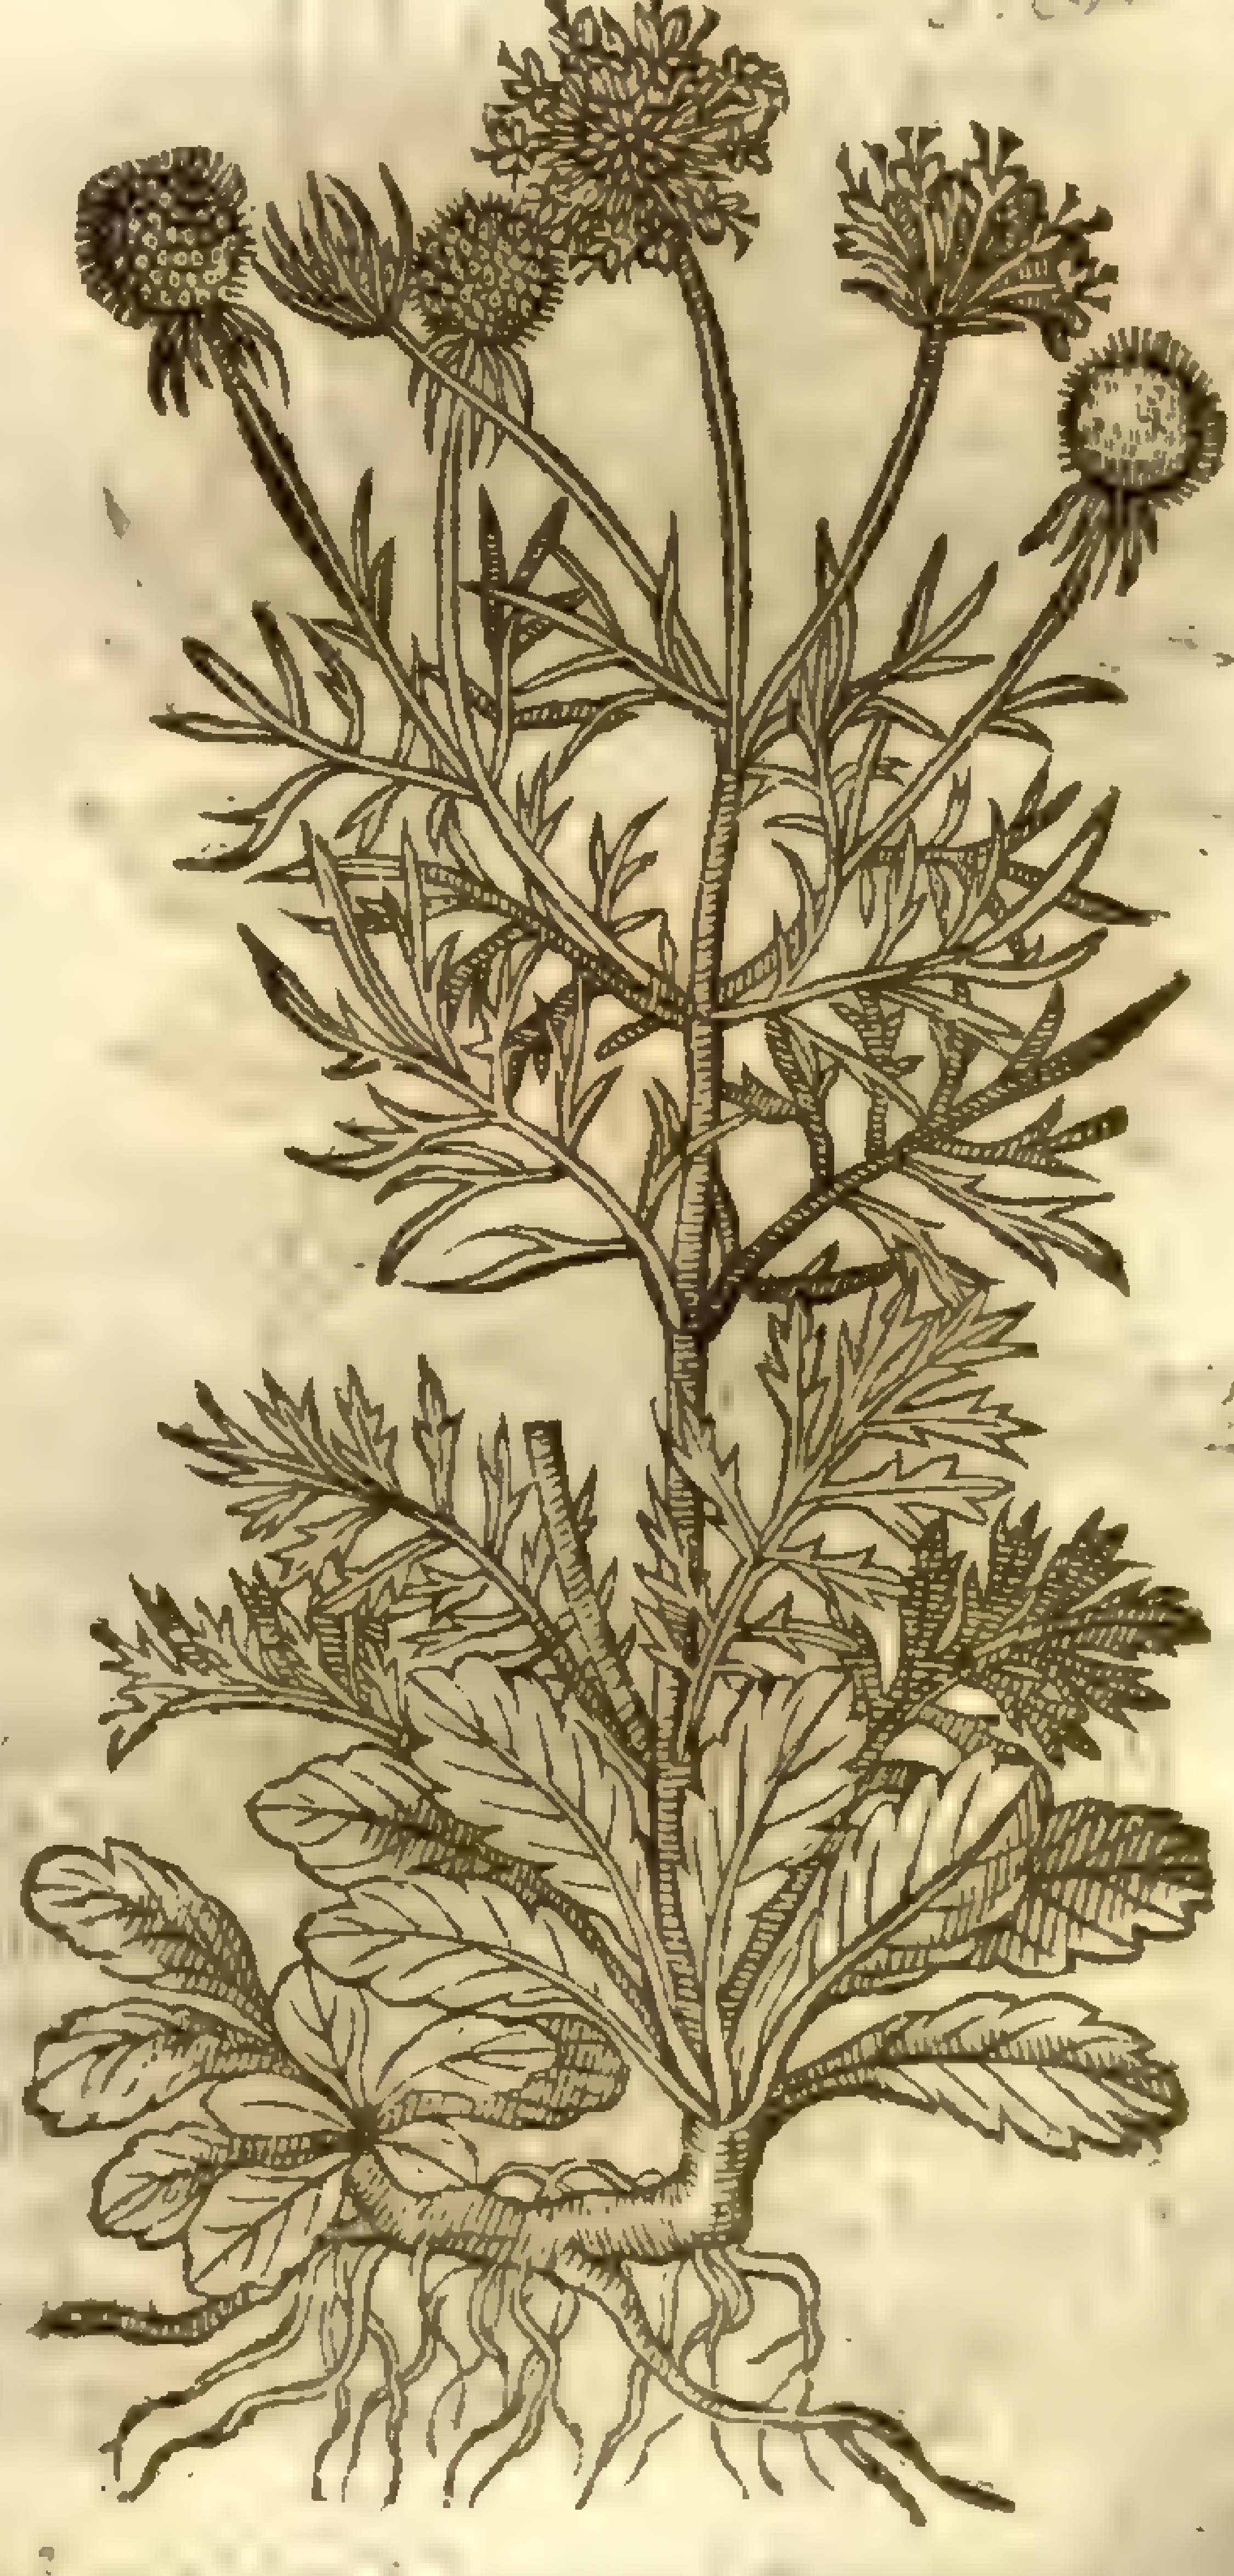
† 1 *Scabioſa major vulgaris.*
Common Scabious.



[illegible] fol. 122 [illegible] 95

† 2 *Scabioſa minor, ſiue Columbaria.*
The ſmall common Scabious.

S. columbaria [illegible] [illegible] 195



¶ *The Deſcription.*

1 THe firſt kinde of Scabious being the moſt common and beſt knowne, hath leaues long and broad, of a grayiſh, hoary, and hairy colour, ſpred abroad vpon the ground, among which riſe vp round and rough ſtems, beſet with hairy jagged leaues, in faſhion like

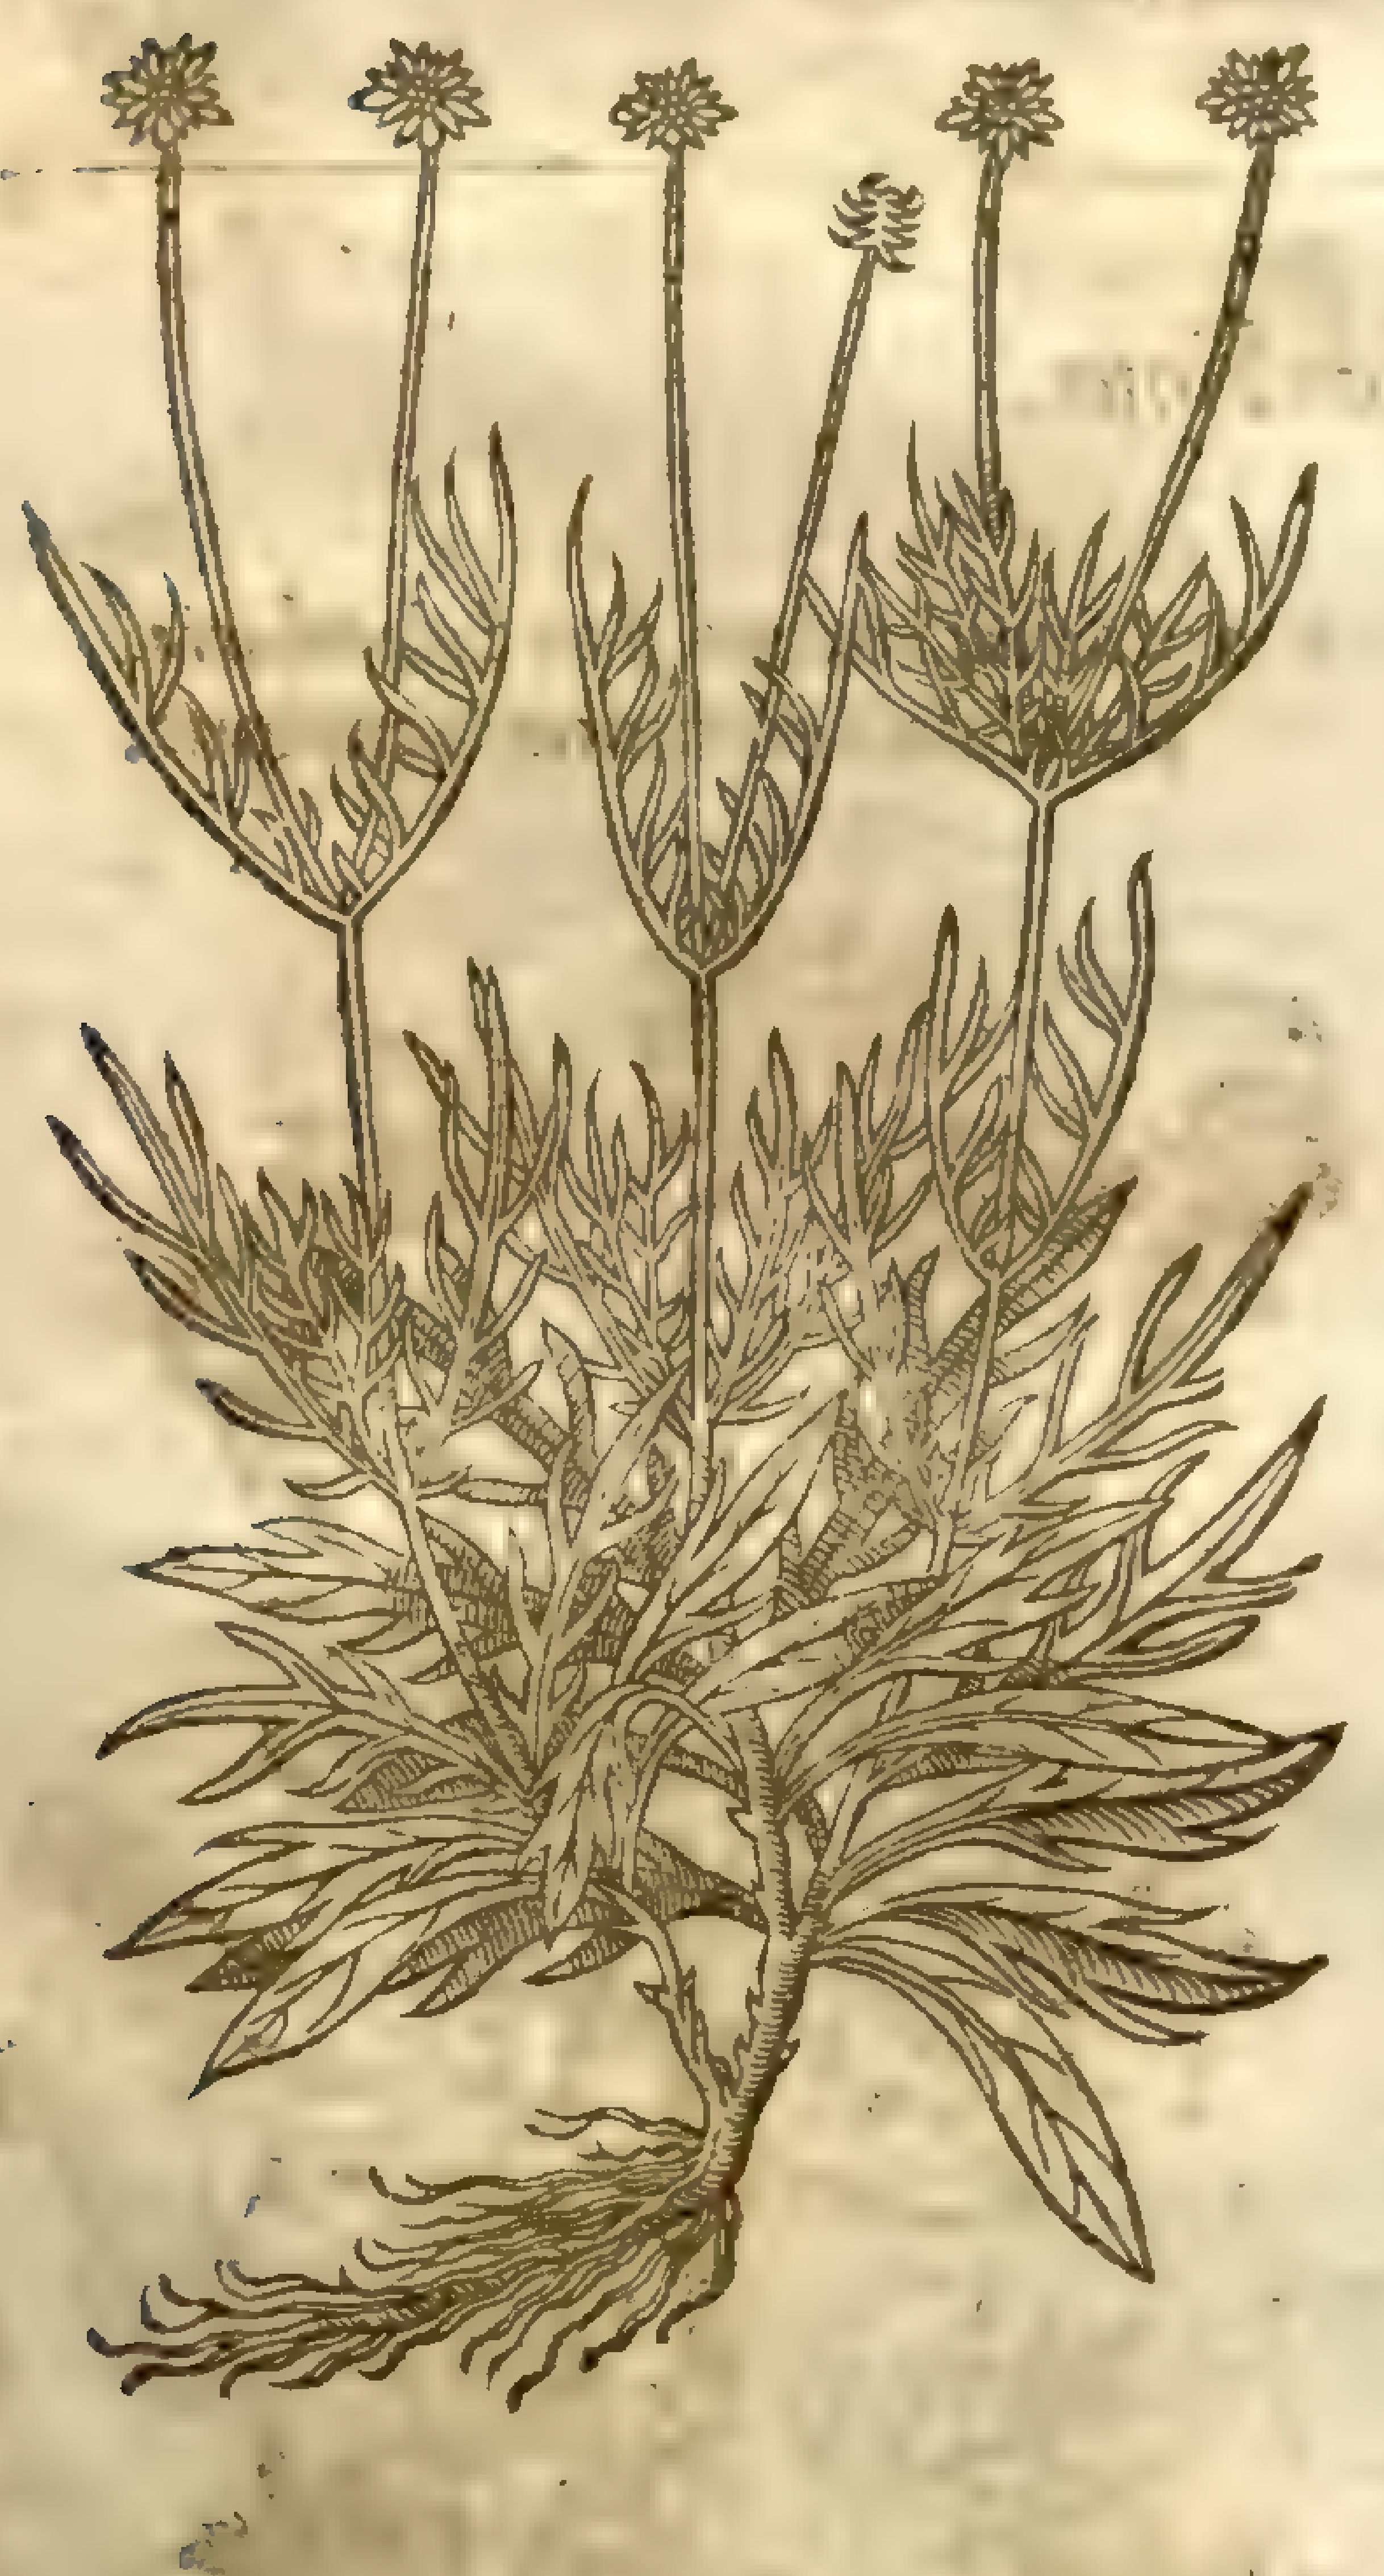
great Valerian, which we call Setwall. At the top of the ſtalkes grow blew floures in thicke tufts or buttons. The root is white and ſingle.

2 The ſecond is like vnto the former, ſauing that his leaues are much cut or jagged, and the whole plant is altogether leſſer, ſcarcely growing to the height of a foot.

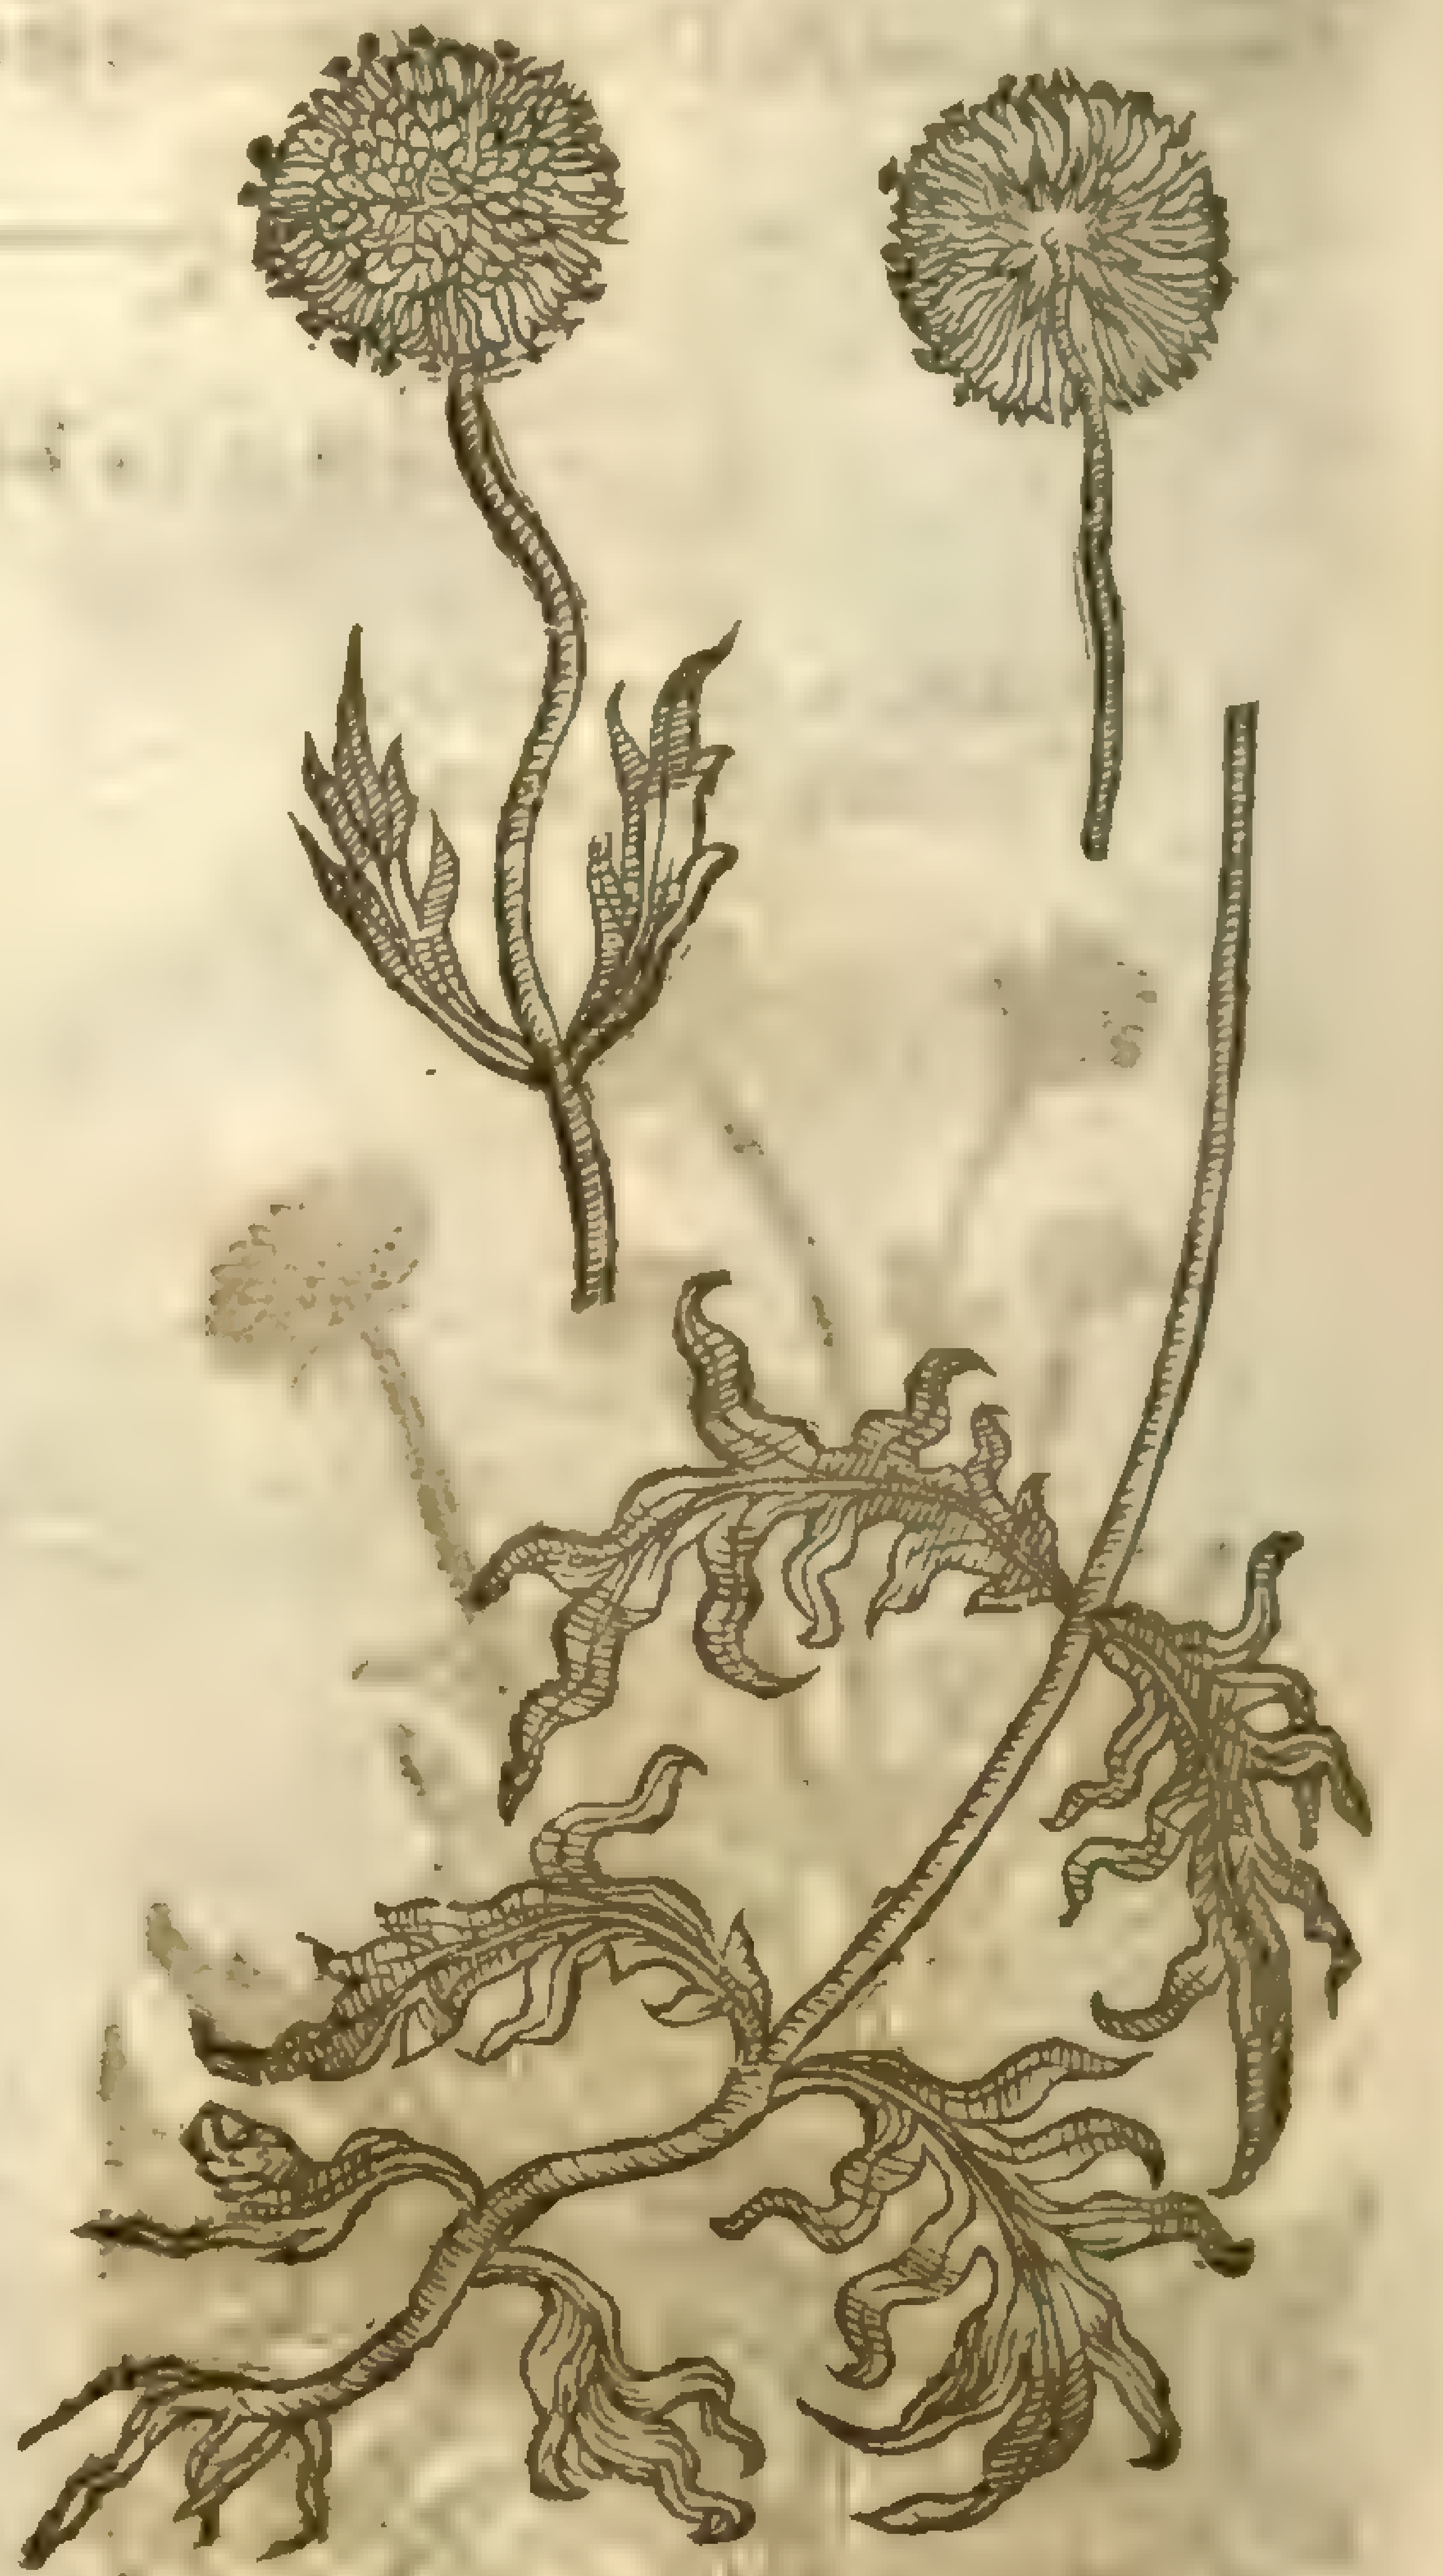
3 The third kinde of Scabious is in all things like vnto the ſecond, ſauing that the knap or head doth not dilate himſelfe ſo abroad, and is not ſo thicke or cloſely thruſt together, and the loweſt leaues are not ſo deepely cut or jagged, but the vpper are much ſmaller, and alſo the more diuided.

† 4 The fourth groweth with large ſtalkes, hauing two leaues one ſet right againſt another, very much jagged, almoſt like vnto common Ferne, or rather Aſh: and at the top of the ſtalks there grow larger floures, like vnto the firſt, but greater, and the root is alſo like it, and it differs no way from the firſt deſcribed, but onely by reaſon of the ſoile.

‡ 3 *Scabioſa media.*
Middle Scabious.



4 *Scabioſa campeſtris, ſiue ſegetum.*
Corne Scabious.

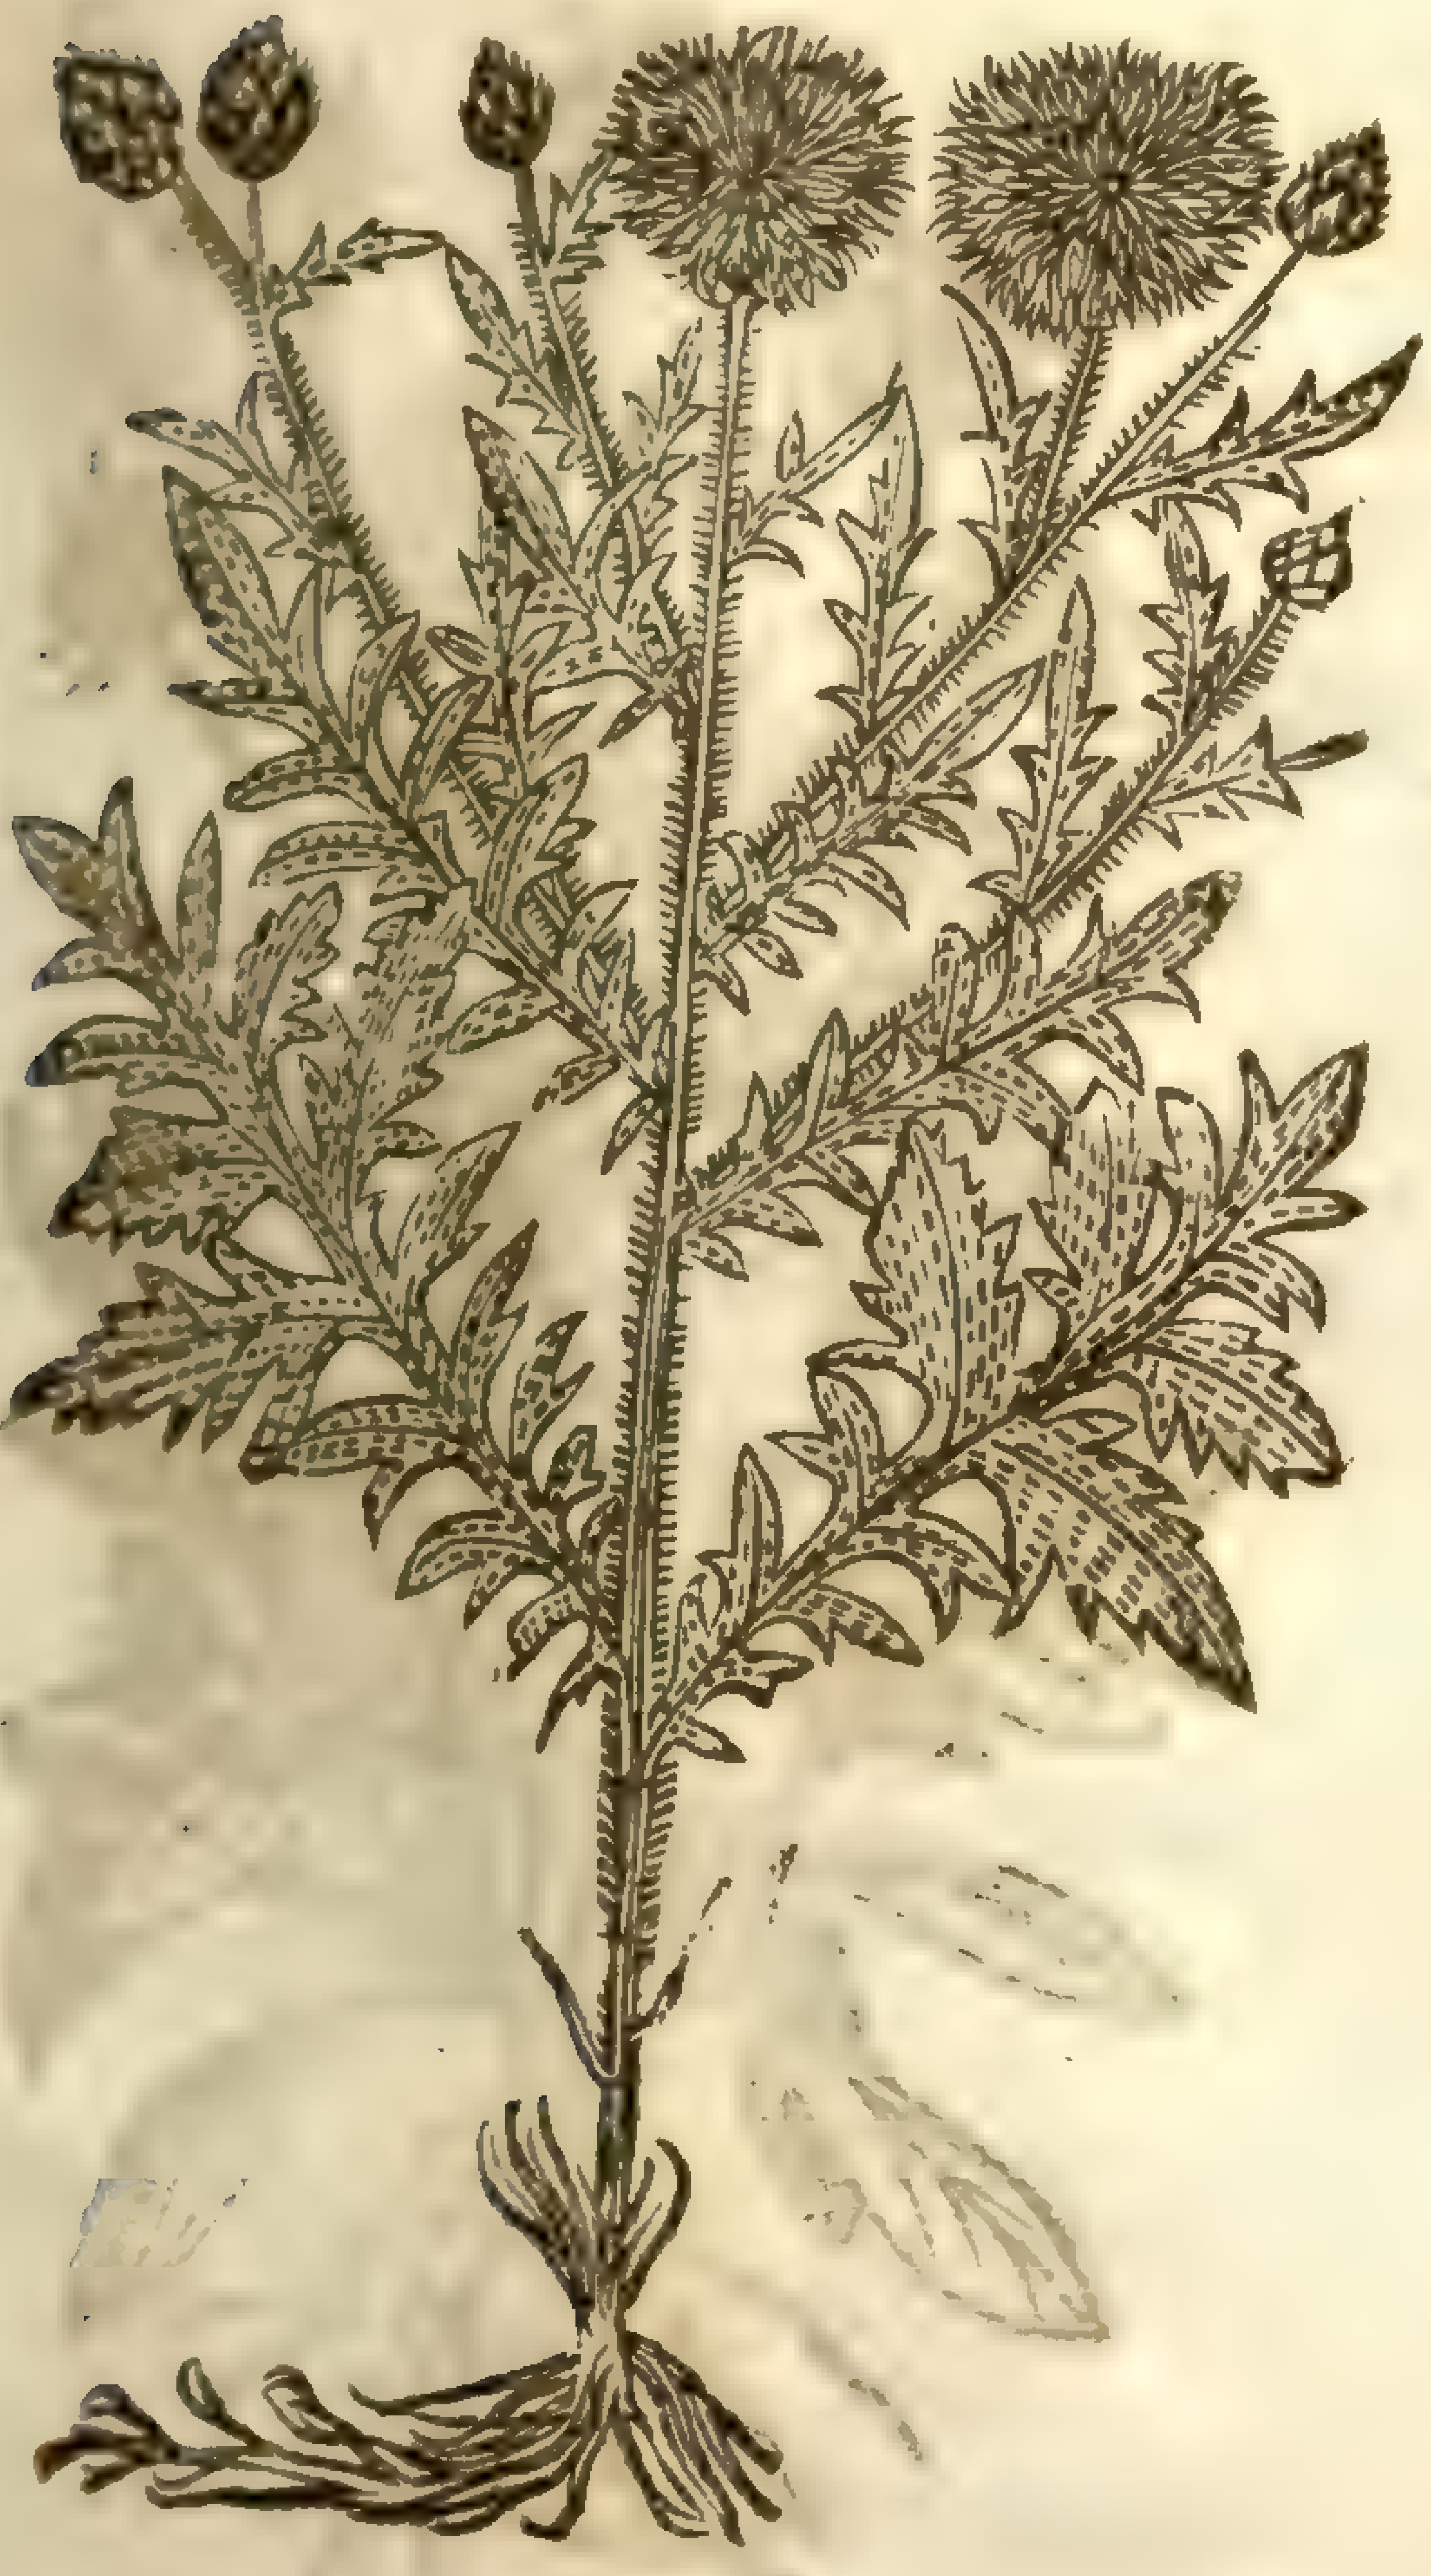


5 Purple floured Scabious hath a rough hairie ſtalke, whereon doe grow broad leaues deepely cut in the edges, in forme like thoſe of Sowthiſtle, rough likewiſe and hairie; the floures grow at the top of the ſtalkes, compoſed of an innumerable ſort of purple thrums: after which come ſcaly knaps like thoſe of *Iacea*, or Knapweed, wherein is the ſeed. The root is ſmall and threddy.

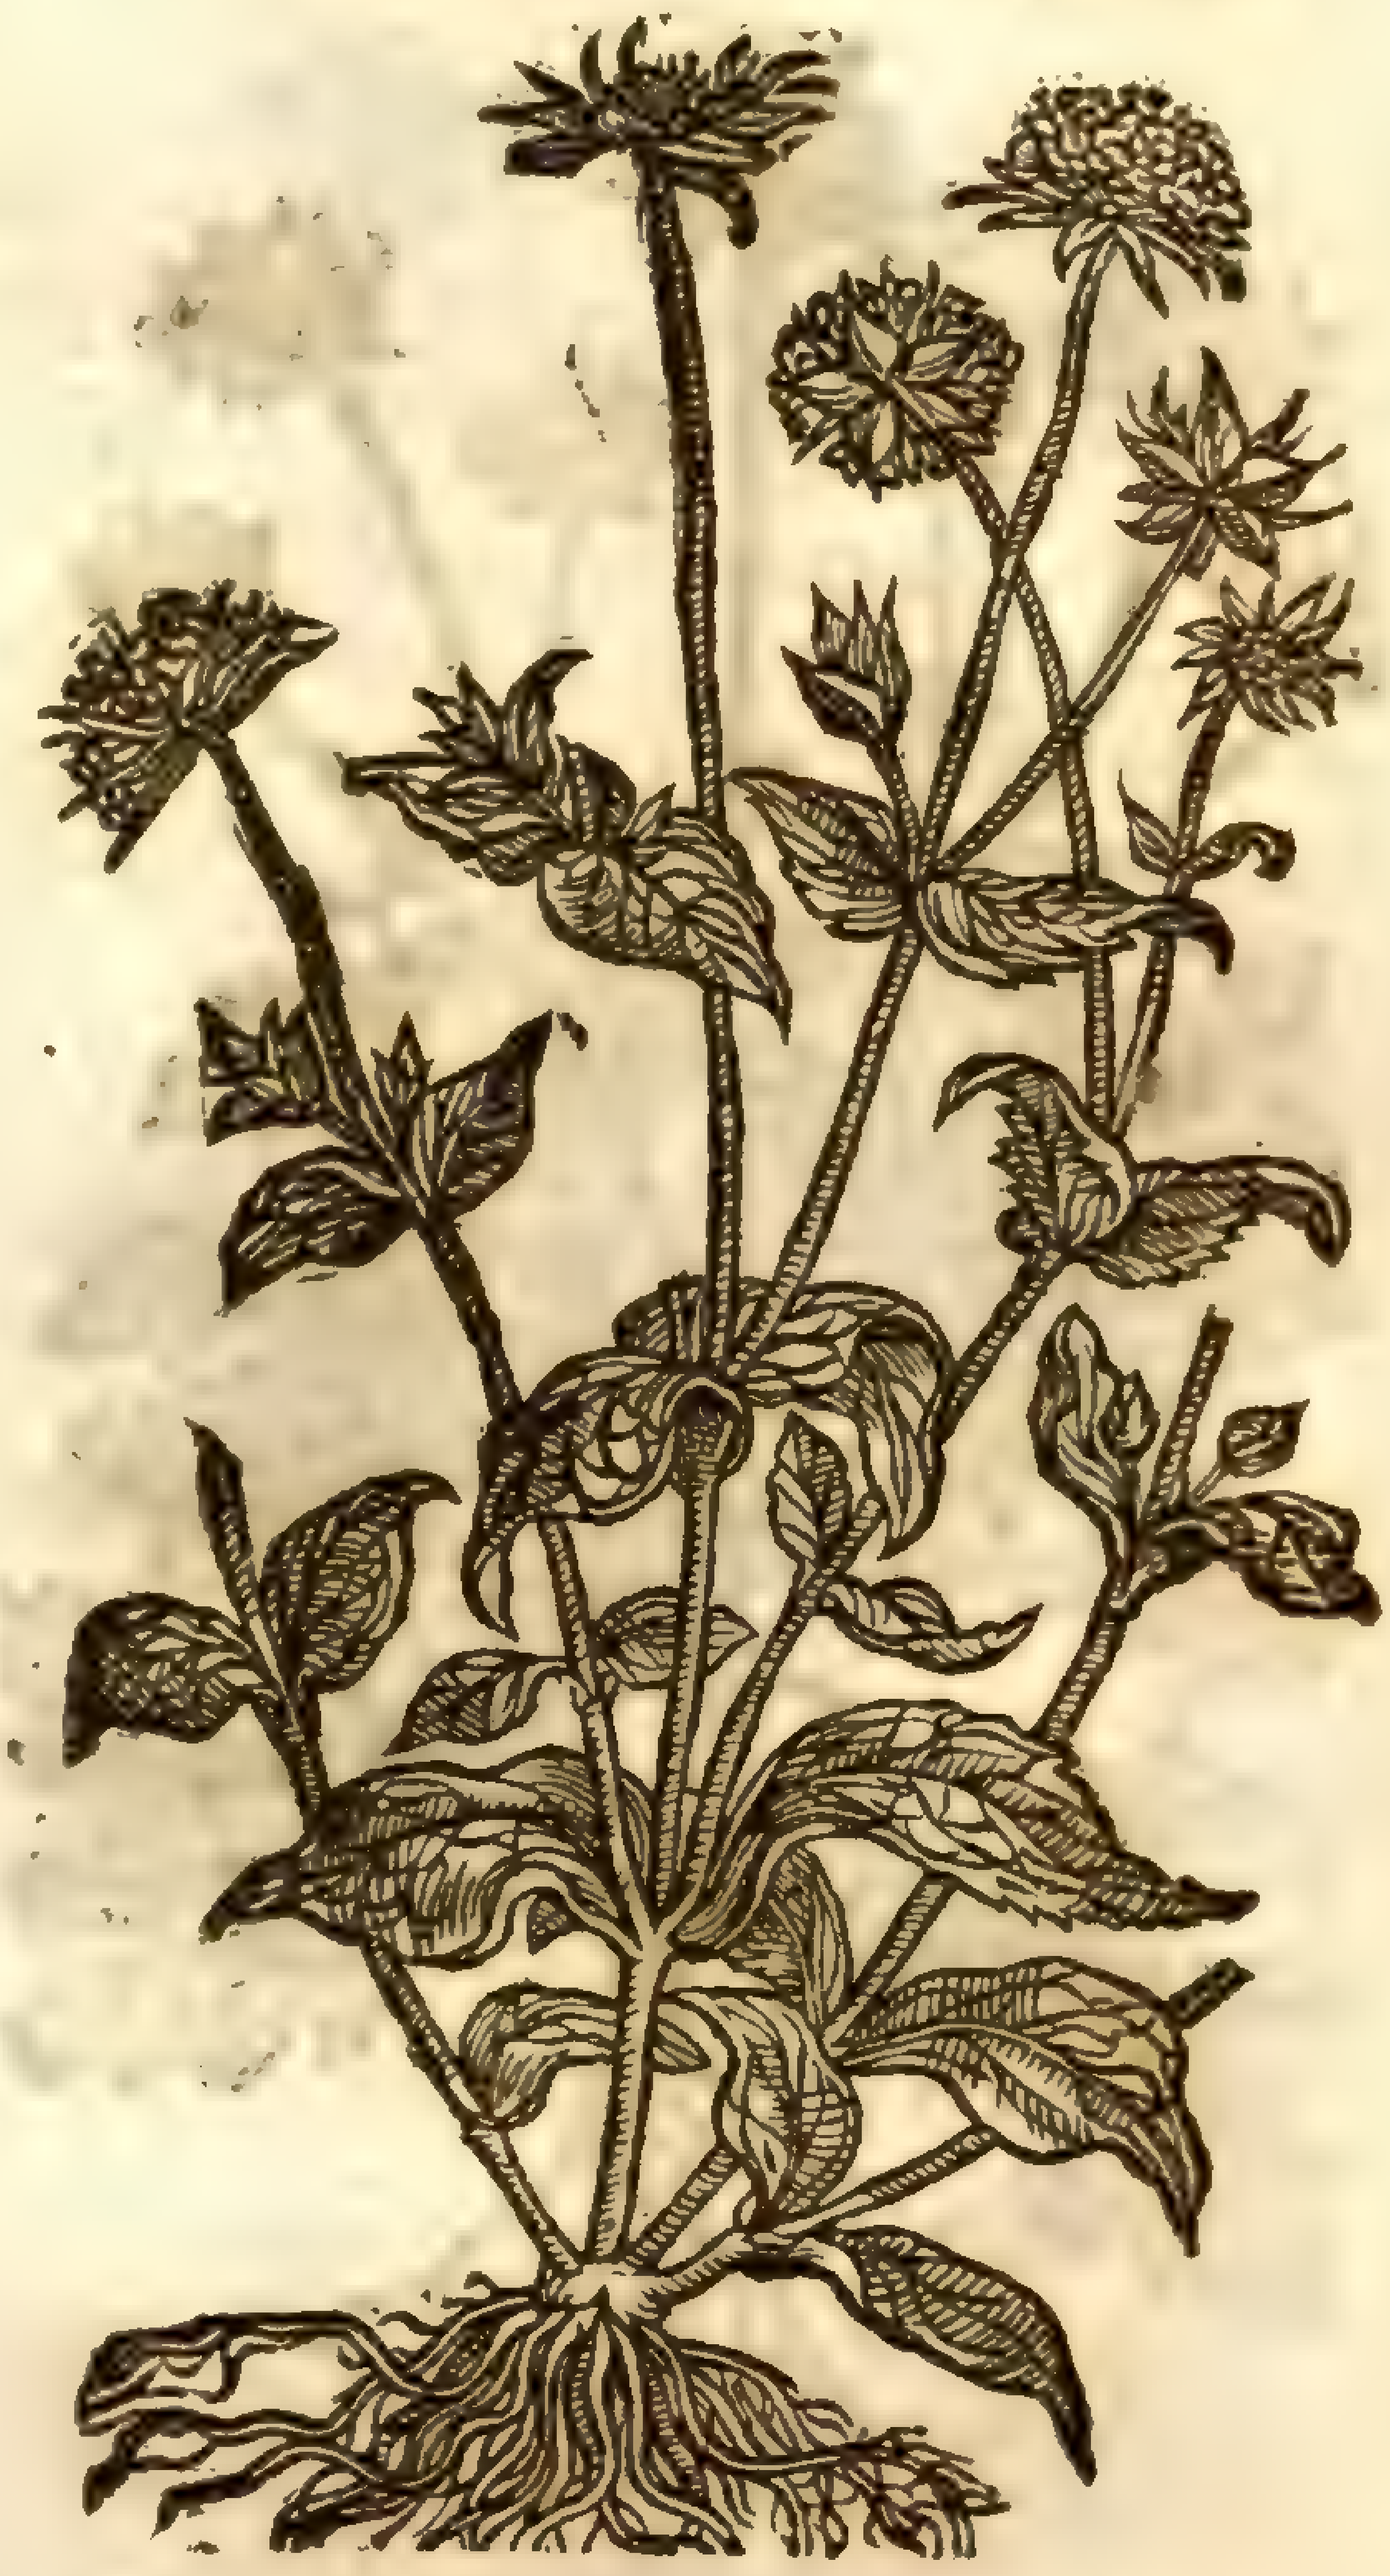
‡ 6 The ſixth ſort of Scabious hath ſtalkes ſome cubit high, round, and ſet with leaues not cut and jagged almoſt to the middle rib, as in the former, yet ſomewhat rough and hairy, ſnipt about the edges, and of a light greene colour; amongſt which riſe vp rough ſtalkes, on the top whereof doe grow faire red floures conſiſting of a bundle of thrummes. The root is long, tough, and fibrous. ‡

7 The ſeuenth kinde of Scabious hath ſundry great rough and round ſtemmes, as high as a tall man, beſet with leaues like the firſt Scabious, but far greater. The floures grow at the top of the ſtalkes like vnto the others, but of a faint yellow colour, which fall as ſoone as it is touched with the hand, whereby it mightily increaſeth, notwithſtanding the root endureth for many years, and groweth to be wonderfull great: and in my Garden it did grow to the bigneſſe of a mans body.

5 *Scabioſa flore purpureo.*
Purple floured Scabious.

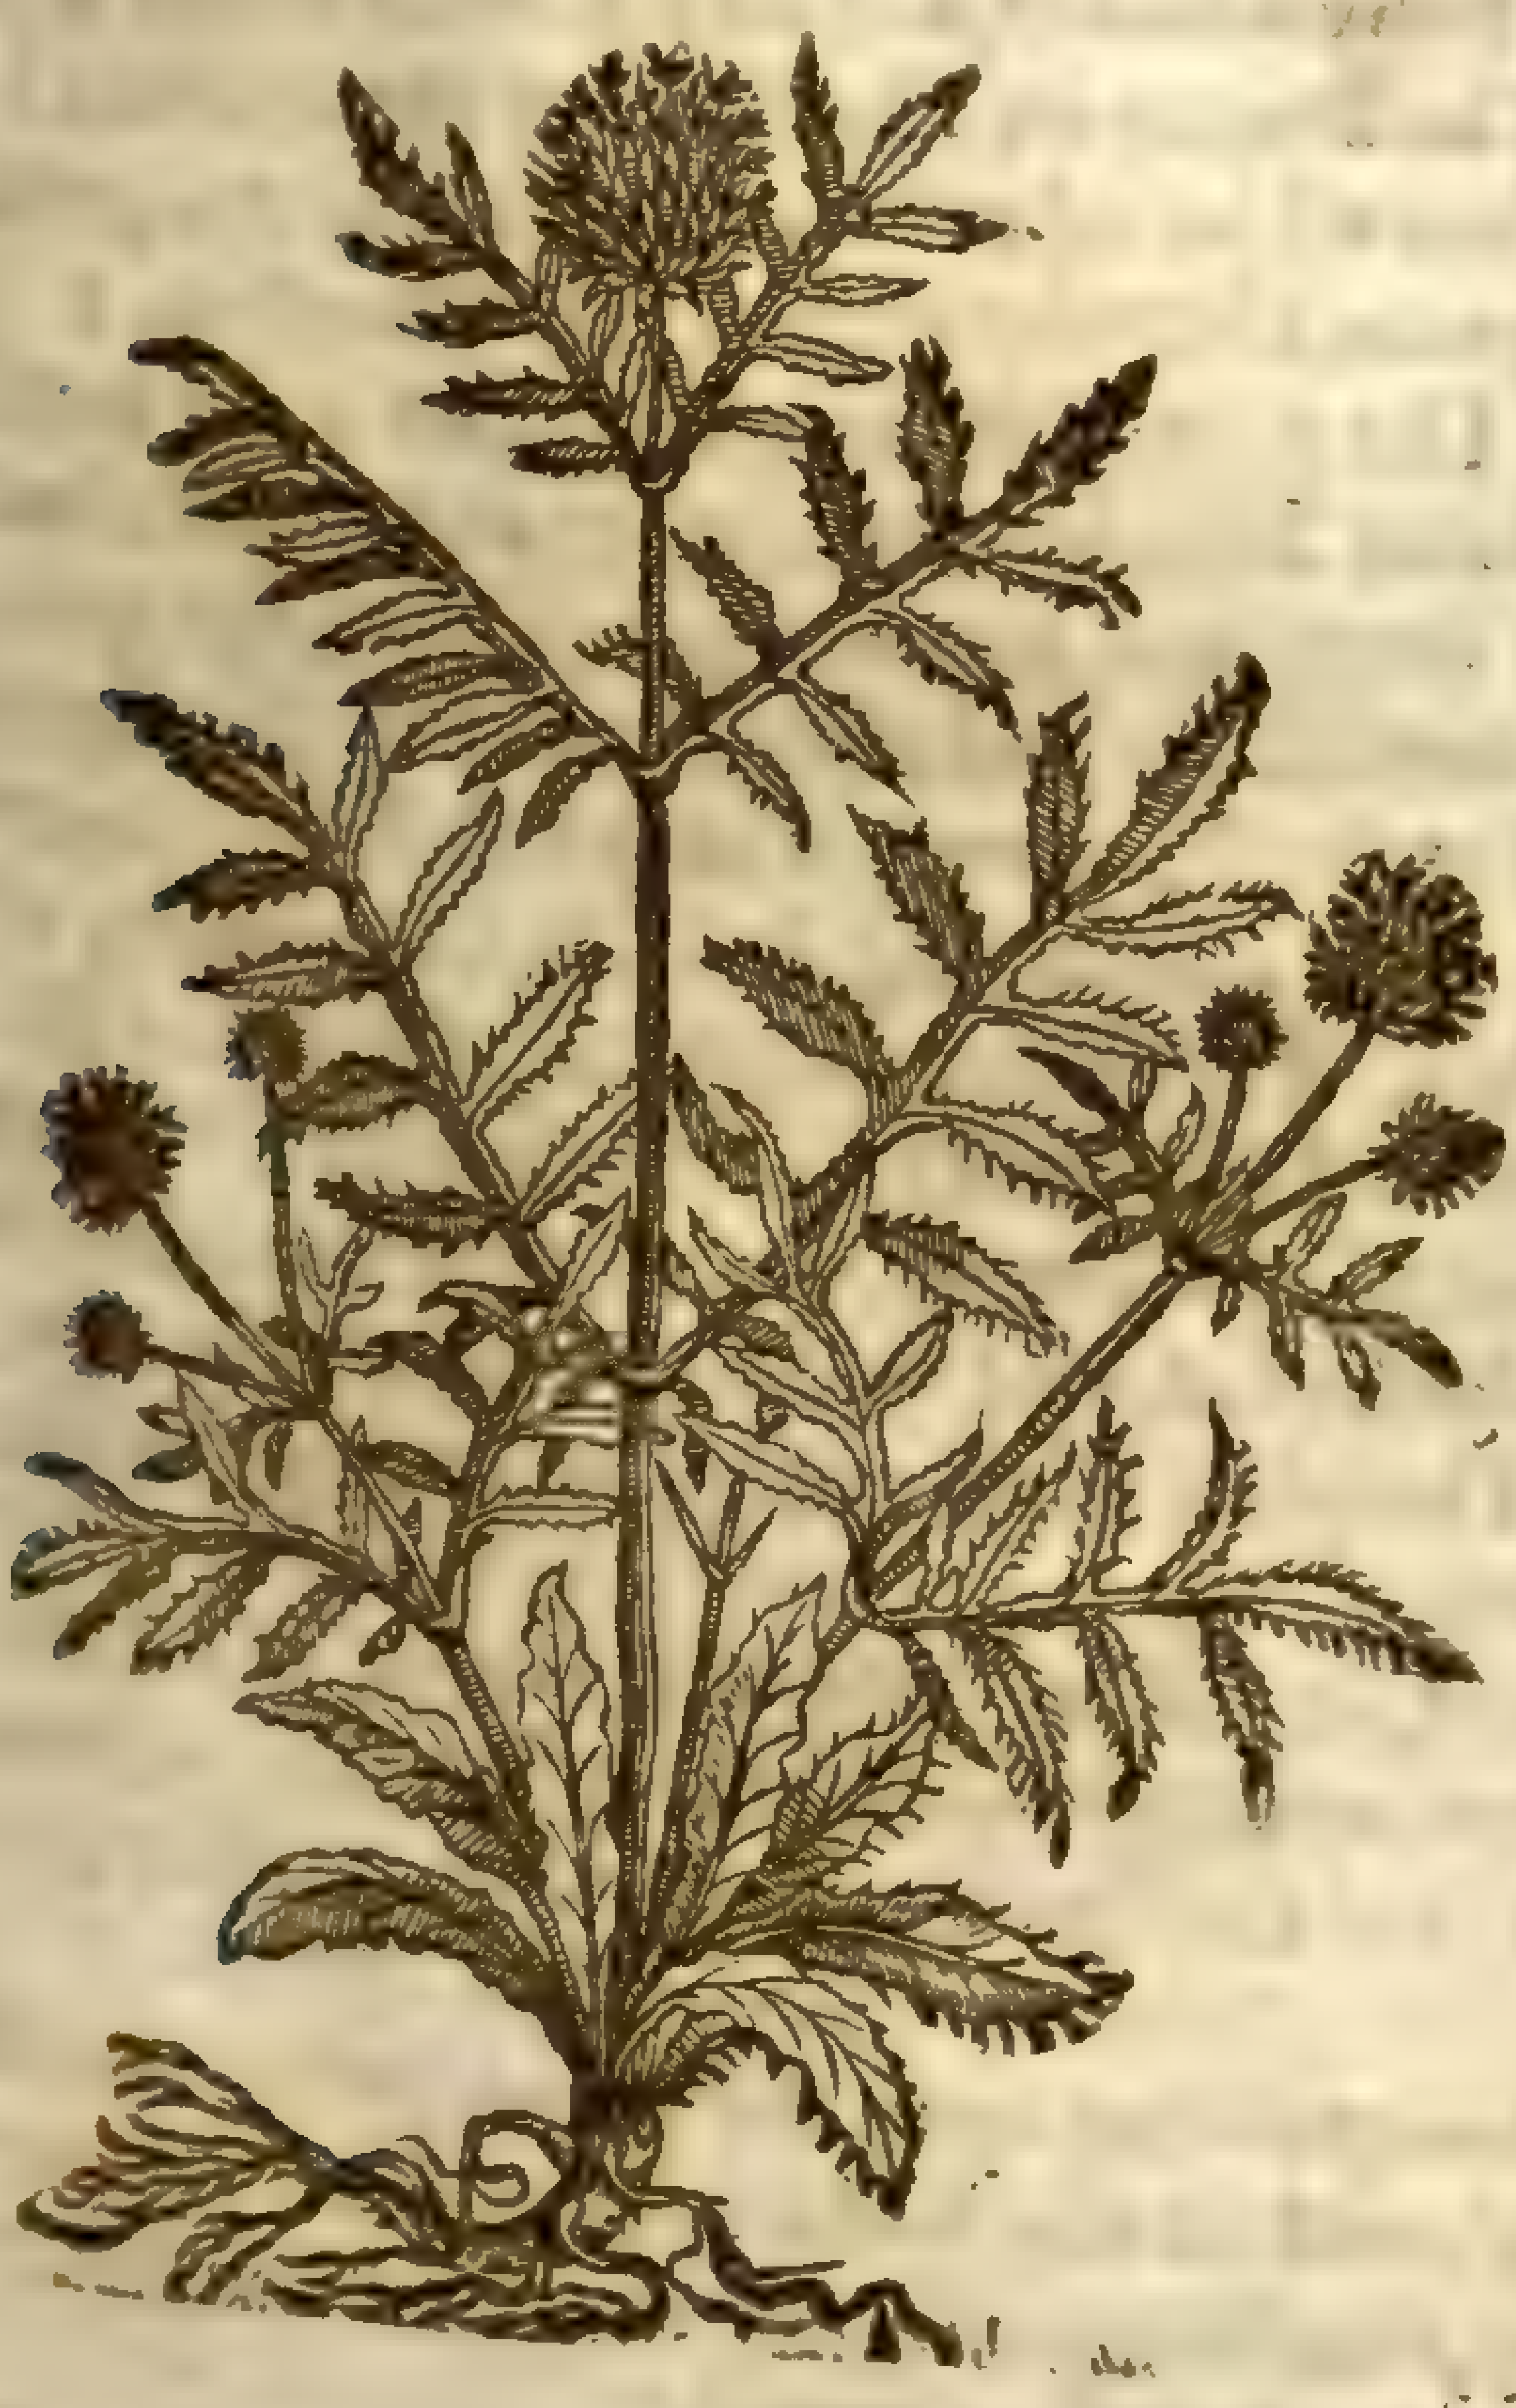


† 6 *Scabioſa rubra Auſtriaca.*
Red Scabious of Auſtrich.

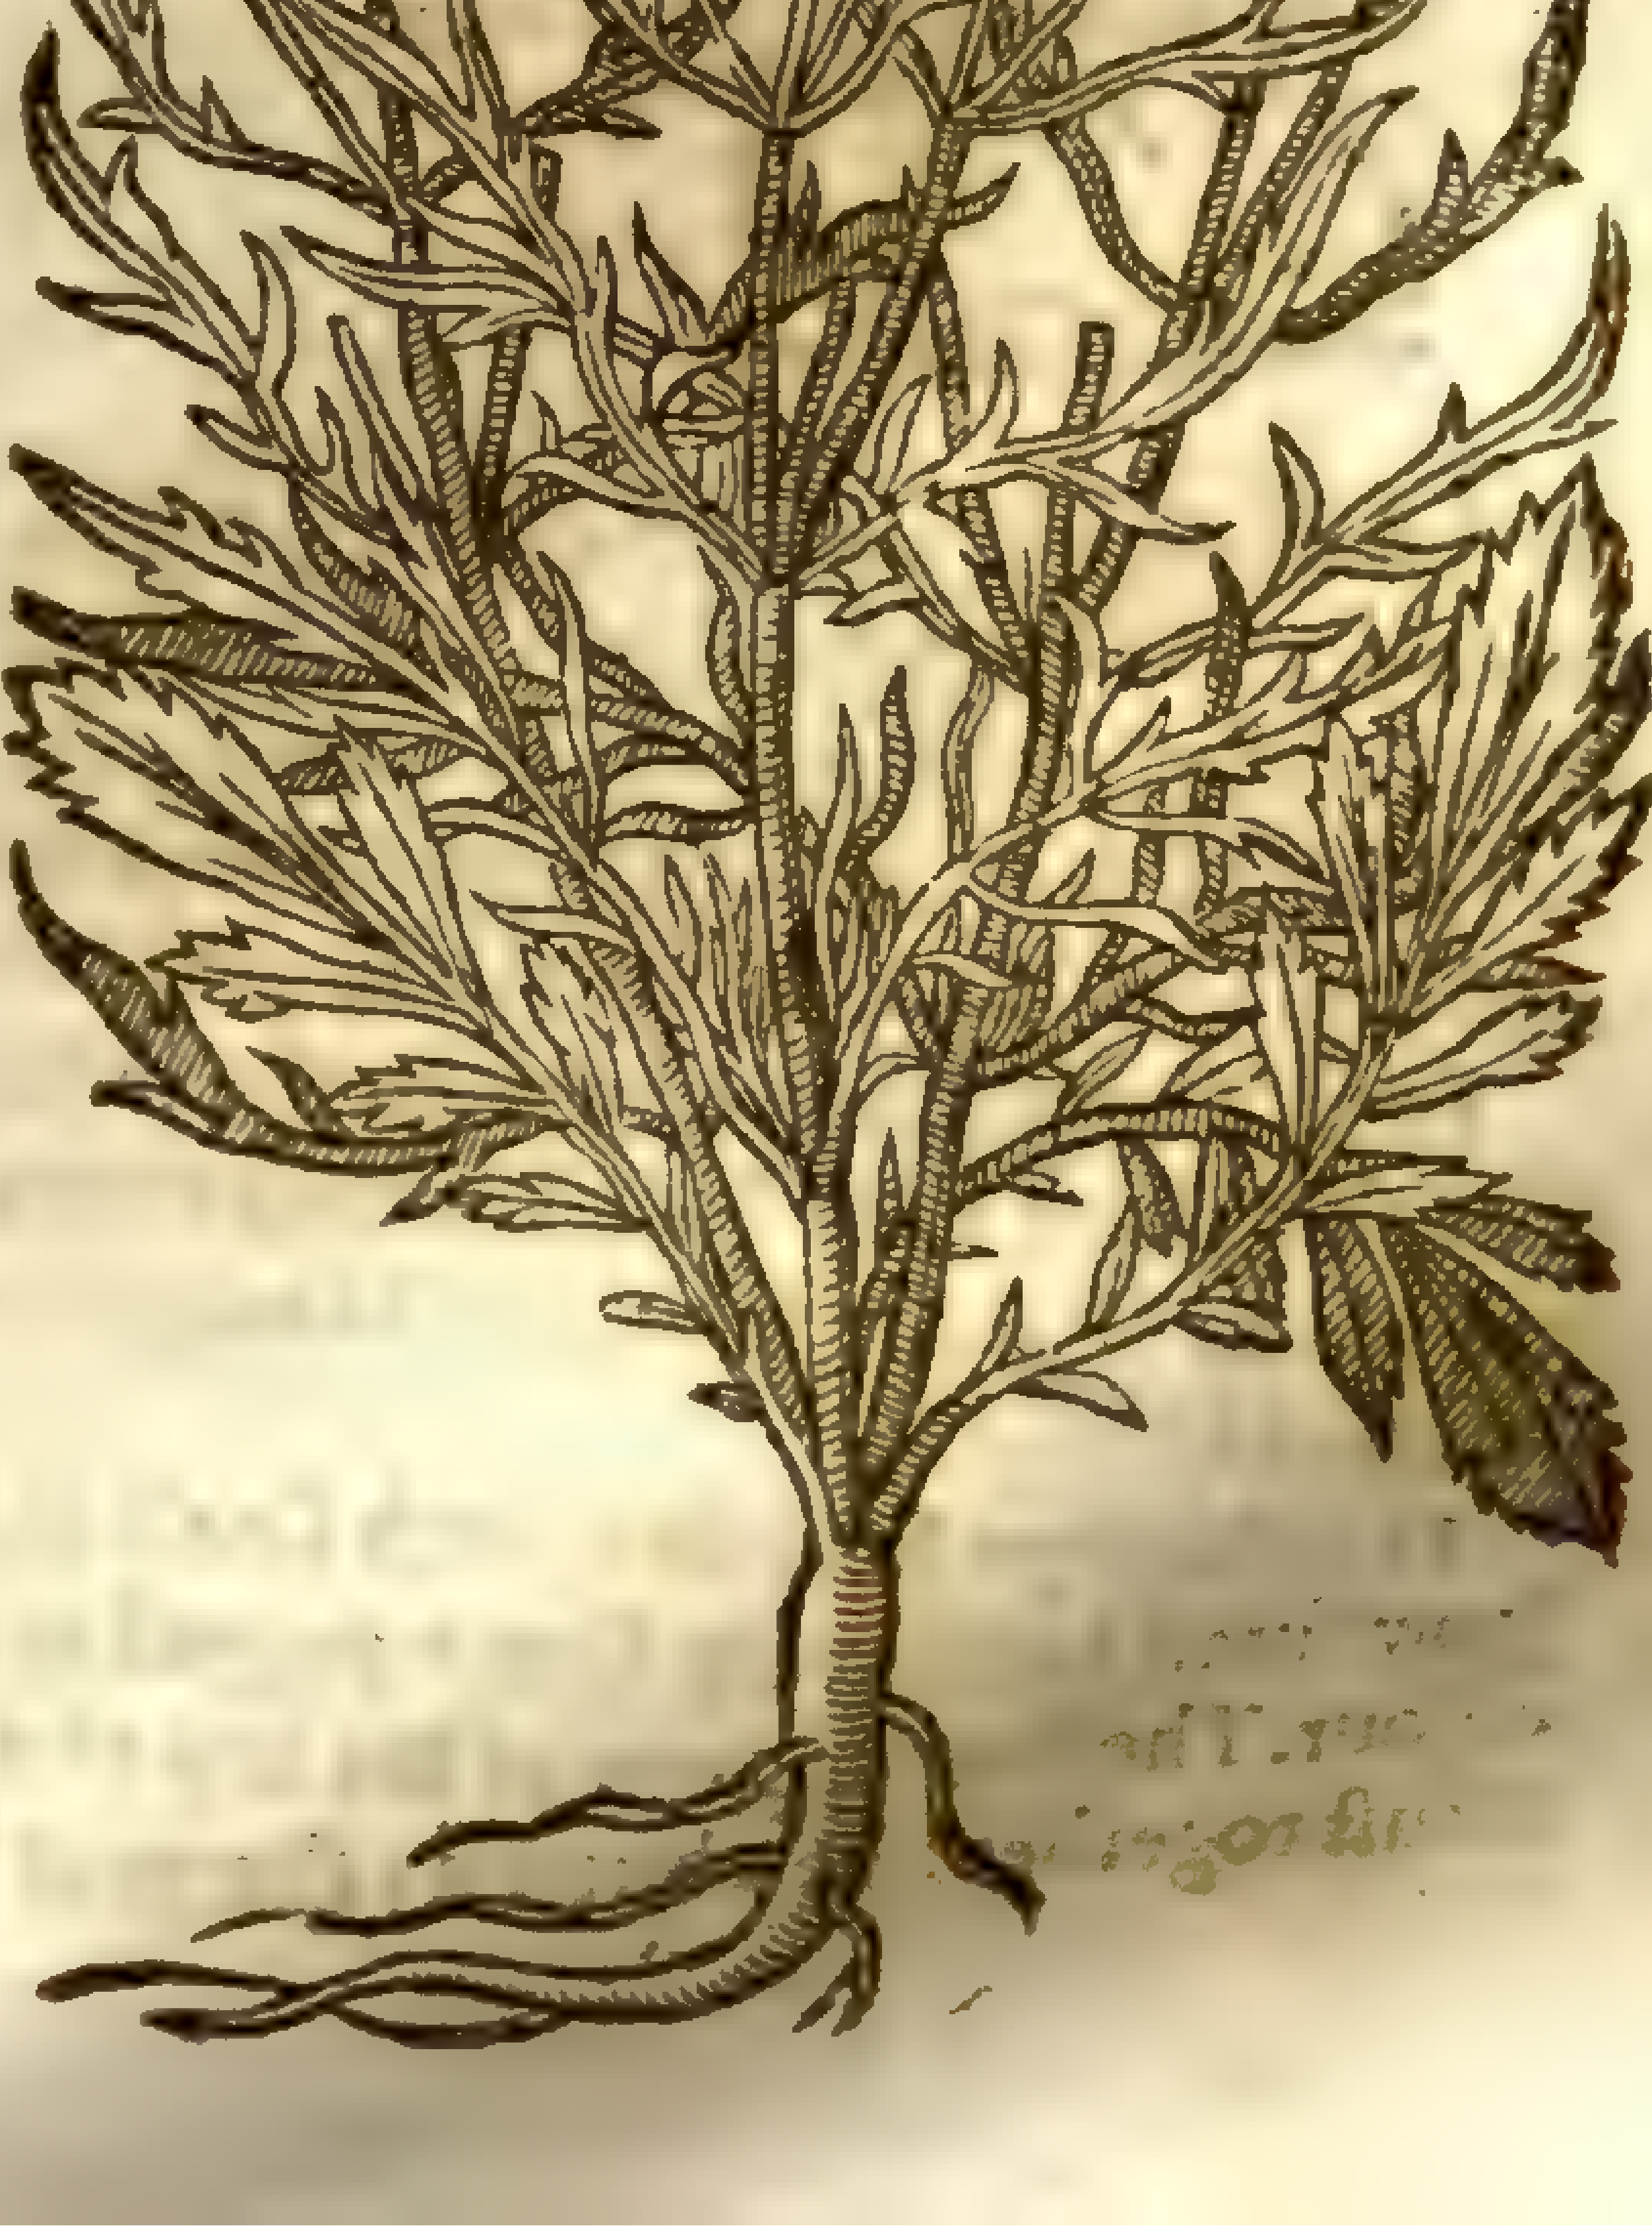


† 7 *Scabioſa montana maxima.*
Mountaine Scabious.

S. alpina, [illegible]

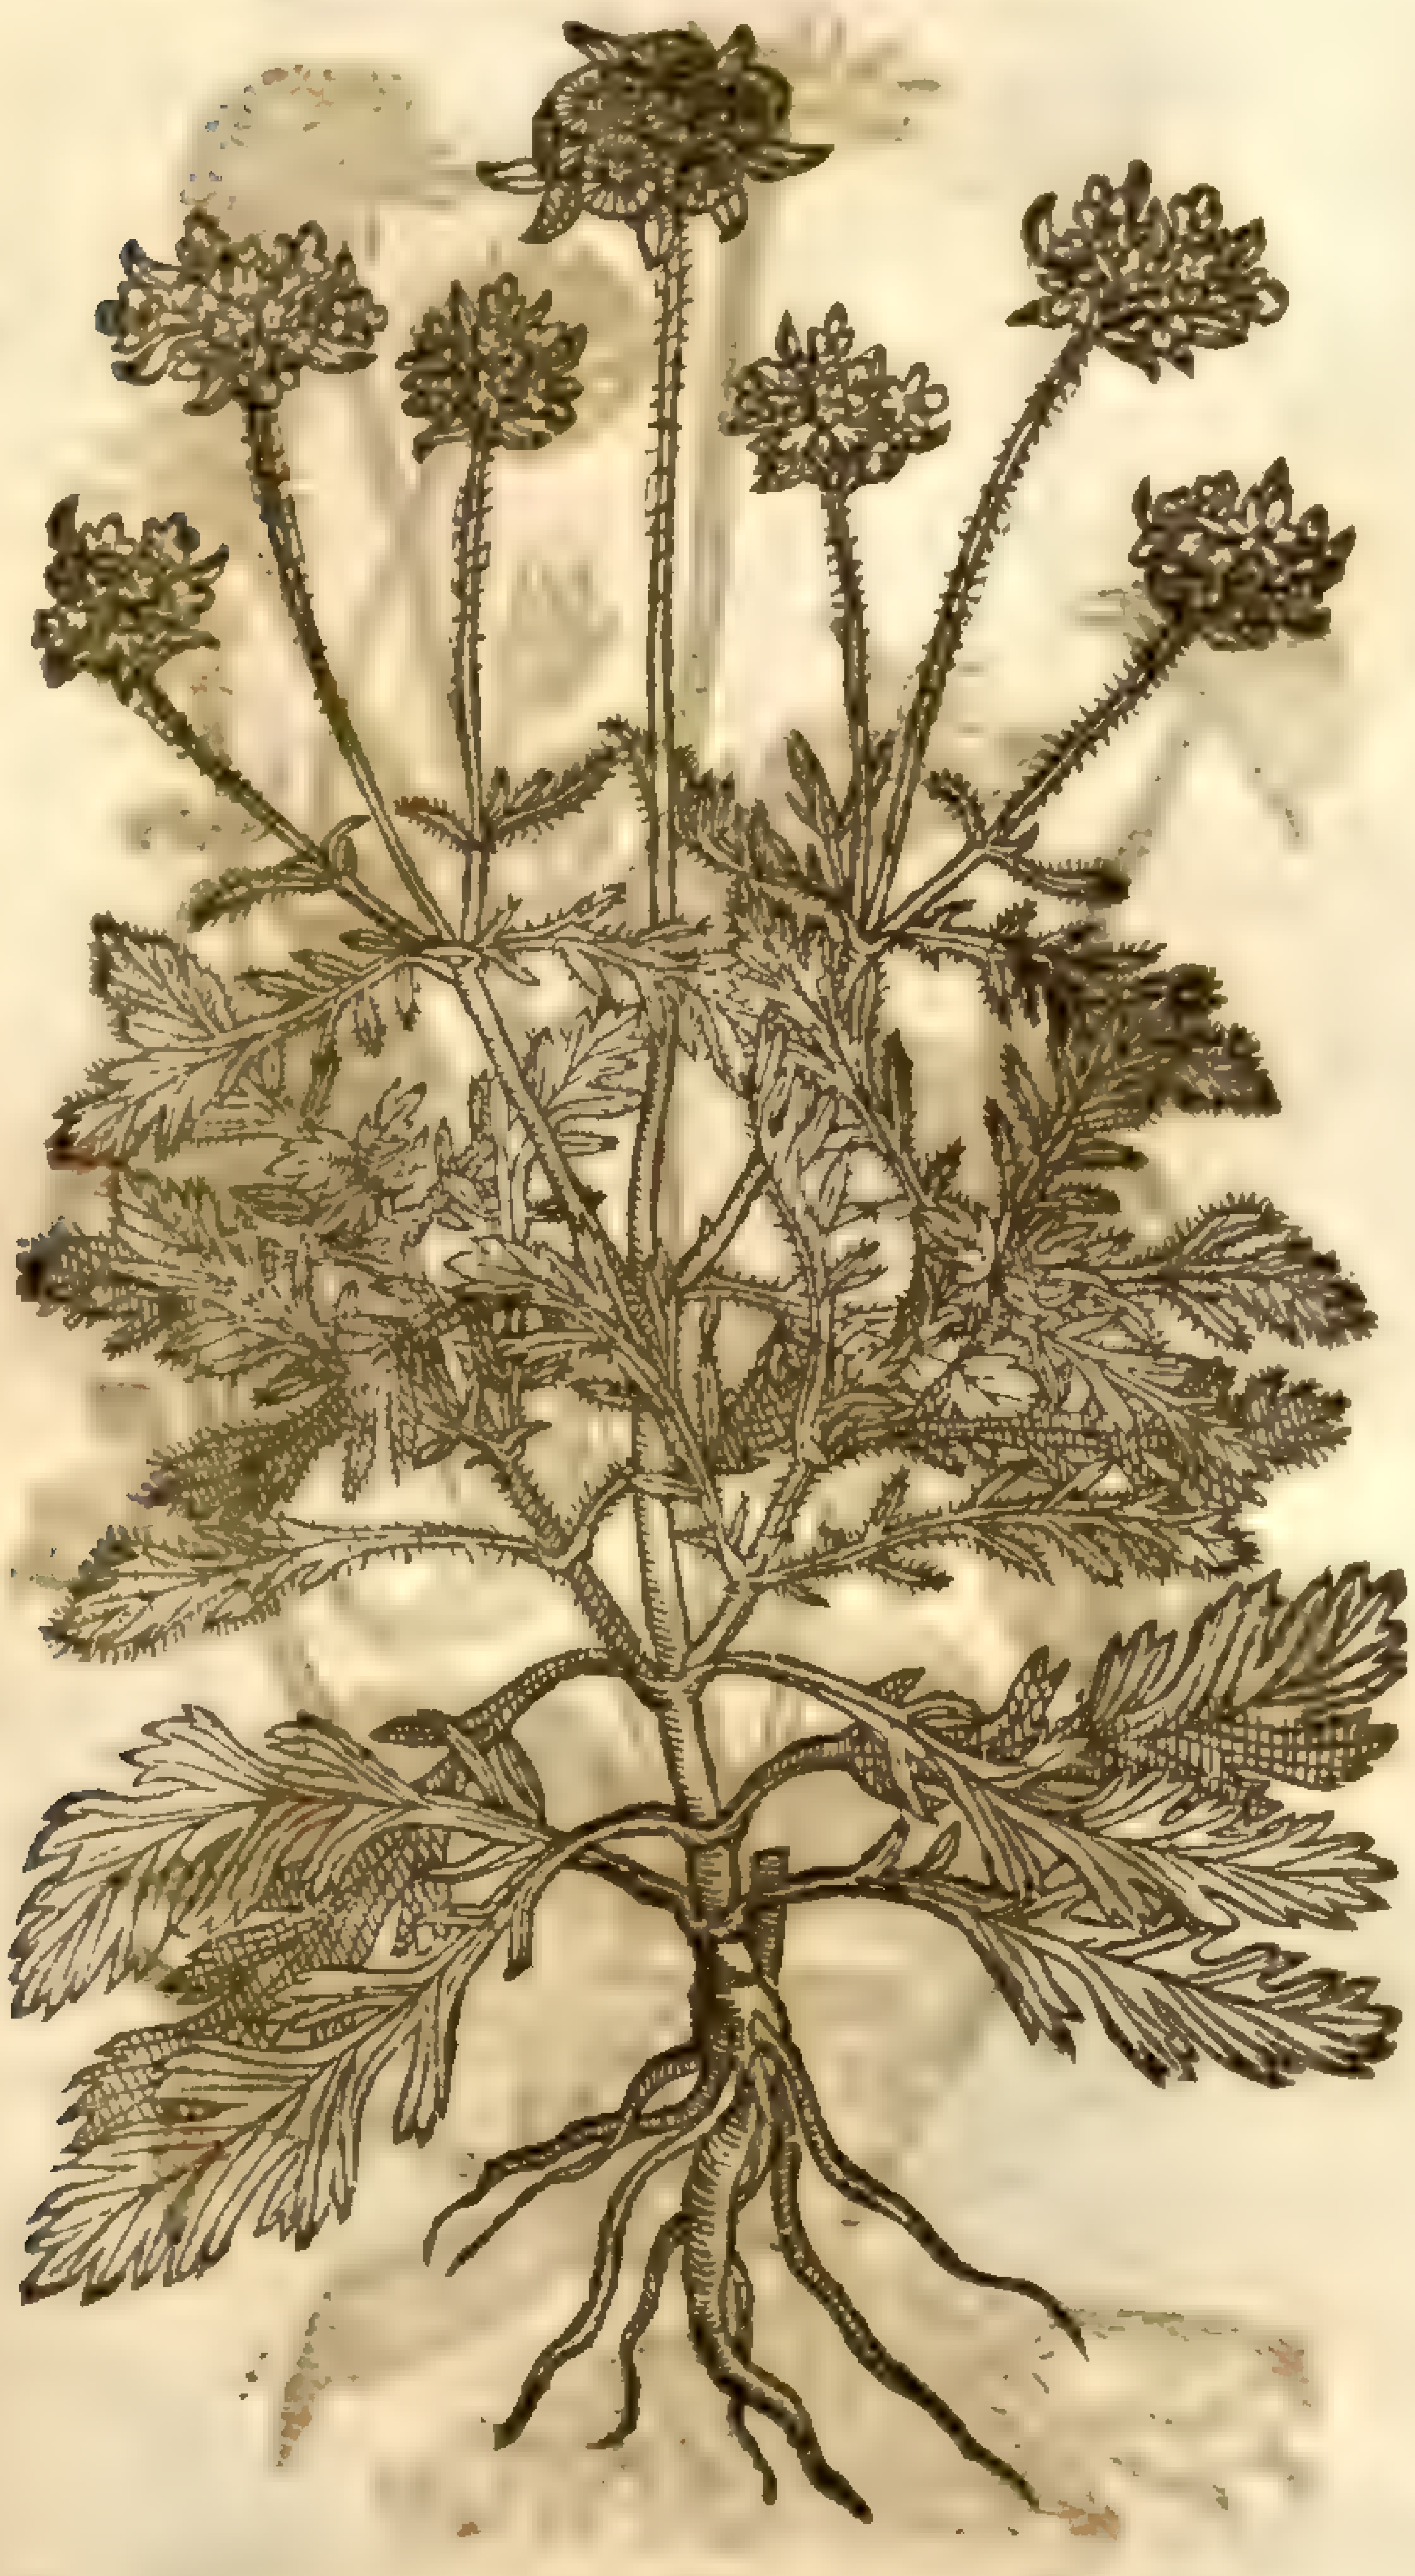


‡ 8 *Scabioſa montana alba.*
White mountaine Scabious.

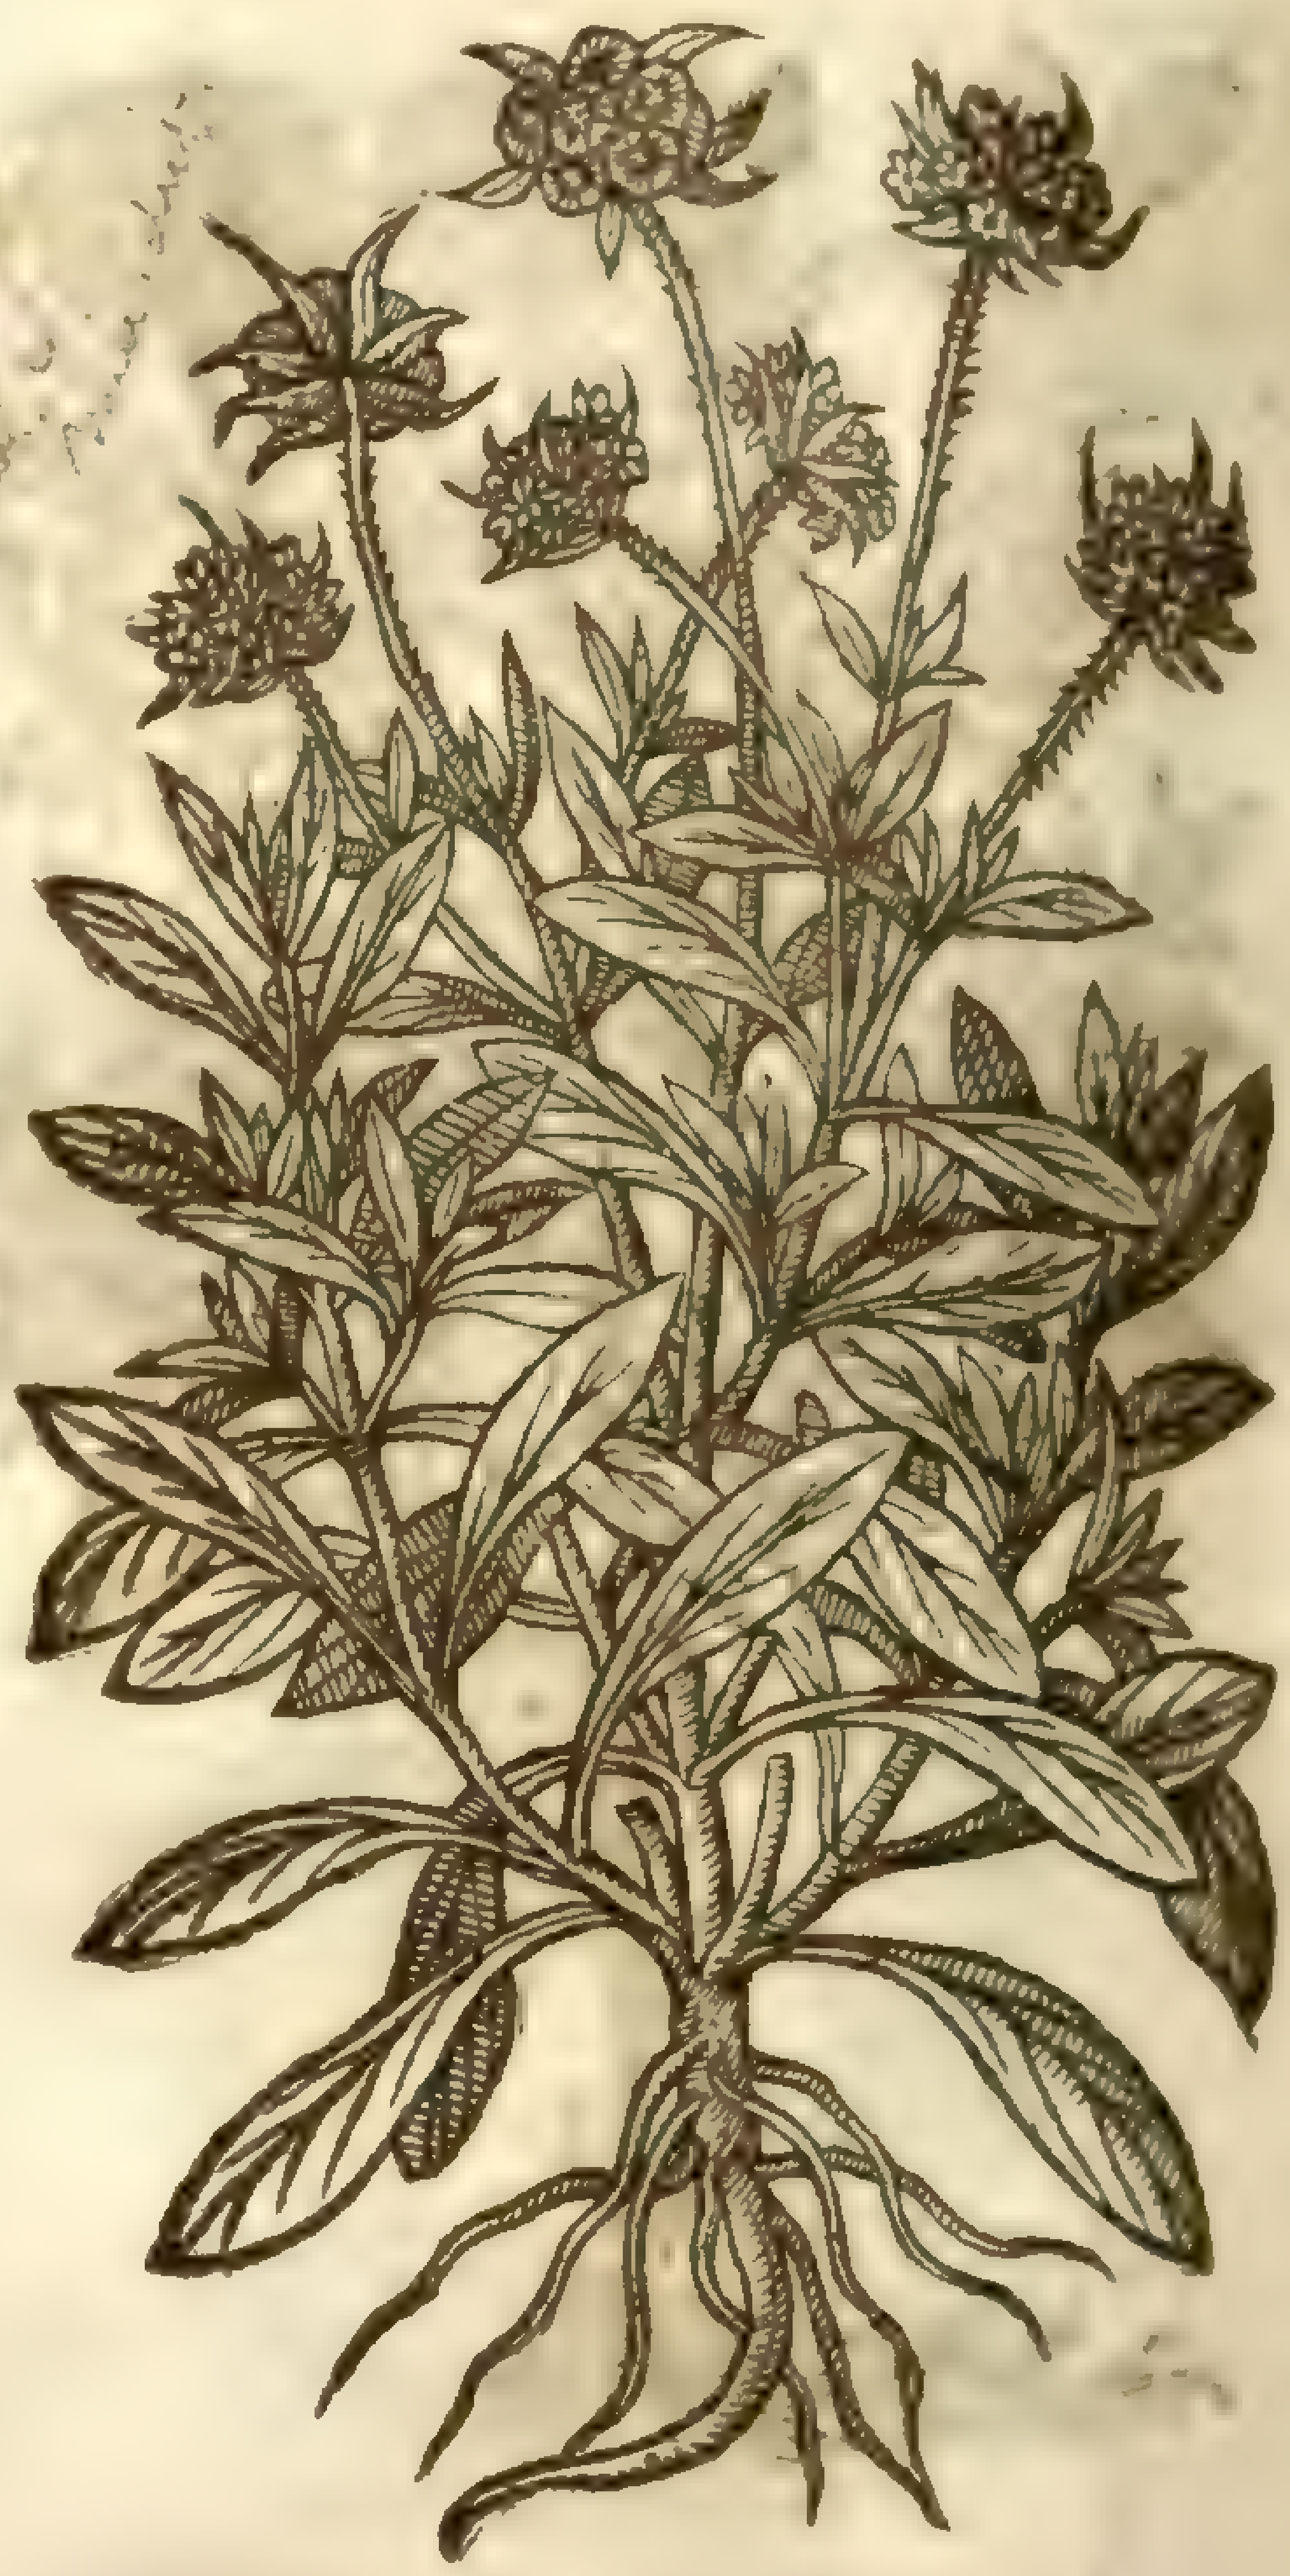


9 *Scabioſa major Hiſpanica.*
Spaniſh Scabious.

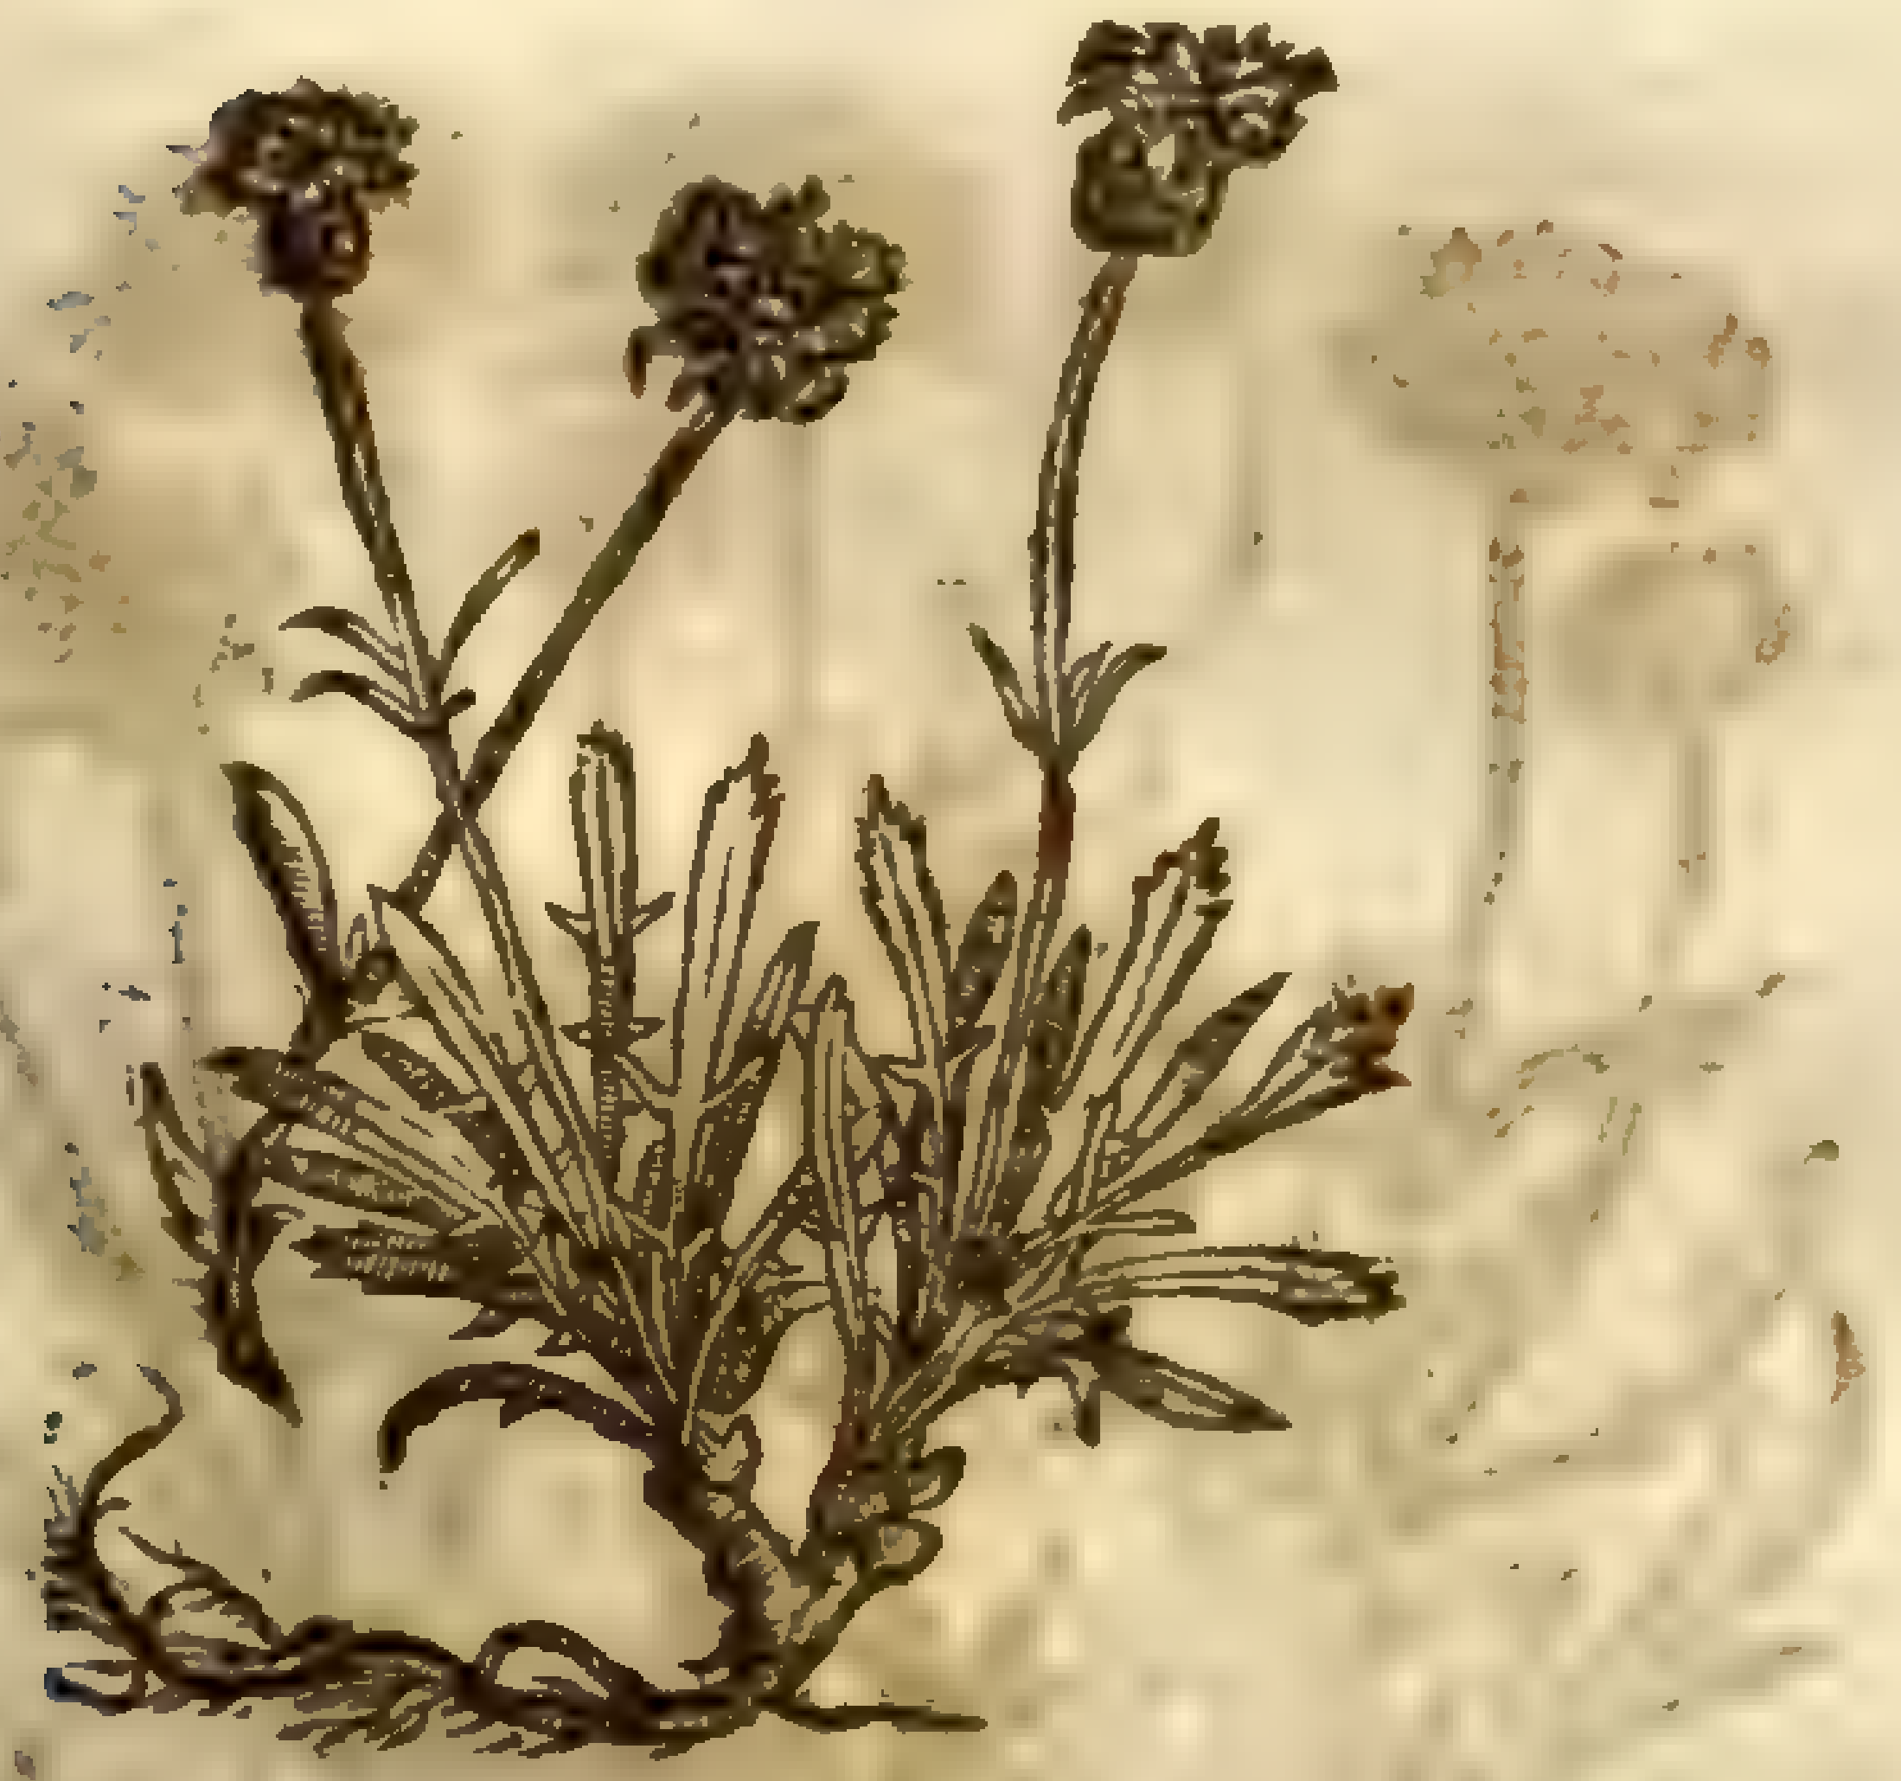
S. stellata [illegible]



10 *Scabioſa peregrina.*
Strange Scabious.



† 11 *Scabioſa omnium minima.*
Sheepes Scabious.



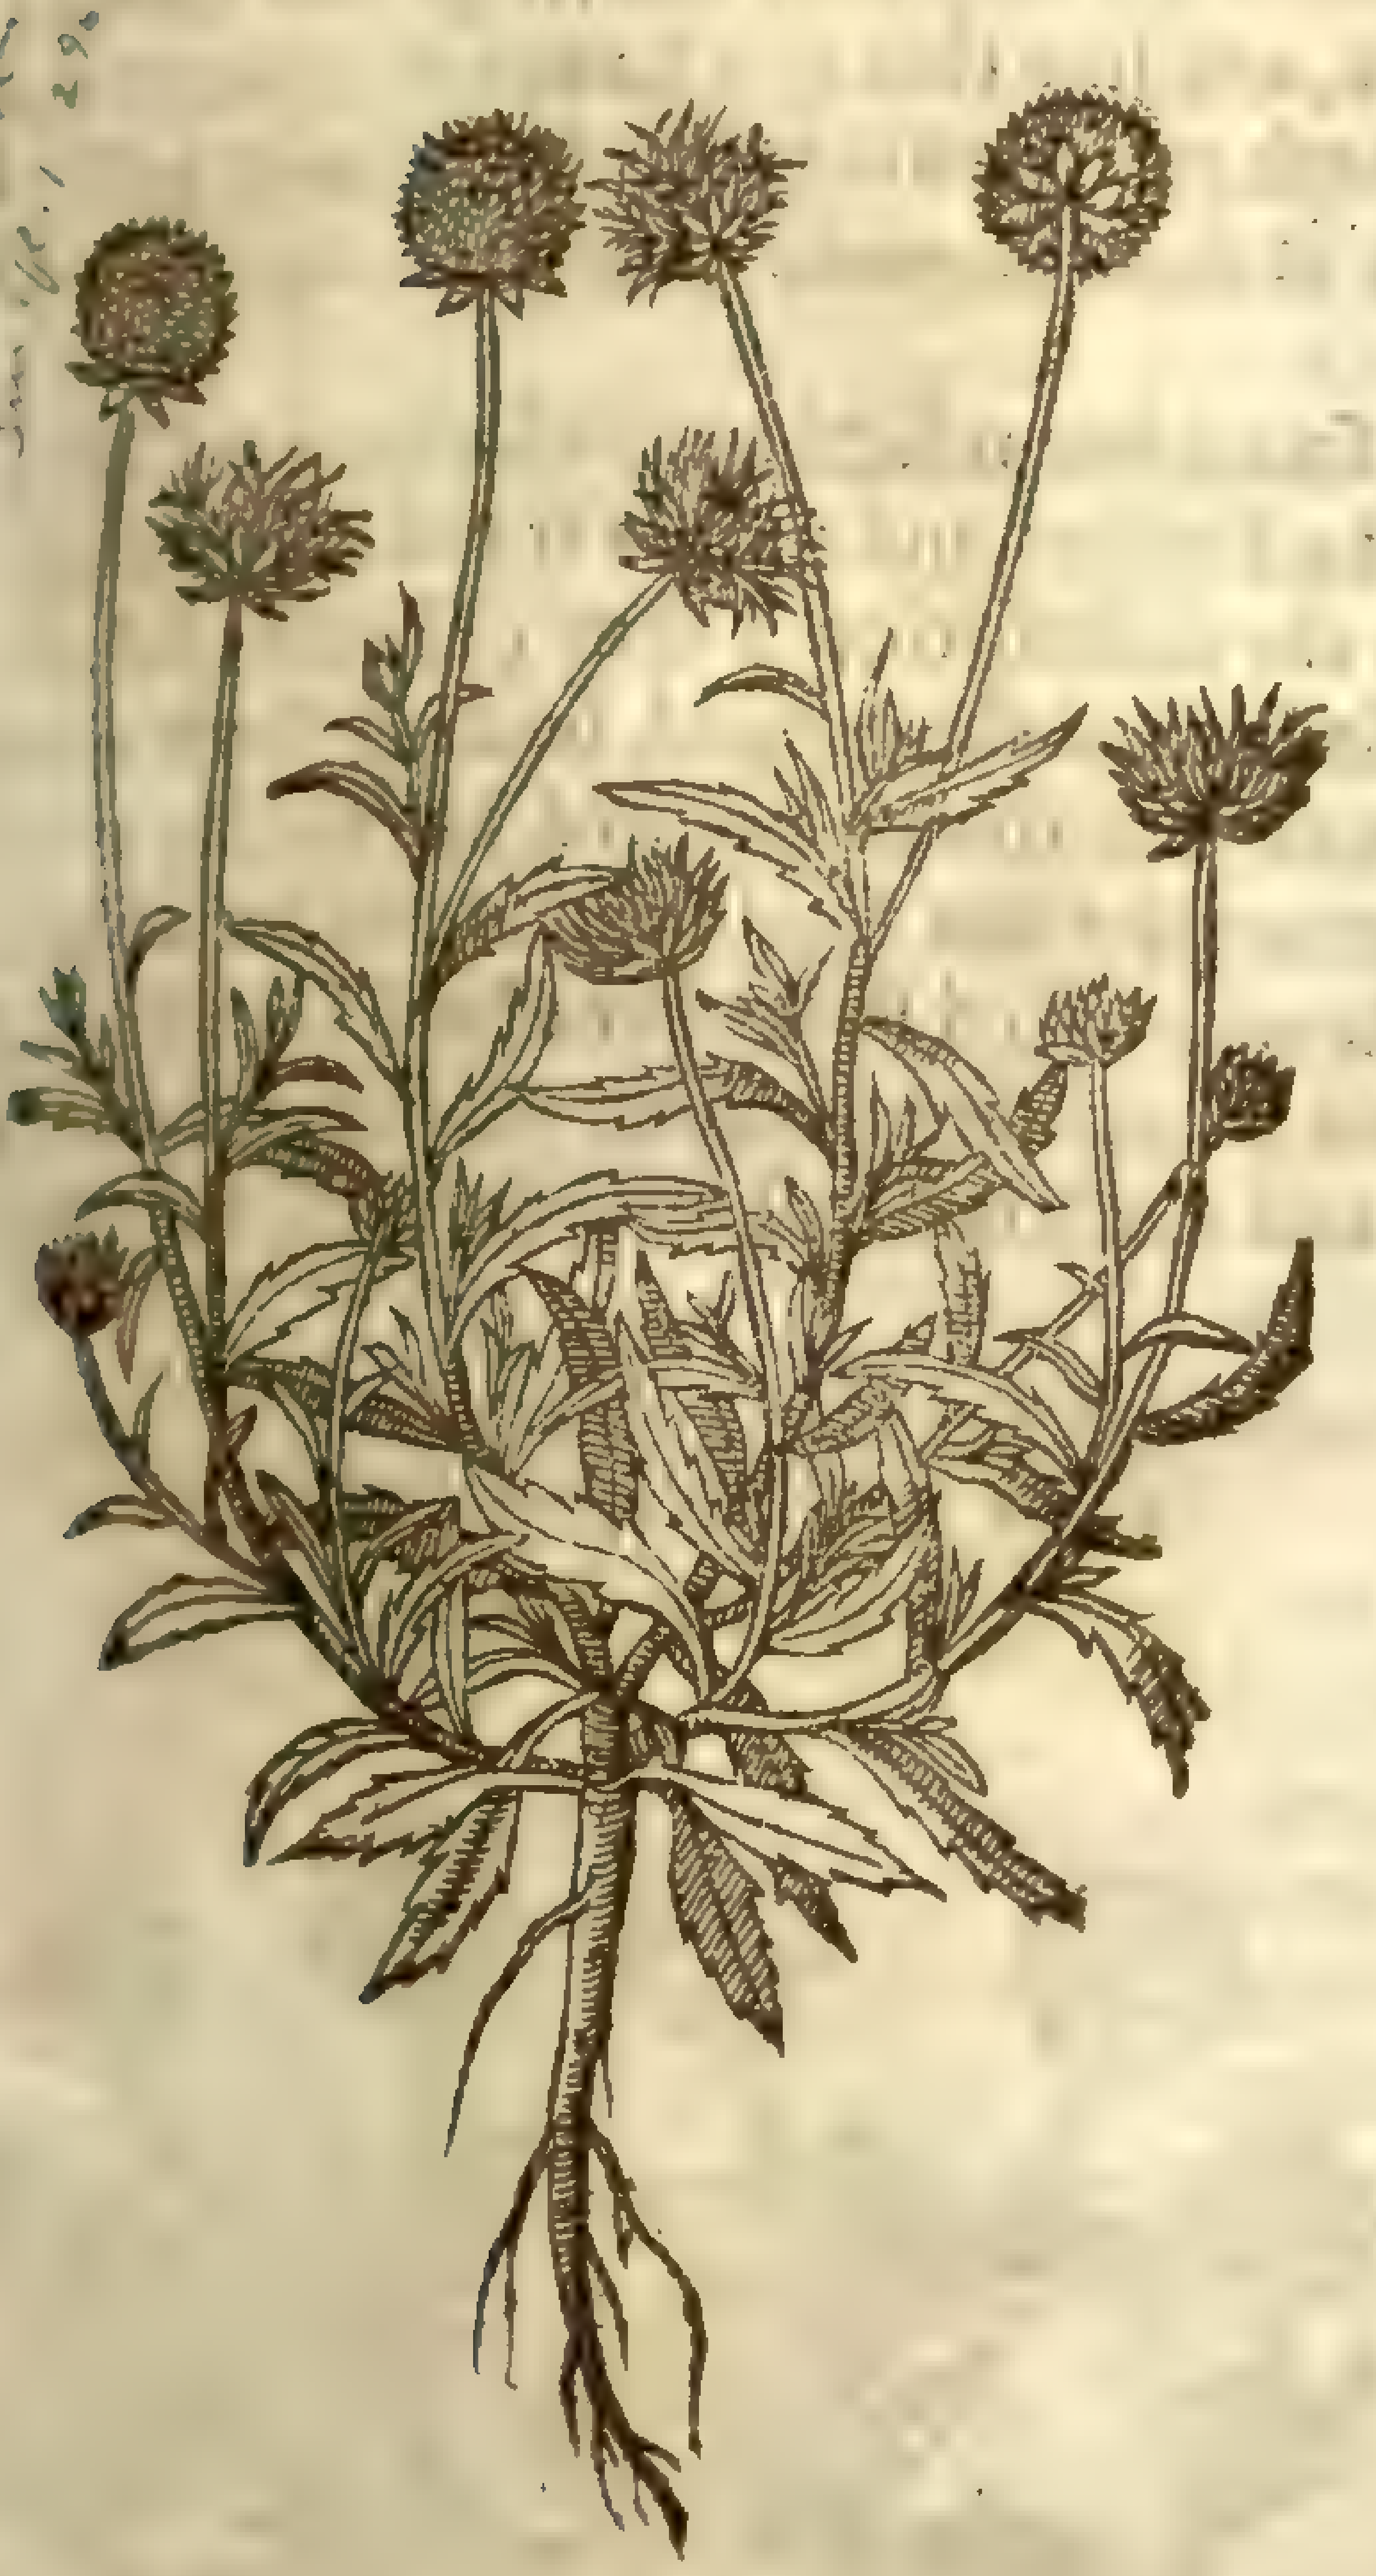
‡ 8 The white mountaine Scabious hath broad leaues ſpred vpon the ground, like thoſe of the field Primroſe, but greater. Amongſt which riſeth vp a great ſtiffe ſtalke ſmooth and plain, garniſhed with leaues not like thoſe next the ground, but leſſer, much more diuided, and of a greener colour & harder. The floures are like thoſe of the common Scabious, but white of colour: the root of this periſhes euery yeare after the perfecting of the ſeed. ‡

9 The ninth kinde of Scabious is like vnto the mountaine Scabious, but lower and ſmaller, hauing ſundry large and broad leaues next the ground, ſnipt confuſedly and out of order at the edges like the Oken leafe; among which riſeth vp a ſtem two cubits high, diuiding it ſelſe into ſundry other branches. The floures are ſet at the top of the naked ſtalkes, of a whitiſh colour; which being paſt, the ſeed appeareth like a tuft of ſmall bucklers, round, and ſomewhat hollow within, and made as it were of parchment, very ſtrange to behold: and within the bucklers there are ſundry ſmall croſſes of blacke faſtened to the bottome, as it were the needle in a diall, running vpon the point of a needle. The plant dieth at the beginning of Winter, and muſt be ſowne in Aprill in good and fertile ground.

10 The tenth is like vnto the laſt before mentioned, in ſtalkes, root, and floures, and differeth that this plant hath leaues altogether without any cuts or jagges about the edges, but is ſmooth and plaine like the leaues of Marigolds, or Diuels bit, and the floures are like vnto thoſe of the laſt deſcribed.

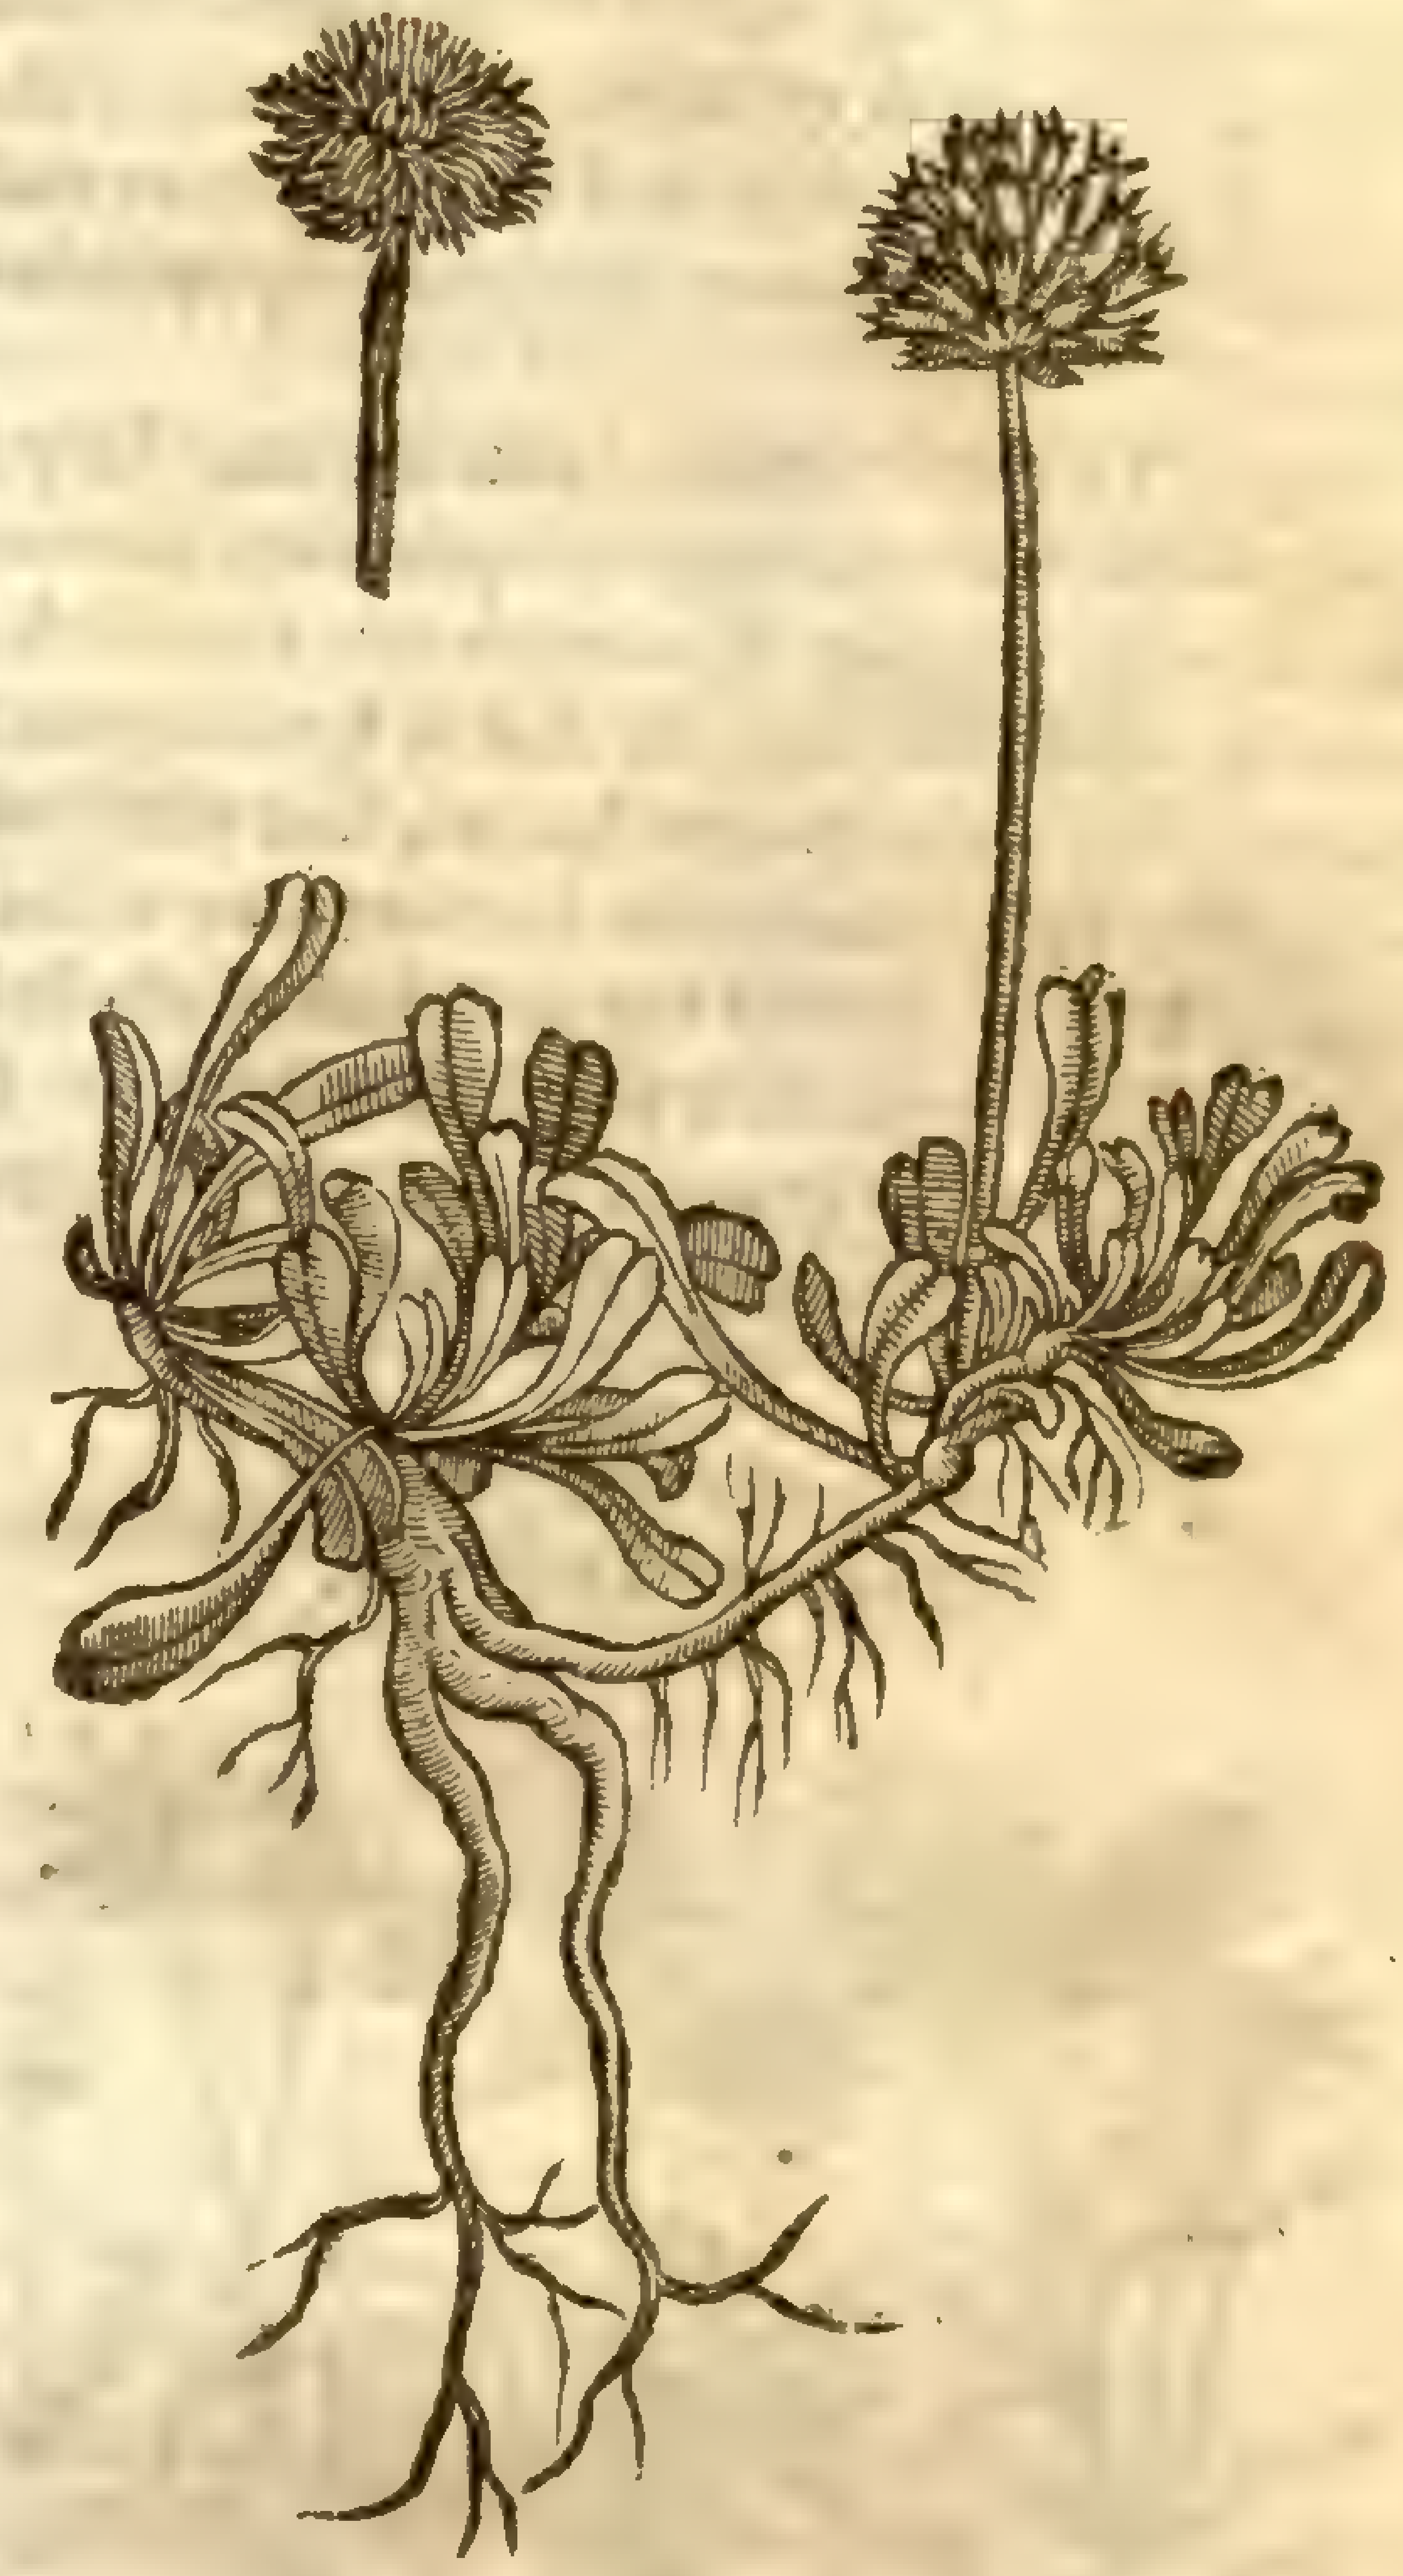
11 Sheeps Scabious hath ſmall and tender branches trailing vpon the ground, whereupon doe grow ſmall leaues very finely jagged or minced euen almoſt to the middle ribbe, of an ouerworne colour. The floures grow at the top of a blewiſh colour, conſiſting of much thrummie matter, hard thruſt together like a button; the root is ſmall, and creepeth in the ground.

12 *Scabioſa minima hirſuta.*
Hairie Sheepes Scabious.

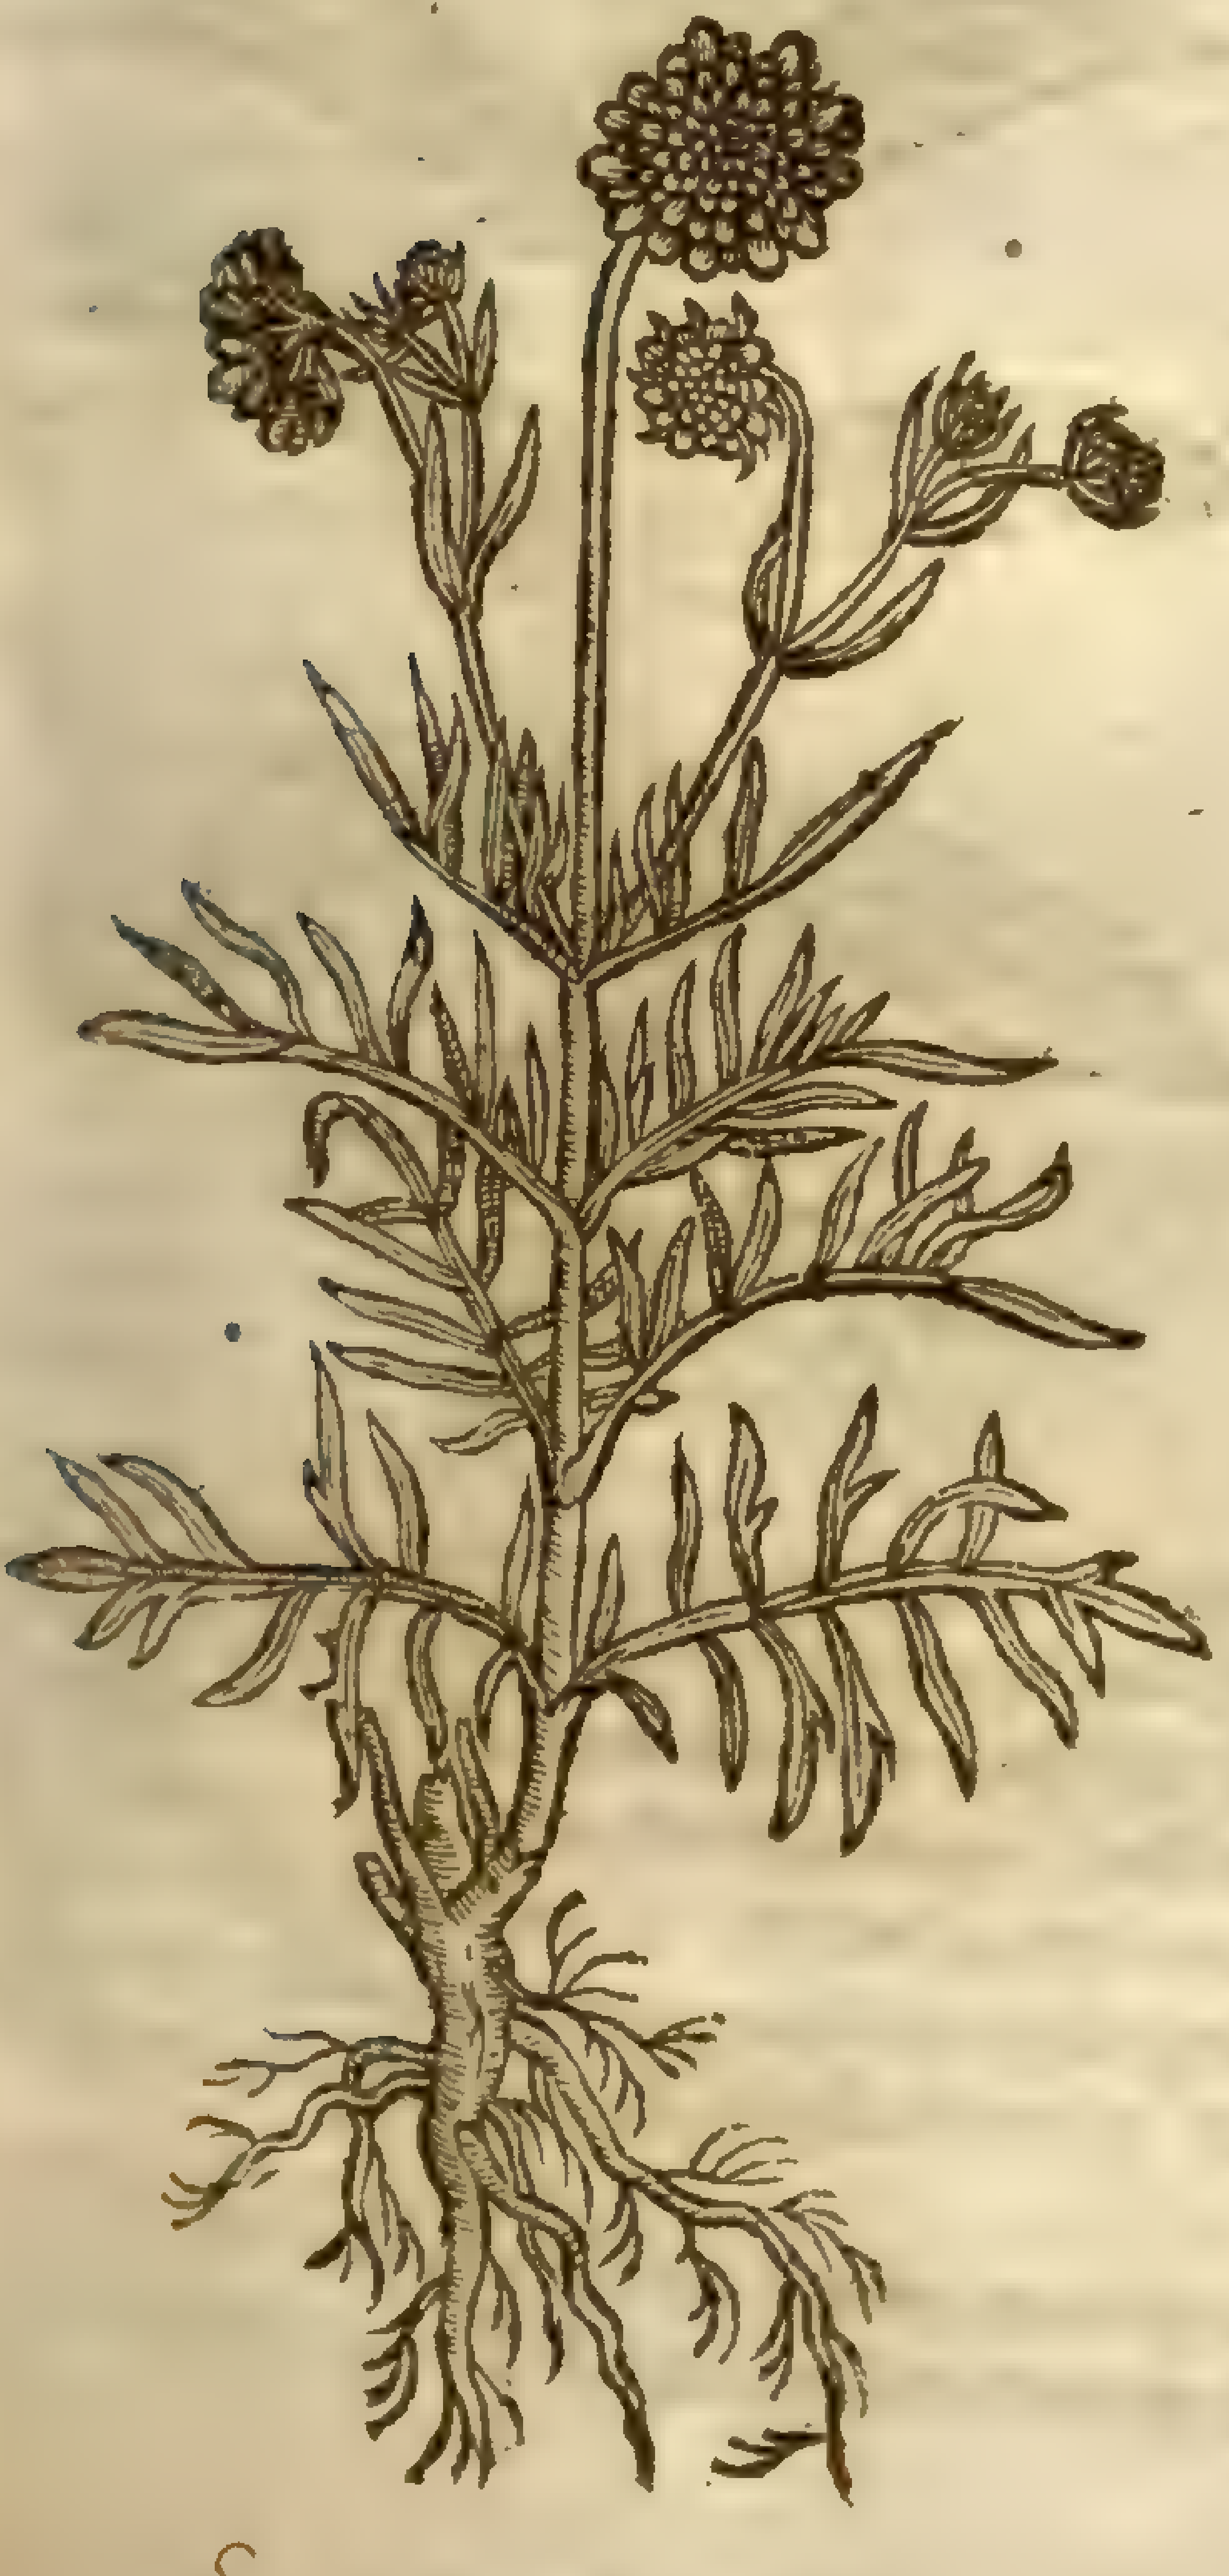


[illegible]

‡ 13 *Scabioſa minima Bellidis folio.*
Daiſie leaued Scabious.

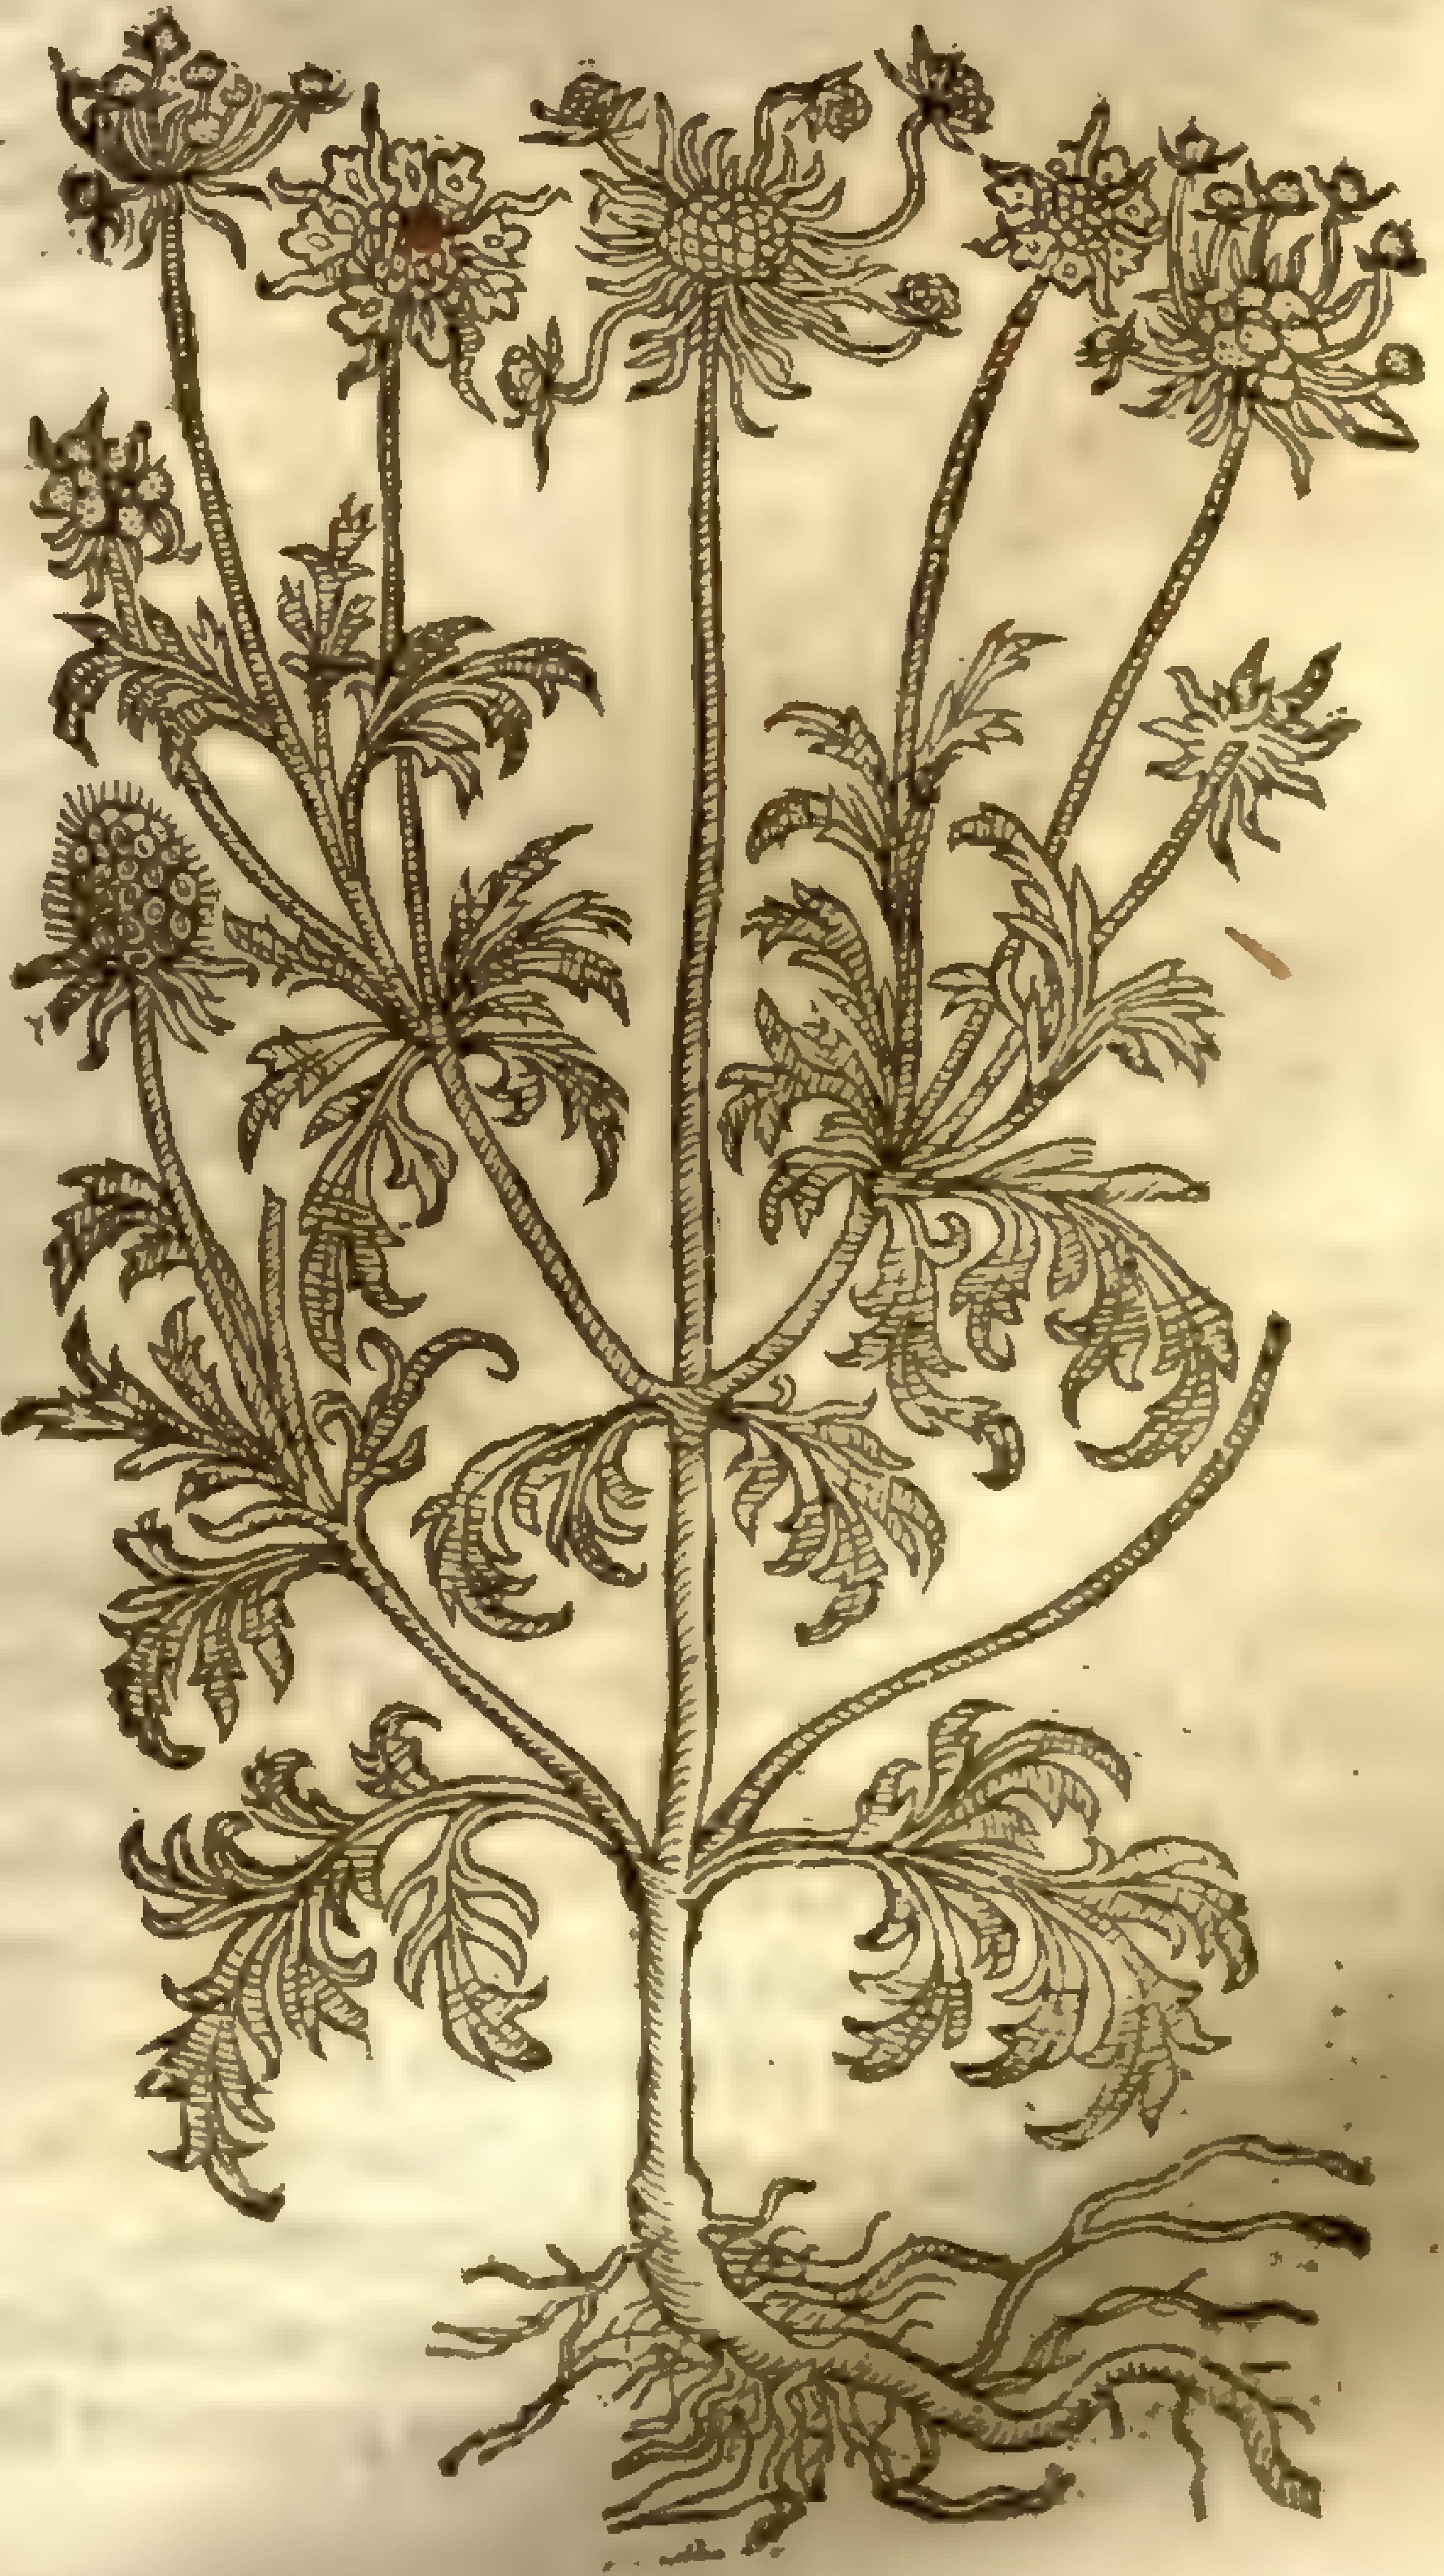


‡ 14 *Scabioſa flore pallido.*
Yellow Scabious.



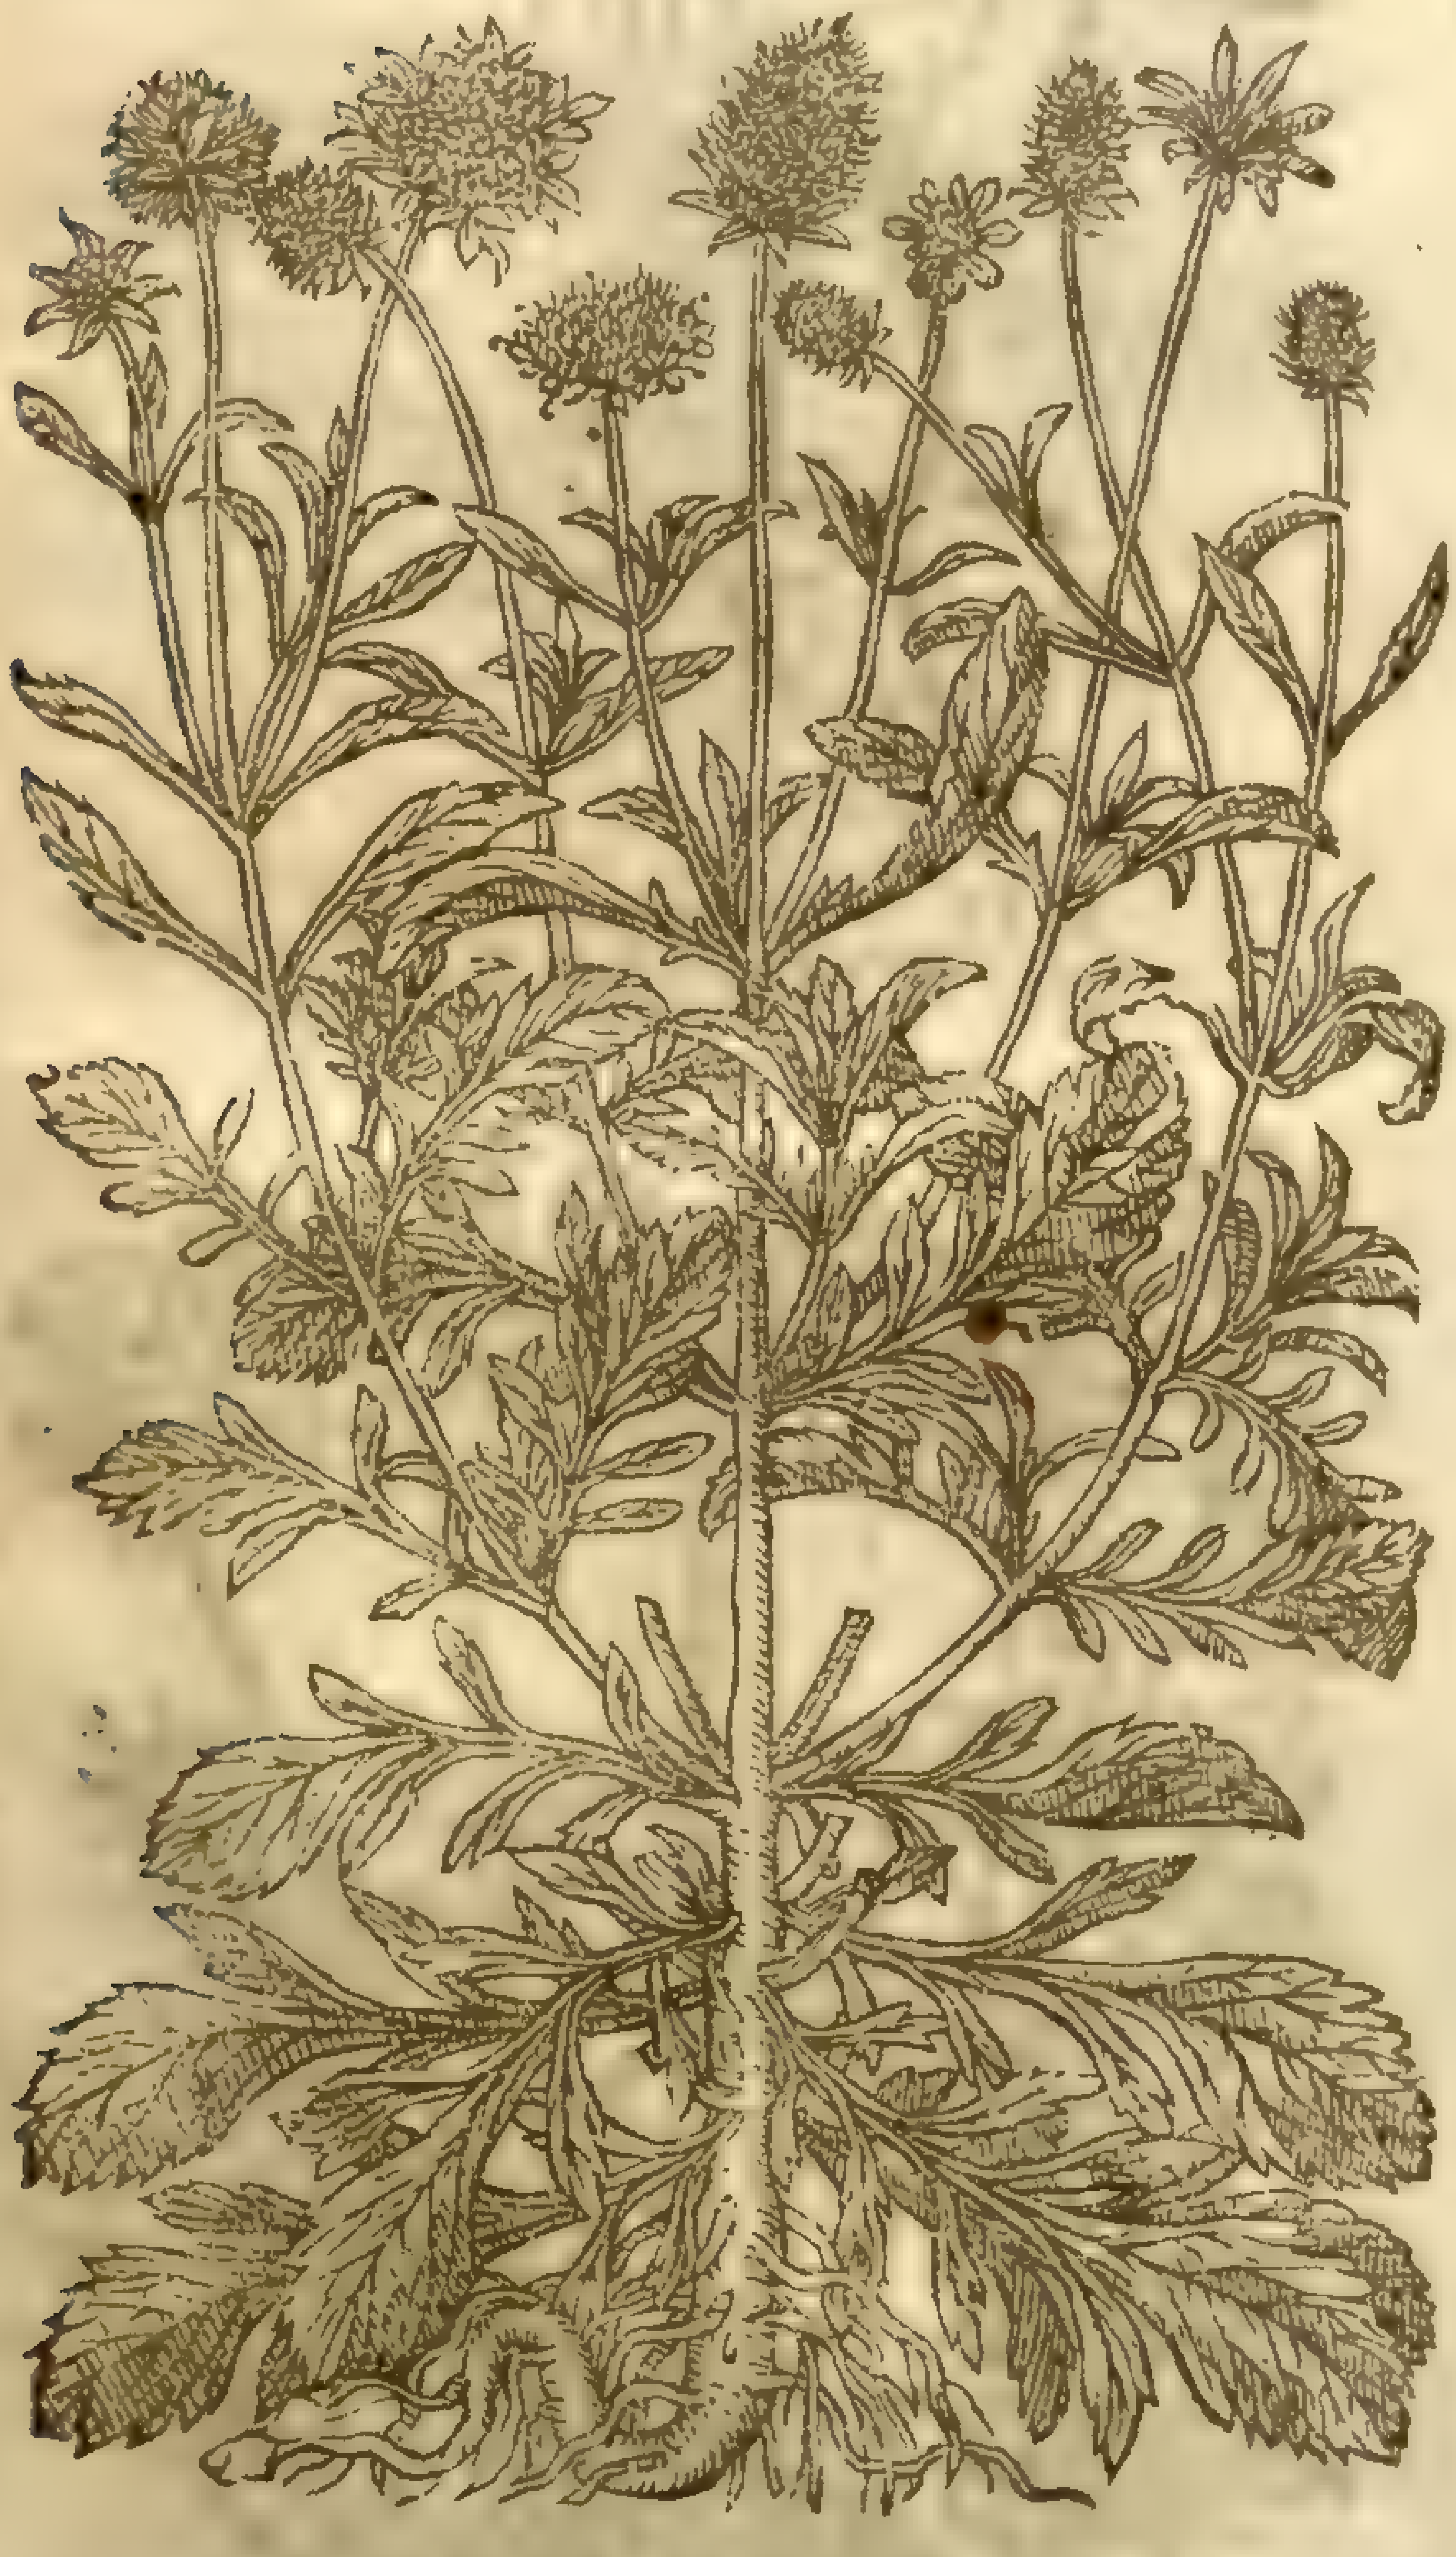
S. ochroleuca, L.
Mill. dict.

‡ 15 *Scabioſa prolifera.*
Childing Scabious.

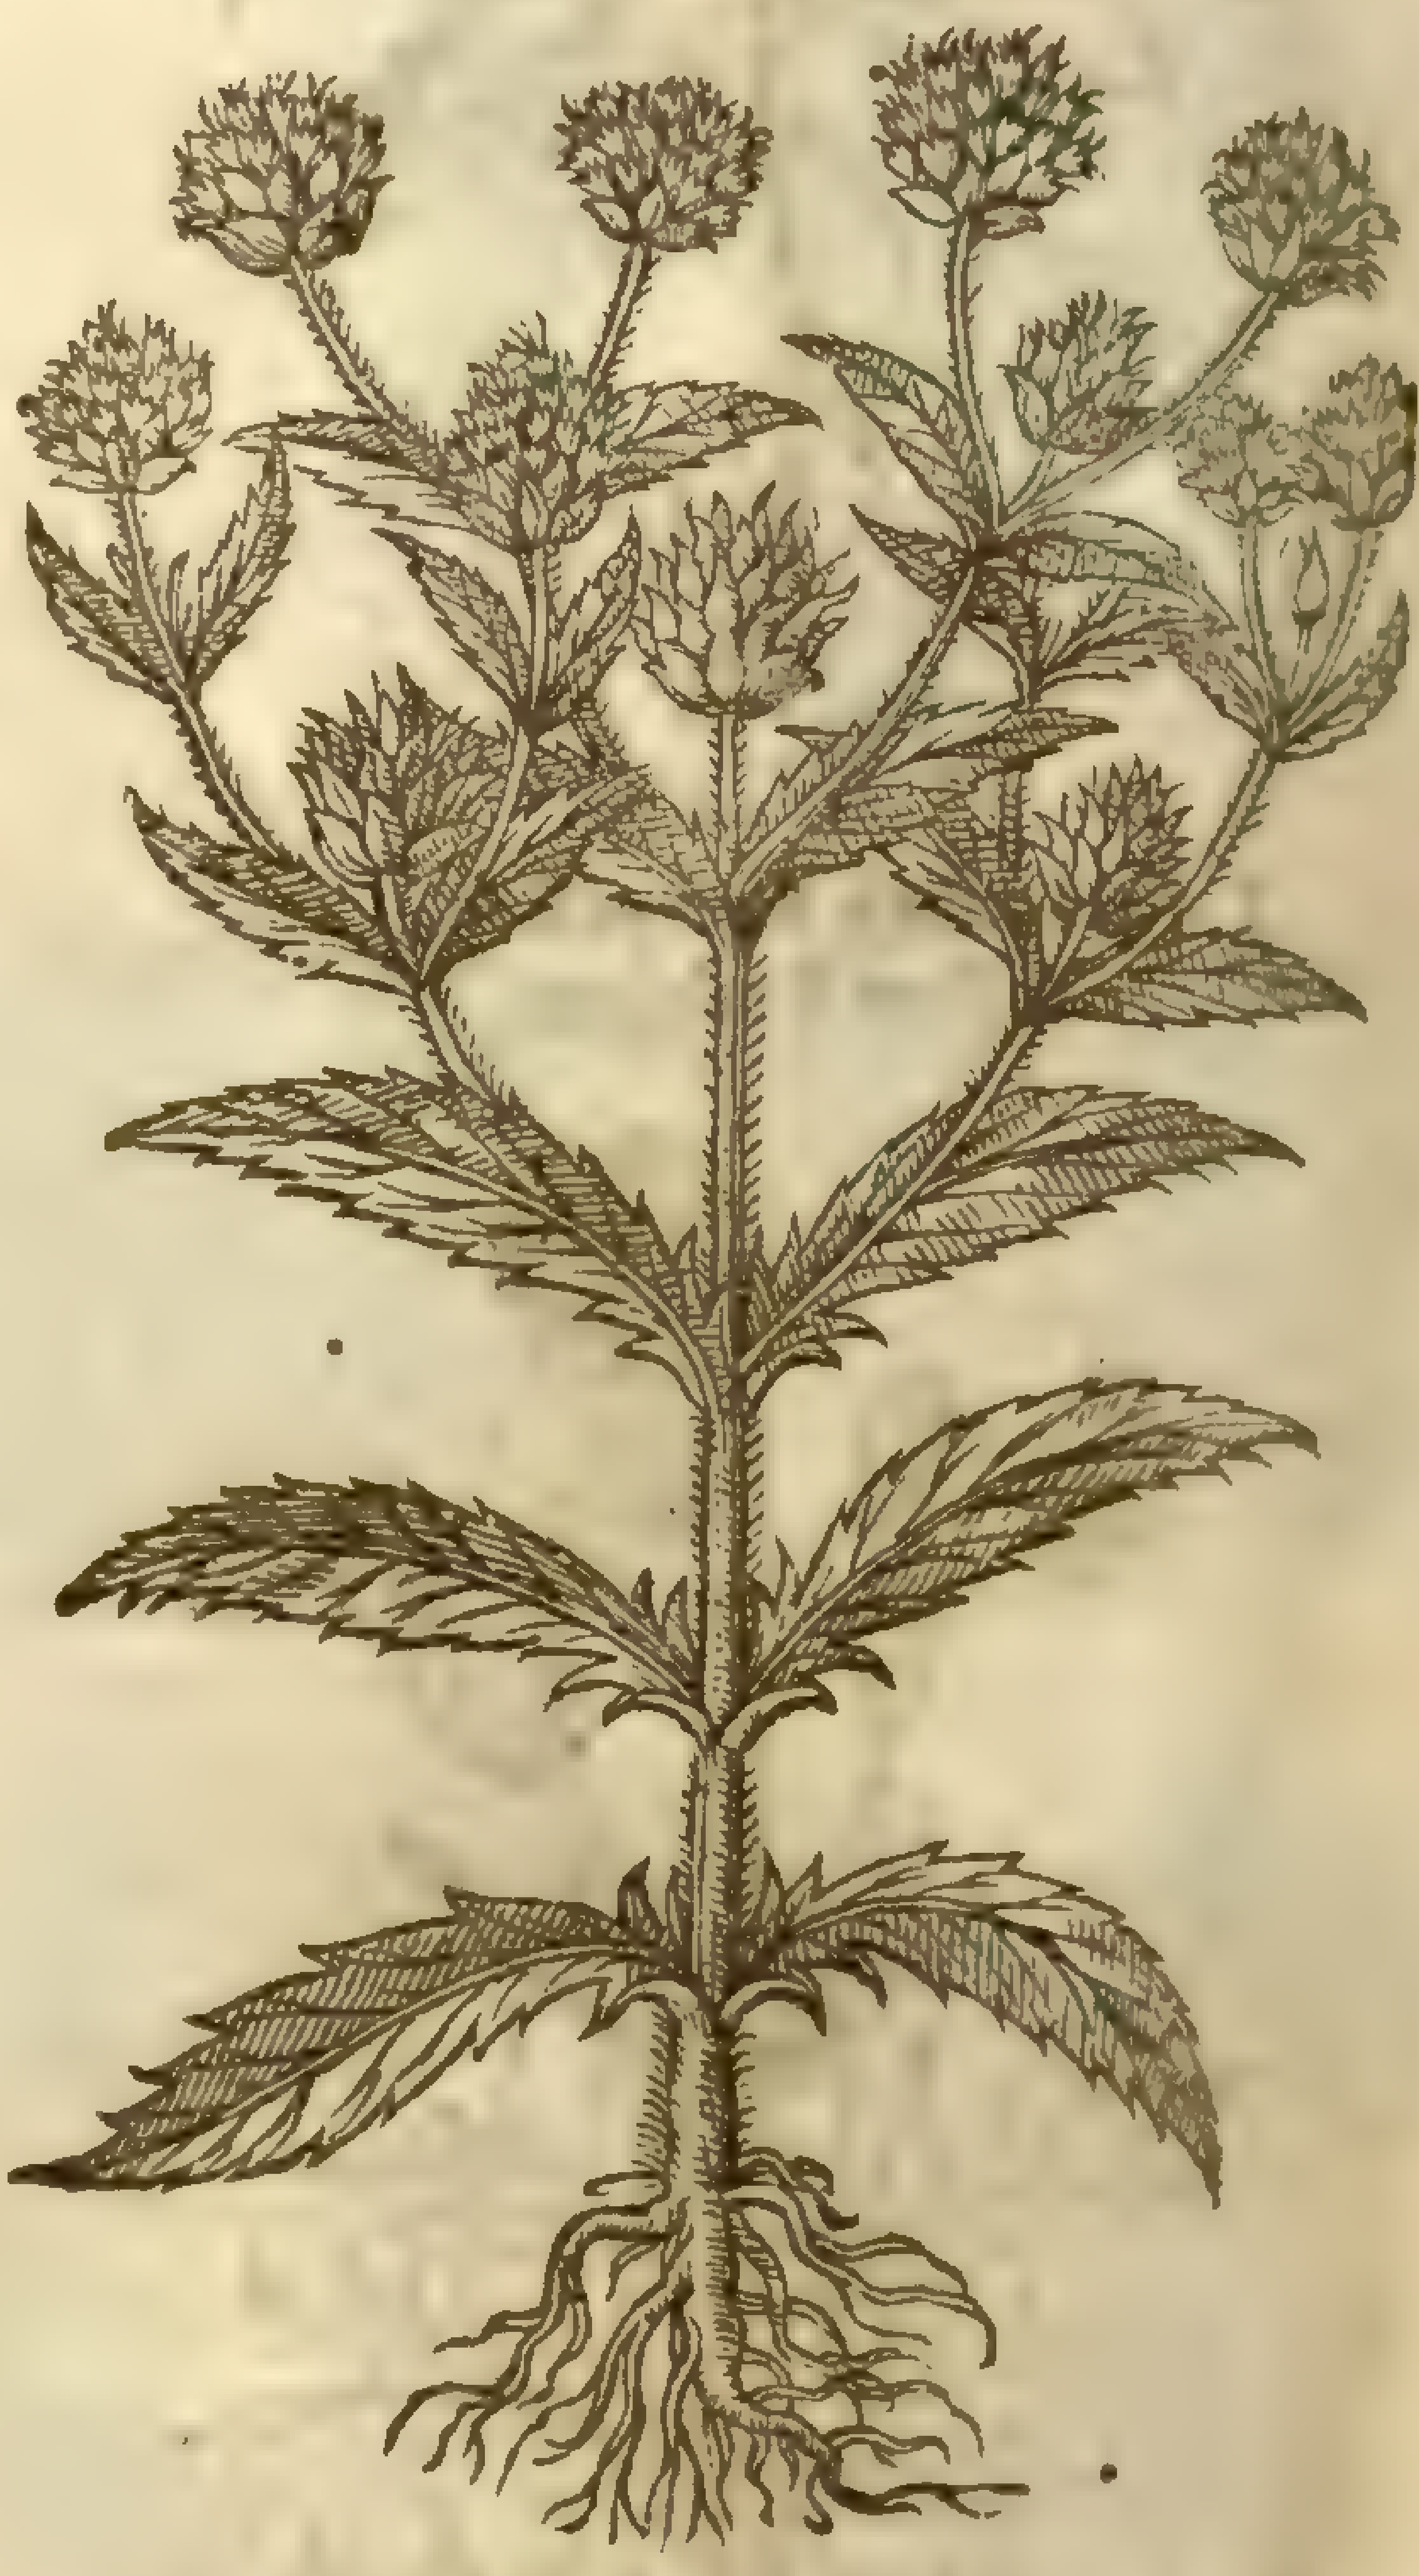


‡ 12 The other Sheeps Scabious of our Author (according to the figure) is greater than the laſt deſcribed, growing ſome foot or better high, with ſlender rough branches ſet with leaues not ſo much diuided, but onely nicked about the edges: the floures are in colour and ſhape like thoſe of the laſt deſcribed, or of the blew Daiſie; the root is ſingle, and like that of a Rampion, whence *Fabius Columna* (the ſeed and milkie juyce inducing him) hath refer'd this to the Rampions, calling it *Rapuntium montanum capitatum leptophyllon*. *Lobel* calls it *Scabioſa media*: and *Dodonæus*, *Scabioſa minor*.

13 To theſe little plants we may fitly adde another ſmall one refer'd by *Cluſius* to this Claſſis, and called *Scabioſa*. 10. *ſive repens*: yet *Bauhine* refers it to the Daiſies, and termes it *Bellis cærulea montana frutescens*; but it matters not to which we referre it: the deſcription is thus; The root is hard, blacke, and creeping, ſo that it ſpreds much vpon the ſurface of the ground, ſending forth many thicke, ſmooth, greene leaues, like thoſe of the blew Daiſie, not ſharpe pointed, but ending as we vulgarly figure an heart, hauing a certaine graſſie but not vnpleaſant ſmell, and ſomewhat a bitter and hot taſte: out of the middeſt of theſe leaues grow ſlender naked ſtalks ſome hand high, hauing round floures on their tops, like thoſe of Diuells bit, and of the ſame colour, yet ſometimes of a lighter blew. It growes in the mountaines of Hungary and Auſtria. It floures in Aprill and May, and ripens the ſeed in July and Auguſt.



‡ 16 *Scabioſa rubra Indica.*
Red Indian Scabious.



‡ 17 *Scabioſa æſtivalis Cluſij.*
Summer Scabious.

14 This (which is the ſeuenth Scabious of *Cluſius*, and which hee termes ὠχρολευκής, of the whitiſh yellow colour of the floure) hath round, ſlender, ſtiffe, and greene ſtalkes ſet at each joynt with two large and much diuided leaues of a whitiſh greene colour: thoſe leaues that come from the root before the ſtalke grow vp are broader, and leſſe diuided; vpon the tops of the branches and ſtalkes grow floures like thoſe of the common Scabious, being white or rather (before they be throughly open) of a whitiſh yellow colour; which fading, there follow ſeeds like as in the ordinary kinde. This floures in Iune and Iuly, and growes very plentifully in all the hilly grounds and dry Meades of Auſtria and Morauia.

15 There is alſo a kinde of Scabious hauing the leaues much cut and diuided, and the ſtalkes and floures like to the common ſort, of a blewiſh purple colour, but differing in this, that at

the ſides of the floure it puts forth little ſtalkes, bearing ſmaller floures, as is ſeene in ſome other plants, as in Daiſies and Marigolds, which therefore are fitly tearmed in Latine *Prolifera* or Childing. This growes only in Gardens, and floures at the ſame time with the former.

16 The ſtalks of the red Scabious grow ſome cubit or more in height, and are diuided into many very ſlender branches, which at the tops carry floures compoſed after the manner of the other ſorts of Scabious, that is, of many little floures diuided into fiue parts at the top, and theſe are of a perfect red colour, and haue ſmall threds with pendants at them comming forth of the middle of each of theſe little floures, which are of a whitiſh colour, and make a pretty ſhow. The leaues are green, and very much diuided or cut in. The ſtarry ſeeds grow in long round hairy heads handſomly ſet together. This is an annuall, and periſhes as ſoone as it hath perfected the ſeed. *Cluſius* maketh it his ſixt Scabious, and calls it *Scabioſa Indica*. It floures in Iuly, and growes in the gardens of our prime Herbariſts.

17 The ſame Author hath alſo giuen vs the figure and deſcription of another Scabious, which ſends vp a ſtalke ſome three cubits or more high, ſet at certaine ſpaces with leaues large, and ſnipt about their edges, and a little cut in neer their ſtalks. The ſtalks are diuided into others, which at their tops carry blewiſh floures in long ſcaly heads, which are ſucceeded by long whitiſh ſeed: the root is whitiſh and fibrous, and dyes euery yeare. This is the *Scabioſa 9. ſiue æſtiualis* of *Cluſius*. ‡

¶ *The Place.*

Theſe kindes of Scabious do grow in paſtures, medowes, corn fields, and barren ſandy grounds almoſt euery where.

The ſtrange ſorts do grow in my garden, yet are they ſtrangers in England.

¶ *The Time.*

They floure and flouriſh in the Summer moneths.

¶ *The Names.*

Scabious is commonly called *Scabioſa*; diuers think it is named ψώρα, which ſignifieth a ſcab, and a certaine herbe ſo called by *Aëtius*: I do not know, ſaith *Hermolaus Barbarus*, whether it be Scabious which *Aëtius* doth call *Pſora*, the ſmoke of which being burnt killeth cankers or little wormes. The Author of the Pandects doth interpret *Scabioſa* to be *Dioſcorides* his *Stæbe*: *Dioſcorides* deſcribeth *Stæbe* by no markes at all, being commonly known in his time; and *Galen*, *lib.* 1. of Antidotes ſaith thus: There is found amongſt vs a certaine ſhrubbie herbe, hot, very ſharpe and biting, hauing a little kinde of aromaticall or ſpicy ſmell, which the inhabitants call *Colymbade*, and *Stæbe*, ſingular good to keepe and preſerue wine: but it ſeemeth that this *Stæbe* doth differ from that of which he hath made mention in his book of the faculties of medicines, which agrees with that of *Dioſcorides*: for he writeth that this is of a binding quality without biting; ſo that it cannot be very ſharpe.

¶ *The Temperature.*

Scabious is hot and dry in the later end of the ſecond degree, or neere hand in the third, and of thin and ſubtile parts: it cutteth, attenuateth, or maketh thin, and throughly concocteth tough and groſſe humors.

¶ *The Vertues.*

Scabious ſcoureth the cheſt and lungs; it is good againſt an old cough, ſhortneſſe of breath, paine in the ſides, and ſuch like infirmities of the cheſt. A

The ſame prouoketh vrine, and purgeth now and then rotten matter by the bladder, which happeneth when an impoſtume hath ſomewhere lien within the body. B

It is reported that it cureth ſcabs, if the decoction thereof be drunk certaine daies, and the juice vſed in ointments. C

The later Herbariſts do alſo affirm, that it is a remedy againſt the bitings of Serpents and ſtingings of venomous beaſts, being outwardly applied or inwardly taken. D

The juice beeing drunke procureth ſweat, eſpecially with Treacle; and it ſpeedily conſumeth plague ſores, if it be giuen in time, and forthwith at the beginning: but it muſt be vſed often. E

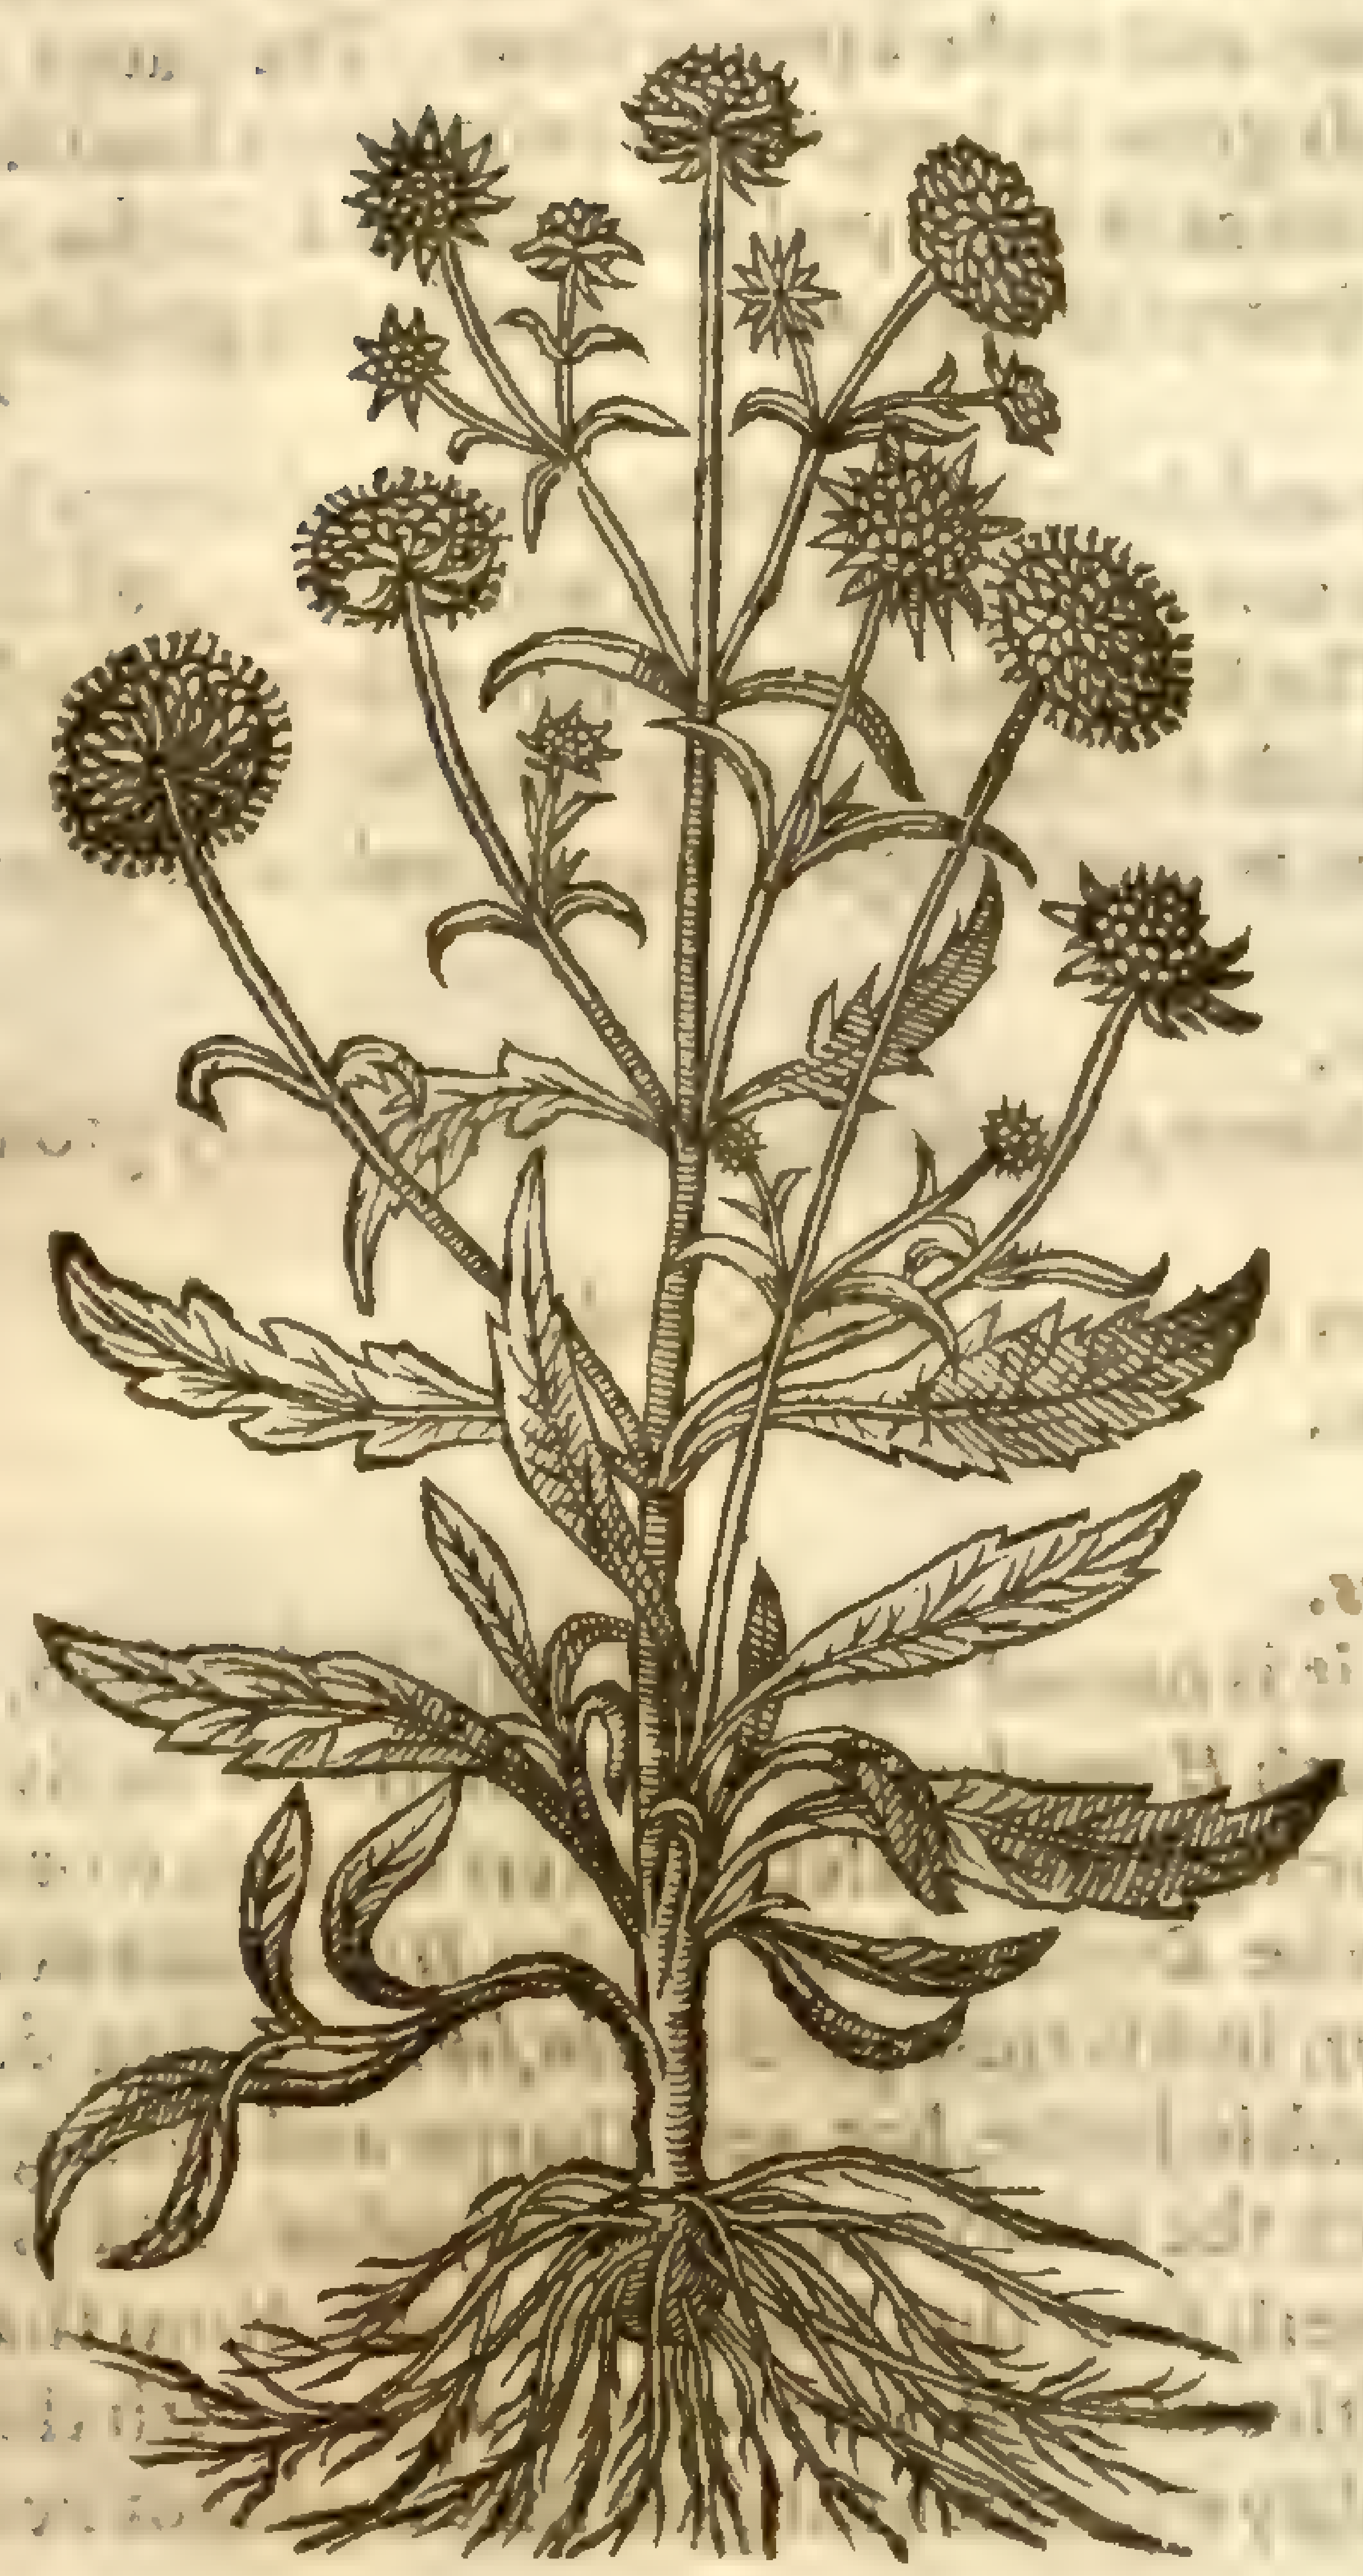
It is thought to be forceable againſt all peſtilent feuers. F

---

† Formerly the 1. 2. 3. 11. figures were all nothing elſe than the varieties of one plant, being of the 1. 2. 3. 4. *Scabioſa minor* of *Tabern.* they differ only in the more or leſſe cutting or diuiding of the leaues: I haue of theſe only reſerued the third, and in other places put ſuch figures as are agreeable to the title. The figure that was in the ſixt place was of the ordinary firſt deſcribed Scabious; and the figure that ſhould haue been there was in the eighth place; and that which was in the ſeuenth place belongs to the plant deſcribed by me in the fourteenth place.

Chap. 248. *Of Diuels bit.*

Morſus Diaboli.
Diuels bit.



Scabiosa succisa [illegible]
Sp. pl. 1. 194

¶ *The Deſcription.*

Diuels bit hath ſmall vpright round ſtalkes of a cubite high, beſet with long leaues ſomwhat broad, very little or nothing ſnipt about the edges, ſomwhat hairie and euen. The floures alſo are of a dark purple colour, faſhioned like the floures of Scabious: the ſeeds are ſmal and downy, which being ripe are carried away with the winde. The root is blacke, thick, hard and ſhort, with many threddie ſtrings faſtned thereto. The great part of the root ſeemeth to be bitten away: old fantaſticke charmers report, that the diuel did bite it for enuie, becauſe it is an herbe that hath ſo many good vertues, and is ſo beneficial to mankinde.

¶ *The Place.*

Diuels bit groweth in dry medows and woods, & about waies ſides. I haue found great ſtore of it growing in Hampſtead wood neer London, at Lee in Eſſex and at Raleigh in Eſſex, in a wood called Hammerell, and ſundrie other places.

¶ *The Time.*

It floureth in Auguſt, and is hard to be knowne from Scabious, ſauing when it floureth.

¶ *The Names.*

It is commonly called *Morſus Diaboli*, or Diuels bit, of the root (as it ſeems) that is bitten off: for the ſuperſtitious people hold opinion, that the diuell for enuy that he beareth to mankinde, bit it off, becauſe it would be otherwiſe good for many vſes: it is called of *Fuchſius Succiſa*: in high-Dutch, **Teuffels abbiſz**: in low-Dutch, **Duyuelles beet**: in French, *Mors du diable*: in Engliſh, Diuels bit, and Forebit. ‡ *Fabius Columna* iudges it to be the *Pycnocomon* of *Dioſcorides*, deſcribed by him *lib.* 4. *cap.* 176. ‡

¶ *The Temperature.*

Diuels bit is ſomthing bitter, and of a hot and drie temperature, and that in the later end of the ſecond degree.

¶ *The Vertues.*

A There is no better thing againſt old ſwellings of the Almonds, and vpper parts of the throat that be hardly ripened.

B It clenſeth away ſlimie flegme that ſticketh in the jawes, it digeſteth and conſumeth it: and it quickely taketh away the ſwellings in thoſe parts, if the decoction thereof bee often held in the mouth and gargarized, eſpecially if a little quantitie of *Mel Roſarum*, or honie of Roſes be put into it.

C It is reported to be good for the infirmities that Scabious ſerueth for, and to be of no leſſe force againſt the ſtingings of venomous beaſts, poiſons, and peſtilent diſeaſes, and to conſume and waſt away plague ſores, being ſtamped and laid vpon them.

D And alſo to mitigate the paines of the matrix or mother, and to driue forth winde, if the decoction thereof be drunke.

CHAP. 249.

Of Matfellon or Knapweed.

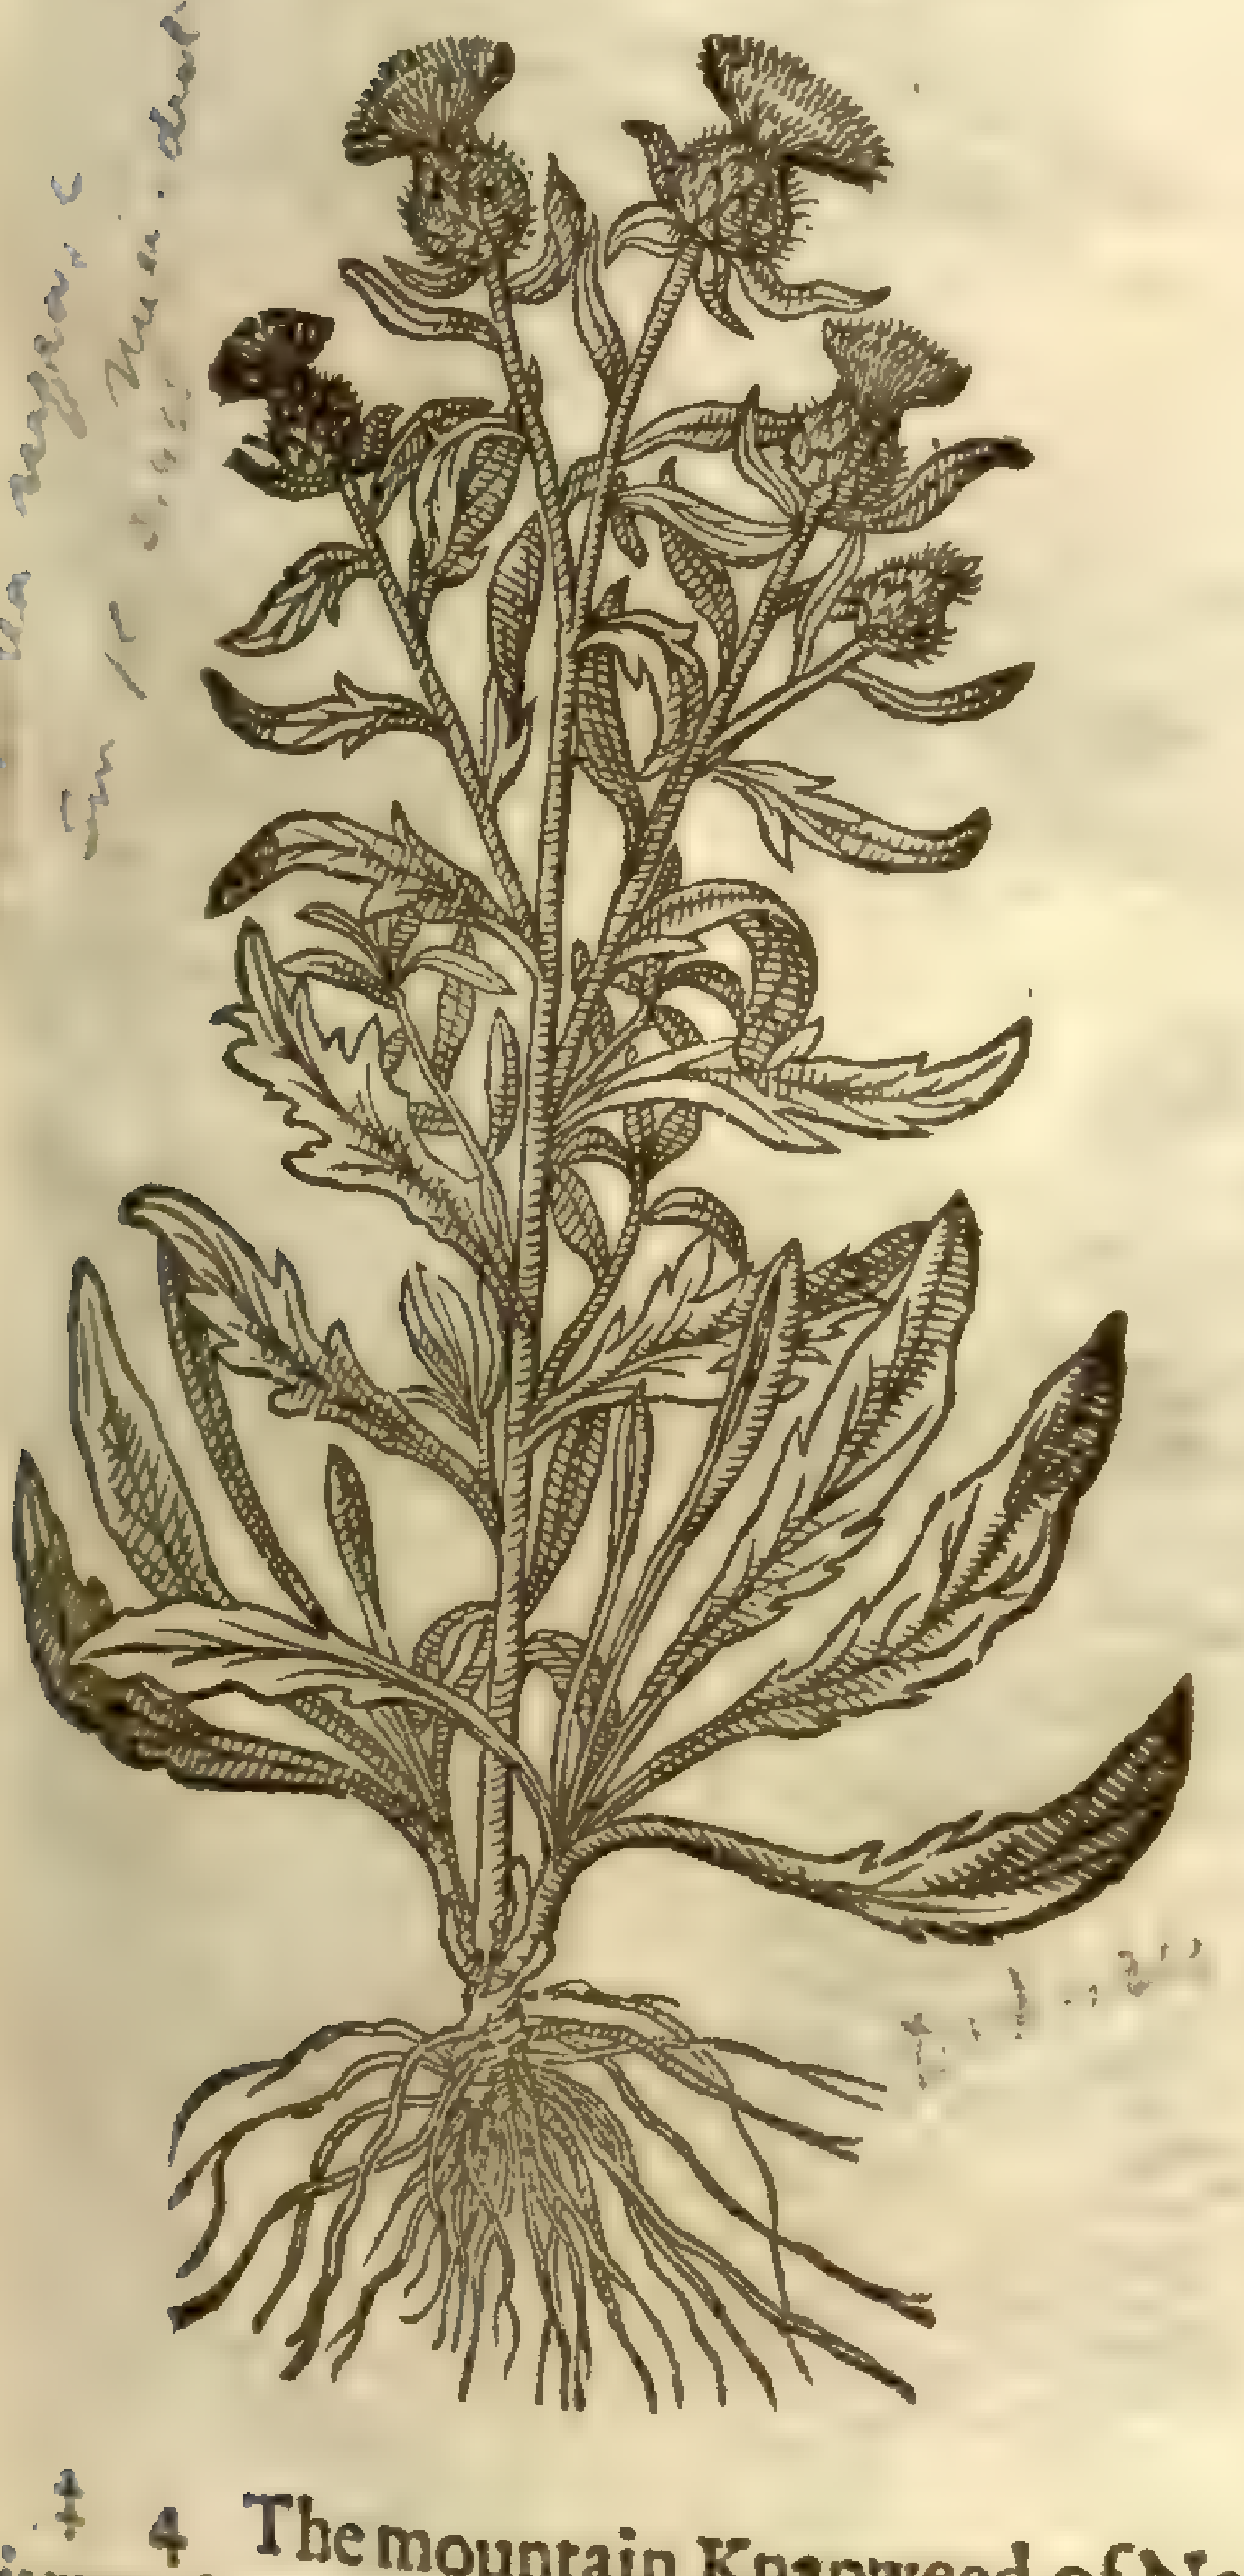
¶ *The Deſcription.*

1 MAtfellon or blacke Knapweed is doubtleſſe a kinde of Scabious, as all the others are intituled with the name of *Iacea*; yet for diſtinction I haue thought good to ſet them in a ſeuerall Chapter, beginning with that kind which is called in Engliſh Knapweed and Matfellon, or *Materfilon*: it hath long and narrow leaues of a blackiſh greene colour, in ſhape like Diuels bit, but longer, ſet vpon ſtalks two cubits high, ſomewhat bluntly cut or ſnipt about the edges: the floures grow at the top of the ſtalkes, beeing firſt ſmall ſcaly knops like to the knops of Corn-floure or Blew-Bottles, but greater: out of the midſt thereof groweth a purple thrummy or threddy floure. The root is thicke and ſhort.

2 The great Knapweed is very like vnto the former, but that the whole plant is much greater, the leaues bigger, and more deeply cut euen to the middle rib: the floures come forth of ſuch like ſcaly heads, of an excellent faire purple colour, and much greater.

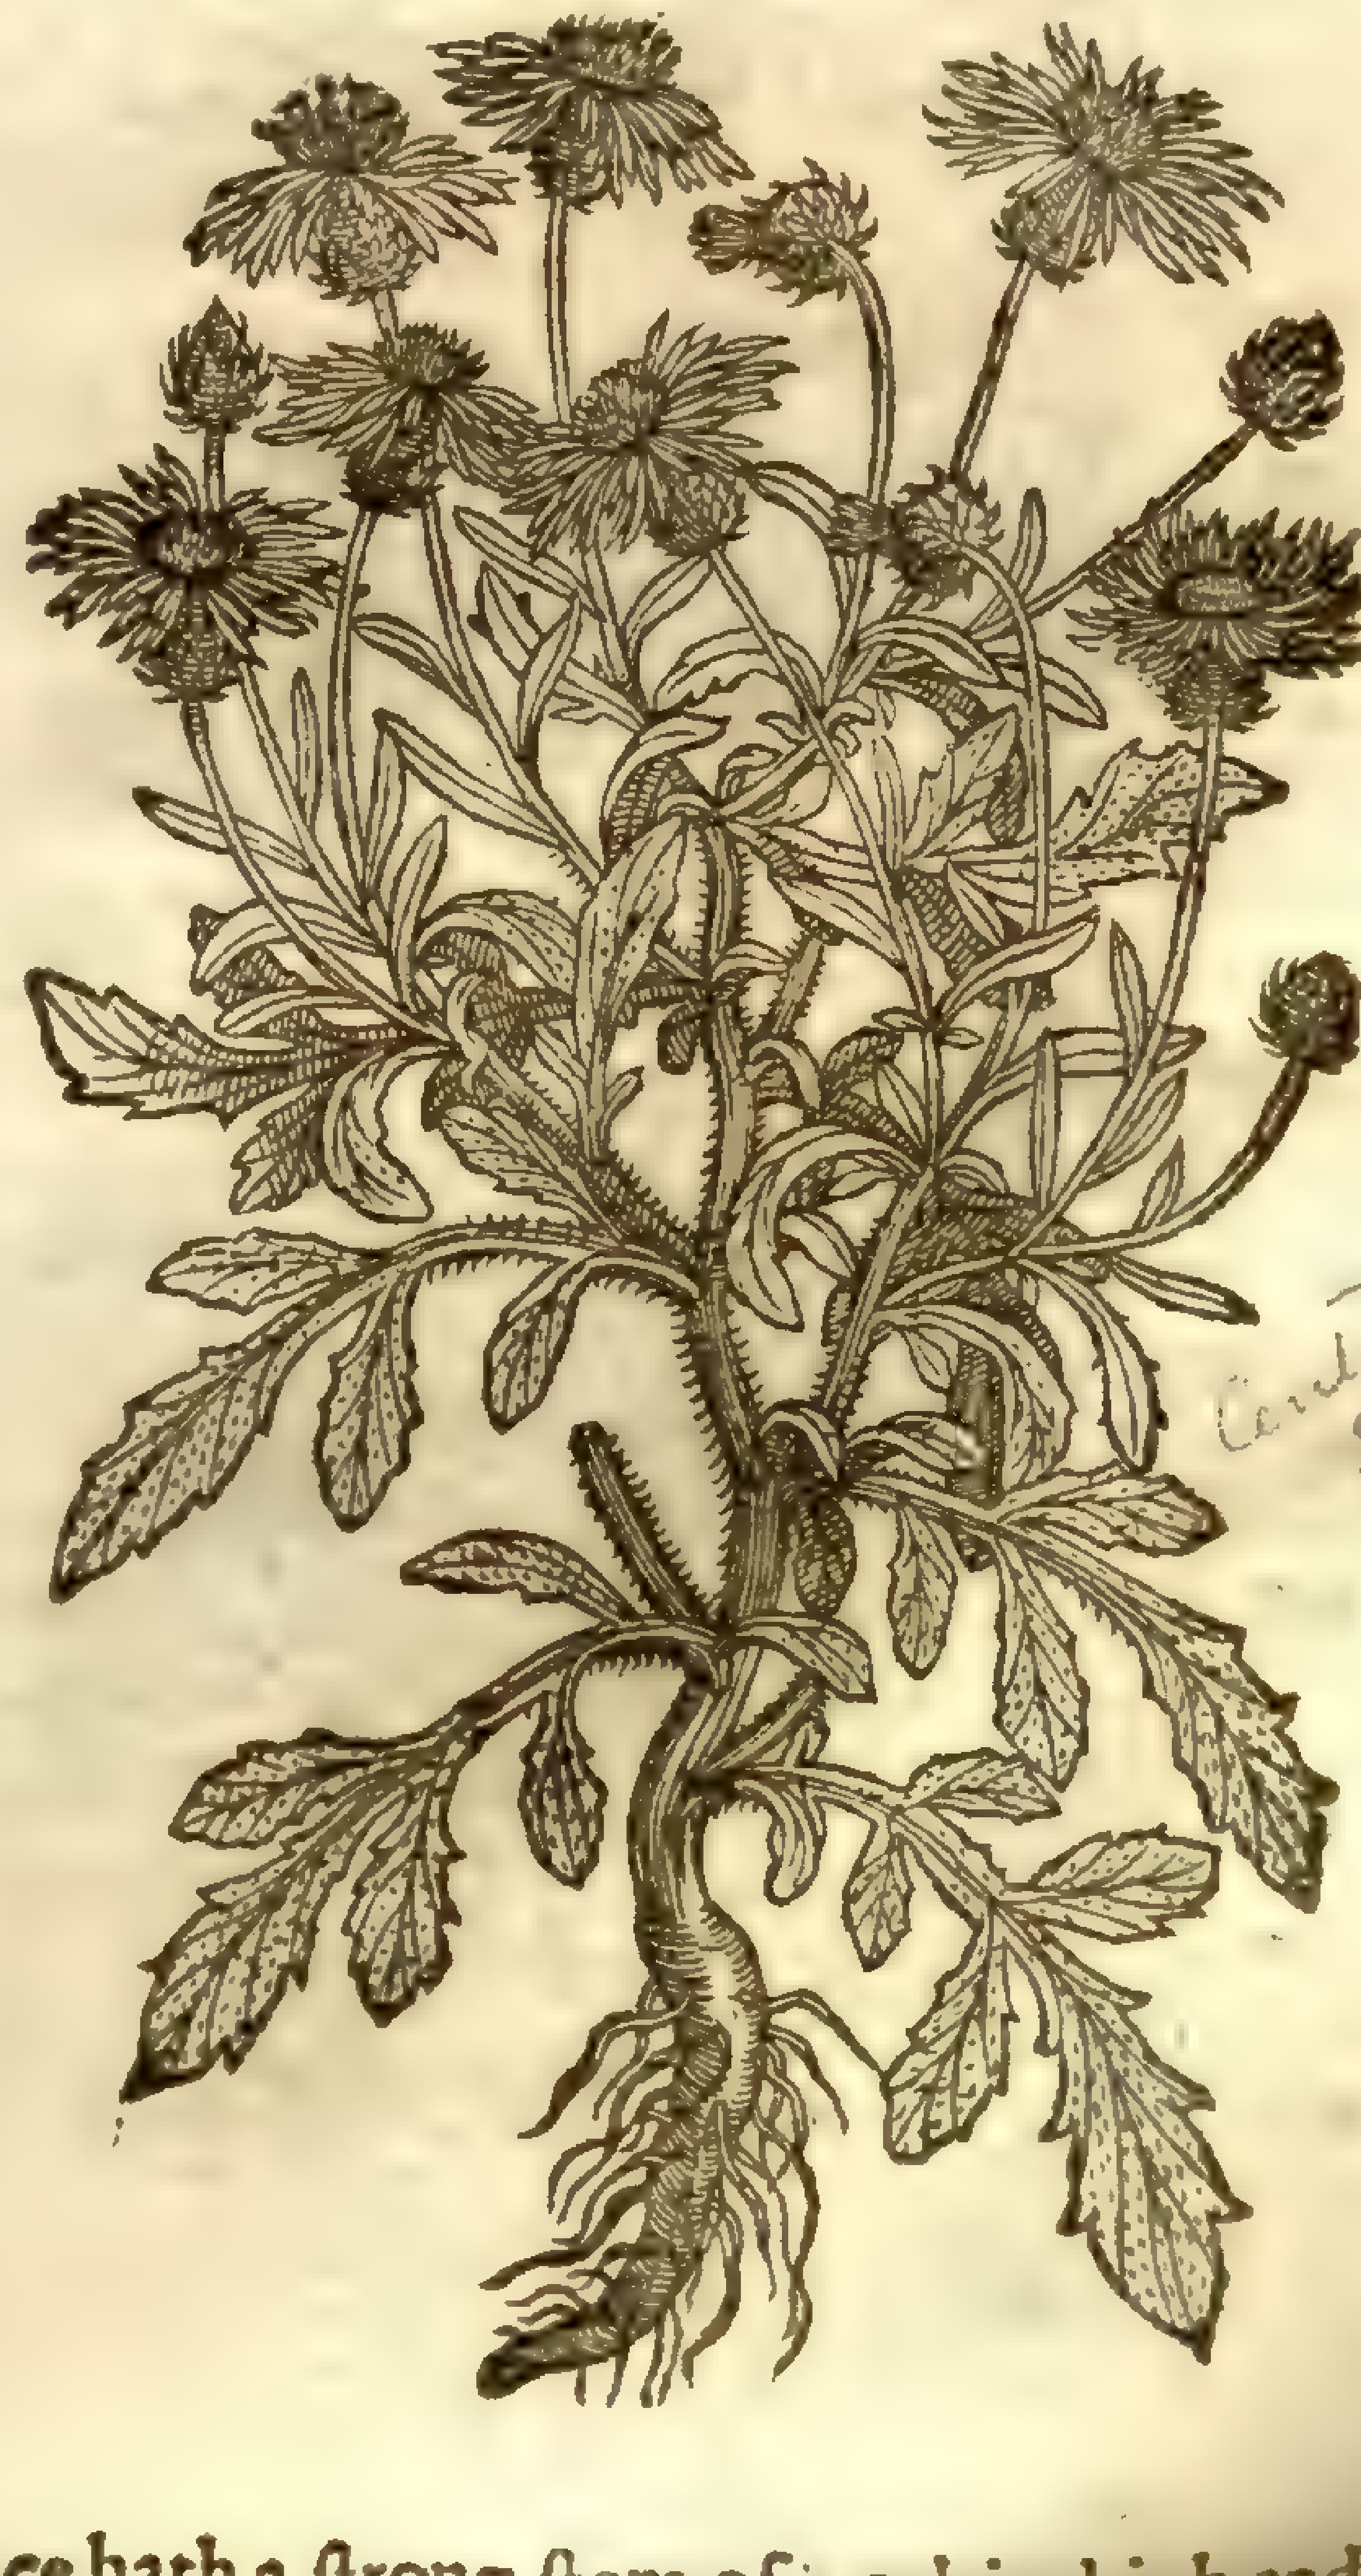
3 The third kinde of Matfellon or Knapweed is very like vnto the former great Knapweed laſt before mentioned, ſauing that the floures of this plant are of an excellent faire yellow colour, proceeding forth of a ſcaly head or knop, beſet with moſt ſharpe prickes not to bee touched without hurt: the floure is of a pleaſing ſmell, and very ſweet; the root is long and laſting, and creepes far abroad, by means whereof it greatly encreaſeth.

1 *Iacea nigra.*
Blacke Matfellon.



[illegible]

† 2 *Iacea major.*
Great Matfellon.

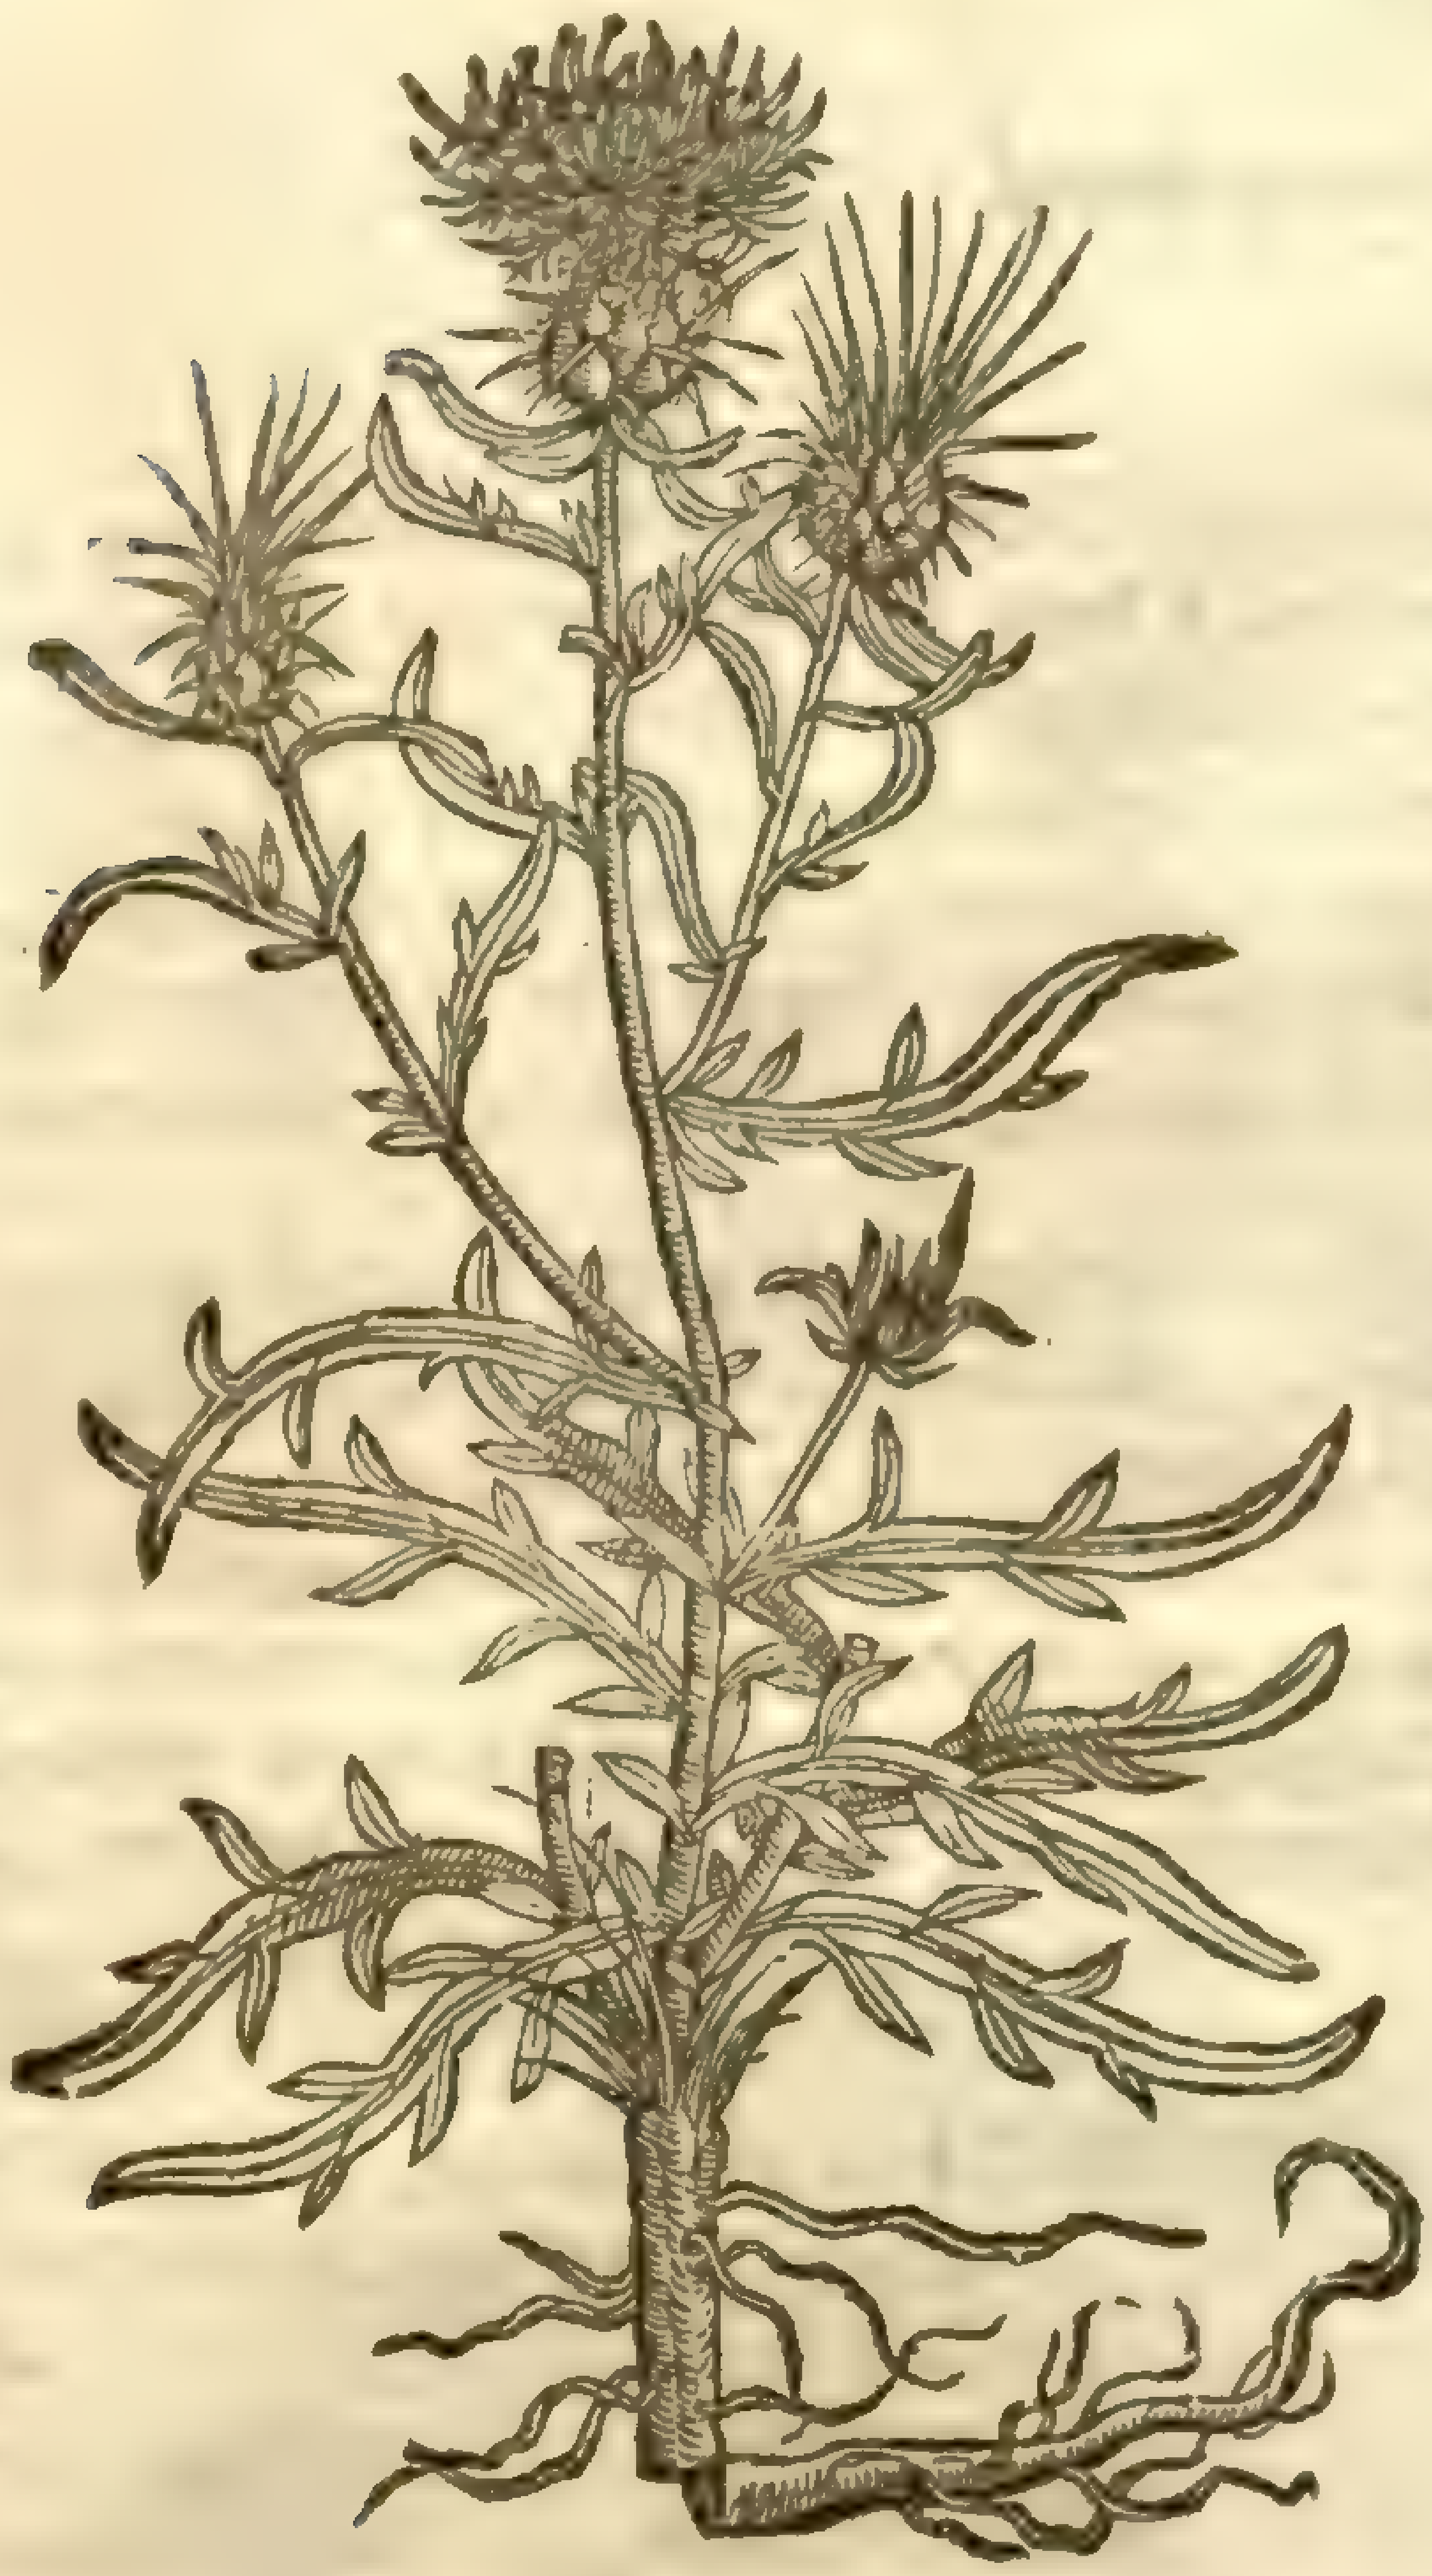


Centaurea Scabiosa [illegible]

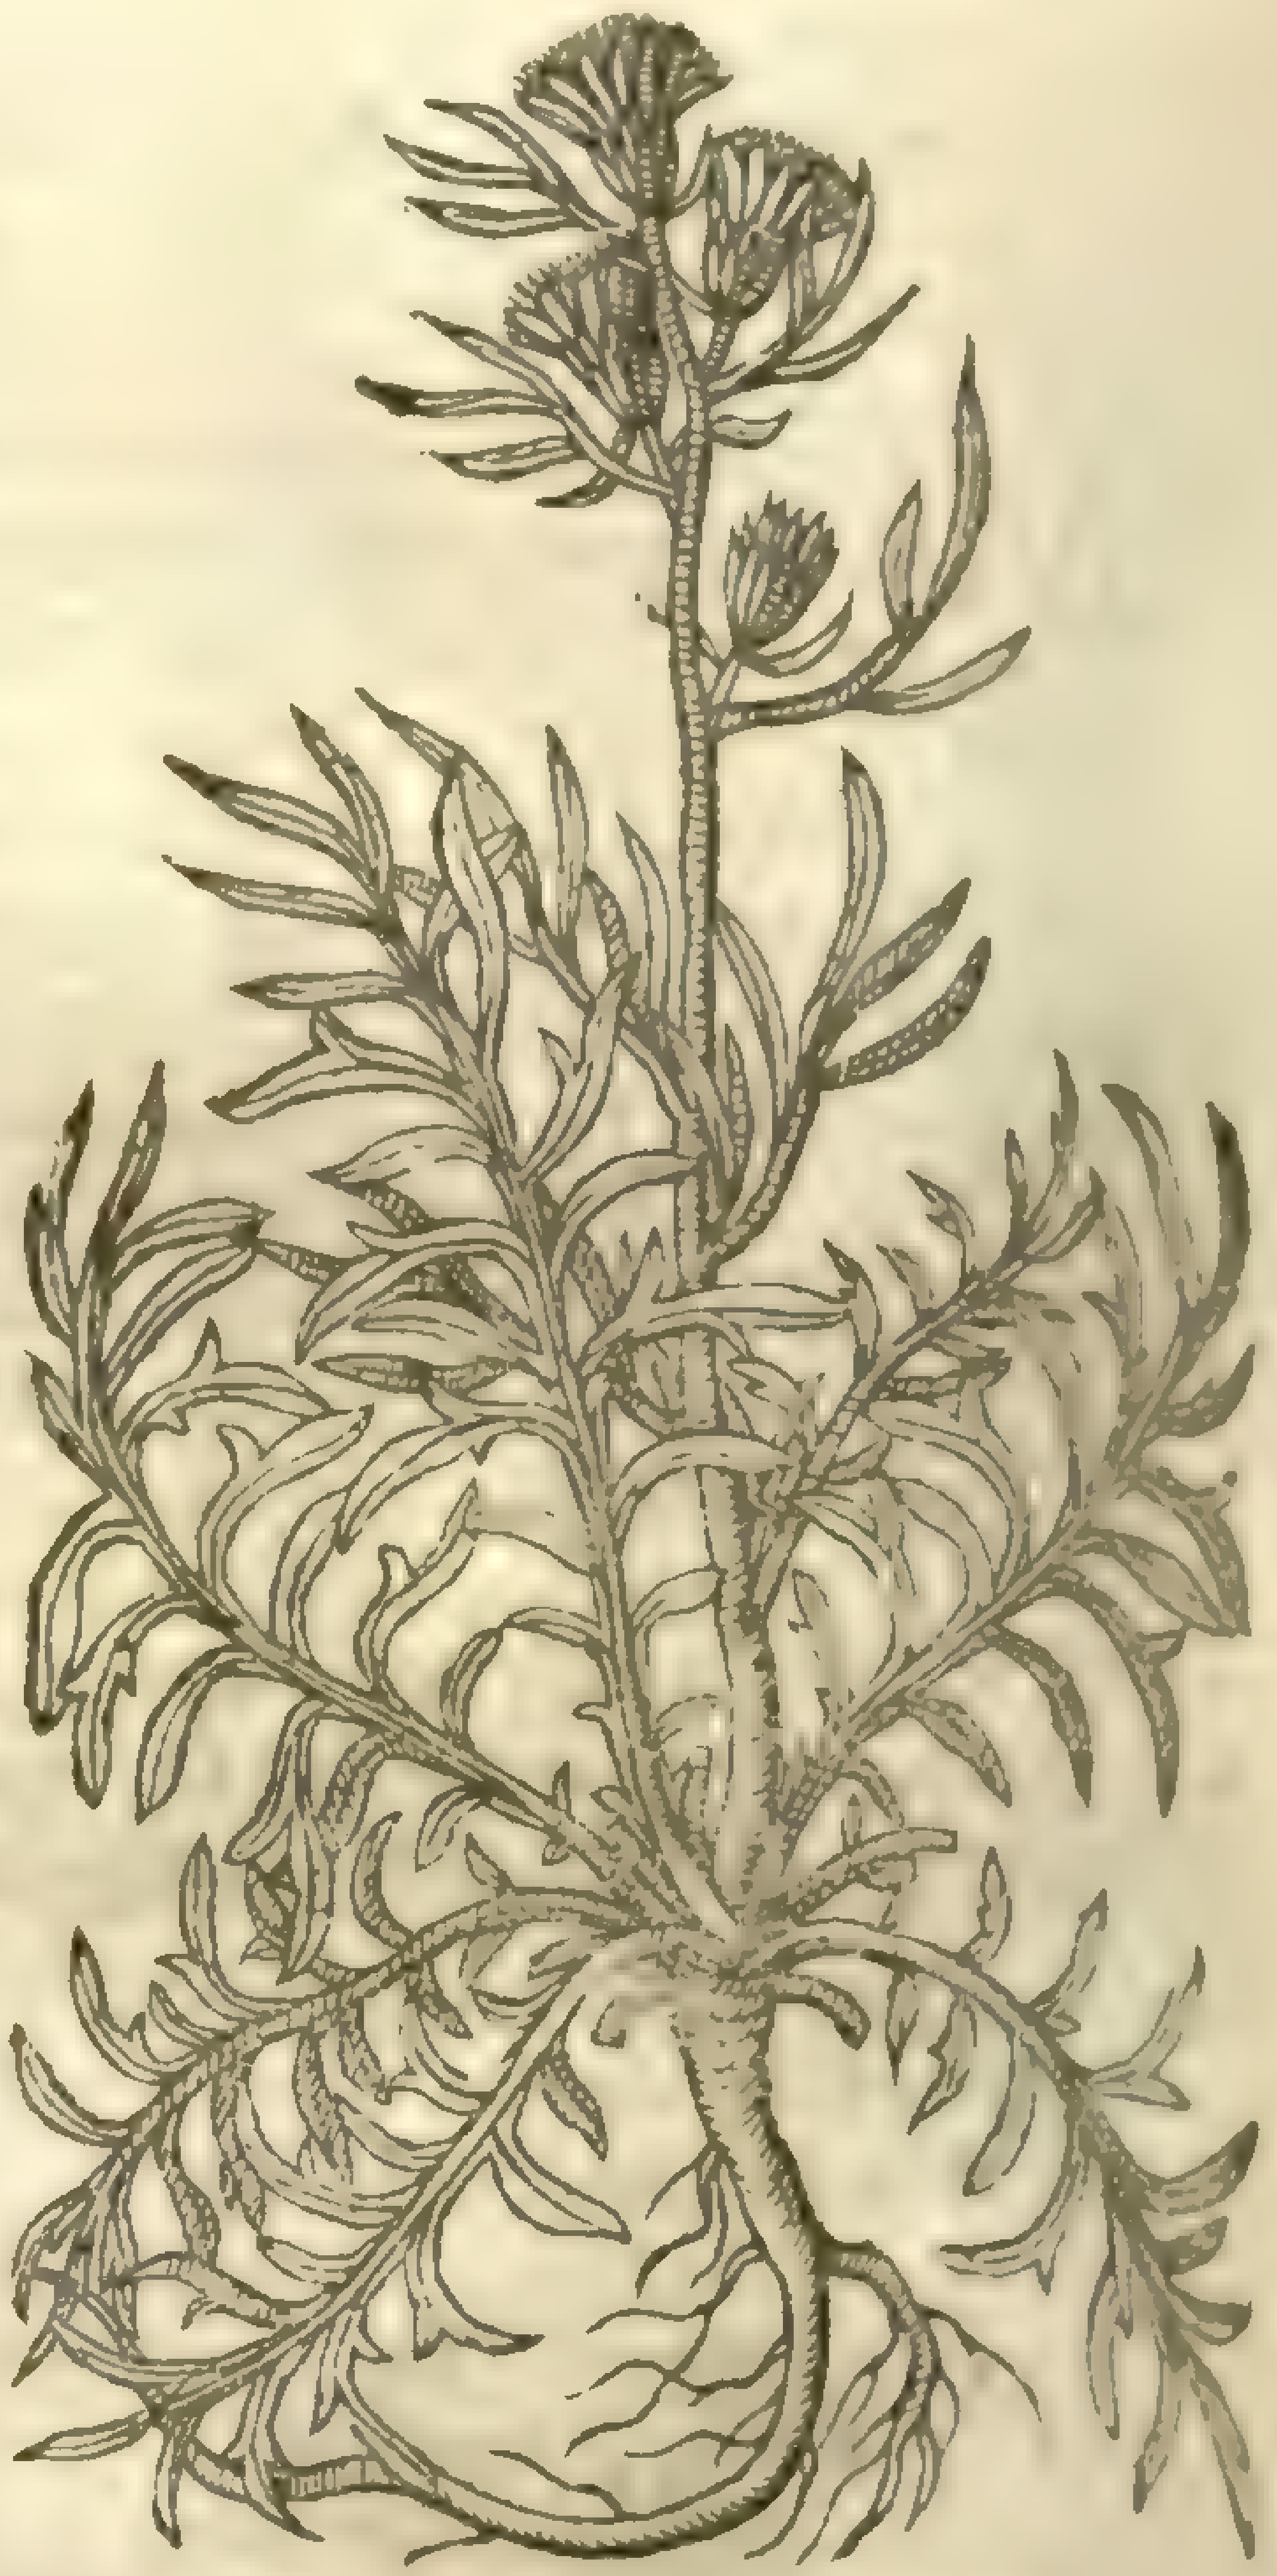
‡ 4 The mountain Knapweed of Narbone in France hath a ſtrong ſtem of 2 cubits high, and is very plentifull about Couentry among the hedges and buſhes: the leaues are very much jagged in forme of *Lonchitis* or Spleene-wort: the floures are like the reſt of the Knapweeds, of a purple colour.

3 *Iacea major lutea.*
Yellow Knapweed.

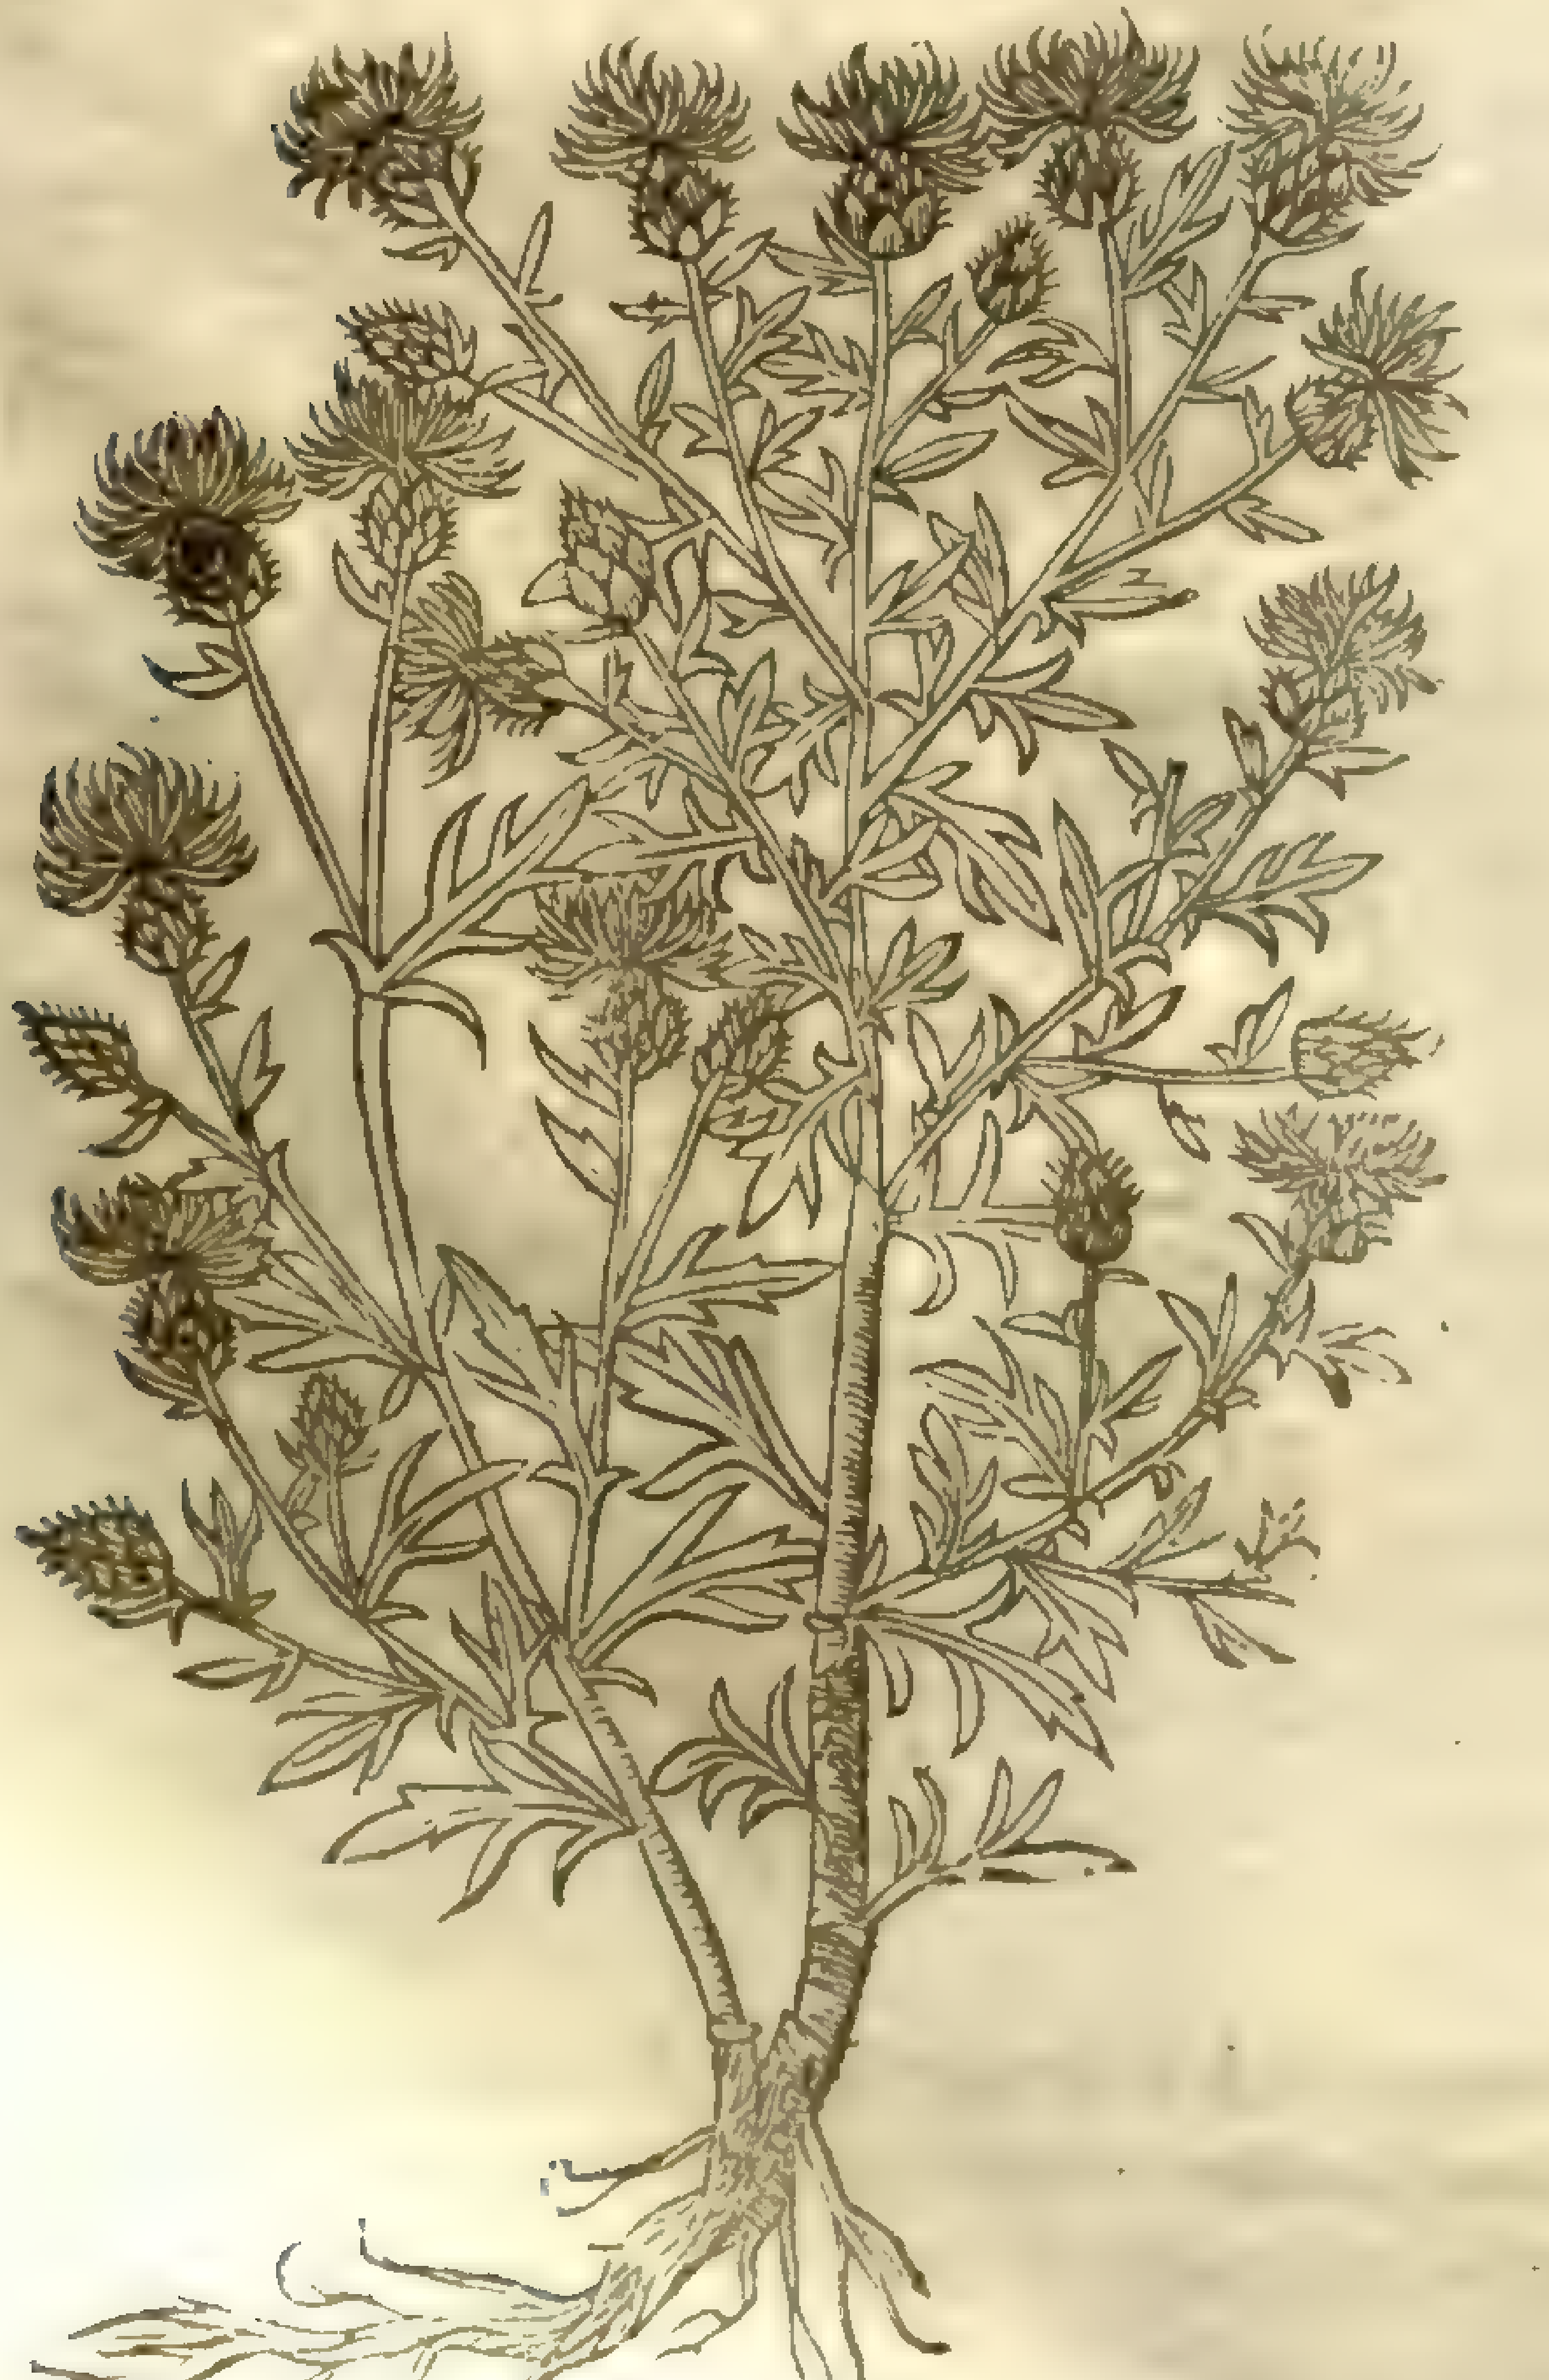
Centaurea collina, L.
See Clus. 2. 5



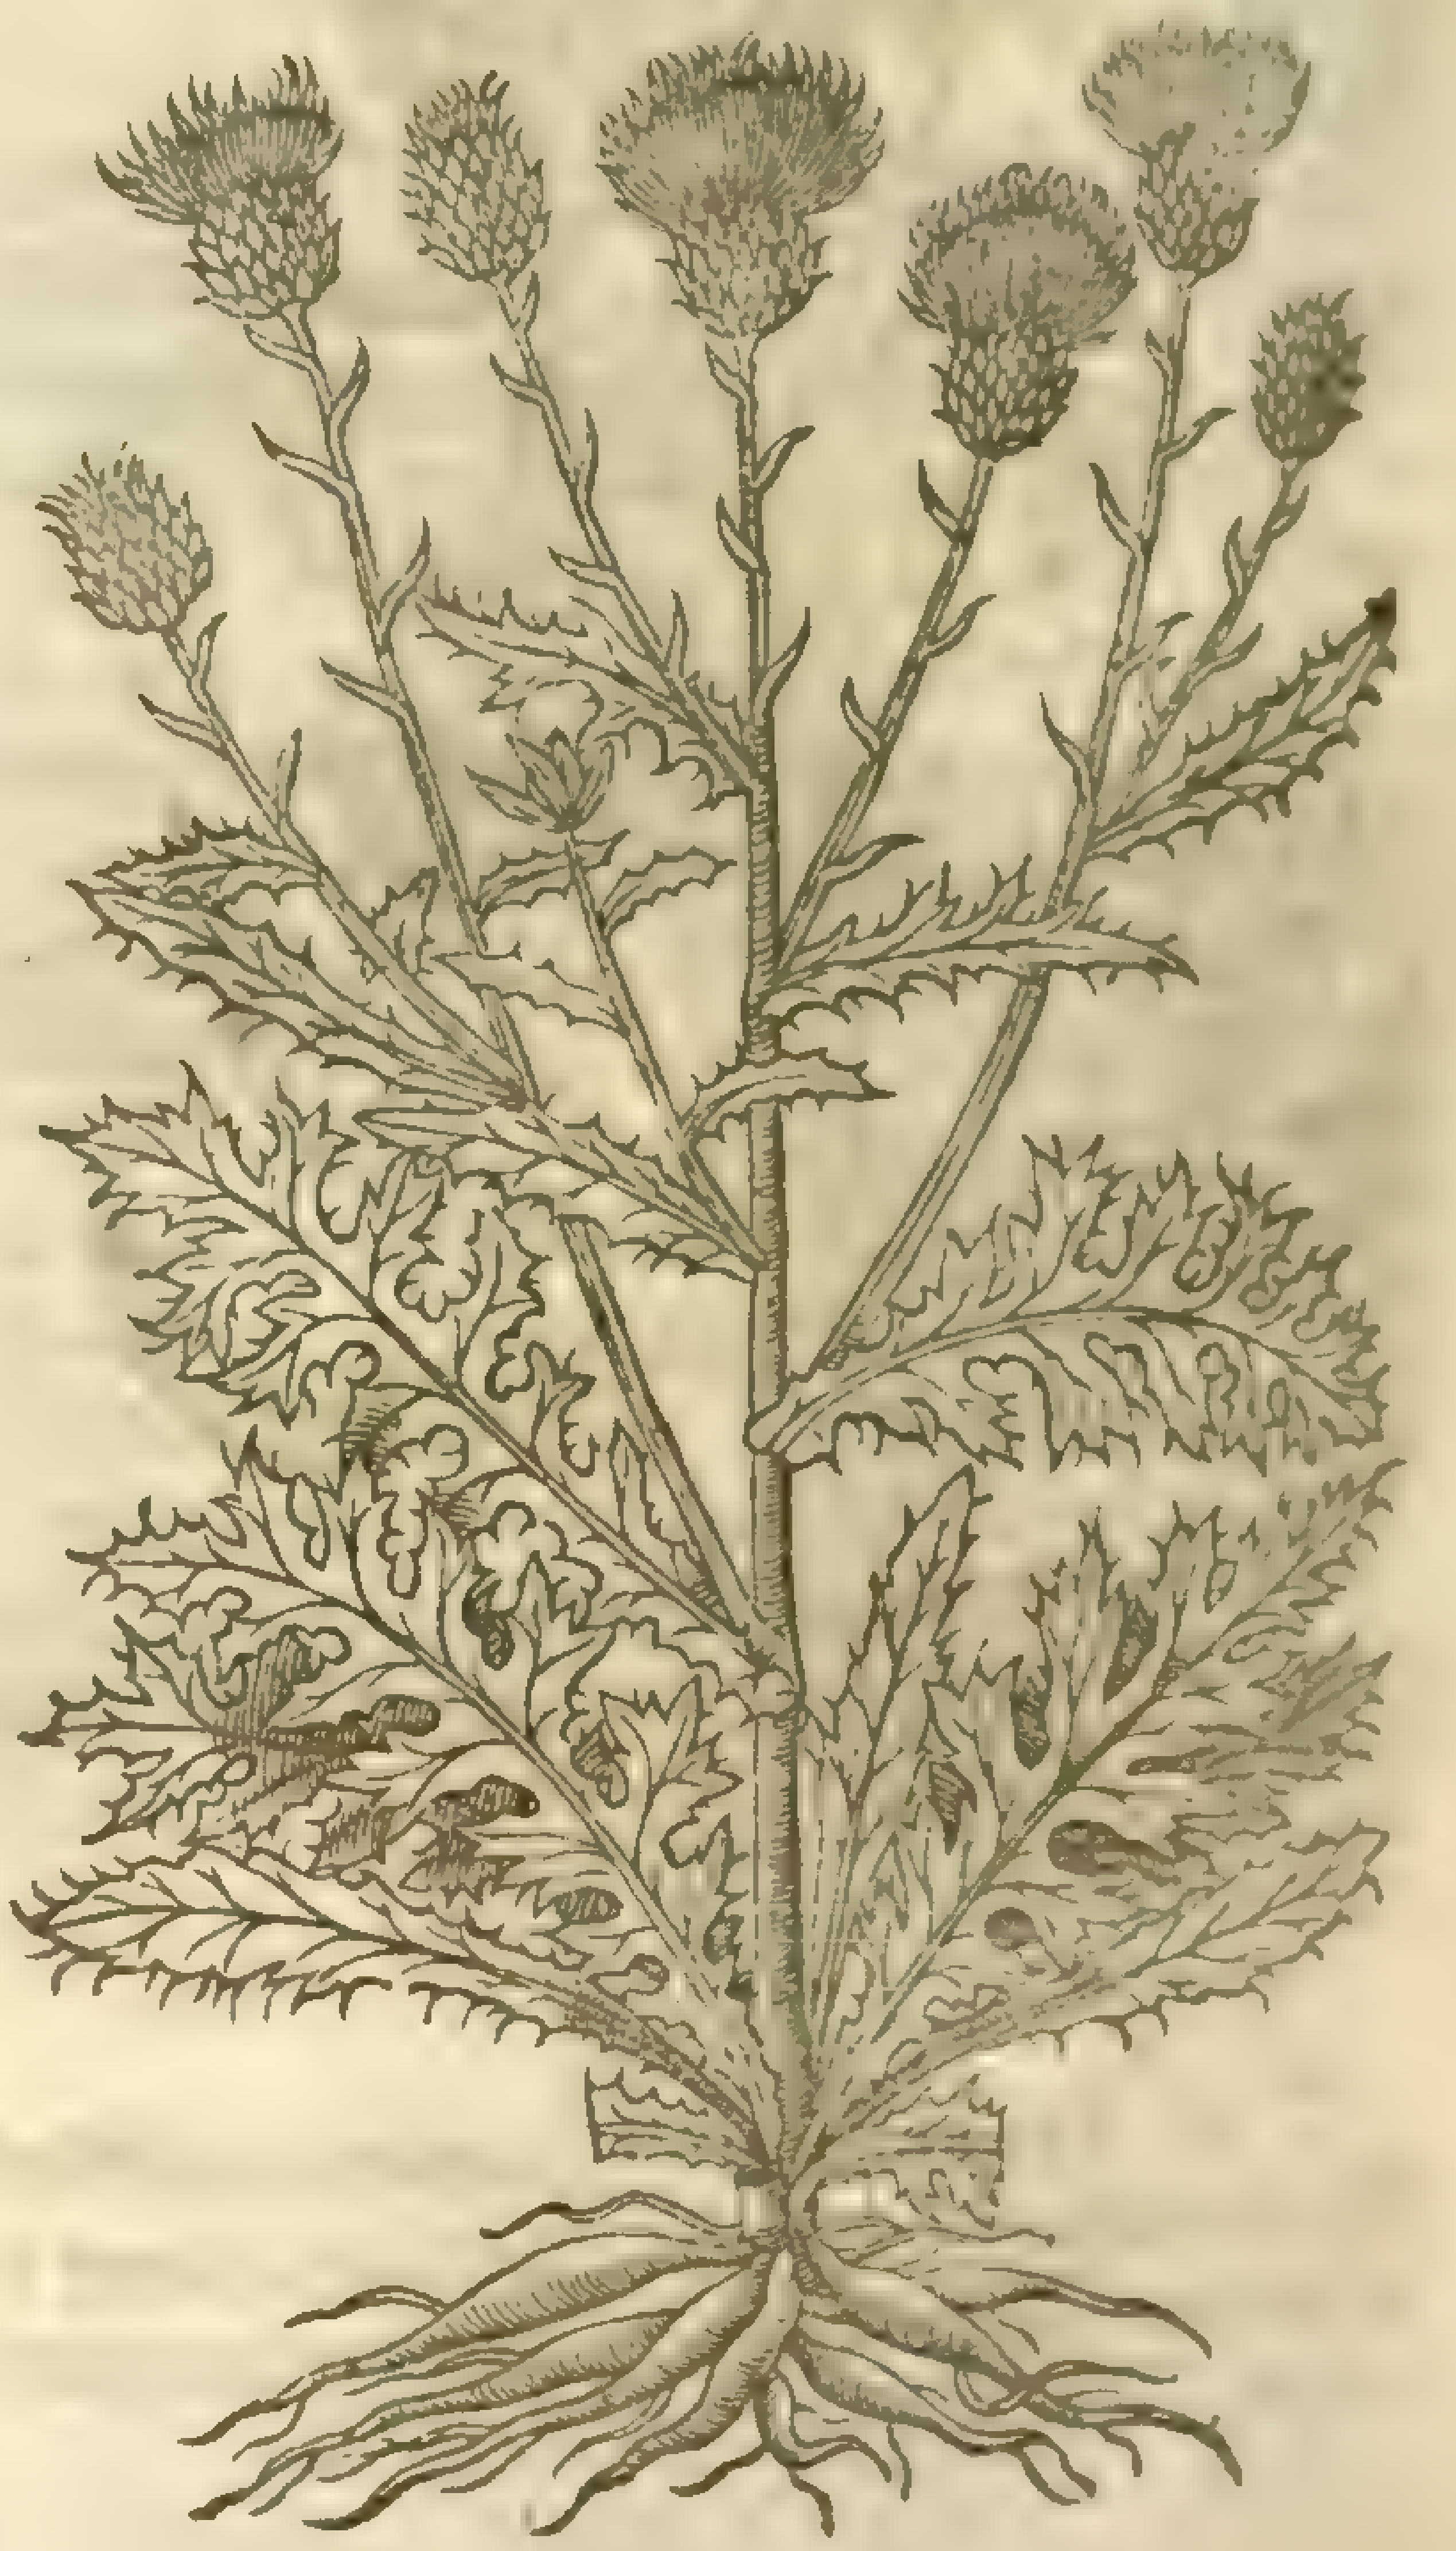
4 *Iacea montana.*
Mountain Knapweed.



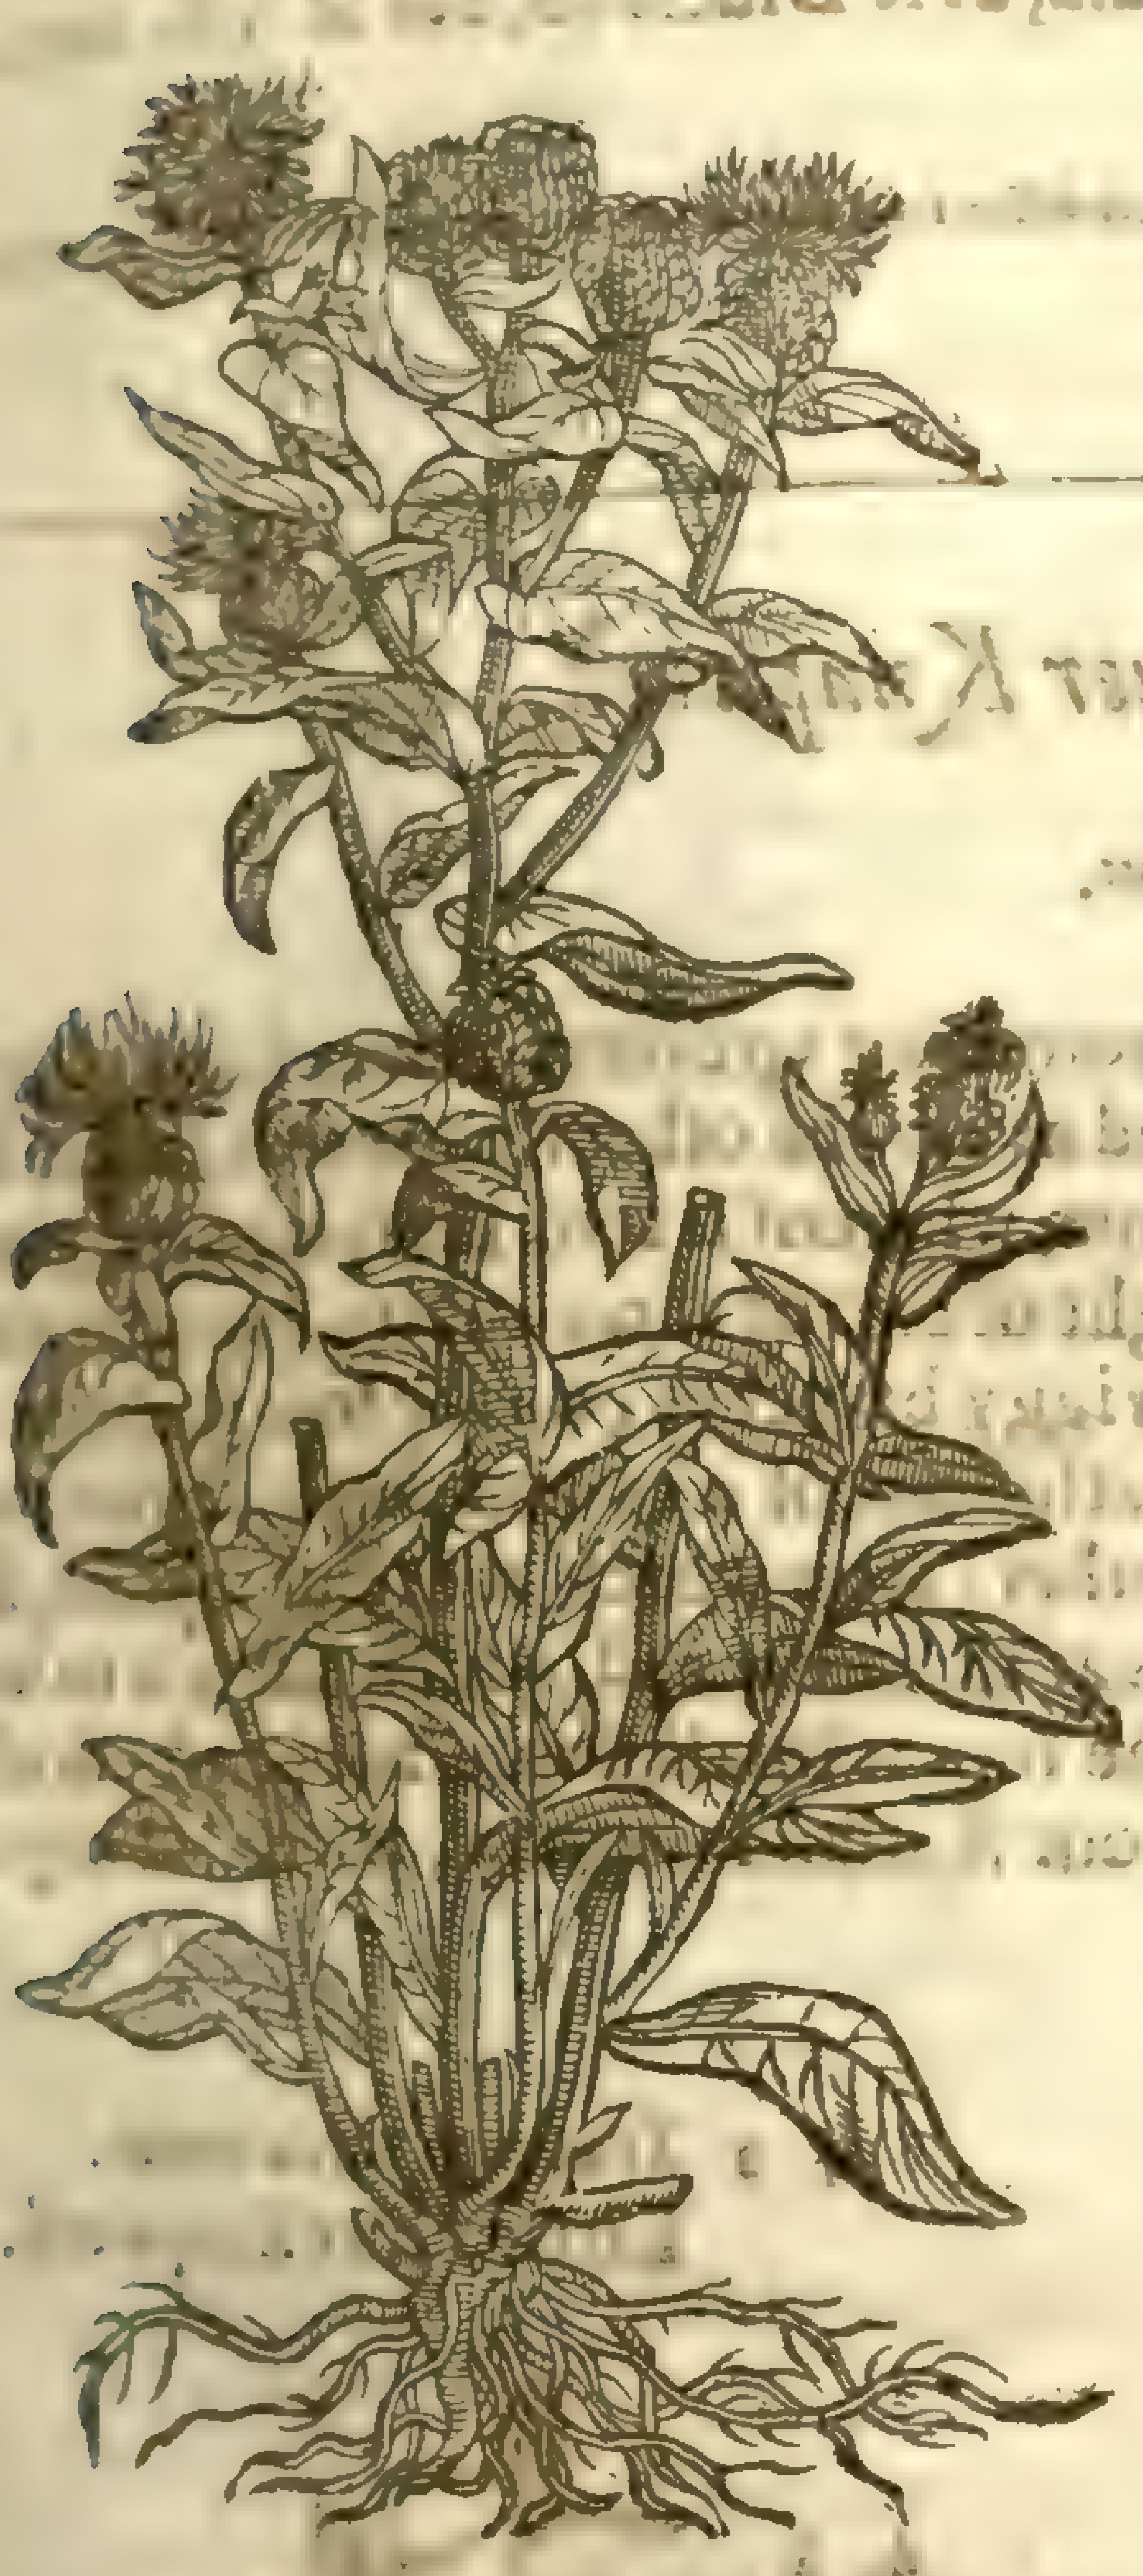
5 *Iacea flore albo.*
White floured Knapweed.



6 *Iacea tuberoſa.*
Knobbed Knapweed.



‡ 7 *Iacea Auſtriaca villoſo capite.*
Rough headed Knapweed.



‡ 5 The white floured Knapweed hath creeping roots, which ſend vp pretty large whitiſh greene leaues much diuided or cut in almoſt to the middle rib; from the middeſt of which riſes vp a ſtalke ſome two foot high, ſet alſo with the like diuided leaues, but leſſer: the floures are like thoſe of the common ſort, but of a pleaſant white colour. I firſt found this growing wild in a field neere Martin Abbey in Surry, and ſince in the Iſle of Tenet. ‡

6 The tuberous or knobby Knapweed being ſet forth by *Tabern.* and which is a ſtranger in theſe parts, hath many leaues ſpread vpon the ground, rough, deepely gaſht or hackt about the edges like thoſe of Sow-thiſtle. Among which riſeth vp a ſtraight ſtalke diuiding it ſelf into other branches, wheron grow the like leaues, but ſmaller: the knappy flours ſtand on the top of the branches, of a bright red colour, in ſhape like the other Knapweeds The root is great, thicke, and tuberous, conſiſting of many cloggy parcels, like thoſe of the Aſphodill.

‡ 7 This (ſaith *Cluſius*) is a comely plant, hauing broad and long leaues, white, ſoft, and lightly ſnipt about the edges: the taſt is gummy, and not a little bitter: it ſends vp many creſted ſtalks from one root, ſome cubit high or more: at the tops of them grow the heads ſome two or three together, conſiſting of many ſcales, whoſe ends are hairy, and they are ſet ſo orderly, that by this meanes the heads ſeem as they were incloſed in little nets. The floures are purple, and like thoſe of the firſt deſcribed: the ſeed is ſmall and long, and of an aſh colour. This *Cluſius* calls *Iacea 4 Auſtriaca villoſo capite.*

Iacea capitulis hirſutis Boelij.

8 This hath many ſmal cornered ſtraked hairy trailing branches growing from the root, & thoſe again diuided into many other branches, trailing or ſpreading vpon the ground three or foure foot long, imploying or couering a good plot of ground, whereon grow hairy leaues diuided or jagged into many parts, like the leaues of *Iacea maior*, or Rocket, of a very bitter taſte: at the top of each branch groweth one ſcaly head, each ſcale ending with fiue, ſix, or ſeuen little weak prickles growing orderly like halfe the rowell of a ſpurre, but far leſſe: the floures grow forth of the heads, of a light purple colour, conſiſting of many ſmall floures, like thoſe of the common *Iacea*, the bordering floures, being bigger and larger than thoſe of the middle of the floure, each ſmall floure being diuided into fiue ſmall parts or leaues, not much vnlike thoſe of *Cyanus*: the ſeed is ſmall, and incloſed in down. The root periſheth when the ſeed is ripe.

This plant hath not been hitherto written of, that I can find. Seeds of it I receiued from Mr *William Coys*, with whom alſo I obſerued the plant, Octob. 10. 1621. he receiued it from *Boelius* a low-Country man. *Iohn Goodyer.* ‡

¶ *The Place.*

The two firſt grow commonly in euery fertile paſture. The reſt grow in my garden.

¶ *The Time.*

They floure in Iune and Iuly.

¶ *The Names.*

The later age calls it *Iacea nigra*, putting *nigra* for a difference between it and the Hearts-eaſe or Pancie, which is likewiſe called *Iacea*: it is called alſo *Materfillon* and *Matrefillen*: in Engliſh, Matfellon, Bulweed, and Knapweed.

¶ *The Temperature and Vertues.*

A These plants are of the nature of Scabious, whereof they be kindes, therefore their faculties are like, although not ſo proper to phyſicks vſe.

B They be commended againſt the ſwellings of the Vvula, as is Diuels bit, but of leſſe force and vertue.

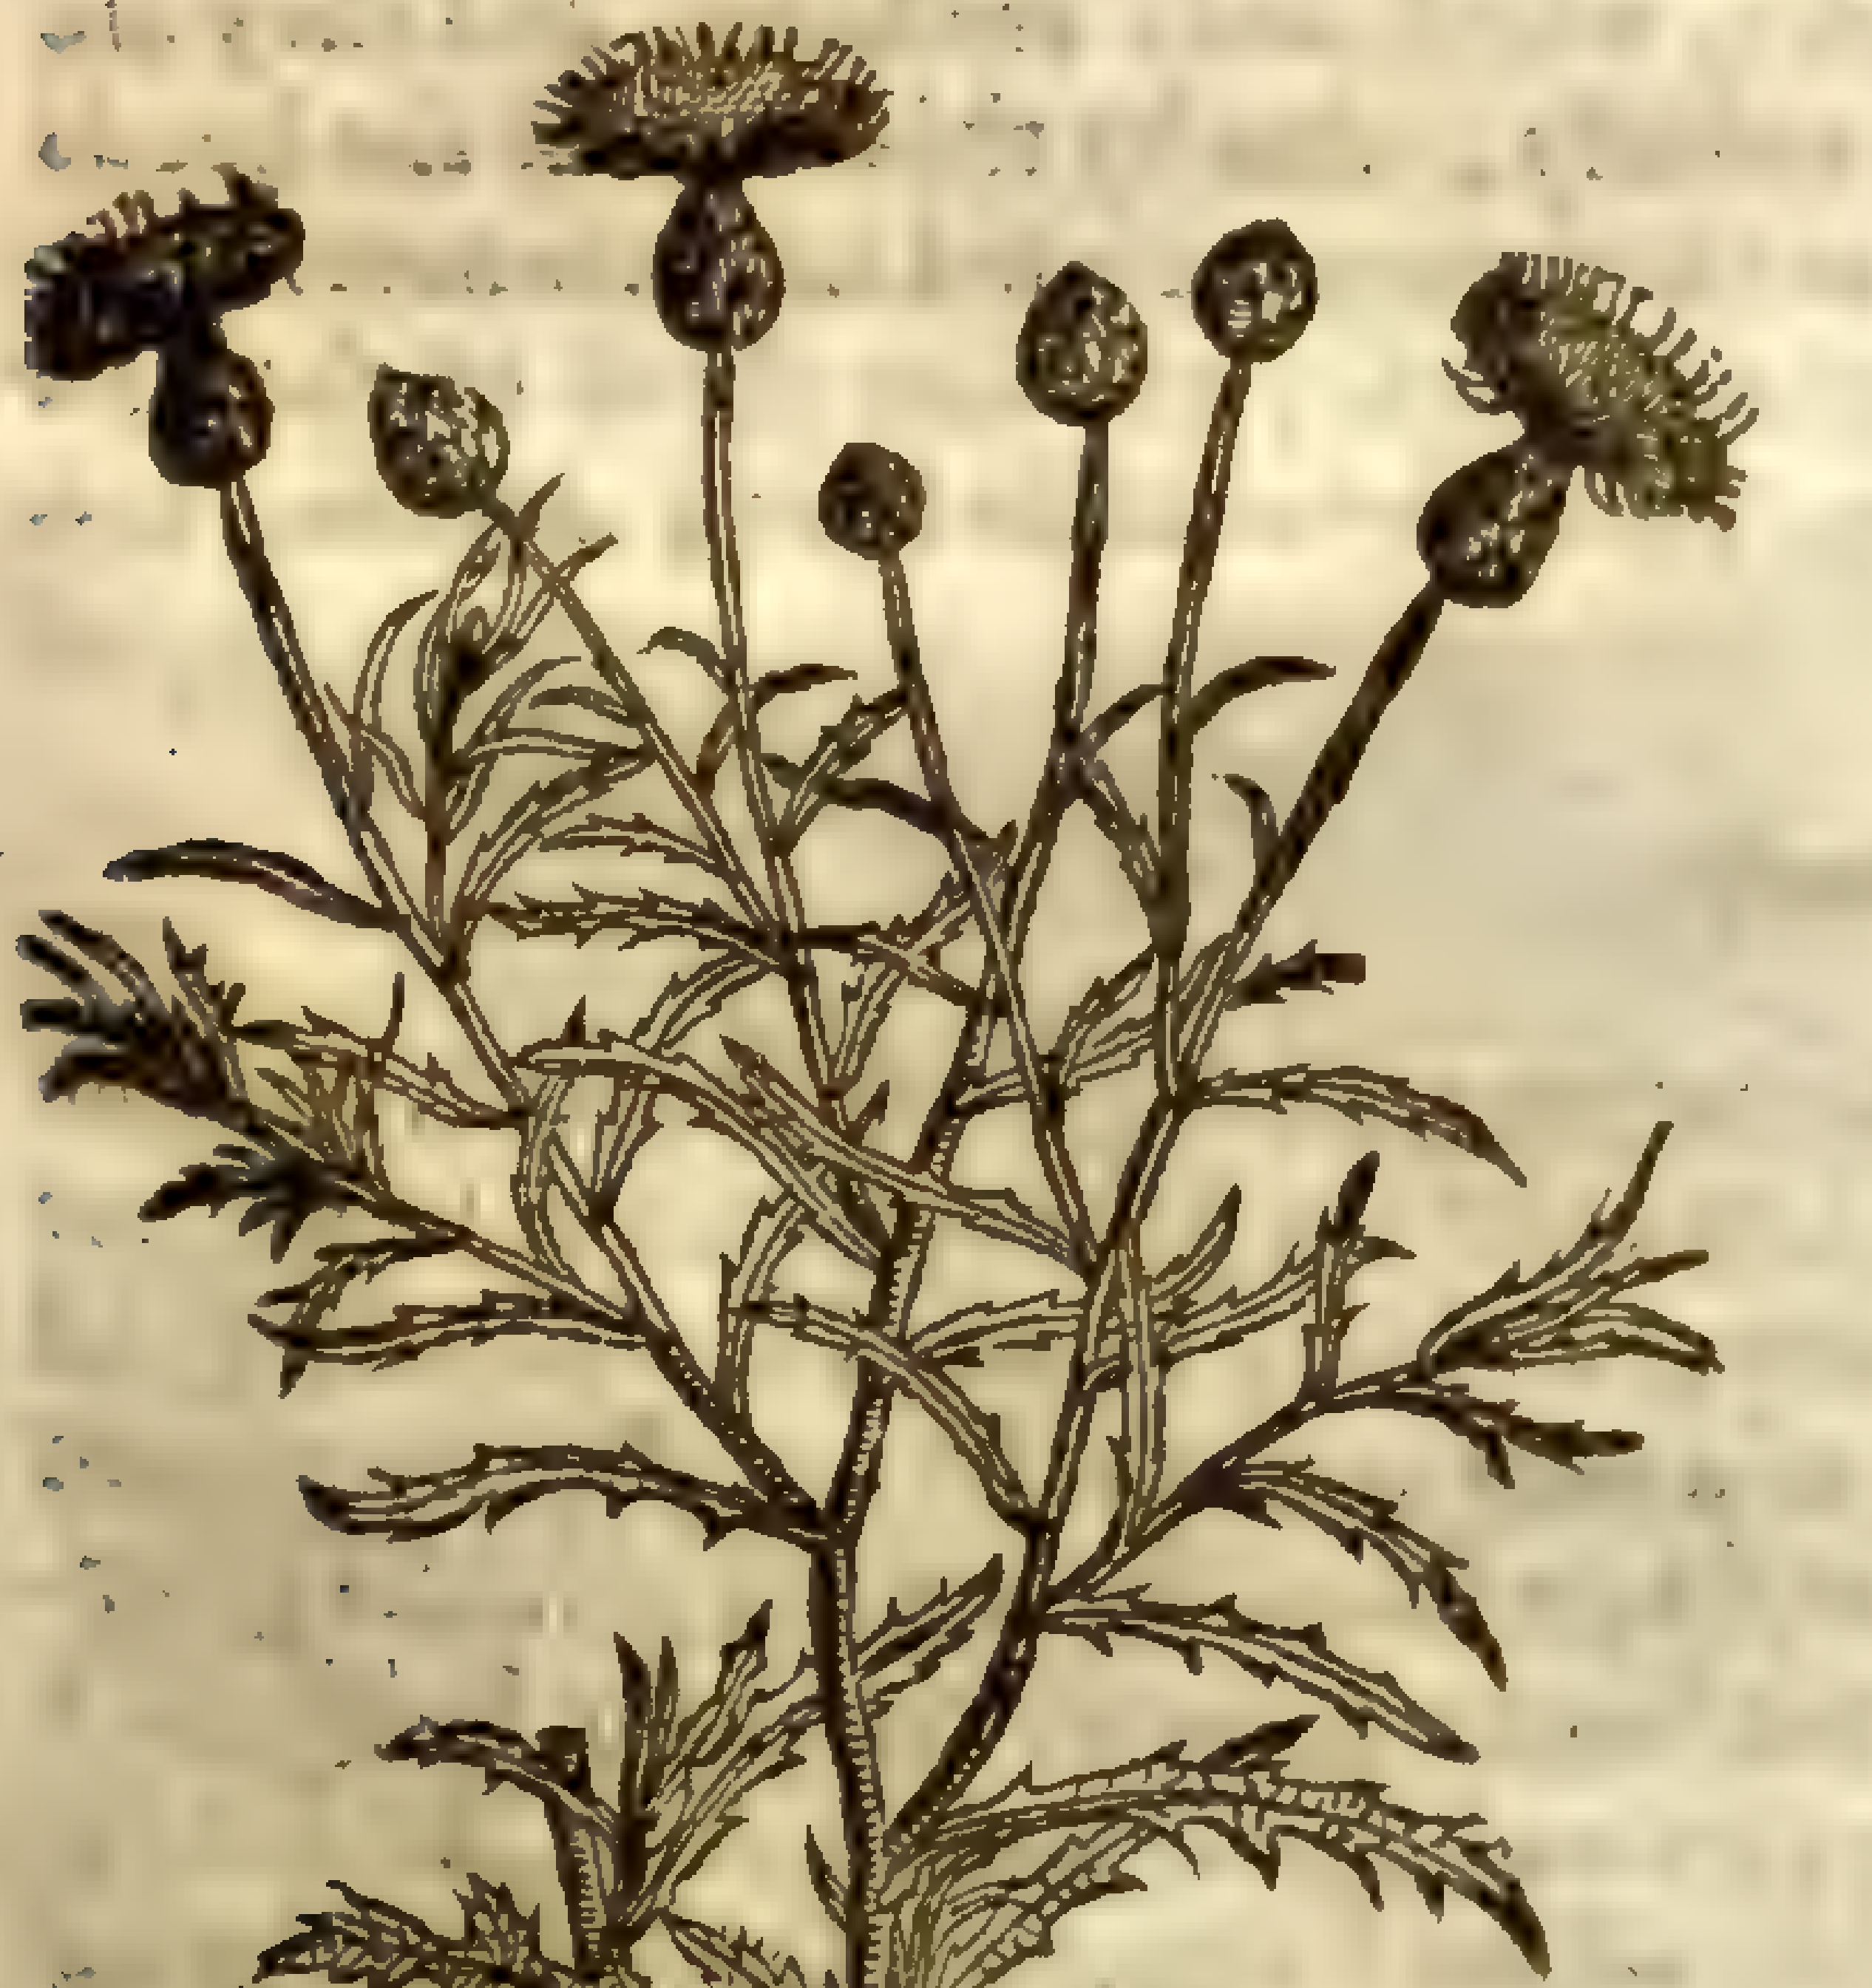
† The figure that was formerly in the ſecond place was of the *Iacea tertia* of *Tabern.* which differs from that our Author meant and deſcribed, whoſe figure we haue giuen you in the place thereof.

Chap. 250. *Of Siluer Knapweed.*

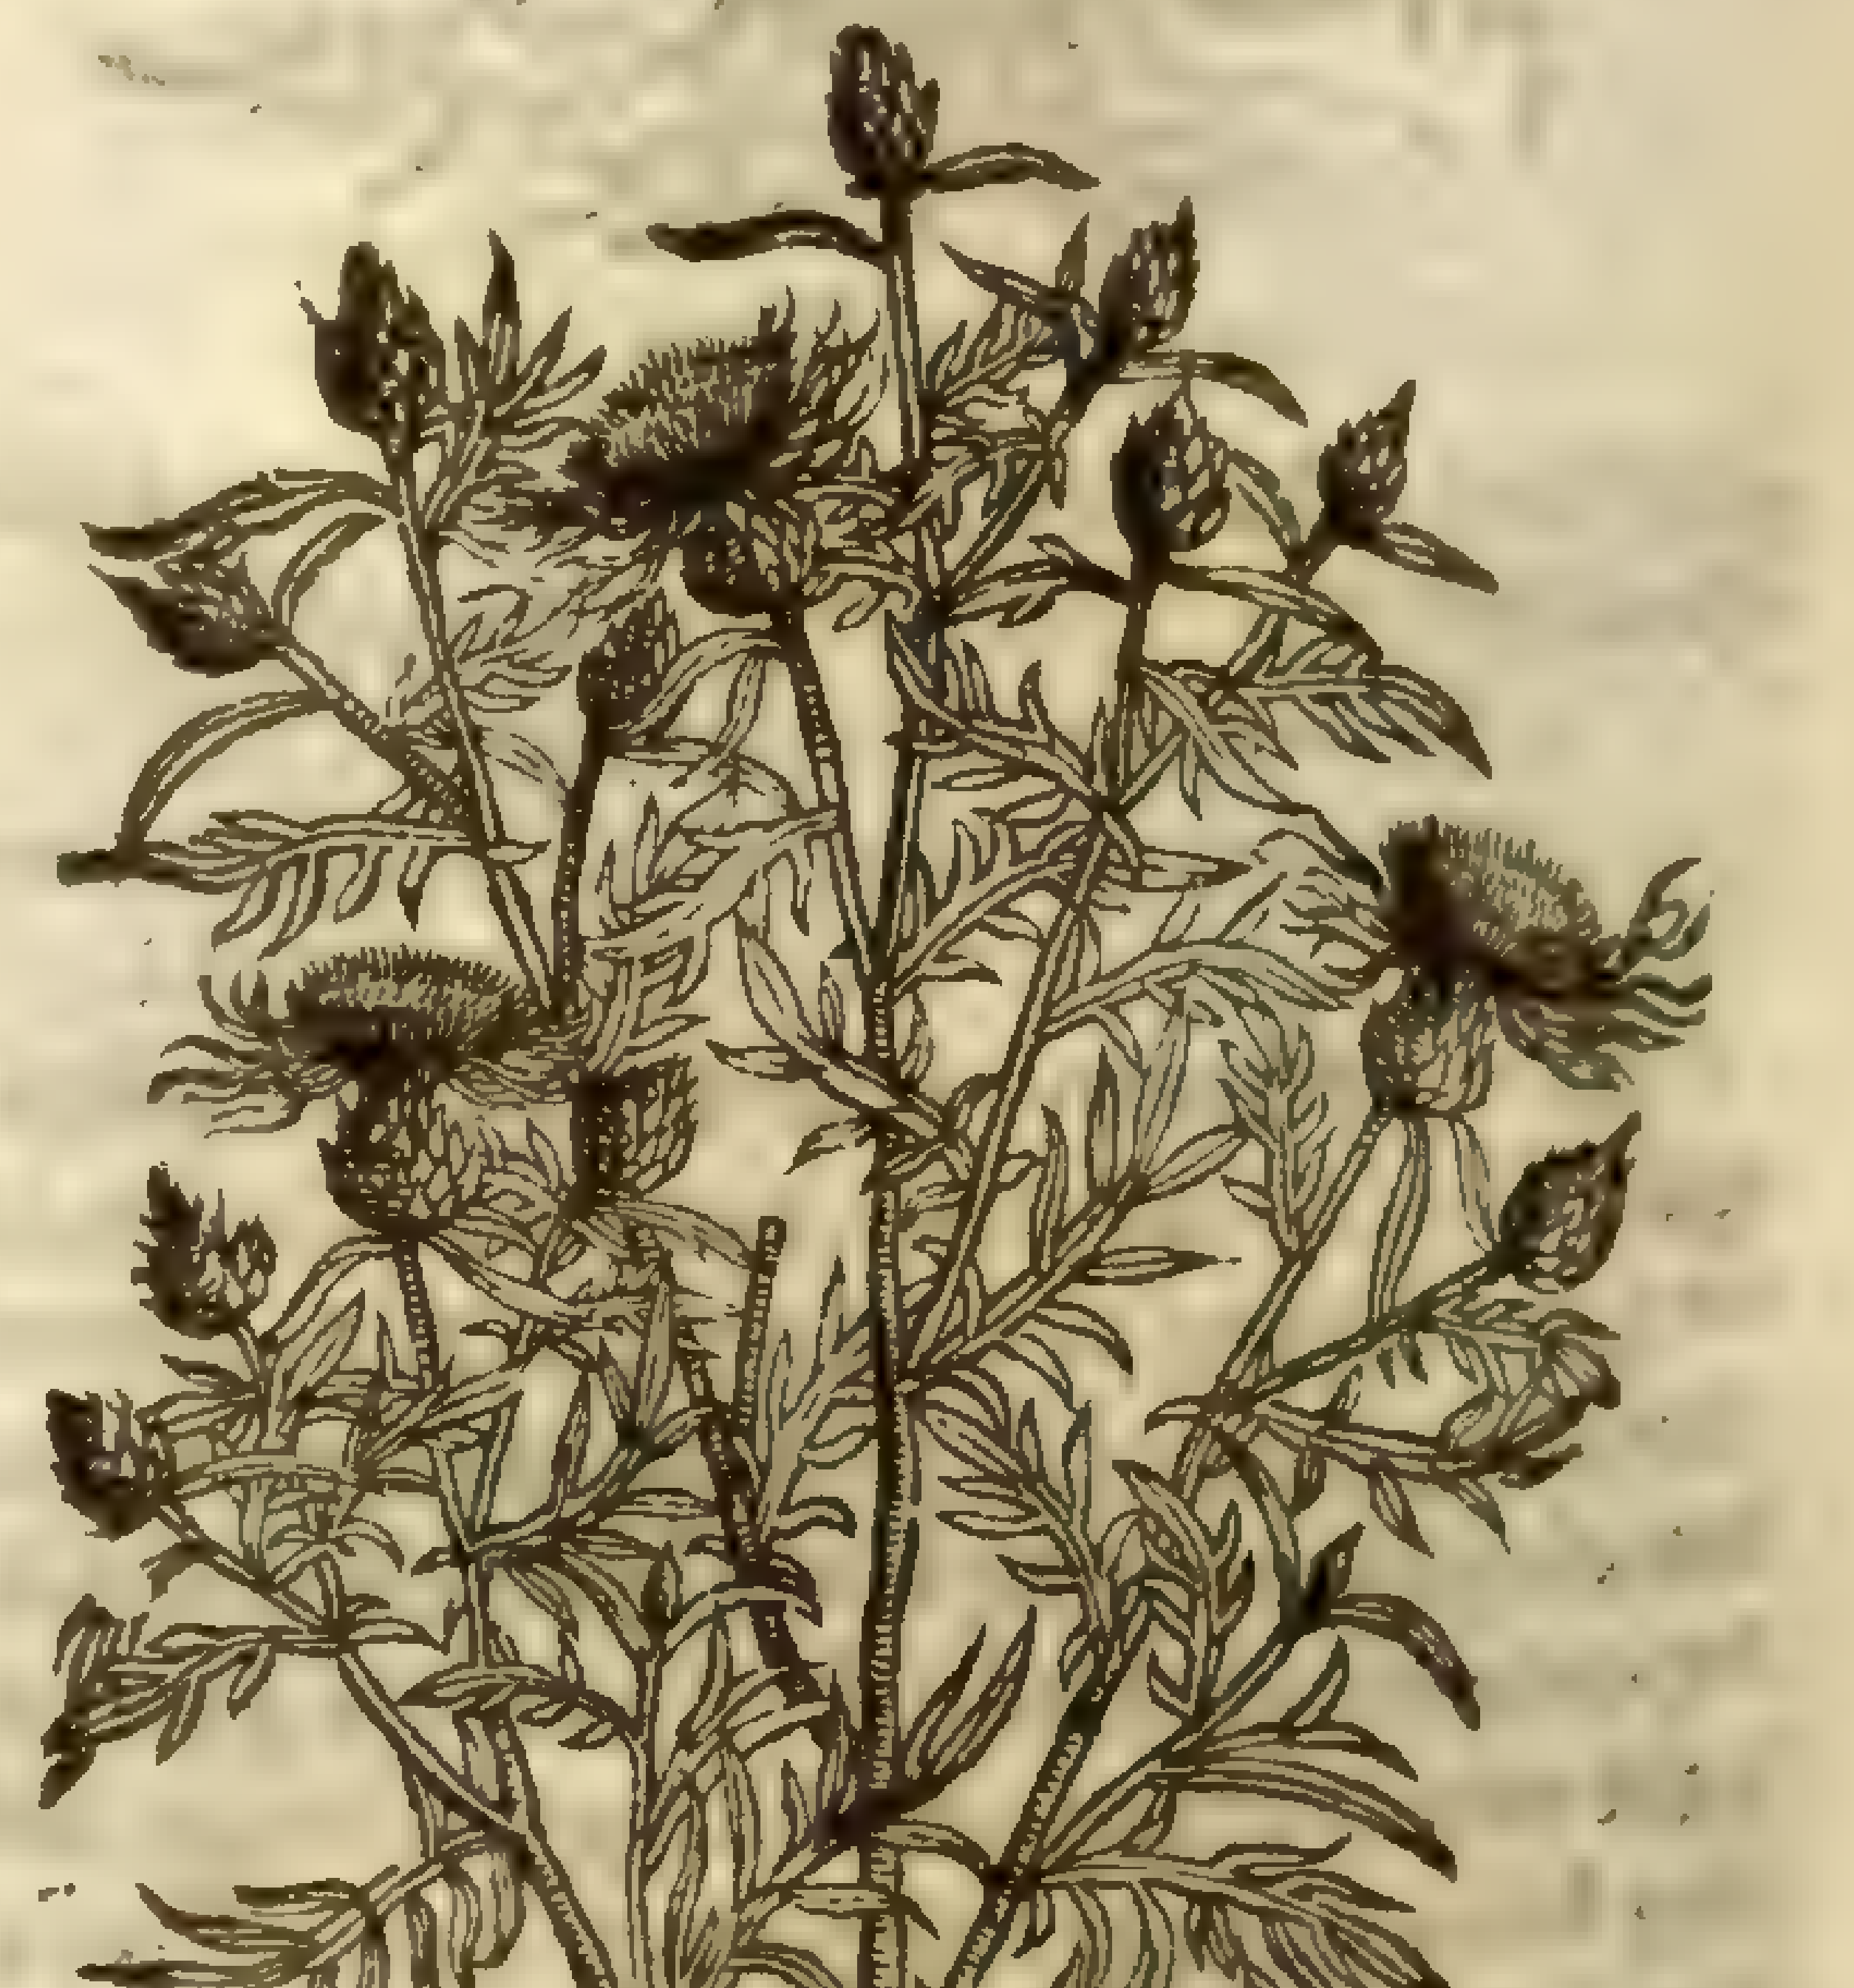
¶ *The Deſcription.*

1 The great ſiluer Knapweed hath at his firſt comming vp diuers leaues ſpred vpon the ground, of a deep green colour, cut and jagged as are the other Knapweeds, ſtraked here and there with ſome ſiluer lines down the ſame, whereof it took his ſyrname *Argentea*: among which leaues riſeth vp a ſtraight ſtalk of the height of two or three cubits, ſomwhat rough and brittle, diuiding it ſelfe toward the top into other twiggy branches; on the tops whereof doe grow floures ſet in ſcaly heads or knaps like the other Matfellons, of a gallant purple colour, conſiſting of a number of threds or thrums thicke thruſt together: after which the ſeeds appeare, ſlipperie, ſmooth at one end, and bearded with blacke haires at the other end, which makes it to leape and skip away when a man doth but lightly touch it. The root is ſmall, ſingle, and periſheth when the ſeed is ripe. ‡ This is not ſtreaked with any lines, as our Author imagined, nor called *Argentea* by any but him ſelfe, and that very vnfitly. ‡

† 1 *Stæbe argentea maior.*
Great ſiluer Knapweed.

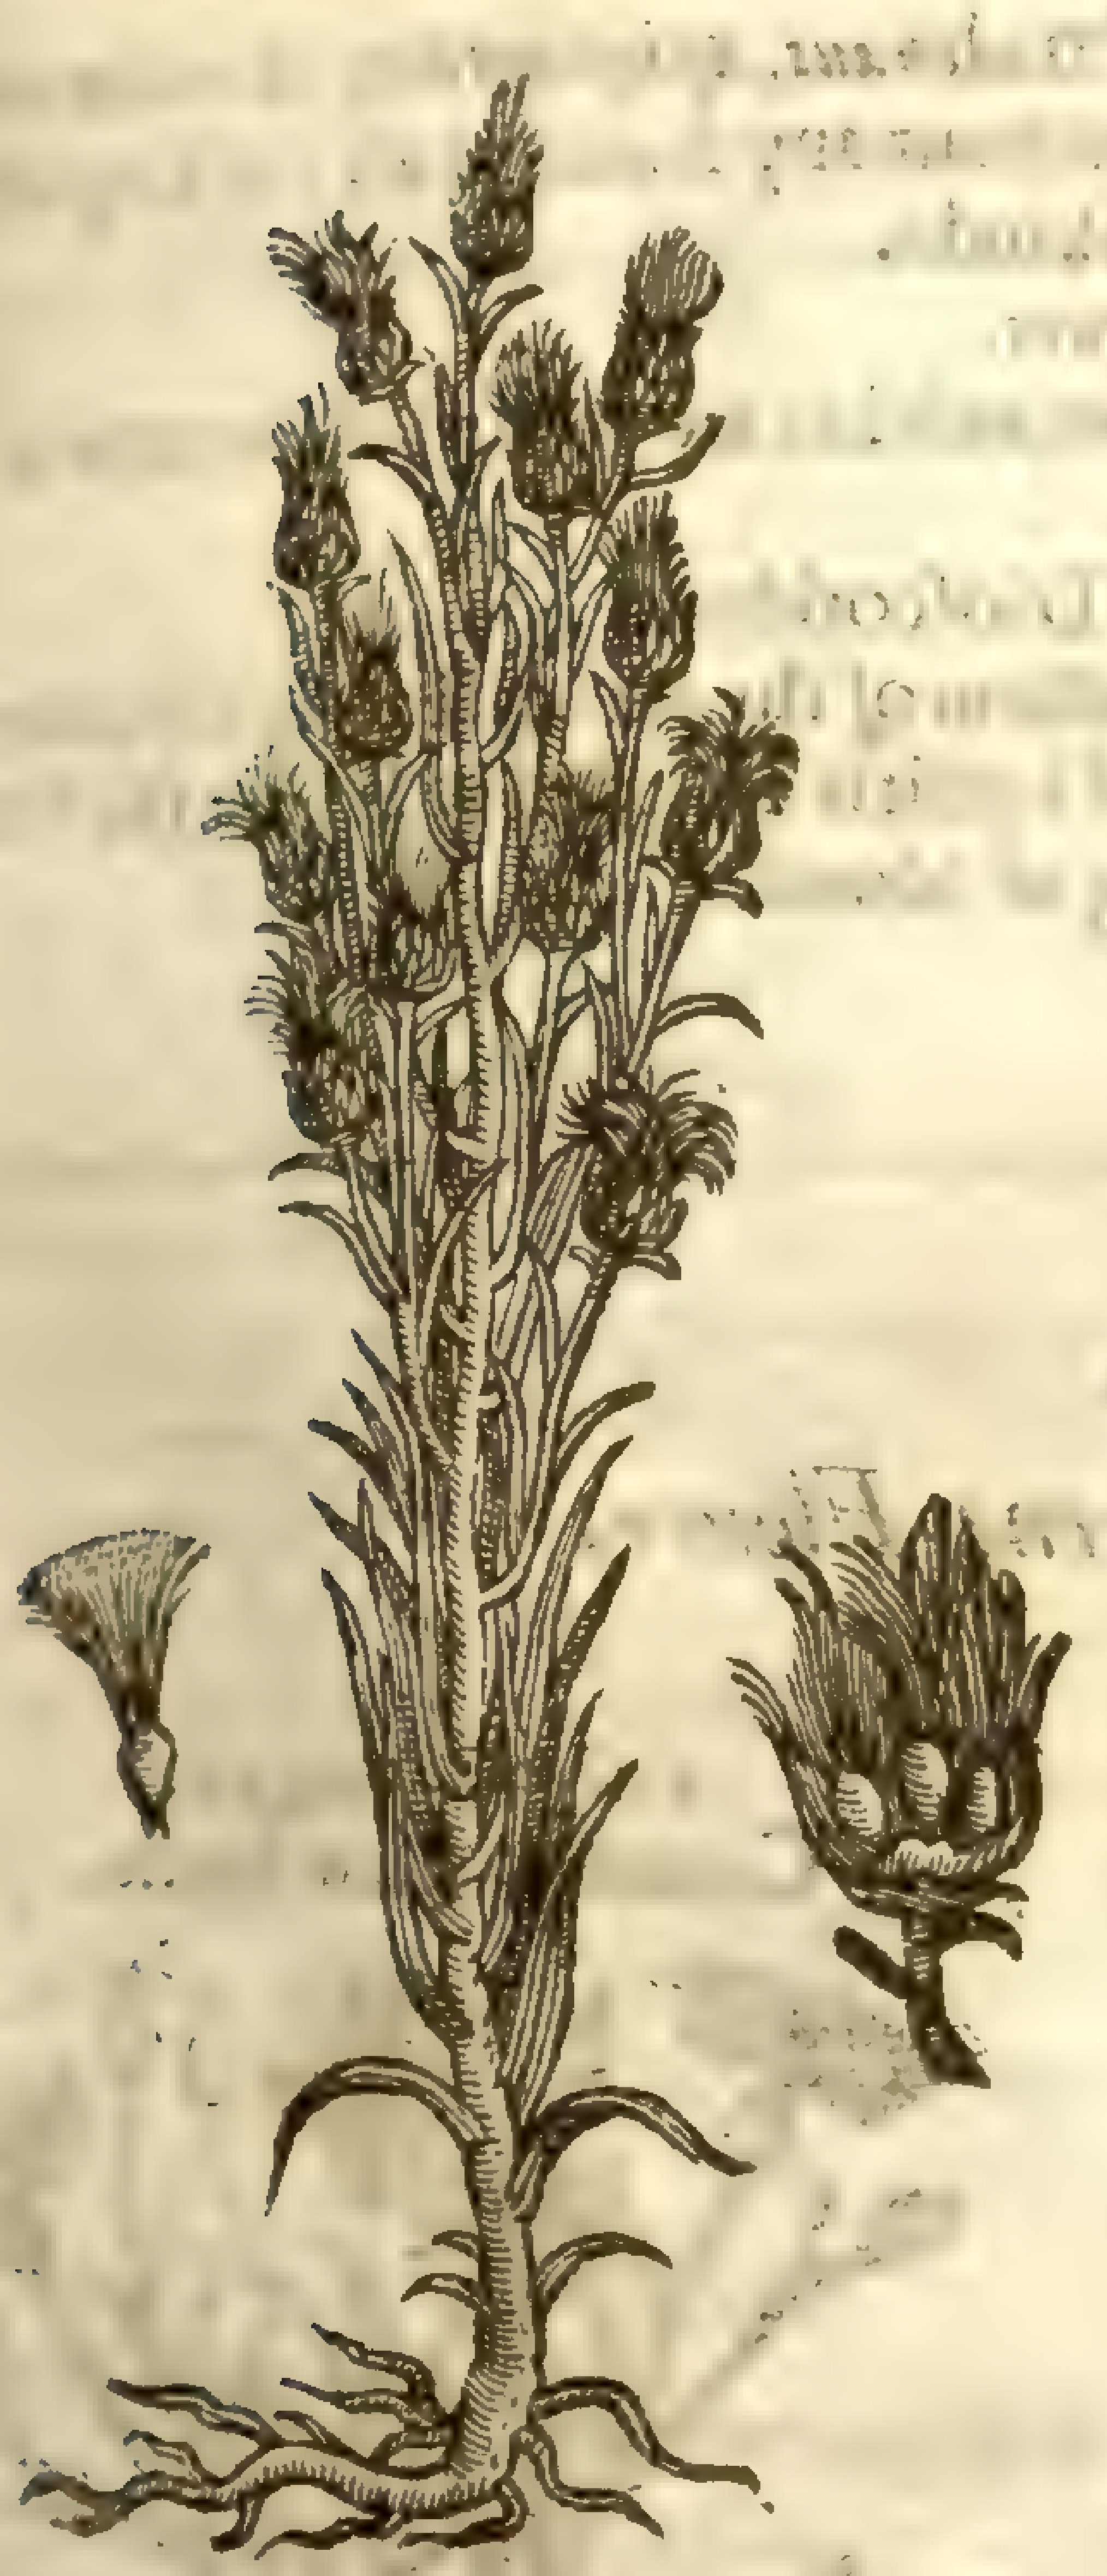


† 2 *Stæbe argentea minor.*
Little ſiluer Knapweed.

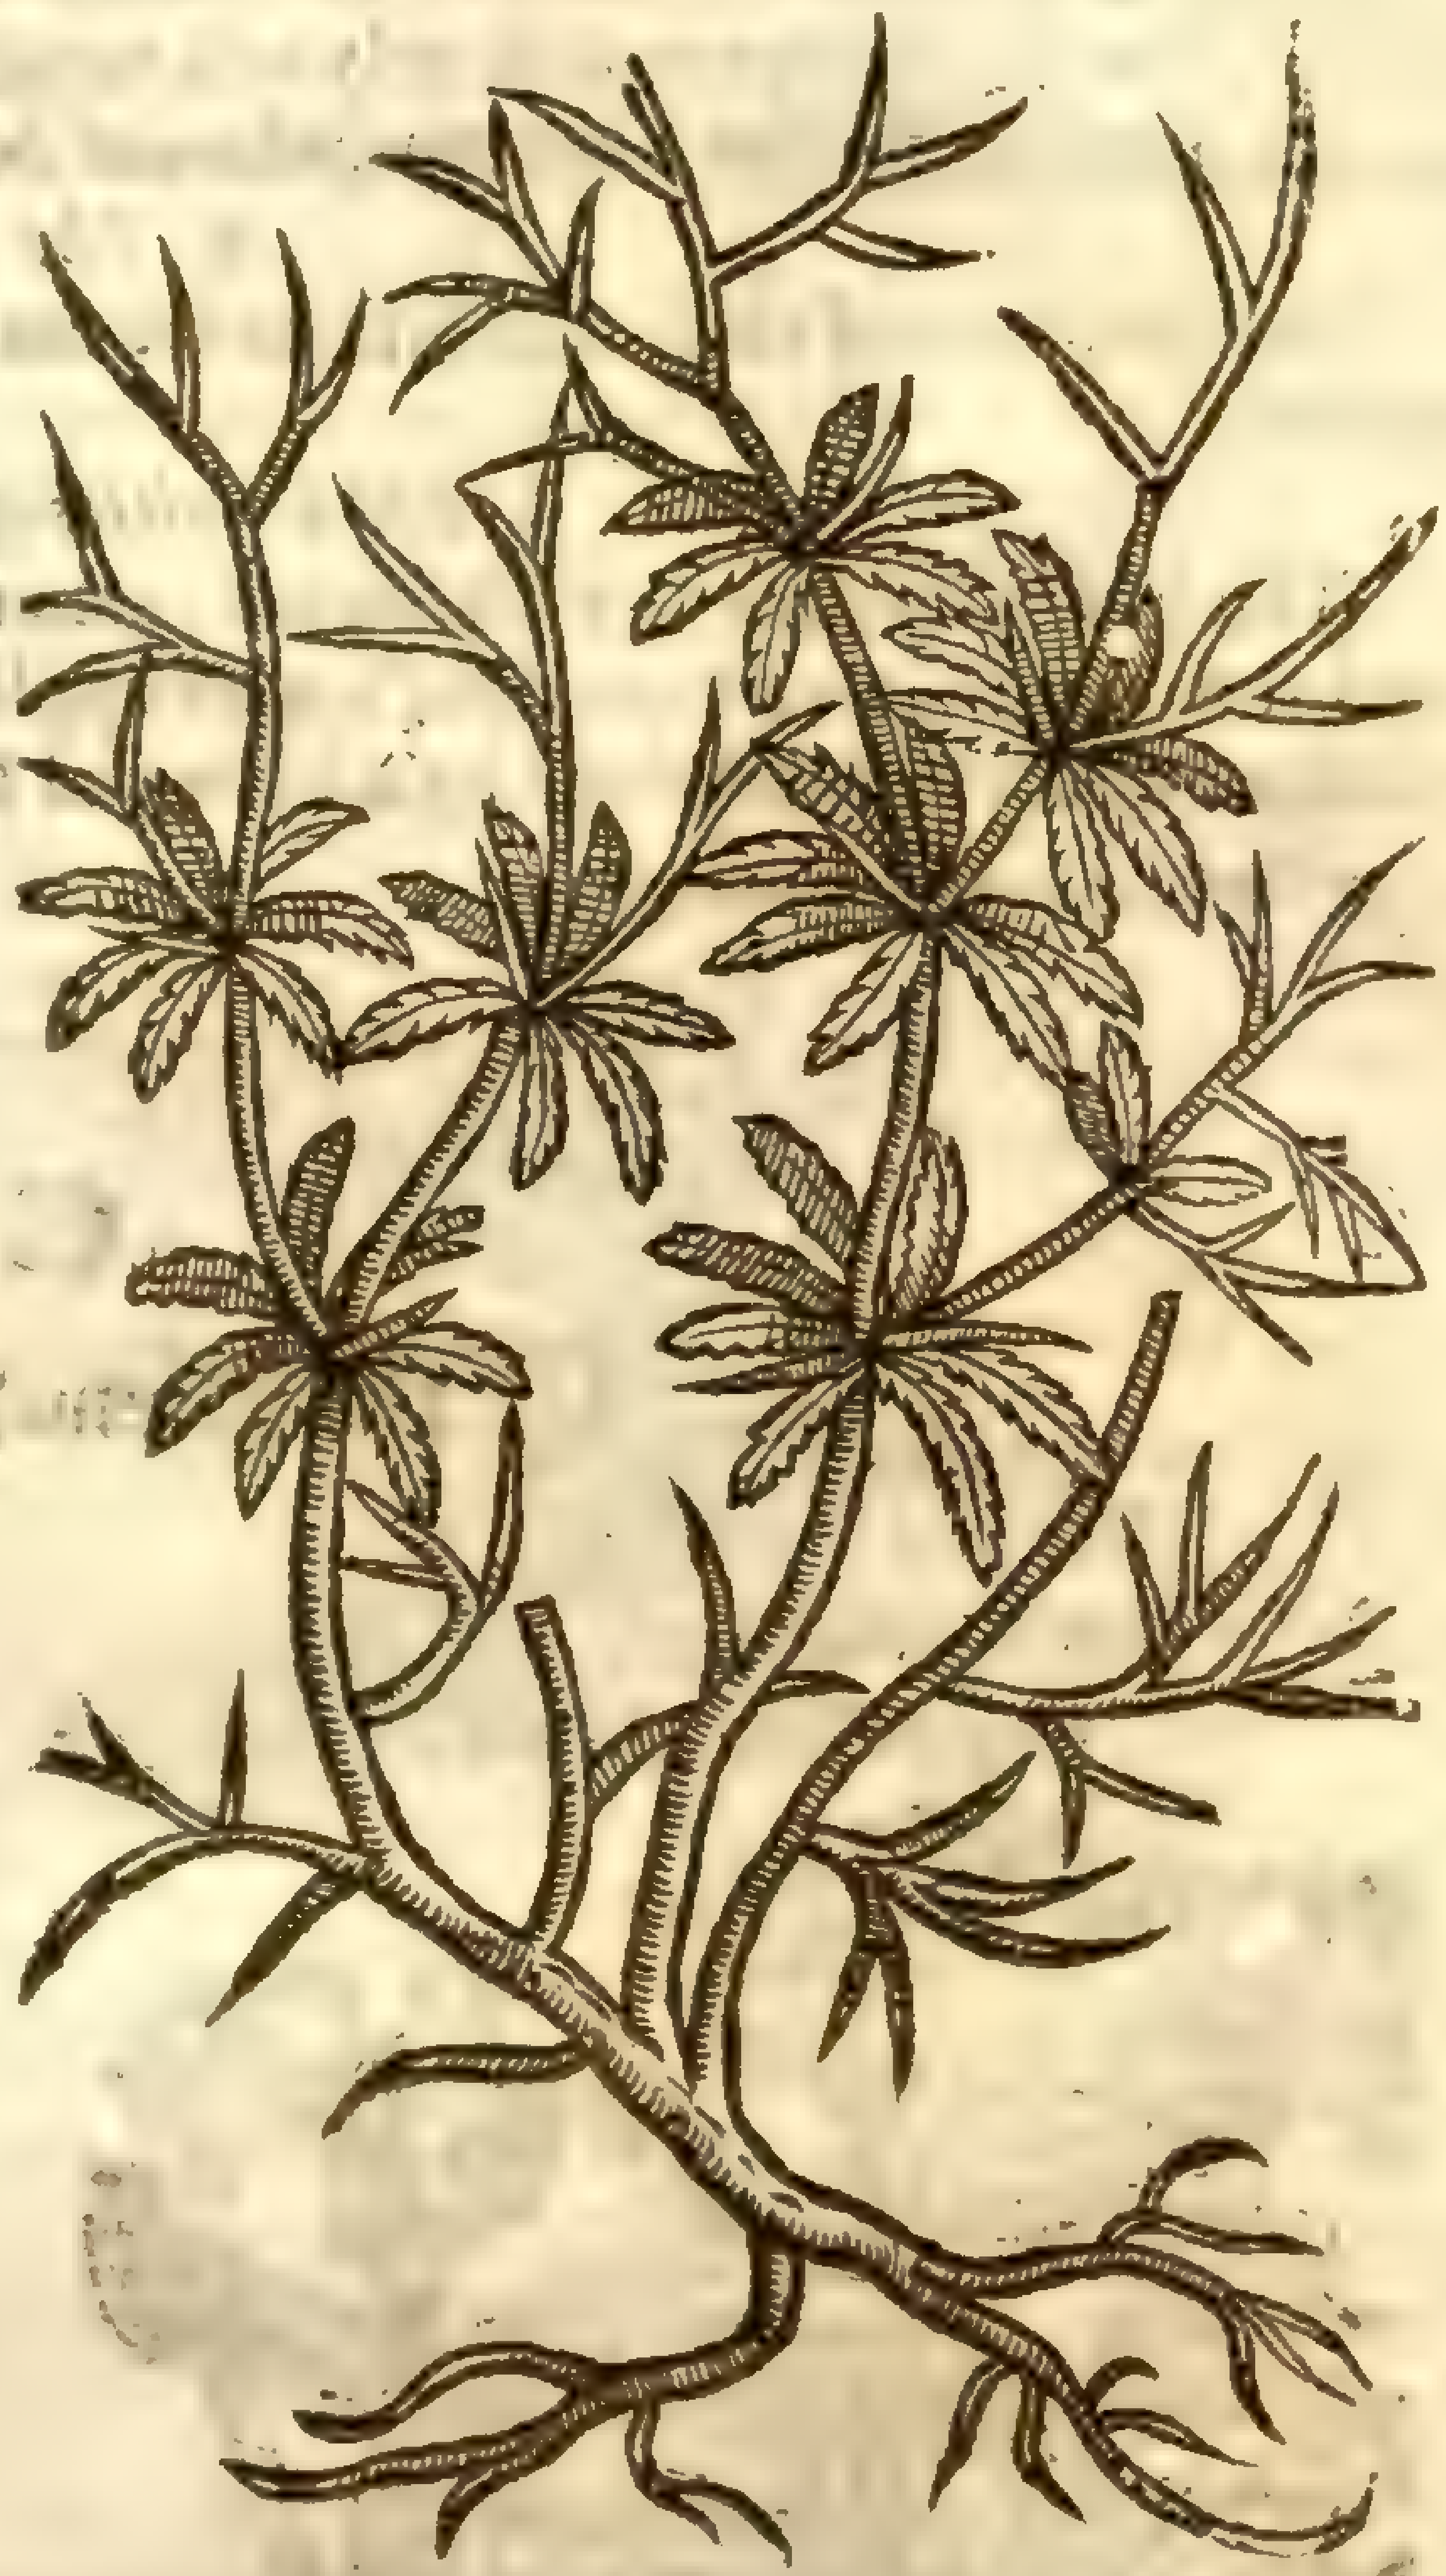


2 The ſecond agreeth with the firſt in each reſpect, ſauing that the leaues hereof are more jagged, and the ſiluer lines or ſtrakes are greater, and more in number, wherin conſiſteth the difference.

‡ 4 *Stæbe Roſmarini folio.*
Narrow leafed Knapweed.



‡ 5 *Stæbe ex Codice Cæſareo.*
Thorny Knapweed.



‡ The leaues of this are very much diuided and hoary, the ſtalkes ſome two cubits high, ſet alſo with much diuided leaues that end in ſoft harmleſſe prickles: at the tops of the branches ſtand the heads compoſed as it were of ſiluer ſcales (whence *Lobel* and others haue called this plant *Stæbe argentea*) and out of theſe ſiluer heads come floures like thoſe of the Blew-bottles, but of a light purple colour: the ſeed is ſmall, blackiſh, and hairy at the tops.

3 There is another like this in each reſpect, but that the heads haue not ſo white a ſhining ſiluer colour: and this I haue alſo ſeen growing with Mr *Iohn Tradeſcant* at South Lambeth.

4 To theſe may be added that plant which *Pona* hath ſet forth by the name of *Stæbe capitata Roſmarini folio*. It hath a whitiſh wooddy root, from whence ariſe diuers branches ſet with long narrow leaues ſomwhat like thoſe of Roſemary, but liker thoſe of the Pine, of a greeniſh colour aboue, & whitiſh below: at the tops of the branches grow ſuch heads as in the firſt deſcribed *Stæbe*, with floures of ſomewhat a deeper purple colour: the ſeed is like that of *Carthamus*, but blackiſh. The root is not annual, but laſts many yeares.

5 Though theſe plants haue of late bin vulgarly ſet forth by the name of *Stæbe's*, yet are they not iudged to be the true *Stæbe* of *Dioſcorides* and the Antients, but rather of another, whoſe figure which we here giue was by *Dodonæus* taken forth of a Manuſcript in the Emperors Library; and he ſaith, *Paludanus* brought home ſome of the ſame out of Cyprus and Morea, as he returned from his journey out of Syria: the bottom leaues are ſaid to be much diuided, thoſe on the ſtalks long, and only ſnipt about the edges, and white: the floures white, contained in ſcaly heads like the Blew-bottles, and the tops of the branches end in ſharpe prickles. ‡

¶ *The Place.*

These grow of themſelues in fields neere common high-wayes and in vntilled places; but are ſtrangers in England, neuertheleſſe I haue them in my garden.

¶ *The Time.*

They ſpring vp in Aprill, they floure in Auguſt, and the ſeed is ripe in September.

¶ *The Names.*

Siluer Knapweed is called of *Lobel, Stœbe Salamantica*: of *Dodonæus, Aphyllanthes*, that is, without leaues; for the floures conſiſt only of a number of threds, without any leaues at all: in Engliſh, ſiluer Knapweed, or ſiluer Scabious, whereof doubtleſſe it is a kinde.

¶ *The Nature and Vertues.*

The faculties of theſe Matfellons are not as yet found out, neither are they vſed for meat or medicine.

† *The Faculties of* Stœbe *out of* Dioſcorides.

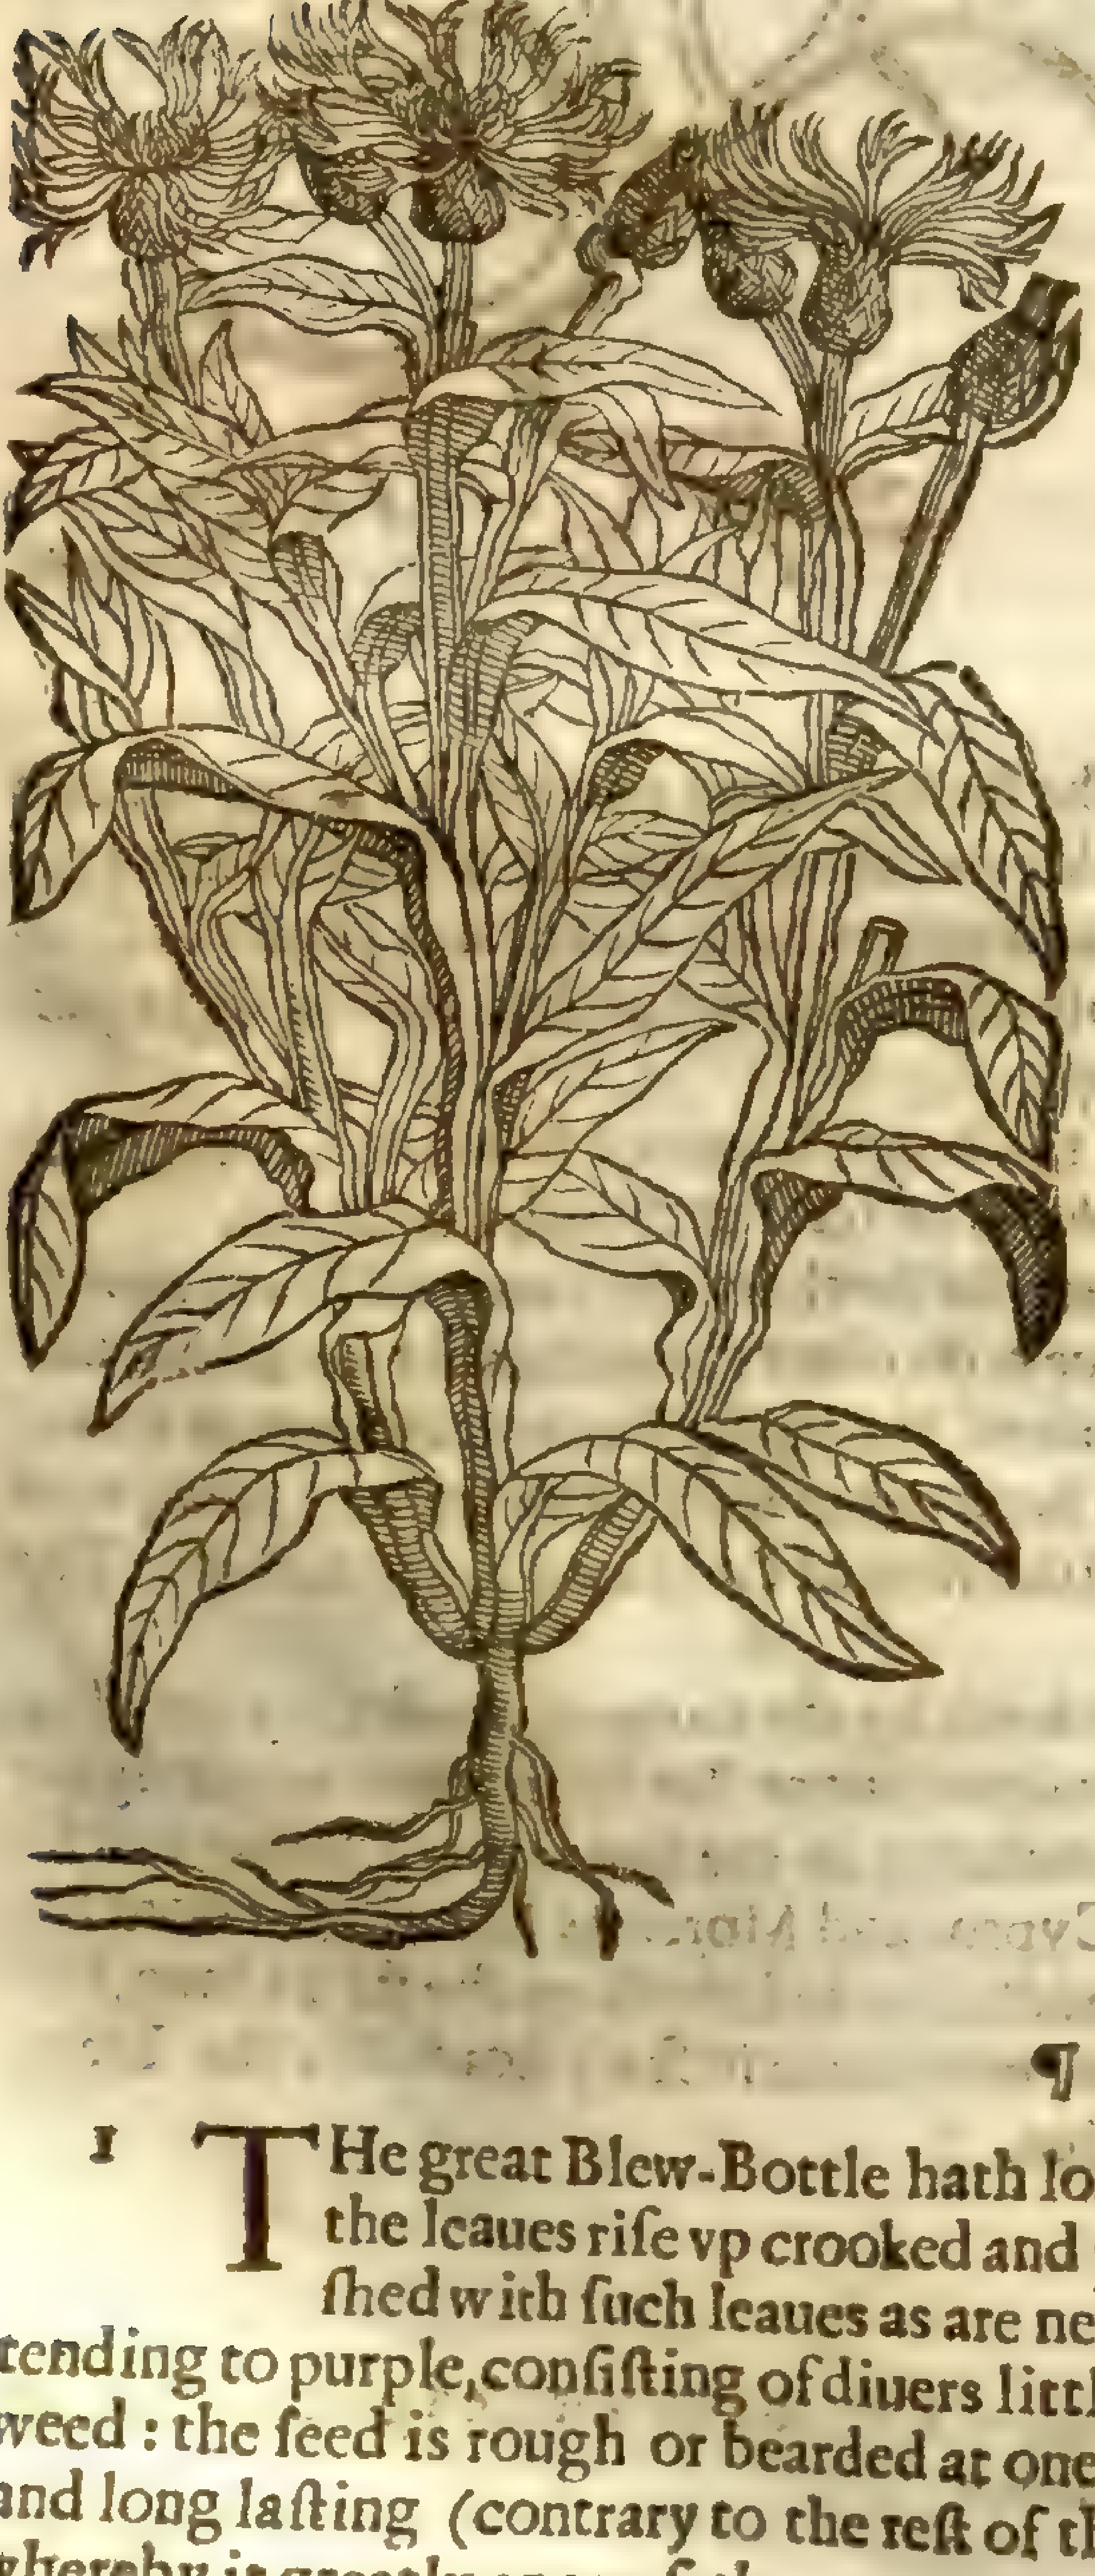
A The ſeed and leaues are aſtringent, wherefore the decoction of them is caſt vp in Dyſenteries, and into purulent eares, and the leaues applied in manner of a pultis are good to hinder the blackeneſſe of the eyes occaſioned by a blow, and ſtop the flowing of bloud.

† The figures were formerly tranſpoſed.

Chap. 251.

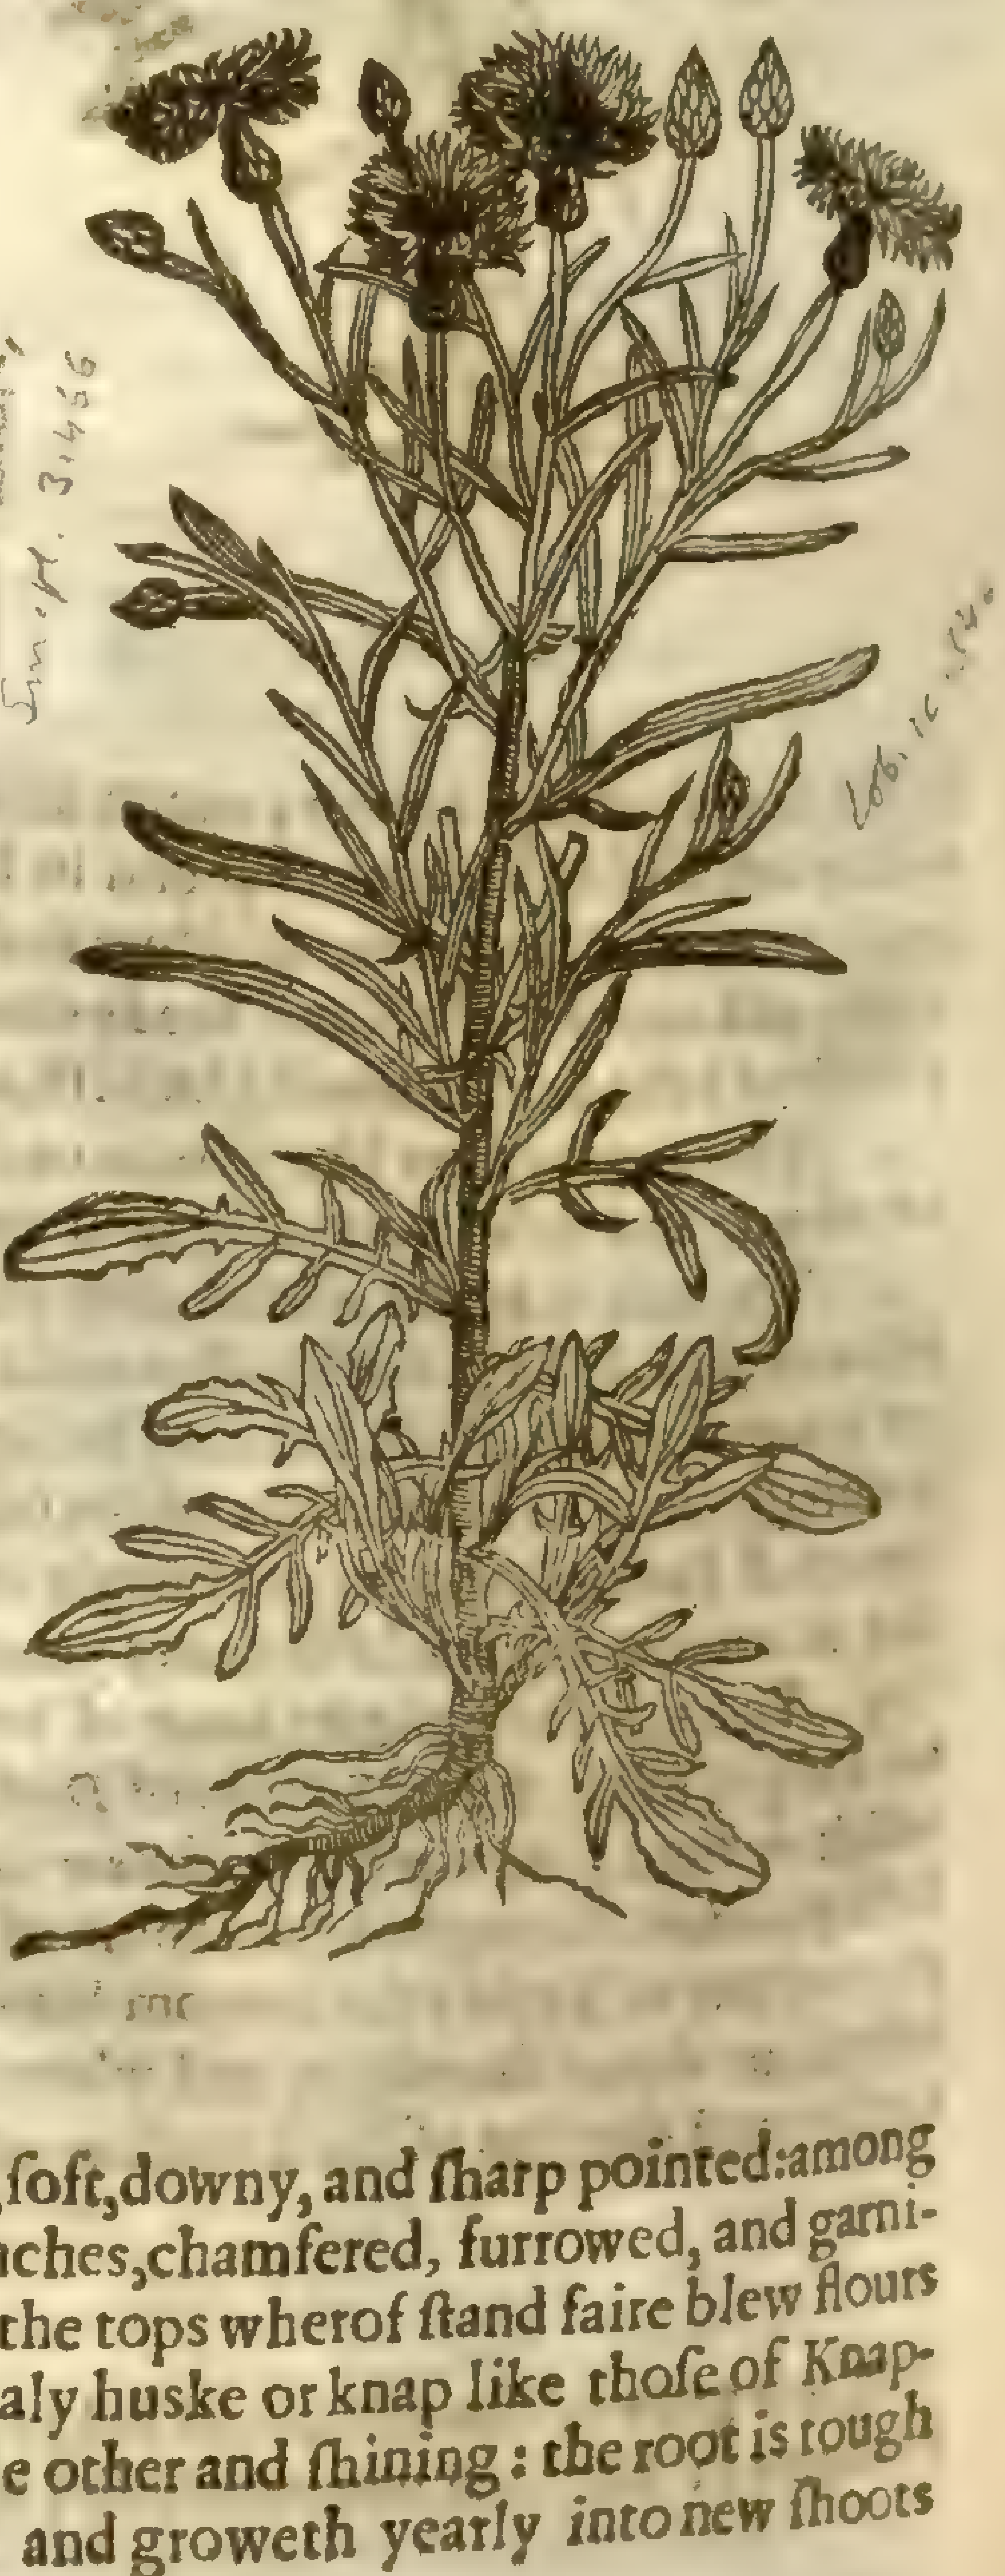
Of the Blew-Bottle or Corne-Floure.

1 *Cyanus maior.*
Great Blew-Bottle.



Centaurea montana, L.
Linnæi. abrid.

2 *Cyanus vulgaris.*
Common Blew-Bottle.



Centaurea Cyanus, L.
Linnæi. abrid.
Sm. pl. 3.456

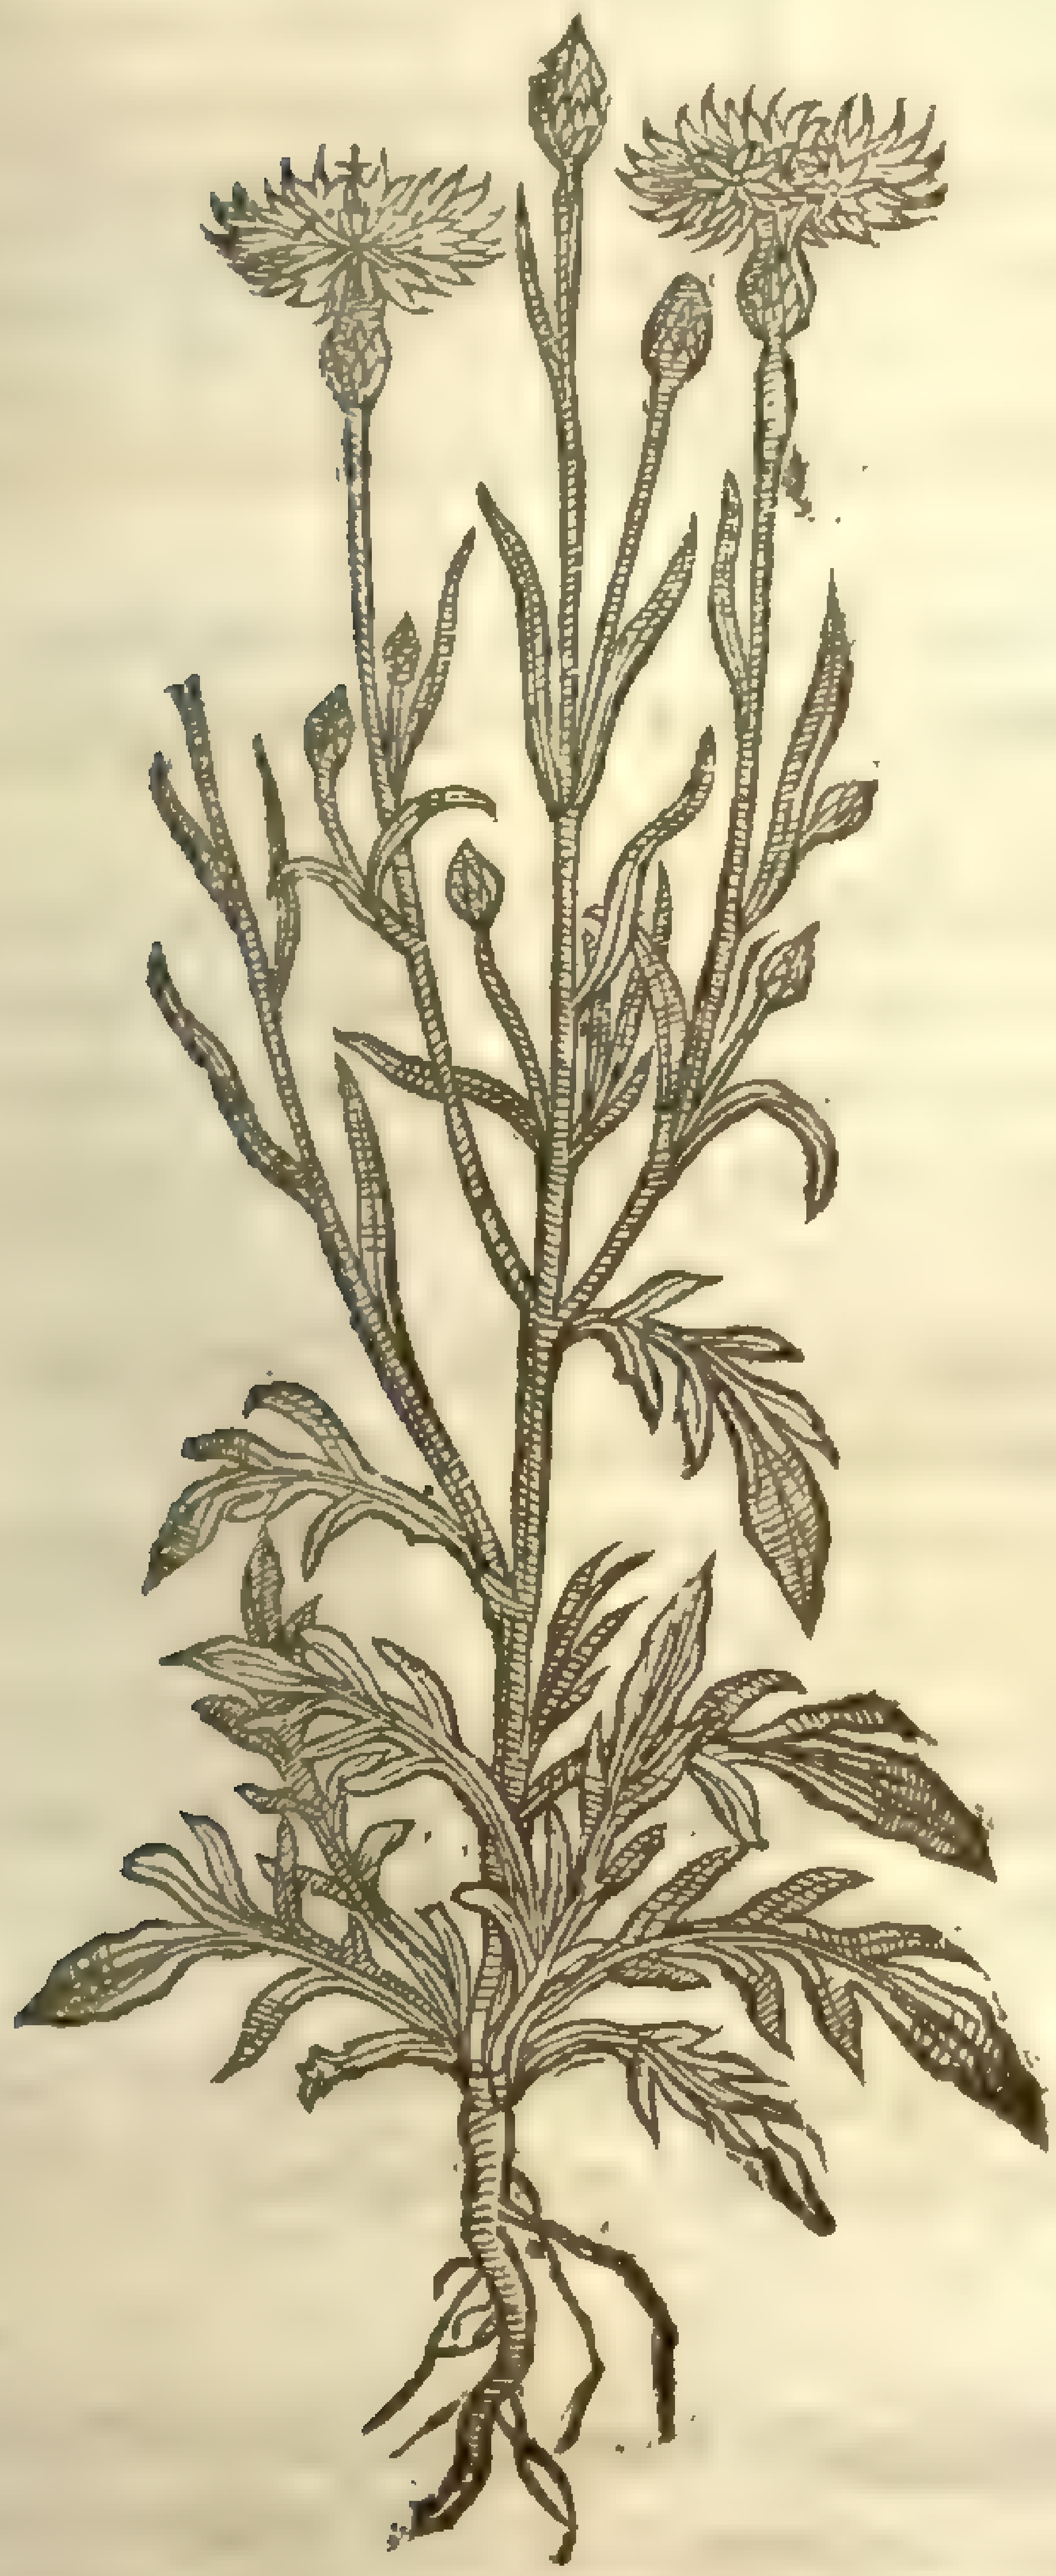
Lob. ic. 546

¶ *The Deſcription.*

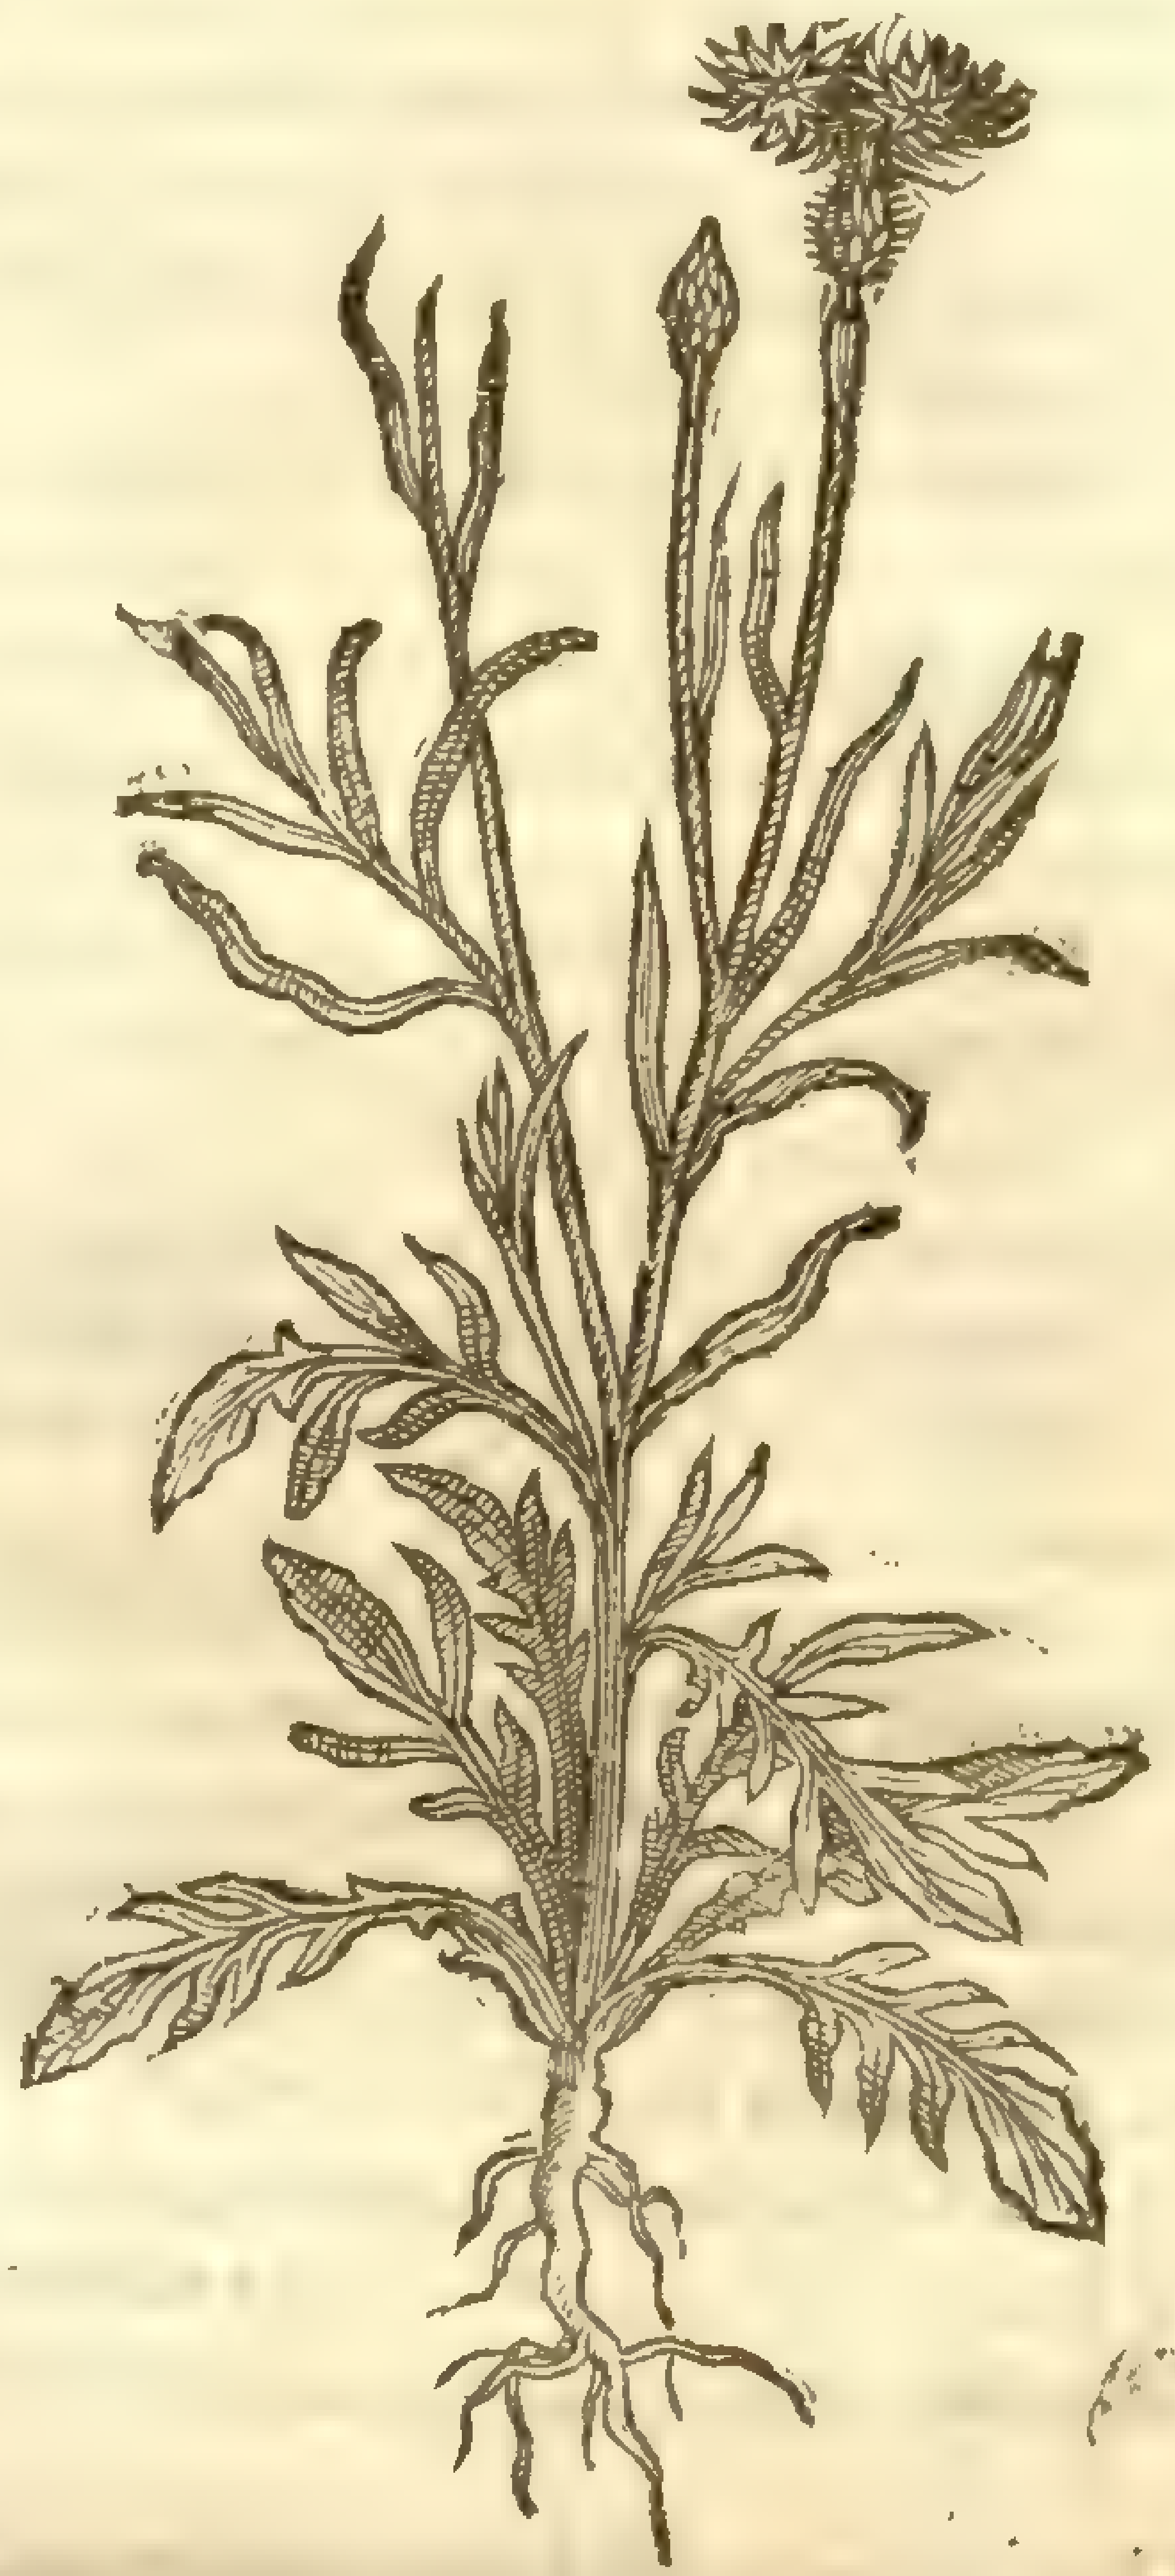
1 The great Blew-Bottle hath long leaues ſmooth, ſoft, downy, and ſharp pointed: among the leaues riſe vp crooked and pretty thicke branches, chamfered, furrowed, and garniſhed with ſuch leaues as are next the ground: on the tops whereof ſtand faire blew flours tending to purple, conſiſting of diuers little flours, ſet in a ſcaly huske or knap like thoſe of Knapweed: the ſeed is rough or bearded at one end, ſmooth at the other and ſhining: the root is rough and long laſting (contrary to the reſt of the Corne-floures) and groweth yearly into new ſhoots whereby it greatly encreaſeth.

2 The

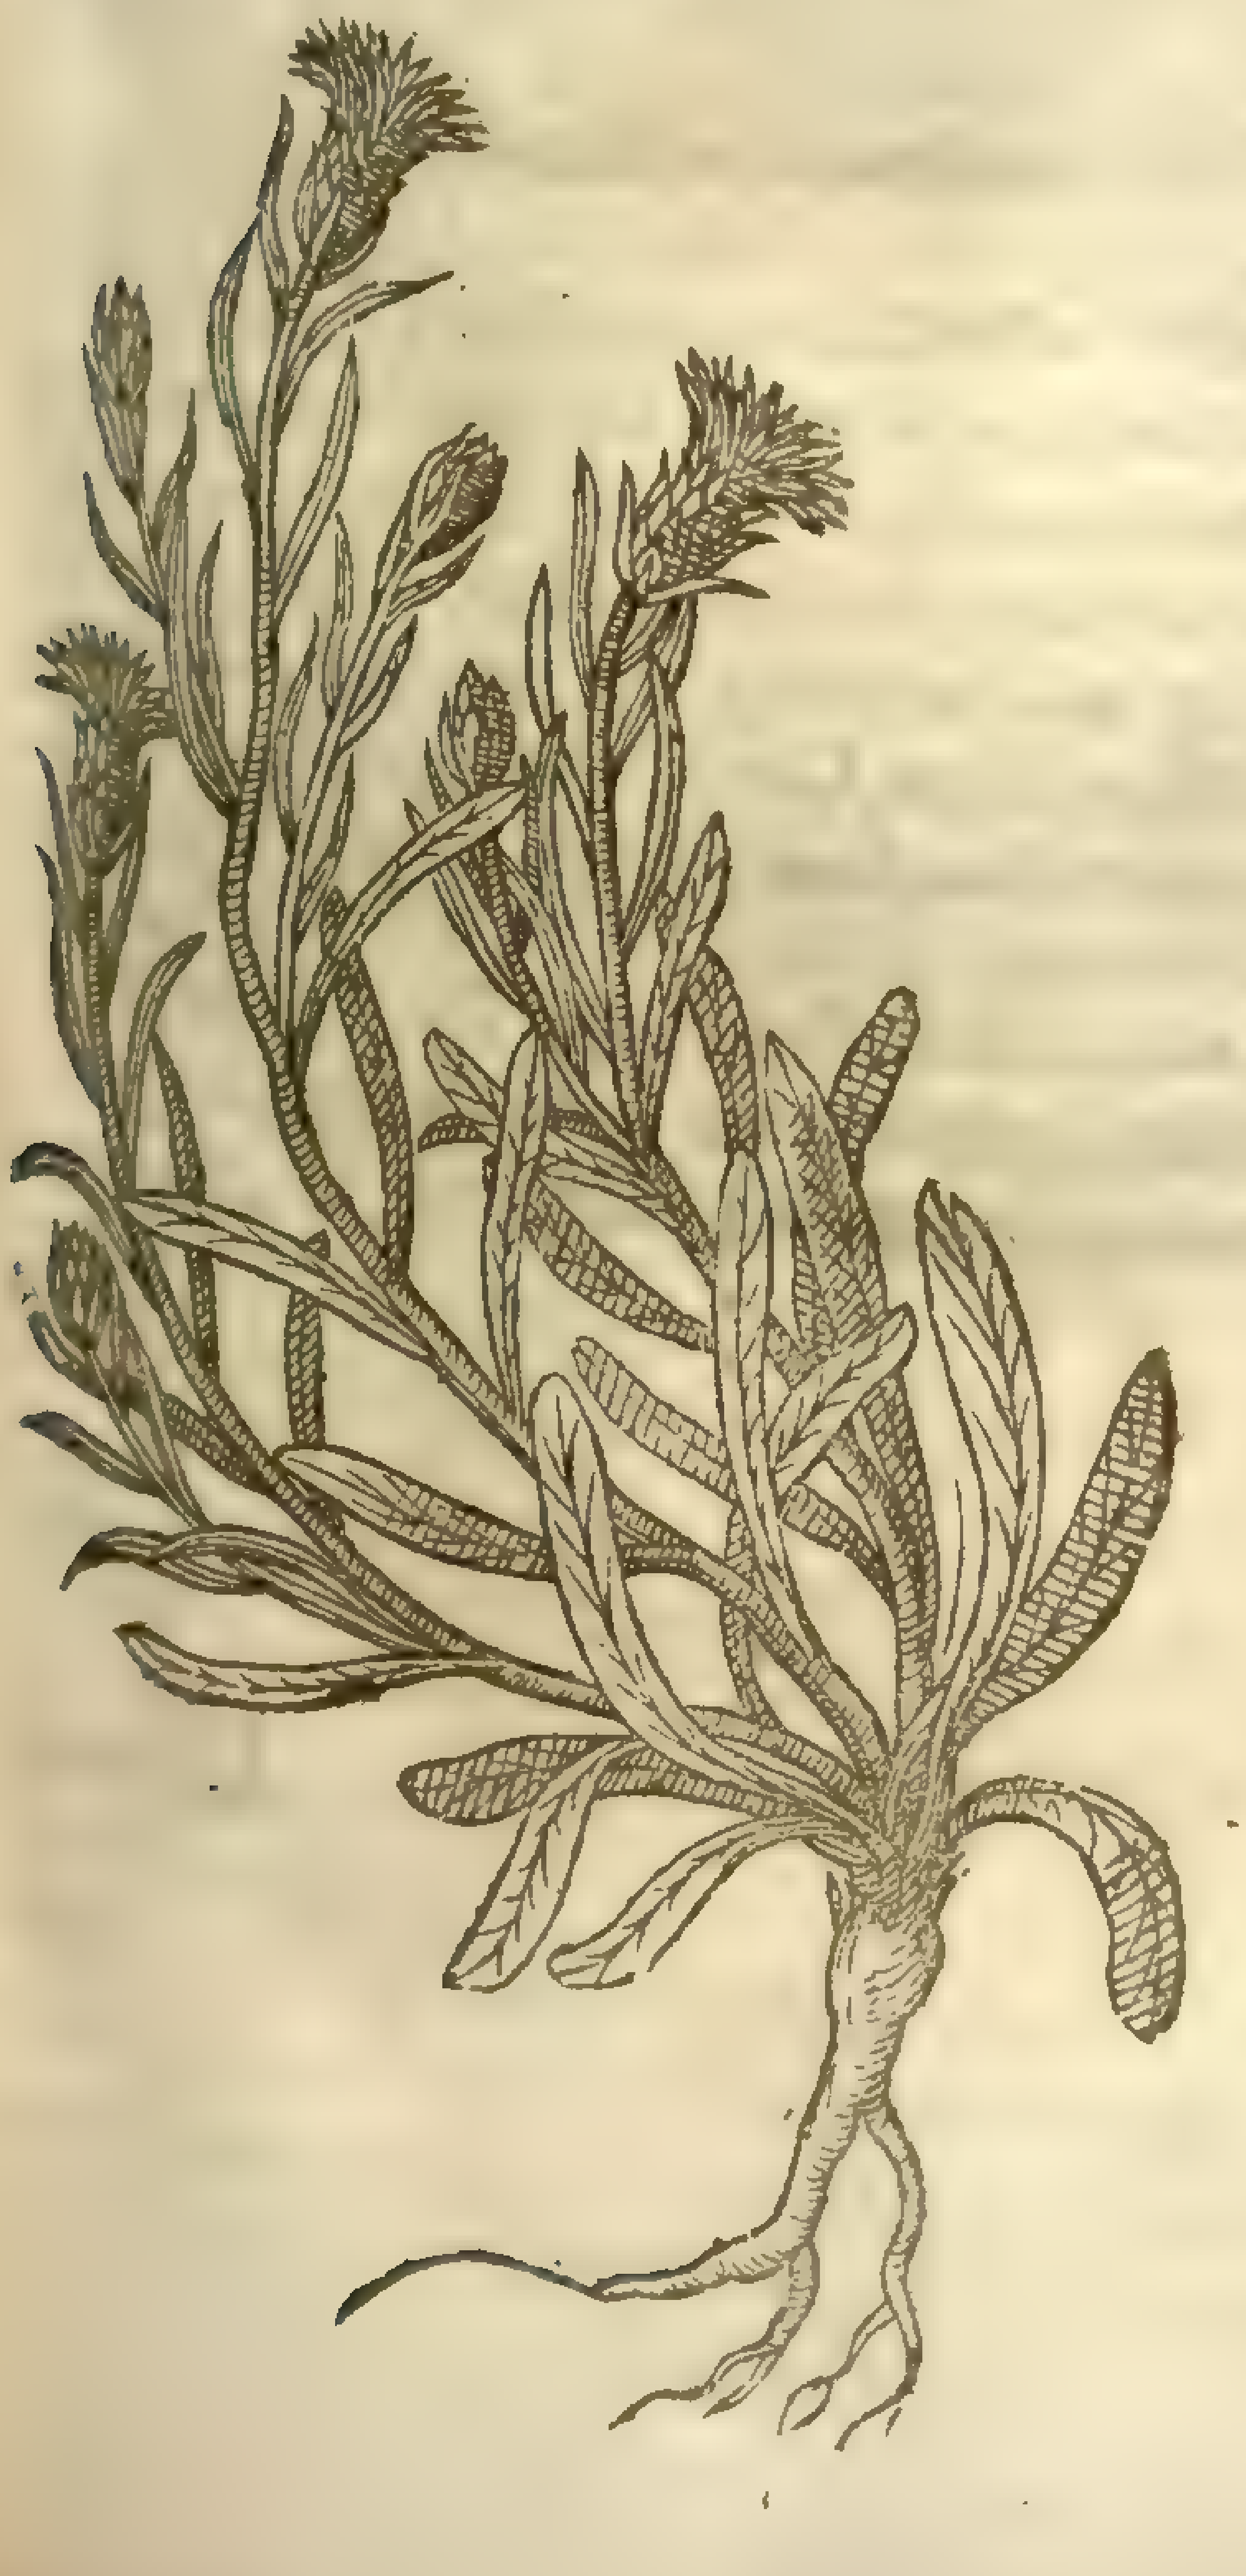
7 *Cyanus cæruleus multiflorus.*
Double Blew-Bottles.



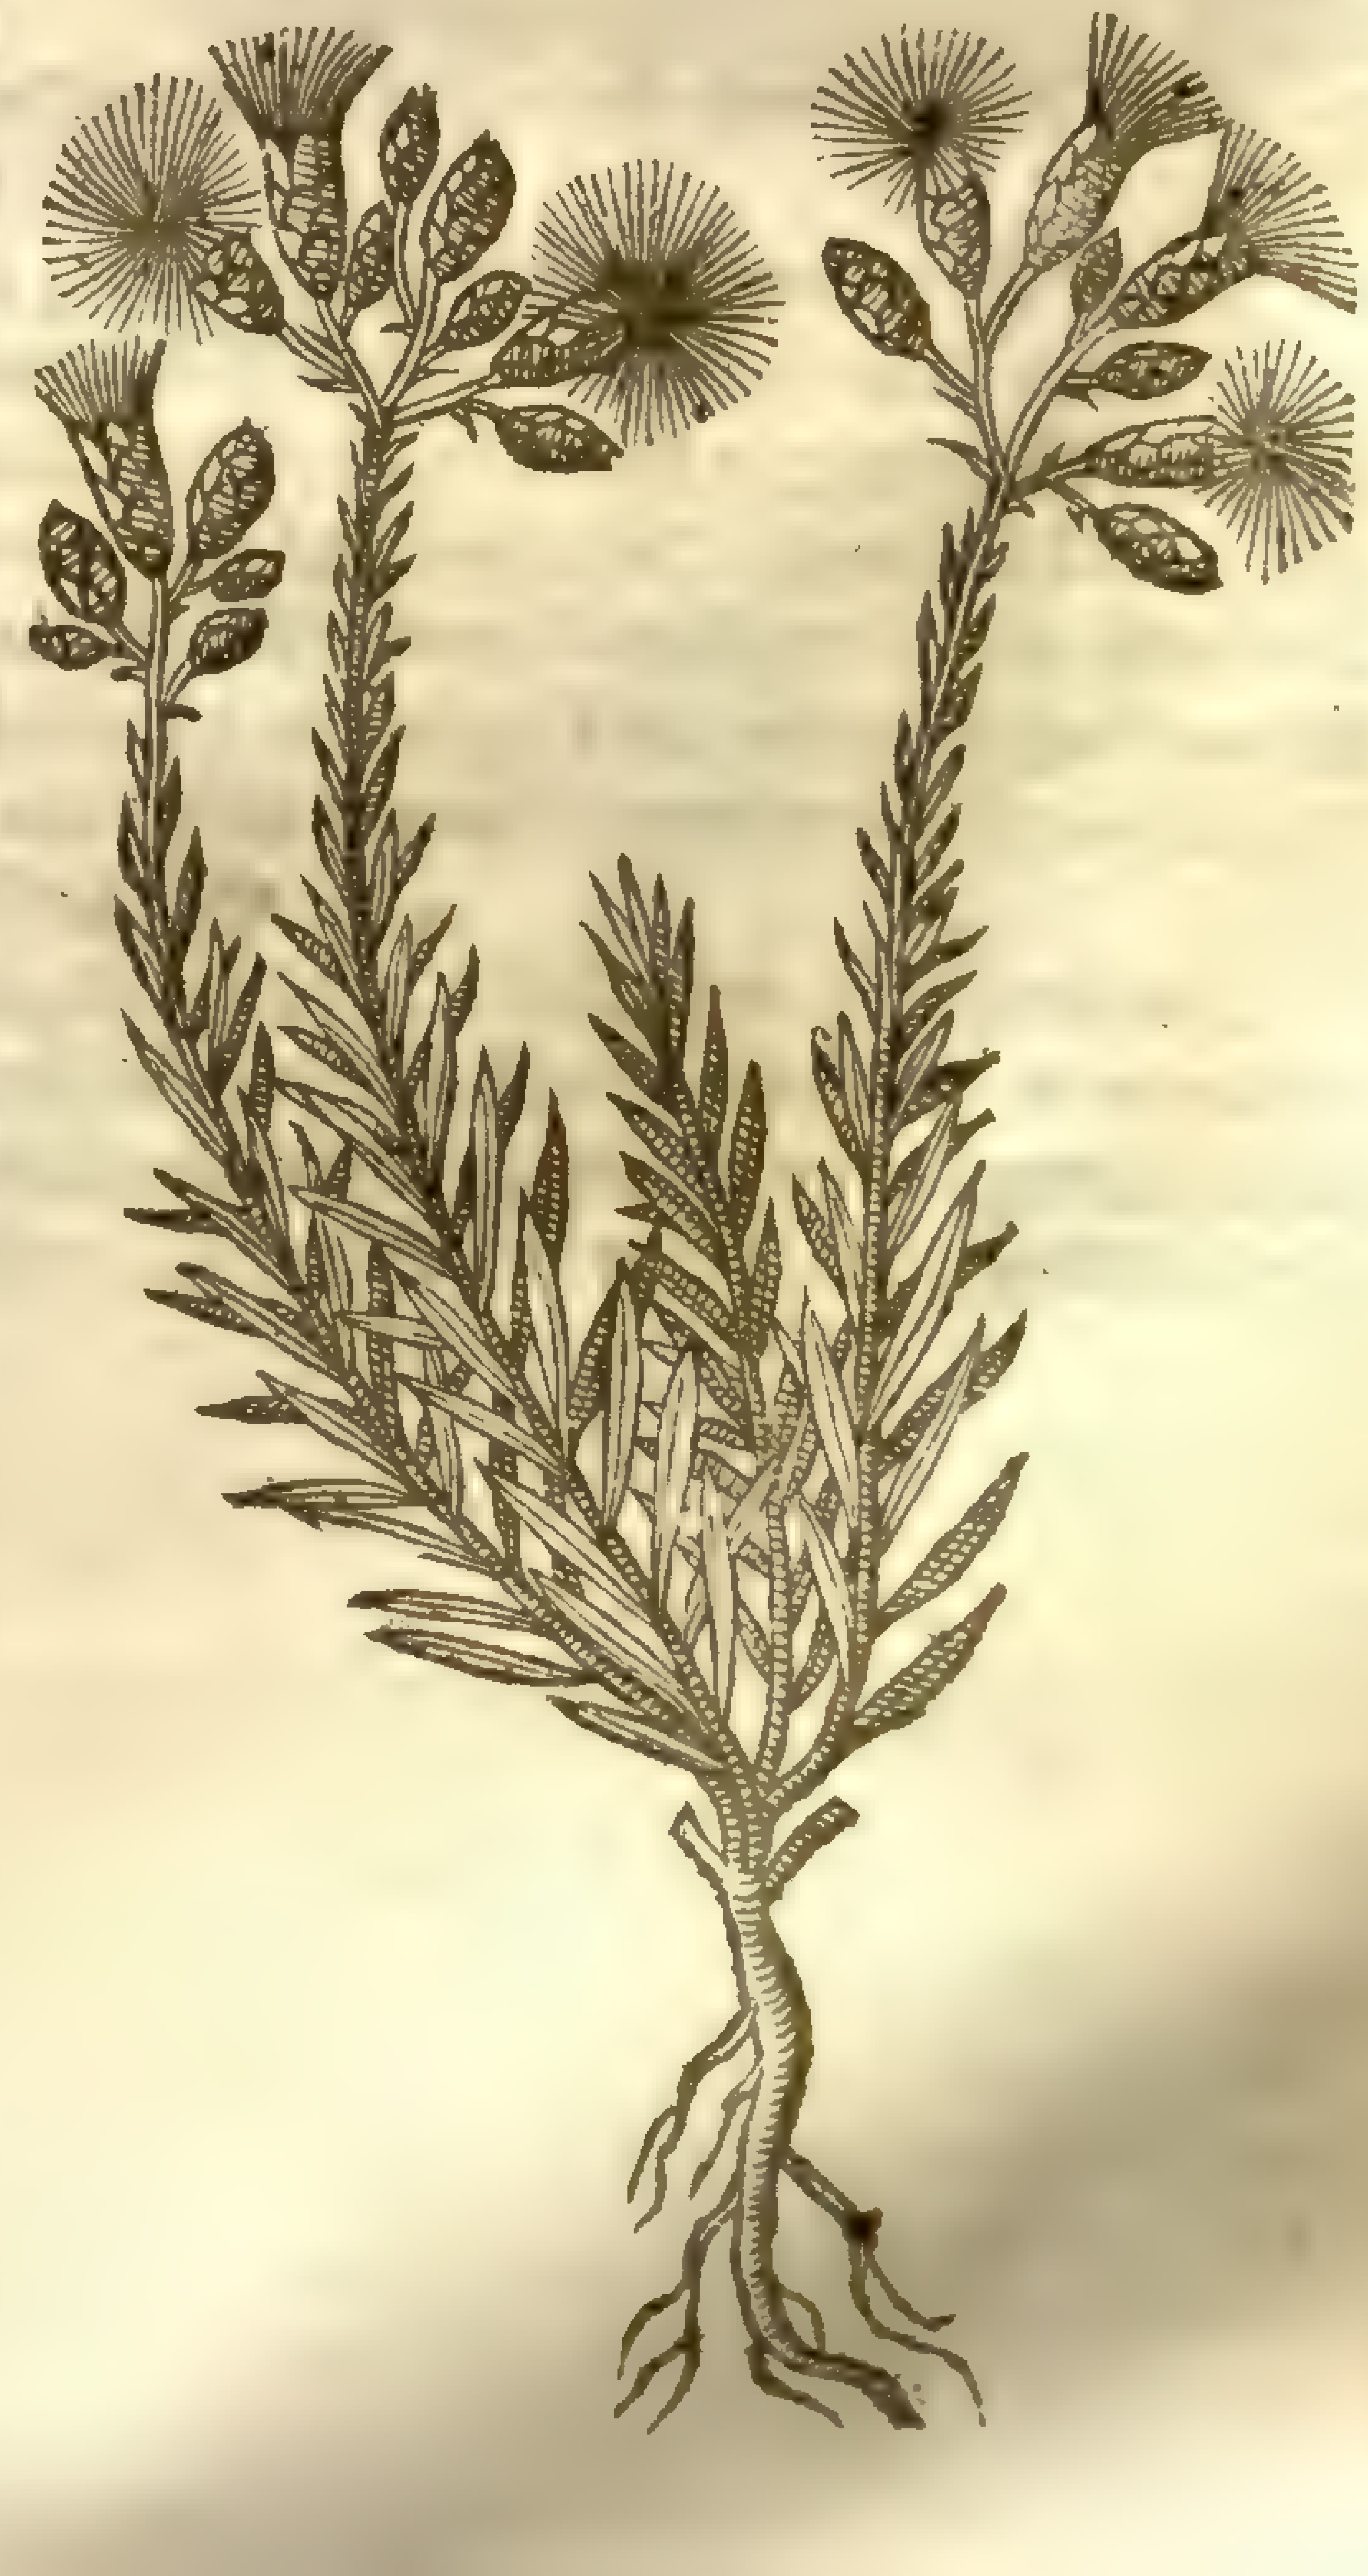
8 *Cyanus purpureus multiflorus.*
Double purple Bottles.



‡ 9 *Cyanus repens latifolius.*
Broad leafed creeping Blew-Bottle.



‡ 10 *Cyanus repens anguſtifolius.*
Small creeping Blew-Bottle.



2 The common Corn-floure hath leaues ſpred vpon the ground,of a whitiſh green colour,ſomwhat hackt or cut in the edges like thoſe of corne Scabious: among which riſeth vp a ſtalke diuided into diuers ſmall branches, whereon do grow long leaues of an ouerworne green colour, with few cuts or none at all. The floures grow at the top of the ſtalks,of a blew colour,conſiſting of many ſmal floures ſet in a ſcaly or chaffie head like thoſe of the Knapweeds:the ſeed is ſmooth,bright ſhining,and wrapped in a woolly or flocky matter.The root is ſmall and ſingle,and periſheth when it hath perfected his ſeed.

3 This Bottle is like to the laſt deſcribed in each reſpect,ſauing in the colour of the floures, which are purple,wherein conſiſteth the difference.

4 The fourth Bottle is alſo like the precedent,not differing in any point but in the floures;for as the laſt before mentioned are of a purple colour, contrariwiſe theſe are milke white,which ſets forth the difference.

5 The violet coloured Bottle or Corne-floure is like the precedent in ſtalkes,leaues,ſeeds,and roots: the only difference is,that this bringeth floures of a Violet colour,and the others not ſo.

6 Variable Corn-floure is ſo like the others in ſtalks,leaues,and proportion, that it cannot be diſtinguiſhed with words; only the floures hereof are of two colours,purple and white mixt together,wherein it differeth from the reſt.

7 There is no difference to be found in the leaues,ſtalks,ſeed,or roots of this Corn-floure,from the other,but only that the floures hereof are of a faire blew colour,and very double.

8 The eighth Corne-floure is like vnto the precedent without any difference at all, ſauing in the colour of the floures,which are of a bright purple,that ſetteth forth the difference.

‡ 9 This from a ſmall root ſends vp diuers creeping branches ſome foot long, ſet with long hoary narrow leaues: at the tops of the ſtalkes ſtand the floures in ſcaly heads, like as the other Blew-Bottles,but of a darke purple colour. The whole plant is very bitter and vngratefull to the taſte. *Lobel* calls this *Cyanus repens.*

10 This is like the laſt deſcribed, but that the leaues are much ſmaller or narrower, alſo the ſcaly heads of this are of a finer white ſiluer colour;and this plant is not poſſeſſed with ſuch bitterneſſe as the former. *Lobel* calls this *Cyanus minimus repens.* ‡

¶ *The Place.*

The firſt groweth in my garden,and in the gardens of Herbariſts, but not wilde that I know of. The others grow in corn fields among Wheat,Rie,Barley,and other graine: it is ſowne in gardens, and by cunning looking to doth oft times become of other colours,and ſome alſo double, as hath beene touched in their ſeuerall deſcriptions. ‡ The two laſt grow wilde about Montpellier in France. ‡

¶ *The Time.*

They bring forth their floures from the beginning of May to the end of Harueſt.

¶ *The Names.*

The old Herbariſts call it *Cyanus flos*, of the blew colour which it naturally hath: moſt of the later ſort following the common Germane name,call it *Flos frumentorum*: for the Germanes name it **Coꝛn blumen**: in low-Dutch,**Coꝛn bloemen**: in French,*Blaueole*,and *Bluet*: in Italian,*Fior campeſe*,and *Bladiſeris*,i.*Ceris bladi*,and *Battiſecula*,or *Baptiſecula*,as though it ſhould be called *Blaptiſecula*, becauſe it hindereth and annoyeth the Reapers, by dulling and turning the edges of their ſicles in reaping of corne: in Engliſh it is called Blew-Bottle,Blew-Blow,Corne-floure,and hurt-Sicle. ‡ *Fabius Columna* would haue it to be the *Papauer ſpumeum* or *Heracleum* of the Antients. ‡

¶ *The Temperature and Vertues.*

A The faculties of theſe floures are not yet ſufficiently known. Sith there is no vſe of them in phyſicke,we will leaue the reſt that might be ſaid to a further conſideration: notwithſtanding ſome haue thought the common Blew-Bottle to be of temperature ſomething cold, and therefore good againſt the inflammation of the eyes,as ſome thinke.

Chap.

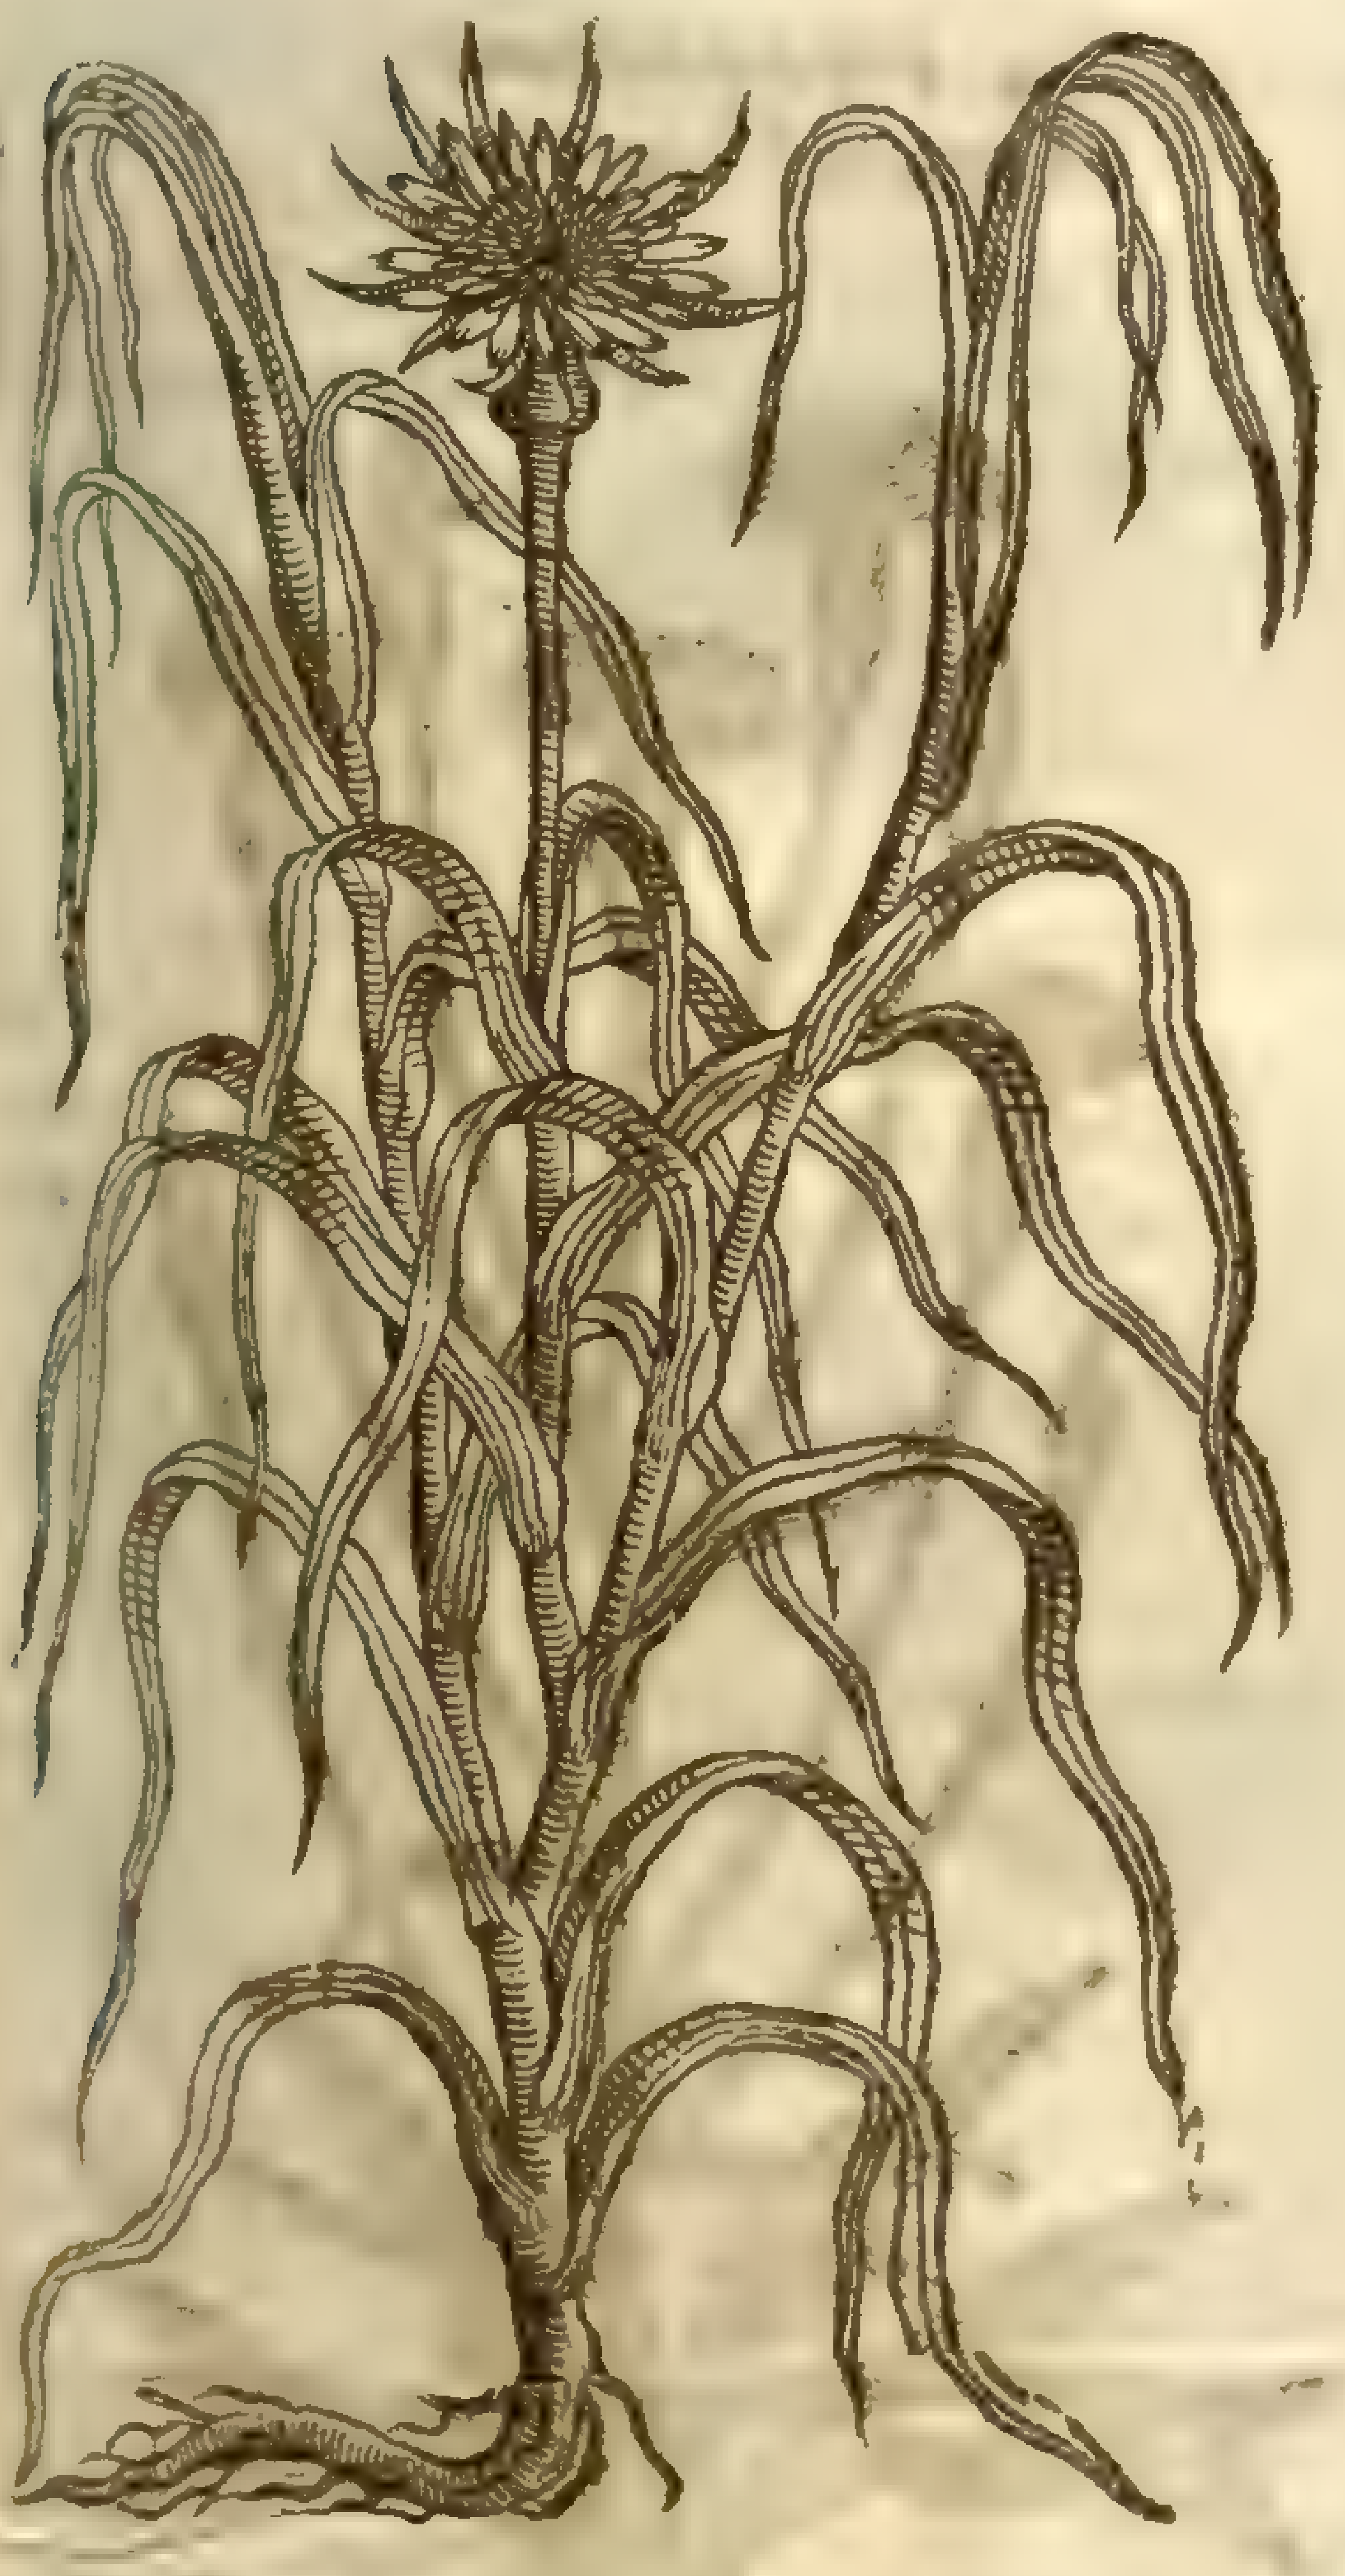
CHAP. 252. Of Goats Beard, or Go to bed at noone.

¶ The Deſcription.

1 Goats-beard, or Go to bed at noone hath hollow ſtalks, ſmooth, and of a whitiſh green colour, whereupon do grow long leaues creſted downe the middle with a ſwelling rib, ſharp pointed, yeelding a milkie juice when it is broken, in ſhape like thoſe of Garlick: from the boſome of which leaues thruſt forth ſmal tender ſtalks, ſet with the like leaues, but leſſer: the floures grow at the top of the ſtalks, conſiſting of a number of purple leaues, daſht ouer as it were with a little yellow duſt, ſet about with nine or ten ſharp pointed green leaues: the whole floure reſembles a Star when it is ſpred abroad; for it ſhutteth it ſelfe at twelue of the clock, and ſheweth not his face open vntill the next daies Sunne doth make it floure anew, whereupon it was called Go to bed at noone: when theſe floures be come to their full maturitie and ripeneſſe, they grow into a downy Blow-ball like thoſe of Dandelion, which is carried away with the winde. The ſeed is long, hauing at the end one peece of that downy matter hanging at it. The root is long and ſingle, with ſome few threds thereto annexed, which periſhes when it hath perfected his ſeed, yeelding much quantitie of a milky juice when it is cut or broken, as doth all the reſt of the plant.

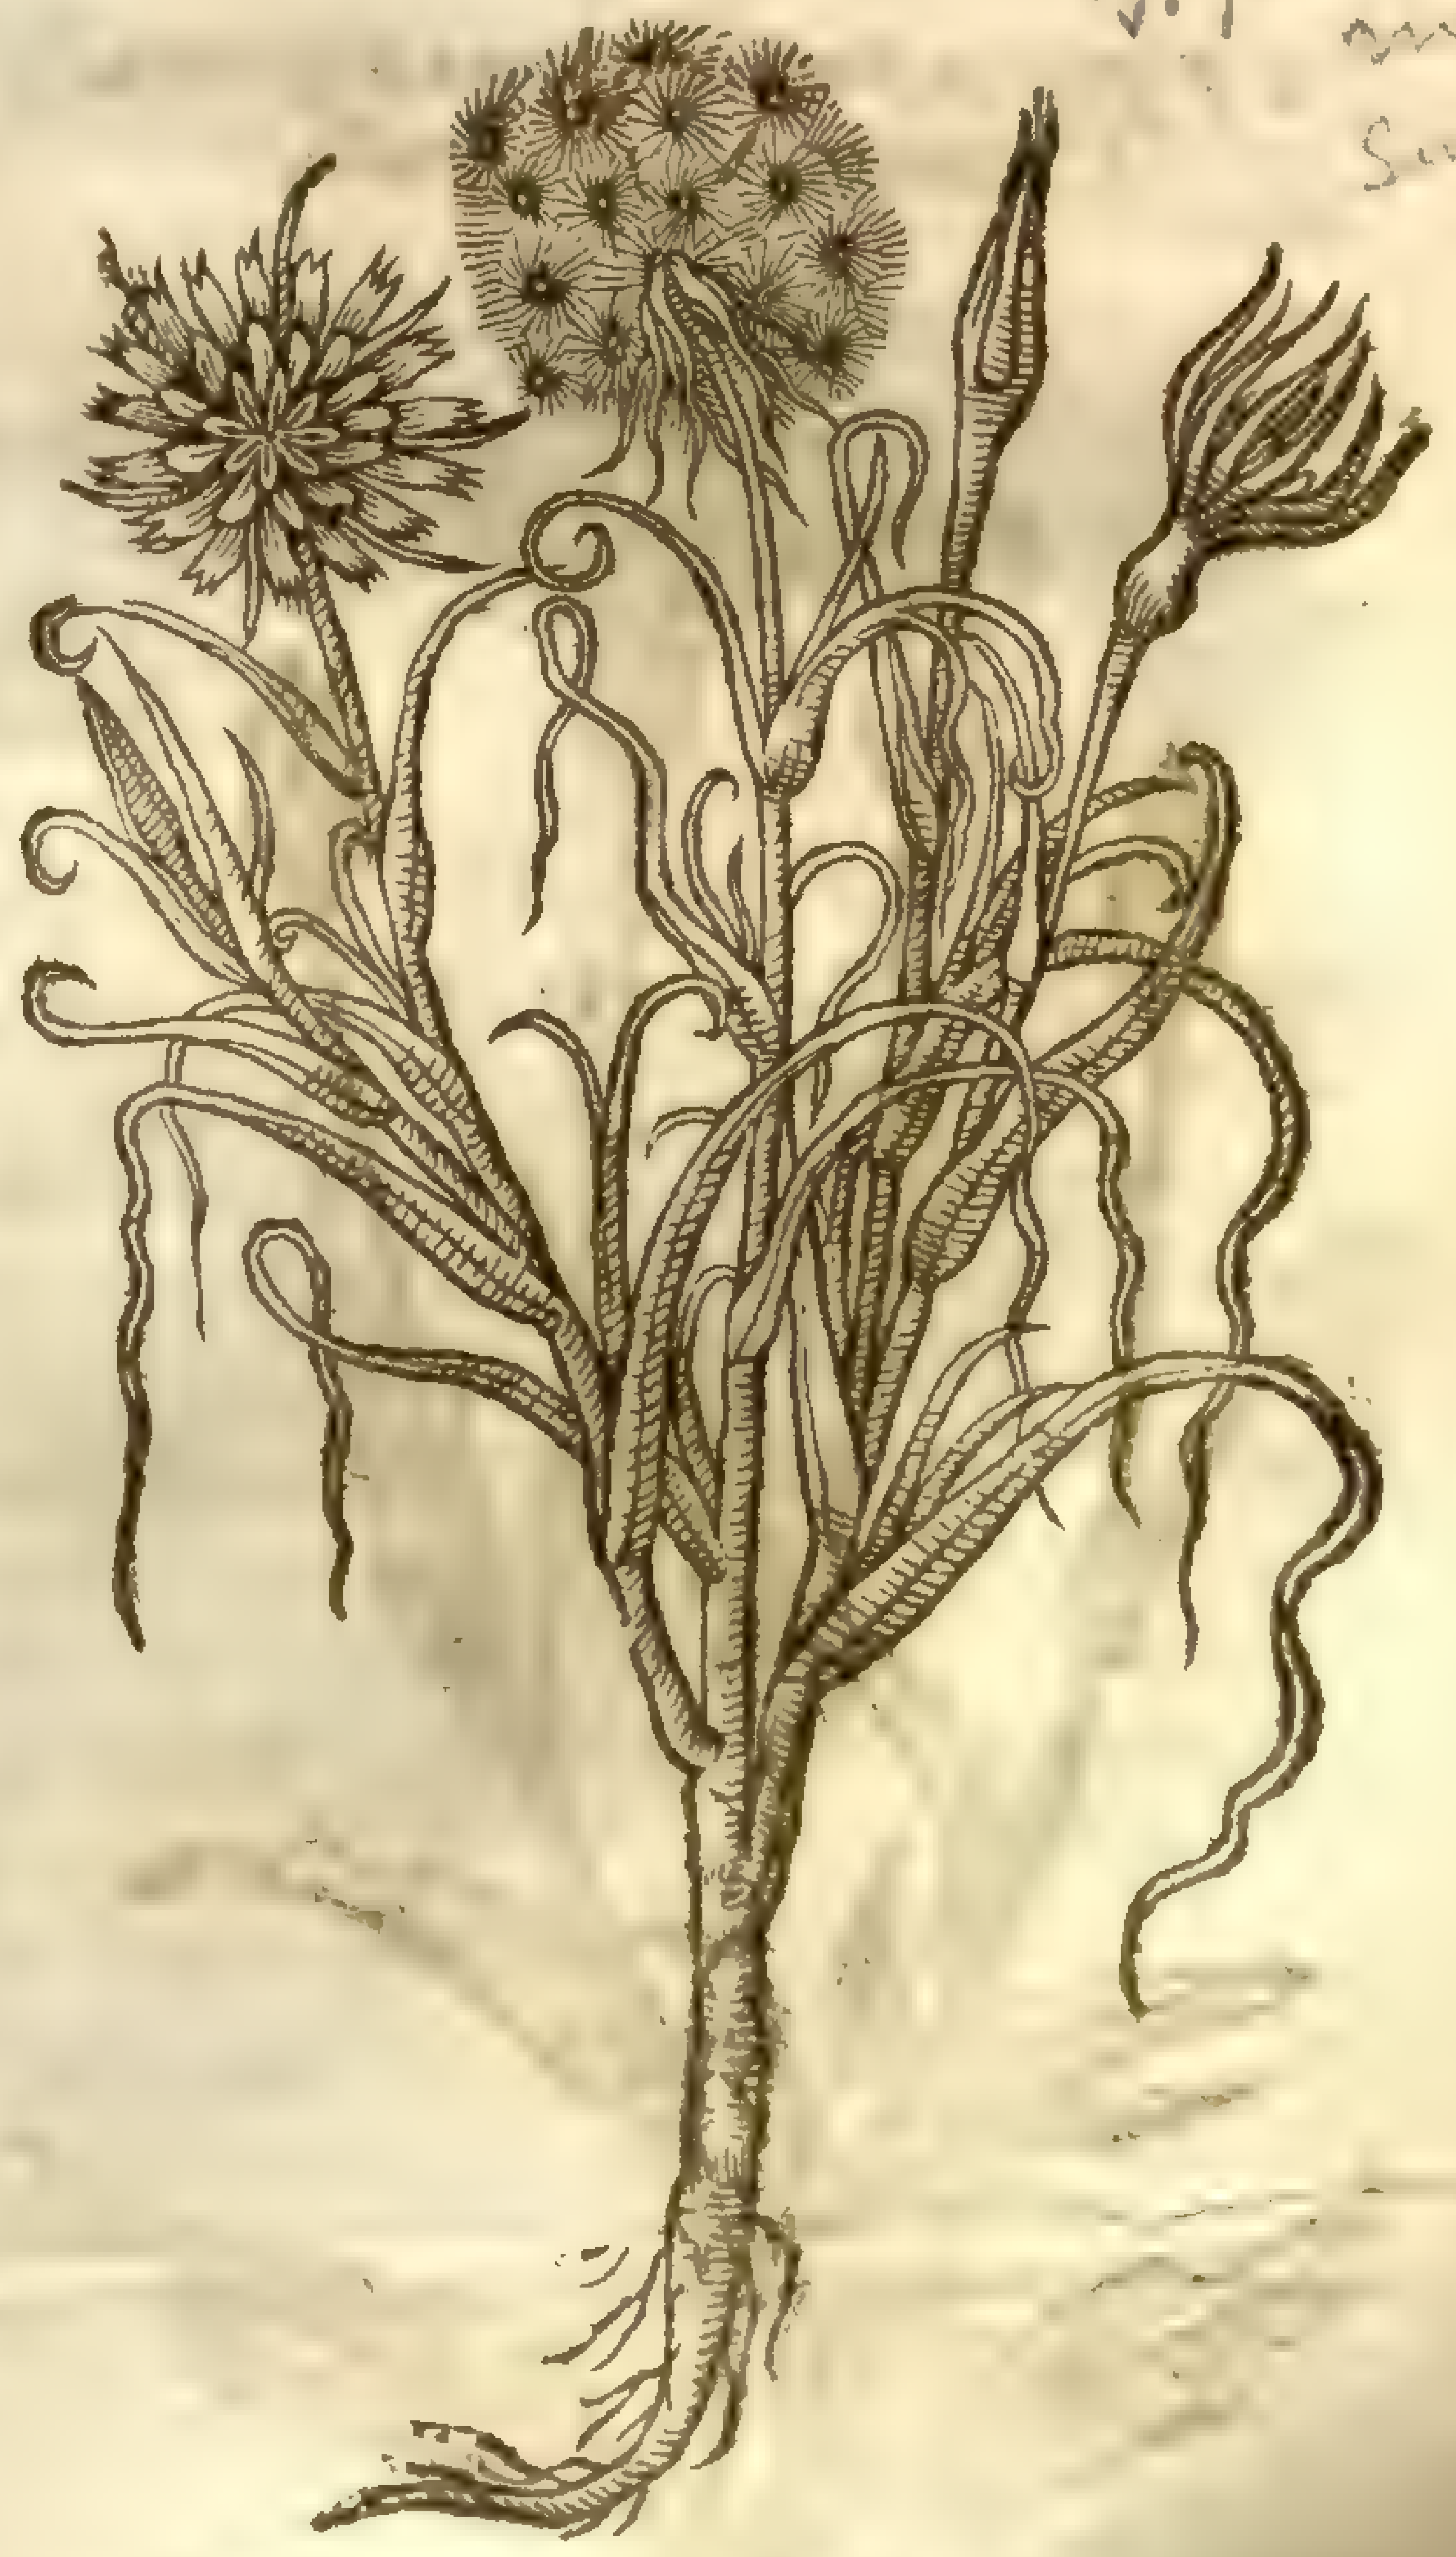
2 The yellow Goats beard hath the like leaues, ſtalks, root, ſeed, and downie blow-balls that the other hath, and alſo yeeldeth the like quantitie of milke, inſomuch that if the pilling while it is greene be pulled from the ſtalks, the milky juice followeth: but when it hath there remained a little while it waxeth yellow. The floures hereof are of a gold yellow colour, and haue not ſuch long green leaues to garniſh it withall, wherein conſiſteth the difference.

1 *Tragopogon purpureum.*
Purple Goats-beard.



2 *Tragopogon luteum.*
Yellow Goats-beard.

T. pratense [illegible] dict. [illegible] 337



3 There is another ſmall ſort of Goats-beard or Go to bed at noone, which hath a thicke root full of a milky ſap, from which riſe vp many leaues ſpred vpon the ground, very long, narrow, thin, and like vnto thoſe of graſſe, but thicker and groſſer: among which riſe vp tender ſtalkes, on the tops whereof do ſtand faire double yellow floures like the precedent, but leſſer. The whole plant

yeeldeth a milkie ſap or juice as the others do: it periſhes like as the other when it hath perfected his ſeed. This may be called *Tragopogon minus anguſtifolium*, Little narrow leaued Goats-beard.

¶ *The Place.*

The firſt growes not wild in England that I could euer ſee or heare of, except in Lancaſhire on the banks of the riuer Chalder, neere to my Lady *Heskiths* houſe, two miles from Whawley: it is ſown in gardens for the beauty of the floures almoſt euery where. The others grow in medows and fertil paſtures in moſt places of England. It growes plentifully in moſt of the fields about London, as at Iſlington, in the medows by Redriffe, Deptford, and Putney, and in diuers other places.

¶ *The Time.*

They floure and flouriſh from the beginning of Iune to the end of Auguſt.

¶ *The Names.*

Goats-beard is called in Greeke, τραγοπώγων: in Latine, *Barba hirci*, and alſo *Coma*: in high-Dutch, **Bocxbaert**: in low-Dutch, **Joſephes bloemen**: in French, *Barbe de bouc*, and *Saſsify*: in Italian, *Saſſefrica*: in Spaniſh, *Barba Cabruna*: in Engliſh, Goats beard, Ioſephs floure, Star of Ieruſalem, Noon-tide, and Go to bed at noone.

¶ *The Temperature.*

Theſe herbes are temperate between heate and moiſture.

¶ *The Vertues.*

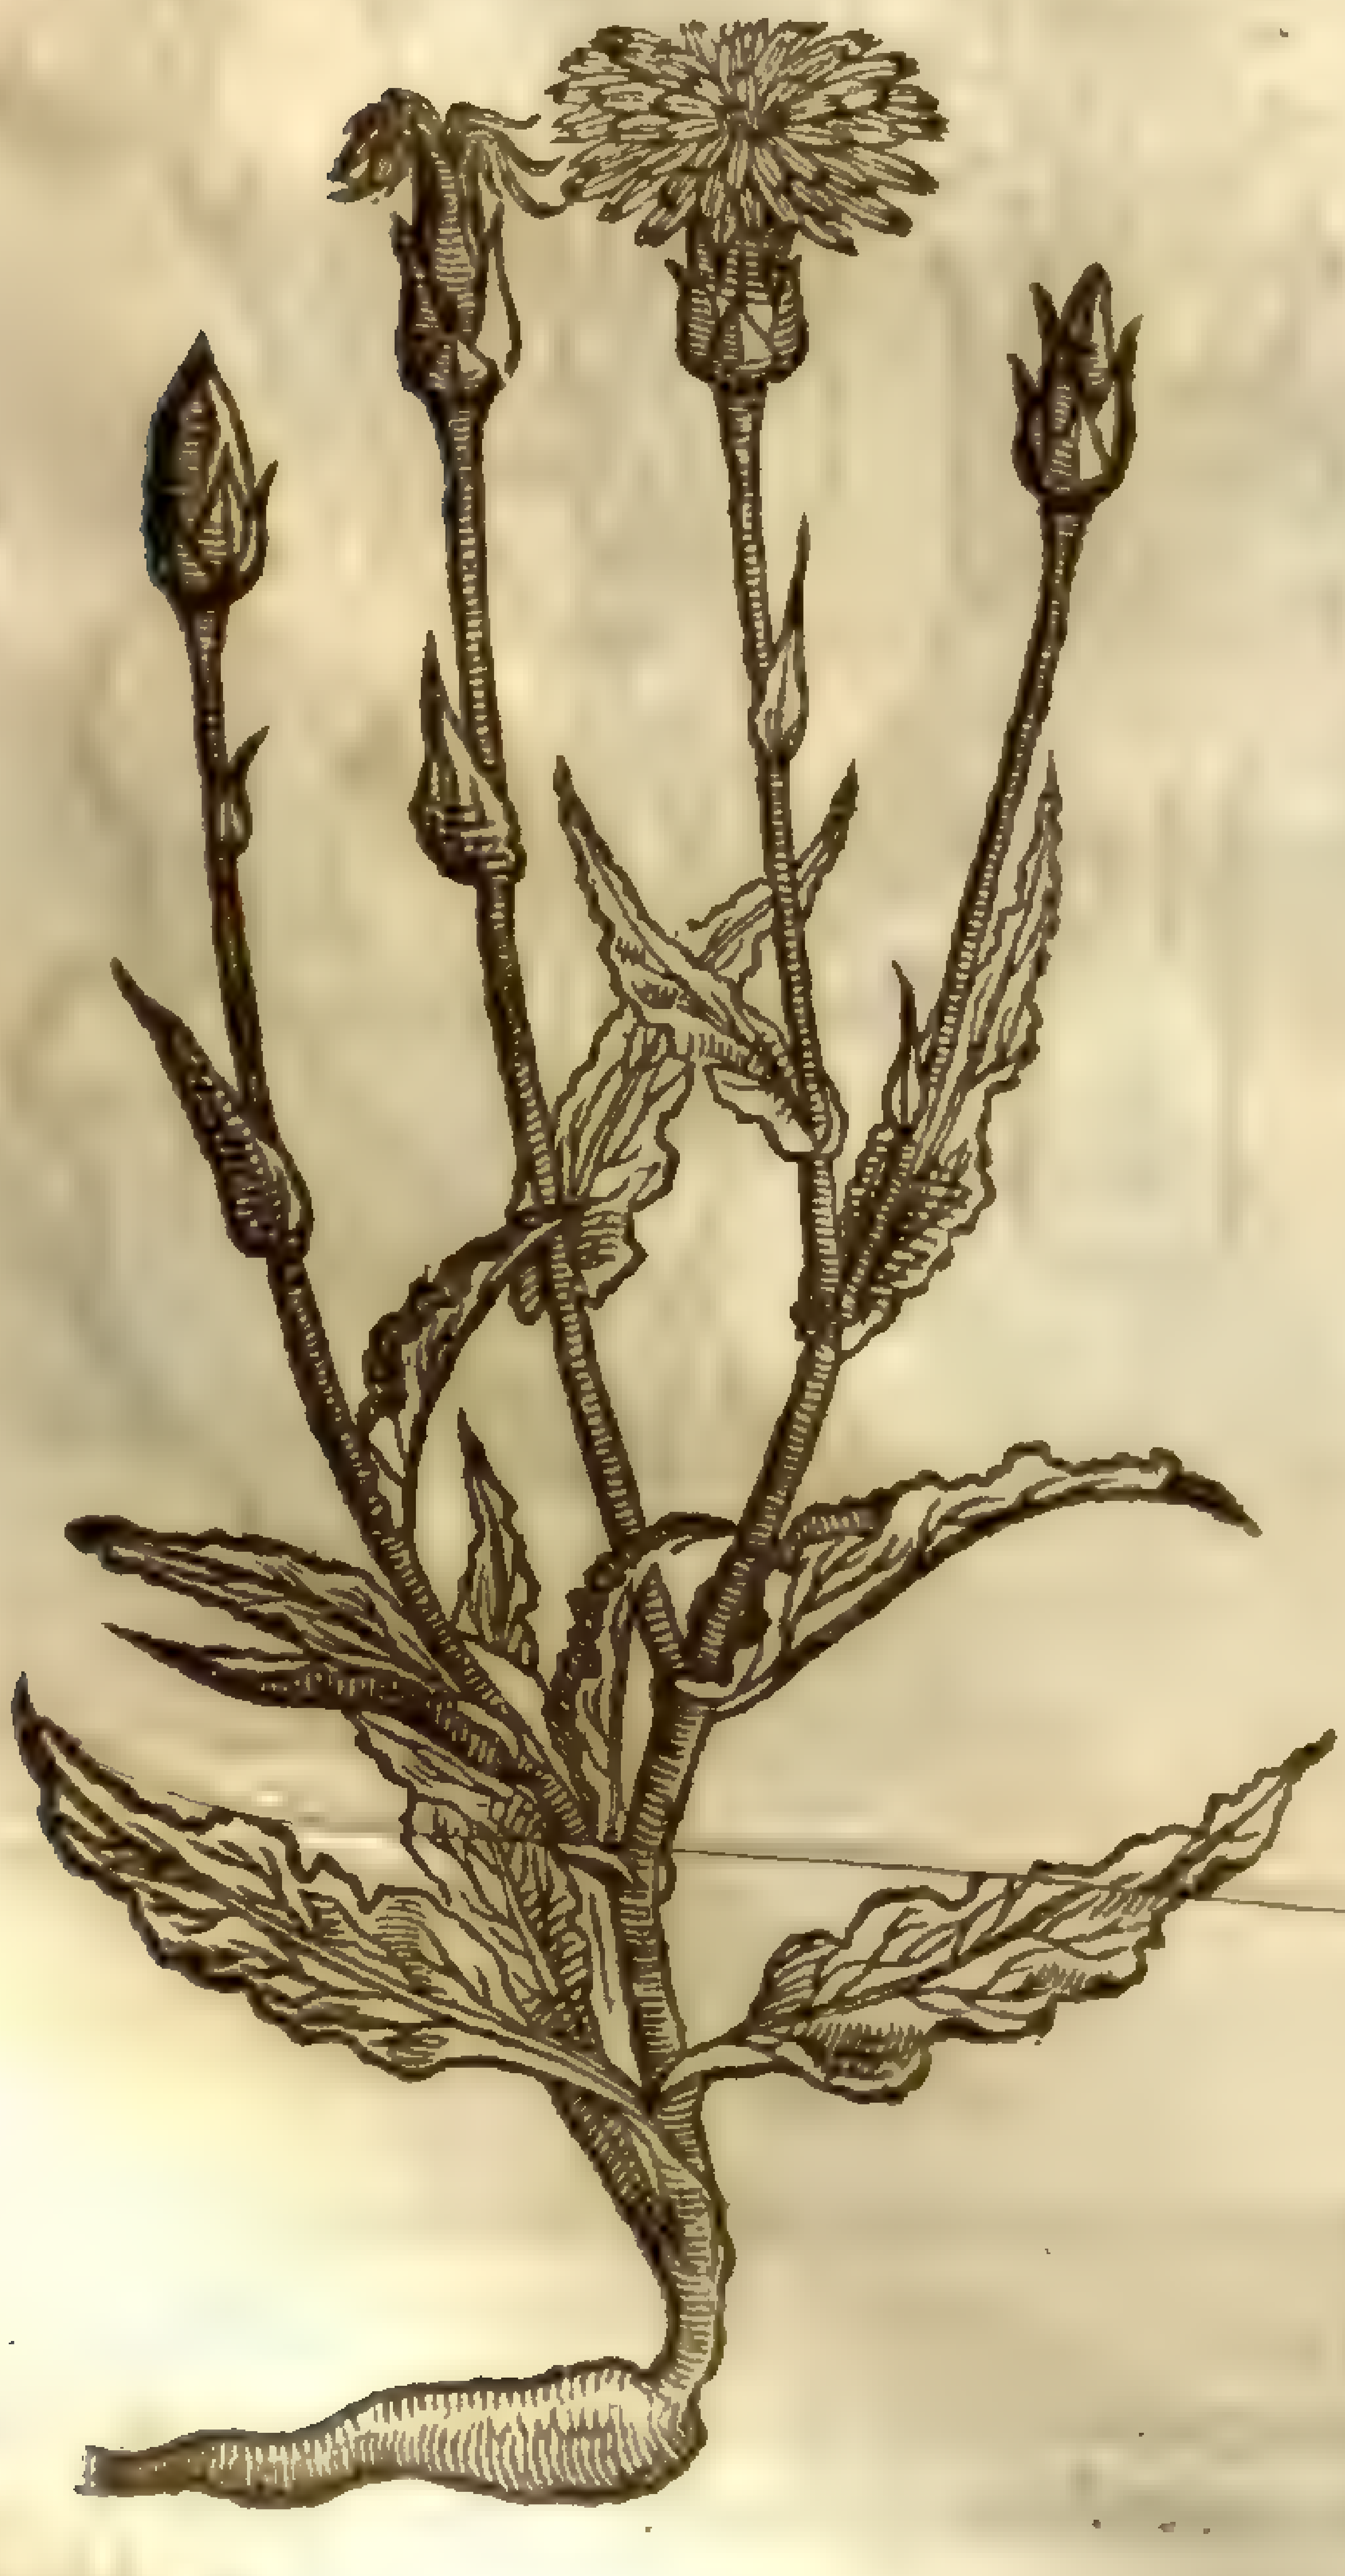
A The roots of Goats-beard boiled in wine and drunk, aſſwageth the pain and pricking ſtitches of the ſides.

B The ſame boiled in water vntill they be tender, and buttered as parſneps and carrots, are a moſt pleaſant and wholeſome meate, in delicate taſte far ſurpaſſing either Parſenep or Carrot: which meat procures appetite, warmeth the ſtomacke, preuaileth greatly in conſumptions, and ſtrengthneth thoſe that haue been ſicke of a long lingring diſeaſe.

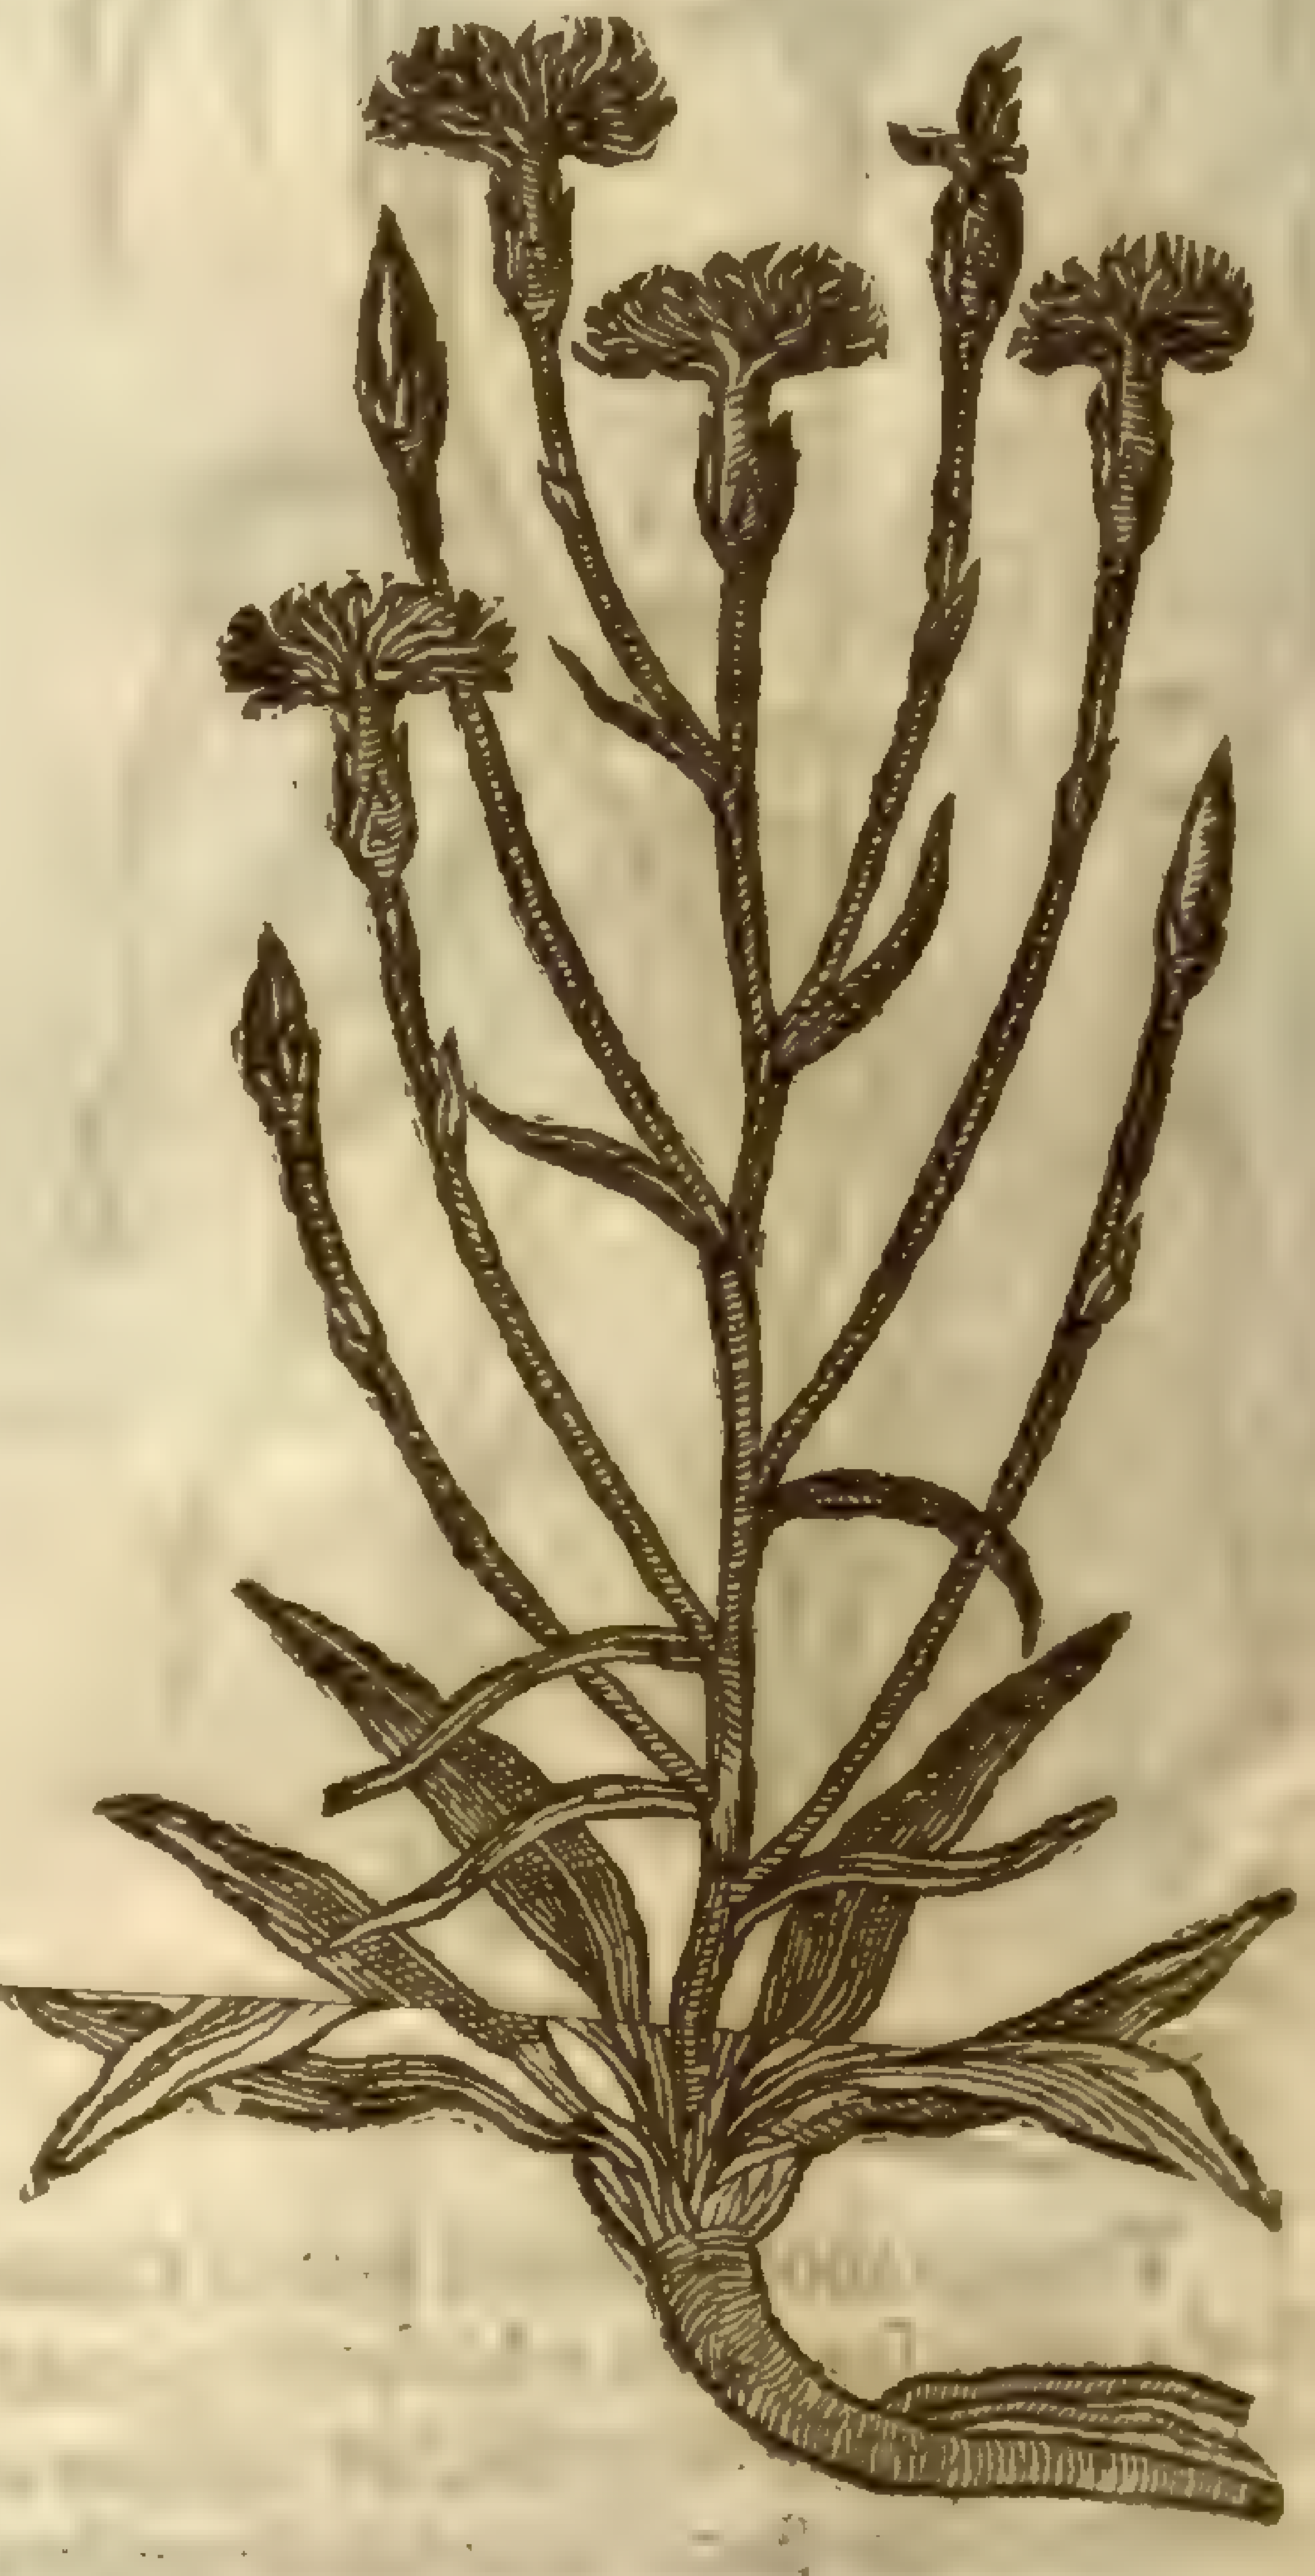
Chap. 253. *Of Vipers-graſſe.*

1 *Viperaria, ſiue Scorzonera Hiſpanica.*
Common Vipers graſſe.

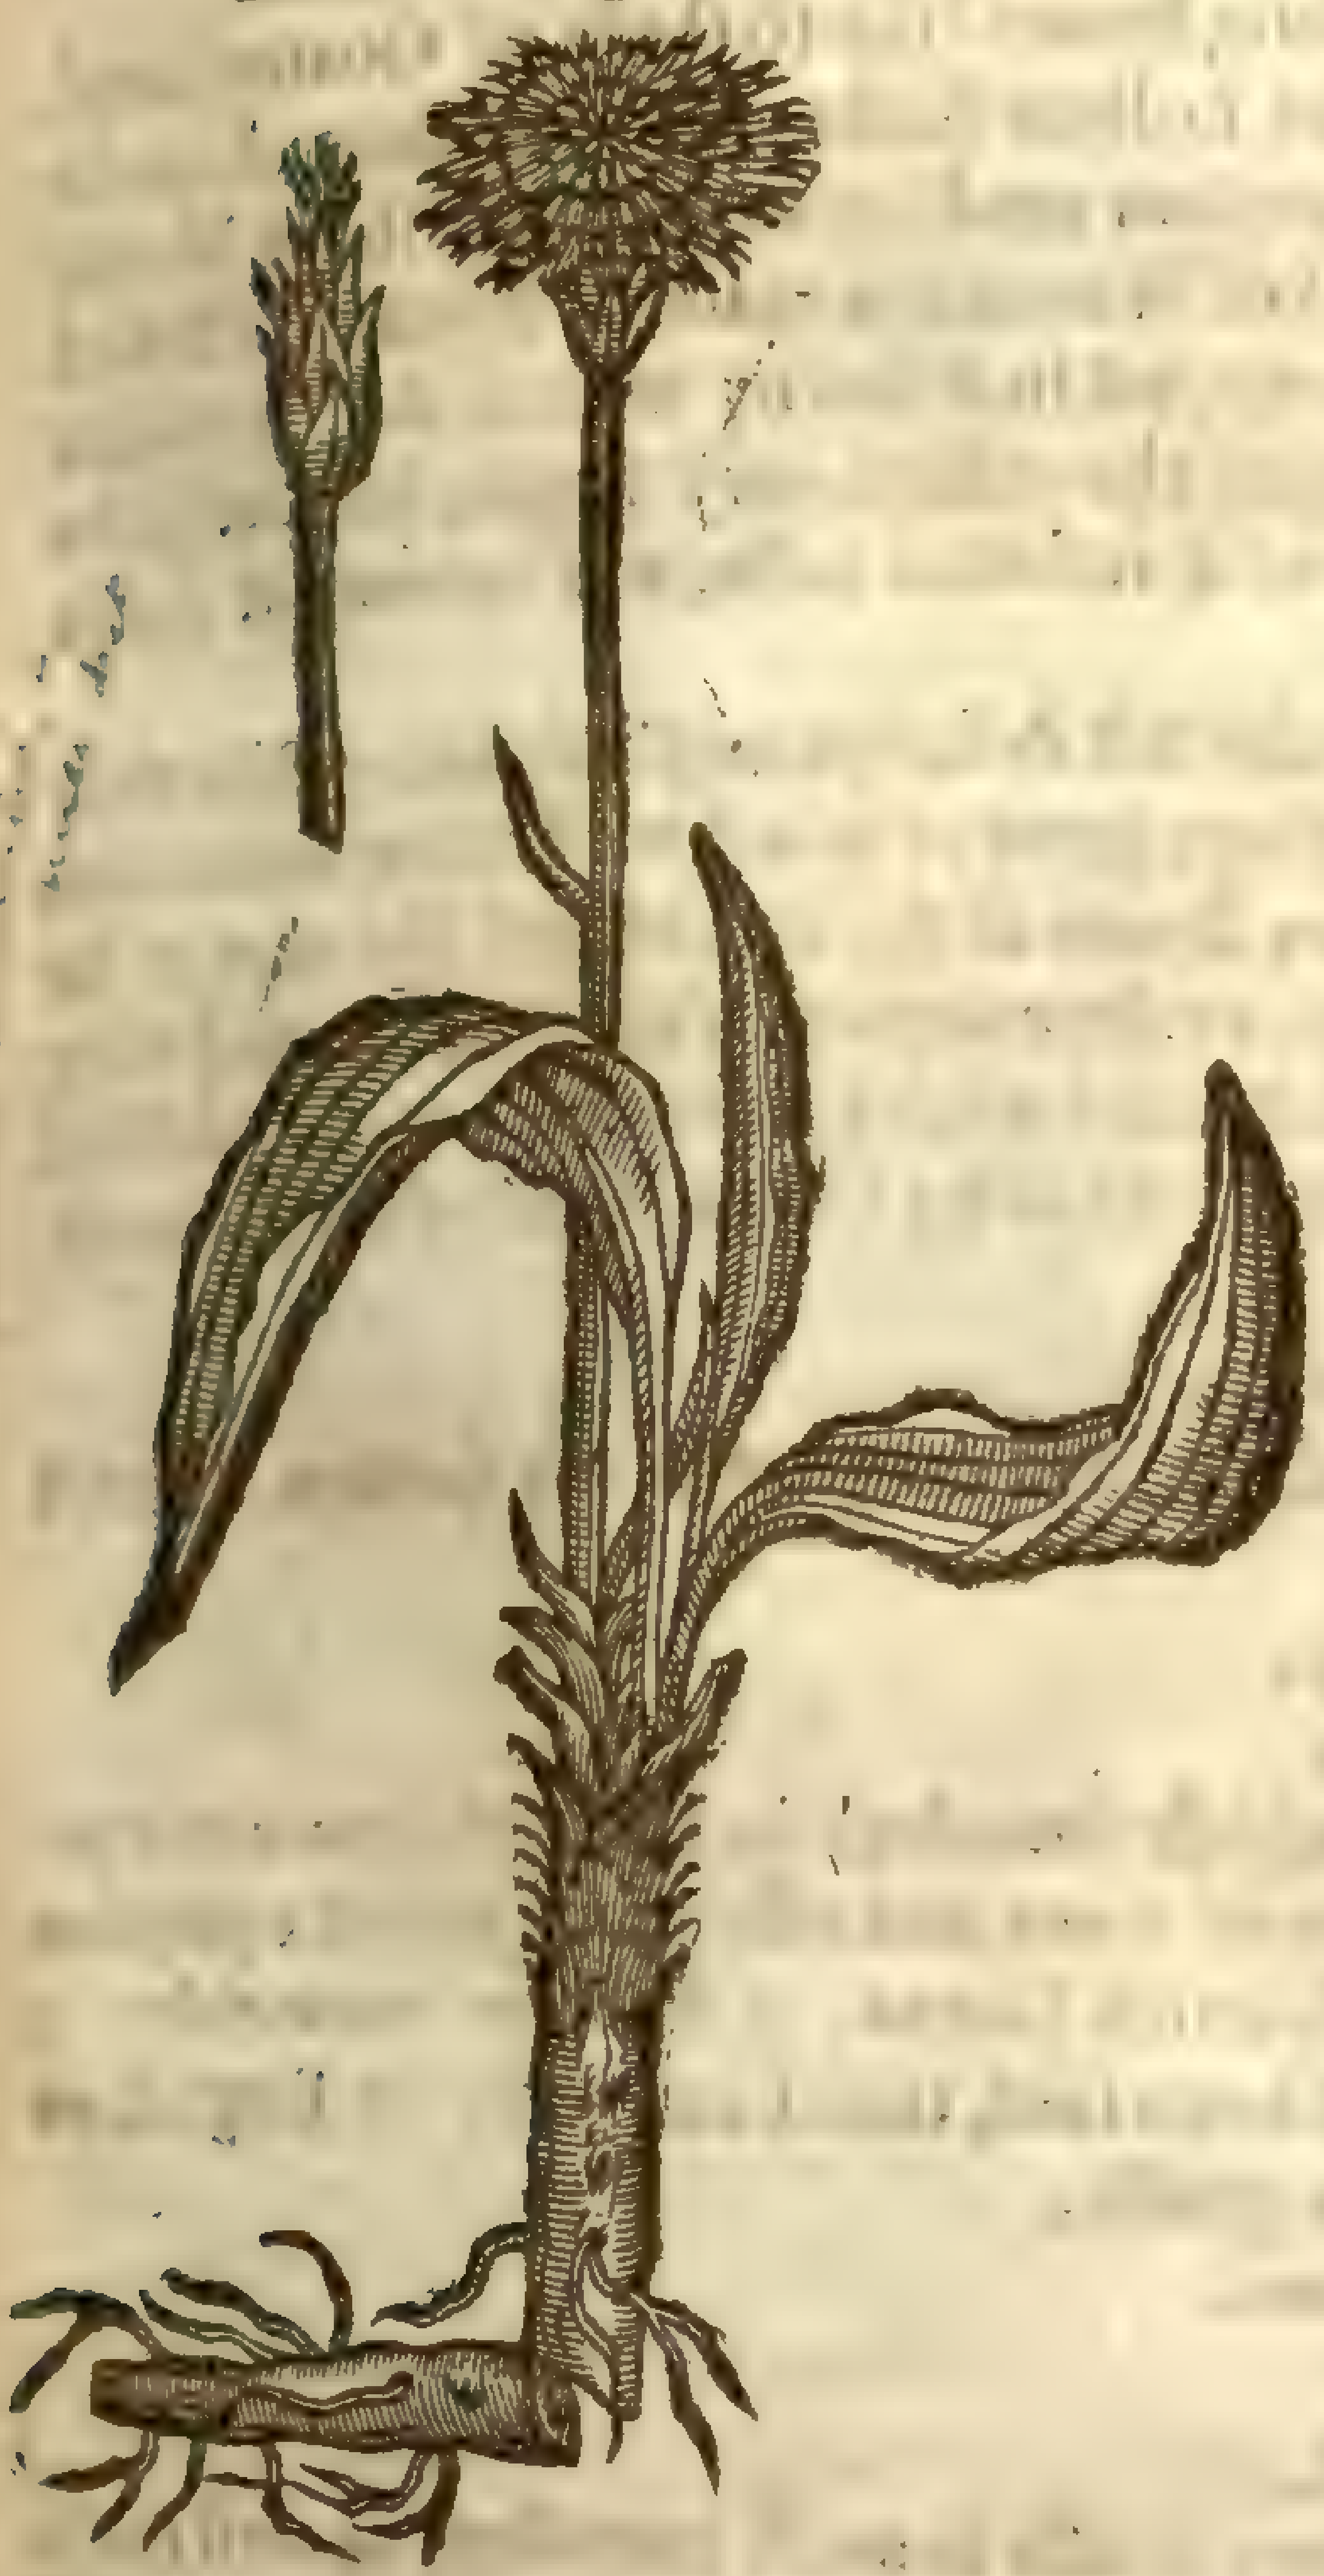
Scorzonera hispanica, L.
[illegible]



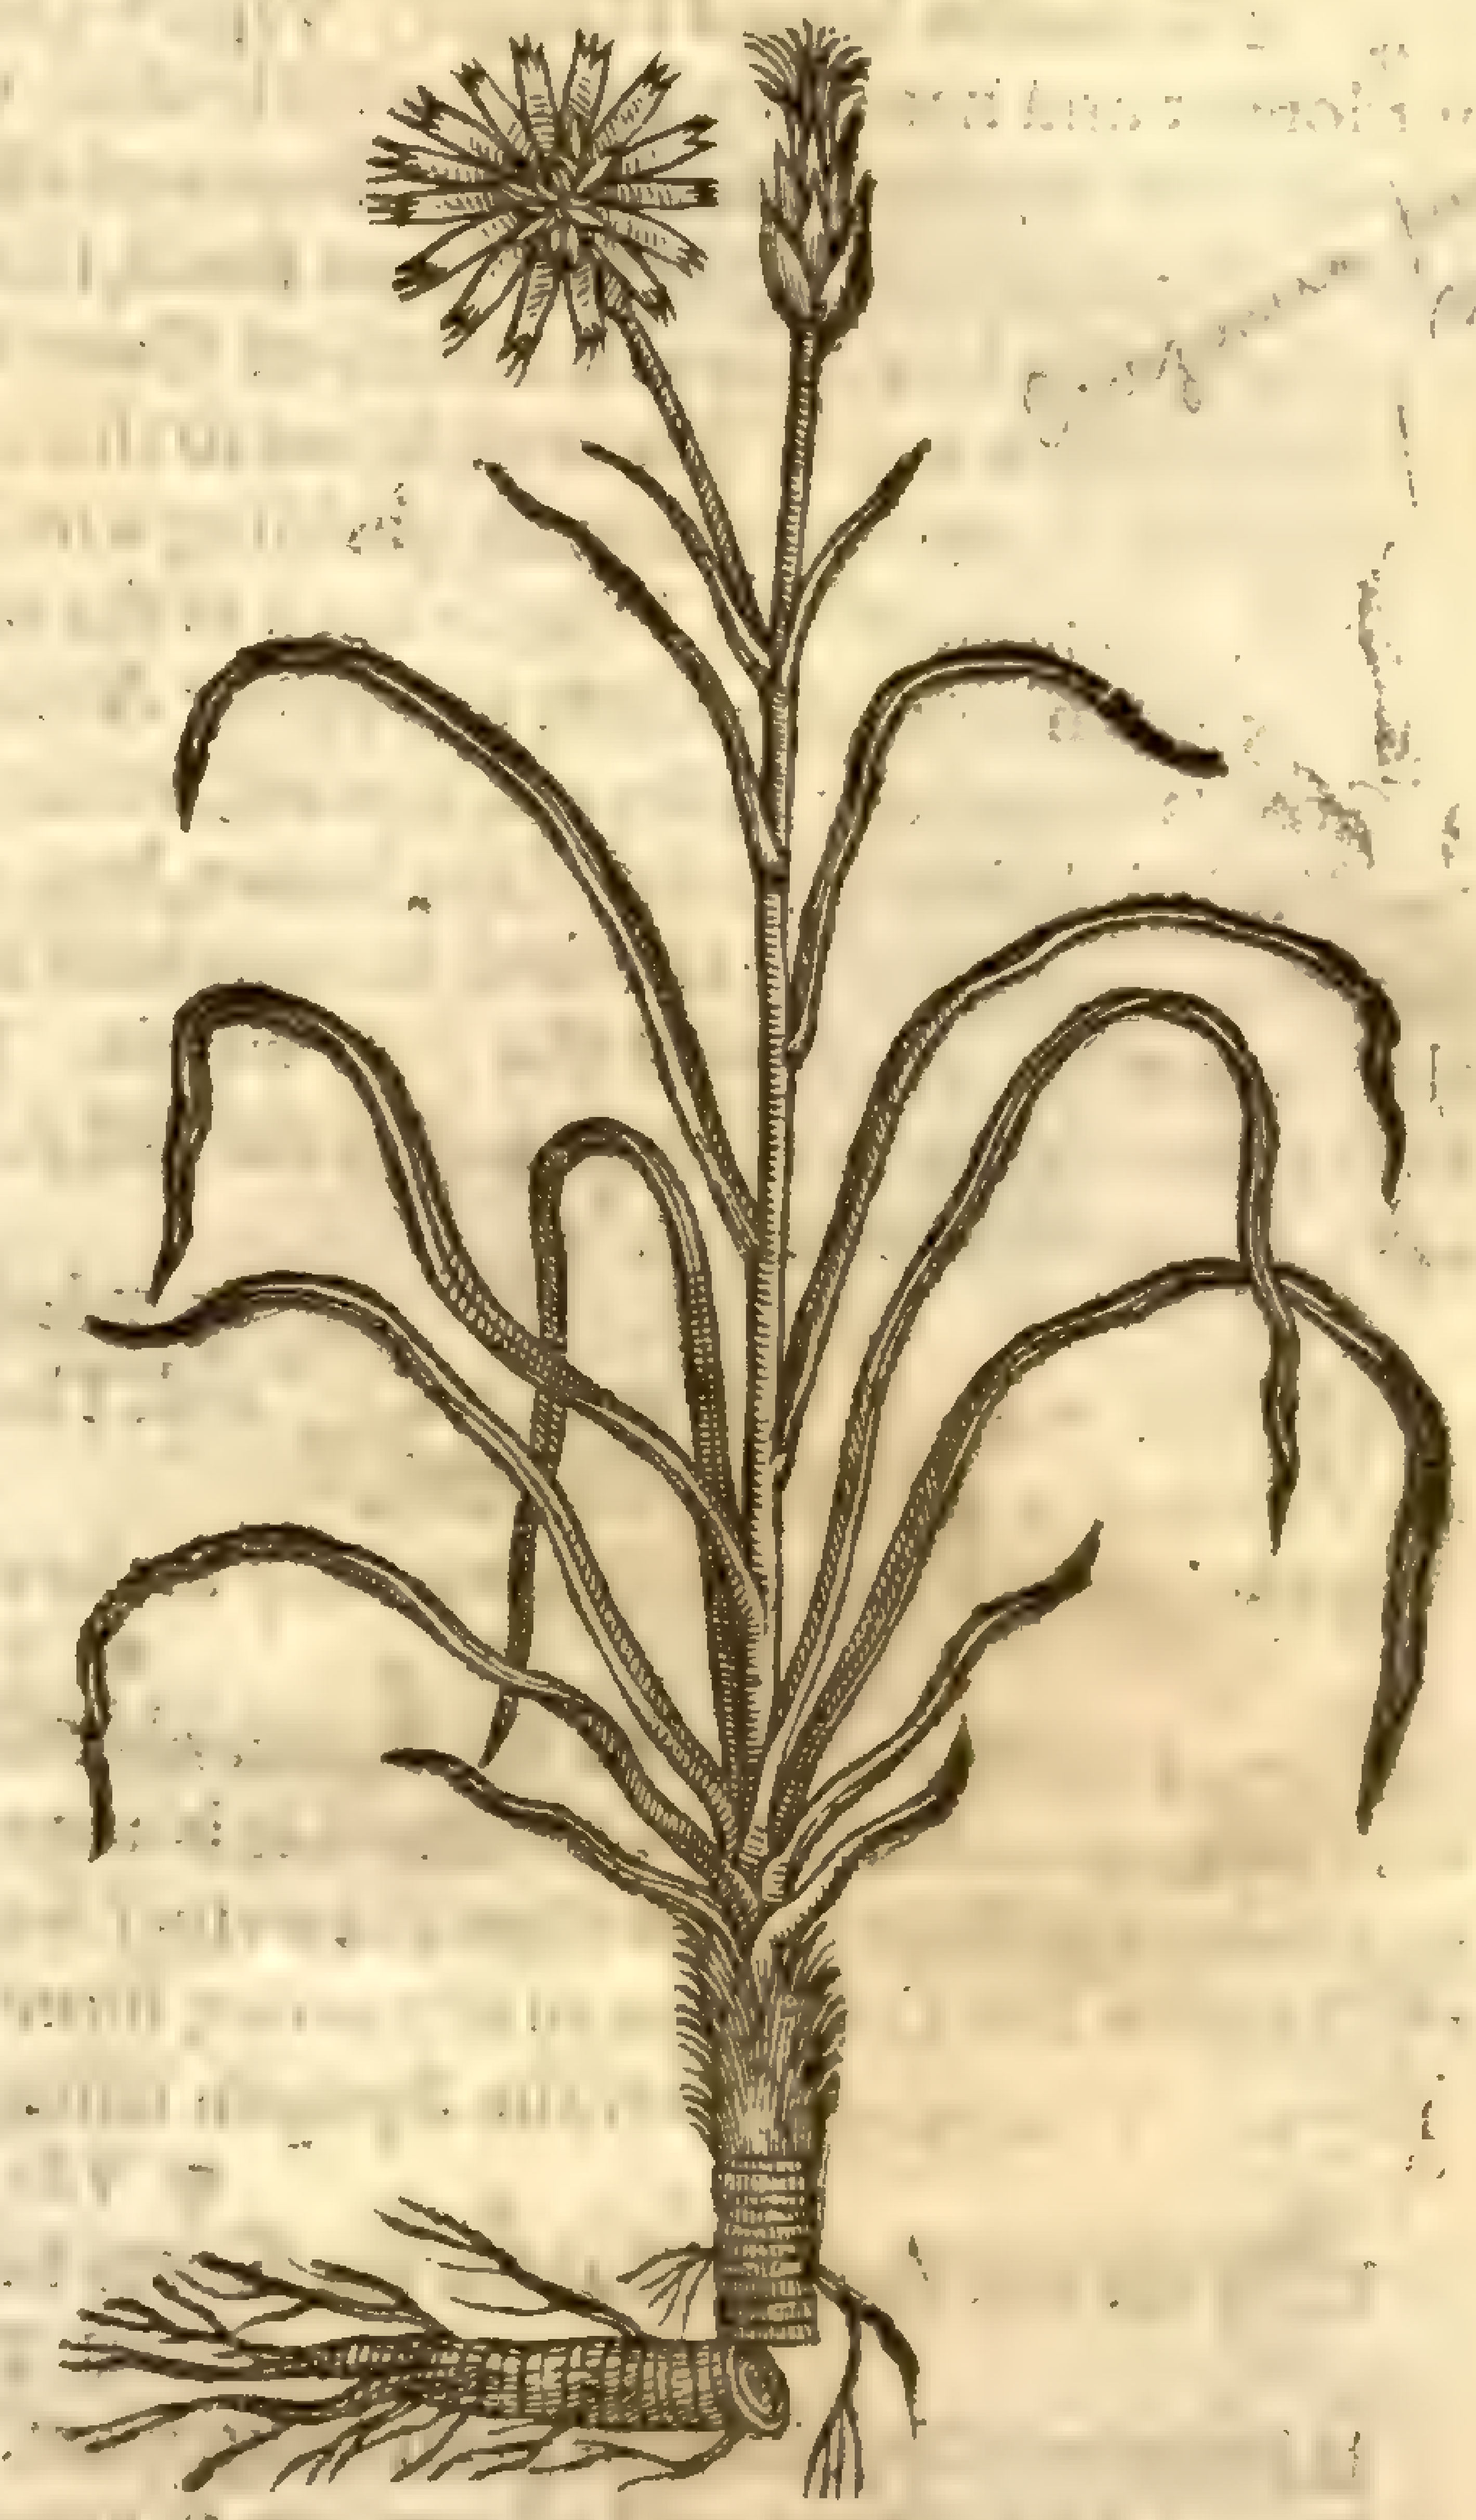
2 *Viperaria humilis.*
Dwarfe Vipers graſſe.



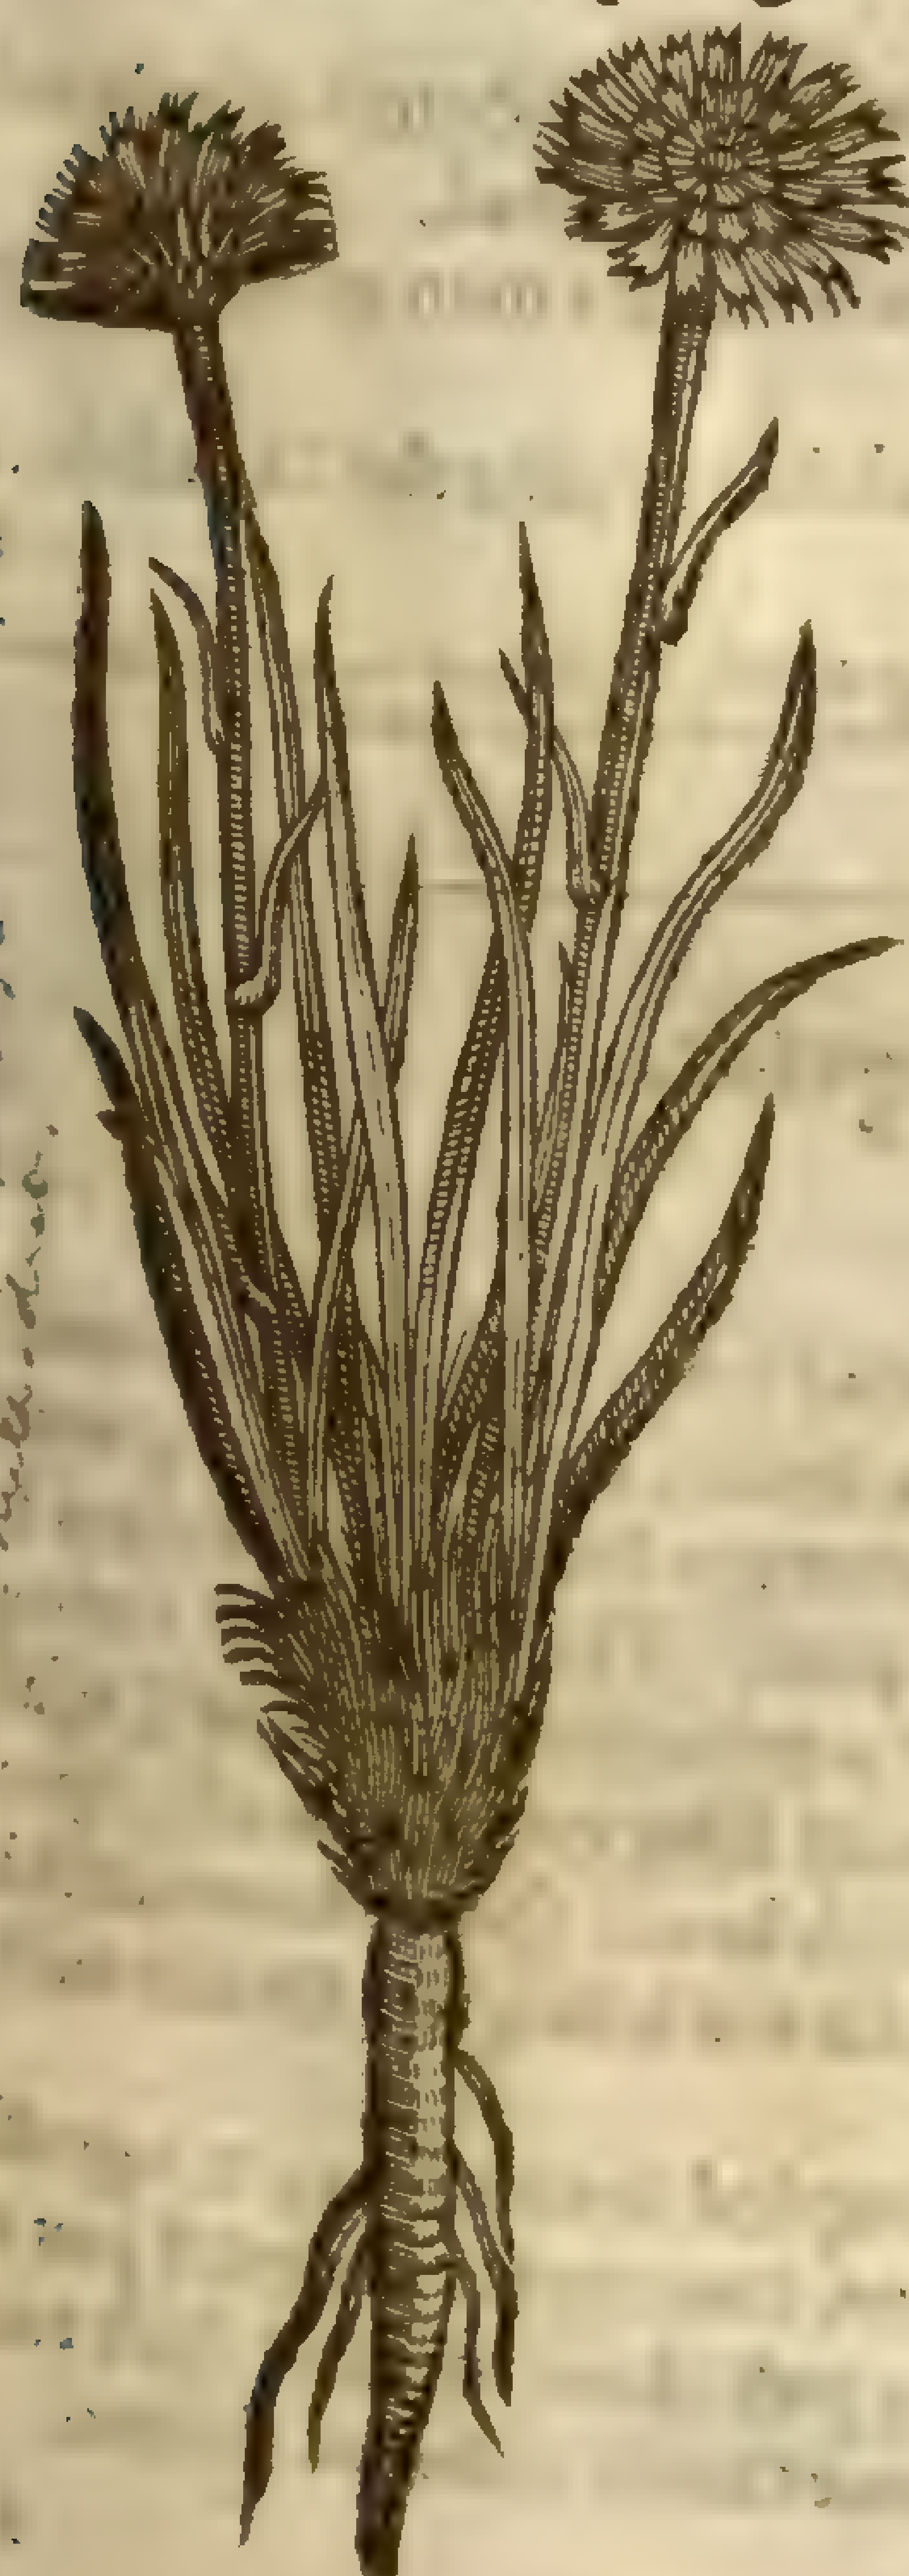
† 3 *Viperaria Pannonica.*
Auſtrian Vipers graſſe.



‡ 4 *Viperaria anguſtifolia elatior.*
Hungary Vipers graſſe.



5 *Viperaria Pannonica anguſtifolia.*
Narrow leaued Vipers graſſe.



[illegible] angustifolia, [illegible]

¶ *The Deſcription.*

1 THe firſt of the Viper graſſes hath long broad leaues, fat, or ful bodied, vneuen about the edges, ſharpe pointed, with a high ſwolne ribbe downe the middle, and of an ouerworne colour, tending to the colour of Woade: among which riſeth vp a ſtiffe ſtalke, ſmooth and plaine, of two cubits high, whereon do grow ſuch leaues as thoſe next the ground. The flours ſtand on the top of the ſtalkes, conſiſting of many ſmall yellow leaues thicke thruſt together, very double, as are thoſe of Goats-beard, whereof it is a kinde, as are all the reſt that doe follow in this preſent chapter: the root is long, thicke, very brittle, continuing many yeeres, yeelding great increaſe of roots, blacke without, white within, and yeelding a milkie juyce, as doe the leaues alſo, like vnto the Goates-beard.

2 The dwarfe Vipers graſſe differeth not from the precedent, ſauing that it is altogether leſſer, wherein eſpecially conſiſteth the difference.

† 3 The broad leaued Auſtrian Vipers-graſſe hath broad leaues ſharpe pointed, vneuen about the edges, of a blewiſh greene colour: the ſtalke riſeth vp to the height of a foot or better; on the top whereof doe ſtand faire yellow floures, very double, greater and broader than any of the reſt

of a reaſonable good ſmell. The ſeed followeth, long and ſharpe, like vnto thoſe of Goates-beard. The root is thicke, long, and full of milkie juyce, as are the leaues alſo.

4 The narrow leaued Hungary Vipers-graſſe hath long leaues like to thoſe of Goates-beard, but longer and narrower, among which riſeth vp a ſlender hollow ſtalke, ſtiffe and ſmooth, on the top whereof do ſtand faire double floures of a faire blew colour tending to purple, in ſhape like the other of his kinde, of a pleaſant ſweet ſmell, like the ſmell of ſweet balls made of *Benzoin*. The ſeed is conteined in ſmall cups like thoſe of Goates-beard, wrapped in a downy matter, that is carried away with the winde. The root is not ſo thicke nor long as the others, very ſingle, bearded at the top, with certaine hairy thrums yeelding a milky juyce of a reſinous taſte, and ſomewhat ſharpe withall. It endureth the Winter euen as the others do.

‡ 5 This (whoſe figure was by our Author put to the laſt deſcription) hath leaues like thoſe of Goates-beard, but ſtiffer and ſhorter, amongſt which there growes vp a ſhort hollow ſtalke ſome handfull high, ſet with a few ſhort leaues, bearing a yellow floure at the top, almoſt like that of the laſt ſaue one, but leſſe: the ſeed is conteined in ſuch cups as the common Vipers-graſſe, and being ripe is carried away with the leaſt winde. The root is blacke with a wrinkled barke, and full of milke, hauing the head hairy, as alſo the laſt deſcribed hath. This by *Cluſius* is called *Scorſonera humilis anguſtifolia Pannonica*. ‡

¶ *The Place and Time.*

Moſt of theſe are ſtrangers in England. The two firſt deſcribed do grow in my Garden. The reſt are touched in their ſeuerall titles.

They floure and flouriſh from May to the end of Iuly.

¶ *The Names.*

Vipers graſſe is called of the Spaniards, *Scorzonera*, which ſoundeth in Latine *Viperaria*, or *Viperina*, or *Serpentaria*, ſo called becauſe it is accounted to be of force and efficacy againſt the poyſons of Vipers and ſerpents, for *Vipera* or a viper is called in Spaniſh *Scurzo*: it hath no name either in the high or low Dutch, nor in any other, more than hath been ſaid, that I can reade: in Engliſh we may call it Scorzoner, after the Spaniſh name, or Vipers graſſe.

¶ *The Temperature.*

They are hot and moiſt as are the Goats-beards.

¶ *The Vertues.*

A It is reported by thoſe of great judgement, that Vipers-graſſe is moſt excellent againſt the infections of the plague, and all poyſons of venomous beaſts, and eſpecially to cure the bitings of vipers, (of which there be very many in Spaine and other hot countries, yet haue I heard that they haue beene ſeene in England) if the juyce or herbe be drunke.

B It helpeth the infirmities of the heart, and ſuch as vſe to ſwoune much: it cureth alſo them that haue the falling ſickeneſſe, and ſuch as are troubled with giddineſſe in the head.

C The root being eaten, either roſted in embers, ſodden, or raw, doth make a man merry, and remoueth all ſorrow.

D The root condited with ſugar, as are the roots of *Eringes* and ſuch like, worke the like effects: but more familiarly, being thus dreſſed.

‡ Formerly there were ſix figures in this chapter, whereof the firſt and fourth were both of one plant, and the fifth which was of the *Scorſonera Bœtica* of *Matthiolus* did not much differ from them, if it differ at all. In the title and hiſtory of the third there ſhould haue been put *Pannonica*, as now it is.

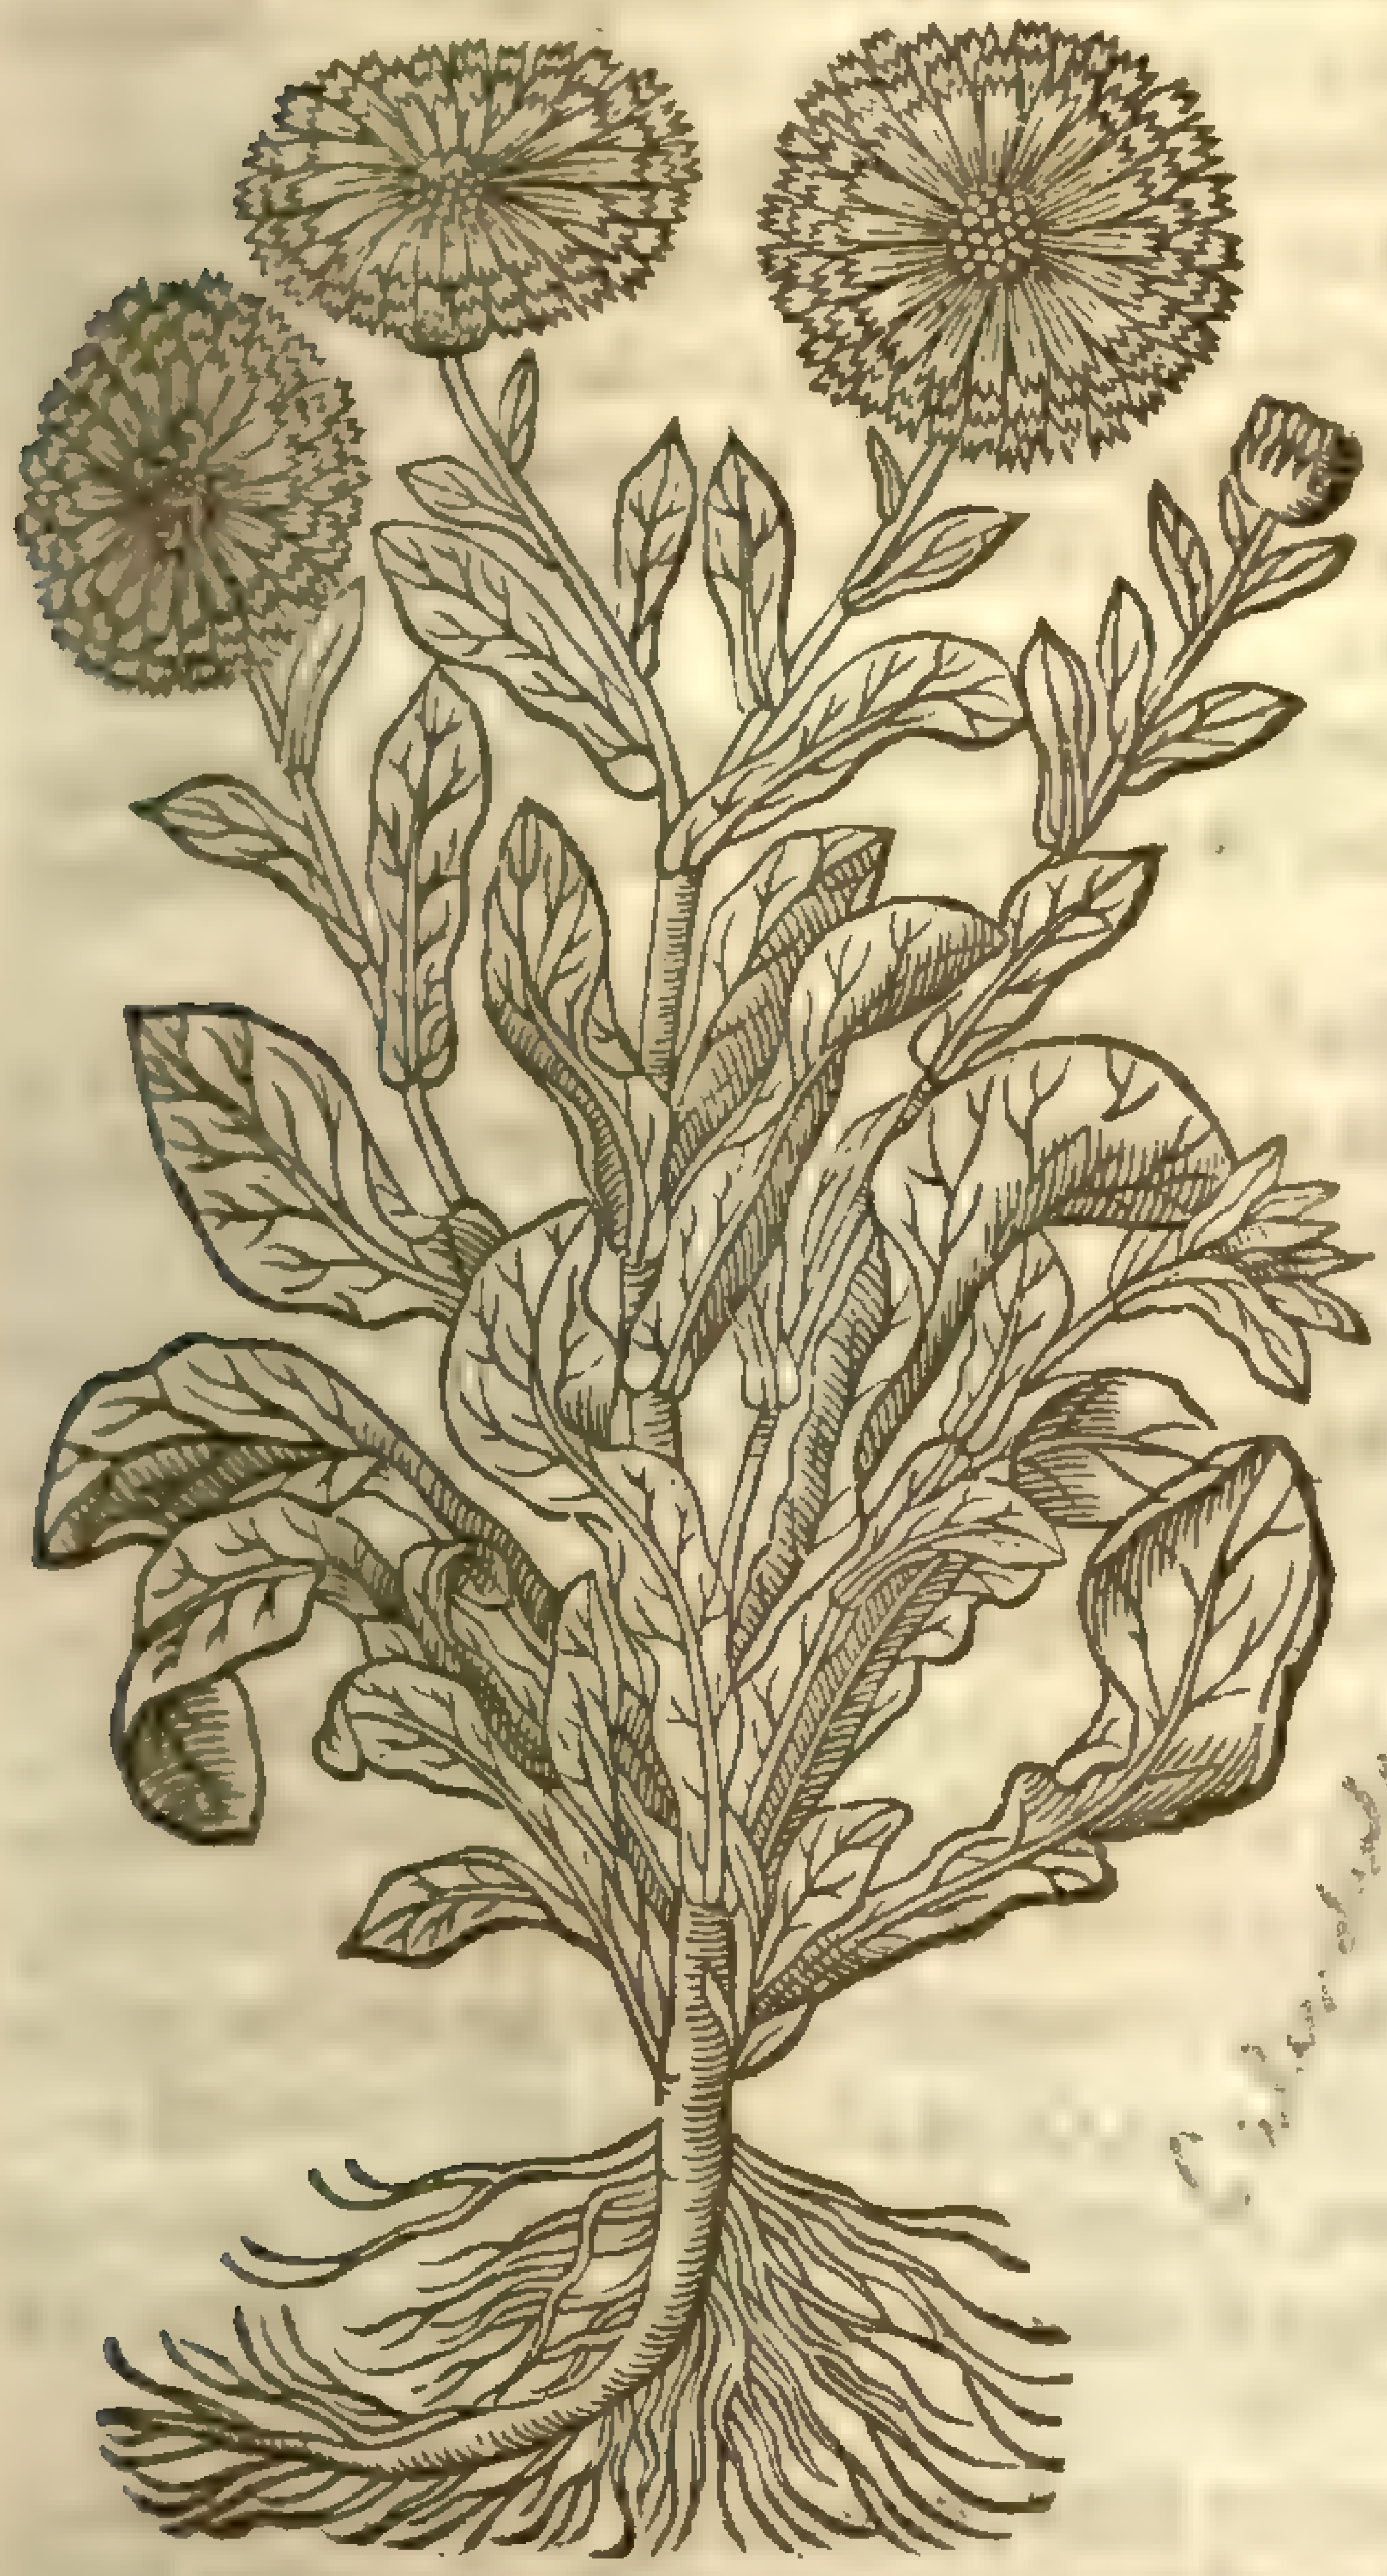
Chap. 254. *Of Marigolds.*

¶ *The Deſcription.*

1 The greateſt double Marigold hath many large, fat, broad leaues, ſpringing immediatly from a fibrous or threddy root; the vpper ſides of the leaues are of a deepe greene, and the lower ſide of a more light and ſhining greene: among which riſe vp ſtalkes ſomewhat hairie, and alſo ſomewhat joynted, and full of a ſpungeous pith. The floures in the top are beautifull, round, very large and double, ſomething ſweet, with a certaine ſtrong ſmell, of a light ſaffron colour, or like pure gold: from the which follow a number of long crooked ſeeds, eſpecially the outmoſt, or thoſe that ſtand about the edges of the floure; which being ſowne commonly bring forth ſingle floures, whereas contrariwiſe thoſe ſeeds in the middle are leſſer, and for the moſt part bring forth ſuch floures as that was from whence it was taken.

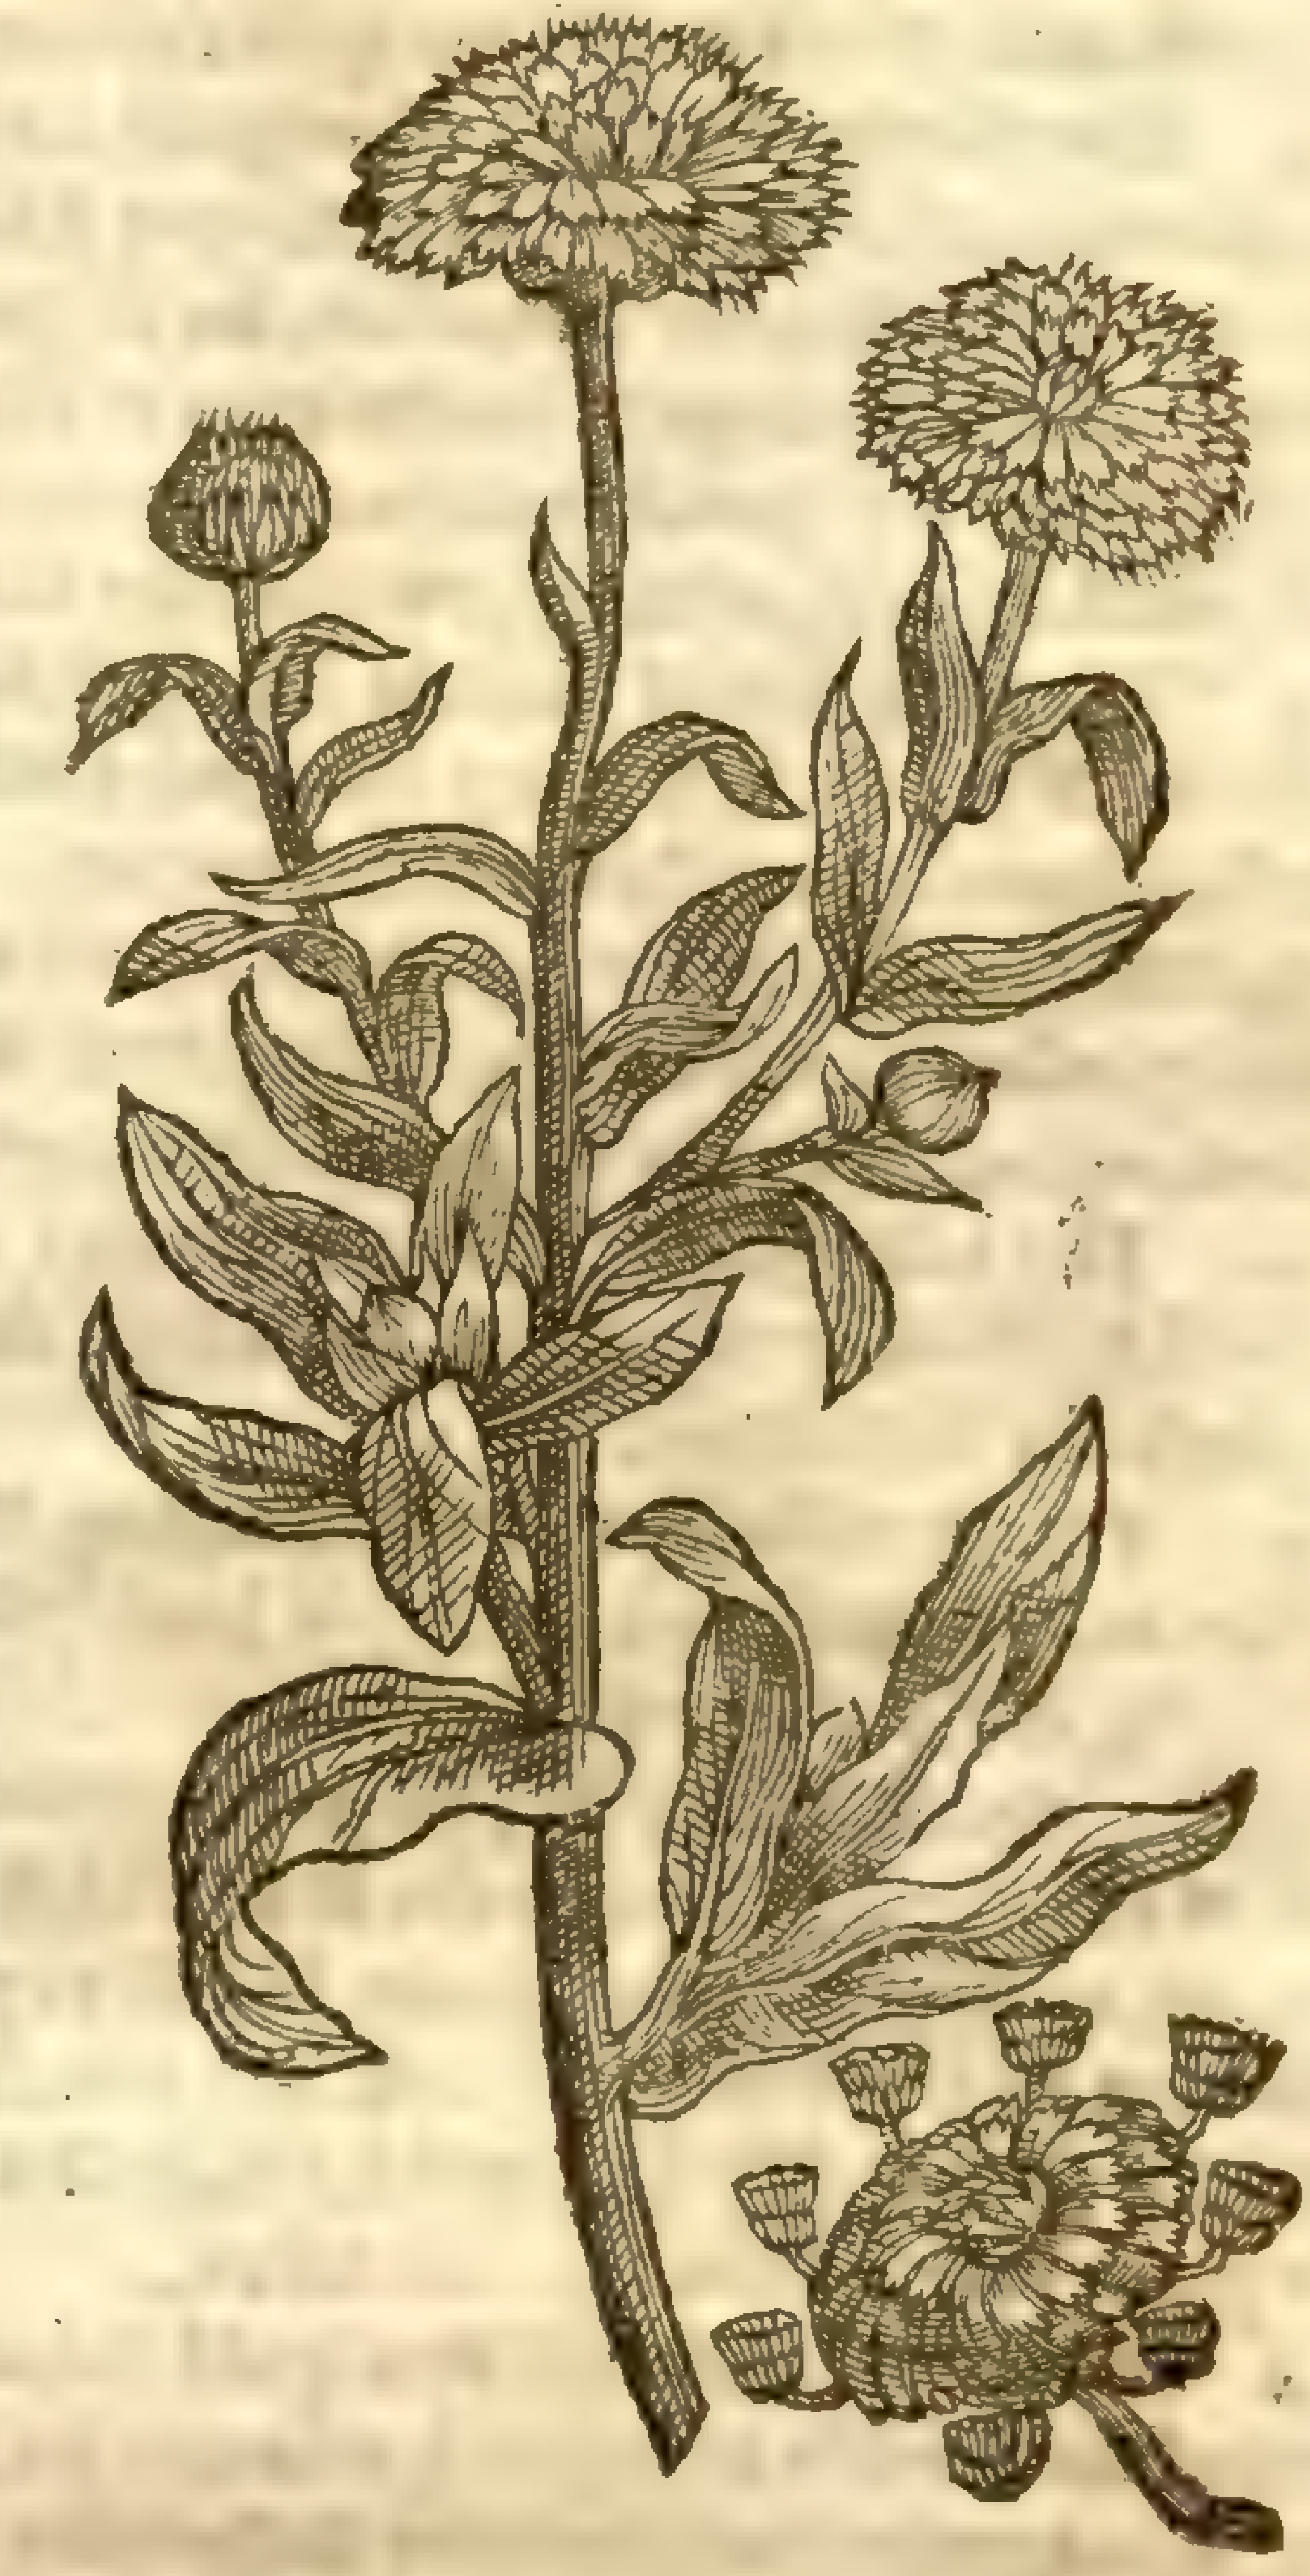
2 The common double Marigold hath many fat, thicke, crumpled leaues ſet vpon a groſſe and ſpungeous ſtalke: whereupon do grow faire double yellow floures, hauing for the moſt part in the middle a bunch of threddes thicke thruſt together: which being paſt there ſucceed ſuch crooked ſeeds as the firſt deſcribed. The root is thicke and hard, with ſome threds annexed thereto.

1. 2. *Calendula major polyanthos.*
The great double Marigold.

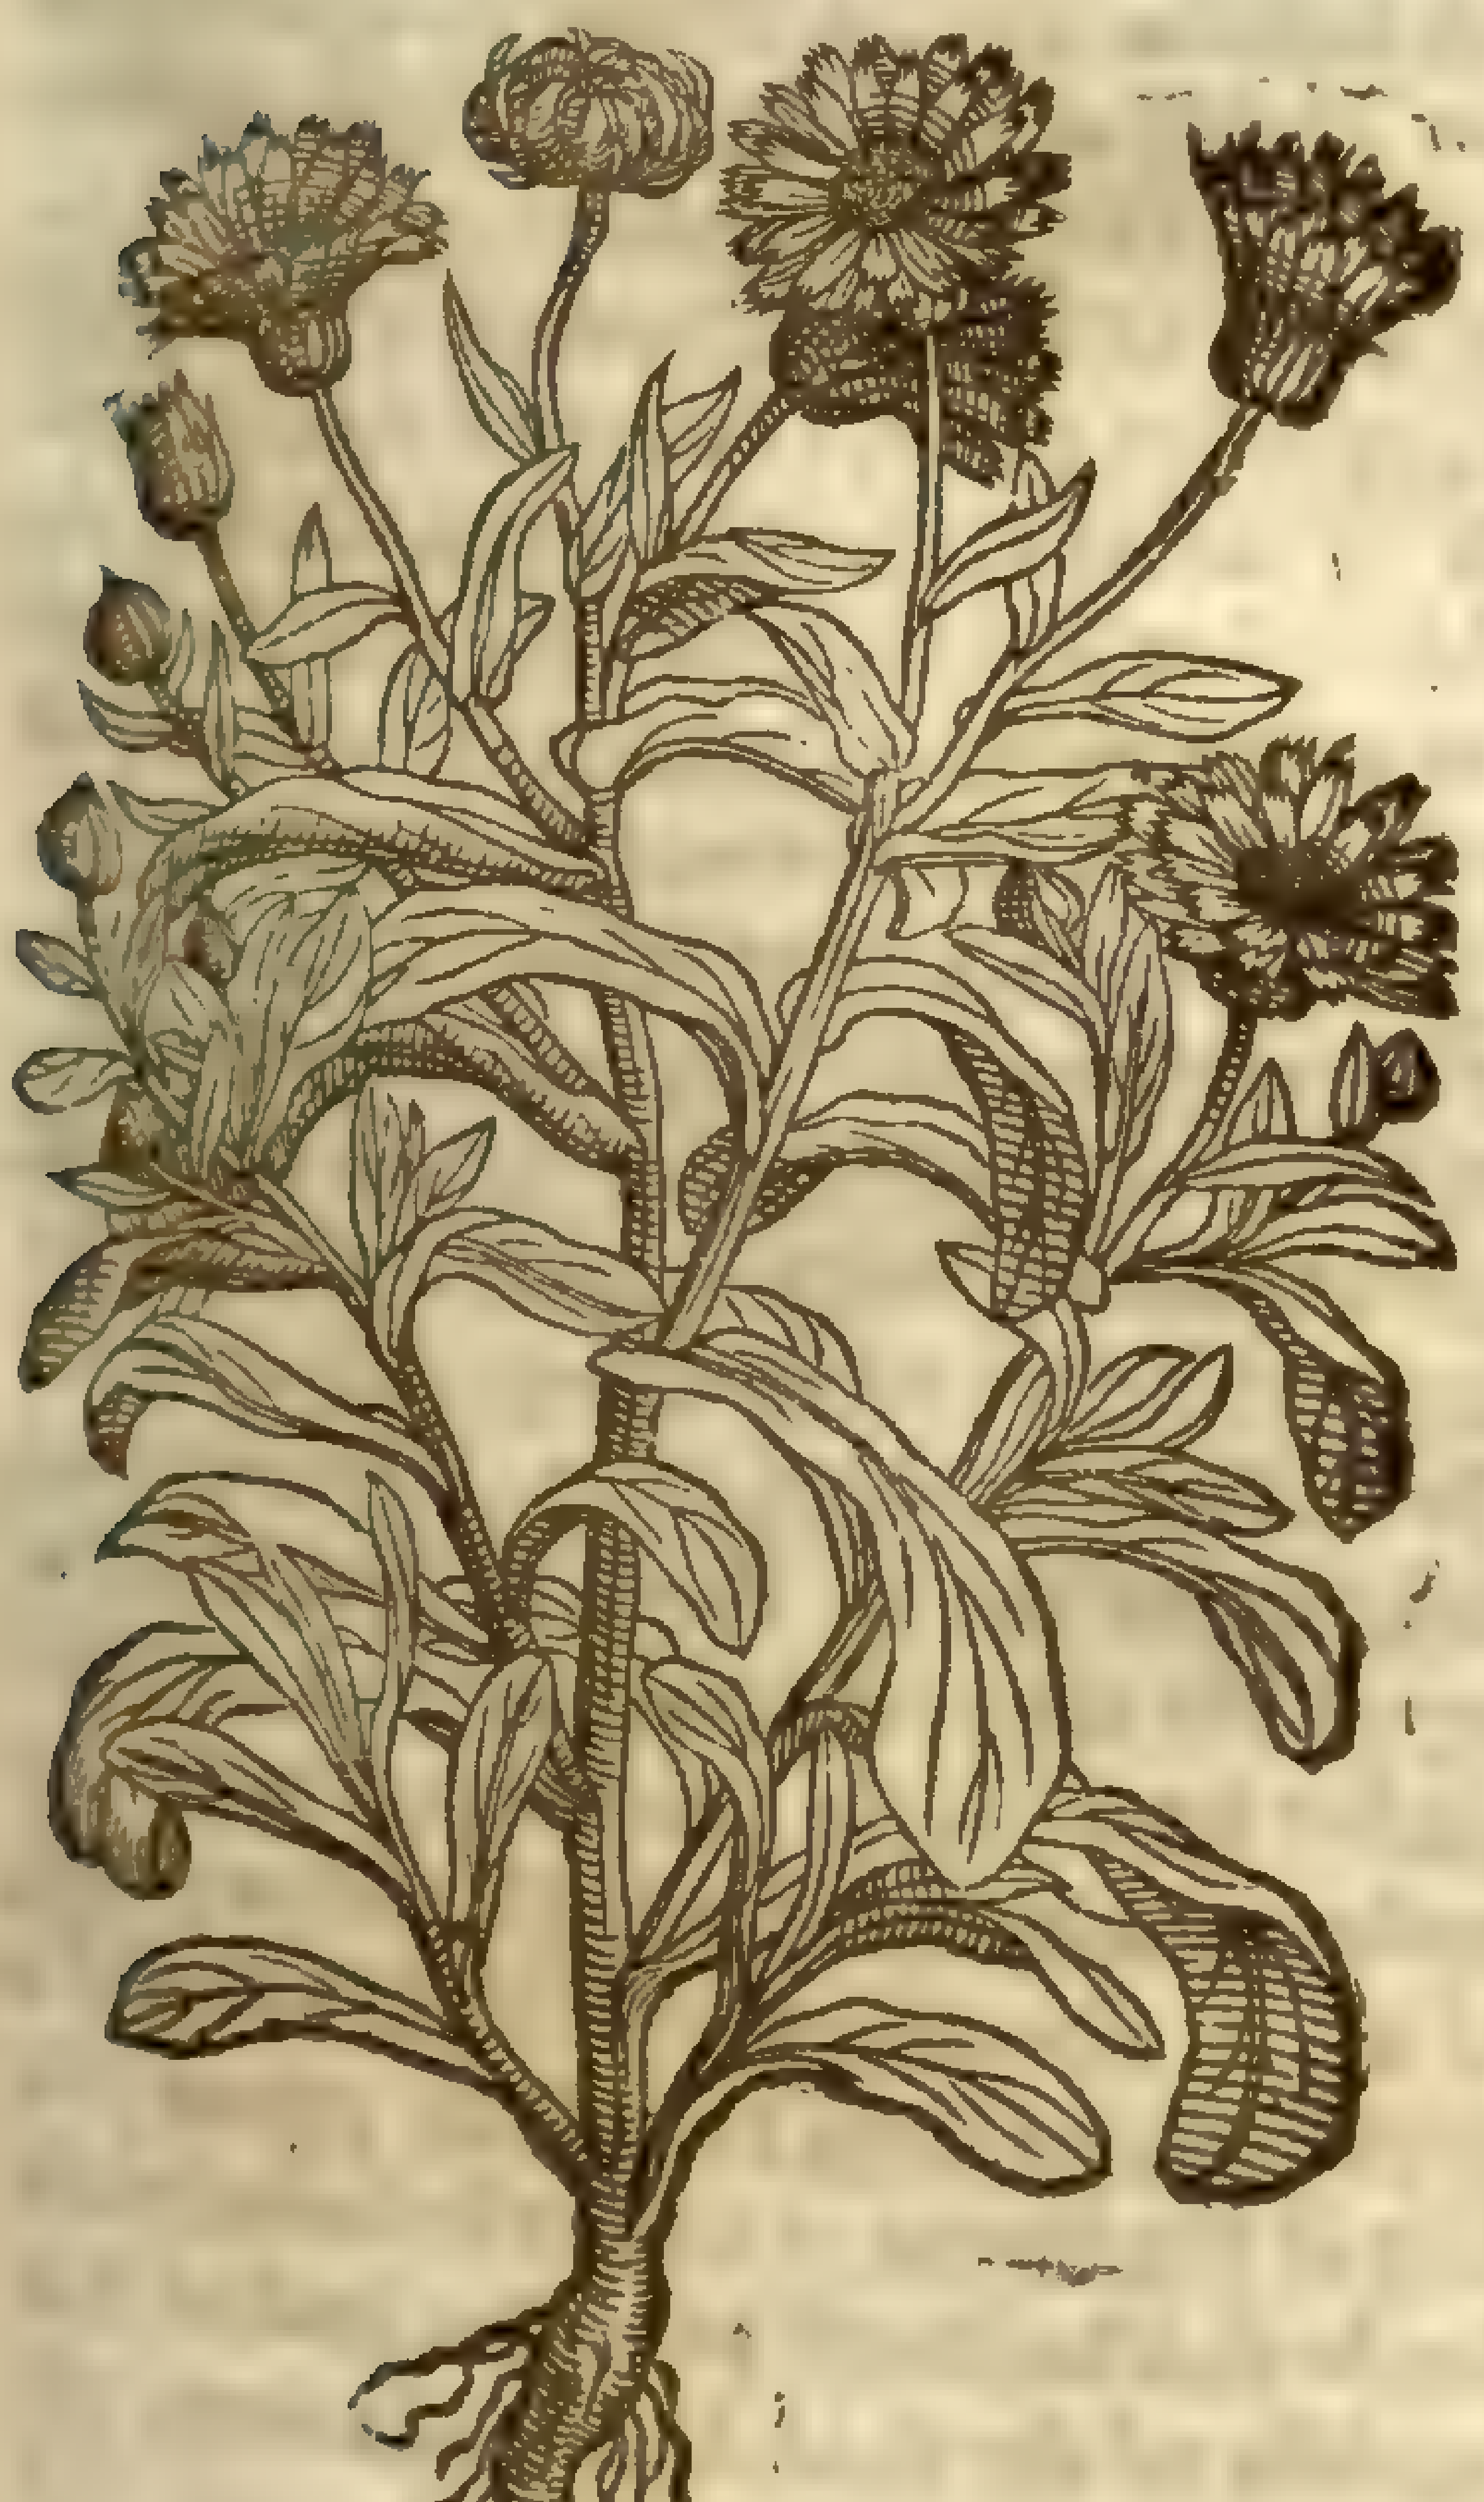


Calendula Africana [illegible]

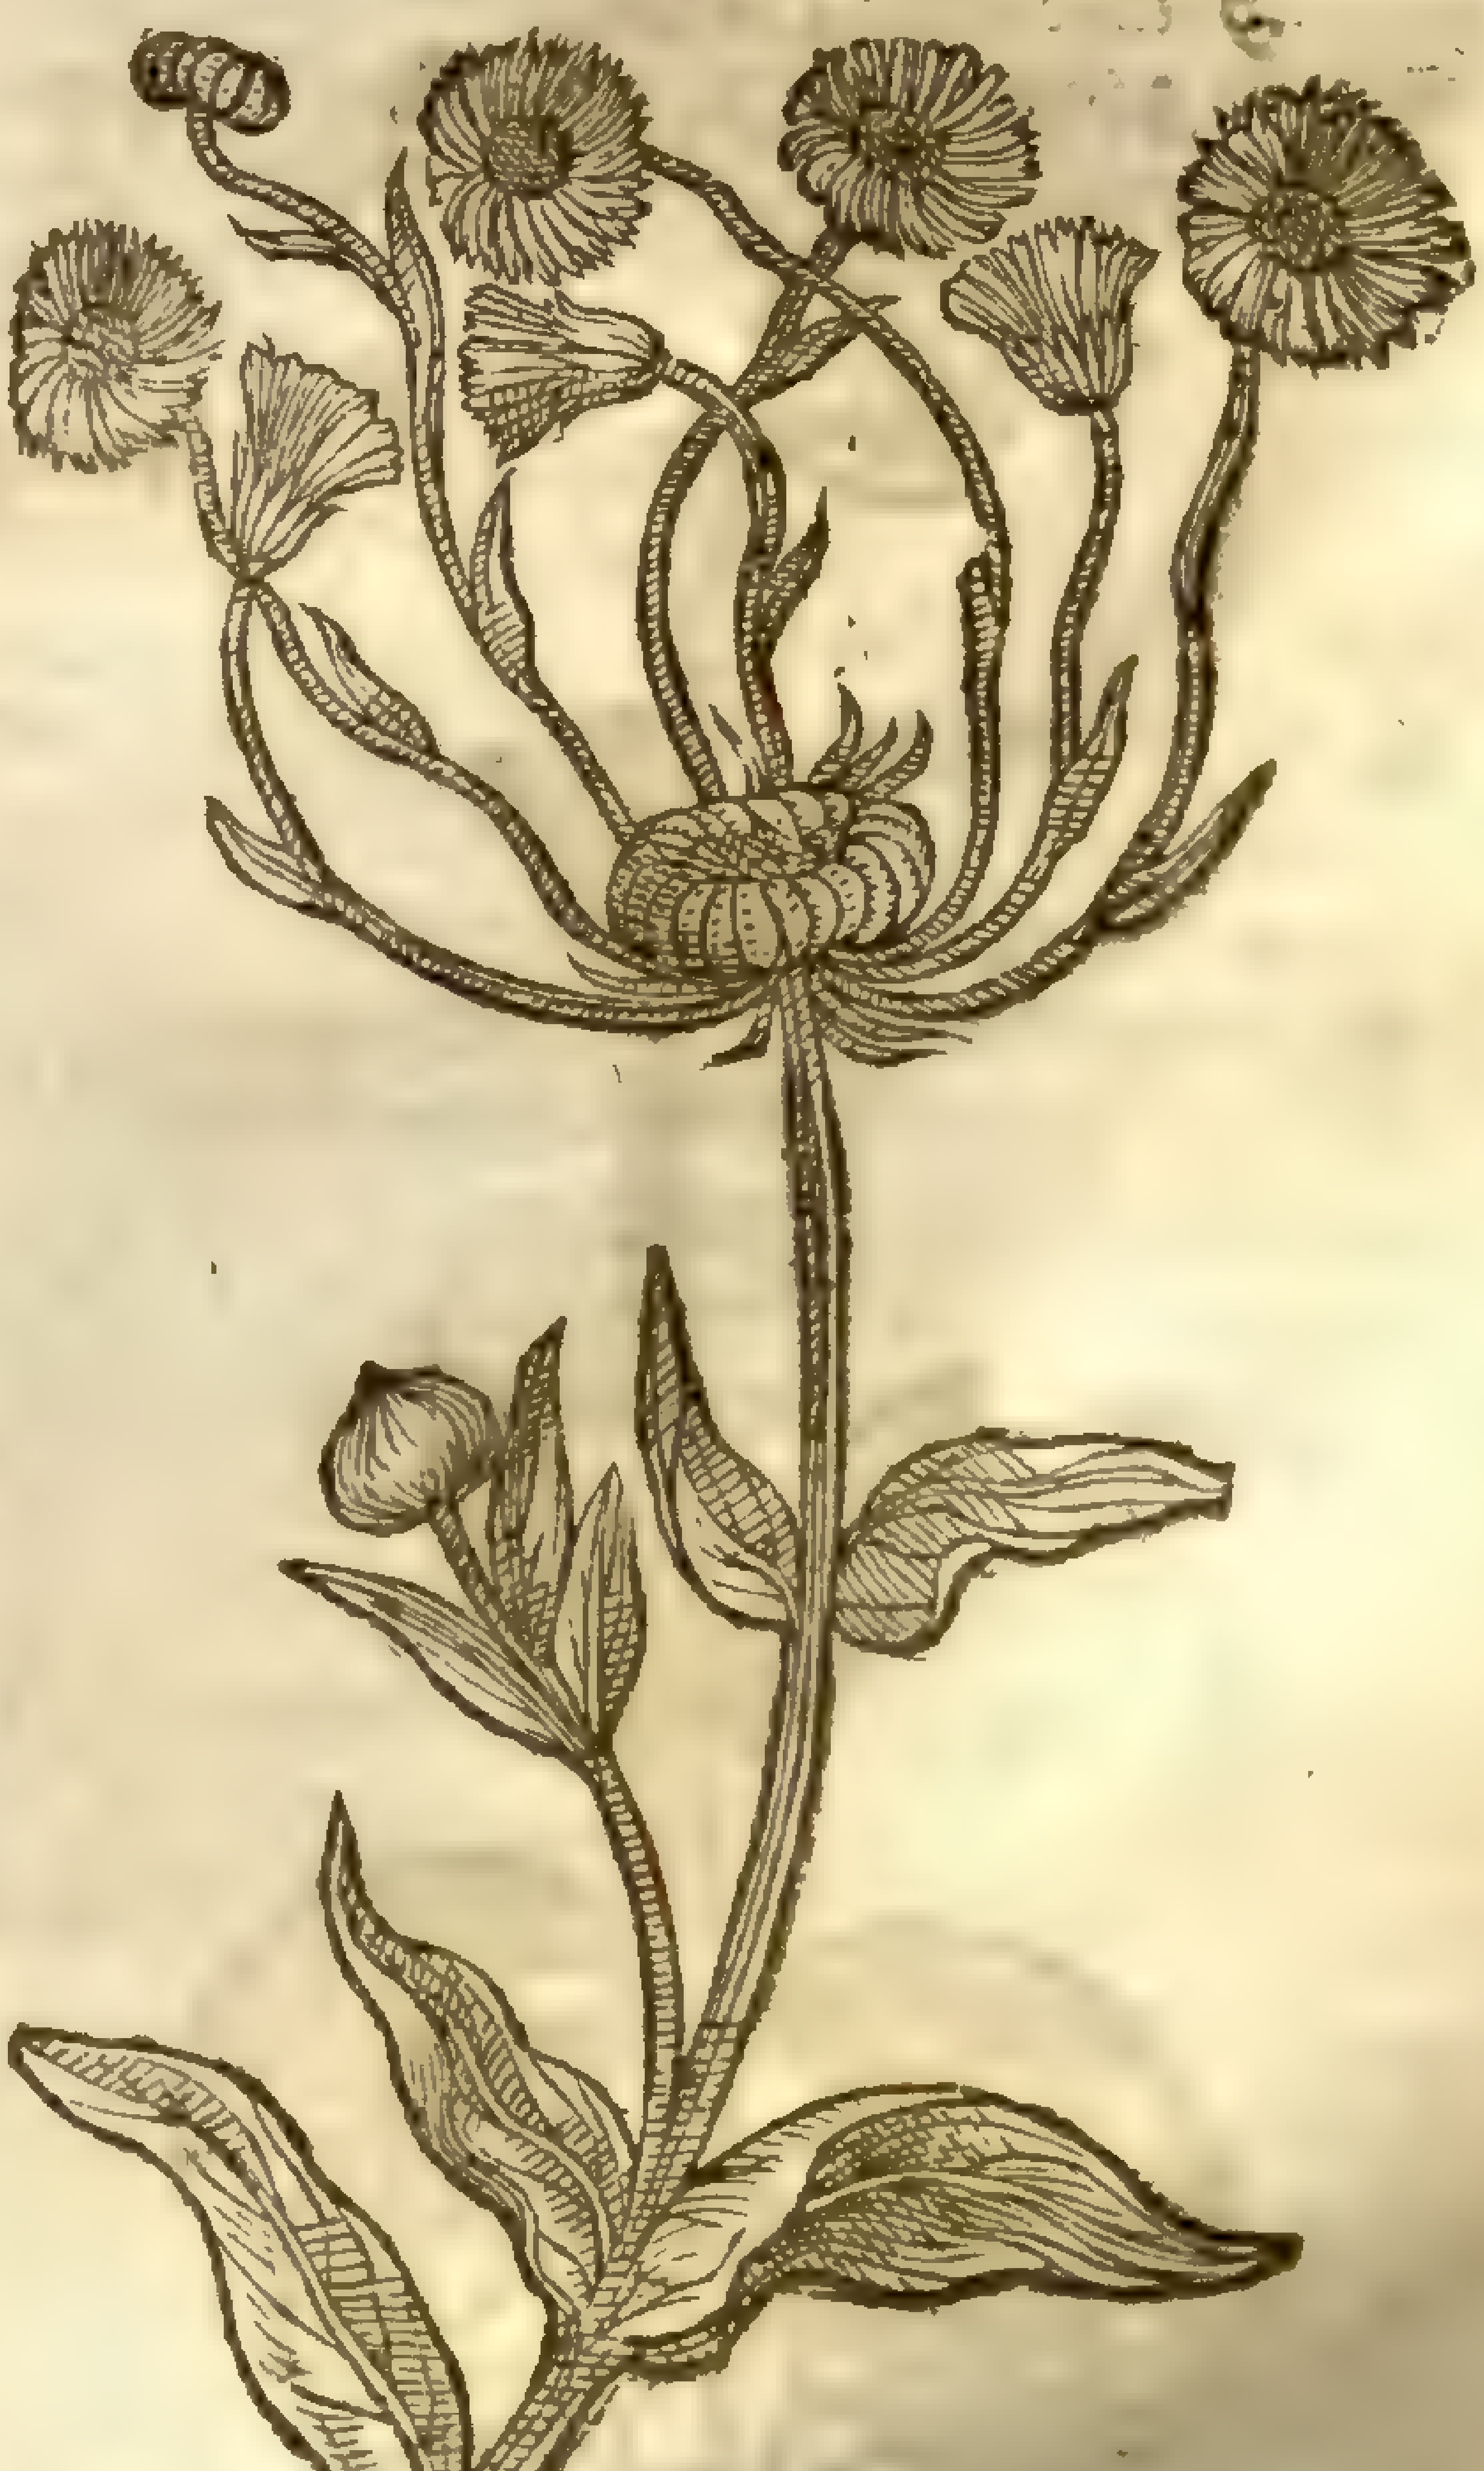
4 *Calendula multiflora orbiculata.*
Double globe Marigold.



6 *Calendula ſimplici flore.*
Single Marigold.



7 *Calendula prolifera.*
Fruitfull Marigold.



3 The ſmaller or finer leafed double Marigold groweth vpright, hauing for the moſt part one or fat ſpongeous ſtalke, garniſhed with ſmooth and flat leaues confuſedly. The floures grow he top of the ſmall branches, very double, but leſſer than the other, conſiſting of more fine jagdneſſe, and of a faire yellow gold colour. The root is like the precedent.

4 The Globe-flouring Marigold hath many large broad leaues riſing immediately forth of the ground; among which riſeth vp a ſtalke of the height of a cubit, diuiding it ſelfe toward the top into other ſmaller branches, ſet or garniſhed with the like leaues, but confuſedly, or without order. The floures grow at the tops of the ſtalkes, very double; the ſmall leaues whereof are ſet in comely order by certaine rankes or rowes, as ſundry lines are in a Globe, trauerſing the whole compaſſe of the ſame; whereupon it tooke the name *Orbiculata*.

5 The fifth ſort of double Marigold differeth not from the laſt deſcribed, ſauing in the colour of the floures; for this plant bringeth forth floures of a ſtraw or light yellow colour, and the others not ſo, wherein conſiſteth the difference.

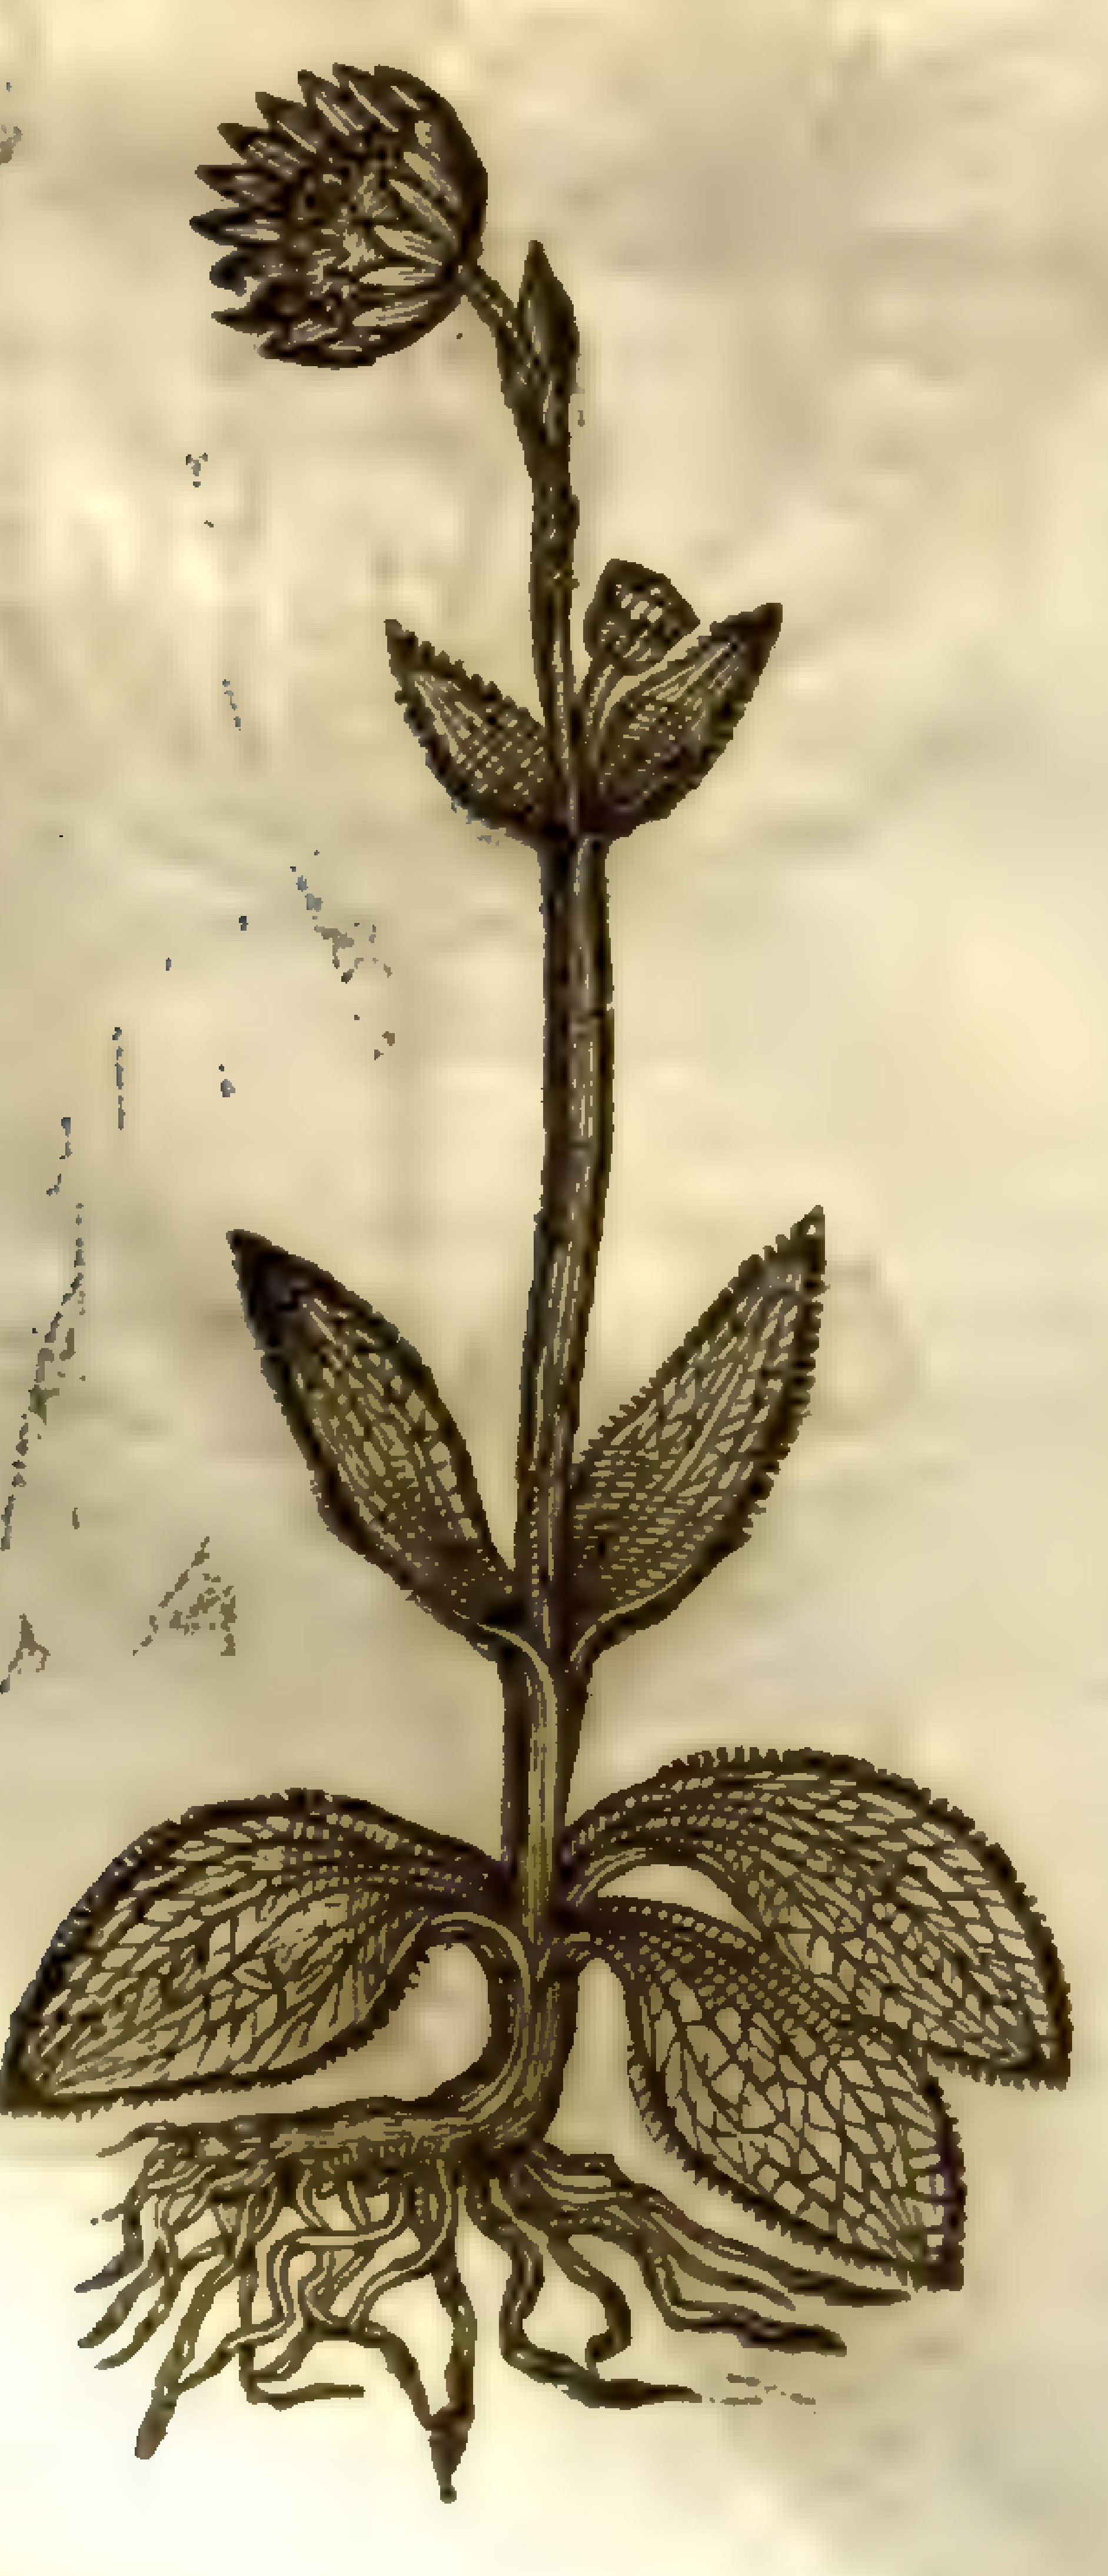
‡ All theſe fiue here deſcribed, and which formerly had ſo many figures, differ nothing but in the bigneſſe and littleneſſe of the plants and floures, and in the intenſeneſſe and remiſneſſe of their colour, which is either orange, yellow, or of a ſtraw colour. ‡

6 The Marigold with ſingle floures differeth not from thoſe with double floures, but in that t conſiſteth of fewer leaues, which we therefore terme ſingle, in compariſon of the reſt, and that maketh the difference.

7 This fruitfull or much bearing Marigold is likewiſe called of the vulgar ſort of women, Iacke-an-apes on horſe backe: it hath leaues, ſtalkes, and roots like the common ſort of Marigold, differing in the ſhape of his flours, for this plant doth bring forth at the top of the ſtalke one floure like the other Marigolds; from the which ſtart forth ſundry other ſmall floures, yellow likewiſe, and of the ſame faſhion as the firſt, which if I be not deceiued commeth to paſſe *per accidens*, or by chance, as Nature oftentimes liketh to play with other floures, or as children are borne with two thumbes on one hand, and ſuch like, which liuing to be men, do get children like vnto others; euen ſo is the ſeed of this Marigold, which if it be ſowen, it brings forth not one floure in a thouſand like the plant from whence it was taken.

8 The other fruitfull Marigold is doubtleſſe a degenerate kind, comming by chance from the ſeed of the double Marigold, whereas for the moſt part the other commeth of the ſeed of the ſingle floures, wherein conſiſteth the difference. ‡ The floure of this (wherein the only difference conſiſts) you ſhall finde expreſt at the bottome of the fourth figure. ‡

9 *Calendula Alpina.*
Mountaine Marigold.



9 The Alpiſh or mountaine Marigold, which *Lobelius* ſetteth downe for *Nardus Celtica*, or *Plantago Alpina*, is called by *Tabernamontanus*, *Caltha*, or *Calendula Alpina*: and becauſe I ſee it rather reſembles a Marigold, than any other plant, I haue not thought it amiſſe to inſert it in this place, leauing the conſideration thereof vnto the friendly Reader, or to a further conſideration, becauſe it is a plant that I am not well acquainted withall; yet I do reade that it hath a thicke root, growing aſlope vnder the vpper cruſt of the earth, of an aromaticall or ſpicie taſte, and ſomewhat biting, with many threddy ſtrings annexed thereto: from which riſe vp broad thicke and rough leaues of an ouerworn green colour, not vnlike to thoſe of Plantaine: among which there riſeth vp a rough and tender ſtalke ſet with the like leaues: on the top wherof commeth forth a ſingle yellow floure, paled about the edges with ſmall leaues of a light yellow, tending to a ſtraw colour; the middle of the floure is compoſed of a bundle of threds, thicke thruſt together, ſuch as is in the middle of the field Daiſie, of a deepe yellow colour.

‡ This plant is all one with the two deſcribed in the next Chapter: they vary onely

thus; the ſtalkes and leaues are ſometimes hairy, otherwhiles ſmooth; the floure is yellow, or elſe blew. I hauing three figures ready cut, thinke it not amiſſe to giue you one to expreſſe each varietie. ‡

10 The wilde Marigold is like vnto the ſingle garden Marigold, but altogether leſſer, and the whole plant periſheth at the firſt approach of Winter, and recouereth it ſelfe againe by falling of the ſeed.

¶ *The Place.*

Theſe Marigolds, with double floures eſpecially, are ſet and ſowne in Gardens: the reſt, their titles do ſet forth their naturall being.

¶ *The Time.*

The Marigold floureth from Aprill or May euen vntill Winter, and in Winter alſo, if it bee warme.

¶ *The Names.*

The Marigold is called *Calendula*: it is to be ſeene in floure in the Calends almoſt of euery moneth: it is alſo called *Chryſanthemum*, of his golden colour: of ſome, *Caltha*, and *Caltha Poetarum*: whereof *Columella* and *Virgil* doe write, ſaying, That *Caltha* is a floure of a yellow colour: whereof *Virgil* in his Bucolickes, the ſecond Ecloge, writeth thus:

> *Tum Caſia atque aliјs intexens ſuauibus herbis*
> *Mollia Luteola pingit vaccinia Caltha.*

> And then ſhee'l Spike and ſuch ſweet herbes infold,
> And paint the Iacinth with the Marigold.

Columella alſo in his tenth booke of Gardens hath theſe words;

> *Candida Leucoia & flauentia Lumina Calthæ.*

> Stock-Gillofloures exceeding white,
> And Marigolds moſt yellow bright.

It is thought to be *Gromphena Plinij*: in low Dutch it is called, **Goudt bloemen**: in high Dutch, **Ringelblumen**: in French, *Souſij & Goude*: in Italian, *Fior d'ogni meſe*: in Engliſh, Marigolds and Ruddes.

¶ *The Temperature and Vertues.*

The floure of the Marigold is of temperature hot, almoſt in the ſecond degree, eſpecially when it is dry: it is thought to ſtrengthen and comfort the heart very much, and alſo to withſtand poyſon, as alſo to be good againſt peſtilent Agues, being taken any way. *Fuchſius* hath written, That being drunke with wine it bringeth downe the termes, and that the fume thereof expelleth the ſecondine or after-birth. A

But the leaues of the herbe are hotter; for there is in them a certaine biting, but by reaſon of the moiſture ioyned with it, it doth not by and by ſhew it ſelfe; by meanes of which moiſture they mollifie the belly, and procure ſolubleneſſe if it be vſed as a pot-herbe. B

Fuchſius writeth, That if the mouth be waſhed with the iuyce it helpeth the tooth-ache. C

The floures and leaues of Marigolds being diſtilled, and the water dropped into red and watery eies, ceaſeth the inflammation, and taketh away the paine. D

Conſerue made of the floures and ſugar taken in the morning faſting, cureth the trembling of the heart, and is alſo giuen in time of plague or peſtilence, or corruption of the aire. E

The yellow leaues of the floures are dried and kept throughout Dutchland againſt Winter, to put into broths, in Phyſicall potions, and for diuers other purpoſes, in ſuch quantity, that in ſome Grocers or Spice-ſellers houſes are to be found barrels filled with them, and retailed by the penny more or leſſe, inſomuch that no broths are well made without dried Marigolds. F

CHAP. 255. *Of Germane Marigolds.*

¶ *The Deſcription.*

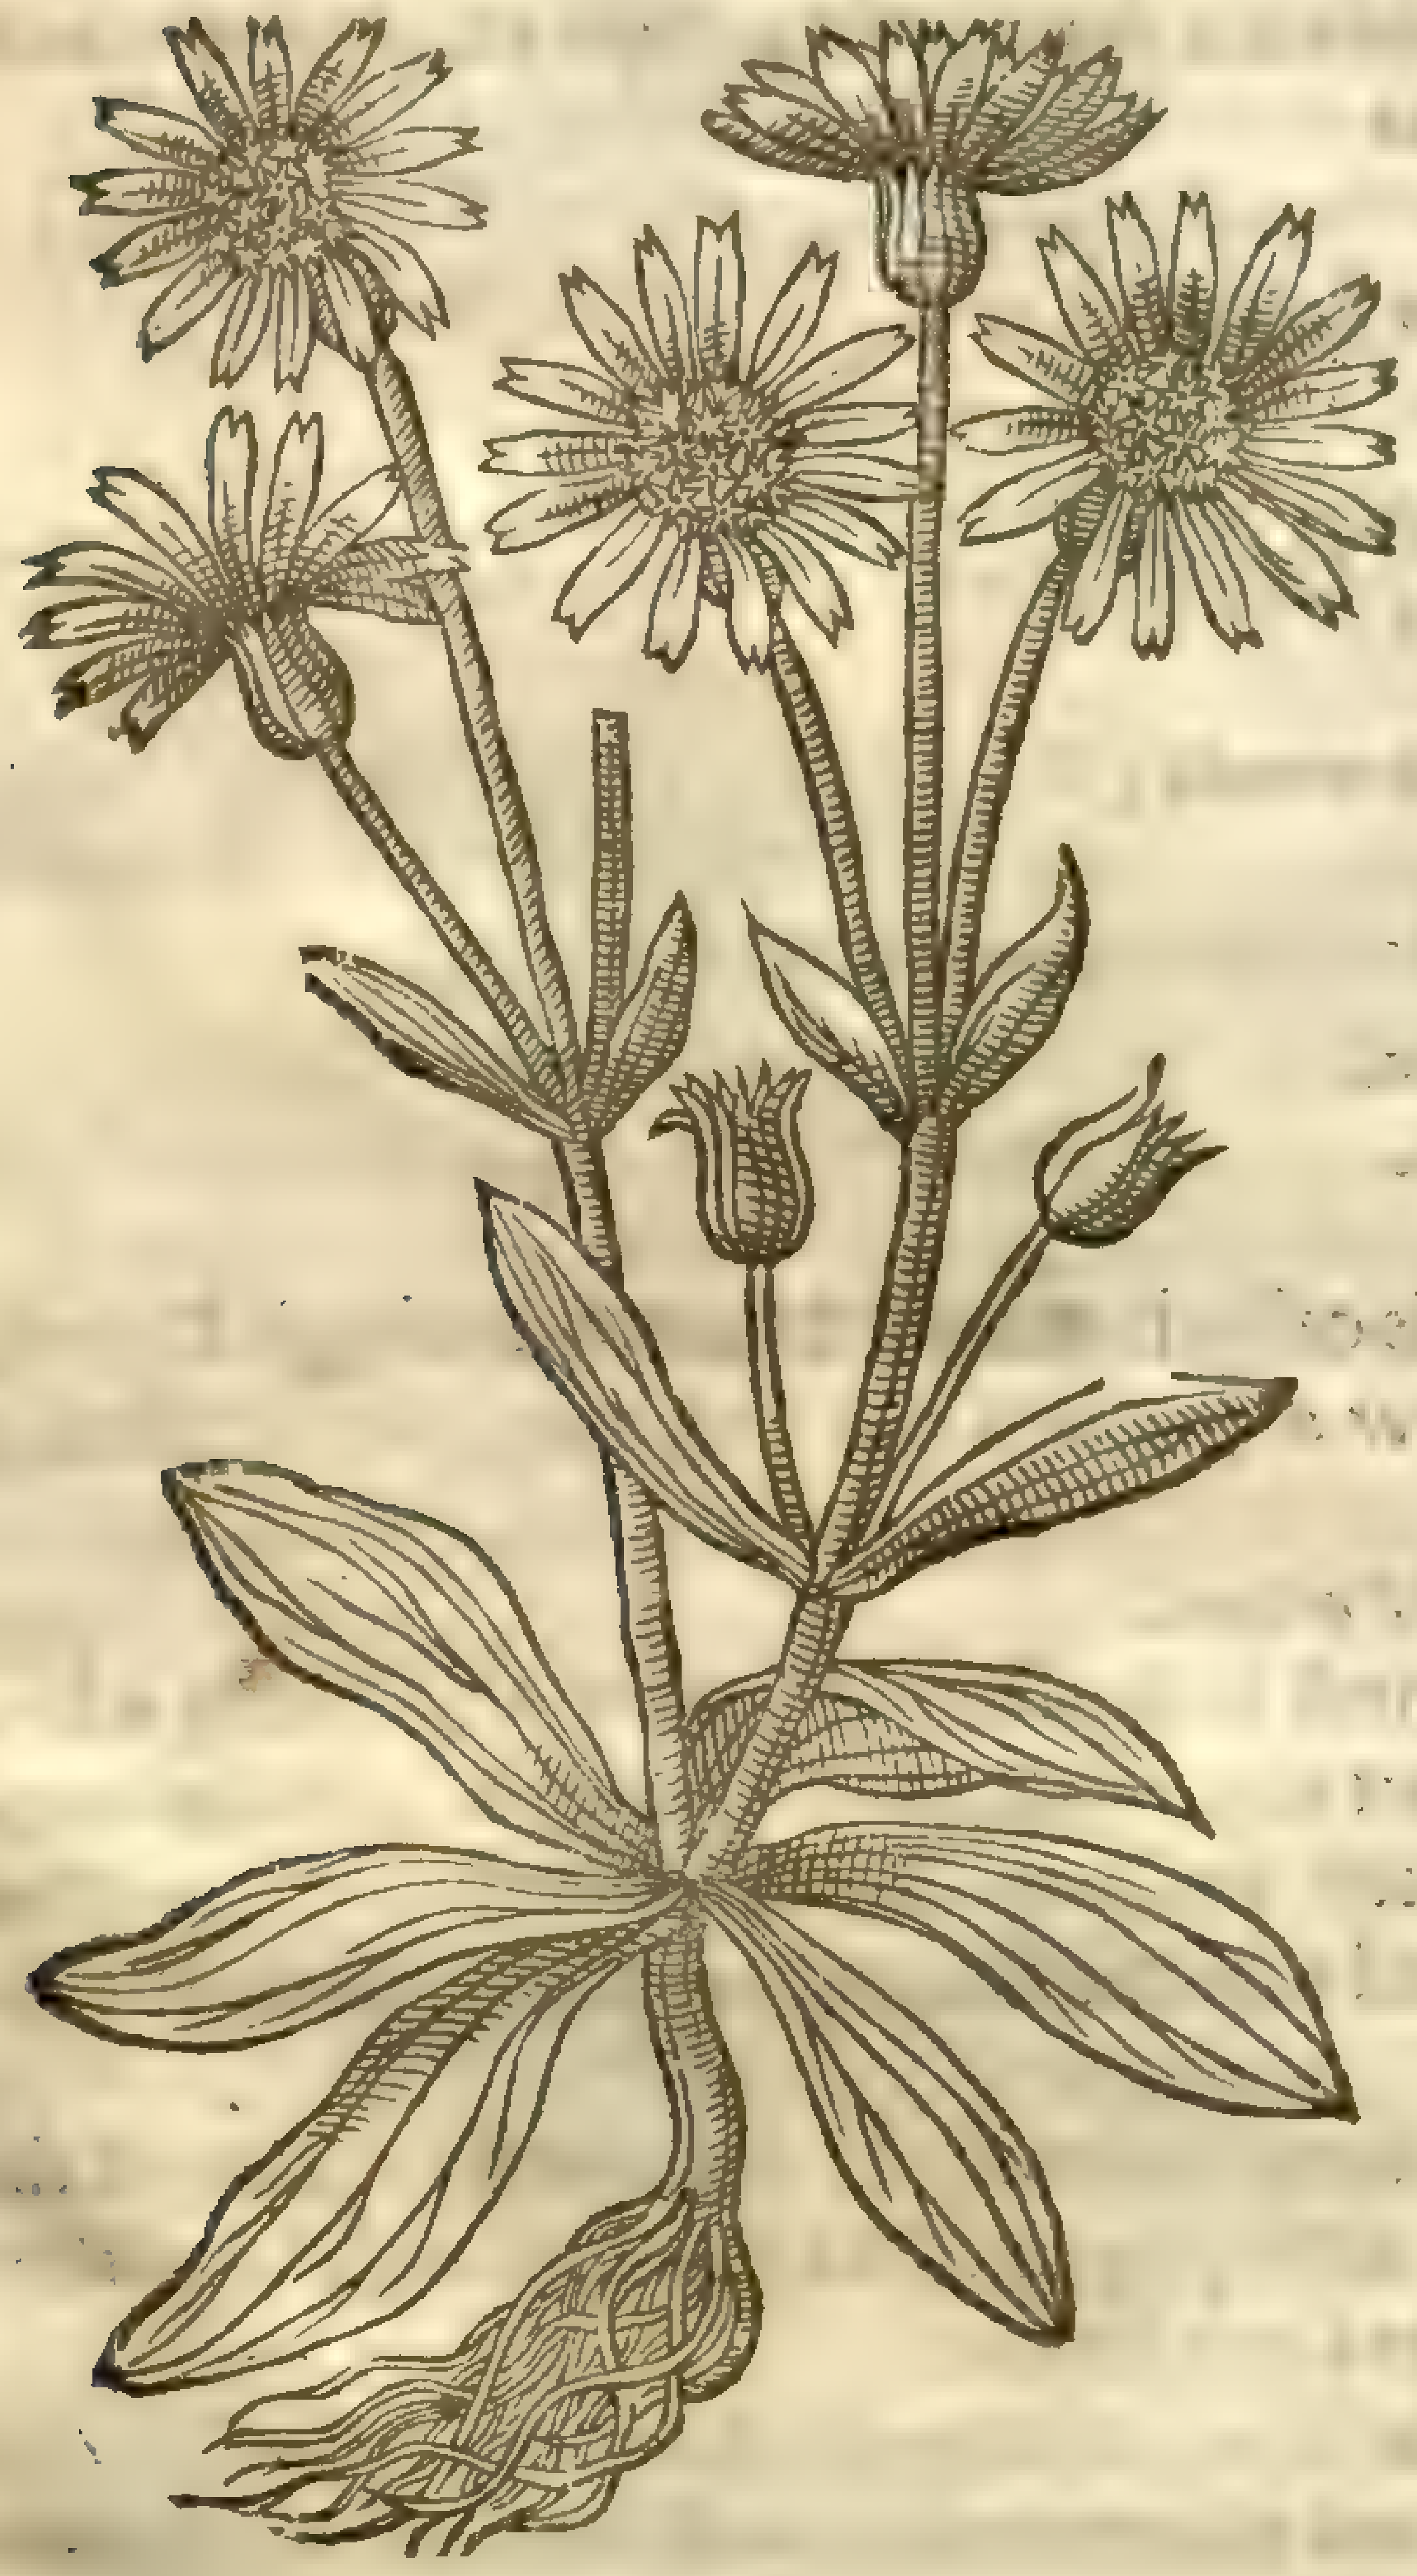
1 GOlden Marigold with the broad leafe doth forthwith bring from the root long leaues ſpred vpon the ground, broad, greene, ſomething rough in the vpper part, vnderneath ſmooth, and of a light greene colour: among which ſpring vp ſlender ſtalkes a cubit

high, ſomething hoarie, hauing three or foure ioynts, out of euery one whereof grow two leaues ſet one right againſt another, and oftentimes little ſlender ſtems; on the tops wherof ſtand broad round floures like thoſe of Ox-eie, or the corne Marigold, hauing a round ball in the middle (ſuch as is in the middle of thoſe of Camomill) bordered about with a pale of white yellow leaues. The whole floure turneth into downe that is carried away with the winde; among which downe is found long blackiſh ſeed. The root conſiſteth of threddy ſtrings.

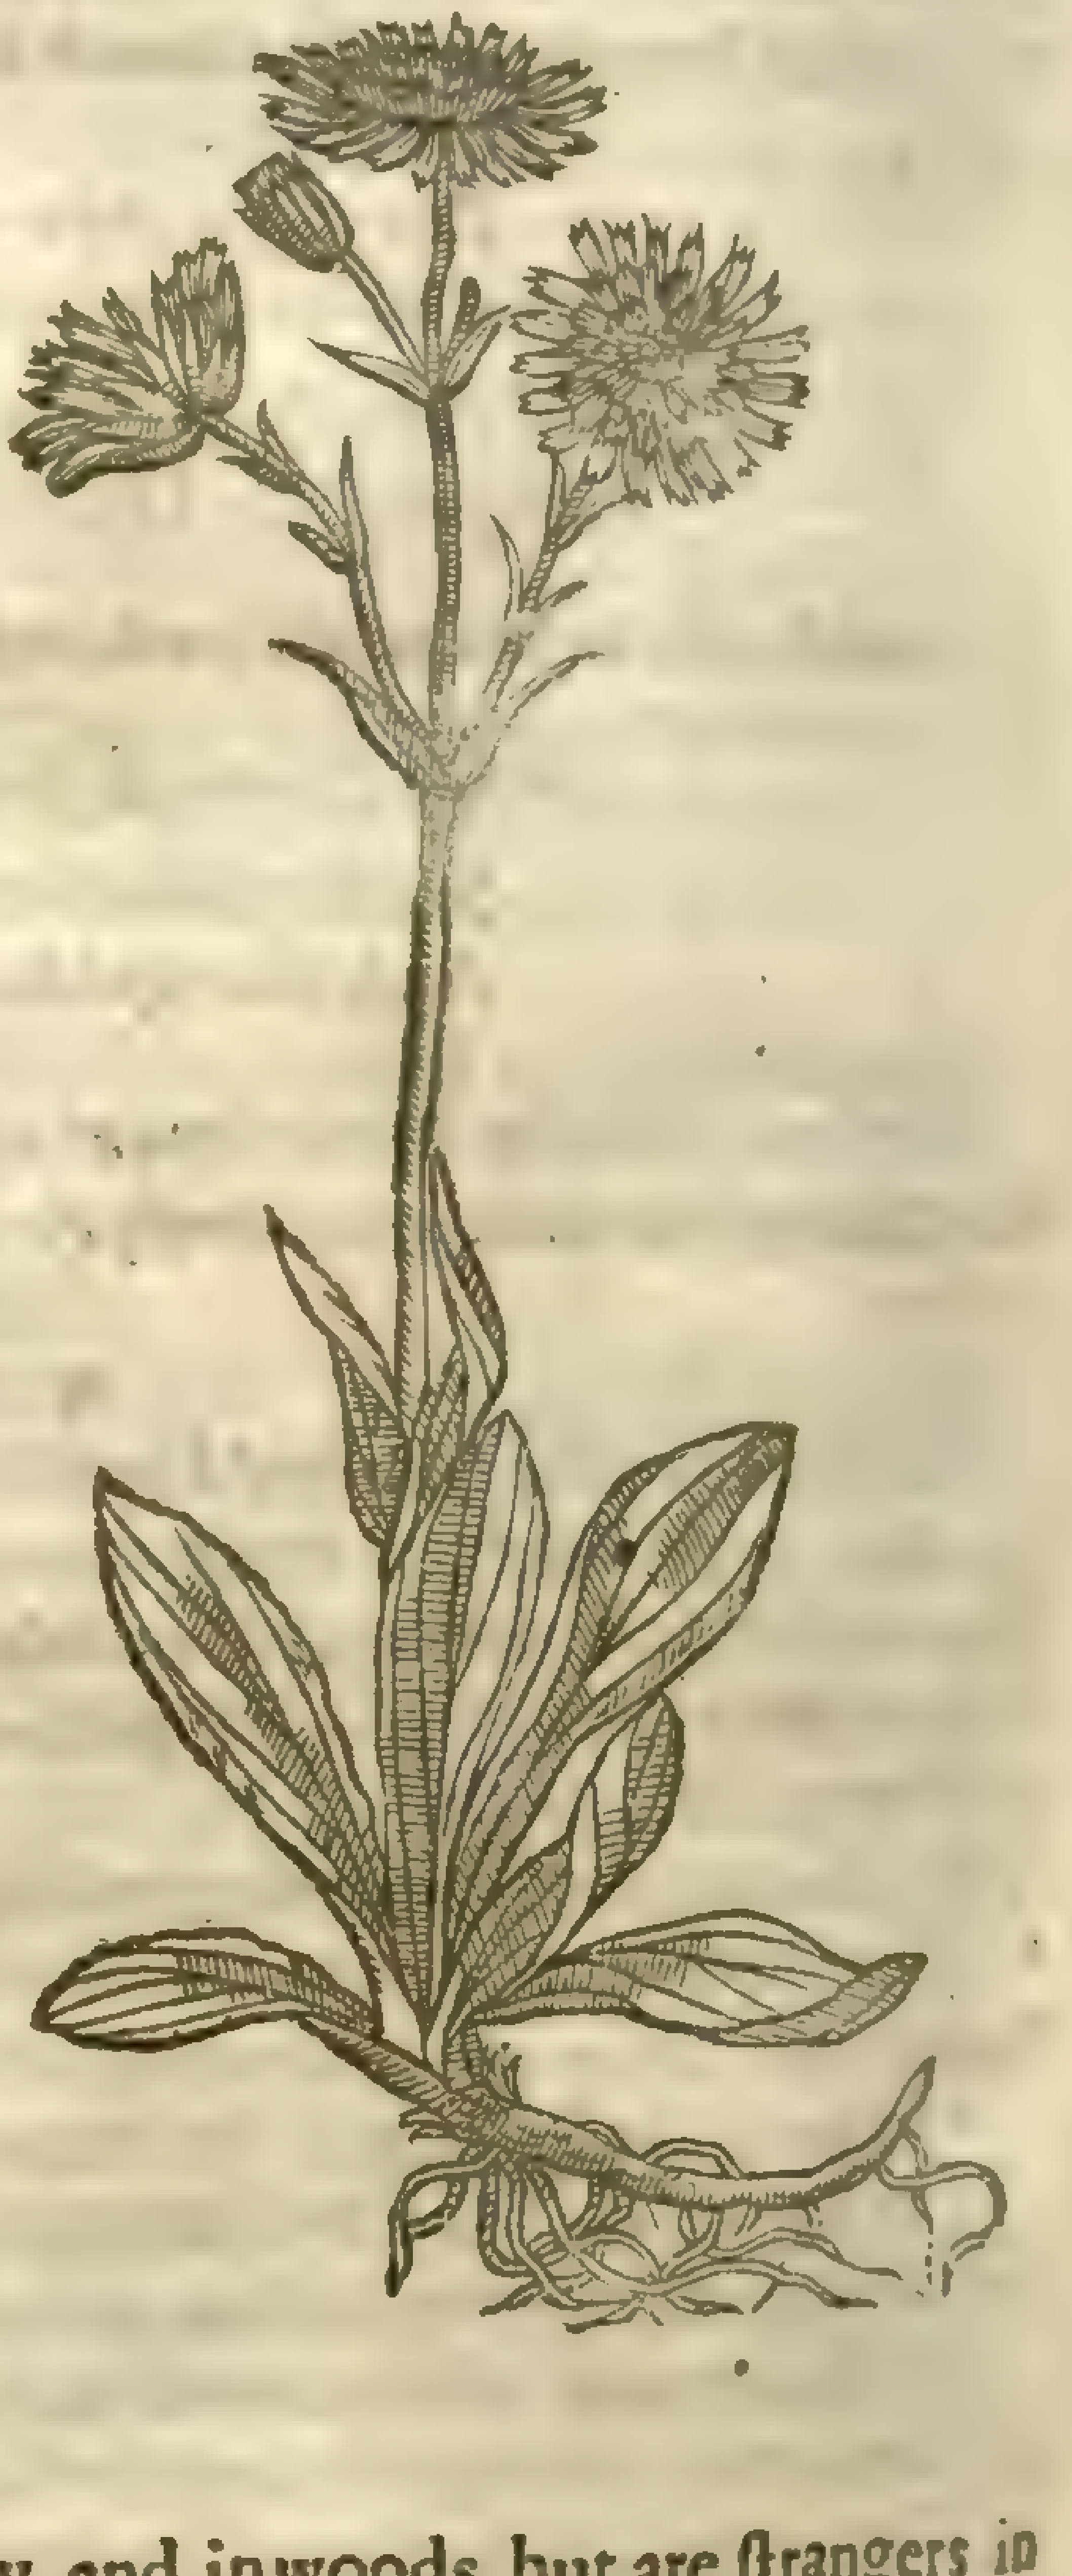
† 2 The leſſer ſort hath foure or fiue leaues ſpred vpon the ground like vnto thoſe of the laſt deſcribed, but altogether leſſer and ſhorter: among which riſeth vp a ſlender ſtalke two hands high; on the top whereof ſtand ſuch floures as the precedent, but not ſo large, and of a blew colour.

‡ Theſe two here deſcribed, and that deſcribed in the ninth place of the foregoing chapter, are all but the varieties of one & the ſame plant, differing as I haue ſhewed in the foregoing chapter. ‡

1 *Chryſanthemum latifolium.*
Golden Marigold with the broad leafe.



2 *Chryſanthemum latifolium minus.*
The leſſer Dutch Marigold.



¶ *The Place.*

They be fonnd euery where in vntilled places of Germany, and in woods, but are ſtrangers in England.

¶ *The Time.*

They are to be ſeene with their floures in Iune, and Iuly, in the Gardens of the Low-countries.

¶ *The Names.*

Golden Marigold is called in high-Dutch, **Waldtblume**. There are that would haue it to be *Aliſma Dioſcoridis*; which is alſo called *Damaſonium*, but vnproperly; therefore we muſt rather call it *Chryſanthemum latifolium*, than raſhly attribute vnto it the name of *Aliſma*. ‡ This plant indeed is a *Doronicum*, and the figure in the precedent chapter by *Cluſius* is ſet forth by the name of *Doronicum 6. Pannonicum*: *Matthiolus* calls this plant *Aliſma*: *Geſner*, *Caltha Alpina*: *Dodonaus*, *Chryſanthemum latifolium*: *Pena* and *Lobel*, *Nardus Celtica altera*. Now in the *Hiſtoria Lugd.* it is ſet forth in foure ſeuerall places by three of the former names; and *pag.* 1169. by the name of *Ptarmica montana Daleſchampij*. ‡

¶ *The Temperature.*

It is hot and dry in the ſecond degree being greene, but in the third being dry.

¶ *The*

¶ *The Vertues.*

The women that liue about the Alps wonderfully commend the root of this plant againſt the ſuffocation of the mother, the ſtoppings of the courſes, the greene ſickeneſſe and ſuch like affects in maids. *Hiſtor. Lugd.* ‡

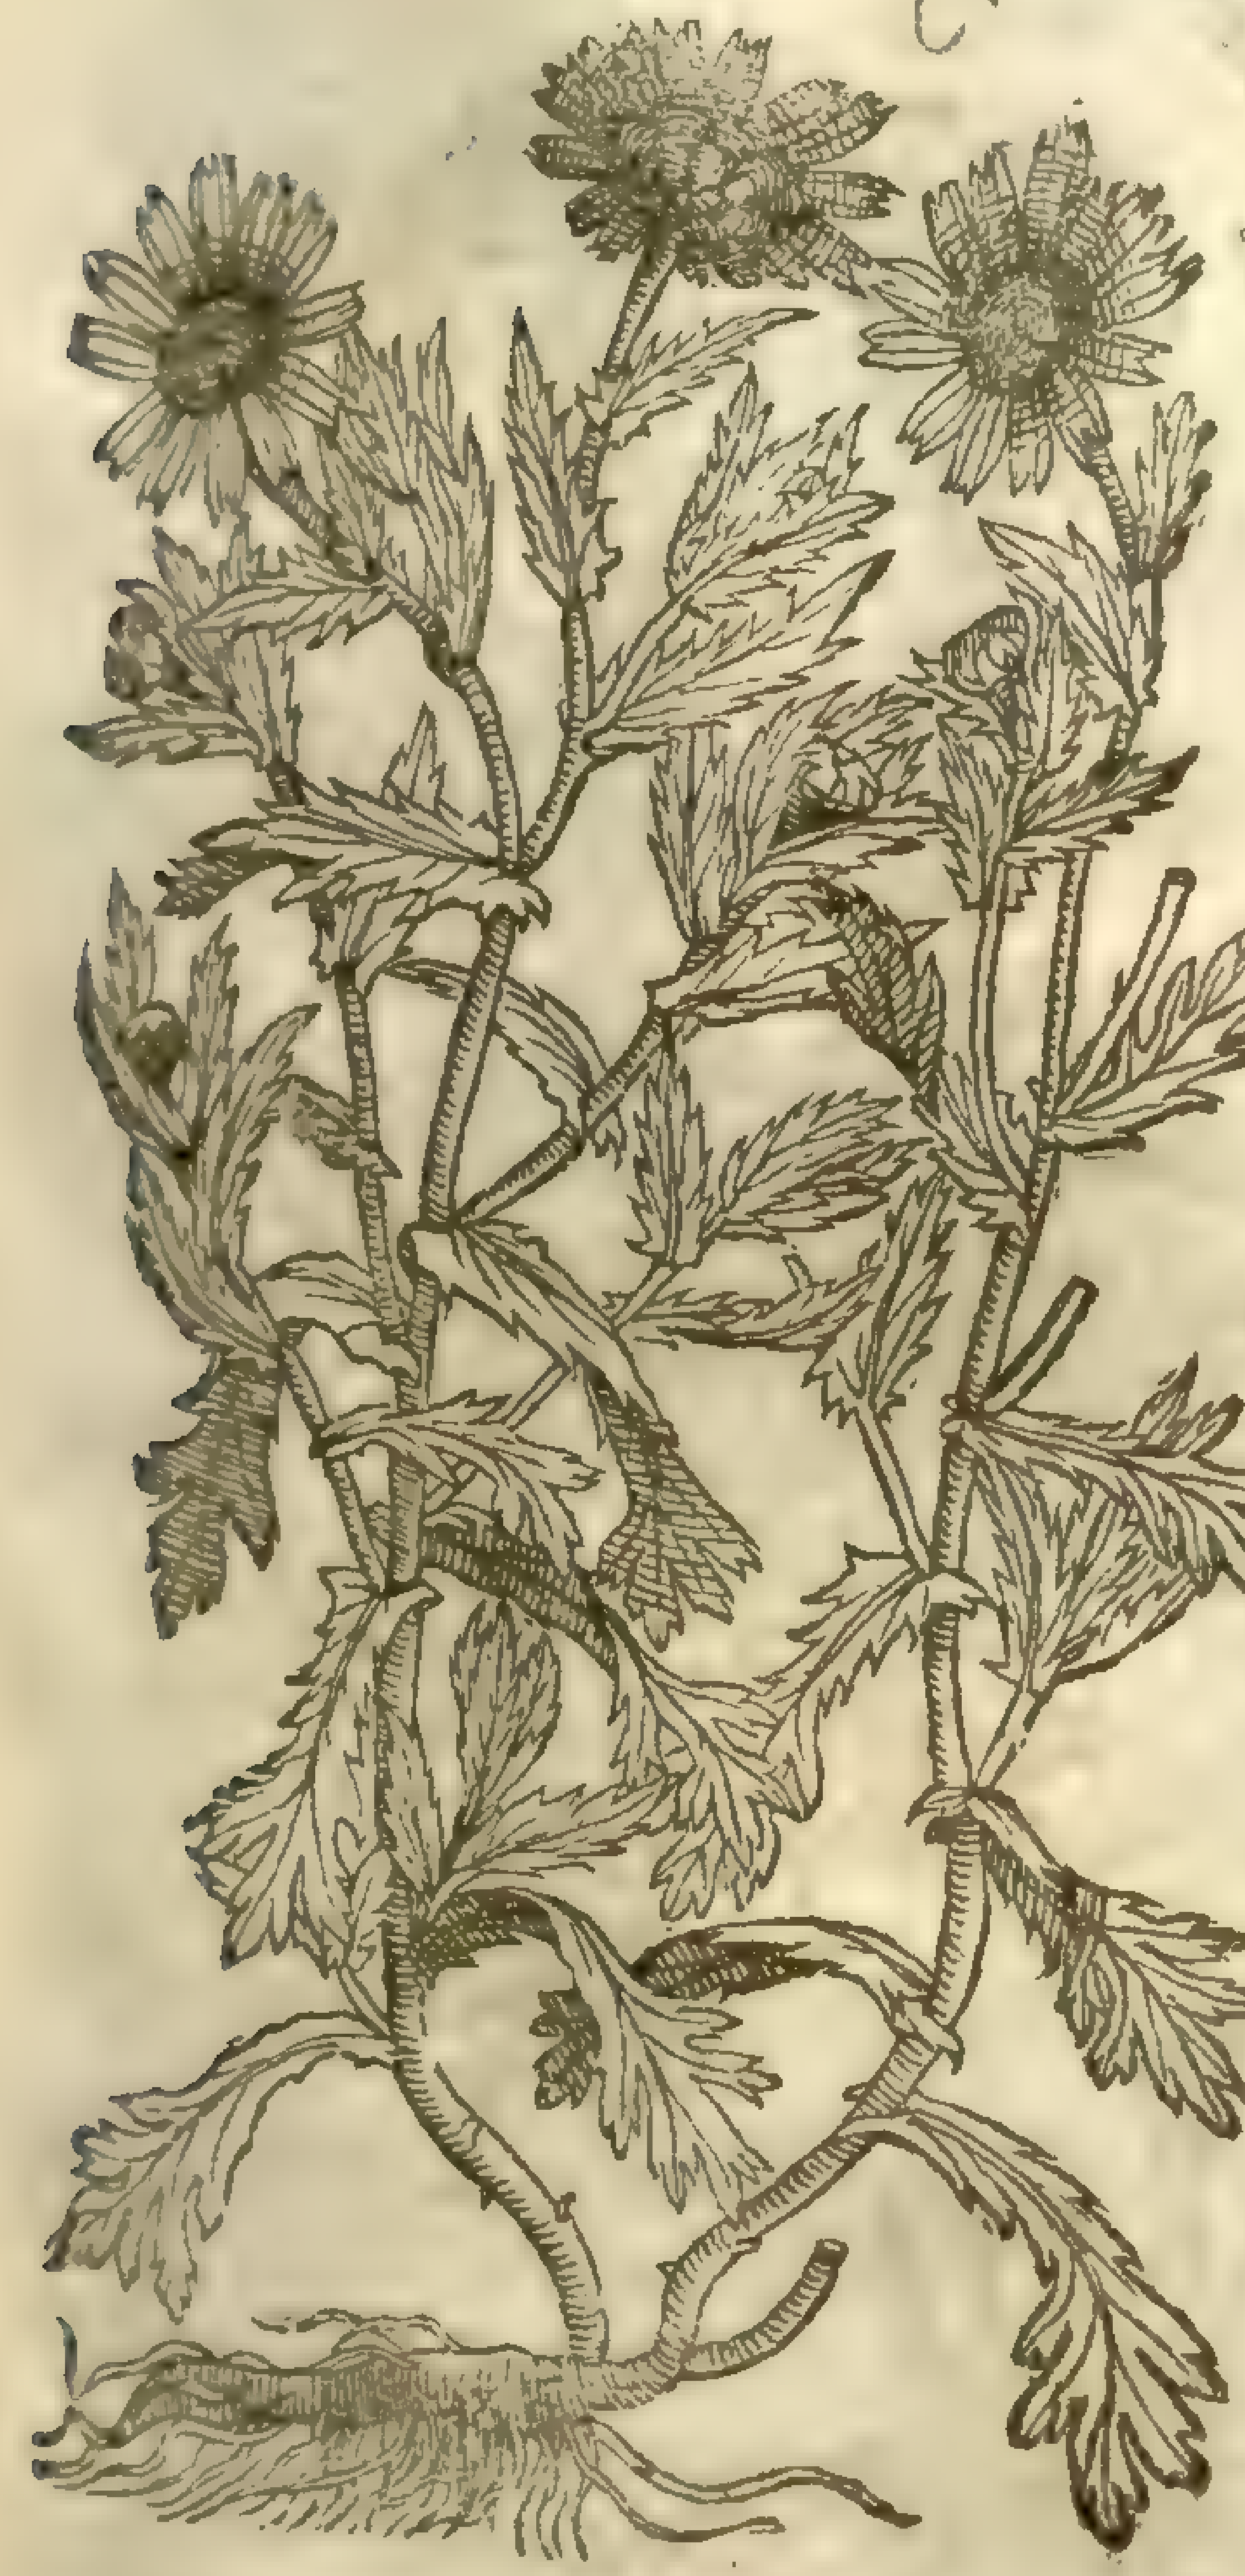
CHAP. 256. *Of Corne-Marigold.*

¶ *The Deſcription.*

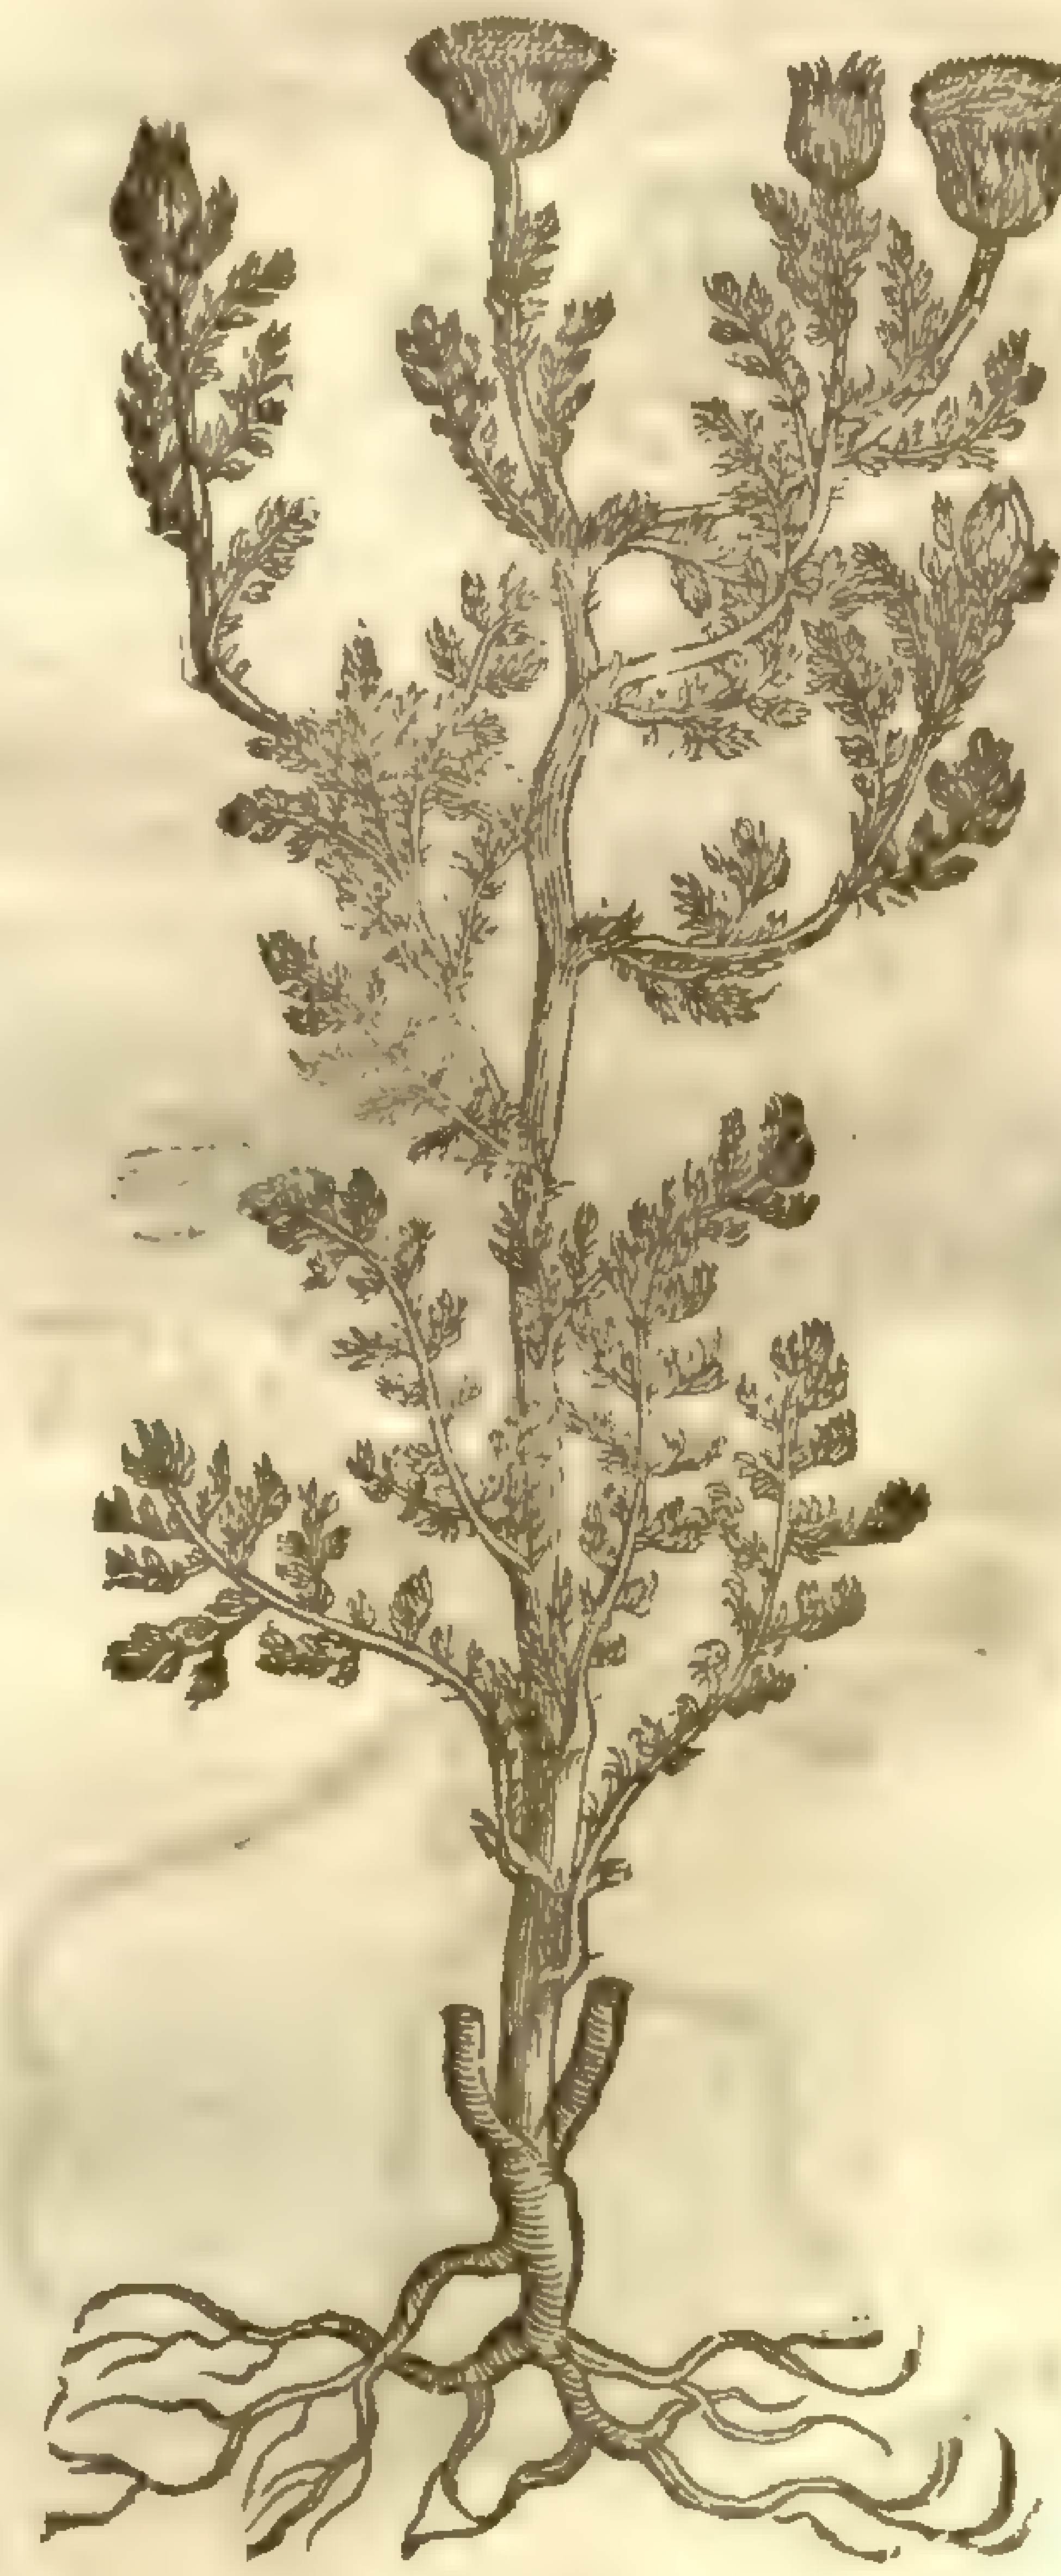
1 CORne Marigold or golden Corne floure hath a ſoft ſtalke, hollow, and of a greene colour, whereupon do grow great leaues, much hact and cut into diuers ſections, and placed confuſedly or out of order: vpon the top of the branches ſtand faire ſtar-like flours, yellow in the middle, and ſuch likewiſe is the pale or border of leaues that compaſſeth the ſoft ball in the middle, like that in the middle of Camomill floures, of a reaſonable pleaſant ſmel. The roots are full of ſtrings.

† 1 *Chryſanthemum ſegetum.*
Corne Marigold.

C. [illegible]



2 *Chryſanthemum Valentinum.*
Corne Marigold of Valentia.



2 The golden floure of Valentia hath a thick fat ſtalk, tough, vneuen, and ſomewhat crooked, whereupon do grow long leaues, conſiſting of a long middle rib, with diuers little fether-like leaues ſet thereon without order. The floures grow at the top of the ſtalks, compoſed of a yellow thrummie matter, ſuch as in the middle of the Camomill floures, and is altogether like the Corne Marigold laſt deſcribed, ſauing it doth want that border or pale of little leaues that doe compaſſe the ball or head: the root is thicke, tough, and diſperſeth it ſelfe far abroad.

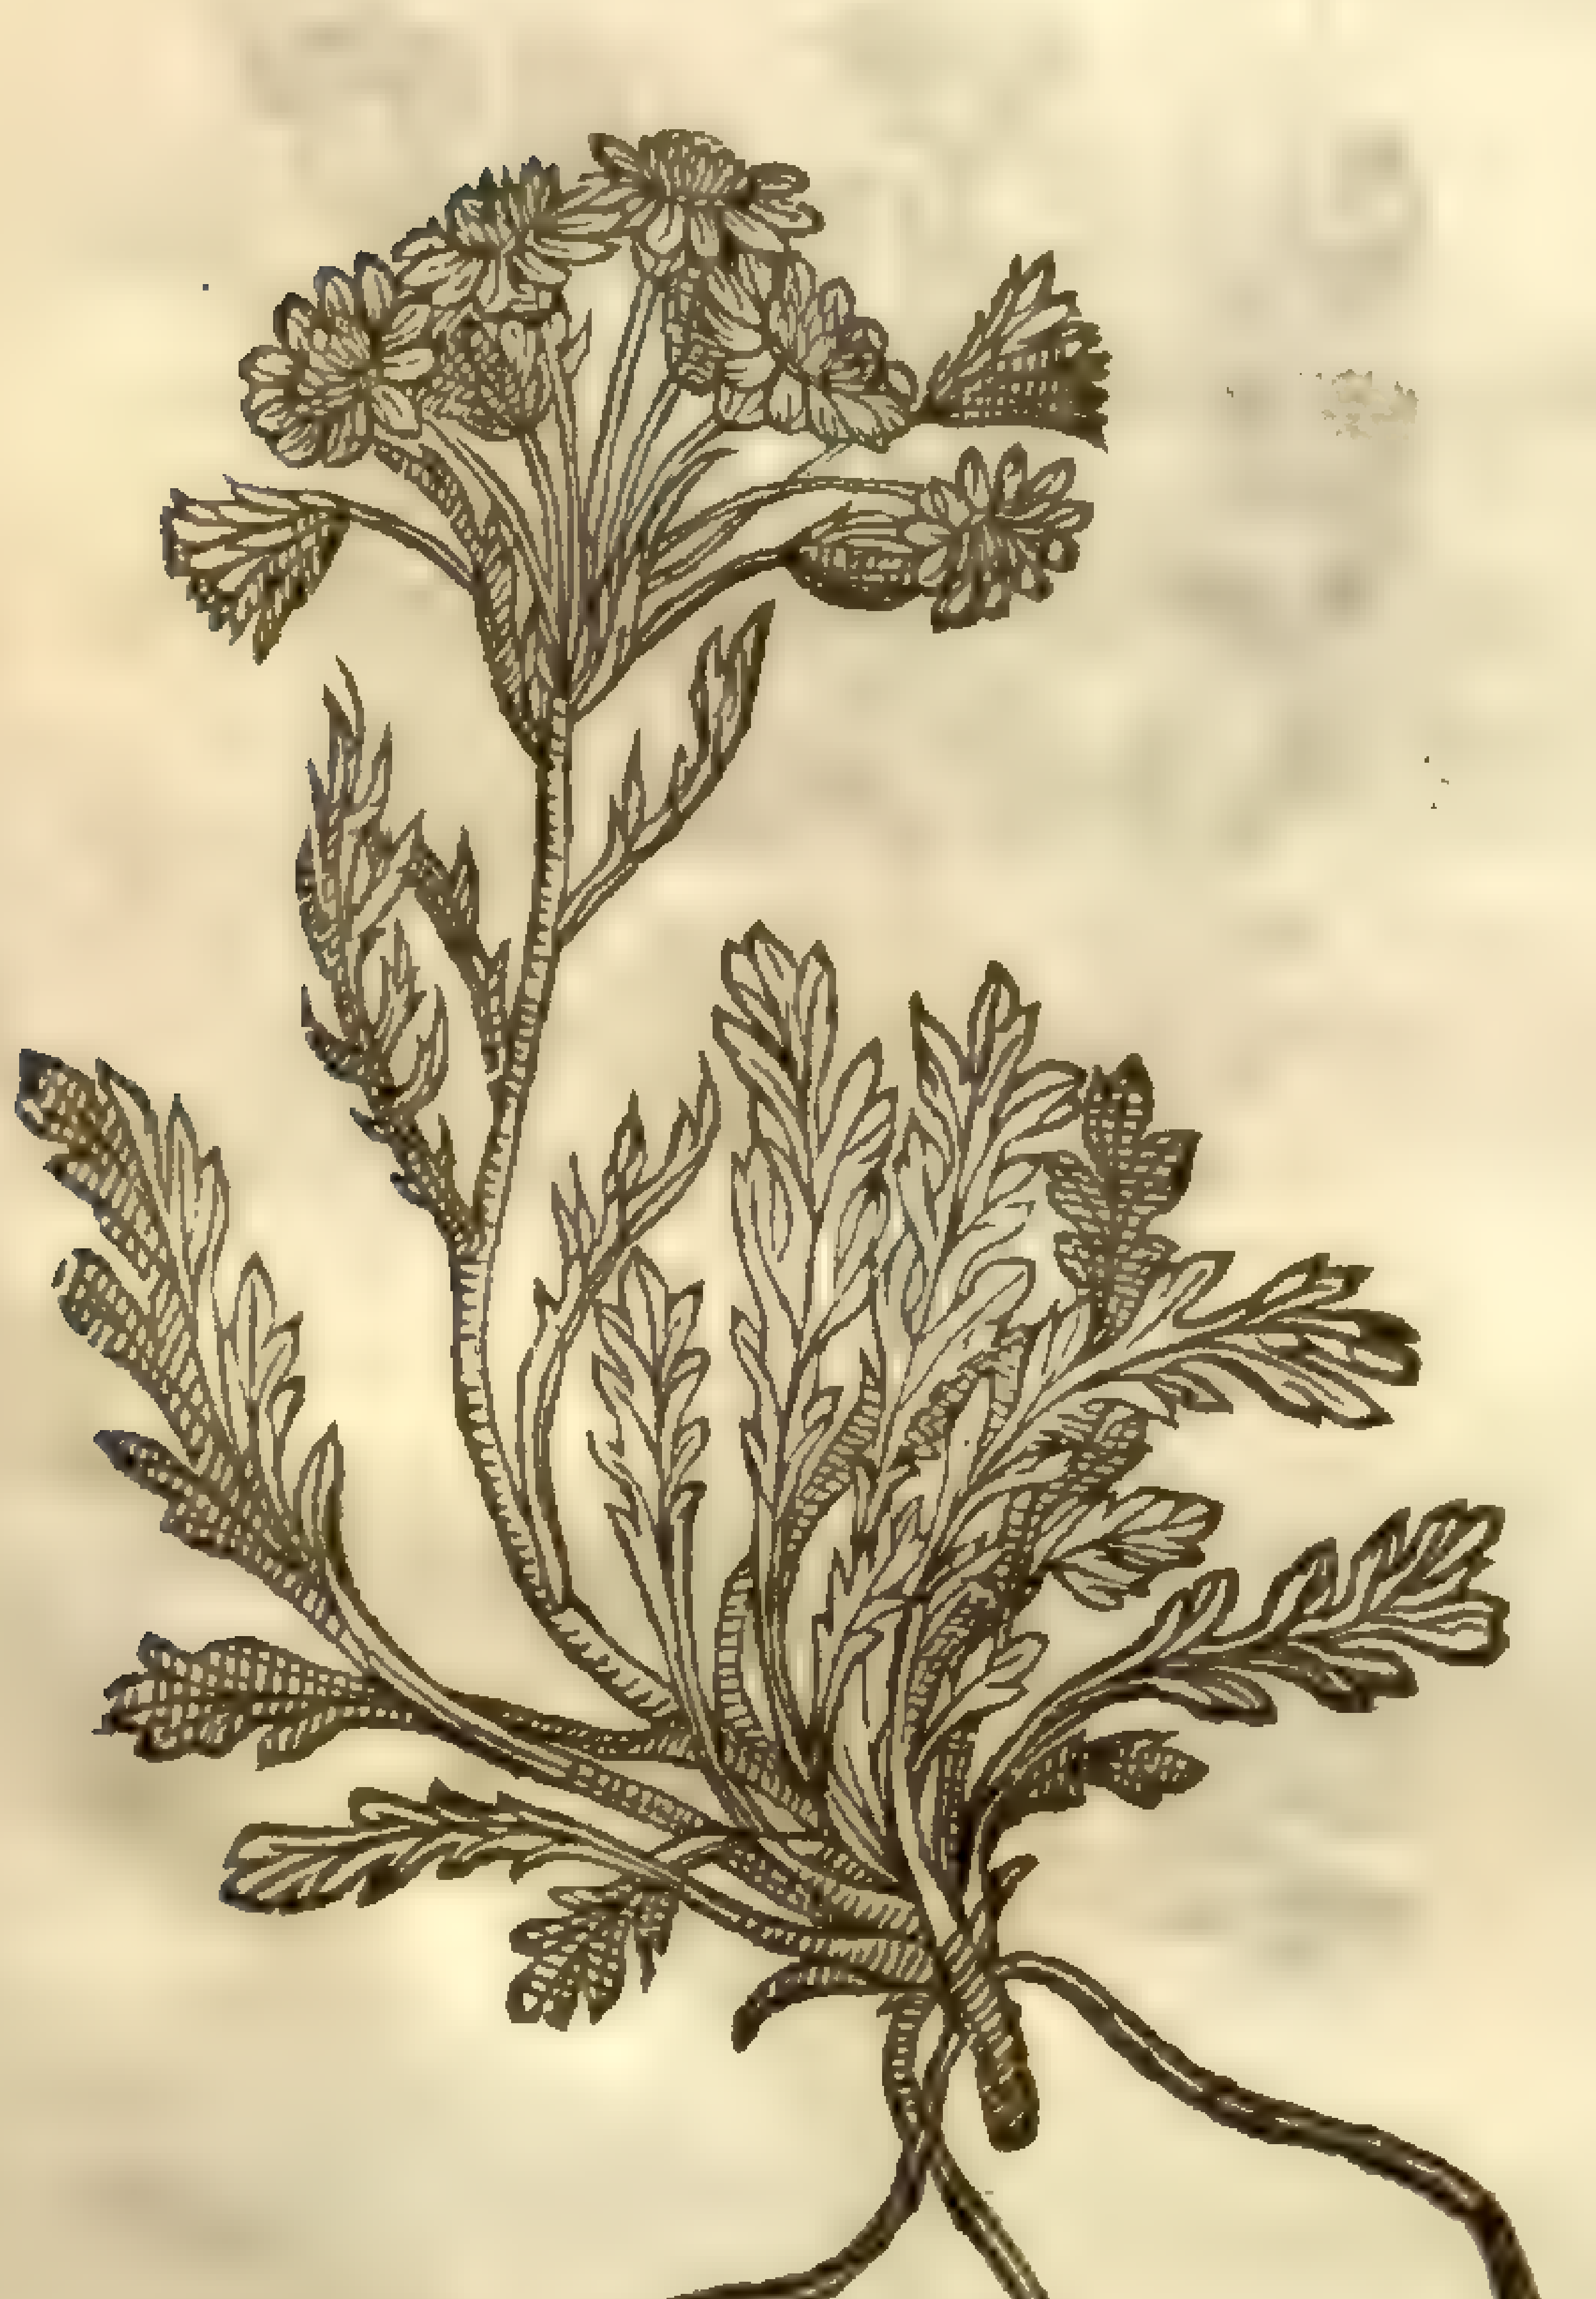
‡ 3 To theſe may be added diuers other, as the *Chryſanthema Alpina*, of *Cluſius*, and his *Chryſanthemum Creticum*, & others. The firſt of theſe ſmal mountain Marigolds of *Cluſius* his deſcription hath leaues like thoſe of white Wormewood, but greener and thicker: the ſtalkes grow ſome handfull high, ſet with few and much diuided leaues; and at the tops, as in an vmbell, they carry ſome dozen

floures more or leſſe, not much vnlike in ſhape, colour, and ſmell, to thoſe of the common *Iacobæa*, or Ragwort. The root is ſomewhat thicke, and puts forth many long white fibres. It floures in Iuly and Auguſt, and growes vpon the Alpes of Stiria. *Cluſius* calls it *Chryſanthemum Alpinum*. 1.

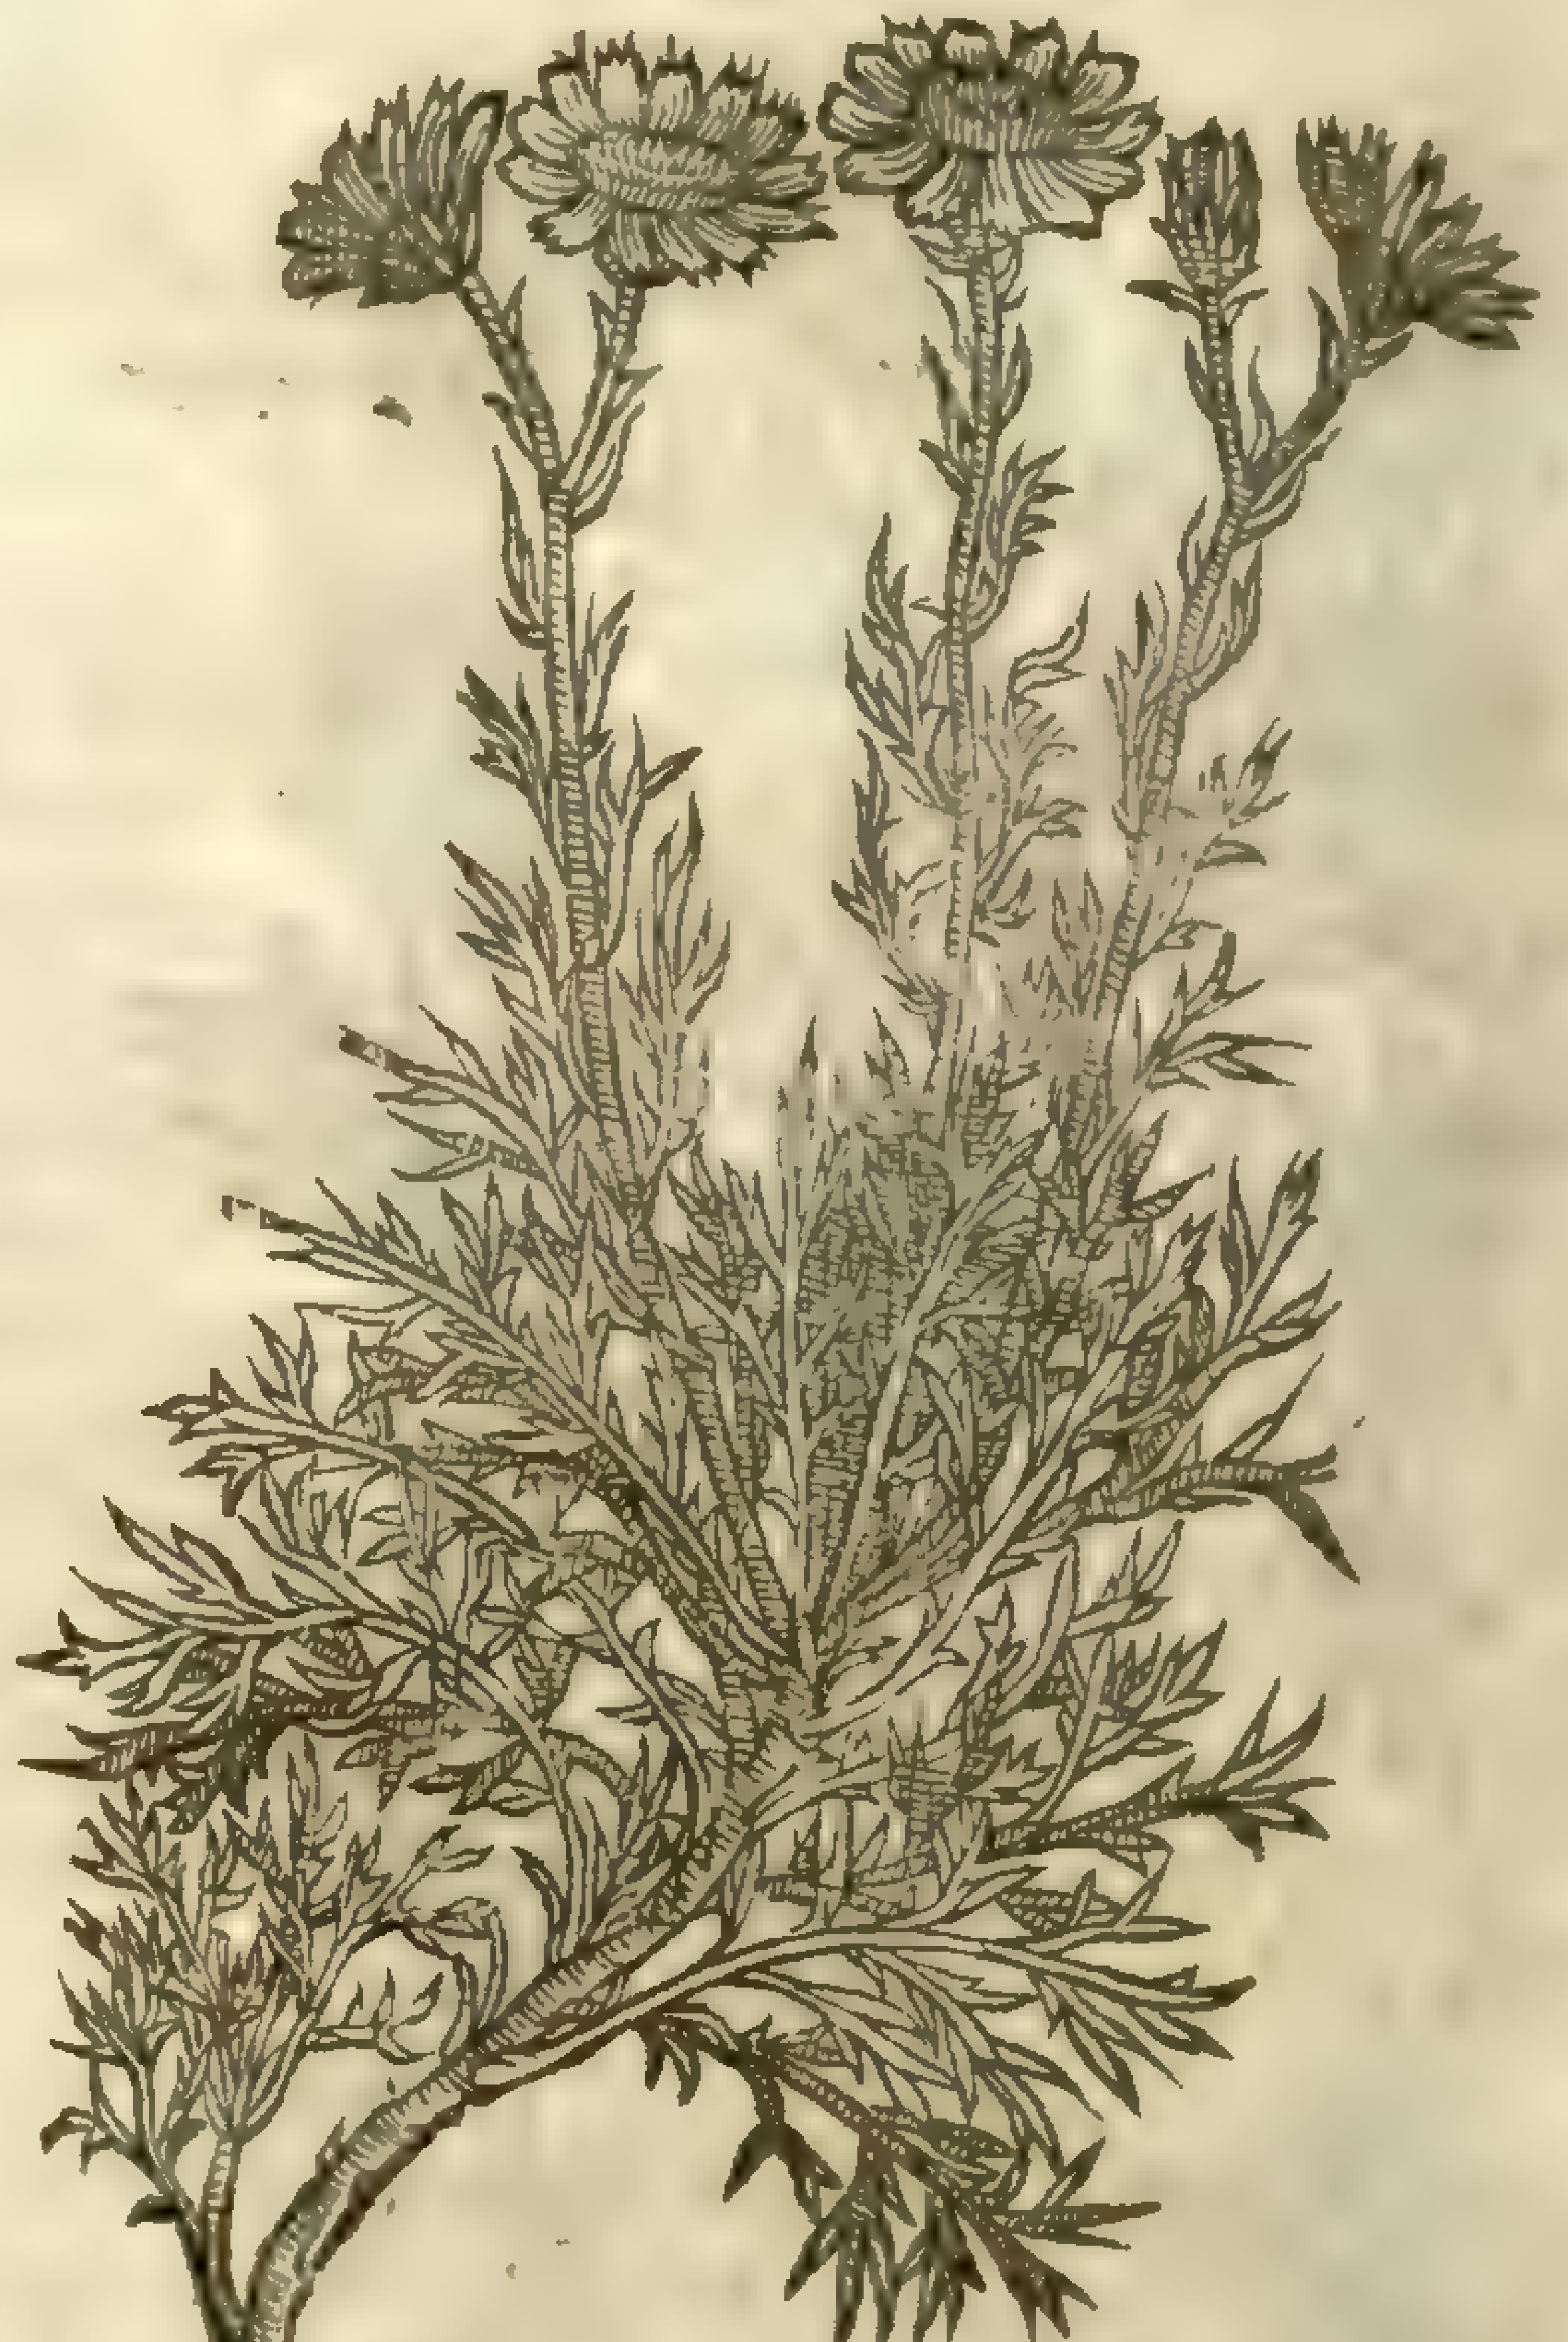
4 The ſecond of his deſcription hath many leaues at the root, like to the leaues of the male Sothernwood, but of a lighter and brighter greene, and of no vnpleaſant ſmell, though the taſte be bitteriſh and vngratefull: in the middeſt of the leaues grow vp ſtalkes ſome foot high, diuided at their tops into ſundry branches, which carry each of them two or three floures bigger than, yet like thoſe of the common Camomill, but without ſmell, and wholly yellow: the root is fibrous, blackiſh and much ſpreading. It floures in Auguſt, and growes in the like places as the former. *Bauhine* iudges this to be the *Achillæa montana Artemiſiæ tenuifoliæ facie* of the *Aduerſ.* and the *Ageratum ferulaceum* in the *Hiſt. Lugd.* But I cannot be of that opinion; yet I iudge the *Achillæa montana*, and *Ageratum ferulaceum* to be but of the ſame plant. But different from this, and that chiefly in that it hath many more, and thoſe much leſſe floures than thoſe of the plant here figured and deſcribed.

5 Now ſhould I haue giuen you the Hiſtorie of the *Chryſanthemum Creticum* of the ſame Authour, but that my friend Mr. *Goodyer* hath ſaued me the labour, by ſending an exact deſcription thereof, together with one or two others of this kinde, which I thinke fit here to giue you.

‡ 3 *Chryſanthemum Alpinum* 1. *Cluſ.*
Small mountaine Marigold.



‡ 4 *Chryſanthemum Alpinum* 2. *Cluſ.*
The other Alpine Marigold.

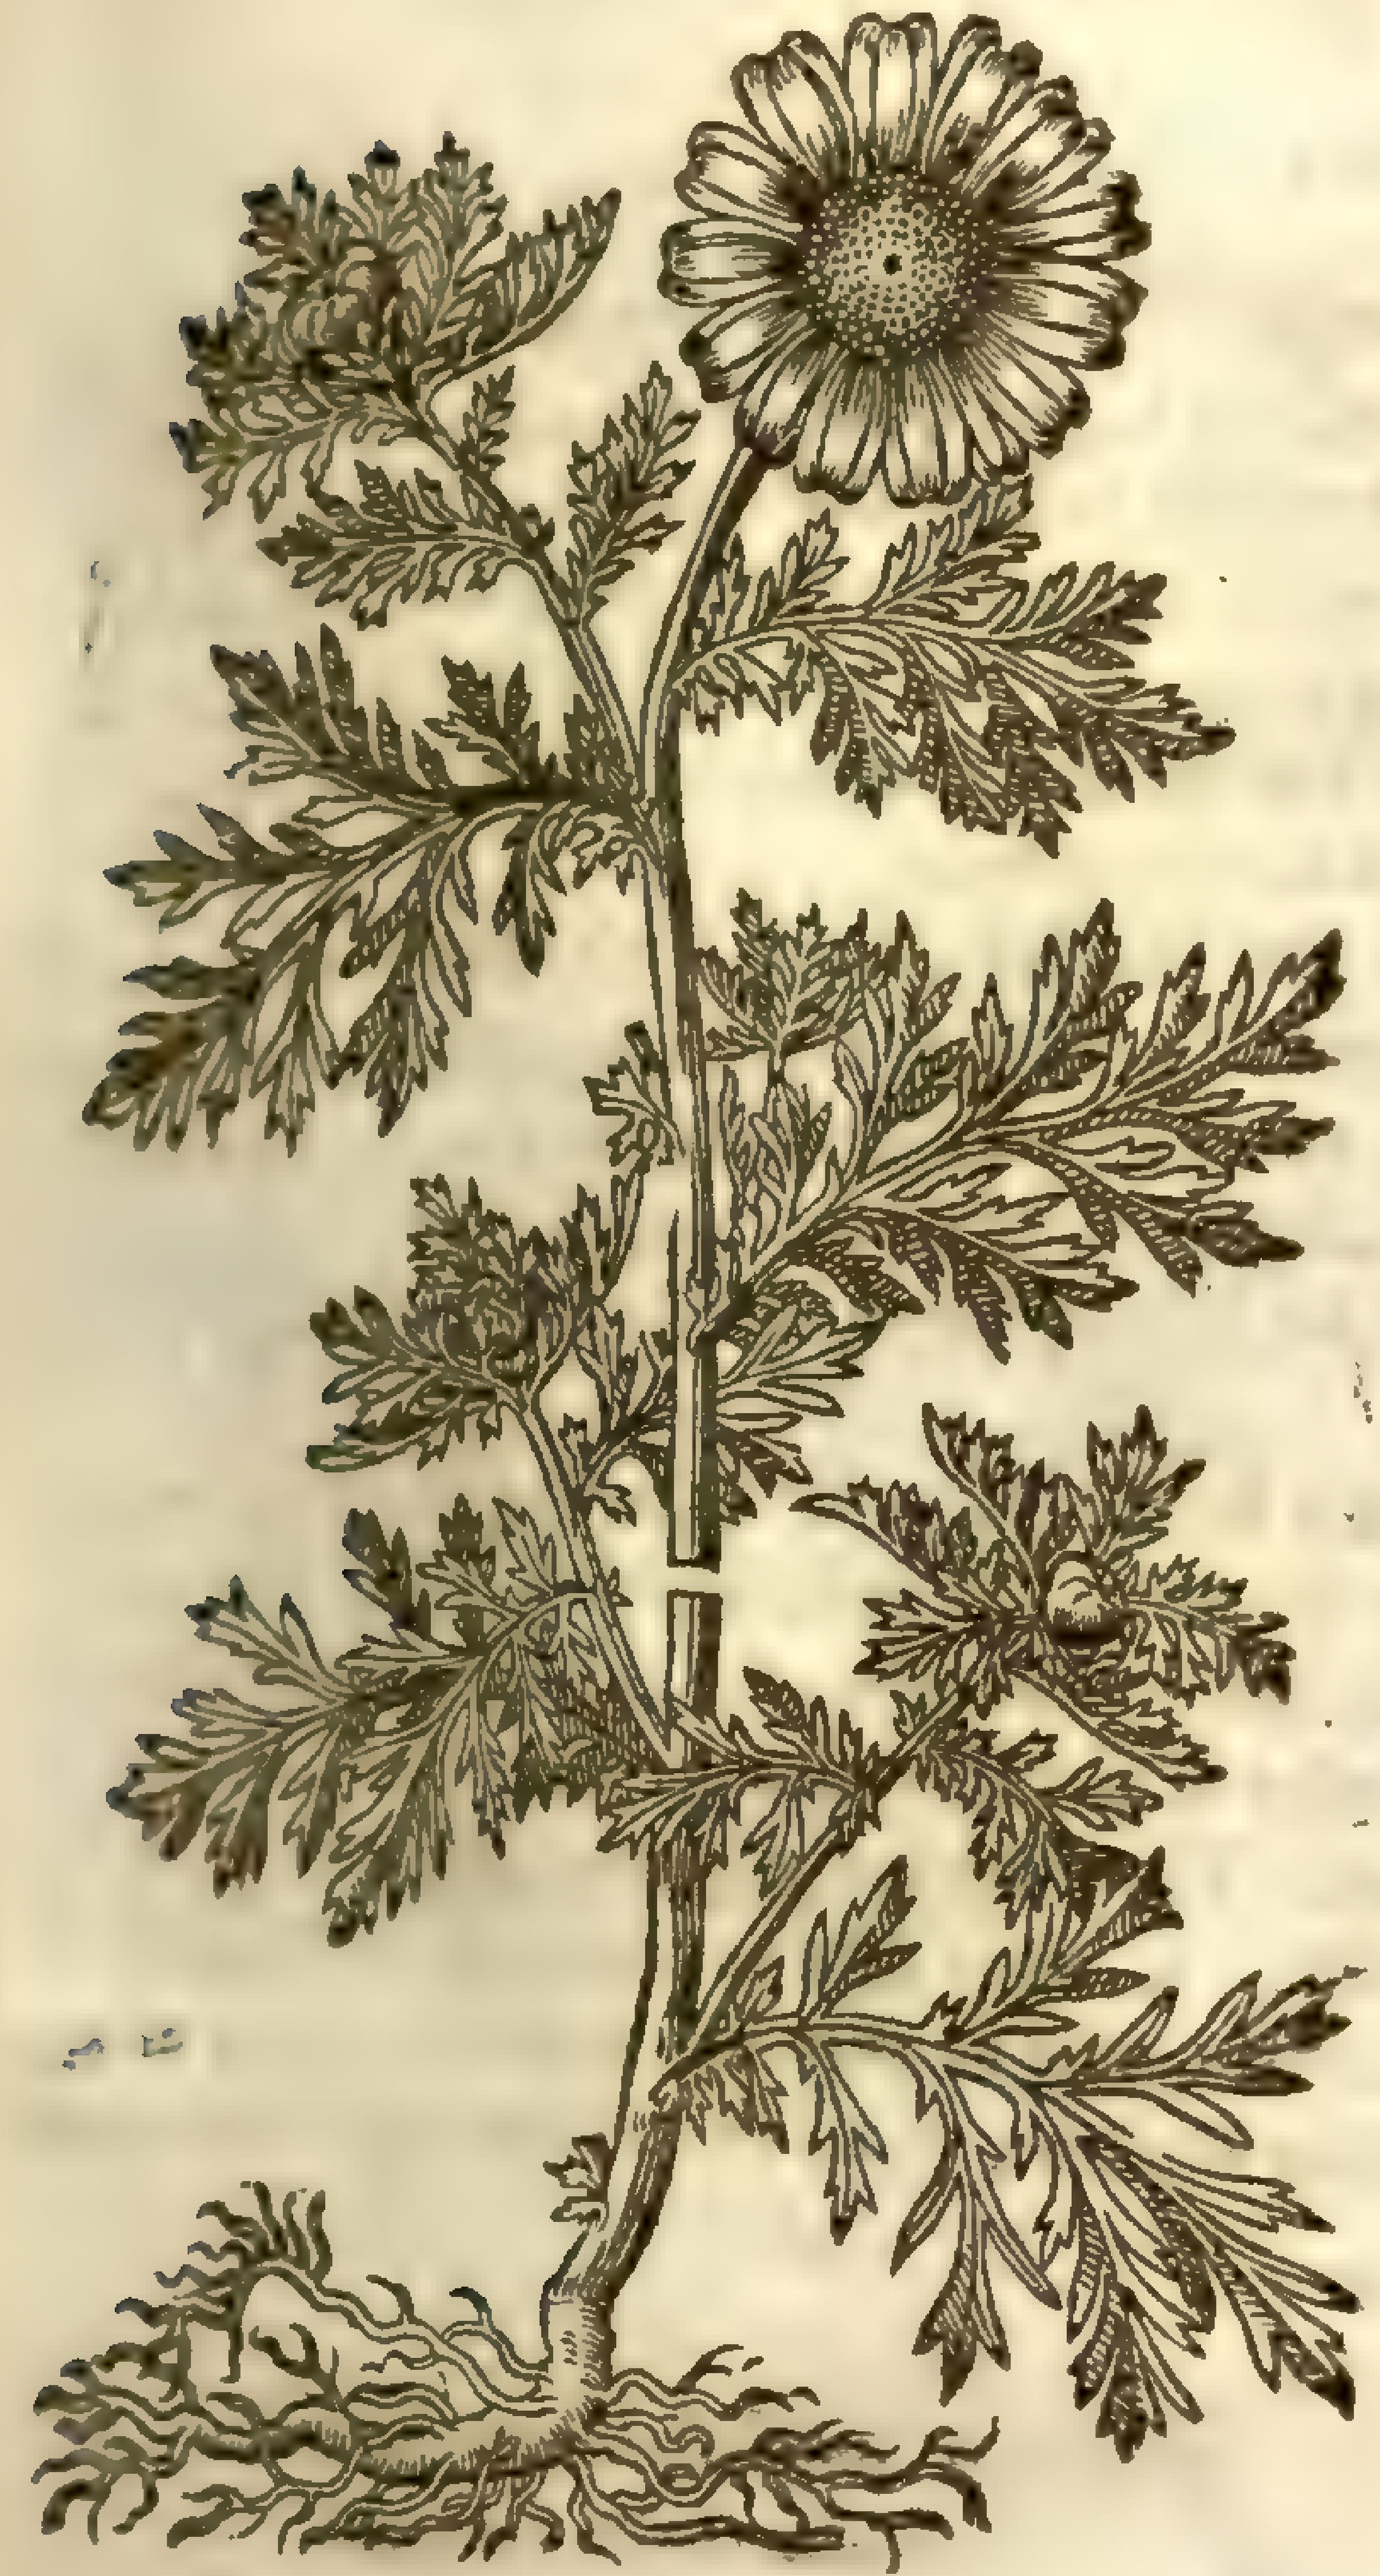


Chryſanthemum Creticum primum Cluſij, pag. 334.

The ſtalkes are round, ſtraked, branched, hard, of a whitiſh greene, with a very little pith within; neere three foot high: the leaues grow out of order, diuided into many parts, and thoſe againe ſnipt or diuided, of the colour of the ſtalkes: at the tops of the ſtalkes and branches grow great floures, bigger than any of the reſt of the Corne-floures, forth of ſcaly heads, conſiſting of twelue or more broad leaues apiece, notched at the top, of a ſhining colden colour at the firſt, which after turne to a pale, whitiſh, or very light yellow, and grow round about a large yellow ball, of ſmell ſomewhat ſweet. The floures paſt, there commeth abundance of ſeed cloſely compact or thruſt together, and it is ſhort, blunt at both ends, ſtraked, of a ſalue colour, ſomwhat flat, and of a reaſonable bignes. The

root

‡ 5 *Chryſanthemum Creticum.*
Candy Corne Marigold.



root is whitiſh, neere a fingers bigneſſe, ſhort, with many threds hanging thereat, and periſheth when the ſeed is ripe; and at the Spring groweth vp againe by the falling of the ſeed.

Chryſanthemum Bæticum Boelij, inſcriptum.

The ſtalks are round, ſtraked, reddiſh brown, diuided into branches, containing a ſpungious white pith within, a cubit high: the leaues grow out of order, without foot-ſtalkes, about three inches long, and an inch broad, notched about the edges, not at all diuided, of a darke greene colour: the floures grow at the tops of the ſtalkes and branches, forth of great ſcaly heads, containing twentie leaues apiece or more, notched at the top, of a ſhining yellow colour, growing about a round yellow ball, of a reaſonable good ſmell, very like thoſe of the common *Chryſanthemum ſegetum*: the ſeed groweth like the other, and is very ſmall, long, round, crooked and whitiſh: the root is ſmall, whitiſh, threddy, and periſheth alſo when the ſeed is ripe.

Chryſanthemum tenuifolium Bæticum Boelij.

The ſtalks are round, ſmall, ſtraked, reddiſh, ſomewhat hairie, branched, a cubit high, or higher: the leaues are ſmal, much diuided, jagged, and very like the leaues of *Cotula fœtida*: the floures are yellow, ſhining like gold, compoſed of thirteene or fourteene leaues a piece, notched at the top, ſet about a yellow ball, alſo like the common *Chryſanthemum ſegetum*: the ſeed groweth amongſt white flattiſh ſcales, which are cloſely compacted in a round head together, and are ſmall, flat, grayiſh, and broad at the top: the root is ſmall, whitiſh, with a few threds, and dyeth when the ſeed is ripe. Iuly 28. 1621. *Iohn Goodyer.* ‡

¶ *The Place.*

The firſt groweth among corne, and where corne hath been growing: it is found in ſome places with leaues more jagged, and in others leſſe.

The ſecond is a ſtranger in England.

¶ *The Time.*

They floure in Iuly and Auguſt.

¶ *The Names.*

Theſe plants are called by one name in Greeke, of the golden glittering colour, χρυσάνθεμον: in High Dutch, **Sant Johans blum**: in Low Dutch, **Wokelaer**: in Engliſh, Corne Marigold, yellow Corne floure, and golden Corne floure.

There be diuers other floures called *Chryſanthemum* alſo, as *Batrachion*, a kinde of yellow Crowfoot, *Heliochryſon*, but theſe golden floures differ from them.

¶ *The Temperature.*

They are thought to be of a meane temperature betweene heat and moiſture.

¶ *The Vertues.*

The ſtalkes and leaues of Corne Marigold, as *Dioſcorides* ſaith, are eaten as other pot-herbes are. A

The floures mixed with wax, oile, roſine, and frankinſence, and made vp into a ſeare-cloth, waſte away cold and hard ſwellings. B

The herbe it ſelfe drunke, after the comming forth of the bath, of them that haue the yellow jaundiſe, doth in ſhort time make them well coloured. C

† The figure that was in the firſt place was of the *Chryſanthemum* of *Matthiolus*, which is a ſtranger with vs, and the leaues of it are much like thoſe of Feuerfew, or Mugwort, the floure is ſomewhat like, but larger than that of Feuerfew, and wholly yellow.

Chap.

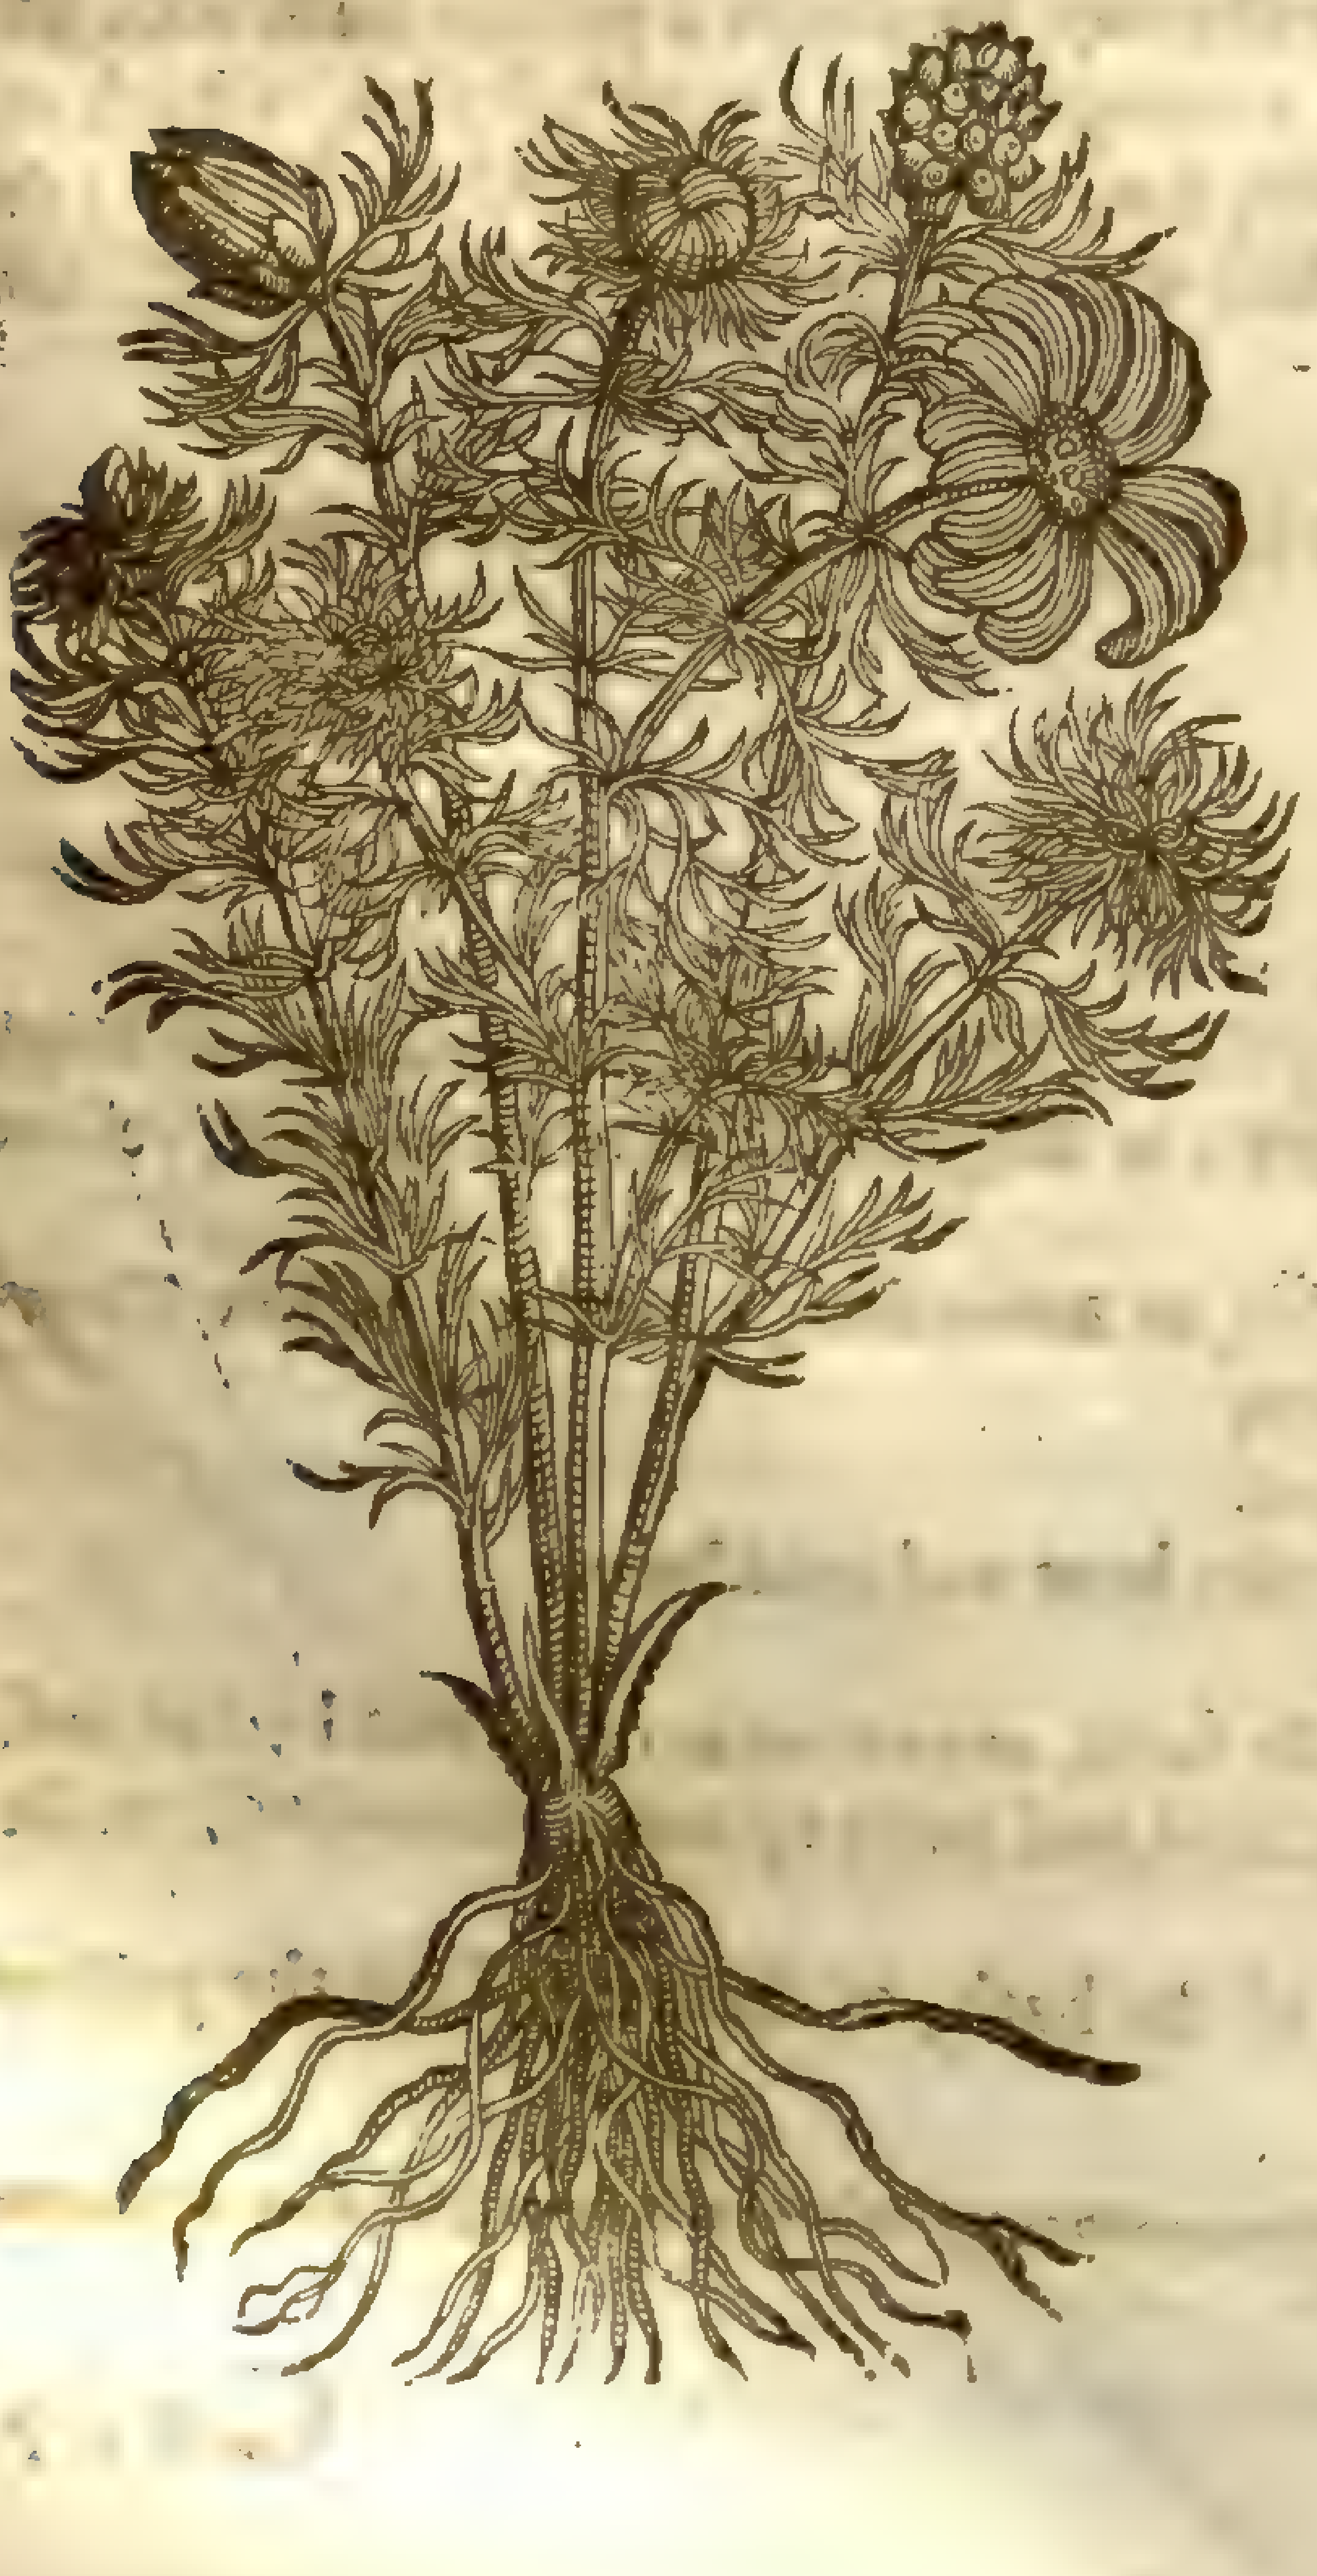
Chap. 257. *Of Oxe-Eie.*

¶ *The Deſcription.*

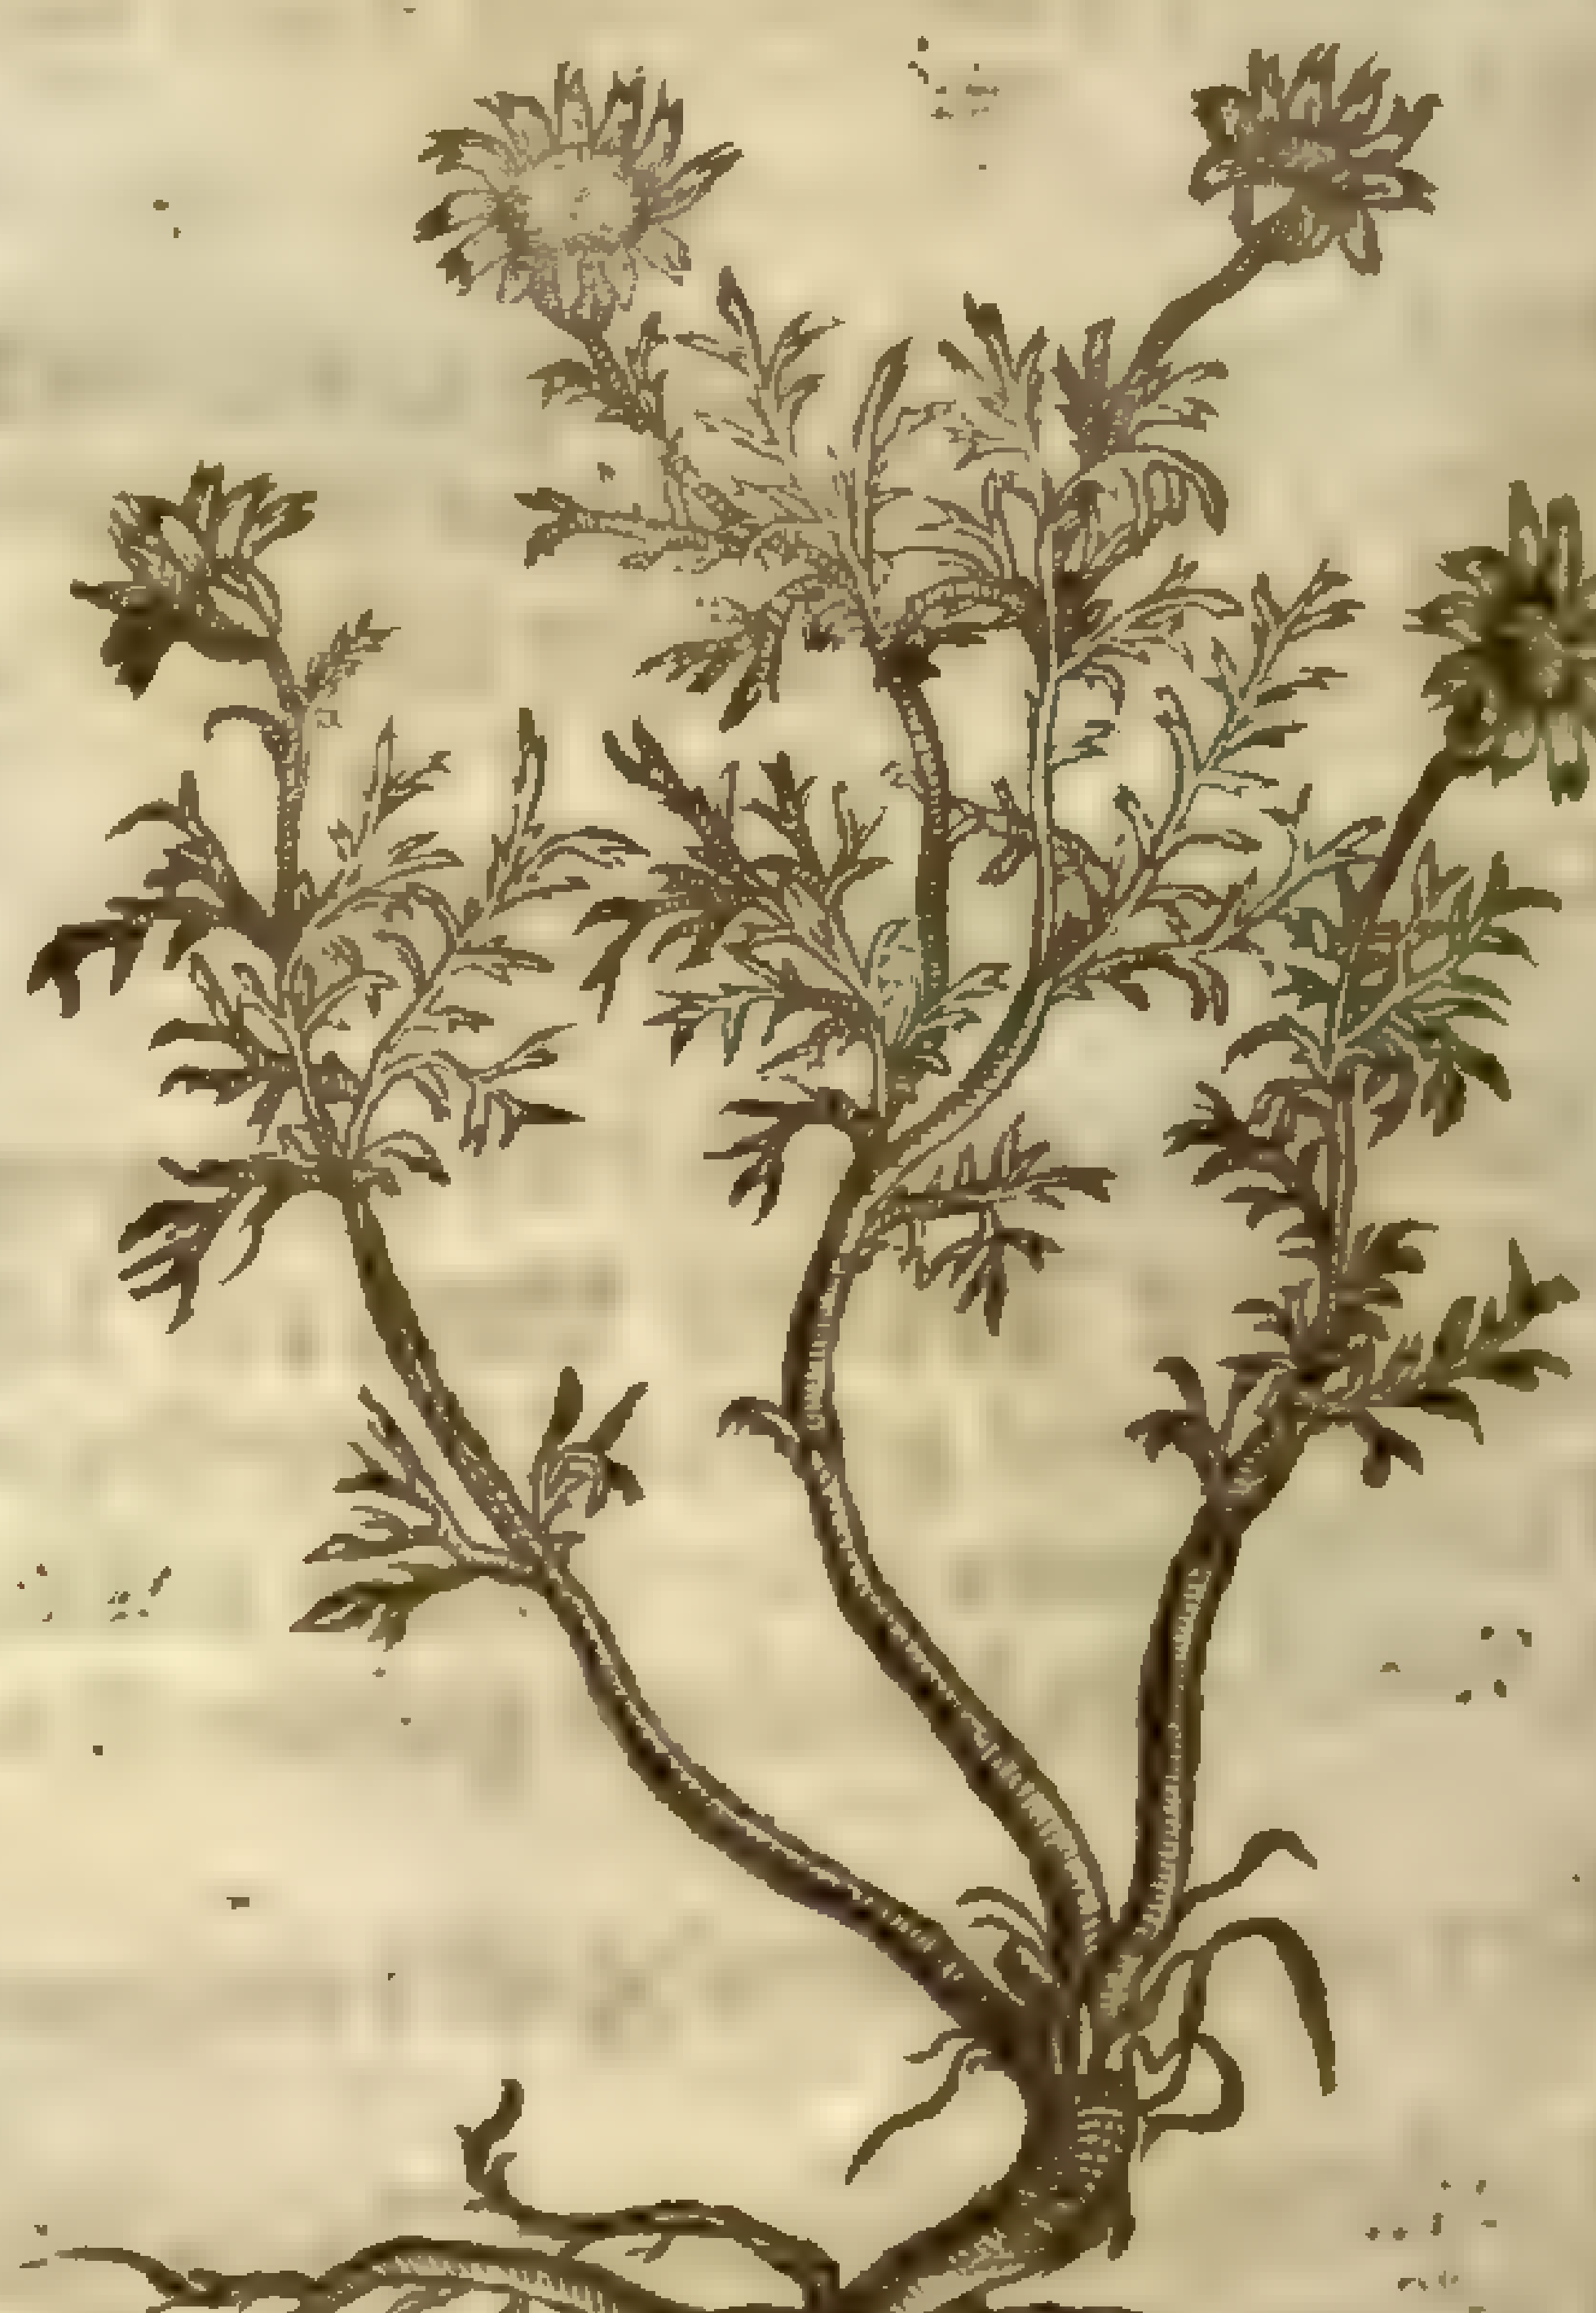
1 THe plant which we haue called *Buphthalmum*, or Oxe-eie, hath ſlender ſtalkes growing from the roots, three, foure, or more, a foot high, or higher, about which be green leaues finely jagged like to the leaues of Fenell, but much leſſer: the floures in the tops of the ſtalks are great, much like to Marigolds, of a light yellow colour, with yellow threds in the middle, after which commeth vp a little head or knap like to that of red Mathes before deſcribed, called *Adonis*, conſiſting of many ſeeds ſet together. The roots are ſlender, and nothing but ſtrings, like to the roots of blacke Ellebor, whereof it hath beene taken to be a kinde.

2 The Oxe-eie which is generally holden to be the true *Buphthalmum*, hath many leaues ſpred vpon the ground, of a light greene colour, laied far abroad like wings, conſiſting of very many fine jags, ſet vpon a tender middle rib: among which ſpring vp diuers ſtalks, ſtiffe and brittle, vpon the top whereof do grow faire yellow leaues, ſet about a head or ball of thrummie matter, ſuch as is in the middle of Cammomill, like a border or pale. The root is tough and thicke, with certain ſtrings faſtned thereto.

3 The white Oxe-eie hath ſmall vpright ſtalkes of a foot high, whereon do grow long leaues, compoſed of diuers ſmall leaues, and thoſe ſnipt about the edges like the teeth of a ſaw. The flours grow on the tops of the ſtalks, in ſhape like thoſe of the other Oxe-eie; the middle part whereof is likewiſe made of a yellow ſubſtance, but the pale or border of little leaues are exceeding white, like thoſe of great Daſie, called *Conſolida media vulnerariorum*. The root is long, creeping alongſt vnder the vpper cruſt of the earth, whereby it greatly increaſeth. ‡ This by the common conſent of all writers that haue deliuered the hiſtory thereof, hath not the pale or out-leaues of the floure white, as our Author affirmes, but of a bright and perfect yellow colour. And this is the *Buphthalmum*, of *Tragus*, *Matthiolus*, *Lobel*, *Cluſius* and others. ‡



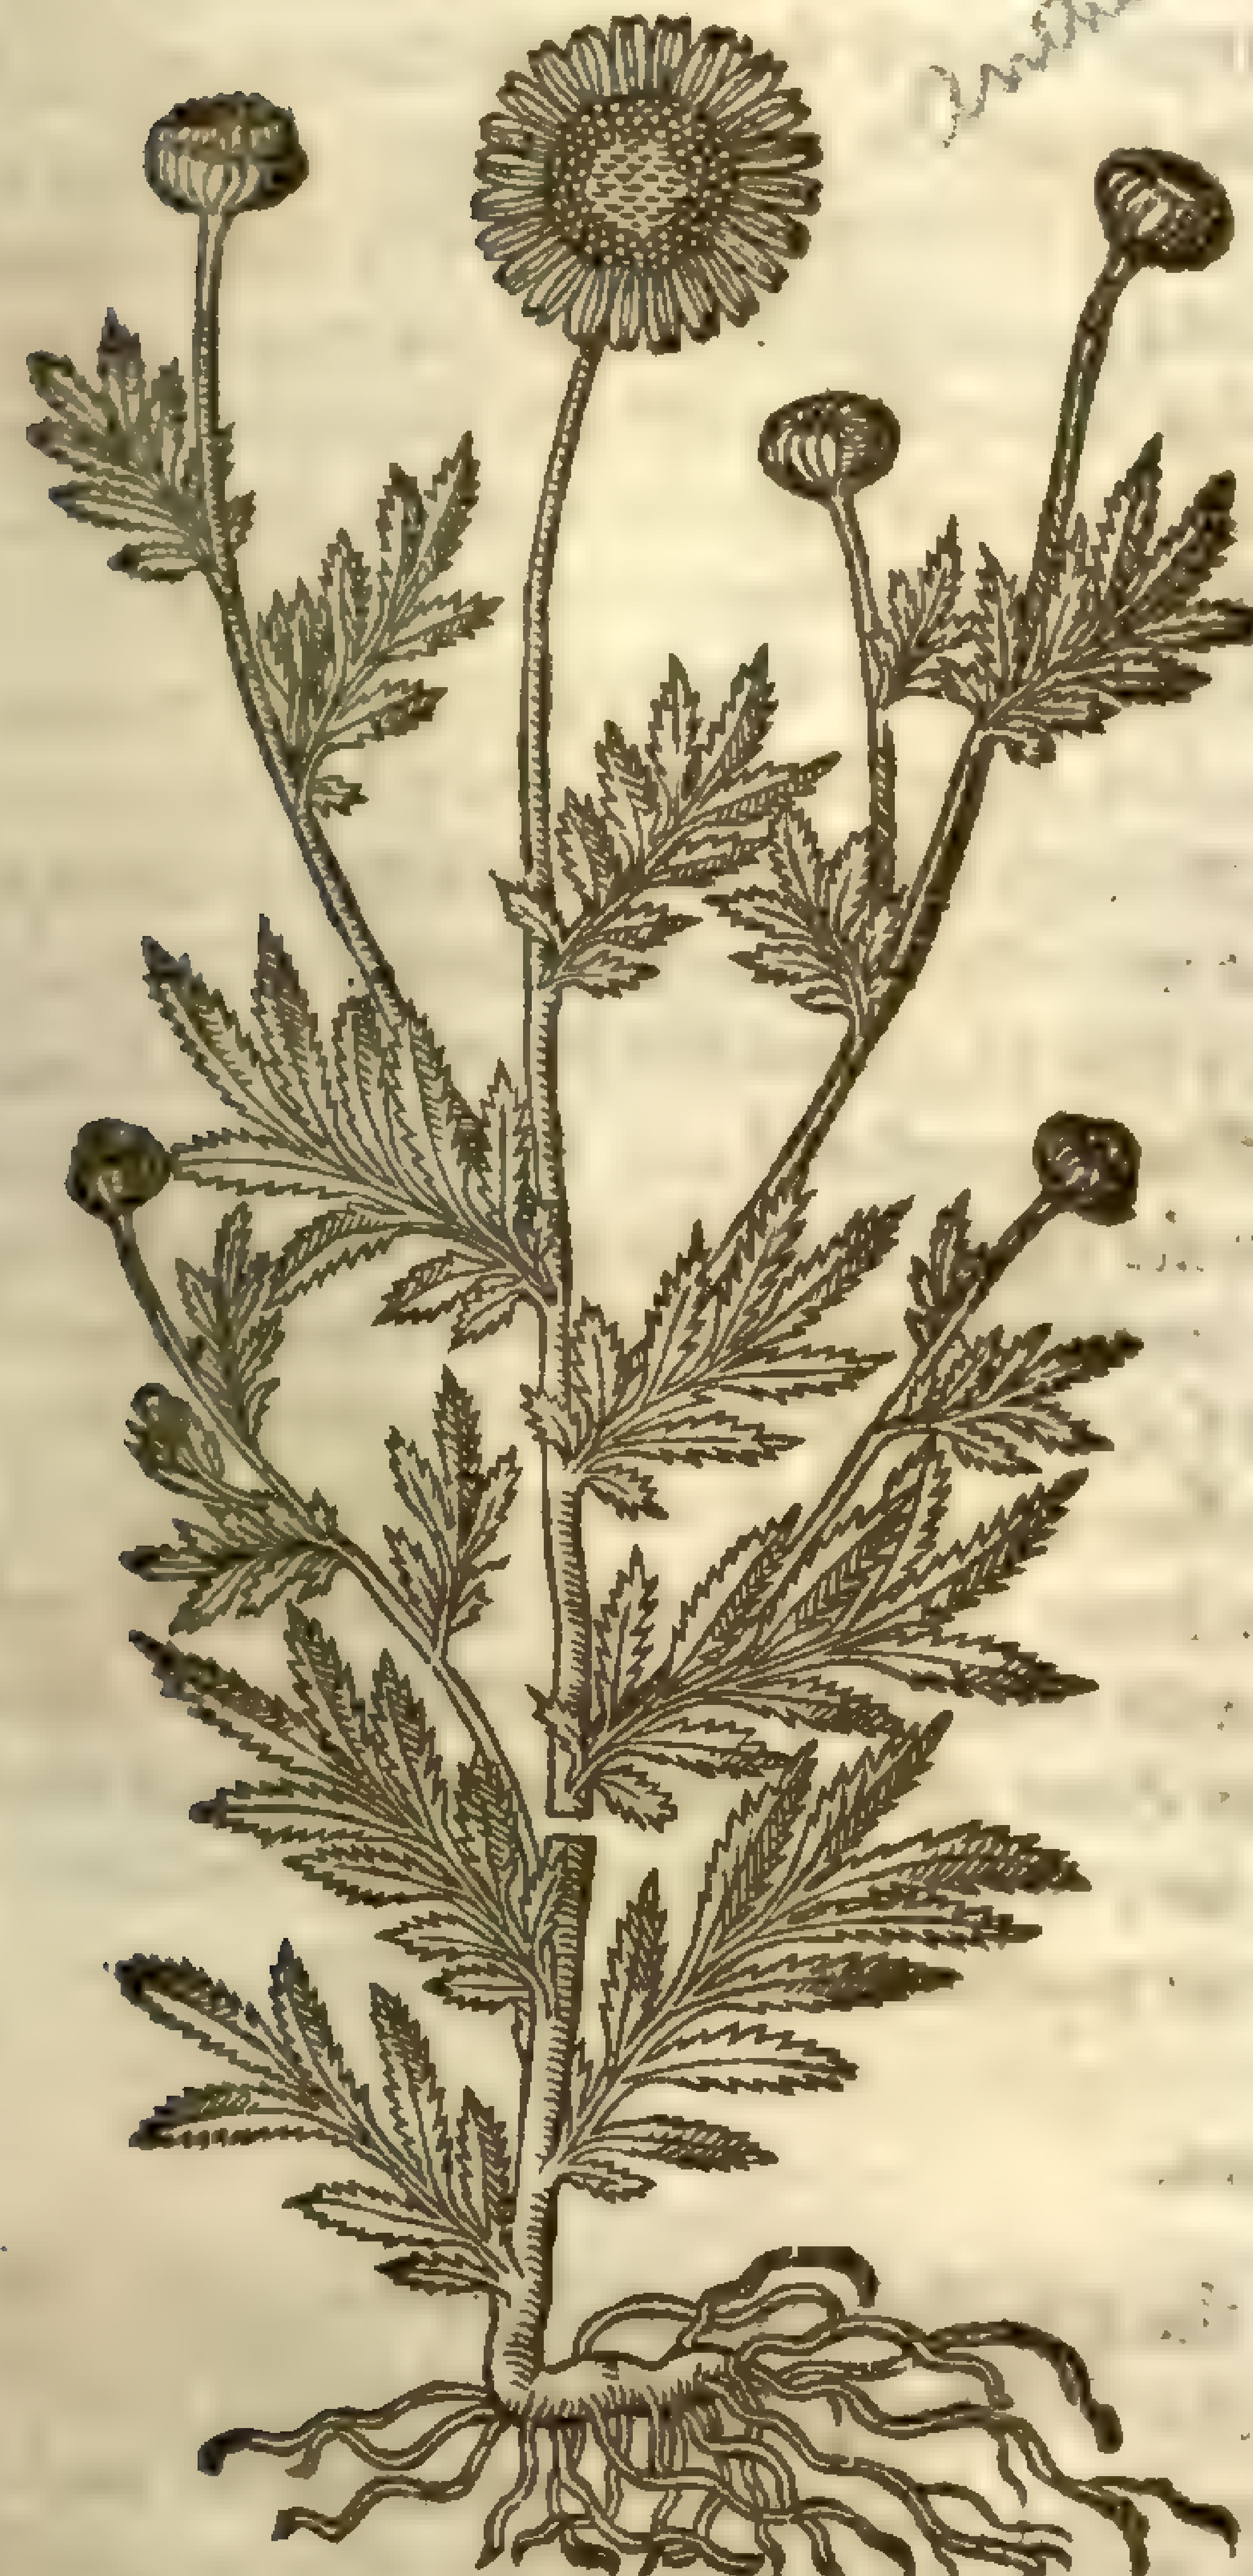
1 *Buphthalmum ſiue Helleborus niger ferulaceus.*
Oxe-eie.



2 *Buphthalmum verum.*
The right Oxe-eie.

3 *Buphthalmum vulgare.*
White Oxe-eie.

Anthemis tinctoria [illegible]



¶ *The Place.*

The two firſt grow of themſelues in Germany, Bohemia, and in the Gardens of the Low-countries; of the firſt I haue a plant in my Garden. The laſt groweth in barren paſtures and fields almoſt euery where.

‡ The laſt is alſo a ſtranger with vs, for any thing that I know or can learne; neither can I conjecture what our Authour meant here: firſt in that he ſaid the floures of this were white, and ſecondly in that it grew in barren paſtures and fields almoſt euery where. ‡

¶ *The Time.*

They floure in May and Iune. The laſt in Auguſt.

¶ *The Names.*

Touching the naming of the firſt of thoſe plants the later writers are of diuers opinions: ſome would haue it to be a kind of *Veratrum nigrum*, black Hellebor: otherſome *Conſiligo*; and againe, others, *Seſamoides*; and ſome, *Elleboraſtrum*: But there be found two kinds of blacke Ellebor among the old writers, one with a leafe like vnto Laurel, with the fruit of *Seſamum*: the other with a leafe like that of the Plane tree, with the ſeed of *Carthamus*, or Baſtard Saffron. But it is moſt euident, that this *Buphthalmum*, in Engliſh, Oxe-eie, which in this Chapter we in the firſt place haue deſcribed, doth agree with neither of theſe: what form *Conſiligo* is of, we find not among the old writers. *Pliny*, 26. *cap*. 7. ſaith, That in his time it was found amongſt the *Marſi*, & was a preſent remedy for the infirmity of the lungs of ſwine, and of all kind of cattel, though it were but drawne through the eare. *Columella* in his 6. booke, chap. 5. doth alſo ſay, that in the mountaines called Marſi there is very great ſtore thereof, and that it is very helpfull to all kind of cattell, and he telleth how and in what manner it muſt be put into the eare, the roots alſo of our Oxe-eie are ſaid to cure certaine infirmities of cattell, if they be put into the ſlit or bored eare: but it followeth not that for the ſame reaſon it ſhould be *Conſiligo*; and it is an ordinary thing to finde our plants that are of a like force and quality: for *Pliny* doth teſtifie in his 25. booke, 5. chapter, That the roots alſo of blacke Ellebor can do the ſame: it cureth (ſaith he) the cough in cattell, if it be drawne through the eare, and taken out again the next day at the ſame houre: which is likewiſe moſt certaine by experiments of the country men of our age; who do cure the diſeaſes of their cattell with the roots of common black Ellebor. The roots of white Ellebor alſo do the like, as *Abſyrtus*, and after him *Hierocles* doth write: who notwithſtanding do not thruſt the roots of white Ellebor into the eare, but vnder the skin of the breſt called the dew lap: after which manner alſo *Vegetius Renatus* doth vſe *Conſiligo*, in his firſt booke of the curing of cattell, chapter 12. intituled, Of the cure of the infirmities vnder the skin: although in his 3. booke 2 chapter, *de Malleo*, he writeth, that they alſo muſt be faſtned thorow the eare: which things do ſufficiently declare, that ſundry plants haue oftentimes like faculties: and that it doth not at all follow by the ſame reaſon, that our Oxe-eie is *Conſiligo*, becauſe it doth cure diſeaſes in cattell as well as *Conſiligo* doth. But if we muſt conjecture by the faculties, *Conſiligo* then ſhould be White Ellebor: for *Vegetius* vſeth *Conſiligo* in the very ſame manner that *Abſyrtus* and *Hierocles* do vſe White Ellebor. This ſuſpition is made the greater, becauſe it is thought that *Vegetius* hath taken this manner of curing from the Græcians; for which cauſe alſo moſt doe take *Conſiligo* to be nothing elſe but white Ellebor: the which if it be ſo, then ſhall this preſent Oxe-eie much differ from *Conſiligo*; for it is nothing at all like to White Ellebor.

And that the ſame is not *Seſamoides*, either the firſt or the ſecond, it is better knowne, than needfull to be confuted.

This ſame alſo is vnproperly called *Helleboraſtrum*; for that may aptly be called *Helleboraſtrum* which hath the forme and likeneſſe of Hellebor: and this Oxe-eie is nothing at all like to Ellebor. For all which cauſes it ſeemeth that none of theſe names agree with this plant, but only the name *Buphthalmum*, with whoſe deſcription which is extant in *Dioſcorides*, this plant doth moſt aptly agree. We take it to be the right Ox e-eie; for Oxe-eie bringeth forth ſlender ſoft ſtalkes, and hath leaues of the likeneſſe or ſimilitude of Fennell leaues: the floure is yellow, bigger than that of Cammomill, euen ſuch an one is this preſent plant, which doth ſo exquiſitly expreſſe that forme or likeneſſe of Fennell leaues, both in ſlenderneſſe and manifold jaggedneſſe of the leaues, as no other little leafed herbe can doe better; ſo that without all doubt this plant ſeemeth to be the true and right Oxe eie. Oxe eie is called *Cachla*, or rather *Caltha*; but *Caltha* is *Calendula*, or Marigold, which we ſaid that our Oxe-eie in floure did neereſt repreſent. There are ſome that would haue *Buphthalmum* or Oxe-eie to be *Chryſanthemum*, and ſay that *Dioſcorides* hath in ſundry places, and by diuers names intreated of this herbe; but if thoſe men had ſomewhat more diligently weighed *Dioſcorides* his words, they would haue been of another minde: for although deſcriptions of either of them do in many things agree, yet there is no property wanting that may ſhew the plants to differ. The leaues of *Chryſanthemum* are ſaid to be diuided and cut into many fine jags: and the leaues of *Buphthalmum* to be like the leaues of Fennell: for all things that be finely jagged and cut into many parts haue not the likenes of the leaues of Fennell. Moreouer, *Dioſcorides* ſaith, that *Chryſanthemum* doth bring forth a floure much glittering, but he telleth not that the floure of *Buphthalmum*, or Oxe-eie is much glittering, neither doth the floure of that which we haue ſet downe glitter, ſo that it can or ought to bee ſaid to glitter much. Doe not theſe things declare a manifeſt difference betweene *Buphthalmum* and *Chryſanthemum*, and confirme that which we haue ſet downe to be the true and right Oxe eie? we are of that minde, let others thinke as they will: and they that would haue *Chryſanthemum* to be *Buphthalmum*, let them ſeeke out another, if they deny this to be Oxe-eie: for that which we and others haue deſcribed for *Chryſanthemum* cannot be the true *Buphthalmum* or Oxe-eie; for the leaues of it are not like Fennell, ſuch as thoſe of the true *Buphthalmum* ought to be.

¶ *The Temperature.*

But concerning the faculties, *Matthiolus* ſaith, that all the Phyſitions and Apothecaries in Bohemia, vſe the roots of this Oxe-eie in ſtead of thoſe of blacke Ellebor, namely for diſeaſes in cattell: but he doth not affirme that the roots hereof in medicines are ſubſtitutes, or *quid pro quo*; for, ſaith he, I do remember that I once ſaw the roots hereof in a ſufficient big quantitie put by certain Phyſitions into decoctions which were made to purge by ſiege, but they purged no more than if they had not bin put in at all: which thing maketh it moſt plaine, that it cannot be any of the Ellebors, although it hath been vſed to be faſtned through the eares of cattell for certaine diſeaſes, and doth cure them as Ellebor doth. The roots of *Gentian* do mightily open the orifices of Fiſtulaes, which be too narrow, ſo do the roots of *Ariſtolochia*, or Birthwort, or Briony, or pieces of ſpunges, which notwithſtanding do much differ one from another in other operations: wherefore though the roots of Oxe-eie can do ſomething like vnto blacke Ellebor, yet for all that they canot perform all thoſe things that the ſame can. We know that thornes, ſtings, ſplinters of wood, and ſuch like, bring pain, cauſe inflammations, draw vnto them humors from the parts neere adjoyning, if they be faſtned in any part of the body; no part of the body is hurt without paine; the which is encreaſed if any thing be thruſt through, or put into the wound: peraduenture alſo if any other thing beſide be put into the ſlit or bored eare, the ſame effect would follow which hapned by the root of this plant thruſt in; notwithſtanding we here affirme nothing, we onely make way for curious men to make more diligent ſearch touching the operations hereof. ‡ *Cluſius* affirmes, that when he came to Vienna in Auſtria, this was vulgarly bought, ſold, and vſed for the true blacke Ellebor, the ignorance of the Phyſitions and Apothecaries in the knowledge of ſimples was ſuch to make vſe of this ſo far different plant, when as they had the true black Hellebor growing plentifully wilde within ſeuen miles of the citie, the which afterward vpon his admonition, they made vſe of. ‡

¶ *The Vertues.*

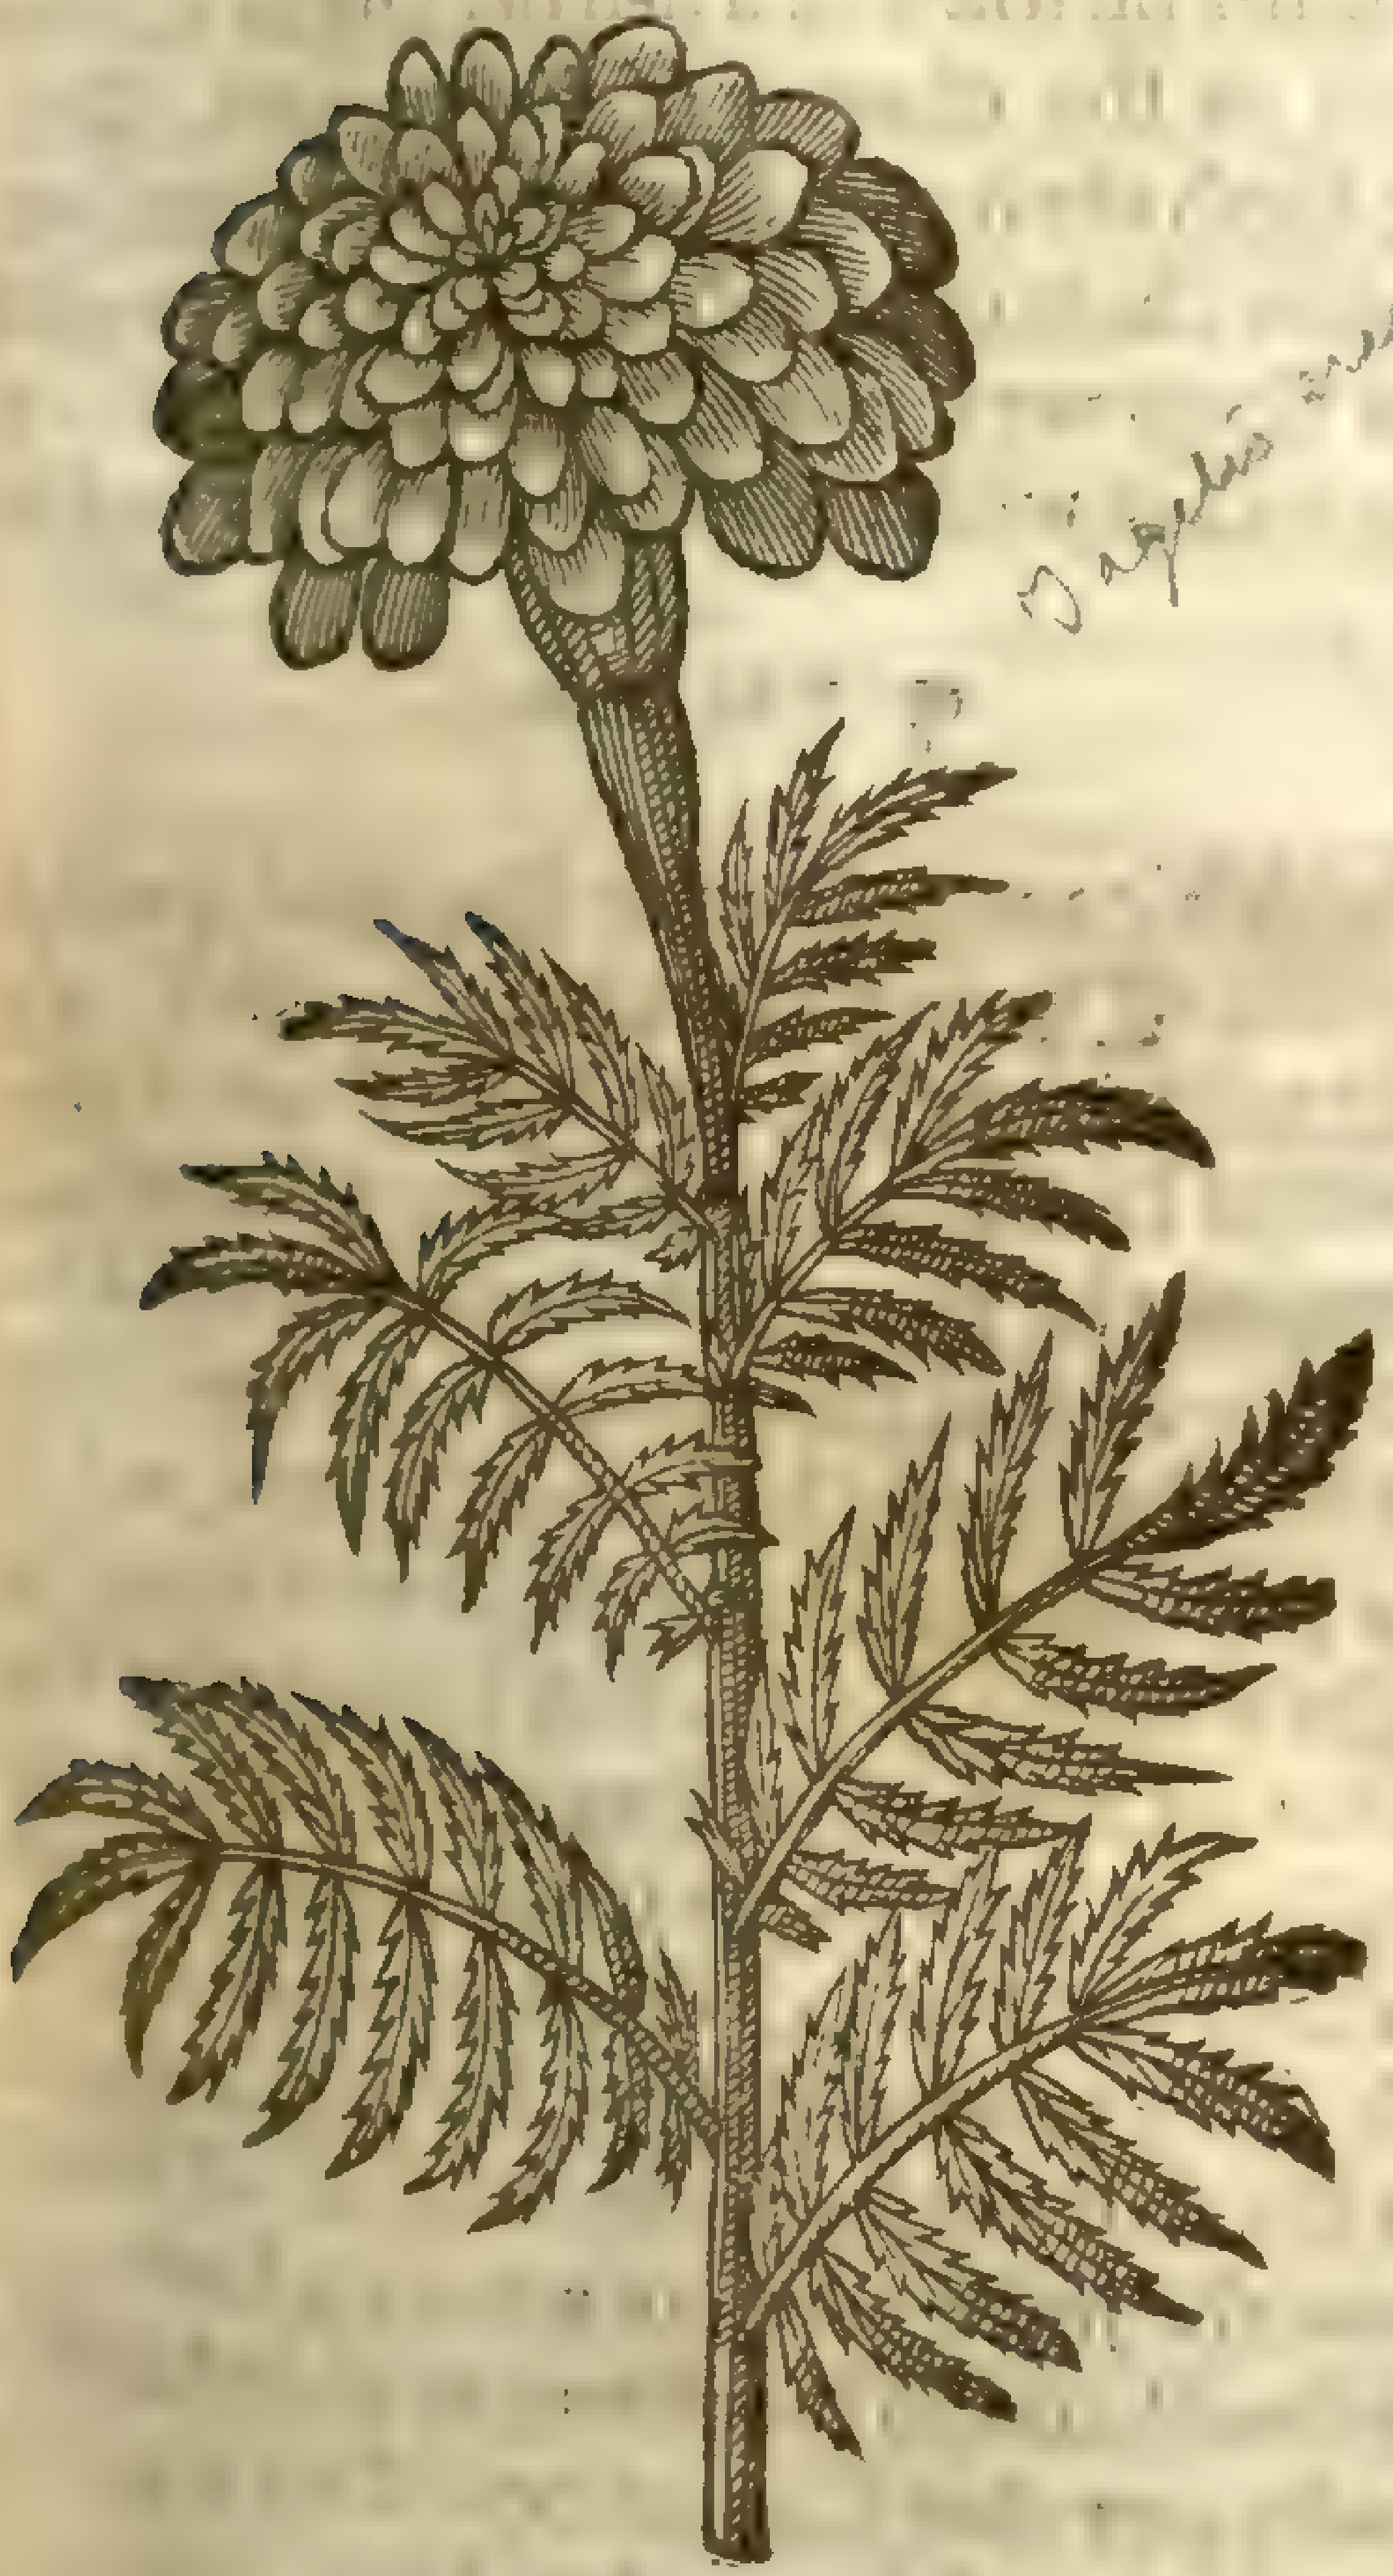
A *Dioſcorides* ſaith, that the floures of Oxe-eie made vp in a ſeare-cloth doe aſſwage and waſte away cold hard ſwellings; and it is reported that if they be drunke by and by after bathing, they make them in ſhort time well coloured that haue beene troubled with the yellow jaundiſe.

Chap. 258. *Of French Marigold, or African Marigold.*

¶ *The Deſcription.*

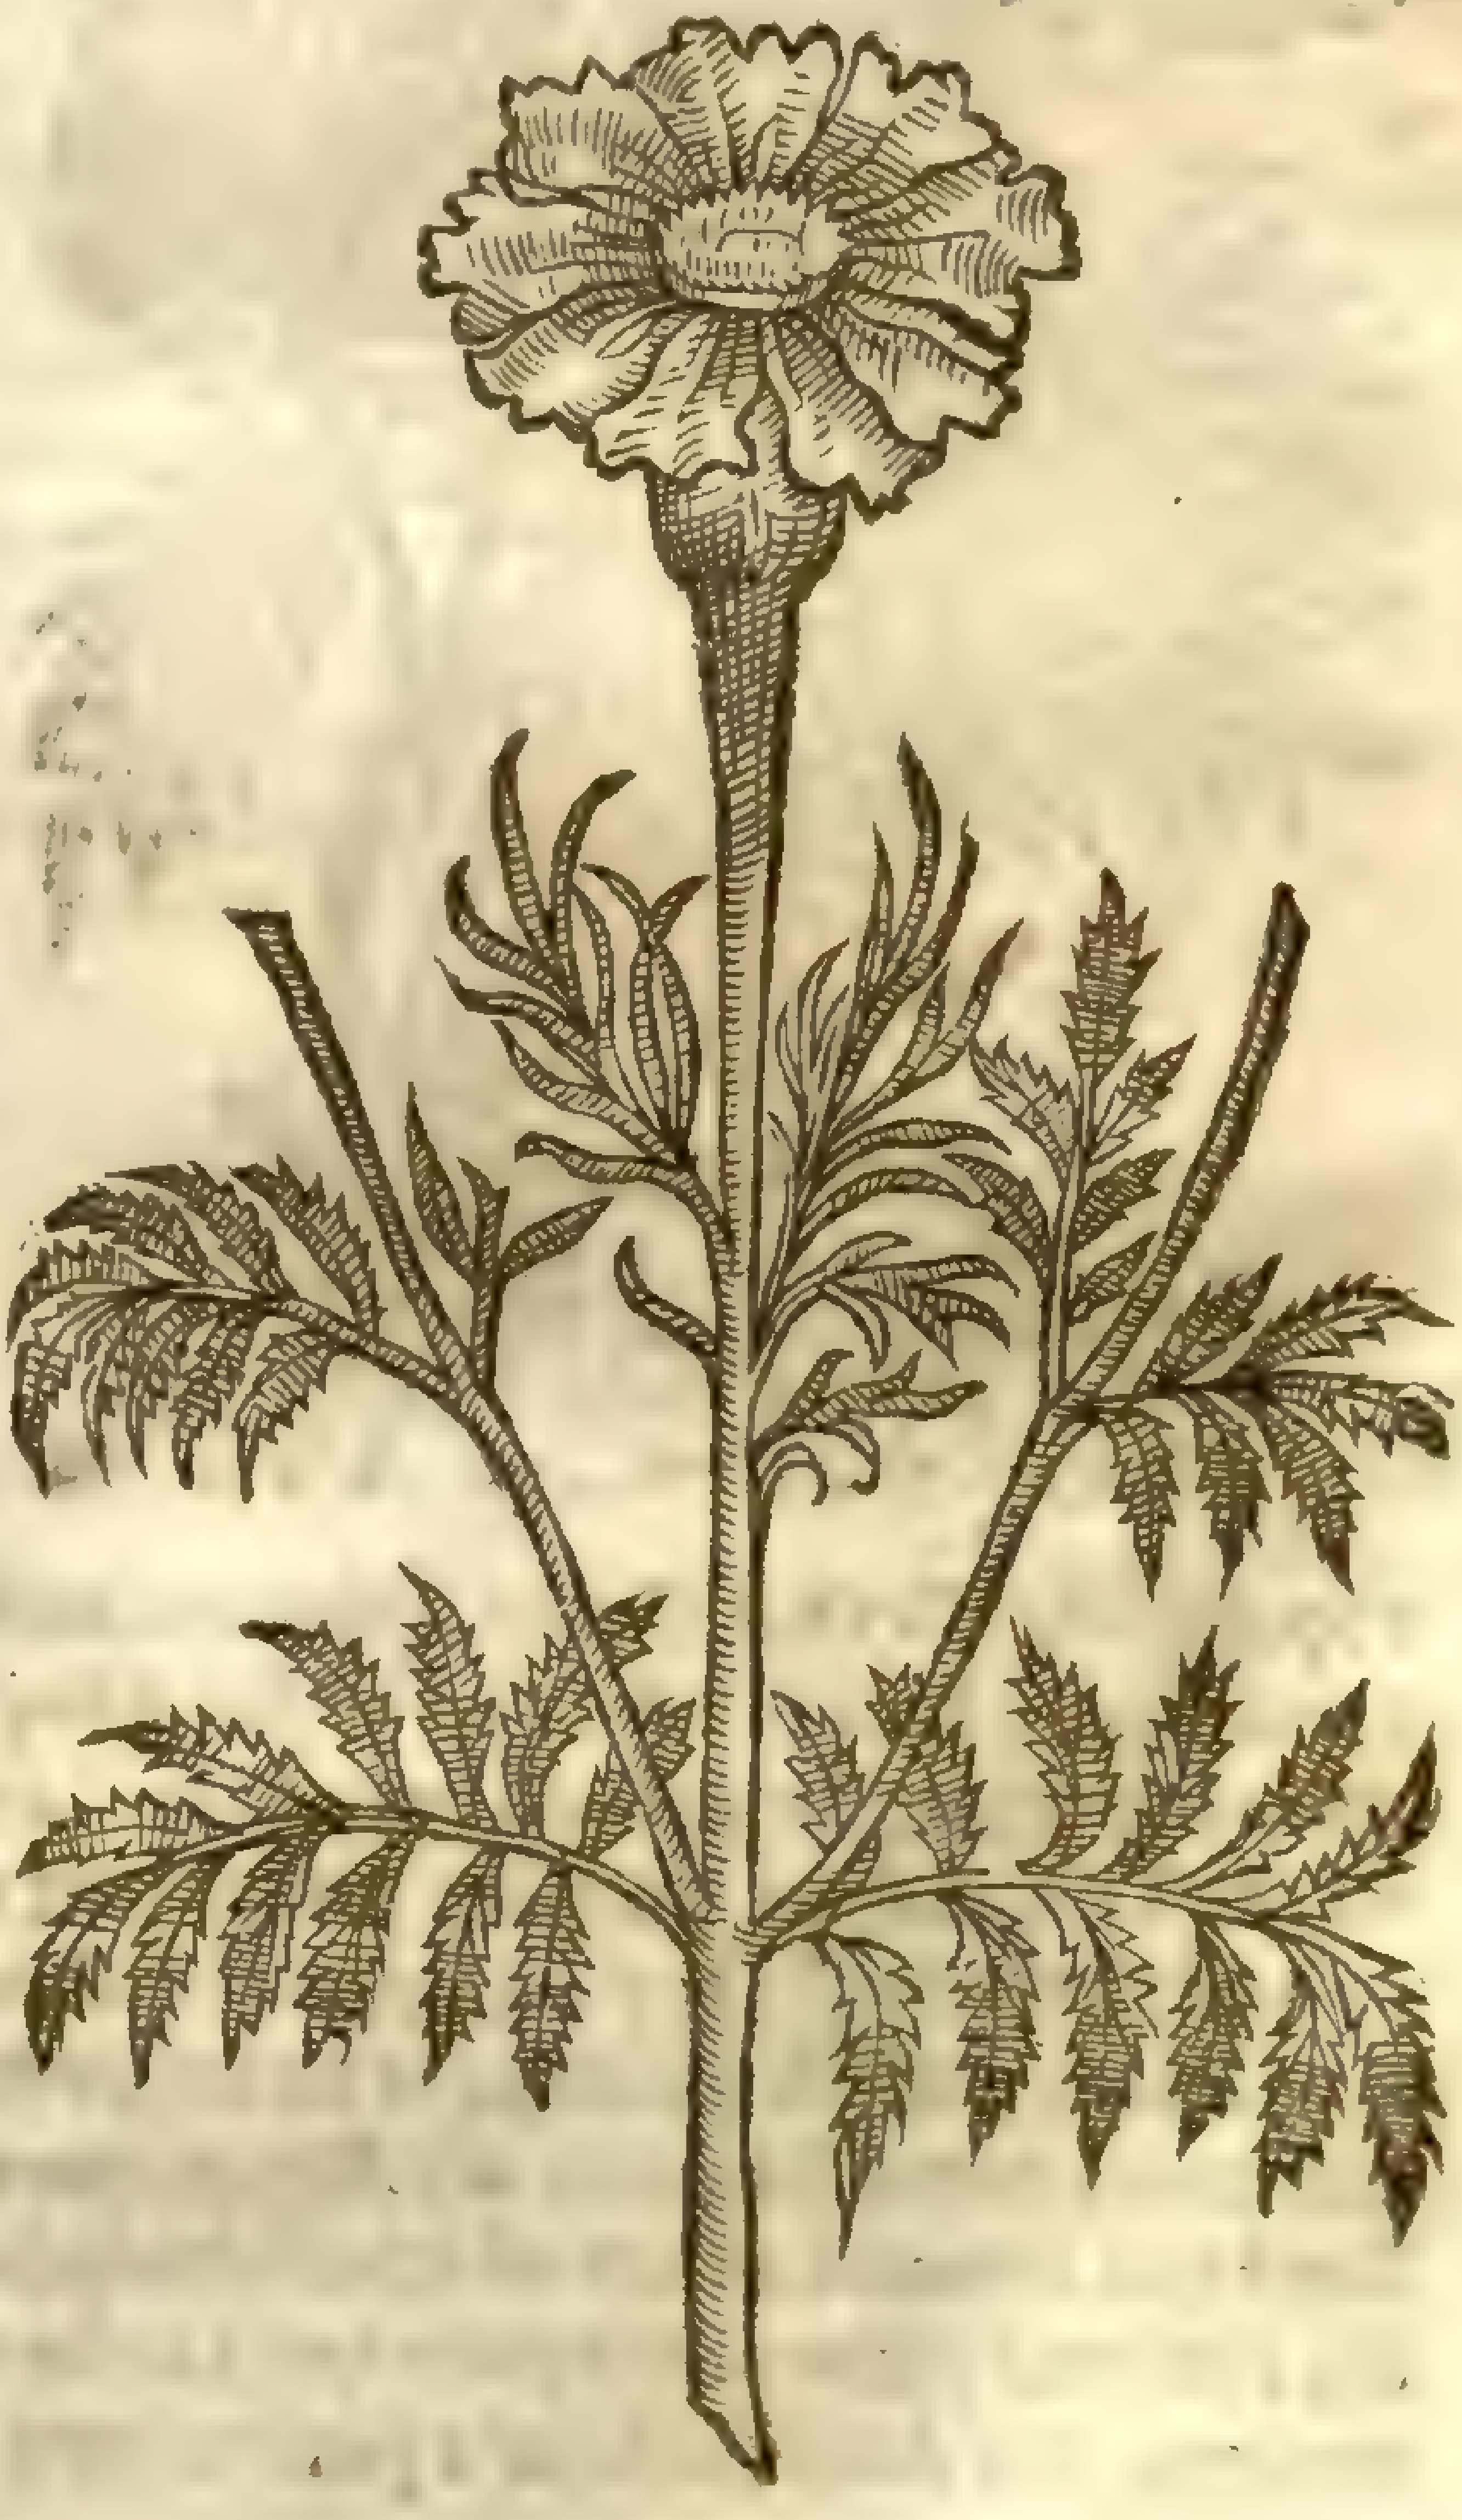
1 THe great double African Marigold hath a great long browne reddiſh ſtalke, creſted, furrowed and ſomewhat knobby, diuiding it ſelfe toward the top into other branches; whereupon grow leaues compoſed of many ſmall leaues ſet vpon a middle rib by couples, much like vnto the leaues of wilde Valerian, bearing at the top very faire and beautifull double yellow flours, greater and more double than the greateſt Damask Roſe, of a ſtrong ſmel, but not vnpleaſant. The floures being paſt, there ſucceedeth long black flat ſeed: the whole plant periſhes at the firſt approch of Winter.

2 There is little difference betweene this and the precedent, or laſt deſcribed, ſauing that this plant is much leſſer, and bringeth forth more ſtore of floures, which maketh the difference. ‡ And we may therefore call it *Flos Aphricanus minor multiflorus*, The ſmall double African Marigold. ‡



1 *Flos Aphricanus major Polyanthos.*
The great African double Marigold.

Tagetes erecta β maior



3 *Flos Aphricanus major ſimplici flore.*
The great ſingle French Marigold.

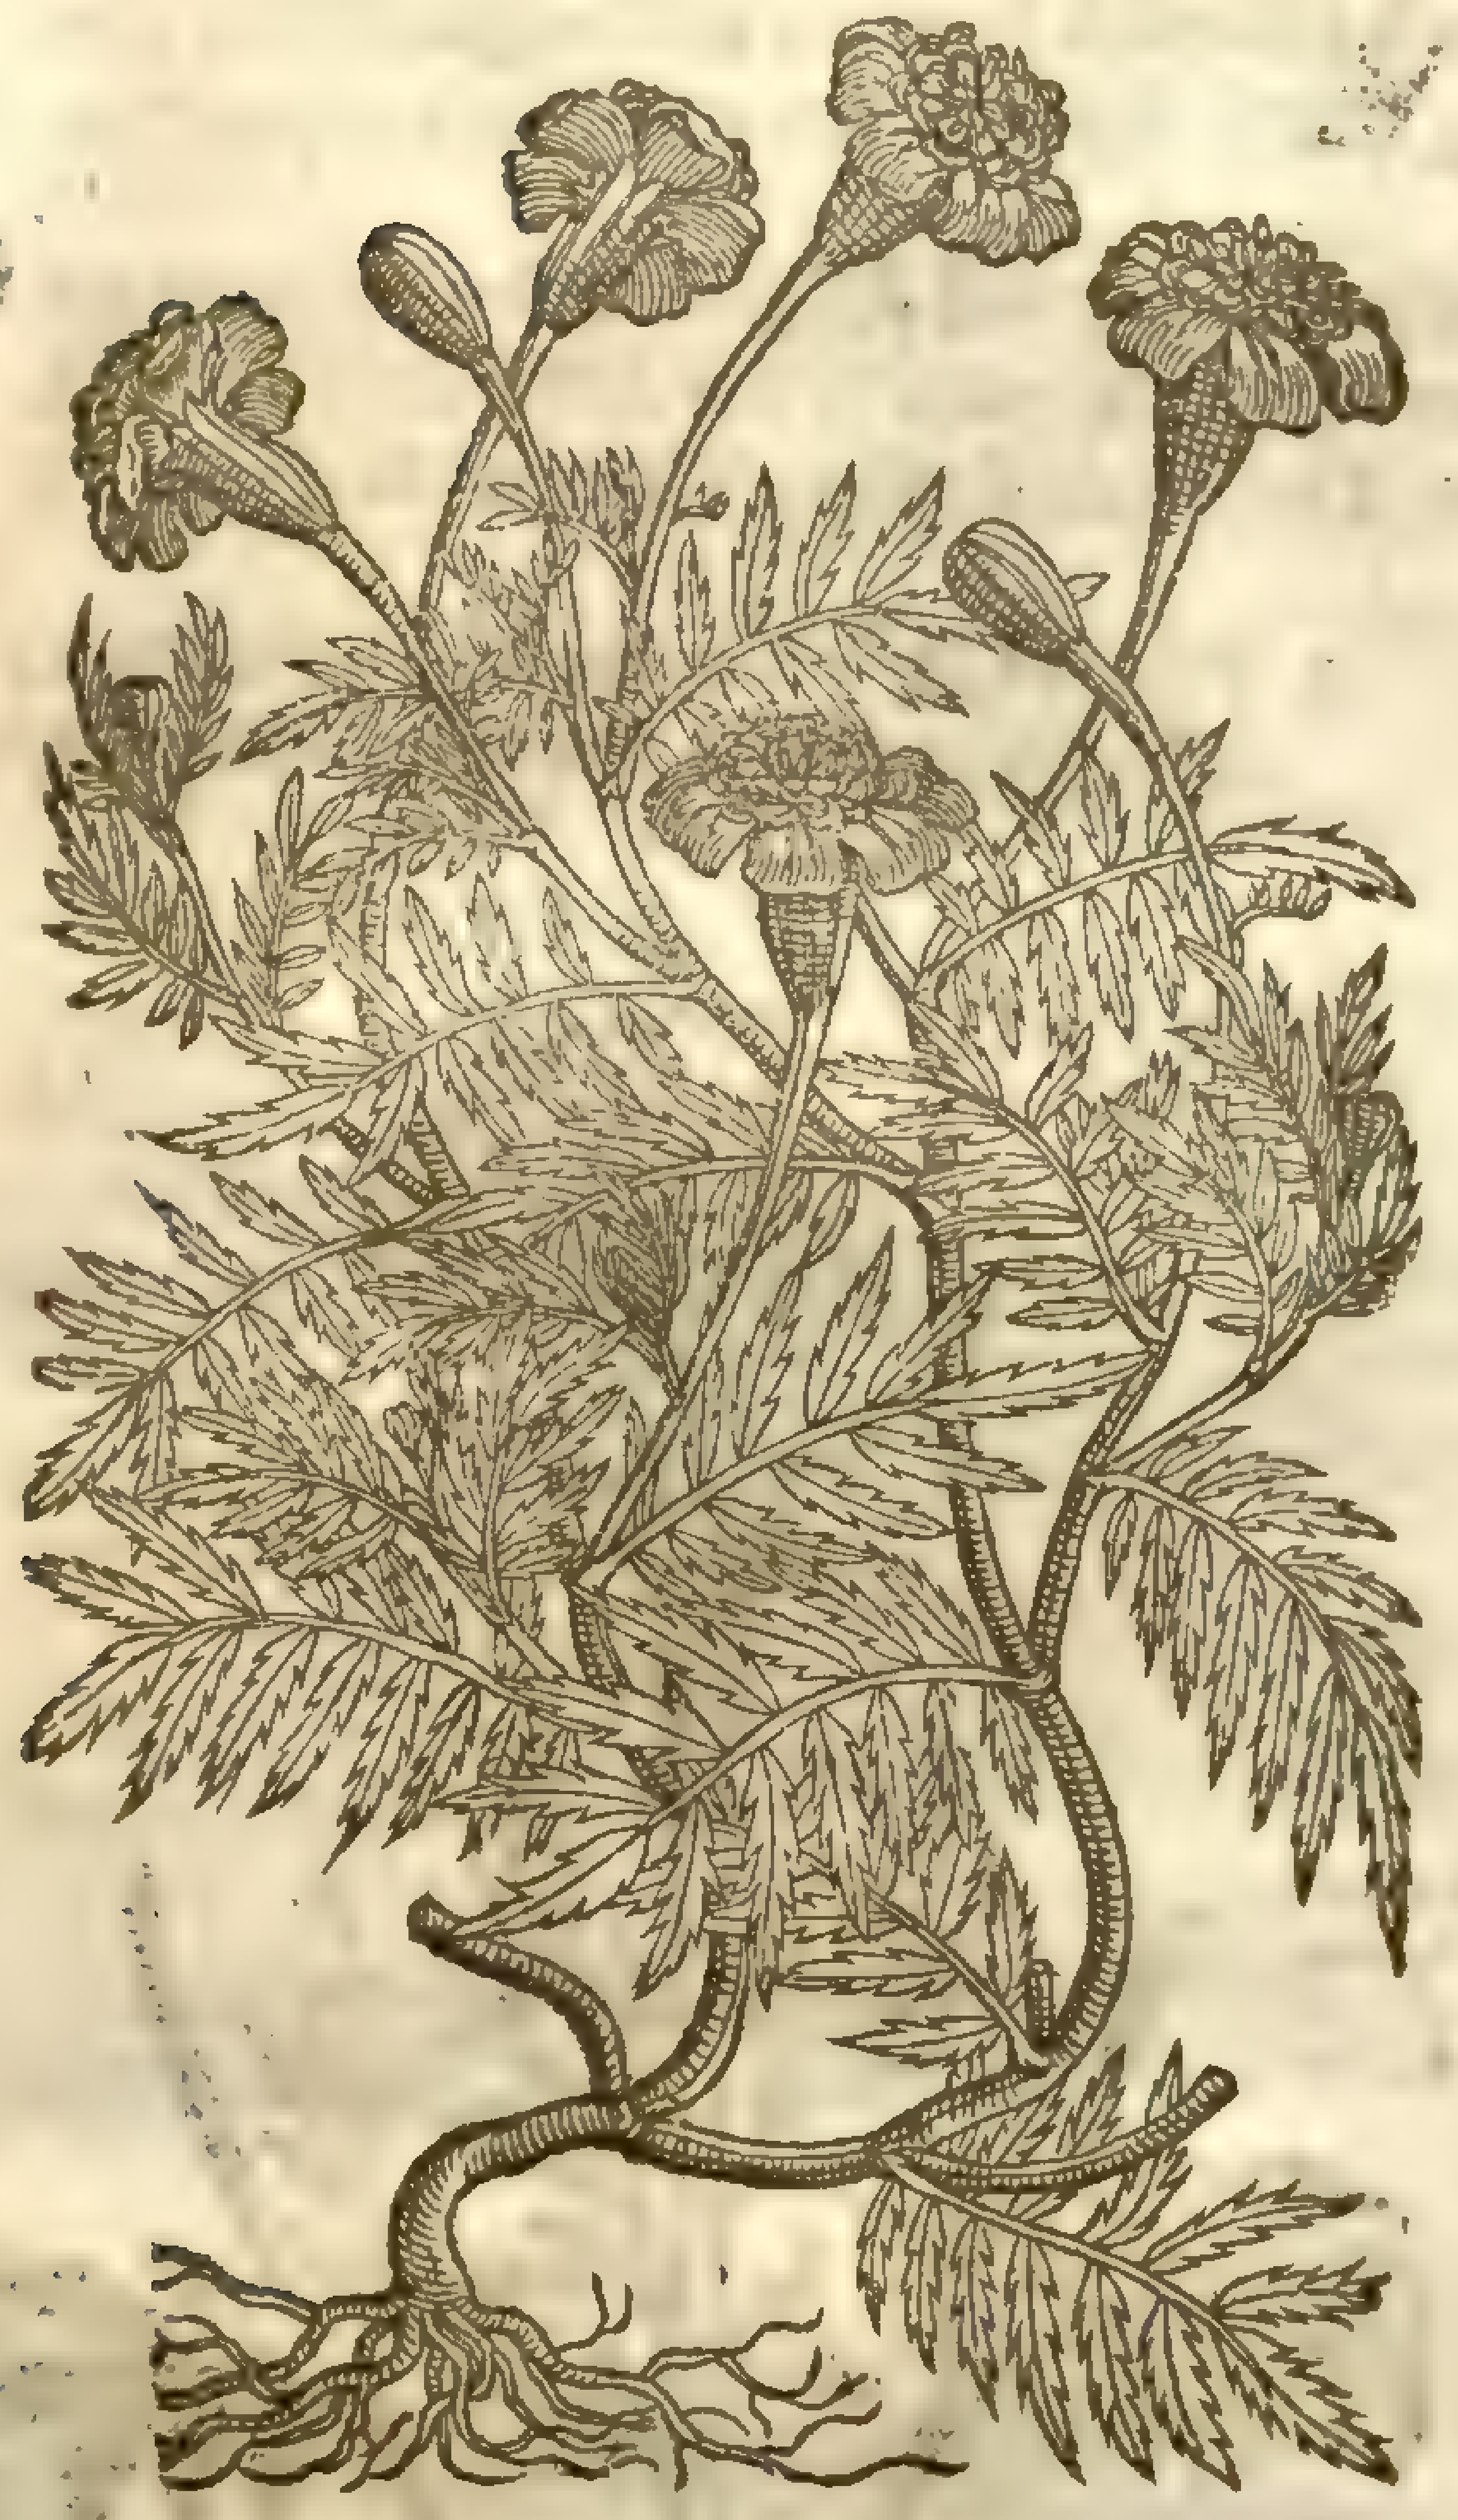
Tagetes erecta

3 The ſingle great Africane Marigold, hath a thicke root, with ſome fibres annexed thereto; from which riſeth vp a thicke ſtalke chamfered and furrowed, of the height of two cubits, diuided into other ſmall branches; whereupon are ſet long leaues, compact or compoſed of many little leaues like thoſe of the Aſh tree, of a ſtrong ſmell, yet not very vnpleaſant: on the top of thebr anches do grow yellow ſingle floures, compoſed in the middleof a bundle of yellow thrummes hard thruſt together, paled about the edges with a border of yellow leaues; after which commeth long blacke ſeed. The whole plant periſheth with the firſt froſt, and muſt be ſowne yerely as the other ſorts muſt be.

4 The common Africane, or as they vulgarly terme it French Marigold, hath ſmall weake and tender branches trailing vpon the ground, reeling and leaning this way and that way, beſet with leaues conſiſting of many particular leaues, indented about the edges, which being held vp againſt the ſunne, or to the light, are ſeene to be full of holes like a ſieue, euen as thoſe of Saint Iohns

woort: the floures ſtand at the top of the ſpringy branches forth of long cups or husks, conſiſting of eight or ten ſmall leaues, yellow vnderneath, on the vpper ſide of a deeper yellow tending to the colour of a darke crimſon veluet, as alſo ſoft in handling: but to deſcribe the colour in words, it is not poſſible, but this way; lay vpon paper with a penſill a yellow colour called Maſticot, which being dry, lay the ſame ouer with a little ſaffron ſteeped in water or wine, which ſetteth forth moſt liuely the colour. The whole plant is of a moſt ranke and vnwholeſome ſmell, and periſheth at the firſt froſt.

4 *Flos Aphricanus minor ſimplici flore.*
The ſmall French Marigold.



Tagetes patula L. a minor. Swt.

¶ *The Place.*

They are cheriſhed and ſowne in gardens euery yere: they grow euery where almoſt in Africke of themſelues, from whence wee firſt had them, and that was when *Charles* the fifth, Emperor of Rome made a famous conqueſt of Tunis; whereupon it was called *Flos Aphricanus*, or *Flos Tunetanus*.

¶ *The Time.*

They are to be ſown in the beginning of April, if the ſeaſon fall out to be warm, otherwiſe they muſt be ſown in a bed of dung, as ſhall be ſhewed in the chapter of Cucumbers. They bring forth their pleaſant floures very late, and therefore there is the more diligence to be vſed to ſow them very early, becauſe they ſhall not be ouertaken with the froſt before their ſeed be ripe.

¶ *The Names.*

The Africane or French Marigold is called in Dutch, **Thunis bloemen**: in high-Dutch, **Indianiſch negelin**: that is, the floure, or Gilloſloure of India: in Latine, *Caryophyllus Indicus*; whereupon the French men call it *Oeilletz d'Inde*. *Cordus* calls it *Tanacetum Peruvianum*, of the likeneſſe the leaues haue with Tanſie, and of Peru a Prouince of America, from whence hee thought it may be, it was firſt brought into Europ. *Geſner* calleth it *Caltha Aphricana*, and ſaith that it is called in the Carthaginian tongue, *Pedua*: ſome would haue it to be *Petilius flos Plinij*, but not properly: for *Petilius flos* is an Autumne floure growing among briers and brambles. *Andreas Lacuna* calleth it *Othonna*, which is a certain herbe of the Troglodytes, growing in that part of Arabia which lieth toward Ægypt, hauing leaues full of holes as though they were eaten with mothes. *Galen* in his firſt booke of the faculties of Simple medicines maketh mention of an herbe called *Lycoperſicum*, the juice whereof a certain Centurion did carrie out of Barbarie all Ægypt ouer with ſo ranke a ſmell, and ſo lothſome, as *Galen* himſelfe durſt not ſo much as taſt of it, but coniectured it to be deadly; yet that Centurion did vſe it againſt the extreme pains of the joints, and it ſeemeth to the patients themſelues, to be of a very cold temperature; but doubtleſſe of a poiſonſome quality, very neere to that of Hemlockes.

¶ *The Nature and Vertues.*

A The vnpleaſant ſmel, eſpecially of that common ſort with ſingle floures (that ſtuffeth the head like to that of Hemlocke, ſuch as the juice of *Lycoperſium* had) doth ſhew that it is of a poiſonſome and cooling qualitie; and alſo the ſame is manifeſted by diuers experiments: for I remember, faith *Dodonæus*, that I did ſee a boy whoſe lippes and mouth when hee began to chew the floures did ſwell extreamely; as it hath often happened vnto them, that playing or piping with quils or kexes of Hemlockes, do hold them a while betweene their lippes: likewiſe he ſaith, we gaue to a cat the floures with their cups, tempered with freſh cheeſe, ſhee forthwith mightily ſwelled, and a little while after died: alſo mice that haue eaten of the ſeed thereof haue been found dead. All which things doe declare that this herbe is of a venomous and poyſonſome facultie; and that they are not to be hearkned vnto,that ſuppoſe this herb to be a harmleſſe plant:ſo to conclude,theſe plants are moſt venomous and full of poiſon,and therefore not to be touched or ſmelled vnto,much leſſe vſed in meat or medicine.

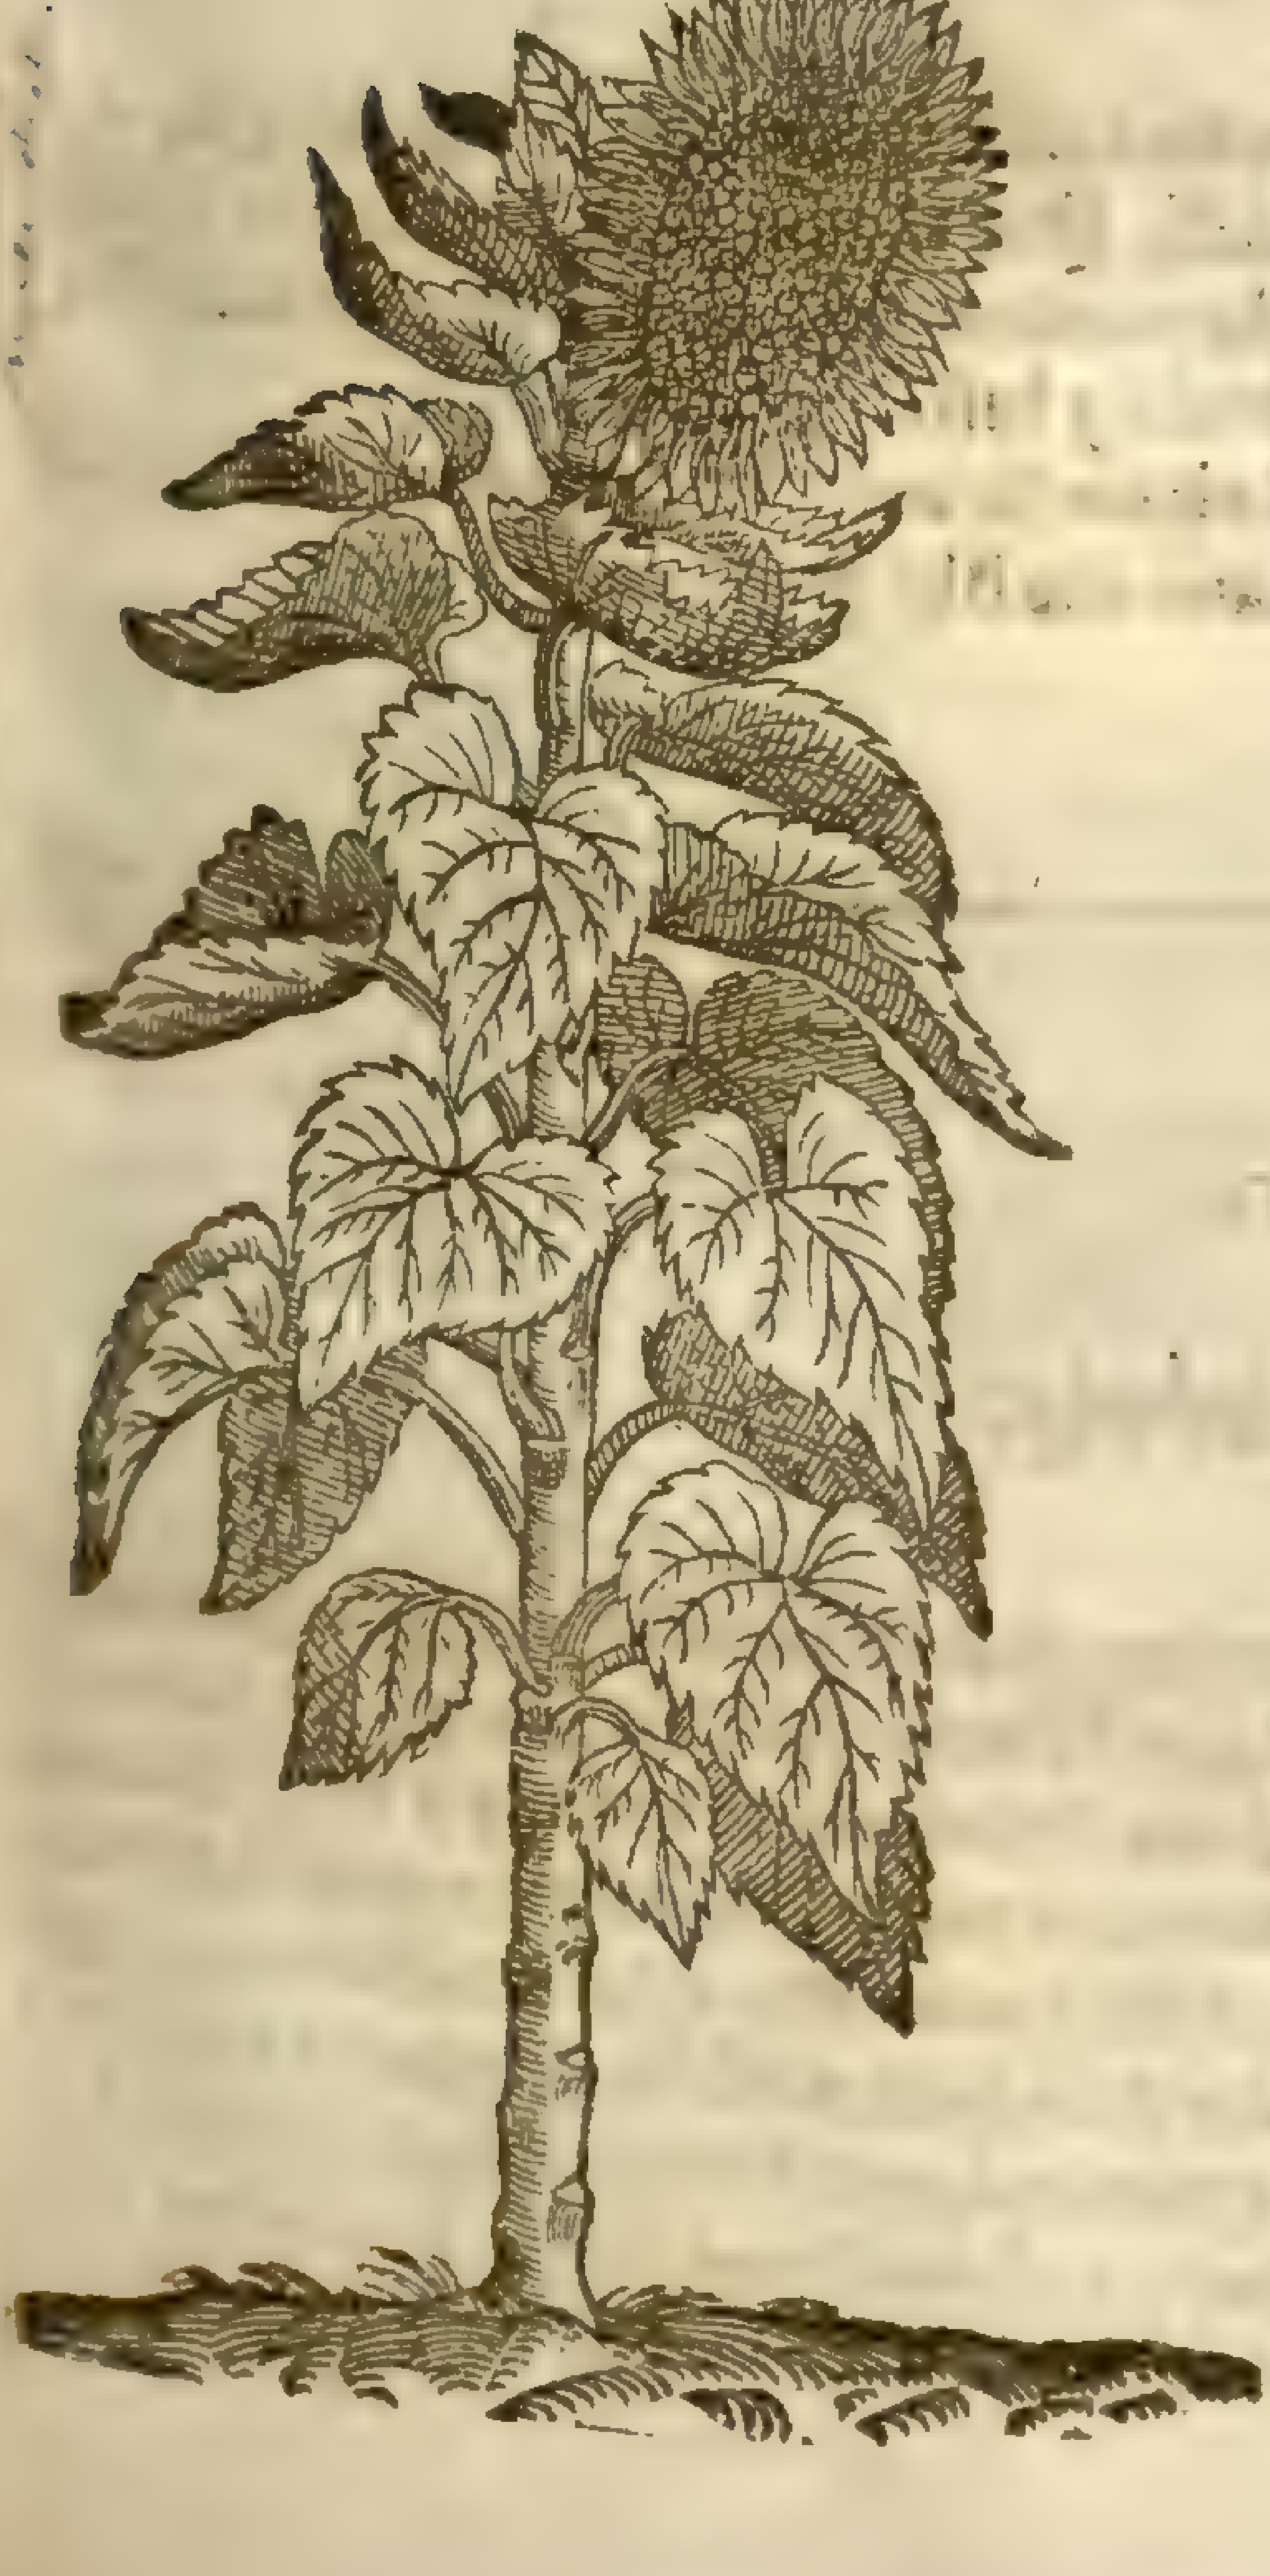
Chap. 259.

Of the Floure of the Sun, or the Marigold of Peru.

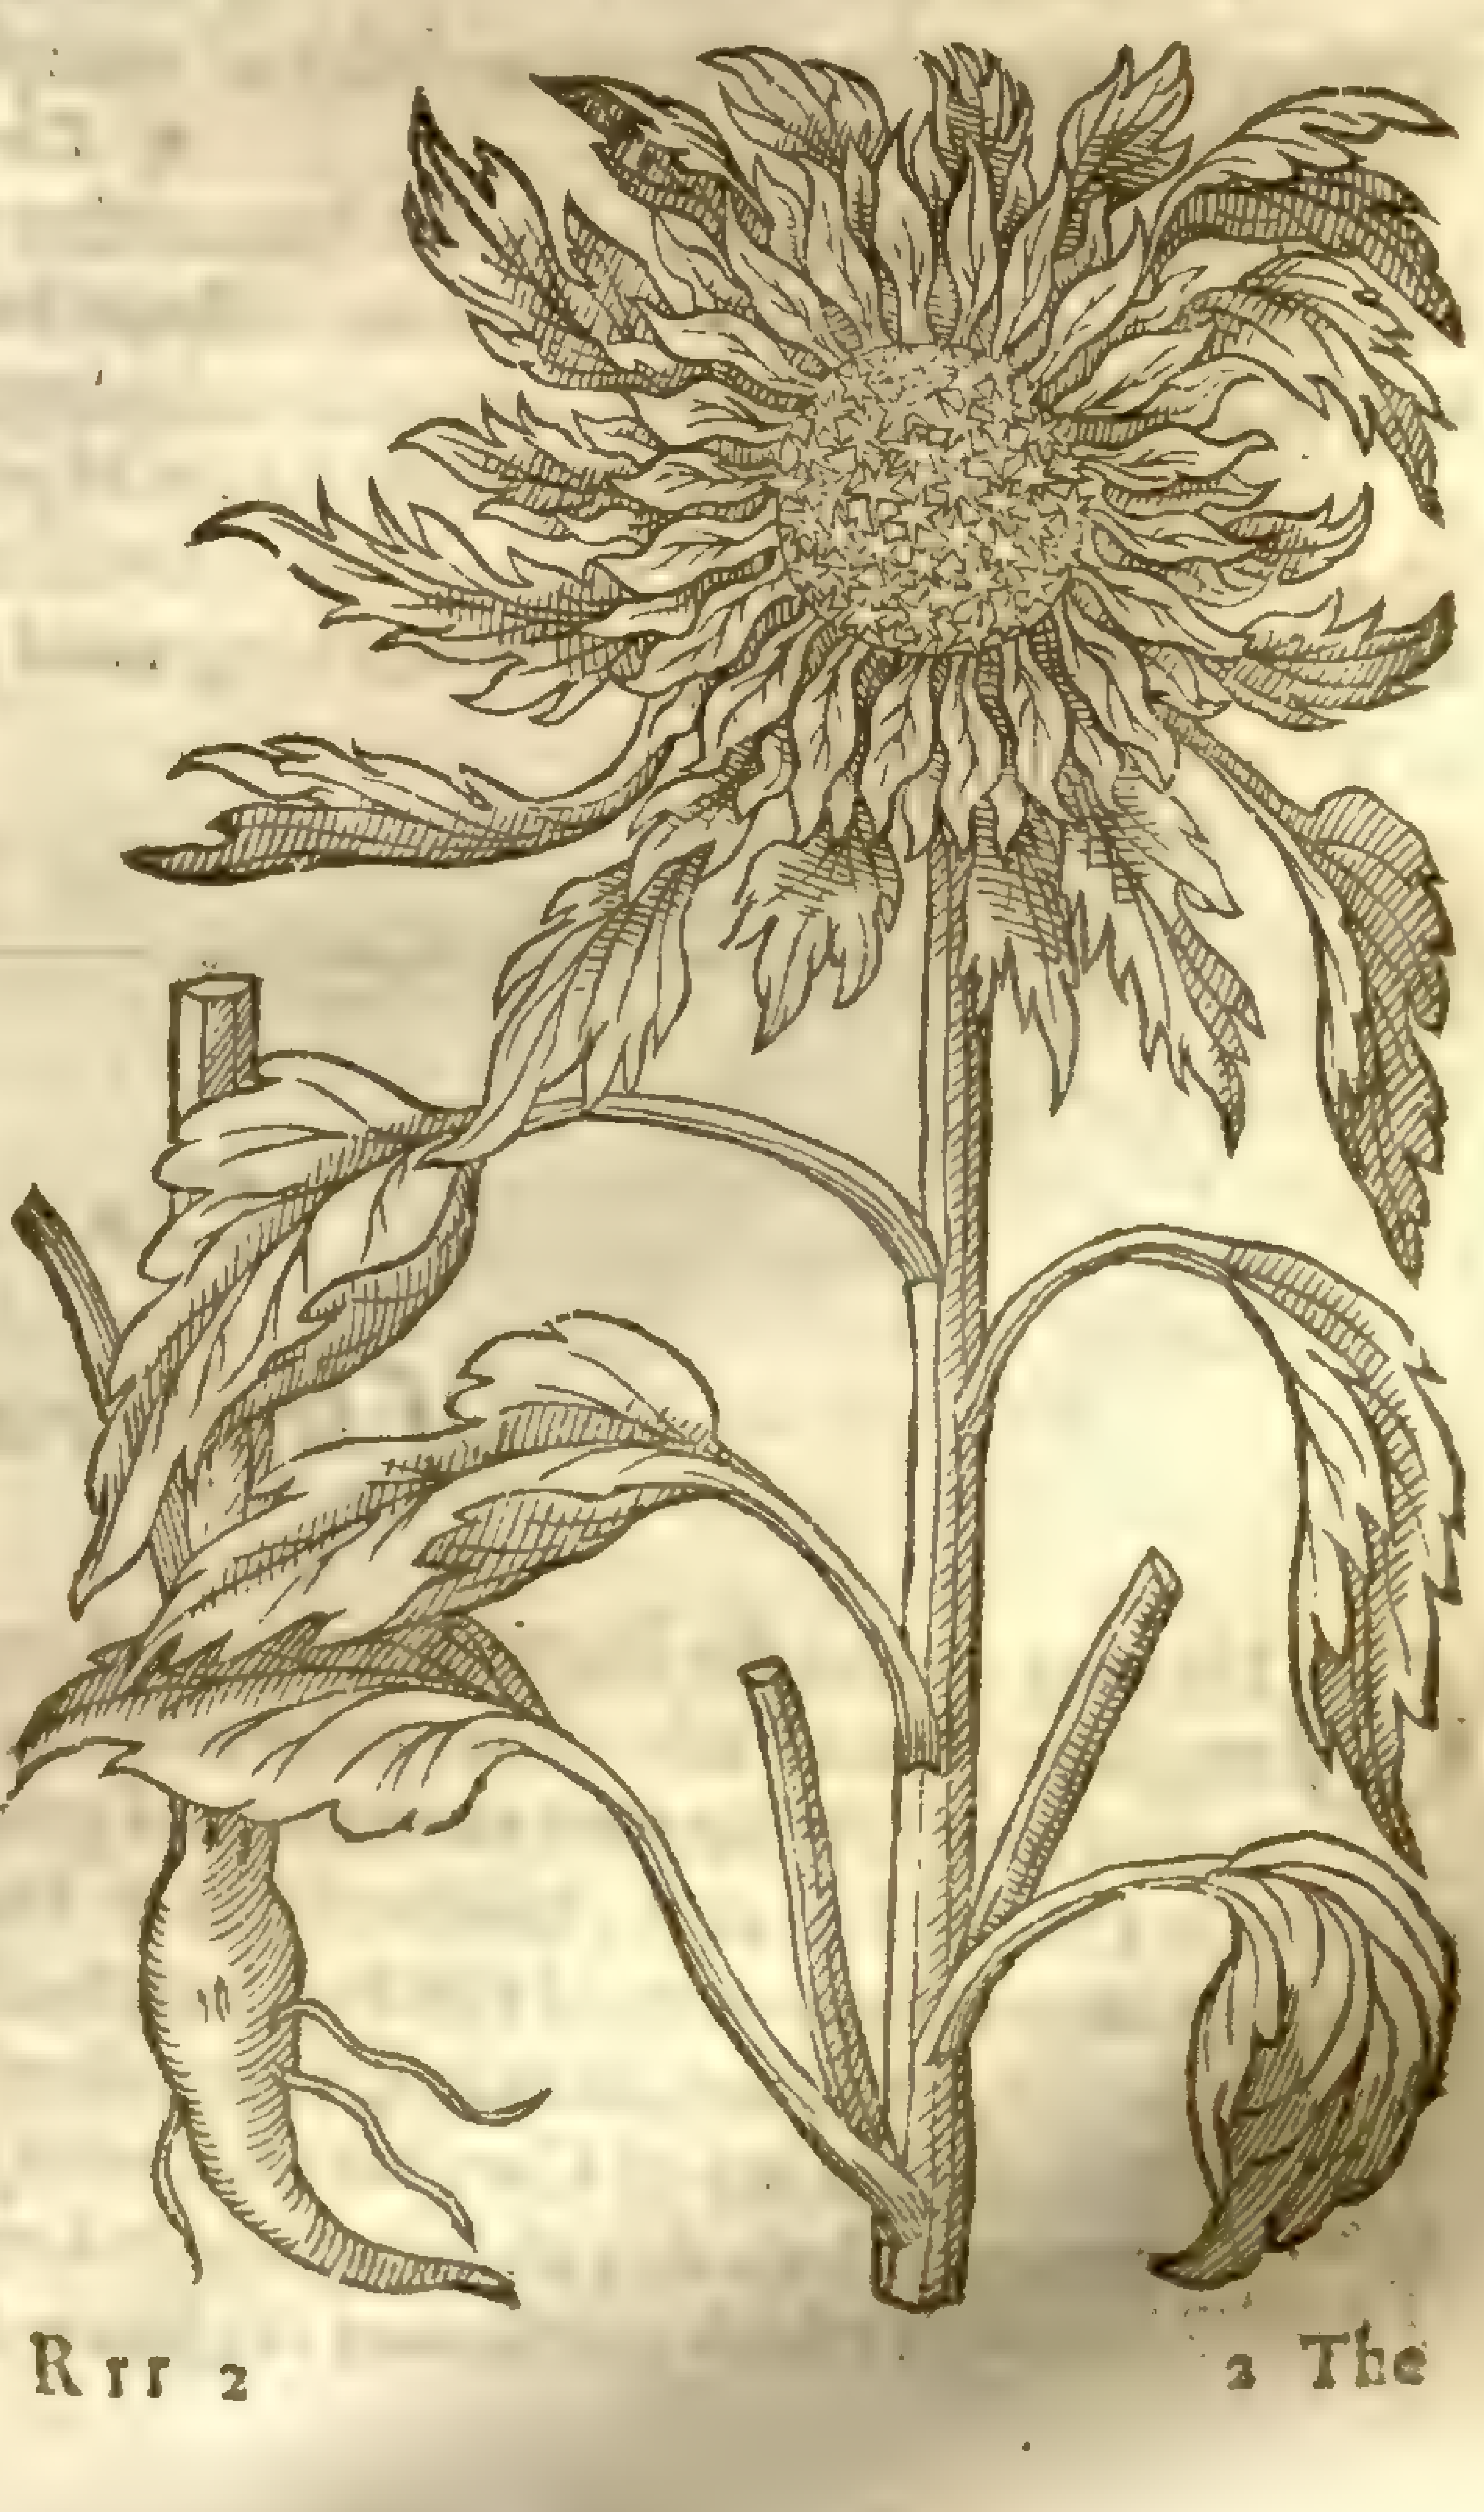
¶ *The Deſcription.*

1 The Indian Sun,or the golden floure of Peru,is a plant of ſuch ſtature and talneſſe,that in one ſummer, beeing ſowne of a ſeed in Aprill, it hath riſen vp to the height of fourteene foot in my garden, where one floure was in weight three pound and two ounces, & croſſe ouerthwart the floure by meaſure ſixteen inches broad. The ſtalks are vpright & ſtraight, of the bigneſſe of a ſtrong mans arme, beſet with large leaues euen to the top, like vnto the great Clot bur: at the top of the ſtalk commeth forth for the moſt part one floure, yet many times there ſpring out ſucking buds which come to no perfection: this great floure is in ſhape like to the Camomil floure,beſet round about with a pale or border of goodly yellow leaues, in ſhape like the leaues of the floures of white Lillies: the middle part whereof is made as it were of vnſhorn veluet,or ſome curious cloath wrought with the needle: which braue worke,if you do thorowly view and marke well,it ſeemeth to be an innumerable ſort of ſmall floures,reſembling the noſe or noſle of a candleſtick broken from the foot thereof; from which ſmall noſle ſweats forth excellent fine and cleare turpentine,in ſight,ſubſtance,ſauor,and taſt. The whole plant in like manner being broken ſmelleth of turpentine: when the plant groweth to maturitie the floures fall away, in place whereof appeareth the ſeed,black and large,much like the ſeed of Gourds,ſet as though a cunning workman had of purpoſe placed them in very good order,much like the hony-combs of Bees: the root is white,compact of many ſtrings,which periſh at the firſt approch of Winter,and muſt bee ſet in moſt perfect dunged ground: the manner how ſhall be ſhewed when vpon the like occaſion I ſhall ſpeake of Cucumbers and Melons.

1 *Flos Solis maior.*
The greater Sun-floure.



2 *Flos Solis minor.*
The leſſer Sun-floure.



2 The other golden floure of Peru is like the former, ſauing that it is altogether lower, and the leaues more jagged, and very few in number.

3 The male floure of the Sun of the ſmaller ſort hath a thicke root, hard, and of a woody ſubſtance, with many threddy ſtrings anexed thereto, from which riſeth vp a gray or ruſſet ſtalk to the height of fiue or ſix cubits, of the bigneſſe of ones arme, whereupon are ſet great broad leaues with long foot ſtalks, very fragill or eaſie to breake, of an ouerworne green colour, ſharp pointed, & ſomwhat cut or hackt about the edges like a ſaw: the floure groweth at the top of the ſtalks, bordered about with a pale of yellow leaues: the thrummed middle part is blacker than that of the laſt deſcribed: the whole floure is compaſſed about likewiſe with diuers ſuch ruſſet leaues as they are that grow lower vpon the ſtalks, but leſſer and narrower. The plant and euery part thereof ſmells of turpentine, and the floure yeeldeth forth moſt cleare turpentine, as my ſelfe haue noted diuers yeares. The ſeed is alſo long and blacke, with certain lines or ſtrakes of white running alongſt the ſame: the root and euery part thereof periſheth when it hath perfected his ſeed.

4 The female or Marigold Sun-floure hath a thicke and wooddy root, from which riſeth vp a ſtraight ſtem diuiding it ſelfe into one or more branches, ſet with ſmooth leaues ſharpe pointed, ſleightly indented about the edges. The floures grow at the top of the branches, of a feint yellow colour, the middle part is of a deeper yellow tending to blackneſſe, of the forme and ſhape of a ſingle Marigold, whereupon I haue named it the Sun Marigold. The ſeed as yet I haue not obſerued.

¶ *The Place.*

Theſe plants grow of themſelues without ſetting or ſowing, in Peru, and in diuers other prouinces of America, from whence the ſeeds haue beene brought into theſe parts of Europ. There hath bin ſeen in Spain and other hot regions a plant ſowne and nouriſhed vp from ſeed, to attaine to the height of 24 foot in one yeare.

¶ *The Time.*

The ſeed muſt be ſet or ſowne in the beginning of April, if the weather be temperat, in the moſt fertill ground that may be, and where the Sun hath moſt power the whole day.

¶ *The Names.*

The flour of the Sun is called in Latine *Flos Solis*, for that ſome haue reported it to turn with the Sun, which I could neuer obſerue, although I haue indeauored to finde out the truth of it: but I rather thinke it was ſo called becauſe it reſembles the radiant beams of the Sunne, whereupon ſome haue called it *Corona Solis*, and *Sol Indianus*, the Indian Sunne-floure: others, *Chryſanthemum Peruvianum*, or the Golden floure of Peru: in Engliſh, the floure of the Sun, or the Sun-floure.

¶ *The Temperature.*

They are thought to be hot and dry of complexion.

¶ *The Vertues.*

A There hath not any thing bin ſet down either of the antient or later writers, concerning the vertues of theſe plants, notwithſtanding we haue found by triall, that the buds before they be floured boiled and eaten with butter, vineger, and pepper, after the manner of Artichokes, are exceeding pleaſant meat, ſurpaſſing the Artichoke far in procuring bodily luſt.

B The ſame buds with the ſtalks neere vnto the top (the hairineſſe being taken away) broiled vpon a gridiron, and after eaten with oile, vineger, and pepper, haue the like propertie.

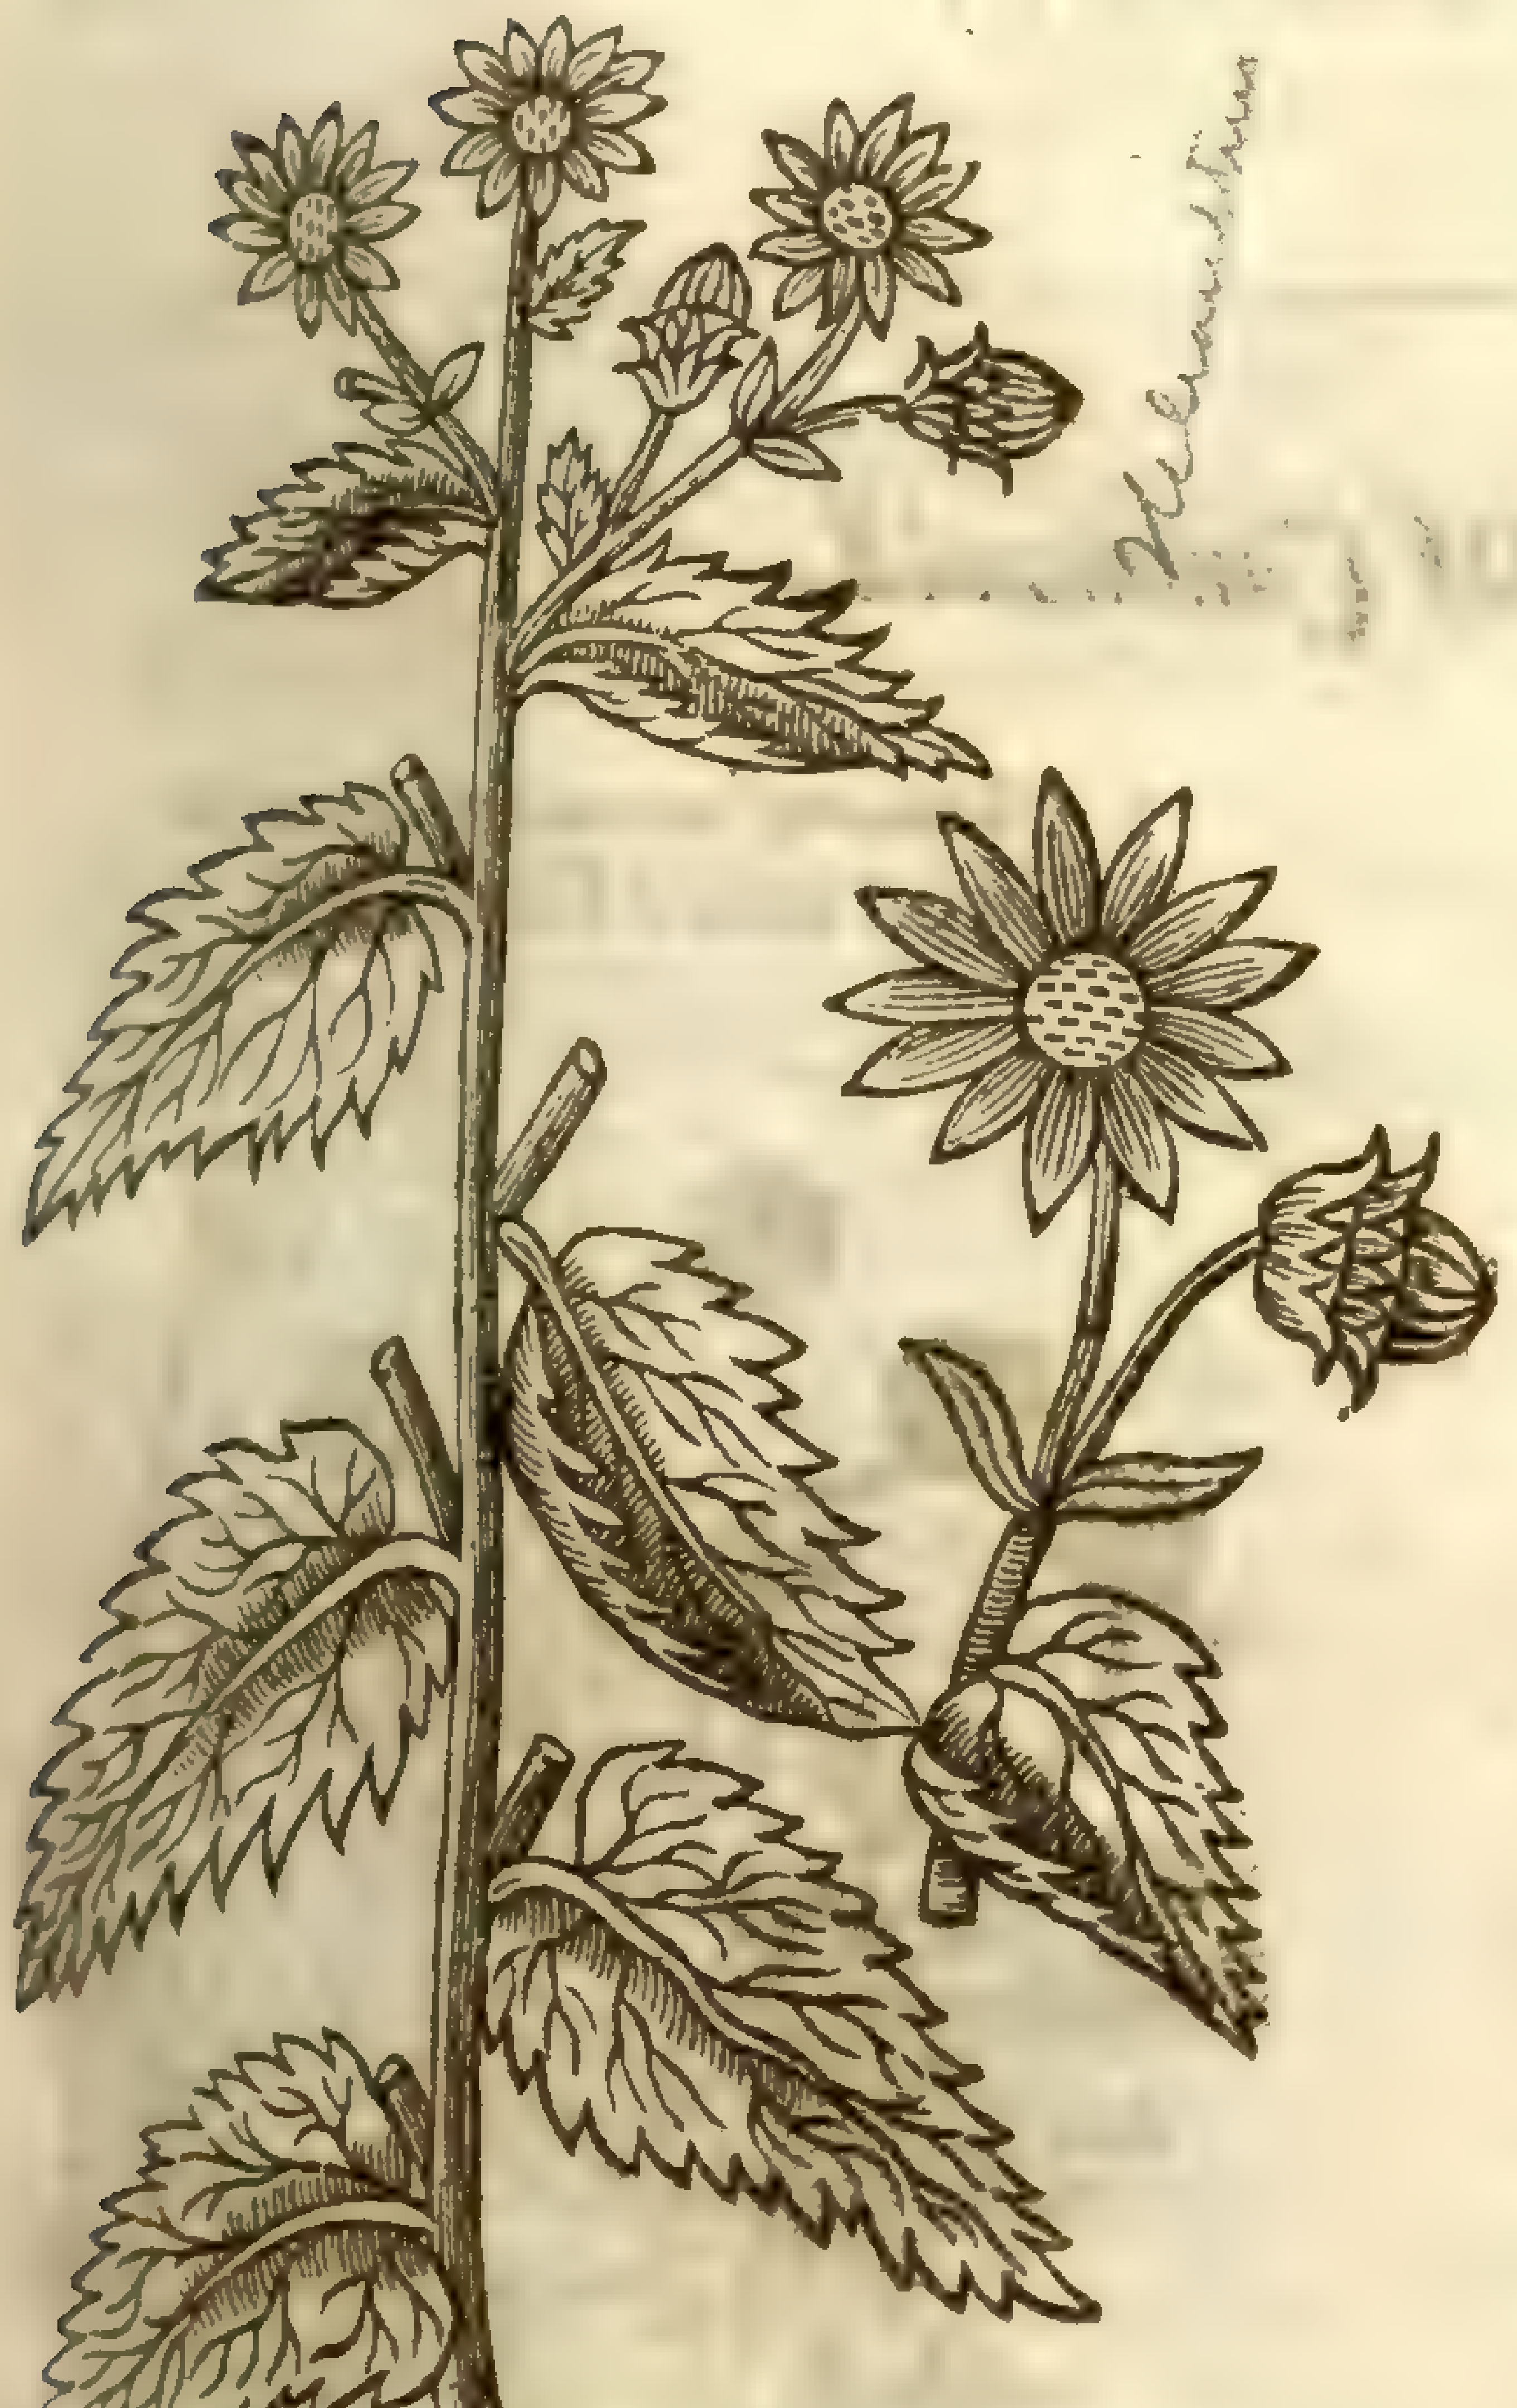
Chap. 260.

Of Ieruſalem Artichoke.

One may wel by the Engliſh name of this plant perceiue, that thoſe that vulgarly giue names to plants, haue little either iudgement or knowledge of them: for this plant hath no ſimilitude in leafe, ſtalke, root, or manner of growing, with an Artichoke, but only a little likeneſſe of taſte in the dreſſed root; neither came it from Ieruſalem, or out of Aſia, but out of America: whence *Fabius Columna* one of the firſt ſetters of it forth, fitly names it *Aſter Peruvianus tuberoſus*, and *Flos Solis Farneſianus*, becauſe it ſo much reſembles the *Flos Solis*, and for that he firſt obſerued it growing in the garden of Cardinal *Farneſius*, who had procured roots thereof from the Weſt Indies. *Pelliterius* calleth this *Heliotropium Indicum tuberoſum*; and *Bauhinus* in his *Prodromus* ſets it forth by the name of *Chryſanthemum latifolium Braſilianum*; but in his *Pinax* he hath it by the name of *Helianthemum Indicum tuberoſum*. Alſo our countryman Mr *Parkinſon* hath exactly deliuered the hiſtorie of this by the name of *Battatas de Canada*, Engliſhing it Potatoes of Canada: now al theſe that haue written and mentioned it bring it from America, but from far different places, as from Peru, Braſill, and Canada: but this is not much materiall, ſeeing it now growes ſo well and plentifully in ſo many places of England. I will therefore deliuer you the hiſtorie as I haue receiued it from my oft mentioned friend Mr *Goodyer*, who, as you may ſee by the date, tooke it preſently vpon the firſt arriuall into England.

‡ *Flos ſolis Pyramidalis.*
Ieruſalem Artichoke.

Tuberoſus [illegible]
Helianthus



¶ *The Deſcription.*

Flos ſolis Pyramidalis, paruo flore, tuberoſa radice Heliotropium Indicum quorundam.

THis wonderfull encreaſing plant hath growing vp from one root, one, ſomtimes two, three, or more round greene rough hairy ſtraked ſtalks, commonly about twelue foot high, ſomtimes ſixteene foot or higher, as big as a childes arme, full of white ſpongeous pith within. The leaues grow all alongſt the ſtalkes out of order, of a light greene colour, rough, ſharpe pointed, about 8 inches broad, and ten or eleuen inches long, deeply notched or indented about the edges, very like the leaues of the common *Flos ſolis Peruanus*, but nothing crumpled, and not ſo broad: the ſtalks diuide themſelues into many long branches euen from the roots to their very tops, bearing leaues ſmaller and ſmaller toward the tops, making the herbe appear like a little tree, narrower and ſlenderer toward the top, in faſhion of a ſteeple or pyramide. The floures with vs grow onely at the tops of the ſtalks and branches, like thoſe of the ſaid *Flos ſolis*, but no bigger than our common ſingle Marigold, conſiſting of twelue or thirteen ſtraked ſharpe pointed bright yellow bordering leaues, growing forth of a ſcaly ſmall hairy head, with a ſmall yellow thrummy matter within. Theſe floures by reaſon of their late flouring, which is commonly two or three weekes after Michaelmaſſe, neuer bring their ſeed to perfection; and it maketh ſhew of abundance of ſmal heads neere the tops of the ſtalkes and branches, forth of the boſoms of the leaues, which neuer open and floure with vs, by reaſon they are deſtroyed with the froſts, which otherwiſe it ſeemeth would be a goodly ſpectacle. The ſtalke ſends forth many ſmall creeping roots, whereby it is fed or nouriſhed, full of hairy threds euen from the vpper part of the earth, ſpreading far abroad: amongſt which from the main root grow forth many tuberous roots, cluſtring together, ſomtimes faſtned to the great root it ſelfe, ſometimes growing on long ſtrings a foot or more from the root, raiſing or heauing vp the earth aboue them, and ſometimes appearing aboue the earth, producing from the increaſe of one root, thirty, forty, or fifty in number, or more, making in all vſually aboue a pecke, many times neere halfe a buſhell, if the ſoile be good. Theſe tuberous roots are of a reddiſh colour without, of a ſoft white ſubſtance within, bunched or bumped out many waies, ſometimes as big as a mans fiſt, or not ſo big, with white noſes or peakes where they wil ſprout or grow the next yeare. The ſtalkes bowed downe, and ſome part of them couered ouer with earth, ſend forth ſmall creeping threddy roots, and alſo tuberous roots like the former, which I haue found by experience. Theſe tuberous roots will abide aliue in the earth all Winter, though the ſtalkes and roots by which they were nouriſhed vtterly rot and periſh away; and will begin to ſpring vp again at the beginning of May, ſeldome ſooner.

¶ *The Place.*

Where this plant groweth naturally I know not. In *An.*1617 I receiued two ſmall roots thereof from Mr *Franquevill* of London, no bigger than hens egges; the one I planted, and the other I gaue to a friend: myne brought me a pecke of roots, wherewith I ſtored Hampſhire.

¶ *The Vertues.*

Theſe roots are dreſſed diuers wayes, ſome boile them in water, and after ſtew them with ſacke and butter, adding a little ginger. Others bake them in pies, putting Marrow, Dates, Ginger, Raiſons of the ſun, Sacke, &c. Others ſome other way as they are led by their skill in Cookerie. But in my judgement, which way ſoeuer they be dreſt and eaten, they ſtirre and cauſe a filthy loathſom ſtinking winde within the body, thereby cauſing the belly to be pained and tormented; and are a meat more fit for ſwine, than men: yet ſome ſay they haue vſually eaten them, and haue found no ſuch windy qualitie in them. 17 Octob. 1621. *Iohn Goodyer.* ‡

2 *Chamæmelum nudum odoratum.*
Sweet naked Cammomill.

Cotula aurea, L
Sm. [illegible]

¶ *The Deſcription.*

1 To diſtinguiſh the kindes of Cammomils with ſundry deſcriptions, would bee but to inlarge the Volume, and ſmal profit would thereby redound to the Reader, conſidering they are ſo well knowne to all: notwithſtanding it ſhal not be amiſſe to ſay ſomthing of them, to keep the order and method of the book hitherto obſerued. The common Cammomill

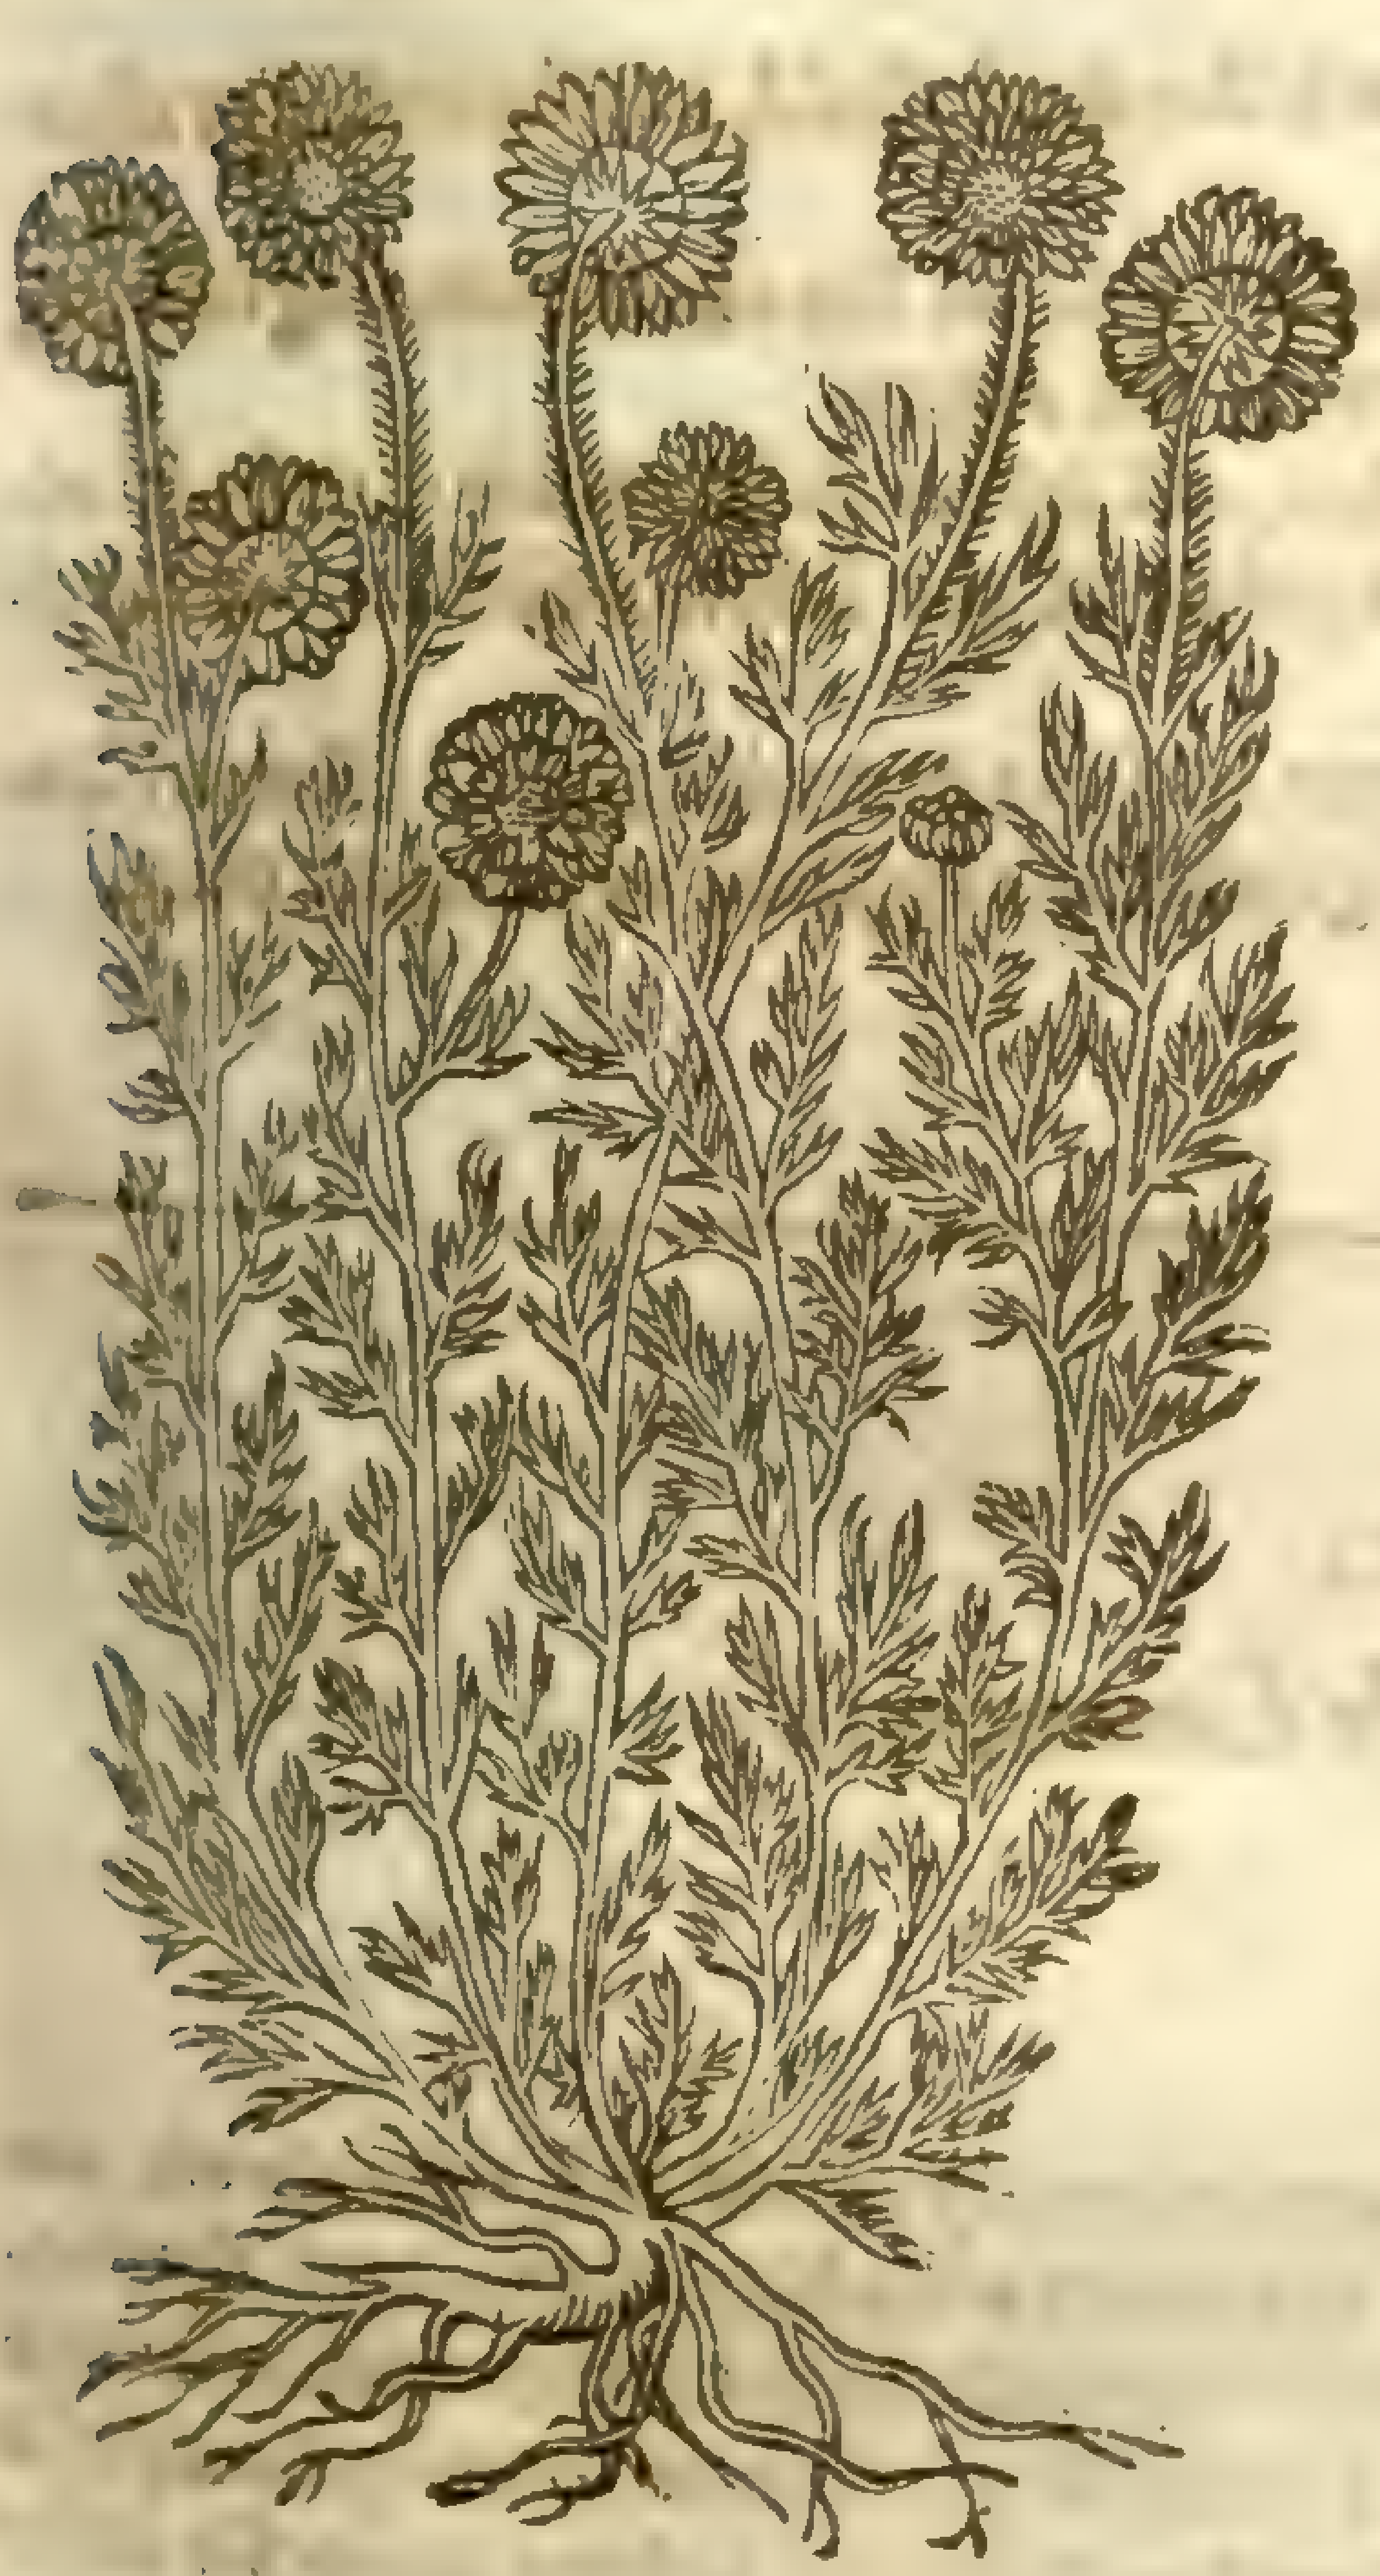
hath many weak and feeble branches trailing vpon the ground,taking hold on the top of the earth as it runneth,whereby it greatly increaſeth. The leaues are very fine, and much jagged or deepely cut,of a ſtrong ſweet ſmell: among which come forth the floures,like vnto the field Daiſie,bordered about the edge with a pale of white leaues: the middle part is yellow, compoſed of the like thrums cloſe thruſt together as is that of the Daiſie. The root is very ſmall and threddy.

2 The ſecond kinde of Cammomill hath leaues,roots,ſtalks, and creeping branches like the precedent: the floures grow at the tops of ſmal tender ſtems,which are nothing elſe but ſuch yellow thrummy matter as is in the midſt of the reſt of the Cammomils, without any pale or border of white floures,as the others haue: the whole plant is of a pleaſing ſweet ſmell,whereupon ſome haue giuen it this addition, *Odoratum*.

3 This third Cammomill differeth not from the former,ſauing that the leaues herof are verie much doubled with white leaues,inſomuch that the yellow thrum in the middle is little ſeen,and the other very ſingle,wherein conſiſteth the difference.

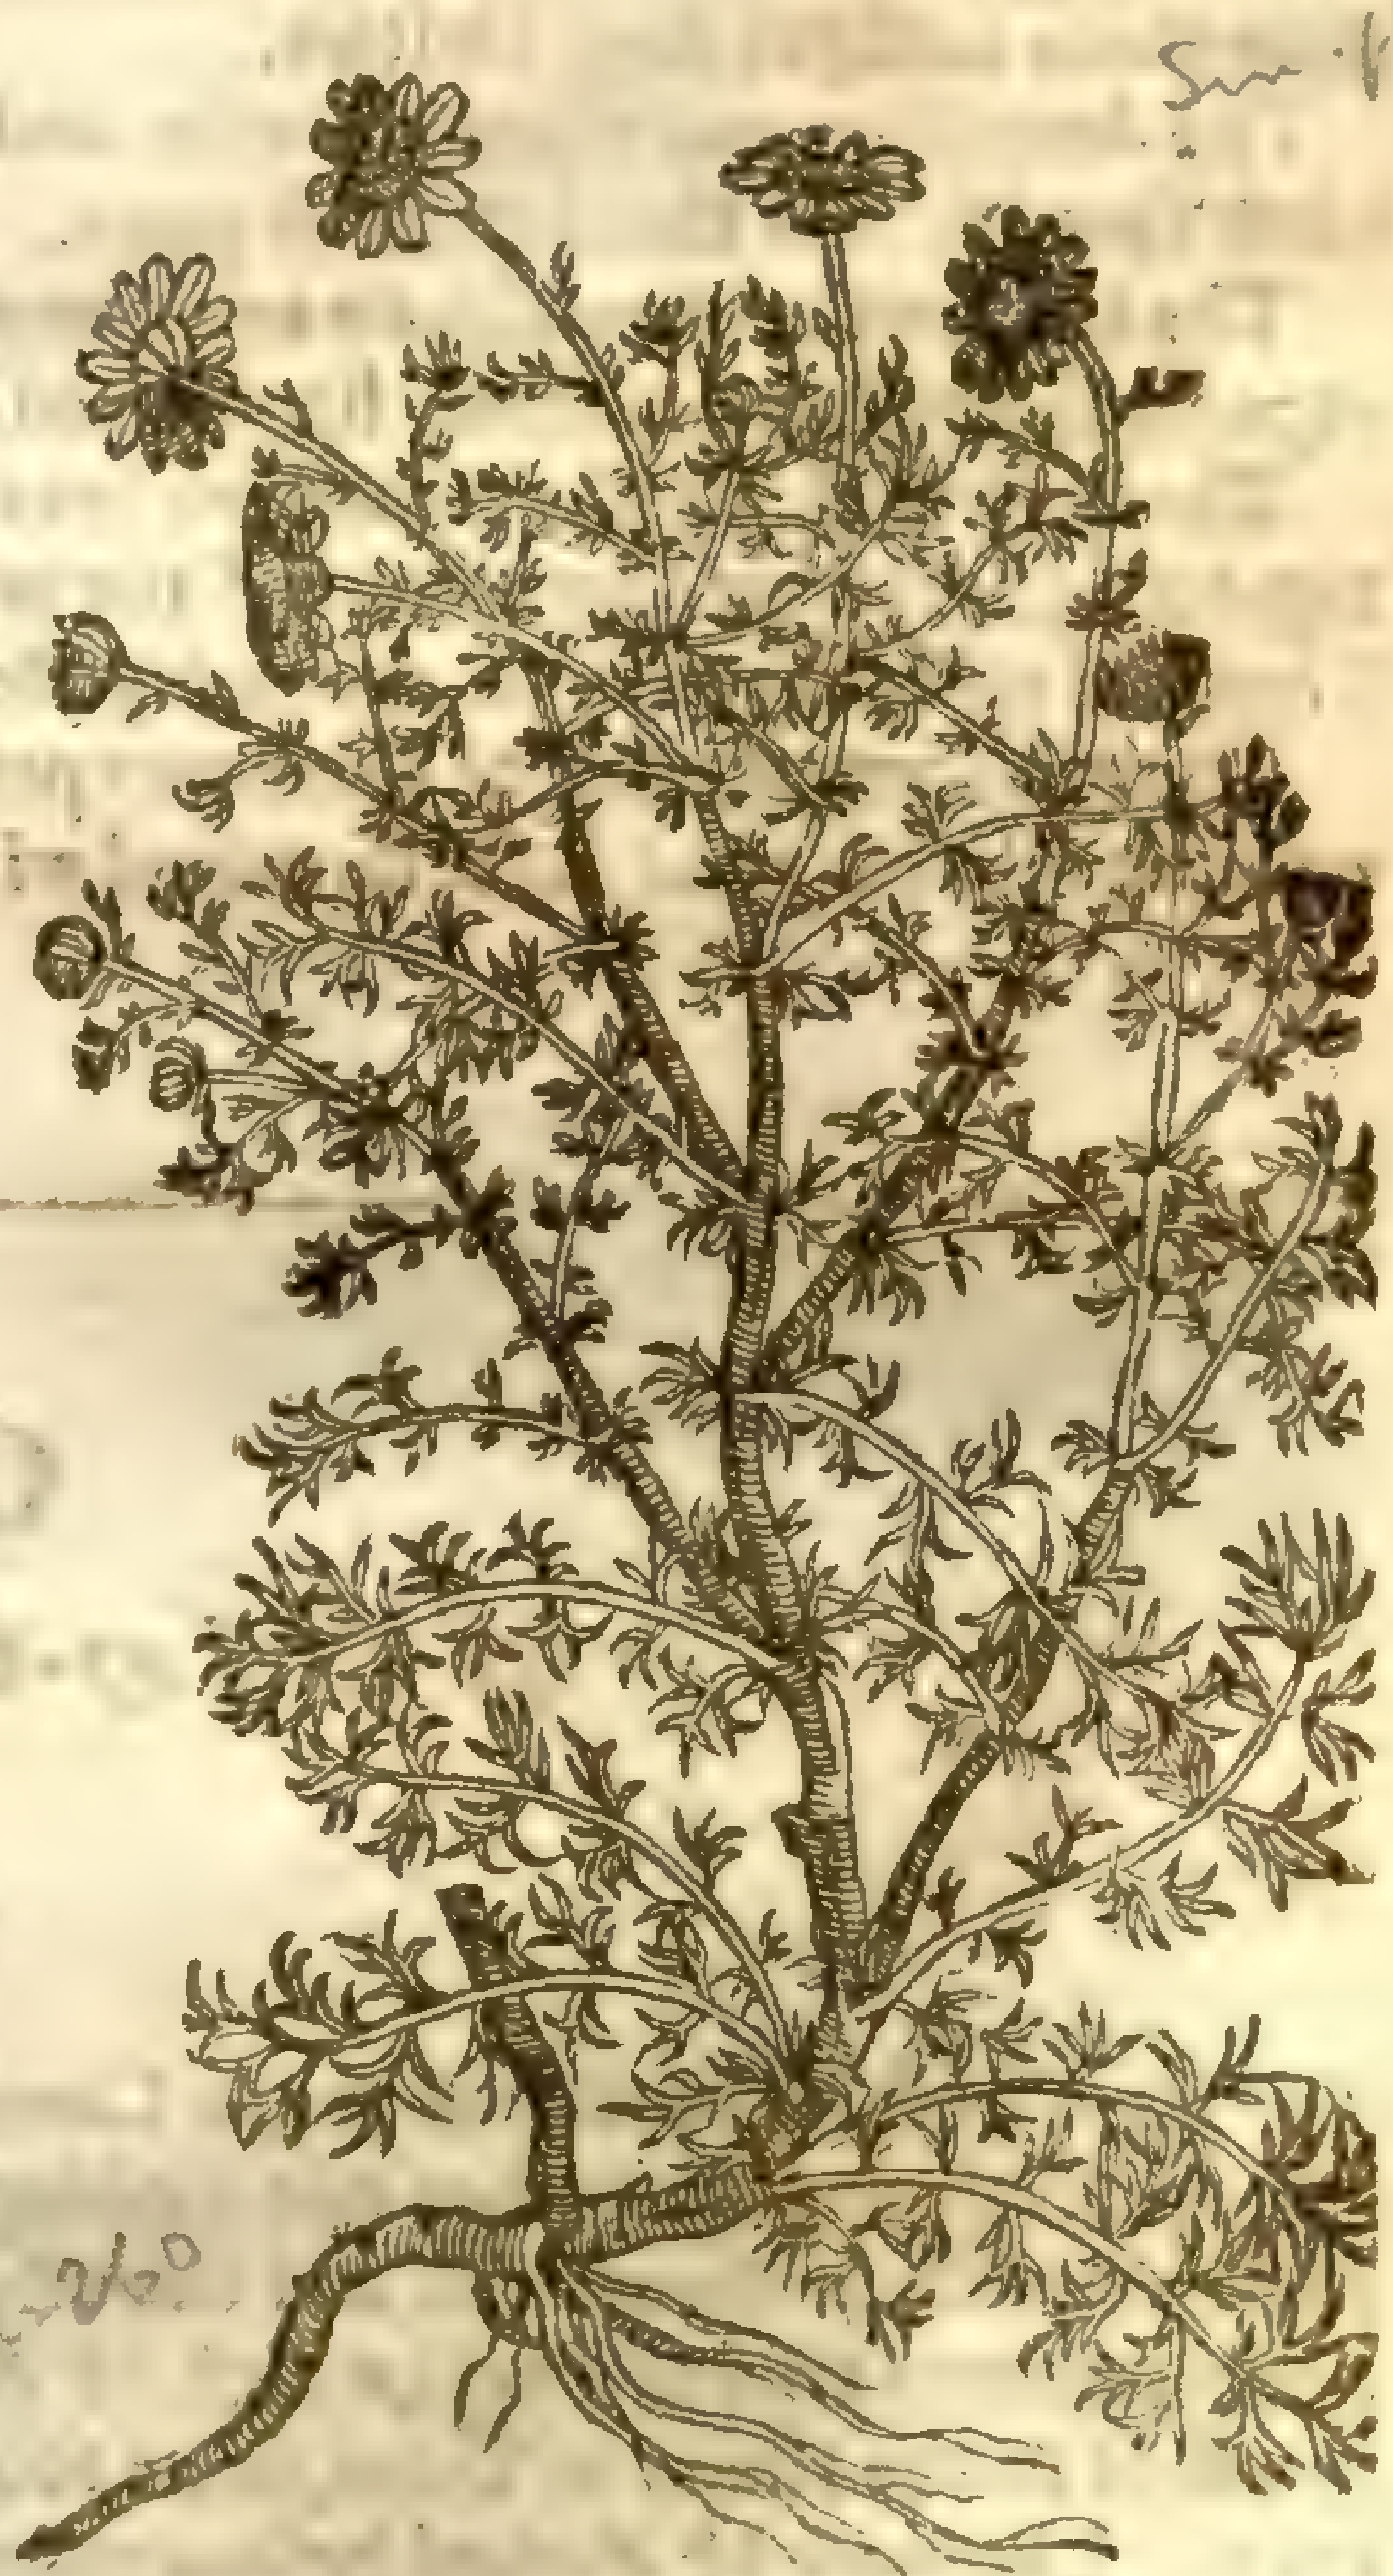
3 *Chamæmelum Anglicum flore multiplici.*
Double floured Cammomill.

[illegible]



4 *Chamæmelum Romanum.*
Romane Cammomill.

Anthemis nobilis [illegible]
Sm. fl. 3. 456



Dod. 260

4 Roman Cammomil hath many ſlender ſtalks,yet ſtiffer and ſtronger than any of the others by reaſon whereof it ſtandeth more vpright,and doth not creep vpon the earth as the reſt do. The leaues are of a more whitiſh colour,tending to the colour of the leaues of Woad. The floures be likewiſe yellow in the middle,and placed about with a border of ſmall white floures.

¶ *The Place.*

Theſe plants are ſet in gardens both for pleaſure and alſo profit.

¶ *The Time.*

They floure moſt part of all the Summer.

¶ *The Names.*

Cammomill is called *Chamæmelum* : of ſome, *Anthemis*, and *Leucanthemis*, and alſo *Leucanthemon*, eſpecially that double floured Cammomill ; which Greek name is taken from the whiteneſſe of his floure : in Engliſh, Cammomill ; ſo called becauſe the floures haue the ſmell of μήλου, an apple, which is plainly perceiued in common Cammomill.

¶ *The Temperature.*

Cammomill, ſaith *Galen*, is hot and dry in the firſt degree, and of thin parts : it is of force to digeſt, ſlacken, and rarifie ; alſo it is thought to be like the Roſe in thinneſſe of parts, comming to the operation of oile in heate, which are to man familiar and temperat : wherefore it is a ſpecial helpe againſt weariſomneſſe : it eaſeth and mitigateth pain, it mollifieth and ſuppleth, and all theſe operations are in our vulgar Cammomill, as common experience teacheth, for it heateth moderately, and drieth little.

¶ *The Vertues.*

A Cammomil is good againſt the Collicke and ſtone, it prouoketh vrine, and is moſt ſingular in Clyſters made againſt the foreſaid diſeaſes.

B Oile of Cammomill is exceeding good againſt all manner of ache and paine, bruiſings, ſhrinking of ſinues, hardneſſe, and cold ſwellings.

C The decoction of Cammomill made in wine and drunke, is good againſt coldneſſe in the ſtomack, ſoure belchings, voideth winde, and mightily bringeth downe the monethly courſes.

D The Egyptians haue vſed it for a remedie againſt all cold agues, and they did therfore conſecrat it (as *Galen* ſaith) to their Deities.

E The decoction made in white wine and drunke expelleth the dead child, and ſecondine or afterbirth ſpeedily, and clenſeth thoſe parts.

F The herb boiled in poſſet ale and giuen to drink, eaſeth the pain of the cheſt comming of wind, expelleth tough and clammy flegme, and helpeth children of the Ague.

G The herb vſed in baths prouoketh ſweat, rarifieth the skin, and openeth the pores : briefly, it mitigateth gripings and gnawings of the belly, allayeth the paine of the ſides, mollifieth hard ſwellings, and waſteth away raw and vndigeſted humors.

H The oile compounded of the flours performeth the ſame, and is a remedie againſt all weariſomneſſe, being with good ſucceſſe mixed with all thoſe things that are applied to mitigate paine.

CHAP. 262.

Of May-weed or wilde Cammomill.

¶ *The Kindes.*

THere be three kindes of wilde Cammomil, which are generally called in Latine *Cotulæ* ; one ſtinking, and two other not ſtinking ; the one hath his floure all white throughout the compaſſe, and alſo in the middle, and the other yellow. Beſides theſe there is another with verie faire double floures void of ſmell, which Mr *Bartholmew Lane* a Kentiſh gentleman found growing wild in a field in the Iſland of Tenet, neere to a houſe called Queakes, ſomtime belonging to Sir *Henrie Criſpe*. Likewiſe Mr *Hesketh* before remembred, found it in the garden of his Inne at Barnet, if my memorie faile me not, at the ſigne of the red Lyon, or neere vnto it, and in a poore womans garden as he was riding into Lancaſhire.

‡ The double floured May-weed, in the yeare 1632, I (being in company with Mr *Wil. Broad*, Mr *Iames Clark*, and ſome other London Apothecaries in the Iſle of Tenet) found it growing wild vpon the cliffe ſide cloſe by the towne of Margate, and in ſome other places of the Iſland. ‡

¶ *The Deſcription.*

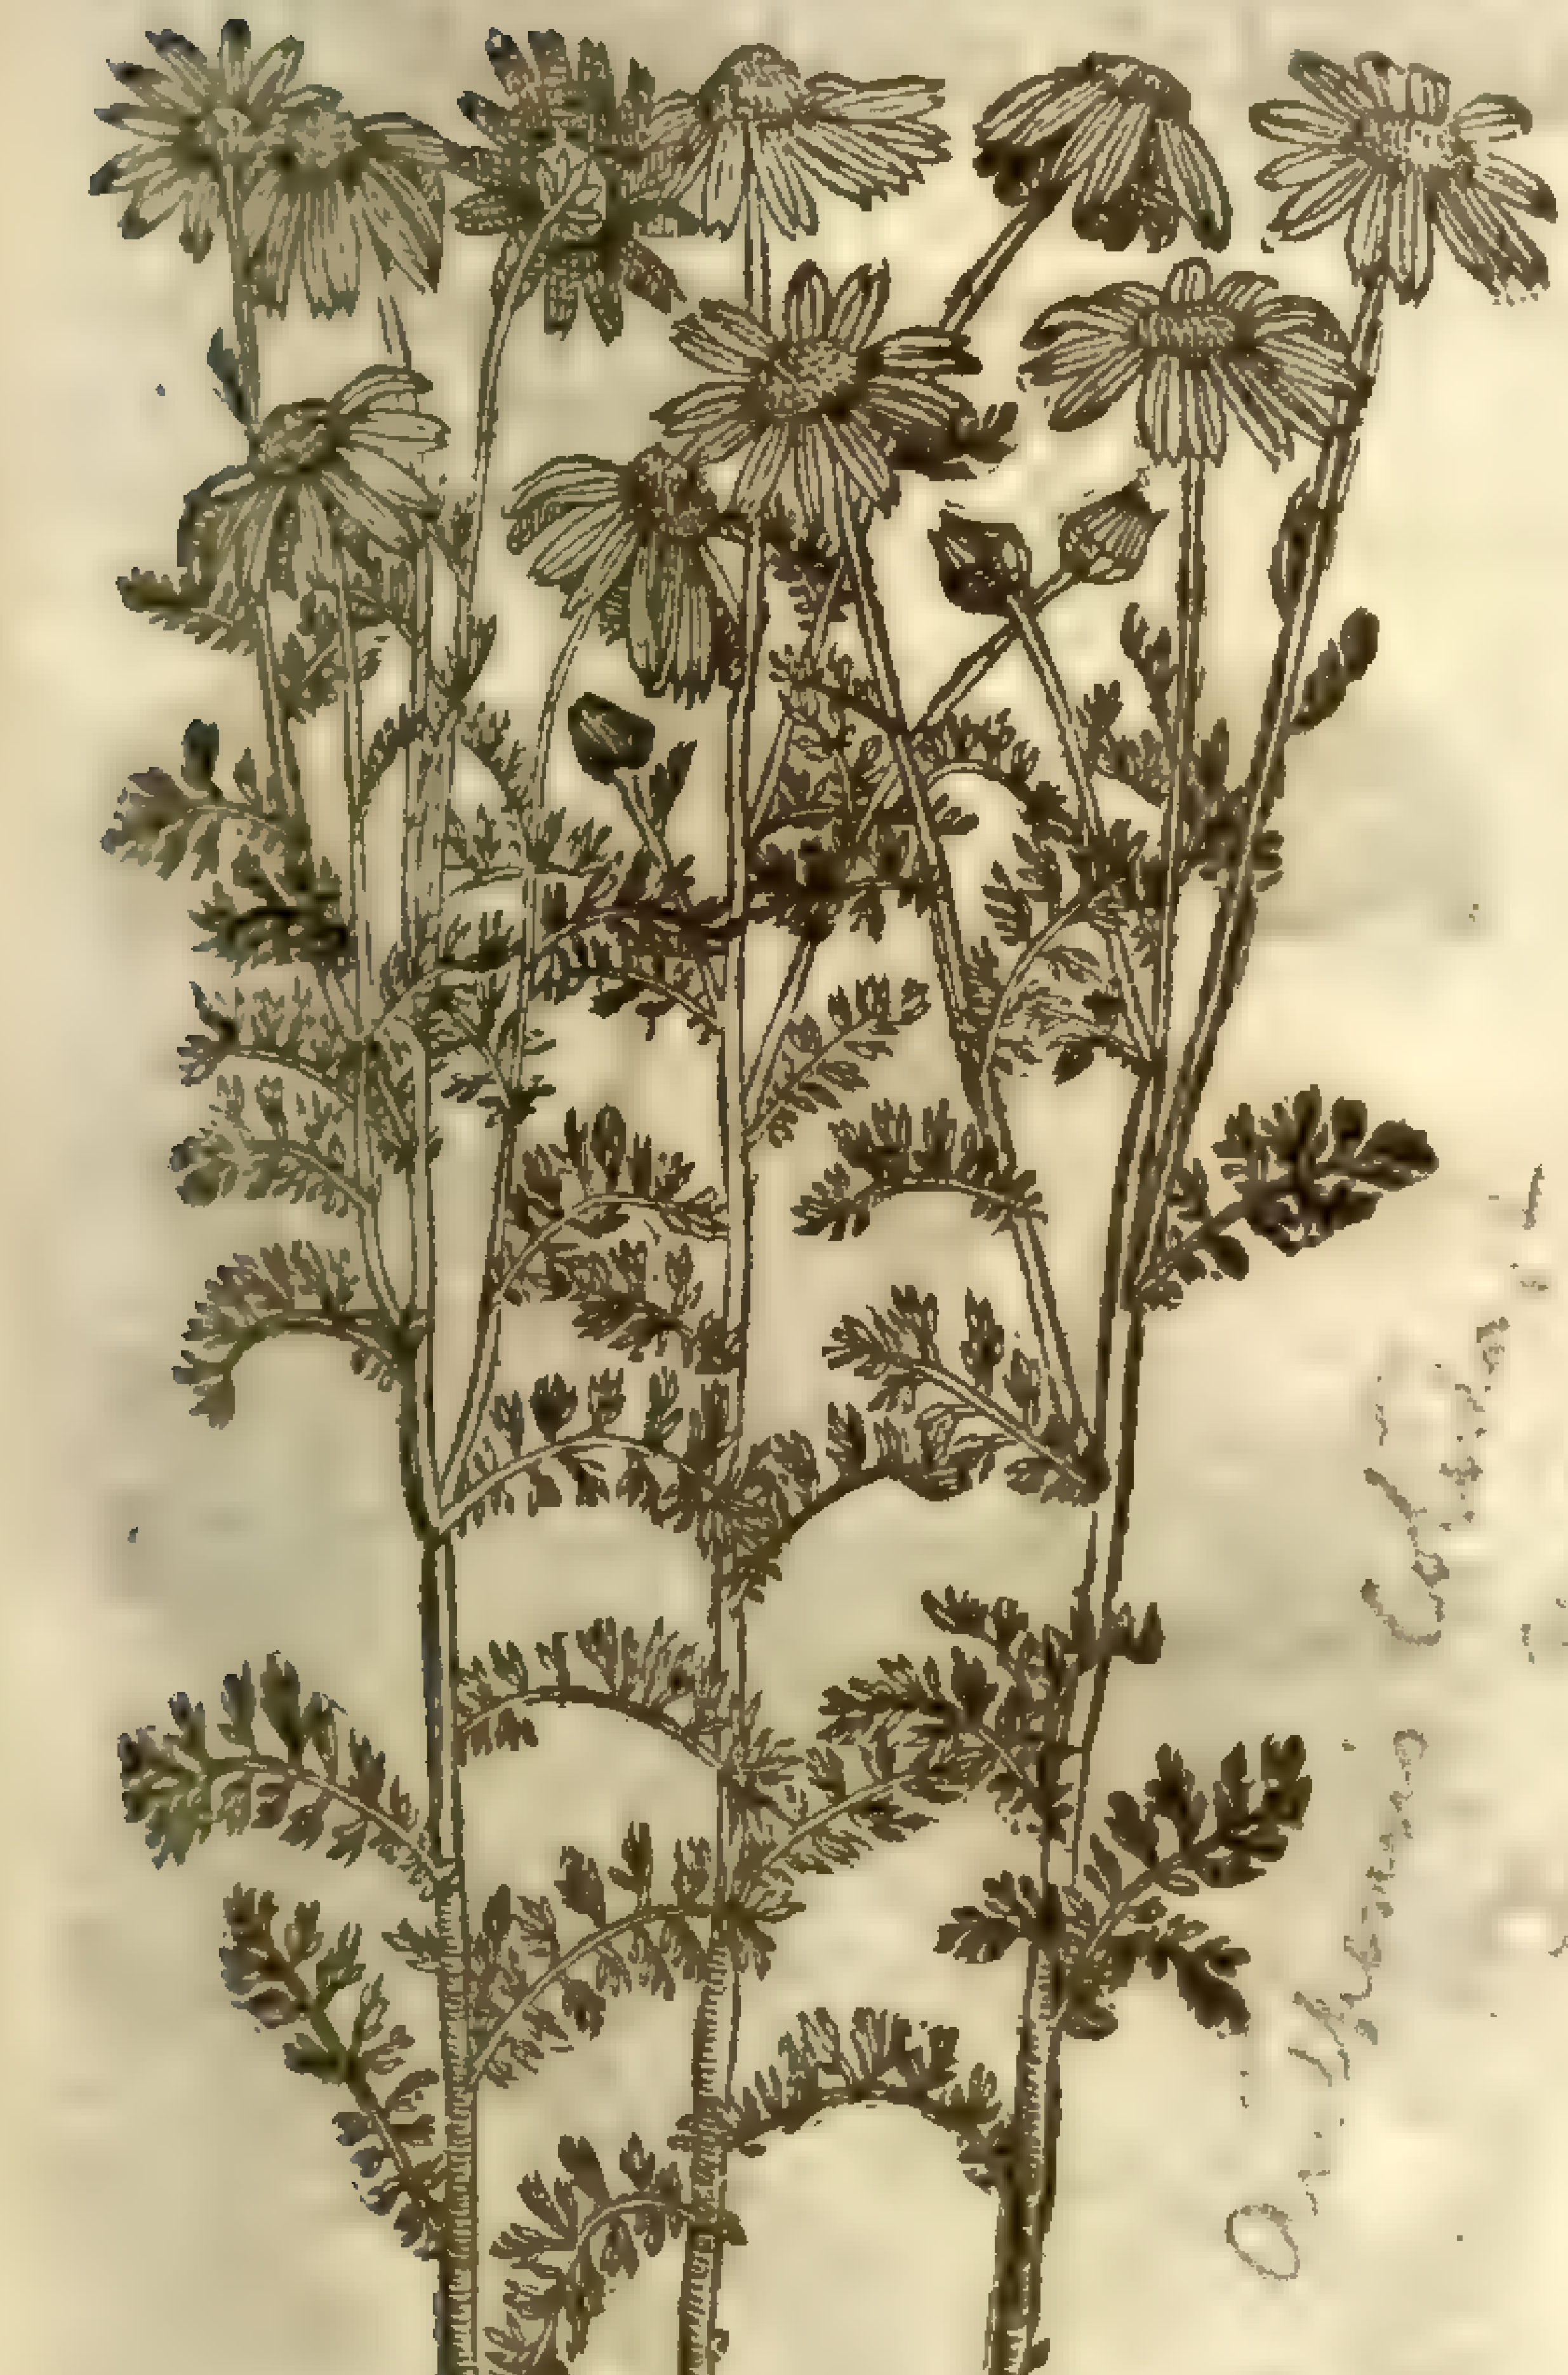
1 MAy-weed bringeth forth round ſtalks, green, brittle, and full of juice, parted into many branches thicker and higher than thoſe of Cammomil ; the leaues in like maner are broader, and of a blackiſh green colour. The floures are like in form and color, yet commonly larger, of a ranke and naughty ſmell. The root is woody, and periſheth when the ſeed is ripe. The whole plant ſtinketh, and giueth a ranke ſmell.

‡ This herb varies, in that it is found ſomtimes with narrower, and otherwhiles with broader leaues; as alſo with a ſtrong vnpleaſant ſmell, or without any ſmell at all: the flours alſo are ſingle or elſe (which is ſeldome found) very double. ‡

2 The yellow May-weed hath a ſmall and tender root, from which riſeth vp a feeble ſtalke diuiding it ſelfe into many other branches, whereupon grow leaues not vnlike to Camomil, but thinner and fewer in number: the floures grow at the top of the ſtalks, of a gold yellow colour. ‡ This I take to be no other than the *Buphthalmum verum* of our Author, formerly deſcribed in the ſecond place, Chap. 257.

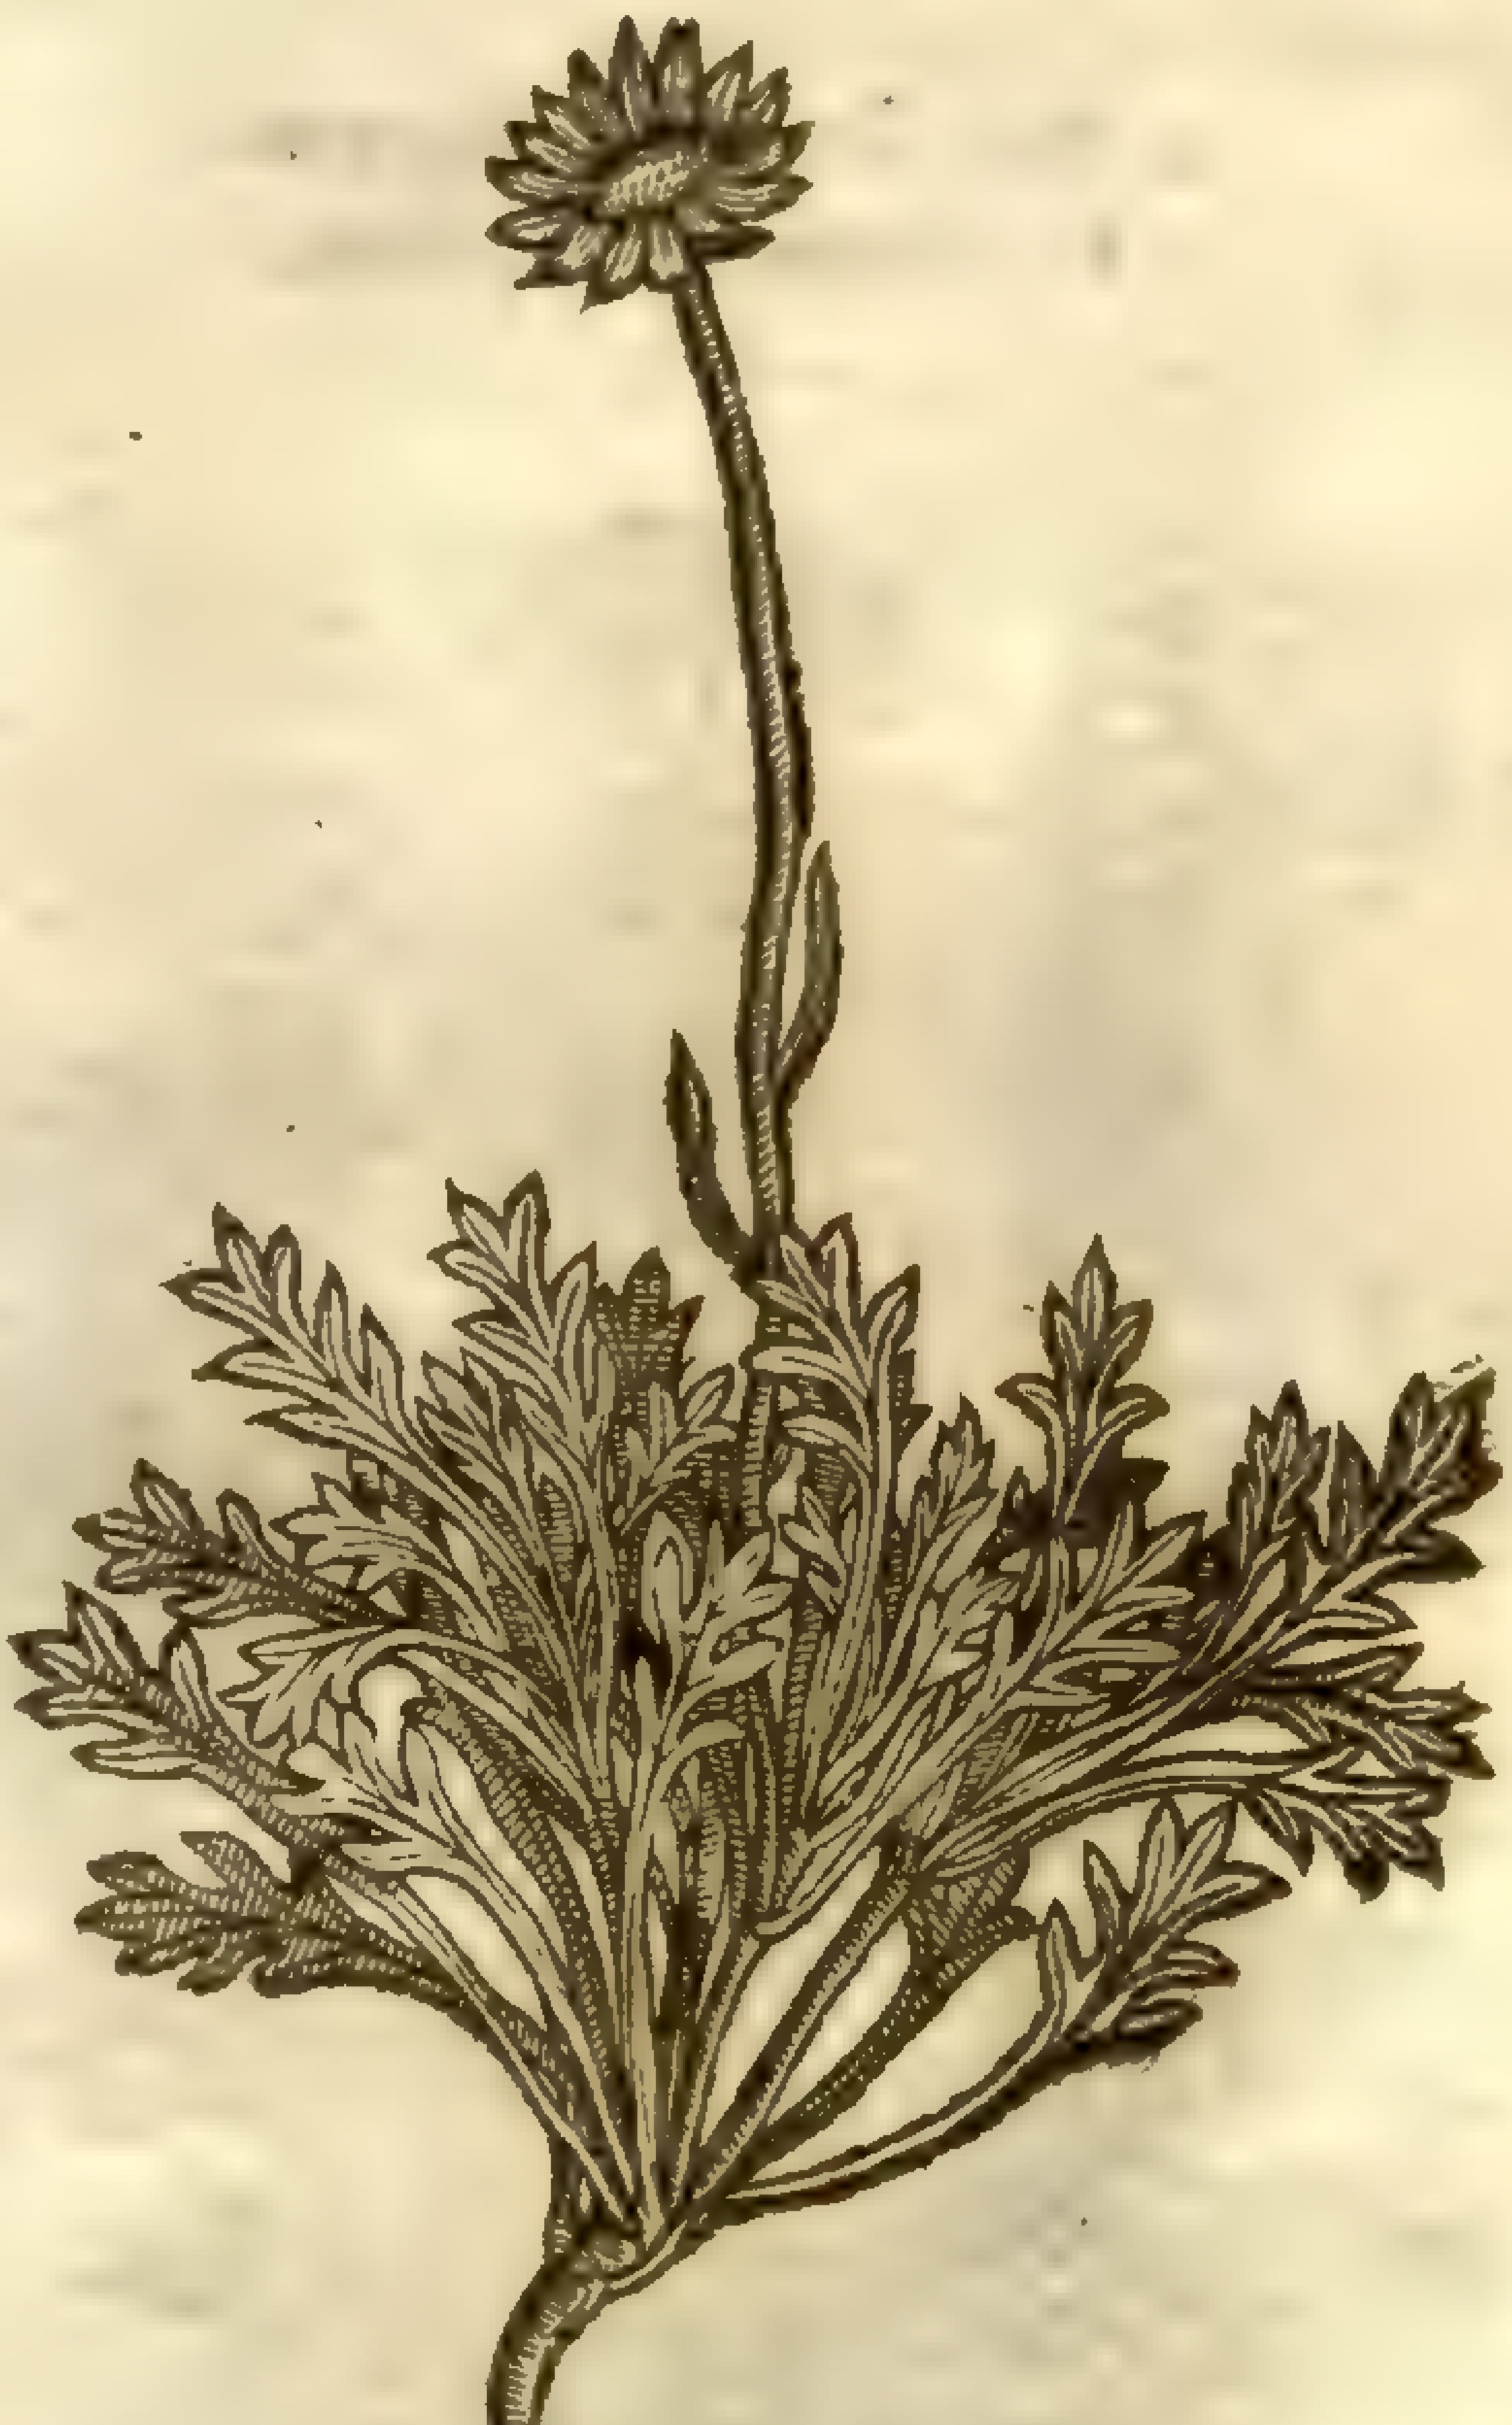
3 The mountain Cammomill hath leaues ſomewhat deepely cut in almoſt to the middle rib, thicke alſo and juicie, of a bitteriſh taſte, and of no vnpleaſant ſmell: the ſtalks are weak, and ſome foot high, carrying at their tops ſingle floures, bigger, yet like thoſe of Cammomill, yellow in the middle, with a border of twenty or more long white leaues incompaſſing it. It increaſeth much, as Cammomil doth, and hath creeping roots. It is found vpon the Stirian Alps, and floureth in Iuly and Auguſt. *Cluſius* hath ſet this forth by the name of *Leucanthemum Alpinum*. ‡

1 *Cotula fœtida.*
May-weed.



Anthemis Cotula

‡ 3 *Leucanthemum Alpinum Cluſij.*
Wilde Mountain Cammomil.



¶ *The Place.*

They grow in Cone fields neere vnto path waies, and in the borders of fields.

¶ *The Time.*

They floure in Iuly and Auguſt.

¶ *The Names.*

May-weed is called in ſhops *Cotula fœtida*: of *Fuchſius*, *Parthenium*, and *Virginea*, but not truly: of others, Κυνάνθεμις: in high-Dutch, **Krotendill**: in low-Dutch, **Paddebloemen**; in French, *Eſpargoutte*: in Engliſh, May-weed, wilde Cammomill, and ſtinking Mathes.

¶ *The Temperature and Vertues.*

A May-weed is not vſed for meat nor medicine, and therefore the faculties are vnknowne; yet all of them are thought to be hot and dry, & like after a ſort in operation to Cammomil, but nothing at all agreeing with mans nature: notwithſtanding it is commended againſt the infirmities of the mother, ſeeing all ſtinking things are good againſt thoſe diſeaſes.

It is an vnprofitable weed among corne, raiſing bliſters vpon the hands of weeders and reapers.

Chap. 263. *Of Pellitorie of Spaine.*

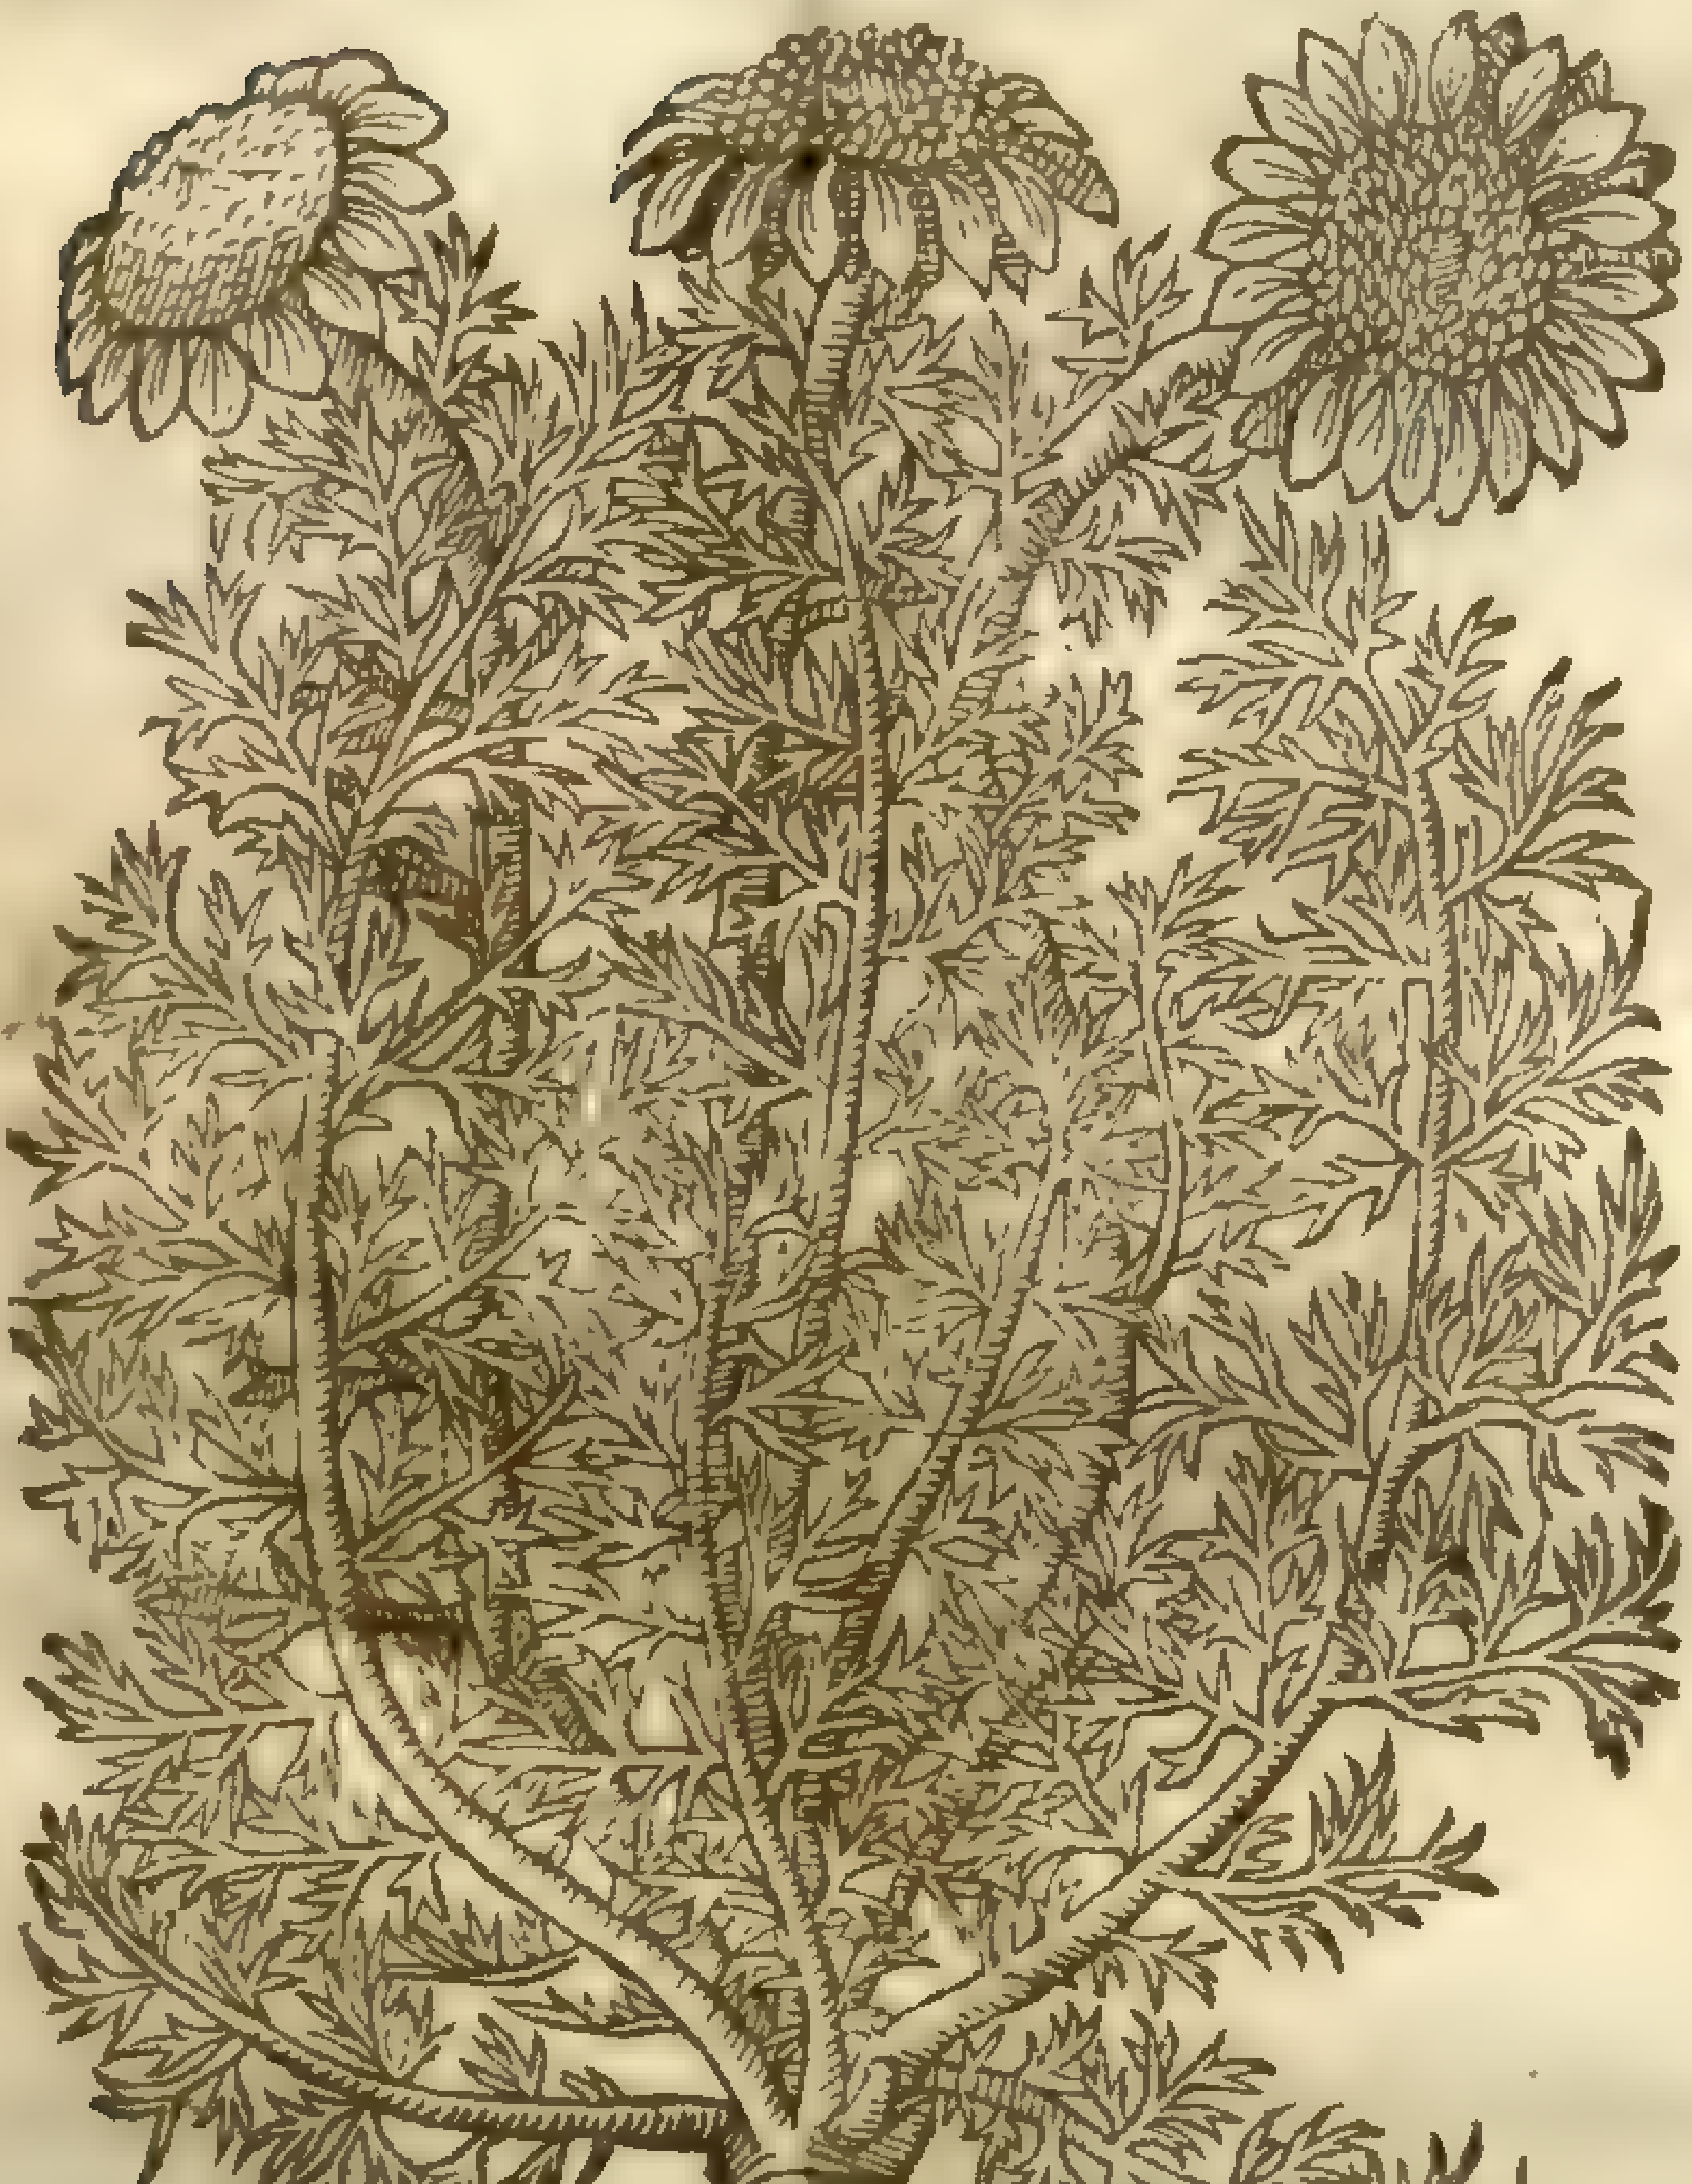
¶ *The Deſcription.*

1 Pyrethrum, in Engliſh Pellitorie of Spain (by the name whereof ſome do vnproperly cal another plant, which is indeed the true *Imperatoria* or Maſterwort, & not Pellitory) hath great and fat leaues like vnto Fennell, trailing vpon the ground: amongſt which immediatly from the root riſeth vp a fat great ſtem, bearing at the top a goodly floure faſhioned like the great ſingle white Daiſie, whoſe bunch or knob in the midſt is yellow like that of the Daiſie, and bordered about with a pale of ſmall leaues exceeding white on the vpper ſide, and vnder of a faire purple colour: the root is long, of the bigneſſe of a finger, very hot, and of a burning taſte.

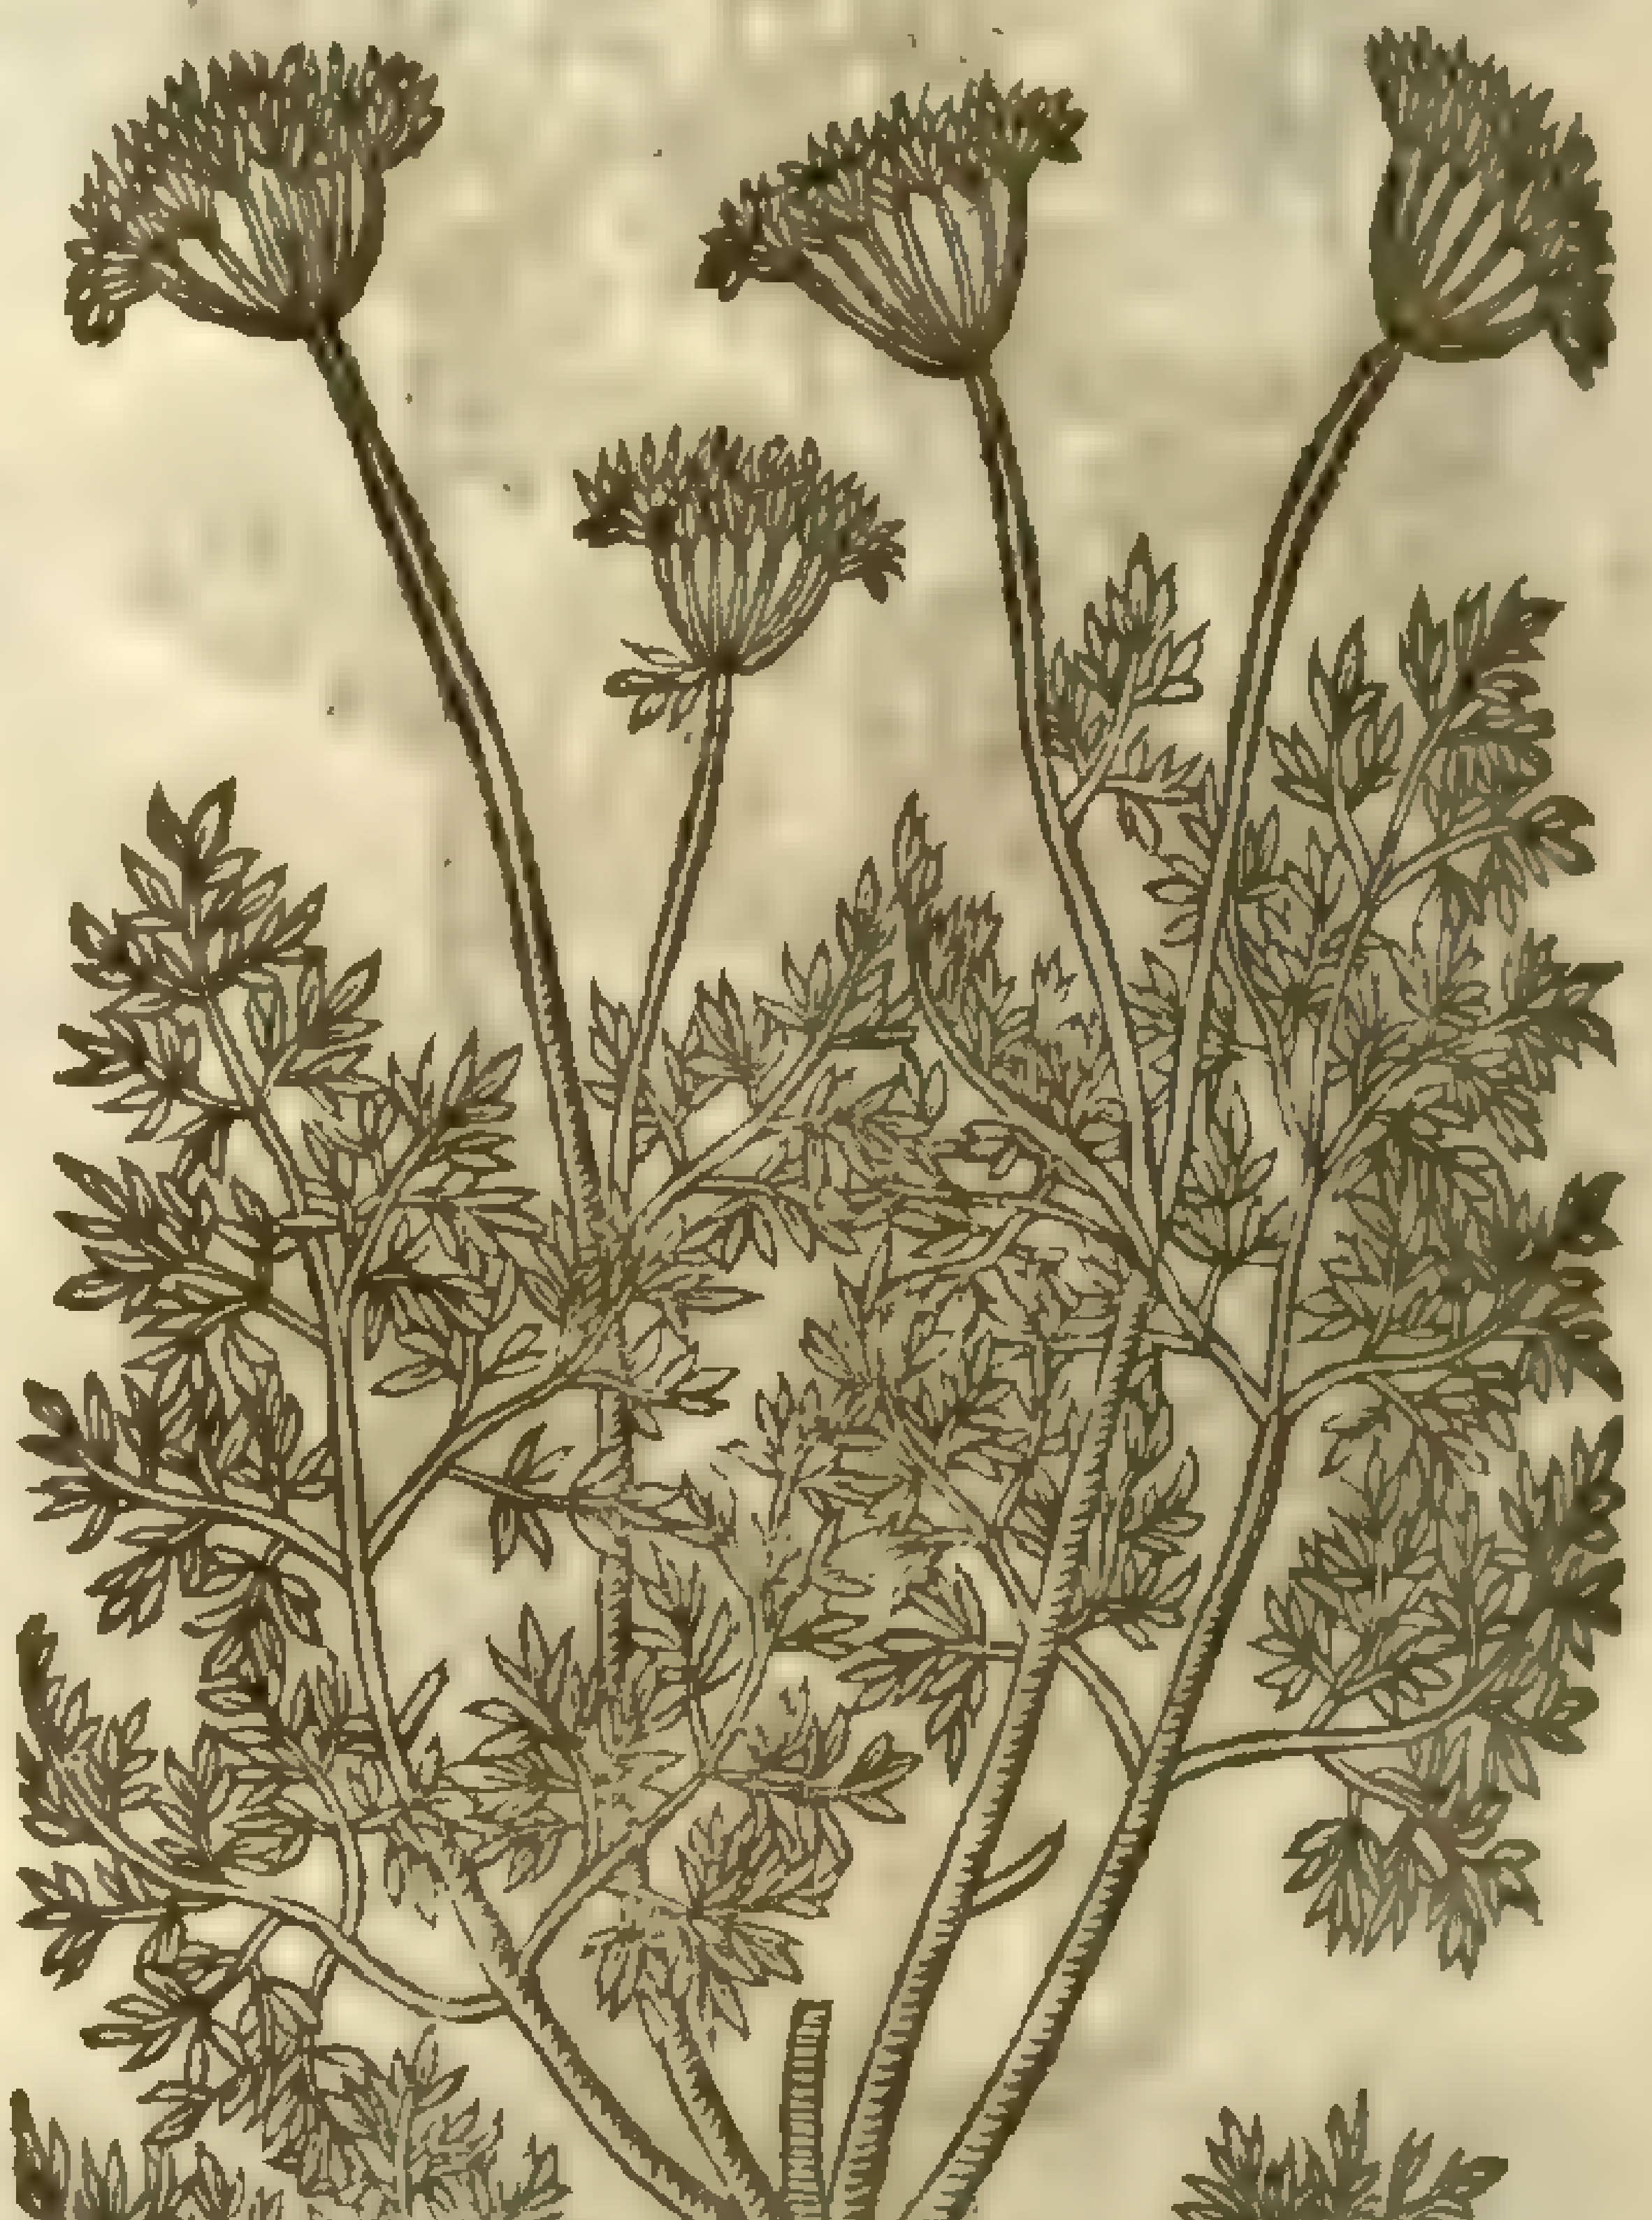
2 The wilde Pellitorie groweth vp like vnto wild Cheruile, reſembling the leaues of *Caucalis*, of a quicke and nipping taſte like the leaues of Dittander or Pepperwort: the floures grow at the top of the ſlender ſtalks, in ſmall tufts or ſpoky vmbels, of a white colour: the root is tough, of the bigneſſe of a little finger, with ſome threds thereto belonging, and of a quick biting taſte.

Anthemis pyrethrum, L.
Miller. dict.

1 *Pyrethrum officinarum.*
Pellitorie of Spaine.



2 *Pyrethrum ſylueſtre.*
Wilde Pellitorie.



¶ *The Place.*

It groweth in my garden very plentifully.

¶ *The Time.*

It floureth and ſeedeth in Iuly and Auguſt.

¶ *The Names.*

Pellitorie of Spaine is called in Greeke πύρεθρον, by reaſon of his hot and fiery taſte: in Shops alſo *Pyrethrum*: in Latine, *Saliuaris*: in Italian, *Pyrethro*: in Spaniſh, *Pelitre*: in French, *Pied d'Alexandre*,

Alexandre, that is to ſay, *Pes Alexandrinus*, or Alexanders foot: in high and low Dutch, **Bertram**: in Engliſh, Pellitorie of Spaine; and of ſome, Bertram, after the Dutch name: and this is the right *Pyrethrum*, or Pellitorie of Spaine; for that which diuers here in England take to bee the right, is not ſo, as I haue before noted:

¶ *The Temperature and Vertues.*

A The root of Pellitorie of Spaine is very hot and burning, by reaſon whereof it taketh away the cold ſhiuering of Agues, that haue been of long continuance, and is good for thoſe that are taken with a dead palſie, as *Dioſcorides* writeth.

B The ſame is with good ſucceſſe mixed with Antidotes or counterpoyſons which ſerue againſt the megrim or continuall paine of the head, the dizzineſſe called *Vertigo*, the apoplexy, the falling ſickneſſe, the trembling of the ſinewes, and palſies, for it is a ſingular good and effectuall remedy for all cold and continuall infirmities of the head and ſinewes.

C *Pyrethrum* taken with hony is good againſt all cold diſeaſes of the braine.

D The root chewed in the mouth draweth forth great ſtore of rheume, ſlime, and filthy wateriſh humors, and eaſeth the paine of the teeth, eſpecially if it be ſtamped with a little Staueſ-acre, and tied in a ſmall bag, and put into the mouth, and there ſuffered to remaine a certaine ſpace.

E If it be boiled in Vineger, and kept warme in the mouth it hath the ſame effect.

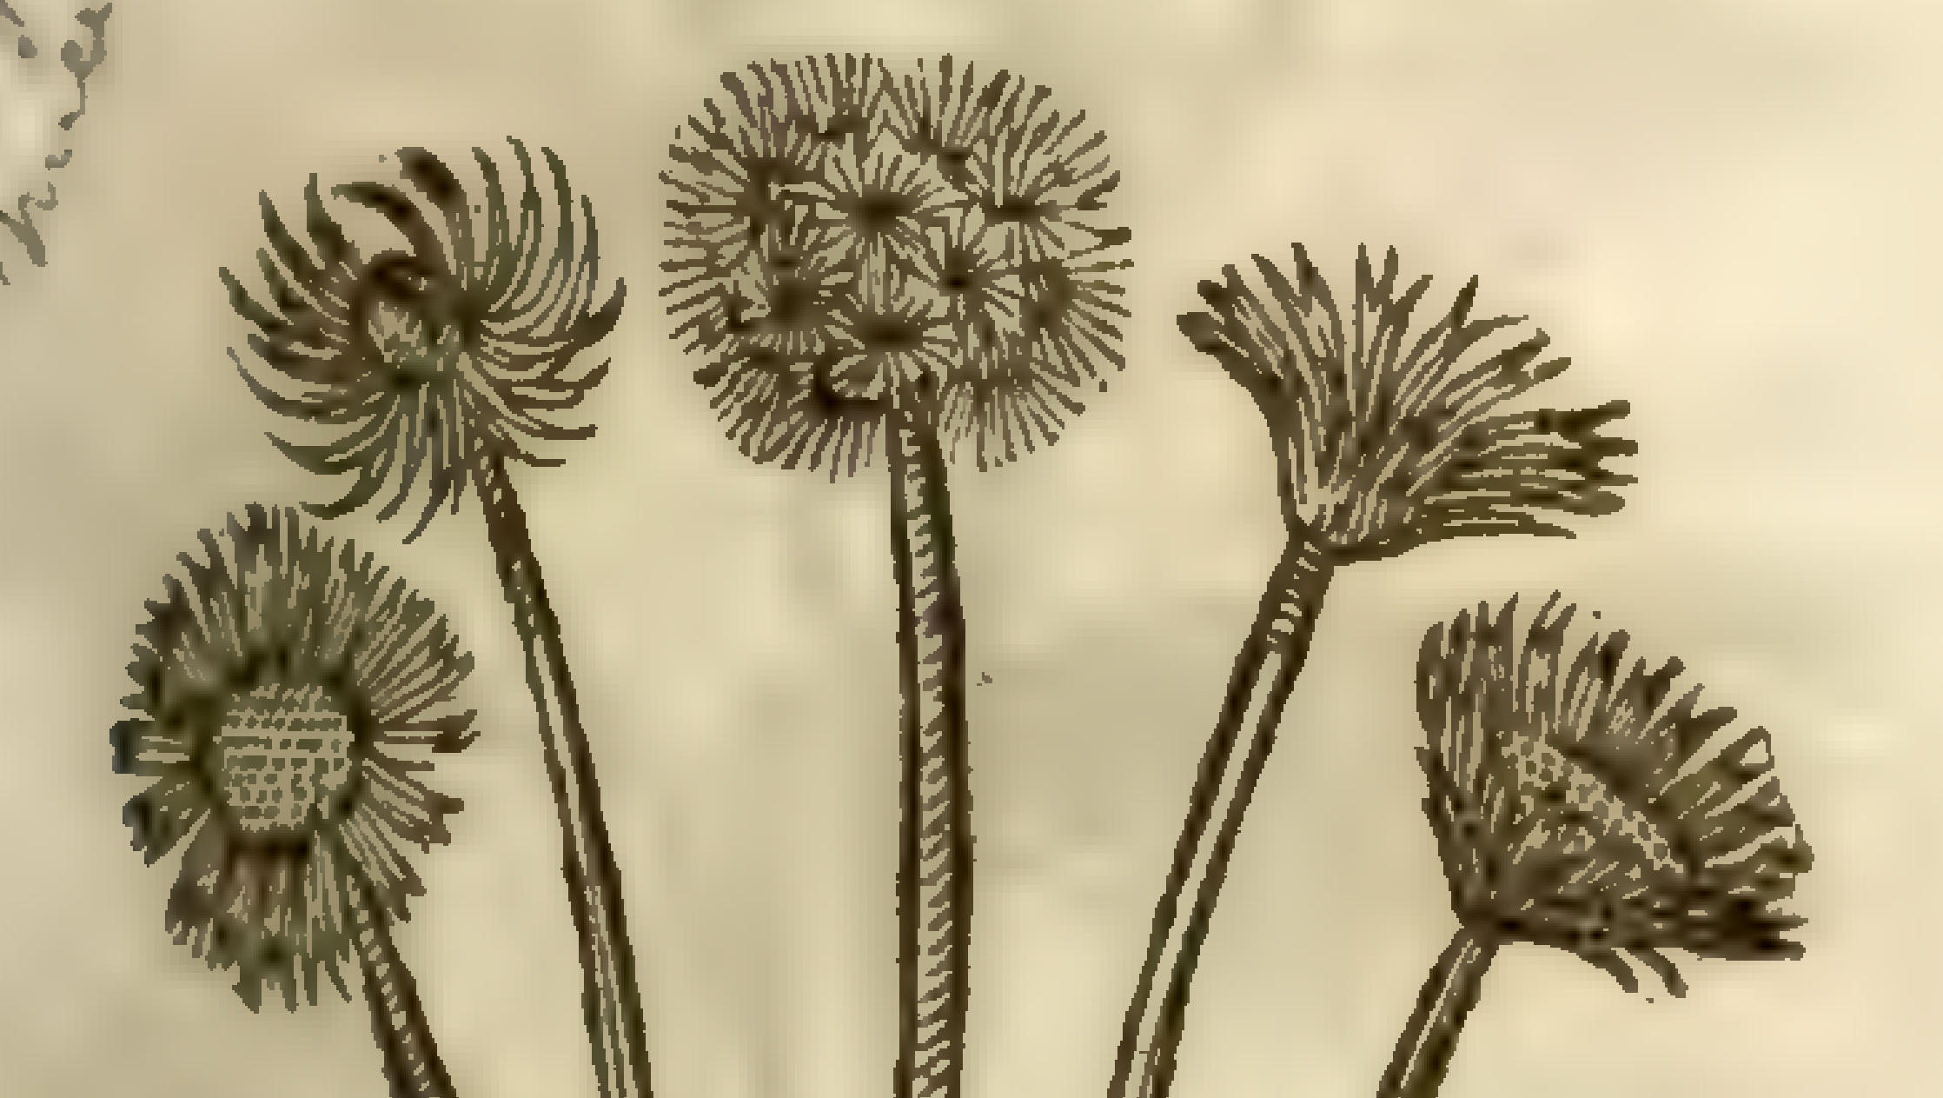
F The oyle wherein Pellitorie hath been boyled is good to anoint the body to procure ſweating, and is excellent good to anoint any part that is bruiſed and blacke, although the member be declining to mortification: it is good alſo for ſuch as are ſtricken with the palſie.

G It is moſt ſingular for the Surgeons of the Hoſpitals to put into their vnctions *contra Neapolitanum morbum*, and ſuch other diſeaſes that be couſin germanes thereunto.

CHAP. 264: *Of Leopards bane.*

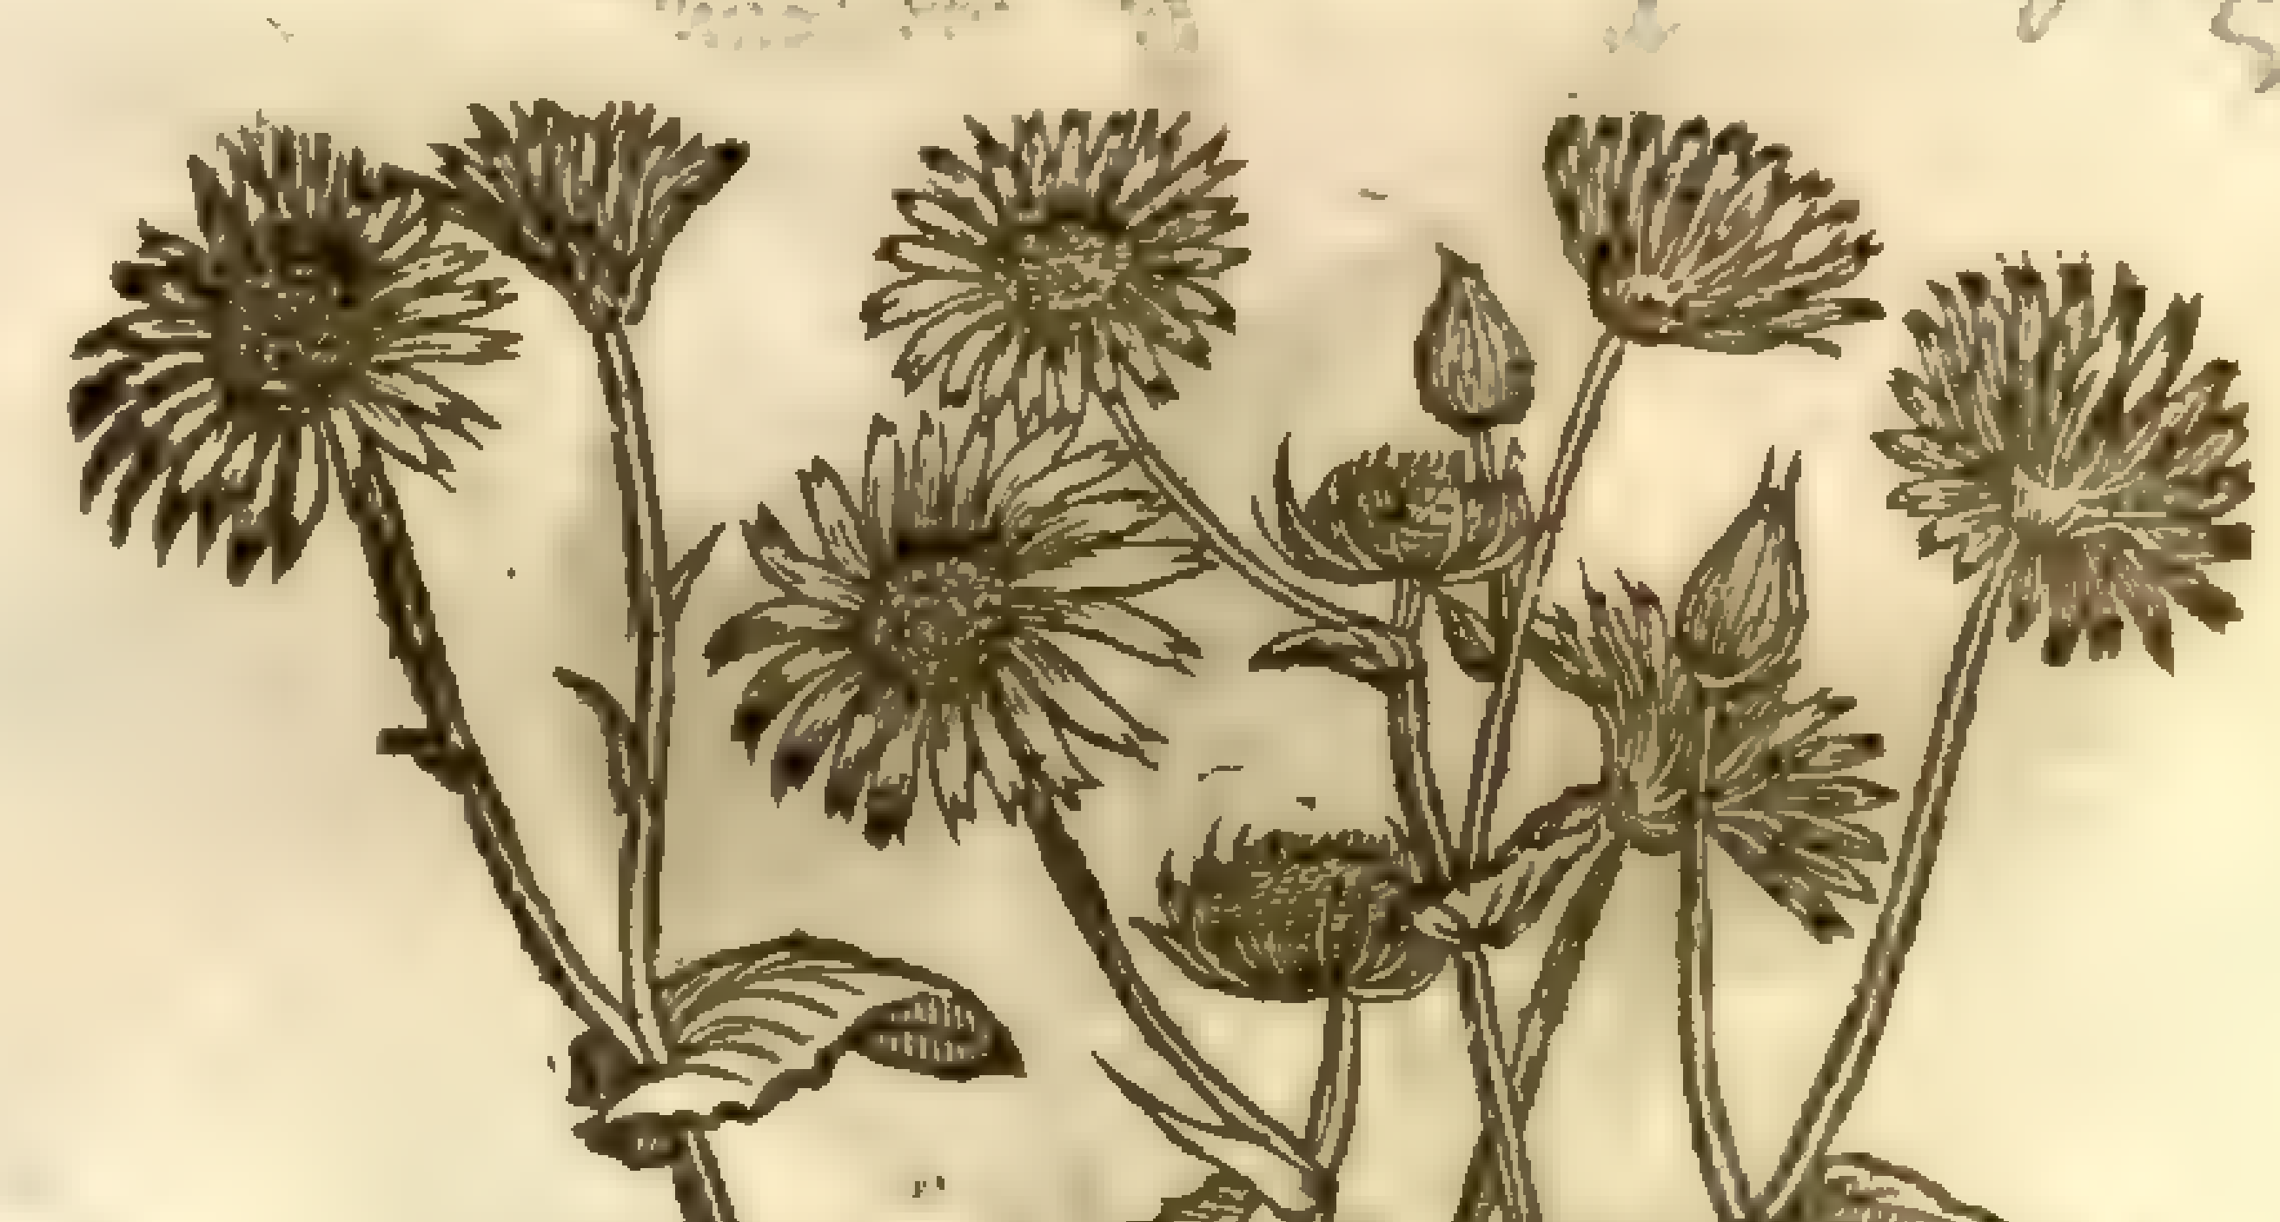
D. pardalianches [illegible]

‡ 1 *Doronicum minus Officinarum.*
Small Leopards bane.



† 2 *Doronicum majus Officinarum.*
Great Leopards bane.

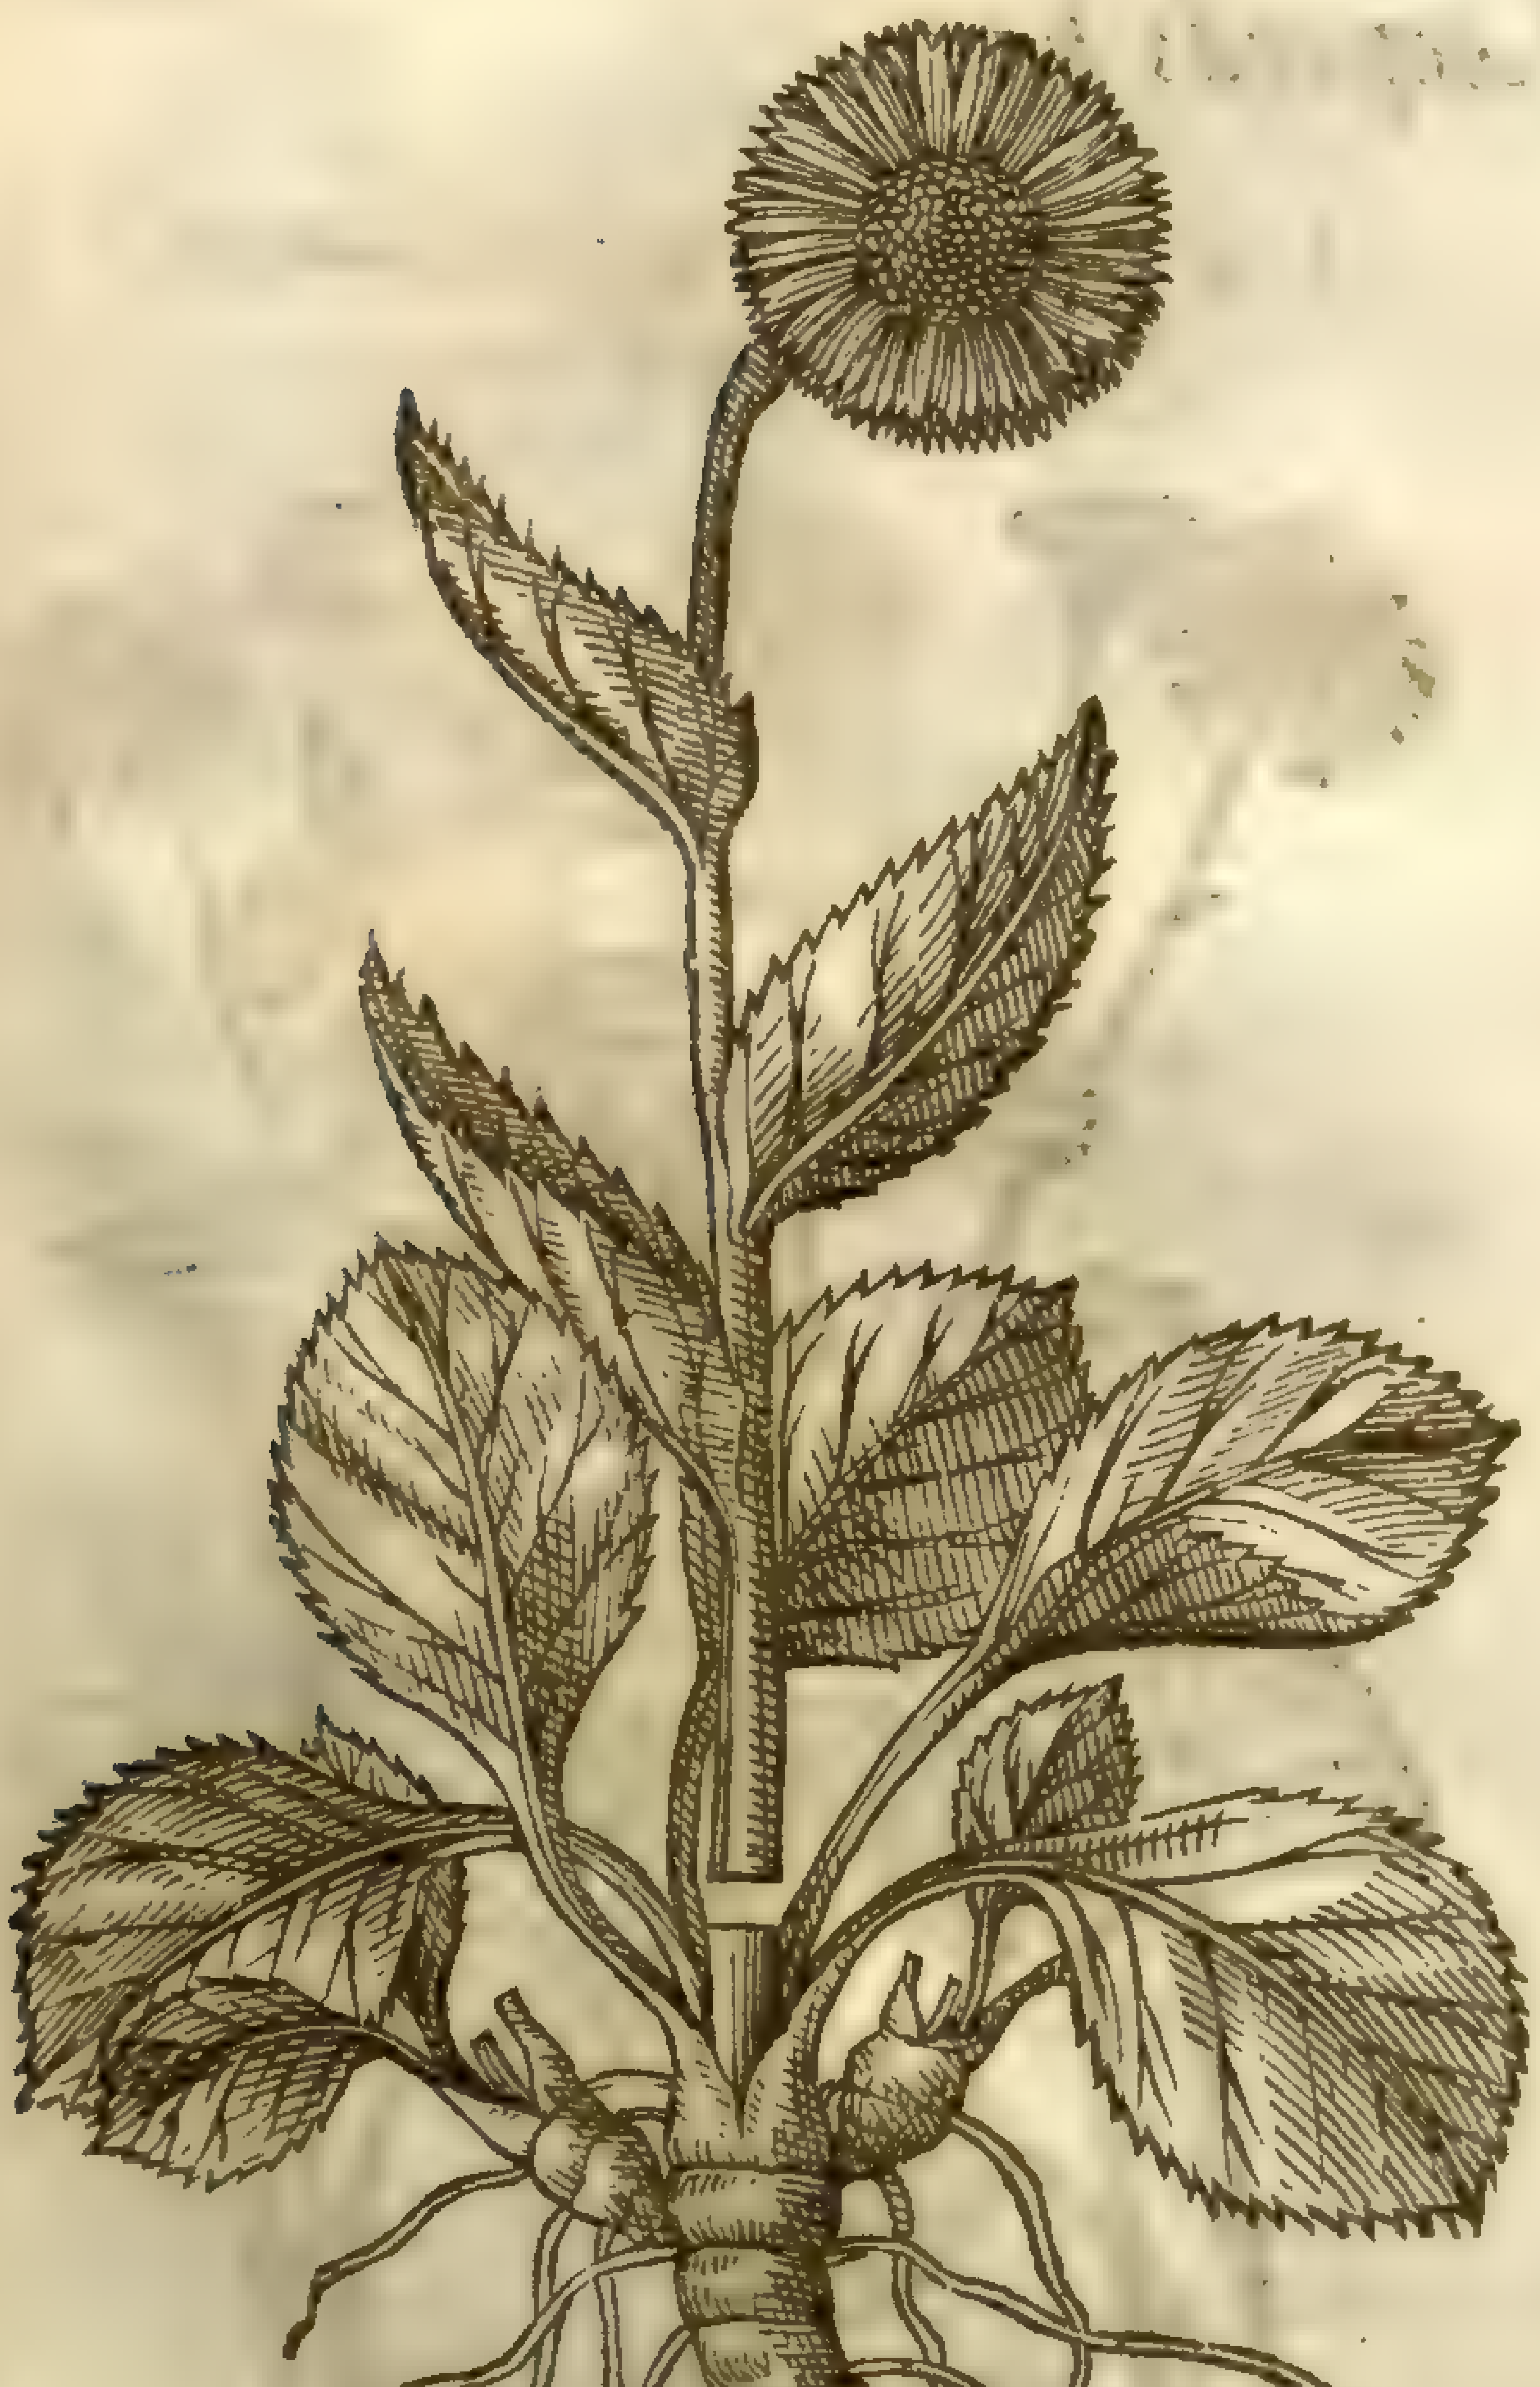
D. pardalianches [illegible]



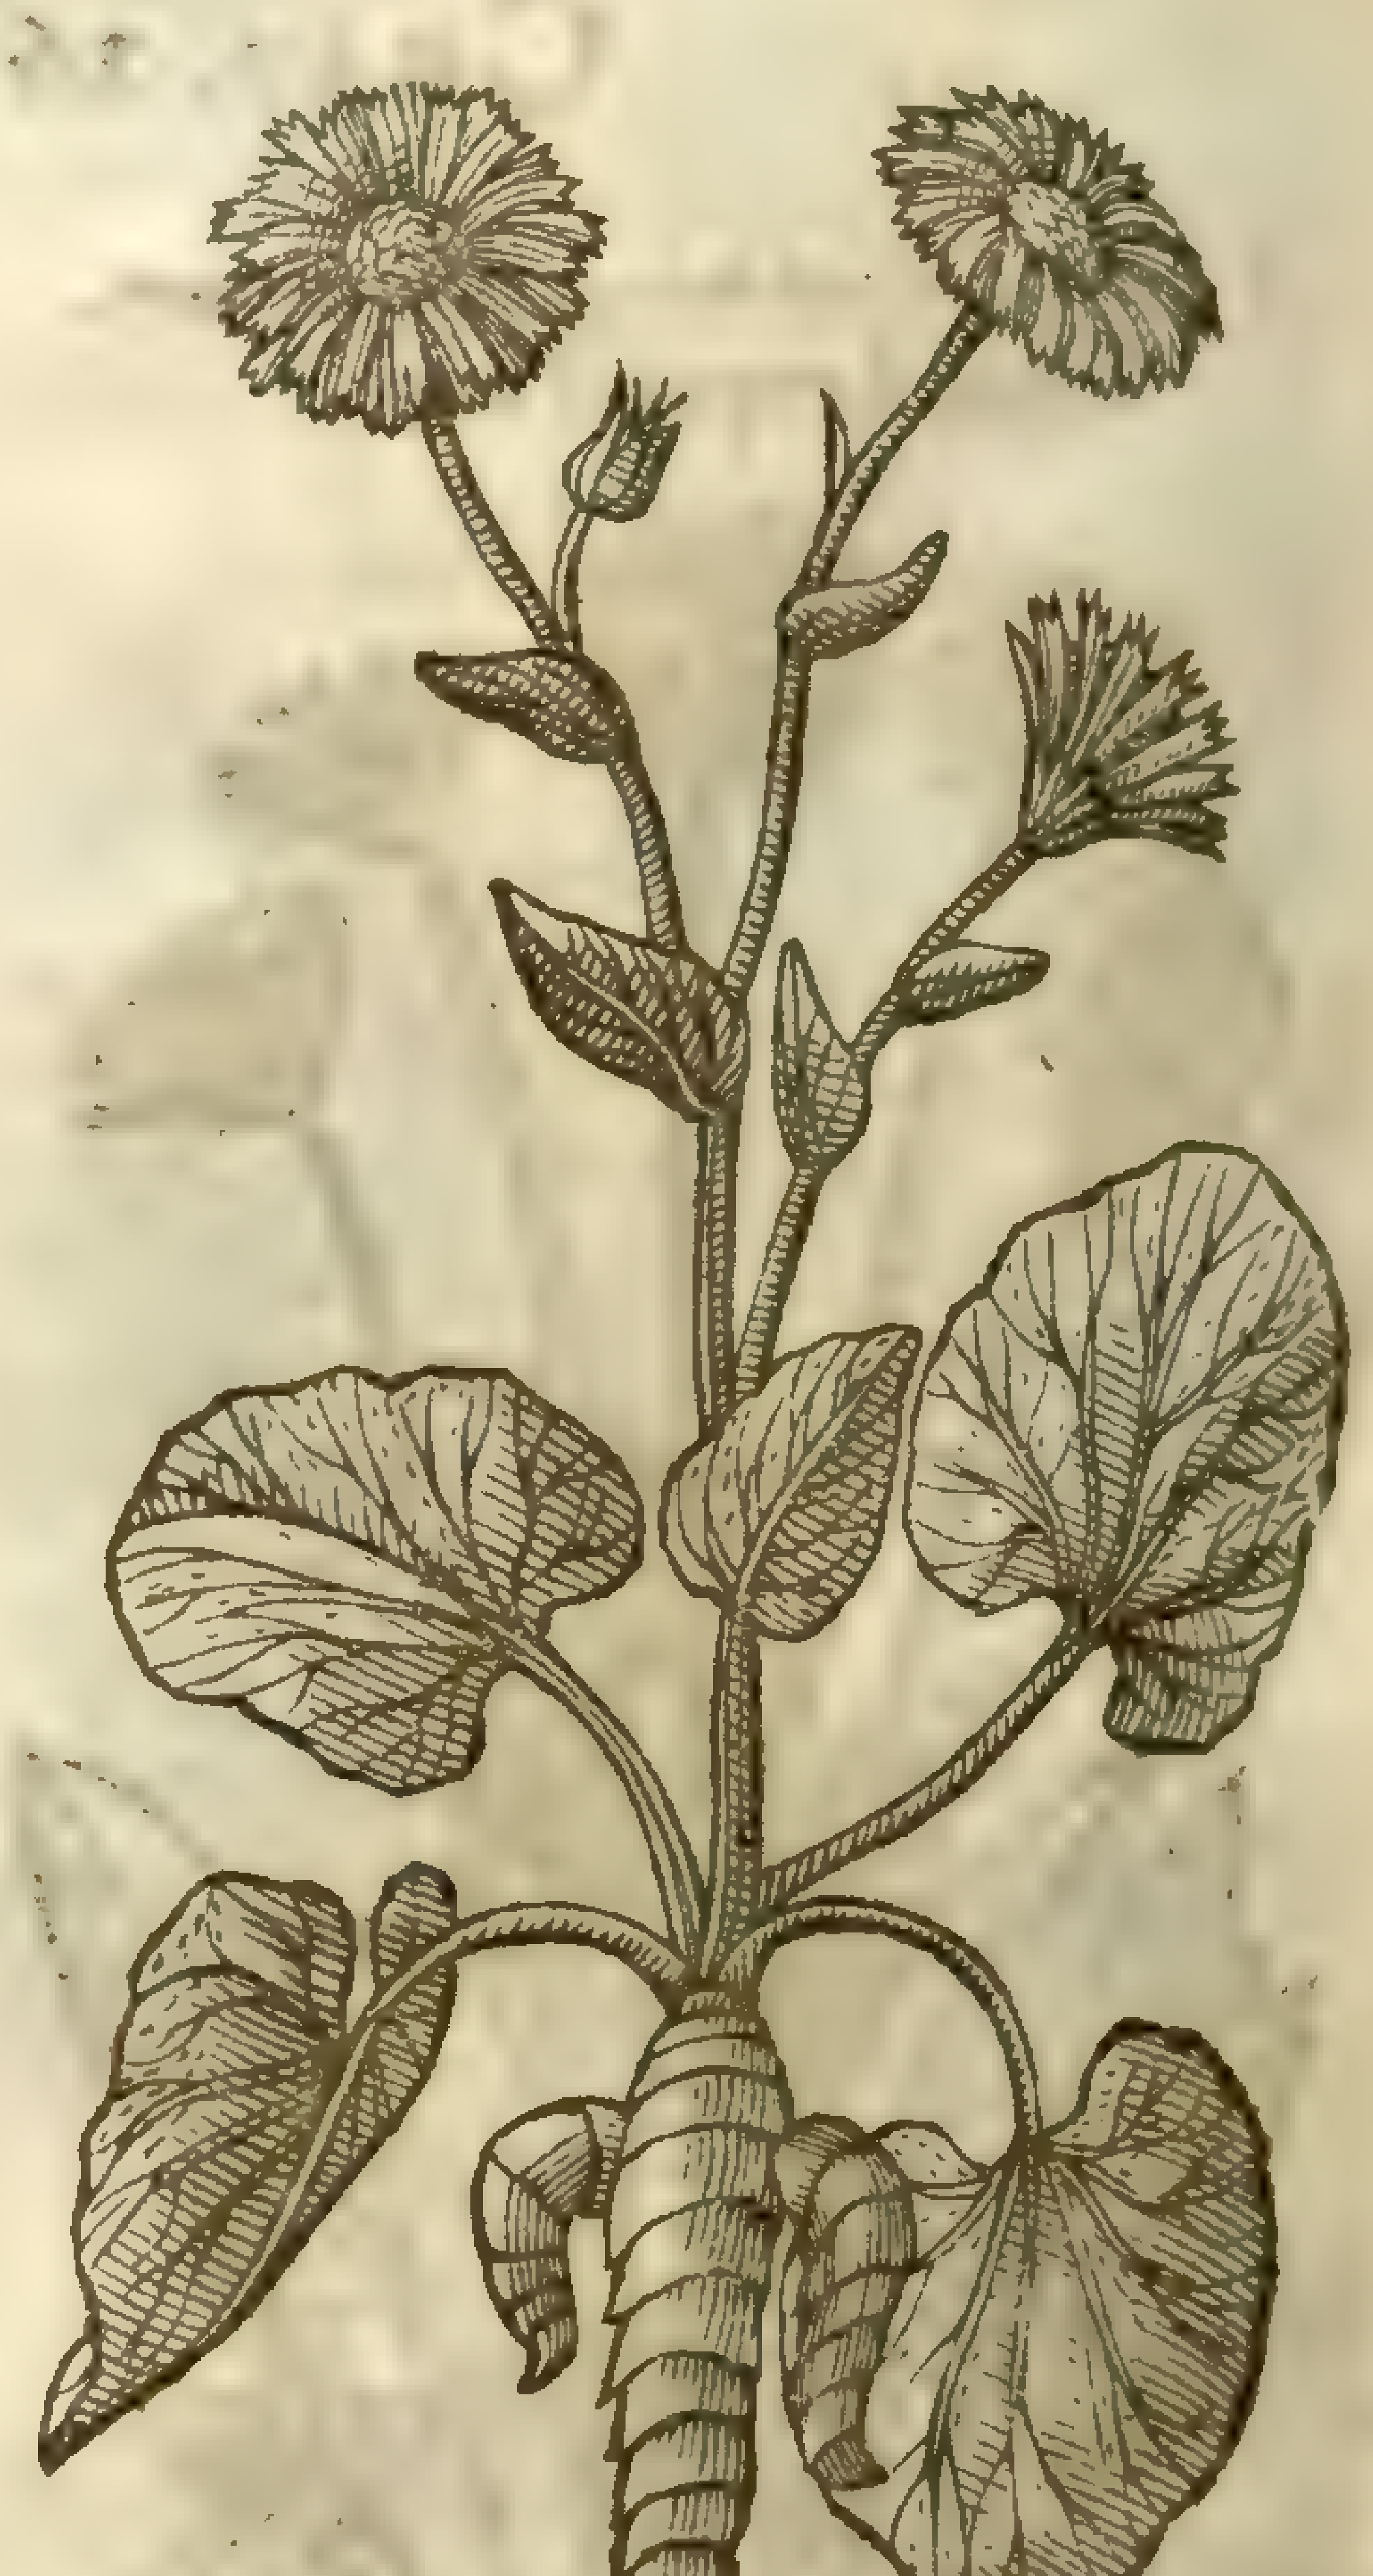
¶ *The Deſcription.*

1 OF this plant *Doronicum*, there be ſundry kindes, whereof I will onely touch foure. *Dodonæus* vnproperly calleth it *Aconitum Pardalianches*, which hath hapned through the

negligence of *Dioſcorides* and *Theophraſtus*, who in deſcribing *Doronicum*, haue not onely omitted the floures thereof, but haue committed that negligence in many and diuers other plants, leauing out in many plants which they haue deſcribed, the ſpeciall accidents; which hath not a little troubled the ſtudy and determination of the beſt Herbariſts of late yeares, not knowing certainly what to determine and ſet downe in ſo ambiguous a matter, ſome taking it one way, and ſome another, and ſome eſteeming it to be *Aconitum*. But for the better vnderſtanding hereof, know that this word *Aconitum*, as it is a name attributed to diuers plants, ſo it is to be conſidered, that all plants called by this name are malignant and venomous, as with the juyce and root whereof ſuch as hunted after wilde and noyſome beaſts, were woont to embrue and dip their arrowes, the ſooner and more ſurely to diſpatch and ſlay the beaſt in chaſe. But for the proofe of the goodneſſe of this *Doronicum*, and the reſt of his kinde, know alſo, That *Lobel* writeth of one called *Iohn de Vroëde*, who ate very many of the roots at ſundry times, and found them very pleaſant in taſt, and very comfortable. But to leaue controuerſies, circumſtances, and obiections which here might be brought in and alledged, aſſure your ſelues that this plant *Doronicum minus Officinarum* (whoſe roots *Pena* reporteth he found plentifully growing vpon the Pede-mountaine hills and certaine high places in France) hath many leaues ſpred vpon the ground, ſomwhat like Plantaine: among which riſe vp many tender hairy ſtalks ſome handfull and an halfe high, bearing at the top certaine ſingle yellow floures, which when they fade change into downe, and are carried away with the wind. The roots are thick and many, very crookedly croſſing and tangling one within another, reſembling a Scorpion, and in ſome yeares do grow in our Engliſh gardens into infinite numbers.



3 *Doronicum radice repente.*
Cray-fiſh Wolfes bane.



4 *Doronicum brachiata radice.*
Winged Wolfes bane.

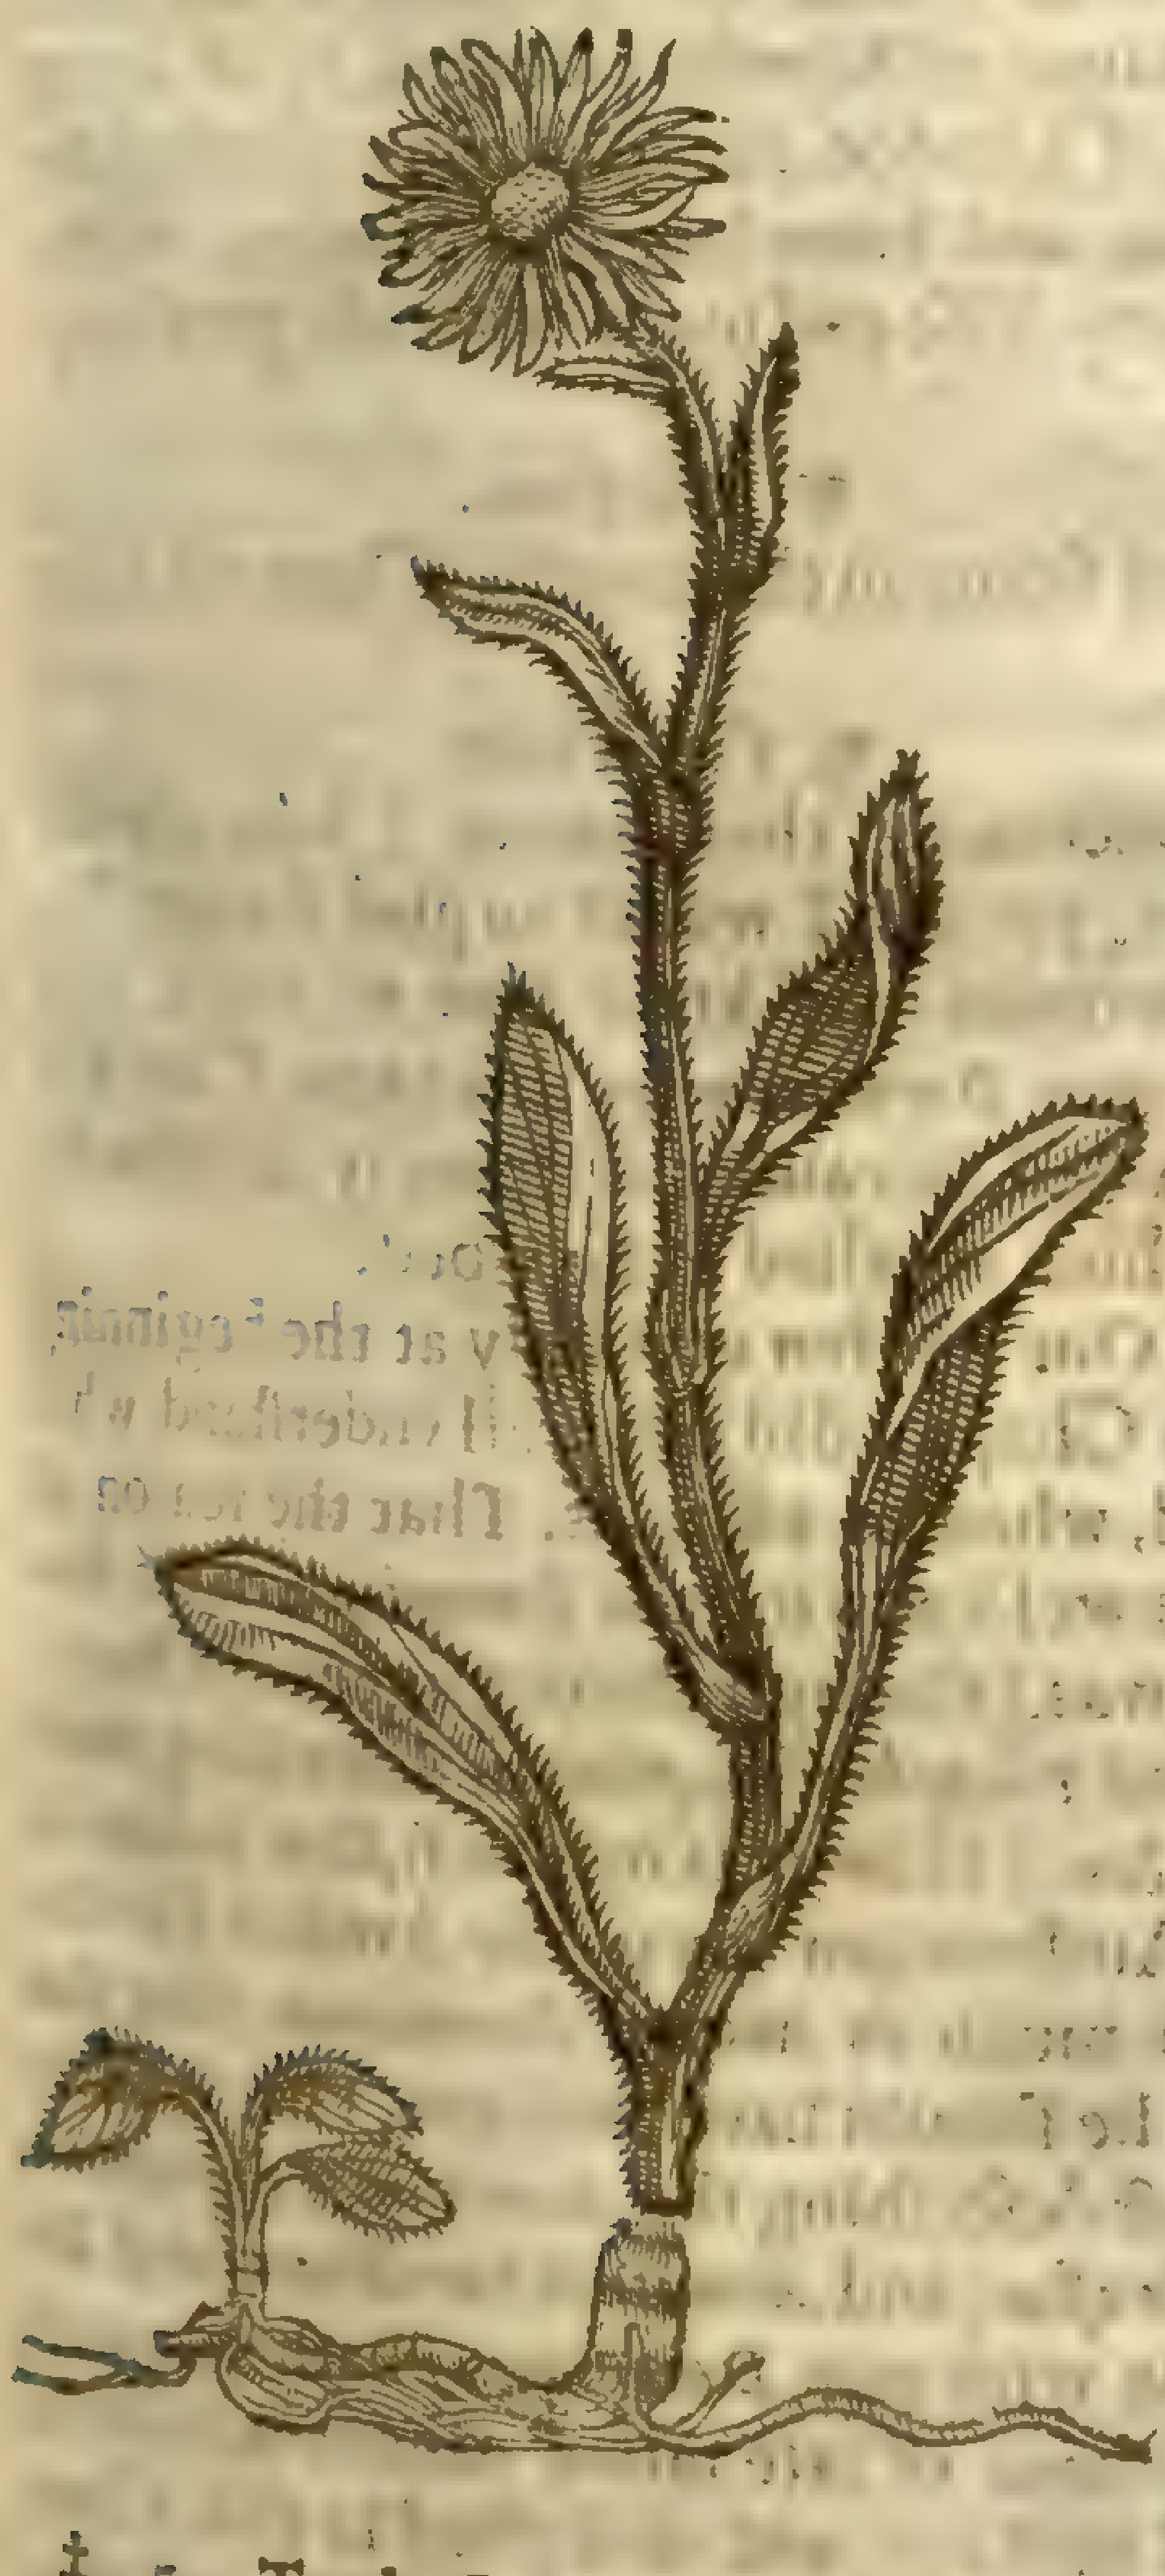
2 The ſecond kinde of *Doronicum* hath larger leaues than the former, but round, and broader, almoſt like the ſmall leaues of the Clot or Bur: among which riſeth vp a ſtalk ſcarſe a cubit high: the floures are like the former: the root is longer and bigger than the former, barred ouer with many ſcaly barkes, in colour white, and ſhining like white marble, hauing on each ſide one arme or finne, not vnlike to the ſea Shrimpe called *Squilla marina*, or rather like the ribs or ſcales of a Scorpions body, and is ſweet in taſte.

3 The third kinde of *Doronicum*, growing naturally in great aboundance in the mountaines

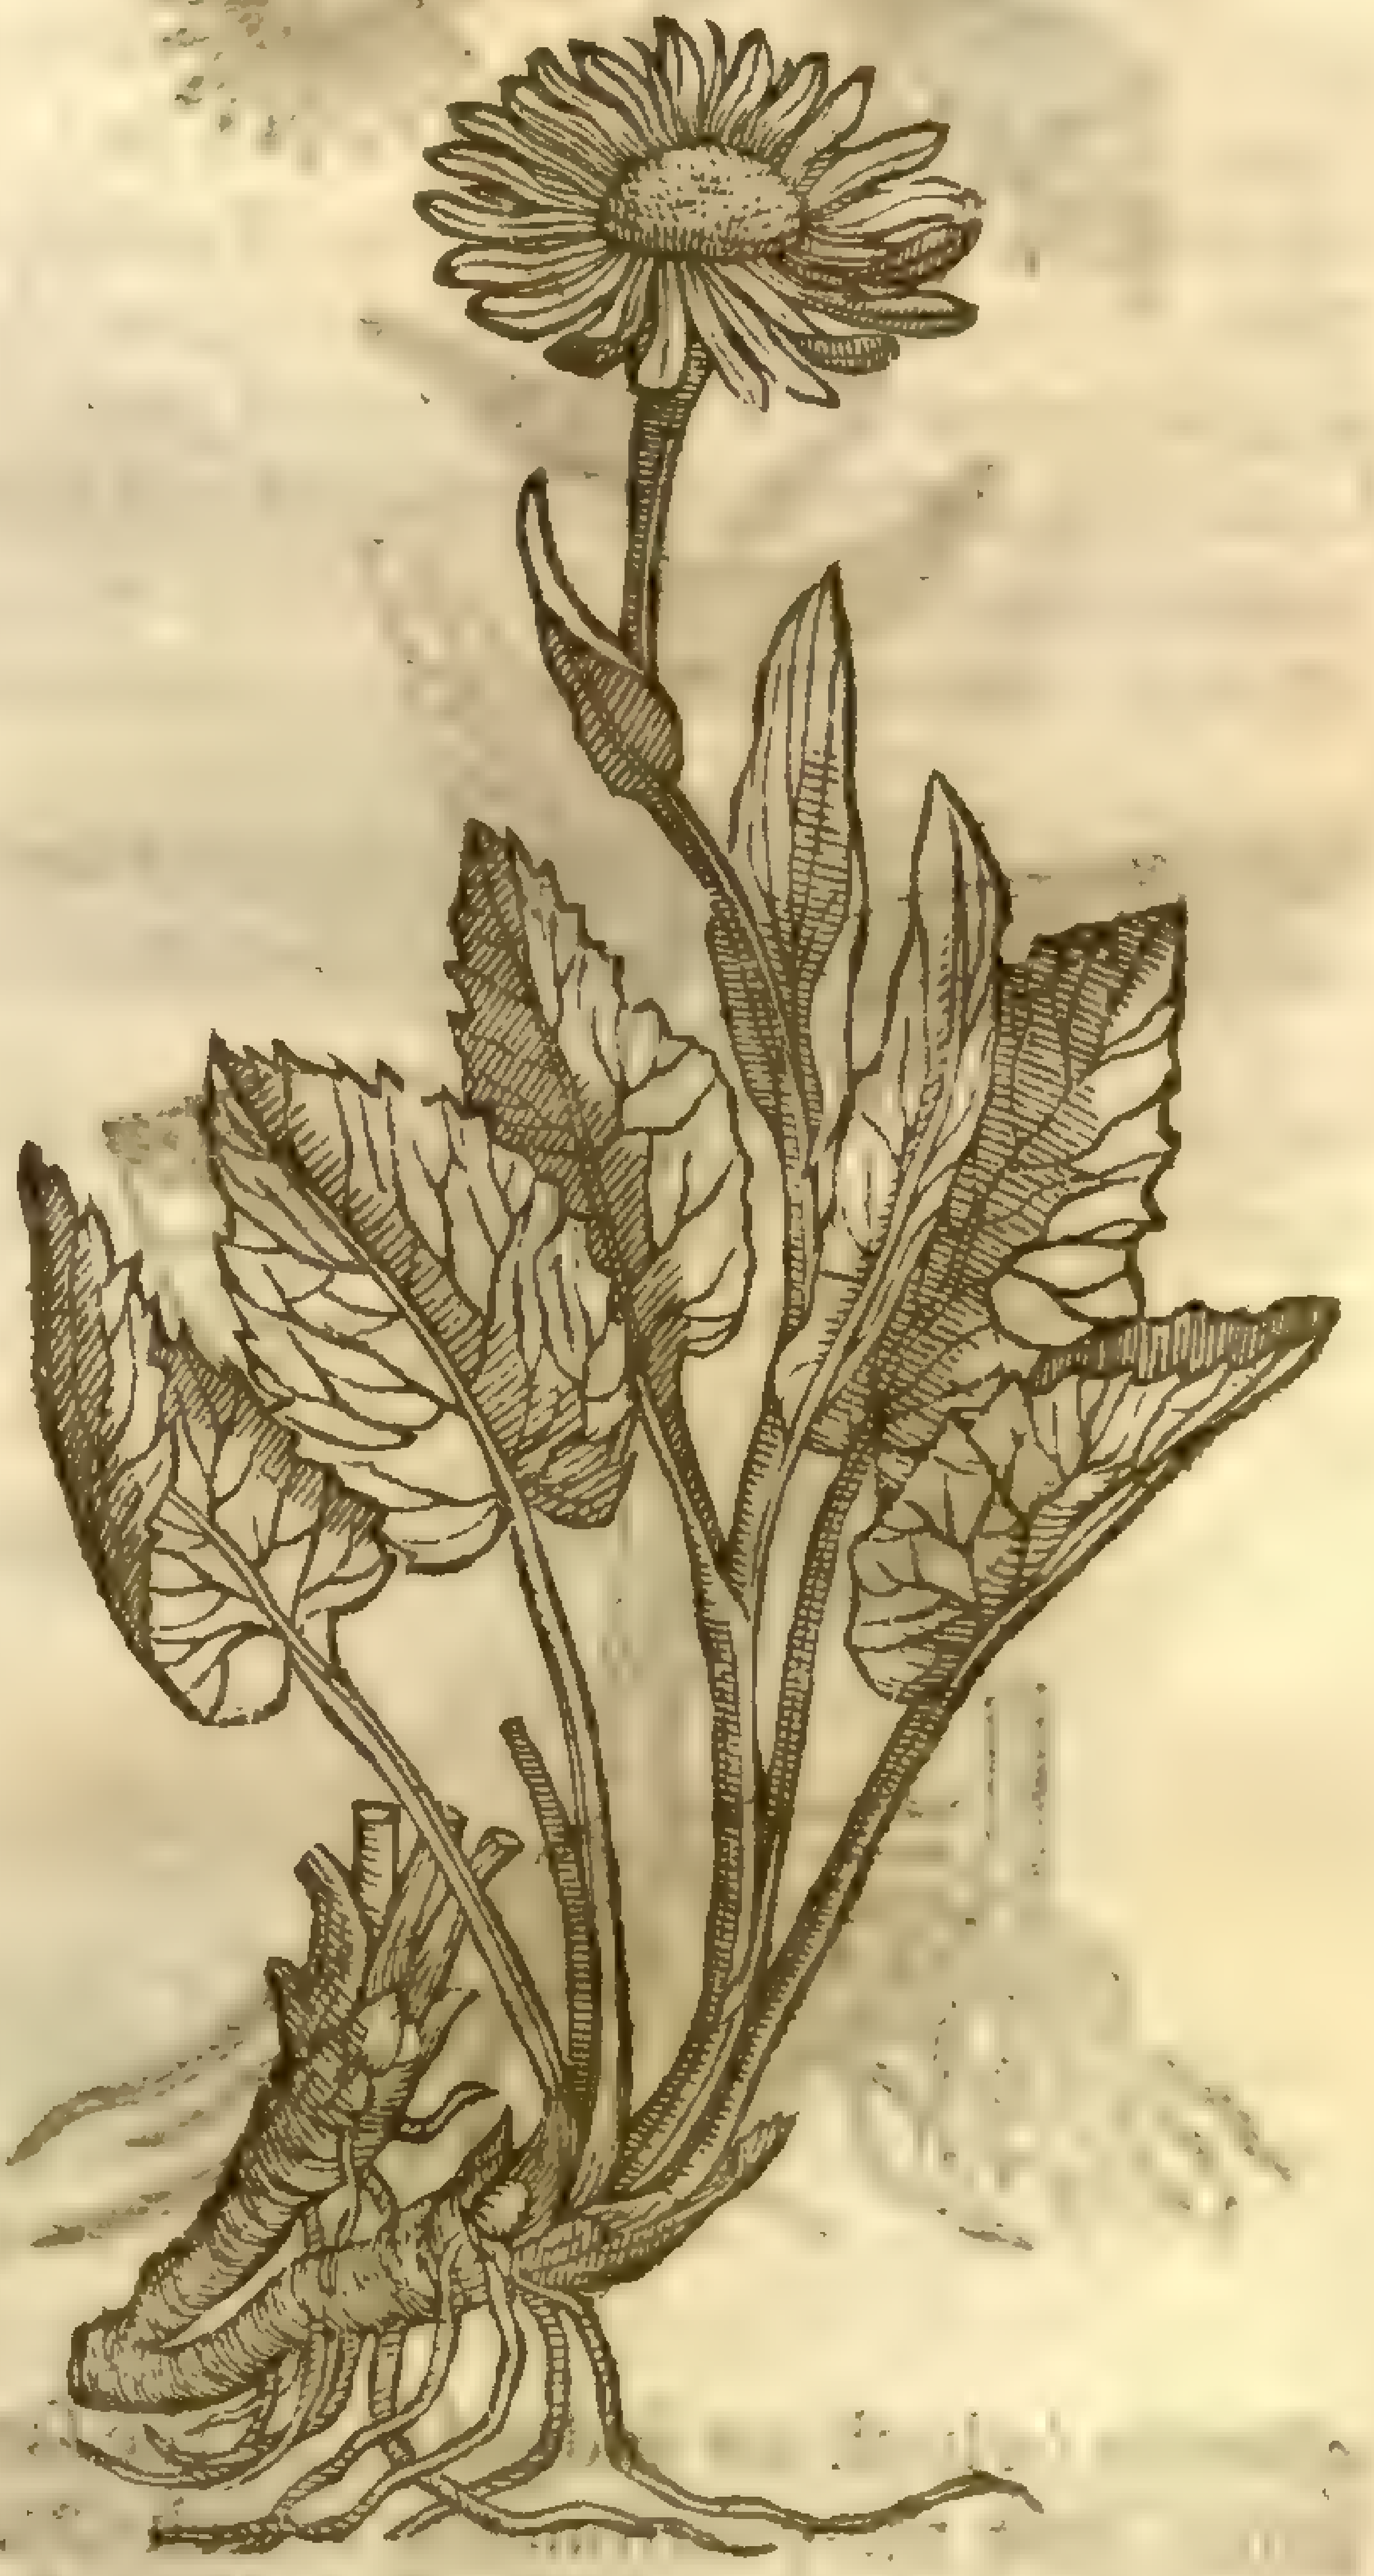
of France, is alſo brought into and acquainted with our Engliſh grounds, bearing very large leaues of a light yellowiſh greene, and hairy like *Piloſella*, or *Cucumis agreſtis*. The ſtalkes are a cubit high, hauing at the top yellow floures like *Buphthalmum*, or *Conſolida media vulnerariorum*; all the root is barred and welted ouer with ſcales like the taile of a Scorpion, white of colour, and in taſte ſweet, with ſome bitterneſſe, yeelding forth much clammineſſe, which is very aſtringent.

4 The fourth kinde hereof is found in the wooddy mountaines about Turin and Sauoy, very like vnto the former, ſauing that the leaues are ſomewhat rougher, the floures greater, and the ſtalks higher. But to be ſhort, each of theſe kindes are ſo like one another, that in ſhew, taſte, ſmell, and manner of growing they ſeeme to be as it were all one: therefore it were ſuperfluous to ſtand vpon their variety of names, *Pardalianches*, *Myoctonum*, *Thelyphonum*, *Camorum*, & ſuch like, of *Theophraſtus*, *Dioſcorides*, *Pliny*, or any of the new Writers, which names they haue giuen vnto *Doronicum*; for by the opinion of the moſt skilfull in plants, they are but Synonimaes of one kinde of plant. And though theſe old writers ſpeake of the hurtfull qualities of theſe plants; yet experience teacheth vs, that they haue written what they haue heard and read, and not what they haue knowne and proued; for it is apparant that *Doronicum* (by the conſent of the old and new writers) is vſed as an antidote or certaine treacle, as well in the confections *de Gemmis Meſuæ*, as in *Electuario Aramatum*. And though *Matthiolus* diſclaimeth againſt the vſe thereof, and calleth it *Pardalianches*, that is, Wolfes bane; yet let the learned know, that *quantitas, non qualitas, nocet*: for though Saffron be comfortable to the heart, yet if you giue thereof, or of Muske, or any ſuch cordial thing, too great a quantitie, it killeth the party which receiueth it.

‡ 5 *Doronicum anguſtifolium Auſtriacum.*
Narrow leafed Wolfes bane.



‡ 6 *Doronicum Stiriacum flore amplo.*
Large floured Wolfes bane.



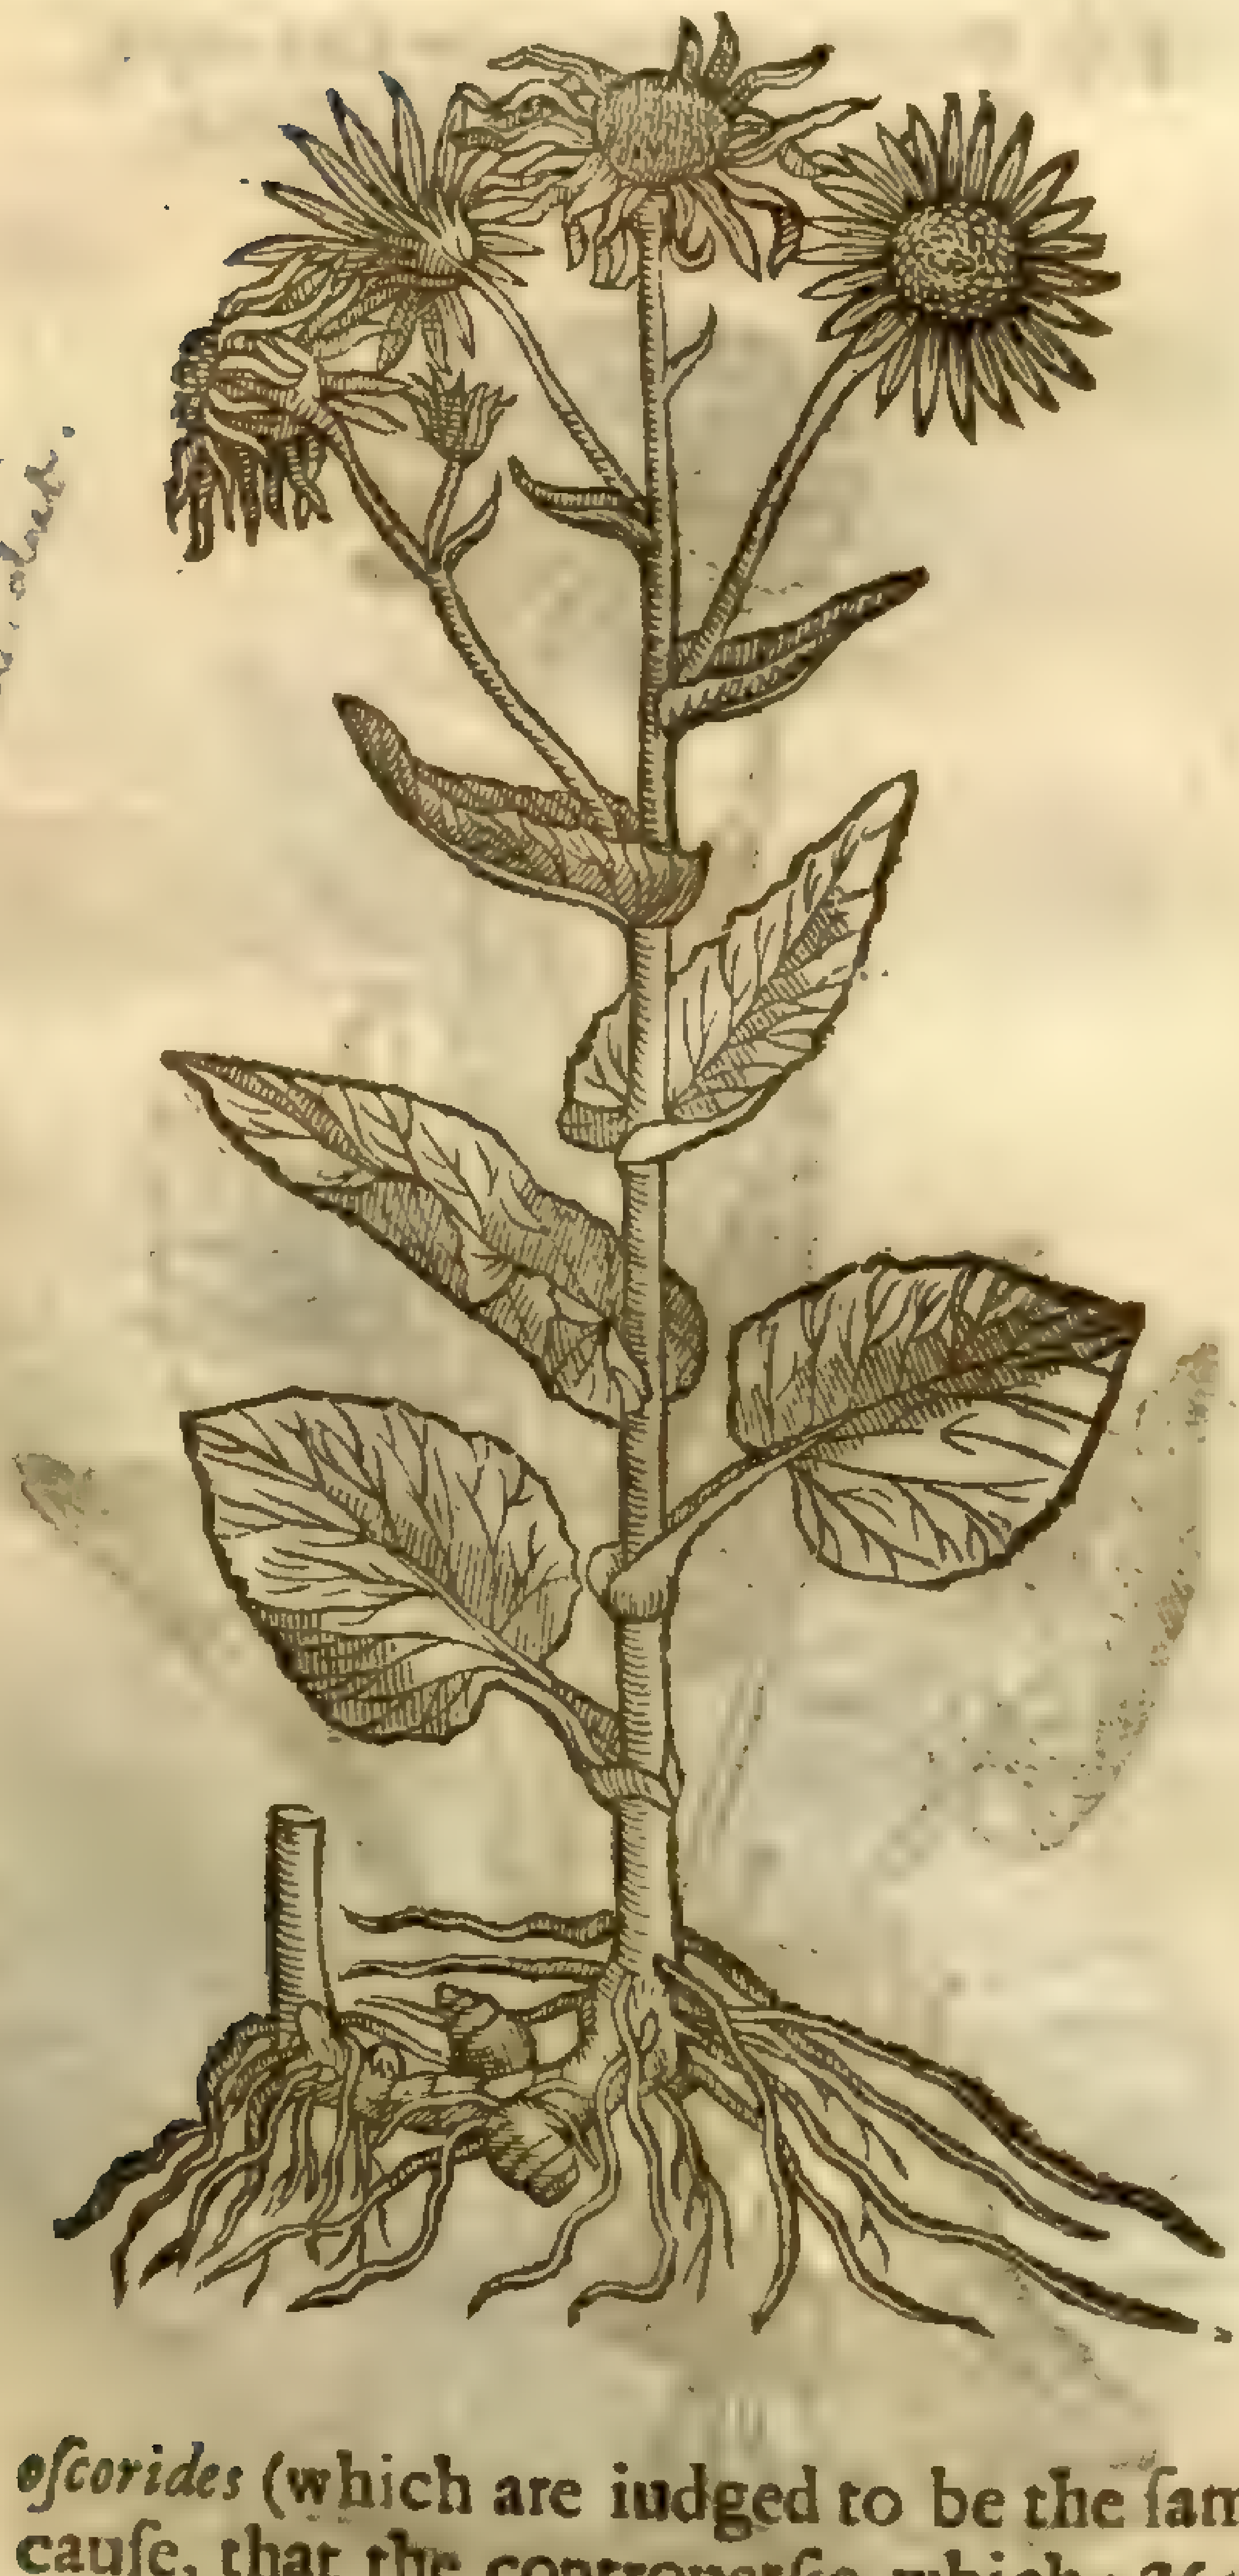
‡ 5 To theſe foure formerly intended by our Author, may we fitly adde ſome others out of *Cluſius*. The firſt of theſe hath a ſtalke ſome foot high, ſoft, rough, and creſted: the leaues are few, thicke, narrow, long, very greene and ſhining, yet hairie on their vpper ſides, but ſmooth on the lower ſides, and of a lighter greene; yet thoſe that adorne the ſtalkes are narrower: there groweth commonly at the top of the ſtalke one ſingle floure of the ſhape and bigneſſe of the common *Doronicum* deſcribed in the ſecond place, but of a brighter yellow: the ſeed is little and blackiſh, and is carried away with the winde: the root is ſmall, blackiſh, and joynted, hauing ſomewhat thicke

white fibres,and an aromaticke taſte. This floures in Iuly and Auguſt,and growes in rockie places vpon the higheſt Alpes. *Cluſius* (the firſt and onely deſcriber thereof) calls it *Doronicum* 2. *ſiue Auſtriacum* 1.

6 This growes ſomewhat higher than the laſt deſcribed, and hath much broader and rounder leaues,and thoſe full of veines,and ſnipt about the edges. The knots and off-ſets of the roots deſcend not downe,but run on the ſurface of the ground,and ſo ſends forth fibres at each ſide,to faſten them and attract nouriſhment. The floure is like that of the former, but much larger. This groweth in the high mountainous places of Stiria, and floures at the ſame time as the former. *Cluſius* calls this *Doronicum* 4.*Stiriacum*.

7 This is the largeſt of all the reſt,and hath a ſtalke two cubits or more high,of the thickneſſe of ones little finger,creſted, rough, and toward the top diuided into ſundry branches. The leaues next to the root are round, wrinkled, hairy, and faſtned to a long ſtalke: thoſe towards the top of the ſtalke are longer and narrower, and ingirt the ſtalke at their ſetting on. The floures are large and yellow, like to the other plants of this kinde: the ſeed alſo is carried away with the winde, and is longiſh, and of a greeniſh colour: the root is knotty or joynted like to a little Shrimpe, and of a whitiſh greene colour. This floures in Iune or Iuly,and growes vpon the like places as the former. *Cluſius* calls this *Doronicum* 7.*Auſtriacum* 3. ‡

‡ 7 *Doronicum maximum.*
The greateſt Wolfe-bane.



D. pardalianches, & male-[illegible]

¶ *The Place.*

The place is ſufficiently ſet forth in the deſcription; yet you ſhall vnderſtand, that I haue the two firſt in my Garden; the ſecond hath beene found and gathered in the cold mountaines of Northumberland, by D^r^.*Penny* lately of London deceaſed,a man of much experience and knowledge in Simples, whoſe death my ſelfe and many others do greatly bewaile.

¶ *The Time.*

They floure in the months of Iune and Iuly.

¶ *The Names.*

Concerning their names I haue already ſpoken; yet ſith I would be glad that our Engliſh women may know how to call it, they may terme *Doronicum* by this name, Cray-fiſh Piſſe-a-bed, becauſe the floure is like Dandelion,which is called Piſſe-a-bed.

‡ Our Author certainly at the beginning of this Chapter did not well vnderſtand what he ſaid, when he affirmes, That the reaſon of the not wel knowing the *Doronicum* of the Antients was,[through the negligence of *Dioſcorides* and *Theophraſtus*,who in deſcribing *Doronicum*,&c.] Now it is manifeſt,that neither of theſe Authors,nor any of the Antient Greekes euer ſo much as named *Doronicum*: but that which he ſhould haue ſaid,was,That the want of exact deſcribing the *Aconitum thelyphonon* in *Theophraſtus*, and *Aconitum Pardalianches* in *Dioſcorides* (which are iudged to be the ſame plant and all one with our *Doronicum*) hath beene the cauſe, that the controuerſie which *Matthiolus* and others haue of late raiſed cannot be fully determined; which is, Whether that vulgar *Doronicum*, vſed in ſhops, and deſcribed in this Chapter,be the *Aconitum Pardalianches? Matthiolus* affirmes it is, and much and vehemently exclaimes againſt the vſe thereof in cordiall Electuaries, as that which is of a moſt pernitious and deadly qualitie, becauſe that(as he affirmes) it will kill dogs: now *Dodonæus* alſo ſeemes to incline to his opinion: but others (and not without good reaſon) deny it;as *Geſner* in his Epiſtles,who made often triall of it vpon himſelfe: part of his words are ſet downe hereafter by our Author (being tranſlated out of *Dodonæus*) and ſome part alſo you ſhall finde added in the end of the vertues: and theſe are other ſome; *Plura alia nunc omitto, quibus oſtendere liquido poſſem, nec Doronicum noſtrum nec*

Aconitum vllo modo eſſe venenatum homini. Canibus autem letiferum eſſe ſcio, non ſolum ſi Drachmarum 4: ſed etiam ſi vnius pondere ſumant. And before he ſaid, *quaſi non alia multa canibus ſint venena, quæ hominibus ſalubria ſunt; vt de aſparago fertur.* Of the ſame opinion with *Geſner* is *Pena* and *Lobel*, who, *Aduerſ. pag.290.& 291.* do largely handle this matter, and exceedingly deride and ſcoffe at *Matthiolus* for his vehement declaiming againſt the vſe thereof. Now briefely my opinion is this, That the *Doronicum* here mentioned is not that mentioned and written of by *Serapio* and the Arabians: neither is it the *Aconitum Pardalianches* of *Dioſcorides*, nor of ſo malignant a quality as *Matthiolus* would haue it, for I my ſelfe alſo haue often eaten of it, and that in a pretty quantity, without the leaſt offence. ‡

¶ *The Nature and Vertues.*

I haue ſufficiently ſpoken of that for which I haue warrant to write, both touching their natures and vertues; for the matter hath continued ſo ambiguous and ſo doubtfull, yea, and ſo full of controuerſies, that I dare not commit that to the world which I haue read: theſe few lines therefore ſhall ſuffice for this preſent; the reſt which might be ſaid I refer to the great and learned Doctors, and to your owne conſideration. A

Theſe herbes are mixed with compound medicines that mitigate the paine of the eies, and by reaſon of his cold quality, being freſh and greene, it helpeth the inflammation or fiery heate of the eyes. B

It is reported and affirmed, that it killeth Panthers, Swine, Wolues, and all kinds of wilde beaſts, being giuing them with fleſh, *Theophraſtus* ſaith, That it killeth Cattell, Sheep, Oxen, and all foure-footed beaſts, within the compaſſe of one day, not by taken it inwardly only, but if the herb or root be tied vnto their priuie parts. Yet hee writeth further, That the root being drunke is a remedy againſt the ſtinging of Scorpions; which ſheweth, that this herbe or the root thereof is not deadly to man, but to diuers beaſts only: which thing alſo is found out by triall and manifeſt experience; for *Conrade Geſner* (a man in our time ſingularly learned, and a moſt diligent ſearcher of many things) in a certaine Epiſtle written two *Adolphus Occo*, ſheweth, That he himſelfe hath oftentimes inwardly taken the root hereof greene, dry, whole, preſerued with hony, and alſo beaten to pouder; and that euen the very ſame day in which he wrote theſe things, he had drunke with warme water two drams of the roots made into fine pouder, neither felt he any hurt thereby: and that he oftentimes alſo had giuen the ſame to his ſicke Patients, both by it ſelfe, and alſo mixed with other things, and that very luckily. Moreouer, the Apothecaries in ſtead of *Doronicum* doe vſe (though amiſſe) the roots thereof without any manifeſt danger. C

That this *Aconite* killeth dogs, it is very certaine, and found out by triall: which thing *Matthiolus* could hardly beleeue, but that at length he found it out to be true by a manifeſt example, as he confeſſeth in his Commentaries. D

‡ I haue (ſaith *Geſner*) oft with very good ſucceſſe preſcribed it to my Patients, both alone, as alſo mixed with other medicines, eſpecially in the *Vertigo* and falling ſickneſſe: ſometimes alſo I mix therewith Gentian, the pouder of Miſſe-toe, and *Aſtrantia*: thus it workes admirable effects in the Epilepſie, if the vſe thereof be continued for ſome time. ‡ E

† Formerly the figure that was in the firſt place ſhould haue beene in the ſecond, and the firſt and ſecond were confounded in the deſcription.

Chap. 265. *Of Sage.*

¶ *The Deſcription.*

1 THe great Sage is very full of ſtalkes, foure ſquare, of a wooddy ſubſtance, parted into branches, about the which grow broad leaues, long, wrinkled, rough, whitiſh, very like to the leaues of wilde Mullein, but rougher, and not ſo white, like in roughneſſe to woollen cloath thread-bare: the floures ſtand forked in the tops of the branches like thoſe of dead Nettle, or of Claric, of a purple blew colour; in the place of which doth grow little blackiſh ſeeds, in ſmall huskes. The root is hard and wooddy, ſending forth a number of little ſtrings.

2 The leſſer Sage is alſo a ſhrubby plant, ſpred into branches like to the former, but leſſer: the ſtalkes hereof are tenderer: the leaues be long, leſſer, narrower, but not leſſe rough: to which there do grow in the place wherein they are fixed to the ſtalke, two little leaues ſtanding on either ſide one right againſt another, ſomewhat after the manner of finnes or little eares: the floures are

eared blew like thoſe of the former: the root alſo is wooddy, both of them ar e of a certaine ſtrong ſmell, but nothing at all offenſiue; and that which is the leſſer is the better.

3 This Indian Sage hath diuers branches of a wooddy ſubſtance, wheron do grow ſmall leaues, long, rough, and narrow, of an ouerworne colour, and of a moſt ſweet and fragrant ſmell. The floures grow alongſt the tops of the branches, of a white colour, in forme like the precedent. The root is tough and wooddy.

4 The Mountaine Sage hath an vpright ſtalke ſmooth and plaine, whereupon doe grow broad rough and rugged leaues, ſleightly nicked, and vneuenly indented about the edges, of an hoary colour, ſharpe pointed, and of a ranke ſmell: the floures grow alongſt the top of the ſtalke, in ſhape like thoſe of Roſemary, of a whitiſh colour. The root is likewiſe wooddy.

1 *Saluia major.*
Great Sage.

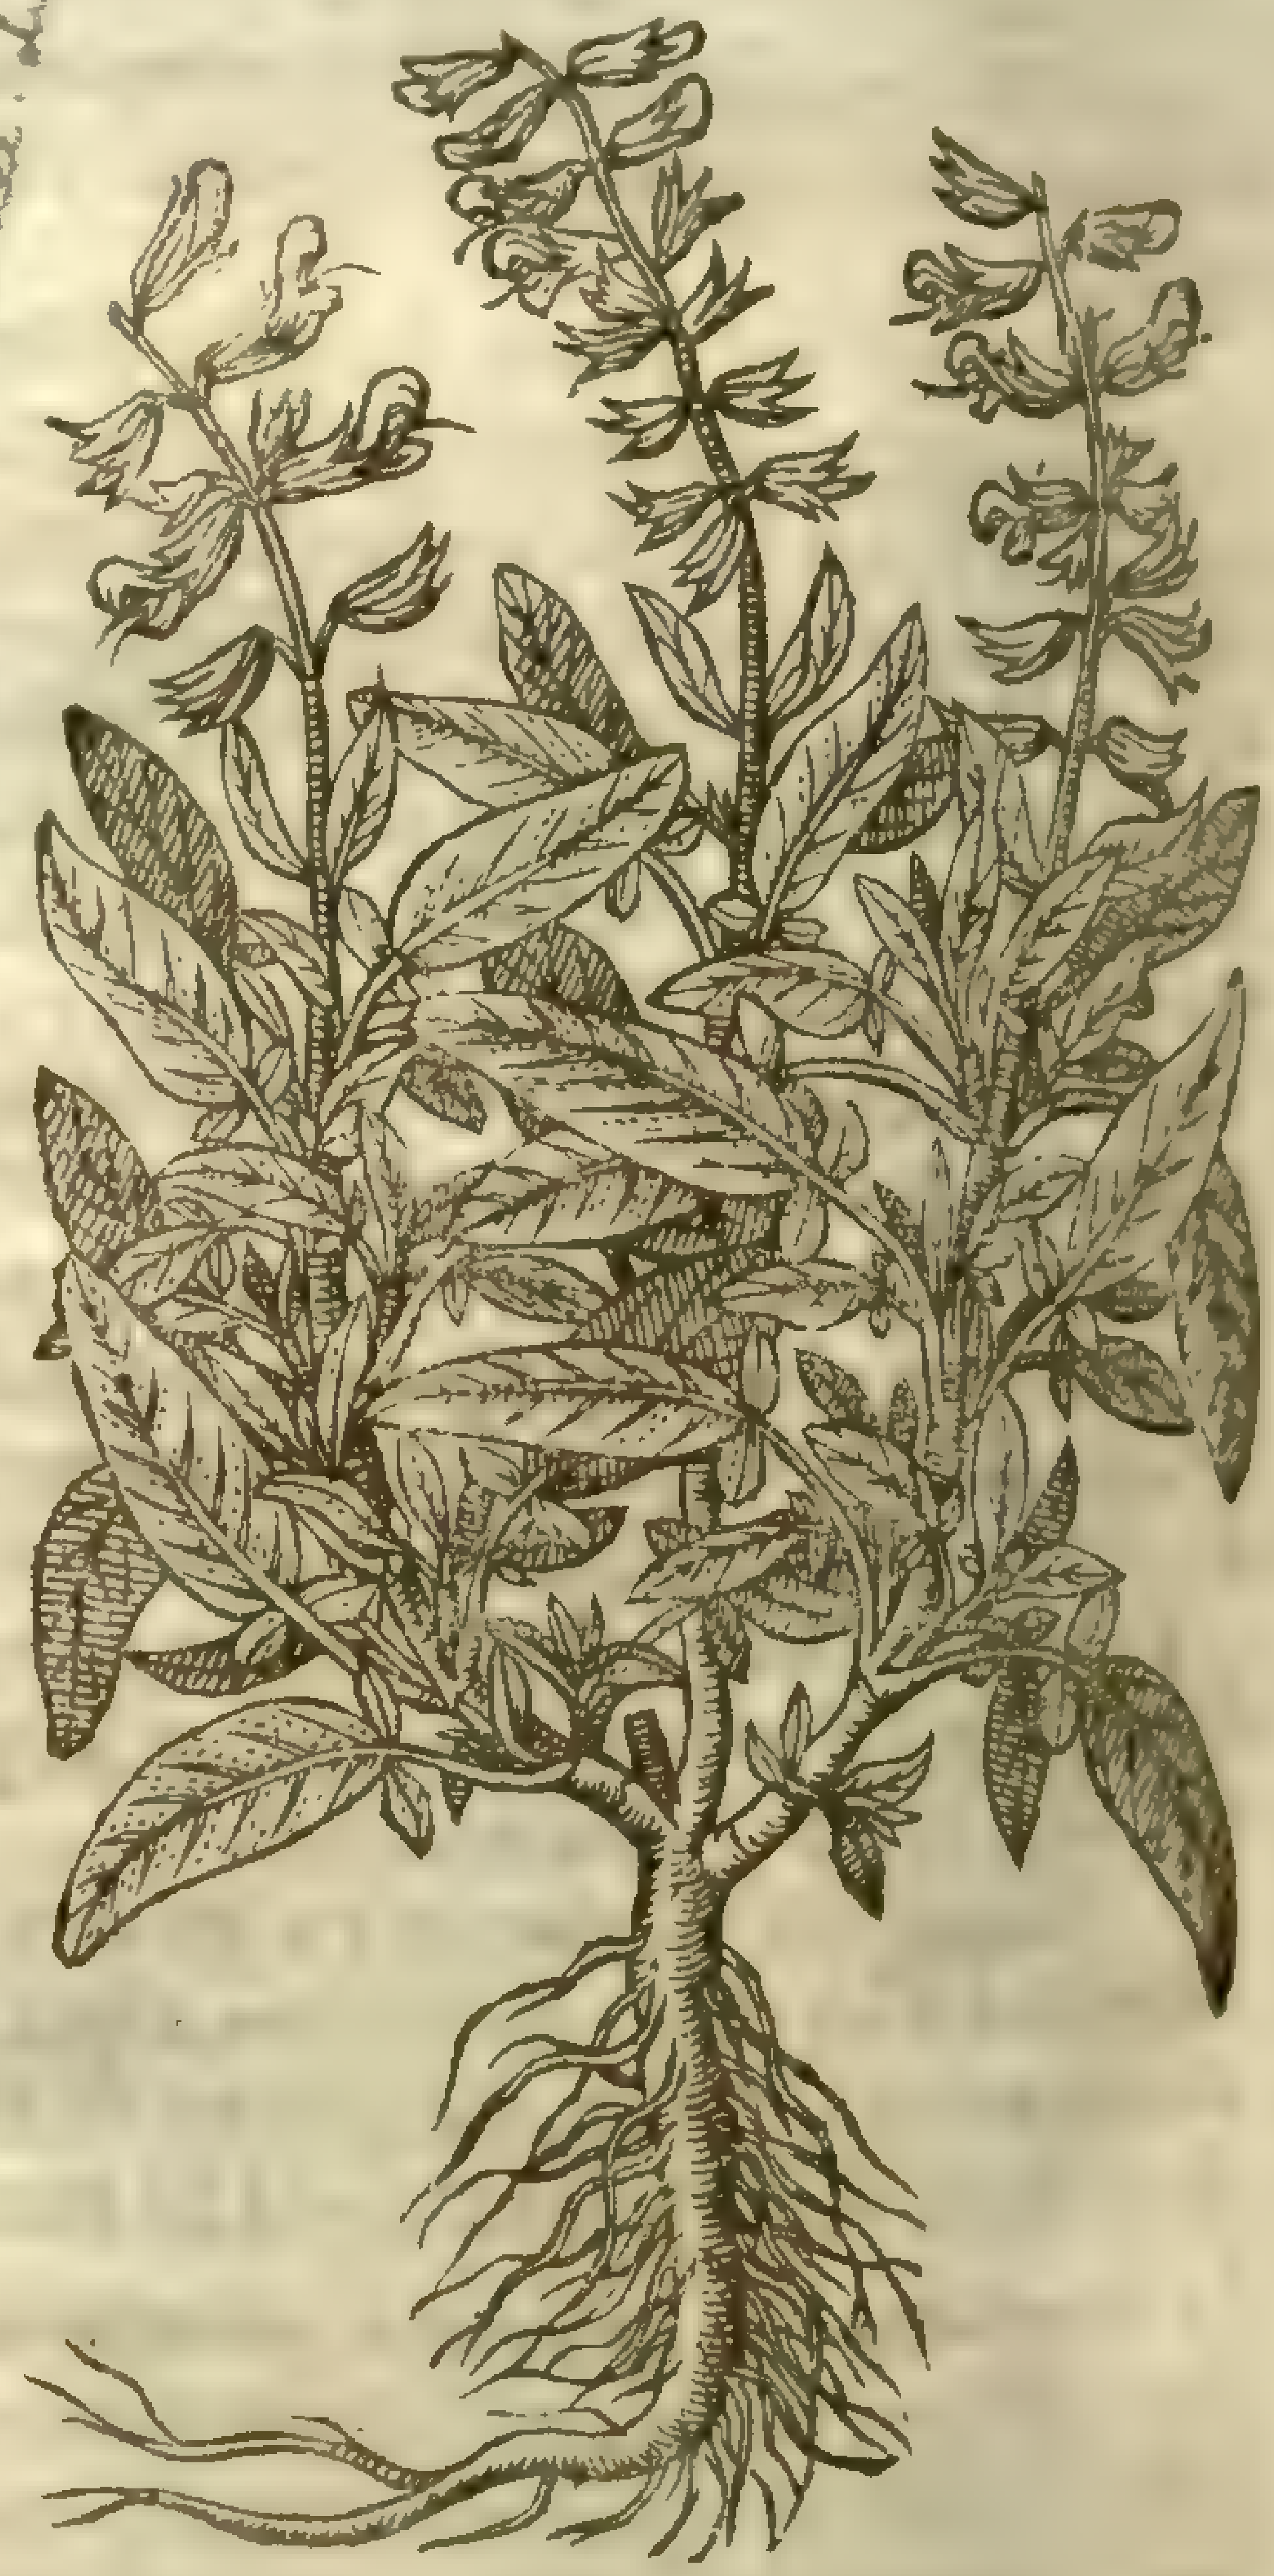
Small Sage.

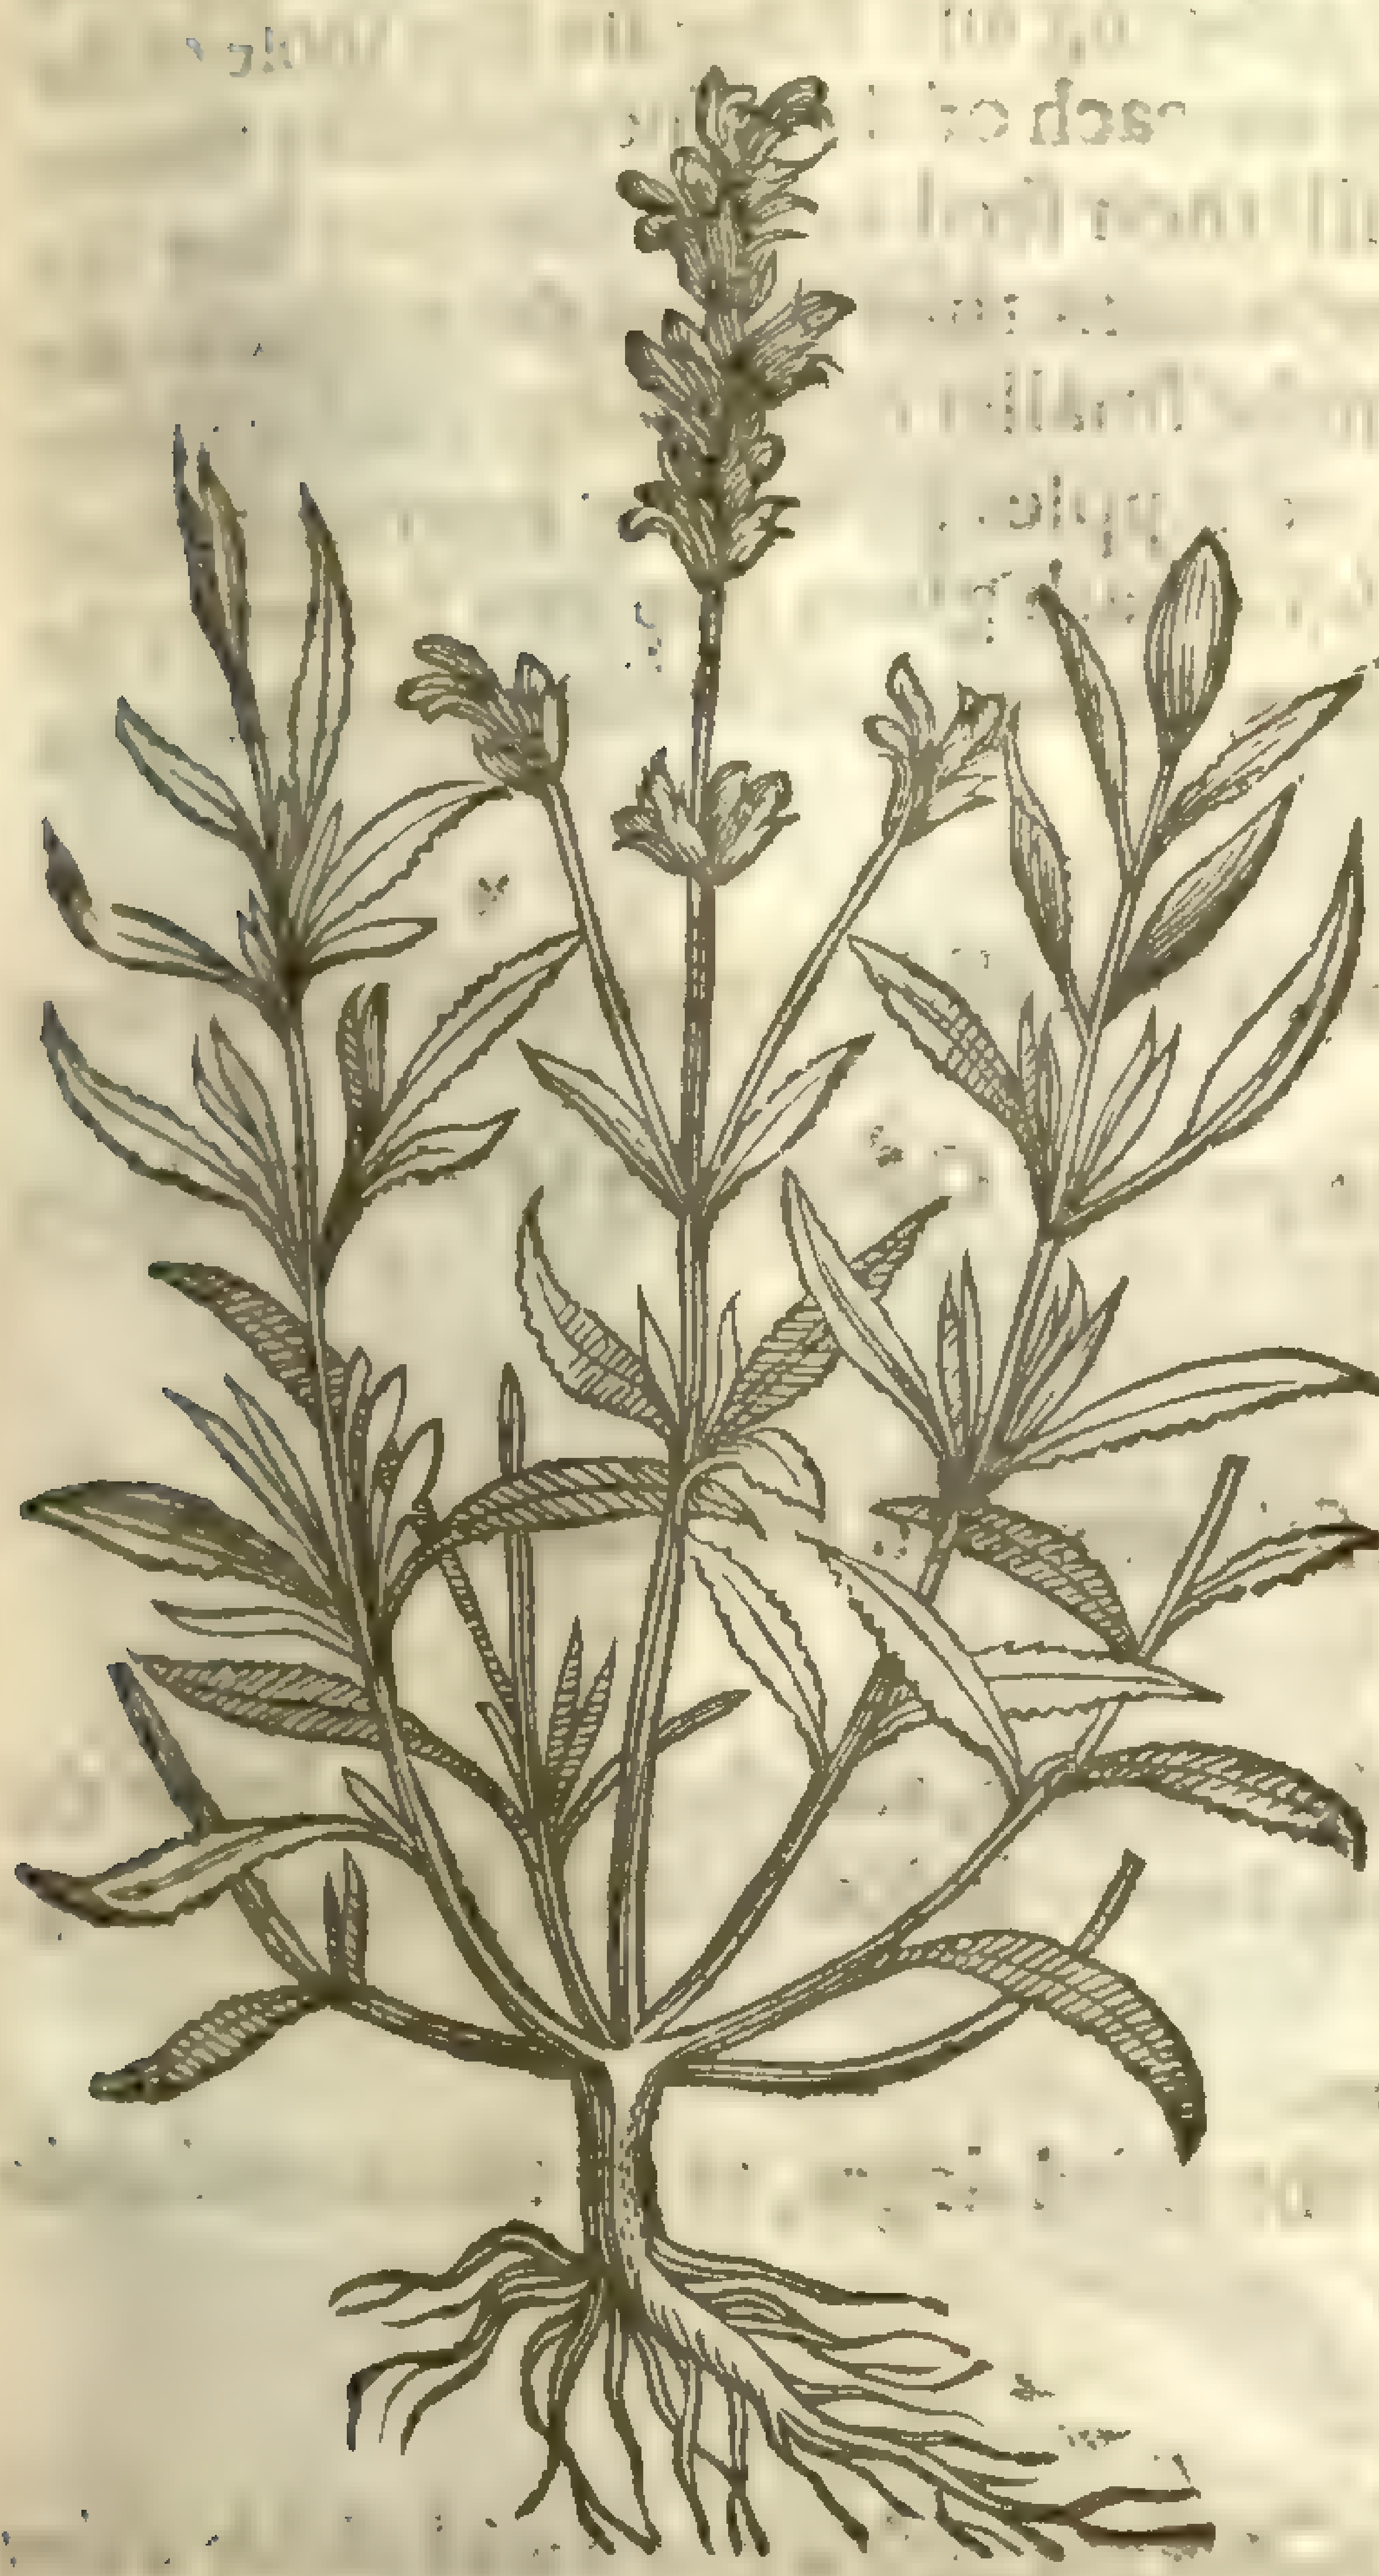


S. Triloba, b. Linn. Ind.

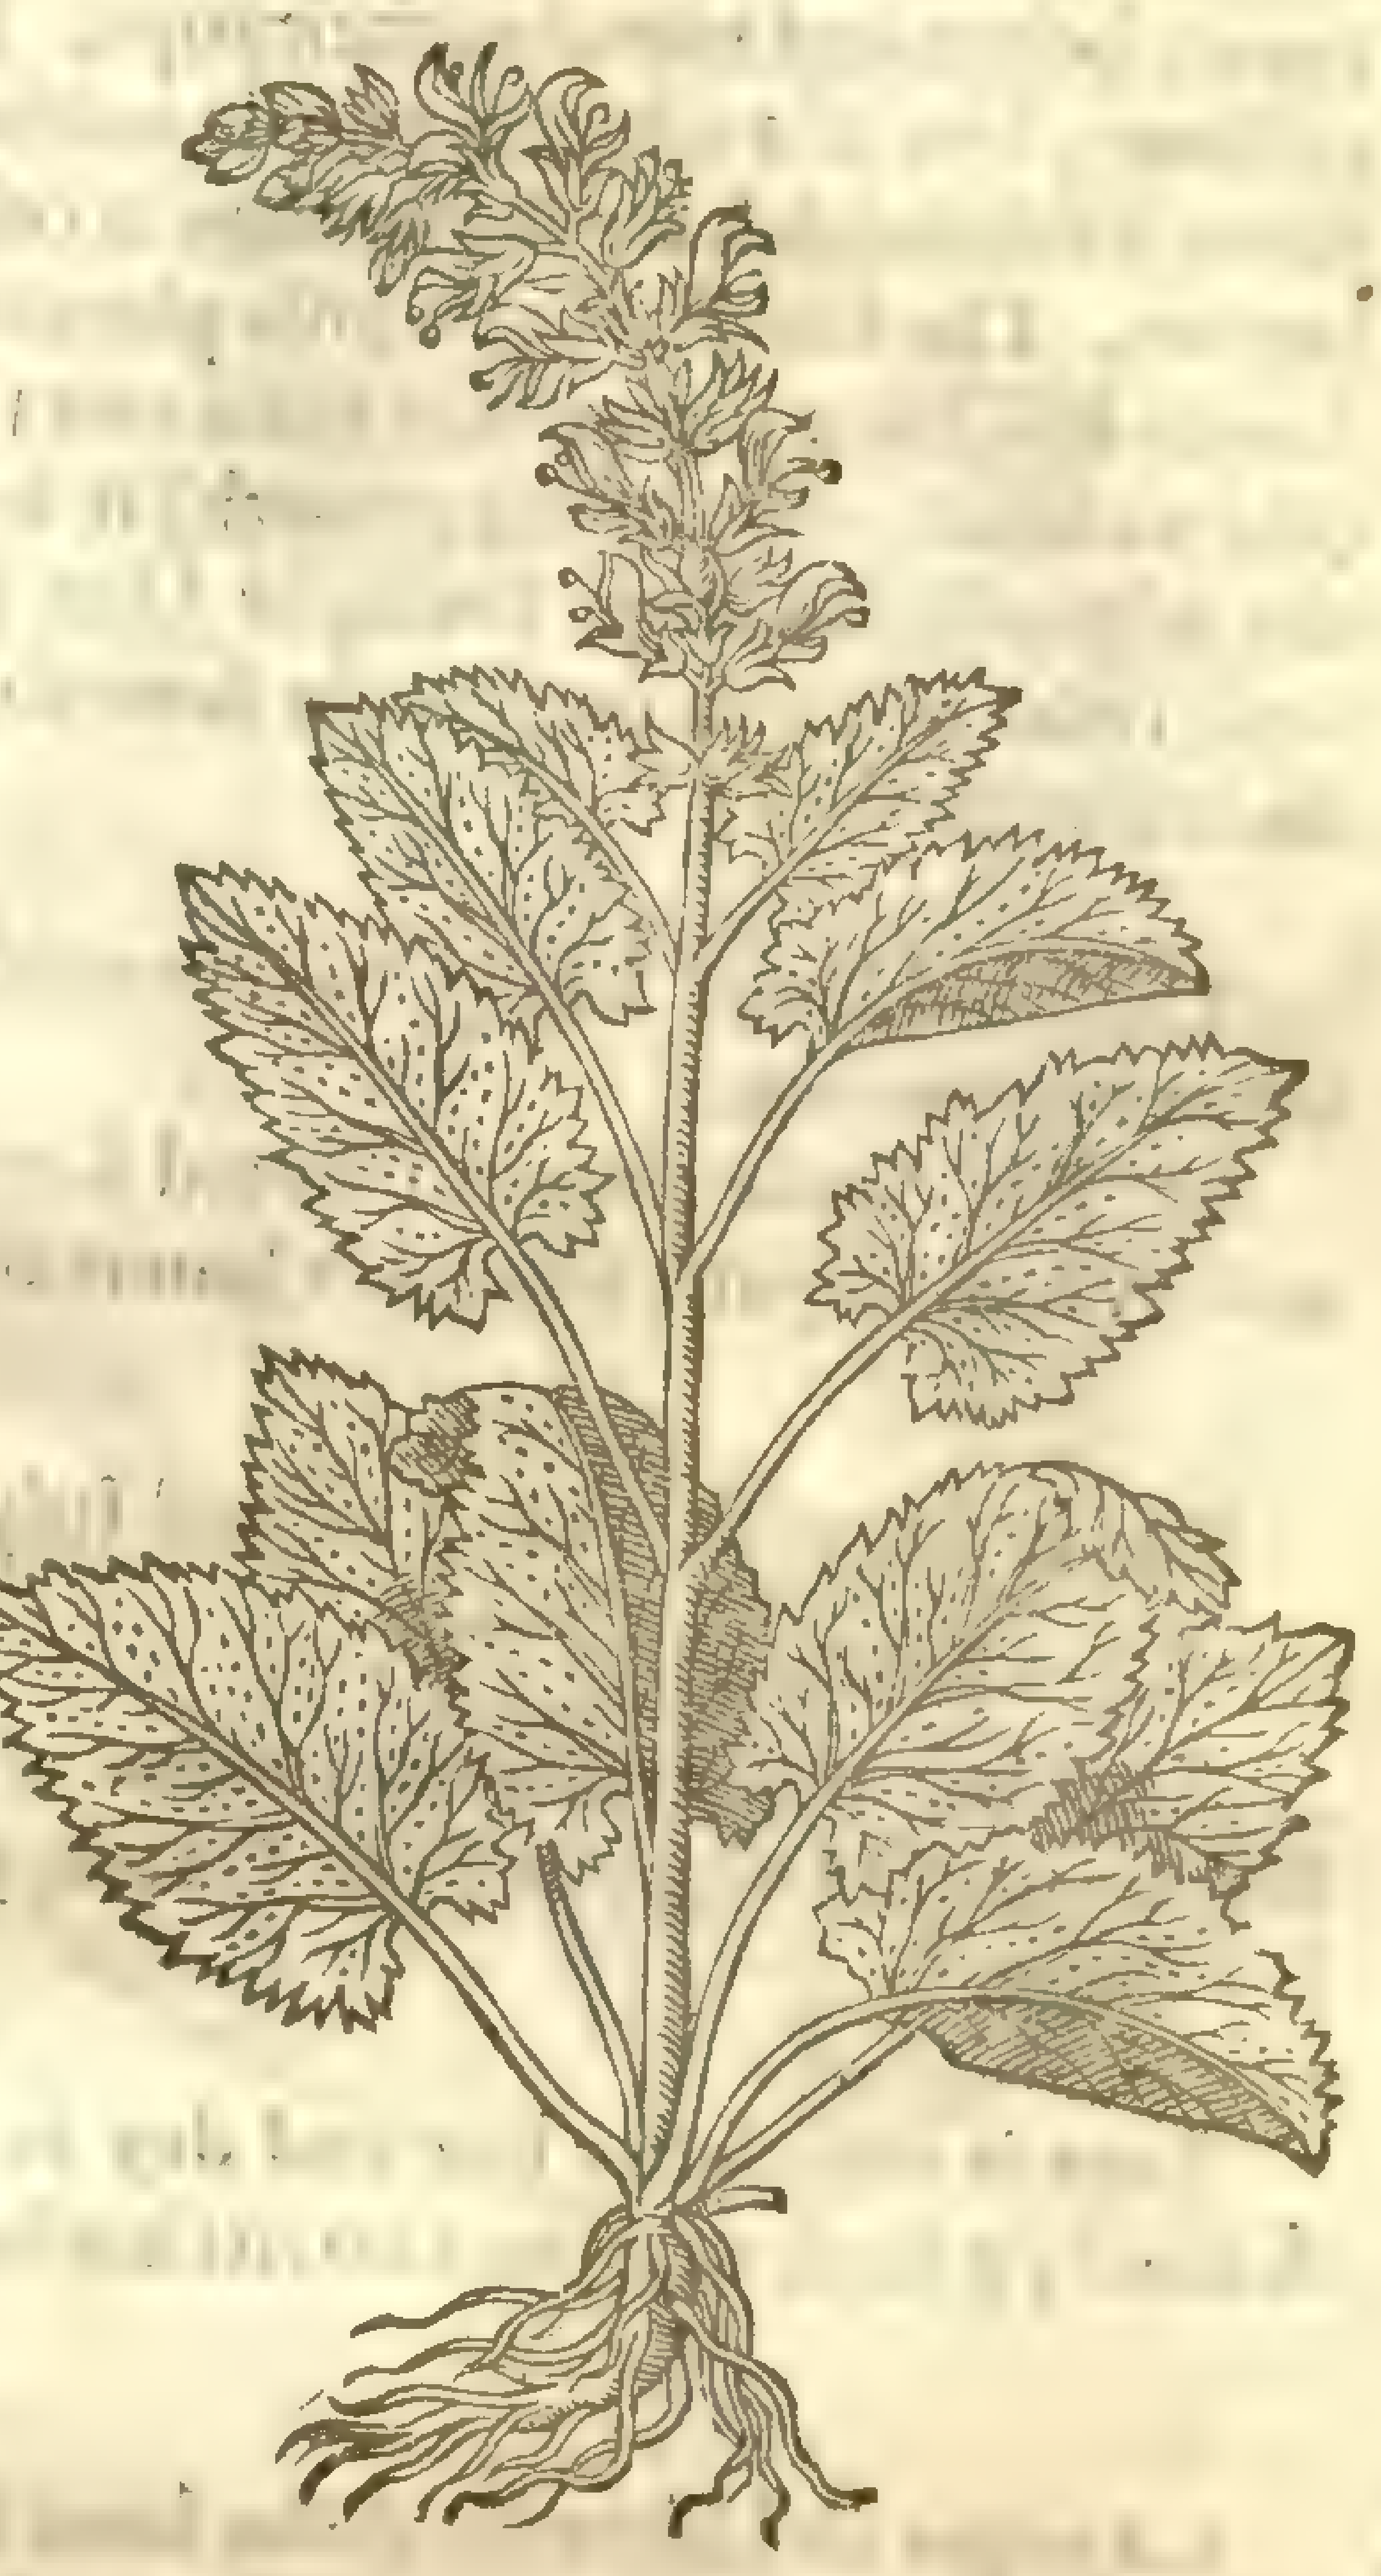
5 We haue in our gardens a kinde of Sage, the leaues whereof are reddiſh; part of thoſe red leaues are ſtripped with white, others mixed with white, greene, and red, euen as Nature liſt to play with ſuch plants. This is an elegant variety, and is called *Salvia variegata elegans*, Variegated or painted Sage.

6 We haue alſo another, the leaues whereof are for the moſt part white, ſomewhat mixed with greene, often one leafe white, and another greene, euen as Nature liſt, as we haue ſaid. This is not ſo rare as the former, nor neere ſo beautifull, wherefore it may be termed *Salvia variegata vulgaris*, Common painted Sage.

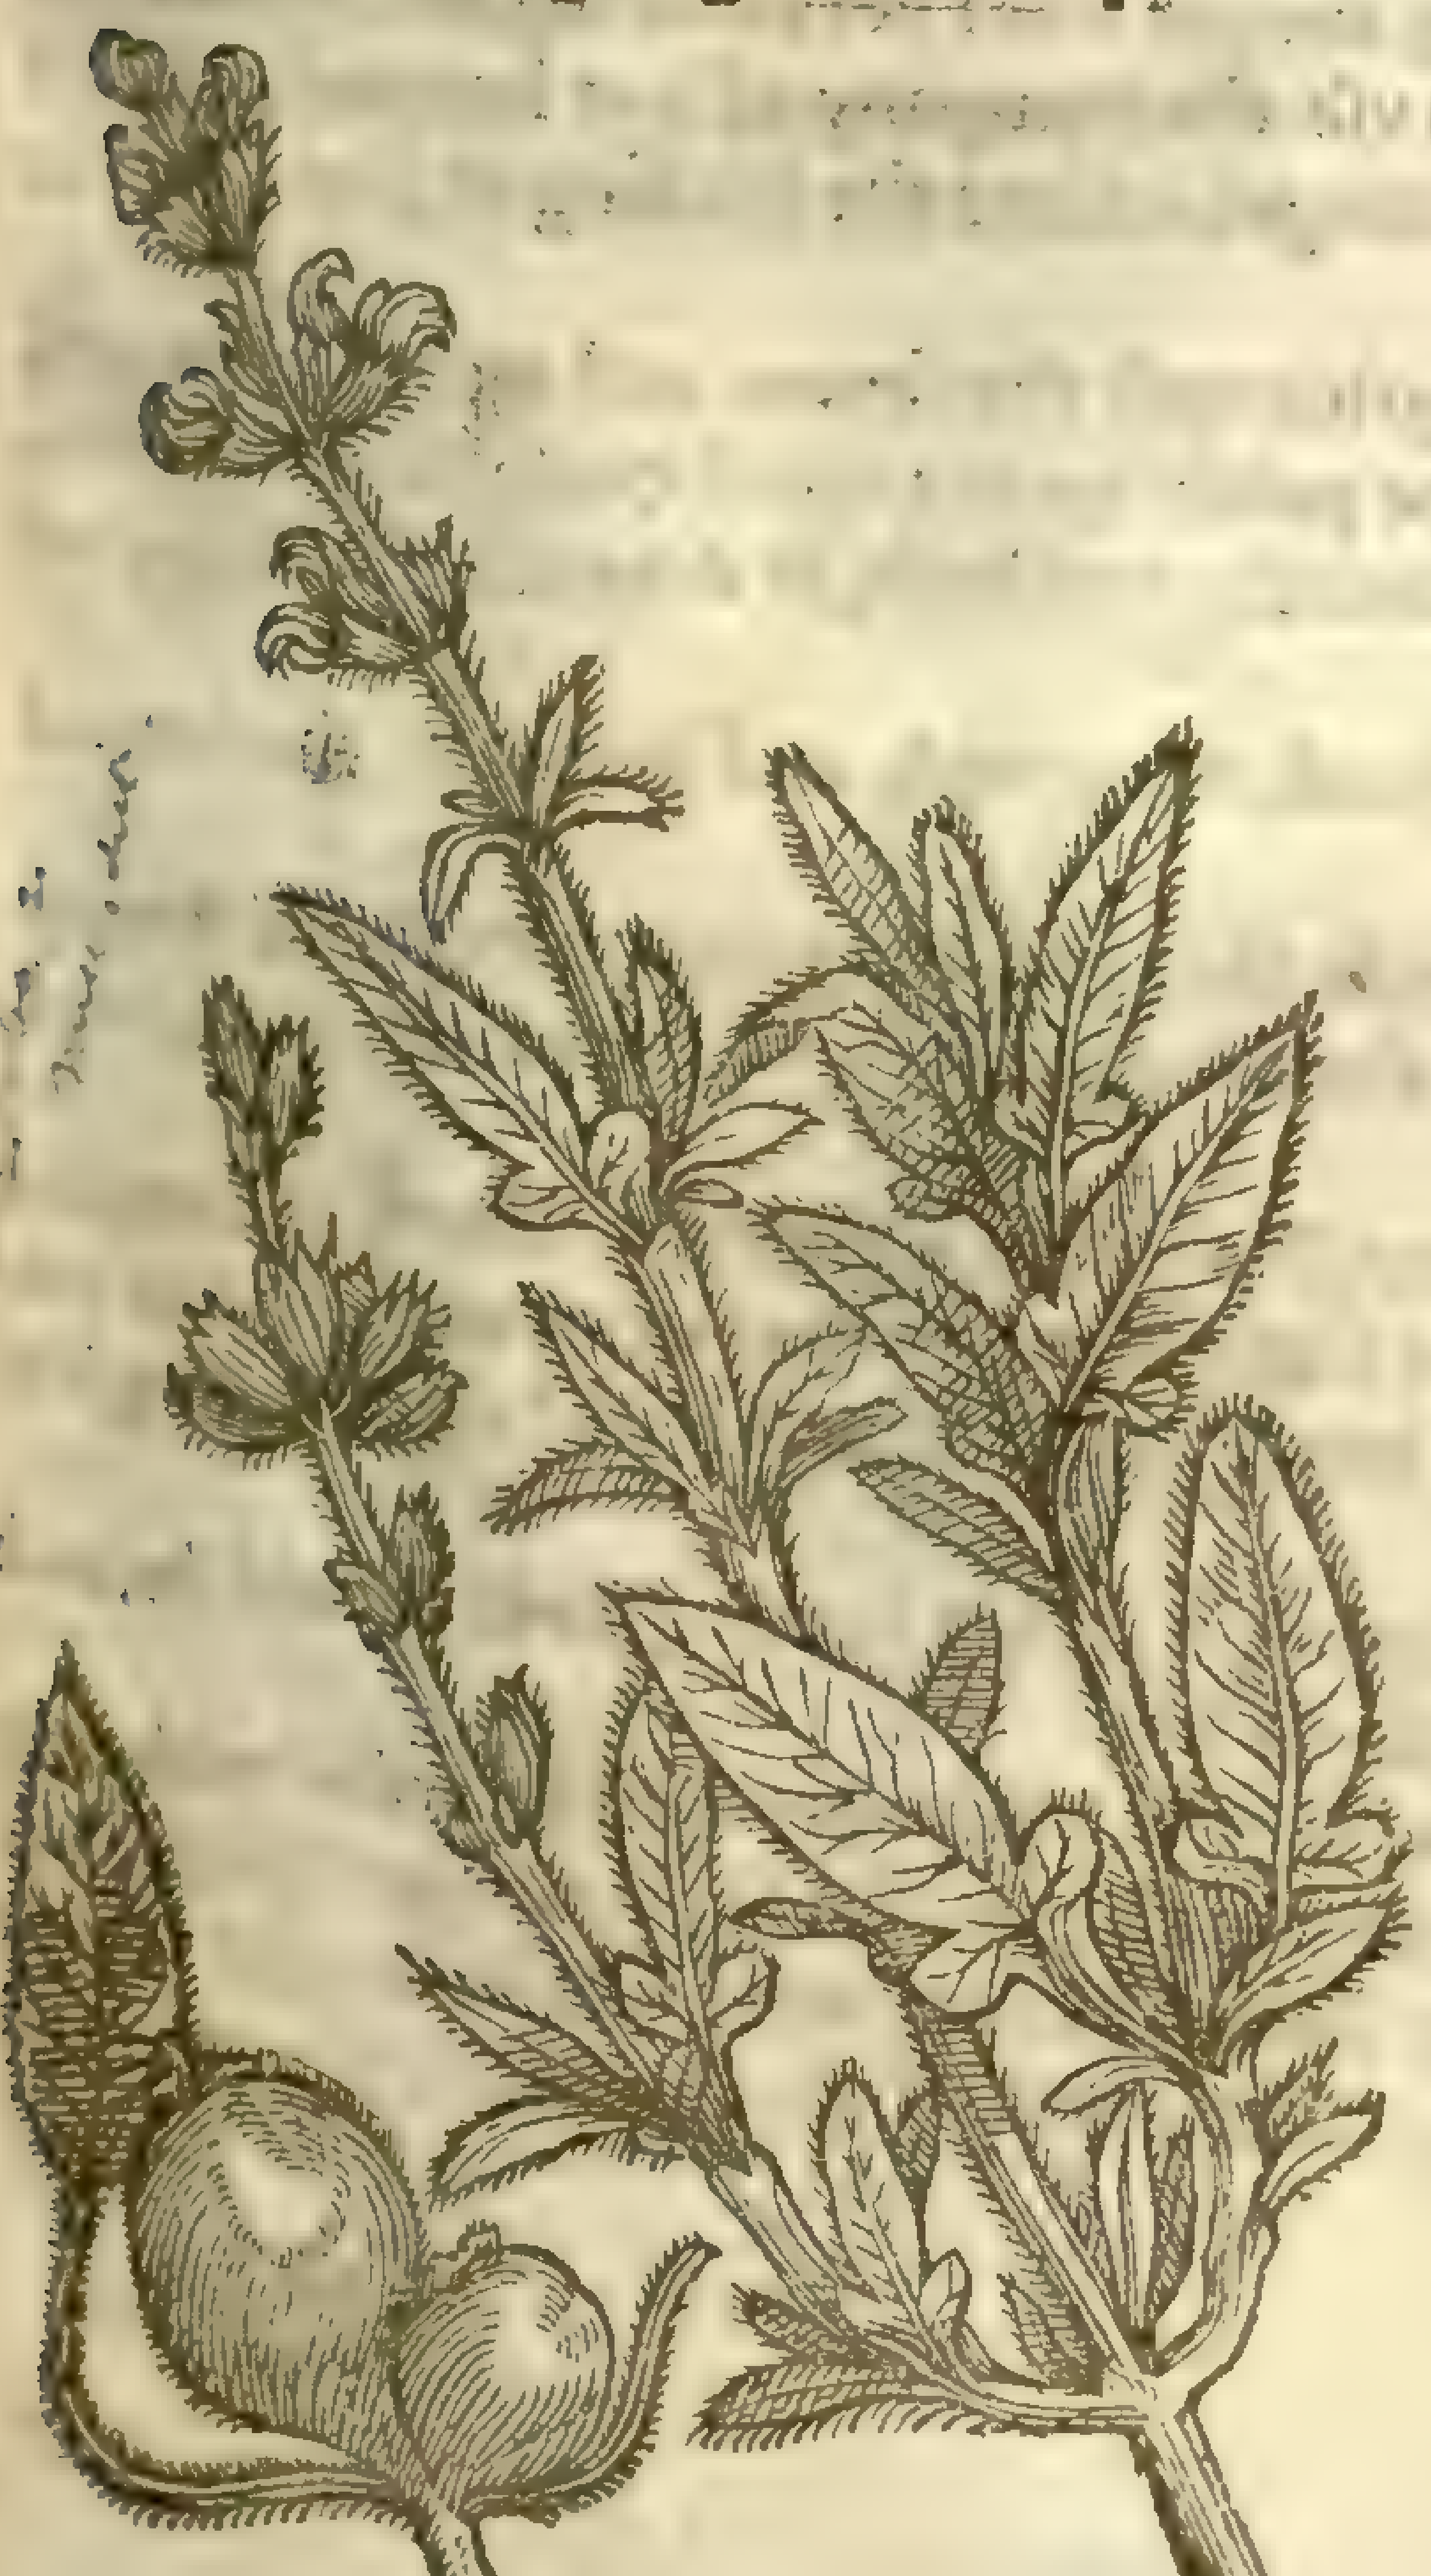
‡ 7 There is kept in ſome of our chiefe gardens a fine Sage, which in ſhape and manner of growing reſembles the ſmaller Sage, but in ſmell and taſte hath ſome affinity with Wormewood; whence it may be termed *Saluia Abſinthites*, or Wormewood Sage. *Bauhine* onely hath mentioned this, and that in the fourth place in his *Pinax pag*. 237. by the name of *Saluia minor altera*: and hee addes, *Hæc odore & ſapore eſt Abſinthij, floreque rubente*: that is, This hath the ſmell and taſte of Wormewood, and a red floure: but ours (if my memory faile me not) hath a whitiſh floure: it is a tender plant, and muſt be carefully preſerued from the extremity of Winter. I firſt ſaw this Sage with Mr. *Cannon*, and by him it was communicated to ſome others.



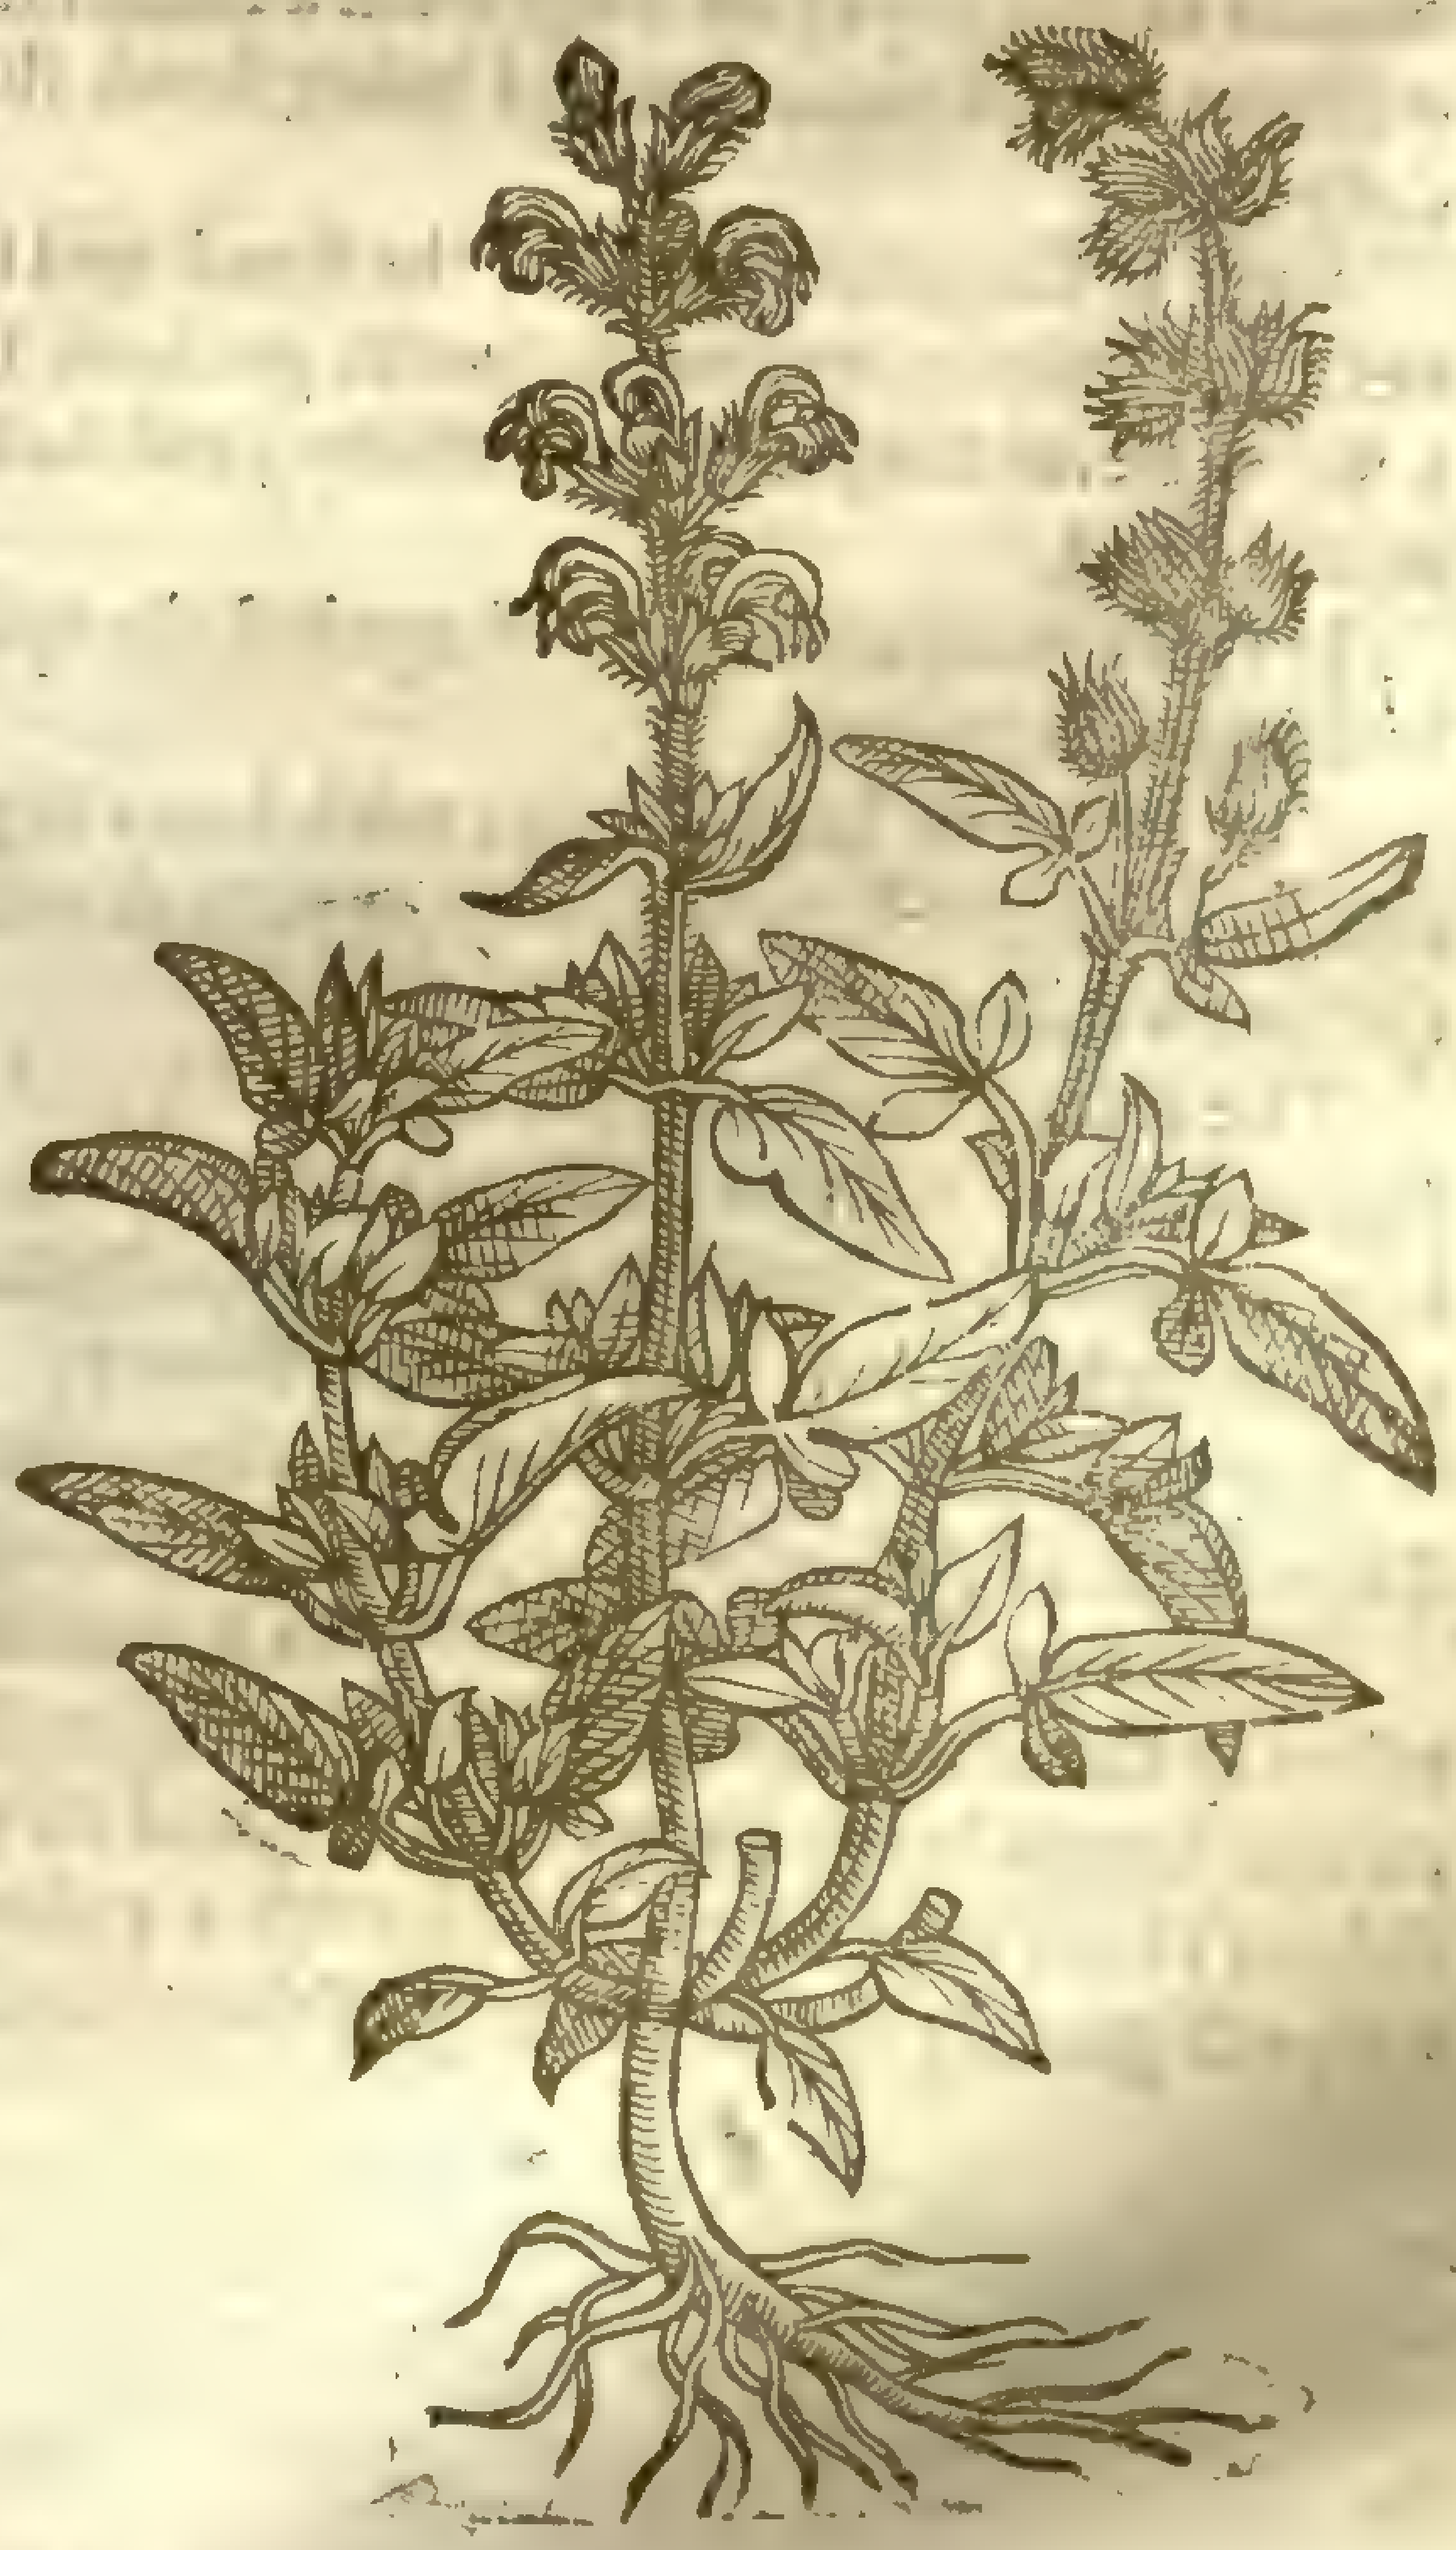
3 *Salvia Indica.*
Indian Sage.



4 *Salvia Alpina.*
Mountaine Sage.



‡ 8 *Salvia Cretica pomifera.*
Apple-bearing Sage of Candy.



‡ 8 *Salvia Cretica non pomifera.*
Candy Sage without Apples.

8 This which we here giue you hath pretty large leaues, and thoſe alſo very hairy on the vnder ſide, but rough on the vpper ſide like as the ordinary Sage. The ſtalkes are rough and hairy, foure ſquare below, and round at their tops. The floures in their growing and ſhape are like thoſe of the ordinary, but of a whitiſh purple colour; and fading, they are each of them ſucceeded by three or foure ſeeds, which are larger than in other Sages, and ſo fill their ſeed-veſſels, that they ſhew like berries. The ſmell of the whole plant is ſomewhat more vehement than that of the ordinarie: the leaues alſo haue ſometimes little eares or appendices, as in the ſmaller or Pig-Sage: and in Candy (the naturall place of the growth) it beares excreſcences, or Apples (if we may ſo terme them) of the bigneſſe of large Galls, or Oke-Apples: whence *Cluſius* hath giuen you two figures by the ſame titles as I here preſent the ſame to your view. *Matthiolus, Dodonæus*, and others alſo haue made mention hereof. ‡

¶ *The Place.*

Theſe kindes of Sage grow not wilde in England: I haue them all in my garden: moſt of them are very common.

‡ The fine or elegant painted Sage was firſt found in a country Garden, by Mr. *Iohn Tradeſcant*, and by him imparted to other louers of plants. ‡

¶ *The Time.*

Theſe Sages floure in Iune and Iuly, or later: they are fitly remoued and planted in March.

¶ *The Names.*

Sage is called in Greeke, ἐλελίσφακος: the Apothecaries, the Italians, and the Spaniards keepe the Latine name *Salvia*: in high Dutch, **Salben**: in French, *Sauge*: in low Dutch, **Sauie**: in Engliſh, Sage.

¶ *The Temperature.*

Sage is manifeſtly hot and dry in the beginning of the third degre, or in the later end of the ſecond; it hath adjoyned no little aſtriction or binding.

¶ *The Vertues.*

A *Agrippa* and likewiſe *Aëtius* haue called it the Holy-herbe, becauſe women with childe if they be like to come before their time, and are troubled with abortments, do eate thereof to their great good; for it cloſeth the matrix, and maketh them fruitfull, it retaineth the birth, and giueth it life, and if the woman about the fourth day of her going abroad after her childing, ſhall drinke nine ounces of the juyce of Sage with a little ſalt, and then vſe the company of her huſband, ſhe ſhall without doubt conceiue and bring forth ſtore of children, which are the bleſſing of God. Thus far *Agrippa*.

B Sage is ſingular good for the head and braine; it quickneth the ſences and memory, ſtrengthneth the ſinewes, reſtoreth health to thoſe that haue the palſie vpon a moiſt cauſe, takes away ſhaking or trembling of the members; and being put vp into the noſthrils, it draweth thin flegme out of the head.

C It is likewiſe commended againſt the ſpitting of bloud, the cough, and paines of the ſides, and bitings of Serpents.

D The juyce of Sage drunke with hony is good for thoſe that ſpit and vomit bloud, and ſtoppeth the flux thereof incontinently, expelleth winde, drieth the dropſie, helpeth the palſie, ſtrengthneth the ſinewes, and cleanſeth the bloud.

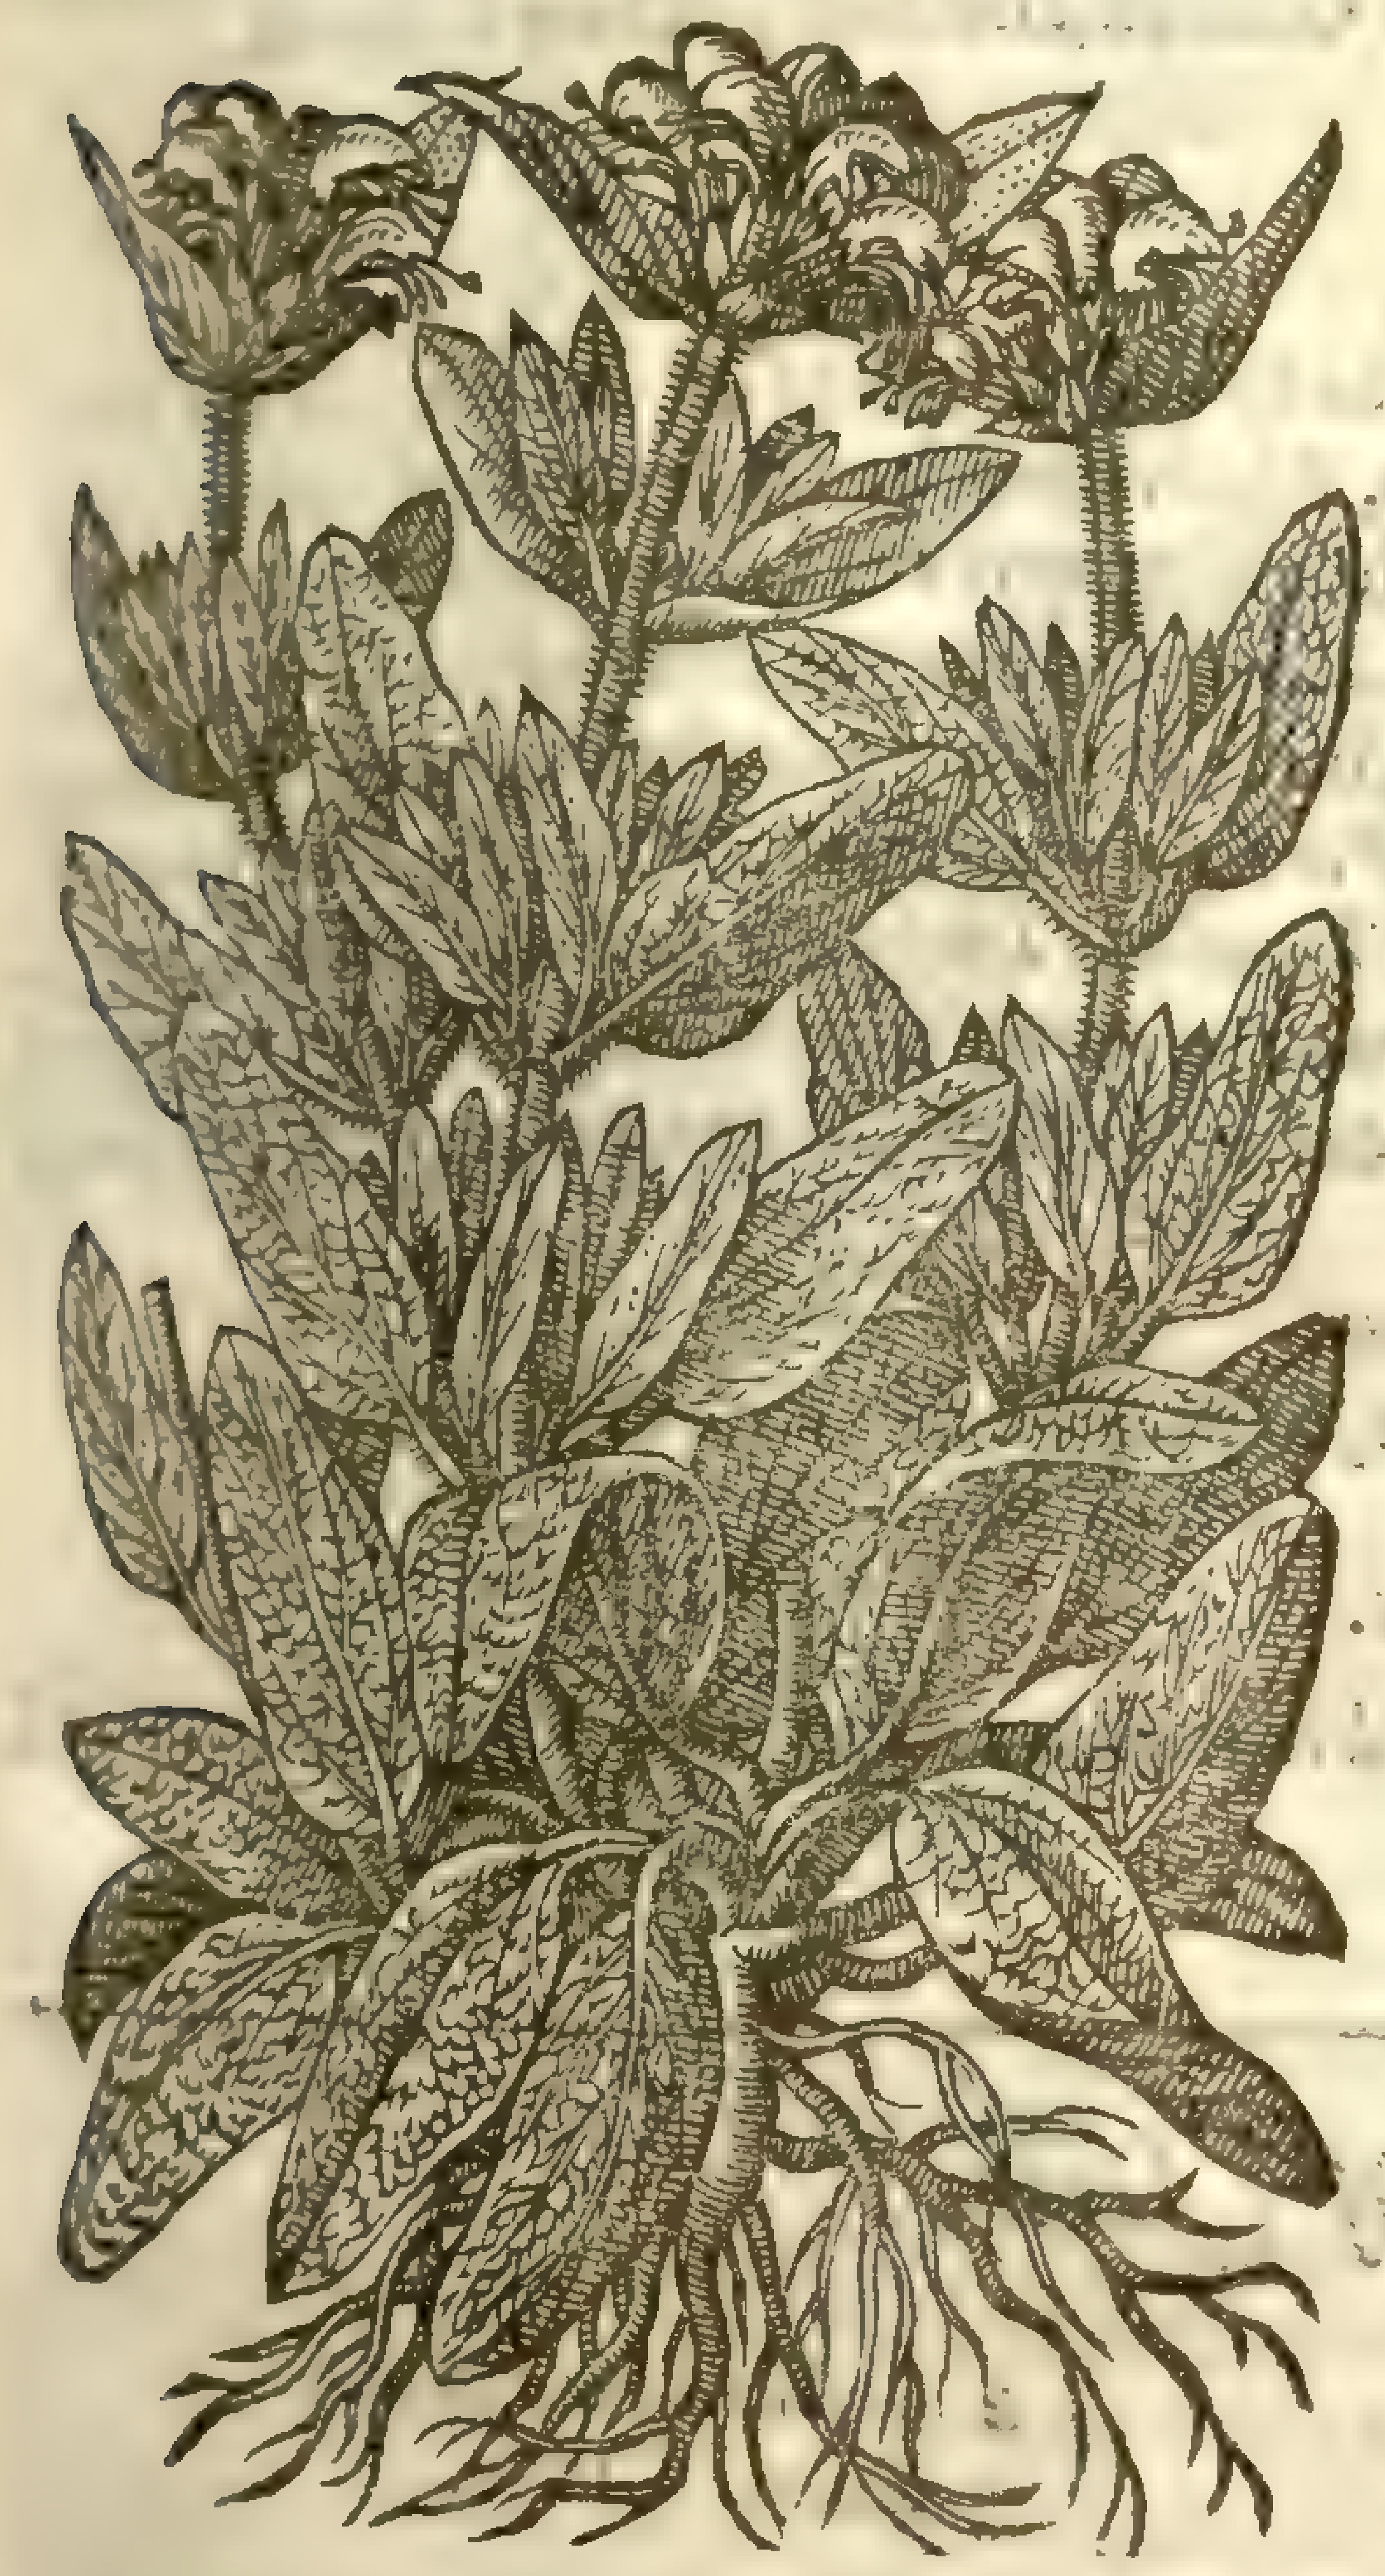
E The leaues ſodden in water, with Wood-binde leaues, Plantaine, Roſemary, Hony, Allome, and ſome white wine, make an excellent water to waſh the ſecret parts of man or woman, and for cankers or other ſoreneſſe in the mouth, eſpecially if you boyle in the ſame a faire bright ſhining Sea-cole, which maketh it of greater efficacy.

F No man needs to doubt of the wholeſomneſſe of Sage Ale, being brewed as it ſhould be, with Sage, Scabious, Betony, Spikenard, Squinanth, and Fennell ſeeds.

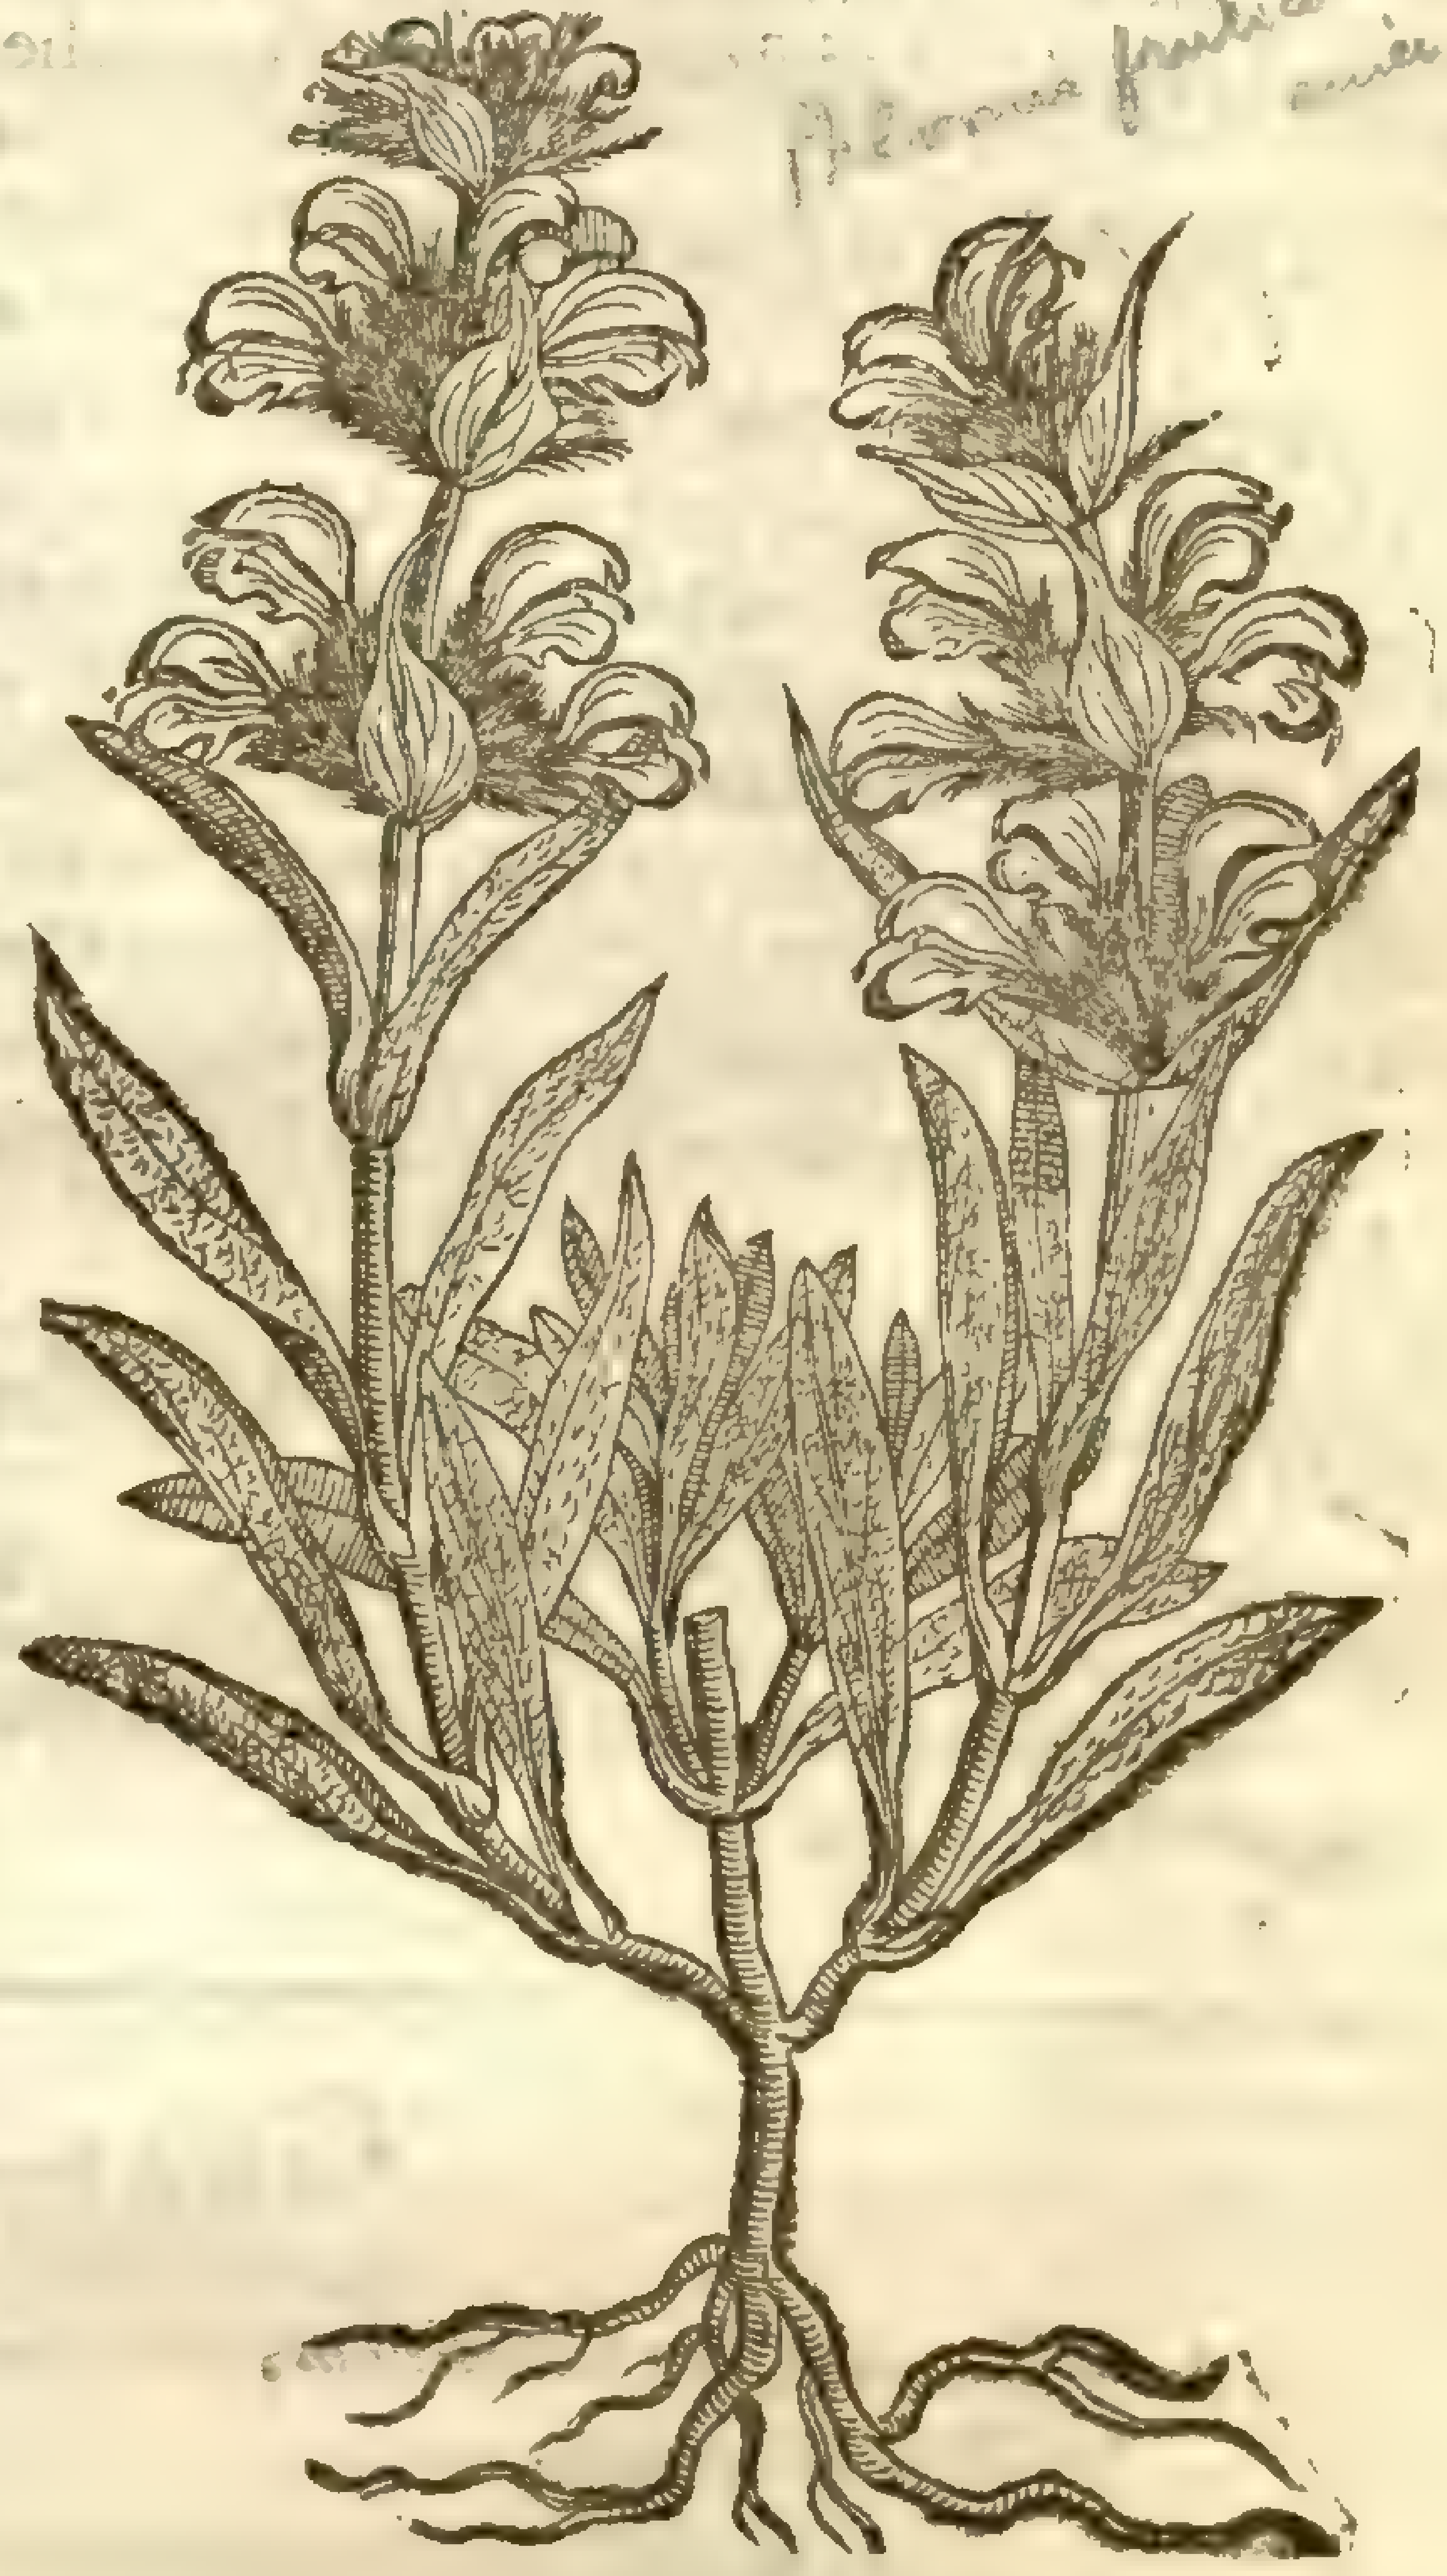
G The leaues of red Sage put into a woodden diſh, wherein is put very quicke coles, with ſome aſhes in the bottome of the diſh to keepe the ſame from burning, and a little vinegre ſprinkled vpon the leaues lying vpon the coles, and ſo wrapped in linnen cloath, and holden very hot vnto the ſide of thoſe that are troubled with a grieuous ſtitch, taketh away the paine preſently: The ſame helpeth greatly the extremity of the pleuriſie.

Chap.

CHAP. 166. *Of French Sage or wooddy Mullein.*

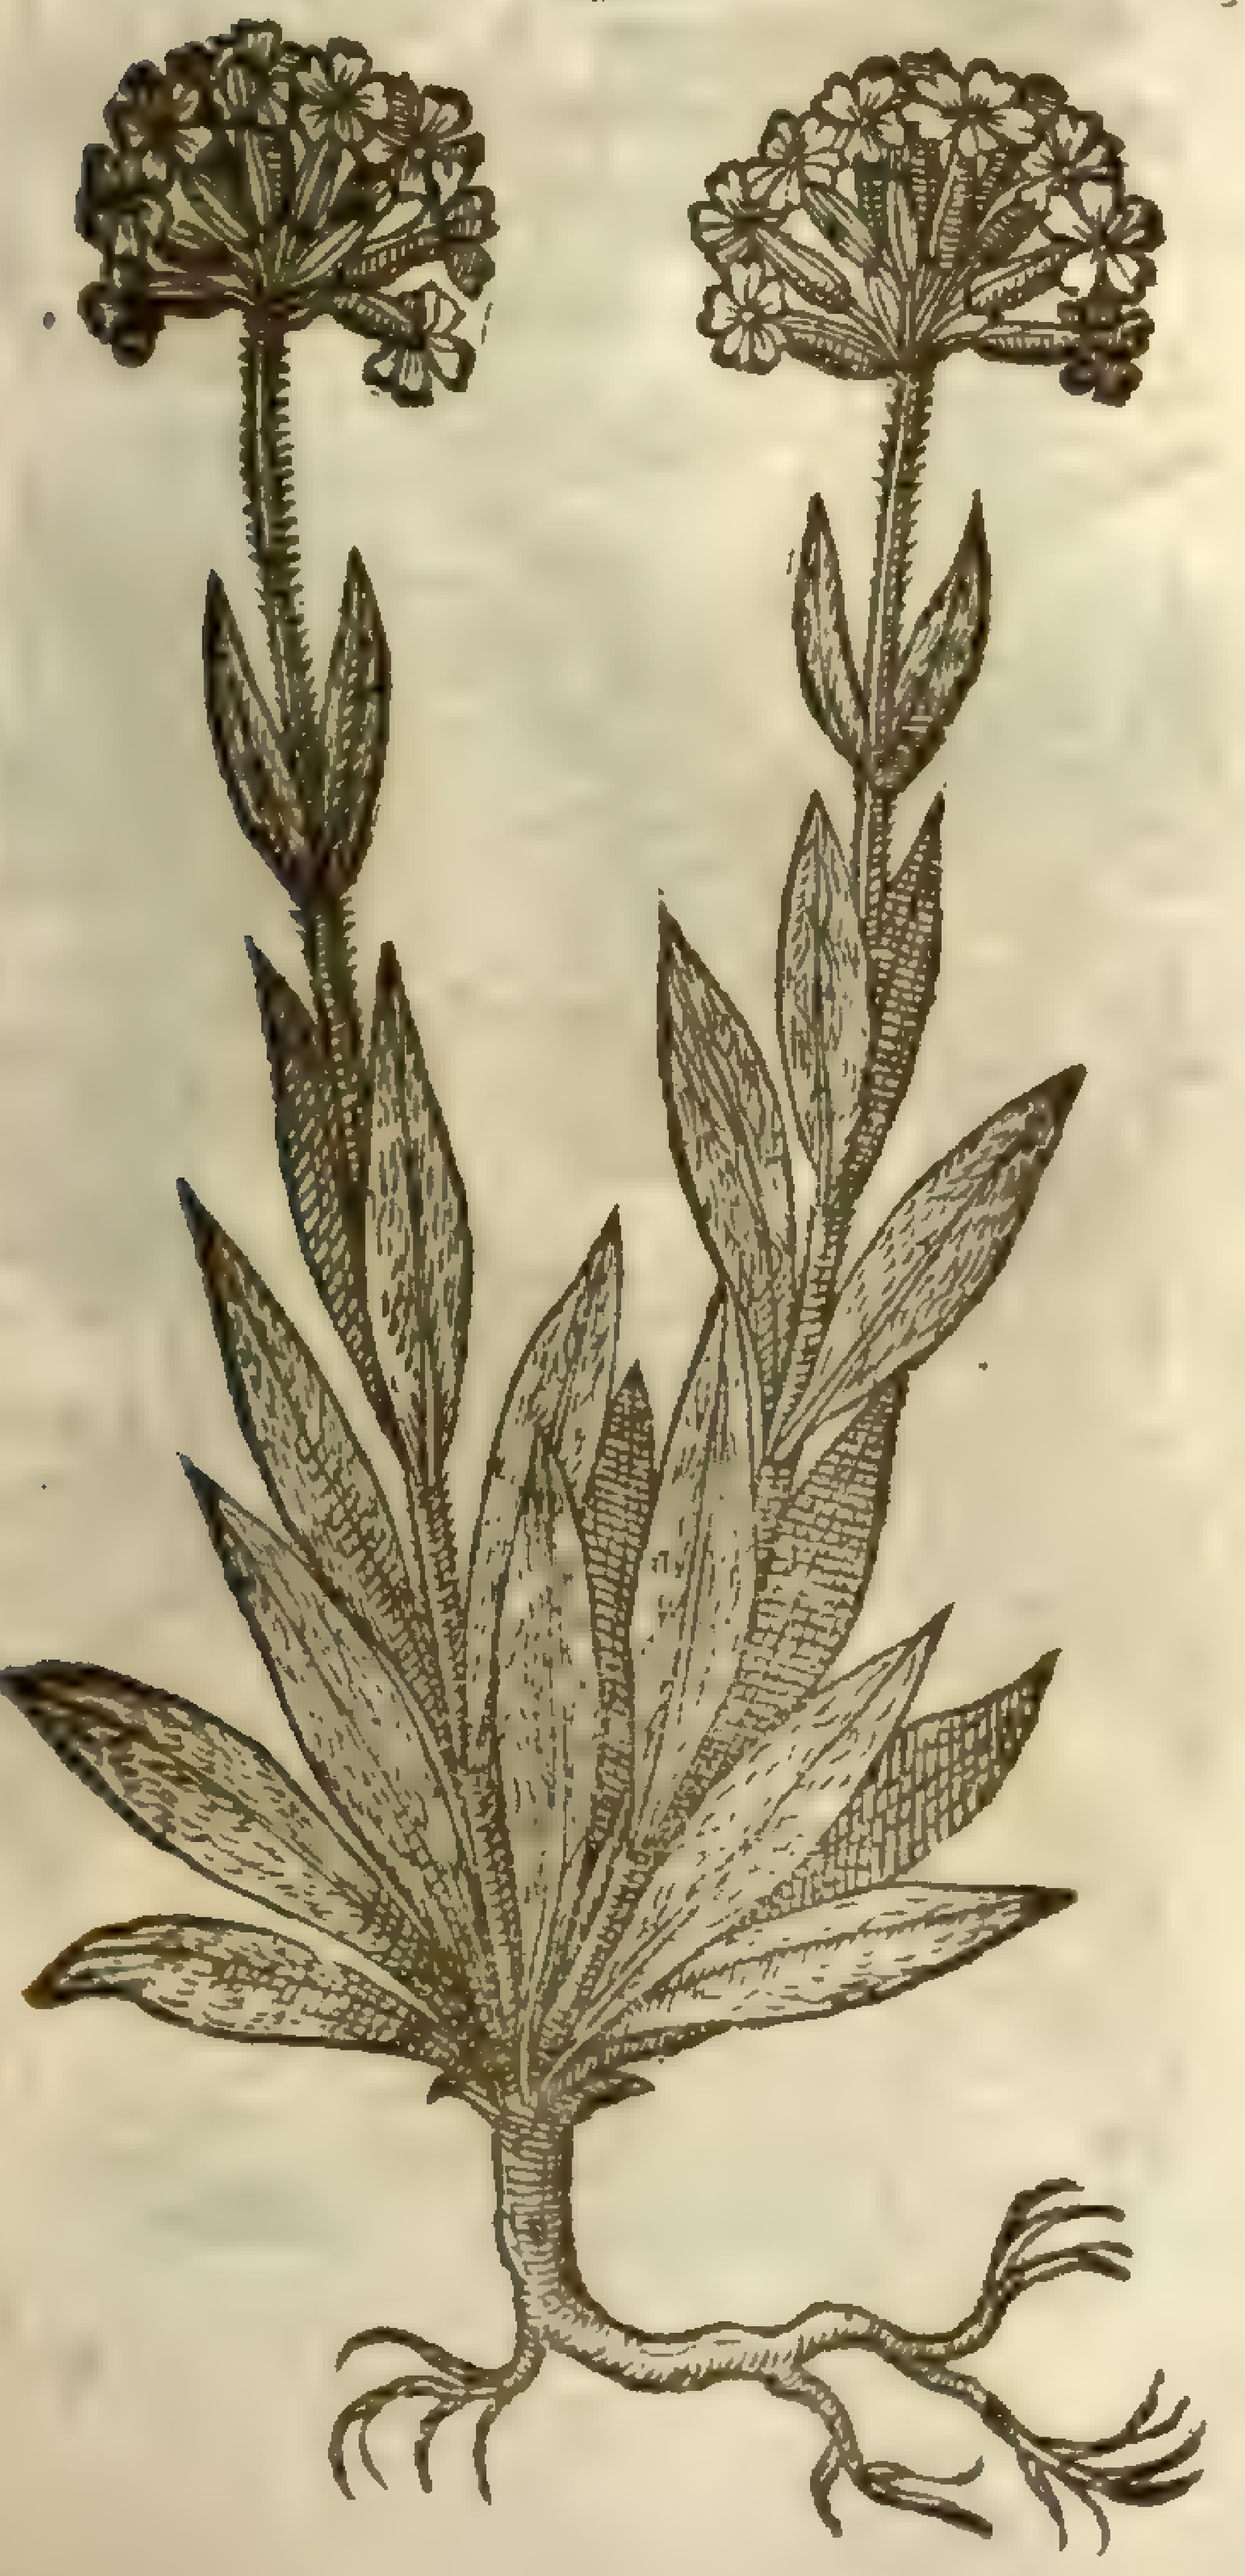


1 *Verbaſcum Matthioli.*
French Sage.



‡ 2 *Verbaſcum anguſtis Salviæ folijs.*
The leſſer French Sage.

Phlomis fruticosa [illegible] amici, [illegible]



‡ 3 *Phlomos Lychnites Syriaca.*
Syrian Sage-leaued Mullein.

¶ *The Deſcription.*

1 WIld Mullein, wooddy Mullein, *Matthiolus* his Mullein, or French Sage groweth vp like a ſmall wooddie ſhrub, hauing many wooddy branches of a woollie and hoarie colour, ſoft and downy: whereupon are placed thicke hoarie leaues, of a ſtrong pontick ſauour, in ſhape like the leaues of Sage, whereupon the vulgar people call it French Sage: toward the top of the branches are placed roundles or crownets of yellow gaping floures like thoſe of dead Nettle, but much greater. The root is thicke, tough, and of a wooddy ſubſtance, as is all the reſt of the plant.

† 2 There is another ſort hereof that is very like the other, ſauing that the leaues & euery other part of this plant, hath a moſt ſweet and pleaſant ſmell, and the other more ſtrong and offenſiue: the leaues alſo are much leſſer and narrower, ſomwhat reſembling thoſe of the leſſer Sage.

‡ 3 I thinke it not amiſſe here to inſert this no leſſe rare than beautifull plant, which differs from the laſt deſcribed in the maner of growing & ſhape of the floures, which reſemble thoſe of the *Lychnis Chalcedonica*, or None-ſuch, but are of a yellow colour. The leaues are hairy, narrow, and ſharp pointed; the ſtalkes ſquare, and root wooddy. *Lobel*

(to whom we are beholden for this figure and deſcription) calls this, *Phlomos Lychnites altera Syriaca.* ‡

¶ *The Place.*

Theſe wilde Mulleins do grow wilde in diuers Prouinces of Spaine, and alſo in Languedoc, vpon dry bankes and ſtony places: I haue them both in my Garden, and many others likewiſe.

¶ *The Time.*

They floure in Iune and Iuly.

¶ *The Names.*

They are called of the learned men of our time, *Verbaſca Sylueſtria*: the firſt is called of the Grecians φλόμος, or φλογμός: in Latine, *Elychnium*, or after others, *Elychinium*, becauſe of the Cottonie ſubſtance thereof, matches or weeks were made to keep light in lamps: *Verbaſcum Lychnitis*, as *Dioſcorides* himſelfe teſtifieth, is named alſo *Thryallis* or Roſe Campion; but the floure of *Thryallis* is red of colour, as *Nicander* in his Counterpoyſons doth ſhew, but the floures of theſe are yellow: therefore they are neither *Thryallis* nor *Lychnitis*, but *Sylueſtre Verbaſcum*, or wilde Mullein, as we haue already taught in the Chapter of Roſe Campion, that *Thryallis* is *Lychnitis ſativa*, or Roſe Campion. There is nothing to the contrary, but that there may be many plants with ſoft downy leaues fit to make Candle weeke of: in Engliſh it is generally called French Sage: we may call it Sage Mullein.

¶ *The Temperature.*

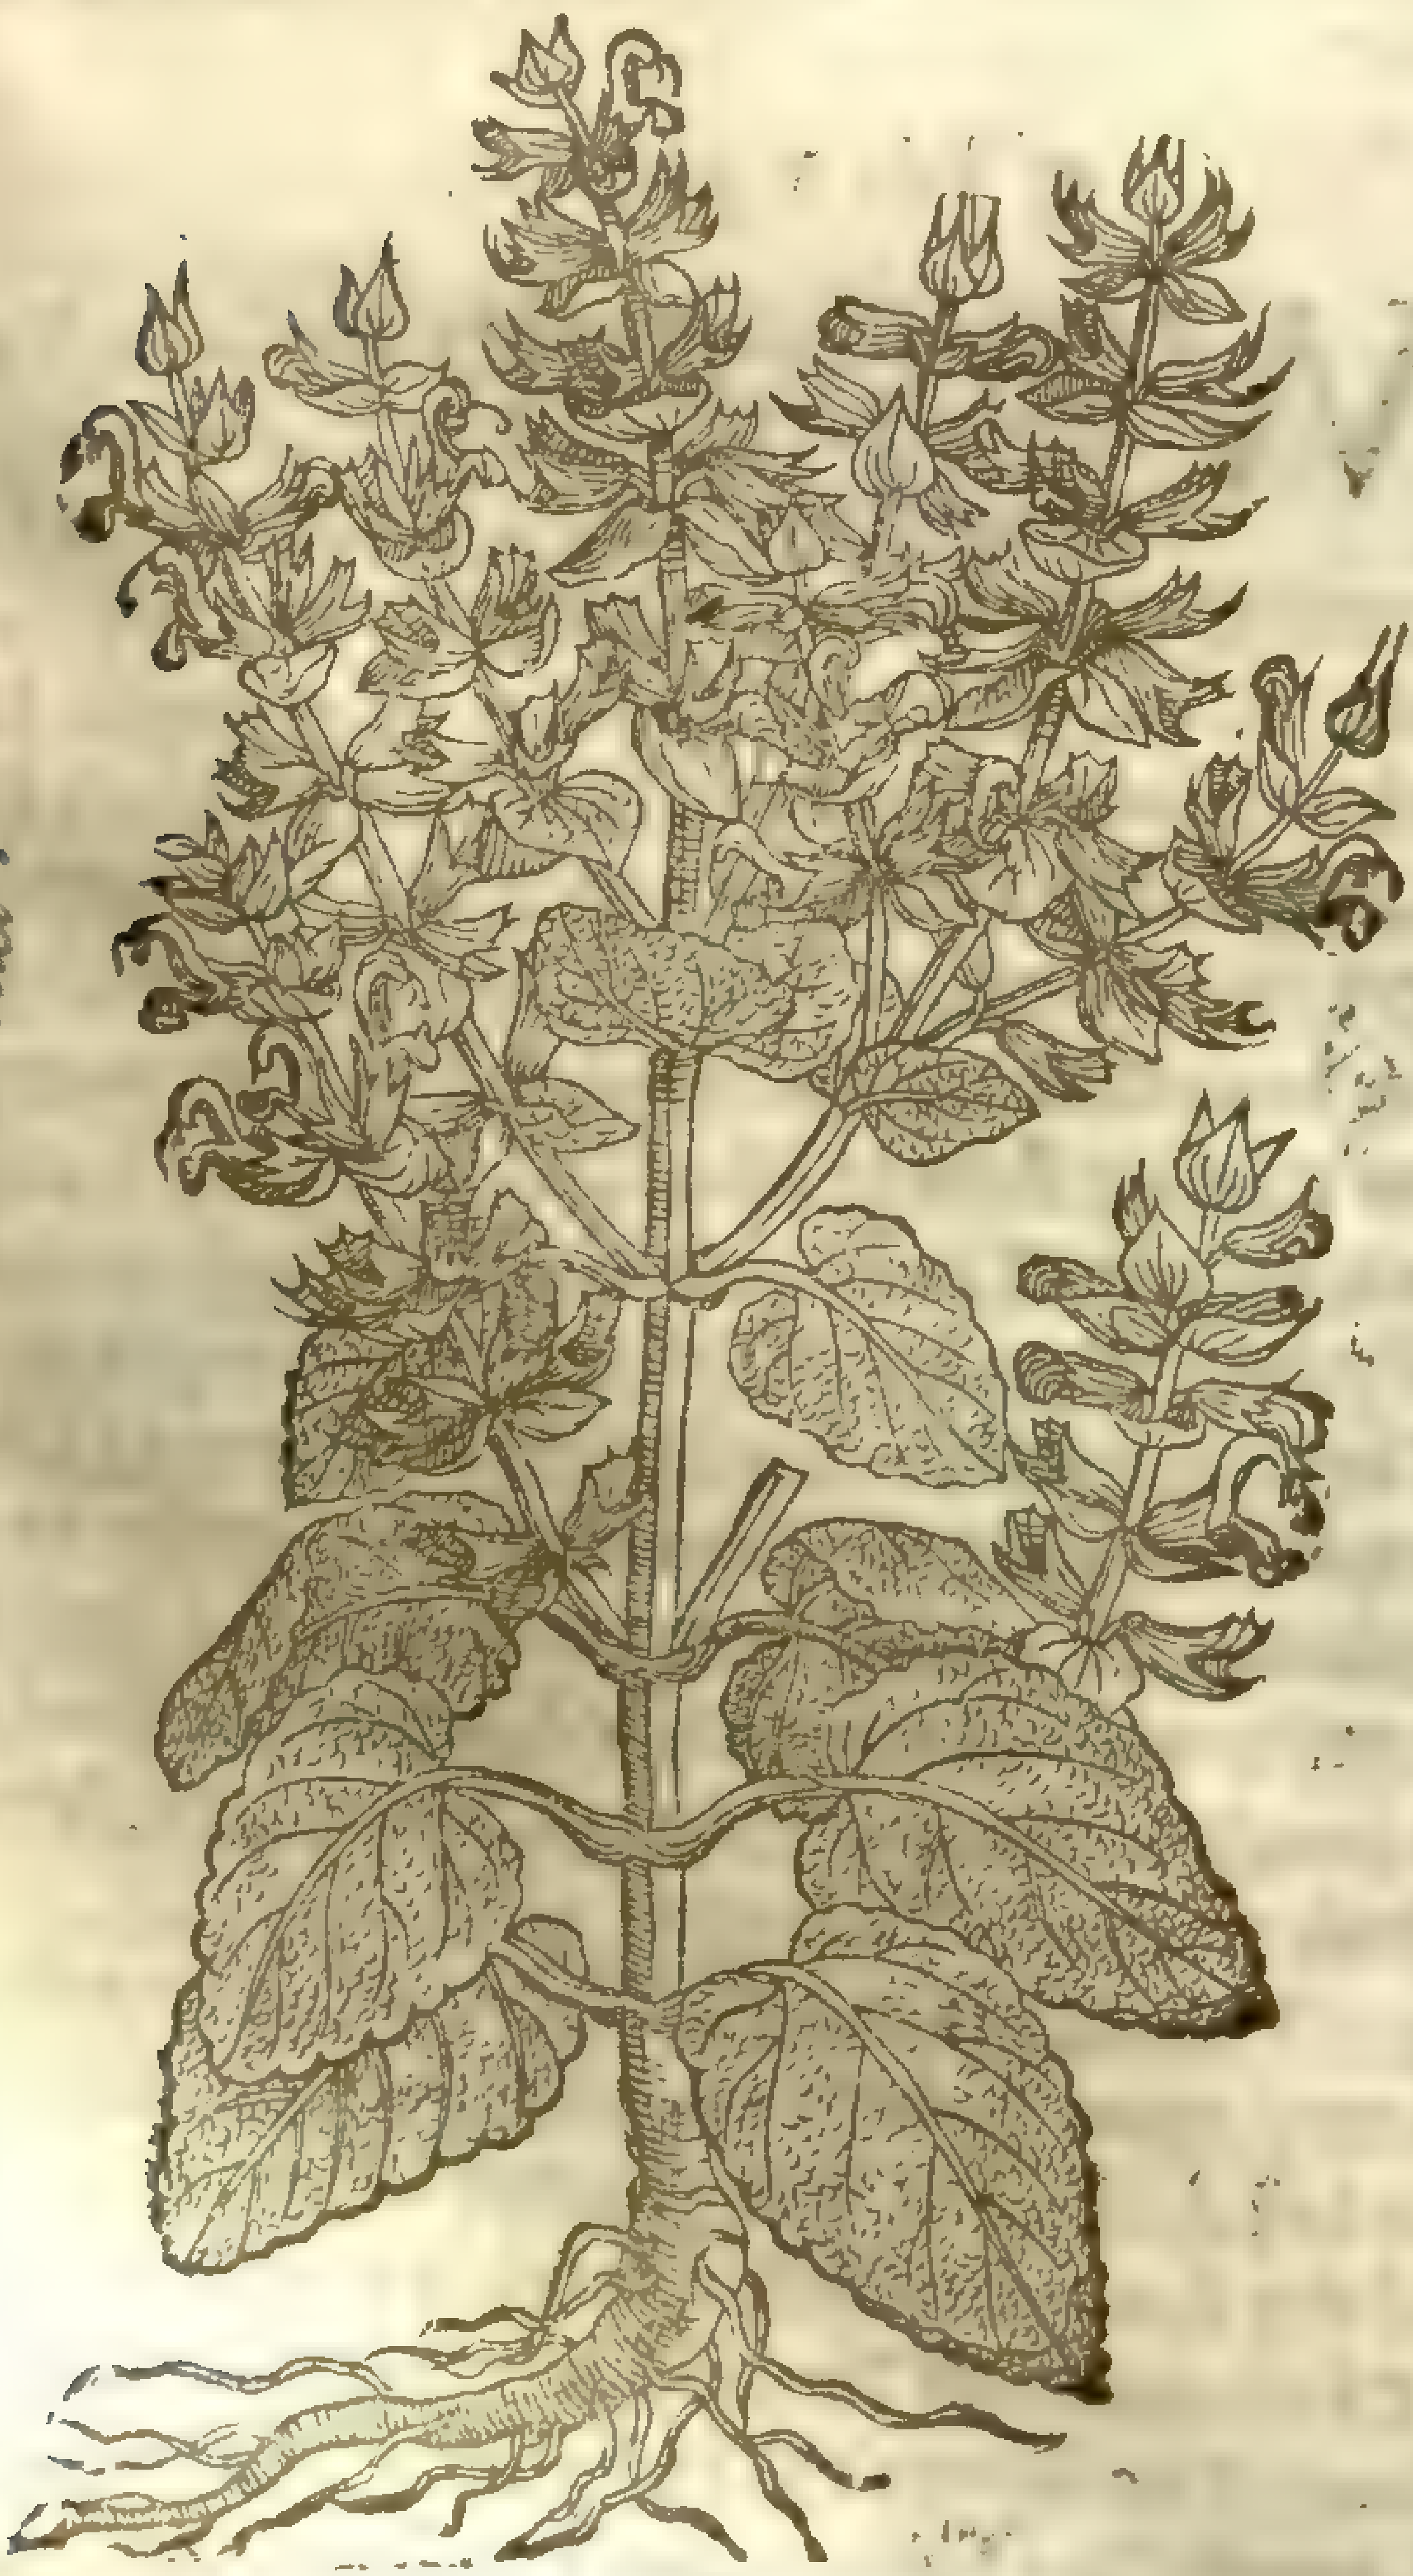
As theſe be like in vertues to the others going before, ſo they be likewiſe dry in temperature.

¶ *The Vertues.*

Dioſcorides ſaith, that the leaues are ſtamped and laied in manner of a pultis vpon burnings and ſcaldings.

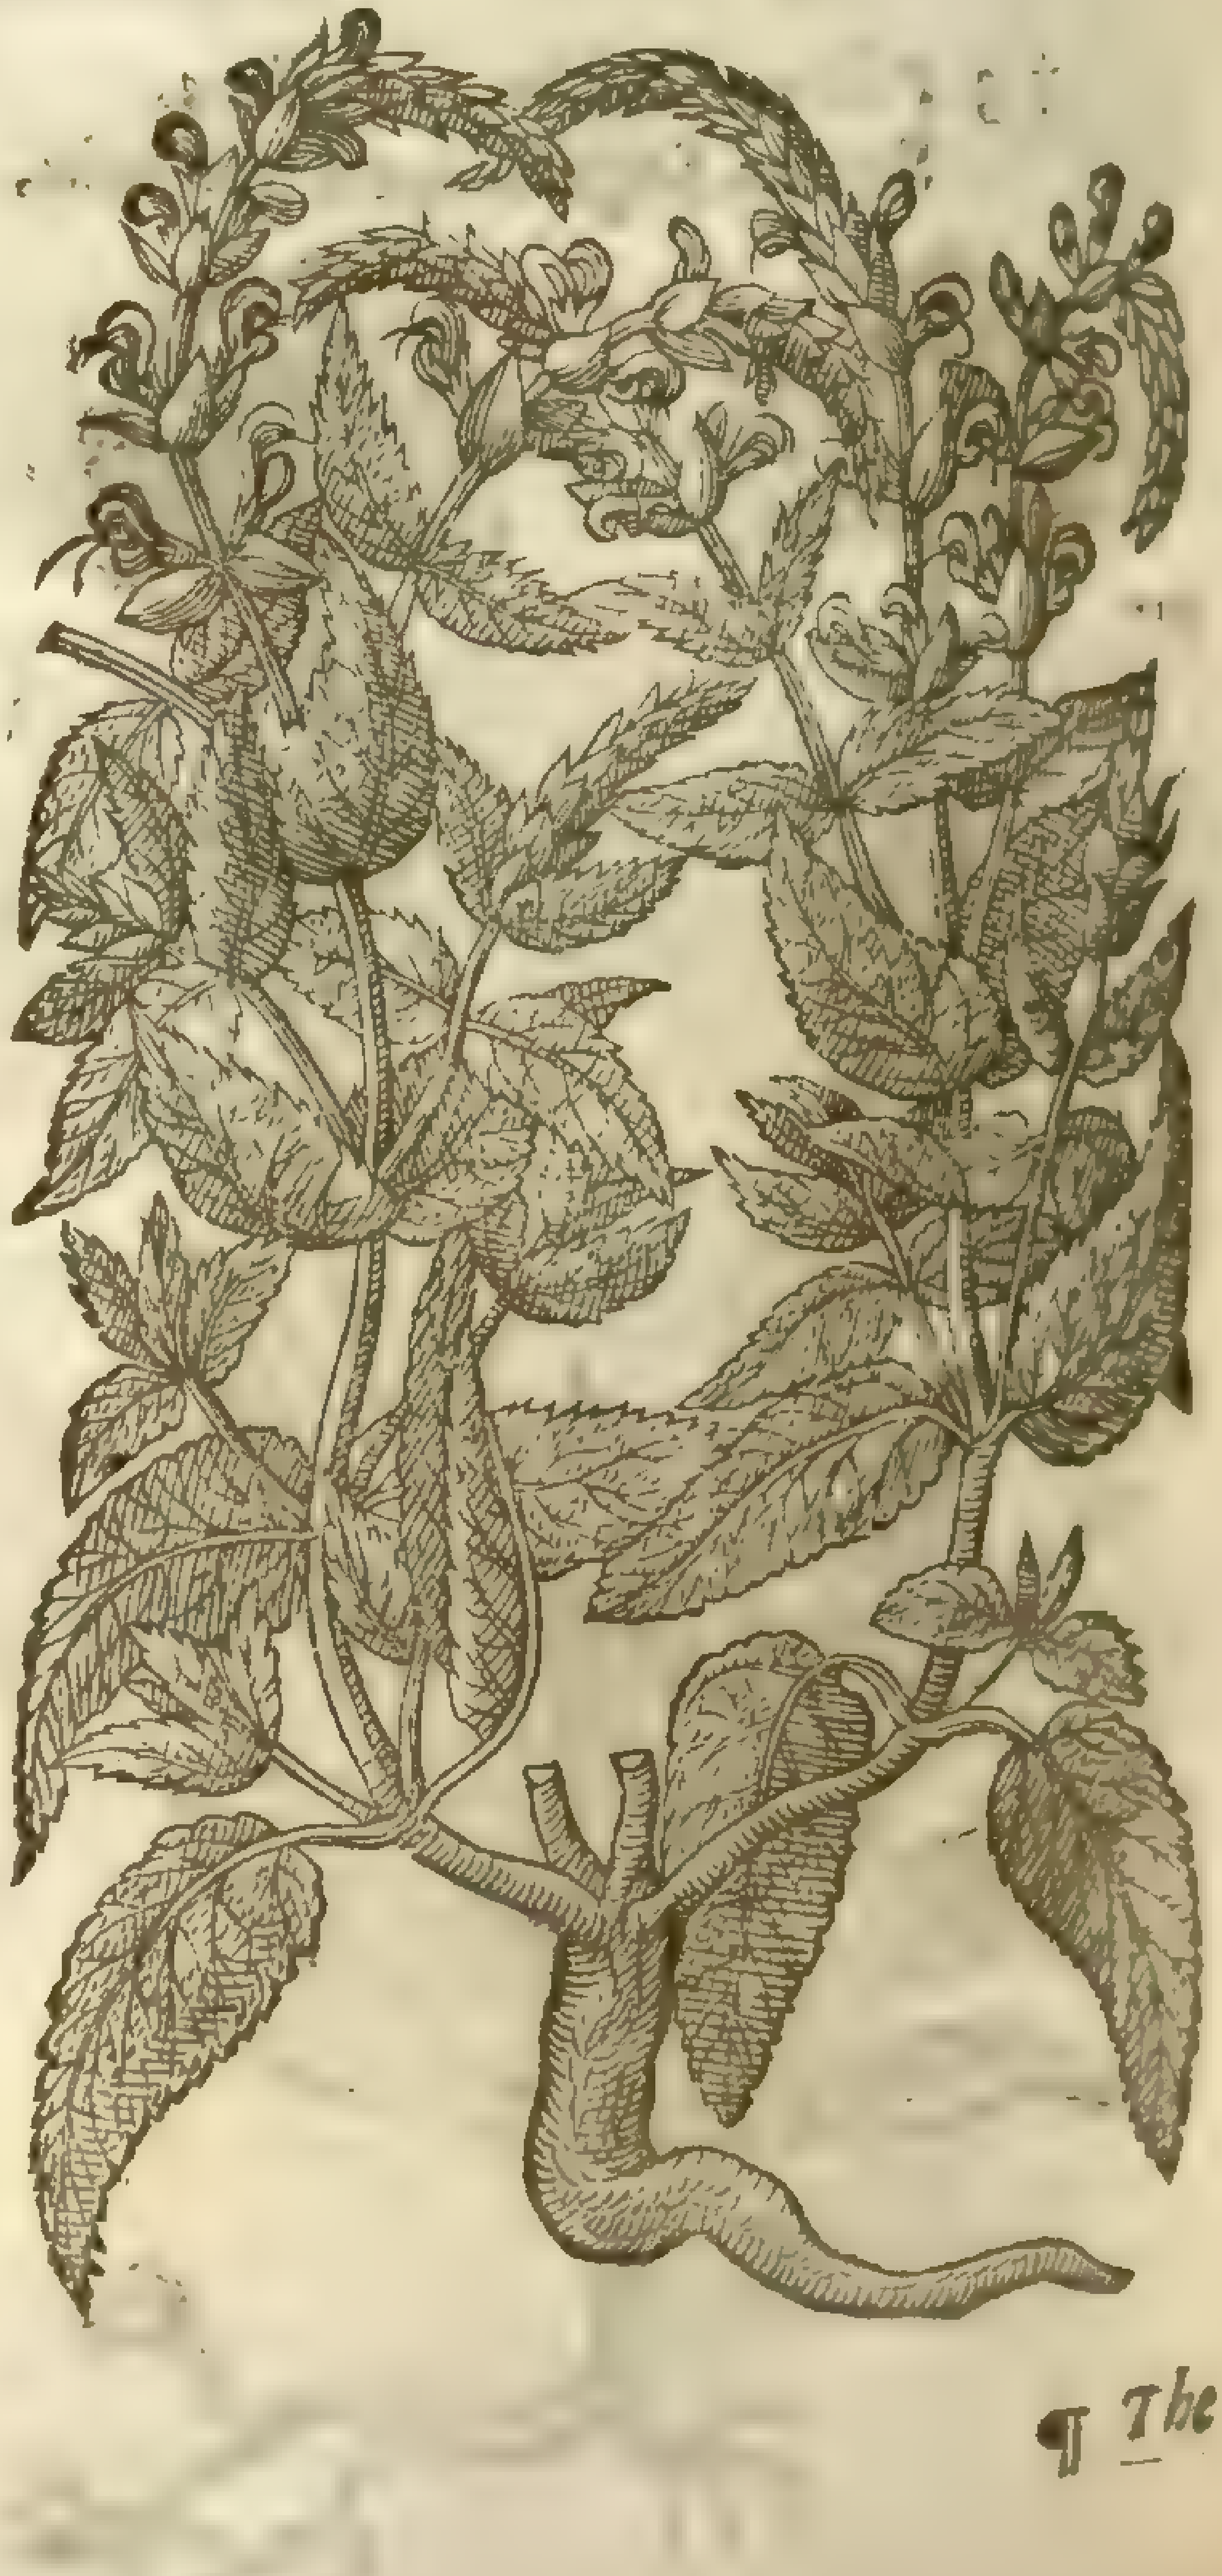
Chap. 267. Of Clarie.

1 *Gallitricum, ſive Horminum.*
Common Clarie.



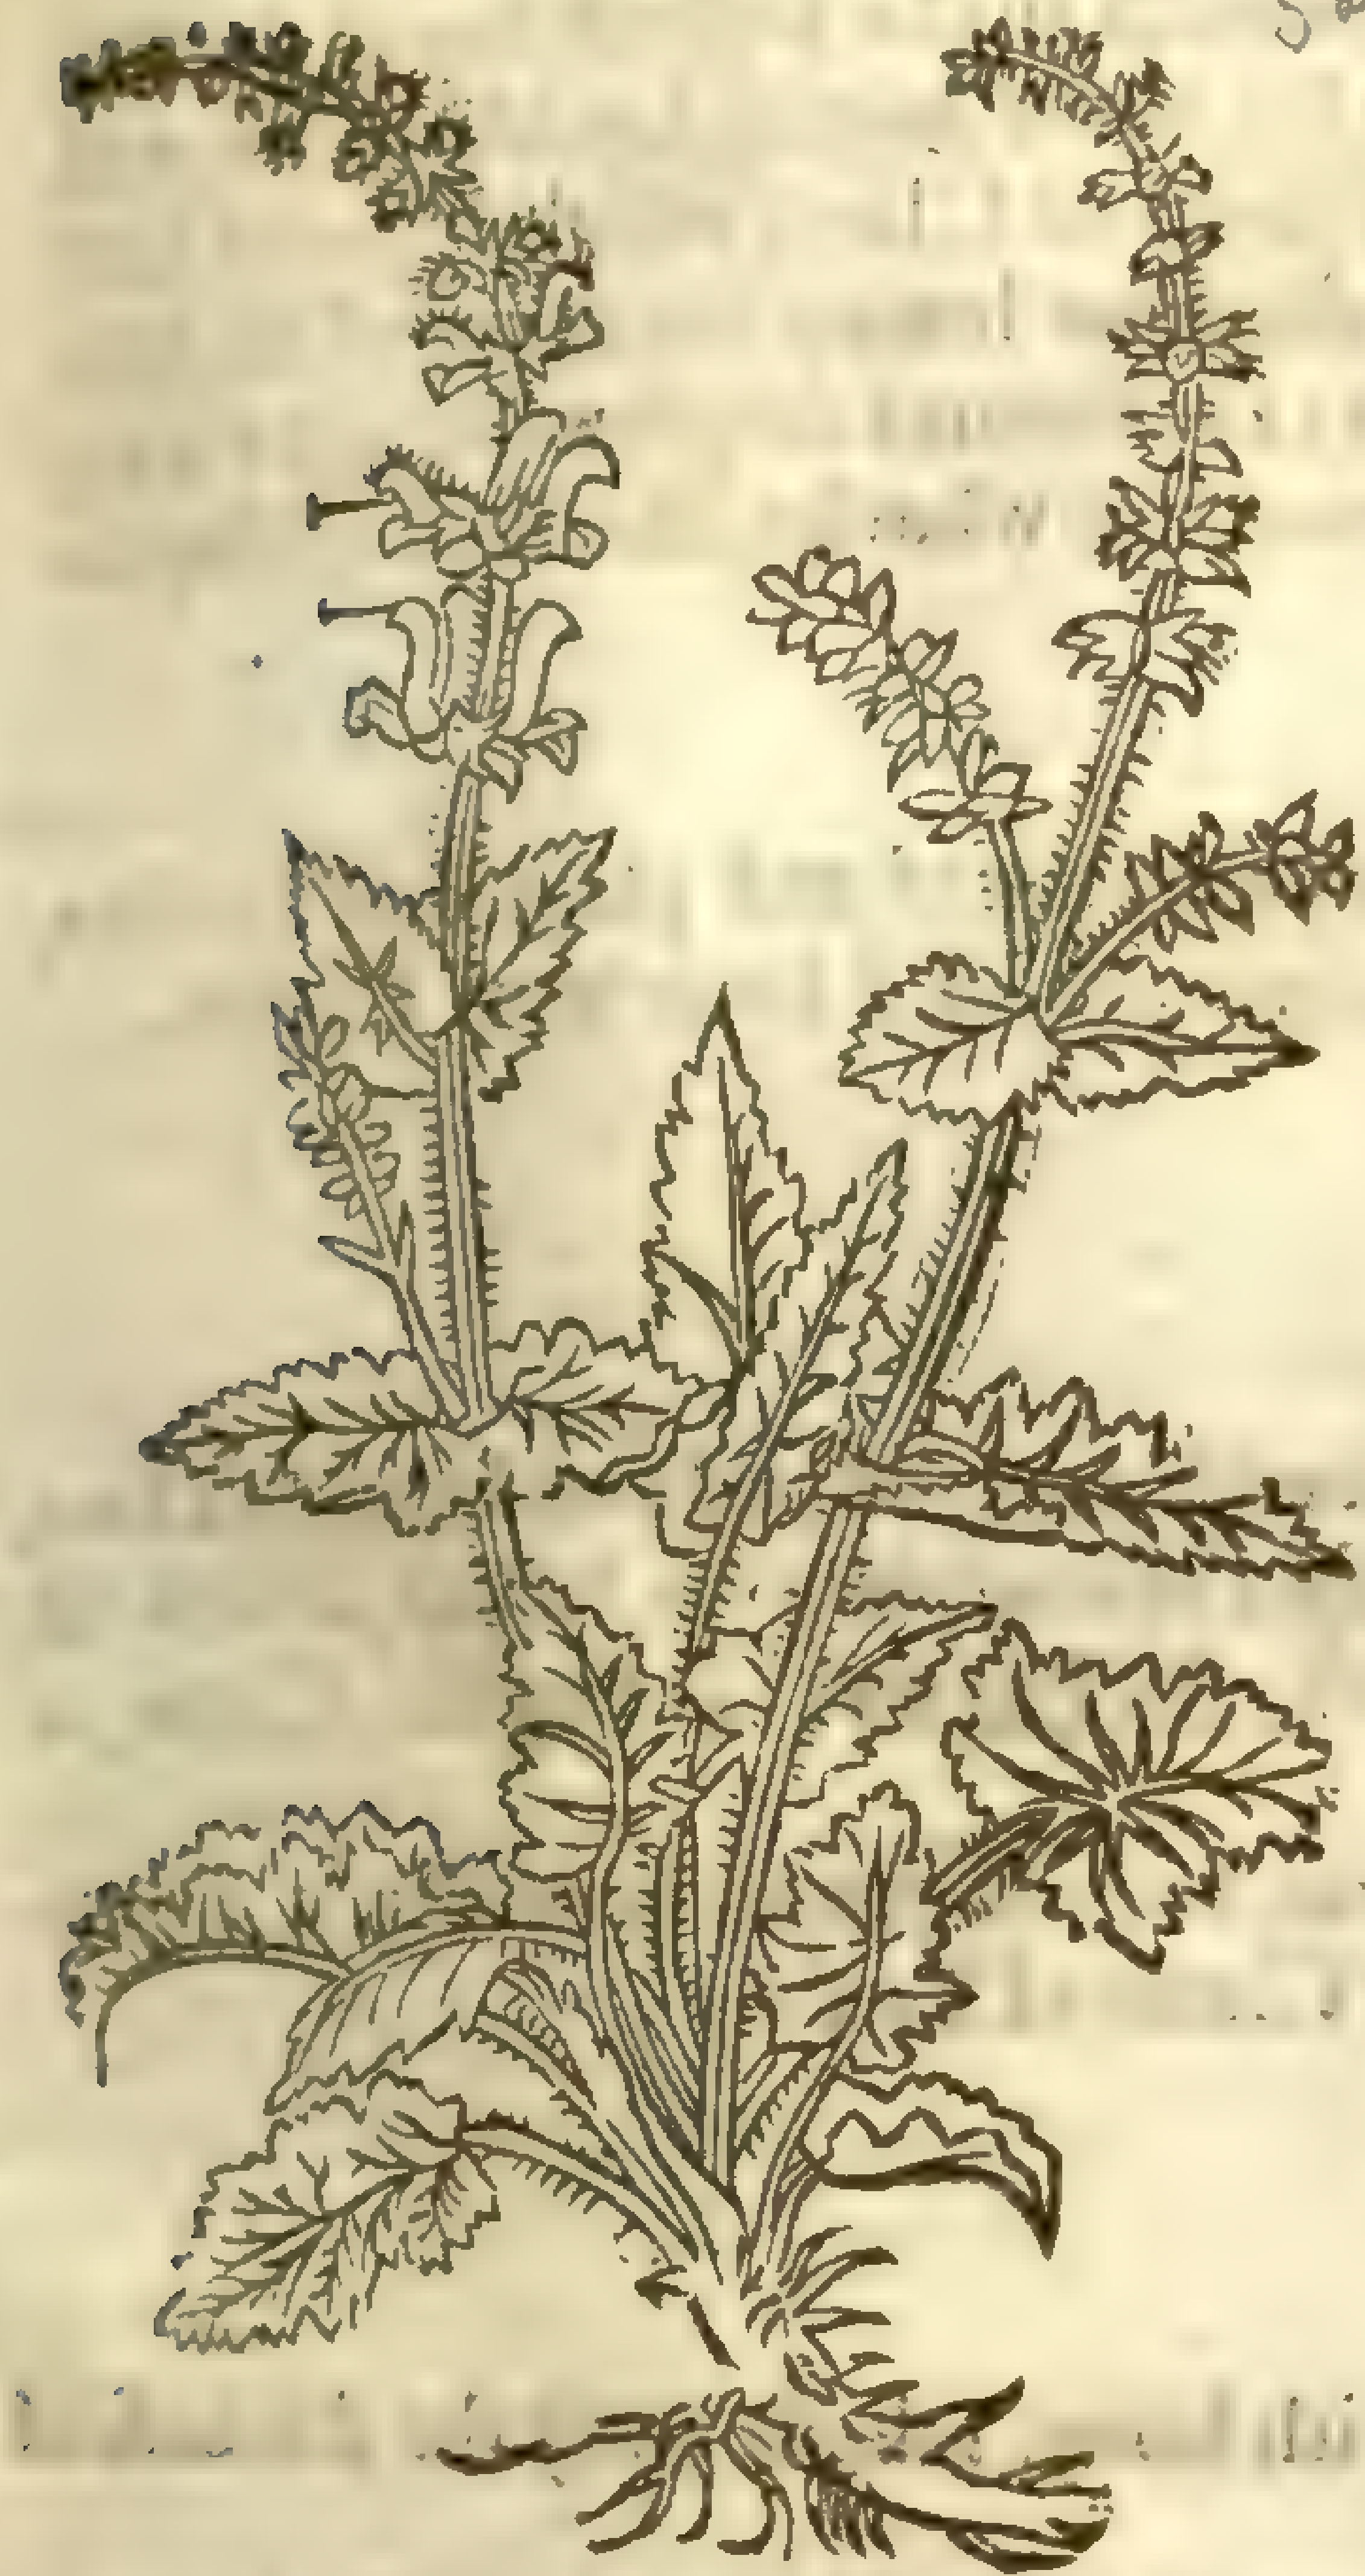
Salvia sclarea; – Linn. dub.

2 *Gallitricum alterum.*
Small Clarie.



¶ The

‡ 3 *Horminum ſylueſtre, Fuchſij.*
Fuchſius his wilde Clarie.



Salvia pratensis, L. [illegible]

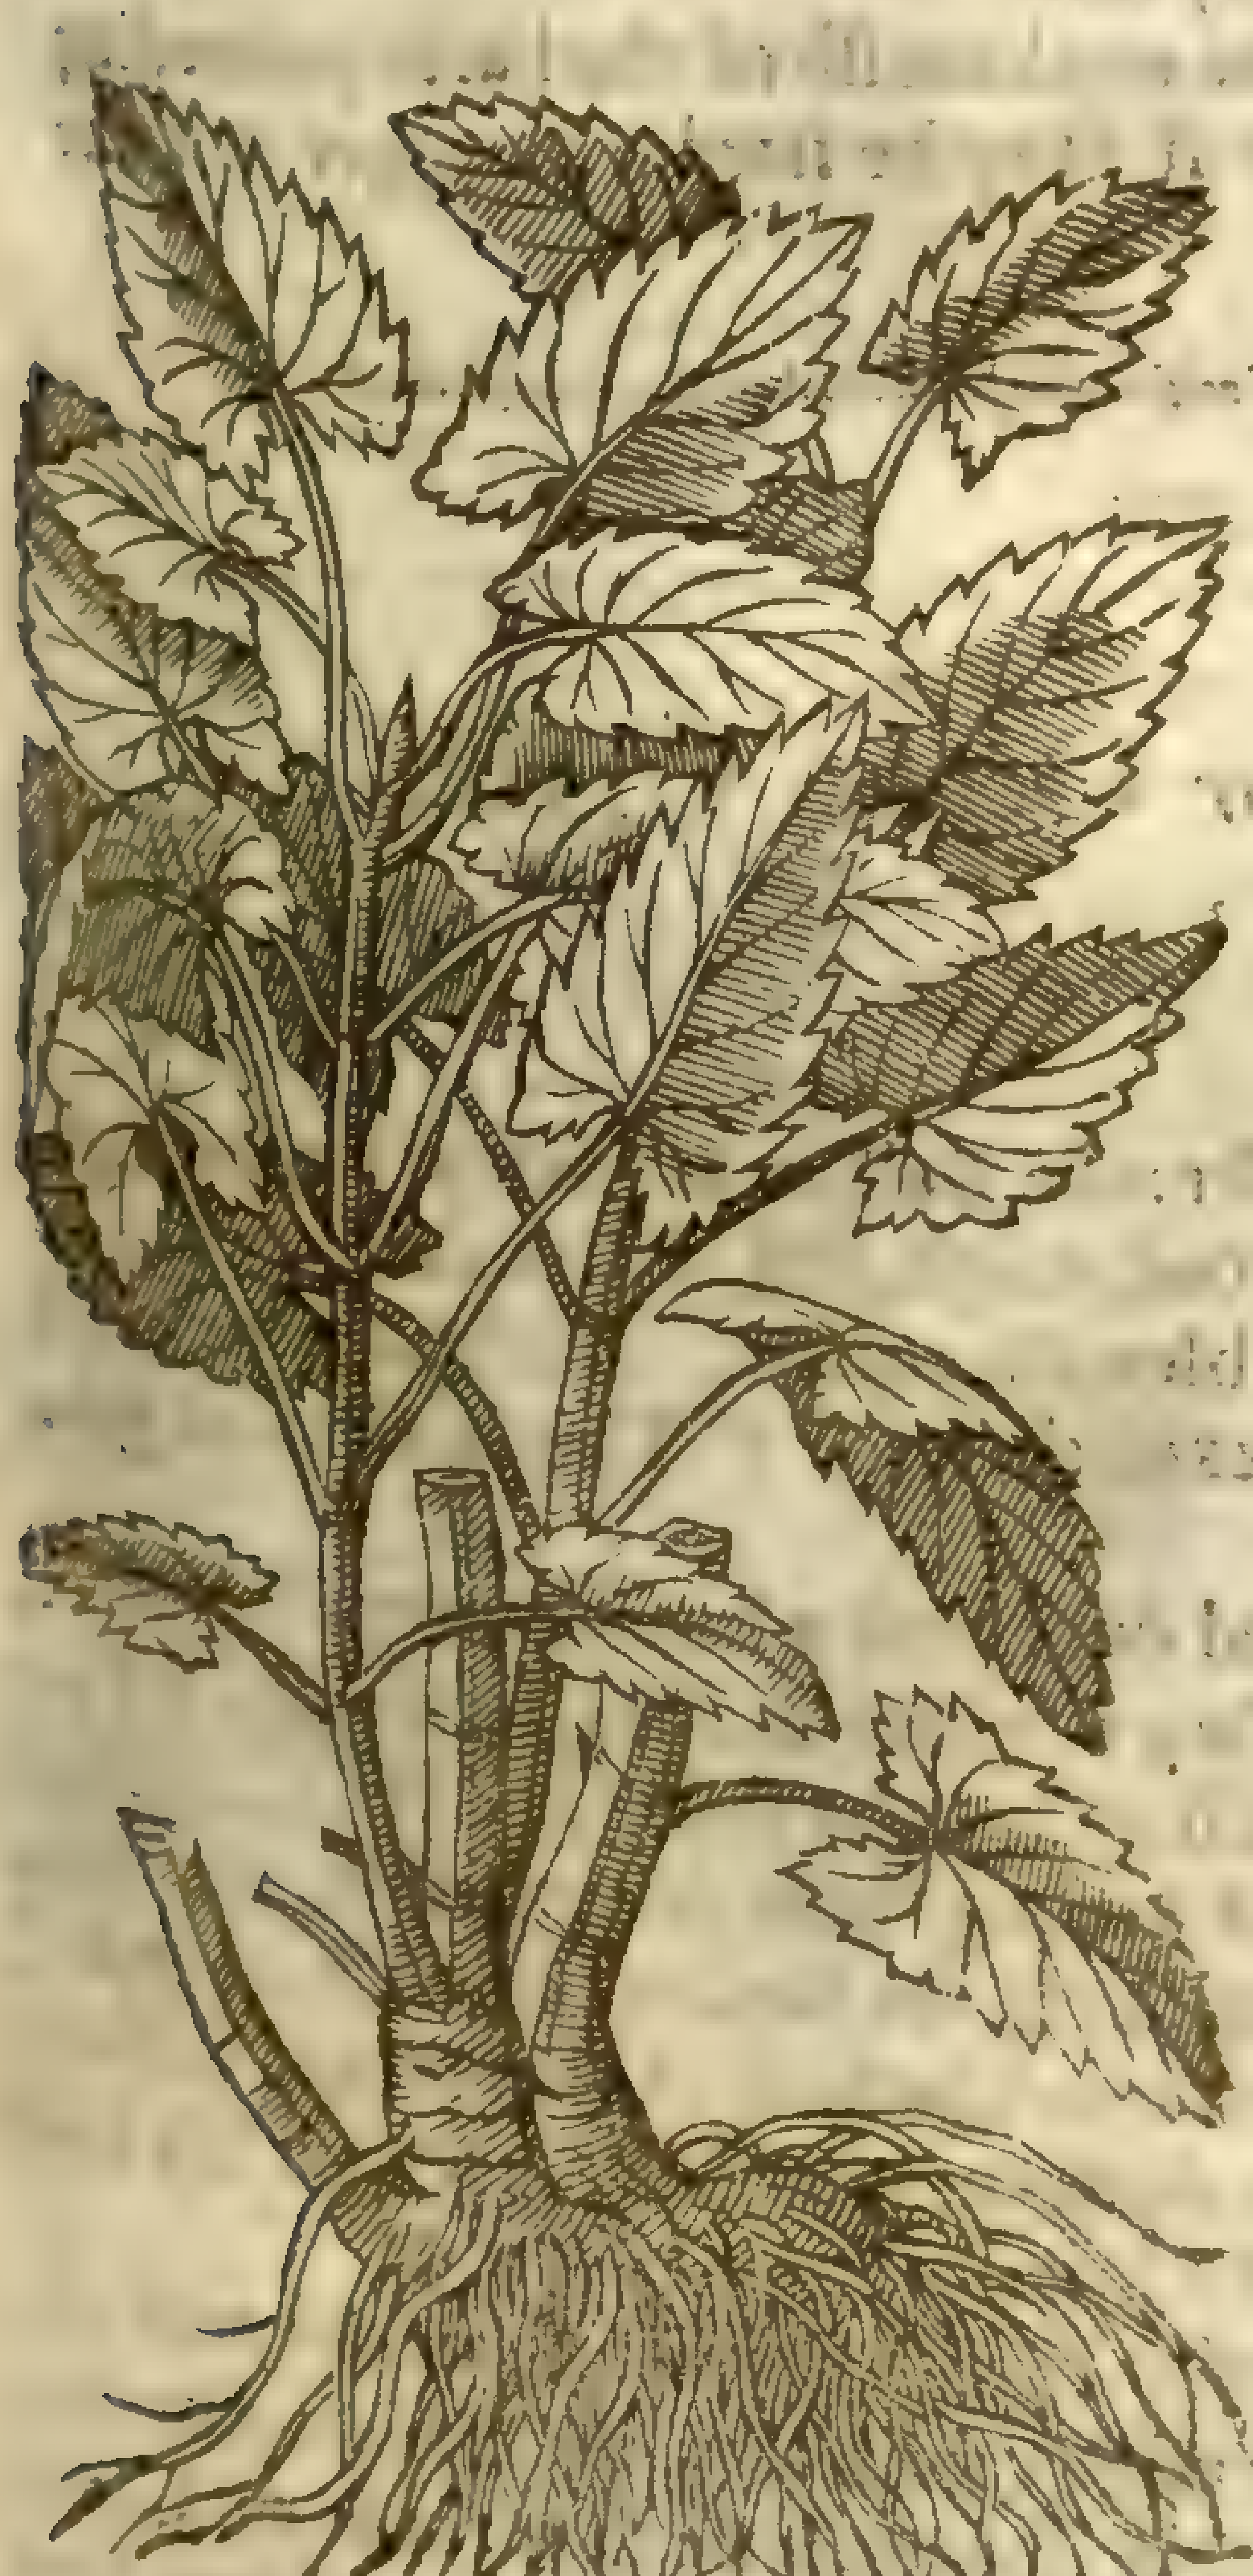
¶ *The Deſcription.*

1 THe firſt kinde of Clarie which is the right, bringeth forth thick ſtalks foure ſquare, two foot long, diuided into branches: it hath many leaues growing both from the roots, and along the ſtalkes and branches by diſtances, one againſt another by two and two, great, a handfull broad or broader, ſomewhat rough, vnequall, whitiſh and hairie, as be alſo the ſtalkes. The floures are like thoſe of Sage, or of dead Nettle, of colour white, out of a light blew: after which grow vp long toothed huskes in ſtead of cods, in which is blacke ſeed. The root is full of ſtrings: the whole herbe yeeldeth forth a rank and ſtrong ſmell that ſtuffeth the head: it periſheth after the ſeed is ripe, which is in the ſecond yeare after it is ſowne.

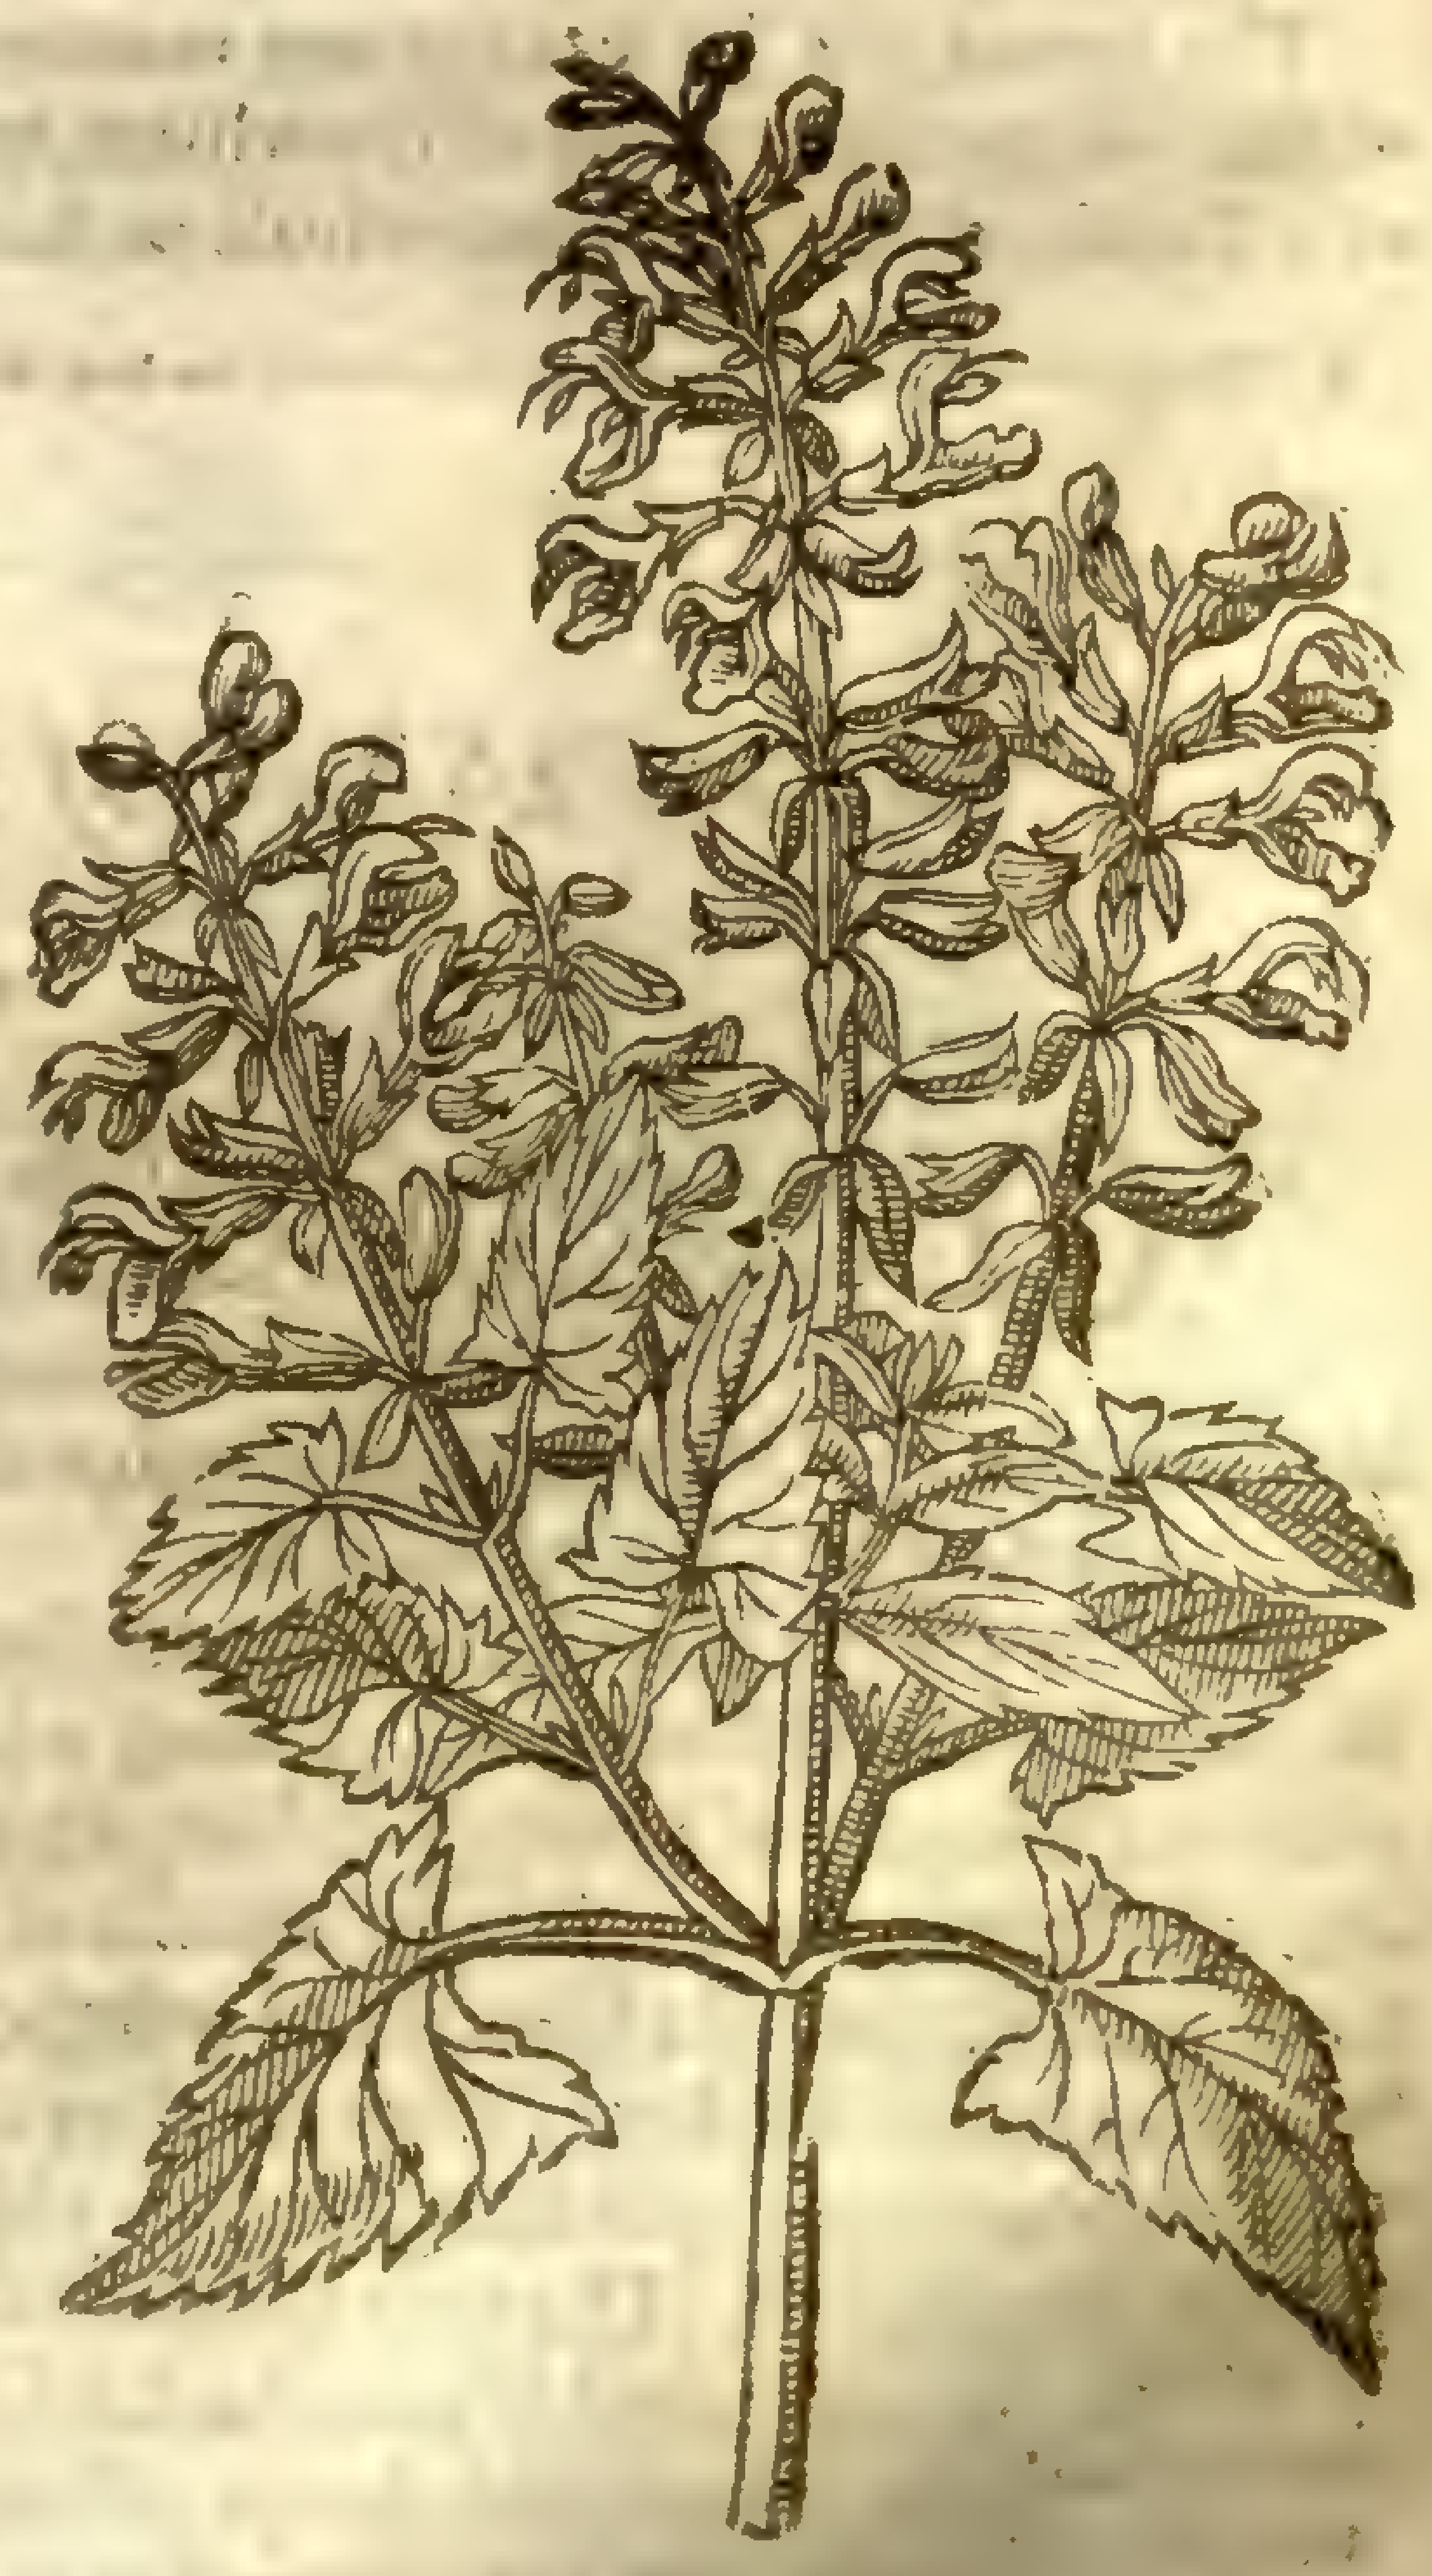
2 The ſecond kinde of Clarie hath likewiſe ſtalkes foure ſquare, a foot and a halfe high: the leaues alſo be rough and rugged, leſſer, and not ſo white. The floures be alike, of colour purple or blew: the roots bee as thoſe of the former are. This hath not ſo ſtrong a ſent by a great deale.

3 There is a kinde of Clarie, which *Fuchſius* pictureth for wilde Clarie, that hath ſhorter ſtalkes, hairie, and alſo foure ſquare: the leaues leſſer, long, deeper indented: the floures blew of colour, ſweet of ſmell, but not ſo ſweet as thoſe of

‡ 4 *Colus Iouis.* Iupiters Diſtaffe.



Salvia glutinosa, L. mihi deest. In hort. [illegible]?



the right Clarie : the husks or cods when they are ripe bend downewards : the ſeed is blackiſh ; the roots in like manner are blacke and full of ſtrings.

4 The fourth kind of *Horminum*, called *Iovis Colus*, repreſenteth in the higheſt top of the ſtalk a diſtaffe, wrapped about with yellow flax, whereof it tooke his name, hauing knobby roots, with certaine ſtrings annexed thereto like *Galeopſis*, or like vnto the roots of Clary, which do yeeld forth ſundry foure ſquare rough ſtalkes, two cubits high; whereon do grow leaues like thoſe of the Nettle, rough, ſharpe pointed, and of an ouerworne greene colour : the floures do grow alongſt the top of the ſtalkes, by certaine ſpaces, ſet round about in ſmall coronets, or wharles, like thoſe of Sage in forme, but of a yellow colour.

¶ *The Place.*

Theſe doe grow wilde in ſome places, notwithſtanding they are anured and planted in Gardens, almoſt euery where, except Iupiters diſtaffe, being a kinde thereof, which I haue in my Garden.

¶ *The Time.*

They floure in Iune, Iuly, and Auguſt.

¶ *The Names.*

Clarie is called of the Apothecaries, *Gallitricum* ; it is likewiſe named *Orvala*: of ſome, *Tota bona*, but not properly : of others, *Scarlea*, *Sclarea*, *Centrum Galli*, and *Matriſalvia* : in Italian, *Sciaria* : in French, *Orvale* : in High Dutch, **Scharlach** : in Low Dutch, **Scharleye** : in Engliſh, Clarie, or Cleere-eie.

Iupiters diſtaffe is called *Colus Iovis* : of ſome, *Galeopſis lutea*, but not properly : of diuers, *Horminum luteum*, or yellow Clarie, and *Horminum Tradentinum*, or Clarie of Trent.

¶ *The Temperature.*

Clarie is hot and dry in the third degree.

¶ *The Vertues.*

A The ſeed of Clarie poudered, finely ſearced and mixed with hony, taketh away the dimneſſe of the eies, and cleereth the ſight.

B The ſame ſtamped, infuſed, or laied to ſteepe in warme water, the muſſilag or ſlimie ſubſtance taken and applied plaiſterwiſe draweth ſplinters of wood, thornes, or any other thing fixed in the bodie : it alſo ſcattereth and diſſolueth all kindes of ſwellings, eſpecially in the joynts.

C The ſeed poudered and drunke with wine, ſtirreth vp bodily luſt.

D The leaues of Clarie taken any manner of way, helpeth the weakeneſſe of the backe proceeding of the ouermuch flowing of the whites, but moſt effectually if they be fried with egges in maner of a Tanſie, either the leaues whole or ſtamped.

† The figure which formerly was vnder the title of *Colus Iovis*, was of the *Horminum ſylueſtre* of *Fuchſius*, which is deſcribed immediatly before it.

Chap. 268. *Of wilde Clarie, or* Oculus Chriſti.

¶ *The Deſcription.*

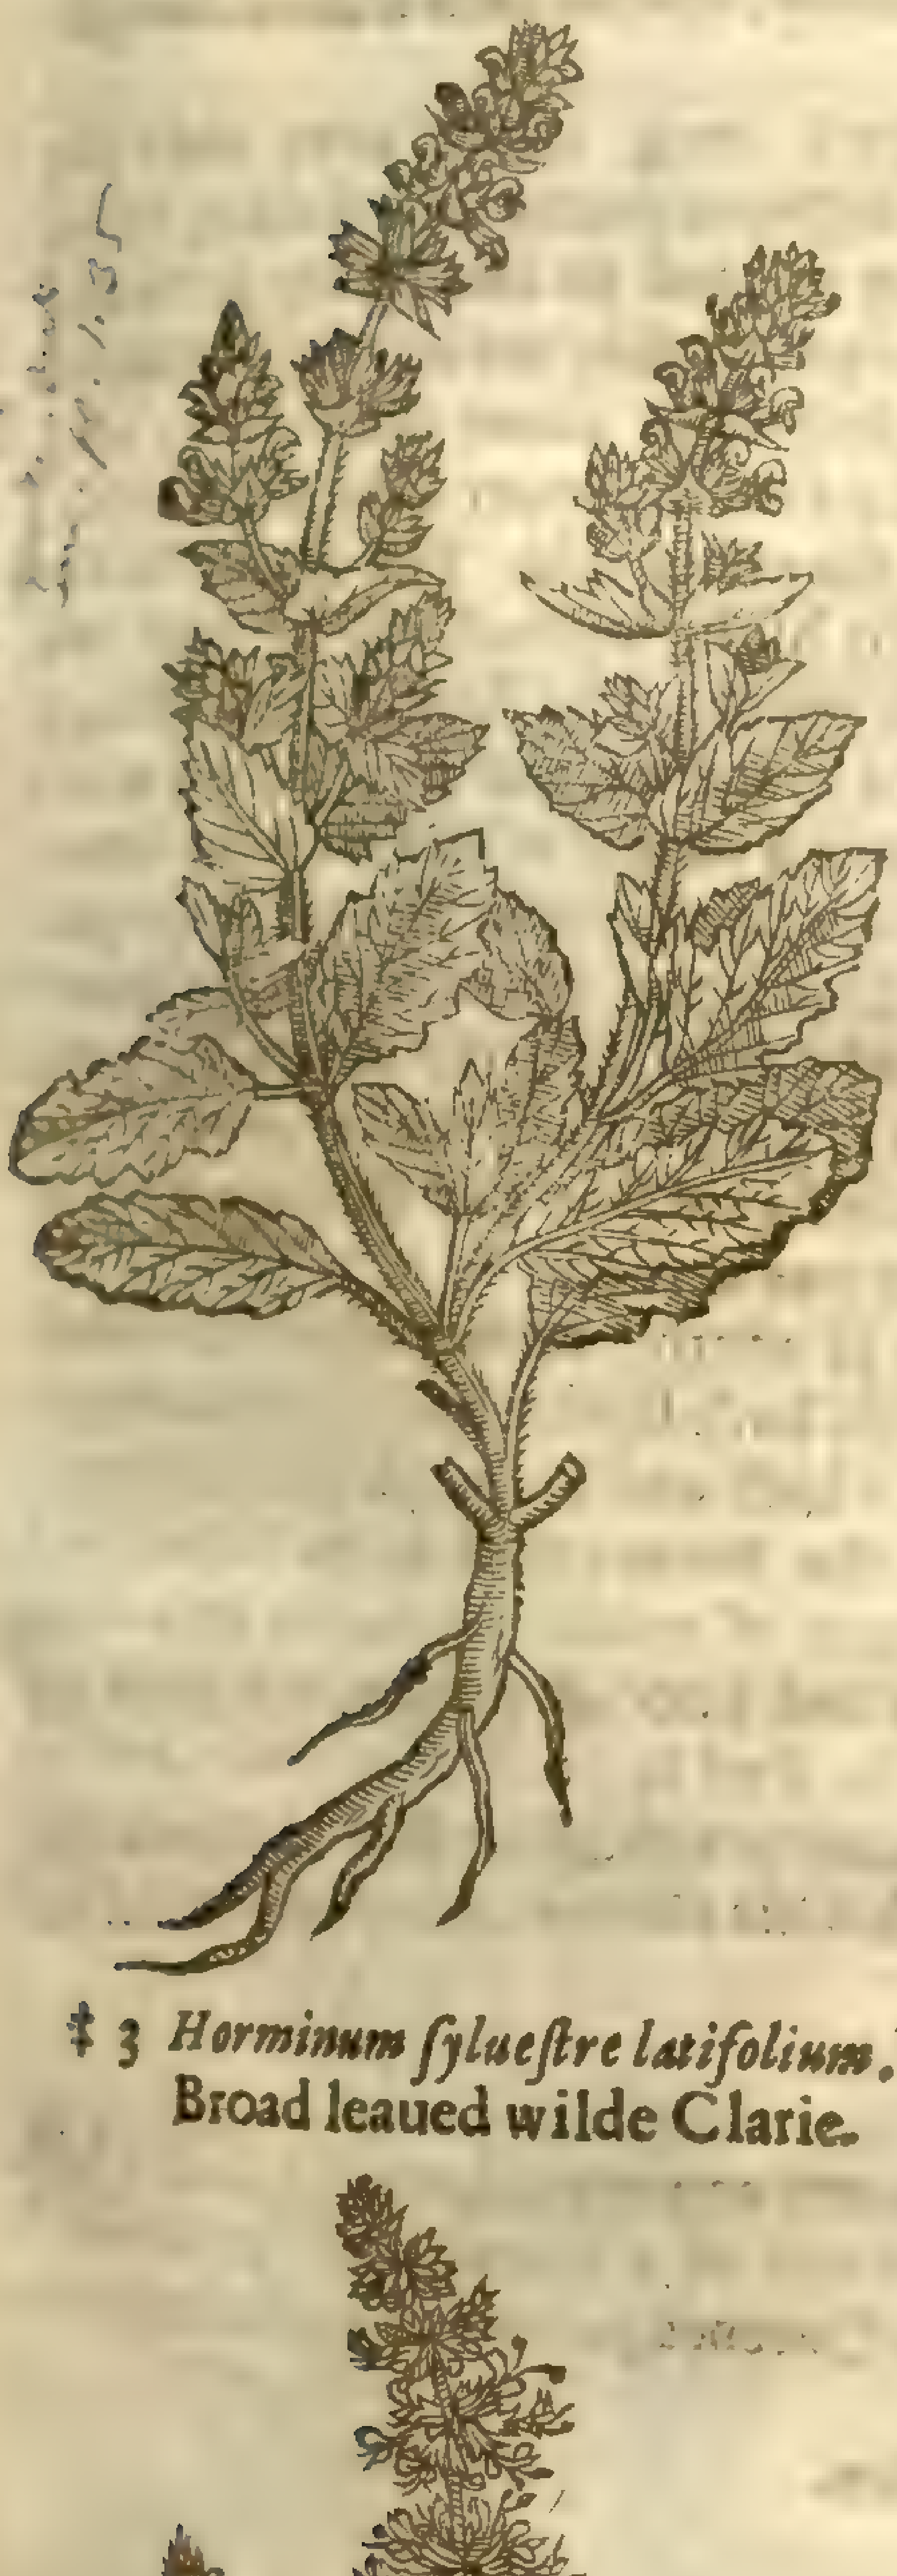
1 O*Cnlus Chriſti* is alſo a kinde of Clarie, but leſſer : the ſtalkes are many, a cubit high, ſquared and ſomewhat hairie : the leaues be broad, rough, and of a blackiſh greene colour. The floures grow alongſt the ſtalkes, of a blewiſh colour. The ſeed is round and blackiſh, the root is thicke and tough, with ſome threds annexed thereto. ‡ This is *Hormini ſylveſtris 4. quinta ſpecies* of *Cluſius*. ‡

2 The purple Clarie hath leaues ſomewhat round, layed ouer with a hoary cottony ſubſtance, not much vnlike Horehound : among which riſe vp ſmall hairy ſquare ſtalkes, ſet toward the top with little leaues of a purple colour, which appeare at the firſt view to be flours, and yet are nothing elſe but leaues, turned into an excellent purple colour : and among theſe beautifull leaues come forth ſmal floures of a blewiſh or watched colour, in faſhion like to the floures of Roſemarie; which being withered, the husks wherein they do grow containe certaine blacke ſeed, that falleth forth vpon the ground very quickely, becauſe that euery ſuch huske doth turne and hang downe his head toward the ground. The root dieth at the firſt approch of Winter.

‡ 3 Broad leaued Clarie hath a ſquare ſtalke ſome cubit high, hairy, firme, and joynted ; the leaues are large, rough, and ſharpe pointed, ſnipt about the edges, wrinkled, and ſtanding by couples at each joynt : vpon the branches in roundles grow purple floures, leſſe than thoſe of Clarie, and ſcarce any bigger than thoſe of Lauander : the ſeed is ſmall and blacke : the root is large, hard, blacke,

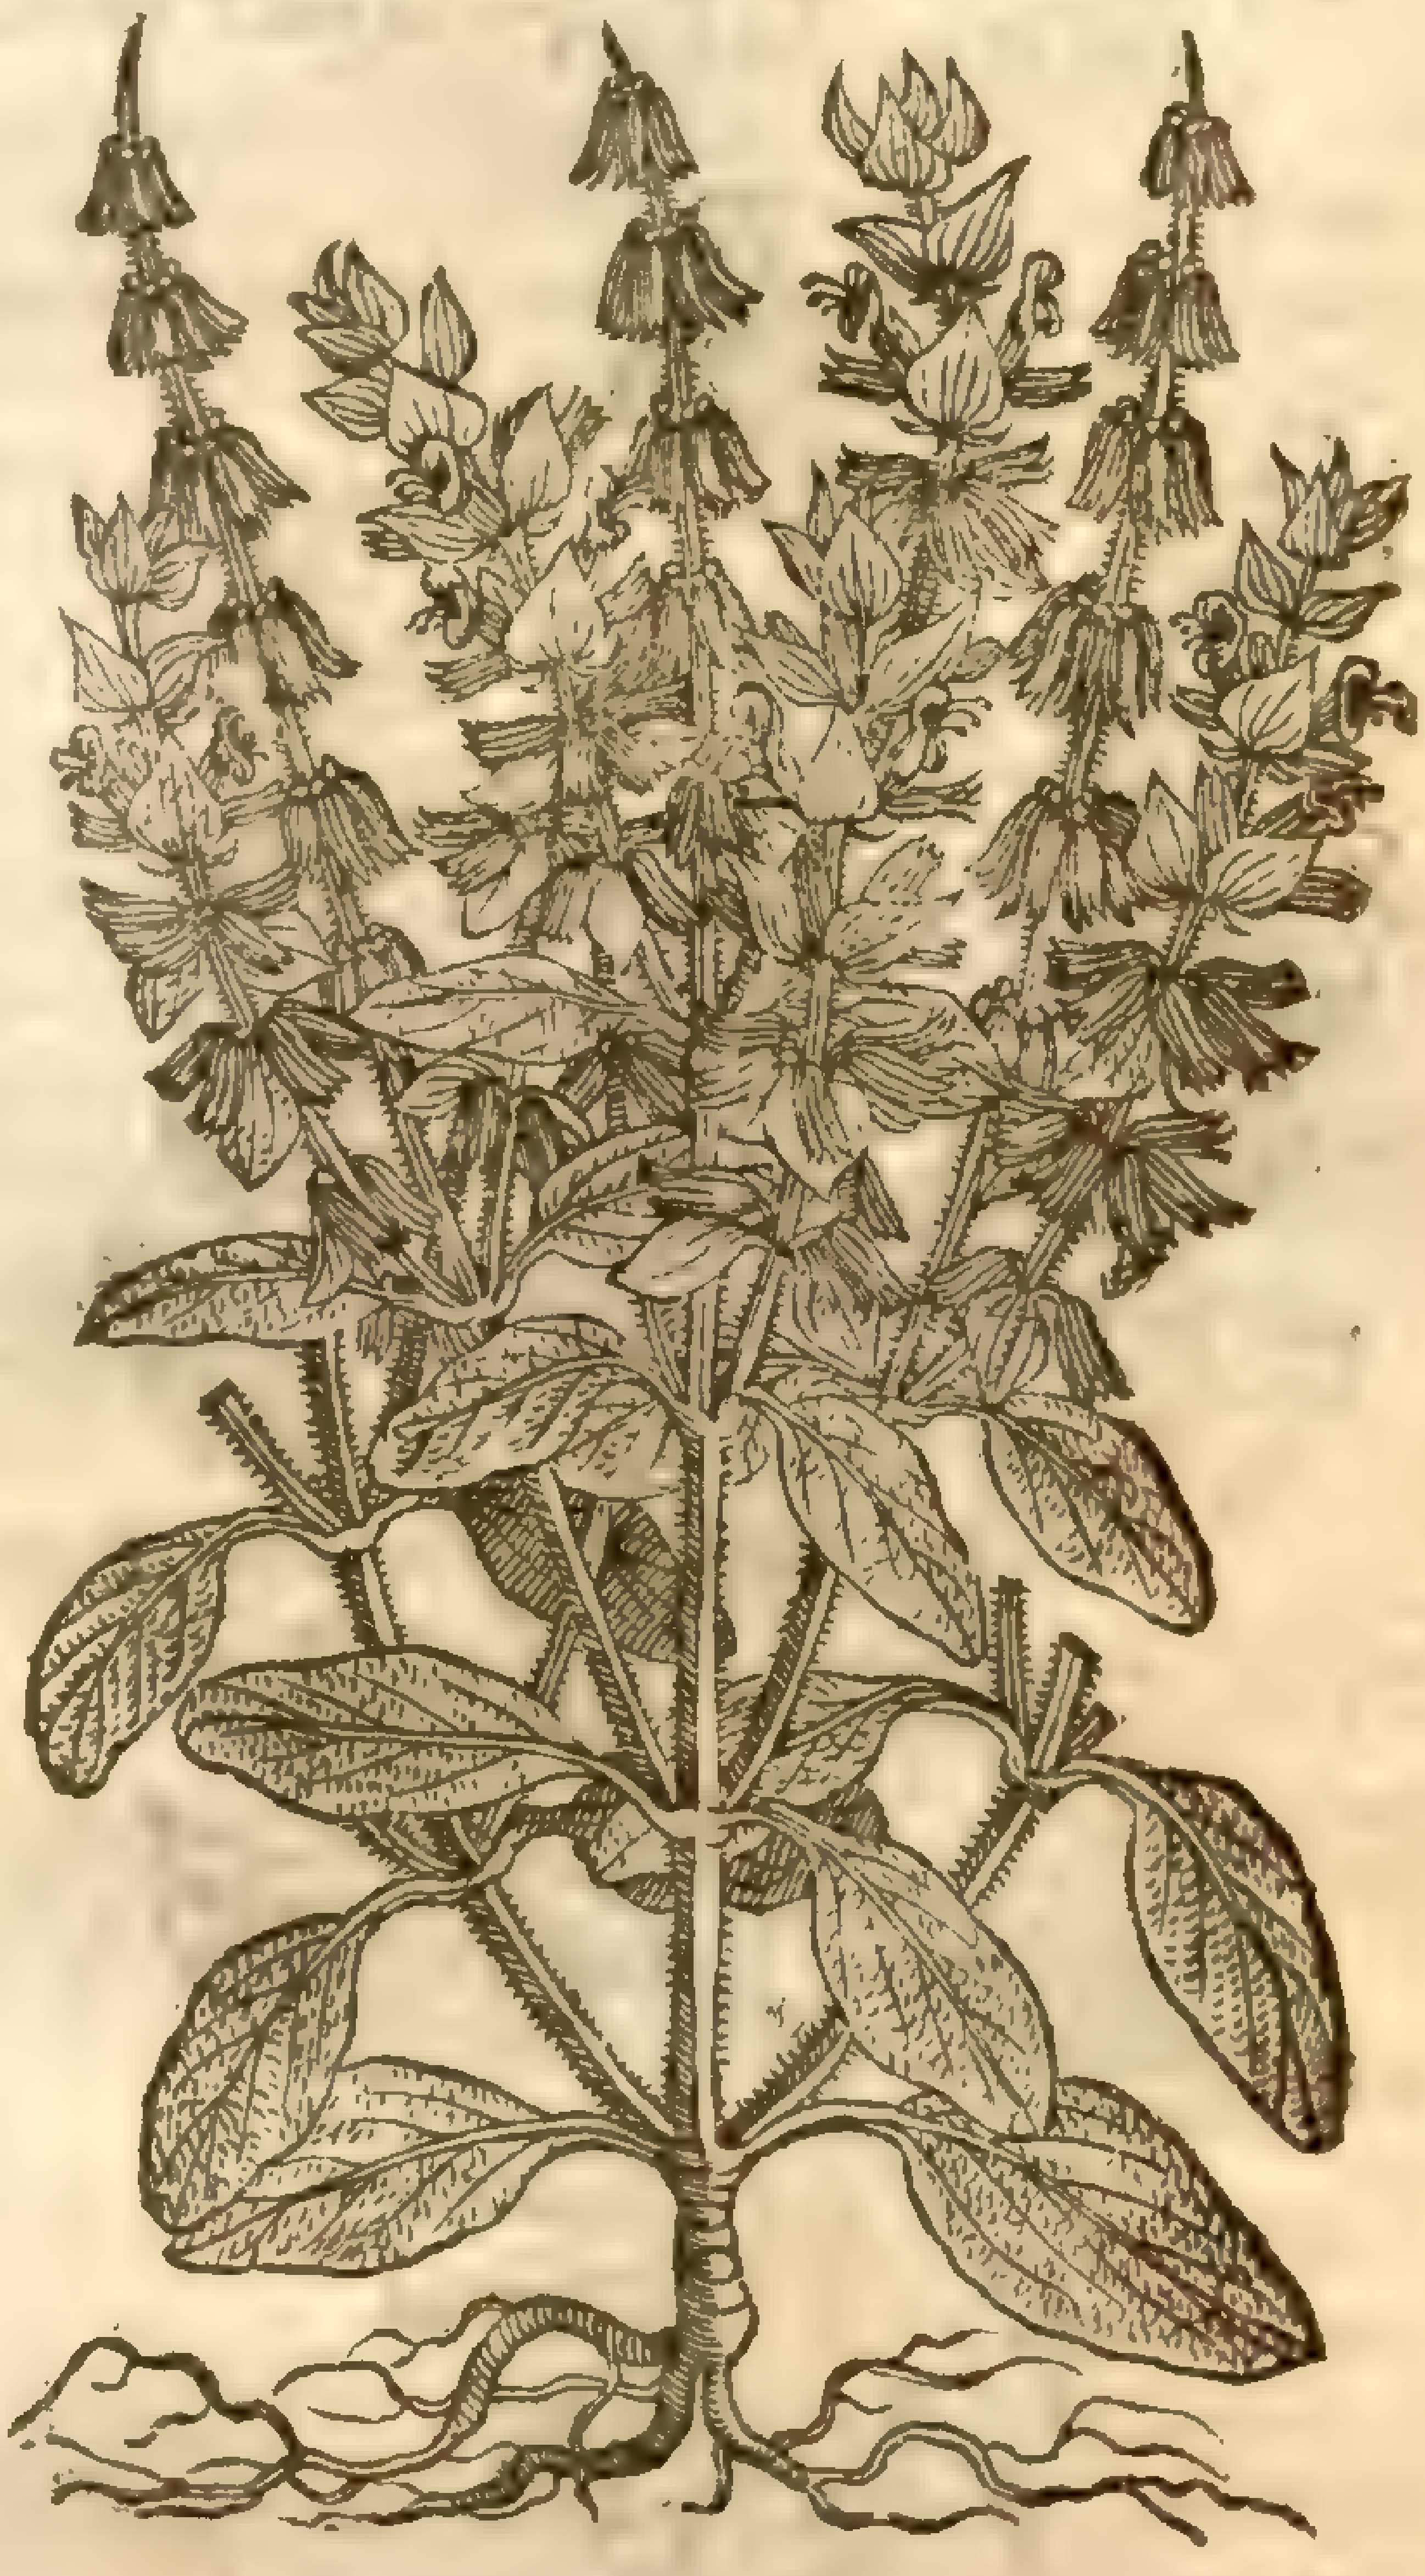
† 1 *Horminum ſylueſtre.*
Wilde Clarie, or *Oculus Chriſti.*

[illegible] p. 135

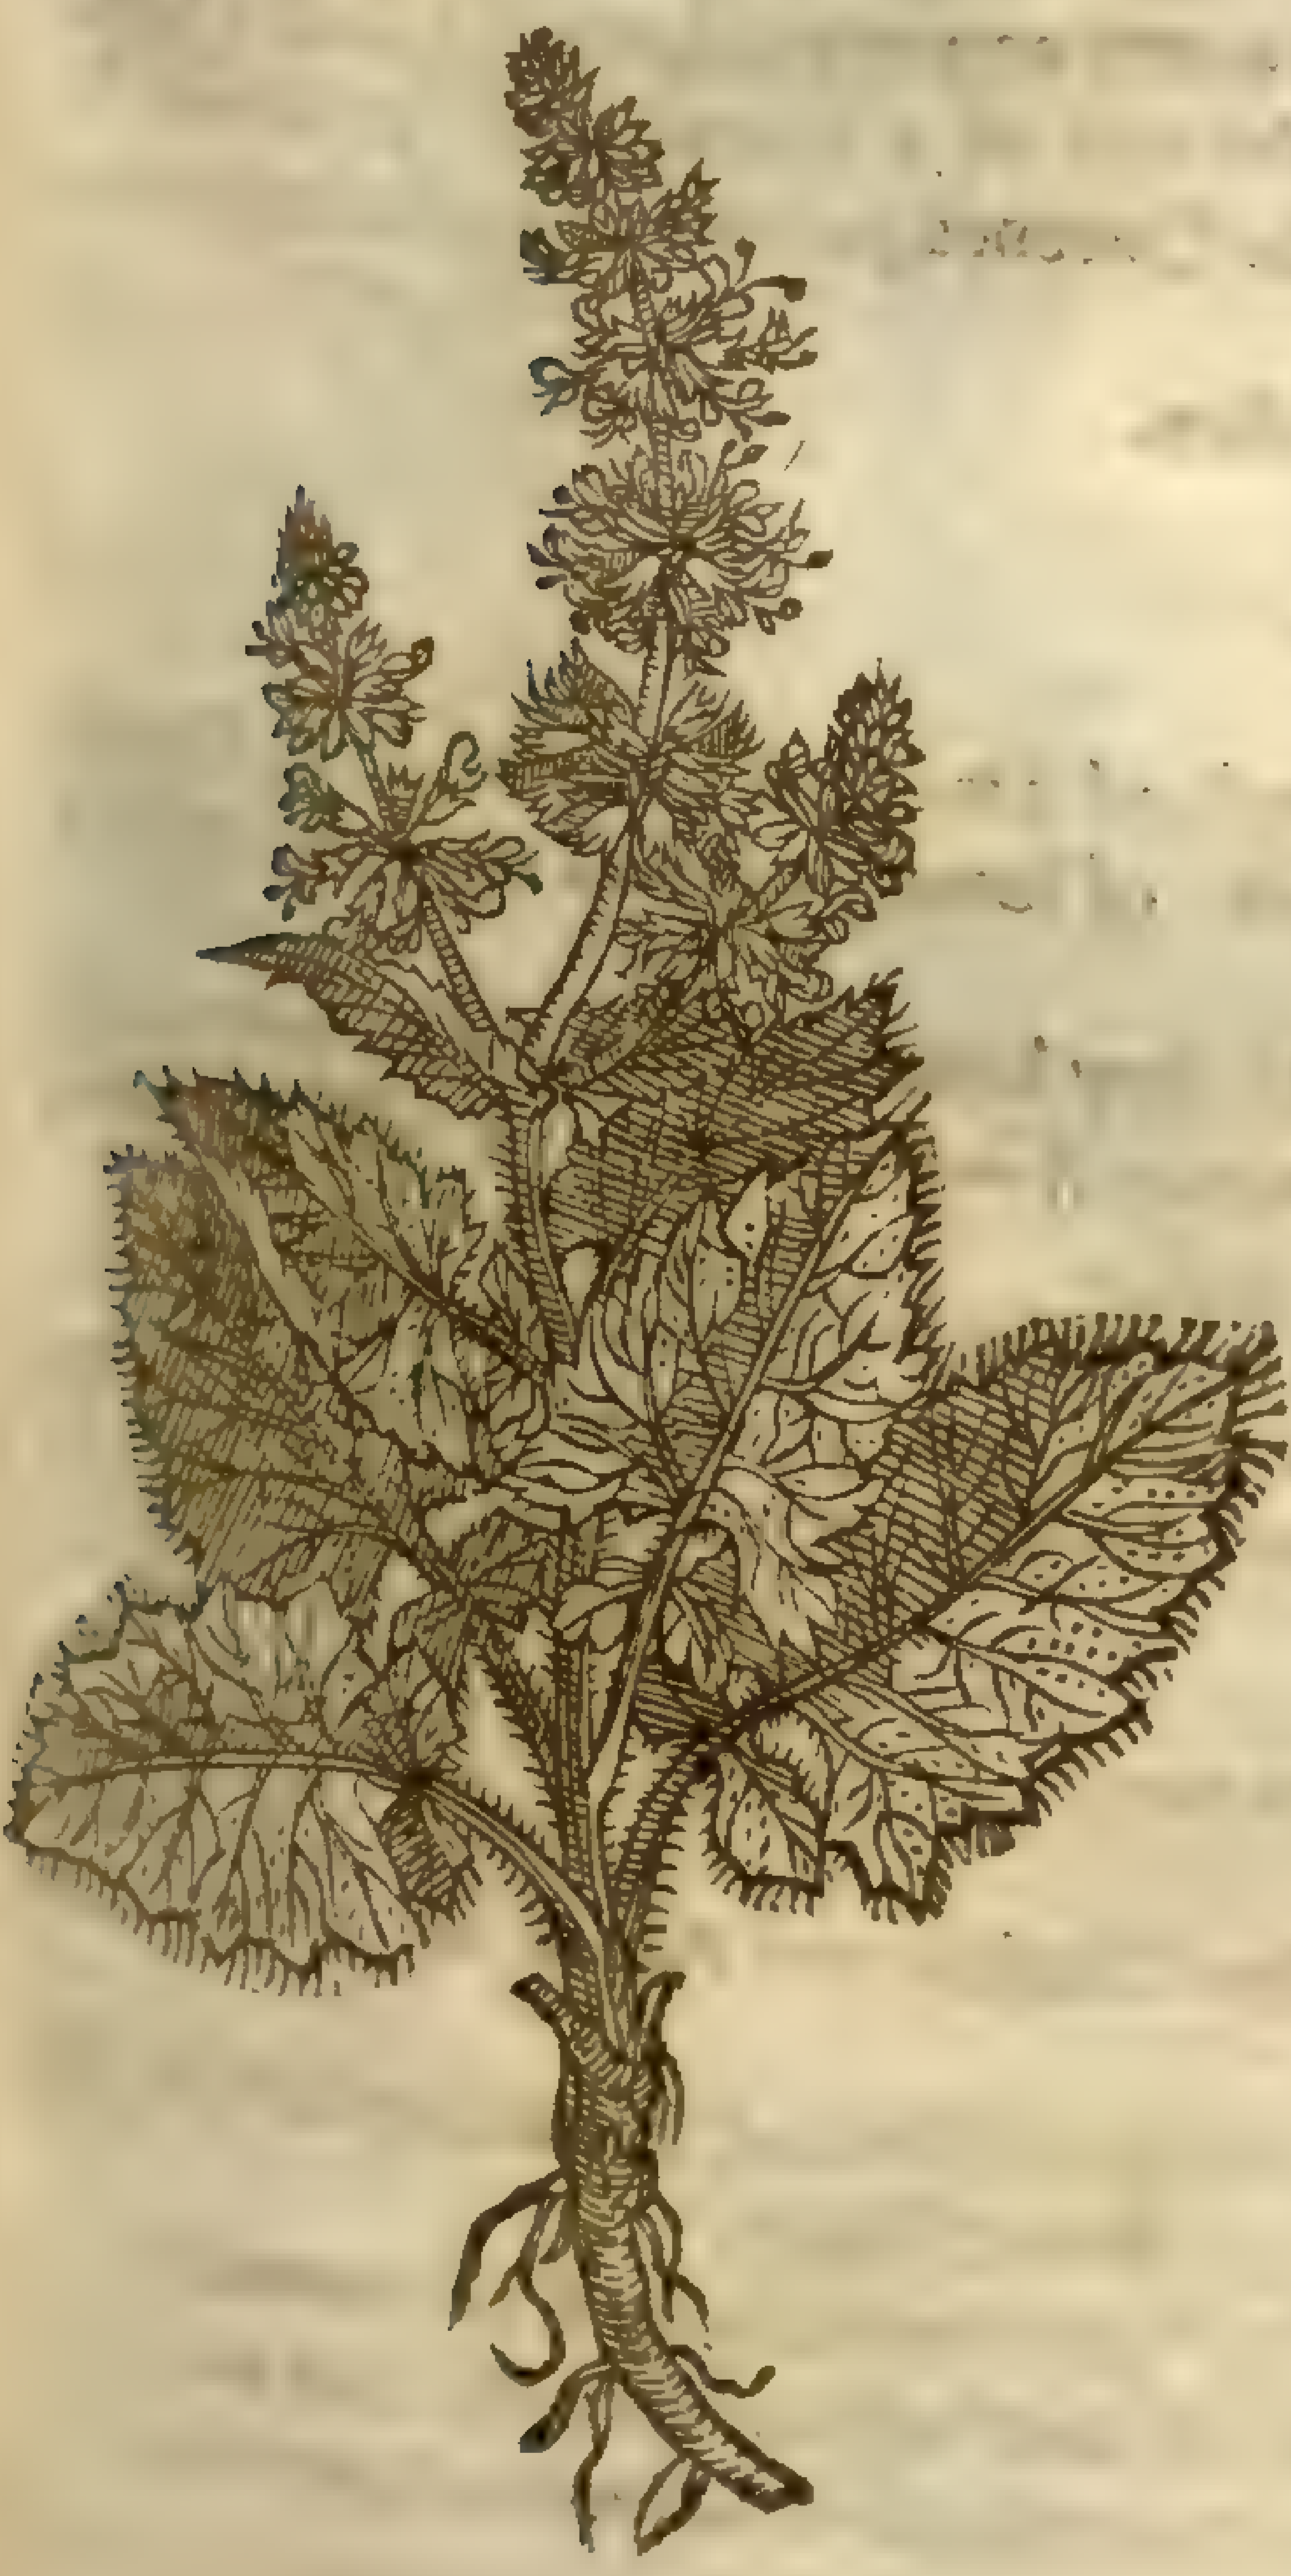


2 *Horminum ſylueſtre folijs purpureis.*
Clarie with purple leaues.

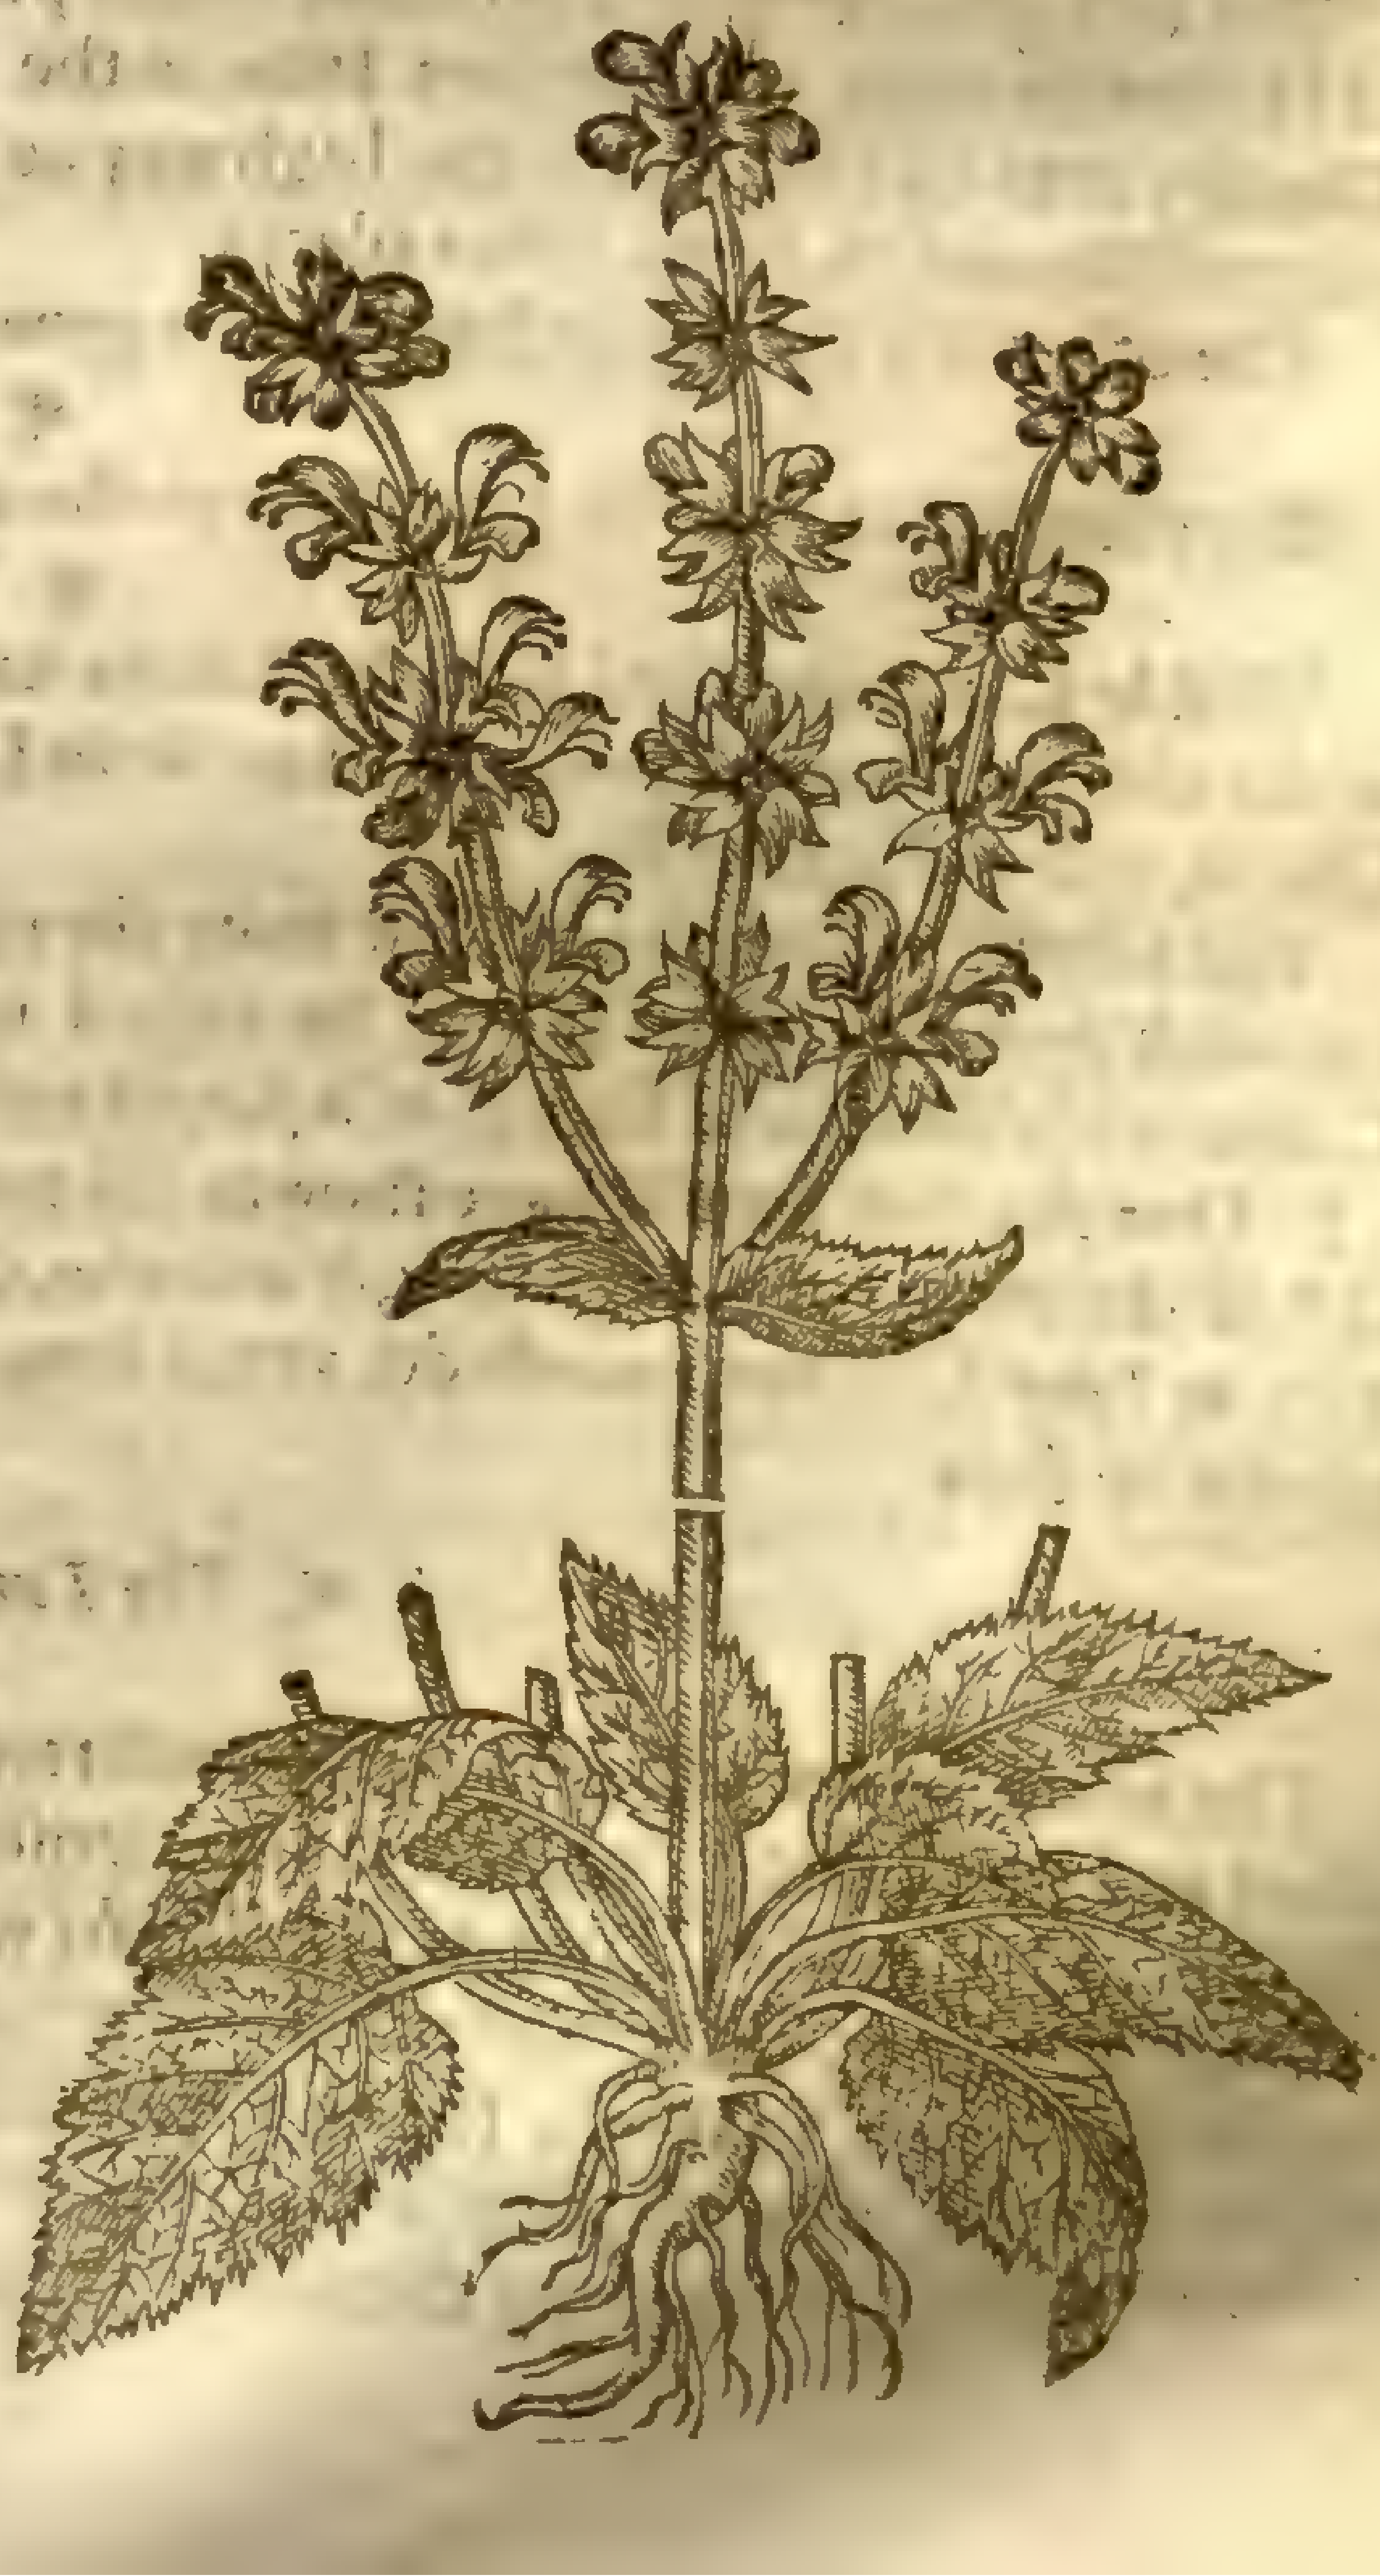
Salvia purpurea [illegible]



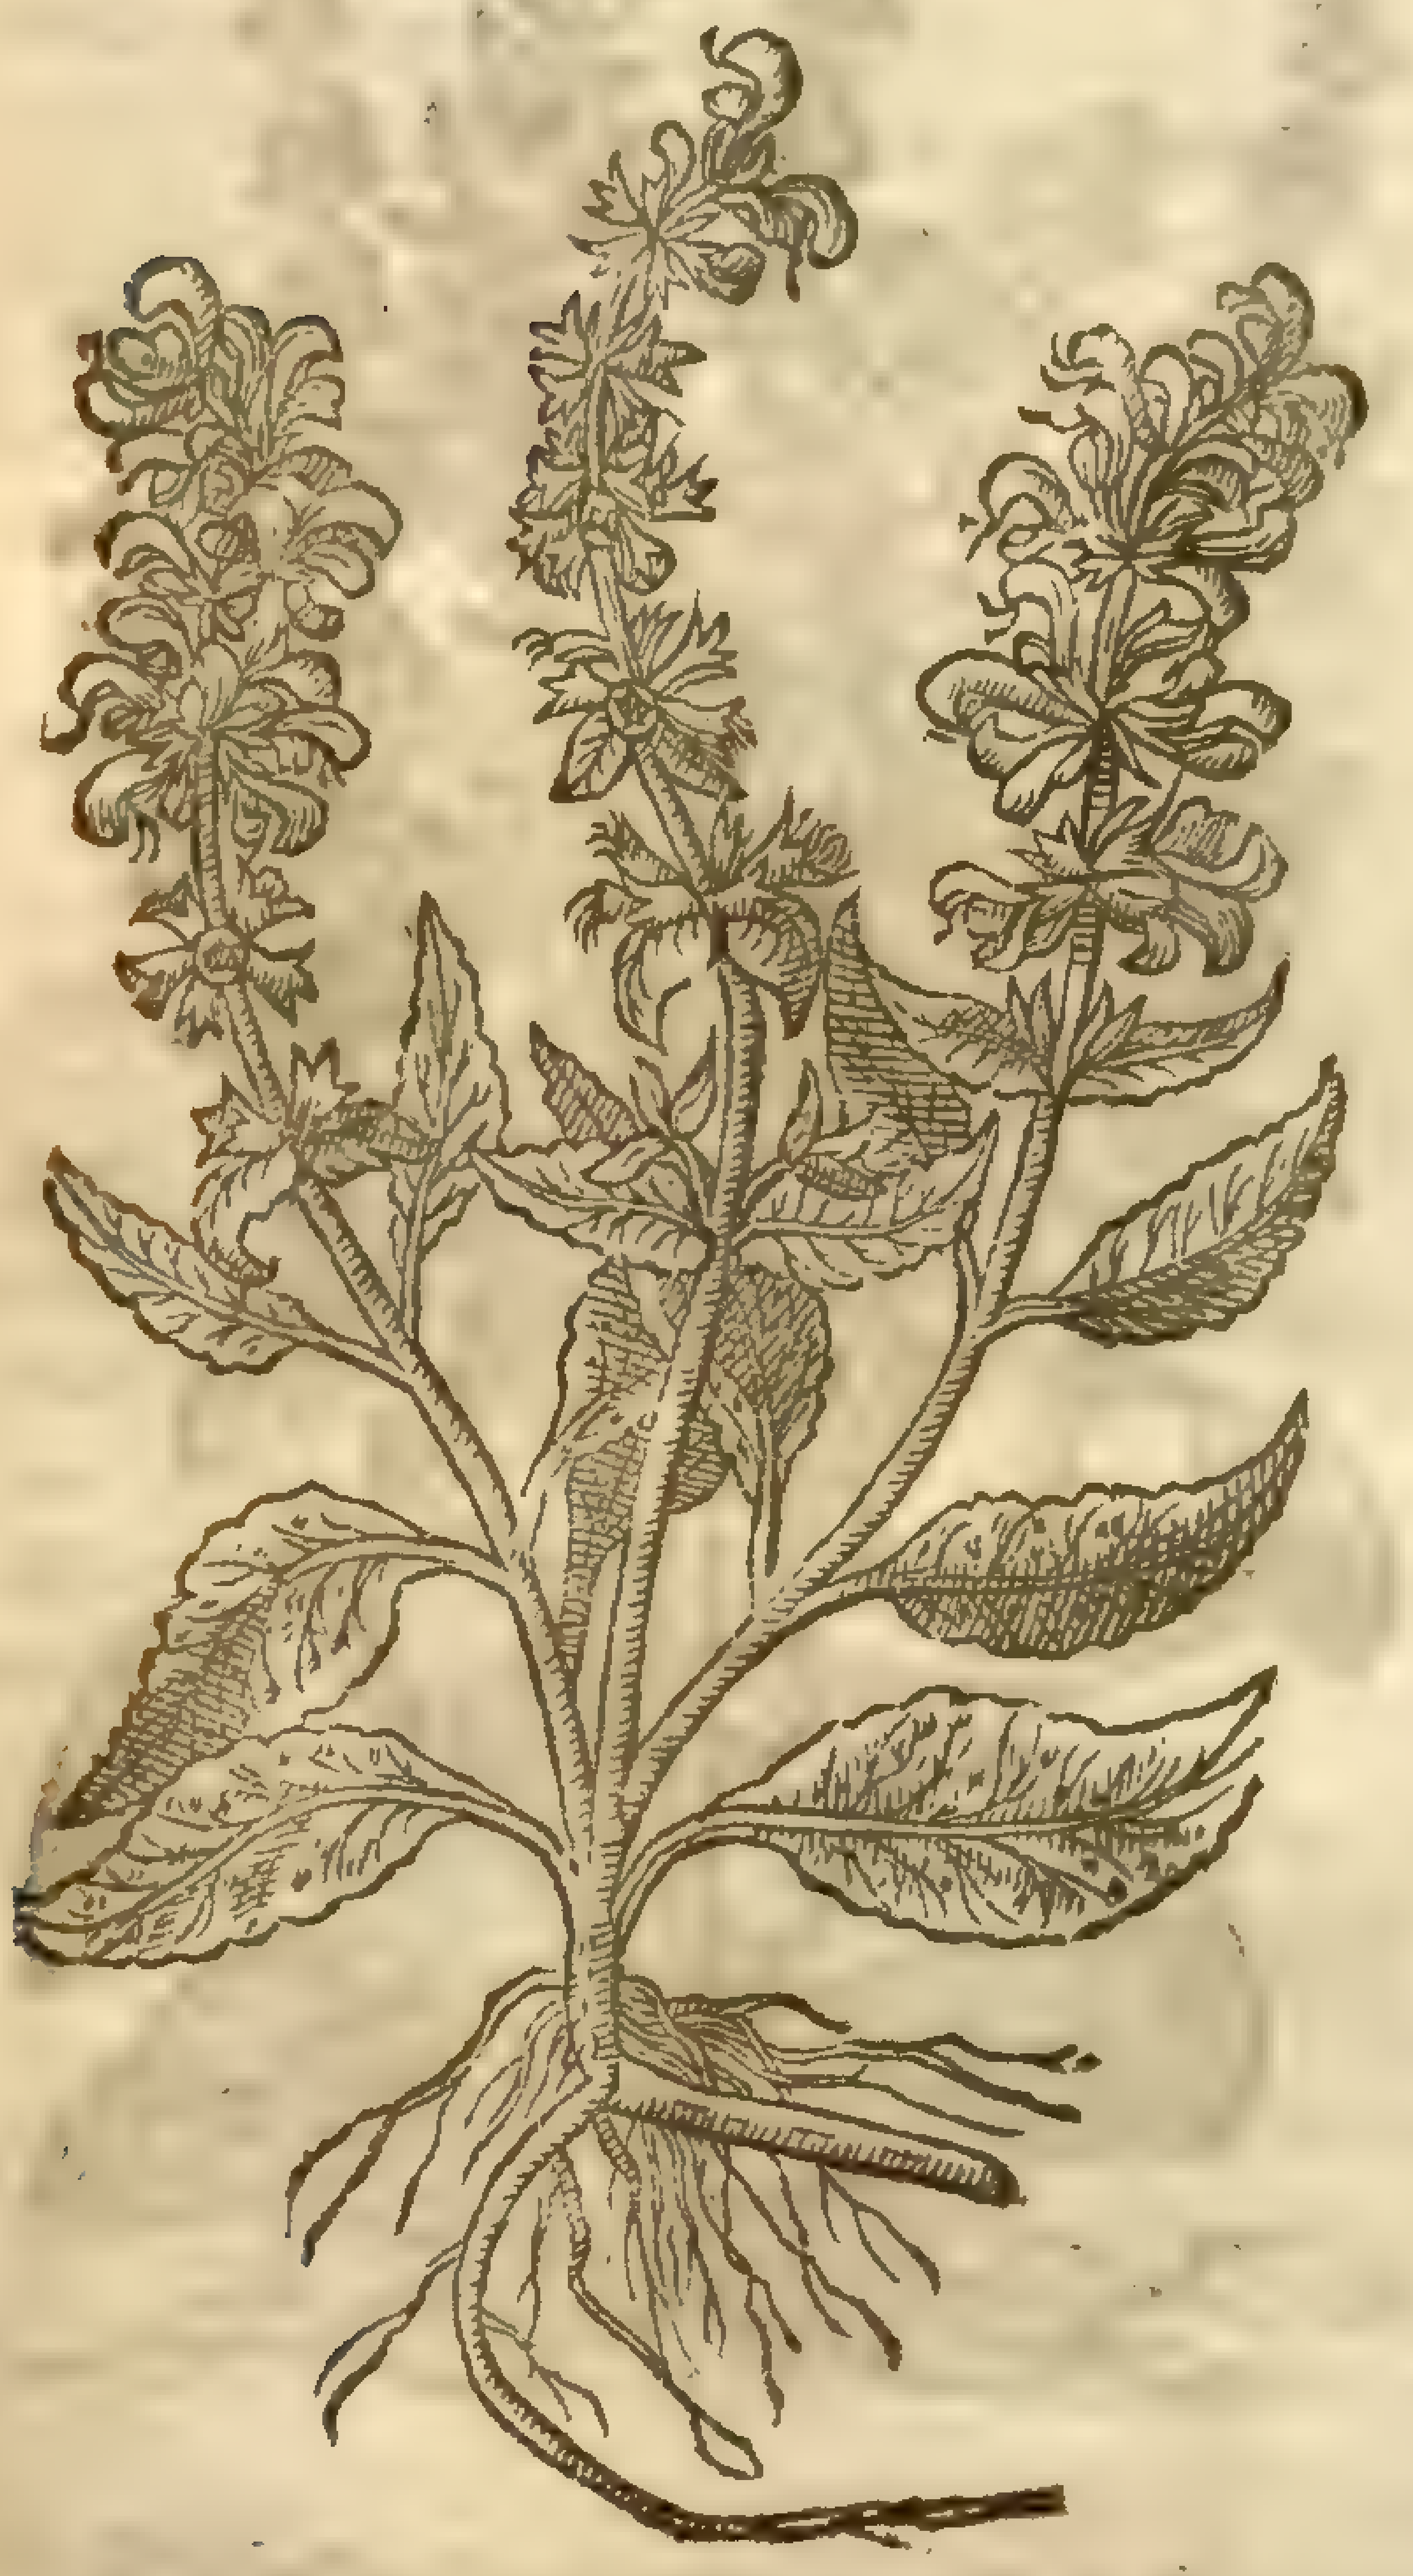
‡ 3 *Horminum ſylueſtre latifolium.*
Broad leaued wilde Clarie.



‡ 4 *Horminum ſylueſtre flore albo.*
White floured wilde Clarie.



‡ 5 *Horminum ſylueſtre flore rubro.*
Red floured wilde Clarie.



blacke, and liues many yeares. It floures in Iune and Iuly, and growes wilde in many mountainous places of Germany. *Cluſius* calls it *Horminum ſylueſtre tertium*.

4 This hath long leaues next vnto the ground, growing vpon pretty long ſtalkes, broad at their ſetting on, and ſo ending by little and little in ſharpe points, they are not deeply cut in, but onely lightly ſnipt about the edges: they are alſo wrinkled on the vpper ſide, and whitiſh, but hairie on the vnder ſide. The ſquare ſtalkes are ſome cubit high, joynted, and ſet with two leaues at each joynt. The floures grow alongſt the tops of the branches, and are of a ſnow white colour. There is a variety of this with the leaues greener, and the floures of an elegant deepe purple colour. This is the *Hormini ſylueſtris quarti ſpecies prima* of *Cluſius*, and the variety with the white floures is his *Hormini ſylueſtris quarti ſpecies prima*: and the figure that our Authour gaue in the firſt place was of theſe.

5 There is another variety of the laſt deſcribed, which alſo hath ſquare ſtalks ſet with rough ſnipt leaues, which end in ſharpe points, but are narrower at the lower end than the former, and they are greene of colour: vpon the tops of the ſtalkes grow red hooded floures, and thoſe not very large: the ſeed is ſmall and blacke, and the root liues many yeares. This floures in Iuly. *Cluſius* makes this his *Hormini ſylueſtris quarti ſpecies quarta*. ‡

¶ *The Place.*

The firſt groweth wilde in diuers barren places, almoſt in euery country, eſpecially in the fields of Holborne neere vnto Grayes Inne, in the high way by the end of a bricke wall: at the end of Chelſey next to London, in the high way as you go from the Queenes pallace of Richmond to the waters ſide, and in diuers other places.

The other is a ſtanger in England: it groweth in my Garden.

¶ *The Time.*

They floure and flouriſh from Iune to the end of Auguſt.

¶ *The Names.*

Wilde Clarie is called after the Latine name *Oculus Chriſti*, of his effect in helping the diſeaſes of the eies: in Greeke, ὅρμινον: and likewiſe in Latine, *Horminum*: of ſome, *Geminalis*: in Engliſh, wild Clarie, and *Oculus Chriſti*.

The ſecond is thought of ſome to be the right Clarie, and they haue called it *Horminum verum*, but with greater errour: it may be called in Latine *Horminum ſylueſtre folijs & floribus purpureis*, Clarie with leaues and floures of a purple colour.

‡ Our Author ſhould haue ſhowne his reaſons why this is not the *Horminum verum*, to haue conuicted the errour of *Anguillara*, *Matthiolus*, *Geſner*, *Dodonæus* *Lobel*, and others, who haue accounted it ſo, as I my ſelfe muſt needs do, vntill ſome reaſon be ſhewed to the contrary, the which I thinke cannot be done.

¶ *The Temperature and Vertues.*

A The temperature and faculties are referred vnto the garden Claries: yet *Paulus Ægineta* ſaith it is hot and moderately dry, and it alſo clenſeth.

B The ſeed of wilde Clarie, as *Dioſcorides* writeth, being drunke with wine, ſtirreth vp luſt, it clenſeth the eies from filmes and other imperfections, being mixed with hony.

C The ſeed put whole into the eies, clenſeth and purgeth them exceedingly from wateriſh humors, redneſſe, inflammation, and diuers other maladies, or all that happen vnto the eies, and takes away the paine and ſmarting thereof, eſpecially being put into the eies one ſeed at one time, and no more,which is a generall medicine in Cheſhire and other countries thereabout, knowne of all, and vſed with good ſucceſſe.

The leaues are good to be put into pottage or broths among other pot-herbes, for they ſcatter congealed bloud,warme the ſtomacke,and help the dimneſſe of the eies.

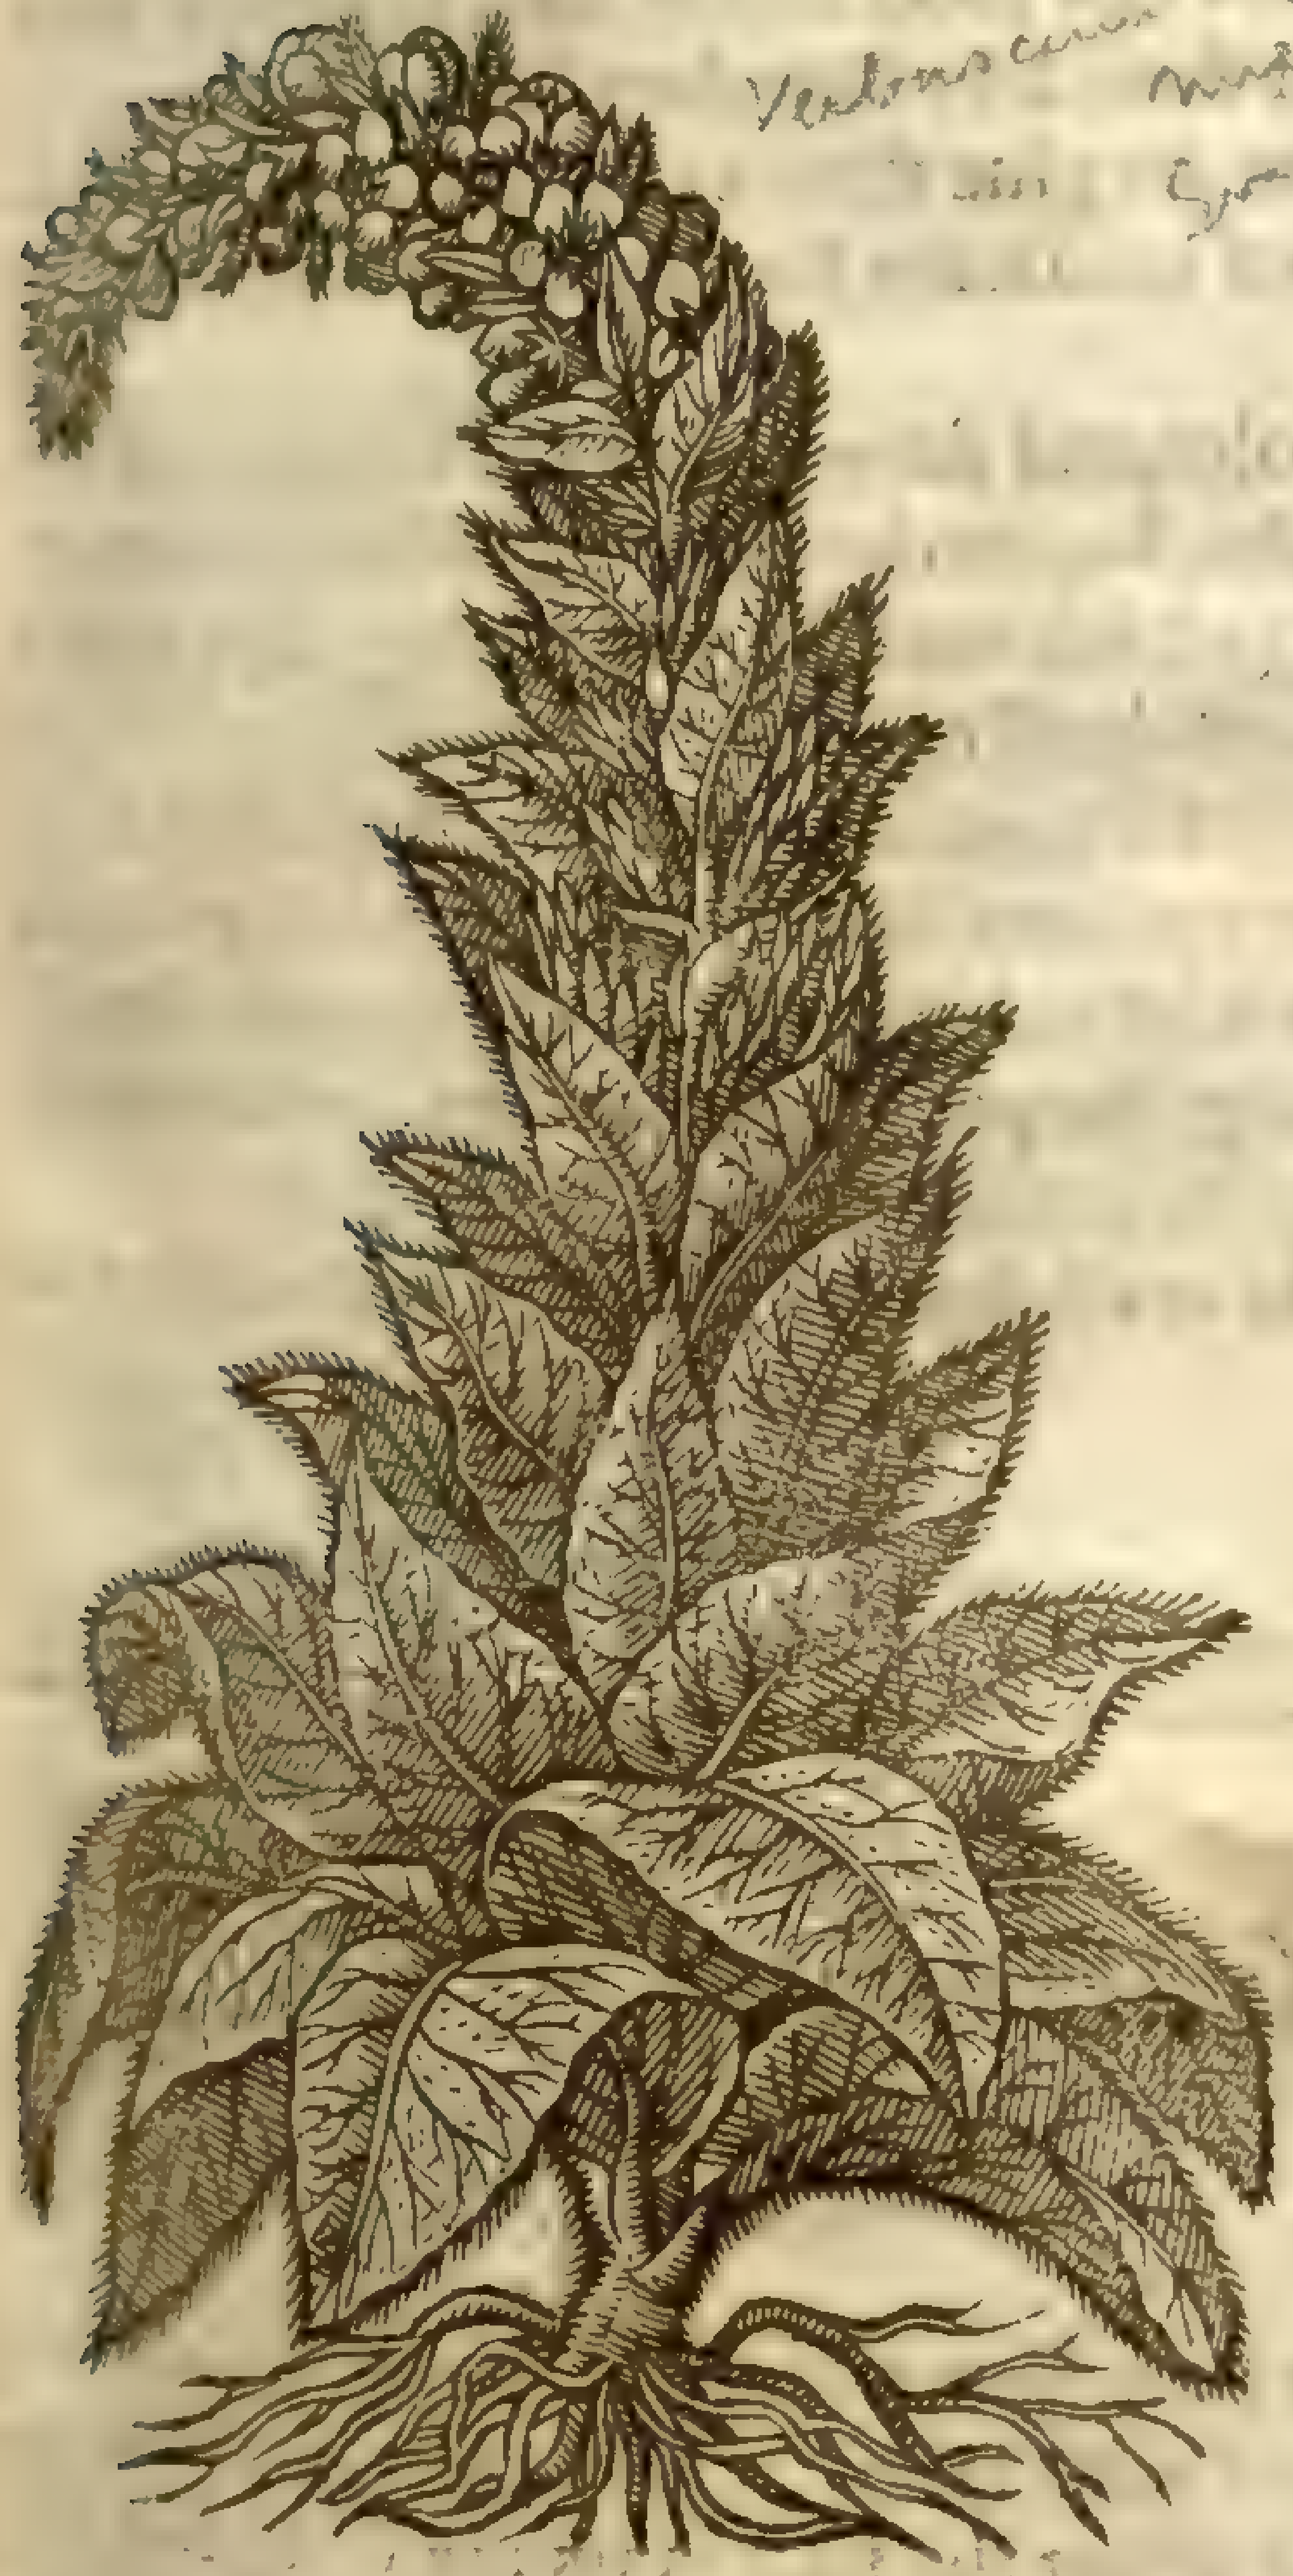
‡ The figure that formerly was in the firſt place,was of that which you may here finde figured and deſcribed in the fourth place.

CHAP. 269. Of Mullein.

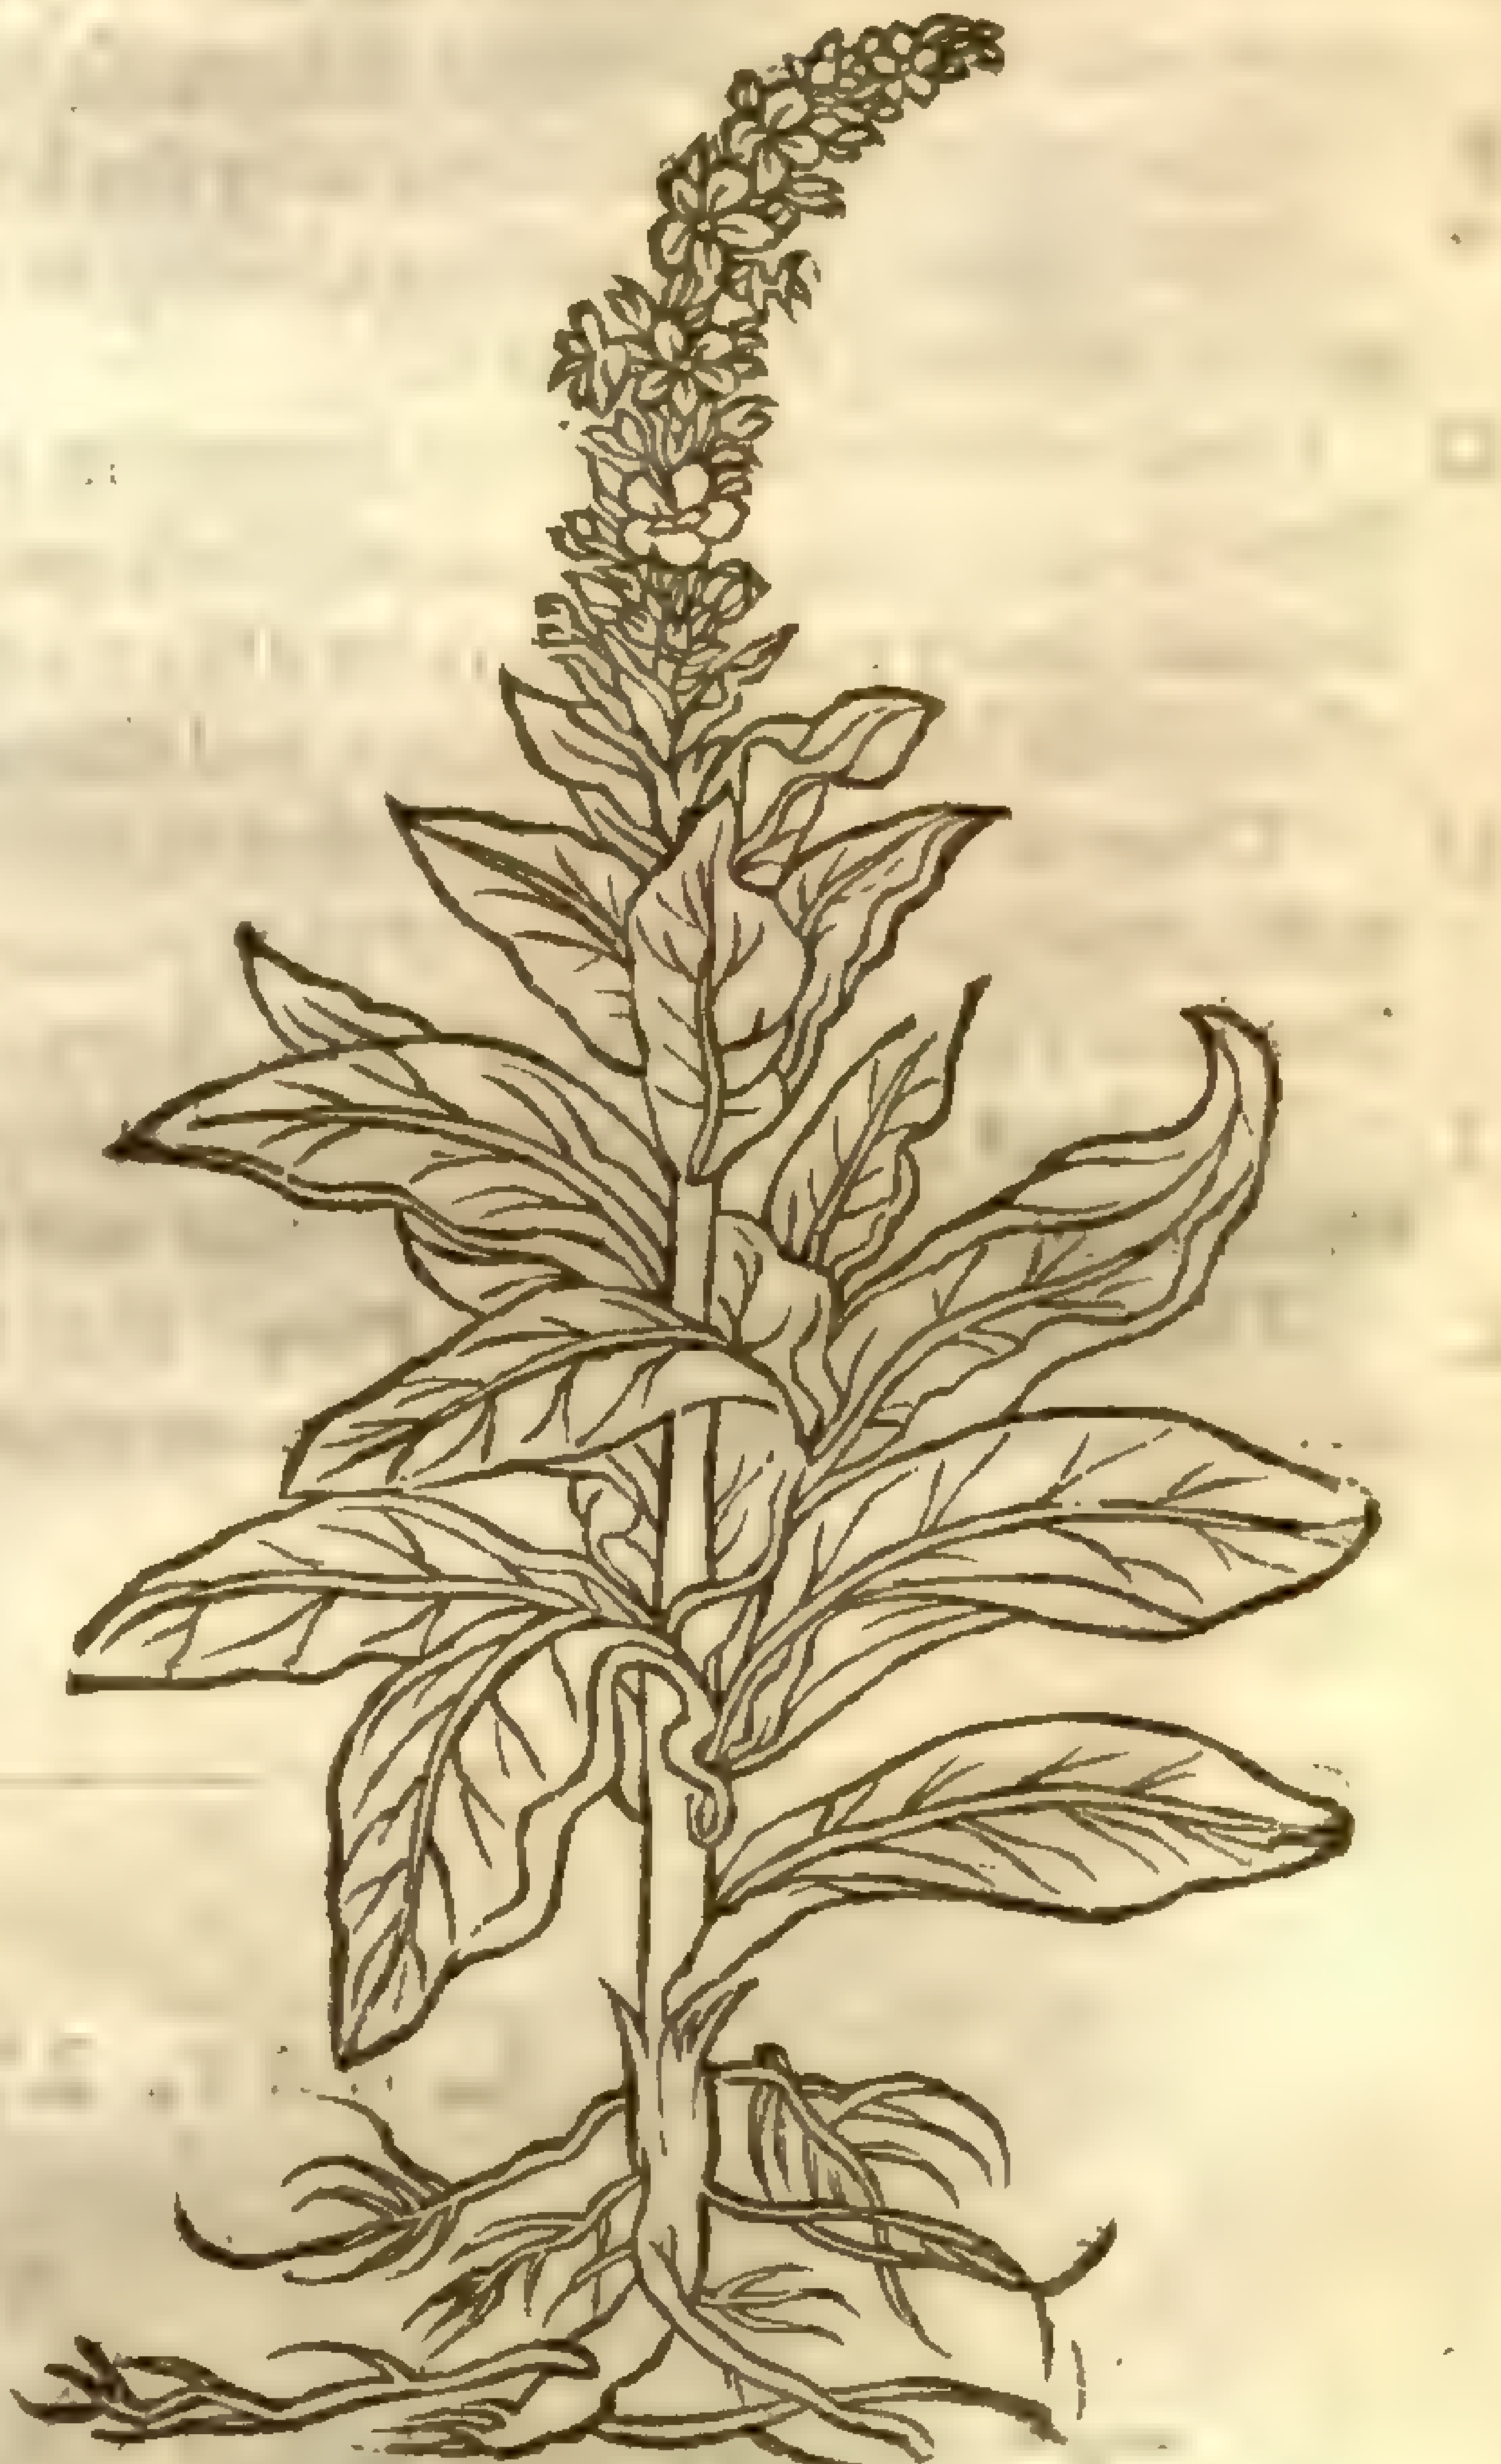
¶ The Deſcription.

1 THe male Mullein or Higtaper hath broad leaues,very ſoft,whitiſh and downy; in the midſt of which riſeth vp a ſtalk,ſtraight,ſingle,and the ſame alſo whitiſh all ouer,with a hoary down,and couered with the like leaues,but leſſer and leſſer euen to the top; among which taperwiſe are ſet a multitude of yellow floures conſiſting of fiue leaues apiece:in the places wherof come vp little round veſſels,in which is contained very ſmall ſeed. The root is long, a finger thicke,blacke without,and full of ſtrings.

Verbascum [illegible] mas [illegible] Syn. p. 1.308



1 *Tapſus barbatus.*
Mullein or Higtaper.



2 *Tapſus barbatus flore albo.*
White floured Mullein.

2 The female Mullein hath likewiſe many white woolly leaues,ſet vpon an hoary cottony vpright ſtalke of the height of foure or fiue cubits: the top of the ſtalke reſembleth a torch decked with infinite white floures,which is the ſpeciall marke to know it from the male kinde,being like in euery other reſpect.

¶ The Place.

Theſe plants grow of themſelues neere the borders of paſtures, plowed fields, or cauſies & dry ſandy ditch banks,and in other vntilled places. They grow in great plenty neere vnto a lyme-kiln vpon the end of Blacke heath next to London,as alſo about the Queenes houſe at Eltham neere to Dartford in Kent; in the highwayes about Highgate neere London,and in moſt countries of England that are of a ſandy ſoile.

¶ *The Time.*

They are found with their floure from Iuly to September,and bring forth their ſeed the ſecond yeare after it is ſowne.

¶ *The Names.*

Mullein is called in Greeke φλόμος: in ſhops, *Tapſus Barbatus*: of diuers, *Candela Regia, Candelaria*, and *Lanaria*: *Dioſcorides, Pliny*, and *Galen* call it *Verbaſcum*: in Italian, *Verbaſco*, and *Taſſo Barbaſſo*: in Spaniſh, *Gordolobo*: in high-Dutch, **Wullkraut**: in French, *Bouillon*: in Engliſh, Mullein, or rather Woollen, Higtaper, Torches, Longwort, and Bullocks Longwort; and of ſome, Hares beard.

¶ *The Temperature.*

Mullein is of temperature dry: the leaues are alſo of a digeſting and clenſing qualitie, as *Galen* affirmeth.

¶ *The Vertues.*

A The leaues of Mullein boiled in water,and laid vpon hard ſwellings and inflammations of the eies,cure and eaſe the paine.

B The root boiled in red wine and drunke,ſtoppeth the laske and bloudy flix.

C The ſame boiled in water and drunke, is good for them that are broken and hurt inwardly, and preuaileth much againſt the old cough.

D A little fine treacle ſpred vpon a leafe of Mullein, and layd to the piles or hemorrhoids, cureth the ſame: an ointment alſo made of the leaues thereof and old hogs greaſe worketh the ſame effect.

E The leaues worne vnder the feet day and night in manner of a ſhoo ſole or ſock, bring downe in yong maidens their deſired ſickeneſſe,being ſo kept vnder their feet that they fall not away.

F The country people,eſpecially the husbandmen in Kent,do giue their cattel the leaues to drink againſt the cough of the lungs,being an excellent approued medicine for the ſame,wherupon they call it Bullocks Lungwort.

G Frankincenſe and Maſtick burned in a chafing diſh of coles,and ſet within a cloſe ſtoole,and the fume thereof taken vnderneath,doth perfectly cure the piles,hemorrhoids,and al diſeaſes hapning in thoſe lower parts,if there be alſo at euery ſuch fuming (which muſt be twice euery day) a leafe of the herb bound to the place,and there kept vntill the next dreſſing.

H There be ſome who think that this herb being but carried about one,doth help the falling ſickneſſe,eſpecially the leaues of that plant which hath not as yet born floures,and gathered when the Sun is in Virgo, and the Moon in Aries;which thing notwithſtanding is vaine and ſuperſtitious.

I The later Phyſitions commend the yellow floures, being ſteeped in oile and ſet in warme dung vntill they be waſhed into the oile and conſumed away,to be a remedie againſt the piles.

K The report goeth (ſaith *Pliny*) that figs do not putrifie at all that are wrapped in the leaues of Mullein: which *Dioſcorides* alſo mentioneth.

CHAP. 270. *Of baſe Mullein.*

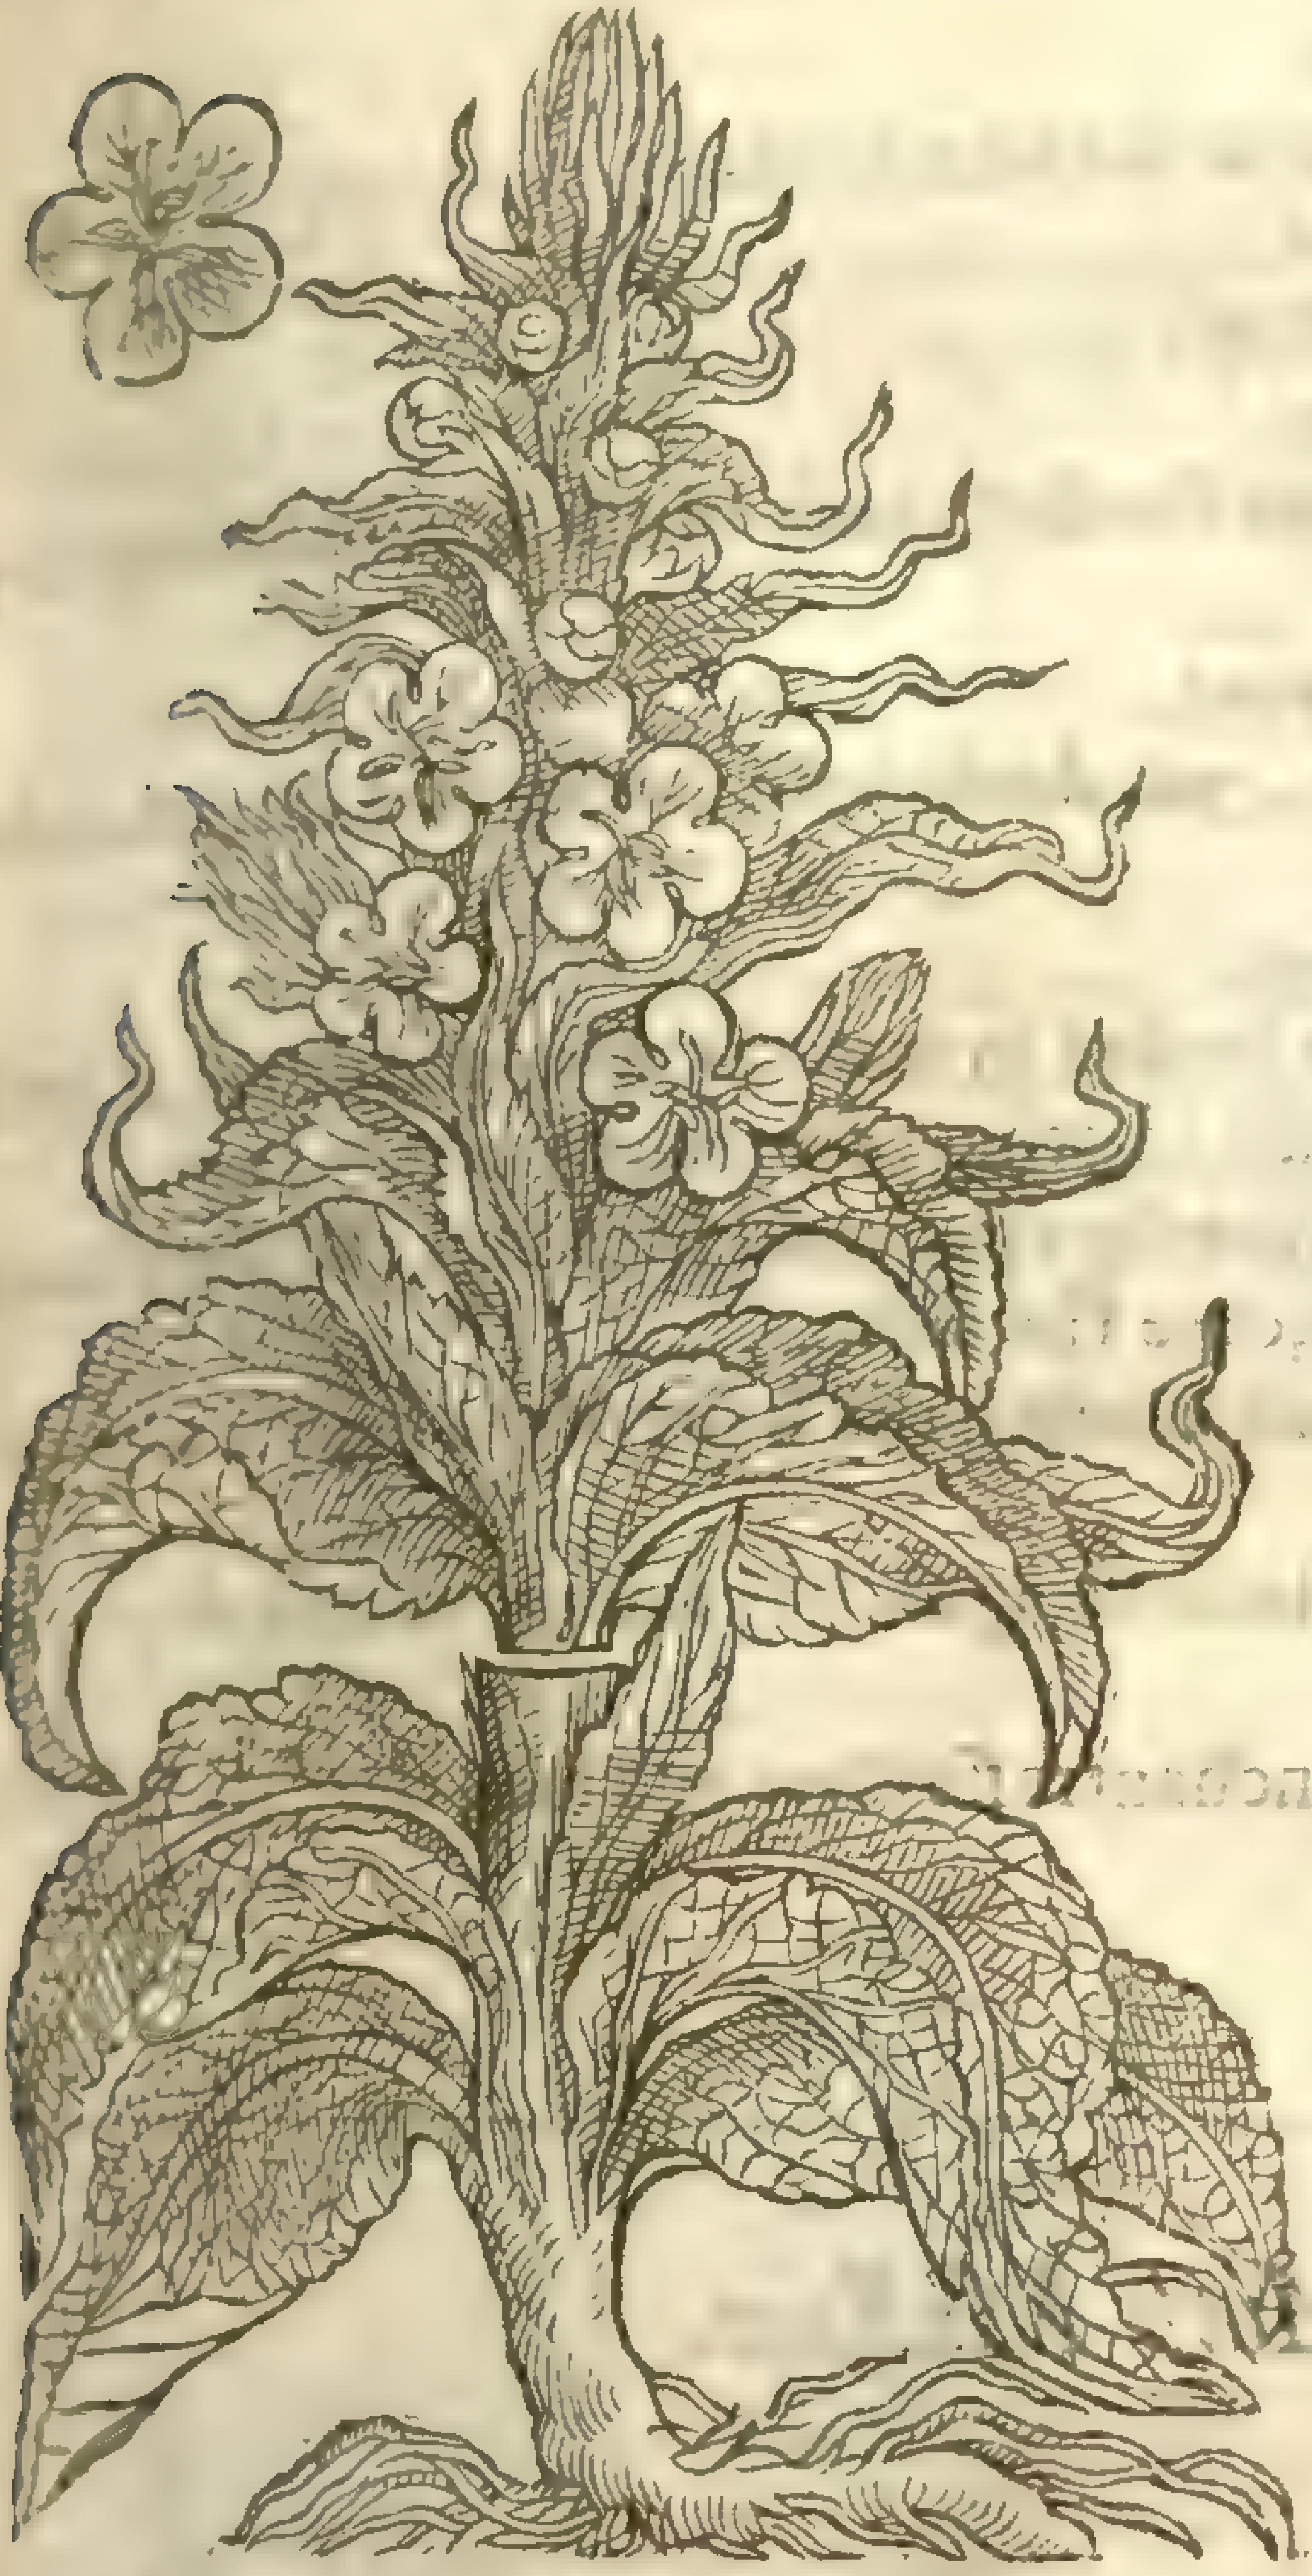
¶ *The Deſcription.*

1 The baſe white Mullein hath a thicke wooddy root,from which riſeth vp a ſtiffe & hairy ſtalke of the height of foure cubits,garniſhed with faire grayiſh leaues like thoſe of Elecampane,but leſſer:the floures grow round about the ſtalks taper or torch faſhion, of a white colour,with certain golden thrums in the middle: the ſeed followeth,ſmall, and of the colour of duſt.

2 Blacke Mullein hath long leaues not downy at all,large and ſharp pointed,of an ouerworne blackiſh green colour,ſomewhat rough,and ſtrongly ſmelling: the floures grow at the top of the ſtalks,of a golden yellow colour,with certain threds in the middle thereof. The root differeth not from the precedent.

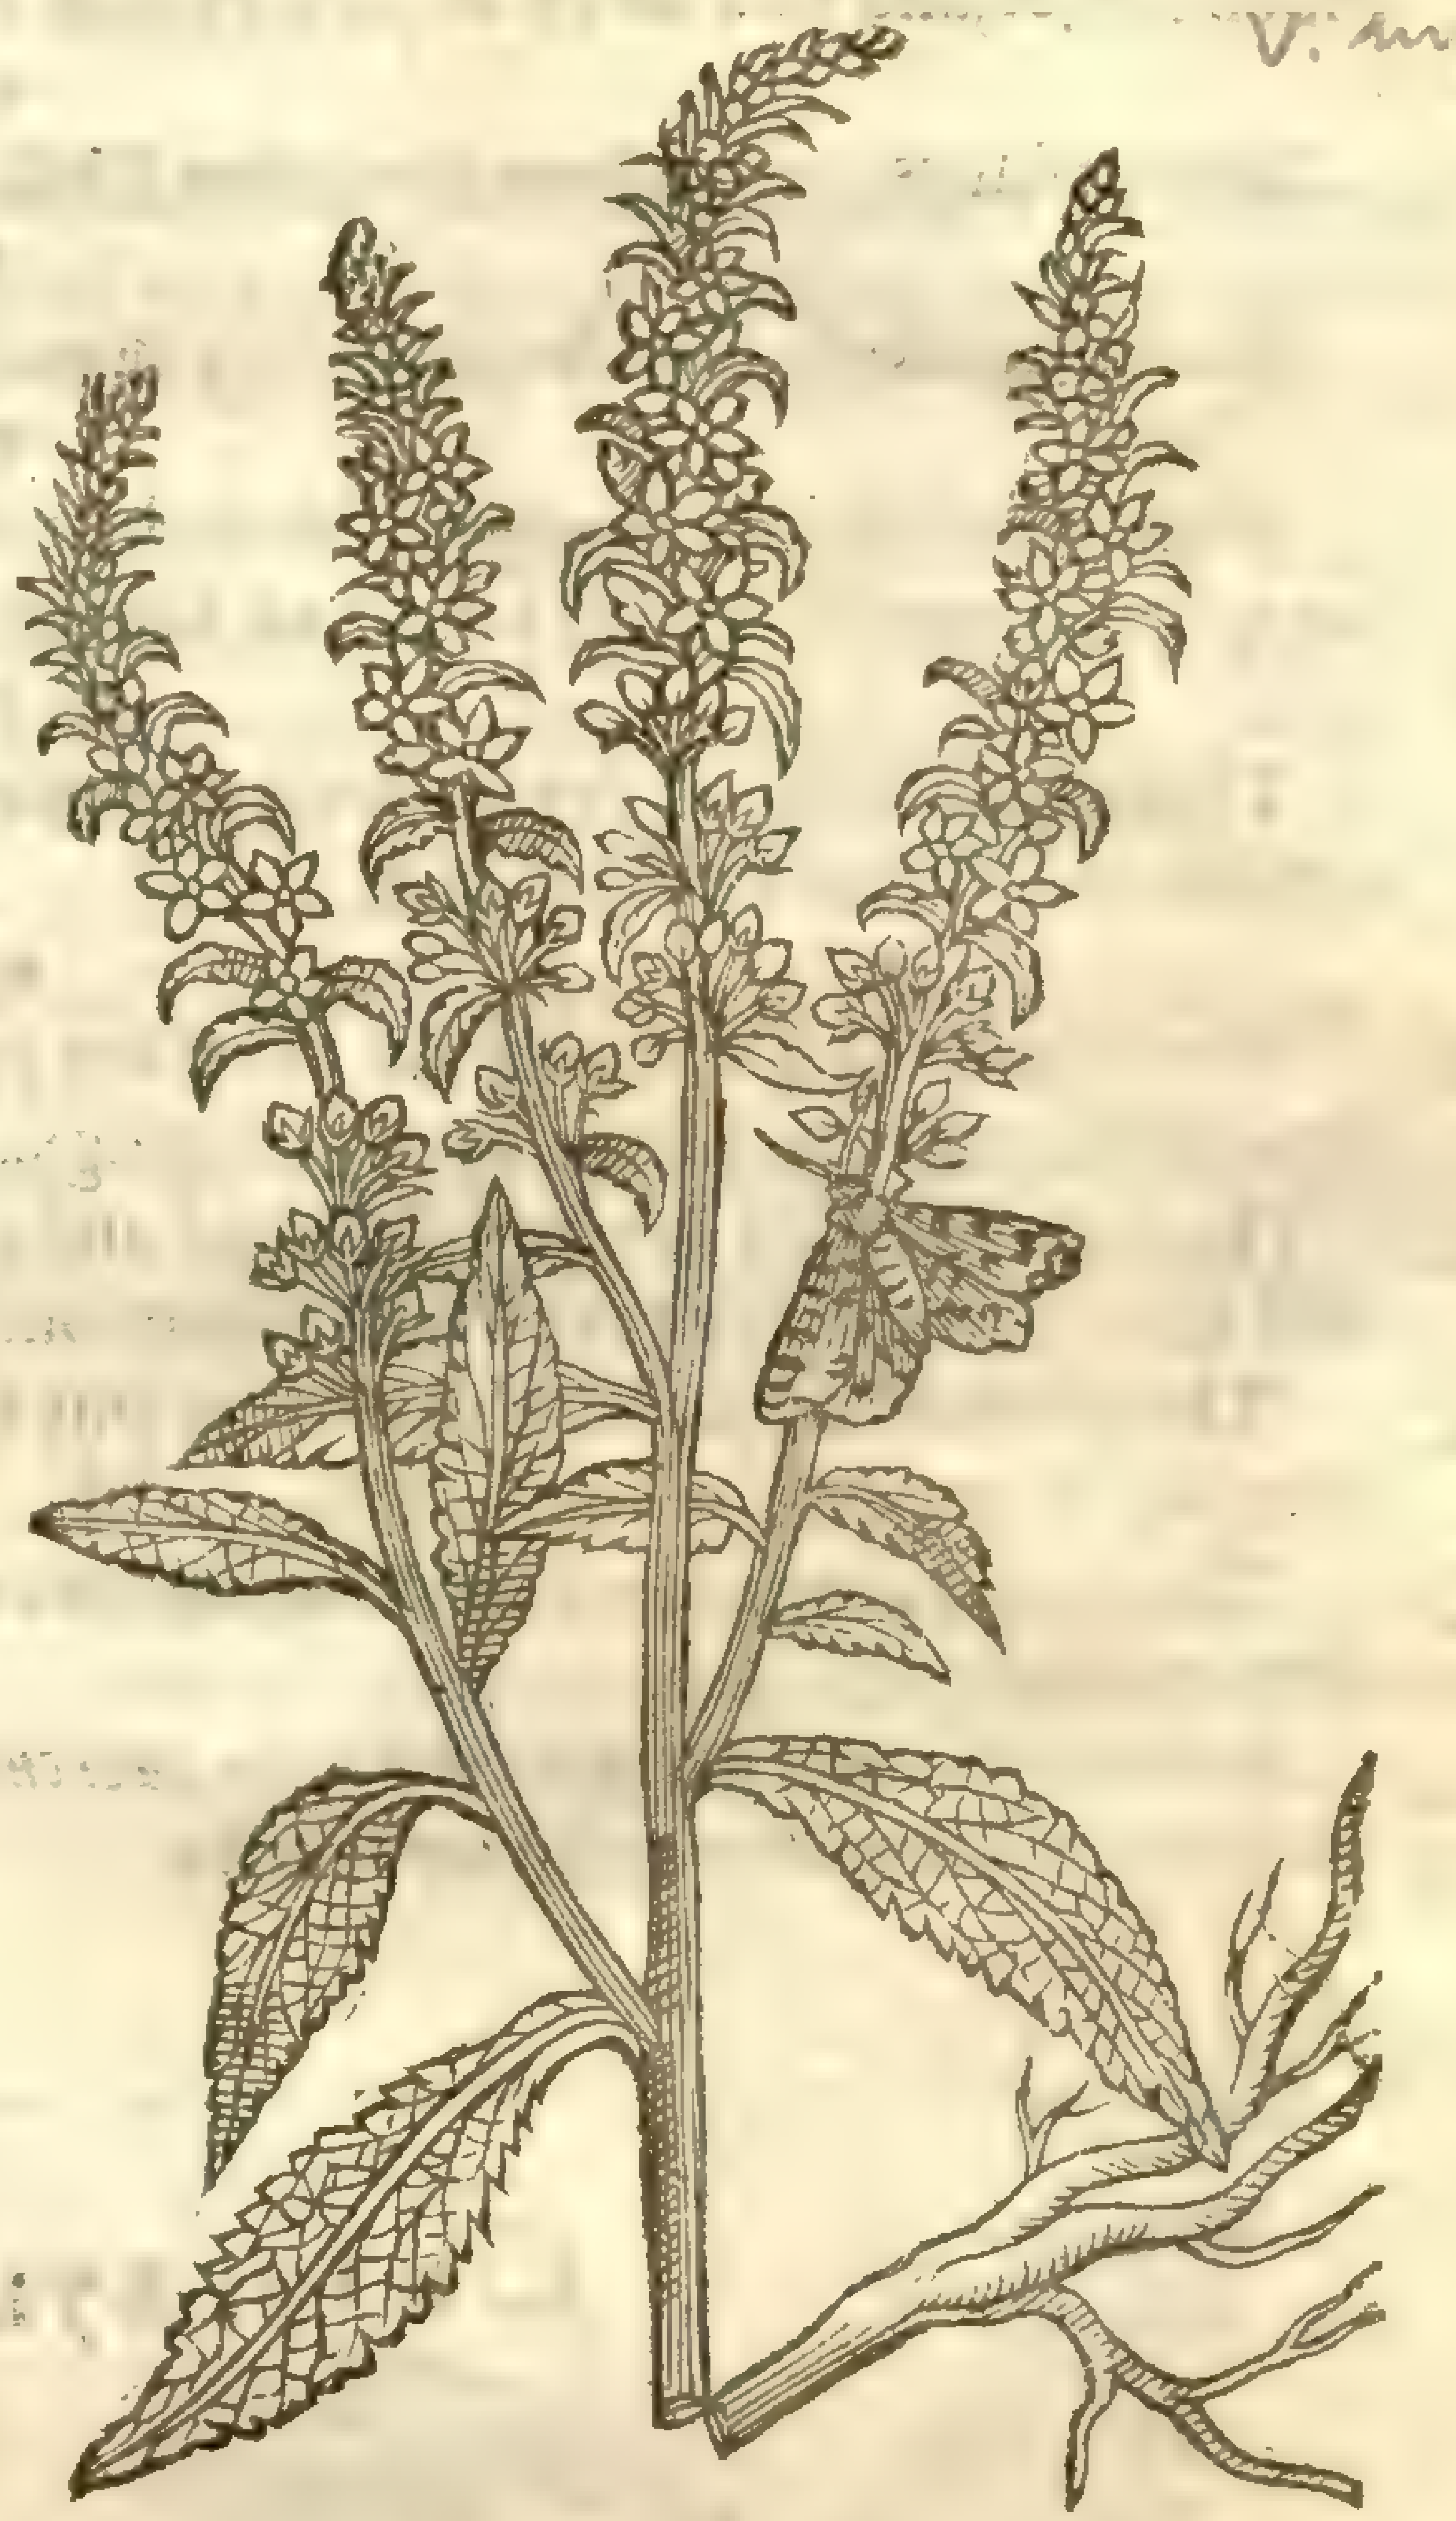
3 Candleweek Mullein hath large broad and woolly leaues, like vnto thoſe of the common Mullein: among which riſeth vp a ſtalke couered with the like leaues, euen to the branches whereon the floures do grow,but leſſer and leſſer by degrees. The ſtalke diuideth it ſelfe toward the top into diuers branches, whereon is ſet round about many yellow floures, which oftentimes doe change into white, varying according vnto the ſoile and clymat. The root is thicke and woody.

1 *Verbaſcum album.*
Baſe white Mullein.

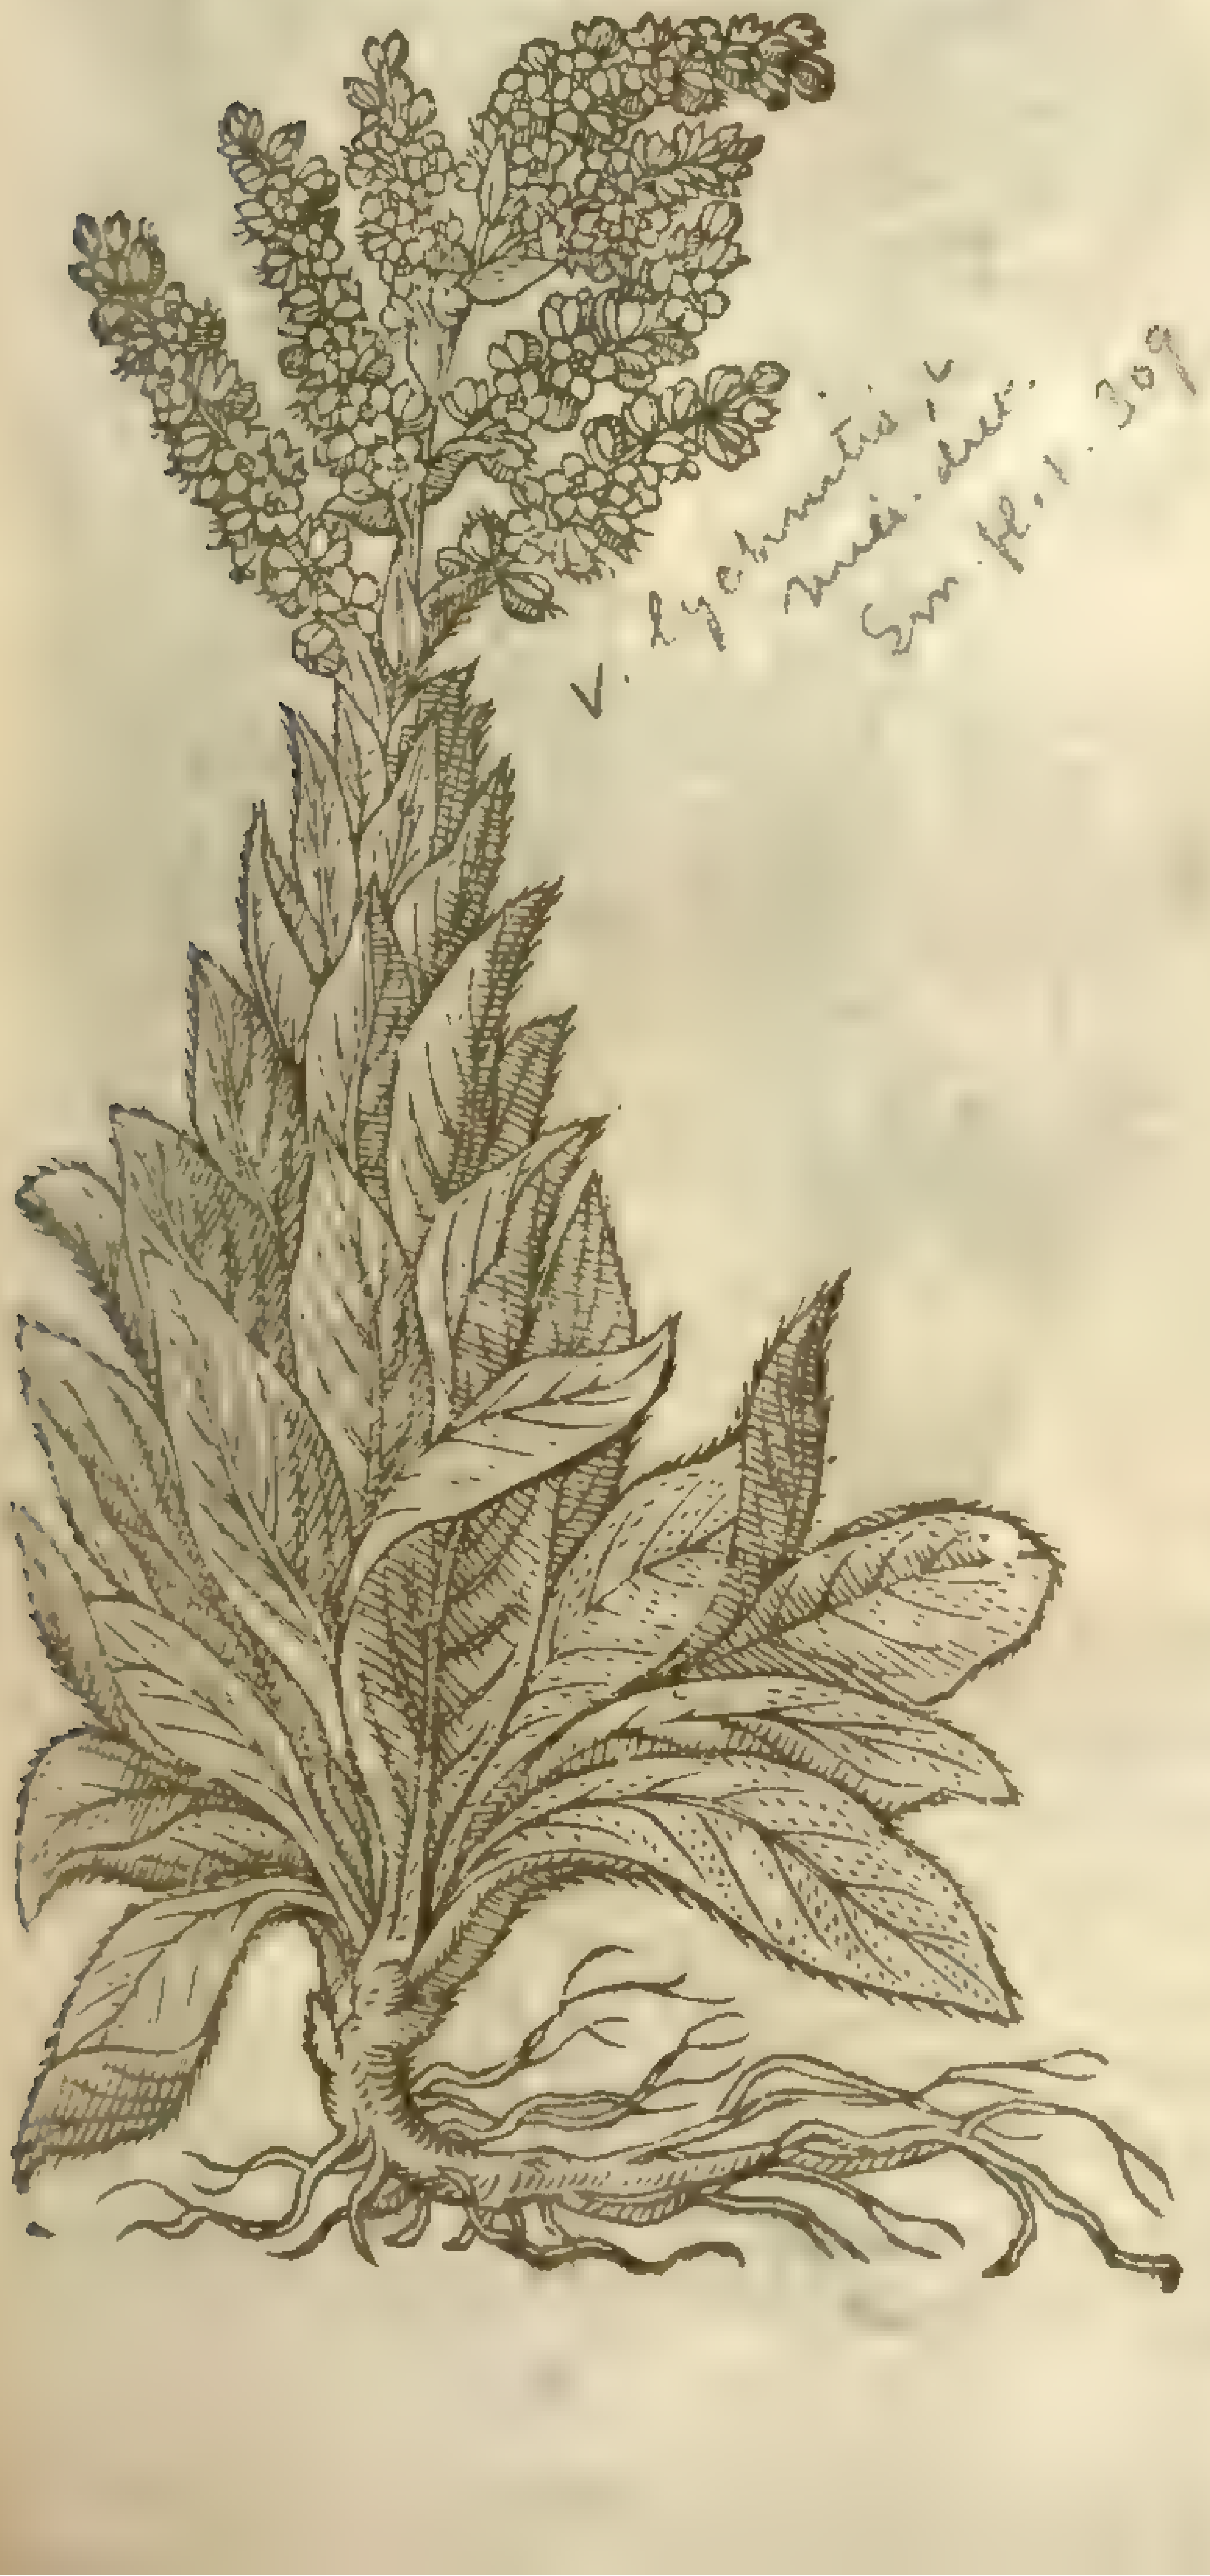


2 *Verbaſcum nigrum.*
Baſe blacke Mullein.

V. nigrum, L.
Mart. dict.

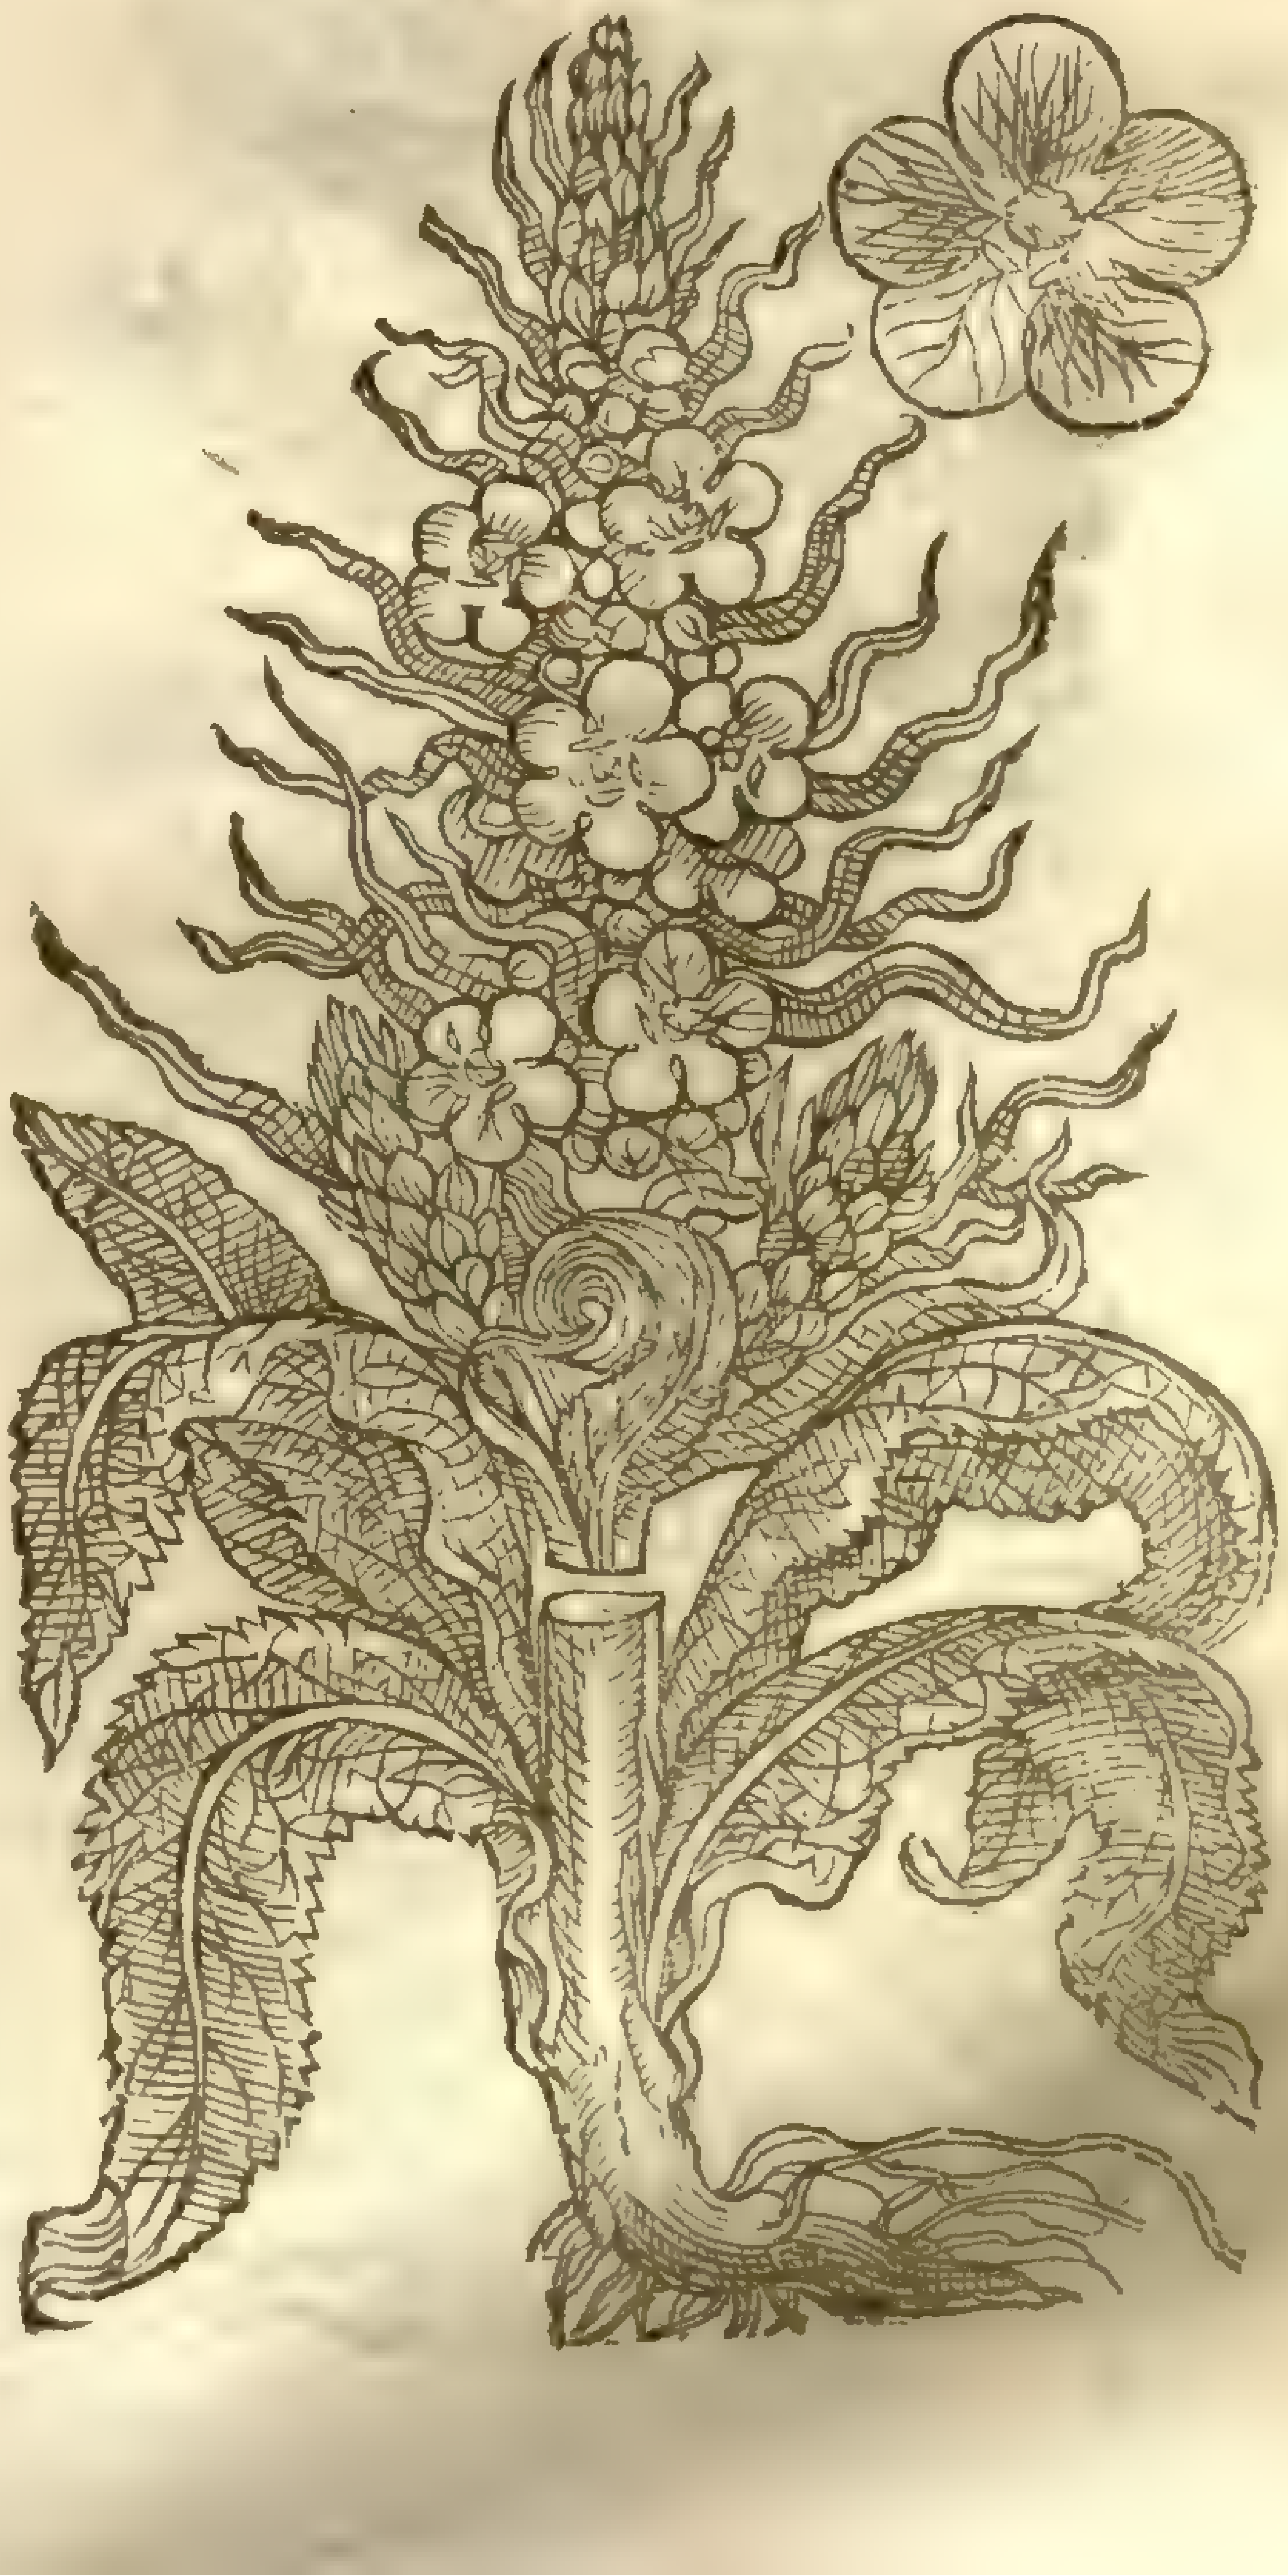


3 *Verbaſcum Lychnite Matthioli.*
Candleweeke Mullein.



V. lychnitis, L.
Mart. dict.
Eng. fl. I. 309

4 *Verbaſcum Lychnite minus.*
Small Candleweek Mullein.



4 The ſmall Candleweek Mullein differs little from the laſt rehearſed, ſauing that the whole plant of this is of a better ſauor, wherein eſpecially conſiſteth the difference. ‡ The floure alſo is much larger, and of a ſtraw or pale yellow colour. ‡

¶ *The Place.*

Theſe plants grow where the other Mulleins do, and in the like ſoile.

¶ *The Time.*

The time likewiſe anſwereth their flouring and ſeeding.

¶ *The Names.*

Their capitall names expreſſed in the titles ſhal ſerue for theſe baſe Mulleins, conſidering they are all and euery of them kindes of Mulleins.

¶ *The Temperature.*

Theſe Mulleins are dry without any manifeſt heate, yet doubtleſſe hotter and drier than the common Mullein or Hygtaper.

¶ *The Vertues.*

A The blacke Mullein with his pleaſant yellow flours boiled in water or wine and drunk, is good againſt the diſeaſes of the breſt and lungs, and againſt all ſpitting of corrupt rotten matter.

B The leaues boiled in water, ſtamped and applied pultis wiſe vpon cold ſwellings called *Oedemata*, and alſo vpon the vlcers and inflammations of the eyes, cure the ſame.

C The floures of blacke Mullein are put into lie, which cauſeth the haire of the head to wax yellow, if it be waſhed or kembed therewith.

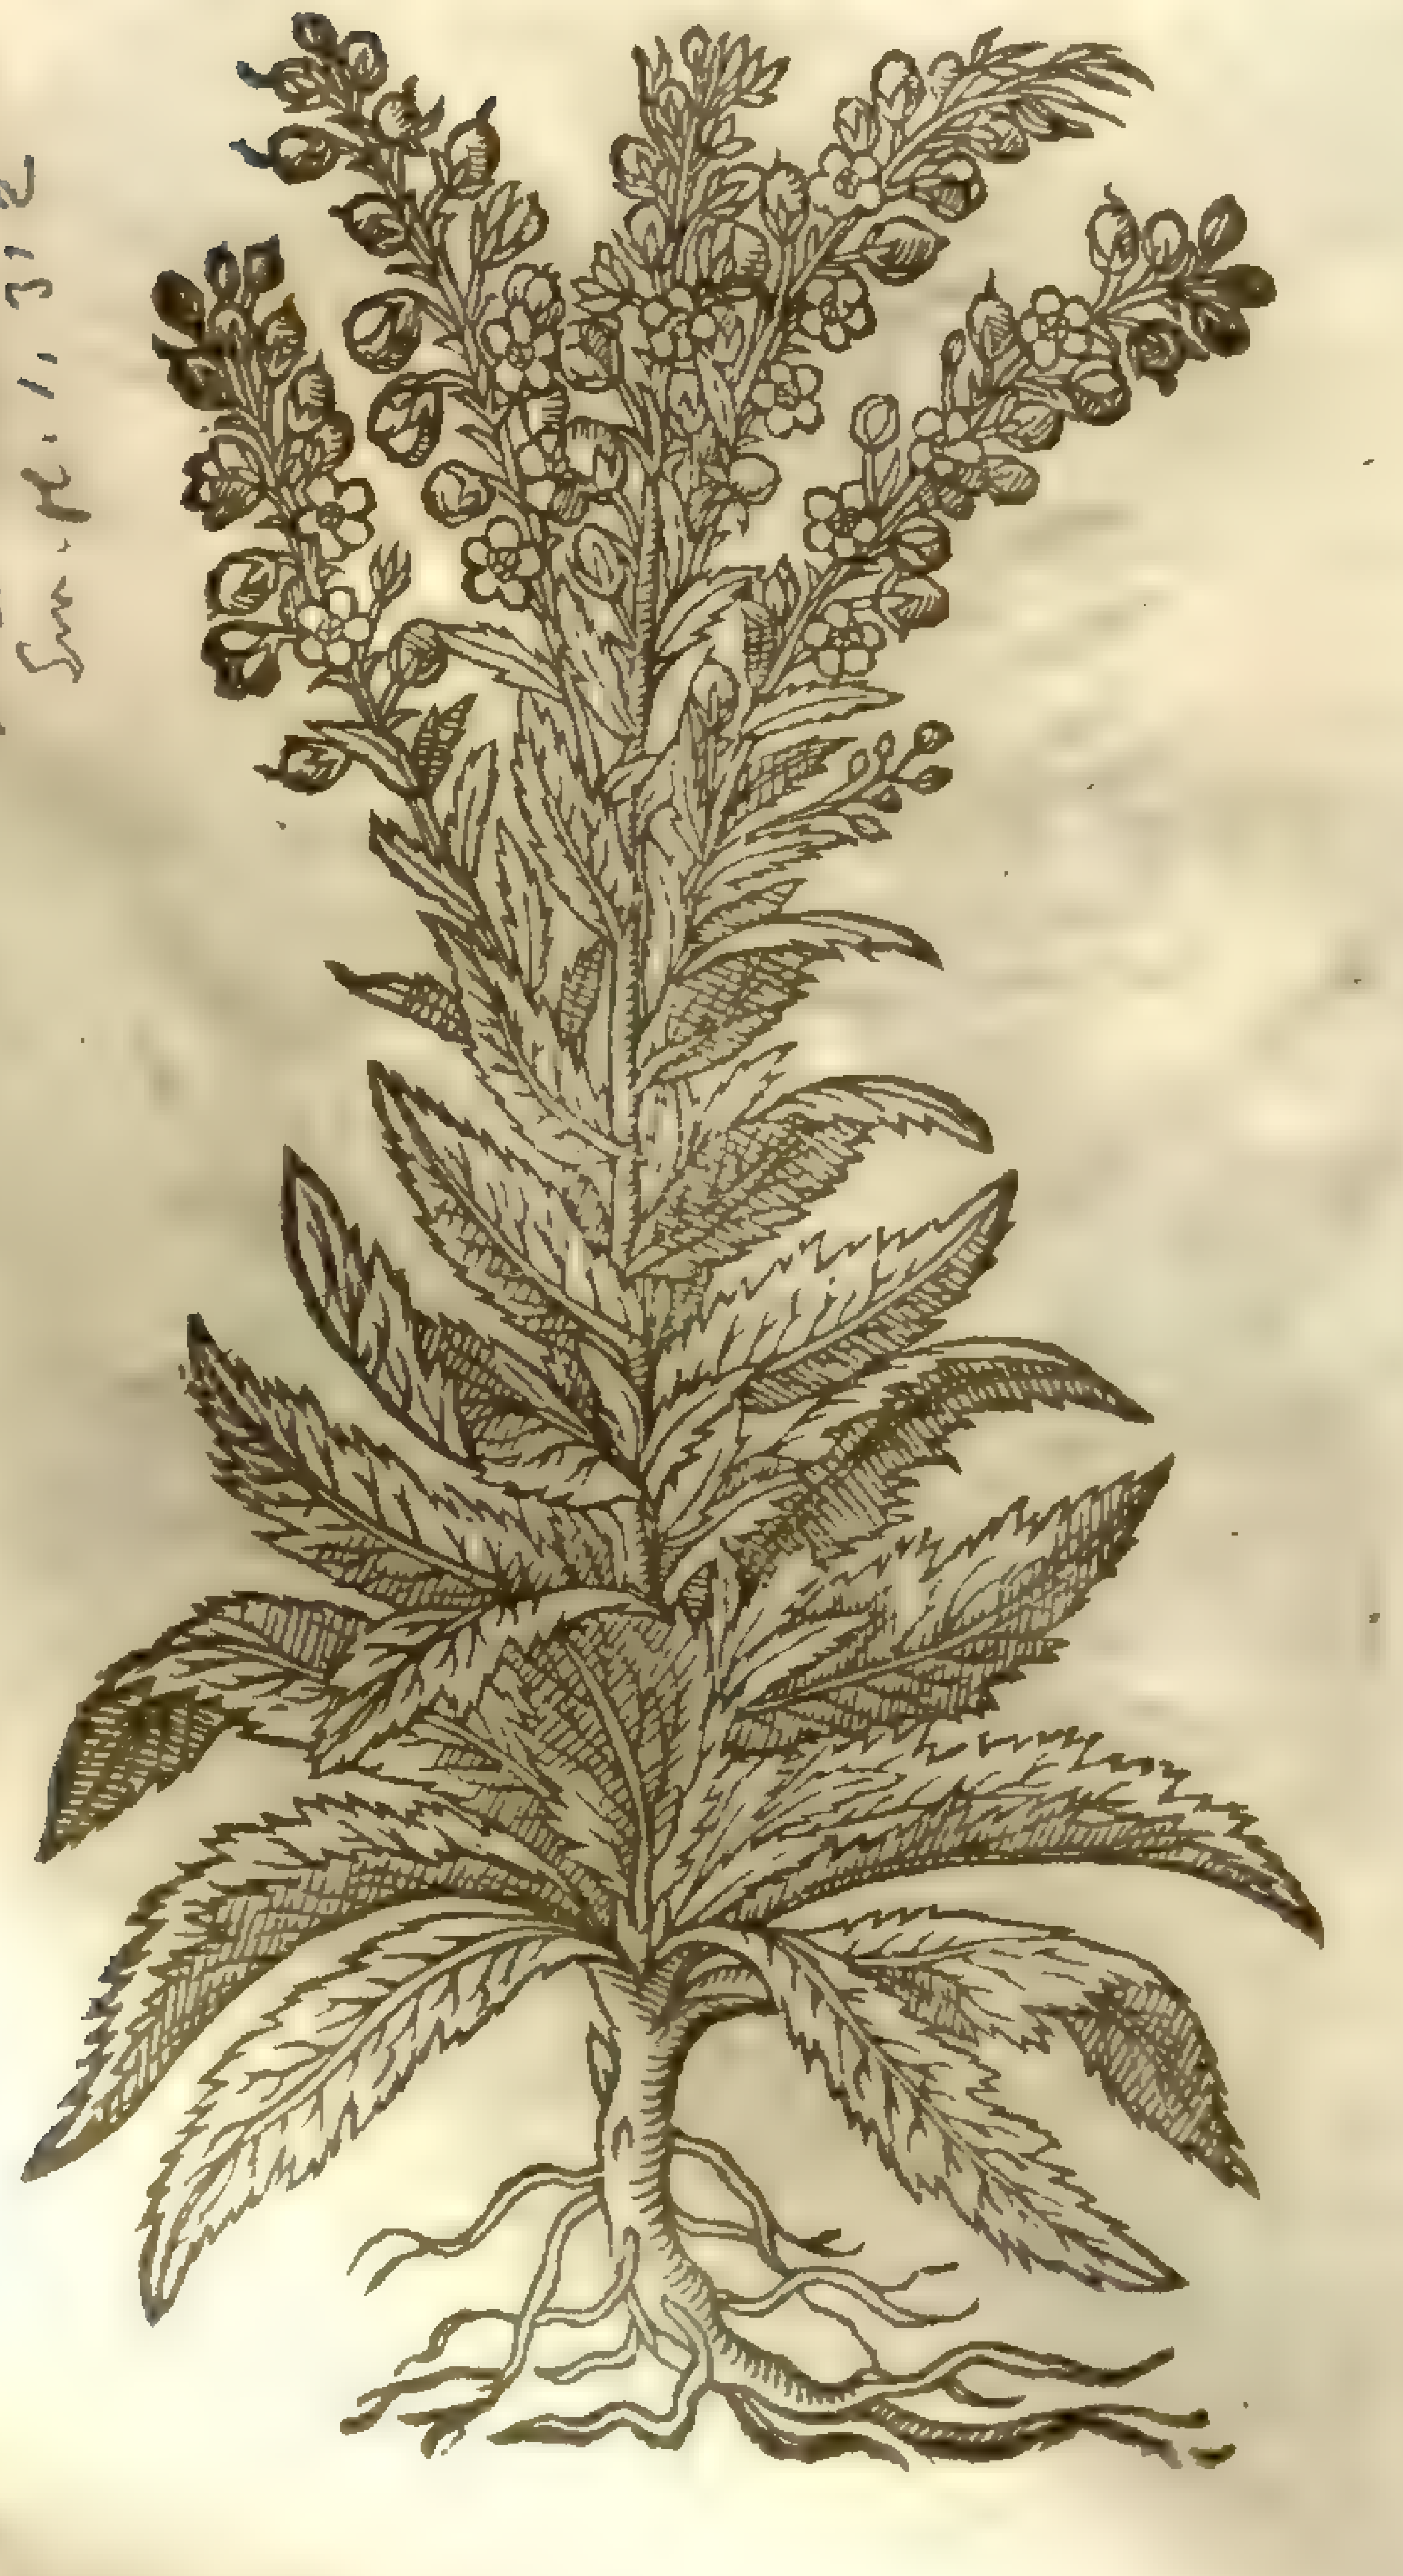
D The leaues are put into cold ointments with good ſucceſſe, againſt ſcaldings and burnings with fire or water.

E *Apuleius* reporteth a tale of *Vlyſſes*, *Mercury*, and the Inchantreſſe *Circe*, and their vſe of theſe herbs in their incantations and witchcrafts.

Chap. 271. *Of Moth Mullein.*

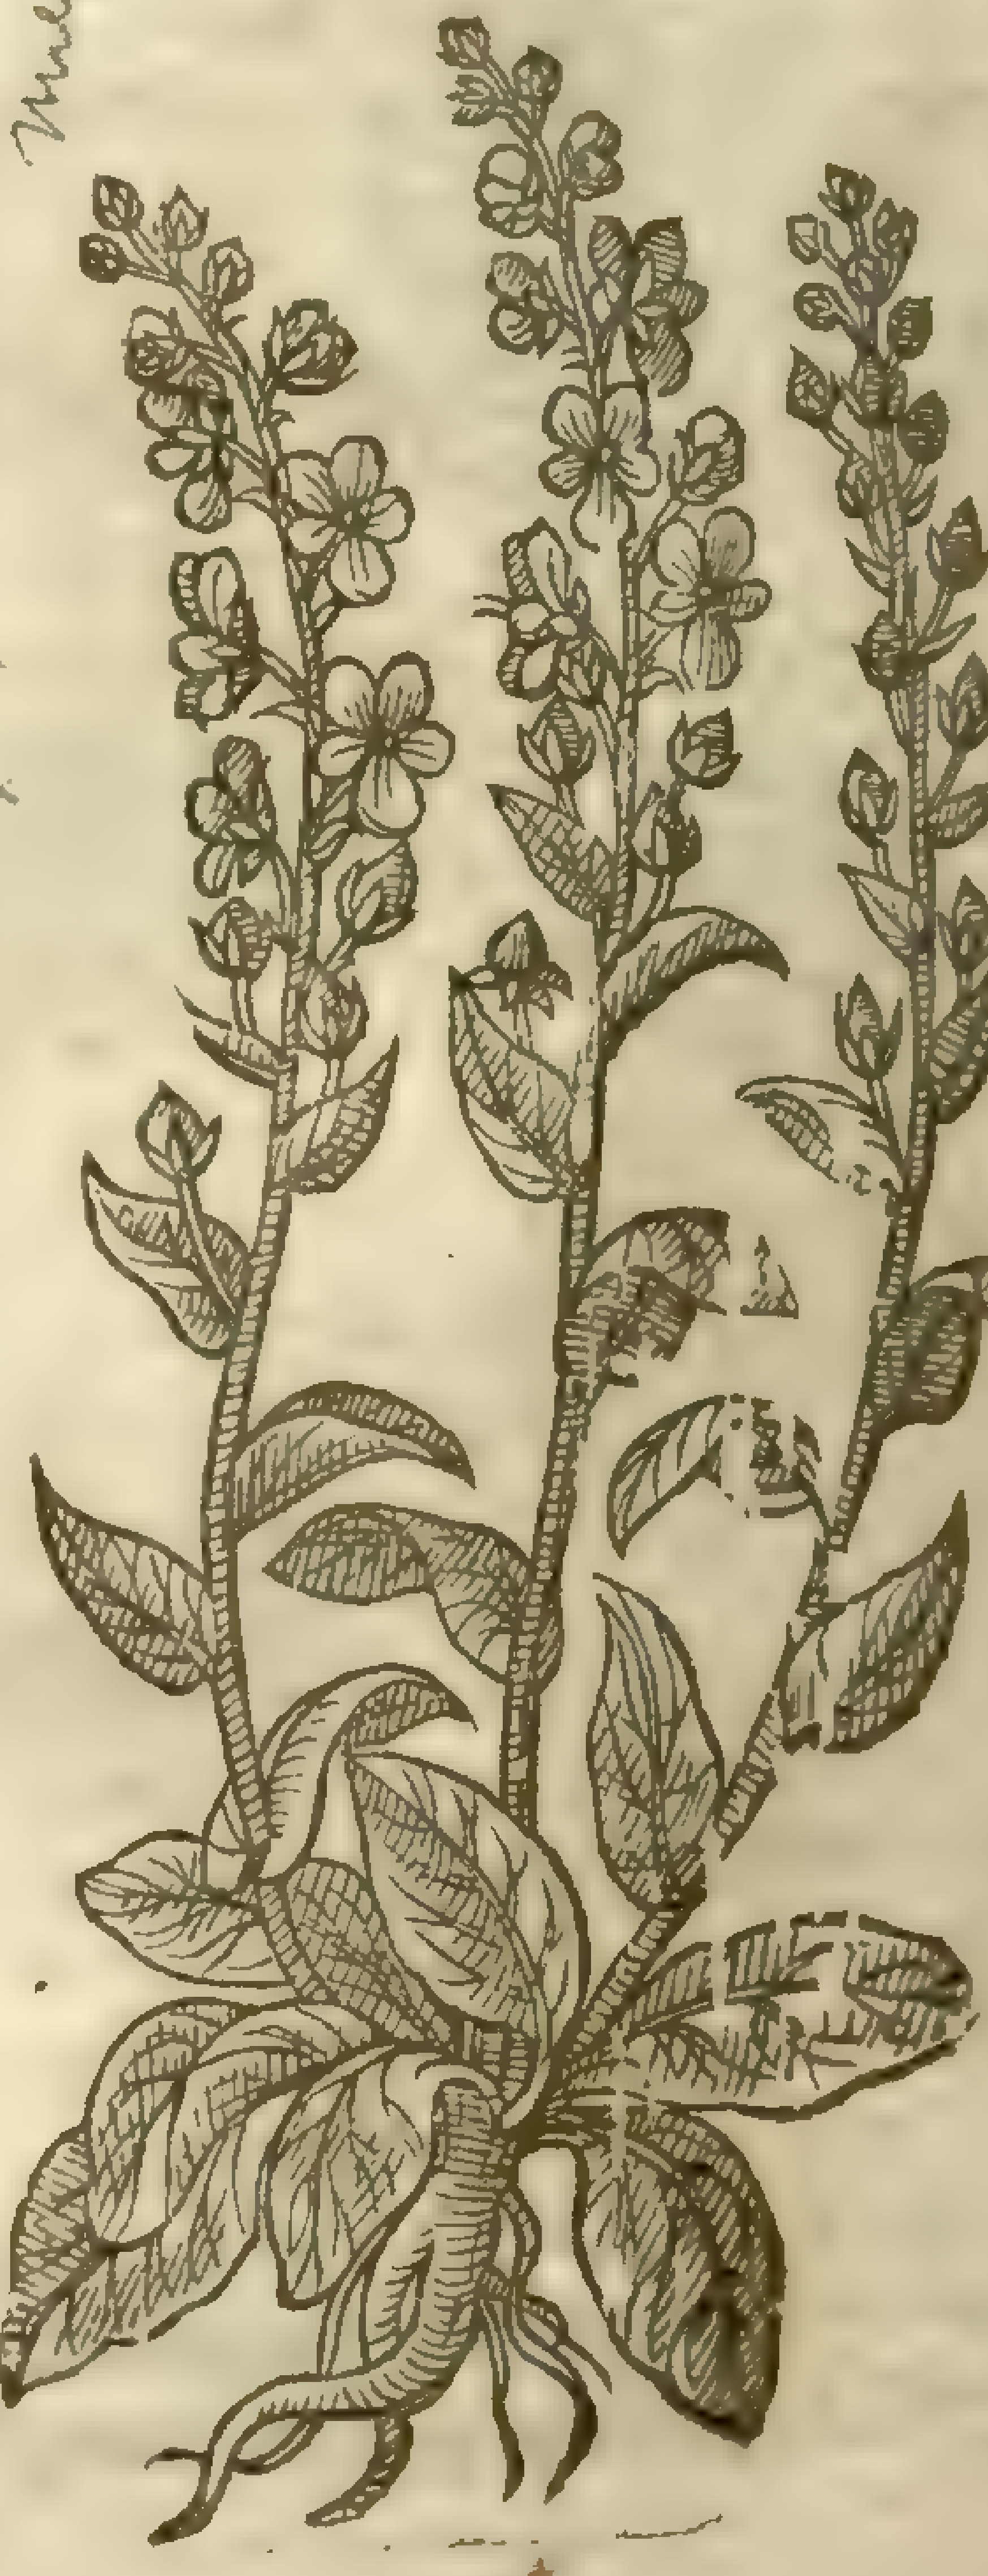
1 *Blattaria Plinij.*
Plinies Moth Mullein.

Verbascum Blattaria, L. Mill. Dict. Sm. Fl. 1, 312



2 *Blattaria flore purpureo.*
Purple moth Mullein.

Verbascum phoeniceum, L. Mill. Dict.



¶ *The Deſcription.*

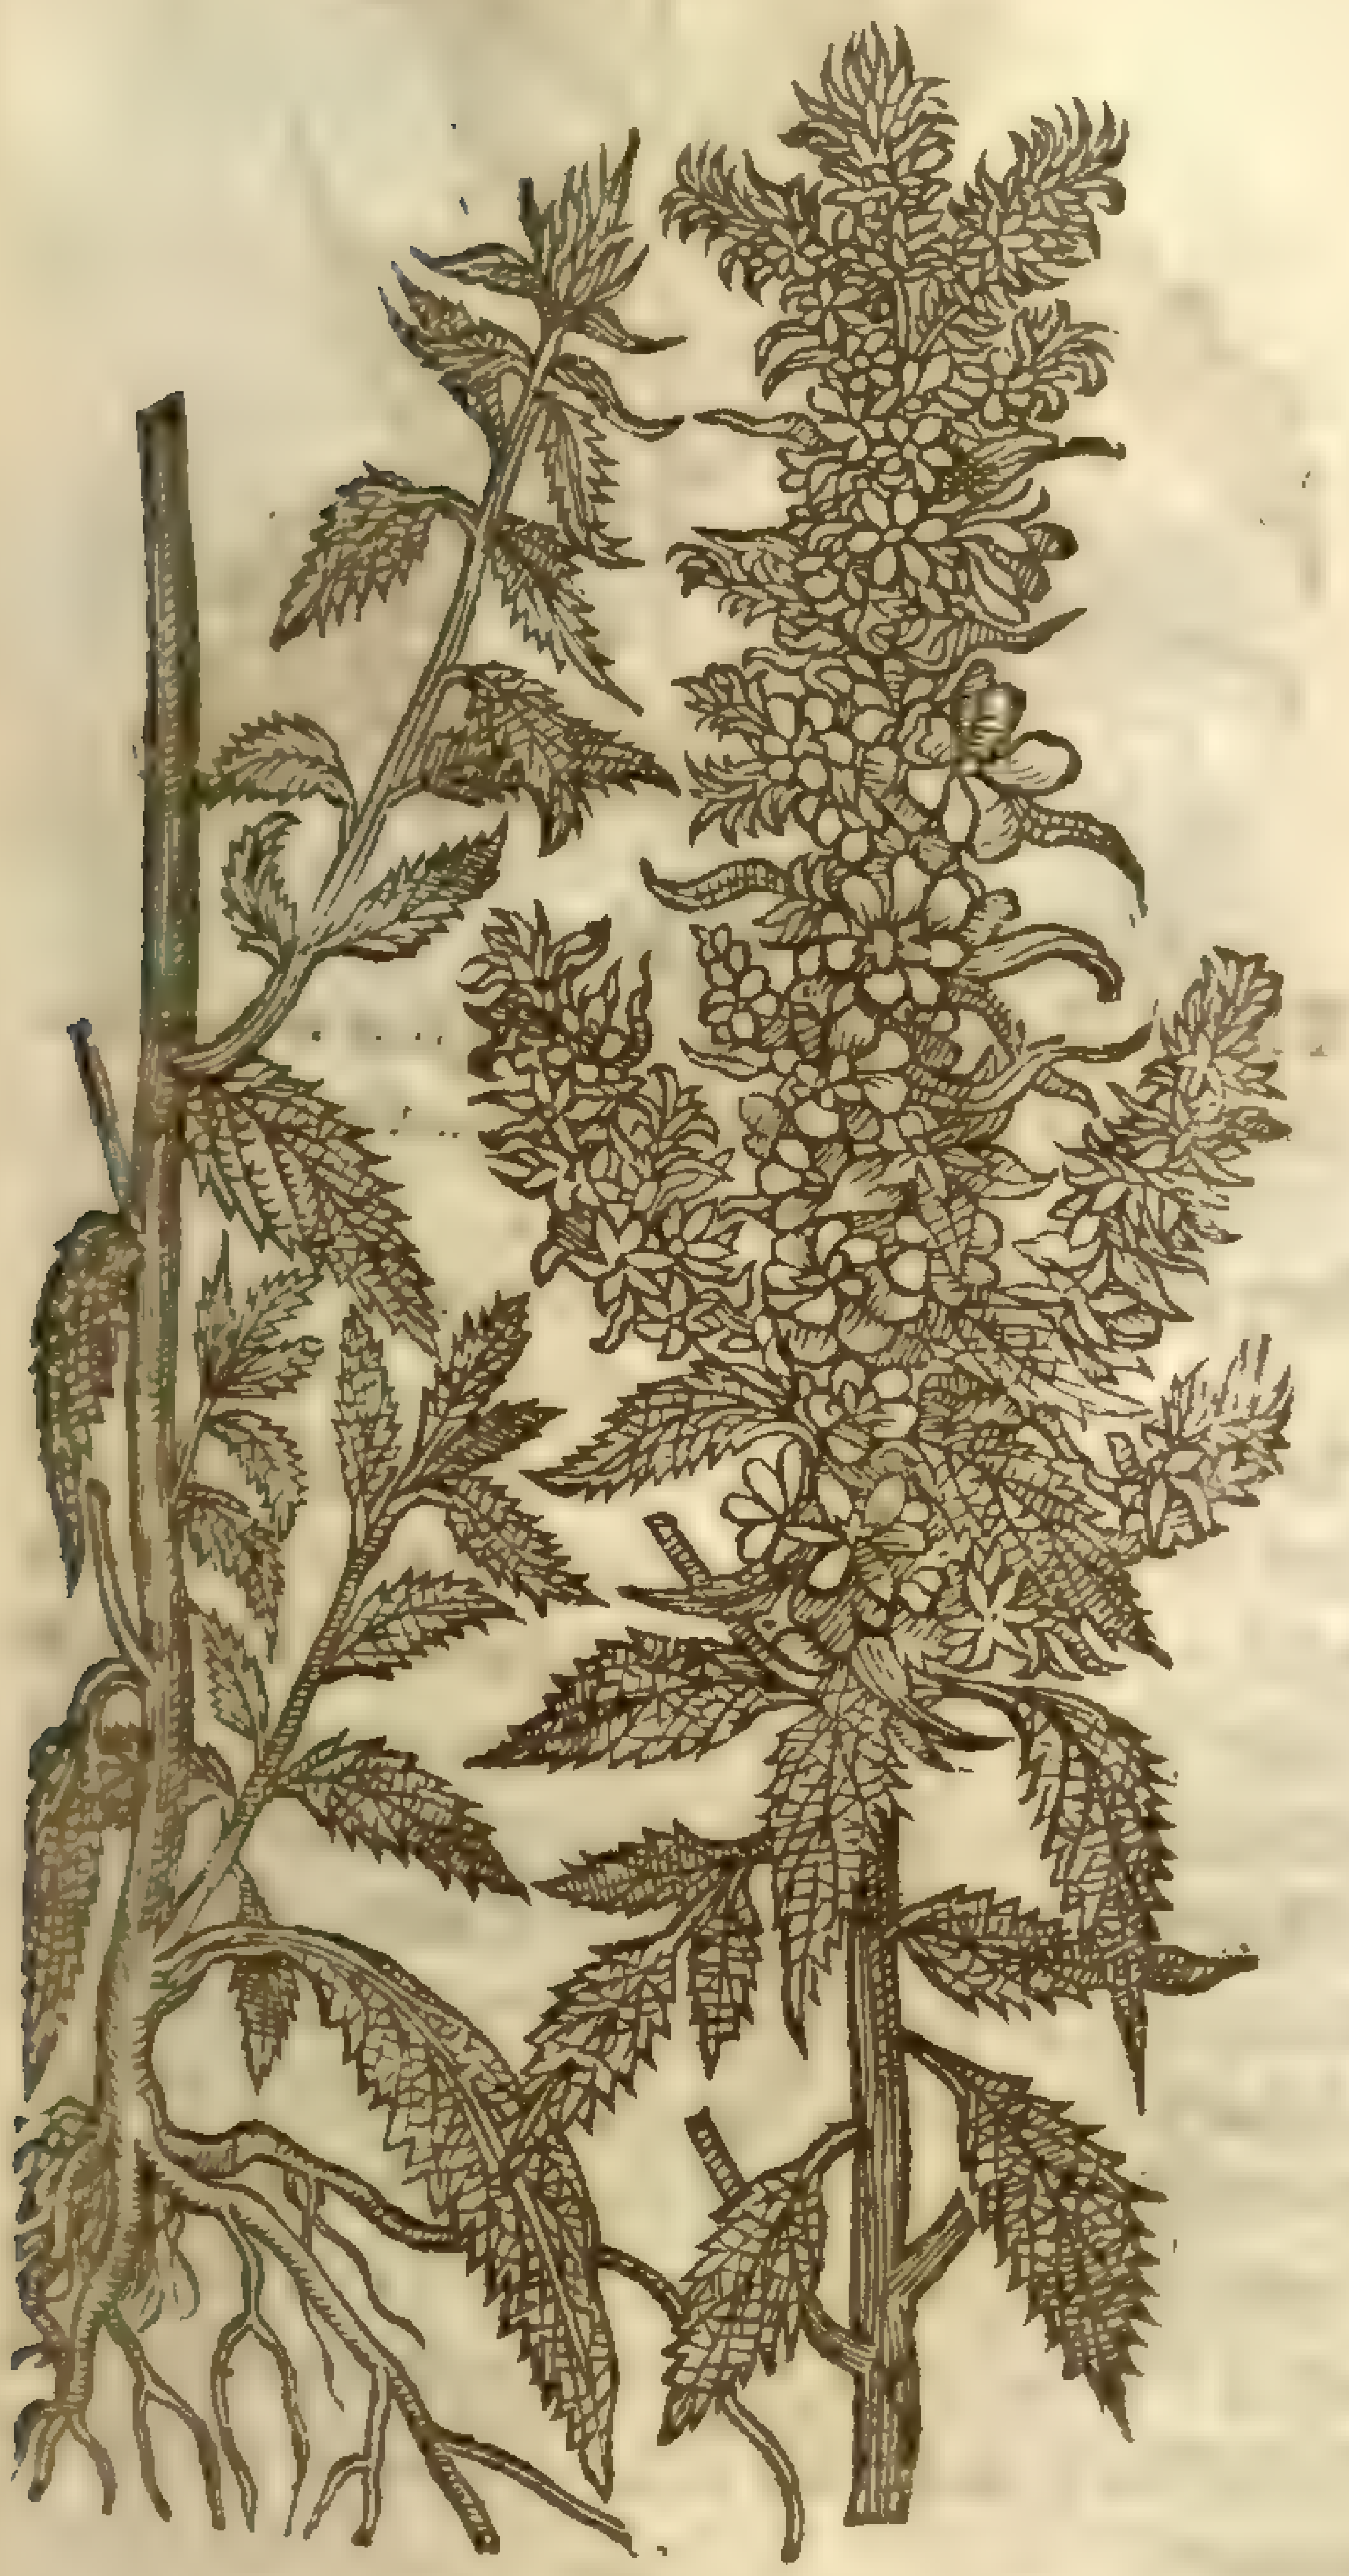
1 PLiny hath ſet forth a kind of *Blattaria* which hath long and ſmooth leaues ſomwhat jagged or ſnipt about the edges: the ſtalk riſeth vp to the height of three cubits,diuiding it ſelfe toward the top into ſundry armes or branches,beſet with yellow leaues like vnto blacke Mullein.

2 *Blattaria* with purple floures hath broad black leaues,without any manifeſt ſnips or notches by the ſides,growing flat vpon the ground; among which riſeth vp a ſtalke two cubits high, garniſhed with floures like vnto the common *Blattaria,* but that they are of a purple colour,and thoſe few threds or chiues in the middle of a golden colour: the root is as thicke as a mans thumb,with ſome threds hanging thereat,and it endures from yeare to yeare.

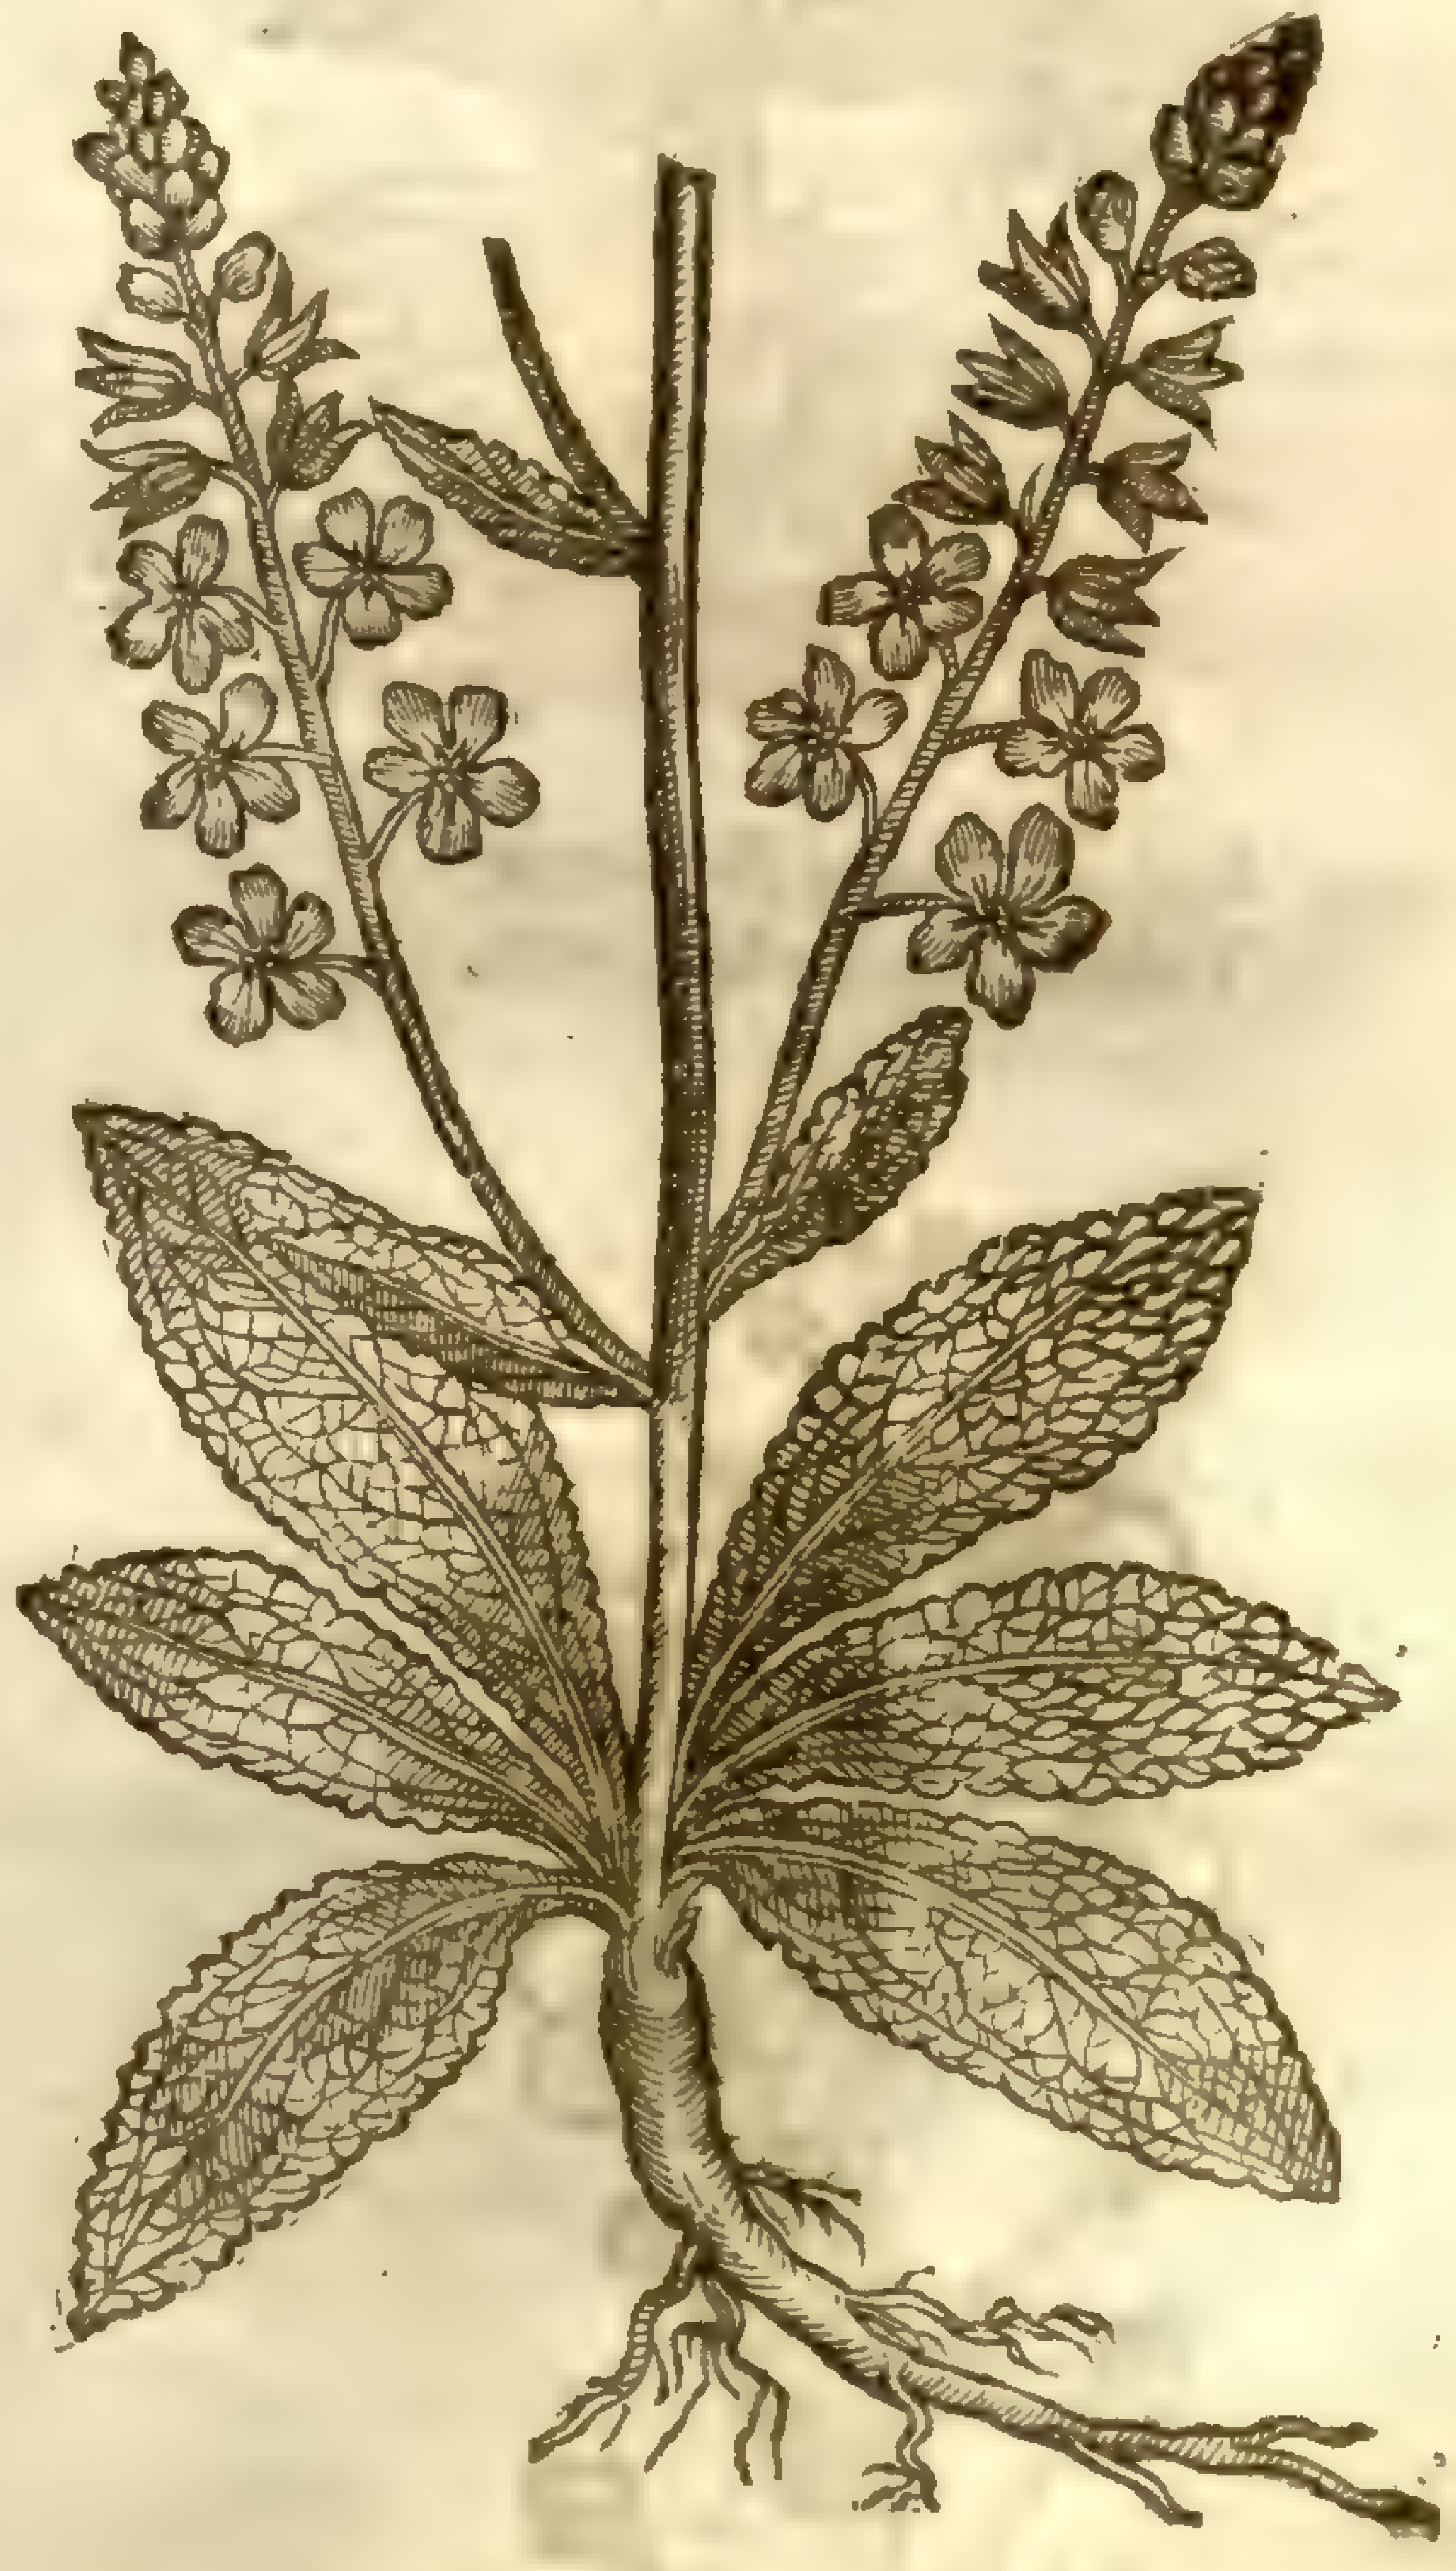
3 There is another kinde like vnto the blacke Mullein in ſtalks,roots,and leaues,and other reſpects,ſauing that his ſmall floures are of a green colour.

4 There is another like vnto the laſt before written, ſauing that his leaues are not ſo deepely cut about the edges,and that the ſmall floures haue ſome purple colour mixed with the greeneſſe.

‡ 3 *Blattaria flore viridi.*
Greene Moth Mullein.



‡ *Blattaria flore ex viridi purpuraſcente.*
Moth Mullein with the greeniſh purple coloured floure.

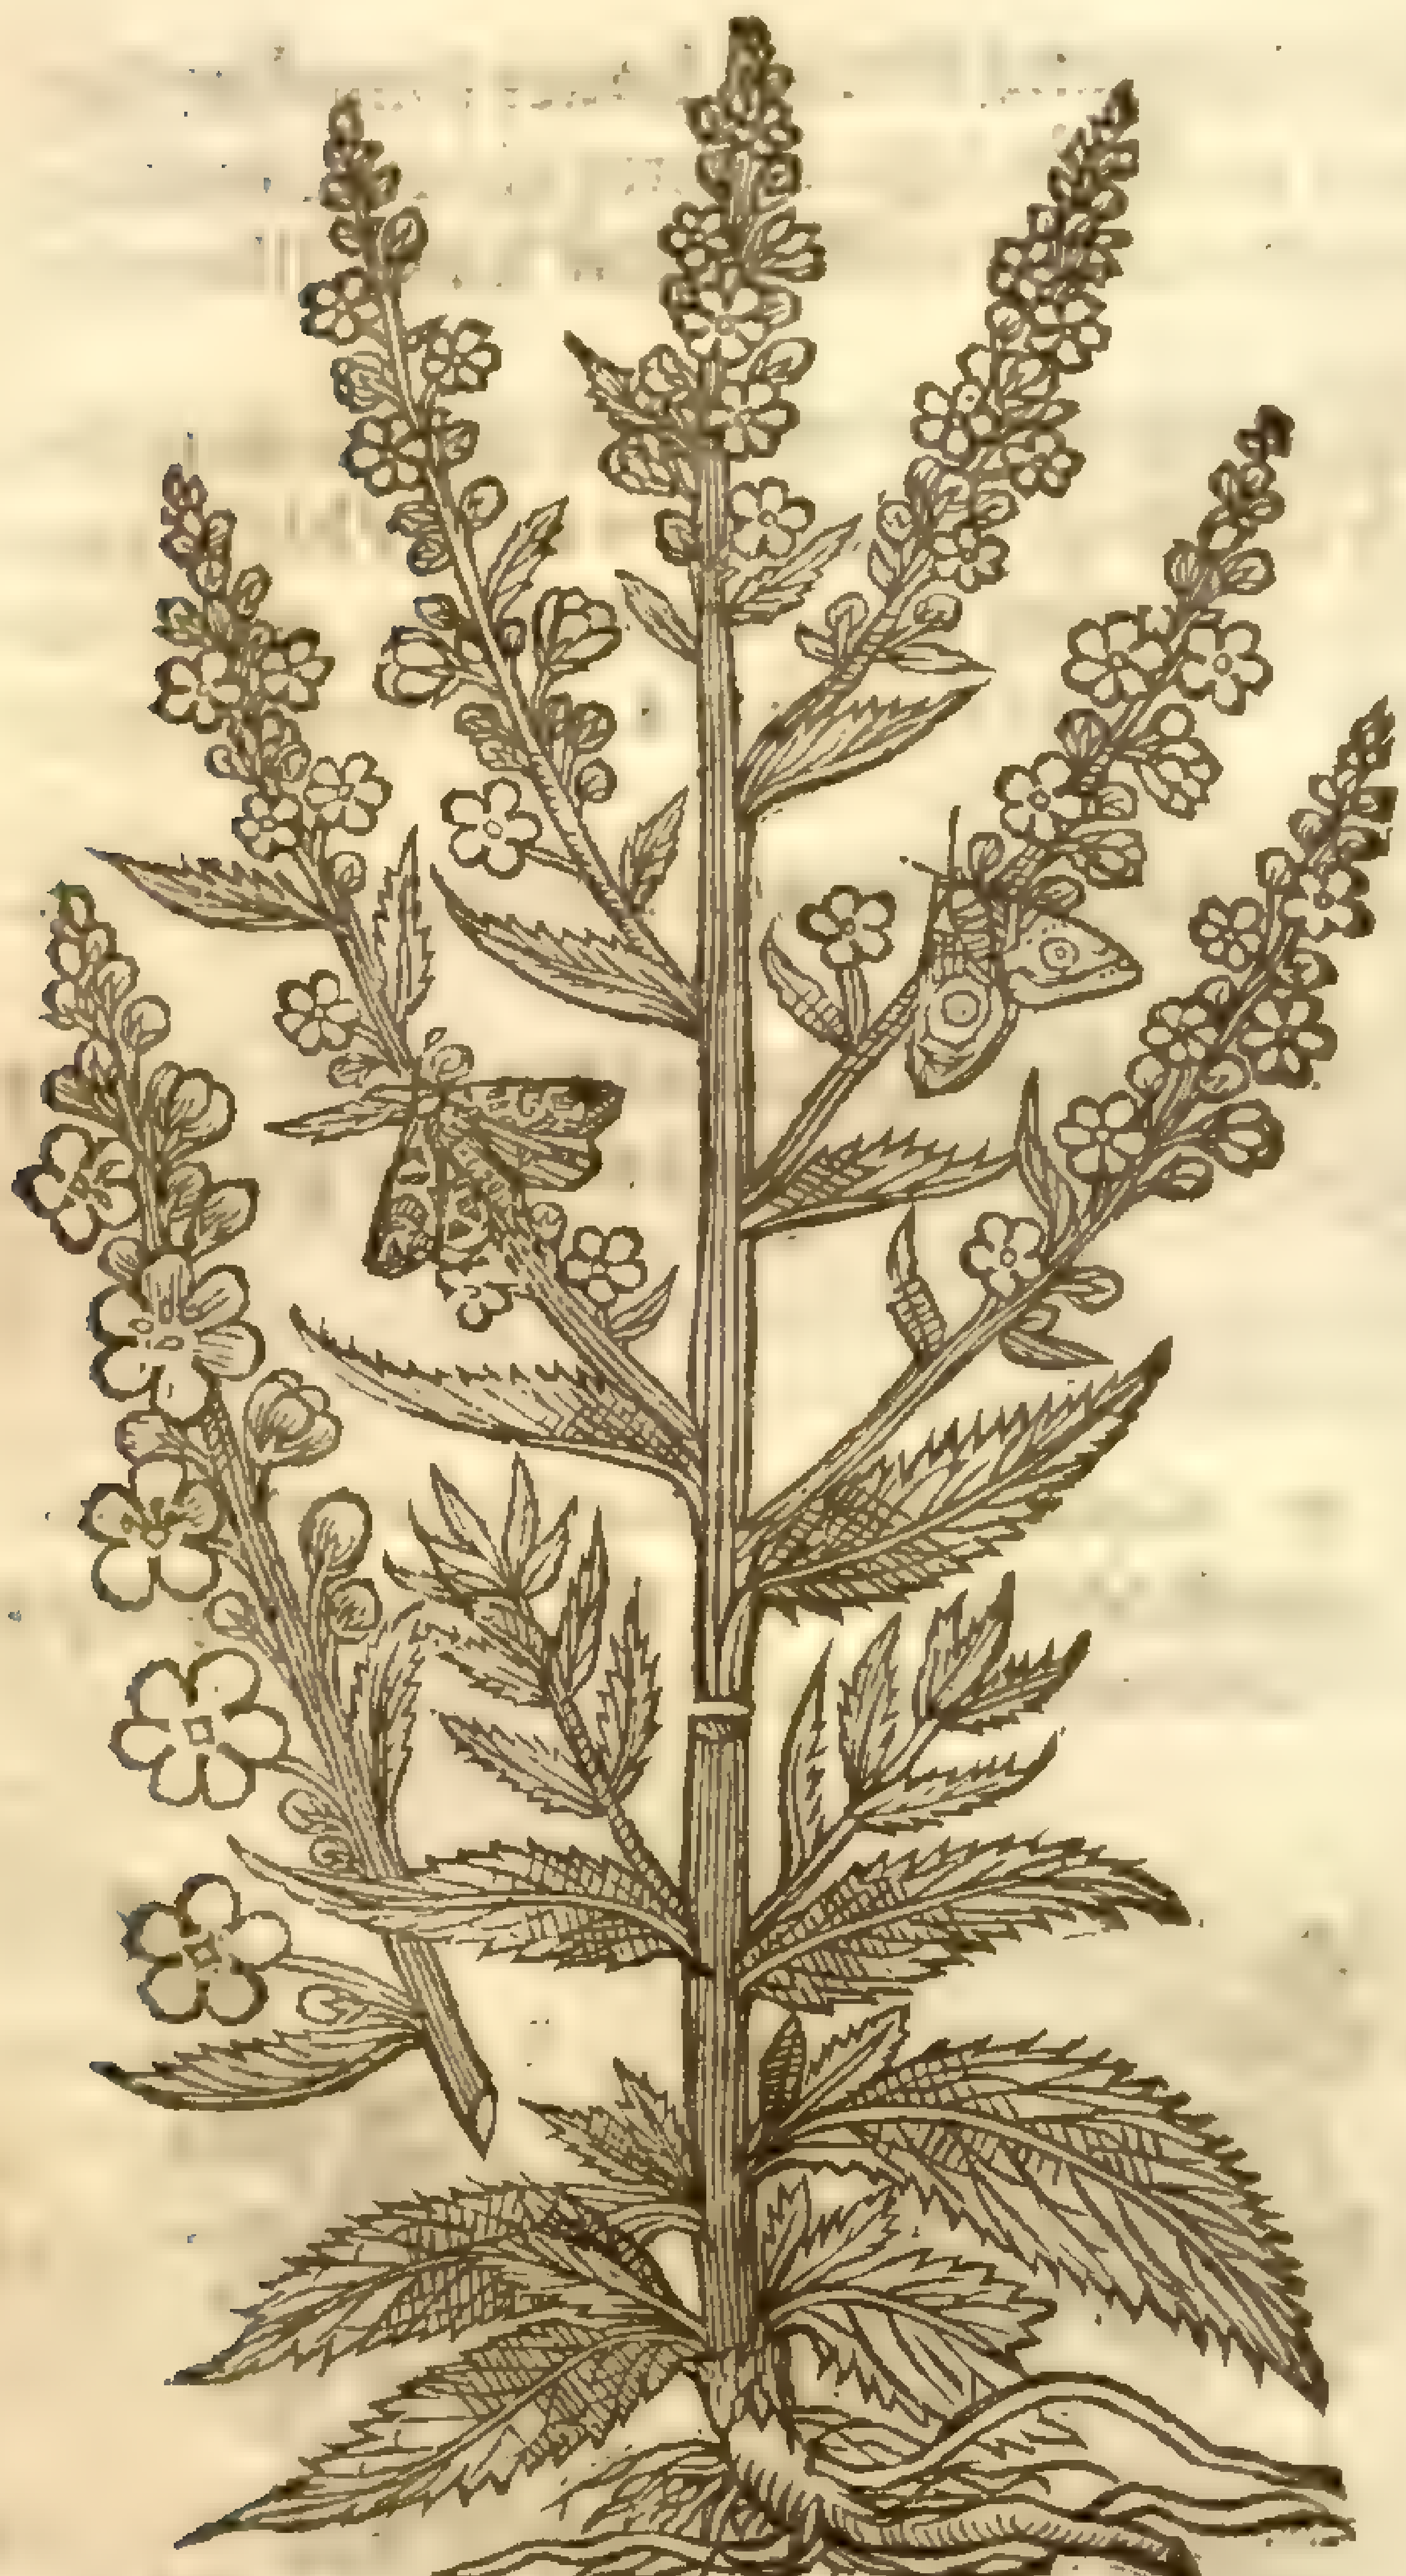


‡ 5 This is ſomewhat like the firſt deſcribed in leaues and ſtalks,but much leſſe,the floures alſo are of a whittiſh or grayiſh colour,wherein conſiſts the greateſt difference.

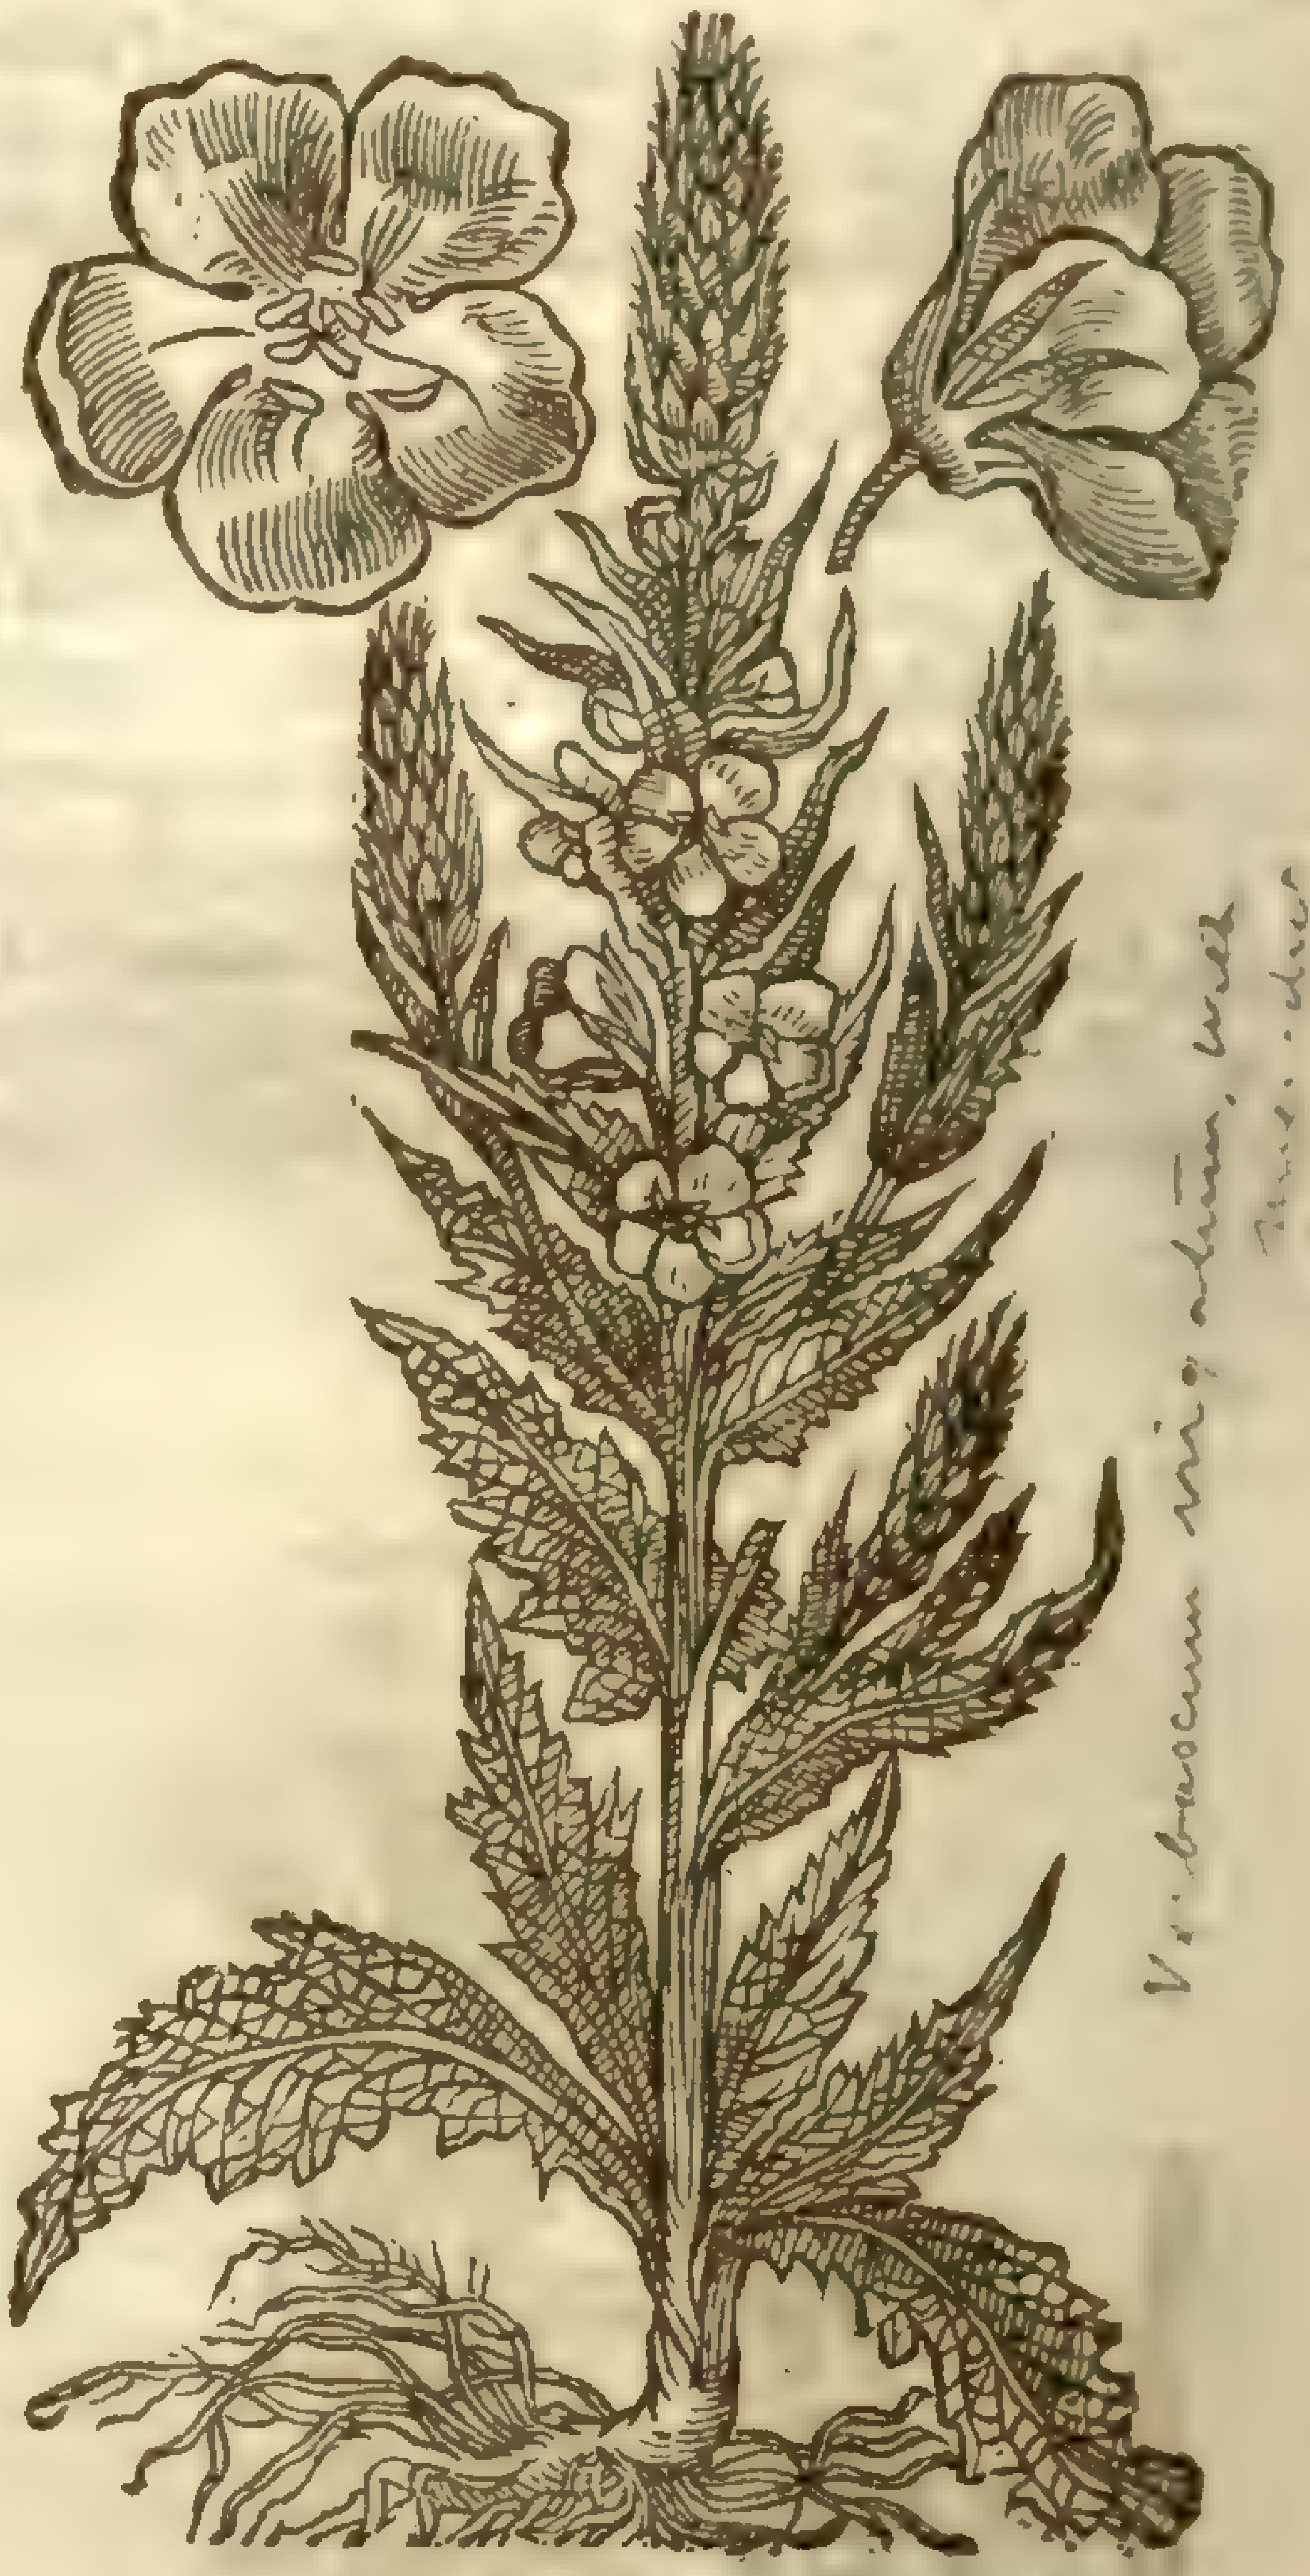
6 There is alſo another varietie of this kinde,which hath very faire and large floures,& theſe either of a bright yellow,or elſe of a purple colour.

7 This hath long narrow leaues like thoſe of the ſecond,ſnipt about the edges,and of a darke green colour:the ſtalks grow ſome 2 cubits high,and ſeldom ſend forth any branches; the floures are large and yellow, with rough threds in their middles tipt with red, and theſe grow in ſuch an order that they ſomwhat reſemble a fly: the ſeed is ſmall,and contained in round buttons. This is an Annuall,and periſheth when the ſeed is ripe. ‡

‡ 5 *Blattaria flore albo.*
White floured Moth Mullein.

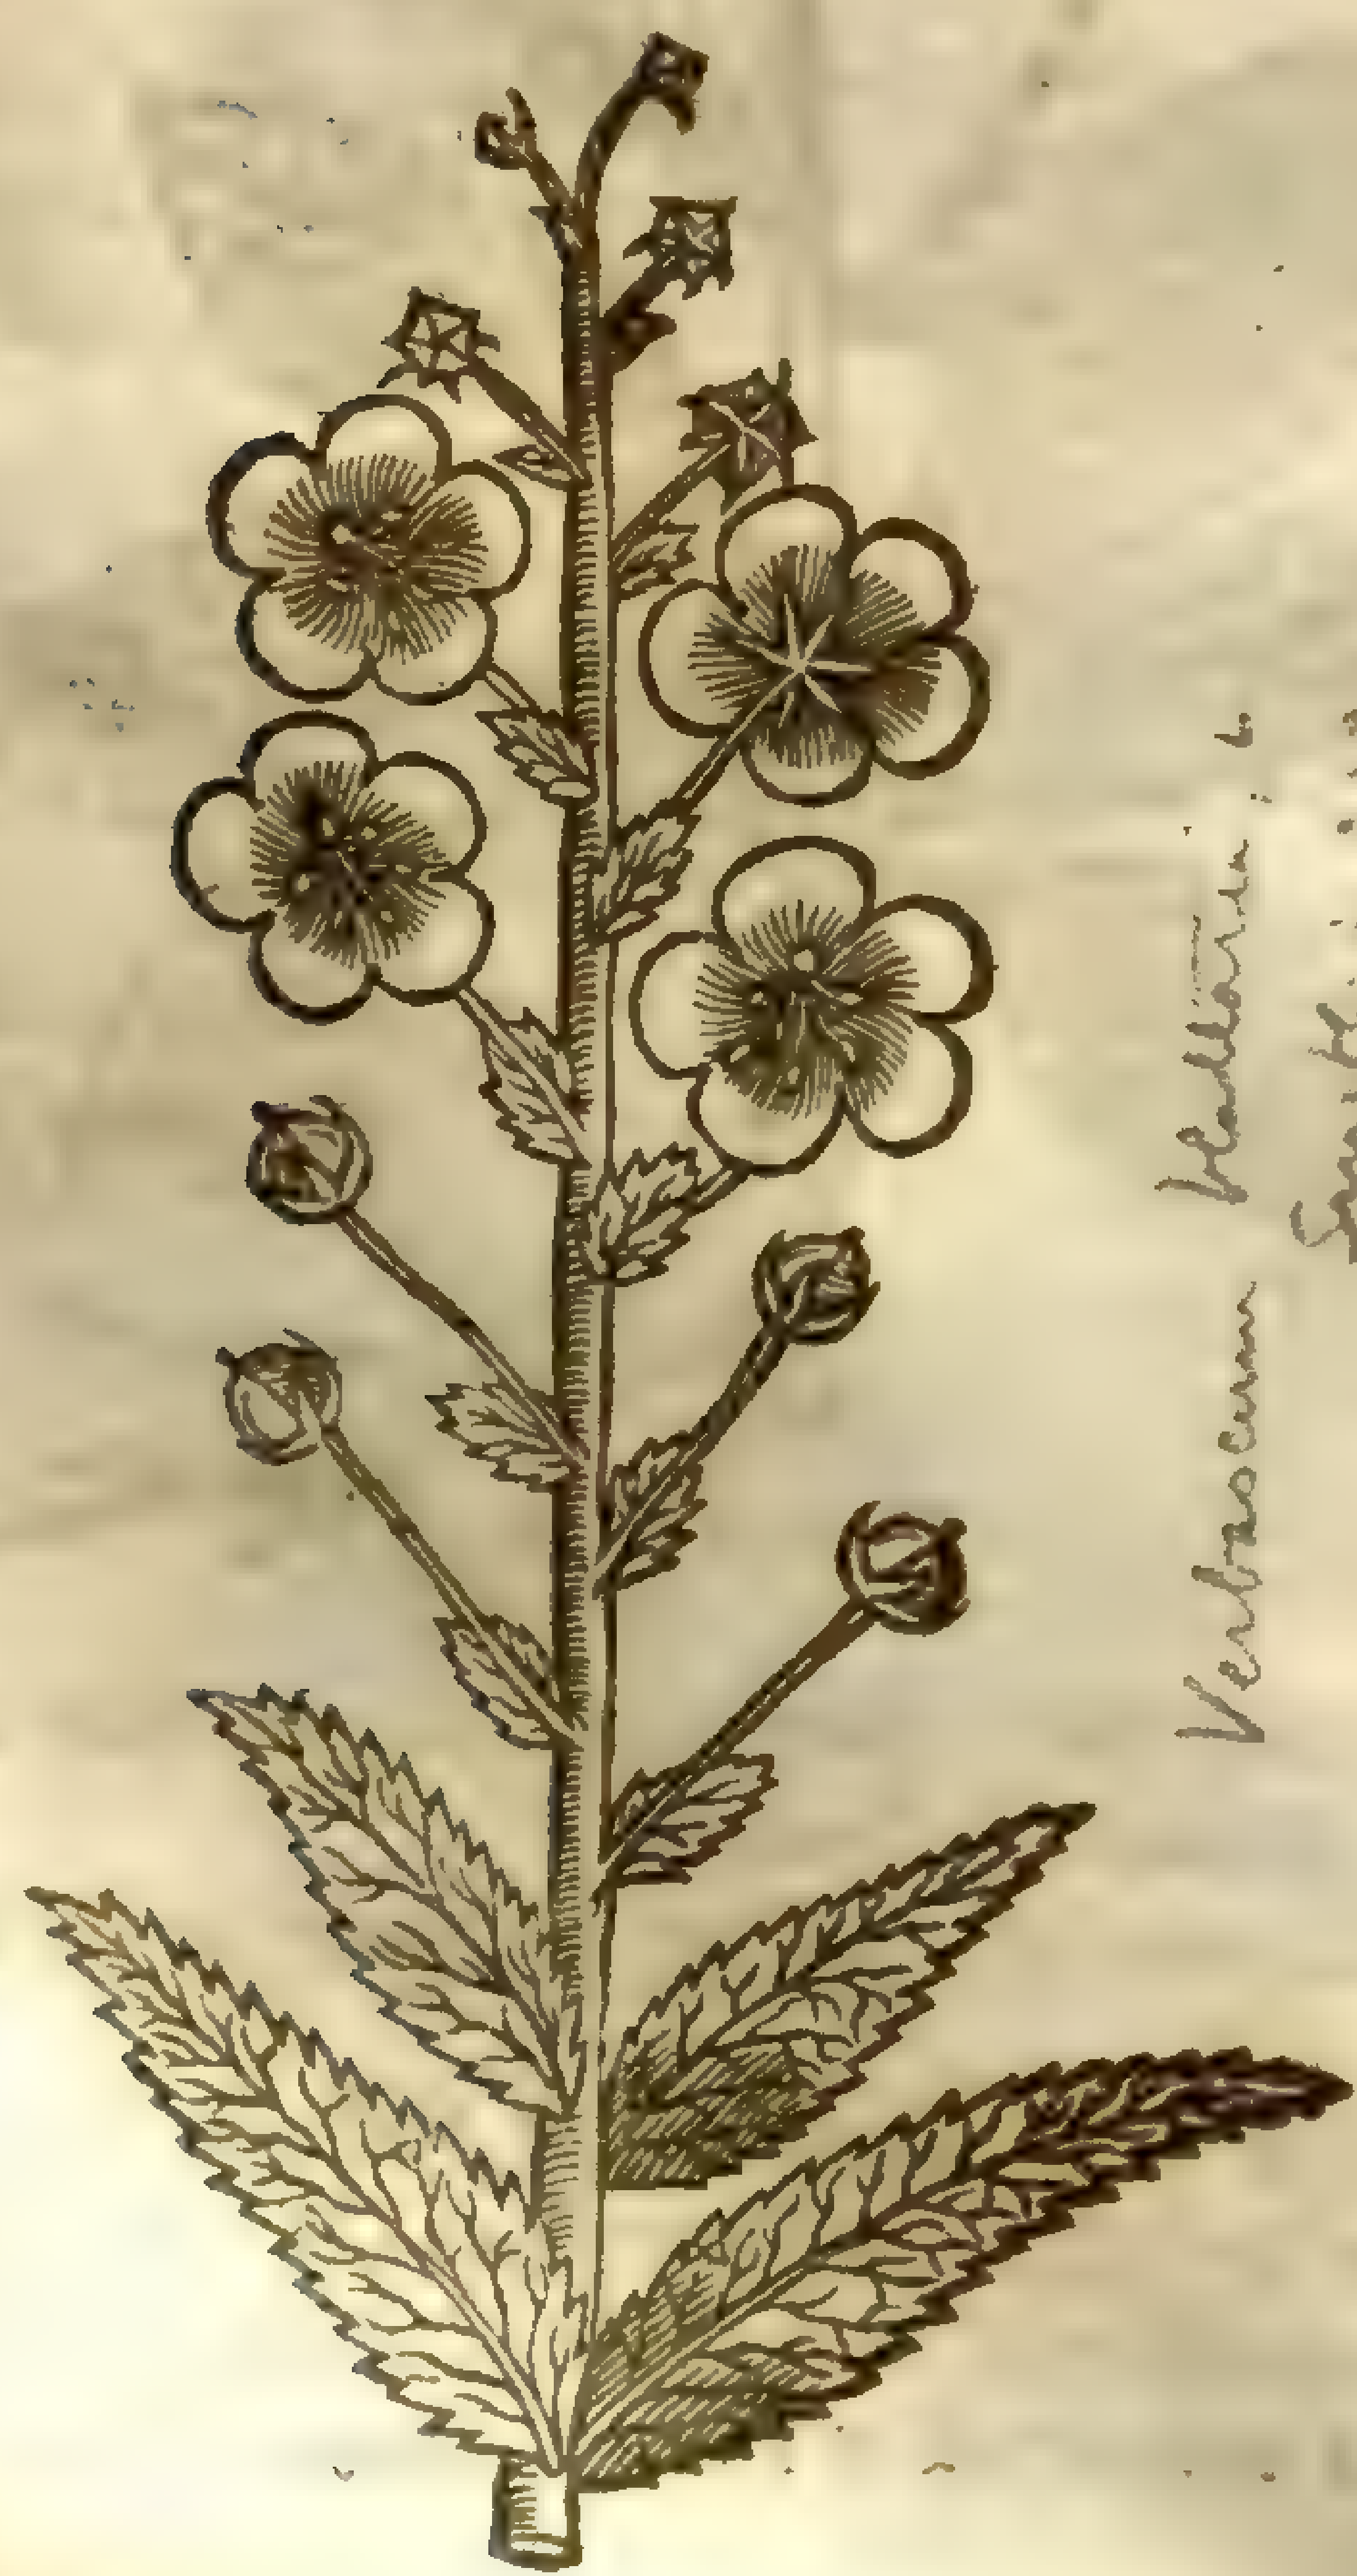


‡ 6 *Blattaria flore amplo.*
Moth Mullein with the great floure.



Verbascum nig: album, vel [illegible]

‡ 7 *Blattaria flore luteo.*
Yellow Moth Mullein.



Verbascum blattaria ; 6
Smith ; 312

¶ *The Place.*

† The firſt and fiſt of theſe grow wild in ſundry places, and the reſt only in gardens with vs.

¶ *The Time.*

They floure in Iuly and Auguſt.

¶ *The Names.*

The later herbariſts cal Moth Mullein *Blattaria*, and do truely take it to be that deſcribed by *Pliny, lib.22.cap.9.* in theſe words: [There is an herb like Mullein or *Verbaſcum nigrum*, which oftentimes deceiueth, being taken for the ſame, with leaues not ſo white, moe ſtalks, & with yellow floures (as we haue written) which do agree with black Mullein; but we haue not as yet learned by obſeruation, that they gather Moths and flies vnto them, as we haue ſaid.] *Valerius Cordus* names it *Verbaſcum Leptophyllon*, or narrow leafed Mullein: their ſeuerall titles ſet forth their Engliſh names.

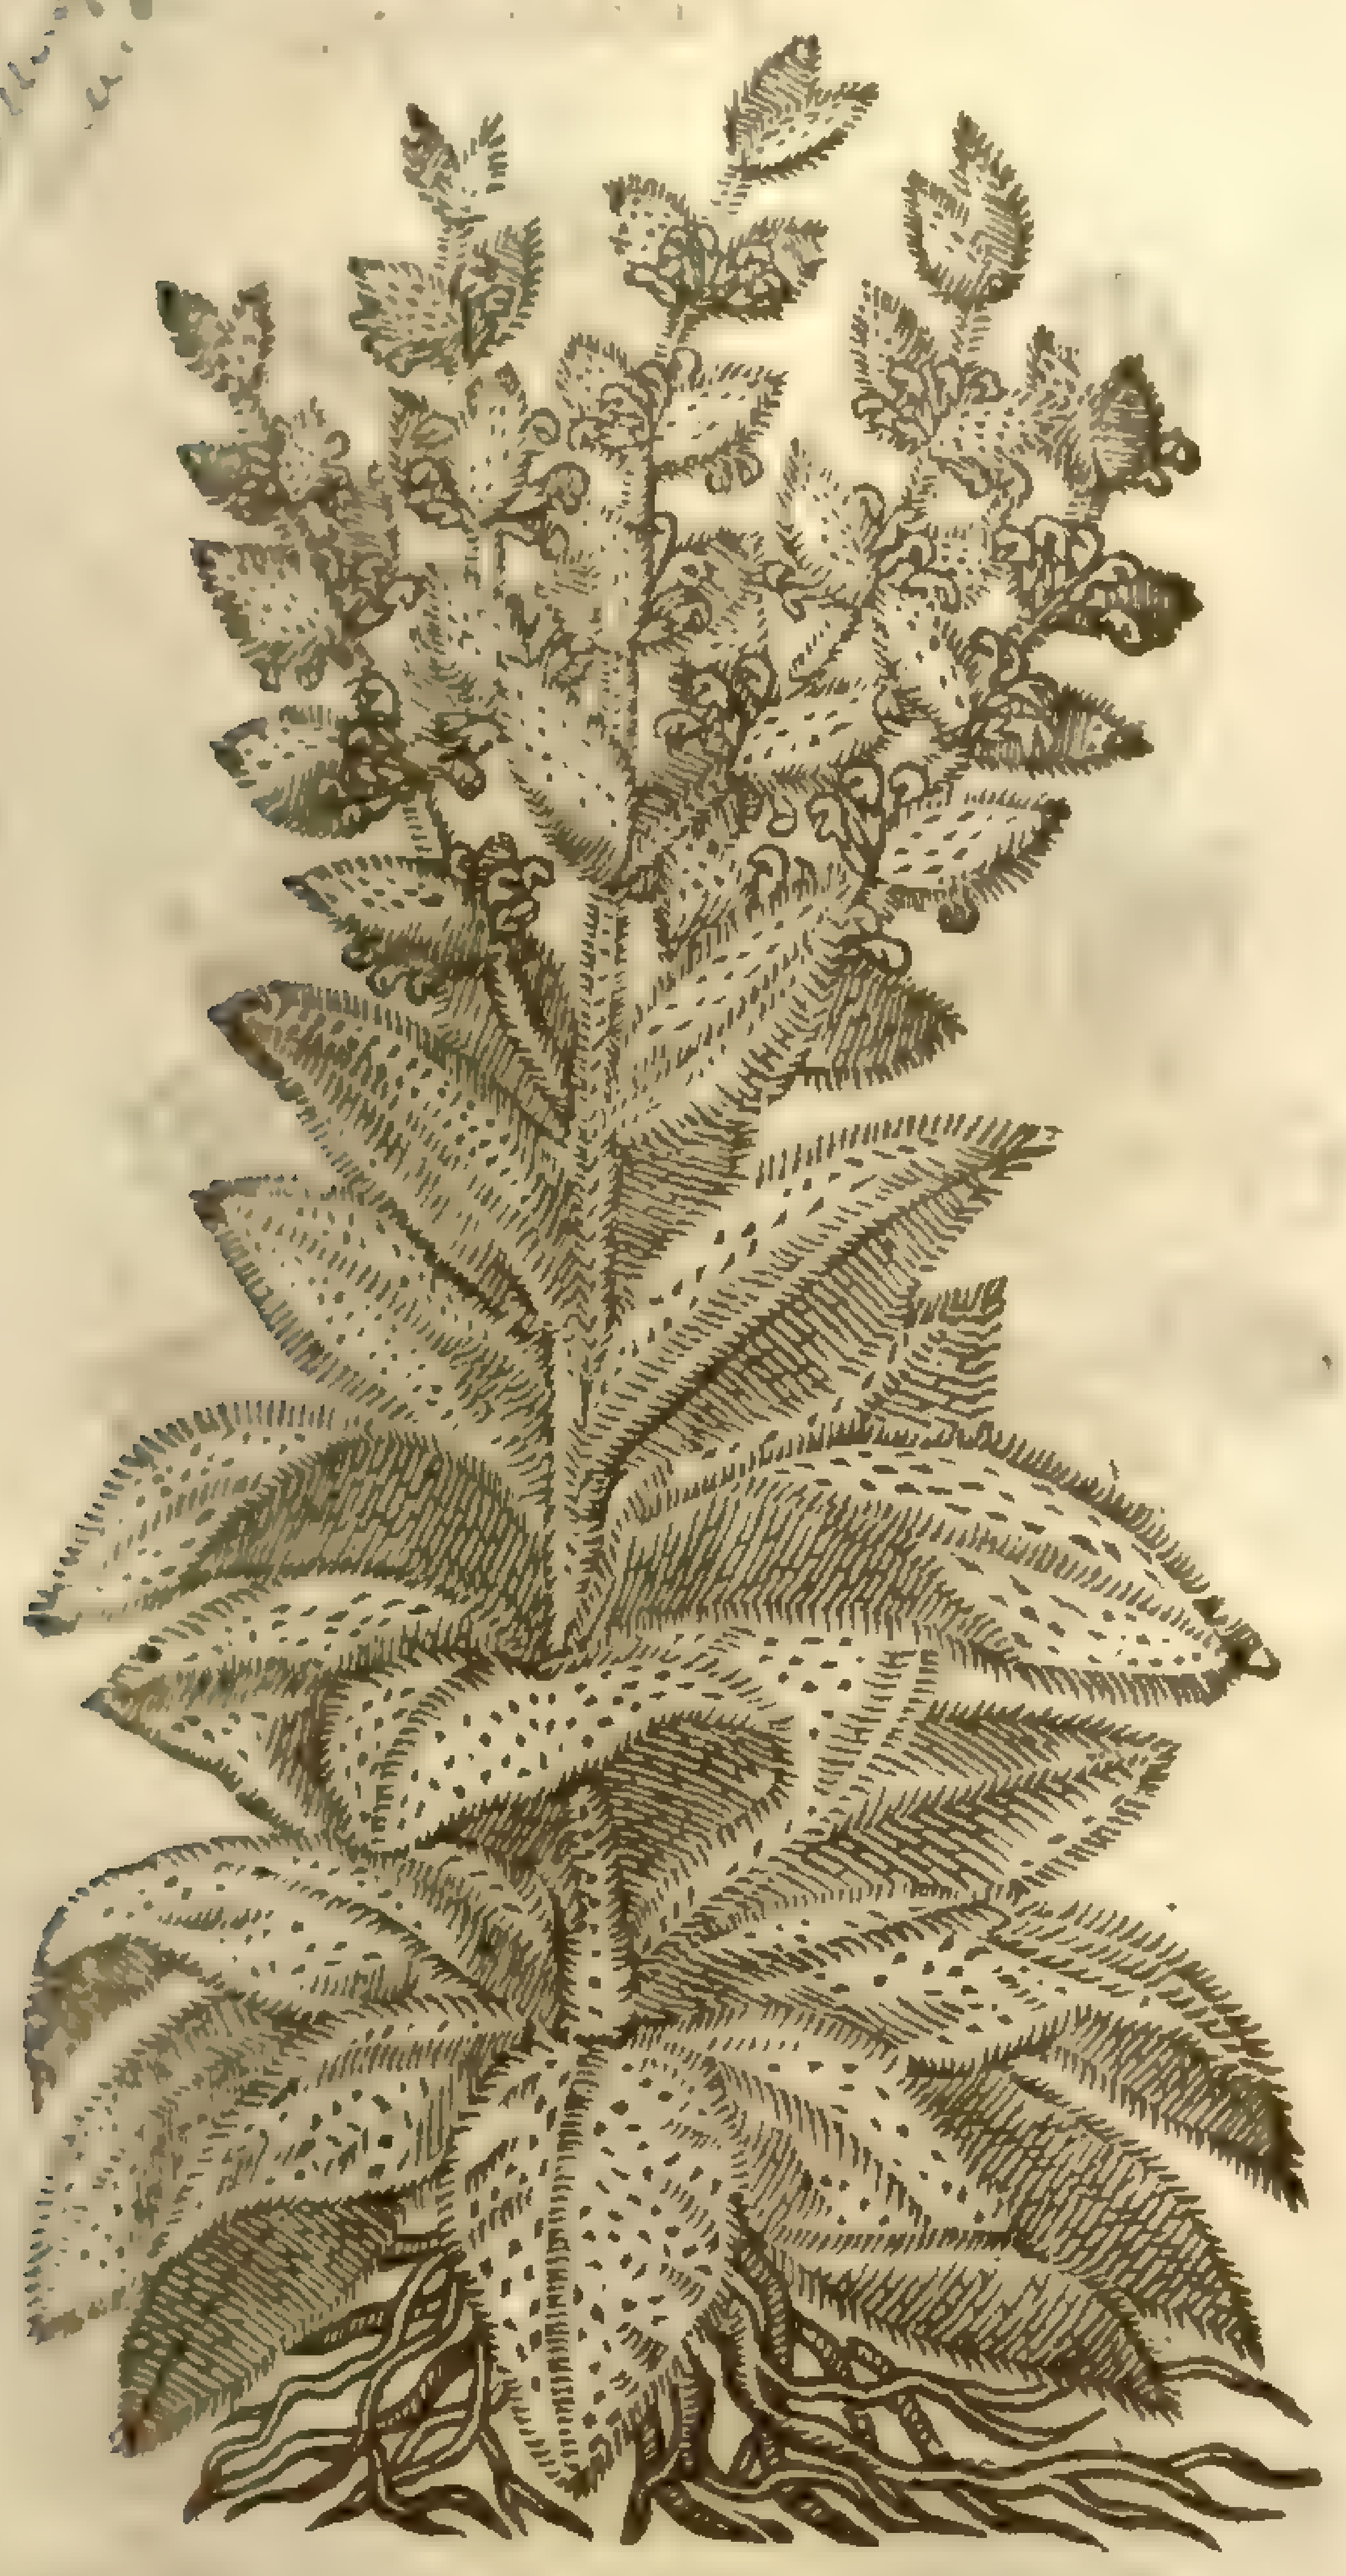
¶ *The Temperature and Vertues.*

A Concerning the plants intituled *Blattaria*, or Moth Mulleins, I find nothing written, but that Moths and Butter-flies, and all other ſmall flies and bats, do reſort to the place where theſe herbs are layd or ſtrewed.

B ‡ The decoction of the floures or leaues of the firſt deſcribed opens the obſtructions of the bowels and meſeraick veines, as *Camerar.* affirmes. ‡

Chap. 272. *Of Mullein of Ethiopia.*

Æthiopis.
Ethyopian Mullein.



¶ *The Deſcription.*

MVllein of Ethiopia hath many very broad hoary leaues ſpred vpon the ground, verie ſoft and downy, or rather woolly like thoſe of Hygtaper, but farre whiter, ſofter, thicker, and fuller of woollineſſe, which wooll is ſo long, that one may with his fingers pull the ſame from the leaues, euen as wool is pulled from a ſheeps skin: amongſt which leaues riſeth vp a foure ſquare downy ſtalk ſet with the like leaues, but ſmaller; which ſtalk is diuided at the top into other branches, ſet about and orderly placed by certain diſtances, hauing many floures like thoſe of Archangell, of a white colour tending to blewneſſe: which being paſt, there ſucccedeth a three ſquare brown ſeed: the root is black, hard, and of a woody ſubſtance.

¶ *The Place.*

It groweth naturally in Ethyopia, and in Ida a hill by Troy, and in Meſſenia a prouince of Morea, as *Pliny* ſheweth, *lib.* 27. *cap.* 4. it alſo growes in Meroë an Iſland in the riuer Nilus; and alſo in my garden.

¶ *The Time.*

It floureth and flouriſheth in Iune, and perfecteth his ſeed in Auguſt.

¶ *The Names.*

It is called in Greeke αἰθιοπὶς: and in Latine *Æthiopis*, of the countrey; and for that cauſe it is likewiſe called *Meroides*, of *Meroë*, as *Pliny* writeth: of ſome, becauſe the Greeke word αἴθω ſignifies in Latine *Fauilla aduſta*, or *Cinere aſperſa*, or couered with aſhes: in Engliſh wee may call it Mullein of Ethyopia, or woolly Mullein.

¶ *The Temperature.*

Æthiopis is dry, without any manifeſt heate.

¶ *The Vertues.*

A *Æthiopis* is good againſt the Pleuriſie, and for thoſe that haue their breſts charged with corrupt and rotten matter, and for the aſperitie and roughneſſe of the throat, and againſt the Sciatica, if one drinke the decoction of the root thereof.

B For the diſeaſes of the breſt and lungs it is good to licke oftentimes of a confection made with the root hereof and hony, and ſo are the roots condited with ſugar, in ſuch manner as they condite the roots of Eringos.

Chap. 273. *Of Cowſlips.*

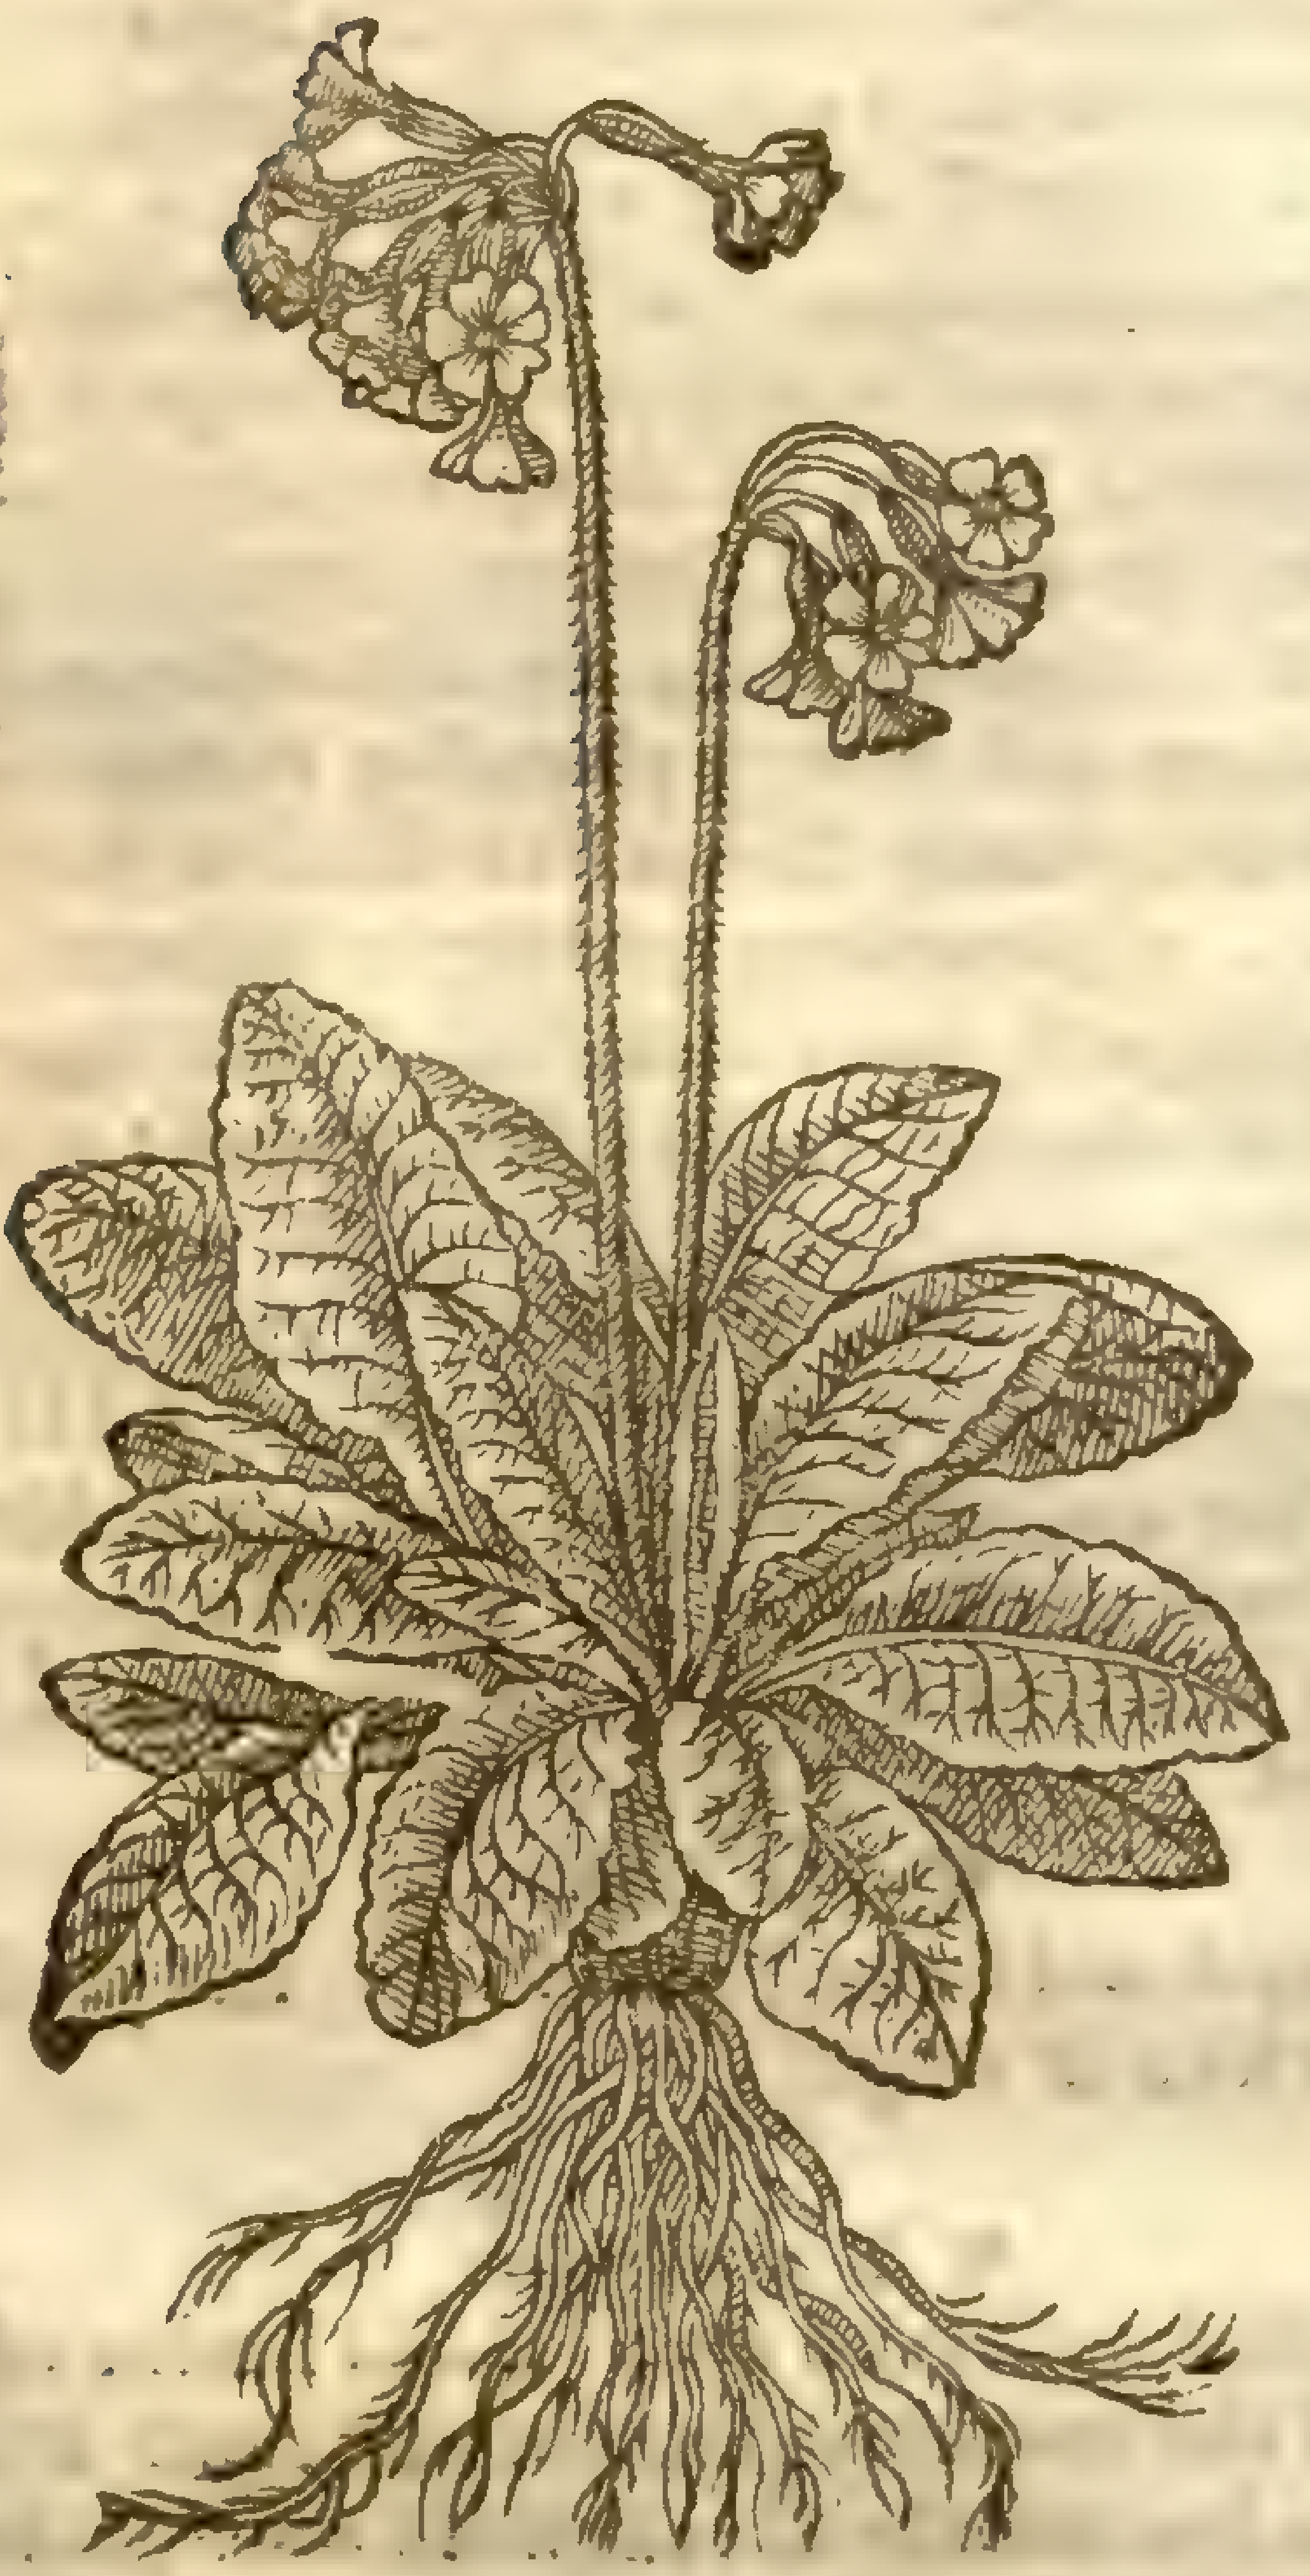
¶ *The Deſcription.*

1 THoſe herbs which at this day are called Primroſes, Cowſlips, and Oxlips, are reckoned among the kindes of Mulleins; notwithſtanding for diſtinctions ſake I haue marſhalled them in a chapter, comming in the rereward as next neighbors to the Mulleins, for that the Antients haue named them *Verbaſculi*, that is to ſay, ſmall Mulleins. The firſt, which is called in Engliſh the field Cowſlip, is as common as the reſt, therefore I ſhal not need to ſpend much time about the deſcription.

2 Theſecond is likewiſe well knowne by the name of Oxlip, and differeth not from the other

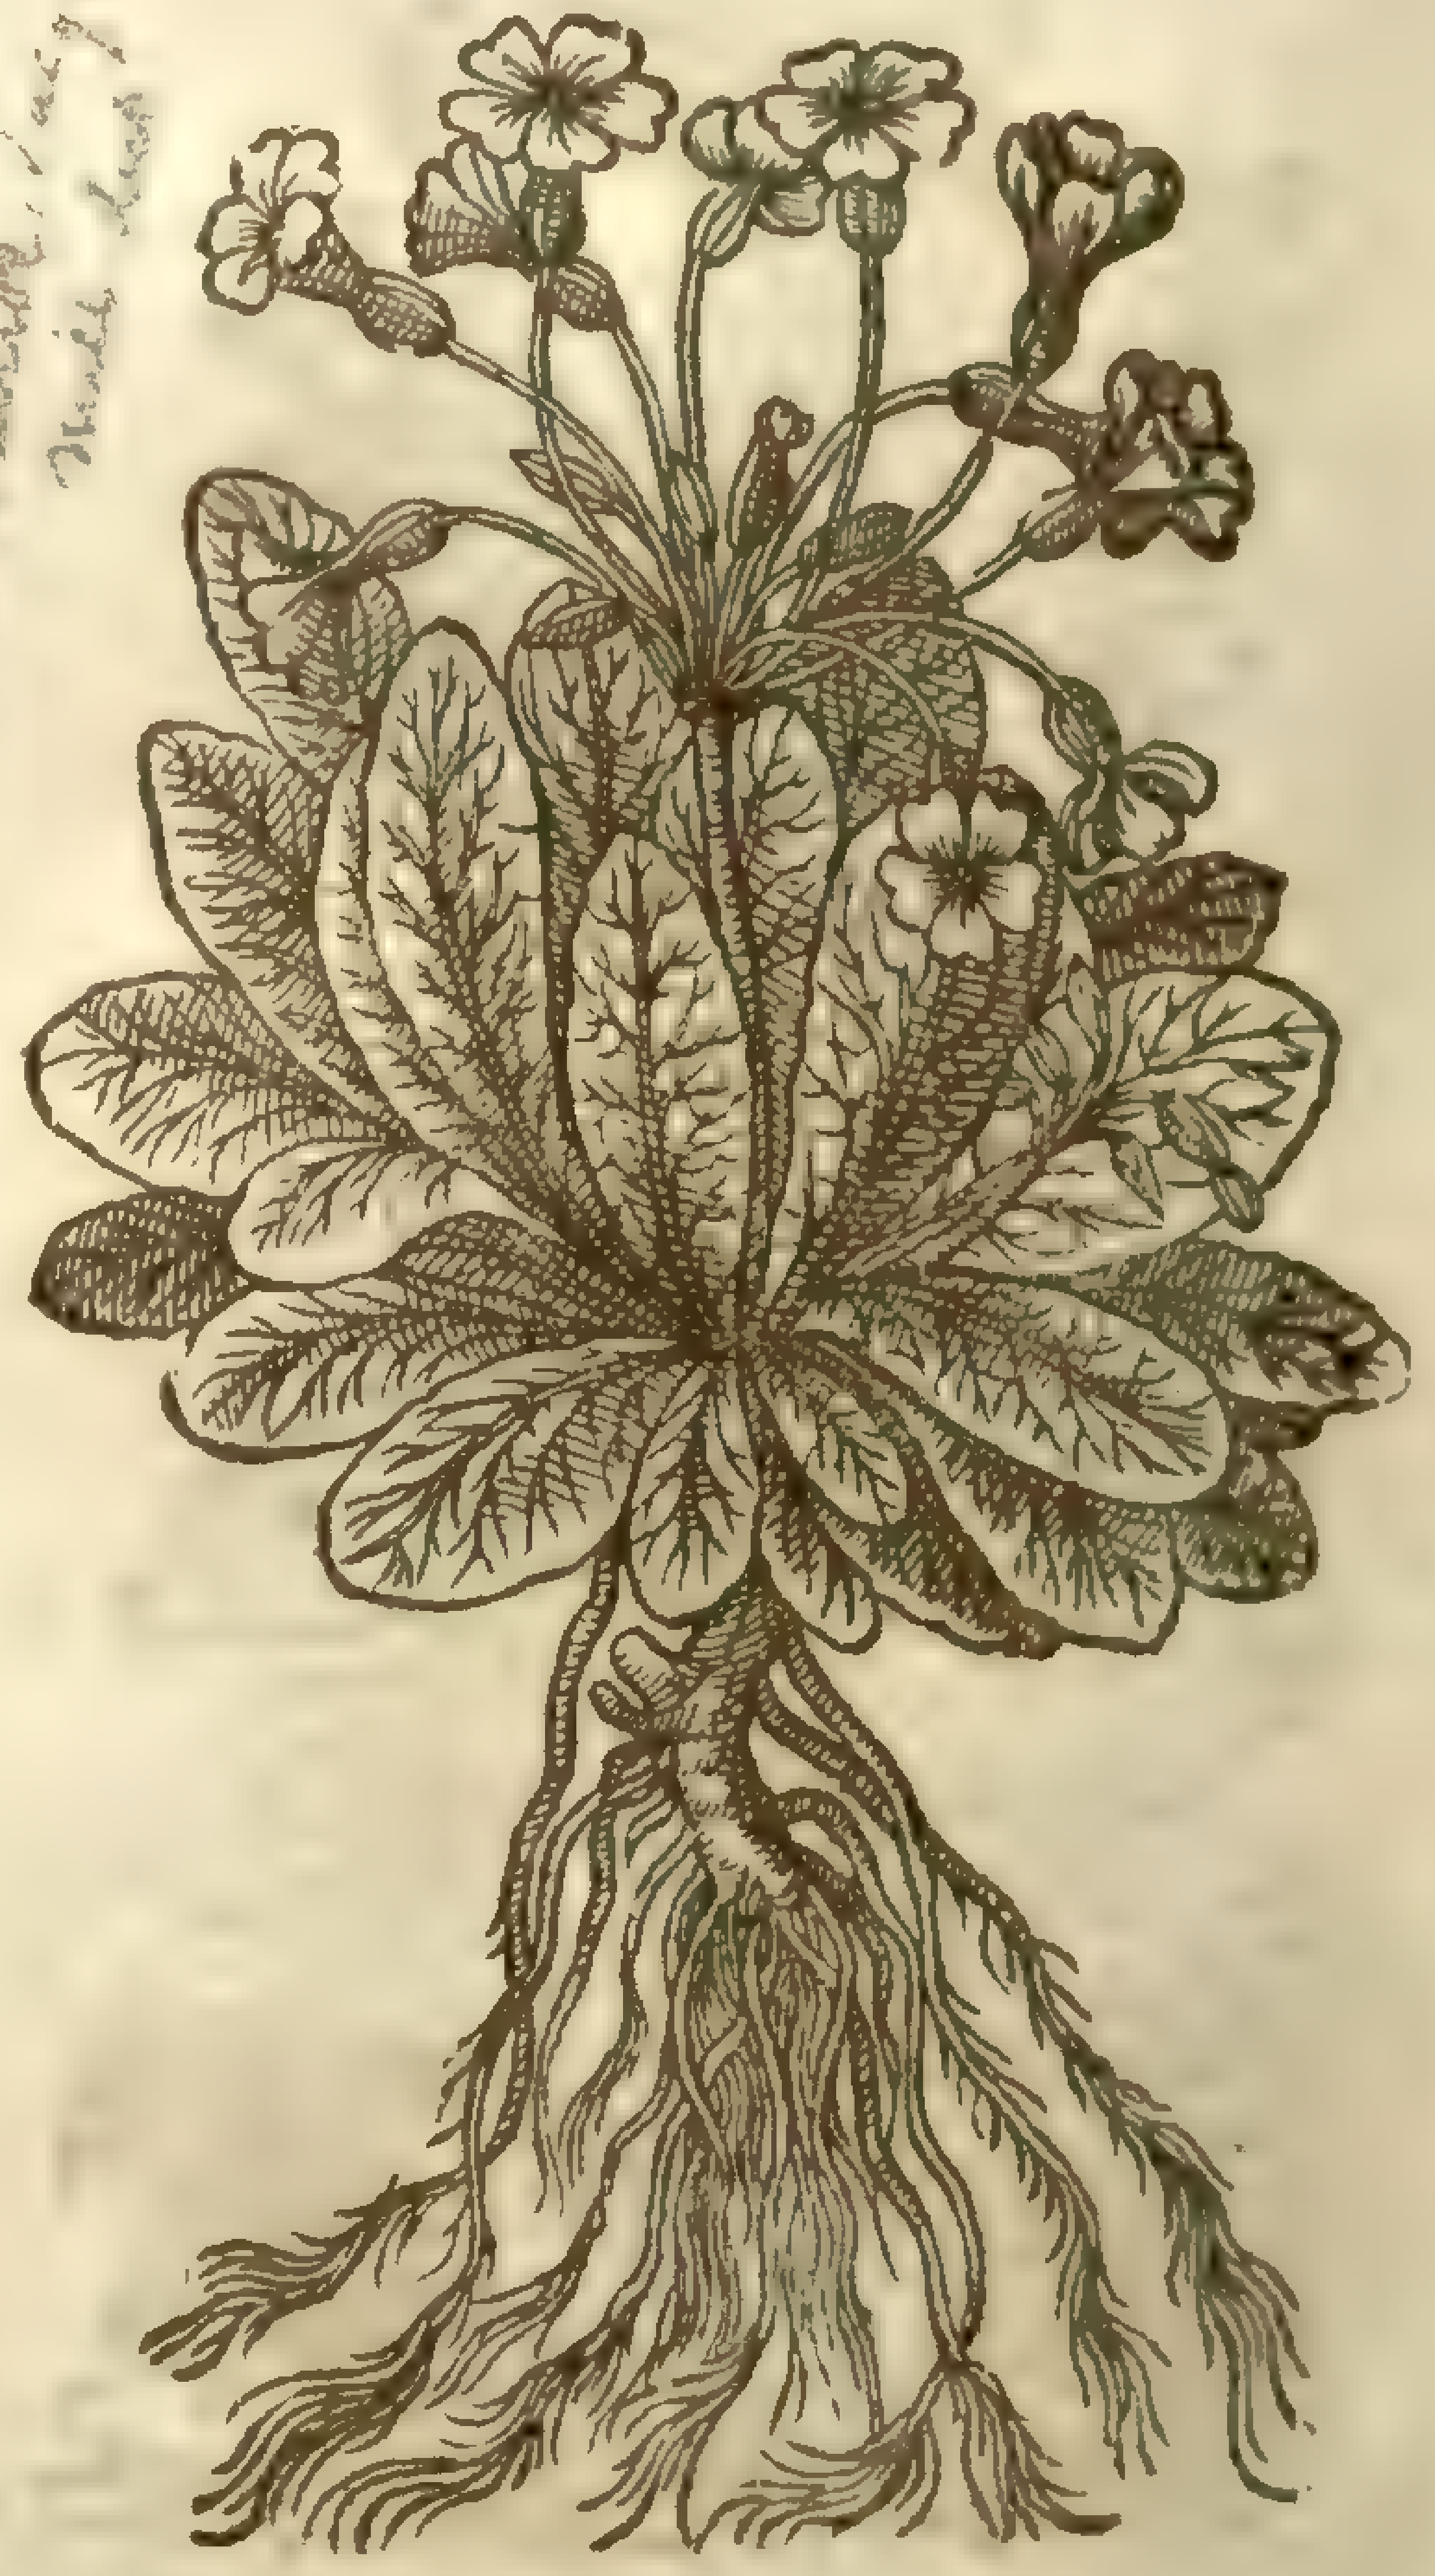
ſaue that the floures are not ſo thicke thruſt together,and they are fairer,and not ſo many in number,and do not ſmell ſo pleaſant as the other : of which kind we haue one lately come into our gardens,whoſe floures are curled and wrinkled after a moſt ſtrange maner,which our women haue named Iack-an-apes on horſebacke.

1 *Primula veris maior.*
Field Cowſlips.



P. veris, L. Sm. [illegible] 27 ; = Primula [illegible] [illegible], Jacq. [illegible]

2 *Primula pratenſis inodorata lutea.*
Field Oxlips.



Primula elatior, Jacq. [illegible]

3 Double Paigle,called of *Pena*, *Primula hortenſis Anglica omnium maxima, & ſerotina floribus plenis* ; that is,The greateſt Engliſh garden Cowſlip with double yellow floures, is ſo commonly knowne that it needeth no deſcription.

4 The fourth is likewiſe known by the name of double Cowſlips,hauing but one floure within another,which maketh the ſame once double, where the other is many times double,called by *Pena*,*Geminata*,for the likeneſſe of the floures,which are brought forth as things againſt nature, or twinnes.

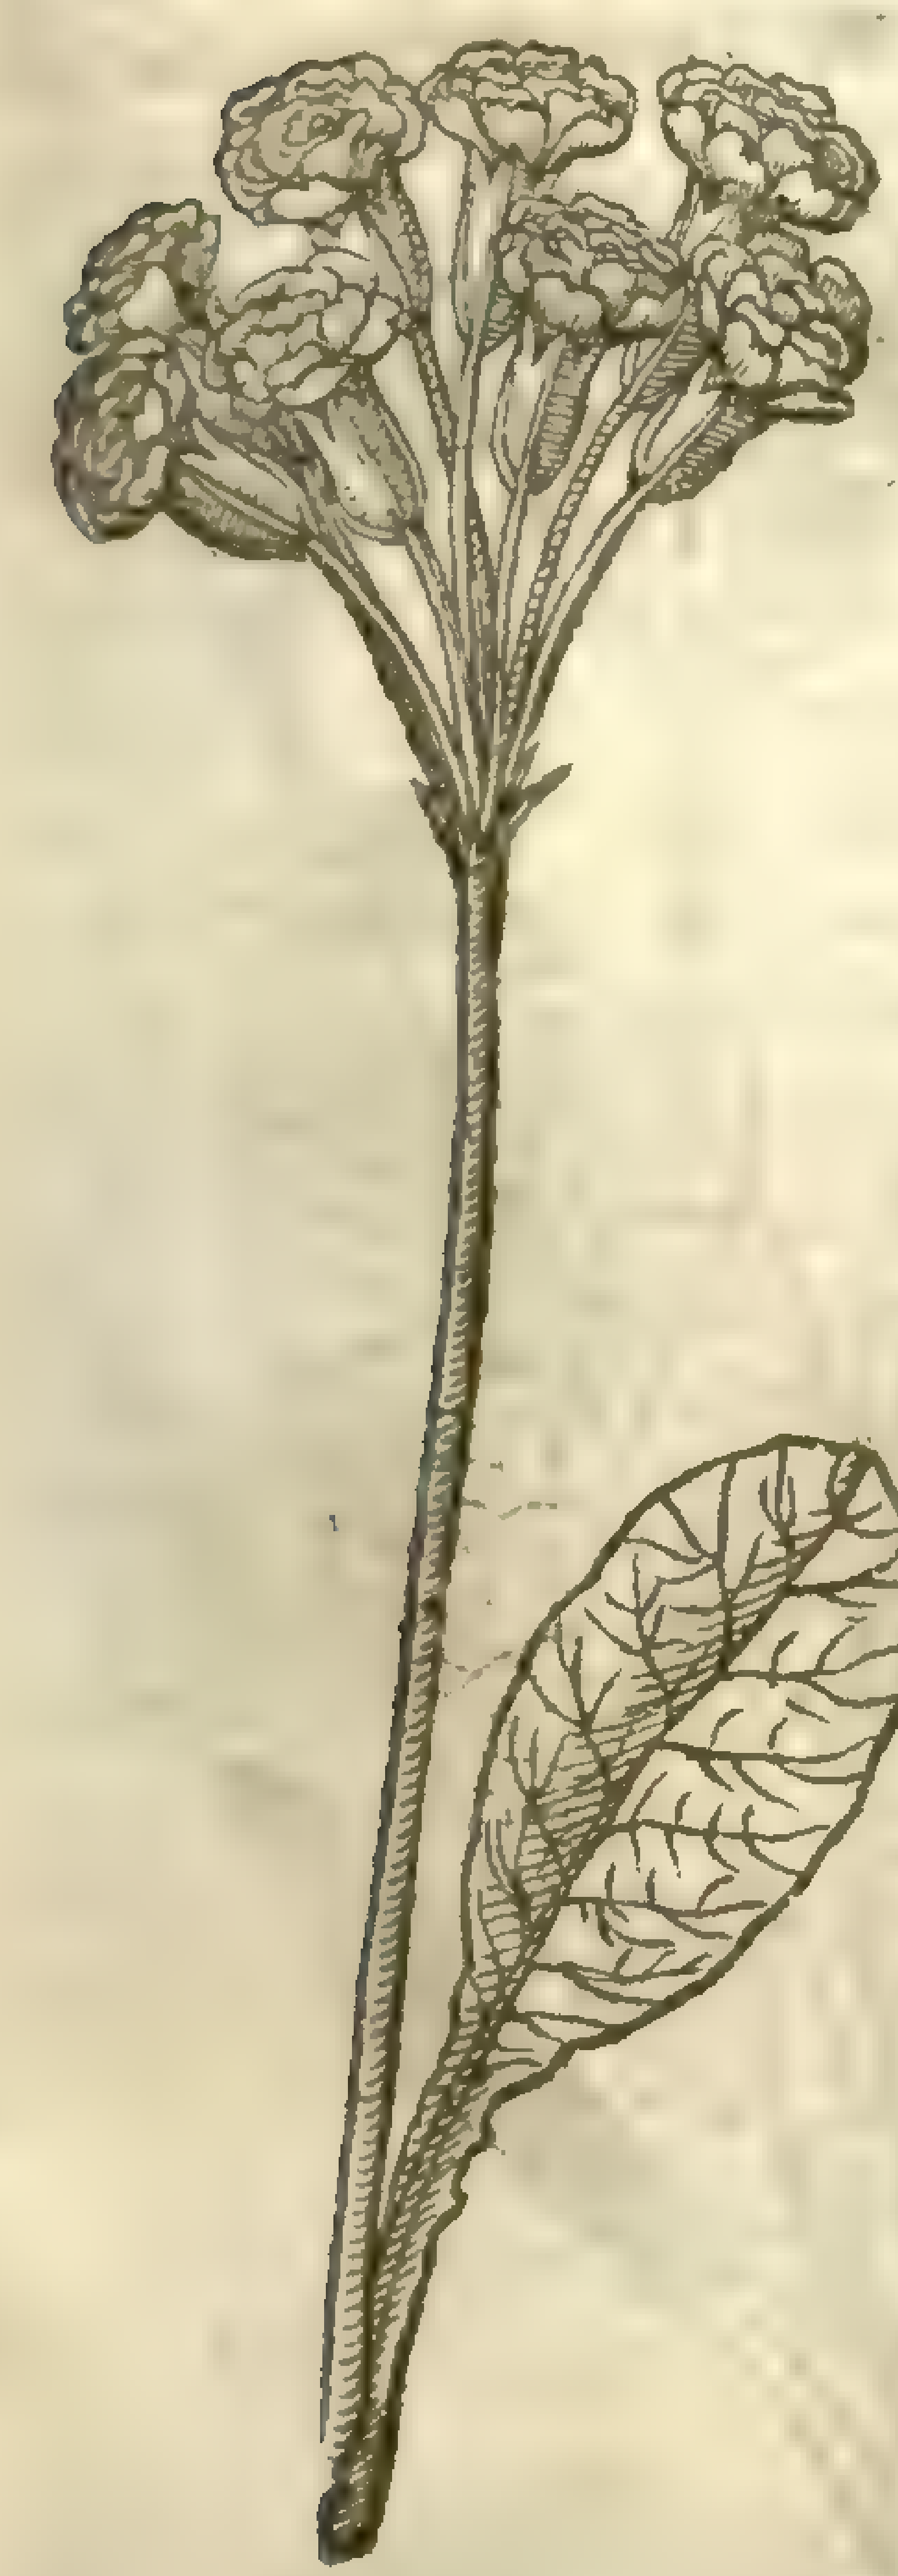
5 The fifth being the common whitiſh yellow field Primroſe,needeth no deſcription.

6 The ſixth, which is our garden double Primroſe, of all the reſt is of greateſt beauty,the deſcription whereof I refer vnto your owne conſideration.

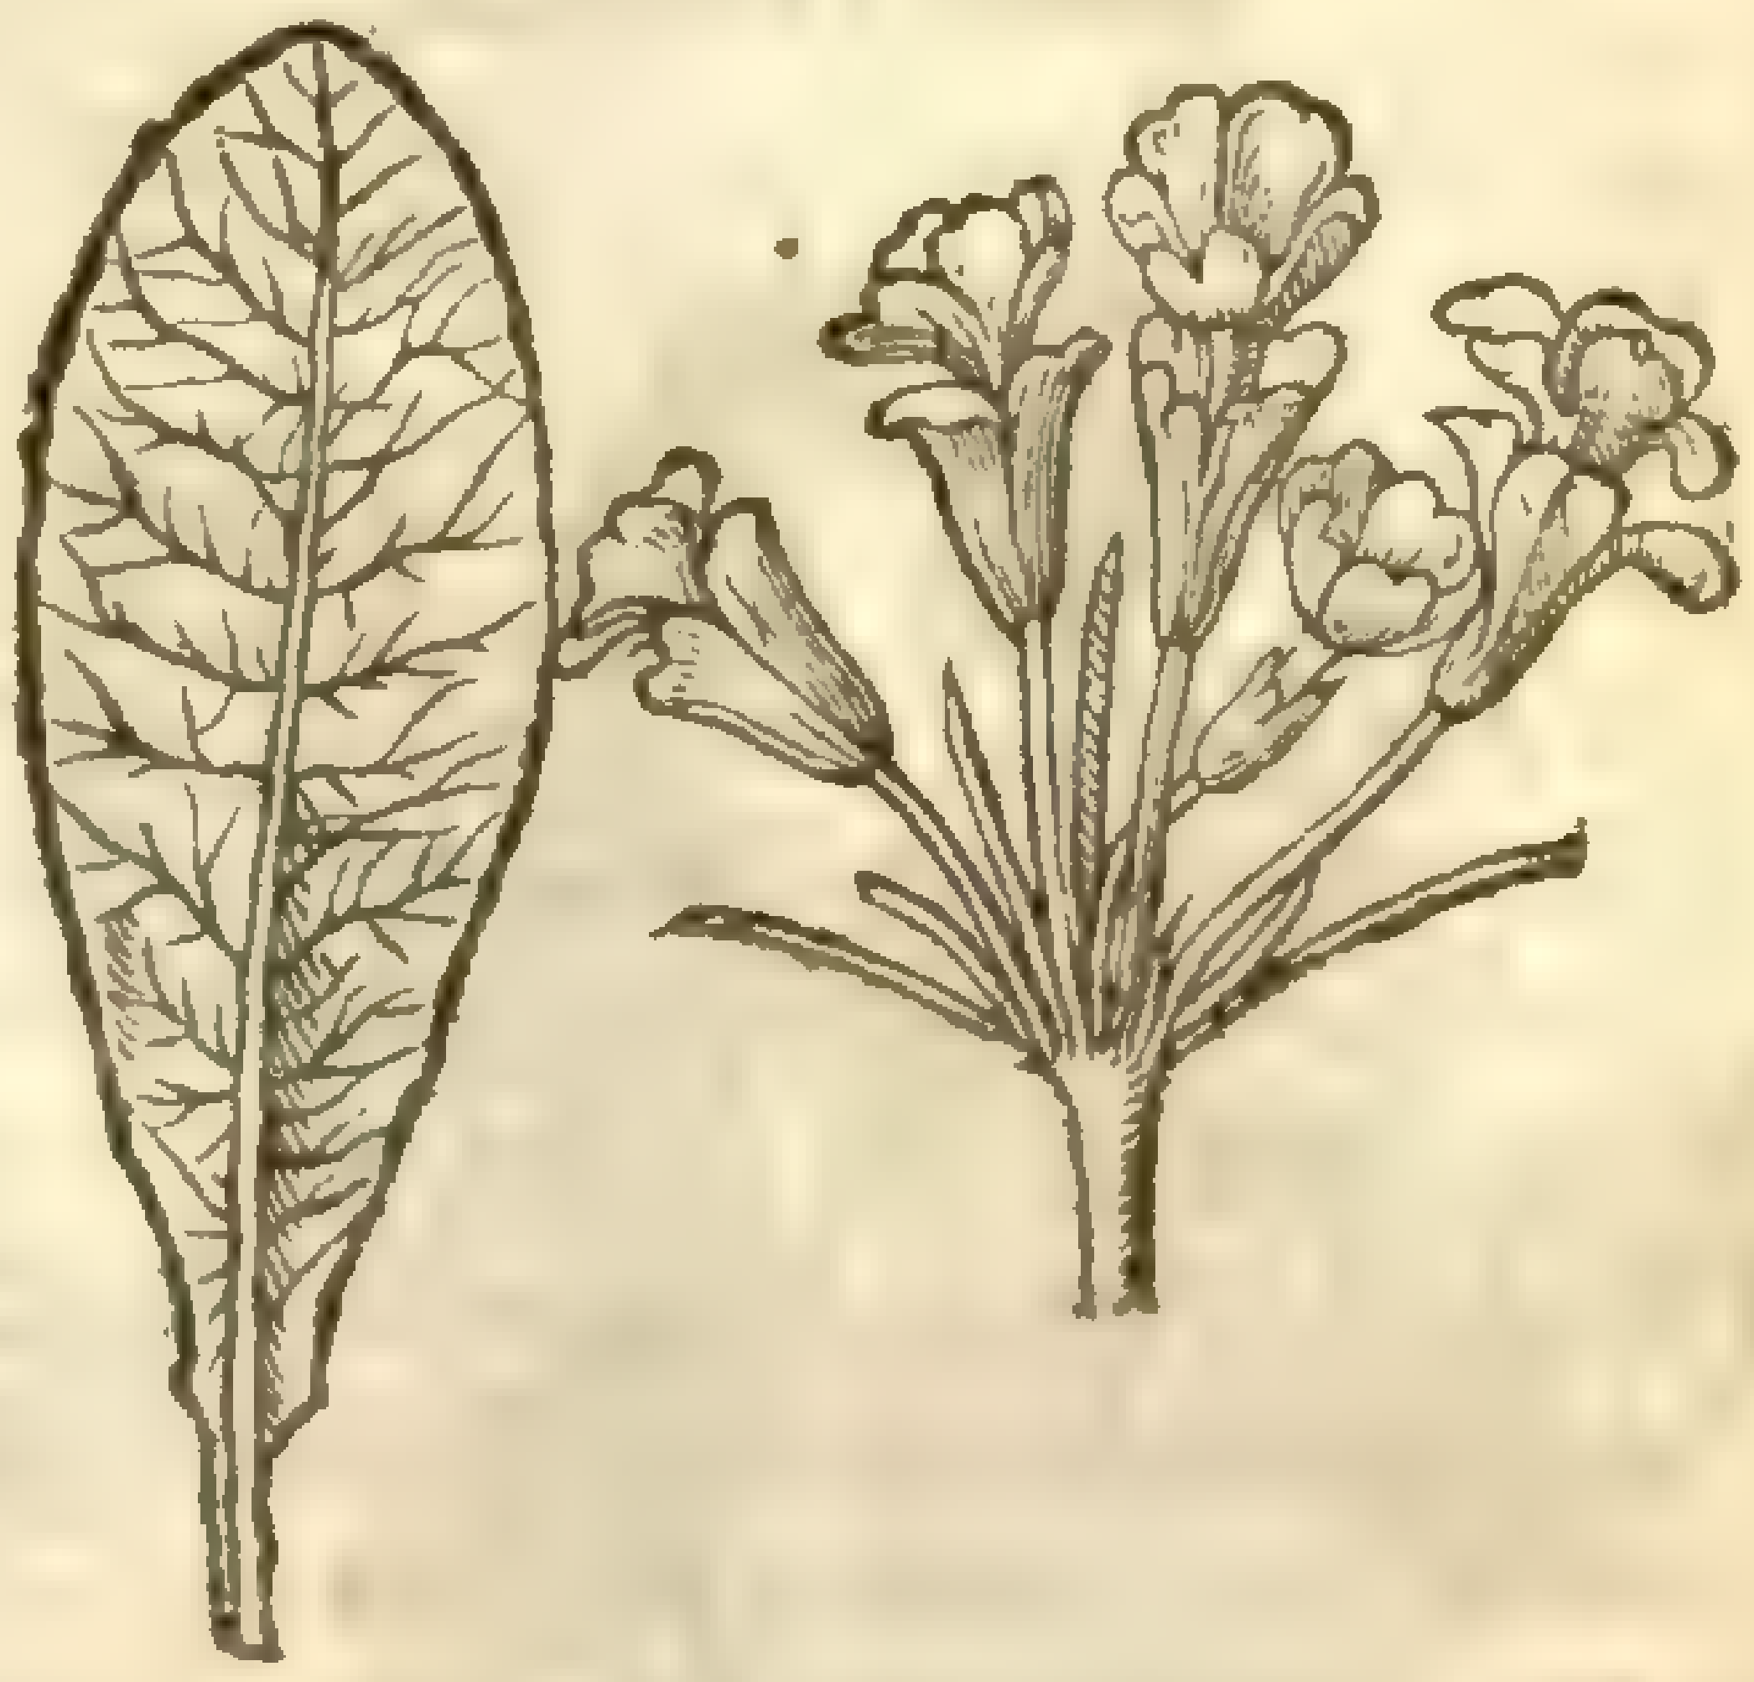
7 The ſeuenth is alſo very well known,being a Primroſe with greeniſh floures ſomwhat welted about the edges ; for which cauſe *Pena* hath called it *Siluarum primula,floribus obſcure verentibus fimbriatis*.

There is a ſtrange Primroſe found in a wood in Yorkſhire growing wilde,by the trauel and induſtry of a learned gentleman of Lancaſhire called M^r *Tho. Hesketh*, a diligent ſearcher of Simples, who hath not only brought to light this amiable and pleaſant Primroſe, but many others alſo, neuer before his time remembred or found out. This kind of Primroſe hath leaues and roots like the wilde field Primroſe in each reſpect : it bringeth forth among the leaues a naked ſtalk of a grauiſh or ouerworne greeniſh colour,at the top whereof doth grow in the Winter time one floure and no more,like vnto that ſingle one of the field : but in the Summer time it bringeth forth a ſoft ruſſet huske or hoſe,wherein are contained many ſmal floures, ſomtimes foure or fiue,many times more, very thicke thruſt together,which make one entire floure,ſeeming to be one of the common double Primroſes,whereas indeed it is one double floure,made of a number of ſmall ſingle floures, neuer ceaſing to beare floures winter nor ſummer,as before is ſpecified.

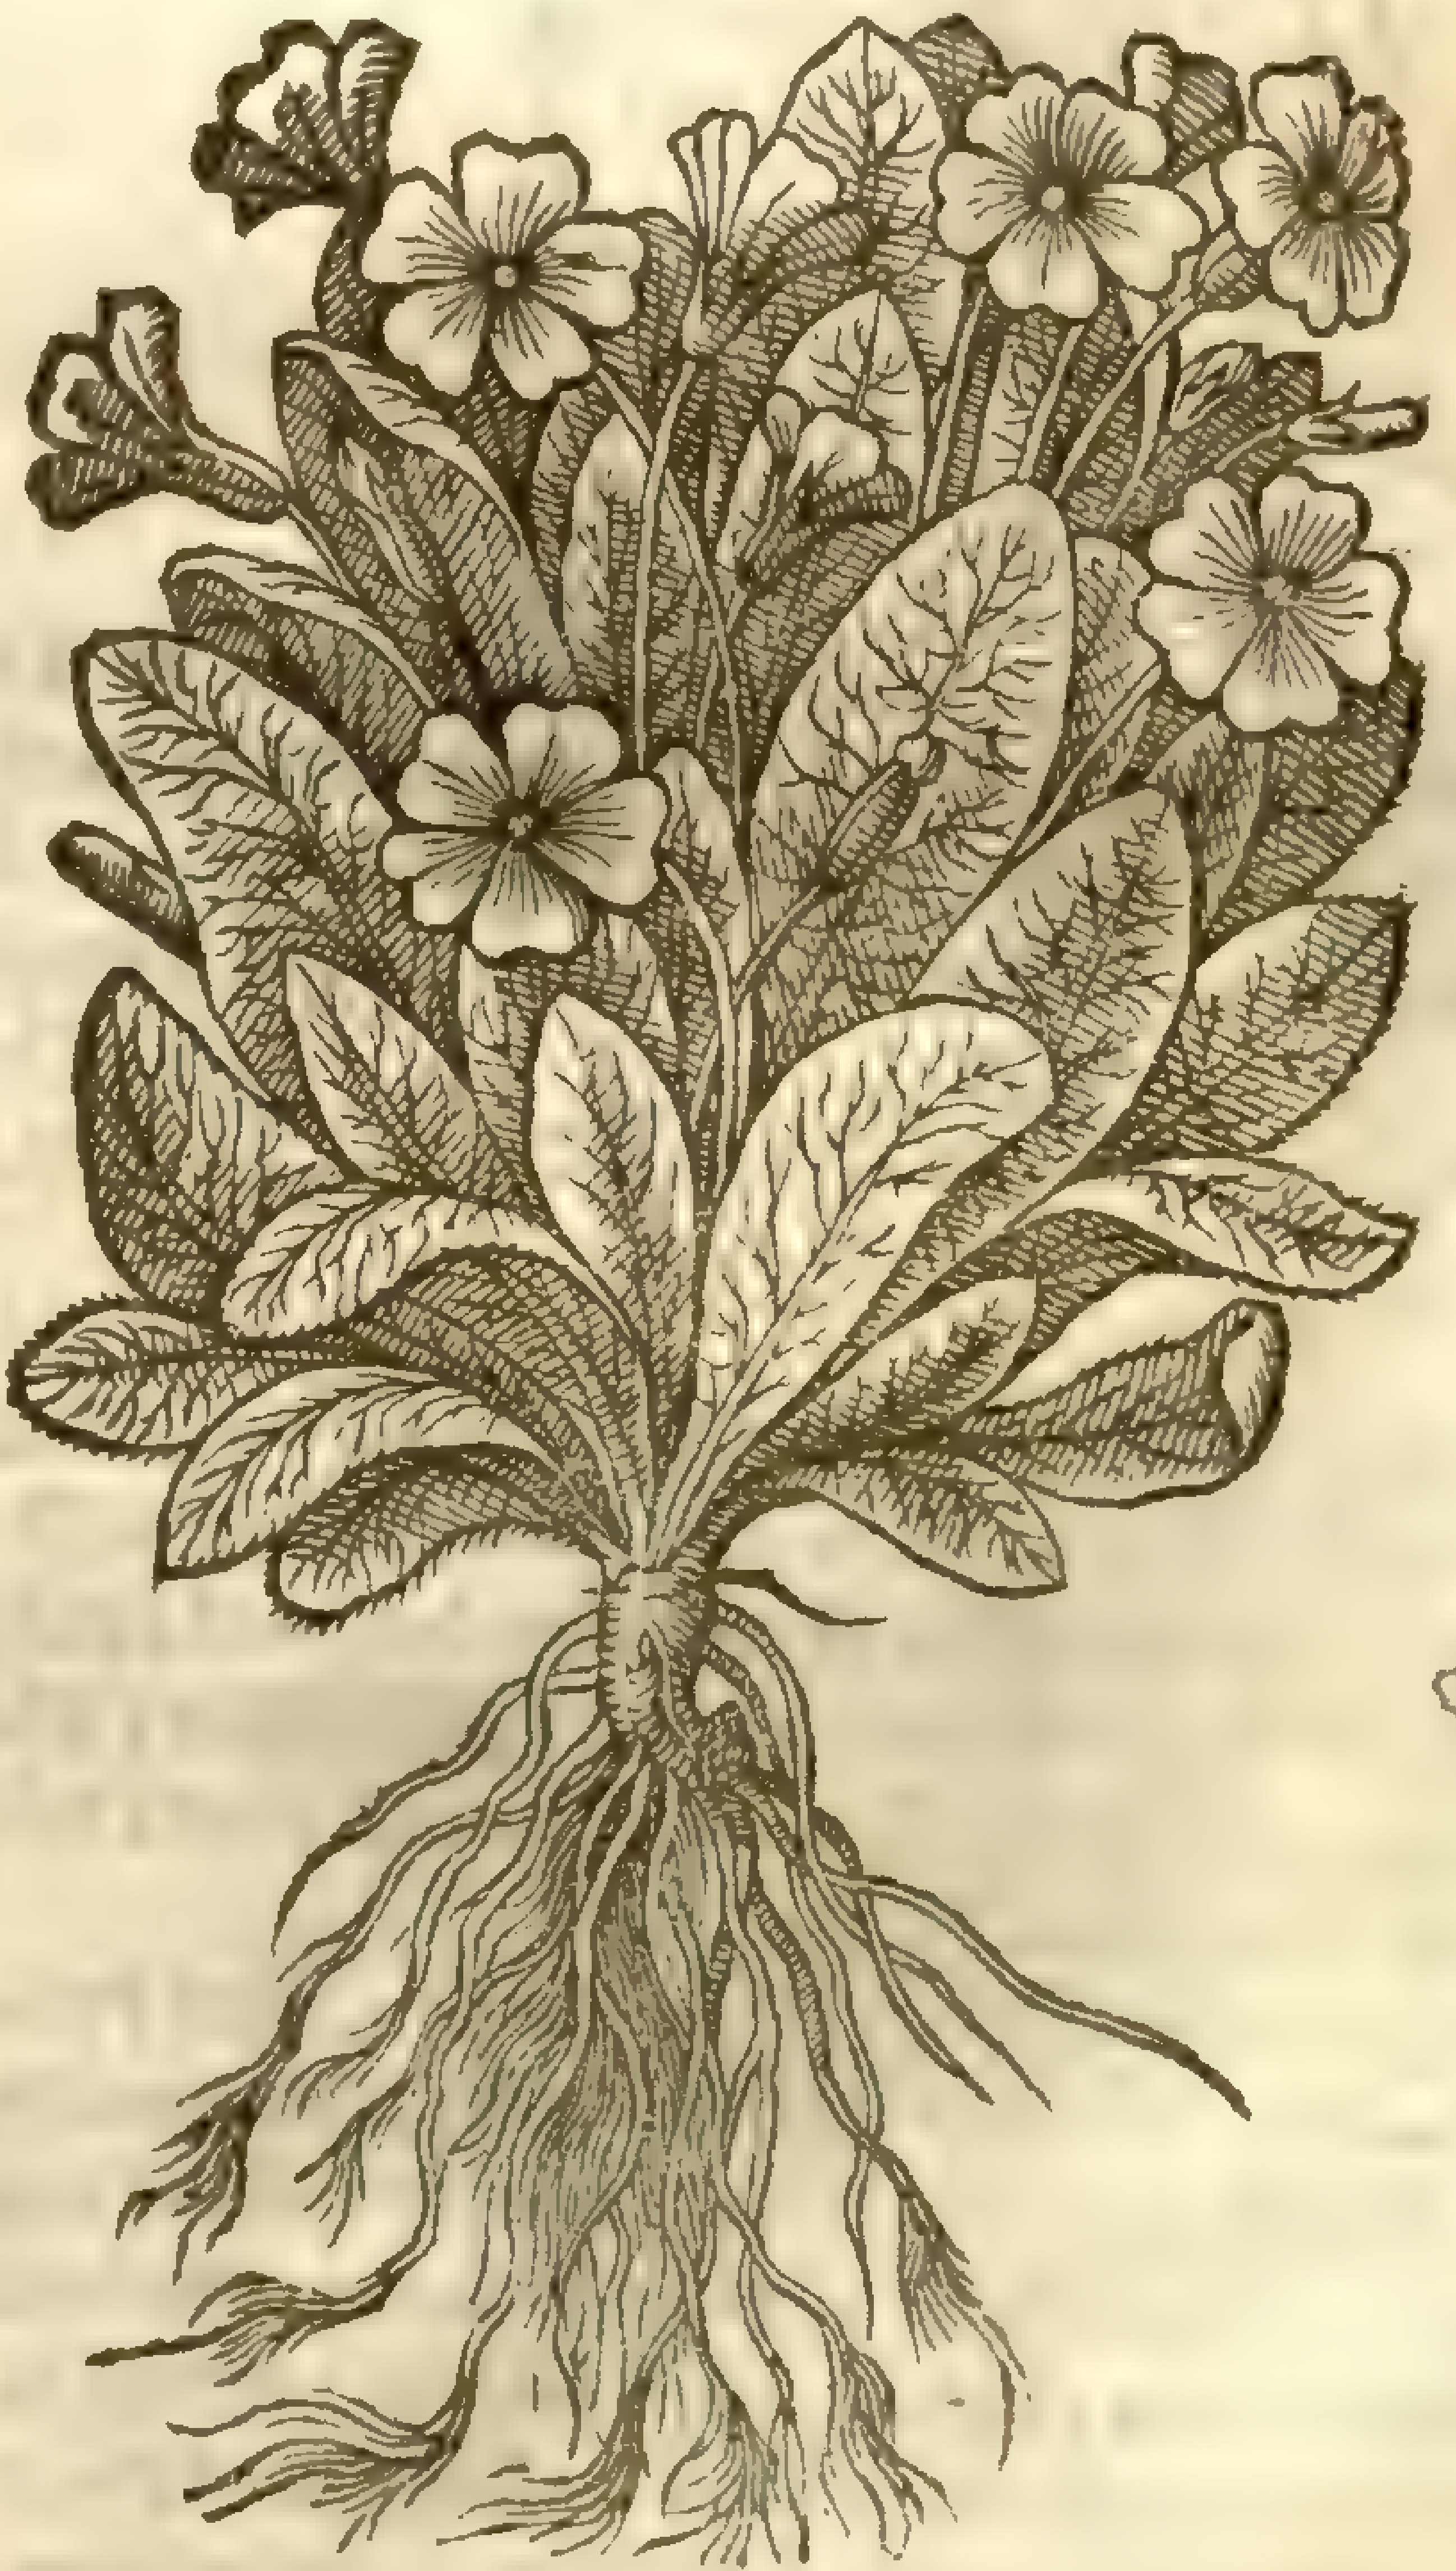
3 *Primula hortenſis Anglica.*
Double Paigles.



4 *Primula veris flore geminato.*
Cowſlips two in a hoſe.

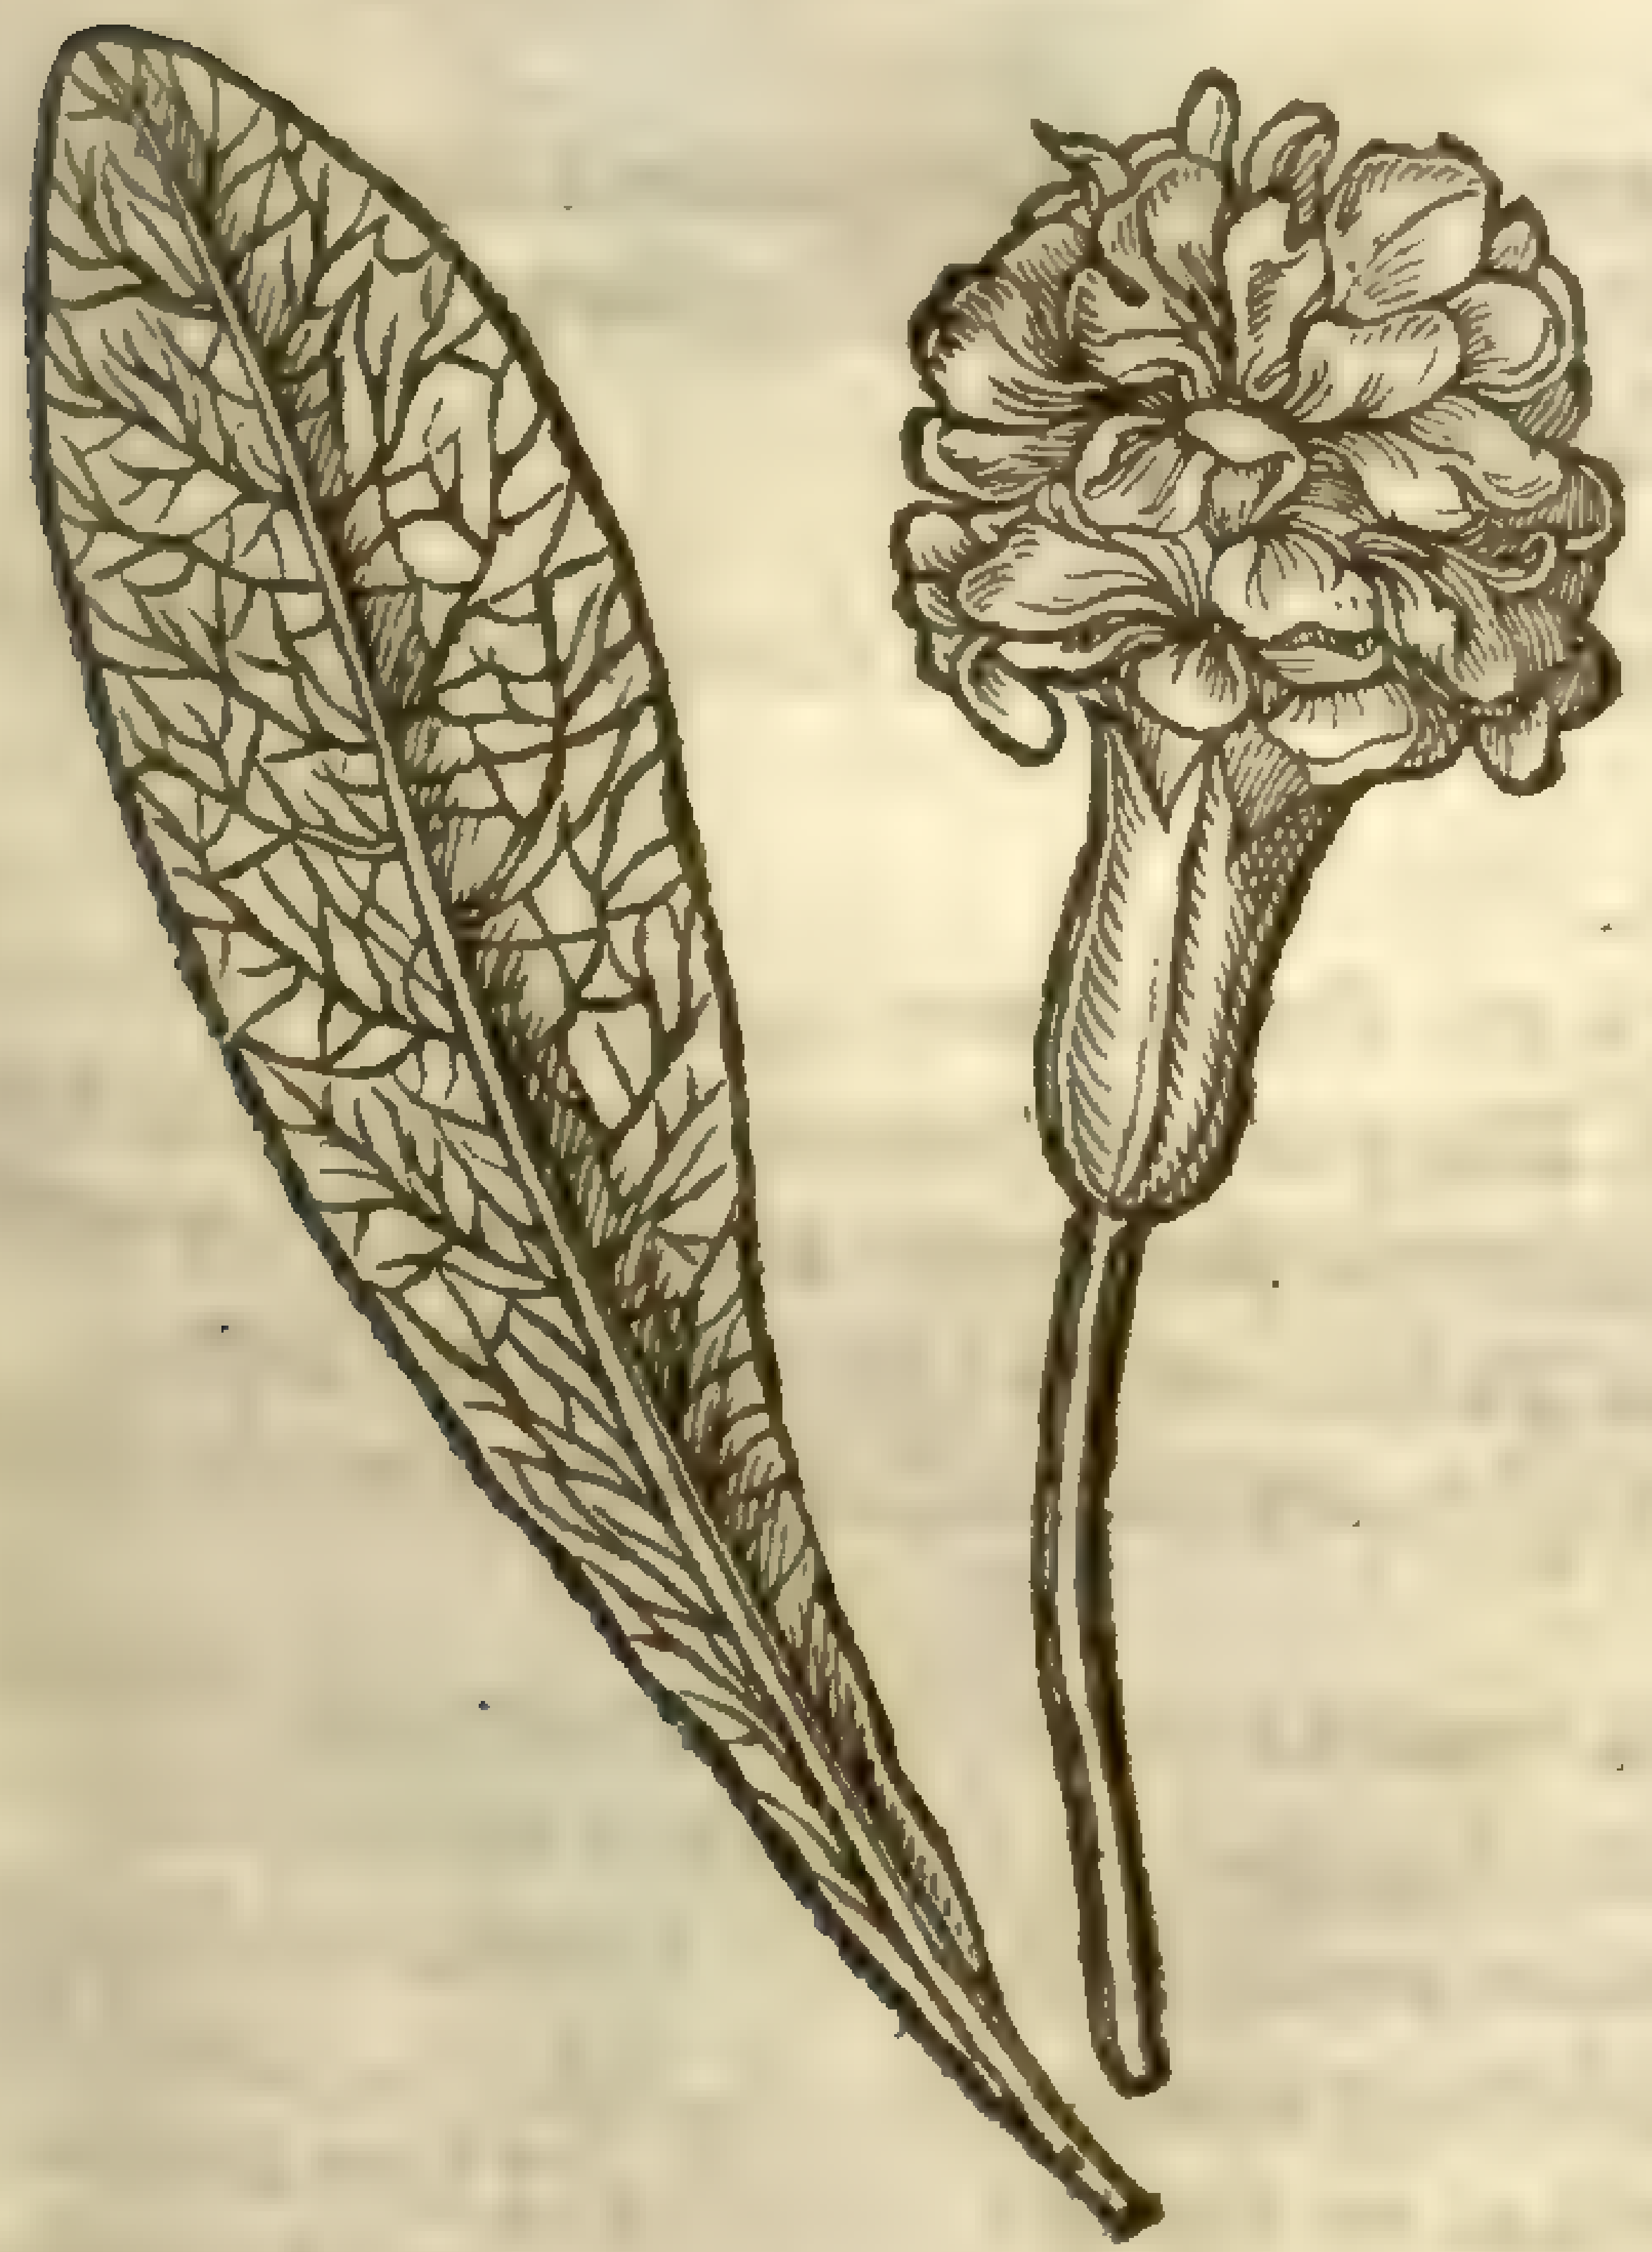


5 *Primula veris minor.*
Field Primroſe.



Primula vulgaris. Huds. [illegible]

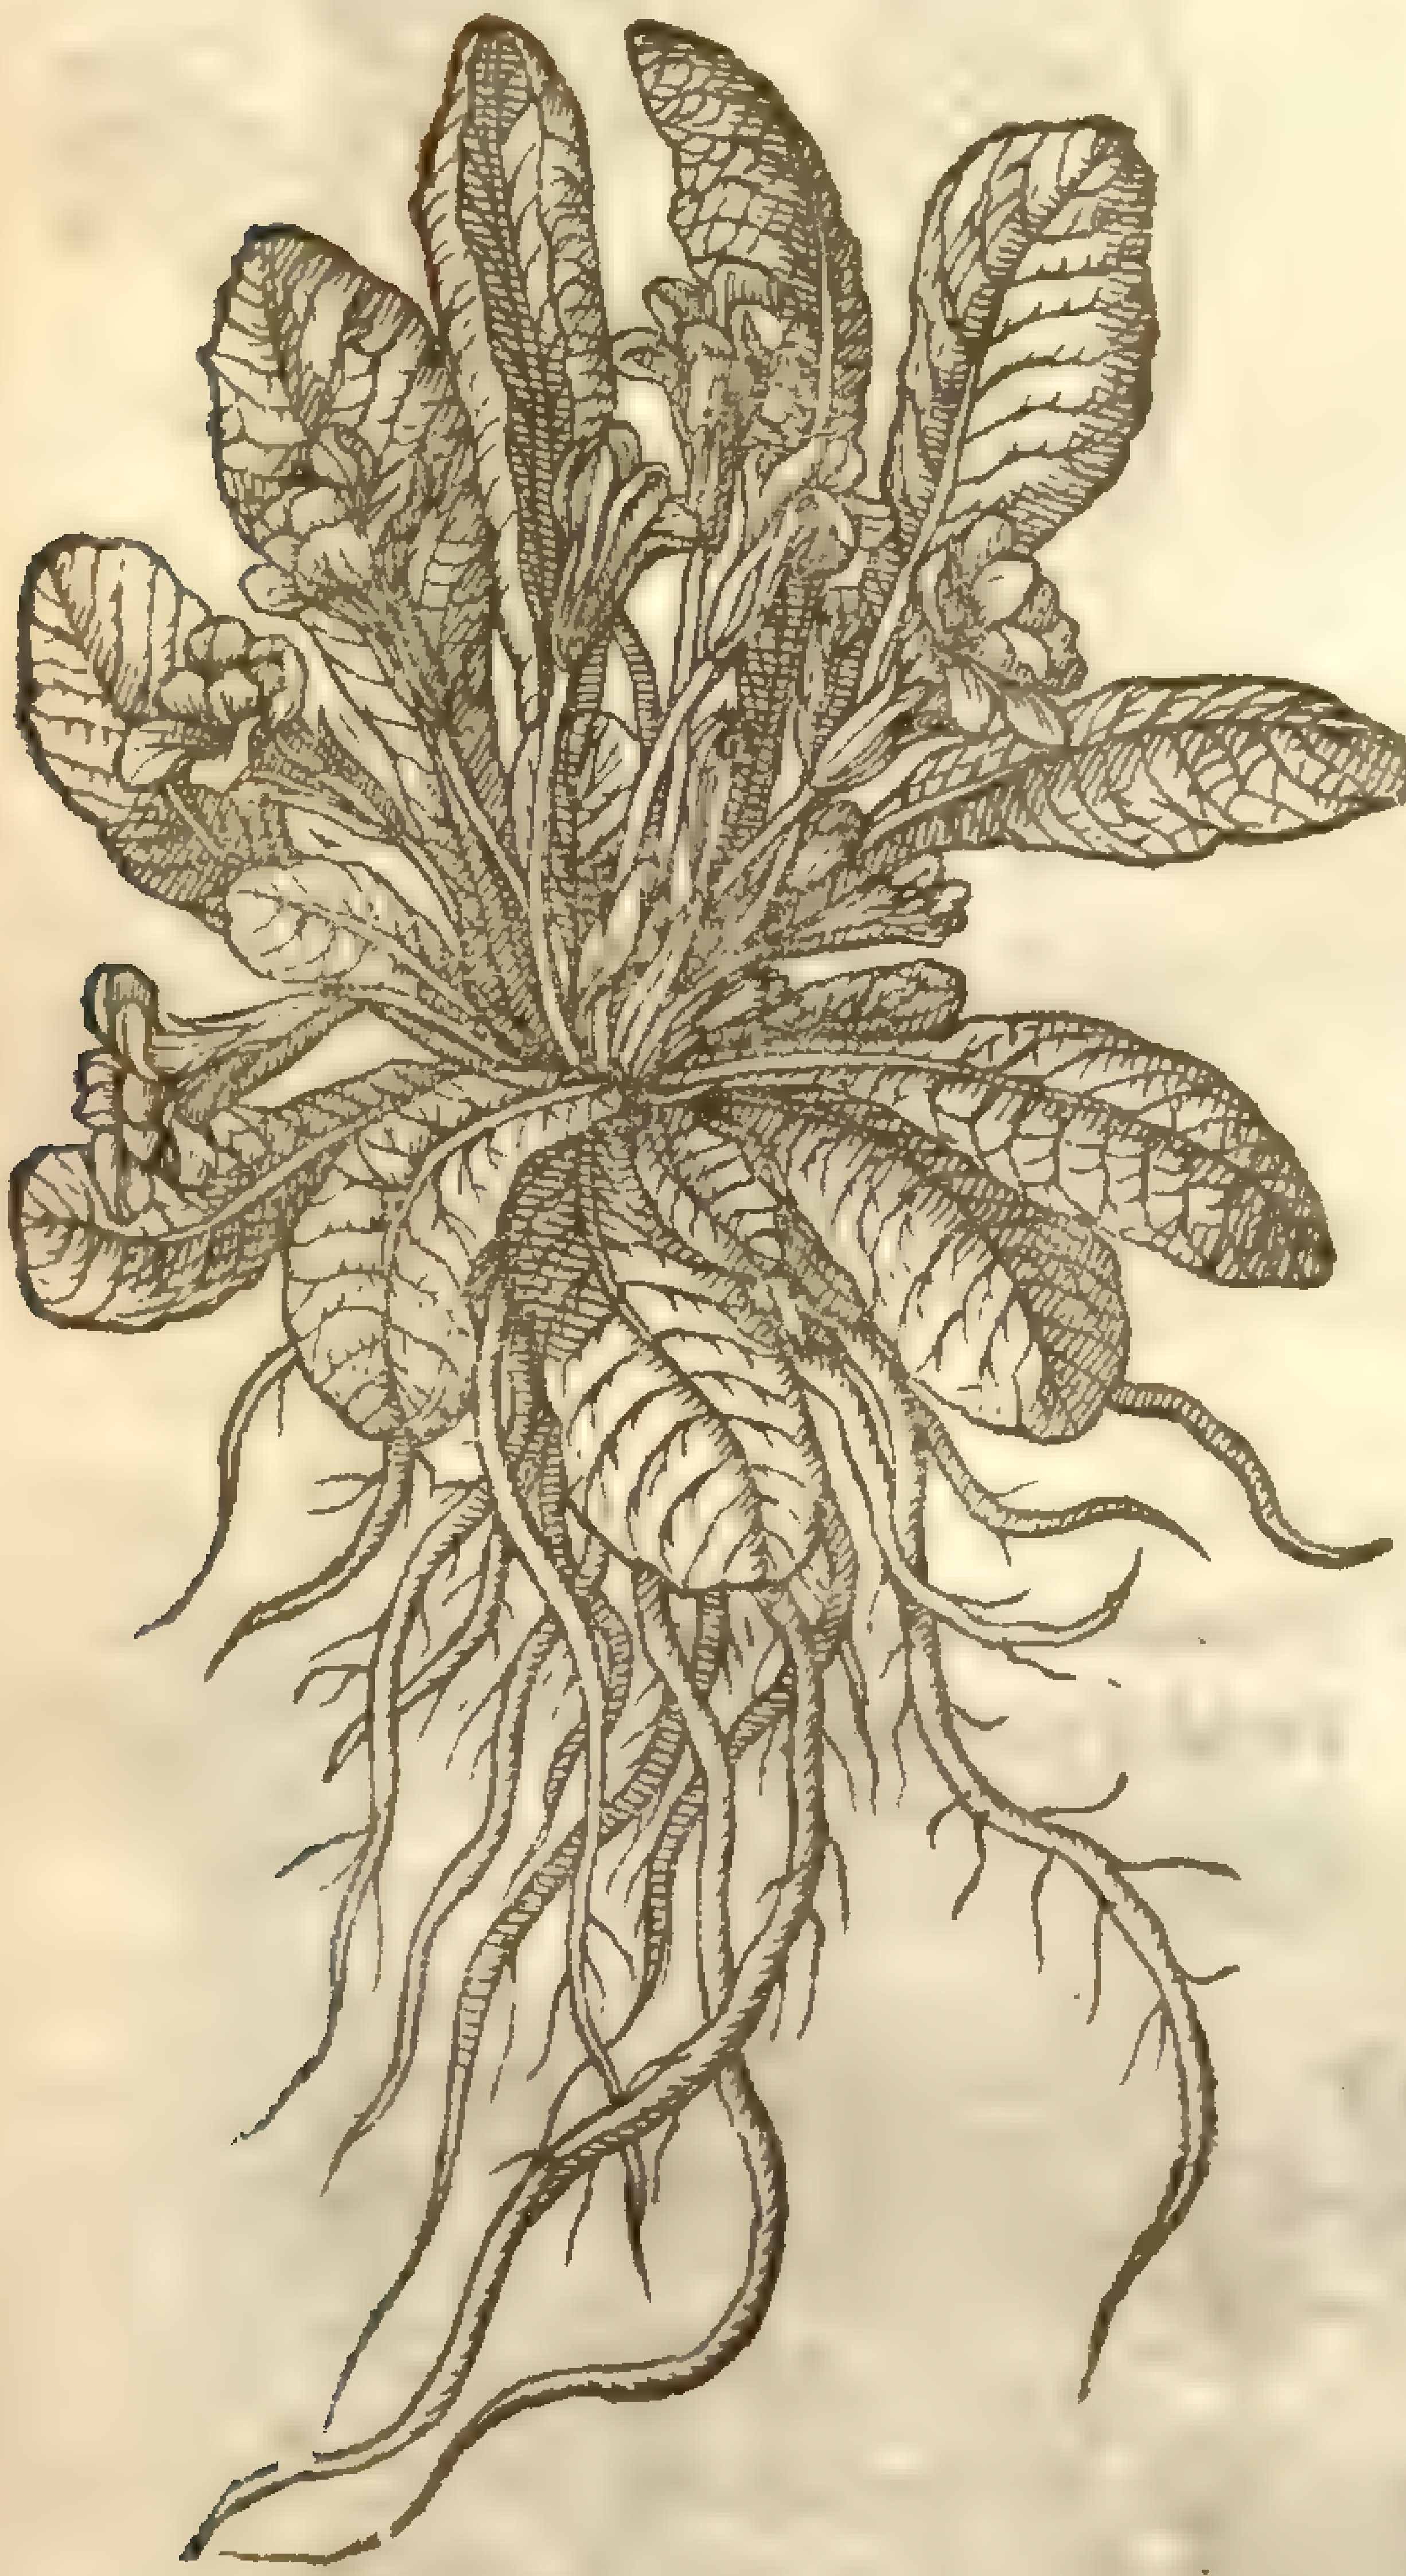
6 *Primula veris flore pleno.*
Double white Primroſe.



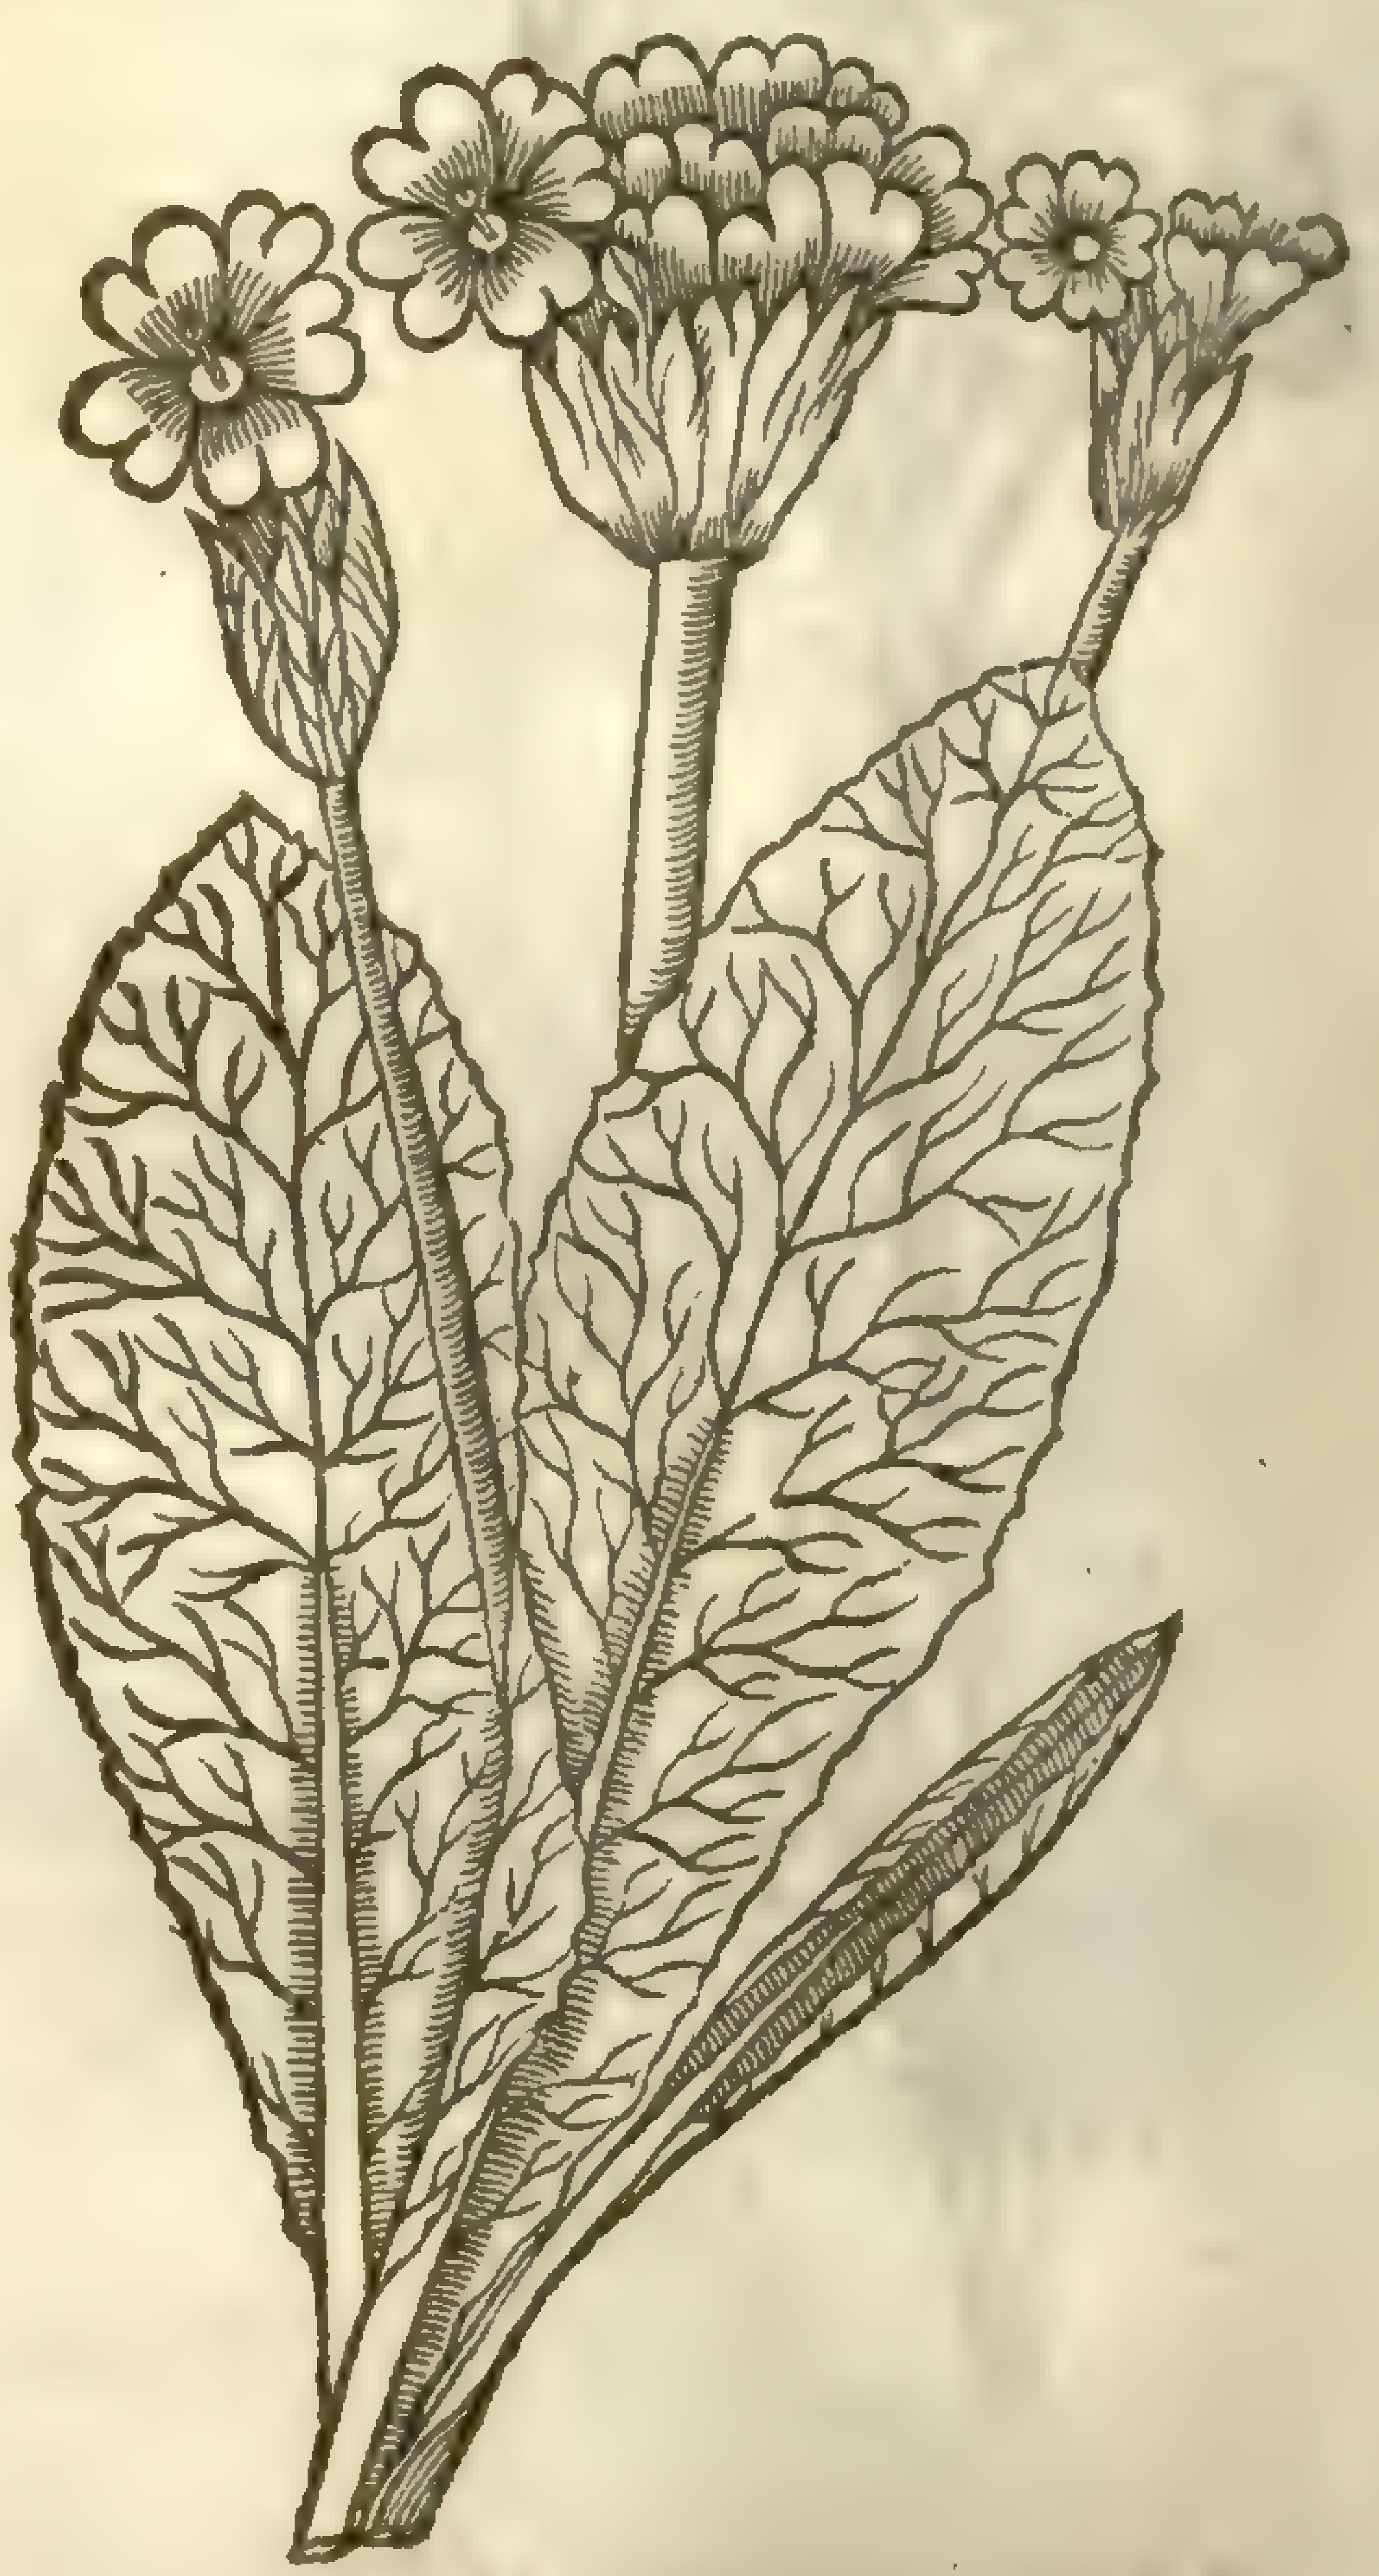
‡ Beſides theſe, there are kept in our gardens and ſet forth by Mr *Parkinſon* (to whoſe Worke I refer the curious Reader) two or three more varieties, one a double Cowſlip hoſe in hoſe, naked, without any huske: the other two beare many greene leaues on the tops of the ſtalkes, the one of them hauing yellowiſh floures among the leaues, and the other only longiſh narrow green leaues. The firſt hee calleth *Paralyſis inodora flore geminato*, Double Oxlips hoſe in hoſe. The ſecond, *Paralyſis fatua*, the Fooliſh Cowſlip: and the laſt, *Paralyſis flore viridi roſeo calamiſtrato*, the double greene feathered Cowſlip. ‡

The

7 *Primula flore viridi.*
Green Primroſe.



‡ 8 *Primula veris Hesketbi.*
Mr *Hesketbs* Primroſe.



¶ *The Place.*

Cowſlips and Primroſes ioy in moiſt and dankiſh places, but not altogether couered with water: they are found in woods and the borders of fields: Mr *Hesketbs* Primroſe growes in a wood called Clapdale, three miles from a towne in Yorkſhire called Settle.

¶ *The Time.*

They flouriſh from Aprill to the end of May, and ſome one or other of them do floure all Winterlong.

¶ *The Names.*

They are commonly called *Primula veris*, becauſe they are the firſt among thoſe plants that doe floure in the Spring, or becauſe they floure with the firſt. They are alſo named *Arthritica*, and *Herbæ paralyſis*, for they are thought to be good againſt the paines of the joints and ſinues. They are called in Italian, *Brache cuculi:* in Engliſh, Petty Mulleins or Palſie-worts: of moſt, Cowſlips.

The greater ſort, called for the moſt part Oxlips or Paigles, are named of diuers *Herba S. Petri:* in Engliſh, Oxlip, and Paigle.

The common Primroſe is vſually called *Primula veris:* moſt herbariſts doe refer the Primroſes to the φλομίδες, called in Latine *Verbaſcula*, or petty Mulleins: but ſeeing the leaues be neither woolly nor round, they are hardly drawne vnto them: for *Phlomides* are deſcribed by leaues, as *Pliny* hath interpreted it, *Hirſutis & rotundis*, hairy and round; tranſlating it thus, *lib.* 25. *cap.* 10. *Sunt & Phlomides duæ hirſutæ, rotundis folijs, humiles:* which is as much as to ſay in Engliſh, There be alſo two pretty Mulleins, hairy, round leafed, low or ſhort. ‡ *Fabius Columna* refers theſe to the *Aliſma* of *Dioſcorides*, and calls the Cowſlip *Aliſma pratorum:* and the Primroſe, *Aliſma ſyluarum.* ‡

¶ *The Temperature.*

The Cowſlips and Primroſes are in temperature dry and a little hot.

¶ *The Vertues.*

A Cowſlips are commended againſt the pain of the joints called the gout, and ſlackneſſe of the ſinues, which is the palſie. The decoction of the roots is thought to be profitably giuen againſt the ſtone in the kidnies and bladder; and the juice of the leaues for members that are looſe and out of joints, or inward parts that are hurt, rent, or broken.

B A dramme and a halfe of the pouder of the dried roots of field Primroſe gathered in Autumne, giuen to drinke in ale or wine purgeth by vomit very forcibly (but ſafely) wateriſh humors, choler, and flegme, in ſuch manner as *Azarum* doth, experimented by a learned and skilfull Apothecary of Colcheſter Mr *Buckſtone*, a man ſingular in the knowledge of Simples.

A conſerue made with the flours of Cowſlips and ſugar preuaileth wonderfully againſt the palſie, convulſions, cramps, and all diſeaſes of the ſinues. C

Cowſlips or Paigles do greatly reſtraine or ſtop the belly in time of a great laske or bloudy flix, if the decoction thereof be drunke warme. D

A practitioner of London who was famous for curing the phrenſie, after he had performed his cure by the due obſeruation of phyſick, accuſtomed euery yeare in the moneth of May to dyet his Patients after this manner: Take the leaues and floures of Primroſe, boile them a little in fountaine water, and in ſome roſe and Betony waters, adding thereto ſugar, pepper, ſalt, and butter, which being ſtrained, he gaue them to drinke thereof firſt and laſt. E

The roots of Primroſe ſtamped and ſtrained, and the juice ſniffed into the noſe with a quill or ſuch like, purgeth the brain, and qualifieth the pain of the megrim. F

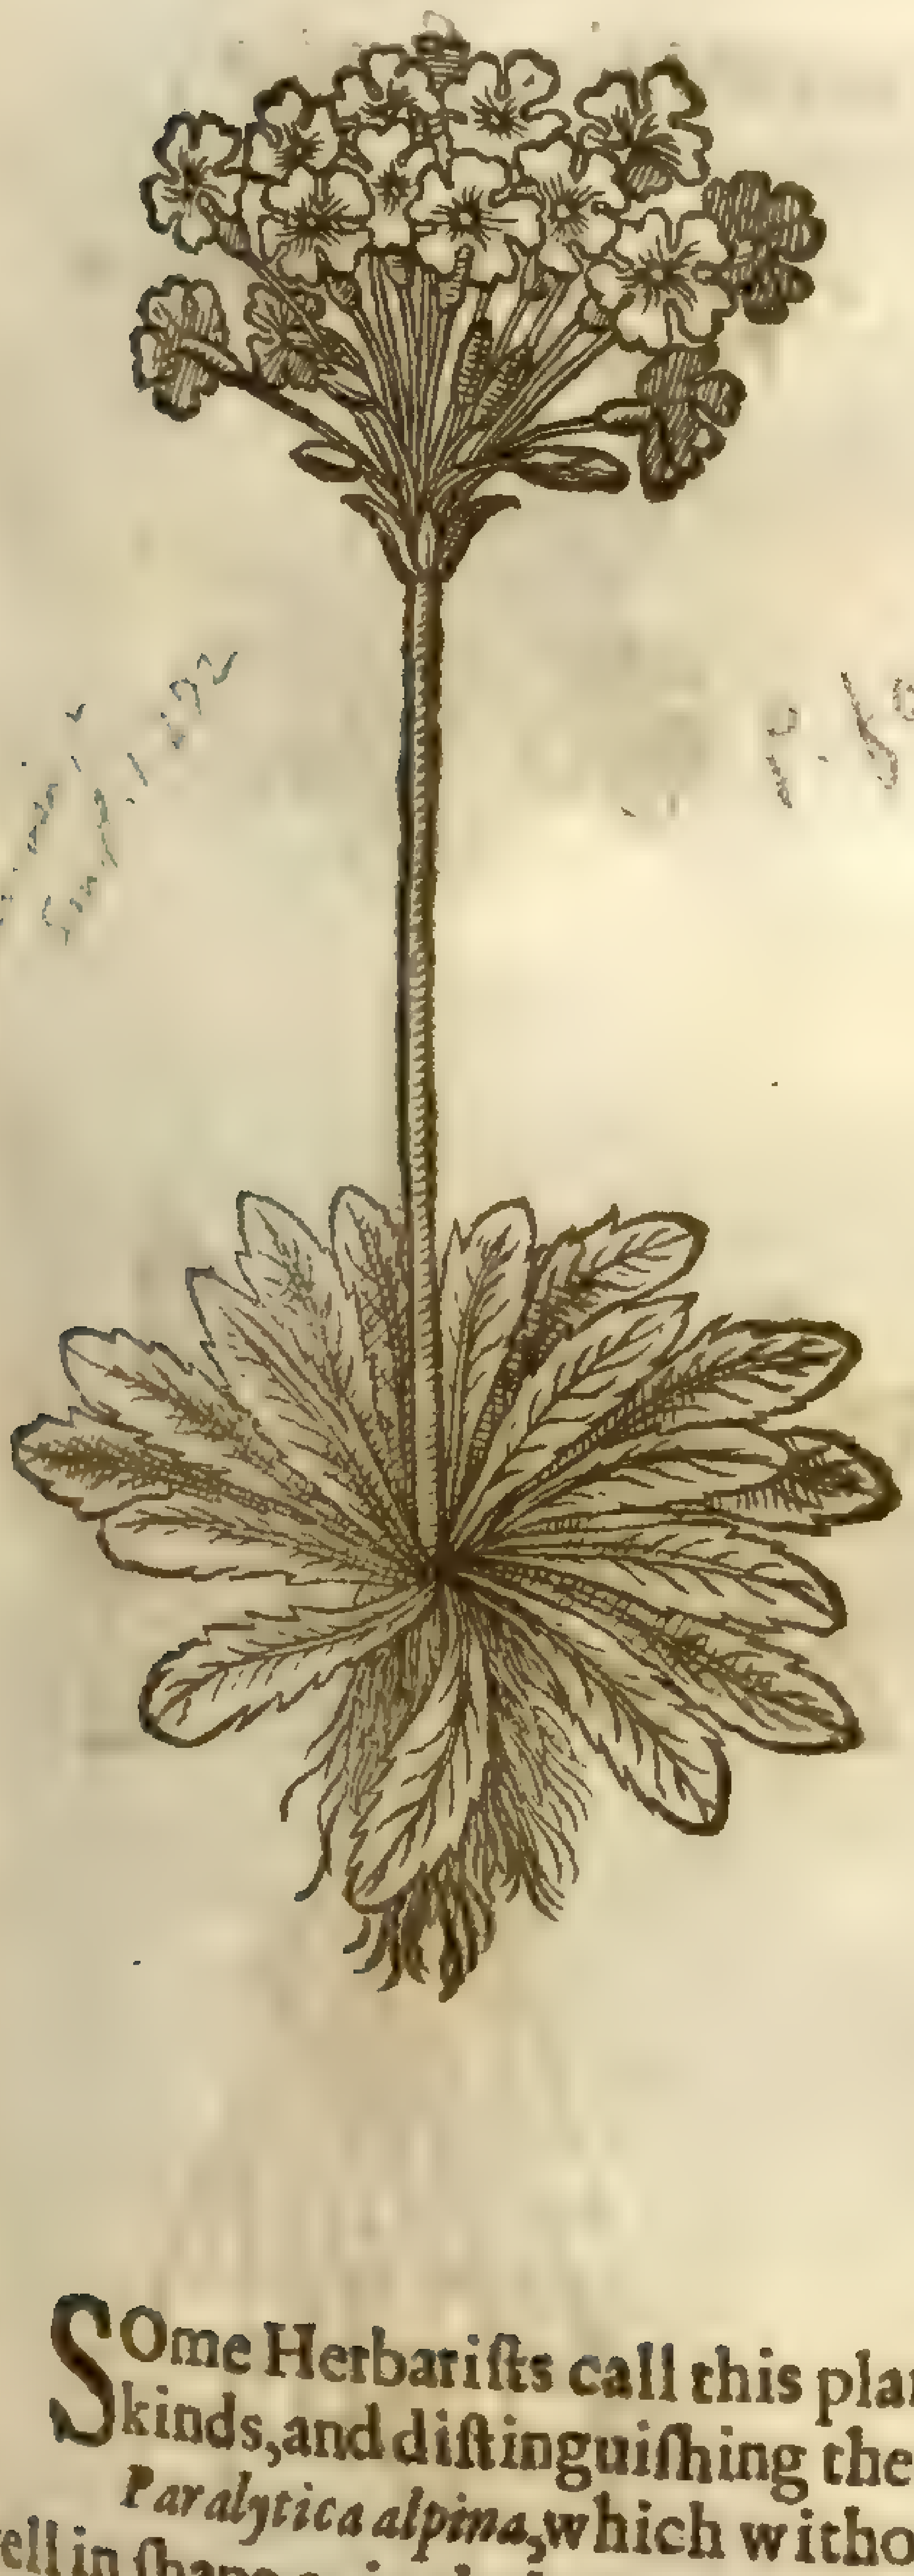
An vnguent made with the juice of Cowſlips and oile of Linſeed, cureth all ſcaldings or burnings with fire, water, or otherwiſe. G

The floures of Primroſes ſodden in vineger and applied, heale the Kings euill, and the almonds of the throat and uvula, if you gargariſe the part with the decoction thereof. H

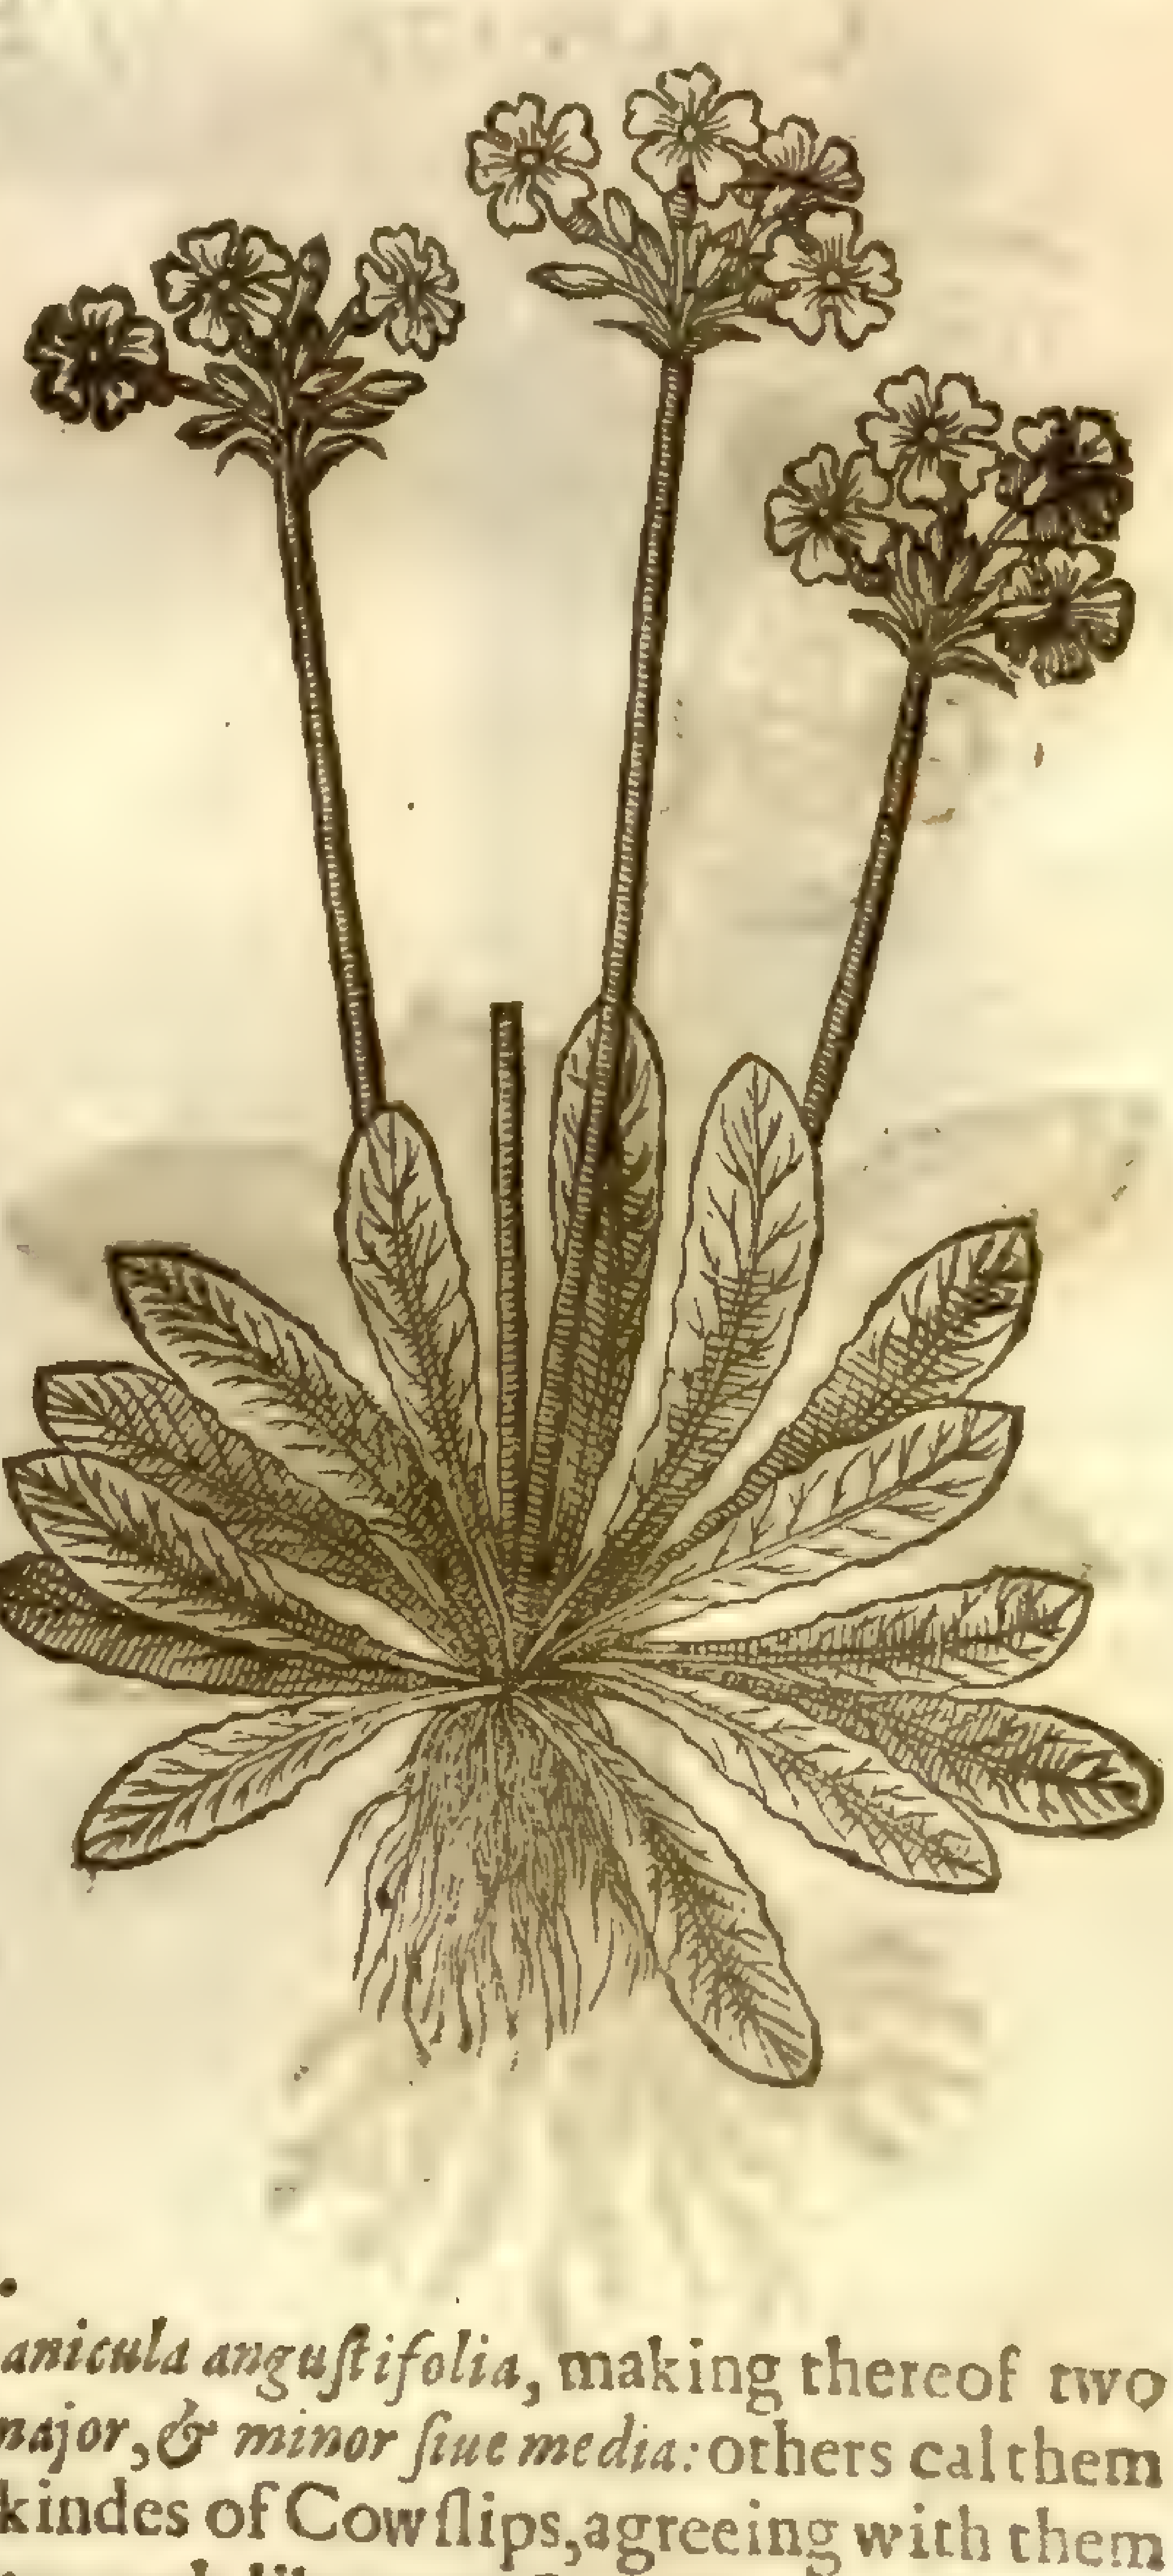
The leaues and floures of Primroſes boiled in wine and drunke, are good againſt all diſeaſes of the breſt and lungs, and draweth forth of the fleſh any thorne or ſplinter, or bone fixed therein. I

Chap. 274. *Of Birds Eyne.*

1 *Primula veris flore rubro.*
Red Bird-eyne.



2 *Primula veris flore albo.*
White Bird-eyne.



[illegible]

P. farinosa L. [illegible] Brit.

¶ *The Deſcription.*

1 Some Herbariſts call this plant by the name of *Sanicula anguſtifolia*, making thereof two kinds, and diſtinguiſhing them by theſe termes, *major, & minor ſiue media:* others cal them *Paralytica alpina*, which without controuerſie are kindes of Cowſlips, agreeing with them as well in ſhape, as in their nature and vertues, hauing leaues much like vnto Cowſlips, but ſmaller,

growing flat vpon the ground,of a feint greeniſh colour on the vpper ſide,& vnderneath of a white or mealy colour: among which riſe vp ſmall and tender ſtalks of a foot high,hauing at the top of euery ſtalke a buſh of ſmall floures in ſhape like the common Oxlip,ſauing that they are of a faire ſtammel colour tending to purple: in the middle of euery ſmall floure appeareth a little yellow ſpot reſembling the eye of a bird; which hath moued the people of the North parts (where it aboundeth) to call it Birds eyne. The ſeed is ſmall like duſt; the root white and threddy.

2 The ſecond is like the firſt,ſauing the whole plant is greater in each reſpect,and the floures of a whitiſh colour.

¶ *The Place.*

Theſe plants grow very plentifully in moiſt and ſqually grounds in the North parts of England, as in Harwood neere to Blackburn in Lancaſhire,and ten miles from Preſton in Aunderneſſe; alſo at Crosby,Rauenswaith,and Crag-Cloſe in Weſtmerland.

They likewiſe grow in the medowes belonging to a village in Lancaſhire neere Maudſley, called Harwood,and at Hesketh not far from thence,and in many other places of Lancaſhire,but not on this ſide Trent,that I could euer certainly know. *Lobel* reporteth,That Dr *Penny* (a famous phyſition of our London Colledge) did finde them in theſe Southern parts.

¶ *The Time.*

They floure and flouriſh from Aprill to the end of May.

¶ *The Names.*

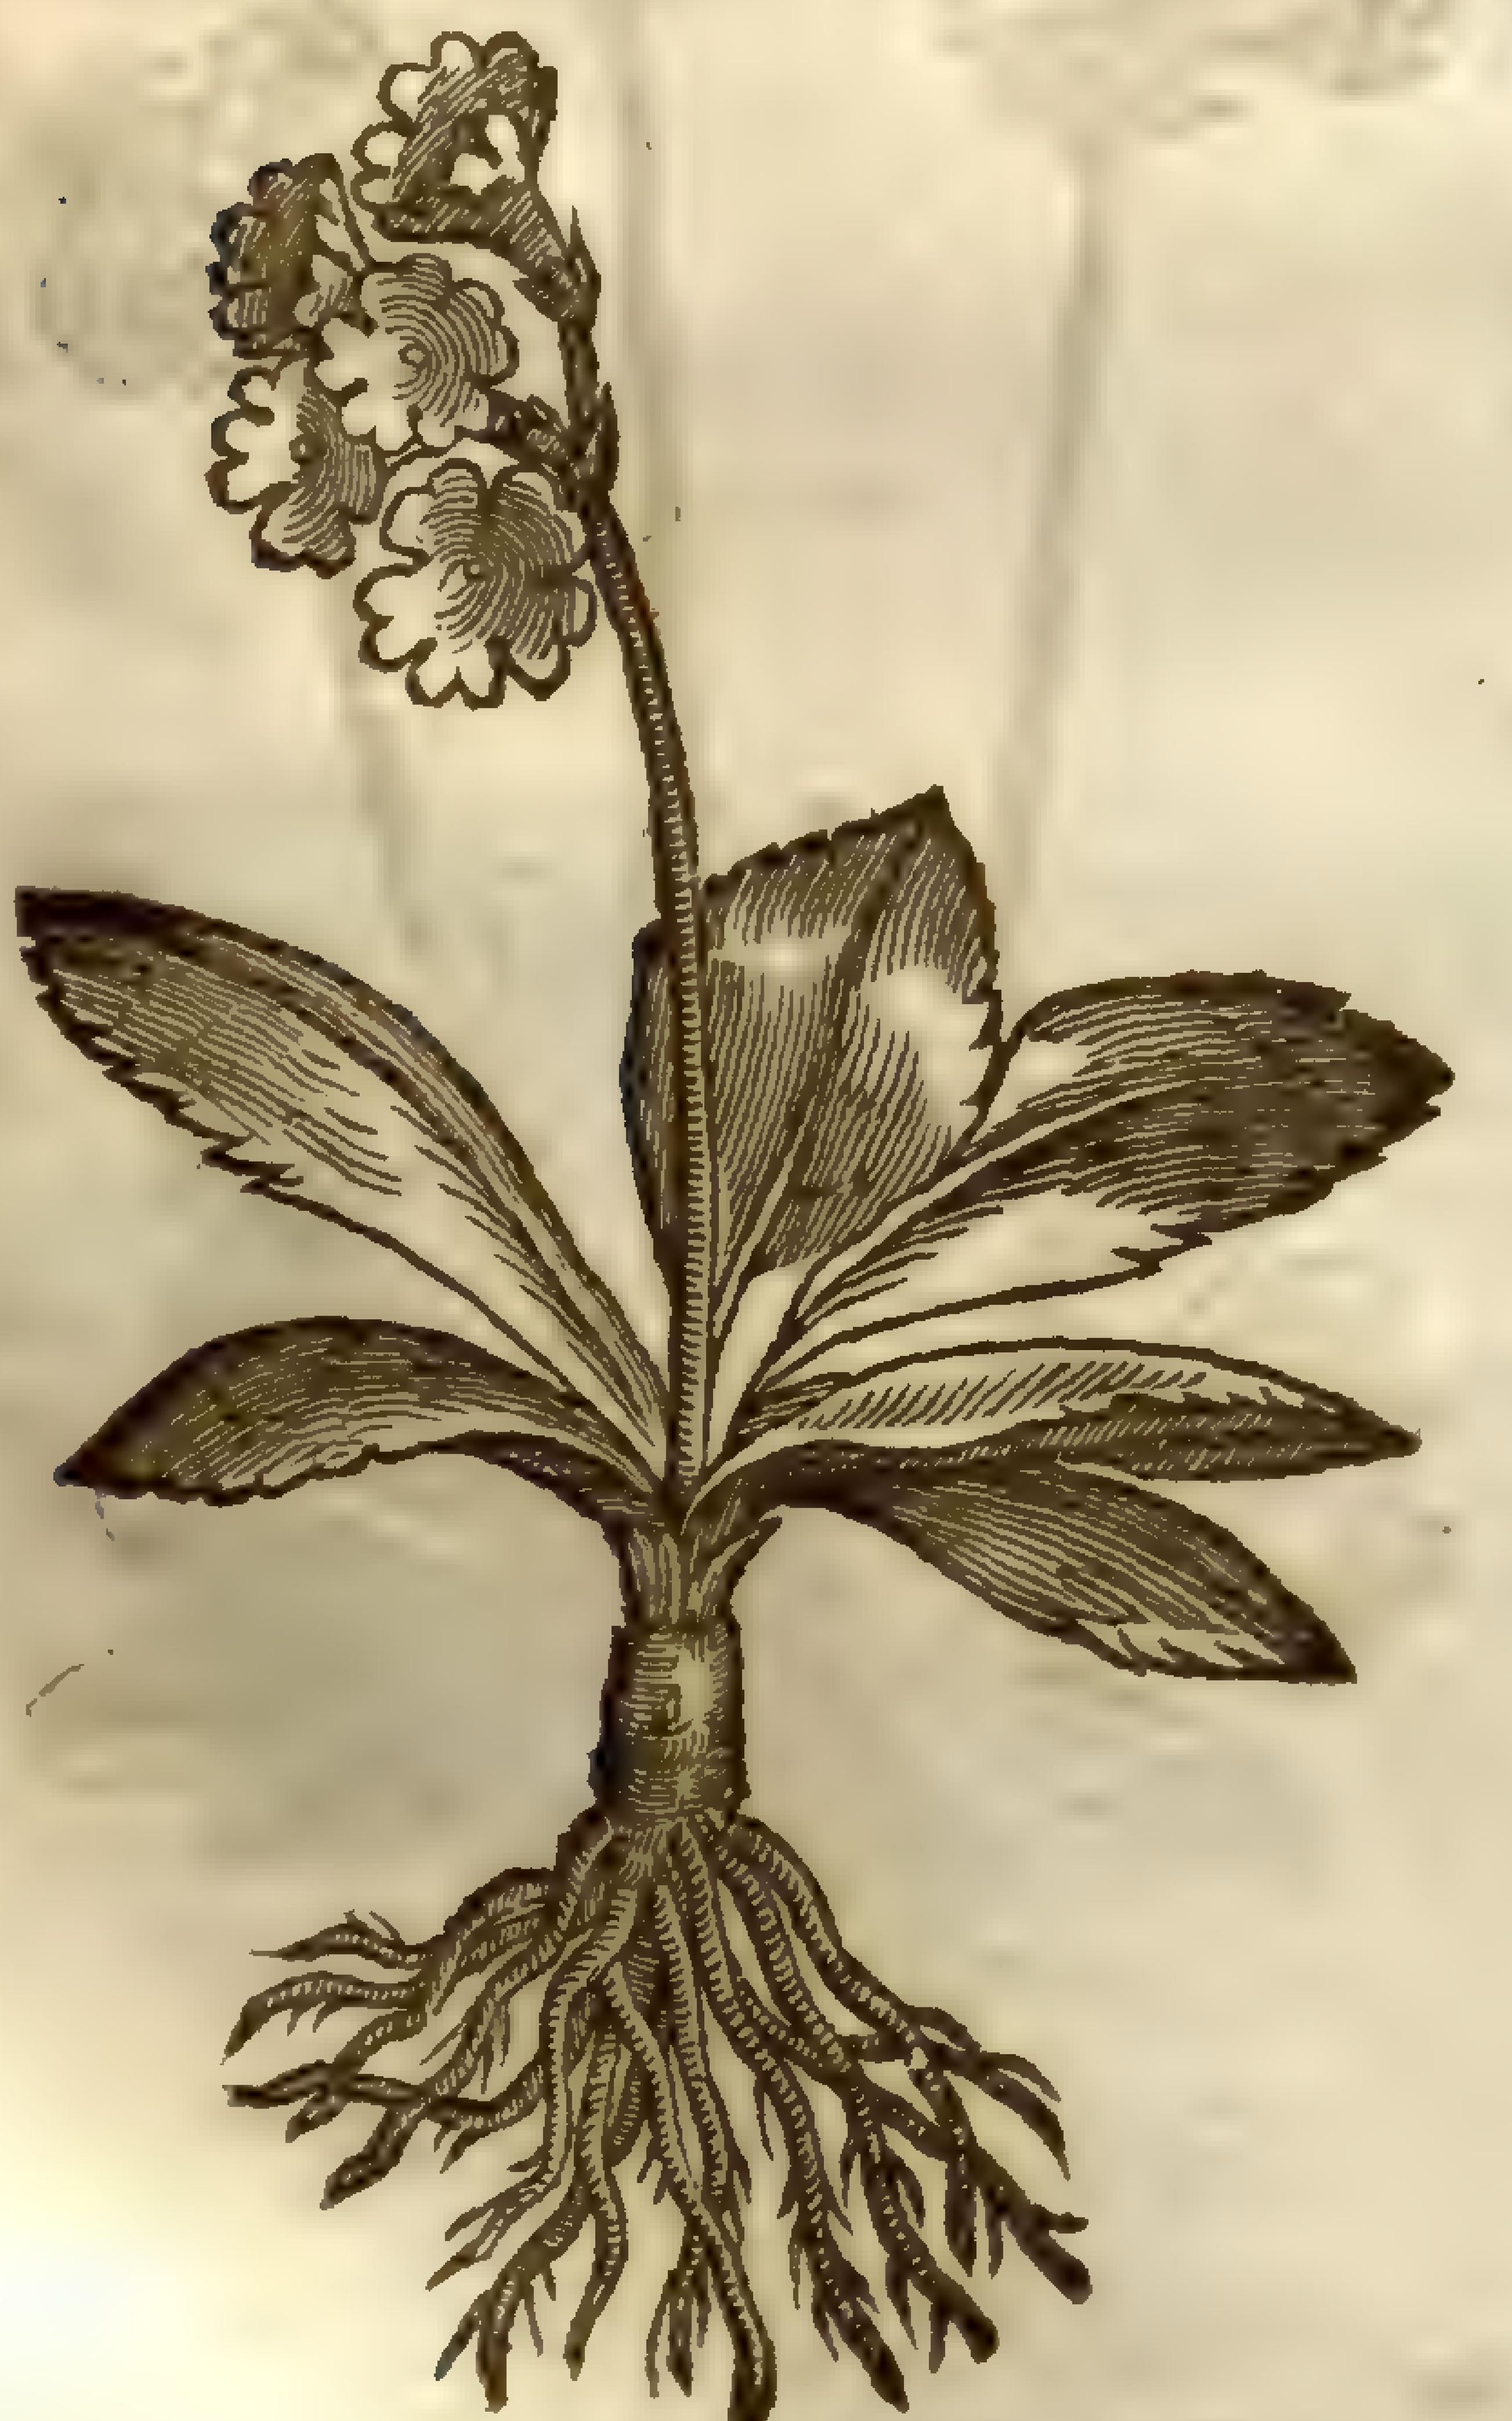
The firſt is called Primroſe with the red floure: the ſecond,Primroſe with the white floure,and Birds eyne.

¶ *The Temperature and Vertues.*

The nature and vertues of theſe red and white Primroſes muſt be ſought out among thoſe aboue named.

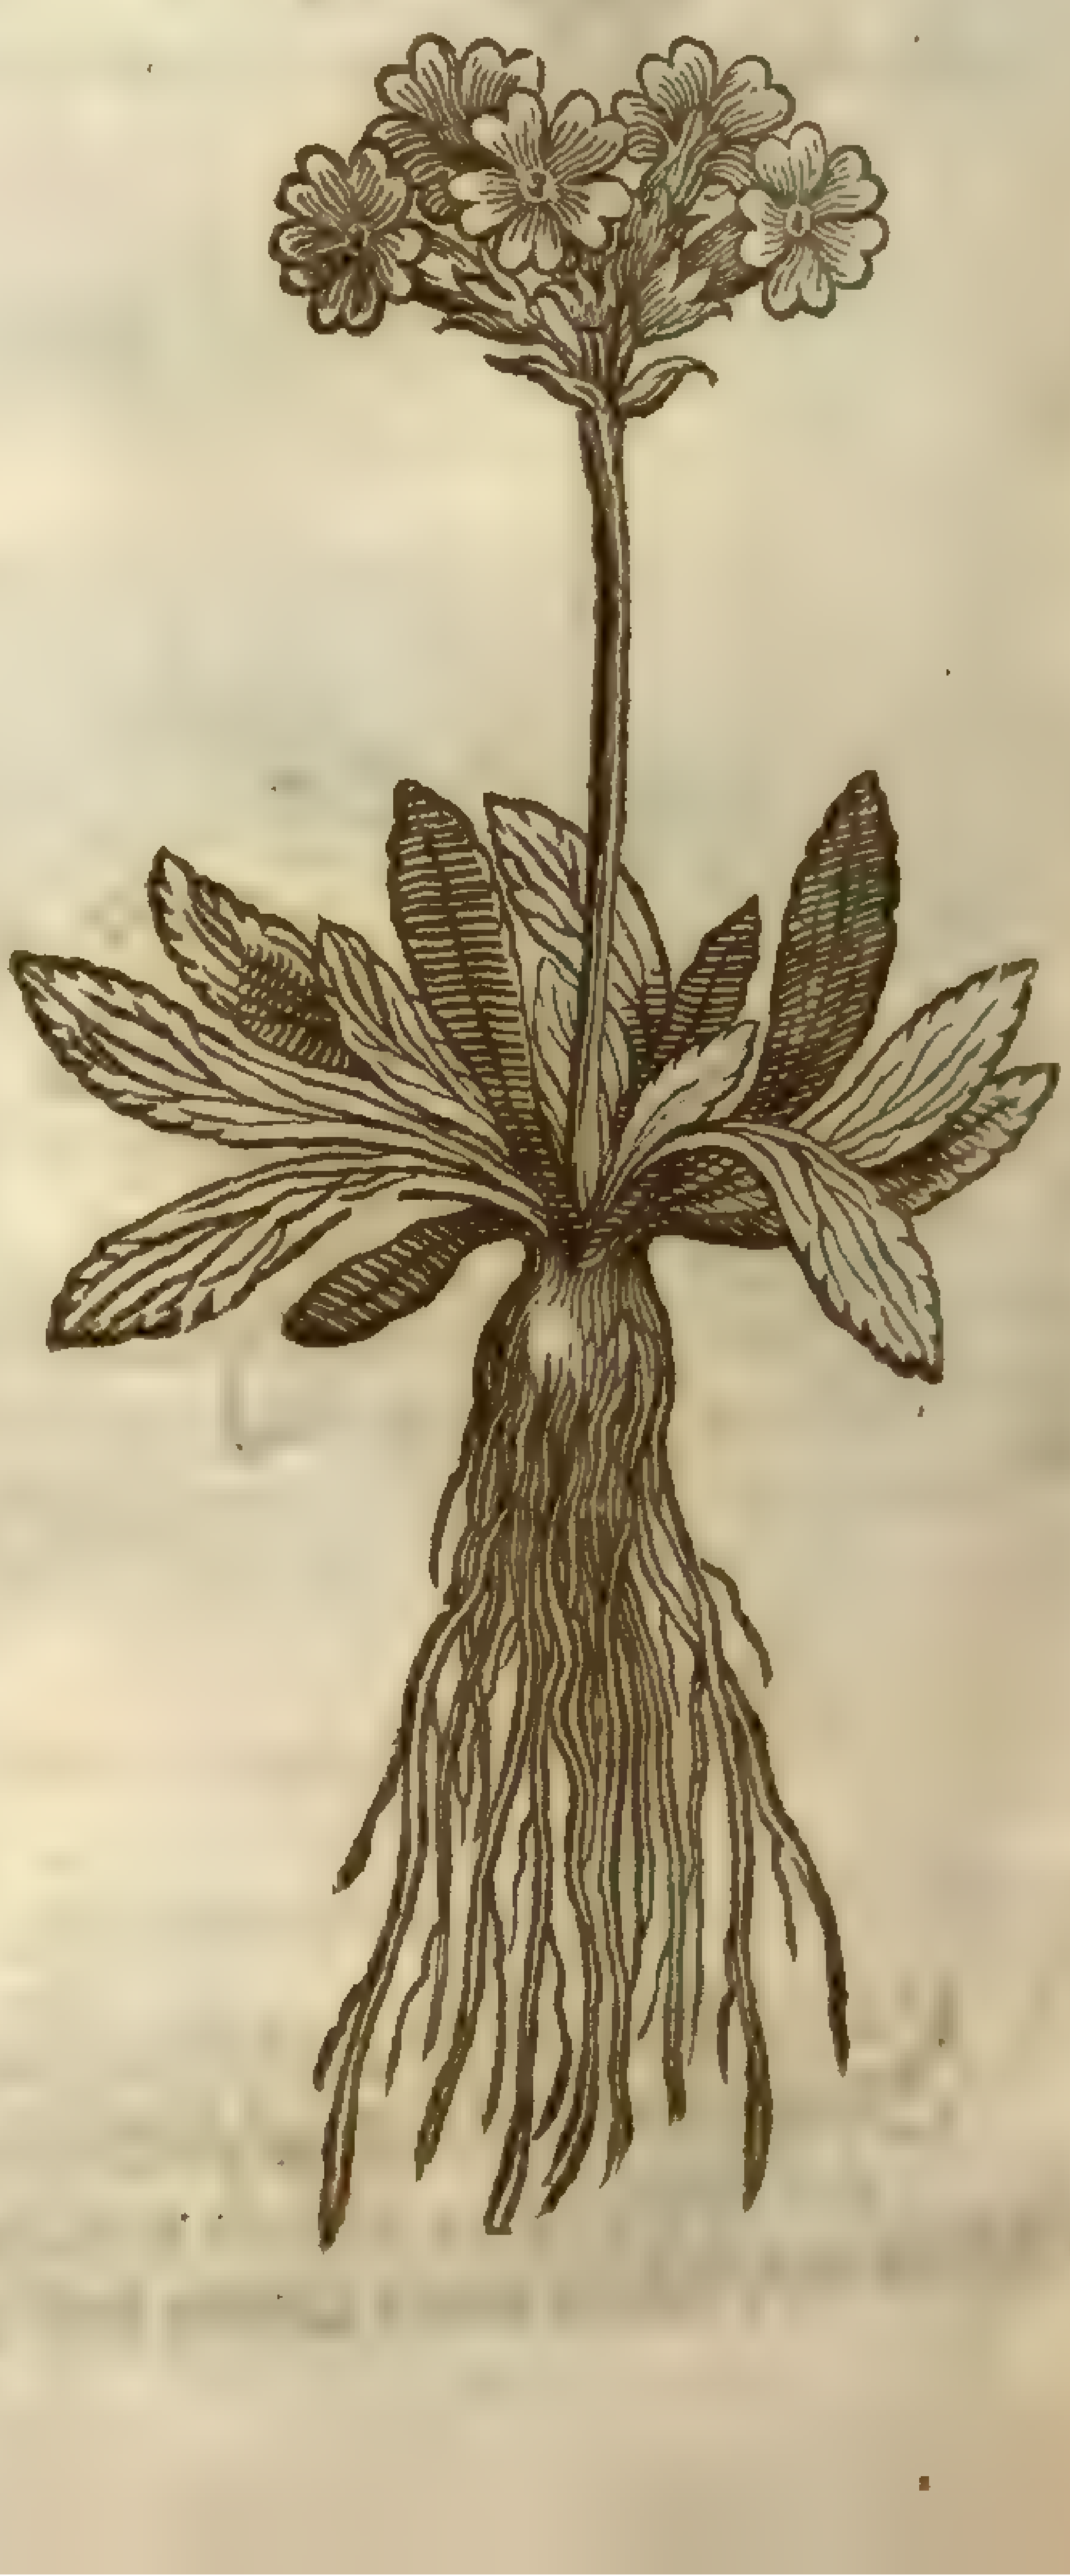
Chap. 275. *Of Beares eares, or mountaine Cowſlips.*

1 *Auricula vrſi flore luteo.*
Yellow Beares eare.



Primula auricula, L. 2
Yuill, dist.

2 *Auricula vrſi flore purpureo.*
Purple Beares eare.

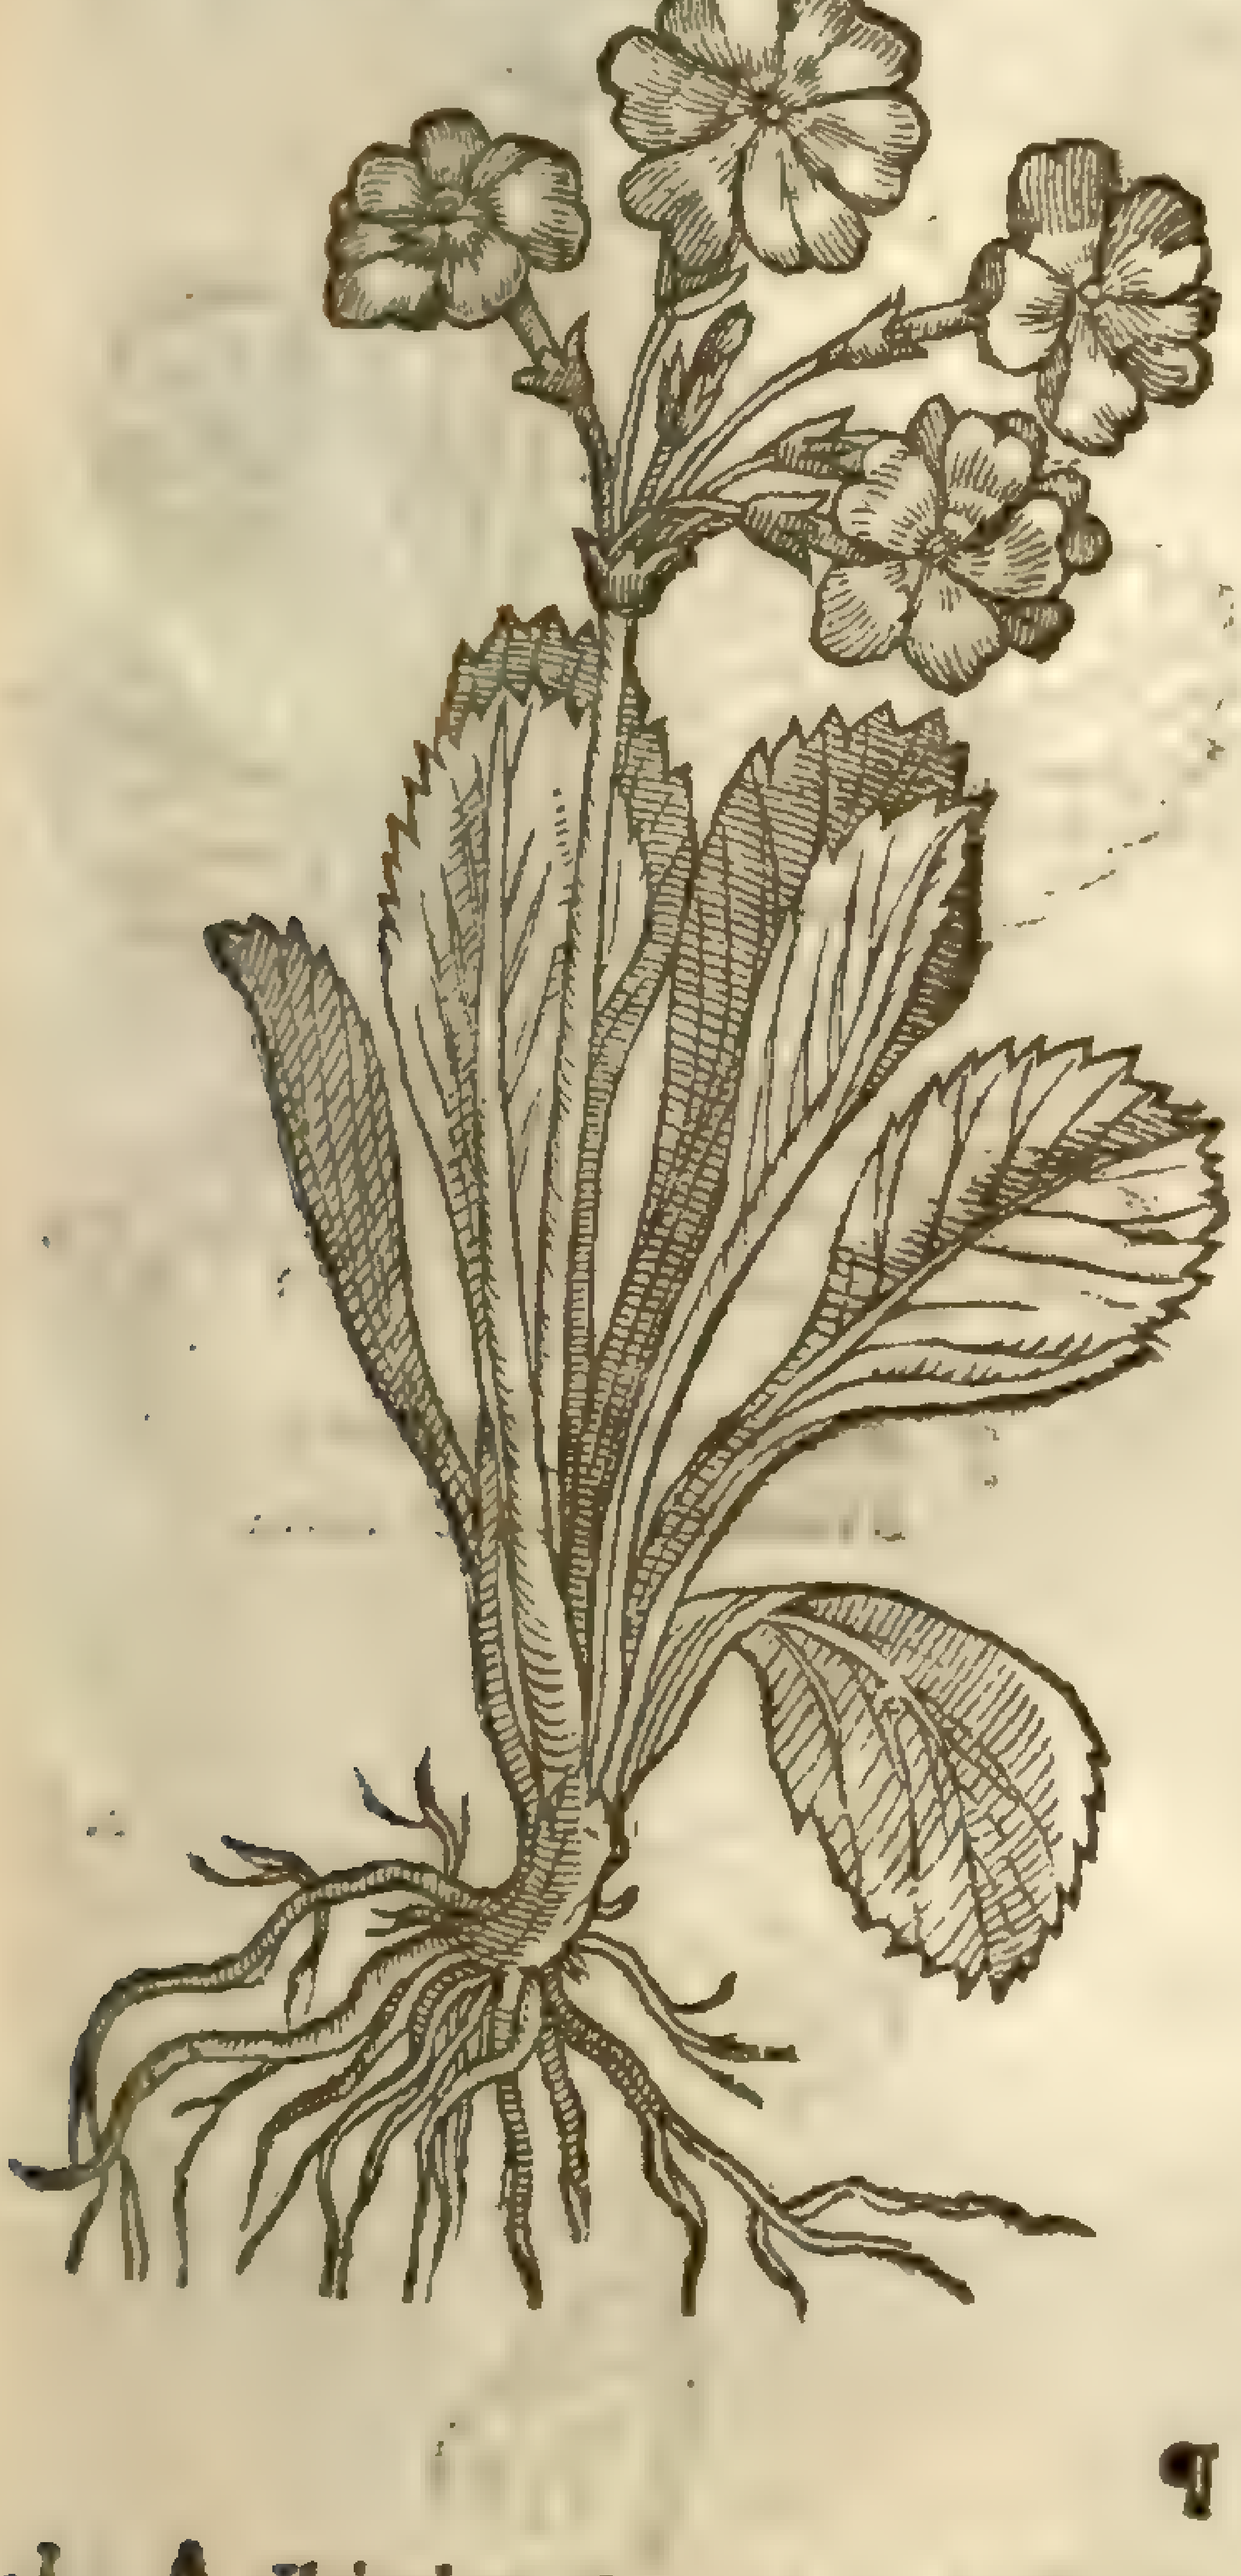


¶ *The Kindes.*

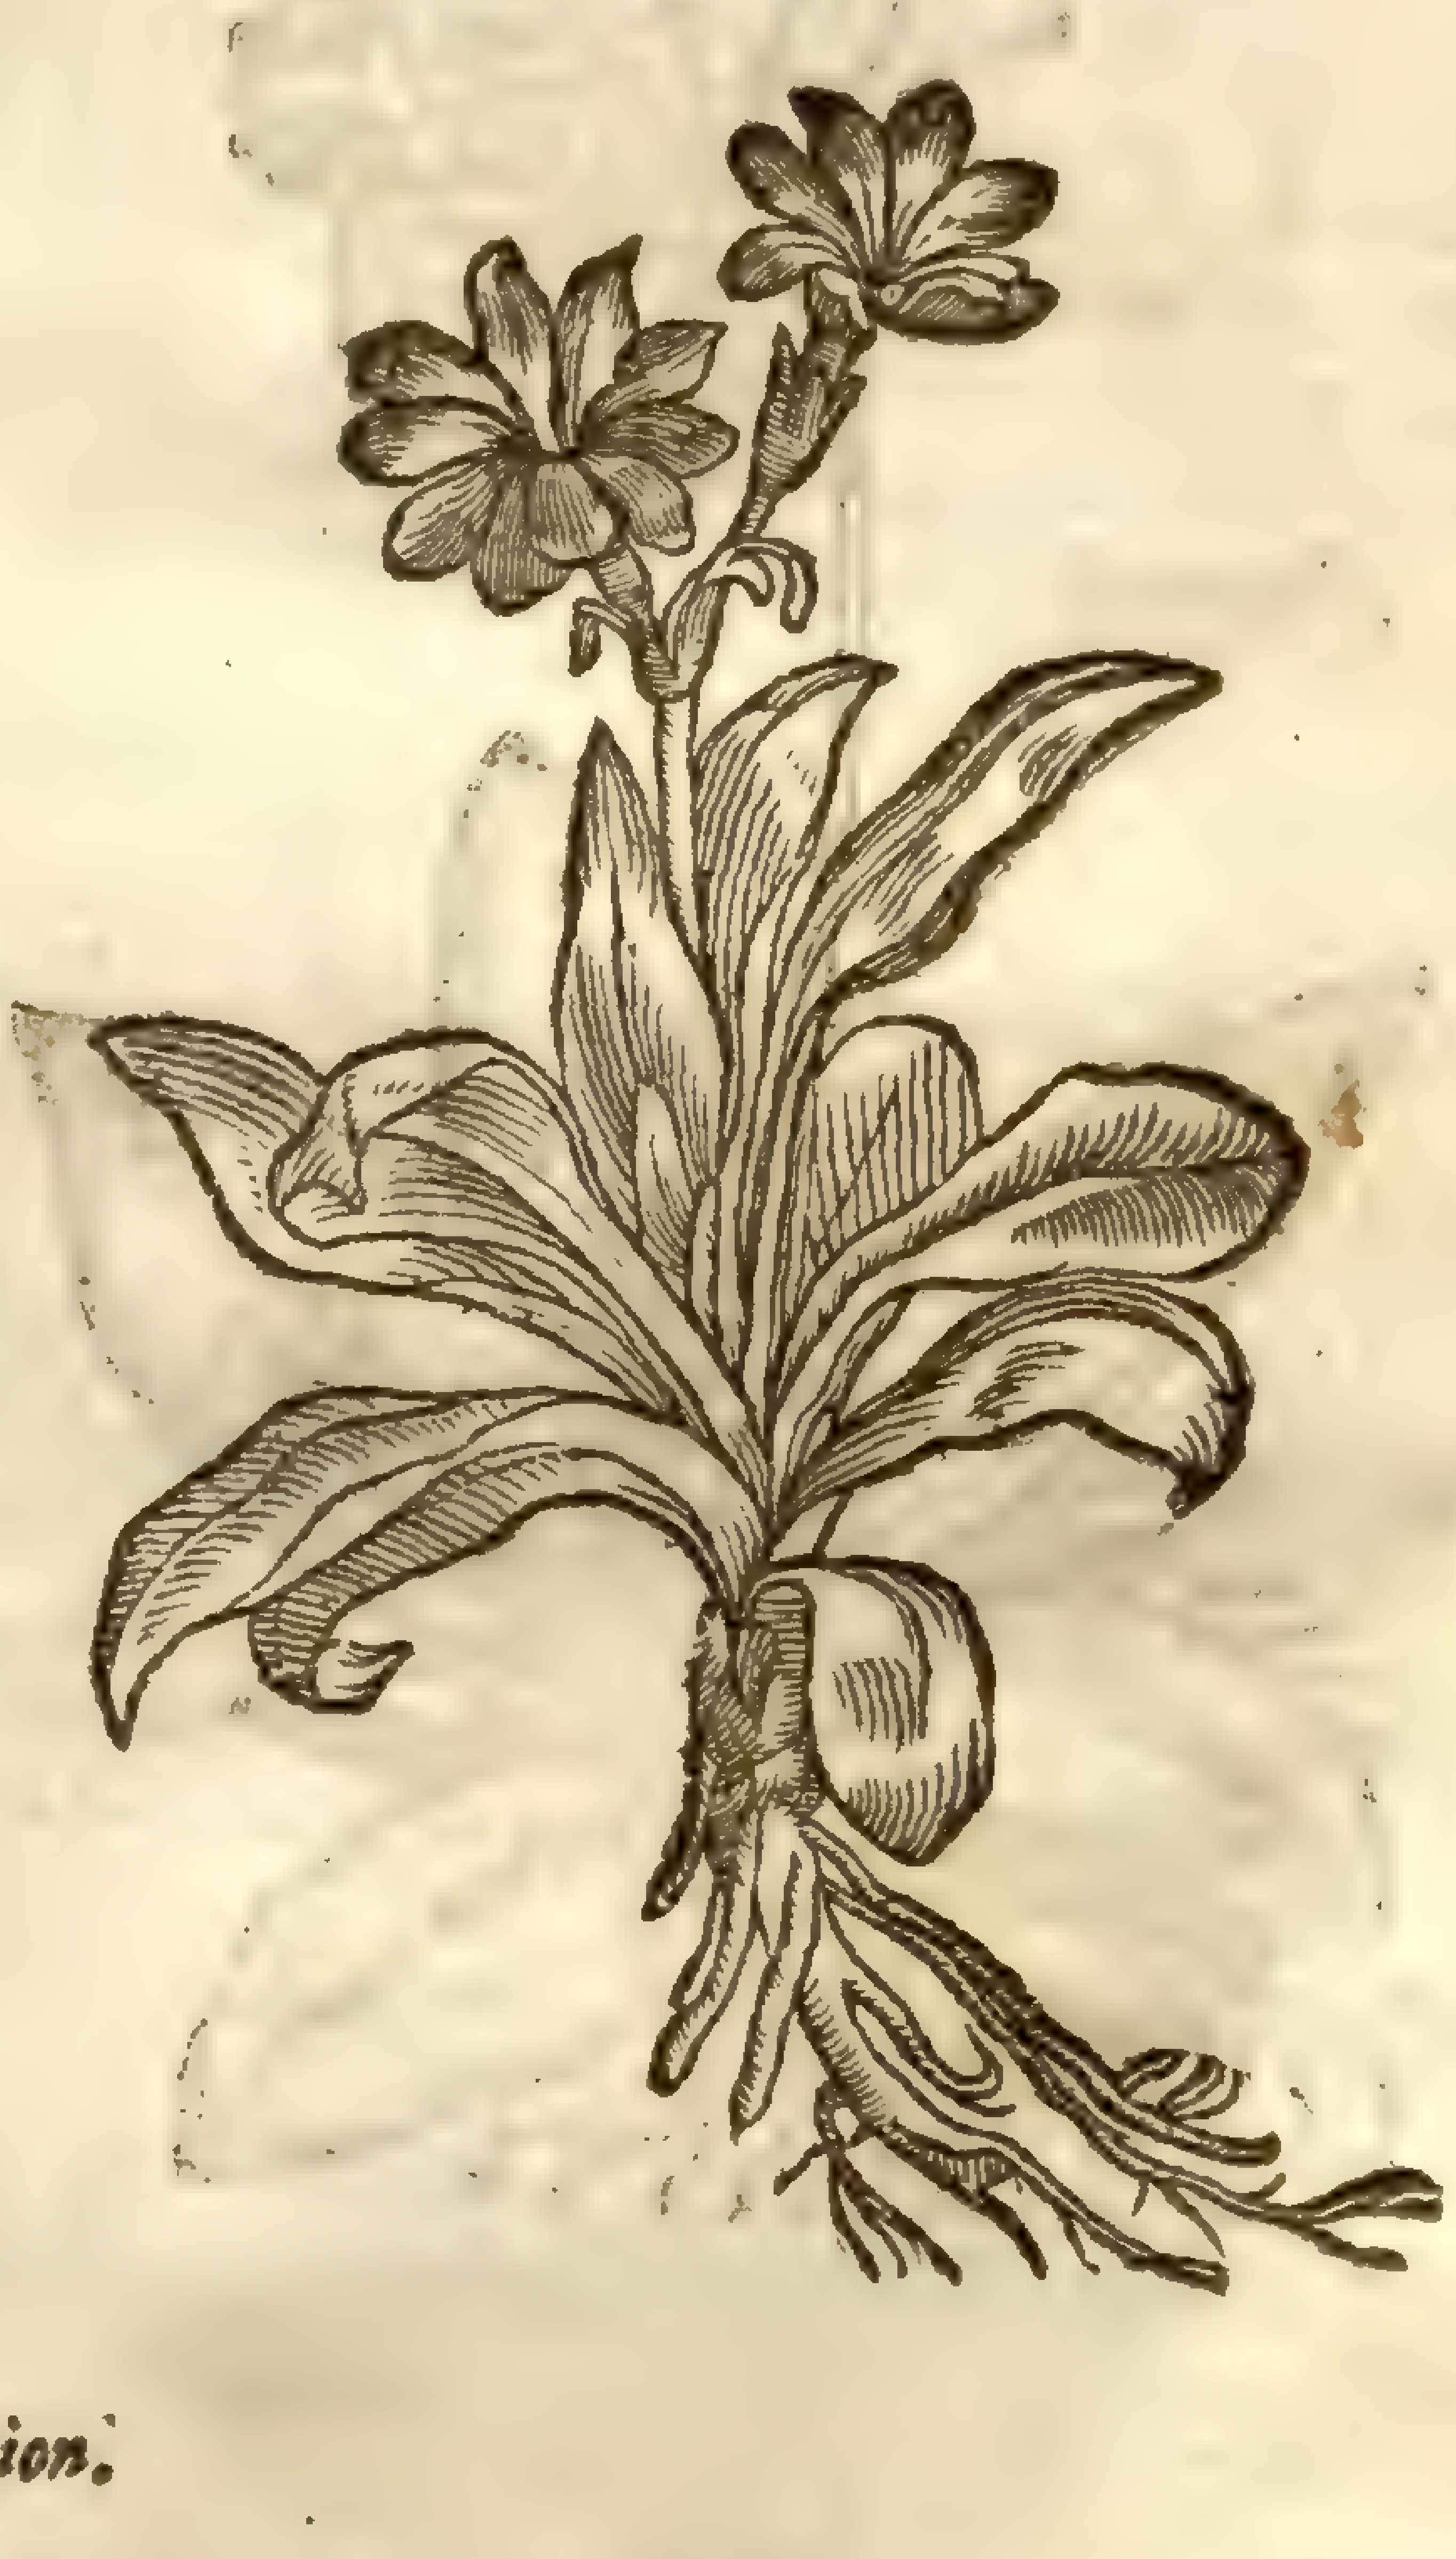
THere be diuers ſorts of Mountaine Cowſlips, or Beares-eares, differing eſpecially in the colour of their floures, as ſhall be declared, notwithſtanding it may appeare to the curious, that there is great difference in the roots alſo, conſidering ſome of them haue knobbed roots, and others threddy: notwithſtanding there is no difference in the roots at all.

‡ There are diuers varieties of theſe floures, and the chiefe differences ariſe, either from the leaues or floures; from their leaues, which are either ſmooth and greene, or elſe gray and hoary, againe they are ſmooth about the edges, or ſnipt more or leſſe; The floures ſome are fairer than otherſome, and their colours are ſo various, that it is hard to finde words to expreſſe them, but they may be referd to whites, reds, yellowes, and purples; for of all the varieties and mixtures of theſe they chiefly conſiſt. The Gardens of Mr. *Tradeſcant* and Mr. *Tuggie* are at this preſent furniſhed with very great varieties of theſe floures. ‡

3 *Auricula Vrſi ij. Cluſij.*
Red Beares-eare.



4 *Auricula Vrſi iij. Cluſij.*
Scarlet Beares-eare.



¶ *The Deſcription.*

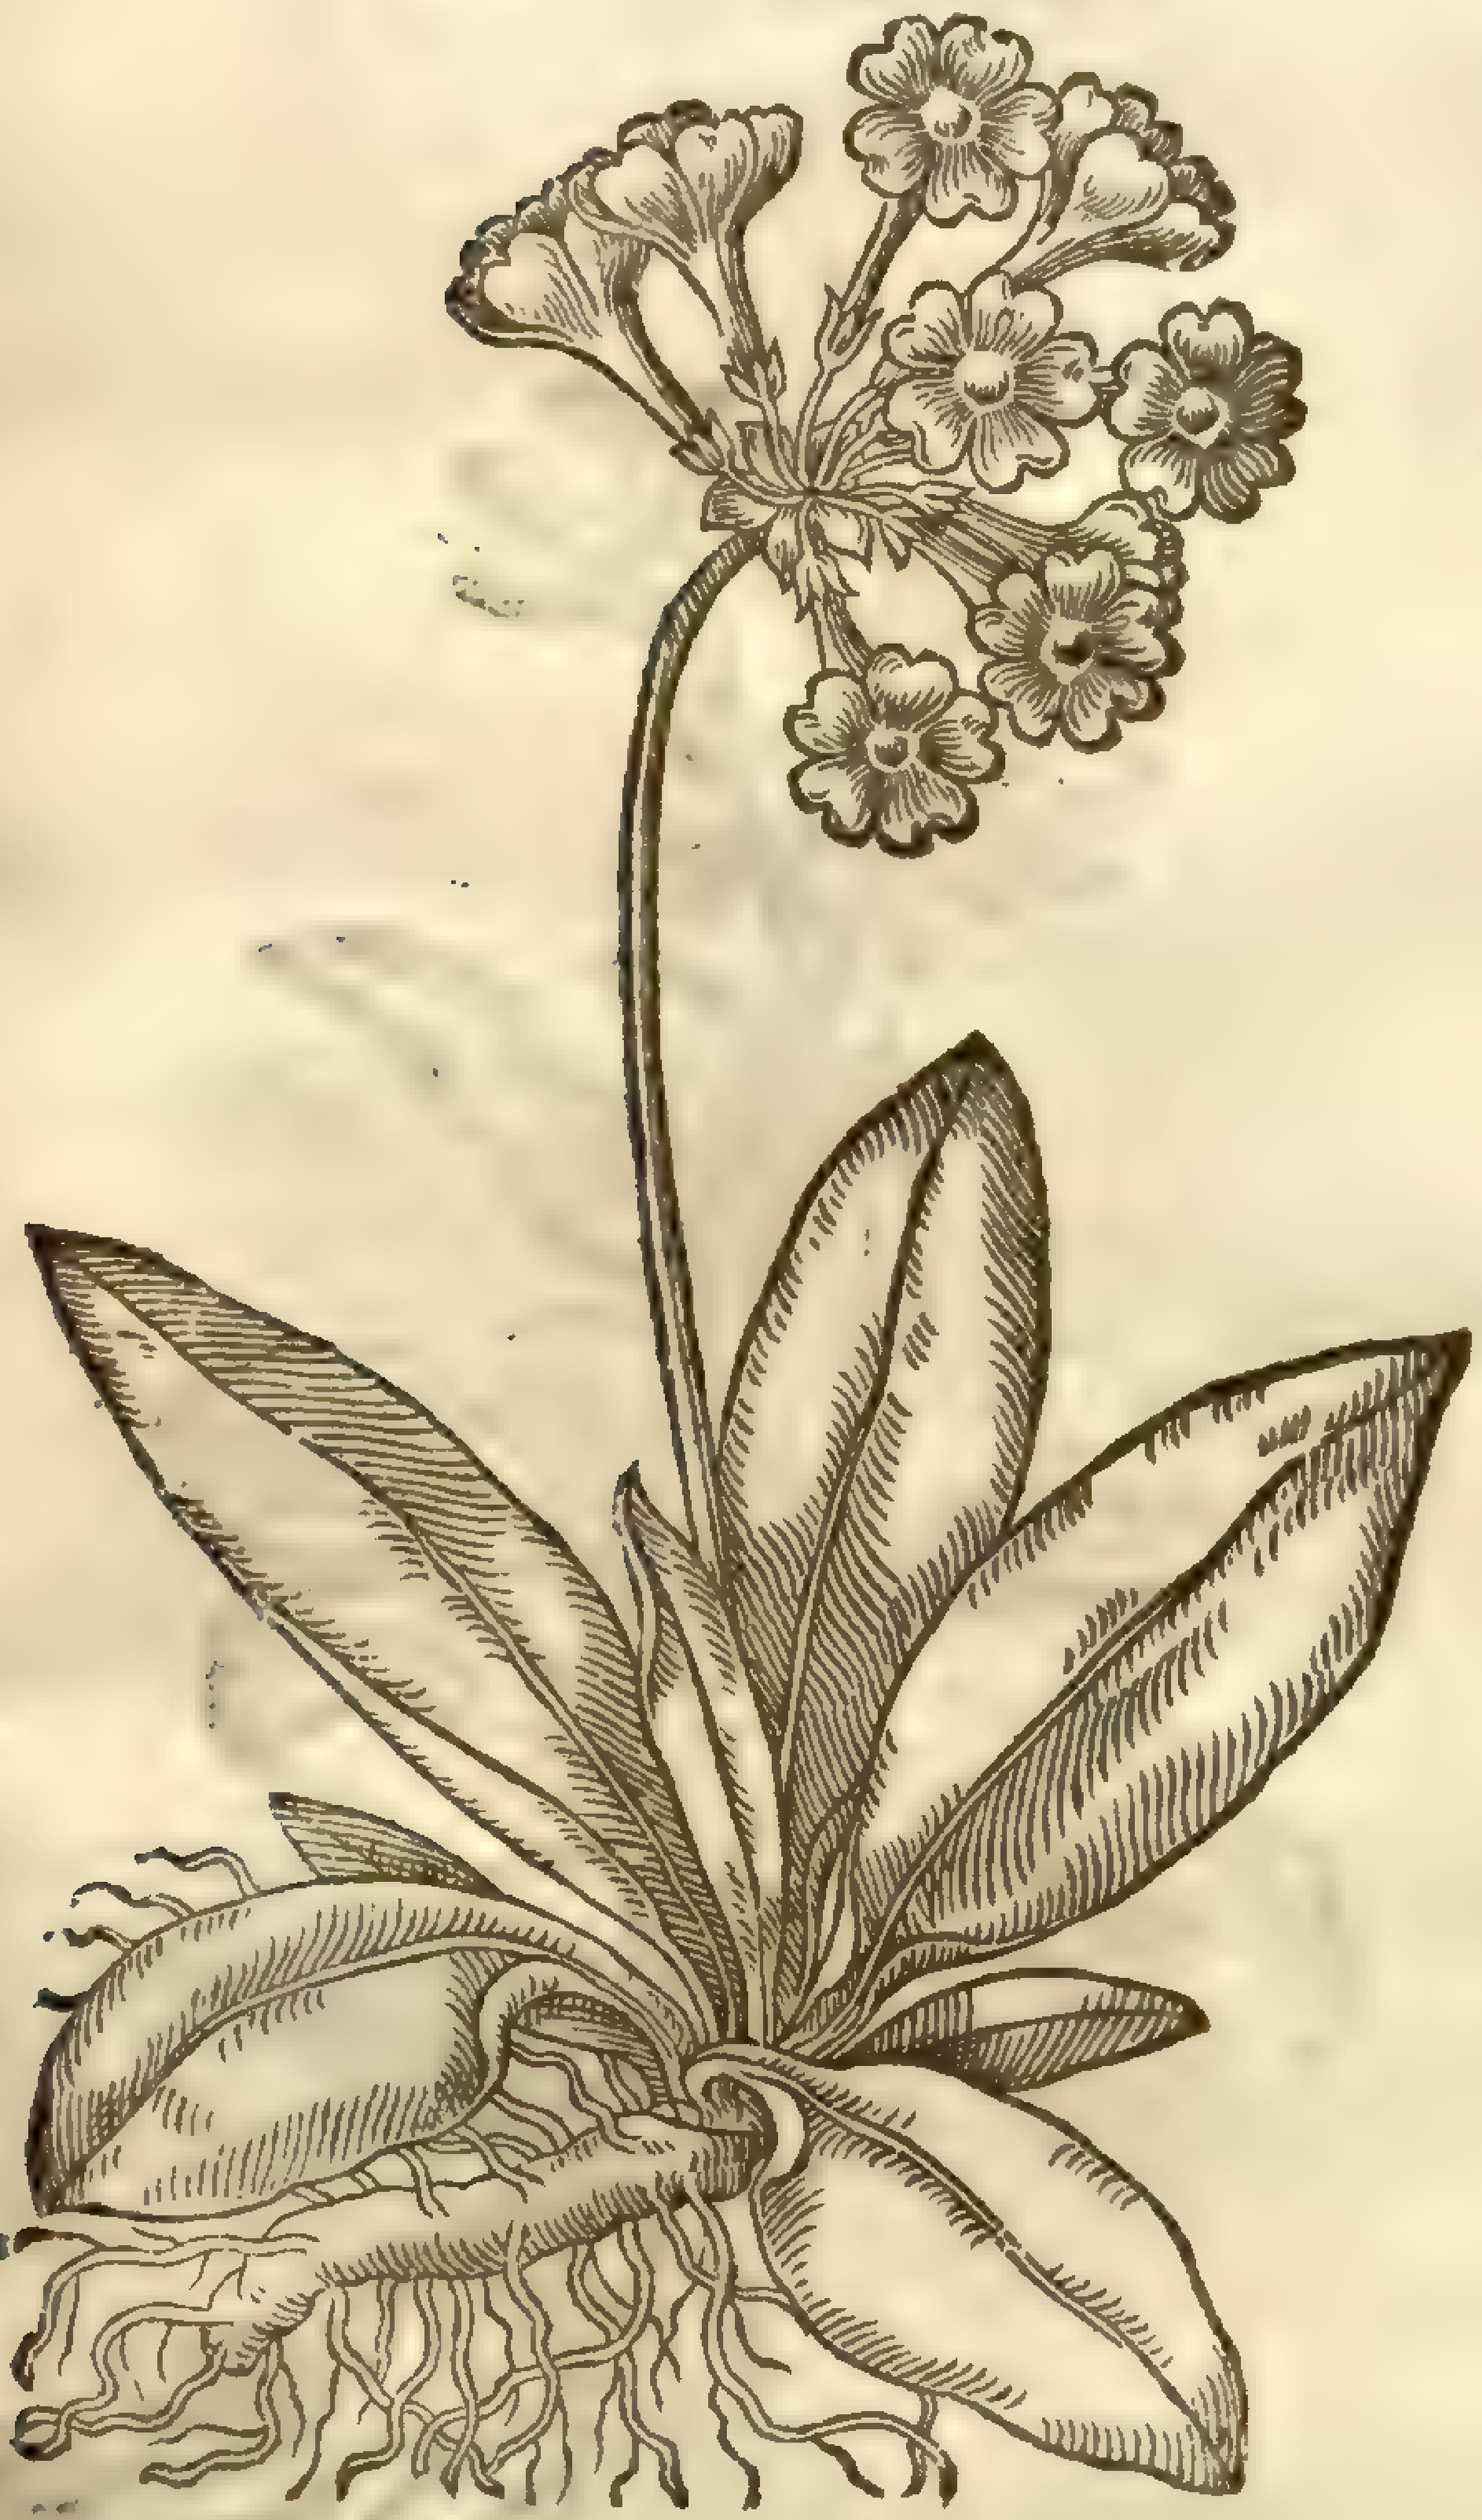
1 *AVricula Vrſi* was called of *Matthiolus*, *Pena*, and other Herbariſts, *Sanicula Alpina*, by reaſon of his ſingular faculty in healing of wounds, both inward and outward. They doe all call it *Paralytica*, becauſe of his vertues in curing the palſies, cramps, and convulſions, and is numbred among the kindes of Cowſlips, whereof no doubt they are kindes as others are which do hereafter follow vnder the ſame title, although there be ſome difference in the colour of the floures. This beautifull and braue plant hath thicke, greene, and fat leaues, ſomewhat finely ſnipt about the edges, not altogether vnlike thoſe of Cowſlips, but ſmoother, greener, and nothing rough or crumpled: among which riſeth vp a ſlender round ſtem a handfull high, bearing a tuft of floures at the top, of a faire yellow colour, not much vnlike to the floures of Oxe-lips, but more open and conſiſting of one only leafe like Cotiledon: the root is very threddy, and like vnto the Oxe-lip

2 The leaues of this kinde which beareth the purple floures are not ſo much ſnipt about the edges: theſe ſaid purple floures haue alſo ſome yellowneſſe in the middle, but the floures are not ſo much laid open as the former, otherwiſe in all reſpects they are like.

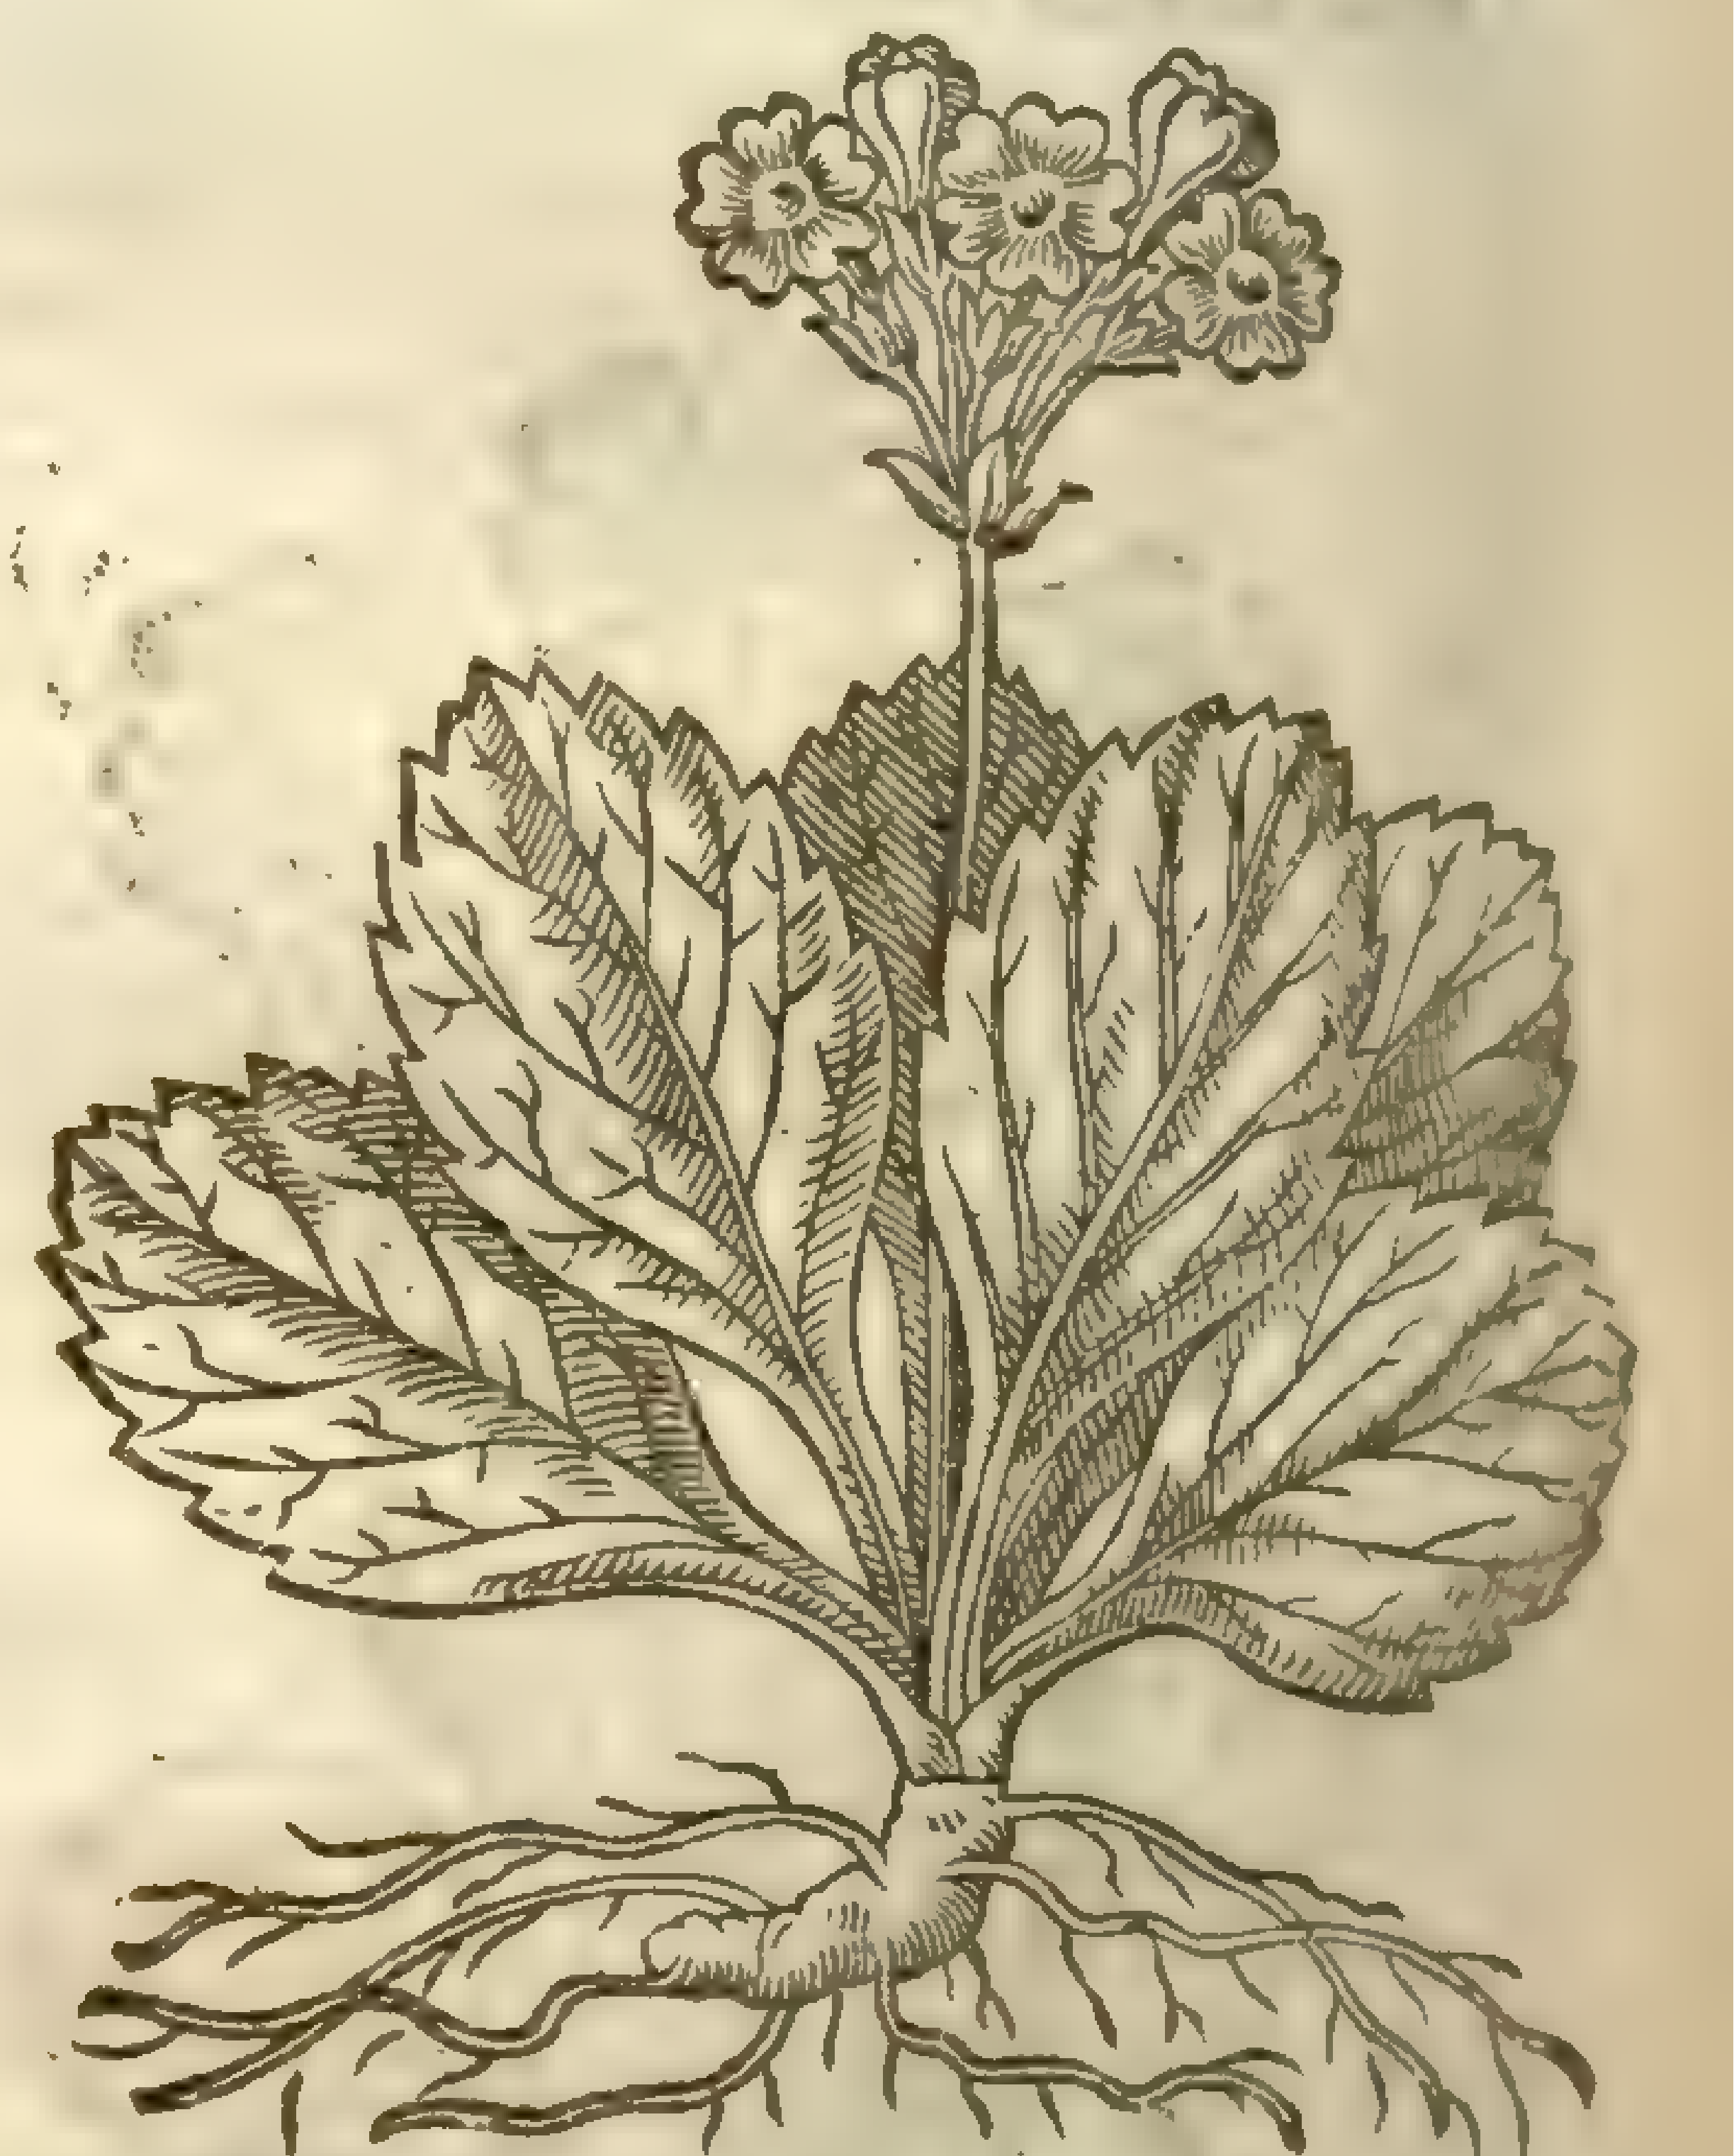
3 *Carolus Cluſius* ſetteth forth in the booke of his Pannonicke trauels two kindes more, whic he hath found in his trauell ouer the Alpes and other mountaines of Germany and Heluetia, be ing the third in number, according to my computation: it hath leaues like the former, but lo ger, ſmaller, and narrower toward the bottome, greene aboue, and of a pale colour vnderneath. The floures are in faſhion like to the former, but of a moſt ſhining red colour within, and on the outſide of the colour of a mulberry: the middle or eie of the floure is of a whitiſh pale colour: the root is like the former.

4 The fourth is a ſmaller plant than any of the foreſaid, whoſe leaues are thicke and fat, no thing at all ſnipt about the edges, greene aboue, and grayiſh vnderneath. The floures are like the former, ſhining about the edges, of an ouerworne colour toward the middle, and in the middle com meth a forke couered with an hairineſſe: the root is blacke and threddy.

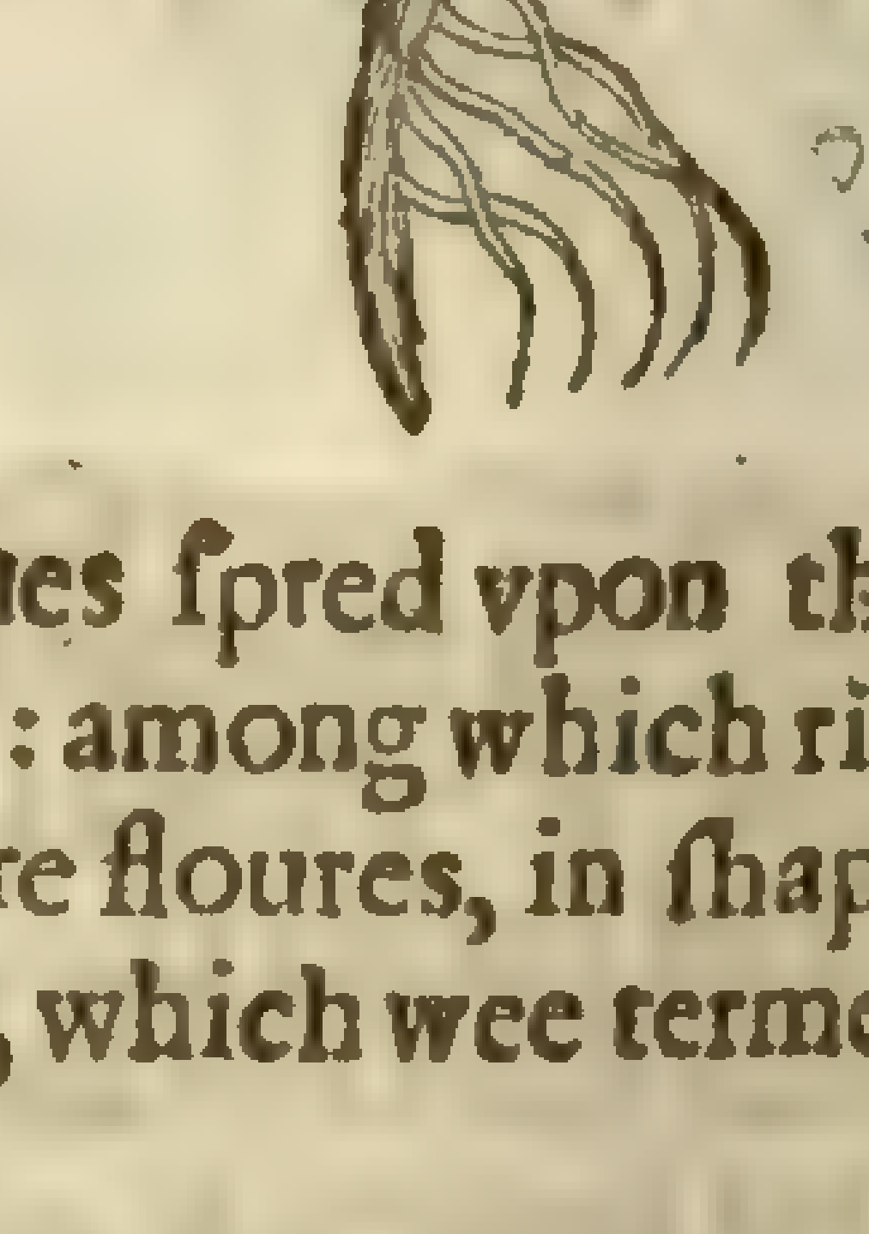
5 *Auricula Vrſi erubeſcens.*
Bluſh coloured Beares eare.



6 *Auricula Vrſi ſuaue rubens.*
Bright red Beares eare.



7 *Auricula Vrſi minima.*
Stamell Beares eare.



[illegible]

5 The bluſh-coloured Beares eare hath diuers thicke fat leaues ſpred vpon the ground, of a whitiſh greene colour, ſleightly or not at all indented in the edges: among which riſeth vp a naked ſtalke likewiſe hairy or whitiſh, on the top whereof ſtand very faire floures, in ſhape like thoſe of the common Cowſlip, but of a whitiſh colour tending to purple, which wee terme bluſh-colour. The root is tough and threddy, as are all the reſt.

6 The bright ſhining red Beares eare of *Matthiolus* deſcription ſeemes to late Herbariſts to be rather a figure made by conceit or imagination, than by the ſight of the plant it ſelfe; for doubtleſſe we are perſuaded that there is no ſuch plant, but onely a figure foiſted for oſtentation ſake, the deſcription whereof we leaue to a further conſideration, becauſe we haue not ſeene any ſuch plant, neither do we beleeue there is any ſuch. ‡ Our Author is here without cauſe iniurious to *Matthiolus*; for he figures and deſcribes onely the common firſt deſcribed yellow Beares eare: yet if he had ſaid the floures were of a light ſhining red, he had not erred; for I haue ſeene theſe floures of all the reds both bright and darke that one may imagine. ‡

Pena ſetteth forth a kinde of Beares eare vnder the name of *Sanicula alpina*, hauing his vppermoſt leaues an inch long, ſomewhat jagged and hem'd at the ends, and broad before like a ſhouell; the lower leaues next the ground are ſomewhat ſhorter, but of the ſame forme; among which riſeth a ſmall ſlender foot-ſtalke of an inch long, whereon doth ſtand a ſmall floure, conſiſting of fiue little leaues of a bright red or ſtammell colour.

8 The ſnow white Beares-eare differeth not from the laſt deſcribed but in the colour of the floure, for as the others are red, contrary theſe are very white, and the whole plant is leſſer, wherein conſiſteth the difference. The root is long, tough, with ſome fibres thereto belonging. Neither of theſe two laſt deſcribed will be content to grow in Gardens.

¶ *The Place.*

They grow naturally vpon the Alpiſh and Heluetian mountaines: moſt of them do grow in our London Gardens.

¶ *The Time.*

Theſe herbes do floure in Aprill and May.

¶ *The Names.*

Either the antient writers knew not theſe plants, or elſe the names of them were not by them or their ſucceſſors diligently committed vnto poſterity. *Matthiolus* and other later writers haue giuen names according to the ſimilitude, or of the ſhape that they beare vnto other plants, according to the likeneſſe of the qualities and operations: you may call it in Engliſh, Beares-eare: they that dwell about the Alpes doe call it **Draſtkrawt**, and **Schwindlekrawt**, by reaſon of the effects thereof; for the root is amongſt them in great requeſt for the ſtrengthning of the head, that when they are on the tops of places that are high, giddineſſe and the ſwimming of the braine may not afflict them: it is there called the Rocke-Roſe, for that it groweth vpon the rockes, and reſembleth the braue colour of the roſe. ‡ *Fabius Columna* proues this to be the *Aliſma* or *Damaſonium* of *Dioſcorides* and the Antients. ‡

¶ *The Temperature.*

Theſe herbes are dry and very aſtringent.

¶ *The Vertues.*

It healeth all outward and inward wounds of the breſt, and the enterocele alſo, if for ſome reaſonable ſpace of time it be put in drinkes, or boyled by it ſelfe. A

Theſe plants are of the nature and temperature of *Primula veris*, and are reckoned amongſt the Sanicles by reaſon of their vertue. B

Thoſe that hunt in the Alps and high mountaines after Goats and bucks, do as highly eſteeme hereof as of *Doronicum*, by reaſon of the ſingular effects that it hath, but (as I ſaid before) one eſpecially, euen in that it preuenteth the loſſe of their beſt joynts (I meane their neckes) if they take the roots hereof before they aſcend the rocks or other high places. C

‡ The root of *Damaſonium* (according to *Dioſcorides*) taken in the weight of one or two drams, helpeth ſuch as haue deuoured the *Lepus marinus* or ſea Hare, or haue beene bitten by a Toad, or taken too great a quantity of *Opium*. D

It is alſo profitably drunke, either by it ſelfe, or with the like quantity of *Daucus* ſeeds, againſt gripings in the belly, and the bloudy flux. E

Alſo it is good againſt conuulſions and the affects of the wombe. F

The herbe ſtaies the flux of the belly, moues the courſes, and applied in forme of a pultis aſſwageth œdematous tumors. ‡ G

Chap. 256. *Of Mountaine Sanicle.*

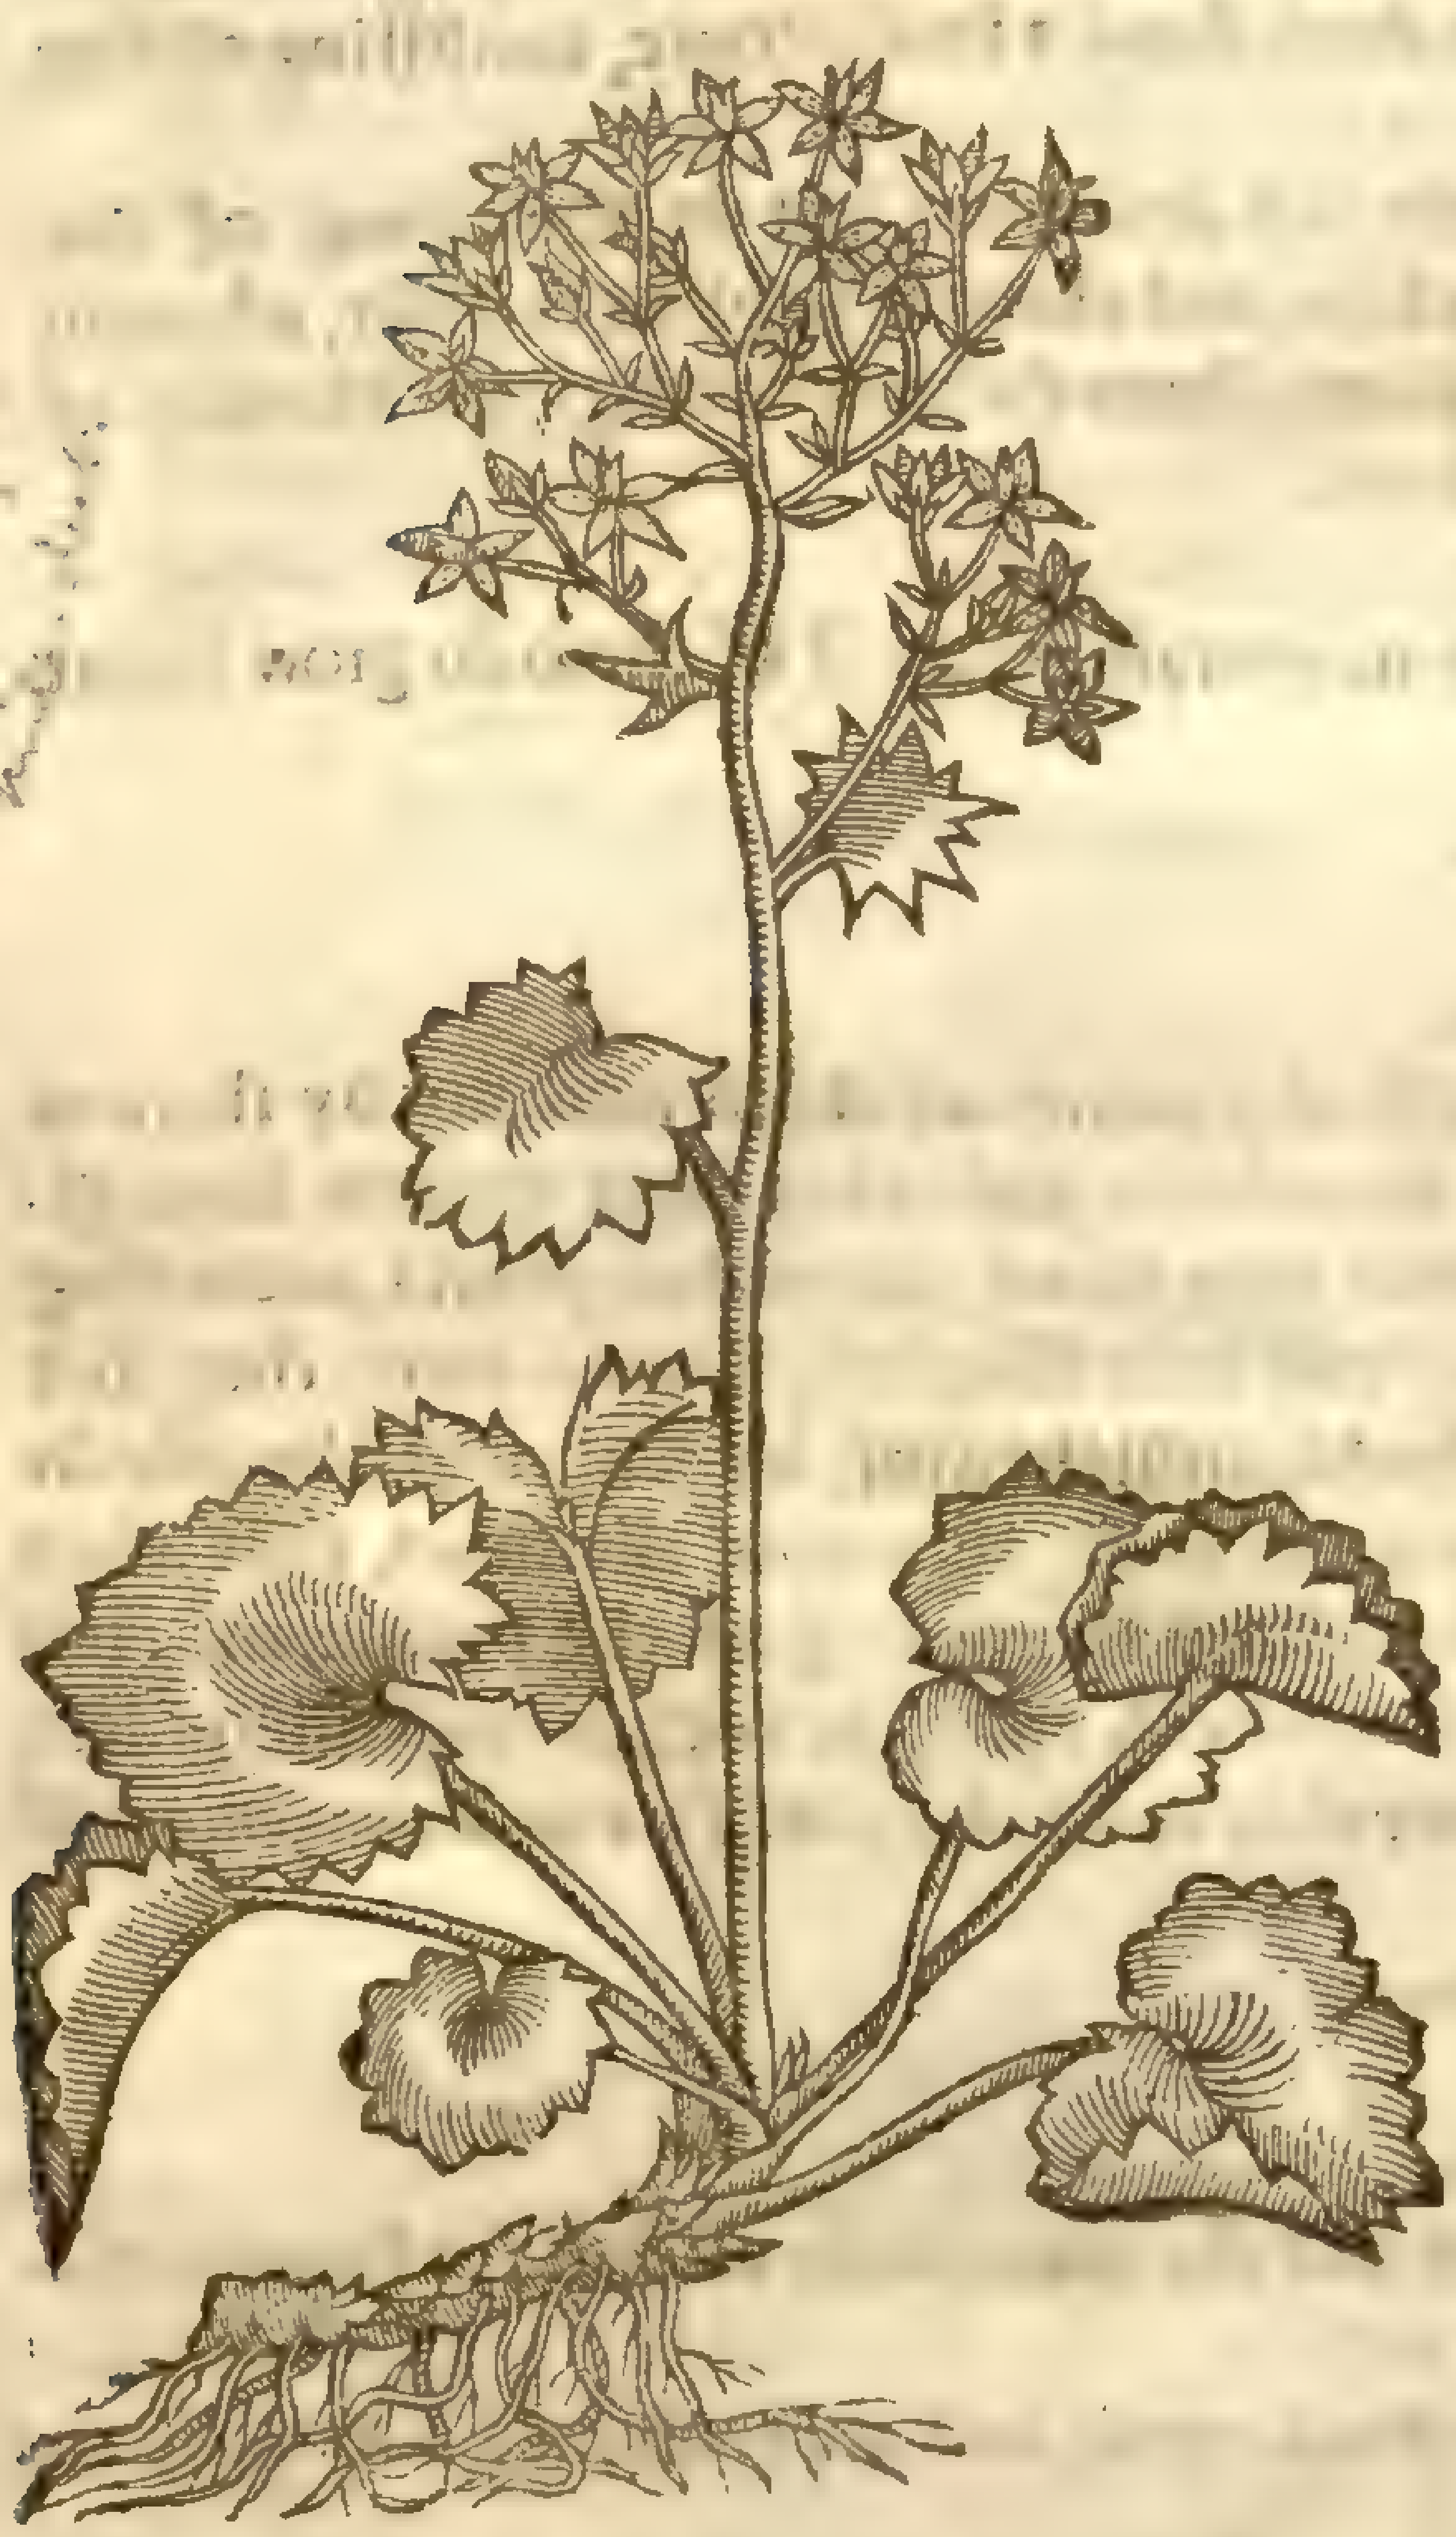
¶ *The Kindes.*

There be ſundry ſorts of herbes contained vnder the name of Sanicle, and yet not one of them agreeing with our common Sanicle, called *Diapenſia*, in any one reſpect, except in the vertues, whereof no doubt they tooke that name; which number doth dayly increaſe, by reaſon that the later writers haue put downe more new plants, not written of before by the Antients, which ſhall be diſtinguiſhed in this chapter by ſeuerall titles.

¶ *The Deſcription.*

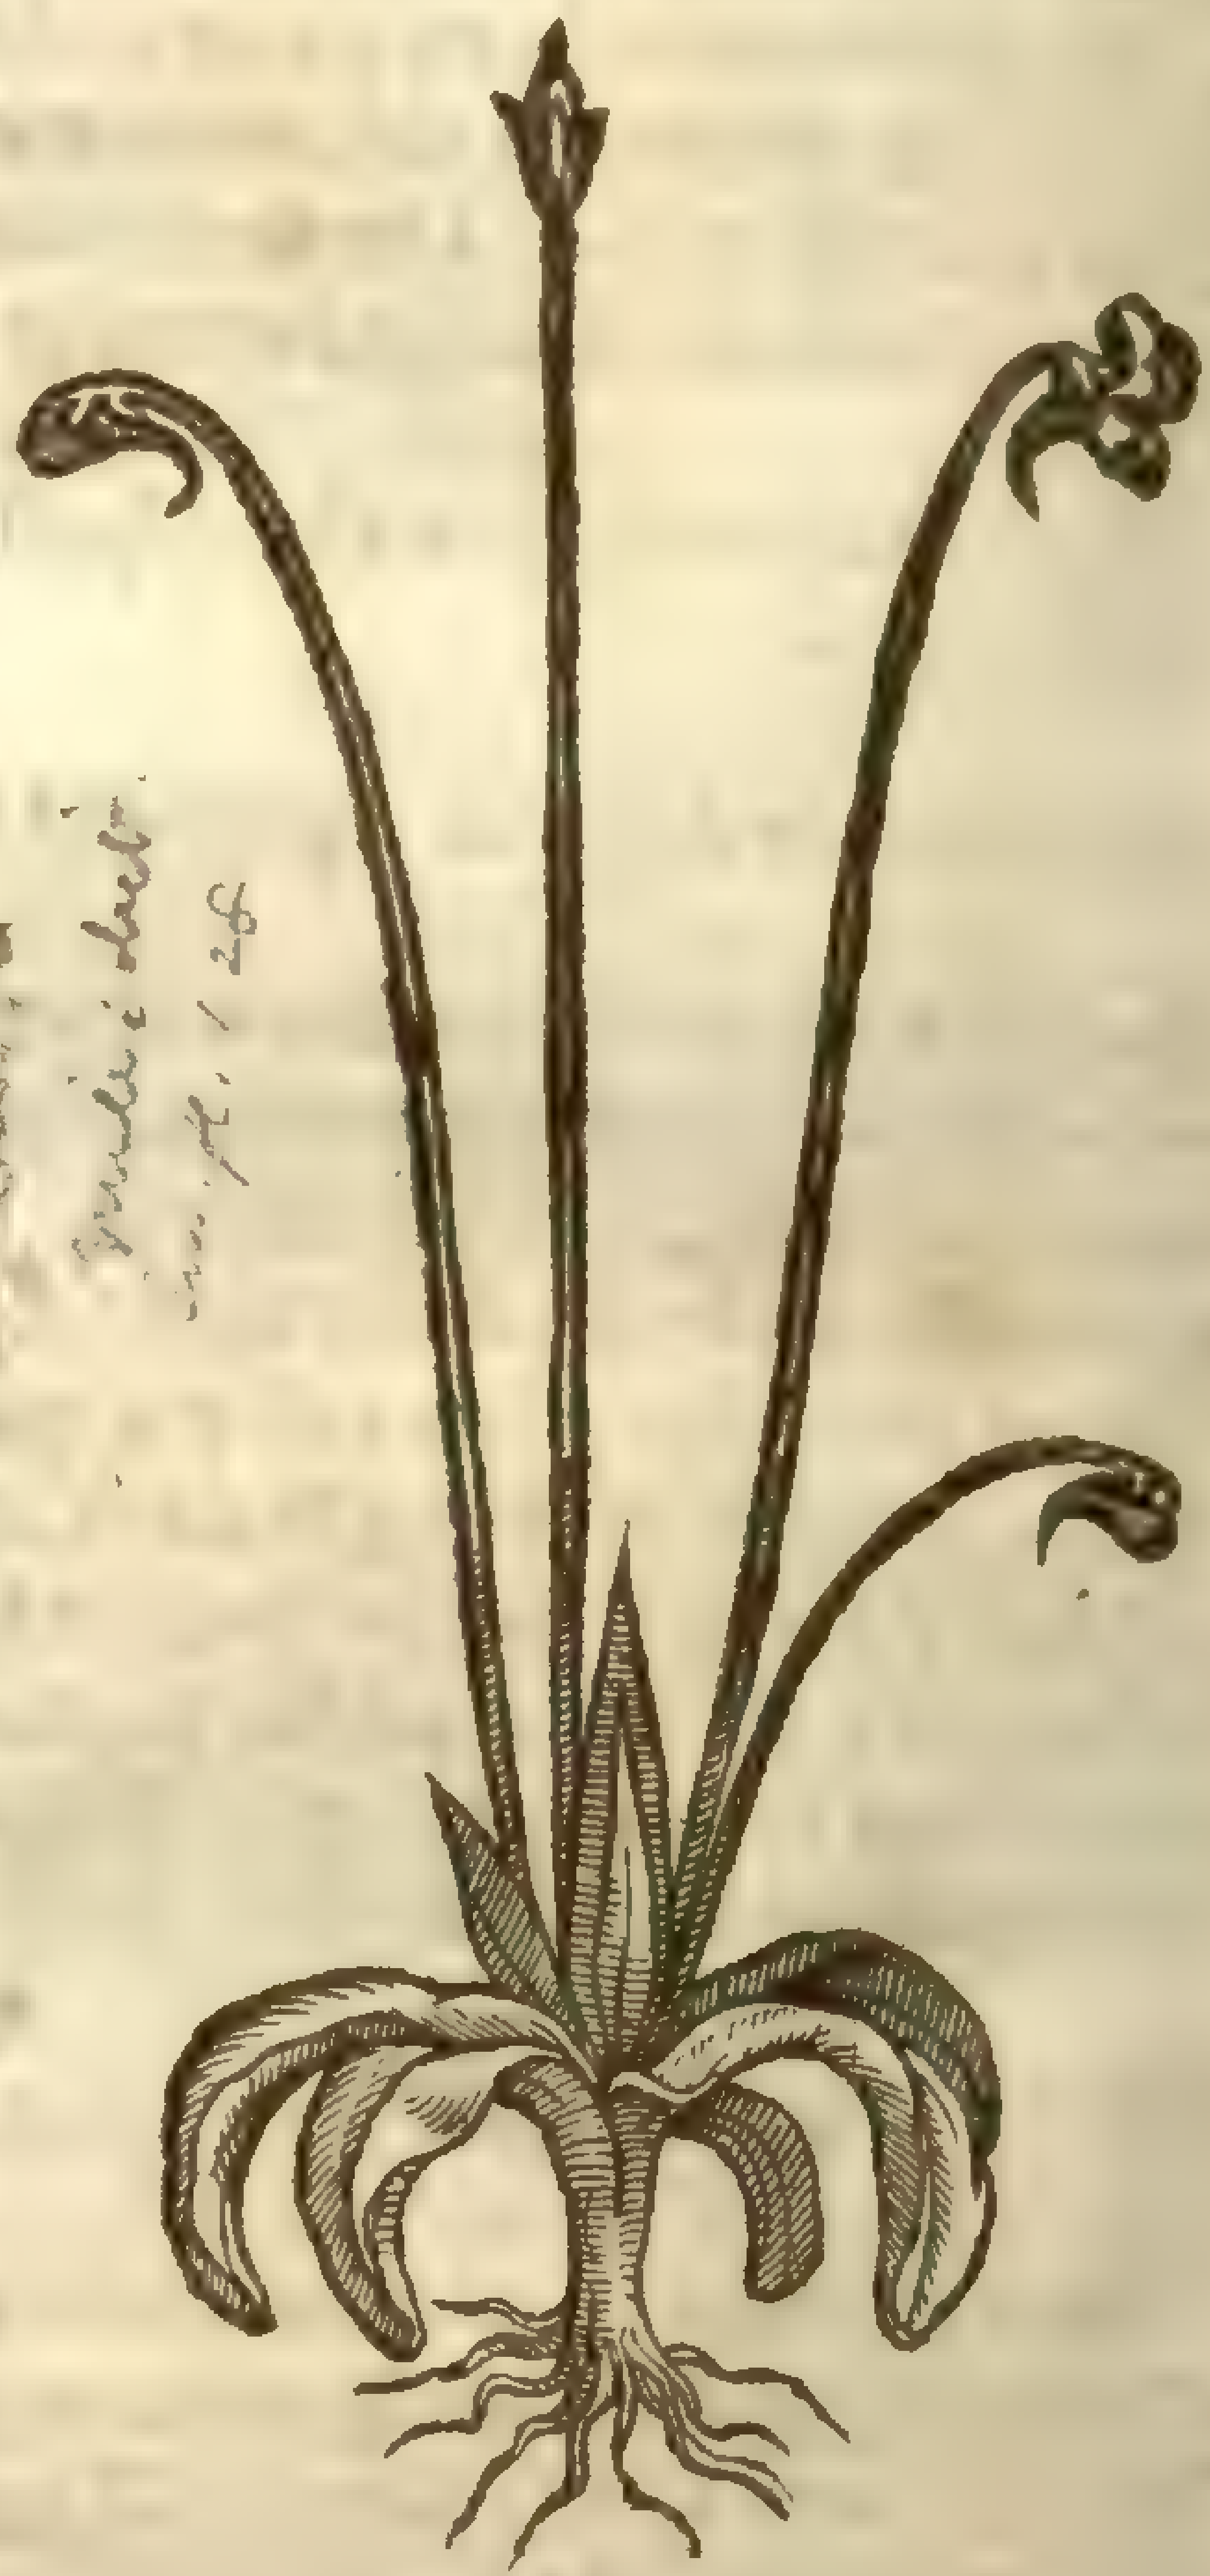
1 Spotted Sanicle of the mountaine hath ſmall fat & round leaues, bluntly indented about the edges, and faſhioned like vnto the leaues of *Saxifragia aurea*, or rather *Cyclamen folio hederæ*, of a darke greene colour, and ſomewhat hairy vnderneath: amongſt which riſe

1 *Sanicula guttata.*
Spotted Sanicle.



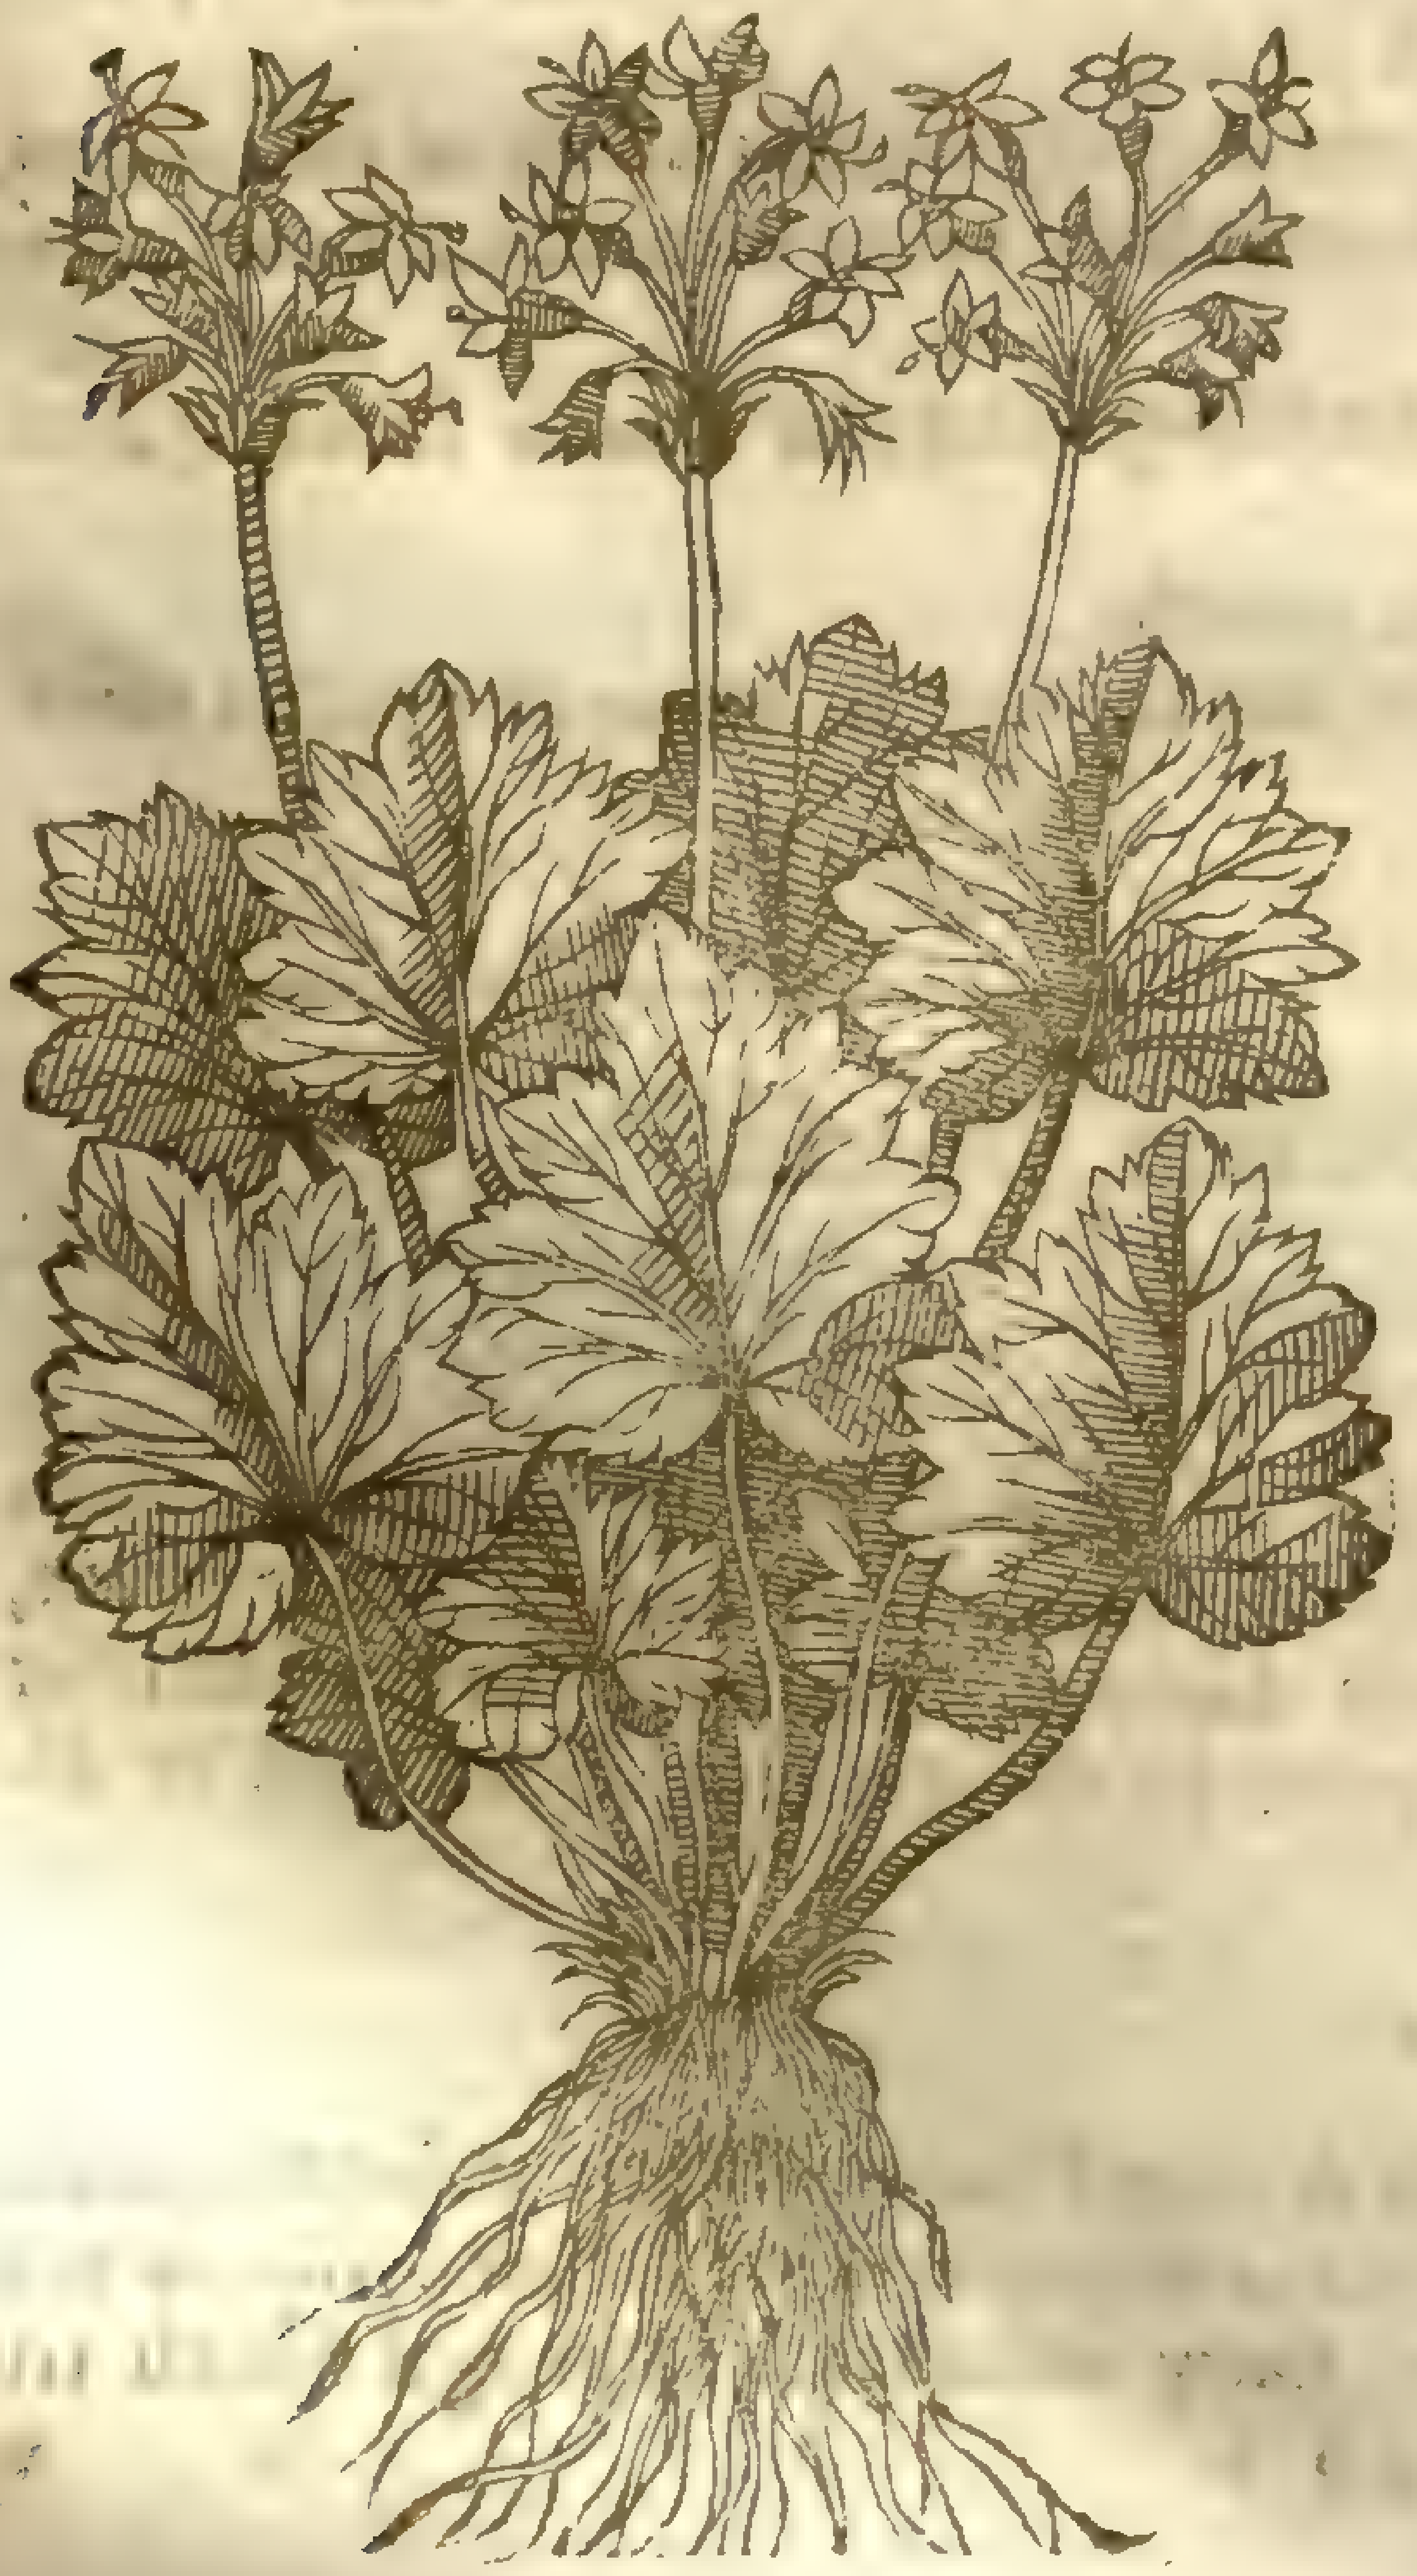
Saxifraga rotundifolia, Nom. dub.

2 *Pinguicula ſiue Sanicula Eboracenſis.*
Butterwort, or Yorkſhire Sanicle.



P. vulgaris, Smith brit. p. 128

3 *Sanicula Alpina Cluſij, ſiue Cortuſa Matthioli.*
Beares-eare Sanicle.



Cortusa Matthioli, L. Nom. dub.

vp ſundry ſtalkes, beſet with like leaues, but ſmaller, and of a cubit high, diuiding themſelues into many ſmall armes or branches, bearing diuers little white floures, ſpotted moſt curiouſly with bloudy ſpecks or prickles, inſomuch that if you marke the admirable workemanſhip of the ſame wrought in ſuch glorious manner, it muſt needs put euery creature in minde of his Creator: the floures are in ſmell like the May floures or Hawthorne: the ſeed is ſmall and blacke, contained in ſmall pointals like vnto white Saxifrage: the root is ſcaly and full of ſtrings.

2 The ſecond kind of Sanicle, which *Cluſius* calleth *Pinguicula*, not before his time remembred, hath ſmall thicke leaues, fat and full of juyce, being broad towards the root, and ſharpe towards the point, of a faint greene colour, and bitter in taſte: out of the middeſt whereof ſprouteth or ſhooteth vp a naked ſlender ſtalke, nine inches long, euery ſtalke bearing one floure and no more, ſometimes white but commonly of a blewiſh purple colour, faſhioned like vnto the common *Conſolida regalis*, hauing the like ſpur or Larks heele annexed thereto.

3 The third kinde of mountaine Sanicle

ſome Herbariſts haue called *Sanicula alpina floro rubro*: the leaues ſhoot forth in the beginning of the Spring, very thicke and fat, and are like a purſe or round lumpe at their firſt comming out of the ground; and when it is ſpread abroad, the vpper part thereof is full of veines or ſinewes, and houen vp or curled like *Ranunculus Luſitanicus*, or like the crumpling of a cabbage leafe; and are not onely indented about the edges, but each leafe is diuided into ſix or more jagges or cuts, deepely hacked, greeniſh aboue, and of an ouerworne greene colour vnderneath, hot in taſte; from the middle whereof ſhooteth forth a bar or naked ſtalke, ſix inches long, ſomewhat purple in colour, bearing at the top a tuft of ſmall hollow floures, looking or hanging downewards like little bells, not vnlike in forme to the common Cowſlips, but of a fine deepe red colour tending to purple, hauing in the middle a certaine ring or circle of white, and alſo certaine pointals or ſtrings, which turne into an head wherein is contained ſeed. The whole plant is couered as it were with a rough woollineſſe: the root is fibrous and threddy.

¶ *The Place.*

Theſe plants are ſtrangers in England; their naturall country is the Alpiſh mountaines of Heluetia: they grow in my Garden, where they flouriſh exceedingly, except Butterwort, which groweth in our Engliſh ſqually wet grounds, and will not yeeld to any culturing or tranſplanting: it groweth eſpecially in a field called Crag-Cloſe, and at Crosby, Rauenſwaith, in Weſtmerland, vpon Ingleborow fels twelue miles from Lancaſter, and in Harwood in the ſame county neere to Blackburne, ten miles from Preſton in Aunderneſſe vpon the bogs, and mariſh grounds, and in the boggie medowes about Biſhops Hatfield; and alſo in the fens in the way to Wittles meare from London, in Huntingdonſhire. ‡ It groweth alſo in Hampſhire, and abundantly in many places of Wales. ‡

¶ *The Time.*

They floure and flouriſh from May to the end of Iuly.

¶ *The Names.*

The firſt is called *Sanicula guttata*, taken from the ſpots wherewith the floures are marked: of *Lobel*, *Geum Alpinum*, making it a kinde of Auens: in Engliſh, ſpotted Sanicle: of our London dames, Pratling Parnell.

The ſecond is called *Pinguicula*, of the fatneſſe or fulneſſe of the leafe, or of fatning: in Yorkeſhire, where it doth eſpecially grow, and in greateſt abundance, it is called Butterworts, Butter-root, and white root: but the laſt name belongeth more properly to Solomons Seale.

¶ *The Temperature.*

They are hot and dry in the third degree.

¶ *The Vertues.*

The husbandmens wiues of Yorkſhire do vſe to annoint the dugs of their kine with the fat and oilous juyce of the herbe Butterwort, when they are bitten with any venomous worme, or chapped, rifted and hurt by any other meanes. A

They ſay it rots their ſheepe, when for want of other food they eat thereof. B

Chap. 277. *Of Fox-Gloues.*

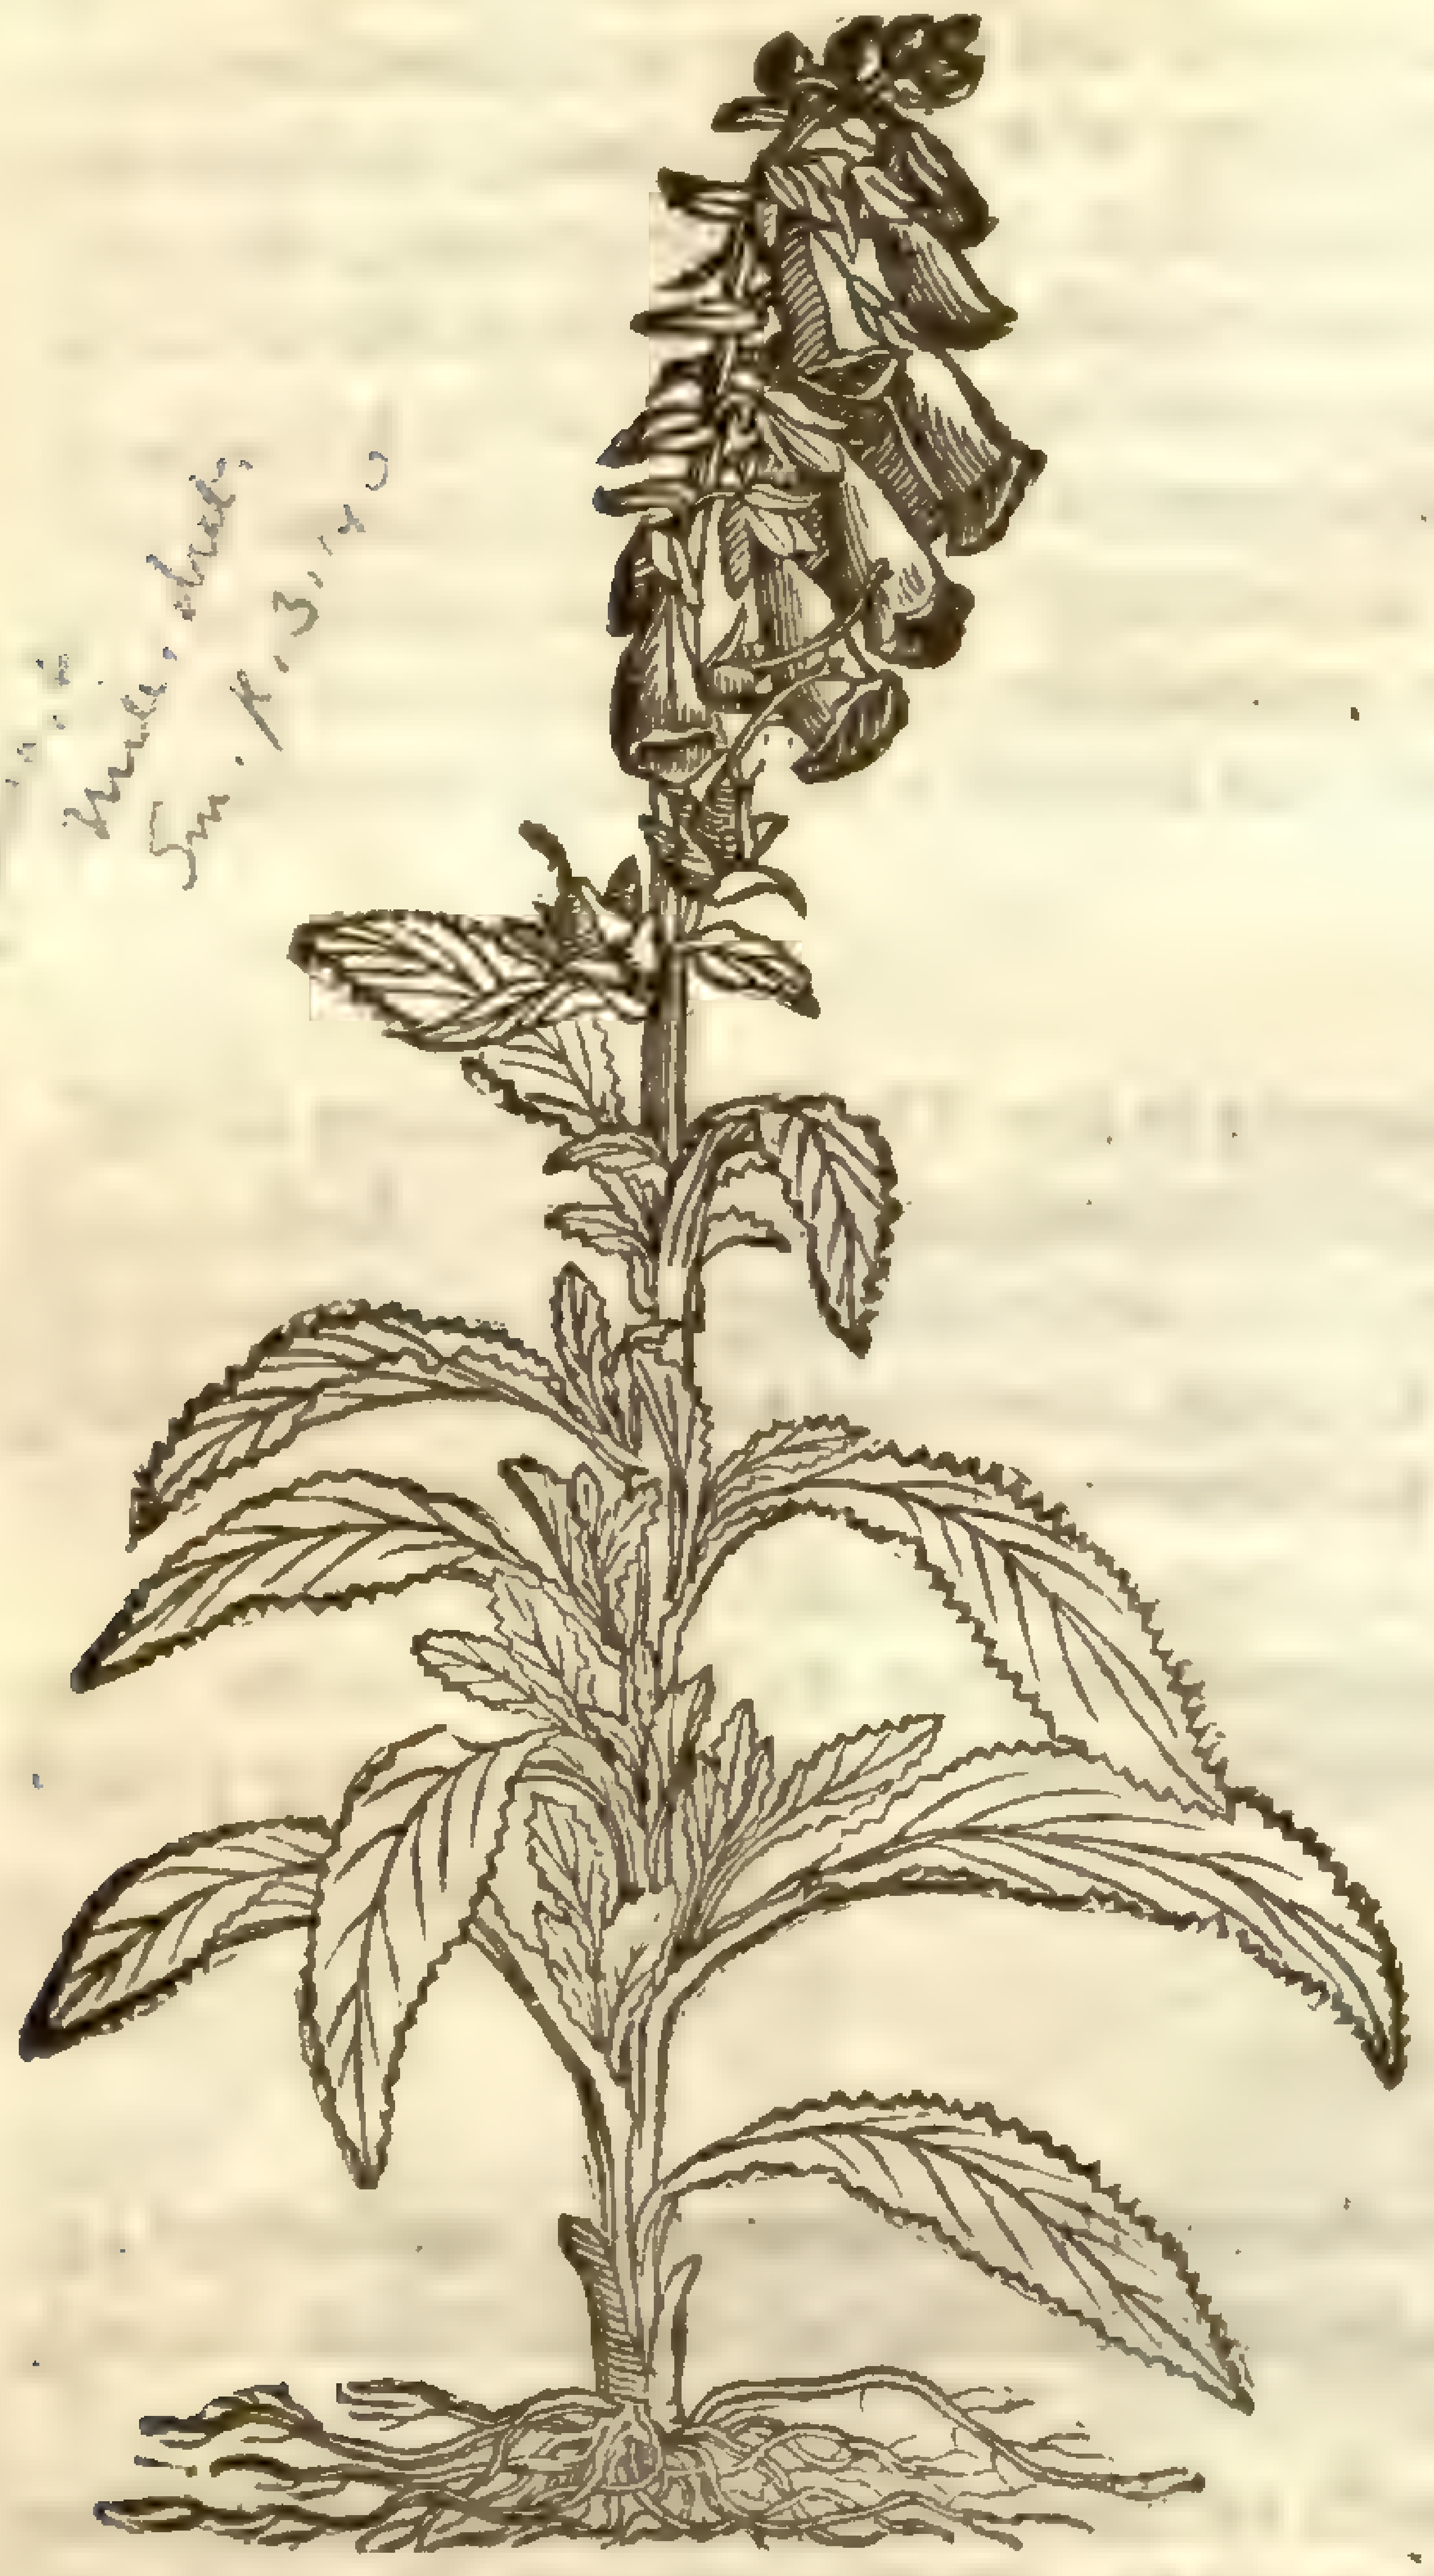
¶ *The Deſcription.*

1 Fox-gloue with the purple floure is moſt common; the leaues whereof are long, nicked in the edges, of a light greene, in manner like thoſe of Mullein, but leſſer, and not ſo downy: the ſtalke is ſtraight, from the middle whereof to the top ſtand the floures, ſet in a courſe one by another vpon one ſide of the ſtalke, hanging downwards with the bottome vpward, in forme long, like almoſt to finger ſtalkes, whereof it tooke his name *Digitalis*, of a red purple colour, with certaine white ſpots daſht within the floure; after which come vp round heads, in which lies the ſeed ſomewhat browne, and as ſmall as that of Time. The roots are many ſlender ſtrings.

2 The Fox-Gloue with white floures differs not from the precedent but in the colour of the floures; for as the other were purple, theſe contrariwiſe are of a milke-white colour.

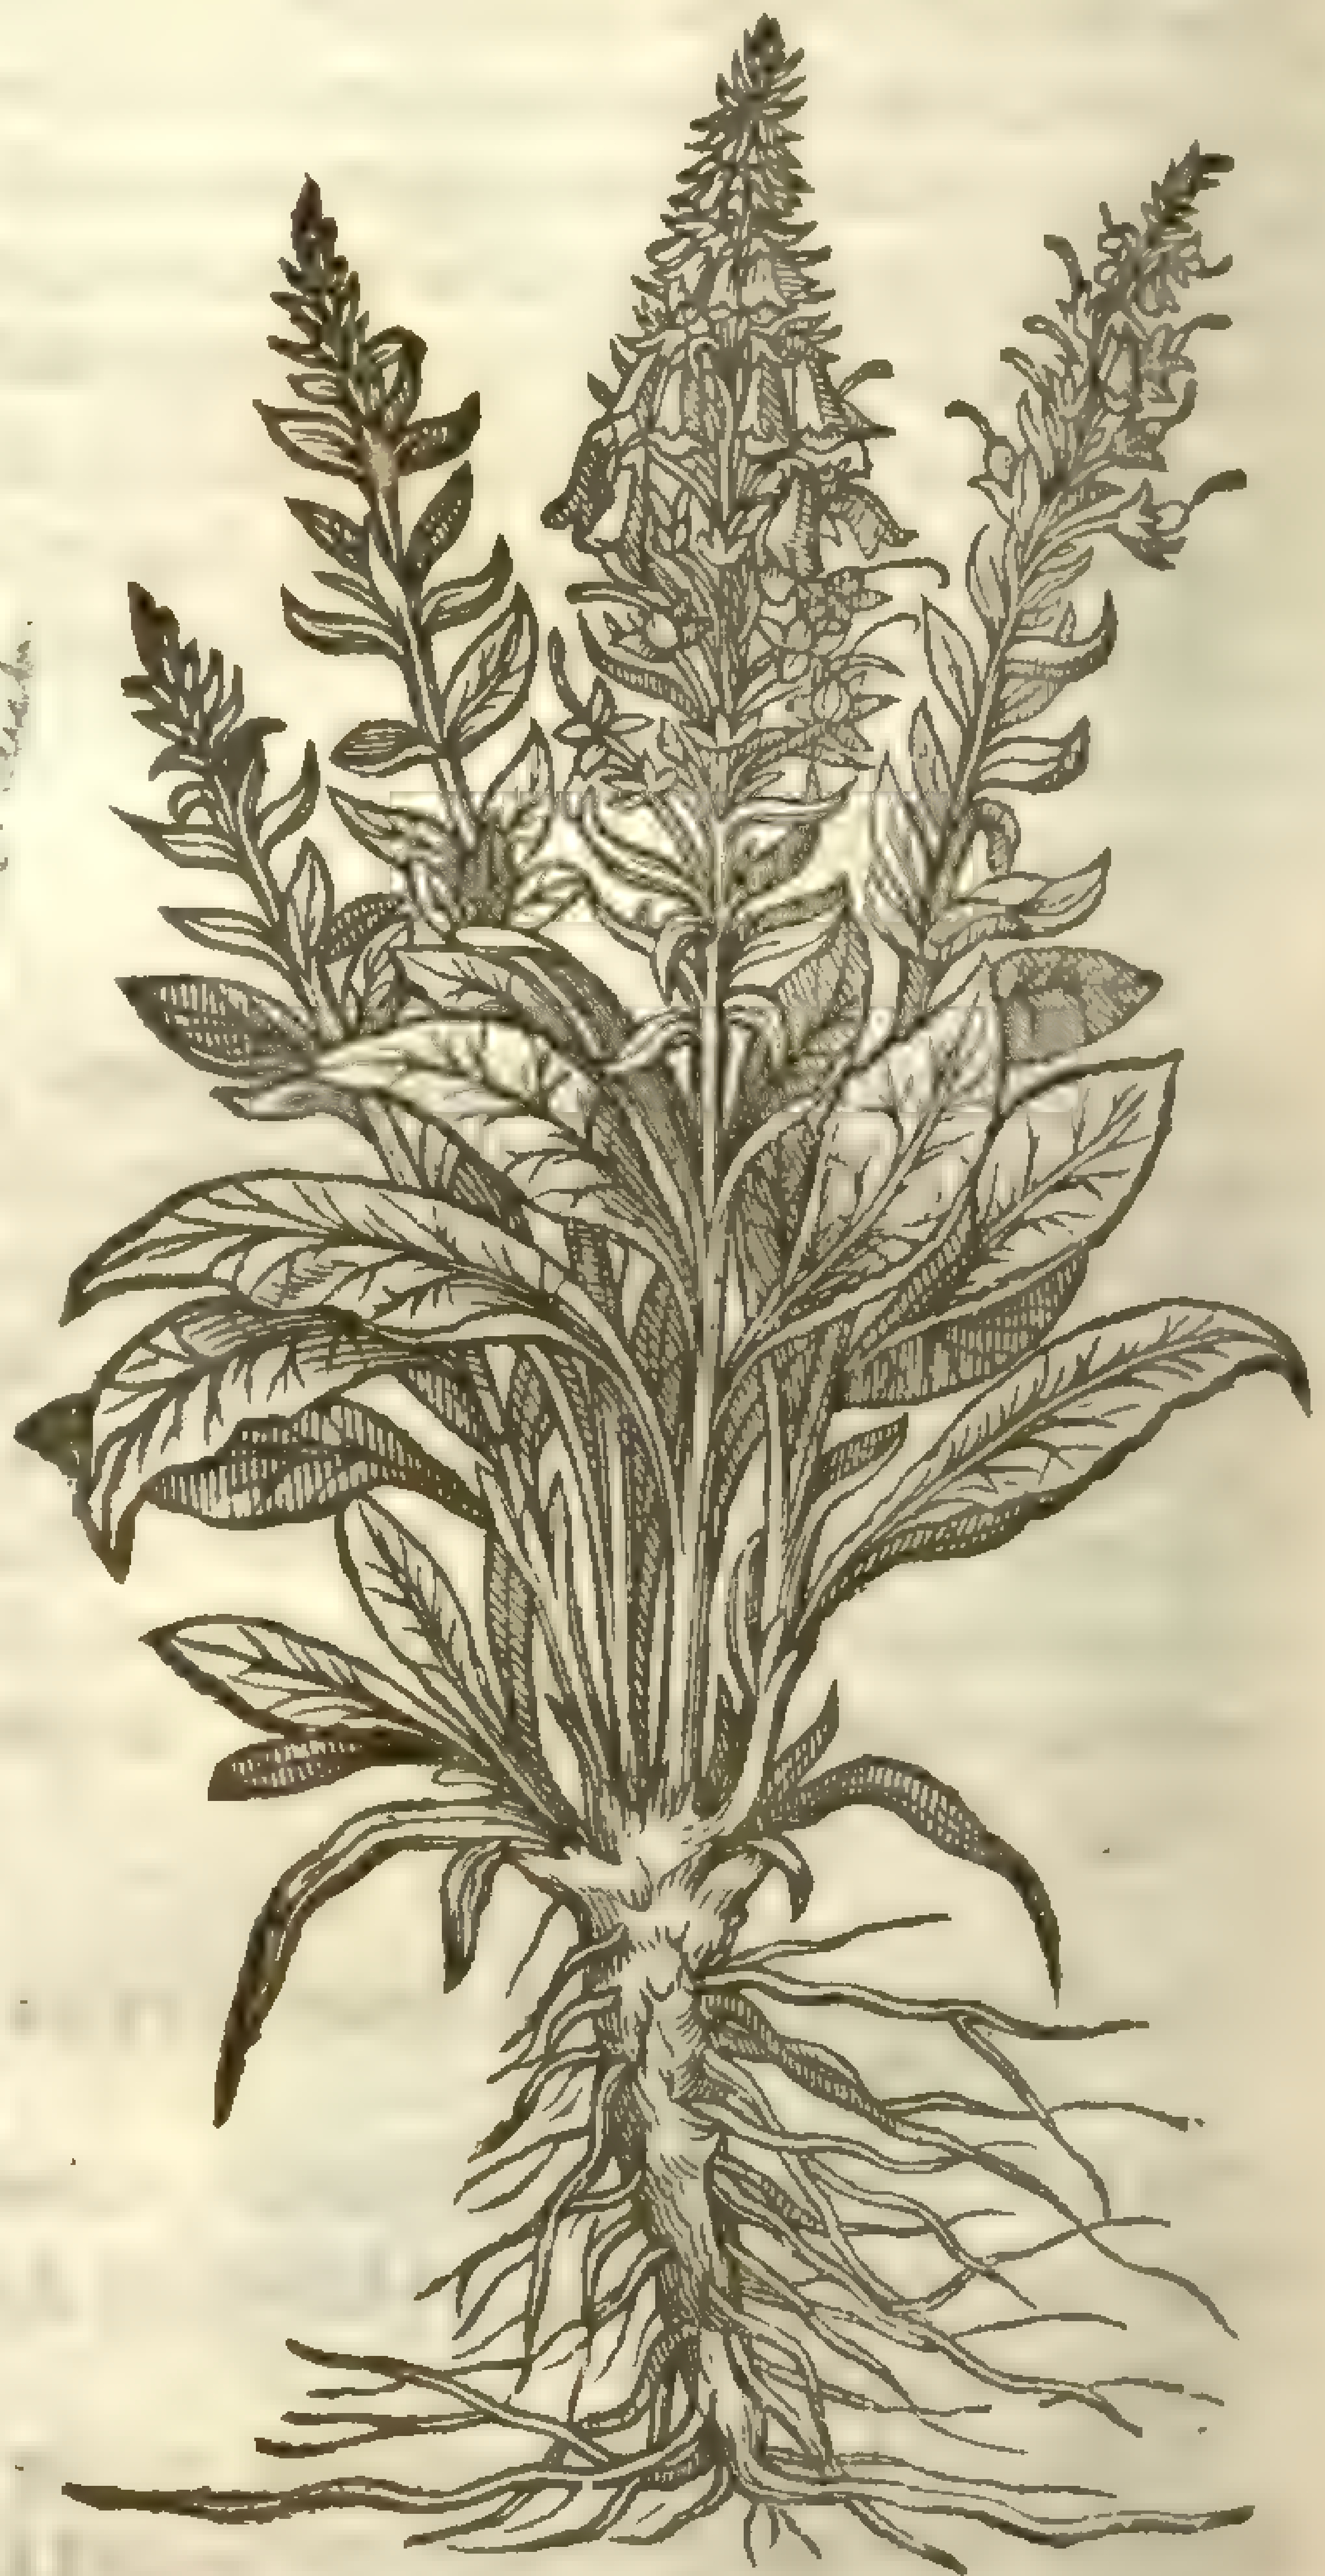
3 We haue in our Gardens another ſort hereof, which bringeth forth moſt pleaſant yellow floures, and ſomewhat leſſer than the common kinde, wherein they differ. ‡ This alſo differs from the common kind in that the leaues are much ſmoother, narrower, and greener, hauing the nerues or veines running alongſt it, neither are the nerues ſnipt, nor ſinuated on their edges. ‡

1 *Digitalis purpurea.*
Purple Fox-gloues.



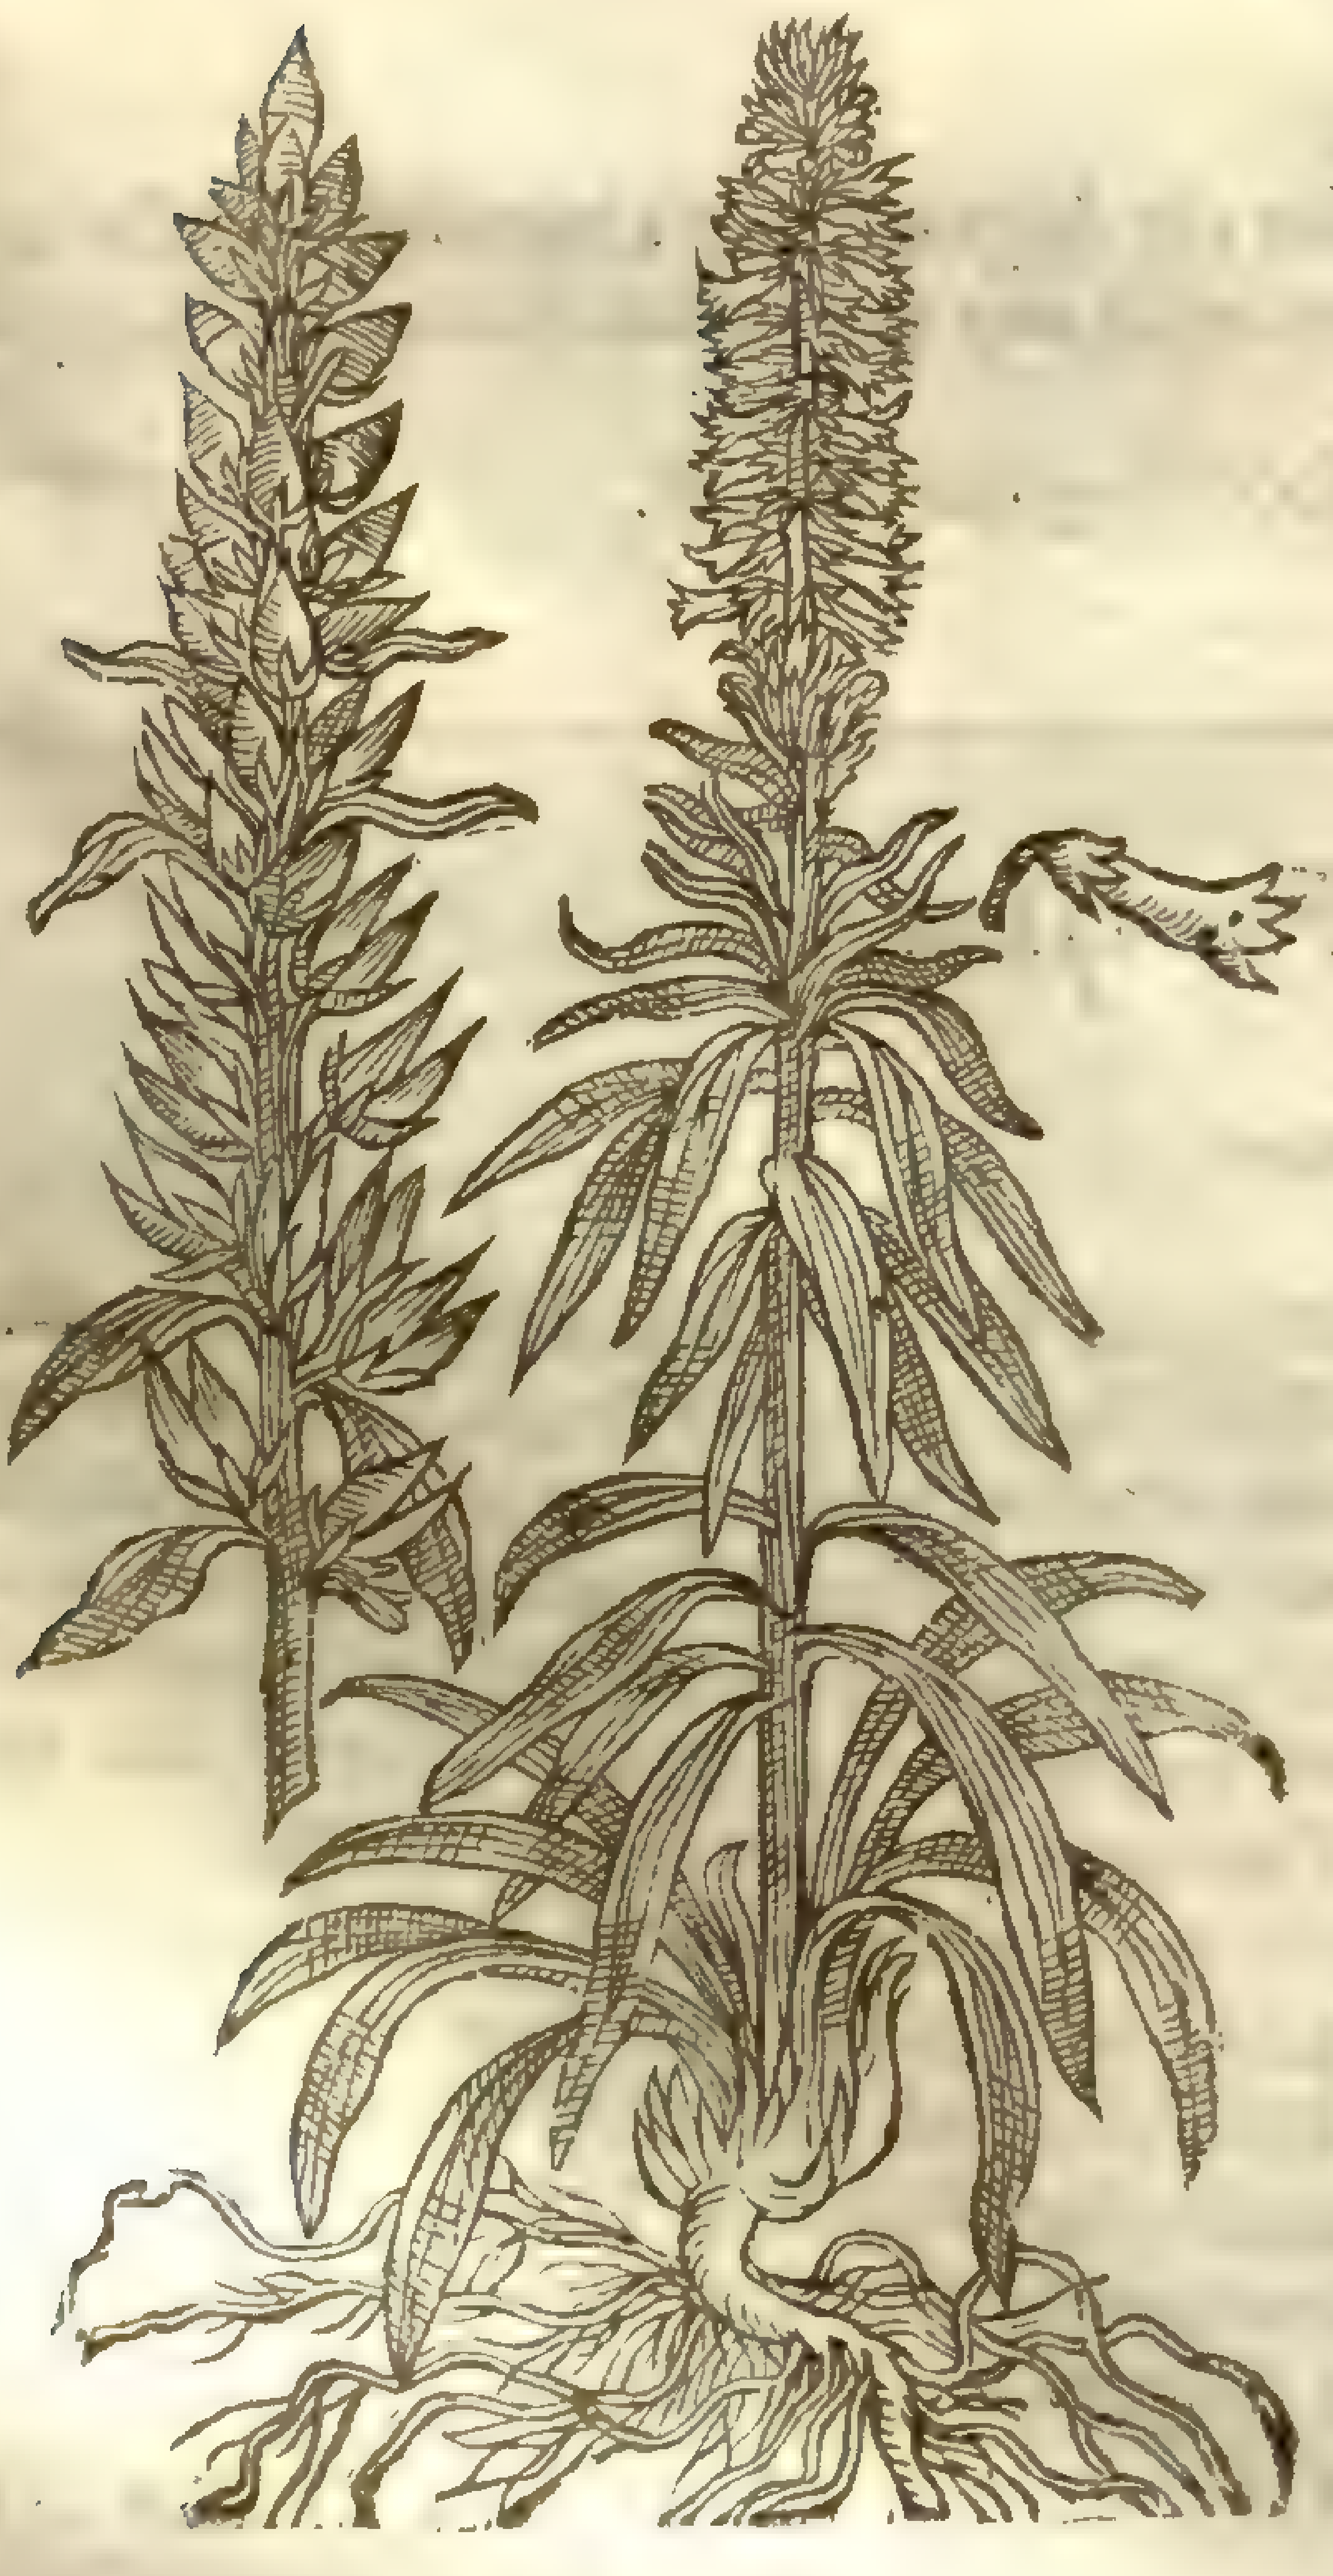
D. purpurea L.
Mill. dict.
Sm. fl. 3, 140

2 *Digatalis alba.*
White Fox-gloues.



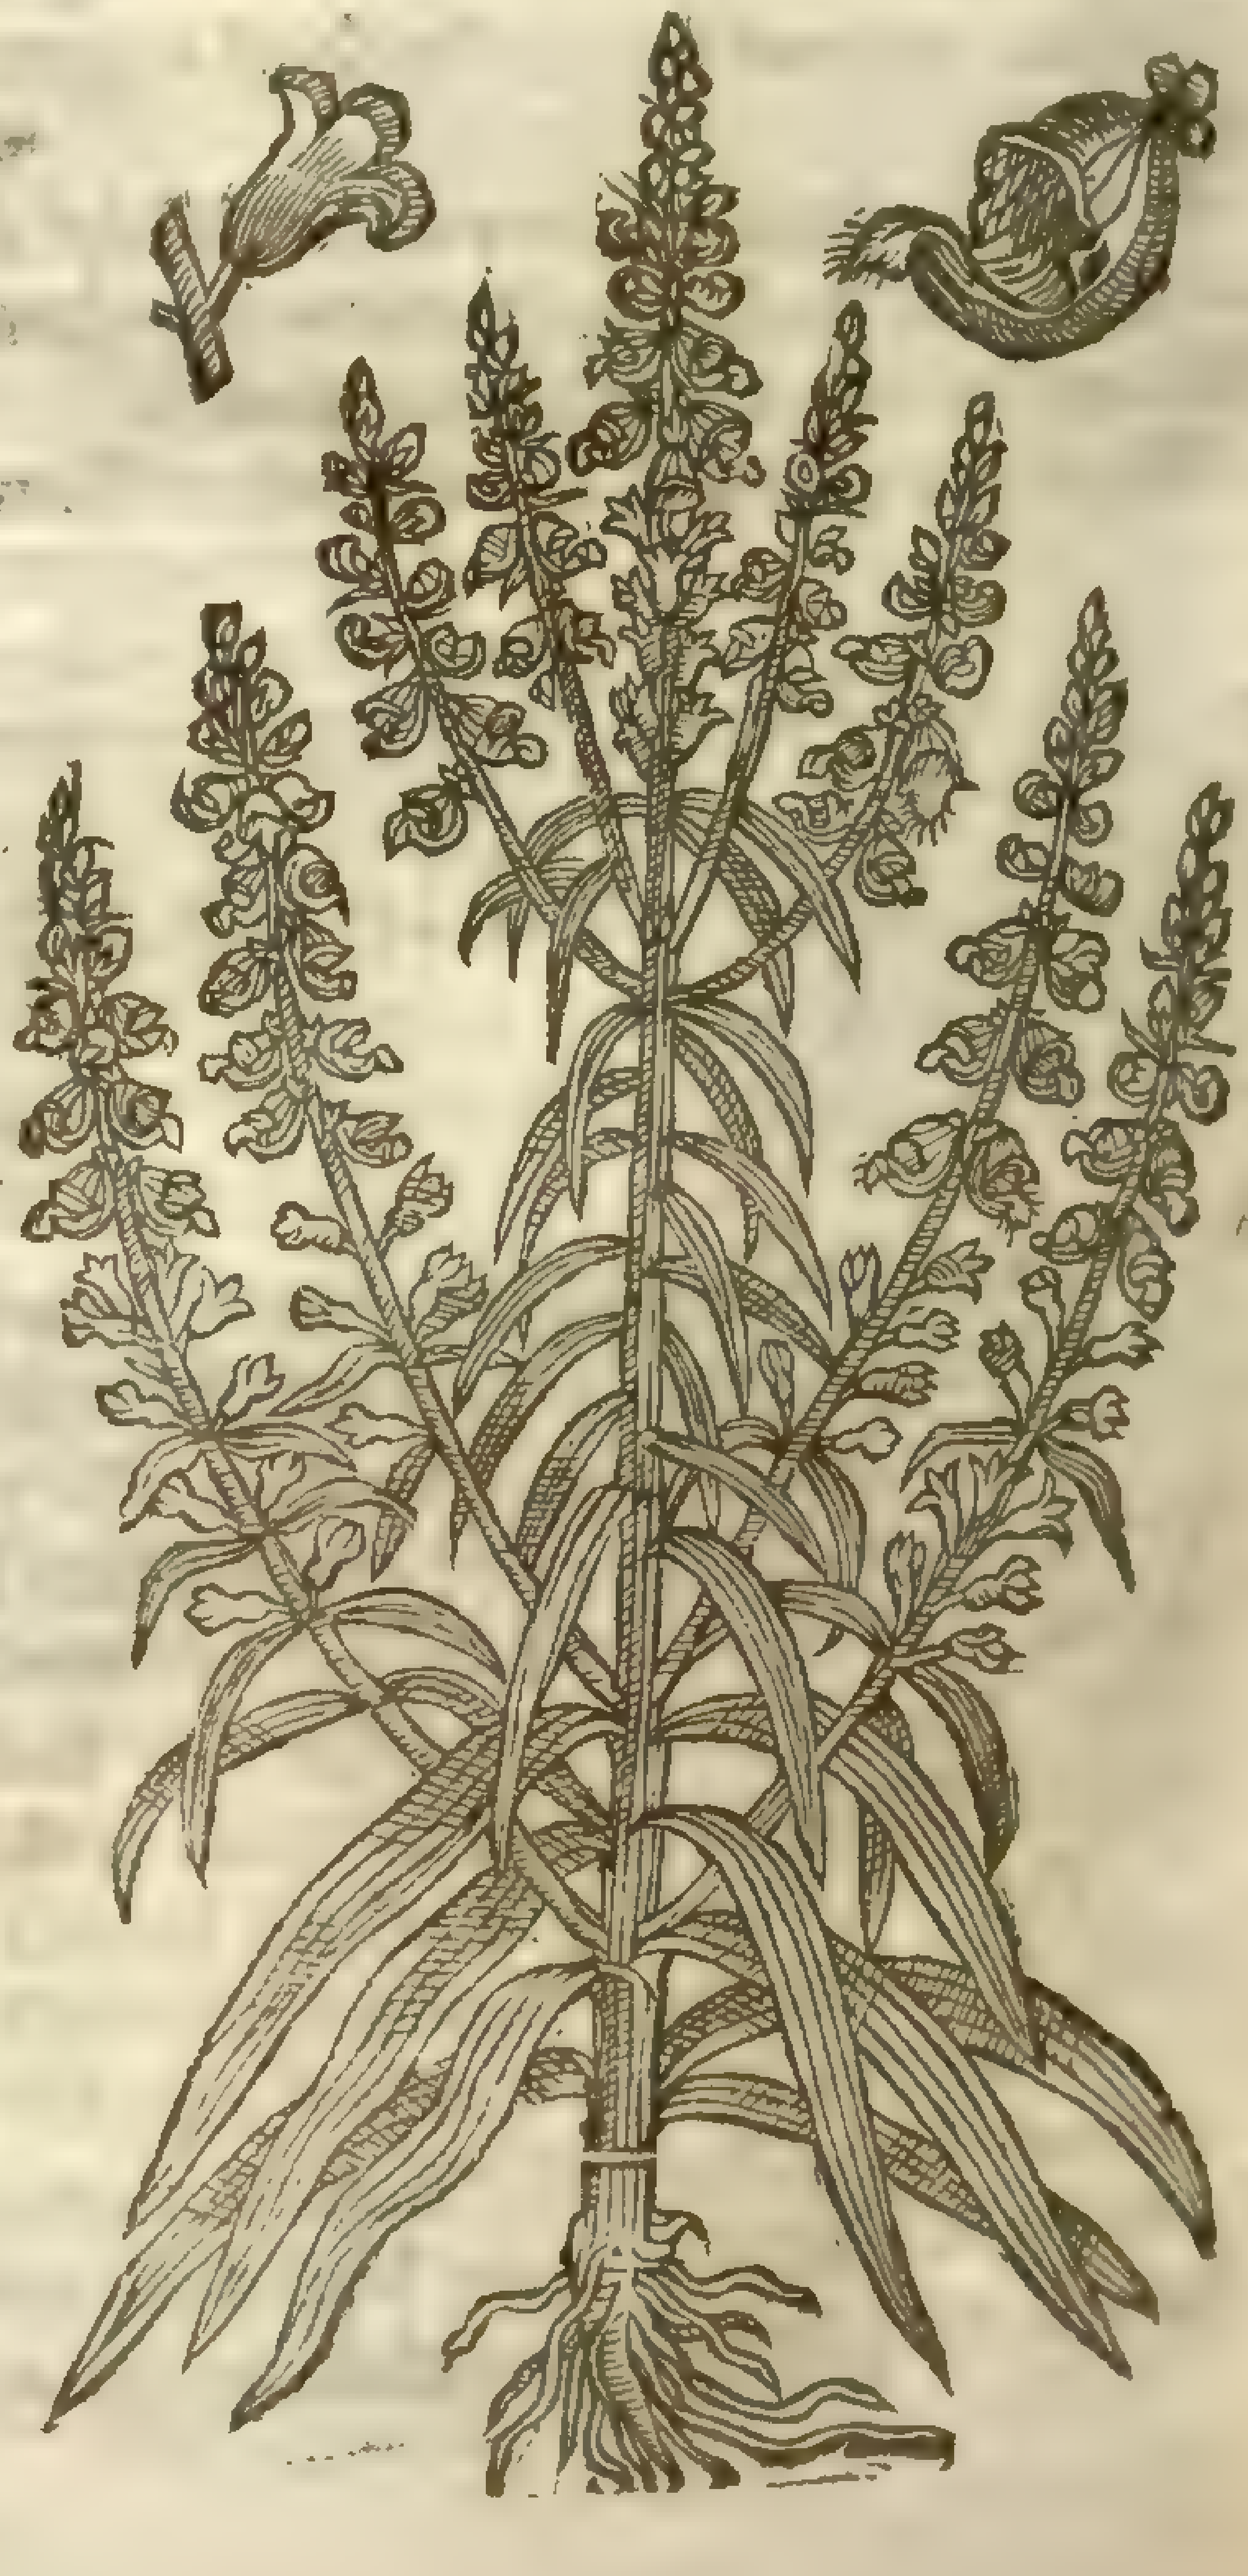
D. purpurea L. β
Mill. dict.

‡ 3 *Digitalis lutea.*
Yellow Fox-gloues.



D. lutea L.
Sec Lob. ic. 573

‡ 4 *Digitalis ferruginea.*
Dusky Fox-gloues.



ferruginea

4 We haue alſo another ſort, which we call *Digitalis ferruginea*, whoſe floures are of the colour of ruſty yron; whereof it tooke his name, and likewiſe maketh the difference. ‡ Of this ſort there is a bigger and a leſſer; the bigger hath the lower leaues ſome foot long, of a darke green colour, with veines running along them; the ſtalks are ſome yard and halfe high, the floures large and ending in a ſharpe turned vp end as you ſee in the figure, and they are of a ruſty colour, mixed of a yellow and red.

5 The leſſer duskie Fox-gloue hath much leſſe leaues and thoſe narrow, ſmooth, and exceeding greene: amongſt which comes vp a ſtalke ſome foot high, hauing ſmall floures of the colour of the laſt deſcribed. This I obſerued in the yeare 1632. in floure with Mr. *Iohn Tradeſcant* in the middle of Iuly. It may fitly be called *Digitalis ferruginea minor*, ſmall duskie Fox-gloues. ‡

¶ *The Place.*

Fox-gloue groweth in barren ſandy grounds, and vnder hedges almoſt euery where.

Thoſe with white floures do grow naturally in Landeſdale, and Crauen, in a field called Cragge cloſe, in the North of England: likewiſe by Colcheſter in Eſſex; neere Exceſter in the Weſt parts, and in ſome few other places. The other two are ſtrangers in England, neuertheleſſe they doe grow with the other in my Garden.

¶ *The Time.*

They floure and flouriſh in Iune and Iuly.

¶ *The Names.*

Fox-gloues ſome call in Greeke, θρυαλλὶς, and make it to be *Verbaſci ſpeciem*, or a kinde of Mullein: in Latine, *Digitalis*: in High Dutch, **Fingerhut**, and **Fingher kraut**: in Low Dutch, **Vinger hoet**: in French, *Gantes noſtre dame*: in Engliſh, Fox-gloues. ‡ *Fabius Columna* thinkes it to be that *Ephemerum* of *Dioſcorides* deſcribed in his fourth booke, and *cap*. 75. ‡

¶ *The Temperature.*

The Fox-gloues in that they are bitter, are hot and dry, with a certaine kinde of clenſing qualitie joyned therewith; yet are they of no vſe, neither haue they any place amongſt medicines, according to the Antients.

¶ *The Vertues.*

Fox-gloue boiled in water or wine, and drunken, doth cut and conſume the thicke toughneſſe of groſſe and ſlimie flegme and naughty humours; it openeth alſo the ſtopping of the liuer, ſpleene, and milt, and of other inward parts. A

The ſame taken in like manner, or boiled with honied water or ſugar, doth ſcoure and clenſe the breſt, ripeneth and bringeth forth tough and clammie flegme. B

They ſerue for the ſame purpoſes whereunto Gentian doth tend, and hath been vſed in ſtead thereof, as *Galen* ſaith. C

‡ Where or by what name *Galen* either mentions, or affirmes this which our Authour cites him for, I muſt confeſſe I am ignorant. But I probably conjecture that our Authour would haue ſaid *Fuchſius*: for I onely finde him to haue theſe words ſet downe by our Author, in the end of his Chapter of *Digitalis*. ‡ D

Chap. 278. *Of Baccharis out of* Dioſcorides.

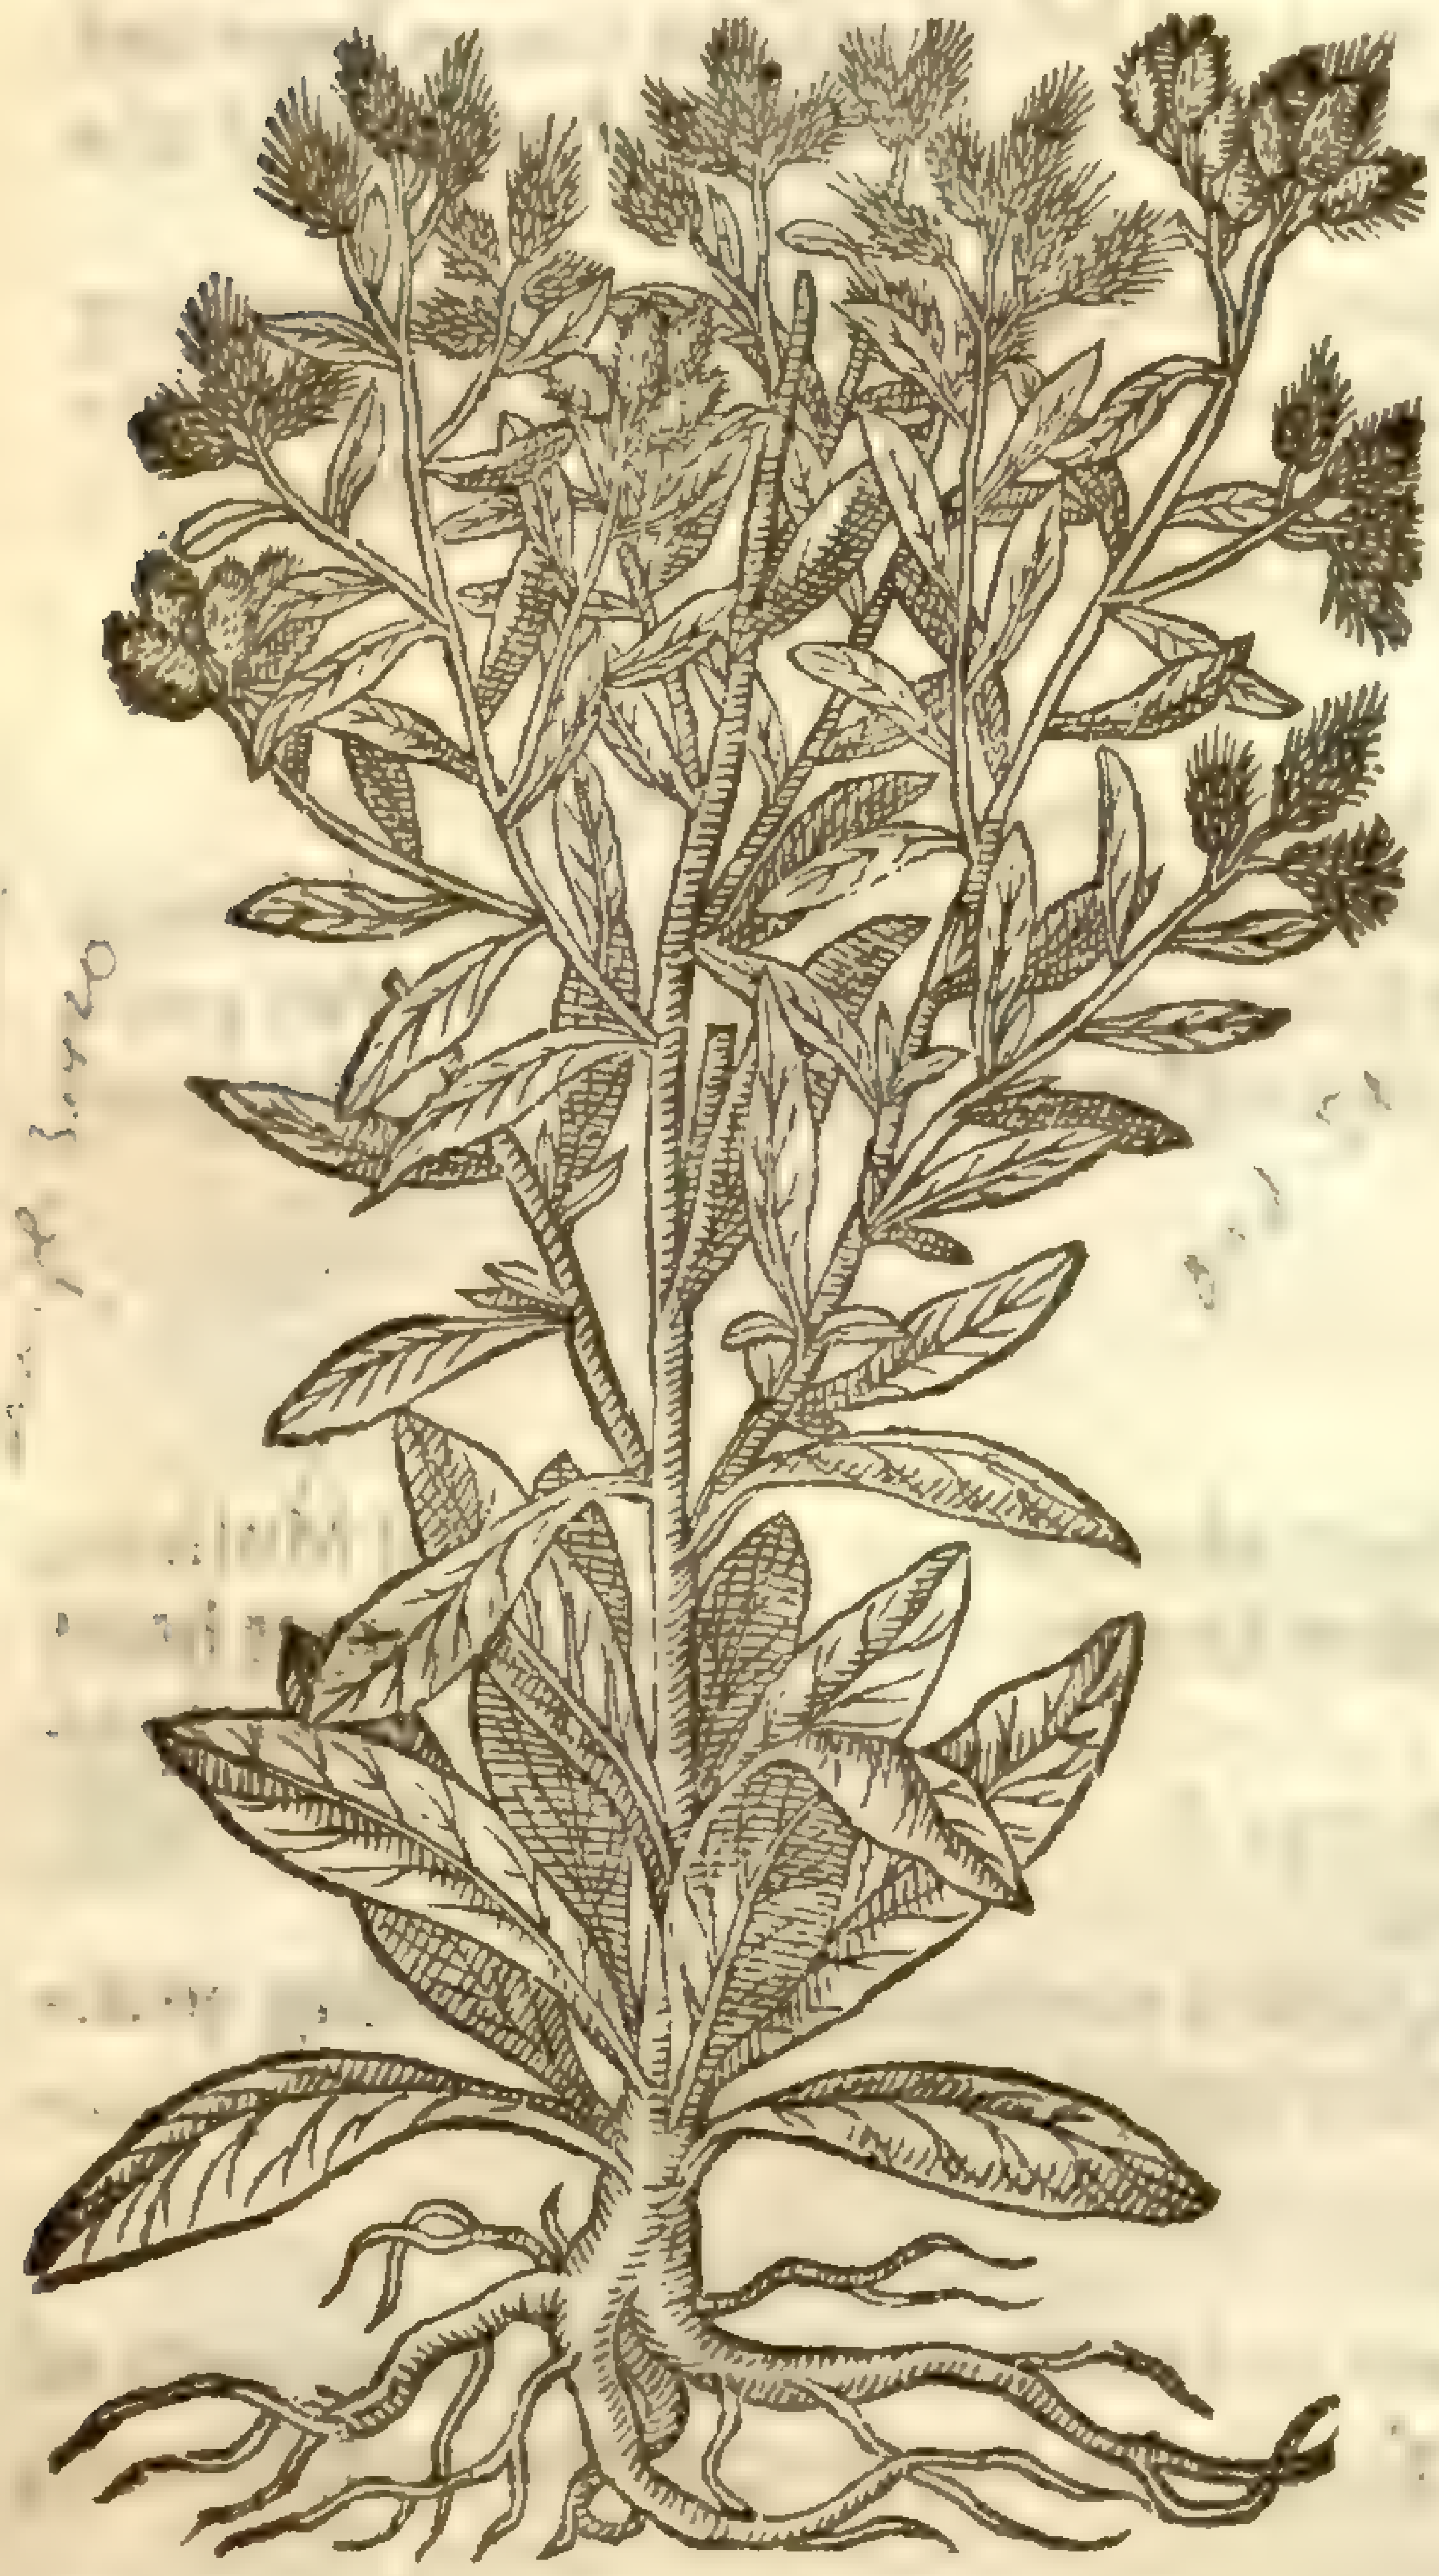
¶ *The Deſcription.*

1 About this plant *Baccharis* there hath beene great contention amongſt the new Writers; *Matthiolus* and *Dodonæus* haue miſtaken this plant, for *Coniza major*, or *Coniza Helenitis Cordi*; *Virgil* and *Athæneus* haue confounded *Baccharis*, and *Azarum* together: but following the antient Writers, it hath many blackiſh rough leaues, ſomwhat bigger than the leaues of Primroſe: amongſt which riſeth vp a ſtalke two cubits high, bearing at the top little chaffie or ſcalie floures in ſmall bunches, of a darke yellowiſh or purple colour, which turne into downe, and are carried away with the winde, like vnto the kindes of Thiſtles: the root is thicke, groſſe, and fat, ſpreading about in the earth, full of ſtrings: the fragrant ſmell that the root of this plant yeeldeth, may well be compared vnto the ſauour of Cinnamon, *Helenium*, or *Enula Campana*, being a plant knowne vnto very many or moſt ſort of people, I meane in moſt parts of England.

¶ *The Place.*

Baccharis delighteth to grow in rough and craggy places, and in a leane ſoile where no moiſture is:

Baccharis Monſpelienſium.
Plowmans Spikenard.



Conyza [illegible]

it: it groweth very plentifully about Montpellier in France, and diuers places in the Weſt parts of England.

¶ *The Time.*

It ſpringeth vp in April, it floureth in Iune, and perfecteth his ſeed in Auguſt.

¶ *The Names.*

The learned Herbariſts of Montpellier haue called this plant *Baccharis*: the Græcians, βακχάρις: or after others, βάκχαρις, by reaſon of that ſweet and aromaticall ſauour which his root containeth and yeeldeth: in Engliſh it may be called the Cinamom root, or Plowmans Spiknard: *Virgil* in his ſeuenth Ecloge of his Bucolicks maketh mention of *Baccharis*, and doth not onely ſhew that it is a Garland plant, but alſo ſuch a one as preuaileth againſt inchantments, ſaying,

—— Bacchare frontem
Cingite, ne vati noceat mala lingua futuro.

With Plowmans Nard my forehead girt,
Leſt euill tongue thy Poët hurt.

Baccharis is likewiſe an ointment in *Athenæus*, in his 15. booke, which may take his name of the ſweet herbe *Baccharis*: for as *Pliny* writeth, *Ariſtophanes* of old, being an antient comical Poët witneſſeth, that ointments were wont to bee made of the root thereof: to bee briefe, *Cratevas*, his *Aſarum* is the ſame that *Dioſcorides* his *Baccharis* is. ‡ This plant here deſcribed is the *Coniza major* of *Matthiolus*, *Tragus*, and others. ‡

¶ *The Temperature.*

Baccharis or Plowmans Spiknard is of temperature very aſtringent or binding.

¶ *The Vertues.*

A *Baccharis* or the decoction of the root, as *Paulus Ægineta* briefely ſetteth downe, doth open the pipes and paſſages that are ſtopped, prouoketh vrine, and bringeth downe the deſired ſickeneſſe: the leaues thereof for that they are aſtringent or binding, ſtop the courſe of fluxes and rheumes.

B *Baccharis* is a ſingular remedy to heale inflammations and Saint Anthonies fire, called *Ignis ſacer*, and the ſmell thereof prouoketh ſleepe.

C The decoction of the roots of *Baccharis* helpeth ruptures and conuulſions, thoſe alſo that haue falne from an high place, and thoſe that are troubled with the ſhortneſſe of breath.

D It helpeth alſo the old cough, and difficulty to make water.

E When it is boiled in wine, it is giuen with great profit againſt the biting of Scorpions, or any venomous beaſt, being implaiſtered and applied thereto.

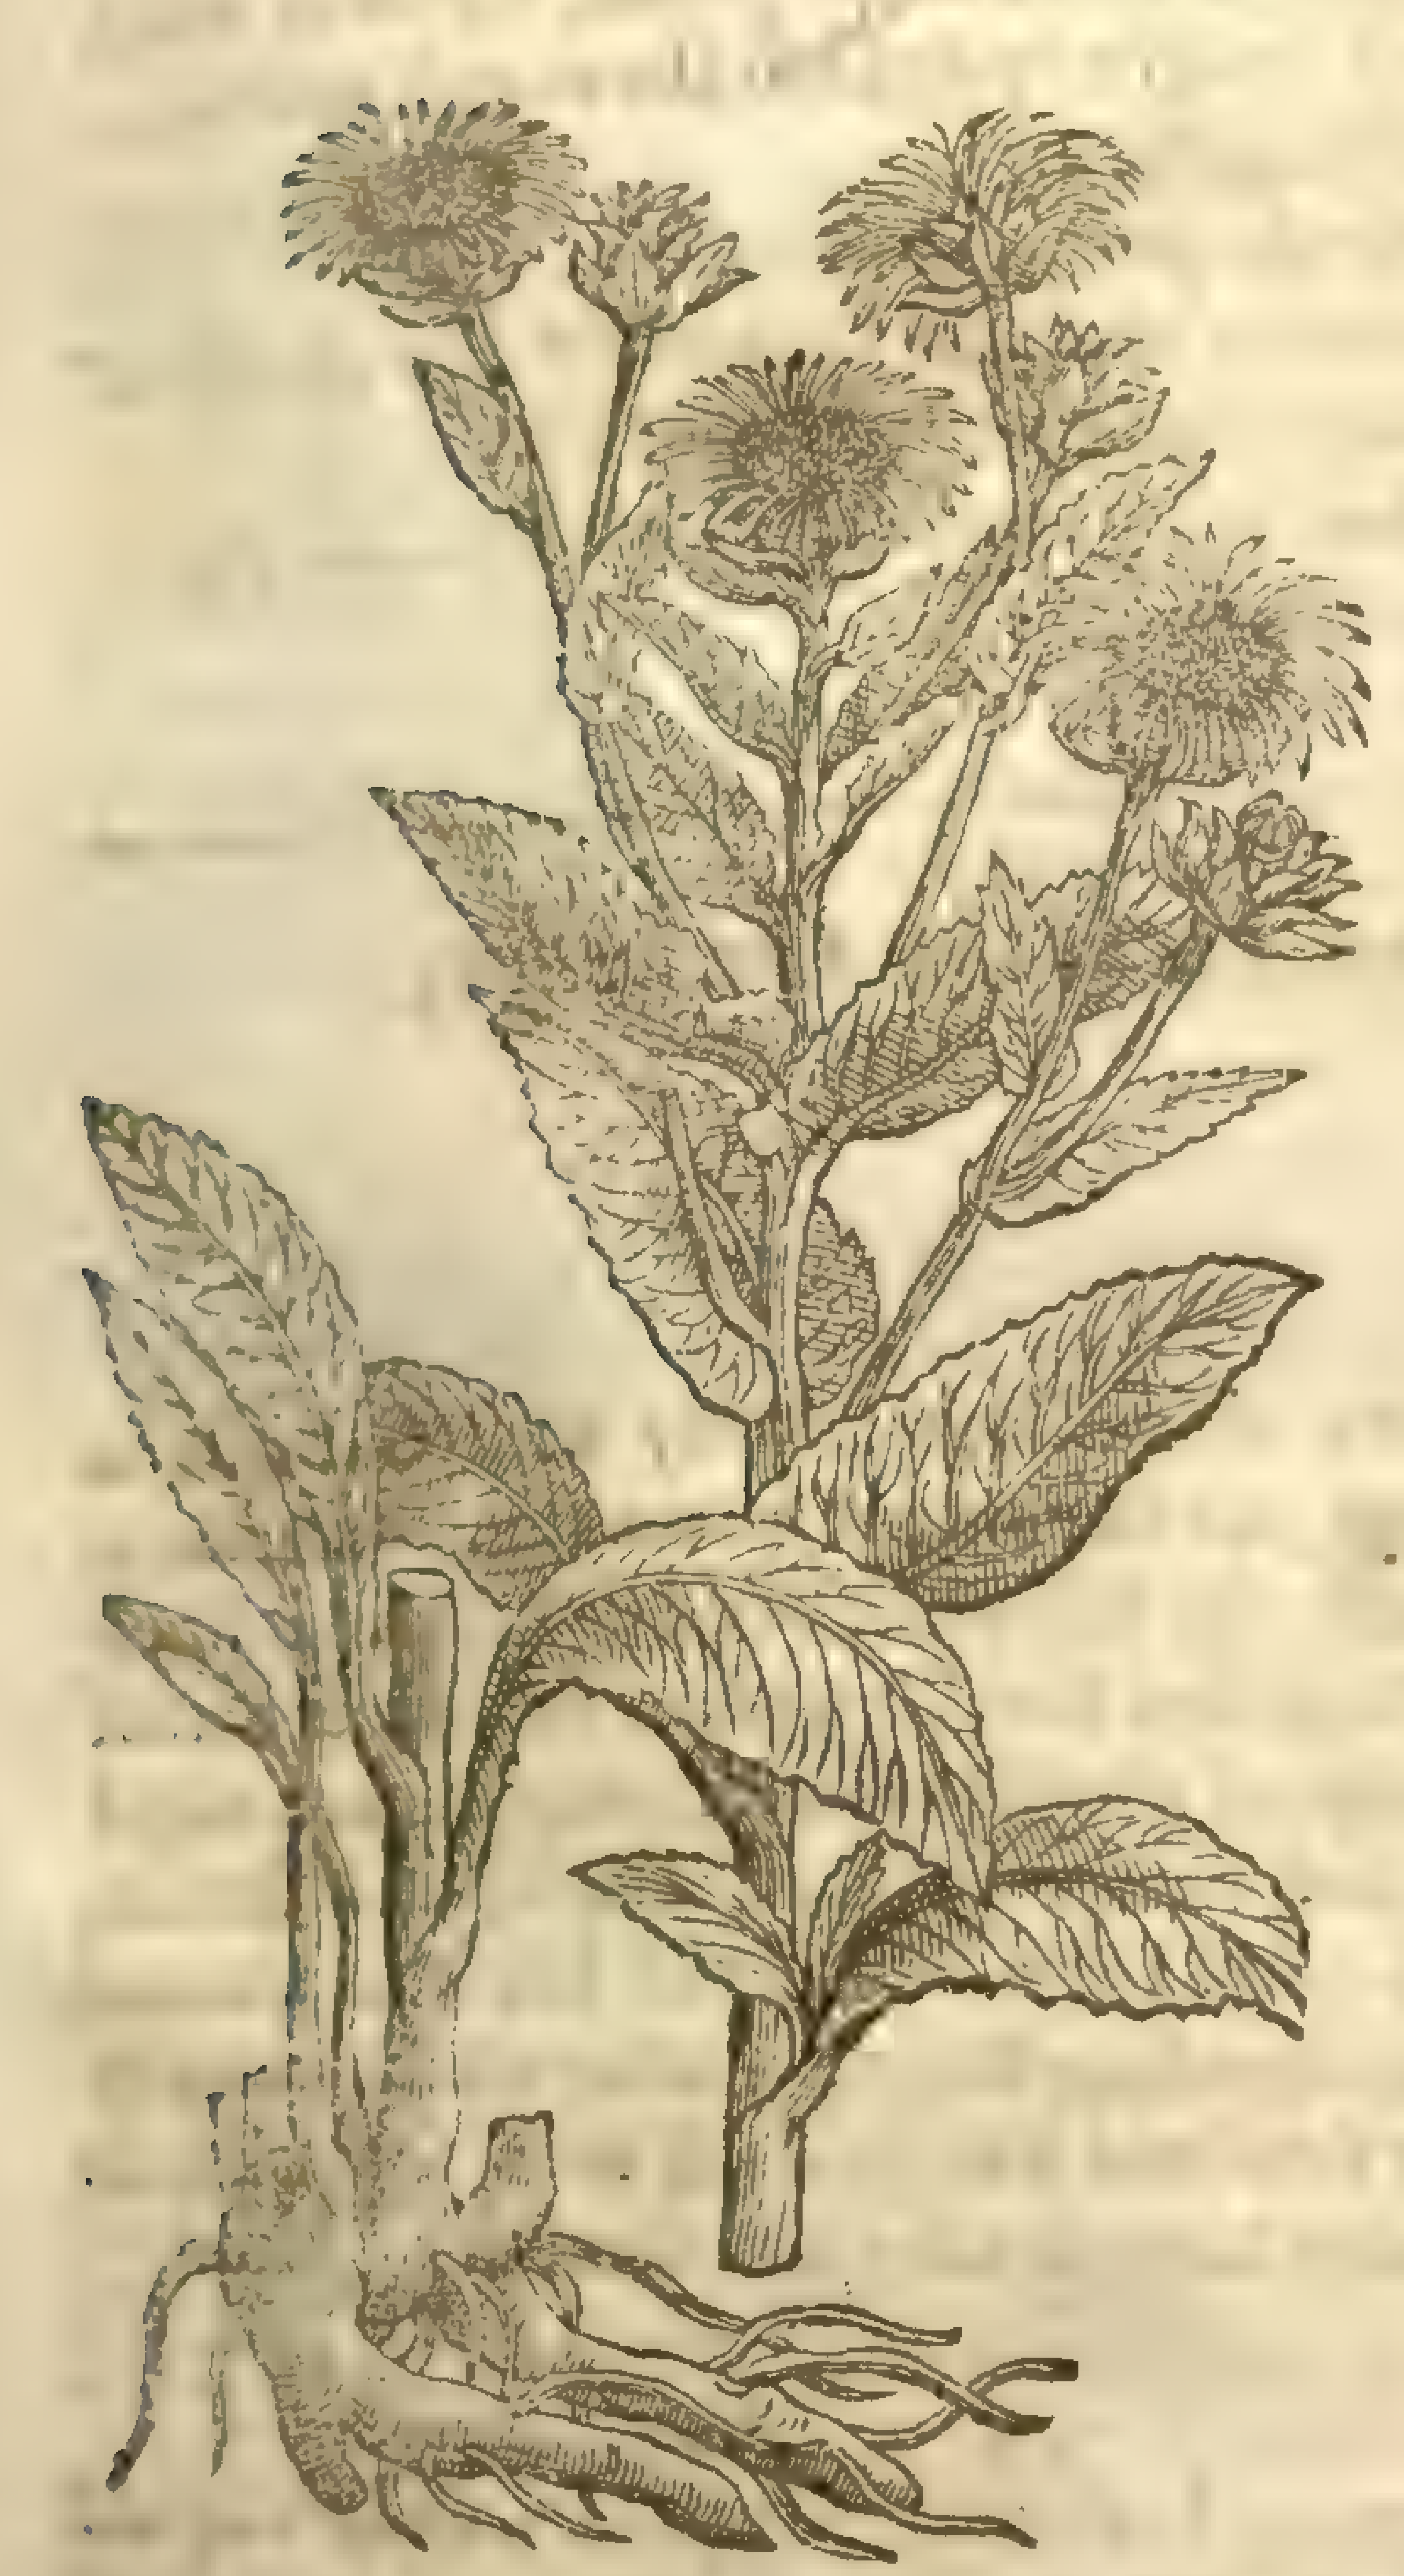
F A bath made thereof and put into a cloſe ſtoole, and receiued hot, mightily voideth the birth, and furthereth thoſe that haue extreame labour in their childing, cauſing them to haue eaſie deliuerance.

CHAP. 279. *Of Elecampane.*

¶ *The Deſcription.*

Elecampane bringeth forth preſently from the root great white leaues, ſharpe pointed, almoſt like thoſe of great Comfrey, but ſoft, and couered with a hairy downe, of a whitiſh greene colour,

Helenium.
Elecampane.



lour, and are more white vnderneath, ſleightly nicked in the edges: the ſtalke is a yard and a halfe long, about a finger thicke, not without downe, diuided at the top into diuers branches, vpon the top of euery ſprig ſtand great floures broad and round, of which not only the long ſmal leaues that compaſſe round about are yellow, but alſo the middle ball or circle, which is filled vp with an infinite number of threds, and at length is turned into fine downe; vnder which is ſlender and long ſeed: the root is vneuen, thicke, and as much as a man may gripe, not long, oftentimes blackiſh without, white within, and full of ſubſtance, ſweet of ſmell, and bitter of taſte.

¶ *The Place.*

It groweth in medowes that are fat and fruitfull: it is alſo oftentimes found vpon mountains, ſhadowie places, that be not altogether dry: it groweth plentifully in the fields on the left hand as you go from Dunſtable to Puddle hill: alſo in an orchard as you go from Colbrooke to Ditton ferry, which is the way to Windſor, and in ſundry other places, as at Lidde, and Folkeſtone, neere to Douer by the ſea ſide.

¶ *The Time.*

The floures are in their brauery in Iune and Iuly: the roots be gathered in Autumne, and oftentimes in Aprill and May.

¶ *The Names.*

That which the Græcians name ἑλένιον, the Latines call *Inula* and *Enula*: in ſhops, *Enula campana*: in high Dutch, **Alantwurtz**: in low Dutch, **Alandt wortele**: in Italian, *Enoa*, and *Enola*: in Spaniſh, *Raiz del alla*: in French, *Enula Campane*: in Engliſh, Elecampane and Scab-woort, and Horſe-heale: ſome report that this plant tooke the name *Helenium* of *Helena* wife to *Menalaus*, who had her hands full of it when *Paris* ſtole her away into Phrygia.

¶ *The Temperature.*

The root of this Elecampane is maruellous good for many things, being of nature hot and dry in the third degree, eſpecially when it is dry: for being greene and as yet full of juyce, it is full of ſuperfluous moiſture, which ſomewhat abateth the hot and dry quality thereof.

¶ *The Vertues.*

It is good for ſhortneſſe of breath, and an old cough, and for ſuch as cannot breathe vnleſſe they A
hold their neckes vpright.

It is of great vertue both giuen in a looch, which is a medicine to be licked on, and likewiſe pre- B
ſerued, as alſo otherwiſe giuen to purge and void out thicke, tough, and clammy humours, which
ſticke in the cheſt and lungs.

The root preſerued is good and wholeſome for the ſtomacke: being taken after ſupper it doth C
not onely helpe digeſtion, but alſo keepeth the belly ſoluble.

The juyce of the ſame boyled, driueth forth all kinde of wormes of the belly, as *Pliny* teacheth: D
who alſo writeth in his twentieth booke, and fifth chapter, the ſame being chewed faſting, doth faſten the teeth.

The root of Elecampane is with good ſucceſſe mixed with counterpoiſons: it is a remedy againſt E
the bitings of ſerpents, it reſiſteth poiſon: it is good for them that are burſten and troubled with
cramps and conuulſions.

Some affirme alſo, that the decoction thereof, and likewiſe the ſame beaten into pouder and F
mixed with hony in manner of an ointment, doth clenſe and heale vp old vlcers.

Galen ſaith, that herewith the parts are to be made red, which be vexed with long and cold griefs: G
as are diuers paſſions of the huckle bones, called the Sciatica, and little and continuall bunnies and
looſeneſſe of certaine joynts, by reaſon of ouermuch moiſture.

The

H The decoction of *Enula* drunken prouoketh vrine,and is good for them that are grieued with inward burſtings, or haue any member out of joynt.

I The root taken with hony or ſugar, made in an electuary, clenſeth the breaſt, ripeneth tough flegme, and maketh it eaſie to be ſpit forth, and preuaileth mightily againſt the cough and ſhortneſſe of breath,comforteth the ſtomacke alſo,and helpeth digeſtion.

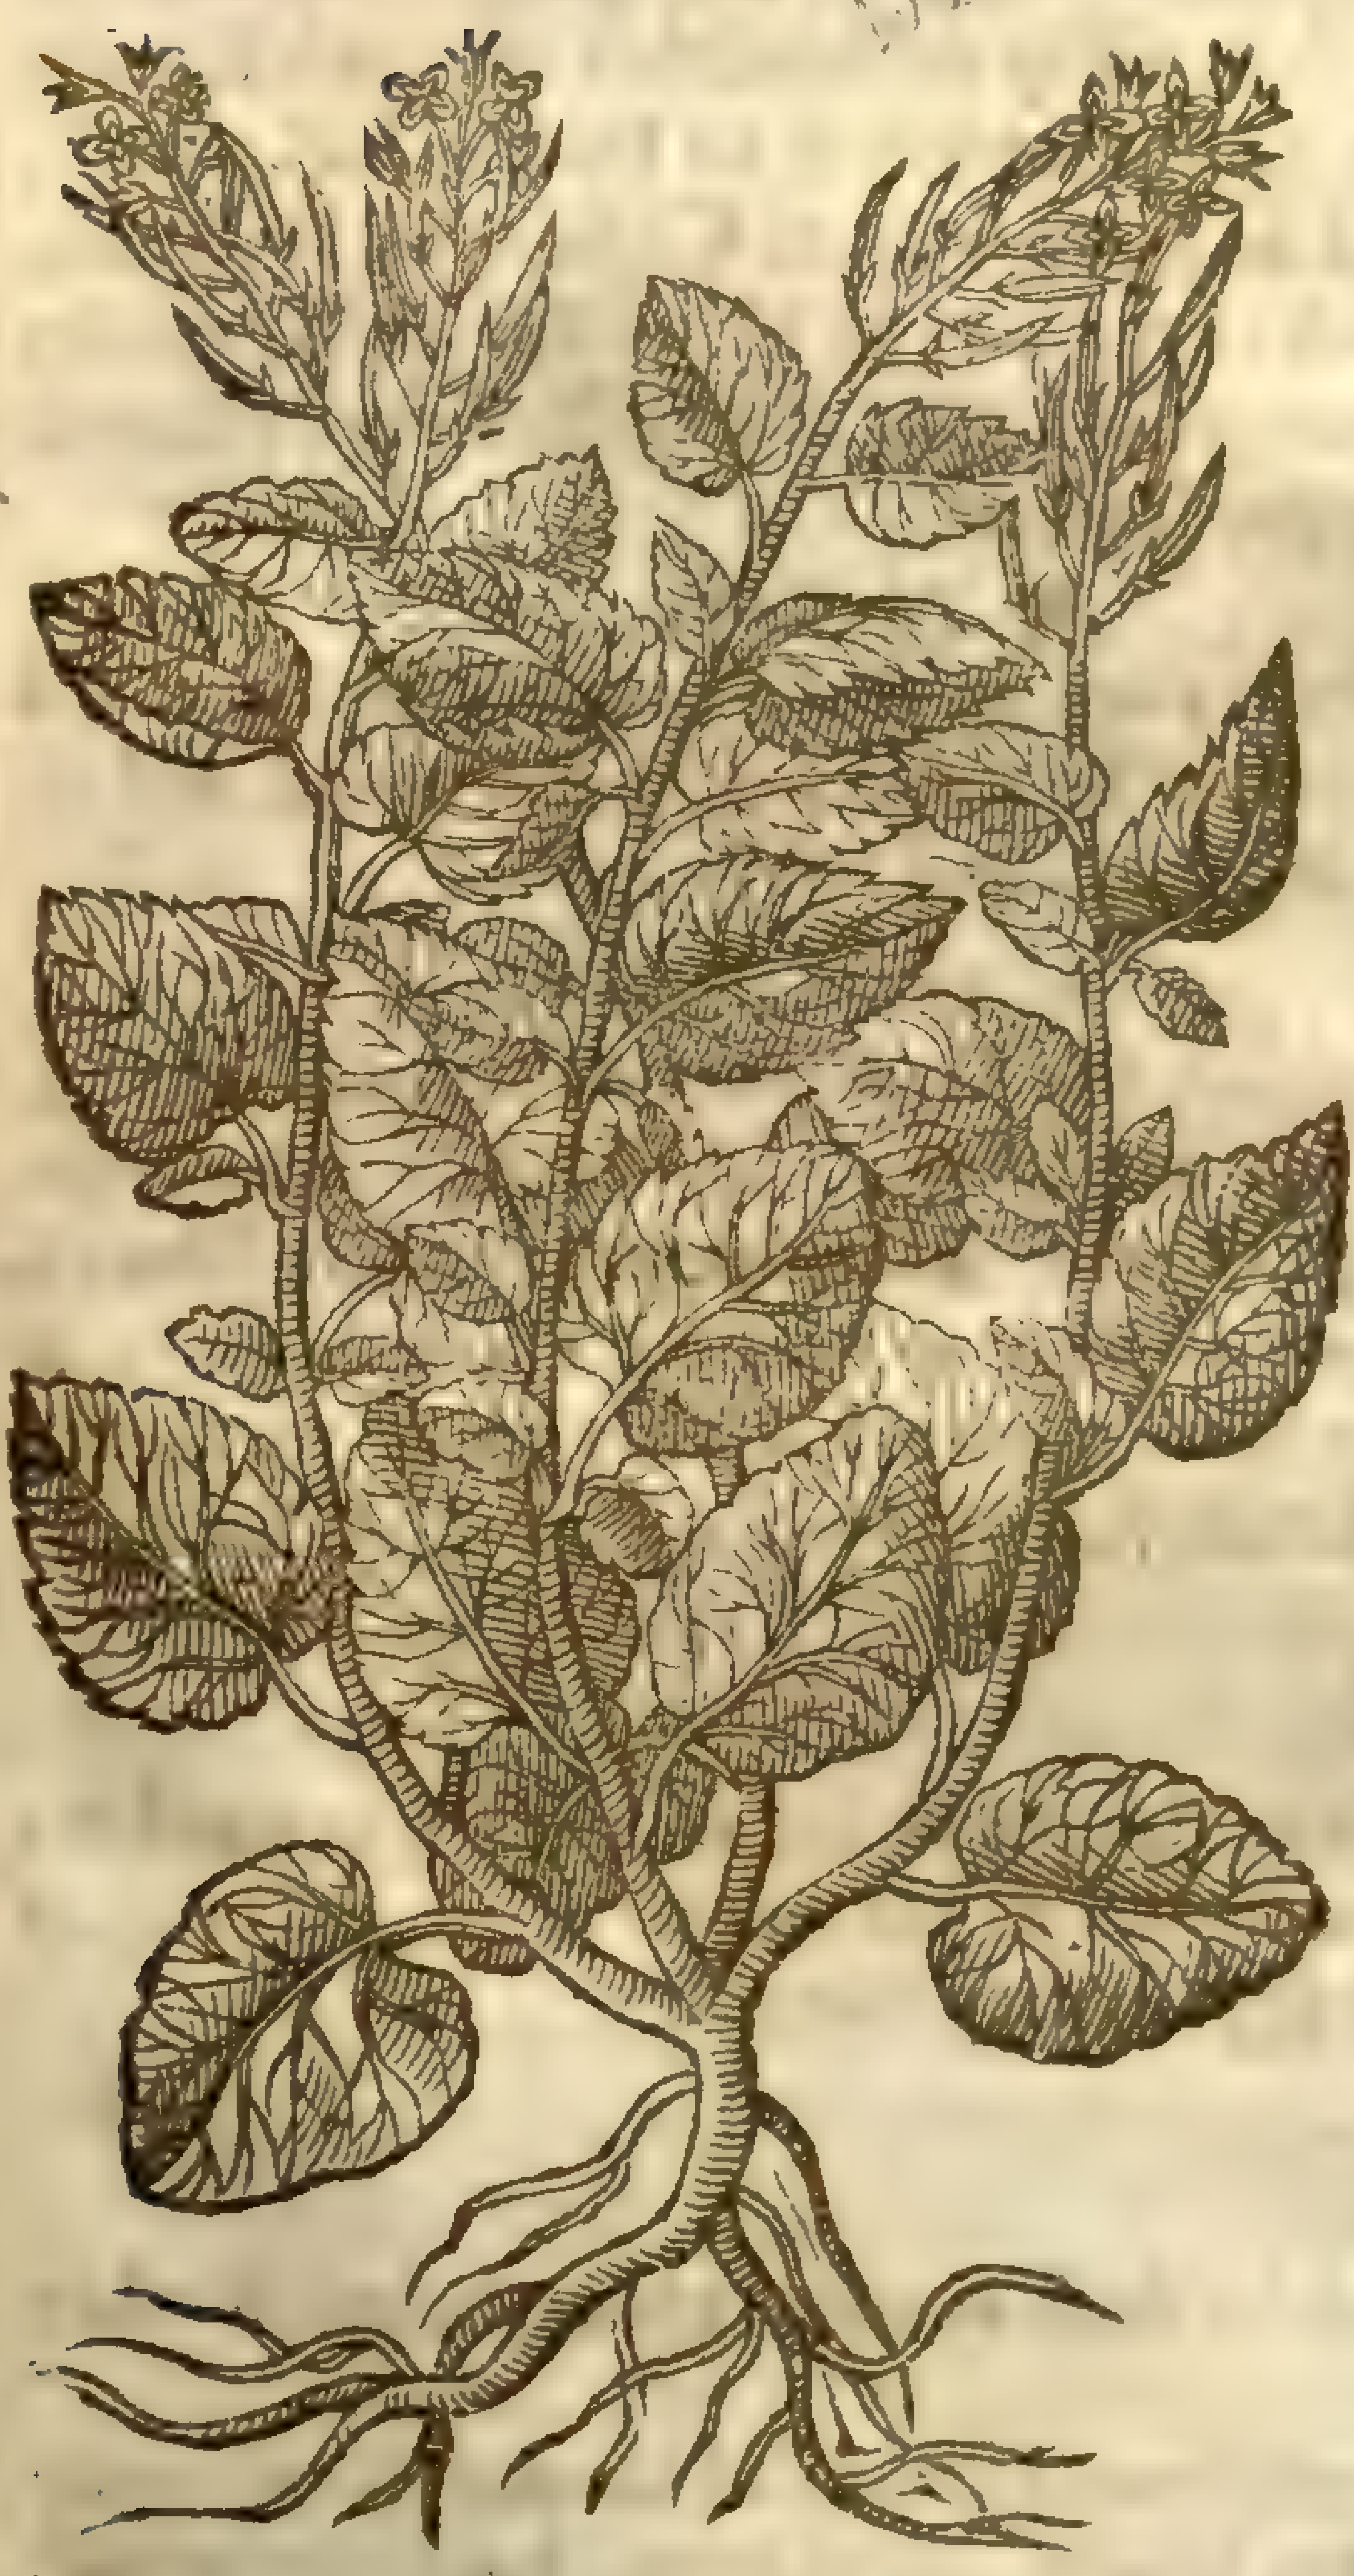
K The roots condited after the manner of *Eringos* ſerue for the purpoſes aforeſaid.

L The root of *Enula* boiled very ſoft, and mixed in a morter with freſh butter and the pouder of Ginger,maketh an excellent ointment againſt the itch,ſcabs,mangineſſe,and ſuch like.

M The roots are to be gathered in the end of September, and kept for ſundry vſes, but it is eſpecially preſerued by thoſe that make Succade and ſuch like.

Chap. 264. *Of Sauce alone, or Iacke by the hedge.*

Alliaria.
Sauce alone.



Eryſimum alliaria, L.
[illegible]

Sauce alone hath affinity with Garlicke in name,not becauſe it is like it in forme,but in ſmell: for if it be bruiſed or ſtamped it ſmelleth altogether like Garlicke: the leaues hereof are broad, of a light greene colour, nicked round about, and ſharpe pointed: the ſtalke is ſlender, about a cubit high, about the branches whereof grow little white floures; after which come vp ſlender ſmal and long cods,& in theſe black ſeed: the root is long,ſlender,and ſomething hard.

¶ *The Place.*

It groweth of it ſelfe by garden hedges,by old wals, by highway ſides, or oftentimes in the borders of fields.

¶ *The Time.*

It floureth chiefely in Iune and Iuly, the ſeed waxeth ripe in the meane ſeaſon. The leaues are vſed for a ſauce in March or Aprill.

¶ *The Names.*

The later writers call it *Alliaria*, and *Alliaris*: of ſome, *Rima Maria*: it is not *Scordium*, or water Germander,which the apothecaries in times paſt miſtooke for this herbe: neither is it *Scordij ſpecies*, or a kinde of water Germander, whereof we haue written: it is named of ſome, *Pes Aſininus*: it is called in High Dutch, **Knoblauch kraut Leuchel**, and **Saſzkraut**: and in Low Dutch, **Loock ſonder Loock**; you may name it in Latine, *Allium non bulboſum*: in French, *Alliayre*: in Engliſh, Sauce alone,and Iacke by the hedge.

¶ *The Temperature.*

Iacke of the hedge is hot and dry,but much leſſe than Garlicke, that is to ſay, in the end of the ſecond degree,or in the beginning of the third.

¶ *The Vertues.*

A We know not what vſe it hath in medicine: diuers eat the ſtamped leaues hereof with Salt-fiſh for a ſauce,as they do thoſe of Ramſons.

B Some alſo boile the leaues in cliſters which are vſed againſt the paine of the collicke and ſtone, in which not only winde is notably waſted, but the pain alſo of the ſtone mitigated and very much eaſed.

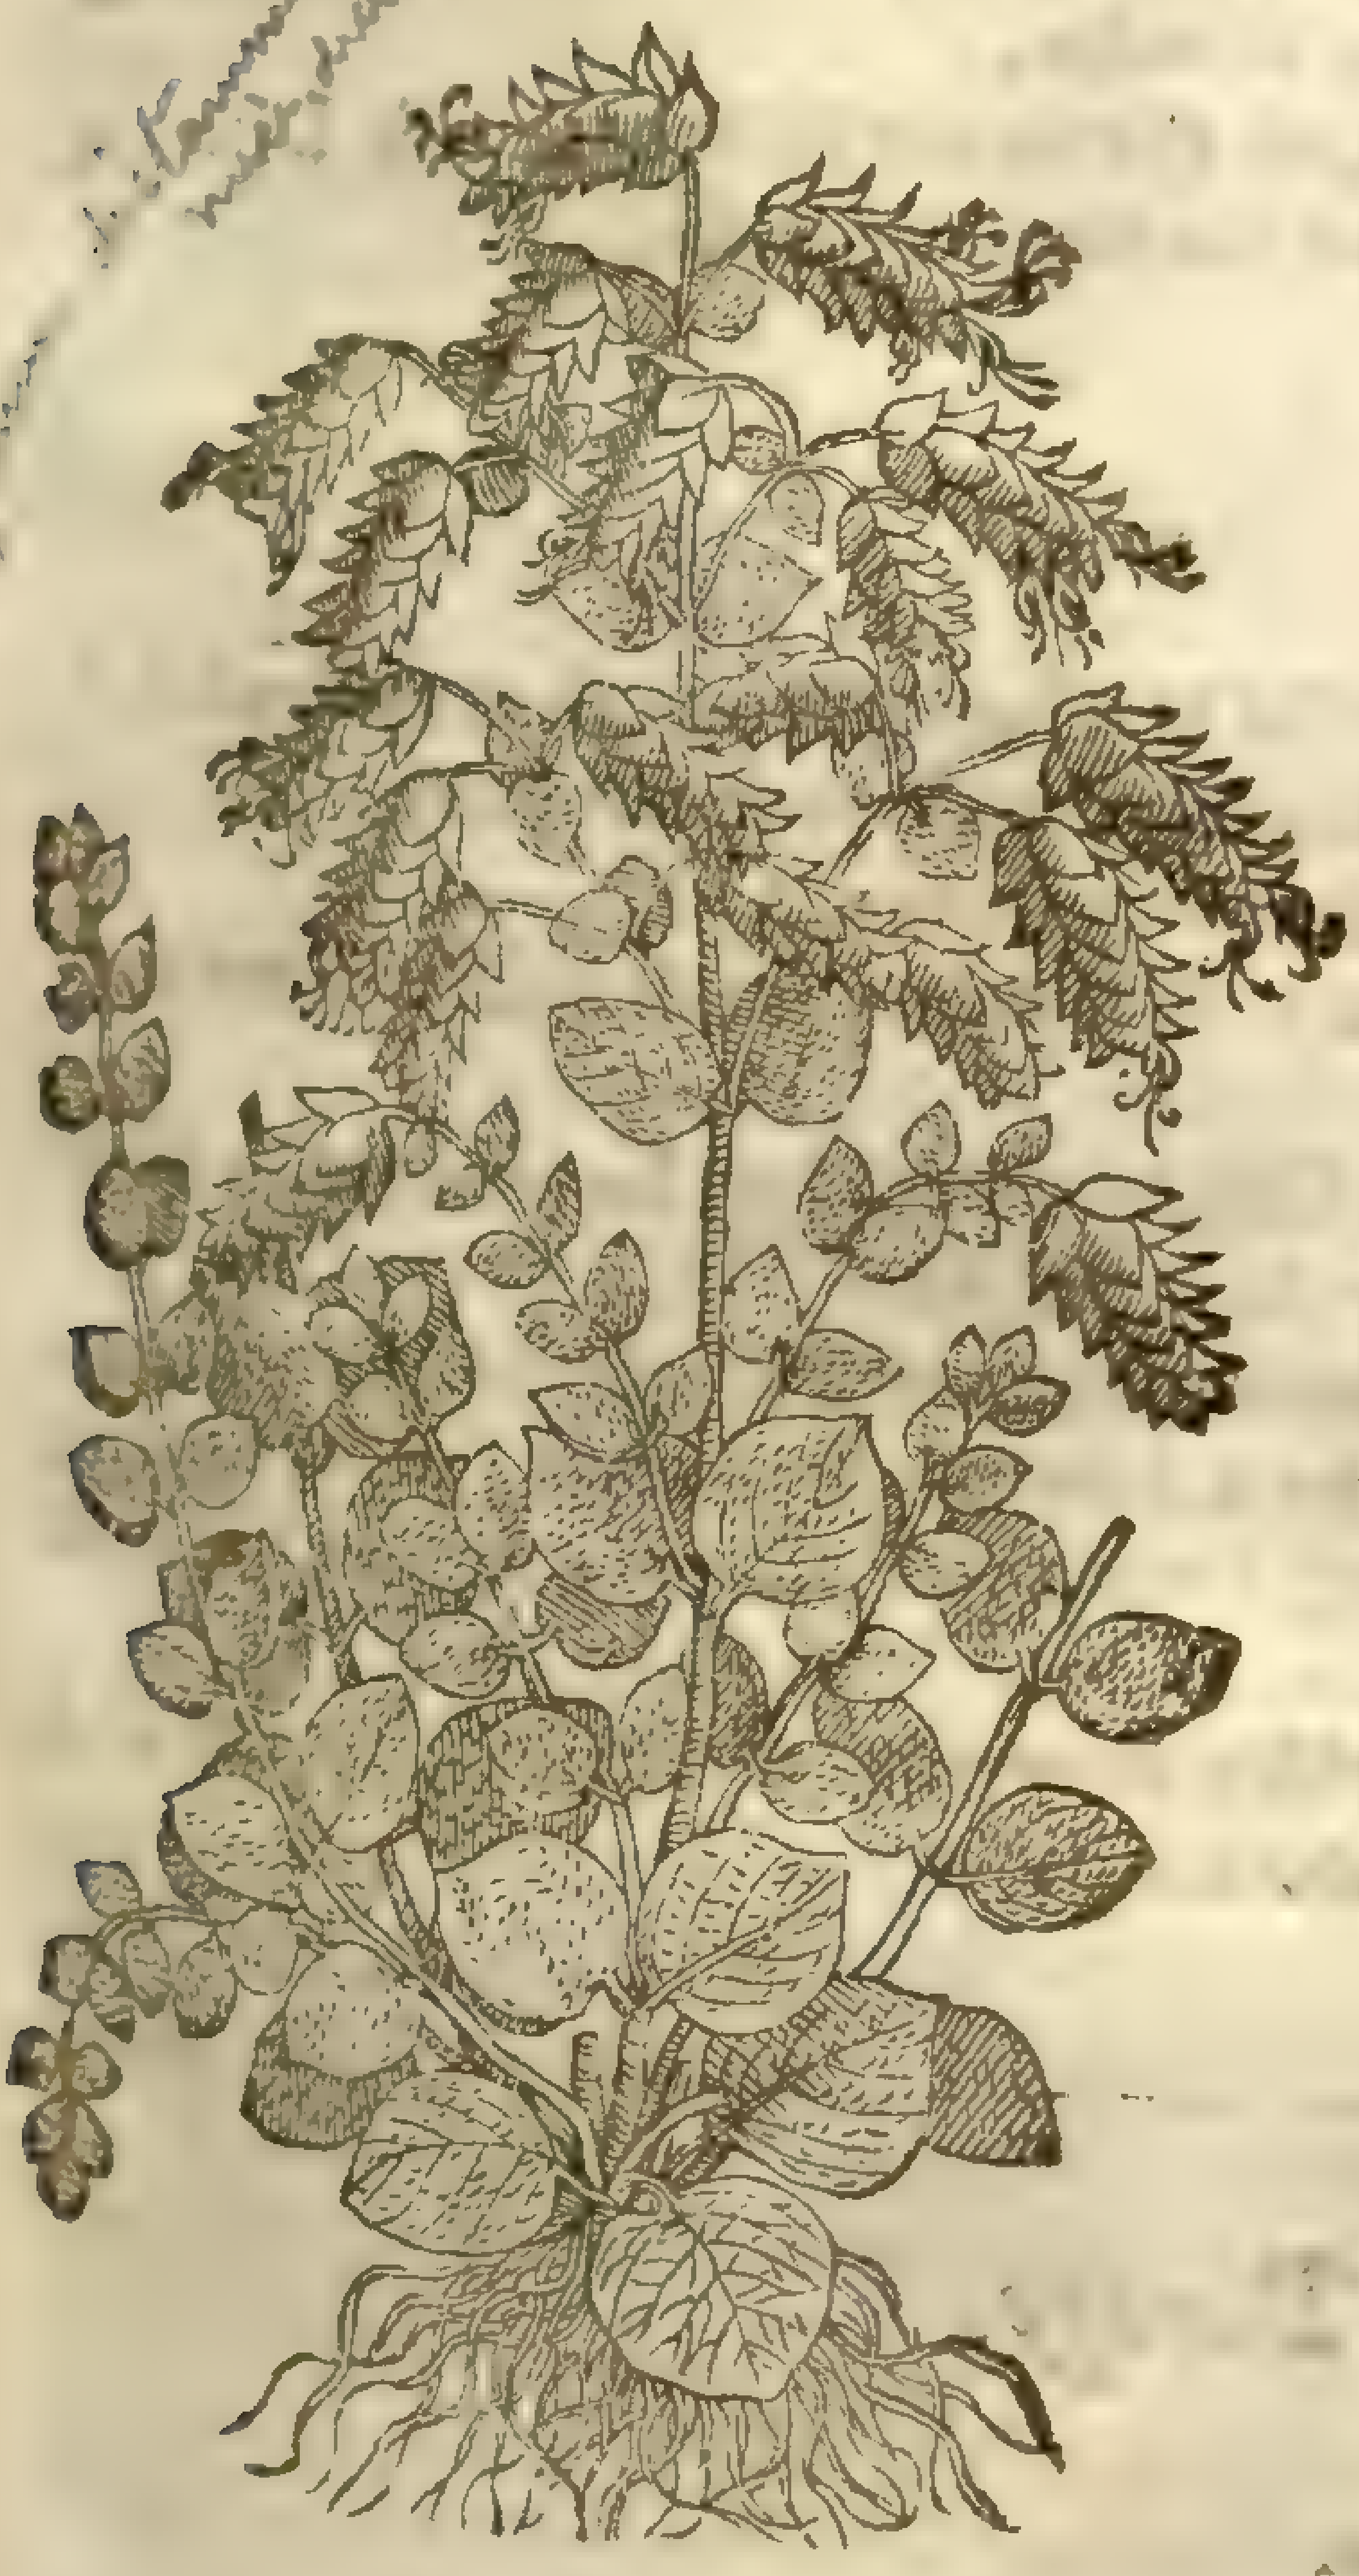
Chap.

Chap. 281. *Of Dittany.*

¶ *The Deſcription.*

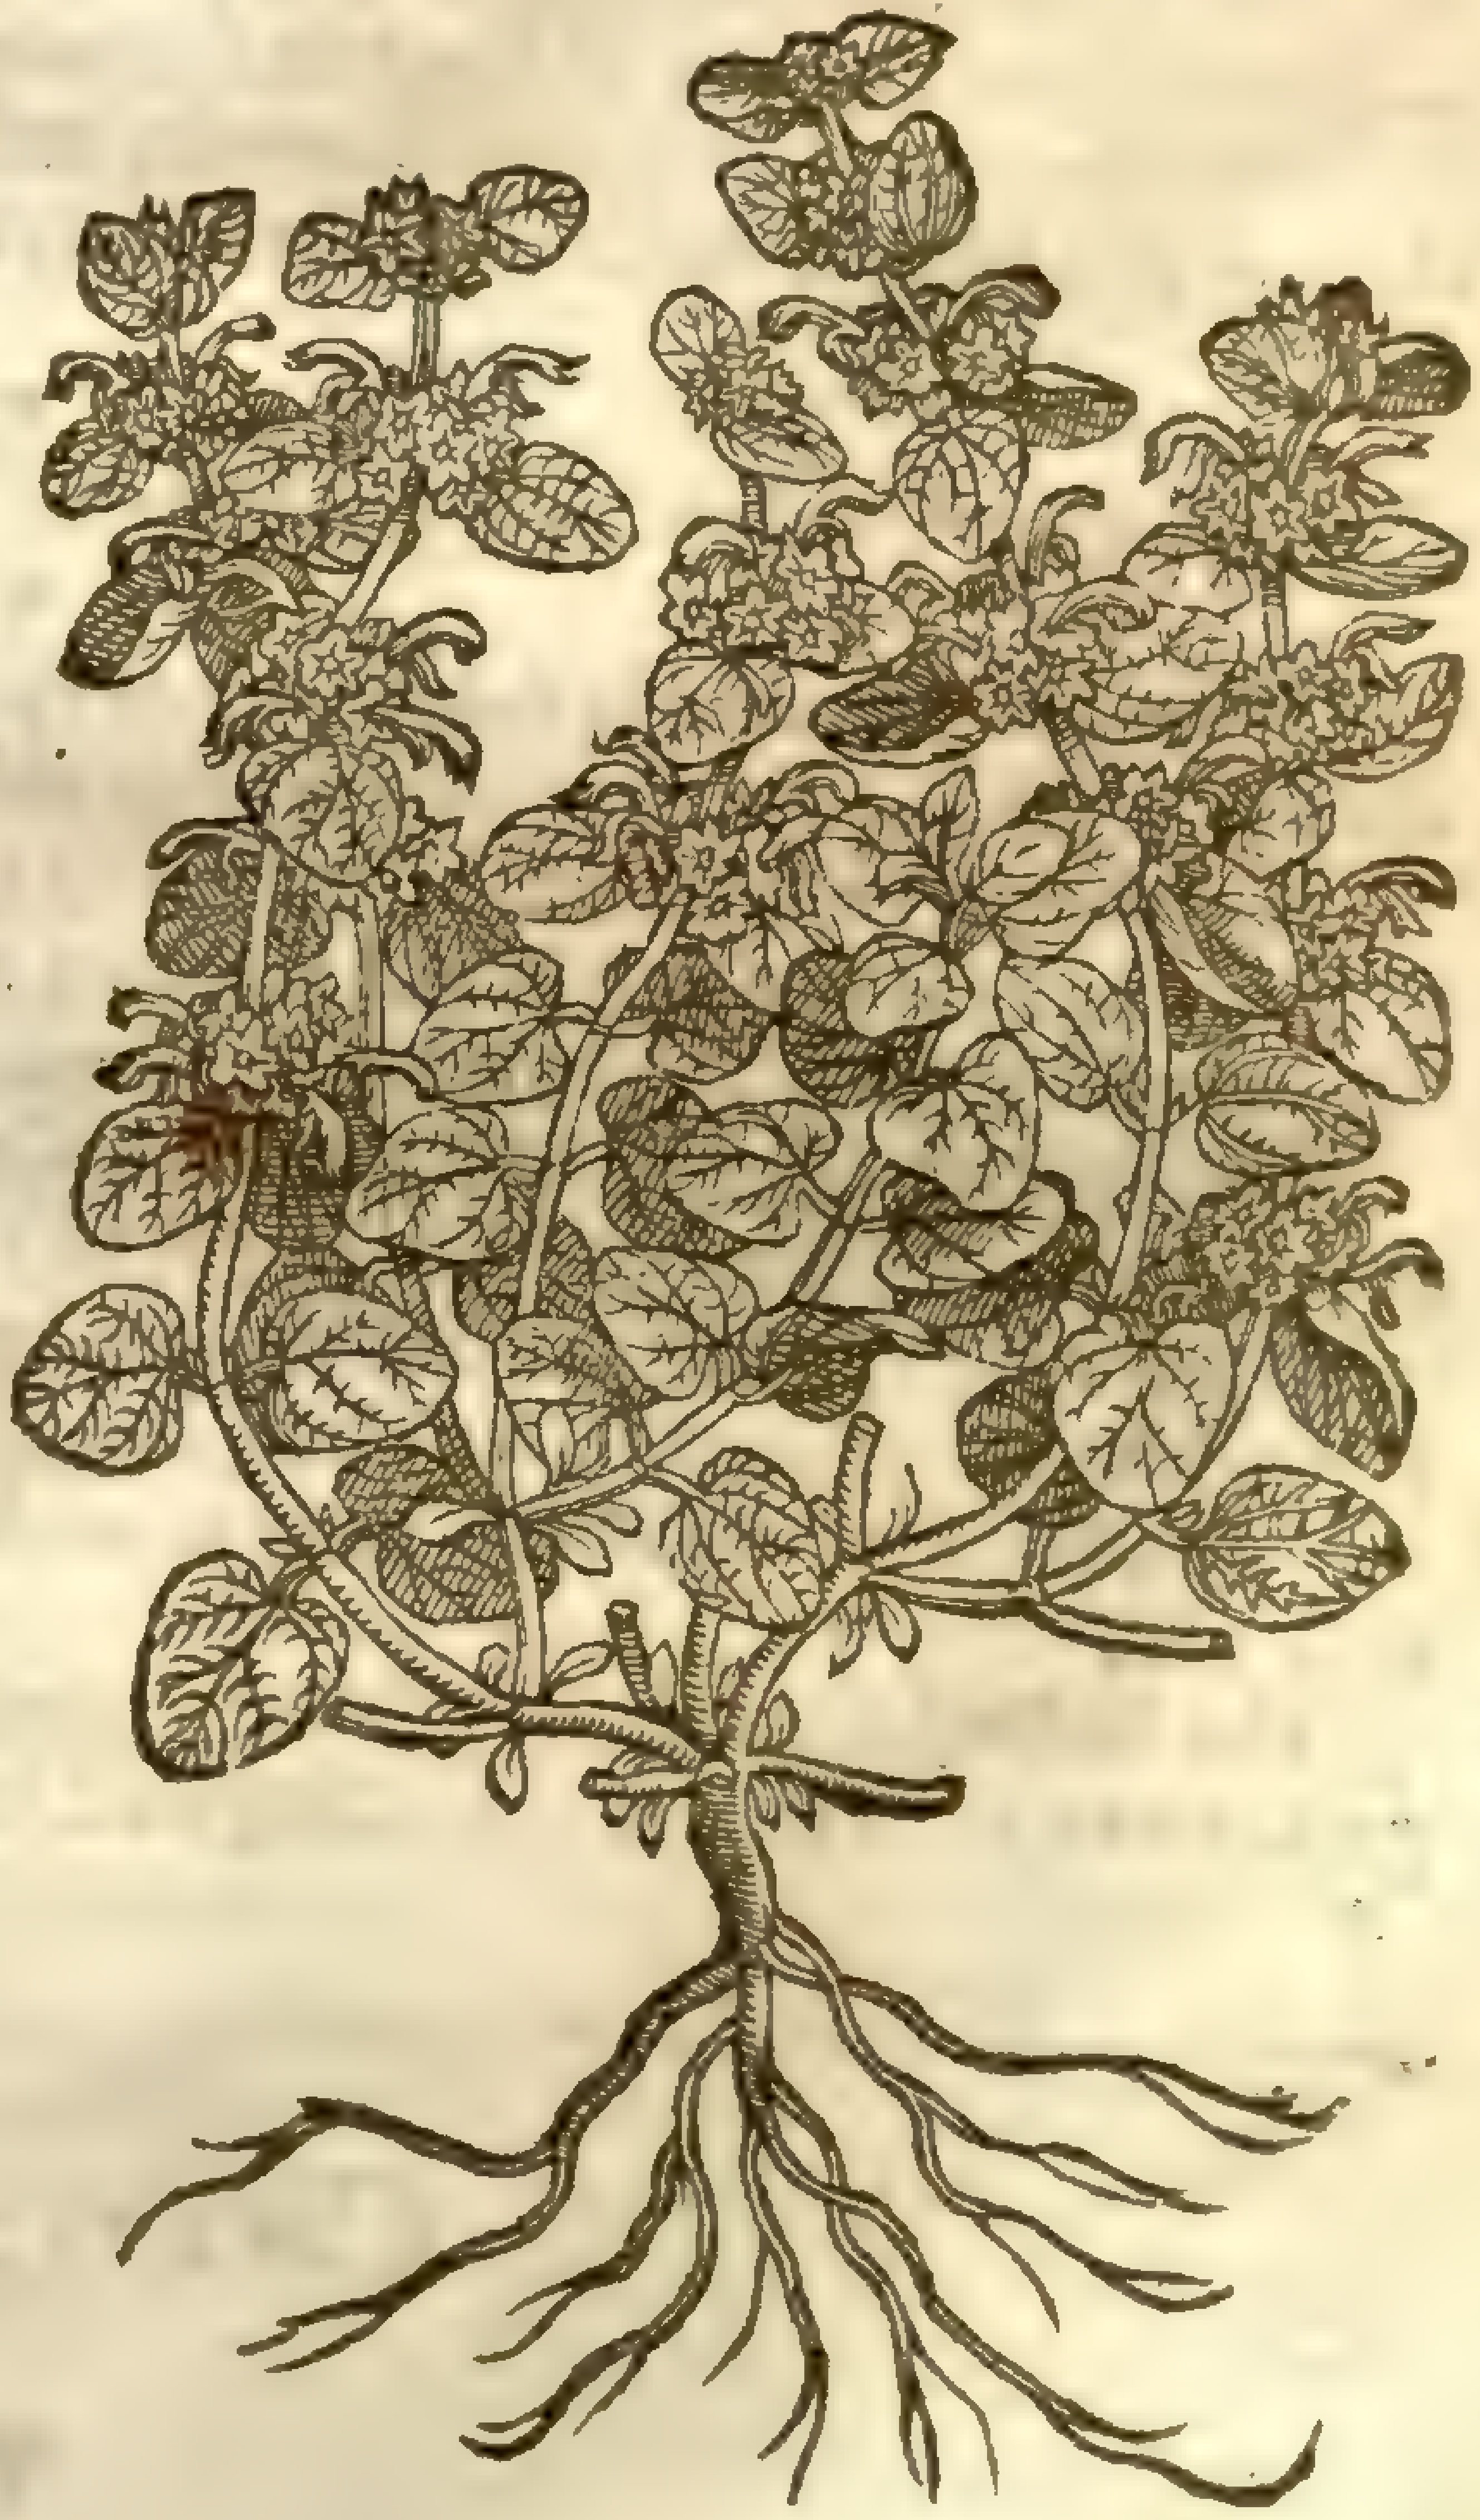
1 Dittanie of Crete now called Candie (as *Dioſcorides* ſaith) is a hot and ſharpe hearbe, much like vnto Penni-Royall, ſauing that his leaues be greater and ſomewhat hoary, couered ouer with a ſoft downe or white woollie cotton: at the top of the branches grow ſmall ſpikie eares or ſcaly aglets, hanging by little ſmall ſtemmes, reſembling the ſpiky tufts of Marjerome, of a white colour: amongſt which ſcales there do come forth ſmall floures like the flouring of Wheat, of a red purple colour; which being paſt, the knop is found full of ſmall ſeed, contrary to the ſaying of *Dioſcorides*, who ſaith, it neither beareth floure nor ſeed, but my ſelfe haue ſeene it beare both in my Garden: the whole plant periſhed in the next Winter following.

1 *Dictamnum Creticum.*
Dittany of Candy.



2 *Pſeudodictamnum.*
Baſtard Dittany.

Marrubium pseudodictamnum &
[illegible]



2 The ſecond kind called *Pſeudodictamnum*, that is, Baſtard Dittany, is much like vnto the firſt, ſauing that it is not ſweet of ſmell, neither doth it bite the tongue, hauing round ſoft woolly ſtalkes with knots and joynts, and at euery knot two leaues ſomewhat round, ſoft, woolly, and ſomewhat bitter: the floures be of a light purple colour, compaſſing the ſtalks by certain ſpaces like garlands or whatles, and like floures of Penny-Roiall. The root is of a wooddy ſubſtance: the whole plant groweth to the height of a cubit and a halfe, and laſteth long.

¶ *The Place.*

The firſt Dittany commeth from Crete, an Iſland which we call Candie, where it growes naturally: I haue ſeene it in my garden, where it hath floured and borne ſeed; but it periſhed by reaſon of the injury of our extraordinary cold Winter that then happened: neuertheleſſe *Dioſcorides* writeth againſt all truth, that it neither beareth floures nor ſeed: after *Theophraſtus*, *Virgil* wineſſeth that it doth beare floures in the twelfth of his Æneidos.

Dictamnum genetrix Cretæa carpit ab Ida,
Puberibus caulem folijs, & flore comantem
Purpureo. ——— ———

In Engliſh thus:

His mother from the Cretæan Ida crops
Dictamnus hauing ſoft and tender leaues,
And purple floures vpon the bending tops, &c.

¶ *The Time.*

They floure and flouriſh in Summer Moneths, their ſeed is ripe in September.

¶ *The Names.*

It is called in Greeke δίκταμνον: in Latine, *Dictamnus* and *Dictamnum*: of ſome, *Pulegium ſylueſtre*, or wilde Pennie-roiall: the Apothecaries of Germany for *Dictamnum* with c, in the firſt ſyllable, doe reade *Diptamnum* with *p*: but (ſaith *Dodonæus*) this errour might haue beene of ſmall importance, if in ſtead of the leaues of Dittanie, they doe not vſe the roots of *Fraxinella* for Dittany, which they falſely call *Dictamnum*: in Engliſh, Dittany, and Dittany of Candie.

The other is called *Pſeudodictamnum*, or baſtard Dittany, of the likeneſſe it hath with Dittany, ſkilleth not, though the ſhops know it not: the reaſon why let the Reader gueſſe.

¶ *The Nature.*

Theſe plants are hot and dry of Nature.

¶ *The Vertues.*

A Dittany being taken in drinke, or put vp in a peſſary, or vſed in a fume, bringeth away dead children: it procureth the monethly termes, and driueth forth the ſecondine or afterbirth.

B The juyce taken with wine is a remedy againſt the ſtinging of ſerpents.

C The ſame is thought to be of ſo ſtrong an operation, that with the very ſmell alſo it driues away venomous beaſts, and doth aſtoniſh them.

D It is reported likewiſe that the wilde Goats or Deere in Candy when they be wounded with arrowes, do ſhake them out by eating of this plant, and heale their wounds.

E It preuaileth much againſt all wounds, and eſpecially thoſe made with invenomed weapons, arrowes ſhot out of guns, or ſuch like, and is very profitable for Chirurgians that vſe the ſea and land wars, to carry with them and haue in readineſſe: it draweth forth alſo ſplinters of wood, bones, or ſuch like.

F The baſtard Dittany or *Pſeudodictamnum*, is ſomewhat like in vertues to the firſt, but not of ſo great force, yet it ſerueth exceeding well for the purpoſes aforeſaid.

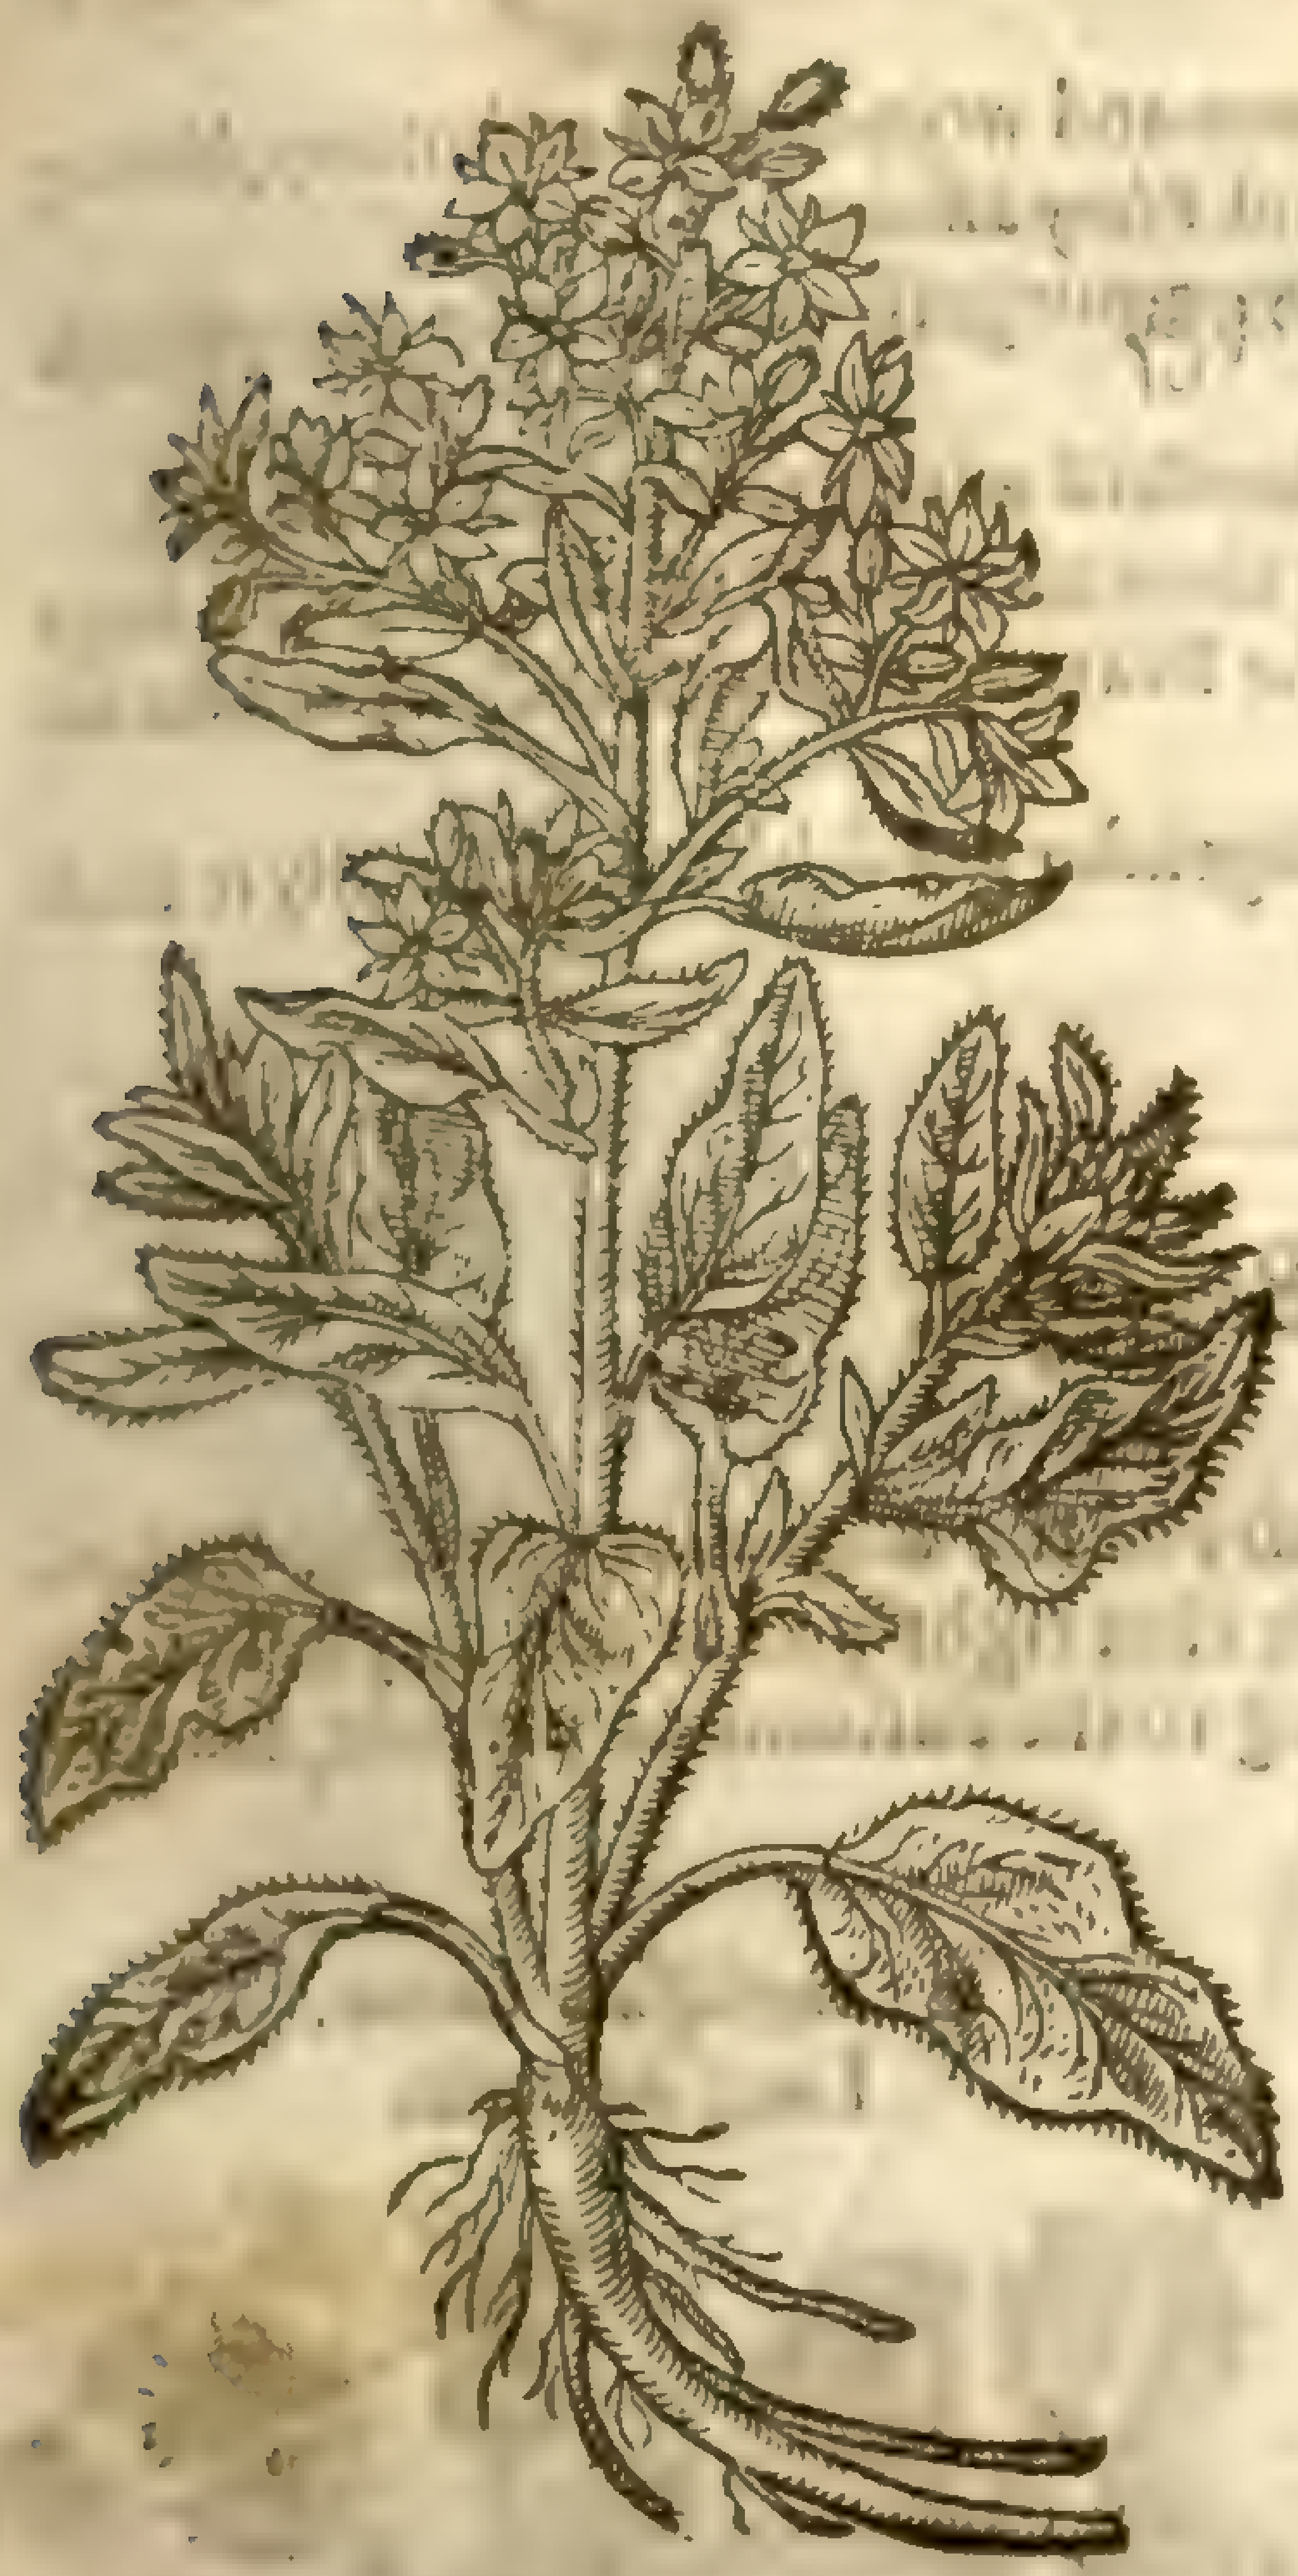
CHAP. 282. *Of Borage.*

¶ *The Deſcription.*

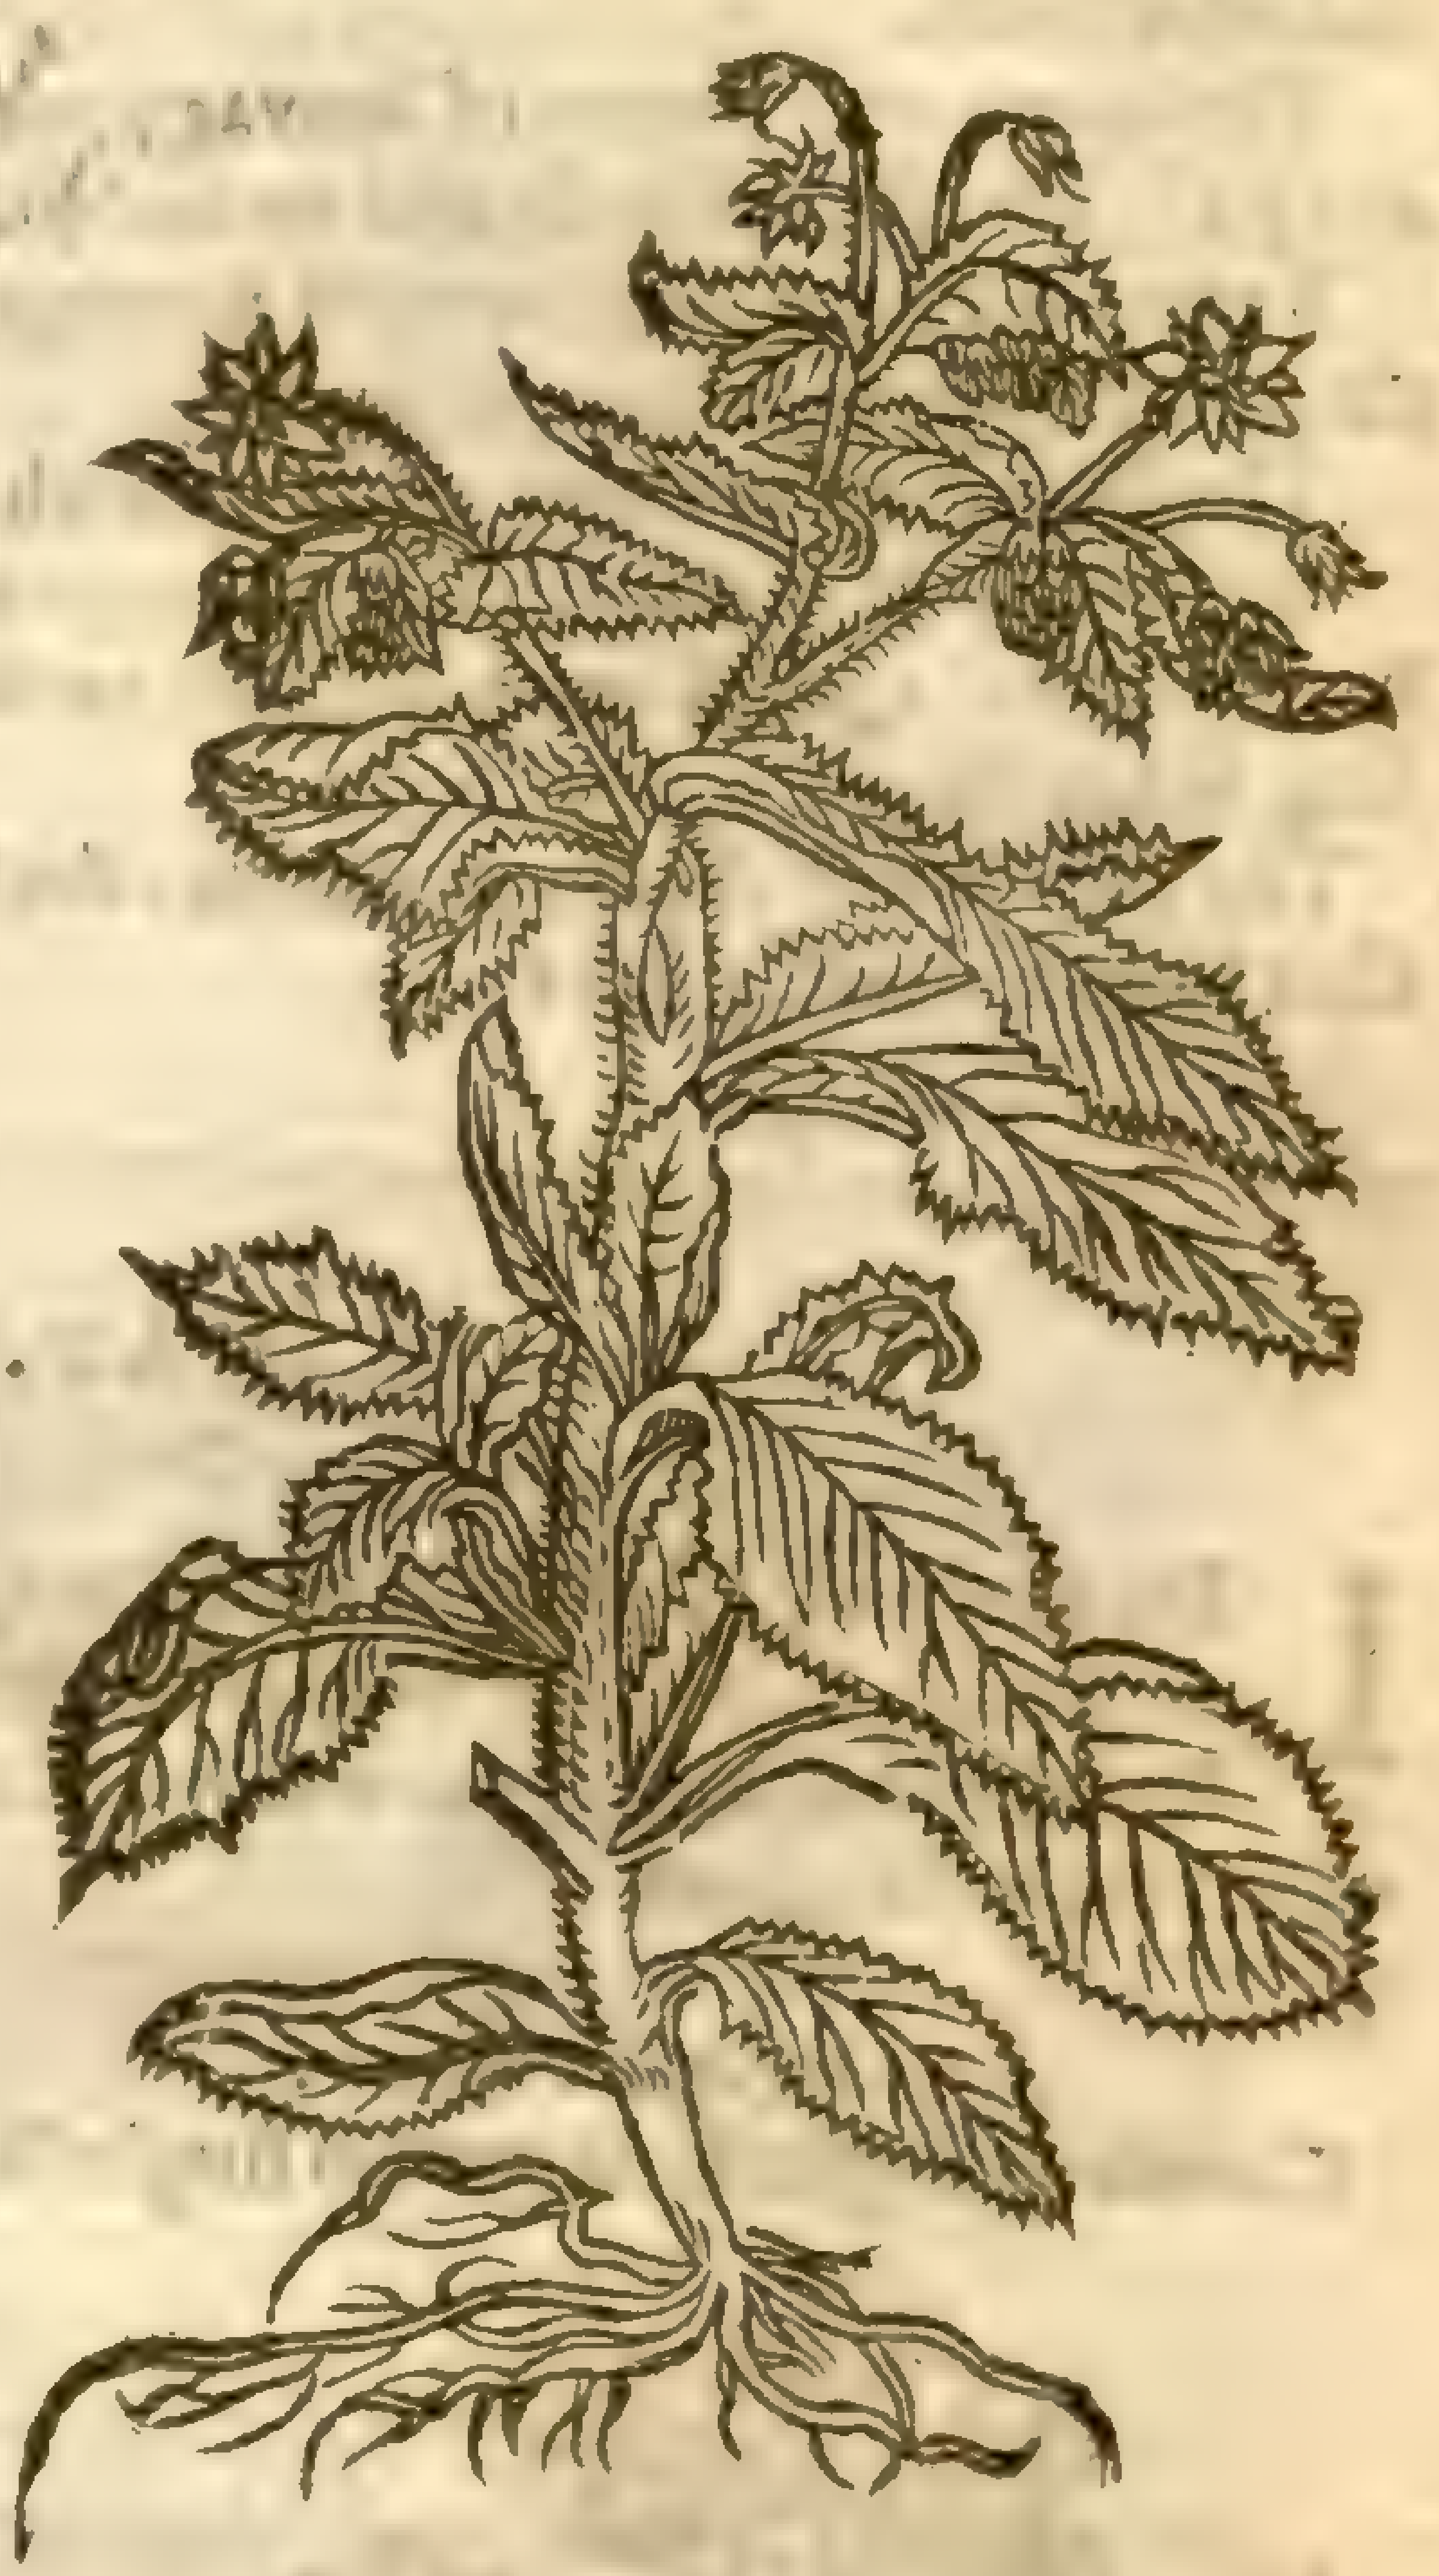
1 Borage hath broad leaues, rough, lying flat vpon the ground, of a blacke or ſwart green colour: among which riſeth vp a ſtalke two cubits high, diuided into diuers branches, wherupon do grow gallant blew floures, compoſed of fiue leaues apiece; out of the middle of which grow forth blacke threds joined in the top, and pointed like a broch or pyramide: the root is threddy, and cannot away with the cold of Winter.

2 Borage with white floures is like vnto the precedent, but differeth in the floures, for thoſe of this plant are white, and other of a perfect blew colour, wherein is the difference.

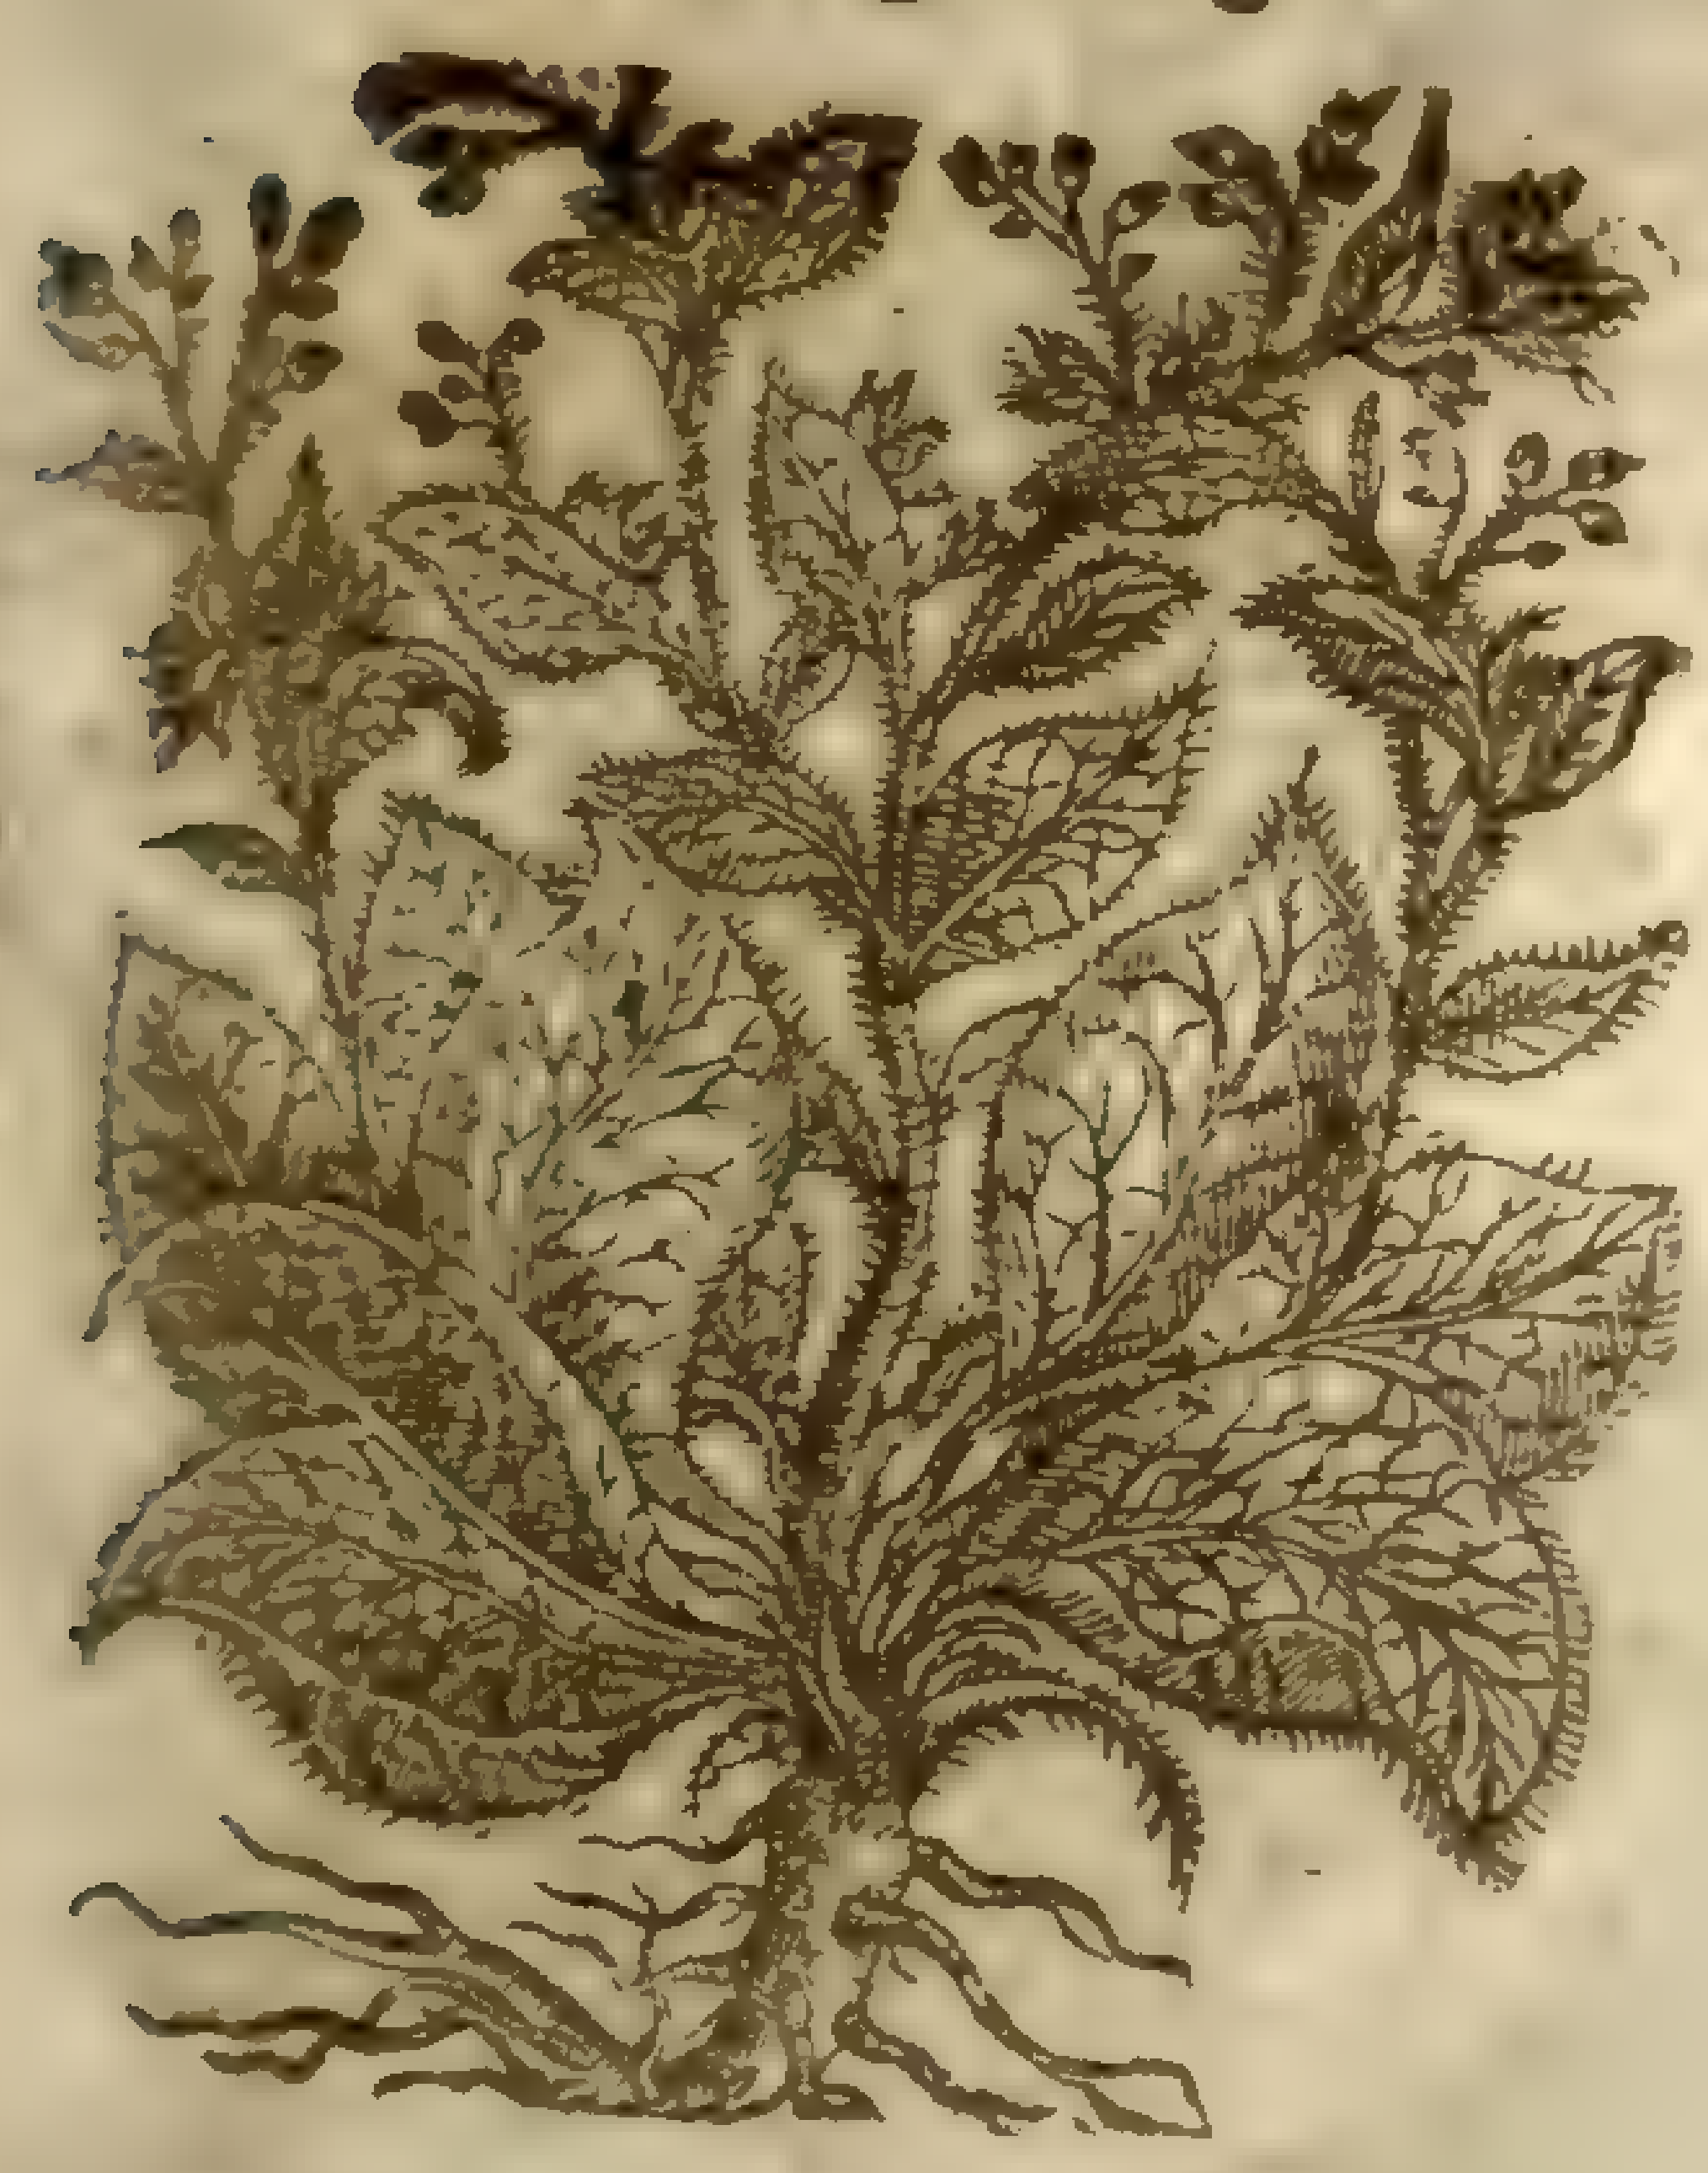
† 3 Neuer dying Borage hath many very broad leaues, rough and hairy, of a blacke darke greene colour: among which riſe vp ſtiffe hairy ſtalkes, whereupon doe grow faire blew floures, ſomewhat rounder pointed than the former: the root is blacke and laſting, hauing leaues both Winter and Summer, and hereupon is was called *Semper virens*, and that very properly, to diſtinguiſh it from the reſt of this kinde, which are but annuall. ‡



1 *Borago hortenſis.*
Garden Borage.



2 *Borago flore albo.*
White floured Borage.



3 *Borago ſemper virens.*
Neuer-dying Borage.

4 There is a fourth ſort of Borage that hath leaues like the precedent, but thinner and leſſer, rough and hairy, diuiding it ſelfe into branches at the bottome of the plant, whereupon are placed faire red floures, wherein is the chiefeſt difference between this and the laſt deſcribed. ‡ The figure which belonged to this deſcription was put hereafter for *Lycopſis Anglica.* ‡

¶ *The Place.*

Theſe grow in my garden and in others alſo.

¶ *The Time.*

Borage floures and flouriſhes moſt part of all Summer, and till Autumne be far ſpent.

¶ *The Names.*

Borage is called in ſhops *Borago*: of the old writers, Βούγλωσσον, which is called in Latine *Lingua bubula*: *Pliny* calleth it *Euphroſinum*, becauſe it makes a man merry and ioyfull: which thing alſo the old verſe concerning Borage doth teſtifie:

Ego Borago gaudia ſemper ago.
I Borage bring alwaies courage.

It is called in high-Dutch, **Burretſch**: in Italian, *Boragine*: in Spaniſh, *Boraces*: in low-Dutch, **Bernagie**: in Engliſh, Borage.

¶ *The Temperature.*

It is euidently moiſt, and not in like ſort hot, but ſeems to be in a mean betwixt hot and cold.

¶ *The Vertues.*

A Thoſe of our time do vſe the floures in ſallads, to exhilerate and make the minde glad. There be alſo many things made of them, vſed for the comfort of the heart, to driue away ſorrow, & increaſe the ioy of the minde.

B The leaues boiled among other pot-herbs much preuaile in making the belly ſoluble; & being boiled in honied water they are alſo good againſt the roughneſſe and hoarſeneſſe of the throat, as *Galen* teacheth.

C The leaues and floures of Borrage put into wine make men and women glad and merry, driuing away all ſadneſſe, dulneſſe, and melancholy, as *Dioſcorides* and *Pliny* affirme.

D Syrrup made of the floures of Borrage comforteth the heart, purgeth melancholy, and quieteth the phrenticke or lunaticke perſon.

E The floures of Borrage made vp with ſugar, do all the aforeſaid with greater force and effect.

F Syrrup made of the juice of Borrage with ſugar, adding thereto pouder of the bone of a Stags heart, is good againſt ſwouning, the cardiacke paſſion of the heart, againſt melancholy and the falling ſickneſſe.

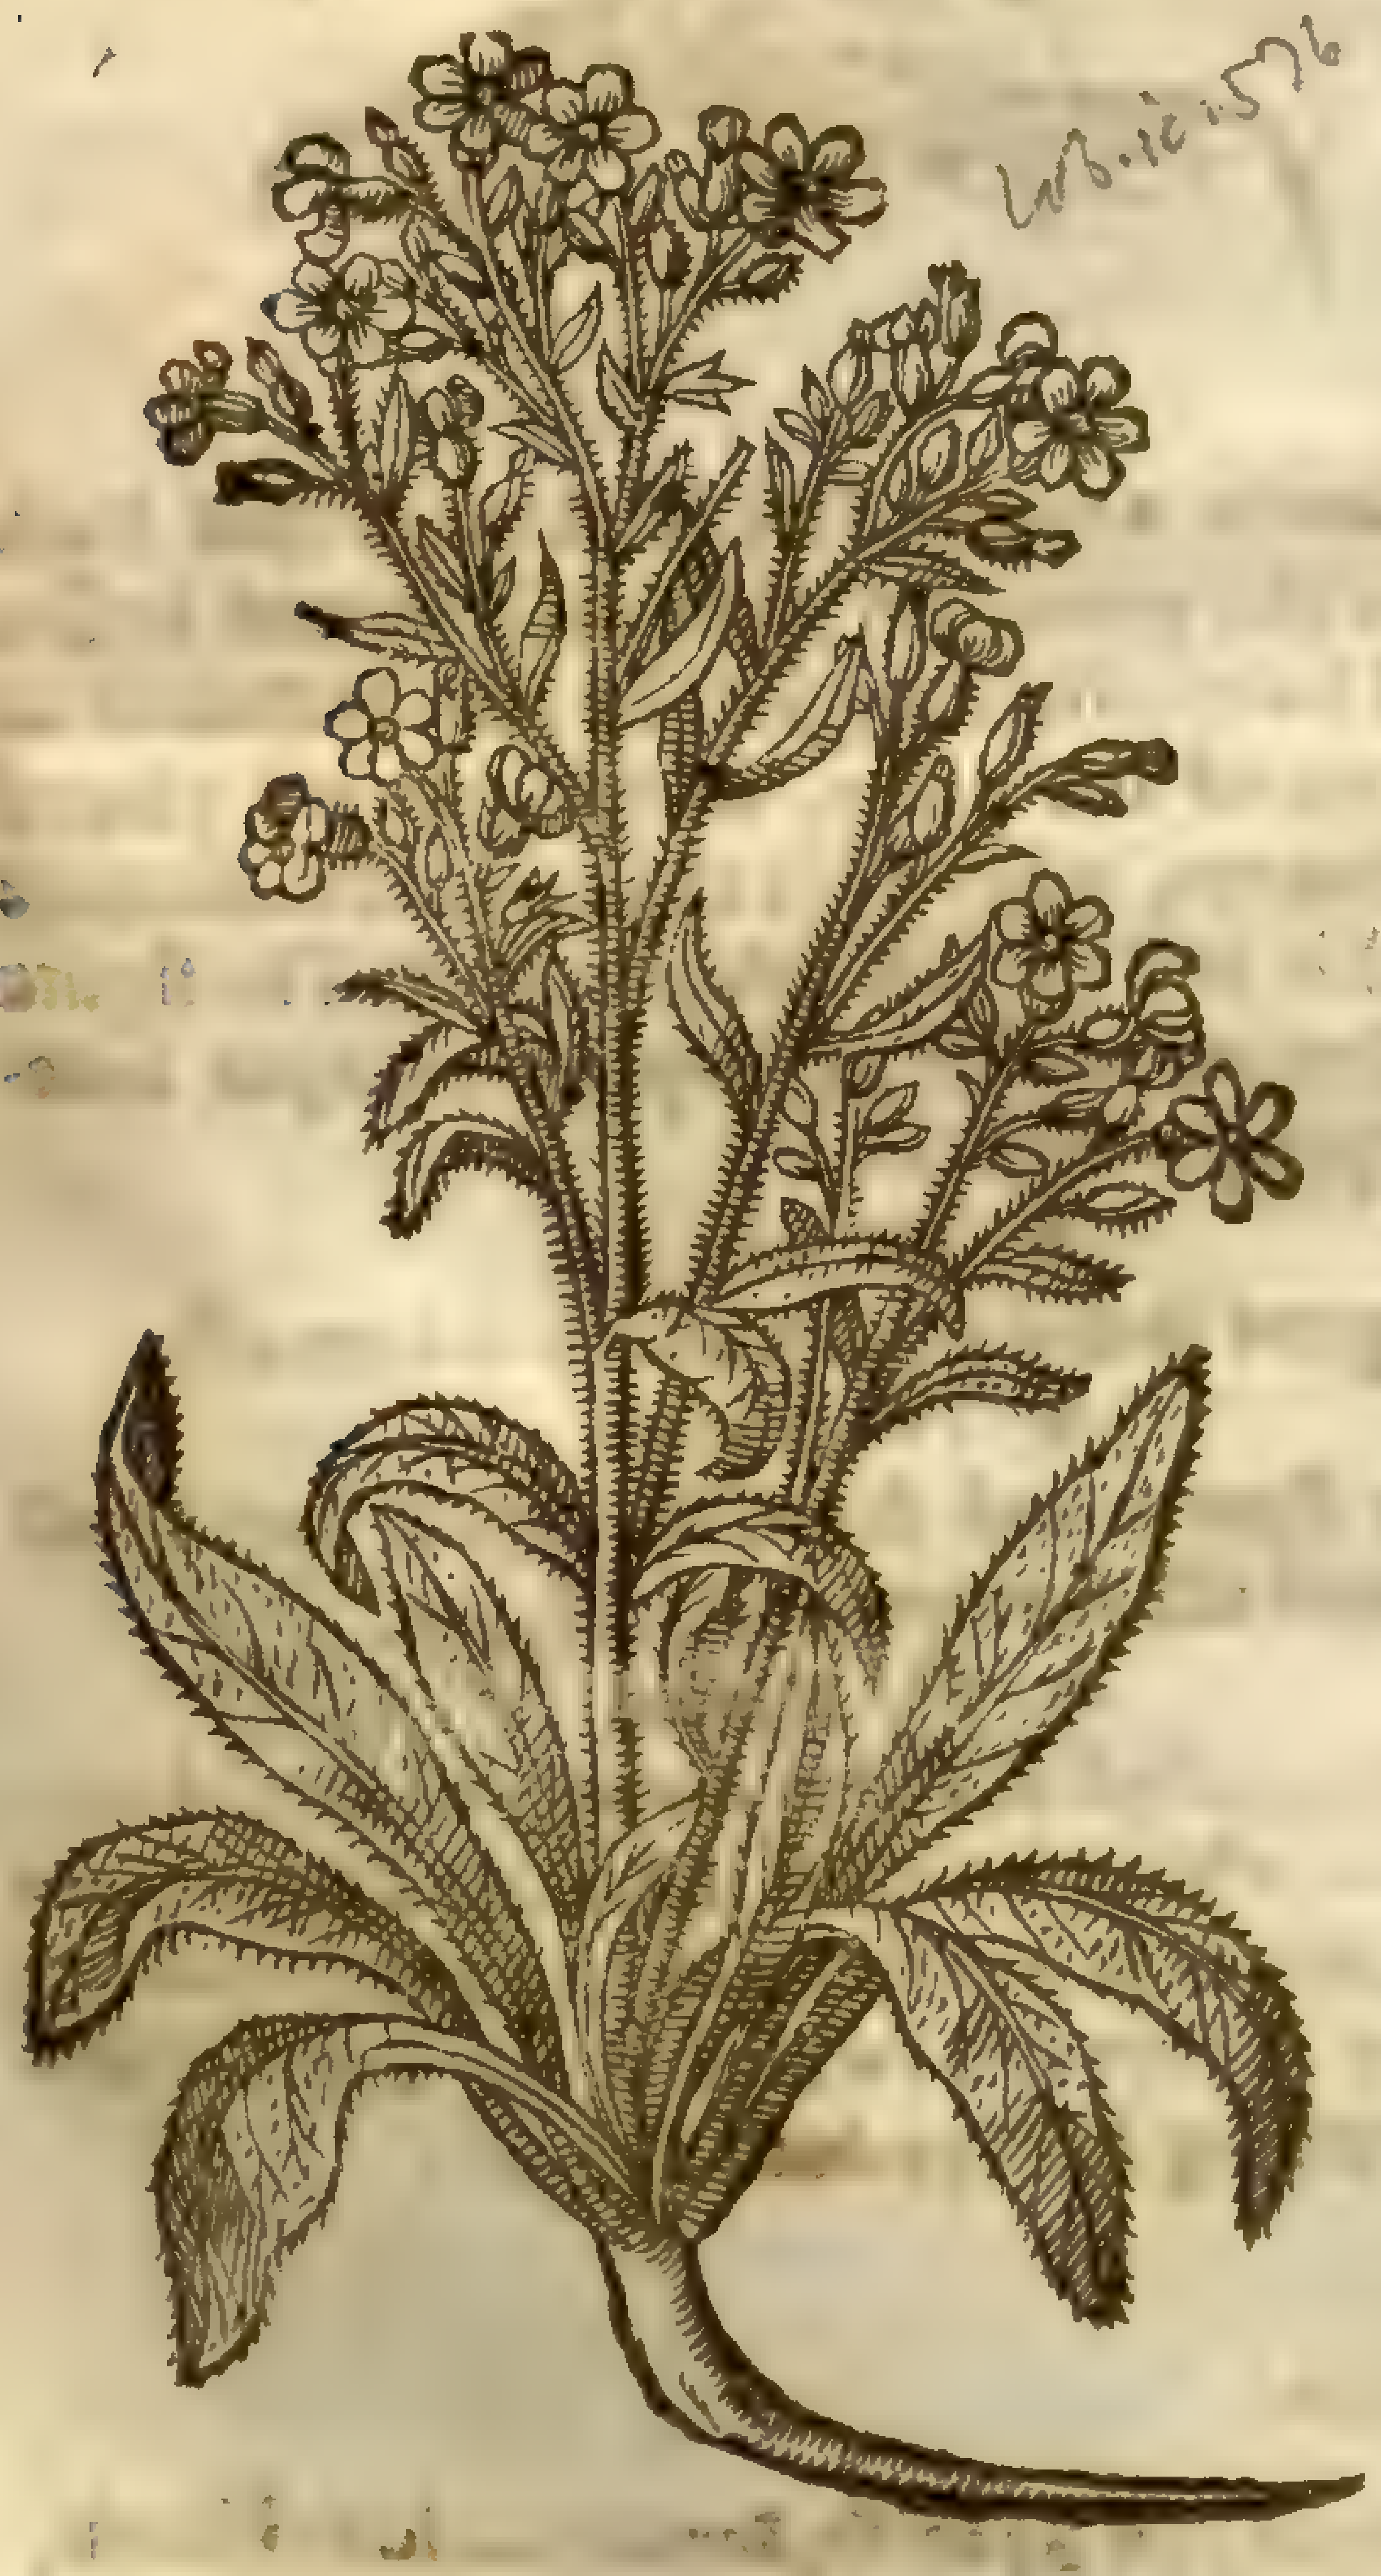
G The root is not vſed in medicine: the leaues eaten raw ingender good bloud, eſpecially in thoſe that haue bin lately ſicke.

Chap. 283. *Of Bugloſſe.*

¶ *The Kindes.*

Like as there be diuers ſorts of Borage, ſo are there ſundry of the Bugloſſes; yet after *Dioſcorides*, Borage is the true Bugloſſe: many are of opinion, & that rightly, that they may be both referred to one kinde, yet will we diuide them according to the cuſtome of our time, and their vſuall denominations.

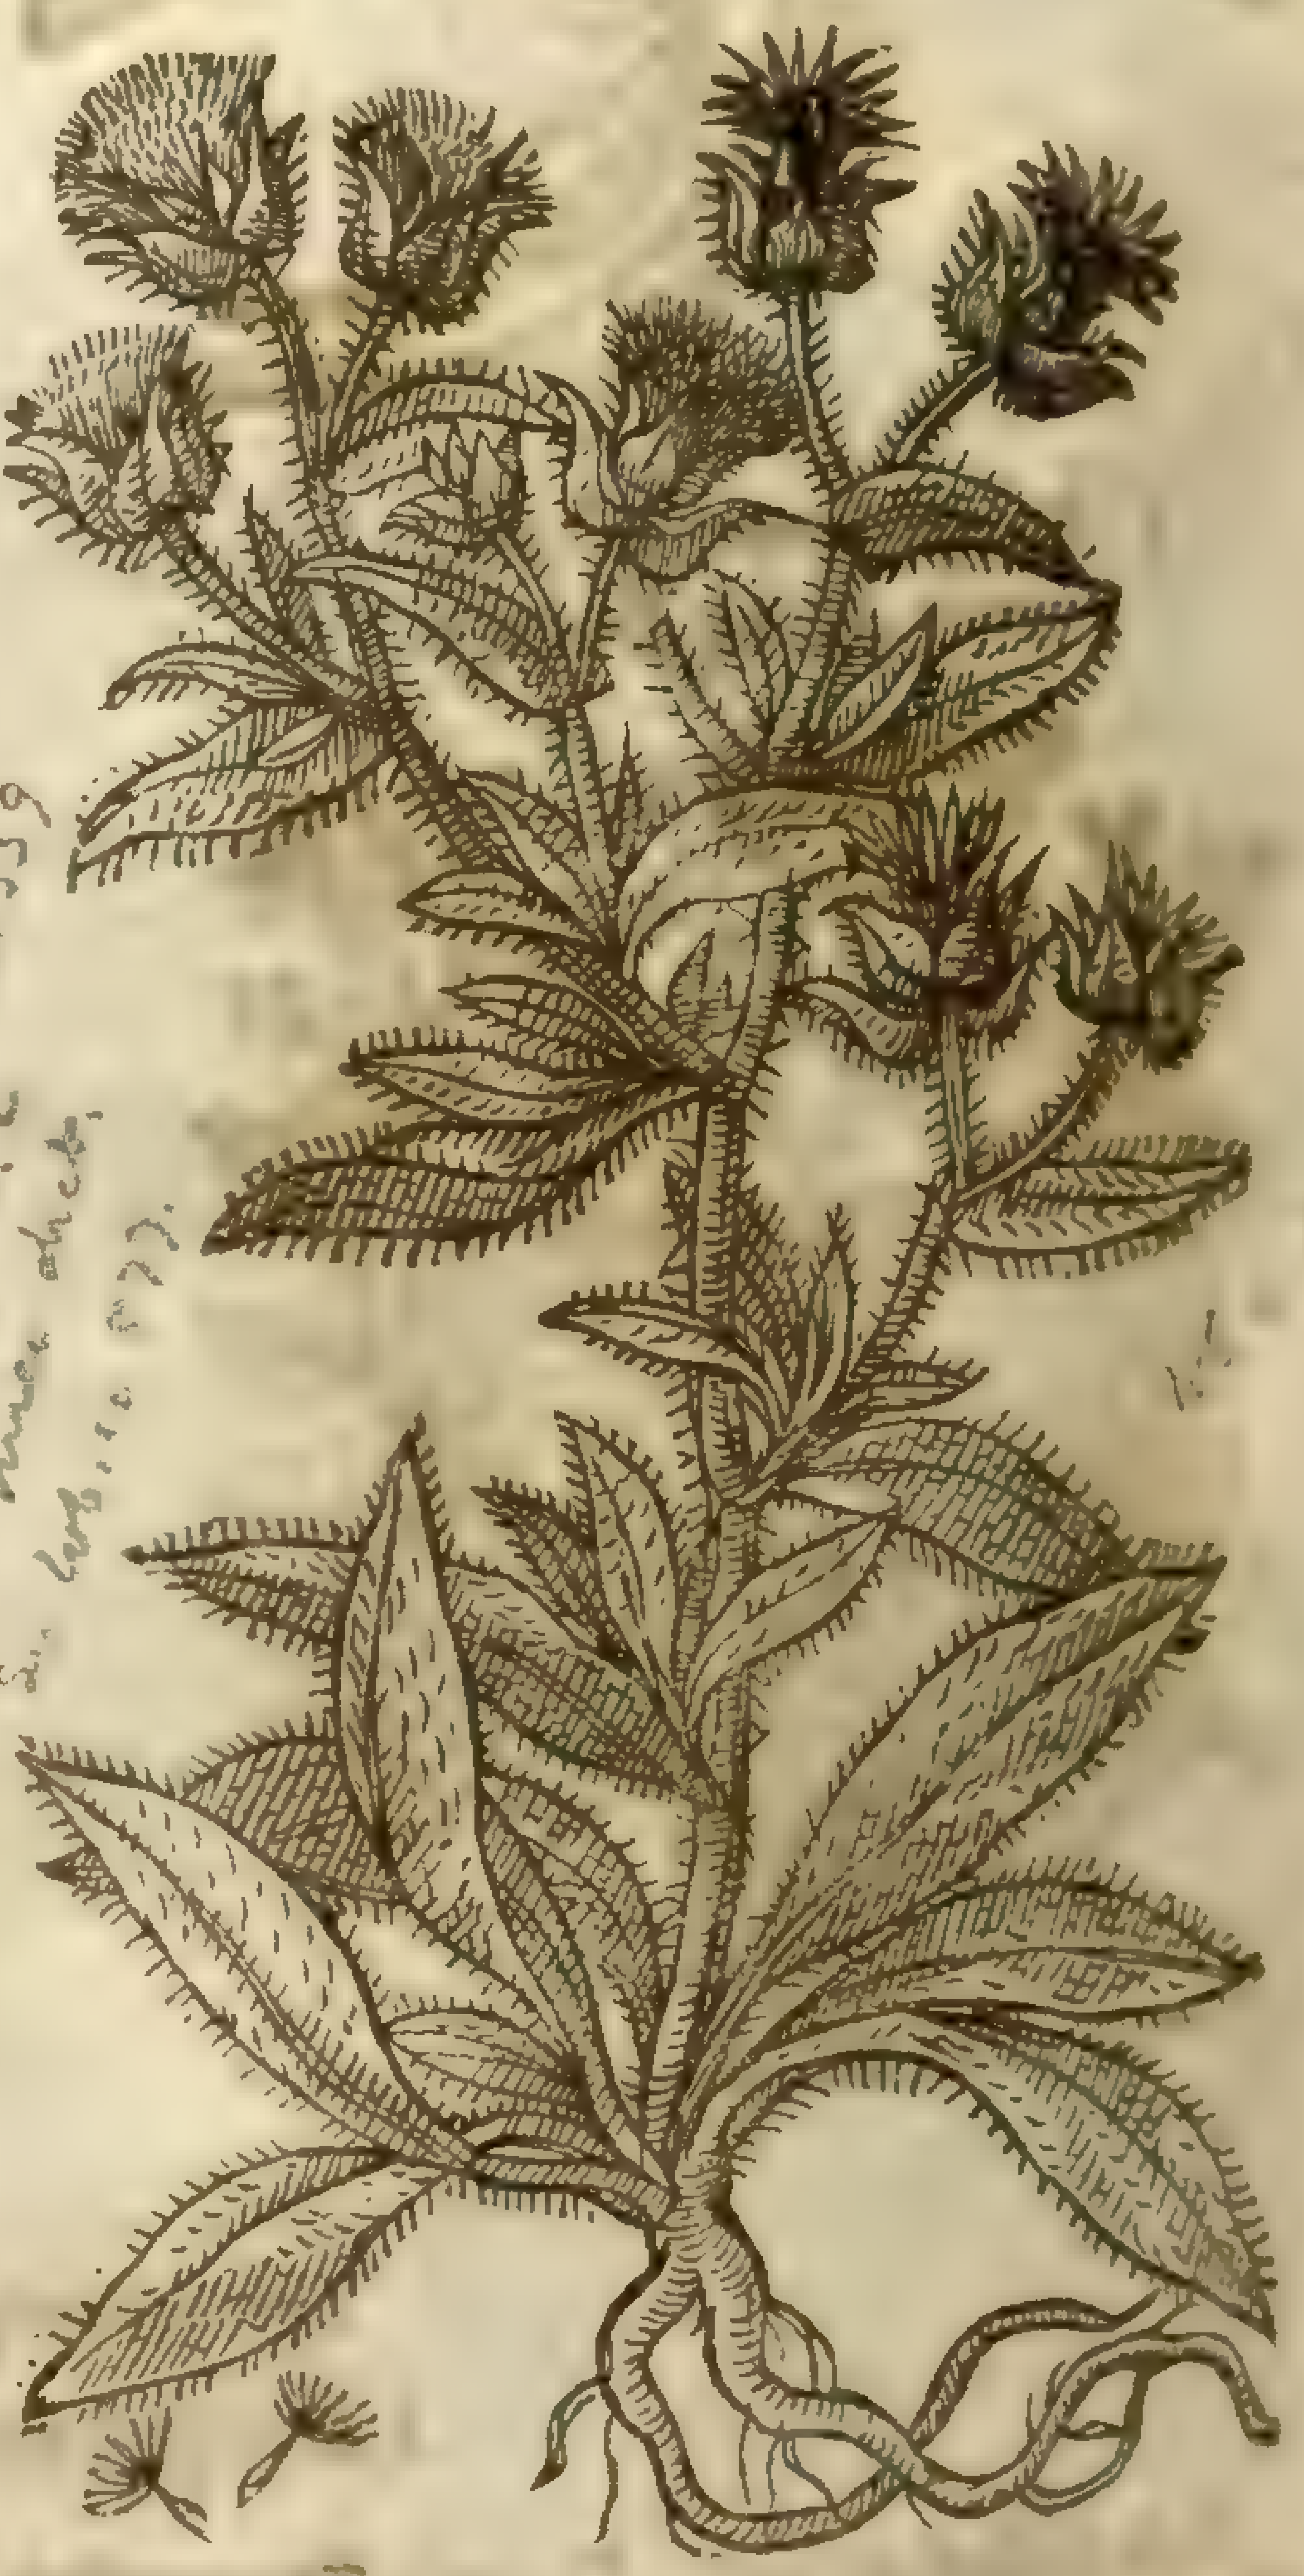
1 *Bugloſſa vulgaris.*
Common Bugloſſe, or garden Bugloſſe.



Lob. ic. 576

Anchusa officinalis, L.
S. Lob. ic. 576

2 *Bugloſſum luteum.*
Lang de beefe.



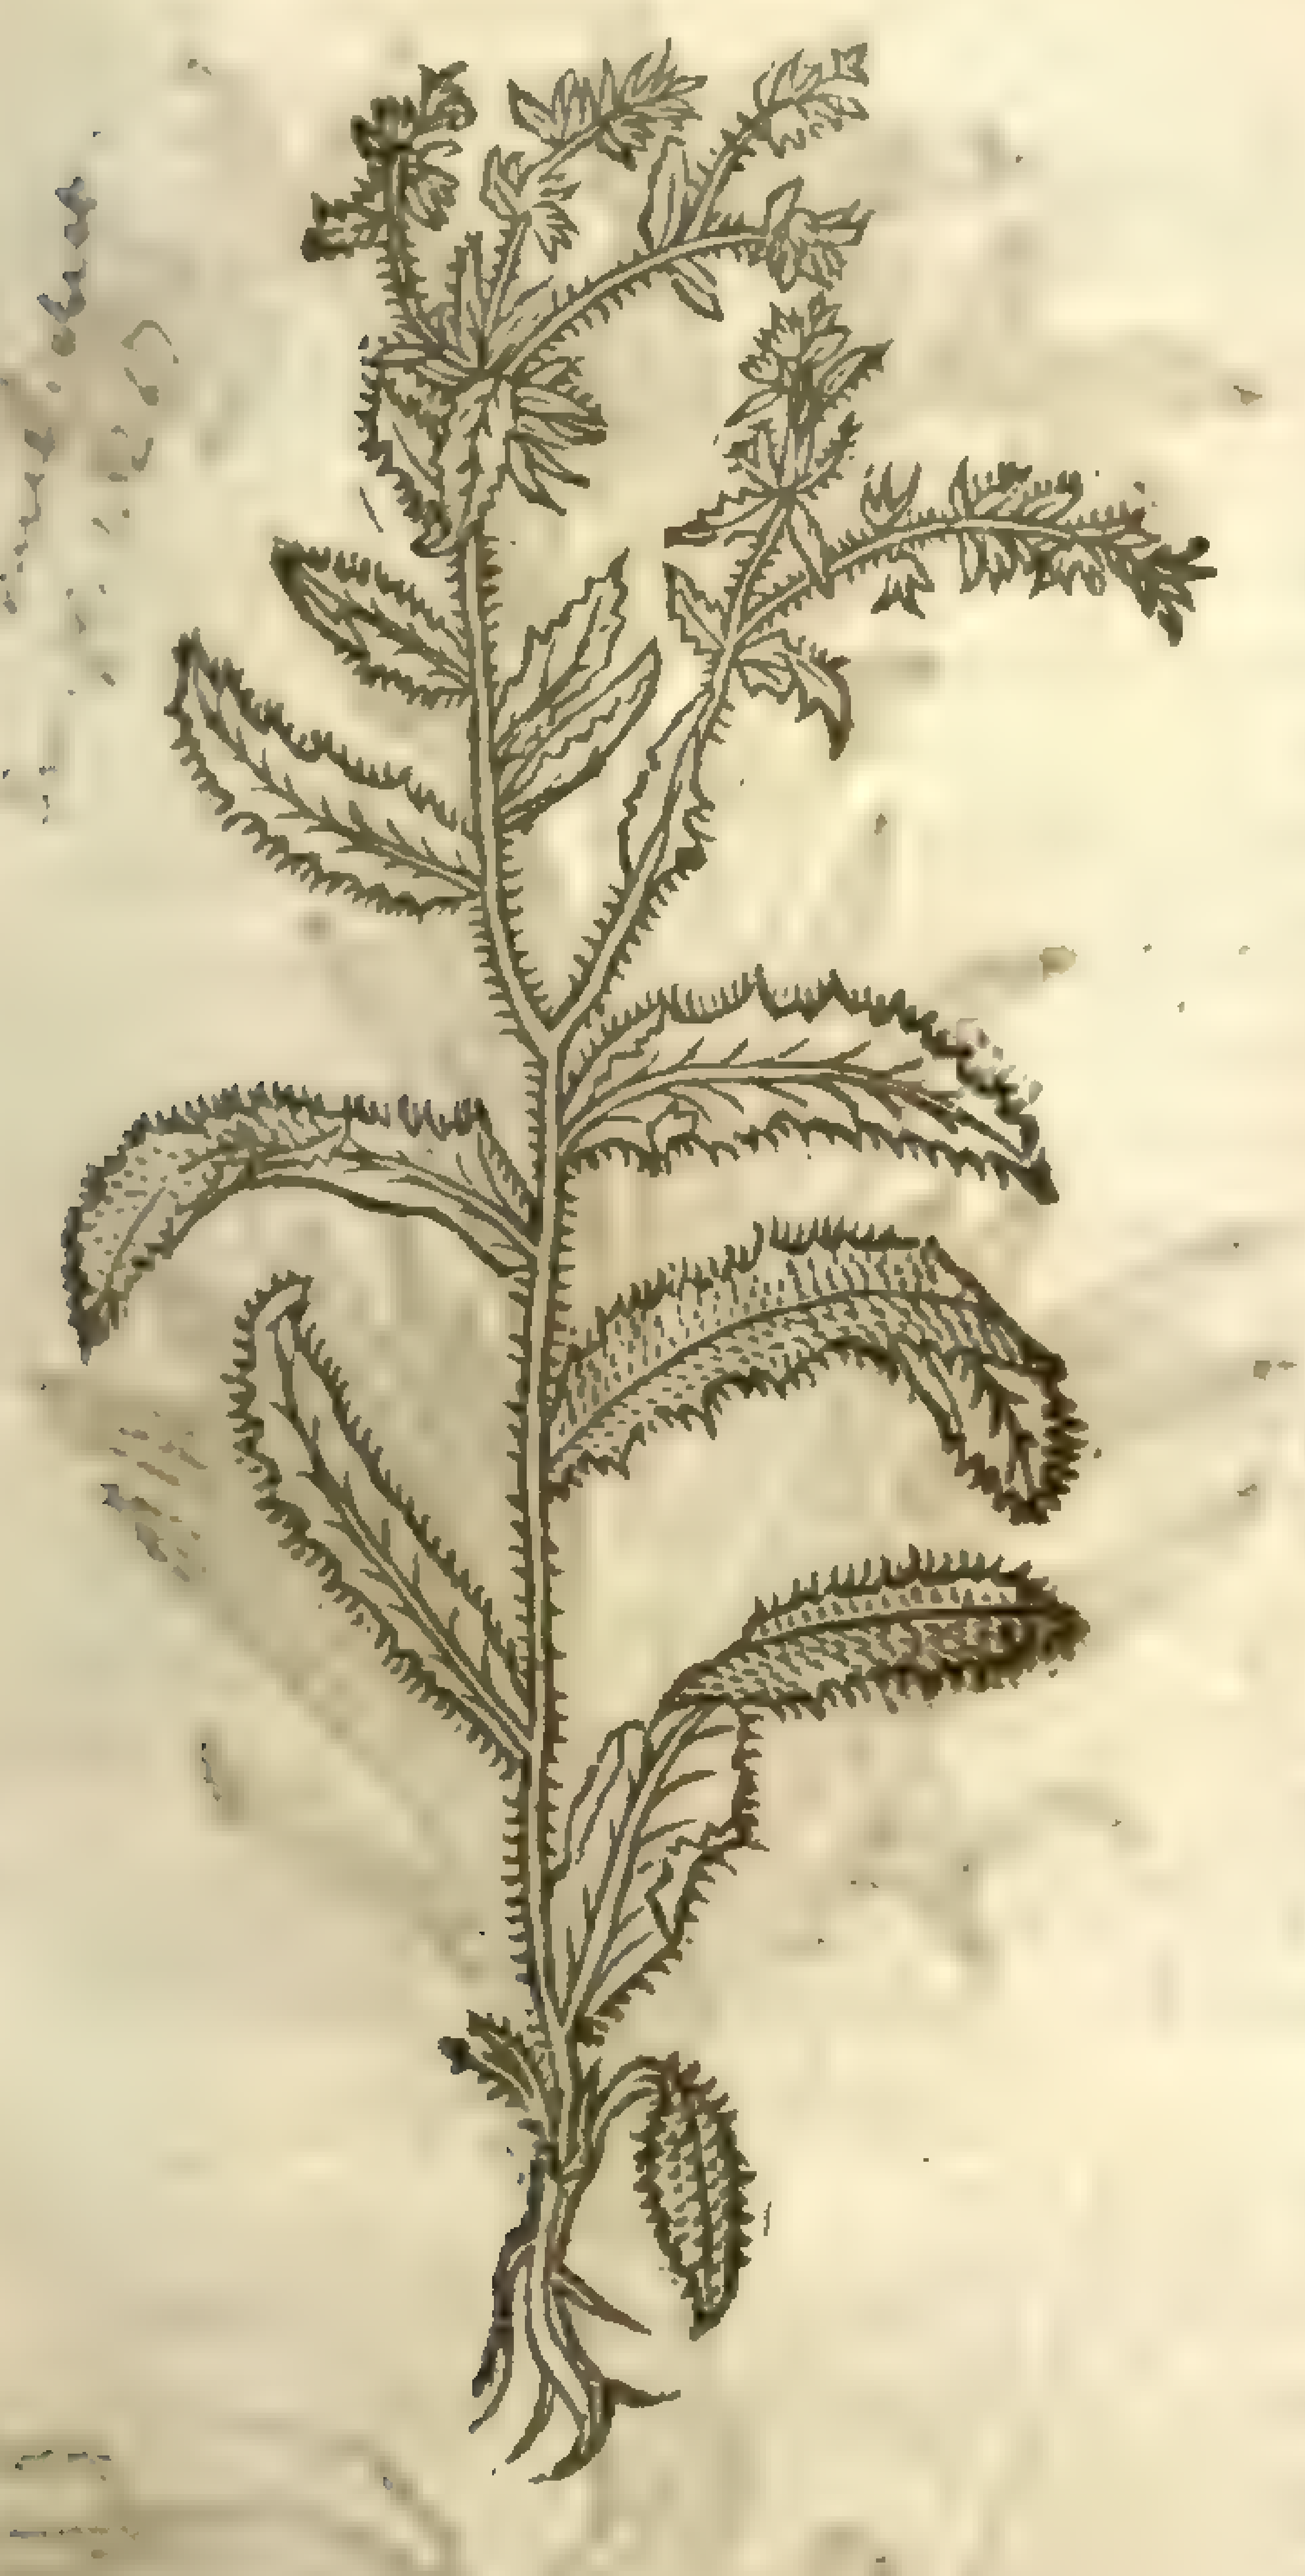
Picris echioides, L.
[illegible] 339
Lob. ic. 577.

¶ *The Deſcription.*

1 That which the Apothecaries call Bugloſſe bringeth forth leaues longer than thoſe of Borage, ſharpe pointed, longer than the leaues of Beets, rough and hairy. The ſtalke groweth vp to the height of two cubits, parted aboue into ſundry branches, whereon are orderly placed blewiſh floures, tending to a purple colour before they be opened, and afterward more blew: the root is long, thicke, groſſe, and of long continuance.

2 Lang

‡ 3 *Bugloſſa ſylueſtris minor.*
Small wilde Bugloſſe.



2 Lang de beef is a kinde hereof, altogether leſſe, but the leaues herof are rougher like the rough tongue of an Oxe or Cowe, whereof it tooke his name. ‡ The leaues of Lang de beef are very rough, the ſtalke ſome cubit and halfe high, commonly red of colour: the tops of the branches carry floures in ſcaly rough heads: theſe floures are compoſed of many ſmall yellow leaues in maner of thoſe of Dandelion, and fly away in down like as they do: the floures are of a very bitter taſt, whence *Lobel* calls it *Bugloſſum echioides luteum Hieracio cognatum. Tabernamontanus* hath fitly called it *Hieracium echioides.*

3 There is another wild Bugloſſe which *Dodonæus* hath by name of *Bugloſſa ſylueſtris*: it hath a ſmall white root, from which ariſes a ſlender ſtalke ſome foot and halfe high, ſet with ſmal rough leaues ſinuated or cut in on the edges: the ſtalkes at the top are diuided into three or foure ſlender branches, bearing little blew floures in rough husks. ‡

¶ *The Place.*

Theſe grow in gardens euery where. ‡ The Lang de beefe growes wilde in many places, as betweene Redriffe and Deptford by the waterie ditch ſides. The little wild Bugloſſe growes vpon the dry ditch banks about Pickadilla, and almoſt euery where. ‡

¶ *The Time.*

They floure from May or Iune, euen to the end of Summer. The leaues periſh in Winter, and new come vp in the Spring.

¶ *The Names.*

Garden Bugloſſe is called of the later Herbariſts, *Bugloſſa*, and *Bugloſſa domeſtica*, or garden Bugloſſe.

Lang de beef is called in Latine, *Lingua bouis*, and *Bugloſſum luteum Hieracio cognatum*, and alſo *Bugloſſa ſylueſtris*, or wilde Bugloſſe.

‡ Small wild Bugloſſe is called *Borago ſylueſtris*, by *Tragus*; *Echium Germanicum ſpinoſum* by *Fuchſius*: and *Bugloſſa ſylueſtris* by *Dodonæus.* ‡

¶ *The Temperature and Vertues.*

The root, ſaith *Dioſcorides*, mixed with oile, cureth green wounds, and adding therto a little barley meale it is a remedie againſt S. *Anthonies* fire. A

It cauſeth ſweat in agues, as *Pliny* ſaith, if the juice be mixed with a little aqua vitæ, and the body rubbed therewith. B

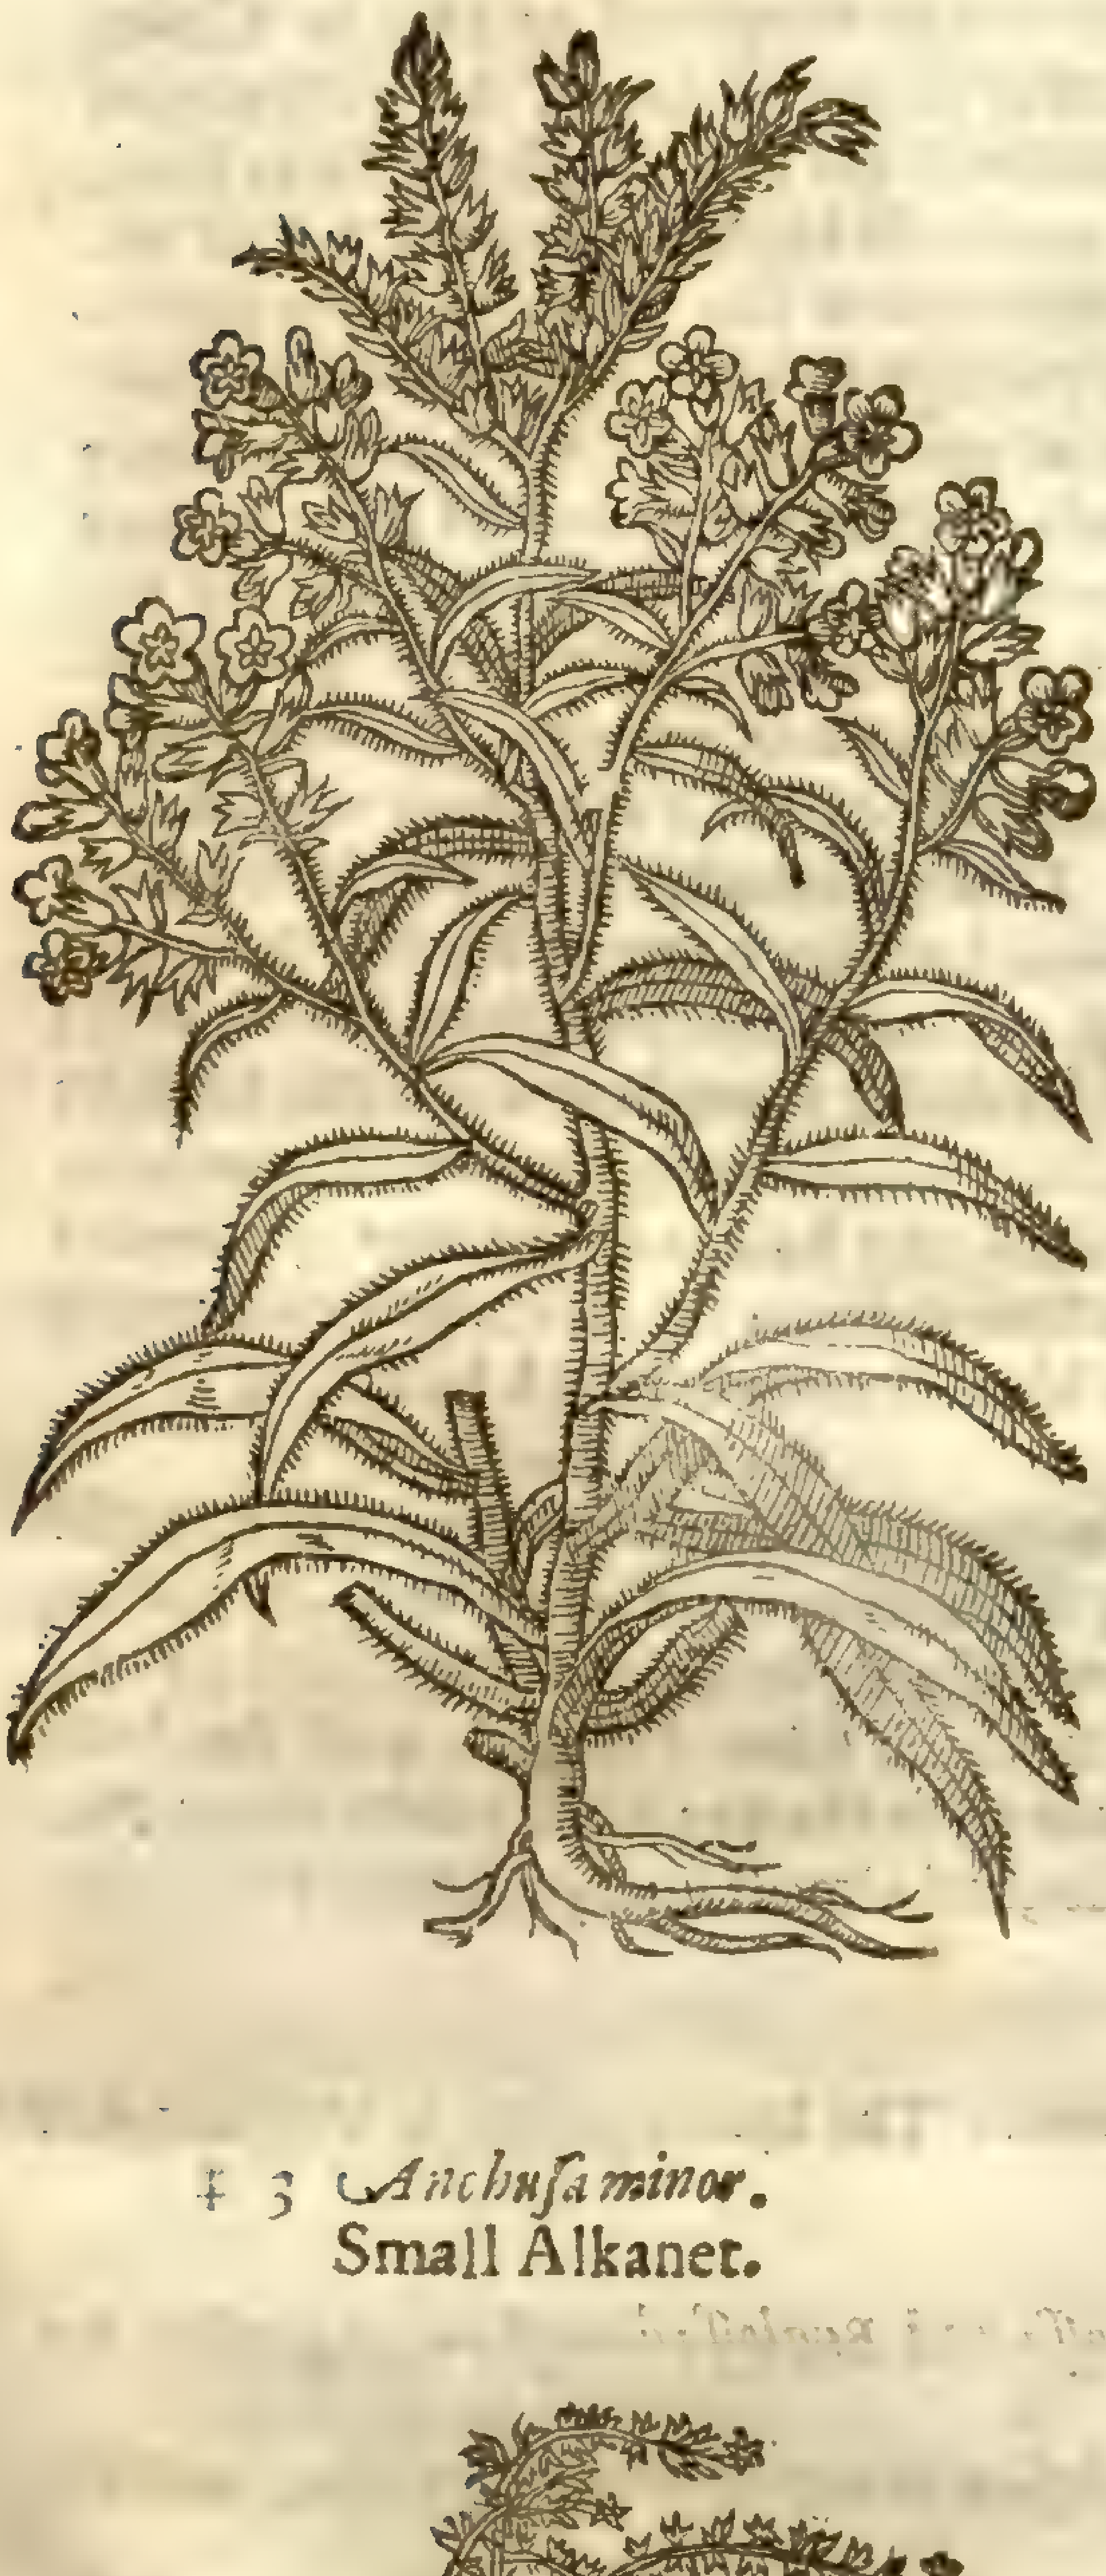
The Phyſitions of later time vſe the leaues, floures, and roots in ſtead of Borage, and put them into all kindes of medicine indifferently, which are of force and vertue to driue away ſorrow & penſiueneſſe of the minde, and to comfort and ſtrengthen the heart. The leaues are of like operation as thoſe of Borage, and are vſed as pot-herbes for the purpoſes aforeſaid, as well Bugloſſe as Lang de beefe, and alſo to keepe the belly ſoluble. C

Chap. 284. *Of Alkanet or wilde Bugloſſe.*

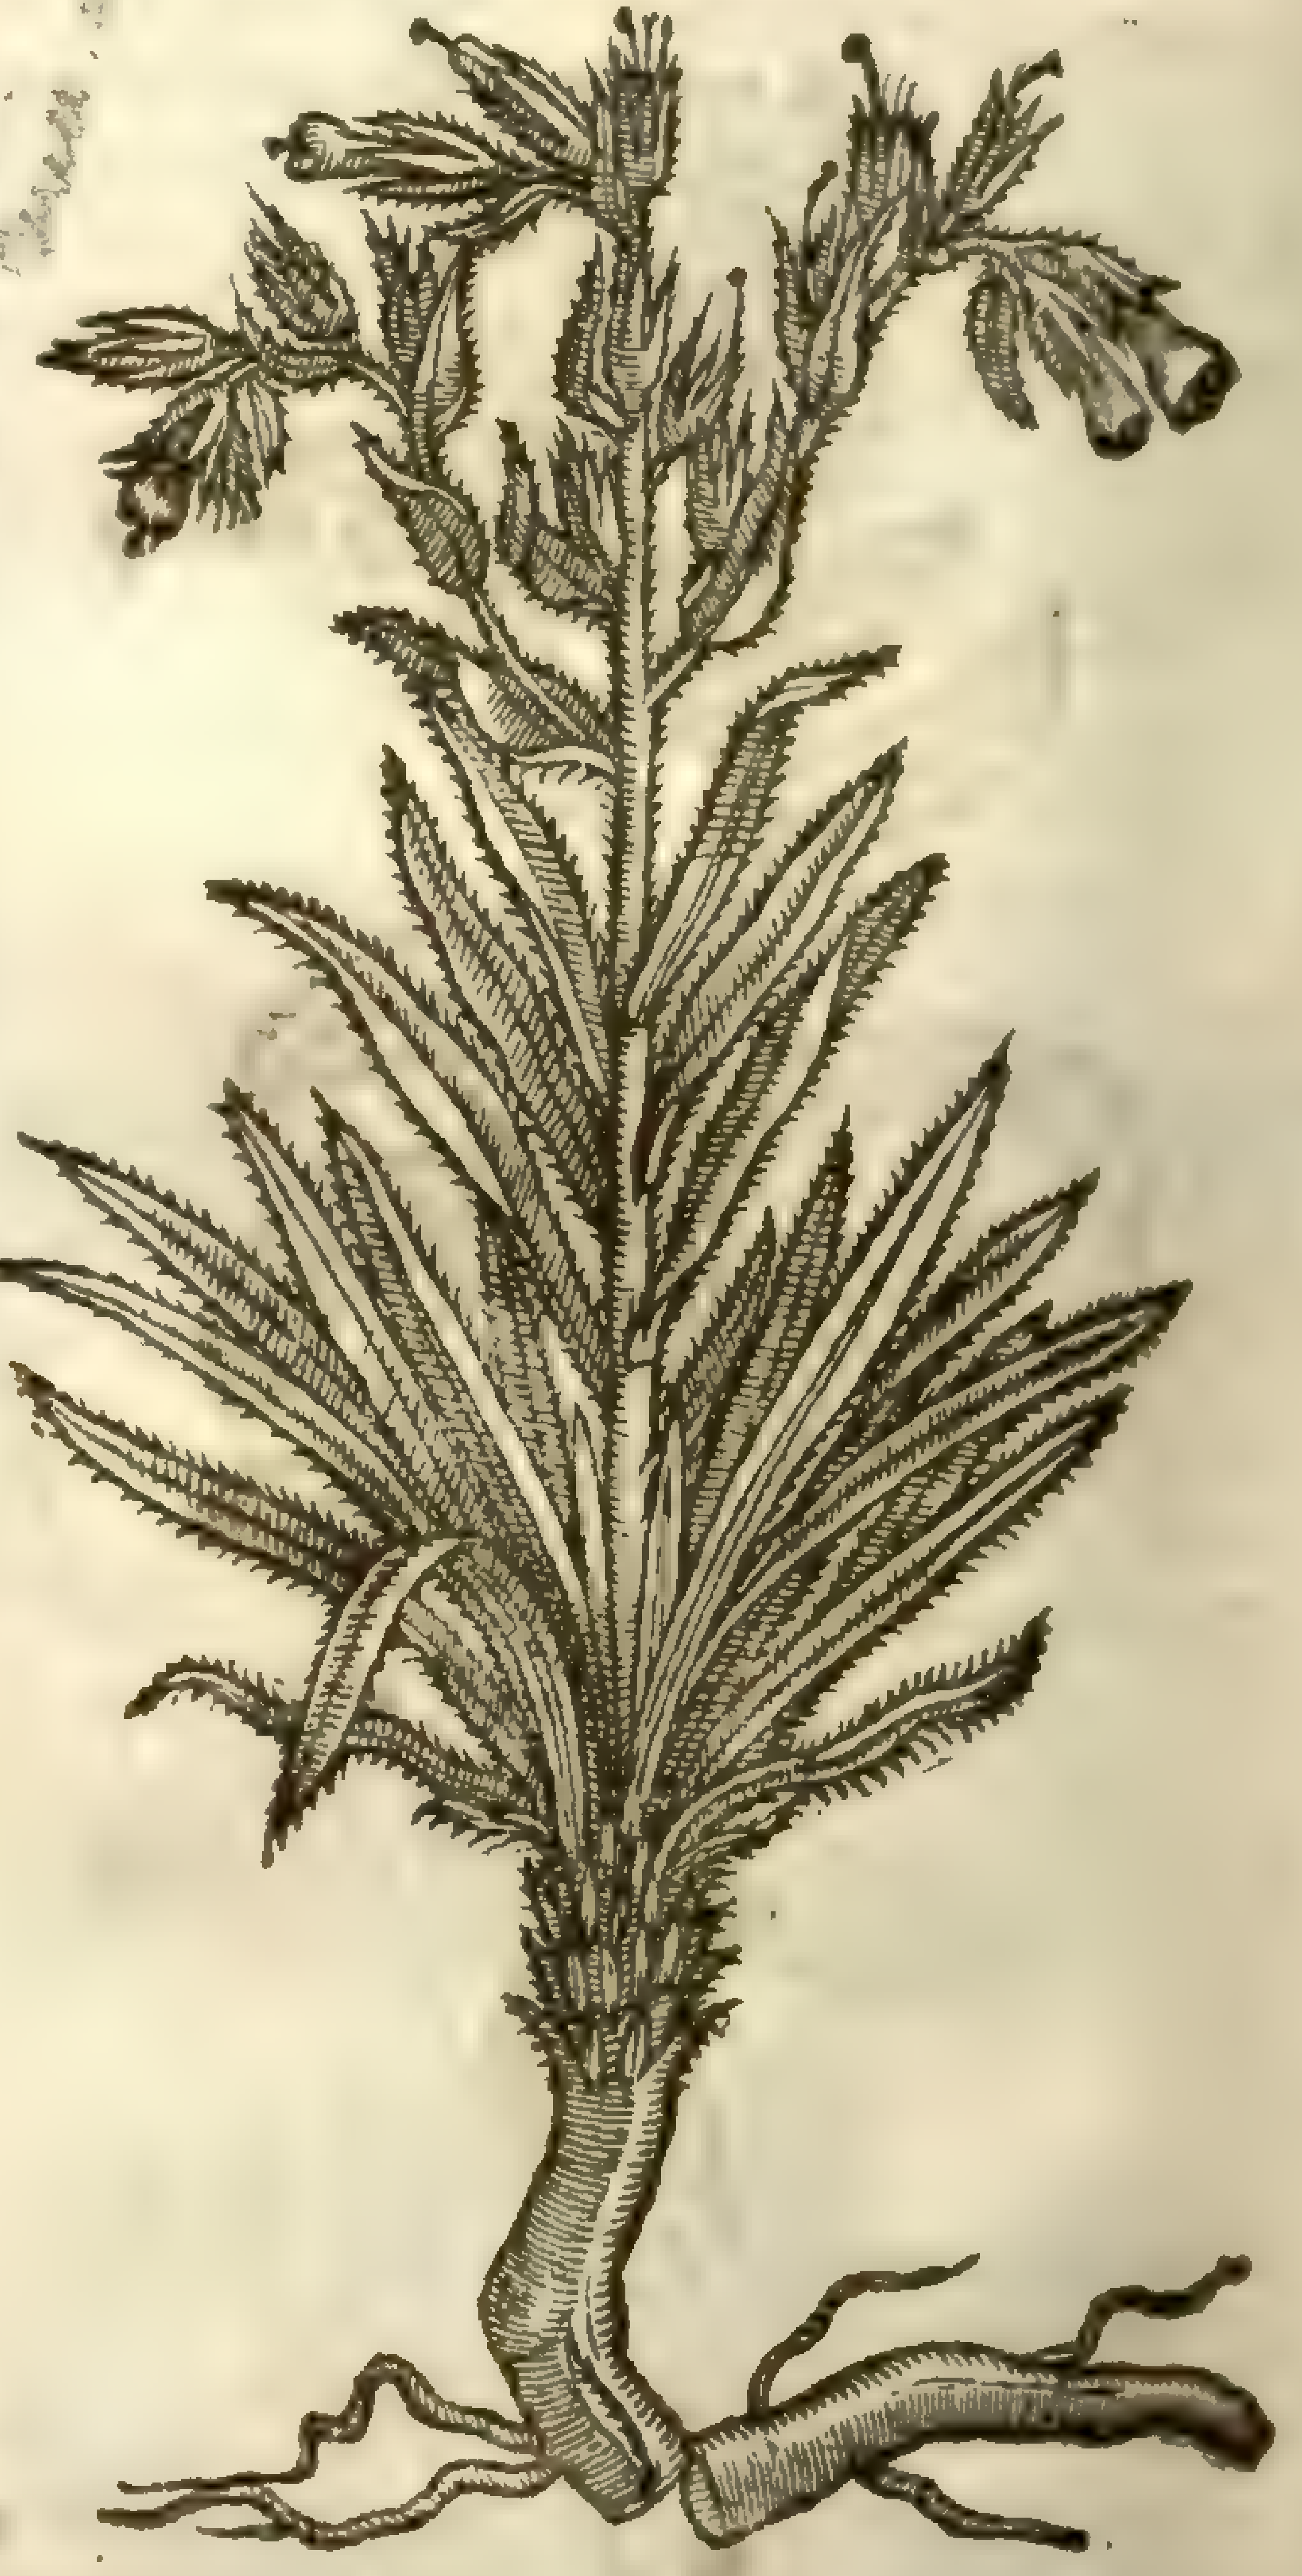
¶ *The Deſcription.*

These herbes comprehended vnder the name of *Anchuſa*, were ſo called of the Greeke word ἐγχεῖν; i. *Illinere ſucco, vel pigmentis*, that is, to colour or paint any thing: Whereupon thoſe

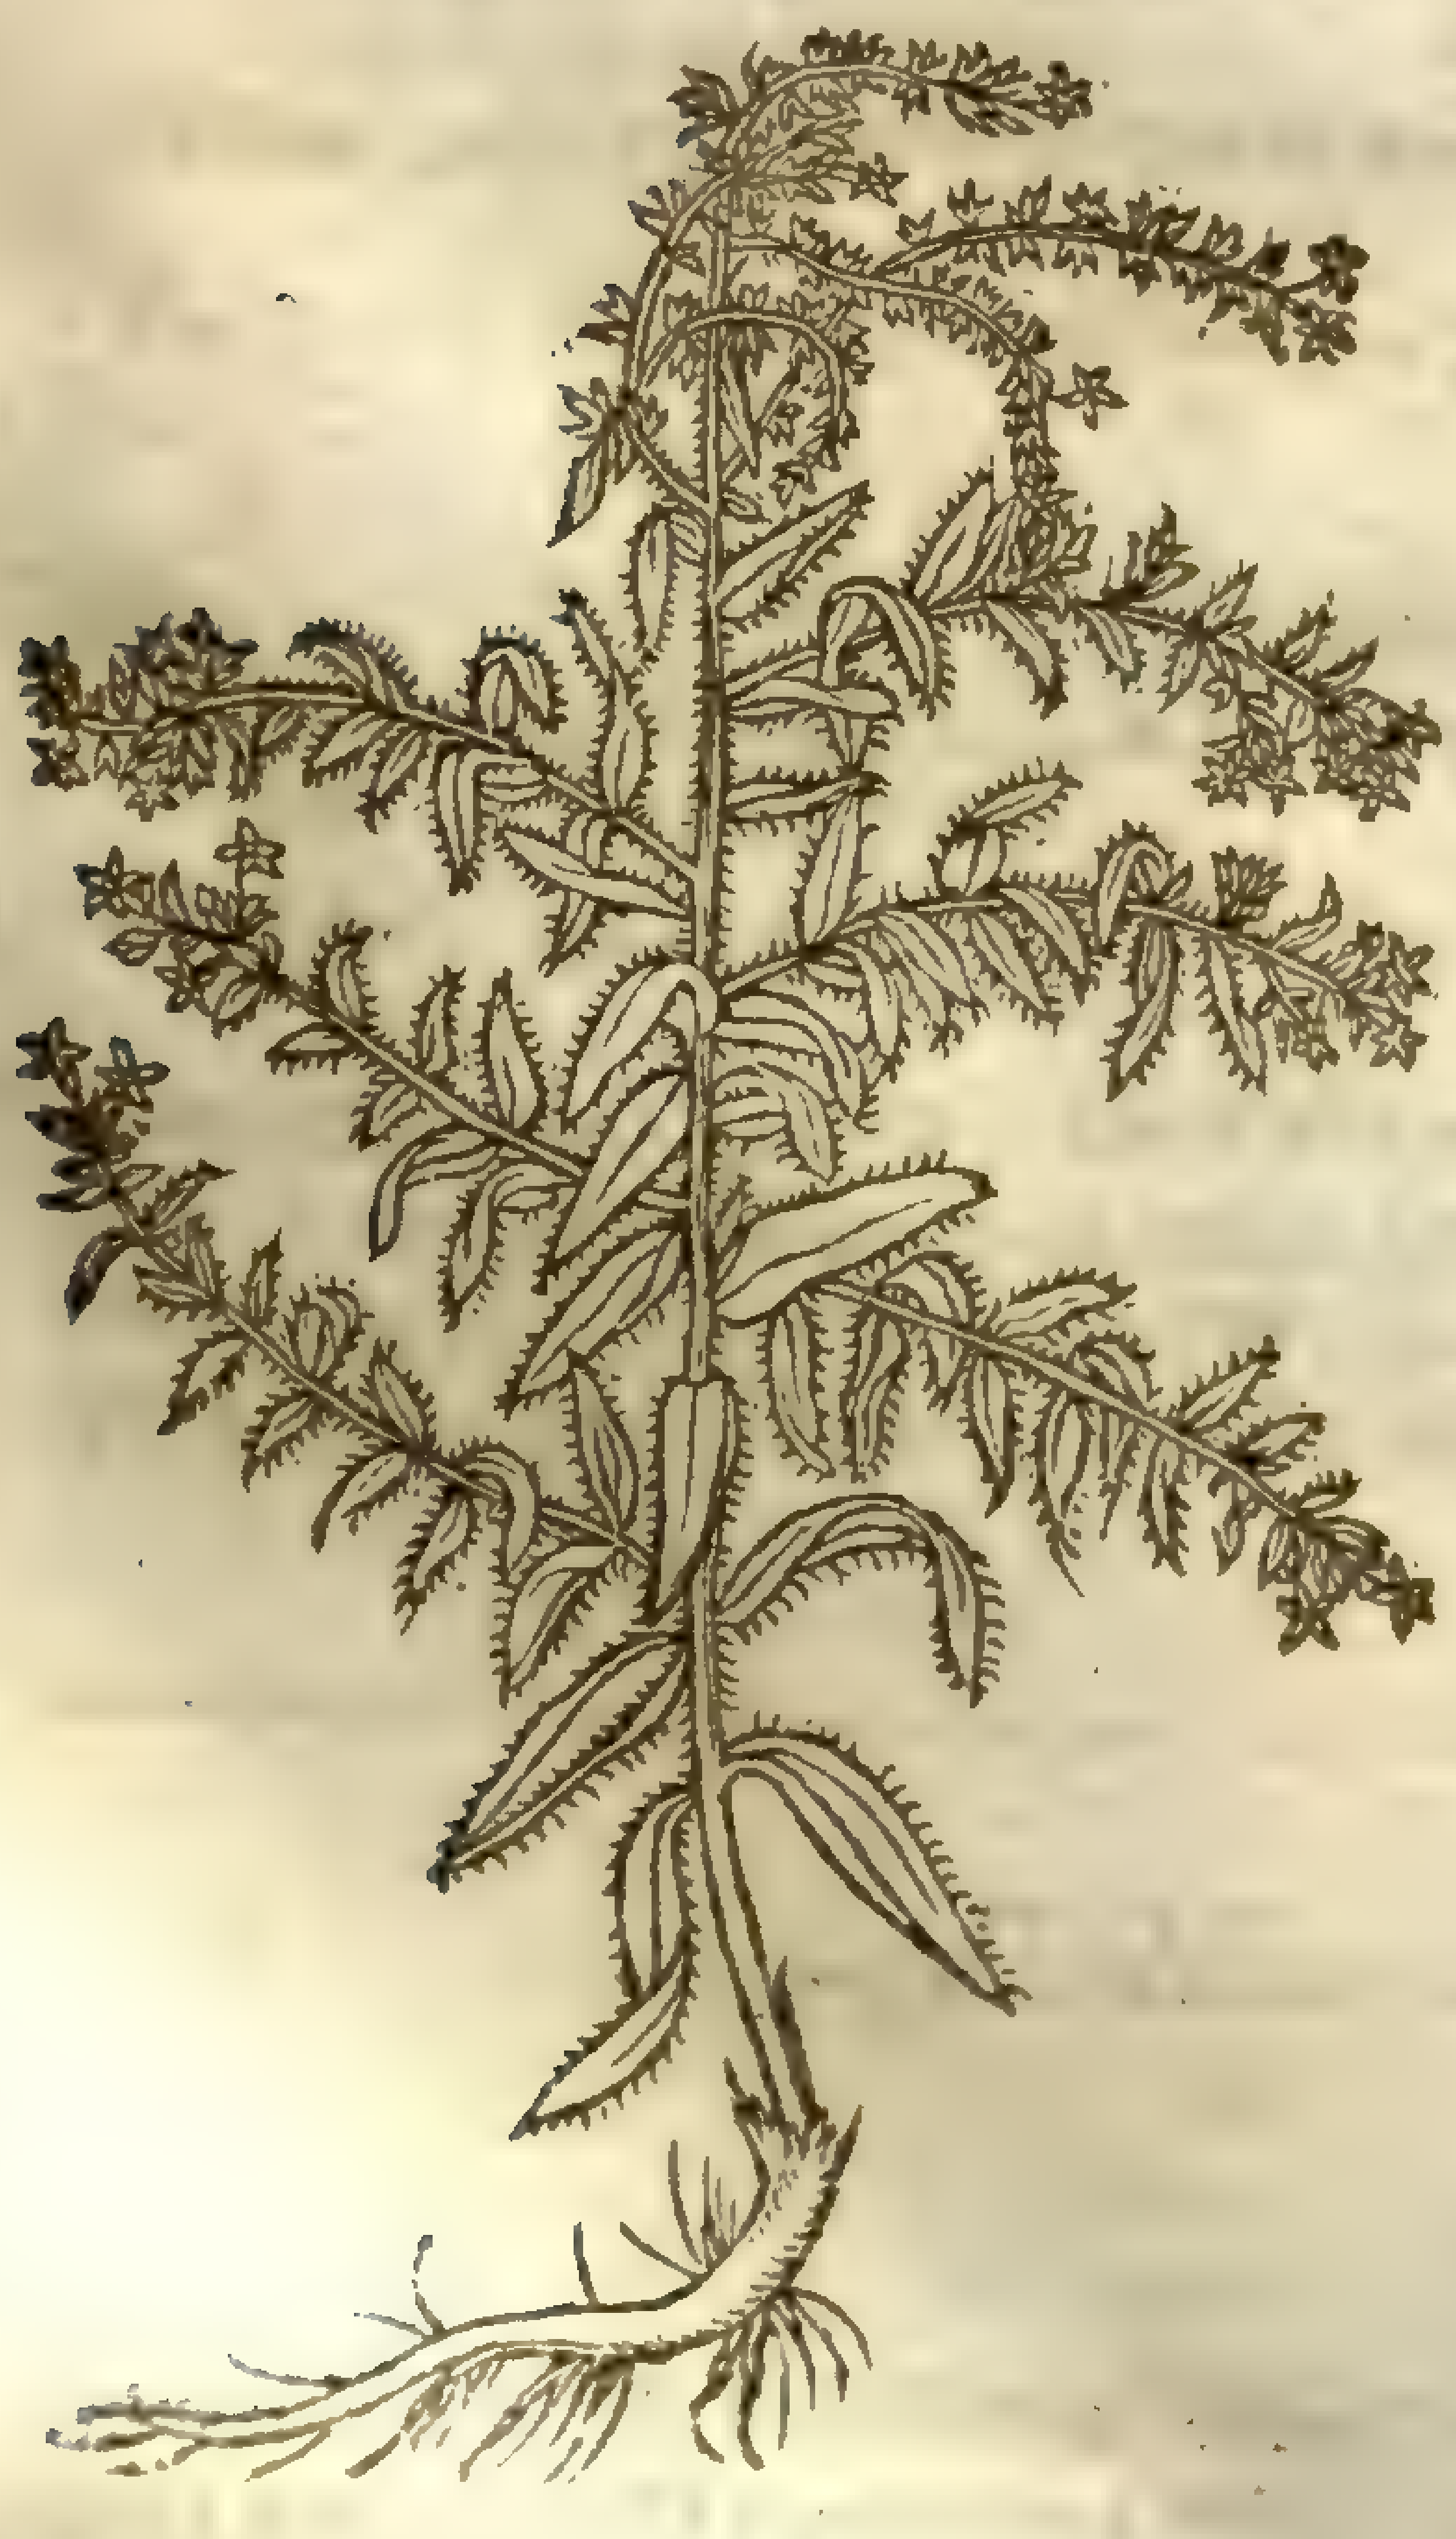
† 1 *Anchuſa Alcibiadion.*
Red Alkanet.



† 2 *Anchuſa lutea.*
Yellow Alkanet.



‡ 3 *Anchuſa minor.*
Small Alkanet.



plants were called *Anchuſa*, of that flouriſhing and bright red colour which is in the root, euen as red as pure and cleare bloud; for that is the onely marke or note whereby to diſtinguiſh theſe herbs from thoſe which be called *Echium*, *Lycopſis*, and *Bugloſſa*, wherto they haue a great reſemblance; I haue therefore expreſſed foure differences of this plant *Anchuſa* or Alkanet, from the other kindes, by the leaues, flours, and bigneſſe.

1 The firſt kinde of Alkanet hath many leaues like *Echium* or ſmall Bugloſſe, couered ouer with a pricky hoarineſſe, hauing commonly but one ſtalke, which is round, rough, and a cubit high. The cups of the floures are of a sky colour tending to purple, not vnlike the floures of *Echium*: the ſeed is ſmall, ſomwhat long, and of a pale colour: the root is a finger thicke, the pith or inner part thereof is of a woody ſubſtance, dying the hands or whatſoeuer toucheth the ſame, of a bloudy colour, or of the colour of Sanders.

2 The ſecond kinde of *Anchuſa* or Alkanet is of greater beauty and eſtimation than the firſt, the branches are leſſe and more buſhy in the top; it hath alſo greater plenty of leaues, and thoſe more woolly or hairy: the ſtalk groweth to the height of two cubits: at the top grow floures of a yellow colour, far different from the other: the root is more ſhining, of an excellent delicat purple colour, and more ful of juice than the firſt.

3 There is a ſmall kinde of Alkanet, whoſe root is greater and more ful of juyce and ſubſtance than the roots of the other kindes: in all other reſpects it is leſſe, for the leaues are narrower, ſmaller, tenderer, and in number more, very greene like vnto Borage, yeelding forth many little tender ſtalkes: the floures are leſſe than of the ſmall Bugloſſe, and red of colour: the ſeed is of an aſh colour, ſomewhat long and ſlender, hauing the taſte of Bugloſſe.

4 There is alſo another kinde of Alkanet, which is as the others before mentioned, a kinde of wilde Bugloſſe, notwithſtanding for diſtinctions ſake I haue ſeparated and ſeuered them. This laſt *Anchuſa* hath narrow leaues, much like vnto our common Summer Sauory. The ſtalkes are two handfuls high, bearing very ſmall floures, and of a blewiſh or skie colour: the root is of a dark browniſh red colour, dying the hands little or nothing at all, and of a wooddy ſubſtance.

¶ *The Place.*

Theſe plants do grow in the fields of Narbone, and about Montpellier, and many other parts of France: I found theſe plants growing in the Iſle of Thanet neere vnto the ſea, betwixt the houſe ſometime belonging to Sir *Henry Criſpe*, and Margate; where I found ſome in their naturall ripenes, yet ſcarcely any that were come to that beautiful color of Alkanet: but ſuch as is ſold for very good in our Apothecaries ſhops I found there in great plenty,

‡ I doubt whether our Author found any of theſe in the place here ſet down, for I haue ſought it but failed of finding; yet if he found any it was only the firſt deſcribed, for I thinke the other three are ſtrangers. ‡

¶ *The Time.*

The Alkanets floure and flouriſh in the Summer moneths: the roots doe yeeld their bloudy juyce in harueſt time, as *Dioſcorides* writeth.

¶ *The Names.*

Alkanet is called in Greeke ἄγχουσα: in Latine alſo *Anchuſa*: of diuers, *Fucus herba*, and *Onocleia*, *Bugloſſa Hiſpanica*, or Spaniſh Bugloſſe: in Spaniſh, *Soagem*: in French, *Orchanet*: and in Engliſh likewiſe, Orchanet and Alkanet.

¶ *The Temperature.*

The roots of Alkanet are cold and dry, as *Galen* writeth, and binding, and becauſe it is bitter it clenſeth away cholericke humours: the leaues be not ſo forceable, yet doe they likewiſe binde and drie.

¶ *The Vertues.*

Dioſcorides ſaith, that the root being made vp in a cerote, or ſearecloth with oyle, is very good for old vlcers; that with parched barley meale it is good for the leprey, and for tetters and ring-worms. **A**

That being vſed as a peſſarie it bringeth forth the dead birth. **B**

The decoction being inwardly taken with Mead or honied water, cureth the yellow jaundiſe, diſeaſes of the kidnies, the ſpleene and agues. **C**

It is vſed in ointments for womens paintings: and the leaues drunke in wine is good againſt the laske. **D**

Diuers of the later Phyſitions do boile with the root of Alkanet and wine, ſweet butter, ſuch as hath in it no ſalt at all, vntill ſuch time as it becommeth red, which they call red butter, and giue it not only to thoſe that haue falne from ſome high place, but alſo report it to be good to driue forth the meaſels and ſmall pox, if it be drunke in the beginning with hot beere. **E**

The roots of theſe are vſed to color ſirrups, waters, gellies, & ſuch like infections as Turnſole is. **F**

Iohn of *Ardern* hath ſet down a compoſition called *Sanguis Veneris*, which is moſt ſingular in deep punctures or wounds made with thruſts, as follows: take of oile oliue a pint, the root of Alkanet two ounces, earth worms purged, in number twenty, boile them together & keep it to the vſe aforeſaid. ‡ **G**

The Gentlewomen of France do paint their faces with theſe roots, as it is ſaid.

‡ ‡ The two figures that were formerly here were both of the ordinary Bugloſſe, whereof the firſt might well enough ſerue, but the 2. was much different from that it ſhould haue been.

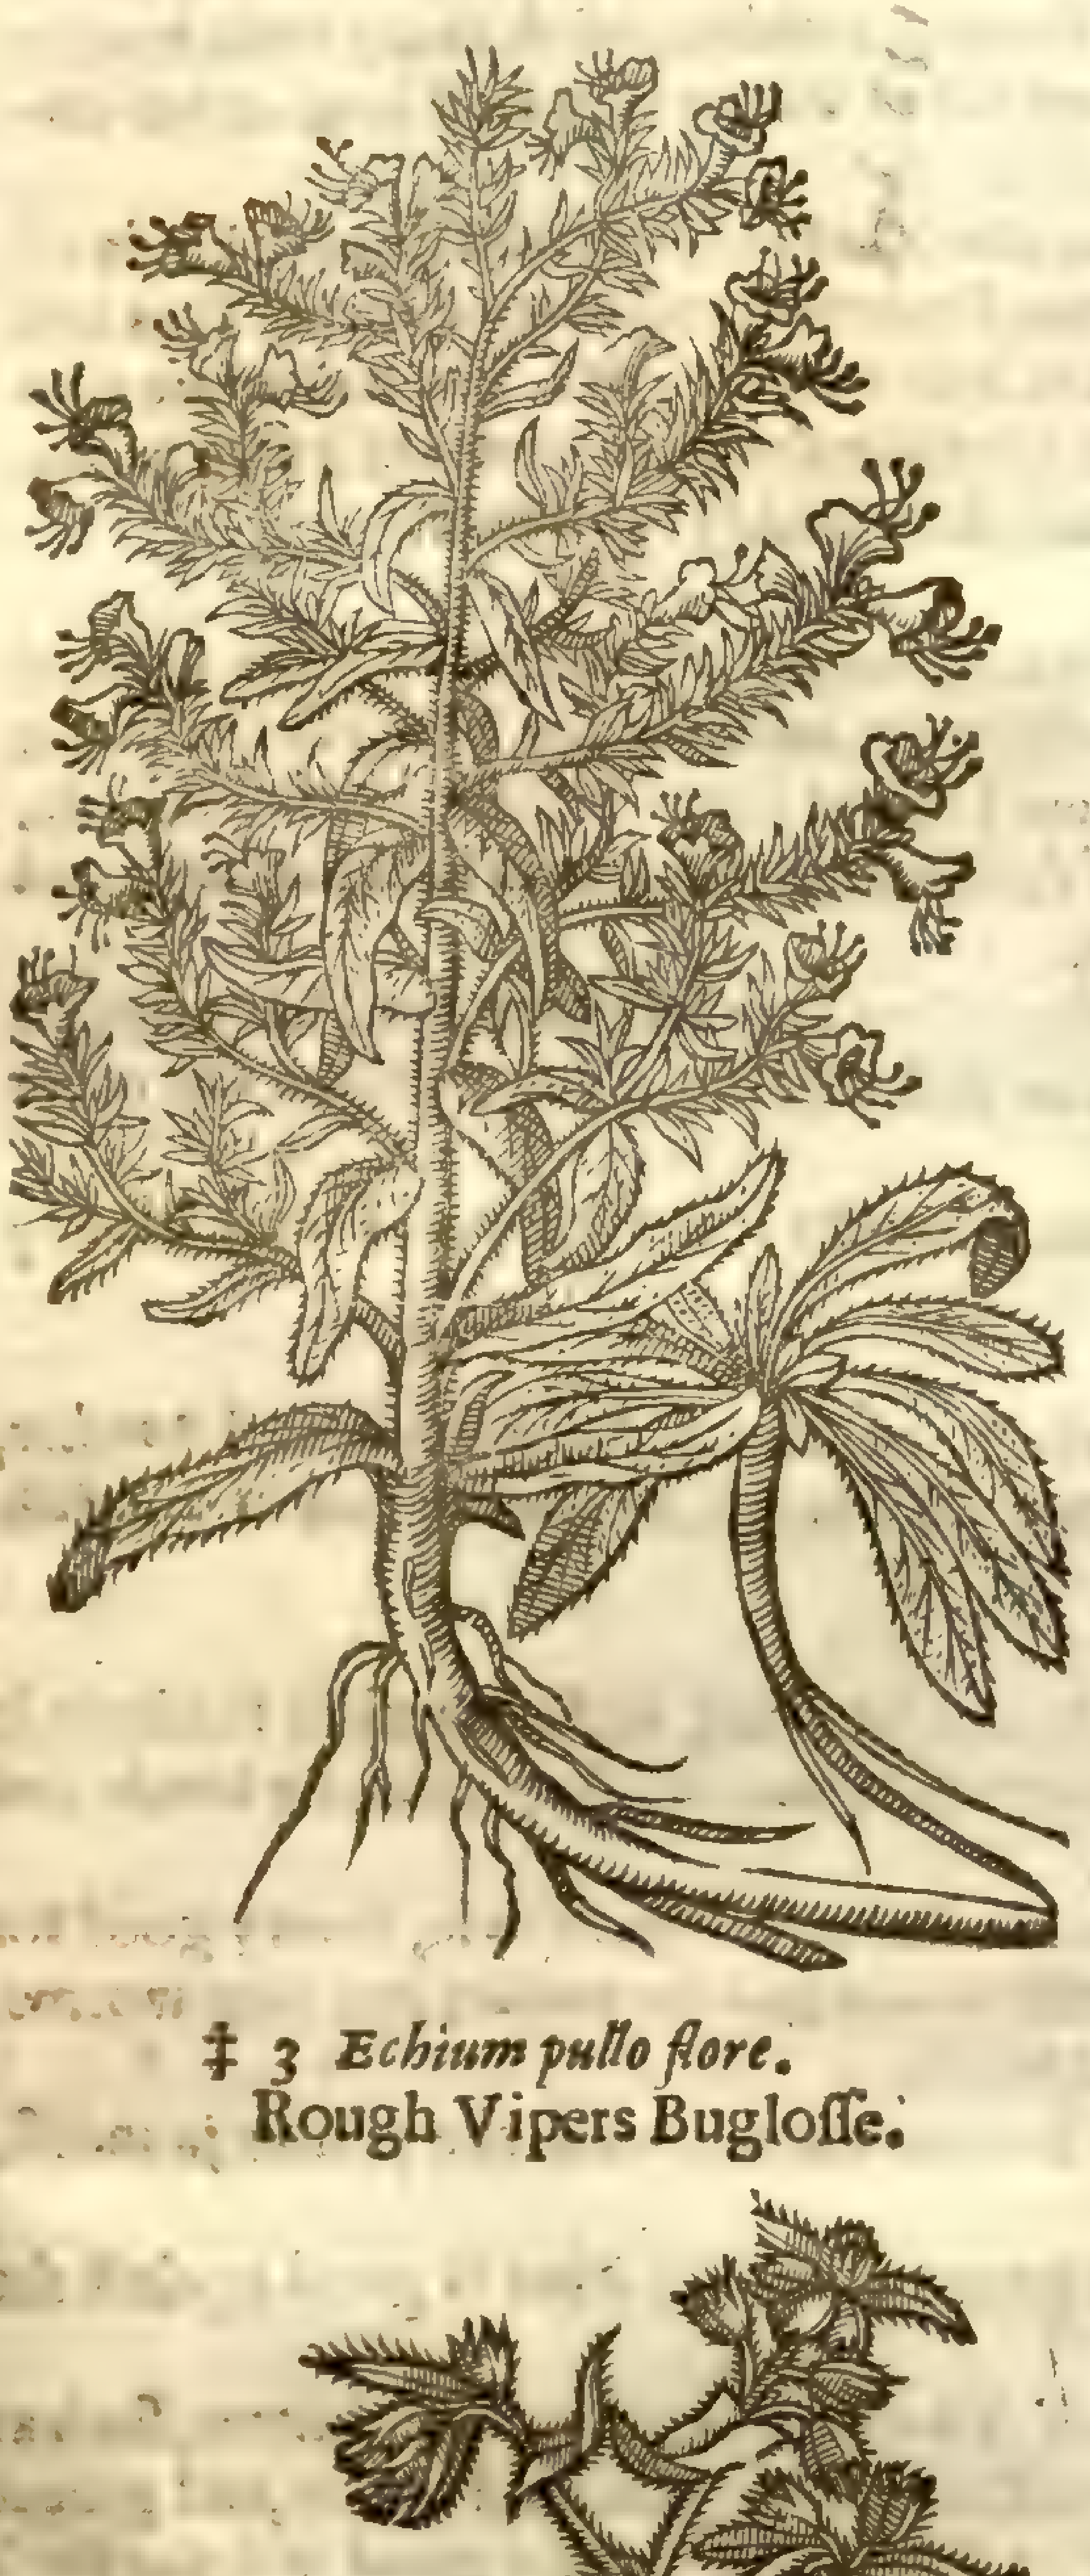
CHAP. 285. *Of Wall and Vipers Bugloſſe.*

¶ *The Deſcription.*

1 LYcopſis *Anglica*, or wilde Bugloſſe, ſo called for that it doth not grow ſo commonly elſewhere, hath rough and hairy leaues, ſomewhat leſſer than the garden Bugloſſe: the floures grow for the moſt part vpon the ſide of the ſlender ſtalke, in faſhion hollow like a little bell, whereof ſome be blew, and others of a purple colour.

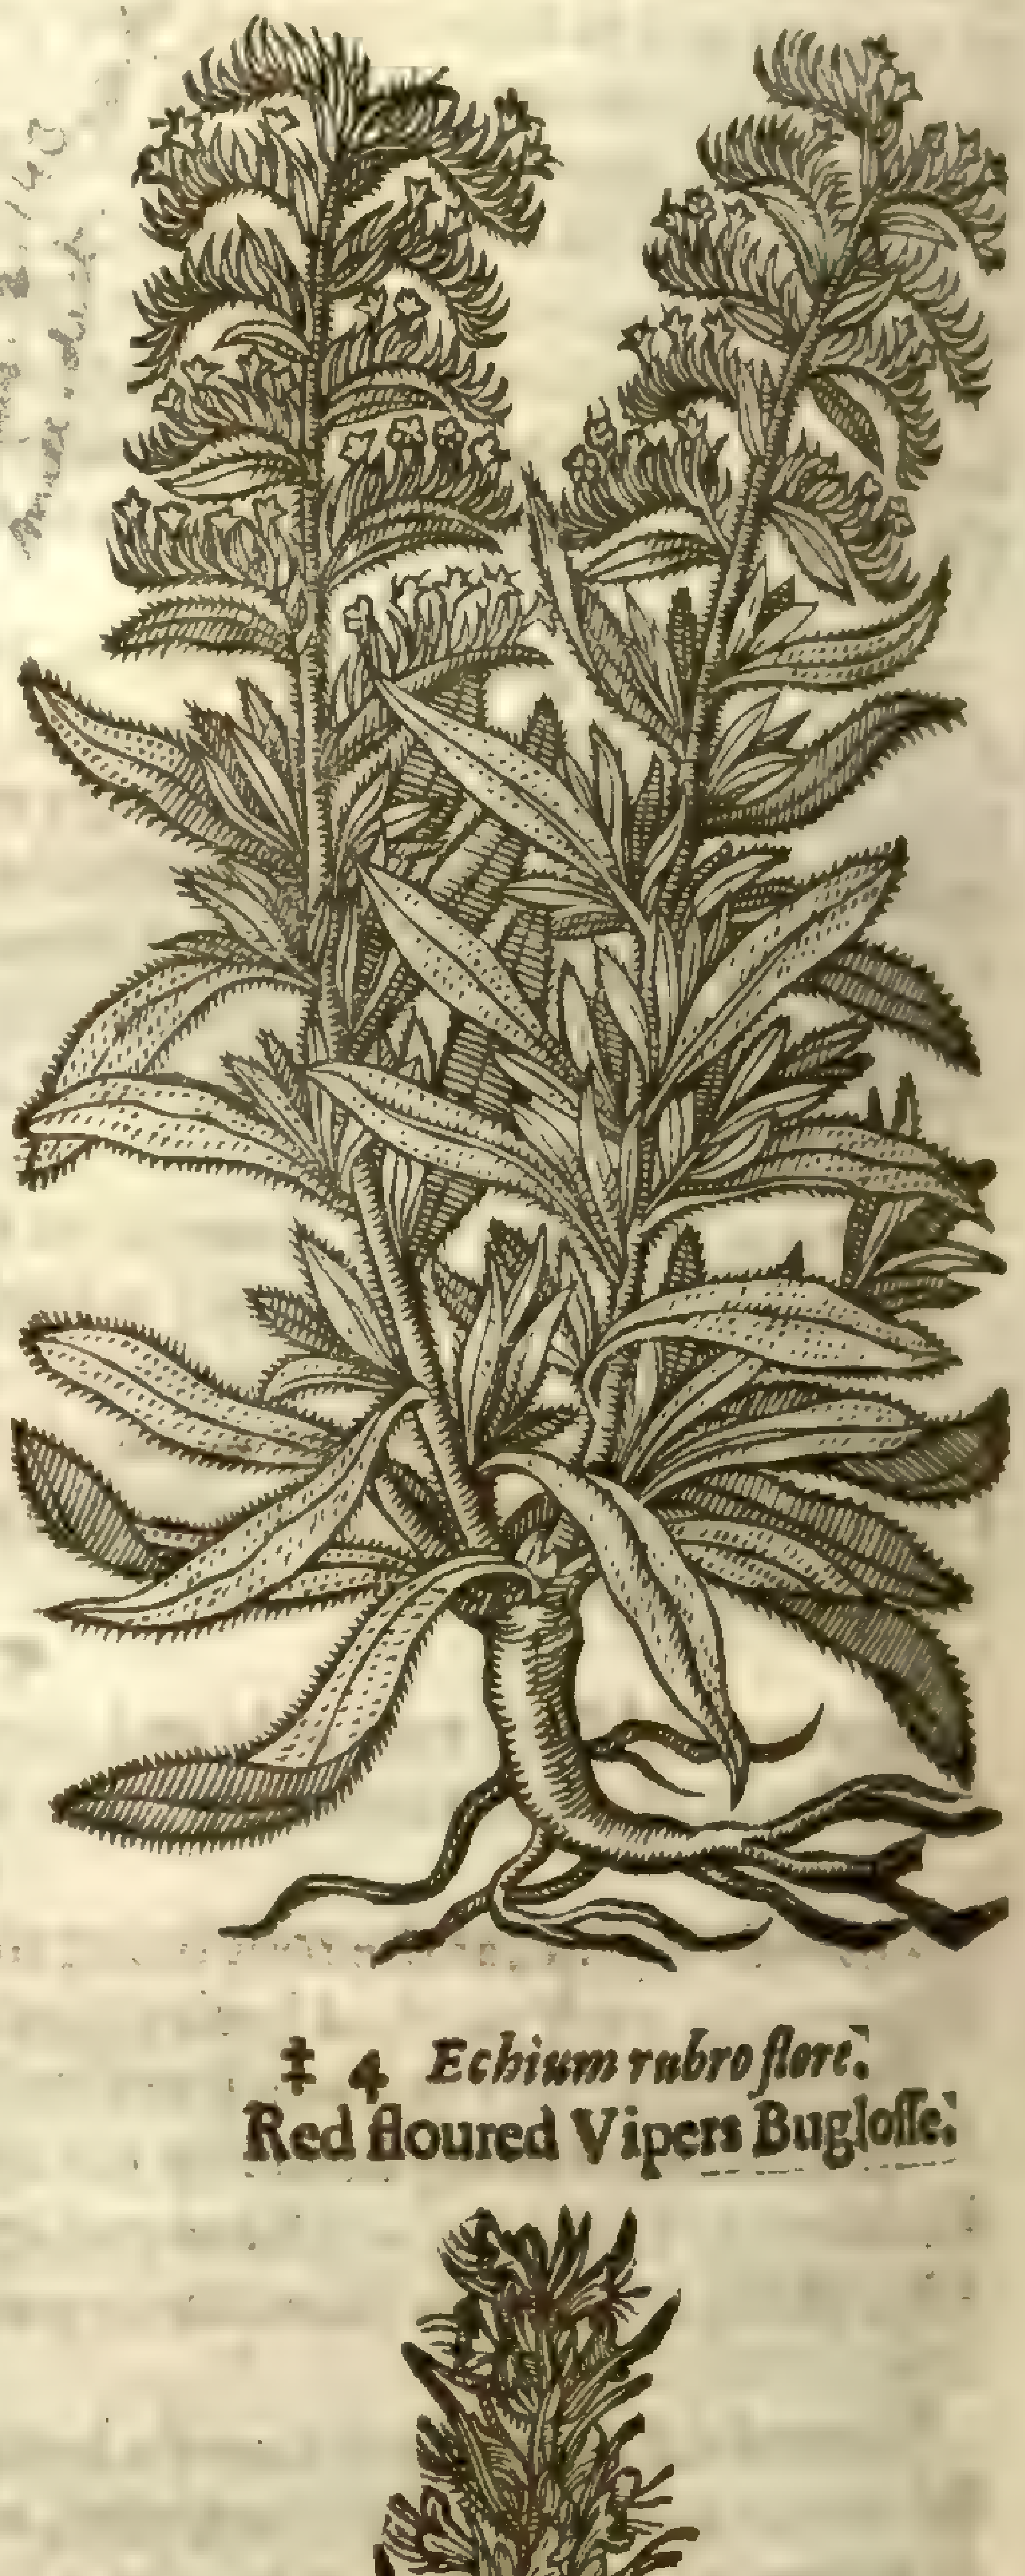
2 There is another kinde of *Echium* that hath rough and hairy leaues likewiſe, much like vnto the former; the ſtalke is rough, charged full of little branches, which are laden on euery ſide with diuers ſmall narrow leaues, ſharp pointed, and of a brown colour: among which leaues grow floures, each floure being compoſed of one leafe diuided into fiue parts at the top, leſſe, and not ſo wide open as that of *Lycopſis*; yet of a ſad blew or purple colour at the firſt, but when they are open they ſhew to be of an azure colour, long and hollow, hauing certaine ſmal blew threds in the middle: the ſeed is ſmall and black, faſhioned like the head of a ſnake or viper: the root is long, and red without.

† 1 *Lycopſis Anglica.*
Wall Bugloſſe.



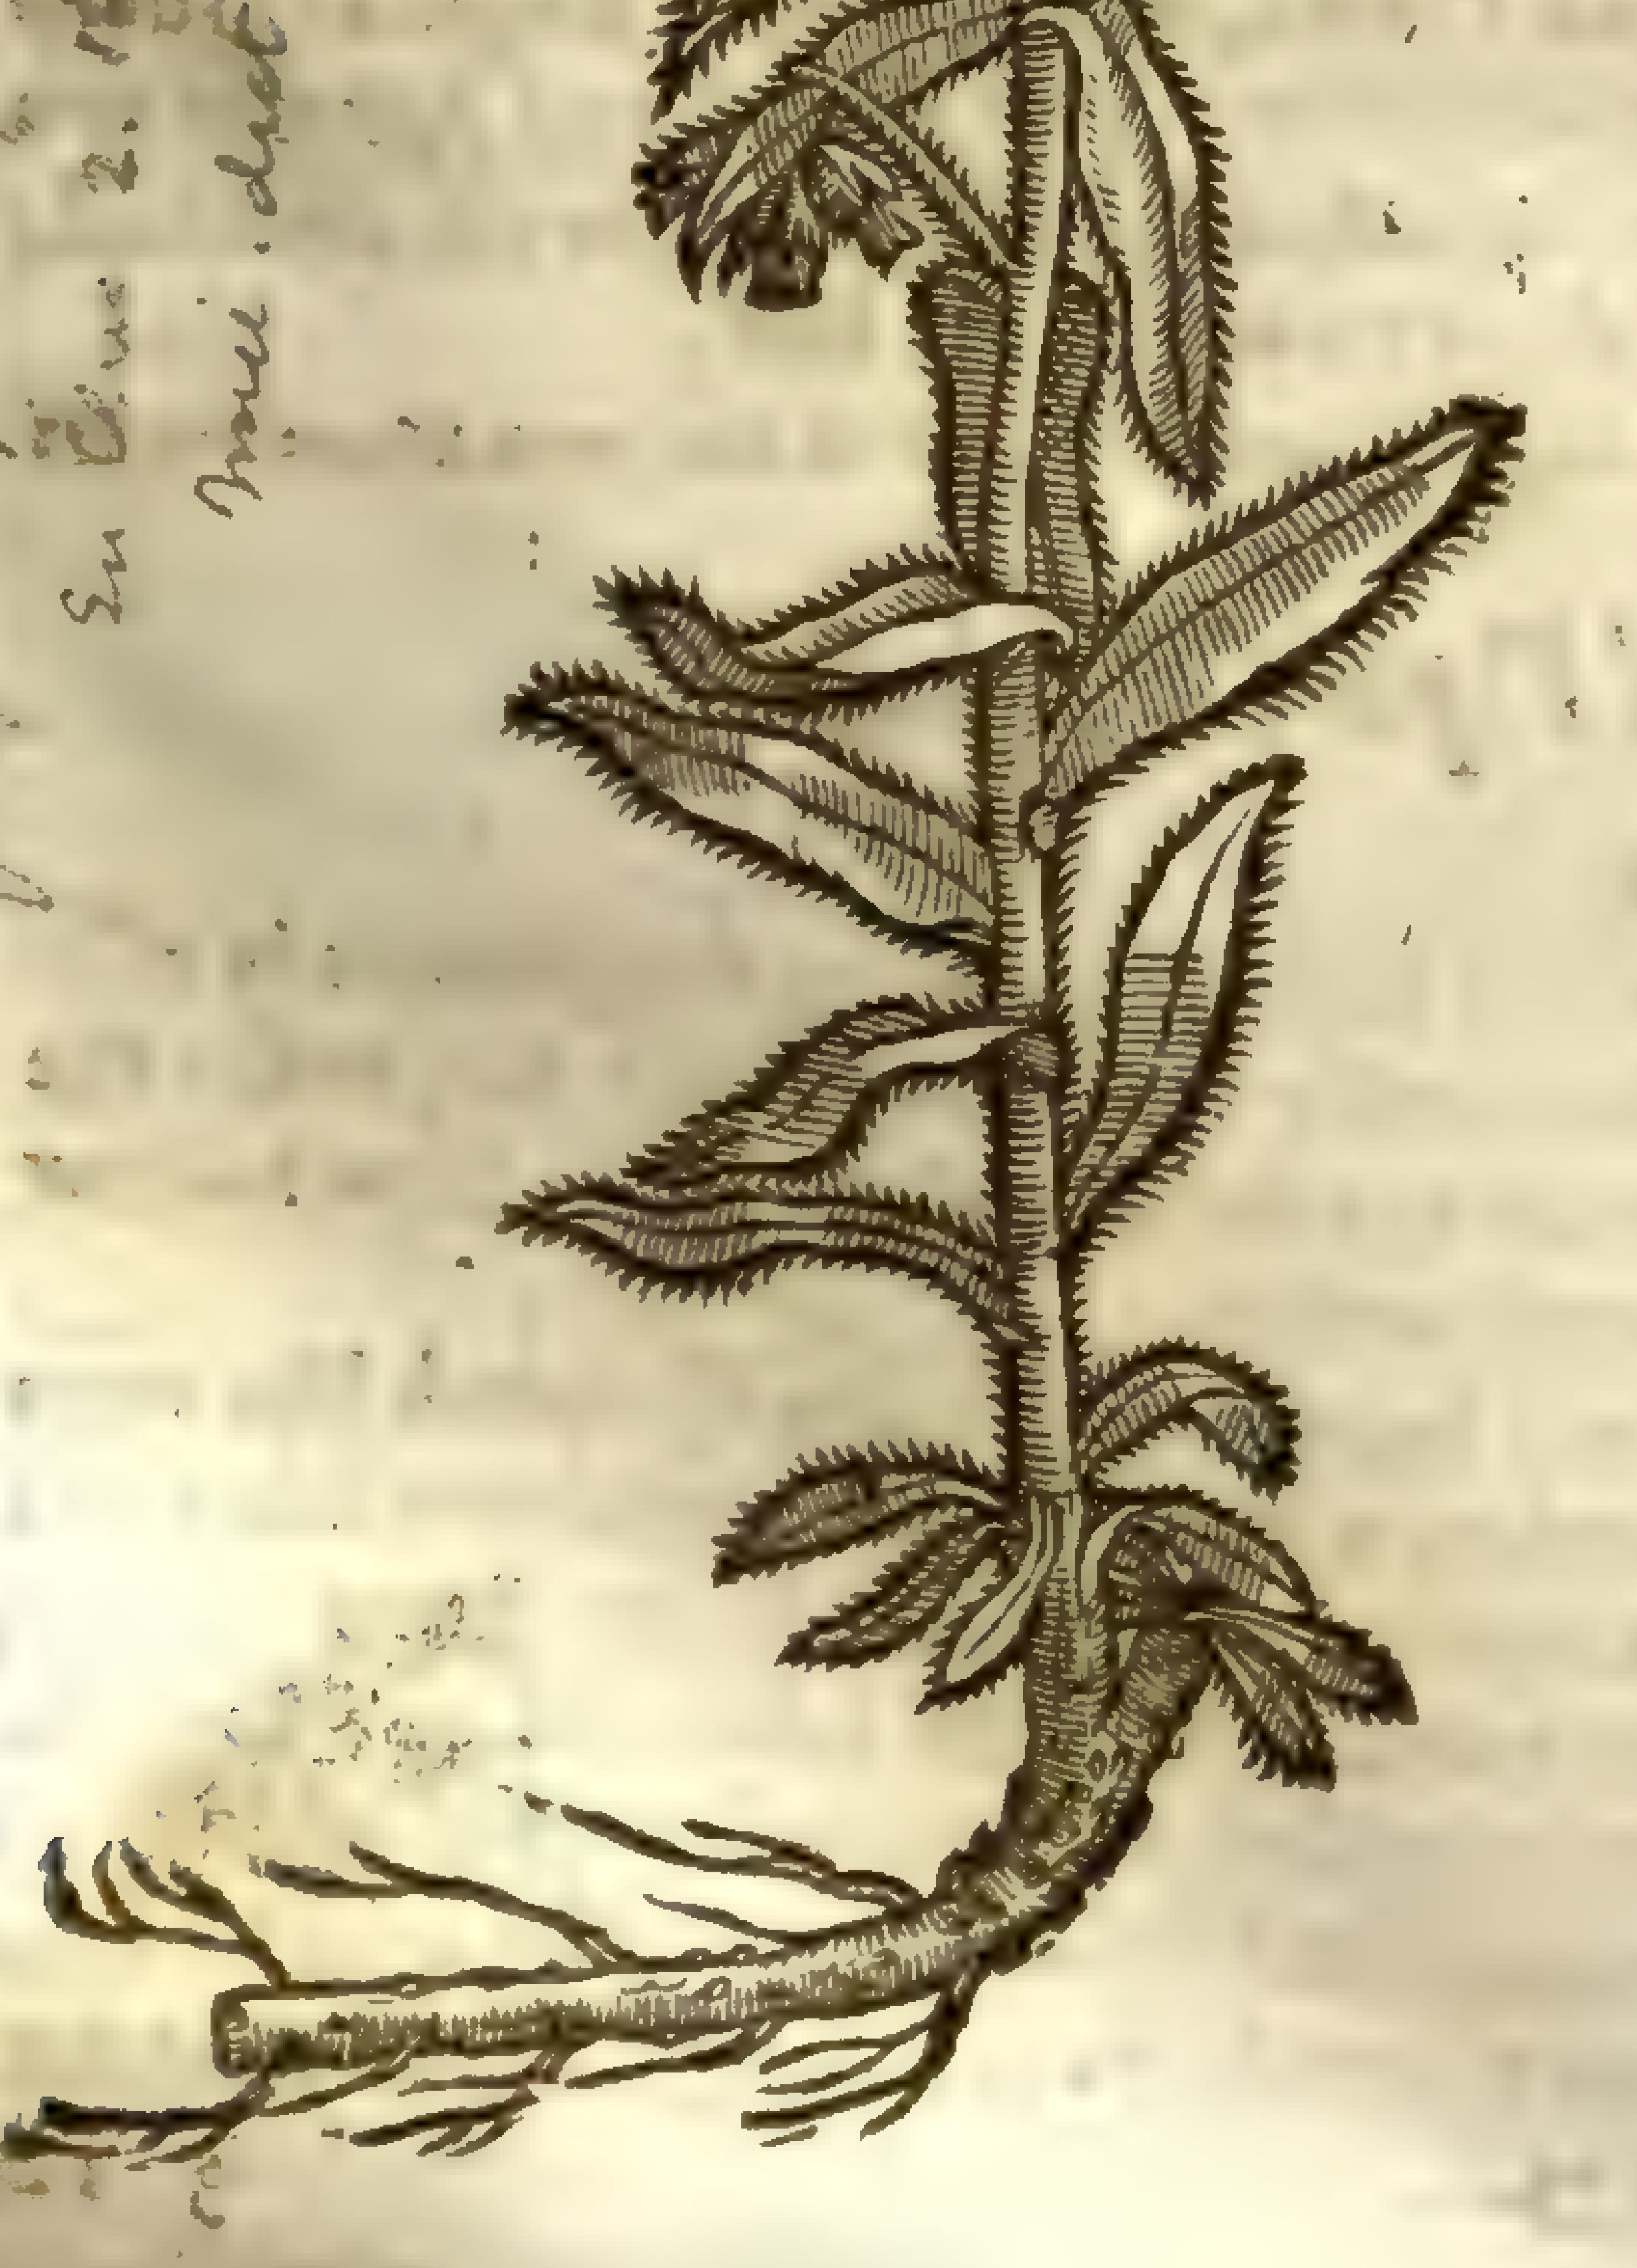
Echium Italicum, & vulgare, [illegible] 1. 168 [illegible]

‡ 2 *Echium vulgare.*
Vipers Bugloſſe.



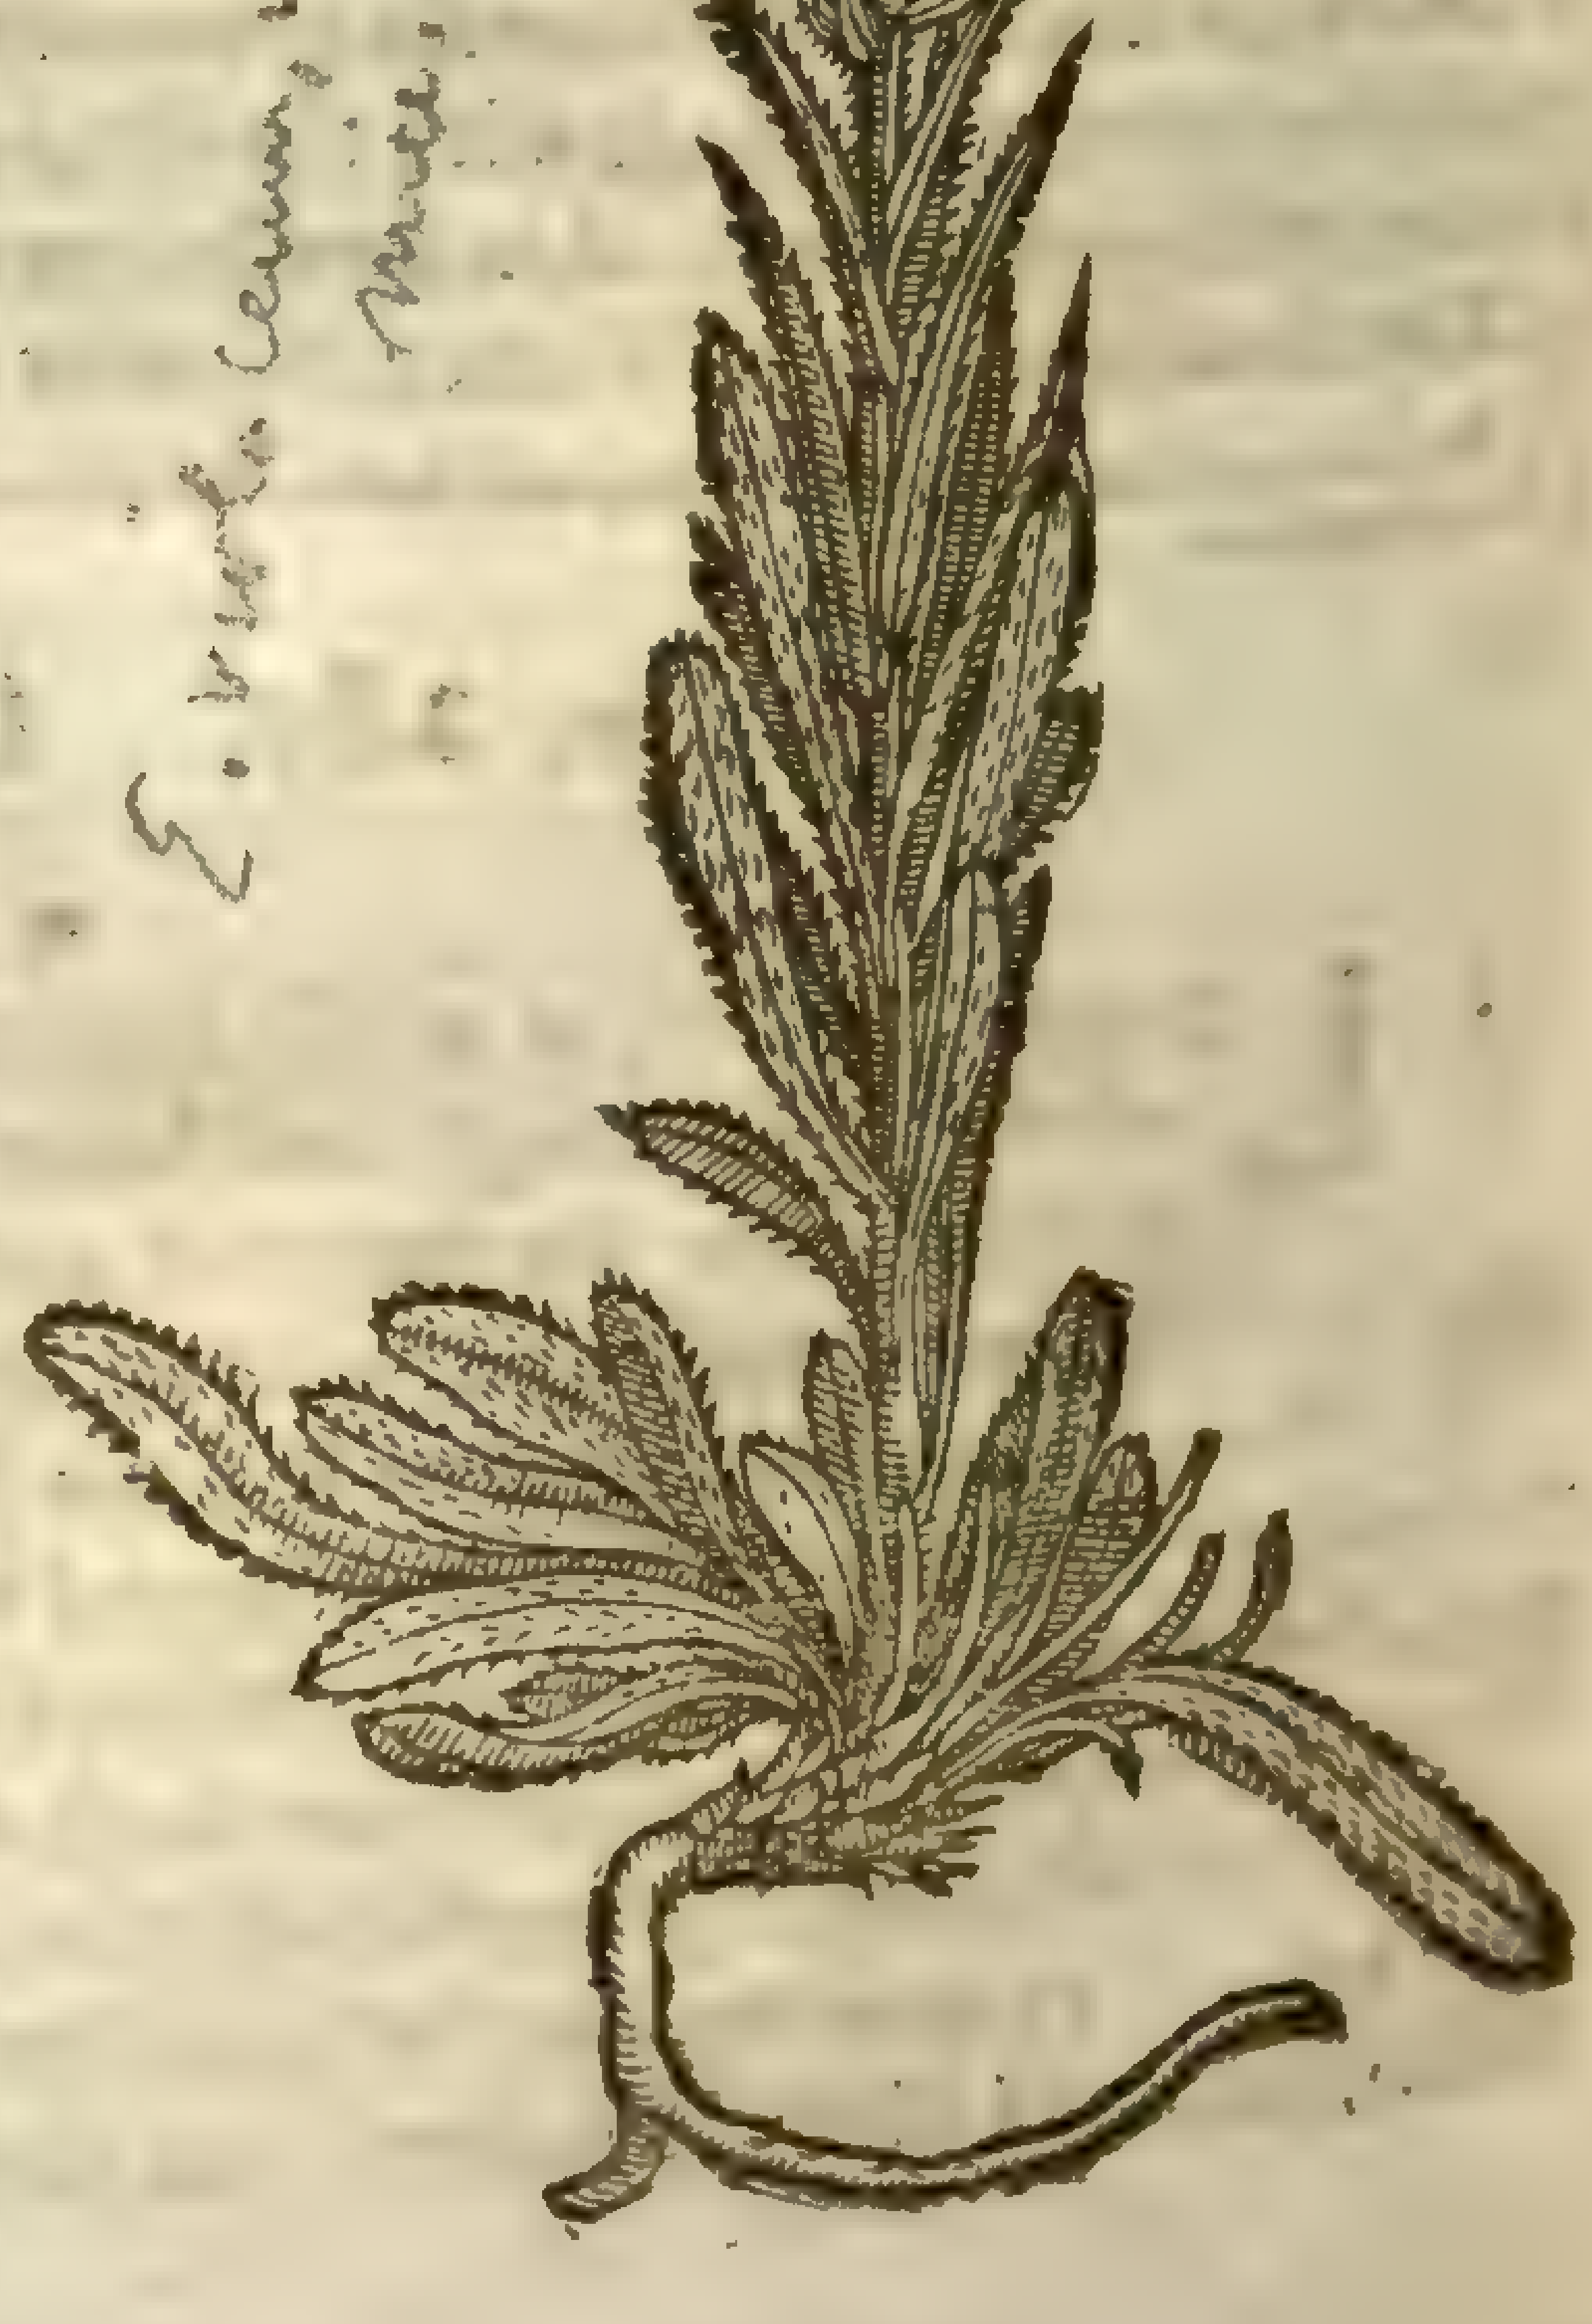
E. vulgare [illegible] 2. 143 [illegible] dict.

‡ 3 *Echium pullo flore.*
Rough Vipers Bugloſſe.



Lycopsis pulla [illegible] 2. 189 mil. dict

‡ 4 *Echium rubro flore.*
Red floured Vipers Bugloſſe.



E. violaceum [illegible] dict.

‡ 3 This hath a creſted very rough and hairy ſtalke ſome foot high; the leaues are like thoſe of Vipers Bugloſſe, and couered ouer with a ſoft downineſſe, and grow diſorderly vpon the ſtalke, which toward the top is parted into ſundry branches, which are diuided into diuers foot-ſtalkes carrying ſmall hollow floures diuided by fiue little gaſhes at their tops; and they are of a darke purple colour, and contained in rough cups lying hid vnder the leaues. The ſeed, as in other plants of this kinde, reſembles a Vipers head: the root is long, as thicke as ones little finger, of a dusky color on the outſide, and it liues diuers yeares. This floures in May, and growes in the dry medowes and hilly grounds of Auſtria. *Cluſius* calls it *Echium pullo flore.*

4 This other being alſo of *Cluſius* his deſcription hath long and narrow leaues like thoſe of the common Vipers Bugloſſe, yet a little broader: the ſtalkes riſe vp ſome cubit high, firme, creſted, and hairy; vpon which grow abundance of leaues, ſhorter and narrower than thoſe below, and amongſt theſe towards the top grow many floures vpon ſhort foot-ſtalkes, which twine themſelues round like a Scorpions taile: theſe floures are of an elegant red colour, and in ſhape ſomewhat like thoſe of the common kinde; and ſuch alſo is the ſeed, but ſomewhat leſſe: the root is laſting, long alſo, hard, wooddy, and blacke on the outſide, and it ſometimes ſends vp many, but moſt vſually but one ſtalke. It floures in May, and was found in Hungary by *Cluſius*, who firſt ſet it forth by the name of *Echium rubro flore.* ‡

¶ *The Place.*

Lycopſis groweth vpon ſtone walls, and vpon dry barren ſtony grounds.

Echium groweth where Alkanet doth grow, in great abundance.

¶ *The Time.*

They flouriſh when the other kindes of Bugloſſes do floure.

¶ *The Names.*

It is called in Greeke, *Echium*, and Ἀλκιβιάδιον, of *Alcibiades* the finder of the vertues thereof: of ſome it is thought to be *Anchuſa ſpecies*, or a kinde of Alkanet: in high Dutch, wilde **Ochſenzungen**: in Spaniſh, *Yerua de la Biuora*, or *Chupamel*: in Italian, *Bugloſſa ſaluatica*: in French, *Bugloſſe ſauuage*: in Engliſh, Vipers Bugloſſe, Snakes Bugloſſe; and of ſome, Vipers herbe, and wilde Bugloſſe the leſſer.

¶ *The Temperature.*

Theſe herbes are cold and dry of complexion.

¶ *The Vertues.*

A The root drunke with wine is good for thoſe that be bitten with Serpents, and it keepeth ſuch from being ſtung as haue drunk of it before: the leaues and ſeeds do the ſame, as *Dioſcorides* writes. *Nicander* in his booke of Treacles makes Vipers Bugloſſe to be one of thoſe plants which cure the biting of Serpents, and eſpecially of the Viper, and that driue ſerpents away.

B If it be drunke in wine or otherwiſe it cauſeth plenty of milke in womens breſts.

C The herbe chewed, and the juyce ſwallowed downe, is a moſt ſingular remedy againſt poyſon and the biting of any venomous beaſt; and the root ſo chewed, and laid vpon the ſore, workes the ſame effect.

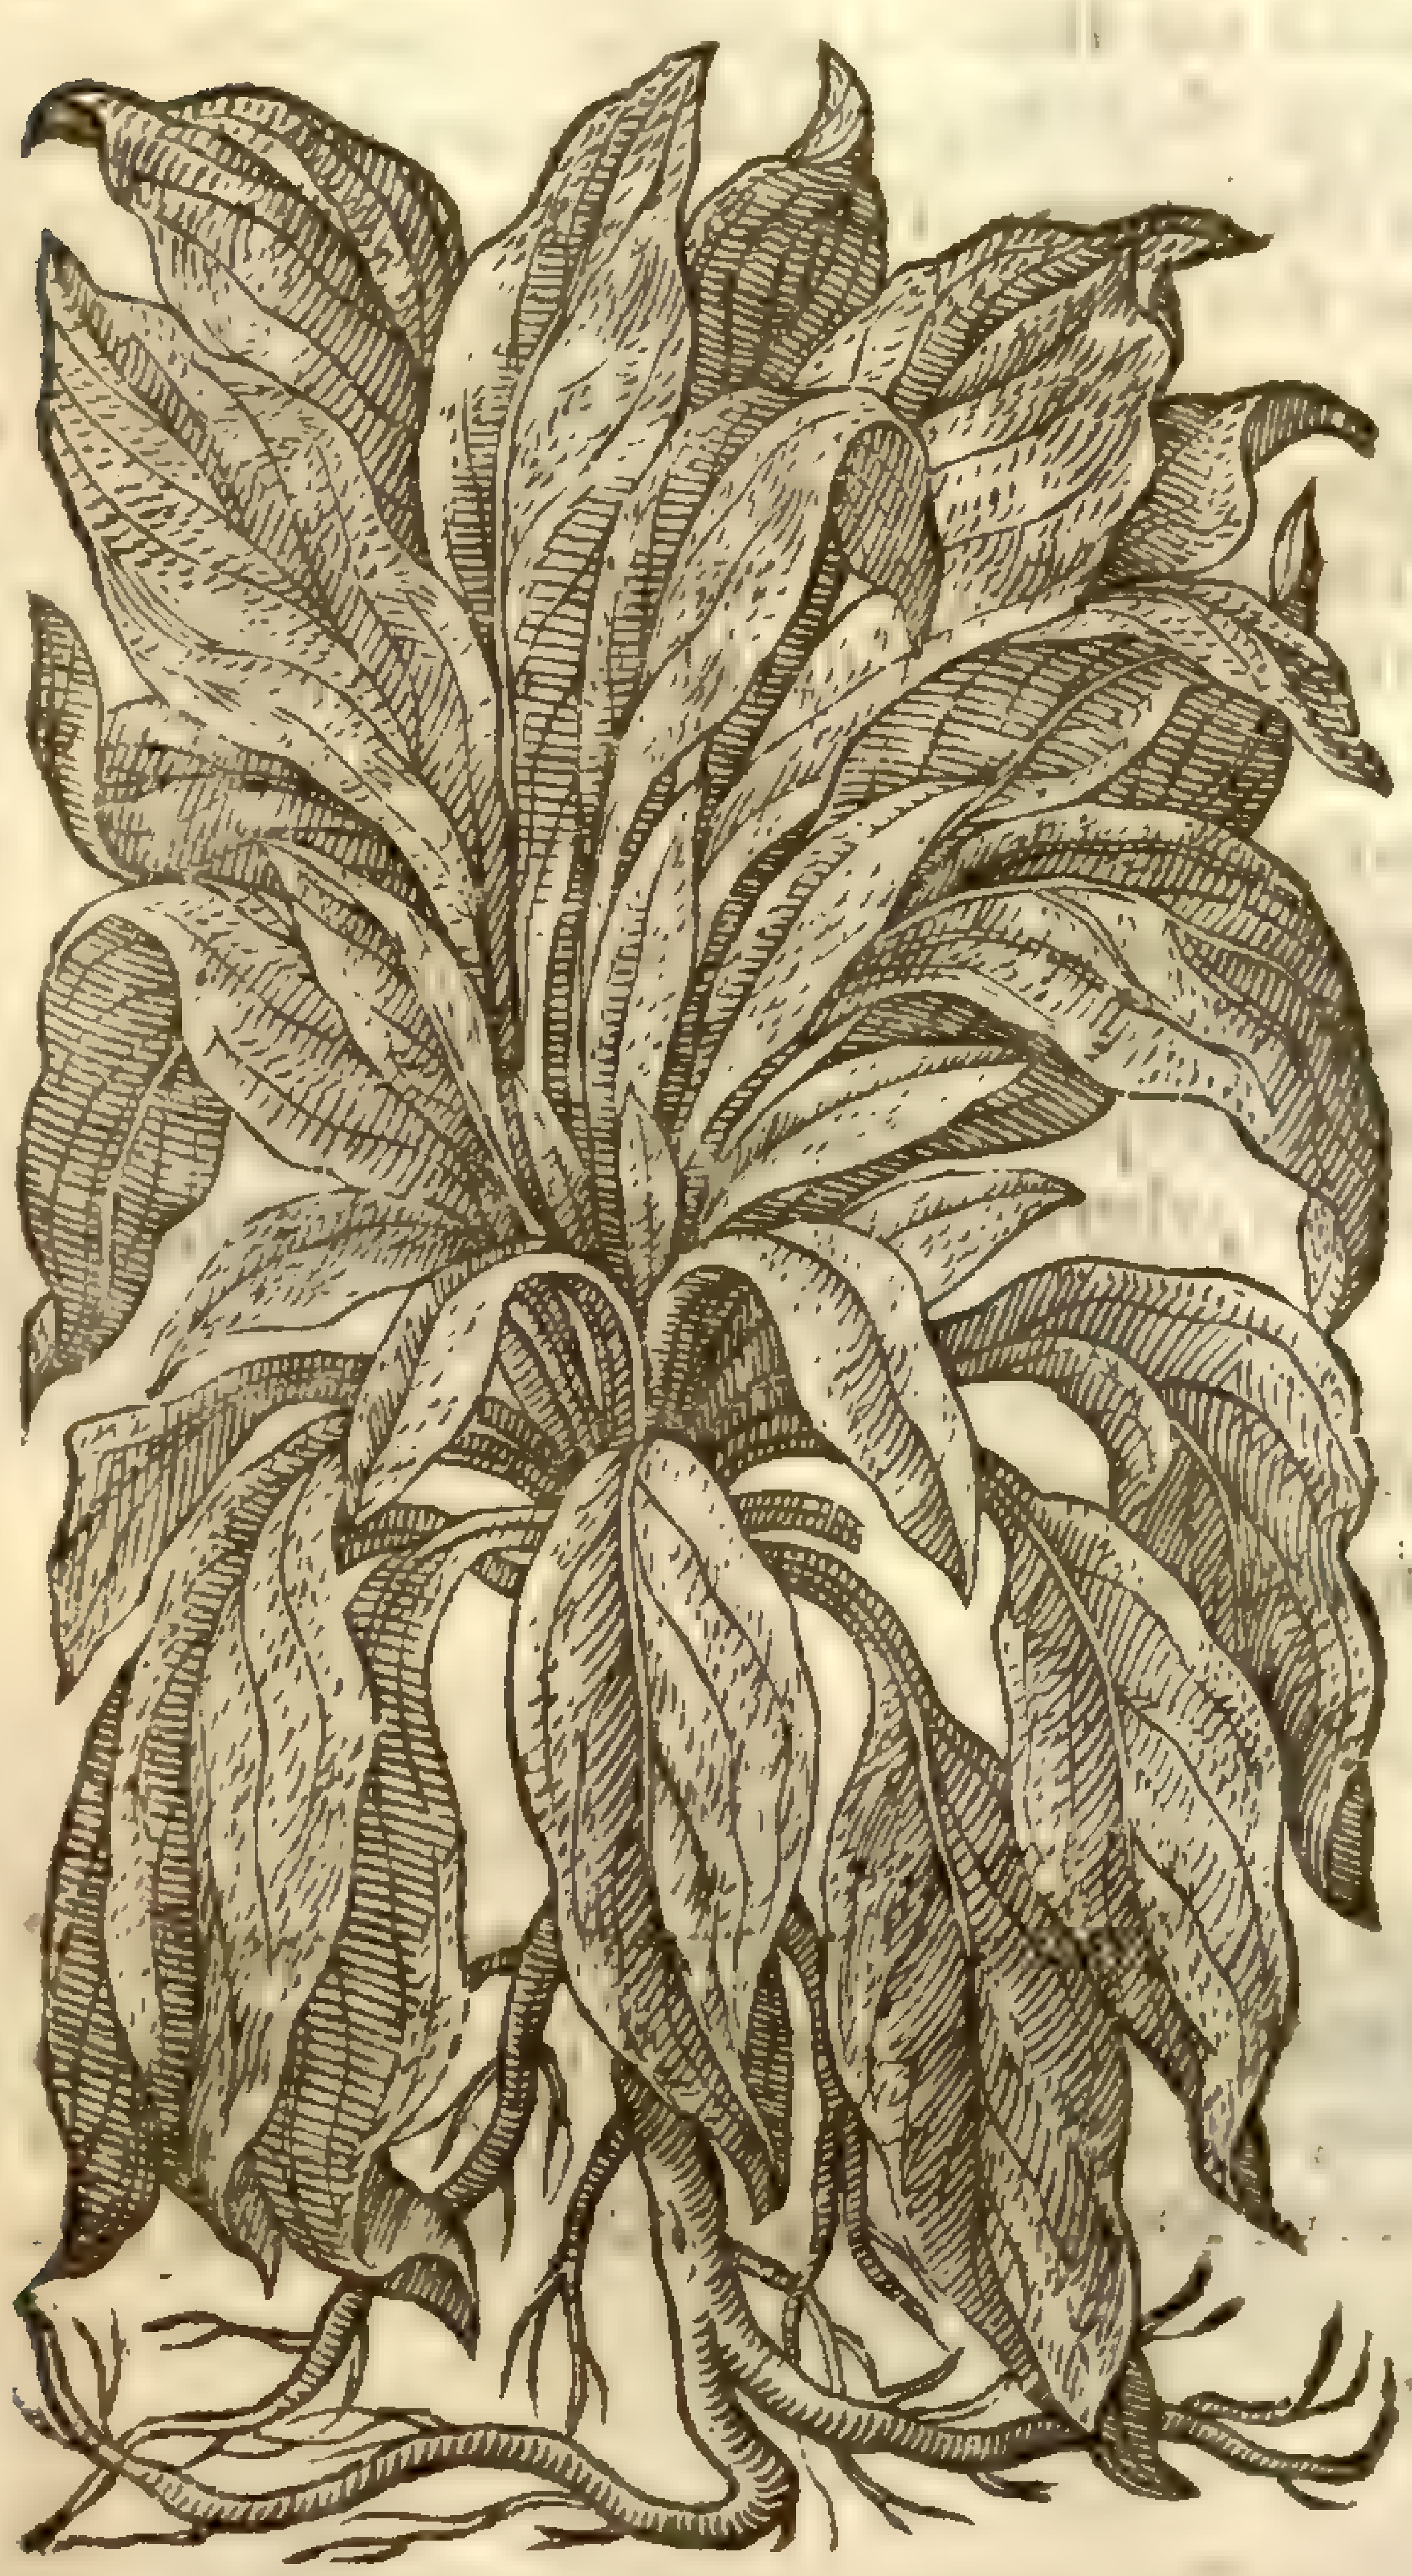
† That figure which formerly ſtood in the ſecond place, vnder the title of *Onoſma*, and whereof there was no more mention made by our Athor, neither in deſcription, name, nor otherwiſe, I take to be nothing elſe than the *Lycopſis* which lies with long leaues ſpred vpon the ground before it comes to ſend vp the ſtalke; as you may ſee it expreſt apart by it ſelfe in the figure we giue you; which is the true figure of that plant our Author deſcribed and meant; for the figure which he gaue was nothing but of the common Borage with narrower leaues, which he deſcribed in the fourth place of the chapter of Borage, as I haue formerly noted.

Chap. 286. *Of Hounds-tongue.*

¶ *The Deſcription.*

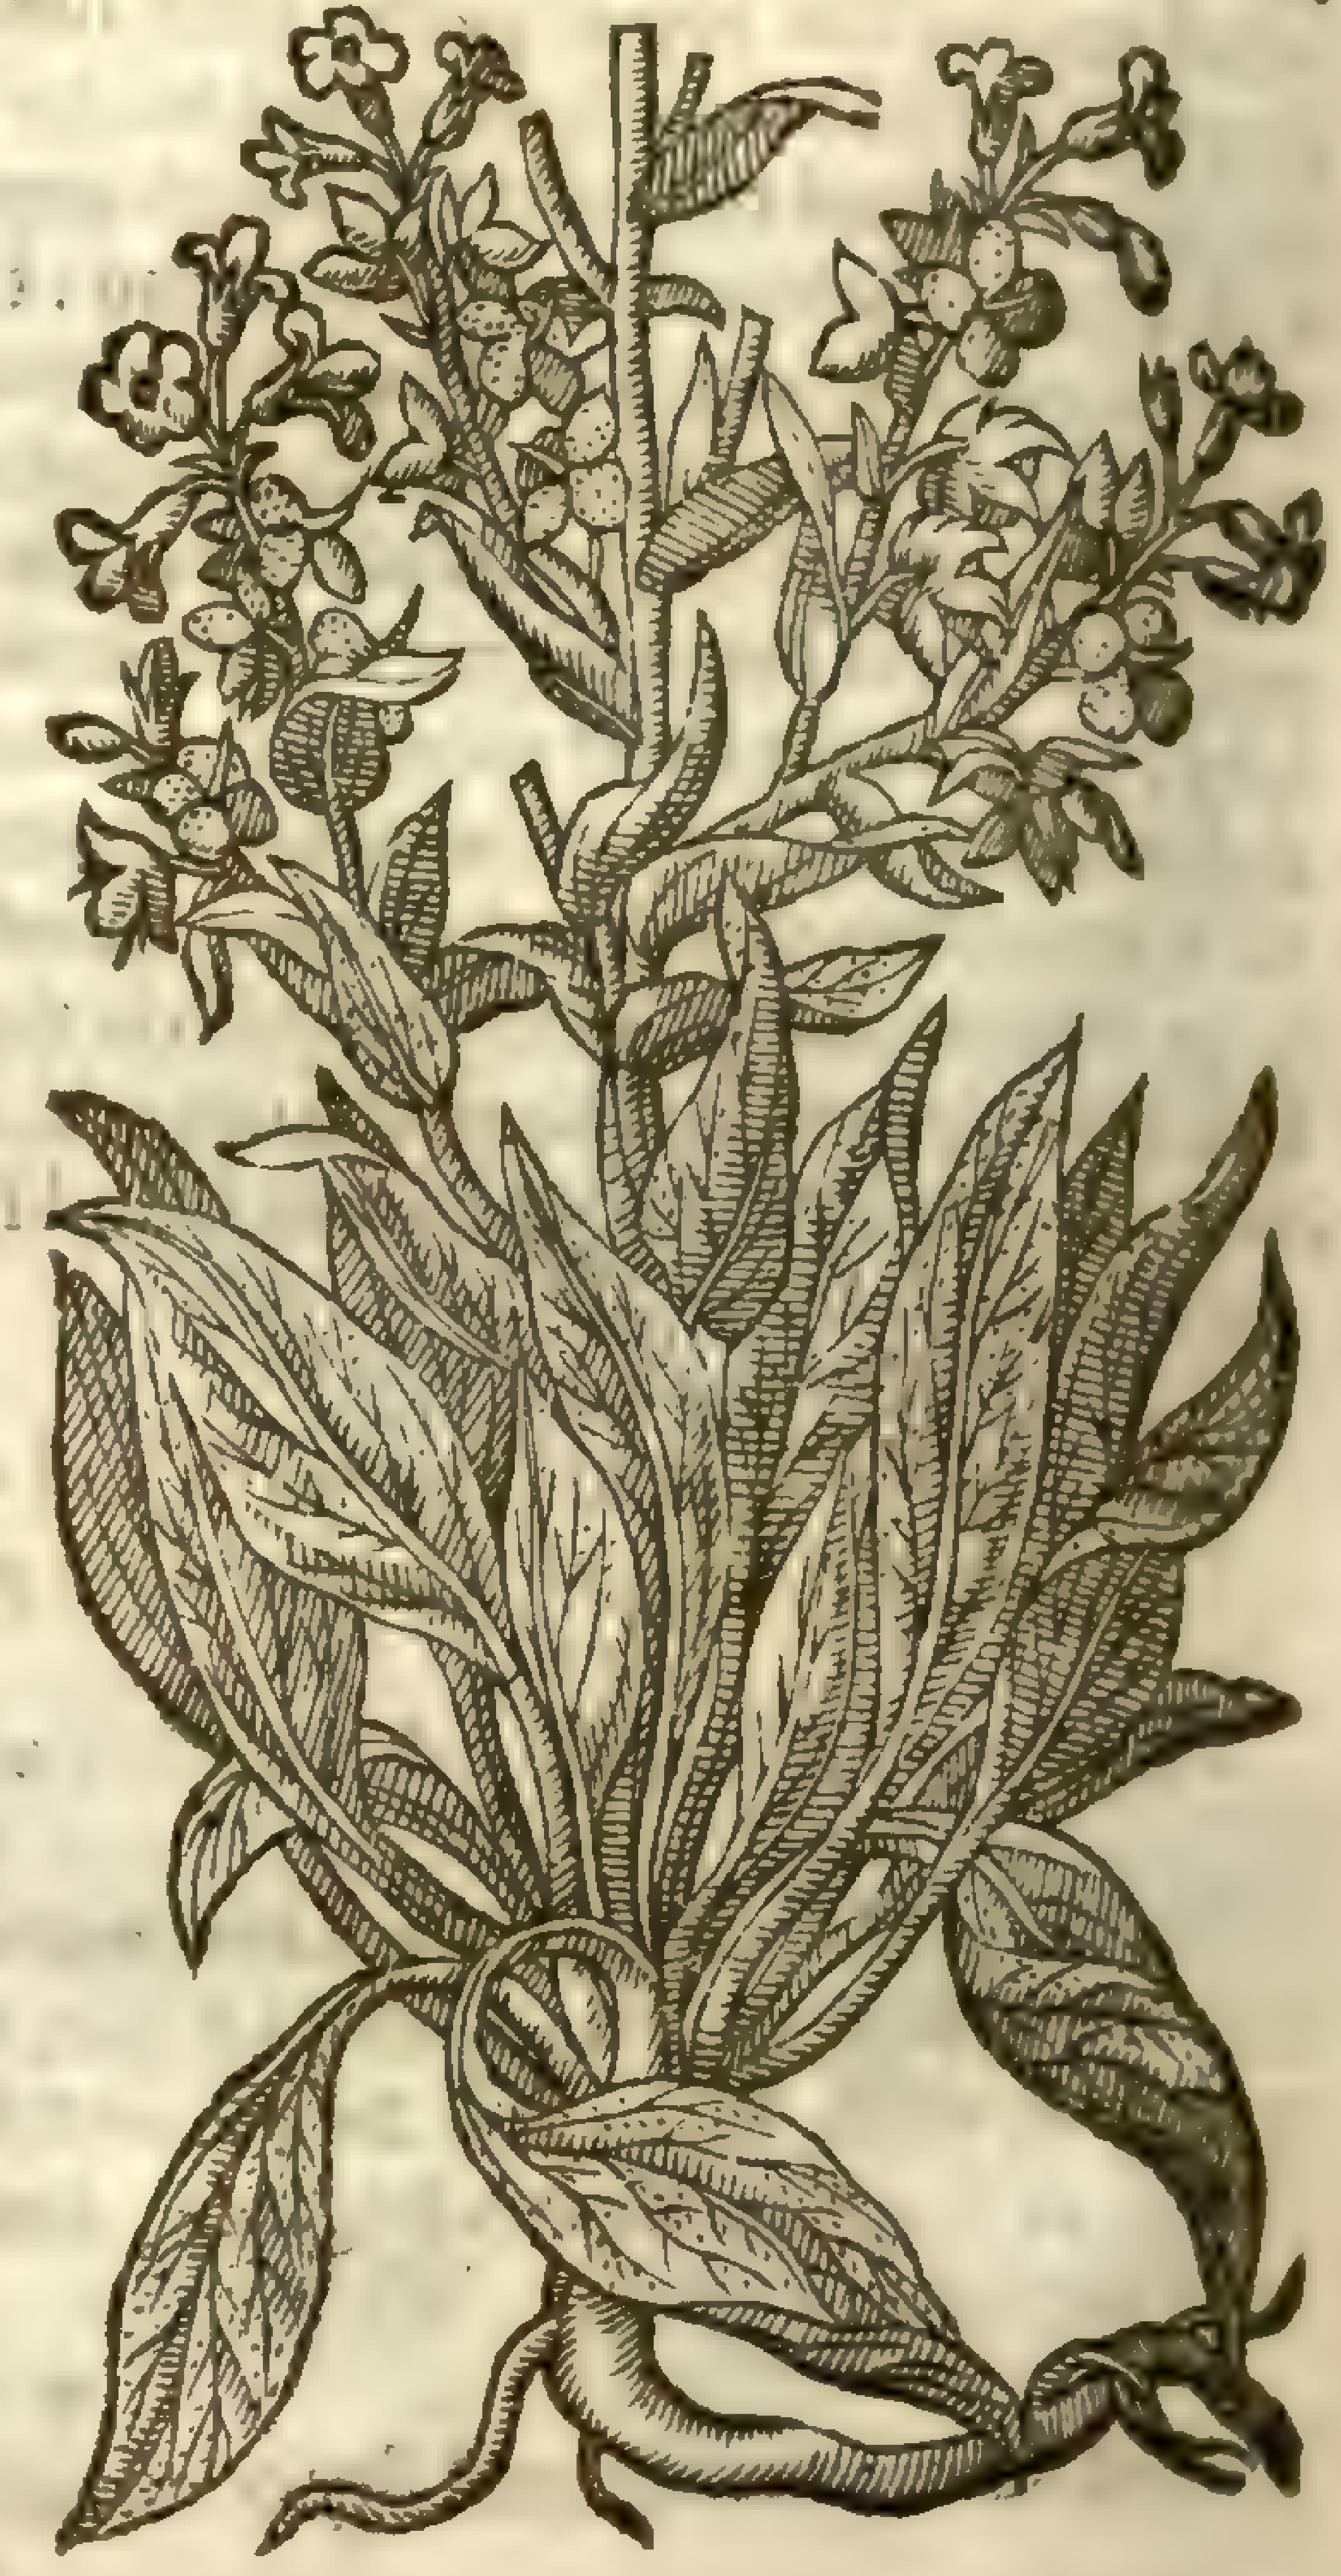
1 The common Hounds-tongue hath long leaues much like the Garden Bugloſſe, but broader, and not rough at all, yet hauing ſome fine hoarineſſe or ſoftneſſe like veluet. Theſe leaues ſtinke very filthily, much like to the piſſe of dogs; wherefore the Dutch men haue called it **Hounds piſſe**, and not Hounds-tongue. The ſtalkes are rough, hard, two cubits high, and of a browne colour, bearing at the top many floures of a darke purple colour: the ſeed is rough, cleauing to garments like Agrimony ſeed: the root is blacke and thicke. ‡ Theſe plants for one yeere after they come vp of ſeed bring forth onely leaues, and thoſe pretty large; and the ſecond yeare they ſend vp their ſtalkes, bearing both floures and ſeed, and then vſually the root periſheth. I haue therefore preſented you with the figures of it, both when it floures, and when it ſendeth forth onely leaues. ‡

1 *Cynogloſſum maius vulgare ſine flore.*
Hounds-tongue without the floure.

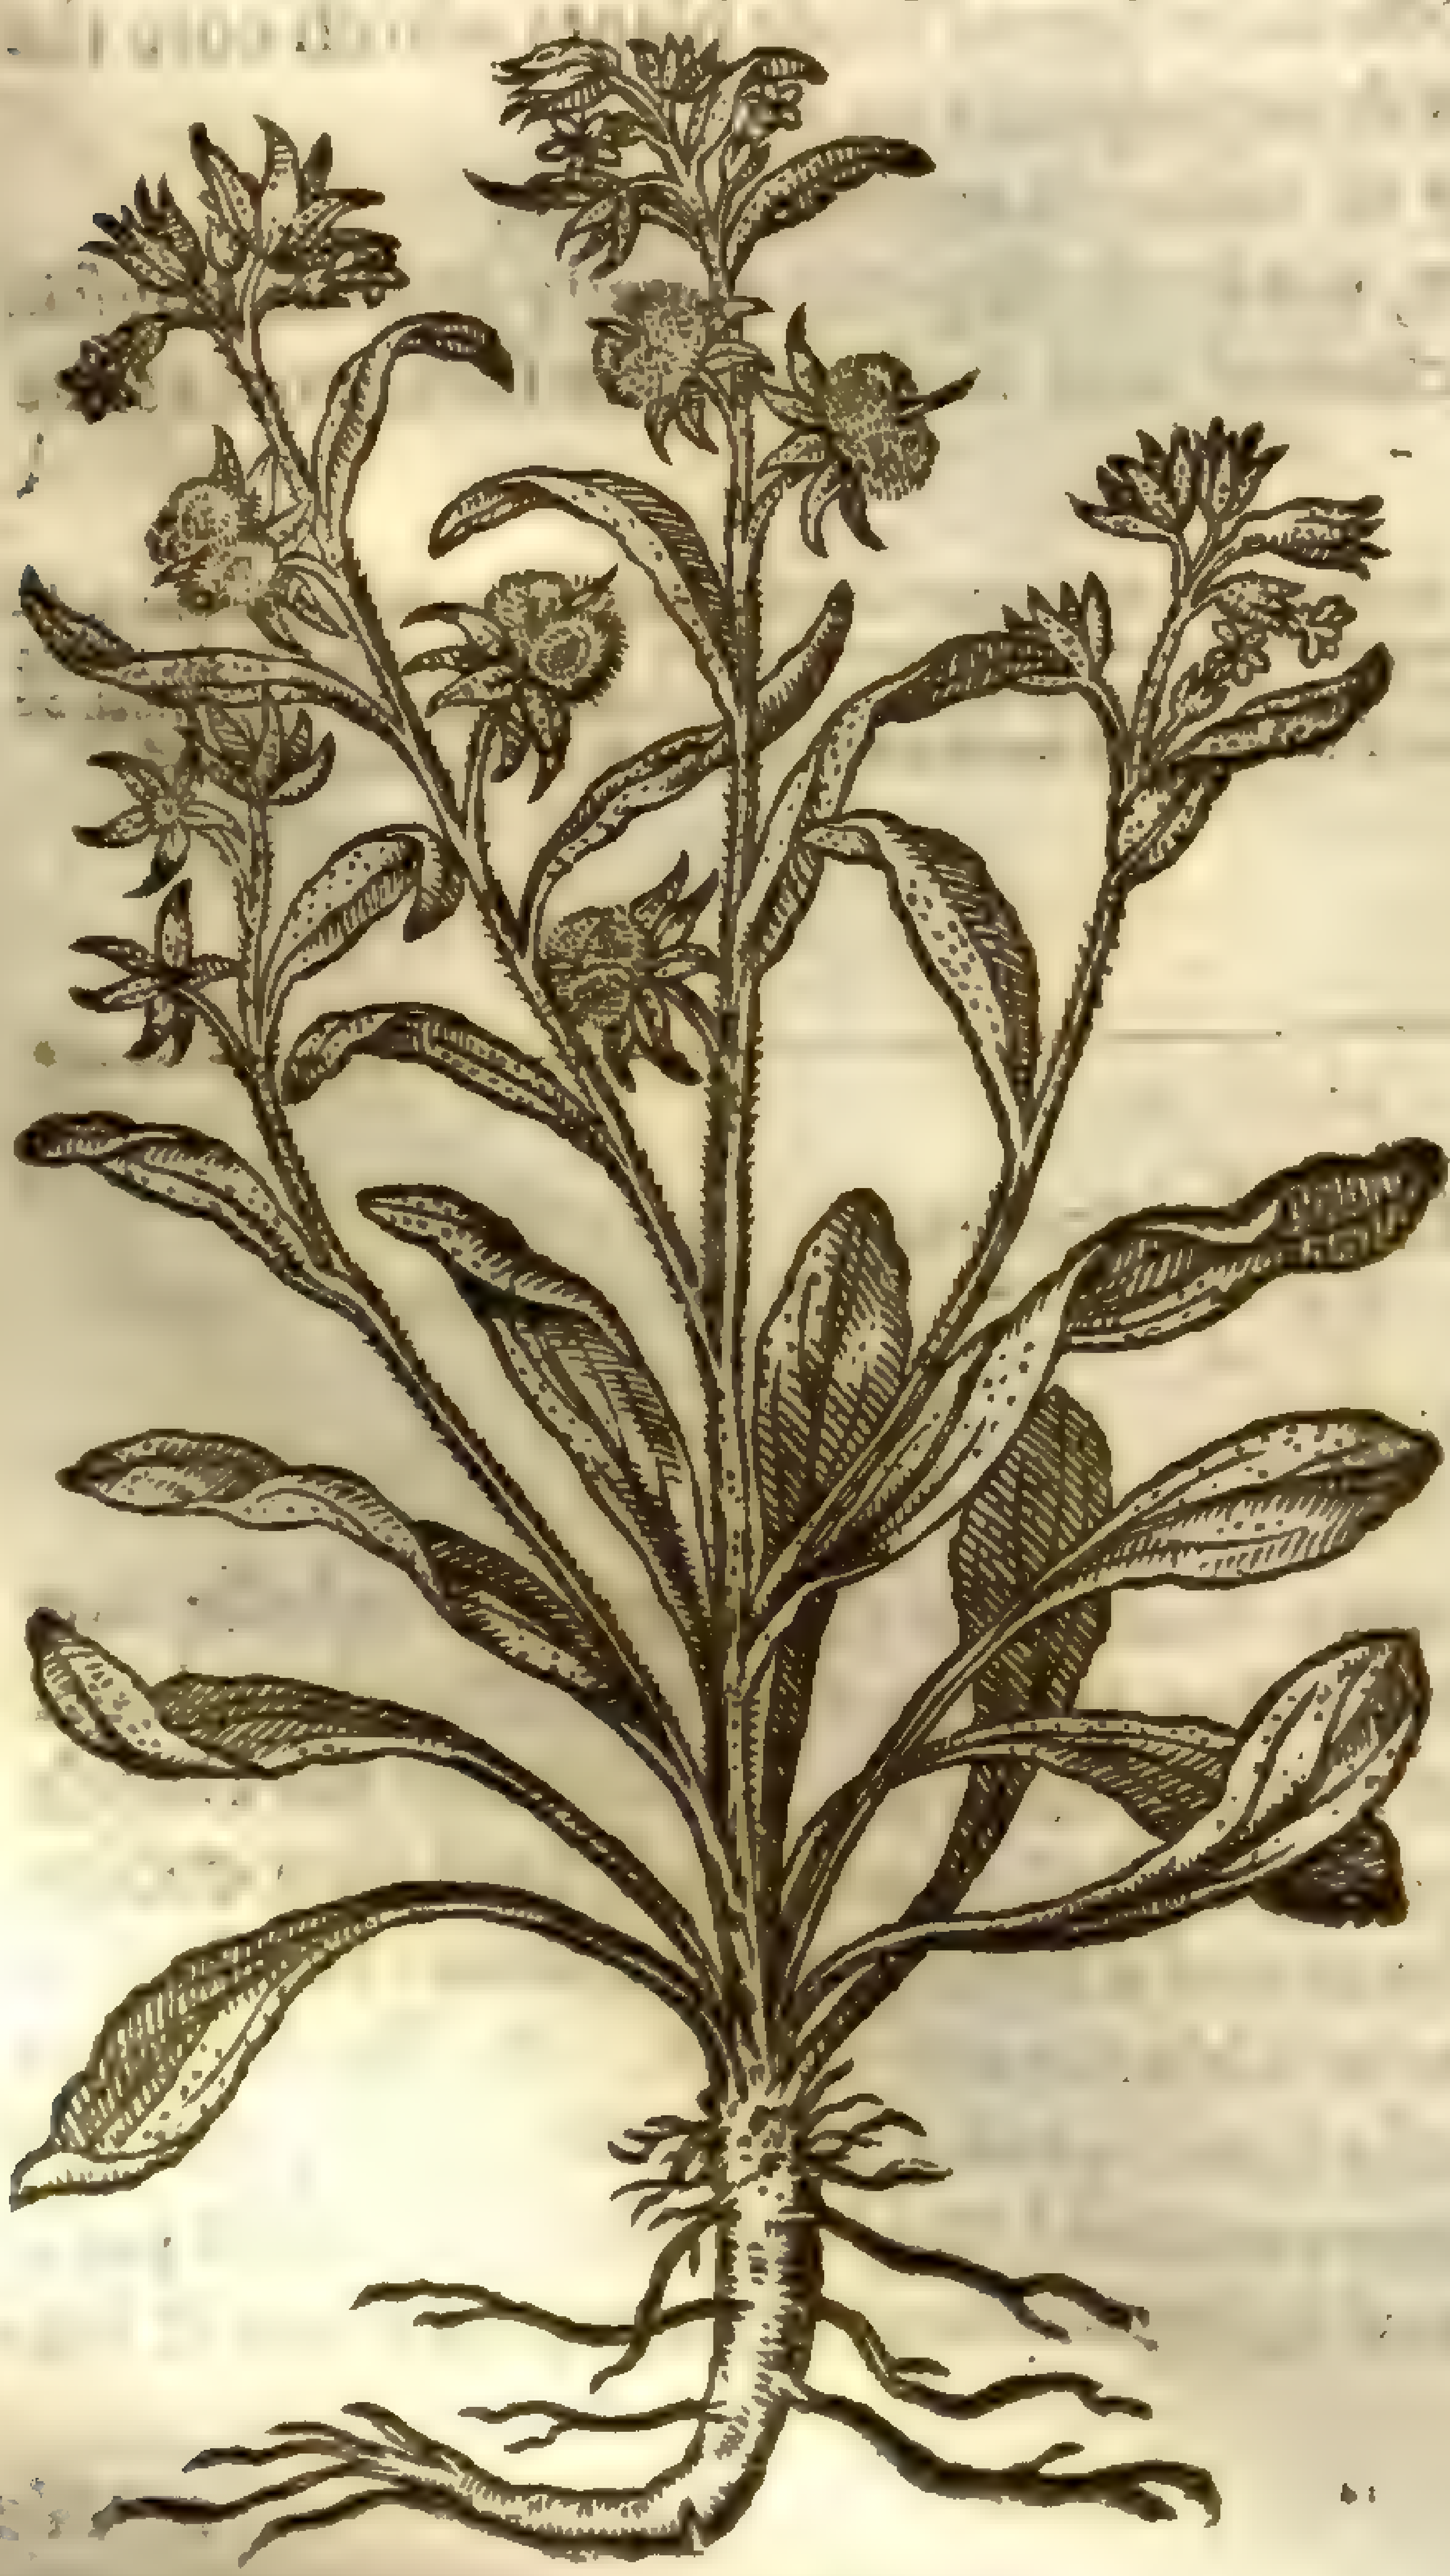


Cynoglossum Apenninum, a male dels. Sm. K. 1. 210

1 *Cynogloſſum maius cum flore & ſemine.*
Hounds-tongue with the floure and ſeed.

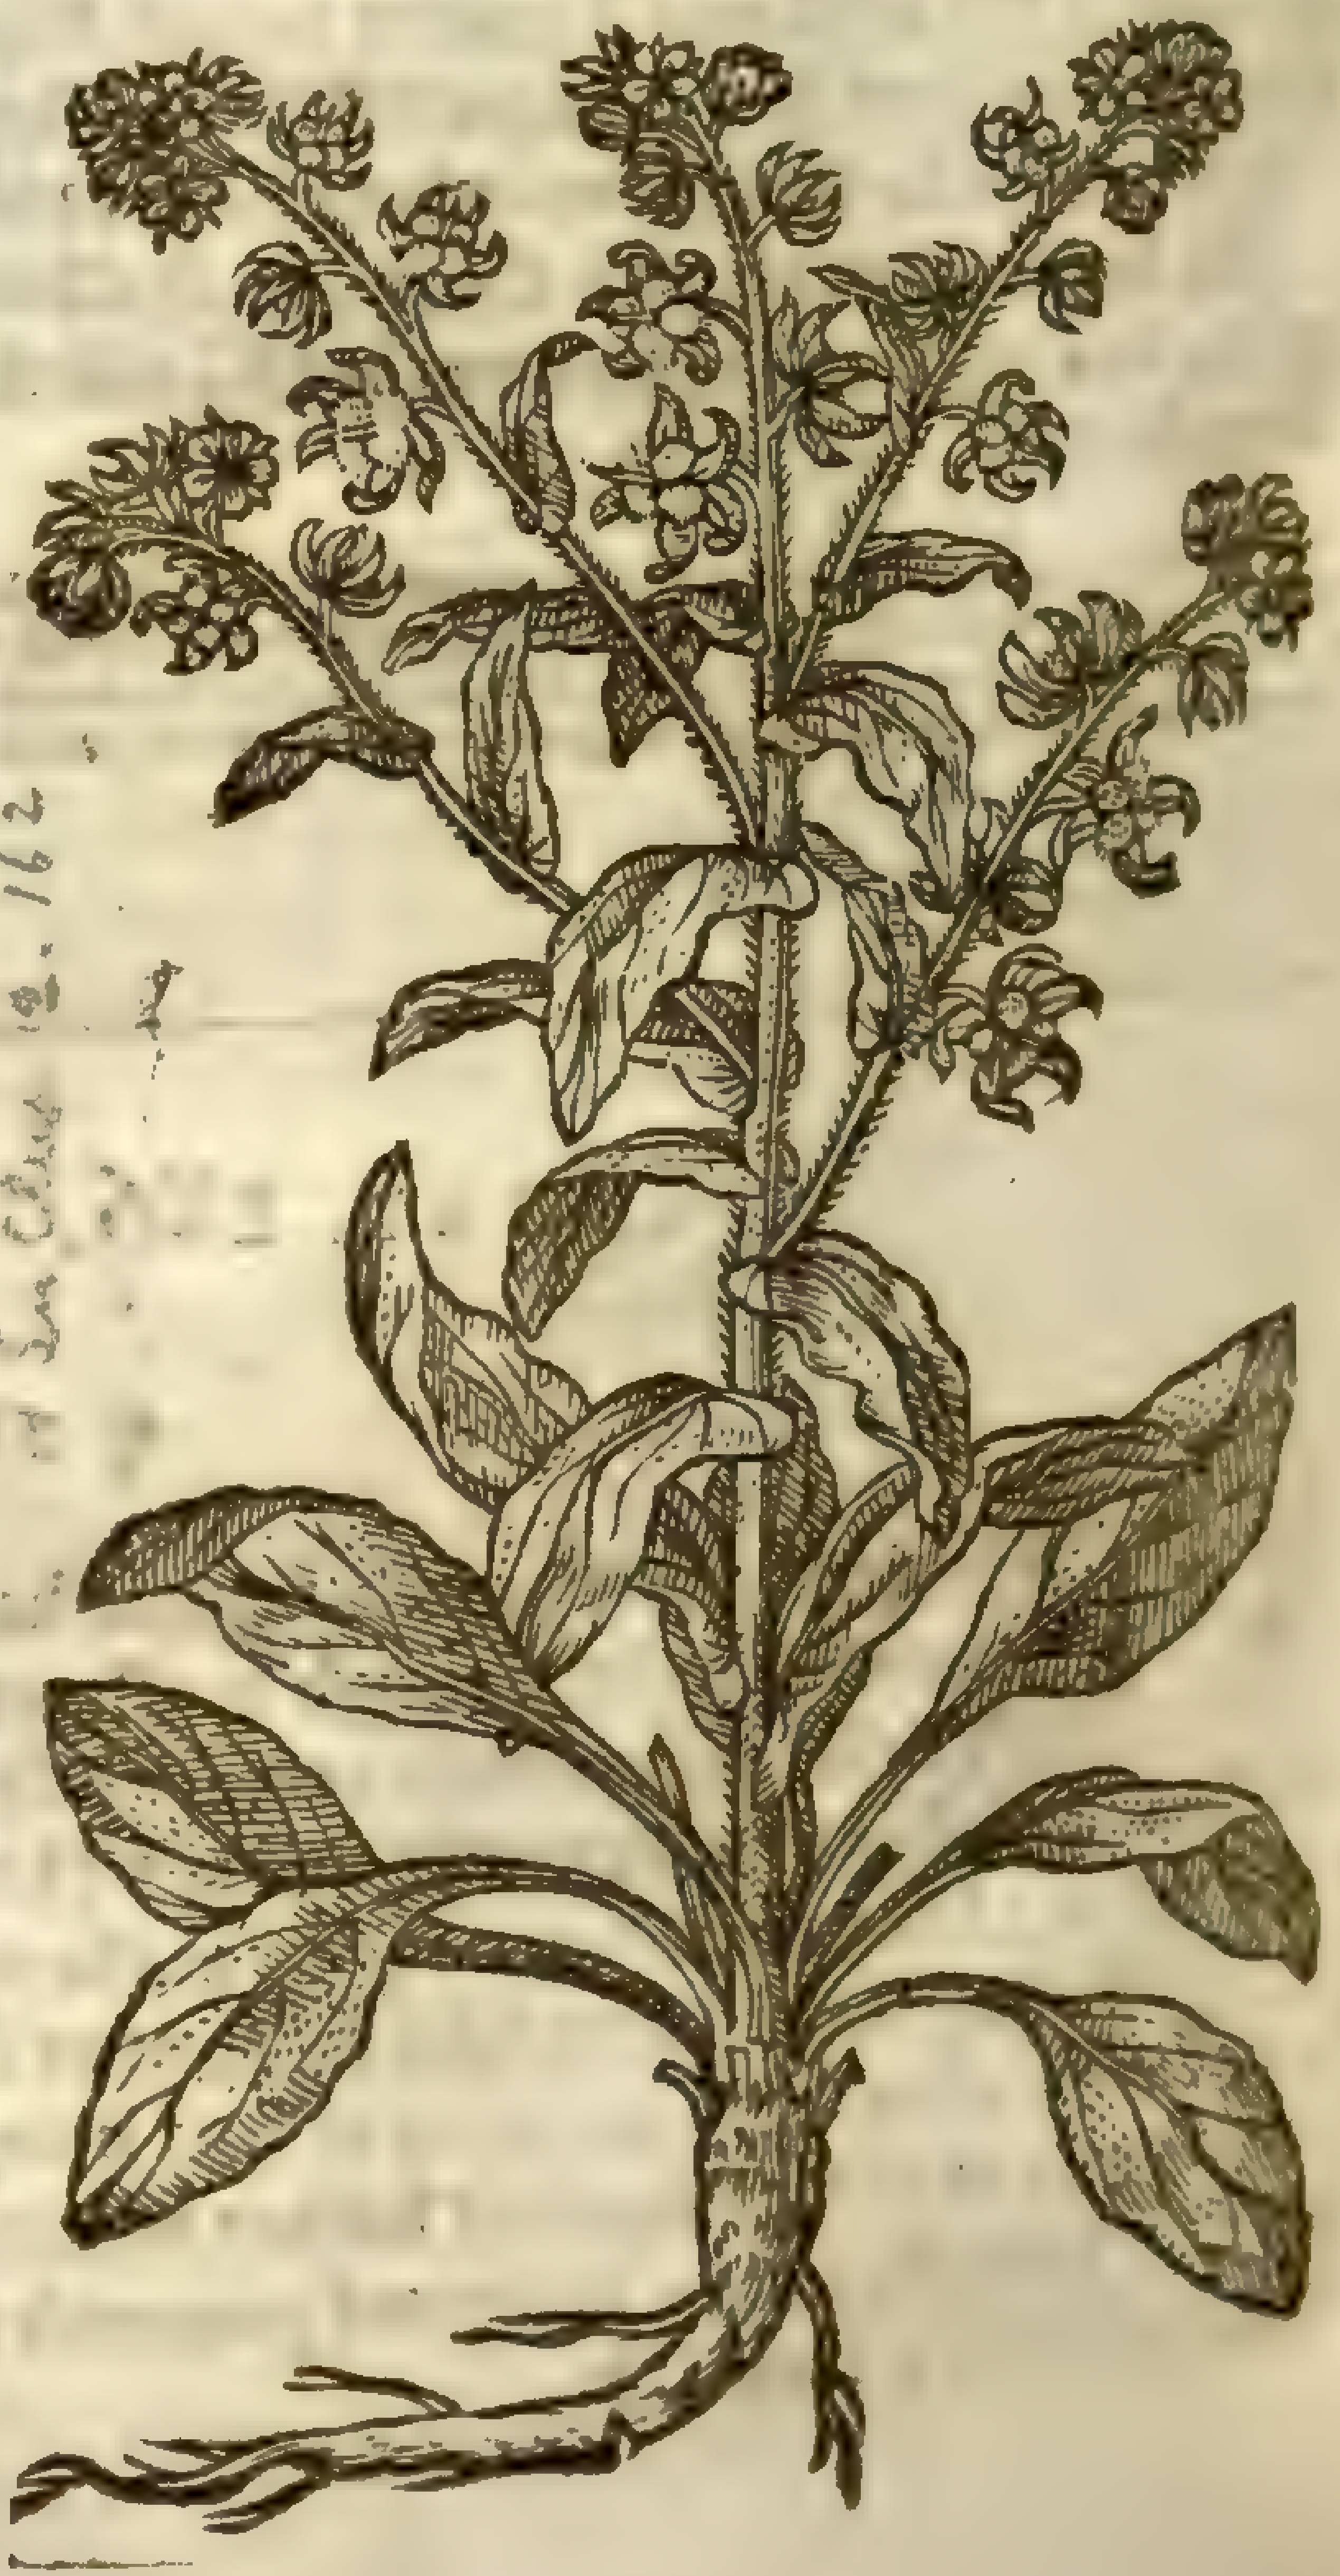


‡ 2 *Cynogloſſum Creticum* 1.
The firſt Candy Dogs-tongue.



Cynoglossum cheirifolium, a male dut

‡ 3 *Cynogloſſum Creticum alterum.*
The other Candy Dogs-tongue.



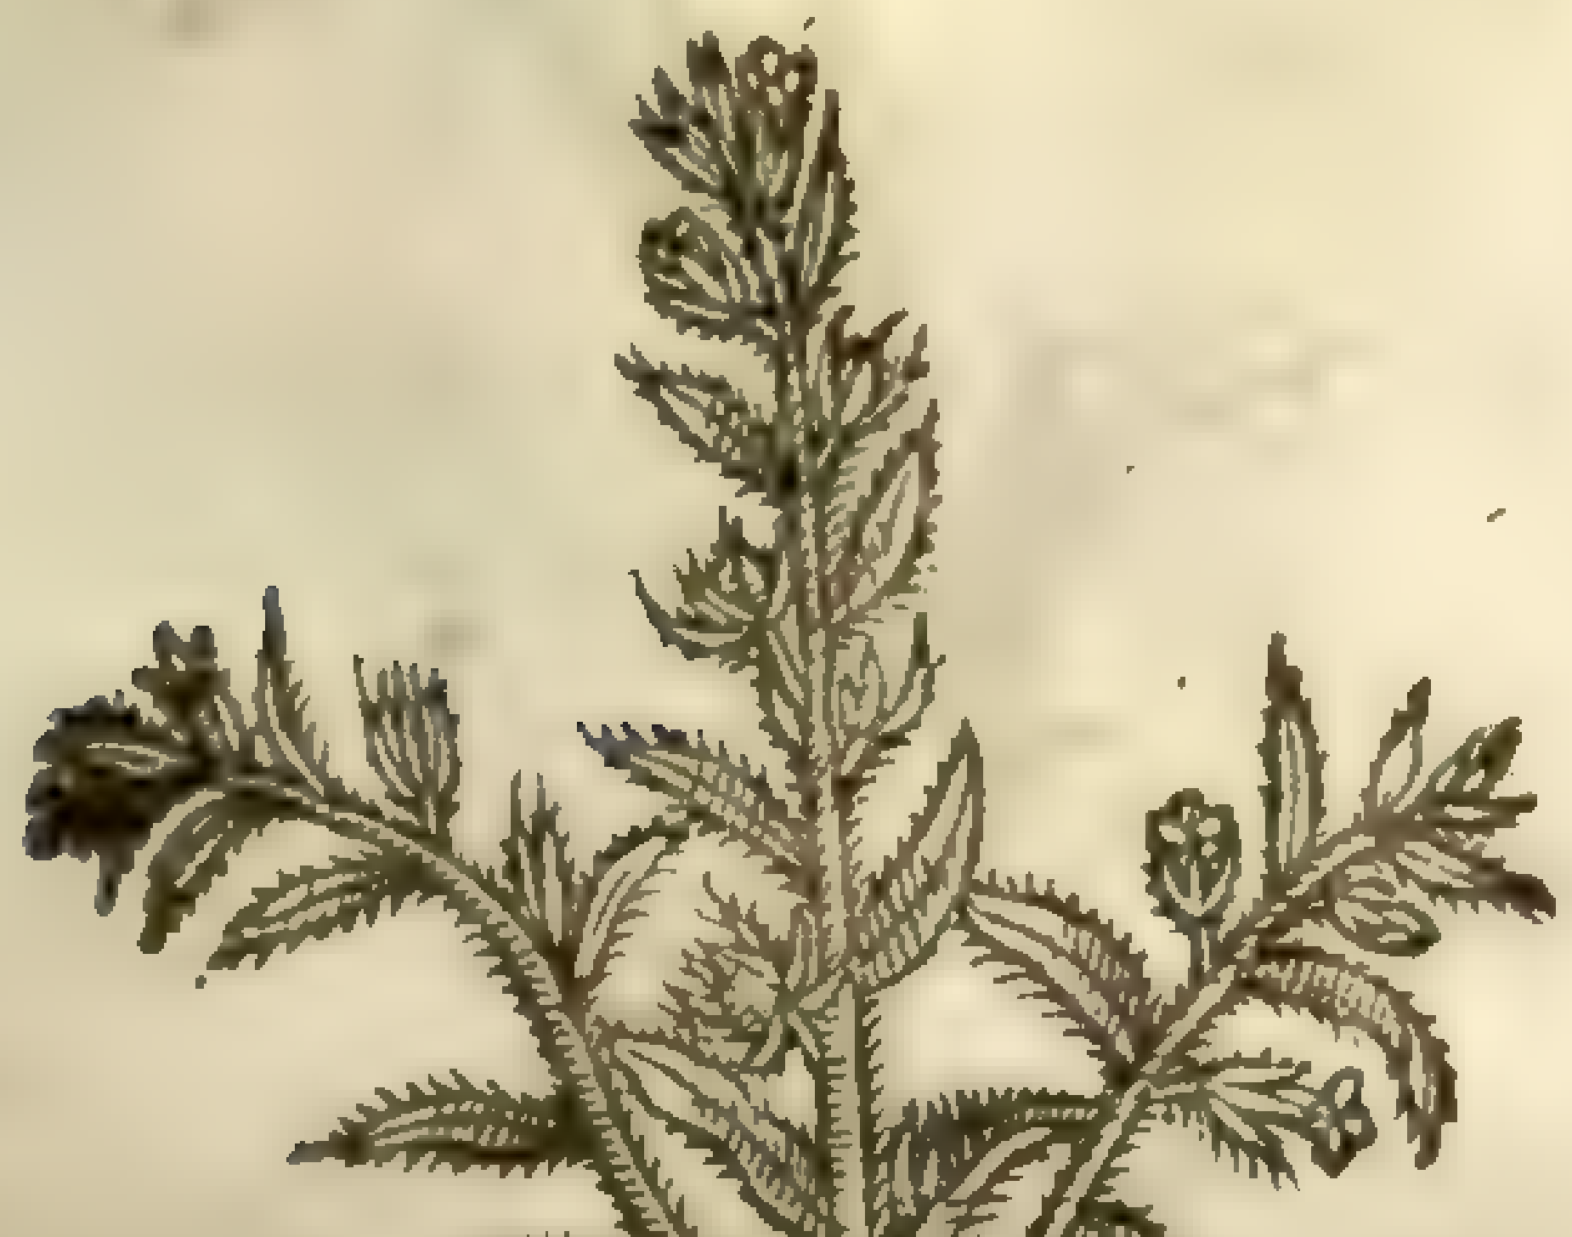
C. pictum, meds. Sm Clus 162

2 We haue receiued another ſort hereof from the parts of Italy, hauing leaues like Woade, ſomewhat rough, and without any manifeſt ſmell, wherein it differeth from the common kinde; the ſeed hereof came vnder the title *Cynogloſſum Creticum*, Hounds tongue of Candy. ‡ The flours are leſſer, and of a lighter colour than thoſe of the former; the ſeeds alſo are rough, and grow foure together, with a point comming out of the middle of them, as in the common kinde, but yet leſſe: the root is long and whitiſh. *Cluſius* hath this by the name of *Cynogloſſum Creticum* 1.

3 This ſecond *Cynogloſſum Creticum* of *Cluſius* hath leaues ſome handfull high, and ſome inch or better broad: among which the next yeare after the ſowing, comes vp a ſtalke ſome cubit or more high, creſted, ſtiffe, ſtraight, and ſomewhat downy, as are alſo the leaues which grow vpon the ſame, being ſomwhat broad at their ſetting on, and of a yellowiſh green colour: the top of the ſtalk is diuided into ſundry branches, which twine or turne on their tops like as the ſcorpion graſſe, and carry ſhorter yet larger floures than the ordinarie kinde, and thoſe of a whitiſh colour at the firſt, with many ſmall purpliſh veins, which after a few daies become blew. The ſeeds are like the former in their growing, ſhape, and roughneſſe. ‡

4 We haue another ſort of Hounds tongue like vnto the common kinde, ſauing it is altogether leſſe: the leaues are of a ſhining green colour.

‡ 4 *Cynogloſſum minus folio virente.*
Small greene leaued Hounds tongue.



¶ *The Place.*

The great Hounds tongue growes almoſt euery where by highwayes and vntoiled ground: the ſmall Hounds tongue groweth very plentifully by the wayes ſide as you ride Colcheſter highway from Londonward, between Eſterford and Wittam in Eſſex.

¶ *The Time.*

They floure in Iune and Iuly.

¶ *The Names.*

Houndstongue is called in Greek, Κυνόγλωσσον: in Latine, *Lingua canis*: of *Pliny*, *Cynogloſſos*: and he ſheweth two kinds thereof: in Engliſh, Hounds tongue, or Dogges tongue, but rather Hounds piſſe, for in the world there is not any thing that ſmelleth ſo like Dogs piſſe as the leaues of this plant doe.

¶ *The Nature.*

Hounds tongue, but eſpecially his root, is cold and dry.

¶ *The Vertues.*

A The roots of Hounds tongue roſted in the embers and laid to the fundament, heal the hemorrhoids, and the diſeaſe called *Ignis ſacer*, or wilde fire.

B The juice boiled with hony of roſes and turpentine to the forme of an vnguent, is moſt ſingular in wounds and deep vlcers.

C *Dioſcorides* ſaith, That the leaues boiled in wine and drunk, doth mollifie the belly, and being ſtamped with old ſwines greaſe, are good againſt the falling away of the haire, proceeding of hot humors.

D Likewiſe they are a remedy againſt ſcaldings or burnings, and againſt the biting of dogs, as the ſame Author addeth.

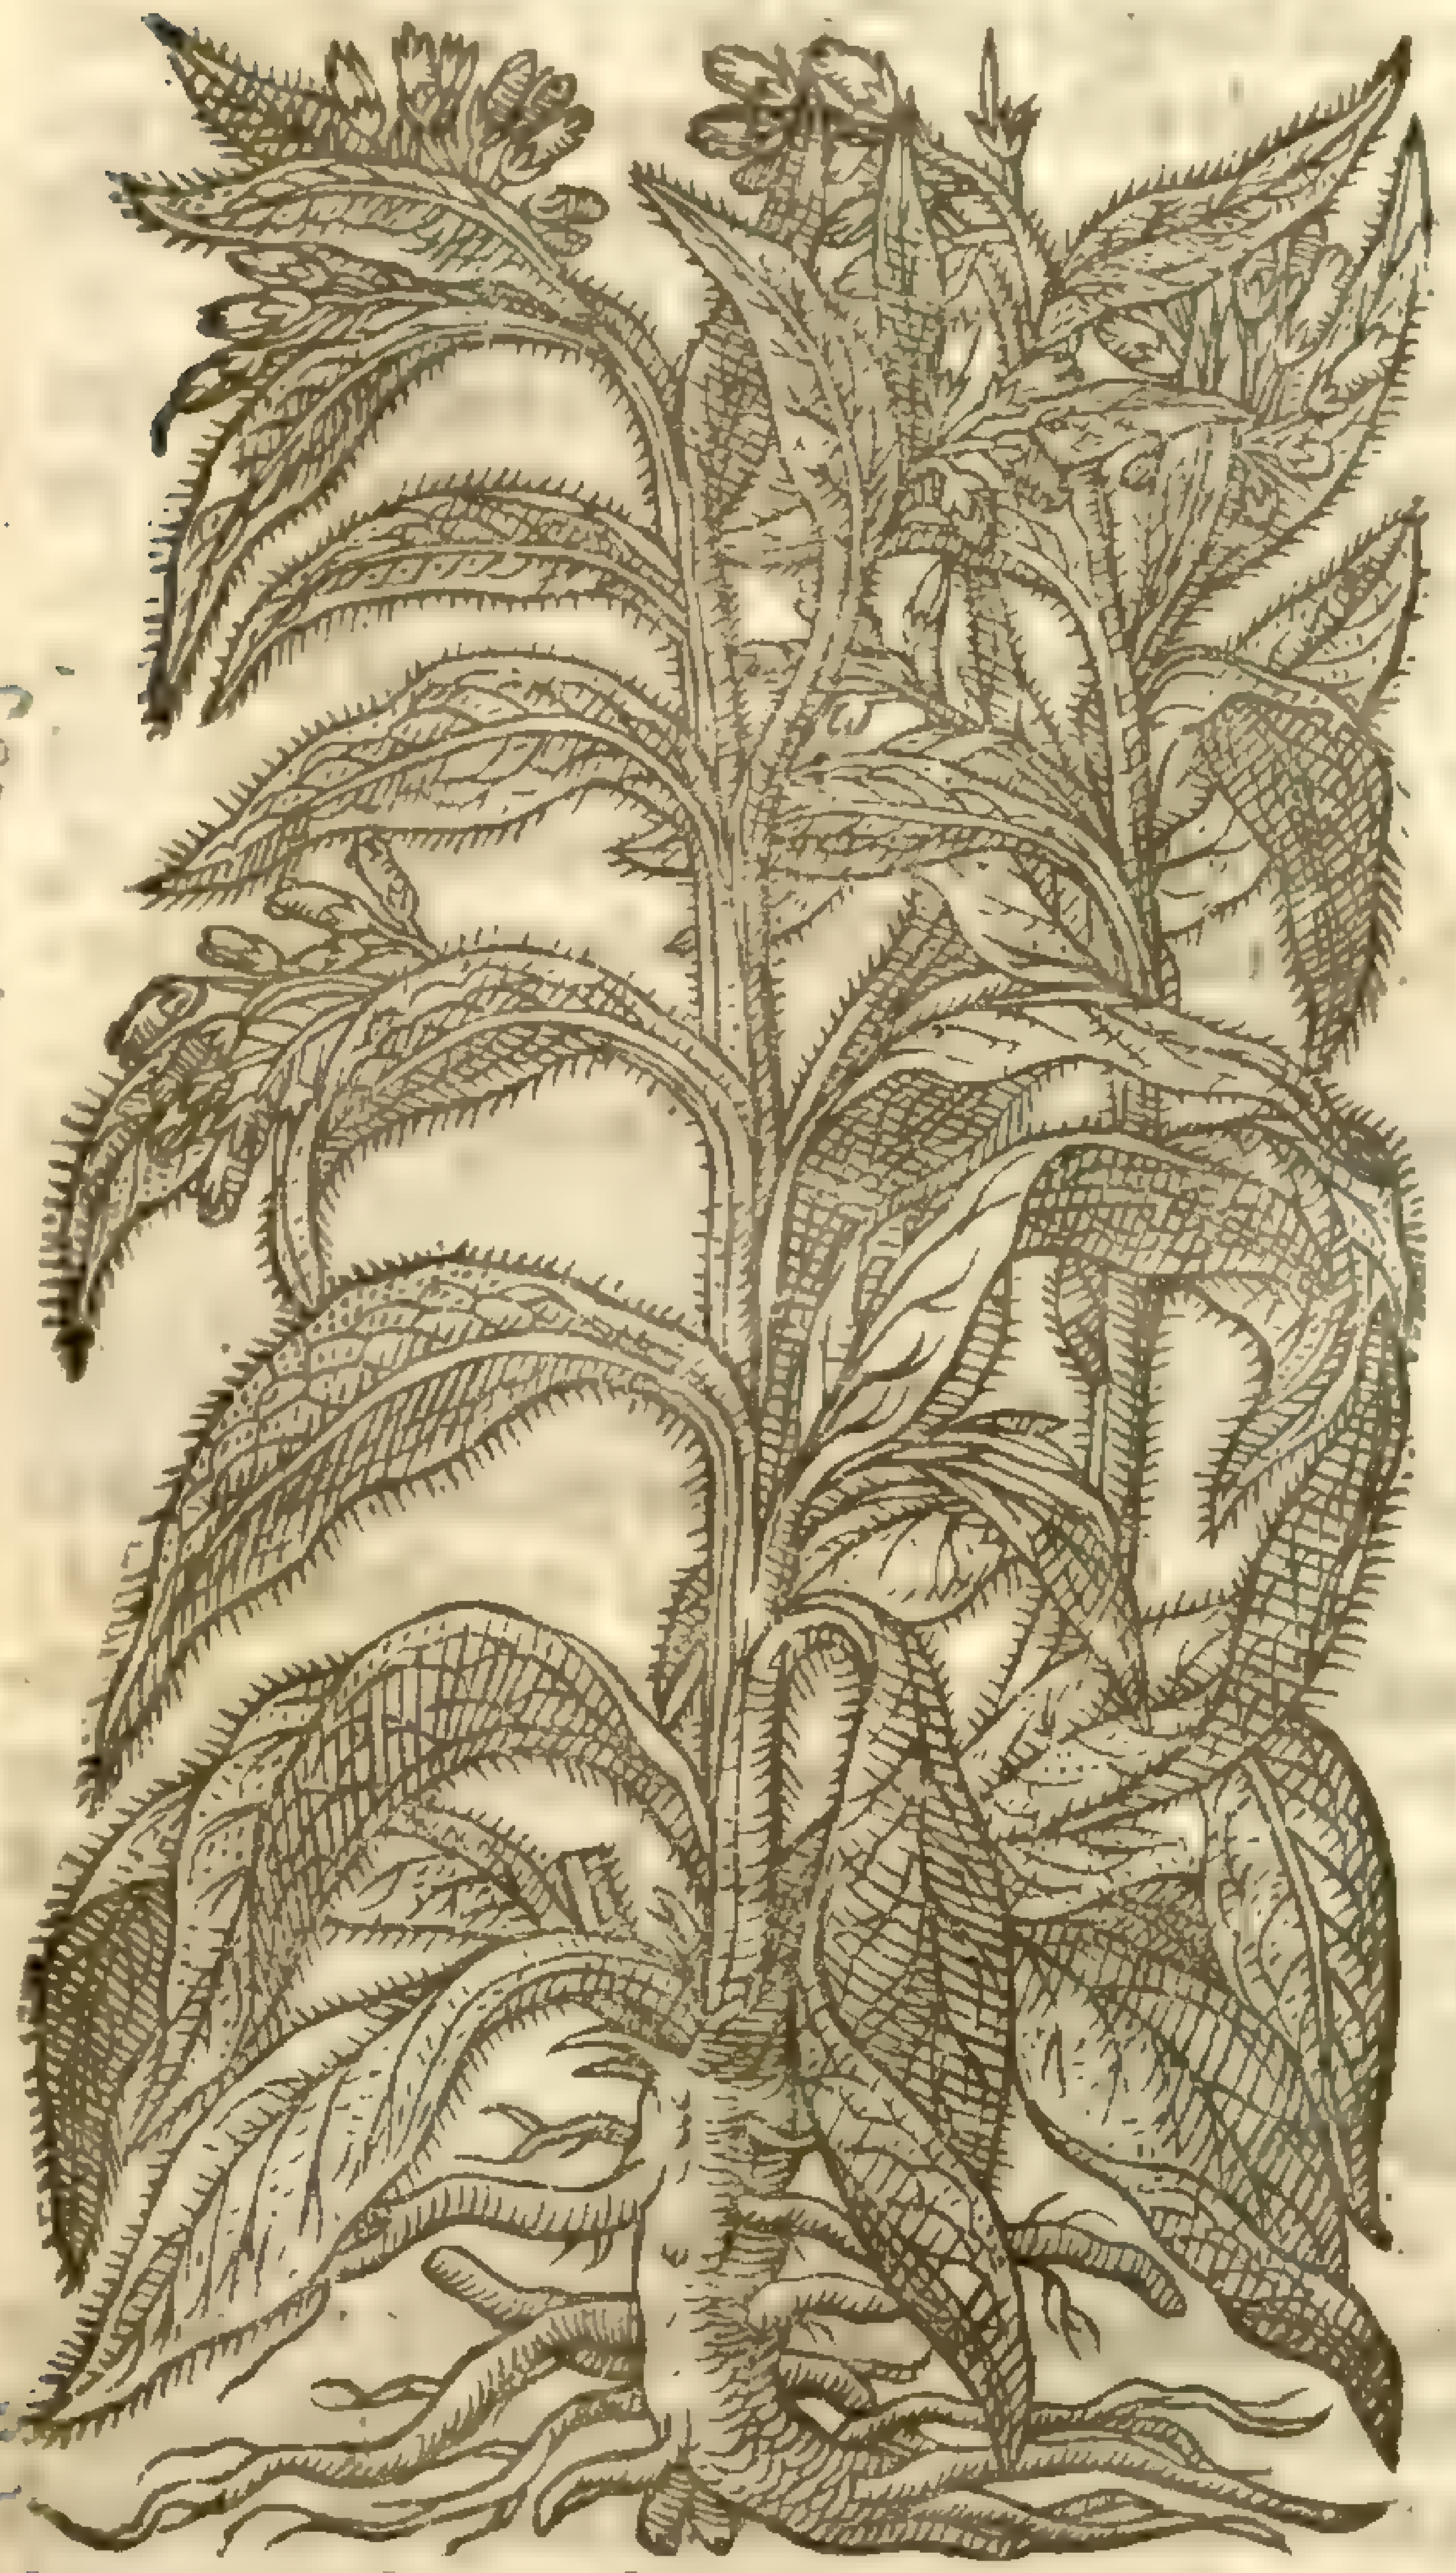
CHAP. 287.

Of Comfrey or great Conſound.

¶ *The Deſcription.*

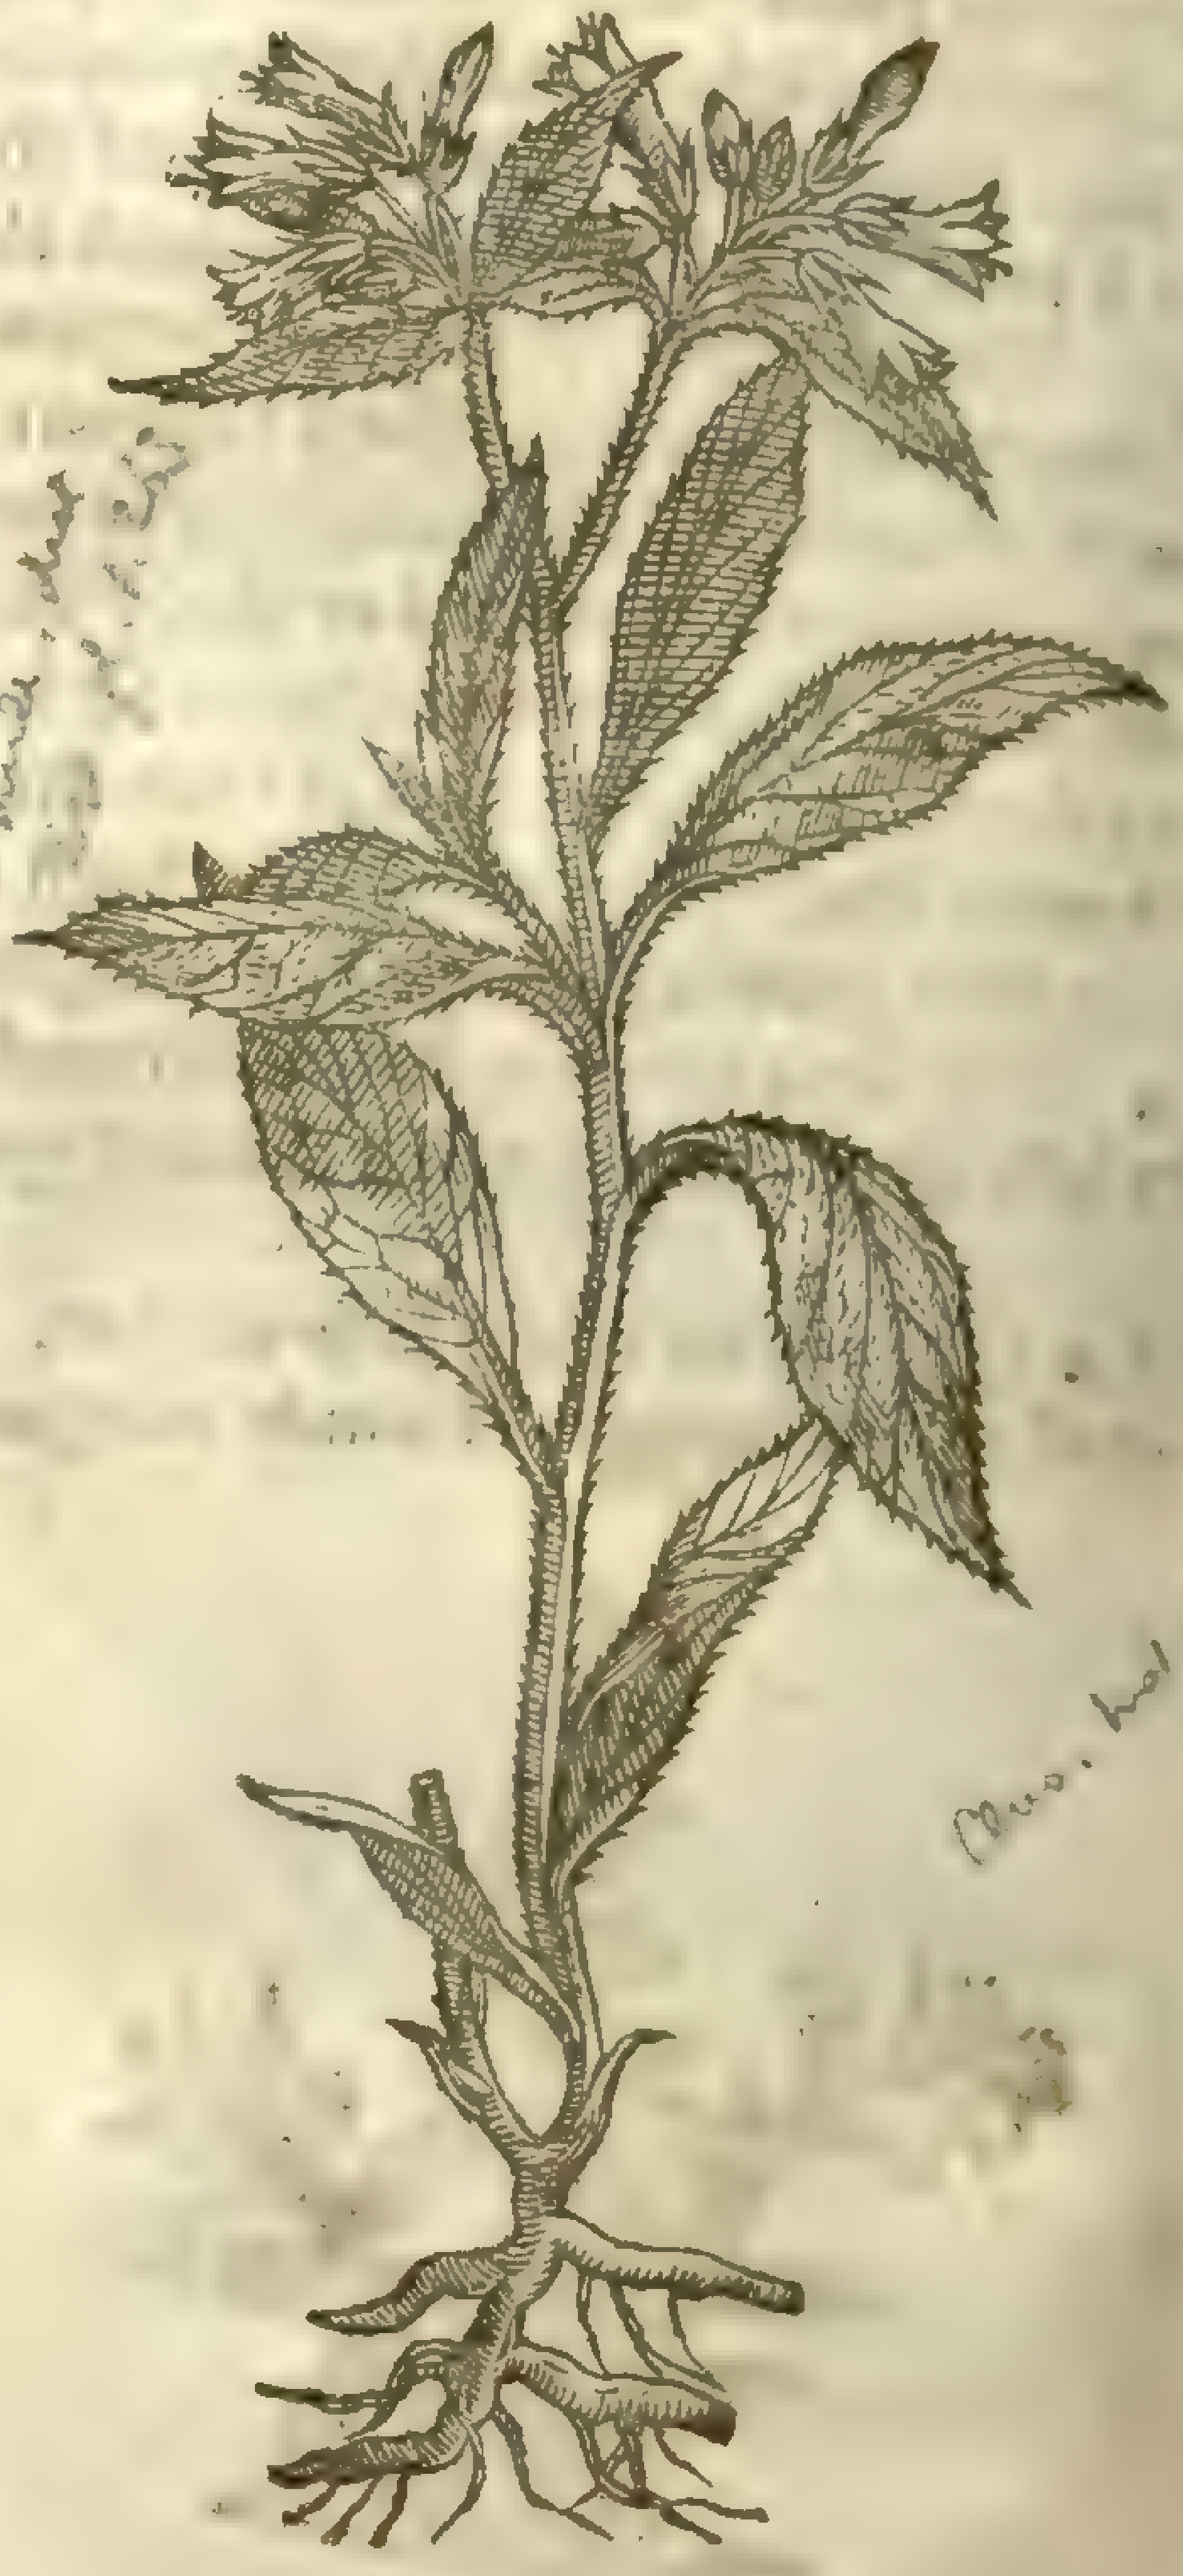
1 THe ſtalke of this Comfrey is cornered, thicke, and hollow like that of *Sow-thiſtle*. It groweth two cubits or a yard high: the leaues that ſpring from the root, and thoſe that grow

1 *Conſolida maior flore purpureo.*
Comfrey with purple floures.



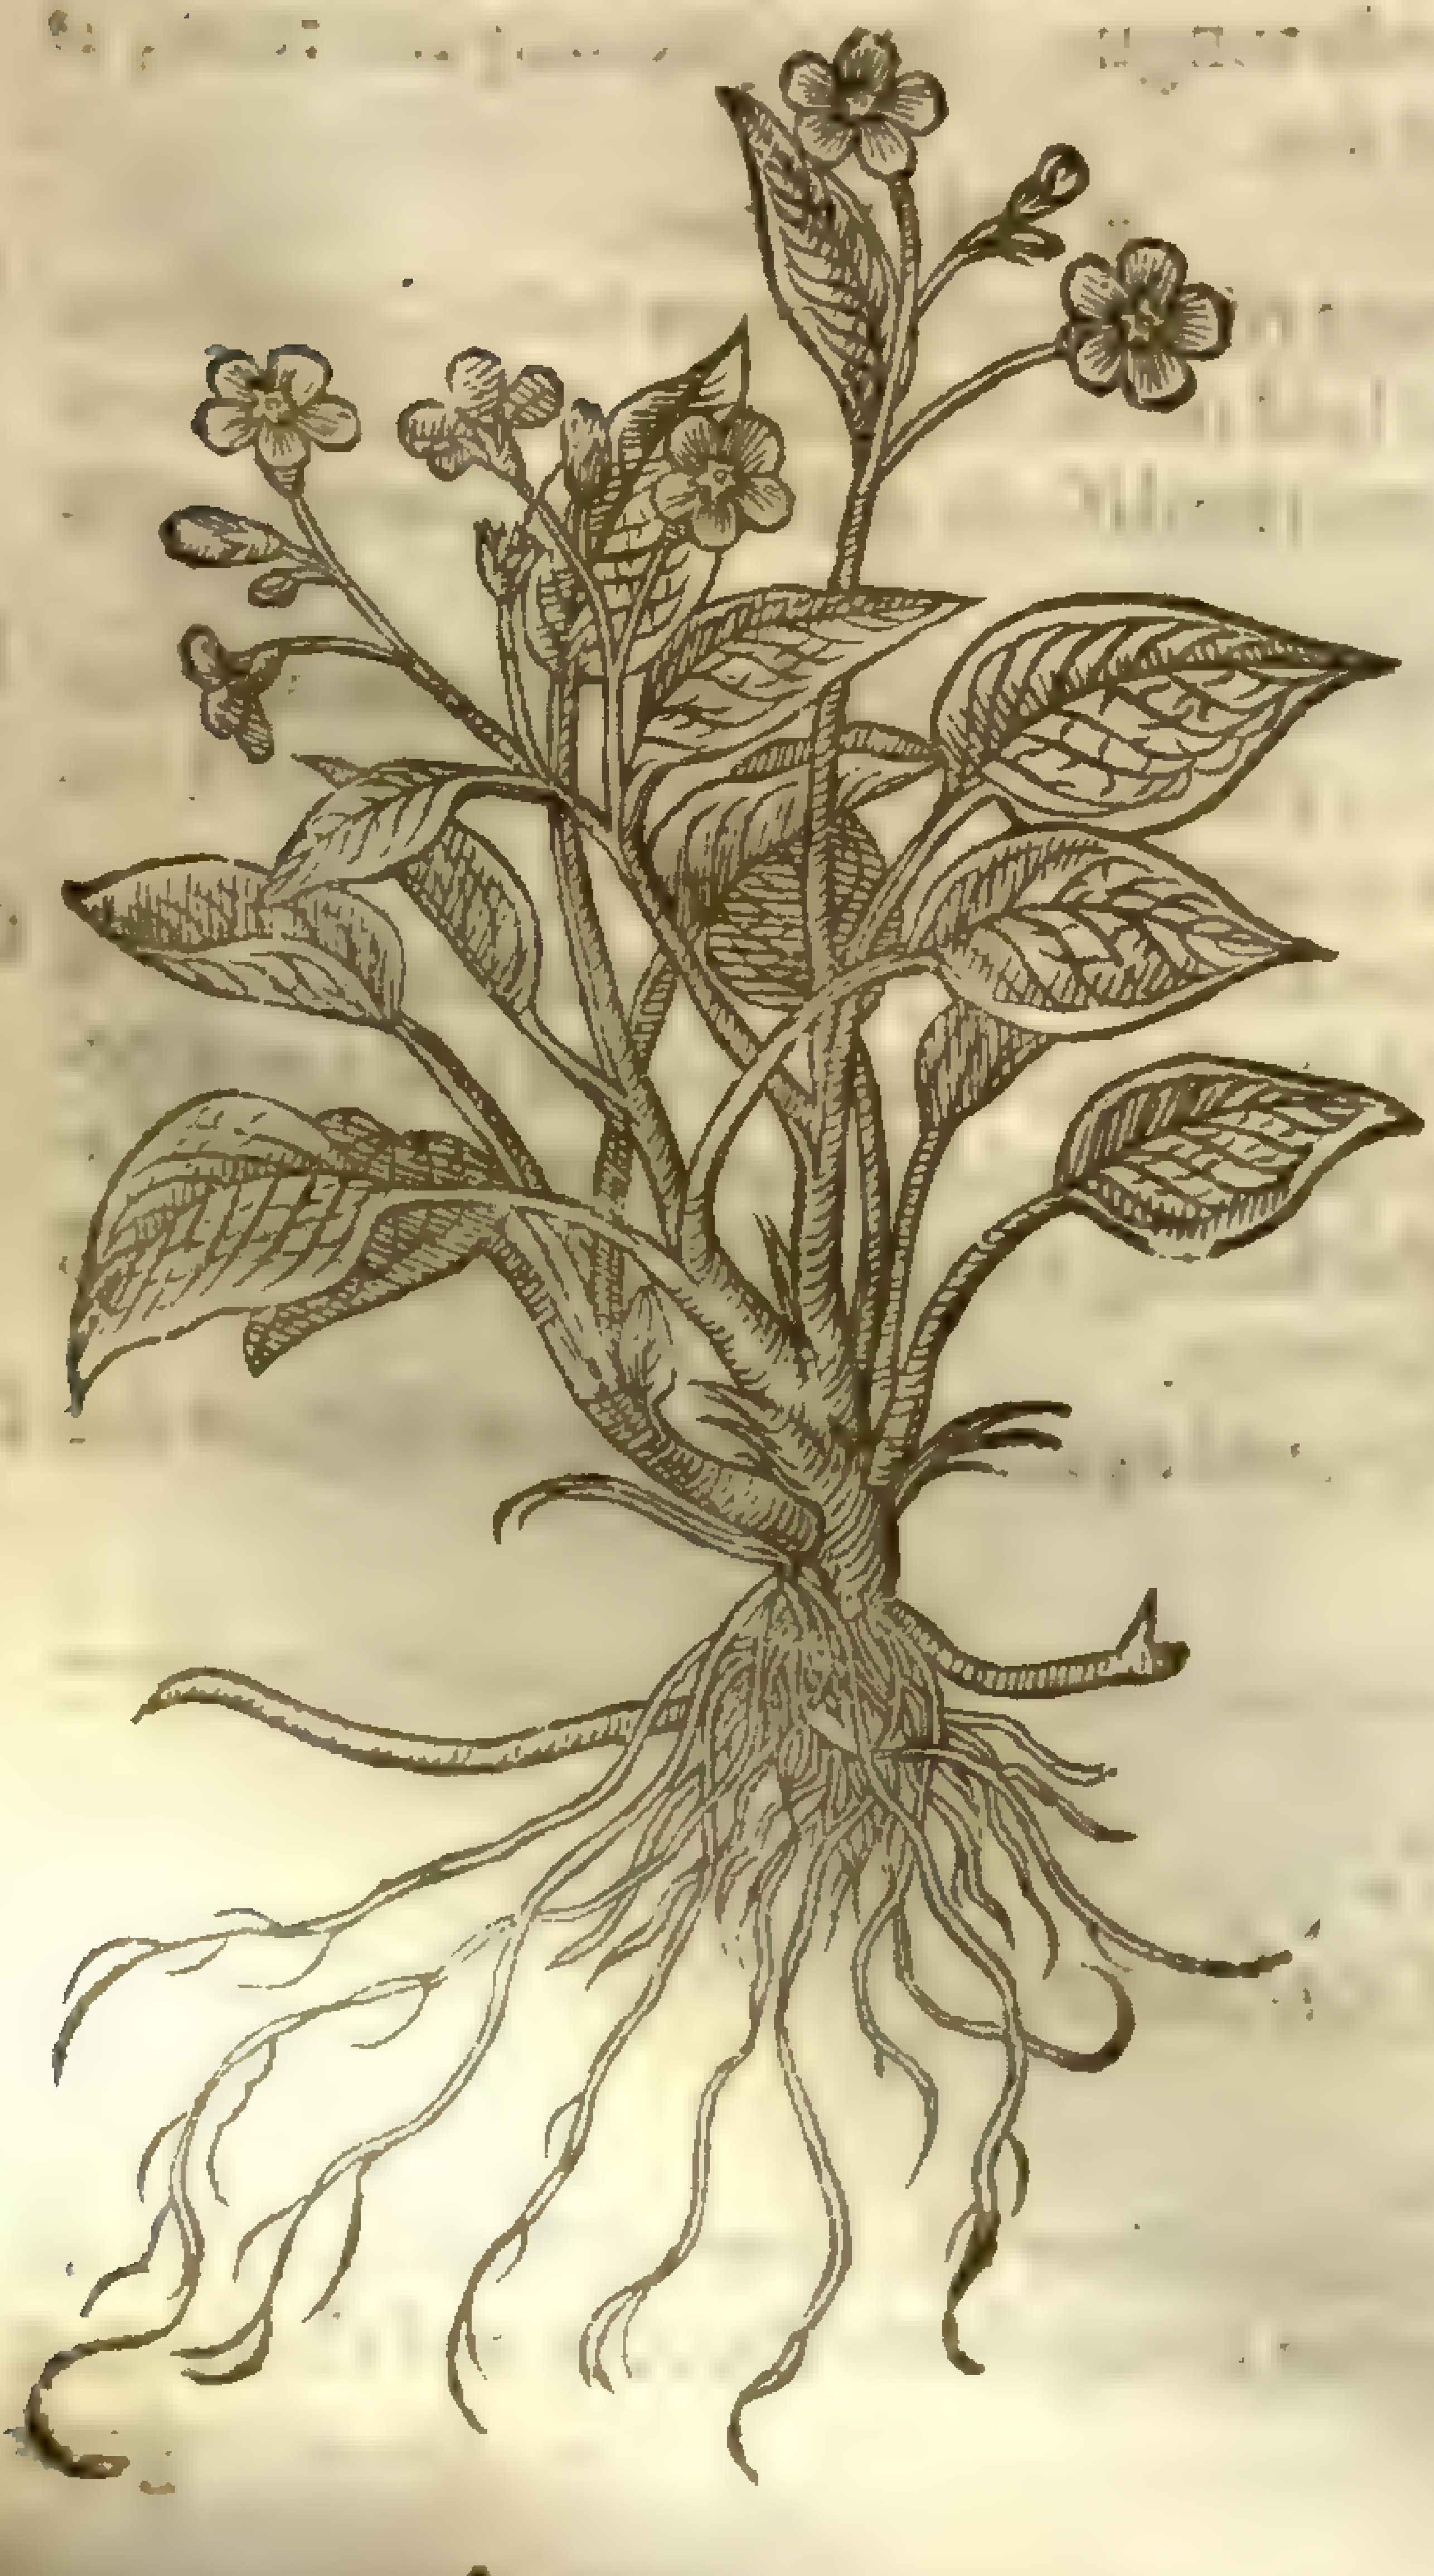
Symphytum officinale, L. Huds. dict. Sm. Fl. i. 263

‡ 3 *Symphytum tuberoſum.*
Comfrey with the knobbed root.



S. tuberosum, L. Huds. dict. Sm. Fl. i. 265

‡ 4 *Symphytum parvum Boraginis facie.*
Borage-floured Comfrey.



[illegible] amplexicaulis, L. [illegible] dub.

grow vpon the ſtalkes are long, broad, rough, and pricking withall, ſomething hairy, and beeing handled make the hands itch, very like in colour and roughneſſe to thoſe of Borage, but longer, and ſharp pointed as bee the leaues of Elecampane: from out the wings of the ſtalkes appeare the floures orderly placed, long, hollow within, of a light red colour: after them growes the ſeed which is black: the root is long and thick, black without, white within, hauing in it a clammy iuice, in which root conſiſteth the vertue.

2 The great Comfrey hath rough hairy ſtalks and long rough leaues much like the garden Bugloſſe, but greater and blacker: the flours be round and hollow like little bells, of a white colour: the root is black without, white within, and very ſlimy. ‡ This differs no way from the former but only in the colour of the flour, which is yellowiſh or white, whenas the other is rediſh or purple. ‡

3 There is another kind of Comfrey which hath leaues like the former, ſauing that they bee leſſer: the ſtalks are rough and tender: the flours be like the former, but that they be of an ouerworn yellow colour: the roots are thicke, ſhort, blacke without, and tuberous, ‡ which in the figure are not expreſſed ſo large and knobby as they ought to haue bin. ‡

‡ 4 This pretty plant hath fibrous and blackiſh roots, from which riſe vp many leaues like thoſe of Borage or Comfrey, but much ſmaller and greener, the ſtalks are ſome eight inches high, and on their tops carry prety floures like thoſe of Borage, not ſo ſharp pointed, but of a more pleaſing blew colour. This flours in the Spring, and is kept in ſome choice gardens: *Lobel* calls it *Symphytum pumilum repens Borraginis facie, ſiue Borrago minima Herbariorum.*

¶ *The Place.*

Comfrey ioyeth in waterie ditches, in fat and fruitfull medowes: they grow all in my garden.

¶ *The Time.*

They floure in Iune and Iuly.

¶ *The Names.*

It is called in Greeke Σύμφυτον: in Latine, *Symphytum*, and *Solidago*: in ſhops, *Conſolida major*, and *Symphytum majus*: of *Scribonius Largus*, *Inula ruſtica*, and *Alus Gallica*: of others, *Oſteocollon*: in high Dutch, **Walwurtz**: in low-Dutch, **Waelwortele**: in Italian, *Conſolida maggiore*: in Spaniſh, *Sueldamajore*, and *Conſuelda maior*: in French, *Couſire*, and *Oreille d'aſne*: in Engliſh, Comfrey, Comfrey Conſound: of ſome, Knit-backe, and Blackwort.

¶ *The Temperature.*

The root of Comfrey hath a cold qualitie, but yet not much: it is alſo of a clammy and gluing moiſture, it cauſeth no itch at all, neither is it of a ſharpe or biting taſte, but vnſauorie or without taſte; ſo farre is the tough and gluing moiſture from the ſharpe clammineſſe of the ſea Onion, as that there is no compariſon betweene them. The leaues may cauſe itching not through heate or ſharpeneſſe, but through their ruggedneſſe, as we haue already written, yet leſſe than thoſe of the Nettle.

¶ *The Vertues.*

The roots of Comfrey ſtamped, and the iuyce drunke with wine, helpeth thoſe that ſpit bloud, and healeth all inward wounds and burſtings. A

The ſame bruiſed and layd to in manner of a plaiſter, doth heale all freſh and green wounds, and are ſo glutinatiue, that it wil ſoder or glew together meat that is chopt in pieces, ſeething in a pot, and make it in one lumpe. B

The roots boiled and drunke, do clenſe the breſt from flegme, and cure the griefes of the lungs, eſpecially if they be confect with ſugar and ſyrrup: it preuaileth much againſt ruptures or burſtings. C

The ſlimy ſubſtance of the root made in a poſſet of ale, and giuen to drinke againſt the paine in the backe gotten by any violent motion, as wreſtling, or ouermuch vſe of women, doth in foure or fiue days preſently cure the ſame, although the involuntarie flowing of the ſeed in man be gotten thereby. D

The roots of Comfry in number foure, Knot-graſſe and the leaues of Clary of each an hand full, ſtamped all together, ſtrained, and a quart of Muſcadel put thereto, the yelks of three eggs, and the pouder of three nutmegs drunke firſt and laſt, is a moſt excellent medicine againſt a Gonorrhæa or running of the reins, and all paines and conſumptions of the backe. E

There is likewiſe a ſyrrup made hereof to be vſed in this caſe, which ſtayeth voiding of bloud, tempereth the heate of agues, allayeth the ſharpneſſe of flowing humors, healeth vp vlcers of the lungs, and helpeth the cough. The receit whereof is this: Take two ounces of the roots of great Comfrey, one ounce of Liquorice, two handfulls of Folefoot roots and all, one ounce and halfe of Pine-apple kernels, twenty Iuiubes, two drams or a quarter of an ounce of Mallow ſeed, one dram of the heads of Poppy; boile all in a ſufficient quantitie of water till one pint remain, ſtrain it, and adde to the liquor ſix ounces of very white ſugar, and as much of the beſt hony, and make thereof a ſyrrup that muſt be throughly boiled. F

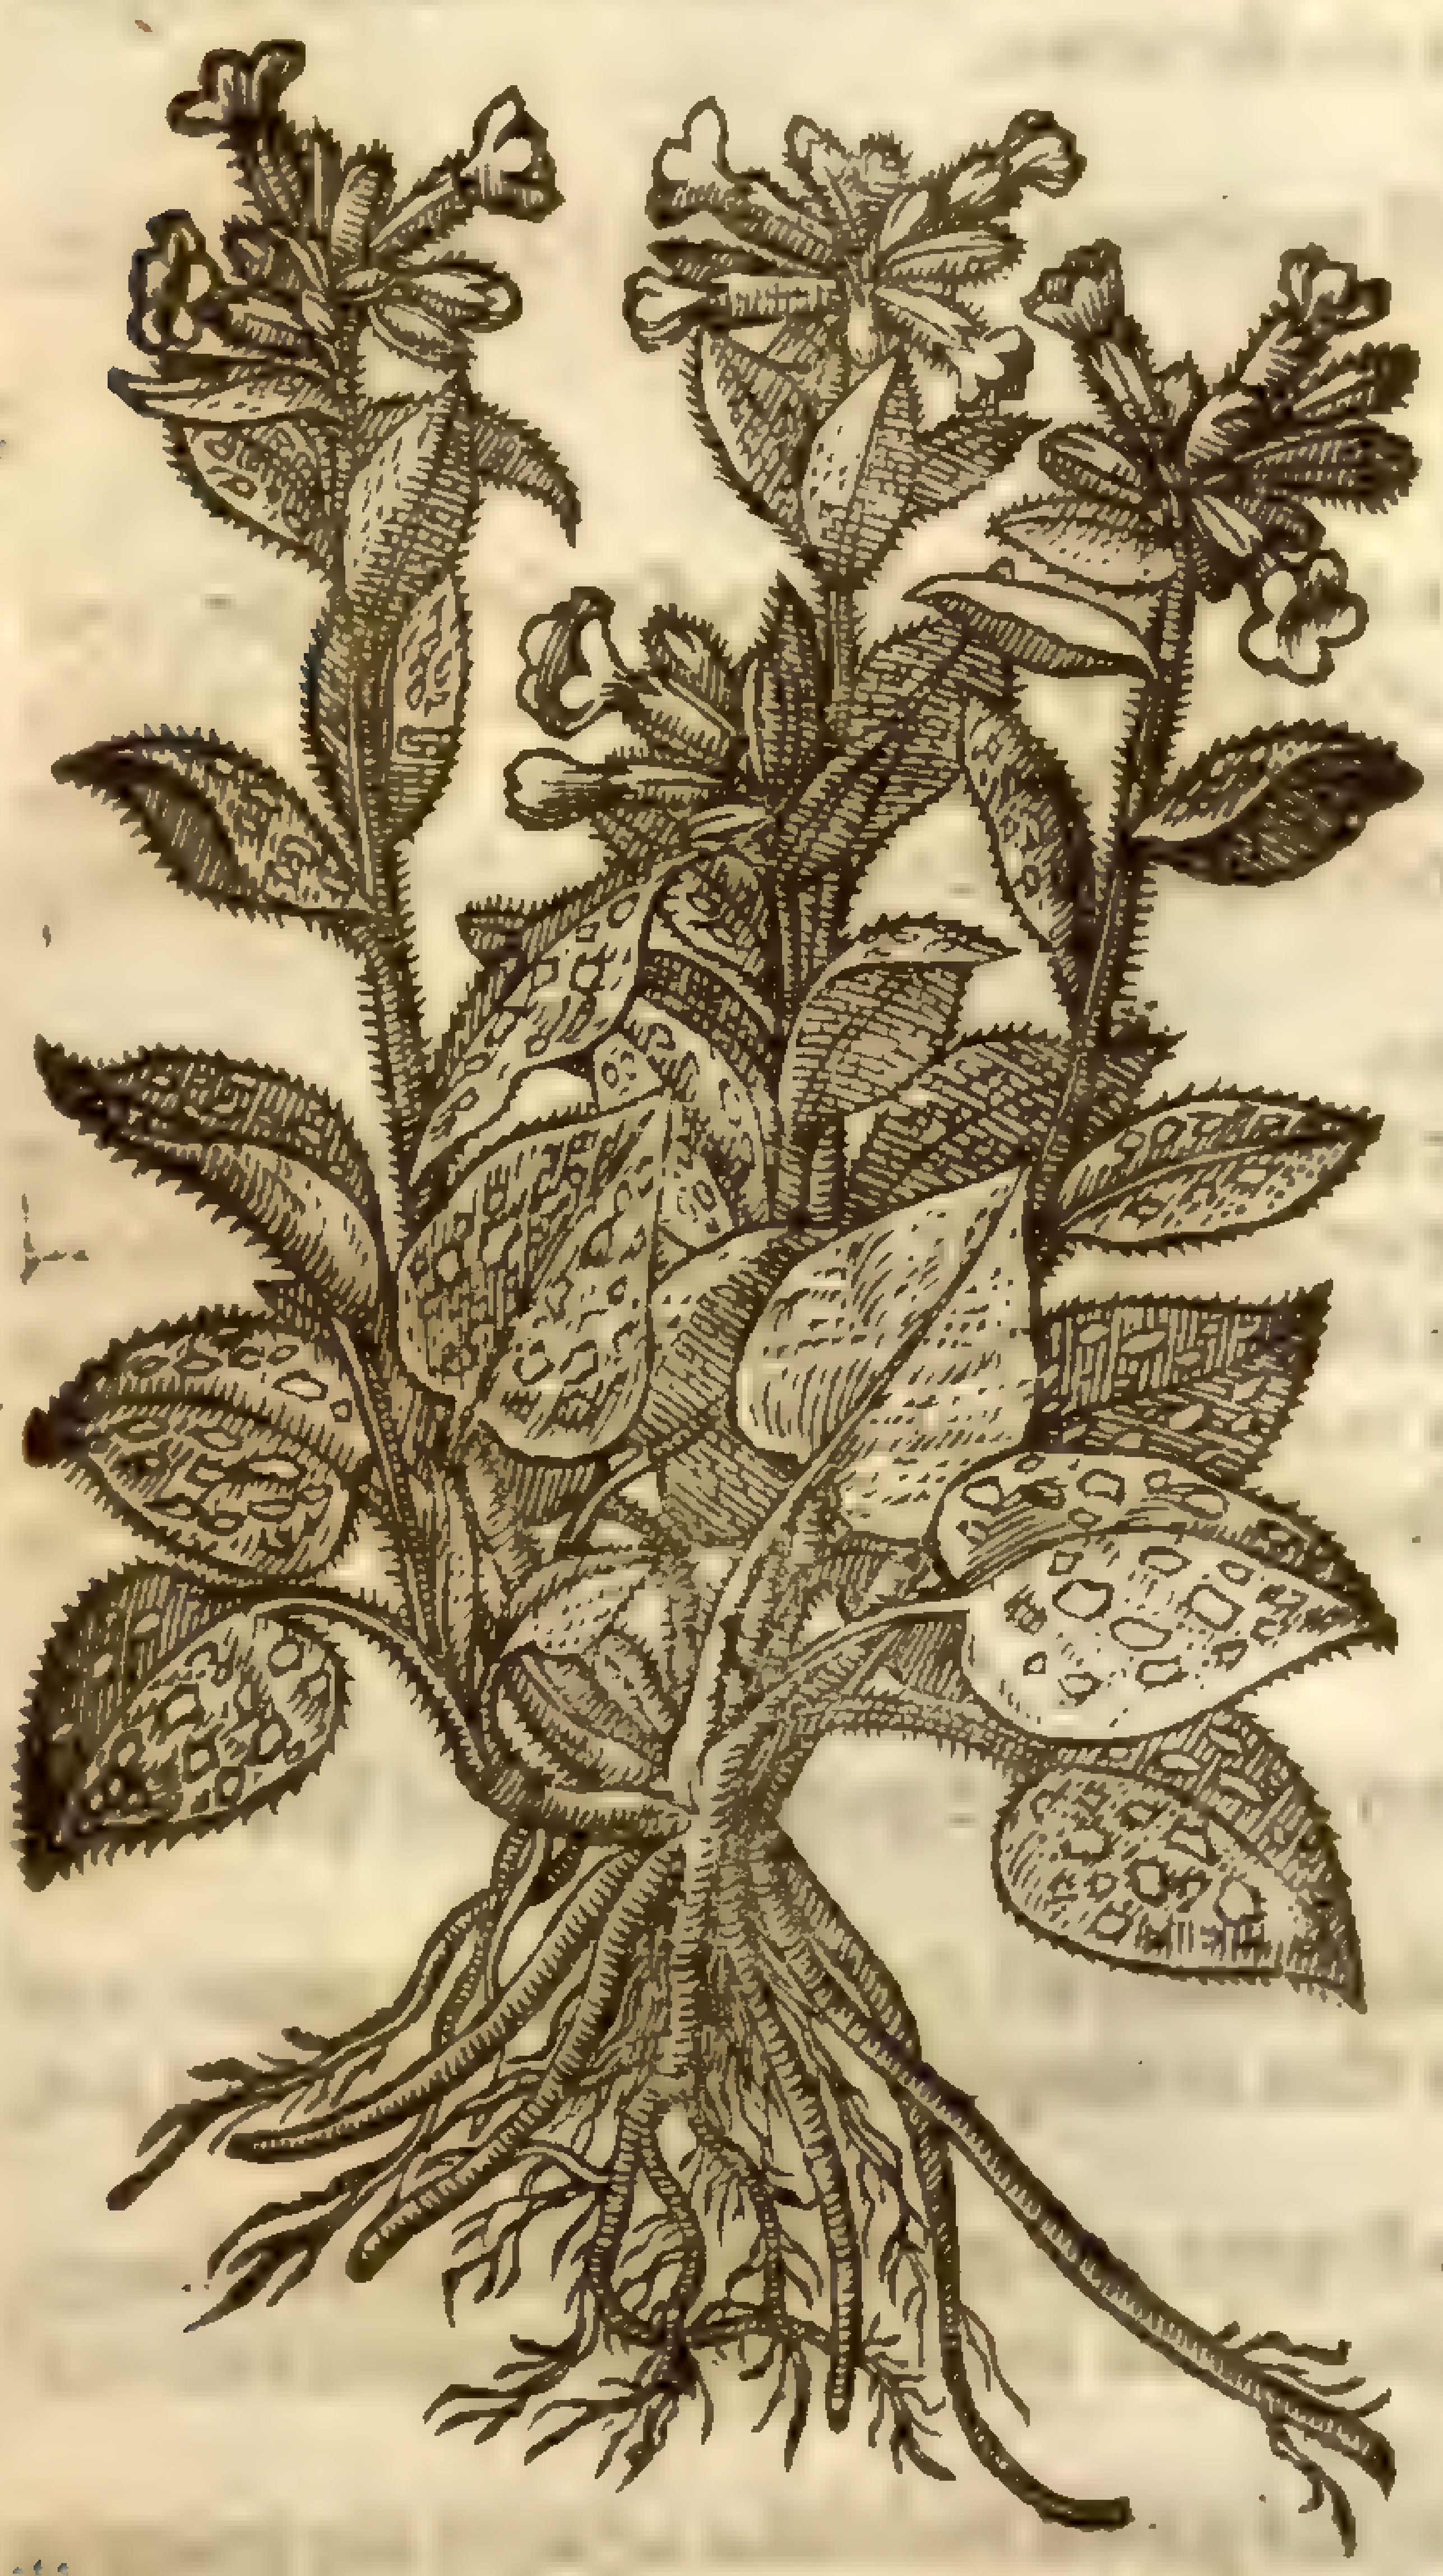
The ſame ſyrrup cureth the vlcers of the kidnies, though they haue bin of long continuance, and ſtoppeth the bloud that commeth from thence. G

Moreouer, it ſtayeth the ouermuch flowing of the monethly ſickneſſe, taken conſtantly for certain daies together. H

It is highly commended for wounds or hurts of all the intrales and inward parts, and for burſtings or ruptures. I

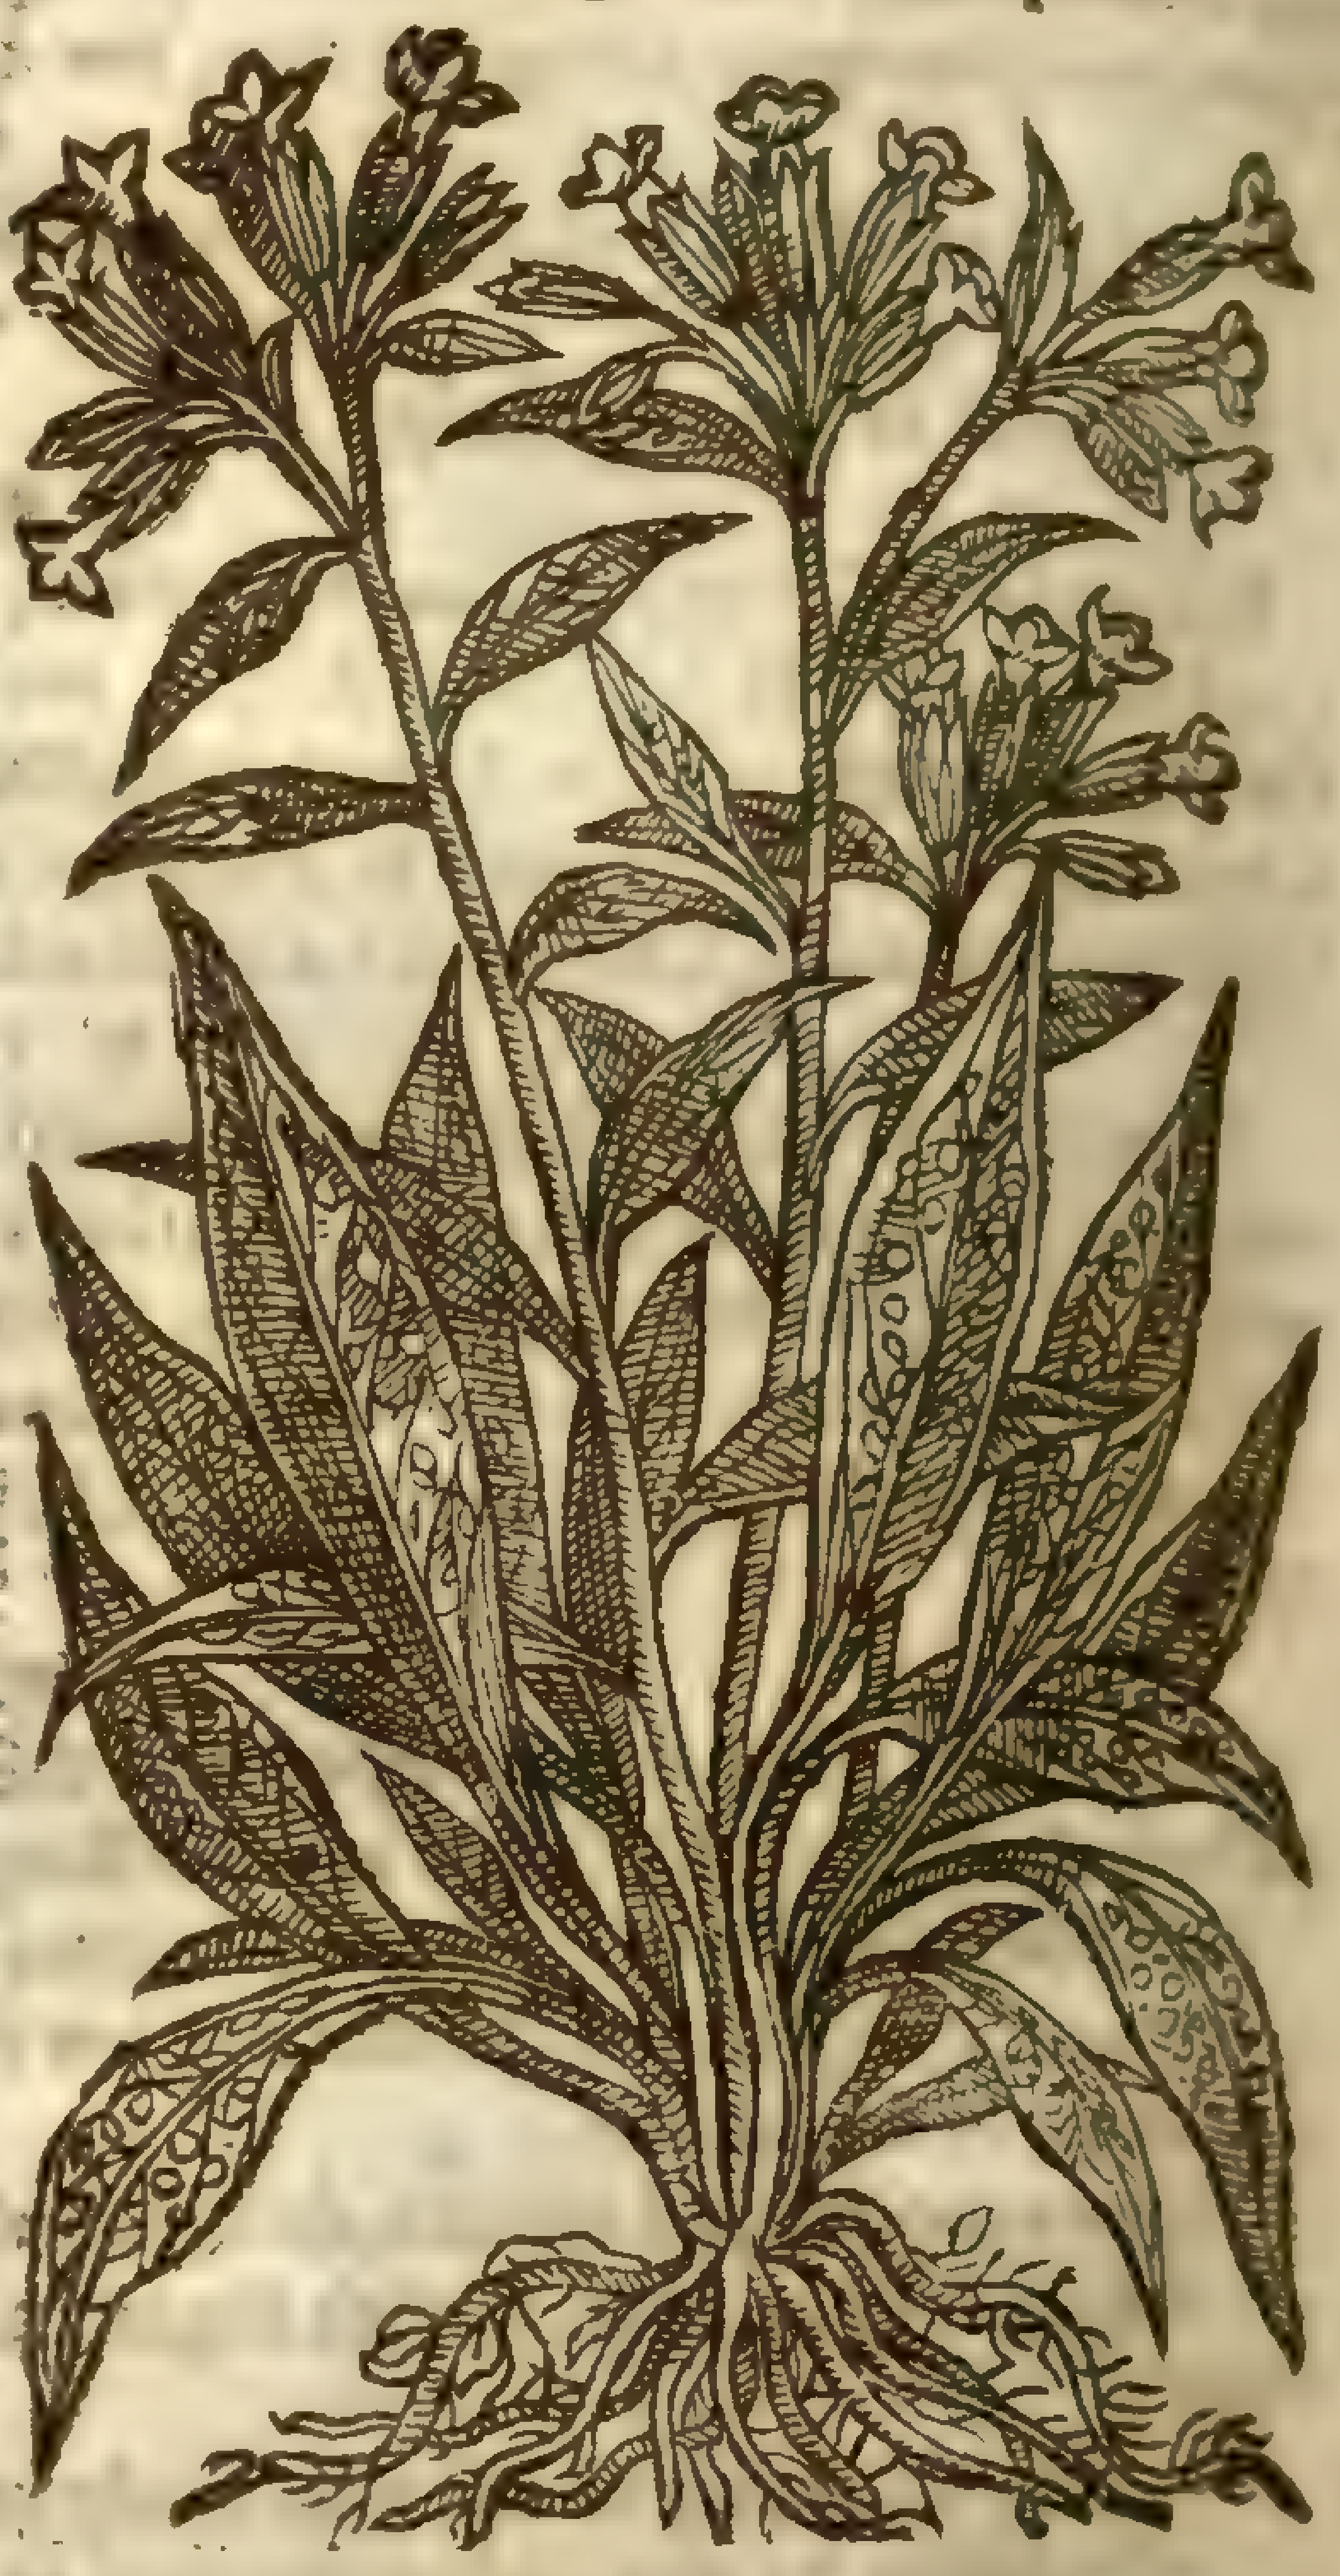
The root ſtamped and applied, taketh away the inflammation of the fundament, and ouermuch flowing of the hemorrhoids. K

Chap. 288. *Of Cowſlips of Ieruſalem.*



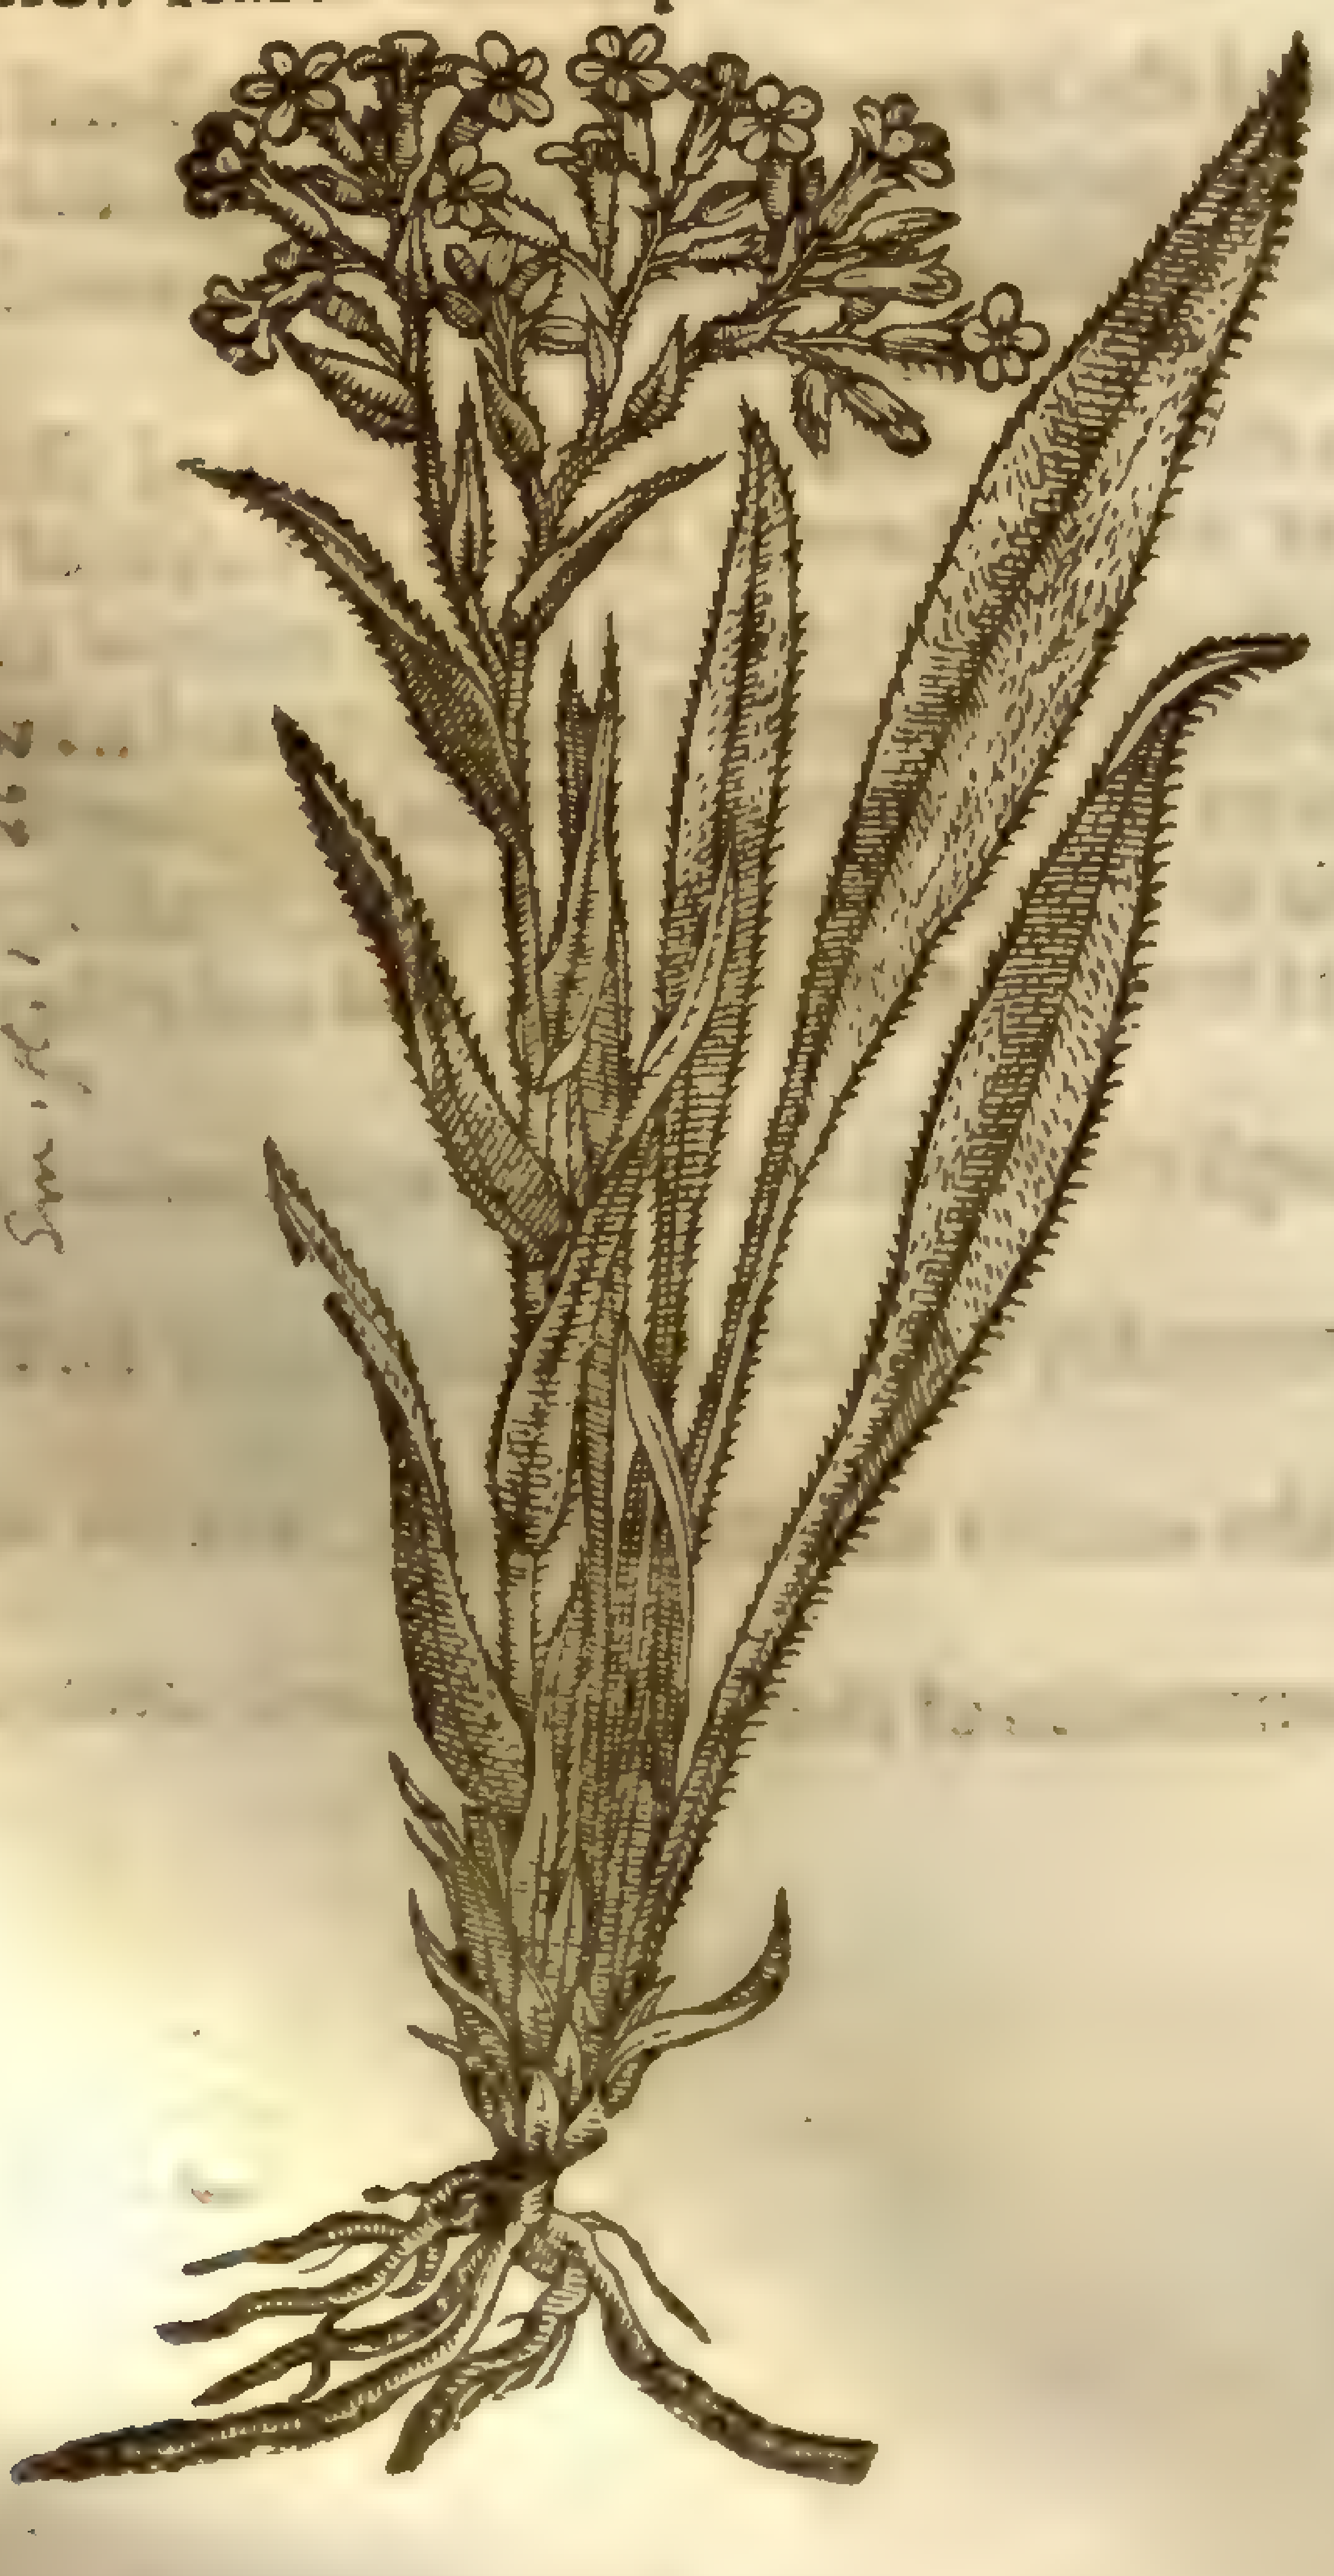
1 *Pulmonaria maculoſa.*
Spotted Cowſlips of Ieruſalem.

Pulmonaria officinalis, L.
mill. dict.
Sm. fl. 1.



2 *Pulmonaria folijs Echij.*
Bugloſſe Cowſlips.

Pulmonaria officinalis, L. mill. dict.
P. angustifolia, L. mill.
Sm. Bri. 2. 163
Sm. fl. 1.



3 *Pulmonaria angustifolia 2 Cluſij.*
Narrow leafed Cowſlips of Ieruſalem.

P. angustifolia, L.
mill. dict.
Sm. fl. 1. 262.

¶ *The Deſcription.*

1 Cowſlip of Ieruſalem, or the true and right Lung-woort hath rough hairie and large leaues of a brown green color, confuſedly ſpotted with diuers ſpots or drops of white: among which ſpring vp certain ſtalks a ſpanne long, bearing at the top many fine flours, growing together in bunches like the flours of Cowſlips, ſauing that they be at the firſt red or purple, ſomtimes blew, and oftentimes all theſe colours at once. The floures being fallen, there come ſmall buttons ful of ſeed. The root is black and threddy. ‡ This is ſomtimes found with white floures. ‡

2 The ſecond kinde of Lungwort is like vnto the former, but greater in each reſpect; the leaues bigger than the former, reſembling wilde Bugloſſe, yet ſpotted with white ſpots like the former: the floures are like the other, but of an exceeding ſhining red color.

3 *Cluſius* ſetteth forth a third kinde of Lungwort, which hath rough & hairy leaues like vnto wild Bugloſſe, but narrower: among which riſes vp a ſtalke a foot high, bearing at the top a bundle of blew floures; in faſhion like vnto thoſe of Bugloſſe or the laſt deſcribed.

¶ The

¶ *The Place.*

Theſe plants do grow in moiſt ſhadowie woods, and are planted almoſt euery where in Gardens. ‡ M. *Goodyer* found the *Pulmonaria folijs Echij*, being the ſecond, May 25. *Anno* 1620. flouring in a wood by Holbury houſe in the New Forreſt in Hampſhire. ‡

¶ *The Time.*

They floure for the moſt part in March and Aprill.

¶ *The Names.*

Cowſlips of Ieruſalem, or Sage of Ieruſalem, is called of the Herbariſts of our time, *Pulmonaria*, and *Pulmonalis*; of *Cordus*, *Symphytum ſylueſtre*, or wilde Comfrey: but ſeeing the other is alſo of nature wilde, it may aptly be called *Symphytum maculoſum*, or *Maculatum*: in high Dutch, **Lungenkraut**: in low Dutch, **Onser vrouwen melcruit**: in Engliſh, ſpotted Comfrey, Sage of Ieruſalem, Cowſlip of Ieruſalem, Sage of Bethlem, and of ſome Lungwort; notwithſtanding there is another Lungwort, of which we will intreat among the kindes of Moſſes.

¶ *The Temperature.*

Pulmonaria ſhould be of like temperature with the great Comfrey, if the root of this were clammie: but ſeeing that it is hard and wooddy, it is of a more drying quality and more binding.

¶ *The Vertues.*

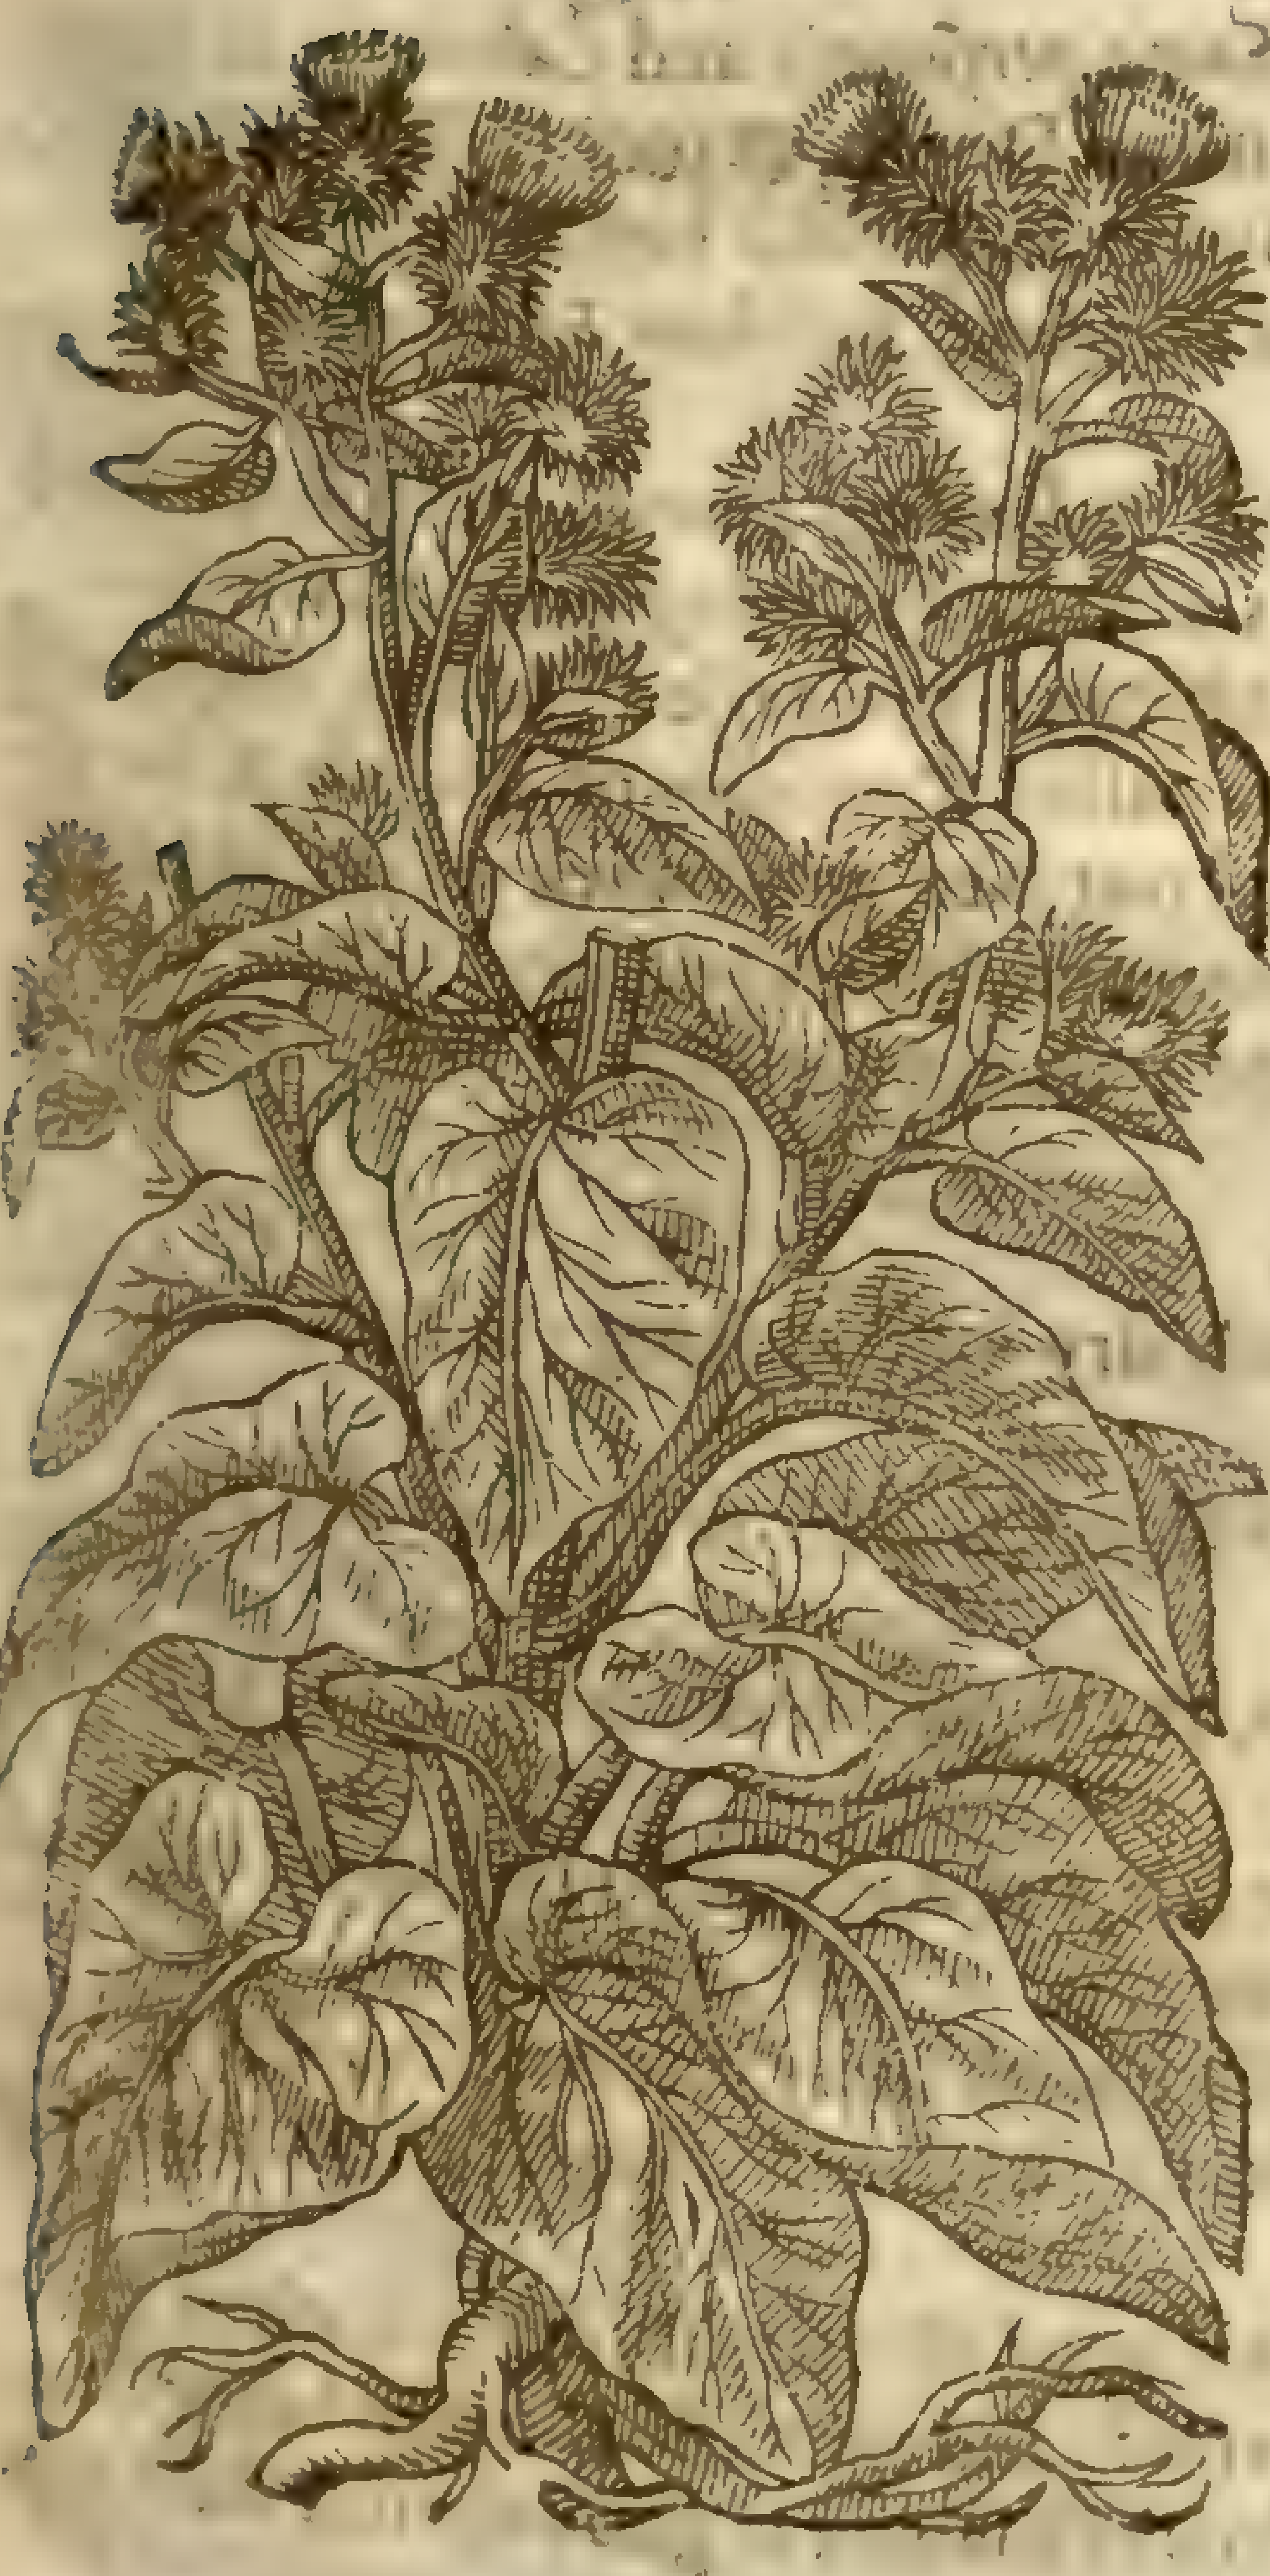
The leaues are vſed among pot-herbes. The roots are alſo thought to be good againſt the infirmities and vlcers of the lungs, and to be of like force with the great Comfrey.

‡ The figure which formerly was in the fourth place of this chapter, was onely of the firſt deſcribed with white floures. But the Title *Pulmonaria Gallorum*, and the deſcription fitted (though little to the purpoſe, and therefore omitted) were intended for the *Pulmonaria Gallorum ſiue aurea*, whereof I haue in the due place largely treated, as you may ſee in this booke, *pag.* 304, *chap.* 36.

Chap. 289. *Of Clote Burre, or Burre Docke.*

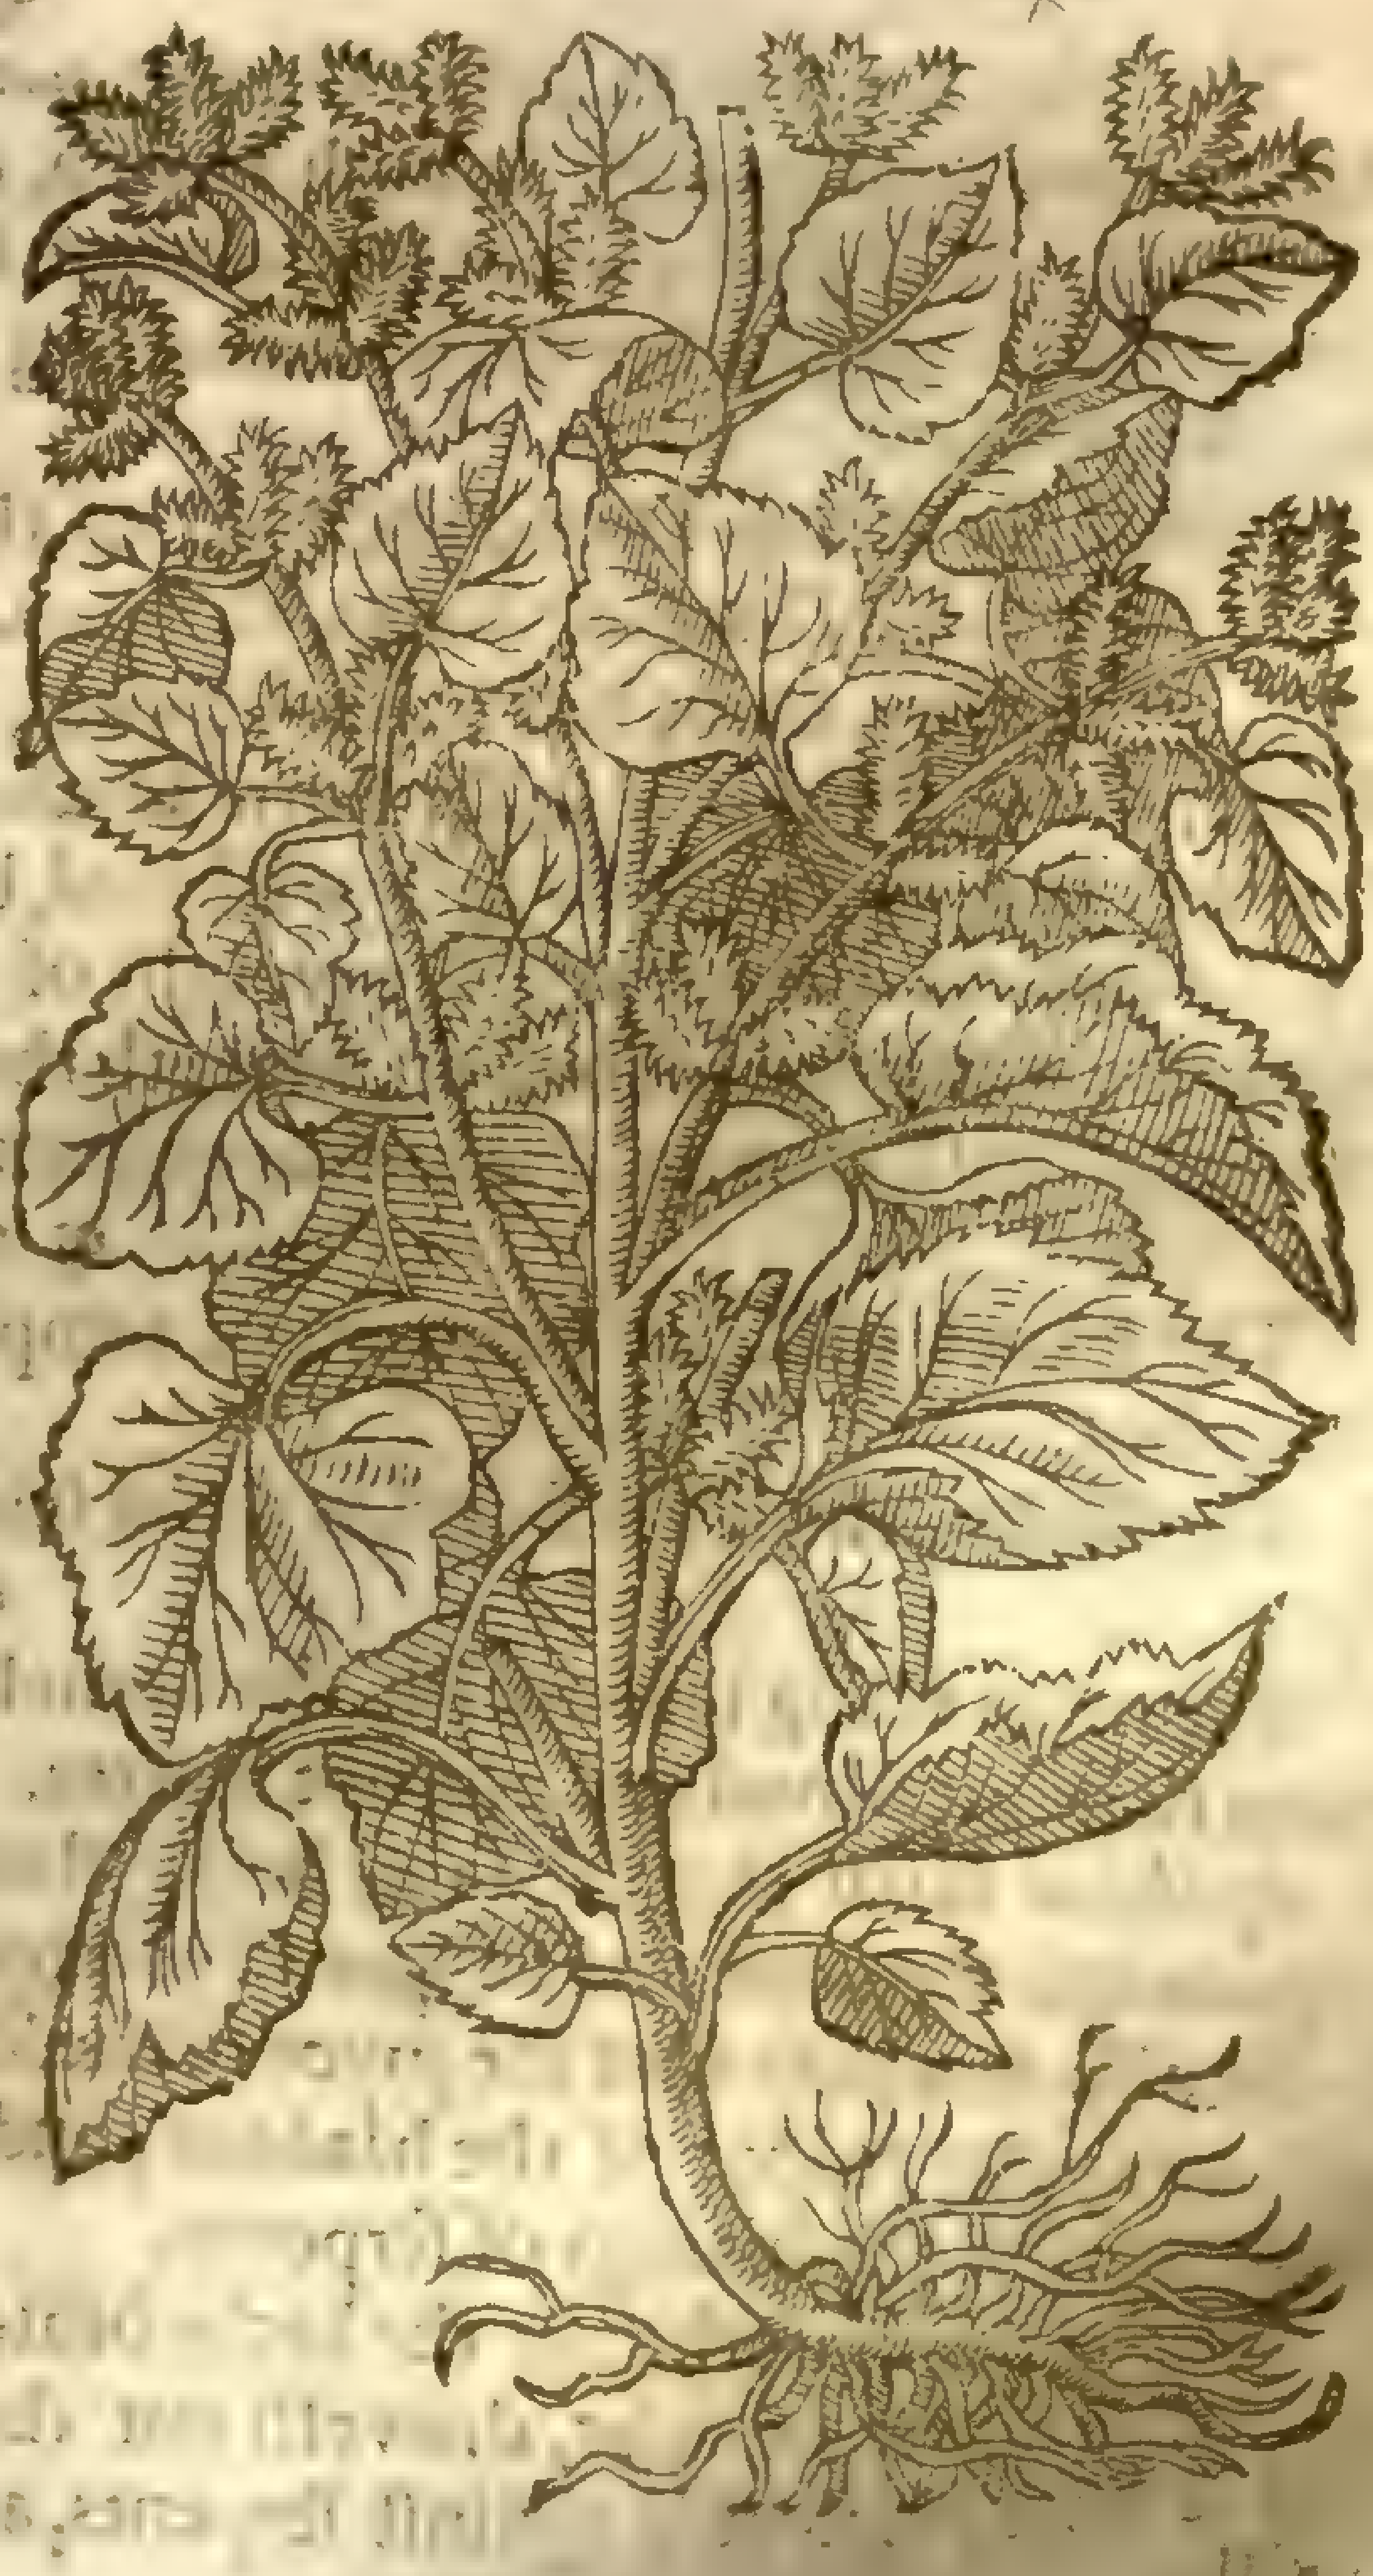
1 *Bardana major.*
The great Burre-Docke.

Sm pl. 3. 380



2 *Bardana minor.*
The leſſer Burre Docke.

Xanthium



b.p.ii. 587

¶ *The Deſcription.*

1 Clot-Burre bringeth forth broad leaues and hairy, far bigger than the leaues of Gourds, and of greater compaſſe, thicker alſo, and blacker, which on the vpper ſide are of a darke greene colour, and on the neither ſide ſomewhat white: the ſtalke is cornered, thicke, beſet with like leaues, but farre leſſe, diuided into very many wings and branches, bringing forth great Burres round like bullets or balls, which are rough all ouer, and full of ſharpe crooked prickles, taking hold on mens garments as they paſſe by; out of the tops whereof groweth a floure thrummed, or all of threds, of colour purple: the ſeed is perfected within the round ball or bullet, and this ſeed when the burres open, and the wind bloweth, is carried away with the winde: the root is long, white within, and blacke without.

‡ There is another kinde hereof which hath leſſer and ſofter heads, with weaker prickles; theſe heads are alſo hairy or downy, and the leaues and whole plant ſomewhat leſſe, yet otherwiſe like the fore deſcribed; *Lobel* calls this *Arction montanum*, and *Lappa minor Galeni*: it is alſo the *Lappa minor altera* of *Matthiolus*. *Lobel* found this growing in Somerſetſhire three miles from Bath, neere the houſe of one Mr. *Iohn Colt*. ‡

2 The leſſer Burre hath leaues farre ſmall than the former, of a grayiſh ouerworne colour like to thoſe of Orach, nicked round about the edges: the ſtalke is a foot and halfe high, full of little blacke ſpots, diuiding it ſelfe into many branches: the flours before the Burres come forth do compaſſe the ſmall ſtalkes round about; they are but little, and quickely vade away: then follow the Burres or the fruit out of the boſome of the leaues, in forme long, on the tops of the branches, as big as an Oliue or a Cornell berry, rough like the balls of the Plane tree, and being touched cleaue faſt vnto mens garments: they do not open at all, but being kept cloſe ſhut bring forth long ſeeds: The root is faſtned with very many ſtrings, and groweth not deepe.

¶ *The Place.*

The firſt groweth euery where: the ſecond I found in the high way leading from Draiton to Iuer, two miles from Colbrooke, ſince which time I haue found it in the high way between Stanes and Egham. ‡ It alſo groweth plentifully in Southwicke ſheet in Hampſhire, as I haue beene enformed by Mr. *Goodyer*. ‡

¶ *The Time.*

Their ſeaſon is in Iuly and Auguſt.

¶ *The Names.*

The great Burre is called in Greeke, ἄρκτιον: in Latine, *Perſonata*, *perſonatia*, and *Arcium*: in ſhops, *Bardana*, and *Lappa maior*: in high Dutch, **Groſsklettẽ**: in low Dutch, **Groot cliſſen**: in French, *Glouteron*: in Engliſh, Great Burre, Burre Docke, or Clot Burre: *Apuleius* beſides theſe doth alſo ſet downe certaine other names belonging to Clot Burre, as *Dardana*, *Bacchion*, *Elephantoſis*, *Nephelion*, *Manifolium*.

The leſſer Burre Docke is called of the Græcians, Ξάνθιον: in Latine, *Xanthium*: in ſhops, *Lappa minor*, *Lappa inuerſa*, and of diuers, *Strumaria*: *Galen* ſaith it is alſo called, *Phaſganion*, and *Phaſganon*, or herbe victory, being but baſtard names, and therefore not properly ſo called: in Engliſh, Louſe Burre, Ditch Burre, and leſſer Burre Docke: it ſeemeth to be called *Xanthium* of the effect, for the Burre or fruit before it be fully withered, being ſtamped and put into an earthen veſſell, and afterward when need requireth the weight of two ounces thereof and ſomewhat more, being ſteeped in warme water and rubbed on, maketh the haires of the head red: yet the head is firſt to be dreſſed or rubbed with niter, as *Dioſcorides* writeth.

¶ *The Temperature.*

The leaues of Clot Burre are of temperature moderately dry and waſting; the root is ſomething hot.

The ſeed of the leſſer Burre, as *Galen* ſaith, hath power to digeſt, therefore it is hot and dry.

¶ *The Vertues.*

A The roots being taken with the kernels of Pine Apples, as *Dioſcorides* witneſſeth, are good for them that ſpit bloud and corrupt matter.

B *Apuleius* ſaith that the ſame being ſtamped with a little ſalt, and applied to the biting of a mad dog, cureth the ſame, and ſo ſpeedily ſetteth free the ſicke man.

C He alſo teacheth that the juyce of the leaues giuen to drinke with hony, procureth vrine, and taketh away the paines of the bladder; and that the ſame drunke with old wine doth wonderfully helpe againſt the bitings of ſerpents.

D *Columella* declareth, that the herbe beaten with ſalt and laid vpon the ſcarifying, which is made with the launcet or raſer, draweth out the poyſon of the viper: and that alſo the root being ſtamped is more auaileable againſt ſerpents, and that the root in like manner is good againſt the Kings euill.

E The ſtalke of Clot-Burre before the burres come forth, the rinde pilled off, being eaten raw with ſalt and pepper, or boyled in the broth of fat meate, is pleaſant to be eaten: being taken in that manner it increaſeth ſeed and ſtirreth vp luſt.

F Alſo it is a good nouriſhment, eſpecially boyled: if the kernell of the Pine Apple be likewiſe added it is the better, and is no leſſe auailable againſt the vlcers of the lungs, and ſpitting of bloud, than the root is.

G The root ſtamped and ſtrained with a good draught of Ale is a moſt approued medicine for a windie or cold ſtomacke.

H Treacle of Andromachus, and the whites of egges, of each a like quantitie, laboured in a leaden mortar, and ſpred vpon the Burre leafe, and ſo applied to the gout, haue beene proued many times moſt miraculouſly to appeaſe the paine thereof.

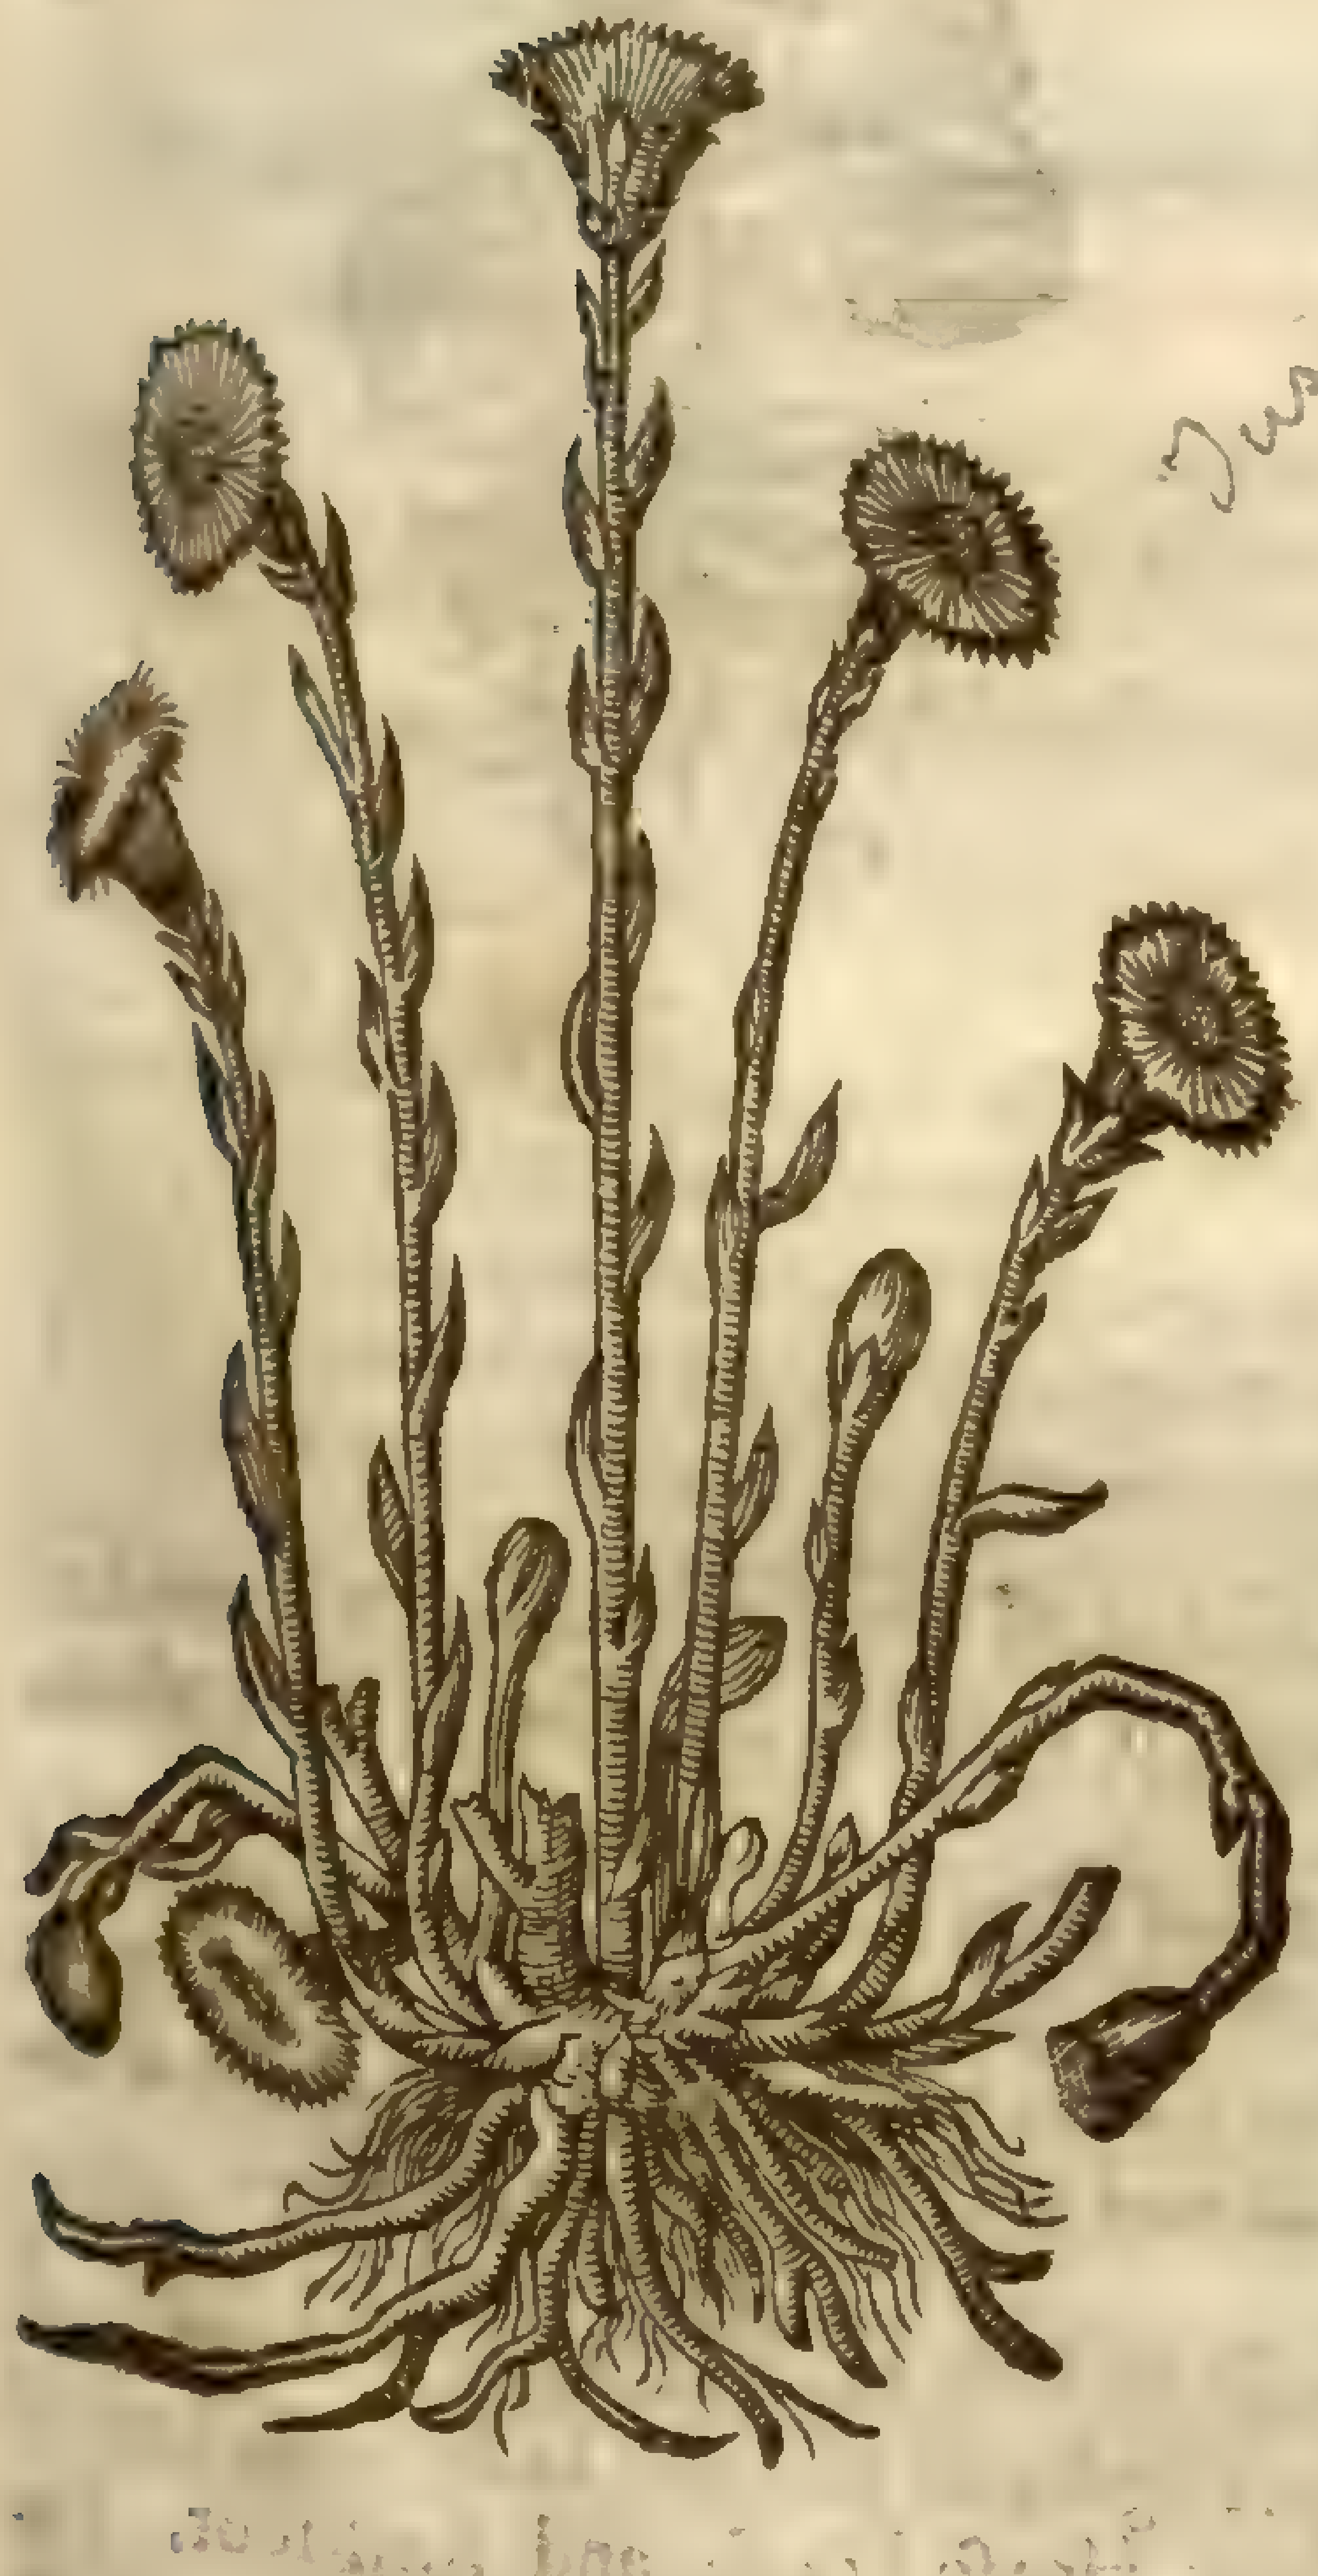
I *Dioſcorides* commendeth the decoction of the root of *Arcion*, together with the ſeed, againſt the tooth-ach, if it be holden a while in the mouth: alſo that it is good to foment therewith both burnings and kibed heeles; and affirmeth that it may be drunke in wine againſt the ſtrangury, and paine in the hip.

K *Dioſcorides* reporteth that the fruit is very good to be laid vnto hard ſwellings.

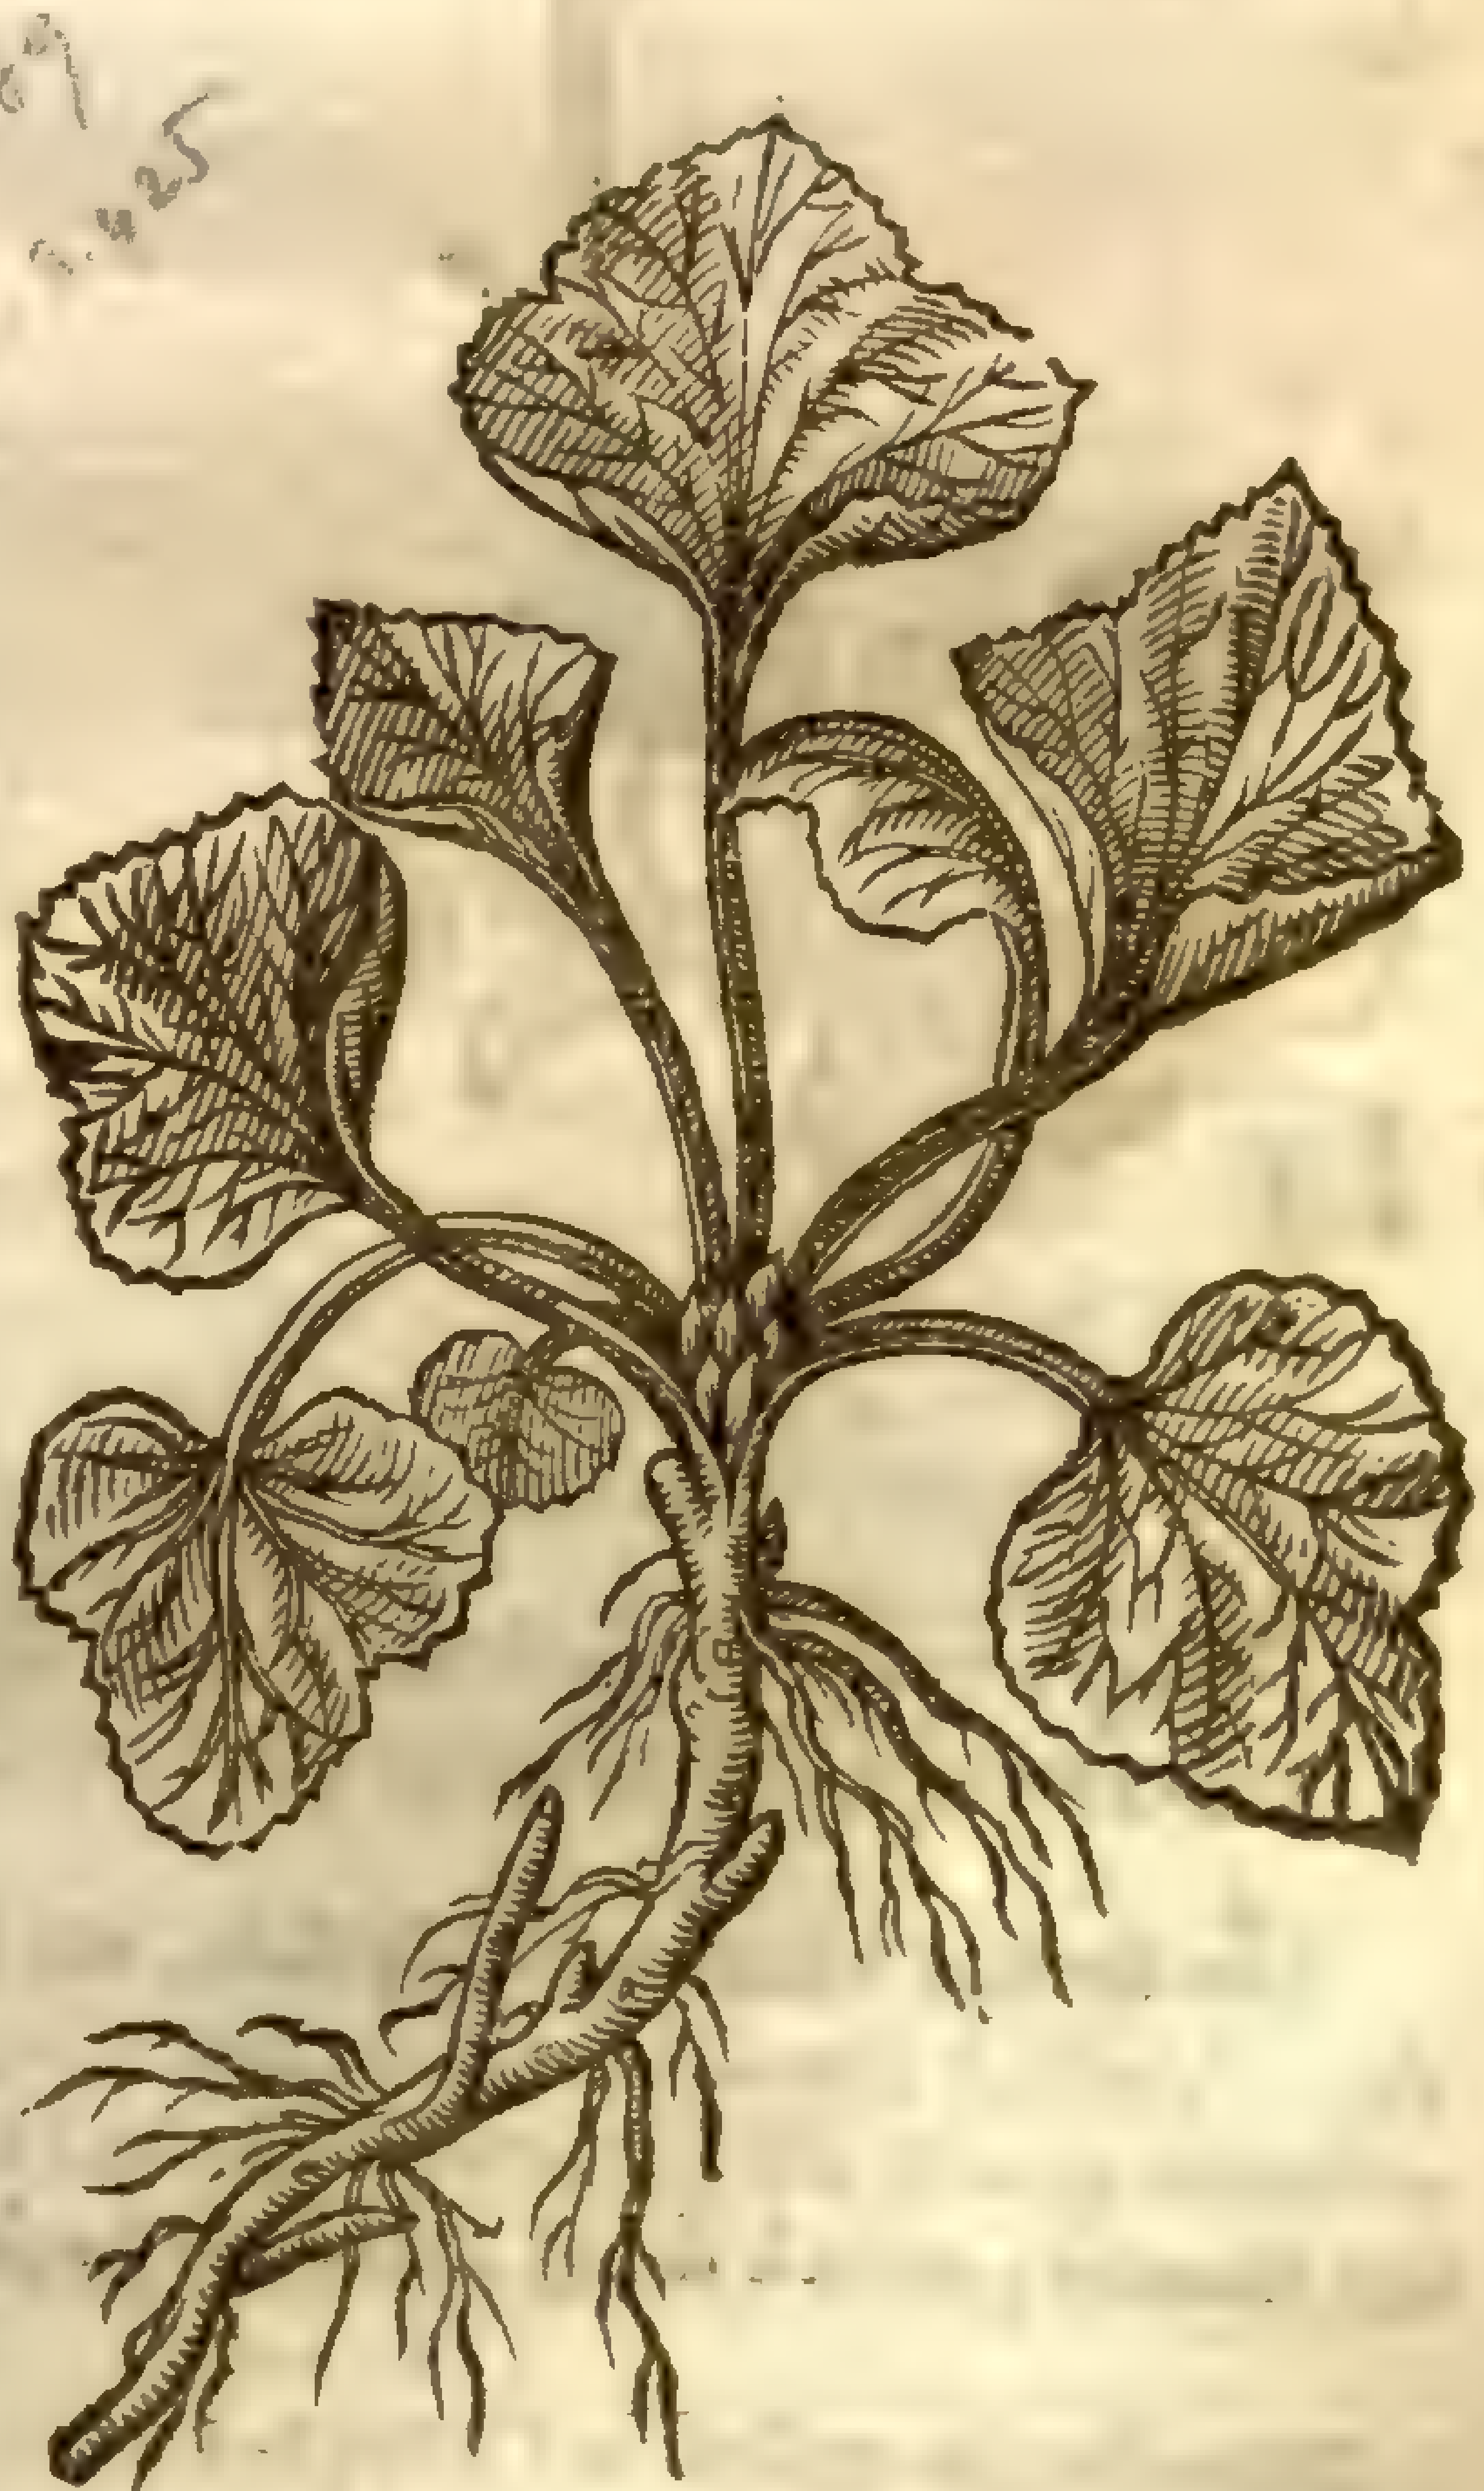
L The root cleane picked, waſhed, ſtamped, and ſtrained with Malmeſey, helpeth the running of the reines, the whites in women, and ſtrengtheneth the backe, if there be added thereto the yelks of egges, the pouder of acornes and nutmegs brued or mixed together, and drunke firſt and laſt.

Chap. 290. *Of Colts-foot, or Horſe-foot.*

1 *Tuſſilago florens.*
Colts-foot in floure.



1 *Tuſſilaginis folia.*
The leaues of Colts-foot.



Tussilago farfara
Linn. Sp.
W. ic. 569
Sm. p. 425

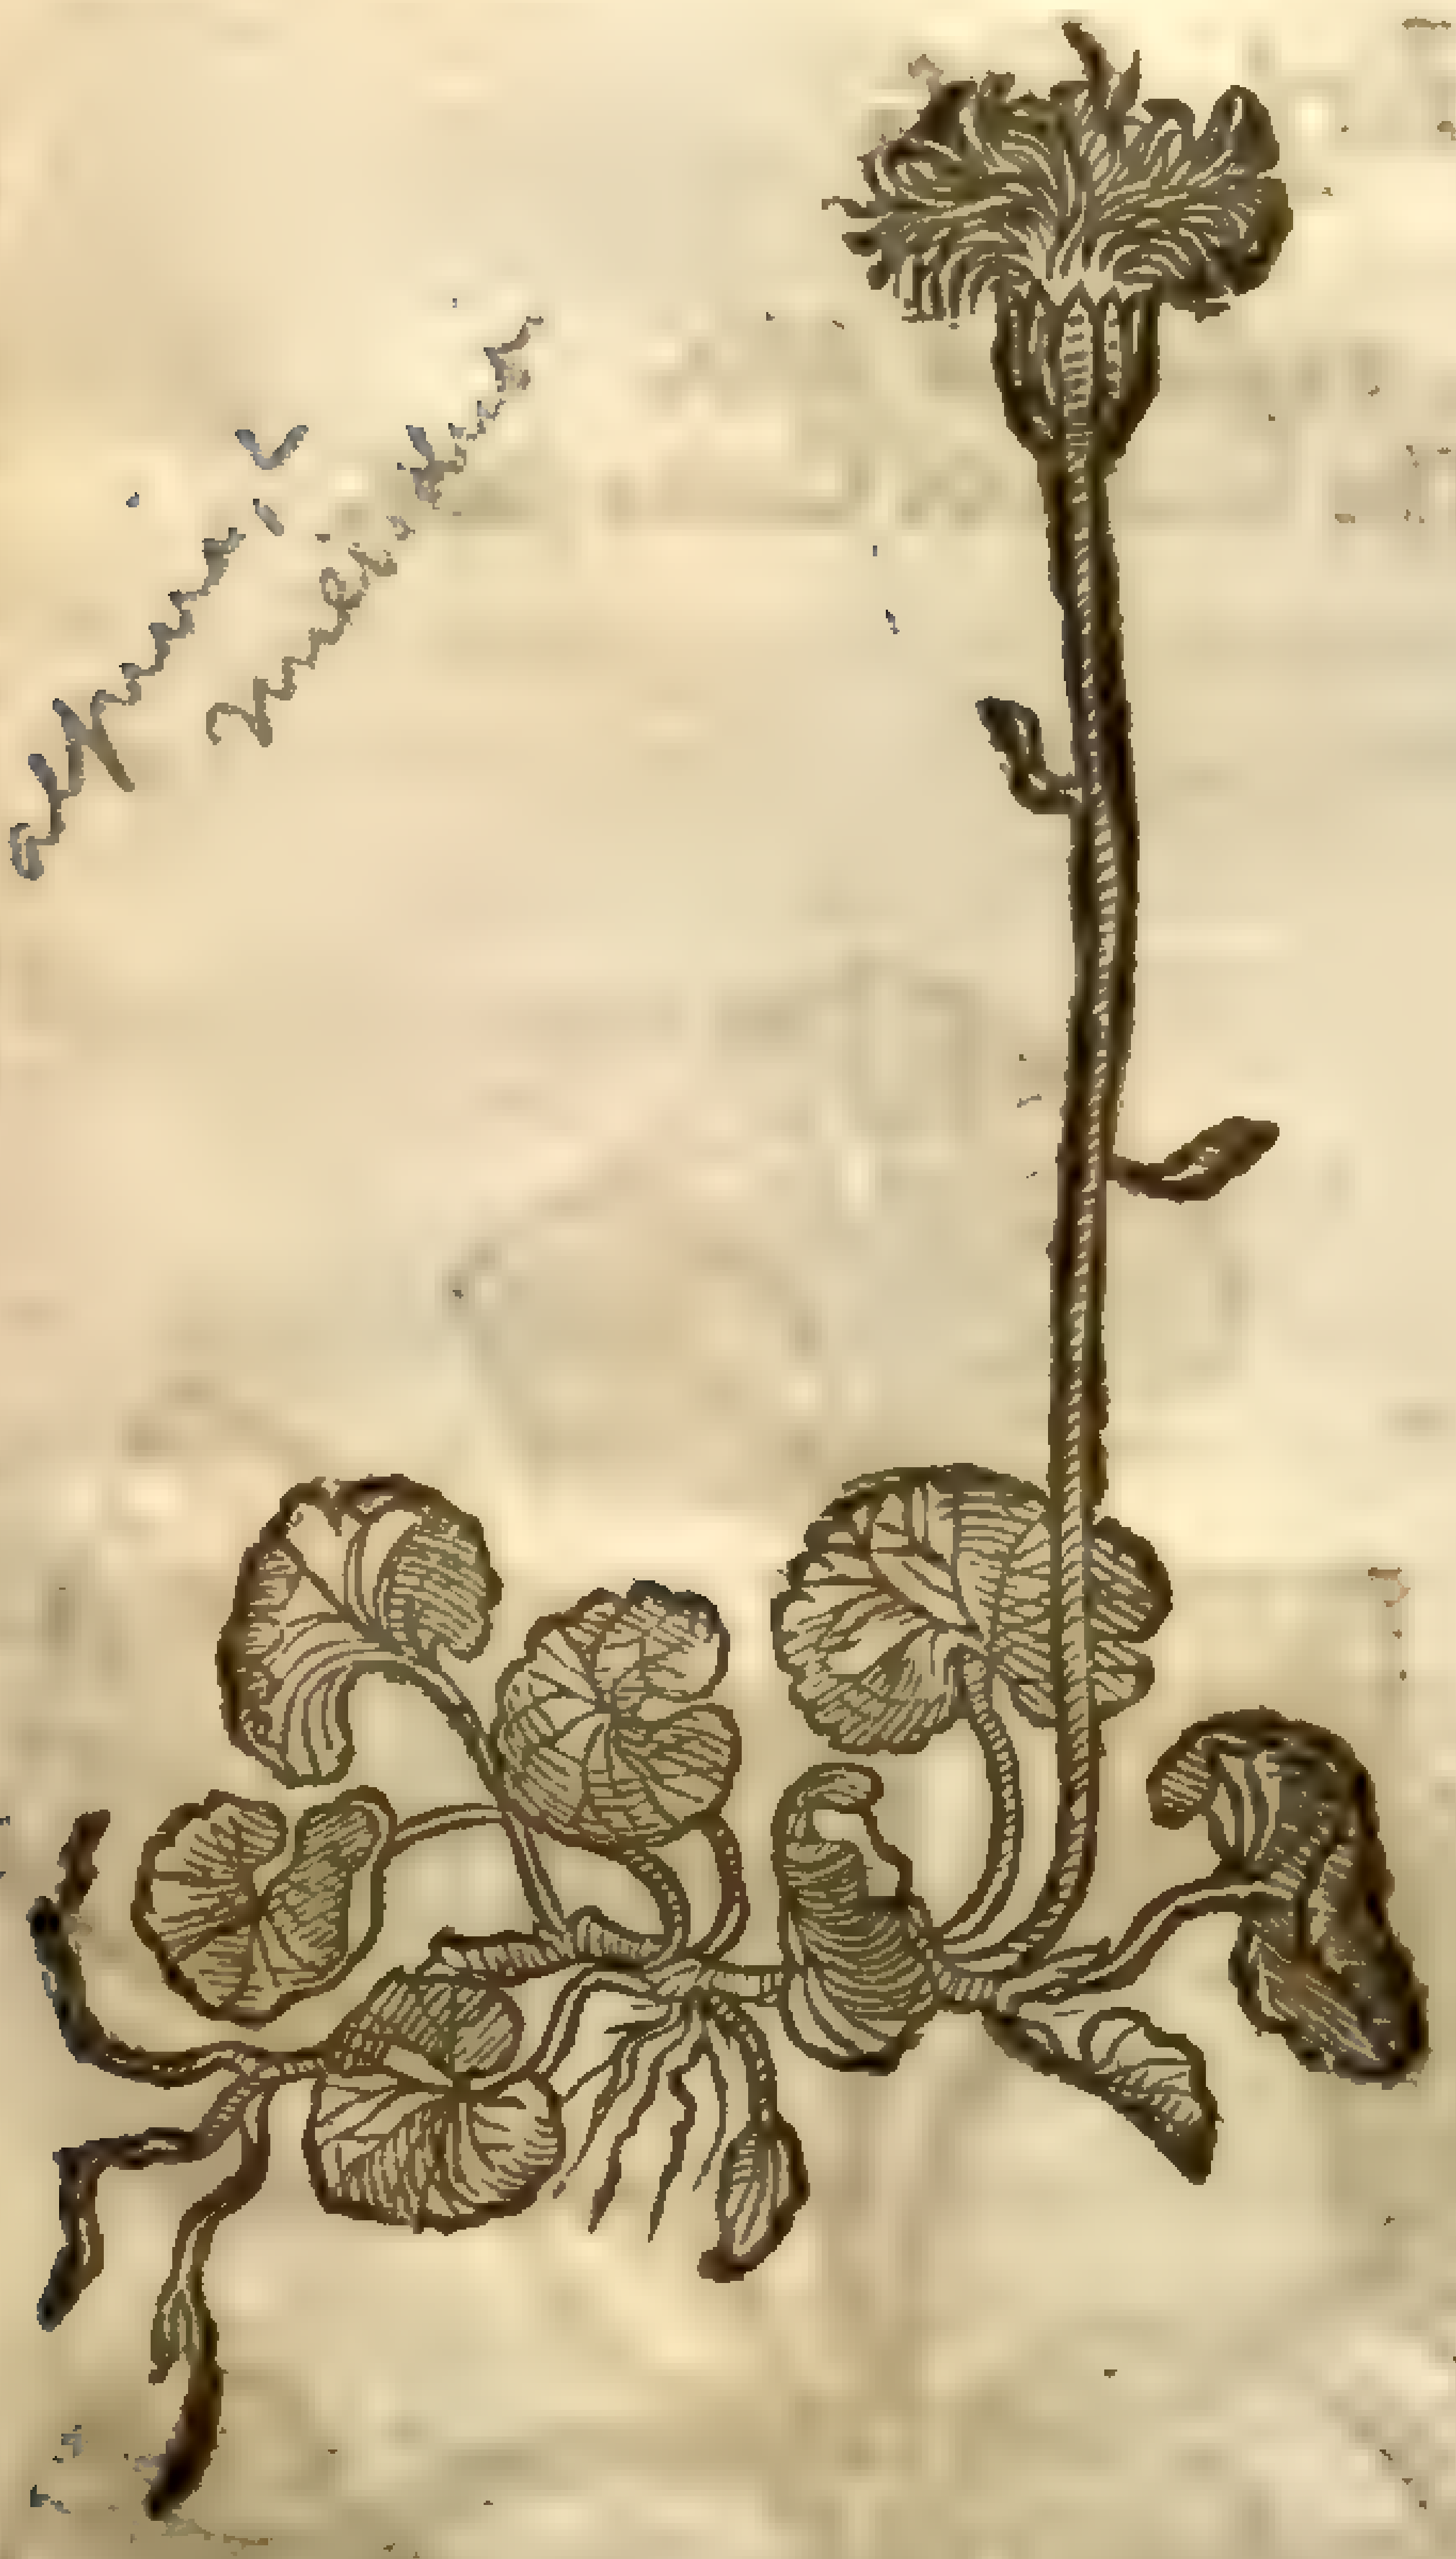
¶ *The Deſcription.*

1 T*Vſſilago* or Fole-foot hath many white and long creeping roots, ſomewhat fat; from which riſe vp naked ſtalkes (in the beginning of March and Aprill) about a ſpanne long, bearing at the top yellow floures, which change into downe and are caried away with the winde: when the ſtalke and ſeed is periſhed, there appeare ſpringing of out the earth many

broad leaues,greene aboue,and next the ground of a white hoarie or grayiſh colour, faſhioned like an Horſe foot; for which cauſe it was called Fole-foot, and Horſe-hoofe: ſeldome or neuer ſhall you find leaues and floures at once,but the flours are paſt before the leaues come out of the ground; as may appeare by the firſt picture, which ſetteth forth the naked ſtalkes and floures; and by the ſecond,which pourtraiteth the leaues only.

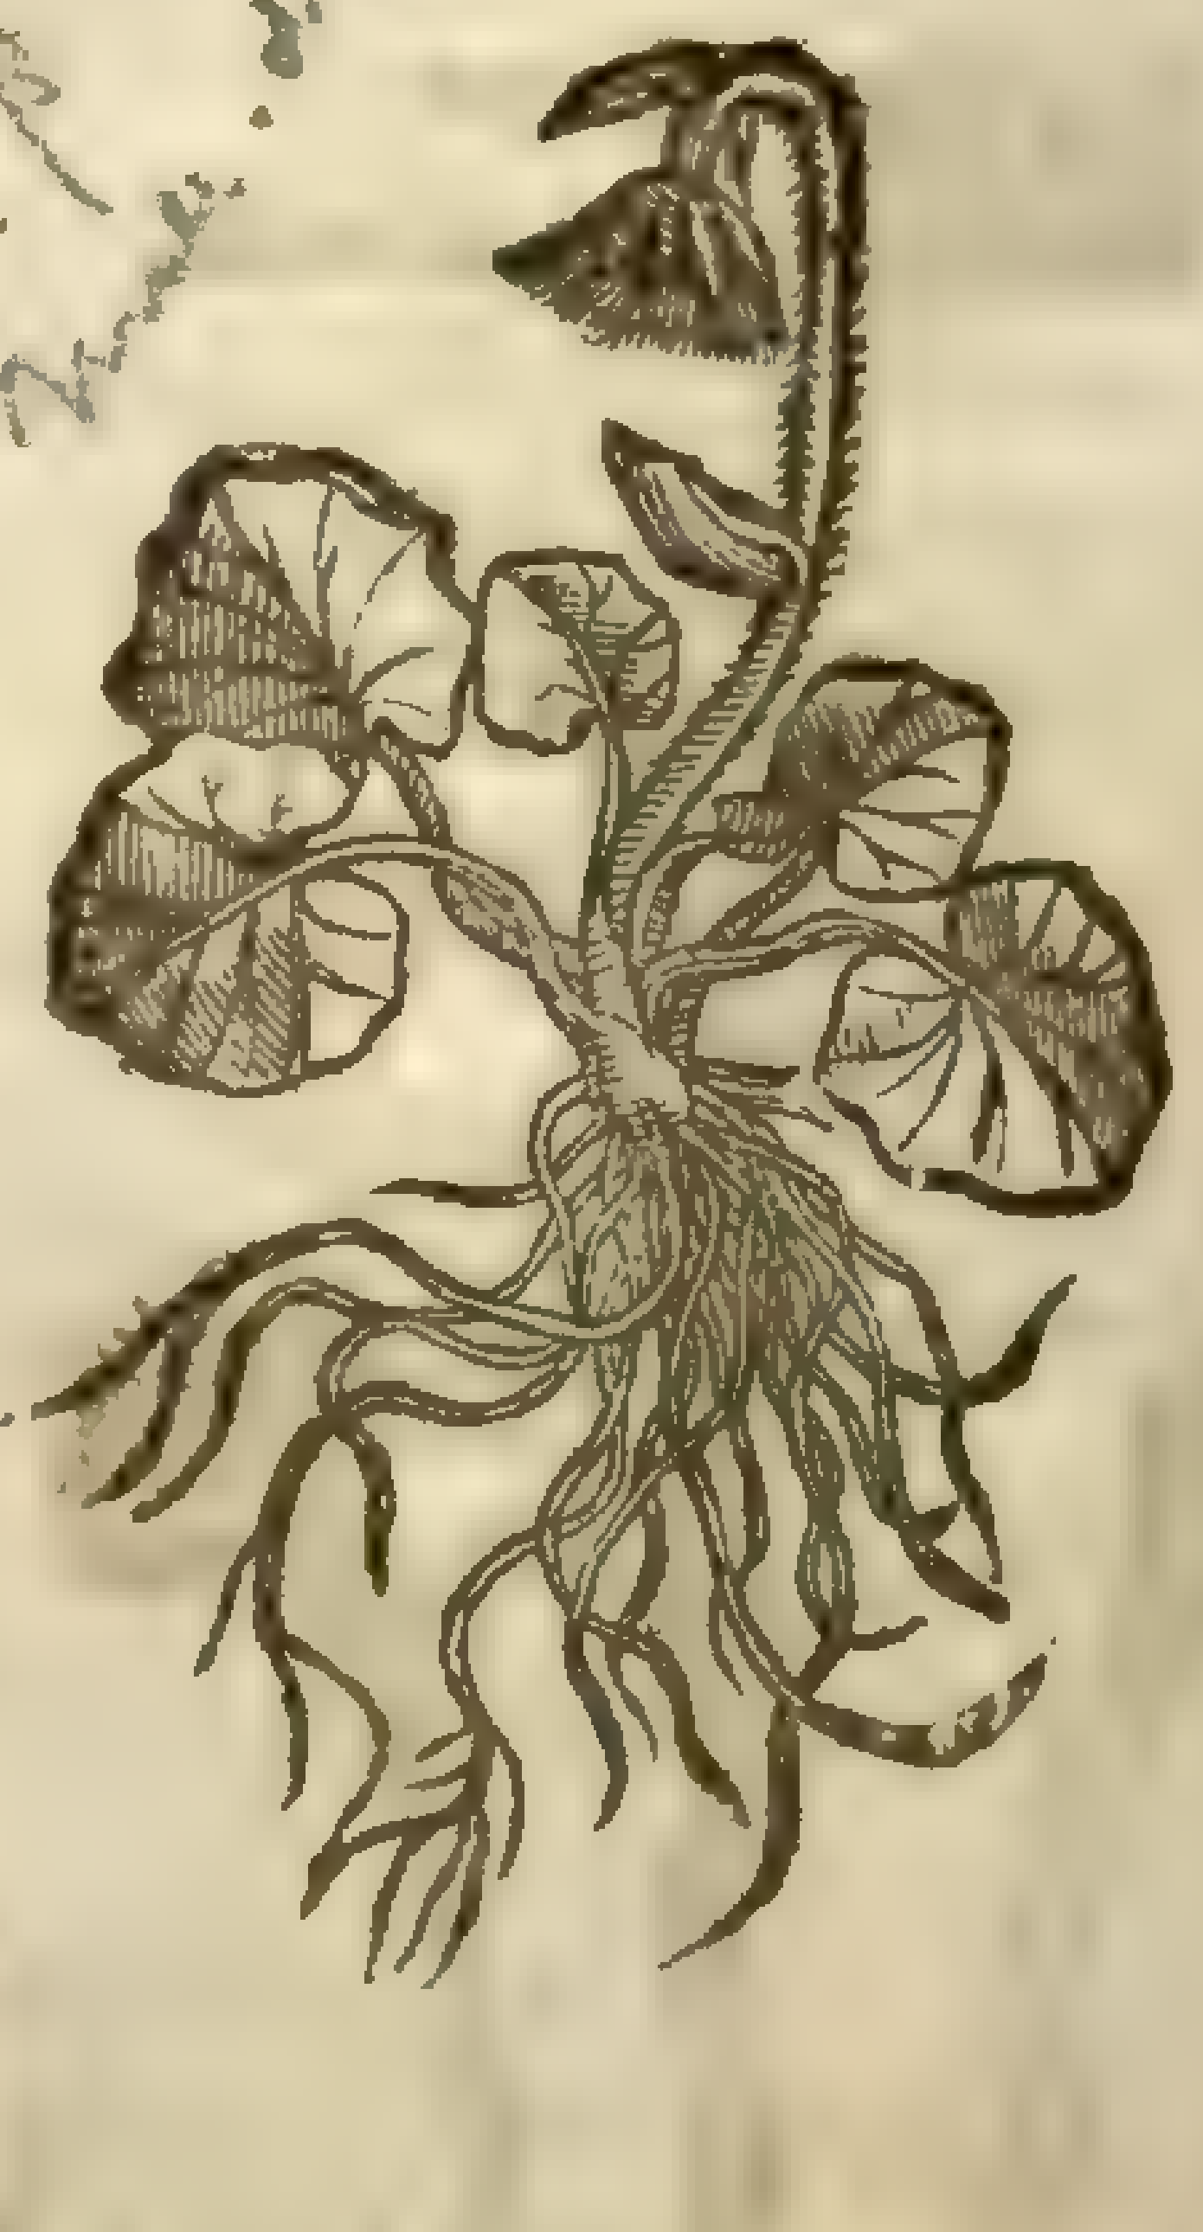
‡ 2 Beſides the commonly growing and deſcribed Colts-foot, there are other two ſmall mountaine Colts feet deſcribed by *Cluſius*; the firſt whereof I will here preſent you with, but the ſecond you ſhall finde hereafter in the chapter of *Aſarum*, by the name of *Aſarina Matthioli*. This here delineated hath fiue or ſix leaues not much vnlike thoſe of Alehoofe,of a darke ſhining greene colour aboue,and very white and downy below: the ſtalke is naked,ſome handfull high,hollow and downy,bearing one floure at the top compoſed of purpliſh threds, and flying away in downe: after which the ſtalke falls away, and ſo the leaues onely remaine during the reſt of the yeare: the root is ſmall and creeping. It growes on the tops of the Auſtrian and Stirian mountaines, where it floures in Iune or Auguſt. Brought into Gardens it floures in Aprill. *Cluſius* calls it *Tuſſilago Alpina*, 1. and he hath giuen two figures thereof,both which I here giue you by the ſame titles as he hath them. ‡

‡ 2 *Tuſſilago Alpina flore aperto.*
Mountaine Colts-foot full in floure.



Tussilago alpina L. [illegible]

‡ 2 *Tuſſilago Alpina flore euanido.*
Mountaine Colts-foot with the floure fading.



T. alpina L. β [illegible]

¶ *The Place.*

This groweth of it ſelfe neere vnto Springs, and on the brinkes of brookes and riuers,in wet furrowes,by ditches ſides,and in other moiſt and watery places neere vnto the ſea, almoſt euery where.

¶ *The Time.*

The floures which quickly fade, are to be ſeene in the end of March, and about the Calends of Aprill, which ſpeedily wither together with the ſtems: after them grow forth the leaues, which remaine greene all Summer long: and hereupon it came that Colts foot was thought to be without floures; which thing alſo *Pliny* hath mentioned in his ſix and twentieth booke, *cap. 6.*

¶ *The Names.*

Fole-foot is called in Greeke, Βήχιον: of the Latines likewiſe *Bechion*, and *Tuſſilago*: in ſhops, *Farfara*, and *Vngula Caballana*: of diuers, *Pata equina*: in Italian, *Vnghia di Cauallo*: in Spaniſh, *Vnha d'aſno*: in French, *Pas d'aſne*: in Engliſh, Folefoot, Colts-foot, Horſe-hoofe, and Bull-foot. The ſame is alſo *Chamaleuce*, which *Pliny* in his twenty eighth booke, and fifteenth chapter reporteth to be likewiſe called *Farfugium*, and *Farranum*, if there be not an errour in the copy: which thing alſo *Aëtius* in his firſt booke affirmeth, pretermitting the name of *Bechium*, and attributing vnto it all the vertues and faculties of *Bechium* or Colts-foot. Whoſe opinion *Orobaſius* ſeemeth to be of, in his fifteenth booke of his medicinable Collections, making mention of *Chamaleuce*, onely *Pliny* alſo agreeth with them; ſhewing that ſome thinke, that *Bechium* is called by another name *Chamælence*, in his twenty ſixth booke, *cap.6.* and it may bee that *Dioſcorides* hath written of one and the ſelfe ſame herbe in ſundry places, and by diuers names. *Bechium* and *Tuſsilago*, which may alſo be Engliſhed Coughwort, ſo called of the effect, and *Farfara*, of the white Poplar tree, to whoſe leaues it is like; which was named of the Antients *Farfarus*, as *Plautus* writeth in his Comedie called *Pœnulus*:

——viſcum legioni dedi.
fundaſque eos proſternebam vt folia Farfari.

To the company I gaue both lime buſh and ſling.
That to the ground as Poplar leaues I might them fling.

‡ *Dodonæus* (from whom our Author tooke this) ſets downe this place in *Plautus* as you finde it here, but not well; for the laſt verſe ſhould be *Fundaſque, eo præſternebant folia Farfari.* Thus it is in moſt editions of *Plautus*, and that rightly, as the enſuing words in that place declare. ‡

The white Poplar tree is called in Greeke, Λεύκη, and hereupon *Bechion* or Colts-foot was alſo called *Chamælence.*

¶ *The Temperature and Vertues.*

The leaues of Colts foot being freſh and greene are ſomthing cold, and haue withall a drying quality; they are good for vlcers and inflammations: but the dried leaues are hot and dry, and ſomewhat biting. A

A decoction made of the greene leaues and roots, or elſe a ſyrrup thereof, is good for the cough that proceedeth of a thin rheume. B

The green leaues of Fole-foot pound with hony, do cure and heale the hot inflammation called Saint Anthonies fire, and all other inflammations. C

The fume of the dried leaues taken through a funnell or tunnell, burned vpon coles, effectually helpeth thoſe that are troubled with the ſhortneſſe of breath, and fetch their winde thicke and often, and breaketh without perill the impoſtumes of the breſt. D

Being taken in manner as they take Tobaco, it mightily preuaileth againſt the diſeaſes aforeſaid. E

Chap. 291. *Of Butter-Burre.*

¶ *The Deſcription.*

1 Butter-Burre doth in like manner bring forth floures before the leaues, as doth Colts-foot, but they are ſmall, moſſie, tending to a purple colour; which being made vp into a big eare as it were, do quickely (together with the ſtem, which is thicke, full of ſubſtance, and brittle) wither and fall away: the leaues are very great like to a round cap or hat, called in Latine *Petaſus*, of ſuch a wideneſſe, as that of it ſelfe it is big and large enough to keepe a mans head from raine, and from the heate of the Sunne: and therefore they be greater than the leaues of the Clot-Burre, of colour ſomewhat white, yet whiter vnderneath: euery ſtem beareth his leafe; the ſtem is oftentimes a cubit long, thicke, full of ſubſtance; vpon which ſtandeth the leafe in the centre or middlemoſt part of the circumference, or very neere, like to one of the greateſt Muſhromes, but that it hath a cleft that ſtandeth about the ſtem, eſpecially when they are in periſhing and withering away: at the firſt the vpper ſuperficiall or outſide of the Muſhromes ſtandeth out, and when they are in withering ſtandeth more in; and euen ſo the leafe of Butter-Bur hath on the outſide a certaine ſhallow hollowneſſe: the root is thicke, long, blacke without, white within, of taſte ſomewhat bitter, and is oftentimes worme-eaten.

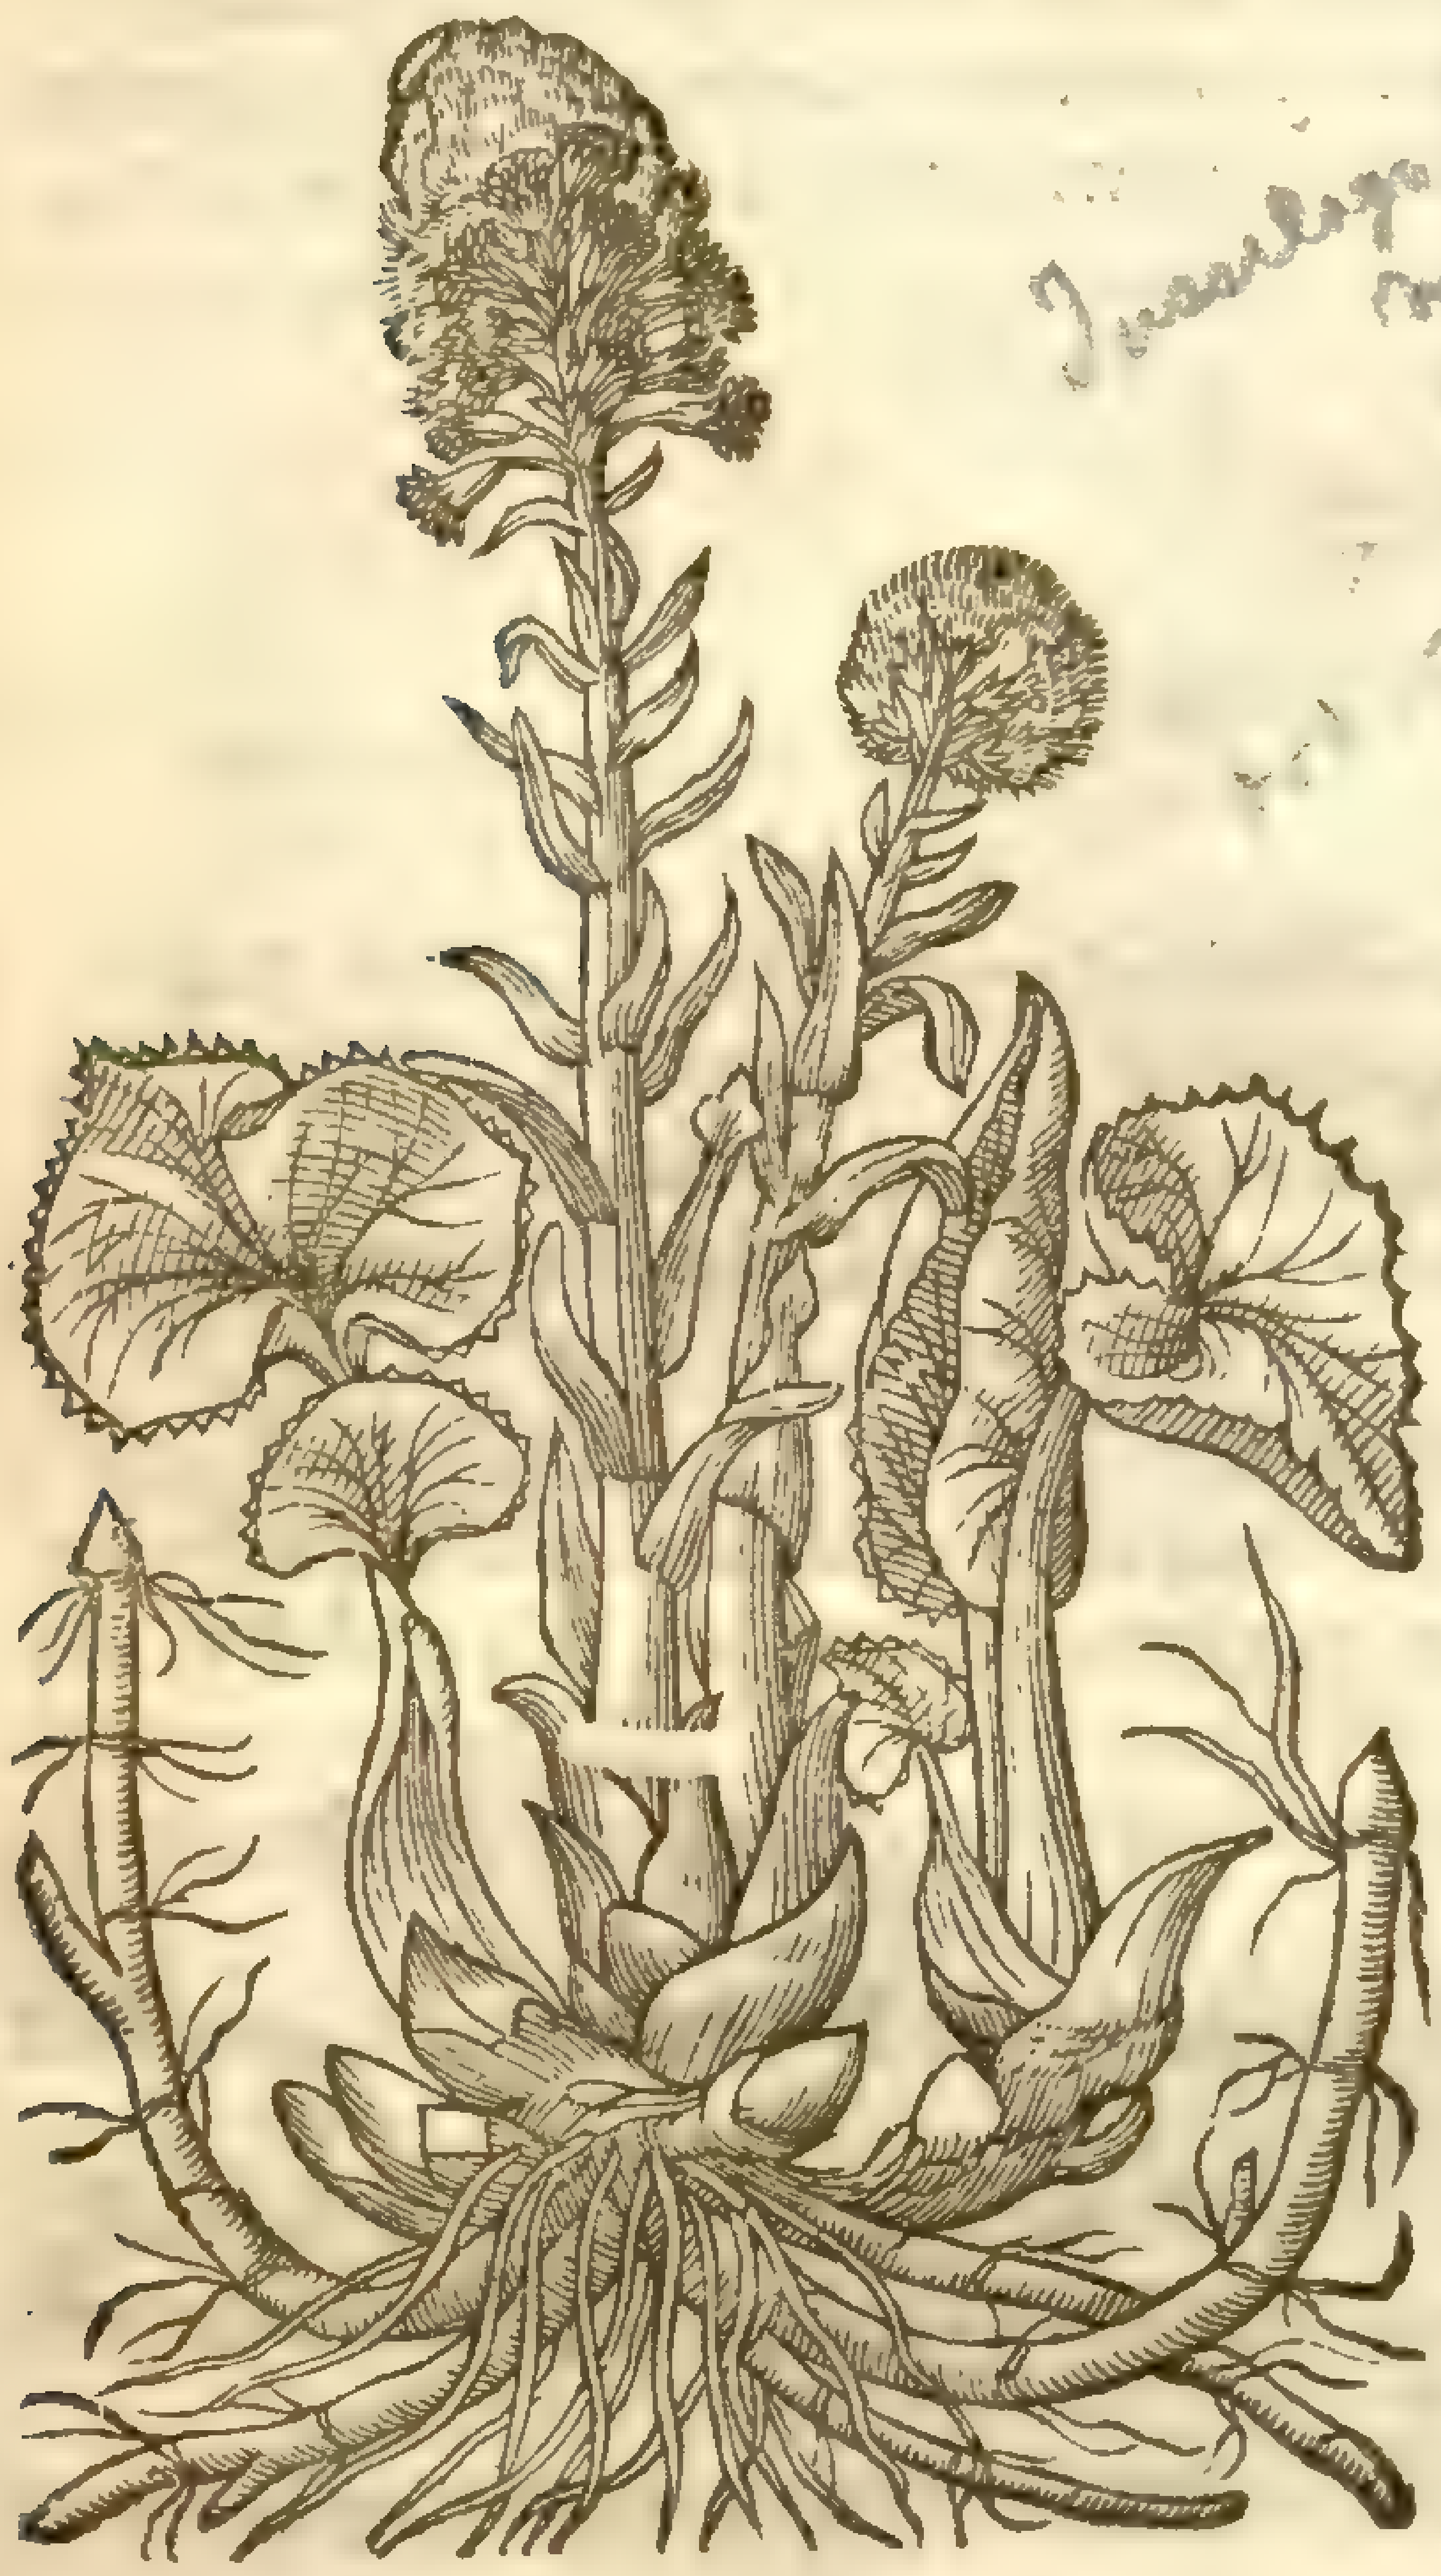
¶ *The Place.*

This groweth in moiſt places neere vnto riuers ſides, and vpon the brinks and banks of lakes and ponds, almoſt euery where.

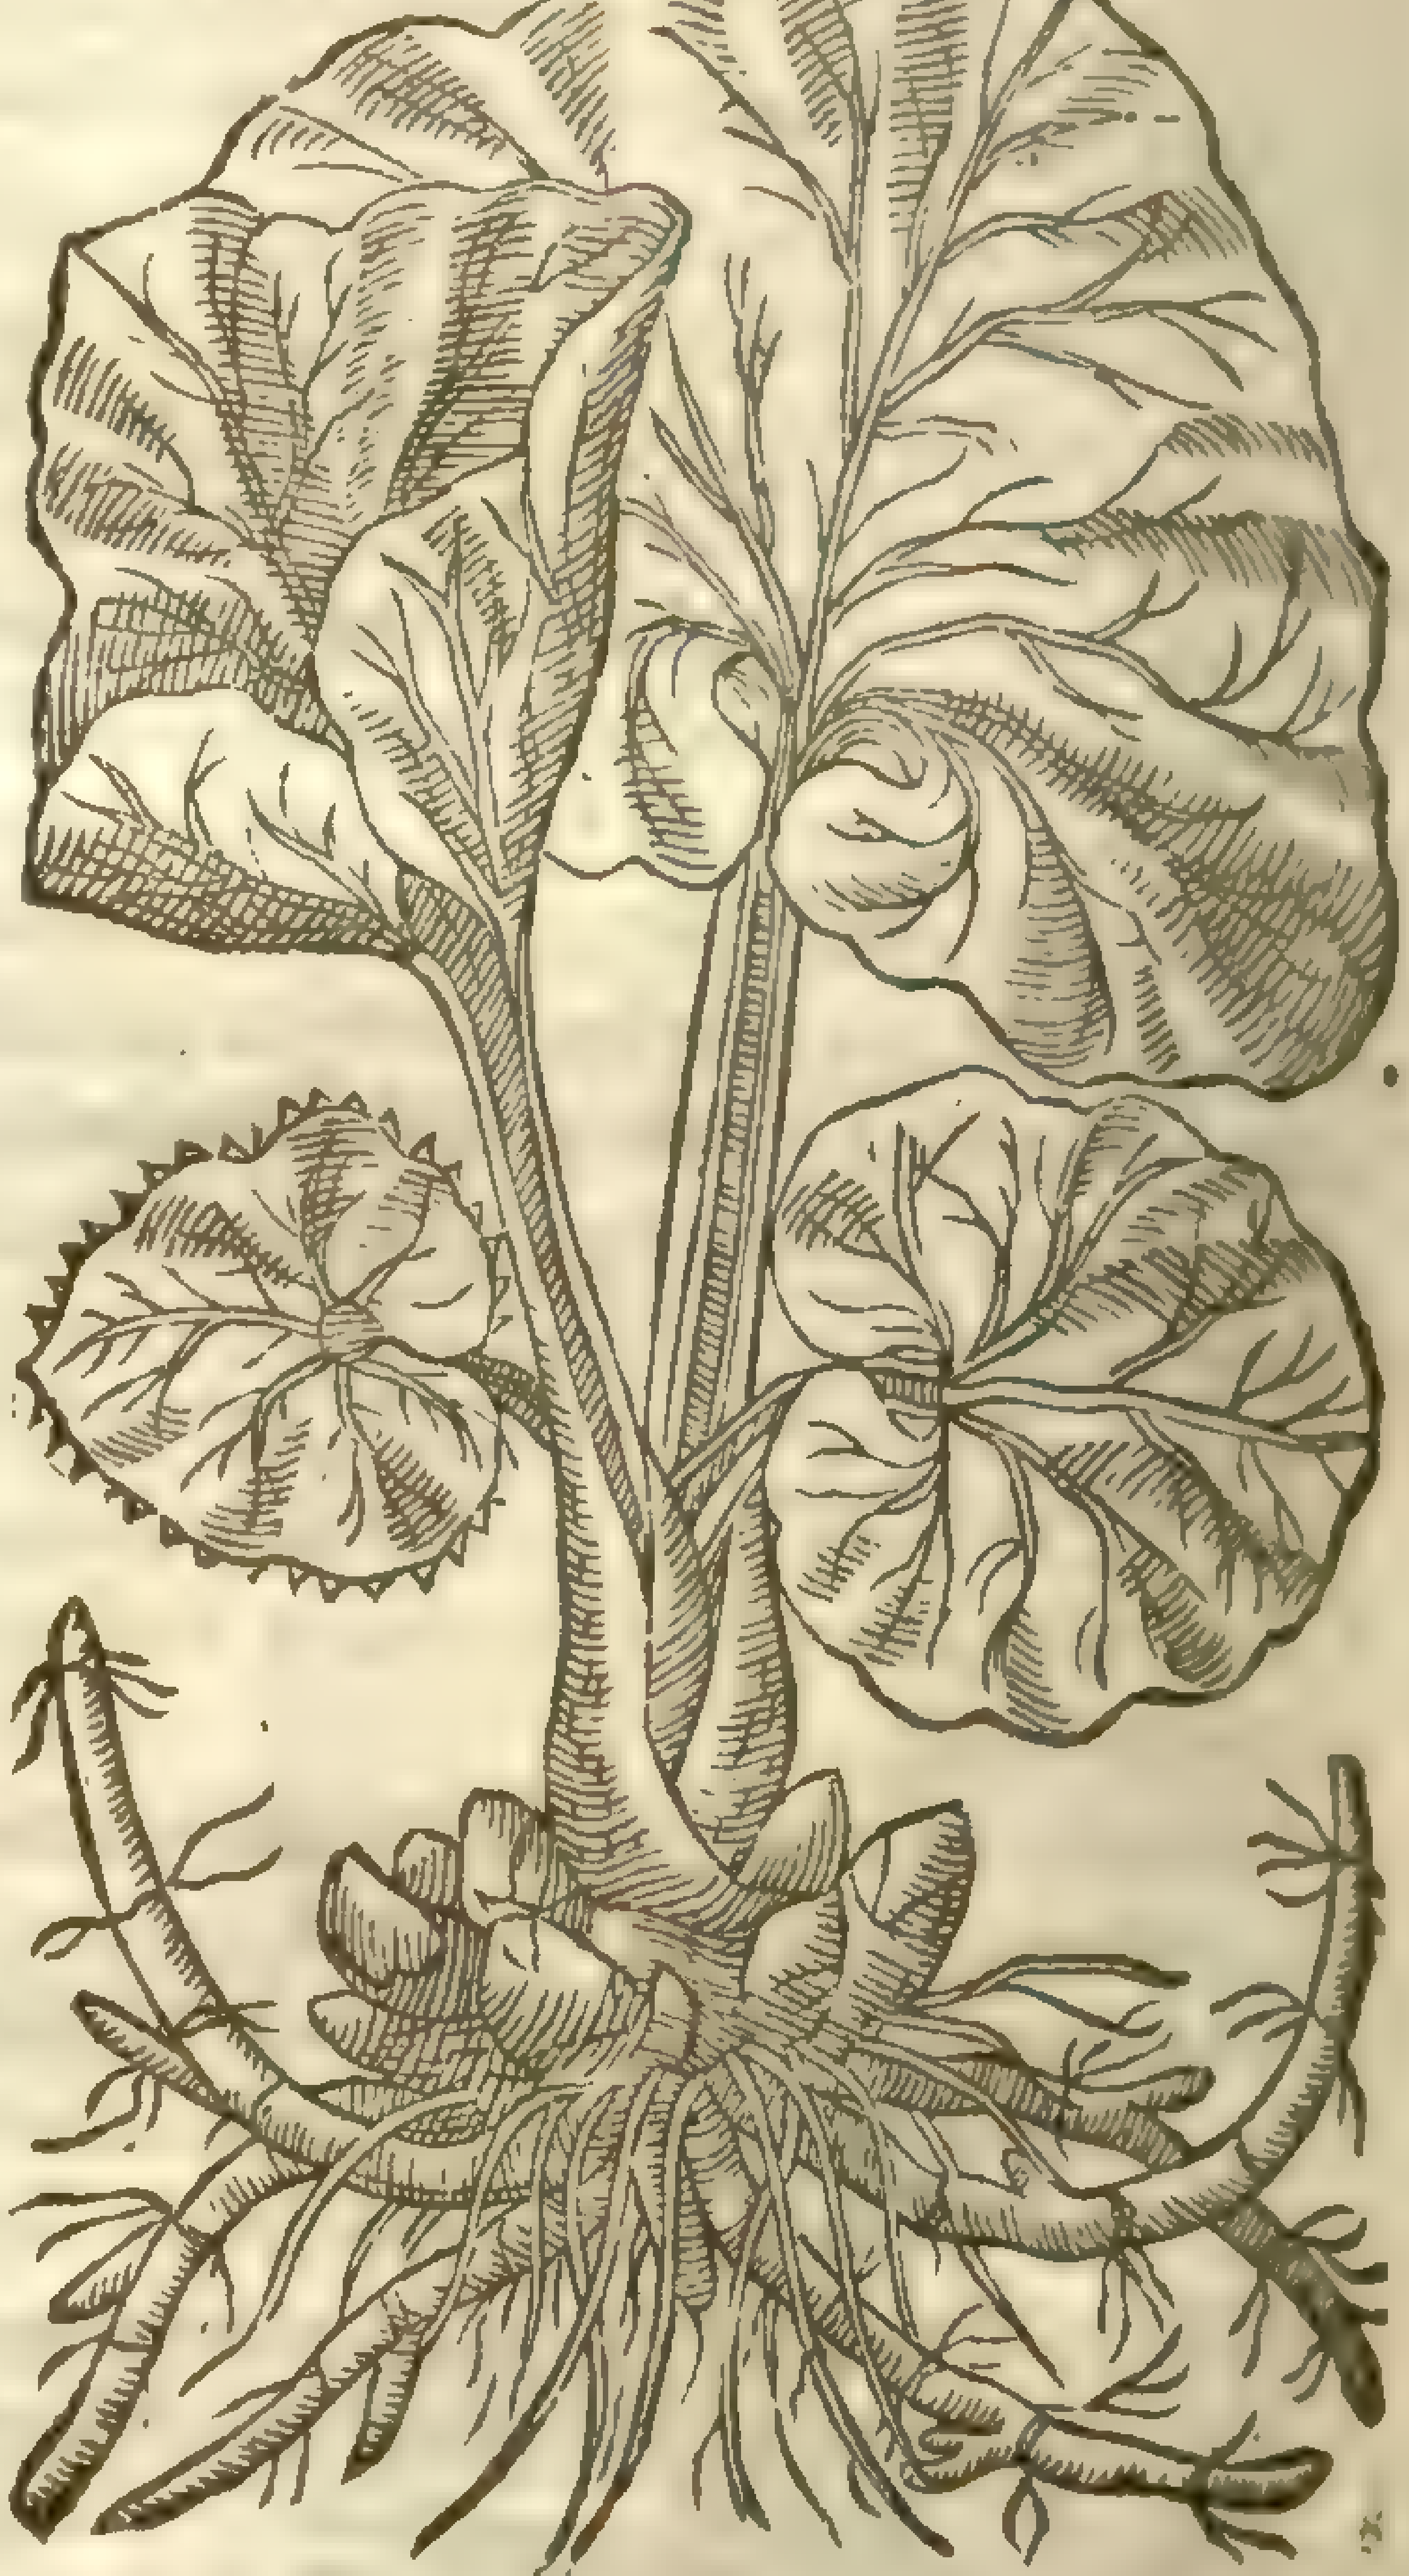
¶ *The Time.*

The eare with the floures flouriſh in Aprill or ſooner: then come vp the leaues, which continue till Winter, with new ones ſtill growing vp.

1 *Petaſites florens.*
Butter-Burre in floure.



2 *Petaſitis folia.*
The leaues of Butter Burre.



Tussilago petasites [illegible]

¶ *The Names.*

Butter-Bur is called in Greeke, πεταςίτης: of the hugeneſſe of the leafe that is like to πέτασος, or a hat: the Latines call it, *Petaſites*: in high Dutch, **Peſtilentzwurtz**: in low-Dutch, **Dockebladeren**: in Engliſh it is named, Butter-Burre: it is very manifeſt that this is like to Colts-foot, and of the ſame kinde.

¶ *The Temperature.*

Butter Burre is hot and dry in the ſecond degree, and of thinne parts.

¶ *The Vertues.*

A The roots of Butter-Burre ſtamped with ale, and giuen to drinke in peſtilent and burning Feuers, mightily coole and abate the heate thereof.

B The roots dried and beaten to pouder, and drunke in wine, are a ſoueraigne medicine againſt the plague and peſtilent feuers, becauſe they prouoke ſweat, and driue from the heart all venome and ill heate: it killeth wormes, and is of great force againſt the ſuffocation of the mother.

C The ſame cureth all naughty filthy vlcers, if the pouder be ſtrewed therein.

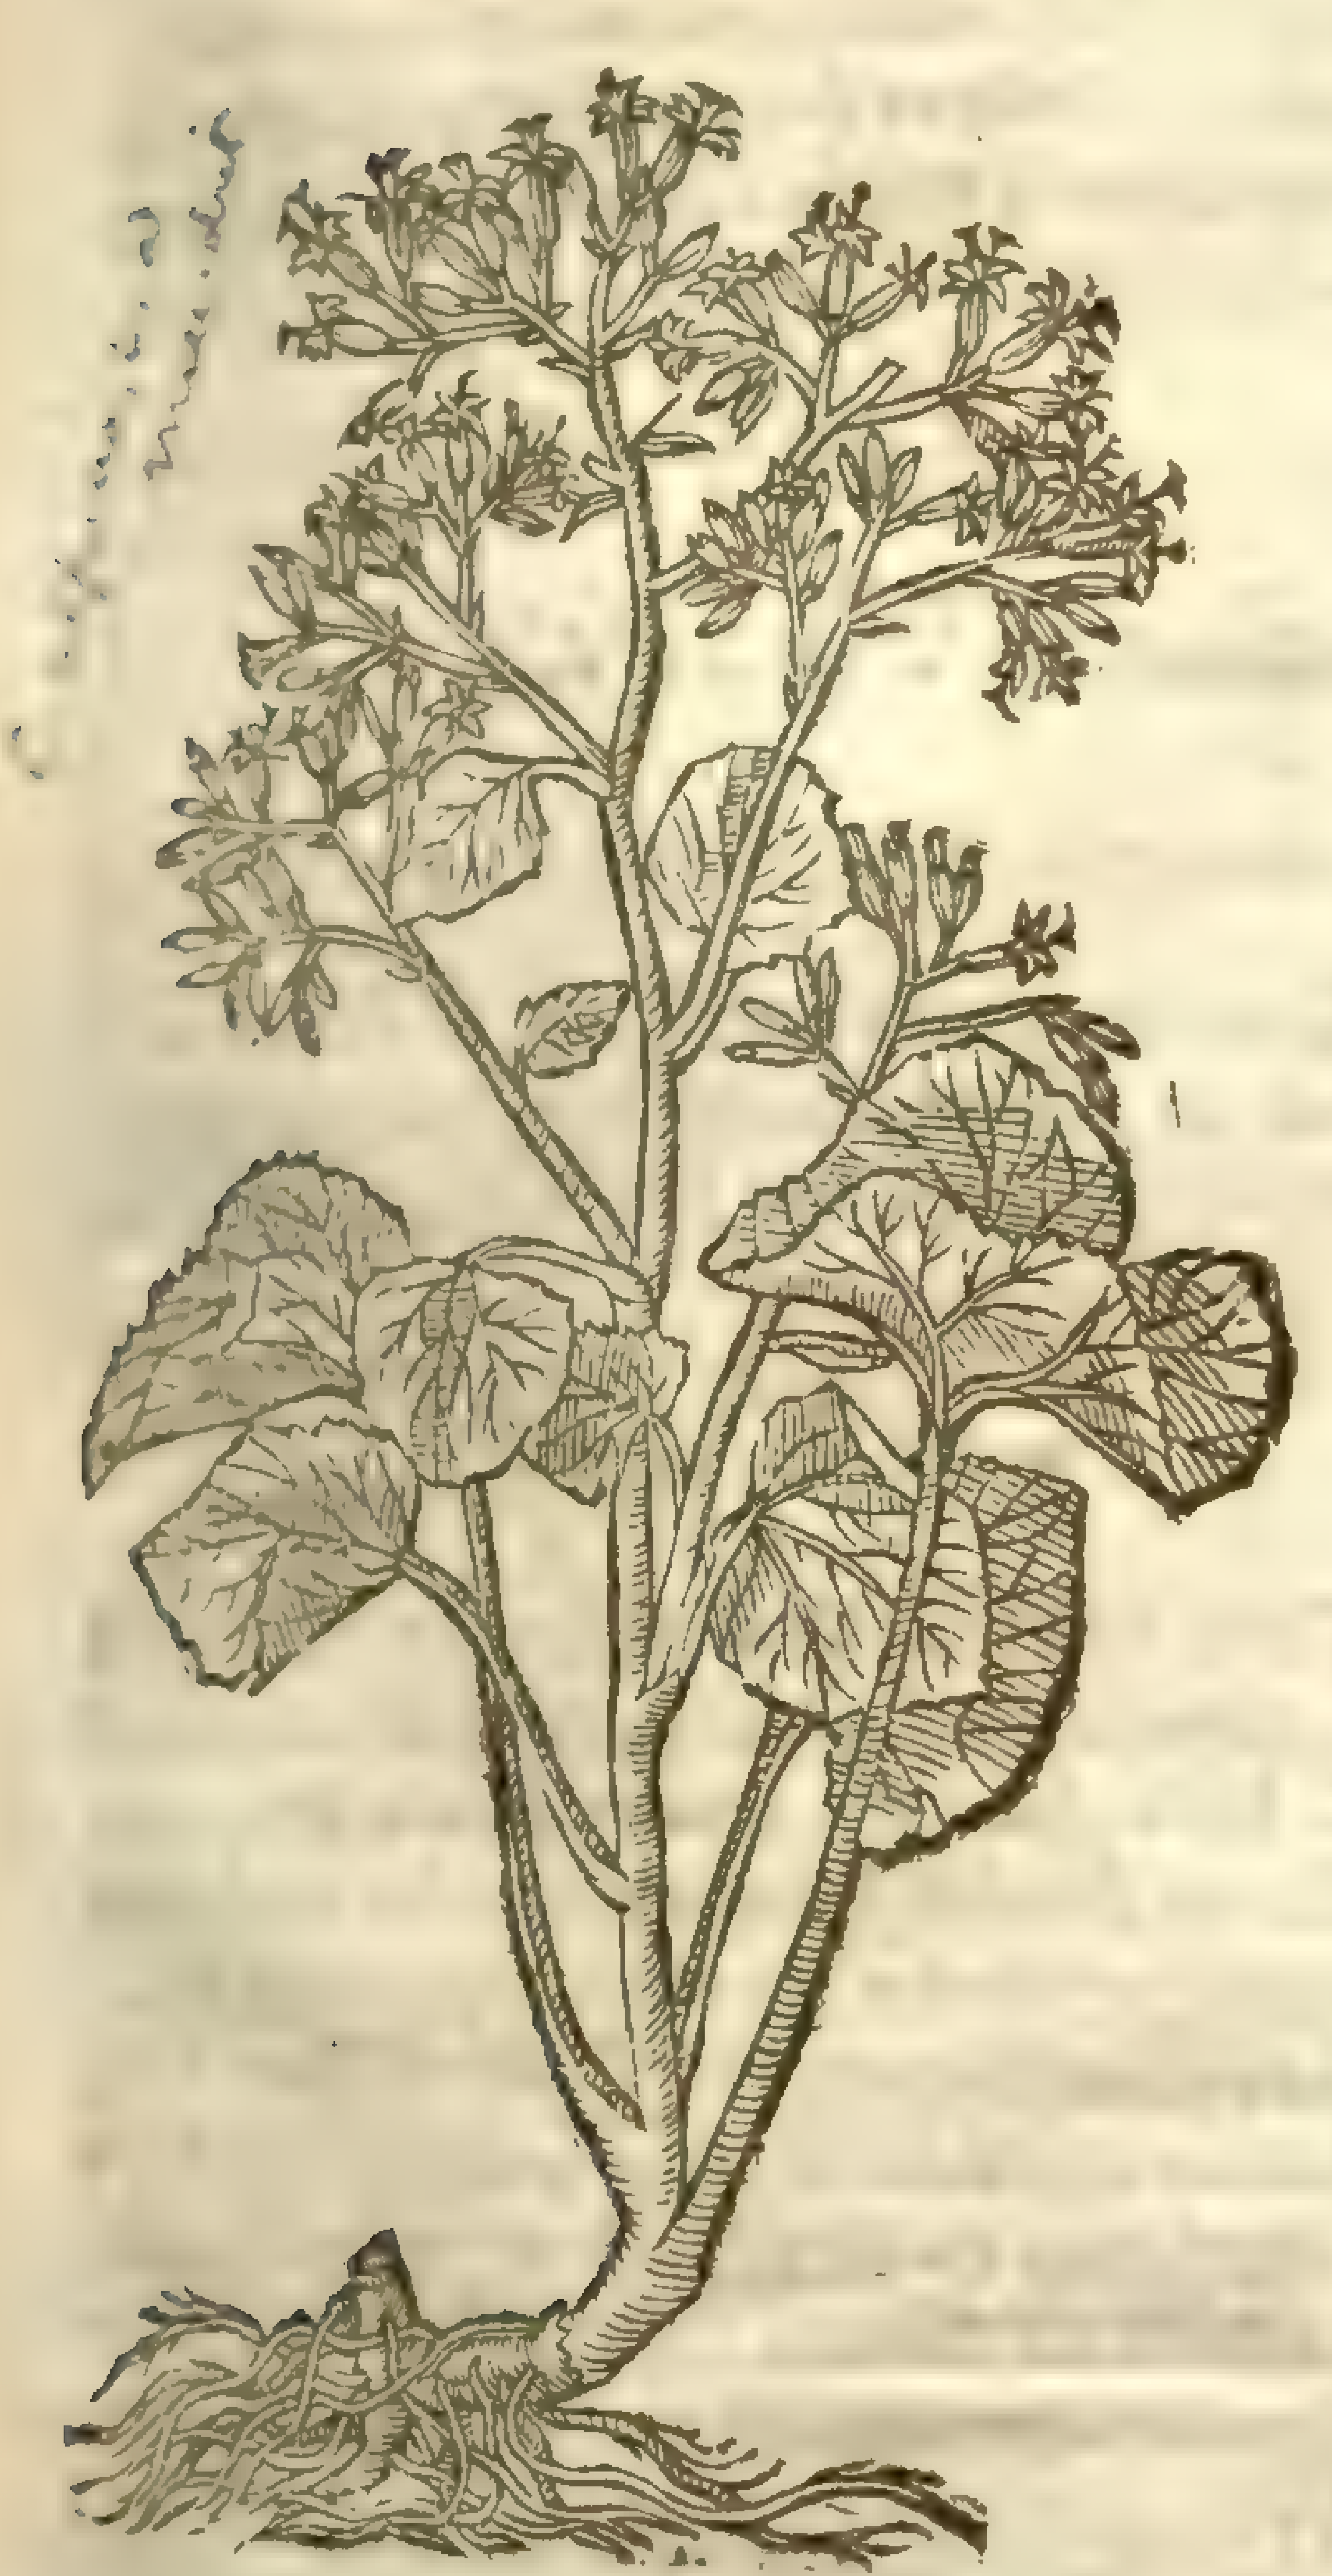
D The ſame kills wormes in the belly: it prouokes vrine, and brings downe the monethly termes.

‡ Chap. 267. *Of Mountaine Horſe-foot.*

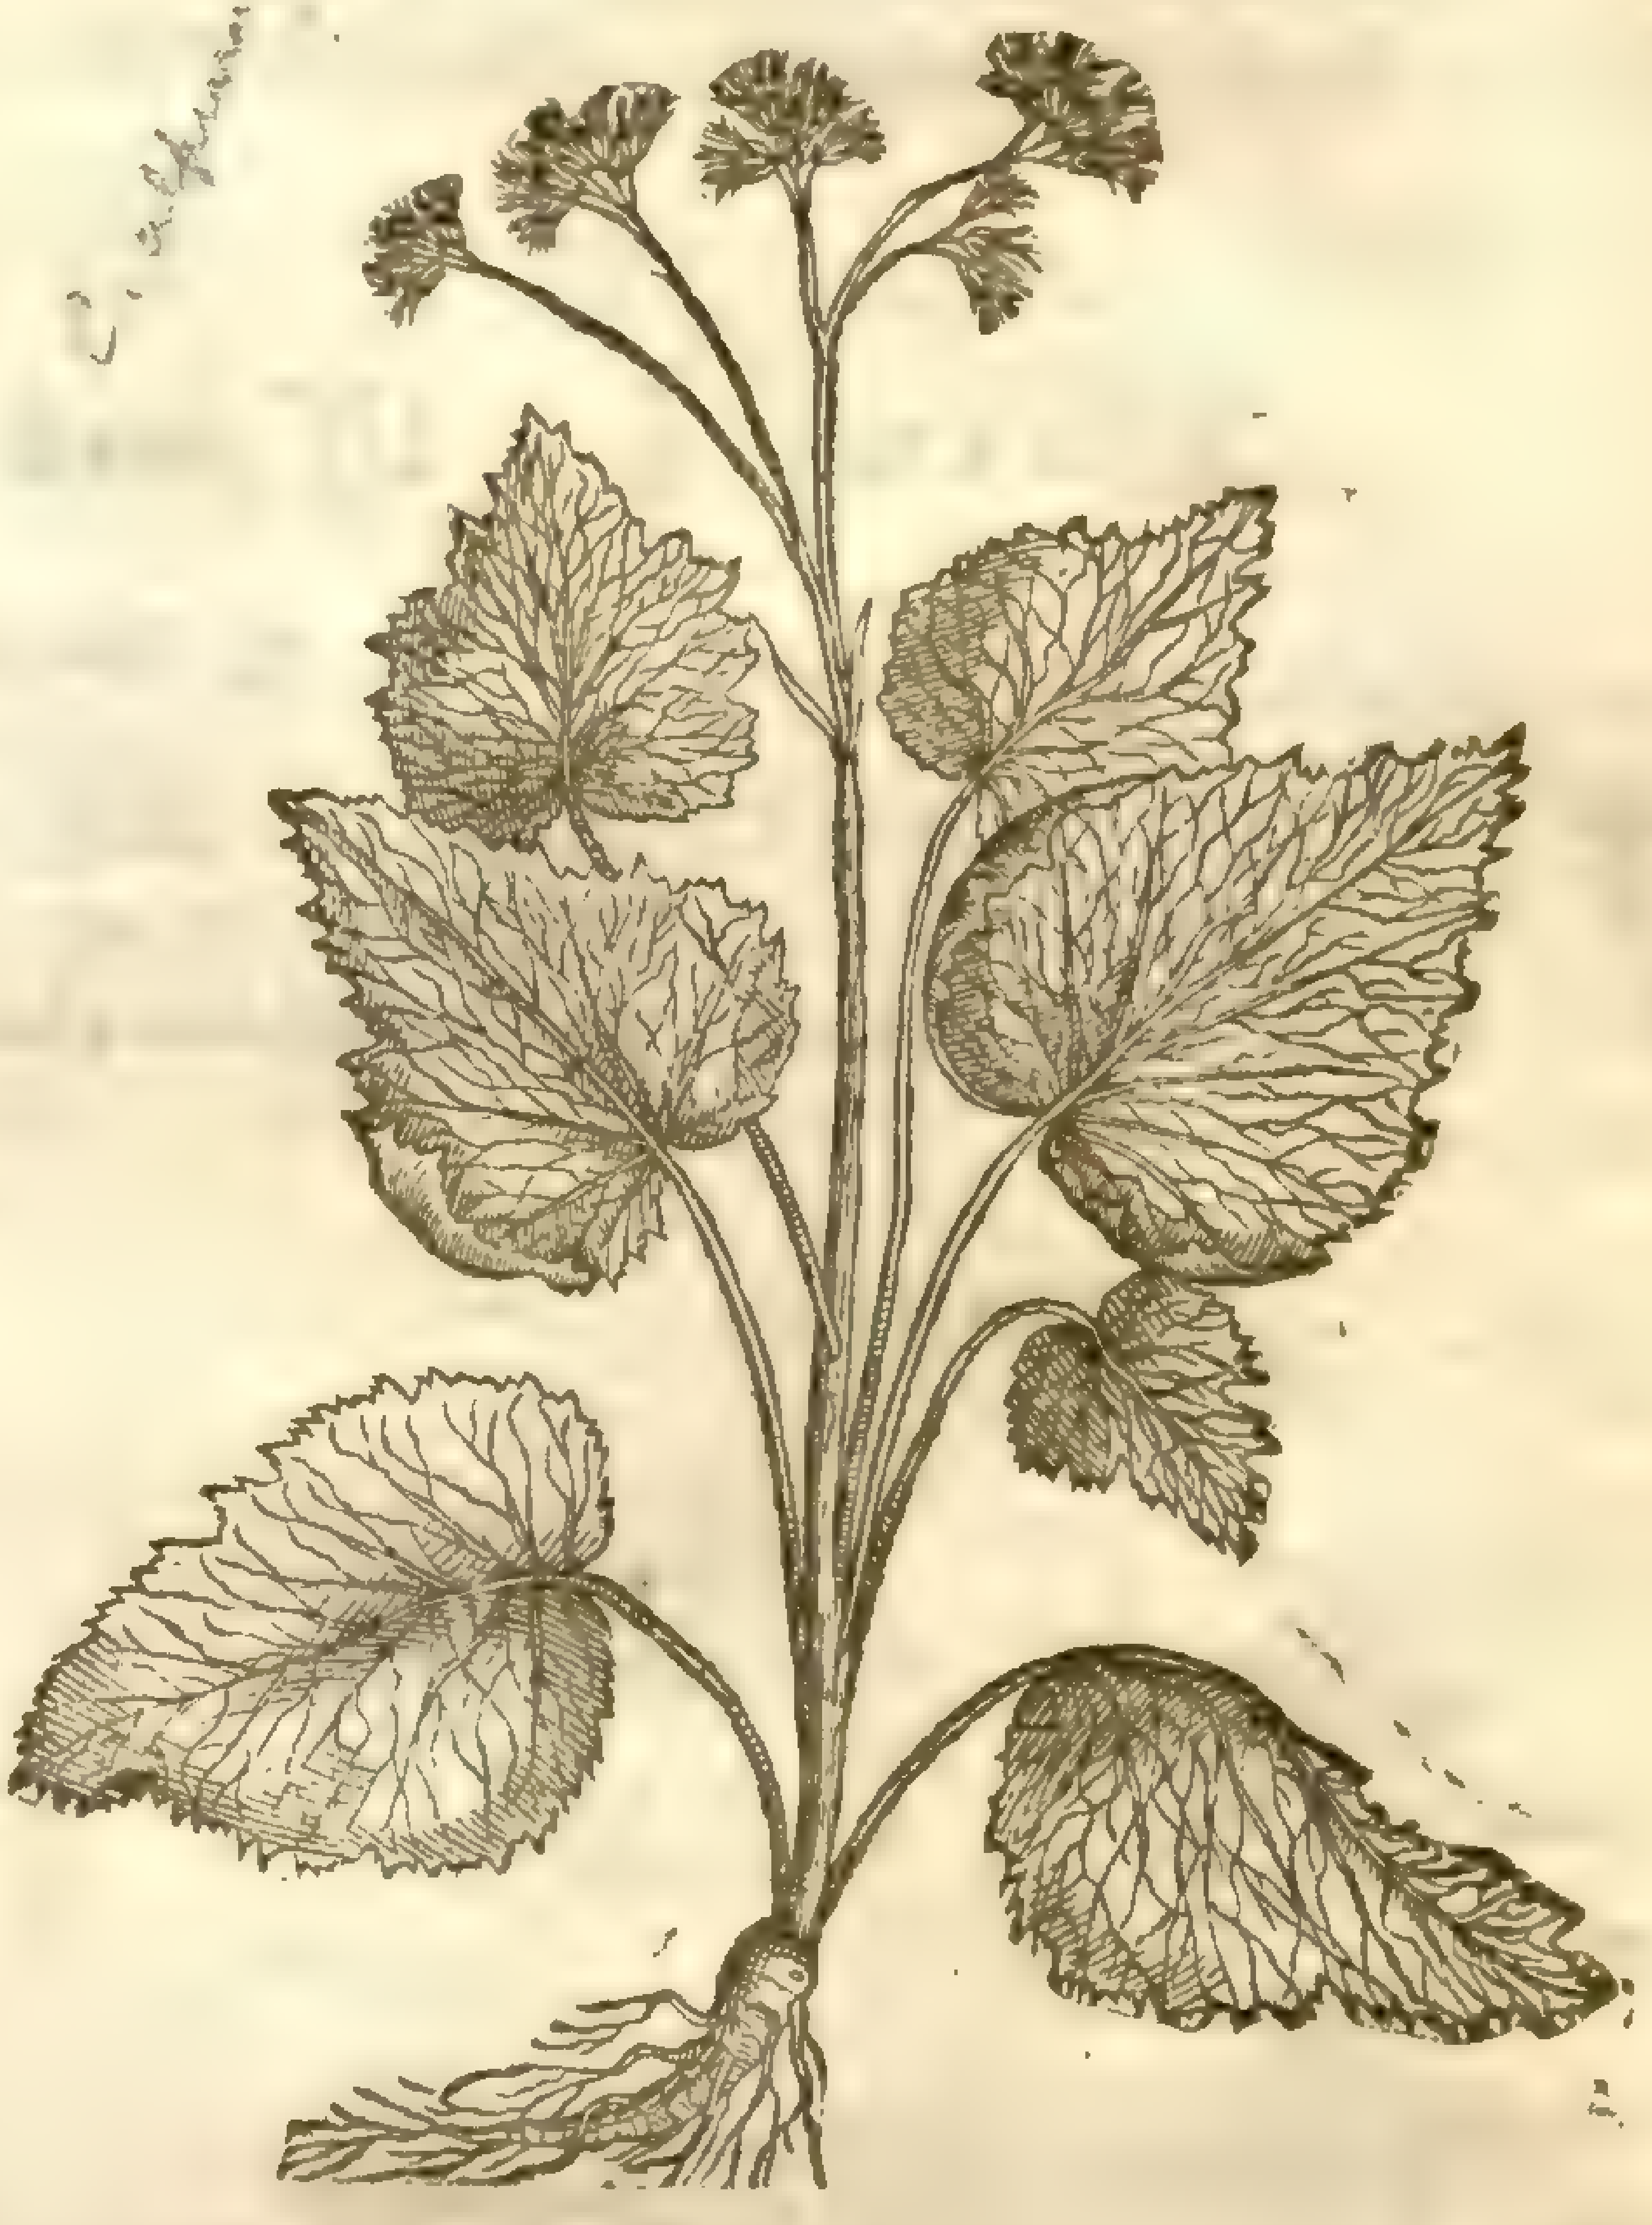
¶ *The Deſcription.*

1 This plant (which the moderne Writers haue referred to the *Cacalia* of the antients, and to the kindes of Colts-foot) I haue thought good to name in Engliſh, Horſe-foot, for that the leaues exceed Colts-foot in bigneſſe, yet are like them in ſhape: and of this plant *Cluſius* (whom I here chiefely follow) hath deſcribed two ſorts: the firſt of theſe haue many leaues almoſt like vnto thoſe of Colts-foot, but larger, very round, and ſnipt about the edges, of a light greene colour aboue, and hoarie vnderneath, hauing alſo many veines or nerues running vp and downe them; and theſe leaues are of an vngratefull taſte, and grow vpon long purpliſh creſted ſtalkes: The ſtemme is ſome two cubits high, creſted likewiſe, and of a purpliſh colour, ſet alſo at certaine ſpaces with leaues very like vnto the other, but leſſer than thoſe next the ground, and more cornered

‡ 1 *Cacalia incano folio.*
Hoarie leaued Horſefoot.



‡ 2 *Cacalia folio glabro.*
Smooth leaued Horſe-foot.



cornered and ſharper pointed; the tops of the ſtalkes and branches carry bunches of purple floures, as in an vmbell: and commonly in each bunch there are three little flours conſiſting of foure leaues a peece, and a forked peſtle, and theſe are of a purple colour, and a weake, but not vnpleaſant ſmell, and they at length turne into downe, amongſt which lies hid a longiſh ſeed: the root, if old, ſends forth diuers heads, as alſo ſtore of long whitiſh fibres.

2 The leaues of this are more thin, tough and hard, and of a deeper greene on the vpper ſides, neither are they whitiſh below, nor come ſo round or cloſe whereas they are faſtened to their ſtalks (which are not creſted as thoſe of the other, but round and ſmooth) they are alſo full of veines and nickt about the edges, and of ſomewhat an vngratefull hot and bitter taſte. The ſtalkes are alſo ſmoother, and the floure of a lighter colour.

¶ *The Place.*

Both theſe grow in the Auſtrian and Stirian Alpes vnder the ſides of woods, among buſhes and ſuch ſhadowie places: but not in England, that I haue yet heard of.

¶ *The Time.*

I find it not ſet downe when theſe floure and ſeed, but iudge it about the ſame time that Coltſfoot doth.

¶ *The Names.*

This by *Cluſius*, *Lobel* and others, hath beene called *Cacalia*, and referred to that deſcribed by *Dioſcorides, lib.4.cap.*123. which is thought to be that ſet forth by *Galen* by the name of *Cancanus*. In the *Hiſtoria Lugd.pag.*1052. The later of theſe two here deſcribed is figured by the name of *Tuſſilago Alpina ſiue montana*, and the former is there, *pag.* 1398. by the name of *Cacalia*, but the floures are not rightly expreſt: and if my iudgement faile me not, the figure which is in the ſeuenteenth page of the *Appendix* of the ſame Author, by the title of *Aconitum Pardalianches primum*, is of no other than this very plant. But becauſe I haue not as yet ſeene the plant, I will not poſitiuely affirme it: but referre this my opinion to thoſe that are iudicious and curious, to know the plant that raiſed ſuch controuerſie between *Matthiolus* and *Geſner*, and whereof neither *Camerarius* nor *Bauhine*, who hath ſet forth *Matthiolus* his Commentaries, haue giuen vs any certain or probable knowledge.

¶ *The*

¶ *The Temperature and Vertues, out of the Antients.*

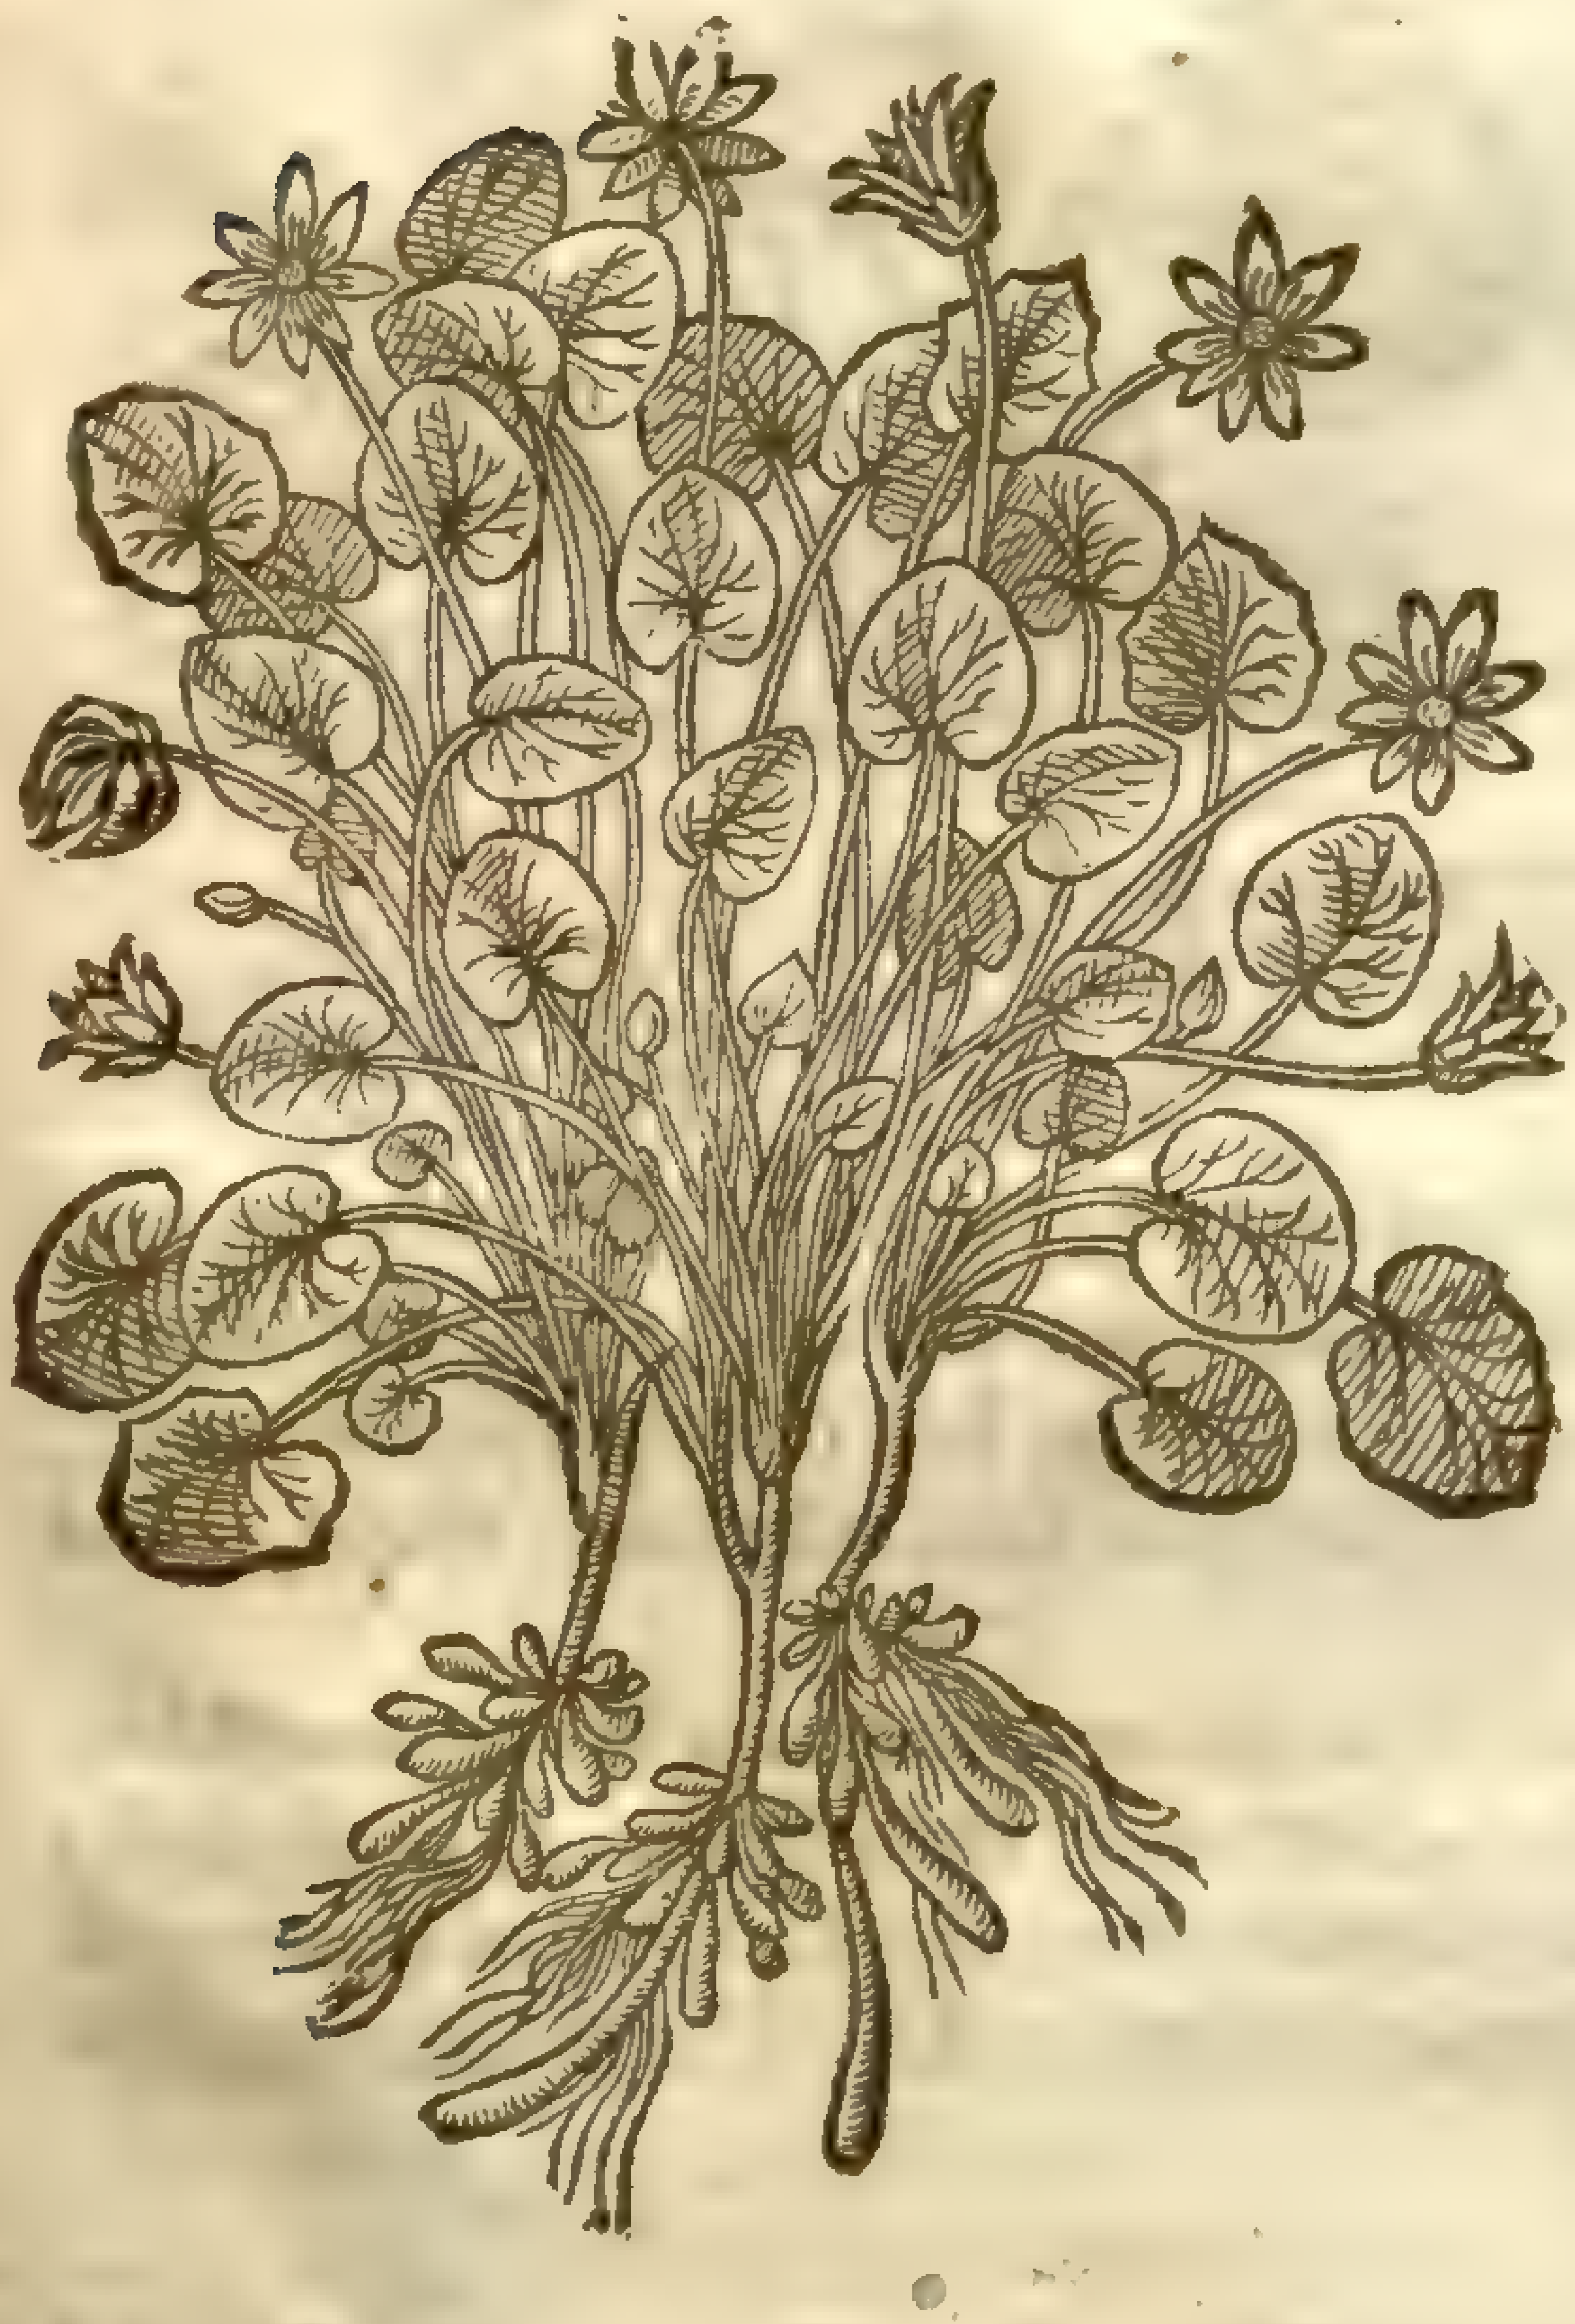
The root of *Cacalia* is void of any biting qualitie, and moderately dries, and it is of a groſſe and emplaiſticke ſubſtance; wherefore ſteeped in wine and ſo taken it helpes the cough, the roughneſſe of the Arterie or hoarſnes, like as *Tragacanth*: neither if you chew it and ſwallow downe the juyce doth it leſſe auaile againſt thoſe effects than the juyce of Liquorice. ‡

Chap. 219. *Of ſmall Celandine or Pilewort.*

¶ *The Kindes.*

There be two kindes of Celandine, according to the old writers, much differing in forme and figure: the one greater, the other leſſer, which I intend to diuide into two diſtinct chapters, marſhalling them as neere as may be with their like, in forme and figure, and firſt of the ſmall Celandine.

Chelidonium minus.
Pilewort.



Ranunculus ficaria L. [illegible] Sm. [illegible] 3.47

¶ *The Deſcription.*

The leſſer Celandine hath greene round leaues, ſmooth, ſlipperie, and ſhining, leſſe than the leaues of the Iuie: the ſtalks are ſlender, ſhort, and for the moſt part creeping vpon the ground: they bring forth little yellow floures like thoſe of Crowfoot; and after the floures there ſpringeth vp a little fine knop or head full of ſeed: the root conſiſteth of ſlender ſtrings, on which doe hang as it were certain graines, of the bignes of Wheat cornes, or bigger.

¶ *The Place.*

It groweth in medows, by common waies, by ditches and trenches, and it is common euery where, in moiſt and dankiſh places.

¶ *The Time.*

It commeth forth about the Calends of March, and floureth a little after: it beginneth to fade away in Aprill, it is quite gone in May, afterwards it is hard to be found, yea ſcarcely the root.

¶ *The Names.*

Is is called in Greeke, χελιδόνιον: of the Latines *Chelidonium minus*, and *Hirundinaria minor*: of diuers, *Scrophularia minor*, *Ficaria minor*: of *Serapio*, *Memiren*: in Italian, *Fauescello*: in High Dutch, **Feigwurtzenkrant**: in French, *Eſclere*, and *Petit Baſſinet*: in Engliſh, little Celandine, Figwort and Pile-wort.

¶ *The Temperature.*

It is hot and dry, alſo more biting and hotter than the greater: it commeth neereſt in faculty to the Crowfoot.

‡ This which is here, and by moſt Authors ſet forth for *Chelidonium minus*, hath no ſuch great heat and Acrimony as *Dioſcorides* and *Galen* affirme to be in theirs; making it hot in the fourth degree, when as this of ours ſcarce exceeds the firſt, as far as we may conjecture by the taſte. ‡

¶ *The Vertues.*

A It preſently, as *Galen* and *Dioſcorides* affirme, exulcerateth or bliſtereth the skin: it maketh rough and corrupt nailes to fall away.

B The juyce of the roots mixed with hony, and drawne vp into the noſthrils, purgeth the head of foule and filthy humors.

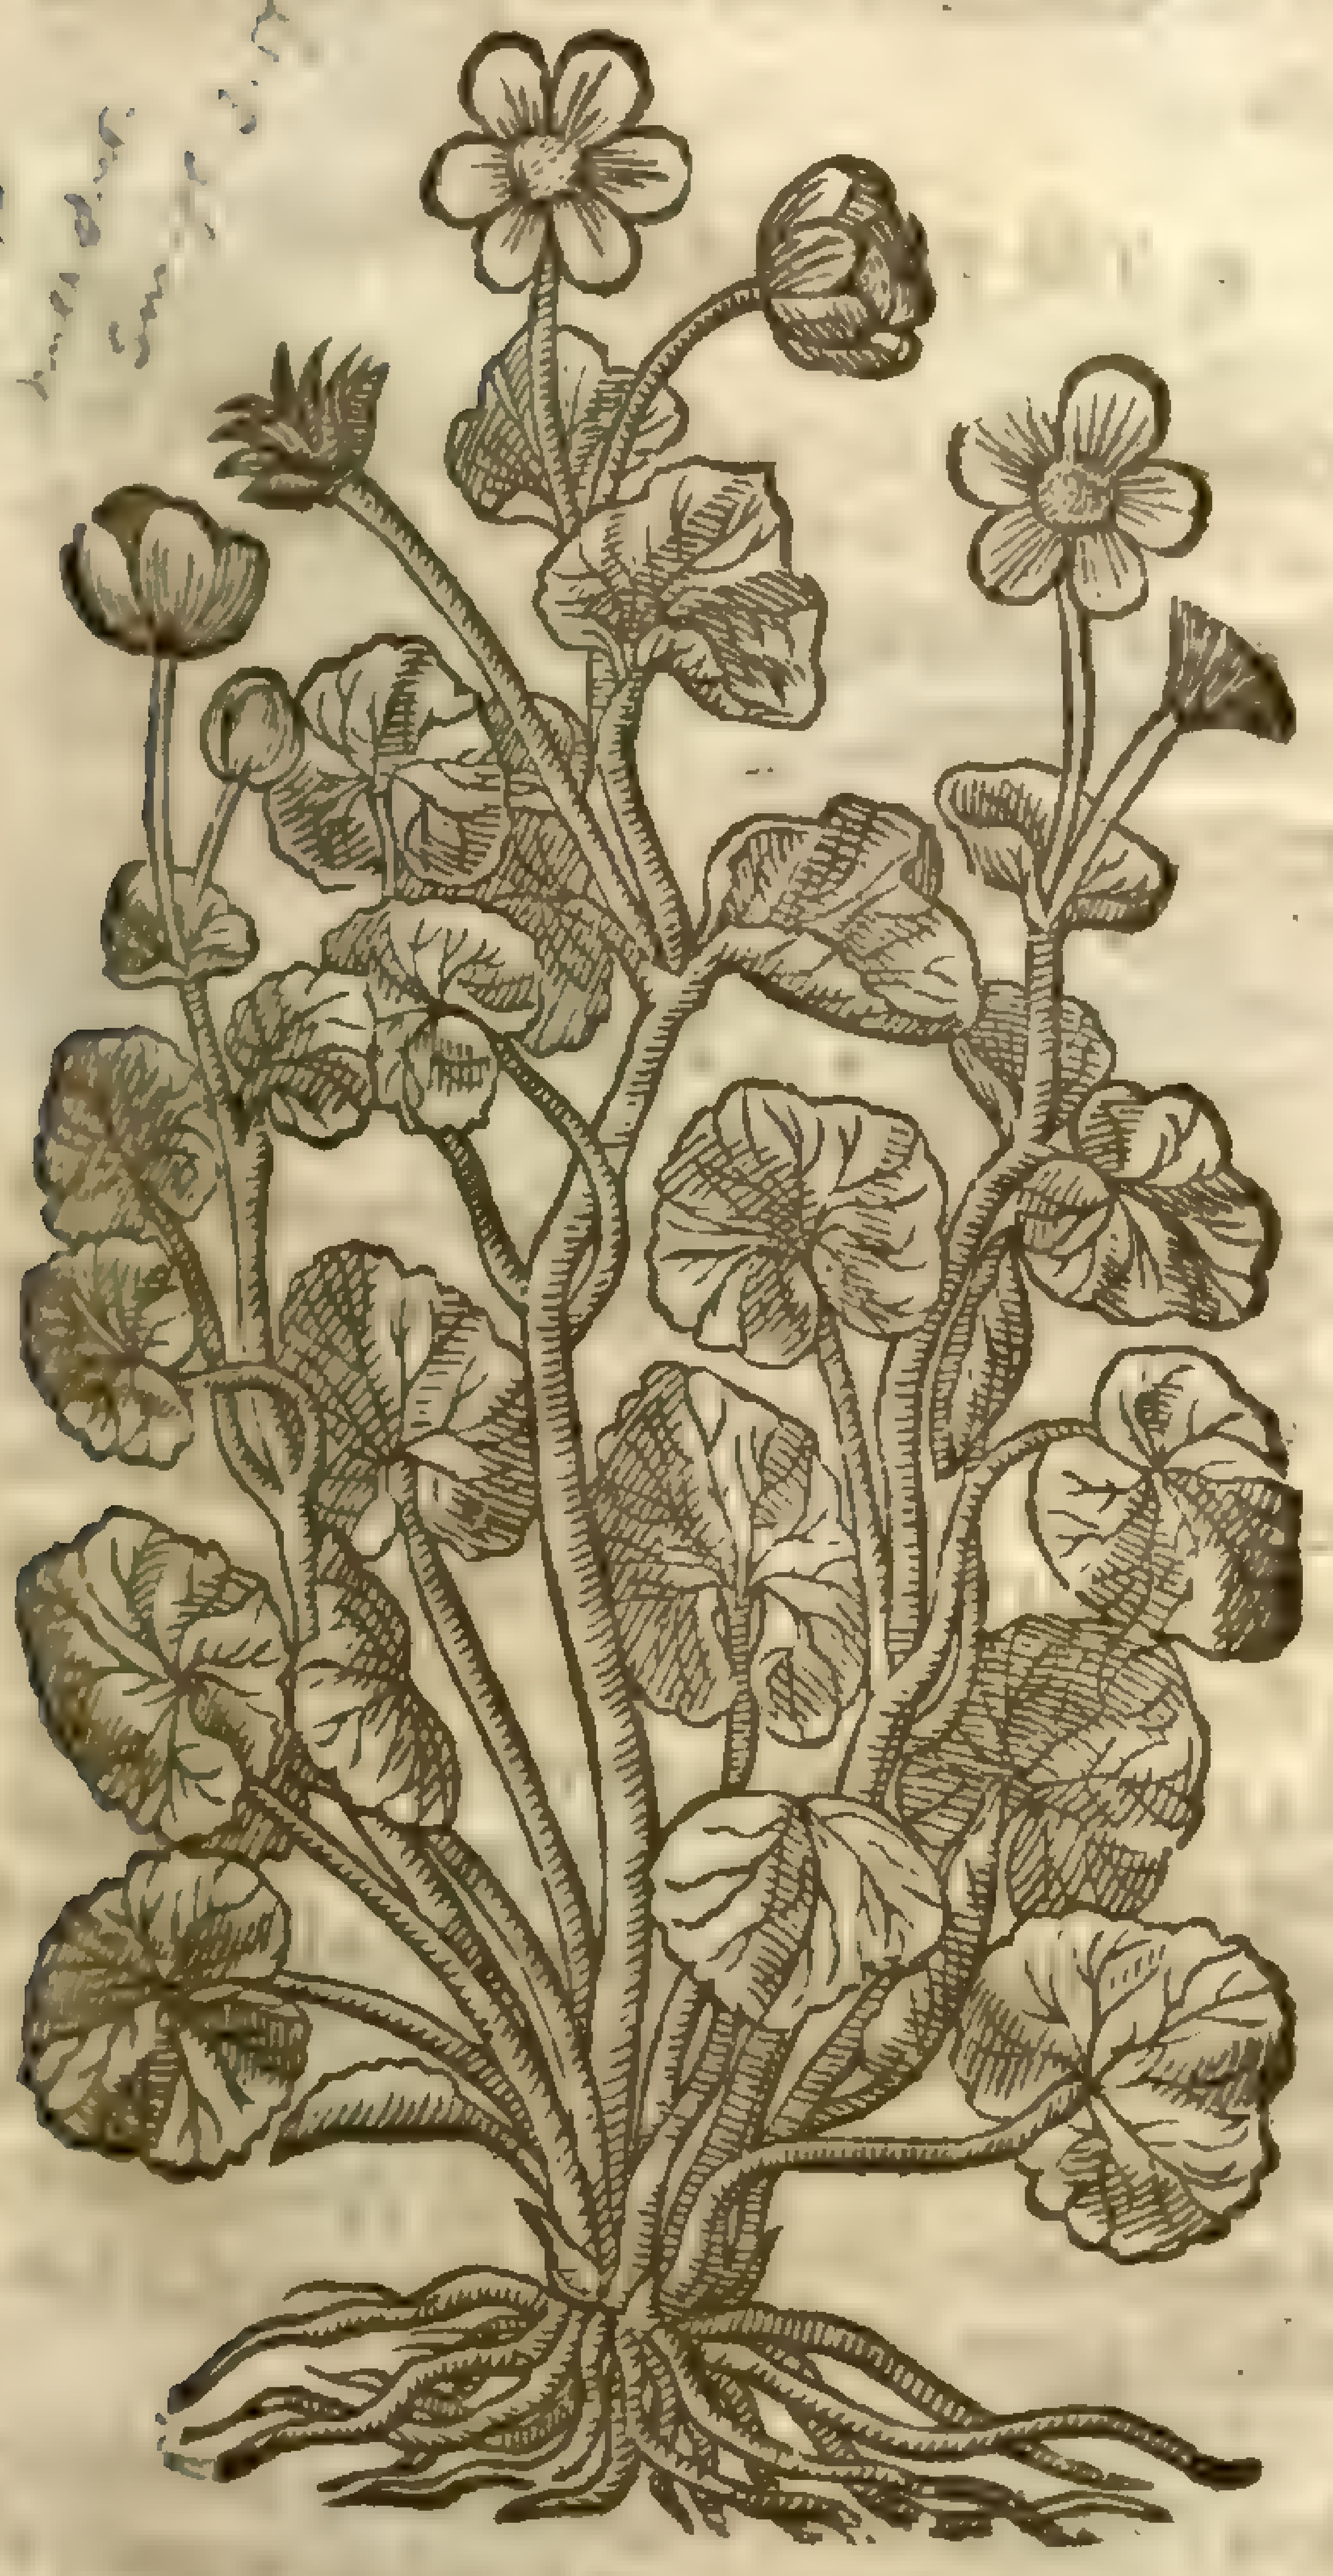
C The later age vſe the roots and graines for the piles, which being often bathed with the iuyce mixed with wine, or with the ſickmans vrine, are drawne together and dried vp, and the paine quite taken away.

D There be alſo who thinke, that if the herbe be but carried about one that hath the piles, the paine forthwith ceaſeth.

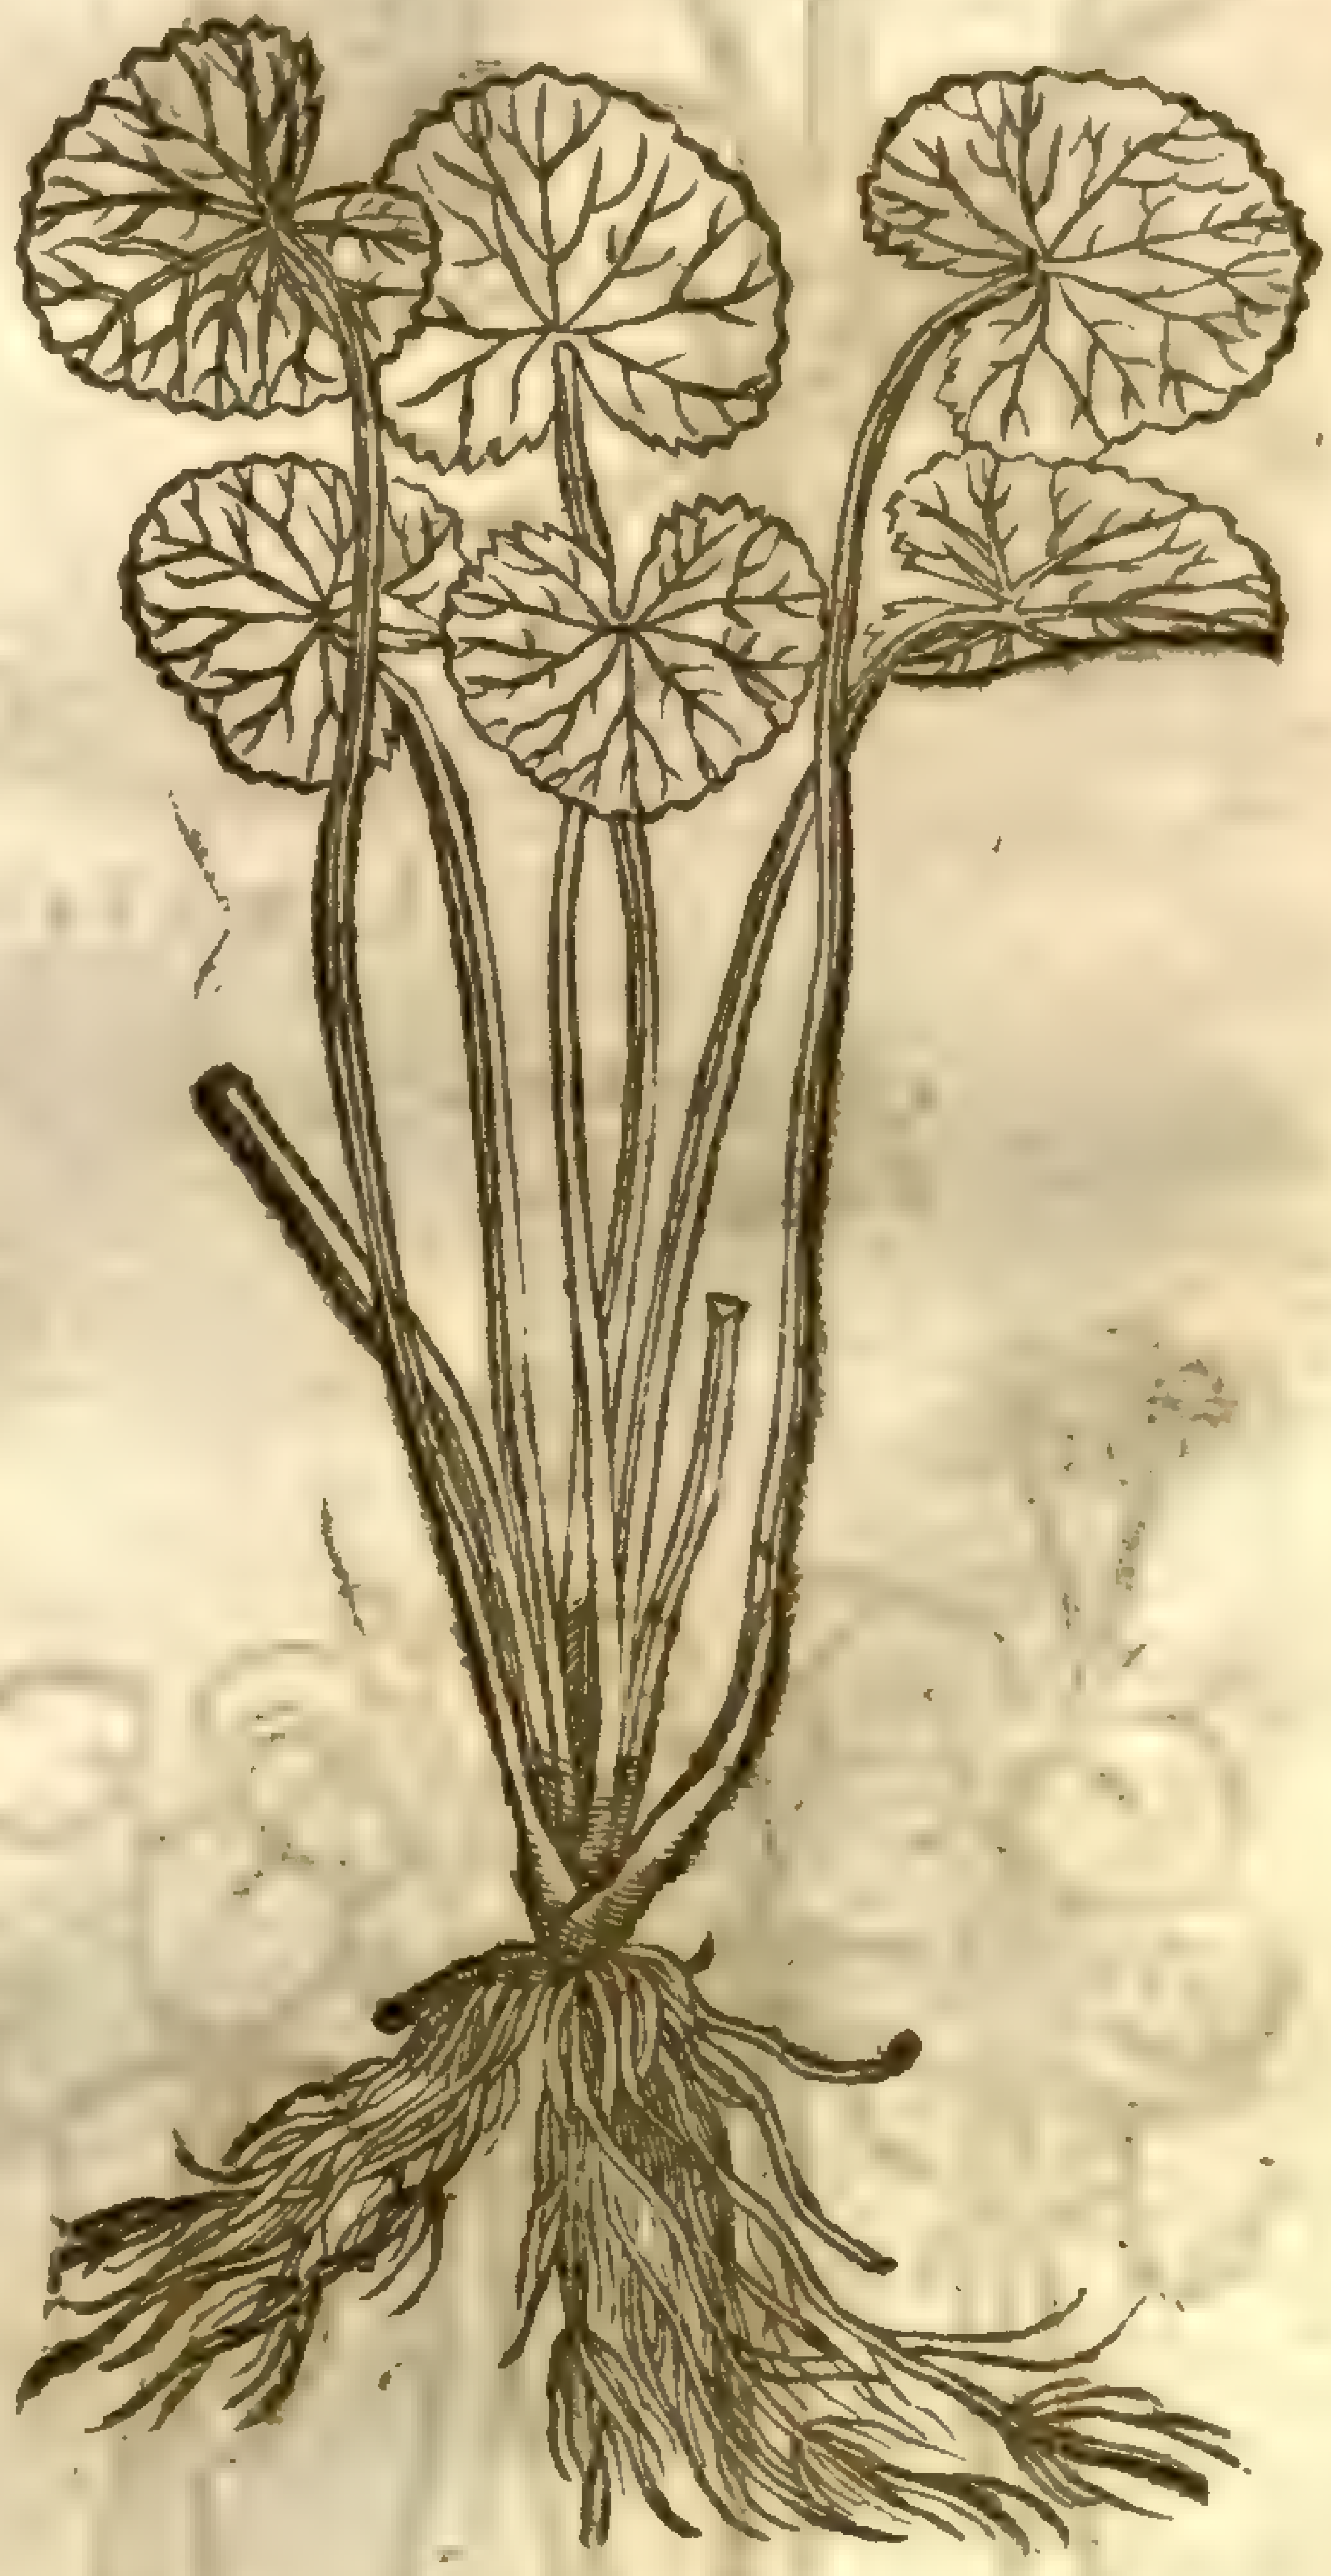
Chap. 294. *Of Marſh Marigold.*

¶ *The Deſcription.*

1 Marſh Marigold hath great broad leaues ſomewhat round, ſmooth, of a gallant greene colour, ſleightly indented or purld about the edges: among which riſe vp thicke fat ſtalkes, likewiſe greene; whereupon doe grow goodly yellow floures, glittering like gold, and like to thoſe of Crow-foot, but greater: the root is ſmall, compoſed of very many ſtrings.



1 *Caltha paluſtris maior.*
The great Marſh Marigold.



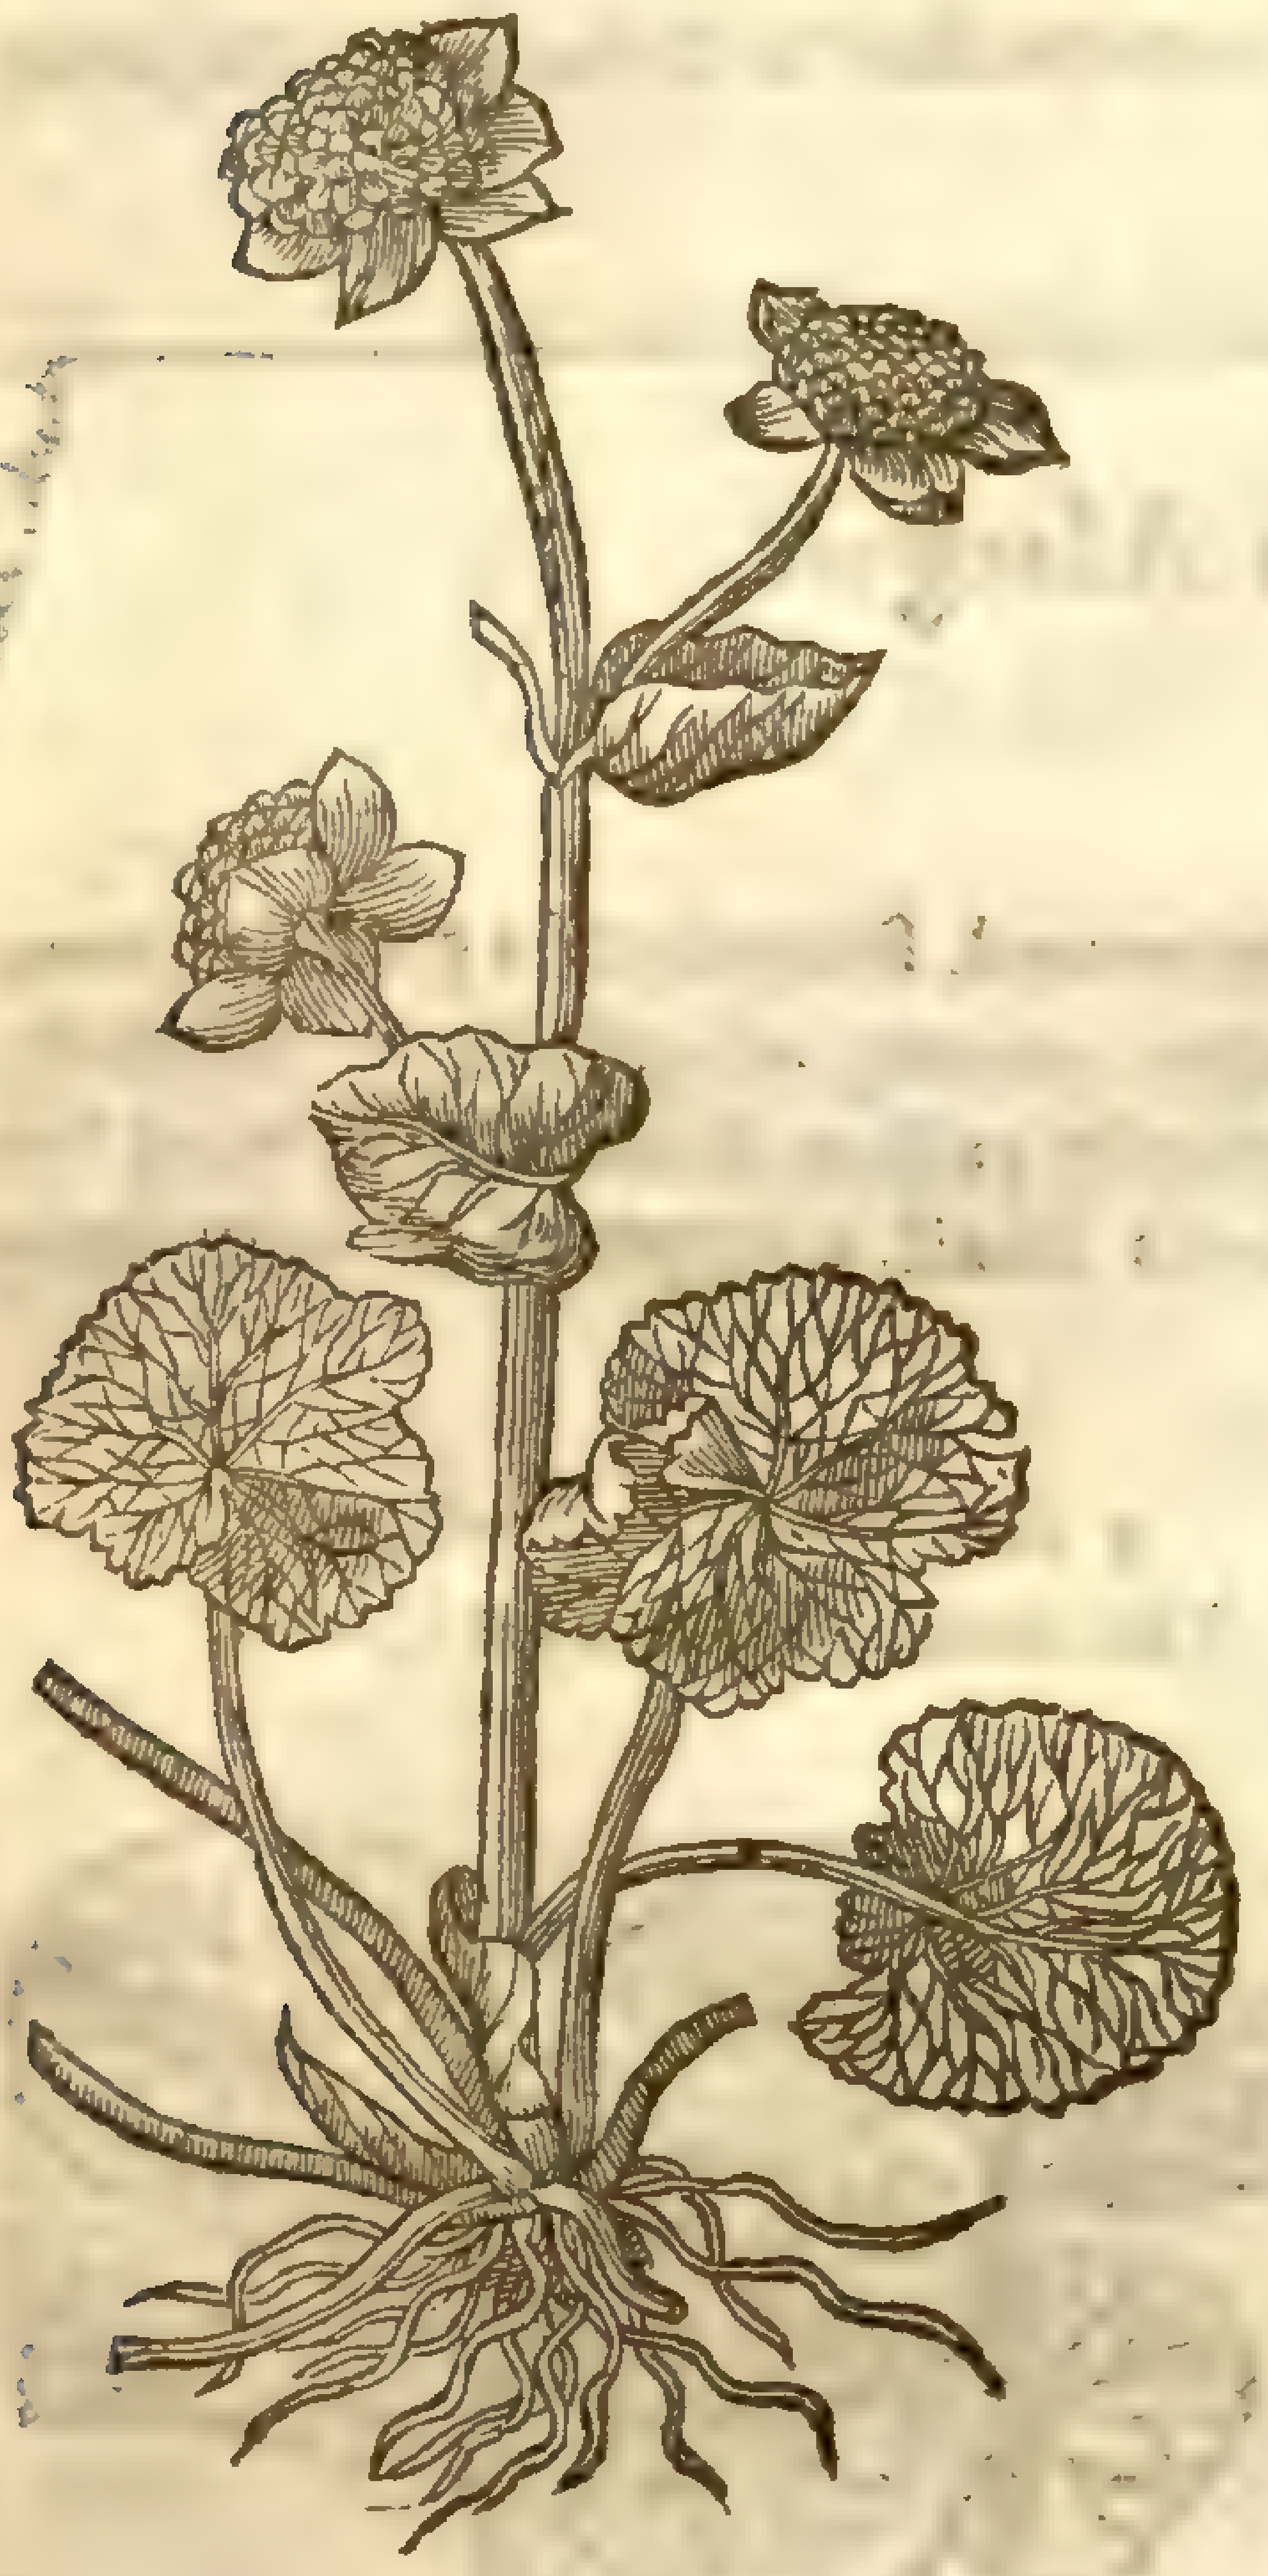
2 *Caltha paluſtris minor.*
The ſmall Marſh Marigold.

2 The ſmaller Marſh Marigold hath many round leaues ſpred vpon the ground, of a darke greene colour: amongſt which riſe vp diuers branches, charged with the like leaues: the floures grow at the toppes of the branches, of a moſt ſhining yellow colour: the root is alſo like the former.

3 The great Marſh Marigold with double floures is a ſtranger in England, his natiue Country ſhould ſeeme to bee in the furtheſt part of Germany, by the relation of a man of thoſe Countries that I haue had conference withall, the which he thus deſcribed: it hath (ſaith he) leaues, roots, and ſtalkes like thoſe of our common ſort, and hath double floures like thoſe of the garden Marigold, wherein conſiſteth the difference.

‡ *Camerarius* writes iuſt contrary to that which our Author here affirmes: for hee ſaith, *In Anglia ſua ſponte non ſolum plenis, ſed odoratis etiam floribus paſſim ſeſe offert.* But I feare that both our

3 *Caltha paluſtris multiplex.*
Double floured Marſh Marigold.



C. palustris L. [illegible]

Author and *Camerarius* were deceiued by truſting the report of ſome lying, or elſe ignorant perſons, for I could neuer find it growing wilde with double floures here, nor *Camerarius* there: yet I do not deny but by chance ſome one with double floures may be found both here and there, but this is not euery where. ‡

¶ *The Place.*

They joy in moiſt and mariſh grounds, and in watery medowes. ‡ I haue not found the double one wilde, but ſeene it preſerued in diuers Gardens for the beauty of the floure. ‡

¶ *The Time.*

They floure in the Spring when the Crowfoots doe, and oftentimes in Summer: the leaues keepe their greeneneſſe all the Winter long.

¶ *The Names.*

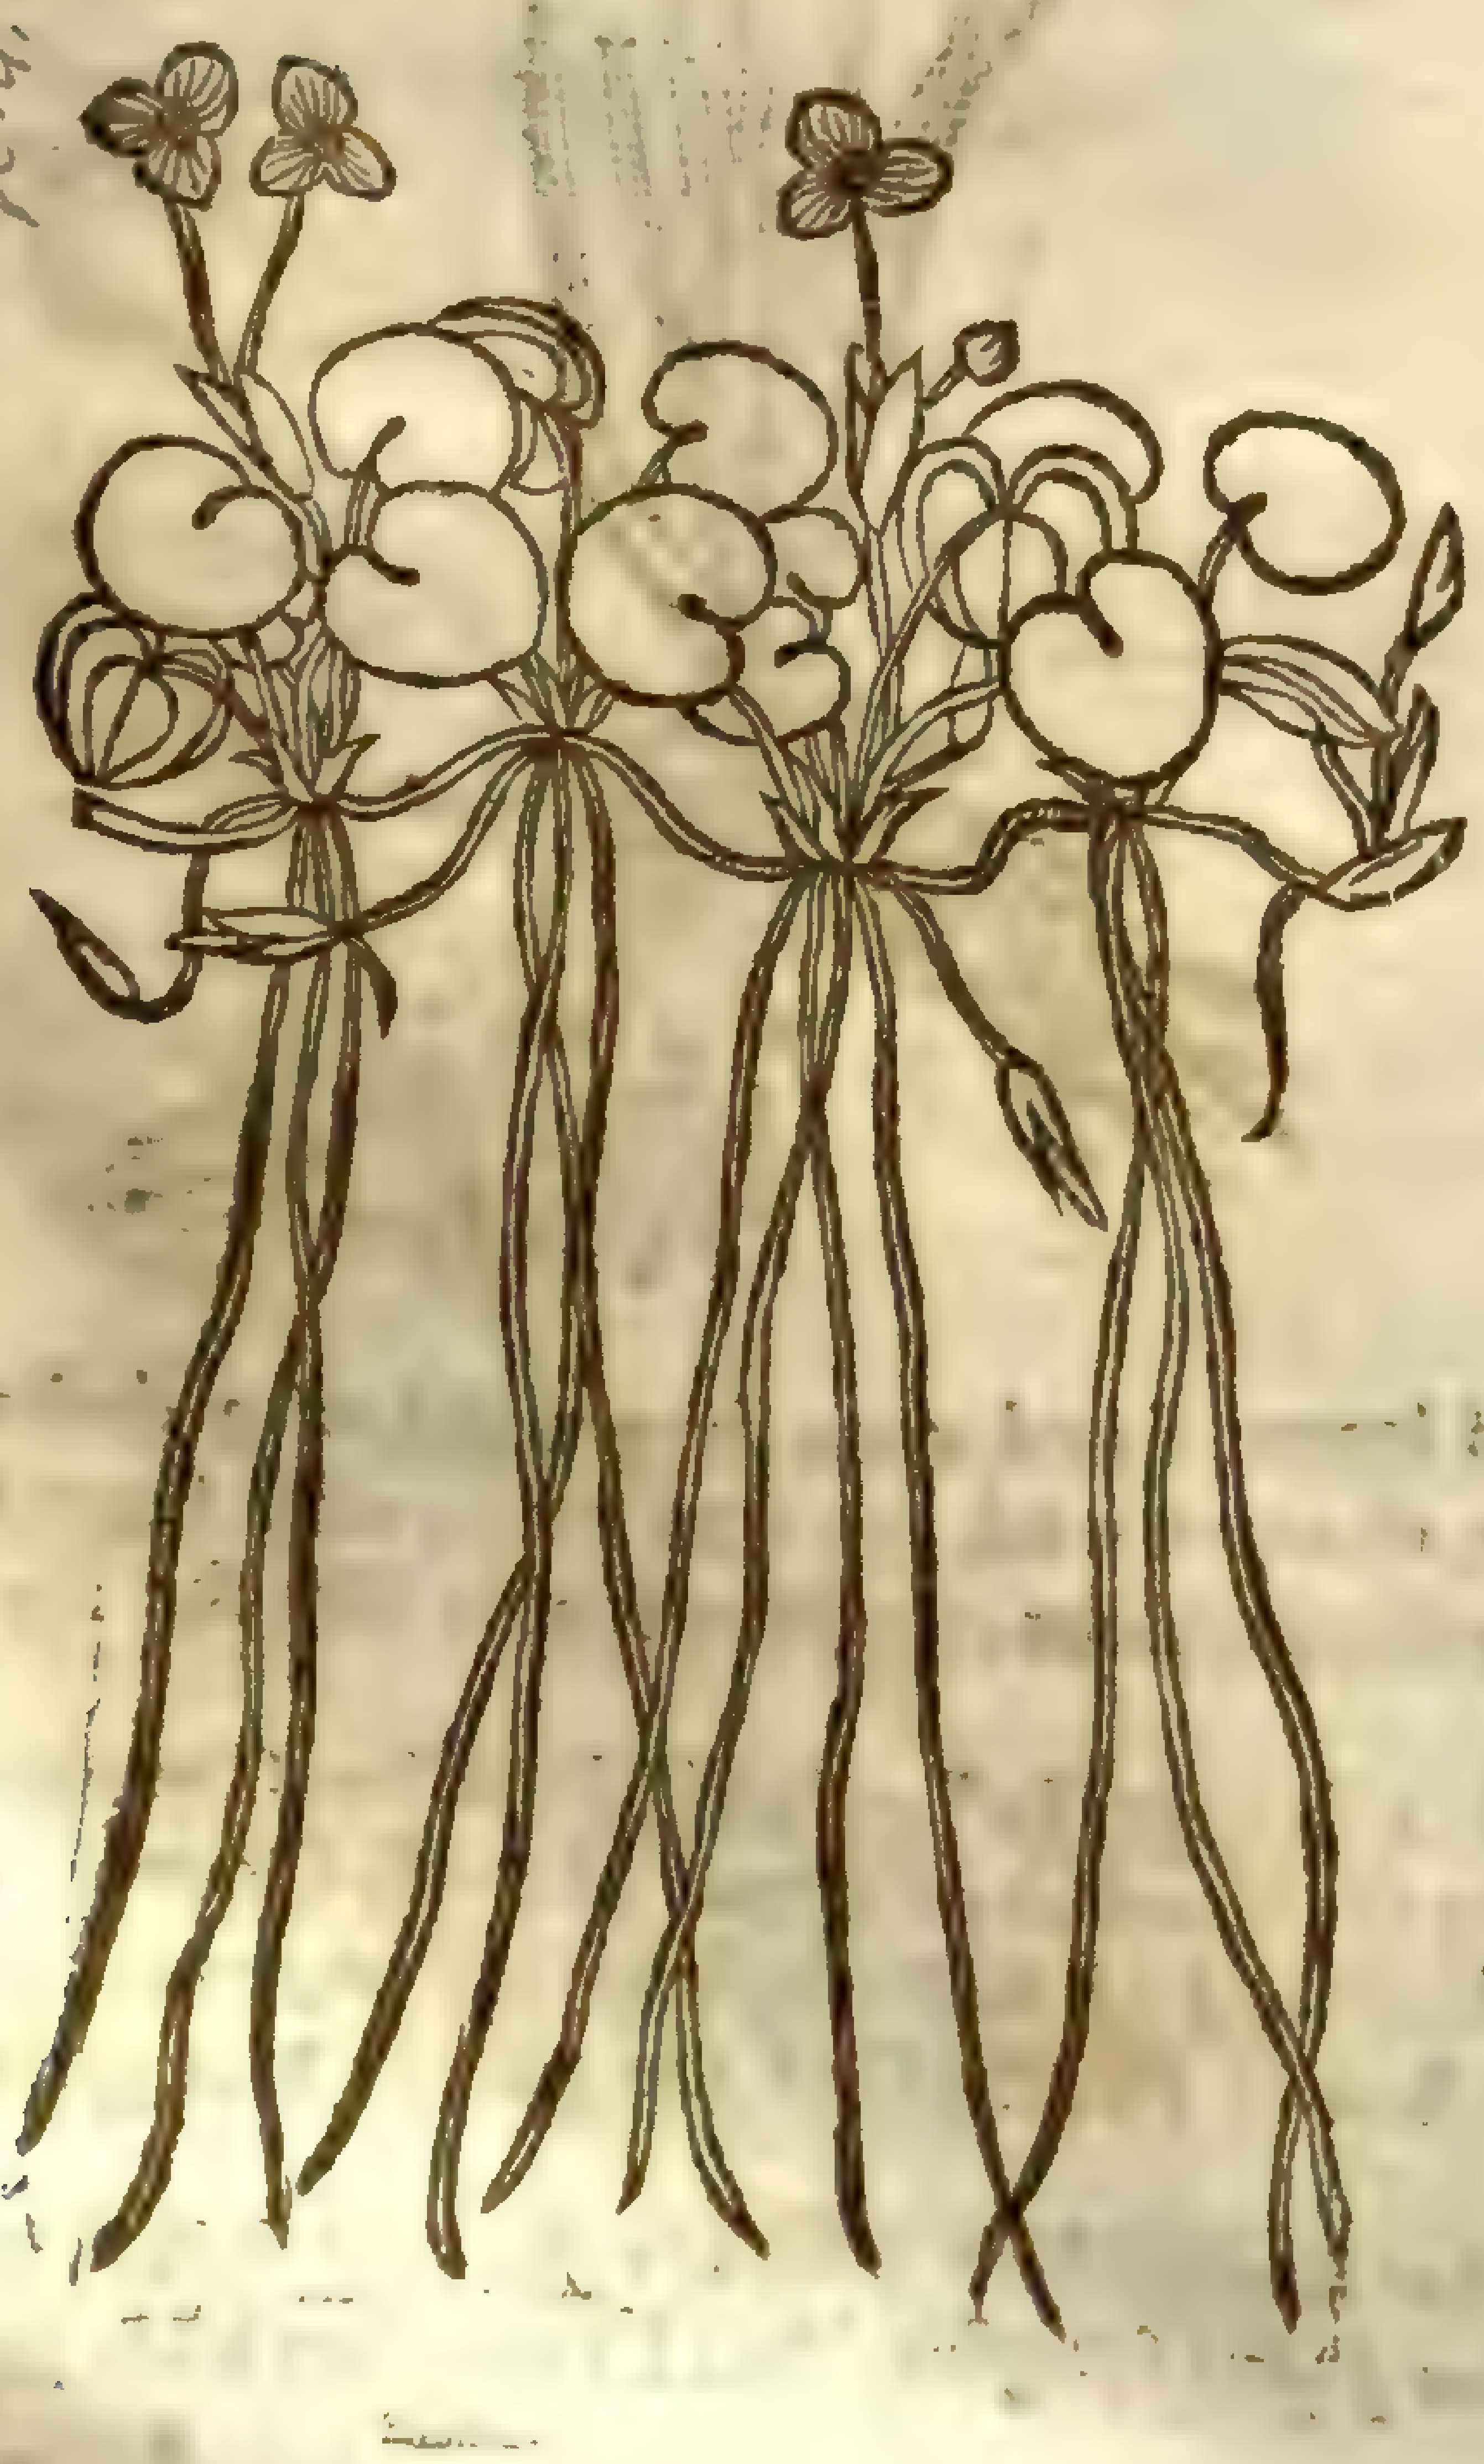
Marſh Marigold is called of *Valerius Cordus*, *Caltha paluſtris*: of *Tabernamontanus*, *Populago*: but not properly: in Engliſh; March Marigolds: in Cheſhire and thoſe parts it is called Bootes.

¶ *The Temperature and Vertues.*

Touching the faculties of theſe plants, wee haue nothing to ſay, either out of other mens writings, or our owne experience.

Chap. 295. Of Frogge-bit.

Morſus Ranæ.
Frogge-bit.



Hydrocharis morsus ranae, L. [illegible]

¶ *The Deſcription.*

There floteth or ſwimmeth vpon the vpper parts of the water a ſmall plant, which we vſually call Frog-bit, hauing little round leaues, thicke and full of juyce, very like to the leaues of wall Peniwort: the floures grow vpon long ſtems among the leaues, of a white colour, with a certain yellow thrum in the middle conſiſting of three leaues: in ſtead of roots it hath ſlender ſtrings, which grow out of a ſhort and ſmall head, as it were, from whence the leaues ſpring, in the bottom of the water: from which head alſo come forth ſlopewiſe certain ſtrings, by which growing forth it multiplieth it ſelfe.

¶ *The Place.*

It is found ſwimming or floting almoſt in euery ditch, pond, poole, or ſtanding water, in all the ditches about Saint George his fields, and in the ditches by the Thames ſide neere to Lambeth Marſh, where any that is diſpoſed may ſee it.

¶ *The Time.*

It flouriſheth and floureth moſt part of all the yeare

¶ *The Names.*

It is called of ſome *Rana morſus*, and *Morſus Ranæ*, and *Nymphæa parua.*

¶ *The Temperature and Vertues.*

It is thought to be a kinde of Pond-weed (or rather of Water Lillie) and to haue the ſame faculties that belong vnto it. A

CHAP. 296. *Of Water Lillie.*

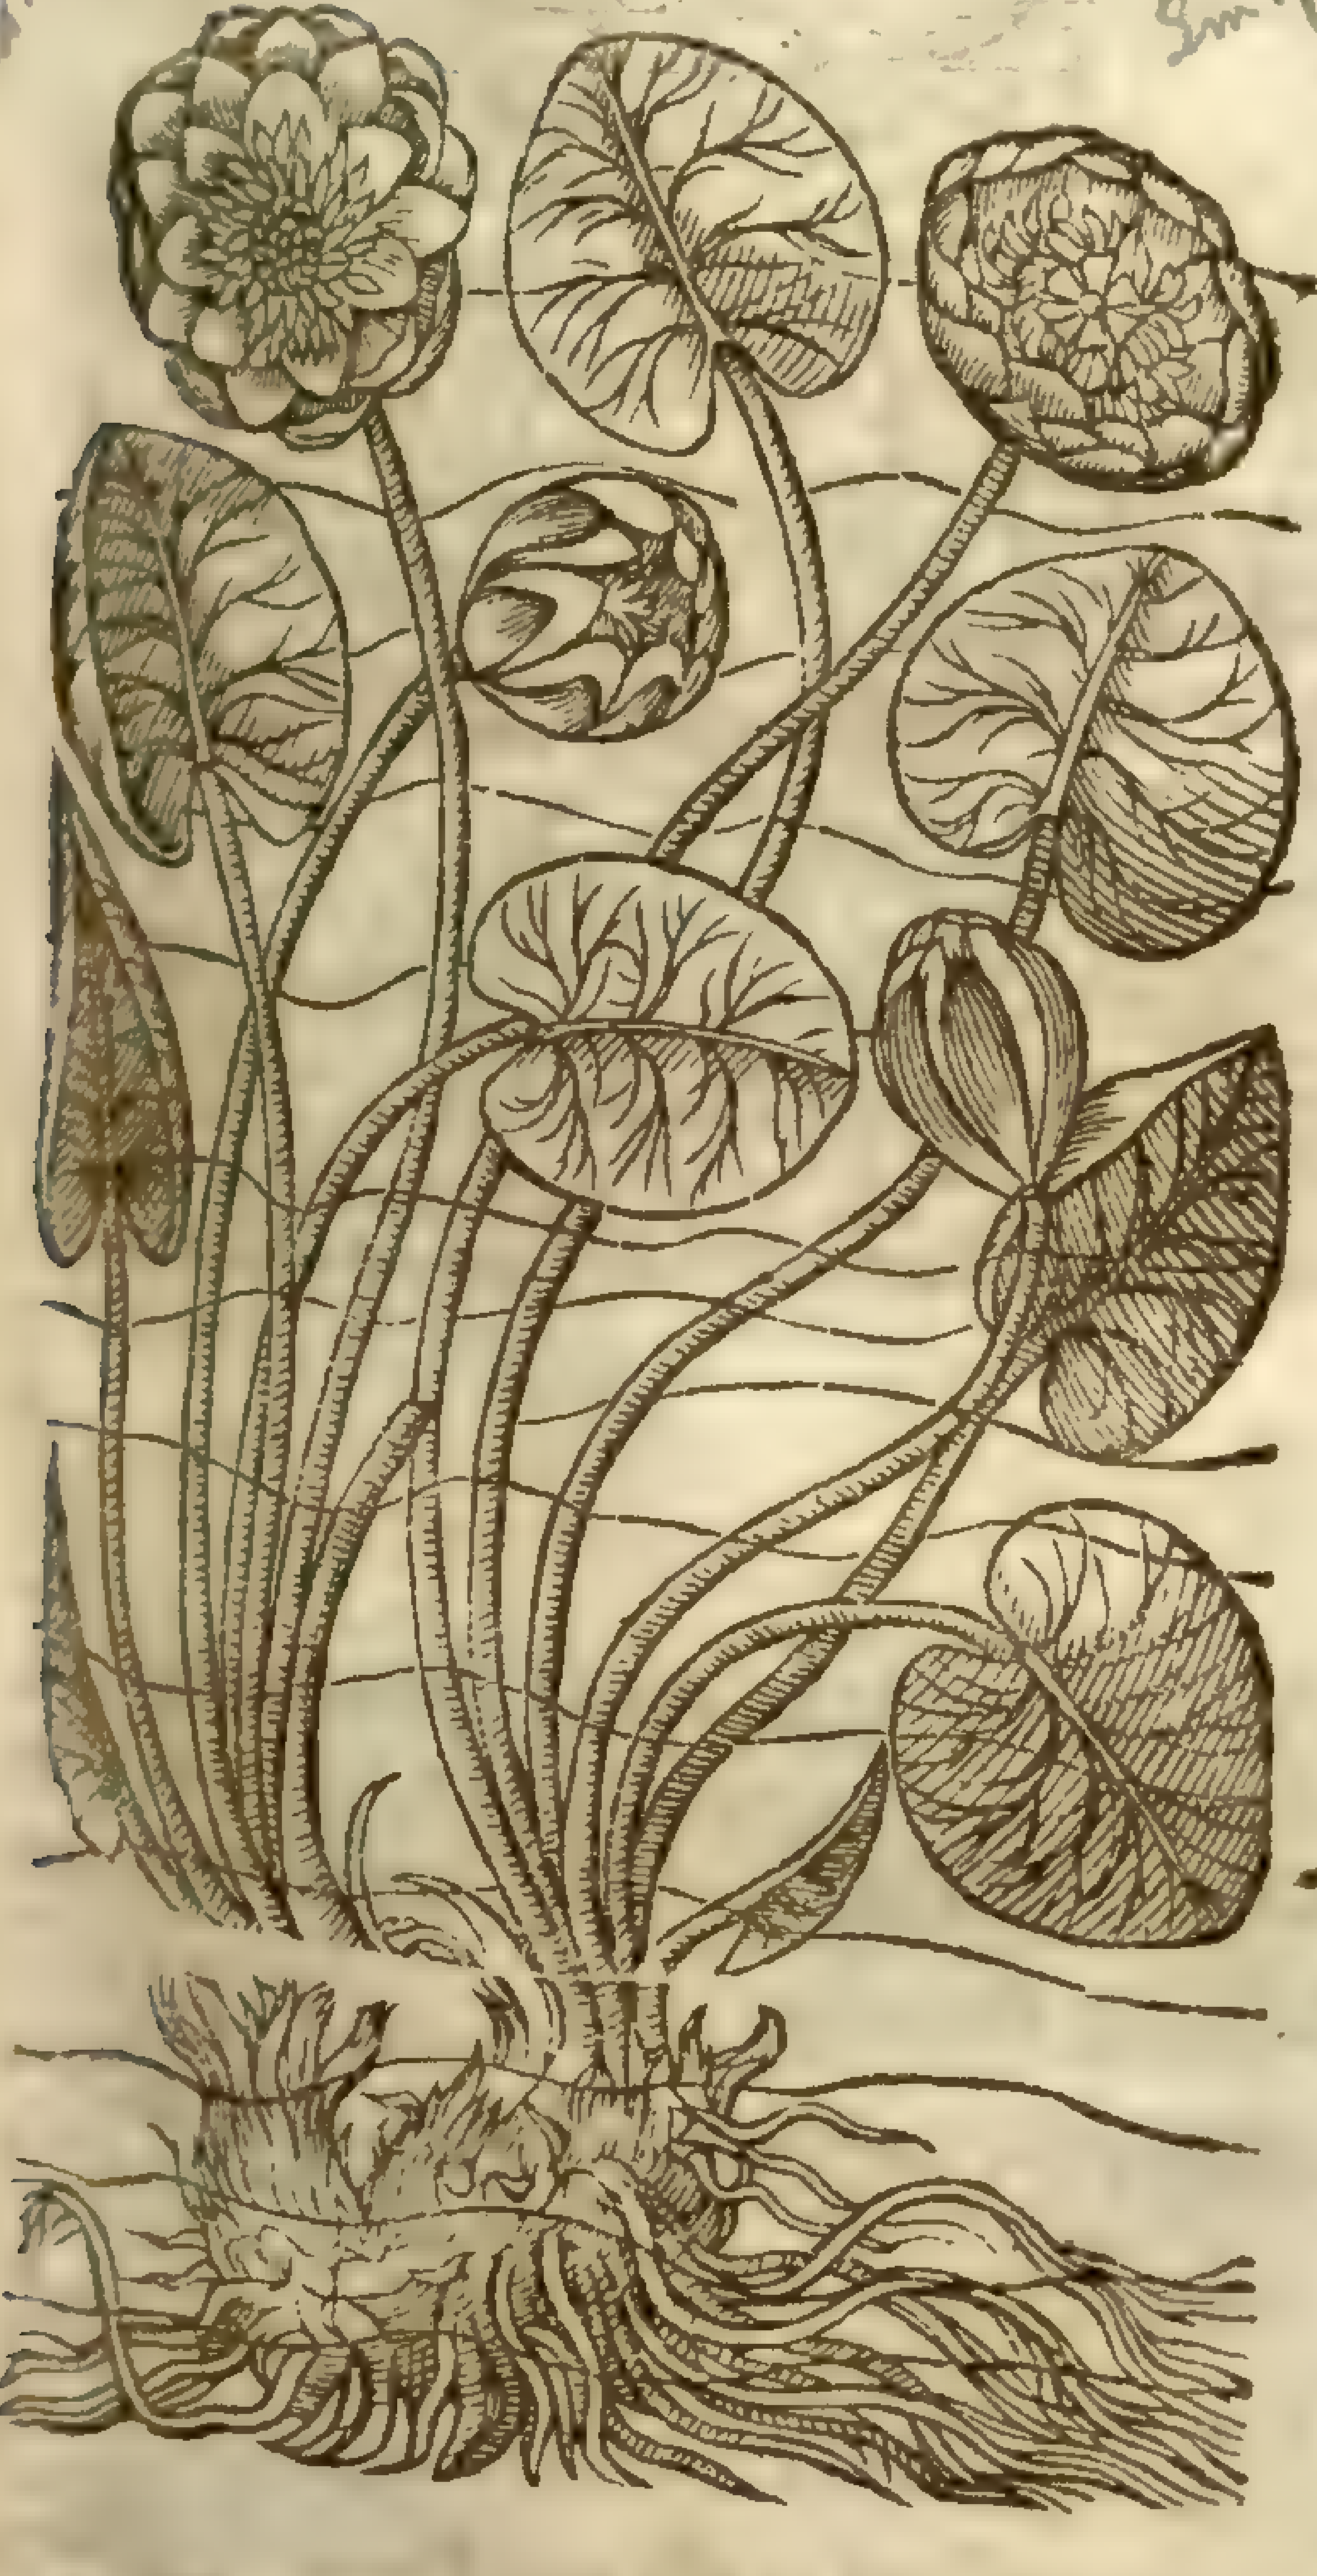
¶ *The Deſcription.*

1 THe white water Lillie of *Nenuphar* hath great round leaues, in ſhape of a buckler, thick, fat, and full of juyce, ſtanding vpon long round and ſmooth foot-ſtalkes, ful of a ſpungious ſubſtance; which leaues do ſwim or flote vpon the top of the water: vpon the end of each ſtalk groweth one floure only, of colour white, conſiſting of many little long ſharpe pointed leaues in the middeſt whereof be many yellow threds: after the floure it bringeth forth a round head, in which lieth blackiſh glittering ſeed. The roots be thicke, full of knots, blacke without, white and ſpungy within, out of which groweth a multitude of ſtrings, by which it is faſtned in the bottome.

1 *Nymphaa alba.*
White Water Lillie.

N. alba, 1 mid-dist. Sm. fl. 3

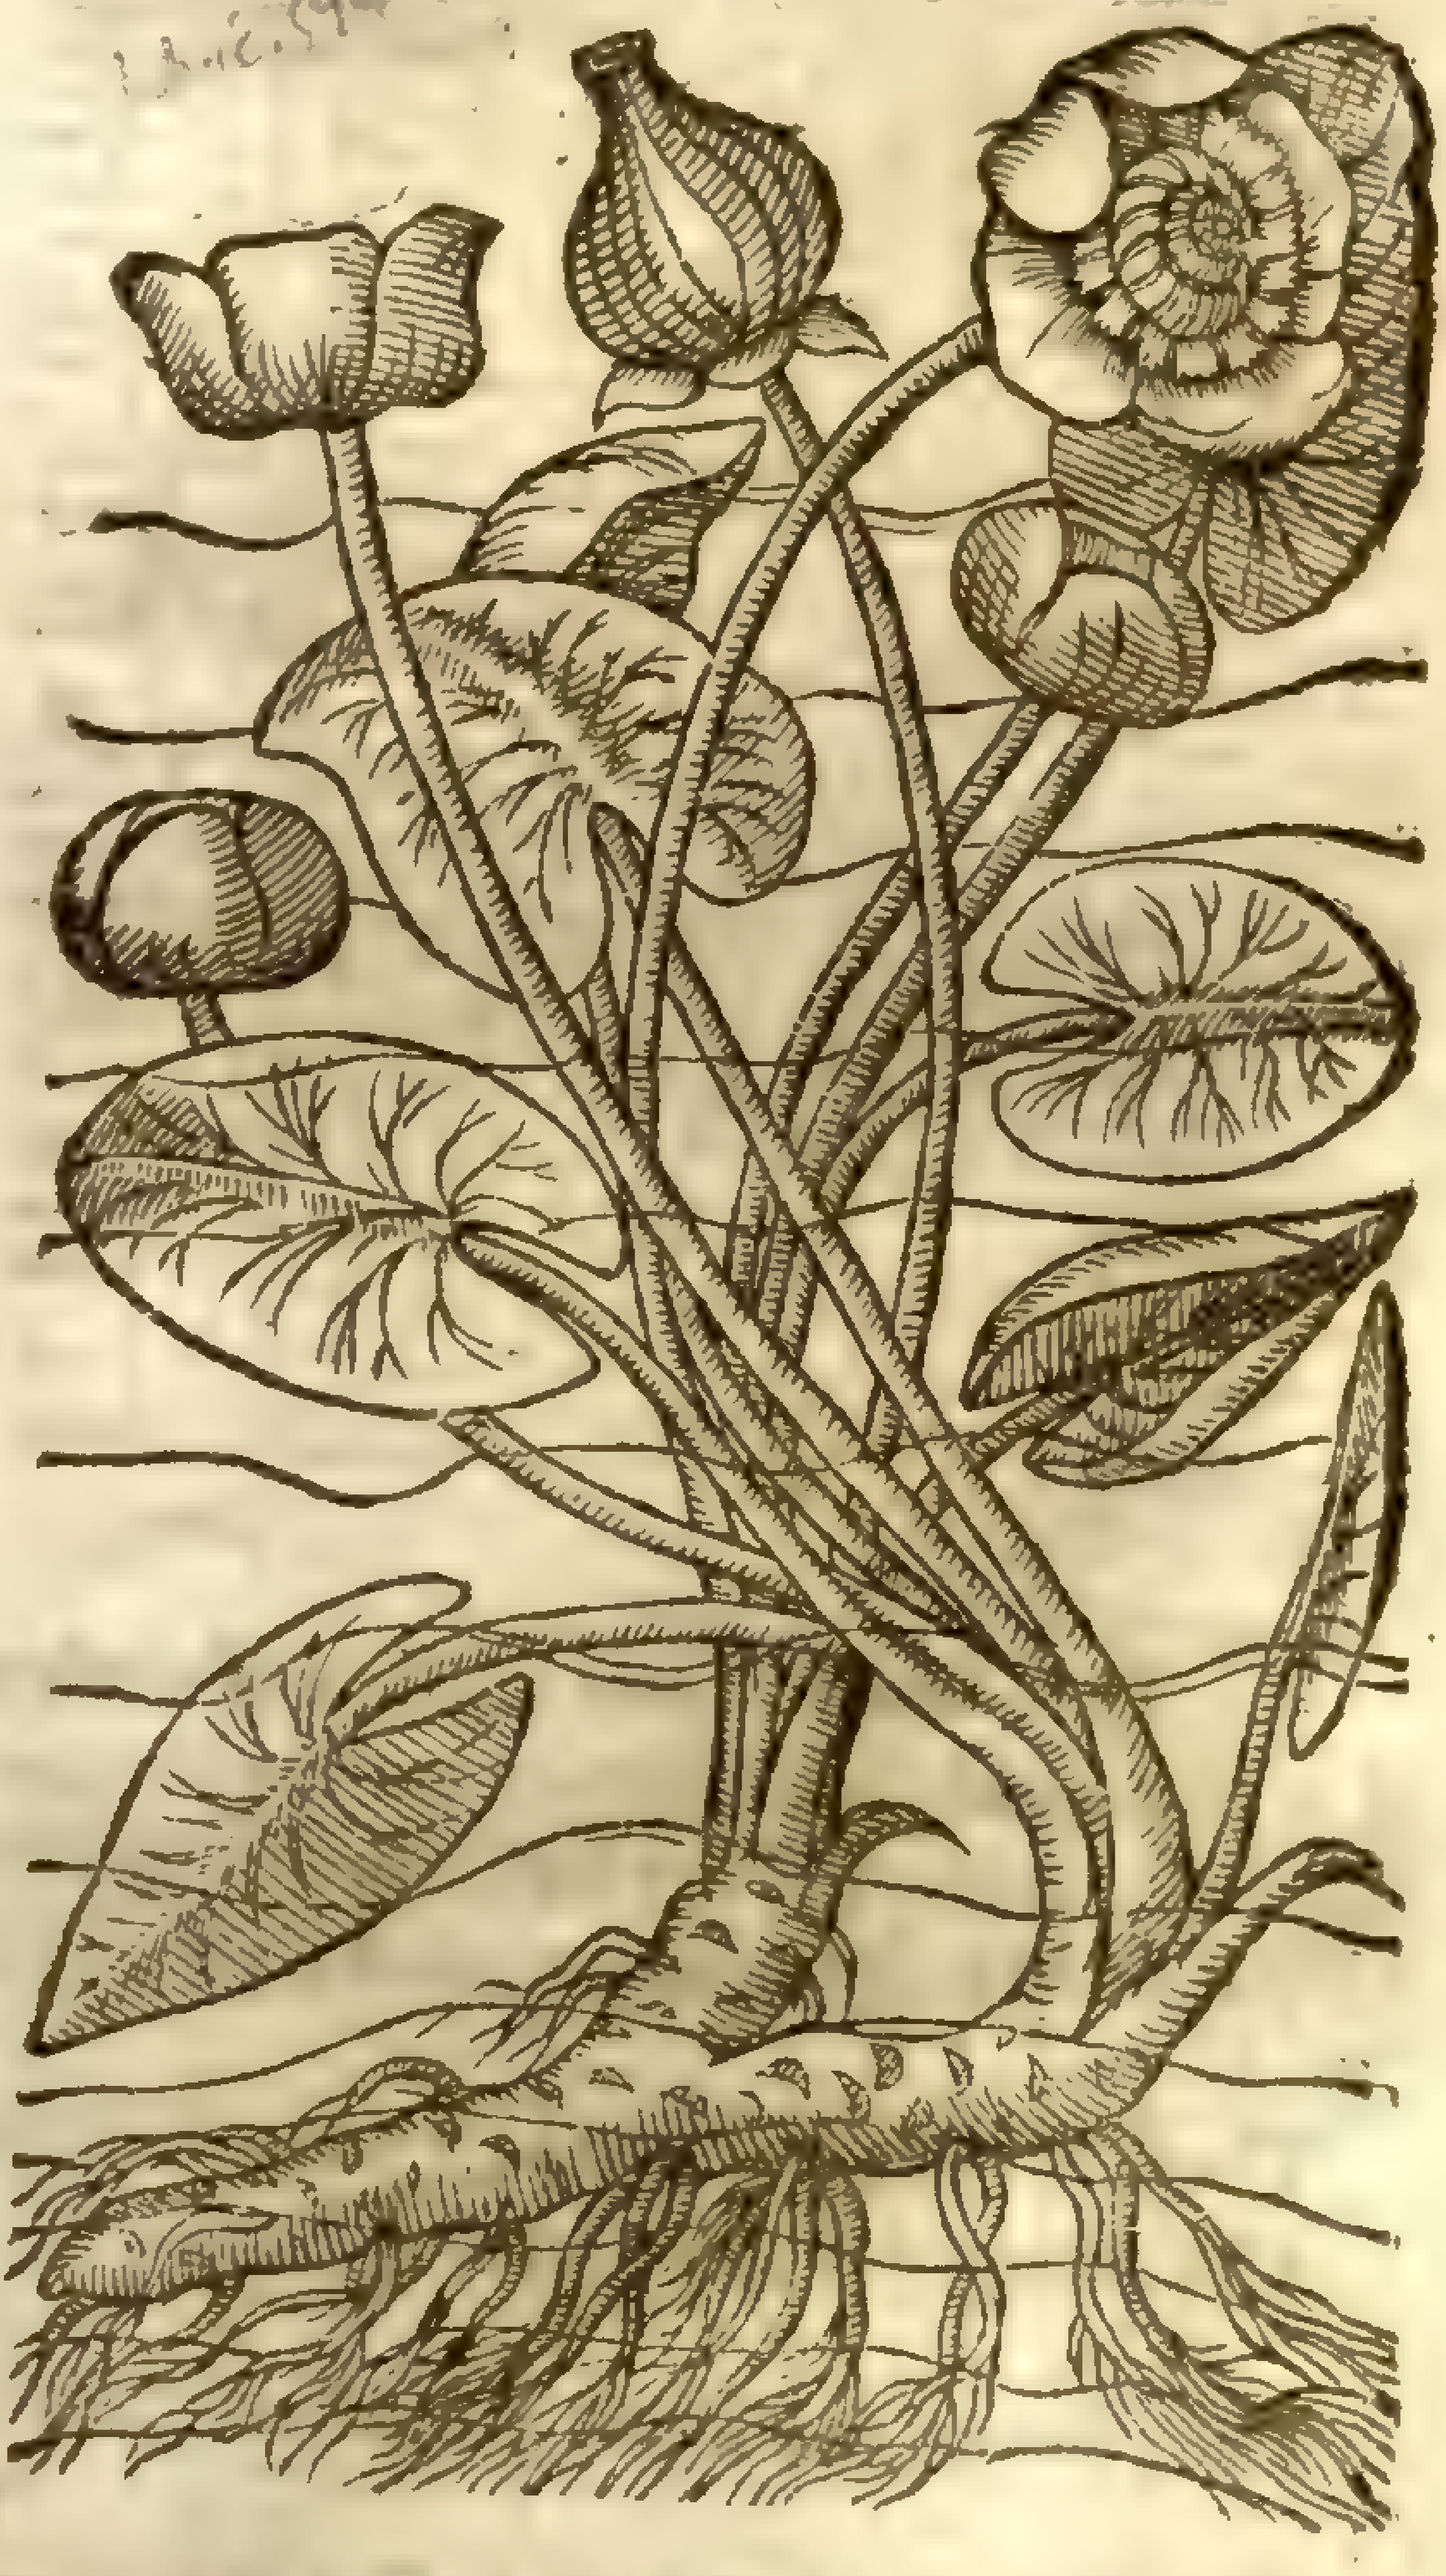
B. ic. [illegible]



2 *Nymphaa lutea.*
Yellow Water Lillie.

N. lutea, 6 mid-dist. Sm. fl. 3. 15

B. ic. 594



2 The leaues of the yellow water Lilly be like to the other, yet are they a little longer. The ſtalkes of the floures and leaues be like: the floures be yellow, conſiſting onely of fiue little ſhort leaues ſomething round; in the middeſt of which groweth a ſmall round head, or button, ſharpe towards the point, compaſſed about with many yellow threds, in which, when it is ripe, lie alſo glittering ſeeds, greater than thoſe of the other, and leſſer than wheat cornes. The roots be thicke, long, ſet with certaine dents, as it were white both within and without, of a ſpungeous ſubſtance.

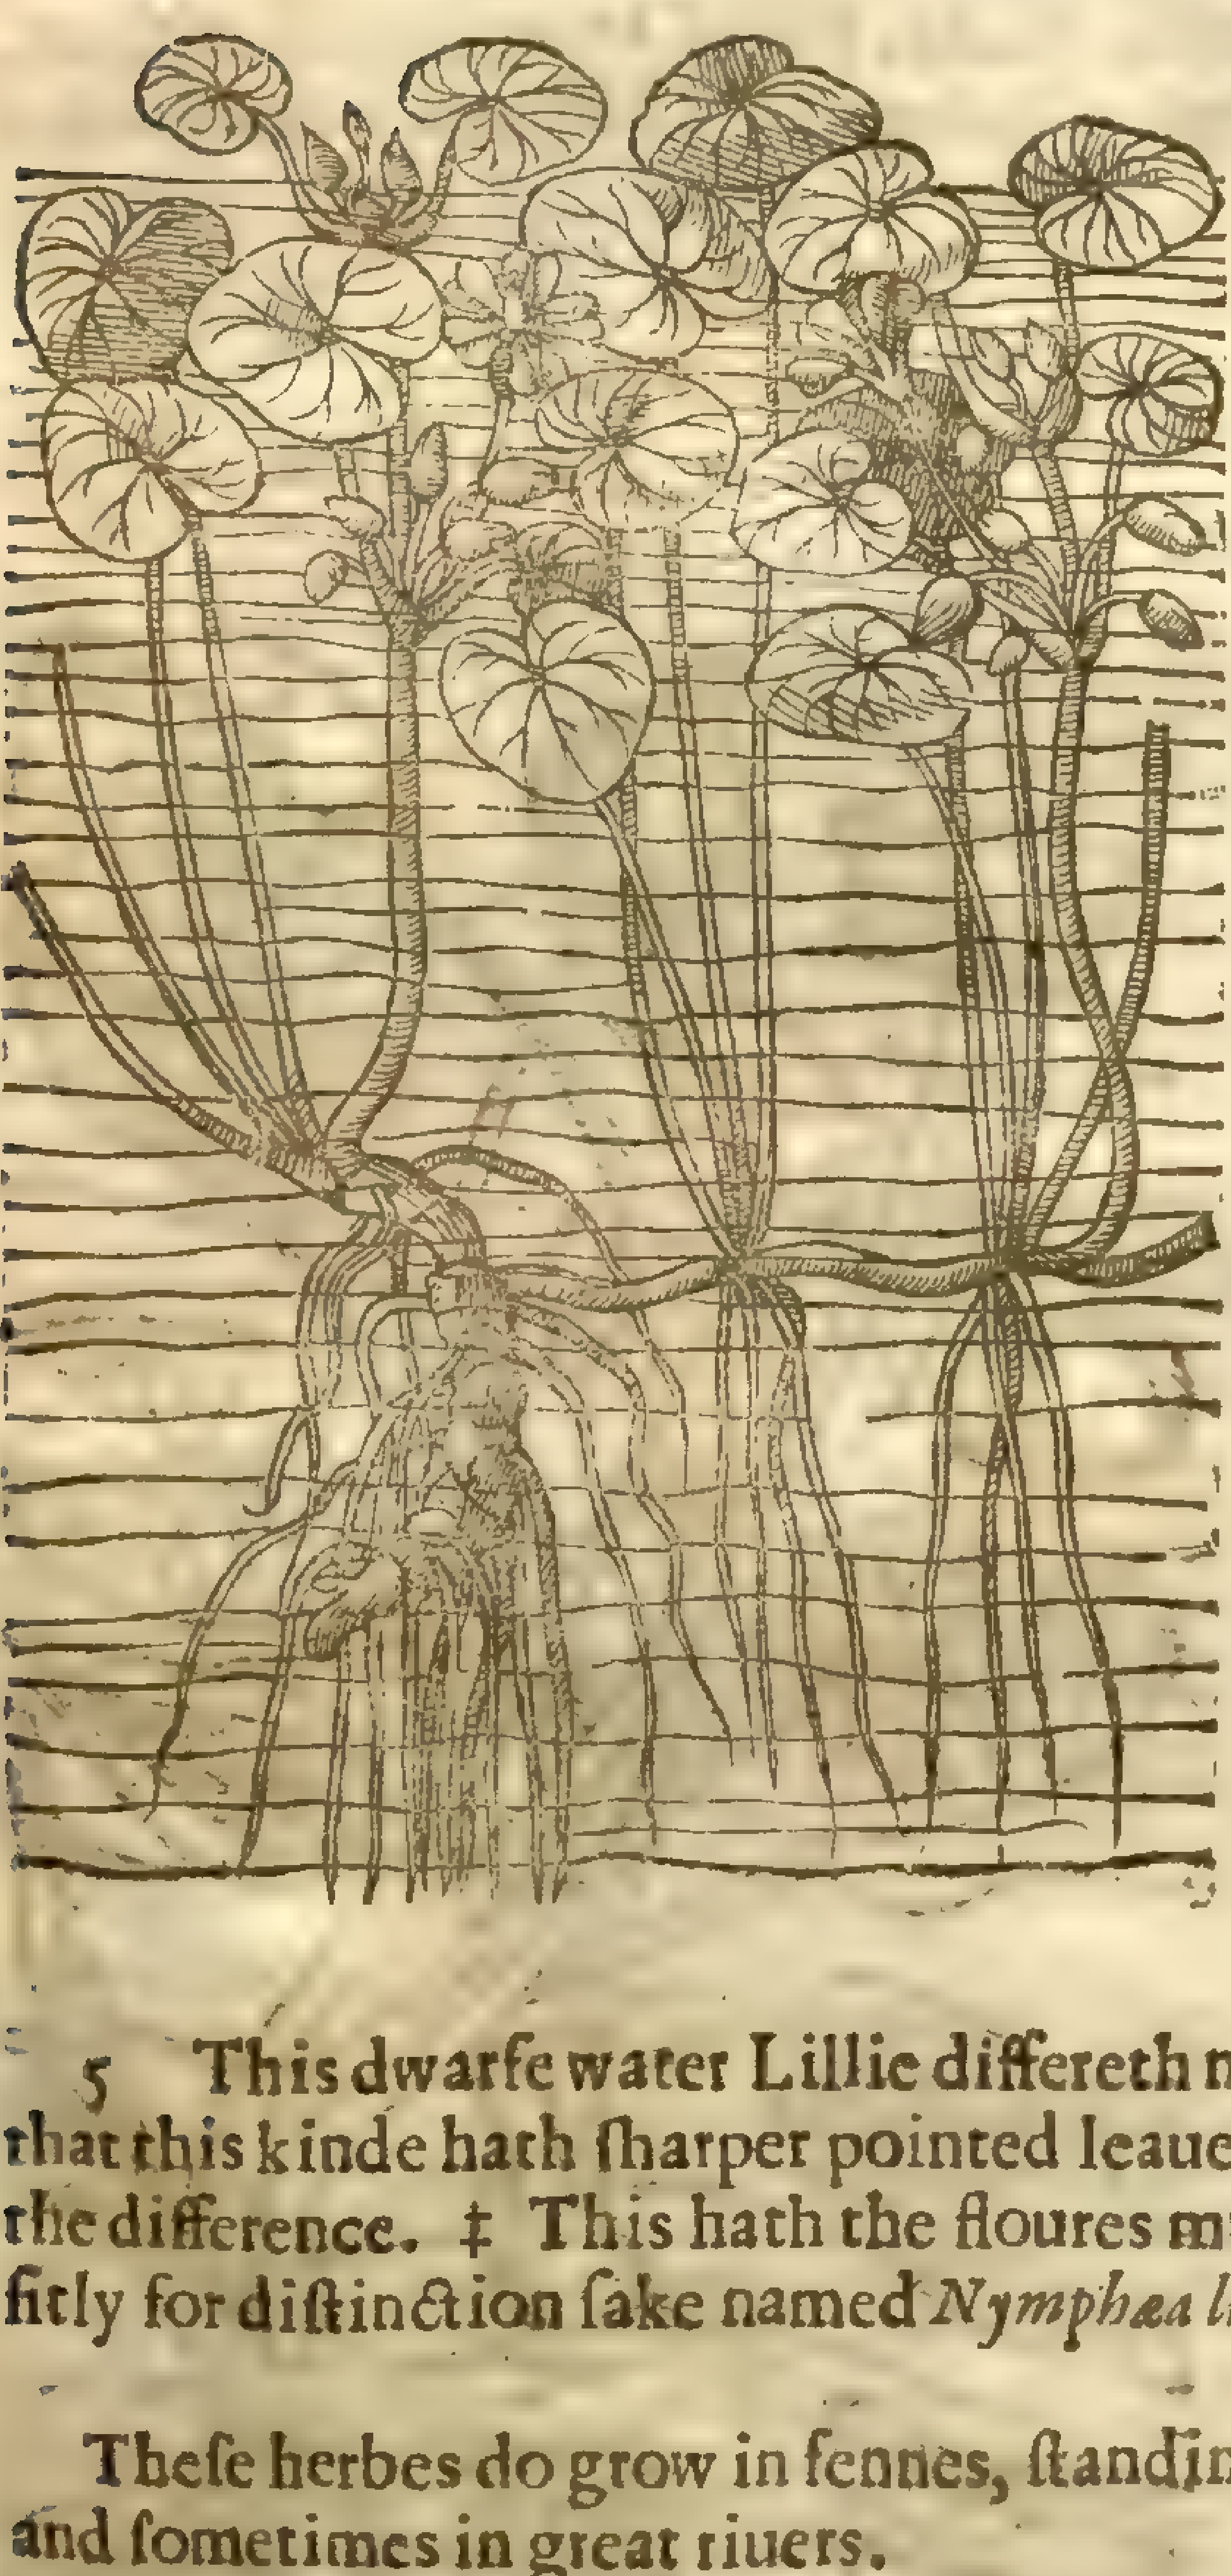
3 The ſmall white water Lillie floteth likewiſe vpon the water, hauing a ſingle root, with ſome few fibres faſtened thereto: from which riſeth vp many long, round, ſmooth, and ſoft foot-ſtalkes, ſome of which doe bring forth at the end faire broad round buckler leaues like vnto the precedent,

but leſſer: on the other foot-ſtalks ſtand pretty white floures, conſiſting of fiue ſmall leaues apeece, hauing a little yellow in the middle thereof.

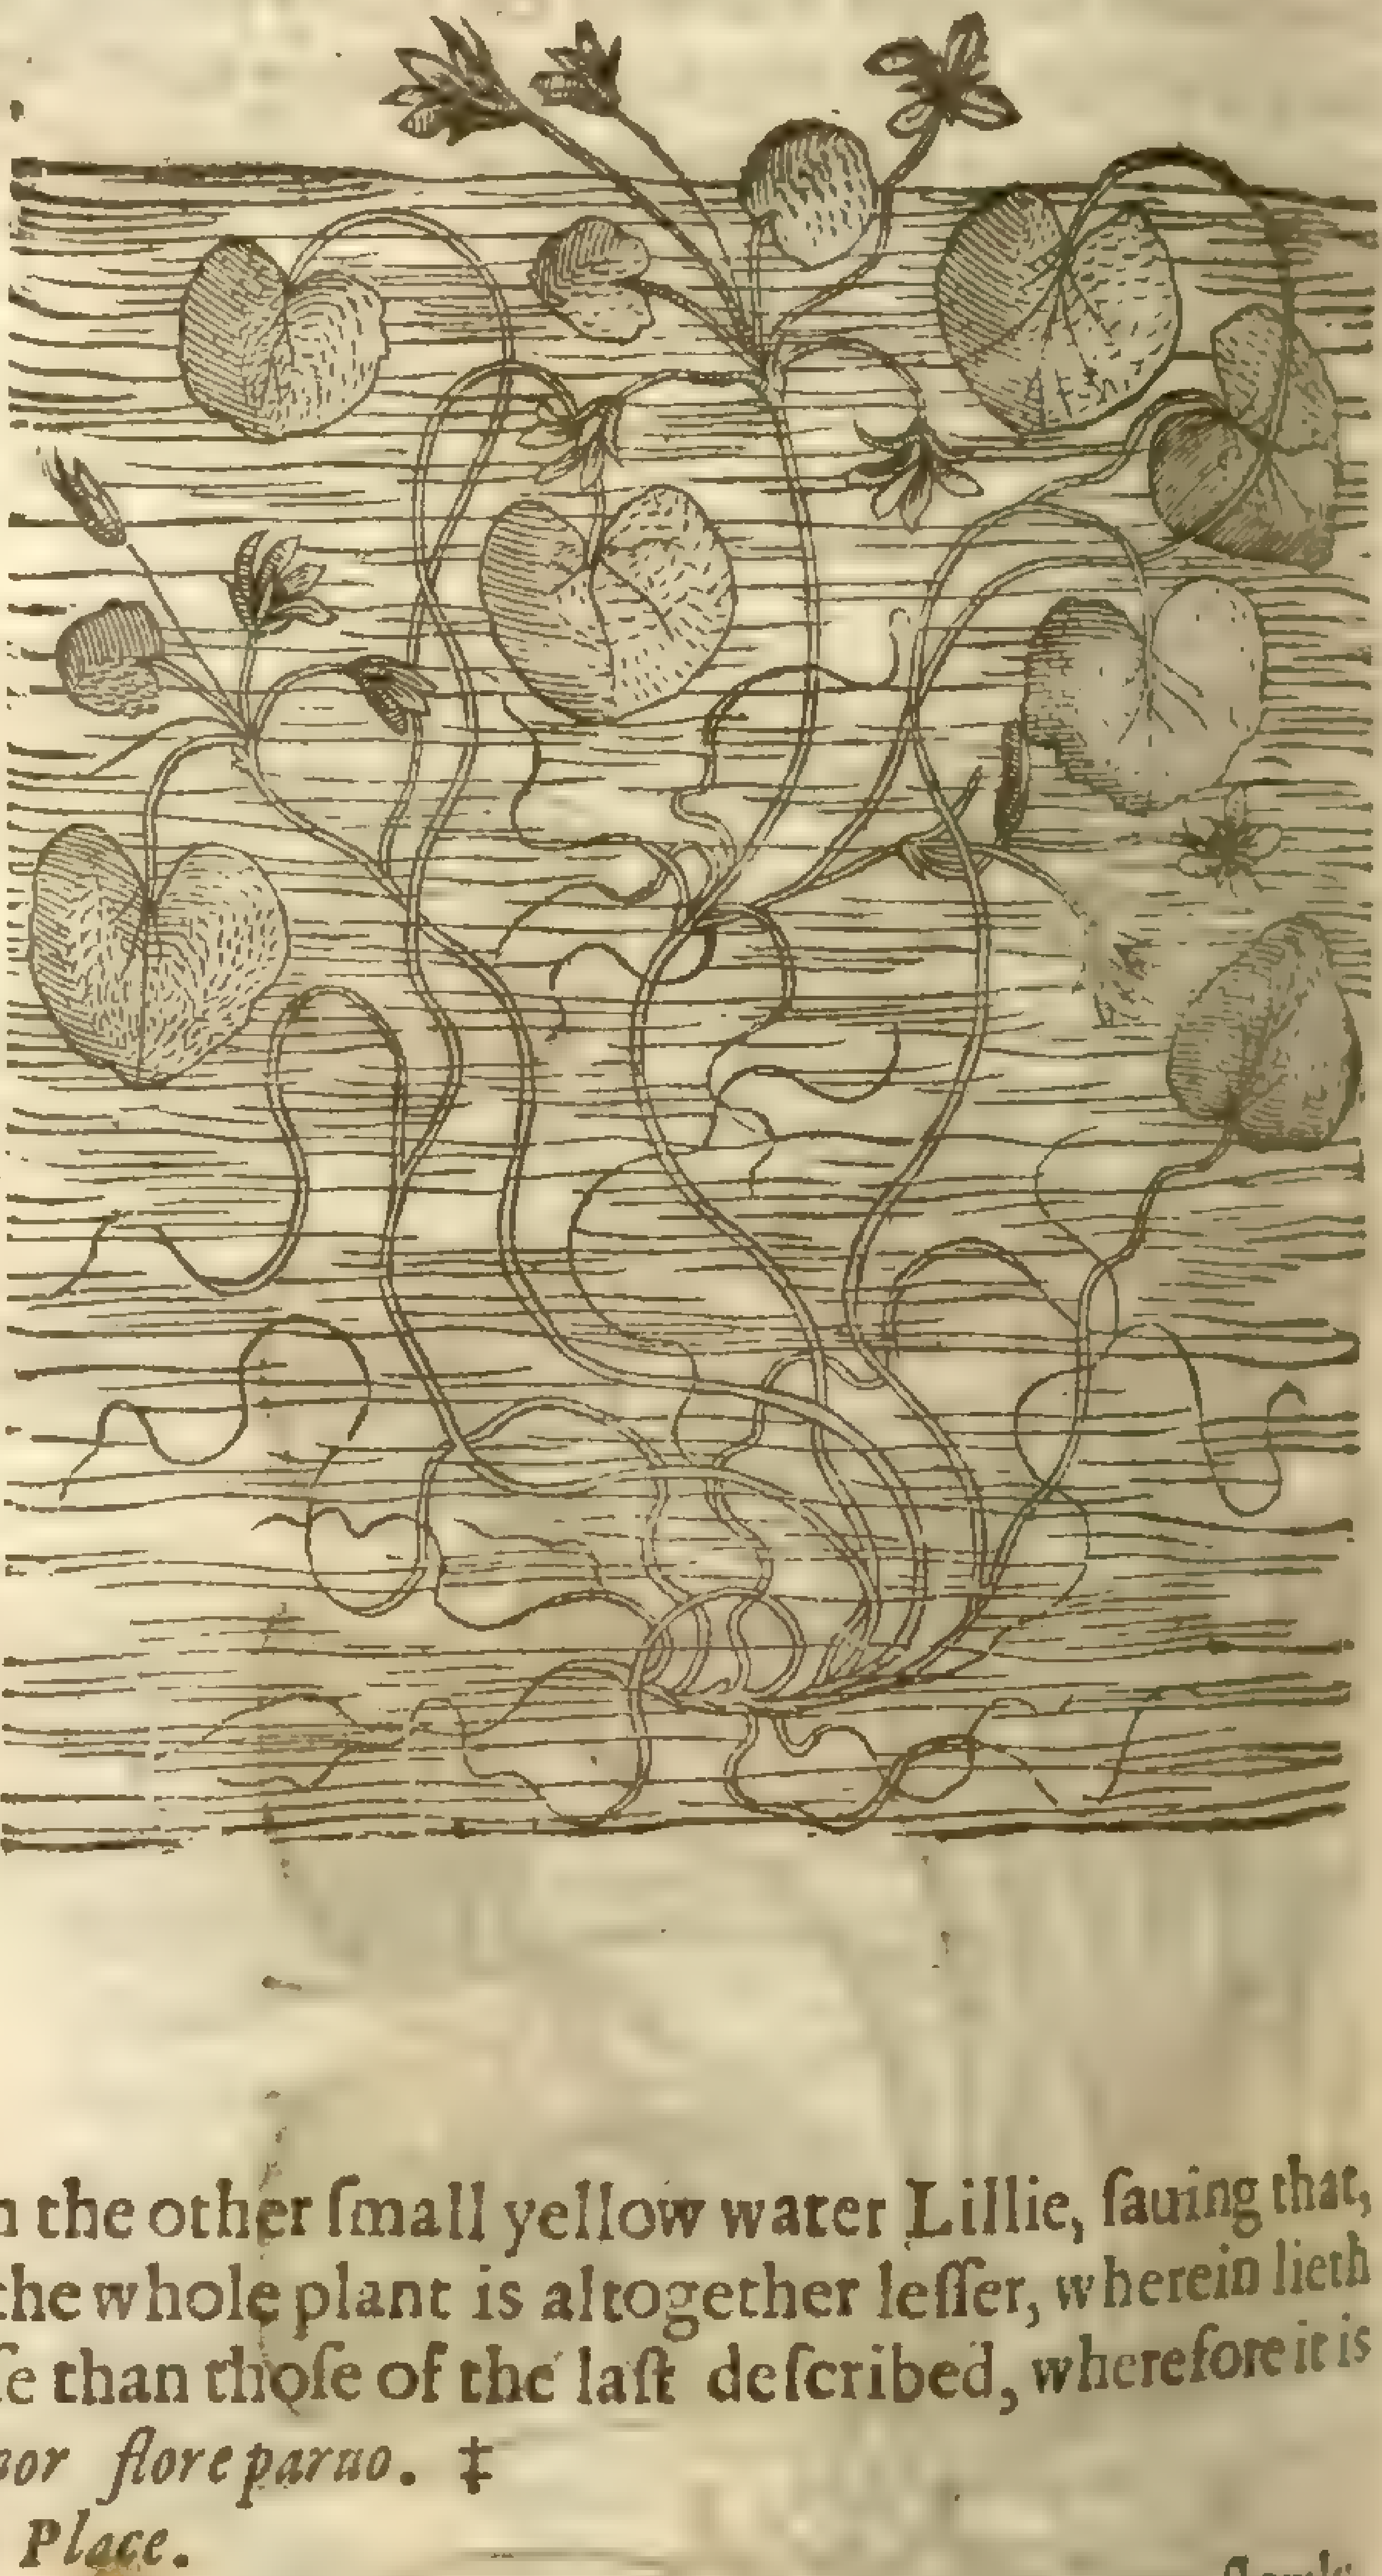
4 The ſmall yellow water Lillie hath a little threddy root, creeping in the bottome of the water and diſperſing it ſelfe far abroad: from which riſe ſmall tender ſtalkes, ſmooth and ſoft, whereon doe grow little buckler leaues like the laſt deſcribed: likewiſe on the other ſmall ſtalke ſtandeth a tuft of many floures likewiſe floting vpon the water as the others do. ‡ This hath the floures larger than thoſe of the next deſcribed, wherefore it may be fitly named *Nymphæa lutea minor flore amplo.* ‡

3 *Nymphæa alba minor.*
The ſmall white Water Lillie.

N. alba [illegible]



5 *Nymphæa lutea minima.*
Dwarfe Water Lillie.



5 This dwarfe water Lillie differeth not from the other ſmall yellow water Lillie, ſauing that, that this kinde hath ſharper pointed leaues, and the whole plant is altogether leſſer, wherein lieth the difference. ‡ This hath the floures much leſſe than thoſe of the laſt deſcribed, wherefore it is fitly for diſtinction ſake named *Nymphæa lutea minor flore paruo.* ‡

¶ *The Place.*

Theſe herbes do grow in fennes, ſtanding waters, broad ditches, and in brookes that run ſlowly, and ſometimes in great riuers.

¶ *The Time.*

They floure and flouriſh moſt of the Summer moneths.

¶ *The Names.*

Water Lillie is called in Greeke, Νυμφαία: and in Latine alſo *Nymphæa,* ſo named becauſe it loues to grow in watery places, as *Dioſcorides* ſaith: the Apothecaries call it *Nenuphar*: of *Apuleius, Mater Herculania, Alga paluſtris, Papauer paluſtre, Clavus Veneris,* and *Digitus Veneris*: *Marcellus* a very old writer reporteth, that it is called in Latine, *Claua Herculis*: in french, *Badittin*: in high Dutch, **Waſſer Mahem**: in low Dutch, **Plompen**: in Engliſh, Water Lillie, Water Roſe.

¶ *The Temperature.*

Both the root and ſeed of water Lillie haue a drying force without biting.

¶ *The Vertues.*

A Water Lillie with yellow floures ſtoppeth laskes, the ouerflowing of ſeed which commeth away by dreames or otherwiſe, and is good for them that haue the bloudy flix.

But

B But water Lilly which hath the white flours is of greater force, inſomuch as it ſtaies the whites: but both this and the other that hath the blacke root muſt be drunke in red wine: they haue alſo a ſcouring qualitie, and clenſe away the morphew, being good alſo againſt the pilling away of the haire of the head: againſt the morphew they are ſteeped in water, and for the pilling away of the haire in Tarre: but for theſe things that is fitter which hath the blacke root, and for the other, that which hath the white root.

C *Theophraſtus* ſaith, That being ſtamped and laid vpon the wound it is reported to ſtay the bleeding.

D The Phyſitions of our age do commend the floures of white *Nymphæa* againſt the infirmities of the head comming of an hot cauſe; and do certainly affirme, that the root of the yellow cures hot diſeaſes of the kidnies and bladder, and is ſingular good againſt the running of the reines.

E The root and ſeed of great water Lilly is very good againſt venerie or fleſhly deſire, if one drink the decoction of it, or vſe the ſeed or root in pouder in his meats; for it drieth vp the ſeed of generation, and ſo cauſeth a man to be chaſte, eſpecially vſed in broth with fleſh.

F The conſerue of the floures is good for the diſeaſes aforeſaid, as alſo againſt hot burning feuers.

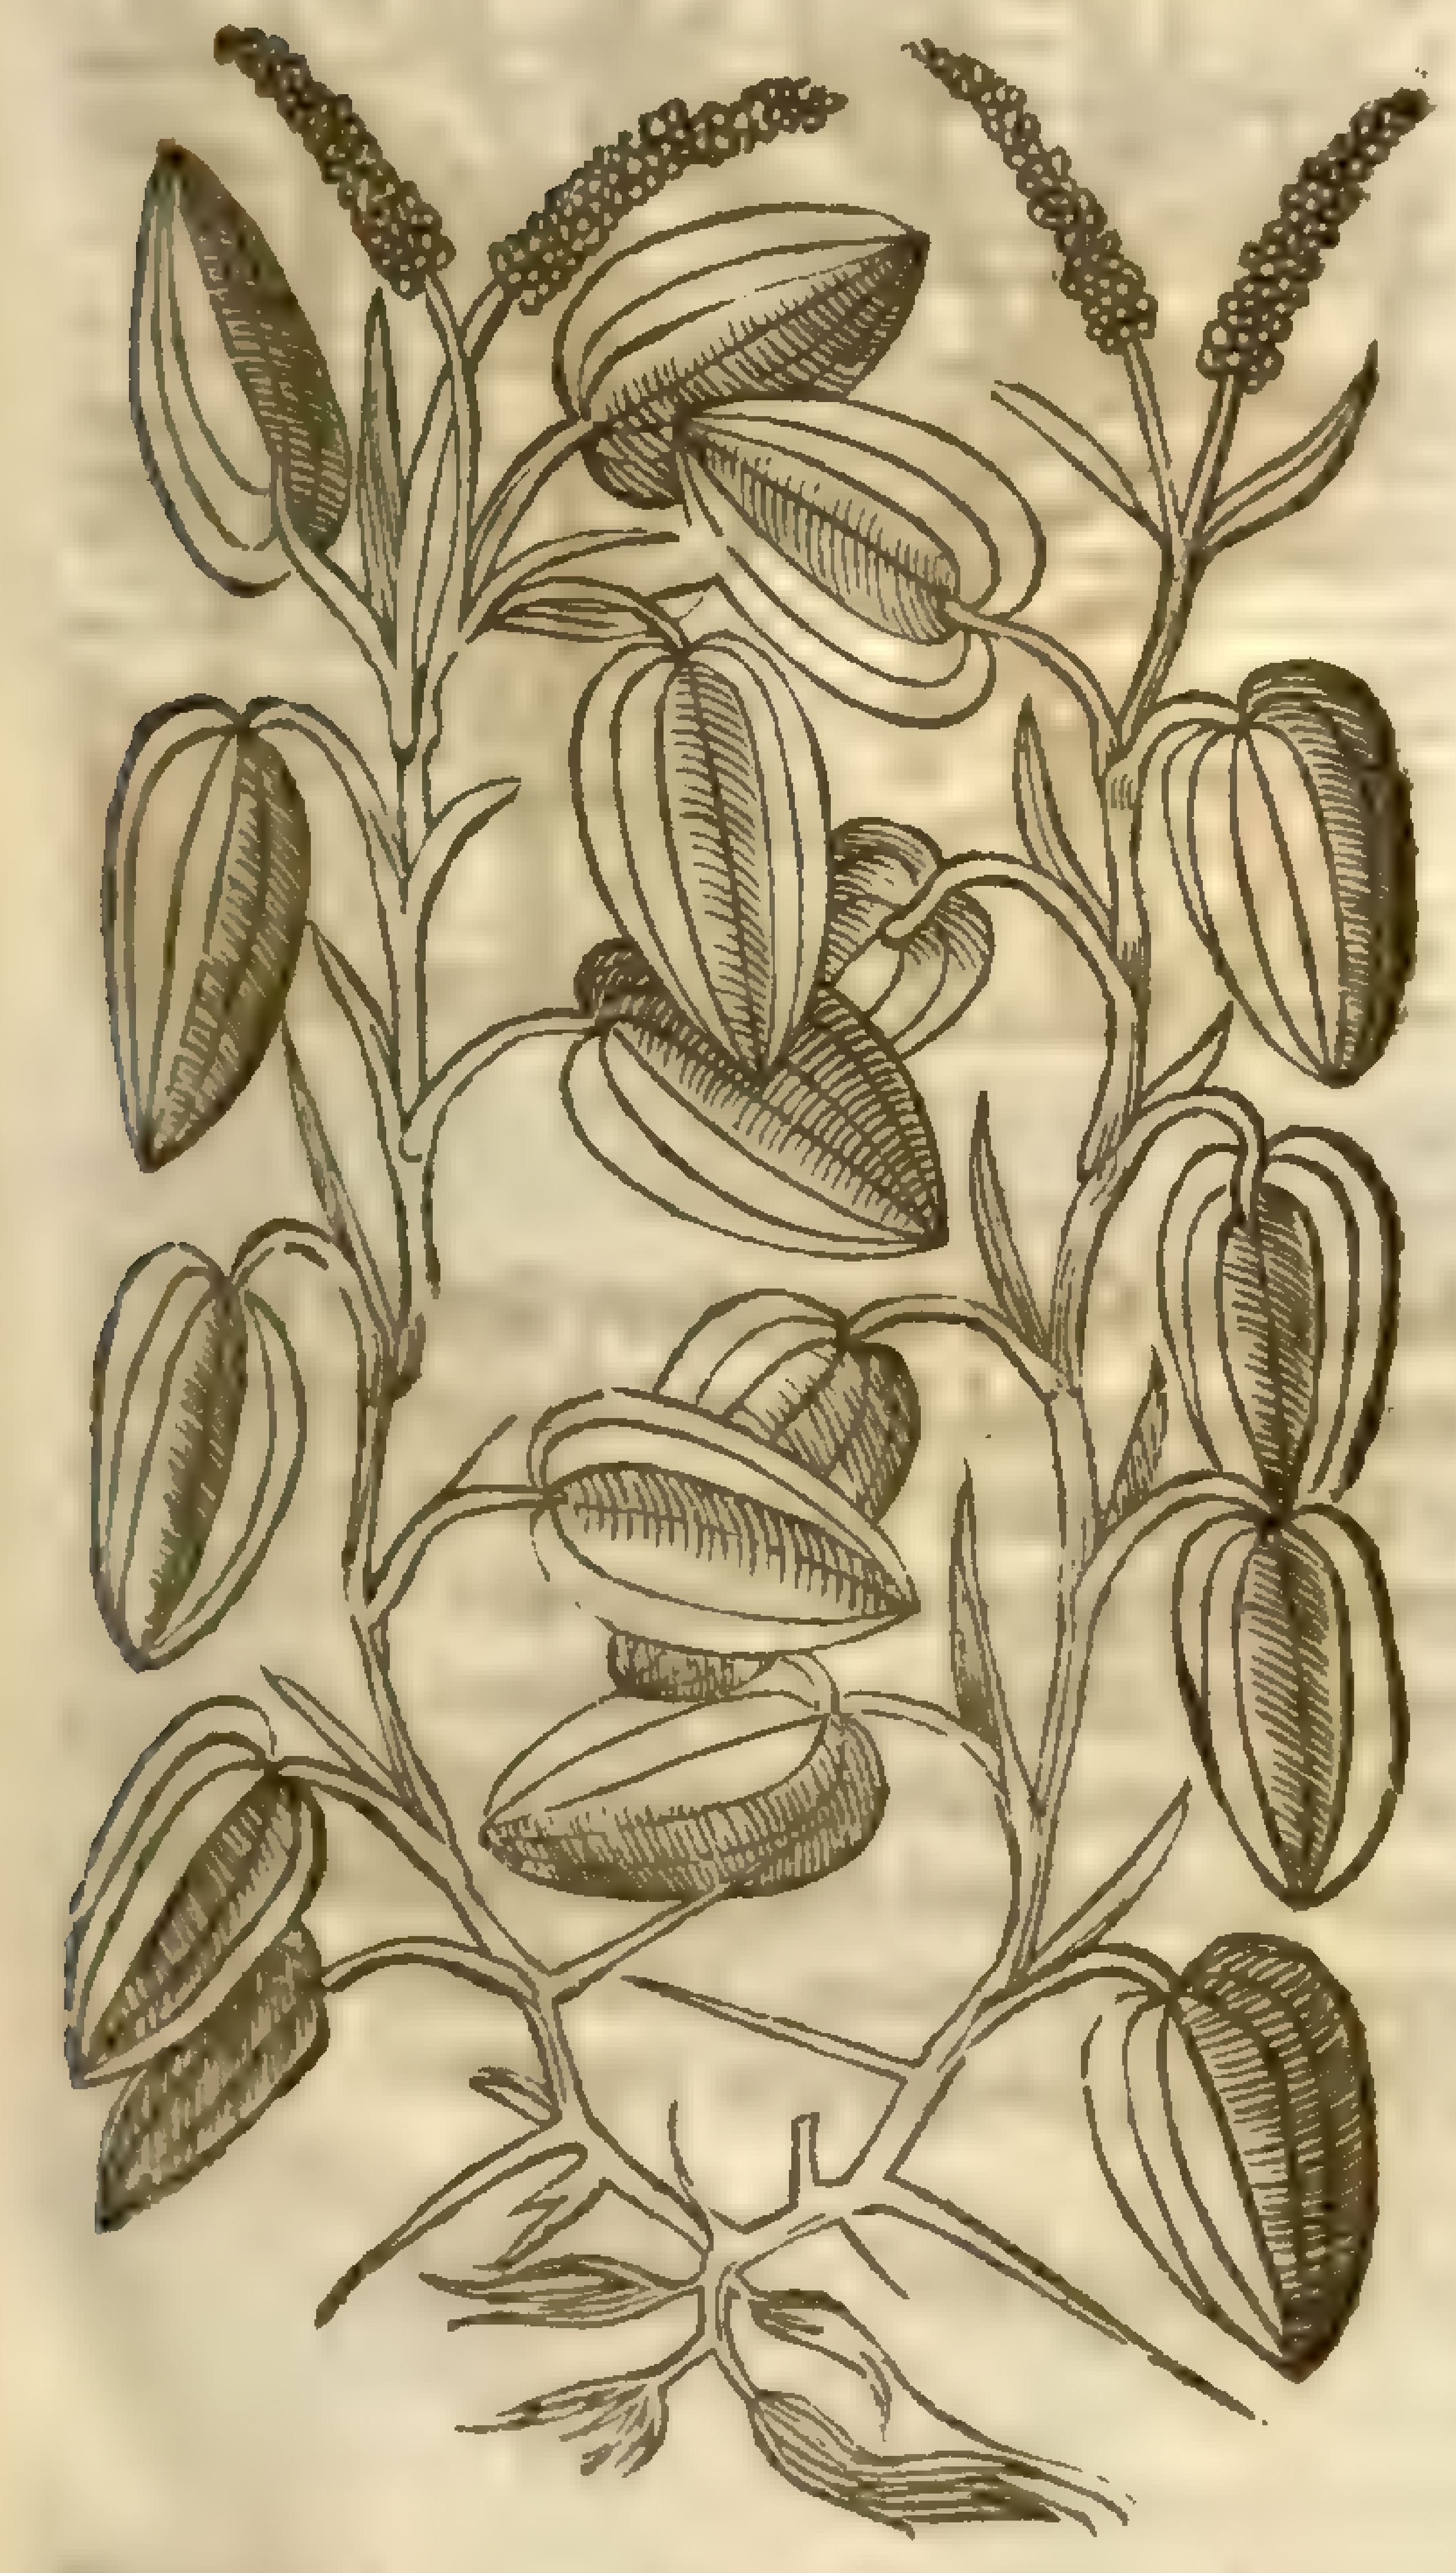
G The floures made into oile as yee make oile of roſes, coole and refrigerate, cauſing ſweat and quiet ſleepe, and put away all venereous dreames: the temples of the head, the palms of the hands and feet, and the breſt being anointed for the one, the genitoirs vpon and about them for the other.

H The green leaues of the great water Lilly either the white or the yellow, laid vpon the region of the backe in the ſmall, mightily ceaſe the involuntary flowing of the ſeed called *Gonorrhæa* or running of the reins, being two or three times a day remoued, and freſh applied thereto.

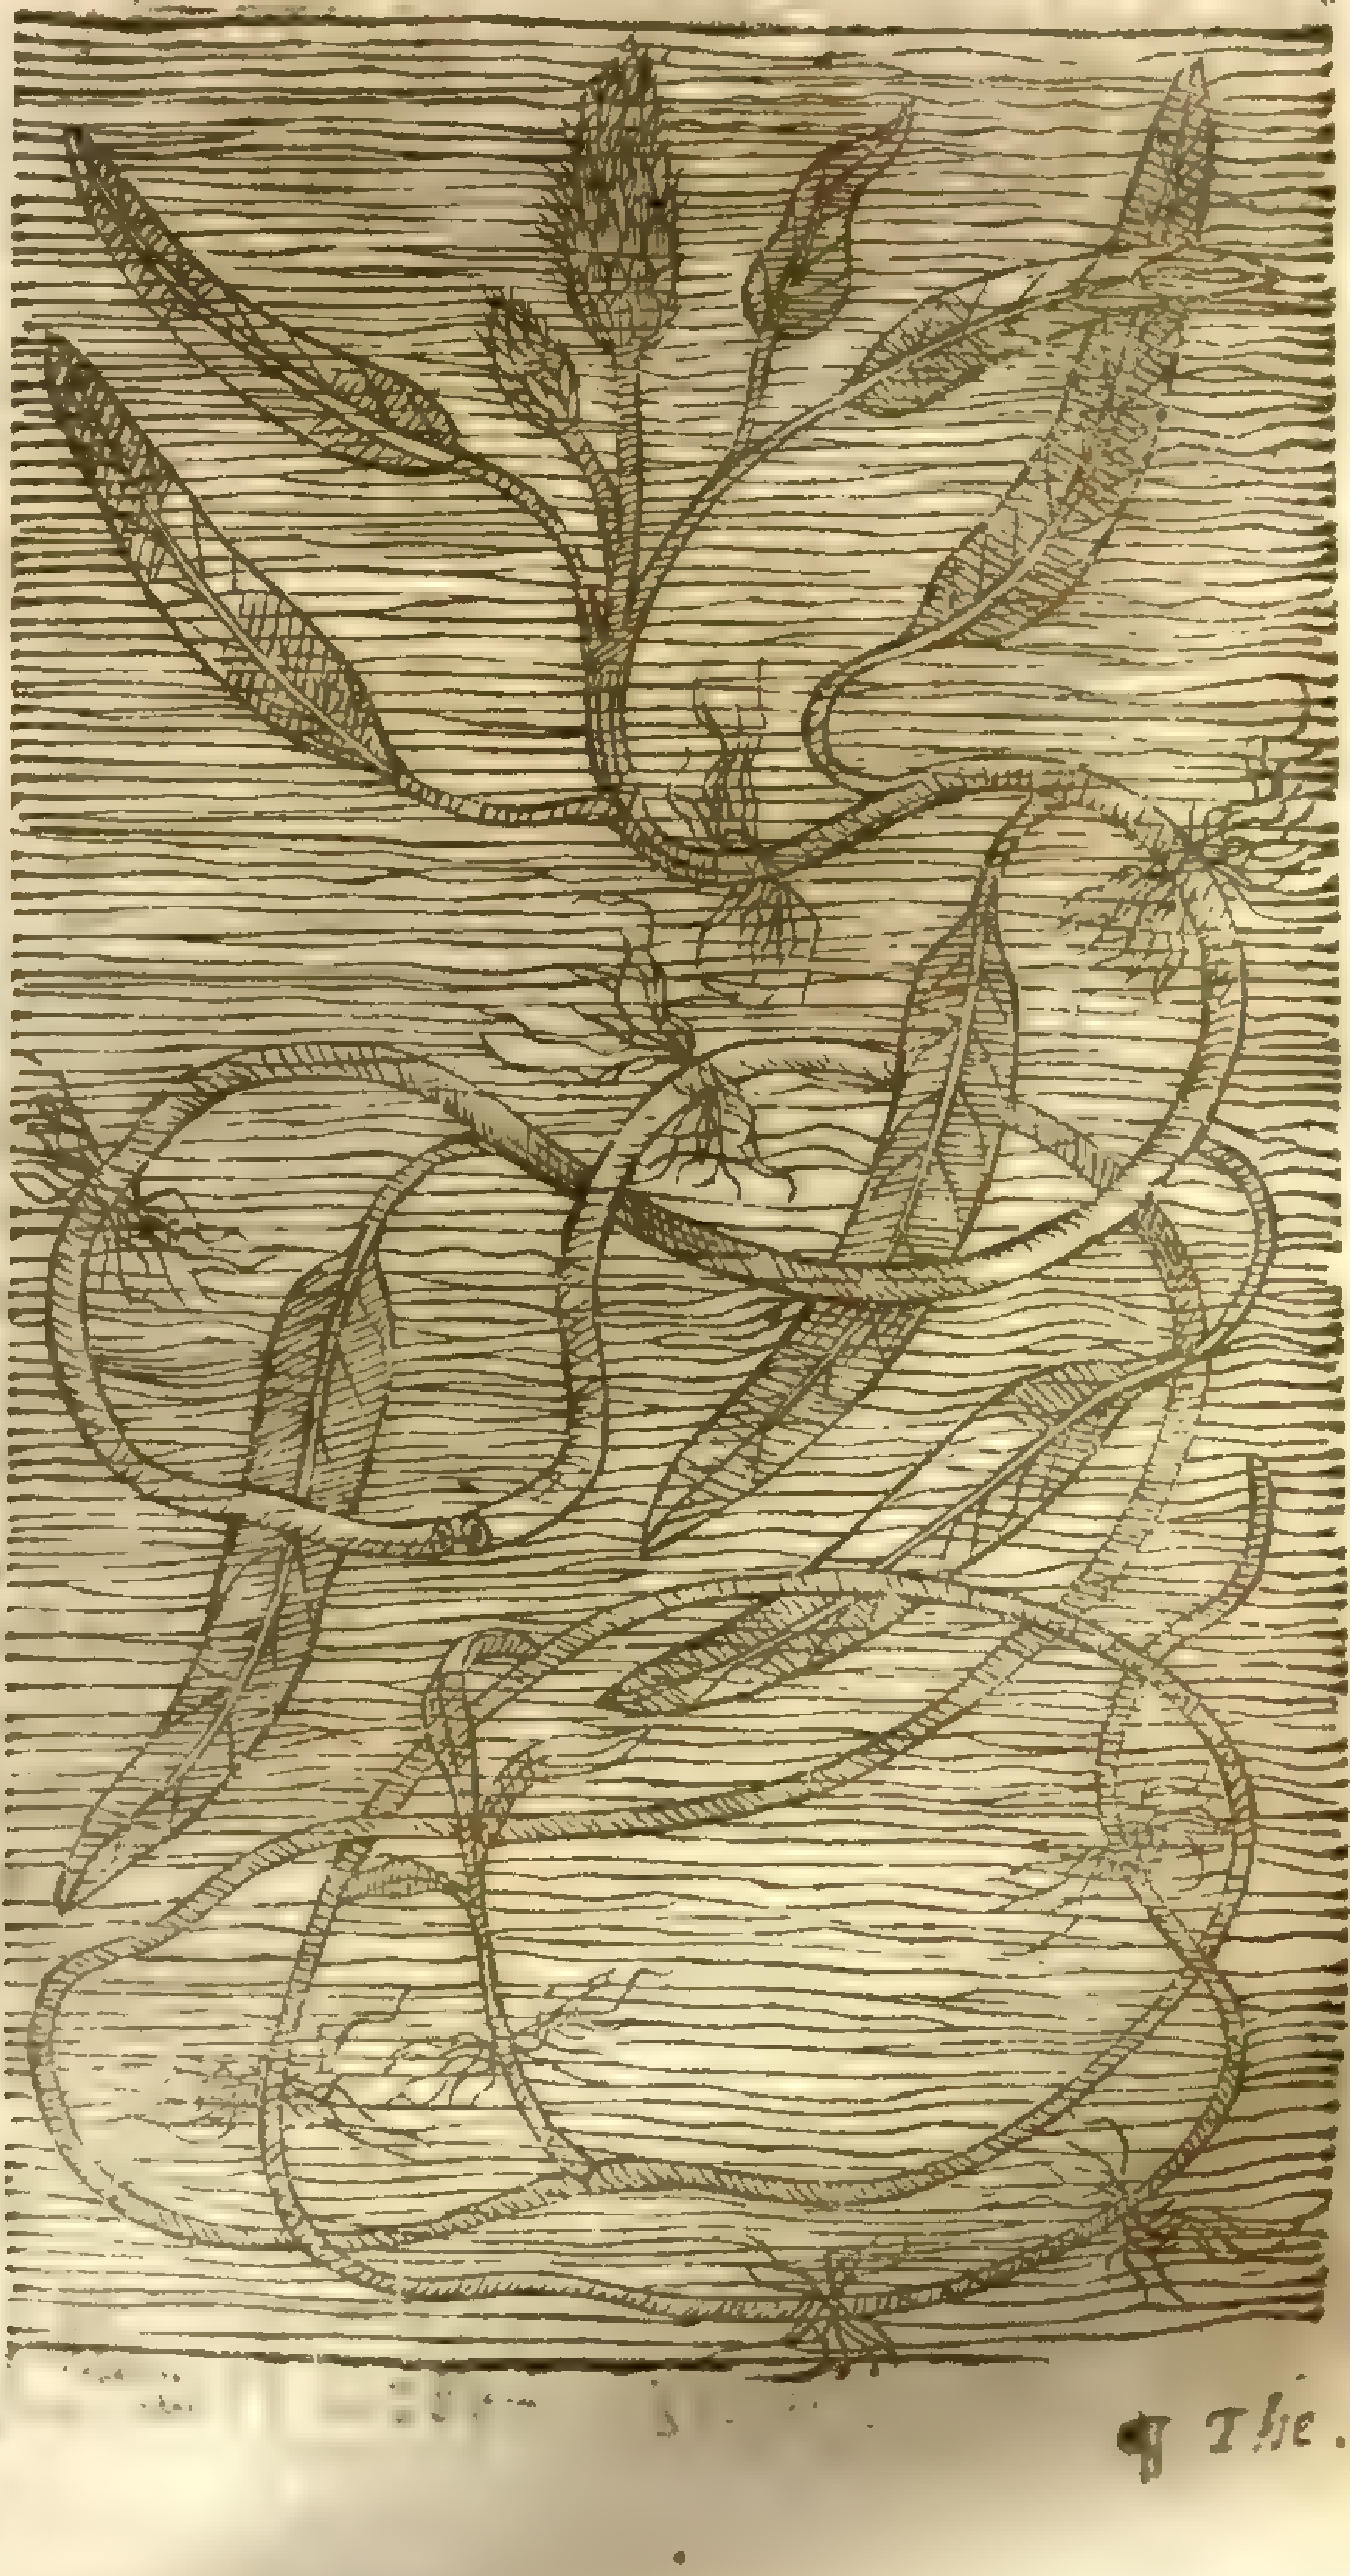
Chap. 297.

Of Pond-weed, or water Spike.

1 *Potamogeiton latifolium.*
Broad leafed Pond-weed.



2 *Potamogeiton anguſtifolium.*
Narrow leafed Pond-weed.



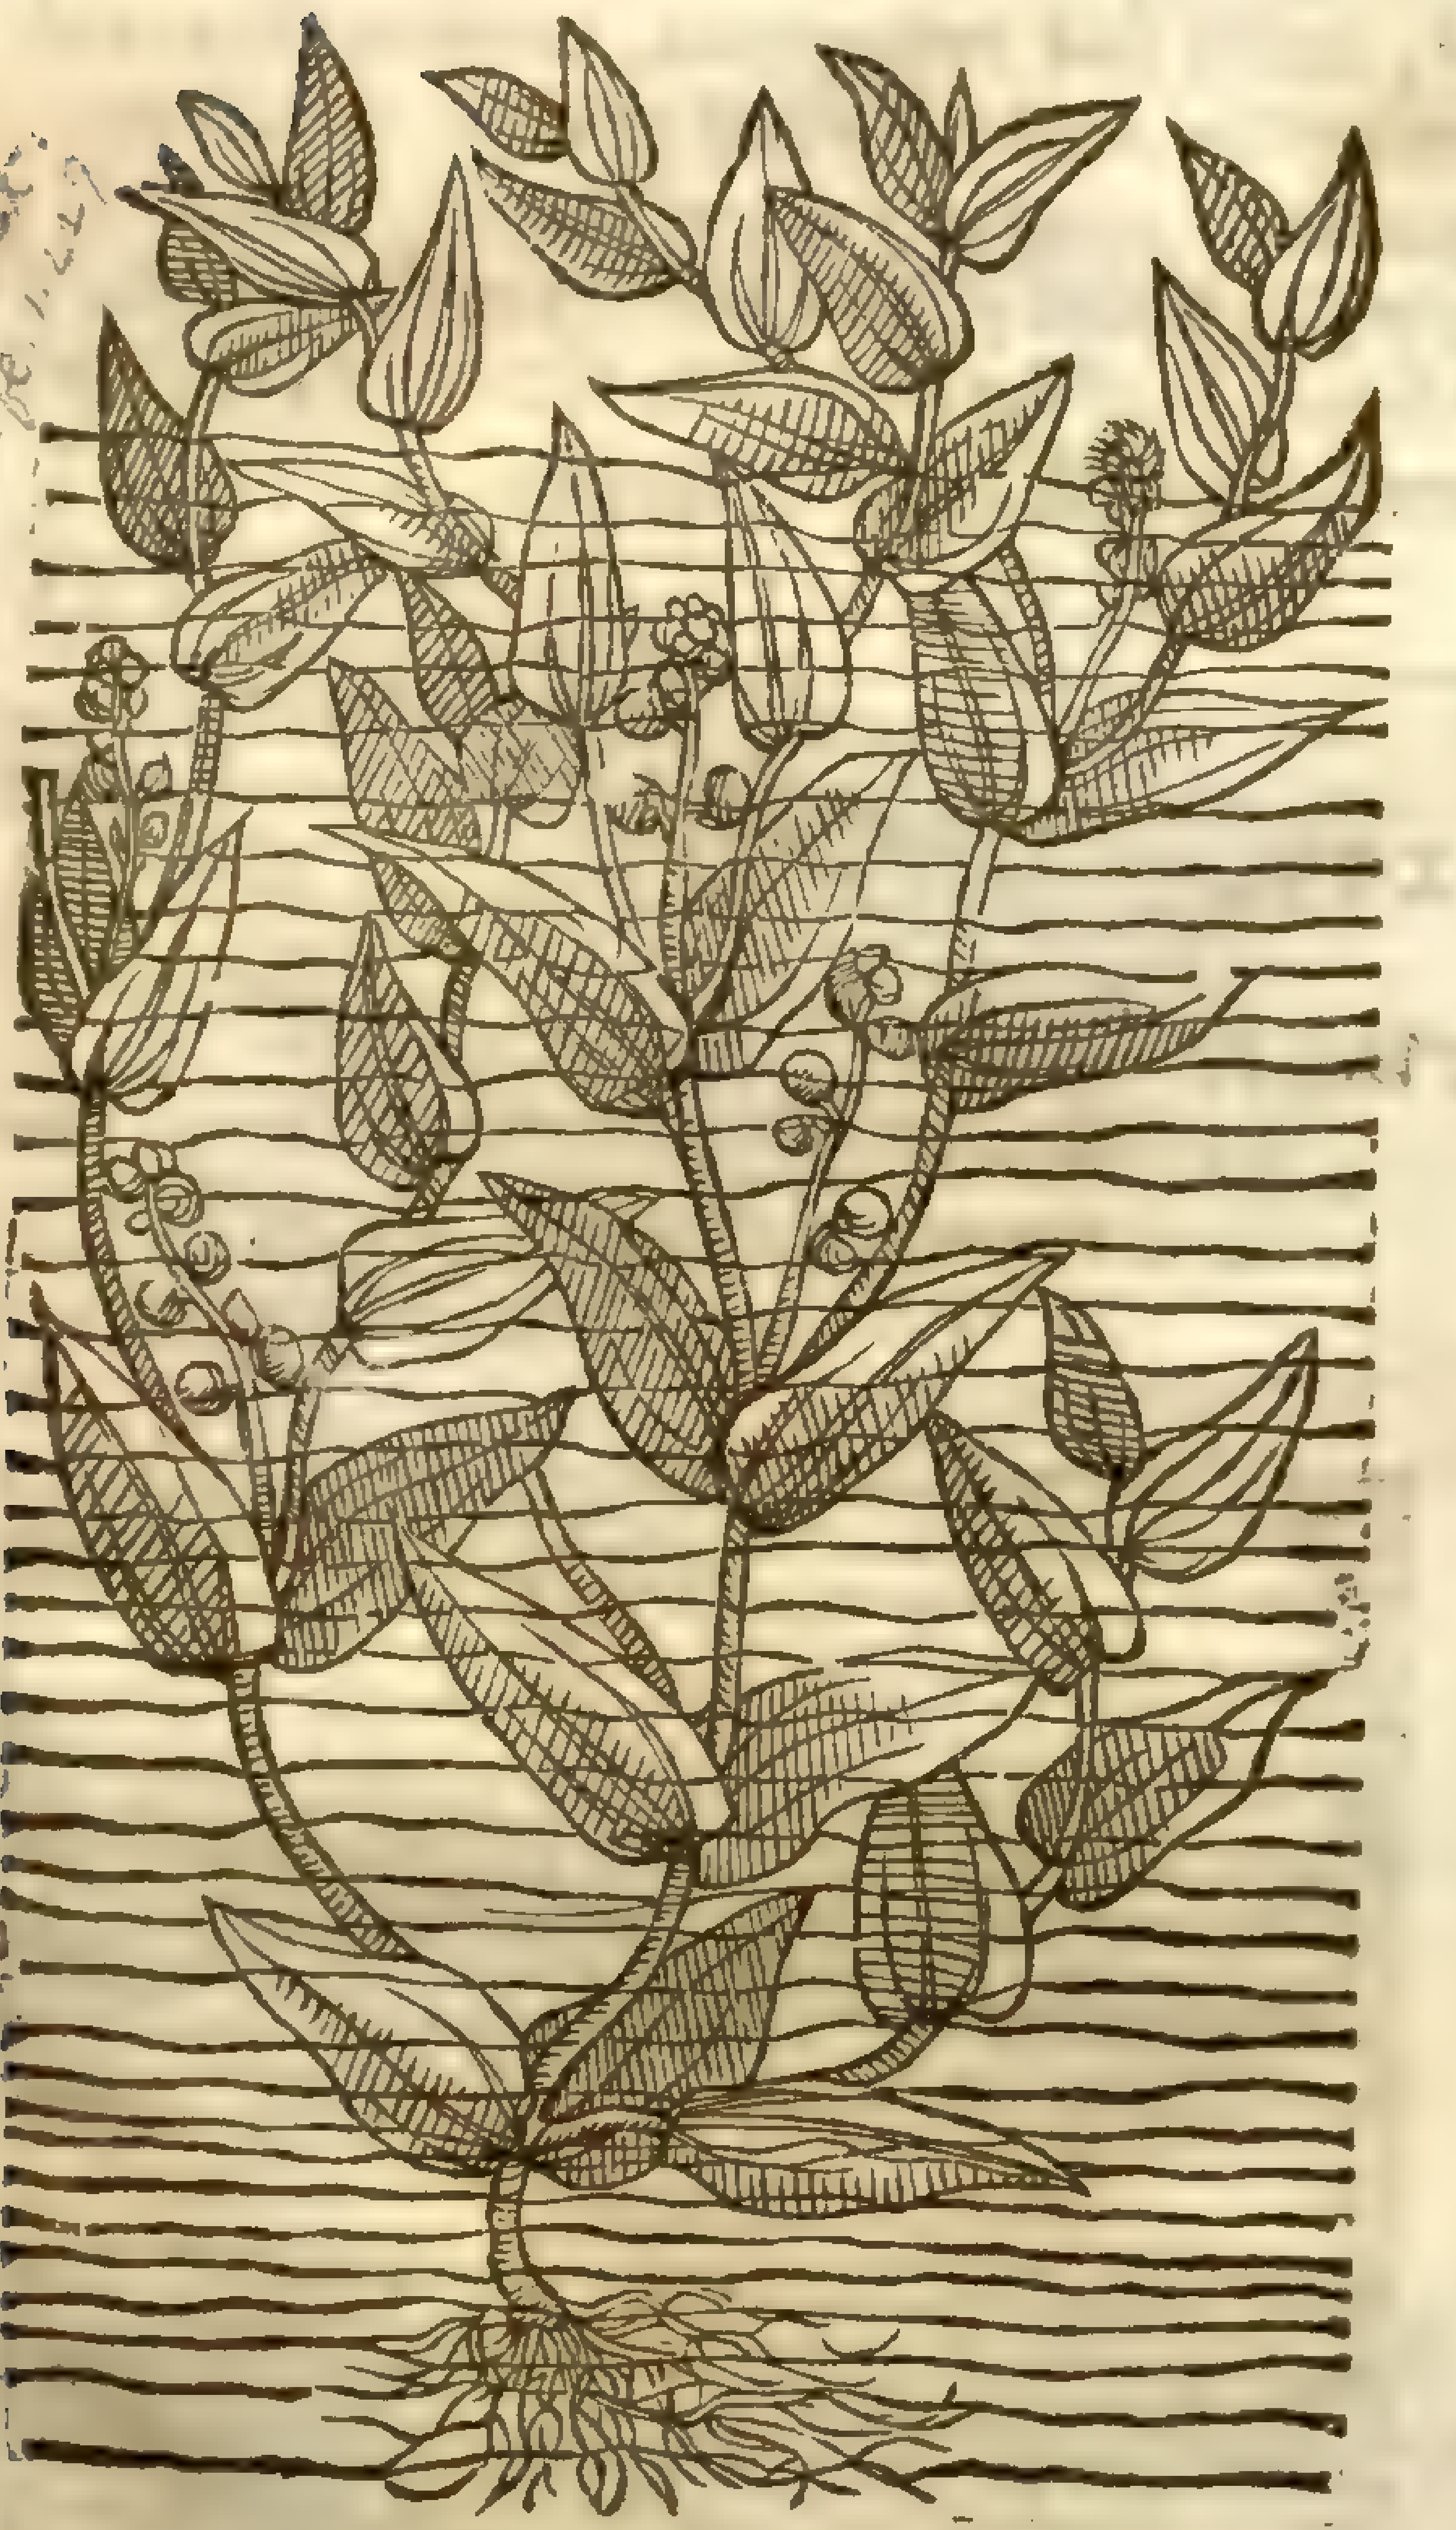
¶ *The Deſcription.*

1 Pond-weed hath little ſtalkes, ſlender, ſpreading like thoſe of the Vine, and jointed: the leaues be long, ſmaller than the leaues of Plantain, and harder, with manifeſt veins running alongſt them as in Plantains, which ſtanding vpon ſlender and long ſtems or footſtalks, ſhew themſelues aboue the water, and lie flat along vpon the ſuperficial or vpper part thereof, as do the leaues of water Lilly: the floures grow in ſhort eares, and are of a light red purple colour like thoſe of Red-ſhanks or Biſtort: the ſeed is hard.

‡ 2 This (whoſe figure was formerly vnfitly put by our Author to the following deſcription) hath longer, narrower, and ſharper pointed leaues than thoſe of the laſt deſcribed, hauing the veins running from the middle rib to the ſides of the leaues, as in a willow leafe, which they ſomwhat reſemble: at the tops of the ſtalkes grow reddiſh ſpikes or eares like thoſe of the laſt deſcribed: the root is long, jointed, and fibrous. ‡

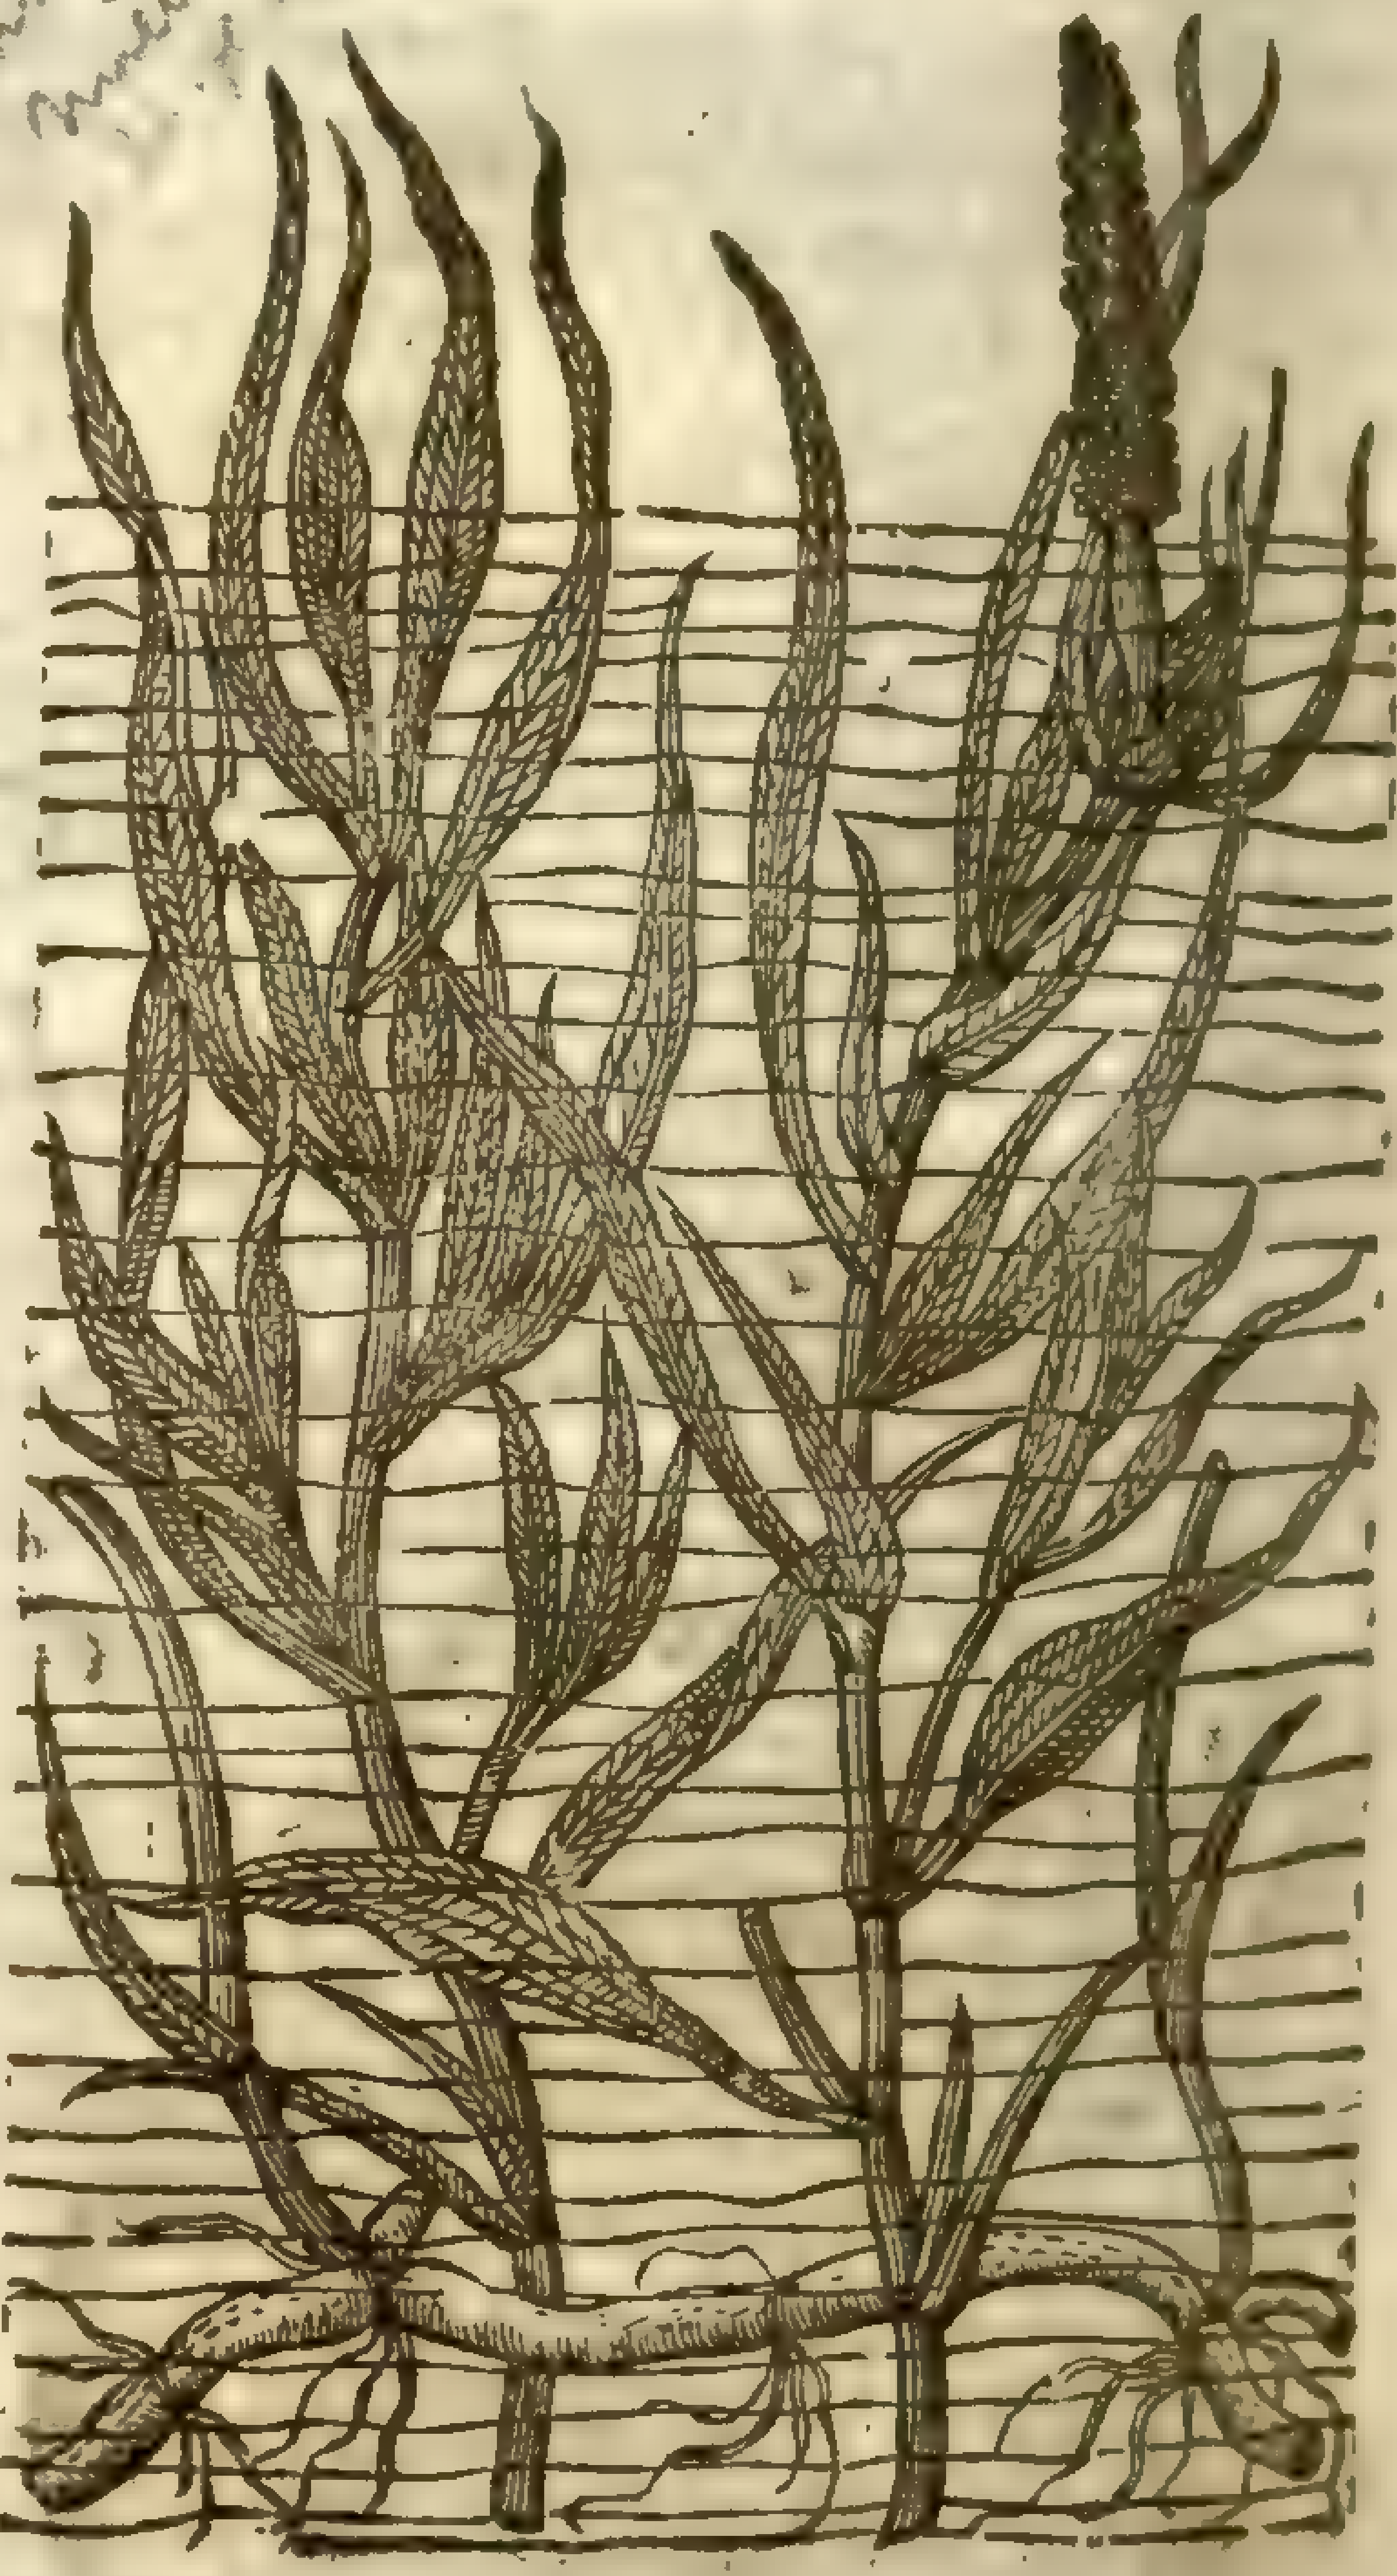
‡ 3 *Potamogeiton 3. Dodonæi.*
Small Pond-weed.

P. perfoliatum, & minor dict. Eng. Bot. 1.229



‡ 4 *Potamogeiton longis acutis folijs.*
Long ſharp leaued Pond-weed.

P. lucens, & minor dict. E. B. 1.285



3 There is another Pond-weed deſcribed thus; it ſhooteth forth into many ſlender & round ſtems, which are diſtributed into ſundry branches: his leaues are broad, long, and ſharp pointed, yet much leſſe than the firſt kinde: out of the boſomes of the branches and leaues there ſpring certain little ſtalks which beare ſundry ſmall white moſſie floures, which turn into plaine and round ſeeds like the common Tare or Vetch: the root is fibrous, throughly faſtned in the ground.

‡ 4 There is alſo another Pondweed, which hath whitiſh and jointed roots creeping in the bottom of the water, with ſome fibres, but ſending vp ſlender jointed and long ſtalkes, ſmall below, and bigger aboue, hauing long narrow and very ſtiffe ſharpe pointed leaues. The floures grow in a reddiſh ſpike like thoſe of the firſt deſcribed. This is the *Potamogeiton altera* of *Dodonæus*. ‡

¶ *The Place.*

Theſe herbs grow in ſtanding waters, pooles, ponds, and ditches almoſt euery where.

¶ *The Time.*

They floure in Iune and Iuly.

¶ *The Names.*

It is called of the Greeks, Ποταμογείτων: in Latine, *Fontalis*, and *Spicata*: in high Dutch, **Zamkraut**: in low-Dutch, **Fonteyncrupt**: in French, *Eſpi d'eaue*: in Engliſh, Pondweed, and water Spike.

¶ The

¶ *The Temperature.*

Pondweed, ſaith *Galen*, doth binde and coole, like as doth Knot-graſſe, but his eſſence is thicker than that of Knot-graſſe.

¶ *The Vertues.*

A It is good againſt the itch and conſuming and eating vlcers, as *Dioſcorides* writeth.

B Alſo it is good being applied to the inflammation of the leggs, wherein *Ignis ſacer* hath got the ſuperioritie.

CHAP. 298.

Of Water Saligot, water Caltrops, or water Nuts.

¶ *The Deſcription.*

1 WAter Caltrops haue long ſlender ſtalks growing vp and riſing from the bottom of the water, and mounting aboue the ſame: the root is long, hauing here & there vnder the water certaine taſſels full of ſmall ſtrings or threddy haires: the ſtem towards the top of the water is very great in reſpect of that which is lower; the leaues are large and ſomewhat round, not vnlike thoſe of the Poplar or Elme tree leaues, a little creuiſed or notched about the edges: amongſt or vnder the leaues grow the fruit, which is triangled, hard, ſharp pointed and prickly, in ſhape like thoſe hurtfull engins in the wars, caſt in the paſſage of the enemy to annoy the feet of their horſes, called Caltrops, whereof this tooke it's name: within theſe heads or Nuts is contained a white kernell in taſte almoſt like the Cheſnut, which is reported to bee eaten green, and being dried and ground to ſerue in ſtead of bread.

‡ There are two other plants which are found growing in many ponds & ditches of this kingdome both about London and elſewhere, and I will here giue you their figures out of *Lobel* and *Cluſius*, and their deſcriptions as they were ſent me by M^r *Goodyer*, who hath ſaued me the labor of deſcribing them.

Tribulus aquaticus minor quercus floribus, Cluſ. p. 252.
Puſillum fontila pathum, Lobelij.

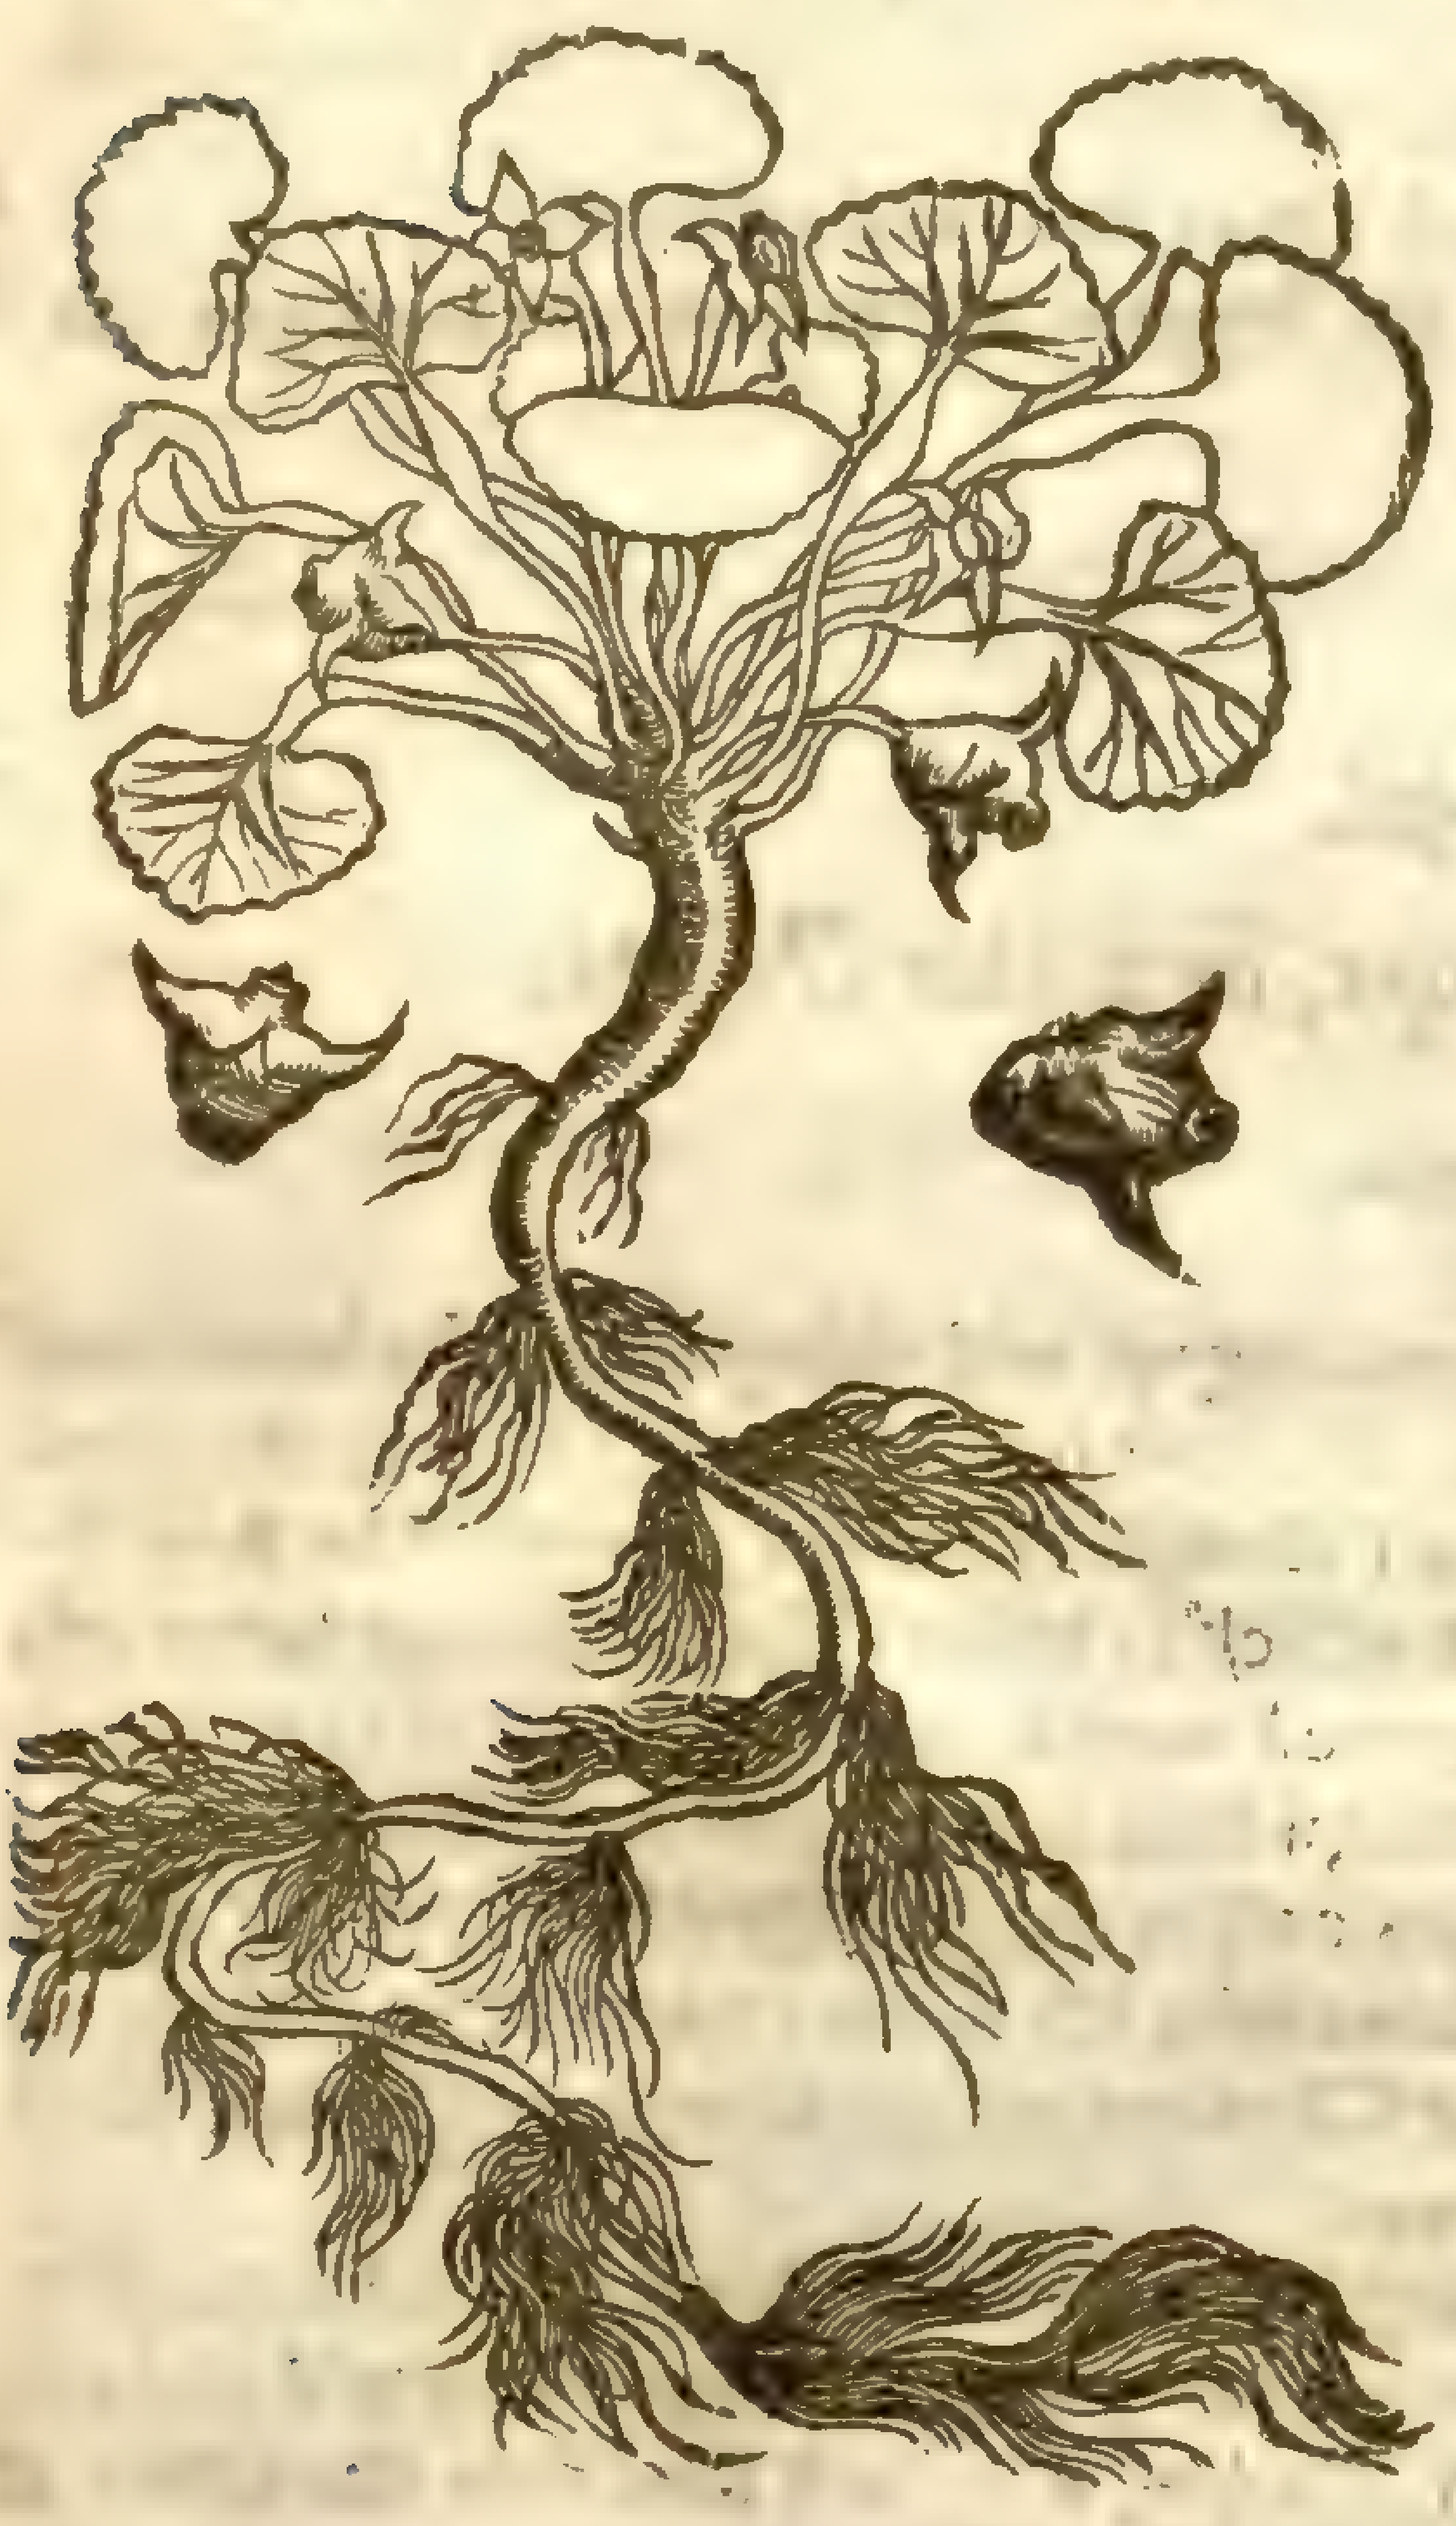
2 This water herb bringeth forth from the root, thin flat knotty ſtalks of a reddiſh colour, two or three cubits long, or longer, according to the depth of the water (which when they are dry are pliant or bowing) diuided towards the top into many parts or branches, bearing but one leafe at euery joint, ſomtimes two inches long, and halfe an inch broad, thin, and as it were ſhining, ſo wrinkled and crumpled by the ſides that it ſeemeth to be torn, of a reddiſh green colour: the footſtalks are ſomwhat long and thicke, and riſe vp from amongſt thoſe leaues, which alwayes grow two one oppoſit againſt another, in a contrary manner to thoſe that grow below on the ſtalk: neere the top of which foot-ſtalke groweth ſmall grape-like husks, out of which ſpring very ſmal reddiſh flours like thoſe of the Oke, euery floure hauing foure very ſmall round topped leaues: after euery floure commeth commonly foure ſharp pointed graines growing together, containing within them a little white kernell. The lower part of the ſtalke hath at euery joint ſmall white threddy roots, ſomwhat long, whereby it taketh hold in the mud, and draweth nouriſhment vnto it. The whole plant is commonly couered ouer with water: it floures in Iune and the beginning of Iuly. I found it in the ſtanding pooles or fiſh-ponds adioyning to a diſſolued Abby called Durford, which ponds diuide Hampſhire and Suſſex, and in other ſtanding waters elſewhere. This deſcription was made vpon ſight of the plant, Iune 2, 1622.

Tribulus aquaticus minor, muſcatellæ floribus. Potamogeton densum
Sm. fl. 230

3 This hath not flat ſtalks like the other, but round, kneed, and alwaies bearing two leaues at euery joint, one oppoſite againſt another, greener, ſhorter, and leſſer than the other, ſharp pointed, not much wrinkled and crumpled by the edges: *Cluſius* ſaith that they are not at all crumpled. I neuer obſerued any without crumples and wrinkles: the floures grow on ſhort ſmall footſtalks of a whitiſh green colour like thoſe of *Muſcatella Cordi*, called by *Gerard*, *Radix caua minima viridi flore*: viz. two flours at the top of euery foot-ſtalke, one oppoſit againſt another, euery floure containing foure ſmall leaues: which two floures being paſt, there come vp eight ſmall huskes, making ſix ſeuerall

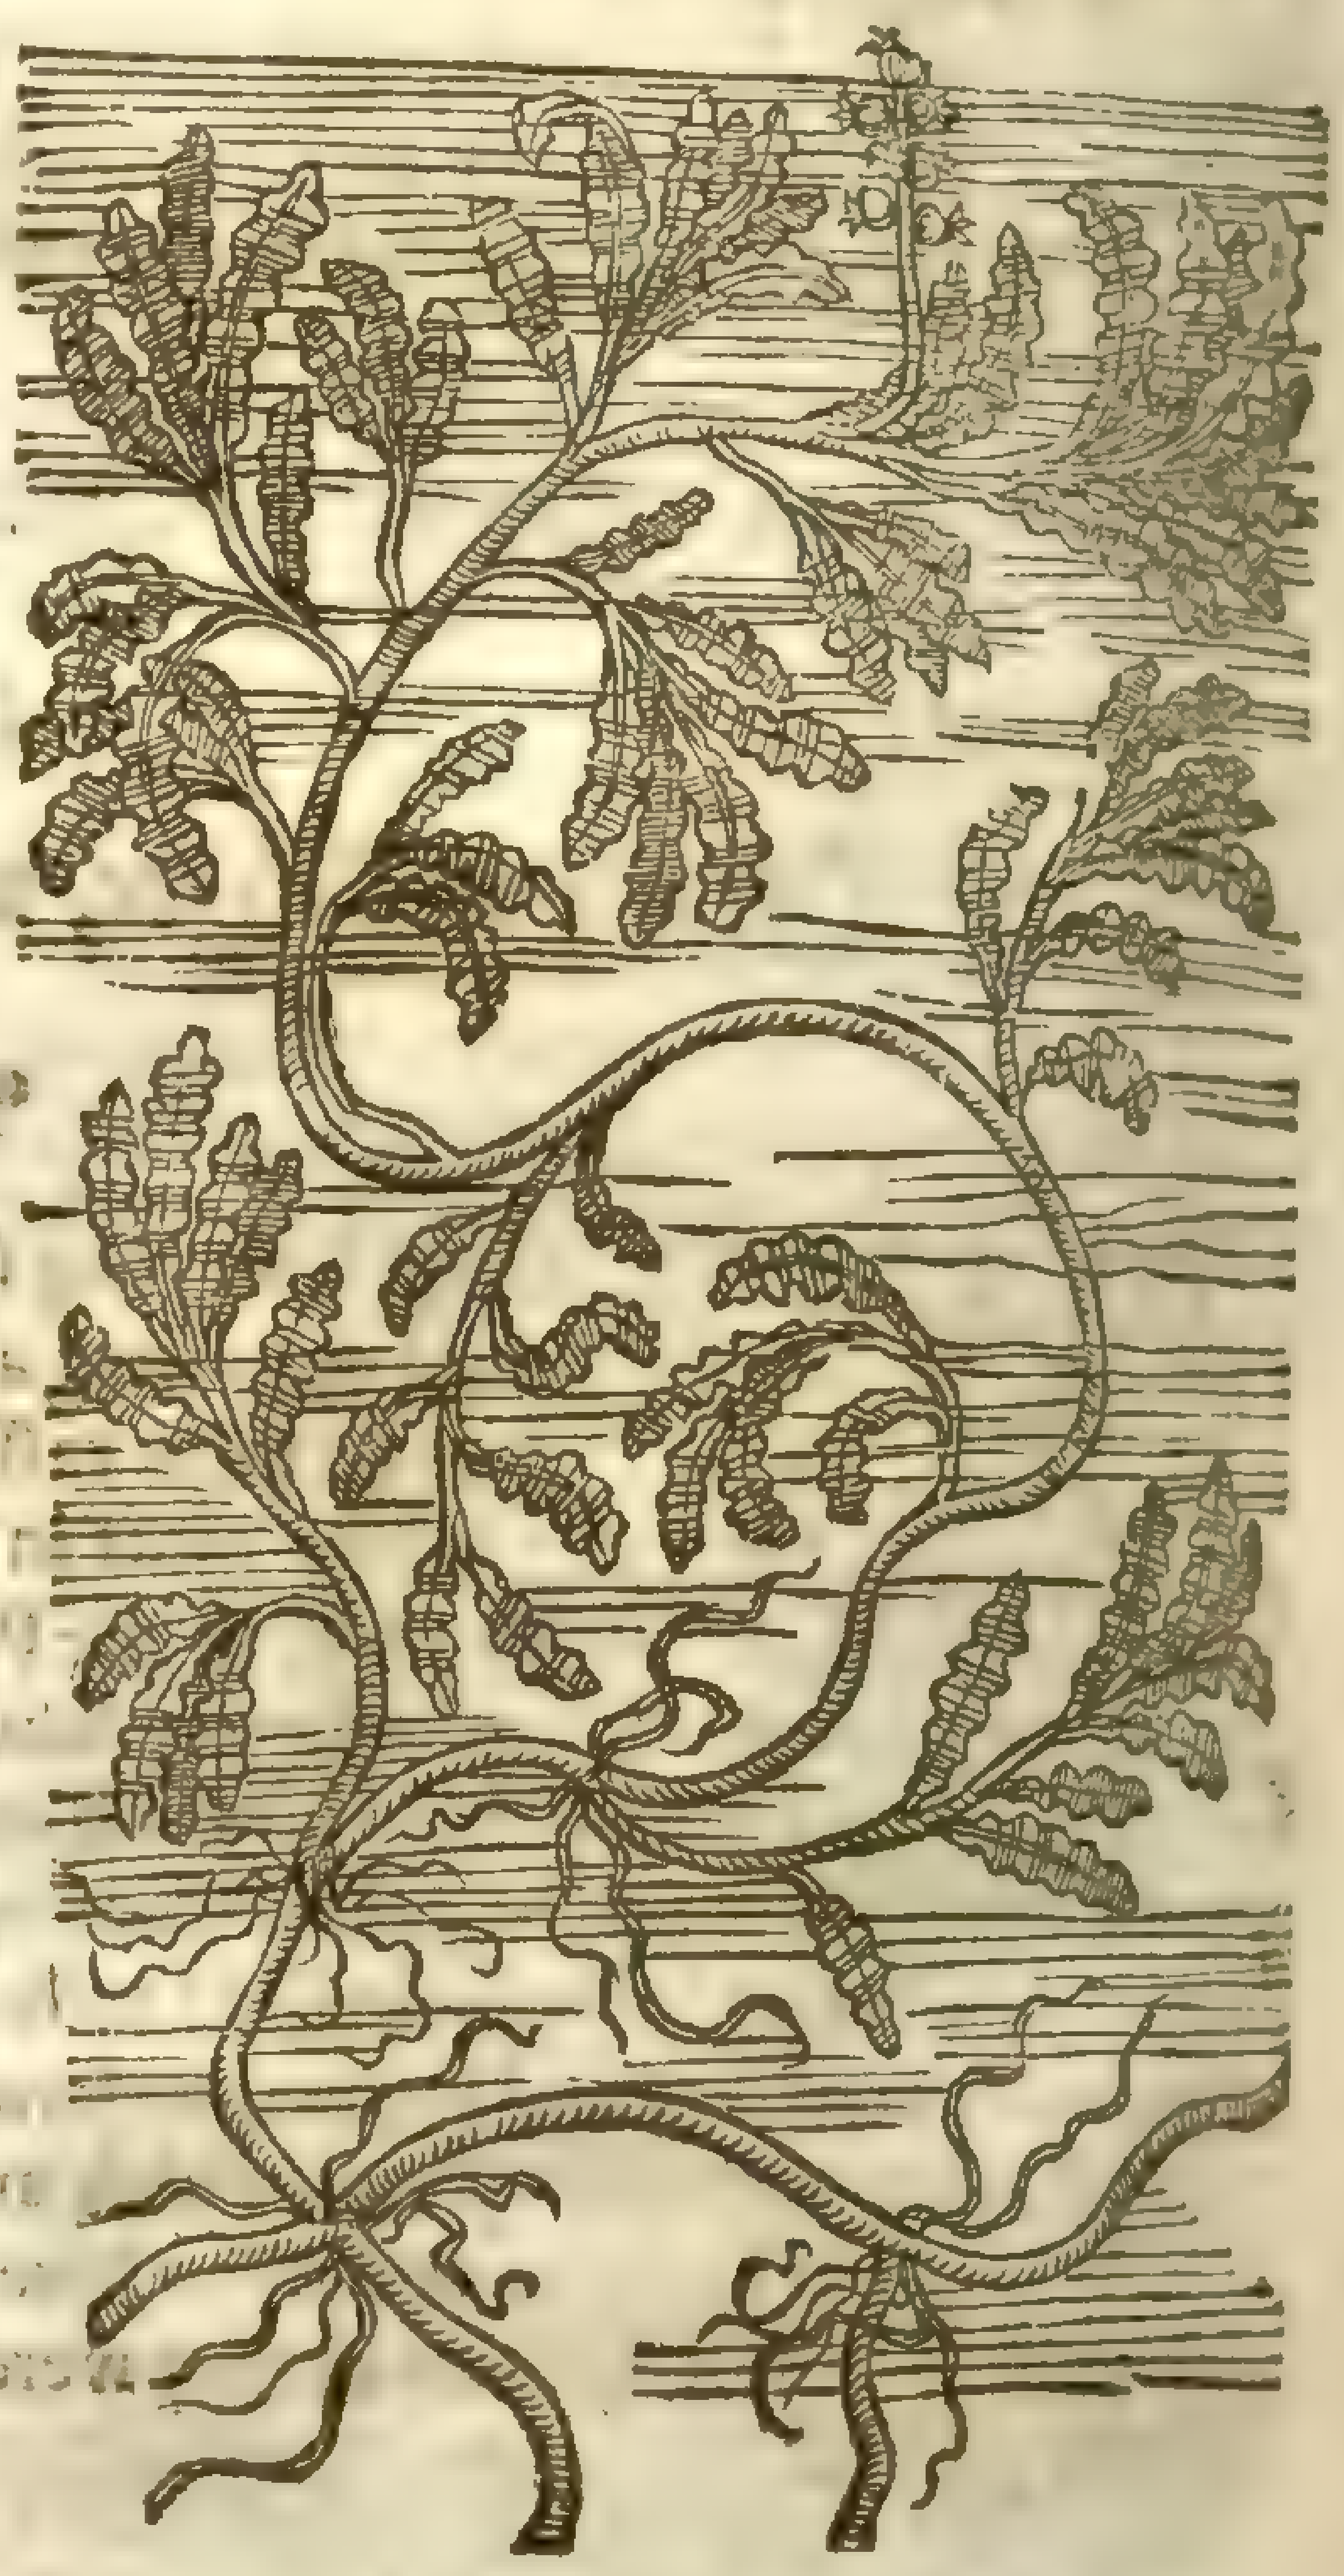
1 *Tribulus aquaticus.*
Water Caltrops.

Trapa natans. — Sm. Brit. 581



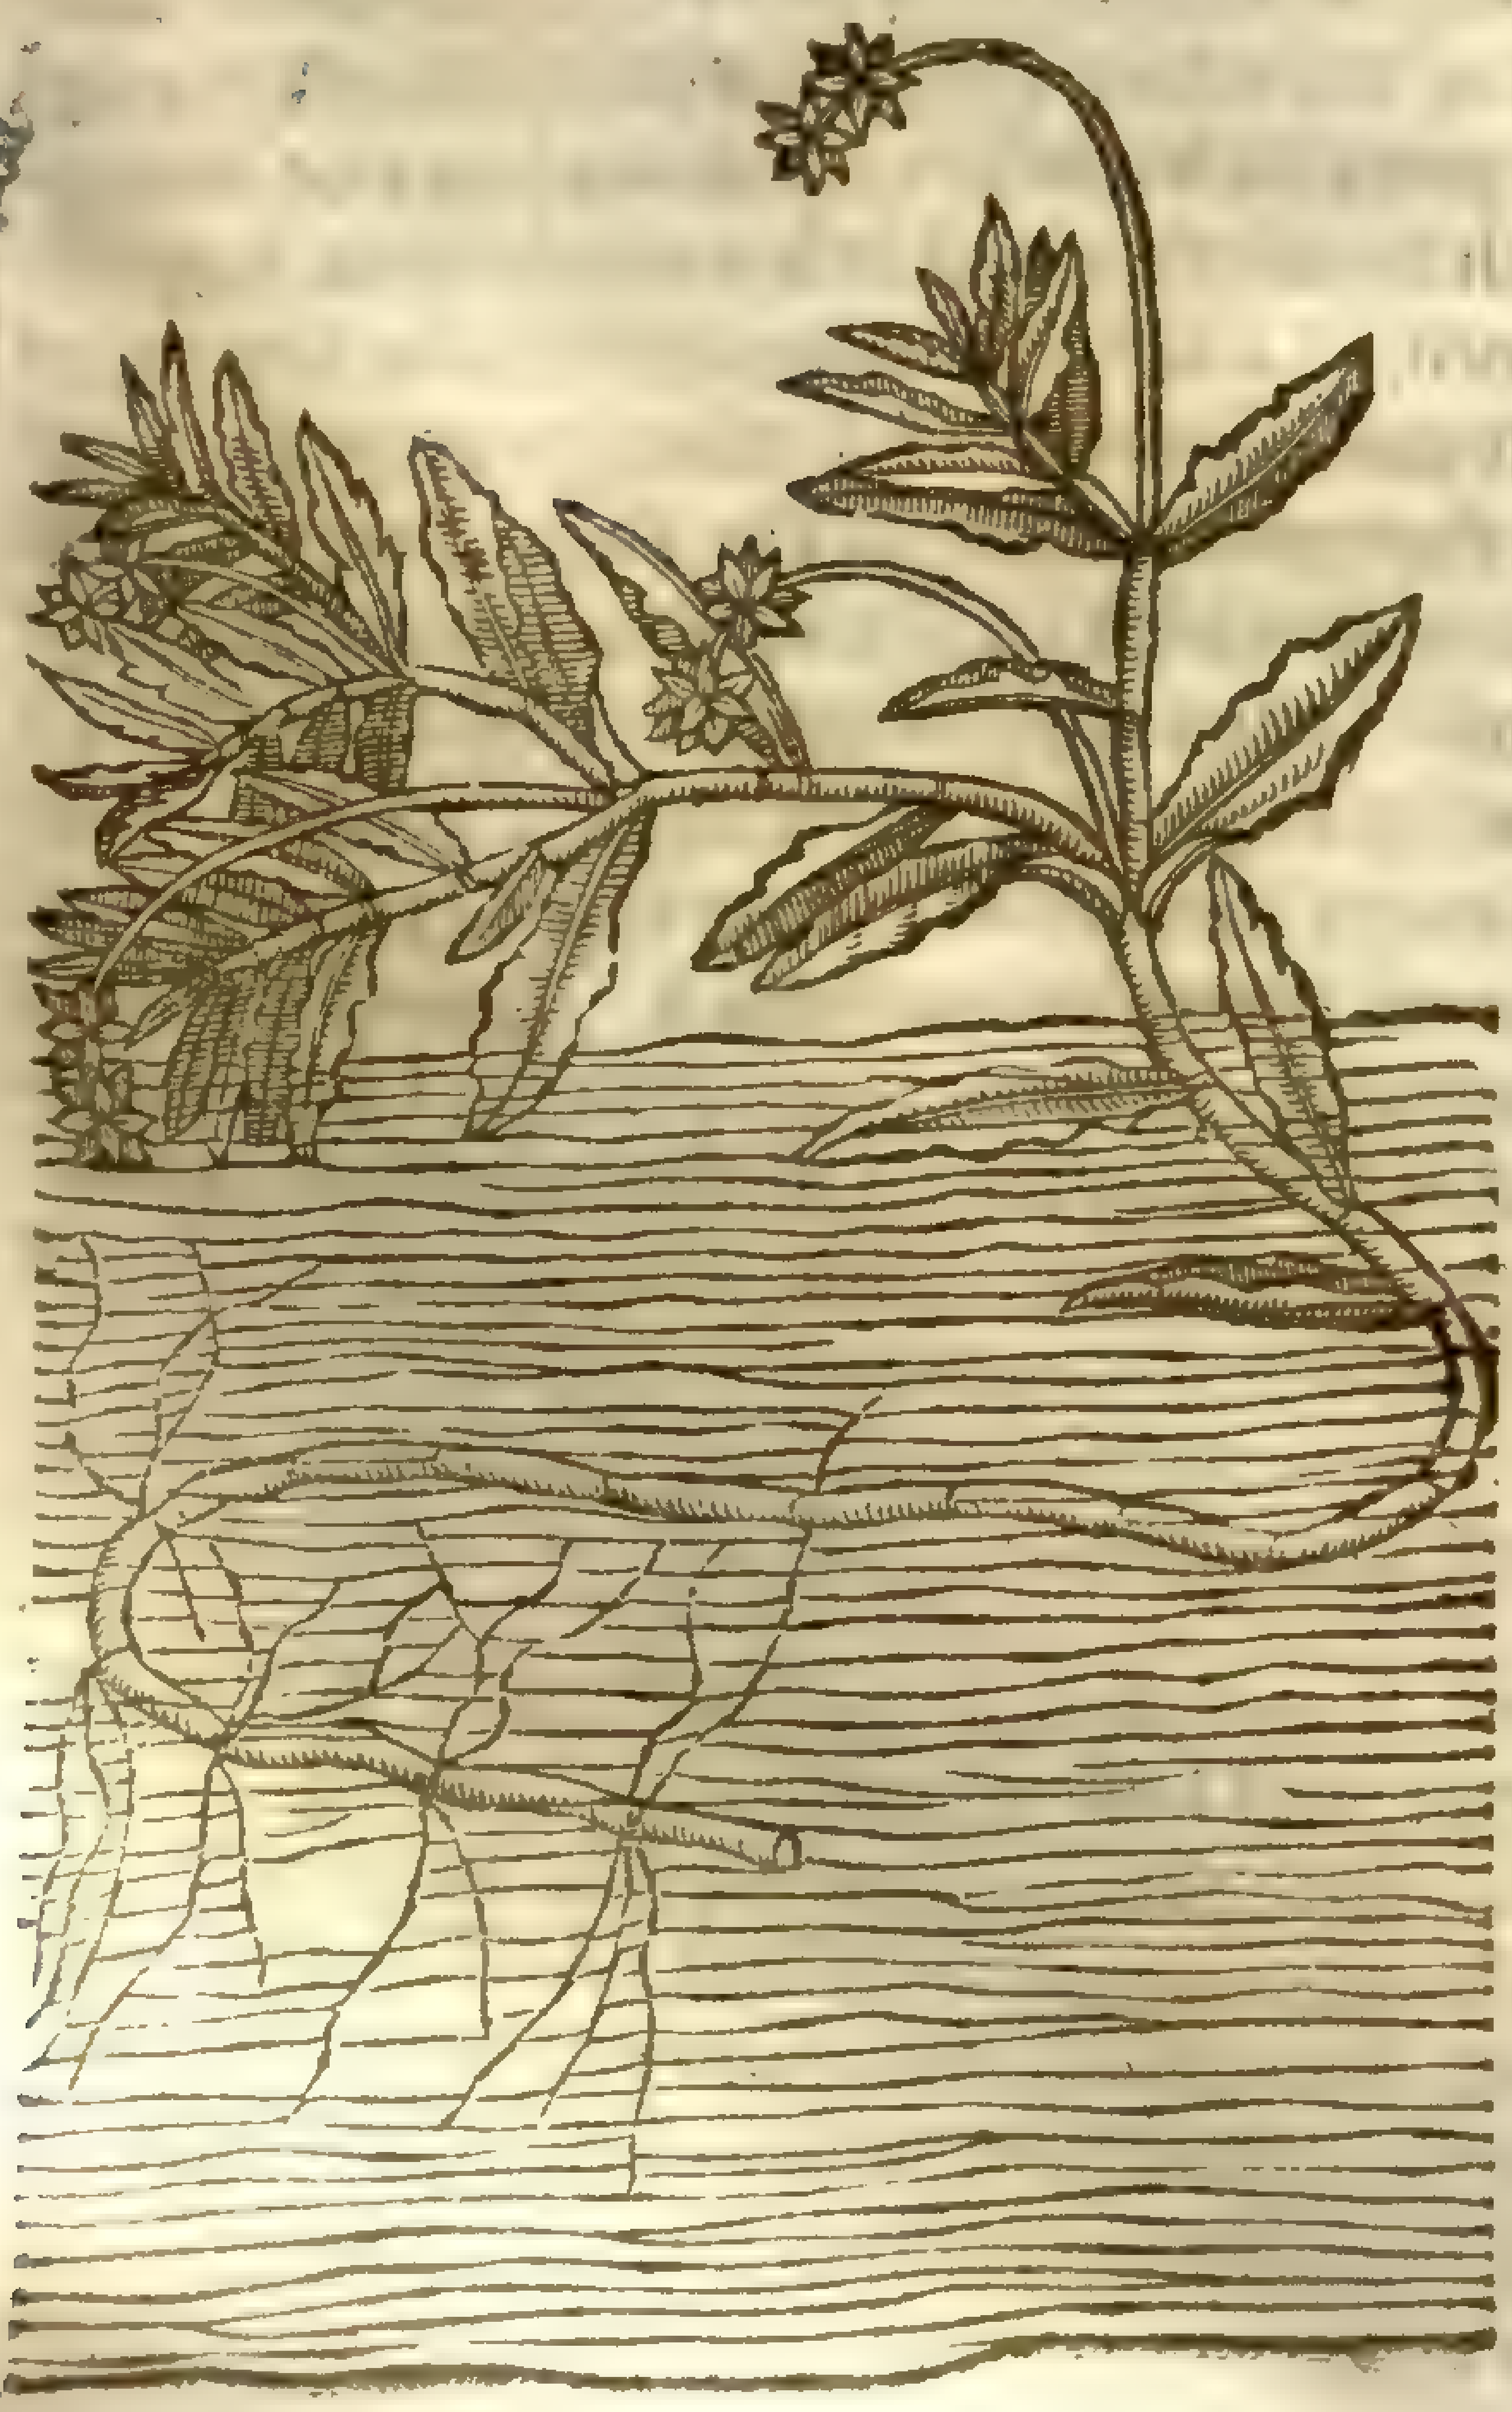
Potamogeton crispum [illegible]

‡ 2 *Tribulus aquaticus minor quercus floribus.*
Small water Caltrops, or Frogs Lettuce.



‡ 3 *Tribulus aquaticus minor, Muſcatellæ floribus.*
Small Frogs Lettuce.

Potamogeton crispum, [illegible] — Sm. Fl. B. 230. 233.



uerall wayes a ſquare of floures. The roots are like the former. This groweth aboundantly in the riuer by Droxford in Hampſhire. It floures in Iune and Iuly when the other doth, and continueth couered ouer with water, green both winter & ſommer. *Iohn Goodyer.* ‡

¶ *The Place.*

Cordus ſaith that it groweth in Germanie in myrie lakes, and in city ditches that haue mud in them: in Brabant and other places of the Lowcountries it is found oftentimes in ſtanding waters and ſprings. *Mathiolus* writeth, that it growes not only in lakes of ſweet water, but alſo in certain ditches by the ſea neere vnto Venice.

¶ *The Time.*

It flouriſheth in Iune, Iuly, & Auguſt.

¶ *The Names.*

The Grecians cal it τρίβολος ἔνυδρος: the Latines, *Tribulus aquatilis* and *aquaticus*, and *Tribulus lacuſtris*: the Apothecaries, *Tribulus marinus*: in high Dutch, 𝔚aſſer nuſz: the Brabanders, 𝔚ater noten: and of the likeneſſe of yron nailes, 𝔐inckiſſers:

the French men, *Macres*: in Engliſh it is named water Caltrops, Saligot, and water Nuts: moſt do call the fruit of this Caltrops, *Caſtaneæ aquatiles*, or water Cheſnuts.

¶ *The Temperature.*

Water Caltrop is of a cold nature, it conſiſteth of a moiſt eſſence, which in this is more waterie than in the land Caltrops, wherein an earthy cold is predominant, as *Galen* ſaith.

¶ *The Vertues.*

A The herb vſed in manner of a pultis, as *Dioſcorides* teacheth, is good againſt all inflammations or hot ſwellings: boiled with hony and water it perfectly cureth cankers of the mouth, ſore gums, and the almonds of the throat.

B The Thracians, ſaith *Pliny*, that dwel in Strymona, fatten their horſes with the leaues of Saligot, and they themſelues feed of the kernels, making very ſweet bread thereof, which bindes the belly.

C The green nuts or fruit of *Tribulus aquaticus*, or Saligot, drunke in wine, are good for them that are troubled with the ſtone and grauell.

D The ſame drunke in like manner, or laid outwardly to the place, helpeth thoſe that are bitten with any venomous beaſt, and reſiſteth all venome and poiſon.

E The leaues of Saligot be giuen againſt all inflammations and vlcers of the mouth, the putrifaction and corruption of the jawes, and againſt the Kings euill.

F A pouder made of the nuts is giuen to ſuch as piſſe bloud and are troubled with grauell: it bindeth the belly very much.

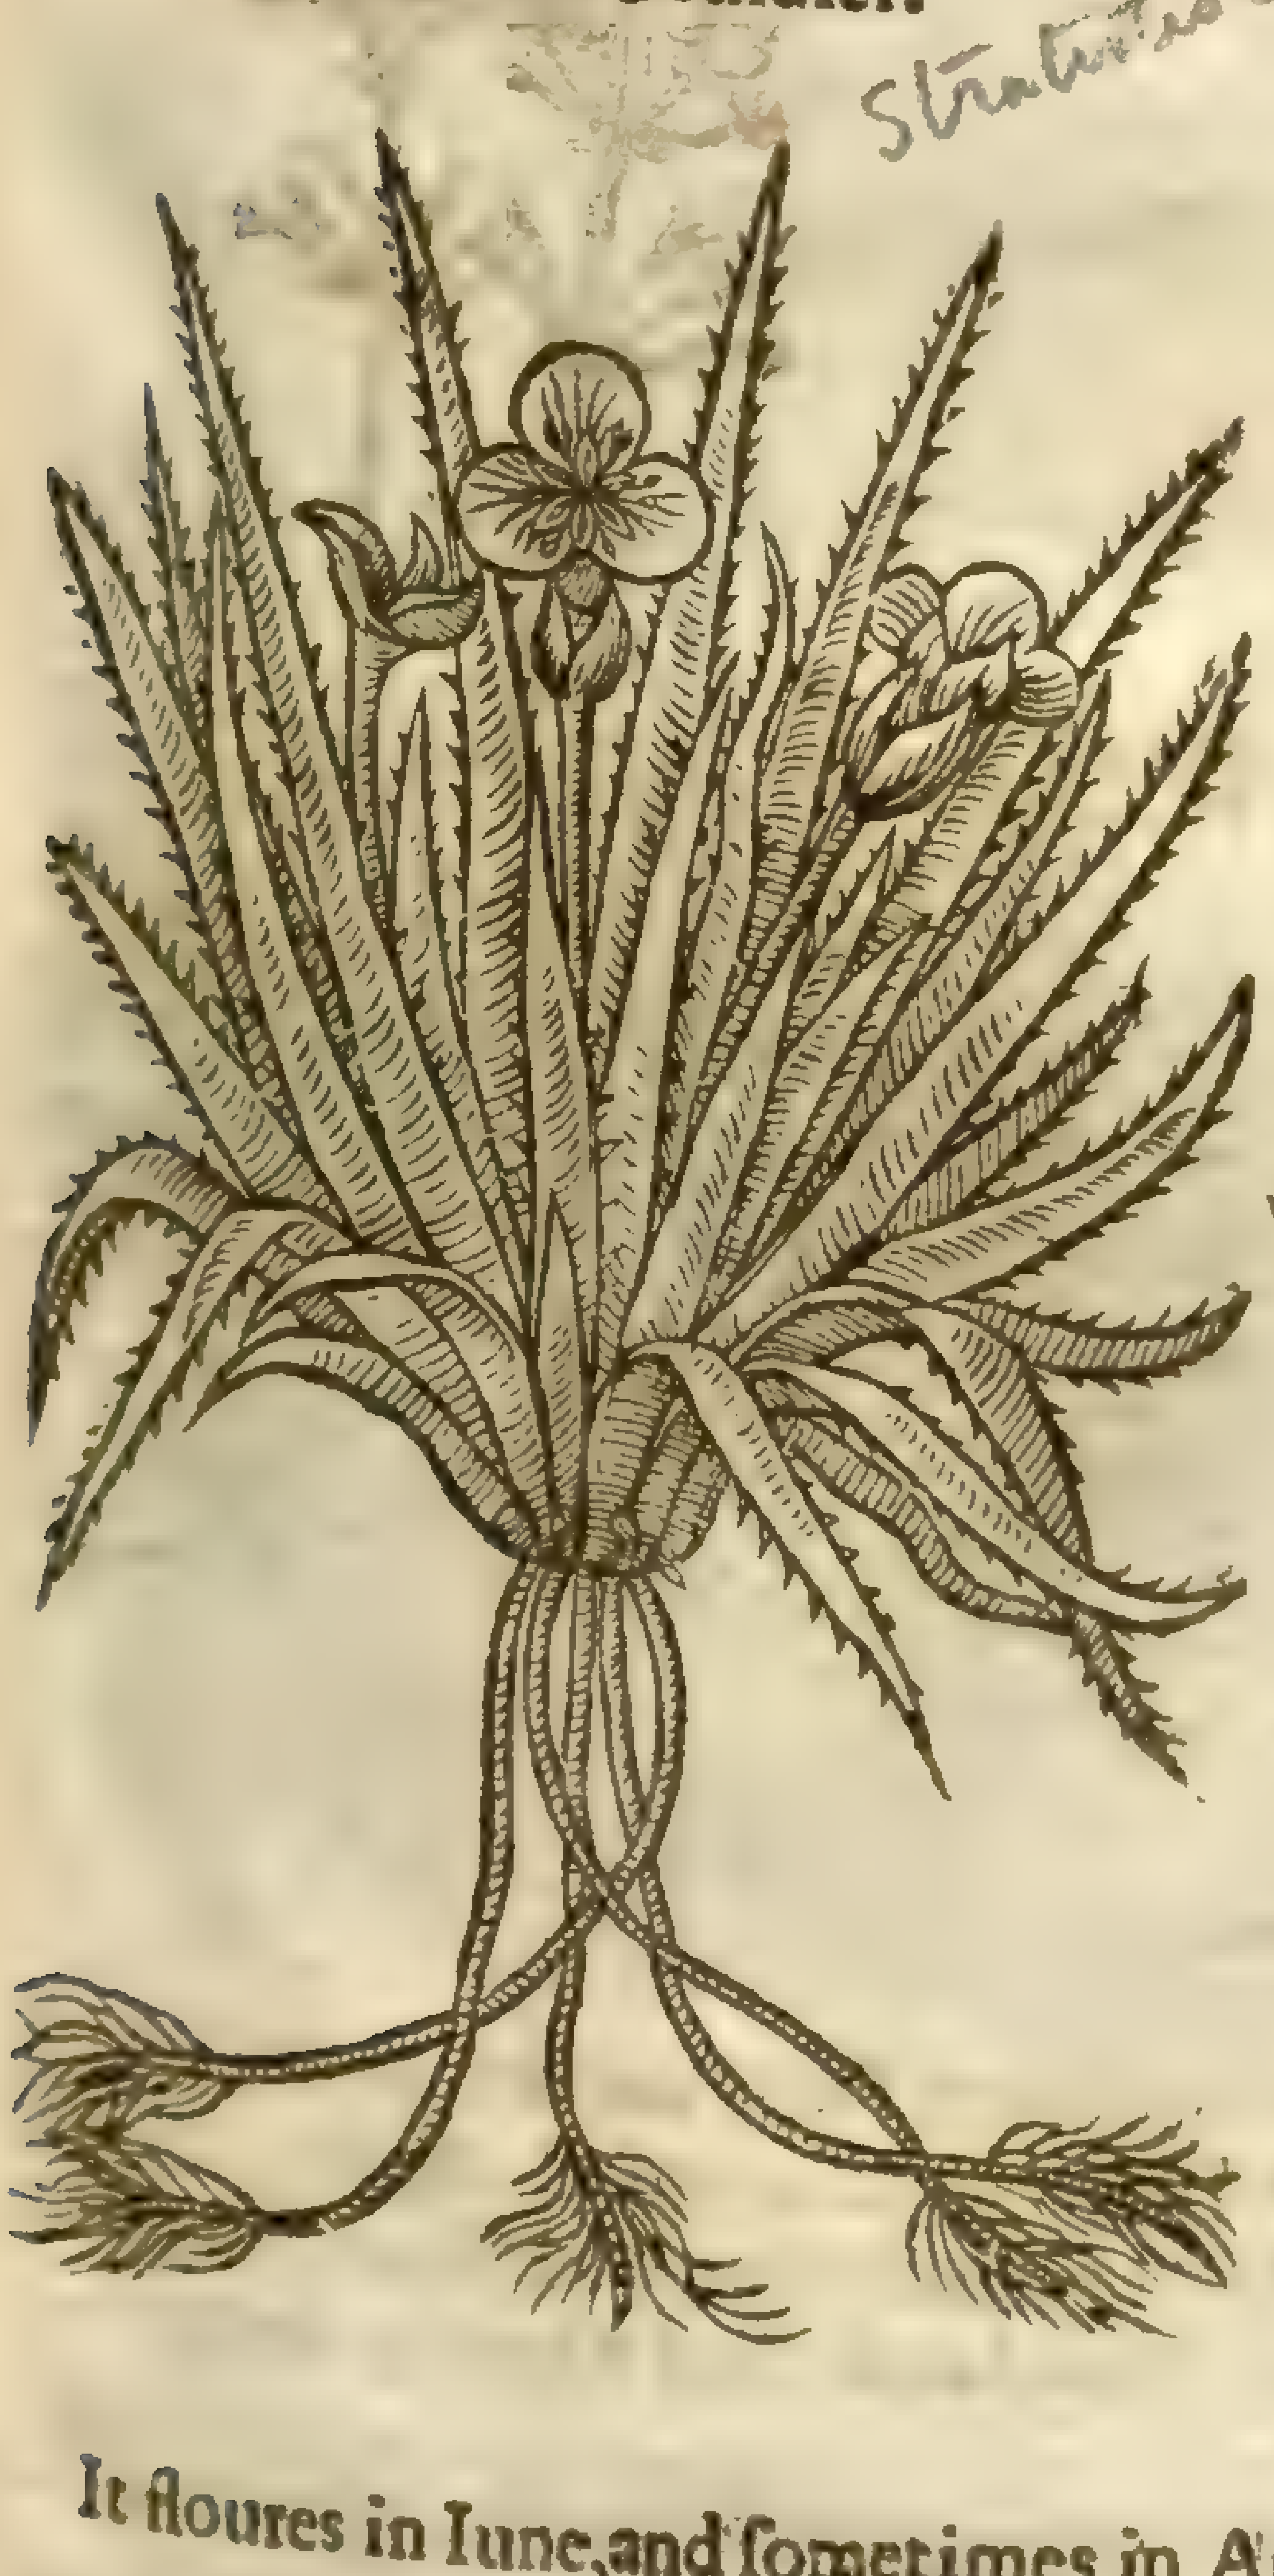
G ‡ The two leſſer water Caltrops here deſcribed are in my opinion much agreeable in temper to the great one, and are much fitter *Succidanea* for it than Aron, which ſome in the compoſition of *Vnguentum Agrippæ* haue appointed for it. ‡

Chap. 299.

Of Water Sengreen, or Freſh-water Souldier.

Militaris Aizoides.
Freſh-water Souldier.

Stratiotes aloides [illegible]
Sm. fl. 3. 3



Lob. ic. 375

¶ *The Deſcription.*

Freſh-water Souldier or Water Houſleeke hath leaues like thoſe of the Herb Aloë or *Sempervivum*, but ſhorter and leſſer, ſet round about the edges with certaine ſtiffe and ſhort prickles: amongſt which commeth forth diuers caſes or husks very like to crabs clawes; out of which when they open grow white floures, conſiſting of three leaues altogether like thoſe of Frogs-bit, hauing in the middle little yellowiſh threads: in ſtead of roots there be long ſtrings, round, white, very like to great harp ſtrings or long worms, which falling down from a ſhort head that brought forth the leaues, go to the bottome of the water, and yet be they ſeldome there faſtned: there grow alſo from the ſame other ſtrings aſlope, by which the plant is multiplied after the manner of Frogs-bit.

¶ *The Place.*

‡ I found this growing plentifully in the ditches about Rotſey a ſmall village in Holderneſſe: and my friend Mr *William Broad* obſerued it in the fennes in Lincolnſhire. ‡ The leaues and flours grow vpon the top of the water, and the roots are ſent downe through the water to the mud.

¶ *The Time.*

It floures in Iune, and ſometimes in Auguſt.

¶ *The Names.*

It may be called *Sedum aquatile*, or water Sengreen, that is to ſay, of the likeneſſe of Herb Aloë, which is alſo called in Latine *Sedum*: of ſome, *Cancri chela*, or *Cancri forficula*: in Engliſh, Water Houſleeke, Knights Pondwort, and of ſome, Knights water Sengreen, Freſh-water Soldier, or wading Pondweed: it ſeems to be *Stratiotes aquatilis*, or *Stratiotes potamios*, or Knights water Woundwort, which may alſo be named in Latine, *Militaris aquatica*, and *Militaris Aizoides*, or ſoldiers Yarrow; for it groweth in the water, and floteth vpon it, and if thoſe ſtrings which it ſendeth to the bottom of the water be no roots, it alſo liueth without roots.

¶ *The Temperature.*

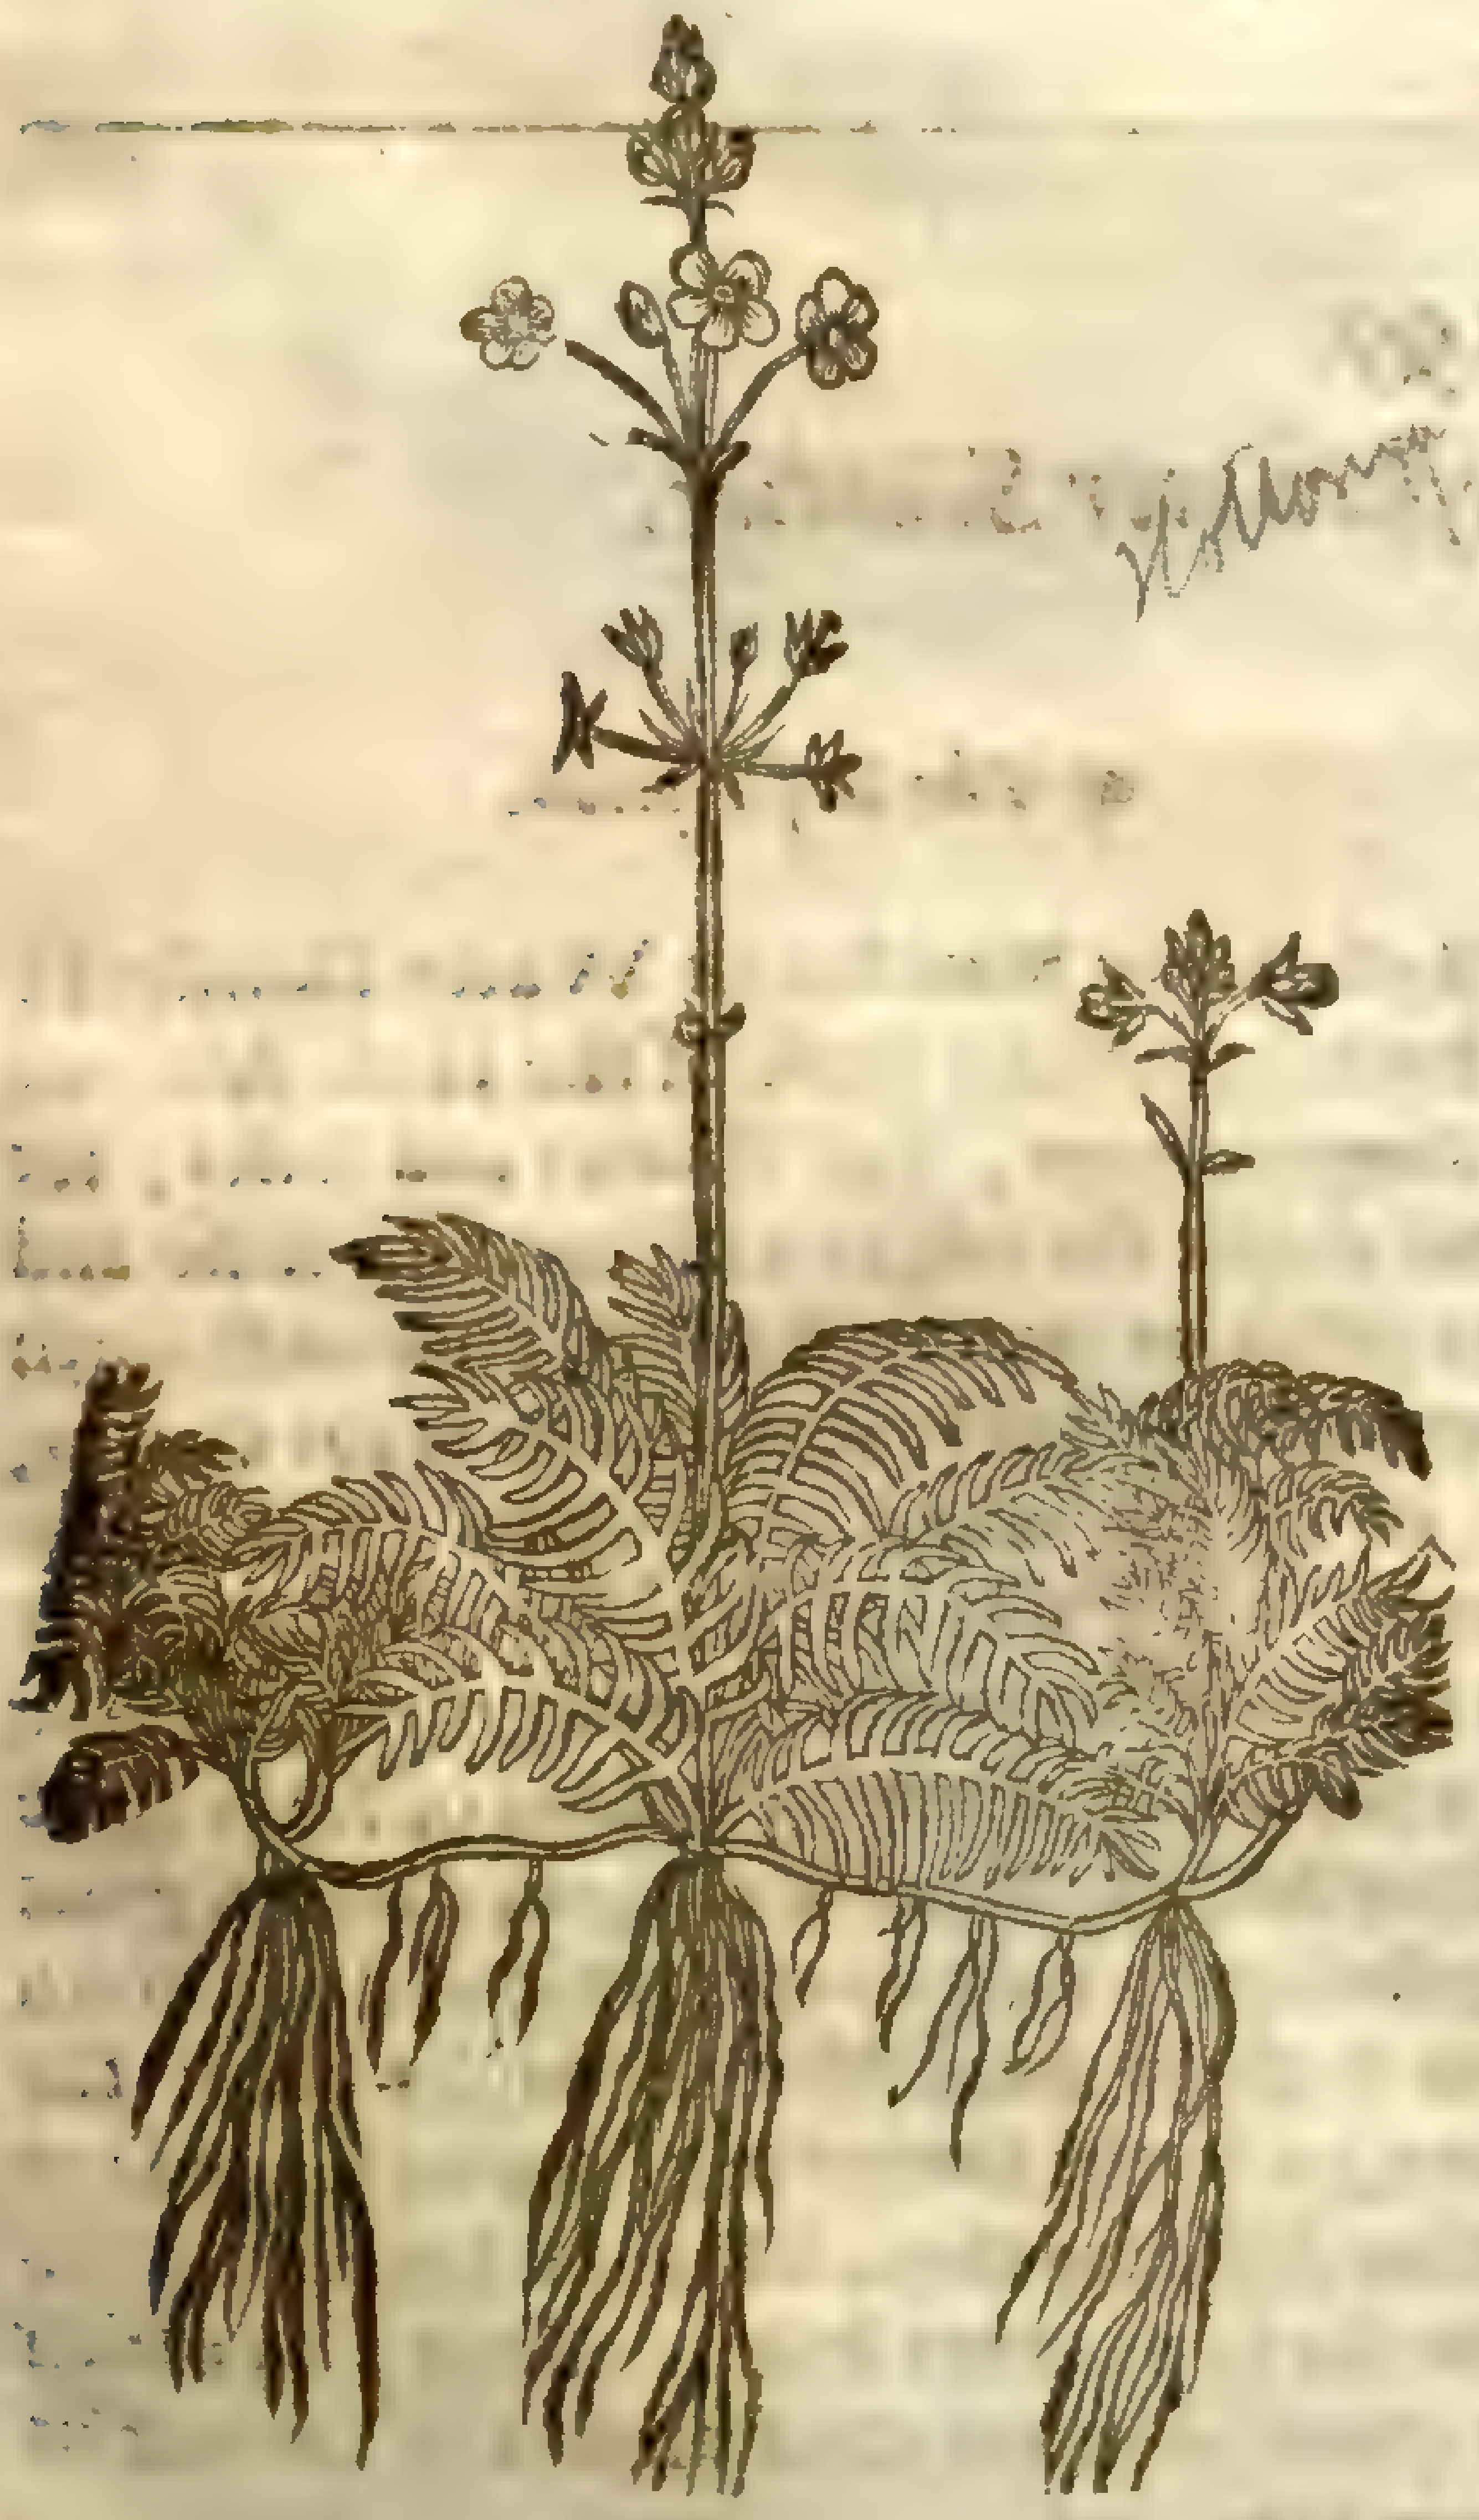
This herb is of a cooling nature and temperament.

¶ *The Vertues.*

This Houſleeke ſtaieth the bloud which commeth from the kidnies, it keepeth greene wounds from being inflamed, and is good againſt S. *Anthonies* fire and hot ſwellings, beeing applied vnto them: and is equall in vertues with the former aforeſaid.

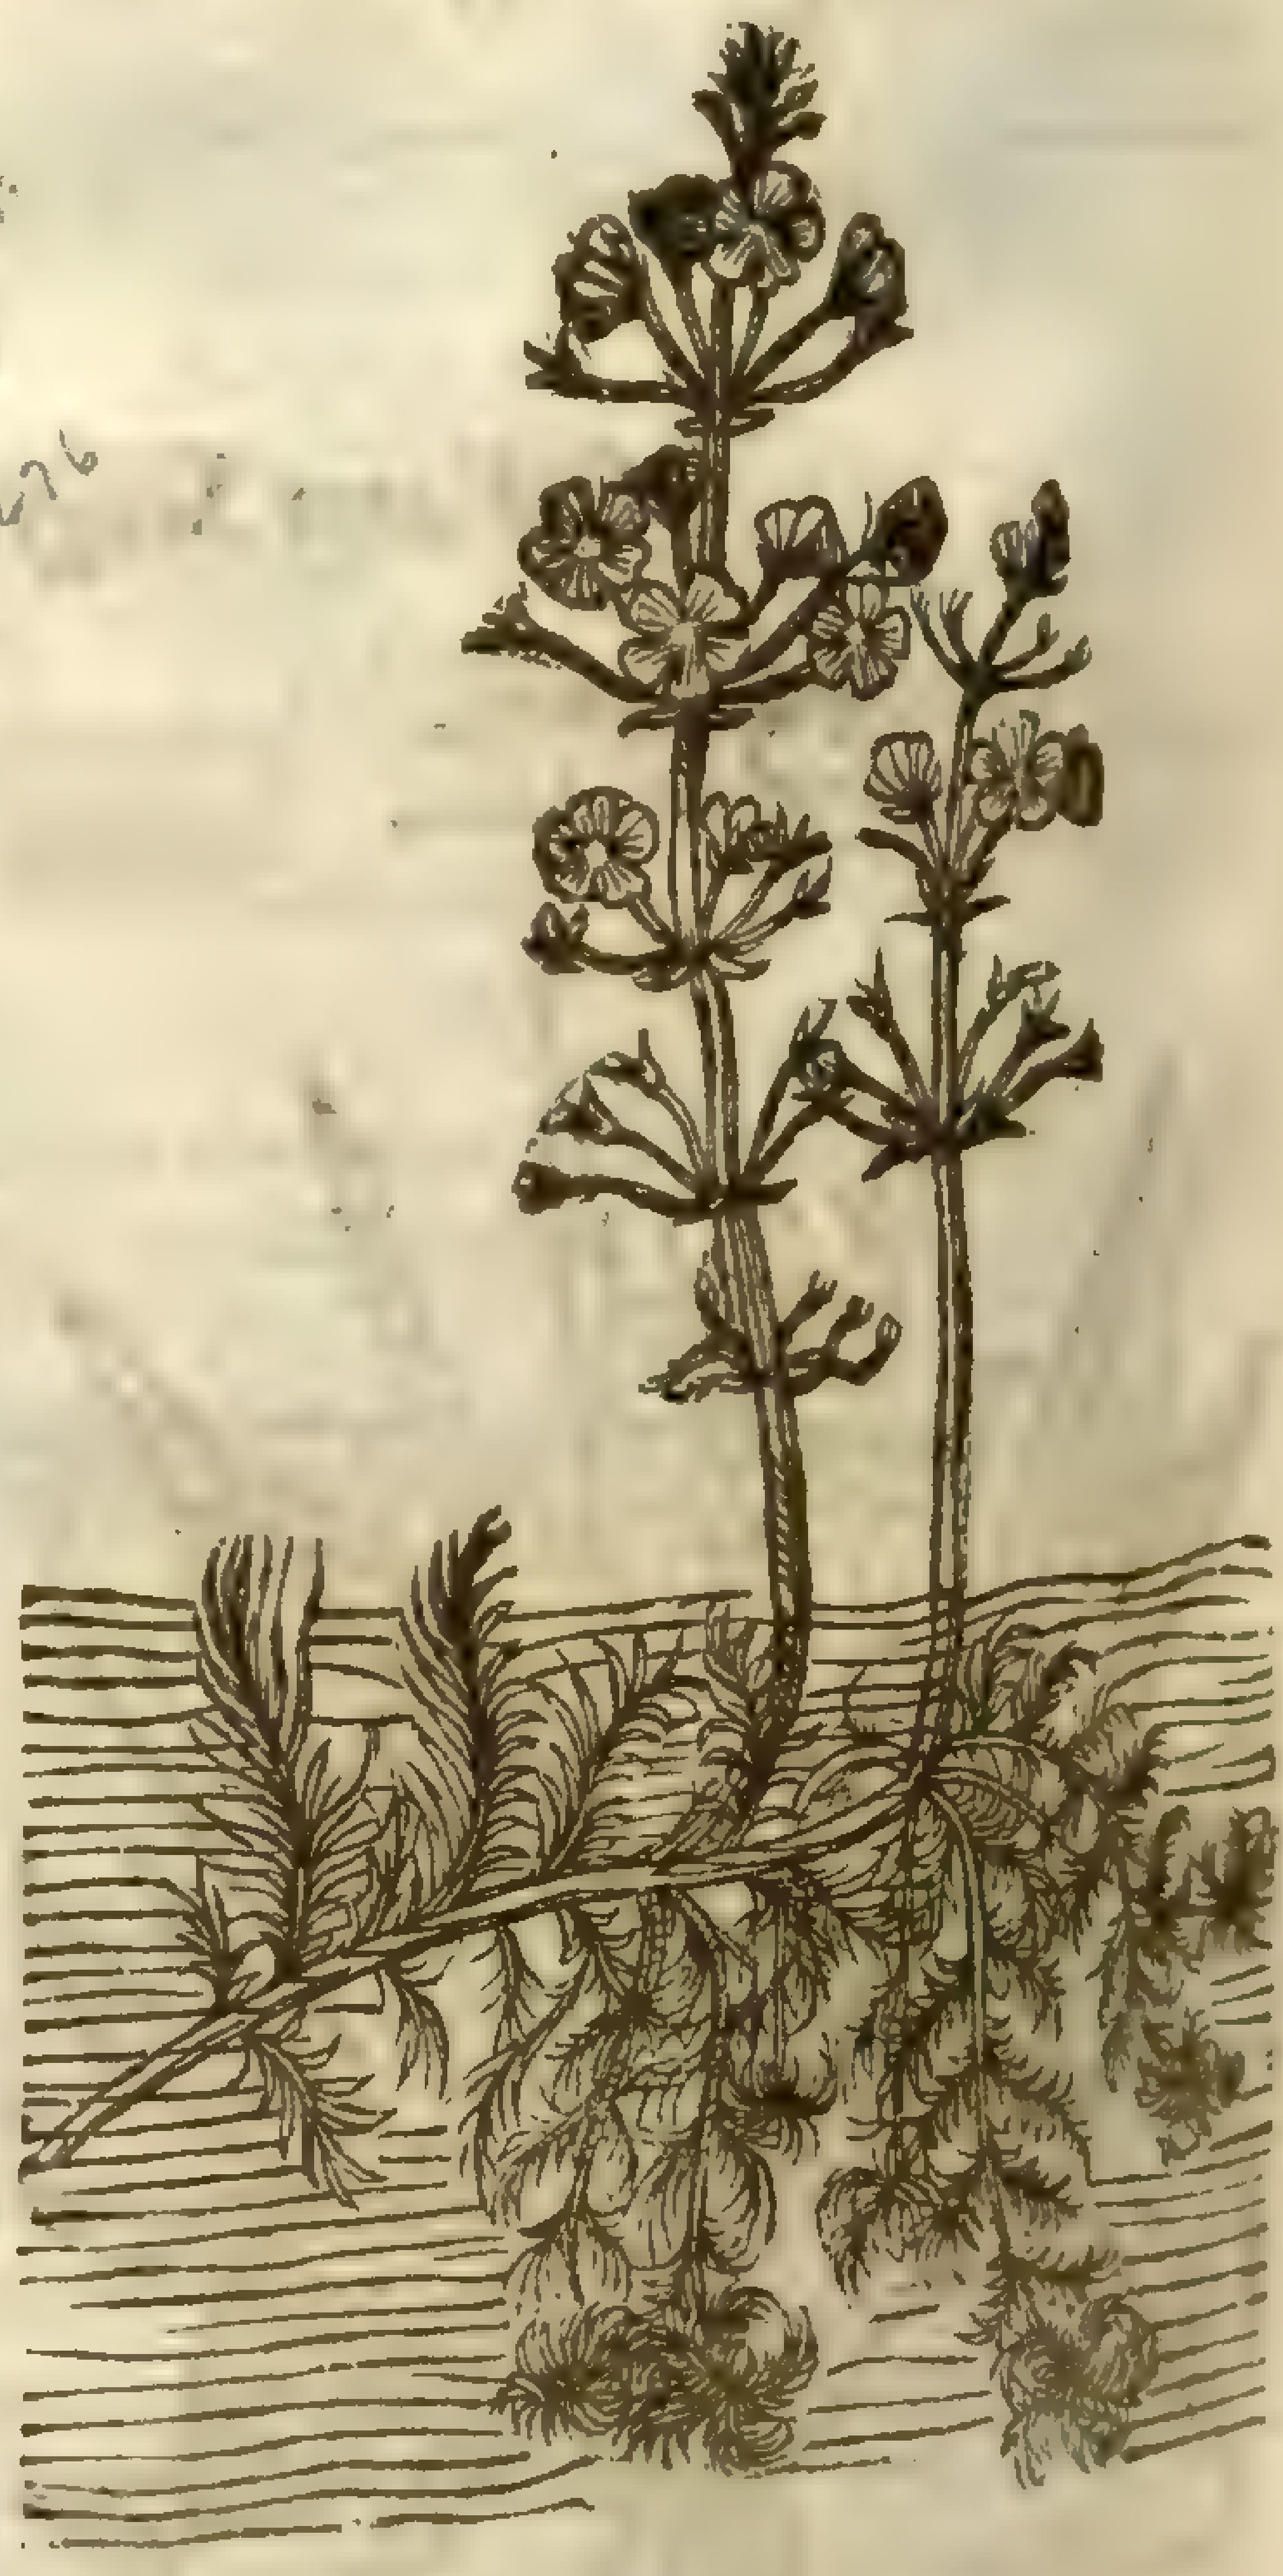
Chap. 300. *Of water Yarrow or water Gilloſloure.*

1 *Viola paluſtris.*
Water Violet.



Hottonia palustris [illegible]
[illegible] [illegible]
Sp. Pl. 1. 276

‡ 2 *Viola paluſtris tenuifolia.*
The ſmaller leaued water Violet.



¶ *The Deſcription.*

1 Water Violet hath long and great jagged leaues very finely cut or rent like Yarrow, but ſmaller: among which come vp ſmall ſtalks a cubit and a halfe high, bearing at the top ſmall white floures like vnto ſtock Gilloſloures, with ſome yellowneſſe in the middle. The roots are long and ſmall like black threds, and at the end whereby they are faſtned to the ground they are white.

‡ There is another variety of this plant, which differs from it only in that the leaues are much ſmaller, as you may ſee them expreſt in the figure. ‡

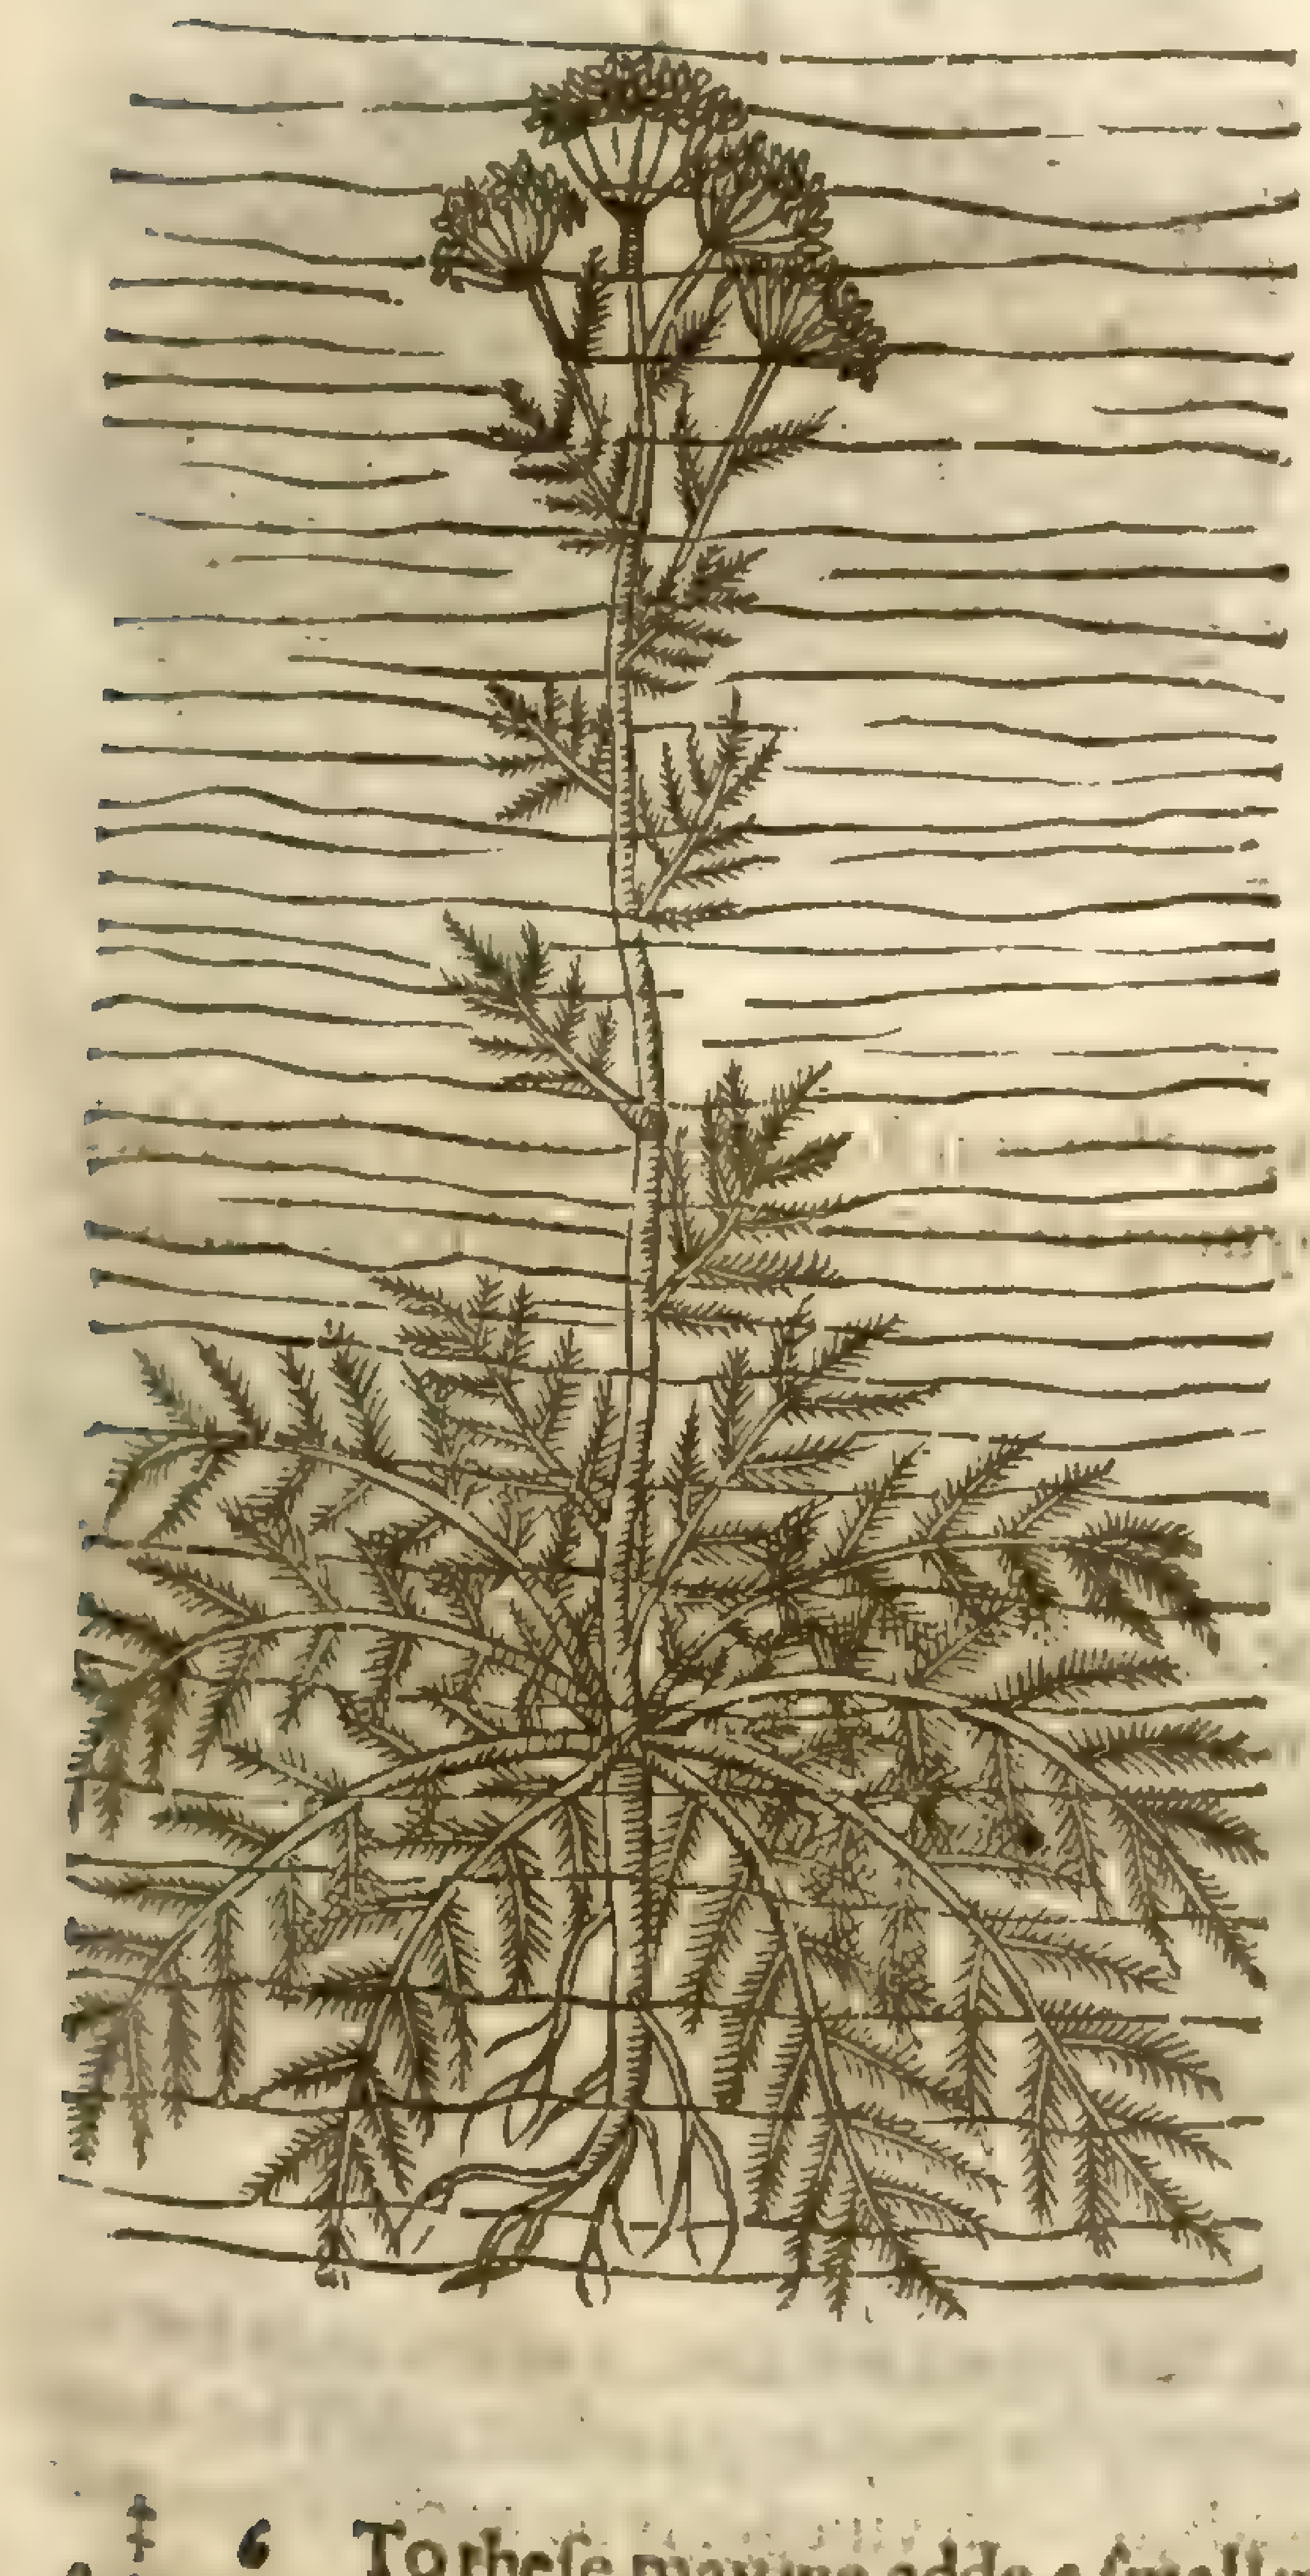
2 Water Milfoile or water Yarrow hath long and large leaues deepely cut with many diuiſions like Fennell, but finelier jagged, ſwimming vpon the water. The root is ſingle, long, and round, which brings vp a right ſtraight and ſlender ſtalke, ſet in ſundry places with the like leaues, but ſmaller. The leaues grow at the top of the ſtalk, tuft-faſhion, and like vnto the land Yarrow.

3 This water Milfoile differeth from all the kindes aforeſaid, hauing a root in the bottom of the water, made of many hairy ſtrings, which yeeldeth vp a naked ſlender ſtalke within the water, and the reſt of the ſtalk which floteth vpon the water diuideth it ſelfe into ſundry other branches or wings, which are bedaſht with fine ſmall jagged leaues like vnto Cammomill, or rather reſembling hairy taſſels or fringe, than leaues. From the boſomes whereof come forth ſmall and tender branches, euery branch bearing one floure like vnto water Crow-foot, white of colour, with a little yellow in the midſt: the whole plant reſembleth water Crow-foot in all things ſaue in the broad leaues.

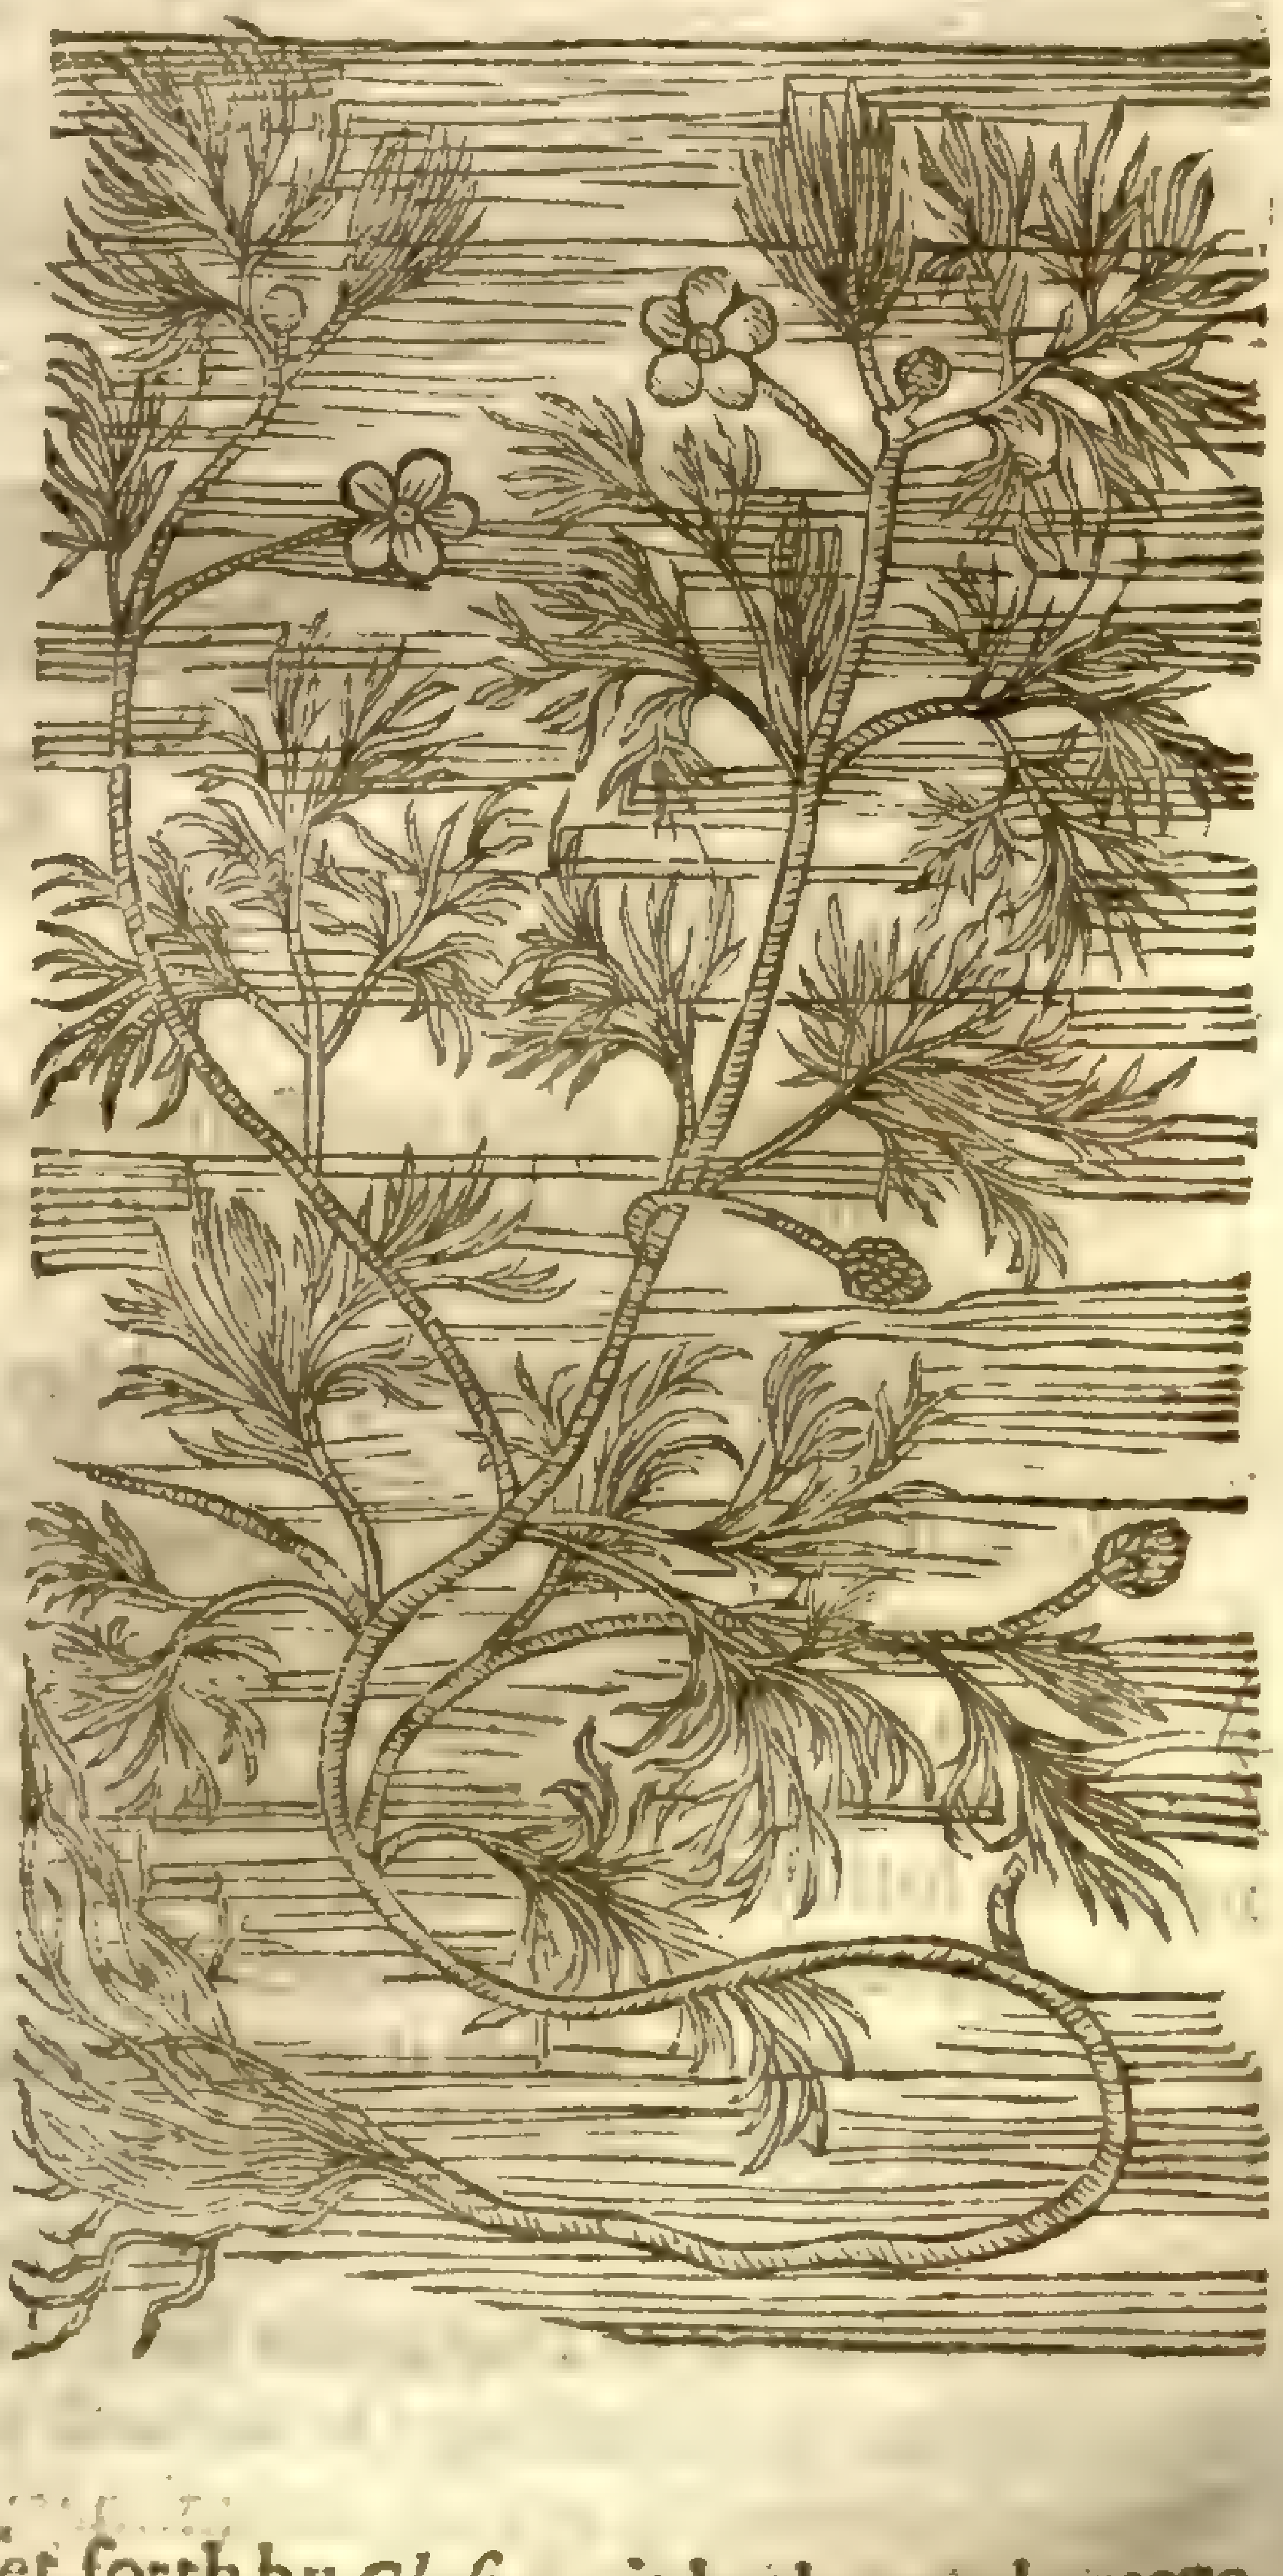
† 4 There is another kinde of water Violet very like the former, ſauing that his leaues are much longer, ſomewhat reſembling the leaues of fennell, faſhioned like vnto wings, and the flours are ſomewhat ſmaller, yet white, with ſome yellowneſſe in their middles, and ſhaped like thoſe of the laſt deſcribed: the ſeed alſo growes like vnto that of the water *Ranunculus* laſt deſcribed.

5 There is alſo another kinde of water Milfoile which hath leaues very like vnto water Violet, ſmaller, and not ſo many in number: the ſtalk is ſmall and tender, bearing yellow gaping flours faſhioned like a hood or the ſmall Snapdragon; which cauſed *Pena* to put vnto his name this additament *Galericulatum*, that is, hooded. The roots are ſmall and threddy, with ſome few knobs hanging thereat like the ſounds of fiſh.

2 *Millefolium aquaticum.*
Water Yarrow.



3 *Millefolium, ſiue Maratriphyllon, flore & ſemine Ranunculi aquatice, Hepaticæ facie.*
Crow-foot, or water Milfoile.



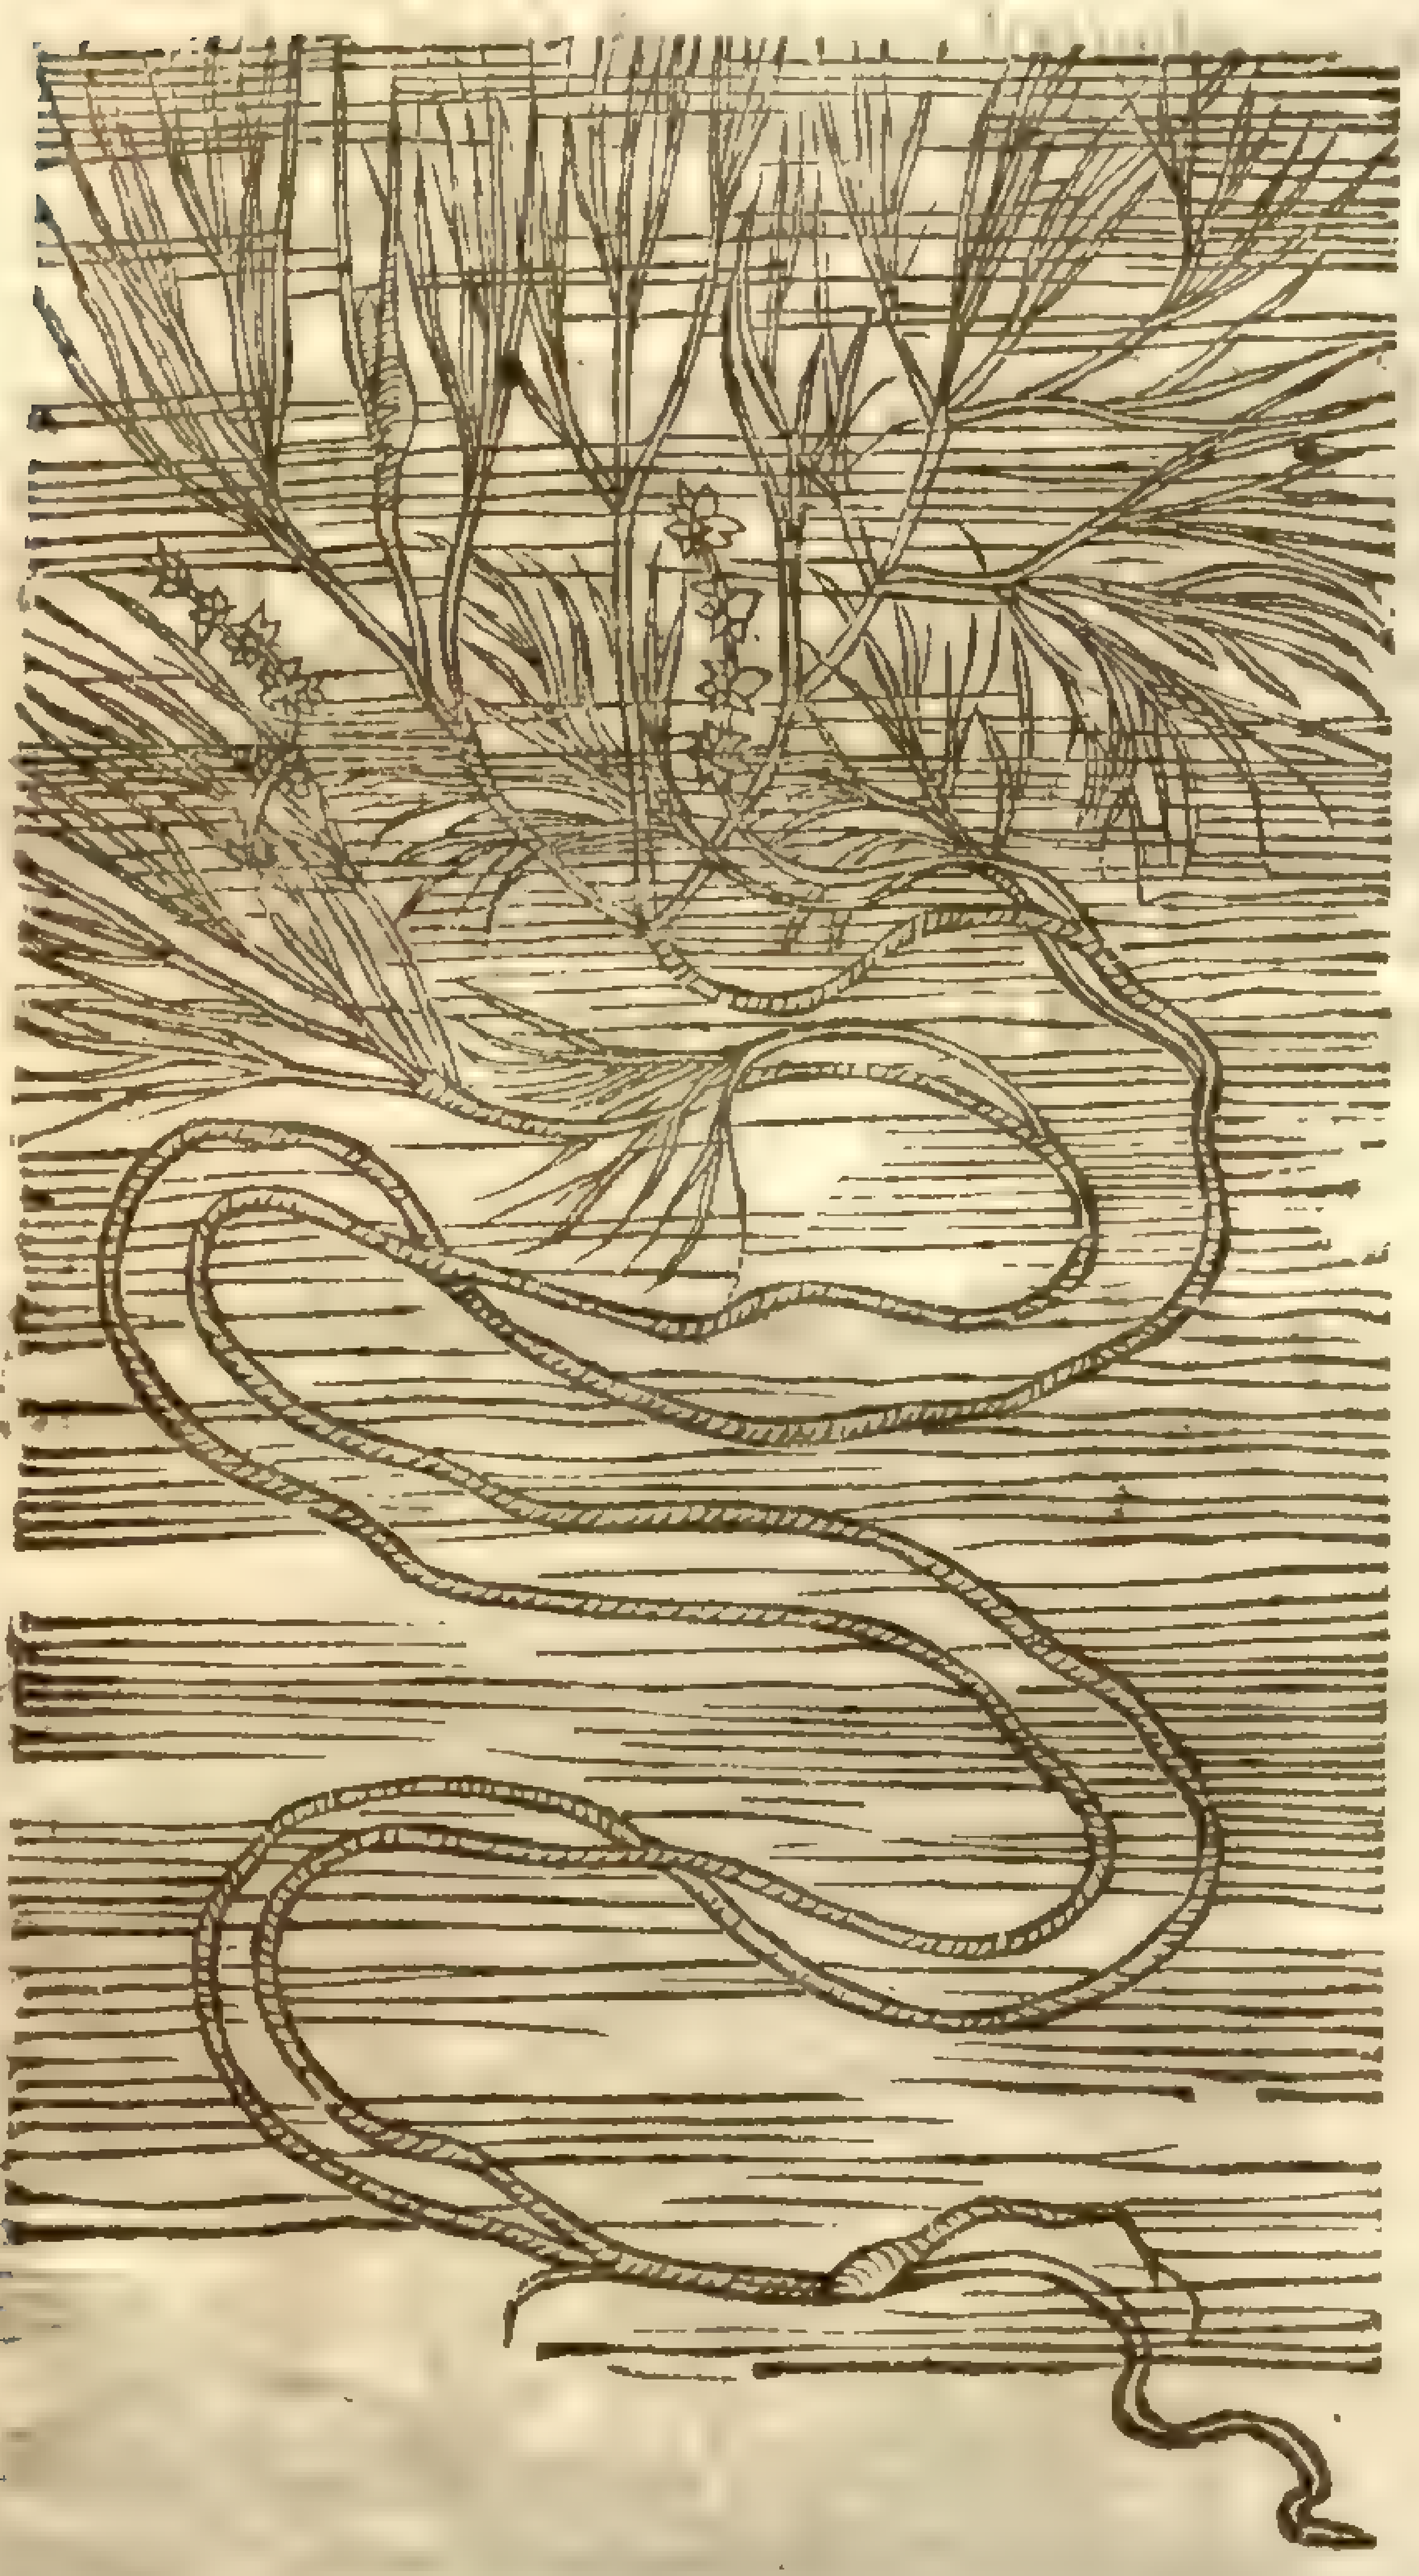
‡ 6 To theſe may we adde a ſmall water Milfoile ſet forth by *Cluſius*: it hath round greene ſtalks ſet with many joints, whereout come at their lower ends many hairy fibres whereby it takes hold of the mud: the tops of theſe ſtems ſtand ſome handfull aboue the water, and at each joint ſend fiue long finely winged leaues, very greene, and ſome inch long, which wax leſſe and leſſe, as

they ſtand higher or neerer the top of the ſtalke; and at each of theſe leaues about the top of the ſtem growes one ſmall white floure conſiſting of ſix little leaues joined together, and not opening themſelues, which at length turne into little knobs, with foure little pointals ſtanding out of them. *Cluſius* calls this *Myriophyllon aquaticum minus.* ‡

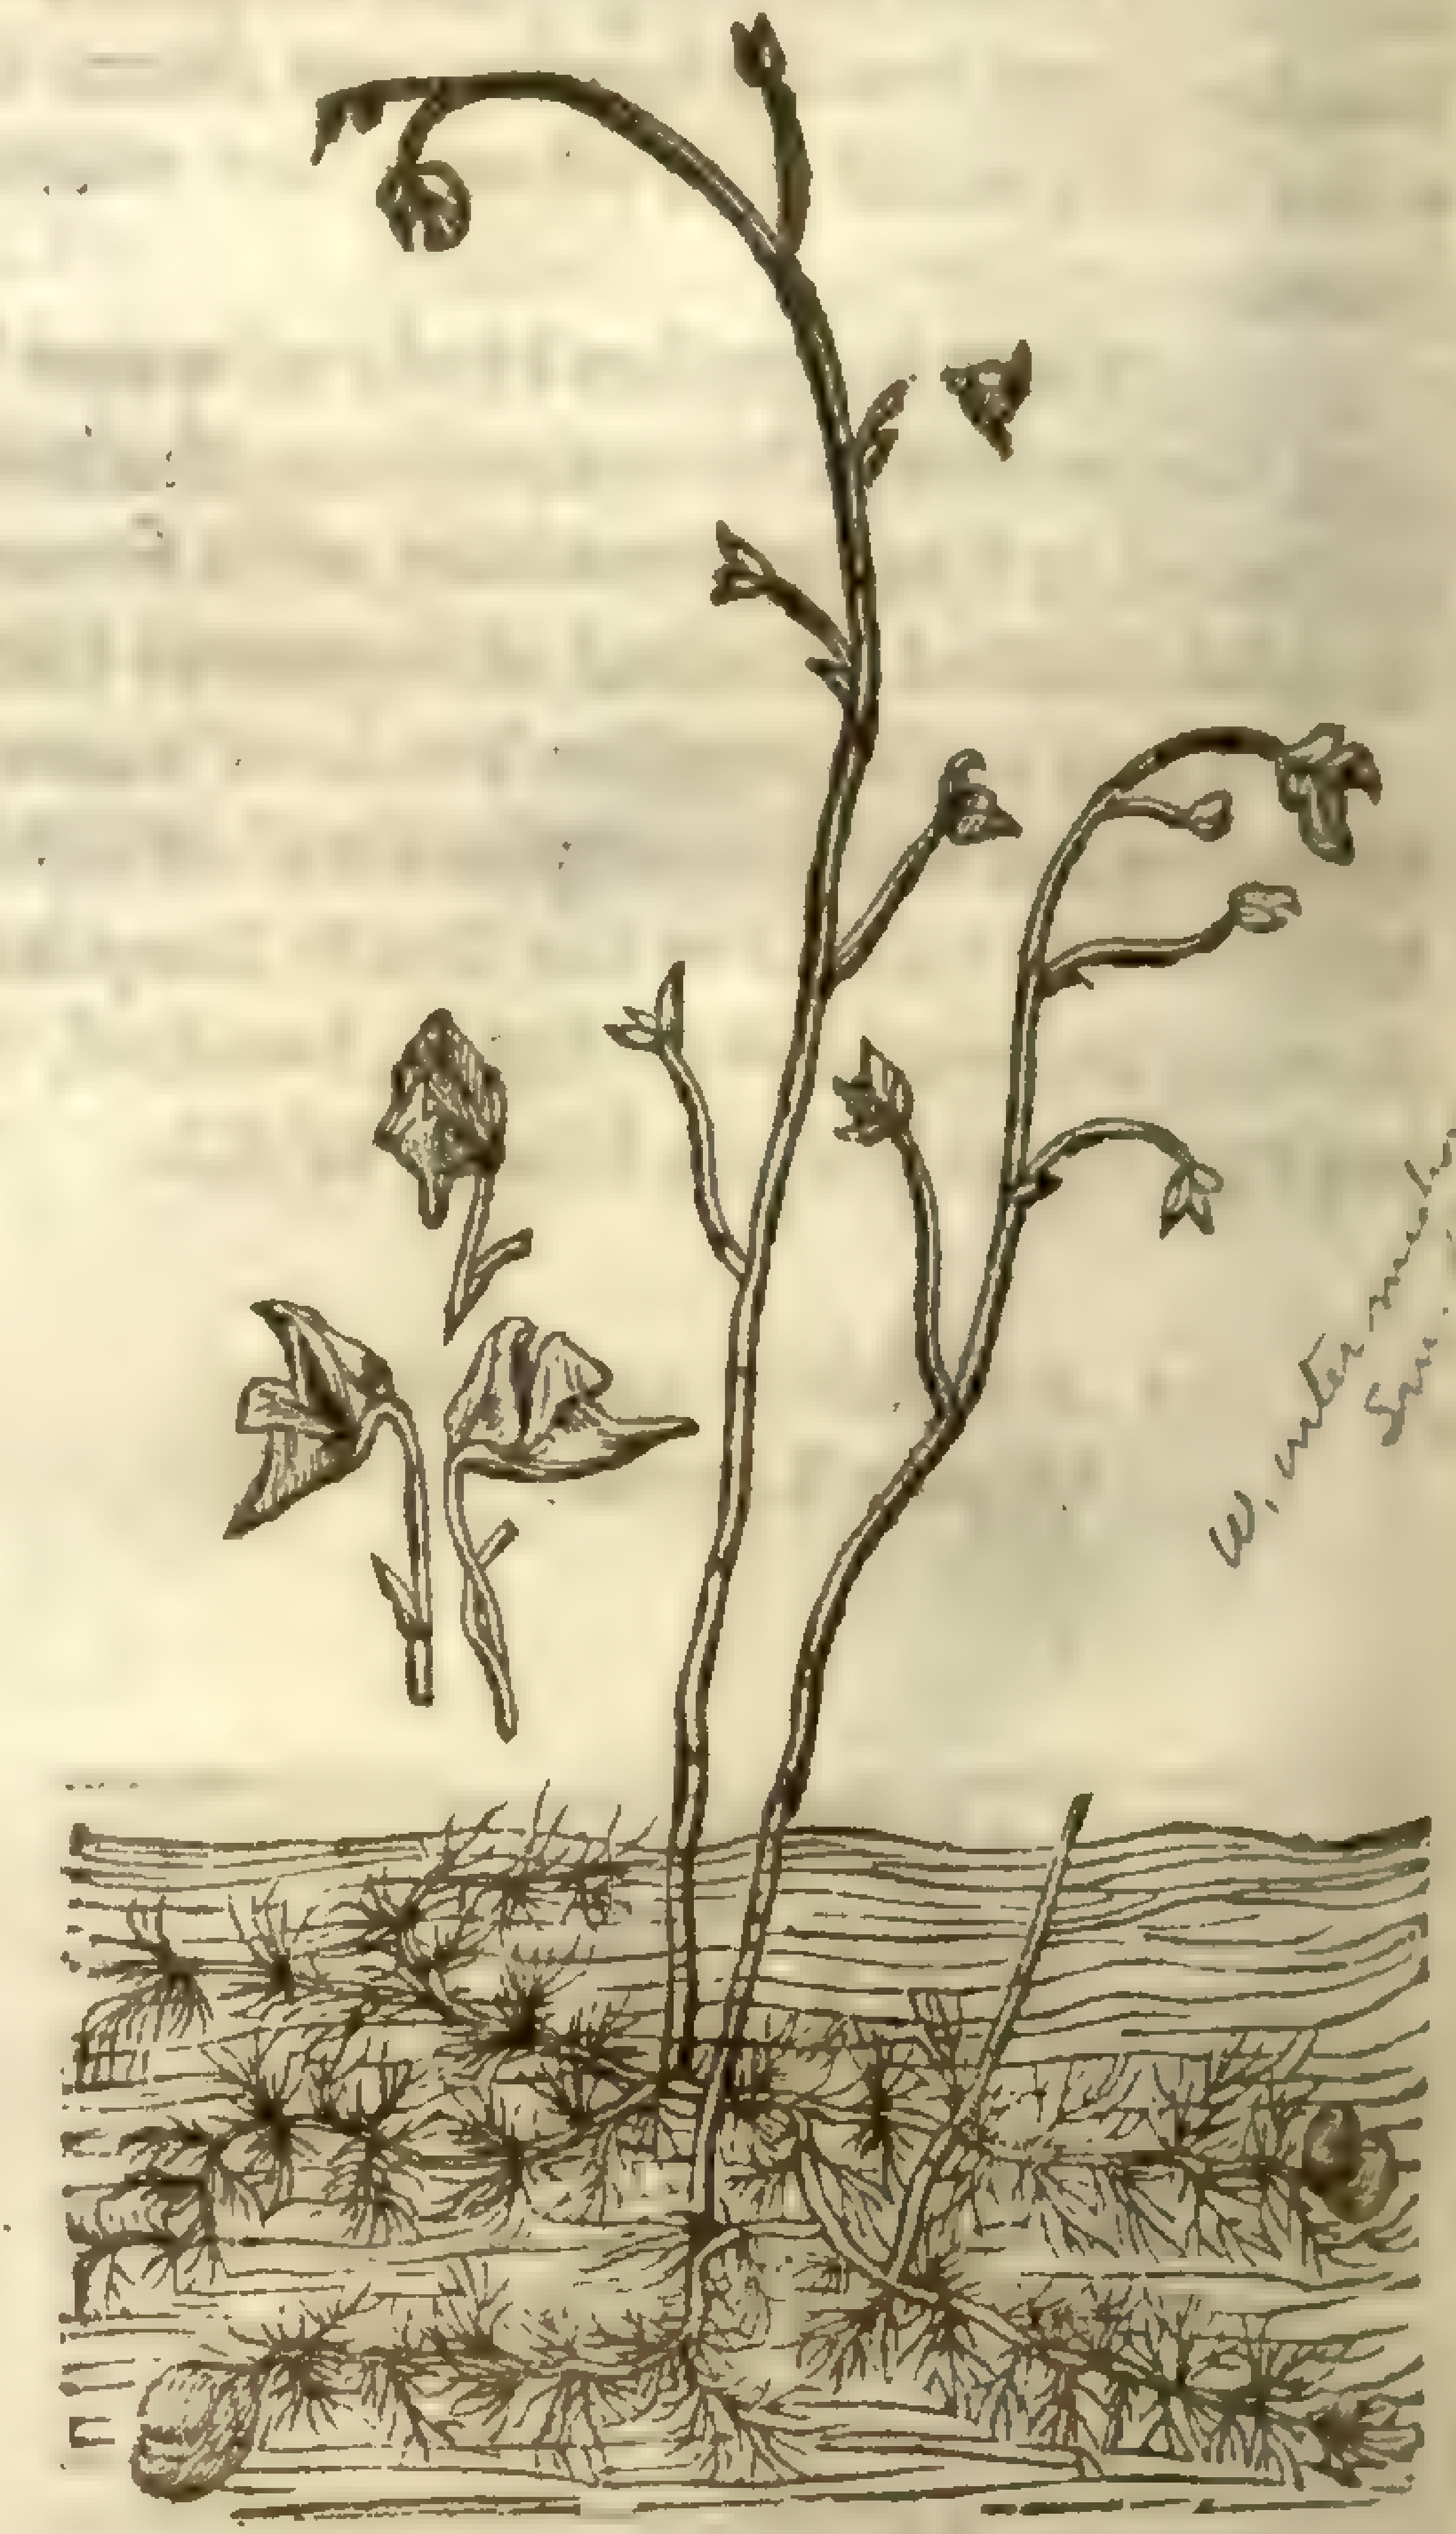
Utricularia vulgaris, [illegible] dict

‡ 4 *Millefolium tenuifolium.*
Fennel-leaued water Milfoile.

Potamogeton pectinatum, Will. dict. Sm. p. 1236



‡ 5 *Millefolium paluſtre galericulatum.*
Hooded water Milfoile.



W. water milfoil Sm. [illegible]

¶ *The Place.*

They be found in lakes and ſtanding waters, or in waters that run ſlowly: I haue not found ſuch plenty of it in any one place as in the water ditches adioyning to S. *George* his field neere London.

¶ *The Time.*

They floure for the moſt part in May and Iune.

¶ *The Names.*

The firſt is called in Dutch, **Water Violerian**, that is to ſay, *Viola aquatilis*: in Engliſh, Water Gilloſloure, or water Violet: in French, *Gyrofflees d'eaue*. *Matthiolus* makes this to be alſo *Myriophylli ſpecies*, or a kinde of Yarrow, although it doth not agree with the deſcription thereof; for neither hath it one ſtalke only, nor one ſingle root, as *Myriophyllon* or Yarrow is deſcribed to haue; for the roots are full of ſtrings, and it bringeth forth many ſtalks.

The ſecond is called in Greeke, Μυριόφυλλον: in Latine, *Millefolium*, and *Myriophyllon*, and alſo *Supercilium Veneris*: in ſhops it is vnknowne. This Yarrow differs from that of the land: the reſt are ſufficiently ſpoken of in their titles.

¶ *The Temperature and Vertues.*

A Water Yarrow, as *Dioſcorides* ſaith, is of a dry facultie, and by reaſon that it takes away hot inflammations and ſwellings, it ſeemeth to be of a cold nature; for *Dioſcorides* affirmeth, That water Yarrow is a remedie againſt inflammation in green wounds, if with vineger it be applied greene or dry: and it is giuen inwardly with vineger and ſalt to thoſe that haue fallen from an high place.

B Water Gilloſloure or water Violet is thought to be cold and dry, yet hath it no vſe in phyſick.

Lemna minor L.

CHAP. 301. *Of Ducks meat.*

Lens paluſtris.
Ducks meat.

¶ *The Deſcription.*

DVcks meat is as it were a certain green moſſe, with very little round leaues of the bignes of Lentils: out of the midſt whereof on the nether ſide grow downe very fine threds like haires, which are to them in ſtead of roots: it hath neither ſtalke, floure, nor fruit.

¶ *The Place.*

It is found in ponds, lakes, city ditches, & other ſtanding waters euery where.

¶ *The Time.*

The time of Ducks meat is known to all.

¶ *The Names.*

Duckes meat is called in Latine, *Lens lacuſtris*, *Lens aquatilis*, and *Lens paluſtris*: of the Apothecaries it is named *Aquæ Lenticula*: in high-Dutch, **Meerlinſen**: in low-Dutch, **Waterlinſen**, & more vſually **Enden gruen**, that is to ſay, *Anatum herba*; Ducks herb, becauſe Ducks do feed thereon; whereupon alſo in Engliſh it is called Ducks meat: ſome term it after the Greek, water Lentils; and of others it is named Graines. The Italians call it *Lent di palude*: in French, *Lentille d'eaue*: in Spaniſh, *Lenteias de agua*.

¶ *The Nature.*

Galen ſheweth that it is cold and moiſt after a ſort in the ſecond degree.

¶ *The Vertues.*

Dioſcorides ſaith that it is a remedie againſt all manner of inflammations, S. *Anthonies* fire, and hot Agues, if they be either applied alone, or elſe vſed with patched barly meale. It alſo knitteth ruptures in yong children. A

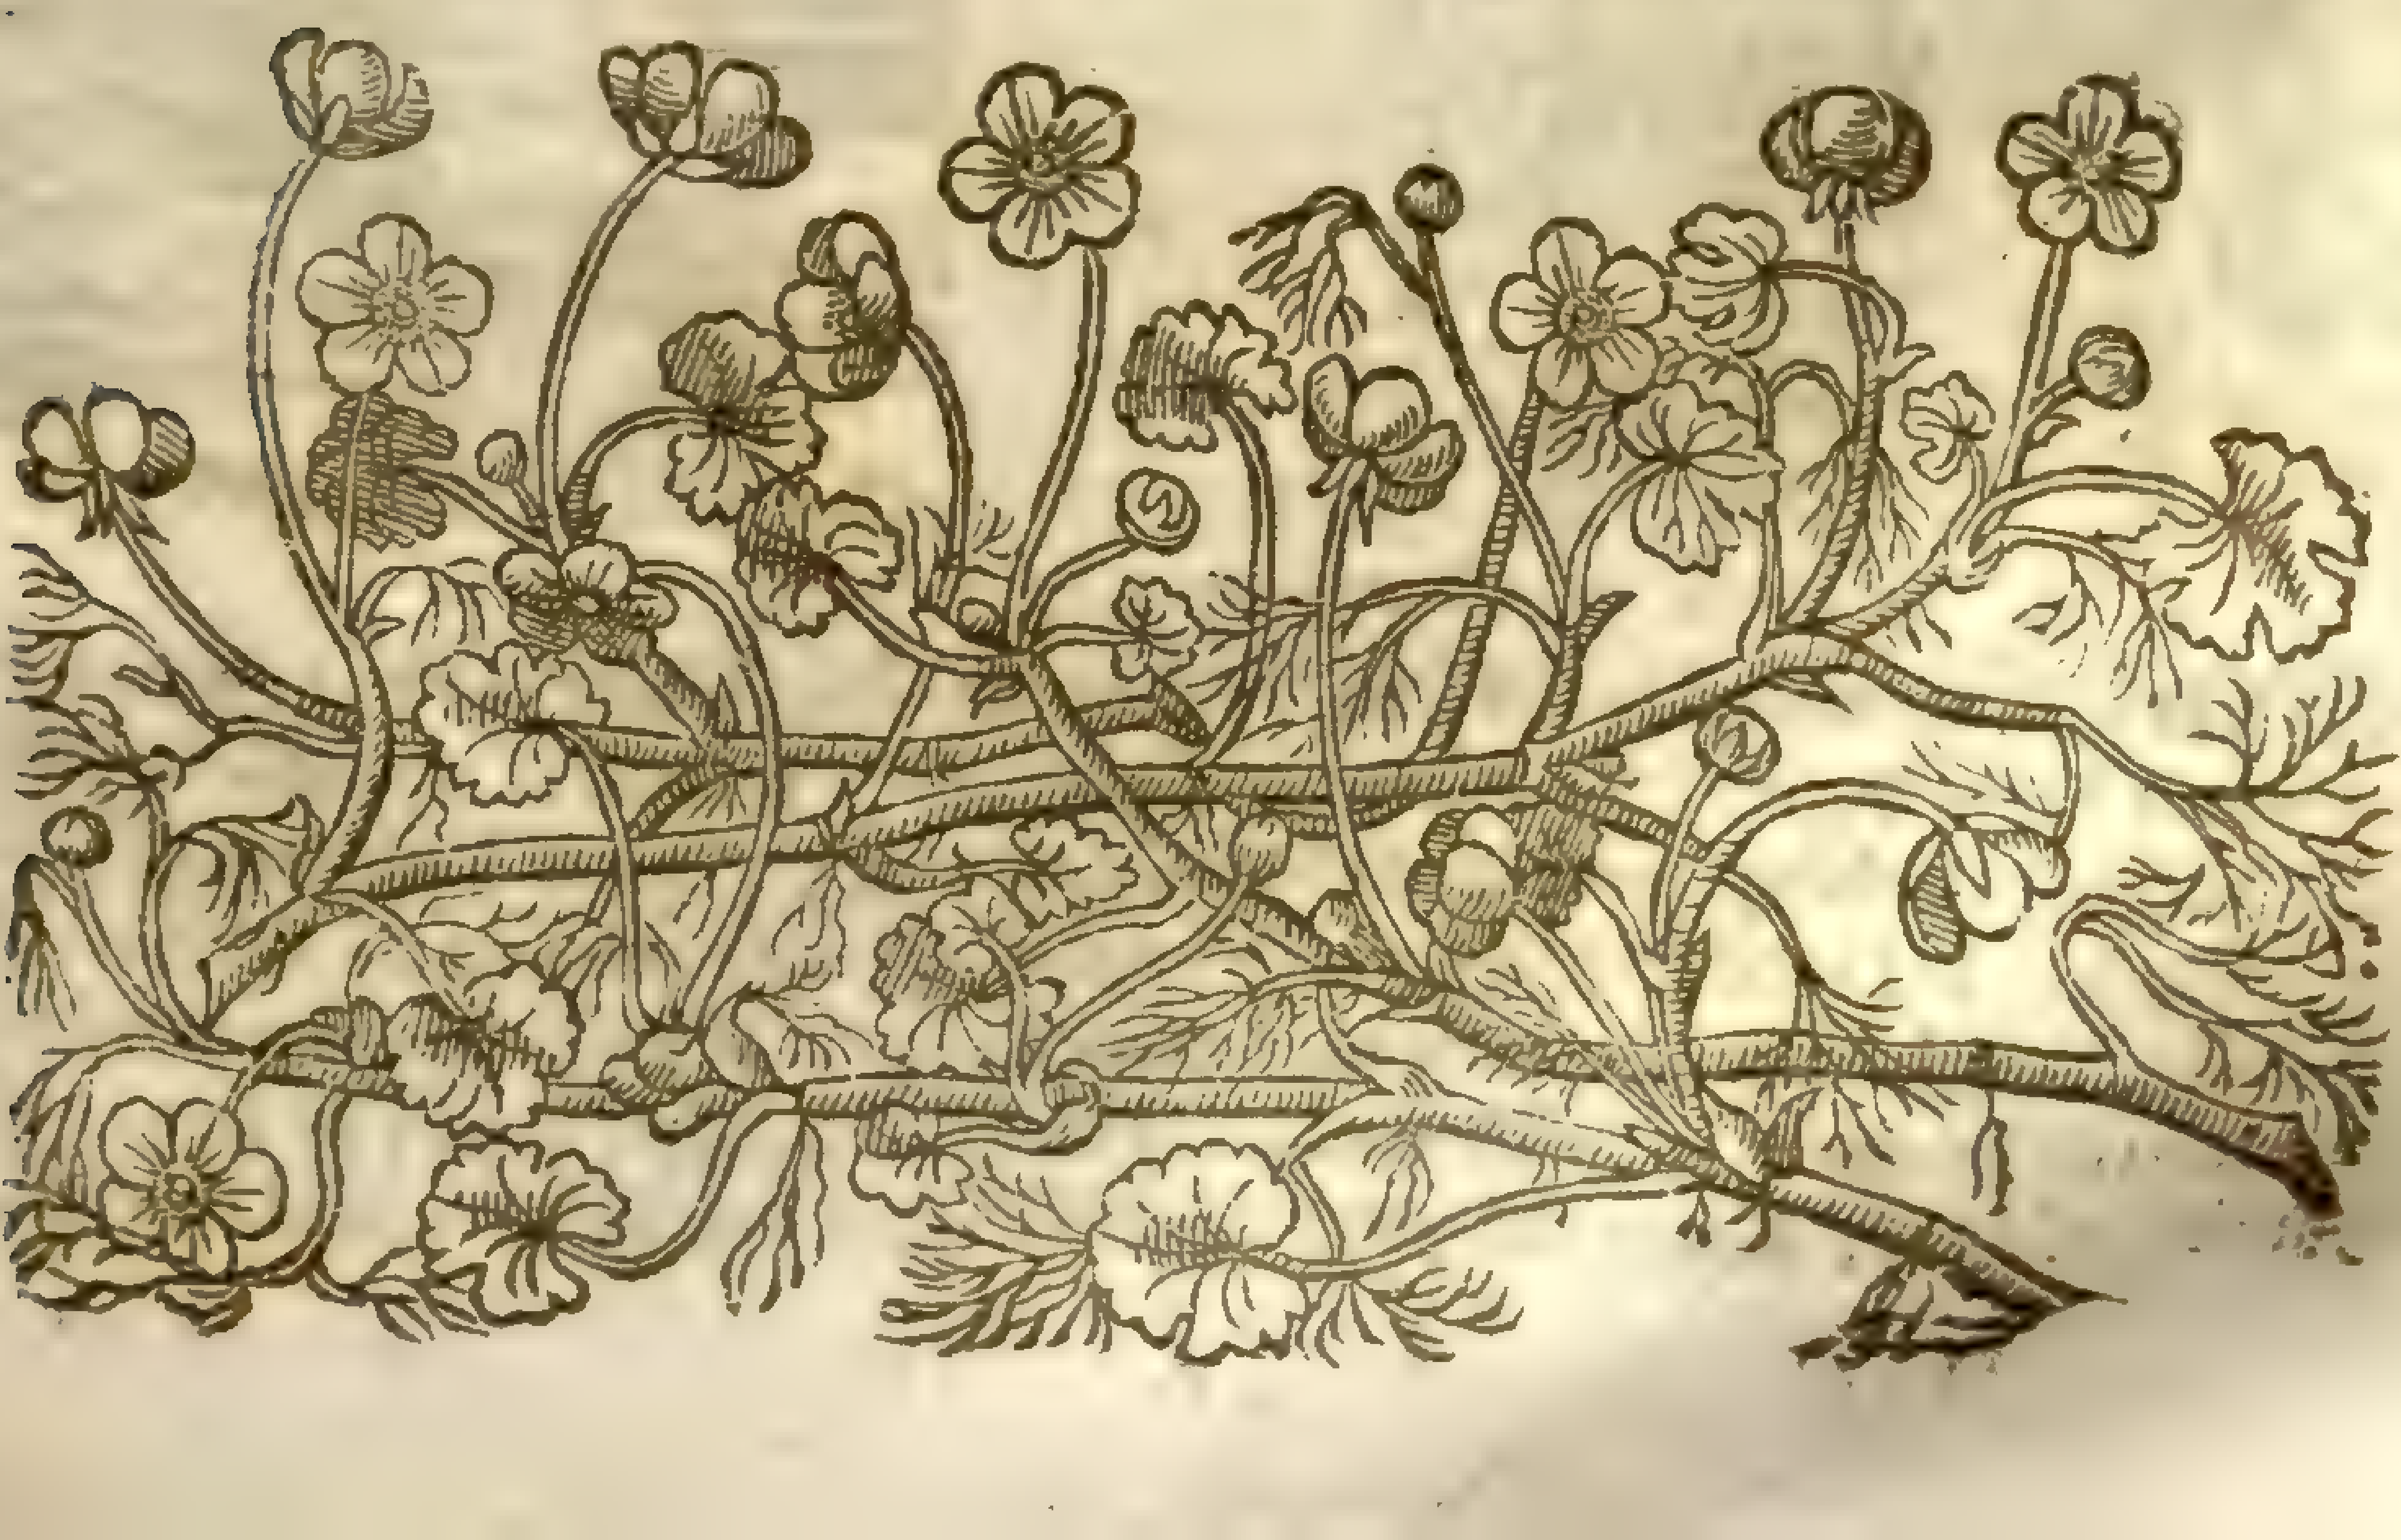
Ducks meat mingled with fine wheaten floure, and applied, preuaileth much againſt hot Swellings, as Phlegmons, Eriſipela's, and paines of the joints. B

The ſame helpeth the fundament fallen downe in yong children. C

CHAP. 302. *Of Water Crow-foot.*

1 *Ranunculus aquatilis.*
Water Crow-foot.

R. aquatilis L. simplex



Ord 557
(Cb. 2 35)

¶ *The Deſcription.*

WAter Crow-foot hath ſlender branches trailing far abroad, whereupon grow leaues vnder the water, moſt finely cut and jagged like thoſe of Cammomill: thoſe aboue the water are ſomwhat round, indented about the edges, in forme not vnlike the ſmal tender leaues of the Mallow, but leſſer: among which doe grow the floures, ſmall, and white of colour, made of fine little leaues, with ſome yellowneſſe in the middle like the floures of the Strawberry, and of a ſweet ſmell: after which there come round rough and prickly knaps like thoſe of the field Crow-foot. The roots be very ſmall hairy ſtrings.

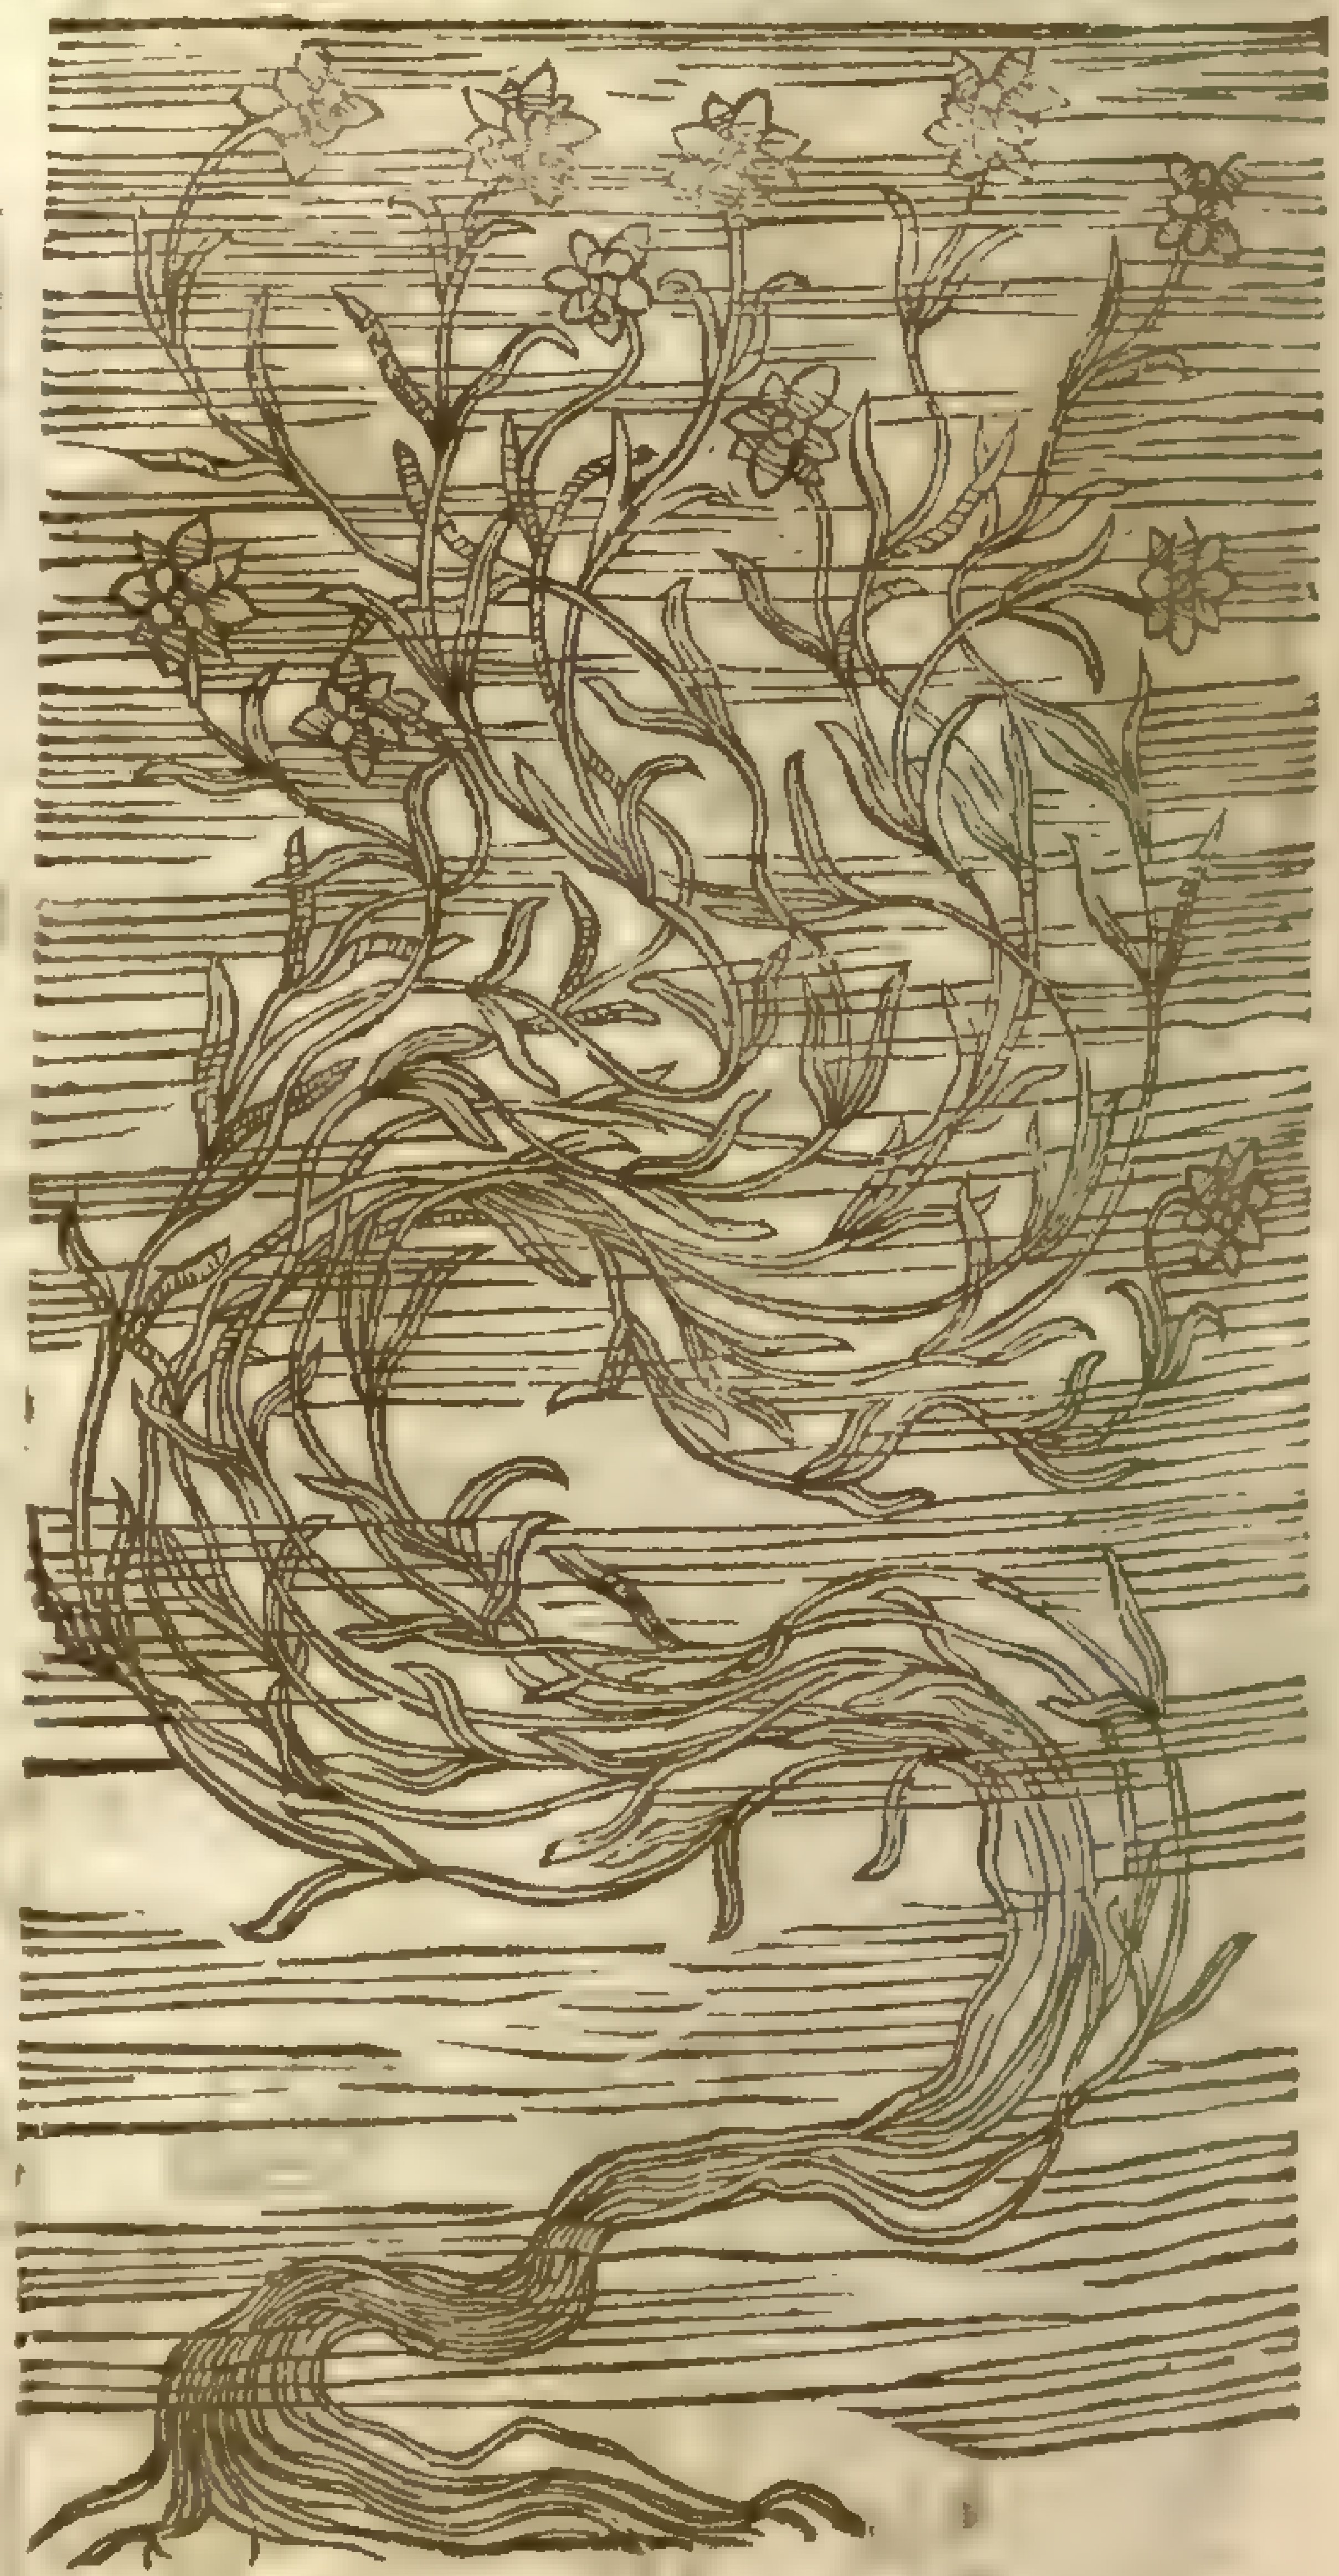
‡ There is ſomtimes to be found a varietie of this, with the leaues leſſe, and diuided into three parts after the maner of an Iuy leafe, and the floures alſo are much leſſer, but white of colour, with a yellow bottom. I queſtion whether this be not the *Ranunculus hederaceus Daleſchampij*, *pag.* 1031. of the *Hiſt. Lugd.* ‡

2 There is another plant growing in the water, of ſmal moment, yet not amiſſe to be remembred, called *Hederula aquatica*, or water Iuy; the which is very rare to finde, neuertheleſſe I found it once in a ditch by Bermondſey houſe neere London, and neuer elſewhere: it hath ſmall threddie ſtrings in ſtead of roots and ſtalks, riſing from the bottome of the water to the top, whereunto are faſtned ſmall leaues ſwimming or floting vpon the water, triangled or three cornered like thoſe of barren Iuy, or rather noble Liuerwort, barren of floures and ſeeds.

2 *Hederula aquatica.*
Water Iuy.

Lemna triſulca, L.
mill. dict.
Sm. Fl. 1.32

‡ 3 *Stellaria aquatica.*
Water Star-wort.



Callitriche verna, [illegible]

3 There is likewiſe another herb of ſmall reckoning that floteth vpon the water, called *Stellaria aquatica* or water Starwort, which hath many ſmall graſſy ſtems like threds comming from the bottom of the water, vnto the vpper face of the ſame; whereupon grow ſmal double flours of a greeniſh or herby colour. ‡ I take this *Stellaria* to be nothing elſe but a water Chickeweed, growing almoſt in euery ditch, with long narrow leaues at each joint, and halfe a dozen or more lying cloſe together at the top of the water, in faſhion of a ſtar: in which ſhape it may be ſeen in the end of Aprill and beginning of May. I haue not yet obſerued either the floure or ſeed thereof. ‡

¶ *The Place.*

Water Crowfoot growes by ditches and ſhallow ſprings, and in other moiſt and plaſhy places.

¶ *The Time.*

It floureth in Aprill and May, and ſomtimes in Iune.

¶ *The Names.*

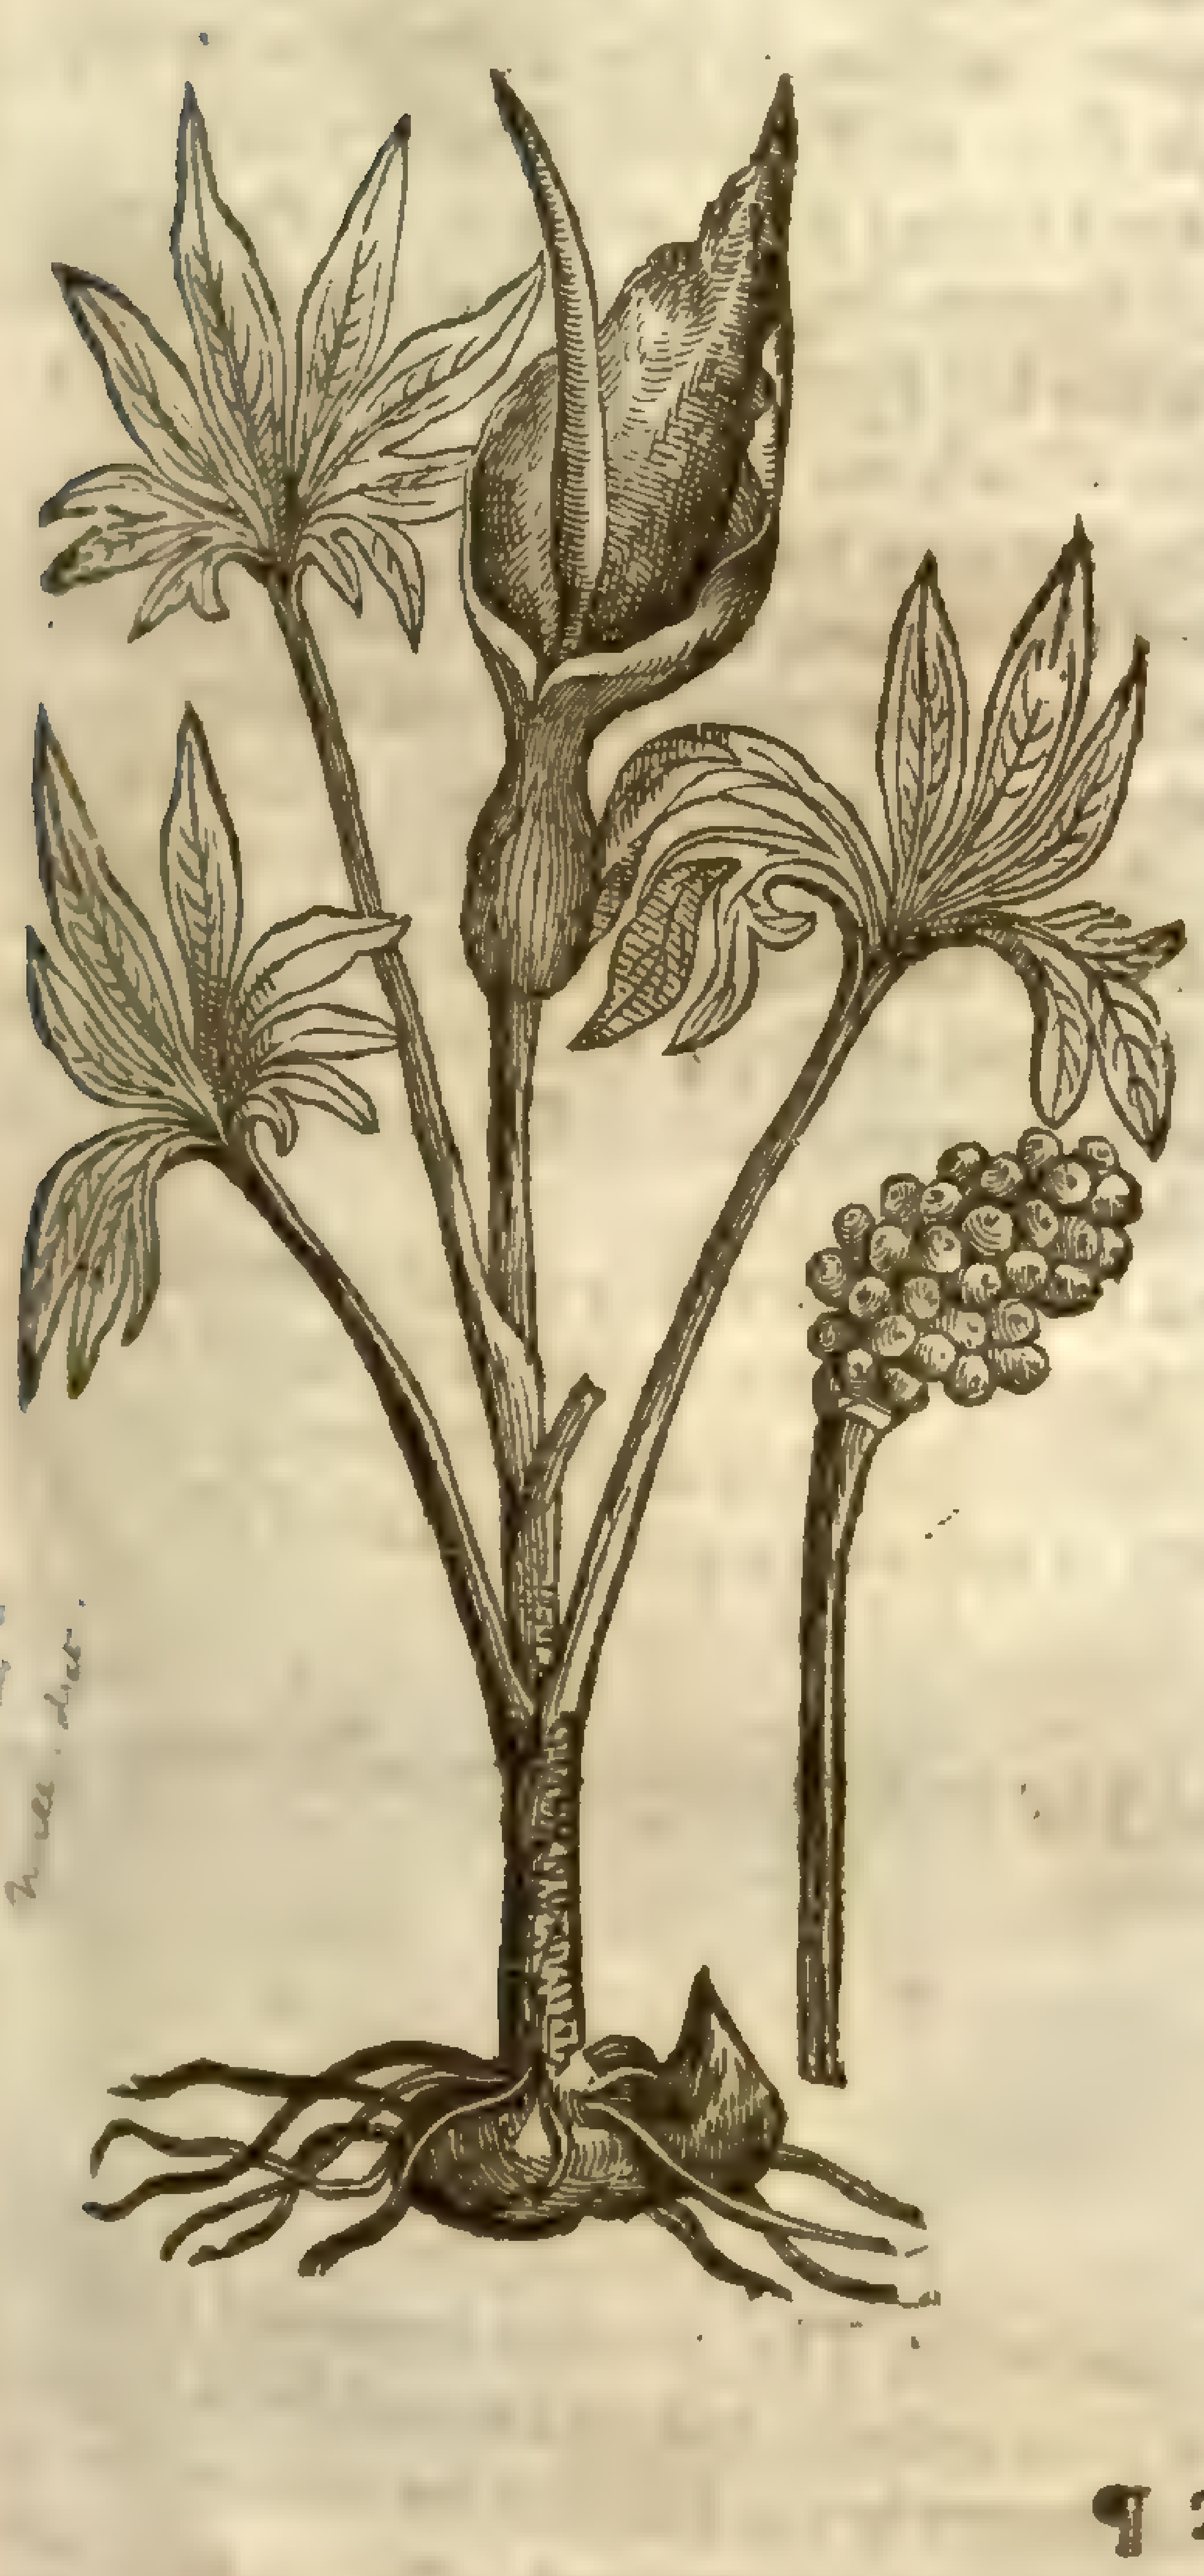
Water Crow-foot is called in Latine *Ranunculus aquatilis*, and *Polyanthemum aquatile*: in Engliſh, water Crow-foot, and white water Crow-foot. Moſt Apothecaries and Herbariſts doe erroniouſly name it *Hepatica aquatica*, and *Hepatica alba*; and with greater error they mix it in medicines in ſtead of *Hepatica alba* or graſſe of Parnaſſus. ‡ I know none that commit this great error here mentioned, neither haue I knowne either the one or the other euer vſed or appointed in medicine with vs in England; though *Dodonæus* (from whom our Author had this and moſt elſe) blame his country-men for this miſtake and error.

¶ *The Temperature and Vertues.*

Water Crow-foot is hot, and like to common Crow-foot.

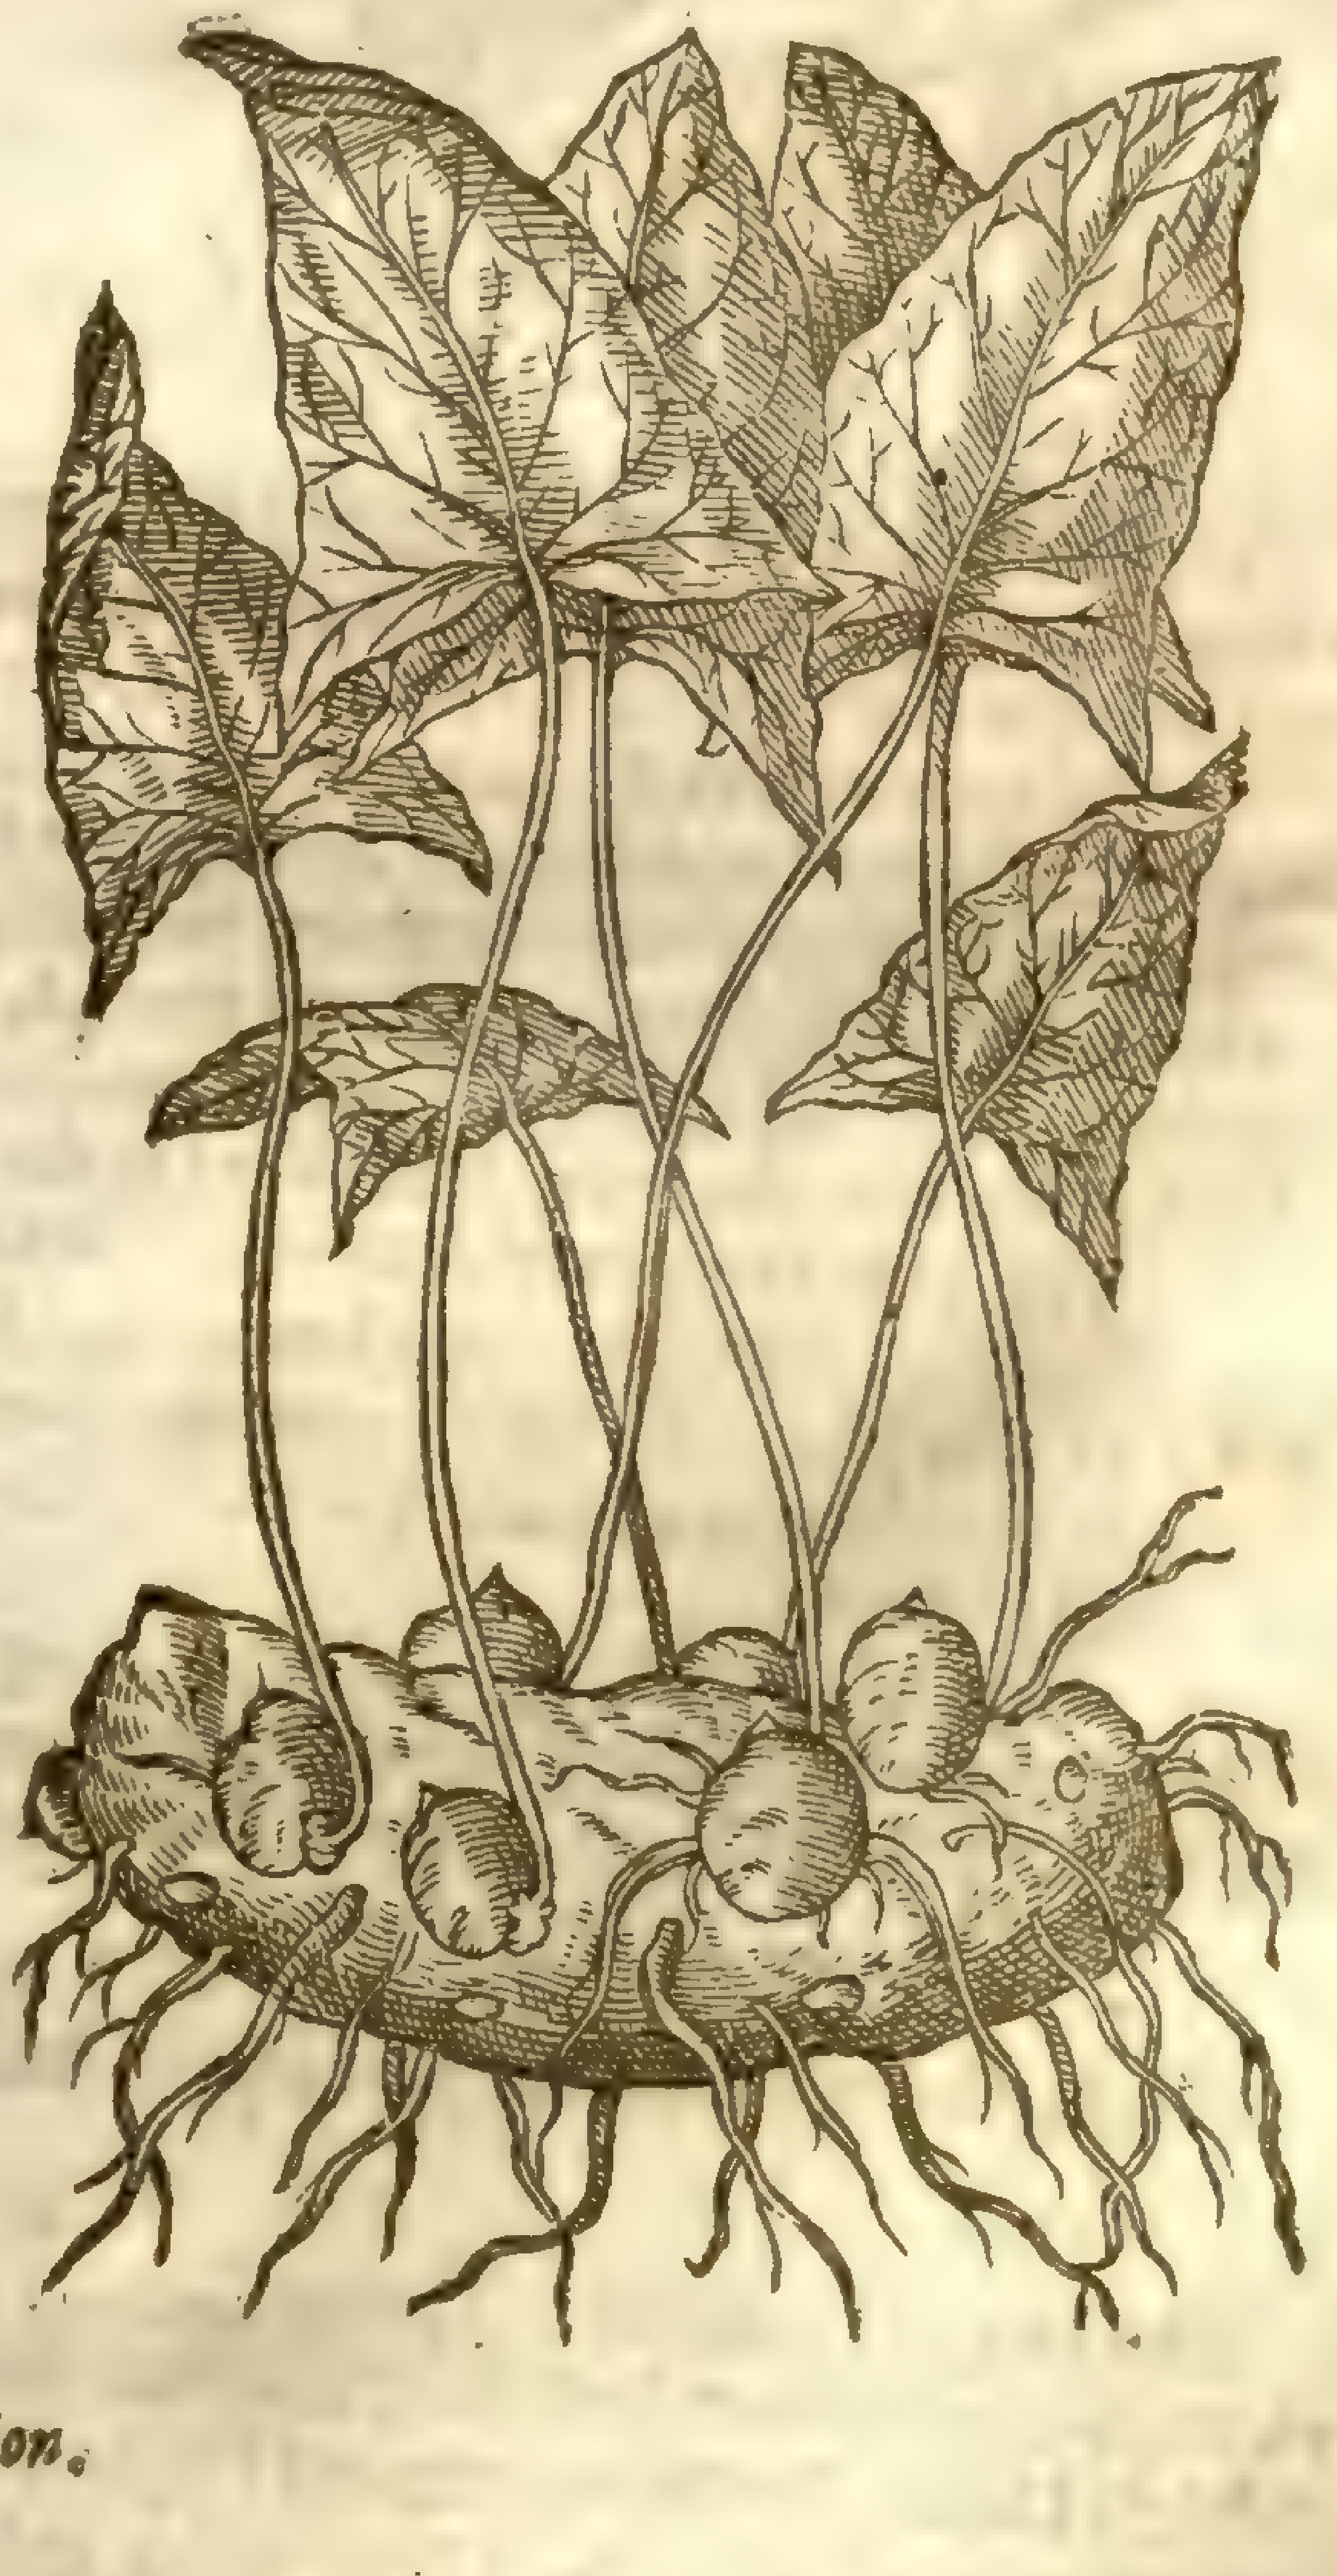
CHAP. 303. *Of Dragon.*

1 *Dracontium majus.*
Great Dragons.



[illegible] Dracunculus L.
Mill. Dict.

† 2 *Dracontium minus.*
Small Dragons.



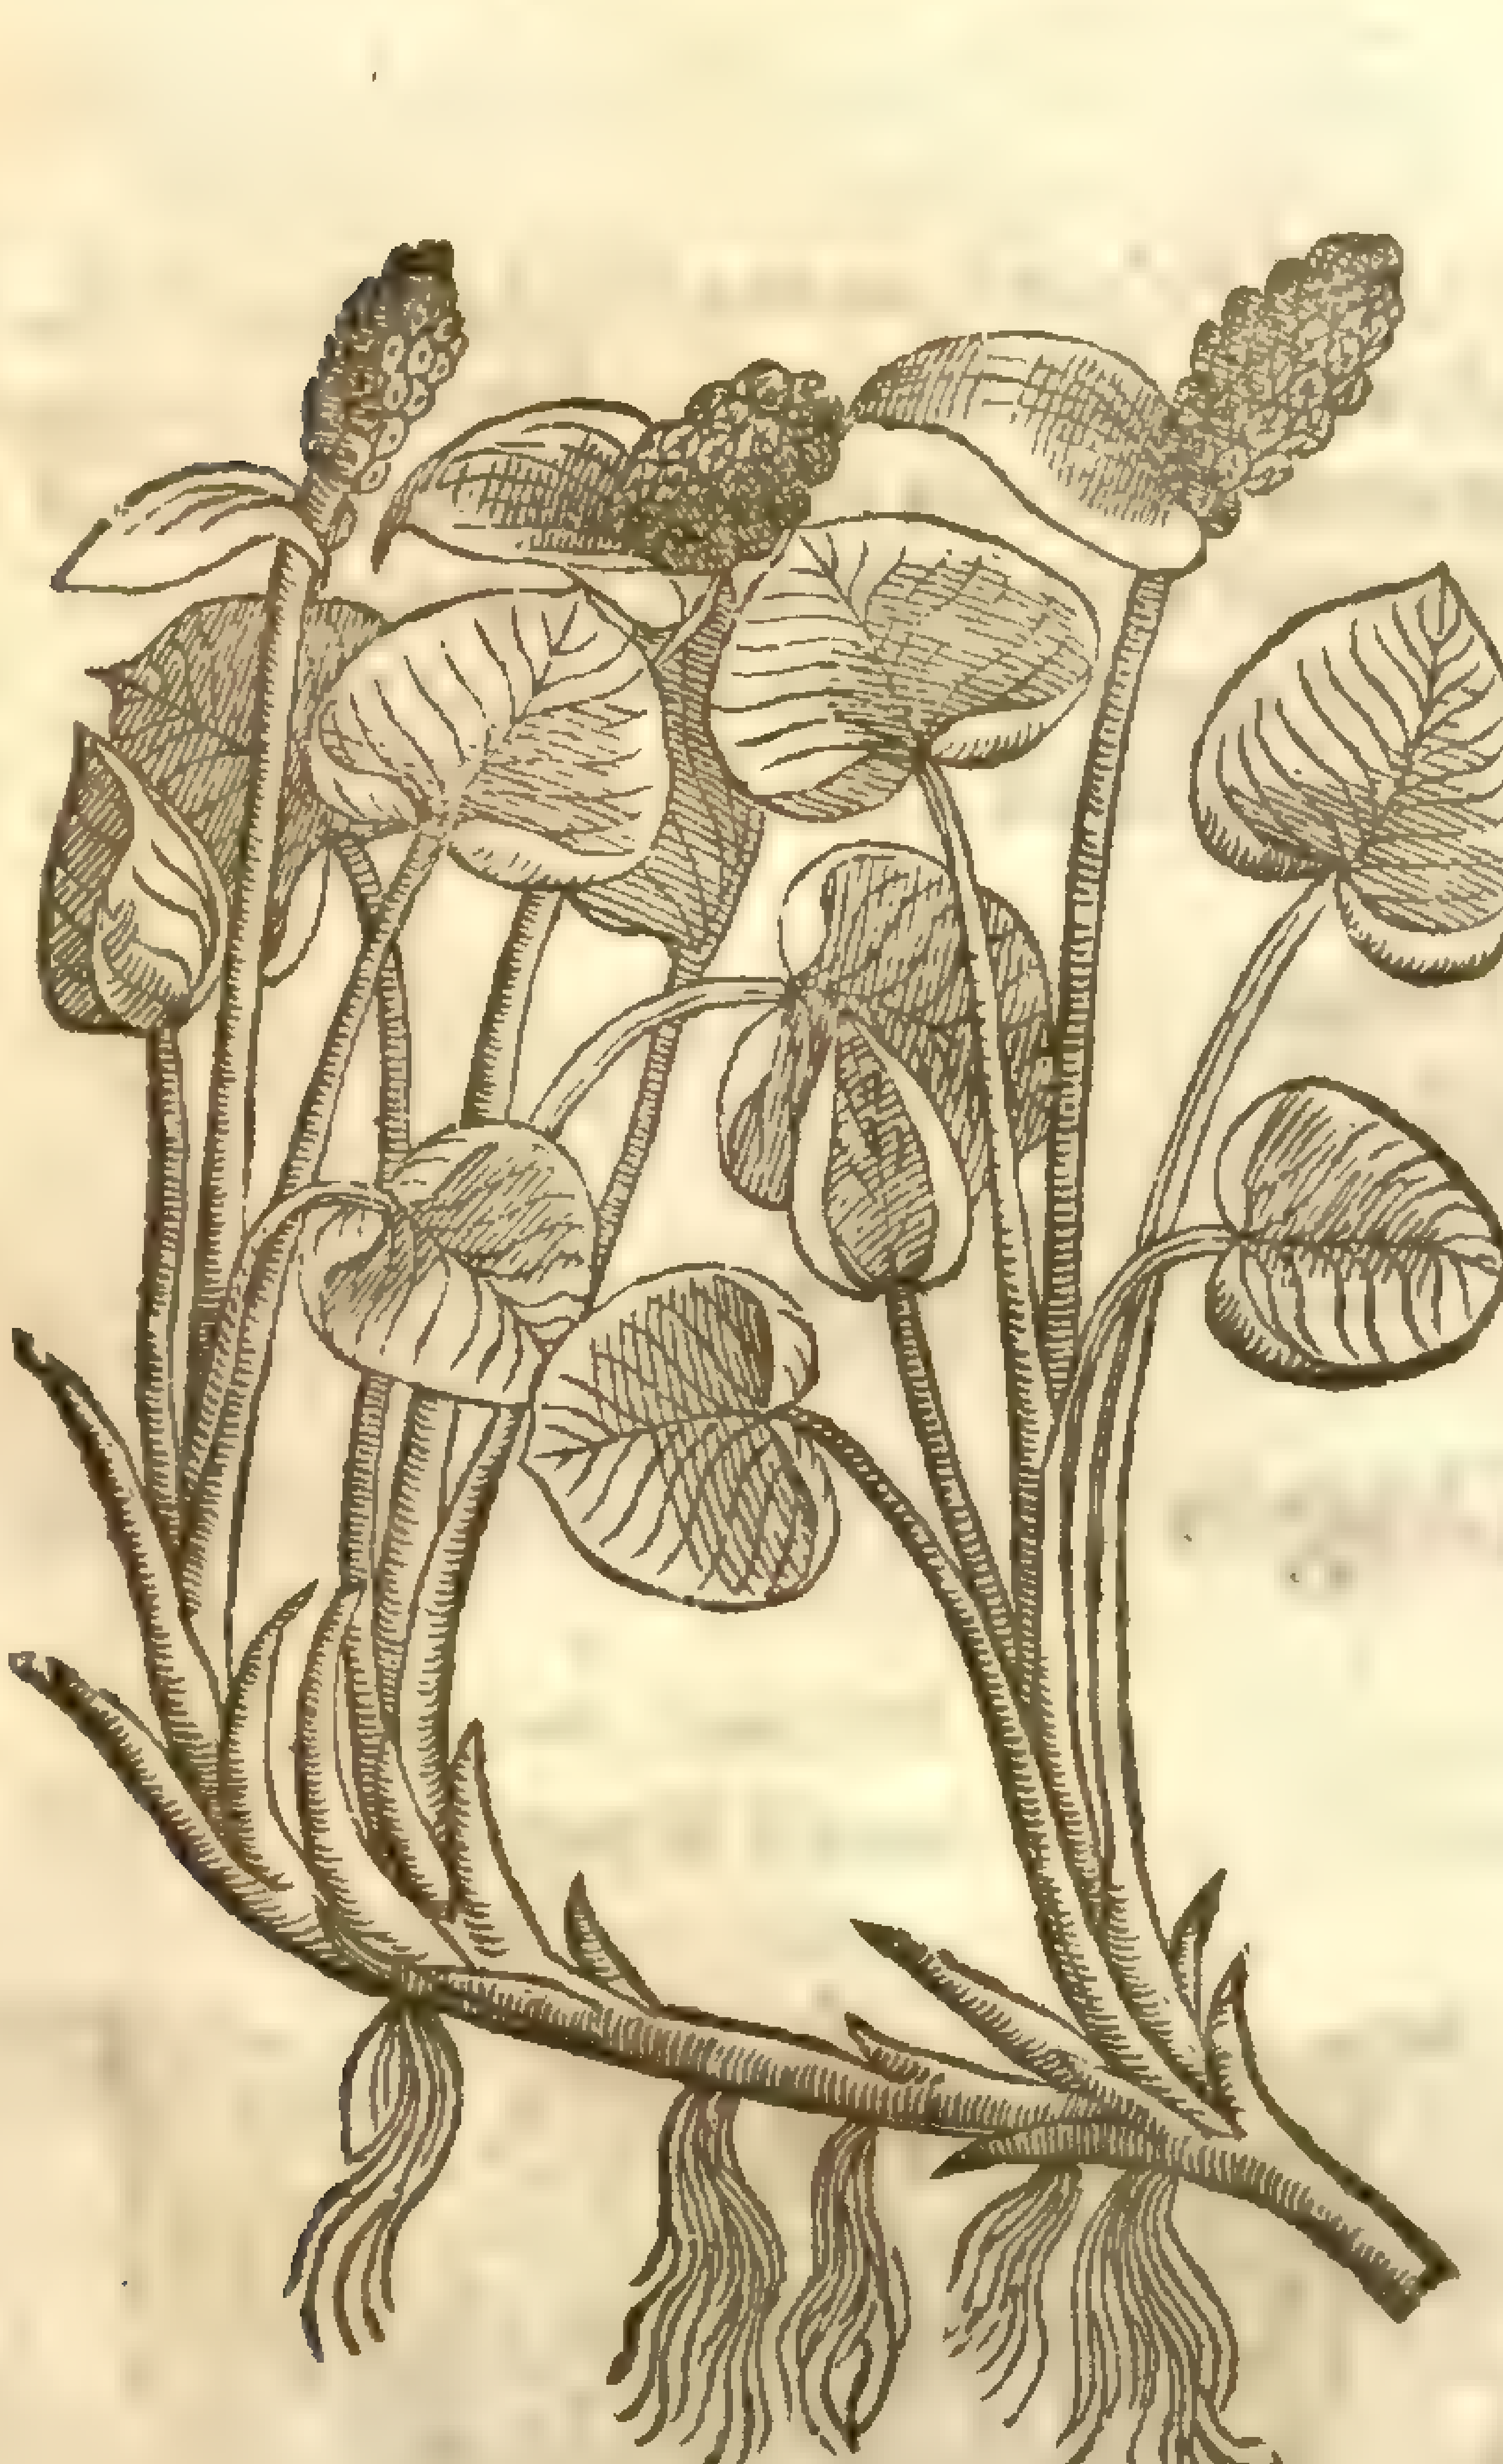
¶ *The Deſcription.*

1 THe great Dragon riſeth vp with a ſtraight ſtalke a cubit and a halfe high or higher, thicke, round, ſmooth, ſprinkled with ſpots of diuers colours, like thoſe of the adder or ſnake: the leaues are great and wide, conſiſting of ſeuen or more ioyned together in order, euery one of which is long and narrow, much like to the leaues of Dock, ſmooth and ſlipperie: out of the top of the ſtalke groweth a long hoſe or husk greater than that of the Cuckow pint, of a greeniſh colour without, and crimſon within, with his peſtell which is blackiſh, long, thick, and pointed like a horne; the skinne or ſilme whereof, when the ſeed waxeth big, beeing ſtretched or

broken

3 *Dracunculus aquaticus.*
Water Dragons.

Calla palustris, L. [illegible]



broken aſunder, there appeareth the fruit, like to a bunch or cluſter of grapes; the berries whereof at the firſt are green, afterwards red and ful of juice; in which is contained ſeed that is ſomewhat hard: the root continueth freſh, thicke like to a knob, white, couered with a thinne pilling, oftentimes of the bigneſſe of a meane apple, full of white little threds appendant thereunto.

2 The leſſer Dragon is like Aron or Wake-Robin in leaues, hoſe or huske, peſtle and berries, yet are not the leaues ſprinkled with blacke, but with whitiſh ſpots, which periſh not ſo ſoone as thoſe of Wake-Robin, but endure together with the berries euen vntill winter: theſe berries alſo be not of a deepe red, but of a colour inclining to ſaffron. The root is not vnlike to the Cuckow-pintle, hauing the forme of a bulb, full of ſtrings, with diuers rude ſhapes of new plants, whereby it greatly increaſeth.

‡ The figure which our Author here gaue by the title of *Dracuntium minus*, was no other than of Aron which is deſcribed in the firſt place of the next Chapter: neither is the deſcription of any other plant than of that ſort thereof which hath leaues ſpotted either with white or blacke ſpots, though our Author ſay only with white. I haue giuen you *Cluſius* his figure of *Arum Byzantinum*, in ſtead of that which our Author gaue. ‡

3 The root of Water Dragon is not round like a bulbe, but very long, creeping, jointed, and of mean bigneſſe; out of the joints whereof ariſe the ſtalks of the leaues, which are round, ſmooth, and ſpongie within, certain white and ſlender ſtrings growing downwards. The fruit ſprings forth at the top vpon a ſhort ſtalke, together with one of the leaues, being at the beginning couered with little white threds, which are in ſtead of the floures: after that it groweth into a bunch or cluſter, at the firſt greene, and when it is ripe red, leſſer than that of Cuckow-pint, but not leſſe biting: The leaues are broad, greeniſh, glib, and ſmooth, in faſhion like thoſe of Ivy, yet leſſer than thoſe of Cuckow-pint; and that thing whereunto the cluſtered fruit growes, is alſo leſſer, and in that part which is towards the fruit (that is to ſay the vpper part) is white.

4 The great Dragon of *Matthiolus* his deſcription is a ſtranger not onely in England, but elſewhere for any thing that we can learne: my ſelfe haue diligently enquired of moſt ſtrangers skilful in plants, that haue reſorted vnto me for conference ſake, but no man can giue mee any certaintie thereof; and therefore I hold it vnfit to giue you his figure or any deſcription, for that I take it for a feigned picture.

¶ *The Place.*

The greater and leſſer Dragons are planted in gardens. The water Dragons grow in watery and mariſh places, for the moſt part in fenny and ſtanding waters.

¶ *The Time.*

The berries of theſe plants are ripe in Autumne.

¶ *The Names.*

The Dragon is called in Greeke Δρακόντιον: in Latine, *Dracunculus*. The greater is named *Serpentaria major*: of ſome, *Biſaria*, and *Colubrina*: *Cordus* calleth it *Dracunculus Polyphyllos*, and *Luph Criſpum*: in high Dutch, **Schlangenkraut**: in low-Dutch, **Speerwortele**: in French, *Serpentaire*: in Italian, *Dracontea*: in Spaniſh, *Taragontia*: in Engliſh, Dragons, and Dragonwort. *Apuleius* calls Dragon *Dracontea*; and ſetteth downe many ſtrange names thereof, which whether they agree with the greater or the leſſer, or both of them, he doth not expound; as *Pythion*, *Anchomanes*, *Sauchromaton*, *Therion*, *Schœnos*, *Dorcadion*, *Typhonion*, *Theriophonon*, and *Eminion*. *Athenæus* ſheweth, That Dragon is called *Aronia*, becauſe it is like to Aron.

¶ *The Temperature.*

Dragon, as *Galen* ſaith, hath a certaine likeneſſe with Aron or Wake-Robin, both in leaues and alſo in root, yet more biting and more bitter than it, and therefore hotter, and of thinner parts: it is alſo ſomething binding, which by reaſon that it is adjoyned with the two former qualities, that is to ſay, biting and bitter, it is made in like manner a ſingular medicine of very great efficacy.

¶ *The Vertues.*

The root of Dragons doth clenſe and ſcoure all the entrailes, making thinne, eſpecially thicke and tough humours; and it is a ſingular remedy for vlcers that are hard to be cured, named in Greeke, χειρώνια. A

It ſcoureth and cleanſeth mightily, aſwell ſuch things as haue need of ſcouring, as alſo white and blacke morphew, being tempered with vinegre. B

The leaues alſo by reaſon that they are of like quality are good for vlcers and greene wounds: and the leſſe dry they are, the fitter they be to heale; for the dryer ones are of a more ſharpe or biting quality than is conuenient for wounds. C

The fruit is of greater operation than either the leaues or the root: and therefore it is thought to be of force to conſume and take away cankers and proud fleſh growing in the noſthrils, called in Greeke, *Polypus*: alſo the juyce doth cleanſe away webs and ſpots in the eies. D

Furthermore, *Dioſcorides* writeth, that it is reported that they who haue rubbed the leaues or root vpon their hands, are not bitten of the viper. E

Pliny ſaith, that ſerpents will not come neere vnto him that beareth dragons about him, and theſe things are read concerning both the Dragons, in the two chapters of *Dioſcorides*. F

Galen alſo hath made mention of Dragon in his booke of the faculties of nouriſhments; where he ſaith, that the root of Dragon being twice or thrice ſod, to the end it may loſe all his acrimony or ſharpeneſſe, is ſomtimes giuen as Aron, or wake-Robin is, when it is needfull to expell the more forceable thicke and clammie humors that are troubleſome to the cheſt and lungs. G

And *Dioſcorides* writeth, that the root of the leſſer Dragon being both ſodde and roſt with hony, or taken of it ſelfe in meate, cauſeth the humors which ſticke faſt in the cheſt to be eaſily voided. H

The juyce of the Garden Dragons, as ſaith *Dioſcorides*, being dropped into the eies, doth clenſe them, and greatly amend the dimneſſe of the ſight. I

The diſtilled water hath vertue againſt the peſtilence or any peſtilentiall feuer or poyſon, being drunke bloud warme with the beſt treacle or mithridate. K

The ſmell of the floures is hurtfull to women newly conceiued with child. L

CHAP. 304. *Of Cuckow pint, or wake-Robin.*

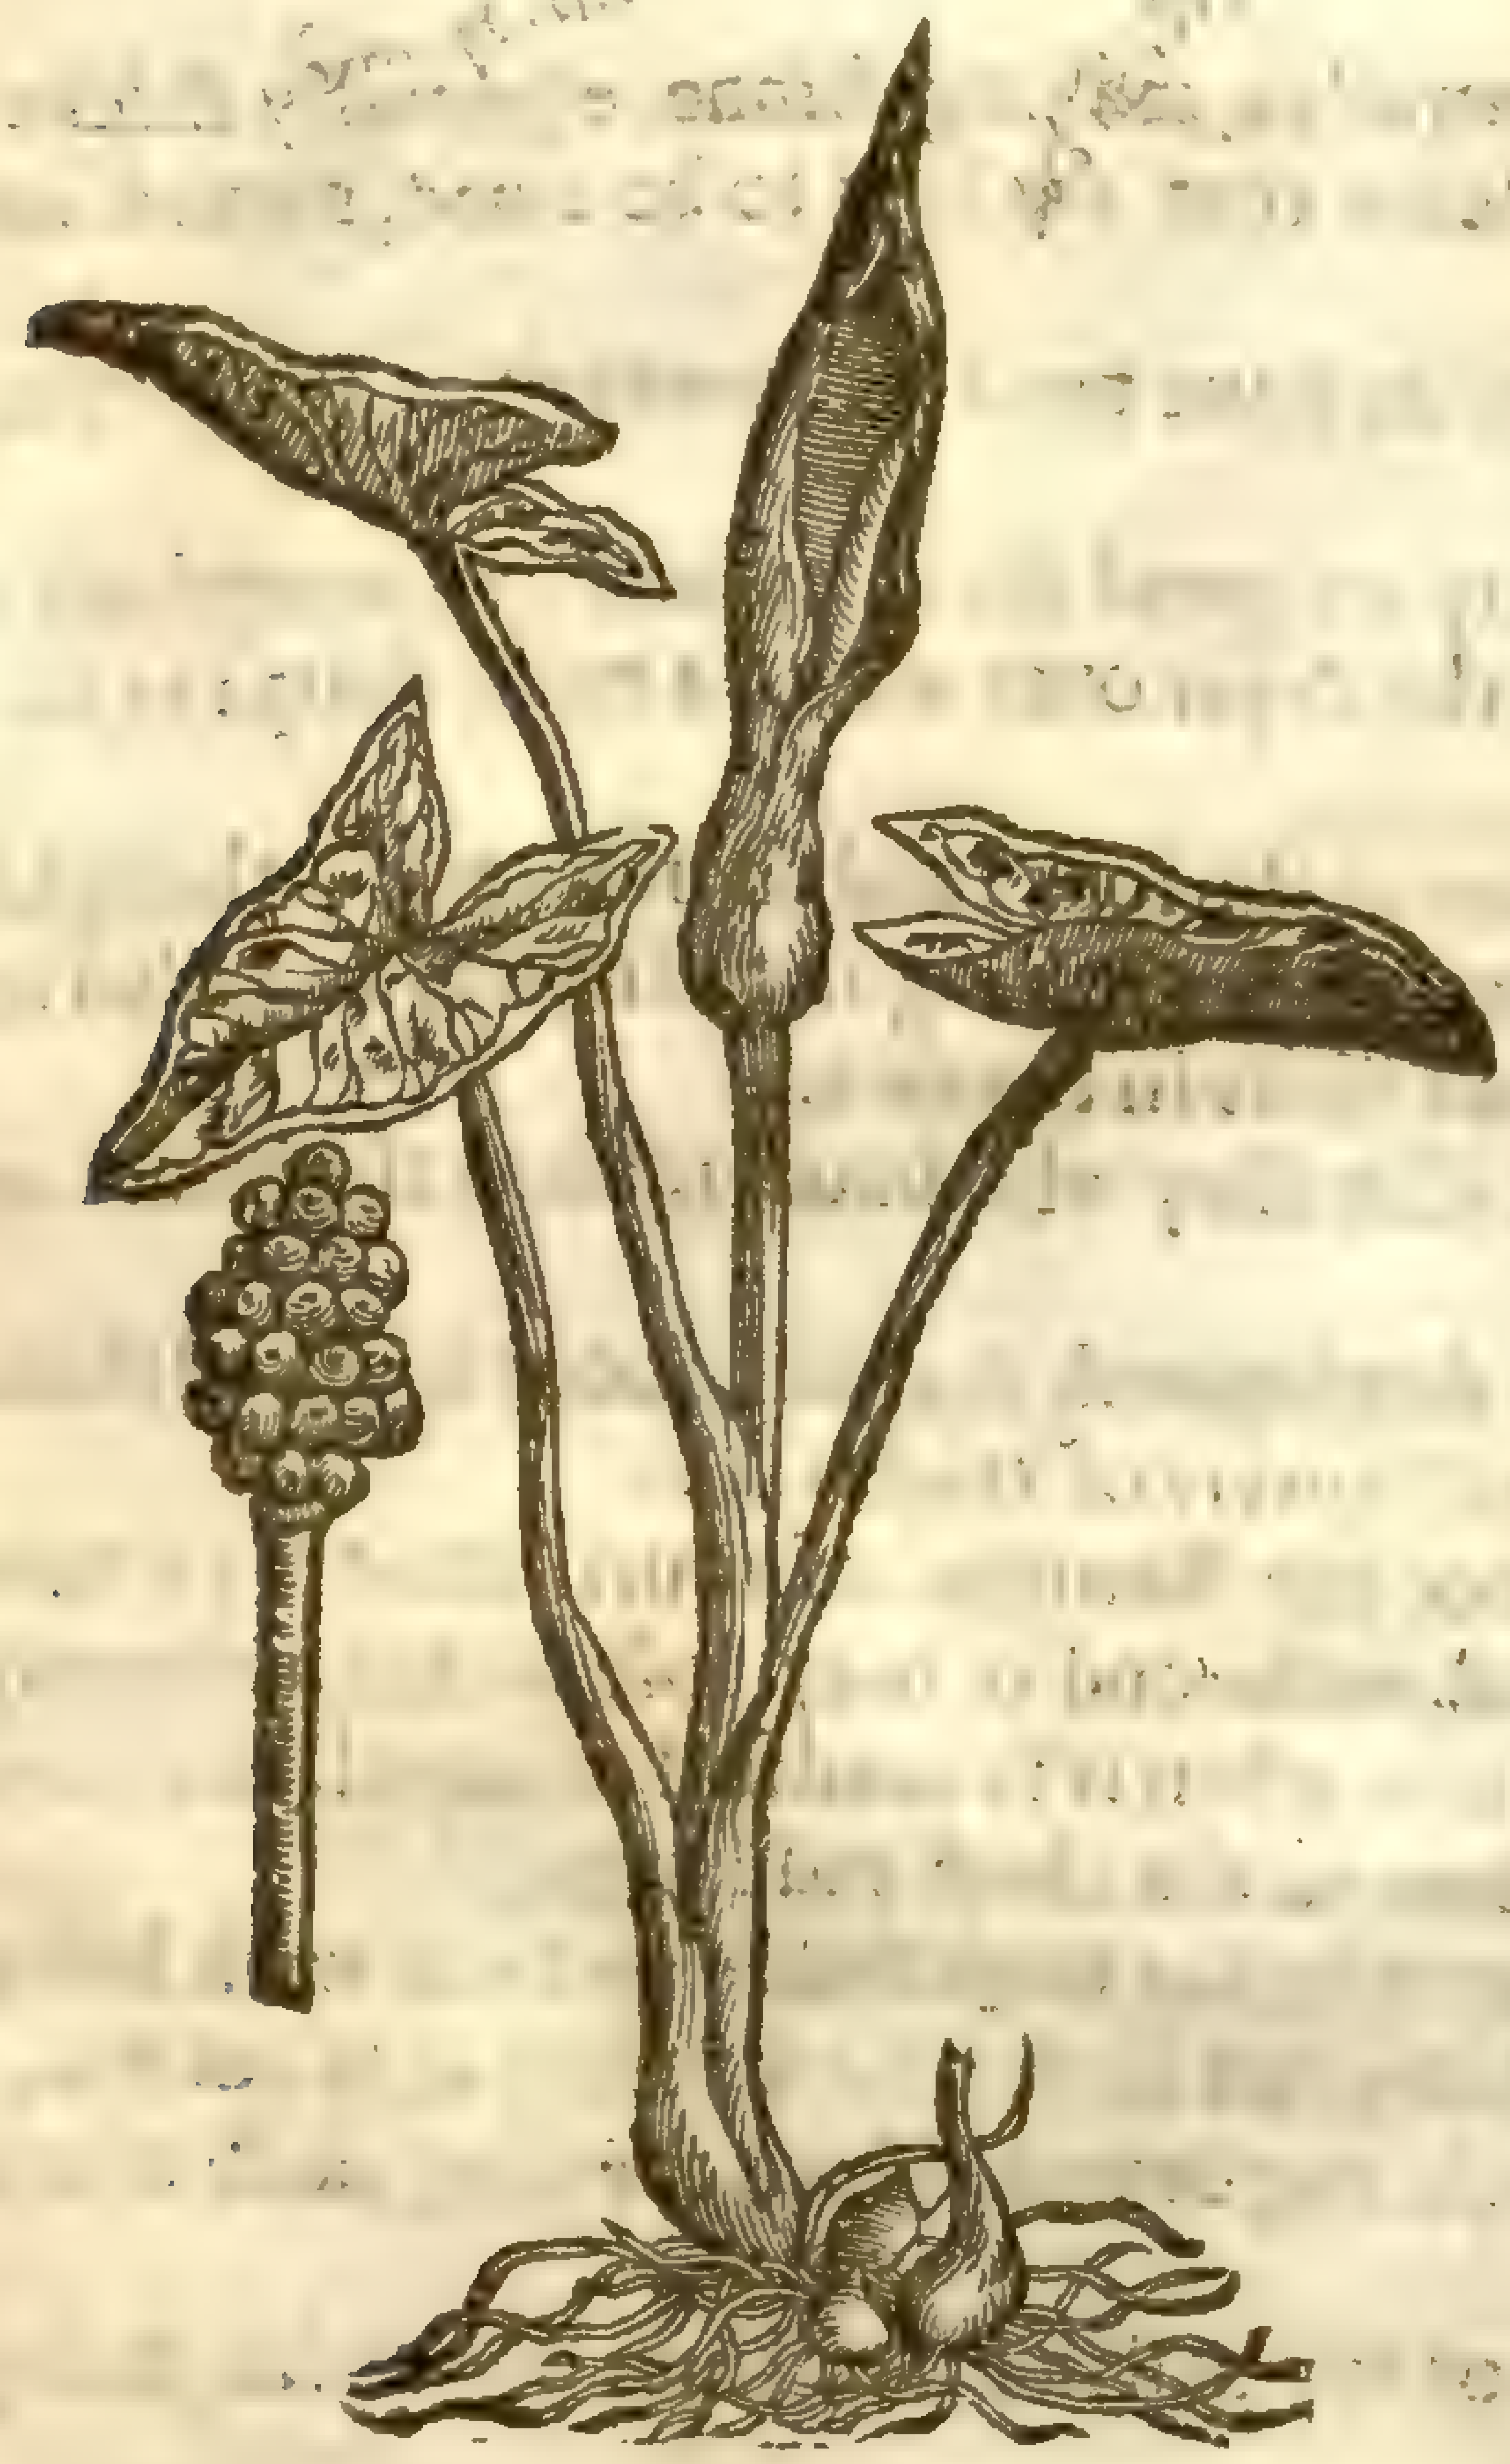
¶ *The Deſcription.*

1 ARum or Cockow pint hath great, large, ſmooth, ſhining, ſharpe pointed leaues, beſpotted here and there with blackiſh ſpots, mixed with ſome blewneſſe: among which riſeth vp a ſtalke nine inches long, beſpeckled in many places with certaine purple ſpots. It beareth alſo a certaine long hoſe or hood, in proportion like the eare of an hare: in the middle of which hood commeth forth a peſtle or clapper of a darke murry or pale purple colour: which being paſt, there ſucceedeth in place thereof a bunch or cluſter of berries in manner of a bunch of grapes, greene at the firſt, but after they be ripe of a yellowiſh red like corall, and full of juyce, wherein lie hid one or two little hard ſeeds. The root is tuberous, of the bigneſſe of a large Oliue, white and ſucculent, with ſome threddy additaments annexed thereto.

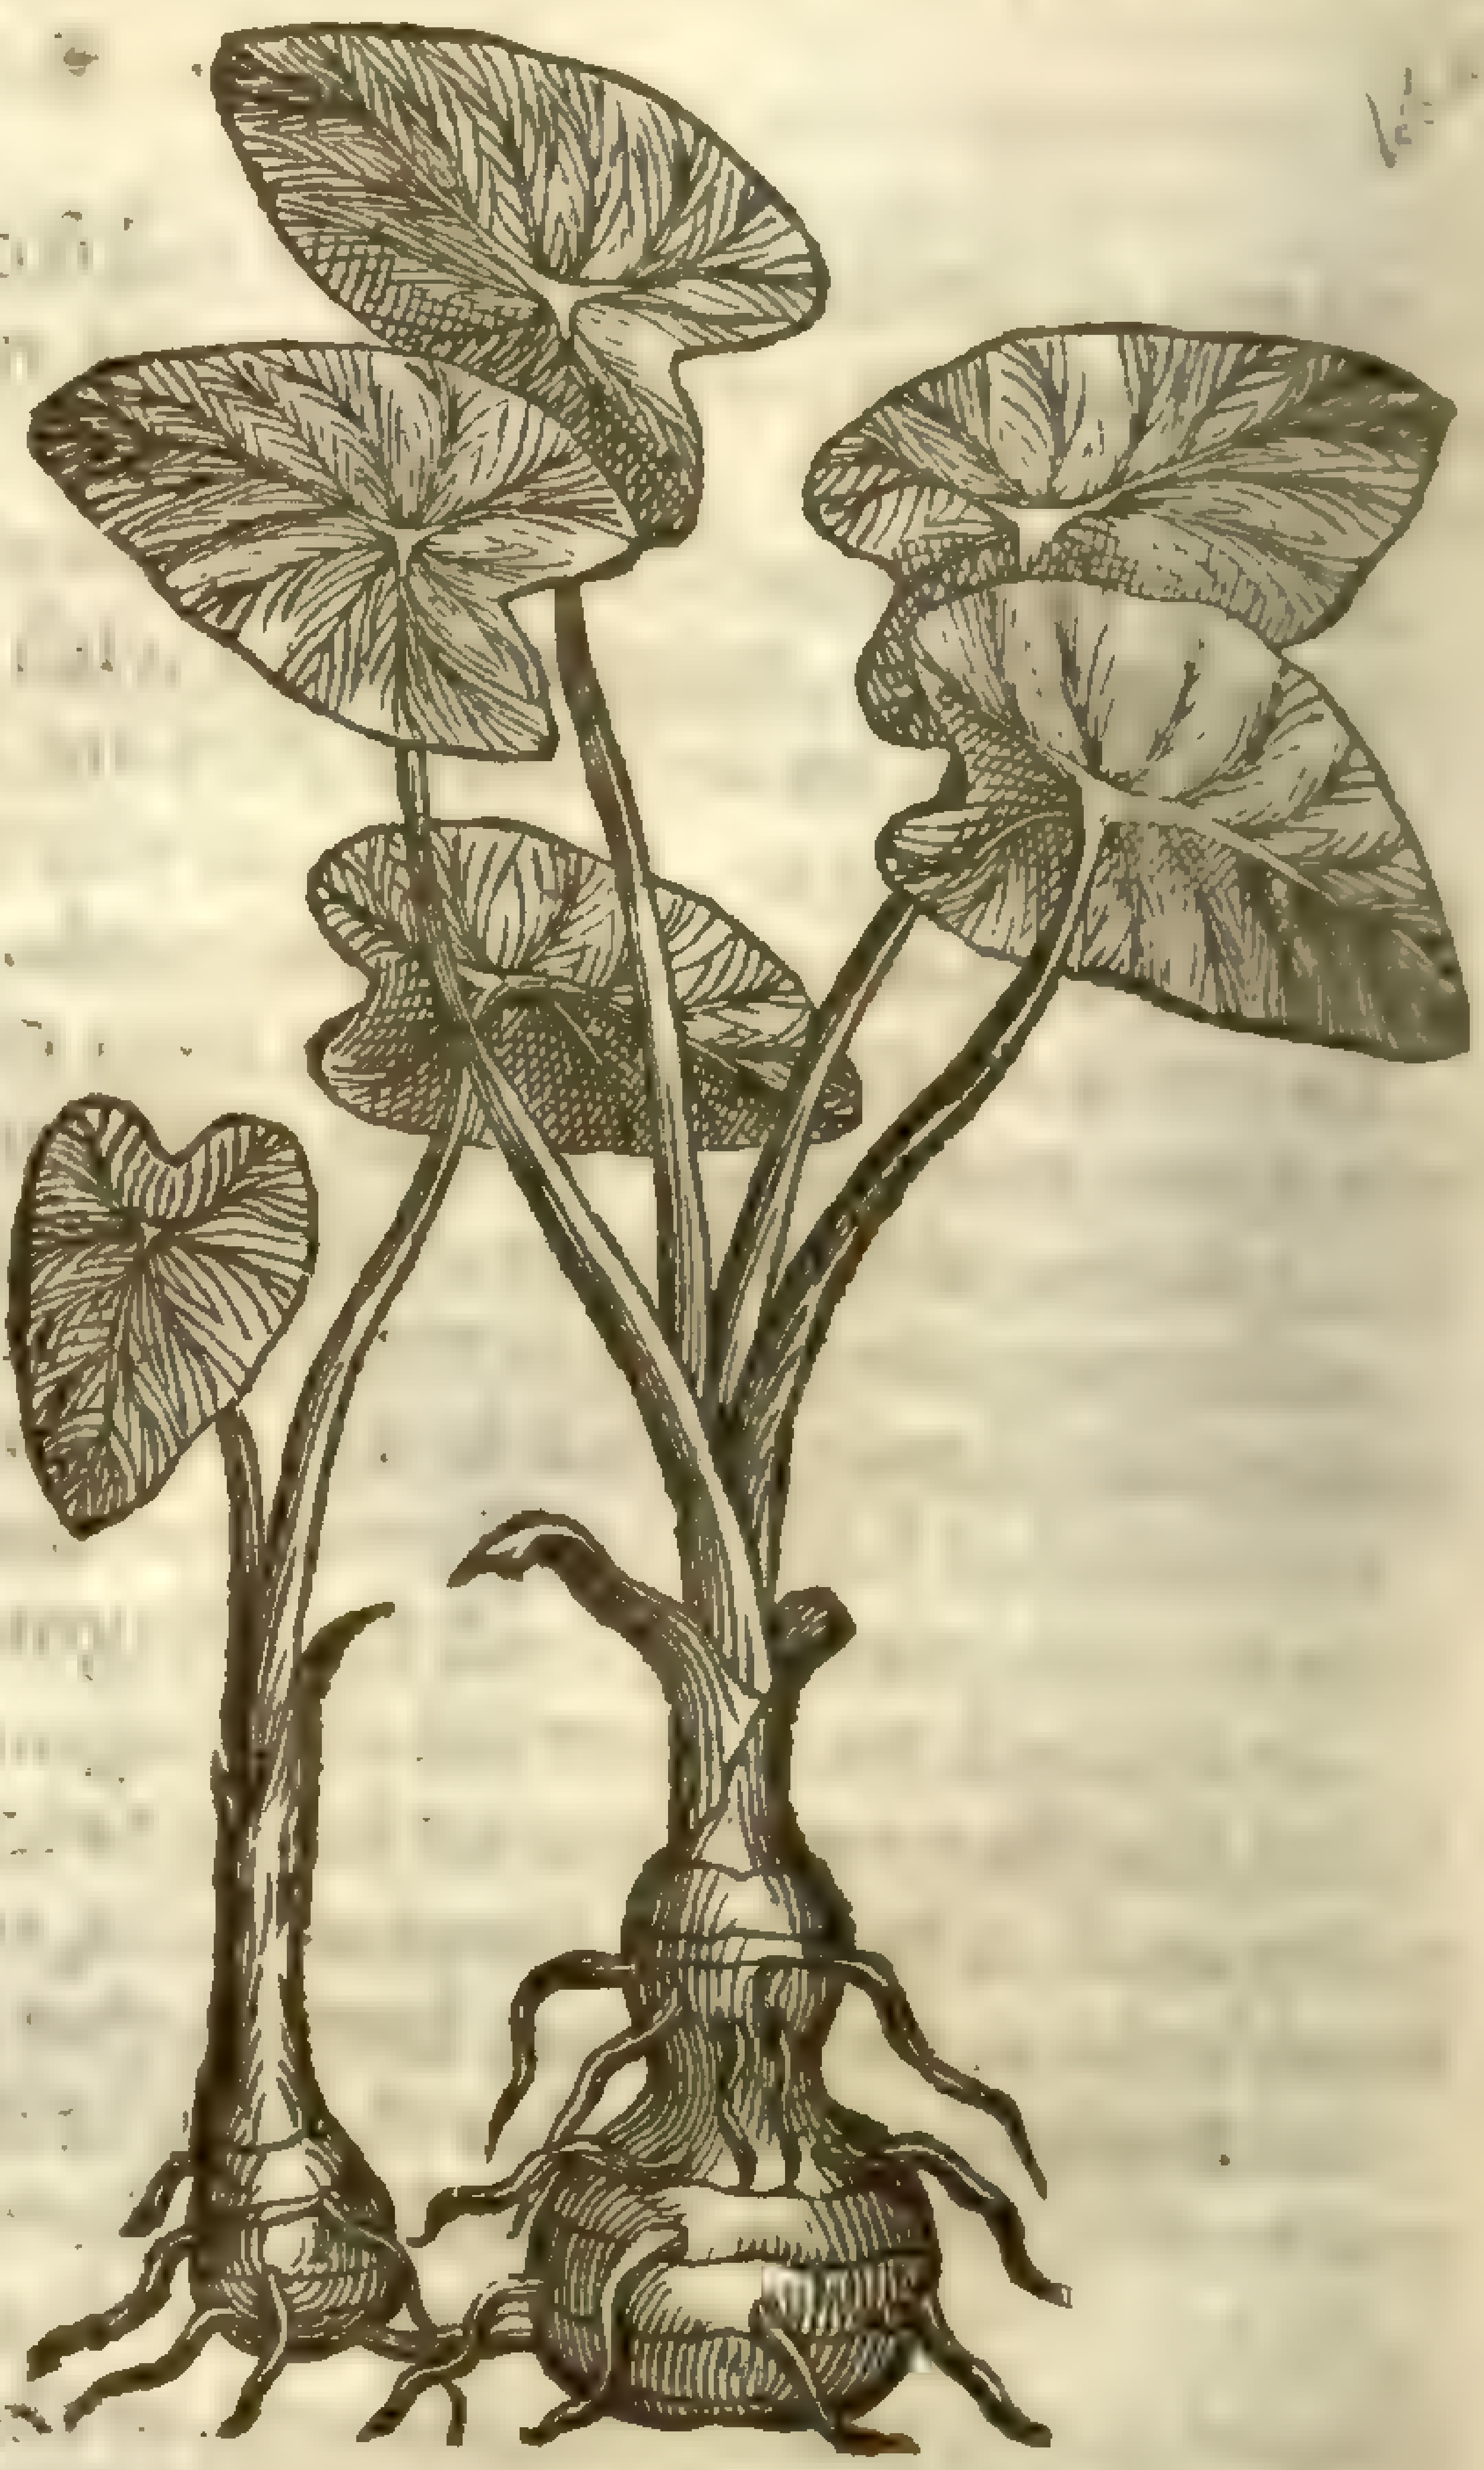
2 There is in Ægypt a kinde of *Arum* which alſo is to be ſeene in Africa, and in certaine places of Luſitania, about riuers and flouds, which differeth from that which groweth in England and other parts of Europe. This plant is large and great, and the leaues thereof are greater than thoſe of the water Lillie: the root is thicke and tuberous, and toward the lower end thicker and broader, and may be eaten. It is reported to be without floure and ſeed, but the increaſe that it hath is by the fibres which runne and ſpread from the roots. ‡ This plant hath alſo peſtels and cluſters of berries as the common Aron, but ſomewhat different, the leaues are not cut into the ſtalke, but joyned before the ſetting thereto: the root alſo is very large. Thoſe that deſire to ſee more of this plant, and the queſtion which ſome haue mooued, whether this be the *Colocaſia*, or *Faba Ægyptia* of the Antients? let them haue recourſe to the firſt chapter of *Fabius Columna*, his *Minus cognitarum ſtirpium pars altera*, and there they ſhall finde ſatisfaction. ‡

1 *Arum vulgare.*
Cockow pint.

A. maculatum,
mill. dict.
[illegible] 146



‡ 2 *Arum Ægyptiacum.*
Ægyptian Cockow pint.



¶ *The Place.*

Cockow pint groweth in woods neere vnto ditches vnder hedges, euery where in ſhadowie places.

¶ *The Time.*

The leaues appeare preſently after Winter: the peſtell ſheweth it ſelfe out of his huske or ſheath in Iune, whileſt the leaues are in withering: and when they are gone, the bunch or cluſter of berries becommeth ripe, which is in Iuly and Auguſt.

¶ *The Names.*

There groweth in Ægypt a kinde of Aron or Cuckow pint which is found alſo in Africa, and likewiſe in certaine places of Portingale neere vnto riuers and ſtreames, that differeth from thoſe of our countries growing, which the people of Caſtile call *Manta de naeſtra ſenora*: moſt would haue it to be called *Colocaſia*, but *Dioſcorides* ſaith that *Colocaſia* is the root of *Faba Ægyptia*, or the Beane of Ægypt. ‡ *Fabius Columna* (in the place formerly alledged) prooues this not to be the true *Colocaſia*, and yet *Proſper Alpinus* ſince in his ſecond booke *de plantis exoticis*, *cap*. 17. and 18. labours to prooue the contrary: let the curious haue recourſe to theſe, for it is to tedious for me in this place to inſiſt vpon it, being ſo large a point of controuerſie, which hath ſo much troubled all the late Writers. ‡

The common Cuckow pint is called in Latine, *Arum*: in Greeke, ἄρον: in ſhops *Iarus*, and *Barba-Aron*: of others, *Pes vituli*: of the Syrians, *Lupha*: of the men of Cyprus, *Colocaſia*, as wee finde among the baſtard names. *Pliny* in his 24 booke, 16. chapter, doth witneſſe, that there is great difference betweene *Aron* and *Dracontium*, although there hath been ſome controuerſie about the ſame among the old Writers, affirming them to be all one: in high Dutch it is called, **Paffen pint**: in Italian, *Gigora*: in Spaniſh, *Taro*: in low Dutch, **Calfsuoet**: in French, *Pied d'veau*: in Engliſh, Cuckow pint, and Cuckow pintle, wake-Robin, Prieſts pintle, Aron, Calfes foot, and Rampe; and of ſome Starchwort.

¶ *The Temperature.*

The faculties of Cuckow pint doe differ according to the varietie of countries: for the root hereof, as *Galen* in his booke of the faculties of nouriſhments doth affirme, is ſharper and more biting in ſome countries than in others, almoſt as much as Dragons, contrariwiſe in Cyren a city in Africke, it is generally in all places hot and dry, at the leaſt in the third degree.

¶ *The Vertues.*

If any may would haue thicke and tough humours which are gathered in the cheſt and lungs to be cleanſed and voided out by coughing, then that Cuckow-pint is beſt that biteth moſt. A

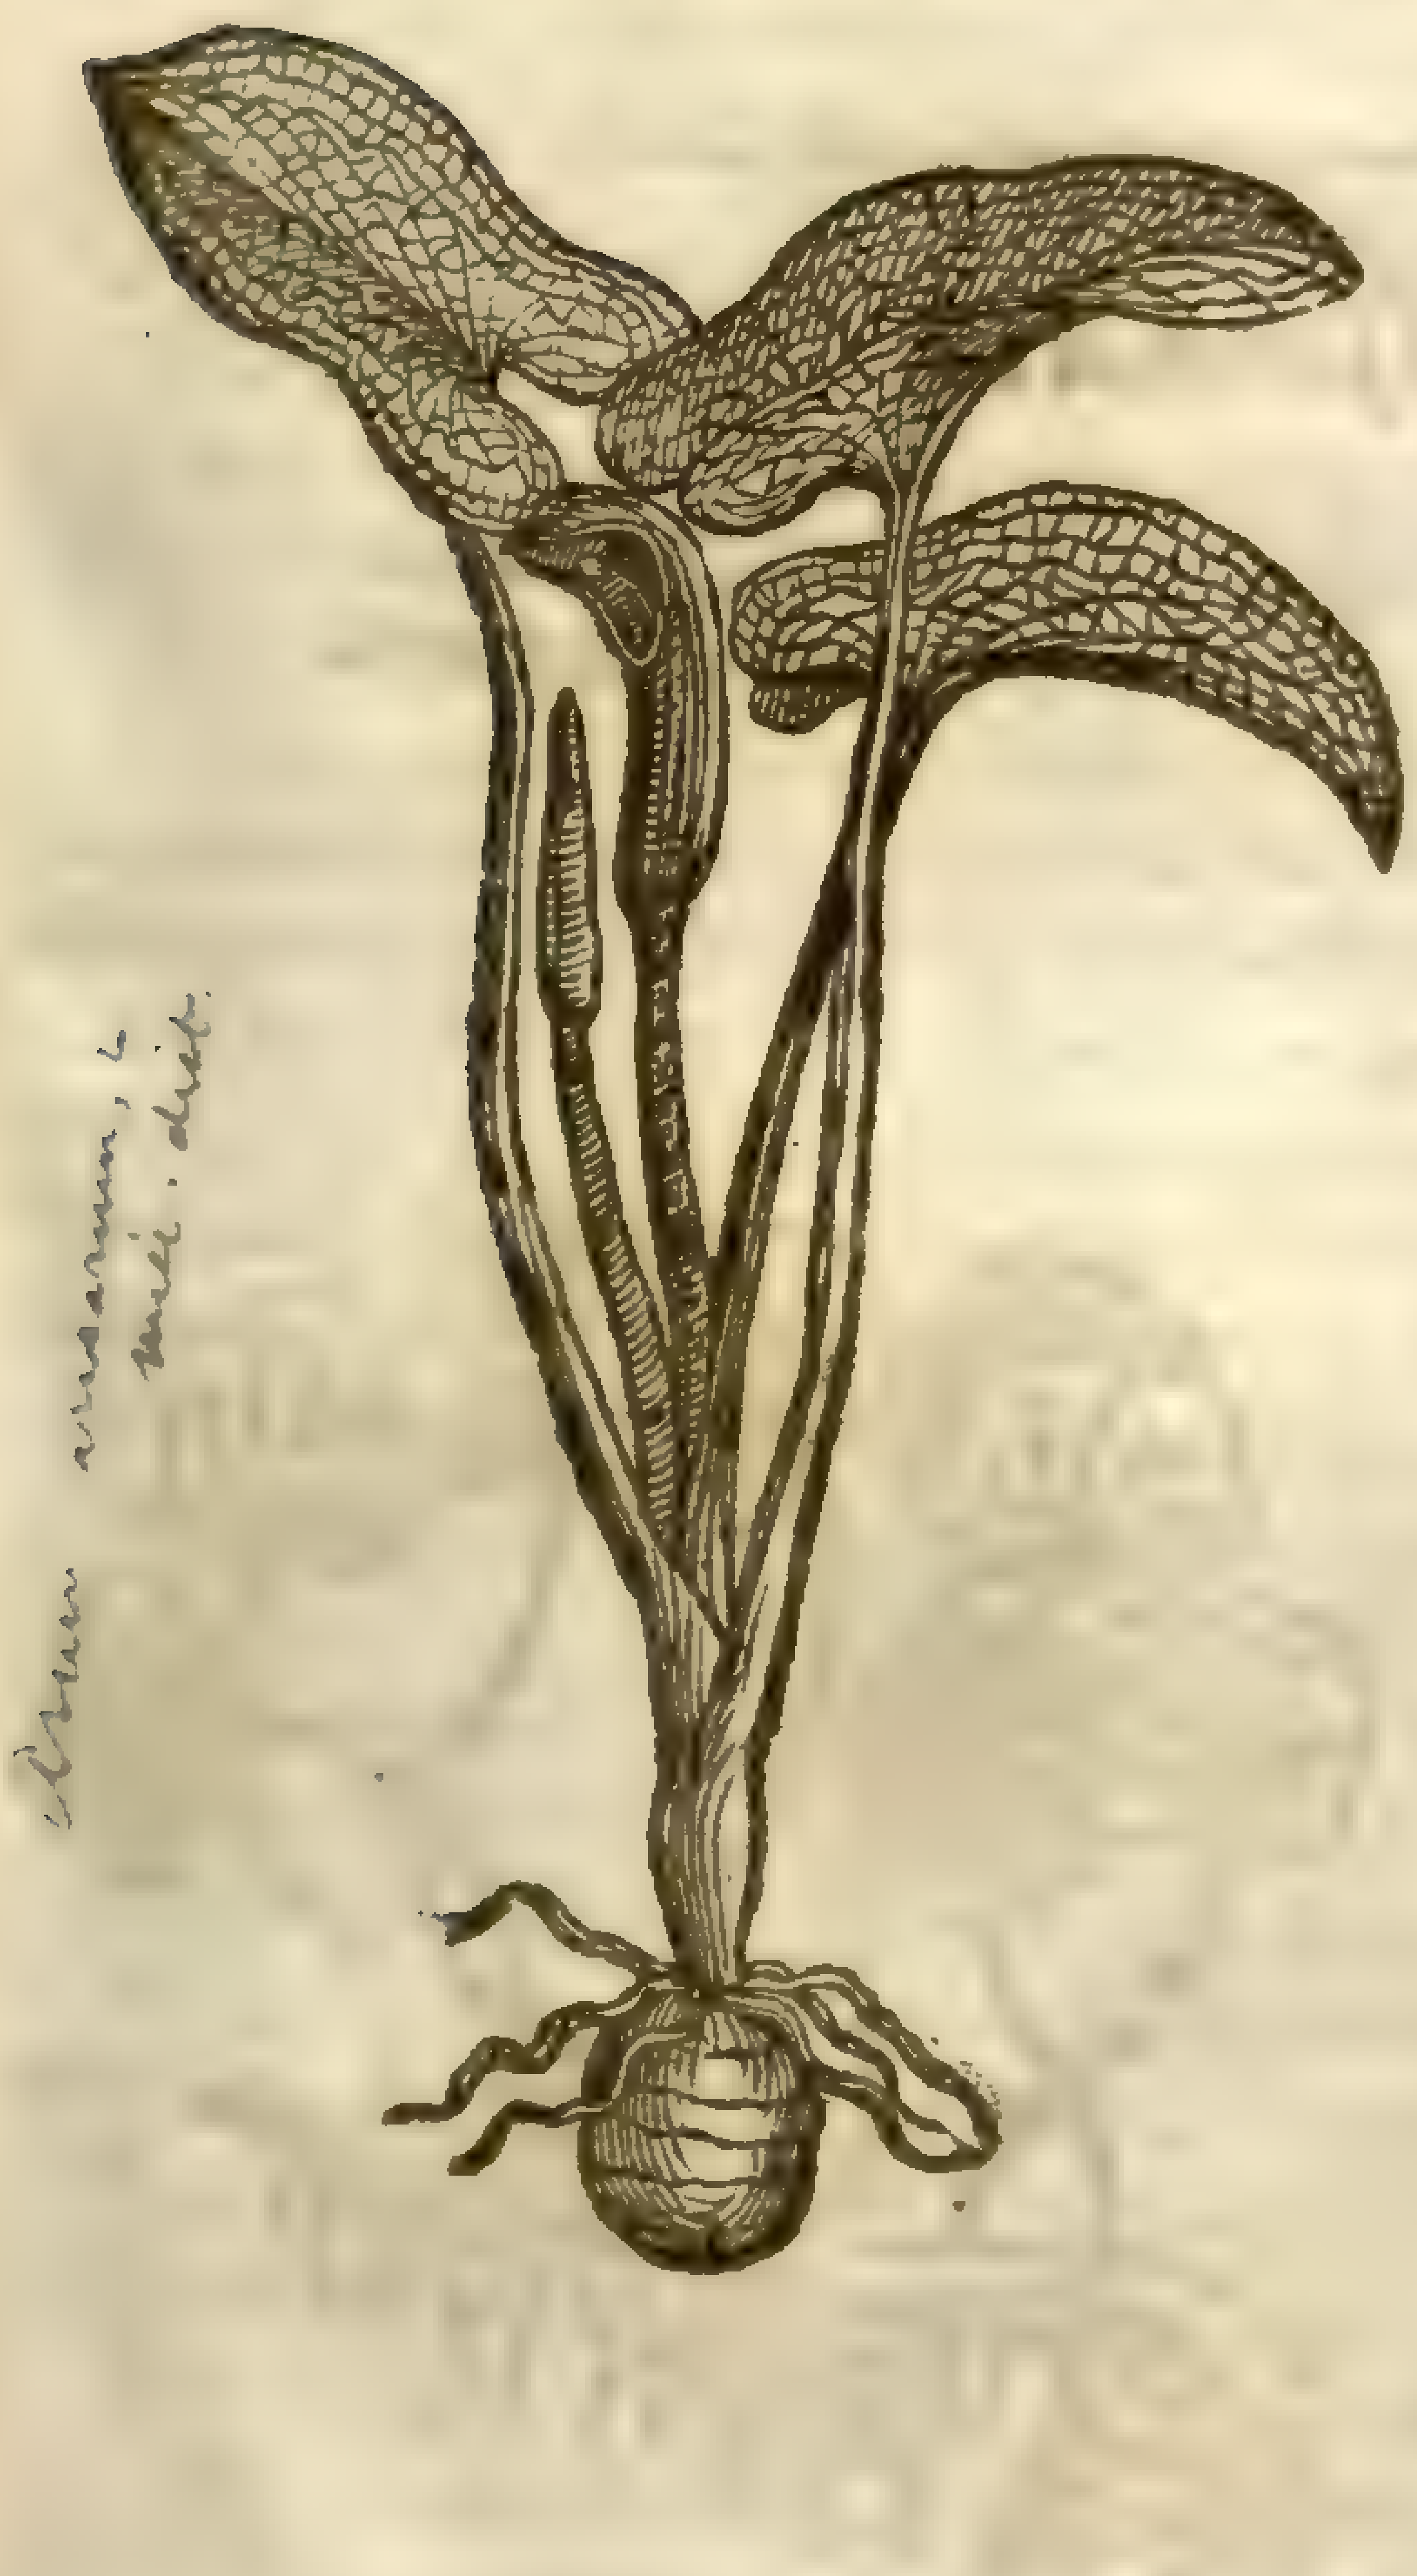
It is eaten being ſodden in two or three waters, and freſh put to, whereby it may looſe his acrimonie; and being ſo eaten, they cut thicke humours meanely, but Dragons is better for the ſame purpoſe. B

Dioſcorides ſheweth, that the leaues alſo are preſerued to be eaten, and that they muſt be eaten after they be dried and boiled; and writeth alſo, that the root hath a peculiar vertue againſt the gout, being laied on ſtamped with Cowes dung. C

Beares after they haue lien in their dens forty daies without any manner of ſuſtenance, but what they get with licking and ſucking their owne feet, doe as ſoone as they come forth eat the herbe Cuckow-pint, through the windie nature thereof the hungry gut is opened and made fit againe to receiue ſuſtenance: for by abſtaining from food ſo long a time, the gut is ſhrunke or drawne ſo cloſe together, that in a manner it is quite ſhut vp, as *Ariſtole*, *Ælianus*, *Plutarch*, *Pliny*, and others do write. D

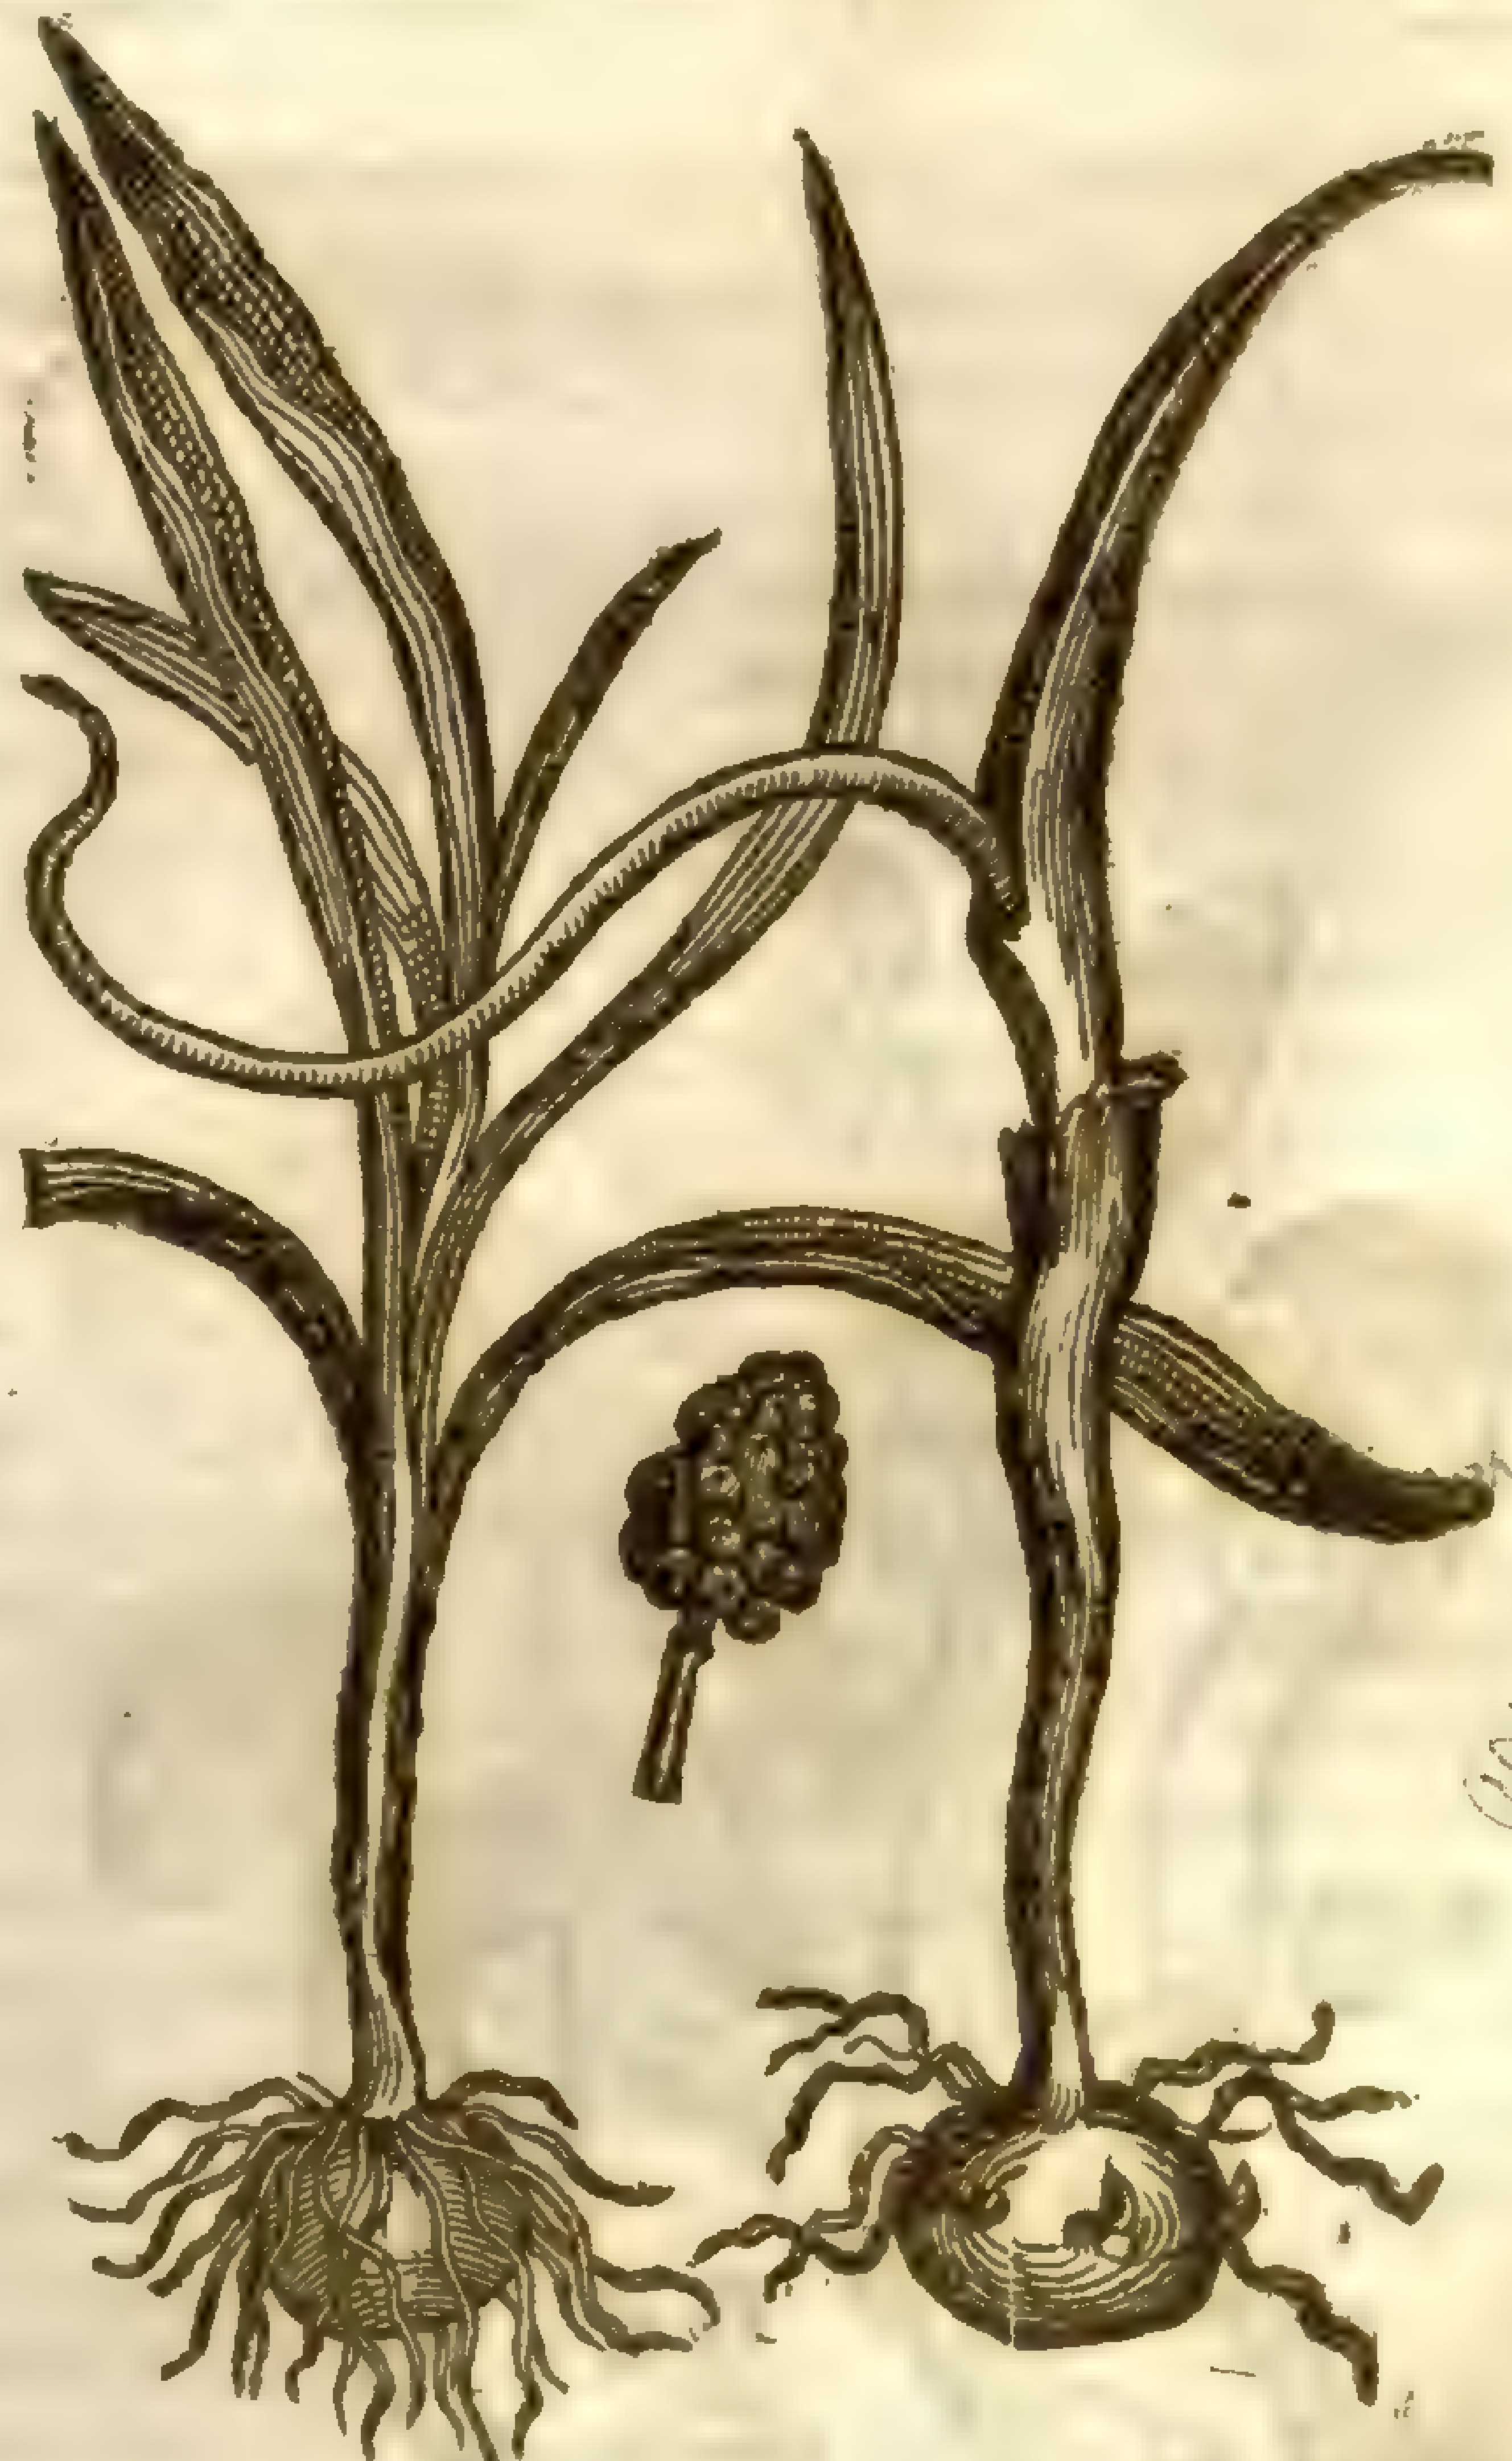
The moſt pure and white ſtarch is made of the roots of Cuckow-pint; but moſt hurtfull to the hands of the Laundreſſe that hath the handling of it, for it choppeth, bliſtereth, and maketh the hands rough and rugged, and withall ſmarting. E

CHAP. 305. *Of Friers Cowle, or hooded Cuckowpint.*



1 *Ariſarum latifolium.*
Broad leaued Friers Cowle.

Arum arisarum, mei. dict.



2 *Ariſarum anguſtifolium.*
Narrow leafed Friers Cowle.

Arum tenuifolium, mei. dict.

¶ *The Deſcription.*

1 BRoad leaued Friers hood hath a leafe like Iuie, broad and ſharpe pointed, but far leſſe approching neere to the forme of thoſe of Cuckowpint: the ſtalke thereof is ſmall and ſlender: the huske or hoſe is little; the peſtell ſmall, and of a blacke purpliſh colour; the cluſter when it is ripe is redde; the kernels ſmall; the root white, hauing the forme of Aron or Cuckowpint, but leſſer, whereof doubtleſſe it is a kinde.

The ſecond Friers hood hath many leaues, long and narrow, ſmooth and glittering: The huske or hoſe is narrow and long; the peſtell that commeth forth of it is ſlender, in forme like a great earth worme, of a blackiſh purple colour, as hath alſo the inſide of the hoſe, vpon which, hard to the ground, and ſometimes a little within the ground, groweth a certaine bunch or cluſter of berries, greene at the firſt, and afterwards red: the root is round and white like the others.

¶ *The Place.*

Theſe plants are ſtrangers in England, but common in Italy, and eſpecially in Tuſcane about Rome, and in Dalmatia, as *Aloiſius Anguillara* witneſſeth: notwithſtanding I haue them in my Garden.

¶ *The Time.*

The floures and fruit of theſe come to perfection with thoſe of Cuckowpint and Dragons.

¶ *The Names.*

Friers hood is called *Dioſcorides*, Ἀρίσαρον: in Latine, *Ariſarum*: but *Pliny* calleth it Ἄρις, or *Aris*; for in his twenty fourth booke, *cap.* 16 hee ſaith, That *Aris* which groweth in Ægypt is like Aron or Cuckowpint: it may be called in Engliſh after the Latine name *Ariſarum*; but in my opinion it may be more fitly called Friers hood, or Friers cowle, to which the floures ſeeme to be like; whereupon the Spaniards name it *Frailillos*, as *Daleſcampius* noteth.

¶ *The Temperature.*

Friers Cowle is like in power and faculty to the Cuckow-pint, yet is it more biting, as *Galen* ſaith.

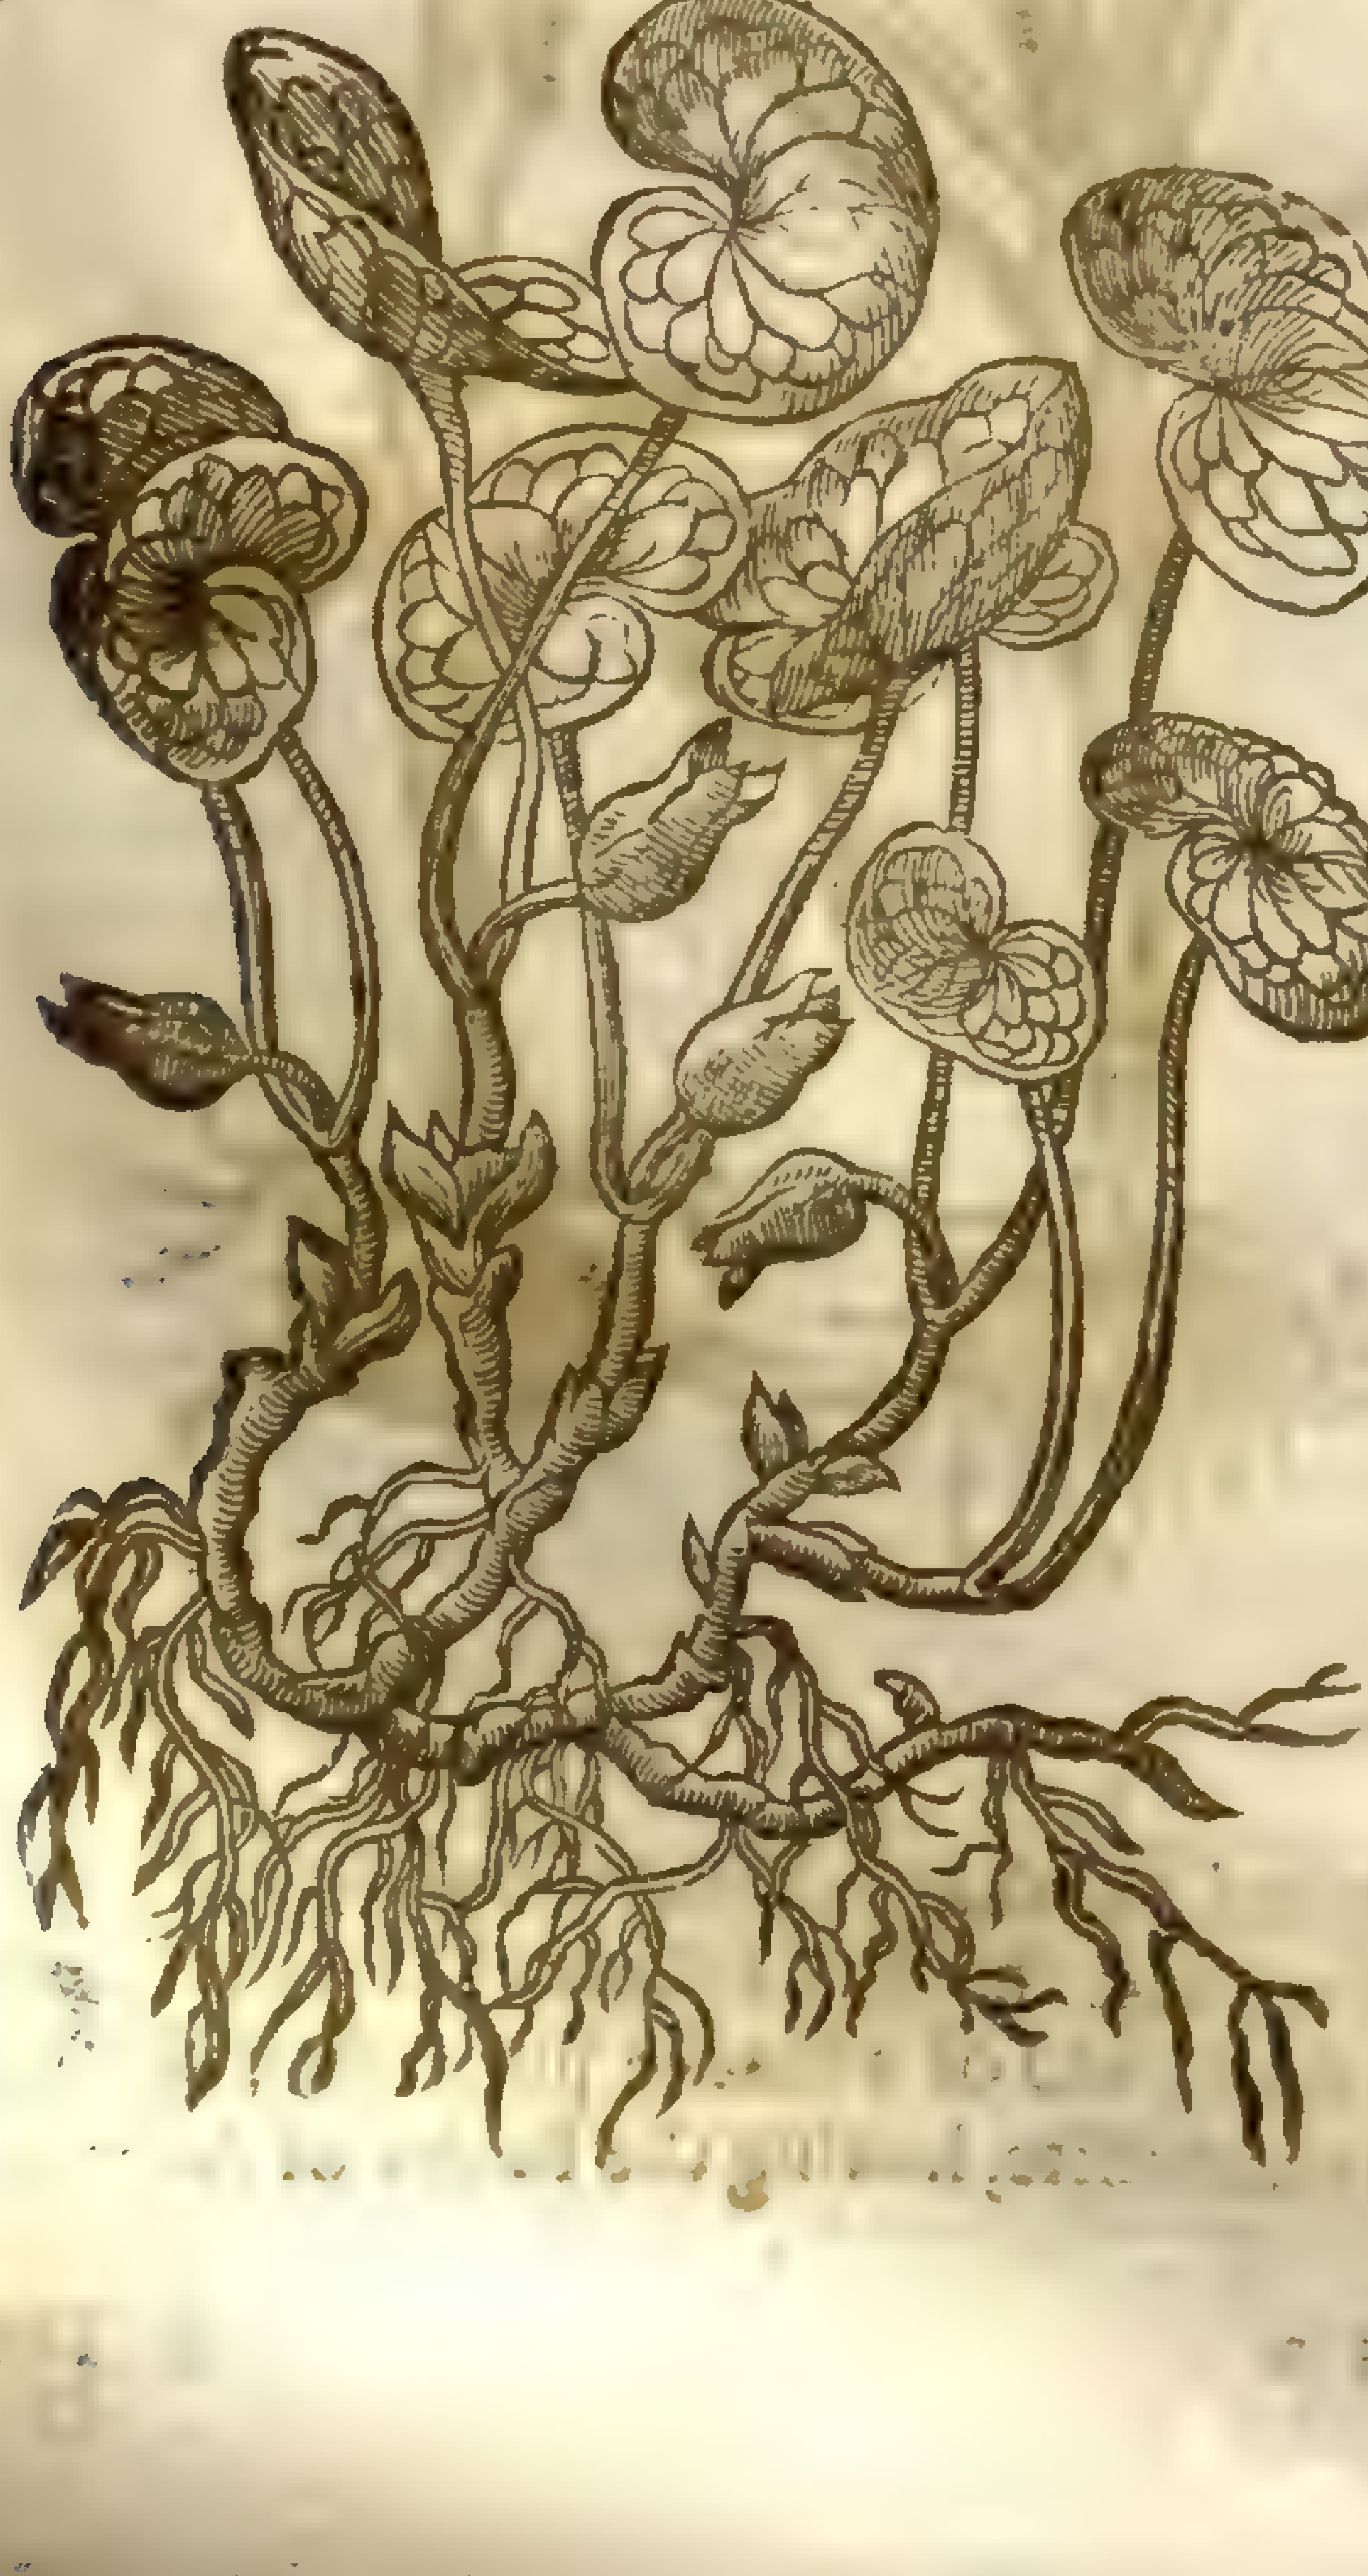
¶ *The Vertues.*

A There is no great vſe of theſe plants in Phyſicke; but it is reported that they ſtay running or eating ſores or vlcers: and likewiſe that there is made of the roots certaine compoſitions called in Greeke *Collyria*, good againſt fiſtula's: and being put into the ſecret part of any liuing thing, it rotteth the ſame, as *Dioſcorides* writeth.

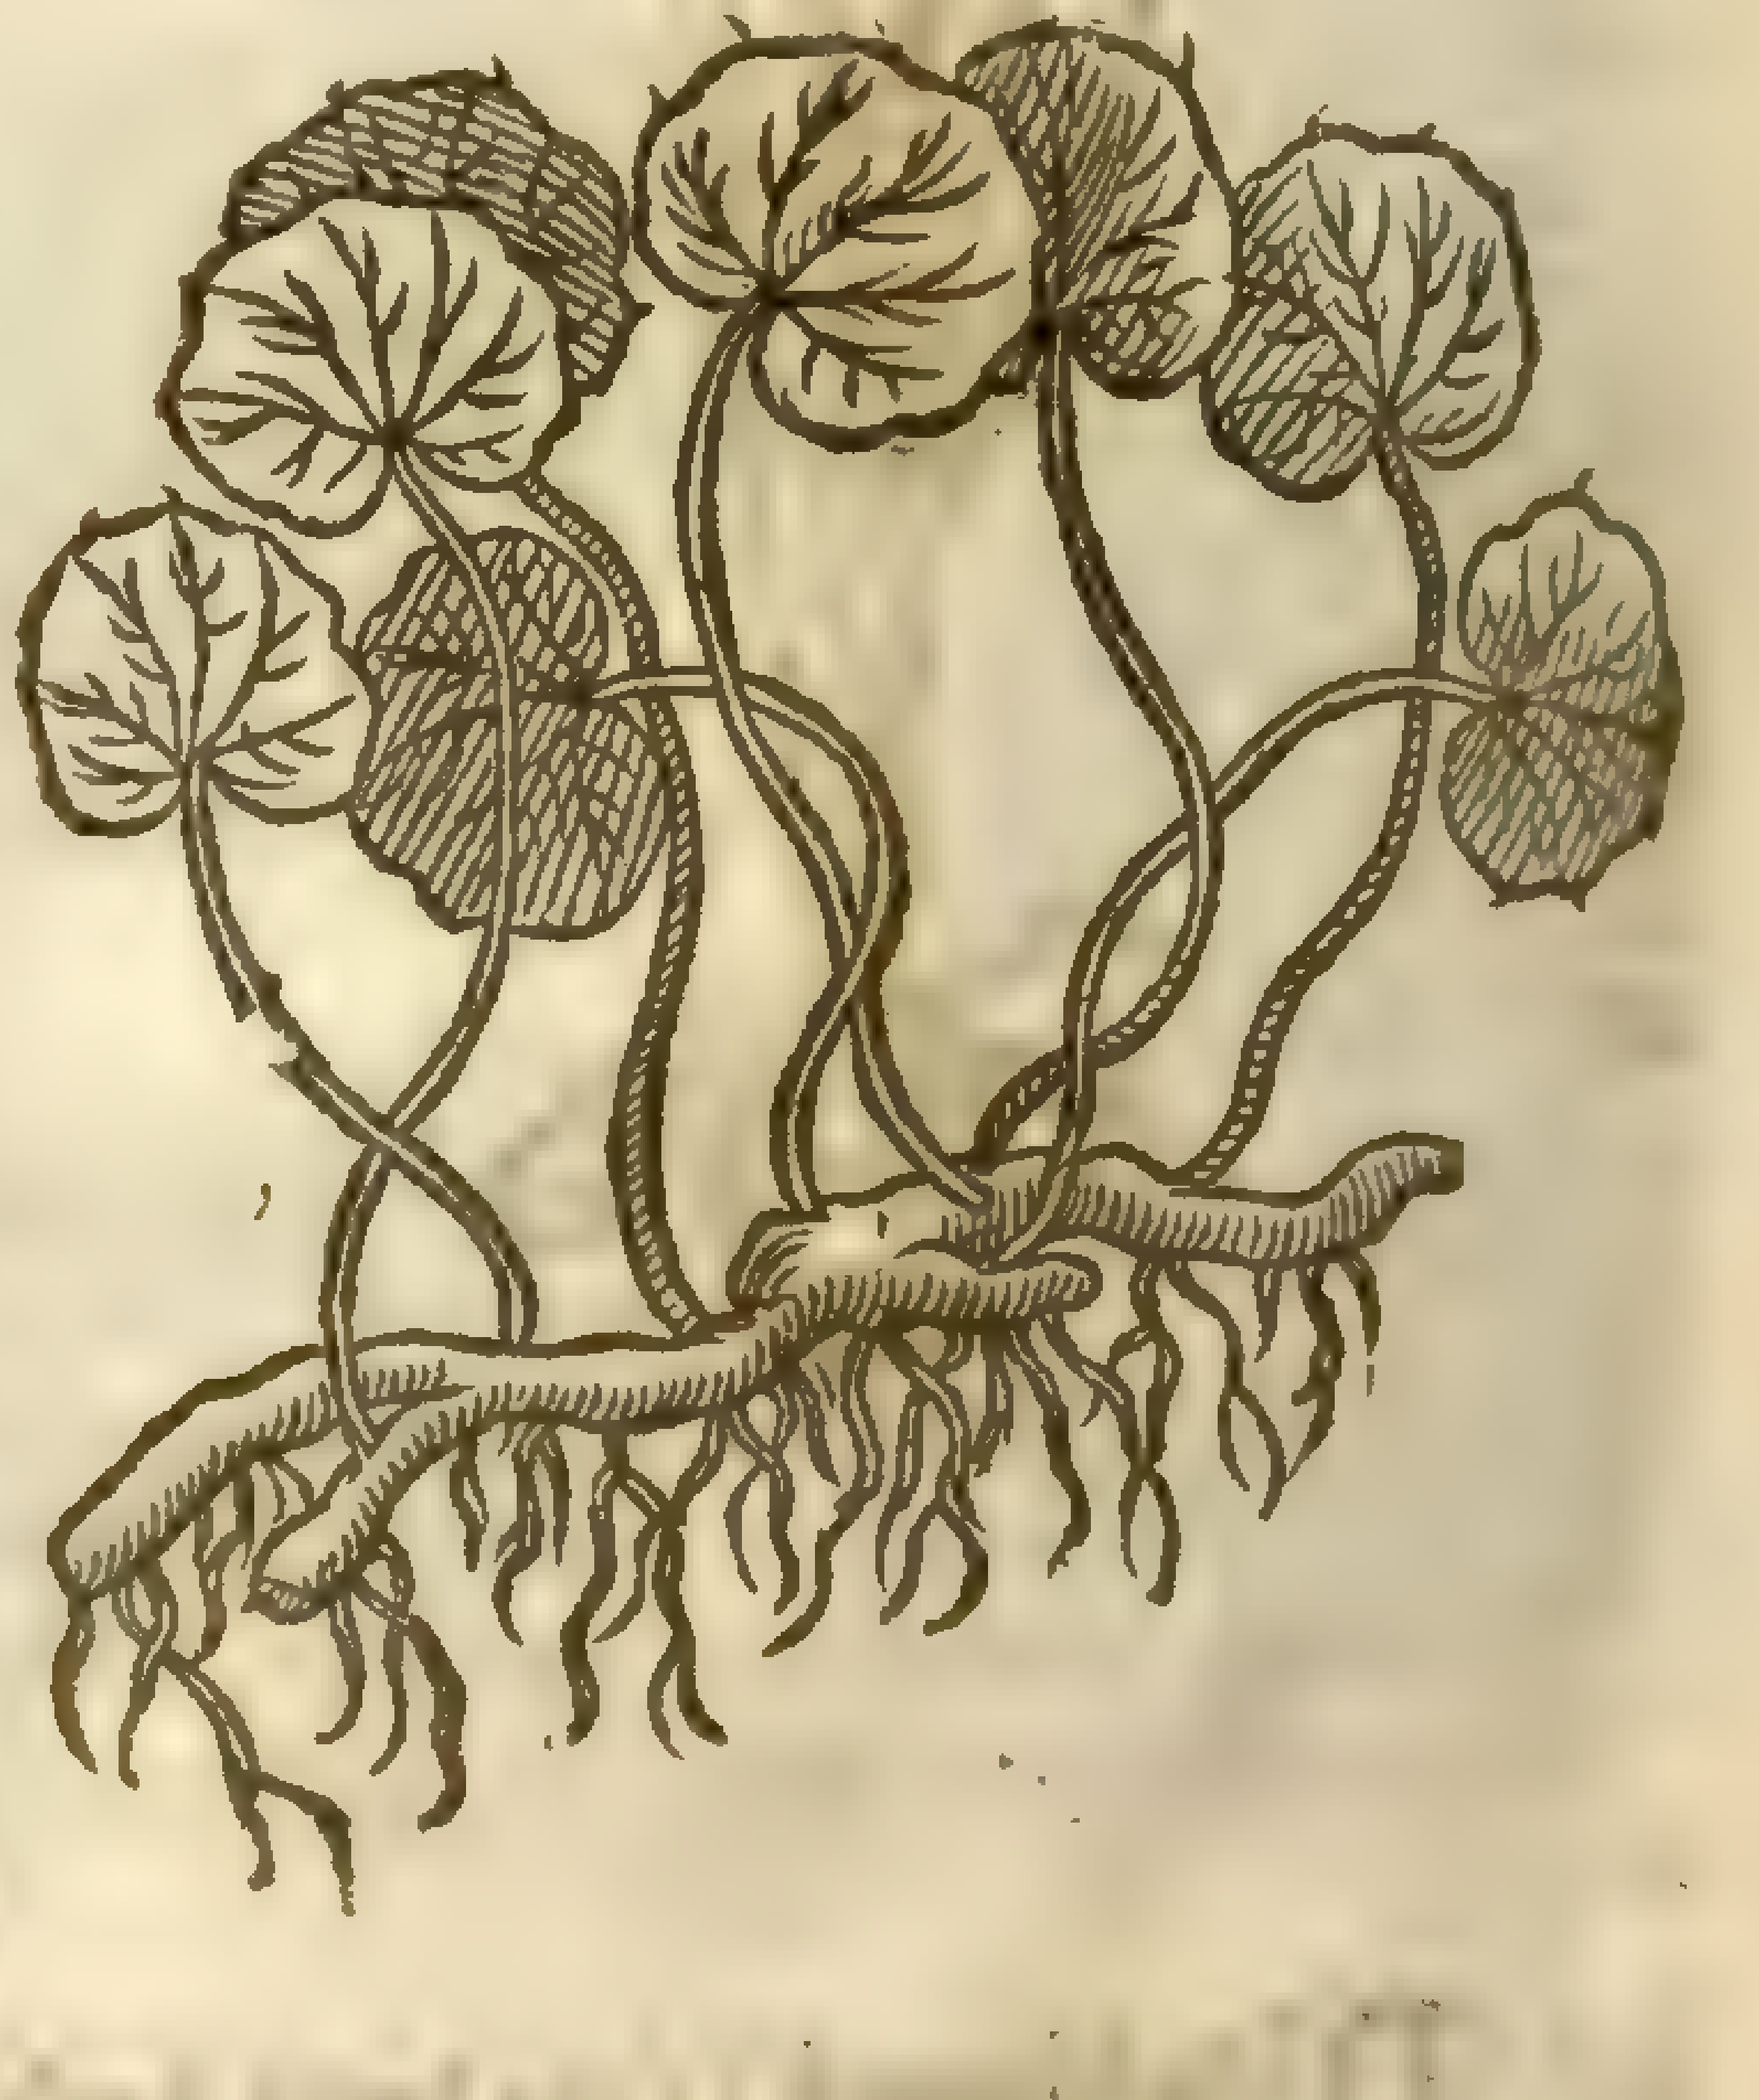
† That which was formerly figured and deſcribed in the third place, vnder the title of *Ariſarum latifolium Matthioli*, was the ſame with that deſcribed by the name of *Dracontium minus*, in the precedent chapter, and therefore here omitted.

Chap. 306. *Of Aſarabacca.*

[illegible]



1 *Aſarum.*
Aſarabacca.



2 *Aſarina Matthioli.*
Italian Aſarabacca.

¶ The

¶ *The Deſcription.*

1 The leaues of Aſarabacca are ſmooth, of a deepe greene colour, rounder, broader, and tenderer than thoſe of Iuie, and not cornered at all, not vnlike to thoſe of Sow-bread: the floures lie cloſe to the roots, hid vnder the leaues, ſtanding vpon ſlender foot-ſtalkes, of an ill-fauoured purple colour, like to the floures and huſkes of Henbane, but leſſe, wherein are contained ſmall ſeeds, cornered, and ſomewhat rough: the roots are many, ſmall and ſlender, growing aſlope vnder the vpper cruſt of the earth, one folded within another, of an vnpleaſant taſte, but of a moſt ſweet and pleaſing ſmell, hauing withall a kinde of biting quality.

2 This ſtrange kinde of Aſarabacca, which *Matthiolus* hath ſet forth creeping on the ground, in manner of our common Aſtrabacca, hath leaues ſomewhat rounder and rougher, ſleightly indented about the edges, and ſet vpon long ſlender foot-ſtalkes: the floures grow hard vnto the ground like vnto thoſe of Cammomill, but much leſſer, of a mealy or duſty colour, and not without ſmell. The roots are long and ſlender, creeping vnder the vpper cruſt of the earth, of a ſharpe taſte, and bitter withall. ‡ This *Aſarina* of *Matthiolus*, *Cluſius* (whoſe opinion I here follow) hath iudged to be the *Tuſſilago Alpina 2.* of his deſcription; wherefore I giue you his figure in ſtead of that of our Author, which had the floures expreſt, which this wants. ‡

¶ *The Place.*

It delighteth to grow in ſhadowie places, and is very common in moſt Gardens.

¶ *The Time.*

The herbe is alwaies greene; yet doth it in the Spring bring forth new leaues and floures.

¶ *The Names.*

It is called in Greeke Ἄσαρον, *Aſarum*: in Latine, *Nardus ruſtica*: and of diuers, *Perpenſa*: *Perpenſa* is alſo *Baccharis* in *Pliny*, *lib.* 21. *cap.* 21. *Macer* ſaith, That *Aſarum* is called *Vulgago*, in theſe words:

Eſt Aſaron Græcè, Vulgago dicta Latinè.

This herbe, *Aſaron* do the Græcians name;
Whereas the Latines *Vulgago* clepe the ſame.

It is found alſo amongſt the baſtard names, that it was called of the great learned Philoſophers Αἷμα ἄρεως: that is, *Martis ſanguis*, or the bloud of *Mars*: and of the French men, *Baccar*; and thereupon it ſeemeth that the word *Aſarabacca* came, which the Apothecaries vſe, and likewiſe the common people: but there is another *Baccharis* differing from *Aſarum*, yet notwithſtanding *Crateuas* doth alſo call *Baccharis*, *Aſarum*.

This confuſion of both the names hath been the cauſe, that moſt could not ſufficiently expound themſelues concerning *Aſarum* and *Baccharis*; and that many things haue been written amiſſe in many copies of *Dioſcorides*, in the chapter of *Aſarum*: for when it is ſet downe in the Greeke copies a ſweet ſmelling garden herbe, it belongeth not to the deſcription of this *Aſarum*, but to that of *Baccharis*: for *Aſarum* (as *Pliny* ſaith) is ſo called, becauſe it is not put into garlands: and ſo by that meanes it came to paſſe, that oftentimes the deſcriptions of the old Writers were found corrupted and confuſed: which thing, as it is in this place manifeſt, ſo oftentimes it cannot ſo eaſily be marked in other places. Furthermore, *Aſarum* in called in French *Cabaret*: in high Dutch, Haſelwurtz: in low Dutch, Mans ooren: in Engliſh, Aſarabacca, Fole-foot, and Hazel wort.

¶ *The Temperature.*

The leaues of Aſarabacca are hot and dry, with a purging qualitie adjoyned thereunto, yet not without a certaine kinde of aſtriction or binding. The roots are alſo hot and dry, yet more than the leaues; they are of thin and ſubtill parts: they procure vrine, bring downe the deſired ſickneſſe, and are like in faculty, as *Galen* ſaith, to the roots of *Acorus*, but yet more forceable; and the roots of *Acorus* are alſo of a thinne eſſence, heating, attenuating, drying, and prouoking vrine, as he affirmeth: which things are happily performed by taking the roots of Aſarabacca, either by themſelues are mixed with other things.

¶ *The Vertues.*

A The leaues draw forth by vomit, thicke phlegmaticke and cholericke humours, and withall mooue the belly; and in this they are more forceable and of greater effect than the roots themſelues.

B They are thought to keepe in hard ſwelling cankers that they encreaſe not, or come to exulceration, or creeping any farther, if they be outwardly applied vpon the ſame.

C The roots are good againſt the ſtoppings of the liuer, gall, and ſpleene, againſt wens and hard ſwellings, and agues of long continuance: but being taken in the greater quantitie, they purge flegme and choler not much leſſe than the leaues (though *Galen* ſay no) by vomit eſpecially, and alſo by ſiege.

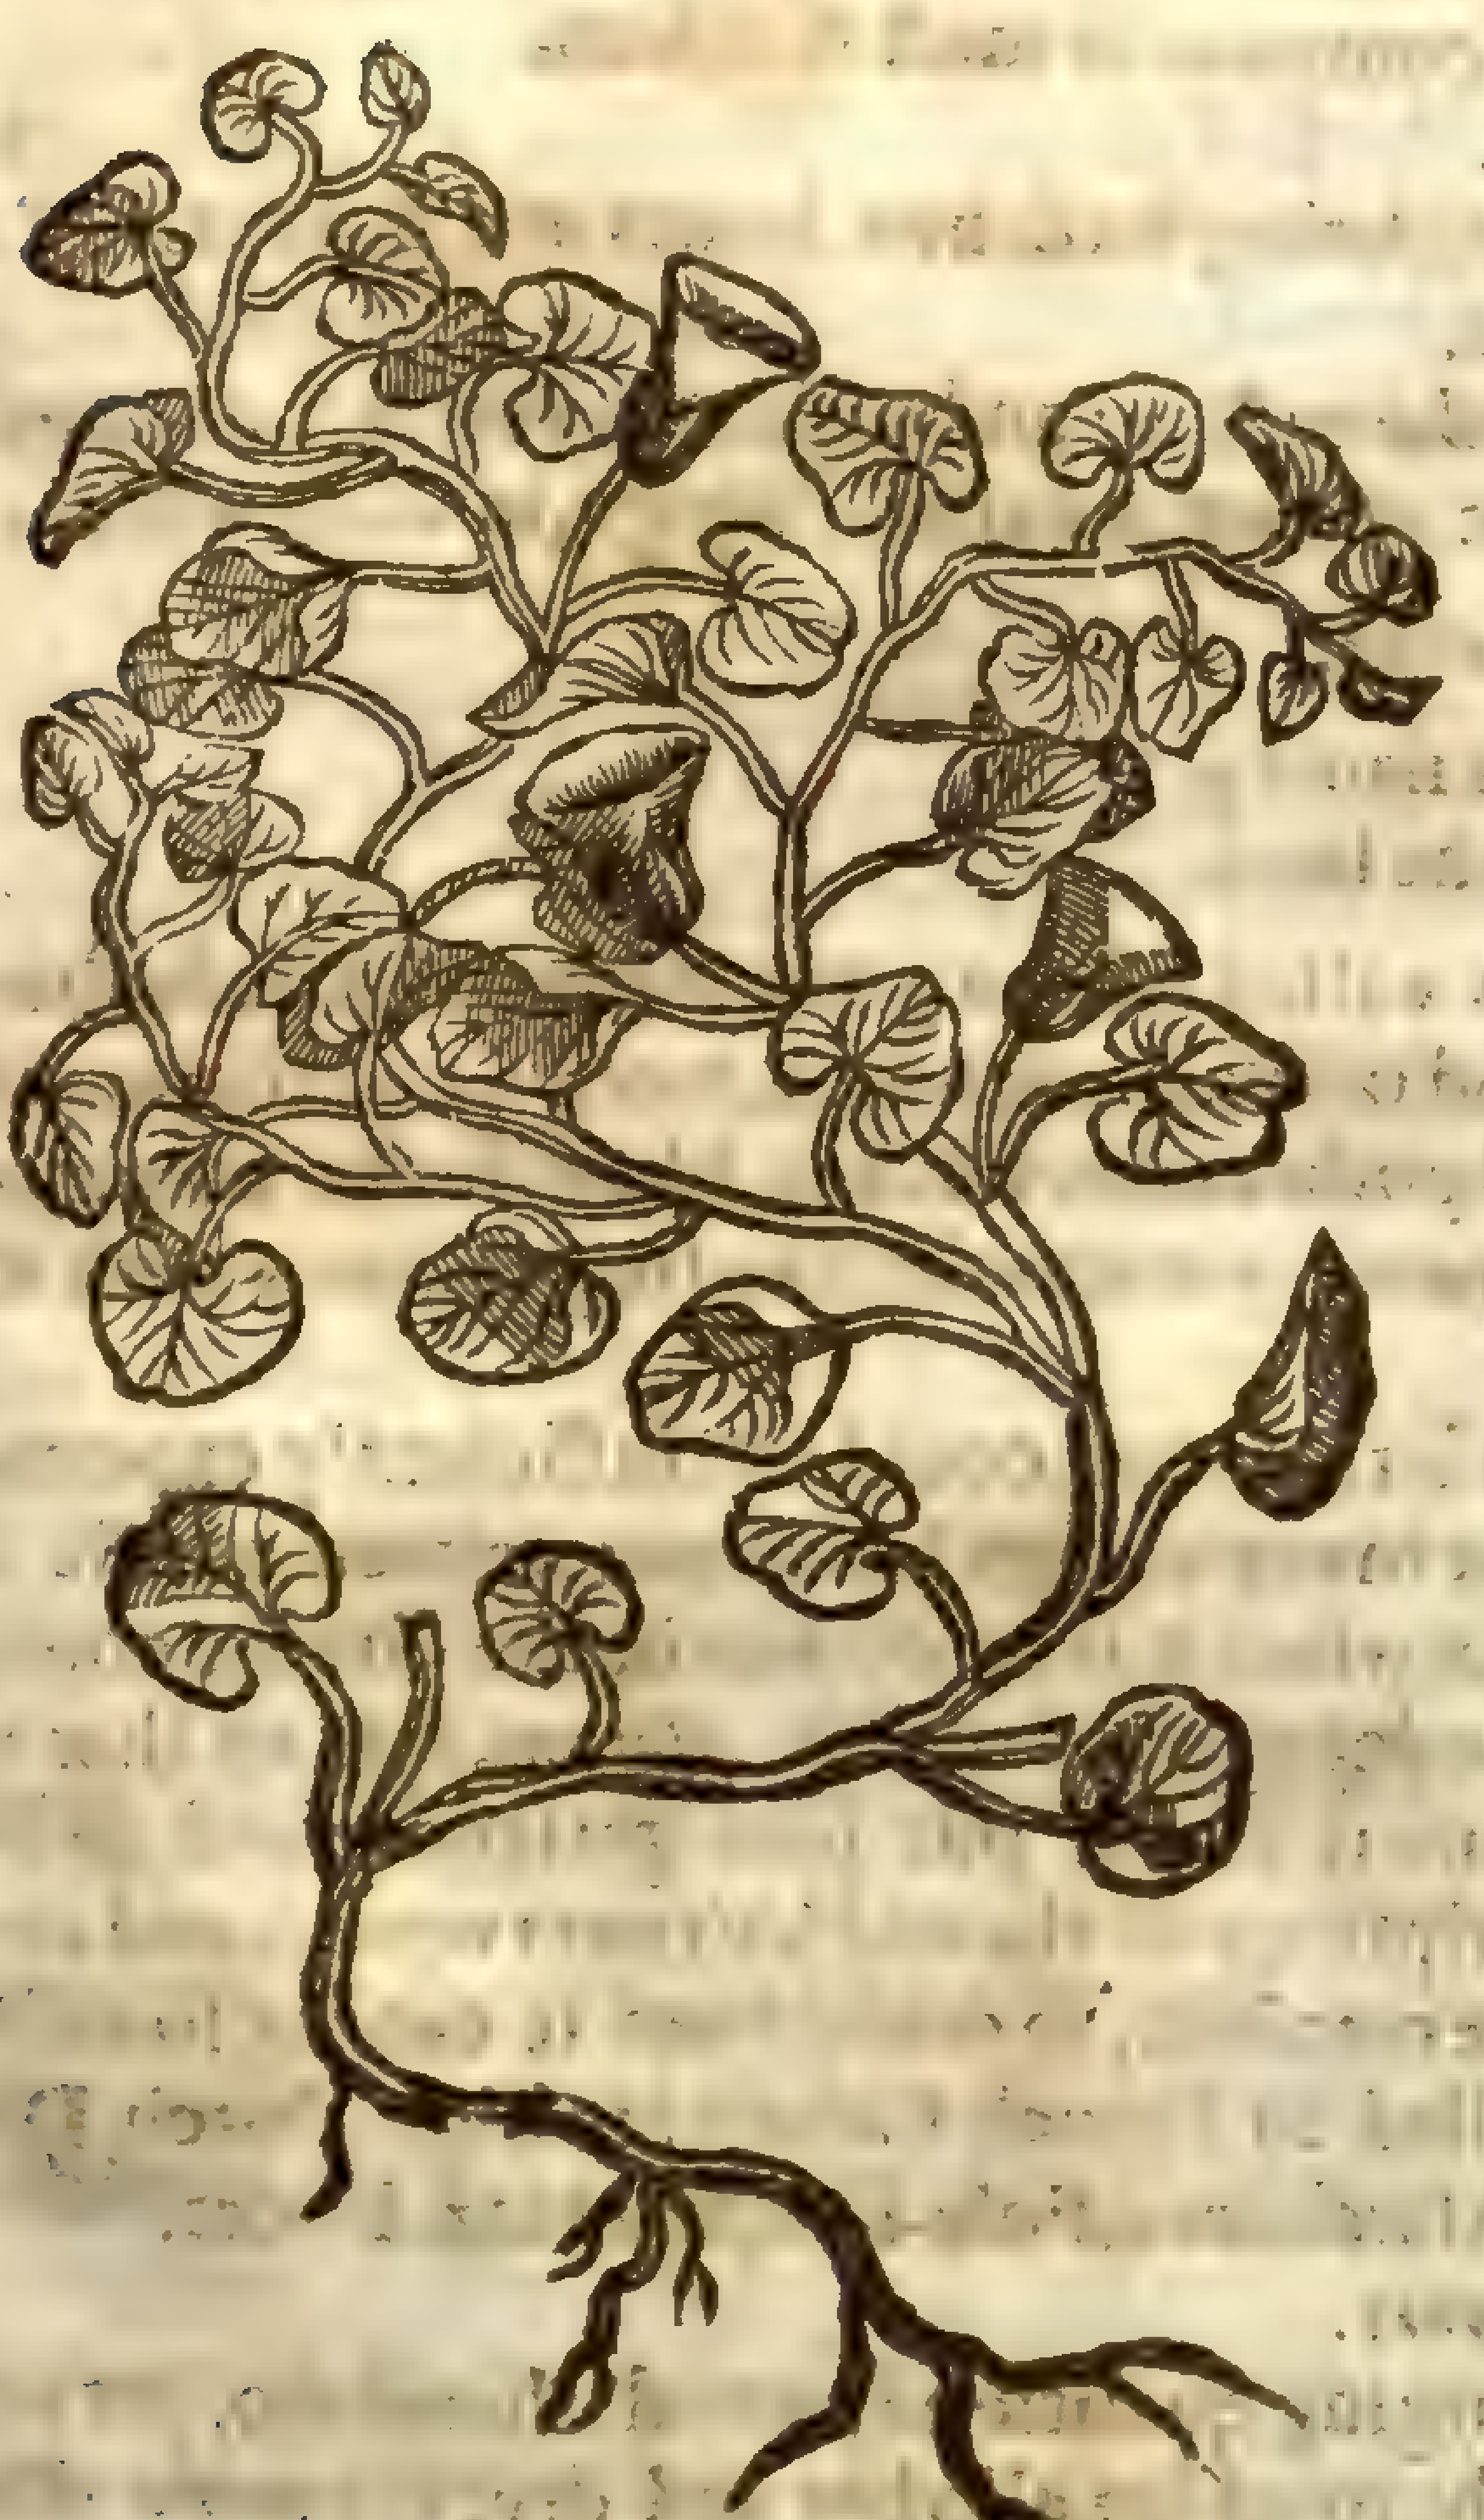
D One dram of the pouder of the roots giuen to drinke in ale or wine, groſſely beaten, prouoketh vomit for the purpoſes aforeſaid; but being beaten into fine pouder, and ſo giuen, it purgeth very little by vomit, but worketh moſt by procuring much vrine; therefore the groſſer the pouder is, ſo much the better.

E But if the roots be infuſed or boiled, then muſt two, three, or foure drams be put to the infuſion; and of the leaues eight or nine be ſufficient: the juyce of which ſtamped with ſome liquid thing, is to be giuen. The roots may be ſteeped in wine, but more effectually in whay or honied water, as *Meſues* teacheth.

F The ſame is good for them that are tormented with the Sciatica or gout in the huckle bones, for thoſe that haue the dropſie, and for ſuch as are vexed with a quartane ague, who are cured and made whole by vomiting.

Chap. 307. *Of Sea Binde-weed.*

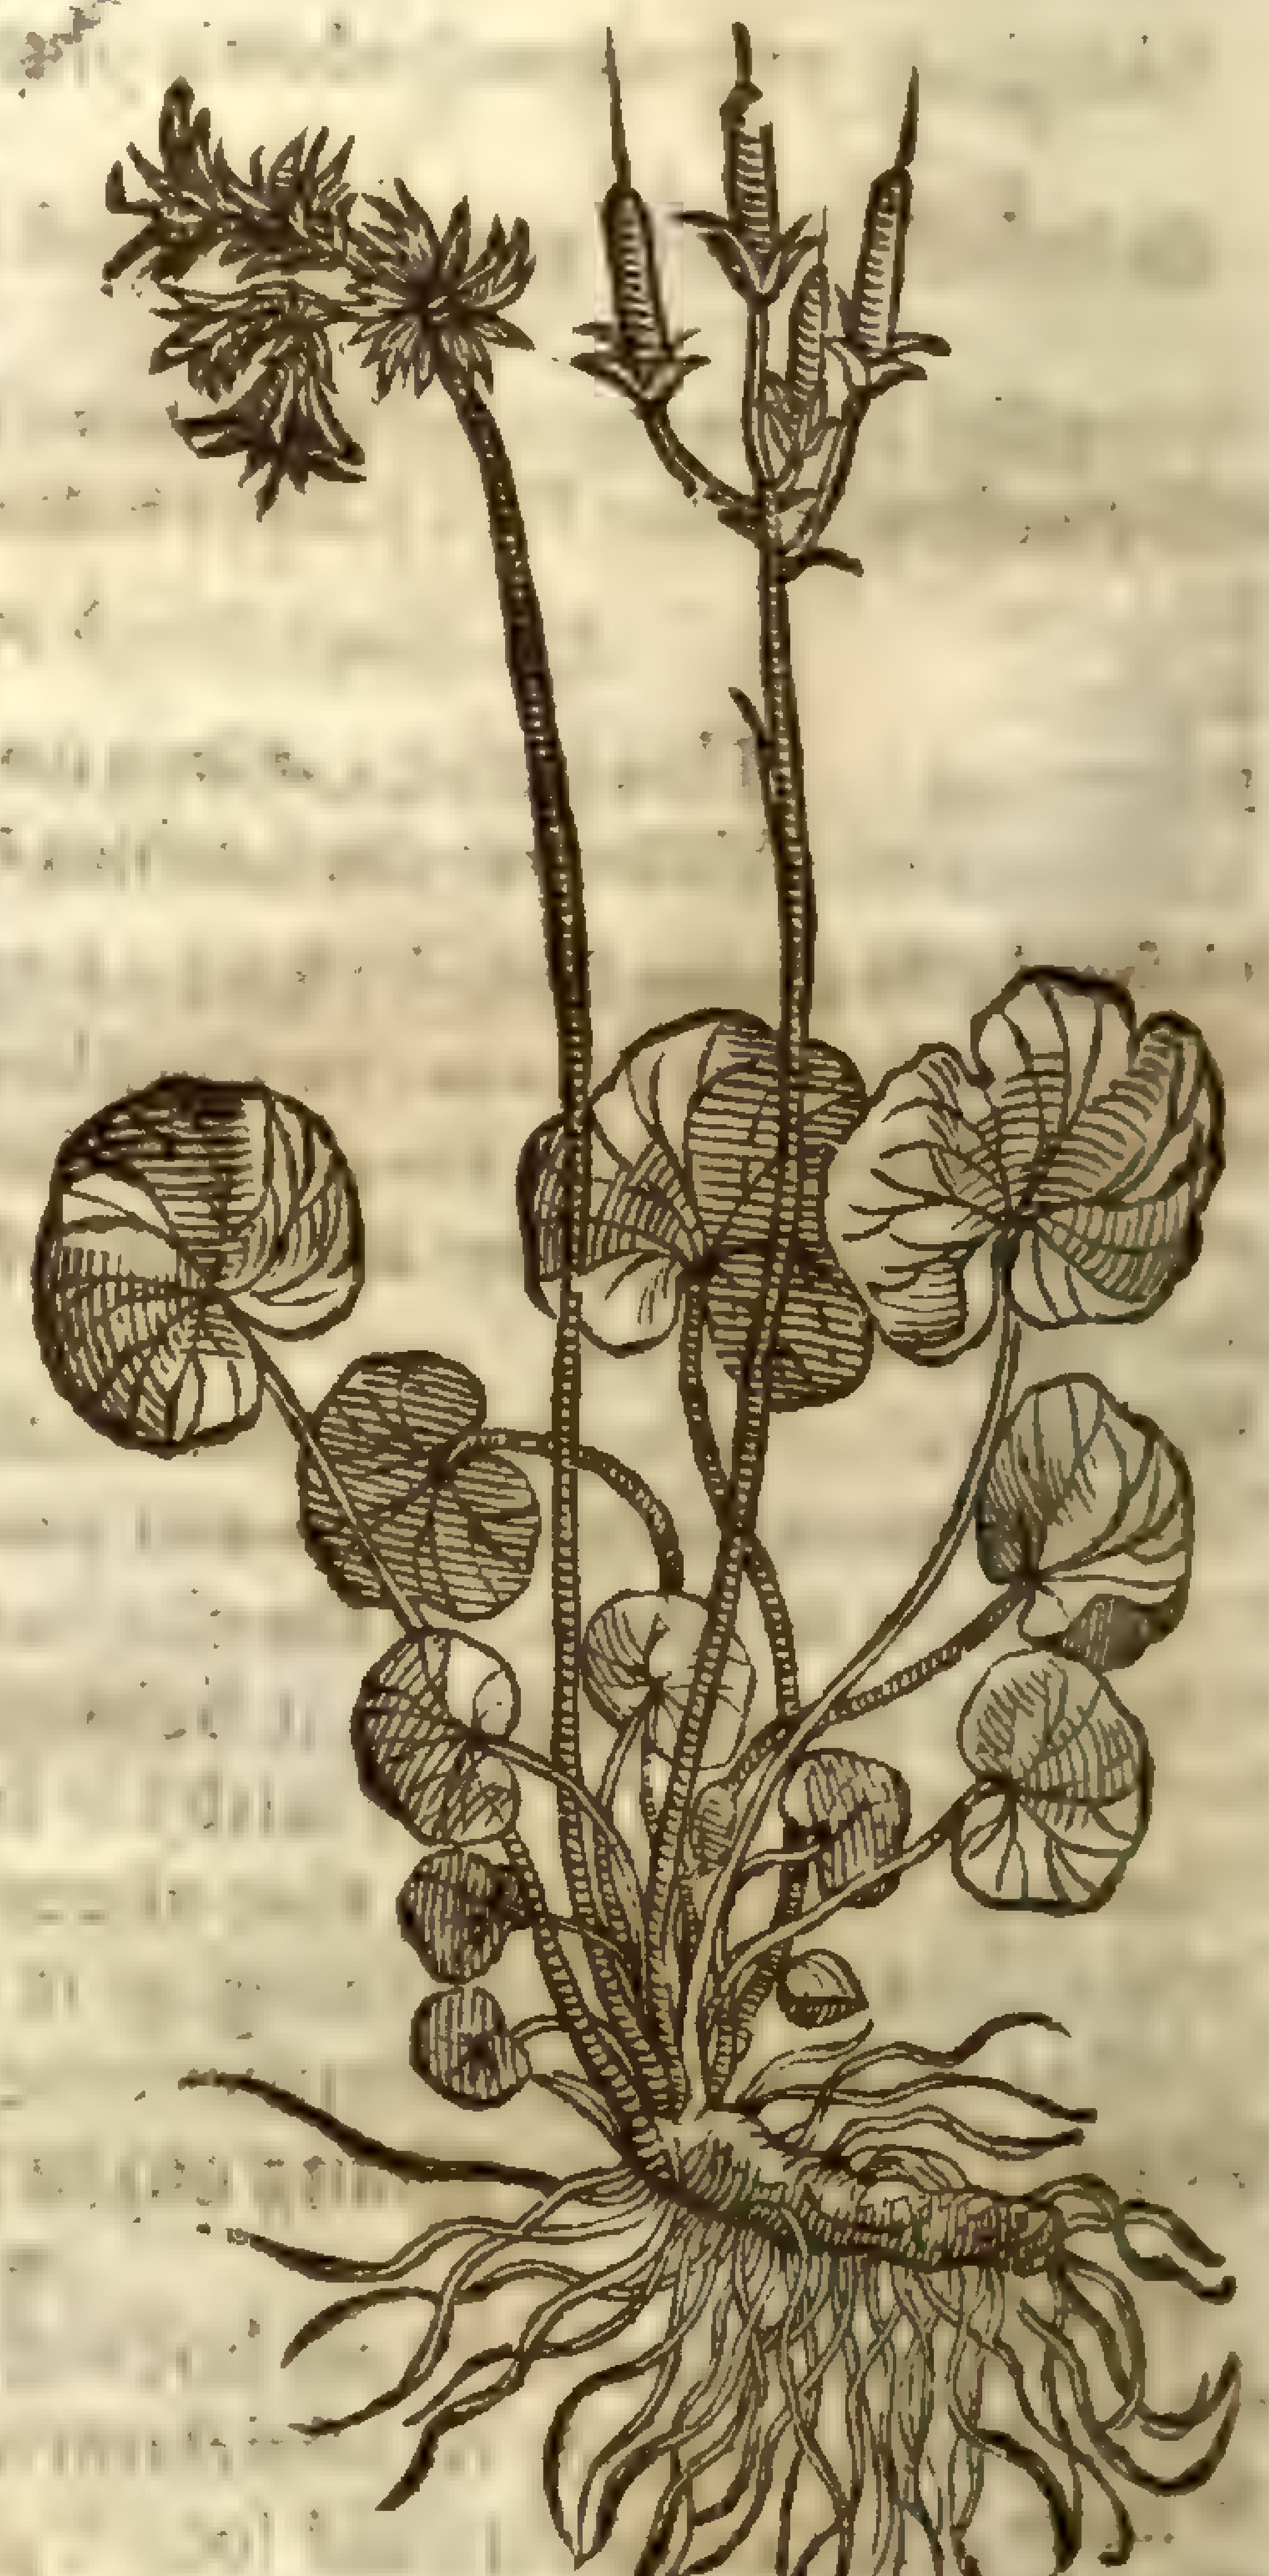
1 *Soldanella marina.*
Sea Binde-weed.



alpina L [illegible]

Convolvulus soldanella, L.
med. dict.
Sm. fl. 1. 285

‡ 2 *Soldanella Alpina major.*
Mountaine Binde-weed.



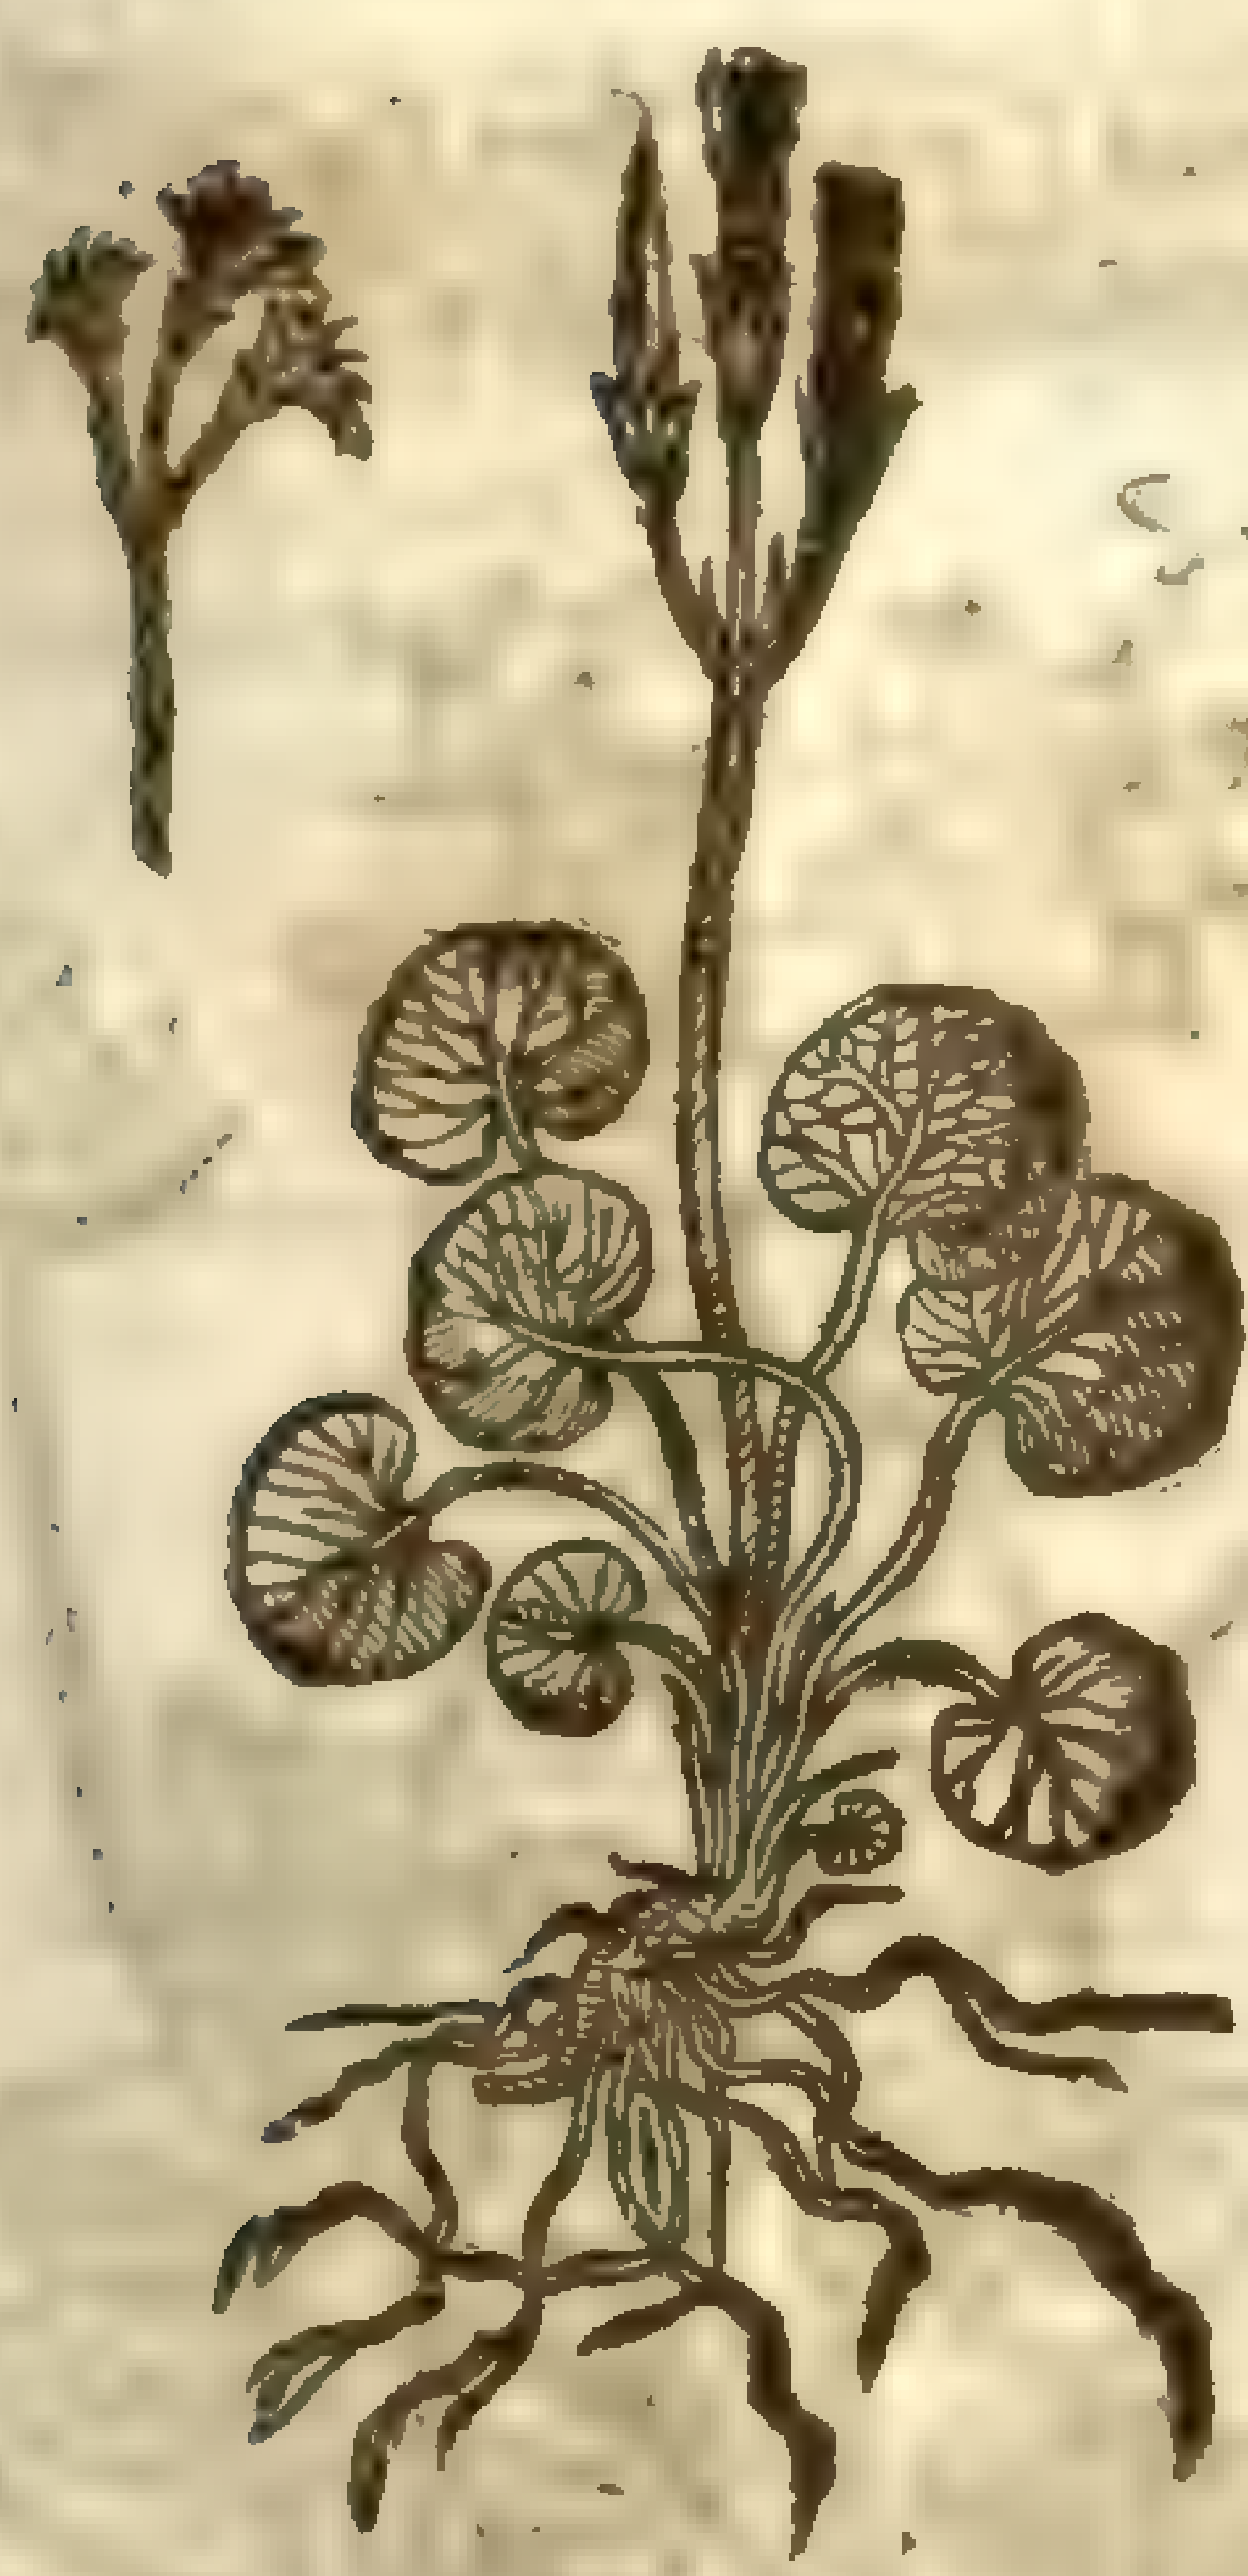
¶ *The Deſcription.*

A 1 *Soldanella* or Sea Binde-weed, hath many ſmall branches, ſomewhat red, trailing vpon the ground, beſet with ſmall and round leaues, not much vnlike Aſarabacca, or the leaues of Ariſtolochia, but ſmaller, betwixt which leaues and the ſtalkes come forth floures formed like a bell, of a bright red incarnate colour, in euery reſpect anſwering the ſmal Bindeweed, whereof it is a kinde, albeit I haue here placed the ſame, for the reaſons rendred in my Proeme. B The ſeed it blacke, and groweth in round huskes: the root is long and ſmall, thruſting it ſelfe far abroad, and into the earth like the other Binde-weeds.

2 *Soldanella* or mountaine Binde-weed hath many round leaues ſpred vpon the ground, not much vnlike the former, but rounder, and more full of veines, greener, of a bitter taſte like ſea Bindeweed: among which commeth forth a ſmall and tender ſtalke a handfull high, bearing at the top little floures like the ſmall Bell-floure, of a sky colour. The root is ſmall and threddy.

‡ 3 There

‡ 3 *Soldanella Alpina minor.*
Small Mountaine Bindweed.



‡ 3 There is of this kinde another hauing all the parts ſmaller, and the leaues redder and rounder: the floures alſo blew, and compoſed of one leafe diuided into fiue parts, and ſucceeded by a longiſh cod, round and ſharp pointed. ‡

¶ *The Place.*

The firſt grows plentifully by the Sea ſhore in moſt places of England, eſpecially neere to Lee in Eſſex, at Merſey in the ſame county, in moſt places of the Iſle of Thanet, and Shepey, and in many places along the Northerne coaſt.

The ſecond groweth vpon the mountaines of Germany, and the Alpes; it groweth vpon the mountaines of Wales, not farre from Cowmers Meare in North-Wales.

¶ *The Time.*

Theſe herbes doe floure in Iune, and are gathered in Auguſt to be kept for medicine.

¶ *The Names.*

The firſt called *Soldanella* is of the Apothecaries and the Antients called *Marina Braſsica*, that is to ſay, Sea Colewoort: but what reaſon hath moued them ſo to do I canot conceiue, vnleſſe it be penury and ſcarſitie of names, and becauſe they know not otherwiſe how to terme it: of this I am ſure, that this plant and *Braſsica* are no more like than things which are moſt vnlike; for *Braſsica Marina* is the Sea Colewort, which doth much reſemble the garden Cabbage or Cole, both in ſhape and in nature, as I haue in his due place expreſſed. A great fault and ouerſight therefore it hath been of the old writers and their ſucceſſors, which haue continued the cuſtome of this error, not taking the paines to diſtinguiſh a Binde-weed from a Cole-wort. But to auoid controuerſies, the truth is, as I haue before ſhewed, that this *Soldanella* is a Binde-weed, and cannot be eſteemed for a *Braſsica*, that is, a Colewort. The later Herbariſts call it *Soldana*, and *Soldanella*: in Dutch, **Zeewind**, that is to ſay, *Convolvulus Marinus*: of *Dioſcorides* κράμβη θαλασσία, (i) *Braſsica Marina*: in Engliſh, Sea Withwinde, Sea Binde-weed, Sea-Bels, Sea-Coale, of ſome, Sea-Fole-foot, and Scottiſh Scuruie-graſſe.

The ſecond is called *Soldanella Montana*: in Engliſh, Mountaine Bind-weed.

¶ *The Nature.*

Sea Bind-weed is hot and dry in the ſecond degree: the ſecond is bitter and very aſtringent.

¶ *The Vertues.*

Soldanella purgeth downe mightily all kinde of watriſh humours, and openeth the ſtoppings of the liuer, and is giuen with great profit againſt the dropſie: but it muſt be boiled with the broth of ſome fat meat or fleſh, and the broth drunke, or elſe the herbe taken in pouder worketh the like effect. A

Soldanella hurteth the ſtomack, and troubleth the weake and delicate bodies which do receiue it in pouder, wherefore aduice muſt be taken to mix the ſaid pouder with Anniſe ſeeds, Cinnamon, ginger, and ſugar, which ſpices do correct his malignitie. B

Practitioners about Auſpurge and Rauiſpurge (cities of Germany) doe greatly boaſt that they haue done wonders with this herbe *Soldanella Montana*; ſaying, that the leaues taken and emplaiſtred vpon the nauell and ſomewhat lower, draw forth water from their bellies that are hydropicke, that is, troubled with water or the dropſie: this effect it worketh in other parts without heating. C

It doth alſo wonderfully bring fleſh in wounds, and healeth them. D

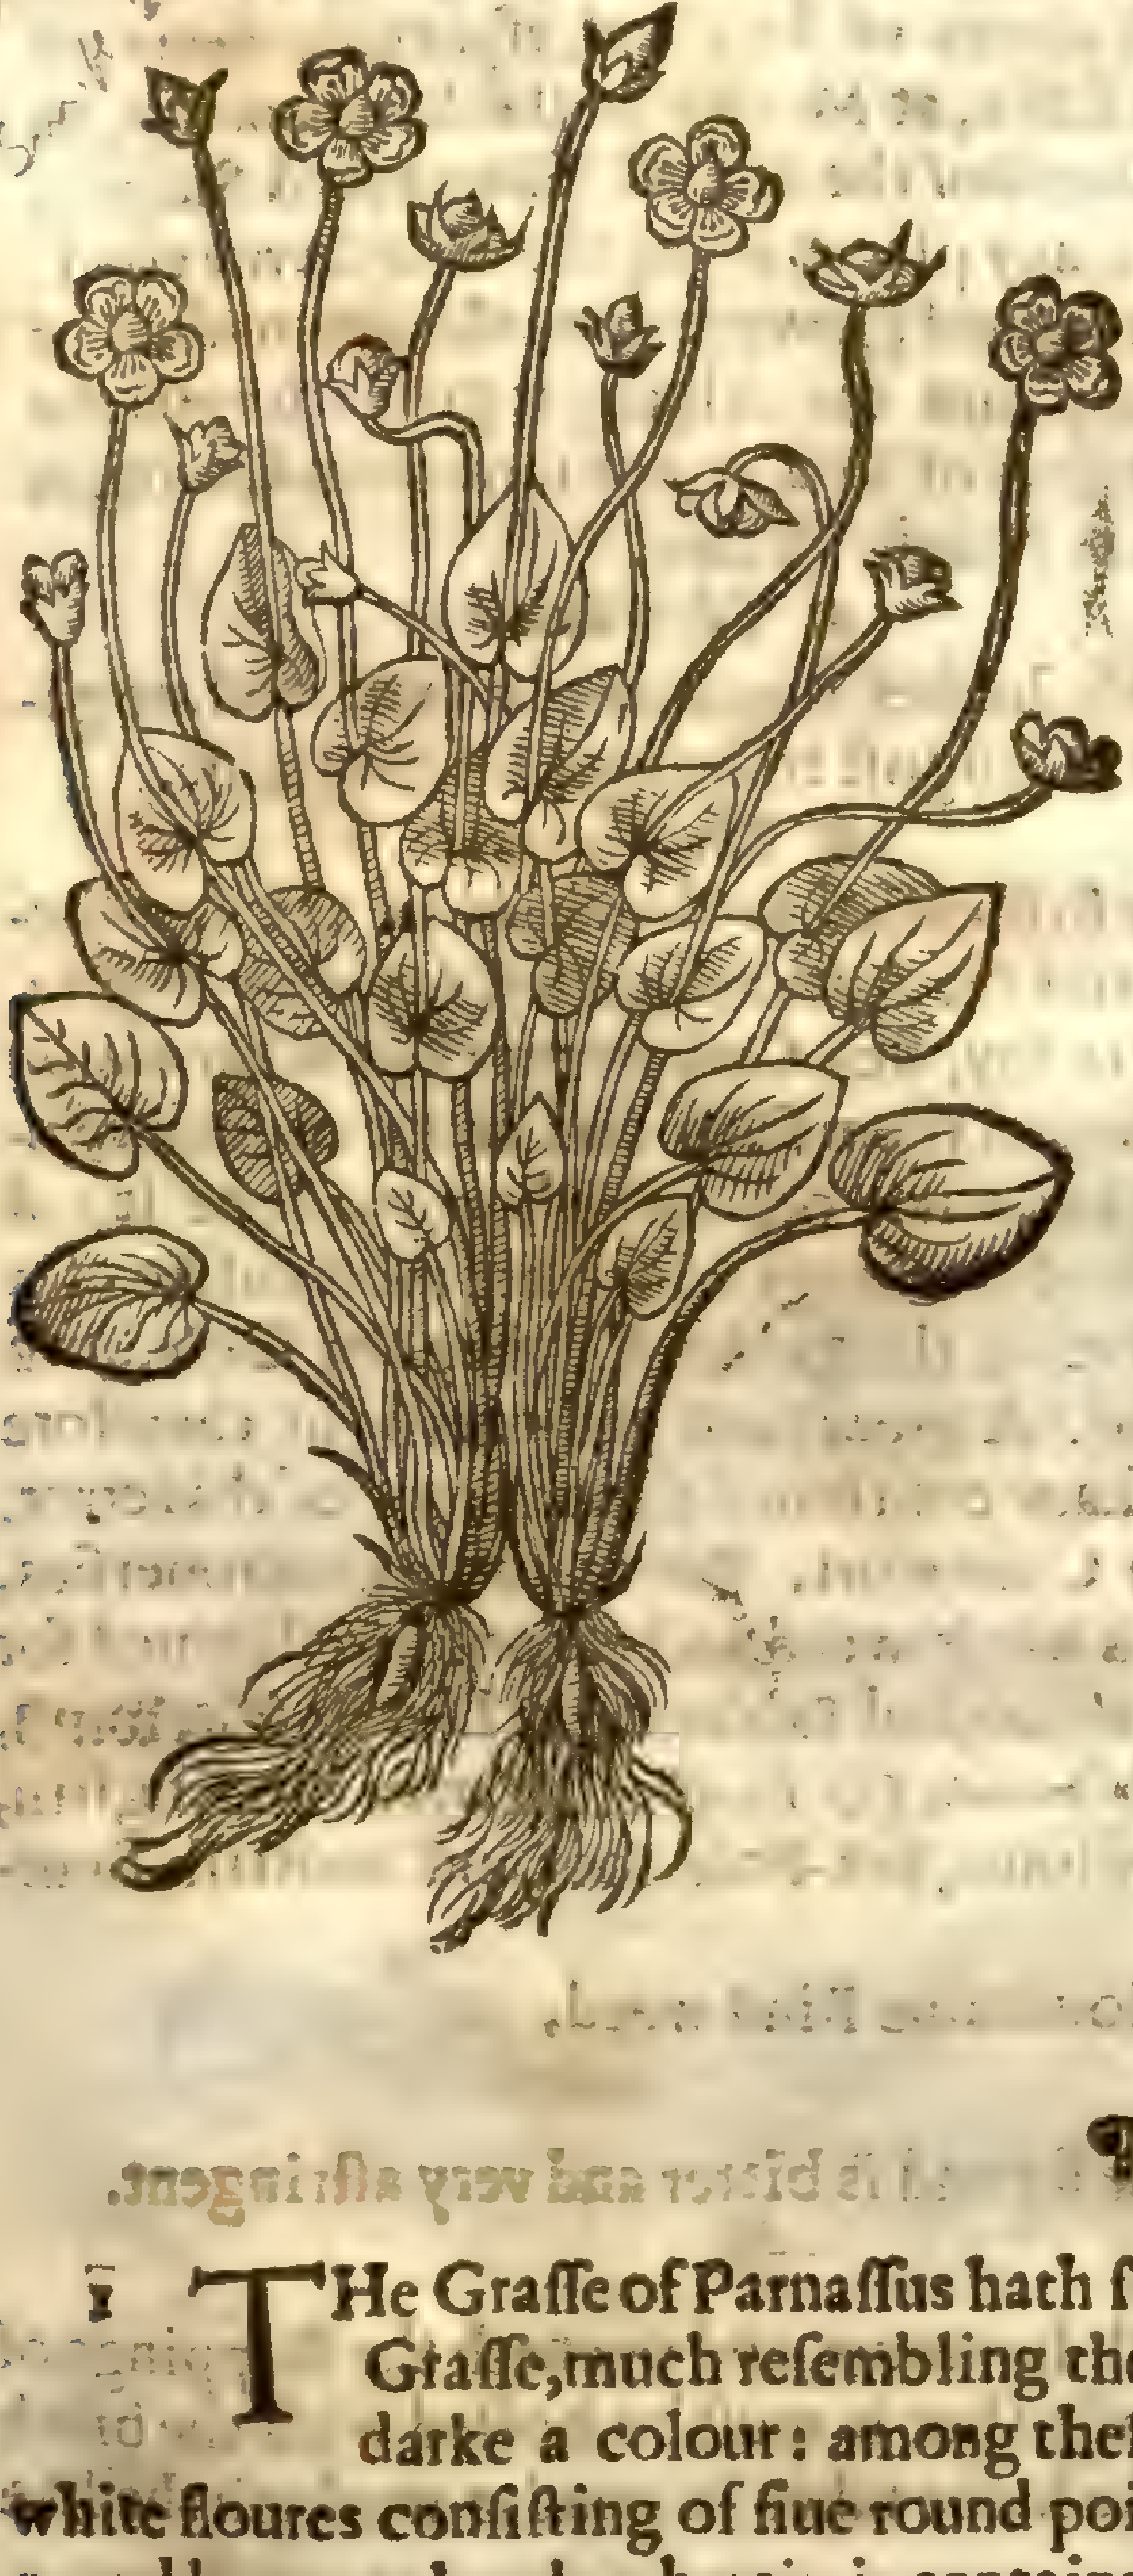
Dioſcorides witneſſeth, that the whole herbe is an enemy to the ſtomacke, biting and extremely purging (both ſodden, and taken with meat) and bringeth troubleſome gripings thereunto, and doth oftentimes more hurt than good. E

‡ My friend Mr. *Goodyer* hath told me, that in Hampſhire at Chicheſter and thereabout they make vſe of this for Scuruie-graſſe, and that not without great errour, as any that know the qualities may eaſily perceiue. ‡ F

Chap. 308. *Of the Graſſe of Parnaſſus.*

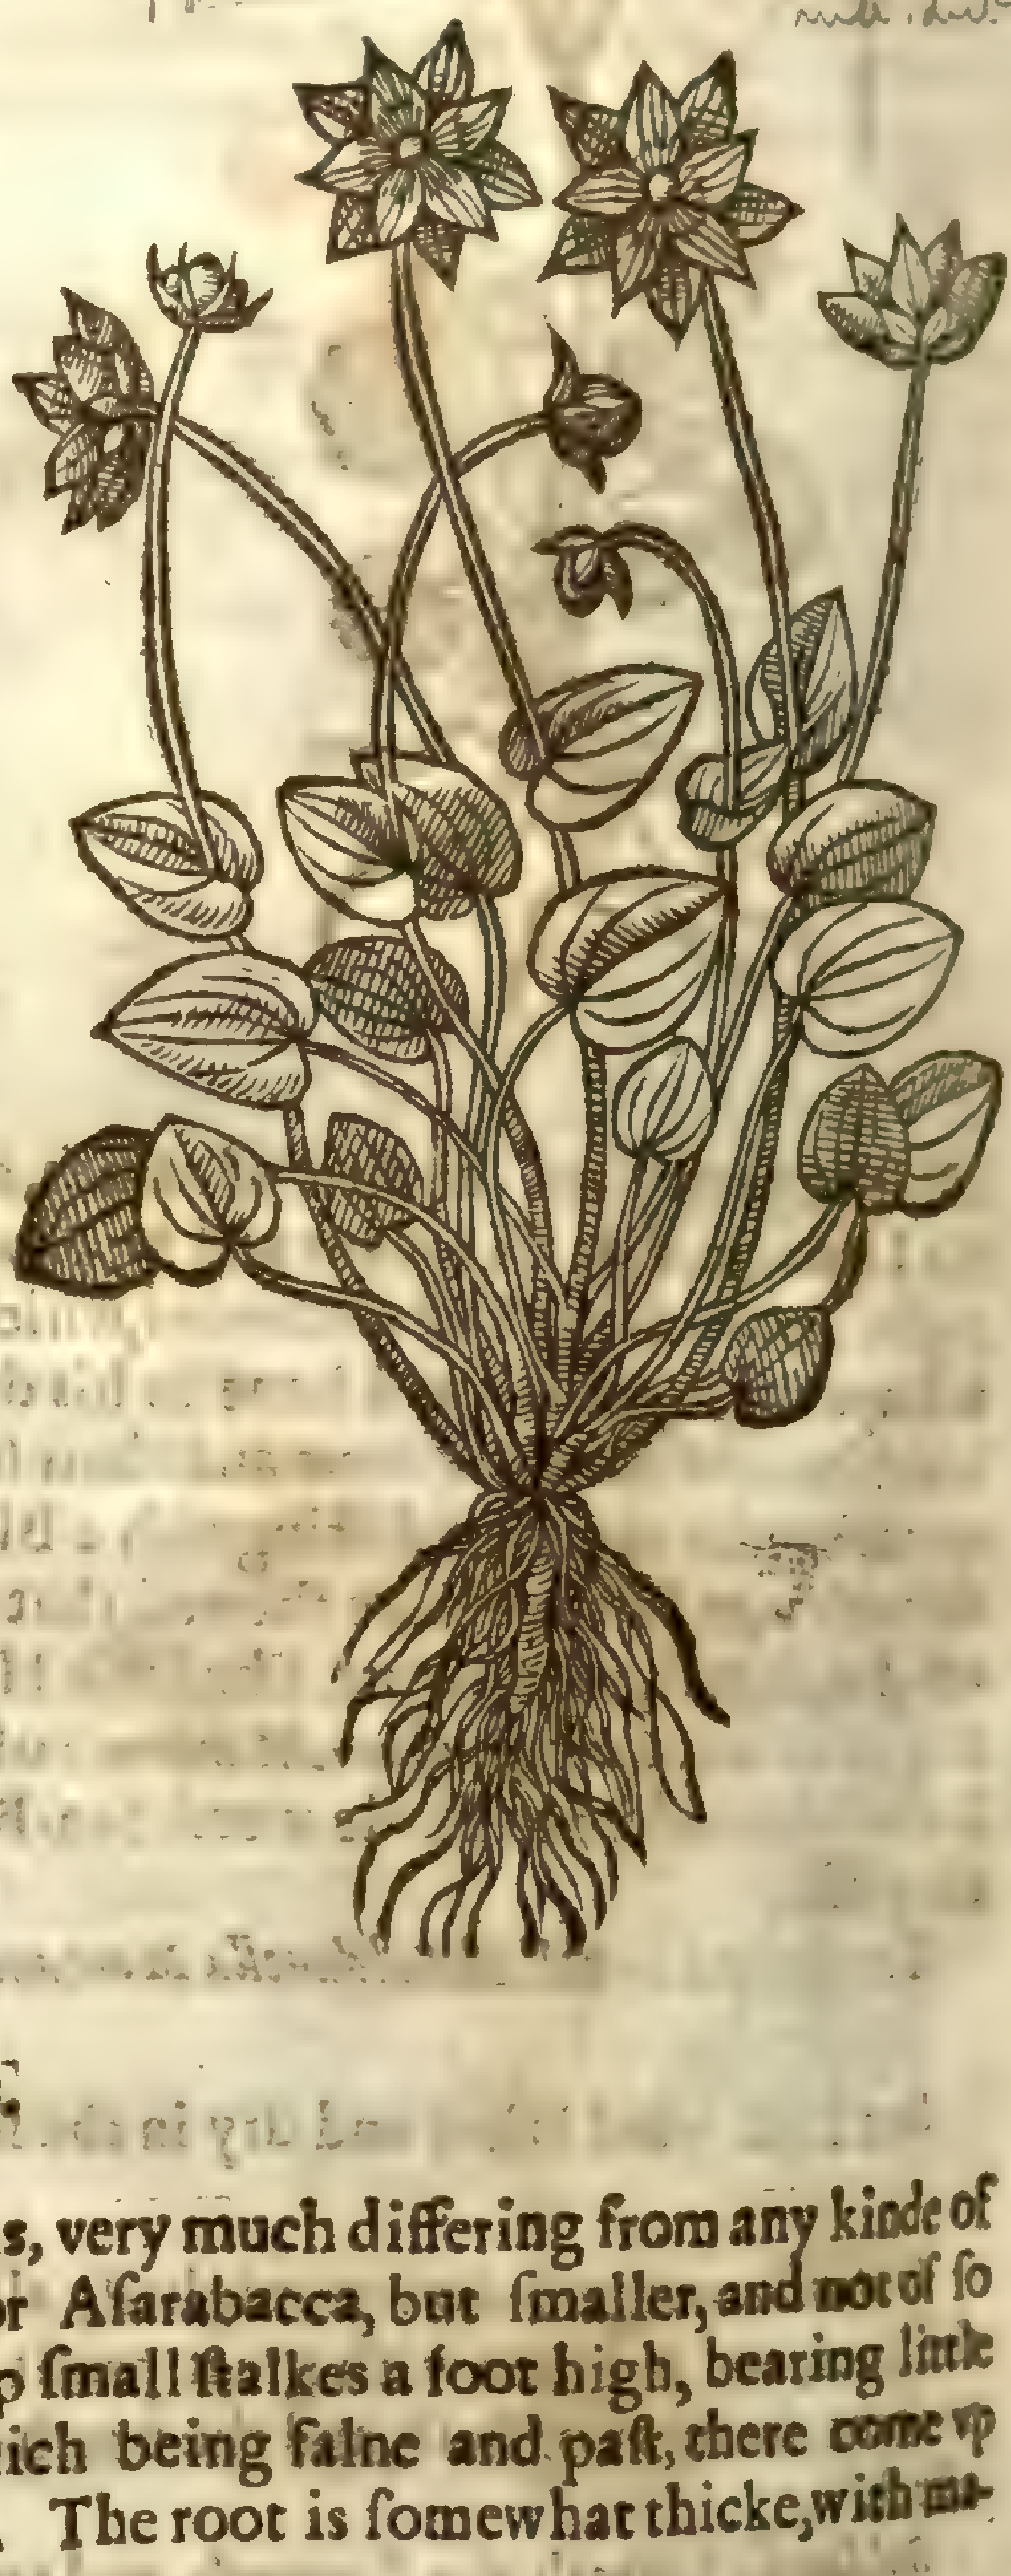
† 1 *Gramen Parnaſsi.*
Graſſe of Parnaſſus.

Parnassia palustris [illegible]
Smith 2. 714



‡ 2 *Gramen Parnaſsi flore duplici.*
Graſſe of Parnaſſus with double floures.

Parnassia [illegible] β



Lob. ic. 603

¶ *The Deſcription.*

1 THe Graſſe of Parnaſſus hath ſmall round leaues, very much differing from any kinde of Graſſe, much reſembling the leaues of Ivie, or Aſarabacca, but ſmaller, and not of ſo darke a colour: among theſe leaues ſpring vp ſmall ſtalkes a foot high, bearing little white floures conſiſting of fiue round pointed leaues; which being falne and paſt, there come vp round knops or heads, wherein is contained a reddiſh ſeed. The root is ſomewhat thicke, with many ſtrings annexed thereto.

2 The ſecond kinde of *Gramen Parnaſsi* doth anſwer the former in each reſpect, ſauing that the leaues are ſomewhat larger, and the floures double, otherwiſe very like.

¶ *The Place.*

The firſt groweth very plentifully in Lanſdall and Crauen, in the North parts of England; at Doncaſter, and in Thornton fields in the ſame country: moreouer, in the Moore neer to Linton, by Cambridge, at Heſſet alſo in Suffolke, at a place named Drinkſtone, in the medow called Butchers mead. ‡ Mr. *Goodyer* found it in the boggy ground below the red well of Wellingborough in Northampton ſhire: and Mr. *William Broad* obſerued it to grow plentifully in the Caſtle fields of Berwicke vpon Tweed. ‡

The ſecond is a ſtranger in England.

¶ *The Time.*

Theſe herbes do floure in the end of Iuly, and their ſeed is ripe in the end of Auguſt.

¶ *The Names.*

Valerius Cordus hath among many that haue written of theſe herbes ſaid ſomething of them to good purpoſe, calling them by the name of *Hepatica alba* (whereof without controuerſie they are kindes) in Engliſh, white Liuerwoort: although there is another plant called *Hepatica alba*, which for diſtinction ſake I haue thought good to Engliſh, Noble white Liuerwort.

The ſecond may be called Noble white Liuerwort the double floure.

¶ *The Temperature.*

The ſeed of Parnaſſus Graſſe, or white Liuerwort, is dry, and of ſubtill parts.

¶ *The Vertues.*

The decoction of the leaues of Parnaſſus Graſſe drunken, doth dry and ſtrengthen the feeble and moiſt ſtomacke, ſtoppeth the belly, and taketh away the deſire to vomit. A

The ſame boiled in wine or water, and drunken, eſpecially the ſeed thereof, prouoketh vrine, breaketh the ſtone, and driueth it forth. B

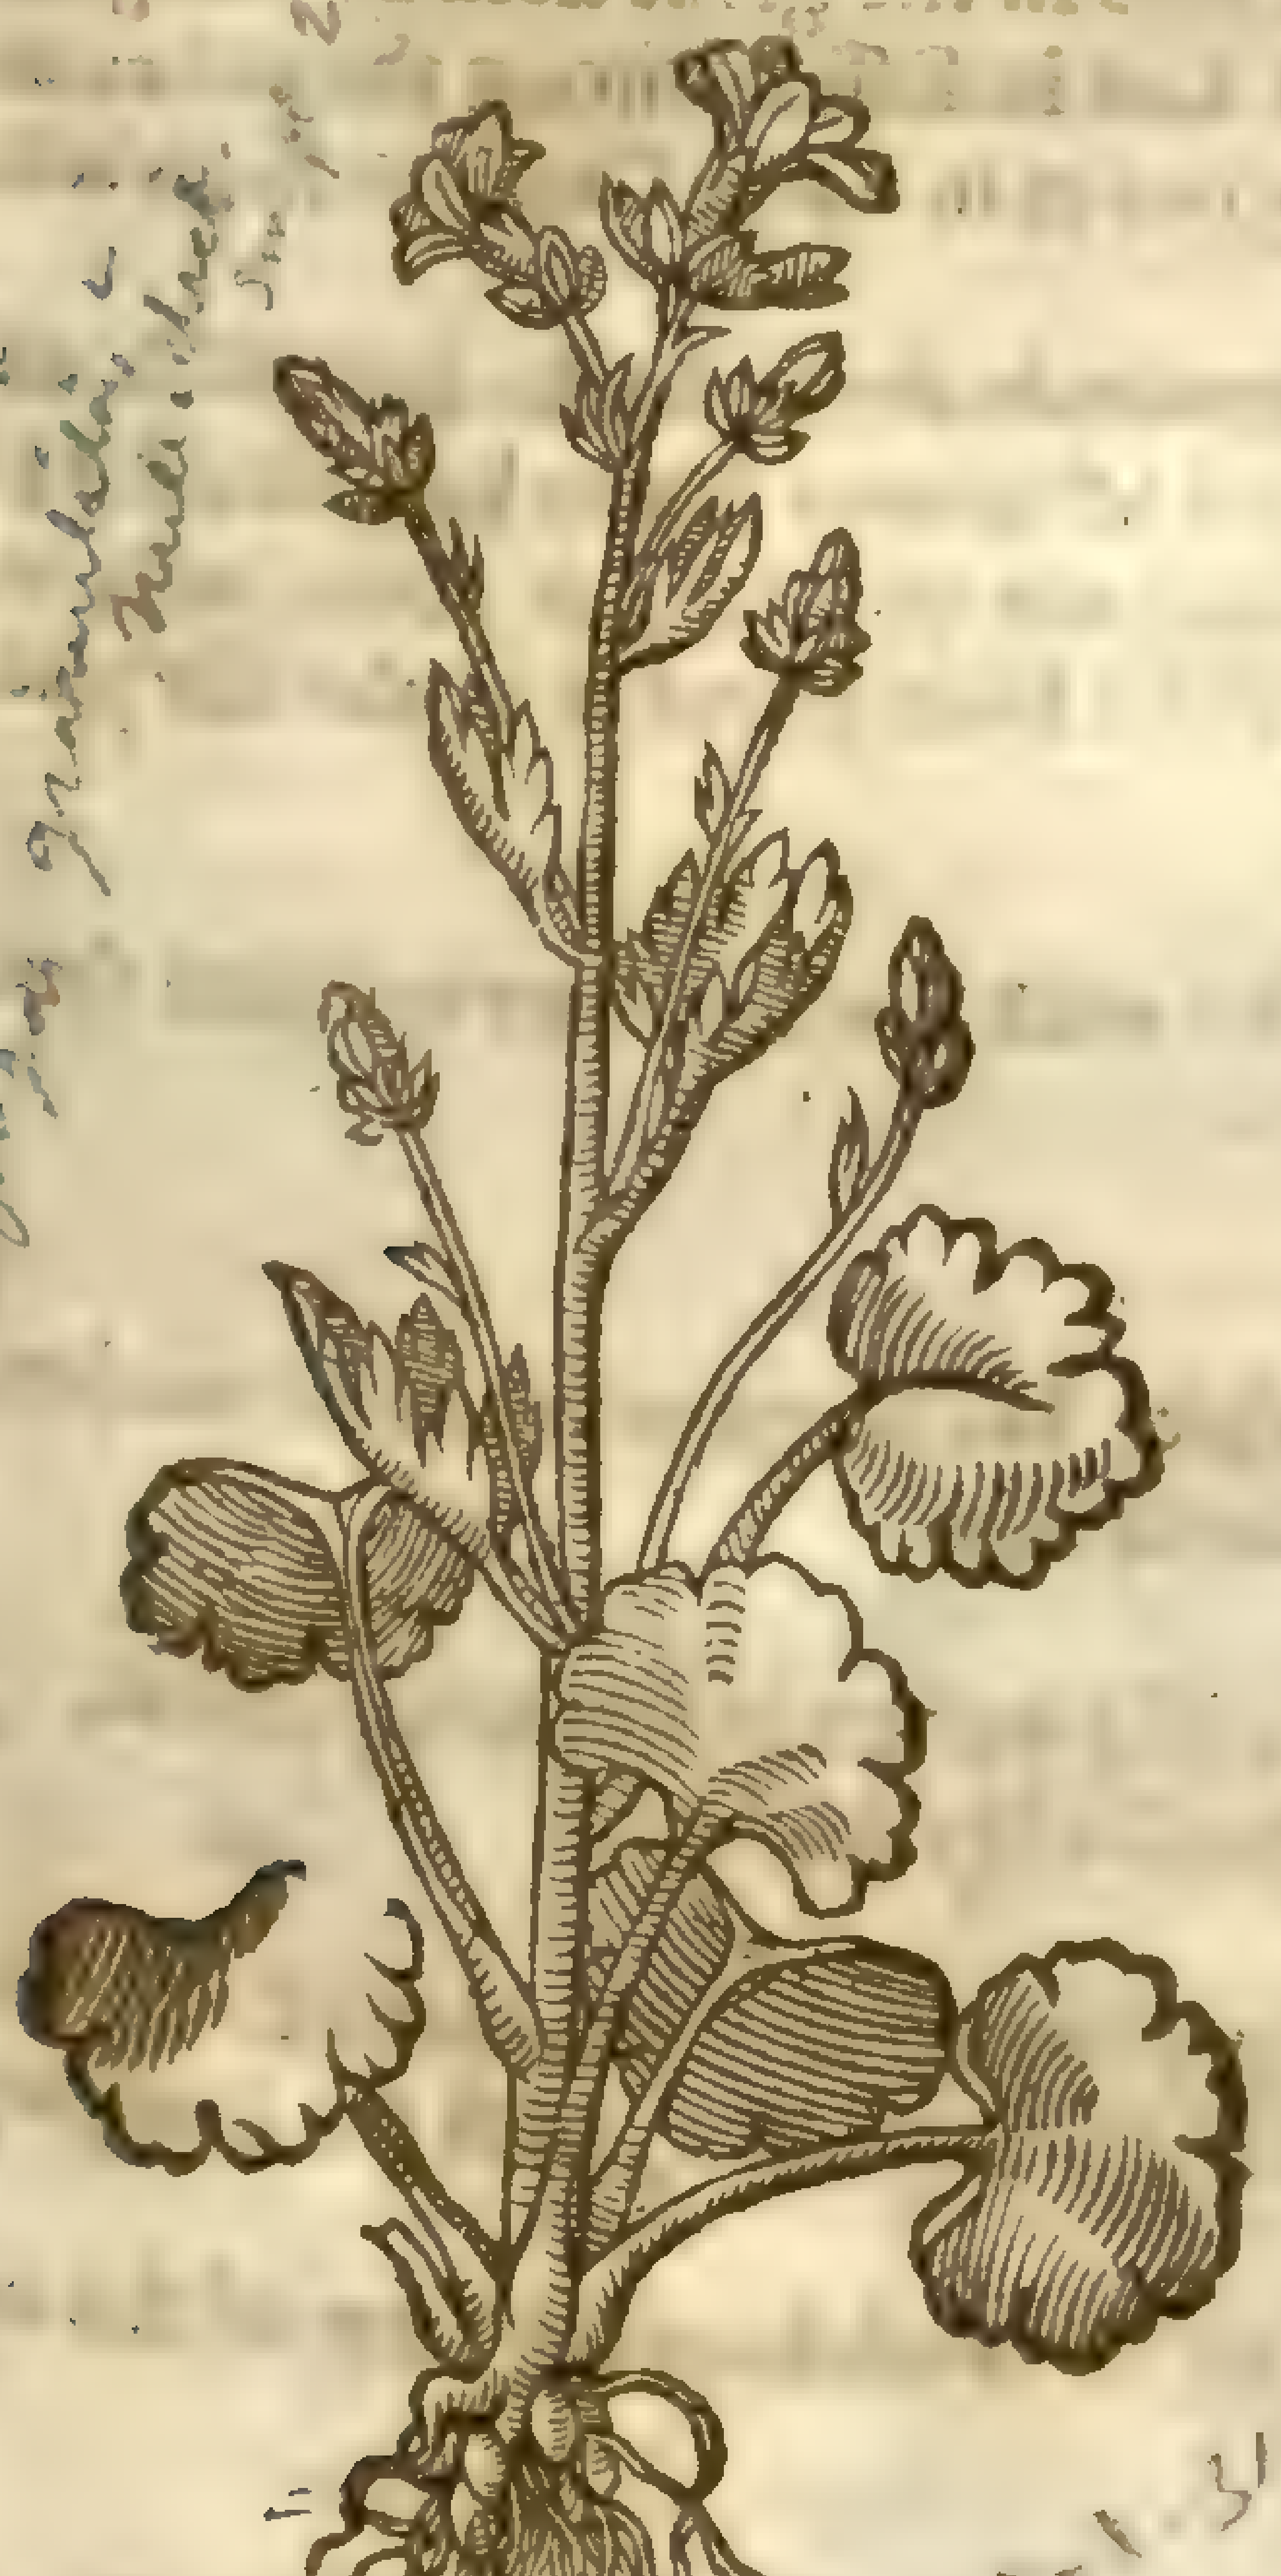
† The figure that was formerly in the firſt place of this Chapter was of *Vnifolium*, deſcribed before, *cap.* 60. *pag.* 406. that which was in the ſecond place belonged to the firſt deſcription.

CHAP. 309. *Of white Saxifrage, or Golden Saxifrage.*

¶ *The Deſcription.*

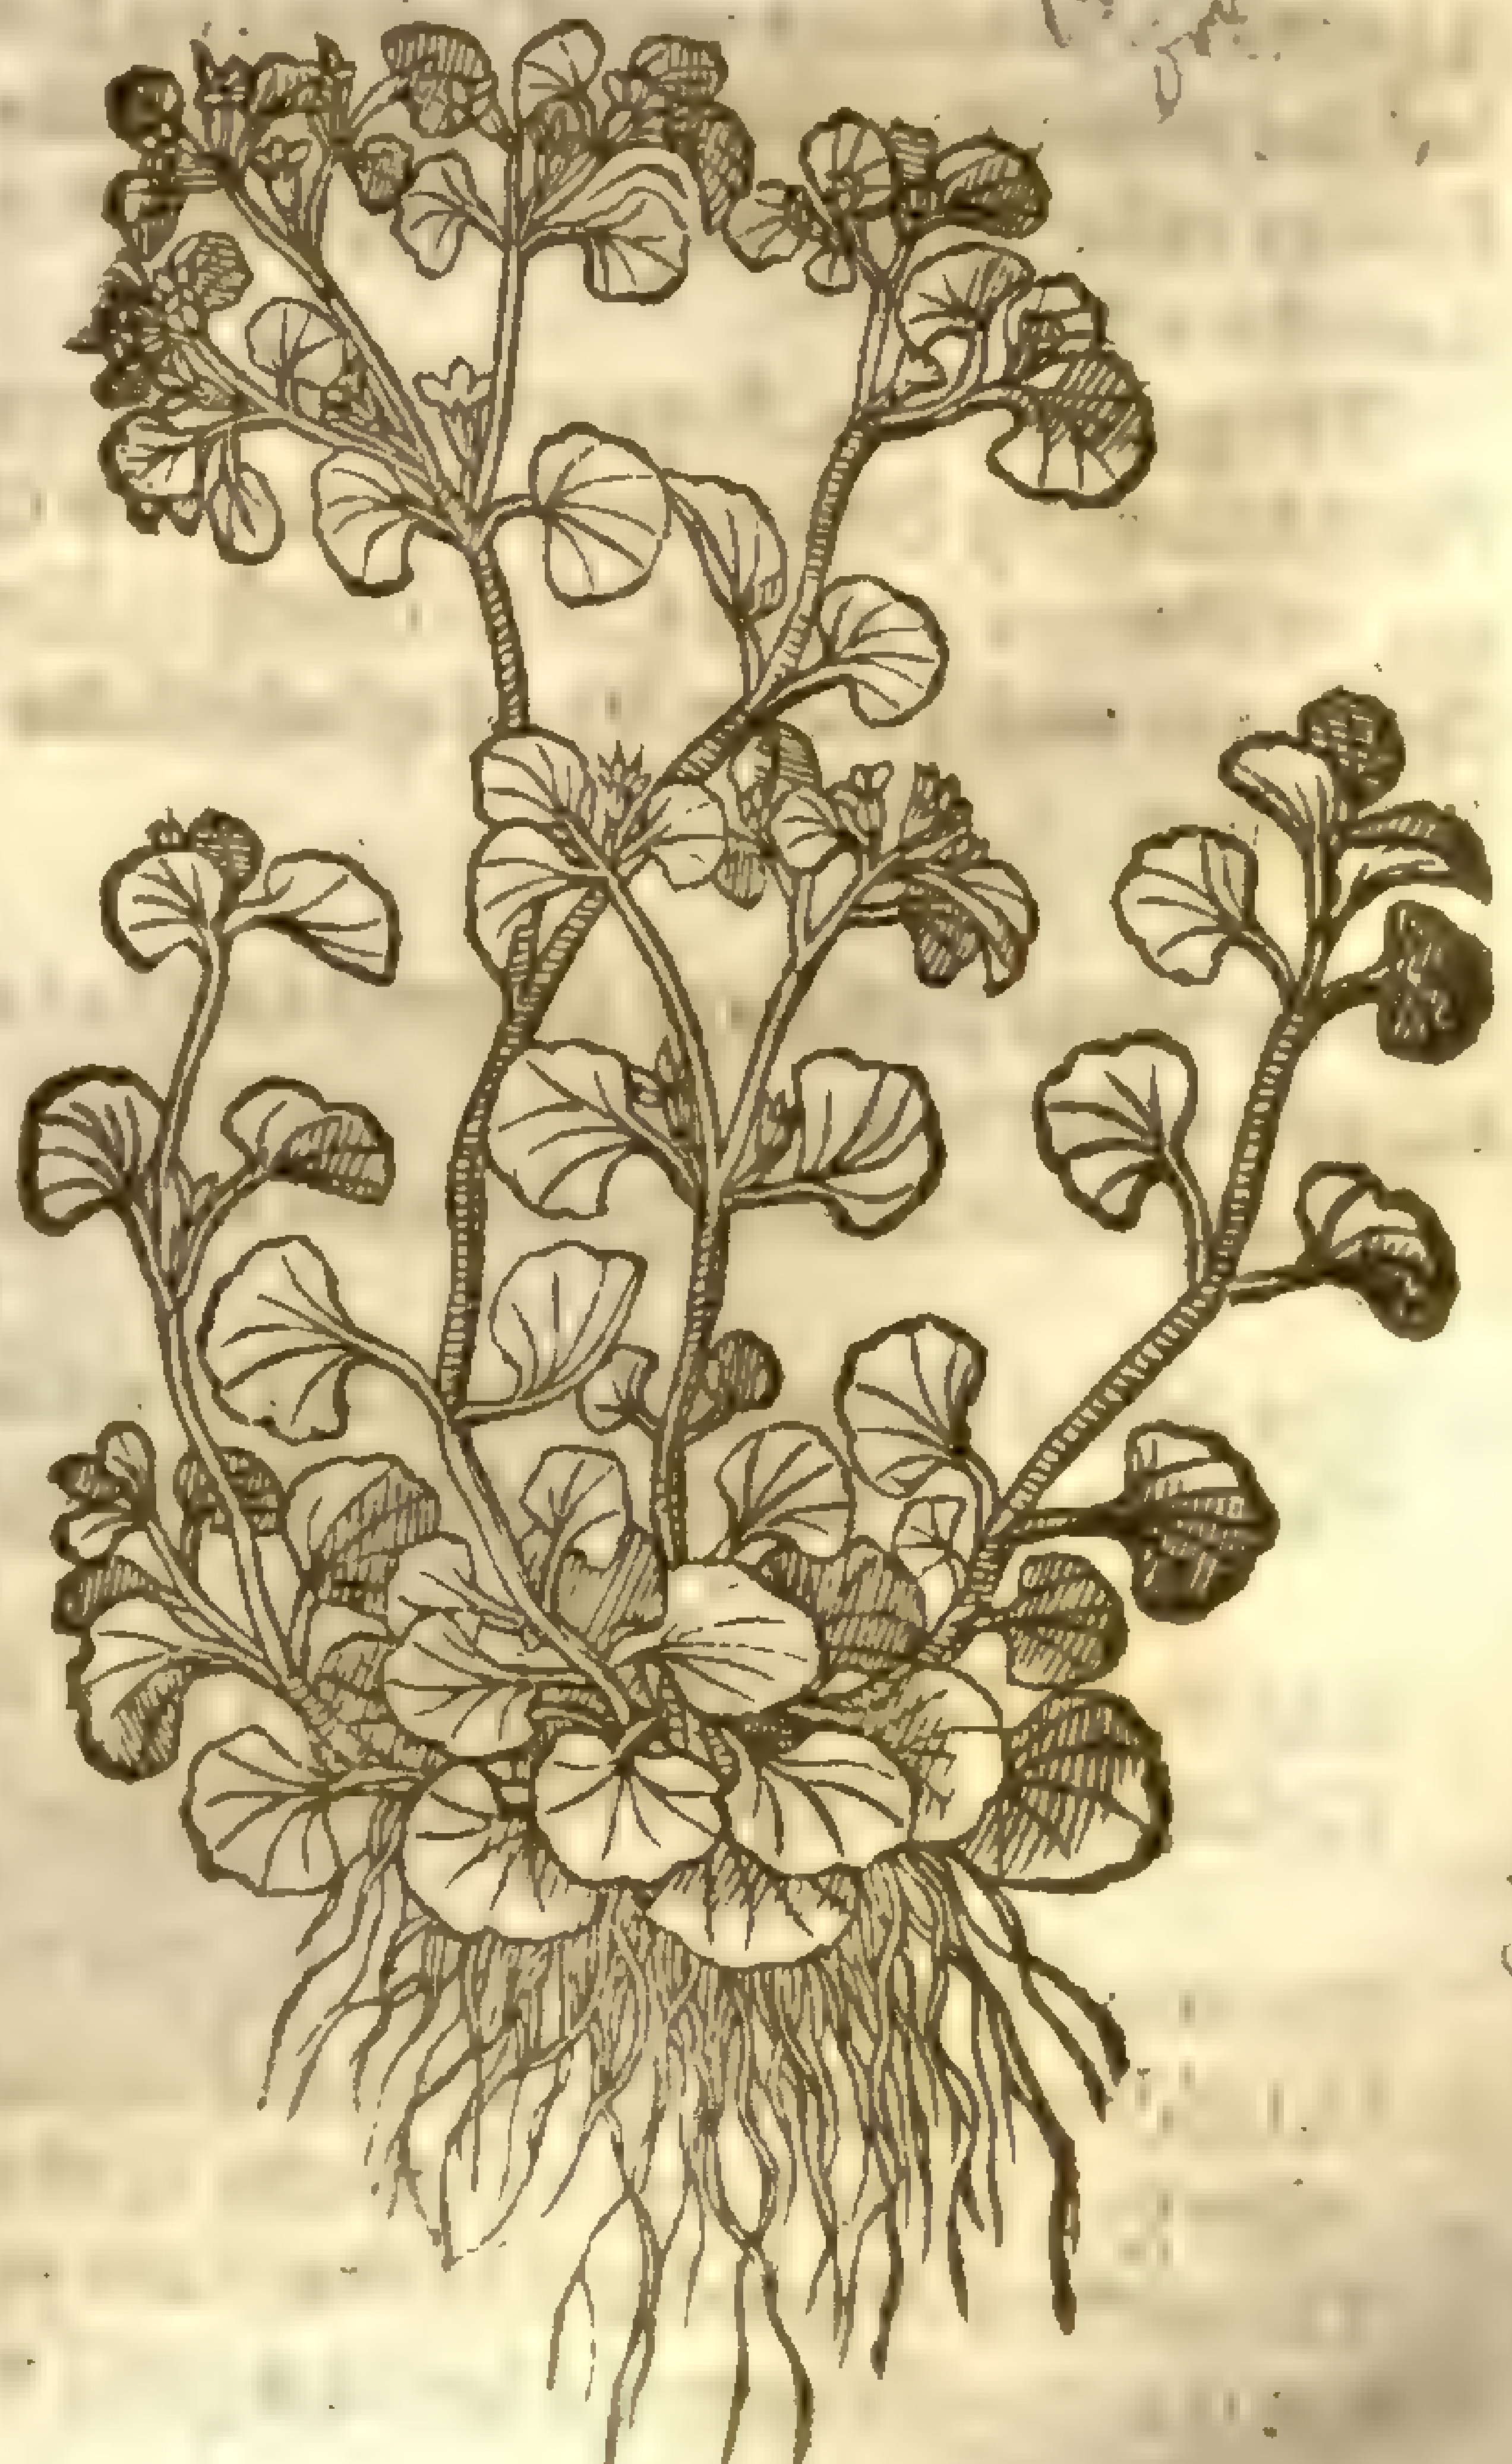
1 THe white Saxifrage hath round leaues ſpred vpon the ground, and ſomewhat jagged about the edges, not much vnlike the leaues of ground Ivie, but ſofter and ſmaller, and of a more faint yellowiſh greene: among which riſeth vp a round hairie ſtalke a cubit high, bearing at the top ſmall white floures, almoſt like Stocke-gillofloures: the root is compact of a number of blacke ſtrings, whereunto are faſtened very many ſmall reddiſh graines or round roots as bigge as pepper cornes, which are vſed in medicine, and are called *Semen Saxifragæ albæ*; that is, the ſeed of white Saxifrage, or Stone-breake, although (beſides theſe foreſaid round knobbes) it hath alſo ſmall ſeed contained in little huskes, following his floure as other herbes haue.

1 *Saxifraga alba.*
White Saxifrage.



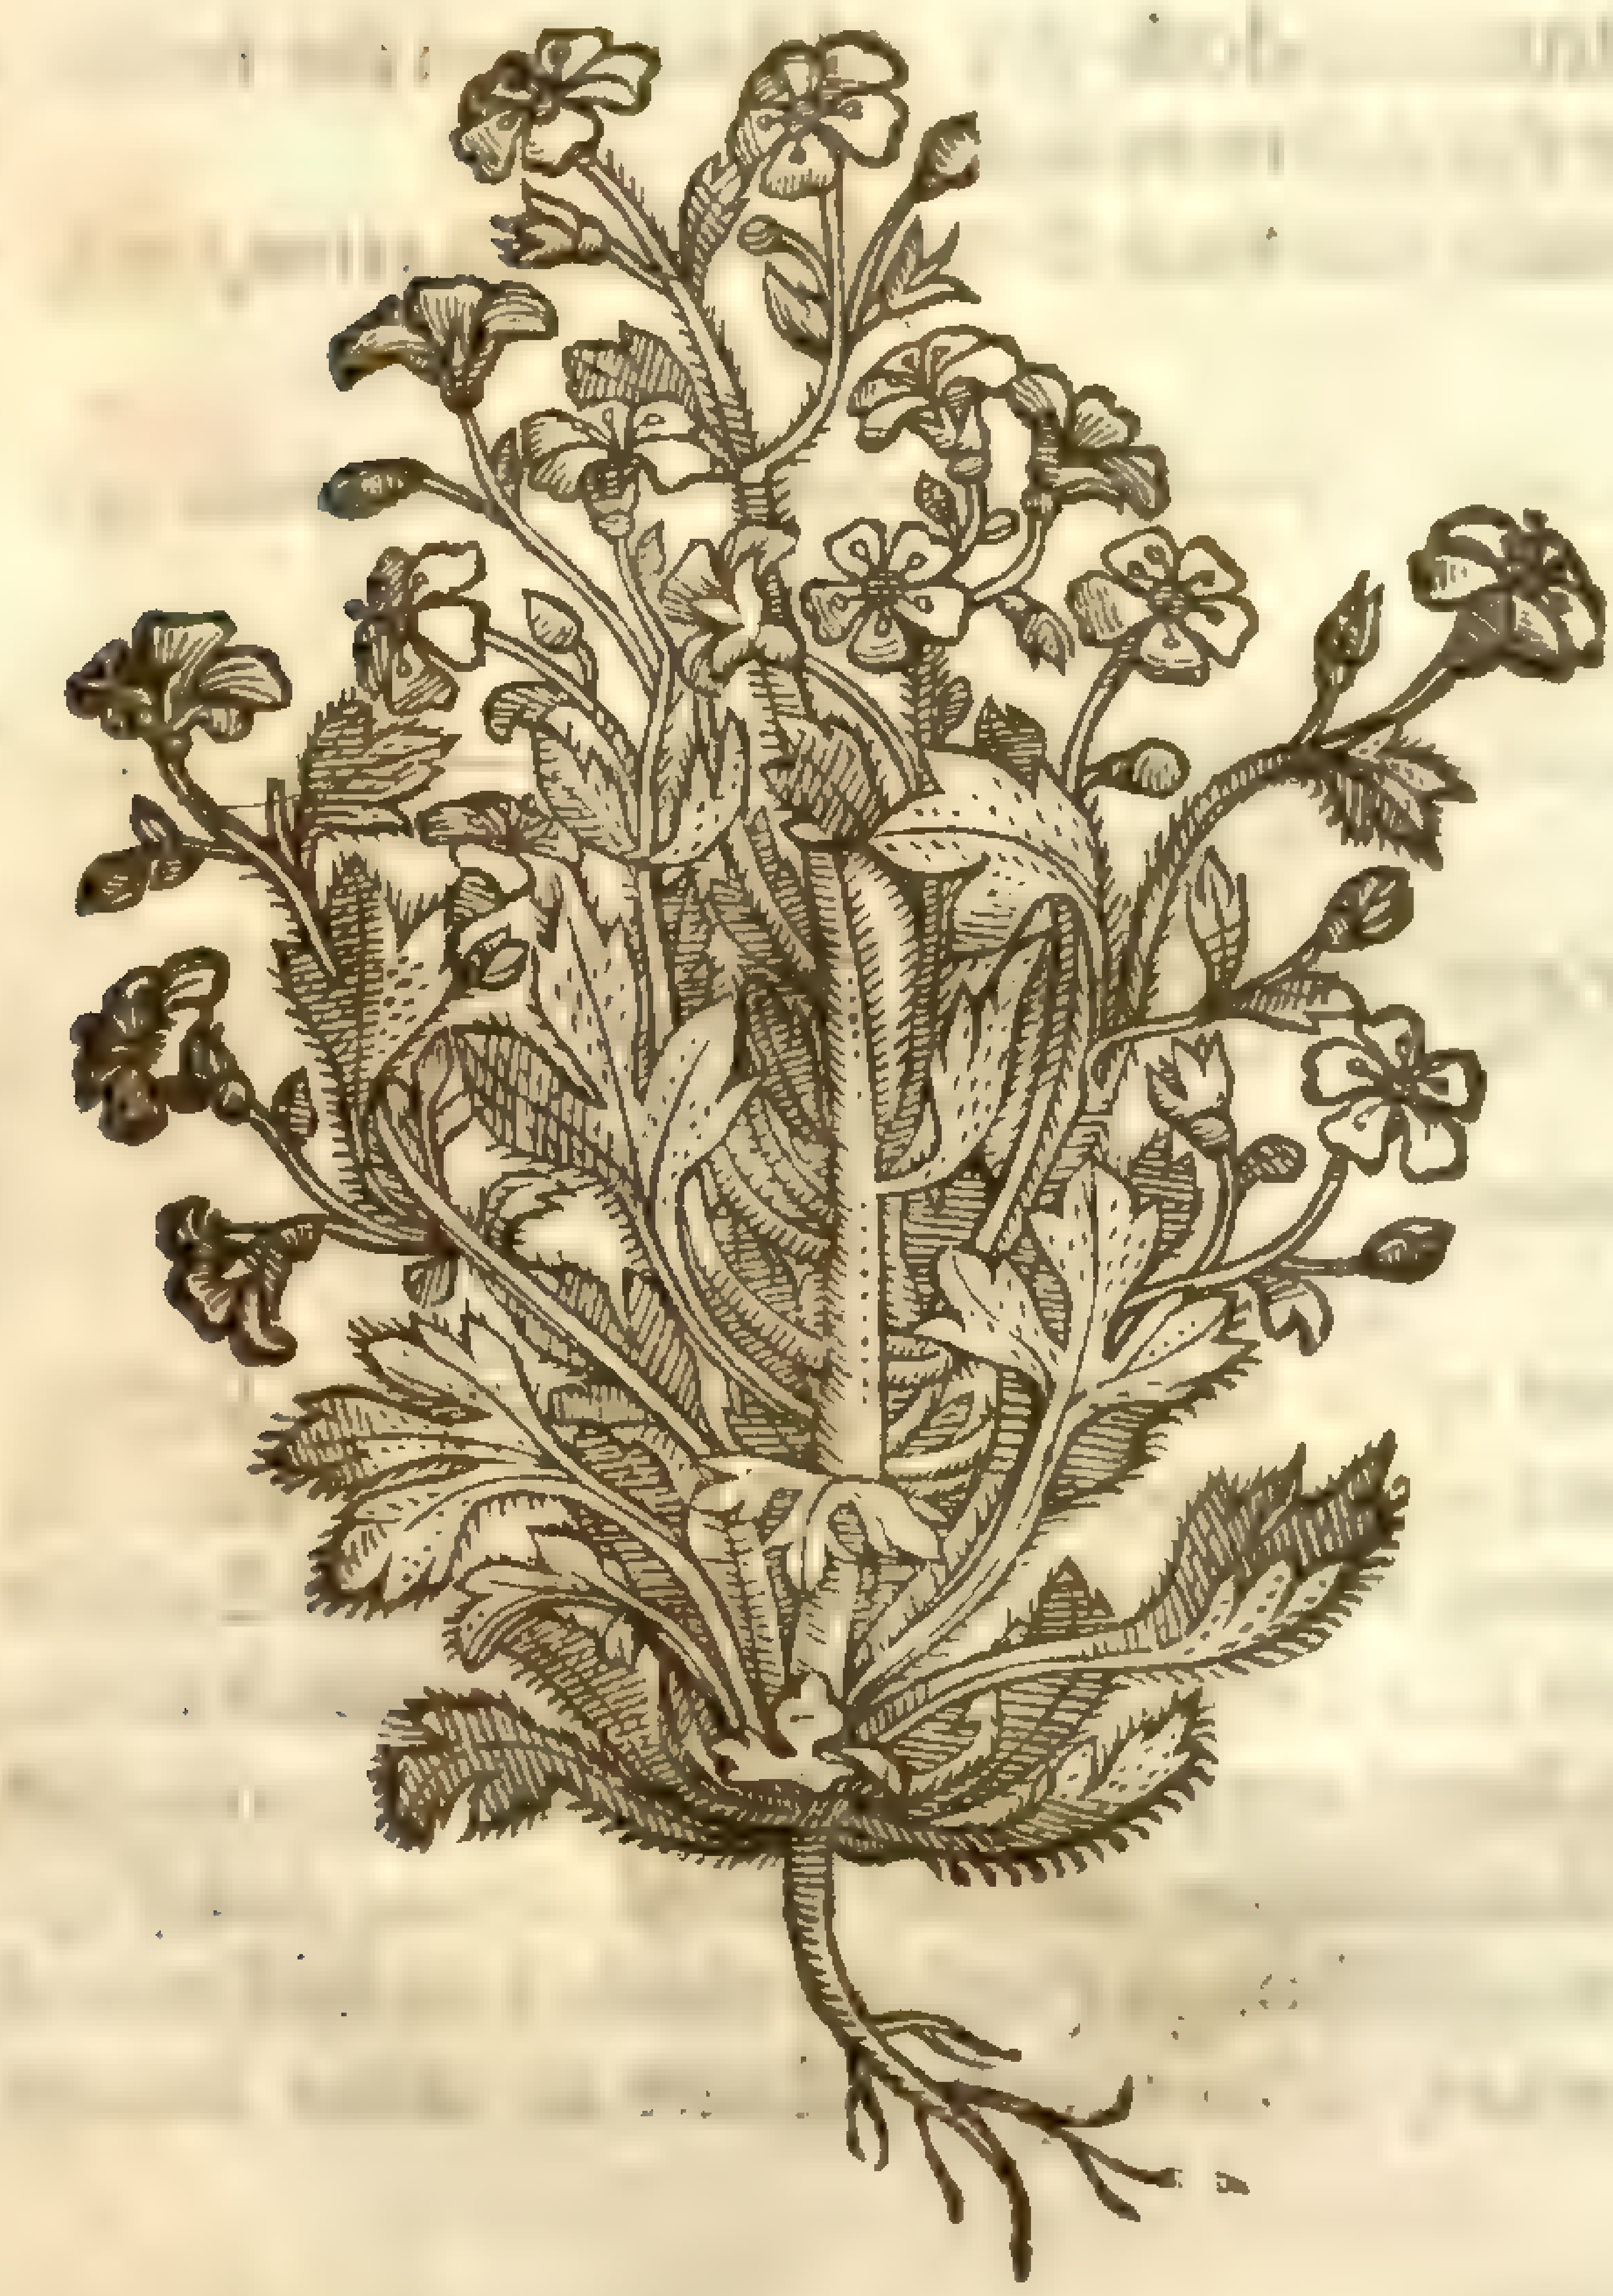
Saxifraga granulata

2 *Saxifraga aurea.*
Golden Saxifrage.



Chrysosplenium

‡ 3 *Saxifraga alba petræa.*
White Rocke Saxifrage.



2 Golden Saxifrage hath round compaſſed leaues, bluntly indented about the borders like the former, among which riſe vp ſtalkes a handfull high, at the top whereof grow two or three little leaues together: out of the middle of them ſpring ſmall floures of a golden color; after which come little husks, wherein is contained the red ſeed, not vnlike the former: the root is tender, creeping in the ground with long threds or haires.

‡ 3 *Pona* hath ſet forth this plant by the name of *Saxifraga alba petræa*, and therefore I haue placed it here; though I thinke I might more fitly haue ranked him with *Paronychia rutaceo folio* formerly deſcribed. It hath a ſmall ſingle root from which ariſe diuers fat longiſh leaues, ſomewhat hairy, and diuided into three parts: amongſt thoſe riſeth vp a round knotty ſtalke, roughiſh, and of a purpliſh colour, ſome halfe foot high, diuided into ſundry branches which carry white floures, conſiſting of fiue leaues apiece, with ſome yellowiſh threds in their middles: theſe falling, there remaines a cup containing a very ſmall ſeed. It floures at the end of Iune in the ſhadowie places of the Alpes, whereas *Pona* firſt obſerued it. ‡

¶ *The Place.*

The white Saxifrage groweth plentifully in ſundry places of England, and eſpecially in a field on the left hand of the high way, as you goe from the place of execution called Saint Thomas Waterings vnto Dedford by London. It groweth alſo in the great field by Iſlington called the Mantles: alſo in the greene places by the ſea ſide at Lee in Eſſex, among the ruſhes, and in ſundry other places thereabout, and elſe where. ‡ It alſo growes in Saint Georges fields behinde Southwarke. ‡

The golden Saxifrage groweth in the moiſt and mariſh grounds about Bathe and Wels, alſo in the Moores by Boſton and Wisbich in Lincolneſhire: ‡ and Mr. *George Bowles* hath found it growing in diuers woods at Chiſſelhurſt in Kent: Mr. *Goodyer* alſo hath obſerued it abundantly on the ſhadowie moiſt rockes by Mapledurham in Hampſhire: and I haue found it in the like places in Yorkſhire. ‡

¶ *The Time.*

The white Saxifrage floureth in May and Iune: the herbe with his floure are no more ſeene vntill the next yeare.

The golden Saxifrage floureth in March and Aprill.

¶ *The Names.*

The firſt is called in Latine *Saxifraga alba:* in Engliſh, white Saxifrage, or white Stone-breake.

The ſecond is called Golden Saxifrage, or Golden Stone-breake.

¶ *The Nature.*

The firſt of theſe, eſpecially the root and ſeed thereof, is of a warme or hot complexion.

Golden Saxifrage is of a cold nature, as the taſte doth manifeſtly declare.

¶ *The Vertues.*

A The root of white Saxifrage boiled in wine and drunken, prouoketh vrine, clenſeth the kidnies and bladder, breaketh the ſtone and driueth it forth, and is ſingular good againſt the ſtrangury, and all other griefes and imperfections in the reines.

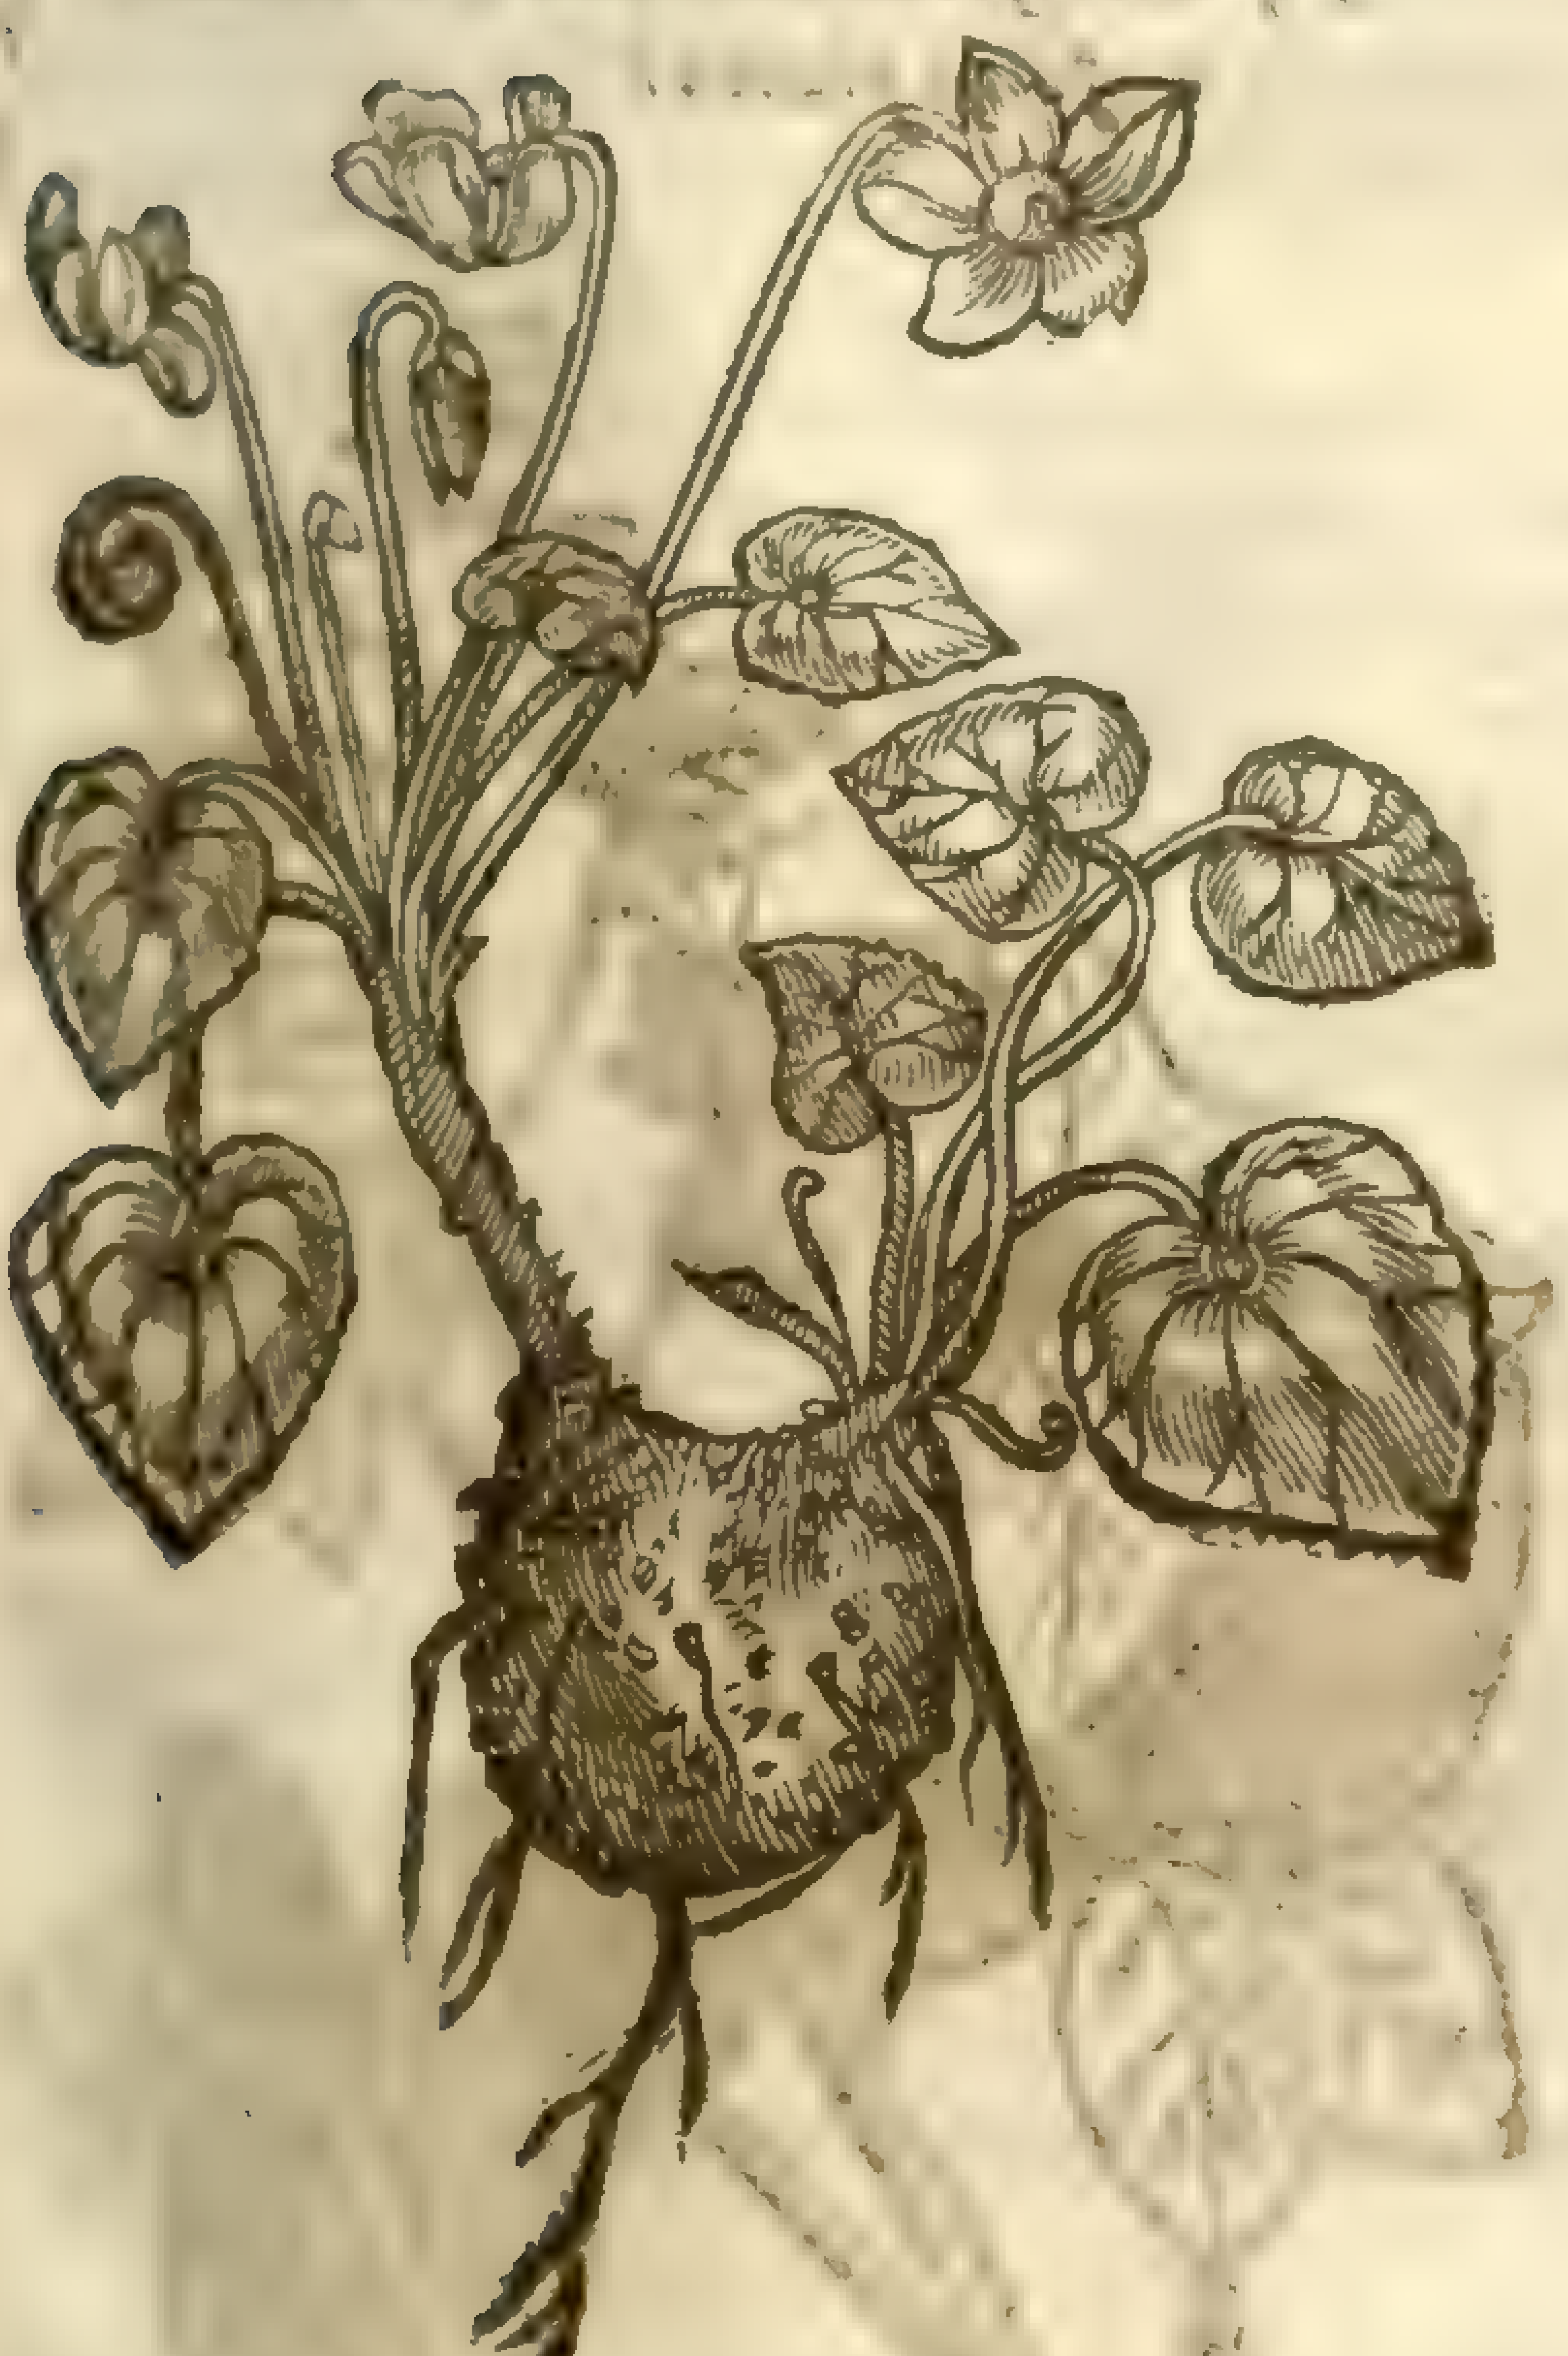
B The vertues of golden Saxifrage are yet vnto vs vnknowne, notwithſtanding I am of this minde, that it is a ſingular wound herbe, equall with Sanicle.

Chap. 310. *Of Sow-bread.*

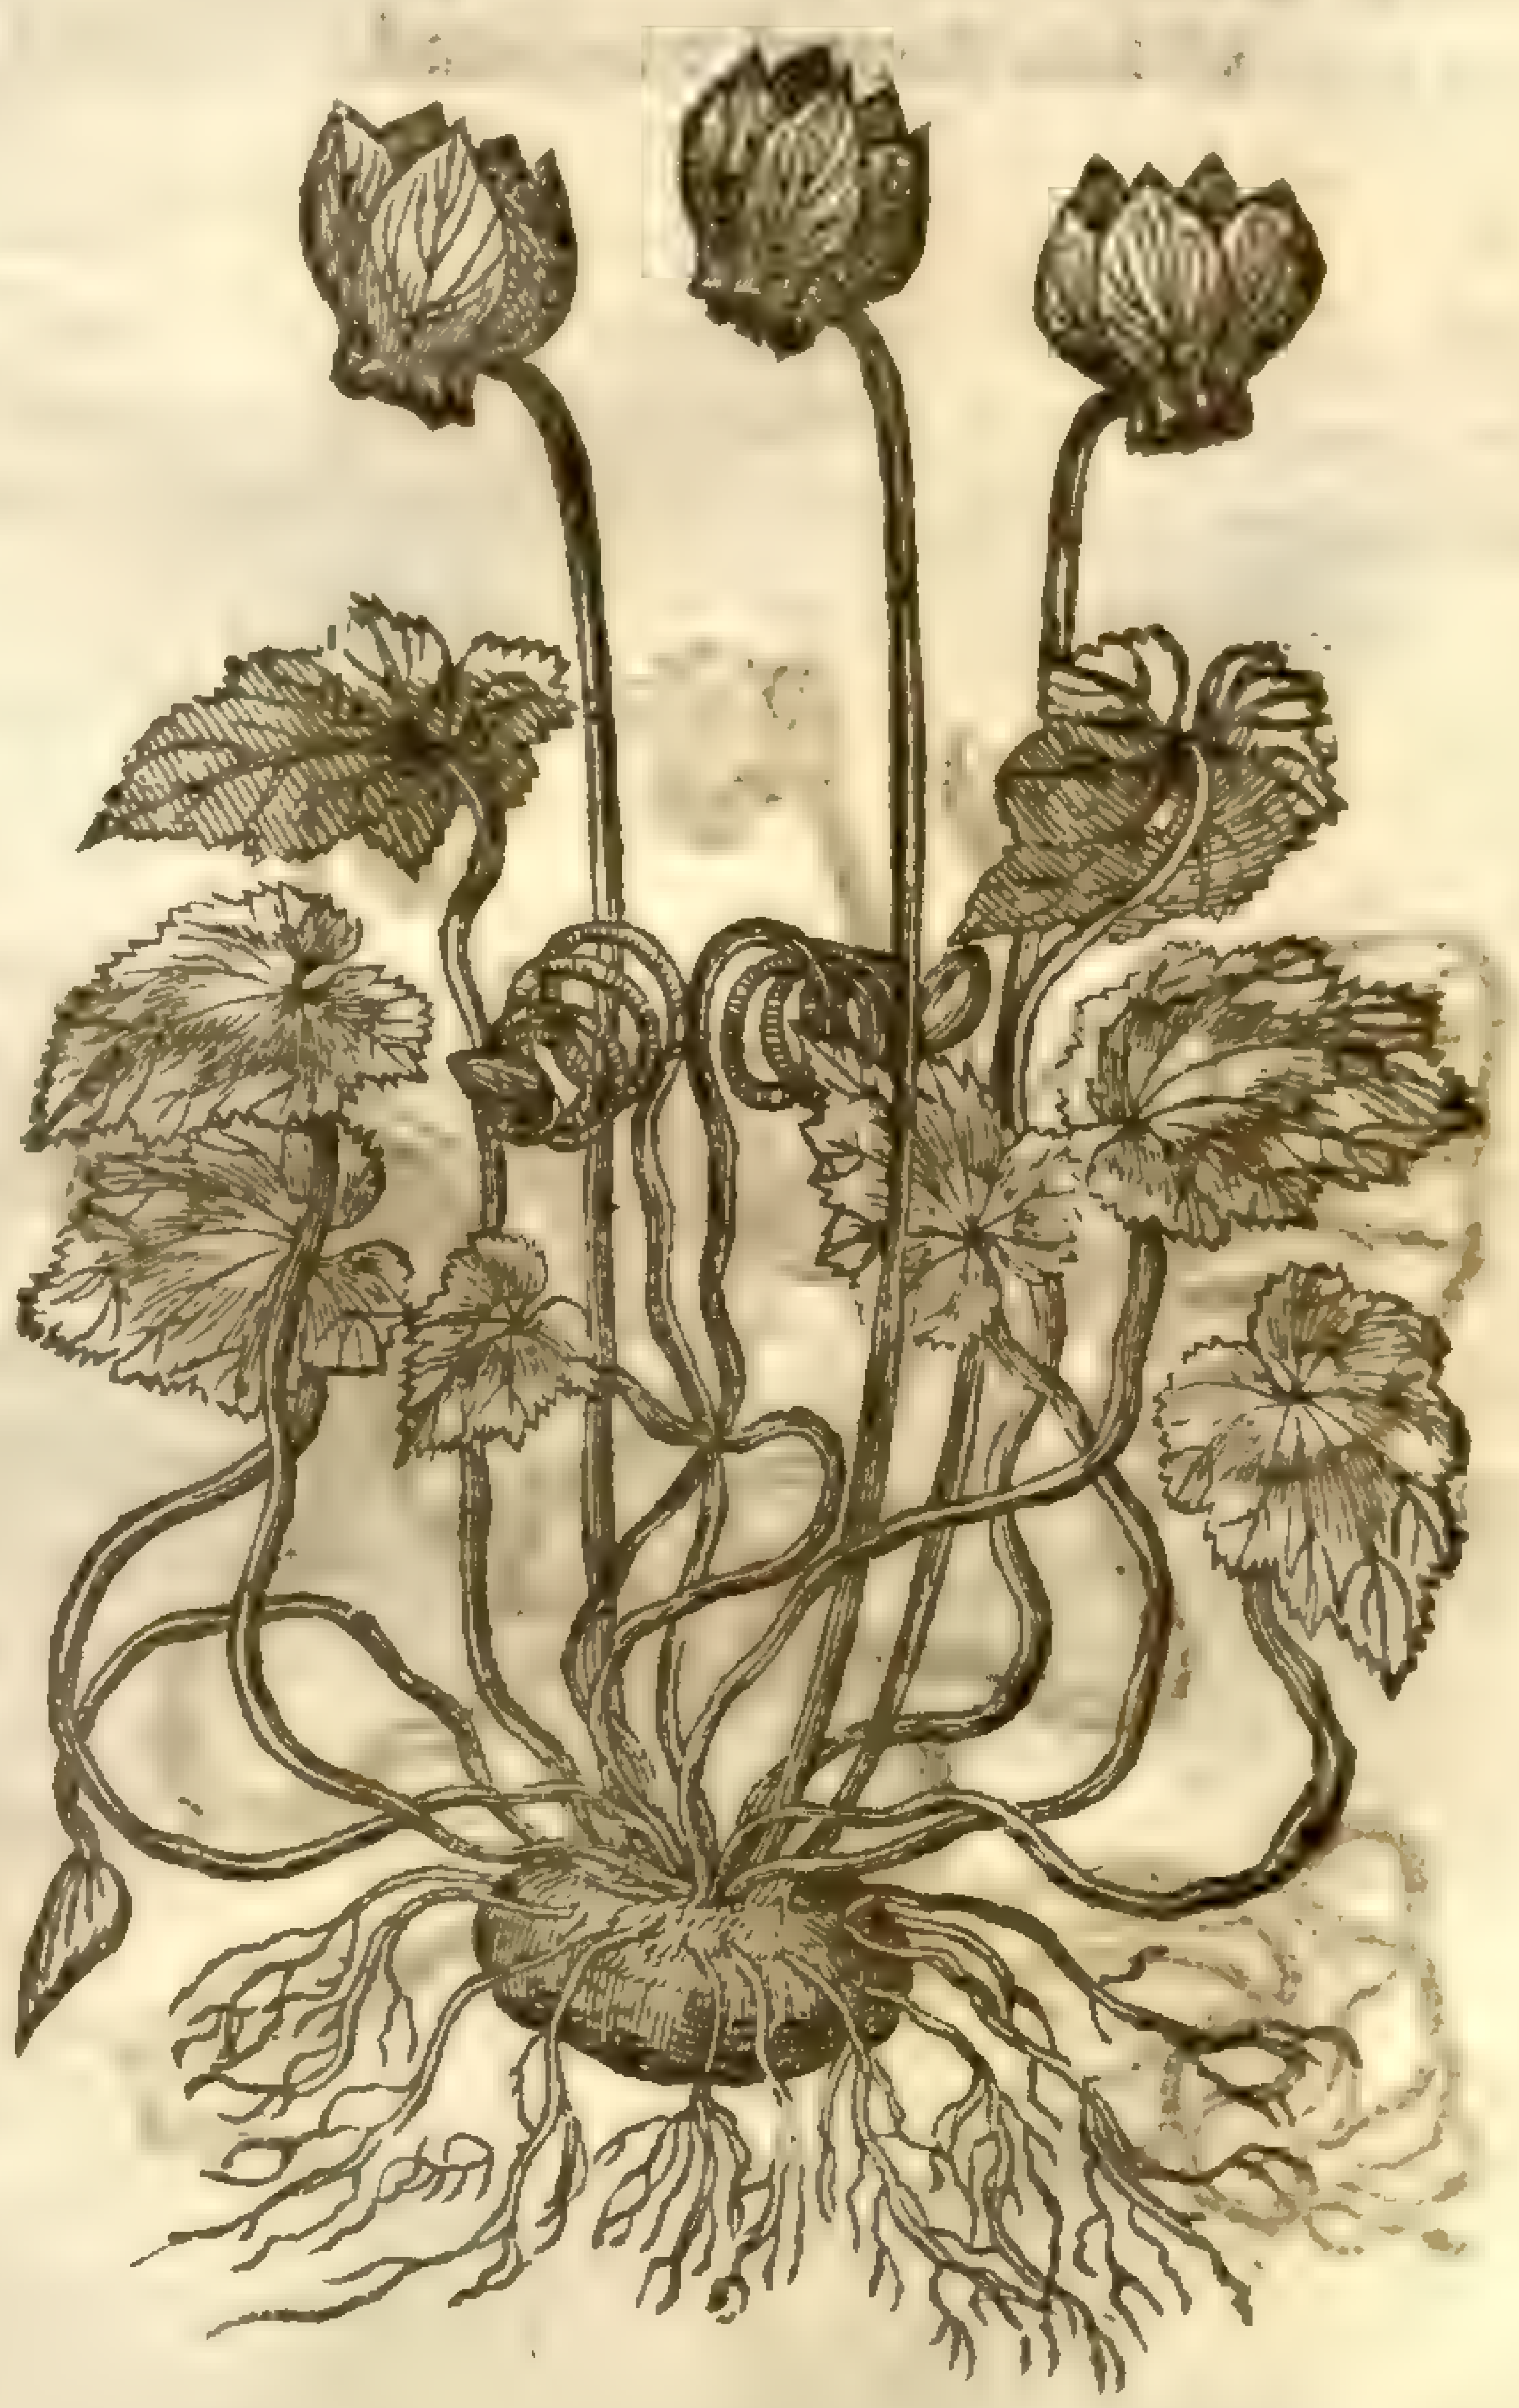
¶ *The Deſcription.*

1 The firſt being the common kinde of Sow-bread, called in ſhops *Panis porcinus*, and *Arthanita*, hath many greene and round leaues like vnto Aſarabacca, ſauing that the vpper part of the leaues are mixed here and there confuſedly with white ſpots, and vnder the leaues next the ground of a purple colour: among which riſe vp little ſtemmes like vnto the ſtalkes of violets, bearing at the top ſmall purple floures, which turne themſelues backward (being full blowne) like a Turks cap, or Tulepan, of a ſmall ſent or ſauour, or none at all: which being paſt, there ſucceed little round knops or heads which containe ſlender browne ſeeds: theſe knops are

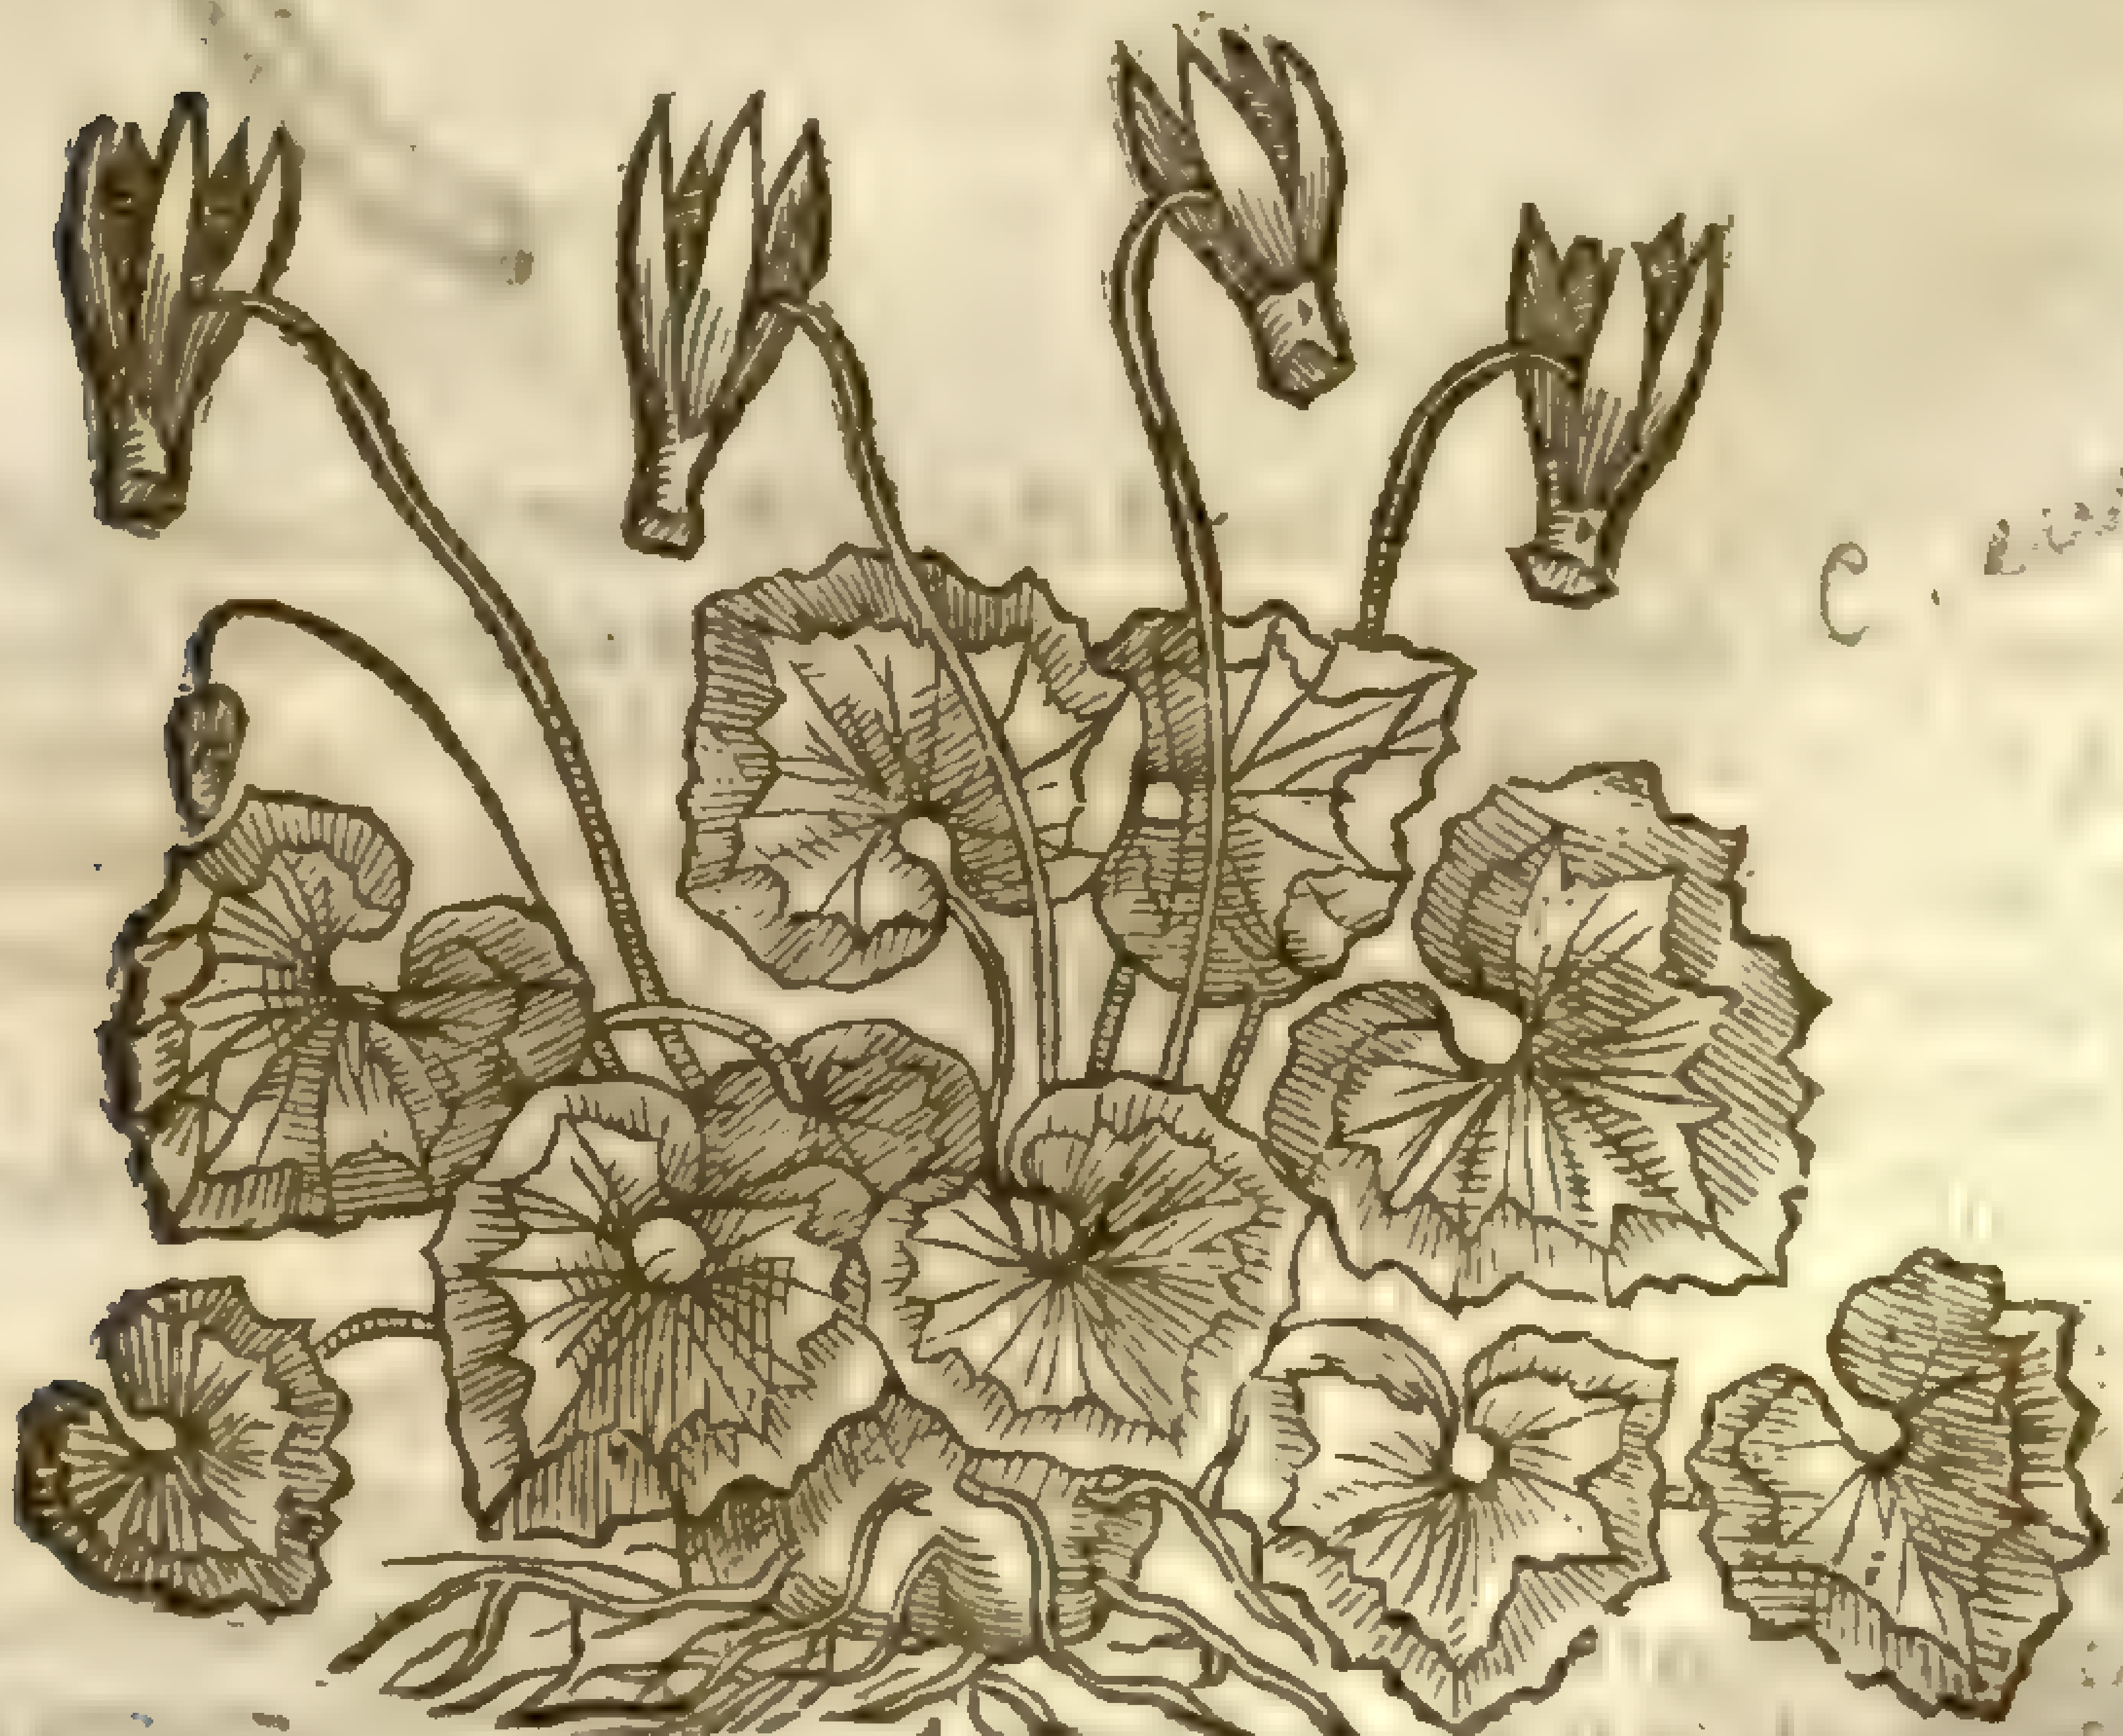
1 *Cyclamen orbiculato folio.*
Round Sow-bread.



2 *Cyclamen folio Hederæ.*
Ivie Sow-bread.



‡ 3 *Cyclamen Vernum.* Spring Sow-bread.

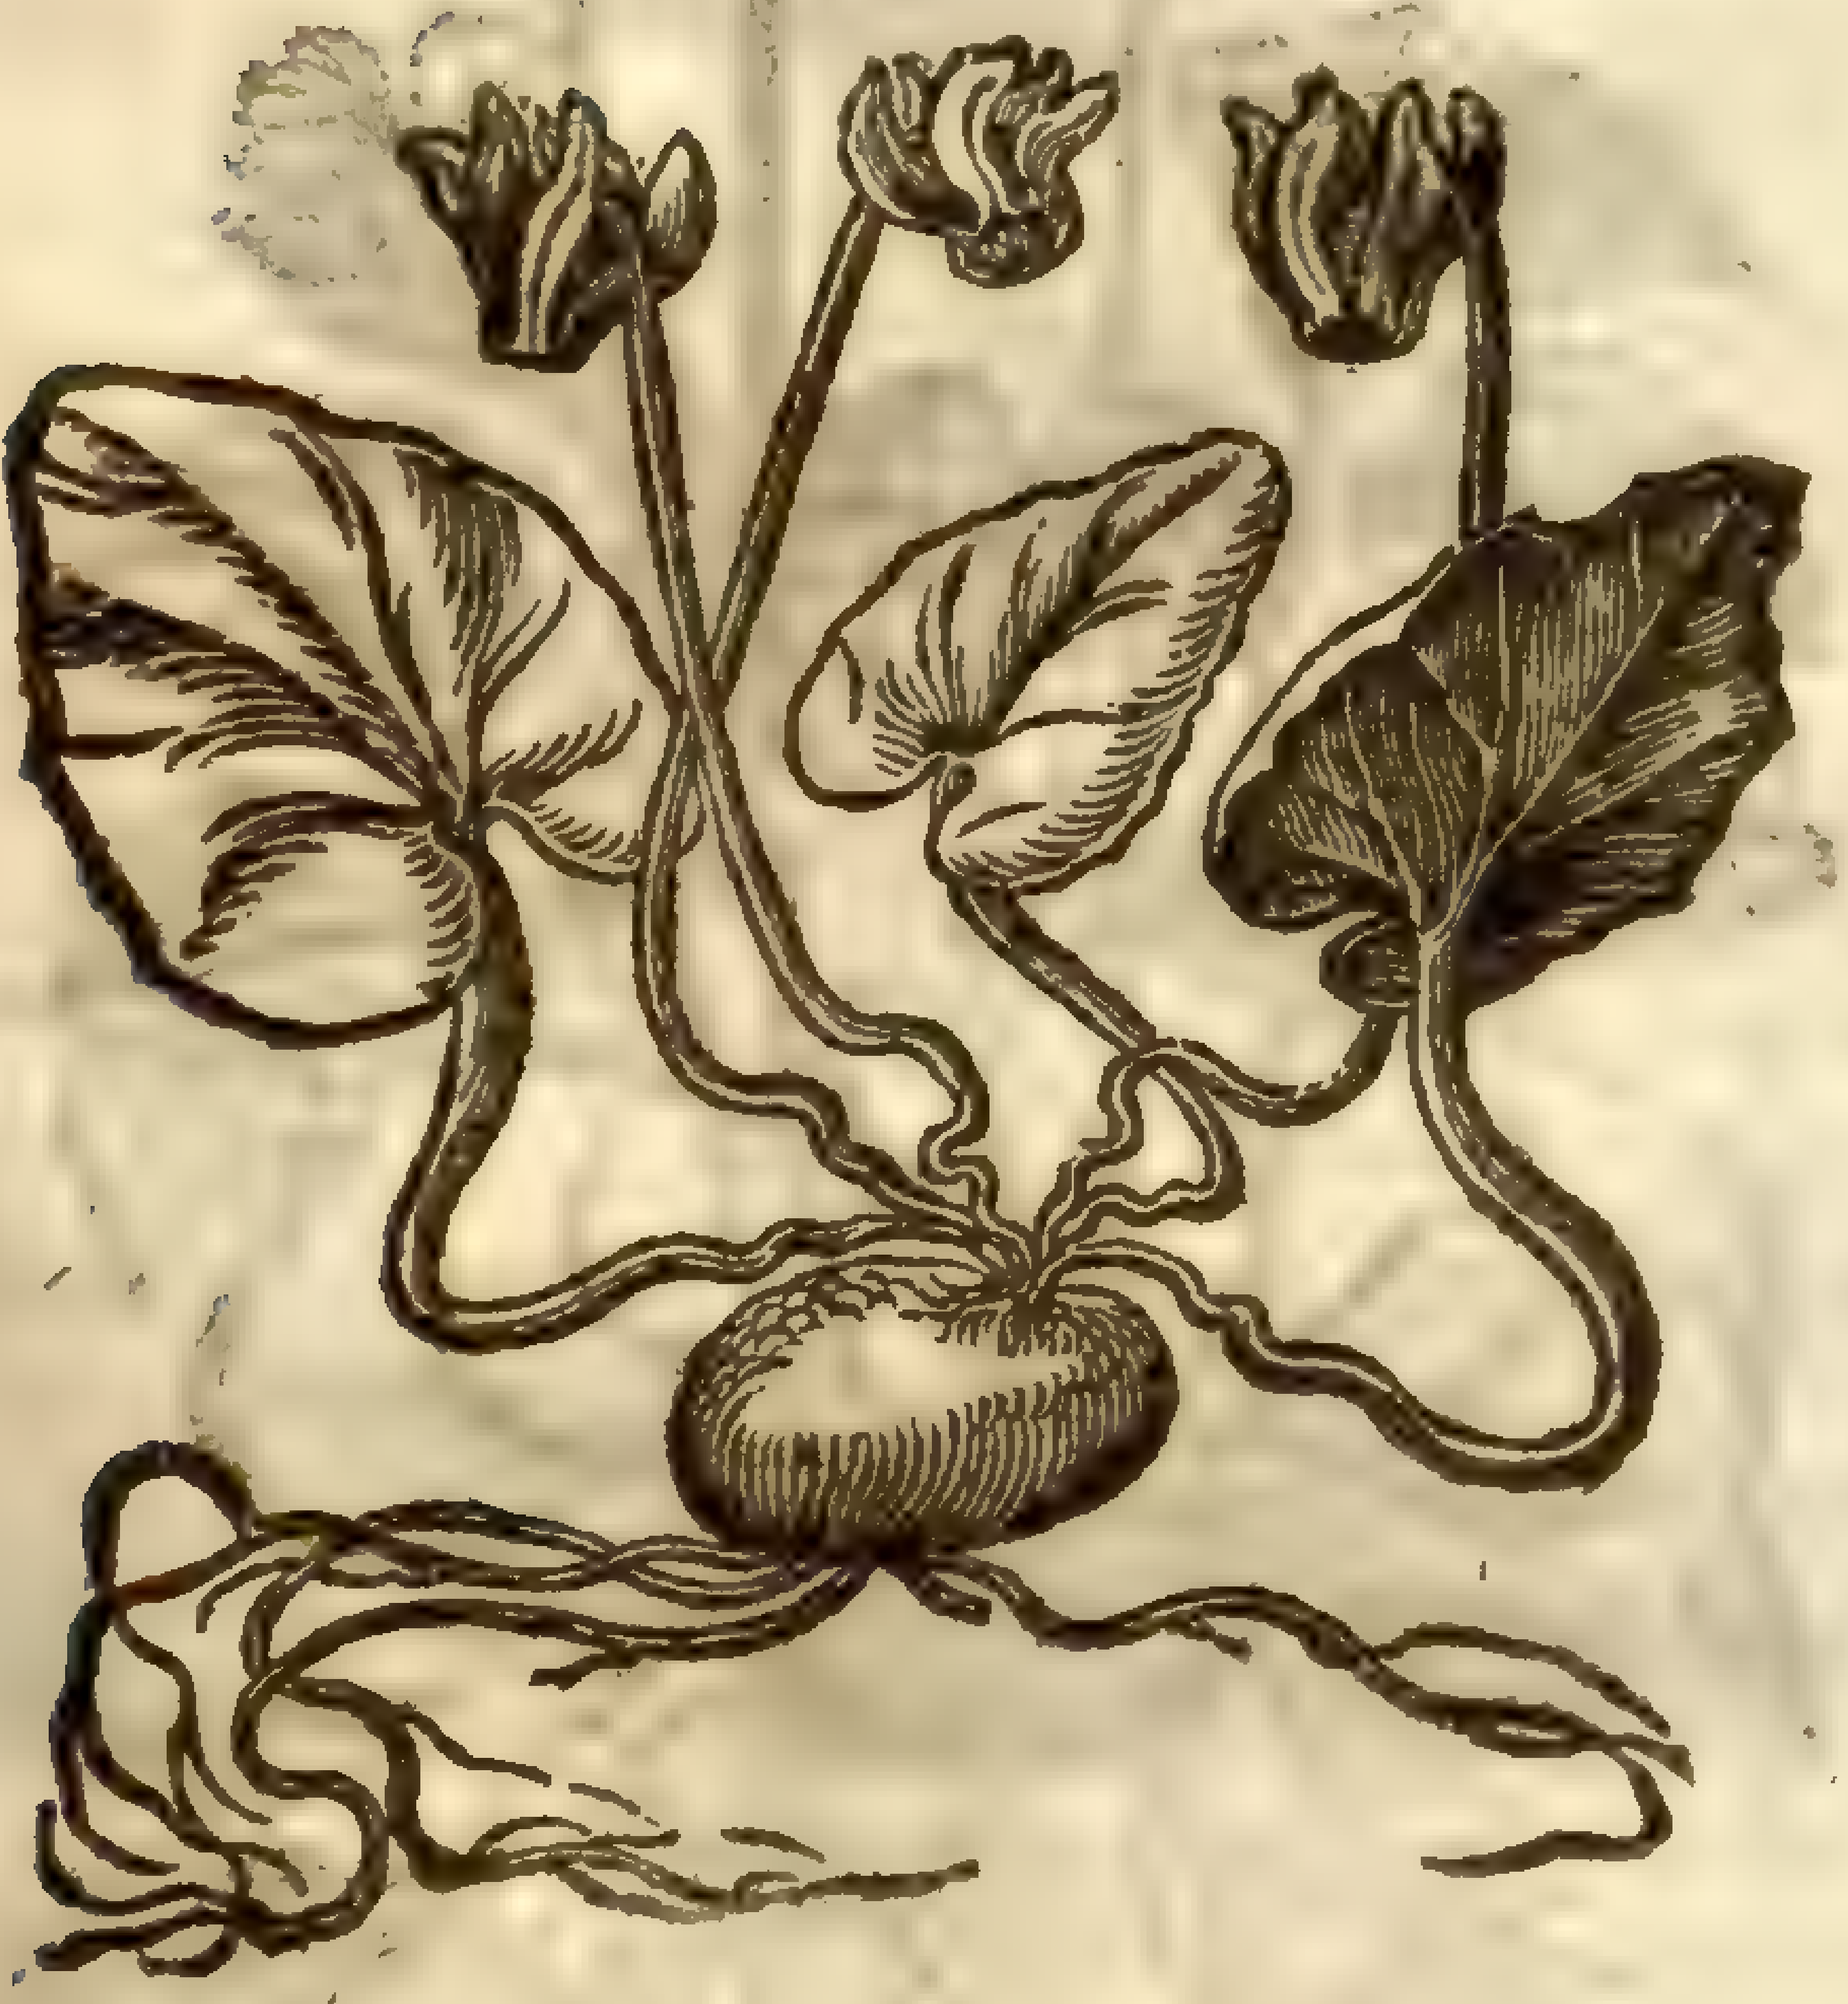


C. [illegible]

wrapped after a few daies in the ſmall ſtalkes, as thred about a bottome, where it remaineth ſo defended from the iniurie of Winter cloſe vpon the ground, couered alſo with the greene leaues aforeſaid, by which meanes it is kept from the froſt, euen from the time of his ſeeding, which is in September, vntill Iune: at which time the leaues doe fade away, the ſtalkes & ſeed remaining bare and naked, whereby it inioyeth the Sun (whereof it was long depriued) the ſooner to bring them vnto maturitie: the root is round like a Turnep, blacke without and white within, with many ſmall ſtrings annexed thereto.

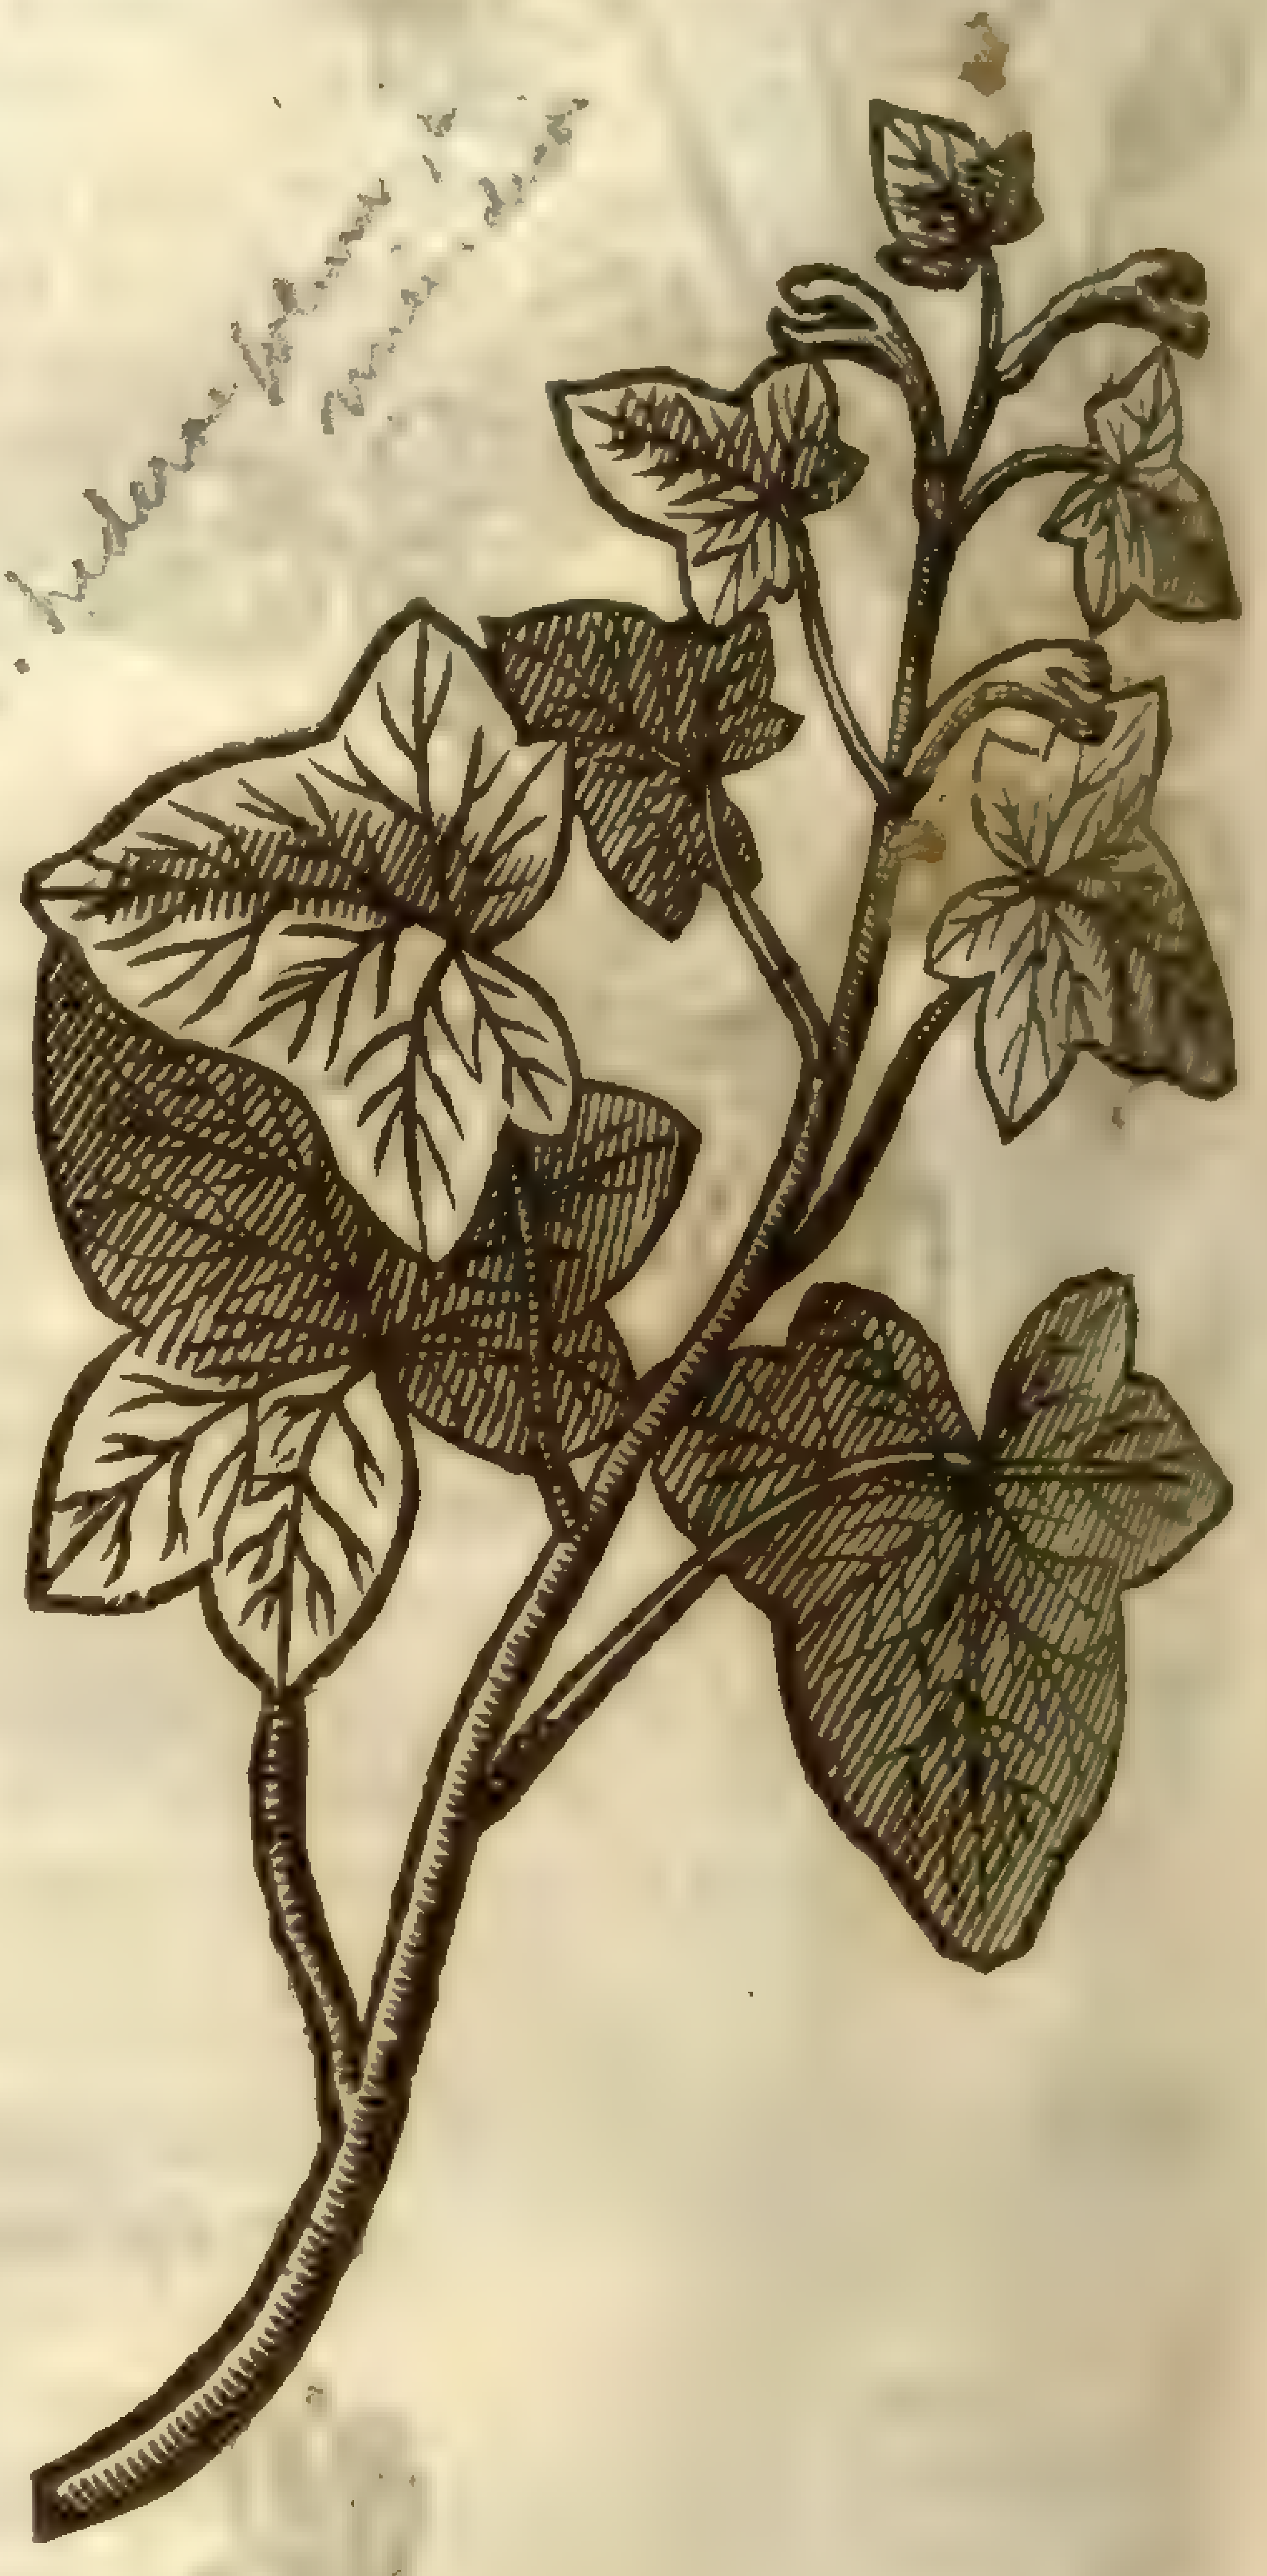
2 The ſecond kinde of Sowbread hath broad leaues ſpred vpon the ground, ſharp pointed, ſomwhat indented about the edges, of a darke greene colour, with ſome little lines or ſtrakes of white on the vpper ſide, and of a darke reddiſh colour on that ſide next the ground: among which riſe vp ſlender foot-ſtalkes of two or three inches long: at the tops whereof ſtand ſuch floures as the precedent, but of a ſweeter ſmel, and more pleaſant colour. The ſeed is alſo wrapped vp in the ſtalk, for his further defence againſt the iniurie of winter. The root is ſomewhat greater, and of more vertue, as ſhall be declared.

‡ 4 *Cyclamen Vernum album.*
White floured Sowbread.



‡ 5 *An Cyclaminos altera, hederaceis folijs planta?*

C. hederæ [illegible]



3 There is a third kinde of Sow-bread that hath round leaues without peaked corners, as the laſt before mentioned, yet ſomewhat ſnipt about the edges, and ſpeckled with white about the brims of the leaues, and of a blackiſh colour in the middle; the floures are like to the reſt, but of a deeper purple: the root alſo like, but ſmaller, and this commonly floures in the Spring.

‡ 4 This in leaues and roots is much like the laſt deſcribed; but the flours are ſmaller, ſnow white, and ſweet ſmelling. There are diuers other varieties of theſe plants, which I thinke it not neceſſary for me to inſiſt vpon: wherefore I referre the curious to the Garden of floures ſet forth by Mr *Iohn Parkinſon*, where they ſhall finde ſatisfaction. ‡

5 There is a plant which I haue ſet forth in this place that may very well be called into queſtion, and his place alſo, conſidering that there hath been great contention about the ſame, and not fully determined on either part, which hath moued me to place him with thoſe plants that moſt do reſemble one another, both in ſhape and name: this plant hath greene cornered leaues like to Ivie,

long and ſmall gaping floures like the ſmall Snapdragon: more hath not been ſaid of this plant, either of ſtalke or root, but is left vnto the conſideration of the learned.

‡ The plant which our Author would here acquaint you with, is that which *Lobel* figures with this title which I here giue, and ſaith it was gathered among other plants on the hils of Italy, but in what part or place, or how growing he knew not; and he only queſtions whether it may not be the *Cyclaminos altera* of *Dioſcorides, lib.2.cap.195.* ‡

¶ *The Place.*

Sow-bread groweth plentifully about Artoies and Vermandois in France, and in the Foreſt of Arden, and in Brabant: but the ſecond groweth plentifully in many places of Italie.

It is reported vnto mee by men of good credit, that *Cyclamen* or Sow-bread groweth vpon the mountaines of Wales; on the hils of Lincolnſhire, and in Somerſet ſhire by the houſe of a gentleman called Mr. *Hales*; vpon a Fox-borough alſo not far from Mr. *Bamfields*, neer to a town called Hardington. The firſt two kindes grow in my garden, where they proſper well. ‡ I cannot learne that this growes wilde in England. ‡

¶ *The Time.*

Sow-bread floureth in September when the plant is without leafe, which doth afterwards ſpring vp, continuing green all the Winter, couering and keeping warme the ſeed vntil Midſommer next, at what time the ſeed is ripe as aforeſaid. The third floureth in the ſpring, for which cauſe it was called *Cyclamen vernum*; and ſo doth alſo the fourth.

¶ *The Names.*

Sow-bread is called in Greek, κυκλάμινος: in Latine, *Tuber terræ*, and *Terræ rapum*: of *Marcellus*, *Orbicularis*: of *Apuleius*, *Palalia*, *Rapum porcinum*, & *Terræ malum*: in ſhops, *Cyclamen*, *Panis Porcinus*, and *Arthanita*: in Italian, *Pan Porcino*: in Spaniſh, *Mazan de Puerco*: in High Dutch, **Schweinbrot**: in Low Dutch, **Verckins broot**: in French, *Pain de Porceau*: in Engliſh, Sow-bread. *Pliny* calleth the colour of this floure in Latine, *Coloſſinus color*: in Engliſh, Murrey colour.

¶ *The Nature.*

Sow-bread is hot and drie in the third degree.

¶ *The Vertues.*

A The root of Sow-bread dried into pouder and taken inwardly in the quantitie of a dram and a halfe, with mead or honied water, purgeth downeward tough and groſſe flegme, and other ſharpe humors.

B The ſame taken in wine as aforeſaid, is very profitable againſt all poiſon, and the bitings of venomous beaſts, and to be outwardly applied to the hurt place.

C The pouder taken as aforeſaid, cureth the jaundiſe and the ſtoppings of the liuer, taketh away the yellow colour of the bodie, if the patient after the taking hereof be cauſed to ſweat.

D The leaues ſtamped with honie, and the juice put into the eies, cleareth the ſight taketh away all ſpots and webs, pearle or haw, and all impediments of the ſight, and is put into that excellent ointment called *Vnguentum Arthanitæ*.

E The root hanged about women in their extreme trauell with childe, cauſeth them to be deliuered incontinent, and taketh away much of their paine.

F The leaues put into the place hath the like effect, as my wife hath prooued ſundry times vpon diuers women, by my aduiſe and commandement, with good ſucceſſe.

G The juice of Sow-bread doth open the Hemorrhoids, and cauſeth them to flow being applied with wooll or flocks.

H It is mixed with medicines that conſume or waſte away knots, the Kings euill, and other hard ſwellings: moreouer it clenſeth the head by the noſthrils, it purgeth the belly being anointed therwith, and killeth the childe. It is a ſtrong medicine to deſtroy the birth, being put vp as a peſſary.

I It ſcoureth the skin, and taketh away the Sun-burning, and all blemiſhes of the face, pilling off the haire, and marks alſo that remaine after the ſmall pocks & meſels: and giuen in wine to drink, it maketh a man drunke.

K The decoction thereof ſerueth as a good and effectuall bath for members out of joint, the gout, and kibed heeles.

L The root being made hollow and filled with oile, cloſed with a little wax, and roſted in the hot embers, maketh an excellent ointment for the griefes laſt rehearſed.

M Being beaten and made vp into trochiſches, or little flat cakes, it is reported to be a good amorous medicine to make one in loue, if it be inwardly taken.

¶ *The Danger.*

It is not good for women with childe to touch or take this herbe, or to come neere vnto it, or ſtride ouer the ſame where it groweth; for the naturall attractiue vertue therein contained is ſuch, that without controuerſie they that attempt it in manner abouesaid, ſhall be deliuered before their time: which danger and inconuenience to auoid, I haue (about the place where it groweth in my garden) faſtned ſticks in the ground, and ſome other ſtickes I haue faſtned alſo croſſe-waies ouer them, leaſt any woman ſhould by lamentable experiment finde my words to be true, by their ſtepping ouer the ſame.

‡ I iudge our Author ſomthing to womaniſh in this, that is, led more by vaine opinion than by any reaſon or experience, to confirme this his aſſertion, which frequent experience ſhews to be vaine and friuolous, eſpecially for the touching, ſtriding ouer, or comming neere to this herbe. ‡

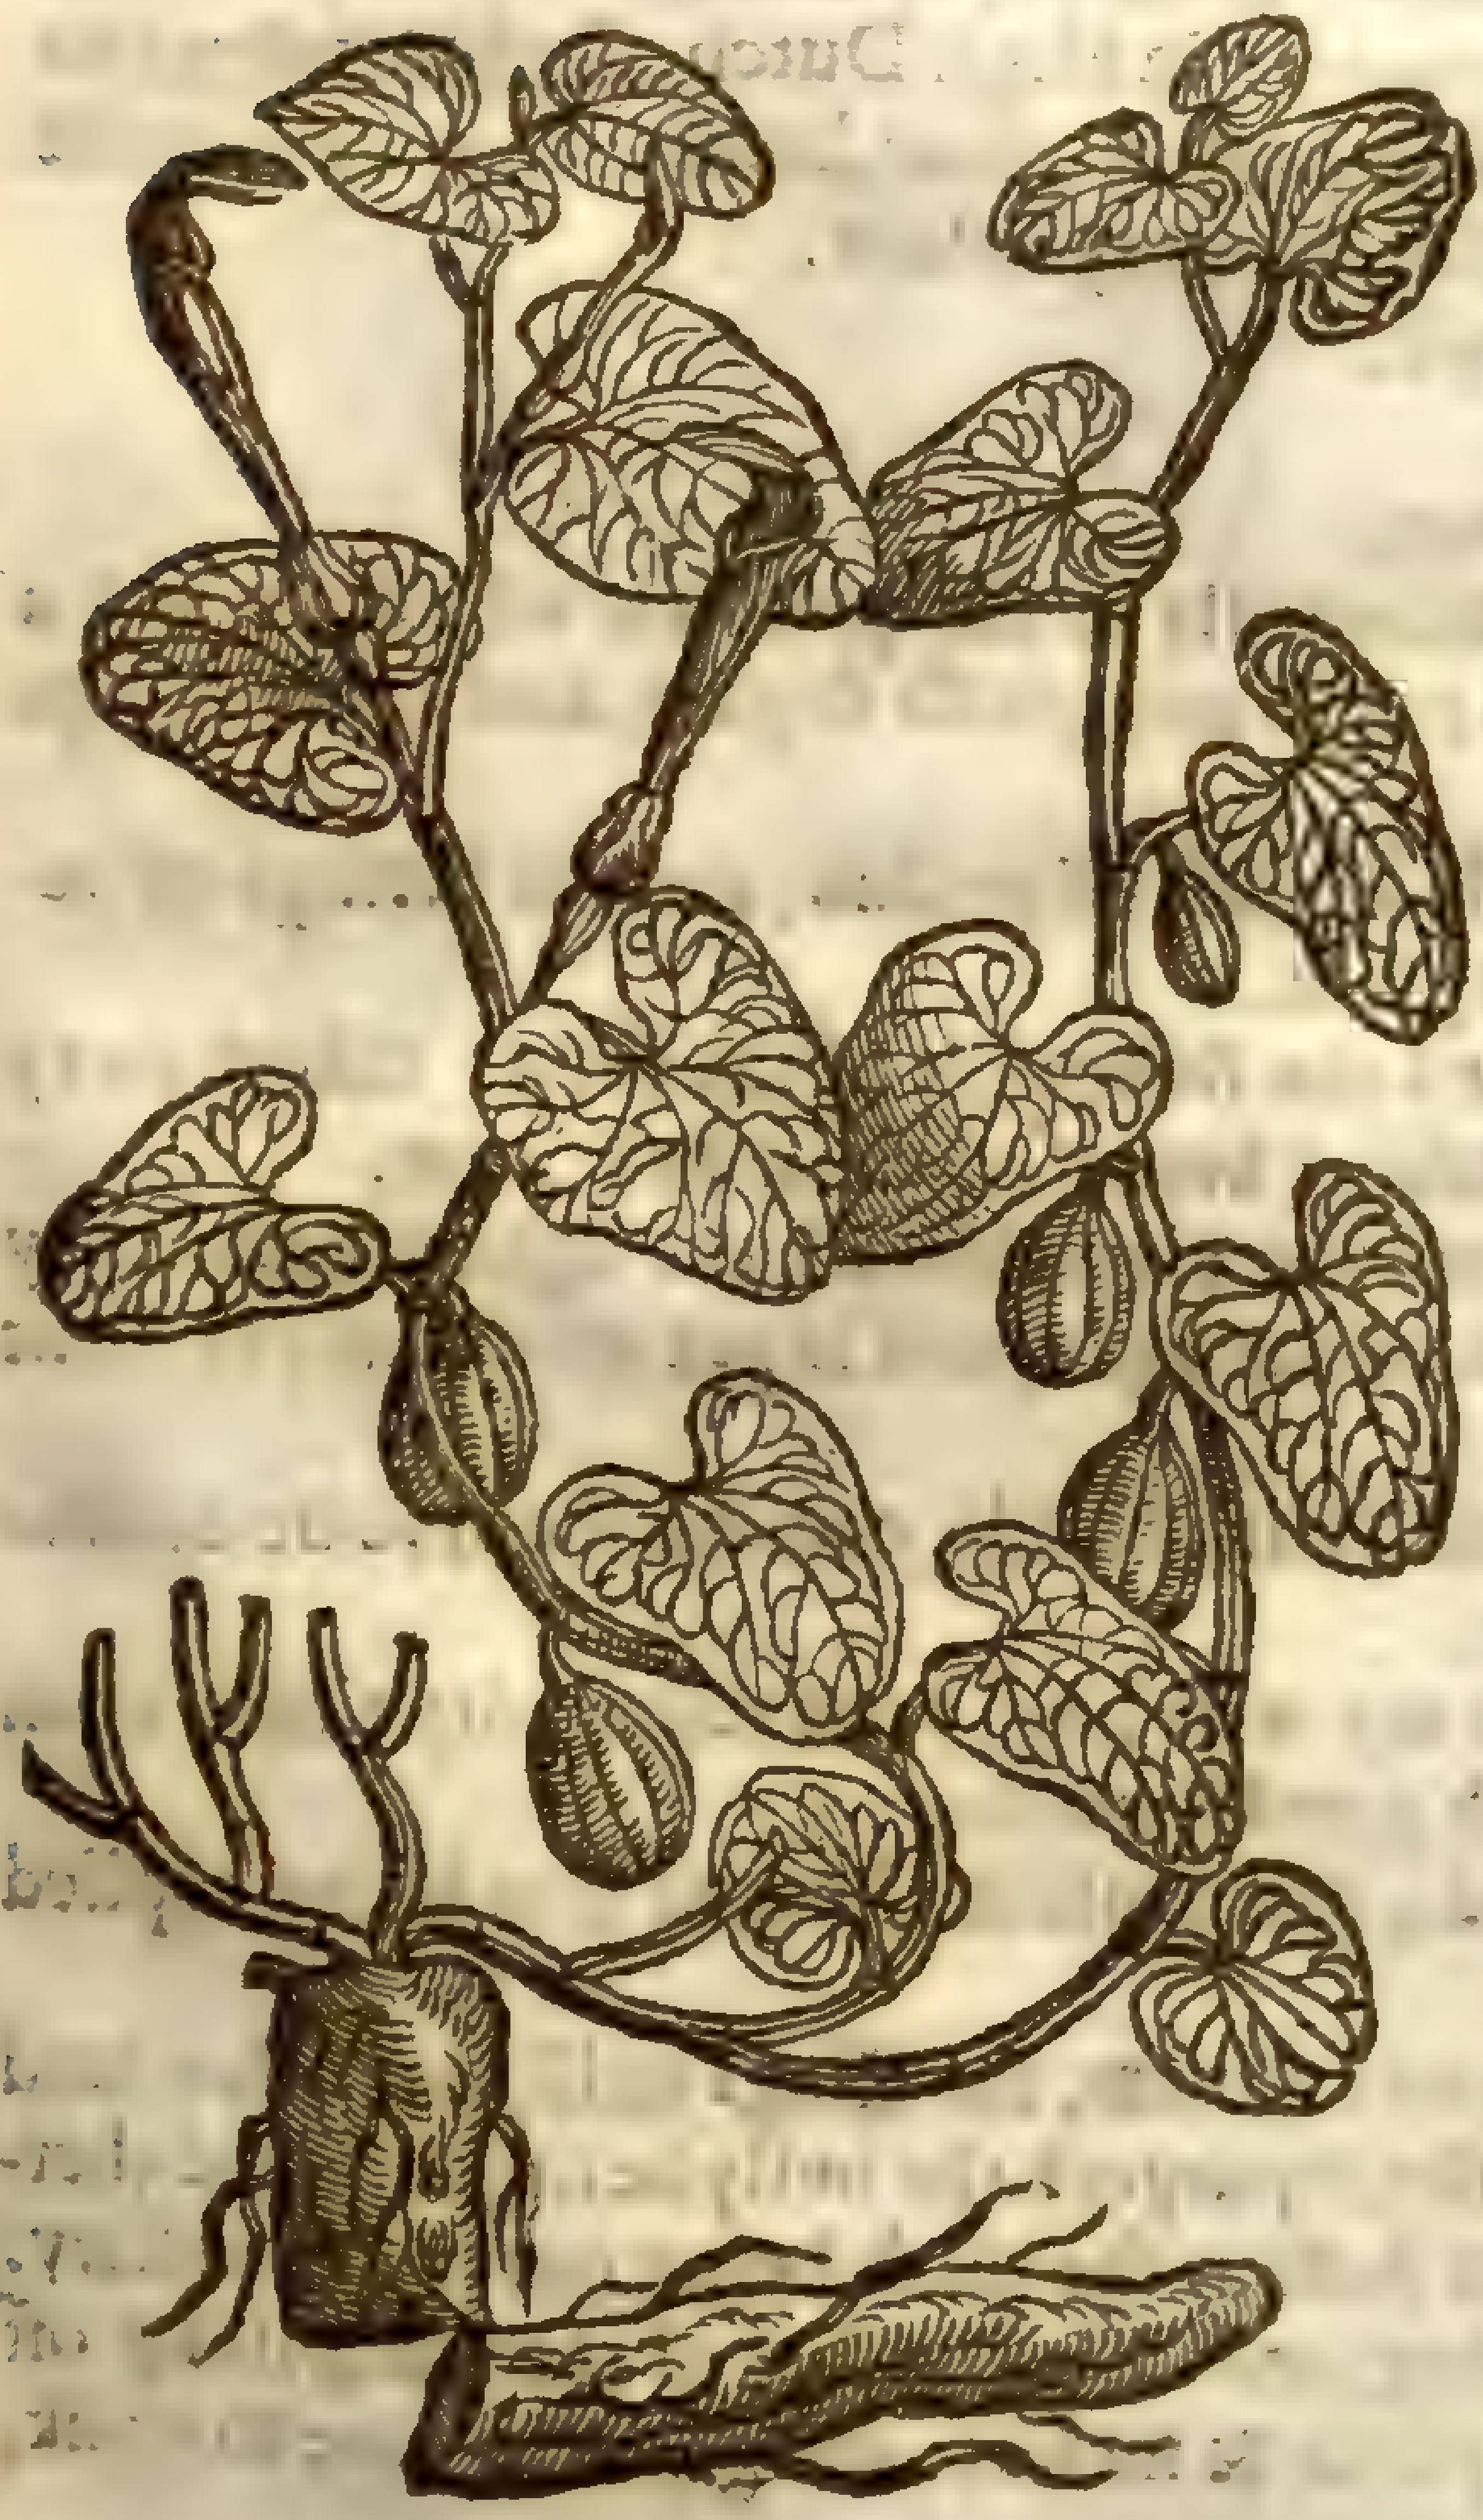
Chap. 311. *Of Birthwoorts.*

¶ *The Kindes.*

Birthwort, as *Dioſcorides* writeth, is of three ſorts, long, round, and winding: *Pliny* hath added a fourth kinde called *Piſtolochia*, or little Birthwoort. The later writers haue joined vnto them a fifth named Saracens Birthwoort.

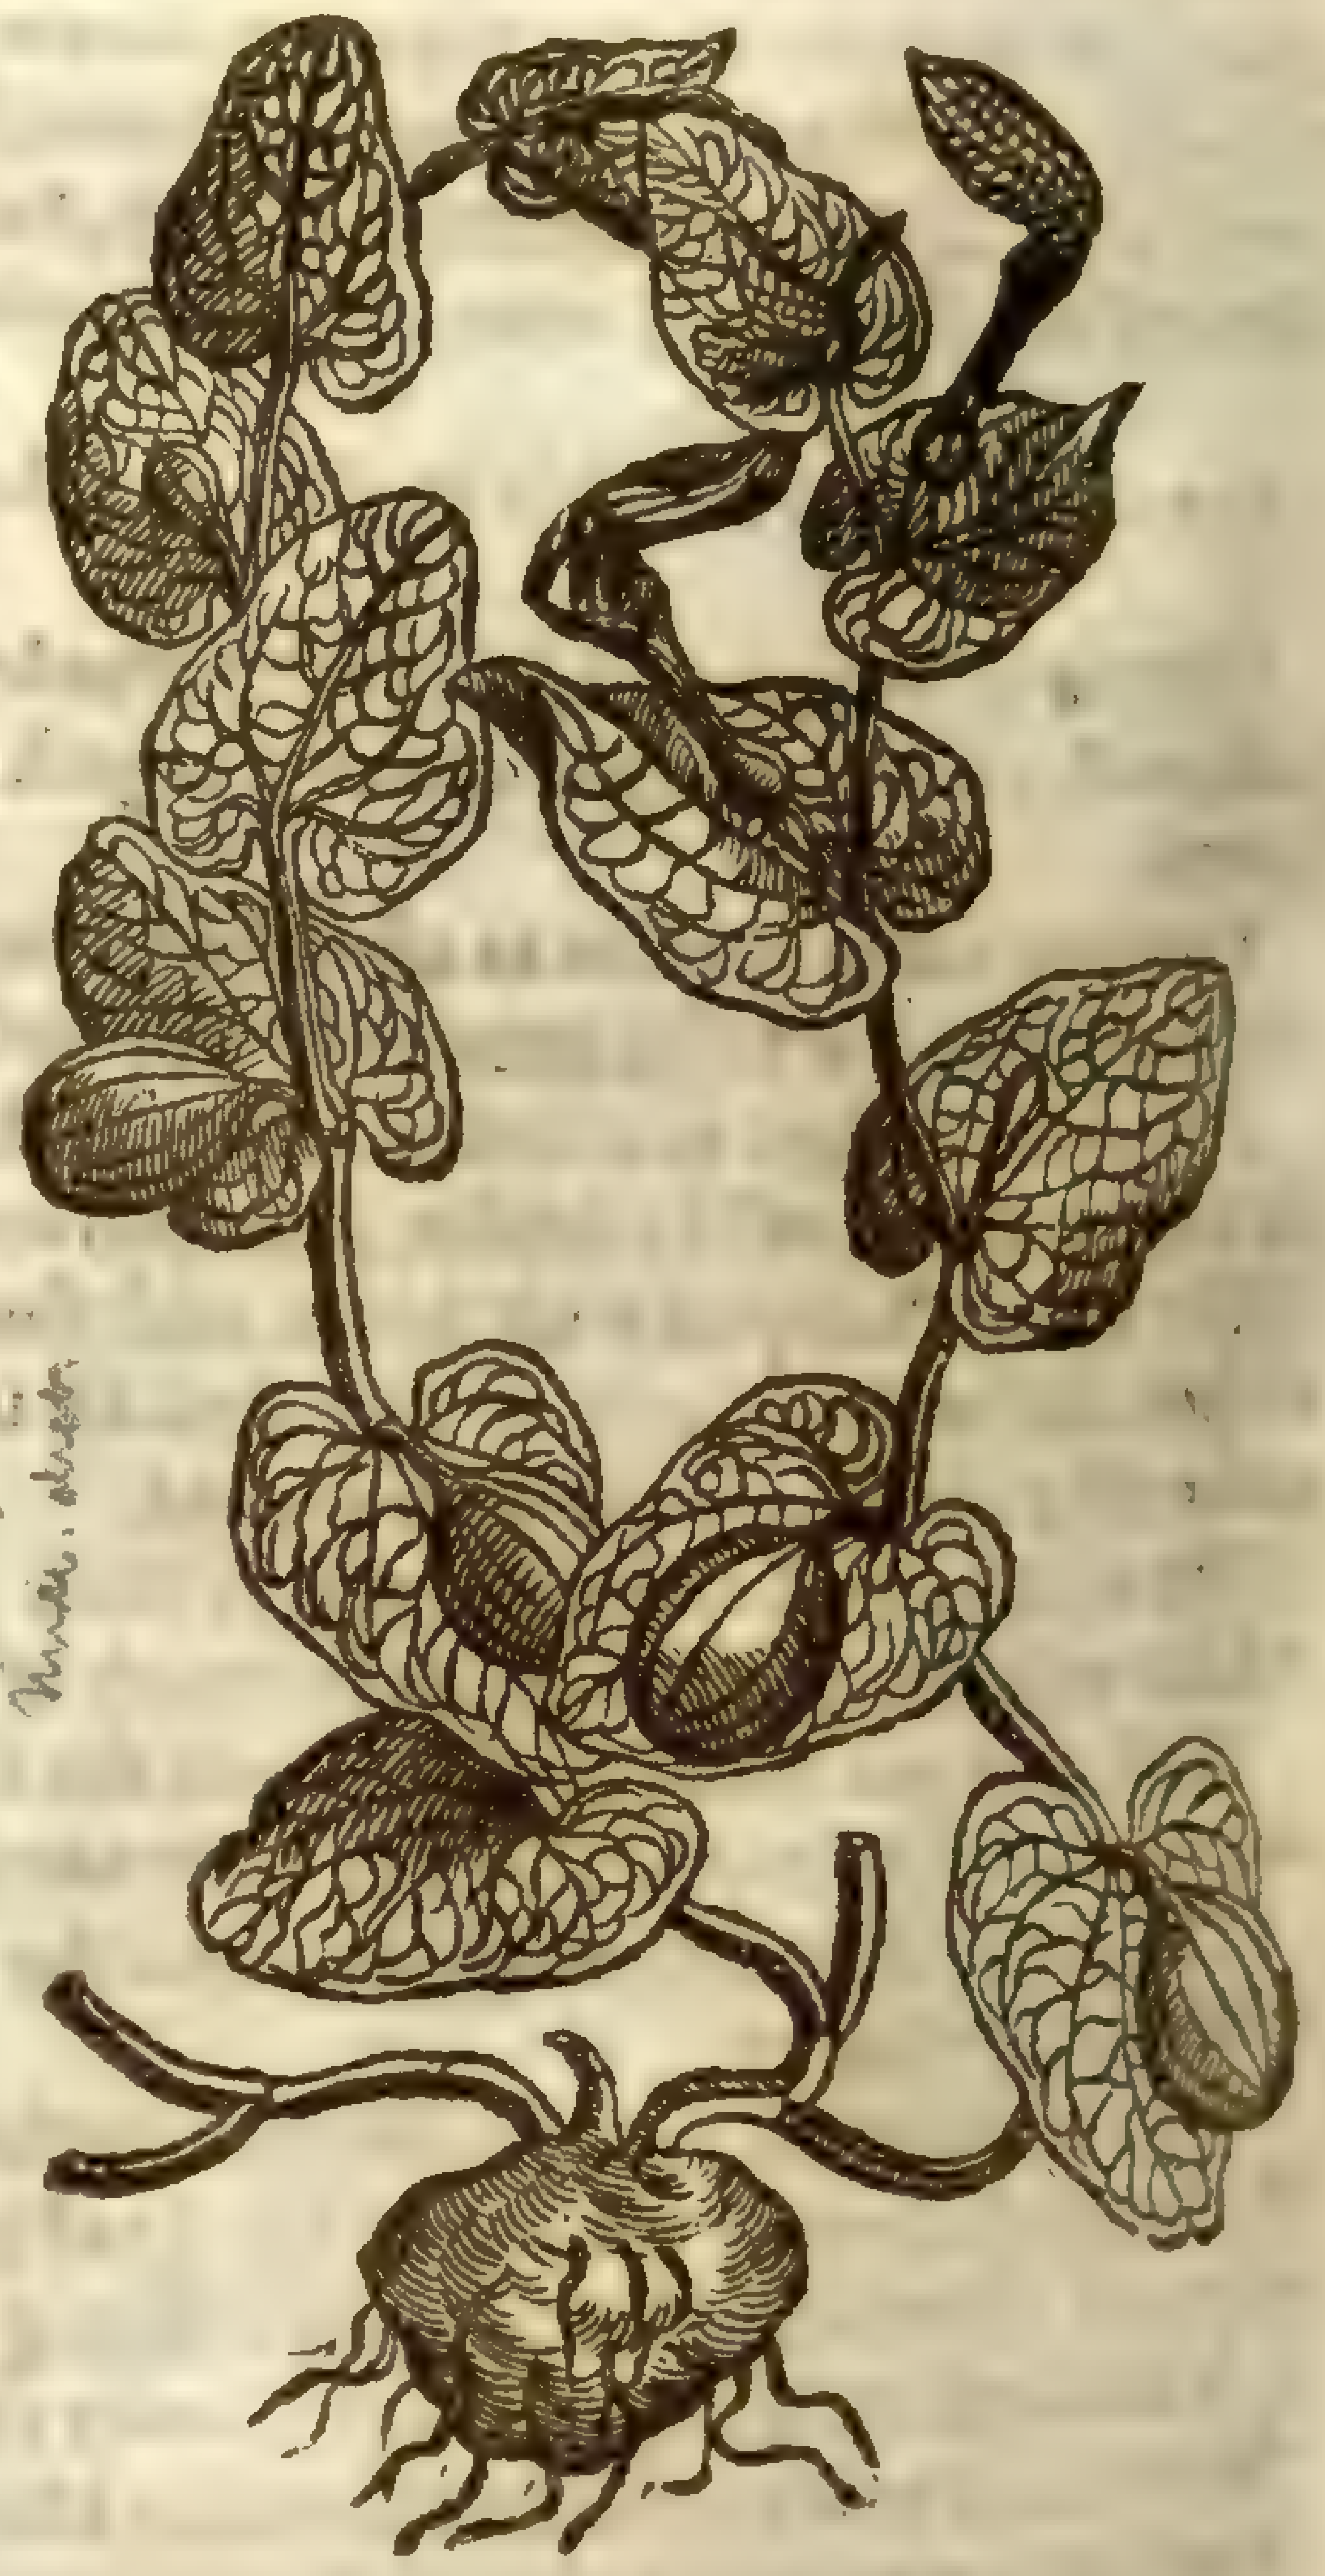
1 *Ariſtolochia longa.*
Long Birthwoort.

A. longa, L.
Mat. med.



2 *Ariſtolochia rotunda.*
Round Birthwoort.

A. rotunda, L.
Mat. med.



¶ *The Deſcription.*

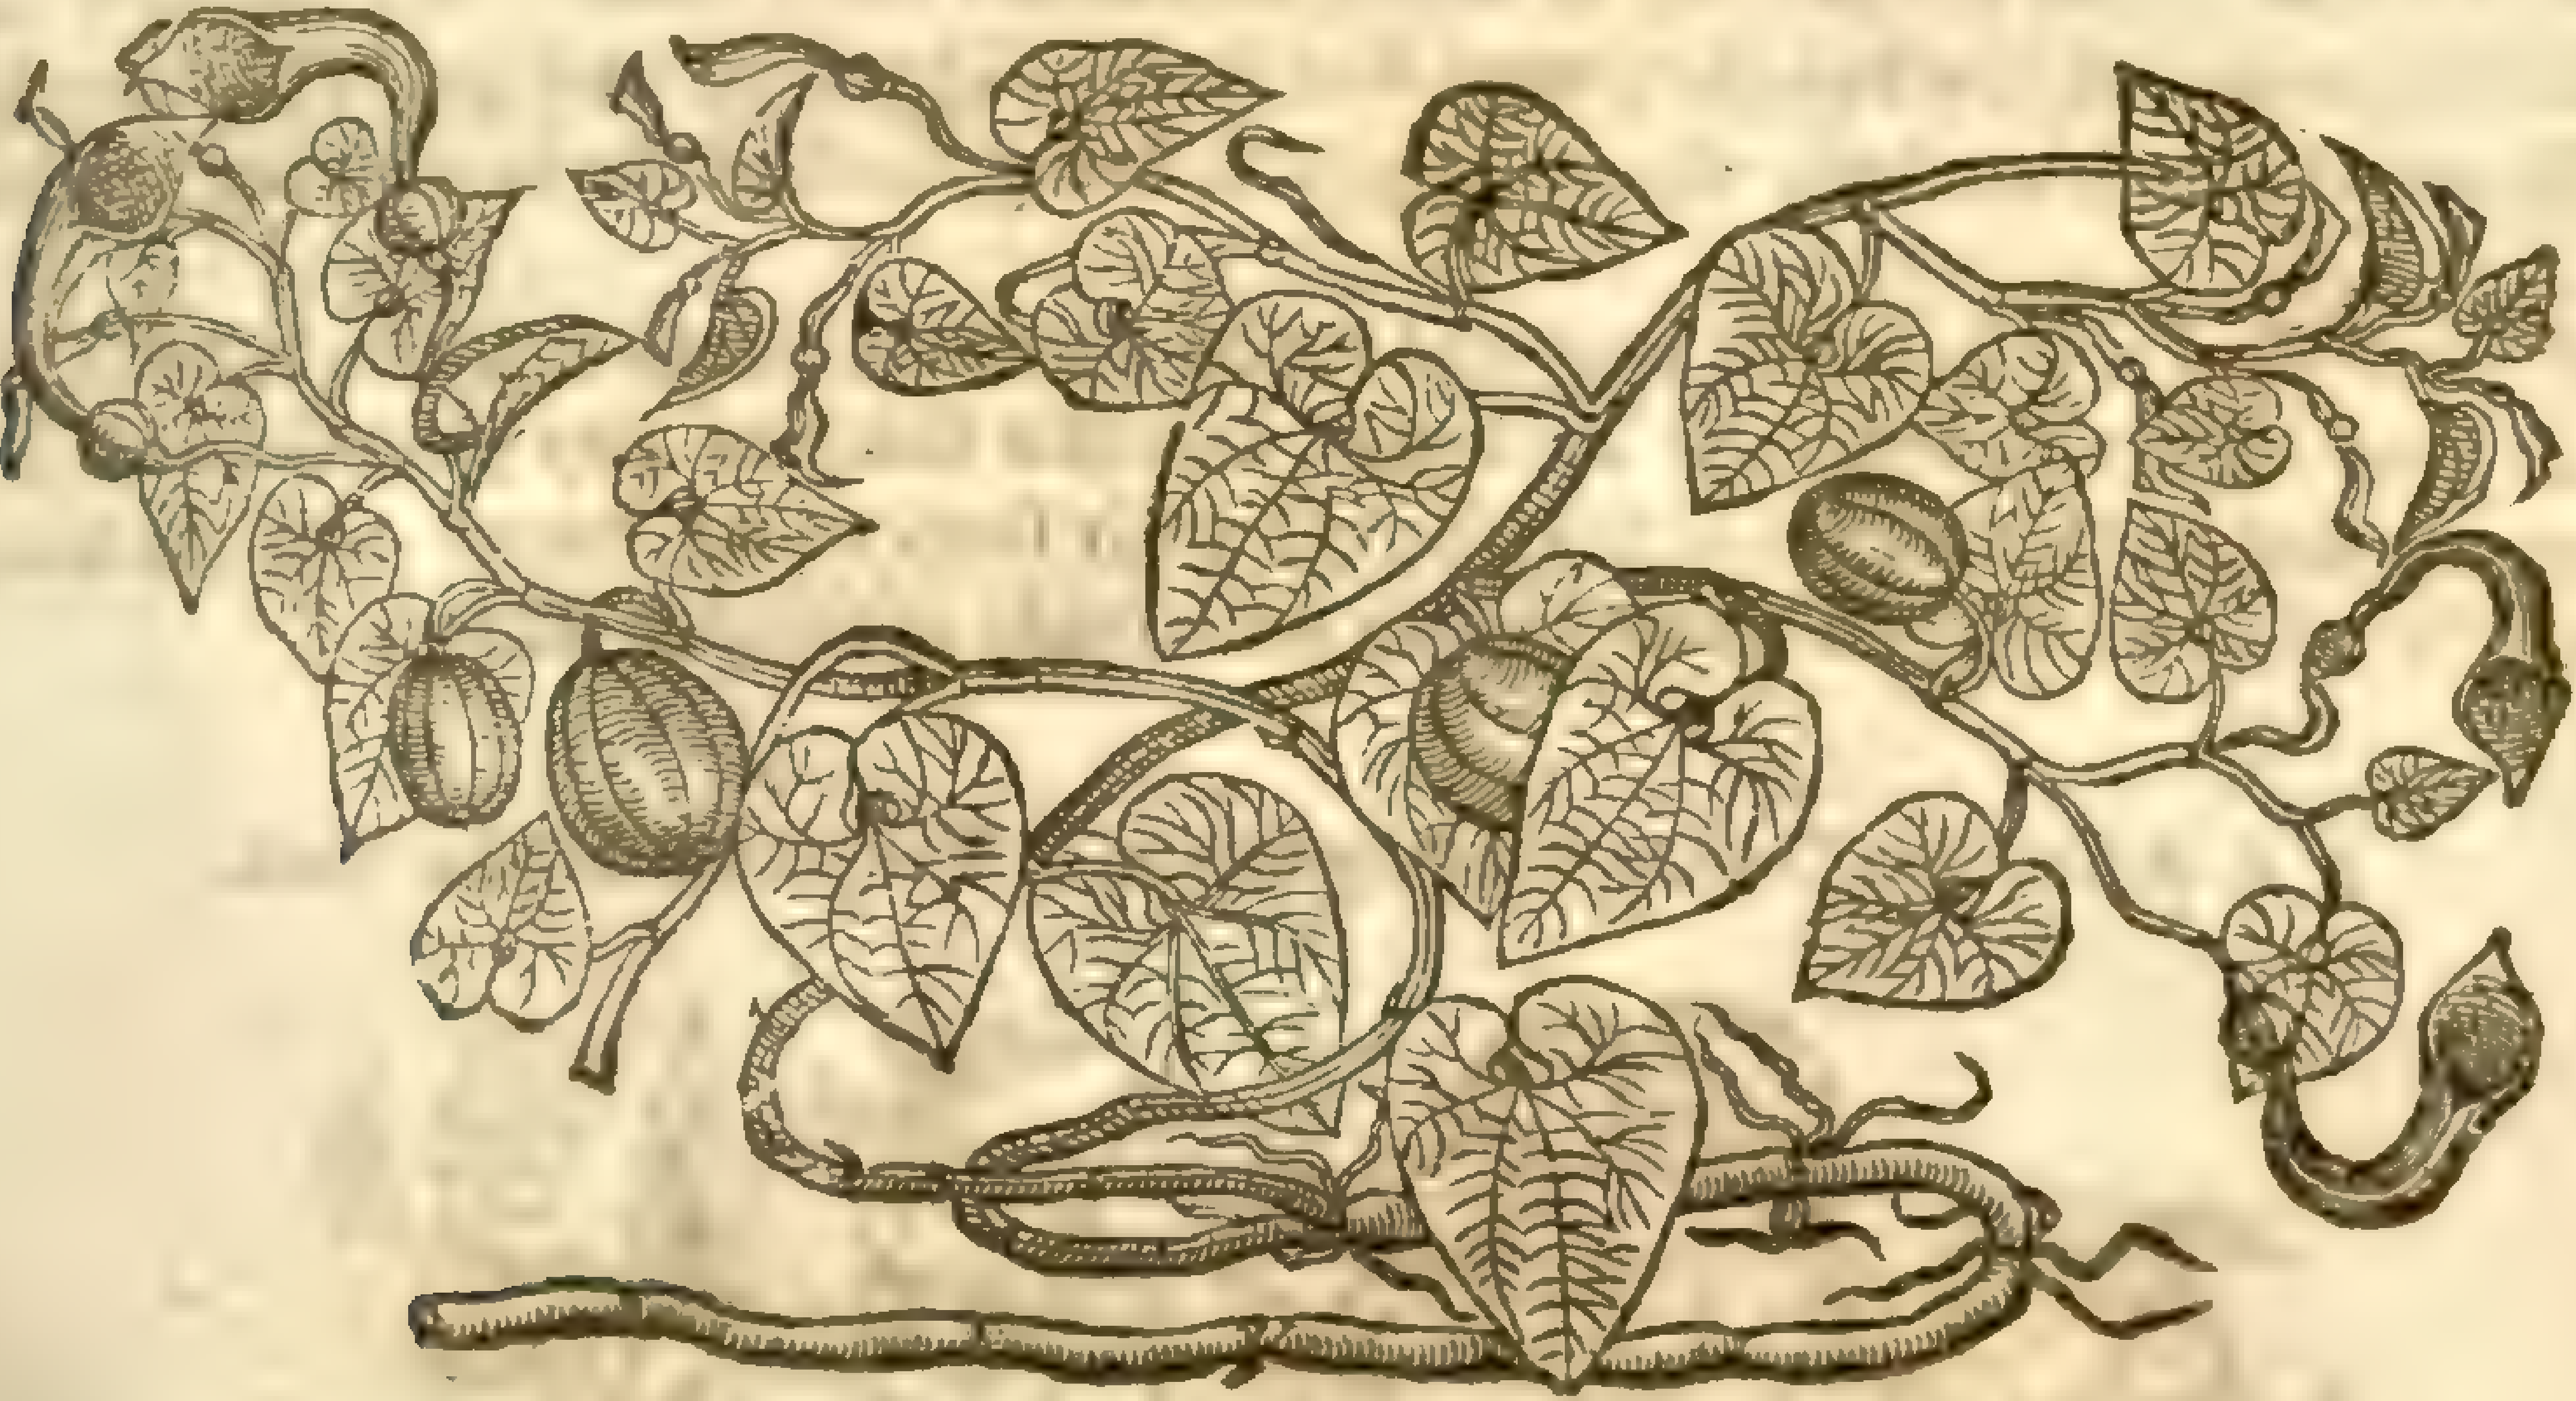
1 Long Birthwoort hath many ſmall long ſlender ſtalkes creeping vpon the ground, tangling one with another very intricately, beſet with round leaues not much vnlike Sowbread or Ivie, but larger, of a light or ouerworne green colour, and of a grieuous or lothſome ſmell and ſauour: among which come forth long hollow floures, not much vnlike the flours of Aron, but without any peſtell or clapper in the ſame; of a darke purple colour: after which follow ſmall fruit like vnto little peares, containing triangled ſeeds of a blackiſh colour. The root is long, thicke, of the colour of box, of a ſtrong ſauour and bitter taſte.

2 The round Birthwoort in ſtalkes aud leaues is like the firſt, but his leaues are rounder: the floures differ onely in this, that they be ſomwhat longer and narrower, and of a faint yellowiſh colour, but the ſmall flap or point of the floure that turneth backe againe, is of a darke or blacke pur-

ple colour. The fruit is formed like a peare, ſharp toward the top, more ribbed and fuller than the former: the root is round like vnto Sow-bread, in taſte and ſauor like the former.

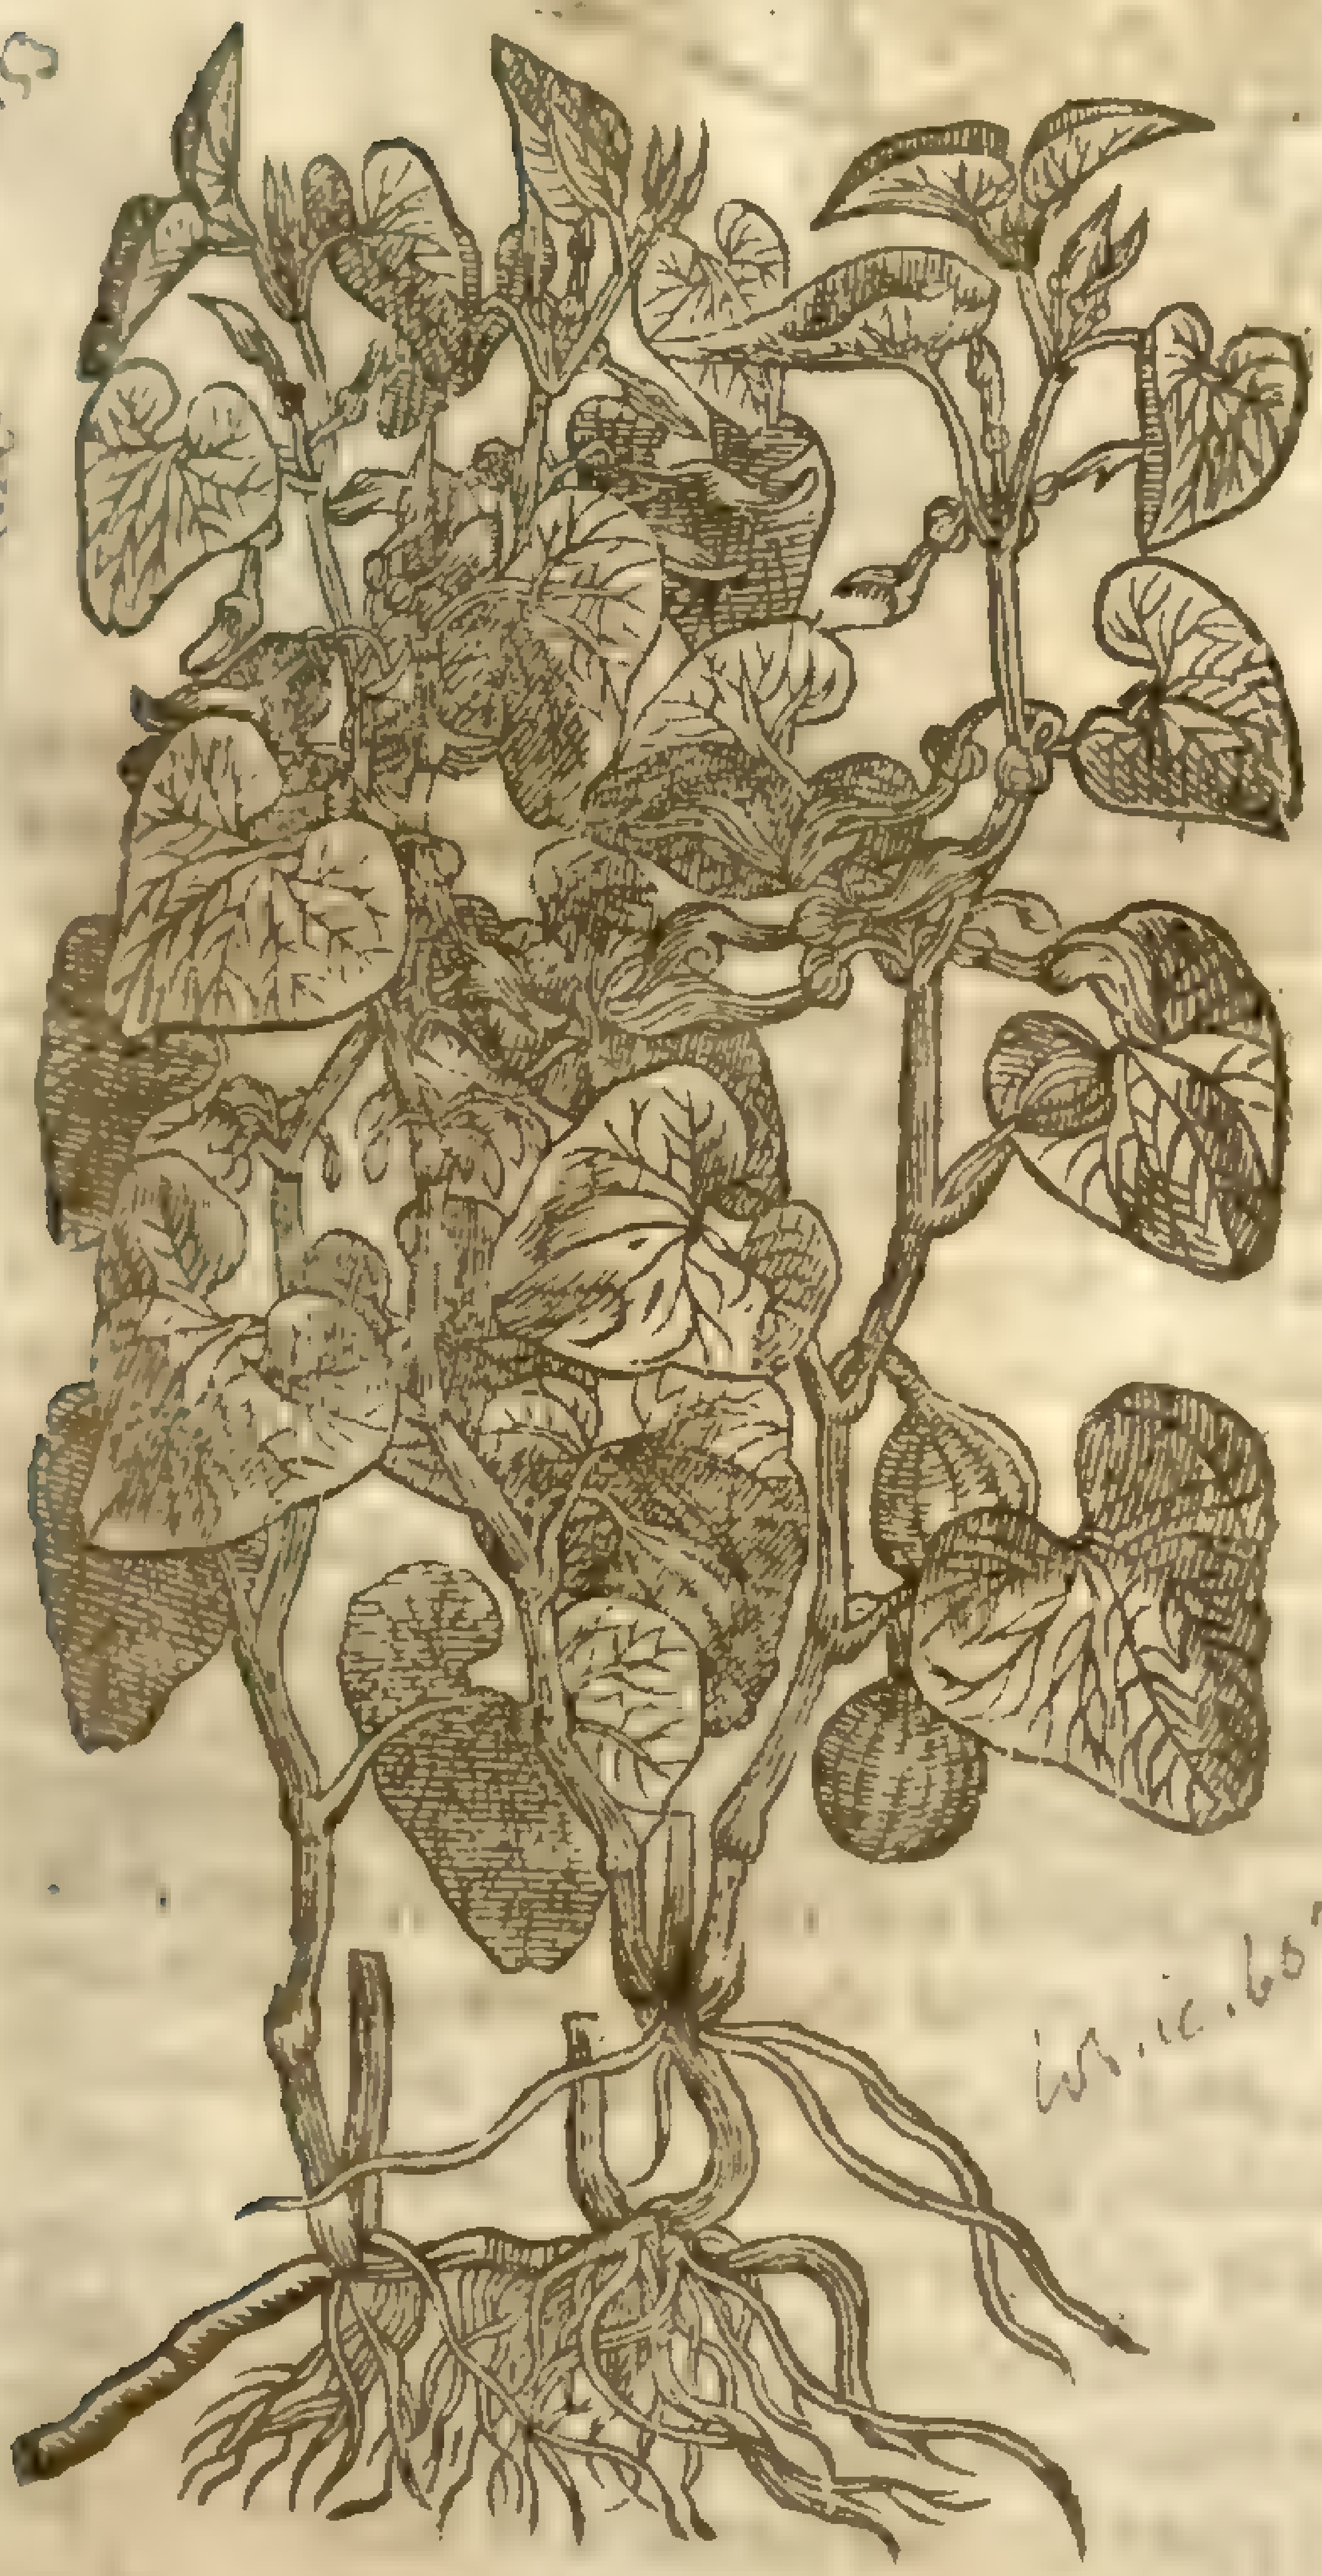
3 *Ariſtolochia clematitis.* Climing Birthwort.

A. [illegible] [illegible]



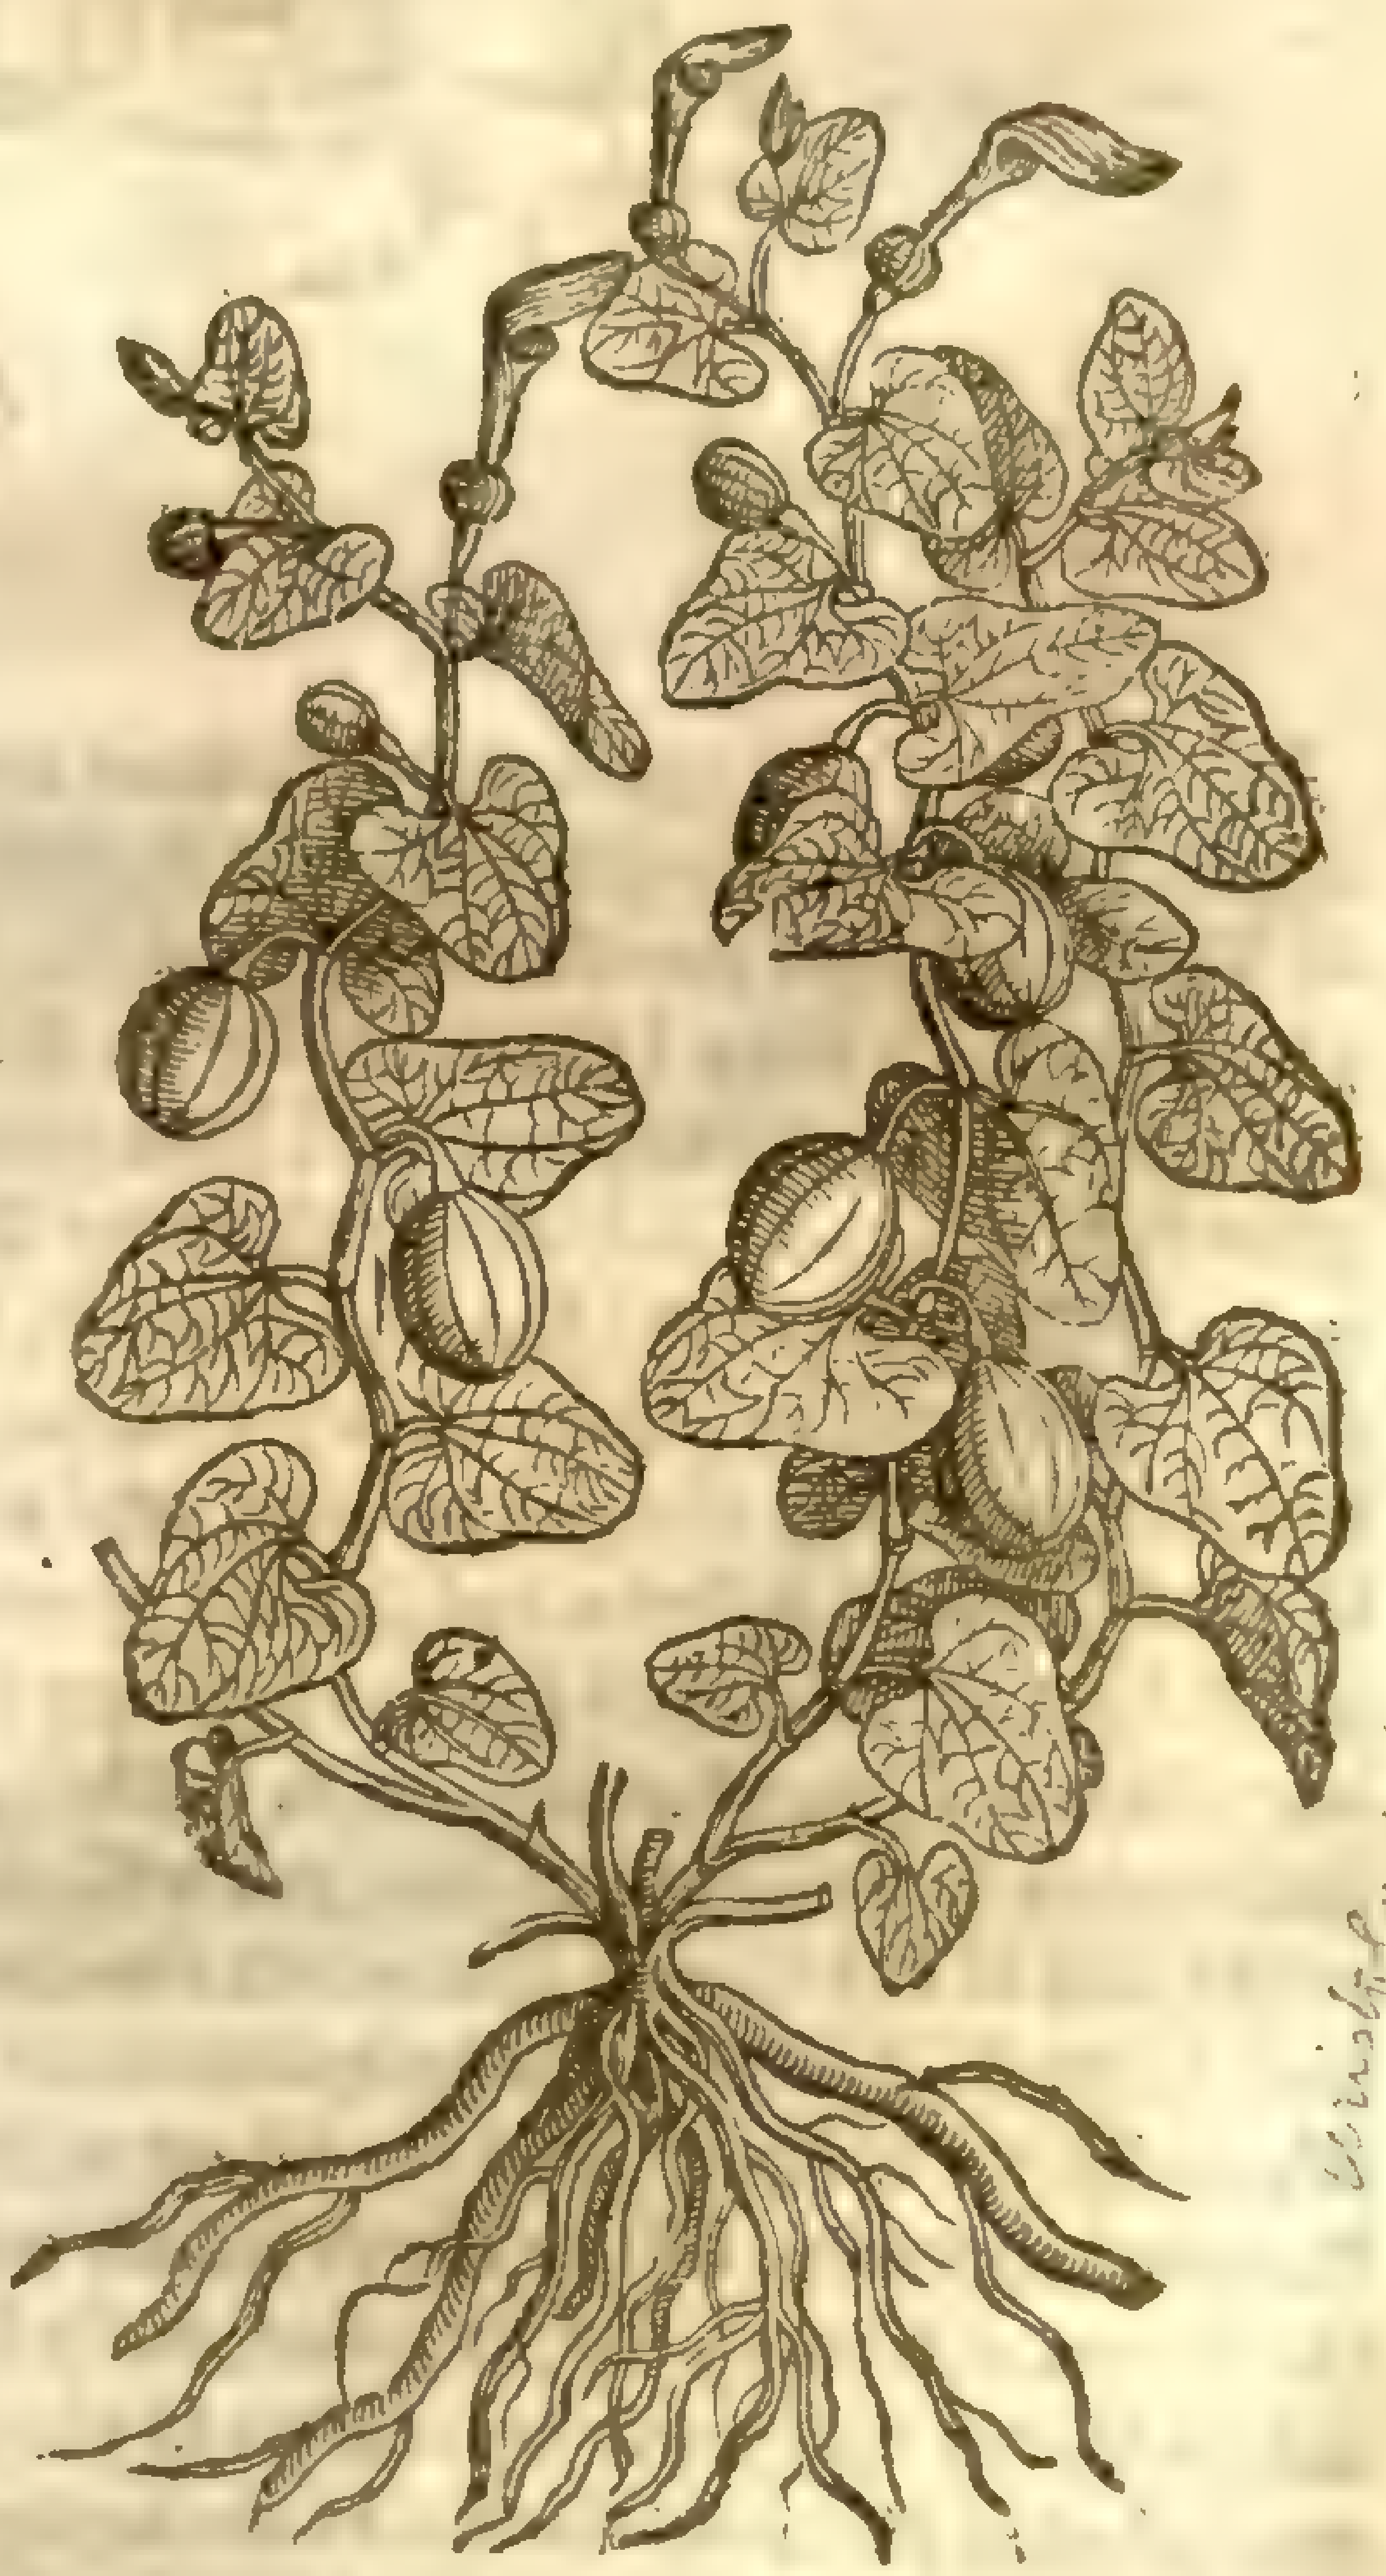
‡ 4 *Ariſtolochia Saracenica.*
Saracens Birthwort.

[illegible]



W.i.c.607

‡ 5 *Piſtolochia.*
Small Birthwort.



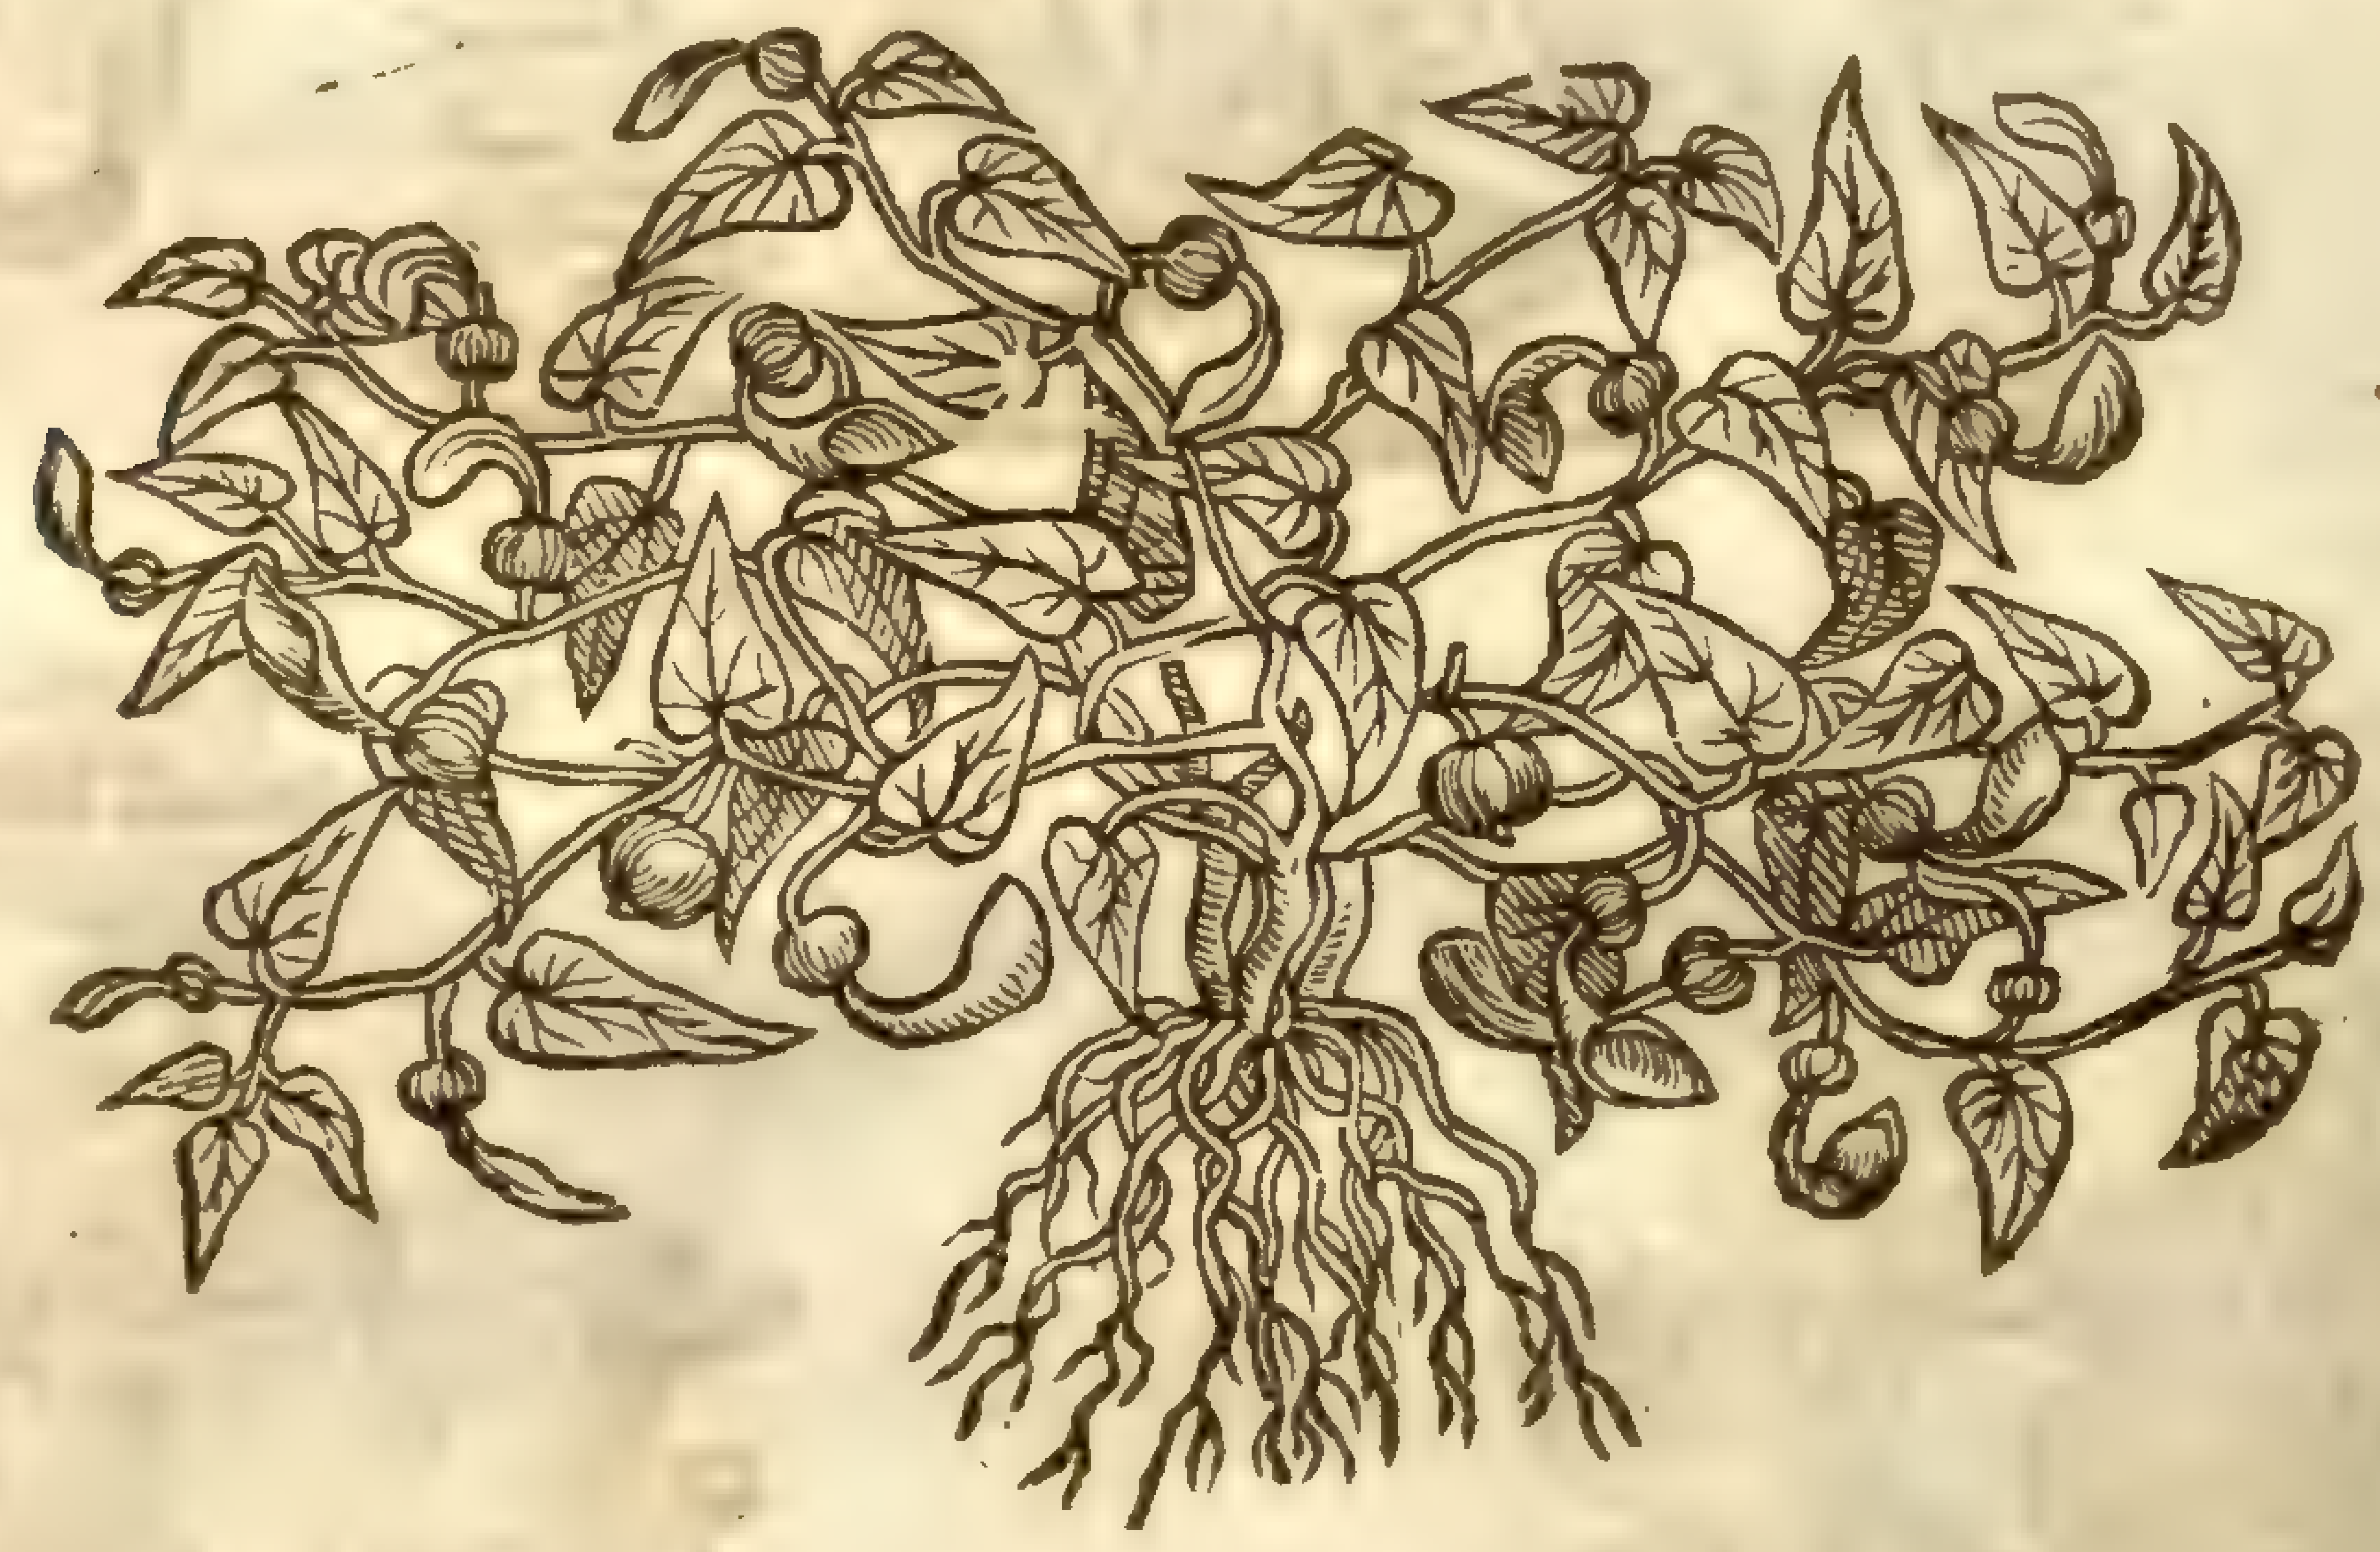
[illegible]

3 Climing Birthwort taketh hold of any thing that is next vnto it, with his long and claſping ſtalks, which be oftentimes branched, and windeth it ſelfe like Bindeweed: the ſtalks of the leaues are longer, whoſe leaues be ſmooth, broad, ſharp pointed, as be thoſe of the others; the flours likewiſe hollow, long, yellow, or of a blackiſh purple color: the fruit differs not from that of the other, but the roots be ſlender and very long, ſometimes creeping on the top of the earth, and ſometimes growing deeper, being of like colour with the former ones.

4 There is a fourth kinde of Birthwort reſembling the reſt in leaues and branched ſtalkes, yet

higher,and longer than either the long or the round: the leaues thereof be greater than thoſe of *Aſarabacca*,the floures hollow,long, and in one ſide hanging ouer, of a yellowiſh colour: the fruit is long and round like a peare,in which the ſeeds lie ſeuered, of forme three ſquare, of an ilfauoured blackiſh colour: the root is ſomwhat long,oftentimes of a mean thickneſſe, yellow like Box, not inferior in bitterneſſe either to the long or round Birthwort: and ſometimes theſe are found to bee ſmall and ſlender,and that is when they were but lately digged vp and gathered: for by the little parcels of the roots which are left, the yong plants bring forth at the beginning tender and branched roots.

5 Small Birthwort is like to the long and round Birthwort both in ſtalkes and leaues, yet is it leſſer and tenderer: the leaues thereof are broad, and like thoſe of Iuy; the floure is long, hollow in the vpper part,and on the outſide blackiſh; the fruit ſomething round like the fruit of round Birthwort: in ſtead of roots there grow forth a multitude of ſlender ſtrings.



‡ 6 *Piſtolochia Cretica,ſiue Virginiana.* Virginian Snake-root.

Ariſtolochia ſerpentaria Mill. dict

‡ 6 *Cluſius* figures and deſcribes another ſmal *Piſtolochia*,by the name of *Piſtolochia Cretica*,to which I thought good to adde the Epithit *Virginiana* alſo, for that the much admired Snakeweed of Virginia ſeems no otherwiſe to differ from it than an inhabitant of Candy from one of the Virginians,which none I think wil ſay to differ in *ſpecie*. I wil,firſt giue *Cluſius* his deſcription,and then expreſſe the little varietie that I haue obſerued in the plants that were brought from Virginia,and grew here with vs: It ſends forth many ſlender ſtalks a foot long,more or leſſe,and theſe are cornered or indented,creſted,branched,tough,and bending towards the ground,or ſpred thereon,and of a darke green colour; vpon which without order grow leaues neruous, and like thoſe of the laſt deſcribed,but much ſharper pointed,and after a ſort reſembling the ſhape of thoſe of *Smilax aſpera*; but leſſe;and of a darke and laſting greene colour,faſtned to longiſh ſtalks; out of whoſe boſomes grow long and crooked floures in ſhape like thoſe of the long Birthwort,but of a darker red on the outſide,but ſomewhat yellowiſh within; and theſe are alſo faſtned to pretty long ſtalkes, and are ſucceeded by fruit not vnlike, yet leſſe than that of the long Birthwort. This hath aboundance of roots like as the former,but much ſmaller,and more fibrous,and of a ſtronger ſmel:it flours in Iuly and Auguſt. Thus *Cluſius* deſcribes his: To which that Snake-weed that was brought from *Virginia*,and grew with M^{r} *Iohn Tradeſcant* at South Lambeth, *An*.1632, was agreeable in all points, but here and there one of the lower leaues were ſomewhat broader, and rounder pointed than the reſt: the floure was long, red, crooked, and a little hairy, and it did not open the top or ſhew the inner ſide,which I iudge was by reaſon of the coldneſſe and vnſeaſonableneſſe of the later part of the ſomer when it floured: the ſtalks in the figure ſhould haue bin expreſt more crooking or indenting, for they commonly grow ſo. How hard it is to iudge of plants by one particle or faculty may very well appeare by this herb I now treat of: for ſome by the ſimilitude the root had with *Aſarum*, and a vomiting quality which they attributed to it(which certainly is no other than accidental)would forthwith pronounce and maintaine it an *Aſarum*: ſome alſo refer it to other things,as to Primroſes,*Vincitoxicum*,&c. Others more warily name it *Serpentaria Virginiana*,& *Radix Virginiana*, names as it were offering themſelues,and eaſily fitted and impoſed vpon ſundry things,but yet too generall,and therfore not fit any more to be vſed,ſeeing the true and ſpecifique denomination is found.‡

¶ *The Place.*

Pliny ſheweth, That the Birthworts grow in fat and Champian places: The fields of Spaine are full of theſe three long and round Birthworts: they are alſo found in Italy and Narbone or Languedoc a country of France. *Petrus Bellonius* writeth, That he found branched Birthwort vpon Ida a mountaine in Candy. *Cluſius* ſaith he found this about Hiſpalis, & in many other places of Granado in Spain among buſhes and brambles. They grow all in my garden.

¶ *The Time.*

They floure in May, Iune, and Iuly.

¶ *The Names.*

Birthwort is called in Greeke Ἀριστολοχία: in Latine likewiſe *Ariſtolochia*, becauſe it is ἄριστα ταῖς λόχοις that is to ſay, good for women newly brought to bed or deliuered with childe: in Engliſh, Birthwort, Hartwort, and of ſome *Ariſtolochia*.

The firſt is called *Ariſtolochia longa*, or long Birthwort, of the forme of his root, and alſo *Ariſtolochia mas* or male Birthwort: the ſecond is thought to be *Fœmina*, or female Birthwort, and is called *Rotunda Ariſtolochia*, or round Birthwort; of diuers alſo, *Terræ Malum*, the Apple of the earth: yet *Cyclaminus* is alſo called *Terræ Malum*, or Earth Apple.

¶ *The Temperature.*

All theſe Birthworts are of temperature hot and dry, euen in the third degree, hauing power to clenſe.

¶ *The Vertues.*

Dioſcorides writeth, That a dram weight of long Birthwort drunke with wine and ſo applied, is good againſt ſerpents and deadly things: and that being drunke with Myrrhe and pepper, it expels whatſoeuer is left in the matrice after the childe is deliuered, the flowrs alſo and dead childe; and that being put in a peſſarie it performeth the ſame. A

Round Birthwort ſerues for all theſe things, and for the reſt of the other poiſons: it preuails alſo againſt the ſtuffing of the lungs, the hicket, the ſhakings or ſhiuerings of agues, hardneſſe of the milt or ſpleen, burſtings, cramps, conuulſions, and pain of the ſides, if it be drunk with water. B

It plucketh out thornes, ſplinters, or ſhiuers, and being mixed in plaiſters or pulteſſes, it drawes forth ſcales or bones, remoueth rottenneſſe or corruption, mundifieth and ſcoureth foul and filthy vlcers, and filleth them vp with new fleſh, if it be mixed with Ireos and hony. C

Galen ſaith, That branched Birthwort is of a more ſweet and pleaſant ſmell, and therefore is vſed in ointments; but it is weaker in operation than the former. D

Birth-wort, as *Pliny* writeth, being drunke in water, is a moſt excellent remedie for cramps, conuulſions, bruiſes, and for ſuch as haue fallen from high places. E

It is good againſt ſhort windedneſſe and the Falling ſickneſſe. F

The round *Ariſtolochia* doth beautifie, clenſe, and faſten the teeth, if they be often fretted or rubbed with the pouder thereof. G

‡ The root of the Virginian *Piſtolochia*, which is of a ſtrong and aromatick ſent, is a ſingular and much vſed antidote againſt the bite of the Rattle-ſnake, or rather Adder or Viper, whoſe bite is very deadly; and therefore by the prouidence of the Creator hee hath vpon his taile a ſkinny dry ſubſtance parted into cels, which contain ſome looſe hard dry bodies that rattle in them (as if one ſhould put little ſtones or peaſe into a ſtiffe and very dry bladder) that ſo he may by this noiſe giue warning of his approch, the better to be auoided: but if any be bitten, they know nor ſtand in need of no better antidote than this root, which they chew and apply to the wound, & alſo ſwallow ſome of it downe, by which means they quickly ouercome the malignitie of this poiſonous bite, which otherwiſe in a very ſhort time would proue deadly. Many alſo commend the vſe of this againſt the plague, ſmall pox, meaſels, and ſuch like maligne and contagious diſeaſes. ‡ H

Chap. 312. *Of Violets.*

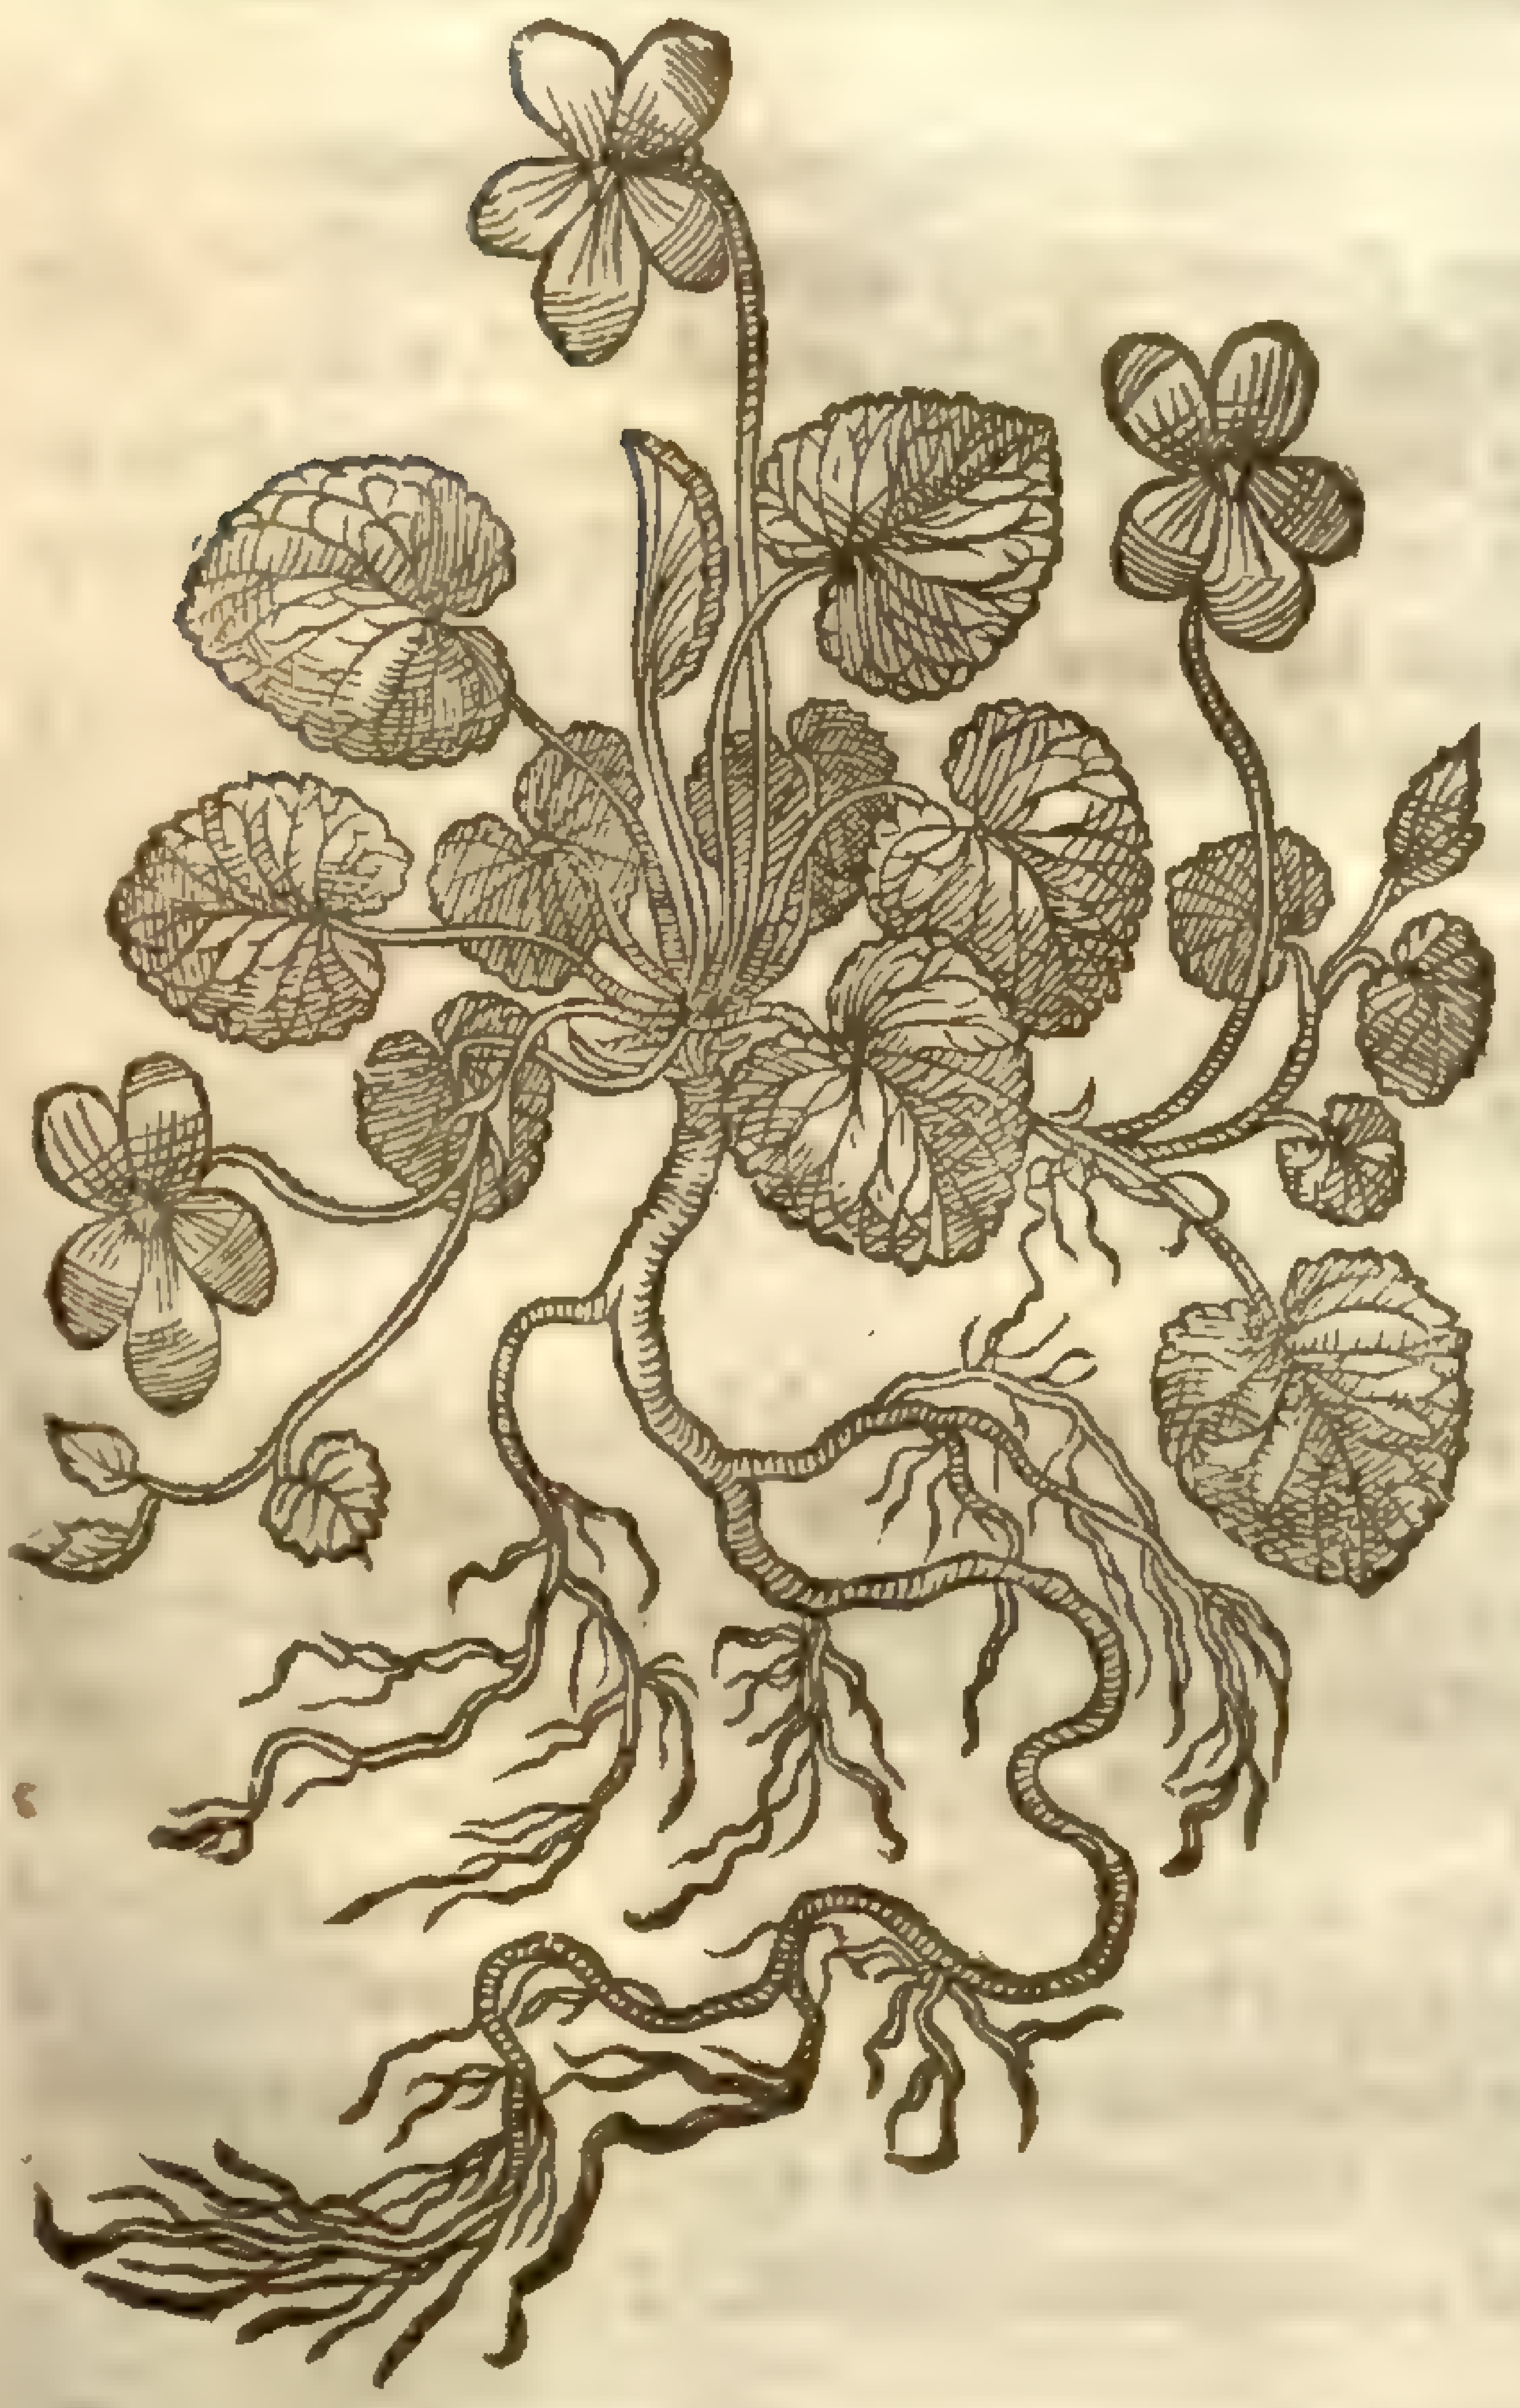
¶ *The Kindes.*

There might be deſcribed many kindes of floures vnder this name of Violets, if their differences ſhould be more curiouſly looked into than is neceſſarie: for we might joine hereunto the ſtock Gillofloures, Wall-floures, Dames Gillofloures, Marian violets, & likewiſe ſome of the bulbed floures, becauſe ſome of them by *Theophraſtus* are termed Violets. But this was not our charge, holding it ſufficient to diſtinguiſh and diuide them as neere as may be in kindred and neighbourhood; addreſſing my ſelfe vnto the Violets called the blacke or purple violets, or March Violets of the garden, which haue a great prerogatiue aboue others, not only becauſe the mind conceiueth a certain pleaſure and recreation by ſmelling and handling thoſe moſt odoriferous floures, but alſo for that very many by theſe violets receiue ornament and comely grace; for there be made of them garlands for the head, noſegaies and poeſies, which are delightfull to looke on and pleaſant to ſmel to, ſpeaking nothing of their appropriat vertues; yea gardens themſelues receiue by theſe the greateſt ornament of all, chiefeſt beauty, and moſt excellent grace, and the recreation of the minde which is taken hereby cannot be but very good and honeſt; for they admoniſh and ſtirre vp a man to that which is comely and honeſt; for floures through their beauty, variety of colour, and exquiſit forme, do bring to a liberall and gentle manly minde, the remembrance of honeſtie, comlineſſe, and all kindes of vertues: for it would be an vnſeemly and filthy thing (as a certain wiſe man ſaith) for him that doth looke vpon and handle faire and beautiful things, to haue his mind not faire, but filthy and deformed.

¶ *The Deſcription.*

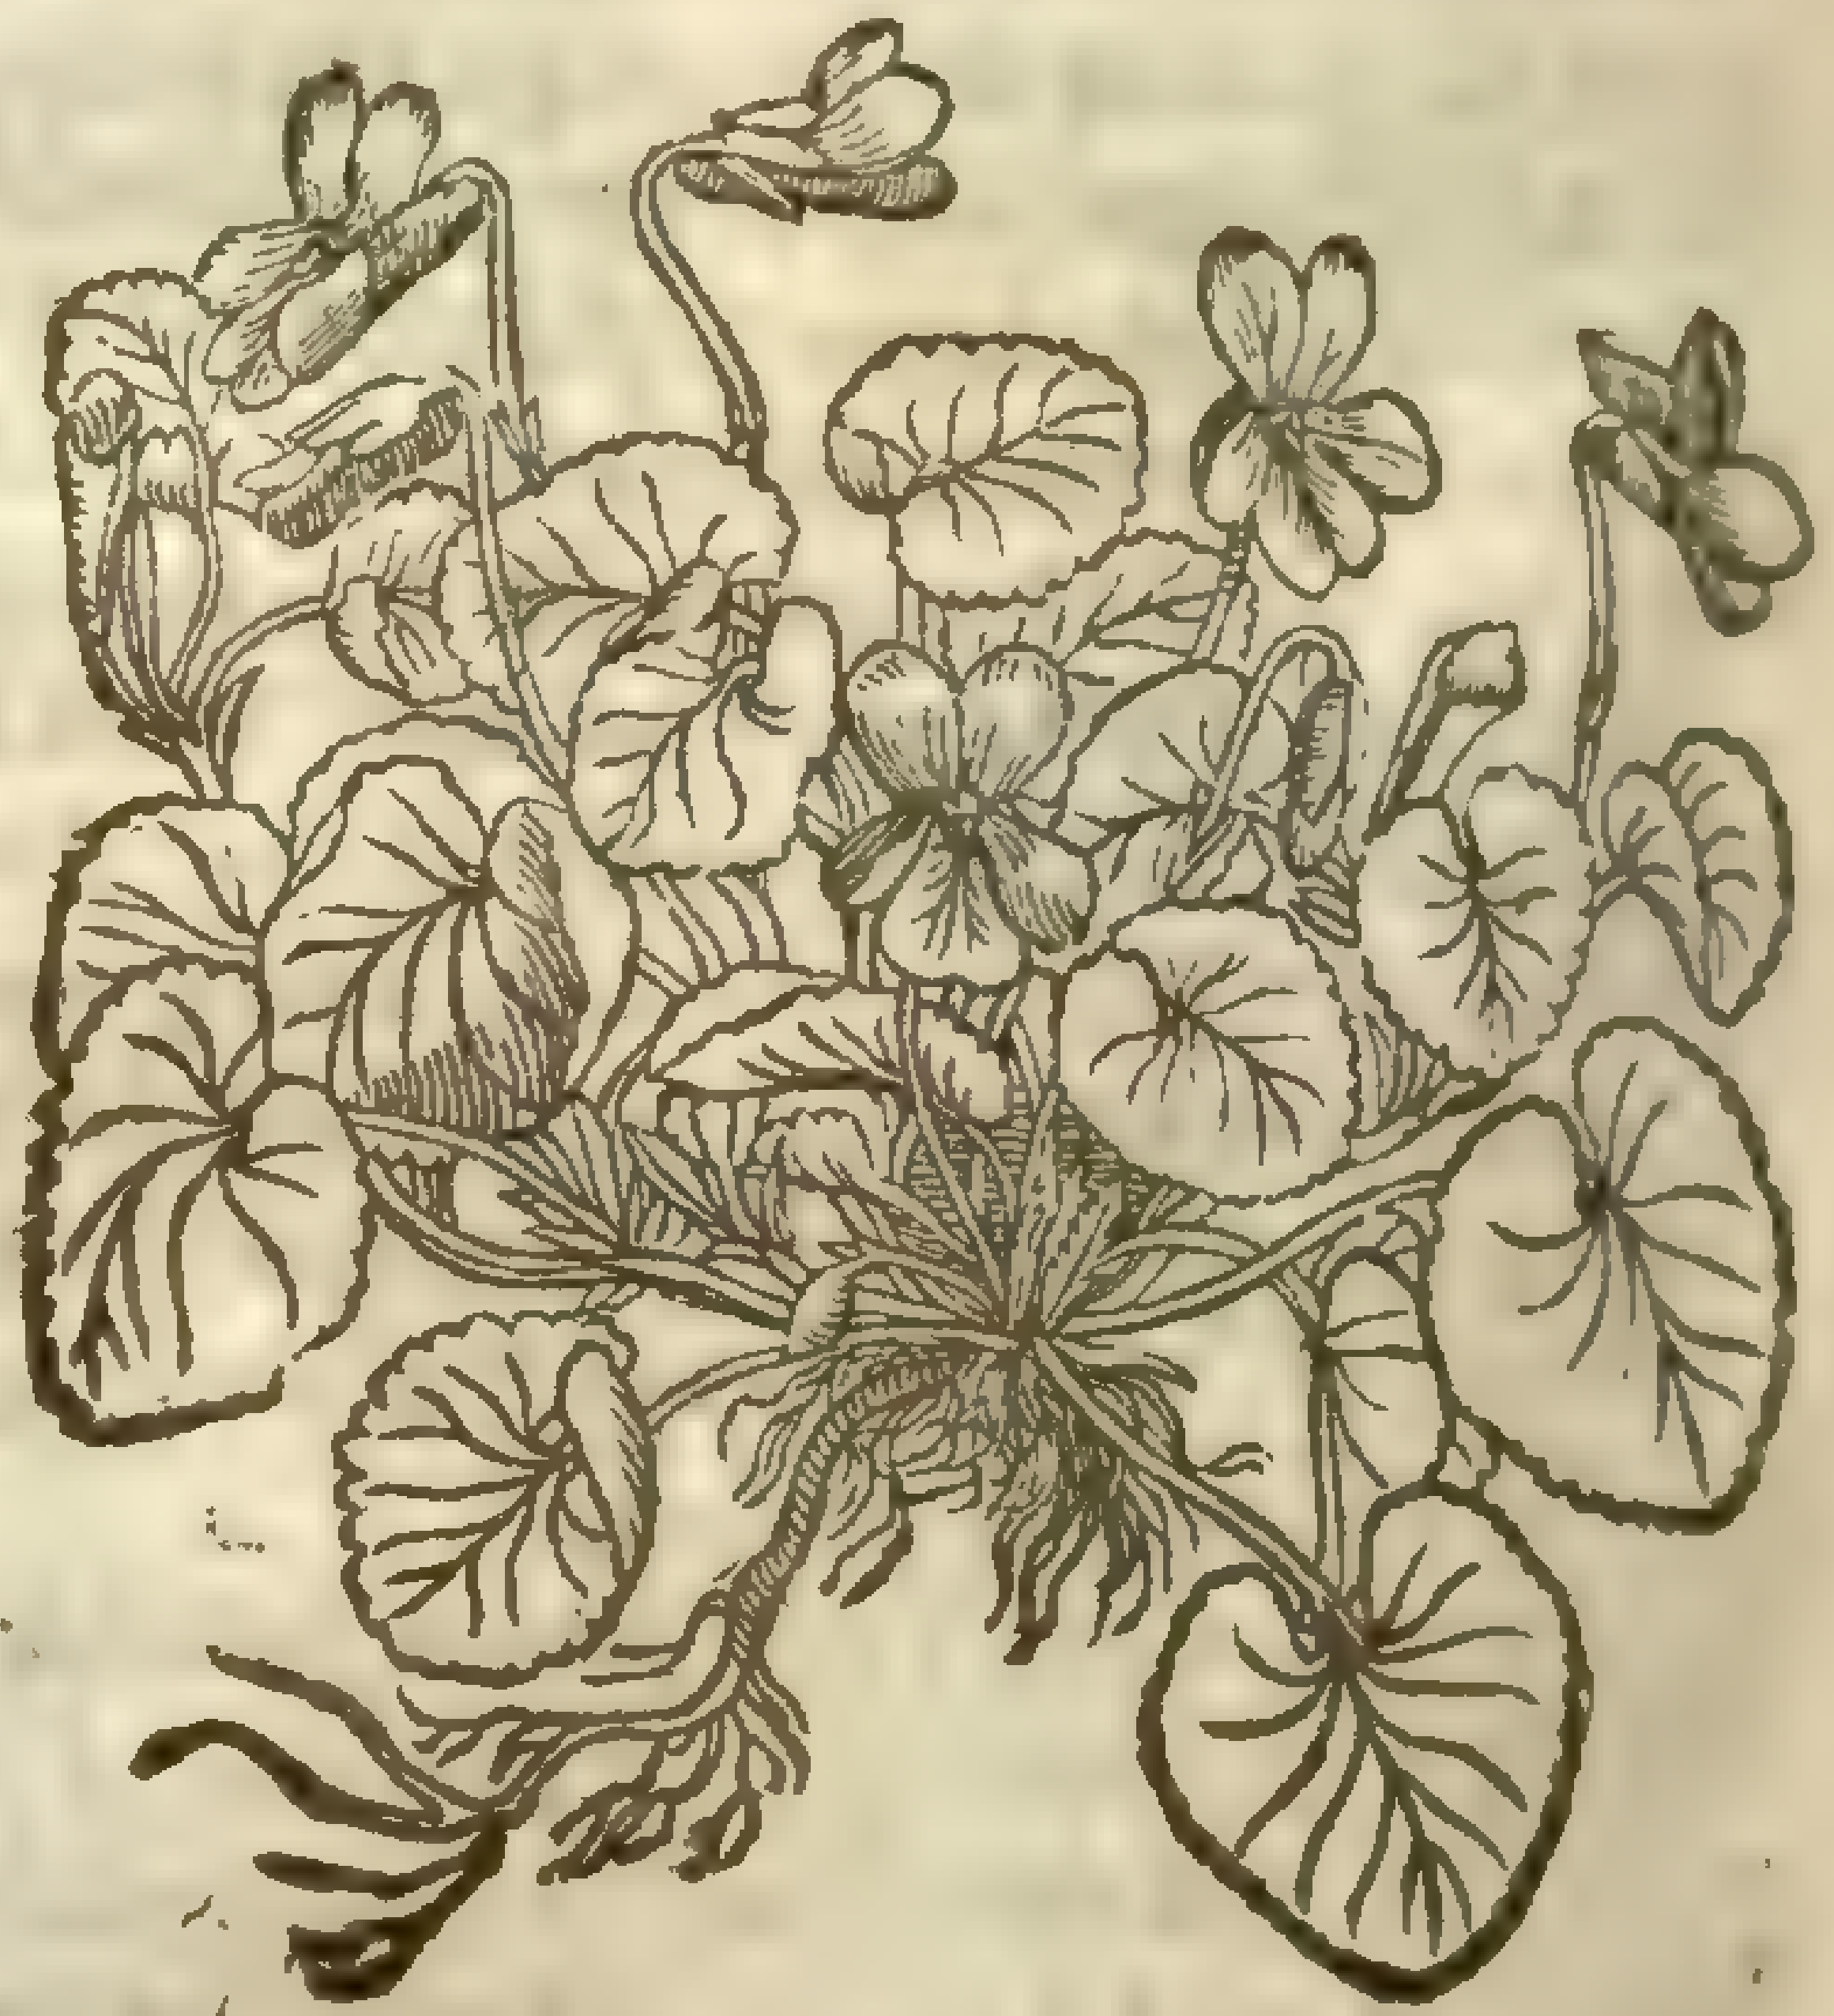
1 The blacke or purple Violet doth forthwith bring from the root many leaues, broad, ſleightly indented in the edges, rounder than the leaues of Iuy; among the midſt whereof ſpring vp fine ſlender ſtems, and vpon euery one a beautifull flour ſweetly ſmelling, of a blew darkiſh purple, conſiſting of fiue little leaues, the loweſt whereof is the greateſt: after them do appeare little hanging cups or knaps, which when they be ripe do open and diuide themſelues into three parts. The ſeed is ſmal, long, and ſomwhat round withall: the root conſiſteth of many threddy ſtrings.

1 *Viola nigra ſiue purpurea.*
The purple garden Violet.



Viola odorata in [illegible] Sm. pl. 1. 302

2 *Viola flore albo.*
The white garden Violet.



V. odorata, fl. B. [illegible] Sm. pl. 1. 302

2 The white garden Violet hath many milke white floures, in forme and figure like the precedent; the colour of whoſe floures eſpecially ſetteth forth the difference.

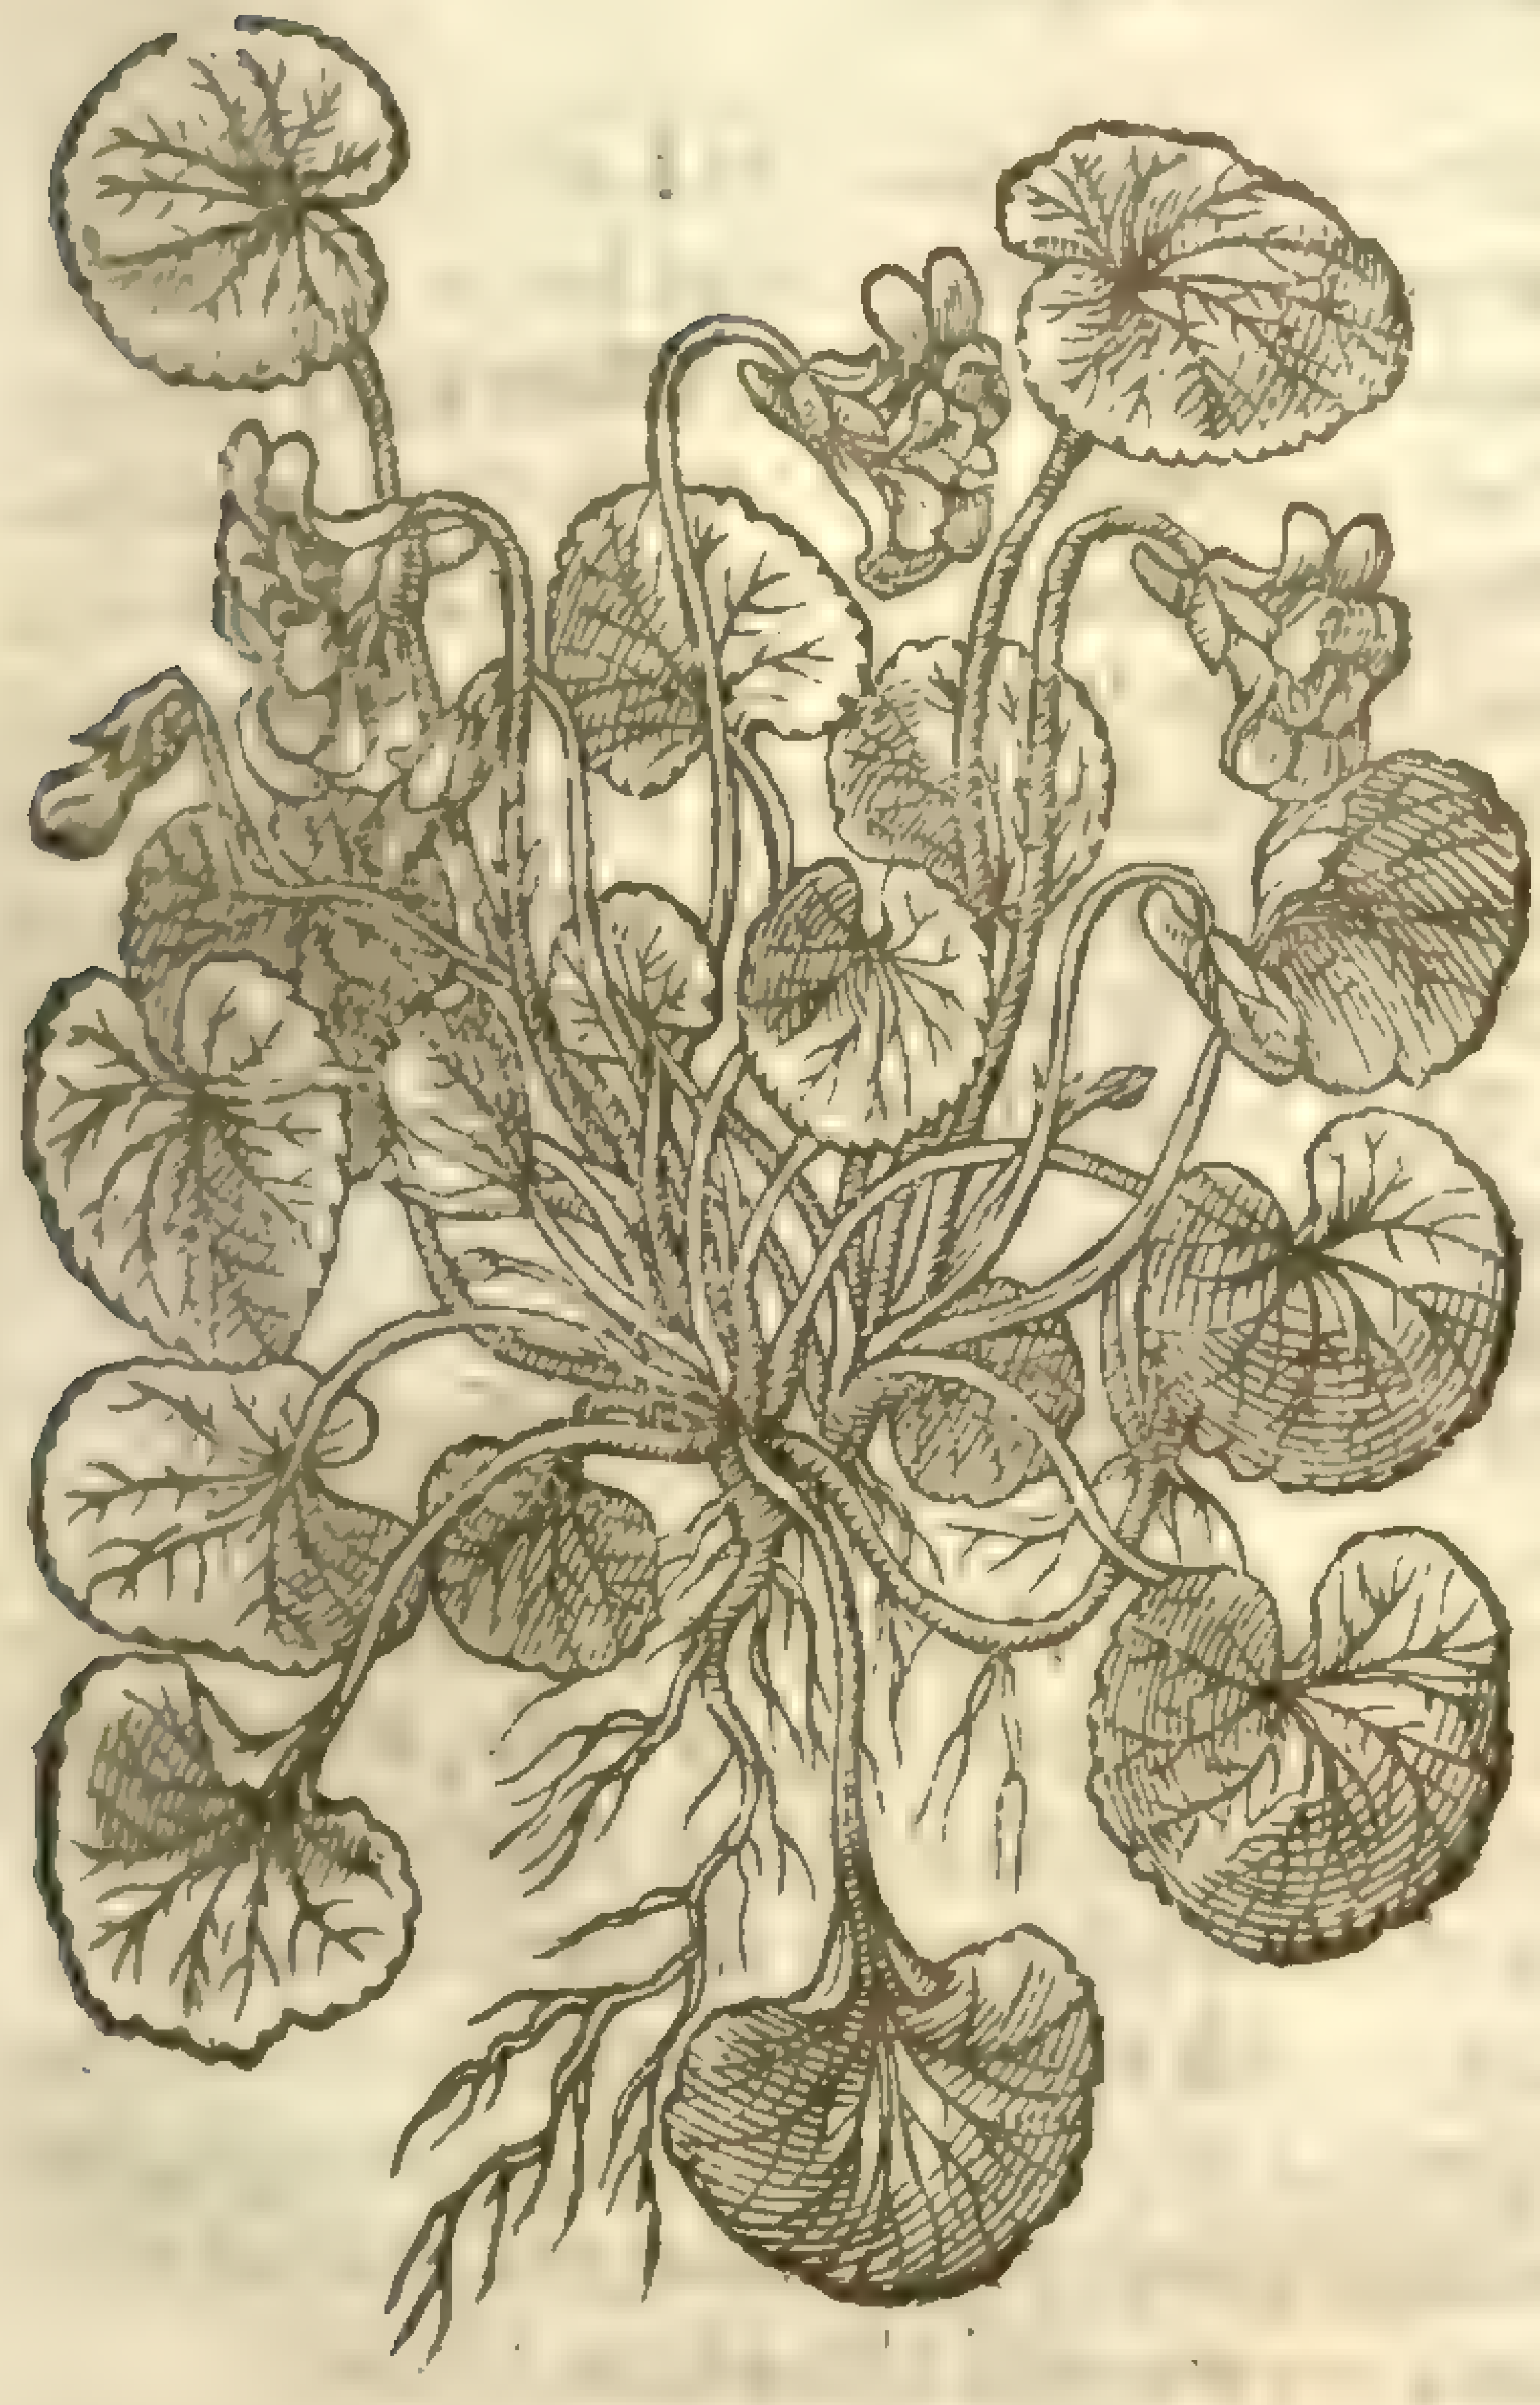
3 The double garden Violet hath leaues, creeping branches, and roots like the garden ſingle Violet; differing in that, that this Violet bringeth forth moſt beautifull ſweet double floures, and the other ſingle.

4 The white double Violet likewiſe agrees with the other of his kinde, differing onely in the colour; for as the laſt deſcribed bringeth double blew or purple flours, contrariwiſe this plant beareth double white floures, which maketh the difference.

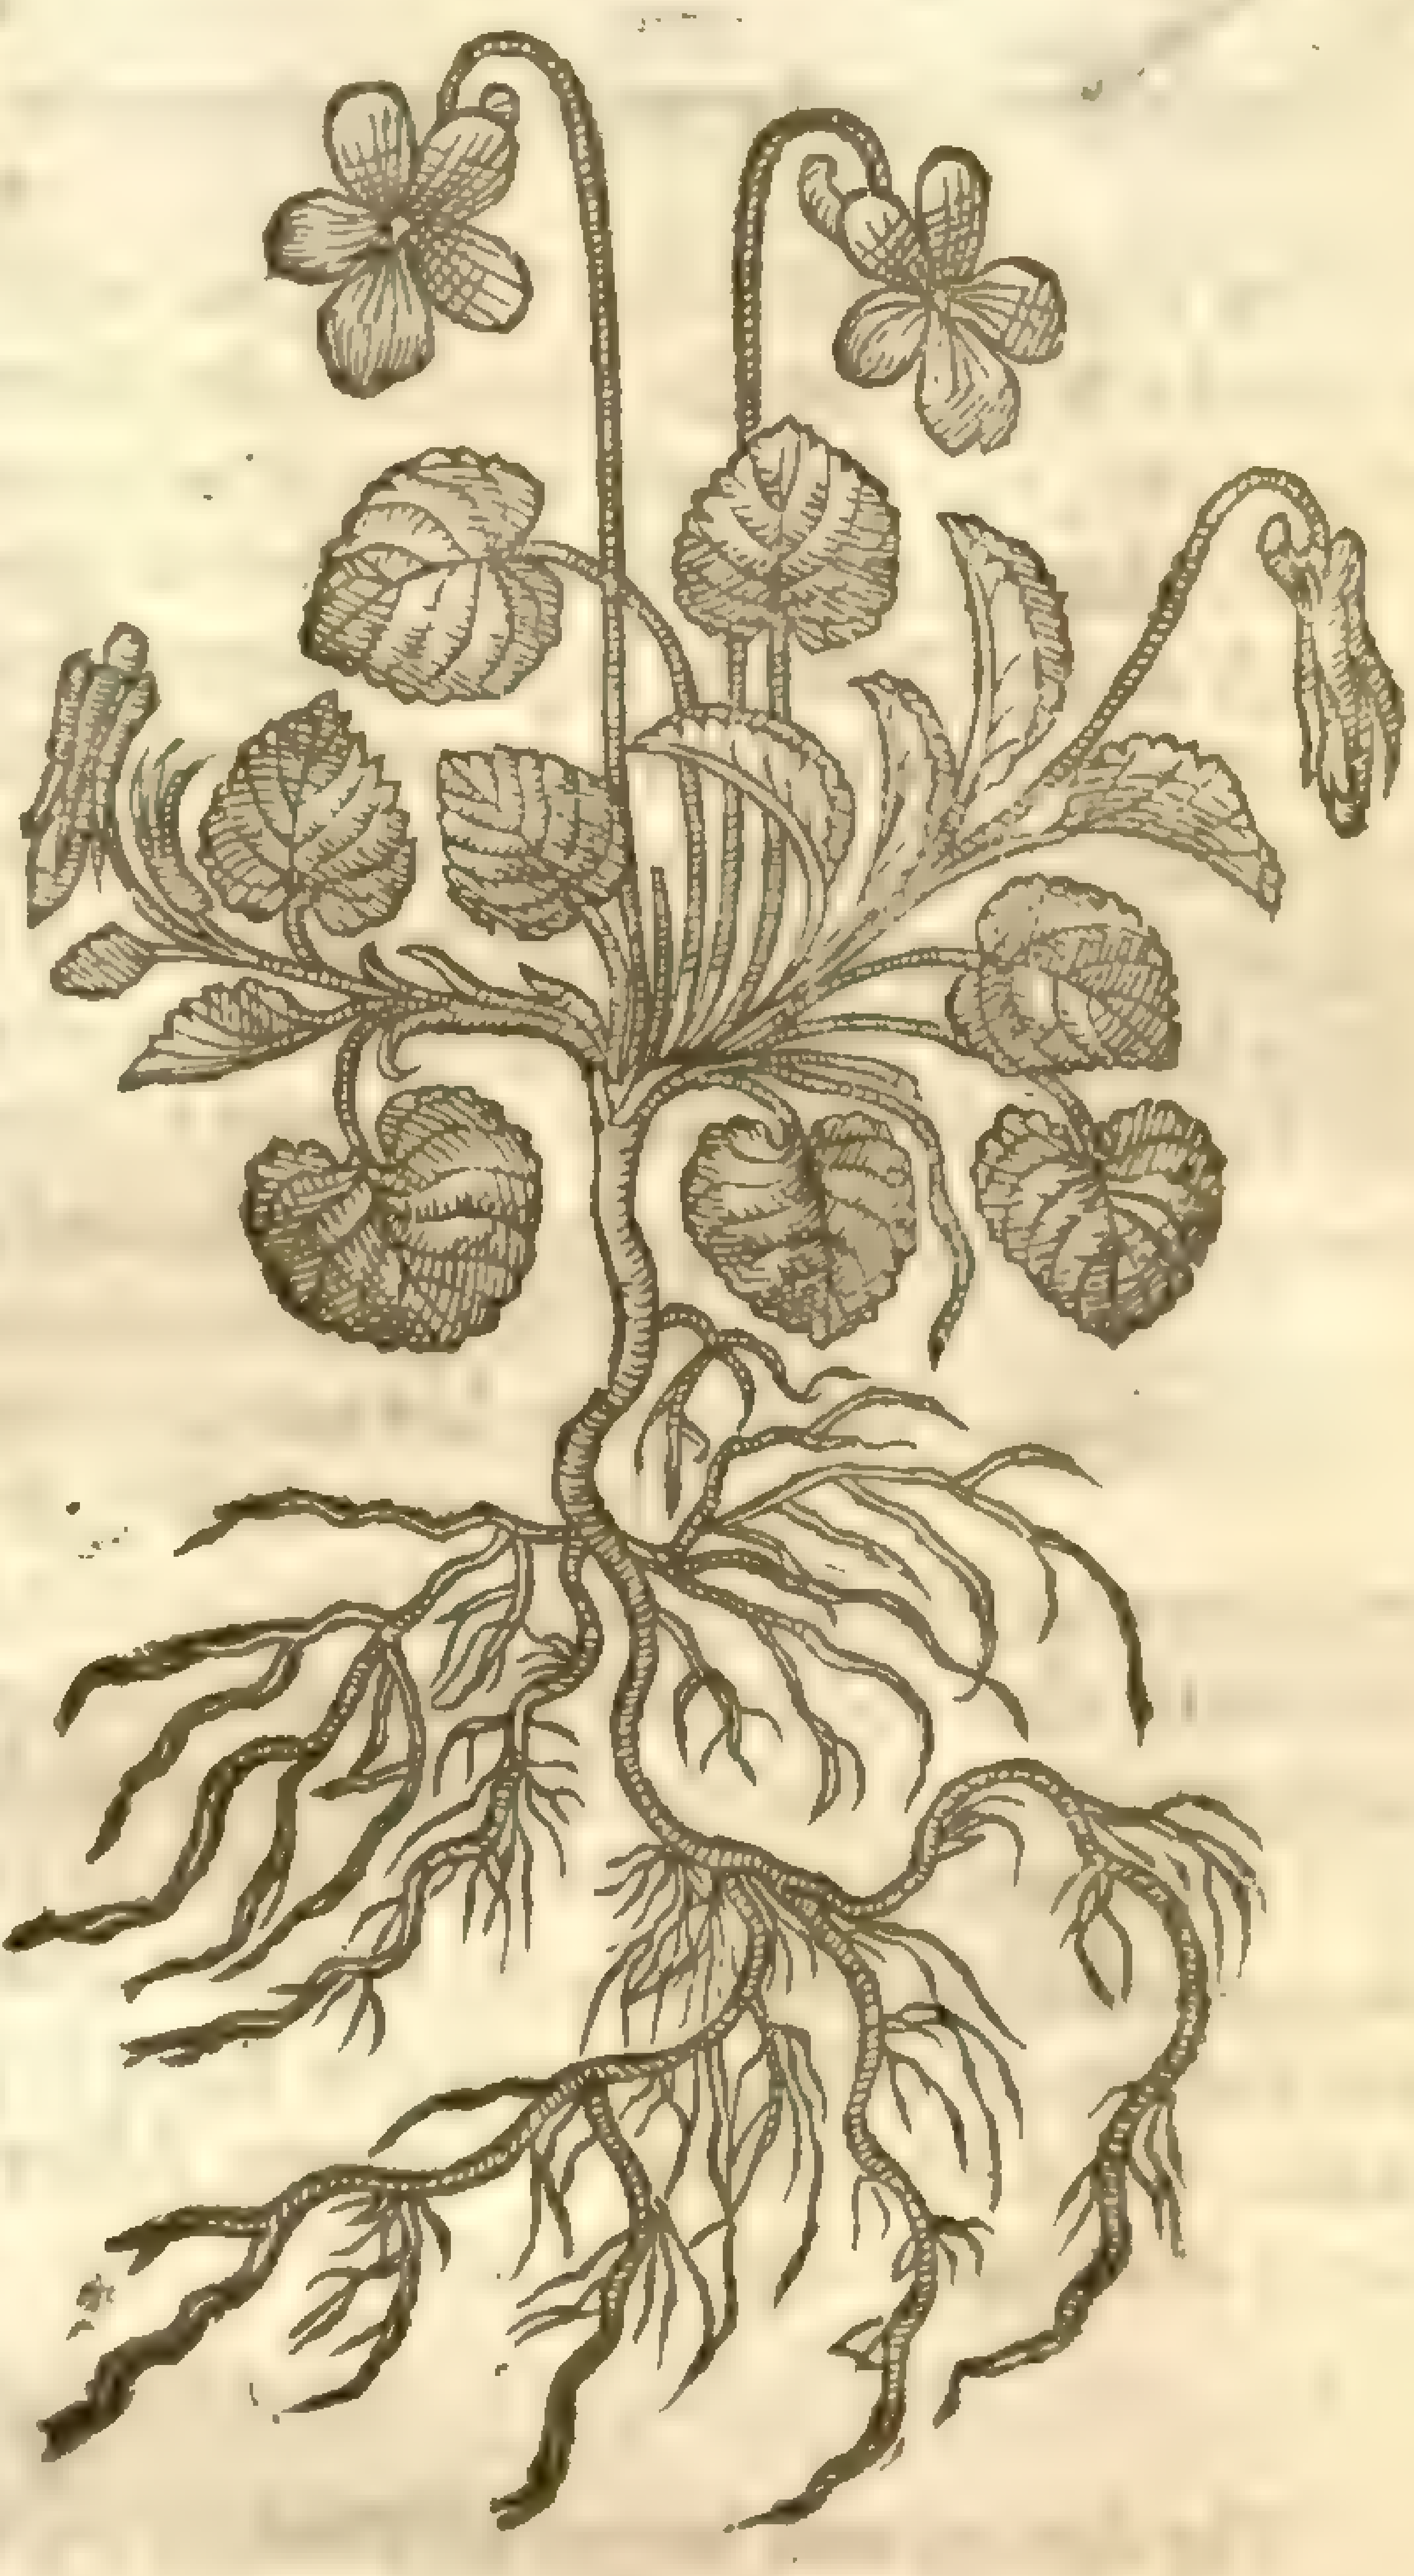
5 The yellow Violet is by nature one of the wilde Violets, for it groweth ſeldom any where but vpon moſt high and craggy mountaines, from whence it hath been diuers times brought into the garden, but it can hardly be brought to culture or grow in the garden without great induſtrie. And by the relation of a gentleman often remembred, called Maſter *Thomas Hesketh*, who found it

growing

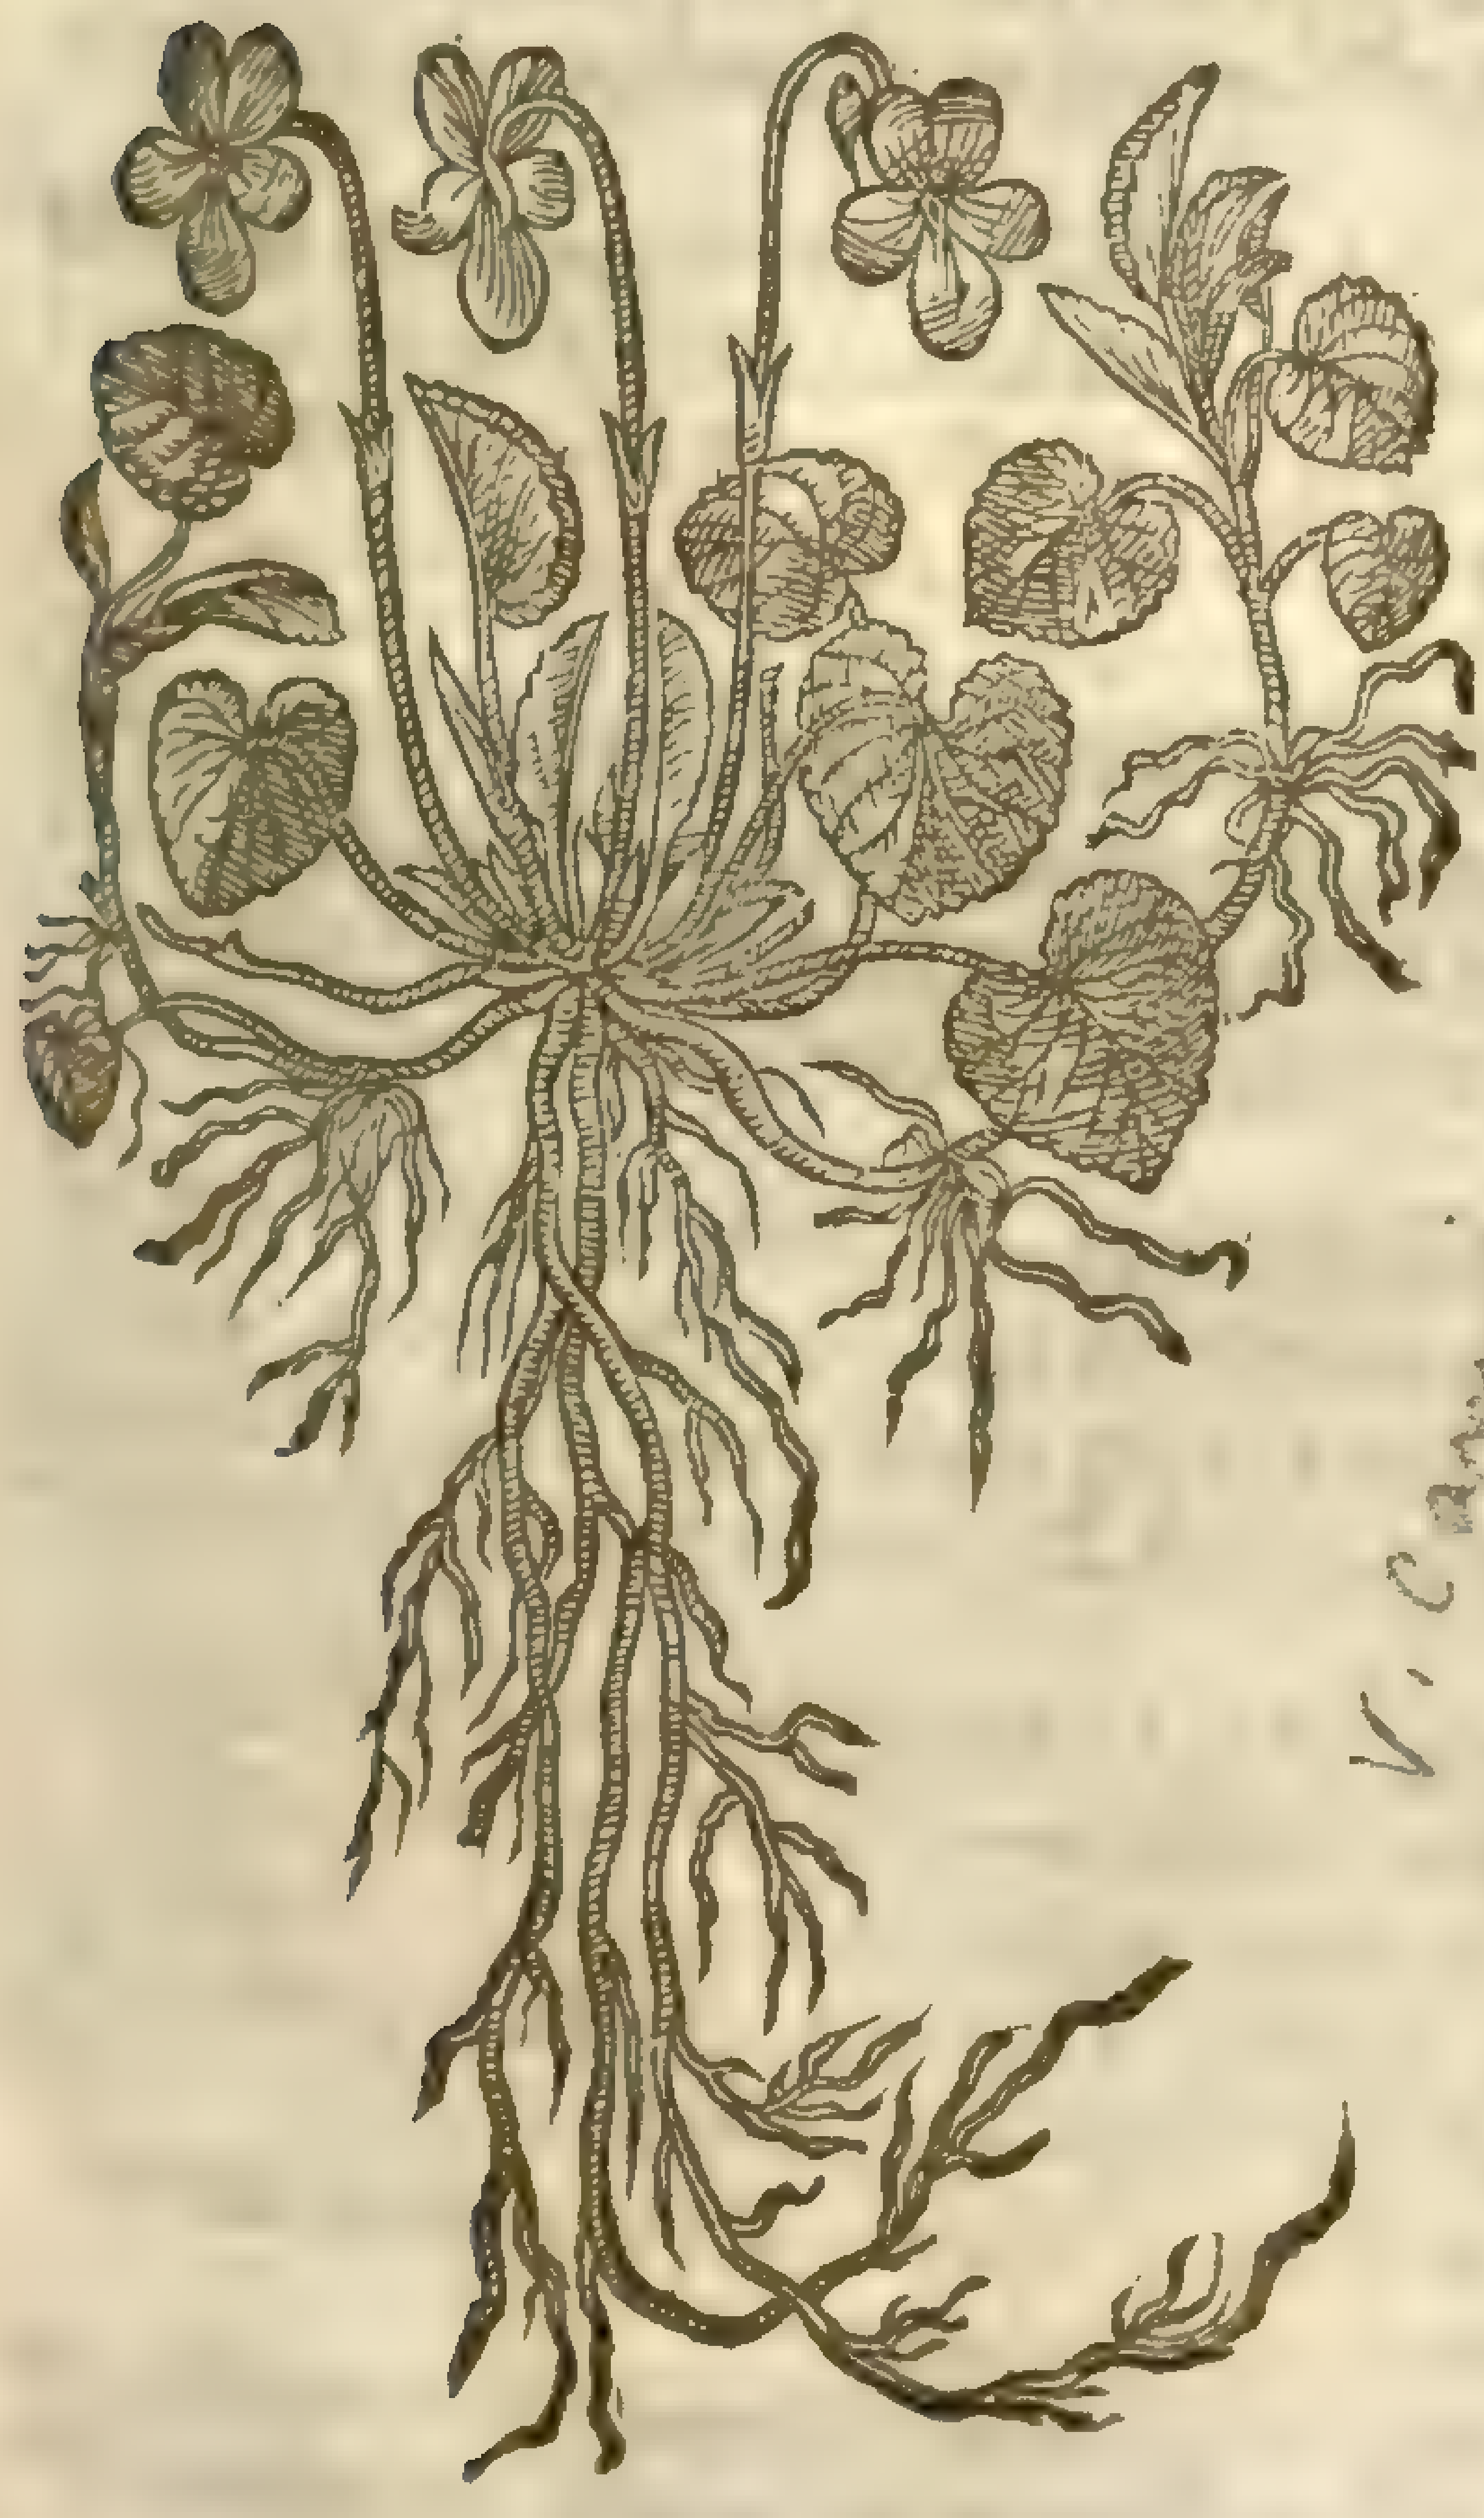
3 *Viola martia purpurea multiplex.*
The double garden purple Violet.



5 *Viola martia lutea.*
Yellow Violets.



† 6 *Viola canina ſylueſtris.*
Dogs Violets, or wilde Violets.



V. Canina. [illegible] Sp. pl. 1.333

growing vpon the hils in Lancaſhire, neere vnto a village called Latham; and though he brought them into his garden, they withered and pined. The whole plant is deſcribed to be like vnto the field Violet, and differeth from it, in that this plant brings forth yellow floures, yet like in forme and figure, but without ſmell.

6 The wilde field Violet with round leaues riſeth forth of the ground from a fibrous root, with long ſlender branches, whereupon do grow round ſmooth leaues. The floures grow at the top of the ſtalkes, of a light blew colour: ‡ and this growes commonly in woods and ſuch like places, and floures in Iuly and Auguſt. There is another varietie of this wilde Violet, hauing the leaues longer, narrower, and ſharper pointed: and this was formerly figured & deſcribed in this place by our Author. ‡

7 There is found in Germany about Noremberg and Strasburg, a kind of Violet altogether a ſtranger in theſe parts. It hath (ſaith my Author) a thick tough root of a wooddy ſubſtance, from which riſeth vp a ſtalk diuiding it ſelf into diuers branches of a woody ſubſtance: whereon grow long jagged leaues like thoſe of the panſy: the flours grow at the top, compact of fiue leaues apiece, of a watchet colour.

V. [illegible]

¶ The

¶ *The Place.*

The Violet groweth in gardens almoſt euery where: the others which are ſtrangers haue beene touched in their deſcriptions.

¶ *The Time.*

The floures for the moſt part appeare in March, at the fartheſt in Aprill.

¶ *The Names.*

The Violet is called in Greeke, Ἴον: of *Theophraſtus*, both Ἴον μέλαν, and μελάνιον: in Latine, *Nigra viola* or blacke Violet, of the blackiſh purple colour of the floures. The Apothecaries keepe the Latine name *Viola*, but they call it *Herba Violaria*, and *Mater Violarum*: in high-Dutch, **Blaw Viel**: in low Dutch **Violeten**: in French, *Violette de Mars*: in Italian, *Viola mammola*: in Spaniſh, *Violeta*: in Engliſh, Violet. *Nicander* in his Geoponicks beleeueth (as *Hermolaus* ſheweth) that the Grecians did call it Ἴον, becauſe certain Nymphs of Iönia gaue that floure firſt to *Iupiter*. Others ſay it was called Ἴον, becauſe when *Iupiter* had turned the yong damoſell *Iö*, whom he tenderly loued, into a Cow, the earth brought forth this floure for her food; which being made for her ſake, receiued the name from her: and thereupon it is thought that the Latines alſo called it *Viola*, as though they ſhould ſay *Vitula*, by blotting out the letter *t*. *Seruius* reporteth, That for the ſame cauſe the Latines alſo name it *Vaccinium*, alledging the place of *Virgil* in his Bucolicks;

Alba liguſtra cadunt, vaccinia nigra leguntur.

Notwithſtanding *Virgil* in his tenth Eclog ſheweth, that *Vaccinium* and *Viola* do differ:

Et nigræ violæ ſunt, & vaccinia nigra.

† *Vitruvius* alſo, *lib.* 7. of Architecture or Building, doth diſtinguiſh *Viola* from *Vaccinium*: for he ſheweth, that the colour called *Sile Atticum* or the Azure of Athens, is made *ex Viola*; and the gallant purple, *ex Vaccinio*. The Dyers, ſaith he, when they would counterfeit *Sile* or Azure of Athens, put the dried violets into a fat, kettle, or caldron, and boile them with water: afterwards when it is tempered, they poure it into a linnen ſtrainer, and wringing it with their hands, receiue into a mortar the liquor coloured with the Violets; and ſteeping earth of *Erethria* in it, and grinding it, they make the Azure colour of Athens. After the ſame maner they temper *Vaccinium*, and putting milk vnto it do make a gallant purple colour. But what *Vaccinia* are we will elſewhere declare.

¶ *The Temperature.*

The floures and leaues of Violets are cold and moiſt.

¶ *The Vertues.*

A The floures are good for all inflammations, eſpecially of the ſides and lungs; they take away the hoarſeneſſe of the cheſt, the ruggedneſſe of the winde-pipe and jawes, allay the extreme heate of the liuer, kidnies, and bladder, mitigate the fiery heate of burning agues, temper the ſharpneſſe of choler, and take away thirſt.

B There is an oile made of Violets which is likewiſe cold and moiſt. The ſame being anointed vpon the teſticles doth gently prouoke ſleep which is hindred by an hot and dry diſtemper: mixed or labored together in a woodden diſh with the yelke of an egge, it aſſwageth the pain of the fundament and hemorrhoids: it is likewiſe good to be put into cooling cliſters, and into pulteſſes that coole and eaſe paine.

C But let the oile in which the Violets be ſteeped be either of vnripe Oliues, called *Omphacinum*, or of ſweet almonds, as *Meſues* ſaith; and the Violets themſelues muſt be freſh and moiſt, for being dry and hauing loſt their moiſture they do not coole, but ſeem to haue gotten a kinde of heate.

D The later phyſitions thinke it good to mix dry Violets with medicines that are to comfort and ſtrengthen the heart.

E The leaues of Violets inwardly taken do coole, moiſten, and make the belly ſoluble. Being outwardly applied, they mitigate all kinde of hot inflammations, both taken by themſelues, and alſo applied with Barley floure dried at the fire, after it hath lien ſoking in the water. They are likewiſe laid vpon a hot ſtomacke, and on burning eies, as *Galen* witneſſeth. *Dioſcorides* writeth, that they be alſo applied to the fundament that is fallen out.

F They may help the fundament that is fallen out, not as a binder keeping backe the fundament, but as a ſuppler and a mollifier. Beſides, *Pliny* ſaith that Violets are as well vſed in garlands, as for ſmell, and are good againſt ſurfeting, heauineſſe of the head; and being dried in water & drunk, they remoue the Squinancie or inward ſwellings of the throat. They cure the falling ſickeneſſe, eſpecially in yong children, and the ſeed is good againſt the ſtinging of ſcorpions.

G There is a ſyrrup made of Violets and ſugar, whereof three or foure ounces taken at one time, ſoften the belly and purge choler. The manner to make it is as followes:

H Firſt make of clarified ſugar by boiling, a ſimple ſyrrup of good conſiſtence or meane thickeneſſe, whereunto put the floures cleane picked from all manner of filth, as alſo the white ends nipped away,a quantitie according to the quantity of the ſyrrup, to your owne diſcretion, wherein let them infuſe or ſteep foure and twenty houres,and ſet vpon a few warme embers; then ſtrain it, and put more violets into the ſame ſyrrup: thus do three or foure times,the oftner the better;then ſet them vpon a gentle fire to ſimper,but not to boile in any wiſe: ſo haue you it ſimply made of a moſt perfect purple colour,and of the ſmell of the floures themſelues. Some do adde therto a little of the juice of the floures in the boiling,which maketh it of better force and vertue. Likewiſe ſome do put a little quantitie of the juice of Lymmons in the boiling,which doth greatly increaſe the beauty thereof,but nothing at all the vertue.

I There is likewiſe made of Violets and ſugar certaine plates called Sugar violet, Violet tables, or Plate,which is moſt pleaſant and wholeſome, eſpecially it comforteth the heart and the other inward parts.

K The decoction of Violets is good againſt hot feuers,and the inflammation of the liuer, and all other inward parts: the like propertie hath the juyce, ſyrrup or conſerue of the ſame.

L Syrrup of Violetts is good againſt the inflammation of the lungs and breſt, againſt the pluriſie and cough,againſt feuers and agues in yong children,eſpecially if you put vnto an ounce of ſyrrup eight or nine drops of oyle of Vitrioll, and mix it together, and giue it to the childe a ſpoonefull at once.

M The ſame giuen in manner aforeſaid is of great efficacie in burning feuers and peſtilent diſeaſes,greatly cooling the inward parts: and it may ſeeme ſtrange to ſome that ſo ſharpe a corroſiue as oile of Vitrioll ſhould be giuen into the bodie; yet being delayed and giuen as aforeſaid, ſucking children may take it without any perill.

N The ſame taken as aforeſaid cures all inflammations of the throat,mouth,uvula,ſquinancy,and the falling euill in children.

O Sugar-Violet hath power to ceaſe inflammations,roughneſſe of the throat,comforts the heart, aſſwageth paines of the head,and cauſeth ſleep.

P The leaues of Violets are vſed in cooling plaiſters, oiles, and comfortable cataplaſmes or pulteſſes; and are of greater efficacie among other herbs,as Mercurie, Mallowes, and ſuch like,in cliſters for the purpoſes aforeſaid.

CHAP. 313. *Of Hearts-eaſe, or Panſies.*

¶ *The Deſcription.*

1 THe Hearts-eaſe or Panſie hath many round leaues at the firſt comming vp; afterward they grow ſomewhat longer, ſleightly cut about the edges, trailing or creeping vpon the ground: the ſtalks are weake and tender, whereupon grow floures in form & figure like the Violet,and for the moſt part of the ſame bigneſſe,of three ſundry colours,whereof it tooke the ſyrname *Tricolor*, that is to ſay, purple,yellow,and white or blew; by reaſon of the beauty and brauerie of which colours they are very pleaſing to the eye,for ſmel they haue little or none at all. The ſeed is contained in little knaps of the bigneſſe of a Tare, which come forth after the floures be fallen,and do open of themſelues when the ſeed is ripe. The root is nothing elſe but as it were a bundle of threddy ſtrings.

2 The vpright Panſie bringeth forth long leaues deeply cut in the edges,ſharpe pointed,of a bleake or pale green colour,ſet vpon ſlender vpright ſtalkes,cornered, jointed, or kneed a foot high or higher; whereupon grow very faire floures of three colours, *viz.* of purple,blew,and yellow, in ſhape like the common Hearts-eaſe, but greater and fairer; which colours are ſo excellently and orderly placed,that they bring great delight to the beholders, though they haue little or no ſmell at all:for oftentimes it hapneth that the vppermoſt floures are differing from thoſe that grow vpon the middle of the plant,and thoſe vary from the lowermoſt, as Nature liſt to dally with things of ſuch beauty. The ſeed is like that of the precedent.

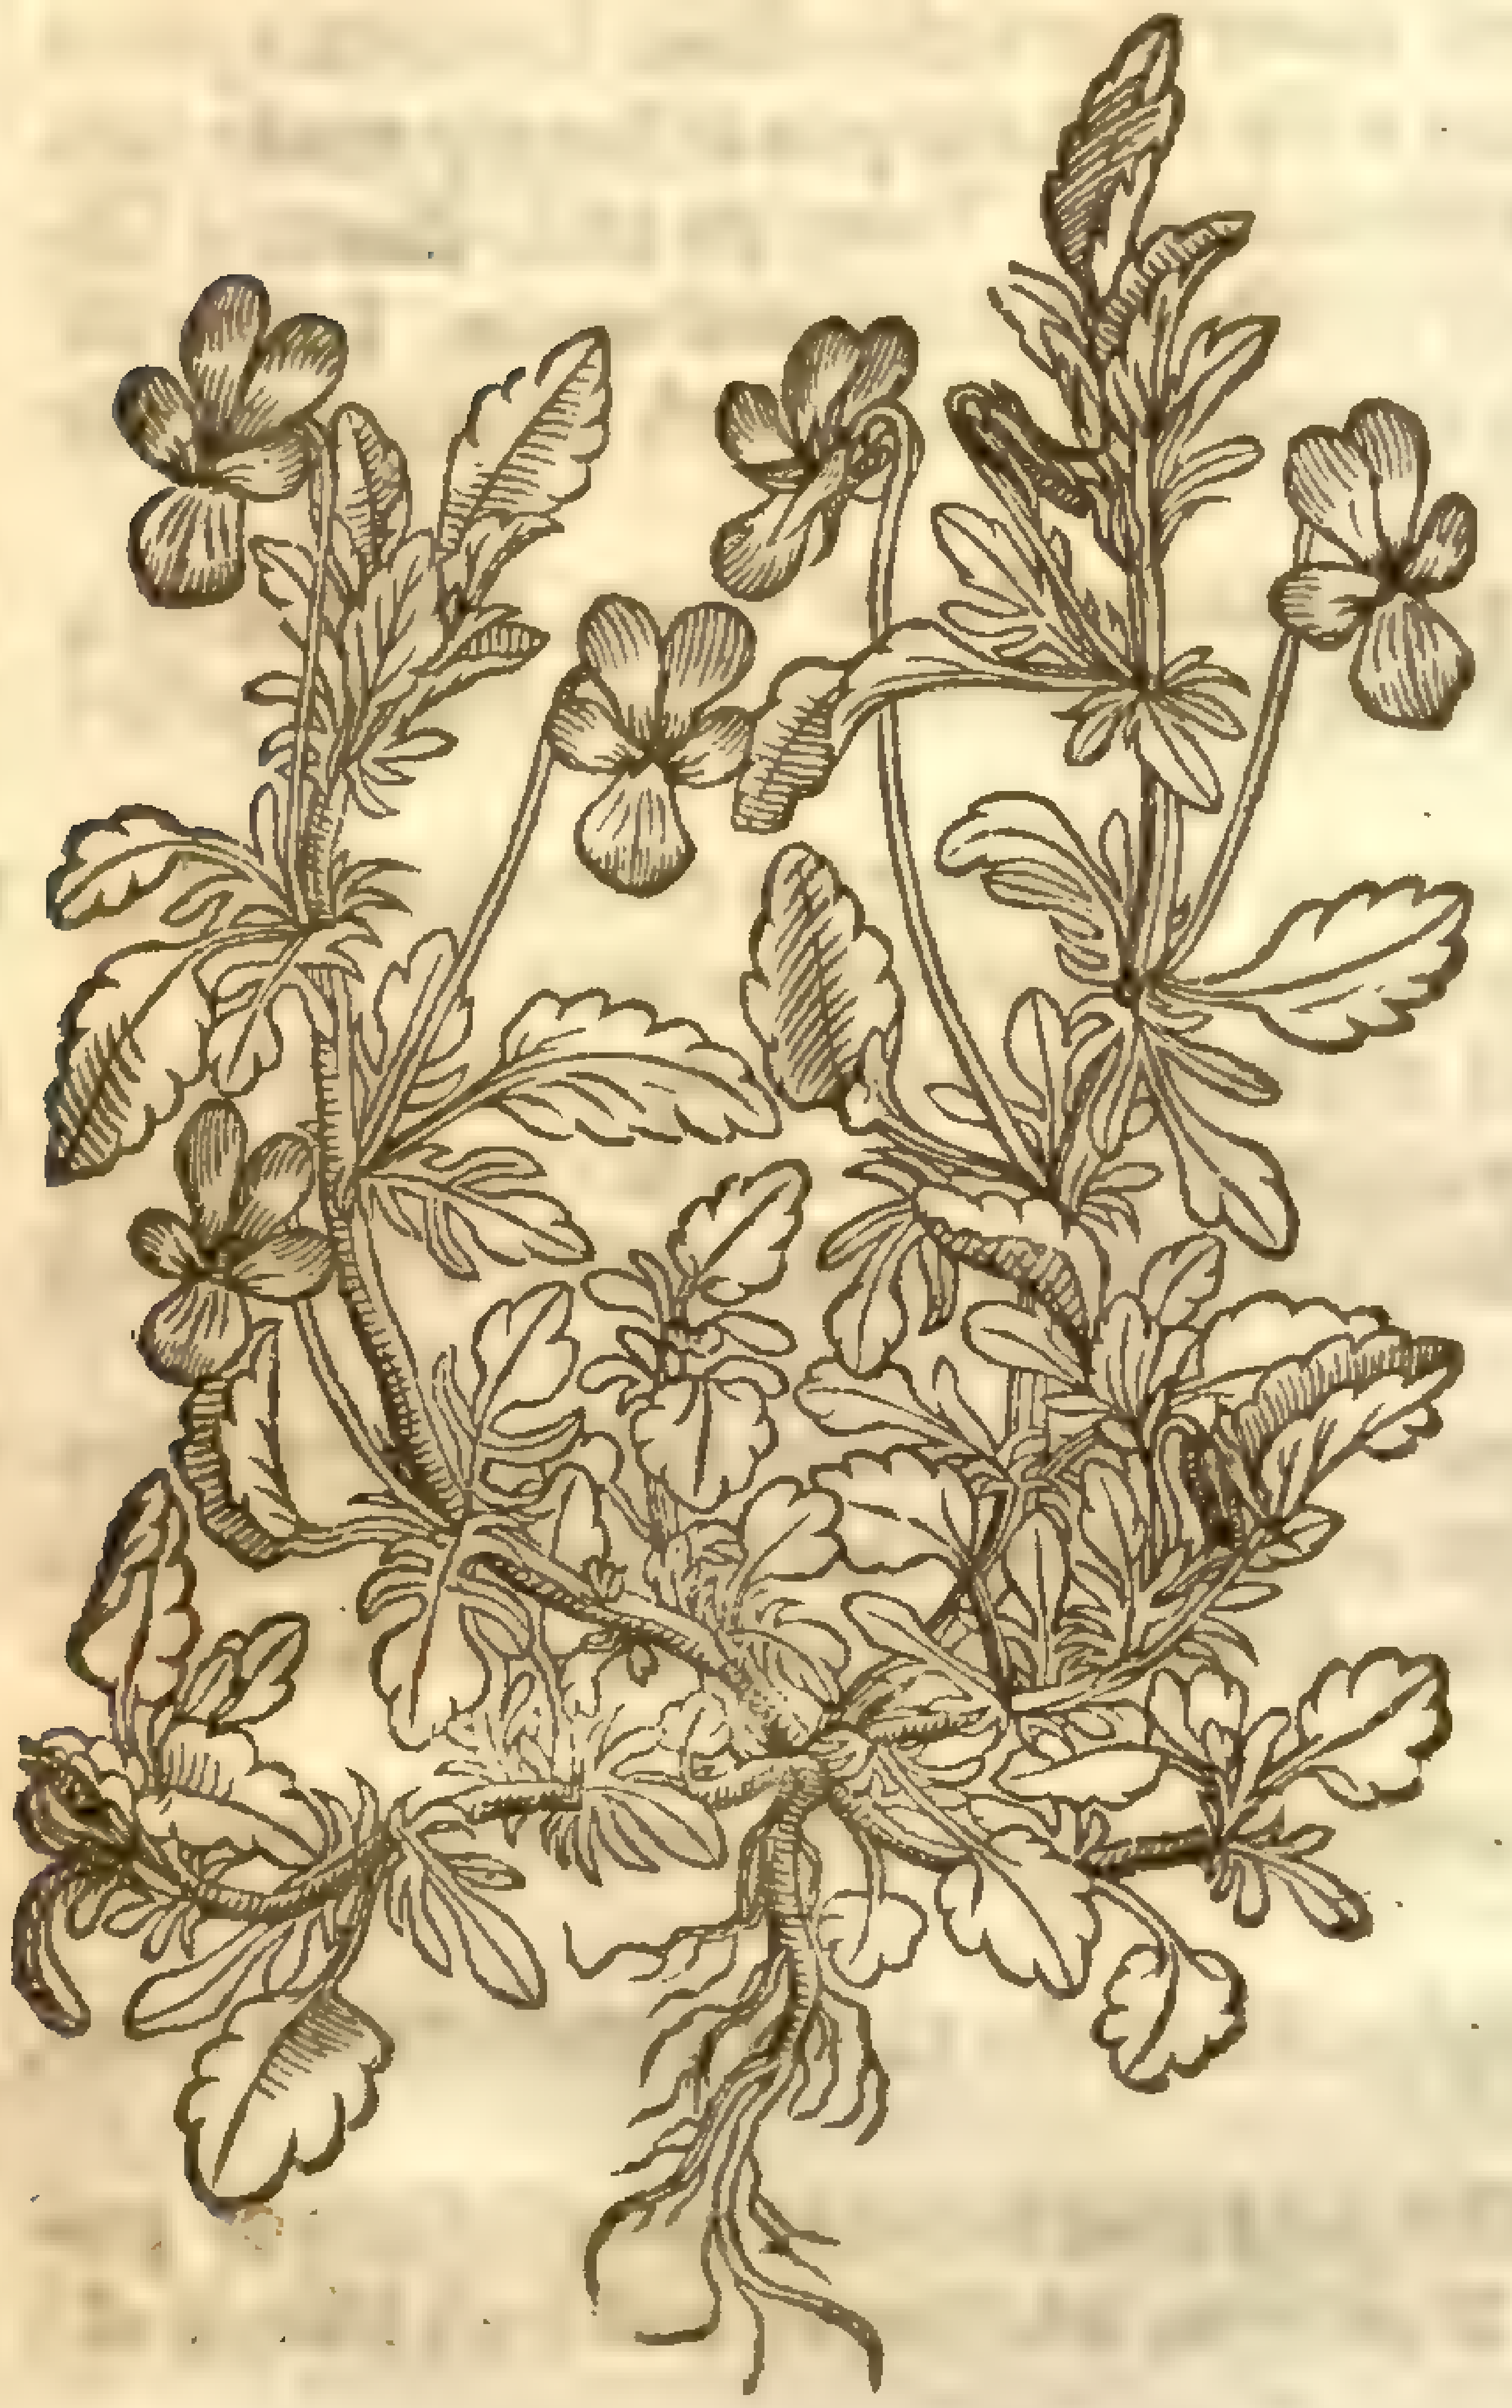
3 The wilde Panſie differeth from that of the garden,in leaues,roots,and tender branches:the floures of this wilde one are of a bleak and pale colour,far inferior in beauty to that of the garden, wherein conſiſteth the difference.

4 Stony Hearts-eaſe is a baſe and low plant: the leaues are rounder, not ſo much cut about the edges as the others: the branches are weak and feeble, trailing vpon the ground: the flours are likewiſe of three colours,that is to ſay,white,blew,and yellow,void of ſmell:the root periſheth hauing perfected his ſeed.

5 There is found in ſundry places of England a wilde kinde hereof,hauing floures of a feint yellow colour,without mixture of any other colour, yet hauing a deeper yellow ſpot in the loweſt

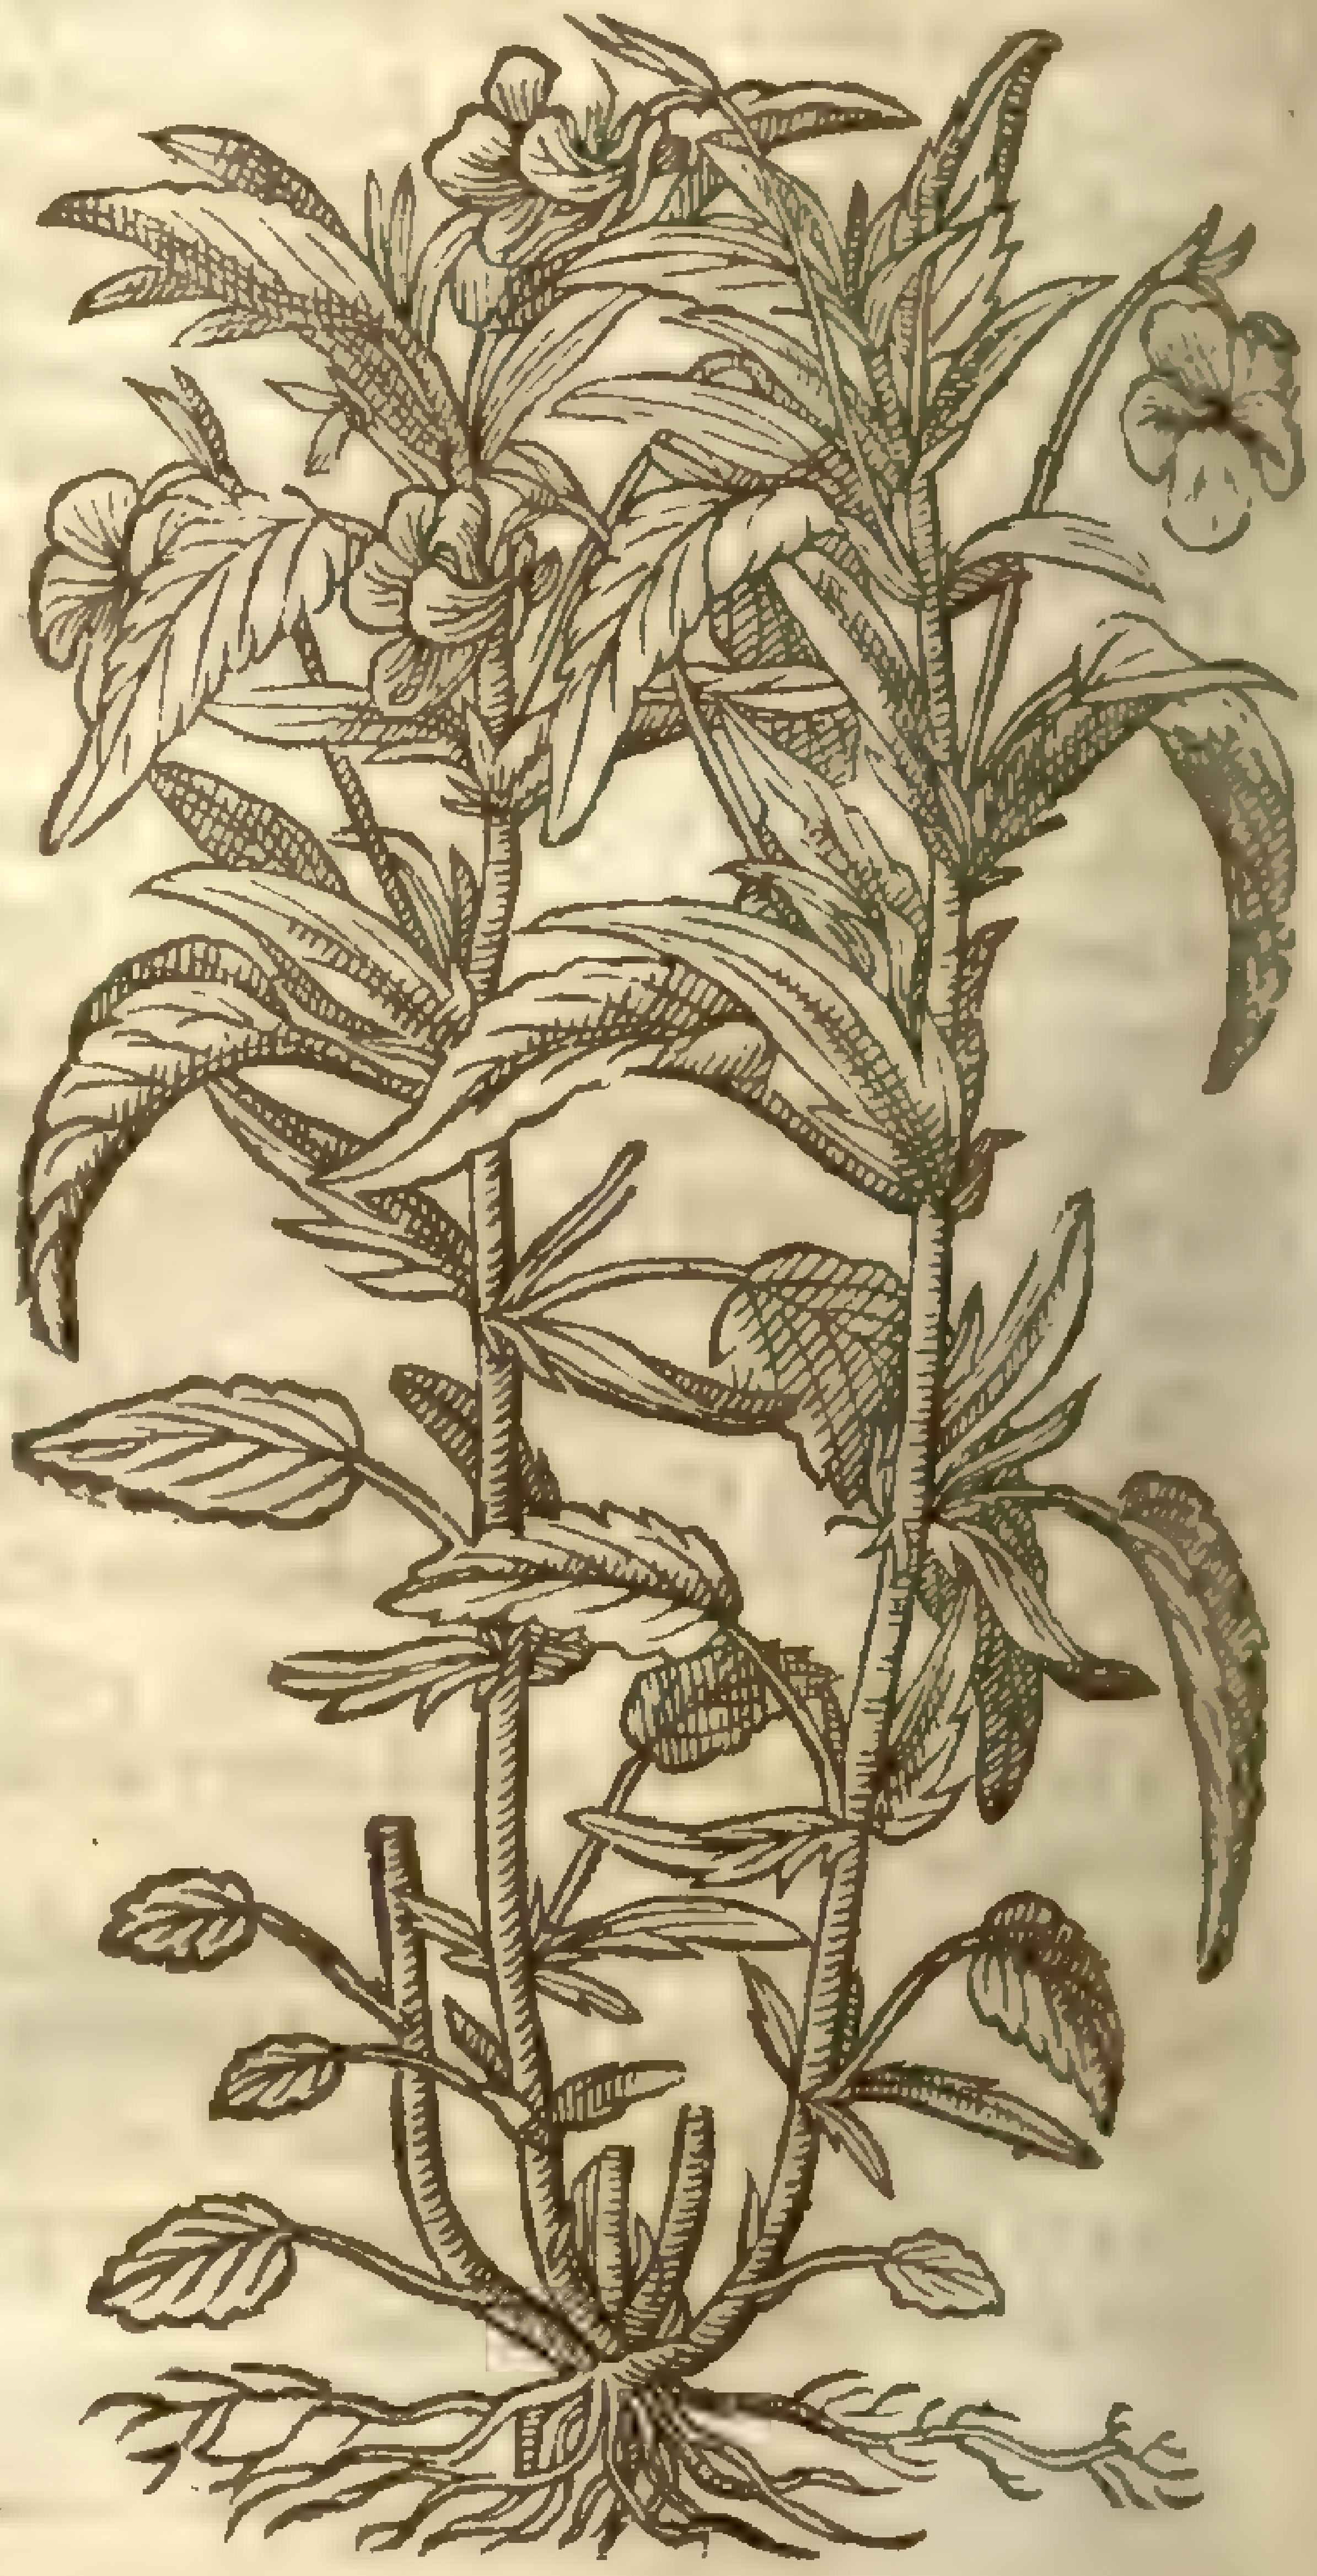
leafe,

1 *Viola tricolor.*
Hearts eaſe.

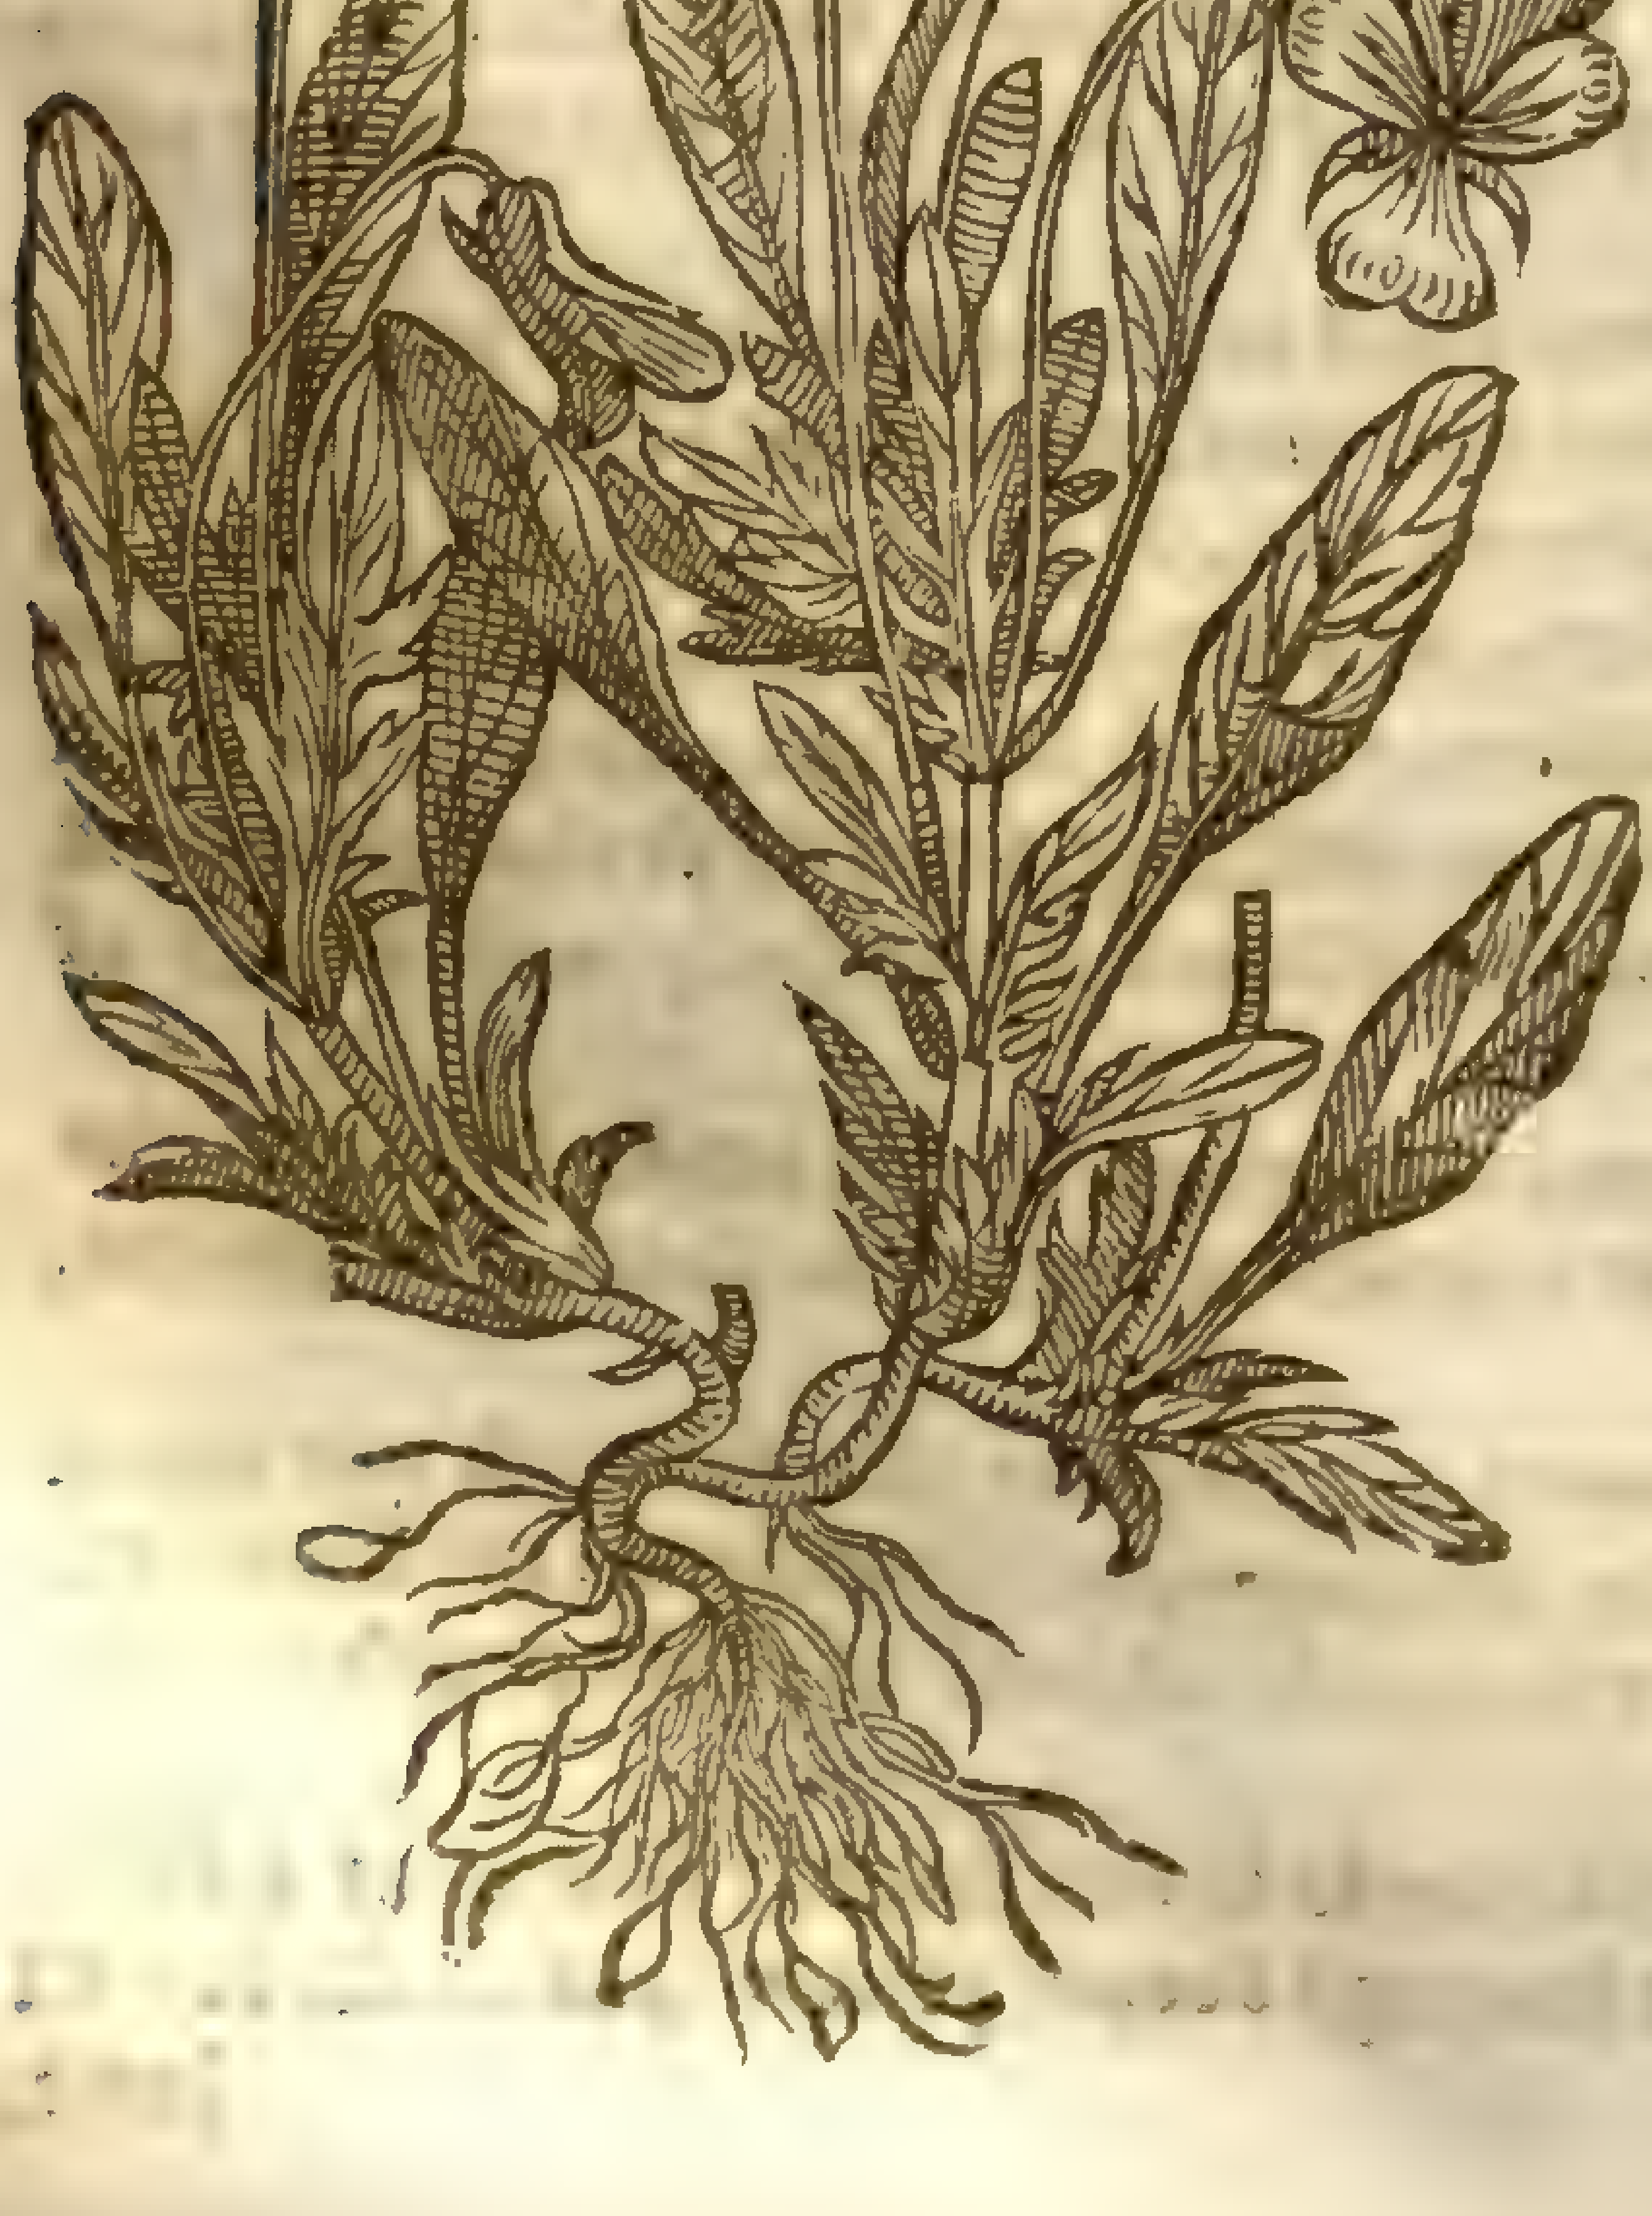


montana [illegible]

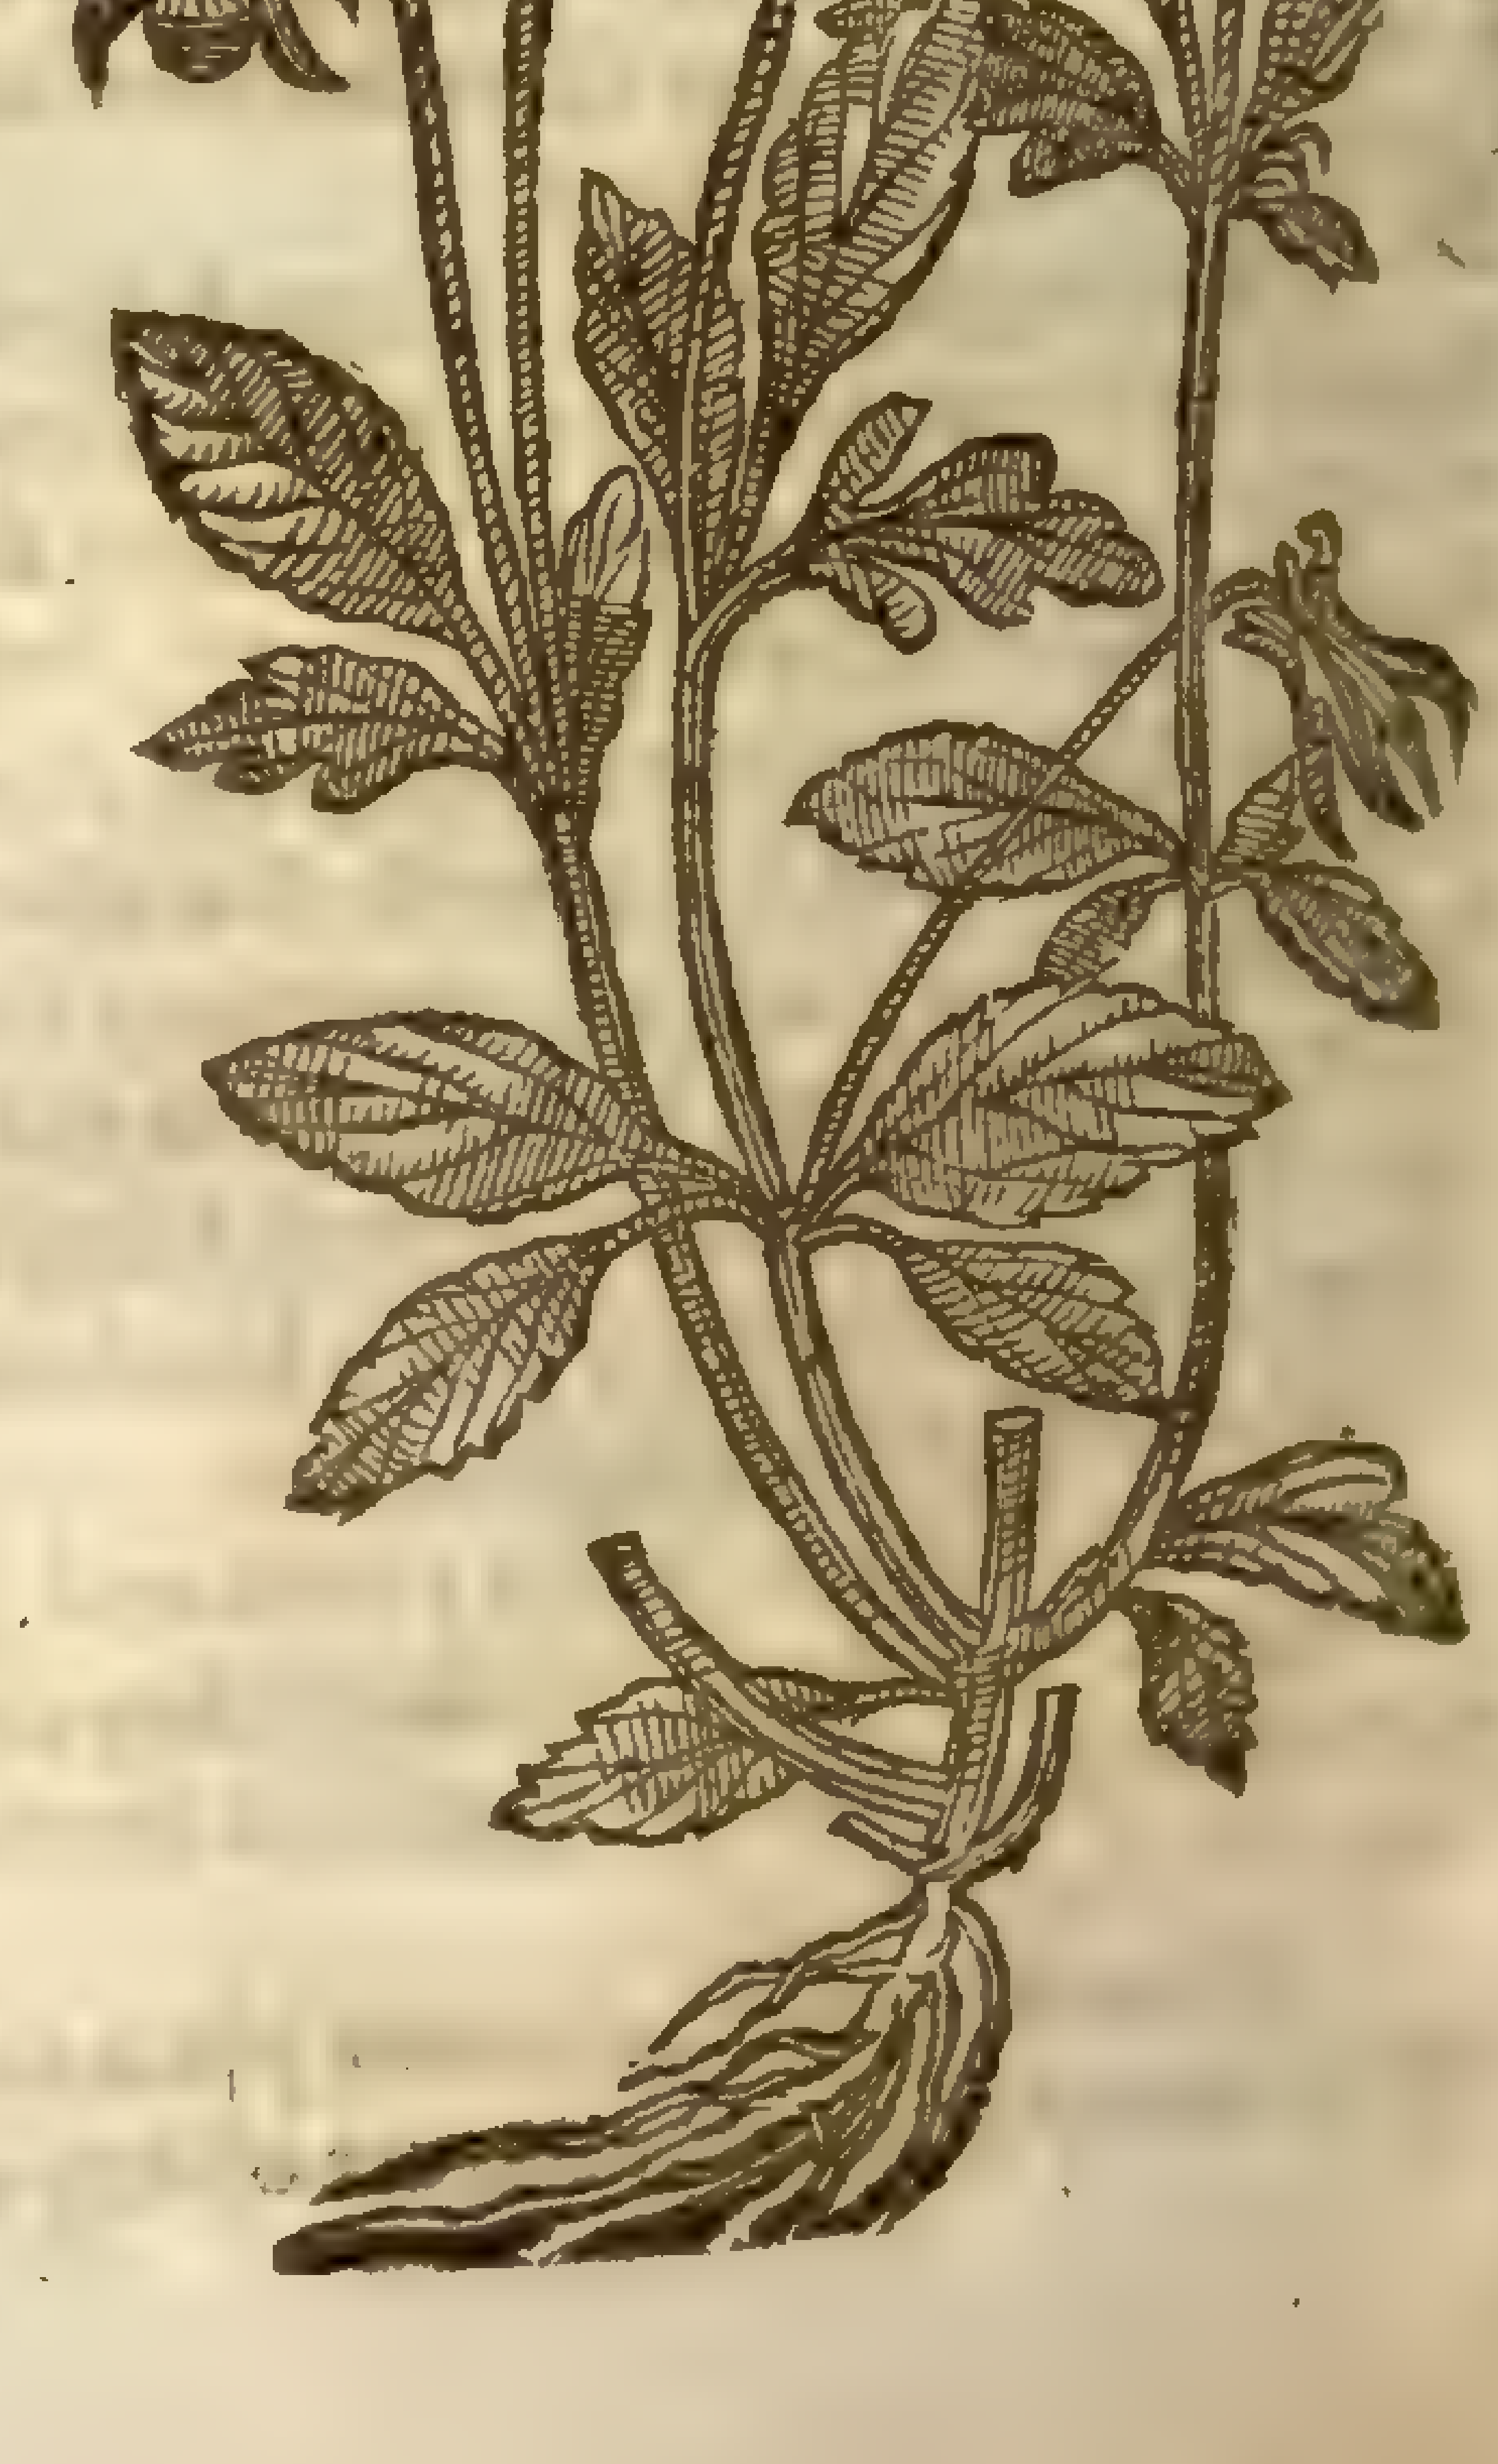
2 *Viola aſſurgens tricolor.*
Vpright Hearts eaſe.



3 *Viola tricolor ſylveſtris.*
Wilde Paunſies.



4 *Viola tricolor petræa.*
Stony Hearts eaſe.



leafe with foure or fiue blackiſh purple lines, wherein it differeth from the other wilde kinde: and this hath been taken of ſome young Herbariſts to be the yellow Violet.

¶ *The Place.*

The Hearts-eaſe groweth in fields in many places, and in gardens alſo, and that oftentimes of it ſelfe: it is more gallant and beautifull than any of the wilde ones.

Matthiolus reporteth, that the vpright Paunſie is found on mount Baldus in Italy. *Lobel* ſaith that it groweth in Languedocke in France, and on the tops of ſome hills in England; but as yet I haue not ſeene the ſame.

Thoſe with yellow floures haue beene found by a village in Lancaſhire called Latham, foure miles from Kyrcham, by Mr. *Thomas Hesketh* before remembred.

¶ *The Time.*

They floure not onely in the Spring, but for the moſt part all Summer thorow, euen vntill Autumne.

¶ *The Names.*

Hearts eaſe is named in Latine *Viola tricolor*, or the three coloured Violet; and of diuers, *Iacea*; (yet there is another *Iacea* ſyrnamed *Nigra*: in Engliſh, Knap-weed, Bull-weed, and Matfellon) of others, *Herba Trinitatis*, or herbe Trinitie, by reaſon of the triple colour of the floures: of ſome others, *Herba Clauellata*: in French, *Penſees*: by which name they became knowne to the Brabanders and others of the Low-countries that are next adioyning. It ſeemeth to be *Viola flammea*, which *Theophraſtus* calleth φλόξ, which is alſo called φλόγιον: in Engliſh, Hearts-eaſe, Paunſies, Liue in idleneſſe, Cull me to you, and Three faces in a hood.

The vpright Panſie is called not vnproperly *Viola aſſurgens*, or *Surrecta*, and withall *Tricolor*, that is to ſay, ſtraight or vpright Violet three coloured: of ſome, *Viola arboreſcens*, or Tree Violet, for that in the multitude of branches and manner of growing, it reſembles a little Tree.

¶ *The Nature.*

It is of temperature obſcurely cold, but more euidently moiſt, of a tough and ſlimie juice, like that of the Mallow; for which cauſe it moiſtneth and ſuppleth, but not ſo much as the Mallow doth.

¶ *The Vertues.*

It is good, as the later Phyſitians write, for ſuch as are ſicke of an ague, eſpecially children and infants, whoſe convulſions and fits of the falling ſickneſſe it is thought to cure. A

It is commended againſt inflammations of the lungs and cheſt, and againſt ſcabs and itchings of the whole bodie, and healeth vlcers. B

The diſtilled water of the herbe or floures giuen to drinke for ten or more daies together, three ounces in the morning, and the like quantitie at night, doth wonderfully eaſe the paines of the French diſeaſe, and cureth the ſame, if the patient be cauſed to ſweat ſundry times, as *Coſtaus* reporteth, in his booke *de natura Vniuerſ. ſtirp.* C

CHAP. 314. *Of Ground-Iuy, or Ale-hooſe.*

¶ *The Deſcription.*

1 GRound Ivy is a low or baſe herbe; it creepeth and ſpreads vpon the ground hither and thither all about, with many ſtalkes of an vncertaine length, ſlender, and like thoſe of the Vine, ſomething cornered, and ſometimes reddiſh: whereupon grow leaues ſomething broad and round, wrinckled, hairy, nicked in the edges, for the moſt part two out of euerie joint: amongſt which come forth the floures gaping like little hoods, not vnlike to thoſe of Germander, of a purpliſh blew colour: the roots are very threddy: the whole plant is of a ſtrong ſmell and bitter taſte.

‡ 2 Vpon the rockie and mountainous places of Prouince and Daulphine grows this other kinde of Ale-hoofe, which hath leaues, ſtalkes, floures, and roots like in ſhape to thoſe of the former, but the floures and leaues are of a light purple colour, and alſo larger and longer. This by *Lobel* is called *Aſarina, ſiue ſaxatilis hedera.* ‡

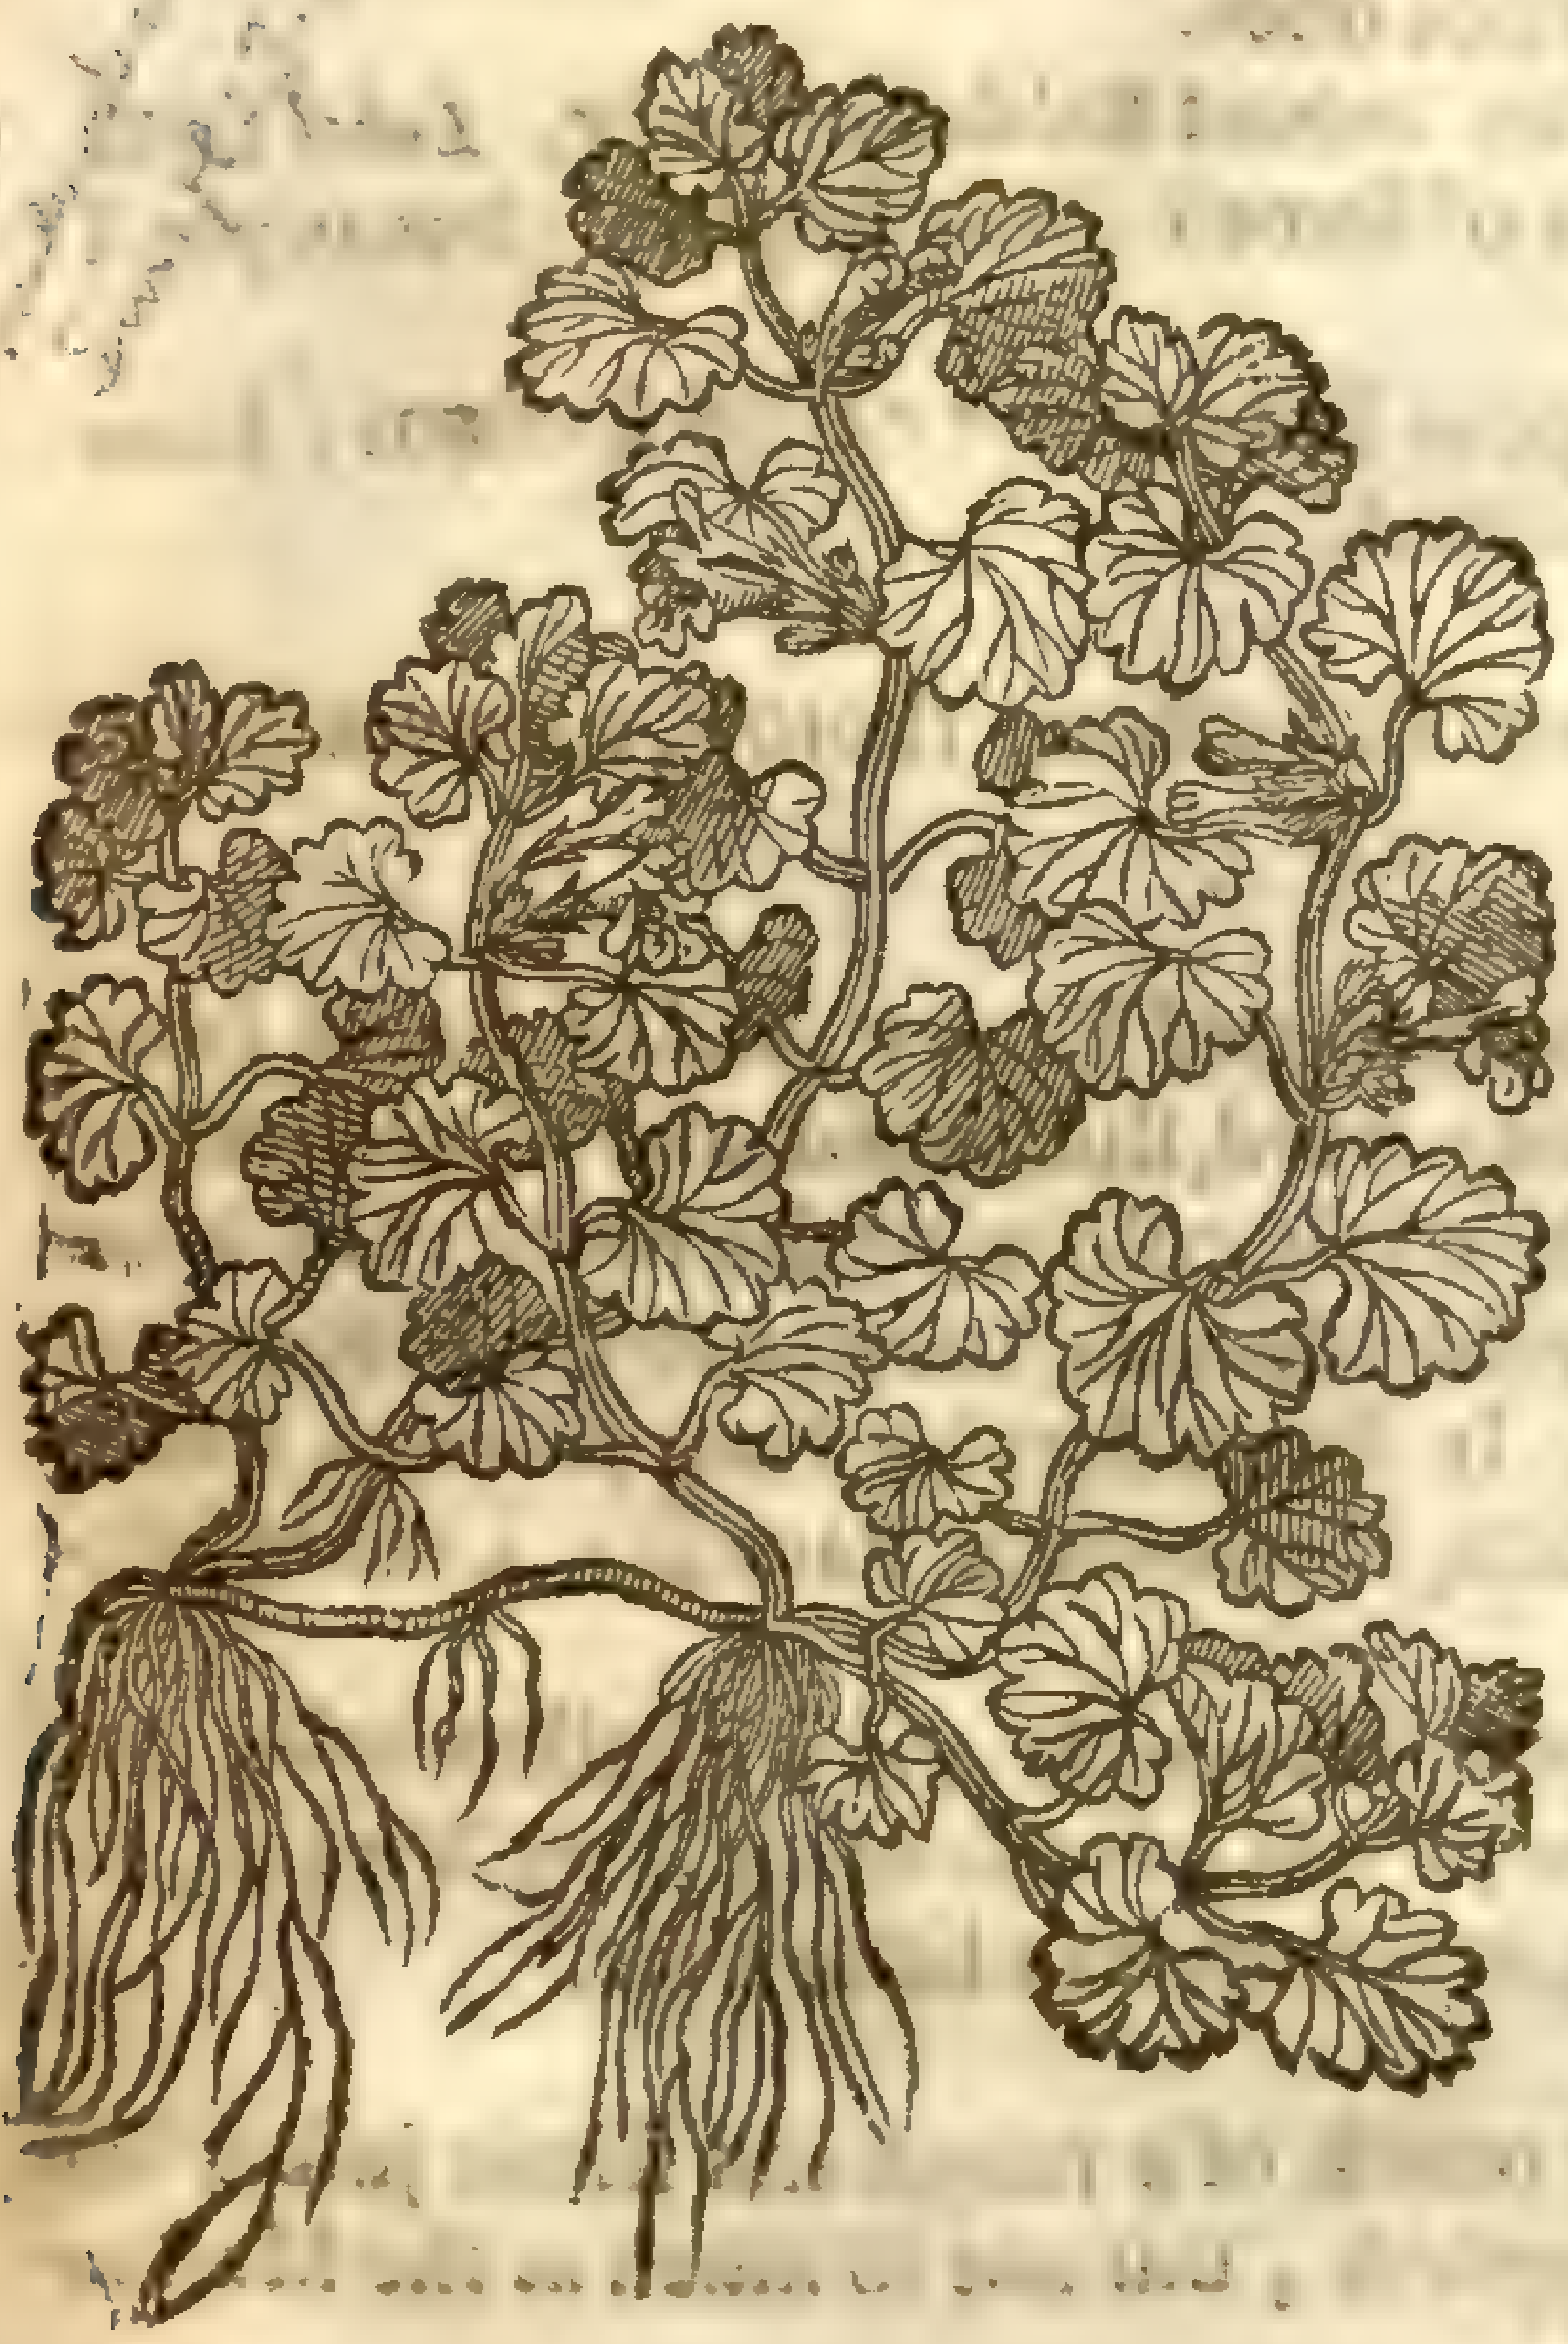
¶ *The Place.*

It is found as well in tilled as in vntilled places, but moſt commonly in obſcure and darke places, vpon banks vnder hedges, and by the ſides of houſes.

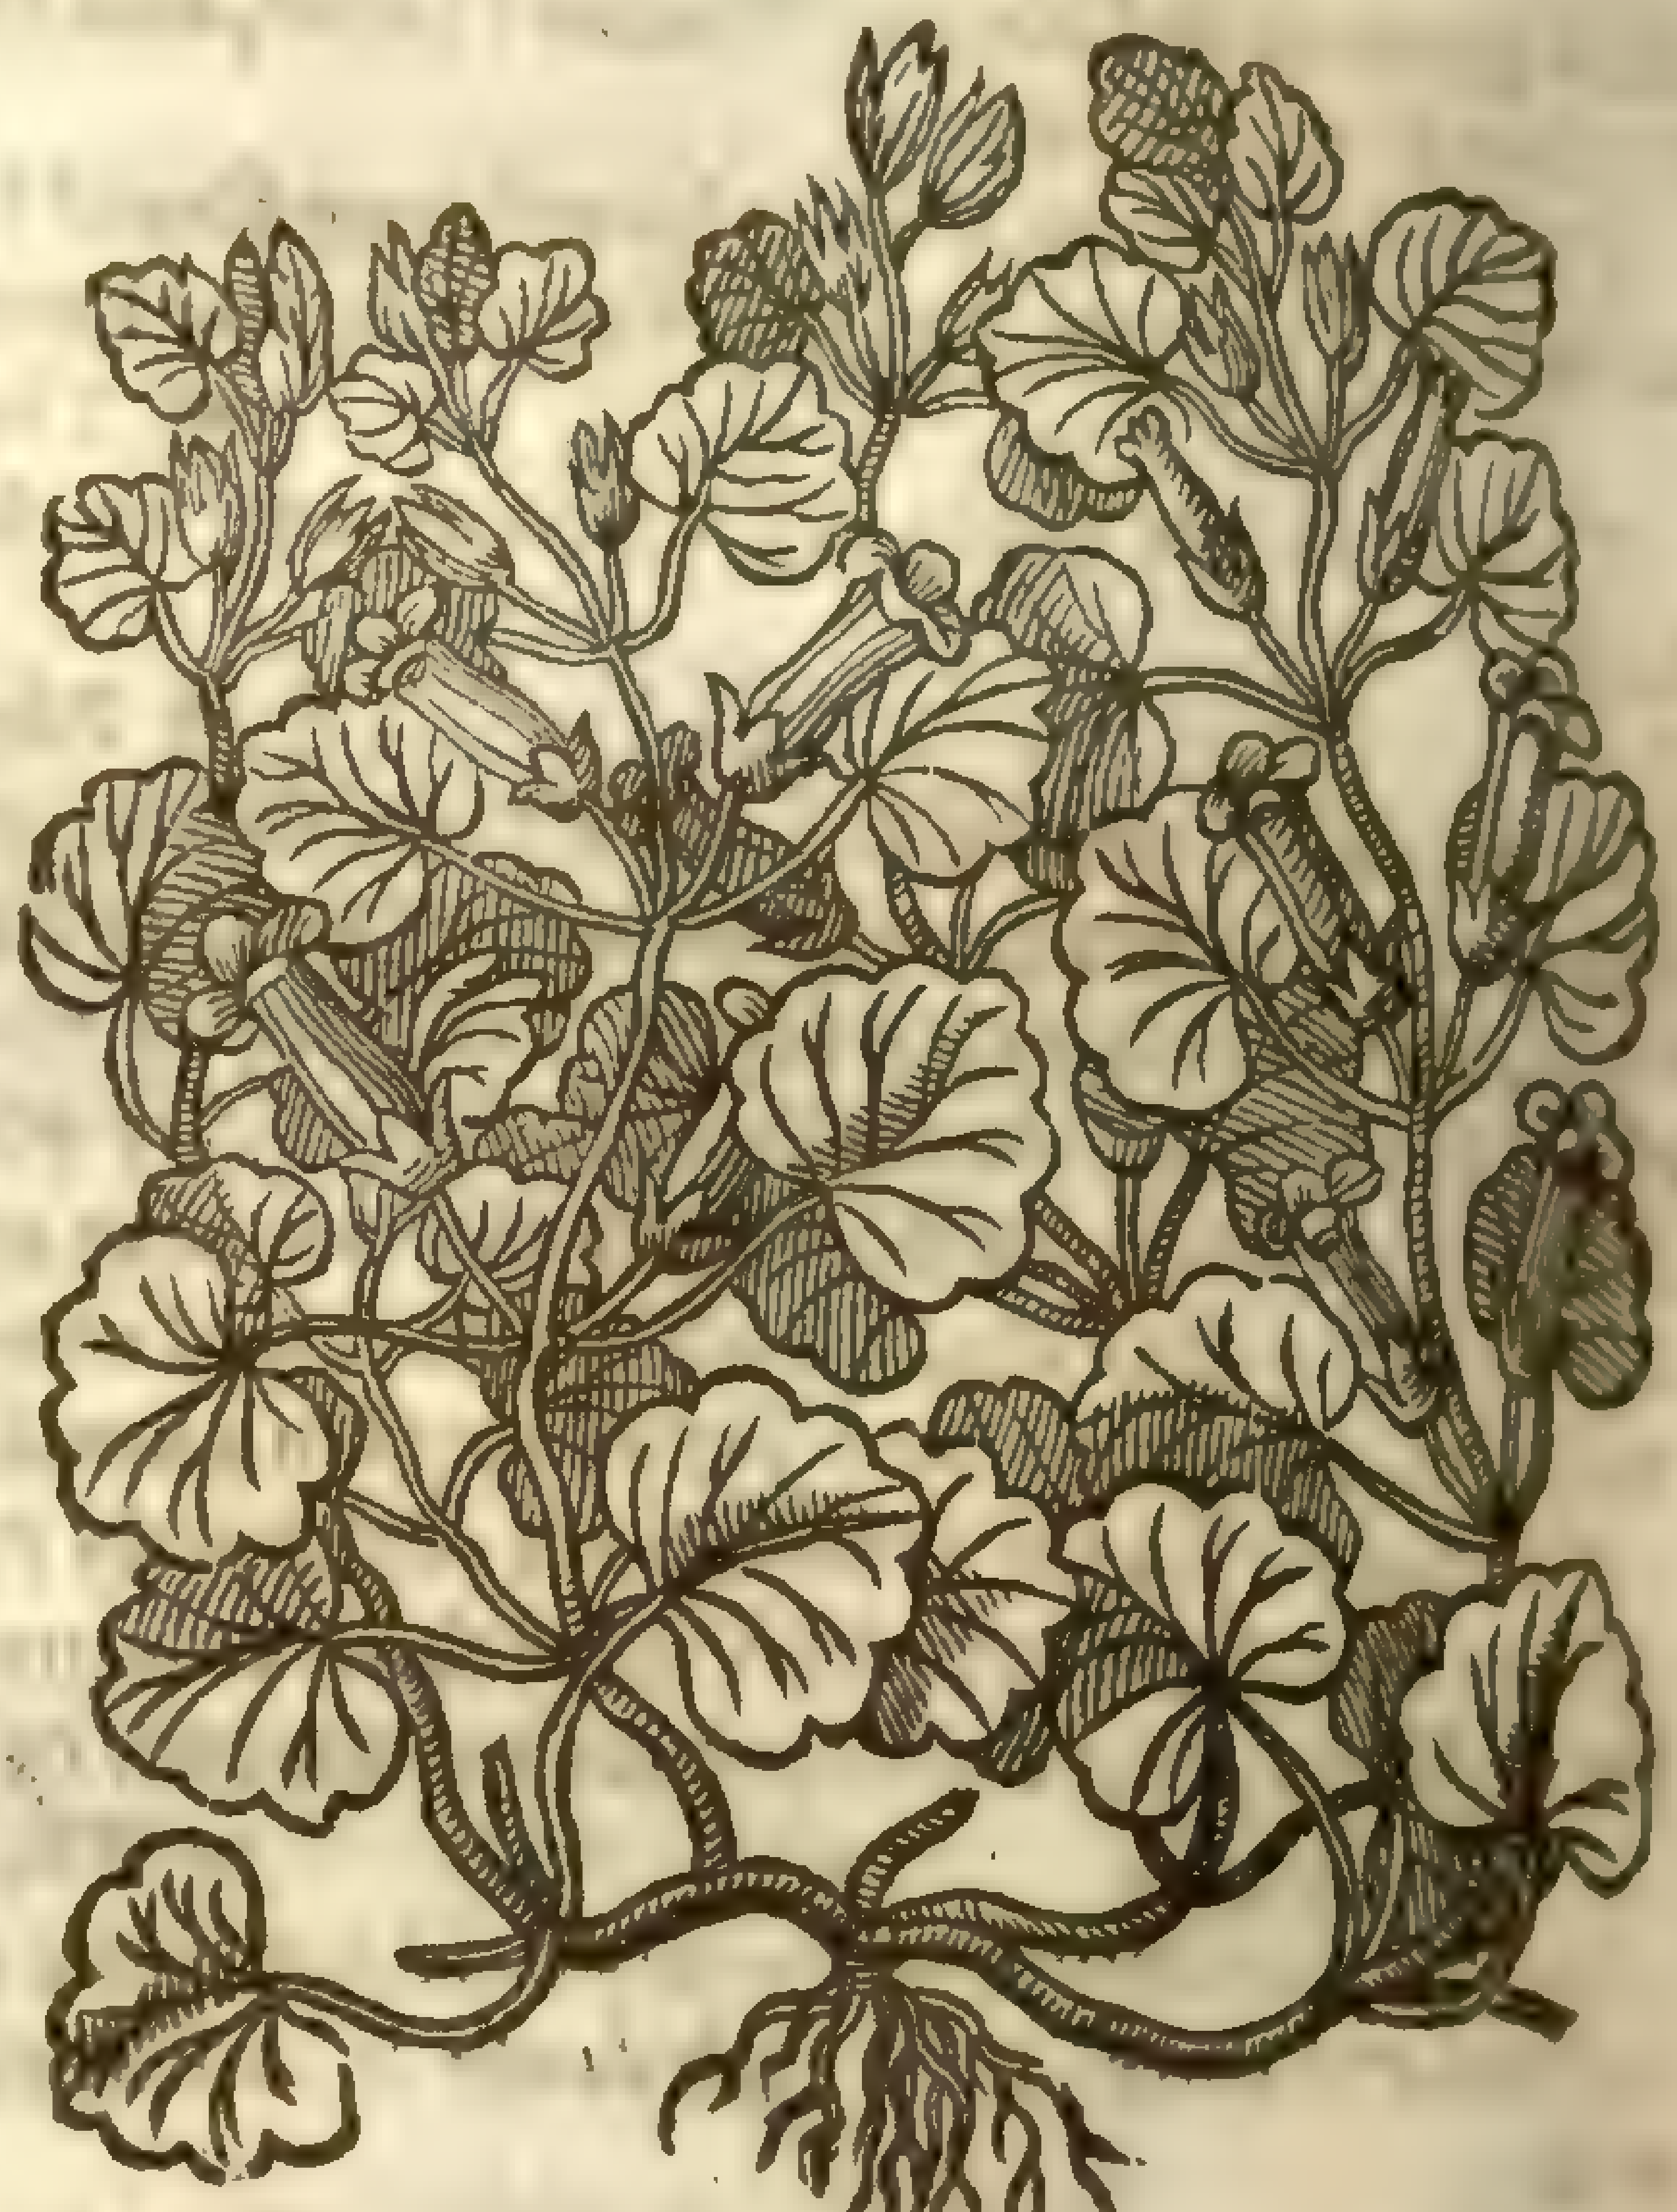
¶ *The Time.*

It remaineth greene not onely in Summer, but alſo in Winter at any time of the yeare: it floureth from Aprill till Summer be far ſpent.

1 *Hedera terreſtris.*
Ale-hooſe.



‡ 2 *Hedera ſaxatilis.*
Rocke Ale-hooſe.



¶ *The Names.*

It is commonly called *Hedera terreſtris* : in Greeke, χαμαίκισσον : alſo *Corona terræ* : in High-Dutch, **Gundelreb** : in Low-Dutch, **Onderhaue** : in French, *Lierre terreſtre* : *Hedera humilis* of ſome, and *Chamæciſſum* : in Engliſh, Ground-Ivy, Ale-hooſe, Gill go by ground, Tune-hoof, and Cats-foot. ‡ Many queſtion whether this be the *Chamæciſſus* of the Antients : which controuerſie *Dodonæus* hath largely handled, *Pempt*.3. *lib*.3.*cap*.4. ‡

¶ *The Temperature.*

Ground Ivie is hot and dry, and becauſe it is bitter it ſcoureth, and remoueth ſtoppings out of the intrals.

¶ *The Vertues.*

A Ground-Ivy is commended againſt the humming noyſe and ringing ſound of the eares, being put into them, and for them that are hard of hearing.

B *Matthiolus* writeth, That the juice being tempered with Verdugreaſe, is good againſt fiſtulaes and hollow vlcers.

C *Dioſcorides* teacheth, That halfe a dram of the leaues being drunk in foure ounces and a halfe of faire water, for fortie or fiftie daies together, is a remedie againſt the Sciatica, or ache in the huckle bone.

D The ſame taken in like ſort ſix or ſeuen daies doth alſo cure the yellow jaundiſe. *Galen* hath attributed (as we haue ſaid) all the vertue vnto the floures : Seeing the floures of Ground-Ivy (ſaith he) are very bitter, they remoue ſtoppings out of the liuer, and are giuen to them that are vexed with the Sciatica.

E Ground-Ivy, Celandine, and Daiſies, of each a like quantitie, ſtamped and ſtrained, and a little ſugar and roſe water put thereto, and dropped with a feather into the eies, taketh away all manner of inflammation, ſpots, webs, itch, ſmarting, or any griefe whatſoeuer in the eyes, yea although the ſight were nigh hand gone : it is proued to be the beſt medicine in the world.

F The herbes ſtamped as aforeſaid, and mixed with a little ale and honey, and ſtrained, take away the pinne and web, or any griefe out of the eyes of horſe or cow, or any other beaſt, being ſquirted into the ſame with a ſyringe, or I might haue ſaid the liquor injected into the eies with a ſyringe. But I liſt not to be ouer eloquent among Gentlewomen, to whom eſpecially my Workes are moſt neceſſarie.

G The women of our Northerne parts, eſpecially about Wales and Cheſhire, do turne the herbe Ale-hoof into their Ale; but the reaſon thereof I know not : notwithſtanding without all controuerſie it is moſt ſingular againſt the griefes aforeſaid; being tunned vp in ale and drunke, it alſo purgeth the head from rheumaticke humors flowing from the braine.

Hedera terreſtris boyled in water ſtaieth the termes; and boyled in mutton broth it helps weake and aking backes. I

They haue vſed to put it into ointments againſt burning with fire, gunpouder, and ſuch like. K

Hedera terreſtris, being bound in a bundle, or chopt as herbes for the pot, and eaten and drunke in thin broth ſtaieth the flux in women. L

CHAP. 315. *Of Ivy.*

¶ *The Kindes.*

THere be two kindes of Ivie, as *Theophraſtus* witneſſeth, reckoned among the number of thoſe plants which haue need to be propped vp; for they ſtand not of themſelues, but are faſtned to ſtone walls, trees, and ſuch like, and yet notwithſtanding both of a woody ſubſtance, and yet not to be placed among the trees, ſhrubs, or buſhes, becauſe of the affinitie they haue with climbing herbes; as alſo agreeing in forme and figure with many other plants that climbe, and are indeed ſimply to be reckoned among the herbes that clamber vp. But if any will cauill, or charge me with my promiſe made in the beginning of this hiſtory, where we made our diuiſion, namely, to place each plant as neere as may be in kindred and neighbourhood; this promiſe I haue fulfilled, if the curious eie can be content to reade without raſhneſſe thoſe plants following in order, and not only this climbing Ivie that lifteth her ſelfe to the tops of trees, but alſo the other Ivie that creepeth vpon the ground.

Of the greater or the climing Ivie there are alſo many ſorts; but eſpecially three, the white, the blacke, and that which is called *Hedera Helix*, or *Hedera ſterilis*.

1 *Hedera corymboſa.*
Clymbing or berried Ivie.

2 *Hedera Helix.*
Barren or creeping Ivie.

H. helix, L. [illegible]

Bell
H. helix, L.
Sm. fl. 1. 335

¶ *The Deſcription.*

1 THe greater Ivie climbeth on trees, old buildings, and walls: the ſtalkes thereof are woody, and now and then ſo great as it ſeemes to become a tree; from which it ſendeth a multitude of little boughes or branches euery way, whereby as it were with

armes

armes it creepeth and wandereth far about: it alſo bringeth forth contiuually fine little roots, by which it faſtneth it ſelfe and cleaueth wonderfull hard vpon trees, and vpon the ſmootheſt ſtone walls: the leaues are ſmooth, ſhining eſpecially on the vpper ſide, cornered with ſharpe pointed corners. The floures are very ſmall and moſſie; after which ſucceed bundles of black berries, euery one hauiug a ſmall ſharpe pointall.

There is another ſort of great Ivie that bringeth forth white fruit, which ſome call *Acharnicam irriguam*: and alſo another leſſer, the which hath blacke berries. This *Pliny* calleth *Selinitium.*

We alſo finde mentioned another ſort hereof ſpred abroad, with a fruit of a yellow Saffron colour, called of diuers, *Dionyſias*, as *Dioſcorides* writeth: others *Bacchica*, of which the Poëts vſed to make garlands, as *Pliny* teſtifieth, *lib.* 16. *cap.* 34.

2 Barren Ivie is not much vnlike vnto the common Ivie aforeſaid, ſauing that his branches are both ſmaller and tenderer, not lifting or bearing it ſelfe vpward, but creeping along by the ground vnder moiſt and ſhadowie ditch bankes. The leaues are moſt commonly three ſquare, cornered, of a blackiſh greene colour, which at the end of Summer become browniſh red vpon the lower ſide. The whole plant beareth neither floures nor fruit, but is altogether barren and fruitleſſe.

‡ 3 There is kept for noueltes ſake in diuers gardens a Virginian, by ſome (though vnfitly) termed a Vine, being indeed an Ivie. The ſtalkes of this grow to a great heighth, if they be planted nigh any thing that may ſuſtaine or beare them vp: and they take firſt hold by certaine ſmall tendrels, vpon what body ſoeuer they grow, whether ſtone, boords, bricke, yea glaſſe, and that ſo firmely, that oftentimes they will bring pieces with them if you plucke them off. The leaues are large, conſiſting of foure, fiue, or more particular leaues, each of them being long, and deepely notched about the edges, ſo that they ſomewhat reſemble the leaues of the Cheſnut tree: the floures grow cluſtering together after the manner of Ivie, but neuer with vs ſhew themſelues open, ſo that we cannot iuſtly ſay any thing of their color, or the fruit that ſucceeds them. It puts forth his leaues in Aprill, and the ſtalkes with the rudiments of the floures are to be ſeene in Auguſt. It may as I ſaid be fitly called *Hedera Virginiana.* ‡

¶ *The Place.*

Ivie groweth commonly about walls and trees; the white Ivie groweth in Greece, and the barren Ivie groweth vpon the ground in ditch bankes and ſhadowie woods.

¶ *The Time.*

Ivie flouriſheth in Autumne: the berries are ripe after the Winter Solſtice.

¶ *The Names.*

Ivie is called in Latine, *Hedera*: in Greeke, κιττὸς, and κισσὸς: in high Dutch, **Epheu**: in low Dutch, **Veyle**: in Spaniſh, *Tedra*: in French, *Liarre.*

The great Ivie is called of *Theophraſtus*, ὀρθὸς κισσὸς: in Latine, *Hedera attollens*, or *Hedera aſſurgens*: *Gaza* interpreteth it *Hedera excelſa.* The later Herbariſts would haue it to be *Hedera arborea*, or tree Ivie, becauſe it groweth vpon trees, and *Hedera muralis*, which hangeth vpon walls.

Creeping or barren Ivie is called in Greeke, ἐπίγειος κισσὸς: in Engliſh, Ground-Ivie: yet doth it much differ from *Hedera terreſtris* or Ground-Ivie before deſcribed: of ſome it is called *Clavicula, Hedera Helix*, and *Hedera ſterilis*; and is that herbe wherein the Bore delighteth, according to *Iohannes Khuenius.*

¶ *The Temperature.*

Ivie, as *Galen* ſaith, is compounded of contrarie faculties; for it hath a certaine binding earthy and cold ſubſtance, and alſo a ſubſtance ſomewhat biting, which euen the very taſte doth ſhew to be hot. Neither is it without a third faculty, as being of a certaine warme watery ſubſtance, and that is if it be greene: for whileſt it is in drying, this watery ſubſtance being earthy, cold, and binding conſumeth away, and that which is hot and biting remaineth.

¶ *The Vertues.*

A The leaues of Ivie freſh and greene boyled in wine do heale old vlcers, and perfectly cure thoſe that haue a venomous and malitious quality joyned with them; and are a remedy likewiſe againſt burnings and ſcaldings.

B Moreouer, the leaues boiled in vinegre are good for ſuch as haue bad ſpleenes; but the floures or fruit are of more force, being very finely beaten and tempered with vinegre, eſpecially ſo vſed they are commended againſt burnings.

C The juyce drawne or ſnift vp into the noſe doth effectually purge the head, ſtaieth the running of the eares that hath beene of long continuance, and healeth old vlcers both in the eares and alſo in the noſthrils: but if it be too ſharpe, it is to be mixed with oile of Roſes, or ſallad oyle.

D The gum that is found vpon the trunke or body of the old ſtocke of Ivie, killeth nits and lice, and taketh away haire: it is of ſo hot a quality, as that it doth obſcurely burne: it is as it were a certaine wateriſh liquor congealed of thoſe gummie drops. Thus farre *Galen*.

The very ſame almoſt hath *Dioſcorides*, but yet alſo ſomewhat more: for ouer and beſides he ſaith, that fiue of the berries beaten ſmall, and made hot in a Pomegranat rinde, with oyle of roſes, and dropped into the contrary eare, doth eaſe the tooth-ach; and that the berries make the haire blacke. E

Ivie in our time is very ſeldome vſed, ſaue that the leaues are laid vpon little vlcers made in the thighes, legs, or other parts of the body, which are called iſſues; for they draw humors and wateriſh ſubſtance to thoſe parts, and keepe them from hot ſwellings or inflammations, that is to ſay, the leaues newly gathered, and not as yet withered or dried. F

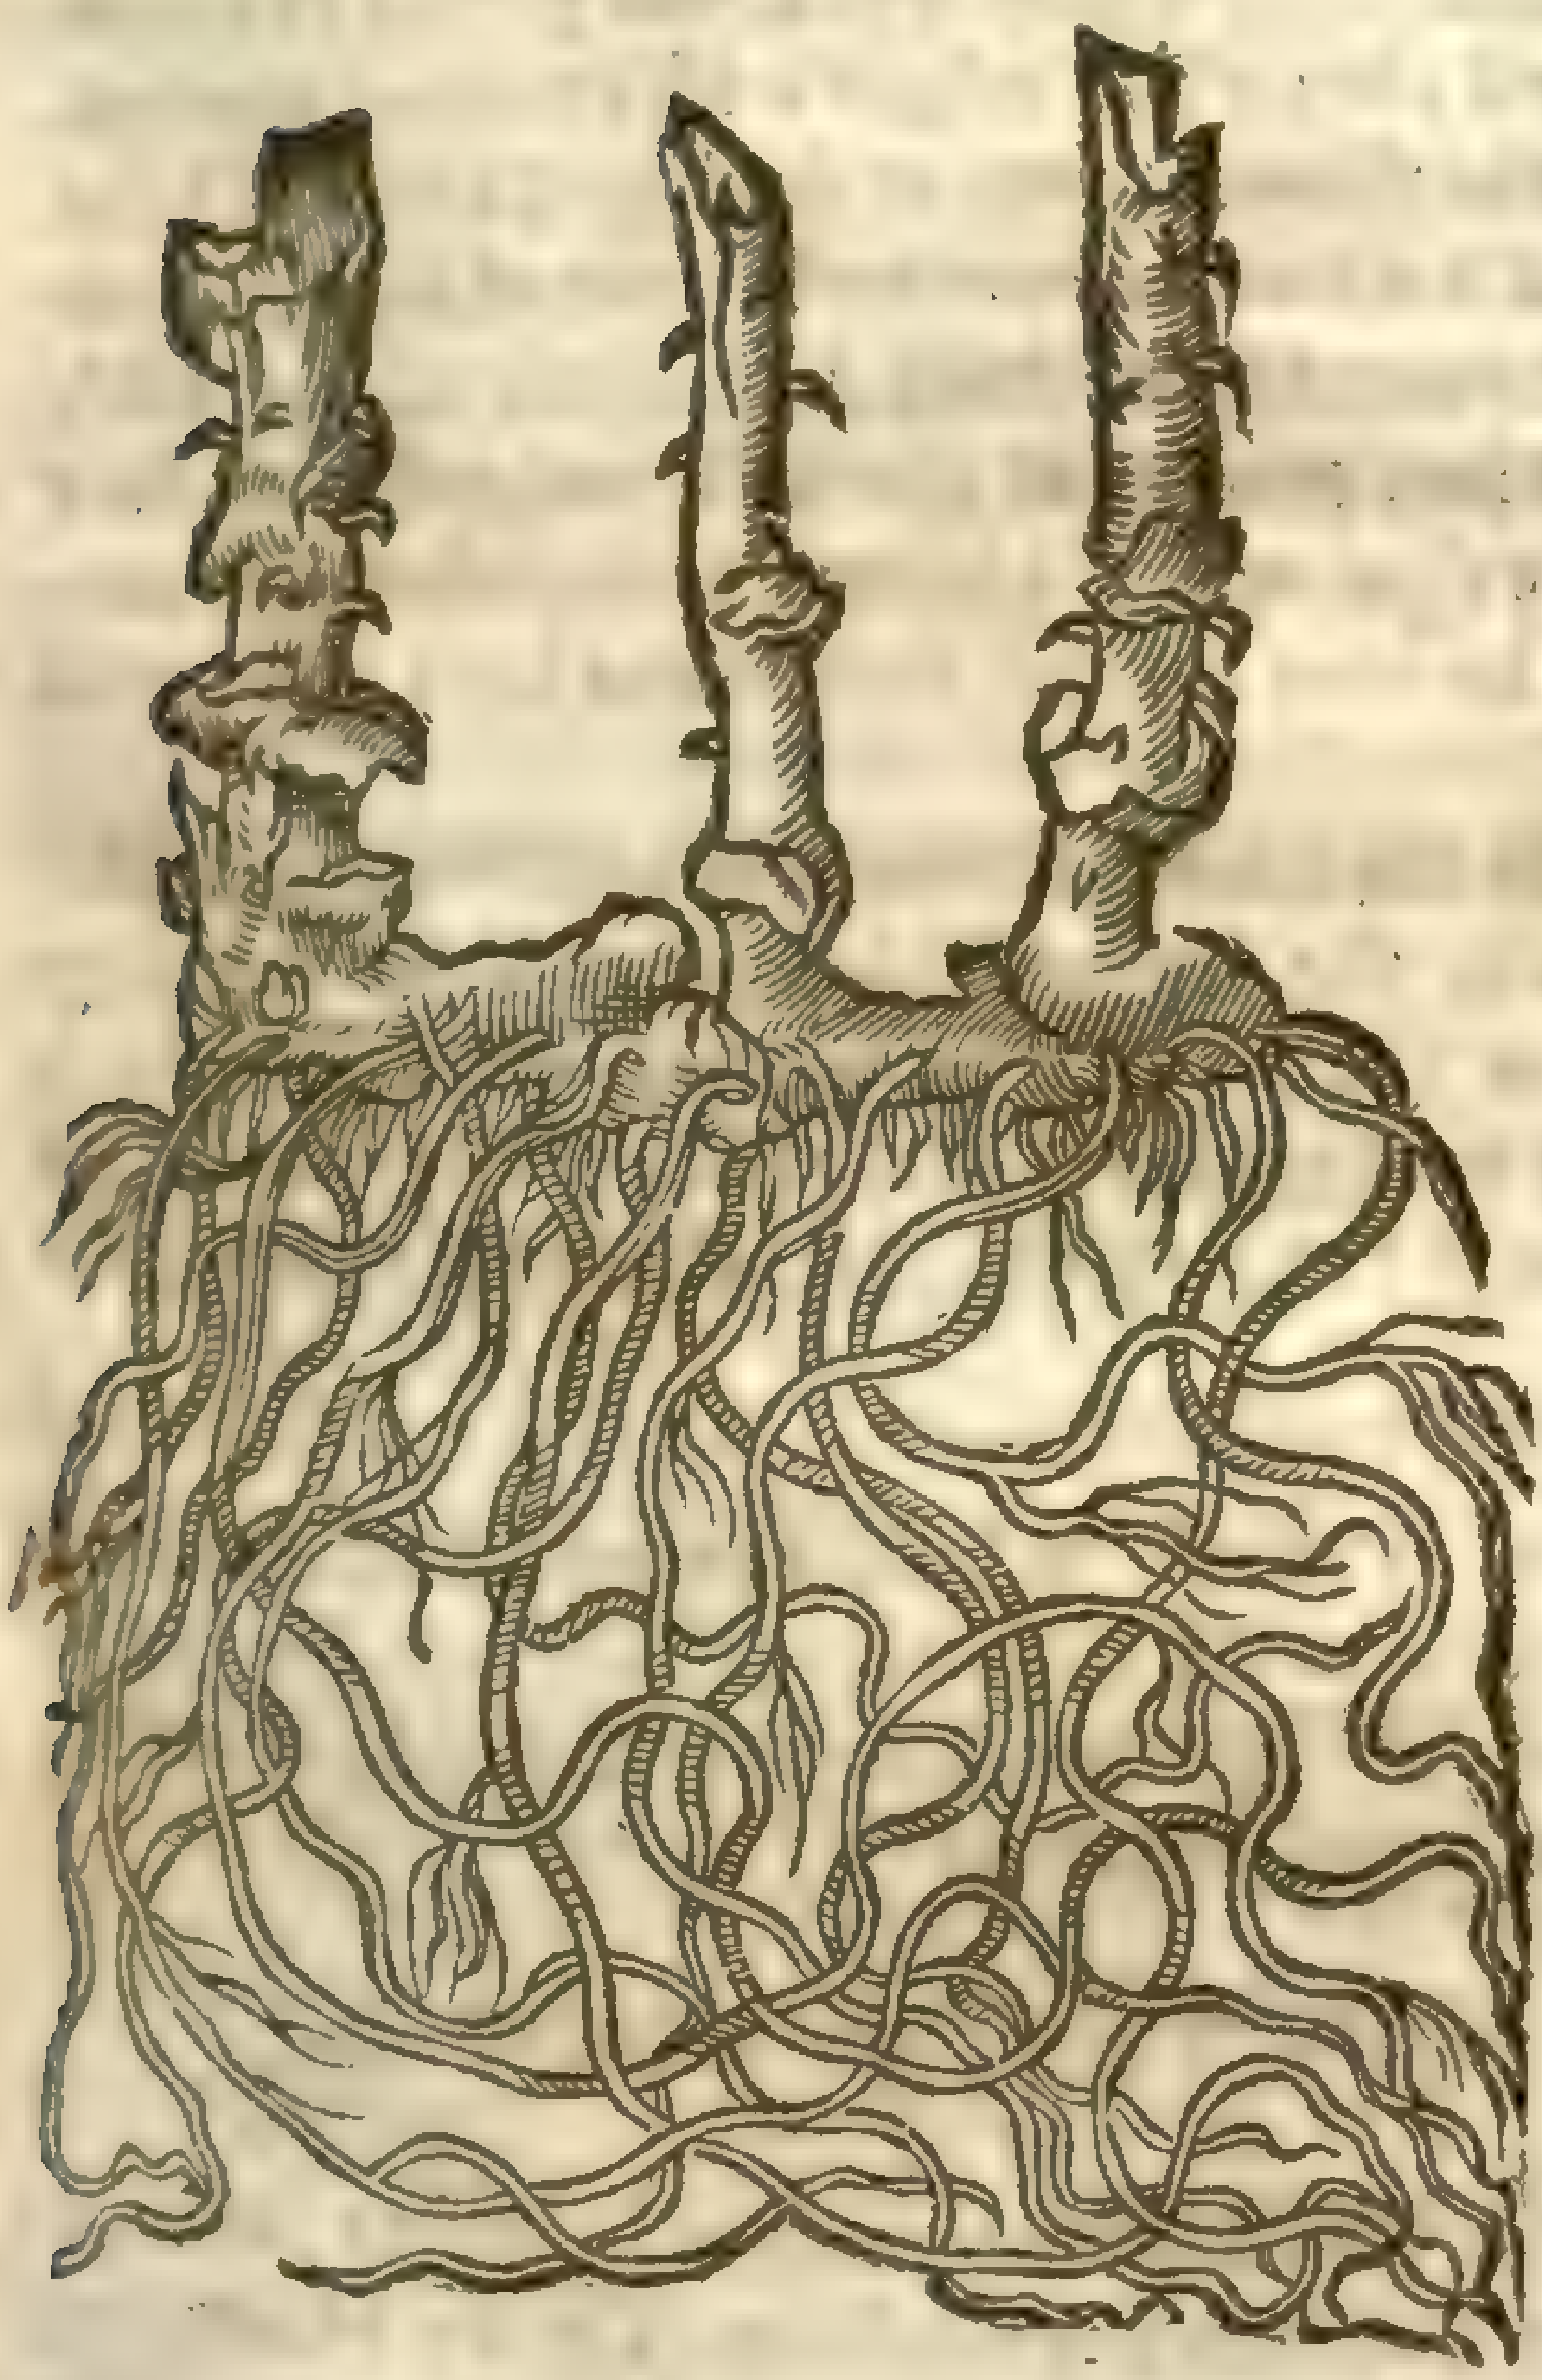
Some likewiſe affirme that the berries are effectuall to procure vrine; and are giuen vnto thoſe that be troubled with the ſtone and diſeaſes of the kidnies. G

The leaues laid in ſteepe in water for a day and a nights ſpace, helpe ſore and ſmarting wateriſh eies, if they be bathed and waſhed with the water wherein they haue beene infuſed. H

Chap. 316. *Of rough Binde-weed.*

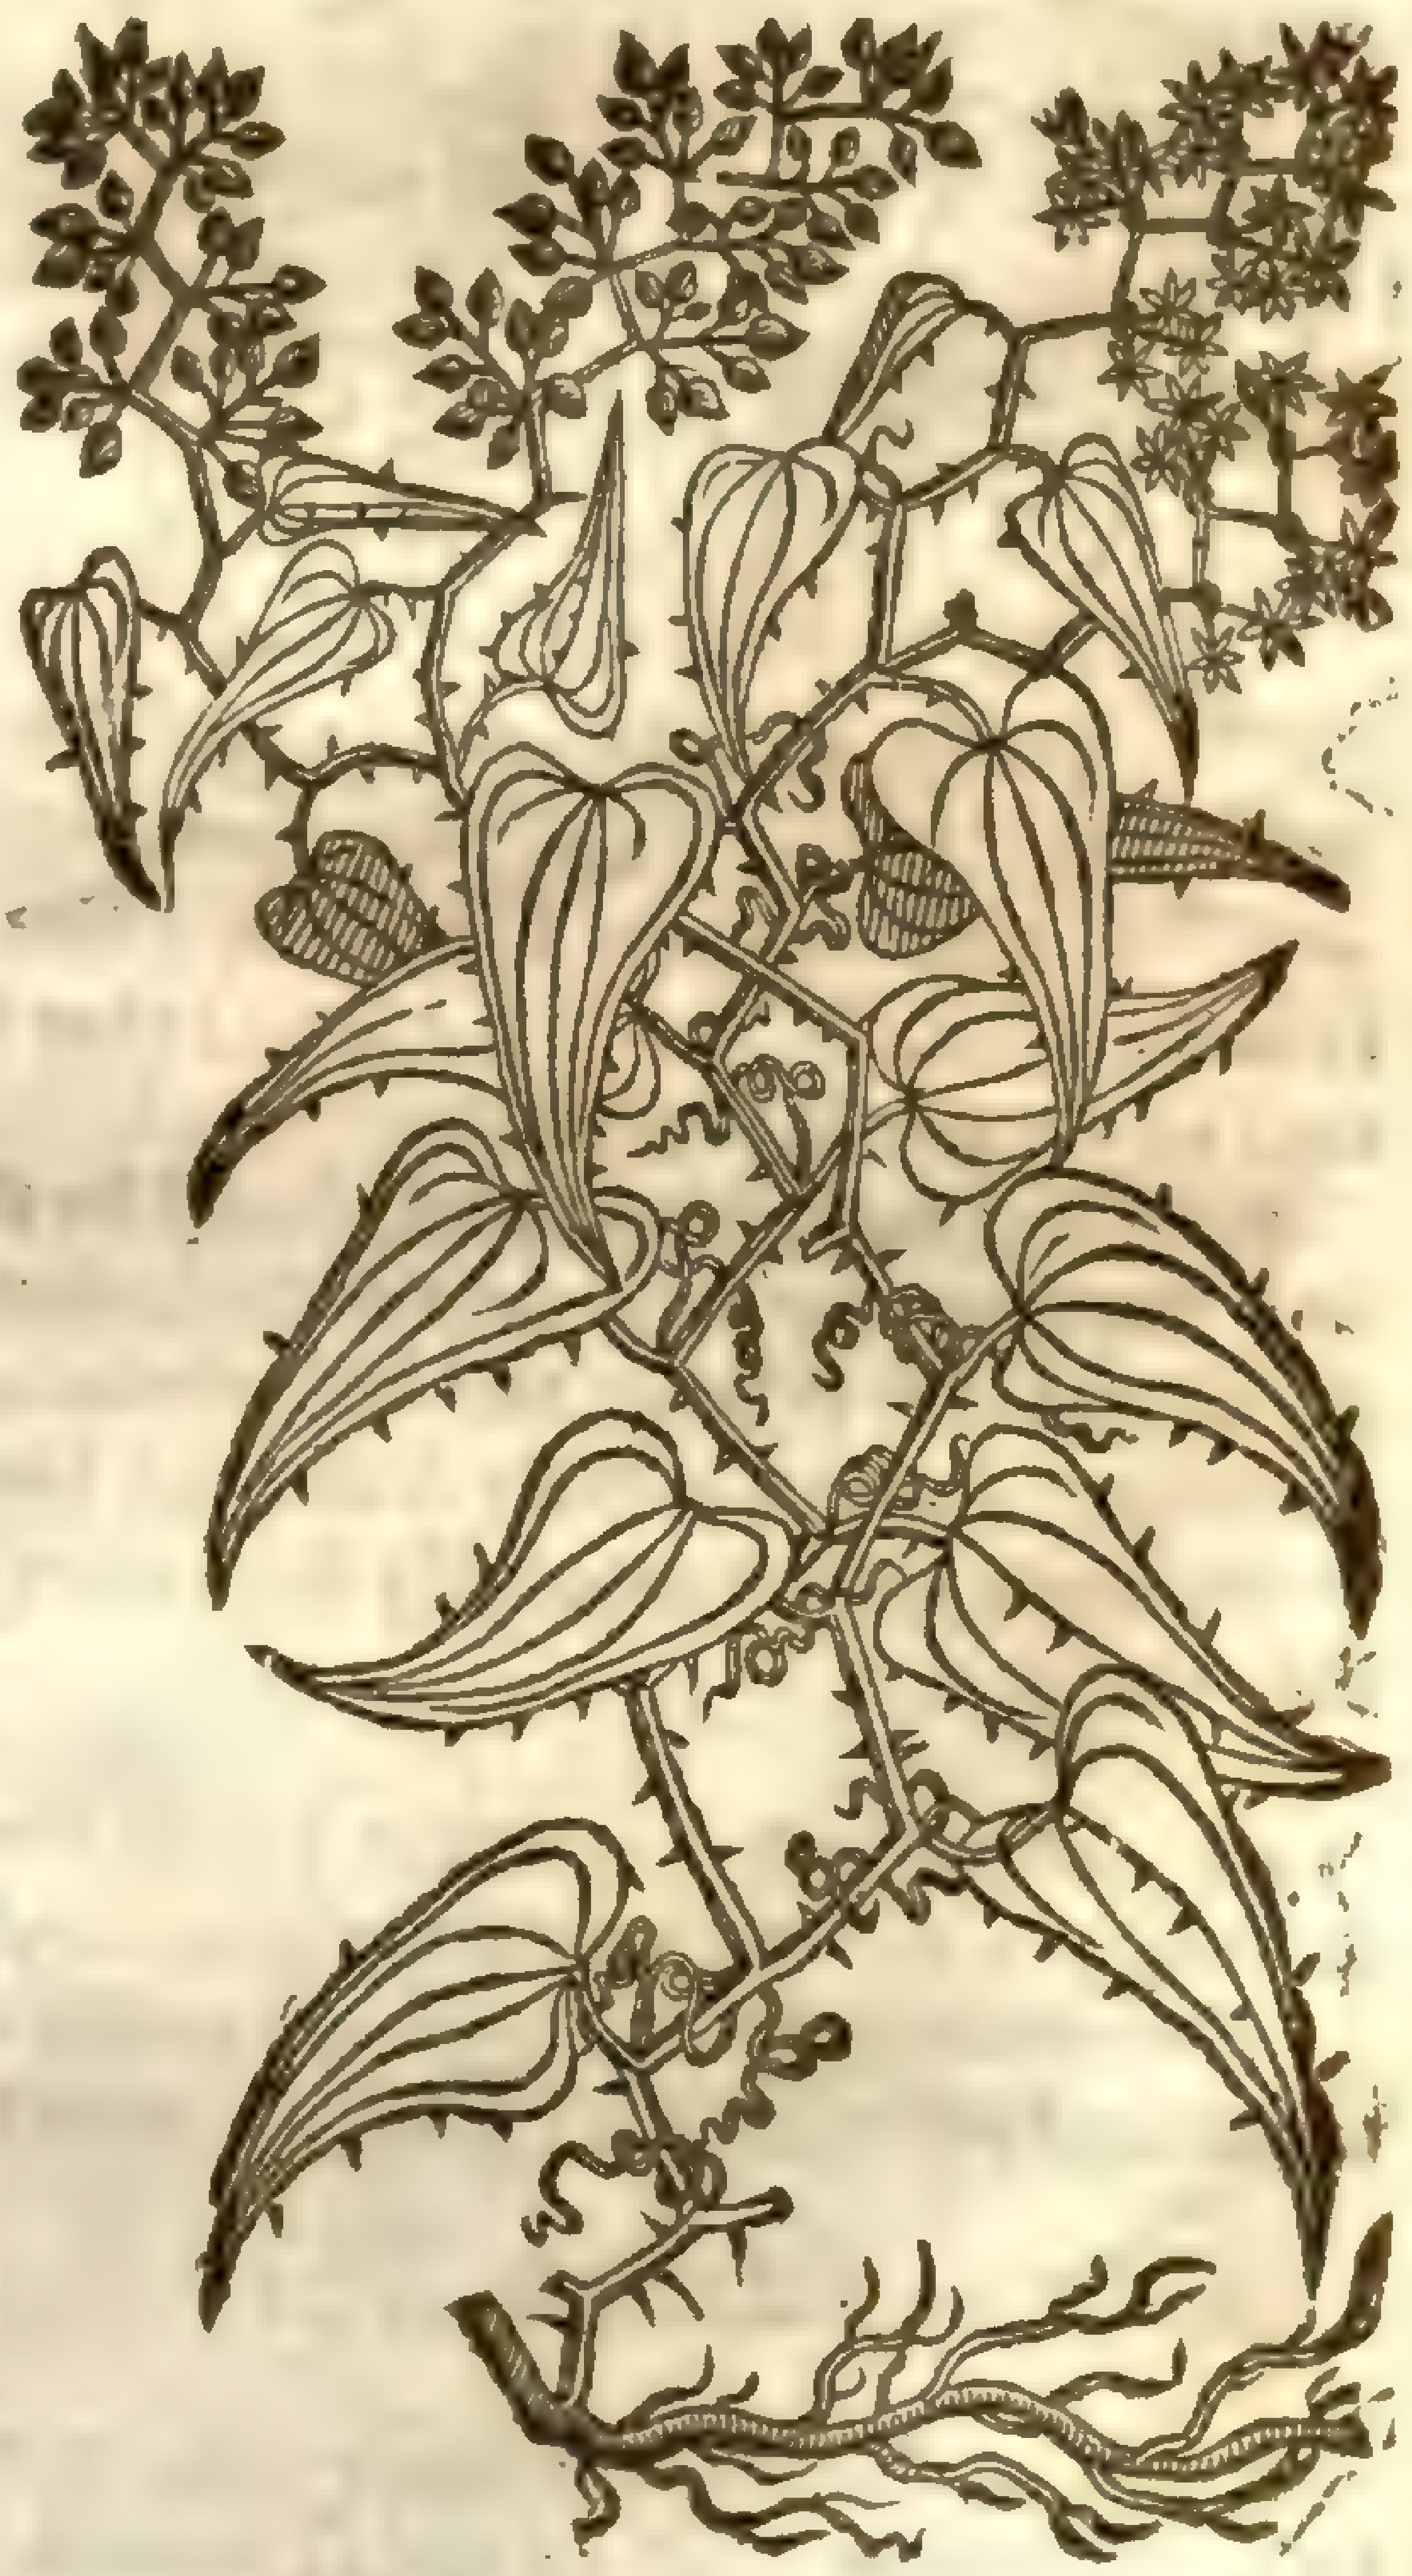
1 *Smilax Peruviana, Salſa parilla.*
Rough Binde-weed of Peru.

S. sarsaparilla L.
[illegible]



2 *Smilax aſpera.*
Common rough Bindeweed.

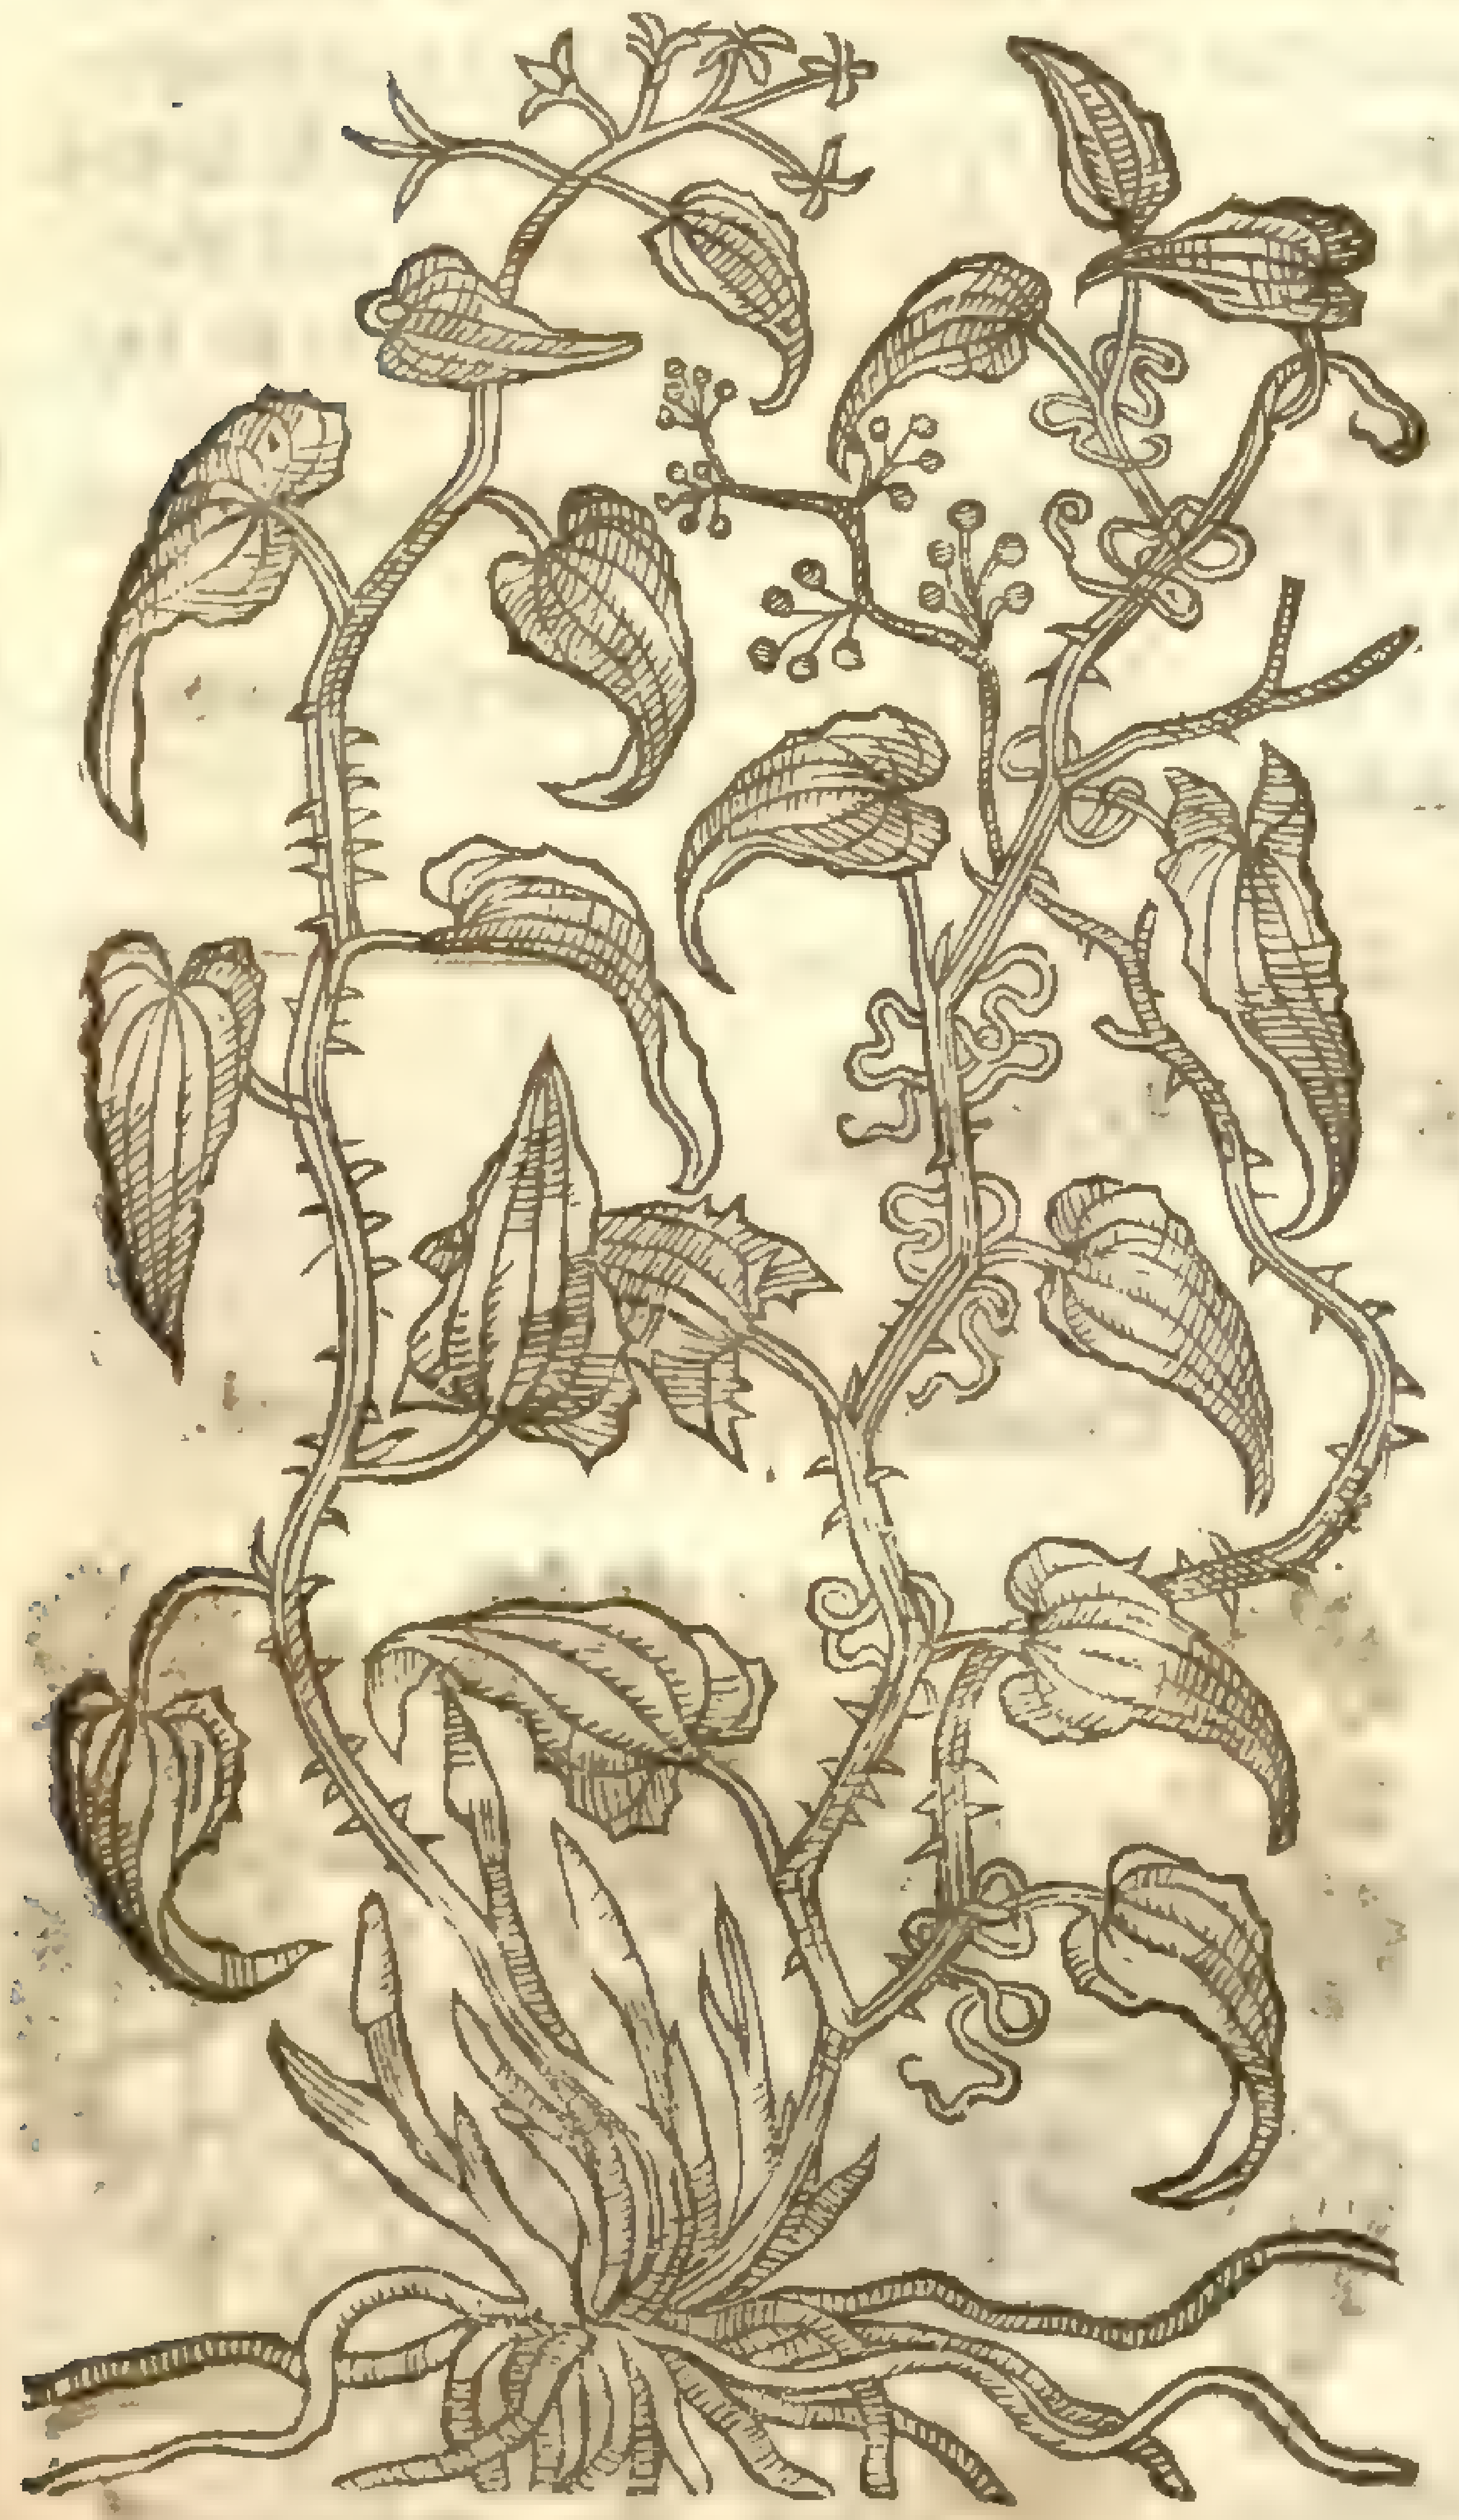
S. aspera L.
[illegible]



¶ *The Deſcription.*

1 Although we haue great plenty of the roots of this Binde-weed of Peru, which we vſually cally *Zarza*, or *Sarſa parilla*, wherewith diuers griefes and maladies are cured, and that theſe roots are very well knowne to all; yet ſuch hath beene the careleſneſſe and ſmall prouidence of ſuch as haue trauelled into the Indies, that hitherto not any haue giuen vs inſtruction ſufficient, either concerning the leaues, floures, or fruit: onely *Monardus* ſaith, that it hath long roots deepe thruſt into the ground: which is as much as if a great learned man ſhould tell the ſimple, that our common carrion Crow were of a blacke colour. For who is ſo blinde that ſeeth the root it ſelfe, but can eaſily affirme the root to be very long? Notwithſtanding, there is in the reports of ſuch as ſay they haue ſeene the plant it ſelfe growing, ſome contradiction or contrarietie: ſome report that it is a kind of Bindweed, and eſpecially one of theſe rough Bind-weeds: others

3 *Smilax aſpera Luſitanica.*
Rough Bind-weed of Portugall.



S. aspera. b. 2. mic. dict.

others, as one Mr. *White* an excellent painter, who carried very many people into Virginia (or after ſome Norembega) there to inhabit, at which time he did ſee thereof great plenty, as he himſelfe reported vnto me, with this bare deſcription; It is (ſaith he) the root of a ſmall ſhrubby tree, or hedge tree, ſuch as are thoſe of our country called Haw-thorns, hauing leaues reſembling thoſe of Iuy, but the floures or fruit he remembreth not. ‡ It is moſt certaine, that *Sarſa parilla* is the root of the Americane *Smilax aſpera*, both by conſent of moſt Writers, and by the relation of ſuch as haue ſeene it growing there. ‡

2 The common rough Bind-weed hath many branches ſet full o little ſharpe prickles, with certaine claſping tendrels, wherewith it taketh hold vpon hedges, ſhrubs, and whatſoeuer ſtandeth next vnto it; winding and claſping it ſelfe about from the bottome to the top; whereon are placed at euery joint one leafe like that of Ivie, without corners, ſharpe pointed, leſſer and harder than thoſe of ſmooth Binde-weed, oftentimes marked with little white ſpots, and garded or bordered about the edges with crooked prickles. The floures grow at the top of crooked ſtalks of a white colour, and ſweet of ſmell. After commeth the fruit like thoſe of the wilde Vine, greene at the firſt, and red when they be ripe, and of a biting taſte; wherein is contained a blackiſh ſeed in ſhape like that of hempe. The root is long, ſomewhat hard, and parted into very many branches.

3 This rough Binde-weed, found for the moſt part in the barren mountaines of Portugall, differeth not from the precedent in ſtalkes and floures, but in the leaues and fruit; for the leaues are ſofter, and leſſe prickly, and ſometimes haue no prickles at all, and they are alſo oftentimes much narrower: the fruit or berry is not red but blacke when as it commeth to be ripe. The root hereof is one ſingle root of a wooddy ſubſtance, with ſome fibres annexed thereto, wherein conſiſteth the difference.

¶ *The Place.*

Zarza Parilla, or the prickly Binde-weed of America, groweth in Peru a prouince of America, in Virginia, and in diuers other places both in the Eaſt and Weſt Indies.

The others grow in rough and vntilled places, about the edges and borders of fields, on mountaines and vallies, in Italy, Languedoc in France, Spaine, and Germany.

¶ *The Time.*

They floure and flouriſh in the Spring: their fruit is ripe in Autumne, or a little before.

¶ *The Names.*

It is named in Greeke, Σμίλαξ τραχεῖα. *Gaza* (*Theophraſtus* his tranſlator) names it *Hedera Cilicia*; as likewiſe *Pliny*, who *lib.*24.*cap.*10. writeth, that it is alſo ſyrnamed *Nicophoron*. Of the Hetrurians, *Hedera ſpinoſa*, and *Rubus Cervinus*: of the Caſtilians in Spaine, as *Lacuna* ſaith, *Zarza parilla*, as though they ſhould ſay, *Rubus viticula*, or Bramble little Vine. *Sarſa* as *Matthiolus* interpreteth it, doth ſignifie a Vine; and *Parilla*, a ſmall or little Vine.

Diuers affirme that the root (brought out of Peru a Prouince in America) which the later Herbariſts do call *Zarza*, is the root of this Bindeweed. *Garcias Lopius Luſitanus* granteth it to be like thereunto, but yet he doth not affirme that it is the ſame. Plants are oftentimes found to be like one another, which notwithſtanding are proued not to be the ſame by ſome little difference; the diuers conſtitutions of the weather and of the ſoile maketh the difference.

Zarza parilla of Peru is a ſtrange plant, and is brought vnto vs from the Countries of the new world called America; and ſuch things as are brought from thence, although they alſo ſeeme and are like to thoſe that grow in Europe, notwithſtanding they do often differ in vertue and operation: for the diuerſitie of the ſoile and of the weather doth not only breed an alteration in the forme but doth moſt of all preuaile in making the vertues and qualities greater or leſſer. Such things as grow in hot places be of more force, and greater ſmell; and in cold,of leſſer. Some things that are deadly and pernitious, being remoued wax milde, and are made wholeſome: ſo in like manner, although *Zarza parilla* of Peru be like to rough Bind-weed, or to Spaniſh *Zarza parilla*, notwithſtanding by reaſon of the temperature of the weather, and alſo through the nature of the ſoile, it is of a great deale more force than that which groweth either in Spaine or in Africke.

The roots of *Zarza parilla* of Peru, which are brought alone without the plant, be long and ſlender, like to the leſſer roots of common liquorice, very many oftentimes hanging from one head, in which roots the middle ſtring is hardeſt. They haue little taſte, and ſo ſmall a ſmell that it is not to be perceiued. Theſe are reported to grow in Honduras a prouince of Peru. They had their name of the likeneſſe of rough Binde weed, which among the inhabitants it keepeth; ſignifying in Spaniſh, a rough or prickly vine,as *Garcias Lopius* witneſſeth.

¶ *The Temperature.*

The roots are of temperature hot and dry, and of thinne and ſubtill parts, inſomuch as their decoction doth very eaſily procure ſweat.

¶ *The Vertues.*

A The roots are a remedie againſt long continuall paine of the joynts and head, and againſt cold diſeaſes. They are good for all manner of infirmities wherein there is hope of cure by ſweating, ſo that there be no ague joyned.

B The cure is perfected in few daies, if the diſeaſe be not old or great; but if it be, it requireth a longer time of cure. The roots here meant are as I take it thoſe of *Zarza parilla*, whereof this *Smilax aſpera* or rough Binde-weed is holden for a kinde: notwithſtanding this of Spaine and the other parts of Europe, though it be counted leſſe worth, yet is it commended of *Dioſcorides* and *Pliny* againſt poyſons. The leaues hereof, ſaith *Dioſcorides*, are a counterpoyſon againſt deadly medicines, whether they be drunke before or after.

† The ſecond and fourth were both formerly of one plant,I meane the hiſtorie; for the figure in the fourth place ſhould haue beene in the third, and the figure in the third was the ſame with the ſecond,and ſhould haue beene in the fourth place.

Chap. 317. *Of ſmooth or gentle Binde-weed.*

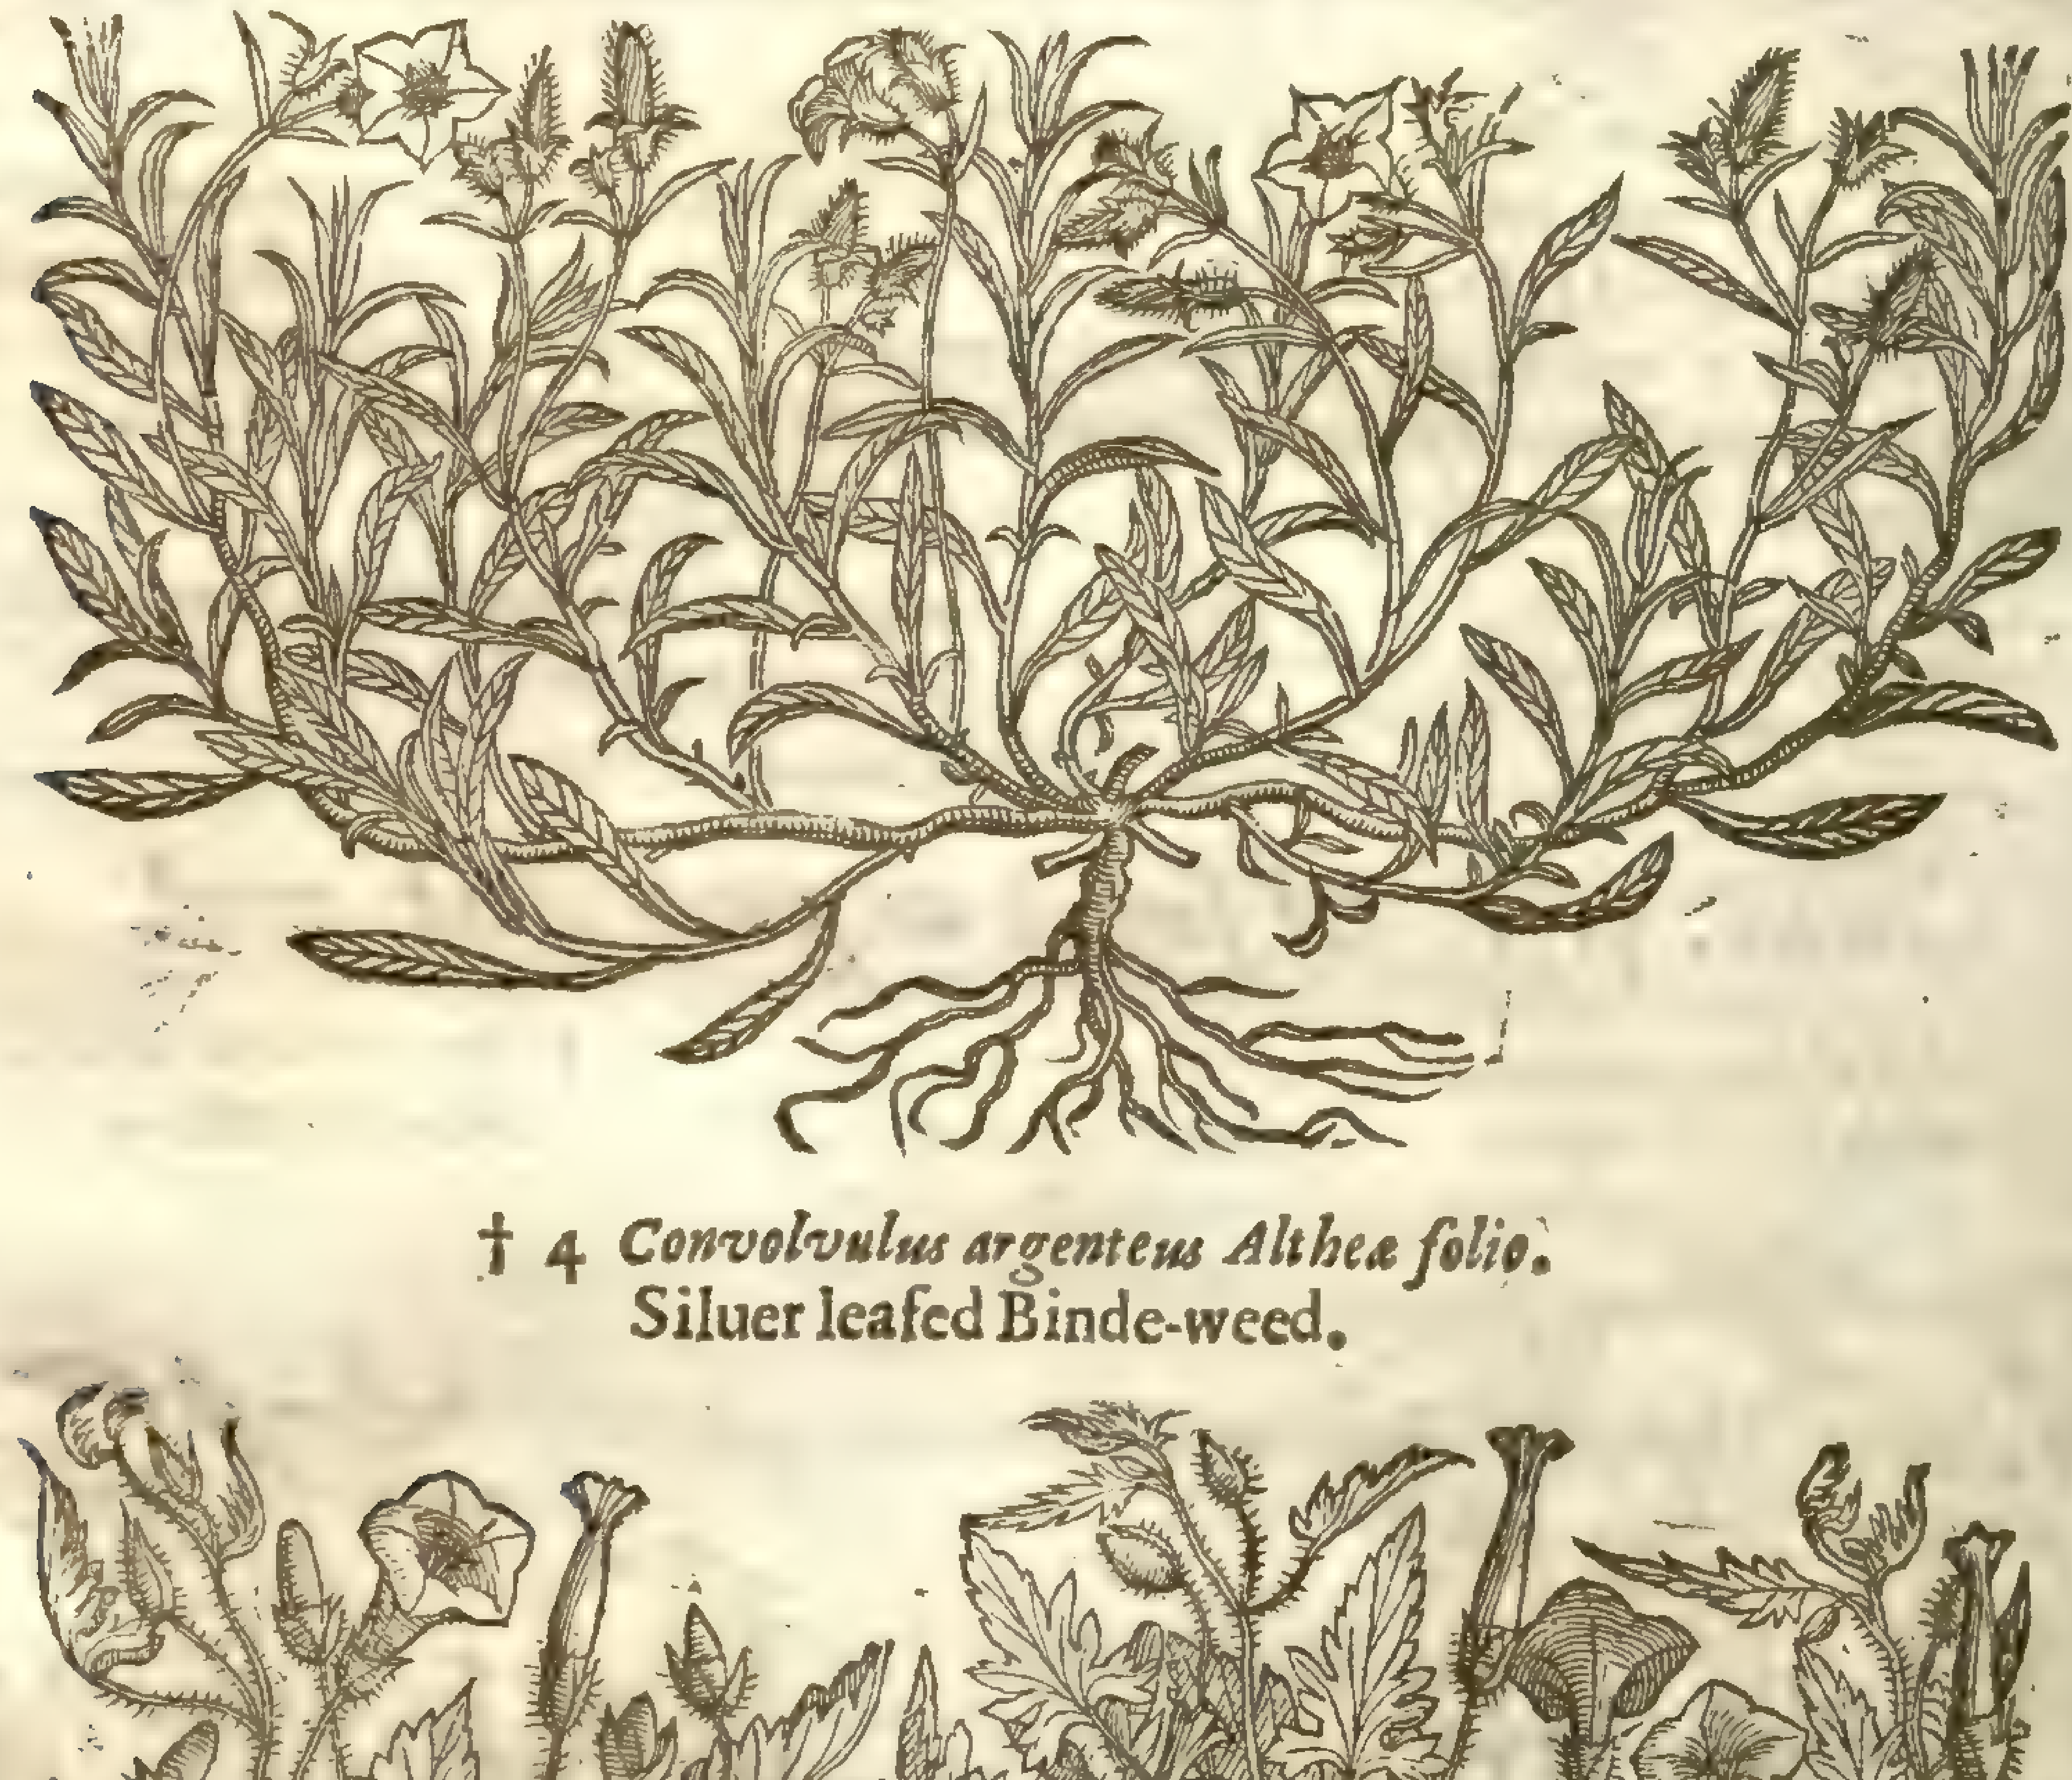
¶ *The Deſcription.*

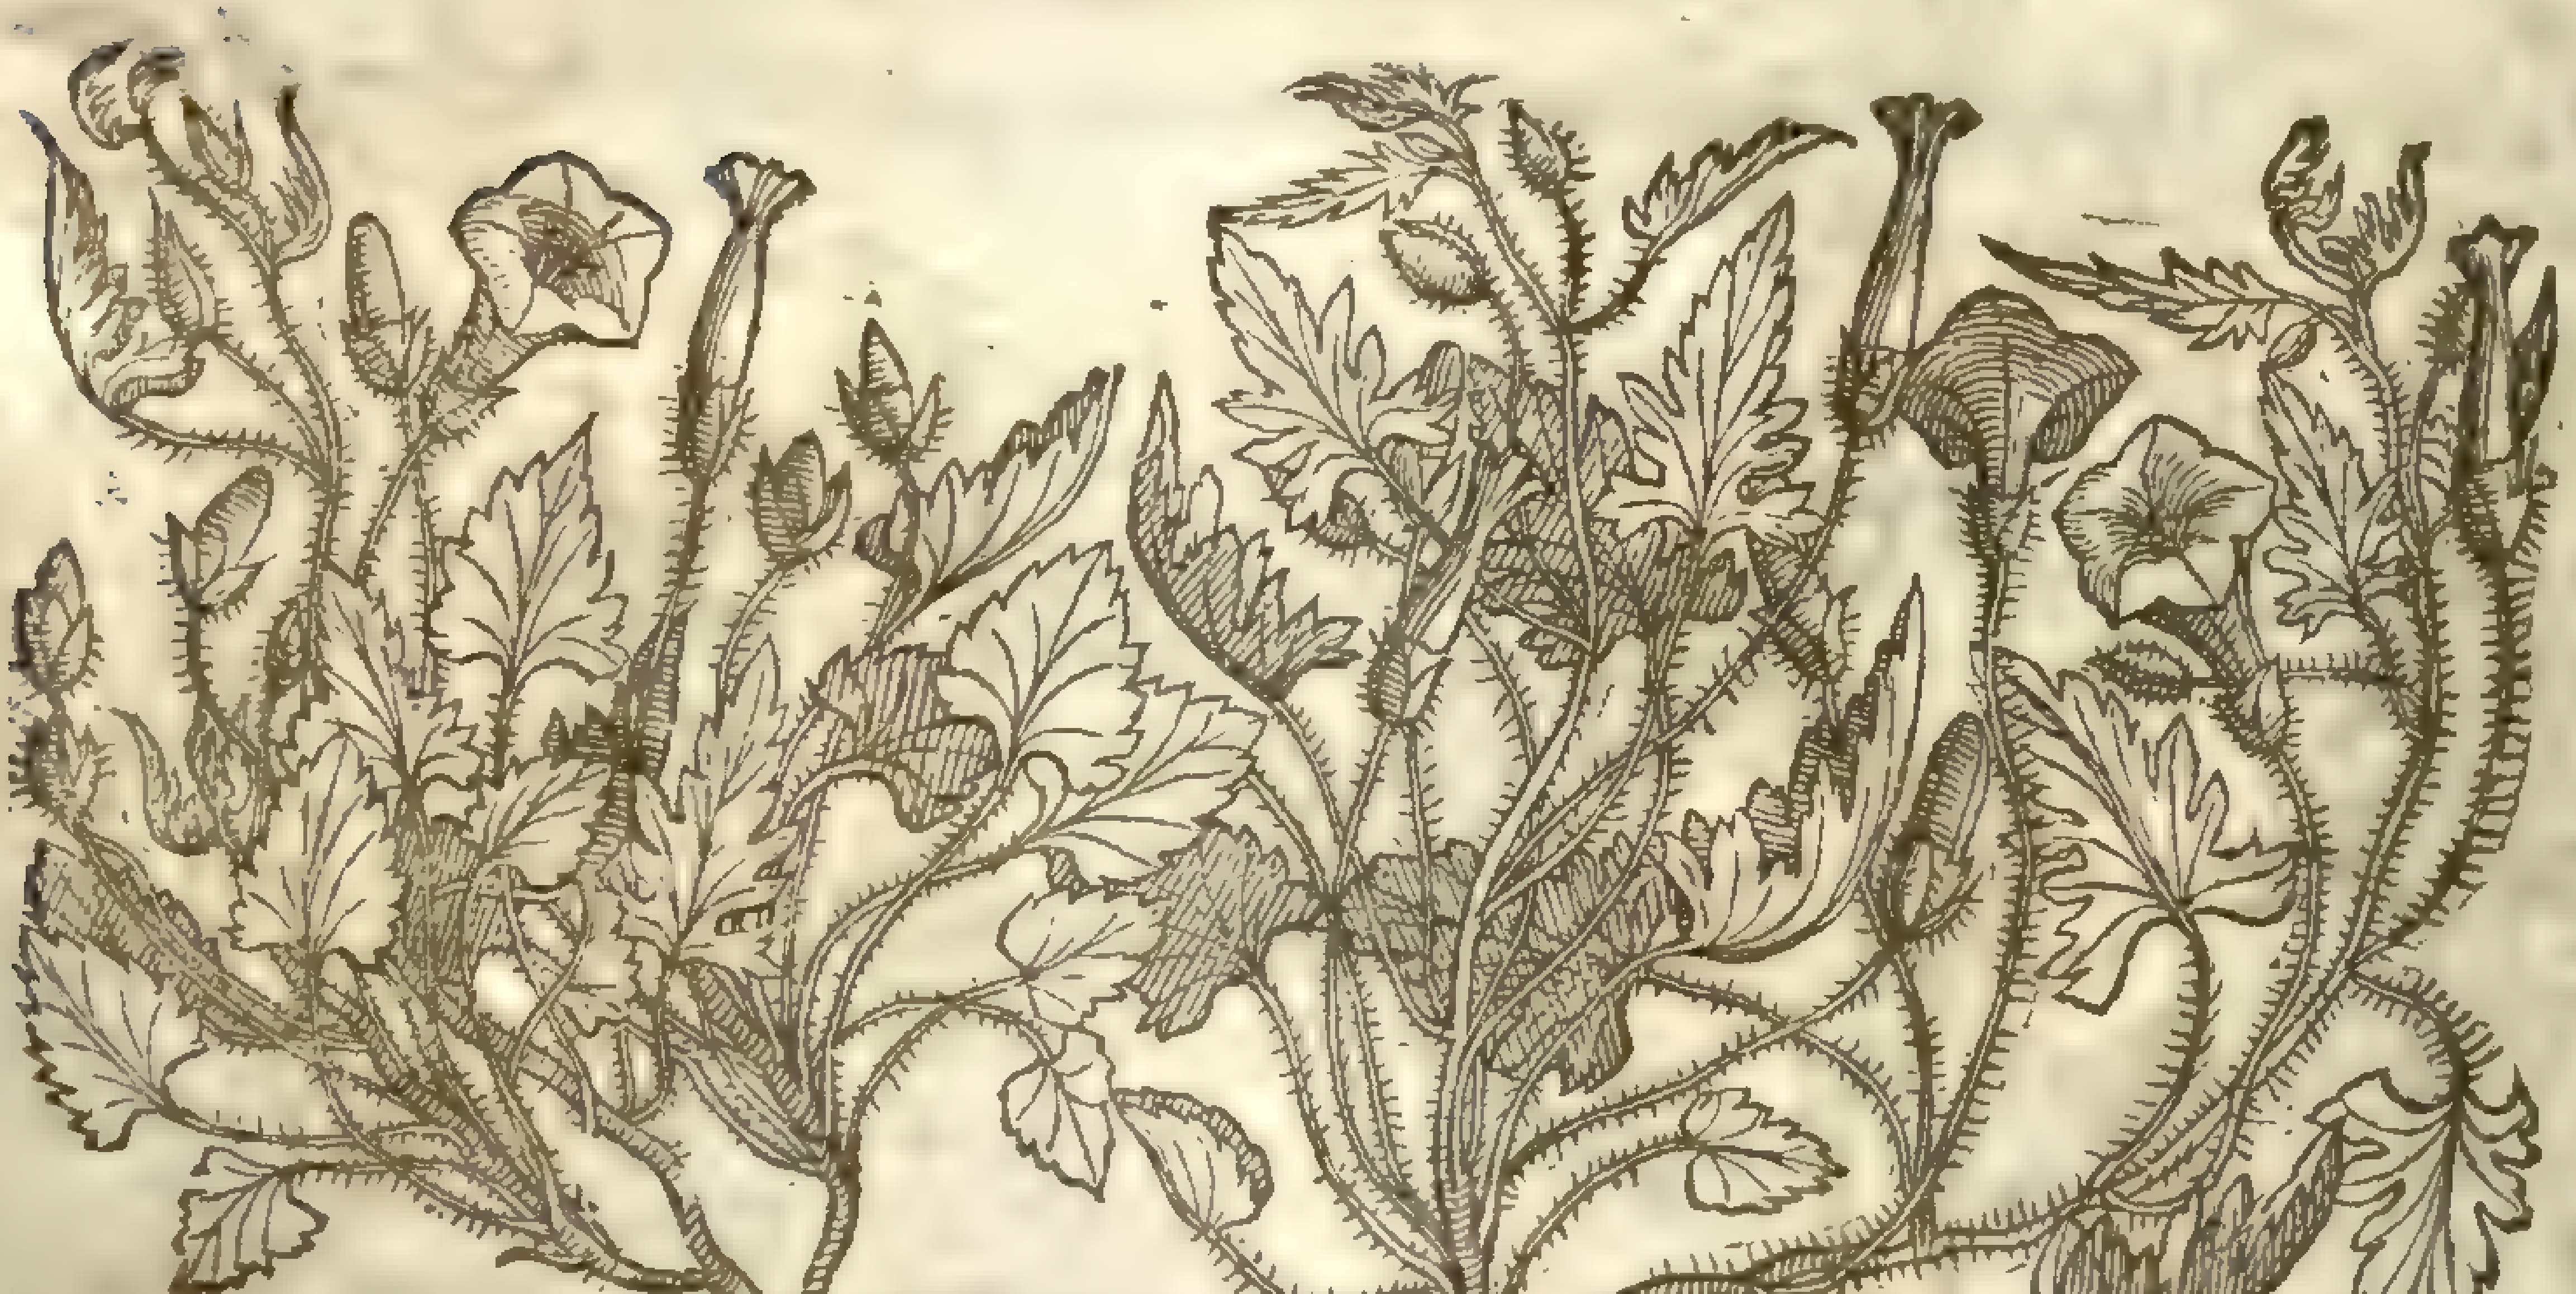
1 IT is a ſtrange thing vnto me, that the name of *Smilax* ſhould be ſo largely extended, as that it ſhould be aſſigned to thoſe plants that come nothing neere the nature, and ſcarſly vnto any part of the forme of *Smilax* indeed. But we will leaue controuerſies to the further conſideration of ſuch as loue to dance in quag-mires, and come to this our common ſmooth *Smilax*, called and knowne by that name among vs, or rather more truly by the name of *Convolvulus major*, or *Volubilis major*: it beareth the long branches of a Vine, but tenderer, and for the length and great ſpreading thereof it is very fit to make ſhadows in arbors: the leaues are ſmooth like Ivie, but ſomwhat bigger, and being broken are full of milke: amongſt which come forth great white and hollow floures like bells. The ſeed is three cornered, growing in ſmall huskes couered with a thinne skin. The root is ſmall, white, and long, like the great Dogs graſſe.

2 *Smilax lævis minor* is much like vnto the former in ſtalkes, leaues, floures, ſeed, and roots, ſauing that in all reſpects it is much ſmaller, and creepeth vpon the ground. The branches are ſmall and ſmooth: the little leaues tender and ſoft: the floures like vnto little bells, of a purple colour: the ſeed three cornered like vnto the others.

3 *Convolvulus minimus ſpica-folius.*
Lauander leafed Binde-weed.



† 4 *Convolvulus argenteus Althea folio.*
Siluer leafed Binde-weed.



3 This Bindweed *Pena* ſaith he neuer ſaw but in the brinks of quicke-ſets and Oliuets in Province, Sauoy, and Narbone; notwithſtanding I found it growing in the corne fields about great Dunmow in Eſſex, in ſuch abundance, that it doth much hurt vnto their corne. This kind of Bindweed or *Volubilis* is like vnto the ſmall Bindweed before mentioned, but it hath a finer floure, plaited or folded in the compaſſe of a bell very orderly, eſpecially before the Sun riſe (for after it opens it ſelfe the welts are not ſo much perceiued) and it is of a darke purple colour: the ſeed is not vnlike the reſt, cornered and flat, growing out of ſlender branches which ſtand vpright and thicke together, proceeding out of a wooddy white root. The leaues are long and narrow, reſembling *Linaria* both in colour and hairineſſe, in taſte drying, and ſomewhat heating.

‡ 4 The

Polygonum 'Convolvulus' [illegible]

5 *Volubilis nigra.*
Blacke Bindweed.

‡ 4 The ſtalkes and branches of this are ſome cubite long, ſlender, weake and hairy, ſo that they lie vpon the ground, if they haue nothing to ſuſtaine them: vpon theſe without any order grow leaues, ſhaped like thoſe of Ivie, or the Marſh Mallow, but leſſe, and couered ouer with a ſiluer-like downe or hairineſſe, and diuided ſomewhat deepe on the edges, ſometimes alſo curled, and otherwhiles onely ſnipt about. The floure growes vpon a long ſtalke like as in other plants of this kinde, and conſiſts of one folding leafe, likeas that of the laſt mentioned, and it is either of a whitiſh purple, or els abſolute purple colour: The root is ſmall and creeping. It growes in many places of Spaine, and there floures in March and Aprill. *Cluſius* calls this *Convolvulus Althea folio*, and ſaith that the Portugals name it *VerdeZilla*, and commend it as a thing moſt effectuall to heale wounds. Our Author gaue the figure hereof (how fitly let the Reader iudge) by the name of *Papauer cornutum luteum minus*, making it a horned Poppy, as you may ſee in the former Edition, *pag.* 294. ‡

† 5 This kind of Bindweed hath a tough root full of threddy ſtrings, from which riſe vp immediatly diuers trailing branches, whereon grow leaues like the common field Bindweed, or like thoſe of Orach, of a black green colour, whereof it tooke his name: the floures are ſmal, and like thoſe of Orach: the ſeed is black, three ſquare, like, but leſſe than that of Buck-wheat. The whole plant is not onely a hurtfull weed, but of an euill ſmell alſo, and too frequently found amongſt corne. *Dodonæus* calls this *Convolvulum nigrum*: and *Helxine Ciſſampelos*; *Tabernamontanus*, *Volubilis nigra*: and *Lobel*, *Helxine Ciſſampelos altera Atriplicis effigie.*

¶ *The Place.*

All theſe kindes of Bindweeds do grow very plentifully in moſt parts of England. ‡ The third and fourth excepted. ‡

¶ *The Time.*

They do floure from May to the end of Auguſt.

¶ *The Names.*

The great Bindweed is called in Greeke, σμίλαξ λεία: in Latine, *Smilax Læuis*: of *Galen* and *Paulus Ægineta*, μίλαξ λεία: it is ſurnamed *Læuis* or ſmooth, becauſe the ſtalkes and branches thereof haue no prickes at all. *Dolichus* called alſo *Smilax hortenſis*, or Kidney beane, doth differ from this: and likewiſe *Smilax* the tree, which the Latines call *Taxus*: in Engliſh, the Yew tree. The later Herbariſts do call this Bindweed *Volubilis maior*, *Campanella*, *Funis arborum*, *Convolvulus albus*, and *Smilax læuis major*: in like manner *Pliny* in his 21. booke, 5. chap. doth alſo name it *Convolvulus*. It is thought to be *Liguſtrum*, not the ſhrub priuet, but that which *Martial* in his firſt booke of Epigrams ſpeaketh of, writing againſt *Procillus*.

The ſmall Bindweed is called *Convolvulus minor*, and *Smilax læuis minor*, *Volubilis minor*: in high Dutch, **Windkraut**: in low Dutch, **Wrange**: in French, *Liſeron*: in Italian, *Vilucchio*: in Spaniſh, *Campanella Yerua*: in Engliſh, Withwinde, Bindeweed, and Hedge-bels.

¶ *The Temperature.*

Theſe herbes are of a hot and dry temperature.

¶ *The Vertues.*

The leaues of blacke Bindeweed called *Helxine Ciſſampelos*, ſtamped and ſtrained, and the juyce drunken, doth looſe and open the belly exceedingly. A

The leaues pound and laid to the grieued place, diſſolue, waſte, and conſume hard lumps and ſwellings, as *Galen* ſaith. B

The

D The reſt of the Bindweeds are not fit for medicine, but vnprofitable weeds, and hurtfull vnto each thing that groweth next vnto them.

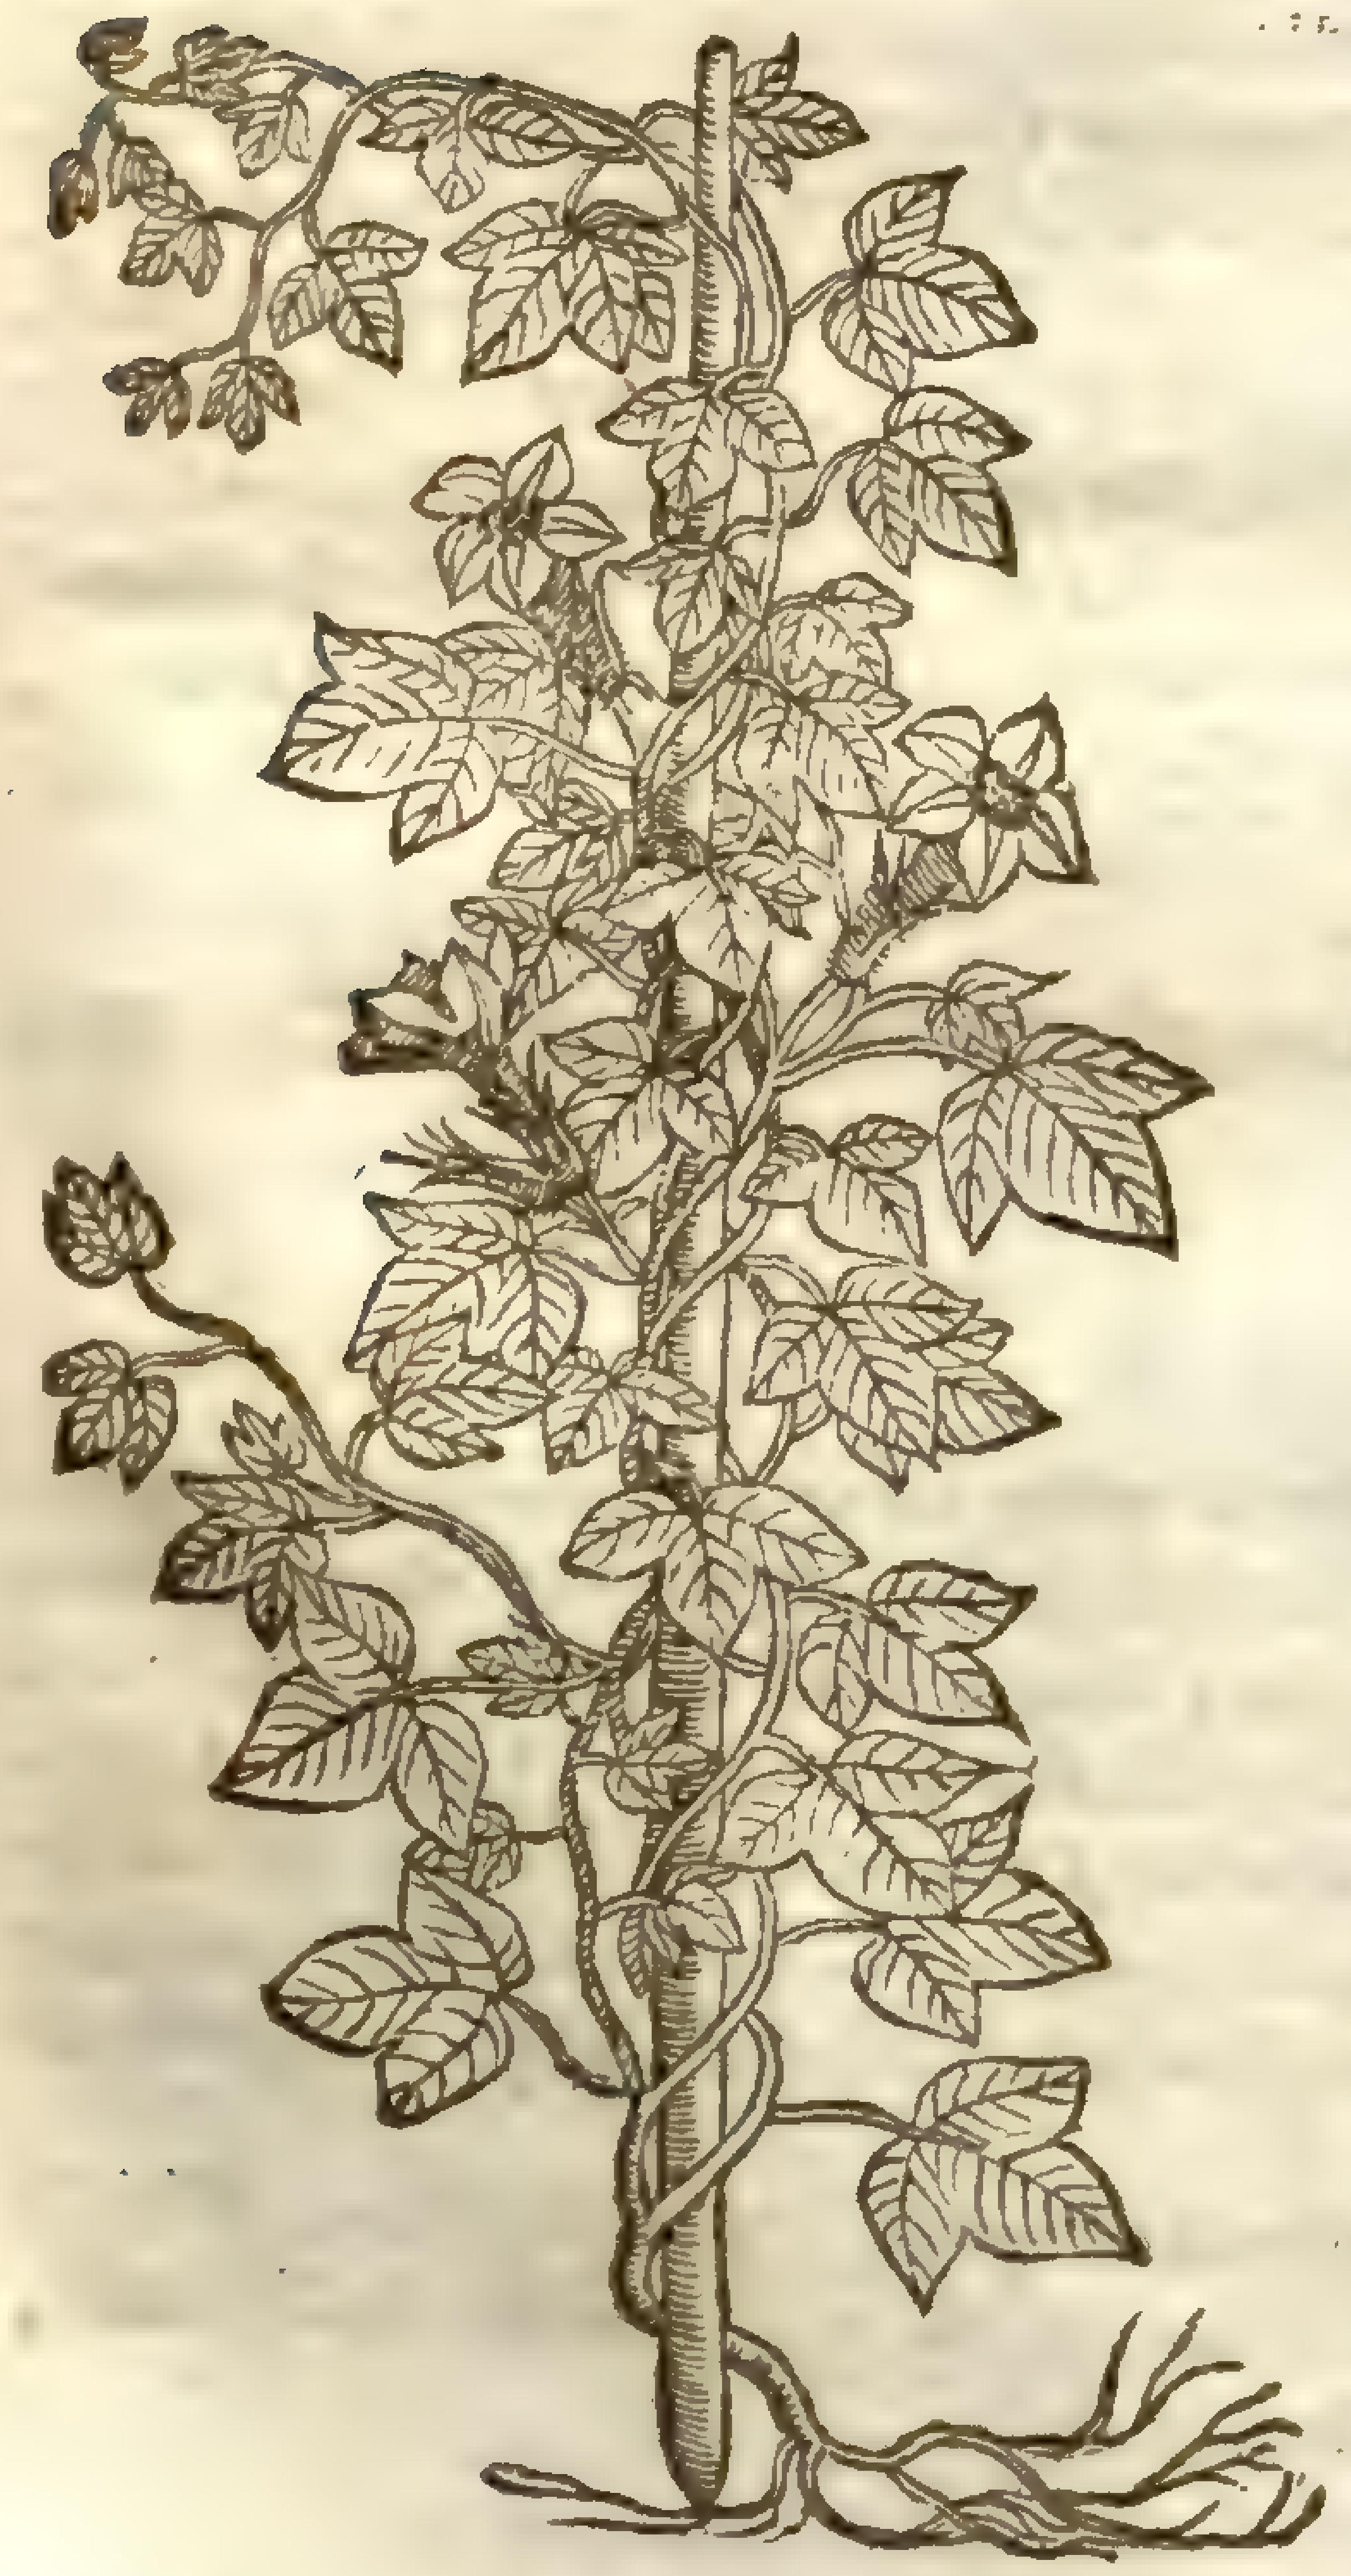
† The deſcription which our Author intended in the firſt place for *Volubilis nigra*, and tooke out of the 274. page of the *Aduerſaria*, but ſo confuſedly and imperfectly, neither agreeing with that he intended, I haue omitted as impertinent, and made his later, though alſo imperfect deſcription, ſomewhat more compleat and agreeable to the plant figured and intended.

Chap. 318. *Of Blew Bindweed.*

¶ *The Deſcription.*

1 Blew Bindweed bringeth forth long, tender, and winding branches, by which it climeth vpon things that ſtand neere vnto it, and foldeth it ſelfe about them with many turnings and windings, wrapping it ſelfe againſt the Sun, contrary to all other things whatſoeuer, that with their claſping tendrels doe embrace things that ſtand neere vnto them; whereupon doe grow broad cornered leaues very like vnto thoſe of Ivie, ſomething rough and hairy, of an ouerworne ruſſet greene colour: among which come forth moſt pleaſant floures bell faſhion, ſomthing cornered as are thoſe of the common Bindweed, of a moſt ſhining azure colour tending to purple: which being paſt, there ſucceed round knobbed ſeed veſſels, wherein is contained long blackiſh ſeed of the bigneſſe of a Tare, and like vnto thoſe of the great hedge Bindweed. The root it thready, and periſheth at the firſt approach of Winter.

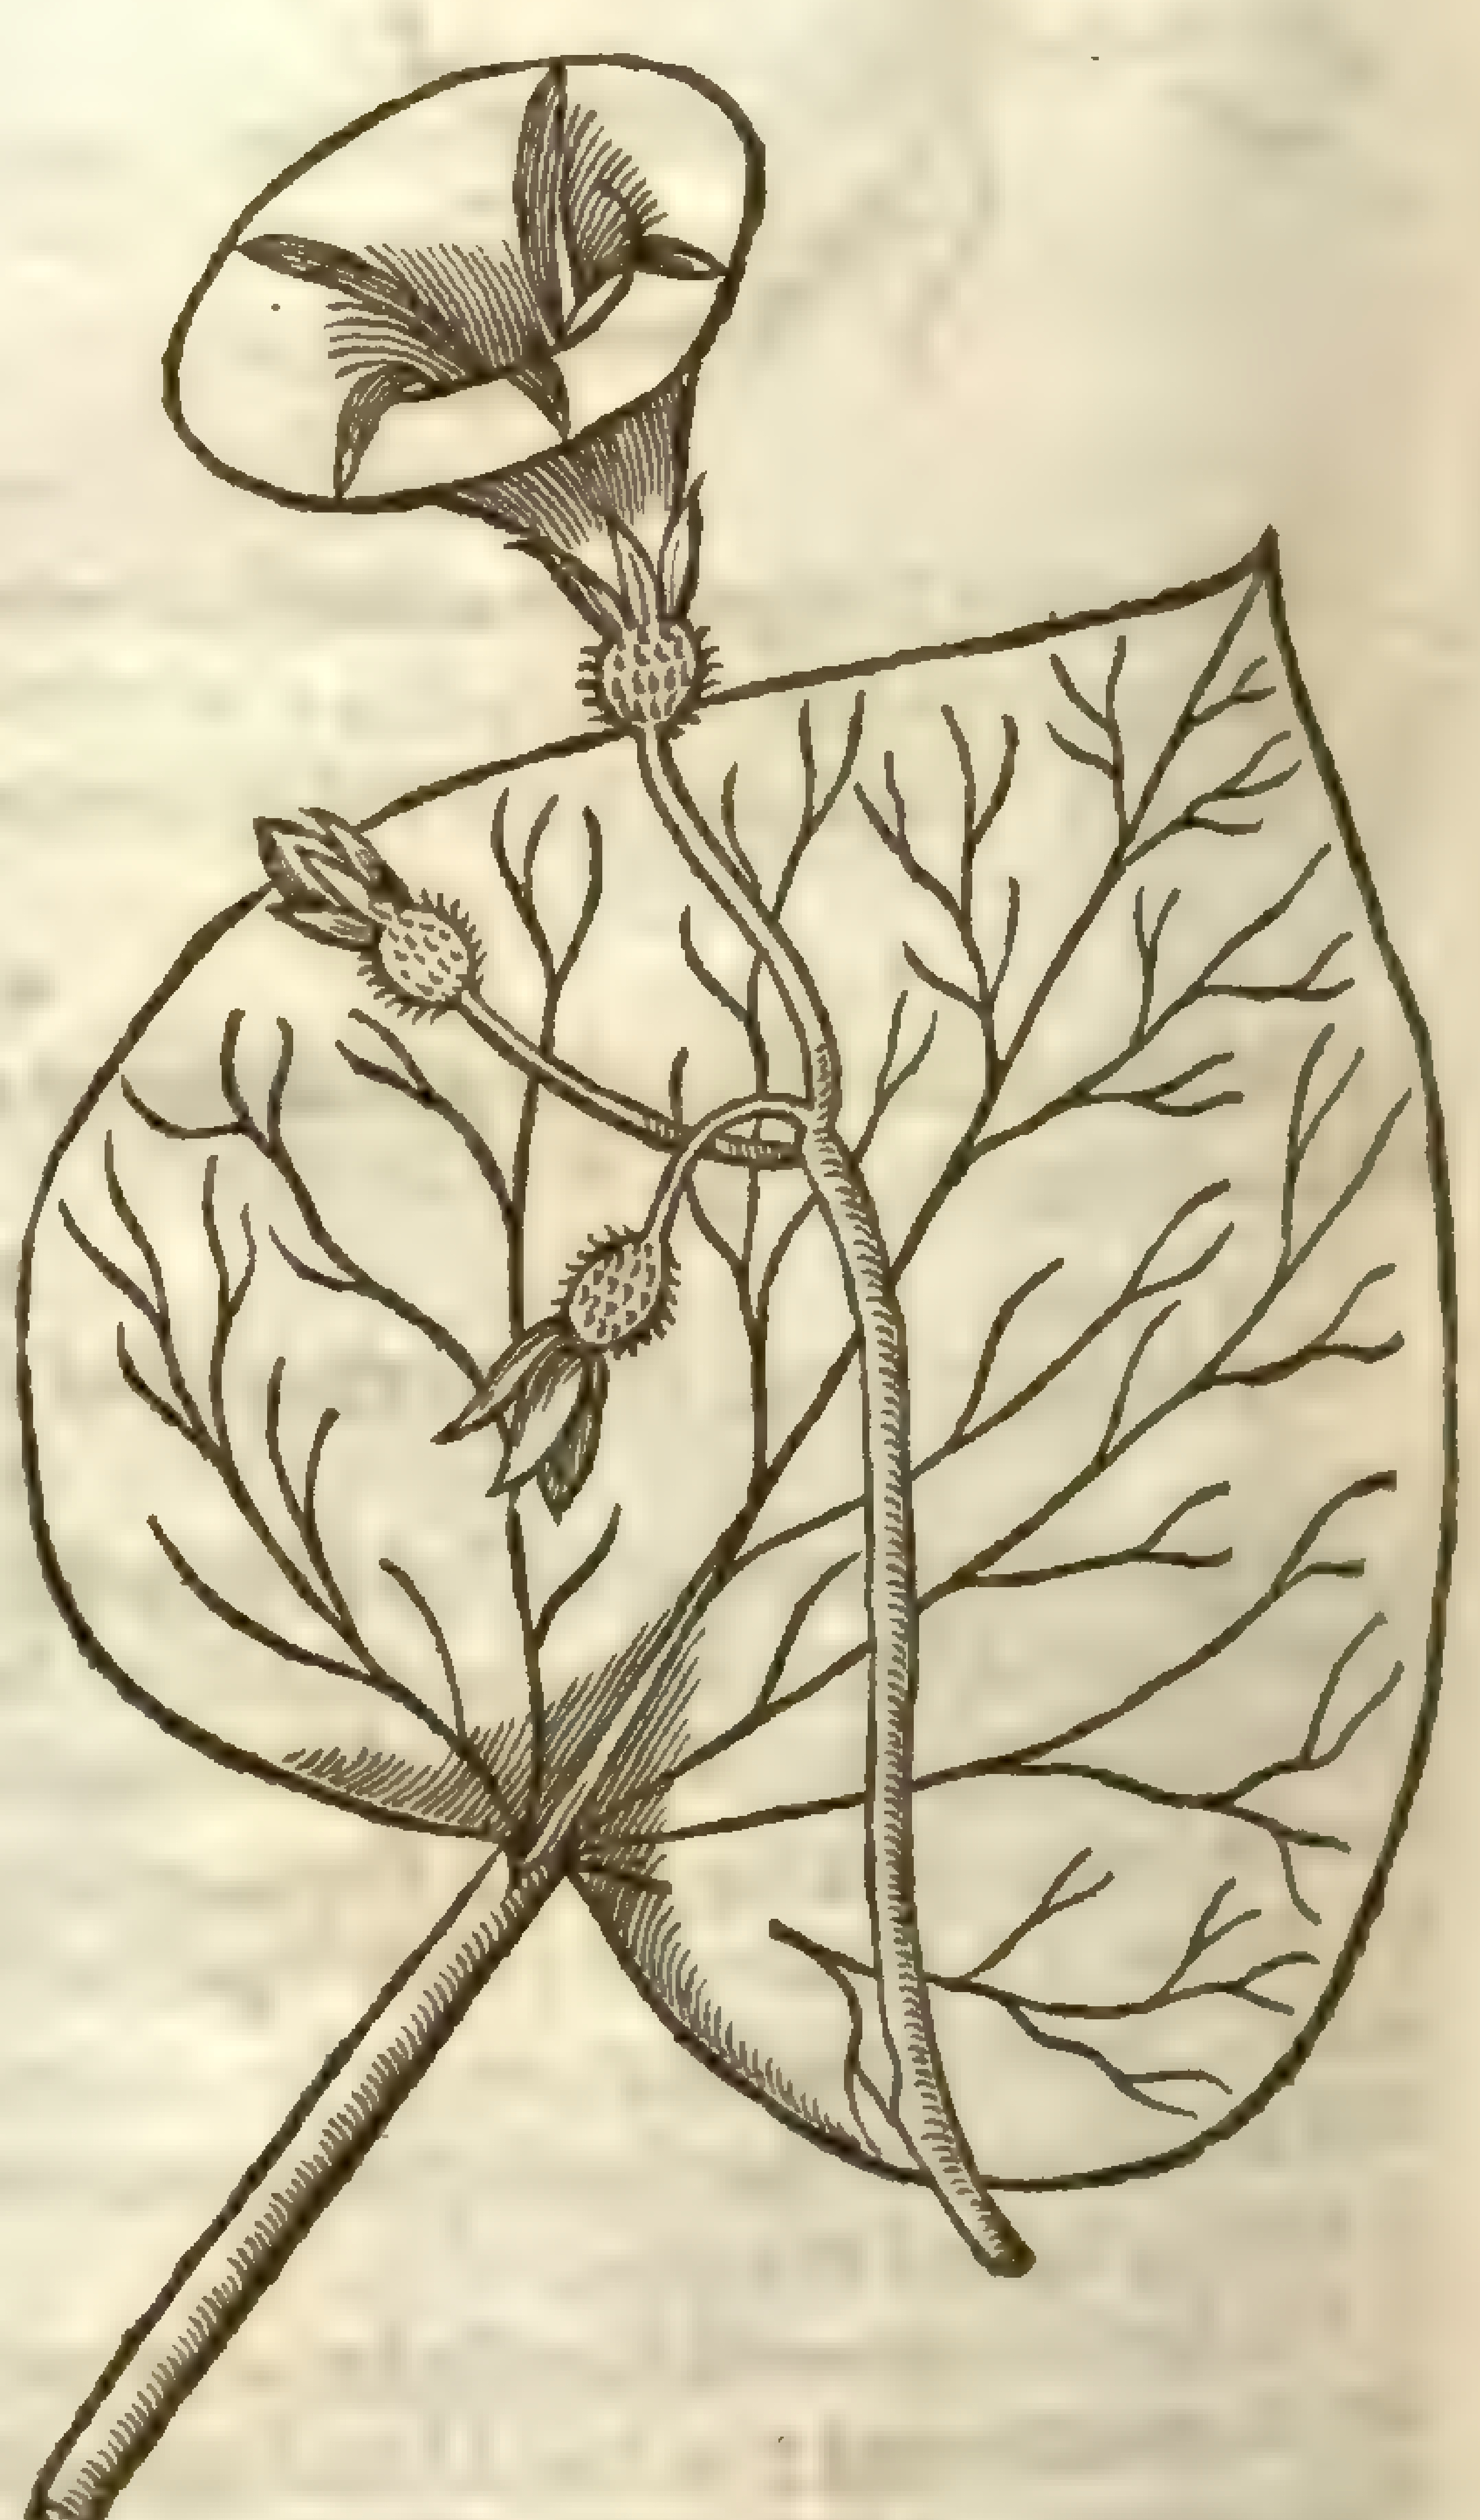
1 *Convolvulus Cæruleus.*
Blew Binde-weed.



Convolvulus nil, L.
Mill. dict.

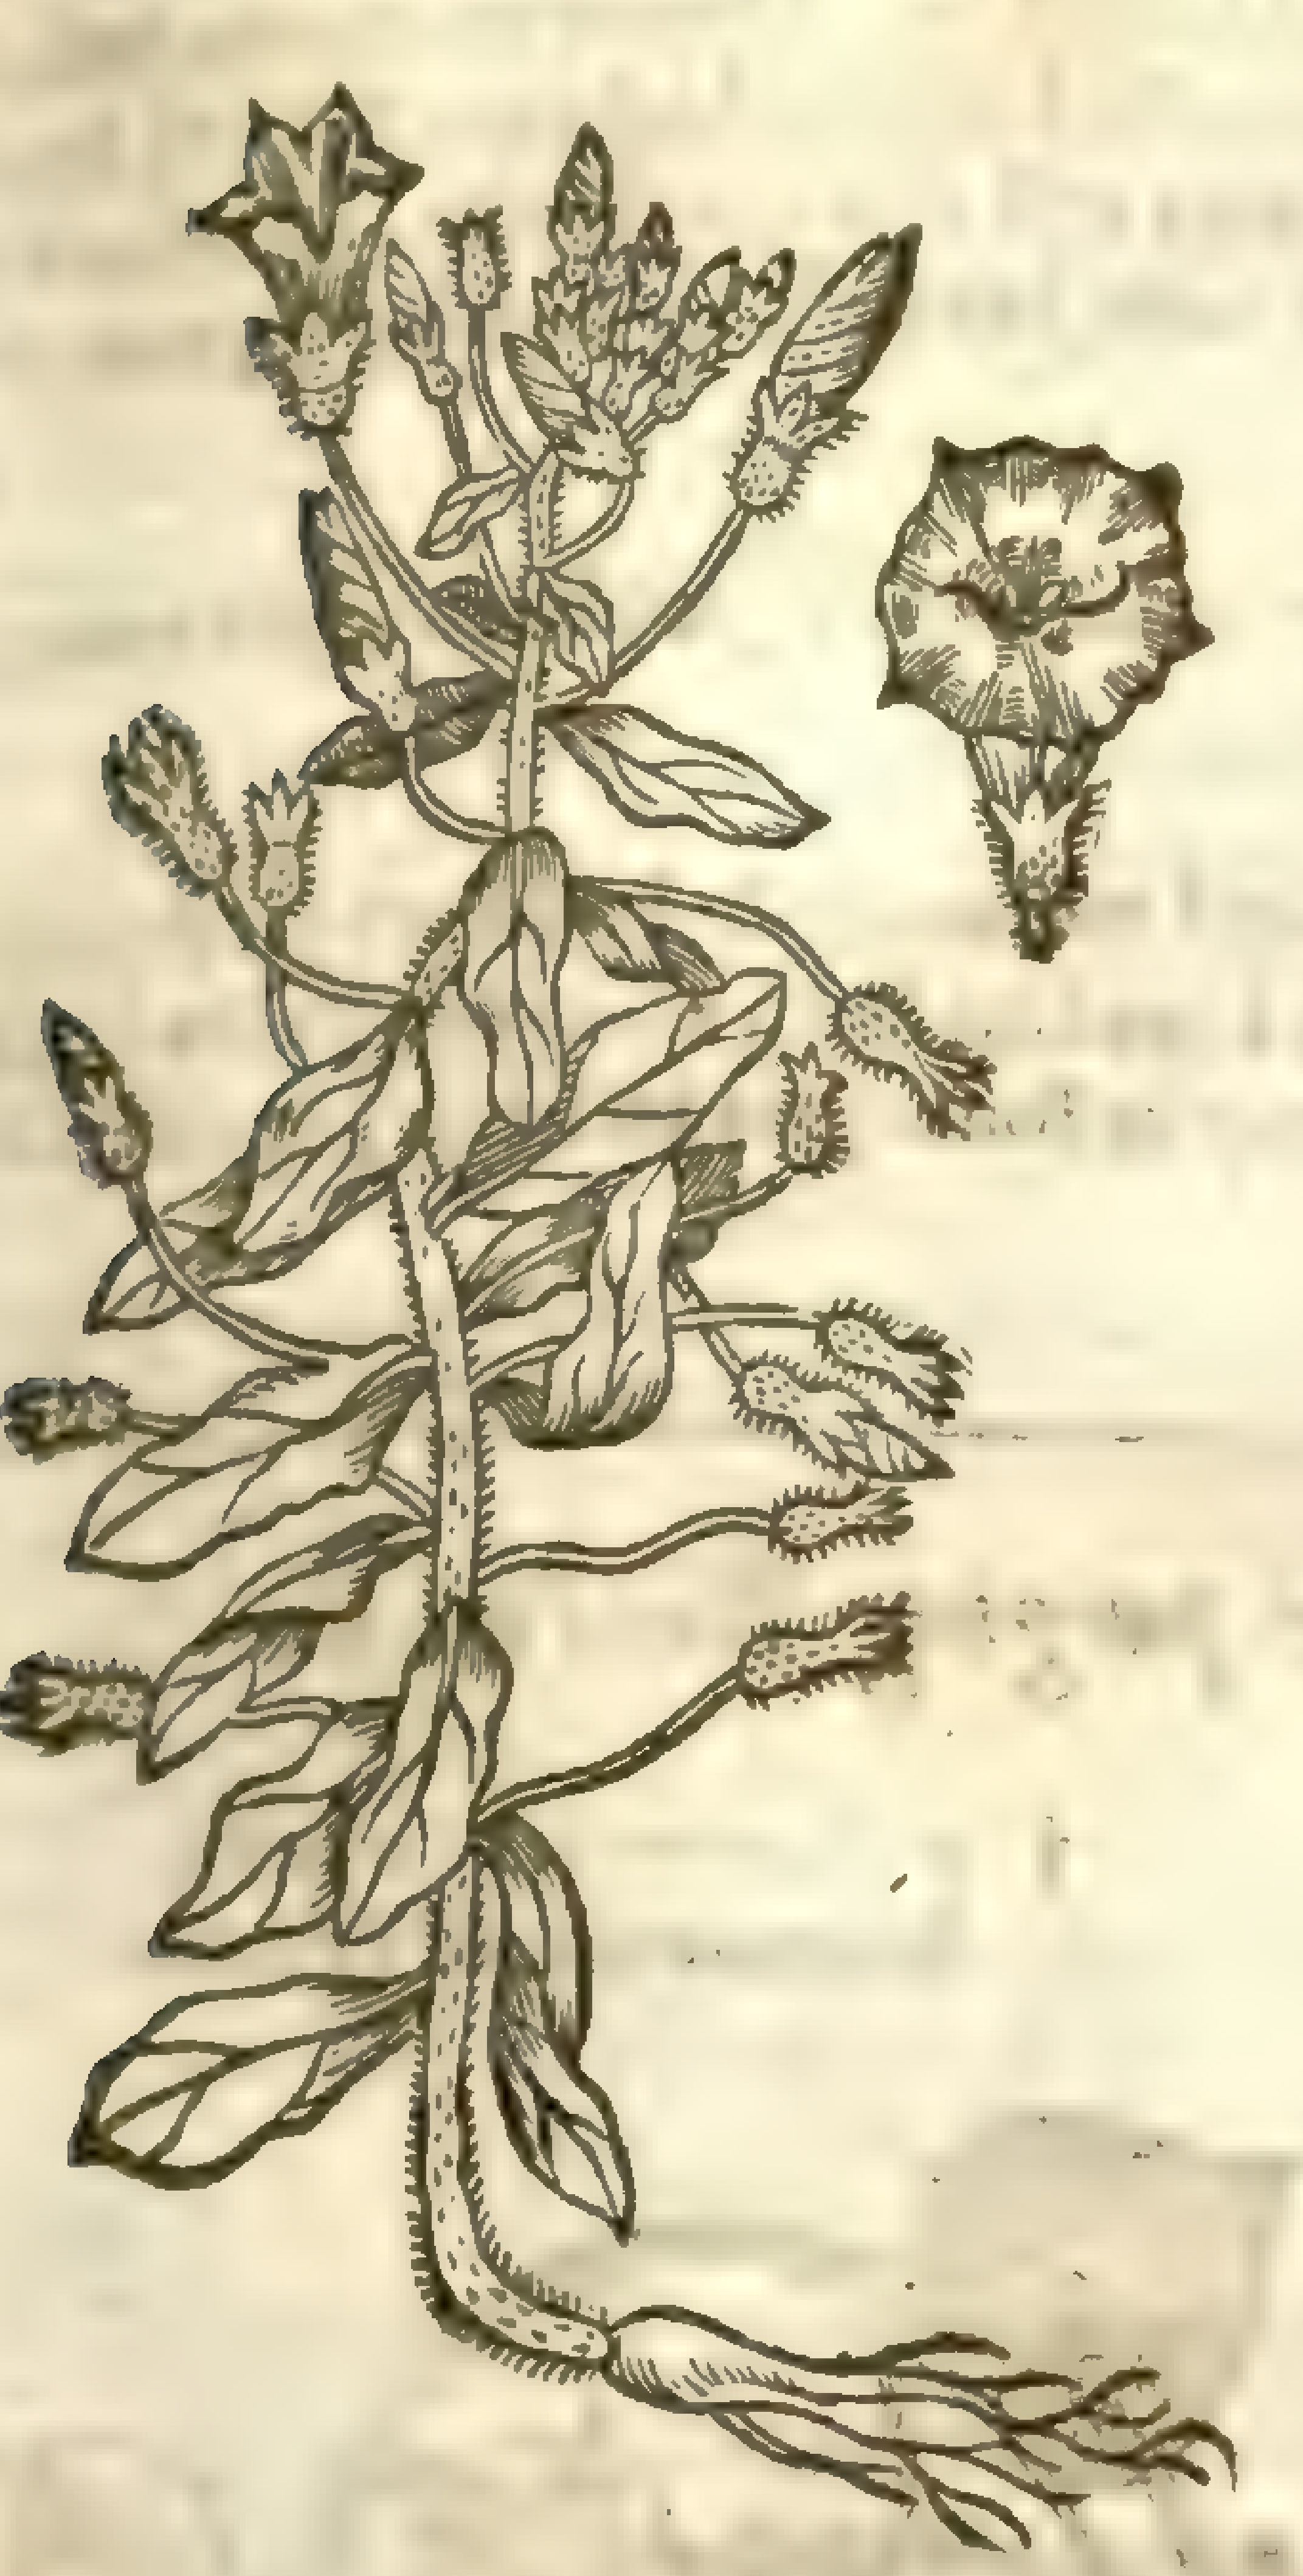
‡ 2 *Convolvulus cæruleus folio rotundo.*
Round leaued blew Bindweed.

C. purpureus, L.
Mill. dict.



‡ 2 There are alſo kept in our Gardens two other blew floured Bindweeds. The one a large and great plant, the other a leſſer. The great ſends vp many large and long winding branches, like thoſe of the laſt deſcribed, and a little hairie: the leaues are large and roundiſh, ending in a ſharpe point: the floures are as large as thoſe of the great Bindweed, and in ſhape like them, but blew of colour, with fiue broad purpliſh veines equally diſtant each from other: and theſe floures commonly grow three neere together vpon three ſeuerall ſtalkes ſome inch long, faſtened to another ſtalke

‡ 3 *Convolvulus cæruleus minor folio oblongo.*
Small blew Bind-weed.



ſtalke ſome handfull long: the cup which holds the floures, and afterwards becomes the ſeed veſſell, is rough and hairie: the ſeed is blacke, and of the bigneſſe of a Tare: the root is ſtringie, and laſts no longer than to the perfecting of the ſeed. I haue onely giuen the figure of the leafe and floure largely expreſt, becauſe for the root and manner of growing it reſembles the laſt deſcribed.

3 This ſmall blew Bind-weed ſendeth forth diuers long ſlender creeping hairie branches, lying flat vpon the ground vnleſſe there be ſomething for it to reſt vpon: the leaues be longiſh and hairy, and out of their boſomes (almoſt from the bottome to the tops of the ſtalkes) come ſmall foot-ſtalkes carrying beautifull floures of the bigneſſe and ſhape of the common ſmal Bindweed, but commonly of three colours; that is, white in the very bottome, yellow in the middle, and a perfect azure at the top; and theſe twine themſelues vp, open and ſhut in fiue plaits like as moſt other floures of this kinde doe. The ſeed is contained in round knaps or heads, and is blacke and cornered: the root is ſmall, and periſhes euery yeare. *Bauhine* was the firſt that ſet this forth, and that by the name of *Convolvulus peregrinus cæruleus folio oblongo.* ‡

¶ *The Place.*

The ſeed of this rare plant was firſt brought from Syria and other remote places of the world, and is a ſtranger in theſe Northerne parts; yet haue I brought vp and nouriſhed it in my Garden vnto flouring, but the whole plant periſhed before it could perfect his ſeed.

¶ *The Time.*

The ſeed muſt be ſowne as Melons and Cucumbers are, and at the ſame time: it floured with me at the end of Auguſt.

¶ *The Names.*

It is called *Campana Lazura*, and *Lazura*: of the later Herbariſts *Campana Cærulea*, and alſo *Convolvulum Cæruleum*: it is thought to be the *Liguſtrum nigrum*; of which *Columella* in his tenth booke hath made mention:

Fer calathis violam, & nigro permiſta liguſtro
Balſama cum Caßia nectens, &c.

In Baskets bring thou Violets, and blew Bindweed withall,
But mixed with pleaſant Baulme, and Caſſia medicinall.

For if the greater ſmooth Withwinde, or Bindweed be *Liguſtrum*, then may this be not vnproperly called *Liguſtrum nigrum*: for a blew purple colour is oftentimes called blacke, as hath beene ſaid in the blacke Violet. But there be ſome that would haue this Bindweed to be *Granum nil Auicennæ*, of which he writes in the 306. chapter; the which differeth from that *Nil* that is deſcribed in the 512. chapter. For this is *Iſatis Græcorum*, or the Grecian Woad: but that is a ſtrange plant, and is brought from India, as both *Avicen* and *Serapio* do teſtifie: *Avicen* in this manner: what is *Granum Nil?* It is *Cartamum Indum*: and *Serapio* thus; *Habal Nil*, is *Granum Indicum*, in *cap.* 283. where the ſame is deſcribed in theſe words: [The plant hereof is like to the plant of *Leblab*, that is to ſay of *Convolvulus*, or Bindweed, taking hold of trees with his tender ſtalke: it hath both green branches and leaues, and there commeth out by euery leafe a purple floure, in faſhion of the Bell-floures: and when the floure doth fall away, it yeeldeth a ſeed in ſmall cods (I read little heads) in which are three graines, leſſer than the ſeeds of Staueſaker] to which deſcription this blew Bindeweed is anſwerable.

There be alſo other ſorts of Bindweeds, which be referred to *Nil Auicennæ*; which no doubt may be kindes of *Nil*; for nothing gaine-ſaith it why they ſhould not be ſo. Therefore to conclude, this beautifull Bind-weed, which we call *Convolvulus Cæruleus*, is called of the Arabians *Nil*: of *Serapio*, *Hab ab Nil*: about Alepo and Tripolis in Syria the inhabitants call it *Haſmiſen*: the Italians, *Campana laZurea*: of the beautifull azured floures, and alſo *Fior de notte*, becauſe his beauty appeares moſt in the night.

¶ *The Temperature.*

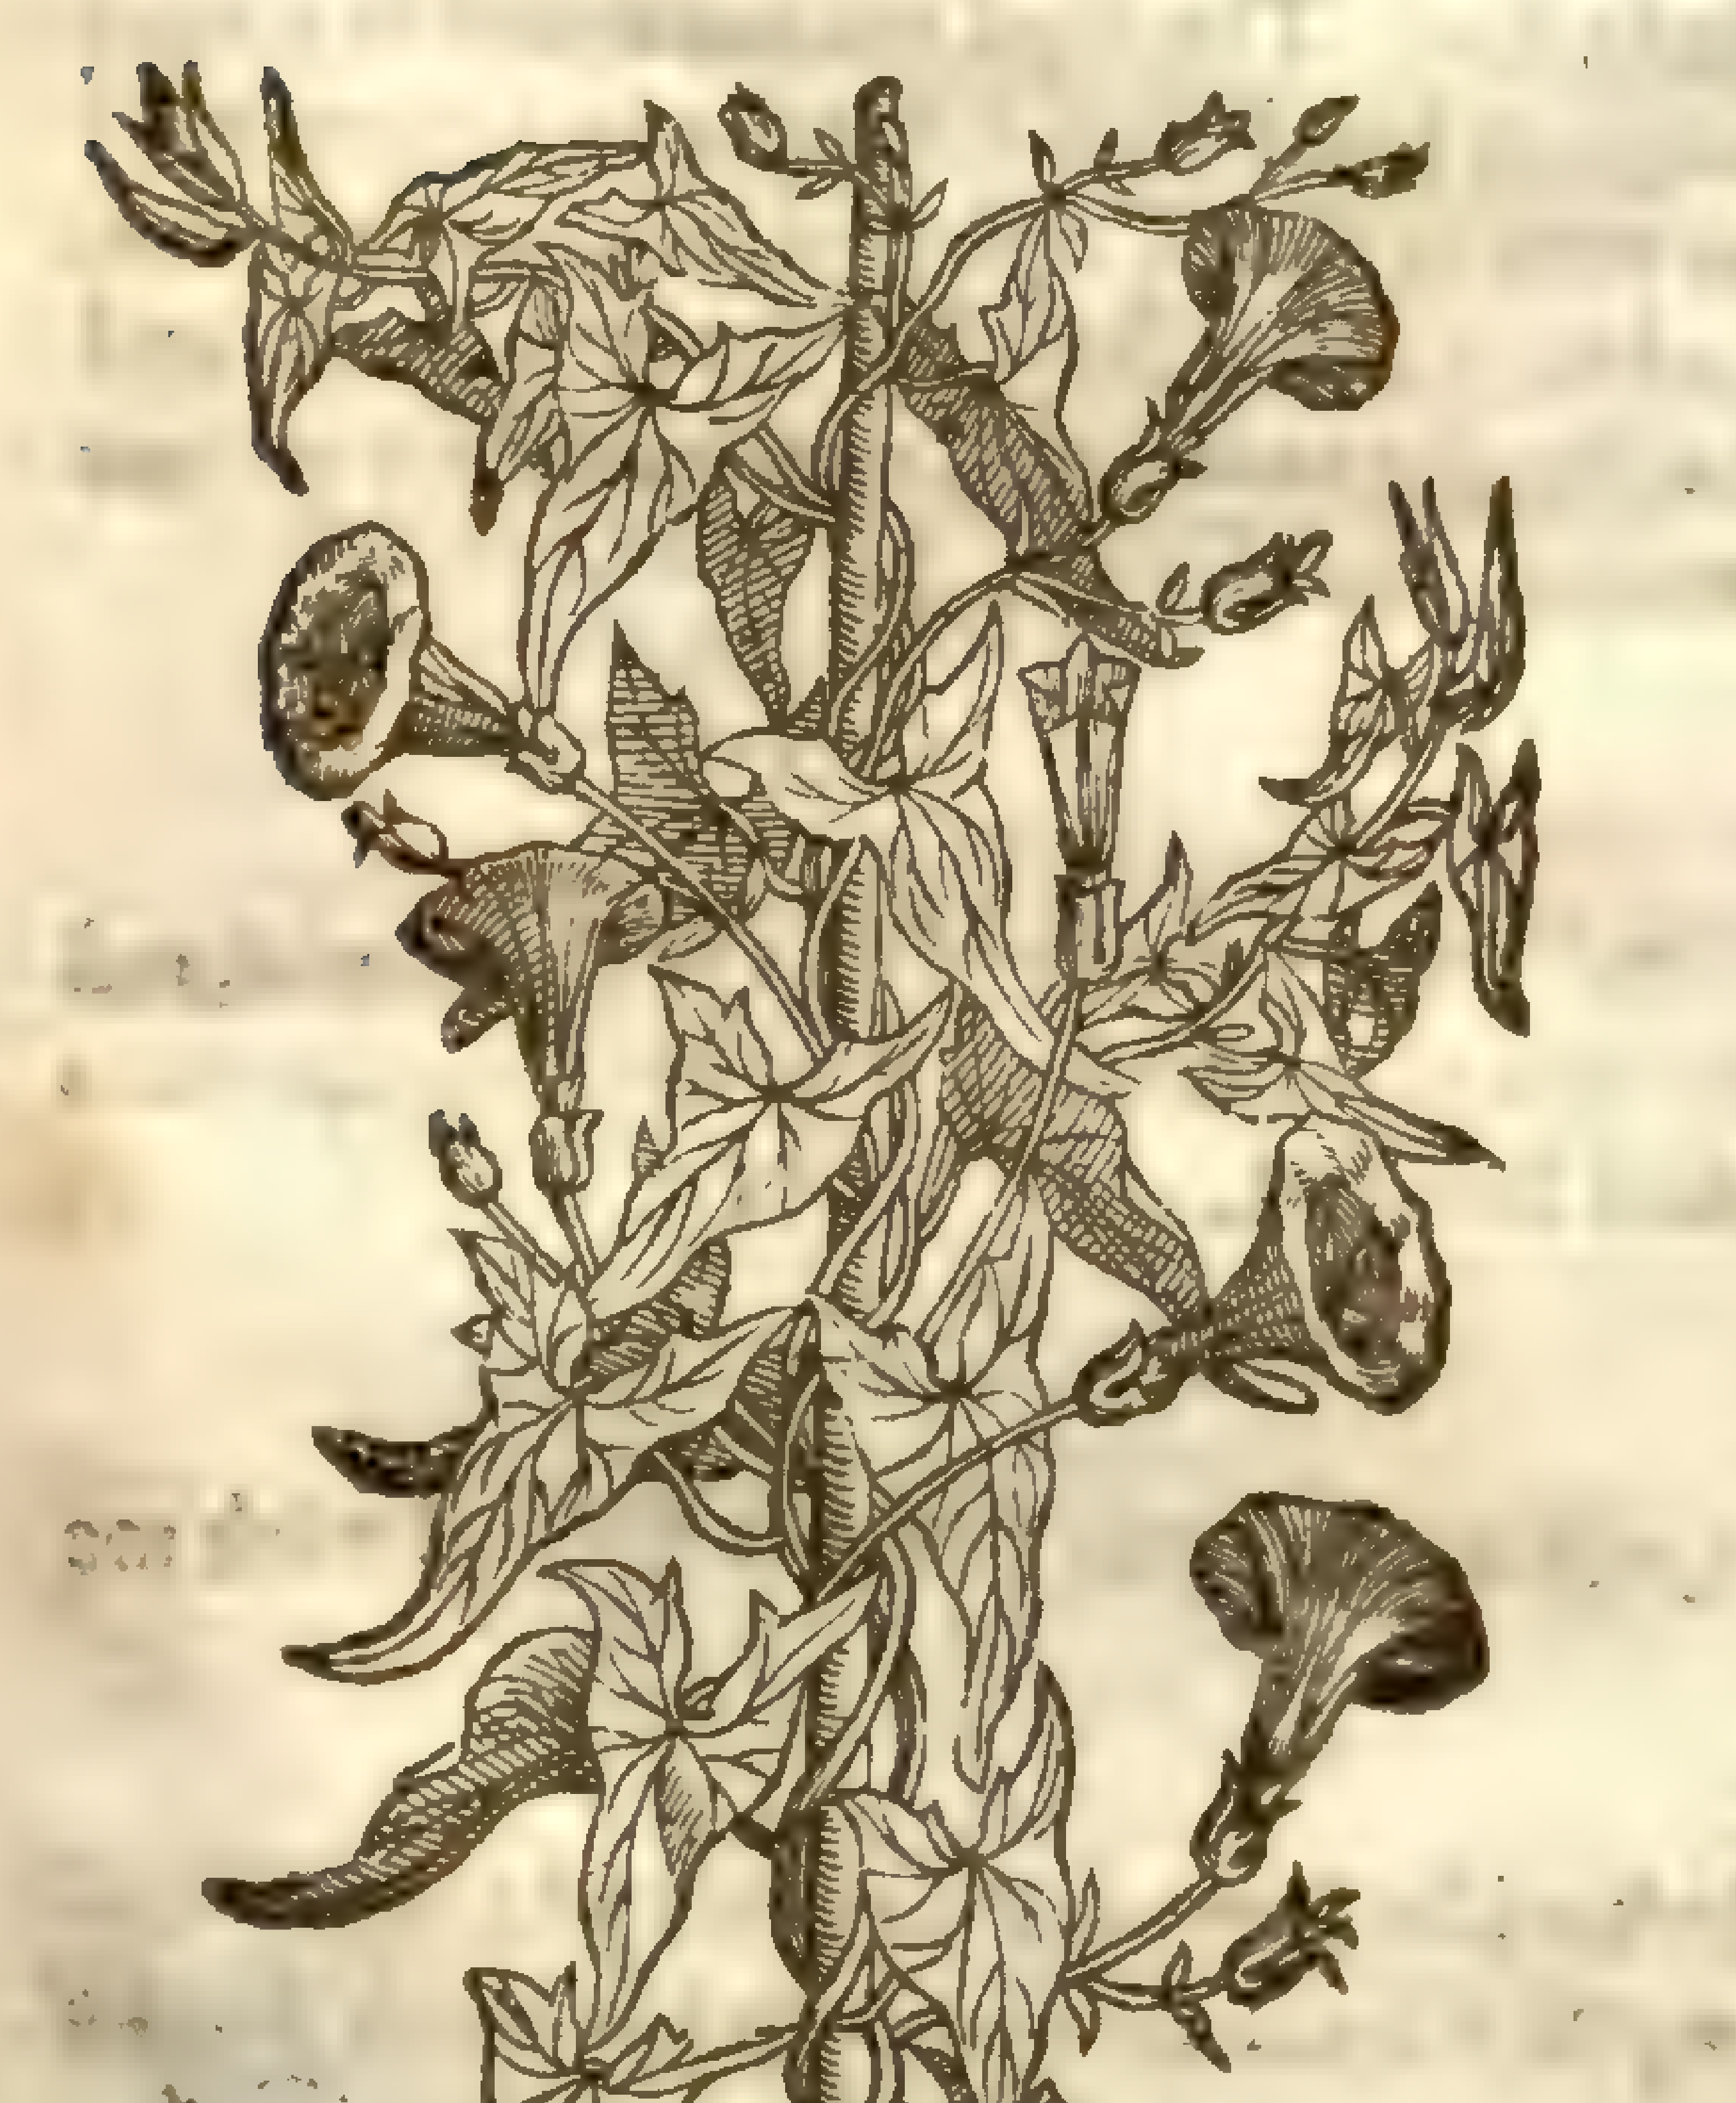
Convolvulus Cæruleus, or *Nil*, as *Auicen* ſaith, is hot and dry in the firſt degree: but *Serapio* maketh it to be hot and dry in the third degree.

¶ *The Vertues.*

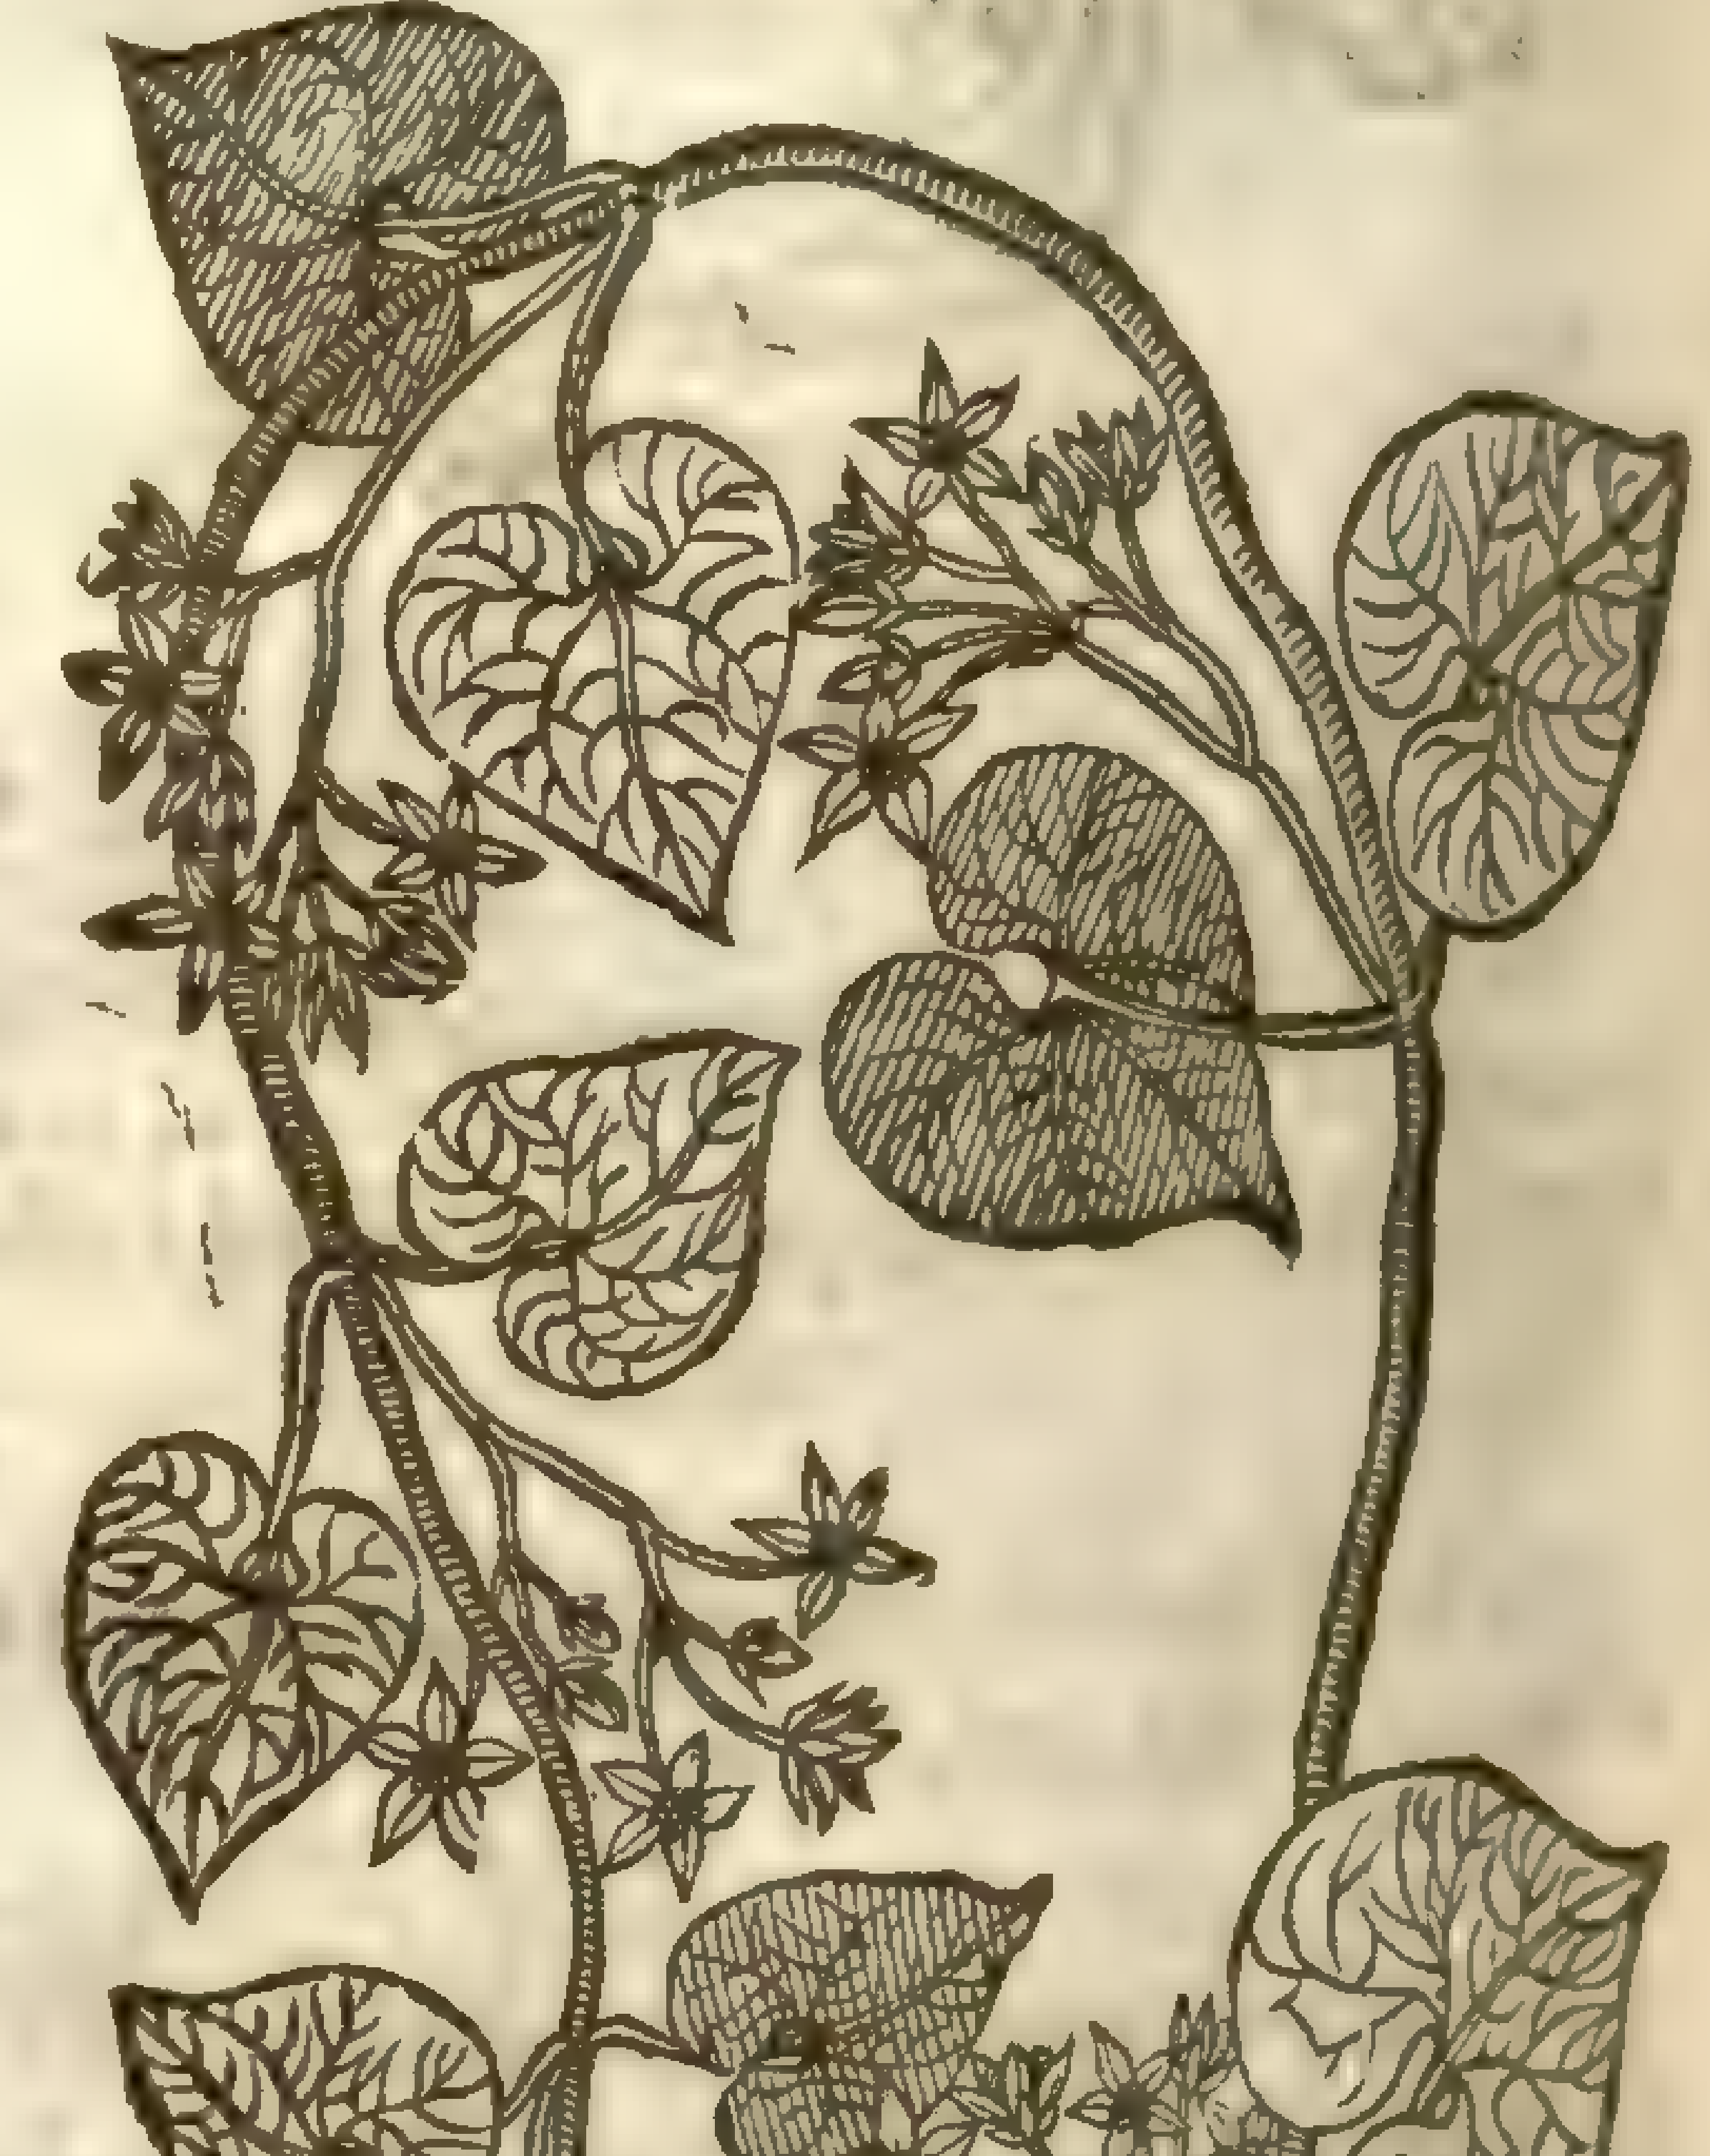
A It purgeth and voideth forth raw, thicke, flegmaticke, and melancholy humours: it driues out all kinde of wormes, but it troubleth the belly, and cauſeth a readineſſe to vomit, as *Avicen* ſaith: it worketh ſlowly, as *Serapio* writeth; in whom more hereof may be found, but to little purpoſe, wherefore we thinke good to paſſe it ouer.

CHAP. 319. *Of Scammonie, or purging Bindweed.*

1 *Scammonium Syriacum.*
Syrian Scammonie.



† 2 *Scammonea Valentina.*
Scammonie of Valentia.



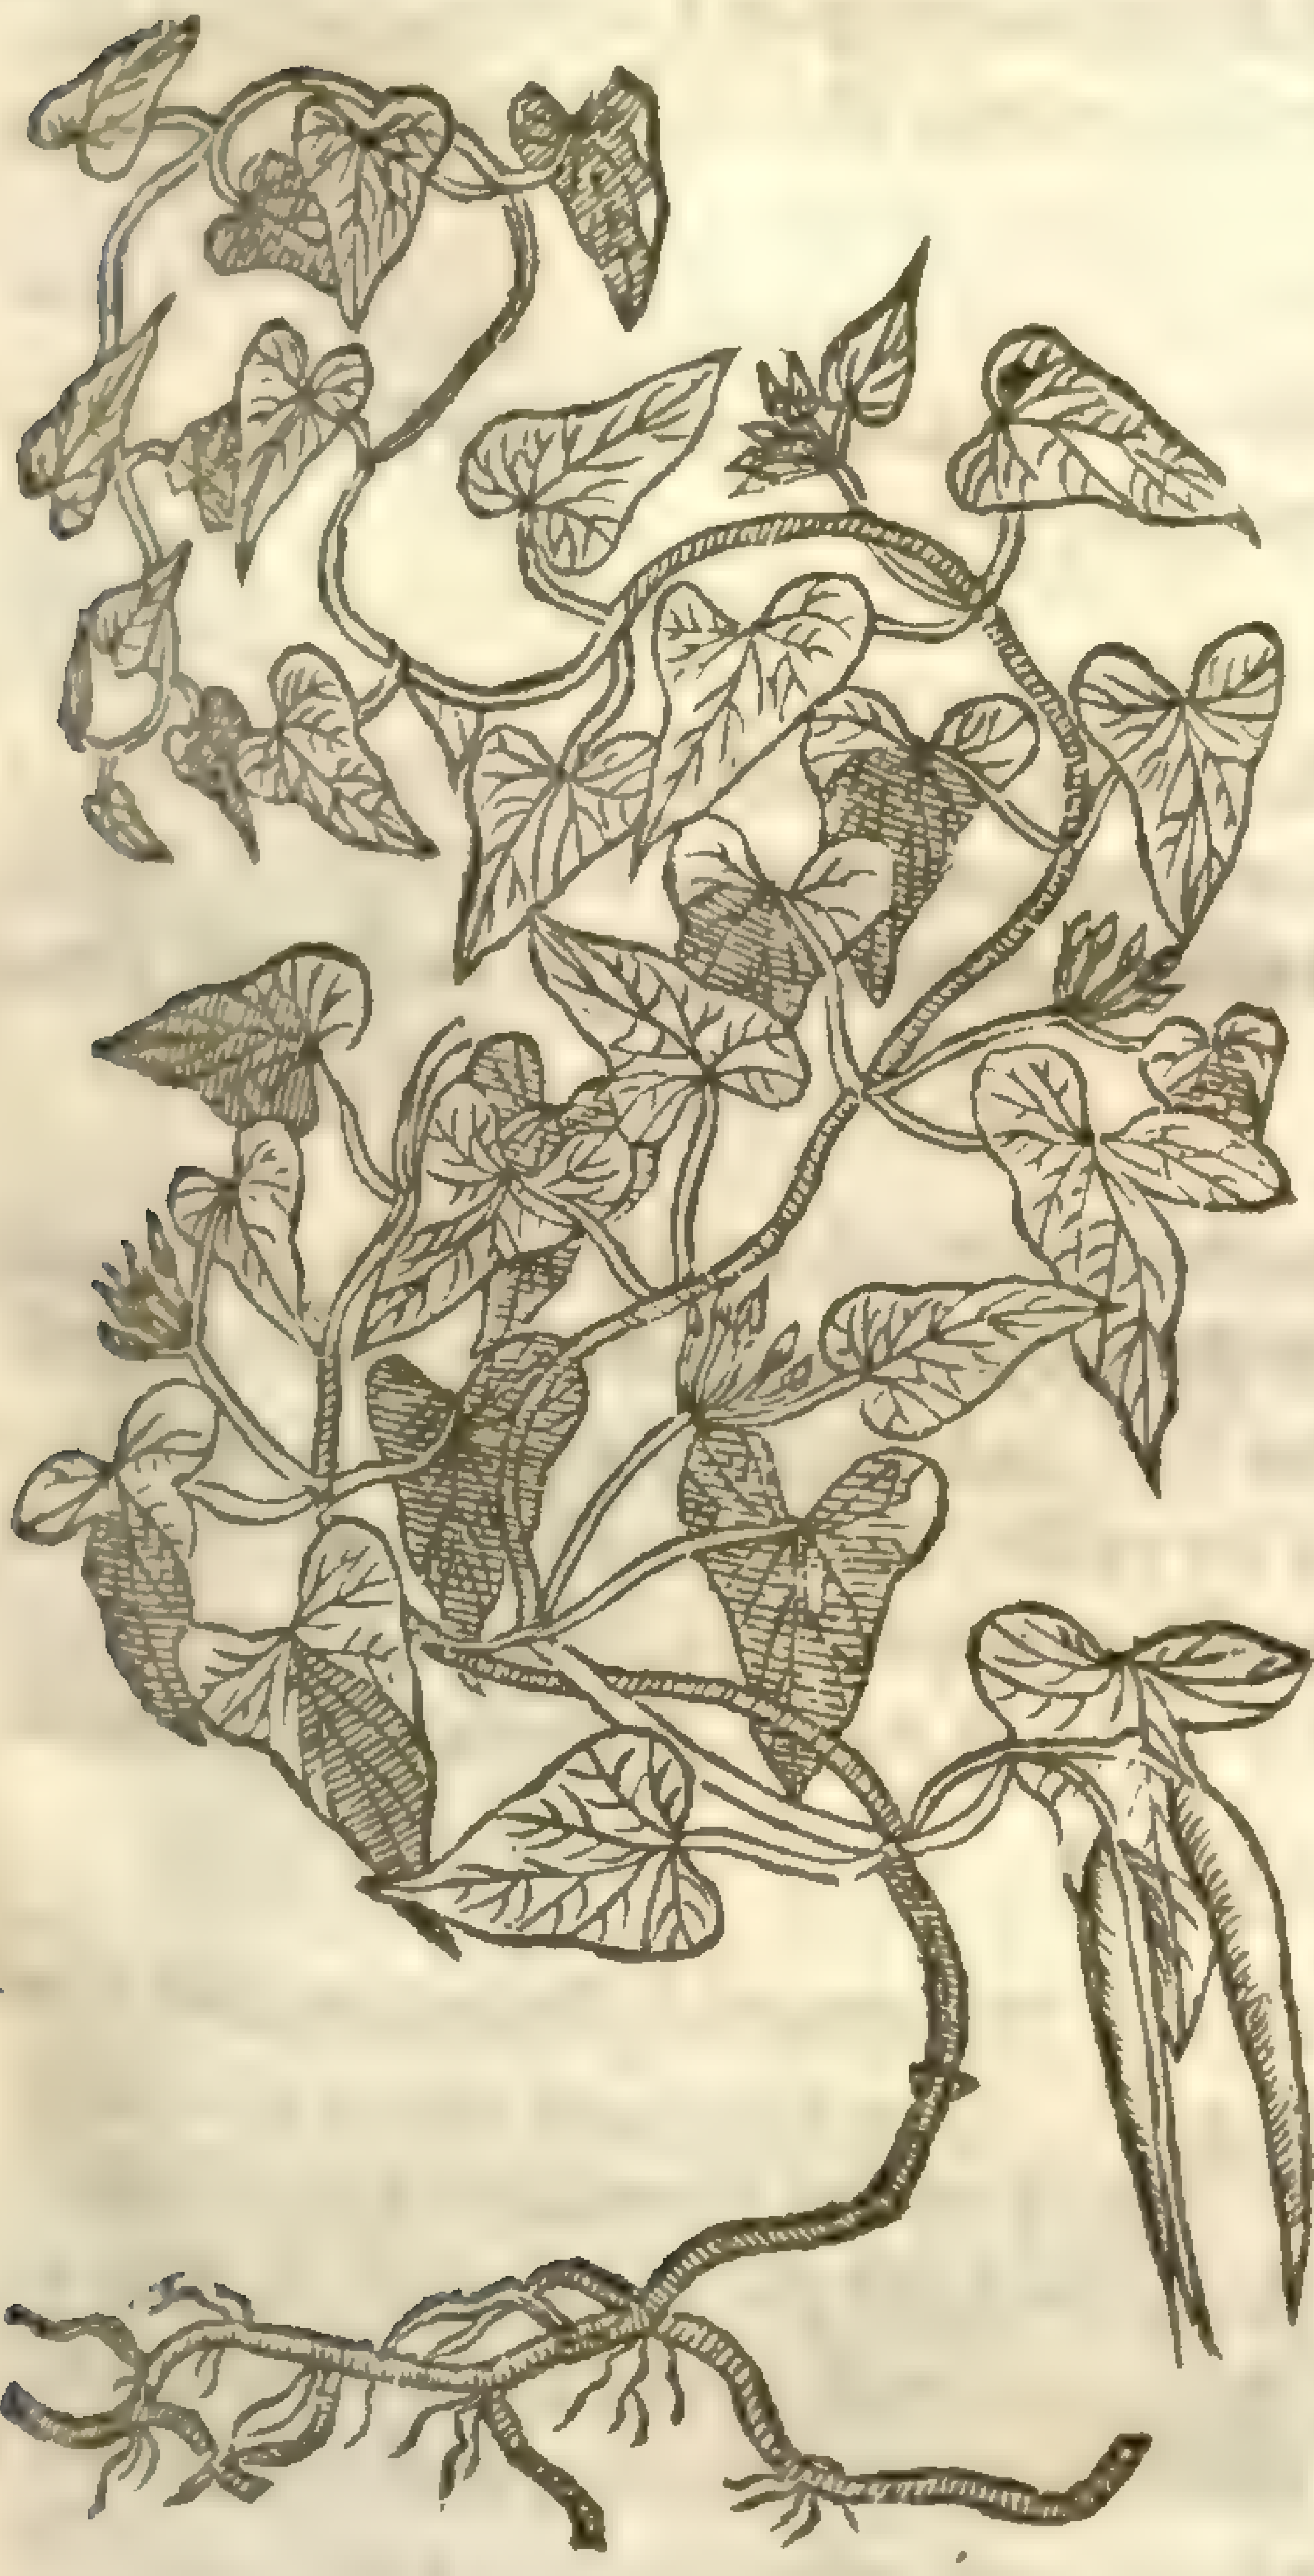
Convolvulus Scammonia, L.
mill: dict.

¶ *The Deſcription.*

1 Scammonie of Syria hath many ſtalkes riſing from one root, which are long, ſlender, and like the claſping tendrels of the vine, by which it climeth and taketh hold of ſuch things as are next vnto it. The leaues be broad, ſharpe pointed like thoſe of the ſmooth or hedge Bind-weed: among which come forth very faire white floures tending to a bluſh colour, bell-faſhion. The root is long, thicke, and white within: out of which is gathered a juyce that being

hardned, is greatly vſed in Phyſicke: for which conſideration, there is not any plant growing vpon the earth, the knowledge whereof more concerneth a Phyſition, both for his ſhape and properties, than this Scammonie, which *Pena* calleth *Lactaria ſcanſoriaque volvula*, that is, milky and climbing Windweed, whereof it is a kinde; although for diſtinction ſake I haue placed them as two ſeuerall kinds. And although this herbe be ſuſpected, and halfe condemned of ſome learned men, yet there is not any other herbe to be found, whereof ſo ſmall a quantity will do ſo much good: neither could thoſe which haue carped at it, and reproued this herbe, finde any ſimple in reſpect of his vertues to be put in his roome: and hereof enſueth great blame to all practitioners, who haue not endeuoured to be better acquainted with this herbe, chiefely to auoid the deceit of the crafty Drug-ſeller and Medicine-maker of this confected Scammony, brought vs from farre places, rather to be called I feare infected Scammony, or poyſoned Scammony, than confected. But to auoid the inconueniences hereof, by reaſon of the counterfeiting and ill mixing thereof: I haue therefore thought good to ſet downe what I haue taken out of the diligent, and no leſſe learned obſeruations of *Pena*, concerning this plant, *Anno* 1561. or 1562. *Vid. aduerſ pag.* 272.

‡ 3 *Scammonium Monſpelienſe.*
French Scammonie.



Sequinus Martinellus an Apothecary of Venice, being a moſt diligent ſearcher of Simples, that he might haue the right Scammony of Antioch, trauelled into Syria, where from the citie of Aleppo he ſent an 100. weight of the juyce of Scammony of Antioch, prepared and hardned into a lumpe, at the making whereof he was preſent himſelfe. This man ſent alſo of the ſeeds thereof, which in all points anſwered the cornered ſeed of *Volubilis*; which being ſowne in the beginning of the Spring at Padua and Venice, grew vp to the form of a braue & goodly *Convolvulus*, in leaues, floures, and ſhew ſo like vnto our *Ciſſampelos*, that a man would haue taken it for the ſame without controuerſie, ſauing that the root was great, and in bigneſſe equall to the great Brionie, as alſo in tenderneſſe. The outward bark of the root was of a dusky colour, and white within: the inner pith beeing taken forth ſeemeth in all mens iudgements to be the ſame and the beſt allowed *Turbith officinarum*: and yet it differeth from Turbith, in that, that it is more brittle, and will more eaſily bee broken, though the pith in Scammony be no leſſe gummie and full of milkie juyce, than Turbith. Further *Pena* reporteth, that afterward he ſent of this ſeed vnto Antwerpe, where it grew very brauely, the climing ſtrings and branches growing vp to the height of fiue or ſix cubits, not differing from that which was ſowne in Italy. Alſo *William Dries* of Antwerpe, a moſt excellent Apothecary, did cut of the branches of his Antwerpian Scammonie from the root, and dried them, planted the ſeeds in his Garden, and conferred the ſuperfluous branched roots with the Turbith of Alexandria, and could not find them to differ or diſagree the one from the other in any point. But he that will know more concerning the making, difference, choiſe and vſe of Scammony, let him read *Pena* in his chapter of Scammonie, in the place formerly cited, where he ſhall finde many excellent ſecrets worthy the noting of thoſe which would know how to vſe ſuch rare and excellent medicines.

2 Scammony of Valentia (whereof I haue plenty in my Garden) is alſo a kinde of Bindweed, growing naturally by the ſea ſide vpon the grauelly ſhore, by the mouth of the riuer Rhodanus, at the waters called *Aquas Marianas*, where the Apothecaries of Montpellier gather of it great plentie, who haue attempted to harden the milkie juyce thereof, to vſe it in ſtead of Scammony of Antioch. This plant bringeth forth many ſlender branches, which will climbe and very well run vpon a pole; as being ſupported therewith, and mounteth to the height of fiue or ſix cubits, climbing and ramping like the firſt kinde of Scammony. The leaues are greene, ſmooth, plaine, and ſharpe

pointed, which being broken do yeeld abundance of milke : the floures are white, ſmall, and ſtarre-faſhion : the roots white and many, ſhooting forth ſundry other roots, whereby it mightily increaſeth.

† 3 This ſtrange kinde of Scammony, which *Cluſius* maketh rightly to be *Periploca ſpecies*, hath very many long branches ramping and taking hold of ſuch things as do grow neer vnto them, of a darkiſh aſh colour : whereupon do grow leaues ſharp pointed, crooked at the ſetting on of the ſtalke like thoſe of the blacke Bryony, and likewiſe of an aſhe colour, ſet together by couples: from the boſome whereof thruſt forth ſmall tender foot-ſtalkes, whereon are placed ſmall white floures ſtar-faſhion : the ſeeds are contained in long cods, and are wrapped in downe, like as thoſe of Swallow-wort. The root is very long, ſlender, and creeping, like that of the ſmall Bindweed, ſo that if it once take in any ground, it can hardly be deſtroied.

¶ *The Place.*

It doth grow in hot regions, in a fat ſoile, as in Miſia, Syria, and other like countries of *Aſia*; it is likewiſe found in the Iſland of Candia, as *Bellon.* witneſſeth; from whence I had ſome ſeeds, of which ſeed I receiued two plants that proſpered exceeding well ; the one whereof I beſtowed vpon a learned Apothecary of Colcheſter, which continueth to this day, bearing both floures and ripe ſeed. But an ignorant weeder of my garden plucked mine vp, and caſt it away in my abſence, in ſtead of a weed : by which miſchance I am not able to write hereof ſo abſolutely as I determined : it likewiſe groweth neere vnto the ſea ſide about Tripolis in Syria, where the inhabitants doe call it *Meudheudi.*

¶ *The Time.*

It floured in my Garden about S. *Iames* tide, as I remember, for when I went to Briſtow Faire I left it in floure ; but at my returne it was deſtroied as aforeſaid.

¶ *The Names.*

The Greekes call it, σκαμμωνία: the Latines, *Scammonium*, ſo naming not onely the plant it ſelfe, but alſo the hard and condenſed juyce : of the Apothecaries, *Scammonea*; and when it is prepared, *Diagridium* : as though they ſhould ſay, δακρύδιον: which ſignifieth a little teare : both the herbe and juyce are named *Scamony* : of *Rhaſis*, *Corziziola.*

¶ *The Temperature.*

The juyce doth mightily purge by the ſtoole, and is the ſtrongeſt purge whatſoeuer ; for as *Oribaſius* ſaith, it is in no part ouercome by thoſe things which ſtir and moue the body. It worketh the ſame not vehemently by any hot quality, but by ſome other hid and ſecret property of the whole ſubſtance : for there is no extremity of heat perceiued in it by taſte : for with what liquor or thing ſoeuer it is mixed, it giueth vnto it no bitterneſſe, biting, or other vnpleaſant taſte at all, and therefore it is not to be accounted among the extreme hot medicines, but amongſt thoſe that are moderately hot and dry.

¶ *The Vertues.*

A It cleanſeth and draweth forth eſpecially choler : alſo thinne and wateriſh humours, and oftentimes flegme, yet is it as *Paulus* teacheth, more hurtfull to the ſtomacke than any other medicine.

B *Meſues* thinketh that it is not onely troubleſome and hurtfull to the ſtomacke, but alſo that it ſhaueth the guts, gnawing and fretting the intrails; openeth the ends of the veines, and through the eſſence of his whole ſubſtance, it is an enemy to the heart, and to the reſt of the inward parts: if it be vſed immoderately and in time not conuenient, it cauſeth ſwounings, vomitings, and ouerturnings of the ſtomacke, ſcouring, the bloudy flux and vlcers in the lower gut, which bring a continuall deſire to the ſtoole.

C Theſe miſchiefes are preuented if the Scammonie be boiled in a Quince and mixed with the ſlime or mucilage of *Pſillium*, called Fleawoort, the pap or pulp of Prunes, or other things that haue a ſlimie juyce, with a little maſticke added, or ſome other eaſie binding thing.

D *Pliny* affirmeth that the hurt thereof is taken away if Aloes be tempered with it : [Scammonie (ſaith he) ouerthroweth the ſtomack, purgeth choler, looſeth the belly vnleſſe two drams of Aloes be put vnto one ſcruple of it] which alſo *Oribaſius* alloweth of in the firſt booke of his *Synopſes*, and the ſeuenth booke of his medicinall Collections.

E The old Phyſitions were alſo woont to boile Scammonie in a quince, and to giue the quince to be eaten, hauing caſt away the Scammony : and this quince ſo taken doth moue the belly without any hurt vnto the ſtomacke, as *Galen* in his firſt booke of the Faculties of Nouriſhments doth ſet downe, and likewiſe in his third booke of the Faculties of ſimple Medicines.

F The Apothecaries do vſe Scammonie prepared in a Quince, which as we haue ſaid they name *Diagridium*, and do mix it in diuers compoſitions.

They keepe vſually in their ſhops two compoſitions, or electuaries, the one of *Pſyllium* or Fleawoort, ſet downe by *Meſue*: the other of Prunes, fathered vpon *Nicolaus*, which were deuiſed for the tempering and correction of Scammony, and be commended for hot burning agues, and tertians, and for what diſeaſes ſoeuer that proceed of choler. G

Galen hath taken Maſticke and *Bdellium* out of the pilles called *Cochia*, which alſo containe in them a great quantitie of Scammony, as we may read in his firſt Booke of medicines according to the places affected, which alſo we meane to touch in the chapter of Coloquintida, where we intend to treate at large concerning maſtick, and other binding things, that are accuſtomed to bee mixed for the correction of ſtrong and violent purgers. H

The quantitie of Scammonie or of *Diagridium* it ſelfe, to be taken at one time, as *Meſue* writeth, is from fiue grains to ten or twelue: it may be kept as the ſame Author ſheweth, foure yeres: *Pliny* iudgeth it to be little worth after 2 yeares: it is to be vſed, ſaith he, when it is two yeres old, and it is not good before, nor after. The mixing or otherwiſe the vſe therof, more than is ſet down, I think it not expedient to ſet forth in the Phyſicall vertues of Scammony, vpon the receipt whereof many times death inſueth: my reaſons are diuers, for that the ſame is very daungerous, either if too great a quantitie thereof be taken, or if it be giuen without correction; or taken at the hands of ſome runnagat phyſick-monger, quack ſaluer, old women-leaches, and ſuch like abuſers of phiſick, and deceiuers of people. The vſe of Scammony I commit to the learned, vnto whom it eſpecially and onely belongeth, who can very carefully and curiouſly vſe the ſame. I

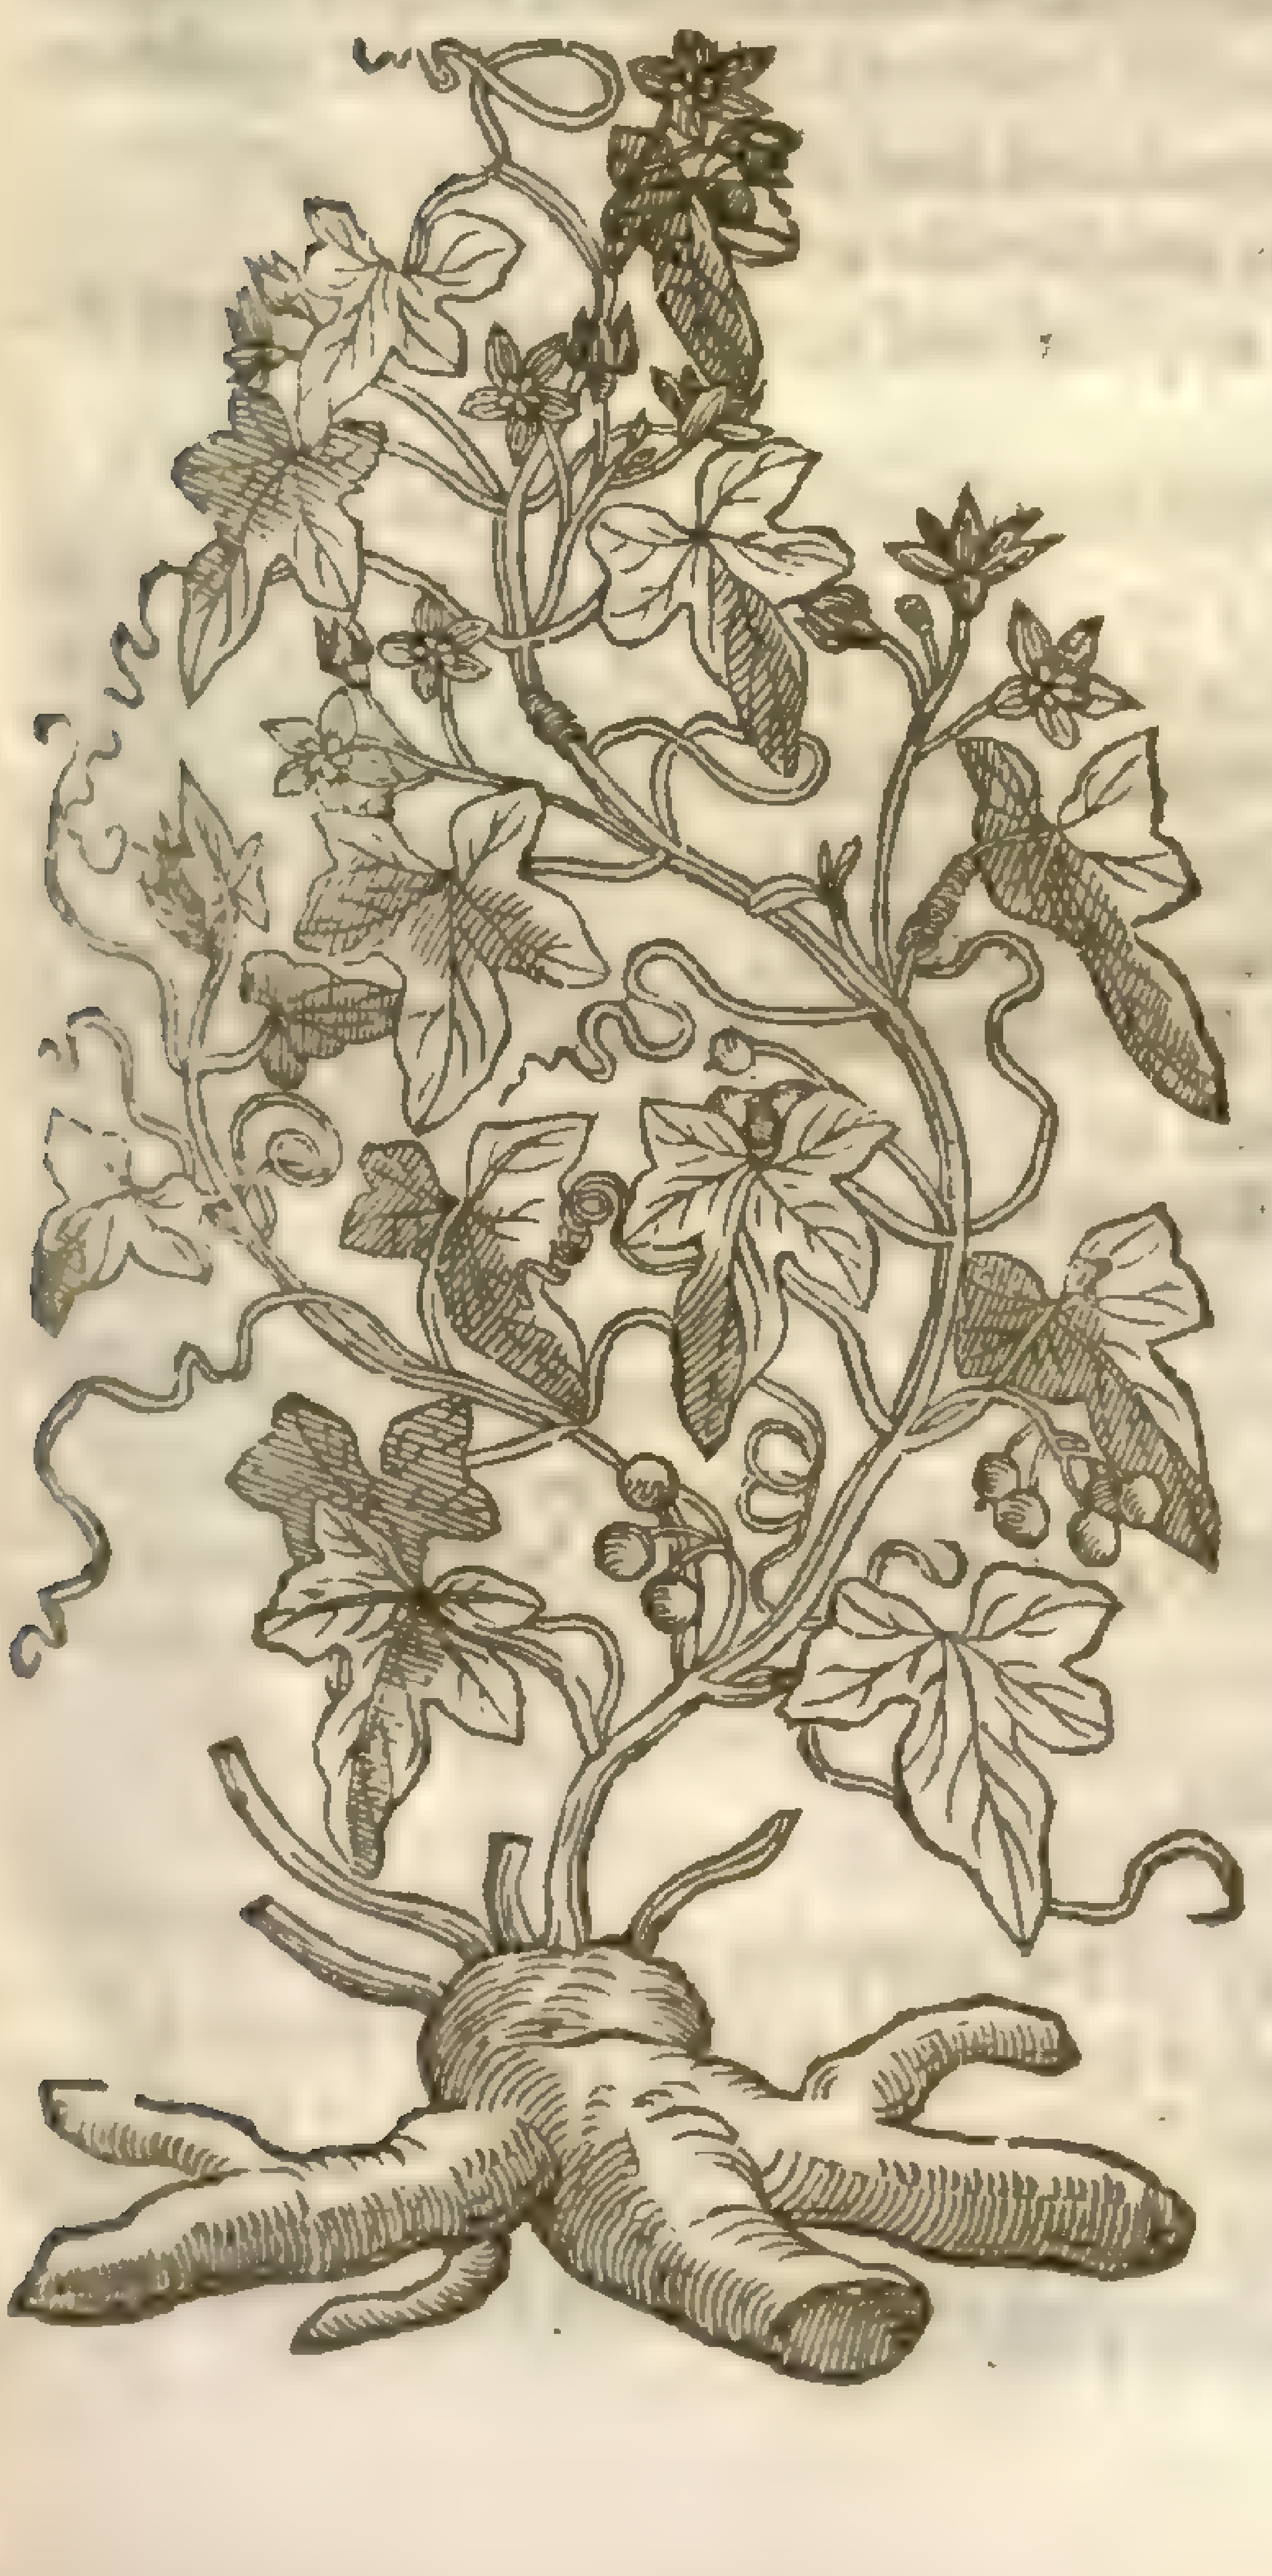
† The titles of the ſecond and third were formerly tranſpoſed, and both the figures belonged to the ſecond deſcription, which was of the *Scammonium Monſpelienſe* of the *Aduerſ.* being the ſame with the *Scammonia Valentina* of *Cluſius*.

Chap. 320. *Of Briony, or the white Vine.*

¶ *The Kindes.*

There be two kinds of Bryony, the one white, the other blacke: of the white Briony as followeth.

Bryonia alba.
White Bryonie.



¶ *The Deſcription.*

White Briony brings forth diuers long and ſlender ſtalkes with many claſping tendrels like the vine, wherwith it catcheth hold of thoſe things that are next to it. The leaues are broad, fiue cornered, and indented like thoſe of the vine; but rougher, more hairy and whiter of colour: the floures be ſmall and white, growing many together. The fruit conſiſteth in little cluſters, the berries whereof are at the firſt green, and red when they be ripe. The root is very great, long, and thicke, growing deepe in the earth, of a white yellowiſh colour, extreame bitter, and altogether of an vnpleaſant taſte. The Queens chiefe Surgion Mr. *William Godorous*, a very curious & learned gentleman, ſhewed me a root herof, that waied half an hundred weight, and of the bignes of a child of a yeare old.

¶ *The Place.*

Briony groweth almoſt euery where among pot-herbes, hedge-buſhes, and ſuch like places.

¶ *The Time.*

It floureth in May, and bringeth forth his grapes in Autumne.

¶ *The Names.*

Briony is called in Greek, ἄμπελος λευκή: in Latine, *Vitis alba*, or white Vine, and it is named, ἄμπελος, becauſe it is not onely like the vine in leaues, but alſo for that it bringeth forth his fruit made vp after the likeneſſe of a little cluſter, although the berries ſtand not cloſe together: it is called of *Pliny*, *Bryonia*, and *Madon*: of the Arabians *Alpheſera*: of *Matthæus*, *Syluaticus*, *Viticella*: in the poore mans Treaſure, *Roraſtrum*: of *Apuleius*, *Apiaſtellum*, *Vitis Taminia*, *Vitis alba*, and *Vitalba*: in high Dutch, **Suchwurtz**: in low Dutch, **Brionie**: in Engliſh, Briony, white Briony, and tetter Berrie: in French *Couleuree*: in Italian, *Zucca ſyluatica*: in Spaniſh, *Nueza blanca*.

¶ *The Temperature.*

White Briony is in all parts hot and dry, exceeding the third degree, eſpecially of heate, with an exceeding great force of clenſing and ſcouring, by reaſon wherof it purgeth and draweth forth, not onely cholericke and flegmaticke humors, but alſo watrie.

¶ *The Vertues.*

A *Dioſcorides* writeth, that the firſt ſprings or ſproutings being boiled and eaten, do purge by ſiege, and vrine. *Galen* ſaith, that all men vſe accuſtomably to eat of it in the ſpring time, and that it is a nouriſhment wholeſome, by reaſon of the binding quality that it hath; which is to be vnderſtood of thoſe of the wild vine, called in Latine, *Tamus*; and not of the ſproutings of this plant; for the ſproutings of the firſt ſprings of white Bryony are nothing binding at all, but do mightily purge the belly, and torment the ſtomacke.

B *Dioſcorides* alſo affirmeth, That the juice of the root being preſſed out in the ſpring, and drunke with meade or honied water, purgeth flegme: and not only the juice, but alſo the decoction of the root draweth forth flegme, choler, and wateriſh humors, and that very ſtrongly; and it is withall oftentimes ſo troubleſome to the ſtomacke, as it procureth vomite.

C This kinde of ſtrong purgation is good for thoſe that haue the dropſie, the falling ſickneſſe, and the dizzineſſe and ſwimming of the braine and head, which hath continued long, and is hardly to be remoued: yet notwithſtanding it is not daily to be giuen (as *Dioſcorides* admoniſheth) to them that haue the falling ſickneſſe, for it will be troubleſome enough to take it now and then: and it is (as we haue ſaid) an exceeding ſtrong medicine, purging with violence, and very forceable for mans nature.

D The root put vp in maner of a peſſary bringeth forth the dead childe and afterbirth: being boiled for a bath to ſit in, it worketh the ſame effect.

E It ſcoureth the skin, and taketh away wrinkles, freckles, ſun burning, blacke markes, ſpots, and ſcars of the face, being tempered with the meale of vetches or Tares, or of Fenugreeke: or boiled in oile till it be conſumed; it taketh away blacke and blew ſpots which come of ſtripes: it is good againſt Whitlowes: being ſtamped with wine and applied it breaketh biles, and ſmall apoſtumes. it draweth forth ſplinters and broken bones, if it be ſtamped and laid thereto.

F The ſame is alſo fitly mixed with eating medicines, as *Dioſcorides* writeth.

G The fruit is good againſt ſcabs and the leprie, if it be applied and anointed on, as the ſame Author affirmeth.

H *Galen* writeth, that it is profitable for Tanners to thicken their leather hides with.

I Furthermore, an electuary made of the roots and hony or ſugar, is ſingular good for them that are ſhort winded, troubled with an old cough, paine in the ſides, and for ſuch as are hurt and burſten inwardly: for it diſſolueth and ſcattereth abroad congealed and clottered bloud.

K The root ſtamped with ſalt is good to be laid vpon filthy vlcers and ſcabbed legges. The fruit is likewiſe good to the ſame intent, if it be applied in manner aforeſaid.

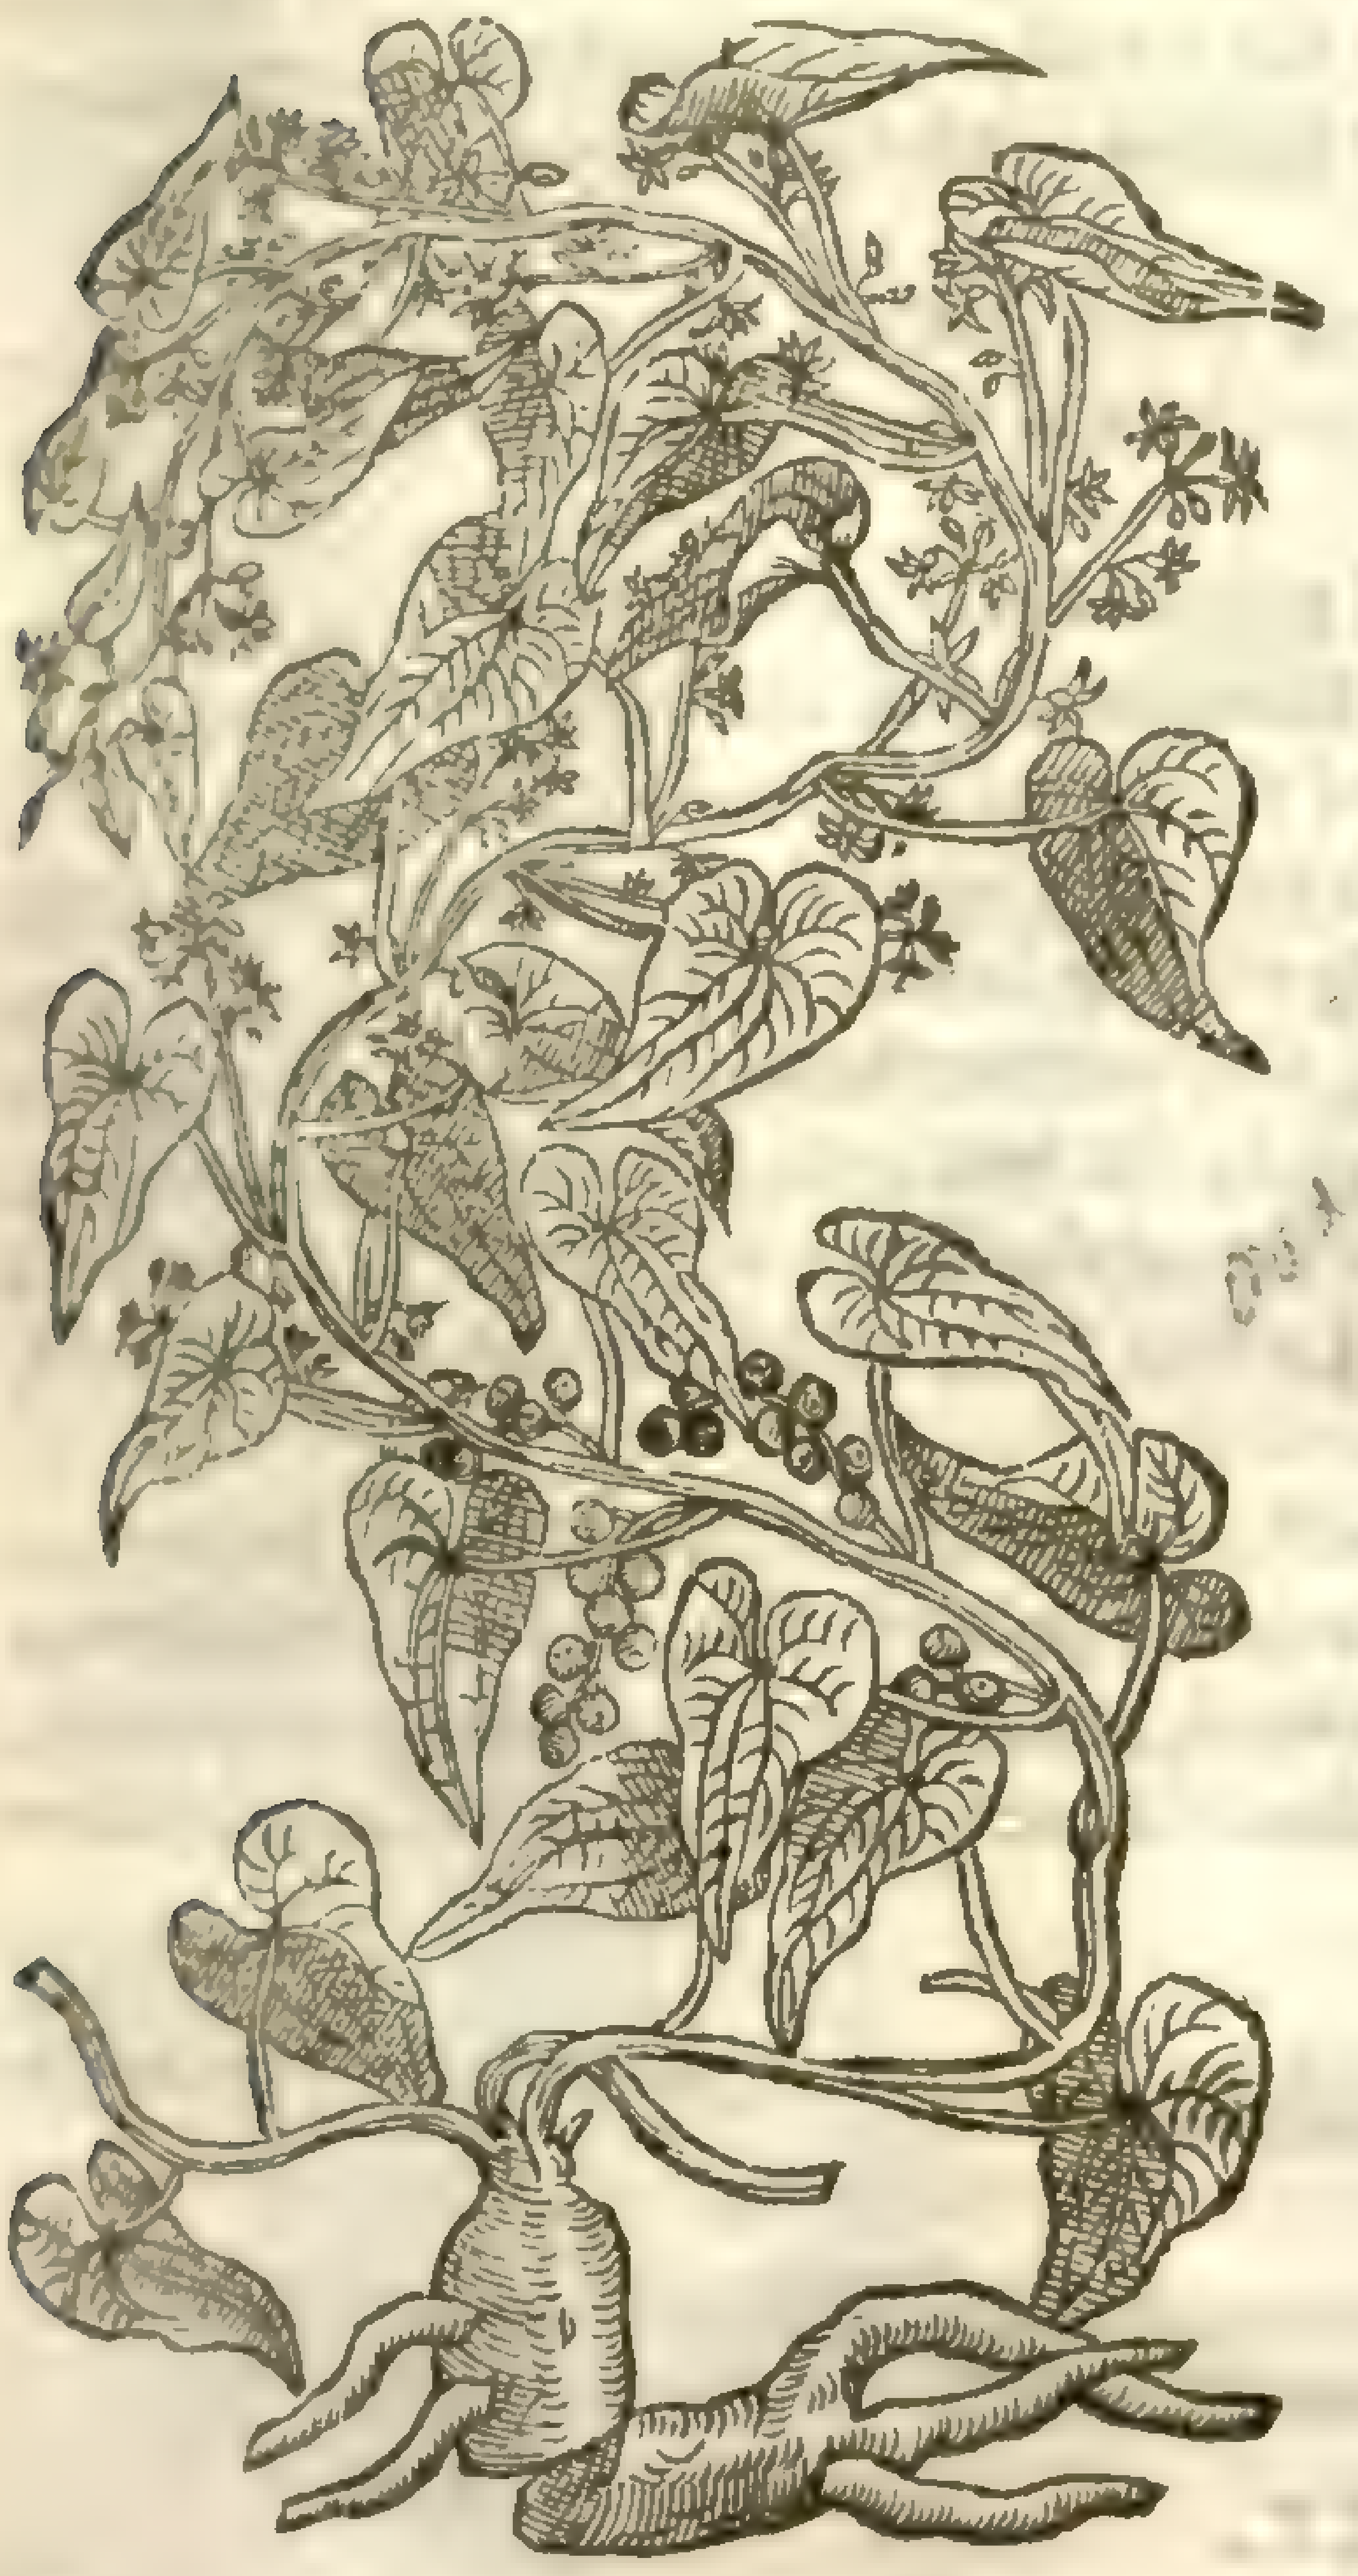
L The root of Briony and of wake-Robin ſtamped with ſome ſulphur or brimſtone, and made vp into a maſſe or lump and wrapped in a linnen clout, taketh away the morphew, freckles, and ſpots of the face, if it be rubbed with the ſame being dipped firſt in vineger.

Chap. 321. *Of blacke Brionie, or the wilde Vine.*

¶ *The Description.*

1 THe black Briony hath long flexible branches of a woody ſubſtance, couered with a gaping or clouen bark growing very far abroad, winding it ſelfe with his ſmall tendrels about trees, hedges, and what elſe is next vnto it, like vnto the branches of the vine: the leaues are like vnto thoſe of Iuie or garden Nightſhade, ſharpe pointed, and of a ſhining greene colour: the floures are white, ſmall, and moſſie; which being paſt, there ſucceed little cluſters of red berries

1 *Bryonia nigra.*
Blacke Bryonie.



berries,ſomewhat bigger than thoſe of the ſmall Raiſins or Ribes, which wee call Currans or ſmall Raiſins. The root is very great and thicke, oftentimes as big as a mans leg, blackiſh without, and very clammy or ſlimy within; which beeing but ſcraped with a knife or any other thing fit for that purpoſe, it ſeemes to be a matter fit to ſpred vpon cloath or leather in manner of a plaiſter of Sear-cloath:which being ſo ſpred and vſed,it ſerueth to lay vpon many infirmities, and vnto verie excellent purpoſes,as ſhal be declared in the proper place.

2 The wild black Bryonie reſembles the former as well in ſlender Vine-ſtalkes,as leaues; but claſping tendrels haue they none, neuertheleſſe by reaſon of the infiniteneſſe of the branches,and the tenderneſſe of the ſame, it takes hold of thoſe things that ſtand next vnto it, although eaſie to be looſed,contrarie vnto the other of his kinde. The berries hereof are blacke of colour when they be ripe; the root alſo is blacke without, and within of a pale yellow colour like Box. ‡ This which is here deſcribed is the *Bryonia nigra* of *Dodonæus*; but *Bauhine* calleth it *Bryonia alba*,and ſaith it differeth from the common white Bryonie, onely in that the root is of a yellowiſh Box colour on the in-ſide,and the fruit or berries are blacke when as they come to ripeneſſe.

Bryonia nigra florens non fructum ferens.

3 This is altogether like the firſt deſcribed in roots,branches,and leaues,only the foot-ſtalks whereon the floures grow are about eight or nine inches long: the floures are ſomething greater, hauing neither before or after their flouring any berries or ſhew thereof,but the flours & footſtalks do ſoon wither and fall away. This I haue heretofore and now this Summer 1621, diligently obſerued,becauſe it hath not bin mentioned or obſerued by any that I know. *Iohn Goodyer.* ‡

¶ *The Place.*

The firſt of theſe plants groweth in hedges and buſhes almoſt euery where.

The ſecond growes in Heſſen, Saxonie, Weſtphalia, Pomerland, and Miſnia, where white Bryonie groweth not,as *Valerius Cordus* hath written;who ſaith that it growes vnder haſell trees neere a city of Germany called Argentine or Strausborough.

¶ *The Time.*

They ſpring in March,bring forth the floures in May,and their ripe fruit in September.

¶ *The Names.*

Blacke Bryonie is called in Greeke, Ἄμπελος ἀγρία: in Latine, *Bryonia nigra*, and *Vitis ſylueſtris*, or wild Vine;notwithſtanding it much differs from *Labruſca*,or *Vitis vinifera ſylueſtris*,that is, the wild Vine,which bringeth forth wine called *Ampelos agria*. Why both theſe were called by one name *Pliny* was the cauſe,who could not ſufficiently expound them, *Lib.*23. *cap.*1. but confounded and made them all one,in which error are alſo the Arabians.

This wilde Vine is alſo called in Latine,*Tamus*;and the fruit thereof *Vua Taminia*. *Pliny* nameth it alſo *Salicaſtrum*. *Ruellius* ſaith that in certain ſhops it is called *Sigillum B. Mariæ*;it is alſo called *Cyclaminus altera*,but not properly: in Engliſh,Blacke Bryonie,wilde Vine,and our Ladies ſeale.

¶ *The Nature.*

The roots of the wilde Vine are hot and dry in the third degree: the fruit is of like temper, but not ſo forceable: both of them ſcoure and waſte away.

¶ *The Vertues.*

A *Dioſcorides* ſaith that the roots do purge wateriſh humors,& are good for ſuch as haue the dropſie,if they be boiled in wine,adding vnto the wine a little ſea water,and be drunke in three ounces of faire freſh water: he ſaith furthermore,that the fruit or berries doth take away the Sunne-burne and other blemiſhes of the skin.

B The berries do not only clenſe and remoue ſuch kinde of ſpots, but do alſo very quickely waſte and conſume away blacke and blew marks that come of bruiſes and dry-beatings:which thing alſo the roots performe being laid vpon them.

C The yong and tender ſproutings are kept in pickle,and reſerued to be eaten with meat,as *Dioſcorides* teacheth. *Matthiolus* writeth,that they are ſerued at mens tables in our age alſo in Tuſcanie; others alſo report the like to be done in Andoloſia one of the kingdomes of Granado.

D It is ſaid that ſwine ſeeke after the roots hereof, which they dig vp and eat with no leſſe delight than they do the roots of *Cyclaminus* or *Panis Porcinus*; whereupon it was called *Cyclaminus altera* or Sow-bread. If this reaſon ſtand for good; then may we in like manner joine hereunto many other roots,and likewiſe call them *Cyclaminus altera* or Sow-bread; for ſwine do not ſeeke after the roots of this only,but alſo of diuers other plants,of which none are of the kinds of Sow-bread. It would therefore be a point of raſhneſſe to affirme *Tamus* or our Ladies ſeale to be a kinde of Sow-bread, becauſe the roots hereof are a pleaſant meat to ſwine.

E The root ſpred vpon ſheeps leather in manner of a plaiſter,whileſt it is yet freſh and greene, taketh away blacke and blew marks,all ſcars and deformitie of the skin,breaks hard apoſtems,drawes forth ſplinters and broken bones,diſſolueth congealed bloud, and being laid on and vſed vpon the hip or huckle bones,ſhoulders,armes,or any other part where there is great paine and ache,it takes it away in ſhort ſpace,and worketh very effectually.

† The figure that was formerly in the ſecond place of this Chapter did no way agree with the deſcription,for it was of the *Viorna* or Trauellers Ioy, hereafter to be mentioned; which *Tabernamontanus* (whoſe figures our Author made vſe of) calls *Vitis nigra ſecunda.*

Chap. 322.

Of Bryonie of Mexico.

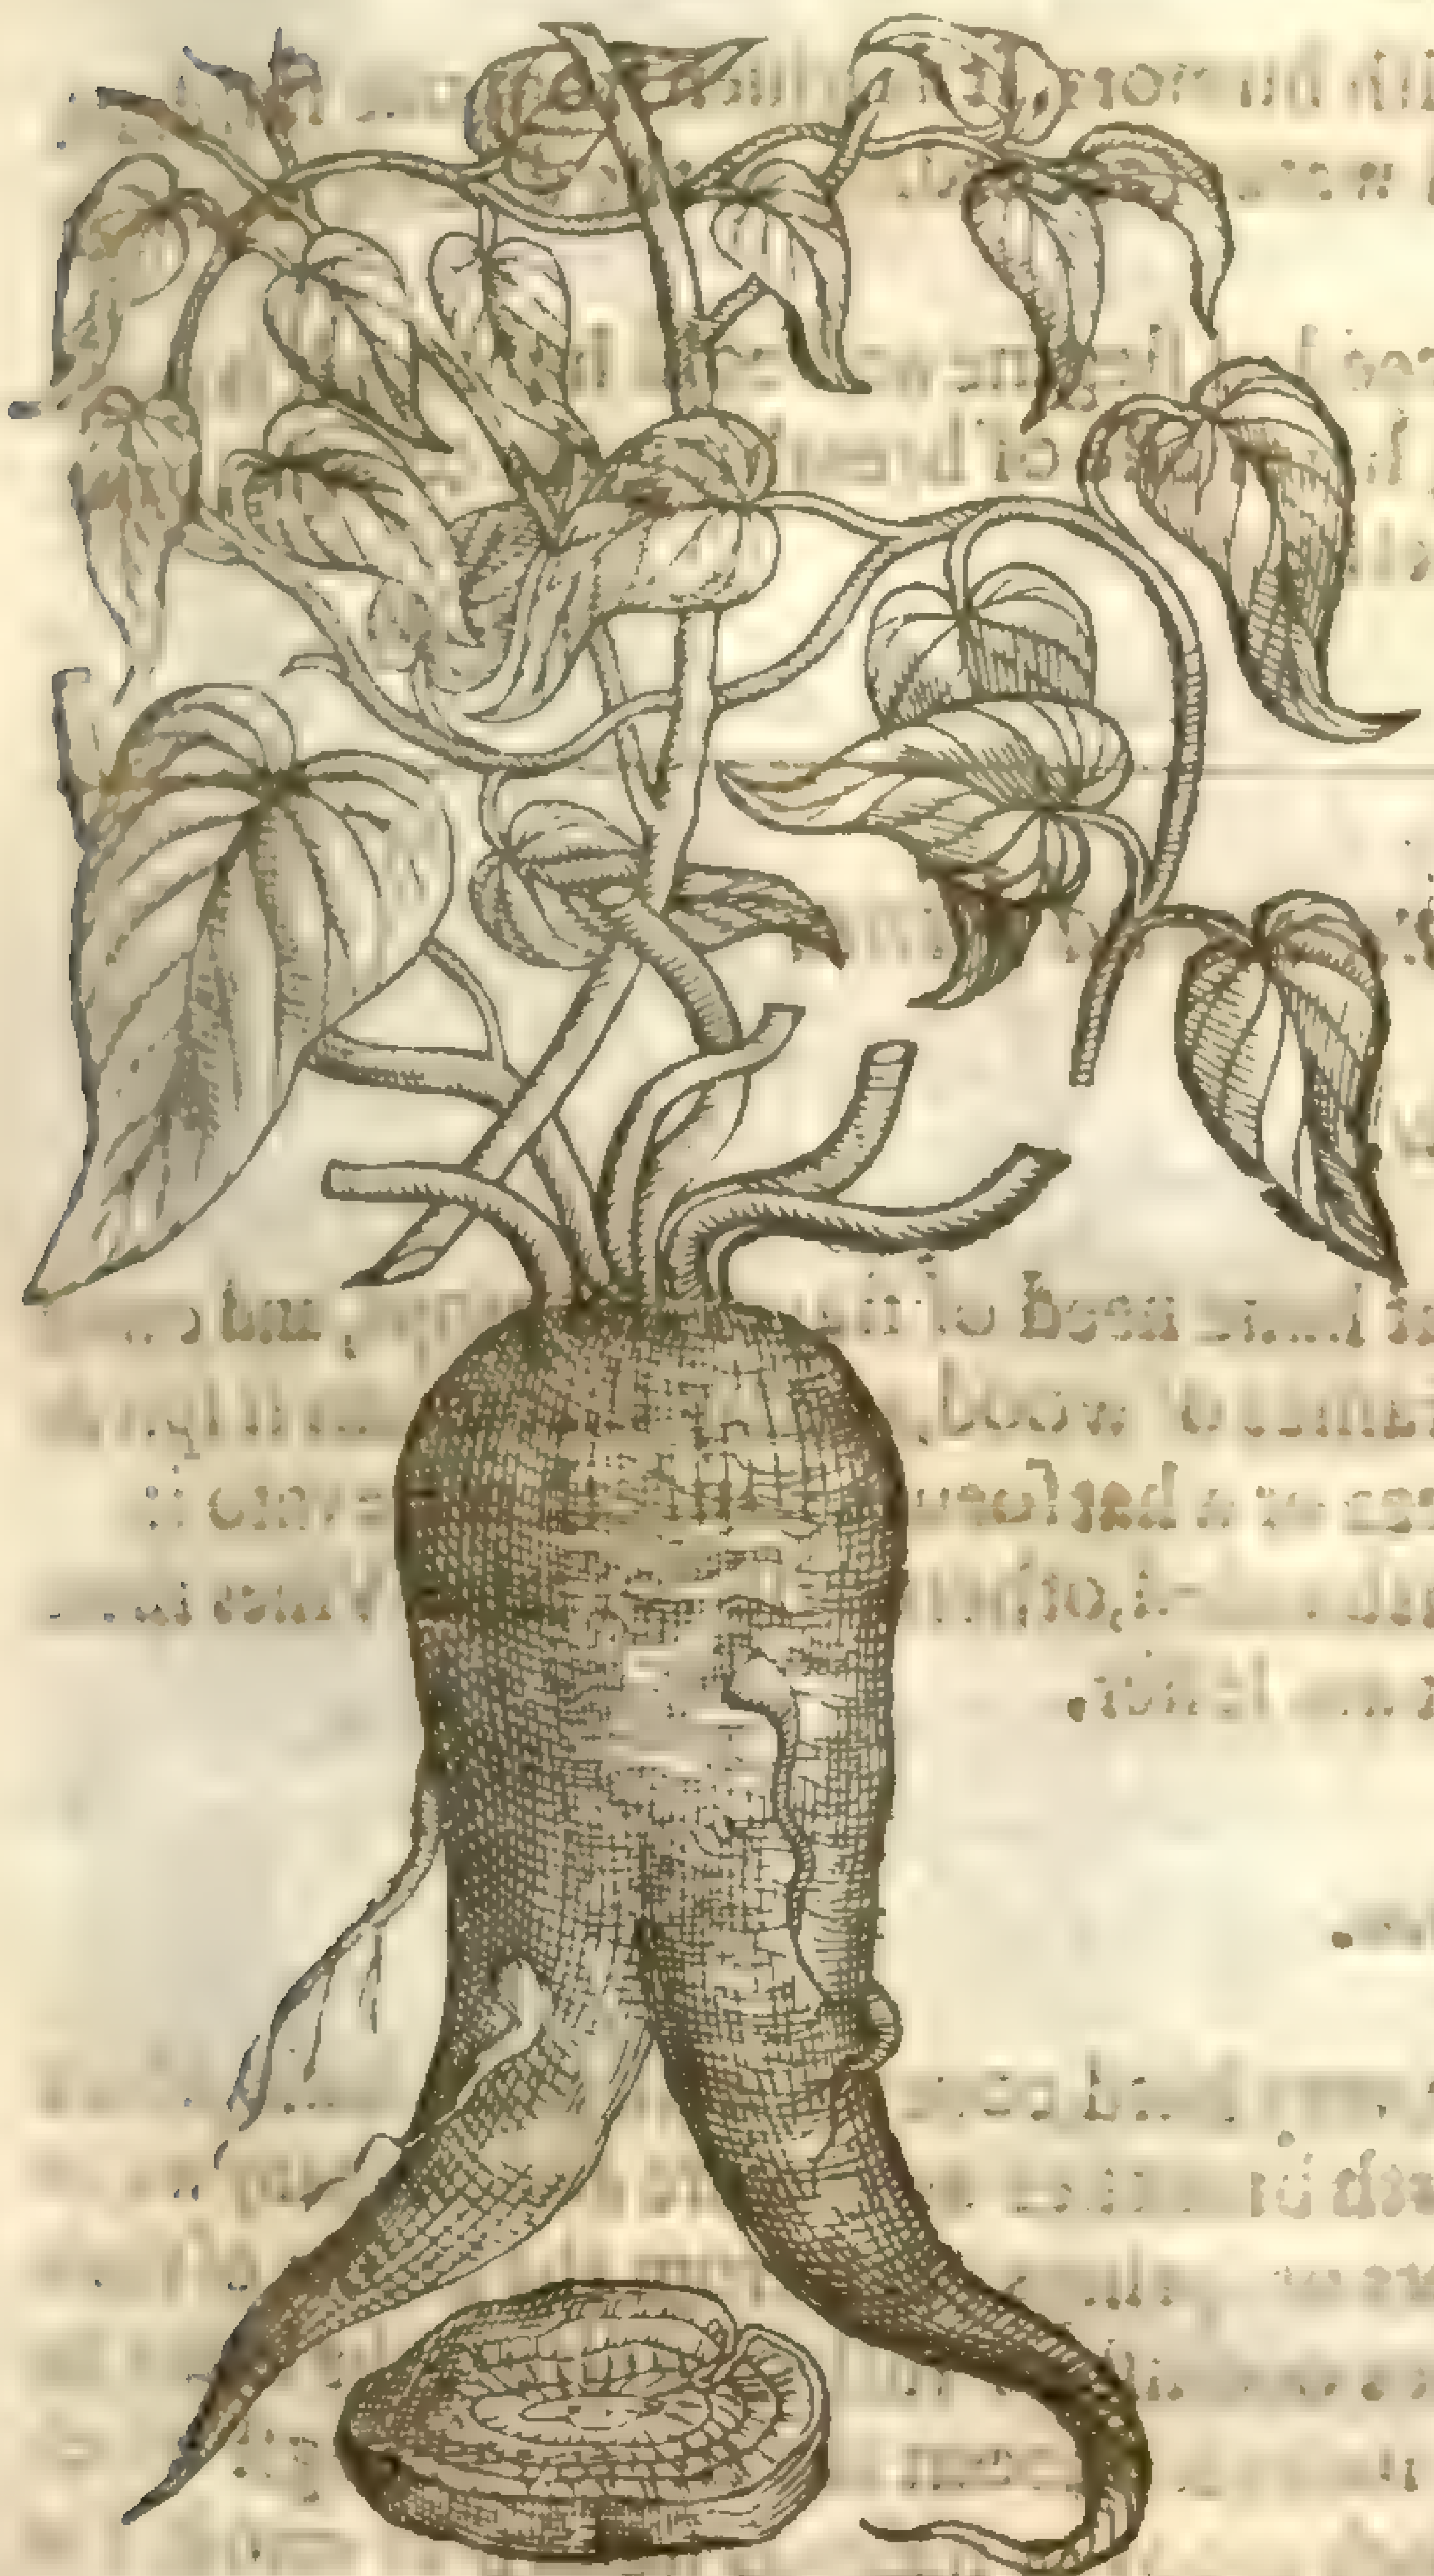
¶ *The Deſcription.*

1 That plant which is now called *Mechoacan* or Bryonie of Mexico commeth very neere the kinds of Bindweeds in leaues and trailing branches, but in roots like the Bryonies: for there ſhooteth from the root thereof many long ſlender tendrels,which do infinitely graſpe or claſpe about ſuch things as grow or ſtand next vnto them; whereupon do grow great broad leaues ſharp pointed,of a darke green colour, in ſhape like thoſe of our Ladies ſeale, ſomewhat rough and hairy,and a little biting the tongue: among the leaues come forth the floures (as *Nicolaus Monardus* writeth) not vnlike thoſe of the Orenge tree, but rather of the golden Apple of Loue,conſiſting of fiue ſmall leaues,out of the midſt whereof comes forth a little clapper or peſtil in manner of a round lump as big as an haſell nut; which being diuided with a thin skin or membrane that commeth through it, openeth into two parts, in each whereof are contained two ſeeds as big as Peaſe,in colour blacke and ſhining. The root is thicke and long,very like vnto the root of white Bryonie,whereof we make this a kinde,although in the taſte of the roots there is ſome difference; for the root of white Bryonie hath a bitter taſte,and this hath little or no taſte at all.

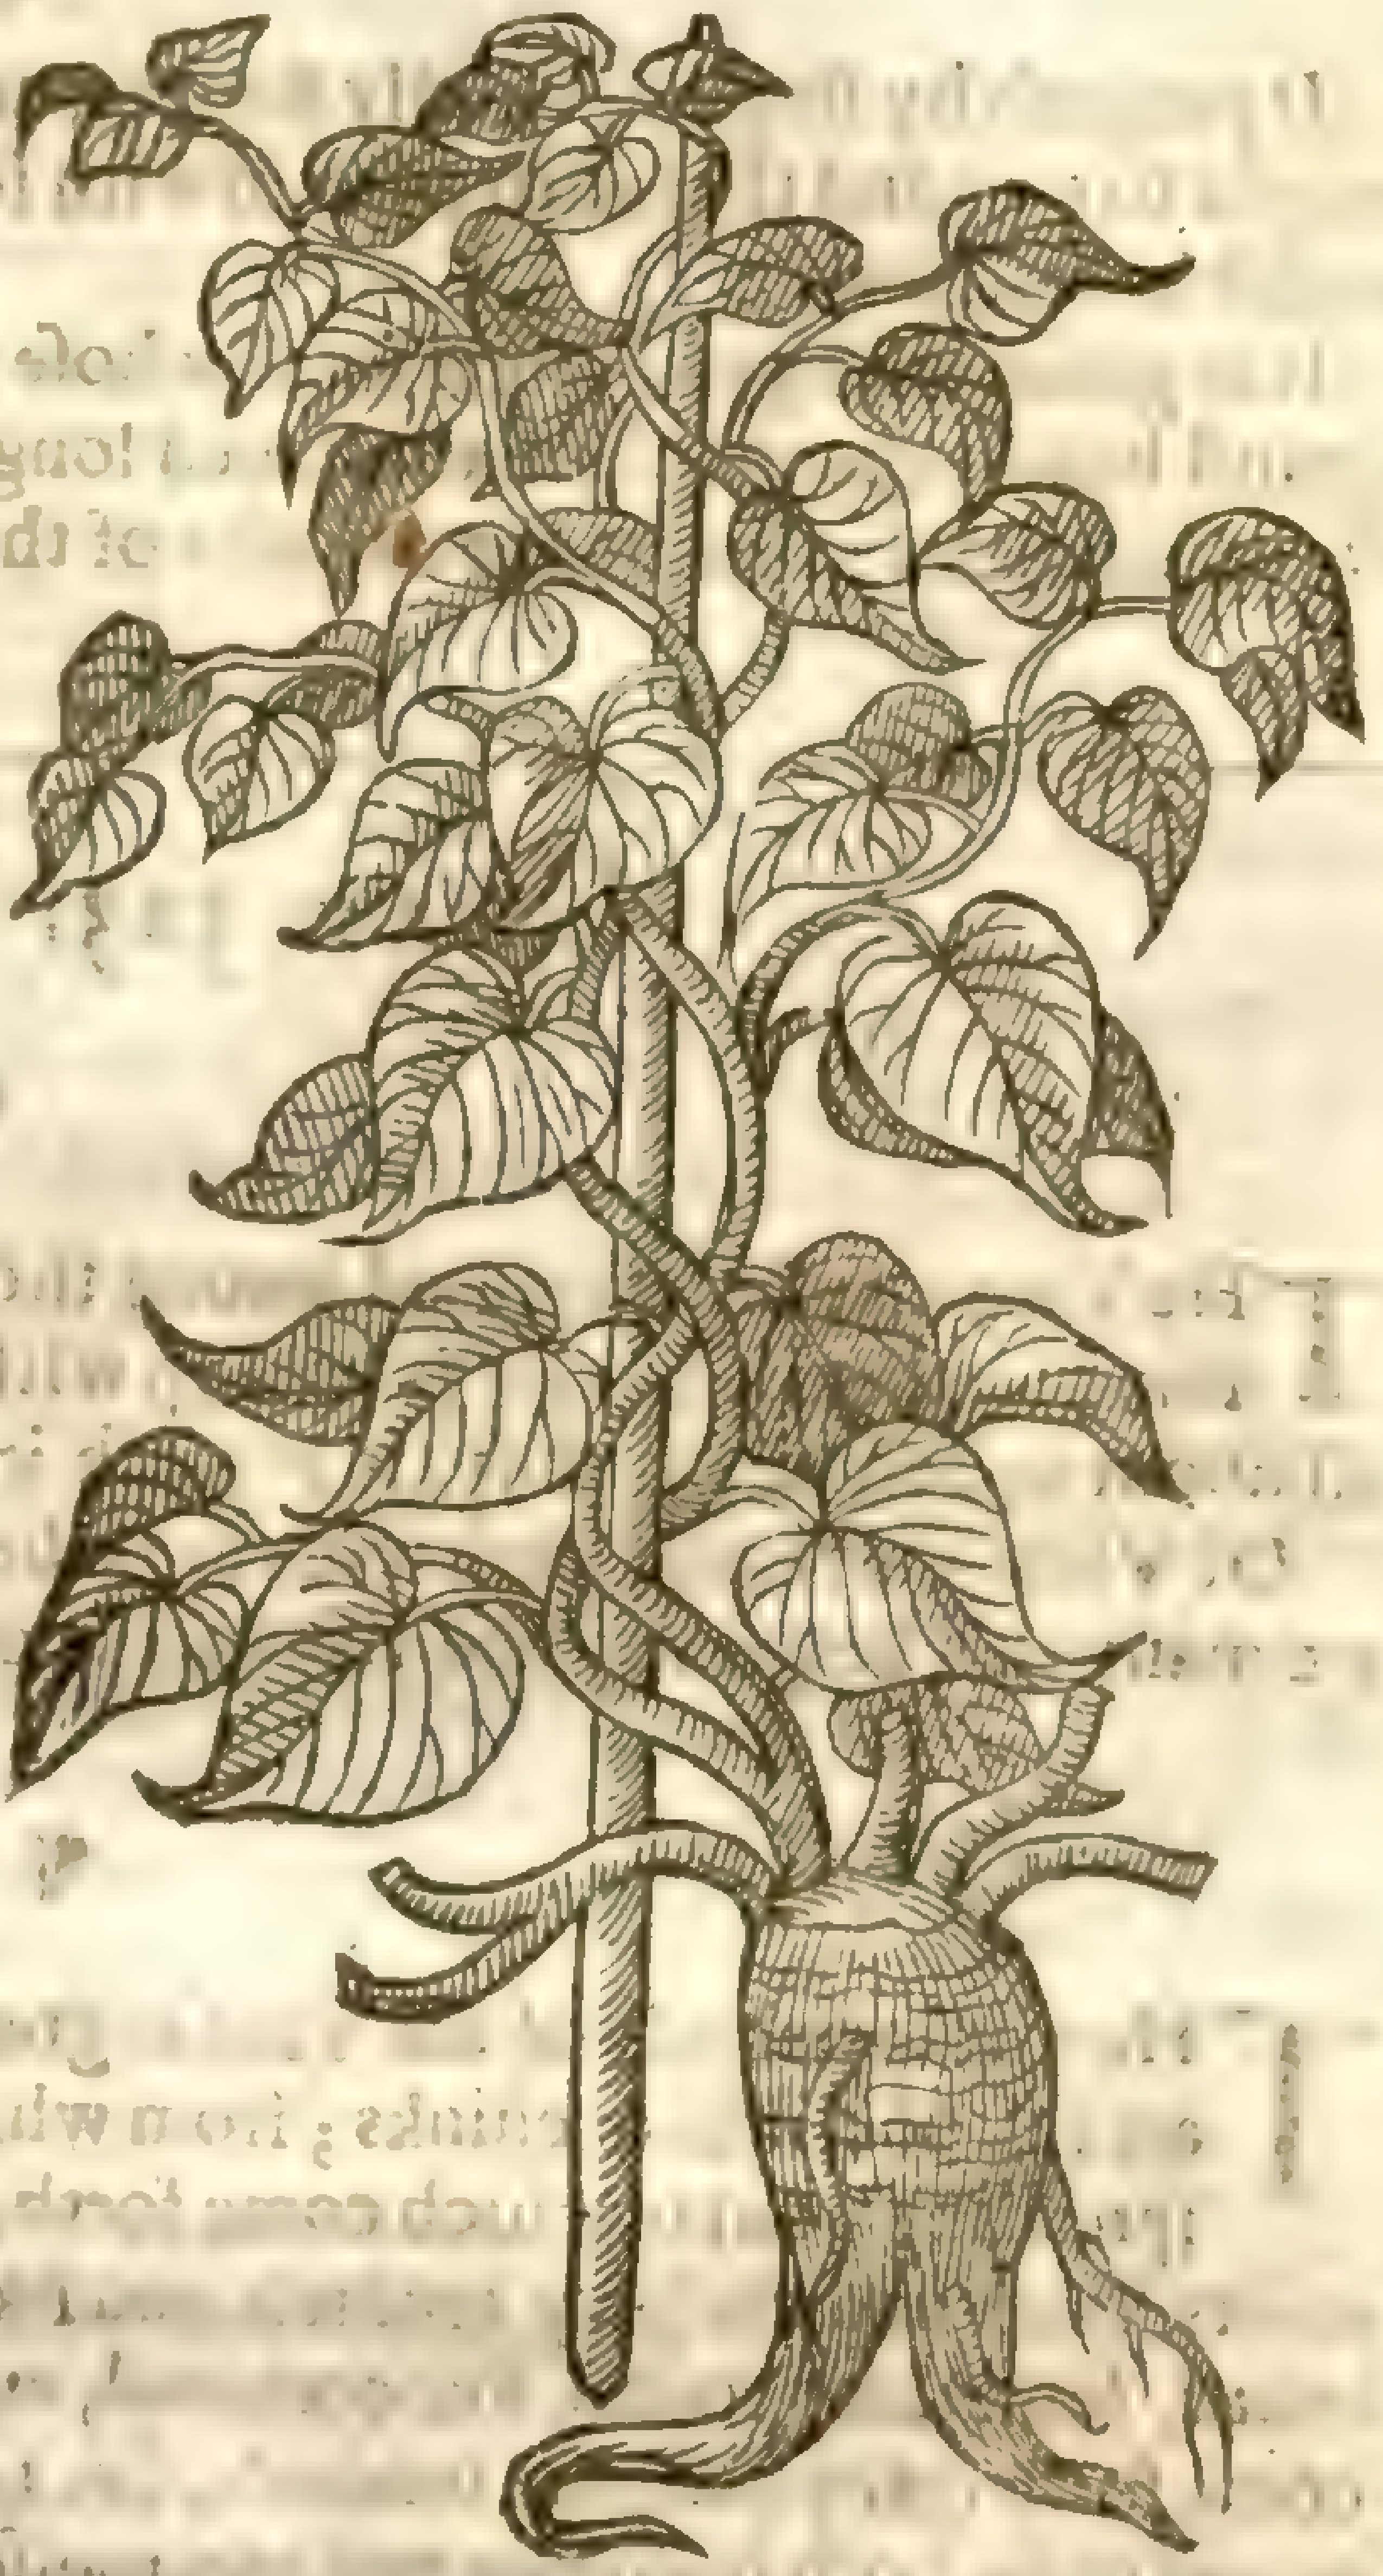
2 The Bryonie or *Mechoacan* of Peru groweth vp with many long trailing flexible branches, interlaced with diuers Viny tendrels which take hold of ſuch things are next or neere vnto them, euen in ſuch manner of claſping or climing as doth the blacke Bryonie or wine Vine,whereunto it is very like almoſt in each reſpect,ſauing that his moſſie floures do ſmell very ſweetly. The fruit as yet I haue not obſerued, by reaſon that the plant which growes in my garden did not perfect the ſame,by occaſion of the great raine and intemperat weather that hapned *An.* 1596. but I am in good hope to ſee it in his perfection,and then we ſhall eaſily judge whether it be that right *Mechoacan* that hath bin brought from Mexico and other places of the Weſt Indies, or no. The root by the figure ſhould ſeeme to anſwer that of the wilde Vine,but as yet thereof I cannot write certainly.

‡ 3 There is brought to vs and into vſe of late time,the root of another plant which ſeemes

1 *Mechoacan.*
Bryonie of Mexico.



2 *Mechoacan Peruviana.*
Bryonie of Peru.



haue much affinity with *Mechoacan*, and therefore *Bauhine* hath called it *Bryonia Mechoacan nigricans* and thus deliuers the hiſtorie thereof: [It is a root like *Mechoacan*, but couered with a blackiſh barke, and reddiſh, or rather grayiſh on the inſide, and cut into ſlices; it was brought ſome yeares agon out of India, by the name of *Chelapa* or *Gelapa*. It is called by thoſe of Alexandria and Marſeiles, *Ialapium*, or *Gelapum*; and of thoſe of Marſeilles it is thought the blacke or male *Mechoacan*: the taſte is not vngratefull, but gummy, and by reaſon of the much gummineſſe, put to the fire it quickly flames: it in facultie exceeds the common *Mechoacan*, for by reaſon of the great gummineſſe it more powerfully purgeth ſerous humours with a little griping, alſo it principally ſtrengthens the liuer and ſtomacke; wherefore it is ſafely giuen ʒj. and performs the operation without nauſeouſneſſe. It is vſually giuen in Succorie water or ſome thin broth, three houres before meat.] Thus much *Bauhine*, who ſaith it was firſt brought to theſe parts eleuen yeres before he ſet forth his *Prodromus*, which was about 1611. It hath bin little vſed here till within theſe ten yeares. ‡

¶ *The Place.*

Some write, that *Mechoacan* was firſt found in the prouince of New Spain, neer the city of Mexico or Mexican, whereof it tooke his name. It groweth likewiſe in a prouince of the Weſt Indies called Nicaragua and Quito, where the beſt is thought to grow.

¶ *The Names.*

It beareth his name, as is ſaid, of the prouince wherein it is found. Some take it for a kinde of Bryonie: but ſeeing the root is nothing bitter, but rather without taſte, it agrees little with Bryonie, for the root of Bryonie is very bitter. Diuers name it *Rha album* or white Rubarb, but vnproperly, being nothing like. It comes neere vnto Scammonie, and if I might yeeld my cenſure, it ſeems to be *Scammonium quoddam Americanum*, or a certaine Scammonie of America. Scammony creepeth, as we haue ſaid, like Binde-weed: the root is both white and thicke: the juice hath but little taſte, as alſo hath this of *Mechoacan*. It is called in Engliſh, Mechoca, and Mechocan, and may be called Indian Bryonie.

¶ *The Temperature.*

The root is of a mean temper between hot and cold, but yet dry.

¶ *The Vertues.*

It purgeth by ſiege eſpecially flegme, and then wateriſh humors. It is giuen from one full dram weight to two, and that with wine, or with ſome diſtilled water (according as the diſeaſe requires) or elſe in fleſh broth.

It is giuen with good effect to all whoſe diſeaſes proceed of flegme and cold humors: it is good againſt head-ache that hath continued long, old coughs, hardneſſe of breathing, the colique, paine of the kidnies and joints, the diſeaſes of the reins and belly.

Chap. 323. *Of the manured Vine.*

¶ *The Kindes.*

THe Vine may be accounted among thoſe plants that haue need of ſtayes and props, and canot ſtand by themſelues; it is held vp with poles and frames of wood, and by that means it ſpreds all about and climbeth aloft: it ioyneth it ſelfe vnto trees or whatſoeuer ſtandeth neere vnto it.

Of Vines that bring forth wine ſome be tame and husbanded, others wild: of tame Vines there are many that be greater, and likewiſe another ſort that are leſſer.

¶ *The Deſcription.*

THe trunke or body of the Vine is great and thicke, very hard, couered with many barks, which are full of cliffes or chinks; from which grow forth branches as it were armes, many wayes ſpreading; out of which come forth jointed ſhoots or ſprings; and from the boſom of thoſe joints, leaues and claſping tendrels, and likewiſe bunches or cluſters full of grapes: the leaues be broad, ſomething round, fiue cornered, and ſomewhat indented about the edges: amongſt which come forth many claſping tendrels, that take hold of ſuch props or ſtaies as ſtand next vnto it. The grapes differ both in colour and greatneſſe, and alſo in many other things, which to diſtinguiſh ſeuerally were impoſſible, conſidering the infinite ſorts or kinds, and alſo thoſe which are tranſplanted from one region or clymat to another, do likewiſe alter both from the forme and taſte they had before: wherefore it ſhall be ſufficient to ſet forth the figure of the manured grape, and ſpeak ſomwhat of the reſt.

There is found in Grecia and the parts of Morea, as *Pantalarea*, *Zante*, *Cephalonia*, and *Petras* (whereof ſome are Iſlands, and others of the continent) a certain Vine that hath a trunk or body of a woody ſubſtance, with a ſcaly or rugged barke of a graviſh colour, whereupon grow faire broad leaues ſleightly indented about the edges, not vnlike thoſe of the marſh Mallow: from the boſom whereof come forth many ſmall claſping tendrels, and alſo tough and pliant foot-ſtalks, whereon grow very faire bunches of grapes of a VVatchet blewiſh colour: from the which fruit commeth forth long tender laces or ſtrings ſuch as is found among Sauorie, whereupon we call that plant which hath it laced Sauorie, not vnlike that growing among and vpon flax, which we cal Dodder, or *Podagra lini*, whereof is made a blacke wine called Greeke wine, yet of the taſte of Sack. The laced fruit of this Vine may be fitly termed *Vva barbata*, laced or bearded Grapes.

The plant that beareth thoſe ſmall Raiſins which are commonly called Corans or Currans, or rather Raiſins of Corinth, is not that plant which among the vulgar people is taken for Currans, it being a ſhrub or buſh that brings forth ſmall cluſters or berries, differing as much as may be from Corans, hauing no affinitie with the Vine or any kinde thereof. The Vine that beareth ſmall Raiſins hath a body or ſtock as other Vines haue, branches and tendrels likewiſe. The leaues are larger than any of the others, ſnipt about the edges like the teeth of a ſaw: among which come forth cluſters of grapes in forme like the other, but ſmaller, of a blewiſh colour; which beeing ripe are gathered and laid vpon hurdles, carpets, mats, and ſuch like, in the Sun to dry: then are they caried to ſome houſe and laid vpon heaps, as wee lay apples and corne in a garner, vntill the merchants buy them: then do they put them into large buts or other woodden veſſels, and tread them downe with their bare feet, which they call Stiuing, and ſo are they brought into theſe parts for our vſe. ‡ And they are commonly termed in Latine, *Vva Corinthiaca*, and *Paſſulæ minores*.

There is alſo another which beareth exceeding faire Grapes whereof they make Raiſins, whiter coloured, and much exceeding the bigneſſe of the common Raiſin of the Sunne; yet that grape

whereof

Vitis Vinifera.
The manured Vine.

whereof the Raiſin of the Sun is made is a large one, and thought to bee the *Vva Zibibi* of the Arabians; and it is that which *Tabernamontanus* figured vnder that name, who therin was followed by our Author: but the figures being little to the purpoſe, I haue thought good to omit them. ‡

There is another kinde of Vine which hath great leaues very broad, of an ouerworne colour; whereupon grow great bunches of grapes of a blewiſh colour, the pulpe or meat whereof ſticketh or cleaueth ſo hard to the graines or little ſtones, that the one is not eaſily diuided from the other, reſembling ſome ſtarued or withered berry that hath been blaſted, whereof it was named *Duracina*.

There be ſome Vines that bring forth grapes of a whitiſh or reddiſh yellow colour; others of a deep red, both in the outward skin, juice, and pulpe within.

There be others whoſe grapes are of a blew colour, or ſomething red, yet is the juice like thoſe of the former. Theſe grapes doe yeeld forth a white wine before they are put into the preſſe, and a reddiſh or paller wine when they are trodden with the husks, & ſo left to macerate or ferment, with which if they remain too long, they yeeld forth a wine of a higher colour.

There be others which make a black and obſcure red wine, whereof ſome bring bigger cluſters, and conſiſt of greater grapes, others of leſſer; ſome grow more cluſtered or cloſer together, others looſer; ſome haue but one ſtone, others more; ſome make a more auſtere or harſh wine, others a more ſweet: of ſome the old wine is beſt, of diuers the firſt yeres wine is moſt excellent: ſome bring forth fruit foure ſquare, of which kindes we haue great plenty.

¶ *The Place.*

A fit ſoile for Vines, ſaith *Florentinus*, is euery blacke earth, which is not very cloſe nor clammy, hauing ſome moiſture. But *Columella* ſaith great regard is to be had, what kinde or ſort of Vine you would nouriſh, according to the nature of the country and ſoile.

A wiſe husbandman will commit to a fat and fruitfull ſoile a leane Vine, of his own nature not too fruitfull: to a lean ground a fruitfull Vine: to a cloſe and compact earth a ſpreading vine, and that is full of matter to make branches of: to a looſe and fruitful ſoile a Vine of few branches. The ſame *Columella* ſaith, that the Vine delighteth not in dung, of what kinde ſoeuer it be; but freſh mold mixed with ſome ſhauings of horne is the beſt to be diſpoſed about the roots to cauſe fertilitie.

¶ *The Time.*

Columella ſaith Vines muſt be pruned before the yong branches ſpring forth. *Palladius* writeth, in Februarie: if they be pruned later they loſe their nouriſhment with weeping.

¶ *The Names.*

The Vine is called in Greeke, Ἄμπελος οἰνόφορος: as much to ſay in Latine, as *Vitis Vinifera*, or the vine which beareth wine; and Ἄμπελος ἥμερος: that is, *Vitis manſuefacta, ſiue cultiva*, Tame or manured Vine. And it is called οἰνόφορος, that it may differ from both the Bryonies, the white and blacke, and from *Tamus* or our Ladies ſeale, which be likewiſe named Ἄμπελοι. It is called *Vitis*, becauſe *invitatur ad vvas pariendas*. It is cheriſhed to the intent to bring forth full cluſters, as *Varro* ſaith.

Pliny, lib. 14. *cap.* 3. maketh *Vva Zibeba, Alexandrina vitis*, or Vine of Alexandria; deſcribing the ſame by thoſe very words that *Theophraſtus* doth. *Dioſcorides* ſets it down to be *altera ſpecies Vitis ſylveſtris*, or a ſecond kinde of wilde Vine; but we had rather retaine it among the tame Vines. We may name it in Engliſh, Raiſin Vine. The fruits hereof are called in ſhops, *Paſſularum de Corintho*: in Engliſh, Corans, or ſmall Raiſins.

Sylveſtris Vitis or wilde Vine is called in Greek, Ἄμπελος ἀγρία: and in Latine *Labruſca*; as in *Virgils* Eclogs.

—— Adſpice ad antrum
Sylveſtris raris ſparſit labruſca racemis.

—— See how the wilde Vine
Bedeck's the caue with ſparſed cluſters fine.

To this wilde Vine doth belong thoſe which *Pliny, lib.* 16. *cap.* 27. reporteth to be called *Trifera* or that bring three ſundry fruits in a yeare, as *Inſana* and mad bearing Vines; becauſe in thoſe ſome cluſters are ripe and full growne, ſome in ſwelling, and others but flouring.

The fruit of the Vine is called in Greeke βότρυς, and σταφυλὴ: in Latine, *Racemus*, and *Vva*: in Engliſh a bunch or cluſter of Grapes.

The cluſter of grapes that hath bin withered or dried in the Sun is named in Greeke σταφὶς: in Latine, *Vva Paſſa*: in ſhops, *Paſſula*: in Engliſh, Raiſins of the Sun.

The berry or grape it ſelfe is called in Latine *Acinus*, and alſo *Granum*, as *Democritus* ſaith, ſpeaking of the berry.

The ſeeds or ſtones contained within the berries are called in Latine *Vinacea*, and ſomtimes *Nuclei*: in ſhops, *Arilli*, as though they ſhould ſay *Ariduli*, becauſe they are dry and yeeld no juice: notwithſtanding *Vinacea* are taken in *Columella* for the droſſe or remnant of the grapes after they bee preſſed.

The ſtalke which is in the middle of the cluſters, and vpon which the grapes doe hang, is called of *Galen*, βότρυχες: of *Varro*, *Scapus uvarum*.

¶ *The Nature and Vertues.*

A The tender claſping branches of the Vine and the leaues do coole and mightily binde: they ſtay bleeding in any part of the body: they are good againſt the laske, the bloudy flix, the heart-burne, heate of the ſtomacke, or readineſſe to vomit. It ſtayeth the luſting or longing of women with childe, though but outwardly applied, and alſo taken inwardly after any maner: they be moreouer a remedie for the inflammation of the mouth and almonds of the throat, if they be gargled, or the mouth waſhed therewith.

B Of the ſame facultie be alſo the cluſters gathered before they be ripe; and likewiſe the bunches of the wilde Grape, which is accounted to be more effectuall againſt all thoſe infirmities.

C *Dioſcorides* ſaith, That the liquor which falleth from the body and branches beeing cut, and that ſomtimes is turned as it were into a gum (which drieuth ſtones out of the kidnies and bladder, if it be drunke in wine) healeth ring-wormes, ſcabs, and lepry, but the place is firſt to be anointed with Nitre. Being often anointed or layd on it taketh away ſuperfluous haires: but yet he ſaith that the ſame is beſt which iſſueth forth of the green and ſmaller ſticks, eſpecially that liquor which falls away whileſt the branches are burning, and it takes away Nits being laid on them.

D The ſtones and other things remaining after the preſſing are good againſt the bloudy flix, the laske of long continuance, and for thoſe that are much ſubiect to vomiting.

E The aſhes made of the ſticks and droſſe that remain after the preſſing, being laid vpon the piles and hard ſwellings about the fundament, cure the ſame: beeing mixed with oile of Rue or Herbe-Grace and Vineger, as the ſame Authour affirmeth, it helpeth to ſtrengthen members out of joynt, and ſuch as are bitten with any venomous beaſt, and eaſeth the pain of the ſpleen or milt, being applied in manner of a plaiſter.

F The later age do vſe to make a Lye with the aſhes of Vine ſtickes, in compoſition of cauſticke and burning medicines, which ſerue in ſtead of an hot iron: the one wee call a potentiall cauterie, and the other actuall.

¶ *Of Grapes.*

G Of Grapes, thoſe that are eaten raw do trouble the belly, and fil the ſtomacke full of wind, eſpecially ſuch as are of a ſoure and auſtere taſte; ſuch kindes of Grapes do very much hinder the concoction of the ſtomacke; and while they are diſperſed through the liuer and veins they ingender cold and raw juice, which cannot eaſily be changed into good bloud.

H Sweet Grapes and ſuch as are thorow ripe are leſſe hurtfull: the juice is hotter, and eaſilier diſperſed. They alſo ſooner paſſe through the belly, eſpecially being moiſt, and moſt of all if the liquor with the pulp be taken without the ſtones and skin, as *Galen* ſaith.

I The ſubſtance of the ſtones, although it be drier, and of a binding quality, doth deſcend thorow all the bowels,and is nothing changed ; as alſo the skins, which are little or nothing at all altered in the body.

Thoſe grapes which haue a ſtrong taſte of wine are in a mean between ſoure and ſweet.

Such grapes as haue little juice do nouriſh more,and thoſe leſſe that haue more juice:but theſe A
do ſooner deſcend ; for the body receiueth more nouriſhment by the pulp than by the juice;by the B
juice the belly is made more ſoluble.

C Grapes haue the preheminence among the Autumne fruits,and nouriſh more than they all, but yet not ſo much as figges ; and they haue in them little ill juice, eſpecially when they bee thorow ripe.

D Grapes may be kept the whole yeare,being ordered after the ſame manner that *Ioachimus Camerarius* reporteth. You ſhall take, ſaith hee, the meale of muſtard ſeed,and ſtrew in the bottome of any earthen pot well leaded ; whereupon you ſhall lay the faireſt bunches of the ripeſt grapes, the which you ſhall couer with more of the foreſaid meale,and lay vpon it another ſort of Grapes, ſo doing vntill the pot be full ; then ſhall you fill vp the pot to the brimme with a kind of ſweet wine called Muſt. The pot being very cloſe couered ſhall be ſet into ſome cellar or other cold place:the grapes you may take forth at your pleaſure,waſhing them with faire water from the pouder.

¶ *Of Raiſins.*

E OF Raiſins moſt are ſweet, ſome haue an auſtere or harſh taſte : ſweet Raiſins are hotter, auſtere colder ; both of them do moderatly bind,but the auſtere ſomwhat more,which do ſtrengthen the ſtomacke more. The ſweet ones do neither ſlacken the ſtomack,nor make the belly ſoluble,beeing taken with their ſtones,which are of a binding qualitie : otherwiſe the ſtones taken forth,they do make the belly looſe and ſoluble.

F Raiſins yeeld good nouriſhment to the body,they haue in them no ill juice at all, but ingender ſomwhat a thick juice,which notwithſtanding nouriſheth the more.

G There comes of ſweet and fat Raiſins moſt plenty of nouriſhment ; of which they are the beſt that haue a thin skin.

H There is in the ſweet ones a temperat and ſmoothing qualitie,with a power to clenſe moderately : they are good for the cheſt,lungs,winde-pipe, kidnies, bladder, and ſtomacke ; for they make ſmooth the roughneſſe of the winde-pipe, and are good againſt hoarſeneſſe, ſhort windedneſſe, or difficultie of breathing : they ſerue to concoct the ſpittle, and cauſe it to riſe more eaſily in any diſeaſe whatſoeuer of the cheſt,ſides,or lungs,and do mitigate the pain of the kidnies and bladder which hath joined with it heate and ſharpeneſſe of vrine : they dull and allay the malice of ſharpe and biting humors that hurt the mouth of the ſtomacke.

I Moreouer,Raiſins are good for the liuer,as *Galen* writeth in his ſeuenth booke of Medicines according to the places affected ; for they be of force to concoct raw humors and reſtraine their malignitie,and they themſelues do hardly putrifie : beſides, they are properly and of their owne ſubſtance familiar to the intrals,cure any diſtemper,and nouriſh much, wherein is their chief vertue ; for they ſtrengthen, reſiſt putrifaction, and helpe without hurt any diſtemperature of moiſture or coldneſſe,as the ſaid *Galen* affirmeth.

K The old Phyſitions haue taught vs to take out the ſtones, as we may ſee in diuers compoſitions of the antient writers;as namely in that called by *Galen, Arteriaca Mithridatis,*which hath the ſeeds taken out : for ſeeing that Raiſins containe in them a thicke ſubſtance, they canot eaſily paſſe thorow the veins,but are apt to breed obſtructions and ſtoppings of the intrals ; which happeneth the rather by reaſon of the ſeeds,for they ſo much the harder paſſe through the body,and do quickely and more eaſily cauſe obſtructions,in that they are more aſtringent or binding. Wherefore the ſeeds are to be taken out, for ſo ſhall the juice of the Raiſins more eaſily paſſe, and the ſooner bee diſtributed through the intrals.

L *Dioſcorides* reporteth,That Raiſins being chewed with pepper draw flegme and water out of the head.

M Of Raiſins is made a pulteſſe good for the gout,rottings about the joints,gangrens, and mortified vlcers : beeing ſtamped with the herb All-heale it quickely takes away the looſe nailes in the fingers and toes,being laid thereon.

¶ *Of Muſt.*

MVſt, called in Latine *Muſtum,*that is to ſay,the liquor newly iſſuing out of the grapes when they be trodden or preſſed, doth fill the ſtomacke and intrals with winde ; it is hardly digeſted, it is of a thicke juice,and if it doe not ſpeedily paſſe through the body, it becommeth more hurtfull. It hath only this one good thing in it (as *Galen* ſaith) that it maketh the body ſoluble.

A That which is ſweeteſt and preſſed out of ripe grapes doth ſooneſt paſſe through; but that which is made of ſoure and auſtere grapes is worſt of all; it is more windy, it is hardly concocted, it ingendreth raw humors, and although it doth deſcend with a looſeneſſe of the belly, notwithſtanding it oftentimes bringeth withall the Colique and pain of the ſtone; but if the belly be not moued, all things are the worſe and more troubleſome, and it oft times brings an extreme laske and the bloudy flix.

B The firſt part of the wine that comes forth of it ſelfe before the grapes be preſſed, is anſwerable to the Grape it ſelf, and doth quickly deſcend; but that which iſſues forth afterward, hauing ſome part of the nature of the ſtones, ſtalks, and skins, is far worſe.

¶ *Of Cute.*

C OF Cute that is made of Muſt, which the Latines call *Sapa*, and *Defrutum*, is that liquor called in Engliſh Cute, which is made of the ſweeteſt Muſt, by boiling it to a certaine thickneſſe, or to a third part, as *Columella* writeth.

D *Pliny* affirmeth, That *Sapa* and *Defrutum* differ in the maner of the boiling, and that *Sapa* is made when the new Wine is boiled away till onely a third part remaines; and *Defrutum* till halfe bee boiled.

E *Siræum* (ſaith he, *lib.* 14. *cap.* 17.) which others call ἕψημα, and we *Sapa*, a worke of wit, and not of Nature, is made of new Wine boyled to a third part; which beeing boyled to halfe, wee call *Defrutum*.

F *Palladius* ioyneth to theſe *Carænum*, which as hee ſaith is made when a third part is boiled away, and two remaine.

G *Leontius* in his Geoponicks ſheweth, That *Hepſema* muſt be made of eight parts of new Wine, and an hundred of wine it ſelfe boiled to a third.

H *Galen* teſtifieth, That *Hepſema* is new wine very much boiled. The later phyſitians call *Hepſema* or *Sapa* boiled wine.

I Cute or boiled wine is hot, yet not ſo hot as wine, but thicker, not ſo eaſily diſtributed or caried through the body, and it ſlowly deſcendeth by vrine, but by the belly oftentimes ſooner, for it moderatly looſens it.

K It nouriſheth more, and filleth the body quickly; yet doth it by reaſon of his thickneſſe ſticke in the ſtomack for a time, and is not ſo fit for the liuer or ſpleen. Cute alſo digeſteth raw humours that ſticke in the cheſt and lungs, and raiſeth them vp ſpeedily; wherfore it is good for the cough and ſhortneſſe of breath.

L The Vintners of the Low-Countries (and perhaps of London) do make of Cute and wine mixt in a certain proportion, a compound and counterfeit wine which they ſell for Candy wine, vſually called Malmſey.

M *Pliny, lib.* 14. *cap.* 9. ſaith, that Cute was firſt deuiſed for a baſtard hony.

¶ *Of Wine.*

N TO ſpeake of wine the juice of Grapes, which being newly preſſed forth is called (as wee haue ſaid) *Muſtum* or new wine; after the dregs and droſſe are ſetled, and it appeareth pure and cleer, it is called in Greek Οἶνος: in Latine, *Vinum*: in Engliſh, Wine, and that not vnproperly. For certain other juices, as of Apples, Pomegranats, Peares, Medlars, Seruices, or ſuch otherwiſe made (for examples ſake) of Barley and Graine, be not at all ſimply called wine, but with the name of the thing added whereof they do conſiſt. Hereupon is the wine which is preſſed forth of the Pomegranate berries named *Rhoites*, or wine of Pomegranats; out of Quinces, *Cydonites*, or wine of Quinces: out of Peares, *Apyites* or Perry; and that which is compounded of Barley is called *Zythum*, or Barley wine: in Engliſh, Ale or Beere.

O And other certain wines haue borrowed ſyrnames of the plants that haue bin infuſed or ſteeped in them; and yet all wines of the Vine, as Wormwood wine, Myrtle wine, and Hyſſop wine, which are all called artificiall wines.

P That is properly and ſimply called wine which is preſſed out of the grapes of the wine, and is without any manner of mixture.

Q The kindes of Wines are not of one nature, nor of one facultie or power, but of many, differing one from another; for there is one difference thereof in taſte, another in colour, the third is referred to the conſiſtence or ſubſtance of the Wine; the fourth conſiſteth in the vertue and ſtrength thereof. *Galen* addeth that which is found in the ſmell, which belongs to the vertue and ſtrength of the Wine.

A That may alſo bee joyned vnto them, which reſpecteth the age: for by age wines become hotter and ſharper, and doe withall change oftentimes the colour, the ſubſtance, and the ſmell: for ſome wines are ſweet of taſte; others auſtere or ſomthing harſh; diuers of a rough taſte, or altogether harſh; and moſt of them ſufficient ſharp: there be likewiſe wines of a middle ſort, inclining to one or other qualitie.

B Wine is of colour either white or reddiſh, or of a blackiſh deep red, which is called blacke, or of ſome middle colour betweene theſe.

C Some wine is of ſubſtance altogether thin; other ſome thick and fat; and many alſo of a middle conſiſtence.

D One wine is of great ſtrength, and another is weake, which is called a wateriſh wine: a full wine is called in Latine *Vinoſum*. There be alſo among theſe very many that be of a middle ſtrength.

E There is in all wines, be they neuer ſo weake, a certaine winie ſubſtance thin and hot. There be likewiſe waterie parts, and alſo diuers earthy: for wine is not ſimple, but (as *Galen*, teſtifieth *lib*. 4. of the faculties of medicines) conſiſteth of parts that haue diuers faculties.

F Of the ſundry mixture and proportion of theſe ſubſtances one with another, there riſe diuers and ſundry faculties of the wine.

G That is the beſt and fulleſt wine in which the hot and winie parts doe moſt of all abound: and the weakeſt is that wherein the waterie haue the preheminence.

H The earthy ſubſtance abounding in the mixture cauſeth the wine to be auſtere or ſomething harſh, as a crude or raw ſubſtance doth make it altogether harſh. The earthy ſubſtance being ſeuered falleth downe, and in continuance of time ſinketh to the bottome, and becomes the dreggs or lees of the wine: yet it is not alwaies wholly ſeuered, but hath both the taſt and other qualities of this ſubſtance remaining in the wine.

I All wines haue their heate, partly from the proper nature and inward or originall heate of the vine, and partly from the Sun: for there is a double heate which ripeneth not onlv the grapes, but alſo all other fruits, as *Galen* teſtifieth; the one is proper and naturall to euery thing; the other is borrowed of the Sun; which if it be perceiued in any thing, it is vndoubtedly beſt and eſpecially in the ripening of grapes.

K For the heate which proceeds from the Sun concocteth the grapes and the juice of the grapes, and doth eſpecially ripen them, ſtirring vp and increaſing the inward and naturall heat of the wine, which otherwiſe is ſo ouerwhelmed with abundance of raw and wateriſh parts, as it ſeemes to bee dulled and almoſt without life.

L For vnleſſe wine had in it a proper and originall heat, the grapes could not be ſo concocted by the force of the Sunne, as that the wine ſhould become hot; no leſſe than many other things naturally cold, which although they be ripened and made perfect by the heat of the Sun, do not for all that loſe their originall nature; as the fruits, iuices, or ſeeds of Mandrake, Nightſhade, Hemlocke, Poppy, and of other ſuch like, which though they be made ripe, and brought to full perfection, yet ſtill retaine their owne cold qualitie.

M Wherefore ſeeing that wine through the heate of the Sunne is for the moſt part brought to his proper heate, and that the heate and force is not all alike in all regions and places of the earth; therefore by reaſon of the diuerſitie of regions and places, the wines are made not a little to differ in facultie.

N The ſtronger and fuller wine groweth in hot countries and places that lie to the Sun; the rawer and weaker in cold regions and prouinces that lie open to the North.

O The hotter the Summer is, the ſtronger is the wine; the leſſe hot or the moiſter it is, the leſſe ripe is the wine. Notwithſtanding not only the manner of the weather and of the Sun, maketh the qualities of the wine to differ, but the natiue propertie of the ſoile alſo; for both the taſt and other qualities of the wine are according to the manner of the Soile. And it is very well knowne, that not only the colour of the wine, but the taſt alſo dependeth vpon the diuerſity of the grapes.

P Wine (as *Galen* writeth) is hot in the ſecond degree, and that which is very old, in the third; but new wine is hot in the firſt degree: which things are eſpecially to bee vnderſtood concerning the meane betweene the ſtrongeſt and the weakeſt; for the fulleſt and mightieſt (being but *Horna*, that is as I take it, of one yeare old) are for the moſt part hot in the ſecond degree. The weakeſt and the moſt wateriſh wines, although they be old, do ſeldome exceed the ſecond degree.

Q The drineſſe is anſwerable to the heate in proportion, as *Galen* ſaith in his book of Simples: but in his books of the gouernment of health he ſheweth, that wine doth not only heate, but alſo moiſten our bodies, and that the ſame doth moiſten and nouriſh ſuch bodies as are extreame dry; and both theſe opinions be true.

R For the faculties of wine are of one ſort as it is a medicine, and of another as it is a nouriſhment; which *Galen* in his book of the faculties of nouriſhments doth plainly ſhew, affirming that thoſe qualities of the wine which *Hippocrates* writeth of in his booke of the manner of diet, be not as a nouriſhment, but rather as of a medicine. For wine as it is a medicine doth dry, eſpecially being outwardly applied; in which caſe, for that it doth not nouriſh the body at all, the drines doth more plainely appeare, and is more manifeſtly perceiued.

A Wine is a ſpeciall good medicine for an vlcer, by reaſon of his heate and moderate drying, as *Galen* teacheth in his fourth booke of the method of healing.

B *Hippocrates* writeth, That vlcers, what manner of ones ſoeuer they are, muſt not be moiſtned vnleſſe it be with wine: for that which is dry (as *Galen* addeth) commeth neerer to that which is whole, and the thing that is moiſt, to that which is not whole.

C It is manifeſt, that Wine is in power or facultie dry, and not in act; for Wine actually is moiſt and liquid, and alſo cold: for the ſame cauſe it likewiſe quencheth thirſt, which is an appetite or deſire of cold and moiſt, and by this actuall moiſture (that we may ſo terme it) it is if it be inwardly taken, not a medicine, but a nouriſhment; for it nouriſheth, and through his moiſture maketh plenty of bloud; and by increaſing the nouriſhment it moiſtneth the body, vnleſſe peraduenture it be old and very ſtrong: for it is made ſharpe and biting by long lying, and ſuch kinde of Wine doth not only heate, but alſo conſume and dry the body, for as much as it is not now a nouriſhment, but a medicine.

D That wine which is neither ſharp by long lying, nor made medicinable, doth nouriſh and moiſten, ſeruing as it were to make plenty of nouriſhment and bloud, by reaſon that through his actuall moiſture it more moiſtneth by feeding, nouriſhing, and comforting, than it is able to dry by his power.

E Wine doth refreſh the inward and naturall heate, comforteth the ſtomacke, cauſeth it to haue an appetite to meat, moueth concoction, and conueyeth the nouriſhment through all parts of the body, increaſeth ſtrength, inlargeth the body, maketh flegme thin, bringeth forth by vrine cholericke and waterie humors, procureth ſweating, ingendreth pure bloud, maketh the body well coloured, and turneth an ill colour into a better.

F It is good for ſuch as are in a conſumption, by reaſon of ſome diſeaſe, and that haue need to haue their bodies nouriſhed atd refreſhed (alwaies prouided they haue no feuer,) as *Galen* ſaith in his ſeuenth booke of the Method of curing. It reſtoreth ſtrength moſt of all other things, and that ſpeedily: It maketh a man merry and ioyfull: It putteth away feare, care, troubles of minde, and ſorrow: It moueth pleaſure and luſt of the body, and bringeth ſleepe gently.

G And theſe things proceed of the moderate vſe of wine: for immoderate drinking of wine doth altogether bring the contrarie. They that are drunke are diſtraughted in minde, become fooliſh, and oppreſſed with a drowſie ſleepineſſe, and be afterward taken with the Apoplexy, the gout, or altogether with other moſt grieuous diſeaſes; the braine, liuer, lungs, or ſome other of the intrals being corrupted with too often and ouermuch drinking of wine.

H Moreouer, wine is a remedy againſt taking of Hemlock or green Coriander, the juice of black Poppy, Wolfes bane, and Leopards-bane, Tode-ſtooles, and other cold poiſons, and alſo againſt the biting of Serpents, and ſtings of venomous beaſts, that hurt and kill by cooling.

I Wine alſo is a remedy againſt the ouer-fulneſſe and ſtretching out of the ſides, windy ſwellings, the green ſickneſſe, the dropſie, and generally all cold infirmities of the ſtomack, liuer, milt, and alſo of the matrix.

K But Wine which is of colour and ſubſtance like water, throughſhining bright, pure, of a thinne ſubſtance, which is called white, is of all wines the weakeſt; and if the ſame ſhould bee tempered with water it would beare very little: and hereupon *Hippocrates* calleth it ὀλιγόφορον, that is to ſay, bearing little water to delay it withall.

L This troubleth the head and hurteth the ſinewes leſſe than others do, and is not vnpleaſant to the ſtomacke: it is eaſily and quickely diſperſed thorow all parts of the body: it is giuen with far leſſe danger than any other wine, to thoſe that haue the Ague (except ſome inflammation or hot ſwelling be ſuſpected) and oftentimes with good ſucceſſe to ſuch as haue intermitting feuers; for as *Galen, lib.* 8. of his Method ſaith, it helpeth concoction, digeſteth humors that be halfe raw, procureth vrine and ſweat, and is good for thoſe that cannot ſleep, and that be full of care and ſorrow, and for ſuch as are ouerwearied.

M Black wine, that is to ſay, wine of a deep red colour, is thick, and hardly diſperſed, and doth not eaſily paſſe through the bladder: it quickely taketh hold of the braine and makes a man drunk: it is harder of digeſtion: it remaineth longer in the body; it eaſily ſtoppeth the liuer and ſpleen; for the moſt part it bindes, notwithſtanding it nouriſheth more, and is more fit to engender bloud: it filleth the body with fleſh ſooner than others do.

N That which is of a light crimſon red colour is for the moſt part more delightfull to the taſte, fitter for the ſtomacke; it is ſooner and eaſier diſperſed: it troubleth the head leſſe, it remains not ſo long vnder the ſhort ribs, and eaſilier deſcendeth to the bladder than blacke wine doth: it doth alſo make the belly coſtiue, if ſo be that it be not ripe. For ſuch crude and rough wines do oftentimes moleſt weake ſtomackes, and are troubleſome to the belly.

A Reddiſh yellow wine ſeemeth to be in a meane betweene a thinne and thicke ſubſtance: otherwiſe it is of all wines the hotteſt; and ſuffereth moſt water to be mixed with it, as *Hippocrates* writeth.

B The old wine of this kinde, being of a thin ſubſtance and good ſmell, is a ſingular medicine for all thoſe that are much ſubiect to ſwouning, although the cauſe thereof proceed of choler that hurteth the mouth of the ſtomacke, as *Galen* teſtifieth in the 12. booke of his method.

C Sweet wine the leſſe hot it is, the leſſe doth it trouble the head, and offend the minde; and it better paſſeth through the belly, making it oftentimes ſoluble: but it doth not ſo eaſily paſſe or deſcend by vrine.

D Againe, the thicker it is of ſubſtance, the harder and ſlowlier it paſſeth through: it is good for the lungs and for thoſe that haue the cough. It ripeneth raw humors that ſticke in the cheſt, and cauſeth them to be eaſilier ſpit vp; but it is not ſo good for the liuer, whereunto it bringeth no ſmall hurt when either it is inflamed, or ſchirrous, or when it is ſtopped. It is alſo an enemy to the ſpleene, it ſticketh vnder the ſhort ribs, and is hurtfull to thoſe that are full of choler. For this kind of wine, eſpecially the thicker it is, is in them very ſpeedily turned into choler: and in others when it is well concocted, it increaſeth plenty of nouriſhment.

E Auſtere wine, or that which is ſomewhat harſh in taſte, nouriſheth not much; and if ſo be that it be thin and white, it is apt to prouoke vrine, it leſſe troubleth the head, it is not quickly digeſted, for which cauſe it is the more to be ſhunned, as *Galen* ſaith in 12. booke of his method.

F That wine which is altogether harſh or rough in taſte, the leſſe ripe it is, the neerer it commeth to the qualities of Verjuyce made of ſower grapes, being euidently binding. It ſtrengtheneth a weake ſtomacke; it is good againſt the vnkindely luſting or longing of women with childe; it ſtaieth the laske, but it ſticketh in the bowels: breedeth ſtoppings in the liuer and milt; it ſlowly deſcendeth by vrine, and ſomething troubleth the head.

G Old wine which is alſo made ſharpe by reaſon of age, is not only troubleſome to the braine, but alſo hurteth the ſinewes: it is an enemy to the entrailes, and maketh the body leane.

H New wine, and wine of the firſt yeere, doth eaſily make the body to ſwell, and ingendreth winde, it cauſeth troubleſome dreames, eſpecially that which is not throughly refined, or thicke, or very ſweet: for ſuch do ſooner ſticke in the entrailes than others do. Other wines that are in a meane in colour, ſubſtance, taſte or age, as they doe decline in vertues and goodneſſe from the extreames; ſo alſo they be free from their faults and diſcommodities. They come neere in faculties to thoſe wines whereunto they be next, either in colour, taſte, or ſubſtance, or elſe in ſmell or in age.

I Wine is fitteſt for thoſe that be of nature cold and dry; and alſo for old men, as *Galen* ſheweth in his fifth booke of the gouernment of health: for it heateth all the members of their bodies, and purgeth away the watery part of the bloud, if their be any.

K The beſt wines are thoſe that be of a fat ſubſtance: for thoſe both increaſe bloud, and nouriſh the body; both which commodities they bring to old men, eſpecially at ſuch time as they haue no ſerous humour in their veines, and haue need of much nouriſhment. It happeneth that oftentimes there doth abound in their bodies a wateriſh excrement, and then ſtand they in moſt need of all of ſuch wines as do prouoke vrine.

L As wine is beſt for old men, ſo it is worſt for children: by reaſon that being drunke, it both moiſteneth and drieth ouermuch, and alſo filleth the head with vapours, in thoſe who are of a moiſt and hot complexion, or whoſe bodies are in a meane betweene the extreames, whom *Galen* in his booke of the gouernment of health doth perſuade, that they ſhould not ſo much as taſte of wine for a very long time: for neither is it good for them to haue their heads filled, nor to be made moiſt and hot, more than is ſufficient, becauſe they are already of ſuch a heate and moiſture, as if you ſhould but little increaſe either quality, they would forthwith fall into the extreme.

M And ſeeing that euery exceſſe is to be ſhunned, it is expedient moſt of all to ſhun this, by which not only the body, but alſo the minde receiueth hurt.

N Wherefore we thinke, that wine is not fit for men that be already of full age, vnleſſe it be moderately taken, becauſe it carrieth them headlong into fury and luſt, and troubleth and dulleth the reaſonable part of the minde.

¶ *Of the delaying, or tempering of Wine.*

O It was an ancient cuſtome, and of long continuance in oldtime, for wines to be mixed with water, as it is plaine and euident not onely by *Hippocrates*, but alſo by other old mens Writings. Wine firſt began to be mixed with water for health and wholeſomeneſſe ſake: for as *Hippocrates* writeth in his booke of antient Phyſicke, beeing ſimply and of it ſelfe much drunke, it maketh a man in ſome ſort weake and feeble: which thing *Ouid* ſeemeth alſo to allow of, writing thus:

Vt Venus eneruat vires, ſic copia vini
Et tentat greſſas, debilitatque pedes.

As Venery the vigour ſpends, ſo ſtore of Wine
Makes man to ſtagger, makes his ſtrength decline.

A Moreouer, wine is the ſweeter, hauing water poured into it, as *Athenæus* ſaith. *Homer* likewiſe commendeth that wine which is well and fitly allaied. *Philocorus* writeth (as *Athenæus* reporteth) that *Amphictyon* king of Athens was the firſt that allaied wine, as hauing learned the ſame of *Dionyſius*: wherefore he ſaith, that thoſe who in that manner drunke it remained in health, that before had their bodies feeble and ouerweakened with pure and vnmixed wine.

B The manner of mingling or tempering of wine was diuers: for ſometimes to one part of wine, there were added two, and ſometimes three or foure of water; or to two parts of wine three of water: of a leſſe delay was that which conſiſted of equall parts of wine and water.

C The old Comedians did thinke that this leſſer mixture was ſufficient to make men mad, among whom was *Mneſitheus*, whoſe words be extant in *Athenæus*.

D *Hippocrates* in the ſeuenth booke of his Aphoriſmes ſaith, that this manner of tempering of wine and water by equall parts bringeth as it were a light pleaſant drunkenneſſe, and that it is kinde of remedy againſt diſquietneſſe, yawnings, and ſhiuerings; and this mingling belongeth to the ſtrongeſt wines.

E Such kinde of wines they might be which in times paſt the Scythians were reported of the old writers to drinke, who for this cauſe doe call vnmixed wine the Scythians drinke. And they that drinke ſimple wine ſay, that they will *Scithyzare*, or do as the Scythians do, as we may reade in the tenth booke of *Athenæus*.

F The Scythians, as *Hippocrates* and diuers other of the old writers affirme, be people of Germany beyond the floud Danubius, which is alſo called Iſter: Rhene is a riuer of Scythia: and *Cyrus* hauing paſſed ouer Iſter is reported to haue come into the borders of the Scythians.

G And in this our age all the people of Germany do drinke vnmixed wine, which groweth in their owne country, and likewiſe other people of the North parts, who make no ſcruple at all to drinke of the ſtrongeſt wines without any mixture.

¶ *Of the liquor which is diſtilled out of Wine, commonly called,* Aqua vitæ.

H There is drawne out of Wine a liquor, which in Latine is commonly called *Aqua vitæ*, or water of life, and alſo *Aqua ardens*, or burning water, which as diſtilled waters are drawne out of herbes and other things, is after the ſame manner diſtilled out of ſtrong wine, that is to ſay, by certaine inſtruments made for this purpoſe, which are commonly called Limbeckes.

I This kinde of liquor is in colour and ſubſtance like vnto waters diſtilled out of herbes, and alſo reſembleth cleere ſimple water in colour, but in faculty it farre differeth.

K It beareth the ſyrname of life, becauſe that it ſerueth to preſerue and prolong the life of man.

L It is called *Ardens*, burning, for that it is eaſily turned into a burning flame: for ſeeing it is not any other thing than the thinneſt and ſtrongeſt part of the wine, it being put to the flame of fire, is quickly burned.

M This liquor is very hot, and of moſt ſubtill and thin parts, hot and dry in the later end of the third degree, eſpecially the pureſt ſpirits thereof: for the purer it is, the hotter it is, the dryer, and of thinner parts: which is made more pure by often diſtilling.

N This water diſtilled out of wine is good for all thoſe that are made cold either by a long diſeaſe, or through age, as for old and impotent men: for it cheriſheth and increaſeth naturall heate; vpholdeth ſtrength, repaireth and augmenteth the ſame: it prolongeth life, quickeneth all the ſenſes, and doth not only preſerue the memory, but alſo recouereth it when it is loſt: it ſharpeneth the ſight.

O It is fit for thoſe that are taken with the Catalepſie (which is a diſeaſe in the braine proceeding of drineſſe and cold) and are ſubject to dead ſleepes, if there be no feuer joyned; it ſerueth for the weakeneſſe, trembling, and beating of the heart; it ſtrengtheneth and heateth a feeble ſtomacke; it conſumeth winde both in the ſtomacke, ſides, and bowels; it maketh good concoction of meate, and is a ſingular remedy againſt cold poyſons.

P It hath ſuch force and power, in ſtrengthening of the heart, and ſtirreth vp the inſtruments of the ſenſes, that it is moſt effectuall, not onely inwardly taken to the quantity of a little ſpoonefull, but alſo outwardly applied: that is to ſay, ſet to the noſthrils, or laid vpon the temples of the head, and to the wreſts of the armes; and alſo to foment and bath ſundry hurts and griefes.

A Being held in the mouth it helpeth the toothache: it is alſo good againſt cold cramps and conuulſions, being chafed and rubbed therewith.

B Some are bold to giue it in quartaines before the fit, eſpecially after the height or prim of the diſeaſe.

C This water is to be giuen in wine with great iudgement and diſcretion; for ſeeing it is extreme hot, and of moſt ſubtill parts, and nothing elſe but the very ſpirit of the wine, it moſt ſpeedily pierceth through, and doth eaſily aſſault and hurt the braine.

D Therefore it may be giuen to ſuch as haue the apoplexie and falling ſickneſſe, the megrim, the headache of long continuance, the Vertigo, or giddineſſe proceeding through a cold cauſe: yet can it not be alwaies ſafely giuen; for vnleſſe the matter the efficient cauſe of the diſeaſe be ſmall, and the ſicke man of temperature very cold, it cannot be miniſtred without danger: for that it ſpredeth and diſperſeth the humours, it filleth or ſtuffeth the head, and maketh the ſicke man worſe: and if the humors be hot, as bloud is, it doth not a little increaſe inflammations alſo.

E This water is hurtfull to all that be of nature and complexion hot, and moſt of all to cholericke men: it is alſo offenſiue to the liuer, and likewiſe vnprofitable for the kidnies, being often and plentifully taken.

If I ſhould take in hand to write of euery mixture, of each infuſion, of the ſundry colours, and euery other circumſtance that the vulgar people doe giue vnto this water, and their diuers vſe, I ſhould ſpend much time but to ſmall purpoſe.

¶ *Of Argall, Tartar, or wine Lees.*

F THe Lees of wine which is become hard like a cruſt, and ſticketh to the ſides of the veſſell and wine casks, being dried, hard, ſound, and well compact, and which may be beaten into pouder, is called in ſhops *Tartarum*: in Engliſh, Argall, and Tartar.

G Theſe Lees are vſed for many things: the ſiluer-Smiths poliſh their ſiluer herewith: the Diers vſe it: and it is profitable in medicine.

H It doth greatly dry and waſte away, as *Paulus Ægineta* ſaith: it hath withall a binding faculty, proceeding from the kinde of wine, of which it commeth.

I The ſame ſerueth for moiſt diſeaſes of the body: it is good for thoſe that haue the greene ſickneſſe and the dropſie, eſpecially that kinde that lieth in the fleſh, called in Latine, *Leucophlagmatica*: being taken euery day faſting halfe a penny weight or a full penny weight (which is a dram and nine graines after the Romanes computation) doth not onely dry vp the wateriſh excrements, and voideth them by vrine, but it preuaileth much to clenſe the belly by ſiege.

K It would worke more effectually, if it were mixed either with hot ſpices, or with other things that breake winde, or elſe with diuretickes, which are medicines that prouoke vrine; likewiſe to be mixed with gentle purgers, as the ſicke mans caſe ſhall require.

L The ſame of it ſelfe, or tempered with oile of Myrtles, is a remedy againſt ſoft ſwellings, as *Dioſcoridees* teacheth: it ſtaieth the laske, and vomiting, being applied outwardly vpon the region of the ſtomacke in a pultis; and if it be laid to the bottome of the belly and ſecret parts, it ſtoppeth the whites, waſteth away hot ſwellings of the kernels in the flankes, and other places, which be not yet exulcerated: it aſſwageth great breſts, and drieth vp the milke, if it be annointed on with vinegre.

M Theſe Lees are oftentimes burnt: if it become all white, it is a ſigne of right and perfect burning, for till then it muſt be burned: being ſo burnt, the Grecians terme it, [illegible], as *Ægineta* ſaith, the Apothecaries call it, *Tartarum vſtum*, and *Tartarum calcinatum*: that is to ſay, burnt or calcined Tartar.

N It hath a very great cauſticke or burning quality: it clenſeth and throughly heateth, bindeth, eateth, and very much drieth, as *Dioſcorides* doth write: being mixed with Roſin, it maketh rough and ill nailes to fall away: *Paulus* ſaith, That it is mixed with cauſtickes or burning medicines to increaſe their burning quality: it muſt be vſed whileſt it is new made, becauſe it quickly vaniſheth, for the Lees of wine burned, doe ſoone relent or wax moiſt, and are ſpeedily reſolued into liquor: therefore he that would vſe it dry, muſt haue it put in a glaſſe, or glaſſed veſſell well ſtopped, and ſet in a hot and dry place. It melteth and is turned into liquor if it be hanged in a linnen bag in ſome place in a celler vnder the ground.

O The Apothecaries call this liquor that droppeth away from it, oile of Tartar. It retaineth a cauſticke and burning quality, and alſo a very dry faculty: it very ſoon taketh away leprie, ſcabs, tetters, and other filth and deformity of the skin and face: with an equall quantity of Roſe water added, and as much Ceruſe as is ſufficient for a linament, wherewith the blemiſhed or ſpotted parts muſt be annointed ouer night.

¶ *The briefe ſumme of that hath beene ſaid of the Vine.*

A The juyce of the greene leaues, branches, and tendrels of the Vine drunken, is good for thoſe that vomit and ſpit bloud, for the bloudy flix, and for women with child that vomit ouermuch. The kernell within the grapes boiled in water and drunke hath the ſame effect.

B Wine moderately drunke profiteth much, and maketh good digeſtion, but it hurteth and diſtempereth them that drinke it ſeldome.

C White wine is good to be drunke before meat; it preſerueth the body, and pierceth quickely into the bladder: but vpon a full ſtomacke it rather maketh opilations or ſtoppings, becauſe it doth ſwiftly driue downe meate before Nature hath of her ſelfe digeſted it.

D Claret wine doth greatly nouriſh and warme the body, and is wholeſome with meate, eſpecially vnto phlegmaticke people; but very vnwholeſome for young children, as *Galen* ſaith, becauſe it heateth aboue nature, and hurteth the head.

E Red wine ſtops the belly, corrupteth the bloud, breedeth the ſtone, is hurtfull to old people, and good or profitable to few, ſaue to ſuch as are troubled with the laske, bloudy flix, or any other looſeneſſe of the body.

F Sacke or Spaniſh wine hath been vſed of a long time to be drunke after meat, to cauſe the meat the better to digeſt; but common experience hath found it to be more beneficiall to the ſtomacke to be drunke before meat.

G Likewiſe Malmſey, Muskadell, Baſtard, and ſuch like ſweet wines haue been vſed before meat, to comfort the cold and weake ſtomacke, eſpecially being taken faſting: but experience teacheth, that Sacke drunke in ſtead thereof is much better, and warmeth more effectually.

H Almighty God for the comfort of mankinde ordained Wine; but decreed withall, That it ſhould be moderately taken, for ſo it is wholſome and comfortable: but when meaſure is turned into exceſſe, it becommeth vnwholeſome, and a poyſon moſt venomous, relaxing the ſinewes, bringing with it the palſey and falling ſickneſſe: to thoſe of a middle age it bringeth hot feuers, frenſie, and lecherie; it conſumeth the liuer and other of the inward parts: beſides, how little credence is to be giuen to drunkards it is euident; for though they be mightv men, yet it maketh them monſters, and worſe than brute beaſts. Finally in a word to conclude; this exceſſiue drinking of Wine diſhonoreth Noblemen, beggereth the poore, and more haue beene deſtroied by ſurfeiting therewith, than by the ſword.

CHAP. 324. *Of Hops.*

¶ *The Kindes.*

There bee two ſorts of Hops: one the manured or the Garden Hop; the other wilde or of the hedge.

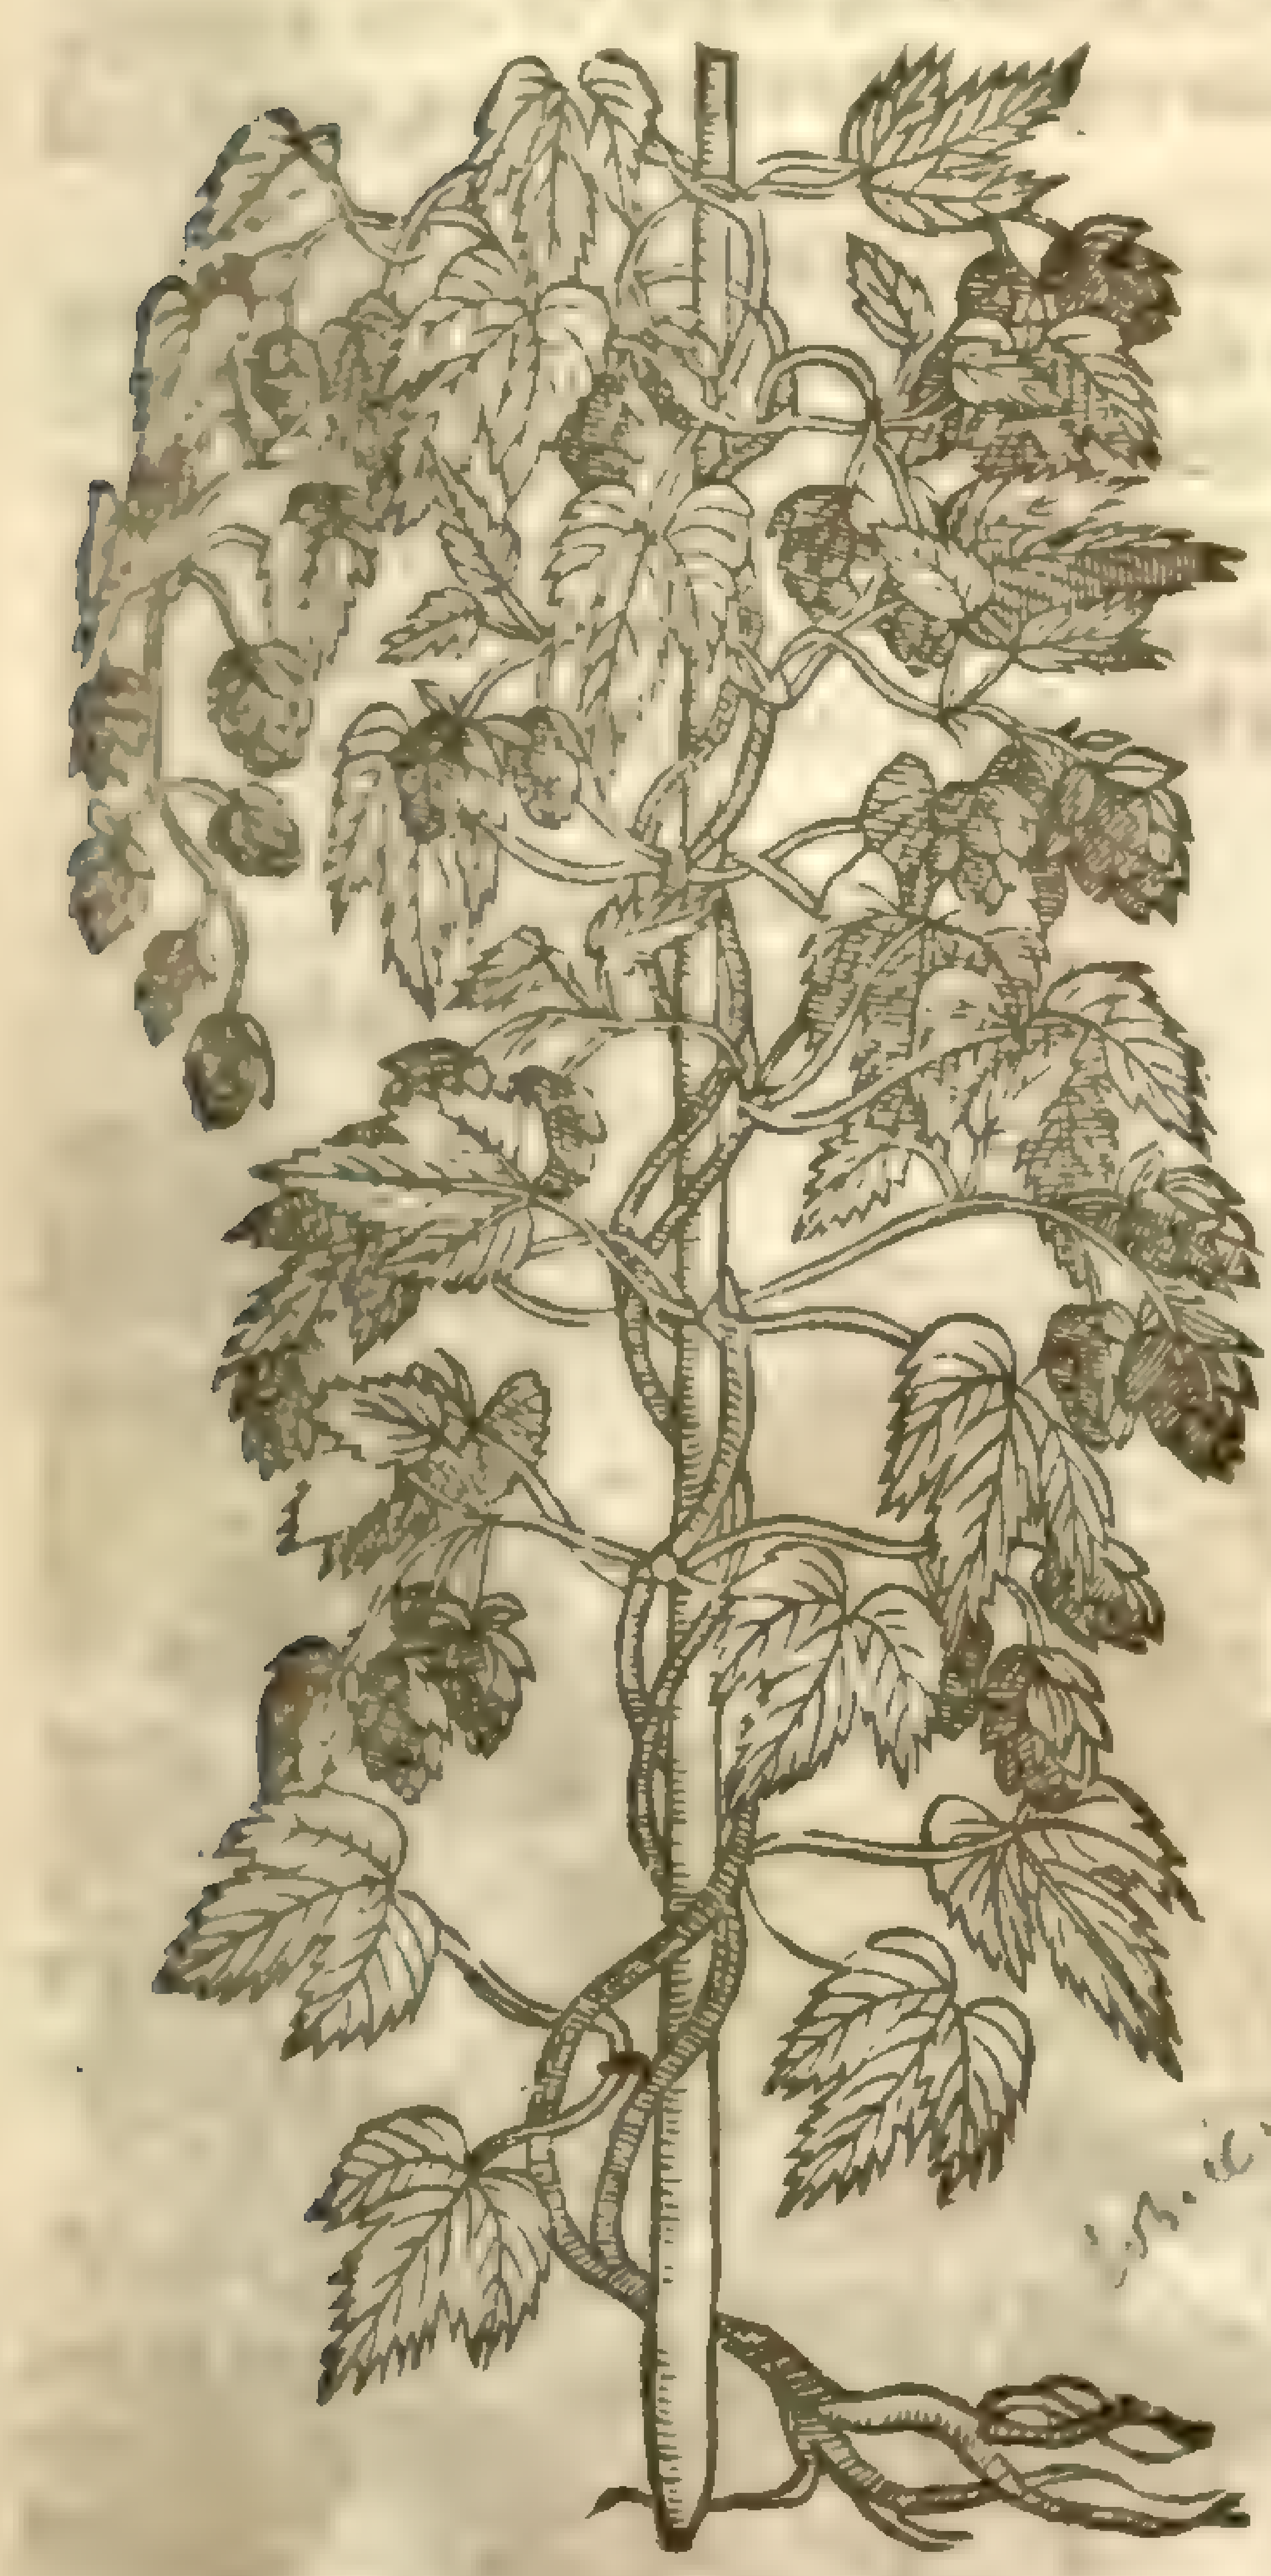
¶ *The Deſcription.*

1 The Hop doth liue and flouriſh by embracing and taking hold of poles, pearches, and other things vpon which it climeth. It bringeth forth very long ſtalkes, rough, and hairie; alſo rugged leaues broad like thoſe of the Vine, or rather of Bryony, but yet blacker, and with fewer dented diuiſions: the floures hang downe by cluſters from the tops of the branches, puffed vp, ſet as it were with ſcales like little canes, or ſcaled Pine apples, of a whitiſh colour tending to yellowneſſe, ſtrong of ſmell: the roots are ſlender, and diuerſly folded one within another.

2 The wilde Hop differeth not from the manured Hop in forme or faſhion, but is altogether leſſer, as well in the cluſters of floures, as alſo in the franke ſhoots, and doth not bring forth ſuch ſtore of floures, wherein eſpecially conſiſteth the difference.

¶ *The Place.*

The Hop joyeth in a fat and fruitfull ground: it proſpereth the better by manuring: alſo it groweth among briers and thornes about the borders of fields, I meane the wilde kinde.



1 *Lupus ſalictarius.*
Hops.

¶ *The Time.*

The floures of hops are gathered in Auguſt and September, and reſerued to be vſed in beere: in the Spring time come forth new ſhoots or buds; in the Winter onely the roots remaine aliue.

¶ *The Names.*

It is called in ſhops and in all other places, *Lupulus*: of ſome, *Lupus ſalictarius*, or *Lupulus ſalictarius*: in high Dutch, **Hopffen**: in low Dutch, **Hoppe**: in Spaniſh, *HombreZillos*: in French, *Houblon*: in Engliſh, Hops.

Pliny, lib. 21.*cap.*15. maketh mention of Hops among the prickly plants.

¶ *The Temperature.*

The floures of the hop are hot and dry in the ſecond degree: they fill and ſtuffe the head, and hurt the ſame with their ſtrong ſmell. Of the ſame temperature alſo are the leaues themſelues, which doe likewiſe open and clenſe.

¶ *The Vertues.*

The buds or firſt ſprouts which come forth in the Spring are vſed to be eaten in ſallads; yet are they, as *Pliny* ſaith, more toothſome than nouriſhing, for they yeeld but very ſmall nouriſhment: notwithſtanding they be good for the intrals, both in opening and procuring of vrine, and likewiſe in keeping the body ſoluble. A

The leaues and little tender ſtalkes, and alſo the floures themſelues remoue ſtoppings out [illegible] the liuer and ſpleene, purge by vrine, helpe the ſpleene, clenſe the bloud, and be profitable againſt long lingring Agues, ſcabs, and ſuch like filth of the skin, if they be boyled in whay. B

The juyce is of more force, and doth not onely remoue obſtructions out of the intrals, but it is alſo thought to auoid choler and flegme by the ſtoole. It is written, that the ſame dropped into the eares, taketh away the ſtench and corruption thereof. C

The floures are vſed to ſeaſon Beere or Ale with, and too many do cauſe bitterneſſe thereof, and are ill for the head. D

The floures make bread light, and the lumpe to be ſooner and eaſilier leauened, if the meale be tempered with liquor wherein they haue been boiled. E

The decoction of Hops drunke openeth the ſtoppings of the liuer, the ſpleene, and kidnies, and purgeth the bloud from all corrupt humors, cauſing the ſame to come forth with the vrine. F

The juyce of Hops openeth the belly, and driueth forth yellow and cholericke humors, and purgeth the bloud from all filthineſſe. G

The manifold vertues of Hops do manifeſt argue the wholeſomeneſſe of beere aboue ale; for the hops rather make it a phyſicall drinke to keepe the body in health, than an ordinary drinke for the quenching of our thirſt. H

CHAP. 325. *Of Trauellers-Ioy.*

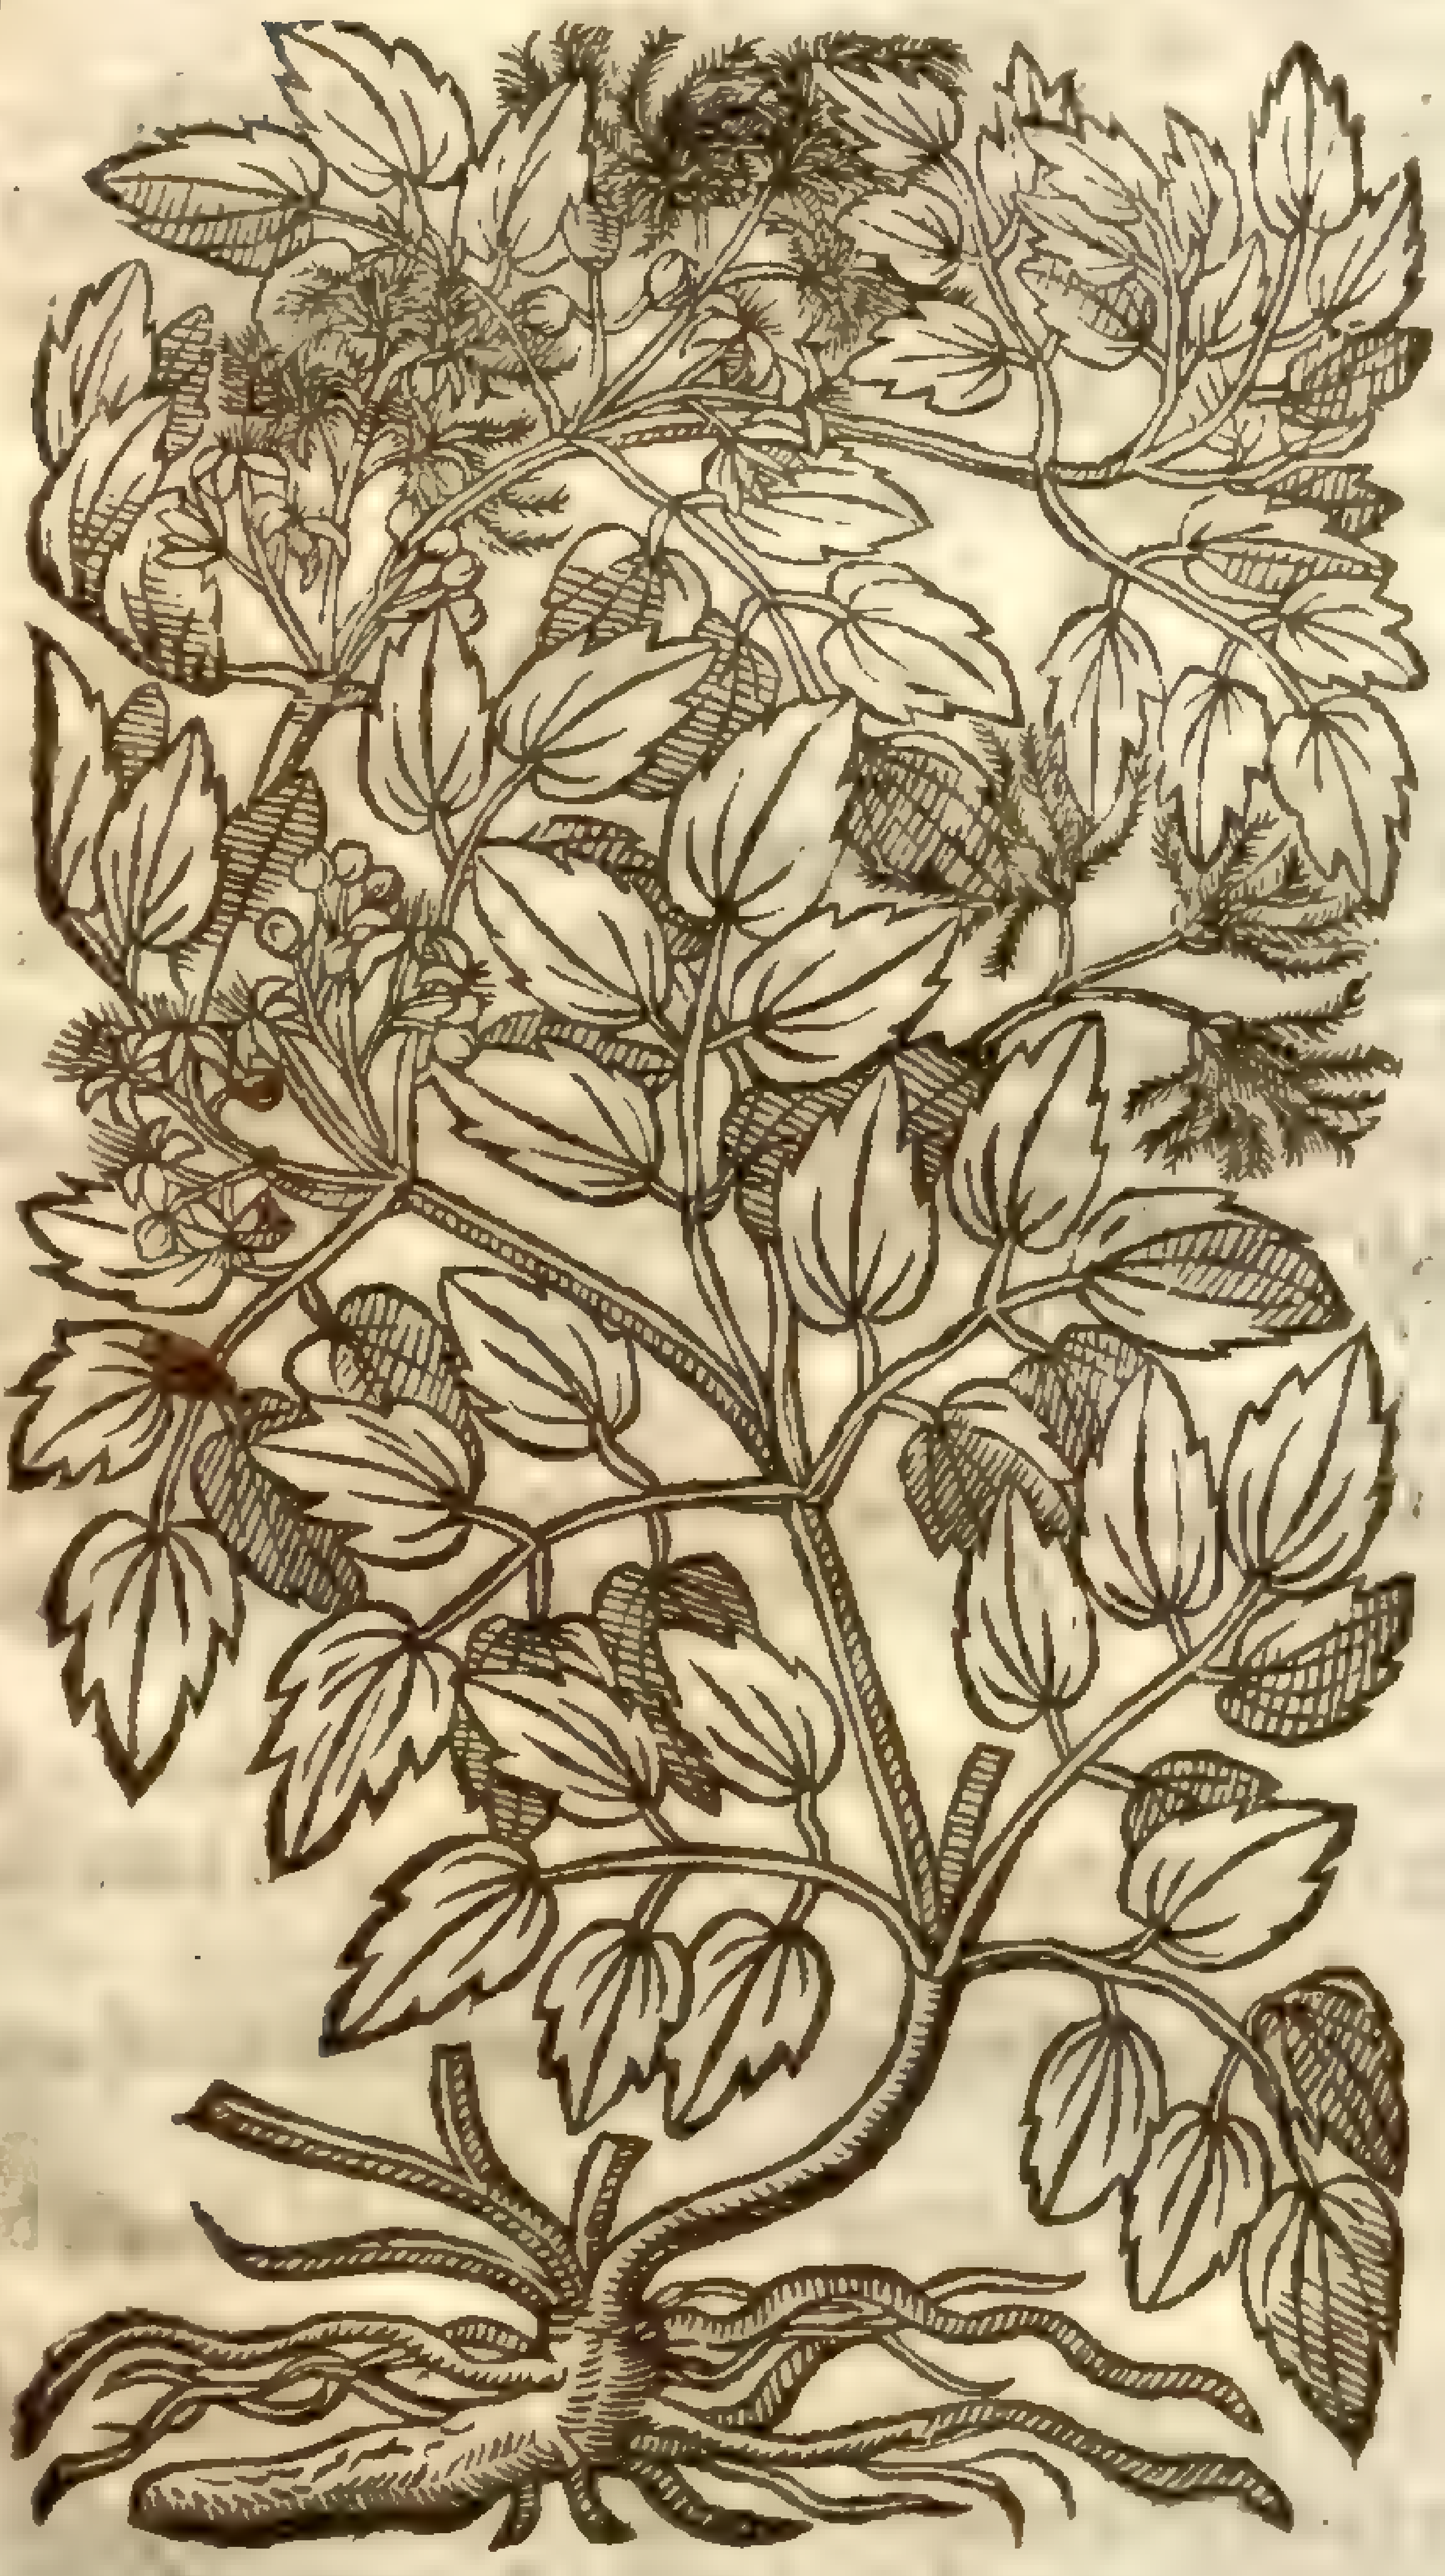
¶ *The Deſcription.*

1 THe plant which *Lobel* ſetteth forth vnder the title of *Viorna*, *Dodonæus* makes *Vitis alba*; but not properly; whoſe long wooddy and viny branches extend themſelues very far, and into infinite numbers, decking with his claſping tendrels and white ſtarre-like floures (being very ſweet) all the buſhes, hedges, and ſhrubs that are neere vnto it. It ſends forth many branched ſtalkes, thicke, tough, full of ſhoots and claſping tendrels, wherewith it foldeth it ſelfe vpon the hedges, and taketh hold and climeth vpon euery thing that ſtandeth neere vnto it.

The leaues are faſtned for the moſt part by fiues vpon one rib or ſtem, two on either ſide, and one in the midſt or point ſtanding alone; which leaues are broad like thoſe of Iuy, but not cornered at all: among which come forth cluſters of white floures, and after them great tufts of flat ſeeds, each ſeed hauing a fine white plume like a feather faſtned to it, which maketh in the Winter a goodly ſhew, couering the hedges white all ouer with his feather-like tops. The root is long, tough, and thicke, with many ſtrings faſtned thereto.

2 *Cluſius* hath ſet forth a kinde of *Clematis*, calling it *Clematis Bætica*, hauing a maruellous long ſmall branch full of joynts, with many leaues indented about the edges like thoſe of the peare tree, but ſtiffer and ſmaller, comming from euery joynt; from whence alſo at each joynt proceed two ſmall claſping tendrels, as alſo the ſmall foot-ſtalkes whereon the ſeeds do ſtand, growing in great tufted plumes or feathers, like vnto the precedent, whereof it is a kinde. The floures are not expreſſed in the figure, nor ſeene by the Author, and therefore what hath been ſaid ſhall ſuffice.

1 *Viorna.*
The Trauellers-Ioy.

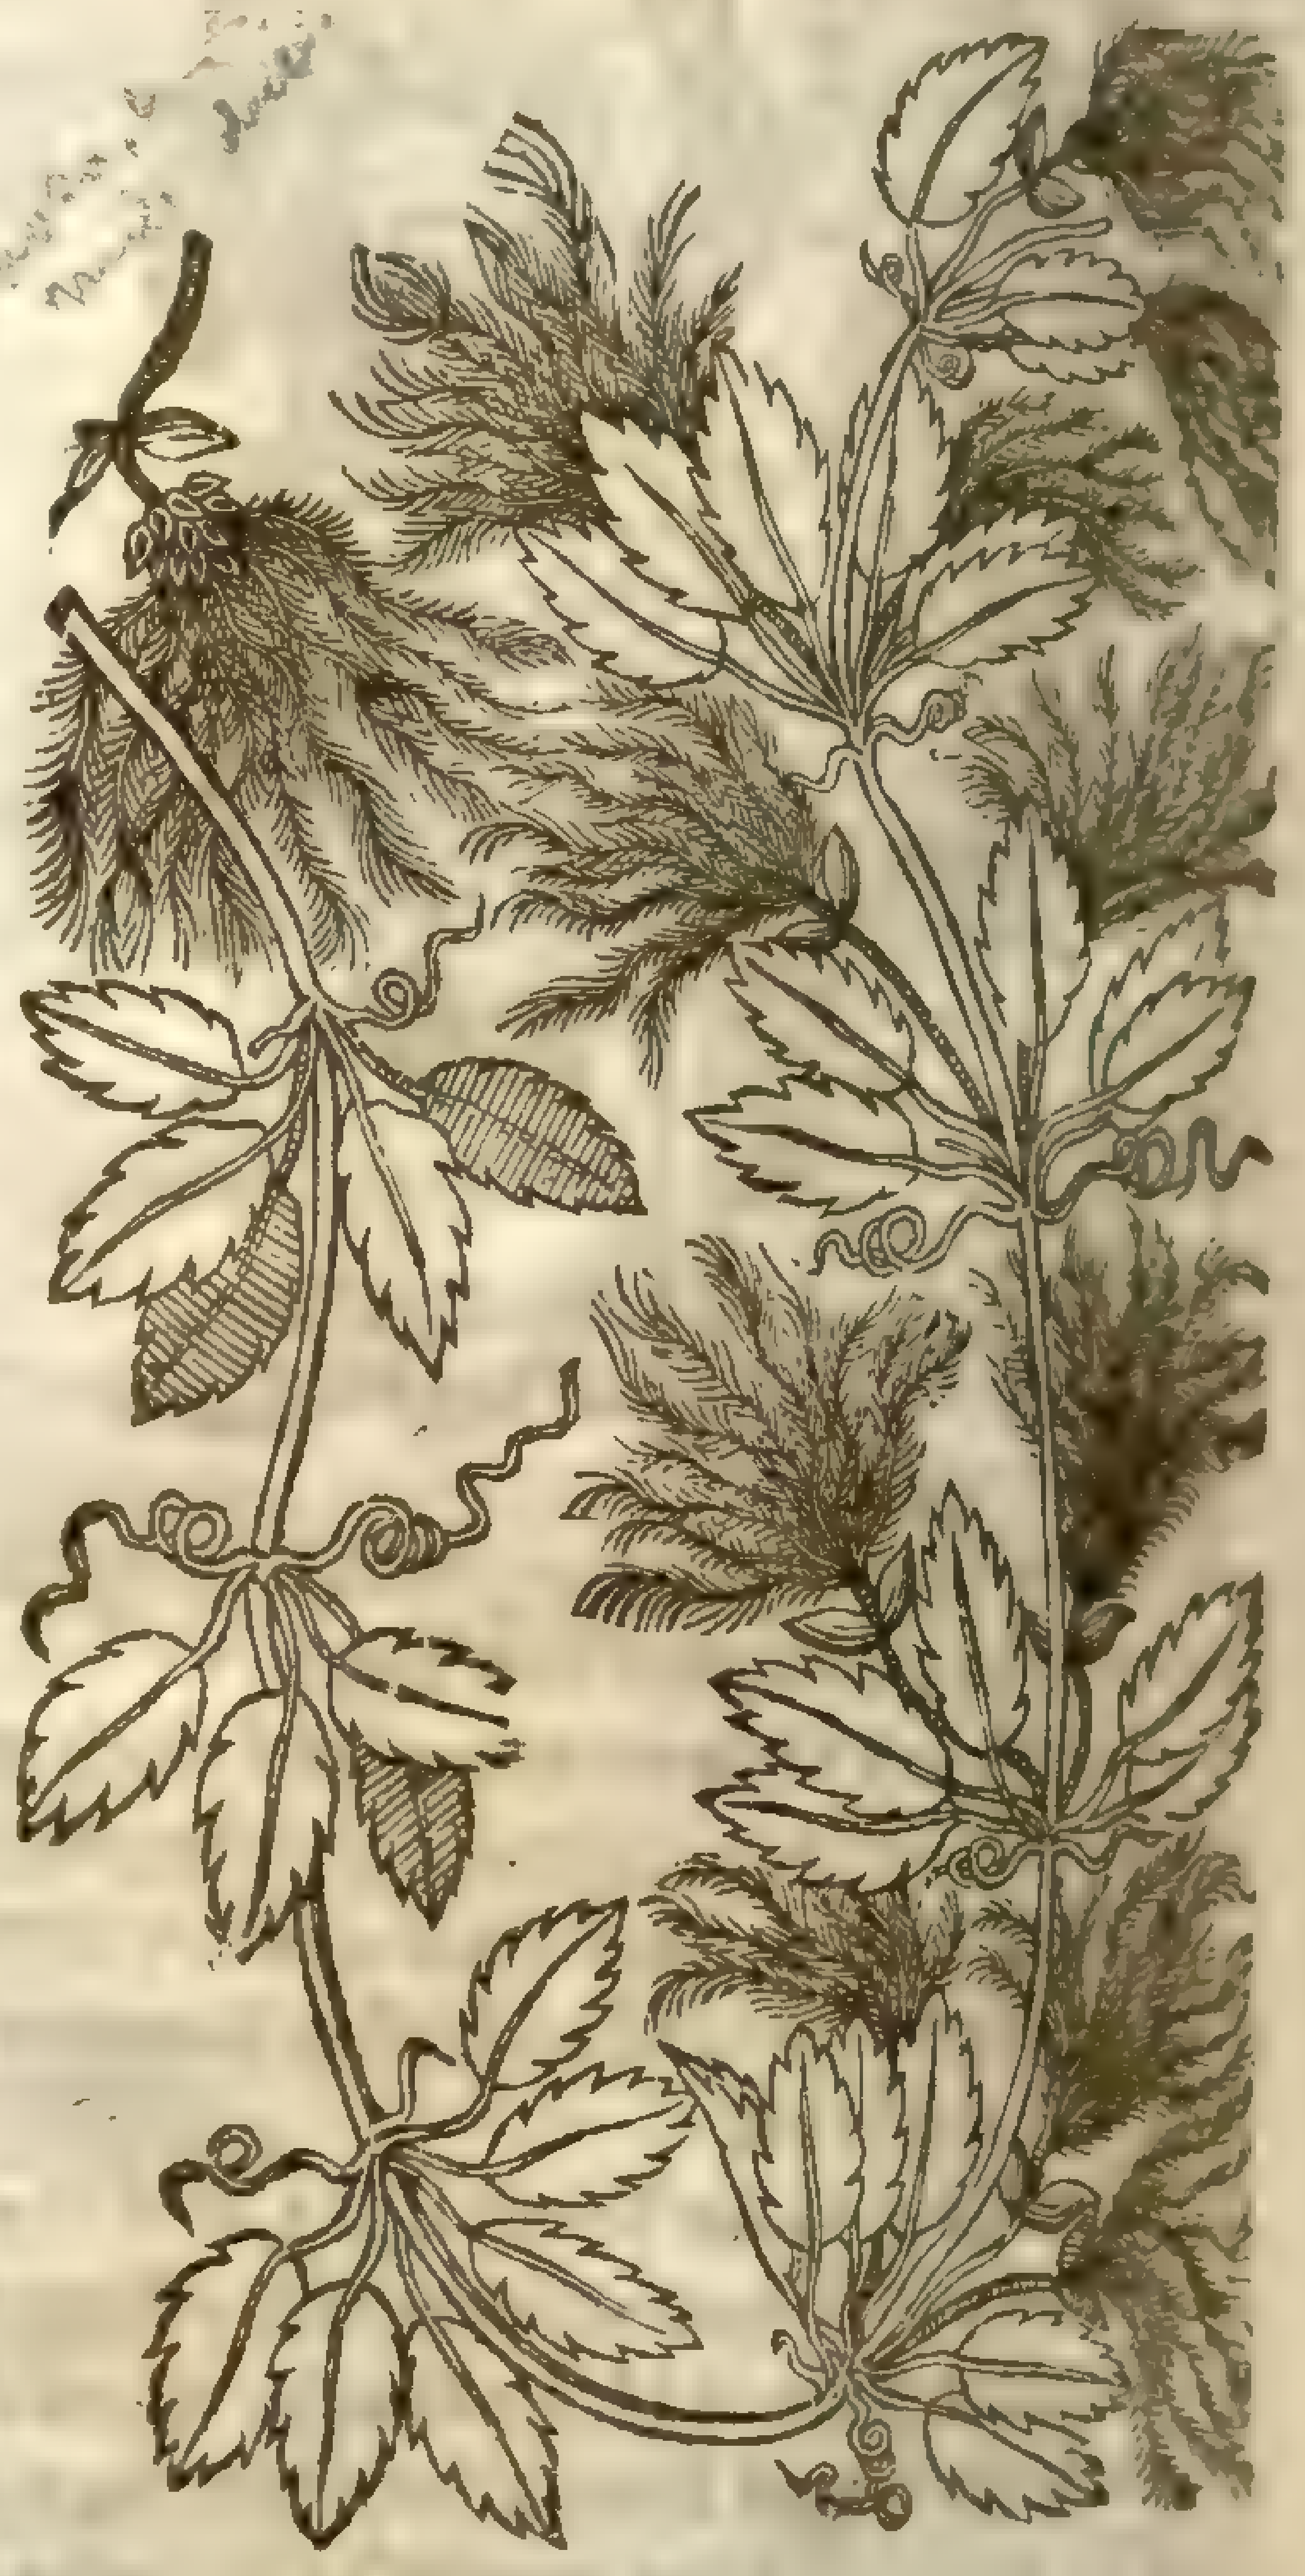


Clematis Vitalba – mihi dict. Sm. pl. 3. 57

Ger. ic. 626 ?

2 *Clematis Bætica.*
The Spaniſh Trauellers-Ioy.

C. cirrhosa mihi dict.



¶ *The Place.*

The Trauellers-Ioy is found in the borders of fields among thornes and briers, almoſt in euery hedge as you go from Grauesend to Canturbury in Kent; in many places of Eſſex, and in moſt of theſe Southerly parts about London, but not in the North of England that I can heare of.

The ſecond is a ſtranger in theſe parts: yet haue I found it in the Iſle of Wight, and in a wood by Waltham abbey.

¶ *The Time.*

The floures come forth in Iuly: the beautie thereof appeares in Nouember and December.

¶ *The Names.*

The firſt is commonly called *Viorna, quaſi vias ornans*, of decking and adorning waies and hedges, where people trauel; and thereupon I haue named it the Tauellers-Ioy: of *Fuchſius* it is called *Vitis nigra*: of *Dodonæus*, *Vitalba*: of *Matthiolus*, *Clematis altera*: of *Cordus*, *Vitis alba*: of *Dioſcorides*, *Vitis ſylueſtris*: of *Theophraſtus*, *Atragene*: in Dutch, **Linen**: in French, as *Ruellius* writeth, *Viorne*.

¶ *The Temperature and Vertues.*

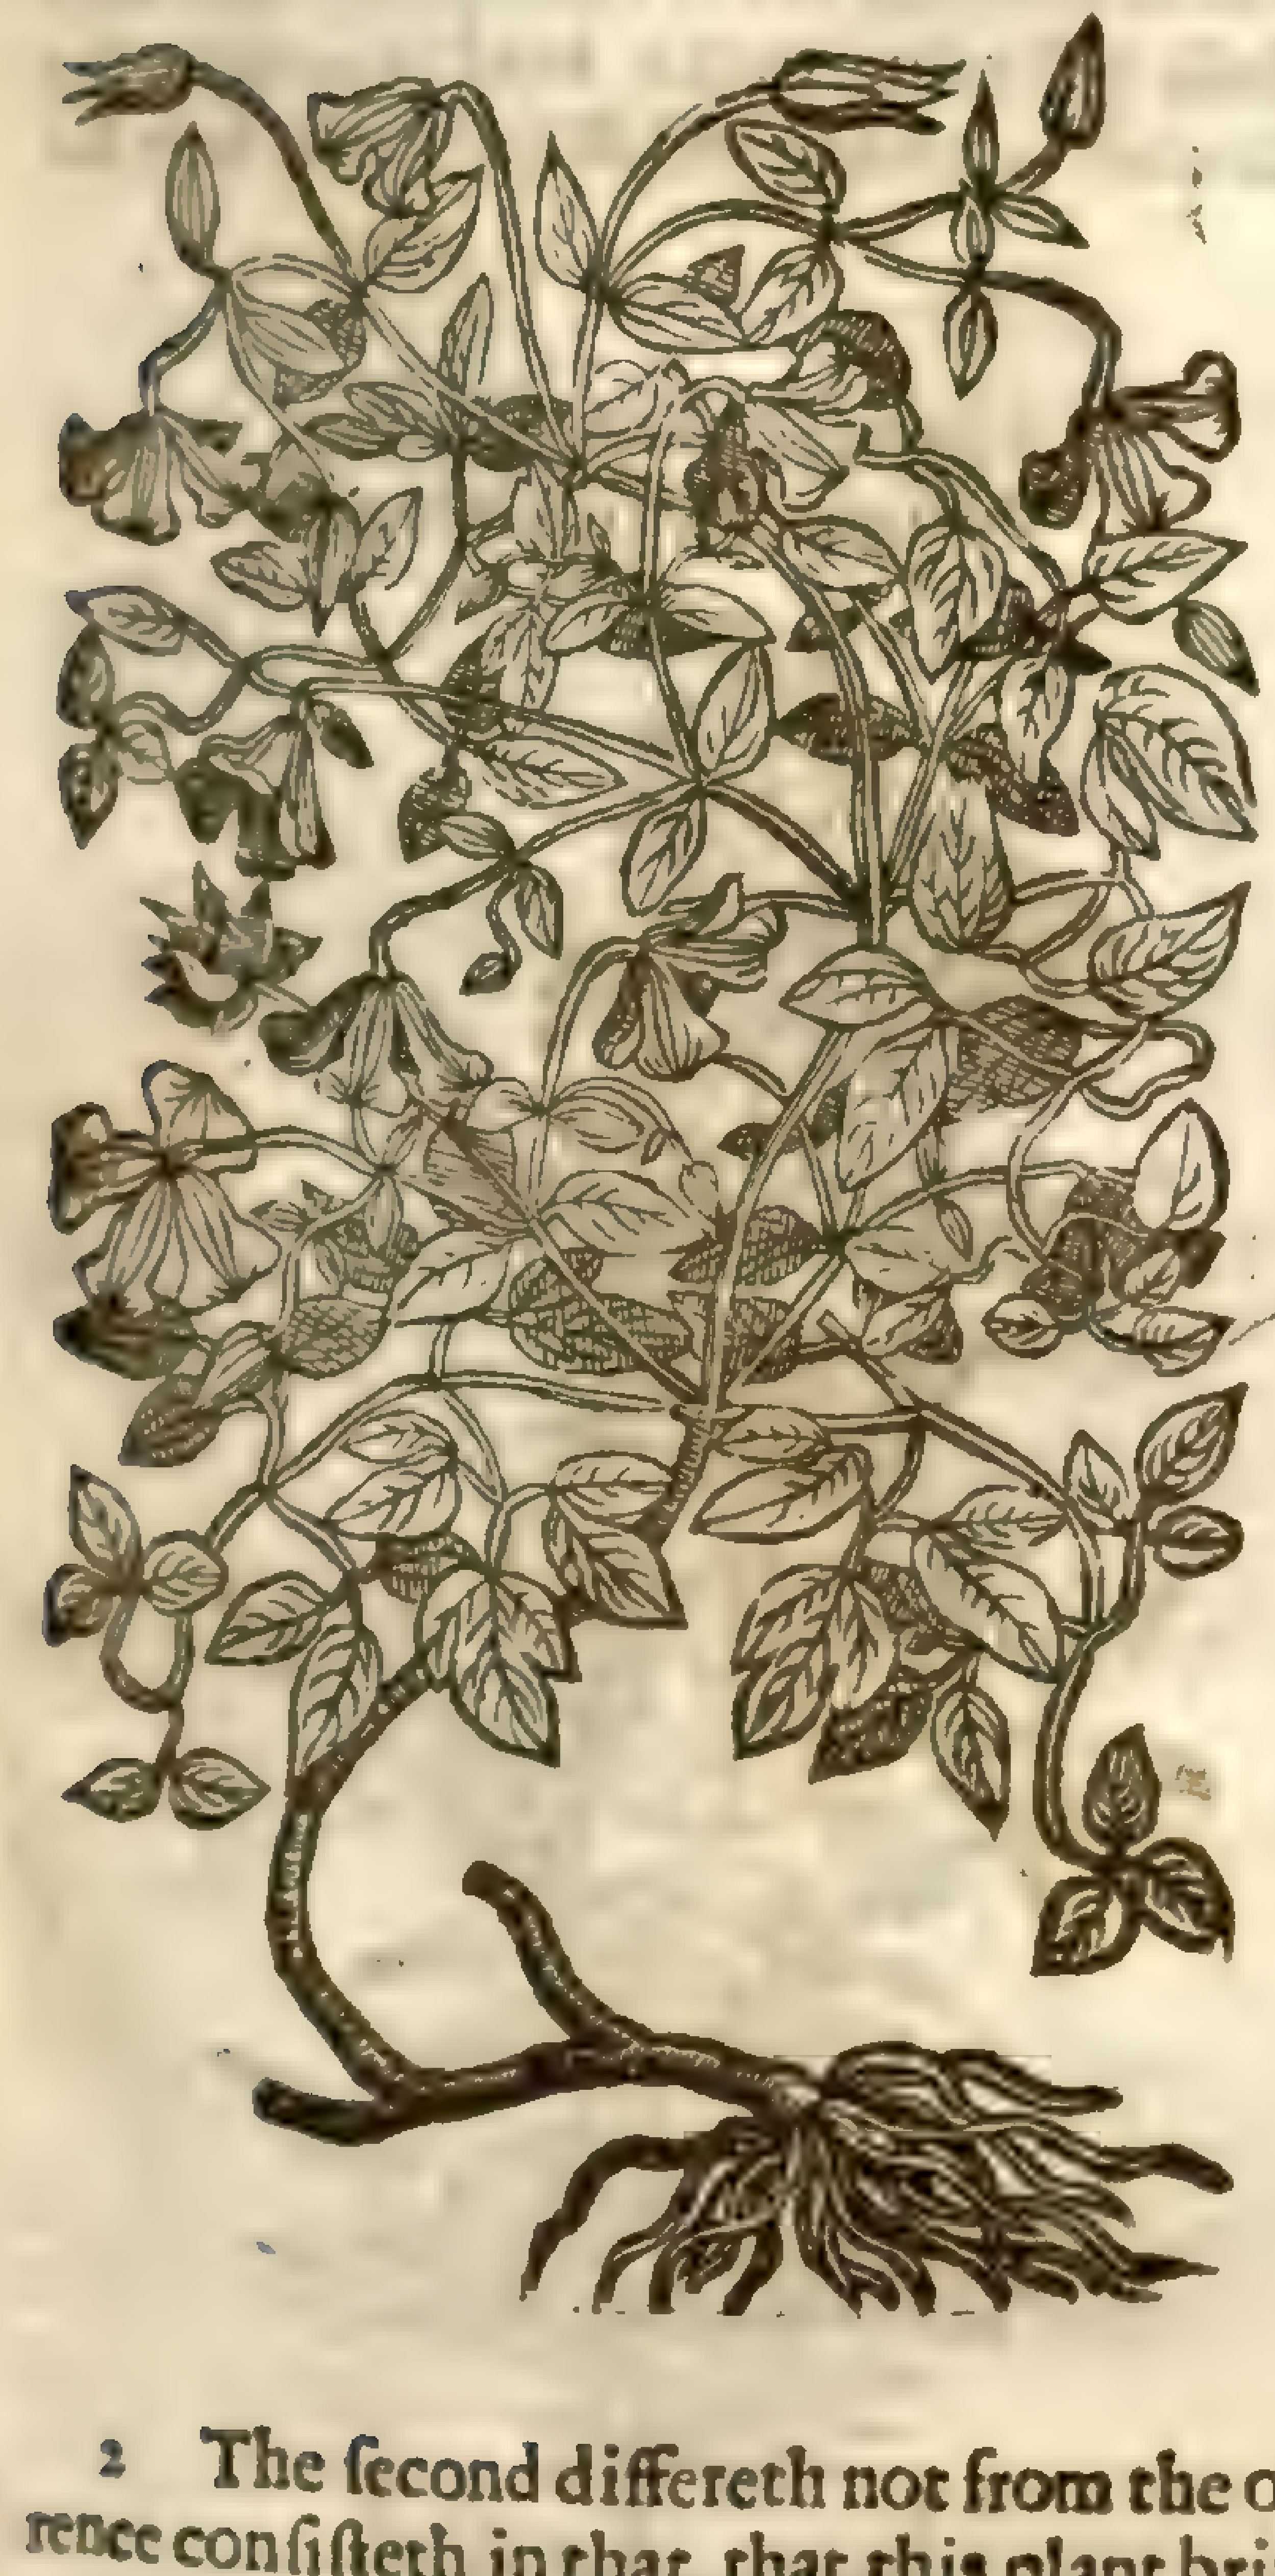
Theſe plants haue no vſe in phyſicke as yet found out, but are eſteemed onely for pleaſure, by reaſon of the goodly ſhadow which they make with their thicke buſhing and clyming, as alſo for the beauty of the floures, and the pleaſant ſent or ſauour of the ſame.

Chap. 326. *Of Ladies Bower, or Virgins Bower.*

¶ *The Deſcription.*

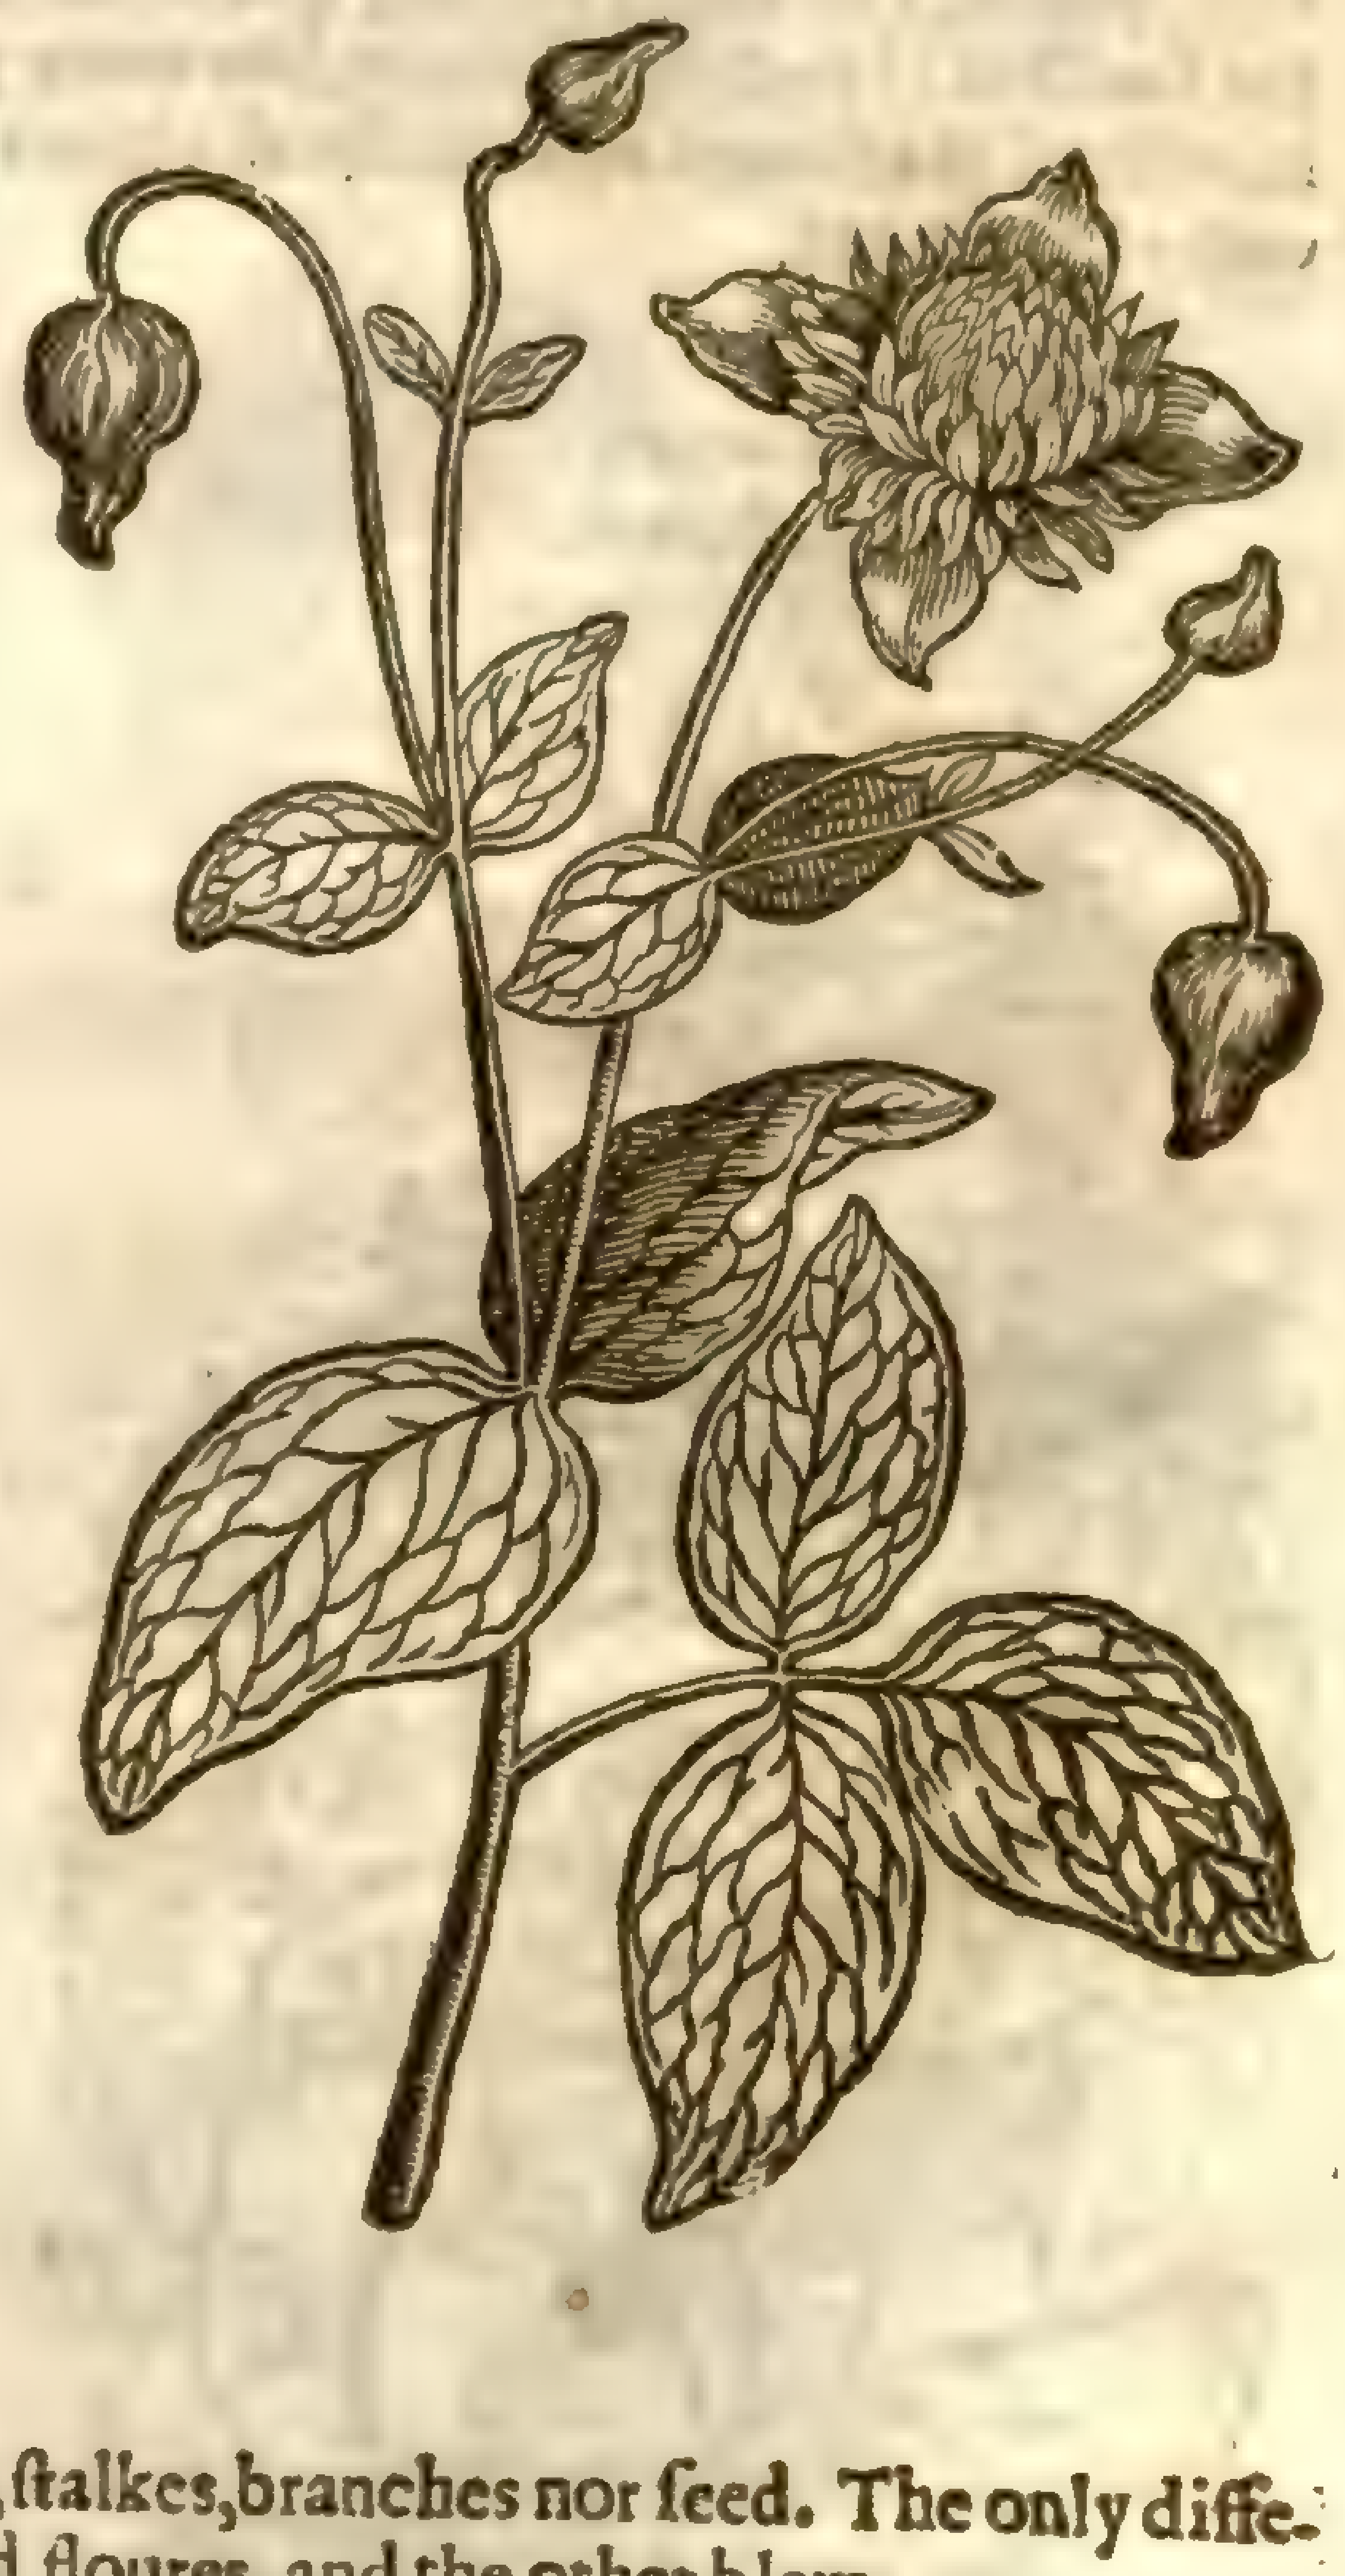
1 That which *Lobel* deſcribeth by the name *Clematis peregrina*, hath very long and ſlender ſtalks like the Vine, which are joynted, of a darke colour ; it climeth aloſt, and taketh hold with his crooked claſpers vpon euery thing that ſtandeth nere vnto it : it hath many leaues diuided into diuers parts ; among which come the floures that hang vpon ſlender footſtalkes, ſomething like to thoſe of Peruinkle, conſiſting onely of foure leaues, of a blew colour, and ſometimes purple, with certaine threds in the middle : the ſeeds be flat, plaine and ſharpe pointed. The roots are ſlender, and ſpreading all about.

1 2 *Clematis peregrina Cærulea, ſive rubra.*
Blew or red floured Ladies-Bower.



[illegible]

‡ 3 *Clematis Cærulea flore pleno.*
Double floured Virgins-Bower.



2 The ſecond differeth not from the other, in leaues, ſtalkes, branches nor ſeed. The only difference conſiſteth in that, that this plant bringeth forth red floures, and the other blew.

‡ 3 There is preſerued alſo in ſome Gardens another ſort of this *Clematis*, which in roots, leaues, branches, and manner of growing differs not from the former : but the floure is much different, being compoſed of abundance of longiſh narrow leaues, growing thicke together, with foure broader or larger leaues lying vnder, or bearing them vp, and theſe leaues are of a darke blewiſh purple colour. *Cluſius* calls this *Clematis altera flore pleno.* ‡

¶ *The Place.*

Theſe plants delight to grow in Sunnie places : they proſper better in a fruitfull ſoile than in barren. They grow in my garden, where they flouriſh exceedingly.

¶ *The Time.*

They floure in Iuly and Auguſt, and perfect their ſeed in September.

¶ *The Names.*

Ladies Bower in called in Greeke, κληματὶς : in Latine, *Ambuxum* : in Engliſh you may call it, Ladies

dies bower, which I take from his aptneſſe in making of Arbors, Bowers, and ſhadie couertures in gardens.

¶ *The Temperature and Vertues.*

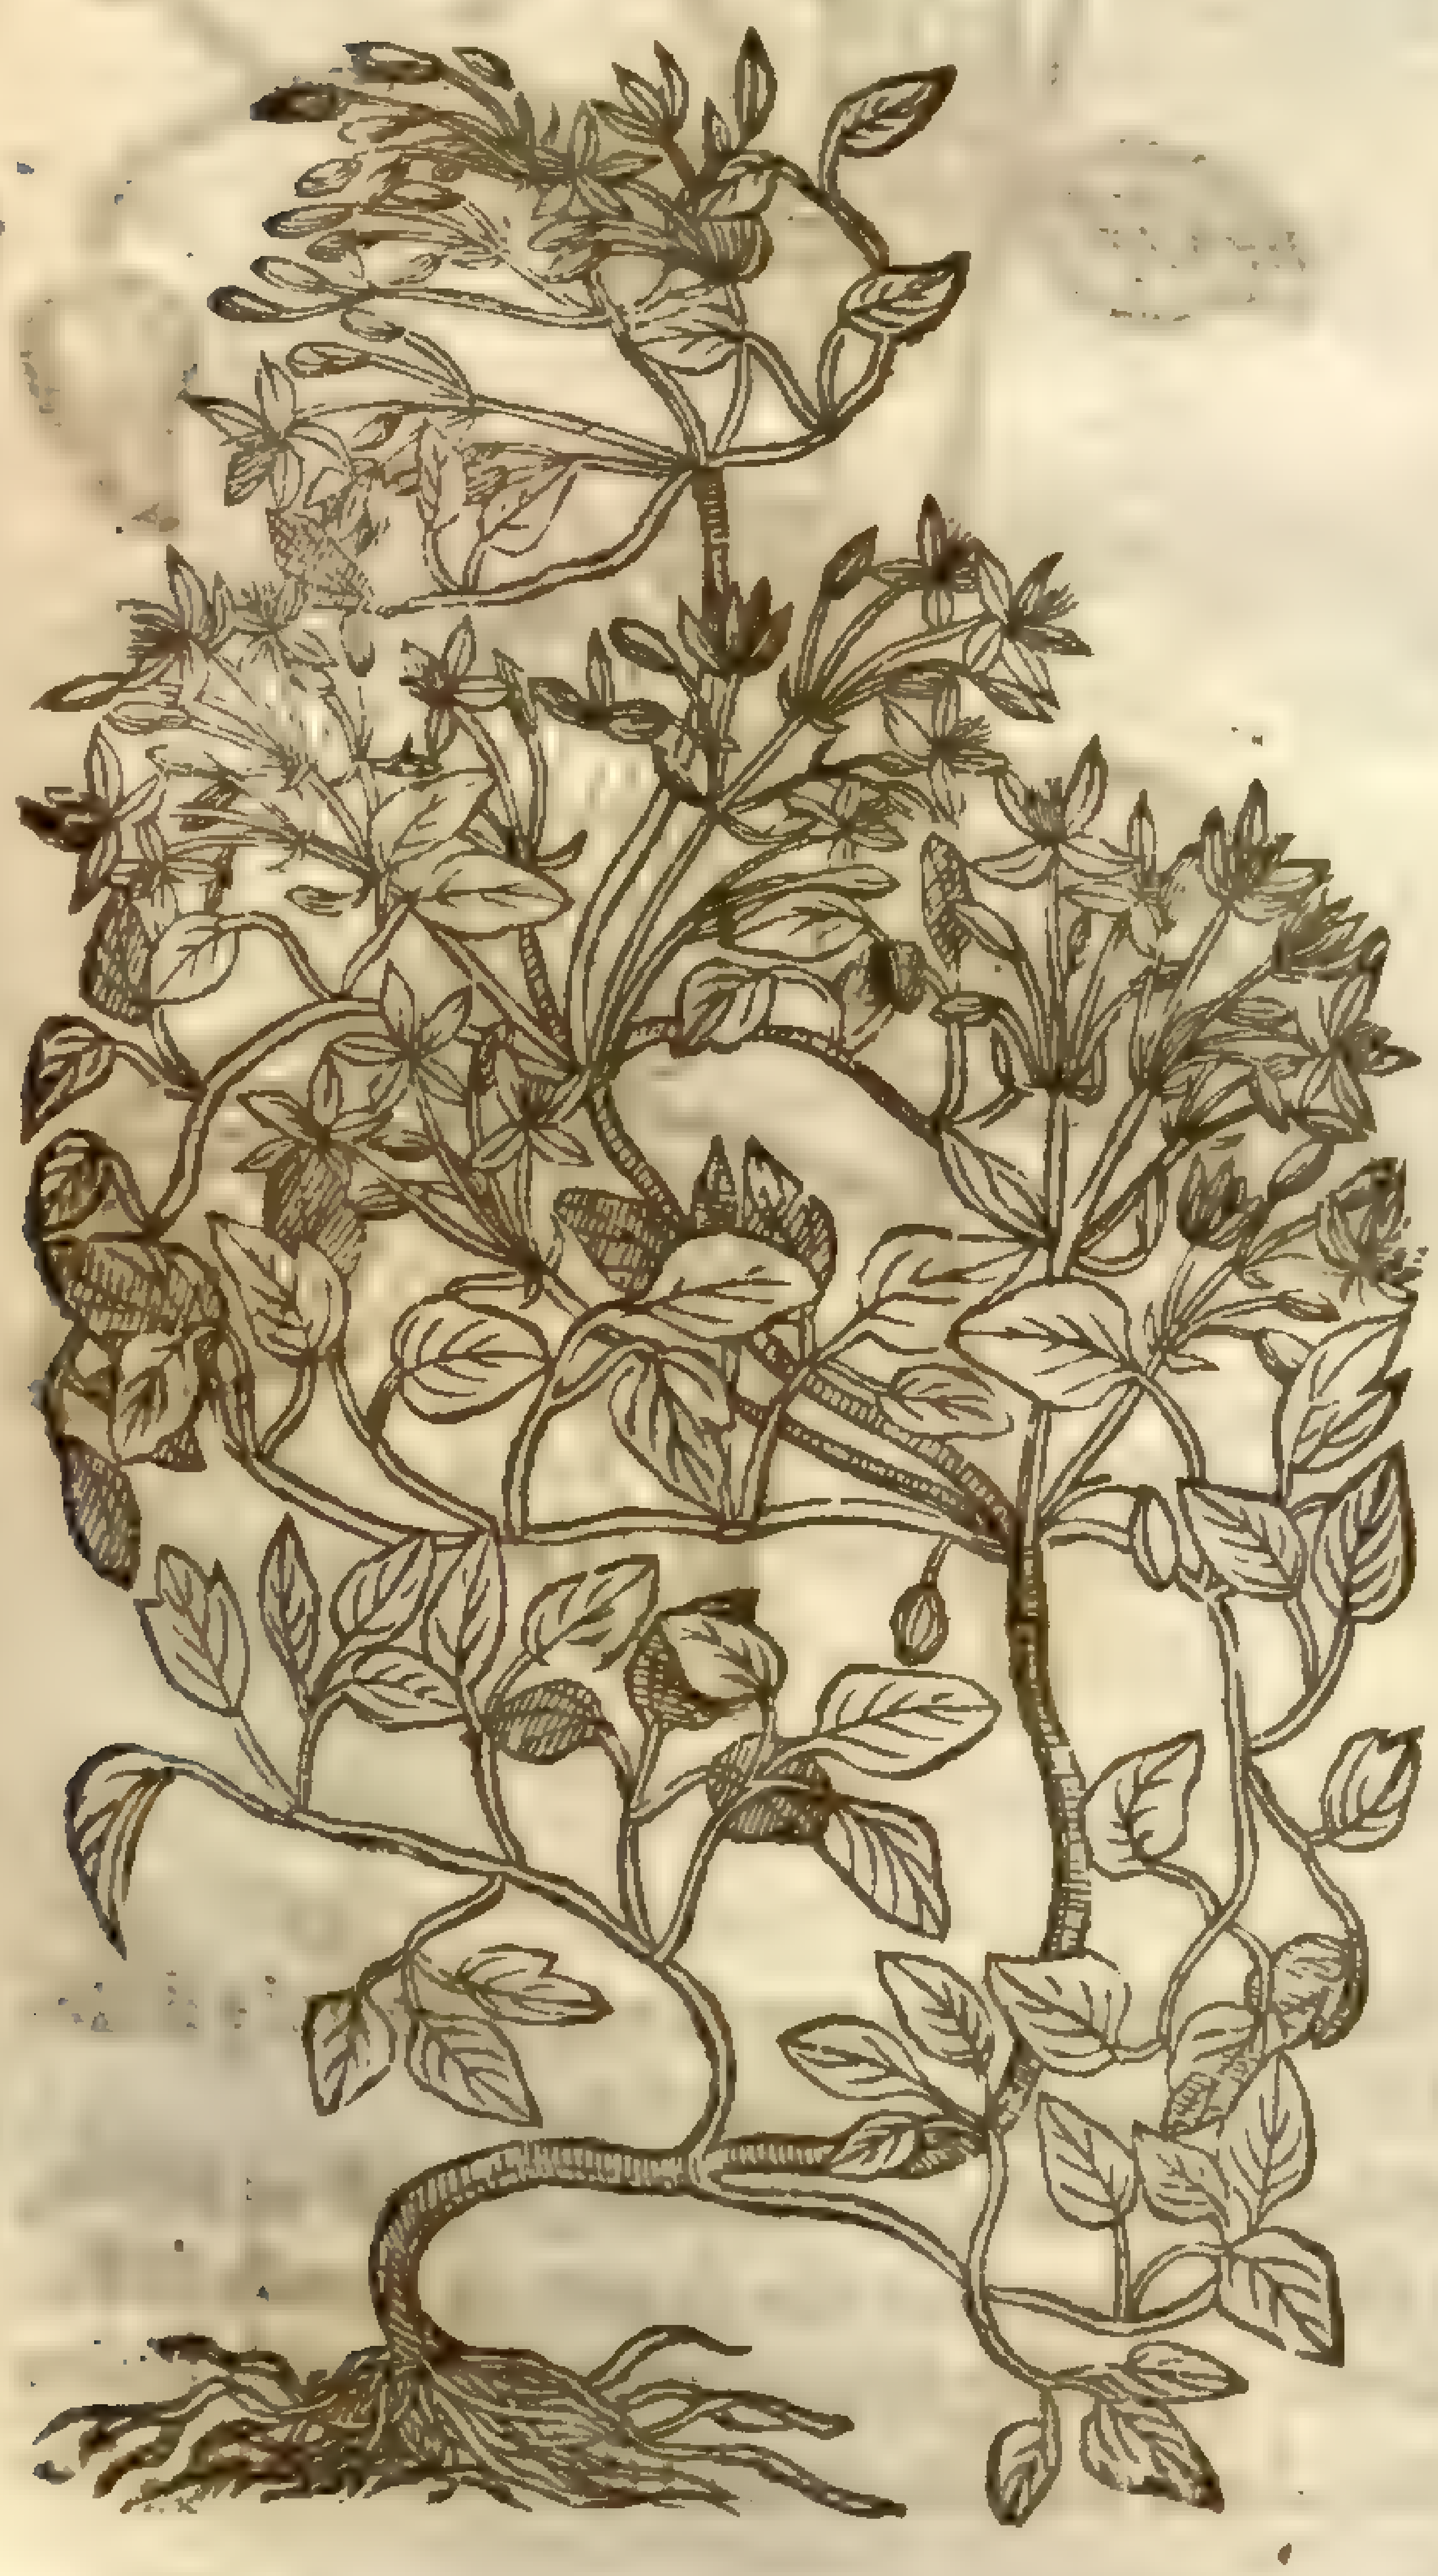
The faculties and vſe of theſe in Phyſicke is not yet knowne.

Chap. 327. *Of purging Peruinkle.*

¶ *The Deſcription.*

1 Among theſe plants which are called *Clematides*, theſe be alſo to be numbred, as hauing certaine affinitie becauſe of the ſpreading, branching, and ſemblance of the Vine; and this is called *Flammula vrens*, by reaſon of his fiery and burning heate, becauſe that being laid vpon the skin, it burneth the place, and maketh an eſchar, euen as our common cauſticke or corroſiue medicines do. The leaues hereof anſwer both in colour and ſmoothneſſe, *Vinca, Peruinca*, or Peruinkle, growing vpon long clambring tender branches, like the other kindes of climbing plants. The flours are very white, ſtar-faſhion, and of an exceeding ſweet ſmell, much like vnto the ſmell of Hawthorne floures, but more pleaſant, and leſſe offenſiue to the head: hauing in the middle of the floures certaine ſmall chiues or threds. The root is tender, and diſperſeth it ſelfe far vnder the ground.

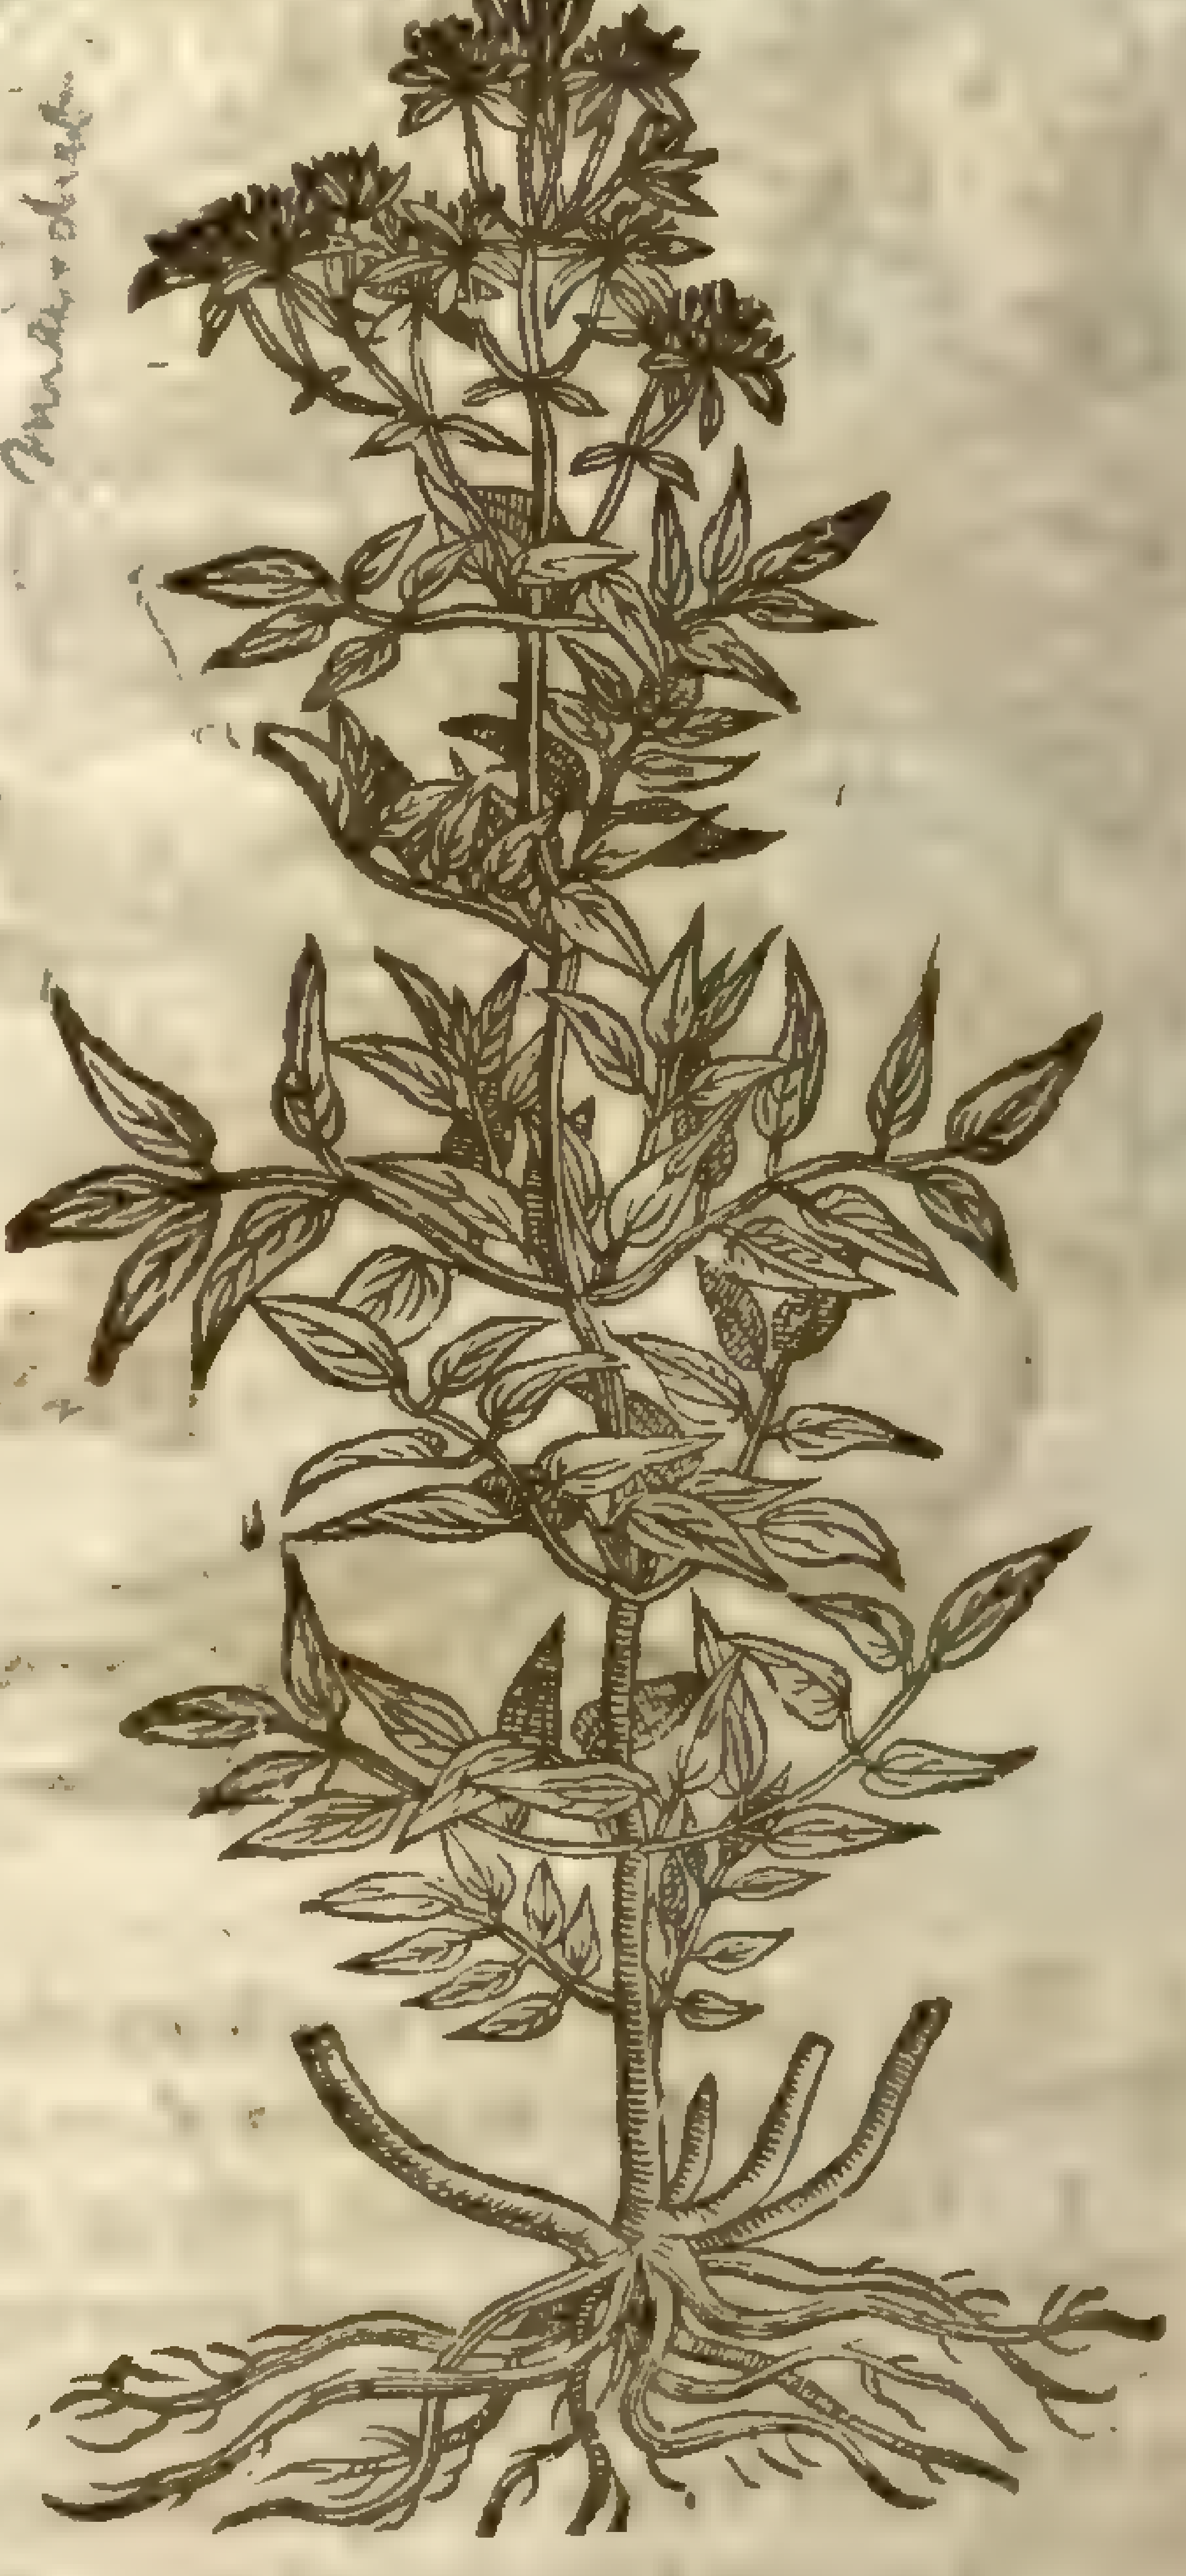
1 *Clematis vrens.*
Virgins Bower.



C. urens; [illegible]

2 *Flammula Iouis ſurrecta.*
Vpright Virgins Bower.

Clematis recta; [illegible]

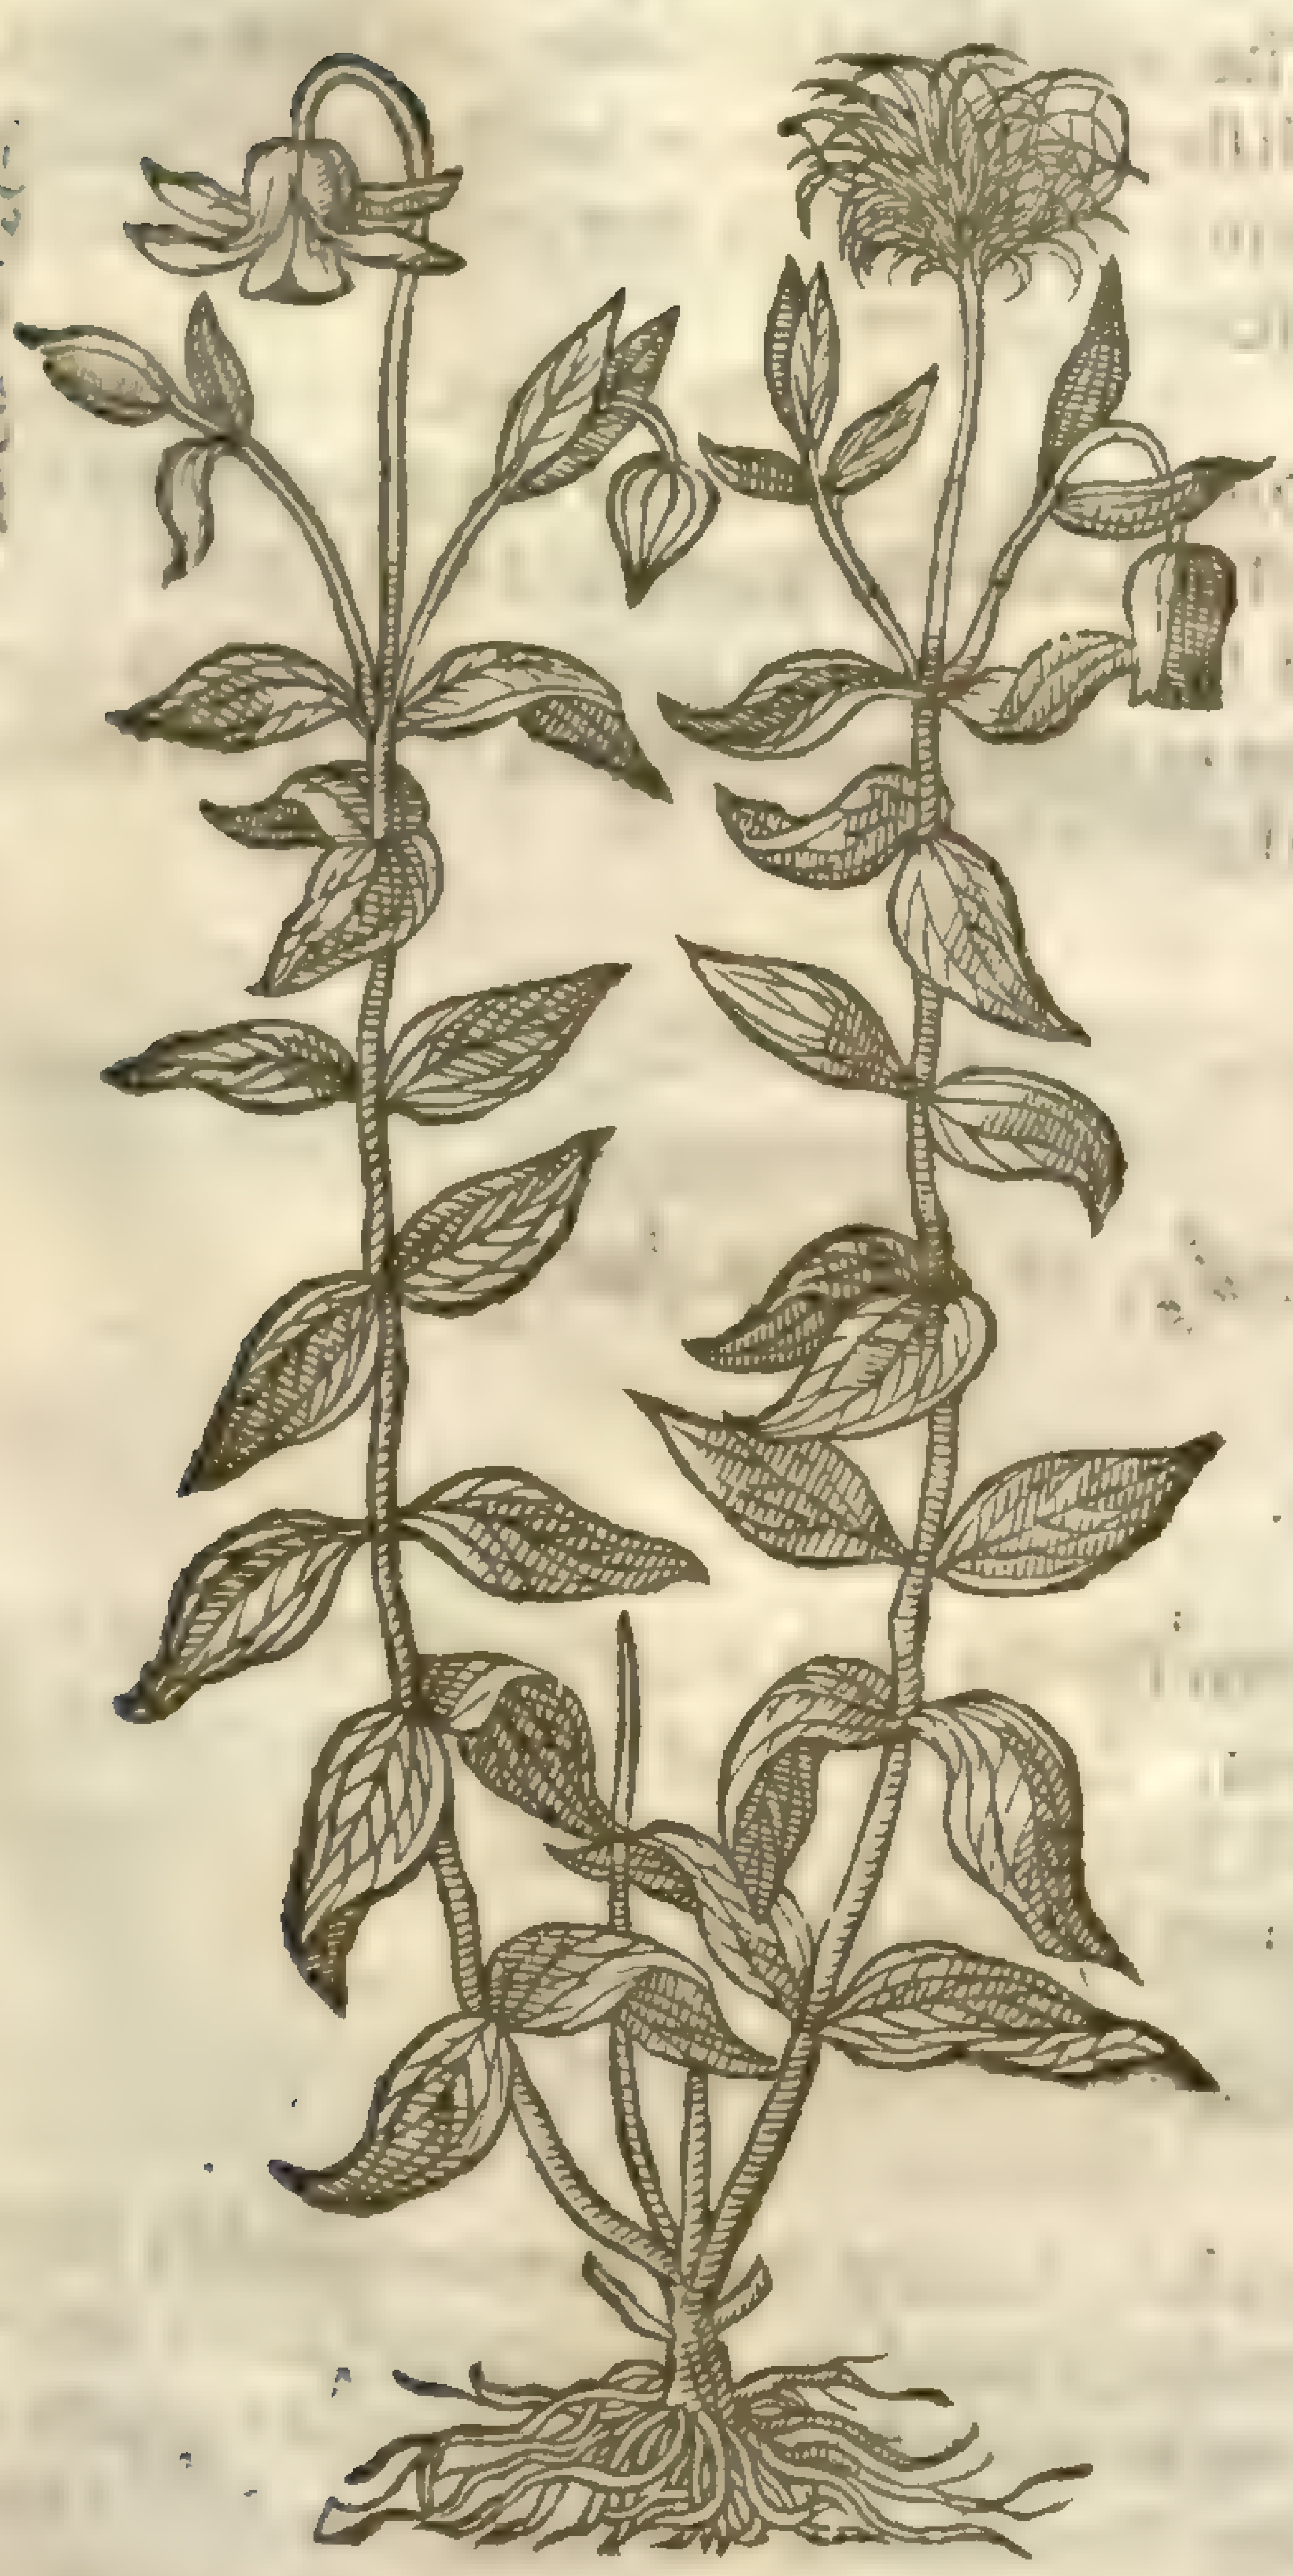


2 Vpright Clamberer or Virgins Bower is alſo a kinde of *Clematis*, hauing long tough roots not vnlike to thoſe of Licorice; from which riſeth vp a ſtraight vpright ſtalke, of the height of three or foure cubits, ſet about with winged leaues, compoſed of diuers ſmall leaues, ſet vpon a middle rib, as are thoſe of the aſhe tre, or Valerian, but fewer in number: at the top of the ſtalkes come forth ſmall white floures, very like the precedent, but not of ſo pleaſant a ſweet ſmell; after which come the ſeeds, flat and ſharpe pointed.

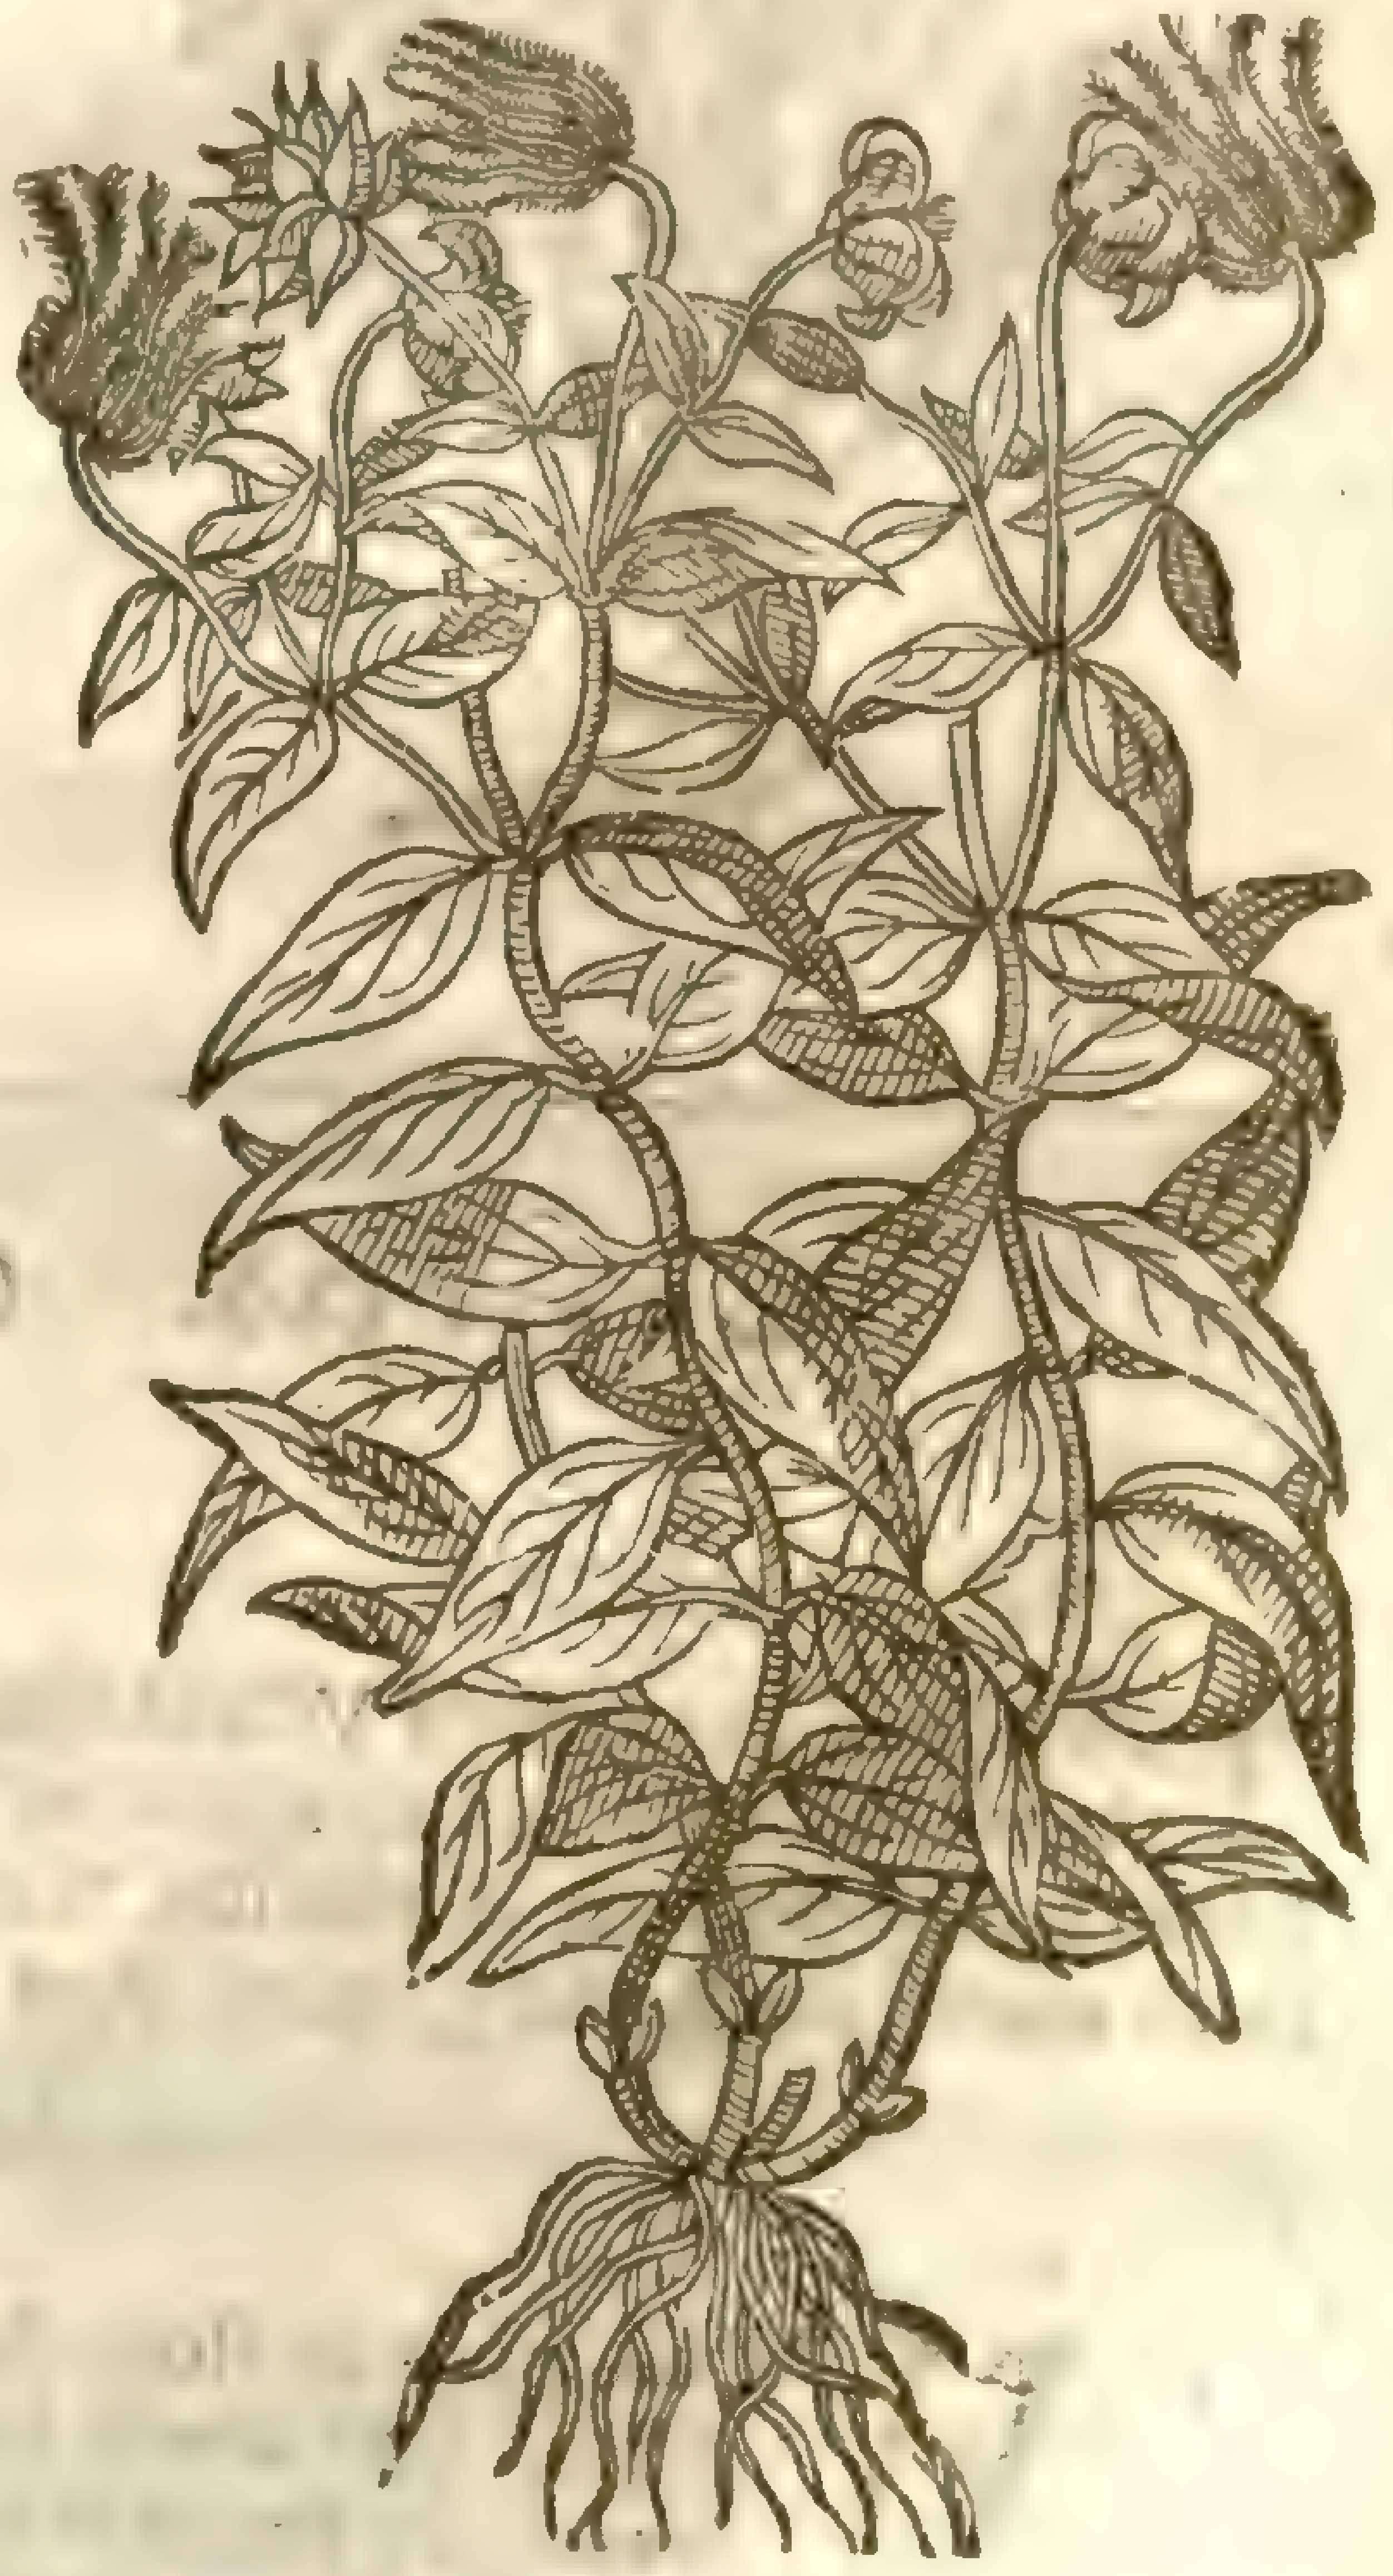
3 There is another *Clematis* of the kinde of the white *Clematis* or burning *Clematis*, which I haue recouered from ſeed, that hath been ſent me from a curious and learned citiſen of Strawsborough, which is like vnto the other in each reſpect, ſauing that, that the floures hereof are very double, wherein conſiſteth the eſpeciall difference.

4 Amongſt the kindes of climbing or clambering plants, *Carolus Cluſius*, and likewiſe *Lobel* haue nu noted theſe two, which approch neere vnto them in leaues and floures, but are far different in claſping tendrels, or climbing otherwiſe, being low and baſe plants in reſpect of the others of their kinde. The firſt hath for his roots a bundle of tough tangling threddes, in number infinite, and thicke thruſt together; from which riſe vp many ſmall ſtalkes, of a browniſh colour, foure ſquare, and of a wooddy ſubſtance: whereupon do grow long leaues, of a biting taſte, ſet together by couples, in ſhape like thoſe of *Aſclepias*, or ſilken Swallow-wort. The floures grow at the top of the ſtalkes, of a faire blew or sky colour, conſiſting of foure parts in manner of a croſſe, hauing in the middle a bunched pointell, like vnto the head of field Poppie when it is young, of a whitiſh yellow colour, hauing little or no ſmell at all. The floures being paſt, then commeth the ſeed, ſuch as is to be ſeene in the other kindes of *Clematis*. The whole plant dieth at the approch of Winter, and recouereth it ſelfe againe from the root, which endureth, whereby it greatly increaſeth.

4 *Clematis Pannonica.*
Buſh Bower.



5 *Clematis major Pannonica.*
Great Buſh Bower.

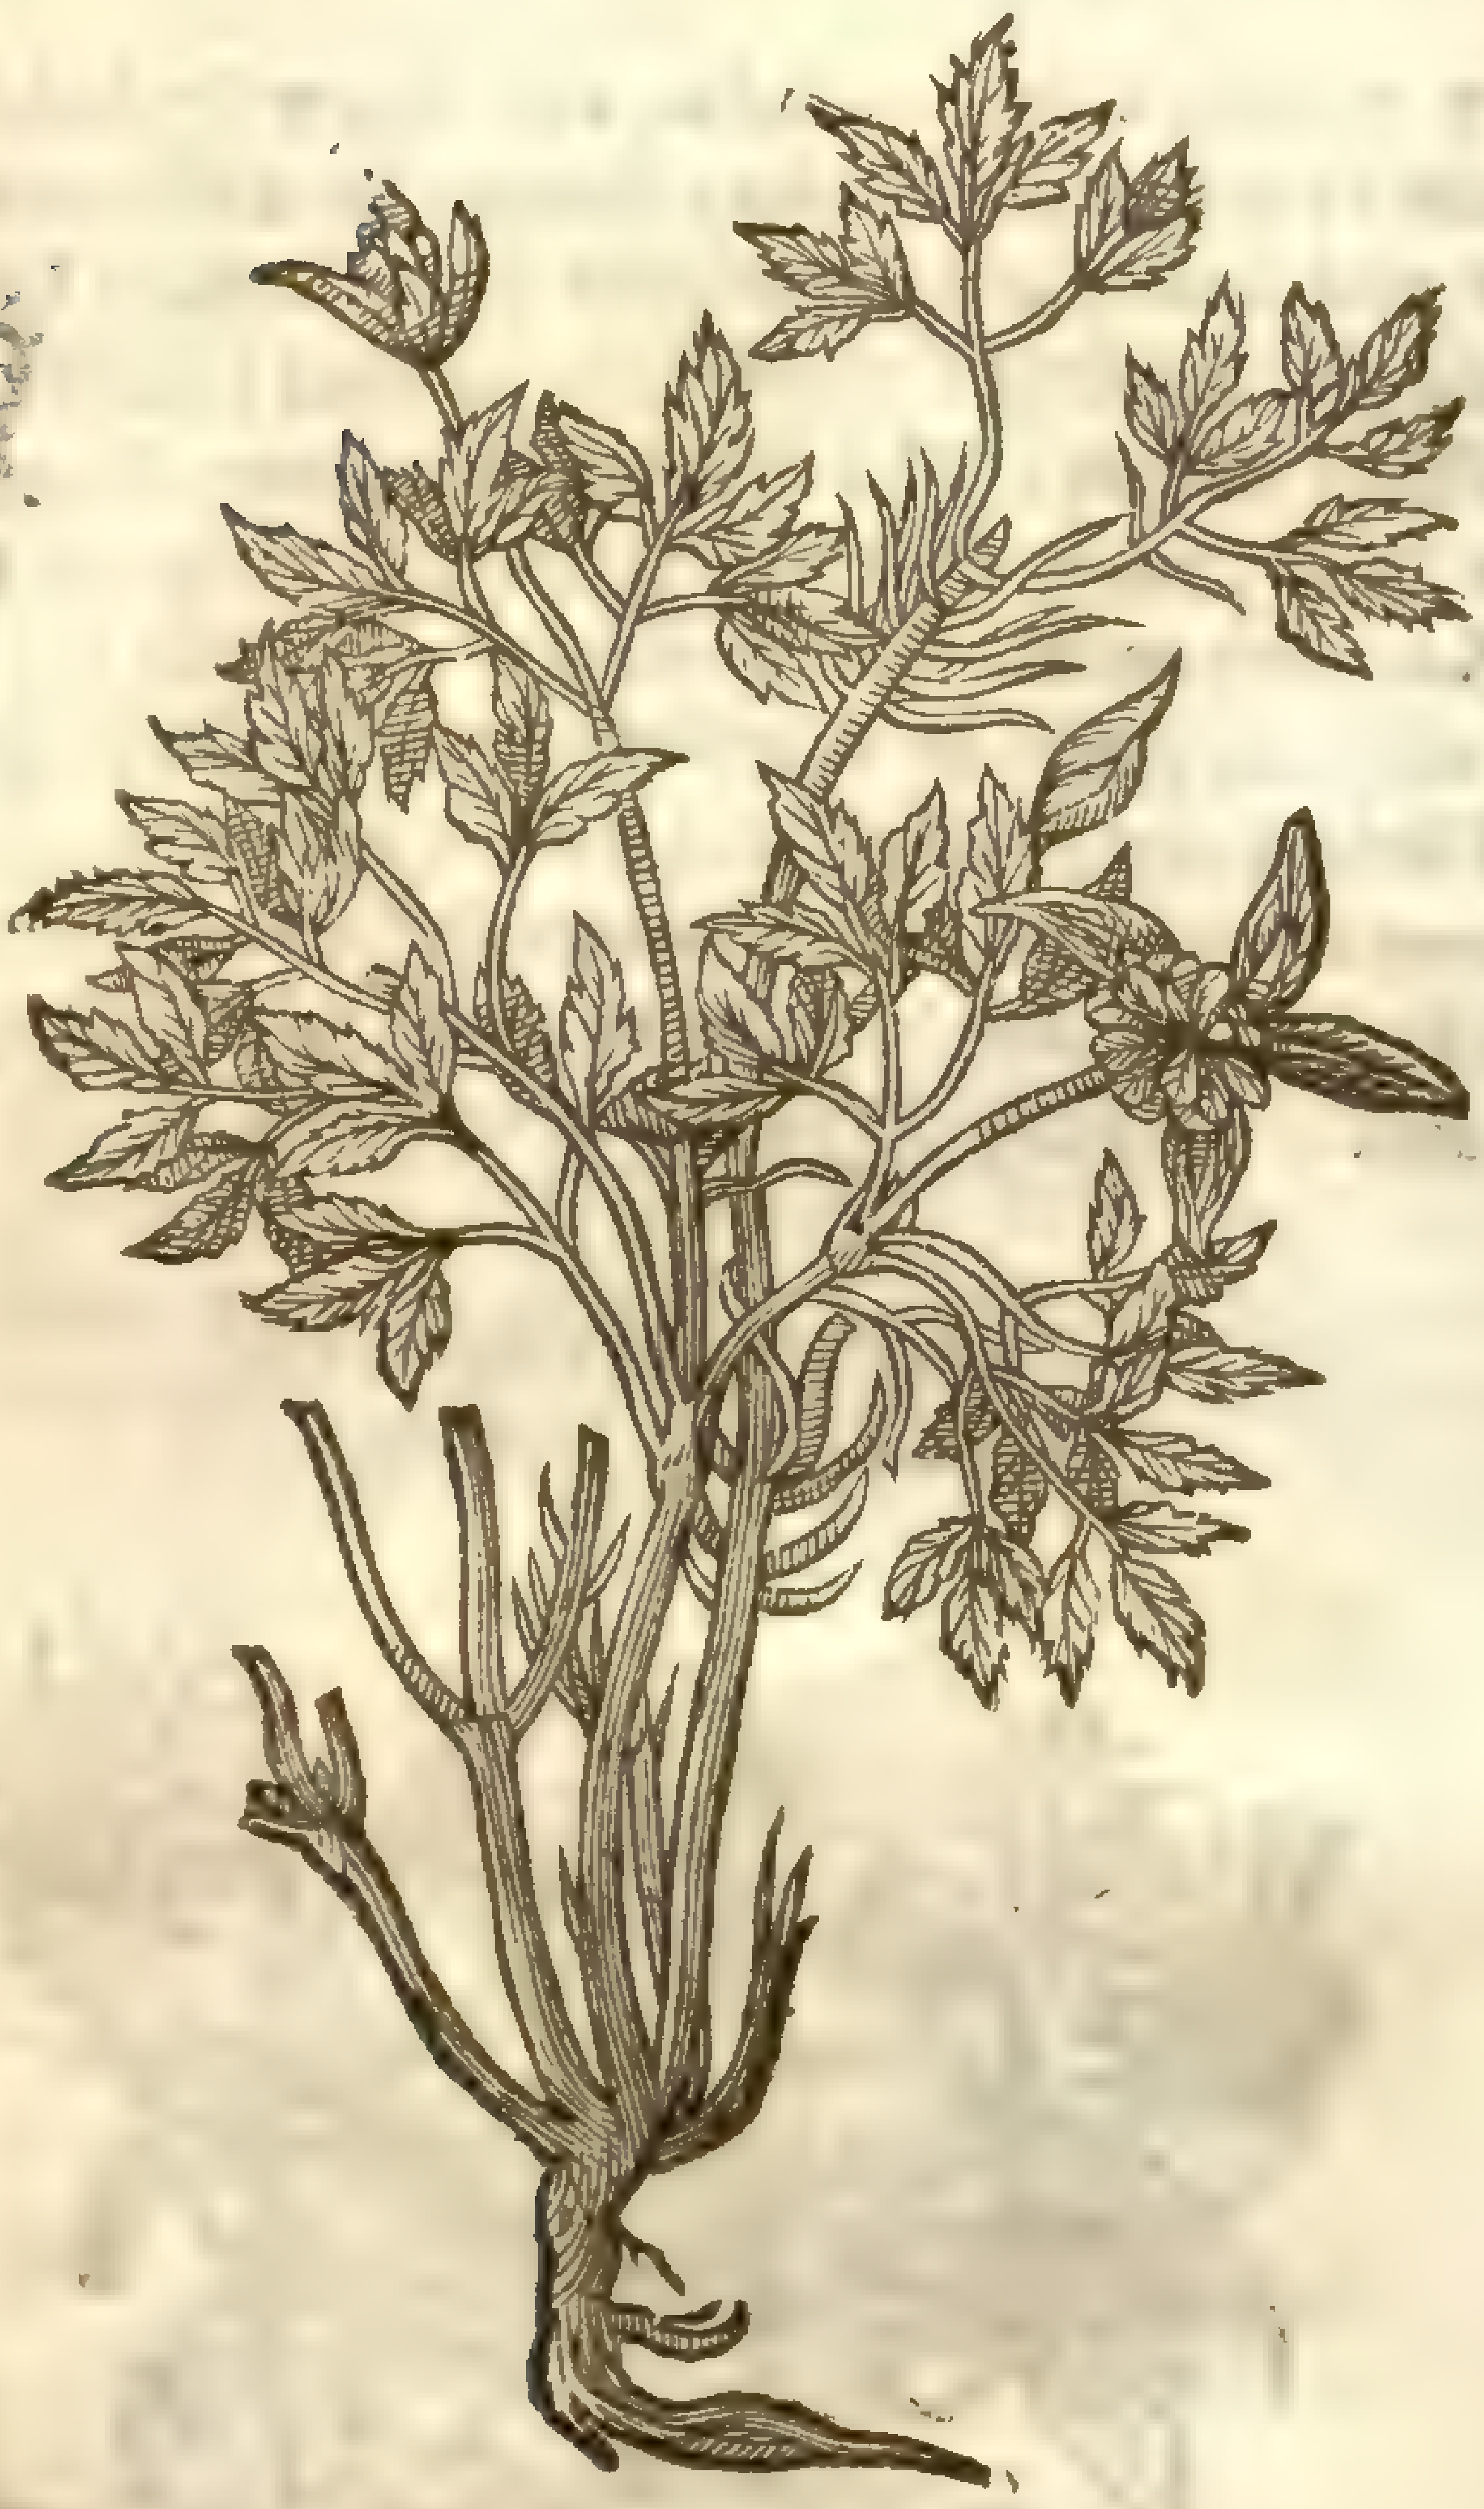


† 5 The great Buſh Bower differeth from the former laſt deſcribed in greatneſſe, as alſo in the ſhape and colour of the floures, which are leſſer, ſtare faſhioned, of a deepe purple colour, and edged with greene. †

‡ 6 Of theſe there is another, whoſe bending creſted ſtalkes are ſome three cubits high, which ſend forth ſundry ſmall branches, ſet with leaues growing together by threes vpon ſhort foot-ſtalkes, and they are like myrtle leaues, but bigger, more wrinkled, darke coloured, and ſnipt about the edges: the floure reſembles a croſſe, with foure ſharpe pointed rough leaues of a whitiſh blew colour, which containe diuers ſmall looſe little leaues in their middles. The root is long and laſting. It growes vpon the rocky places of mount Baldus in Italy, where *Pona* found it, and he calls it *Clematis cruciata Alpina*. ‡

¶ *The*

‡ 6 *Clematis cruciata Alpina.*
Virgins Bower of the Alps.



Atragene alpina, Linn.
[illegible]

¶ *The Place.*

Theſe plants do not grow wilde in England, that I can as yet learne; notwithſtanding I haue them all in my garden, where they flouriſh exceedingly.

¶ *The Time.*

Theſe plants doe floure from Auguſt to the end of September.

¶ *The Names.*

There is not much more found of their names than is expreſſed in their ſeuerall titles, notwithſtanding there hath beene ſomewhat ſaid, as I thinke, by hearesay, but nothing of certaintie: wherefore let that which is ſet downe ſuffice. We may in Engliſh call the firſt, Biting Clematis, or white Clematis, Biting Peruinkle or purging Peruinkle, Ladies Bower, and Virgins Bower.

¶ *The Temperature.*

The leafe hereof is biting, and doth mightily bliſter, being, as *Galen* ſaith, of a cauſticke or burning quality: it is hot in the beginning of the fourth degree.

¶ *The Vertues.*

A *Dioſcorides* writeth, that the leaues being applied do heale the ſcurfe and lepry, and that the ſeed beaten, and the pouder drunke with faire water or with mead, purgeth flegme and choler by the ſtoole.

Chap. 328. *Of Wood-binde, or Hony-ſuckle.*

¶ *The Kindes.*

There be diuers ſorts of Wood-bindes, ſome of them ſhrubs with winding ſtalkes, that wrap themſelues vnto ſuch things as are neere about them. Likewiſe there be other ſorts or kindes found out by the later Herbariſts, that clime not at all, but ſtand vpright, the which ſhall be ſet forth among the ſhrubby plants. And firſt of the common Wood-binde.

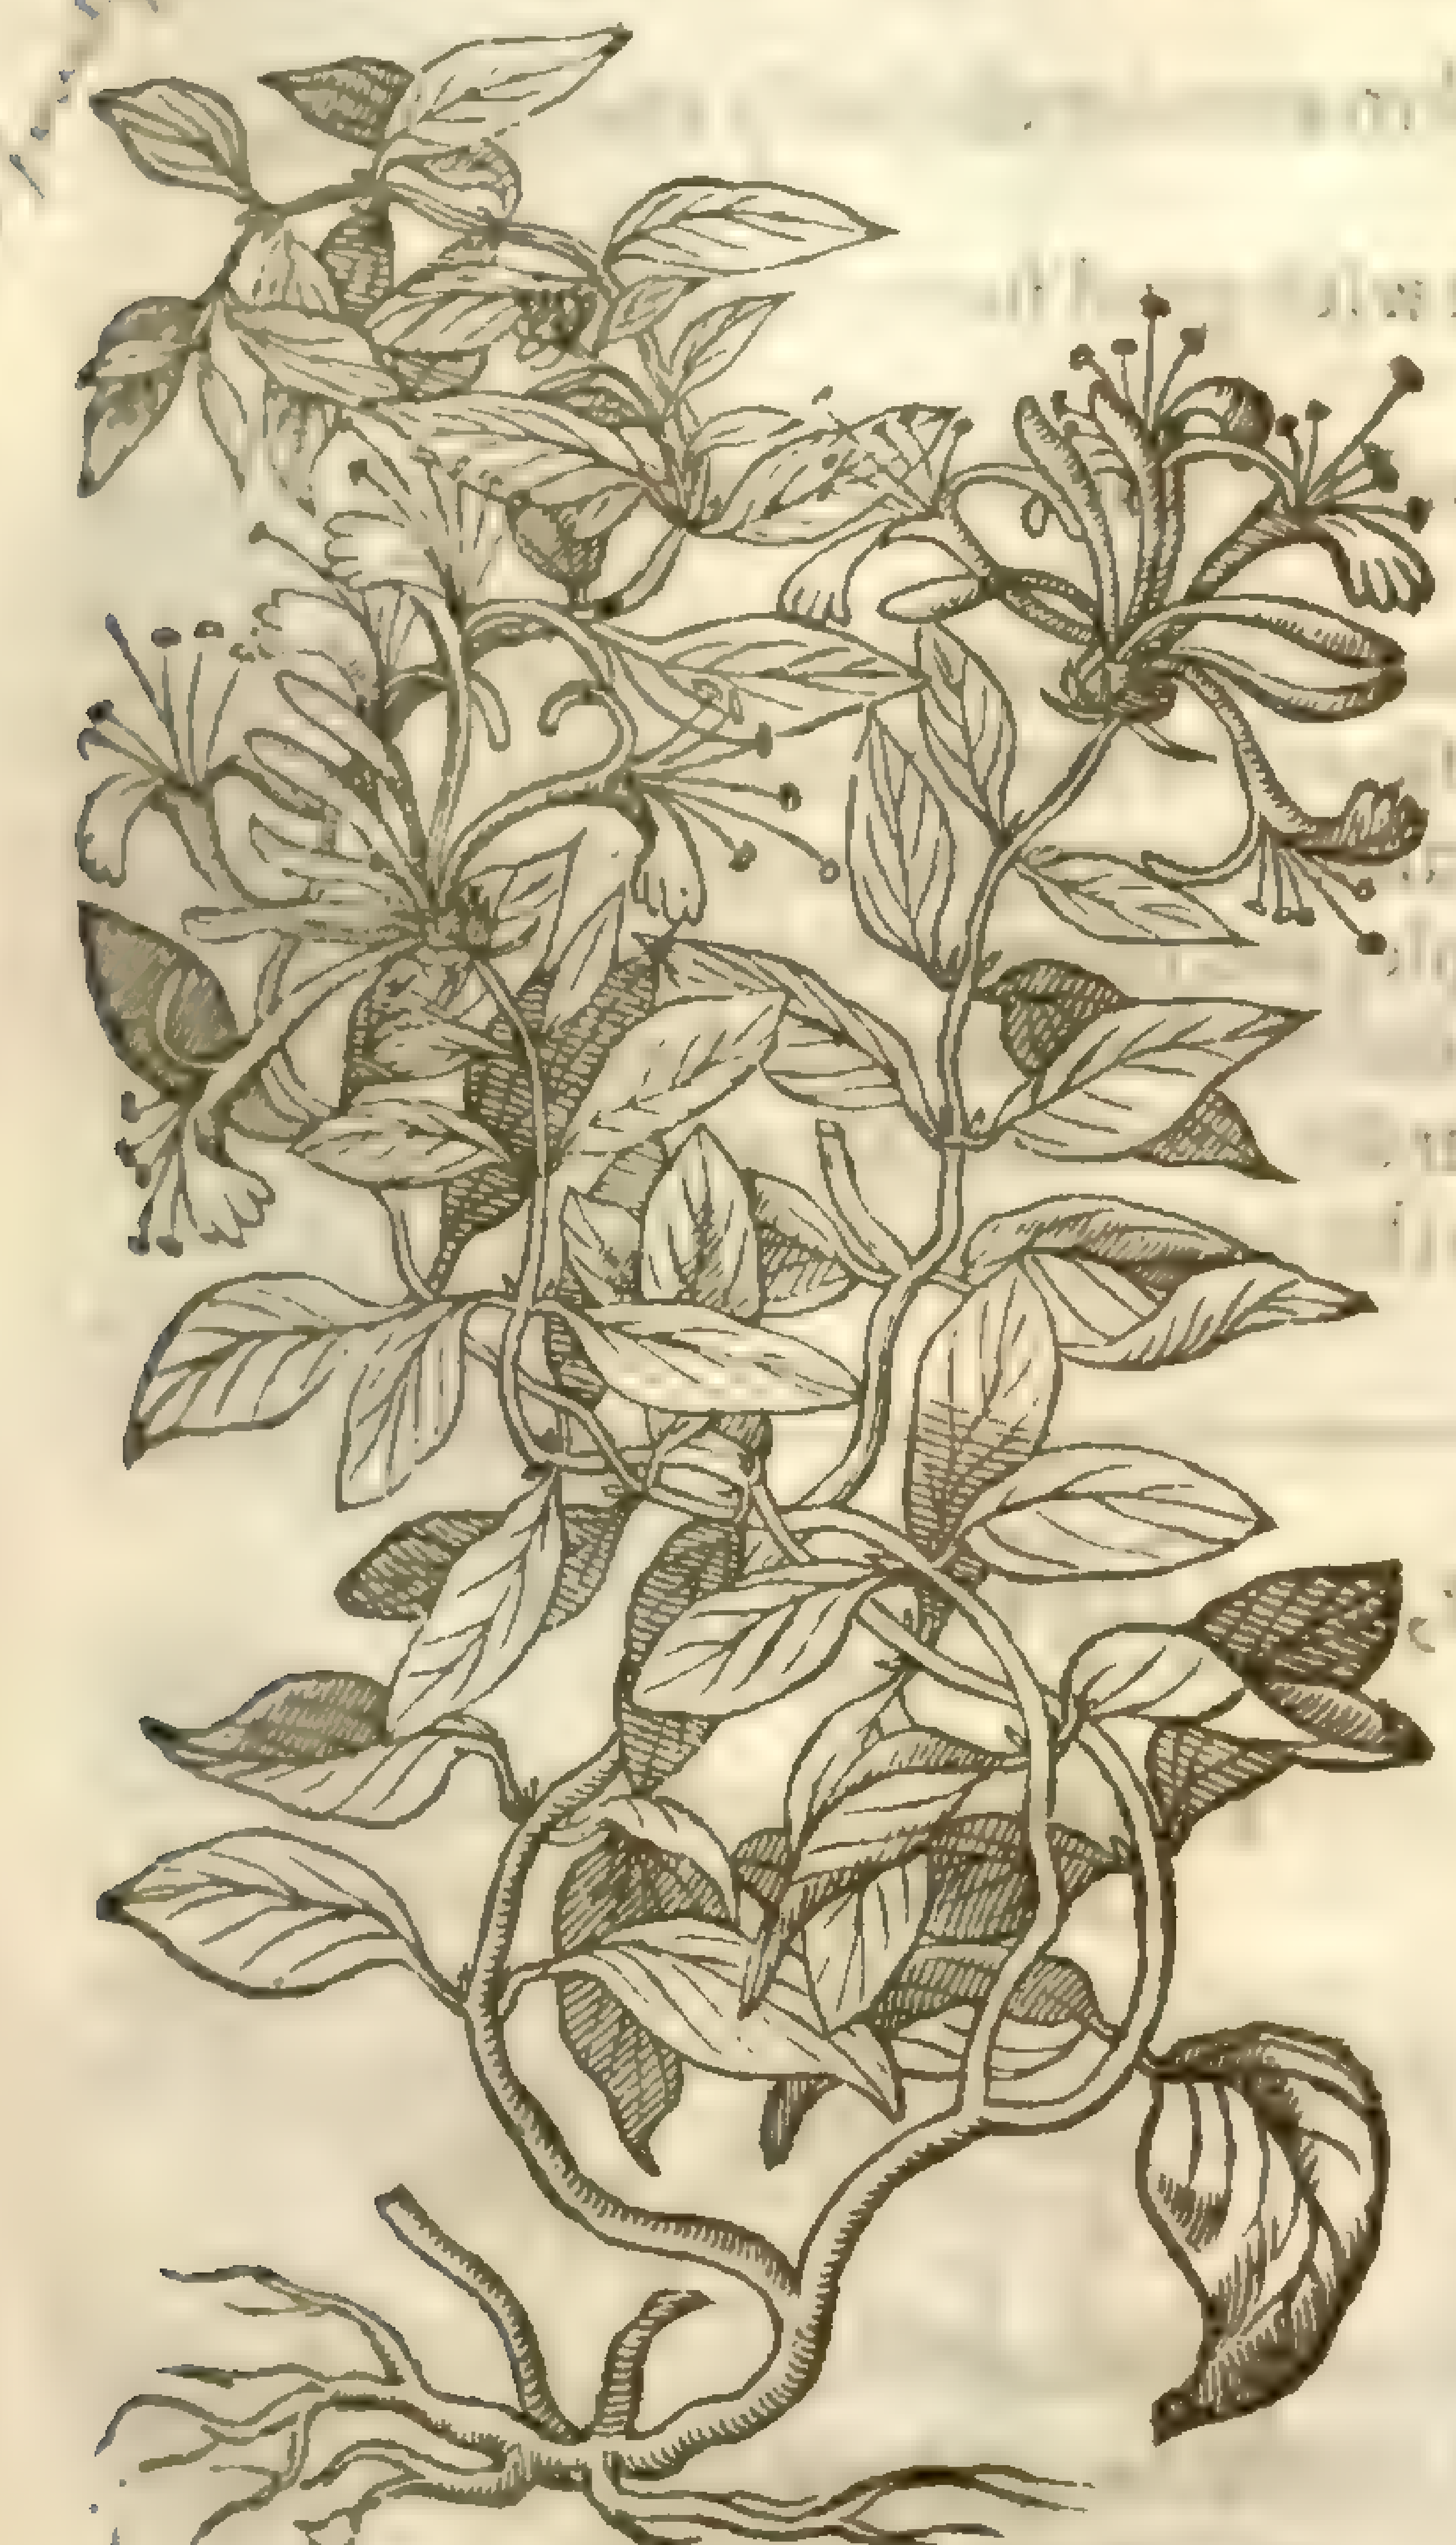
¶ *The Deſcription.*

1 Wood-binde or Hony-ſuckle climeth vp aloft, hauing long ſlender woody ſtalkes, parted into diuers branches: about which ſtand by certaine diſtances ſmooth leaues, ſet together by couples one right againſt another; of a light greene colour aboue, vnderneath of a whitiſh greene. The floures ſhew themſeluas in the tops of the branches, many in number, long, white, ſweet of ſmell, hollow within; in one part ſtanding more out, with certaine threddes growing out of the middle. The fruit is like little bunches of grapes, red when they be ripe, wherein is contained ſmall hard ſeed. The root is woody, and not without ſtrings.

2 This ſtrange kind of Woodbind hath leaues, ſtalks, and roots like vnto the common Woodbinde or Honiſuckle, ſauing that neere vnto the place where the floures come forth, the ſtalkes do grow through the leaues, like vnto the herbe Thorow-wax, called *Perfoliata*; which leaues do reſemble little ſaucers: out of which broad round leaues proceed faire, beautifull, and well ſmelling floures, ſhining with a whitiſh purple colour, and ſomewhat daſht with yellow, by little and little ſtretched out like the noſe of an Elephant, garniſhed within with ſmall yellow chiues or threddes: and when the floures are in their flouriſhing, the leaues and floures do reſemble ſaucers filled with

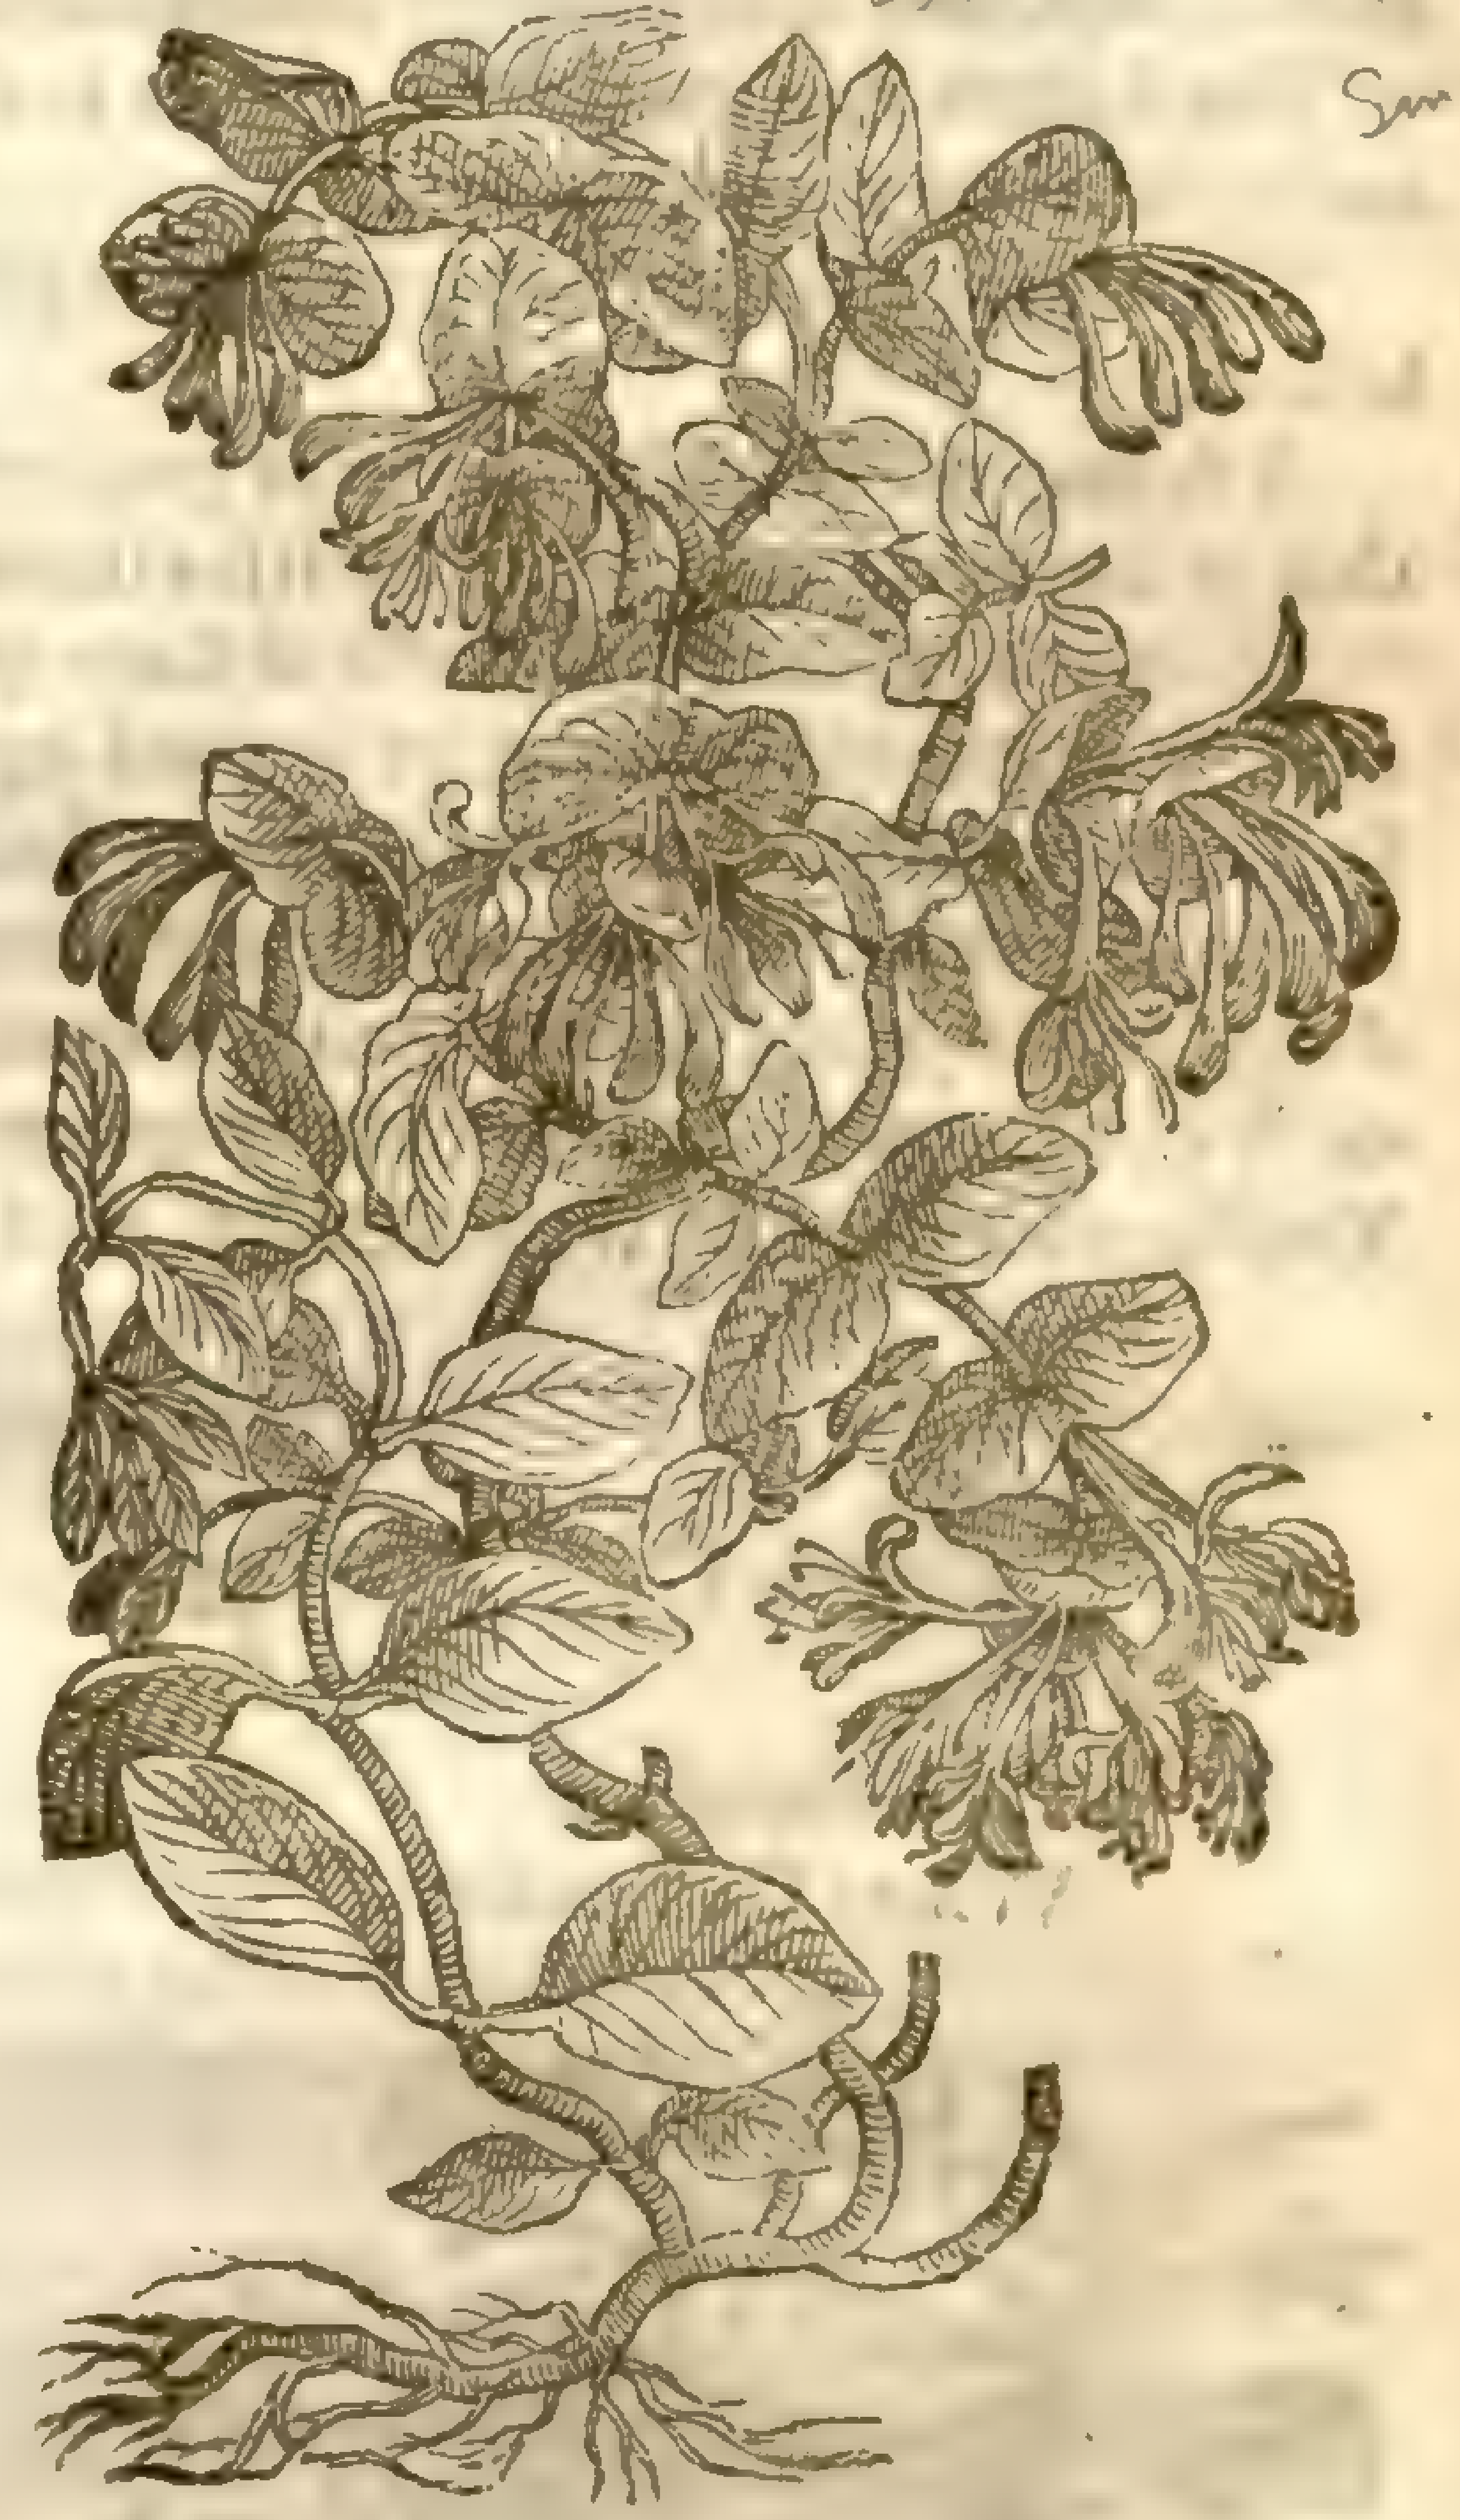
the floures of Woodbinde: many times it falleth out, that there is to be found three or foure ſaucers one aboue another, filled with floures, as the firſt, which hath cauſed it to be called double Hony-ſuckle, or Woodbinde.

1 *Periclymenum.*
Woodbinde or Honiſuckles.



2 *Periclymenum perfoliatum.*
Italian Woodbinde.

Lonicera caprifolium, in [illegible]
Smith. 325



¶ *The Place.*

The Woodbinde groweth in woods and hedges, and vpon ſhrubs and buſhes, oftentimes winding it ſelfe ſo ſtraight and hard about, that it leaueth his print vpon thoſe things ſo wrapped.

The double Honiſuckle groweth now in my Garden, and many others likewiſe in great plenty, although not long ſince, very rare and hard to be found, except in the garden of ſome diligent Herbariſts.

¶ *The Time.*

The leaues come forth betimes in the ſpring: the floures bud forth in May and Iune: the fruit is ripe in Autumne.

¶ *The Names.*

It is called in Greeke, περικλύμενον: in Latine, *Volucrum majus*: of *Scribonius Largus*, *Sylux mater*: in ſhops, *Caprifolium*, and *Matriſylva*: of ſome, *Lilium inter ſpinas*: in Italian, *Vinciboſco*: in High Dutch, **Geyſbladt**: in Low Dutch, **Gheytenbladt**, and **Mammekens Cruit**: in French, *Cheurefucille*: in Spaniſh, *Madreſelva*: in Engliſh, Woodbinde, Honiſuckle, and Caprifoly.

¶ *The Temperature.*

There hath an errour in times paſt growne amongſt a few, and now almoſt paſt recouery to bee called againe, being growne an errour vniuerſall, which errour is, the decoction of the leaues of Honiſuckles, or the diſtilled water of the floures, are raſhly giuen for the inflammations of the mouth and throte, as though they were binding and cooling. But contrariwiſe Honiſuckle is neither cold nor binding; but hot, and attenuating or making thinne. For as *Galen* ſaith, both the fruit of Woodbinde, and alſo the leaues, do ſo much attenuate and heate, as if ſomewhat too much of them be drunke, they will cauſe the vrine to be as red as bloud, yet do they at the firſt onely prouoke vrine.

¶ *The Vertues.*

A *Dioſcorides* writeth, that the ripe ſeed gathered and dried in the ſhadow, and drunke vnto the quantitie of one dram weight, fortie daies together, doth waſte and conſume away the hardneſſe of the ſpleene, remoueth weariſomeneſſe, helpeth the ſhortneſſe and difficulty of breathing, cureth the hicket, procureth bloudy vrine after the ſixth day, and cauſeth women to haue ſpeedy trauell in childe bearing.

B The leaues be of the ſame force: which being drunke thirty daies together, are reported to make men barren, and deſtroy their naturall ſeed.

C The floures ſteeped in oile, and ſet in the Sun, are good to annoint the body that is benummed, and growne very cold.

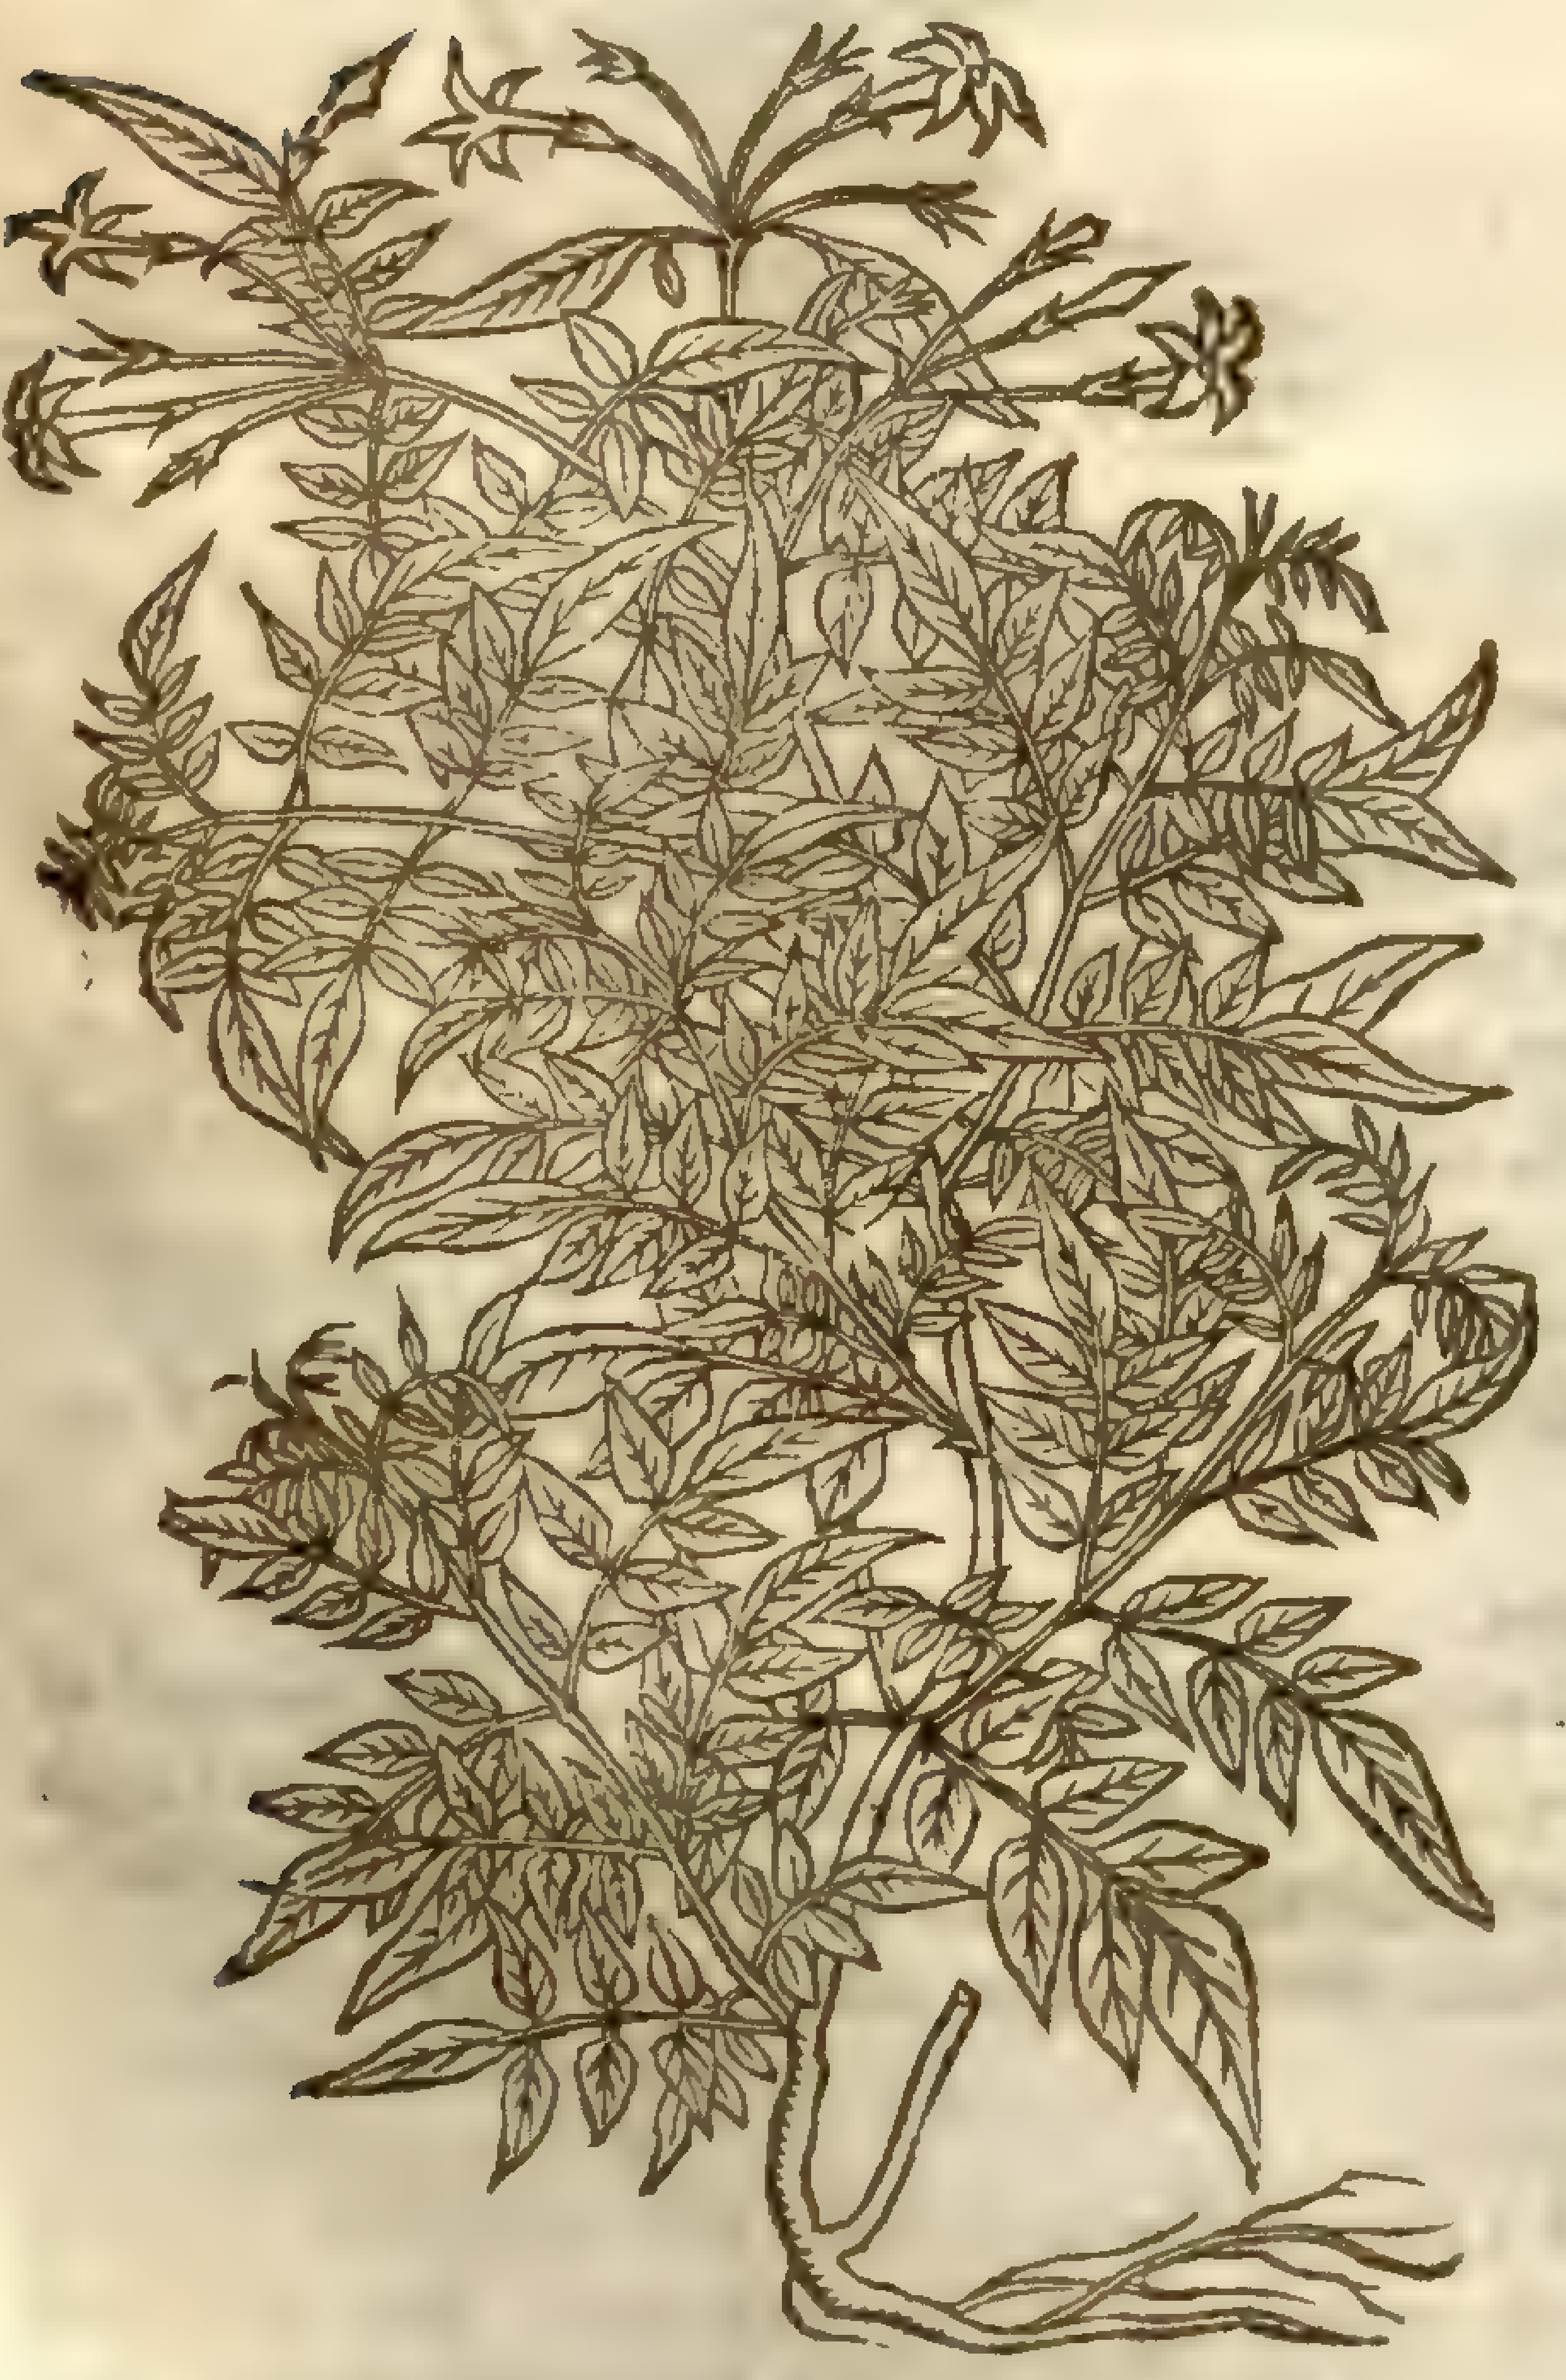
D The diſtilled water of the floures are giuen to be drunke with good ſucceſſe againſt the piſſing of bloud.

E A ſyrrup made of the floures is good to be drunke againſt the diſeaſes of the lungs and ſpleene that is ſtopped, being drunke with a little wine.

F Notwithſtanding the words of *Galen* (or rather of *Dodonæus*) it is certainly found by experience, that the water of Honiſuckles is good againſt the ſoreneſſe of the throat and uvula: and with the ſame leaues boyled, and the leaues or flours diſtilled, are made diuers good medicines againſt cankers, and ſore mouthes, as well in children as in elder people, and likewiſe for vlcerations and ſcaldings in the priuie parts of man or woman; if there be added to the decoction hereof ſome allome or Verdigreace if the ſore require greater clenſing outwardly, prouided alwaies that there be no Verdigreace put into the water that muſt be injected into the ſecret parts.

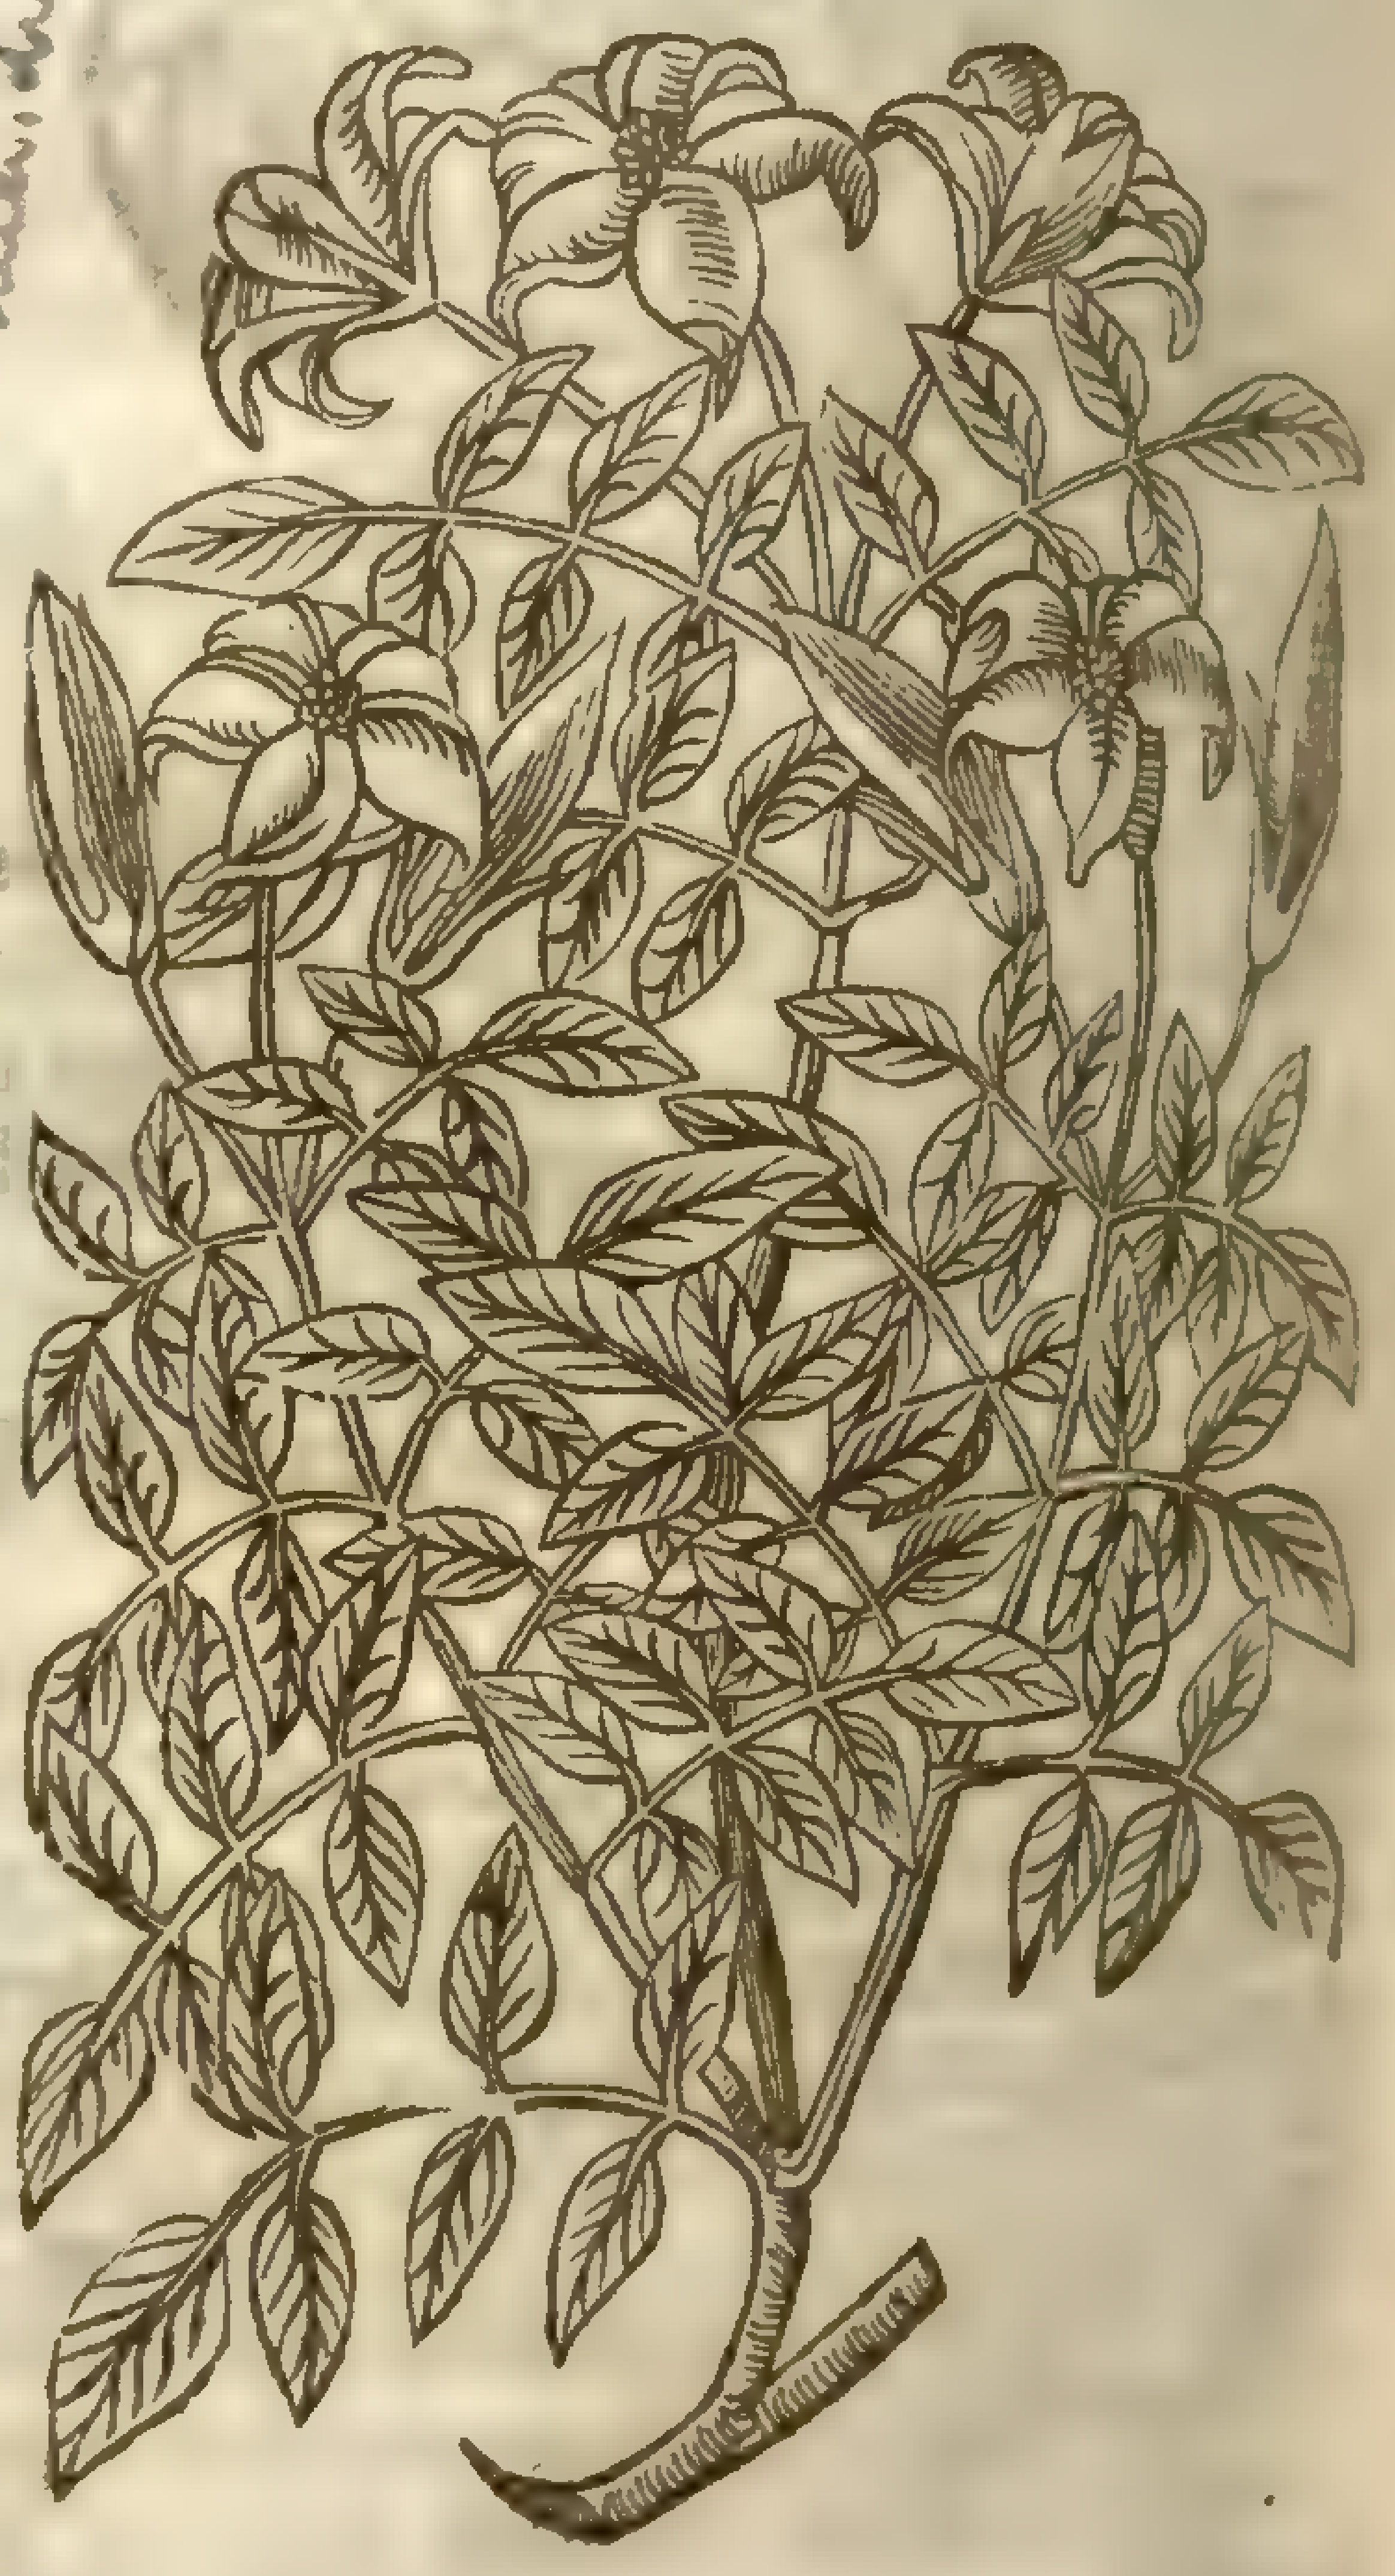
Chap. 329. *Of Iaſmine, or Gelſemine.*

1 *Iaſminum album.*
White Geſſemine.



Jasminum officinale, L. [illegible]

2 *Iaſminum Candiflorum majus.*
Great white Geſſemine.

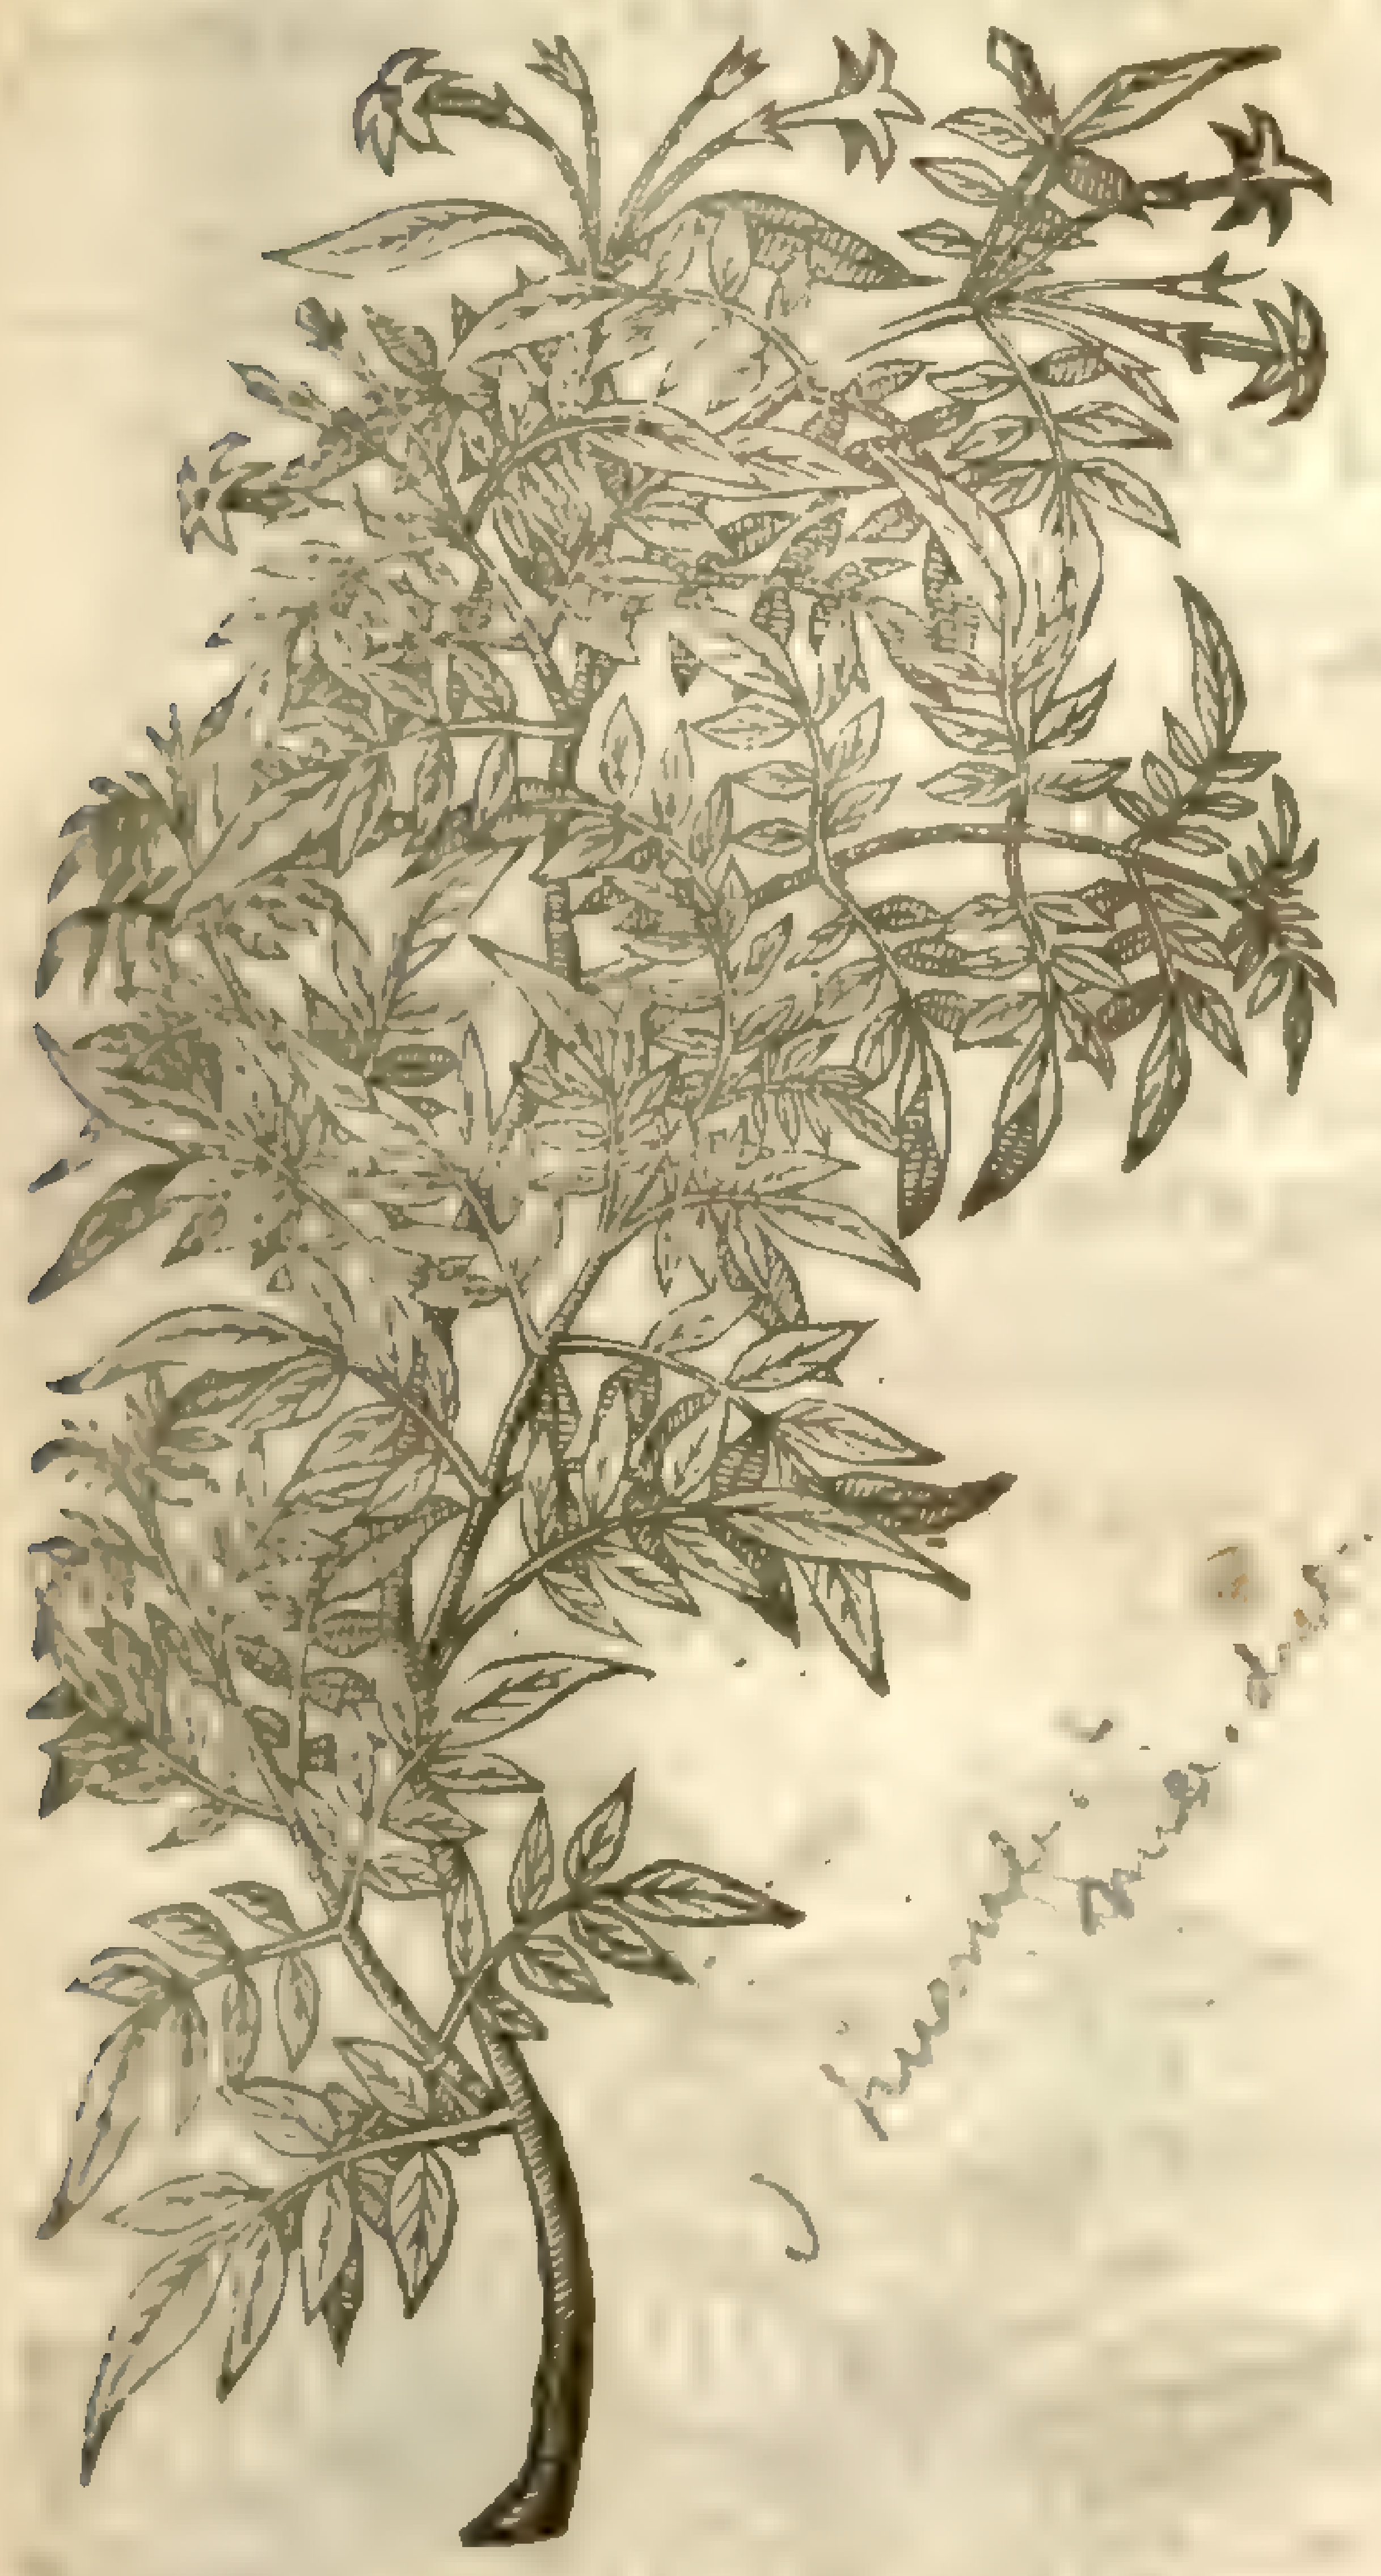


Jasminum grandiflorum, L. [illegible]

¶ *The Deſcription.*

1 IAſmine, or Gelſemine, is of the number of thoſe plants which haue need to be ſupported or propped vp, and yet notwithſtanding of it ſelfe claſpeth not or windeth his ſtalkes about

3 *Iaſminum luteum.*
Yellow Iaſmine.



bout ſuch things as ſtand neere vnto it, but onely leaneth and lieth vpon thoſe things that are prepared to ſuſtain it about arbors and banqueting houſes in gardens, by which it is held vp: the ſtalkes thereof are long,round,branched,jointed or kneed, and of a green colour,hauing within a white ſpongeous pith. The leaues ſtand vpon a middle rib, ſet together by couples like thoſe of the aſh tree, but much ſmaller,of a deepe greene colour: the floures grow at the vppermoſt part of the branches, ſtanding in a ſmall tuft far ſet one from another, ſweet in ſmell,of colour white: the ſeed is flat and broad like thoſe of Lupines,which ſeldom come to ripeneſſe: the root is tough and threddy.

2 *Lobel* reporteth, That hee ſaw in a garden at Bruſſels,belonging to a reuerend perſon called Mr. *Boiſot*, a kinde of Gelſemine very much differing from our Iaſmine,which he nouriſhed in an earthen pot: it grew not aboue (ſaith he) the height of a cubit,diuided into diuers branches, wherupon did grow leaues like thoſe of the common white Iaſmine,but blacker and rounder. The floures in ſhew were moſt beautifull,ſhaped like thoſe of the common Iaſmine,but foure times bigger, gaping wide open, white on the vpper ſide, and of a bright red on the vnder ſide.

3 There is a kinde hereof with yellow floures; but ſome doe deſcribe for the yellow Iaſmine, the ſhrubby Trefoil,called of ſome, *Trifolium fruticans*; and of others, *Polemonium*· but this yellow Iaſmine is one,and that is another plant, differing from the kindes of Iaſmine, as ſhall be declared in his proper place. The yellow Iaſmine differs not from the common white Geſmine in leaues,ſtalks, nor faſhion of the flours: the only difference is,that this plant brings forth yellow flours,and the other white.

4 There is likewiſe another ſort that differs not from the former in any rſpect but in the color of the floure; for this plant hath floures of a blew colour, and the others not ſo, wherein conſiſteth the difference.

¶ *The Place.*

Gelſemine is foſtred in gardens,and is vſed for arbors,& to couer banqueting houſes in gardens: it growes not wild in England,that I can vnderſtand of, though Mr *Lyte* be of another opinion:the white Iaſmine is common in moſt places of England: the reſt are ſtrangers,and not ſeene in theſe parts as yet.

¶ *The Time.*

They bring forth their pleaſant floures in Iuly and Auguſt.

¶ *The Names.*

Among the Arabians *Serapio* was the firſt that named Geſſemine, *Zambach*: it is called *Iaſminum*, *Ieſeminum*,and alſo *Geſſeminum*: in Engliſh, Iaſmine, Geſſemine,and Geſſe.

There is in *Dioſcorides* a compoſition of oile of Iaſmine,which he ſaith is made in Perſia of the white floures of Violets,which Violets ſeem to be none other than the floures of this Geſſemine; for *Dioſcorides* hath often reckoned faire and elegant floures among the Violets;ſo that it muſt not ſeem ſtrange that he calleth the floures of Ieſſemine Violets,eſpecially ſeeing the plant it ſelf was vnknown to him,as is euident.

¶ *The Temperature.*

Geſſemine,and eſpecially the floures thereof, be hot in the beginning of the ſecond degree, as *Serapio* reporteth out of *Meſue*.

¶ *The Vertues.*

The oile which is made of the flours hereof waſteth away raw humors,and is good againſt cold rheums; but in thoſe that are of a hot conſtitution it cauſeth head-ache, and the ouermuch ſmell thereof maketh the noſe to bleed,as the ſame Author affirmeth. It is vſed (as *Dioſcorides* writeth, and A and after him *Aetius*) of the Perſians in their banquets for pleaſures ſake: it is good to be anointed after baths, in thoſe bodies that haue need to be ſuppled and warmed, but for ſmell it is not much vſed.

B The leaues boiled in wine vntill they be ſoft, and made vp to the forme of a pultis, and applied, diſſolue cold ſwellings, wens, hard lumps, and ſuch like out-goings.

Chap. 330. *Of Peruinkle.*

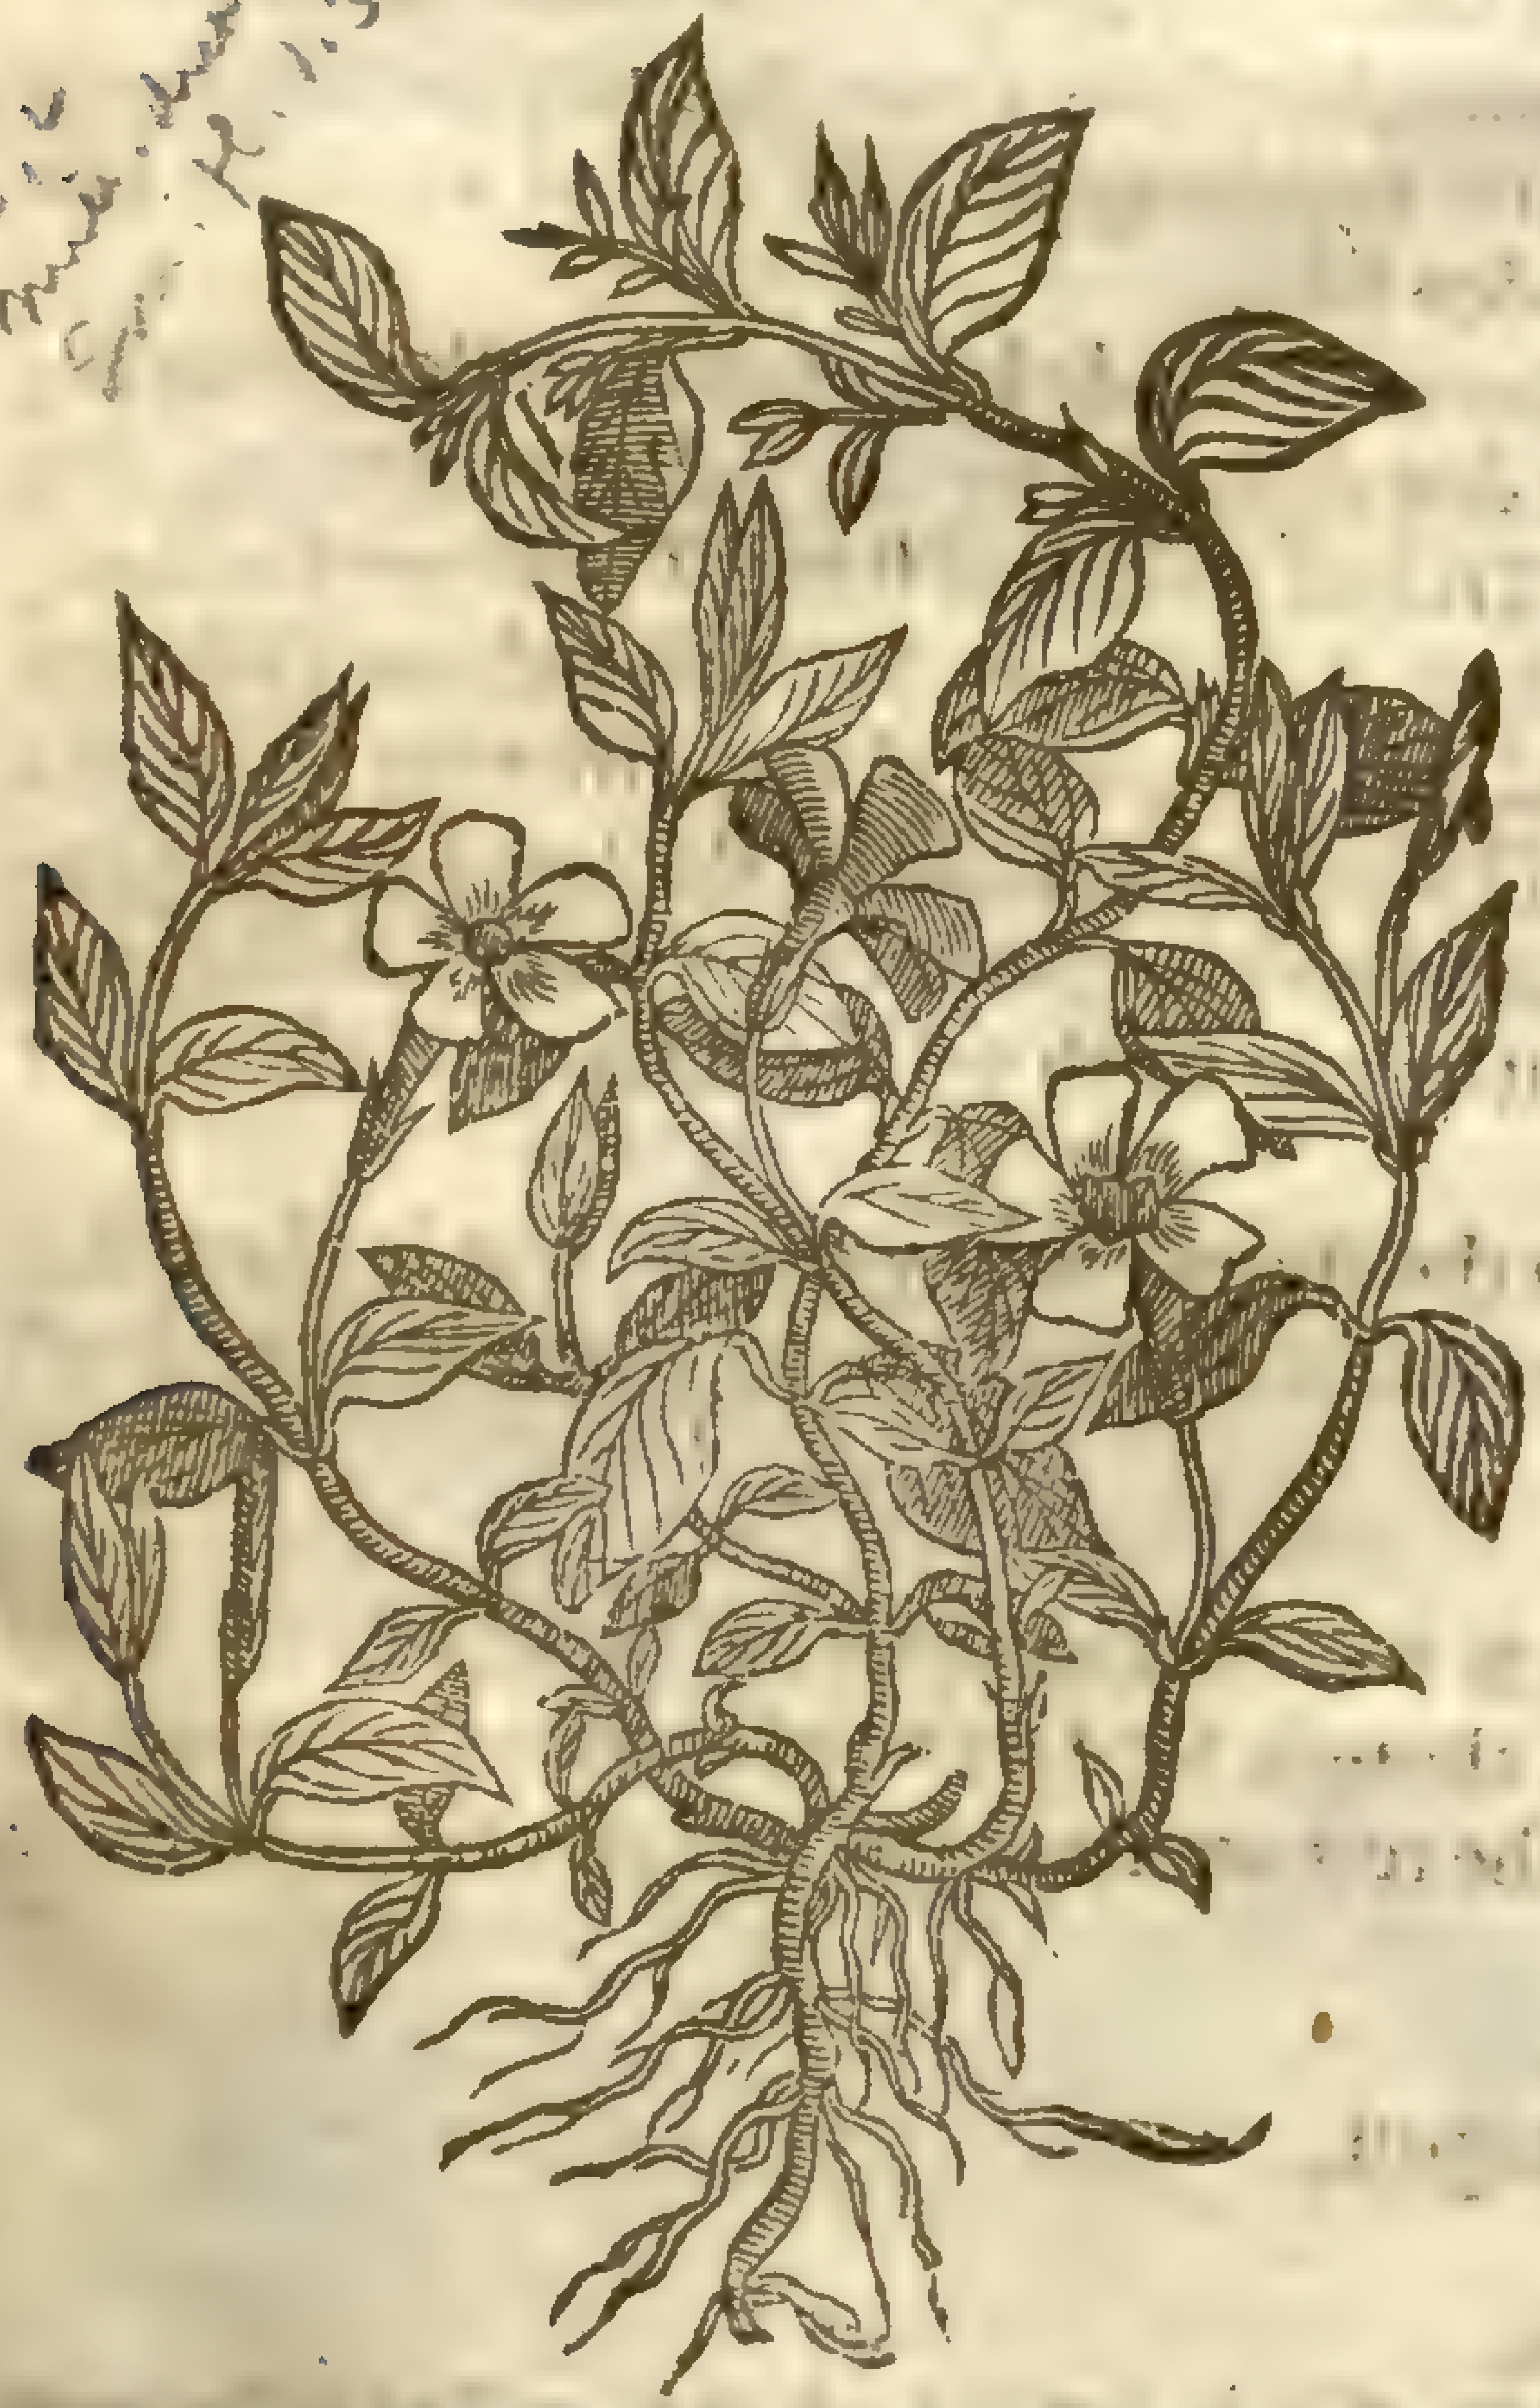
¶ *The Deſcription.*

1 Perunkle hath ſlender and long branches trailing vpon the ground, taking hold here and there as it runneth, ſmall like ruſhes, with naked or bare ſpaces between joint and joint. The leaues are ſmooth, not vnlike to the Bay leafe, but leſſer: the floures grow hard by the leaues, ſpreading wide open, compoſed of fiue ſmall blew leaues.

We haue in our London gardens a kinde hereof bearing white floures, wherein it differs from the former.

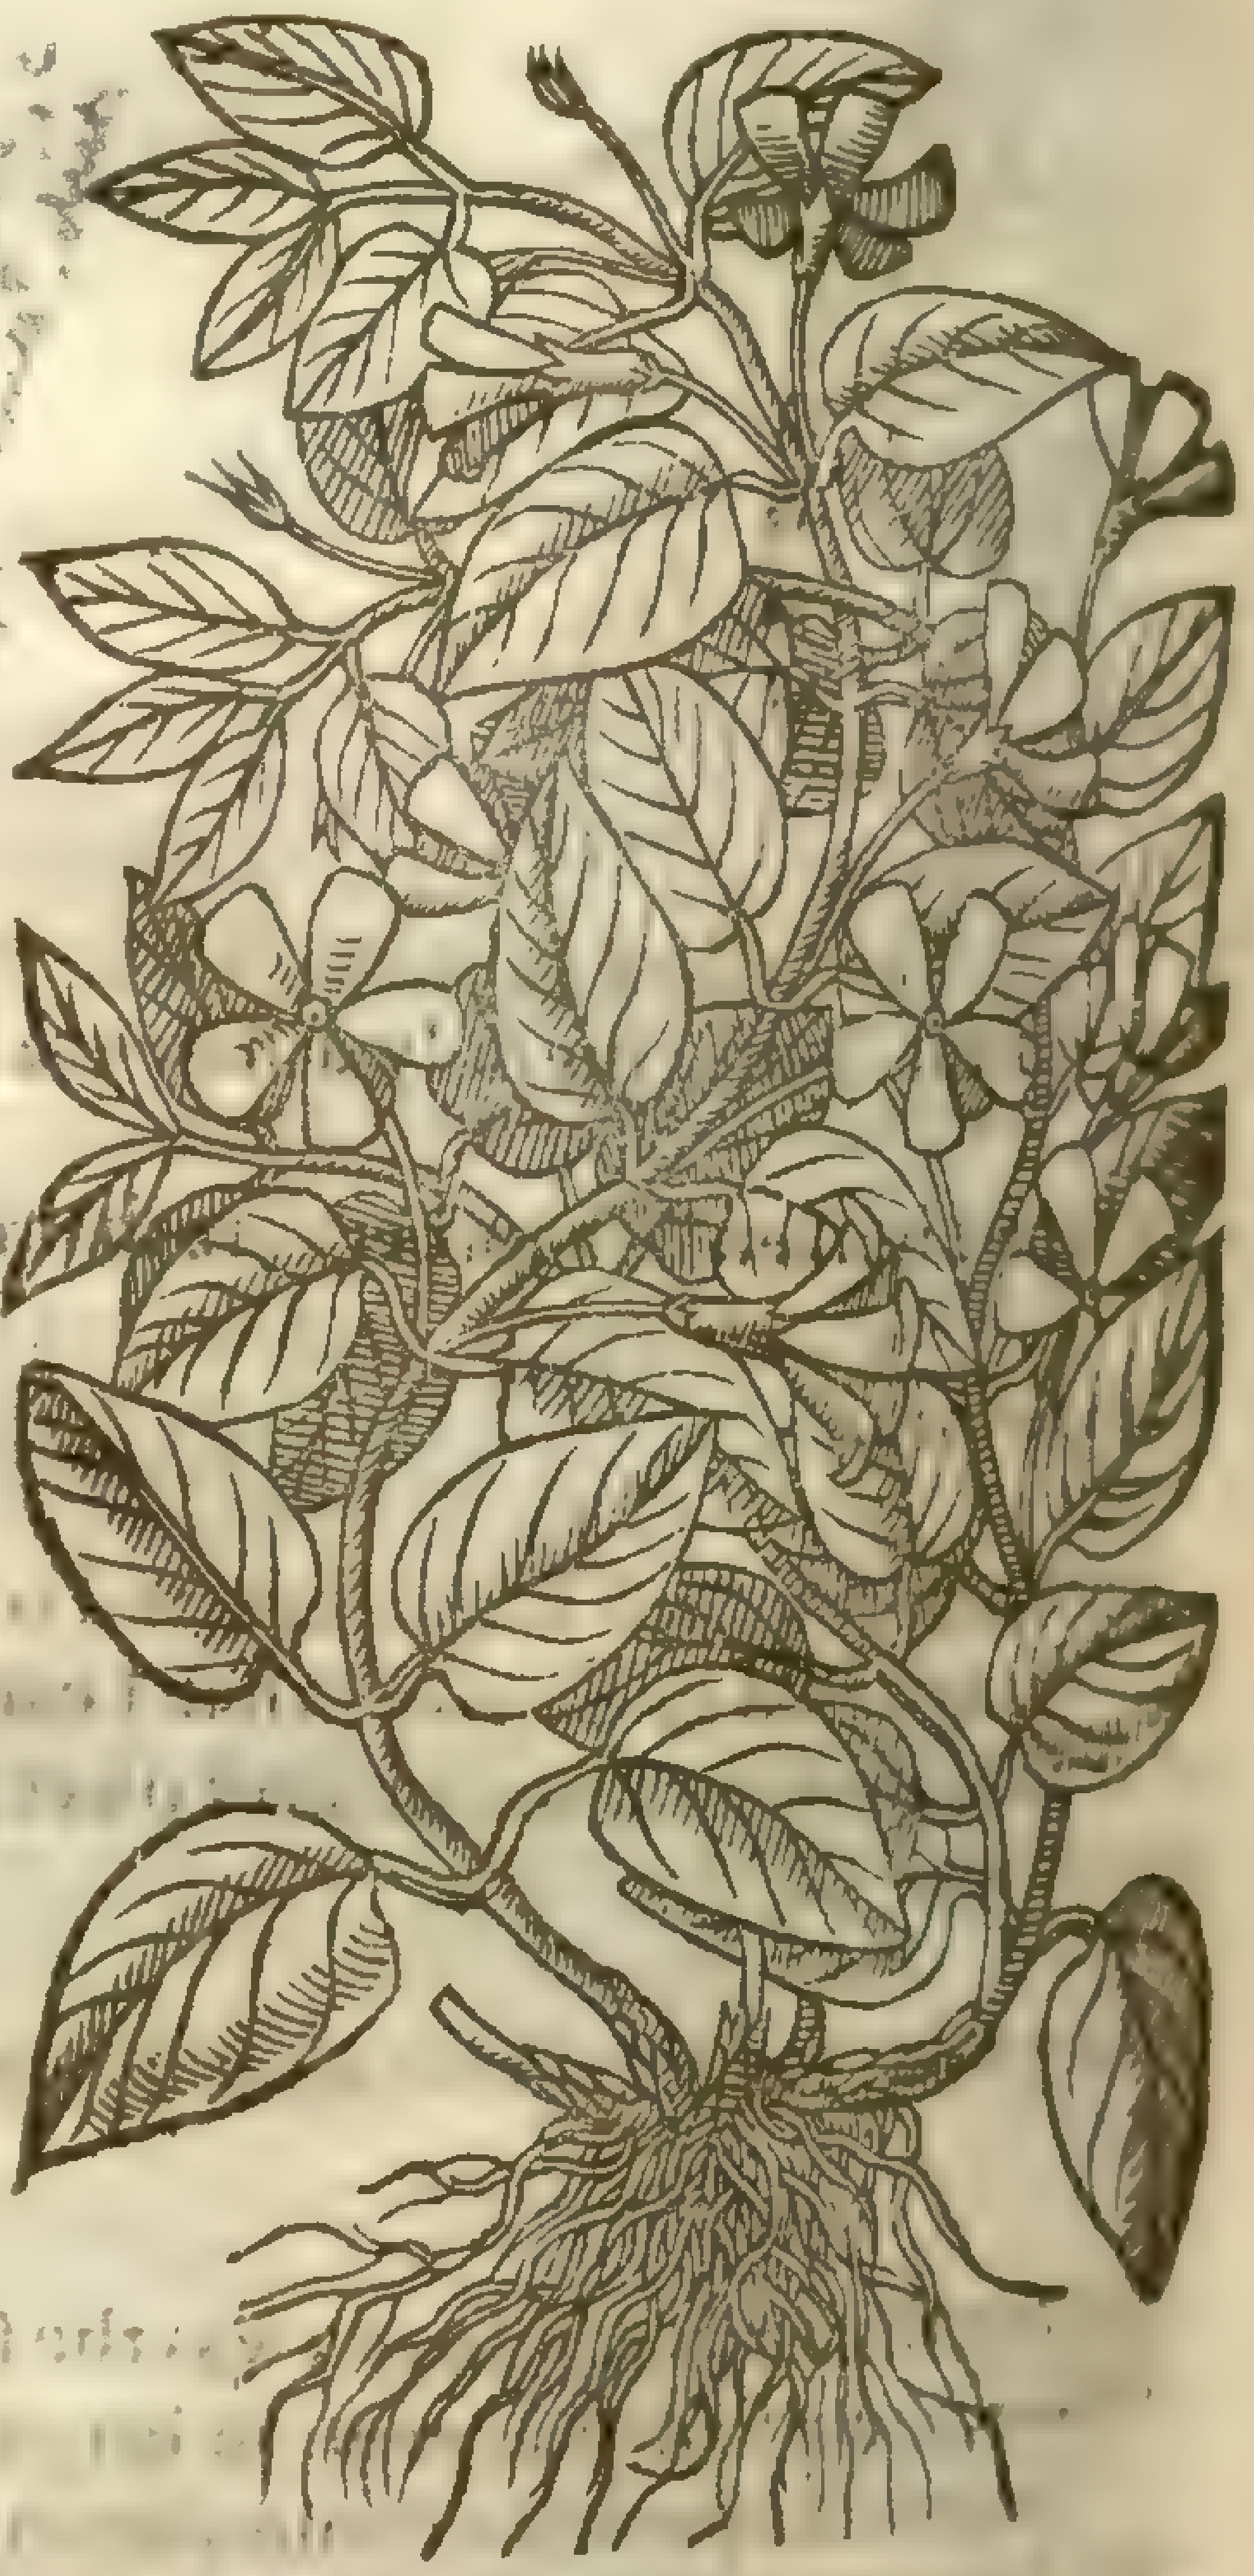
1 *Vinca Peruinca minor.*
Peruinkle.

V. minor [illegible] Sp. Pl. 1.338



‡ 2 *Clematis Daphnoides, ſiue Peruinca major.*
Great Peruinkle.

Vinca major [illegible] Sp. Pl. 1.339



There is another with purple floures, doubling it ſelfe ſomewhat in the middle, with ſmaller leaues, wherein is the difference.

2 There is another ſort greater than any of the reſt, called of ſome, *Clematis Daphnoides*, of the likeneſſe the leaues haue with thoſe of Bay: the leaues and floures are like thoſe of the precedent, but altogether greater, wherein conſiſts the difference.

¶ *The Place.*

They grow in moſt of our London gardens, they loue moiſt and ſhadowie places; the branches remain alwaies green.

¶ *The Time.*

They floure and flouriſh in March, Aprill, and May, and ſometimes later.

¶ The Names.

Peruinkle is called in Greeke, κληματὶς δαφνοειδὴς, becauſe it bringeth forth ſtalkes which creepe like thoſe of the Vine; and *Daphnoeides*, by reaſon that the leaues are like thoſe of the Bay, as aforeſaid. *Pliny* calls it *Vinca peruinca*, and *Chamadaphne*: notwithſtanding there is another *Chamadaphne*, of which in his place. The ſame Author likewiſe calleth it *Centunculus*: in high-Dutch, **Ingrun**: in low-Dutch, **Vincoorte, maegden cruyt**: in French, *Pucellage*, *Vauche*, and *Peruauche*: in Italian, *Provenca*: in Spaniſh, *Peruinqua*: in ſhops, *Clematis peruinca*: in Engliſh, Peruinkle, Pervinkle, and Periwinkle.

¶ The Nature.

Peruinkle is hot within the ſecond degree, ſomthing dry and aſtringent.

¶ The Vertues.

The leaues boiled in wine and drunke ſtop the laske and bloudy flix. A

An handfull of the leaues ſtamped, and the juice giuen to drinke in red wine, ſtoppeth the laske and bloudy flix, ſpitting of bloud, which neuer faileth: it likewiſe ſtops the inordinat courſe of the monethly ſickneſſe. B

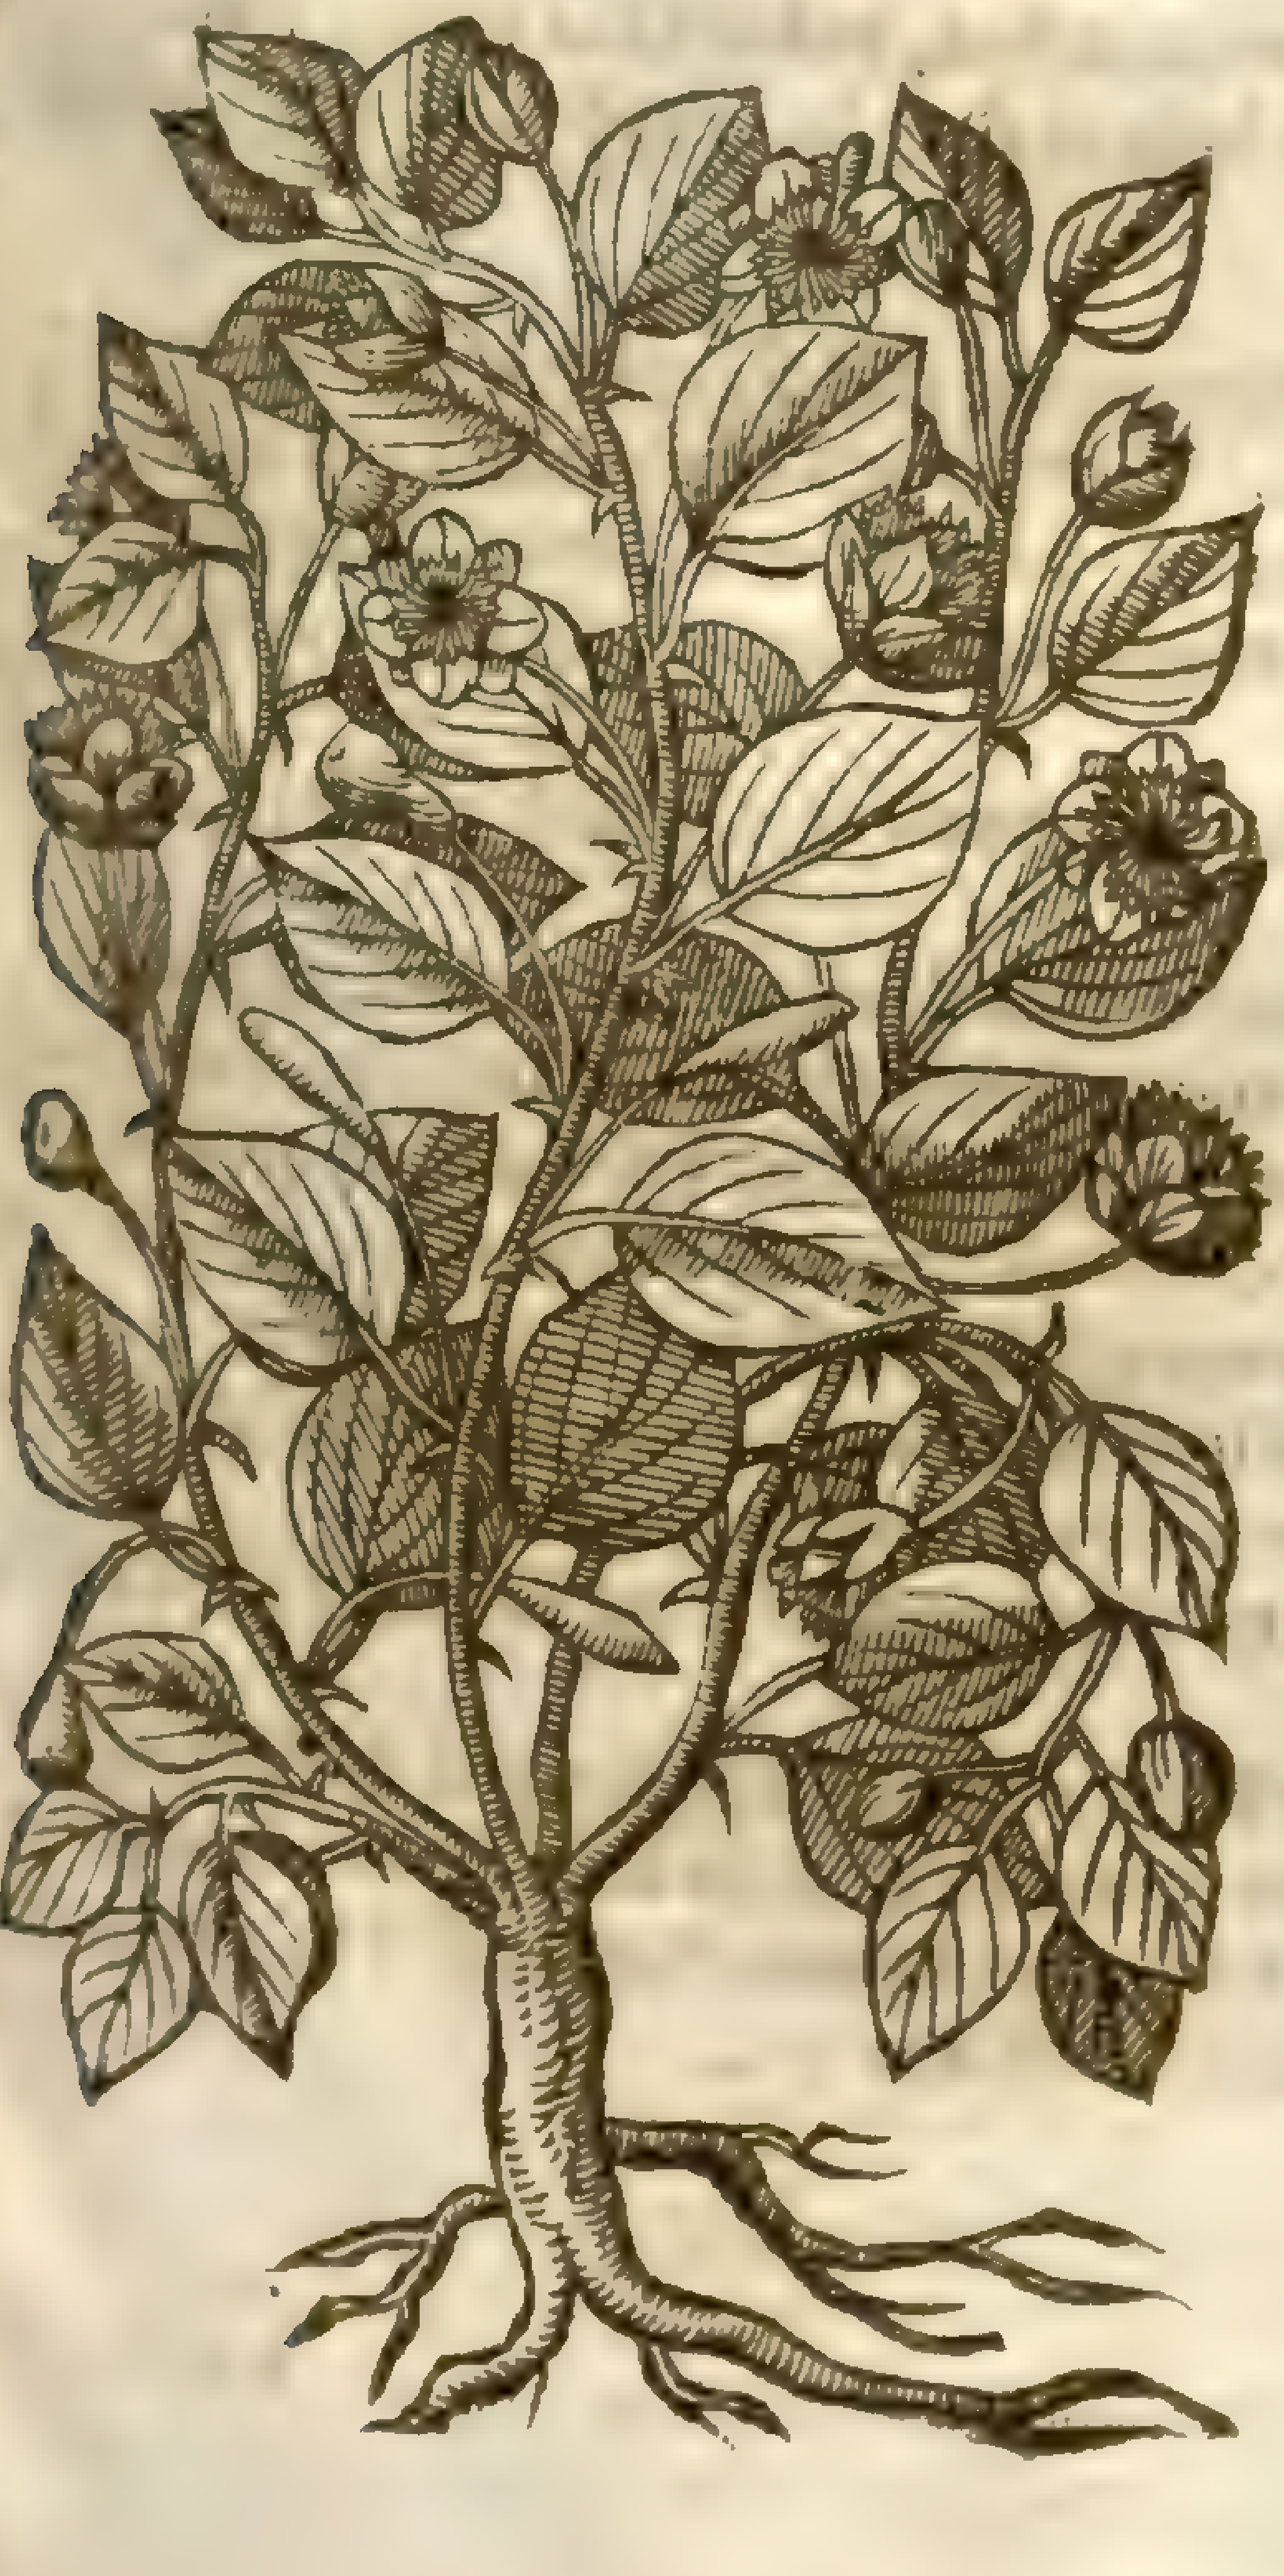
Chap. 331. Of Capers.

¶ The Kindes.

There be two ſorts of Capers eſpecially; one with broad leaues ſharp pointed: the other with rounder leaues. The Brabanders haue alſo another ſort called *Capparis fabago*, or Bean Capers:

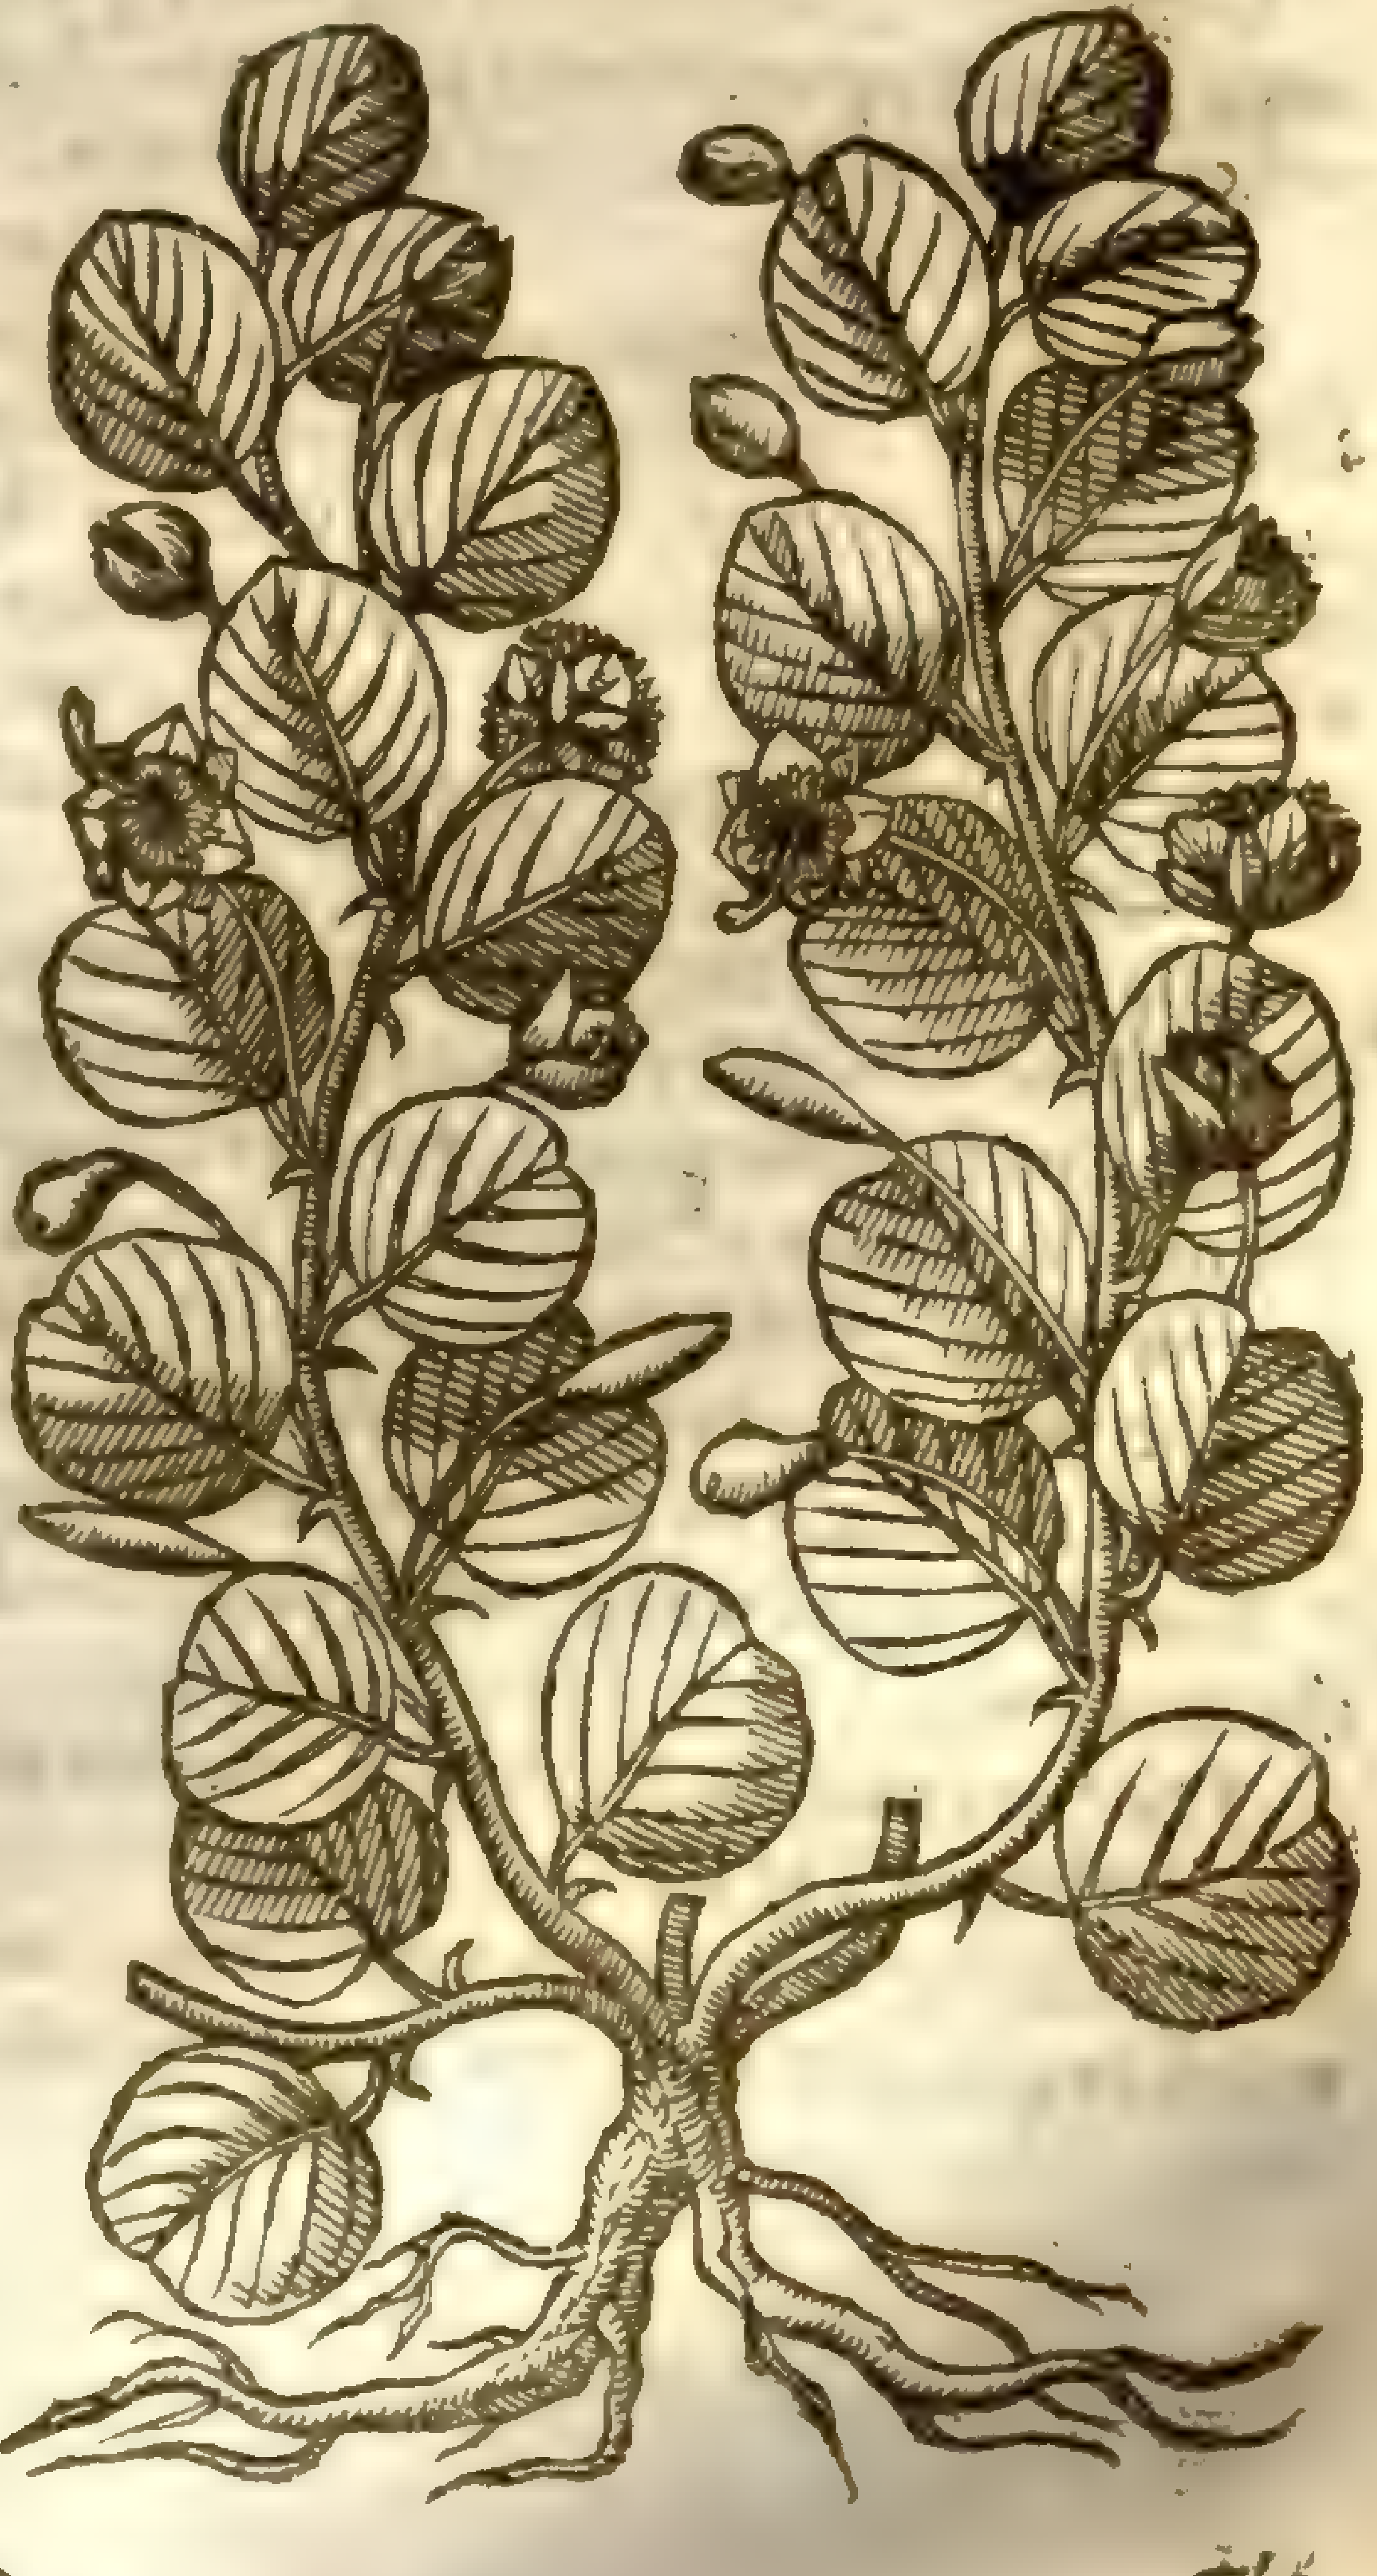
[illegible]

1 *Capparis folio acuto.*
Sharp leafed Capers.



C. spinosa [illegible]

2 *Capparis rotundiore folio.*
Round leafed Capers.



¶ *The Deſcription.*

1 The Caper is a prickly ſhrub,the ſhoots or branches whereof be full of ſharpe prickly thornes,trailing vpon the ground,if they be not ſupported or propped vp: whereupon grow leaues like thoſe of the Quince tree, but rounder: among the which come forth long ſlender footſtalks,whereon grow round knops,which open or ſpred abroad into faire floures: after which come in place long fruit like to an Oliue,and of the ſame colour, wherein is contained flat rough ſeeds,of a dusky colour. The root is wooddy,and couered with a thicke barke or rinde, which is much vſed in Phyſicke.

2 The ſecond kinde of Caper is likewiſe a prickly plant much like the bramble buſh,hauing many ſlender branches ſet full of ſharp prickles. The whole plant traileth vpon the place where it groweth,beſet with round blackiſh leaues diſorderly placed,in ſhape like thoſe of Aſtrabacca,but greater,approching to the forme of Fole-foot: among which commeth forth a ſmall and tender naked twig,charged at the end with a ſmall knap or bud,which openeth it ſelfe to a ſmall ſtar-like floure,of a pleaſant ſweet ſmell; in place whereof comes a ſmal fruit long and round like the Cornell berry,of a brown colour. The root is long and wooddy,couered with a thicke barke or rinde, which is likewiſe vſed in medicine.

¶ *The Place.*

The Caper groweth in Italy,Spaine,and other hot regions,without manuring, in a lean ſoile,in rough places amongſt rubbiſh,and vpon old walls,as *Dioſcorides* reporteth.

Theophraſtus writeth,That it is by nature wilde, and refuſeth to be husbanded, yet in theſe our dayes diuers vſe to cheriſh the ſame,and to ſet it in dry and ſtony places. My ſelfe at the impreſſion hereof planted ſome ſeeds in the bricke walls of my garden, which as yet doe ſpring and grow green: the ſucceſſe I expect.

¶ *The Time.*

The Caper floureth in Summer euen vntil Autumne. The knops of the flours before they open are thoſe Capers we eat as ſauce,which are gathered and preſerued in pickle or ſalt.

¶ *The Names.*

It is called in Greeke, κάππαρις: in Latine alſo *Capparis*: of ſome, *Cynoſbatos*,yet *Cynosbatos* or *Canirubus* is properly taken for the wild Roſe: it is generally called Cappers in moſt languages: in Engliſh,Cappers,Caper,and Capers.

¶ *The Temperature.*

Capers,or the floures not yet fully growne,be of temperature hot, and of thin parts: if they be eaten green they yeeld very little nouriſhment, and much leſſe if they be ſalted; and therefore are rather a ſauce and medicine,than a meat.

¶ *The Vertues.*

A They ſtir vp an appetite to meat, are good for a moiſt ſtomacke, and ſtay the watering thereof, clenſing away the flegme that cleaueth vnto it. They open the ſtoppings of the liuer and milt: with meat they are good to be taken of thoſe that haue a quartan Ague and ill ſpleens. They are eaten boiled (the ſalt firſt waſhed off) with oile and vineger,as other ſallads be,and ſomtimes are boiled with meat.

B The rinde or bark of the root conſiſteth of diuers faculties, it heateth,clenſeth,purgeth,cutteth and digeſteth.

C This barke is a ſingular remedie for hard ſpleenes, being outwardly applied,or inwardly taken: and the ſame boiled with vineger or Oxymel, or beaten and mixed with other ſimples, expelleth thicke groſſe humors,and conueyeth away the ſame mixed with bloud,by vrine and ſiege, wherby the milt or ſpleen is helpled,and the pain of the huckle bones taken away: moreouer, it bringeth downe the deſired ſickneſſe,purgeth and draweth flegme out of the head,as *Galen* writeth.

D The ſame bark (as *Dioſcorides* teacheth) clenſeth old filthy ſores,and ſcoureth away the thicke lips and cruſts about the edges,and being chewed it takes away the tooth-ache.

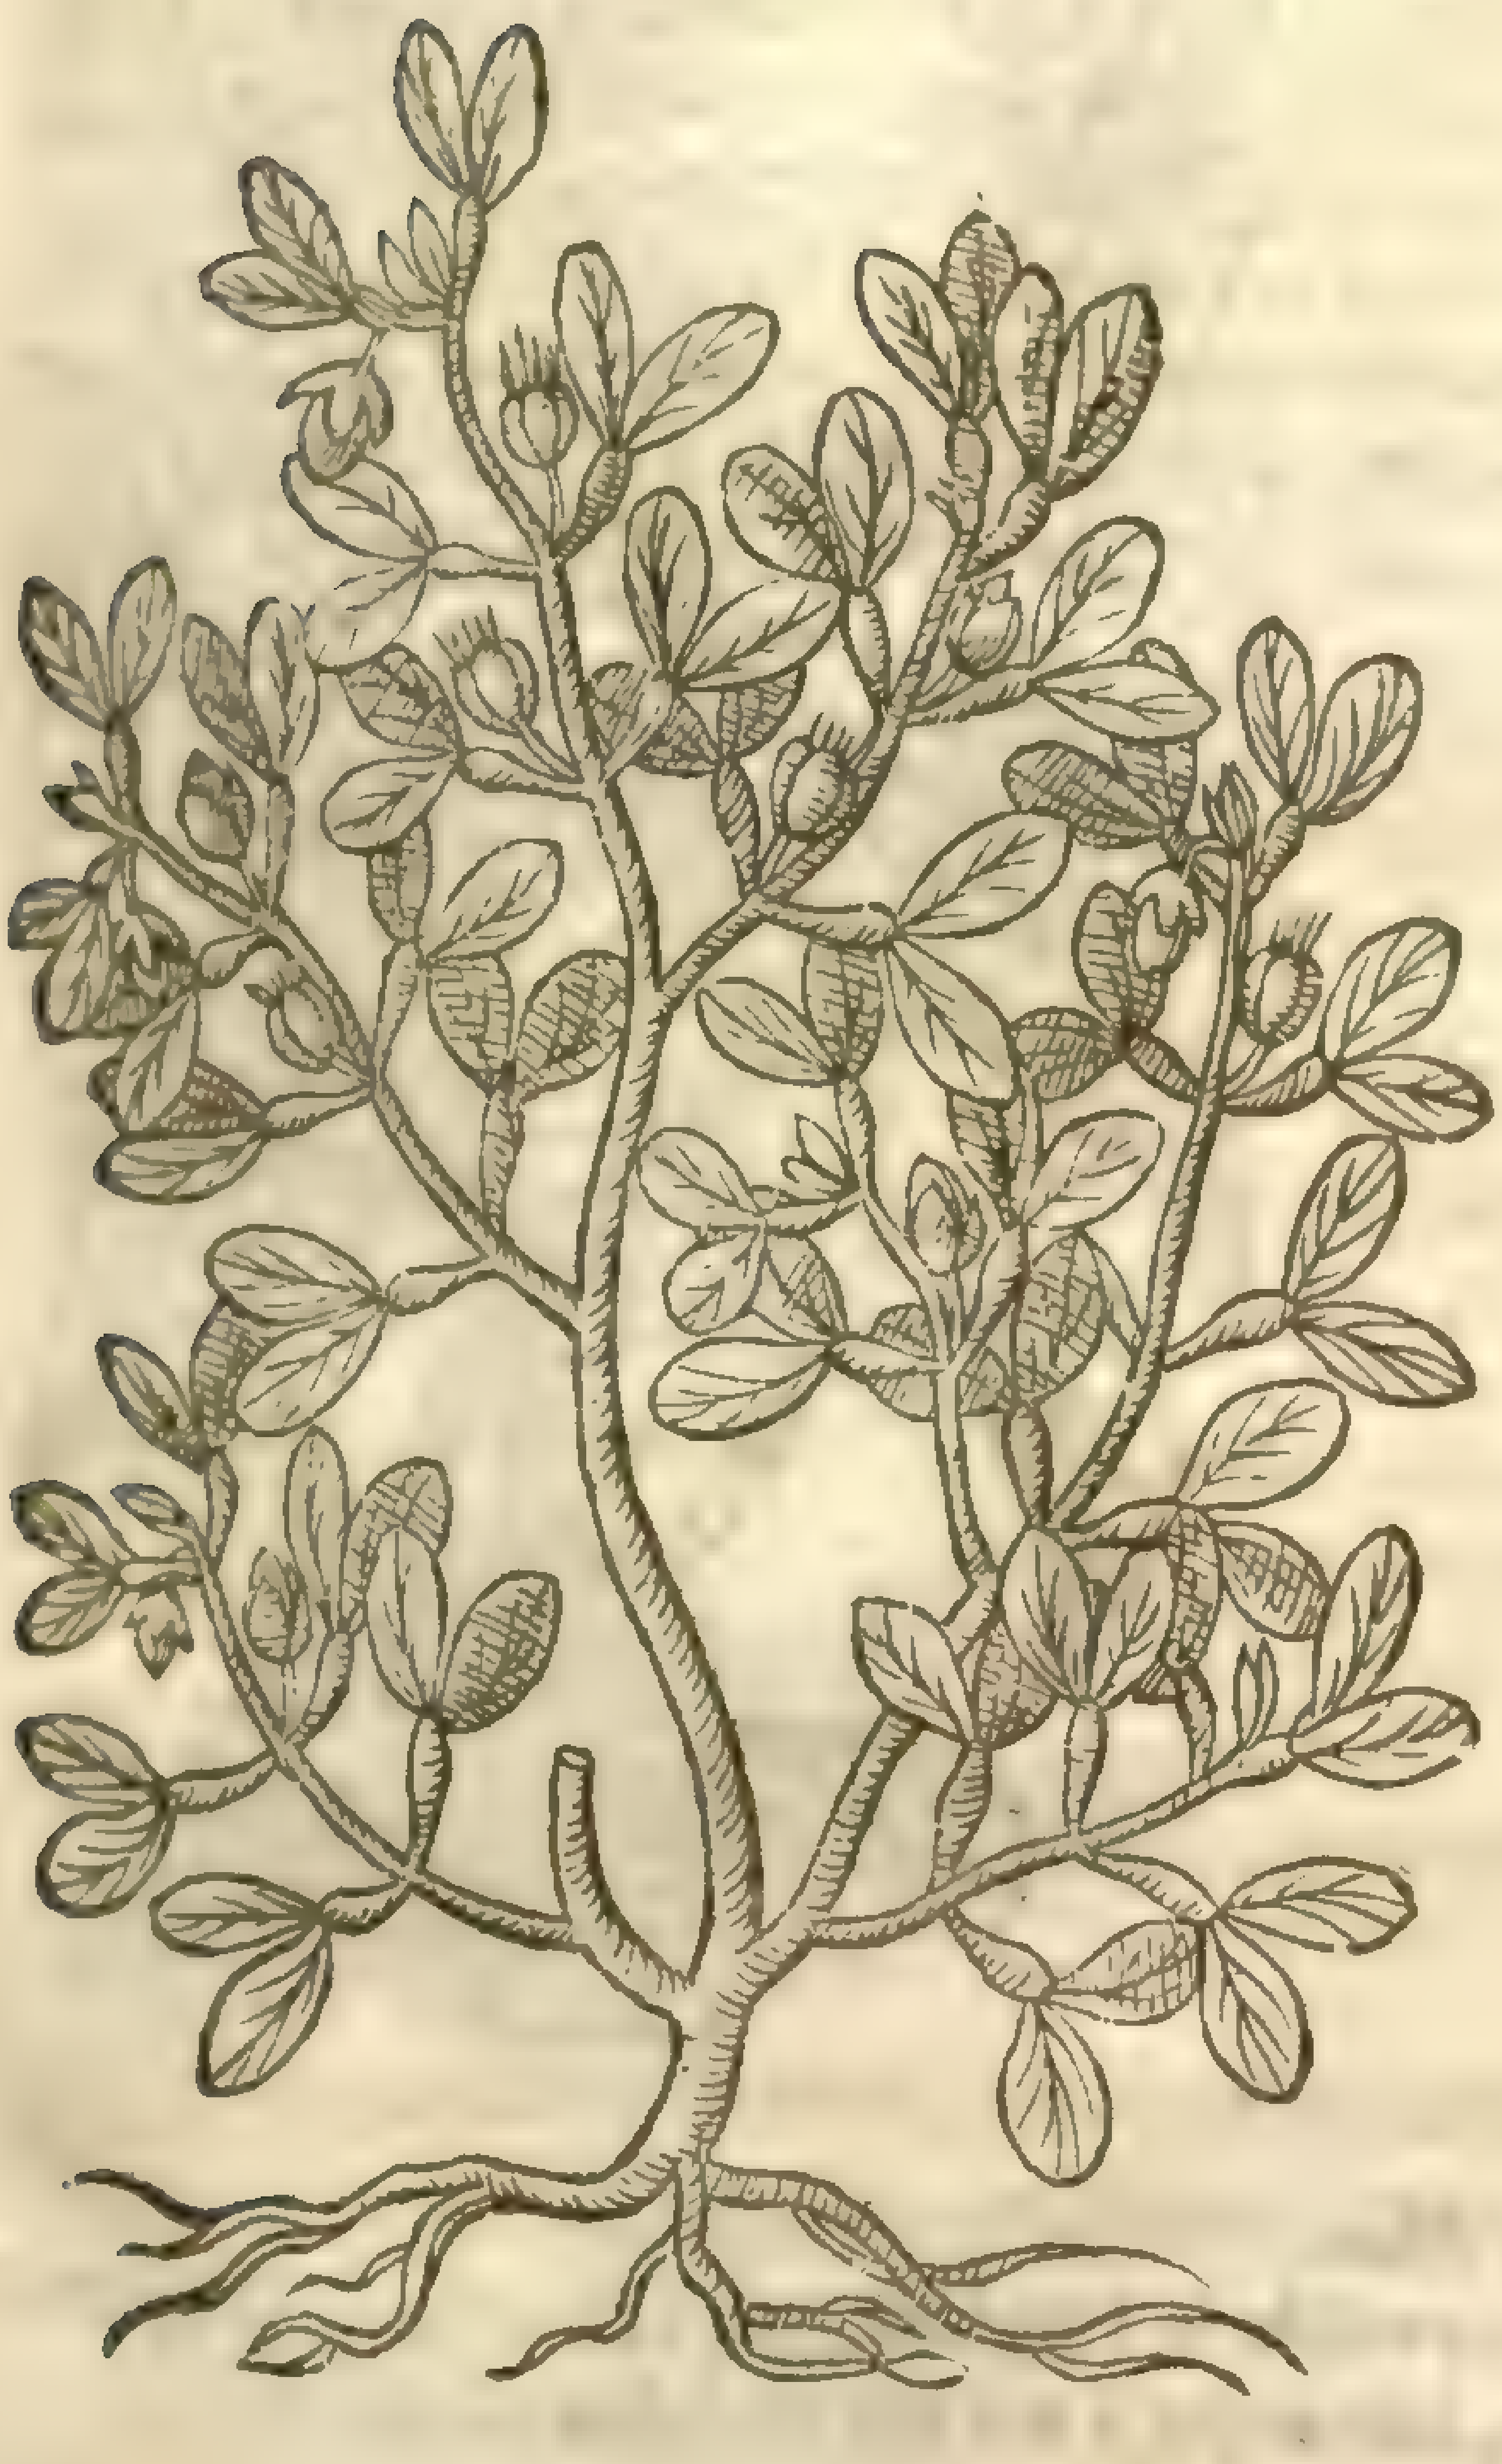
E Being ſtamped with vineger it ſcoureth away tettars and ring-wormes,hard ſwellings,and cures the Kings euill.

F The barke of the roots of Capers is good againſt the hardneſſe and ſtopping of the ſpleen, and profiteth much if it be giuen in drink,to ſuch as haue the ſciatica,palſie,or that are burſten or bruſed by falling from ſome high place: it mightily prouokes vrine,inſomuch that if it be vſed ouermuch,or giuen in too great a quantitie,it draweth out bloud with the vrin.

Chap.

Chap. 332. *Of Beane Capers.*

Capparis Fabago.
Beane Capers.



¶ *The Deſcription.*

This plant which the Germanes call **Fabago**, and *Dodonæus* ſauouring of Dutch, calleth it in his laſt Edition *Capparis Fabago*, and properly: *Lobel* calleth it *Capparis leguminoſa* between which there is no great difference, who labour to refer this plant vnto the kinds of Capers, which is but a low and baſe herb, and not a ſhrubbie buſh, as are the true Capers. It bringeth forth ſmooth ſtalkes tender and branched, wherupon do grow long thick leaues, leſſer than thoſe of the true Capers, & not vnlike to the leaues of Purſlane, comming out of the branches by couples, of a light greene colour. The floures before they bee opened are like to thoſe of the precedent, but when they bee come to maturitie and ripeneſſe they waxe white, with ſome yellow chiues in the midſt: which being paſt, there appeare long cods, wherein is contained ſmall flat ſeed. The root is tender, branching hither and thither.

¶ *The Place.*

It groweth of it ſelfe in corne fields of the low Countries, from whence I haue receiued ſeeds for my garden, where they flouriſh.

¶ *The Time.*

It floureth when the Caper doth.

¶ *The Names.*

It is called in Latine of the later Herbariſts *Capparis fabago*: of moſt *Capparis Leguminoſa*: it is thought to be that herbe which *Avicen* deſcribeth in his 28 chapter, by the name of *Ardifrigi*: we may content our ſelues that *Capparis fabago* retaine that name ſtill, and ſeek for none other, vnleſſe it be for an Engliſh name, by which it may be called after the Latine, Beane Caper.

¶ *The Temperature and Vertues.*

Touching the faculties thereof we haue nothing left in writing worth the remembrance.

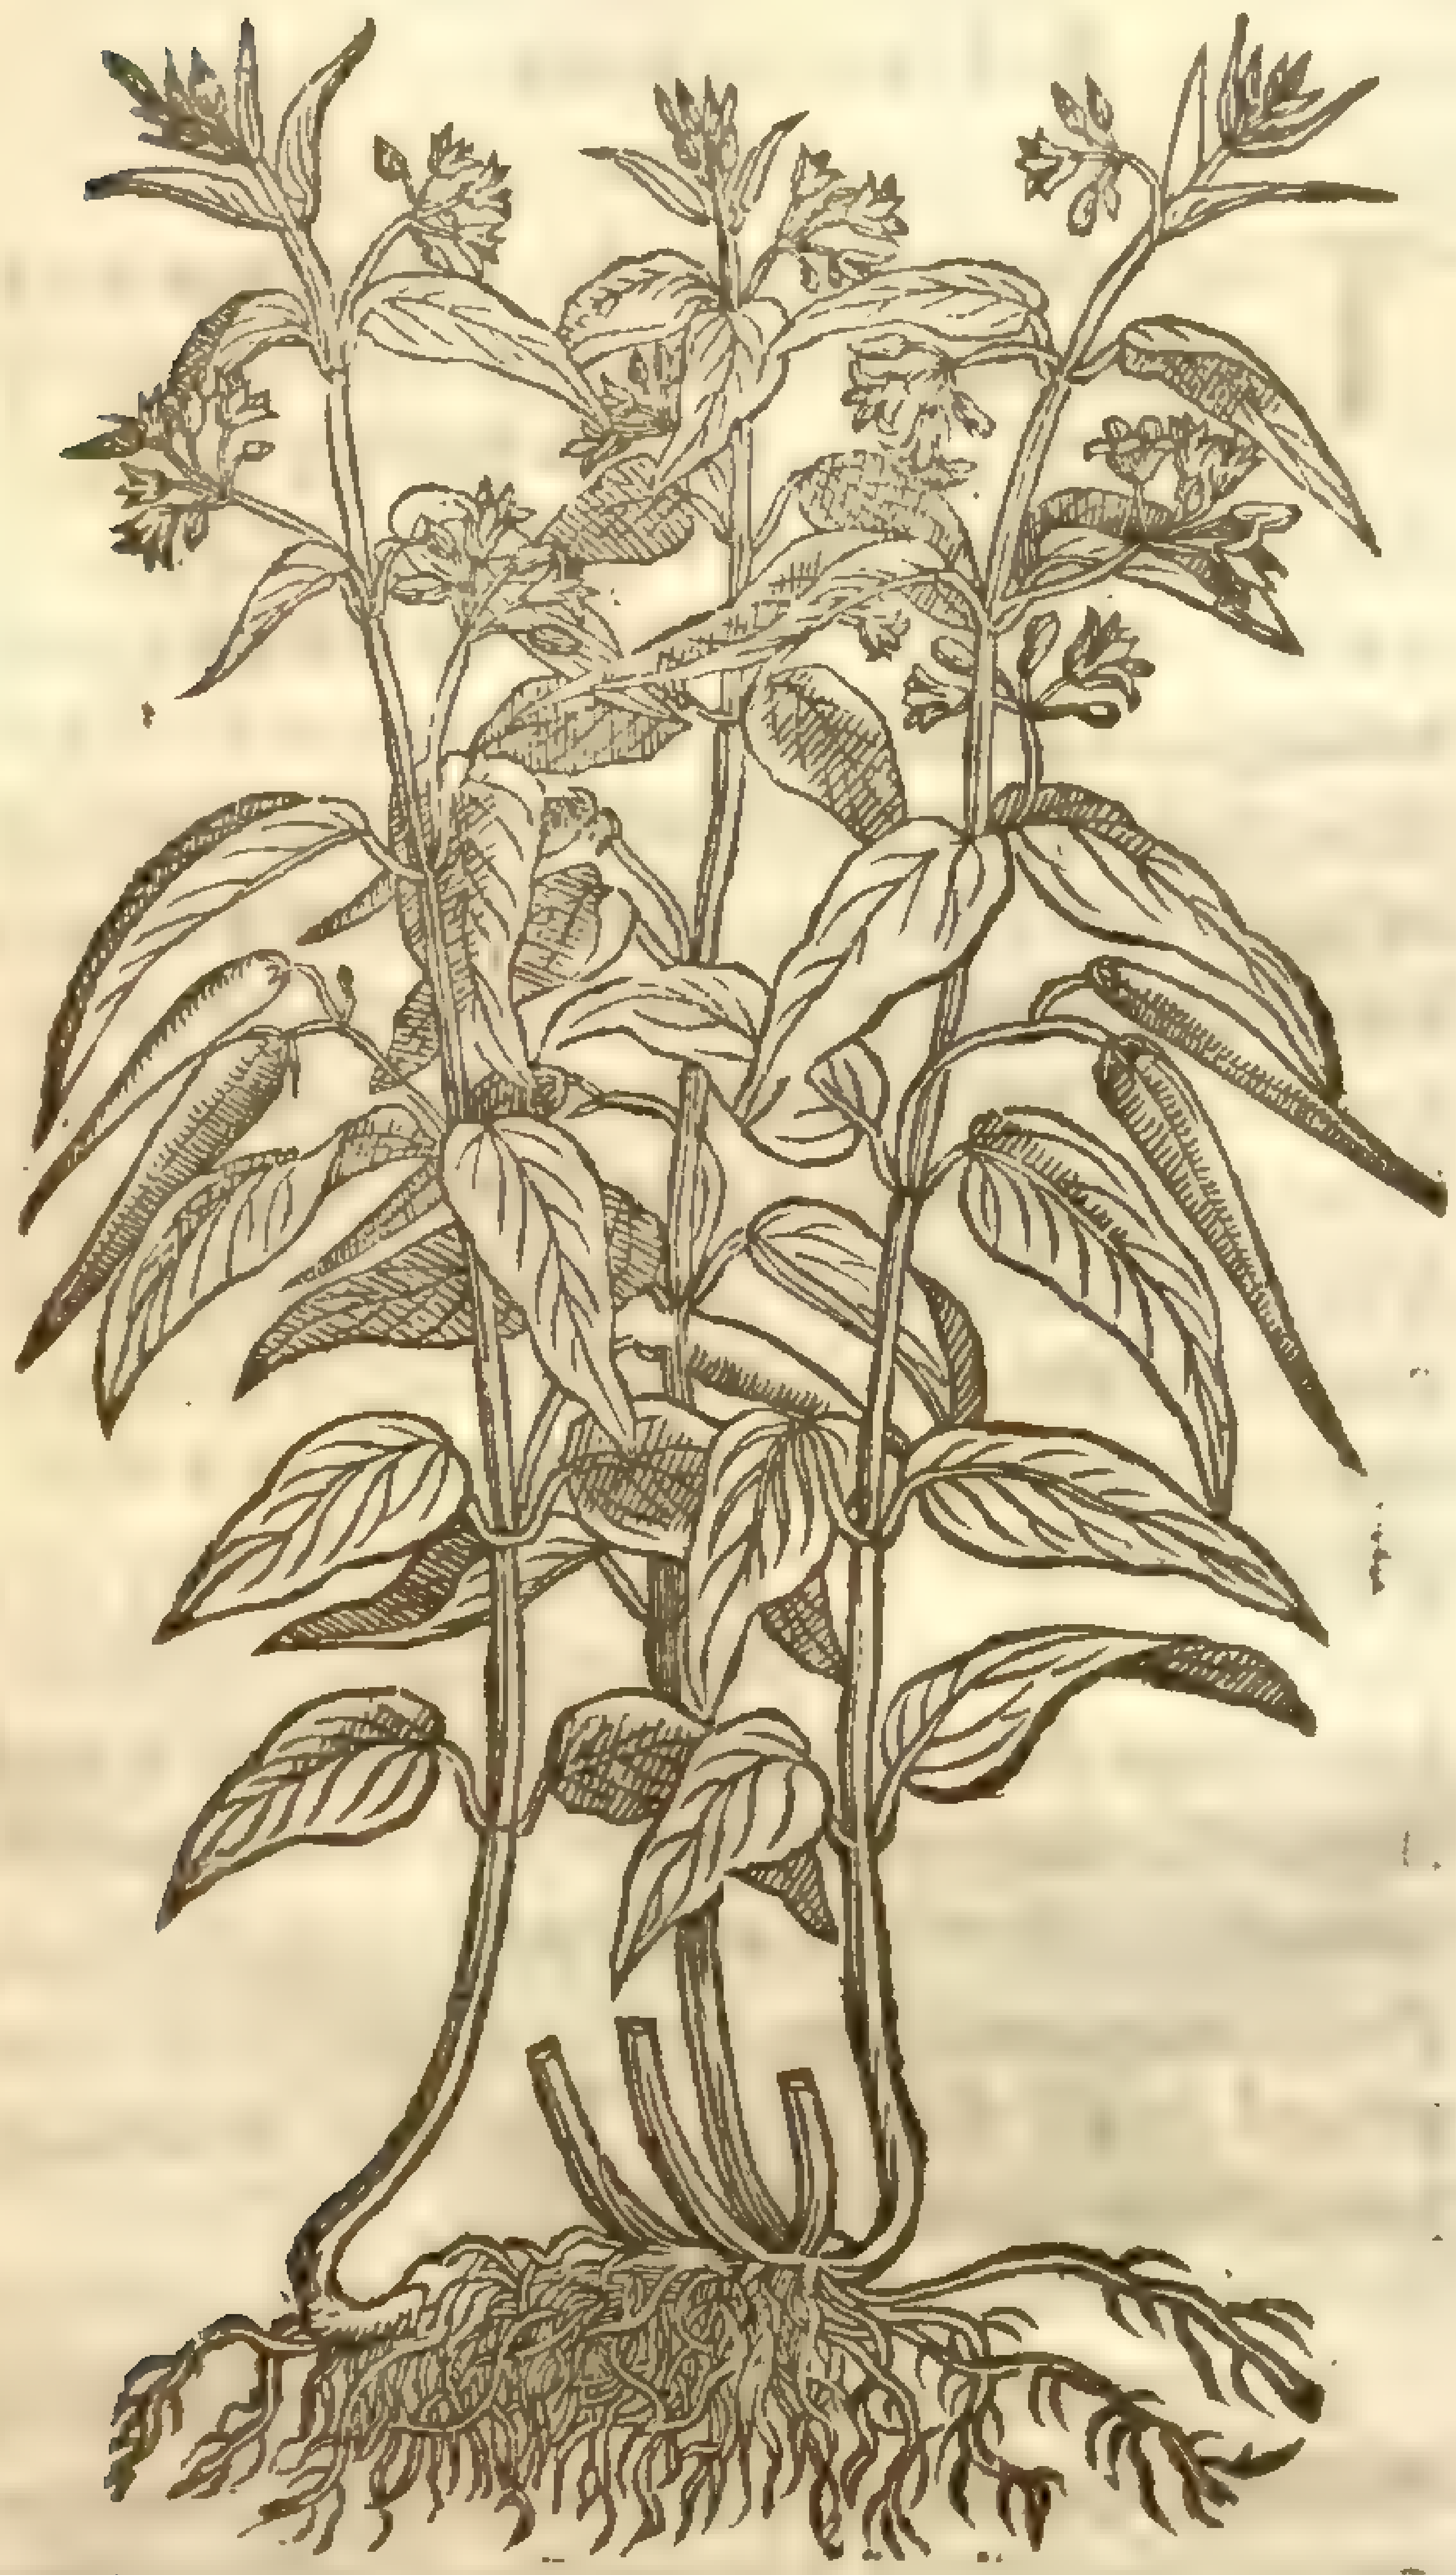
Chap. 333. *Of Swallow-wort.*

¶ *The Deſcription.*

1 Swallow-wort with white floures hath diuers vpright branches of a browniſh colour, of the height of two cubits, beſet with leaues not vnlike to thoſe of *Dulcamara* or wooddy Night-ſhade, ſomewhat long, broad, ſharpe pointed, of a blackiſh greene colour, and ſtrong ſauor: among which come forth very many ſmall white floures ſtar-faſhion, hanging vpon little ſlender foot-ſtalkes: after which come in place thereof long ſharp pointed cods, ſtuffed full of a moſt perfect white cotton reſembling ſilk, as well in ſhew as handling; (our London Gentlewomen haue named it Silken Ciſlie) among which is wrapped ſoft browniſh ſeed. The roots are very many, white, threddie, and of a ſtrong ſauour.

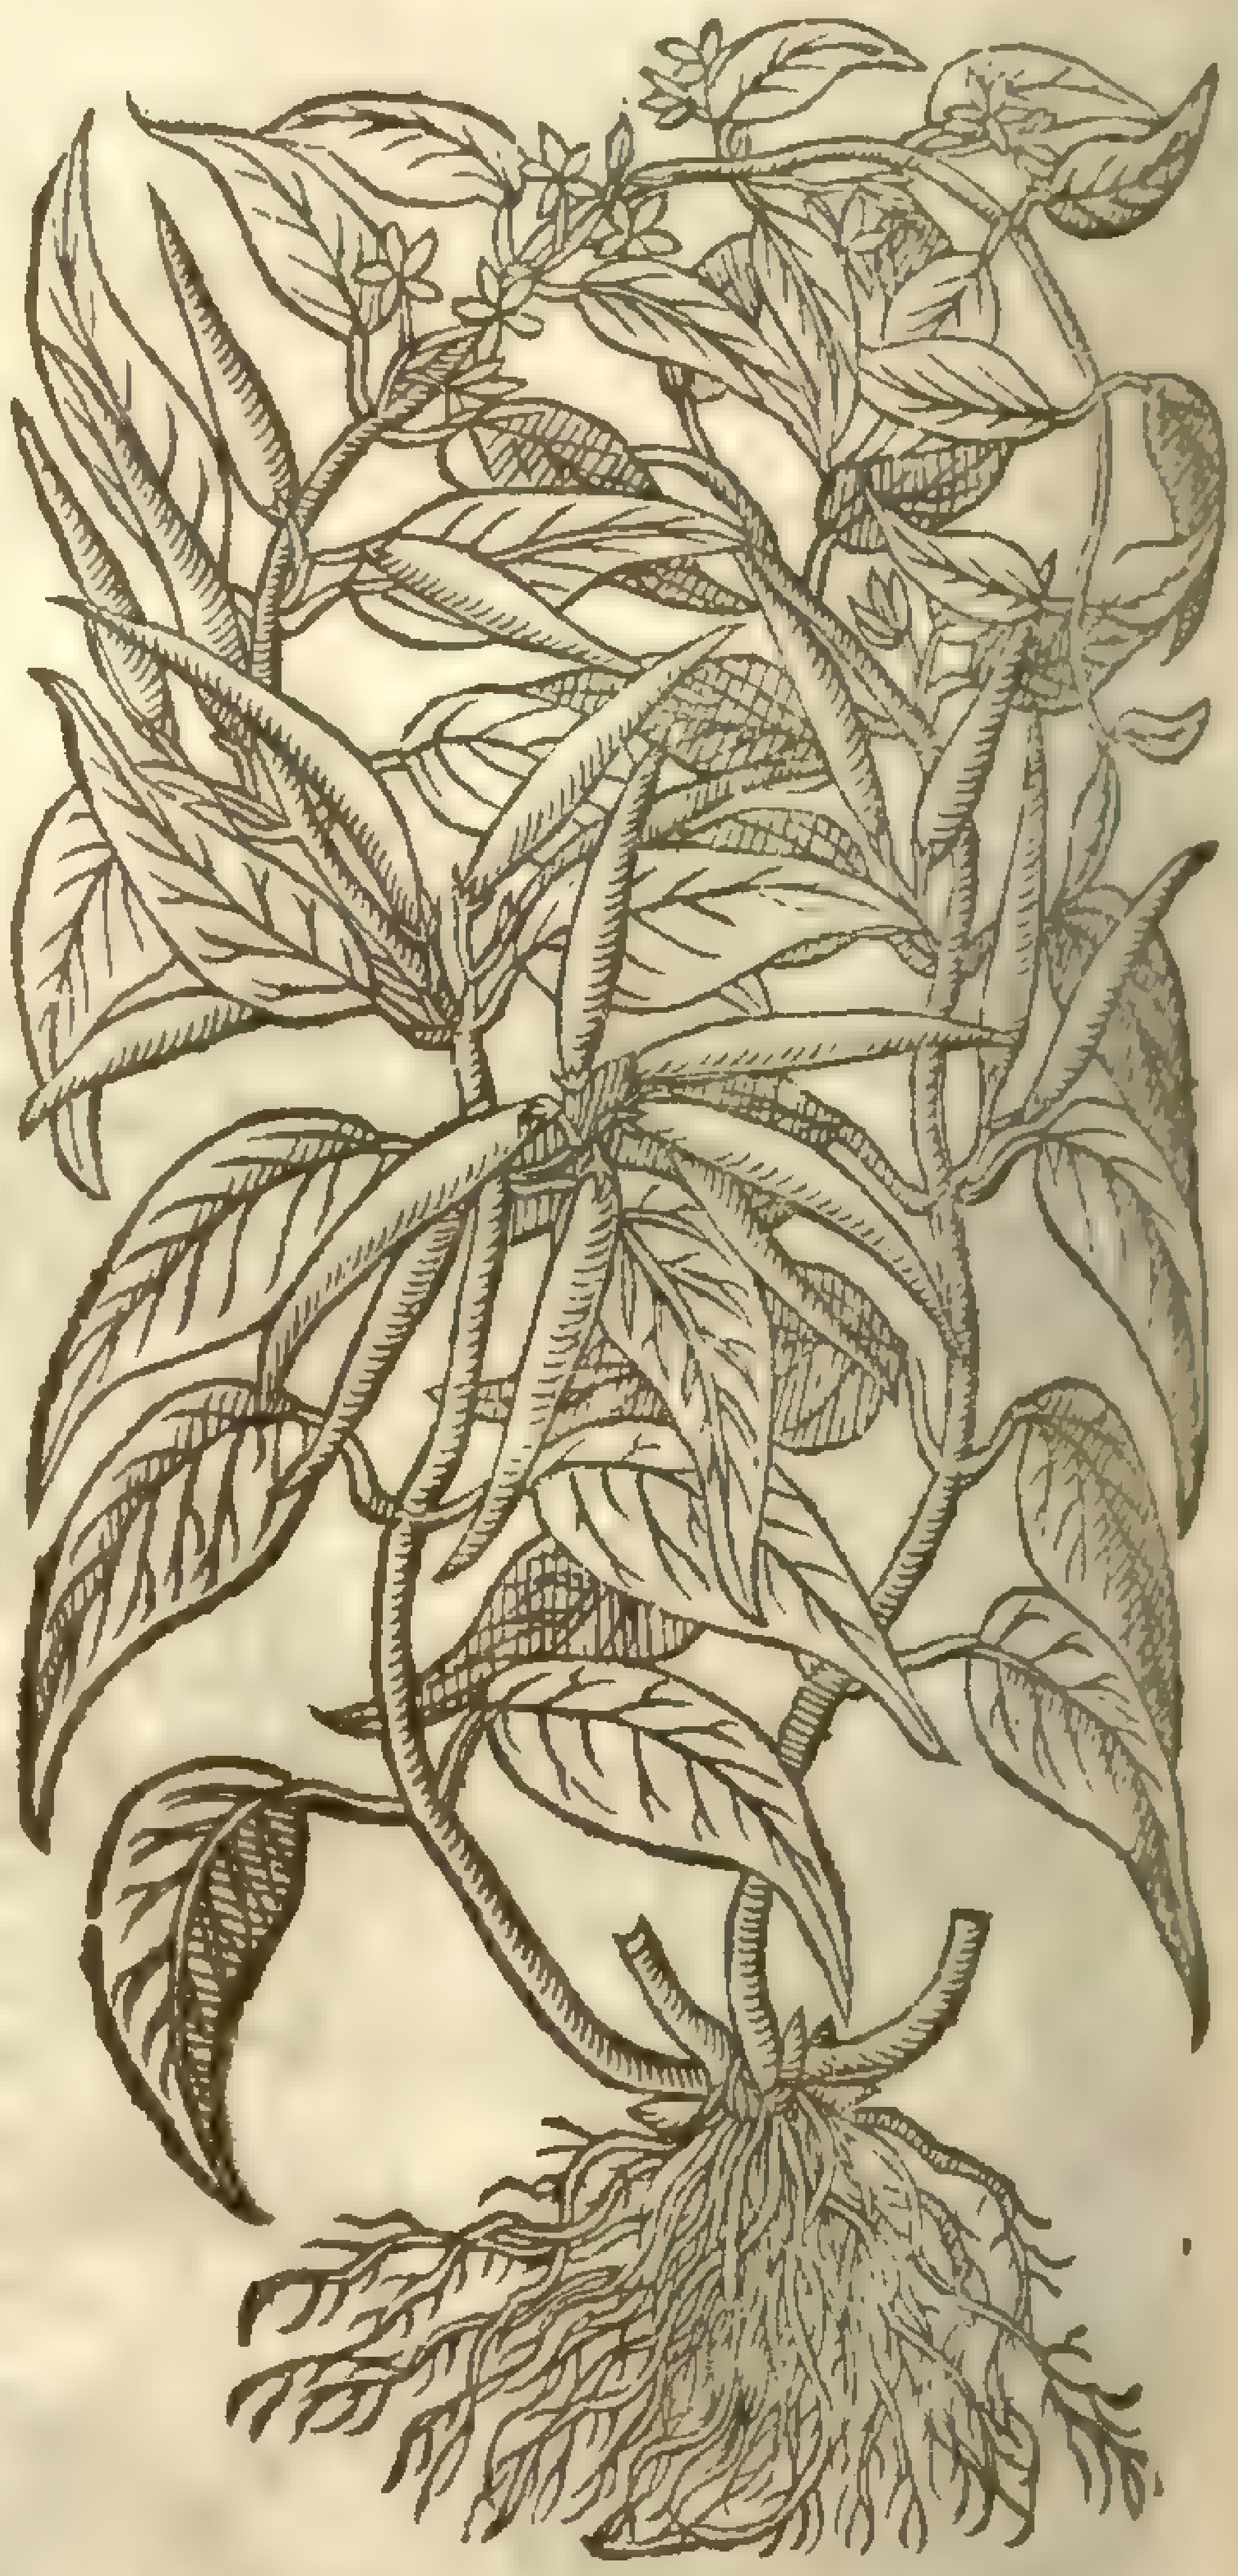
2 The ſecond kinde is oftentimes found with ſtalks much longer, climing vpon props or ſuch things as ſtand neere vnto it, attaining to the height of fiue or ſix cubites, wrapping it ſelfe vpon them with many and ſundry foldings: the floures hereof are black: the leaues, cods, and roots be like thoſe of the former.

1 *Aſclepias flore albo.*
White Swallow-woort.



C. vincetoxicum, L. [illegible]

2 *Aſclepias flore nigro.*
Blacke Swallow-woort.



¶ *The Place.*

Both theſe kindes do grow in my garden, but not wilde in England; yet I haue heard it reported that it groweth in the fields about Northampton, but as yet I am not certaine of it.

¶ *The Time.*

They floure about Iune, in Autumne the downe hangeth out of the cods, and the ſeed falleth to the ground.

¶ *The Names.*

It is called of the later Herbariſts *Vincetoxicum*: of *Ruellius*, *Hederalis*: in High Dutch, **Swaluwe woꝛtele**, that is to ſay in Latine, *Hirundinaria*: in Engliſh, Swallow-woort: of our Gentlewomen it is called Silken Ciſlie; *Æſculapius* (who is ſaid to be the firſt inuentor of phyſick, whom therefore the Greekes and Gentiles honored as a god) called it after his owne name *Aſclepias*, or *Æſculapius* herbe, for that he was the firſt that wrote thereof, and now it is called in ſhops *Hirundinaria*.

¶ *The Temperature.*

The roots of Swallow-woort are hot and dry; they are thought to be good againſt poyſon.

¶ *The Vertues.*

A *Dioſcorides* writeth, That the roots of *Aſclepias* or Swallow-woort boiled in wine, and the decoction drunke, are a remedy againſt the gripings of the belly, the ſtingings of Serpents, and againſt deadly poyſon, being one of the eſpeciallest herbes againſt the ſame.

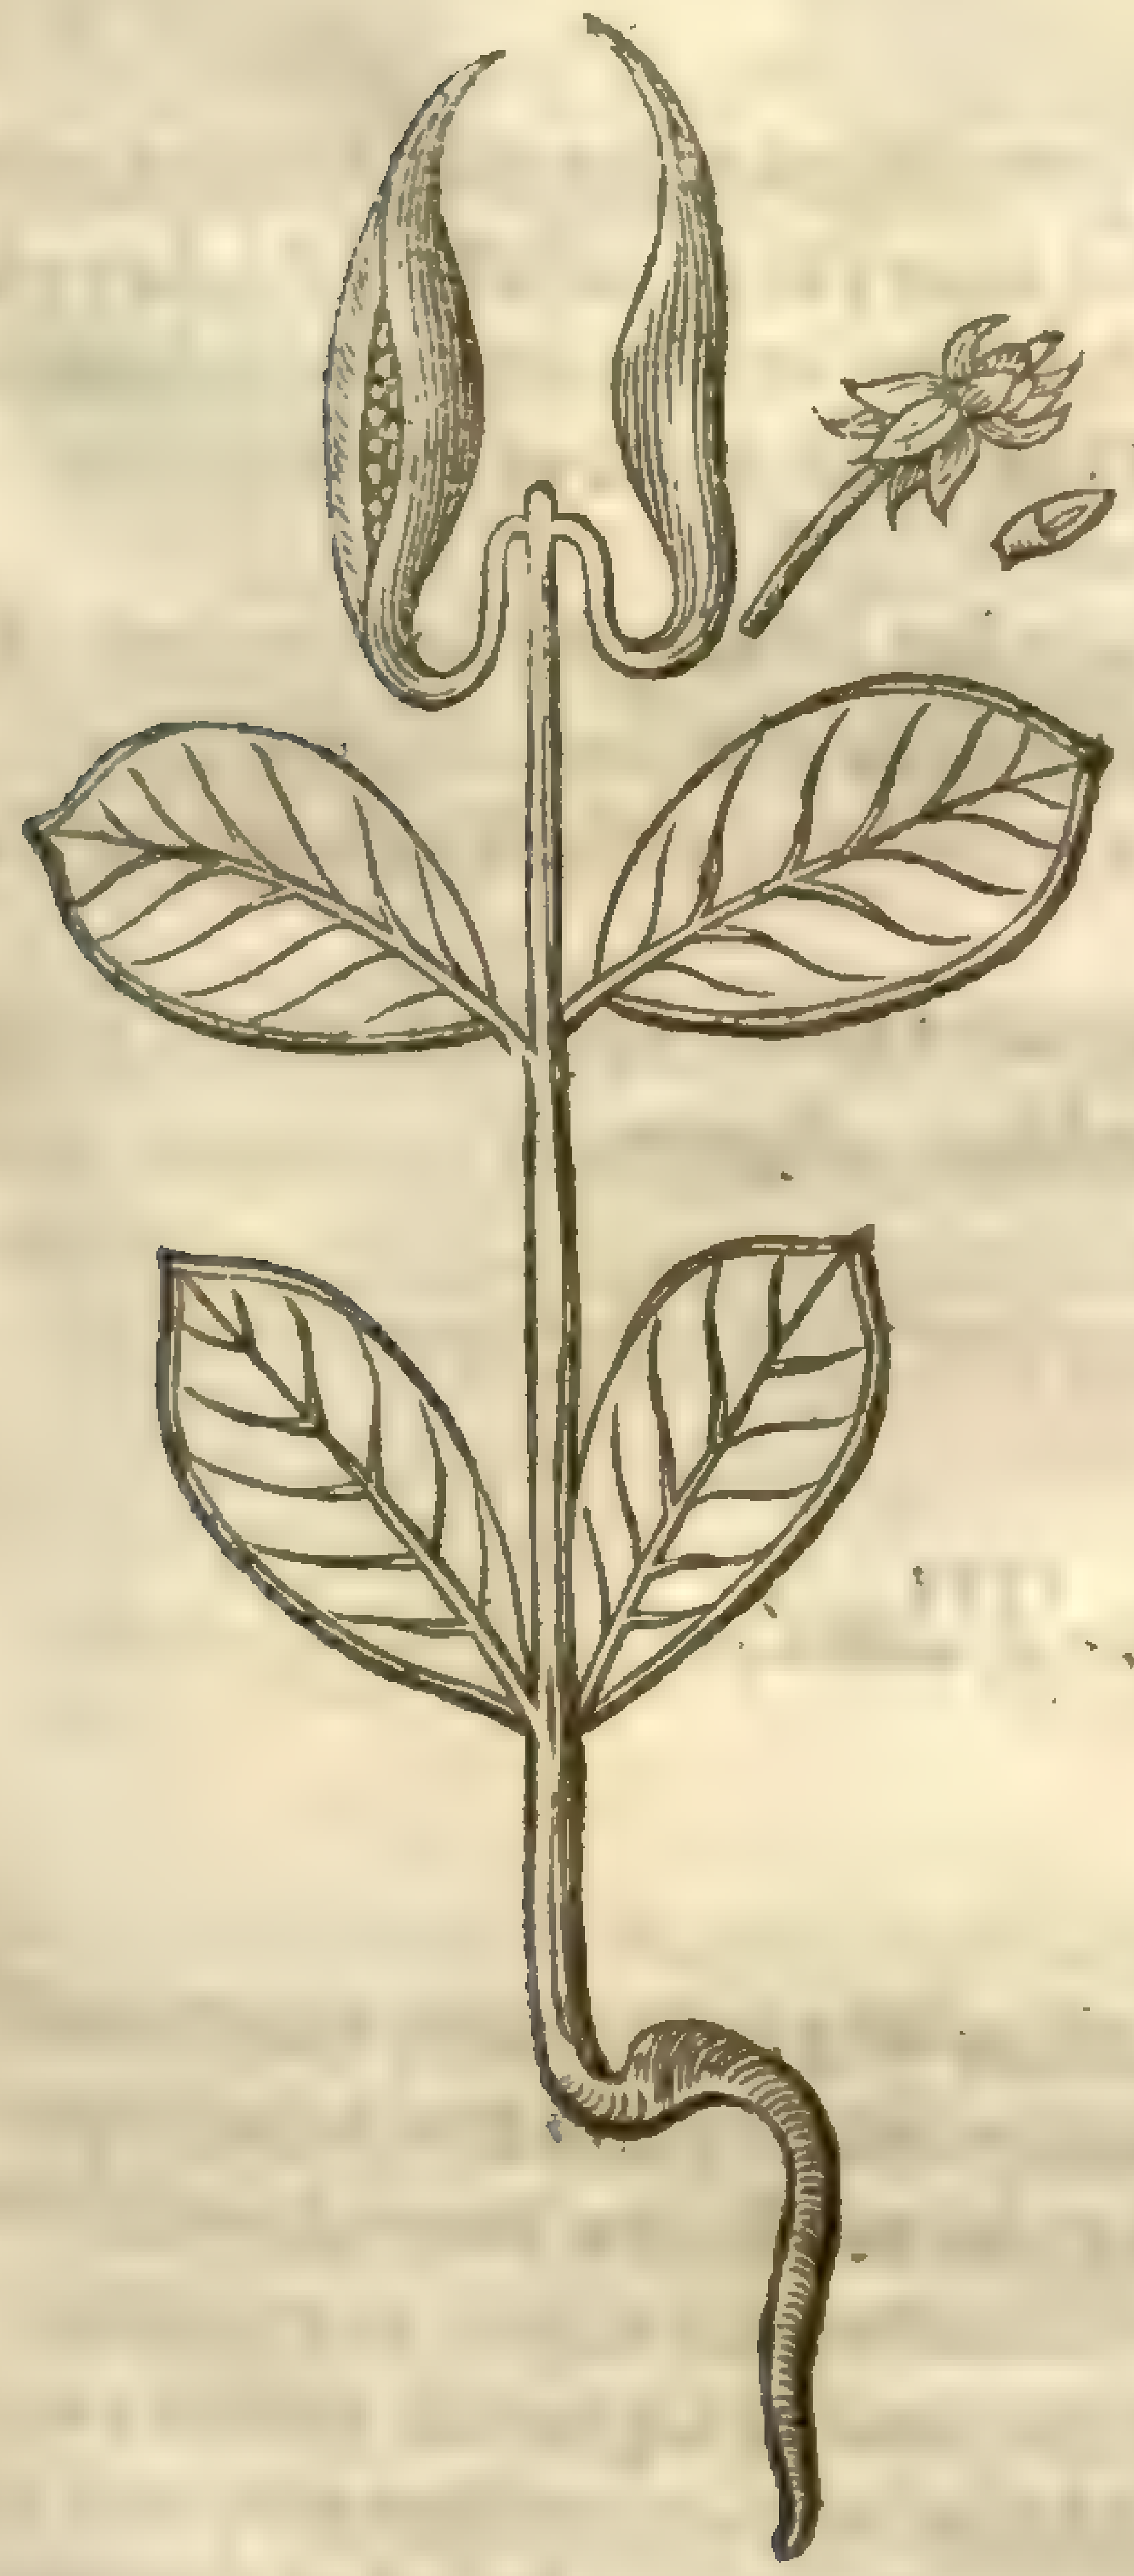
B The leaues boiled and applied in forme of a pultis, cure the euill ſores of the paps or dugs, and matrix, that are hard to be cured.

Chap. 334. *Of Iudian Swallow-woort.*

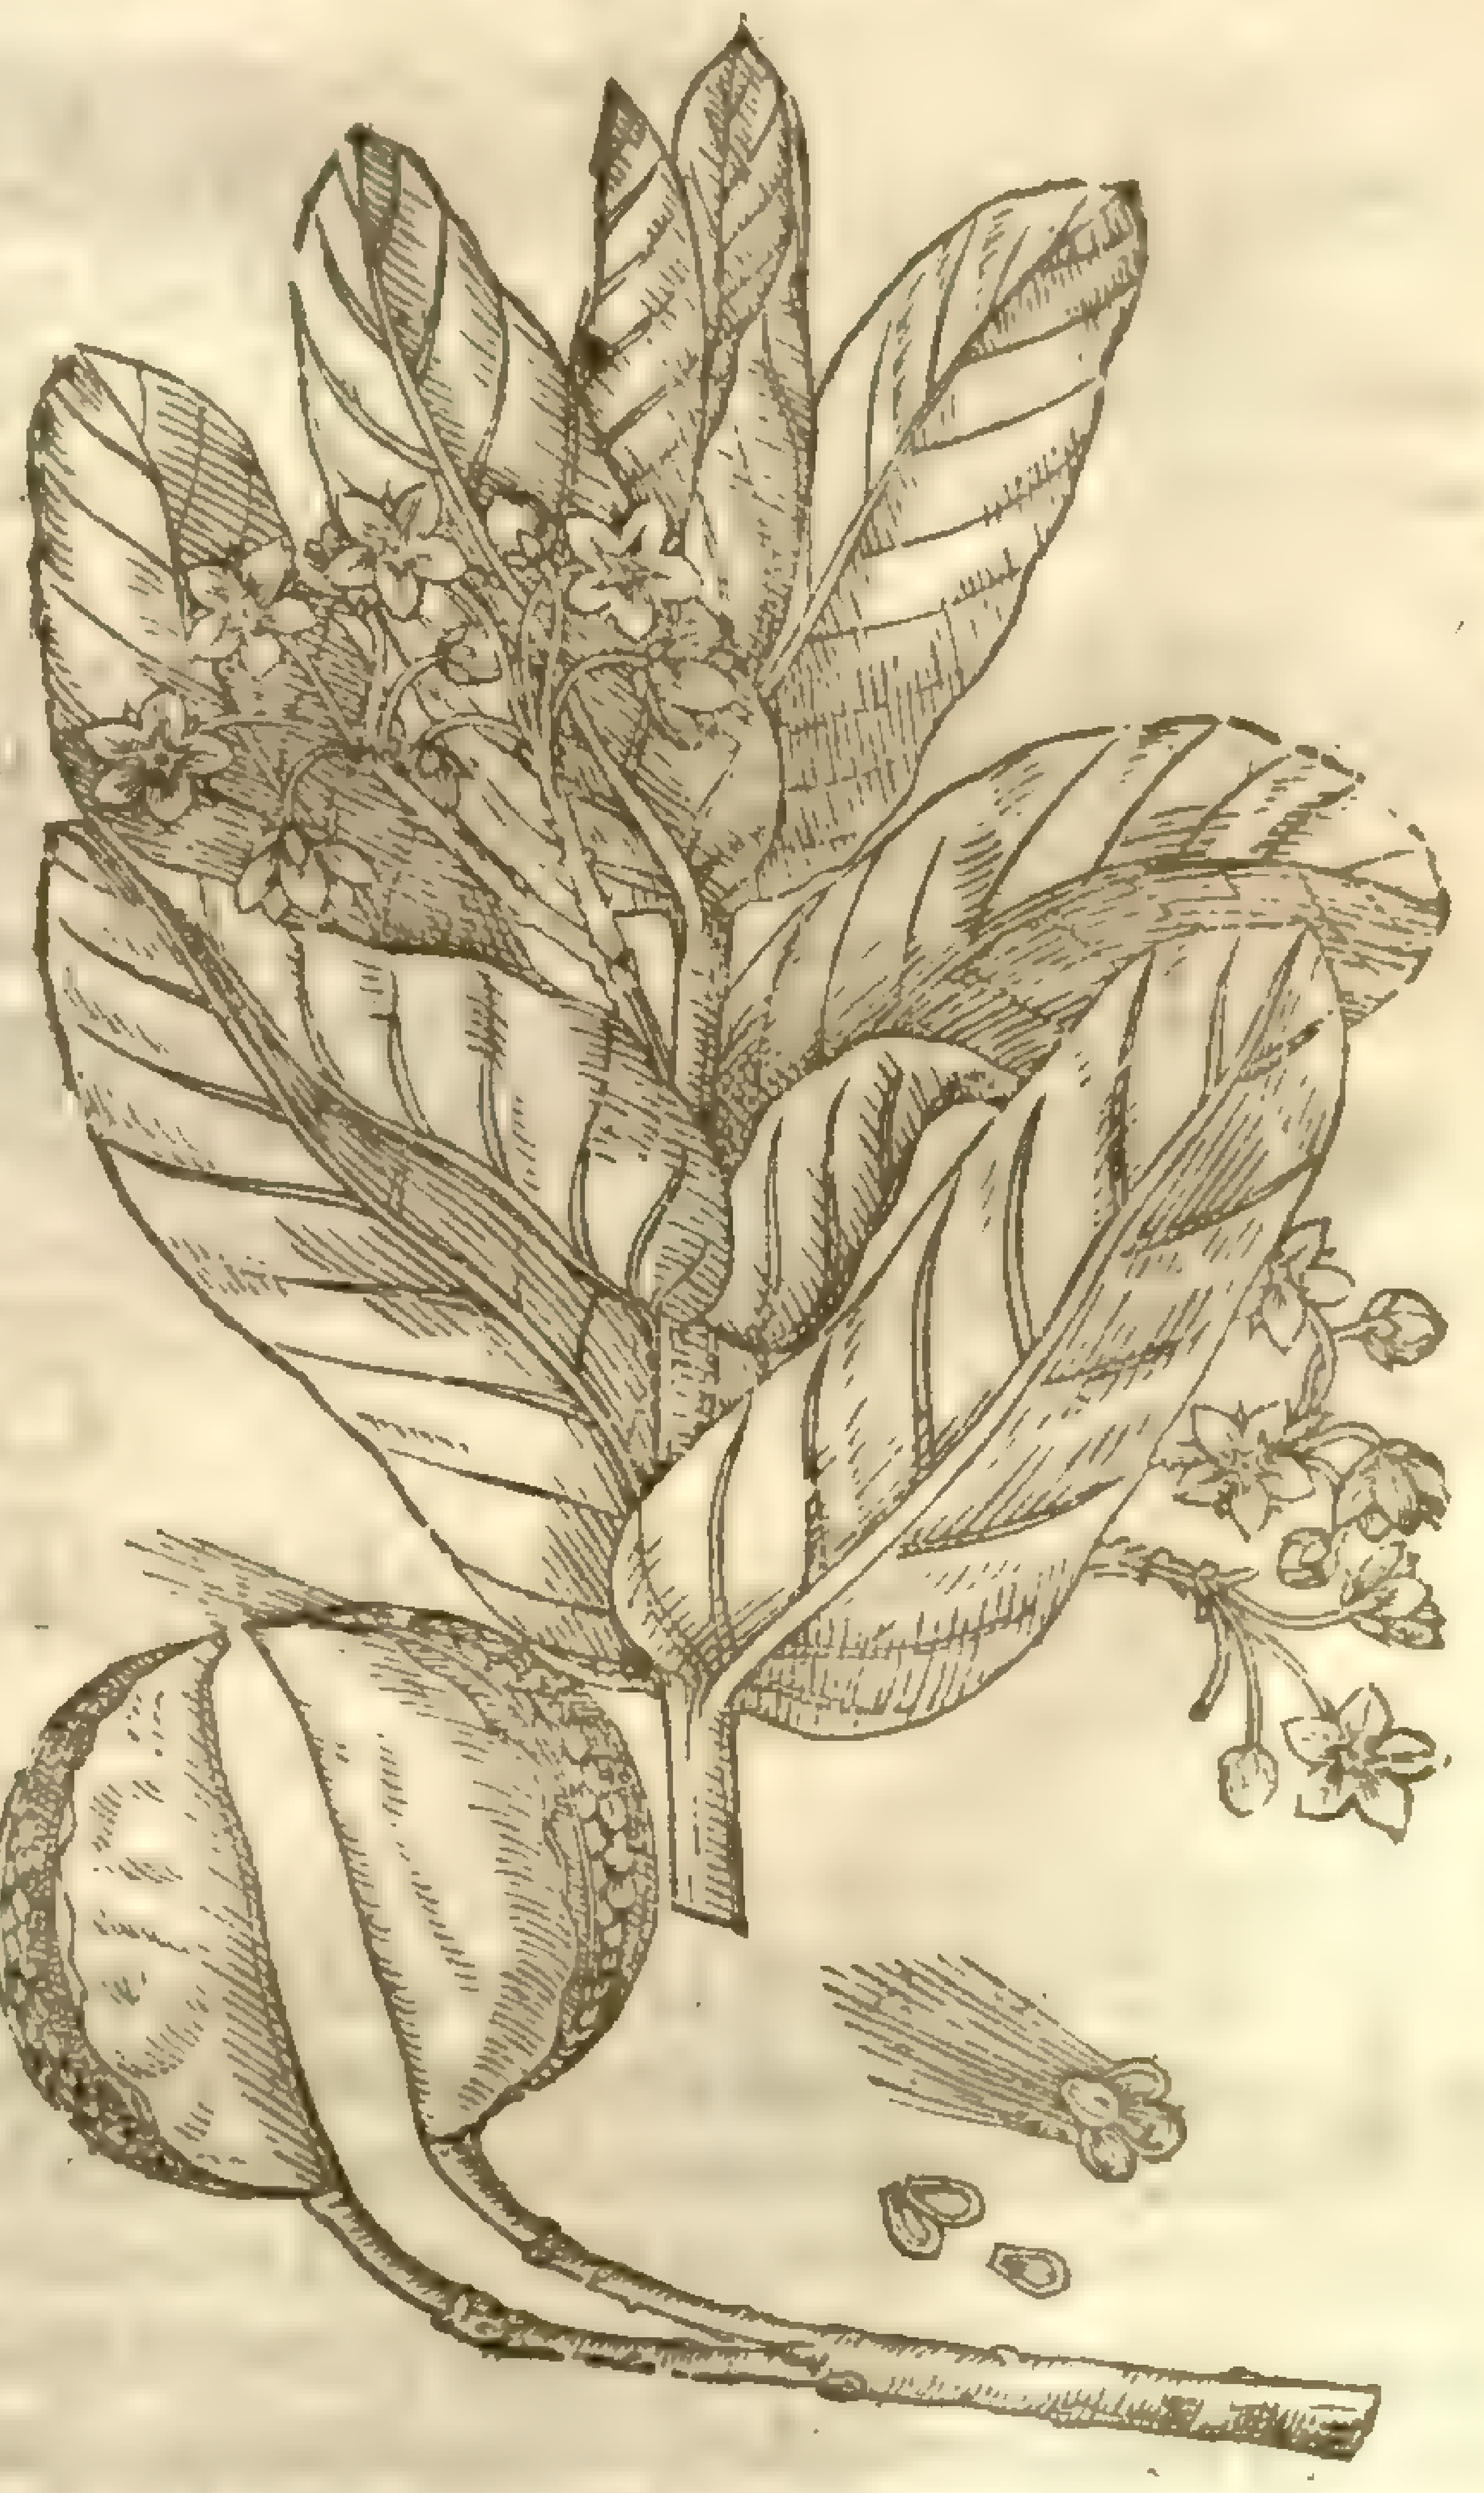
¶ *The Deſcription.*

There groweth in that part of Virginia, or Norembega, where our Engliſh men dwelled (intending there to erect a certaine Colonie) a kinde of *Aſclepias*, or Swallow-woort, which the Sauages call *Wiſanck* : there riſeth vp from a ſingle crooked root, one vpright ſtalk a foot high, ſlender, and of a greeniſh colour: whereupon do grow faire broad leaues ſharp pointed, with many ribs or nerues running through the ſame like thoſe of Ribwort or Plaintaine, ſet together by couples at certaine diſtances. The floures come forth at the top of the ſtalks, which as yet are not obſerued, by reaſon the man that brought the ſeeds & plants hereof did not regard them: after which, there come in place two cods (ſeldome more) ſharp pointed like thoſe of our Swallow-woort, but greater, ſtuffed full of a moſt pure ſilke of a ſhining white colour: among which ſilke appeareth a ſmall long tongue (which is the ſeed) reſembling the tongue of a bird, or that of the herbe called Adders tongue. The cods are not only full of ſilke, but euery nerue or ſinew wherewith the leaues be ribbed are likewiſe moſt pure ſilke; and alſo the pilling of the ſtems, euen as flax is torne from his ſtalks. This conſidered, behold the juſtice of God, that as he hath ſhut vp thoſe people and nations in infidelity and nakednes, ſo hath he not as yet giuen them vnderſtanding to couer their nakedneſſe, nor mater wherewith to do the ſame; notwithſtanding the earth is couered ouer with this ſilke, which daily they tread vnder their feet, which were ſufficient to apparell many kingdomes, if they were carefully manured and cheriſhed.

Wiſanck, ſiue Vincetoxicum Indianum.
Indian Swallow-wort.



‡ *Apocynum Syriacum Cluſij.*



‡ This plant, which is kept in ſome gardens by the name of Virginia Silke graſſe, I take to be the ſame, or very like the *Beidelſar* of *Alpinus*; and the *Apocynum Syriacum* of *Cluſius* : at Padua they call it *Eſula Indica*, by reaſon of the hot milky juice. *Bauhinus* hath very vnfitly named it *Lapathum Ægyptiacum lacteſcens ſiliqua Aſclepiadis*. But he is to be pardoned; for *Iohannes Carolus Roſenbergius*, *cap. 16. p. 46.* of his *Animad. & Exerc. Medica*, or *Roſa nobilis iatrica*, hath taken vpon him the credit and inuention of this abſurd denomination: I may call it abſurd, for that neither any way in ſhape or qualitie it reſembleth or participateth any thing with a Docke. I haue giuen you the figure of our Author with his title, and that of *Cluſius* with his: in the former the cods are onely well expreſt; in the later the leaues and floures reaſonably well, but that they are too few in number, and ſet too far aſunder. Vpon the ſight of the growing and flouring plant I took this deſcription: The root is long and creeping; the ſtalks two or three cubits high, ſquare, hollow, a finger thicke, and of a light green colour, ſending out towards the top ſome few branches: vpon this at

certaine ſpaces grow by couples,leaues ſome halfe foot long,and three inches broad,darke greene on their vpper ſides, more whitiſh below, and full of large and eminent veines: at the top of the ſtalke and branches it carries moſt commonly an hundred or more floures,growing vpon footſtalks ſome inch long,all cloſe thruſt together after the manner of the Hyacinth of Peru at the firſt flouring: each floure is thus compoſed; firſt it hath fiue ſmall greene leaues bending backe, that ſerue for the cup: then hath it other fiue leaues foure times larger than the former, which bend back and couer them; and theſe are green on the vnder ſide, and of a pale colour with ſome redneſſe aboue: then are there fiue little graines (as I may ſo terme them) of a pleaſant red colour,and on their outſide like corns of Millet,but hollow on their inſides, with a little thred or chiue comming forth of each of them: theſe fiue ingirt a ſmall head like a button, greeniſh vnderneath,and whitiſh aboue. I haue giuen you the figure of one floure by the ſide of our Authors figure. The leaues and ſtalkes of this plant are very full of a milky juice. ‡

¶ *The Place.*

It groweth, as before is rehearſed, in the countries of Norembega, now called Virginia,by the honourable Knight Sir *Walter Raleigh*, who hath beſtowed great ſums of money in the diſcouerie thereof; where are dwelling at this preſent Engliſh men.

¶ *The Time.*

It ſpringeth vp, floureth, and flouriſheth both Winter and Summer, as do many or moſt of the plants of that countrey. ‡ It dies down with vs euery winter and comes vp in the Spring,and flours in Auguſt, but neuer bringeth forth the cods with vs,by reaſon of the coldnes of our Climate. ‡

¶ *The Names.*

The ſilke is vſed of the people of Pomeioc and other of the prouinces adioyning,being parts of Virginia, to couer the ſecret parts of maidens that neuer taſted man; as in other places they vſe a white kinde of moſſe Wiſanck: we haue thought *Aſclepias Virginiana*, or *Vincetoxicum Indianum* fit and proper names for it: in Engliſh,Virginia Swallow-wort,or the Silke-wort of Norembega.

¶ *The Temperature and Vertues.*

A We finde nothing by report, or otherwiſe of our owne knowledge,of his phyſicall vertues, but only report of the abundance of moſt pure ſilke, wherewith the whole plant is poſſeſſed.

B ‡ The leaues beaten either crude,or boiled in water, and applied as a pulteſſe,are good againſt ſwellings and paines proceeding of a cold cauſe.

C The milkie juice, which is very hot, purges violently; and outwardly applied is good againſt tettars, to fetch haire off skins,if they be ſteeped in it,and the like. *Alpinus.* ‡

CHAP. 335.

Of the Bombaſte or Cotton-Plant.

¶ *The Deſcription.*

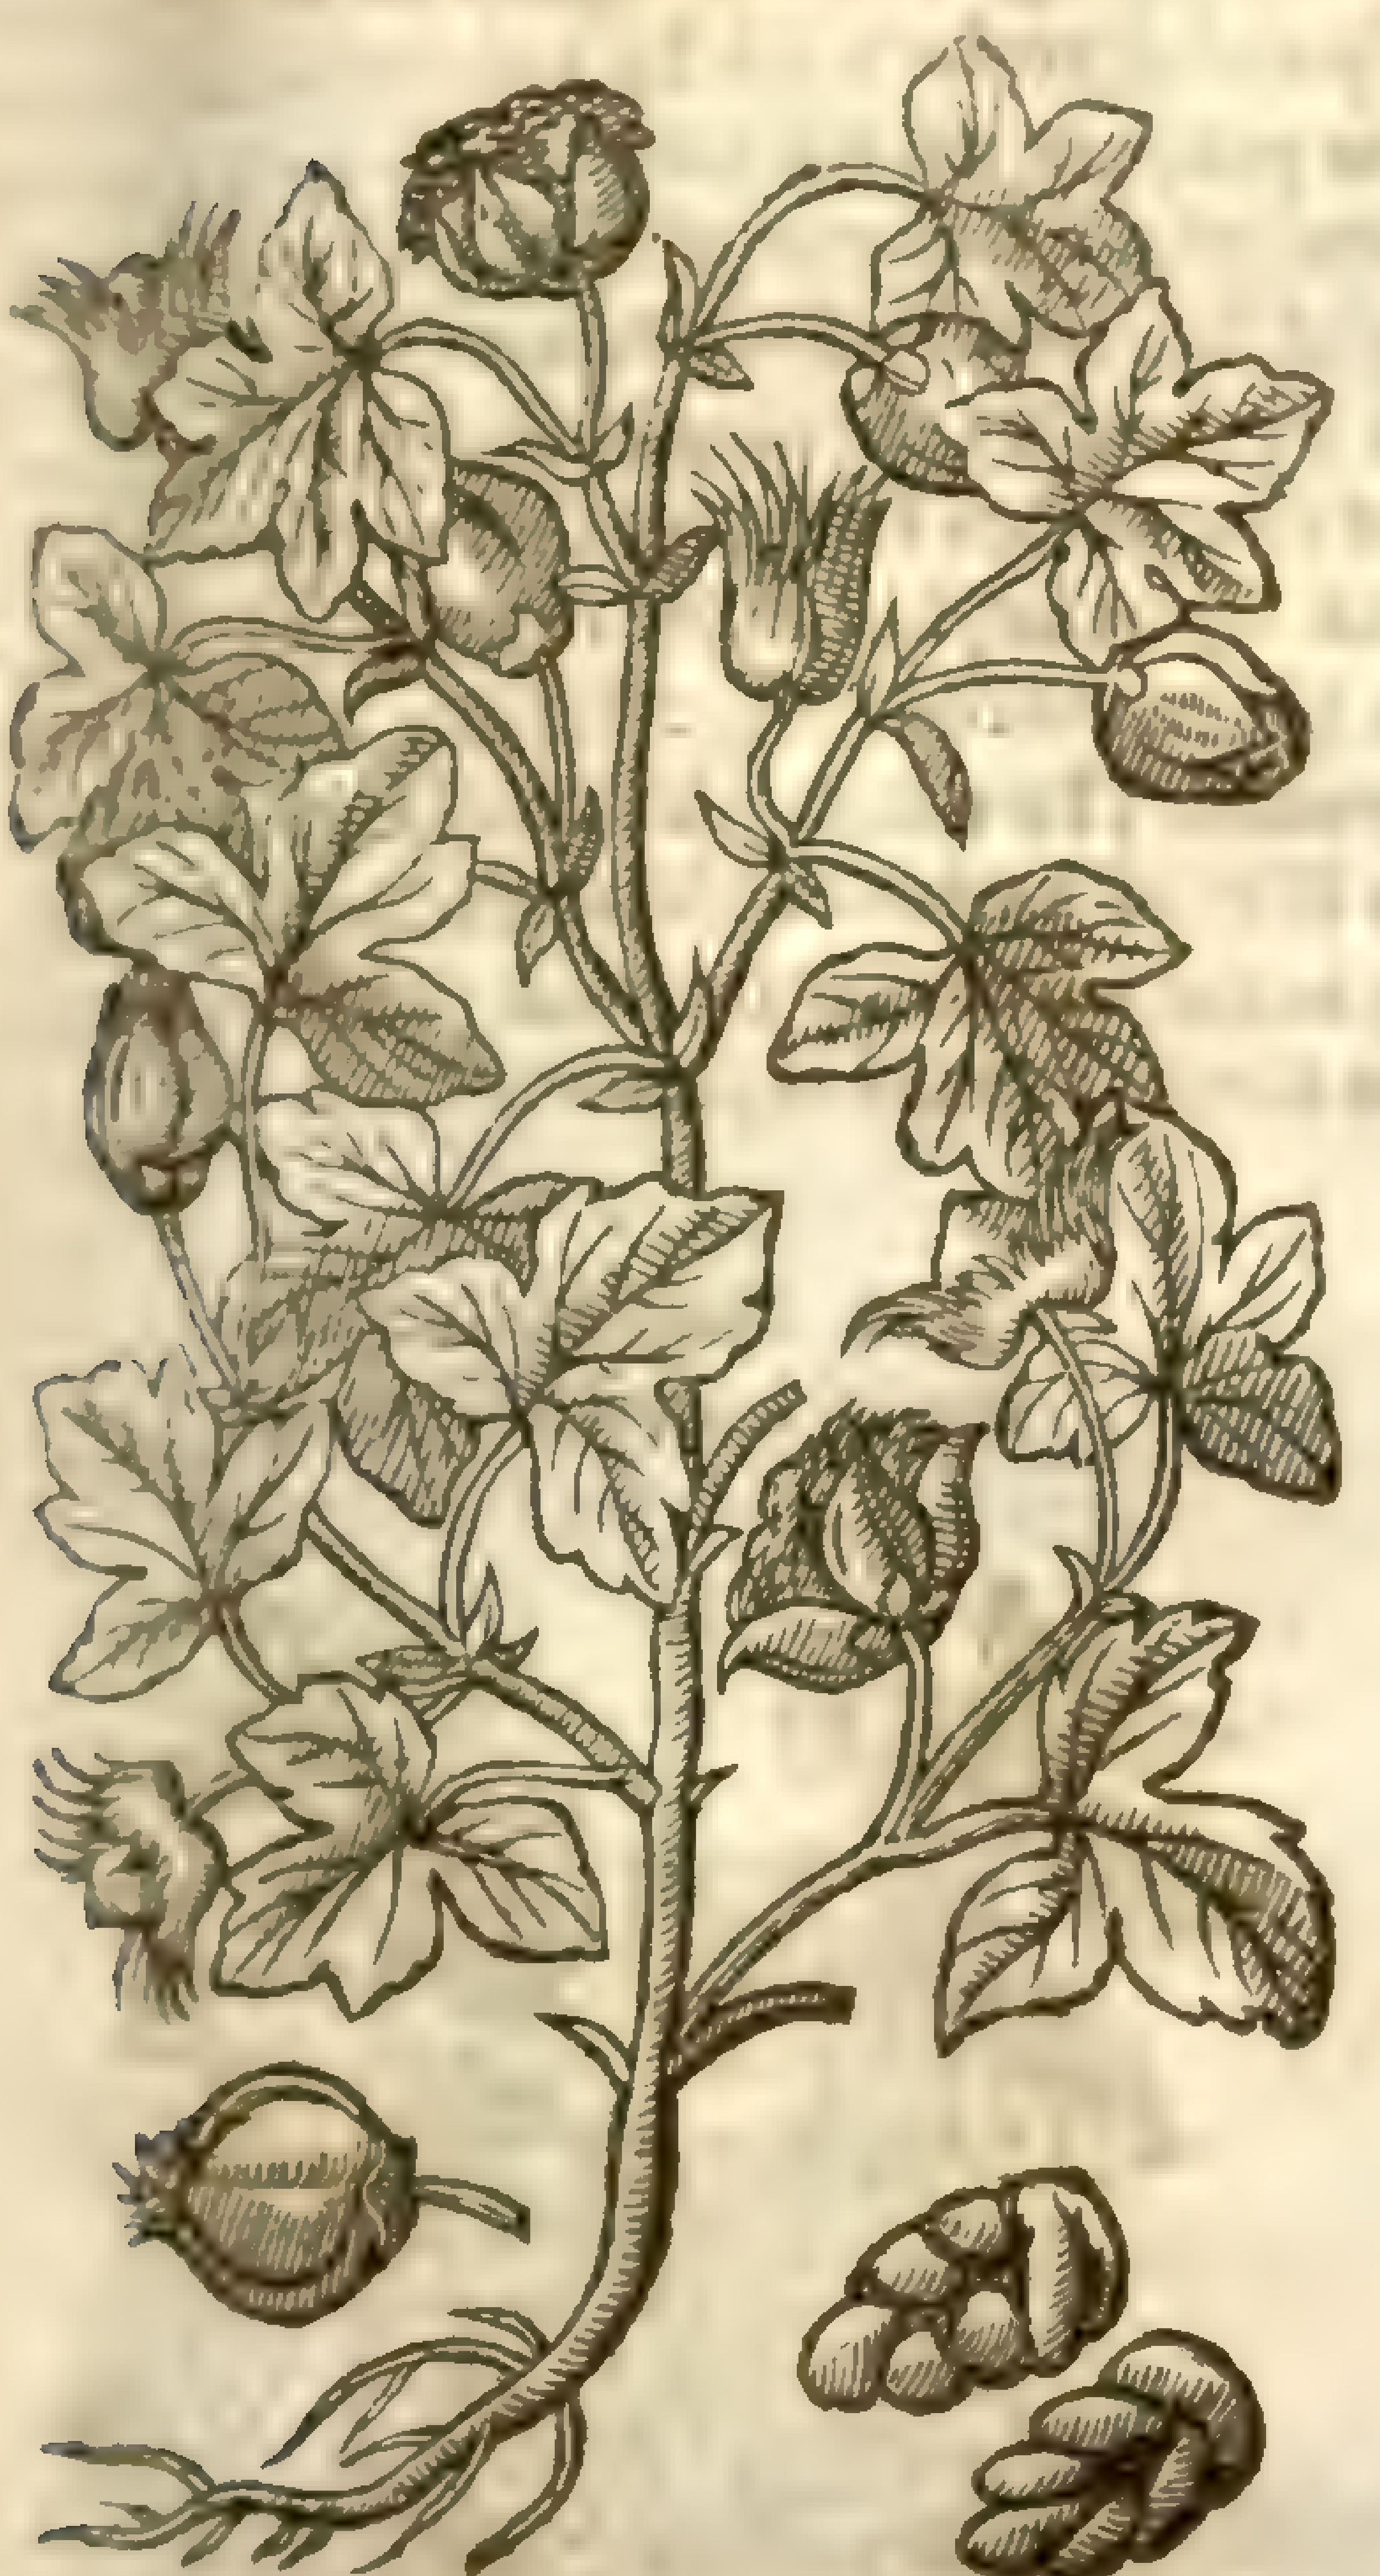
THe Cotton buſh is a low and baſe Plant,hauing ſmall ſtalkes of a cubit high, and ſometimes higher; diuided from the loweſt part to the top into ſundry ſmall branches, whereupon are ſet confuſedly or without order a few broad leaues, cut for the moſt part into three ſections, and ſometimes more,as Nature liſt to beſtow,ſomwhat indented about the edges, not vnlike to the leafe of the Vine,or rather the Veruaine Mallow,but leſſer,ſofter, and of a grayiſh colour: among which come forth the floures, ſtanding vpon ſlender foot-ſtalks,the brims or edges whereof are of a yellow colour,the middle part purple: after which appeareth the fruit,round,and of the bigneſſe of a Tenniſe ball, wherein is thruſt together a great quantity of fine white Cotton wooll; among which is wrapped vp blacke ſeed of the bigneſſe of peaſen,in ſhape like the trettles or dung of a cony. The fruit being come to maturity or ripeneſſe,the husk or cod opens it ſelfe into foure parts or diuiſions, and caſteth forth his wooll and ſeed vpon the ground, if it bee not gathered in his time and ſeaſon. The root is ſmall and ſingle,with lew threds anexed therto,and of a wooddy ſubſtance, as is all the reſt of the plant.

¶ *The Place.*

It groweth in India,in Arabia,Egypt, and in certaine Iſlands of the Mediterranean ſea, as Cyprus,Candy, Malta, Sicilia, and in other prouinces of the continent adiacent. It groweth about Tripolis and Aleppo in Syria, from whence the factor of a worſhipfull merchant in London, Maſter *Nicholas Lete* before remembred, did ſend vnto his ſaid maſter diuers pounds weight of the ſeed; whereof ſome were committed to the earth at the impreſſion hereof,the ſucceſſe we leaue to

the

Goſsipium, ſiue Xylon.
The Cottonbuſh.



the Lord. Notwithſtanding my ſelf three yeares paſt did ſow of the ſeed, which did grow verie frankely, but periſhed before it came to perfection, by reaſon of the cold froſts that ouertooke it in the time of flouring.

¶ *The Time.*

Cotton ſeed is ſowne in plowed fields in the ſpring of the yeare, and reaped and cut downe in harueſt, euen as corne with vs; and the ground muſt be tilled and ſown new again the next yere, and vſed in ſuch ſort as we do the tillage for corn and grain; for it is a plant of one yeare, and periſheth when it hath perfected his fruit, as many other plants do.

¶ *The Names.*

Cotton is called in Greeke ξύλον, and γοσσύπιον: in Latine, *Xylum*, and *Goſsipium*, after the Greeke: in ſhops, *Lanugo*, *Bombax*, and *Cotum*: in Italian, *Bombagia*: in Spaniſh, *Algodon*: in high Dutch, **Baumwool**: in Engliſh and French, Cotton, Bombaſt, and Bombace.

Theophraſtus, lib. 4. *cap.* 9. hath made mention hereof, but without a name; and hee ſaith it is a tree in Tylus which beares wooll. Neither is it any maruell if he took an vnknown ſhrub or plant growing in countries far off, for a tree; ſeeing alſo in this age (in which very many things come to be better knowne than in times paſt) the Cotton or wooll hereof is called of the Germanes (as we haue ſaid) **Baum wool**, that is, Wooll of a tree, whereas indeed it is rather an herb or ſmall ſhrub, and not to be numbred among trees.

Of this *Theophraſtus* writeth thus; It is reported that the ſame Iſland (*viz.* Tylus) brings forth many trees that beare wooll, which haue leaues like thoſe of the Vine, &c.

Pliny, lib. 19. *cap.* 1. writing of the ſame, ſaith thus: The vpper part of Ægypt towards Arabia brings forth a ſhrub called *Goſsipion* or *Xylon*, and therefore the linnen that is made thereof is called *Xylina*. It is (ſaith he) the plant that beareth that wooll wherewith the garments are made which the prieſts of Egypt do weare.

¶ *The Temperature.*

The ſeed of Cotton (according to the opinion of *Serapio*) is hot and moiſt, the wooll it ſelfe is hot and dry.

¶ *The Vertues.*

The ſeed of Cotton is good againſt the cough and ſhort windedneſſe: it alſo ſtirreth vp luſt of the body by increaſing naturall ſeed; wherein it ſurpaſſeth. A

The oile preſſed out of the ſeed takes away freckles, ſpots, and other blemiſhes of the skin. B

The aſhes of the wooll burned ſtanch the bleeding of wounds, vſed in reſtrictiue medicines, as Bole Armonicke, and is more reſtrictiue than Bole it ſelfe. C

To ſpeake of the commodities of the wooll of this plant were ſuperfluous, common experience and the daily vſe and benefit we receiue by it ſhew them. So that it were impertinent to our hiſtorie, to ſpeak of the making of Fuſtian, Bombaſies, and many other things that are made of the wool thereof. D

Chap. 336. *Of Dogs-bane.*

¶ *The Kindes.*

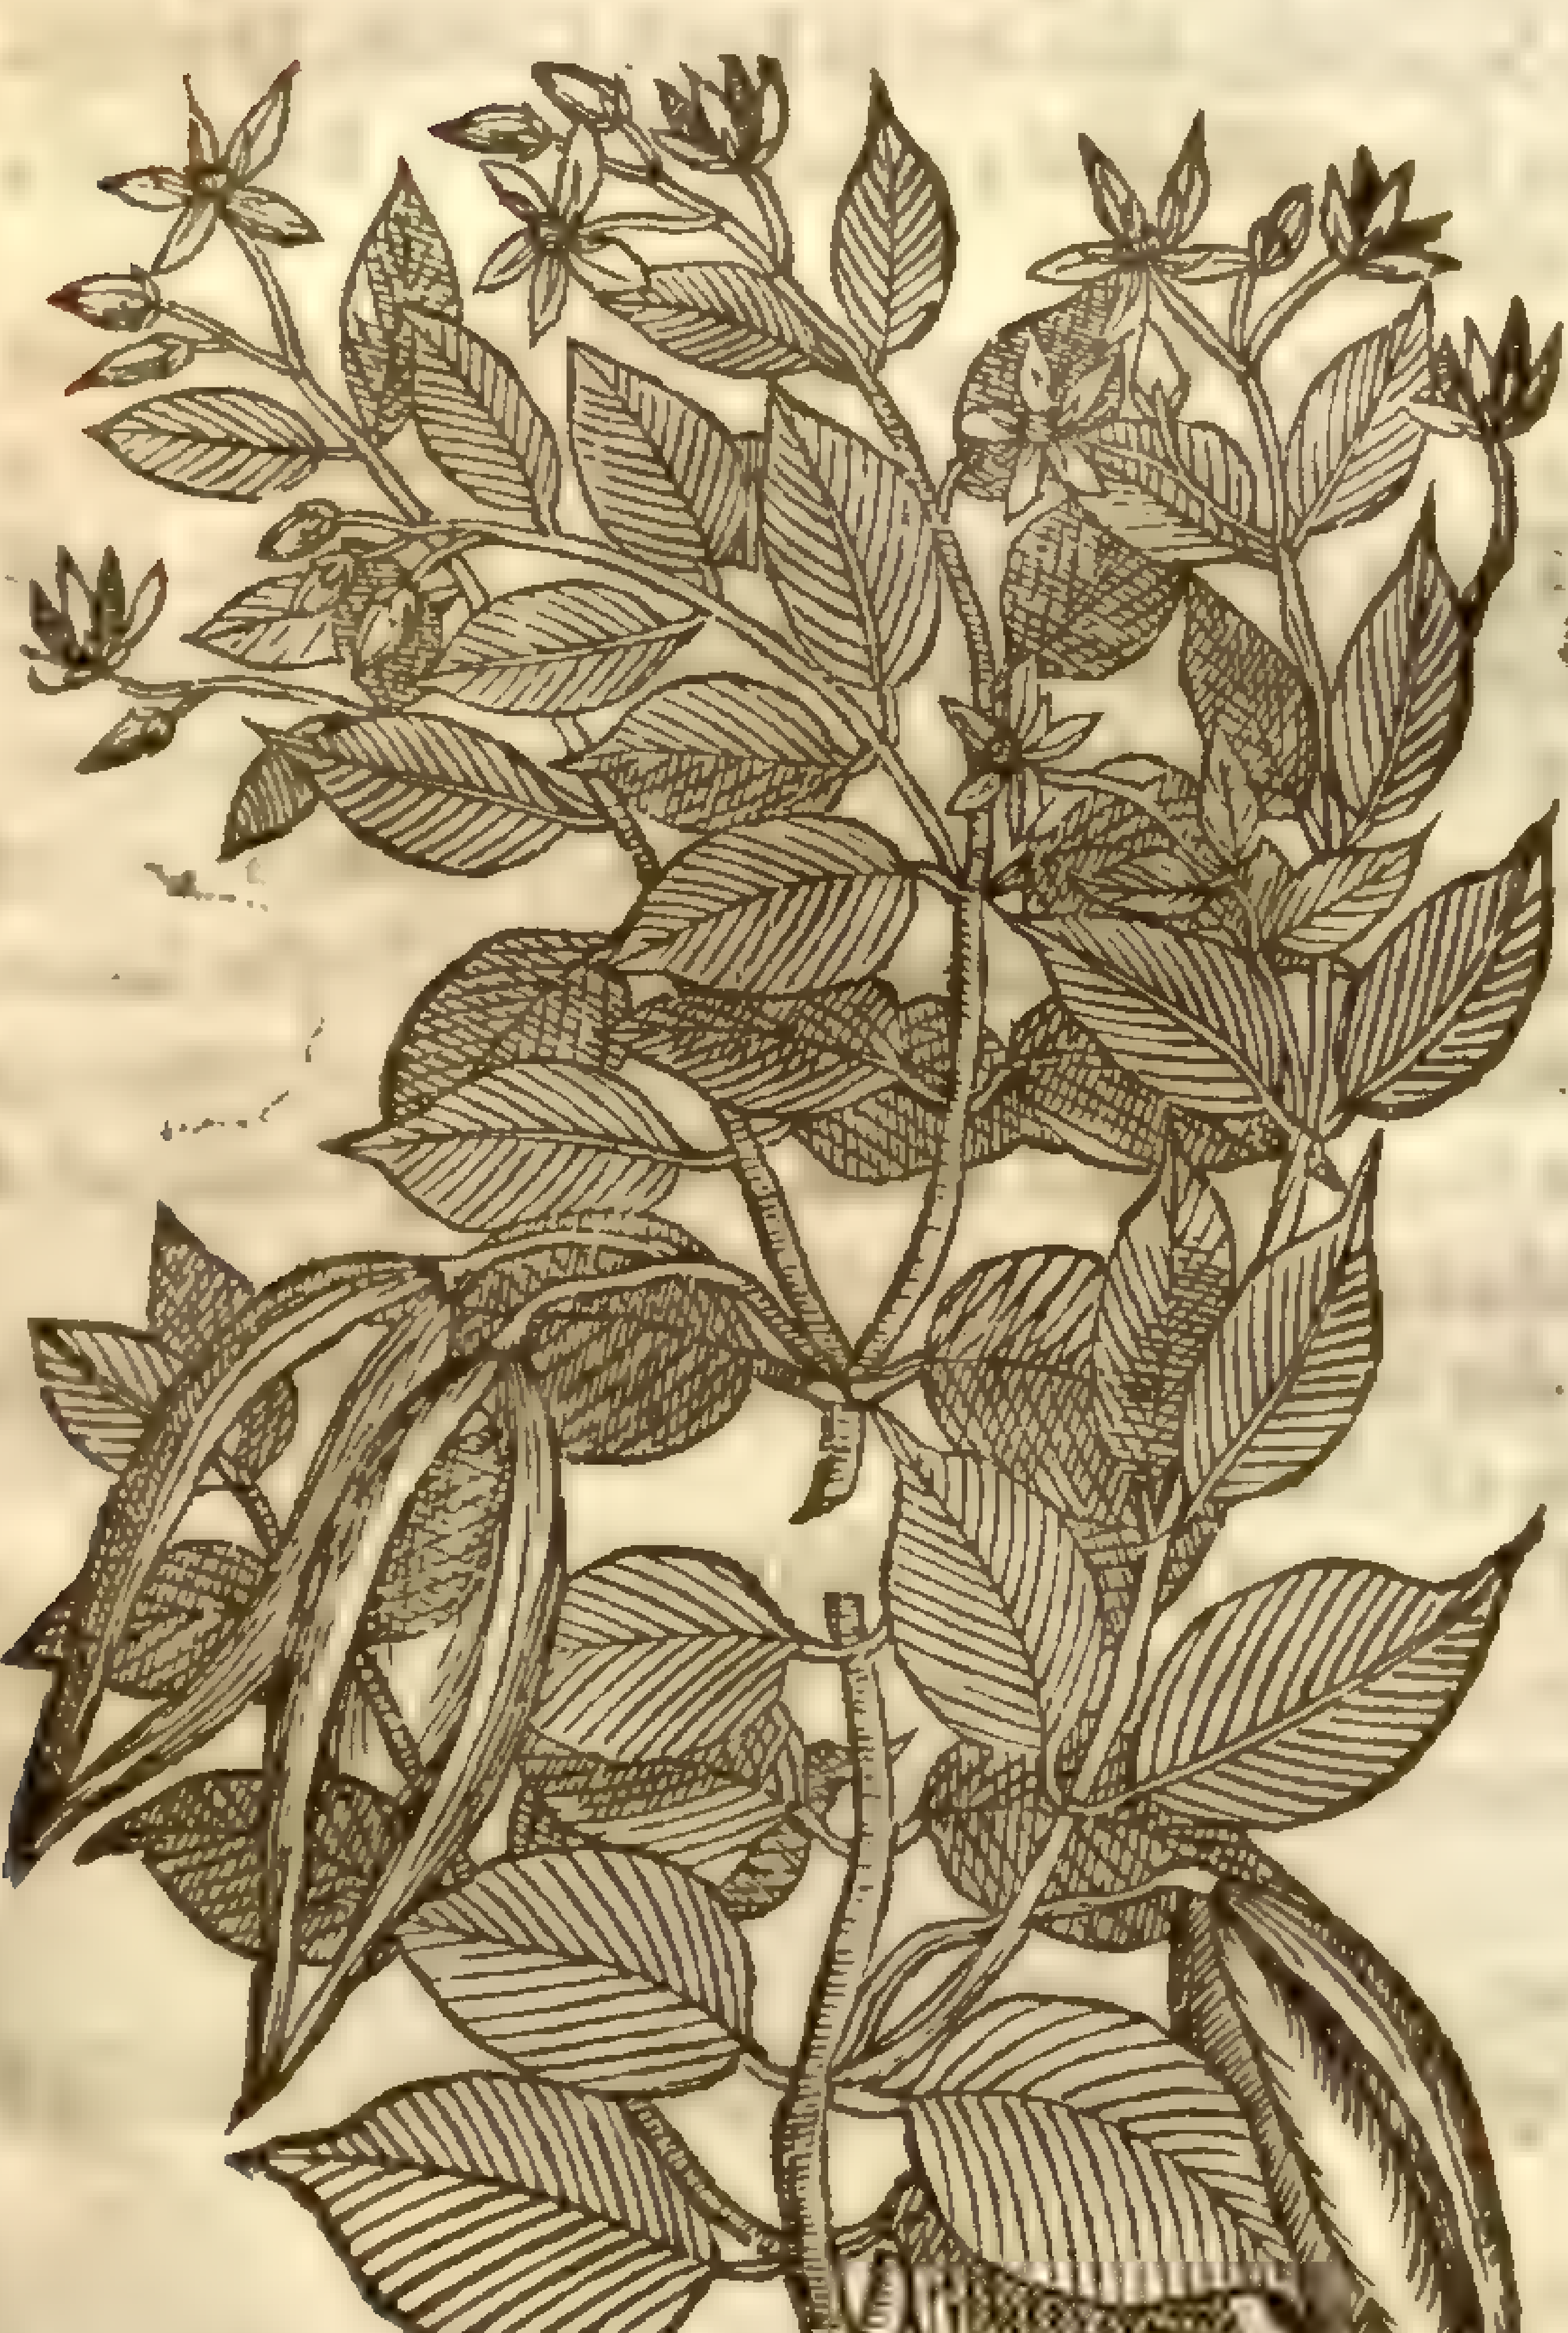
There be two kindes of Dogs-bane: the one a clymbing or clambering plant; the other an vpright ſhrub.

¶ *The Deſcription.*

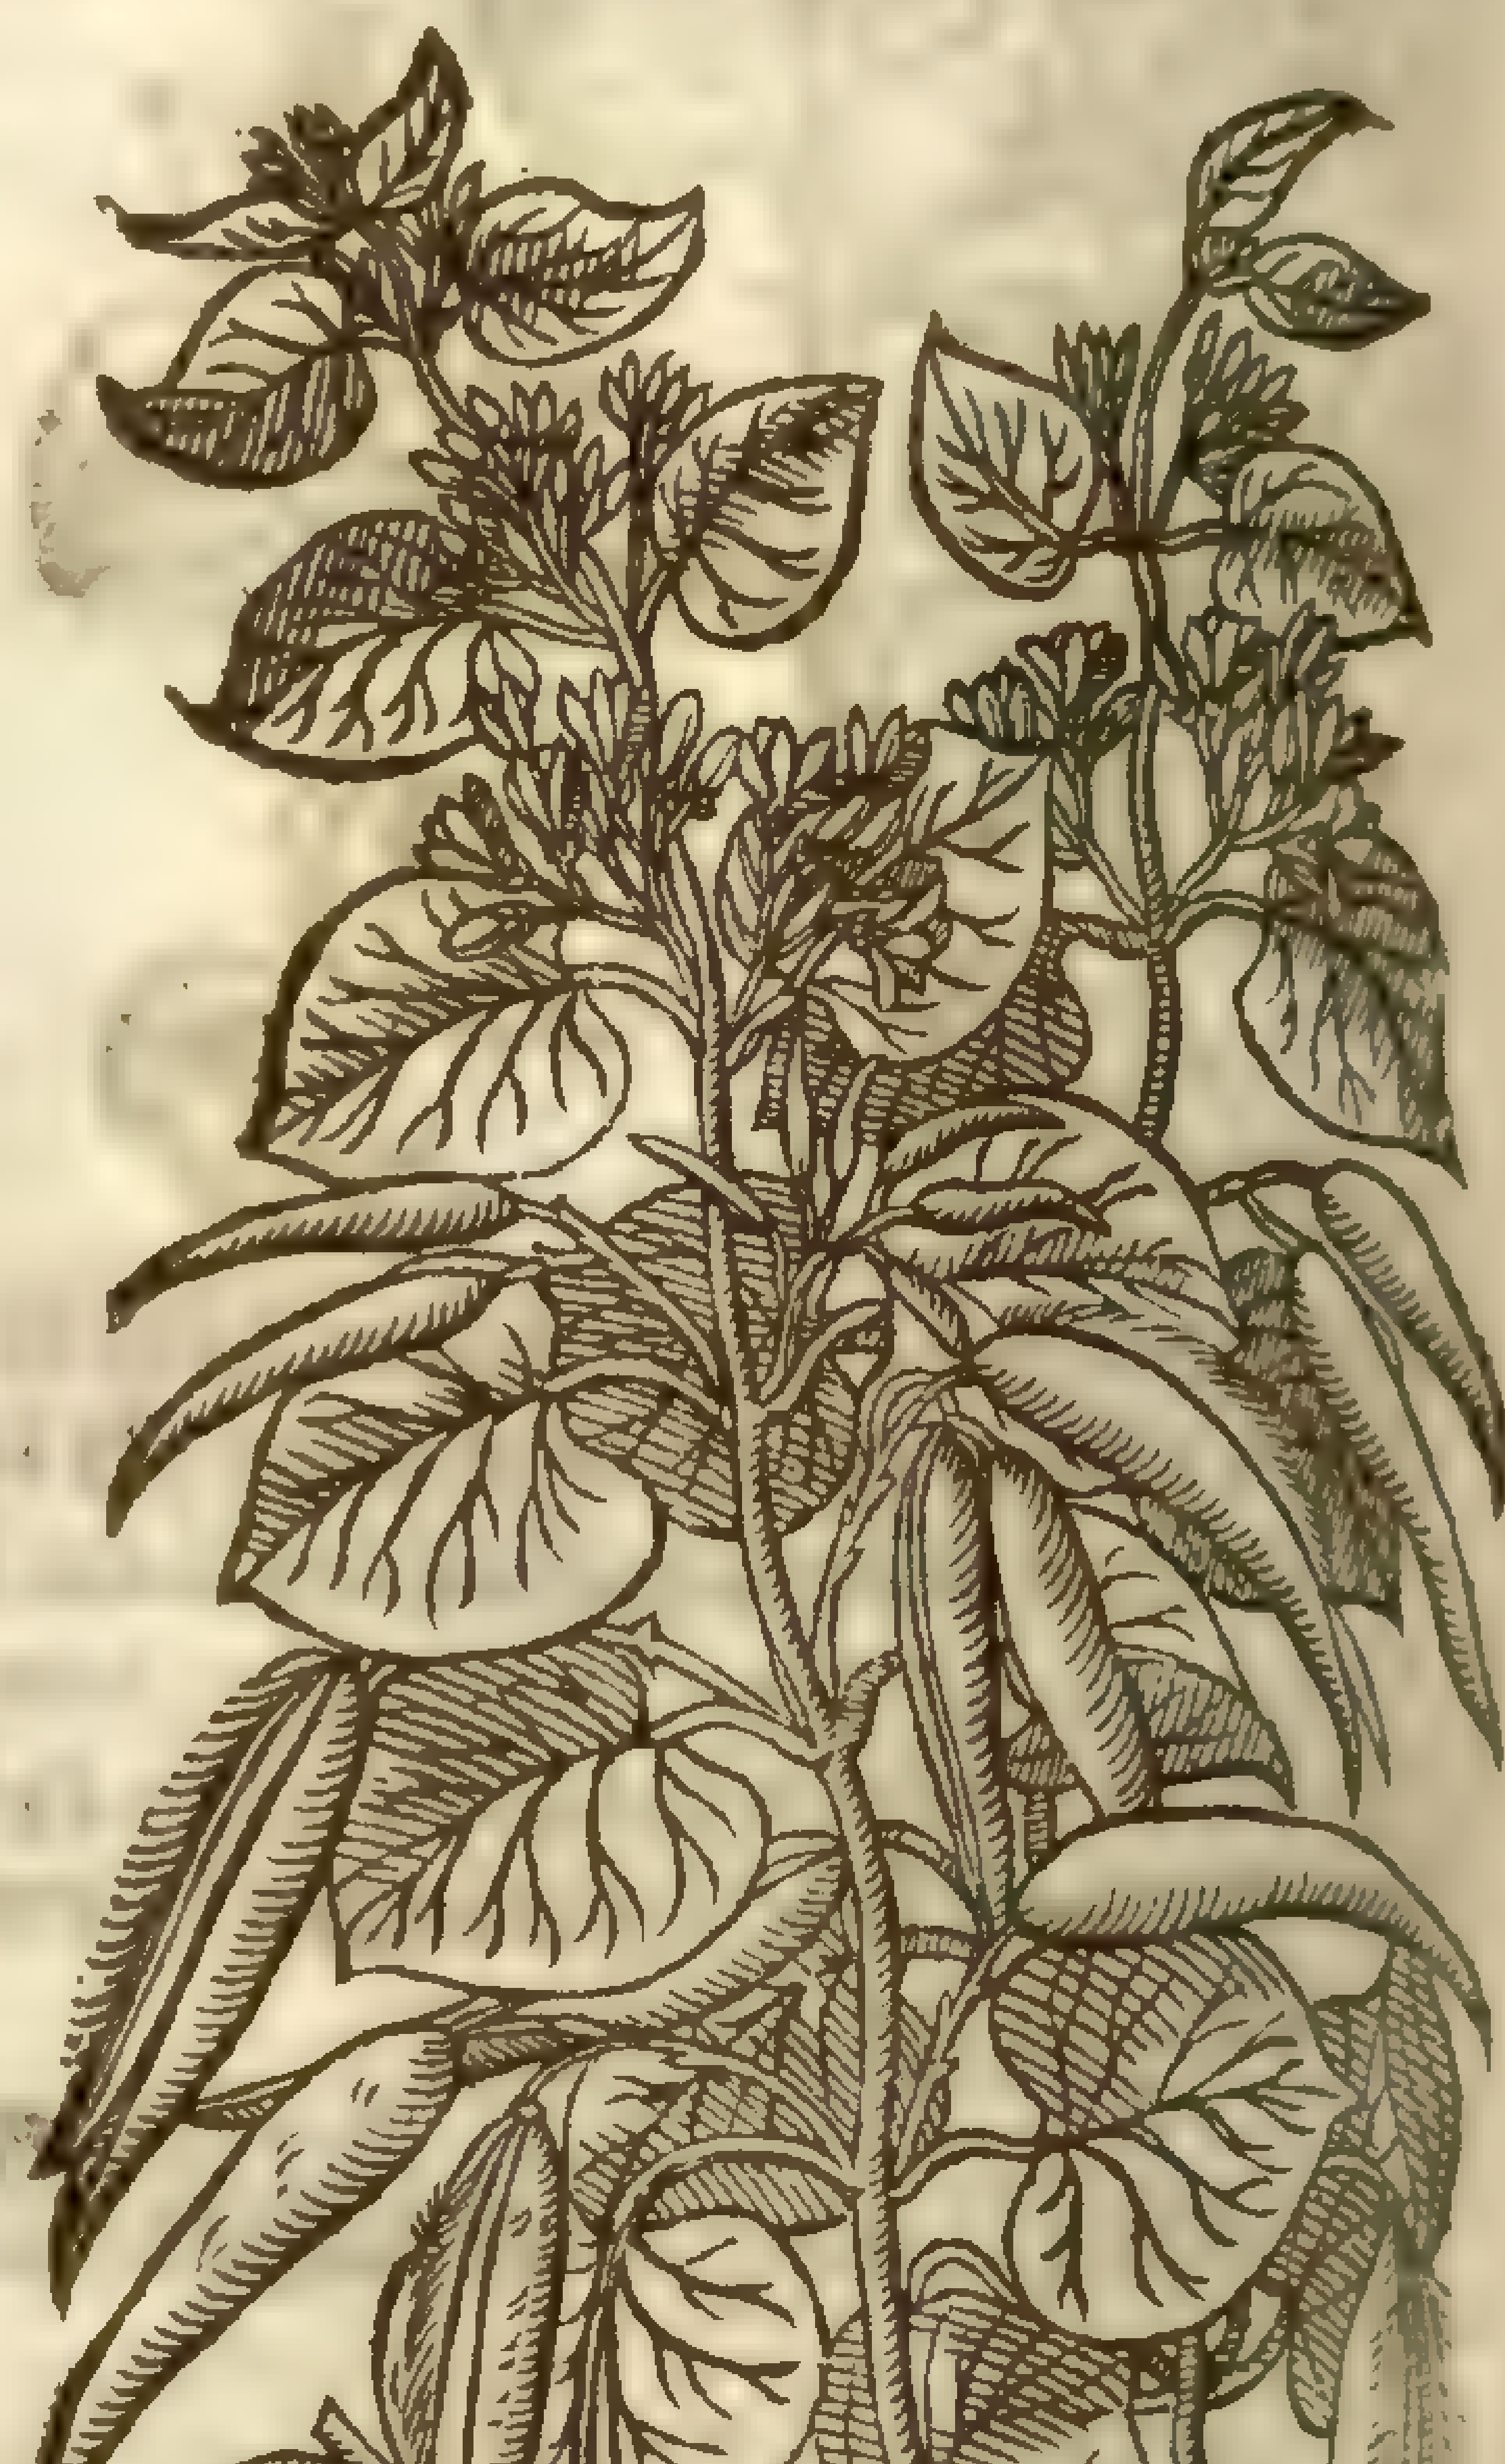
1 DOgs-bane riſeth vp like vnto a ſmall hedge buſh, vpright and ſtraight, vntil it haue attained to a certain height; then doth it claſp and clymbe with his tender branches as do the Bindeweeds, taking hold vpon props or poles, or whatſoeuer ſtands next vnto it: whereupon grow faire broad leaues ſharp pointed like thoſe of the Bay tree, of a deep green colour. The floures come forth at the top of the ſtalks, conſiſting of fiue ſmall white leaues: which beeing paſt, there ſucceed long cods ſet vpon a ſlender foot-ſtalk by couples, ioyning themſelues together at the extreme point, and likewiſe at the ſtalke, making of two pieces knit together one intire cod; which cod is full of ſuch downy matter and ſeed as that of *Aſclepias*, but more in quantitie, by reaſon the cods are greater: which beeing dry and ripe, the ſilken cotton hangeth forth, and by little and little ſheddeth, vntill the whole be fallen vpon the ground. The whole plant yeelds that yellow ſtinking milky juice that the other doth, and ſometimes it is of a white colour, acccording to the clymat where it groweth; for the more cold the country is, the whiter is the juice; and the hotter, the more yellow. The root is long and ſingle, with ſome threds anexed thereto.

P. græca, L. [illegible]

1 *Periploca repens anguſtifolia.*
Climing Dogs-bane.



‡ 2 *Periploca latifolia.*
Broad leafed Dogs-bane.



2 There is another Dogs-bane that hath long ſlender ſtalkes like thoſe of the Vine, but of a browne reddiſh colour, wherewith it windeth it ſelfe about ſuch things as ſtand neere vnto it, in manner of a Bindweed: whereupon are ſet leaues not vnlike thoſe of the Iuy, but not ſo much cornered, of a darke green colour, and of a rank ſmell being bruiſed betwixt the fingers, yeelding forth a ſtinking yellow milky juice when it is ſo broken: amongſt which come forth little white floures ſtanding ſcatteringly vpon little huskes: after the floures come long cods very like *Aſclepias* or Swallow-wort, but greater, ſtuffed with the like ſoft downy ſilke, among which downe is wrapped vp flat blacke ſeed. The roots are many and threddy, creeping all about within the ground, budding forth new ſhoots in ſundry places, whereby it greatly increaſeth.

¶ *The Place.*

They grow naturally in Syria, and alſo in Italy, as *Matthiolus* reporteth. My louing friend *Iohn Robin*, herbariſt in Paris, did ſend me plants of both the kinds for my garden, where they floure and flouriſh: but whether they grow in France, or that hee procured them from ſome other region, as yet I know not.

¶ *The Time.*

They begin to bud forth their leaues in the beginning of May, and ſhew their floures in September.

¶ *The Names.*

Dogs-bane is called by the learned of our age, *Periploca:* it is euident that they are to be referred to the *Apocynum* of *Dioſcorides.* The former of the two hath beene likewiſe called κυνοκράμβη, and *Braßica canina,* or Dogs-Cole: notwithſtanding there is another Dogs Cole which is a kind of wild Mercurie. We may call the firſt Creeping Dogs bane; and the other, Vpright or Syrian Dogs-bane.

¶ *The Nature.*

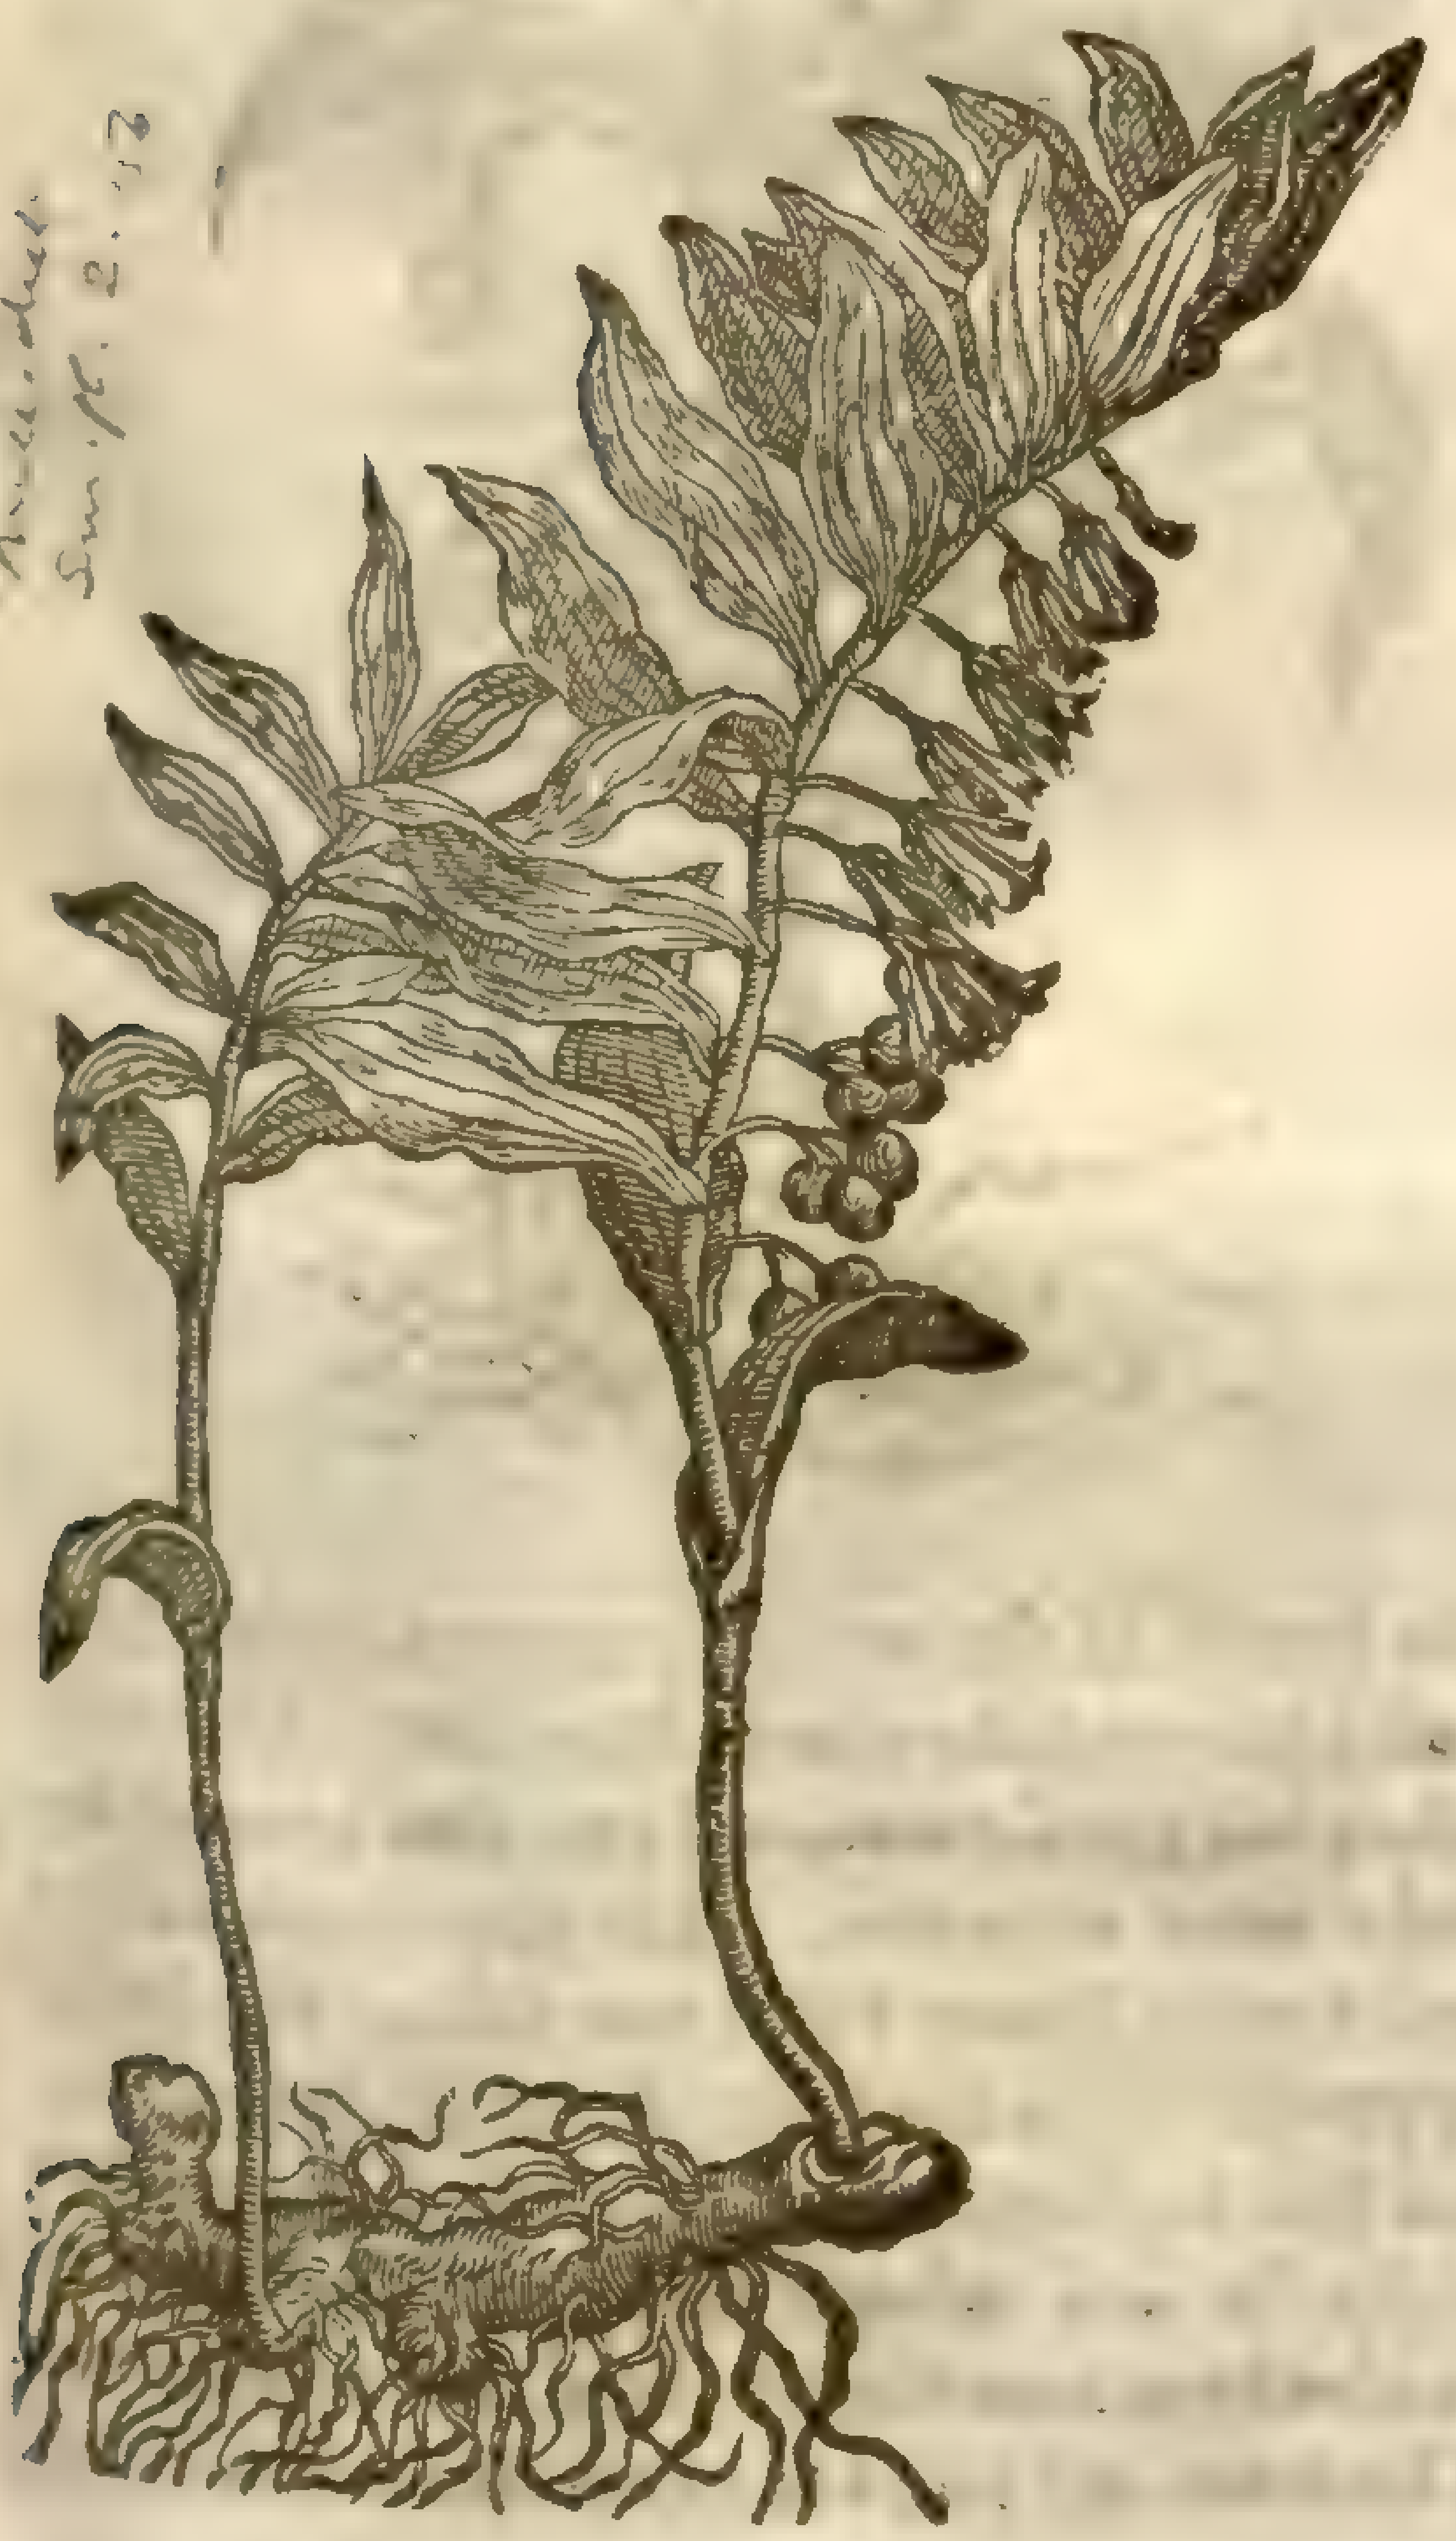
Theſe plants are of the nature of that peſtilent or poyſonous herbe *Thora,* which being eaten of dogs or any other liuing creature doth certainly kill them, vnleſſe there be in readines an antidote or preſeruatiue againſt poiſon, and giuen, which by probability is the herb deſcribed in the former chapter, called *Vincetoxicum,* euen as *Anthora* is the antidote and remedy againſt the poiſon of *Thora;* and *Herba Paris* againſt *Pardalianches.*

¶ *The Vertues.*

A Dogs-bane is a deadly and dangerous plant, eſpecially to foure footed beaſts; for as *Dioſcorides* writes, the leaues hereof mixed with bread and giuen, kill dogs, wolues, foxes, and leopards, the vſe of their legs and huckle bones being preſently taken from them, and death it ſelf following incontinent: wherefore it is not to be vſed in medicine.

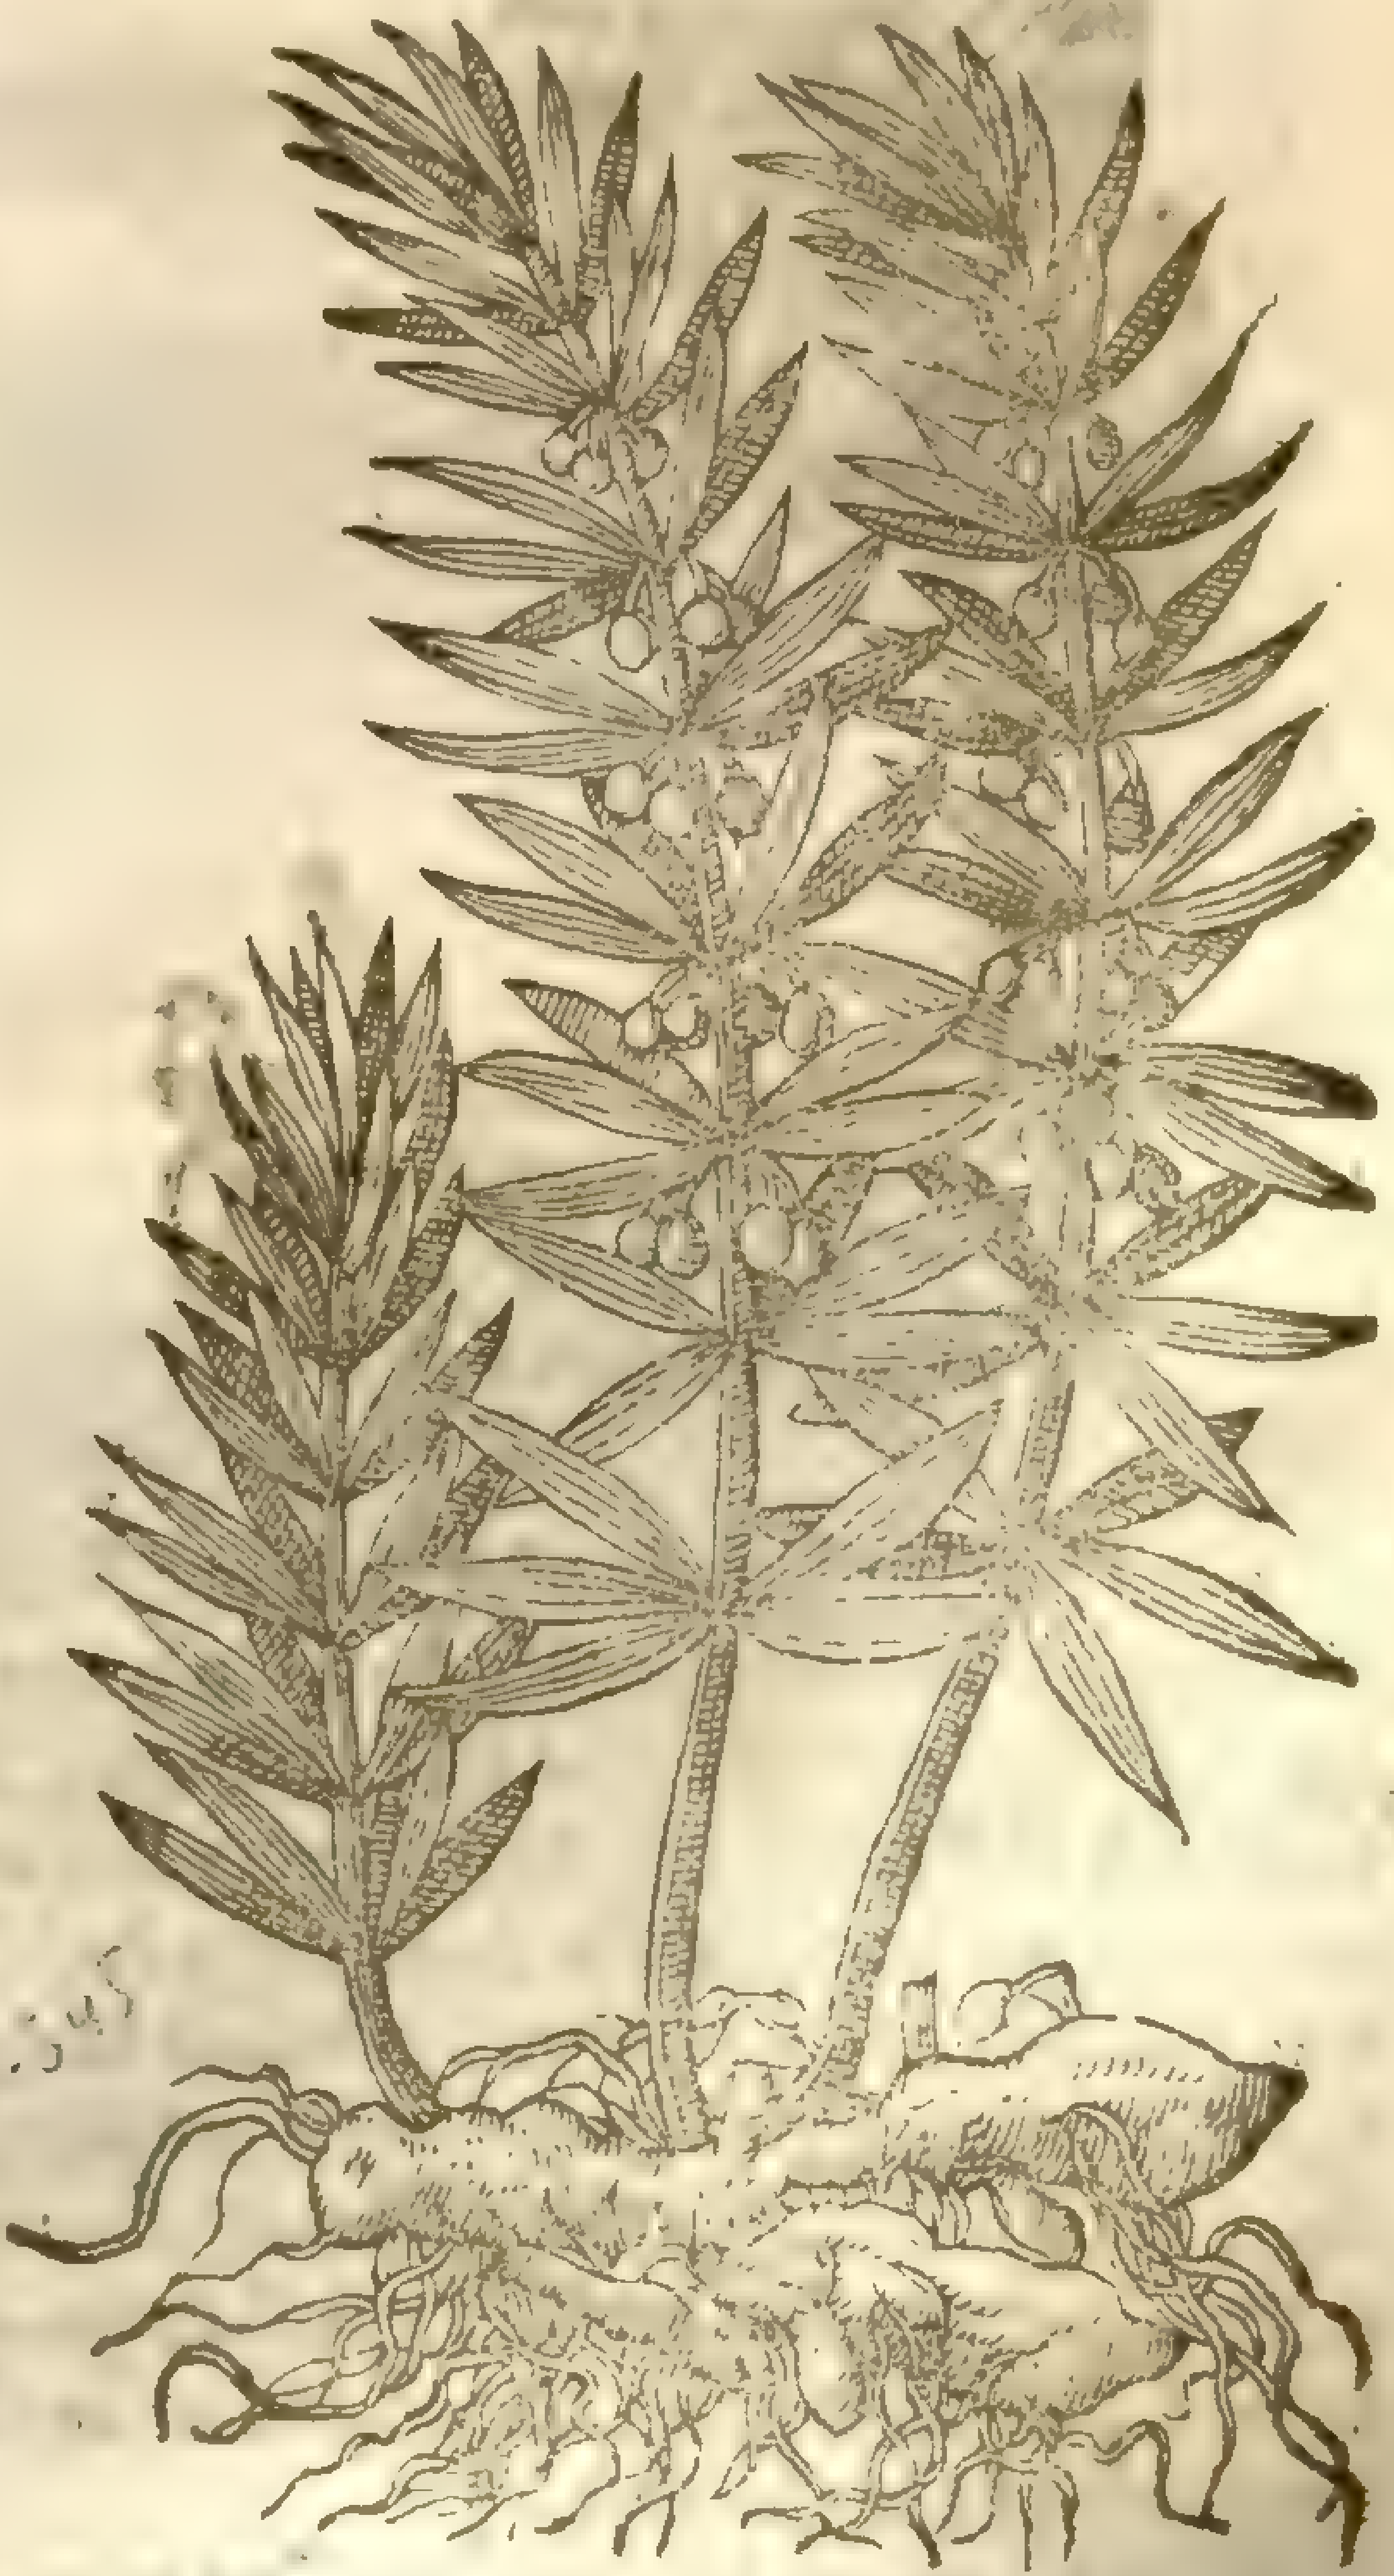
Chap. 337. *Of Solomons Seale.*

1 *Polygonatum.*
Solomons Seale.



Convallaria multiflora [illegible]
Sm. pl. 2. [illegible]

2 *Polygonatum minus.*
Small Solomons Seale.



Convallaria verticillata, L.
[illegible]
Sm. pl. 2. [illegible]

¶ *The Deſcription.*

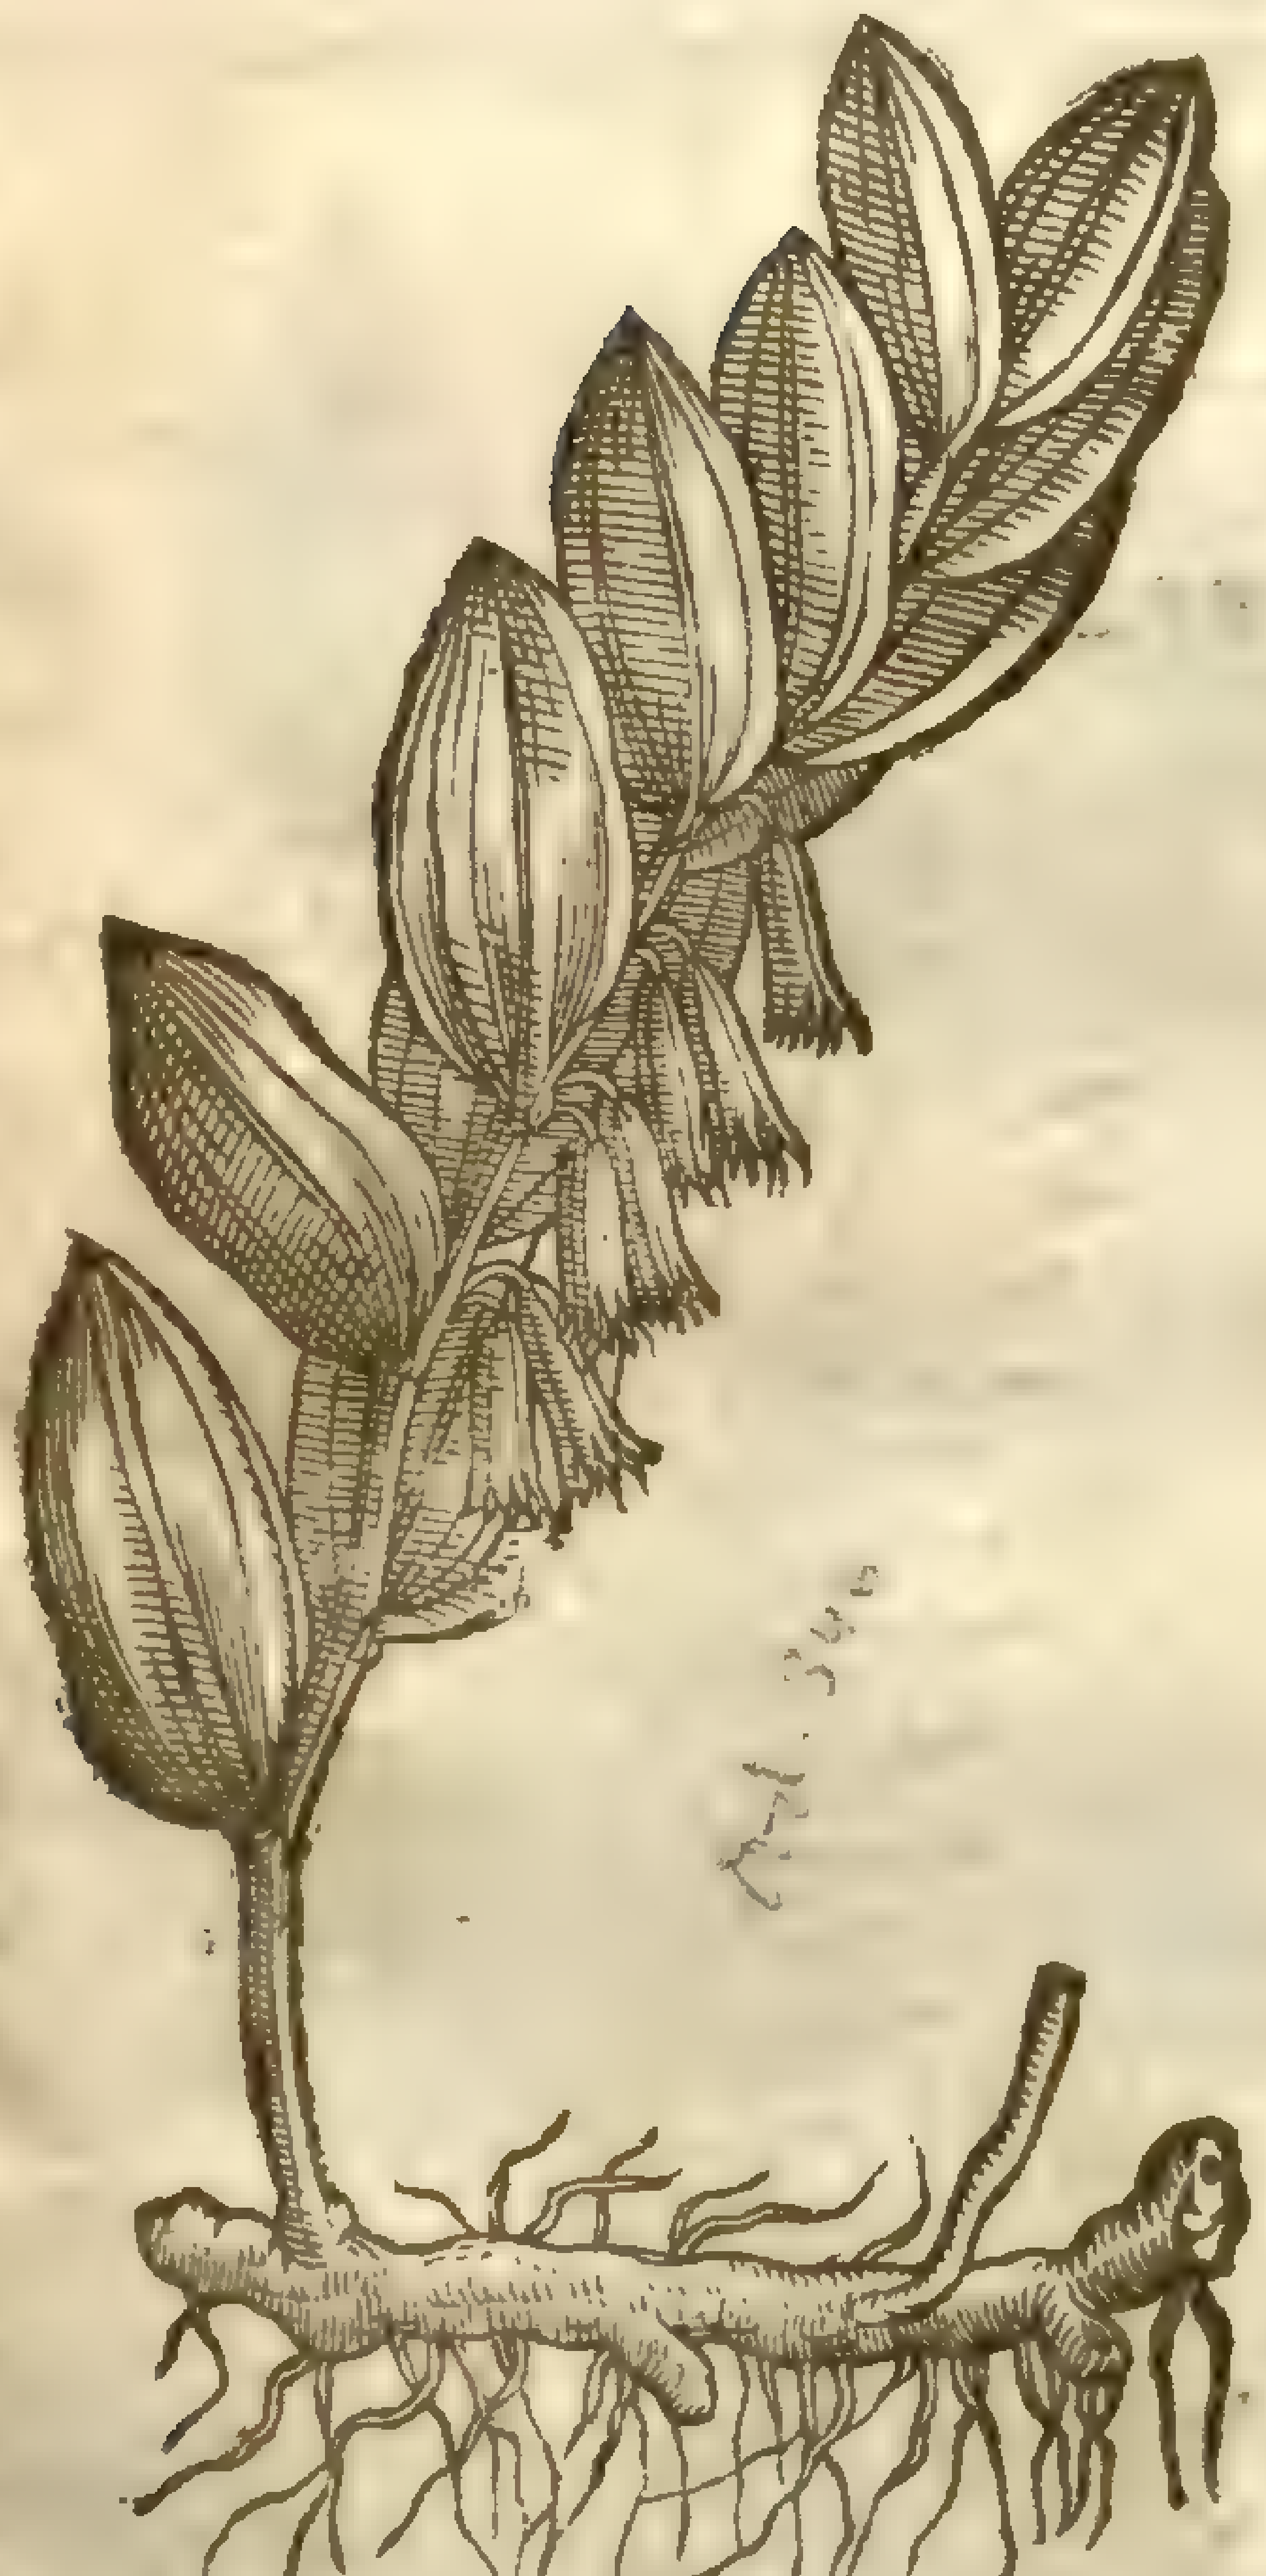
1 The firſt kinde of Solomons Seale hath long round ſtalks, ſet for the moſt part with long leaues ſomewhat furrowed and ribbed, not much vnlike Plantain, but narrower, which for the moſt part ſtand all vpon one ſide of the ſtalke, and hath ſmall white floures reſembling the

floures of Lilly Conual: on the other ſide when the floures be vaded, there come forth round berries, which at the firſt are green and of a blacke colour tending to blewneſſe, and being ripe, are of the bigneſſe of Iuy berries, of a very ſweet and pleaſant taſte. The root is white and thicke, full of knobs or joints, in ſome places reſembling the marke of a ſeale, whereof I thinke it tooke the name *Sigillum Solomonis*; it is ſweet at the firſt, but afterward of a bitter taſte with ſome ſharpneſſe.

2 The ſecond kinde of *Polygonatum* doth not much vary from the former, ſauing in the leaues, which be narrower, and grow round about the ſtalke like a ſpur, in faſhion like vnto Woodroofe or red Madder: amongſt the leaues come forth floures like the former, but of a greener white colour; which being paſt, there ſucceed berries like the former, but of a reddiſh colour: the roots are thick and knobby like the former, with ſome fibres anexed thereto.

3 *Polygonatum latifolium* 2. *Cluſij*.
Sweet ſmelling Solomons ſeale.

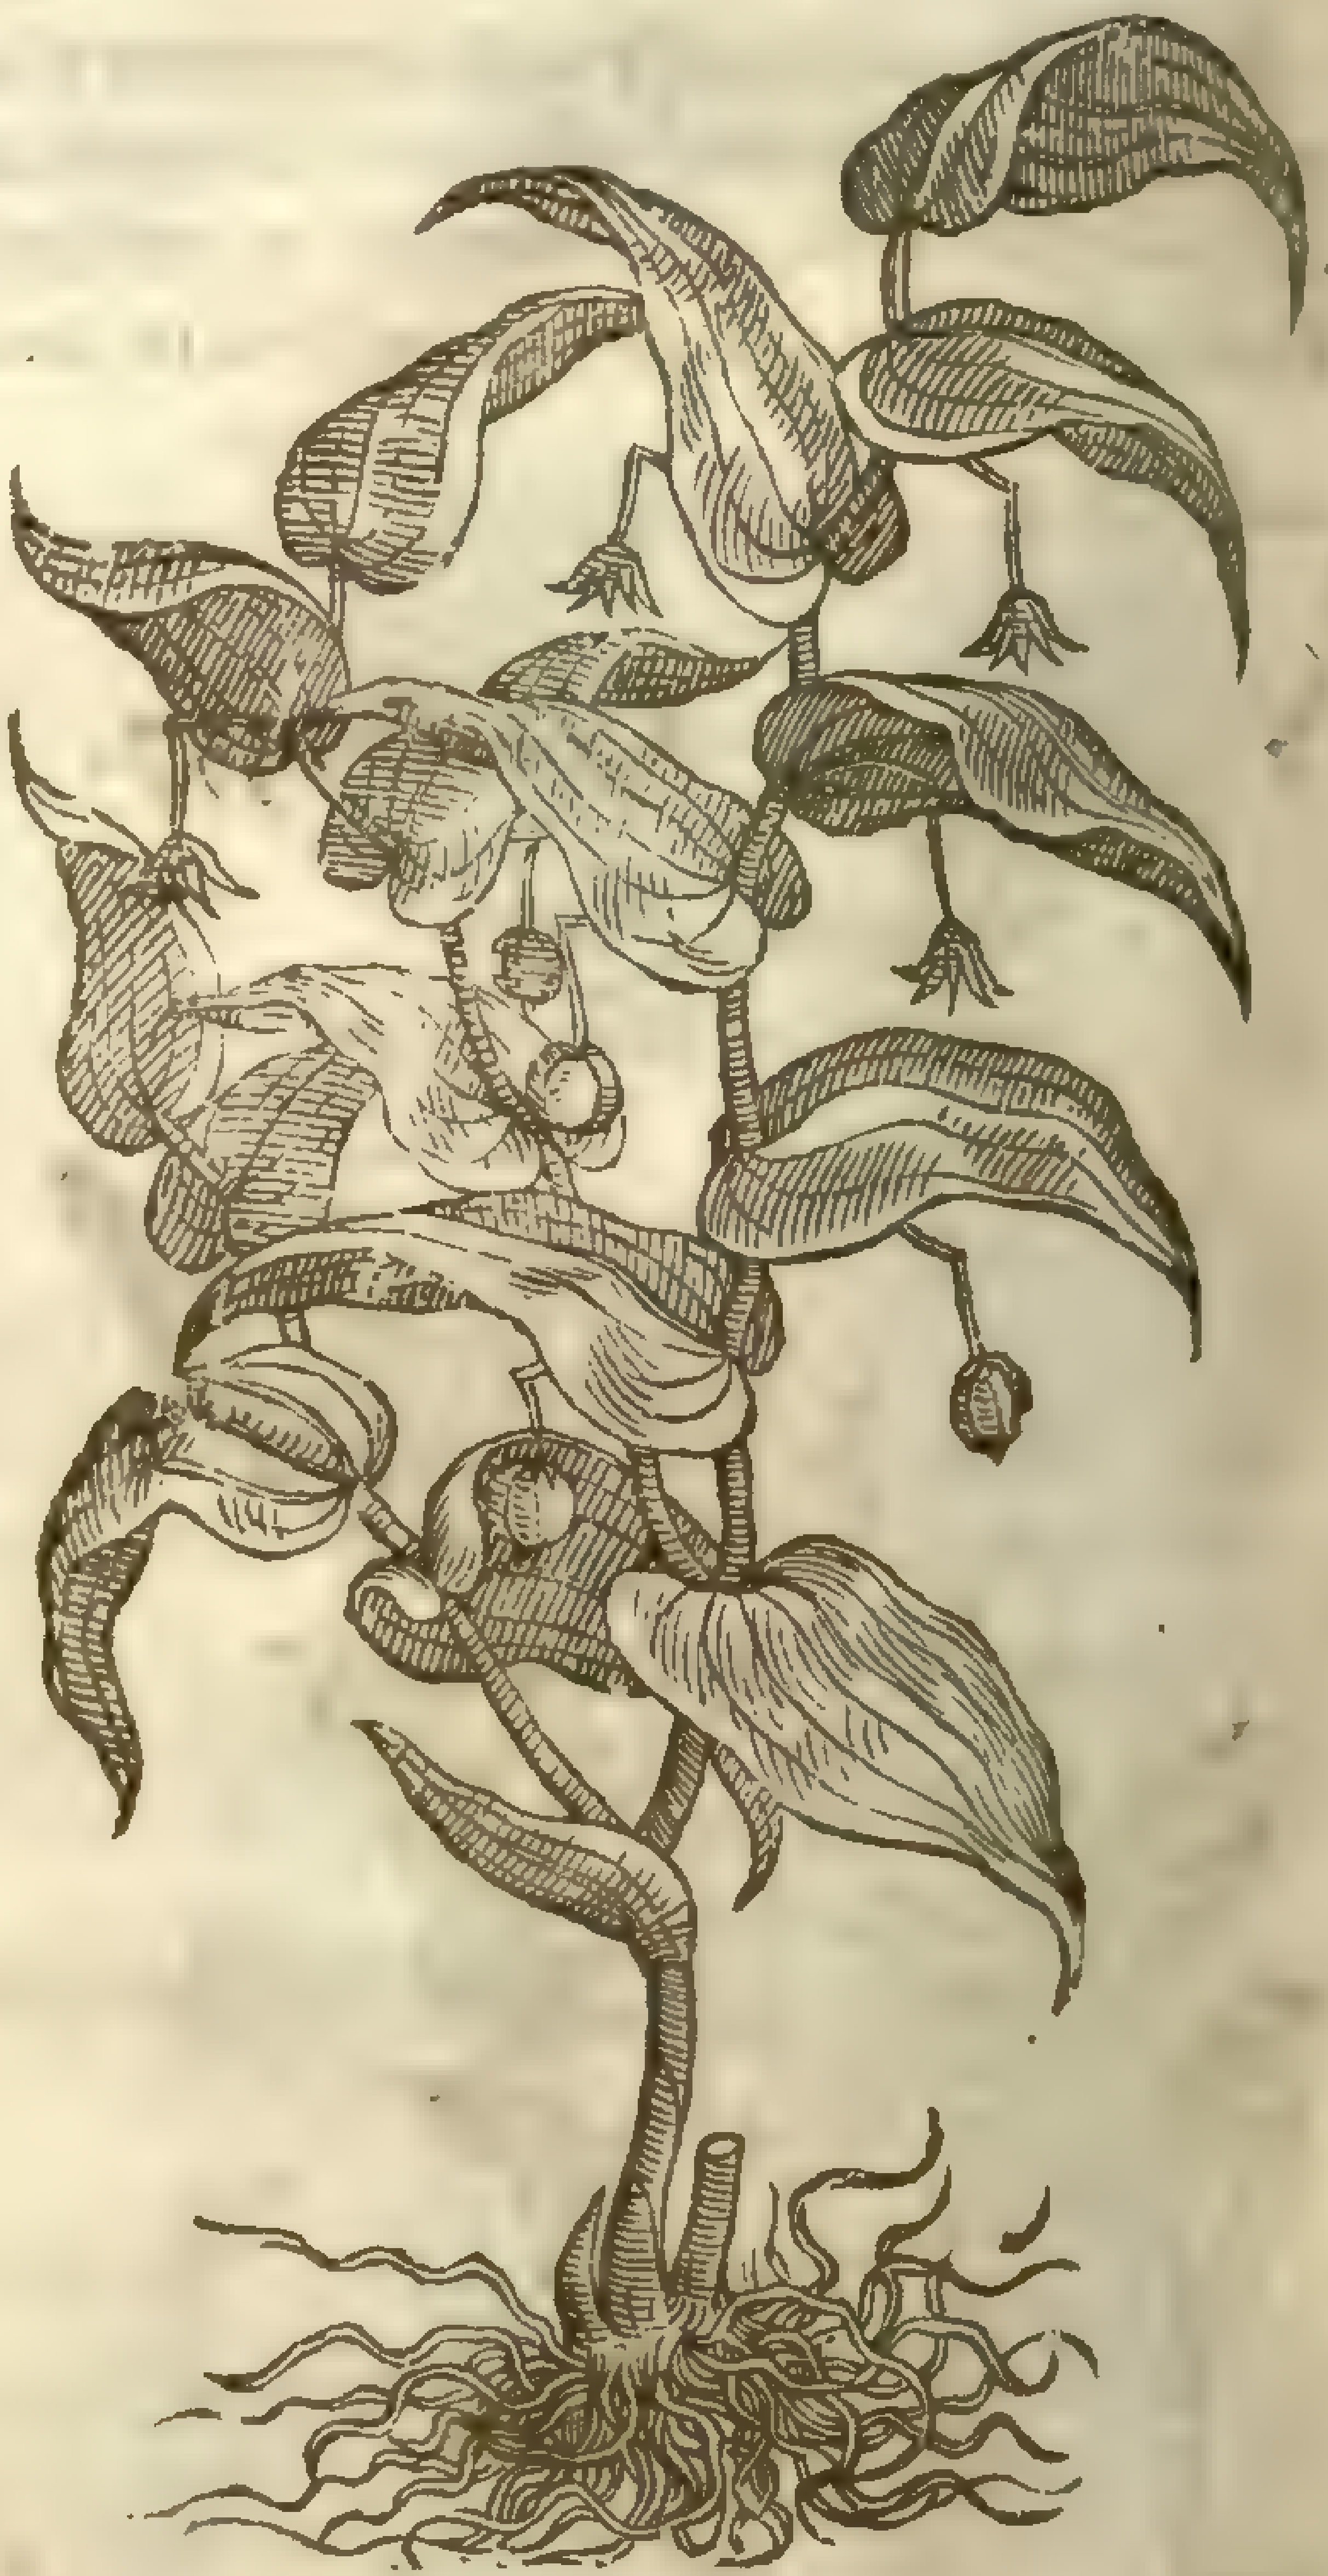
Convallaria polygonatum, mill. dict. Sm. fl. b. 2. 357
2 ed. bot. 346



bot. 346

4 *Polygonatum ramoſum*.
Branched Solomons ſeale.

Uvularia amplexifolia mill. dict.

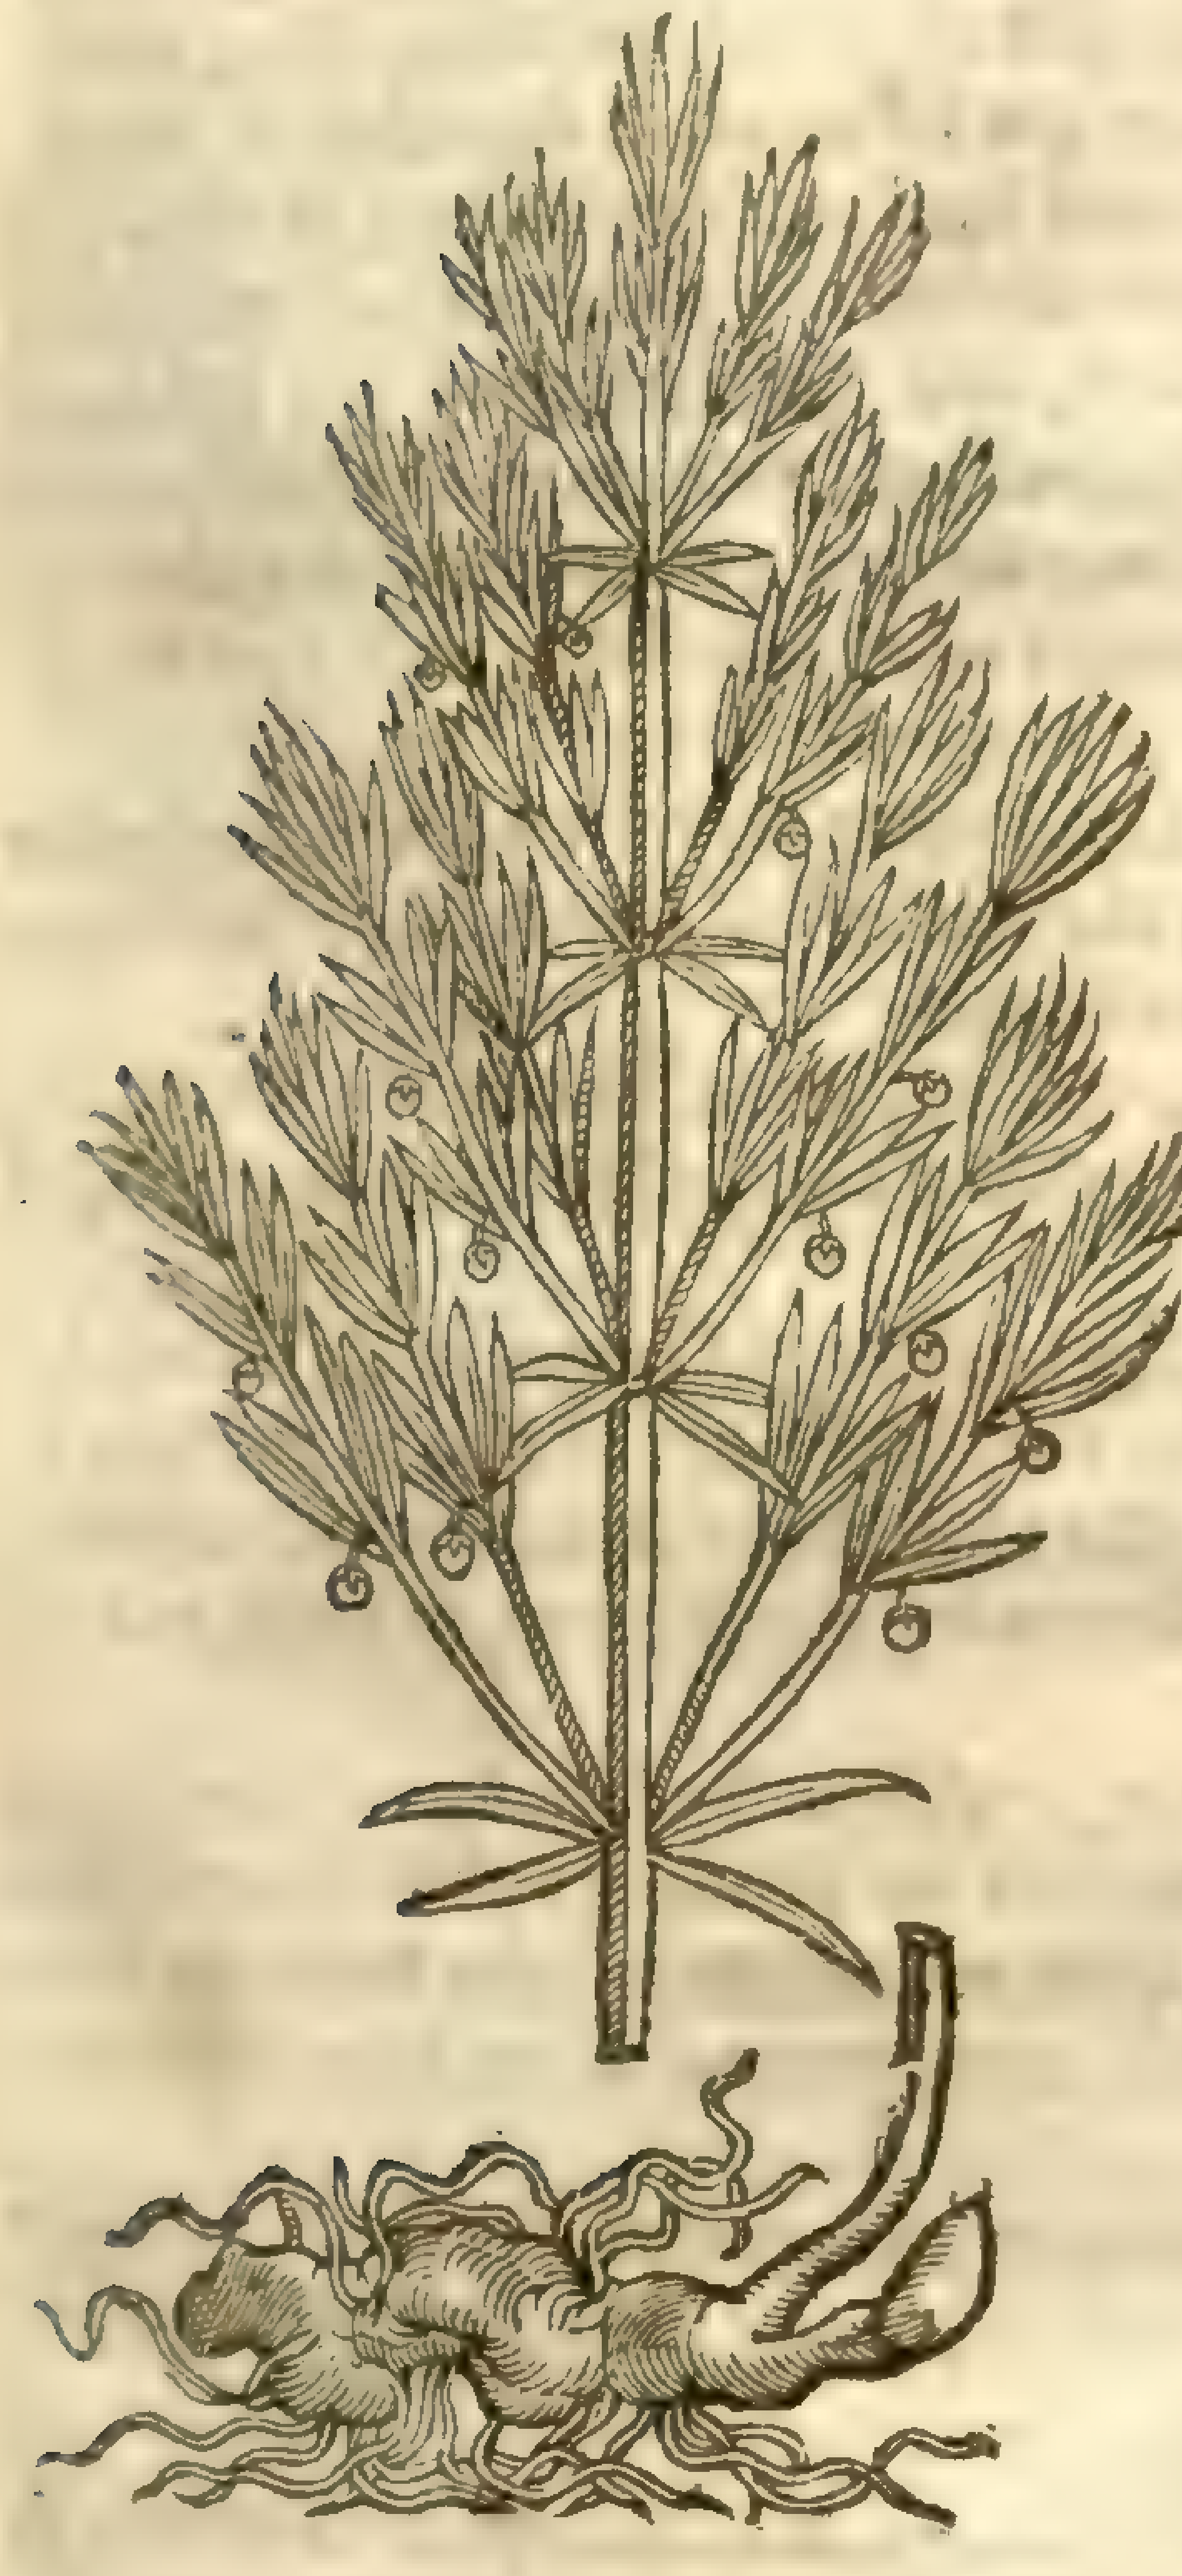


3 The third kinde of Solomons Seale, which *Cluſius* found in the wooddy mountains of Leitenberg, aboue Manderſtorf, and in many other mountains beyond the riuer Danubius, eſpecially among the ſtones, he ſent to London to Mr *Garth*, a worſhipful gentleman, and one that greatly delighteth in ſtrange plants, who very louingly imparted the ſame vnto me. This plant hath ſtalkes very like to the common Solomons ſeale, a foot high, beſet with leaues vpon one ſide of the ſtalke like the firſt and common kinde, but larger, and more approching to the bigneſſe of the broad leafed Plantain; the taſt whereof is not very pleaſant: from the boſome of which leaues come forth ſmall well ſmelling greeniſh white flours not much vnlike the firſt: which being paſt, there follow ſeeds or berries that are at the firſt green, but afterwards blacke, containing within the ſame berries a ſmall ſeed as big as a Vetch, and as hard as a ſtone. The roots are like the other of his kinde, yet not ſo thicke as the firſt.

4 The fourth kinde according to my account, but the third of *Cluſius* (which he found alſo in the mountains aforeſaid) groweth a foot high, but ſeldom a cubit, differing from all the others of his kinde; for his ſtalkes diuide themſelues into ſundry other branches, which are garniſhed with goodly leaues, larger and ſharper pointed than any of the reſt, which do embrace the ſtalkes about after the manner of *Perfoliata* or Thorow-wax, yet very like vnto the kindes of Solomons Seale in

ſhew, ſaue that they are ſomwhat hoarie vnderneath the leaues; which at the firſt are ſweet in taſte, but ſomewhat acride or biting towards the later end. From the backe part of the leaues ſhoot forth ſmall long tender and crooked ſtems, bearing at the end little gaping white flours not much vnlike *Lillium conuallium*, ſauouring like Hawthorne floures, ſpotted on the inner ſide with blacke ſpots: which being paſt, there come forth three cornered berries like the narrow leafed Solomons ſeale; greene at the firſt, and red when they be ripe, containing many white hard graines. The roots differ from all the other kindes, and are like vnto the crambling roots of *Thalictrum*, which the grauer hath omitted in the figure.

5 *Polygonatum anguſtifolium ramoſum.*
Narrow leaued Solomons ſeale.



Convallaria verticillata [illegible]

5 This rare ſort of Solomons Seale riſes vp from his tuberous or knobby root, with a ſtraight vpright ſtalke joynted at certaine diſtances, leauing betweene each joynt a bare and naked ſtalke, ſmooth, and of a greeniſh colour tending to yellownes; from the which joynts thruſt forth diuers ſmal branches, with foure narrow leaues ſet about like a ſtar or the herbe Woodroofe: vpon which tender branches are ſet about the ſtalkes by certaine ſpaces long narrow leaues incloſing the ſame round about: among which leaues come forth ſmall whitiſh floures of little regard. The fruit is ſmall, and of a red colour, full of pulpe or meate; among which is contained a hard ſtony ſeed like that of the firſt Solomons ſeale.

‡ 6 There is kept in our gardens, and ſaid to be brought from ſome part of America another *Polygonatum*, which ſends vp a ſtalk ſome foot and more high, and it hath leaues long, neruous, and very greene and ſhining, growing one by another without any order vpon the ſtalke, which is ſomewhat creſted, crooked, and very greene; bearing at the very top thereof, aboue the higheſt leafe, vpon little foot-ſtalks, ſome eight or nine little white floures, conſiſting of ſix leaues apiece, which are ſucceeded by berries, as in the former. This floures in May, and is vulgarly named *Polygonatum Virginianum*, or Virginians Solomons ſeale. ‡

¶ *The Place.*

The firſt ſort of Solomons ſeale growes naturally wilde in Somerſet-ſhire, vpon the North ſide of a place called Mendip, in the pariſh of Shepton Mallet: alſo in Kent by a village called Crayford, vpon Rough or Row hill: alſo in Odiam parke in Hampſhire; in Bradfords wood, neere to a towne in Wiltſhire foure miles from bath; in a wood neere to a village called Horſley, fiue miles from Gilford in Surrey, and in diuers other places.

That ſort of Solomons ſeale with broad leaues groweth in certaine woods in Yorkeſhire called Clapdale woods, three miles from a village named Settle.

¶ *The Time.*

They ſpring vp in March, and ſhew their floures in May: the fruit is ripe in September.

¶ *The Names.*

Solomons ſeale is called in Greeke, πολυγόνατον: in Latine likewiſe, *Polygonatum*, of many, Knees, for ſo the Greeke word doth import: in ſhops, *Sigillum Salomonis*, and *Scala cœli*: in Engliſh likewiſe, Scala cœly, Solomons ſeale, and White-woort, or White-root: in high Dutch, Weiſwurtz: in French, *Seau de Solomon*: of the Hetrurians, *Fraſinella*, and *Fraxinella*.

¶ *The Temperature.*

The roots of Solomons ſeale, as *Galen* ſaith, haue both a mixt faculty and quality alſo: For they haue (ſaith he) a certaine kinde of aſtriction or binding, and biting withall, and likewiſe a certaine loathſome bitterneſſe, as the ſame Author affirmeth: which is not to be found in thoſe that do grow in our climate.

¶ *The Vertues.*

A *Dioſcorides* writeth, That the roots are excellent good for to ſeale or cloſe vp greene wounds, being ſtamped and laid thereon; whereupon it was called *Sigillum Salomonis*, of the ſingular vertue that it hath in ſealing or healing vp wounds, broken bones, and ſuch like. Some haue thought it tooke the name *Sigillum* of the markes vpon the roots: but the firſt reaſon ſeemes to be more probable.

B The root of Solomons ſeale ſtamped while it is freſh and greene, and applied, taketh away in one night, or two at the moſt, any bruiſe, blacke or blew ſpots gotten by fals or womens wilfulneſſe, in ſtumbling vpon their haſty husbands fiſts, or ſuch like.

C *Galen* ſaith, that neither herbe nor root hereof is to be giuen inwardly: but note what experience hath found out, and of late daies, eſpecially among the vulgar ſort of people in Hampſhire, which *Galen*, *Dioſcorides*, or any other that haue written of plants haue not ſo much as dreamed of; which is, That if any of what ſex or age ſoeuer chance to haue any bones broken, in what part of their bodies ſoeuer; their refuge is to ſtampe the roots hereof, and giue it vnto the patient in ale to drinke: which ſodoreth and glues together the bones in very ſhort ſpace, and very ſtrangely, yea although the bones be but ſlenderly and vnhandſomely placed and wrapped vp. Moreouer, the ſaid people do giue it in like manner vnto their cattell, if they chance to haue any bones broken, with good ſucceſſe; which they do alſo ſtampe and apply outwardly in manner of a pulteſſe, as well vnto themſelues as their cattell.

D The root ſtamped and applied in manner of a pulteſſe, and laid vpon members that haue beene out of joynt, and newly reſtored to their places, driueth away the paine, and knitteth the joynt very firmely, and taketh away the inflammation, if there chance to be any.

E The ſame ſtamped, and the juyce giuen to drinke with ale or white wine, as aforeſaid, or the decoction thereof made in wine, helps any inward bruiſe, diſperſeth the congealed and clotted bloud in very ſhort ſpace.

F That which might be wrtten of this herbe as touching the knitting of bones, and that truely, would ſeeme vnto ſome incredible; but common experience teacheth, that in the world there is not to be found another herbe comparable to it for the purpoſes aforeſaid: and therefore in briefe, if it be for bruiſes inward, the roots muſt be ſtamped, ſome ale or wine put thereto, ſtrained, and giuen to drinke.

G It muſt be giuen in the ſame manner to knit broken bones, againſt bruiſes, blacke or blew marks gotten by ſtripes, falls, or ſuch like; againſt inflammation, tumors or ſwellings that happen vnto members whoſe bones are broken, or members out of joynt, after reſtauration: the roots are to be ſtamped ſmall, and applied pulteſſe or plaiſterwiſe, wherewith many great workes haue beene performed beyond credit.

H *Matthiolus* teacheth, That a water is drawne out of the roots, wherewith the women of Italy vſe to ſcoure their faces from Sunne-burning, freckles, morphew, or any ſuch deformities of the skinne.

† That which our Authour formerly figured and deſcribed in the fifth place of this chapter, by the name of *Polygonatum acutum Cluſii*, was that deſcribed by him in the fourth place; but the figure was not ſo well expreſt.

CHAP. 338. *Of Knee-holme, or Butchers broome.*

¶ *The Deſcription.*

Knee-holme is a low wooddy plant, hauing diuers ſmall branches, or rather ſtems, riſing immediately from the ground, of the height of a foot; whereupon are ſet many leaues like vnto thoſe of the Box-tree, or rather of the Myrtle, but ſharpe and pricking at the point. The fruit groweth vpon the middle rib of the leafe, greene at the firſt, and red as Corall when it is ripe, like thoſe of *Aſparagus*, but bigger. The roots are white, branched, of a meane thickeneſſe, and full of tough ſprouting ſhoots thruſting forth in other places, whereby it greatly increaſeth.

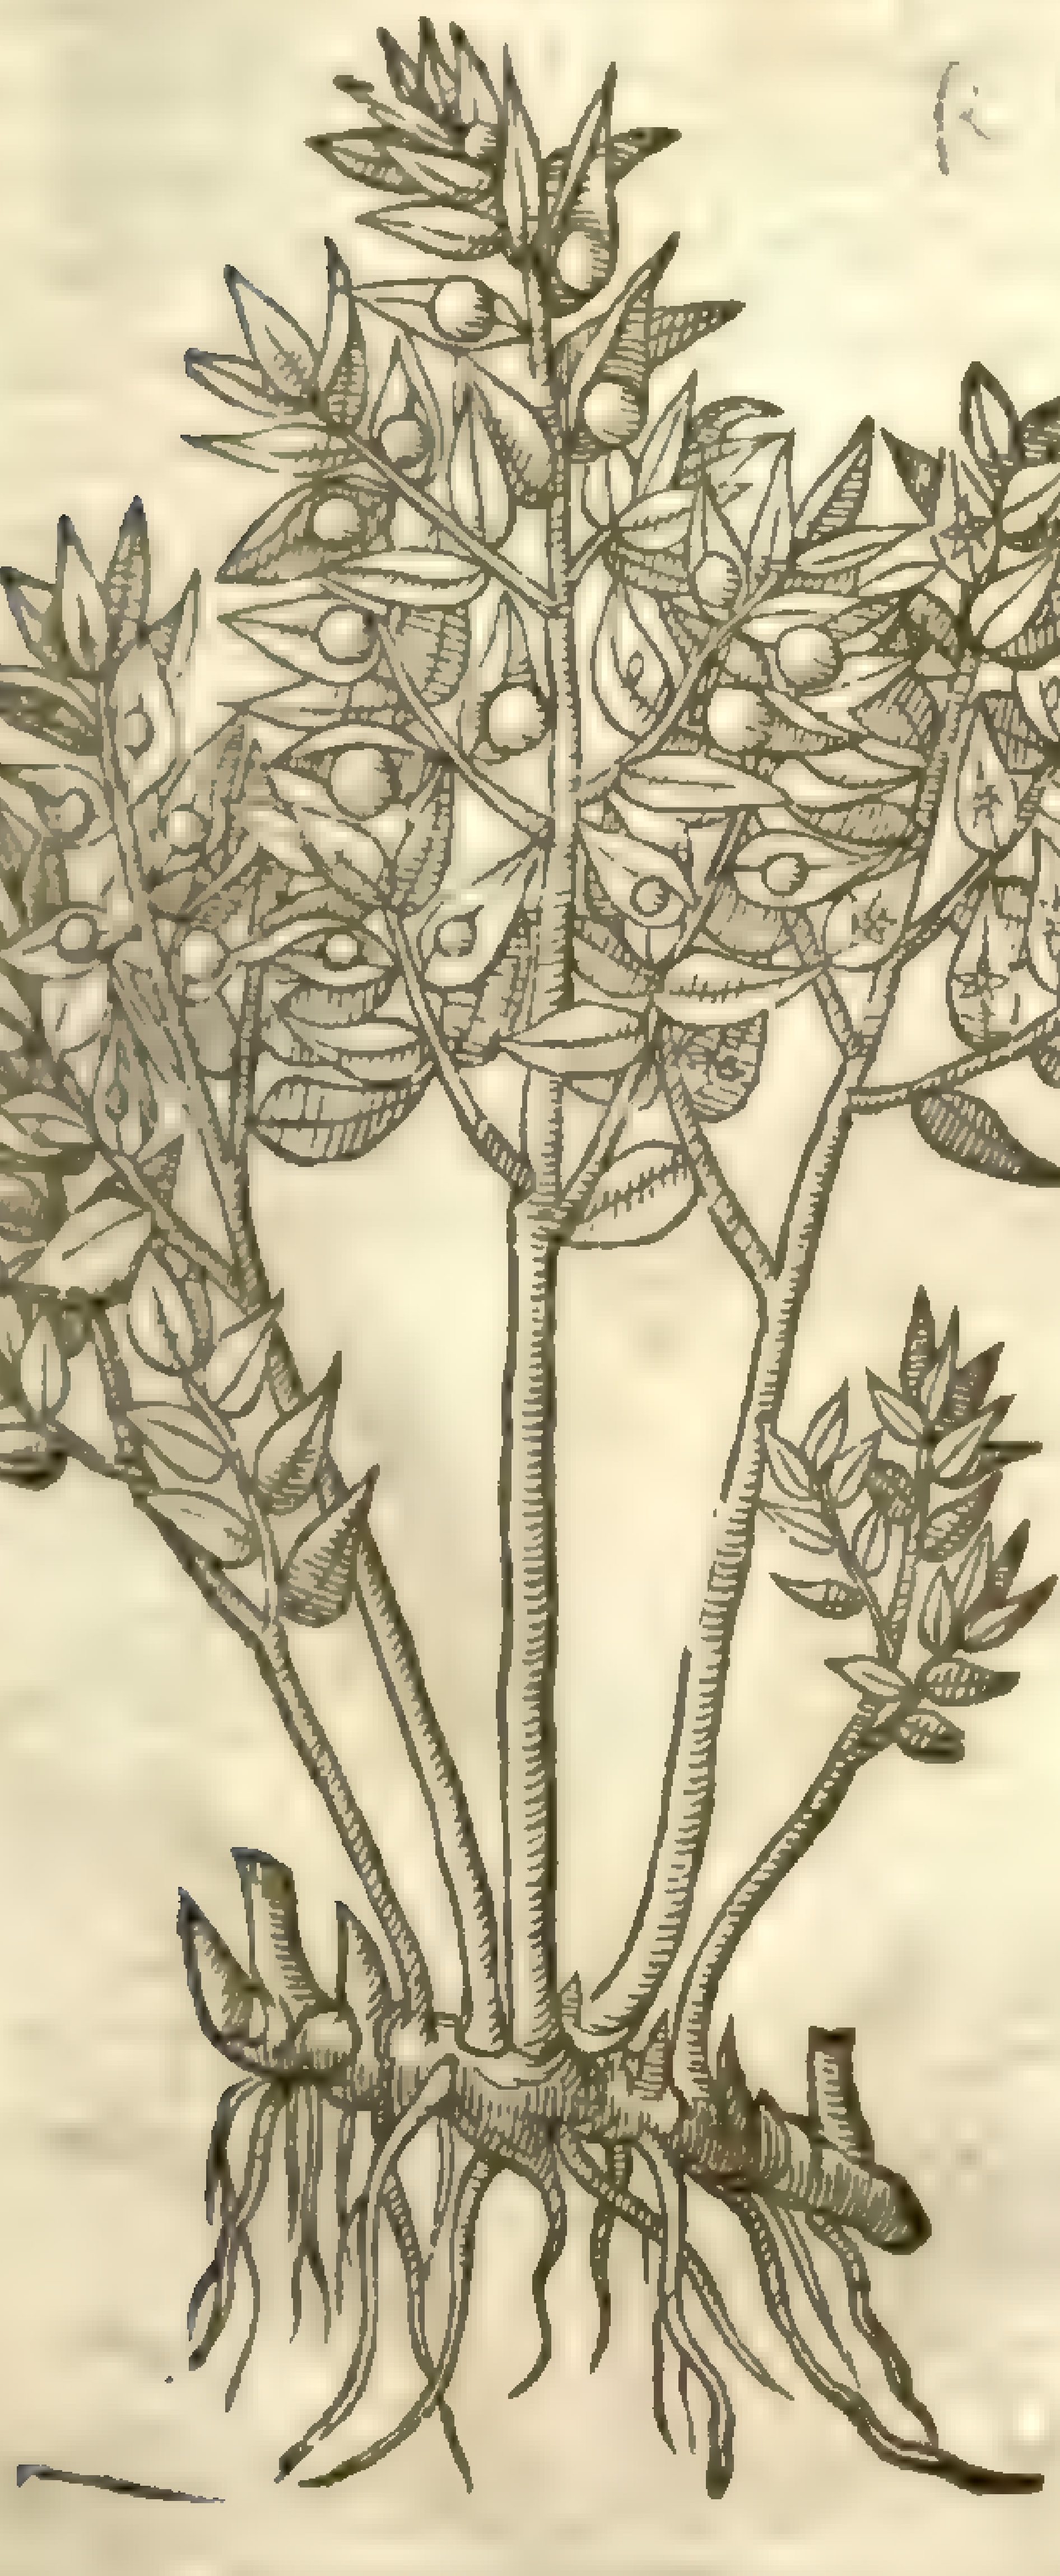
¶ *The Place.*

It groweth plentifully in moſt places in England in rough and barren grounds, eſpecially vpon Hampſted heath foure miles from London; in diuers places of Kent, Eſſex, and Barkſhire, almoſt in euery copſe and low wood.

¶ *The Time.*

The young and tender ſprouts come forth at the firſt of the Spring, which are eaten in ſome places, as the young tender ſtalkes of Aſparagus and ſuch like herbes. The berries are ripe in Auguſt.

Ruſcus, ſiue Bruſcus.
Knee-holme, or Butchers broome.



¶ *The Names.*

It is called in Greeke, ὀξυμυρσίνη, as though they ſhould ſay *Acuta Myrtus*, or pricking Myrtle; and *Myrtus ſylueſtris*, or wild Myrtle, in Latine, *Ruſcum*, or *Ruſcus*: in ſhops, *Bruſcus*, of diuers, *Scopa regia*, as teſtifieth *Marcellus Empericus* an old Writer: in high Dutch, **Meuſdorn**: in low Dutch, **Stekende palm**: in Italian, *Ruſco*, and *Pontogopi*: in Spaniſh, *Gilberbaira* in Engliſh, Knee-holme, Knee-huluer, Butchers broome, and Petigree.

There be ſome (ſaith *Pliny, lib.25.cap.13.*) that call it *Oxymyrſine*.

*Serapio, cap.*288. ſuppoſeth that *Myrtus Agria*, or wilde Myrtle, is the ſame that *Cubebæ* are: he alleageth a reaſon, becauſe *Galen* hath not deſcribed *Myrtus Agria*, or Knee-holme; neither *Dioſcorides Cubebæ*. Which as it is a reaſon of no account, ſo is it alſo without truth: for *Galen* doth no where make mention of *Cubebæ*; and be it that he had, it ſhould not therefore follow that Knee-holme is *Cubebæ*. *Galen* ſpeaketh of *Carpeſium*, which *Auicen* in his 137 chapter makes to be *Cubebæ*: and that *Carpeſium* doth much differ from Kneeholme, thoſe things do euidently declare which *Galen* hath left written hereof in his firſt booke of Counterpoyſons. *Carpeſium* (ſaith he) is an herbe like in kind to that which is called *Phu*, or Setwall, but of greater force, and more aromaticall or ſpicie. This groweth very plentifully in Sida a city of Pamphilia. Alſo he ſaith further, that ſome of the ſtickes of Carpeſium are like to thoſe of Cinnamon: there be two kindes thereof, one which is named *Laërtium*; and another that is called *Ponticum*. They both take their names of the mountaines on which they grow: but *Ponticum* is the better, which is put into medicines in which the herbe *Phu* ought to bee put. For *Carpeſium*, as I haue ſaid, is like vnto *Phu*, or Setwall, yet is it ſtronger, and yeeldeth a certain aromaticall qualitie both in taſte and ſmell. Thus far *Galen*. By which it plainely appeareth, that Knee-holme is not *Carpeſium*, that is to ſay, *Auicenna* his *Cubebæ*, as ſhall be further declared in the chapter of *Cubebæ*.

Herein *Serapio* was likewiſe deceiued, who ſuſpected it to be ſuch a like thing; ſaying, There be certaine fruits or graines called *Cubebæ*, not ſticks: yet do they neither agree with Knee-holme, neither yet were they knowne vnto *Galen*.

Iſaac in the ſecond booke of his practiſe doth number it among the graines: and likewiſe *Haltabbas* in the ſecond booke of his practiſe alſo, *num.*162. The later Græcians, among whom is *Nicolaus Myrepſus*, call them *Cubebæ*.

¶ *The Temperature.*

The roots of Knee-holme, which be chiefely vſed, are of temperature hot, and meanely dry, with a thinneſſe of eſſence.

¶ *The Vertues.*

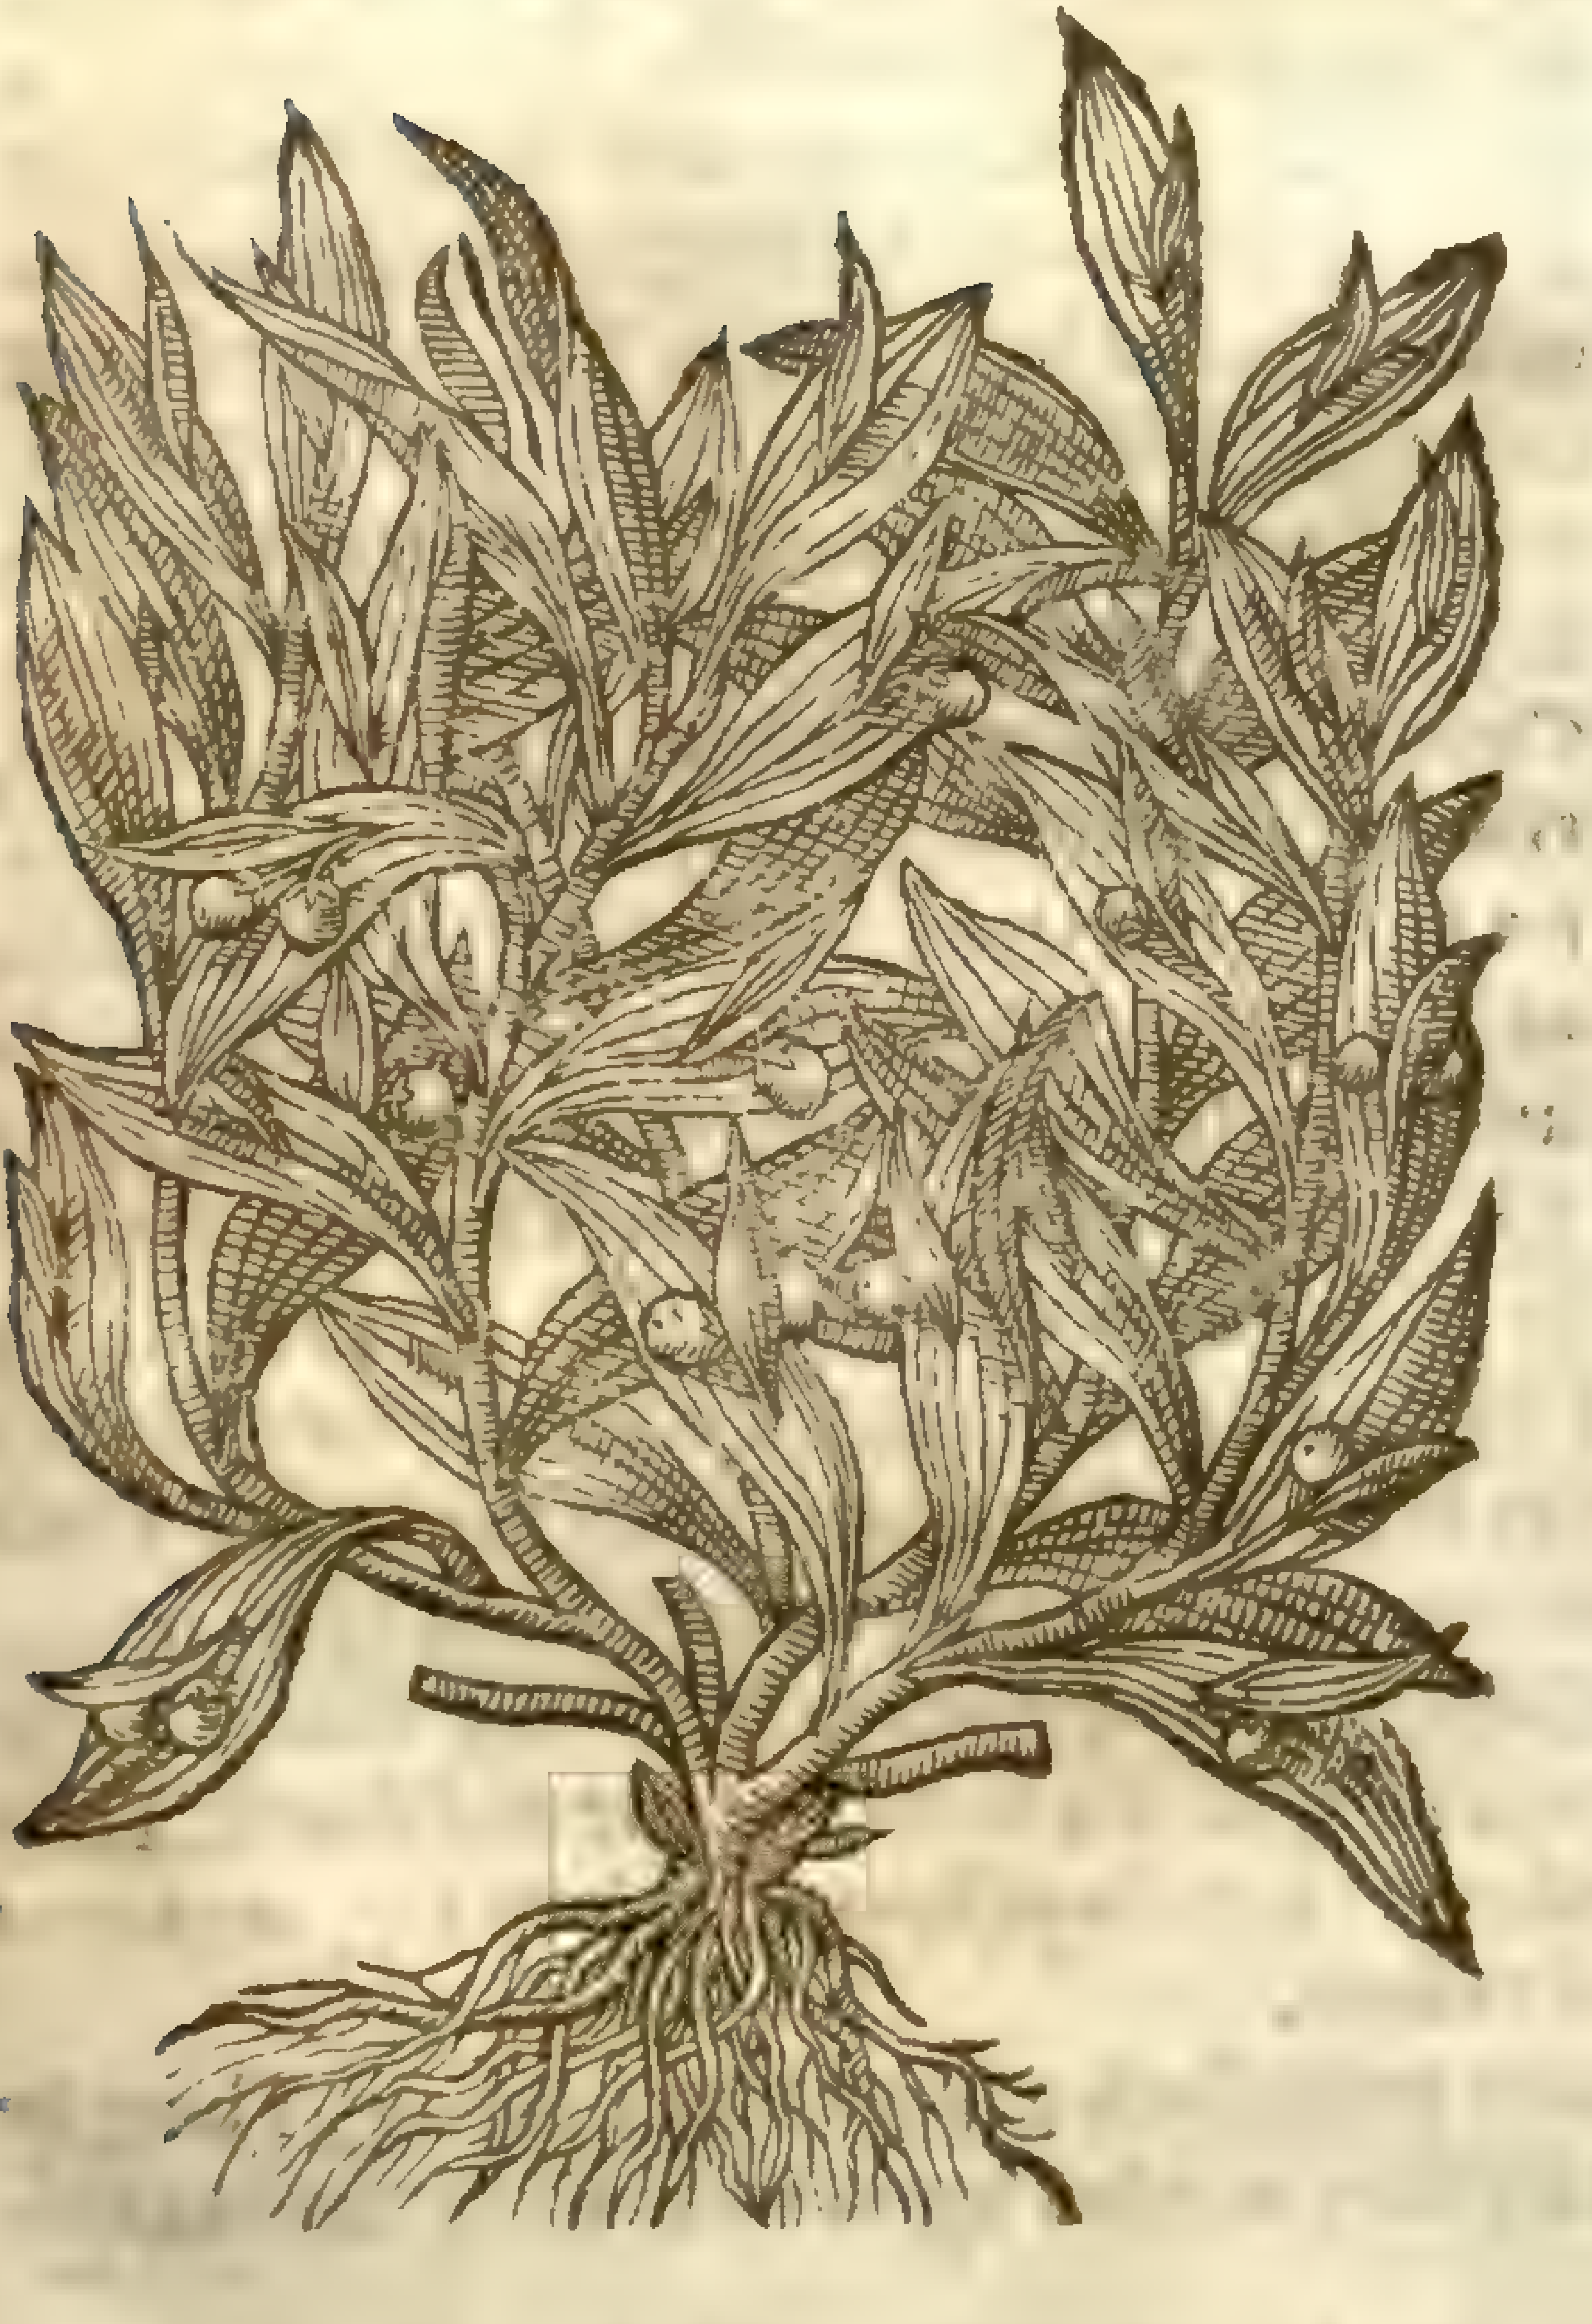
The decoction of the roots of Knee-holme made in wine and drunken, prouoketh vrine, breaketh the ſtone, driueth forth grauell and ſand, and eaſeth thoſe that make their water with great paine. A

Dioſcorides writeth the ſame things of the leaues and berries, which moreouer (ſaith hee) bring downe the deſired ſickeneſſe, helpe the head-ache and the yellow jaundiſe. Ouer and beſides, the roots do ſerue to raiſe vp gently tough and groſſe flegme which ſticketh in the lungs and cheſt, and do concoct the ſame. B

Chap. 339. *Of Horſe-tongue, or Double-tongue.*

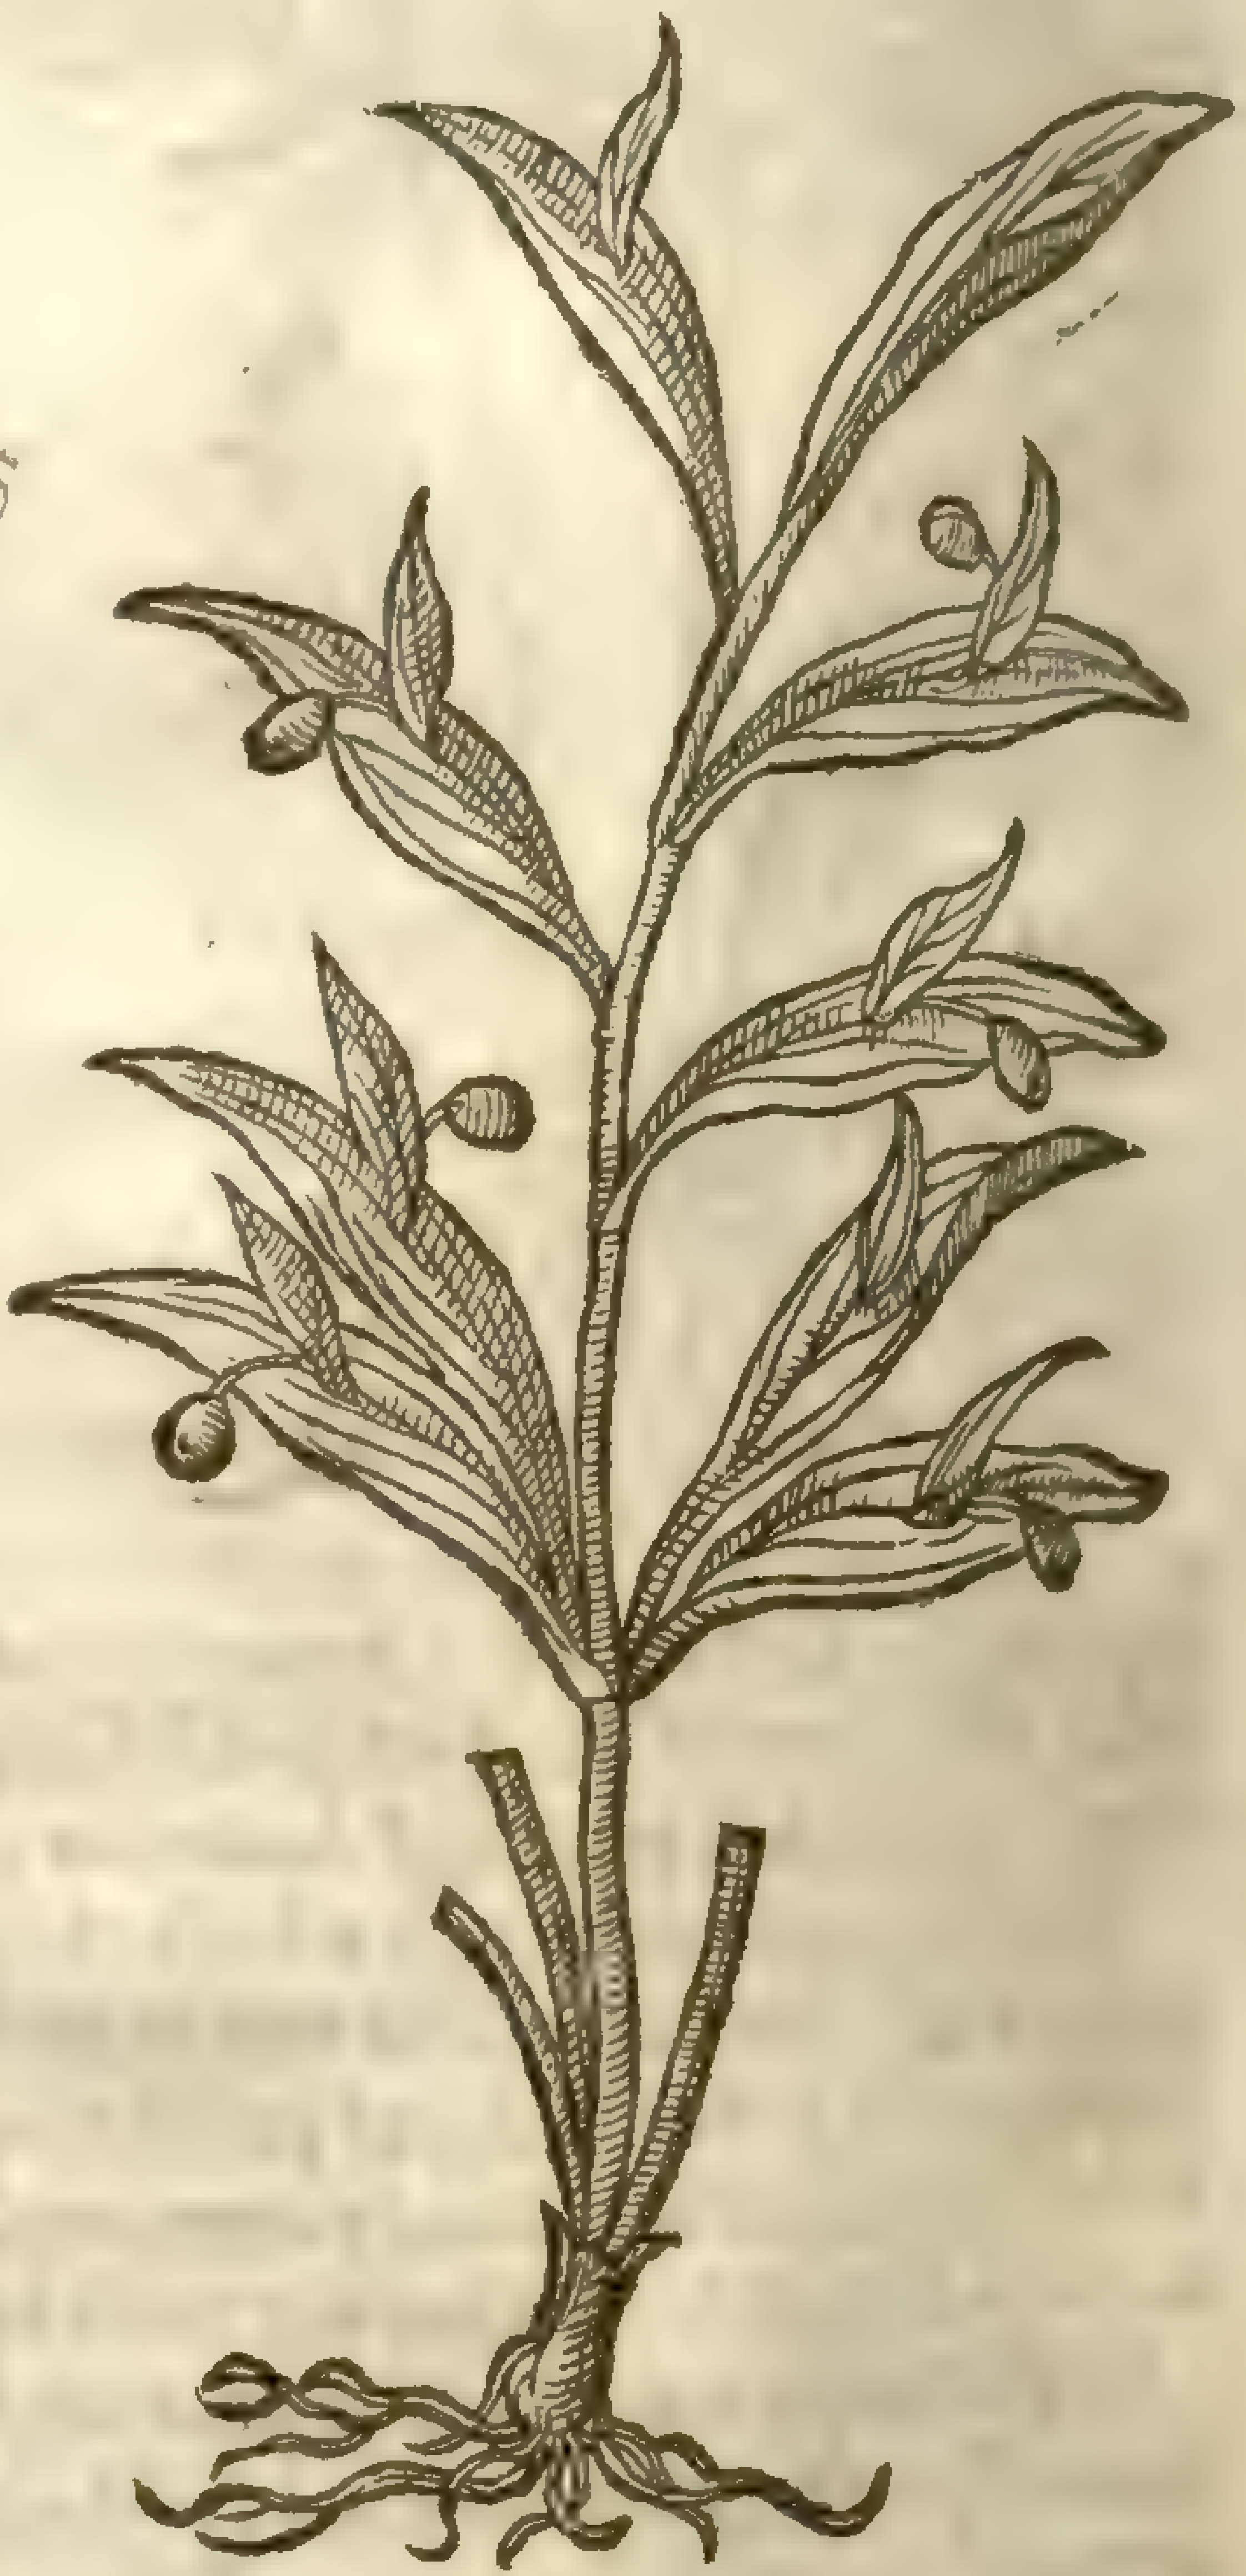
¶ *The Deſcription.*

1 Horſe-tongue ſendeth forth round ſtalkes of a ſpan long; whereupon are ſet long broad and ſharpe pointed leaues, but not pricking as are thoſe of Knee-holme, not vnlike to the leaues of the Bay-tree, but leſſer; greater than thoſe of Knee-holme: out of the middle rib whereof commeth forth another leafe, ſharpe pointed alſo, but ſmall, and of the bigneſſe of the leafe of Knee-holme, reſembling a little tongue. From the boſome of which two leaues commeth forth a berry of the bigneſſe of a peaſe, of colour red when it is ripe, which is ſometimes in a manner all hid vnder the leafe. The root is white, long, and tough, and of a ſweet and pleaſant ſmell.



1 *Hippogloſſum mas.*
The male Horſe-tongue.

Ruscus hypoglossum, [illegible] both. See Sm. 761



2 *Hippogloſſum fœmina.*
The female Horſe-tongue.

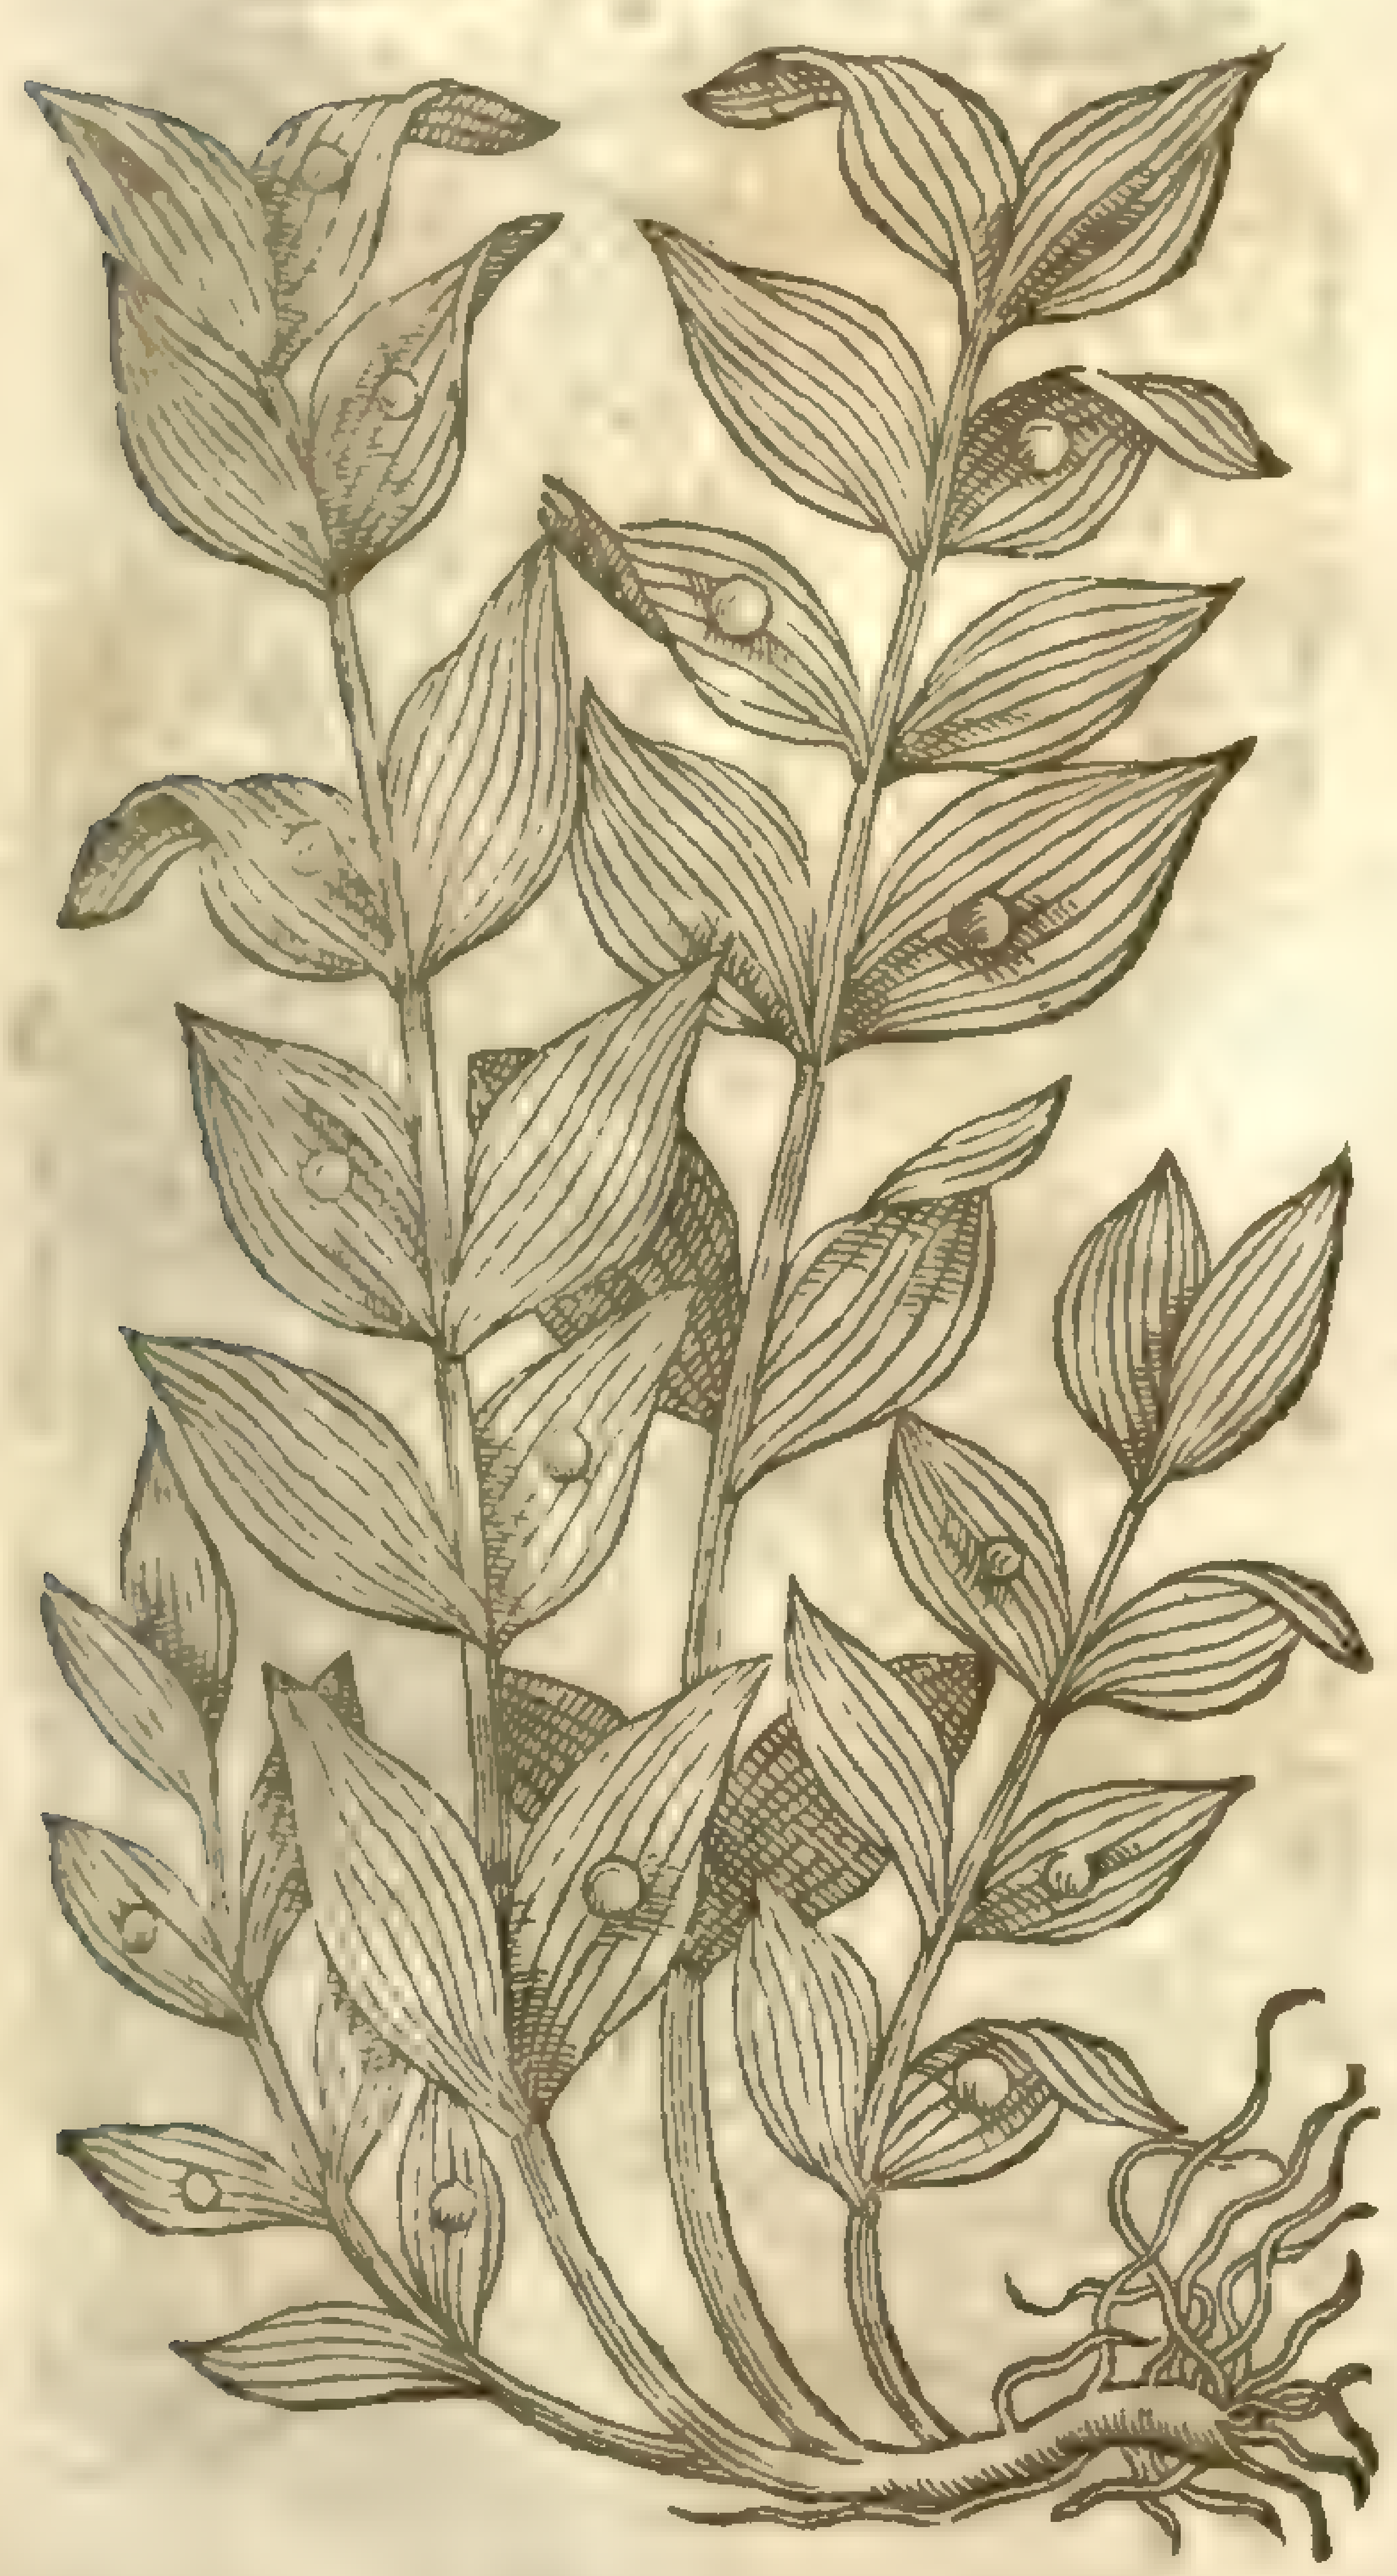
2 The female Horſe-tongue differeth not from the precedent but in ſtature [illegible] colour of the fruit: it riſeth vp (ſaith my Author) foure or fiue handfulls high: the berries come forth of the middle part of the greater leafe, and the ſetting on of the leſſer, of a feint yellowiſh red colour, wherein conſiſteth the difference. ‡ This is all one with the former. ‡

3 There is likewiſe another ſort of Double-tongue ſet forth by *Matthiolus*, which ſeemes vnto ſome not to differ from the firſt deſcribed or beſt known Horſe-tongue, being in truth the ſelf ſame plant without any difference: notwithſtanding I haue ſet forth the figure, that it may appeare to be the ſame, or very little different, and that not to be diſtinguiſhed: but *Matthiolus* may not eſcape without reprehenſion, who knowing the vntrue tranſlation of *Ruellius*, would ſet forth ſo falſe a figure in his Commentaries.

‡ Our Author here, as in many other places, miſtakes himſelfe; for *Matthiolus* did not ſet forth that figure that our Author giues in this place, for *Hippogloſſum*, but by the title of *Laurus Alexandrina altera:* and it thus differs from the common Horſe-tongue; it hath ſhorter and rounder leaues, yet ſharpe pointed, and the berries are not couered with little leaues as in the other, neither haue they any apparant ſtalkes at all, but grow cloſe to the leaues, as you may ſee them expreſt in the figure. ‡

¶ The

3 *Hippogloſſum Matthioli.*
Italian Horſe-tongue.



¶ *The Place.*

They are found on the Alps of Liguria, and on the mountaines of Auſtria. *Bellonius* writeth, that they do grow very plentifully about the hil Athos.

The firſt of the Horſe-tongues growes in my garden very plentifully.

¶ *The Time.*

That which groweth in my Garden floured in the beginning of May: the fruit is ripe in the fall of the leafe.

¶ *The Names.*

Horſe-tongue is called in Greeke, ἱππόγλωσσον: of the later Herbariſts, *Bonifacia, Vvularia, Biſlingua, Lingua Pagana,* and *Victoriola.* The ſame is alſo named δάφνη ἰδαία, of Ida a mountaine of Troy, which is called *Alexanders* Troy: of ſome, *Laurus Alexandrina,* or the Bay of Alexandria, and *Laurus Idæa.*

This *Hippogloſſum,* or *Bonifacia* is called in high Dutch **Zapflinkraut**: in low Dutch, **Tonghenbladt**: in Spaniſh, *Lengua de Cauallo*: in Engliſh, Horſe-tongue, Tongue-blade, Double-tongue, and Laurel of Alexandria.

¶ *The Temperature.*

Horſe-tongue is euidently hot in the ſecond degree, and dry in the firſt.

¶ *The Vertues.*

A The roots of Double-tongue boiled in wine, and the decoction drunke, helpeth the ſtrangury, prouoketh vrine, eaſeth women that haue hard trauell in childe-bearing. It expelleth the ſecondine or afterbirth. The root beaten to pouder, whereof ſix drams giuen in ſweet wine, do helpe the diſeaſes aforeſaid: it bringeth down the termes, as *Dioſcorides* teacheth. The like writeth *Pliny* alſo: adding further, That it cauſeth women to haue ſpeedy deliuerance, eſpecially if halfe an ounce of the pouder of the root be giuen to drinke in a draught of ſweet wine.

B *Baptiſta Sardus* doth notably commend this herbe for the diſeaſes of the mother; by giuing, ſaith he, a little ſpoonfull of the pouder either of the herbe, the fruit, or of the root, to her that is troubled with the mother, ſhe is thereby forthwith recouered. He alſo writeth, that the ſame is a ſingular good medicine for thoſe that be burſten, if a ſpoonefull of the pouder of the root be drunke in the broth of fleſh certaine daies together.

Chap. 340. *Of Cucumbers.*

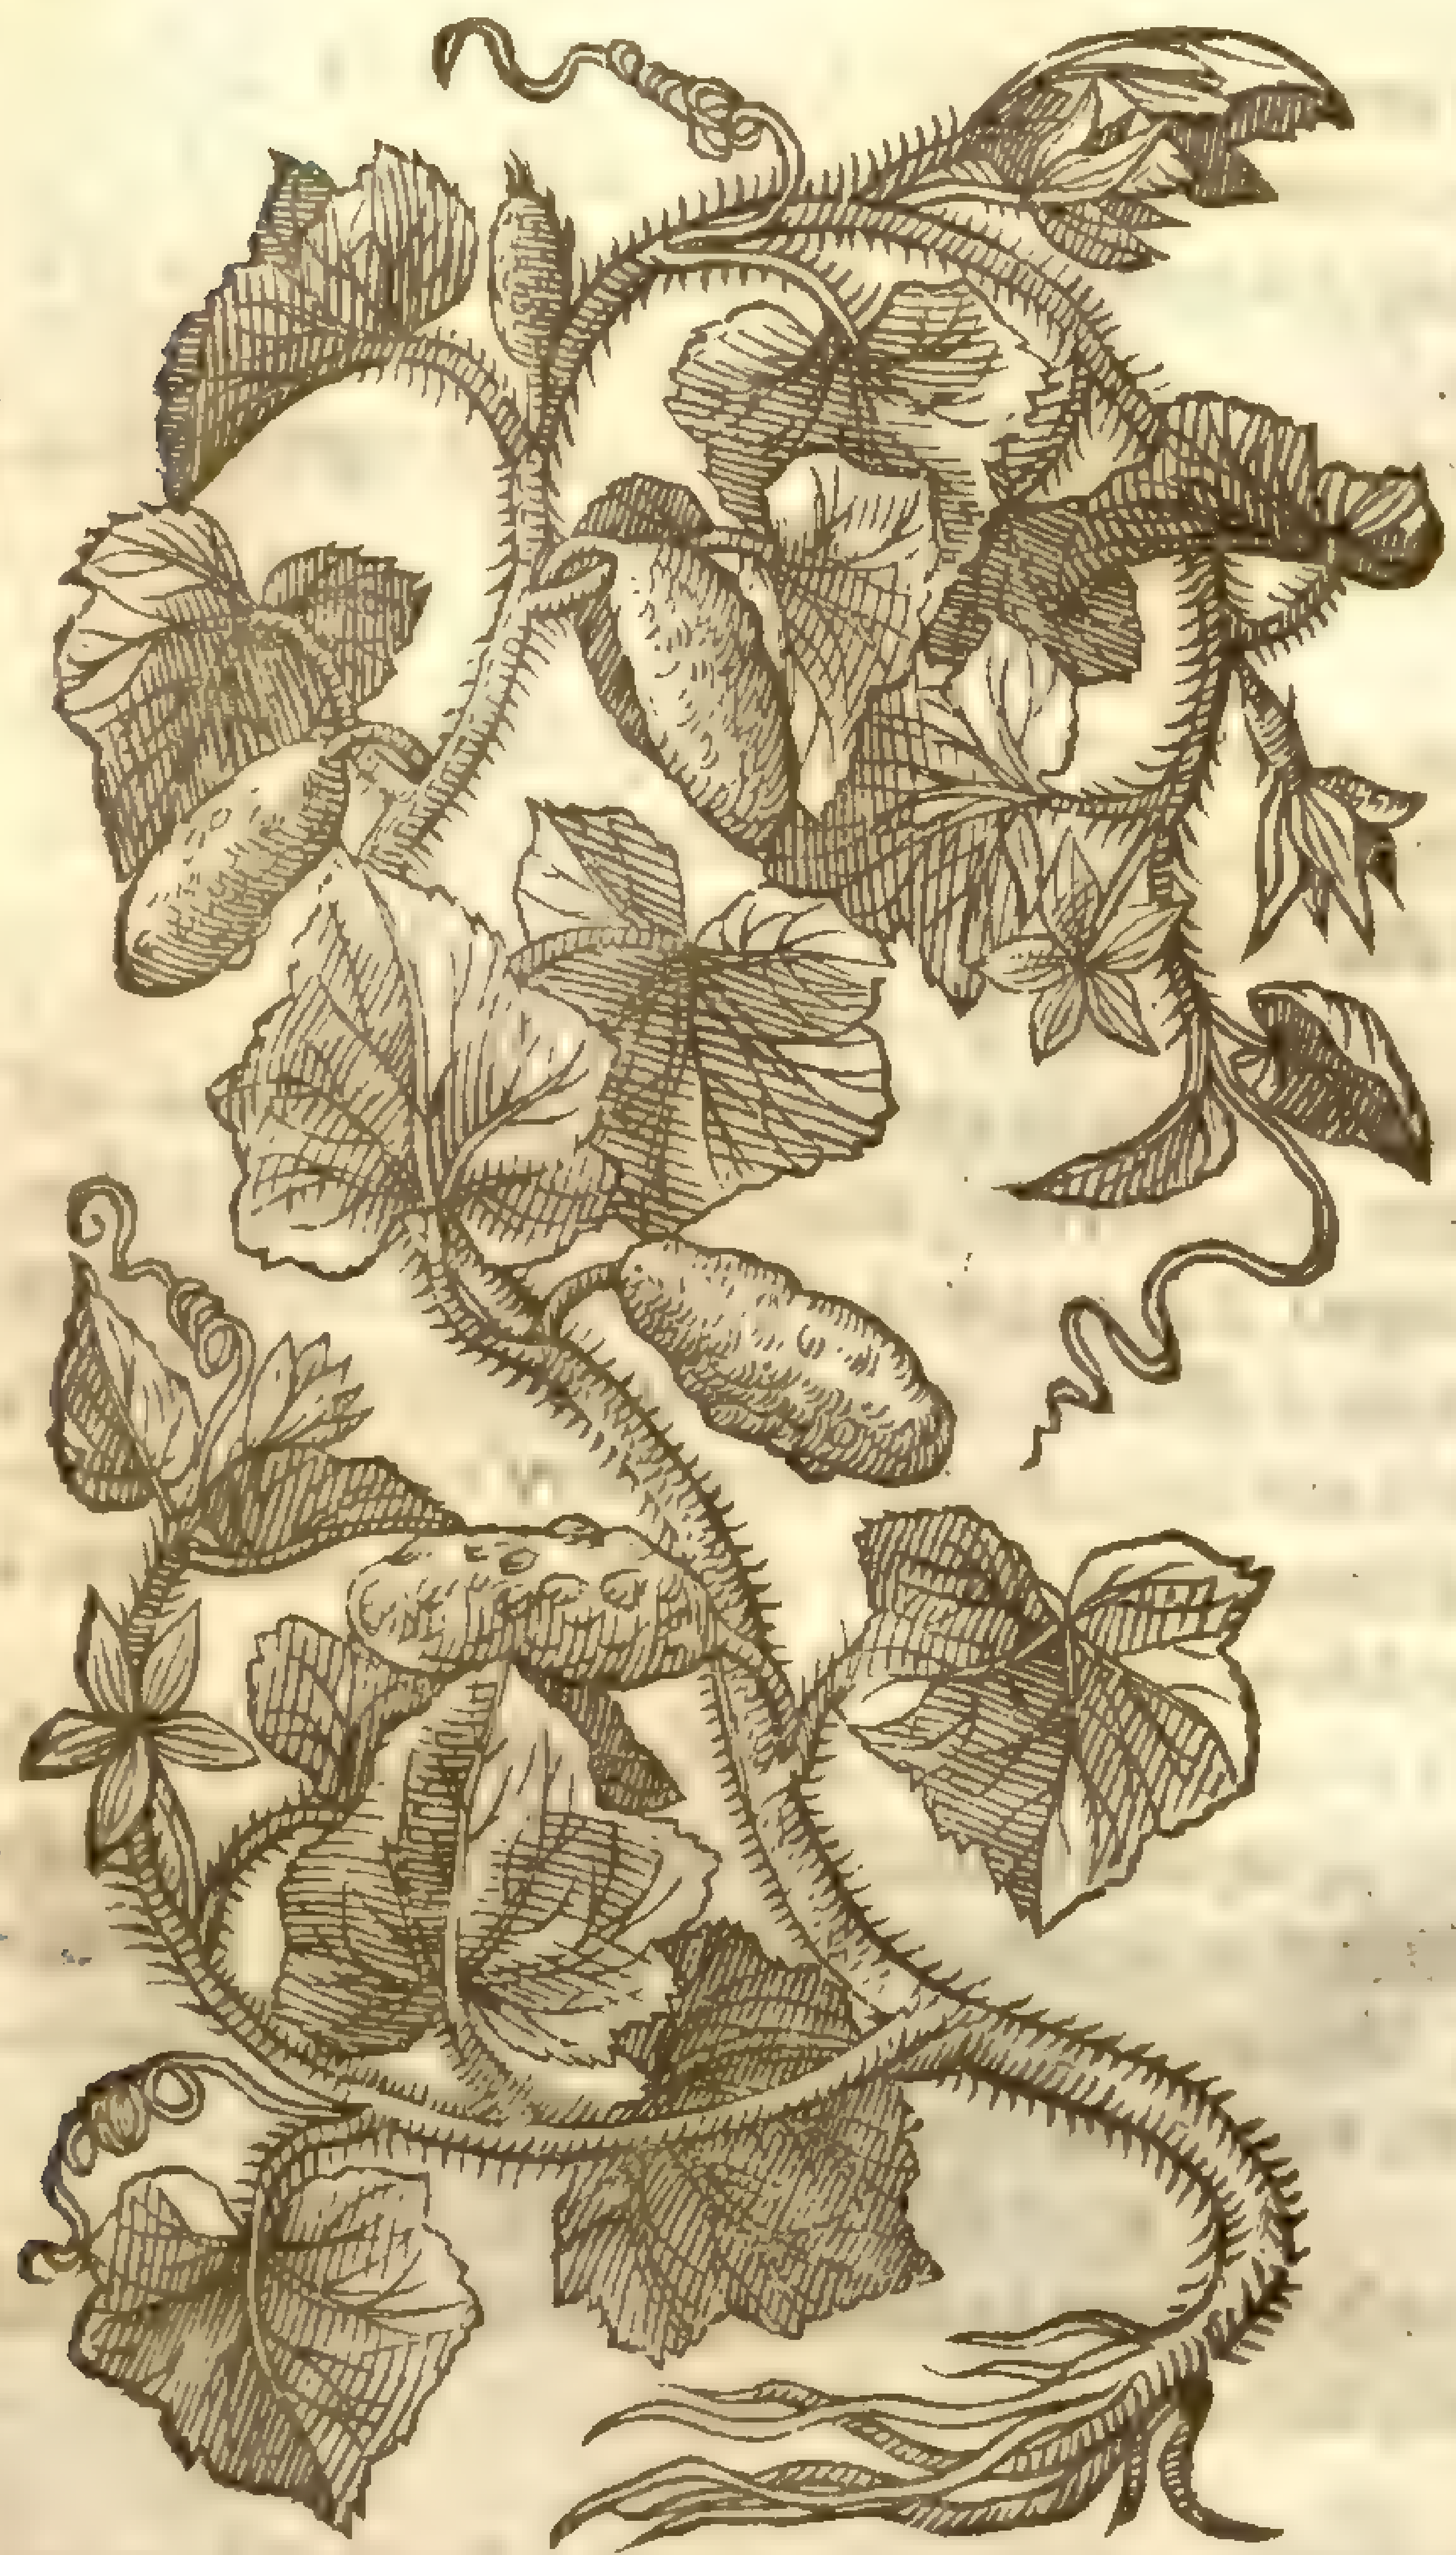
¶ *The Kindes.*

There be diuers ſorts of Cucumbers; ſome greater, others leſſer; ſome of the garden, ſome wilde; ſome of one faſhion, and ſome of another, as ſhall be declared in the following chapter.

¶ *The Deſcription.*

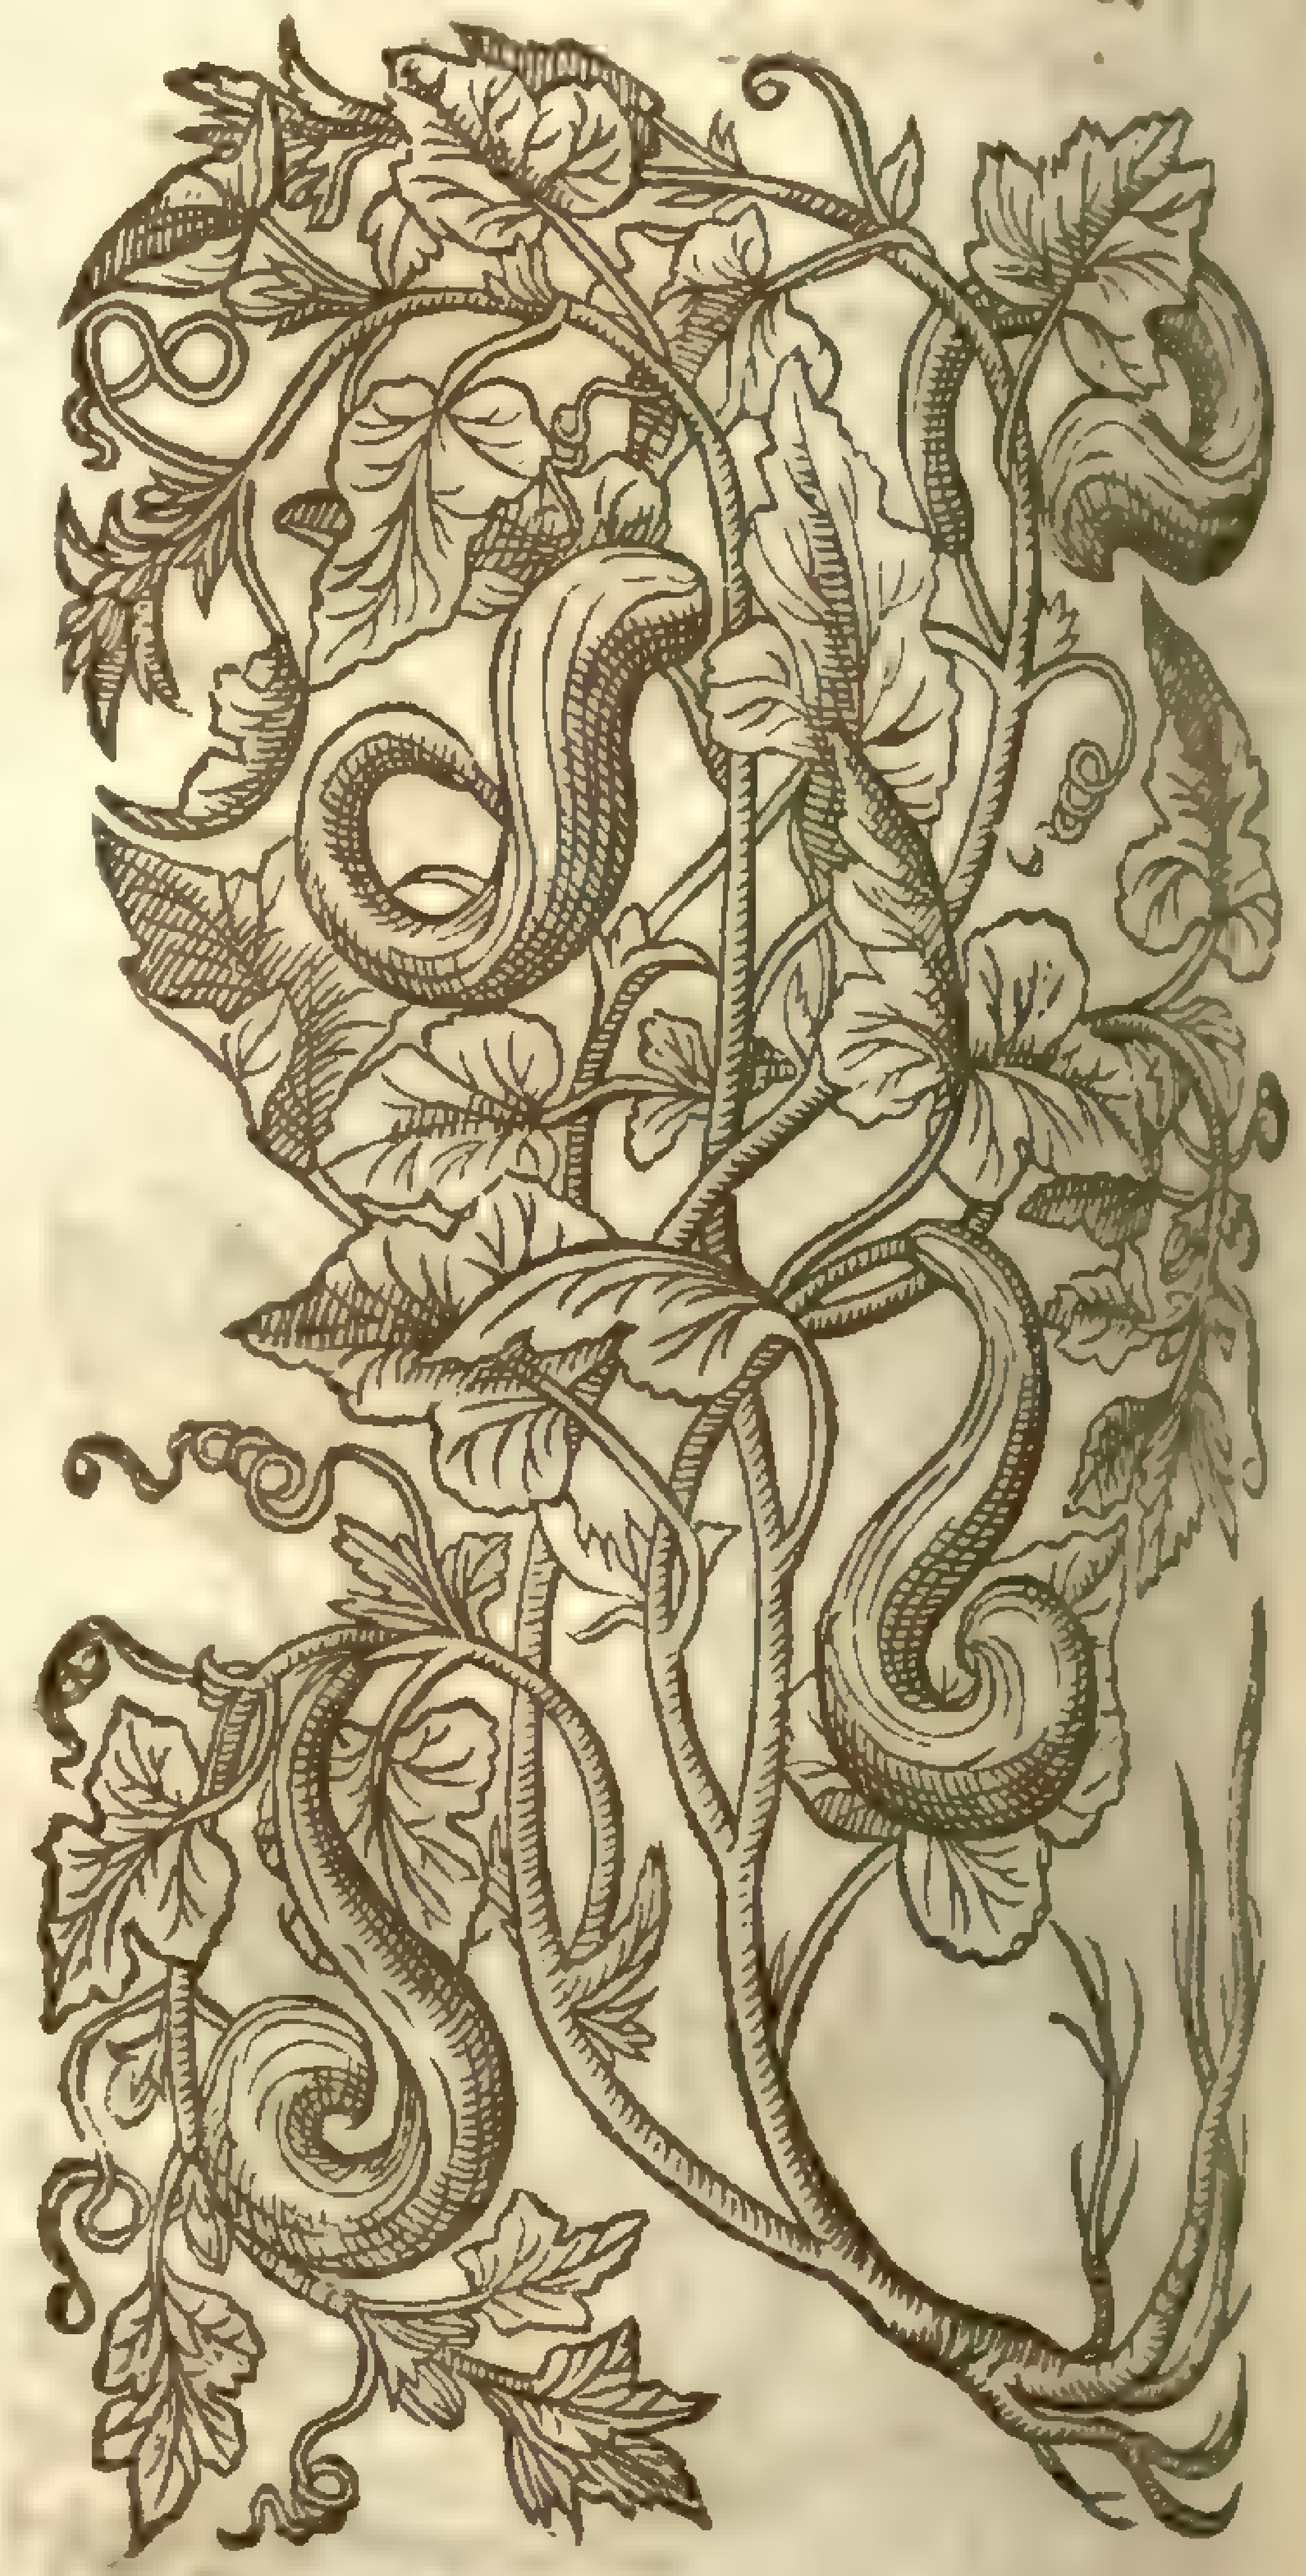
1 The Cucumber creepes alongſt vpon the ground all about, with long rough branches; whereupon doe grow broad rough leaues vneuen about the edges: from the boſome whereof come forth crooked claſping tendrels like thoſe of the Vine. The floures ſhoot forth betweene the ſtalkes and the leaues, ſet vpon tender foot-ſtalkes compoſed of fiue ſmall yellow leaues: which being paſt, the fruit ſucceedeth, long, cornered, rough, and ſet with certaine bumpes or riſings, greene at the firſt, and yellow when they be ripe, wherein is contained a firme and ſollid pulpe or ſubſtance tranſparent or thorow-ſhining, which together with the ſeed is eaten a little before they be fully ripe. The ſeeds be white, long, and flat.

1 *Cucumis vulgaris.*
Common Cucumber.



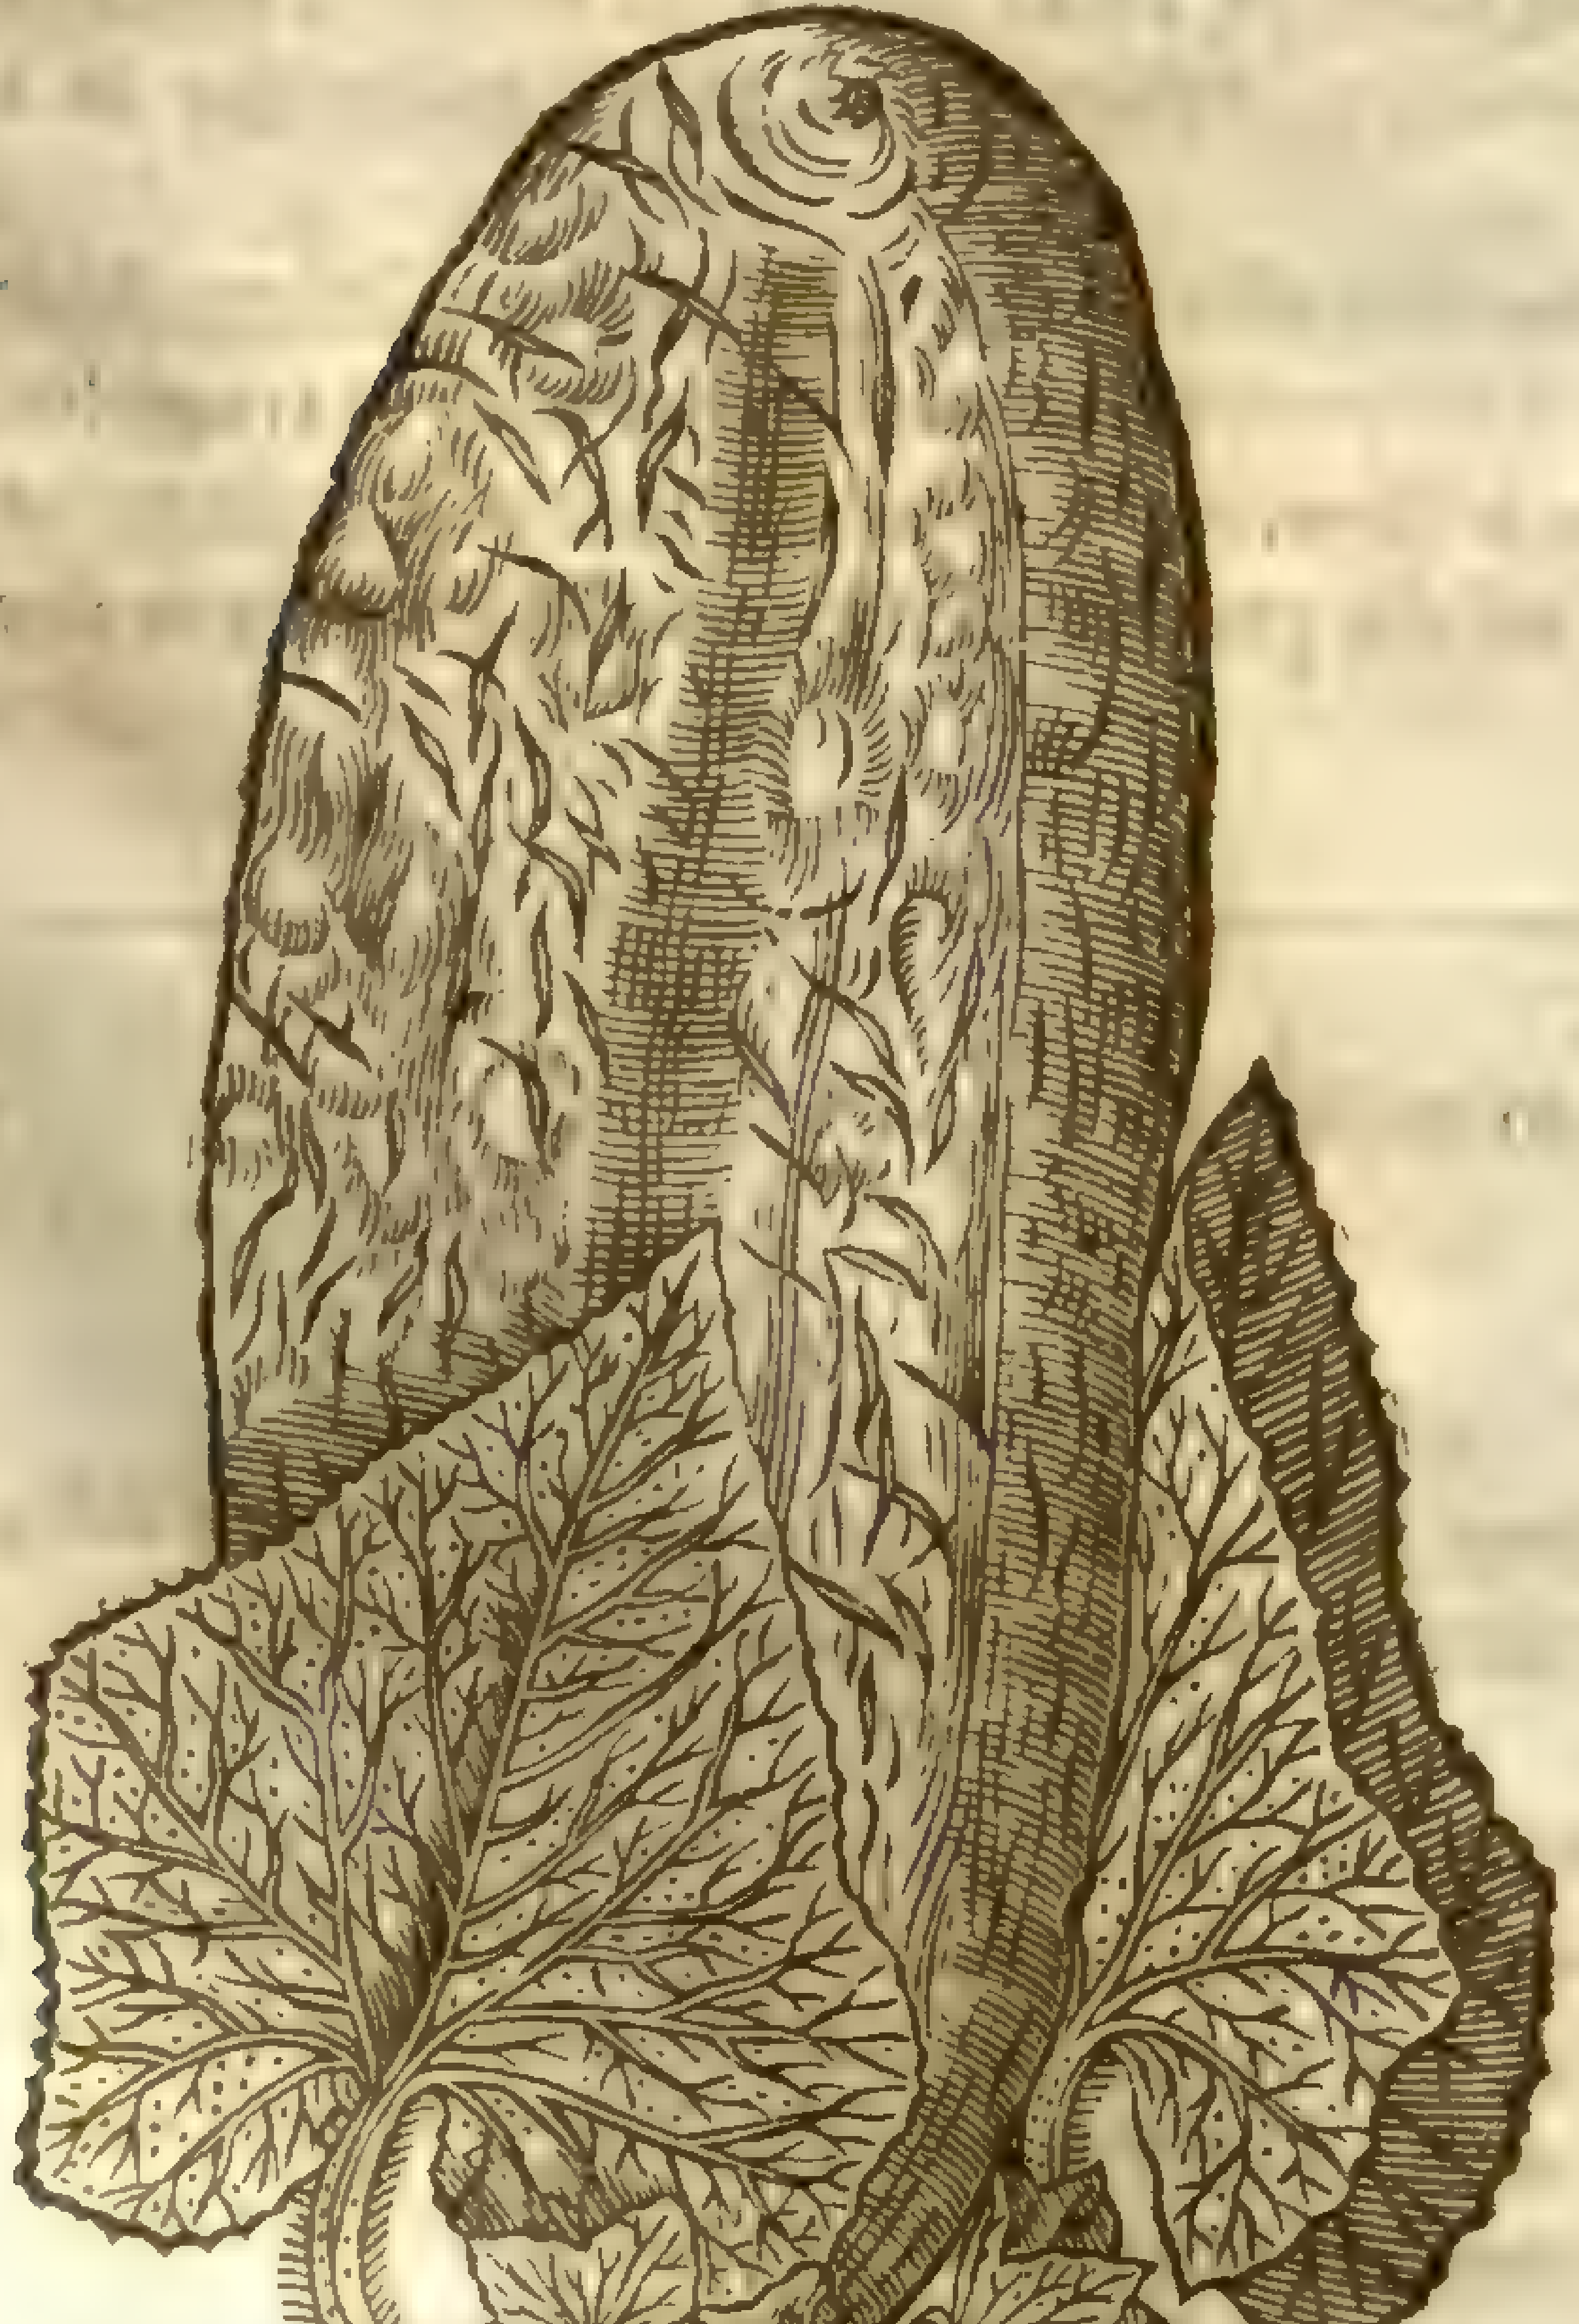
Cucumis sativus, in med. diet.

2 *Cucumis Anguinus.*
Adders Cucumber.



Cucumis flexuosus, in med. diet.

4 *Cucumis ex Hiſpanico ſemine natus.*
Spaniſh Cucumber.



Cucumis sativus, in med. diet.

2 There be alſo certaine long cucumbers, which were firſt made (as is ſaid) by art and manuring, which Nature afterwards did preſerue: for at the firſt, when as the fruit is very little, it is put into ſome hollow cane, or other thing made of purpoſe, in which the cucumber groweth very long, by reaſon of that narrow hollowneſſe, which being filled vp, the cucumber encreaſeth in length. The ſeeds of this kinde of cucumber being ſowne bringeth forth not ſuch as were before, but ſuch as art hath framed; which of their own growth are found long, and oftentimes very crookedly turned: and thereupon they haue beene called *Anguini*, or long Cucumbers.

3 The peare faſhioned Cucumber hath many trailing branches lying flat vpon the ground, rough and prickly; whereon do ſtand at each joynt one rough leafe, ſharpe pointed, and of an ouerworn green colour; among which come forth claſping tendrels, and alſo ſlender foot-ſtalks, whereon do grow yellow ſtarre-like floures. The fruit ſucceeds, ſhaped like a peare, as big as a great Warden. The root is threddy.

4 There hath bin not long ſince ſent out of Spain ſome ſeeds of a rare & beautiful cucumber, into Strausburg a city in Germany, which there brought forth long trailing branches, rough & hairy, ſet with very large rough leaues ſharp pointed, faſhioned like vnto the leaues of

the great Bur-docke, but more cut in or diuided: amongſt which come forth faire yellow floures growing nakedly vpon their tender foot-ſtalkes: the which being paſt, the fruit commeth in place, of a foot in length, greene on the ſide toward the ground, yellow to the Sun ward, ſtraked with many ſpots and lines of diuers colours. The pulpe or meat is hard and faſt like that of our Pompion.

¶ *The Place.*

Theſe kindes of Cucumbers are planted in gardens in moſt countries of the world.

¶ *The Time.*

According to my promiſe heretofore made, I haue thought it good and conuenient in this place to ſet downe not onely the time of ſowing and ſetting of Cucumbers, Muske-melons, Citruls, Pompions, Gourds, and ſuch like, but alſo how to ſet or ſow all manner and kindes of other colde ſeeds, as alſo whatſoeuer ſtrange ſeeds are brought vnto vs from the Indies, or other hot Regions: *videl.*

Firſt of all in the middeſt of Aprill or ſomewhat ſooner (if the weather be any thing temperate) you ſhall cauſe to be made a bed or banke of hot and new horſedung taken from the ſtable (and not from the dunghill) of an ell in breadth, and the like in depth or thickneſſe, of what length you pleaſe, according to the quantity of your ſeed: the which bank you ſhall couer with hoops or poles, that you may the more conueniently couer the whole bed or banke with Mats, old painted cloth, ſtraw or ſuch like, to keepe it from the injurie of the cold froſty nights, and not hurt the things planted in the bed: then ſhall you couer the bed all ouer with the moſt fertileſt earth finely ſifted, halfe a foot thicke, wherein you ſhall ſet or ſow your ſeeds: that being done, caſt your ſtraw or other couerture ouer the ſame; and ſo let it reſt without looking vpon it, or taking away of your couering for the ſpace of ſeuen or eight daies at the moſt, for commonly in that ſpace they will thruſt themſelues vp nakedly forth of the ground: then muſt you caſt vpon them in the hotteſt time of the day ſome water that hath ſtood in the houſe or in the Sun a day before, becauſe the water ſo caſt vpon them newly taken forth of a well or pumpe, will ſo chill and coole them being brought and nouriſhed vp in ſuch a hot place, that preſently in one day you haue loſt all your labour; I mean not onely your ſeed, but your banke alſo; for in this ſpace the great heate of the dung is loſt and ſpent, keeping in memory that euery night they muſt be couered and opened when the day is warmed with the Sun beames: this muſt be done from time to time vntill that the plants haue foure or ſix leaues a piece, and that the danger of the cold nights is paſt: then muſt they be replanted very curiouſly with the earth ſticking to the plant, as neere as may be vnto the moſt fruitfull place, and where the Sun hath moſt force in the garden; prouided that vpon the remouing of them you muſt couer them with ſome Docke leaues or wiſpes of ſtraw, propped vp with forked ſtickes, as well to keepe them from the cold of the night, as alſo the heat of the Sun: for they cannot whileſt they be young and newly planted, endure neither ouermuch cold nor ouermuch heate, vntill they are well rooted in their new place or dwelling.

Oftentimes it falleth out that ſome ſeeds are more franker and forwarder than the reſt, which commonly do riſe vp very nakedly with long necks not vnlike to the ſtalke of a ſmall muſhrome, of a night old. This naked ſtalke muſt you couer with the like fine earth euen to the greene leaues, hauing regard to place your banke ſo that it may be defended from the North-windes.

Obſerue theſe inſtructions diligently, and then you ſhall not haue cauſe to complaine that your ſeeds were not good, nor of the intemperancie of the climat (by reaſon wherof you can get no fruit) although it were in the furtheſt parts of the North of Scotland.

¶ *The Names.*

The Cucumber is named generally *Cucumis*: in ſhops, *Cucumer*: and is taken for that which the Grecians call σικυς ἥμερος: in Latine, *Cucumis ſatiuus*, or garden Cucumber: in high Cutch, **Cucumen**: in Italian, *Concomero*: in Spaniſh, *Cogombro*: in French, *Concombre*: in low Dutch, **Concommeren**: in Engliſh, Cowcumbers and Cucumbers.

¶ *The Temperature and Vertues.*

All the Cucumbers are of temperature cold and moiſt in the ſecond degree. They putrifie ſoon in the ſtomacke, and yeeld vnto the body a cold and moiſt nouriſhment, and that very little, and the ſame not good. A

Thoſe Cucumbers muſt be choſen which are greene and not yet ripe: for when they are ripe and yellow they be vnfit to be eaten. B

The ſeed is cold, but nothing ſo much as the fruit. It openeth and clenſeth, prouoketh vrine, openeth the ſtoppings of the liuer, helpeth the cheſt and lungs that are inflamed; and being ſtamped and outwardly applied in ſtead of a clenſer, it maketh the skin ſmooth and faire. C

Cucumber (ſaith my Author) taken in meats, is good for the ſtomacke and other parts troubled with heat. It yeeldeth not any nouriſhment that is good, inſomuch as the vnmeaſurable vſe thereof filleth the veines with naughty cold humors. D

The ſeed ſtamped and made into milke like as they do with Almonds, or ſtrained with milke or E ſweet wine and drunke, looſeth the belly gently, and is excellent againſt the exulceration of the bladder.

F The fruit cut in pieces or chopped as herbes to the pot, and boiled in a ſmall pipkin with a piece of mutton, being made into potage with Ote-meale, euen as herb potage are made, whereof a meſſe eaten to break-faſt, as much to dinner, and the like to ſupper; taken in this manner for the ſpace of three weekes together without intermiſſion, doth perfectly cure all manner of ſauce flegme and copper faces, red and ſhining fierie noſes (as red as red Roſes) with pimples, pumples, rubies, and ſuch like precious faces.

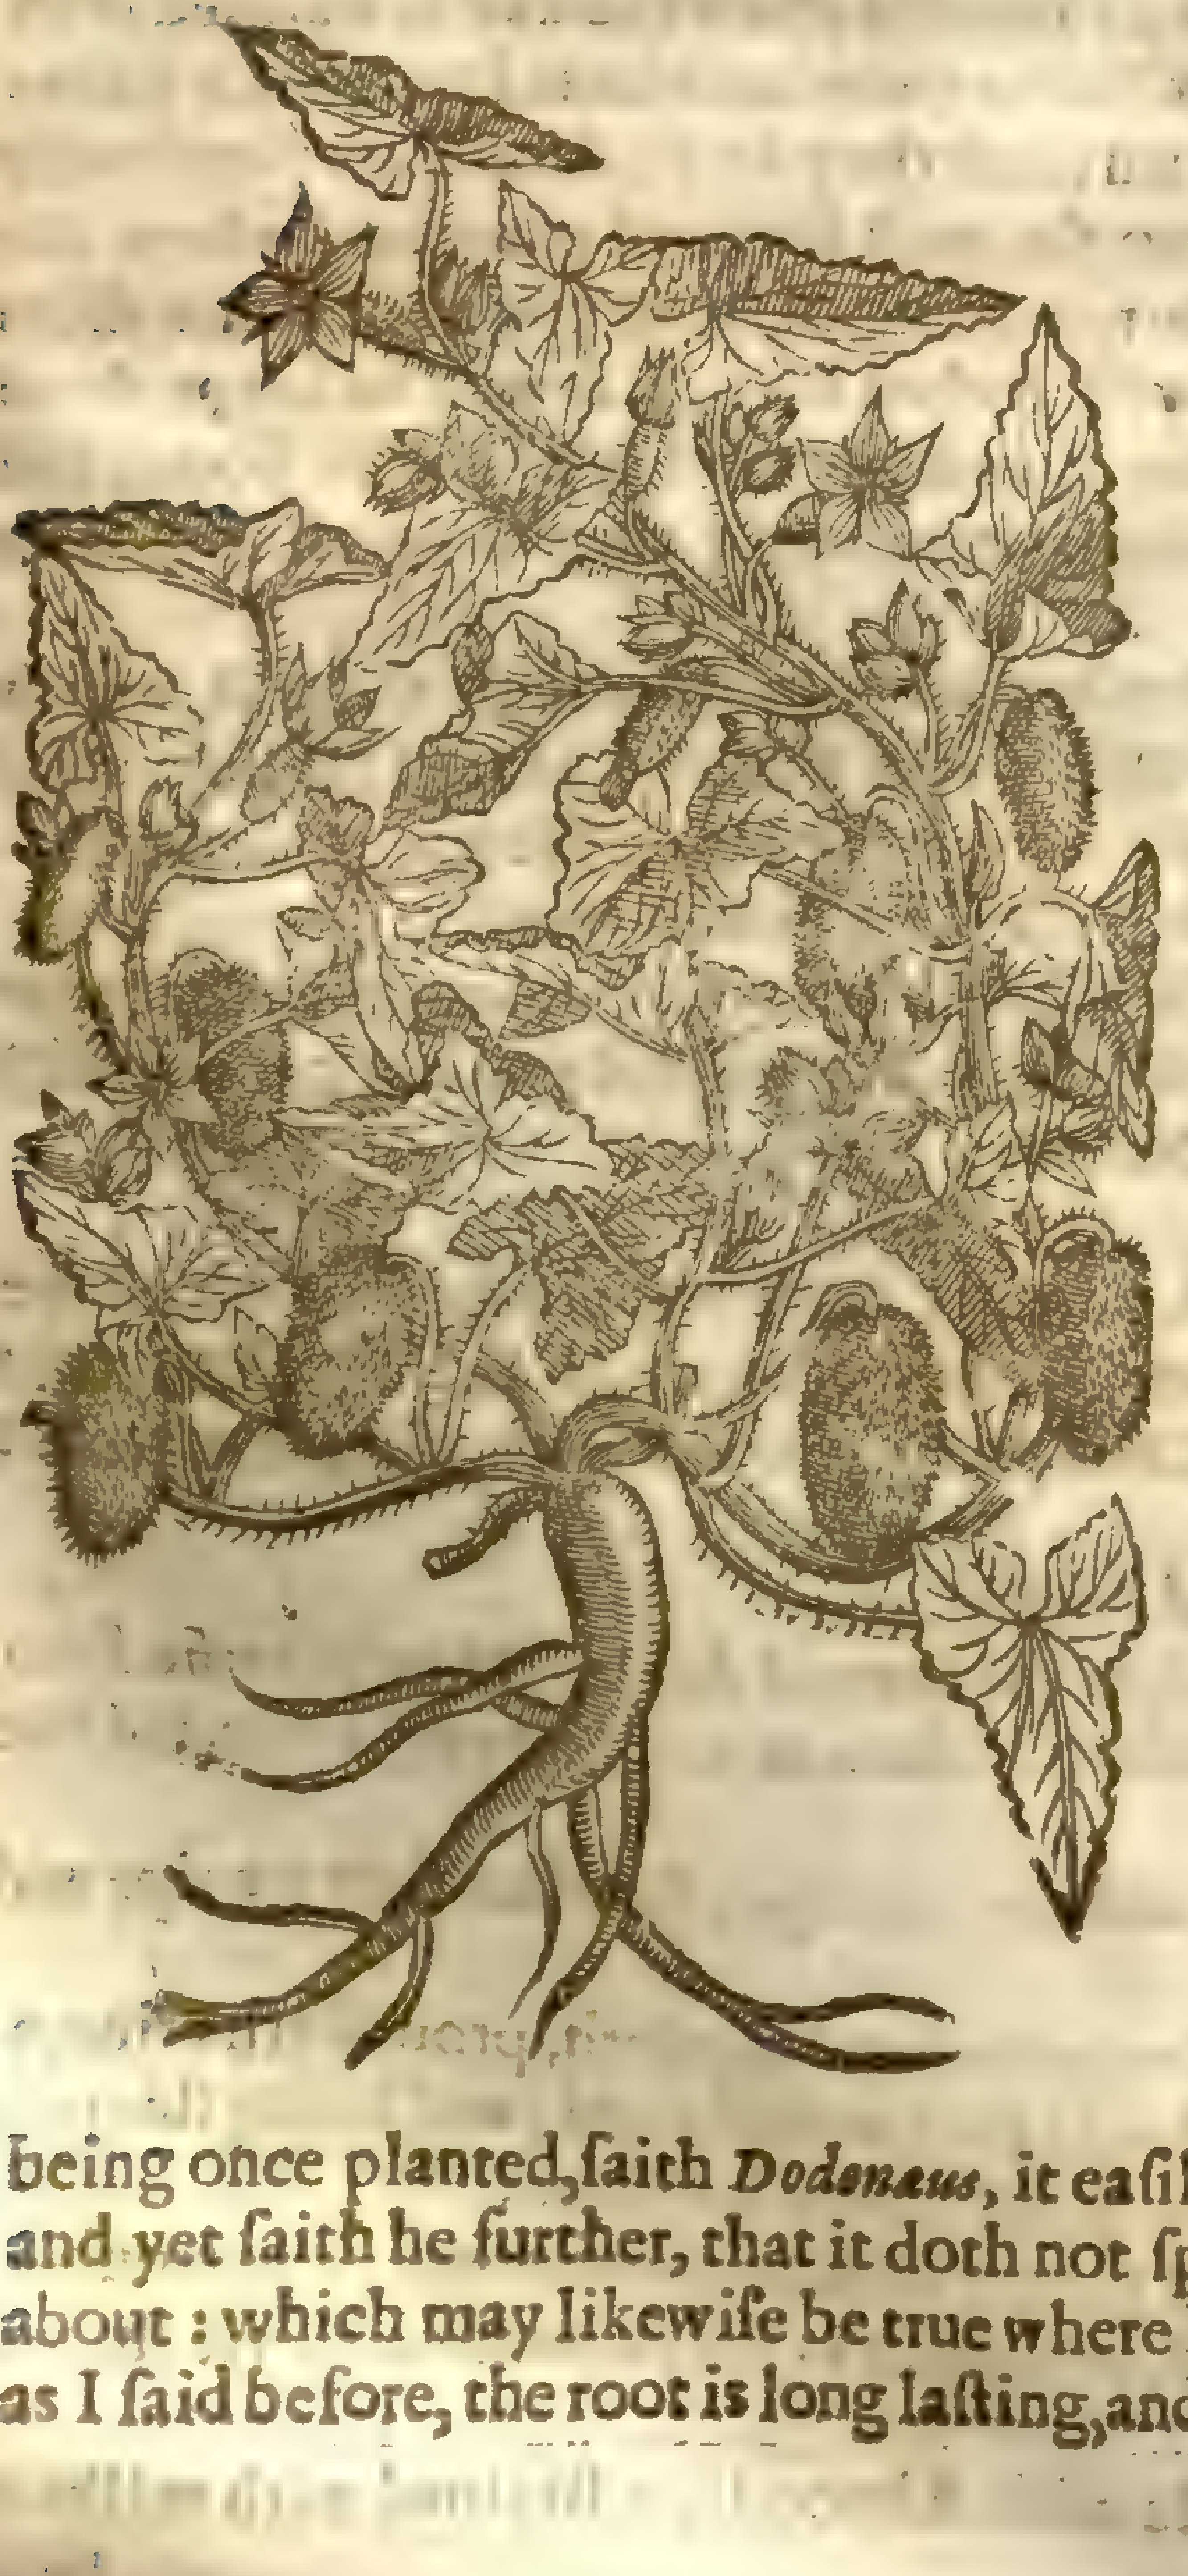
G Prouided alwaies that during the time of curing you doe vſe to waſh or bathe the face with this liquor following.

H Take a pinte of ſtrong white wine vinegre, pouder of the roots of Ireos or Orrice three dragmes, ſearced or bolted into moſt fine duſt, Brimmeſtone in fine pouder halfe a ounce, Camphire two dragmes, ſtamped with two blanched Almonds, foure Oke apples cut thorow the middle, and the juyce of foure Limons: put them all together in a ſtrong double glaſſe, ſhake them together very ſtrongly, ſetting the ſame in the Sunne for the ſpace of ten daies: with which let the face be waſhed and bathed daily, ſuffering it to drie of it ſelfe without wiping it away. This doth not onely helpe fierie faces, but alſo taketh away lentils, ſpots, morphew, Sun-burne, and all other deformities of the face.

† That which formerly was in the ſecond place by the name of *Cucumis Turcicus*, was the ſame with the fifth of the former Edition (now the fourth) and is therefore omitted.

Chap. 341. *Of Wilde Cucumber.*

Cucumis Aſininus.
Wilde Cucumber.



Momordica elaterium, L.
Mill. Dict.

¶ *The Deſcription.*

The wilde Cucumber hath many fat hairie branches, very rough and full of juyce, creeping or trailing vpon the ground, whereupon are ſet very rough leaues, hairy, ſharpe pointed, & of an ouerworne grayiſh greene colour: from the boſome of which come forth long tender footſtalkes: on the ends whereof doe grow ſmall floures compoſed of fiue ſmall leaues of a pale yellow colour: after which commeth forth the fruit, of the bignes of the ſmalleſt pullets egge, but ſomewhat longer, very rough and hairy on the outſide, and of the colour and ſubſtance of the ſtalkes, wherein is contained very much water and ſmal hard blackiſh ſeeds alſo, of the bigneſſe of tares; which being come to maturitie and ripeneſſe, it caſteth or ſquirteth forth his water with the ſeeds, either of it owne accord, or being touched with the moſt tender or delicate hand neuer ſo gently, and oftentimes ſtriketh ſo hard againſt thoſe that touch it (eſpecially if it chance to hit againſt the face) that the place ſmarteth long after: whereupon of ſome it hath beene called *Noli me tangere*, Touch me not. The root is thicke, white and long laſting.

¶ *The Place.*

It is found in moſt of the hot countries among rubbiſh, grauell, and other vntilled places: it is planted in gardens in the Low-countries, and being once planted, ſaith *Dodonæus*, it eaſily commeth vp againe many yeares after (which is true:) and yet ſaith he further, that it doth not ſpring againe of the root, but of the ſeeds ſpirted or caſt about: which may likewiſe be true where he hath obſerued it, but in my garden it is otherwiſe, for as I ſaid before, the root is long laſting, and continueth from yeare to yeare.

¶ *The Time.*

It ſpringeth vp in May, it floureth and is ripe in Autumne, and is to be gathered at the ſame time, to make that excellent compoſition called *Elaterium.*

¶ *The Names.*

It is called in Greeke σίκυς ἄγριος: in Latine, *Agreſtis*, and *Errraticus Cucumis*: in ſhops, *Cucumer aſininus*: in Italian, *Cocomero ſalvatico*: in Spaniſh, *Cogumbrillo amargo*: in Engliſh, wilde Cucumber, ſpitting Cucumbers, and touch me not: in French, *Concombres ſauvages.*

¶ *The Temperature.*

The leaues of wilde Cucumbers, roots and their rindes, as they are bitter in taſte, ſo they be likewiſe hot and clenſing. The juyce is hot in the ſecond degree, as *Galen* witneſſeth, and of thin parts. It clenſeth and waſteth away.

¶ *The Vertues.*

The juyce called *Elaterium* doth purge forth choler, flegme, and watery humours, and that with force, and not onely by ſiege, but ſometimes alſo by vomit. A

The quantity that is to be taken at one time is from fiue graines to ten, according to the ſtrength of the patient. B

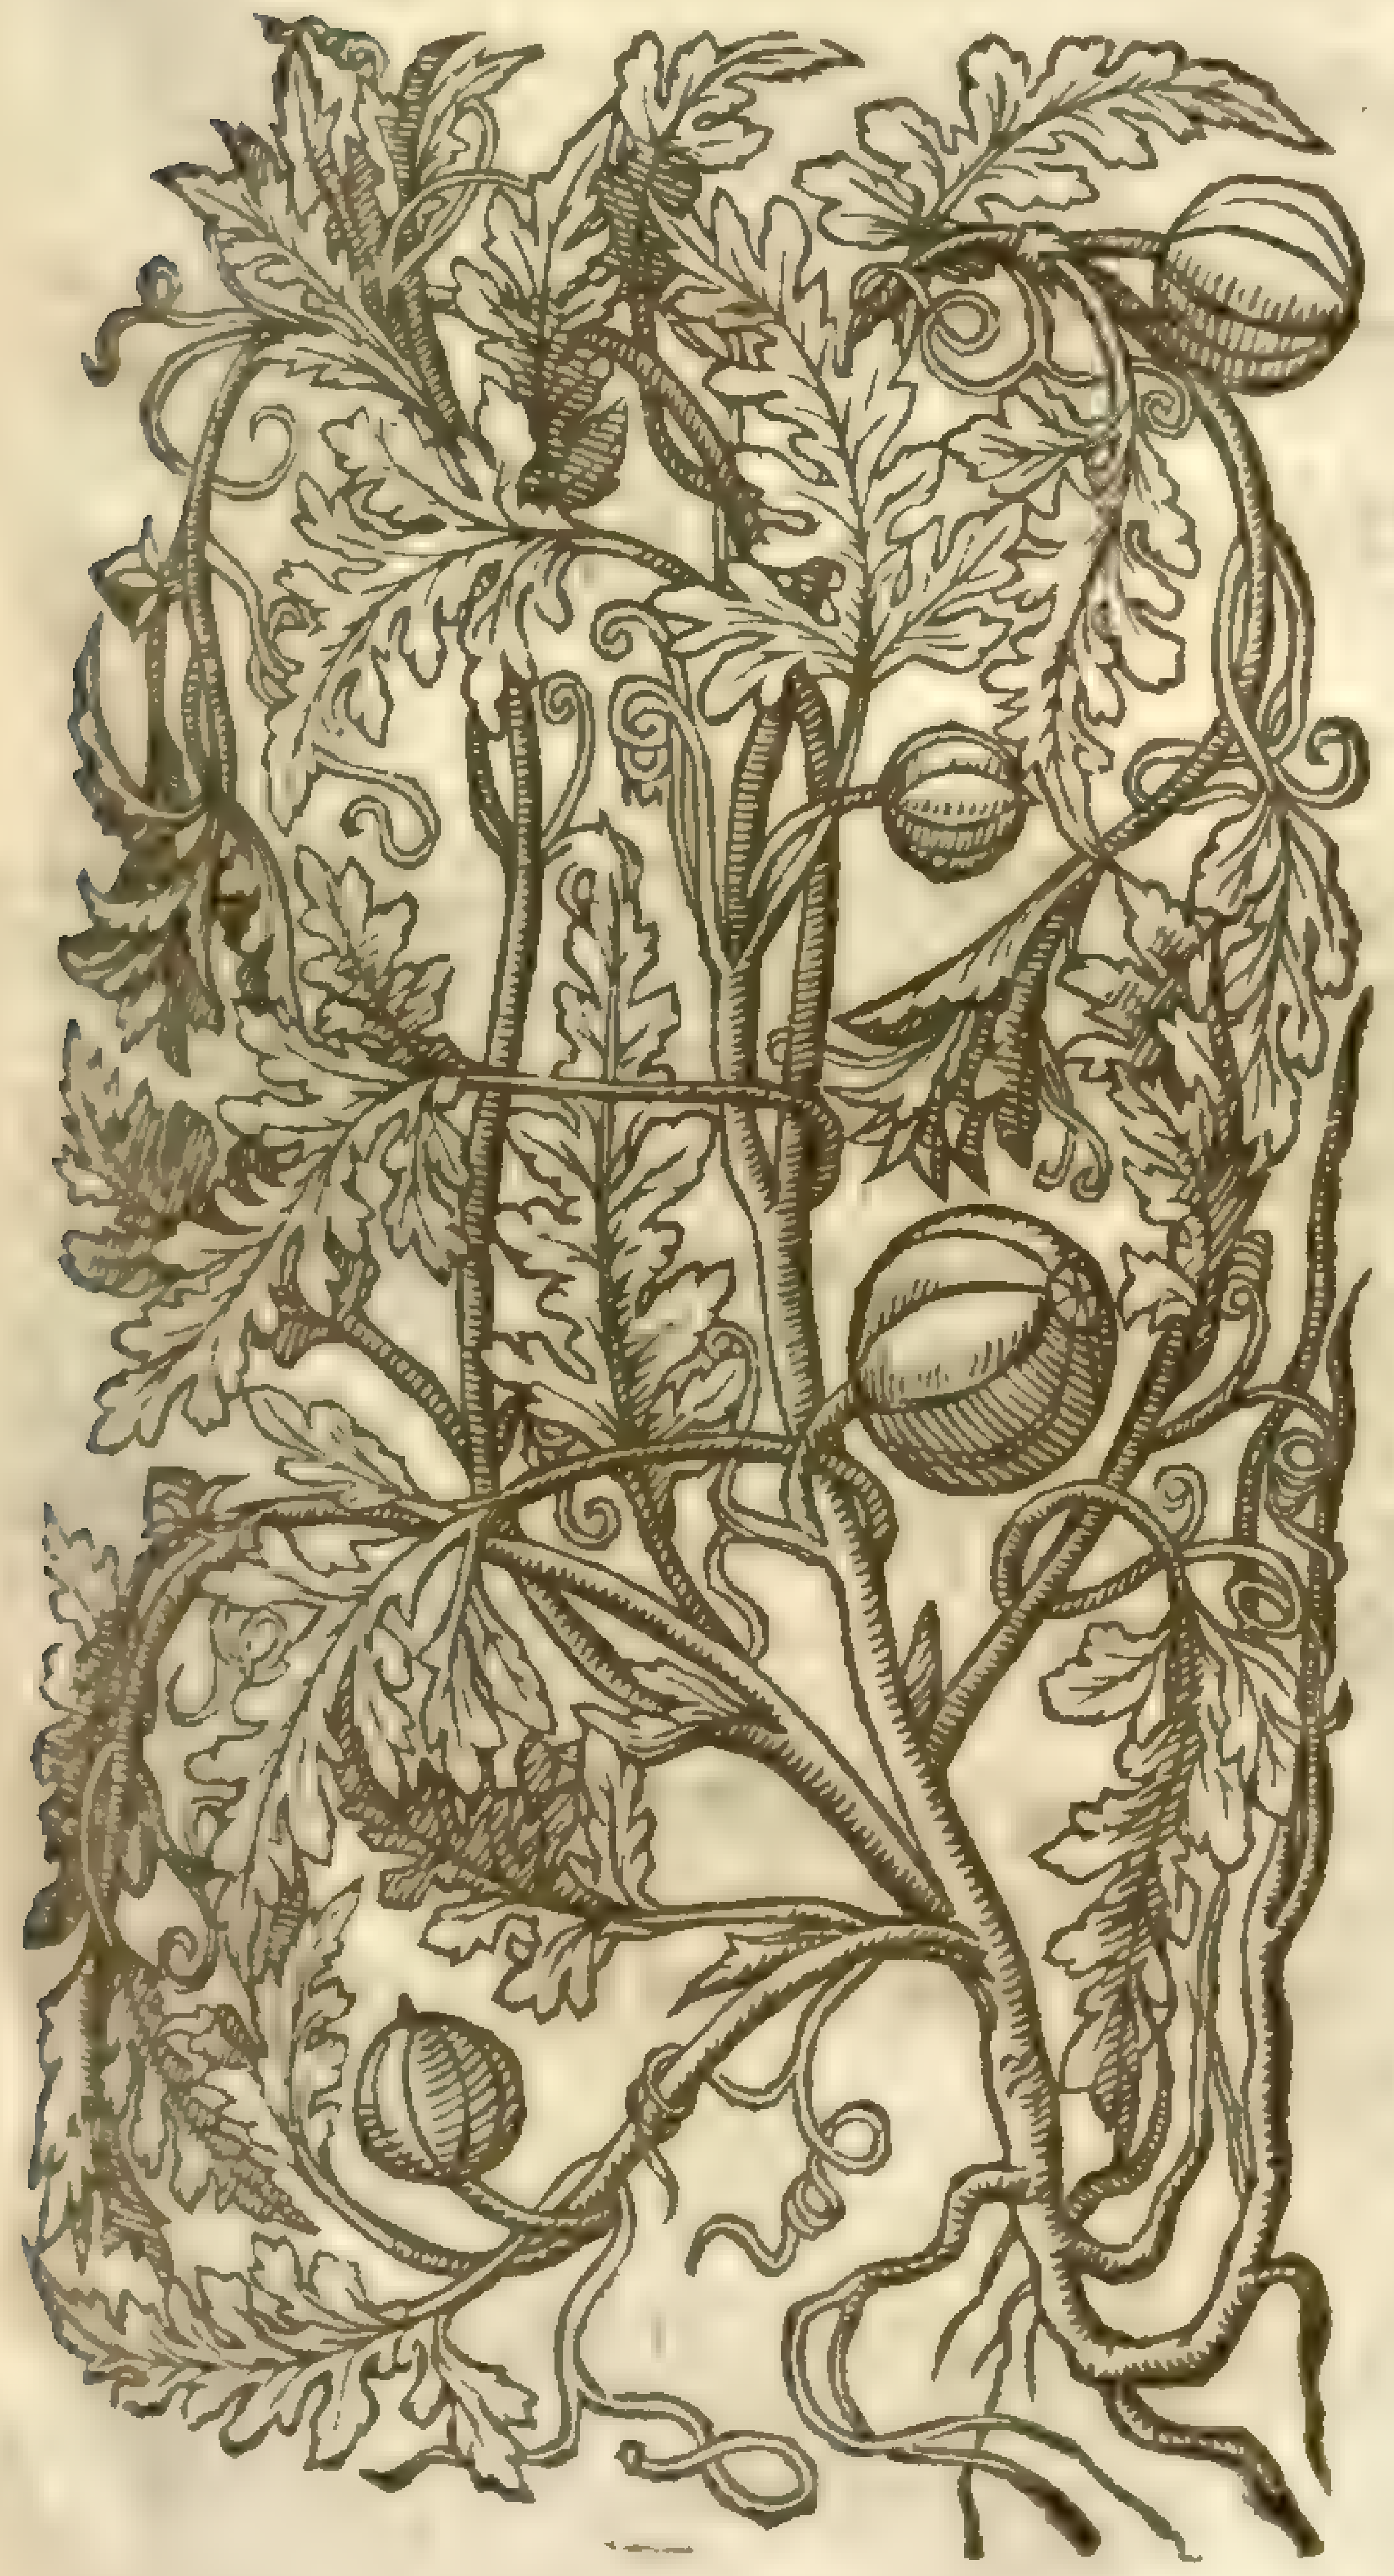
The juyce dried or hardened, and the quantity of halfe a ſcruple taken, driueth forth by ſiege groſſe flegme, cholericke humours, and preuaileth mightily againſt the dropſie, and ſhortneſſe of breath. C

The ſame drawne vp into the noſthrils mixed with a little milke, taketh away the redneſſe of the eies. D

The juyce of the root doth alſo purge flegme, cholericke and wateriſh humours, and is good for the dropſie: but not of ſuch force as *Elaterium*, which is made of the juyce of the fruit: the making whereof I commend to the learned and curious Apothecaries: among which number Mr. *William Wright* in Bucklers Burie my louing friend hath taken more paines in curious compoſing of it, and hath more exactly performed the ſame than any other whatſoeuer that I haue had knowledge of. E

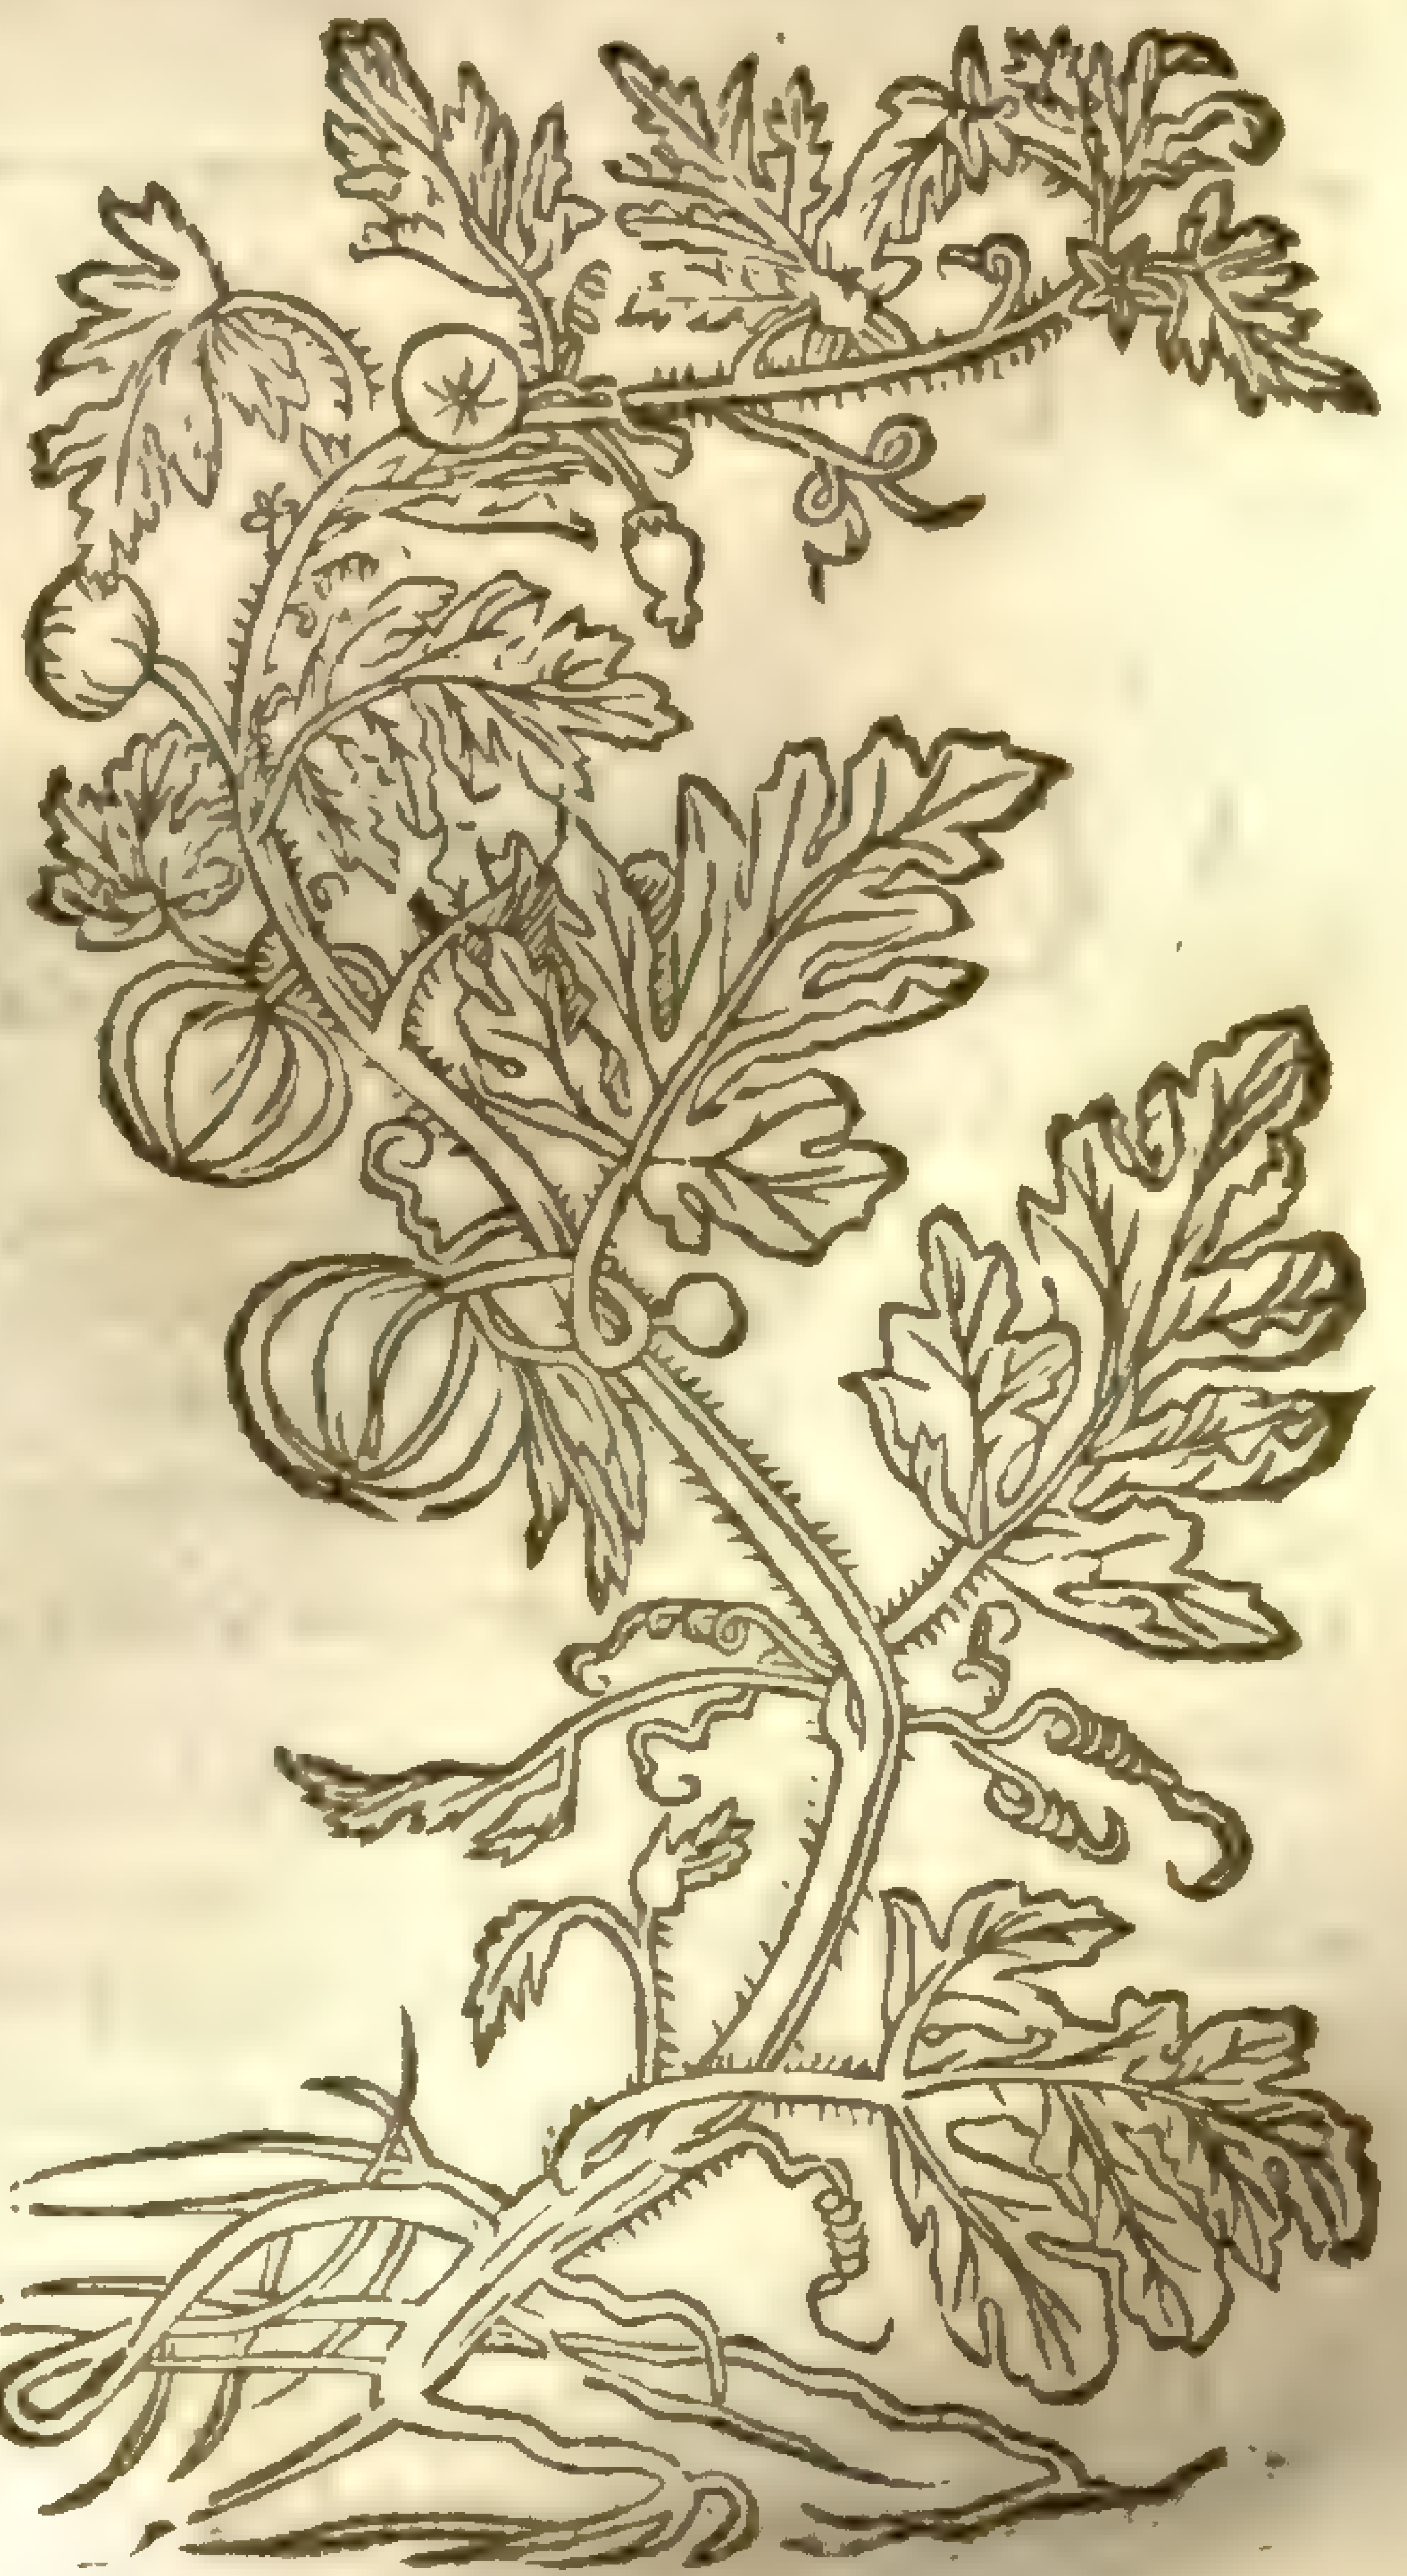
Chap. 342. Of Citrull Cucumbers.

1 *Citrullus officinarum.*
Citrull Cucumber.



Cucurbita citrullus [illegible]
fruit.

‡ 2 *Citrullus minor.*
Small Citrull.



¶ The

¶ *The Deſcription.*

1 The Citrull Cucumber hath many long, flexible, and tender ſtalkes trailing vpon the ground, branched like vnto the Vine, ſet with certaine great leaues deeply cut, and very much jagged: among which come forth long claſping tendrels, and alſo tender footſtalkes, on the ends whereof do grow floures of a gold yellow colour: the fruit is ſomewhat round, ſtraked or ribbed with certaine deepe furrowes alongſt the ſame, of a greene colour aboue, and vnderneath on that ſide that lyeth vpon the ground ſomething white: the outward ſkin whereof is very ſmooth; the meat within is indifferent hard, more like to that of the Pompion than of the Cucumber or Muske-Melon: the pulpe wherein the ſeed lieth, is ſpungie, and of a ſlimie ſubſtance: the ſeed is long, flat, and greater than thoſe of the Cucumbers: the ſhell or outward barke is blackiſh, ſometimes of an ouerworne reddiſh colour. The fruit of the Citrull doth not ſo eaſily rot or putrifie as doth the Melon, which being gathered in a faire dry day may be kept a long time, eſpecially being couered in a heape of Wheat, as *Matthiolus* ſaith; but according to my practiſe you may keepe them much longer and better in a heape of dry ſand.

2 The ſecond kinde of Citrull differeth not from the former, ſauing that it is altogether leſſer, and the leaues are not ſo deeply cut or jagged, wherein conſiſteth the difference.

¶ *The Place and Time.*

The Citrull proſpereth beſt in hot Regions, as in Sicilia, Apulia, Calabria, and Syria, about Alepo and Tripolis. We haue many times ſowne the ſeeds, and diligently obſerued the order preſcribed in planting of Cucumbers.

¶ *The Names.*

The later Herbariſts do call it *Anguria*: in ſhops, *Citrullus*, and *Cucumus Citrullus*: in Engliſh, Citruls, and Cucumber Citruls, and the ſeed is knowne by the name of *Semen Citrulli*, or Citrull ſeed. But if *Cucumis Citrullus* be ſo called of the yellow colour of the Citron, then is the common Cucumber properly *Cucumis Citrullus*: which is knowne vnto all to be contrary.

¶ *The Temperature and Vertues.*

A The meat or pulpe of Cucumer Citrull which is next vnto the bark is eaten raw, but more commonly boyled: it yeeldeth to the body little nouriſhment, and the ſame cold: it ingendreth a wateriſh bloud, mitigateth the extremity of heat of the inner parts, and tempereth the ſharpneſſe and feruent heat of choler: being raw and held in the mouth, it takes away the roughneſſe of the tongue in Agues, and quencheth thirſt.

B The ſeeds are of the like faculty with thoſe of Cucumbers.

Chap. 343. *Of the wilde Citrull called* Colocynthis.

¶ *The Deſcription.*

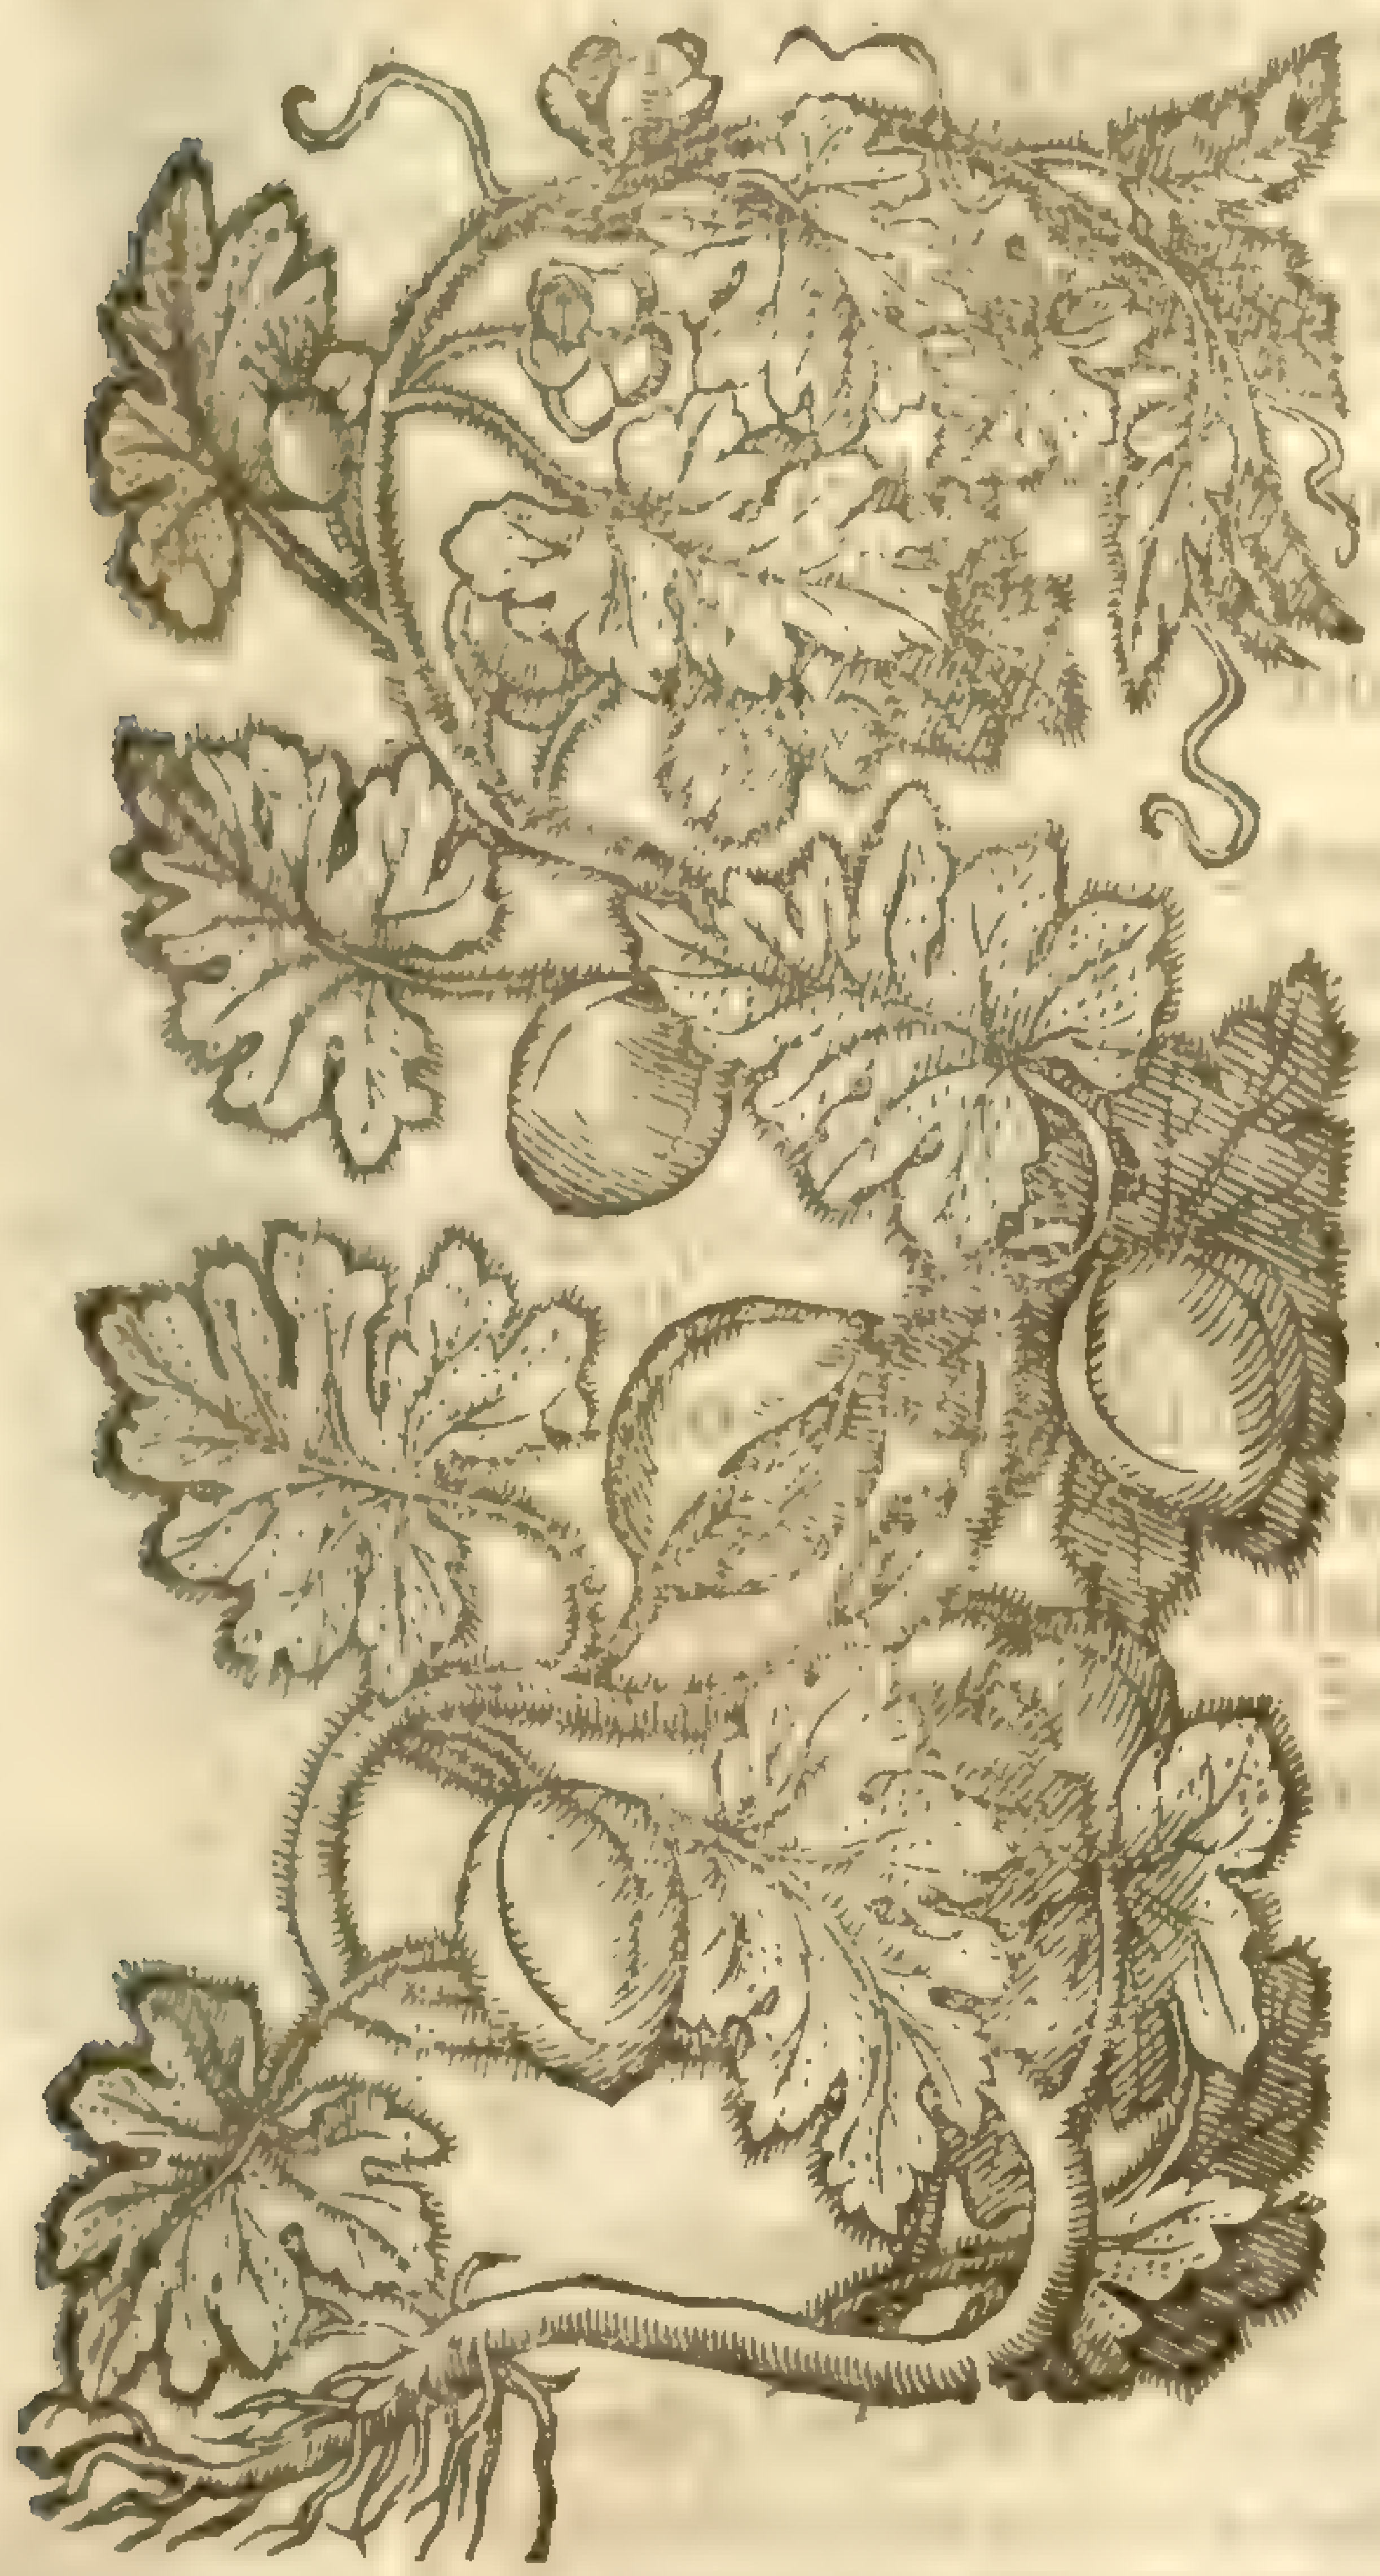
1 Coloquintida hath beene taken of many to be a kind of the wilde Gourd, it lieth along creeping on the ground as do the Cucumbers and Melons, comming neereſt of all to that which in thoſe daies of ſome Herbariſts is called Citrull Cucumber: it bringeth forth vpon his long branches ſmall crooked tendrels like the Vine, and alſo very great broad leaues deeply cut or jagged: among which come forth ſmall floures of a pale yellow colour; then commeth the fruit round as a bowle, couered with a thin rinde, of a yellow colour when it is ripe, which when it is pilled or pared off, the white pulpe or ſpungie ſubſtance appeareth full of ſeeds, of a white or elſe an ouerworne browne colour; the fruit ſo pared or pilled, is dryed for medicine; the which is moſt extreame bitter, and likewiſe the ſeed, and the whole plant it ſelfe in all his parts.

2 The ſecond kinde of Coloquintida hath likewiſe many long branches and claſping tendrels, wherewith it taketh hold of ſuch things as are neere vnto it. It bringeth forth the like leaues, but not ſo much jagged. The floures are ſmall and yellow: the fruit is faſhioned like a peare, and the other ſort round, wherein the eſpeciall difference conſiſteth.

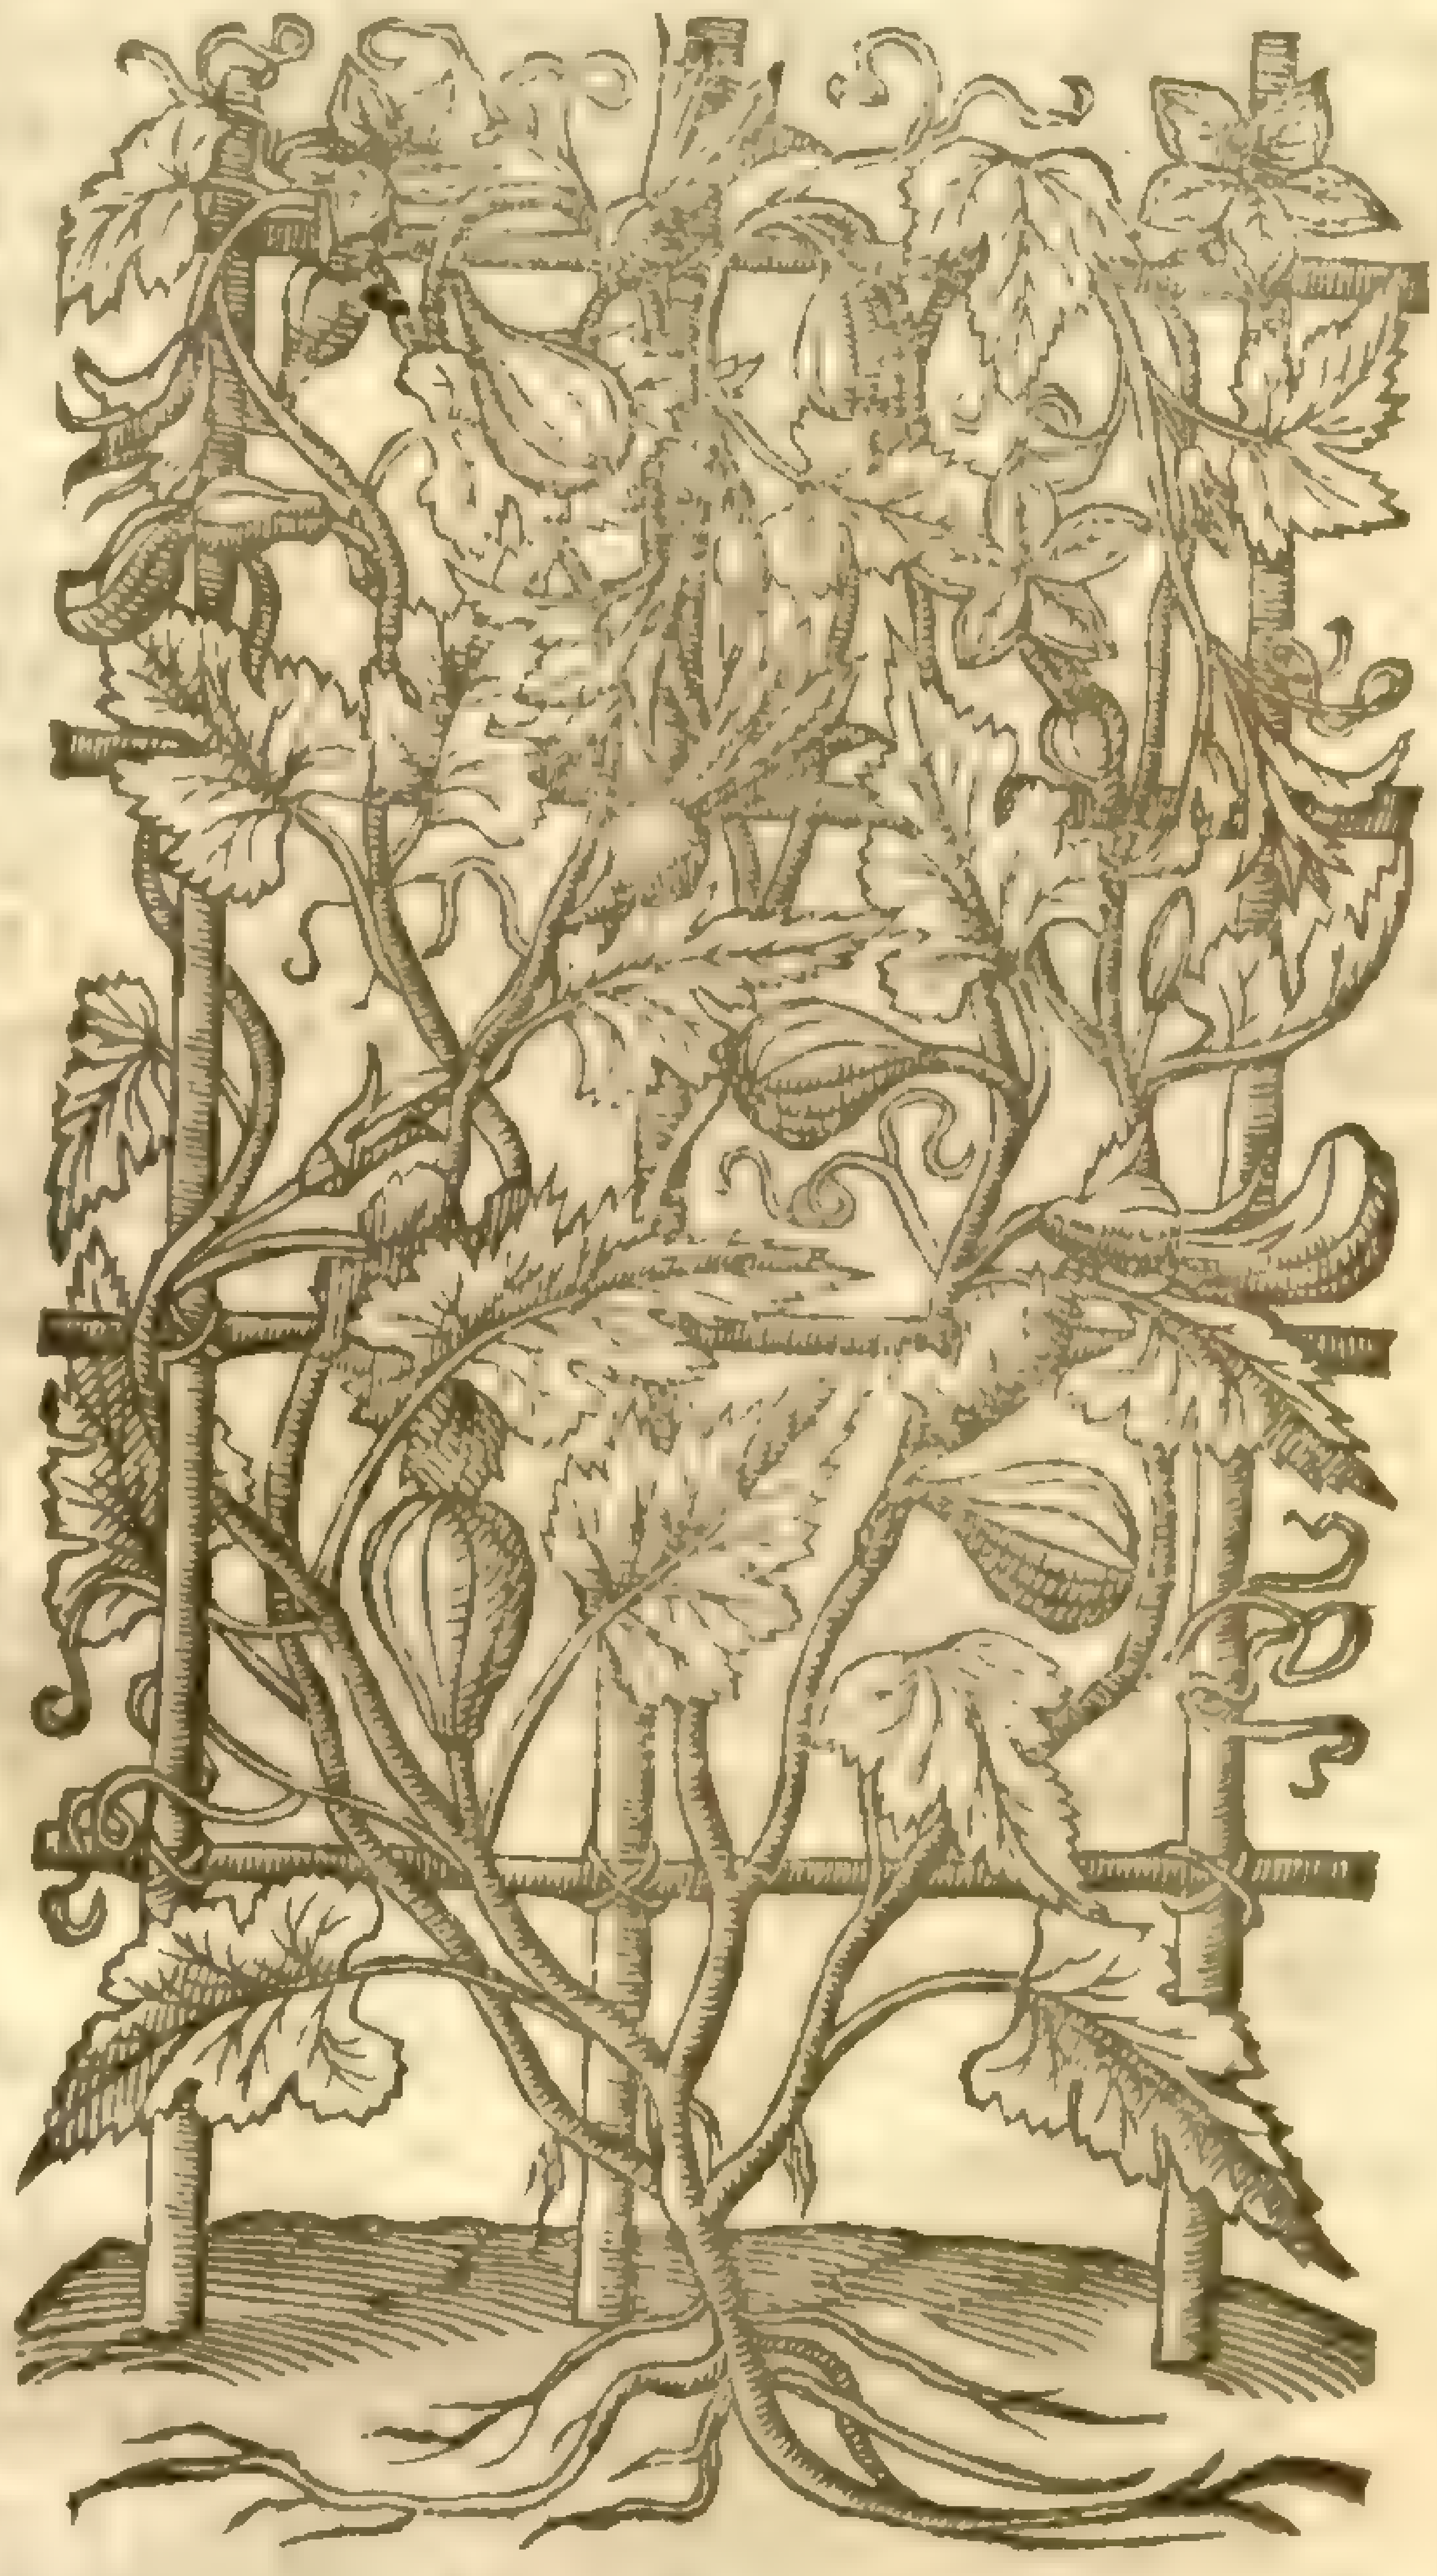
¶ *The Place.*

Coloquintida is ſowne and commeth to perfection in hot regions, but ſeldome or neuer in theſe Northerly and cold countries.

1 *Colocynthis.*
The wilde Citrull or Coloquintida.



2 *Colocynthis pyriformis.*
Peare faſhioned Coloquintida.



¶ *The Time.*

It is ſowne in the Spring, and bringeth his fruit to perfection in Auguſt.

It hath beene diuers times deliuered vnto me for a truth, that they doe grow in the ſands of the Mediterranean ſea ſhore, or very neere vnto it, wilde, for euery man to gather that liſt, eſpecially on the coaſt of Barbarie, as alſo without the mouth of the Streights neer to *Sancta Crux* and other places adjacent; from whence diuers Surgions of London that hath trauelled thither for the curing of ſicke and hurt men in the ſhip haue brought great quantities thereof at their returne.

¶ *The Names.*

It is vulgarly called *Coloquintida*: in Greeke, κολοκυνθὶς: the Latine tranſlators for *Colocinthis* doe oftentimes ſet downe *Cucurbita ſylueſtris*: notwithſtanding there is a *Cucurbita ſylueſtris* that differeth from *Colocinthis*, or Coloquintida: for *Cucurbita ſylueſtris* is called in Greeke κολοκύνθα ἀγρία: or wilde Coloquintida, whereof ſhall be ſet forth a peculiar chapter next after the *Cucurbita* or Gourd: in Engliſh it is called Coloquintida, or Apple of Coloquintida.

¶ *The Temperature.*

Coloquintida as it is in his whole nature and in all his parts bitter, ſo it is likewiſe hot and drie in the later end of the ſecond degree; and therefore it purgeth, clenſeth, openeth and performeth all thoſe things that moſt bitter things do: but that the ſtrong qualitie which it hath to purge by the ſtoole, is, as *Galen* ſaith, of more force than the reſt of his operations.

¶ *The Vertues.*

A Which operation of purging it worketh ſo violently, that it doth not onely draw forth flegme and choler maruellous ſpeedily, and in very great quantitie: but oftentimes fetcheth forth bloud and bloudy excrements, by ſhauing the guts, and opening the ends of the meſeraicall veines.

B So that therefore the ſame is not to bee vſed either raſhly, or without ſome dangerous and extreme diſeaſe conſtraine thereunto: neither yet at all, vnleſſe ſome tough and clammie thing bee mixed therewith, whereby the vehemency thereof may be repreſſed, the hurtfull force dulled, and the ſame ſpeedily paſſing through the belly, the guts be not fret or ſhaued. *Meſues* teacheth to mixe with it either Maſtich, or gum Tragacanth.

C There be made of it Trochiſes, or little flat cakes, with Maſtich, gum Arabick, Tragacanth and

Bdellium, of theſe, Maſtich hath a manifeſt binding quality: but tough and clammy things are much better, which haue no aſtriction at all in them, or very little.

D For by ſuch binding or aſtringent things, violent medicines being reſtrained and brideled, do afterward work their operation with more violence and trouble: but ſuch as haue not binding things mixed with them do eaſilier worke, and with leſſer paine, as be thoſe pils which *Rhaſis* in his ninth booke of *Almanzor* calleth *Illiacæ*: which are compounded of Coloquintida and Scamony, two of the ſtrongeſt medicines that are; and of a third called gum *Sagapene*, which through his clammineſſe doth as it were daube the intrails and guts, and defend them from the harme that might haue come of either of them.

E The which compoſition, although it be wonderfull ſtrong, and not to be vſed without very great neceſſitie vrge thereunto, doth notwithſtanding eaſily purge, aad without any great trouble, and with leſſer torment than moſt of the mildeſt and gentleſt medicines which haue Maſtich and other things mixed with them that are aſtringent.

F And for this cauſe it is very like that *Galen* in his firſt booke of Medicines, according to the places affected, would not ſuffer Maſtich aud Bdellium to be in the pilles, which are ſurnamed *Cochiæ*: the which notwithſtanding his Schoolemaſter *Quintus* was alſo woont before to adde vnto the ſame.

G But Coloquintida is not onely good for purgations, in which it is a remedy for the diſſineſſe or the turning ſickneſſe, the megrim, continuall head-ache, the Apoplexie, the falling ſickeneſſe, the ſtuffing of the lungs, the gnawings and gripings of the guts and intrailes, and other moſt dangerous diſeaſes, but alſo it doth outwardly worke his operations, which are not altogether to be rejected.

H Common oile wherein the ſame is boyled, is good againſt the ſinging in the eares, and deafenes: the ſame killeth and driueth forth all manner of wormes of the belly, and doth oftentimes prouoke to the ſtoole, if the nauell and bottome of the belly be therewith annointed.

I Being boiled in vinegre, and the teeth waſhed therewith, it is a remedy for the tooth-ache, as *Meſues* teacheth.

K The ſeed is very profitable to keepe and preſerue dead bodies with; eſpecially if Aloes and Myrrhe be mixed with it.

L The white pulpe or ſpungious pith taken in the weight of a ſcruple openeth the belly mightily, and purgeth groſſe flegme, and cholericke humors.

M It hath the like force if it be boyled and laid to infuſe in wine or ale, and giuen to drink.

N Being taken after the ſame manner it profiteth the diſeaſes before remembred, that is, the Apoplexie, falling ſickneſſe, giddineſſe of the head, the collicke, looſeneſſe of ſinewes, and places out of joynt, and all diſeaſes proceeding of cold.

O For the ſame purpoſes it may be vſed in cliſters.

P The ſame boiled in oile, and applied with cotton or wooll, taketh away the paine of the Hemorrhoides.

Q The decoction made in wine, and vſed as a fomentation or bathe, bringeth downe the deſired ſickeneſſe.

CHAP. 344. *Of Muske-Melon, or Million.*

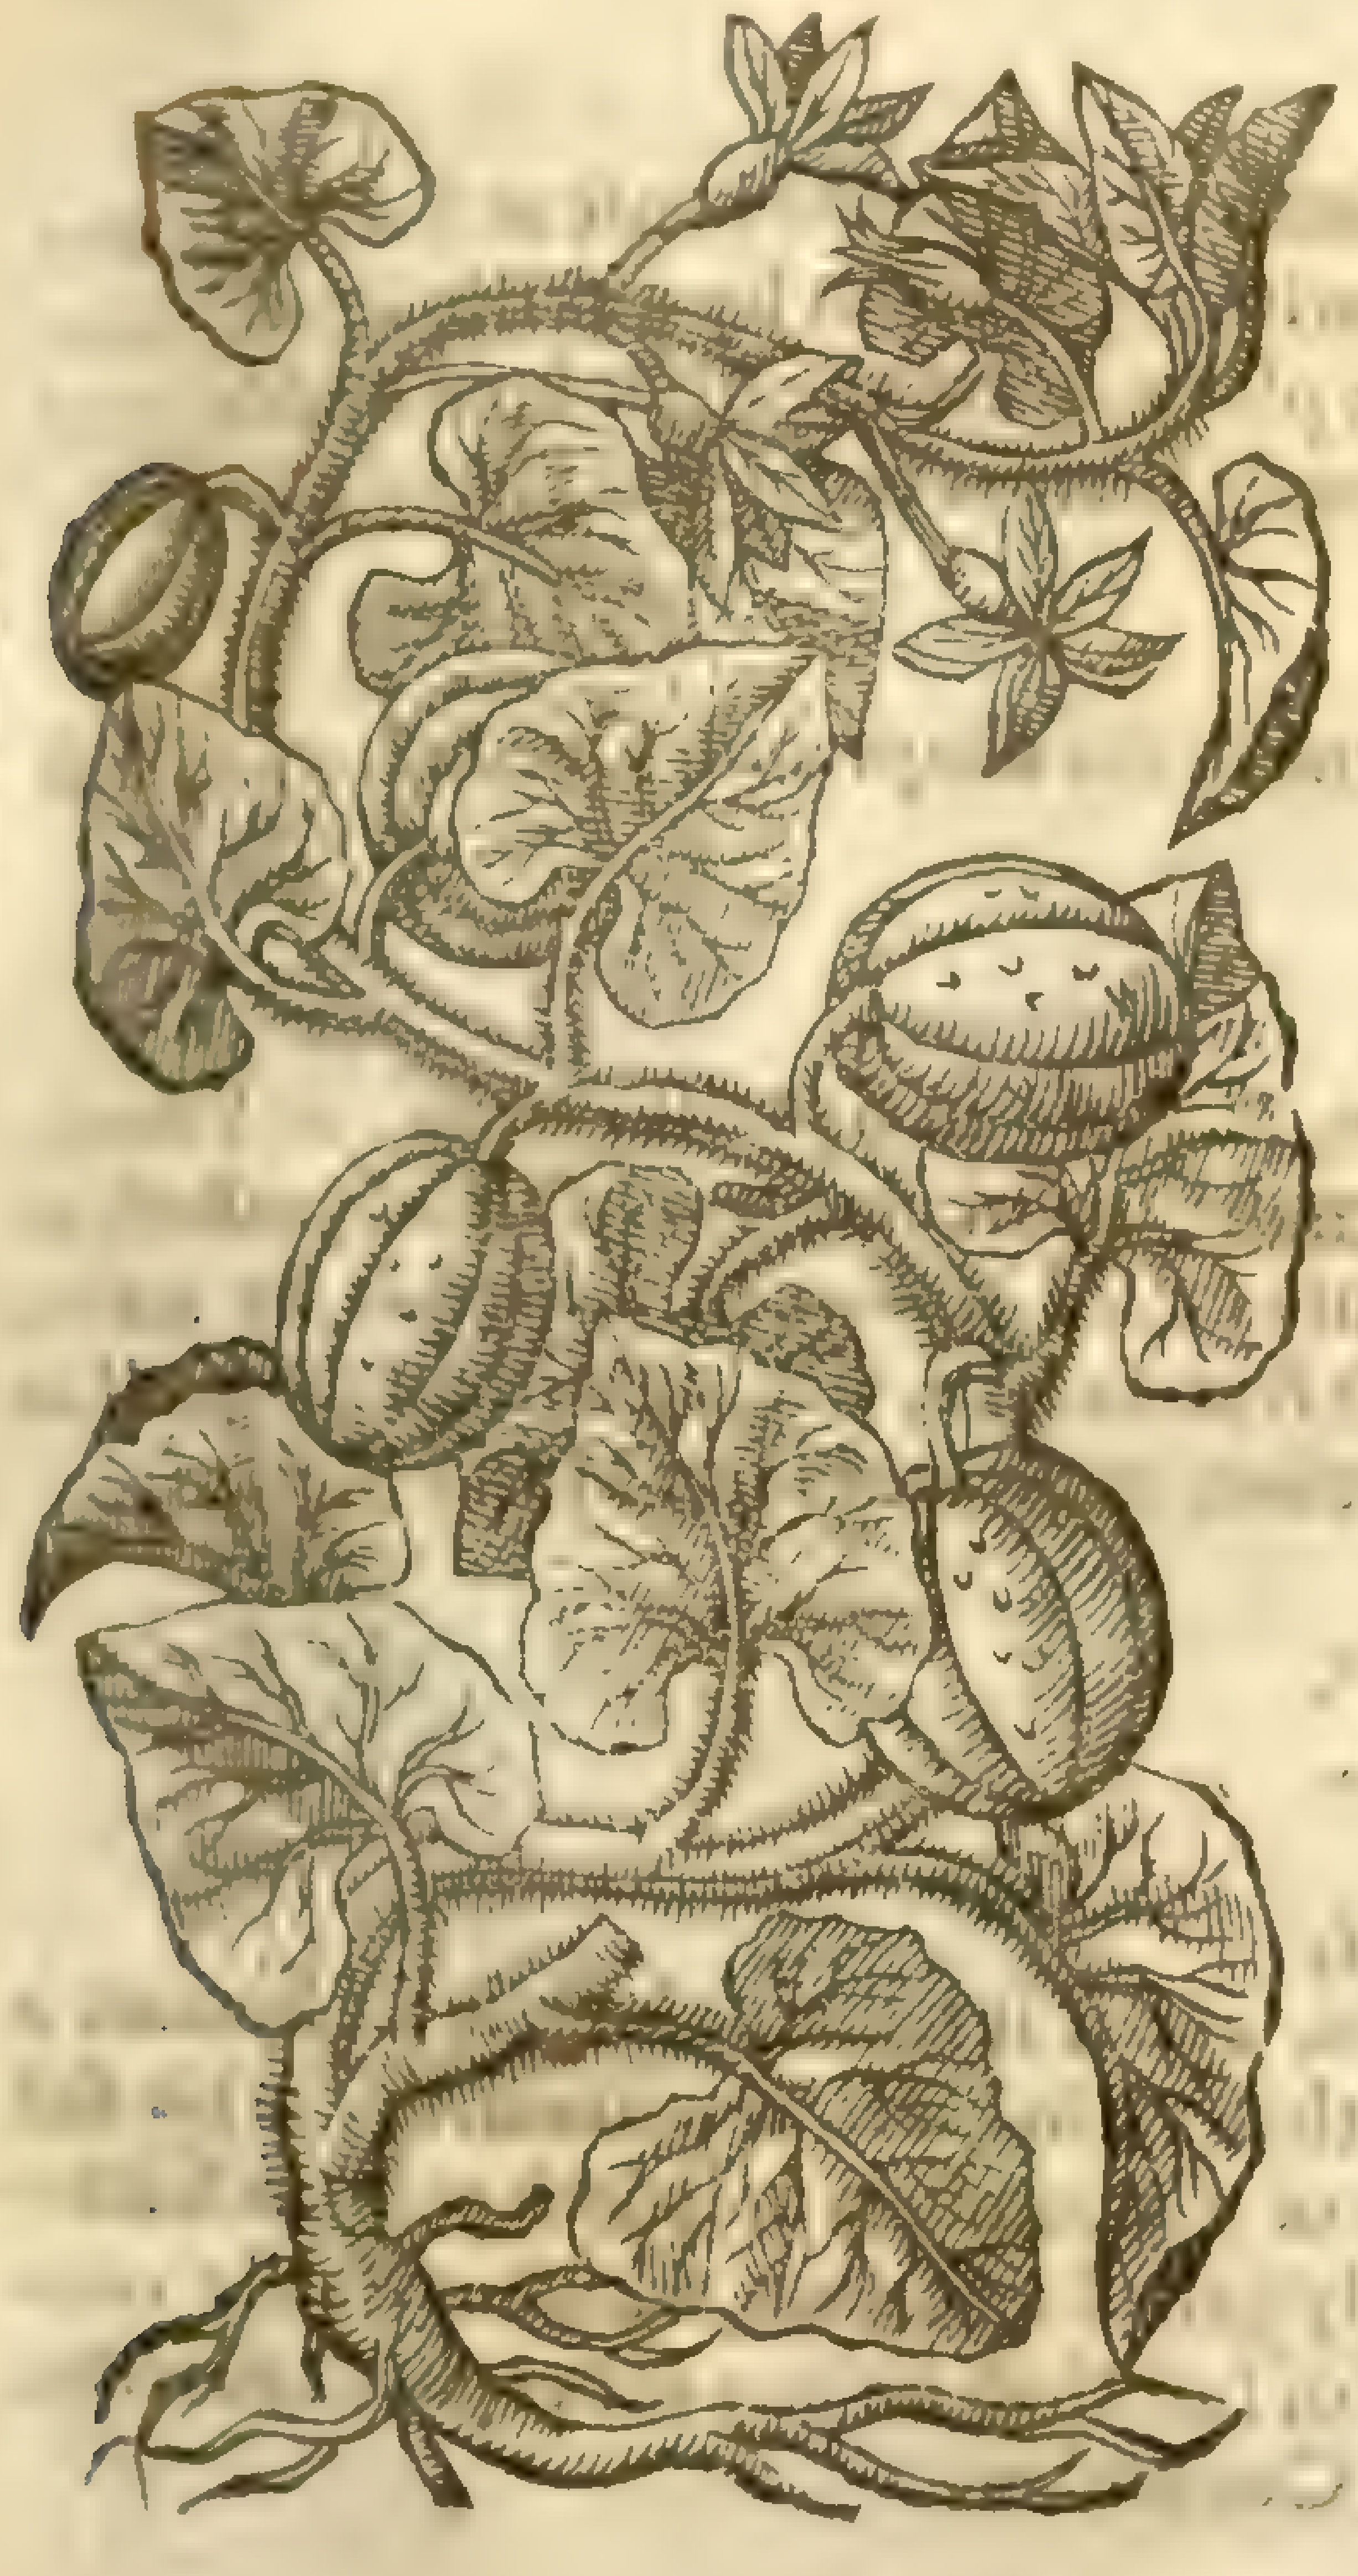
¶ *The Kindes.*

THere be diuers ſorts of Melons found at this day, differing very notably in ſhape and proportion, as alſo in taſte, according to the climate and country where they grow: but of the Antients there was onely one and no more, which is that *Melopepo* called of *Galen*, *Cucumis*, or *Galens* Cucumber: notwithſtanding ſome haue comprehended the Muske-Melons vnder the kindes of Citruls, wherein they haue greatly erred: for doubtleſſe the Muske-Melon is a kinde of Cucumber, according to the beſt approued Authors.

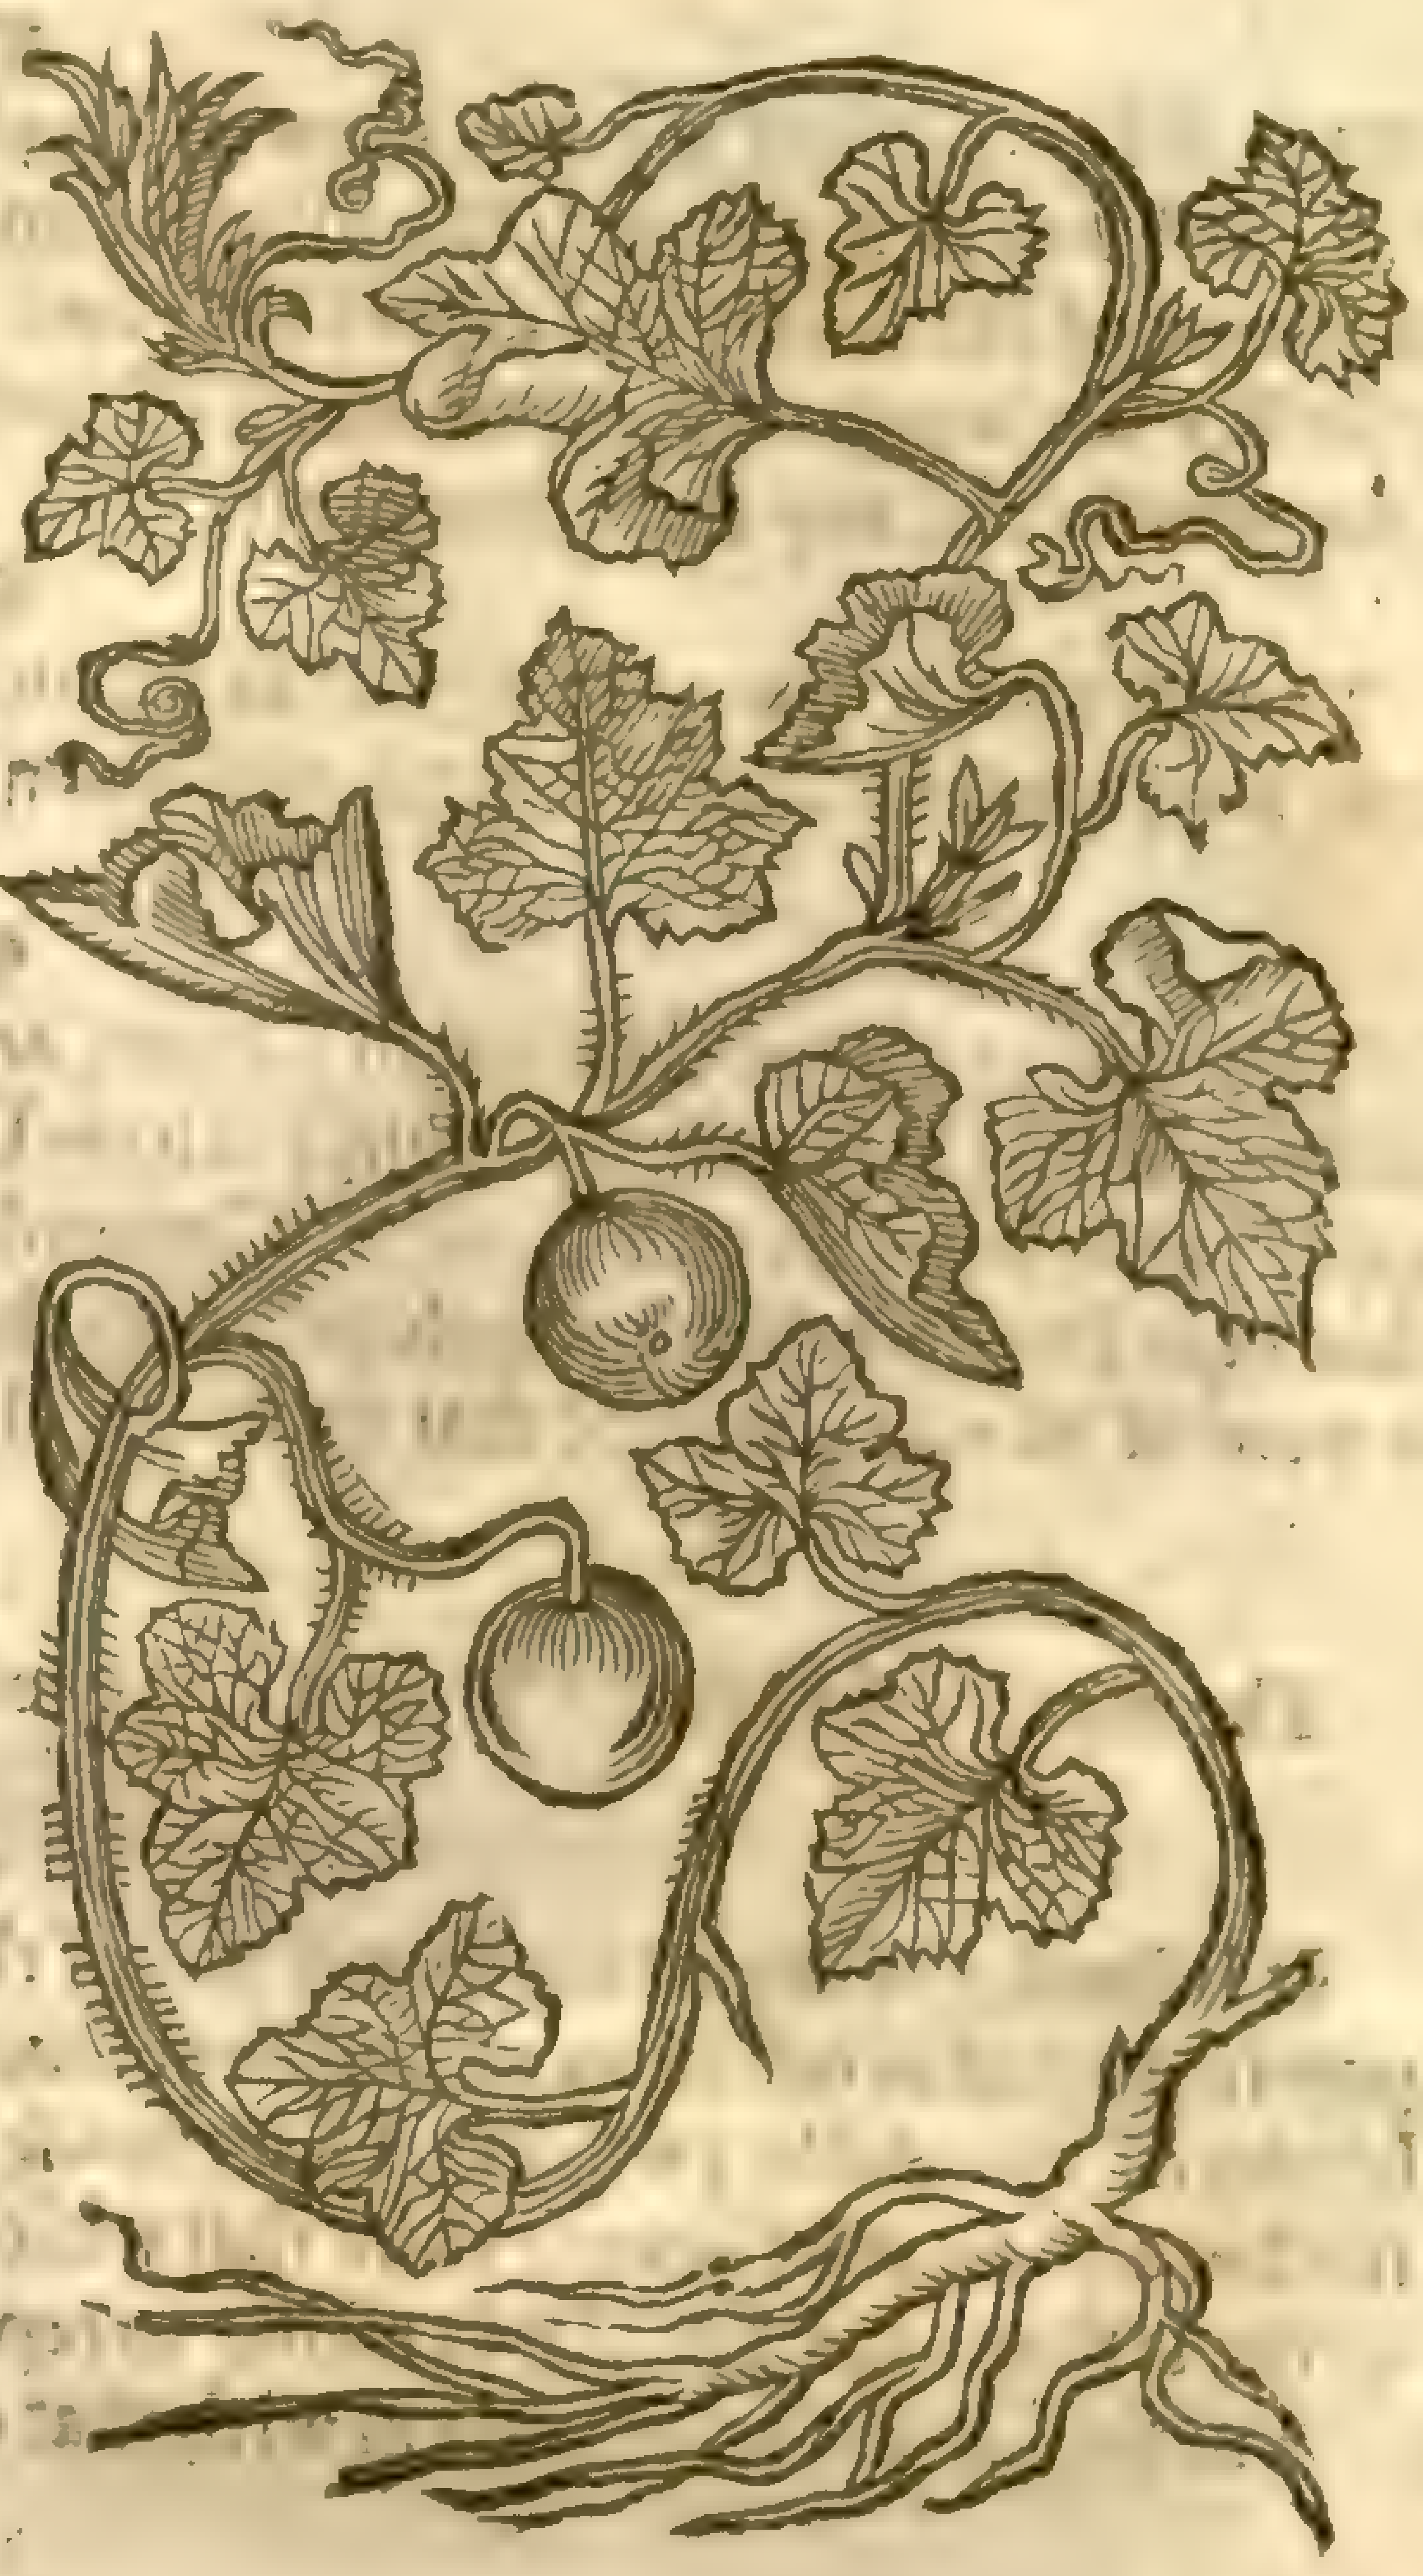
¶ *The Deſcription.*

1 THat which the later Herbariſts do call Muske-Melons is like to the common Cucumber in ſtalks, lying flat vpon the ground, long, branched, and rough. The leaues be much alike, yet are they leſſer, rounder, and not ſo cornered: the floures in like manner bee yellow: the fruit is bigger, at the firſt ſomwhat hairy, ſomthing long, now and then ſomwhat round; oftentimes greater, and many times leſſer: the barke or rinde is of an ouerworne ruſſet greene colour,

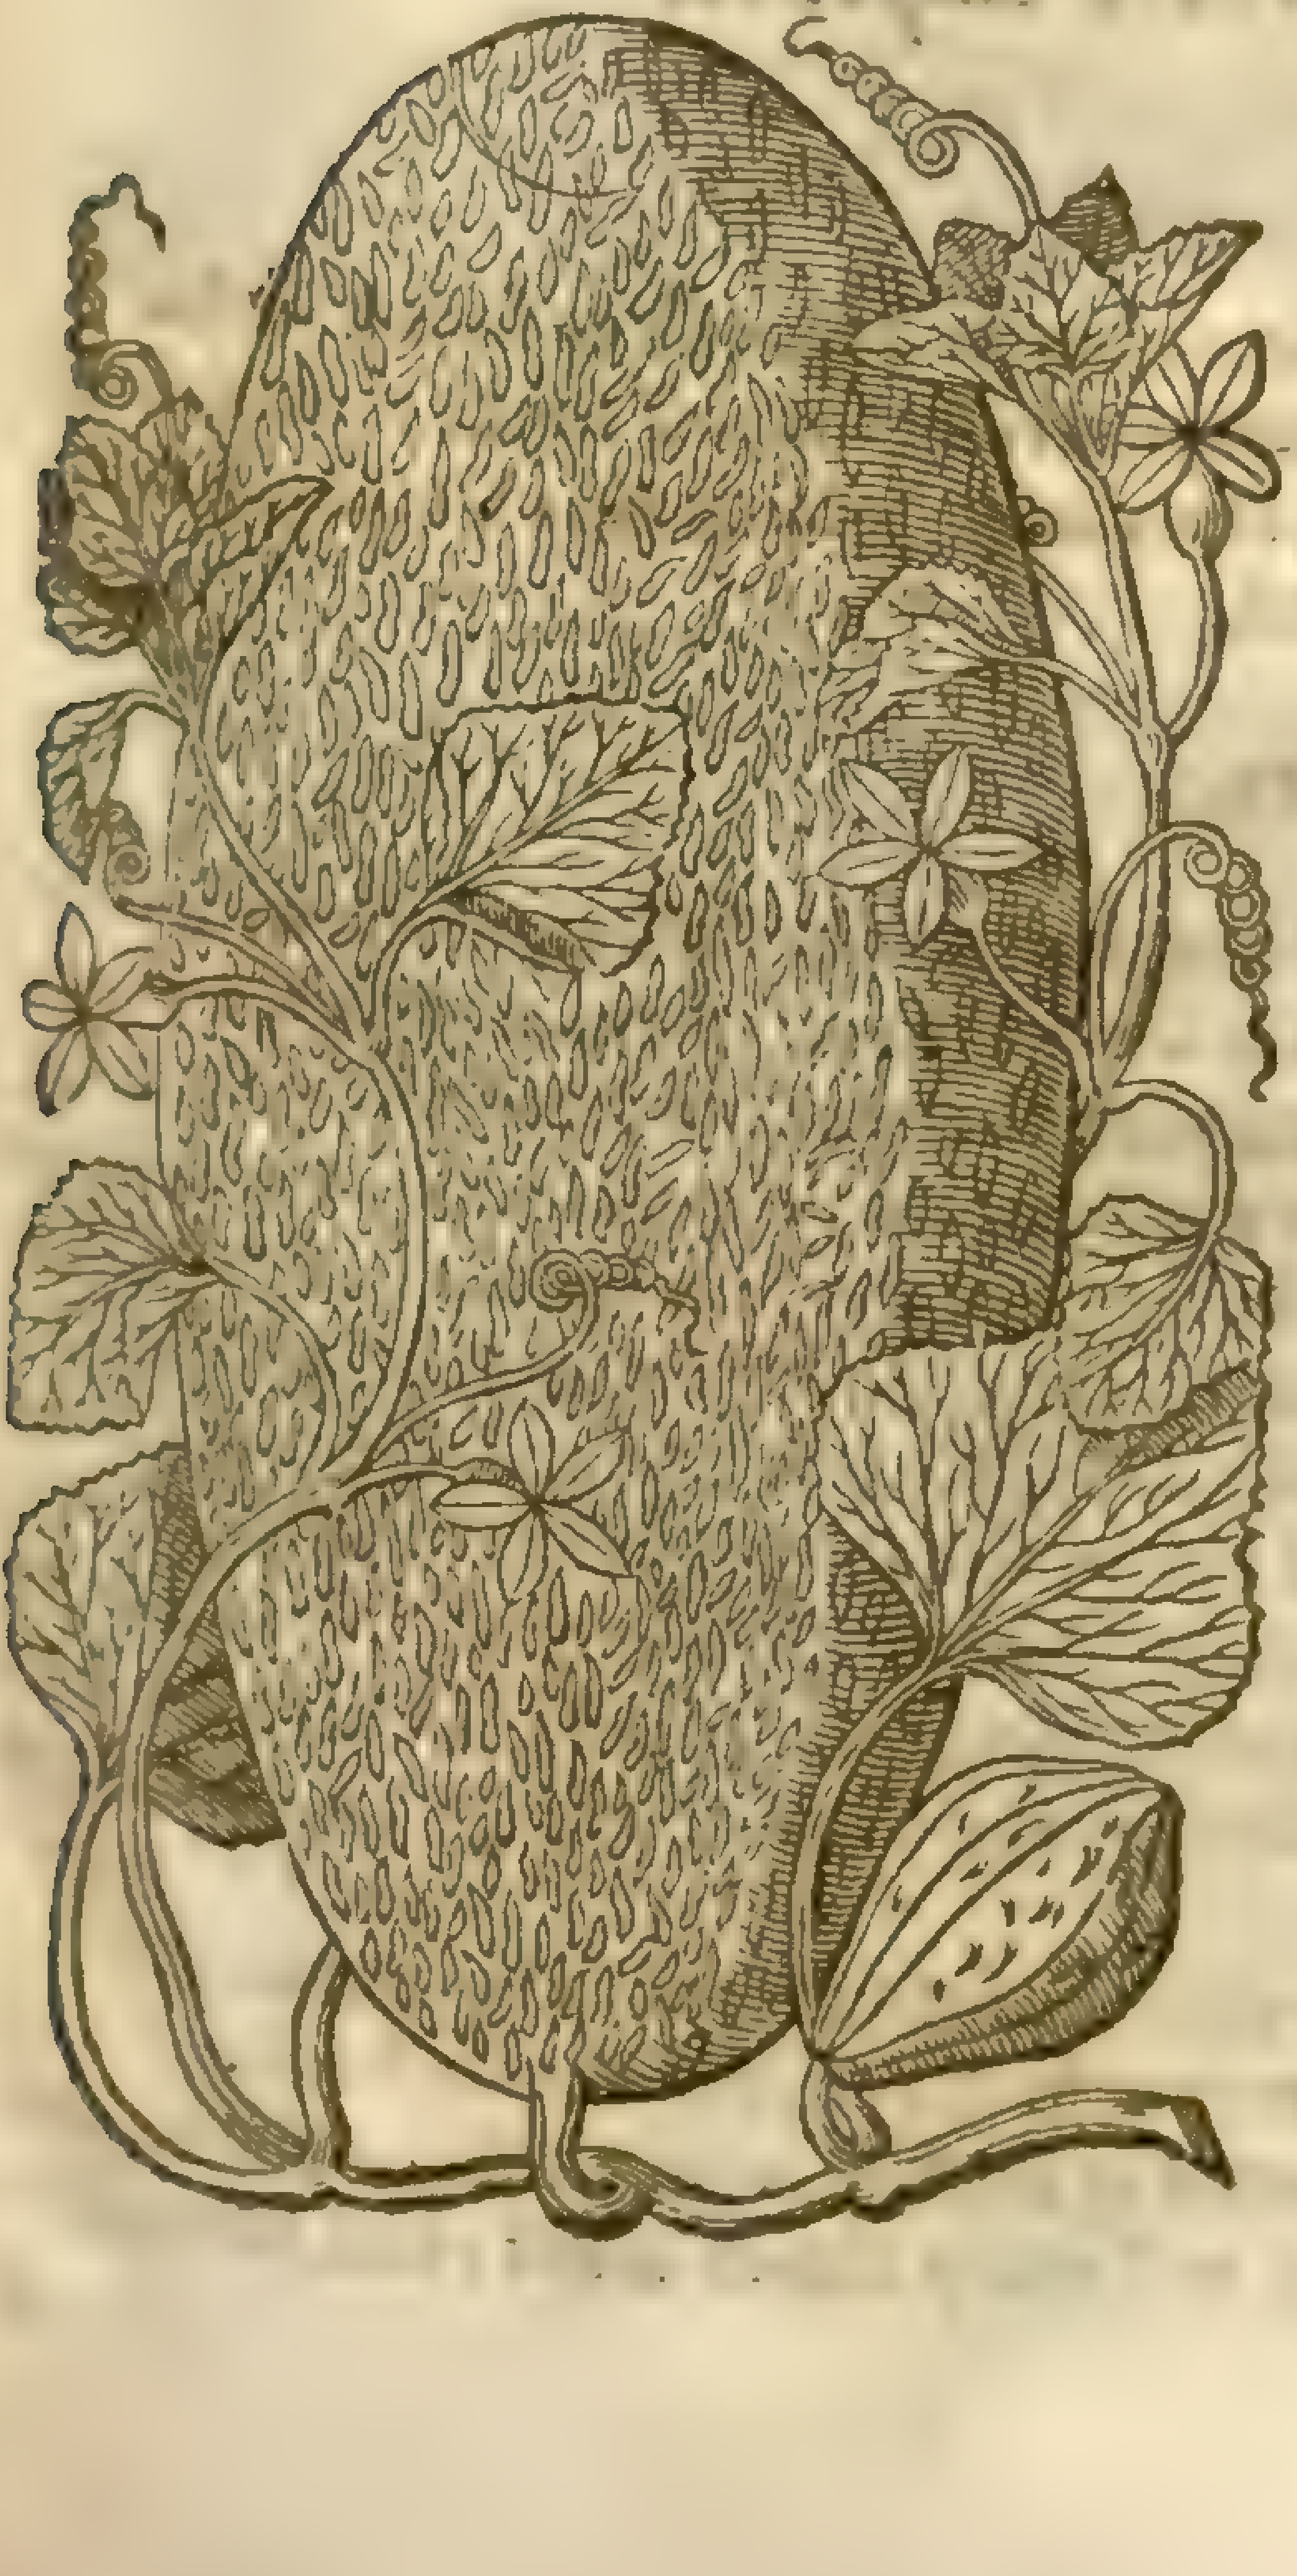
1 *Melo.*
The Muske Melon.



2 *Melo Saccharinus.*
Sugar Melon.



4 *Melo Hiſpanicus.*
Spaniſh Melons.



colour,ribbed and furrowed very deepely, hauing often chaps or chinks,and a confuſed roughneſſe: the pulp or inner ſubſtance which is to be eaten is of a feint yellow colour; the middle part whereof is full of a ſlimie moiſture: amongſt which is contained the ſeed, like to thoſe of the Cucumber,but leſſer,and of a browner colour.

2 The ſugar Melon hath long trailing ſtalks lying vpon the ground,whereon are ſet ſmall claſping tendrels like thoſe of the Vine, and alſo leaues like vnto the common Cucumber,but of a greener colour: the fruit commeth forth among thoſe leaues, ſtanding vpon ſlender foot-ſtalkes, round as the fruit of Coloquintida, and of the ſame bigneſſe, of a moſt pleaſant taſte like ſugar, whereof it tooke the ſyrname *Saccharatus*.

3 The peare-faſhioned Melon hath many long viny branches, whereupon grow cornered leaues like thoſe of the Vine, and likewiſe great ſtore of long tendrels, claſping and taking hold of each thing that it toucheth: the fruit groweth vpon ſleeder foot-ſtalks faſhioned like a peare,of the bigneſſe of a great Quince.

4 The Spaniſh Melon brings forth long trailing branches, wheron are ſet broad leaues ſlightly indented about the edges,not diuided at all,as are all the reſt of the Melons. The fruit groweth neere vnto the ſtalke,like vnto the common Pompion,very long,not creſted or furrowed at all, but

ſpotted with very many ſuch marks as are on the backe of the Hearts-tongue leafe. The pulpe or meat is not ſo pleaſing in taſte as the other.

¶ *The Place.*

They delight in hot regions, notwithſtanding I haue ſeen at the Queens houſe at S. *Iames* many of the firſt ſort ripe, through the diligent and curious nouriſhing of them by a skilfull gentleman the keeper of the ſaid houſe called Mr *Fowle*: and in other places neere the right honourable Lord of Suſſex his houſe of Bermondſey by London, where yearely there is very great plenty, eſpecially if the weather be any thing temperat.

¶ *The Time.*

They are ſet or ſowne in Aprill, as I haue already ſhewne in the chapter of Cucumbers. Their fruit is ripe in the end of Auguſt, and ſomtimes ſooner.

¶ *The Names.*

The Muske Melon is called in Latine, *Melo*: in Italian, *Mellone*: in Spaniſh, *Melon*: in French, *Melons*: in high-Dutch, **Melaun**: in low-Dutch, **Meloenen**: in Greeke, μῆλον, which ſignifieth an apple; and therefore this kinde of Cucumber is more truly called μηλοπέπων, or *Melopepon*, by reaſon that *Pepo* ſmelleth like an apple, whereto the ſmell of this fruit is like, hauing withall the ſmell as it were of Muske; and for that cauſe are alſo named *Melones Muſchatellini*, or Muske Melons.

¶ *The Nature.*

The meat of the Muske Melon is very cold and moiſt.

¶ *The Vertues.*

A It is harder of digeſtion than is any of the Cucumbers, and if it remaine long in the ſtomack it putrifieth, and is occaſion of peſtilent feuers. Which thing alſo *Aëtius* witneſſeth, in his firſt booke of *Tetrabibles*; writing, That the vſe of *Cucumeres* or Cucumbers breedeth peſtilent feuers: for hee alſo taketh *Cucumis* to be that which is commonly called a Melon; which is vſually eaten of the Italians and Spaniards rather to repreſſe the rage of luſt, than for any other phyſicall vertue.

B The ſeed is of like operation with that of the former Cucumber.

Chap. 345. *Of Melons or Pompions.*

¶ *The Kindes.*

THere be found diuers kindes of Pompions which differ either in bigneſſe or forme; it ſhal be therefore ſufficient to deſcribe ſome one or two of them, and refer the reſt to the view of the figures, which moſt liuely doe expreſſe their differences; eſpecially becauſe this Volume waxeth great, the deſcription of no moment, and I haſten to an end.

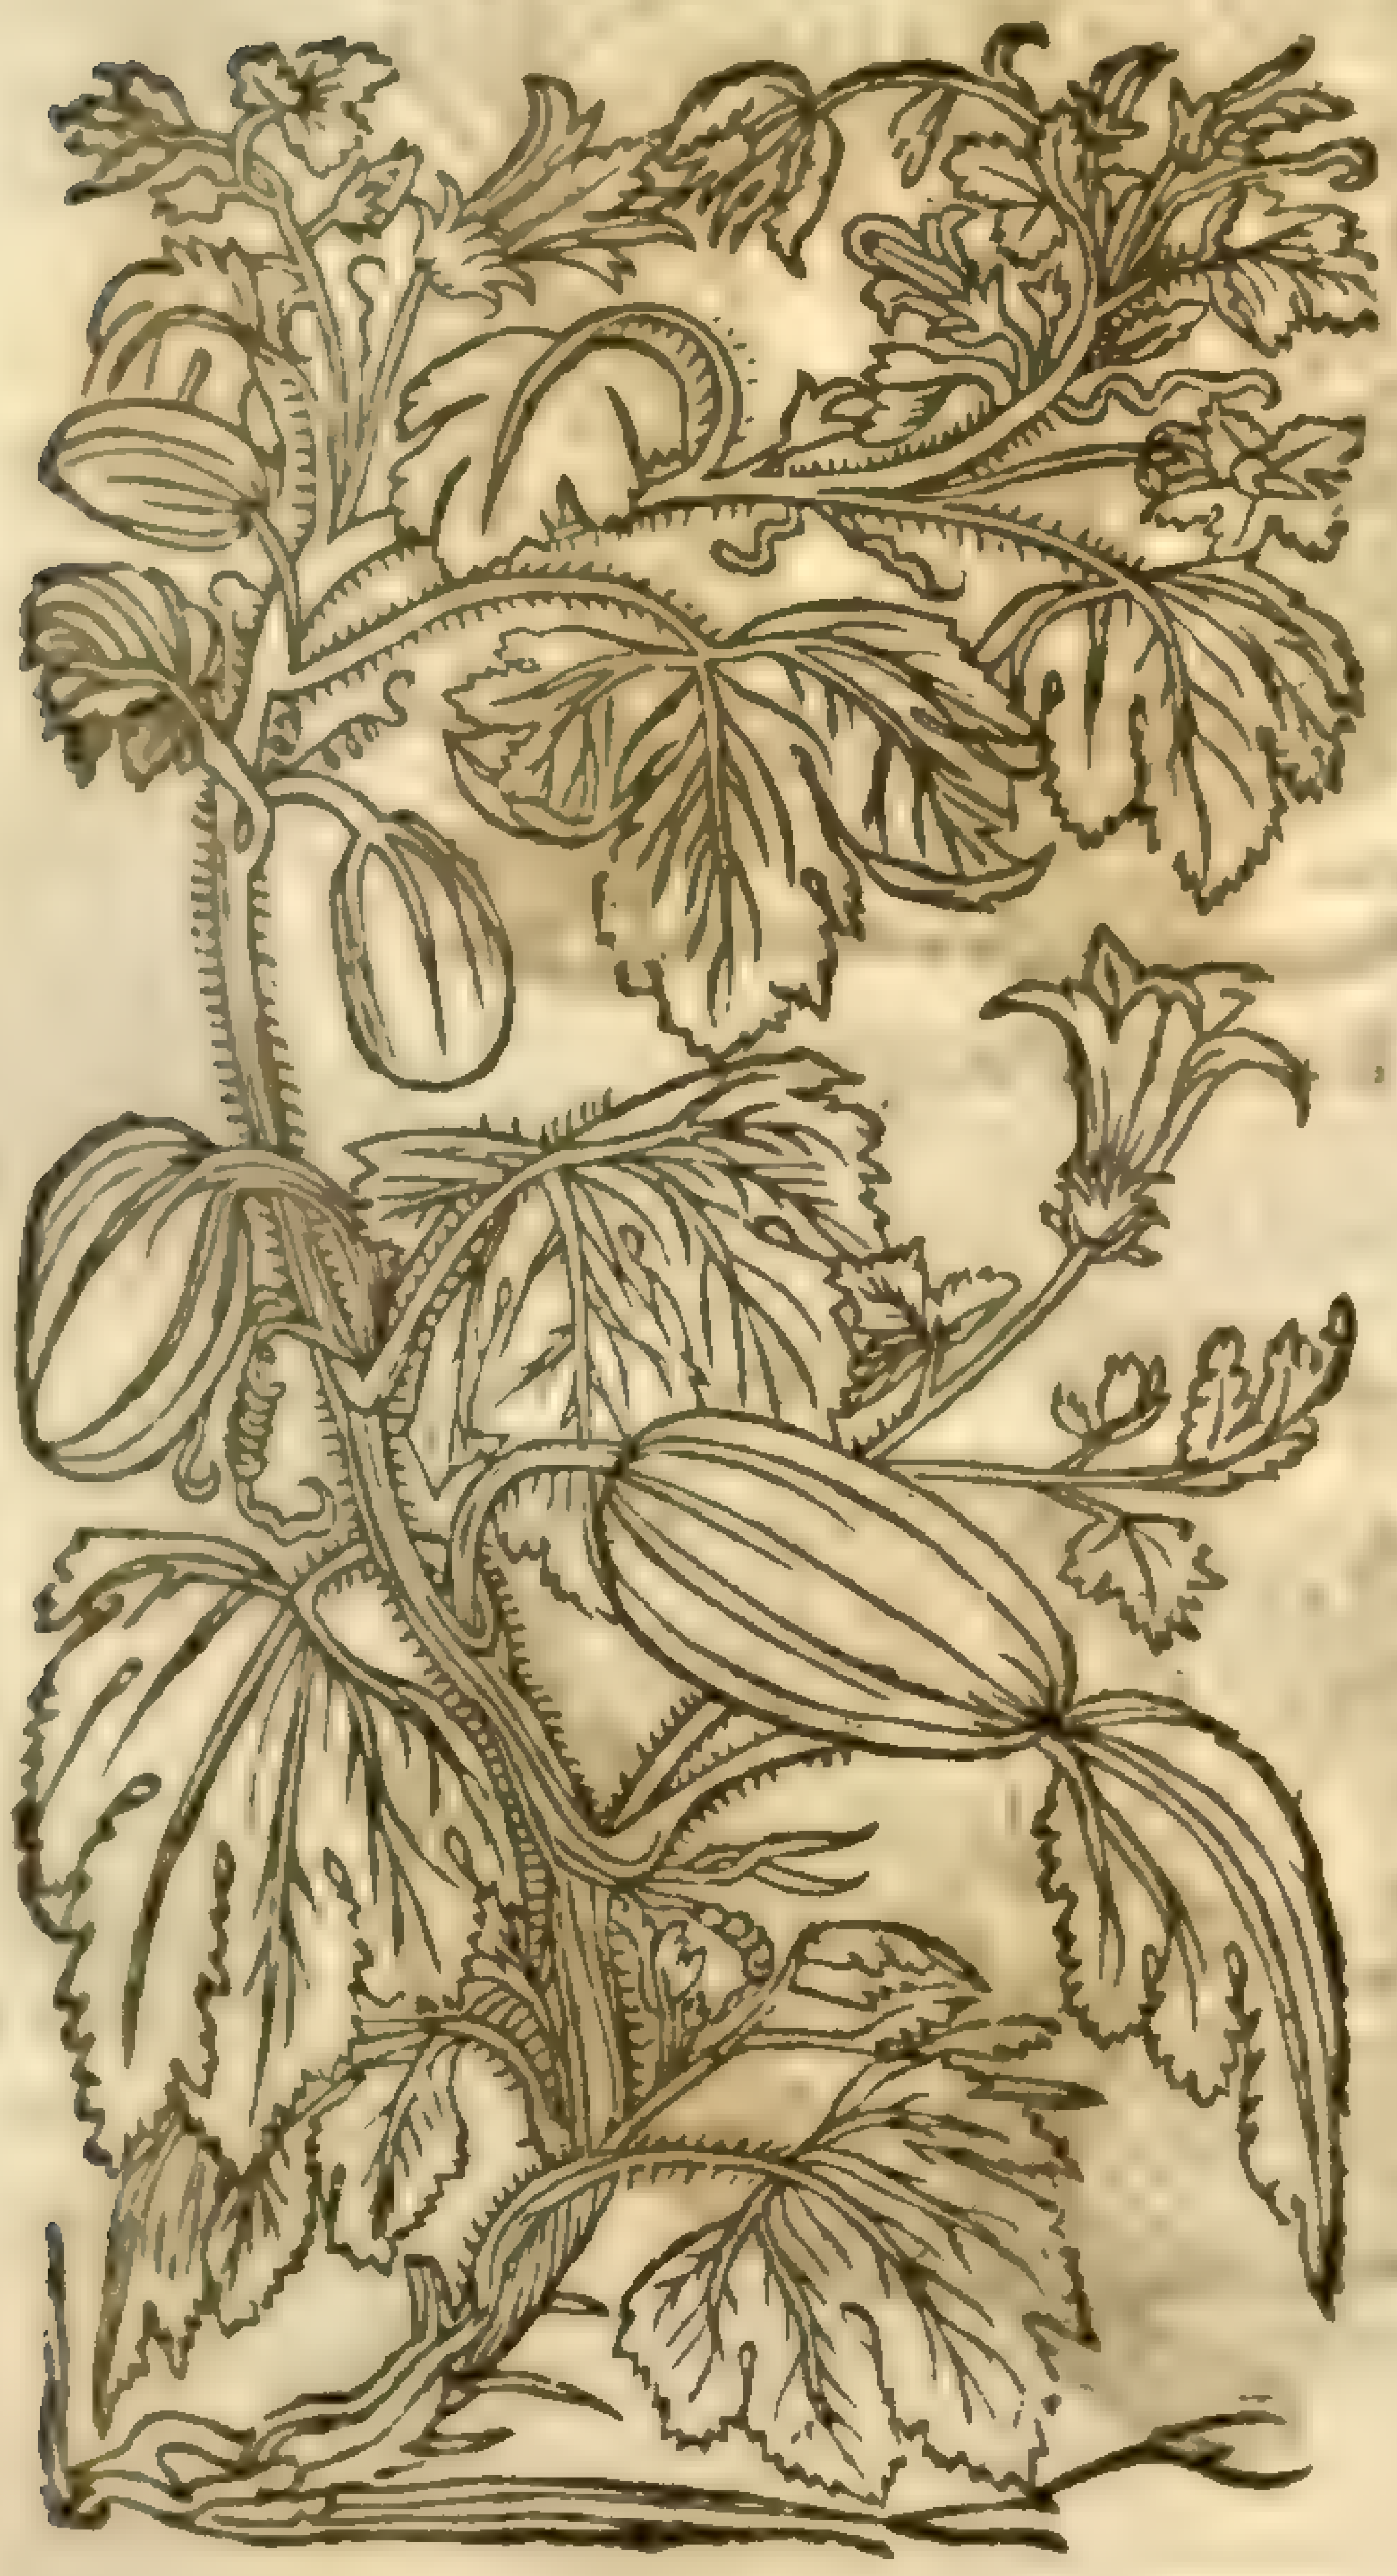
¶ *The Deſcription.*

1 THe great Pompion bringeth forth thicke and rough prickely ſtalkes, which with their claſping tendrels take hold vpon ſuch things as are neere vnto them, as poles, arbours, pales, and ledges, which vnleſſe they were neere vnto them would creep along vpon the ground: the leaues be wide and great, very rough, and cut with certain deep gaſhes, nicked alſo on the edges like a ſaw: the floures be very great like vnto a bell cup, of a yellow colour like gold, hauing fiue corners ſtanding out like teeth: the fruit is great, thicke, round, ſet with thicke ribbs like edges ſticking forth; the pulpe or meat whereof next vnder the rinde is white, and of a mean hardneſſe: the pith or ſubſtance in the middle is ſpongie and ſlimy; the ſeed is great, broad, flat, ſomthing white, much greater than that of the Cucumber, otherwiſe not differing at all in forme. The colour of the barke or rinde is oftentimes of an obſcure green, ſometimes gray. The rinde of the green Pompion is harder, and as it were of a wooddy ſubſtance: the rinde of the gray is ſofter and tenderer.

2 The ſecond kinde of Melons or Pompions is like vnto the former in ſtalkes and leaues, and alſo in claſping tendrels; but the gaſhes of the leaues are not ſo deepe, and the ſtalkes bee tenderer: the floures are in like manner yellow, gaping, cornered at the top, as be thoſe of the former: but the fruit is ſomewhat rounder, ſometimes greater, and many times leſſer; and oftentimes

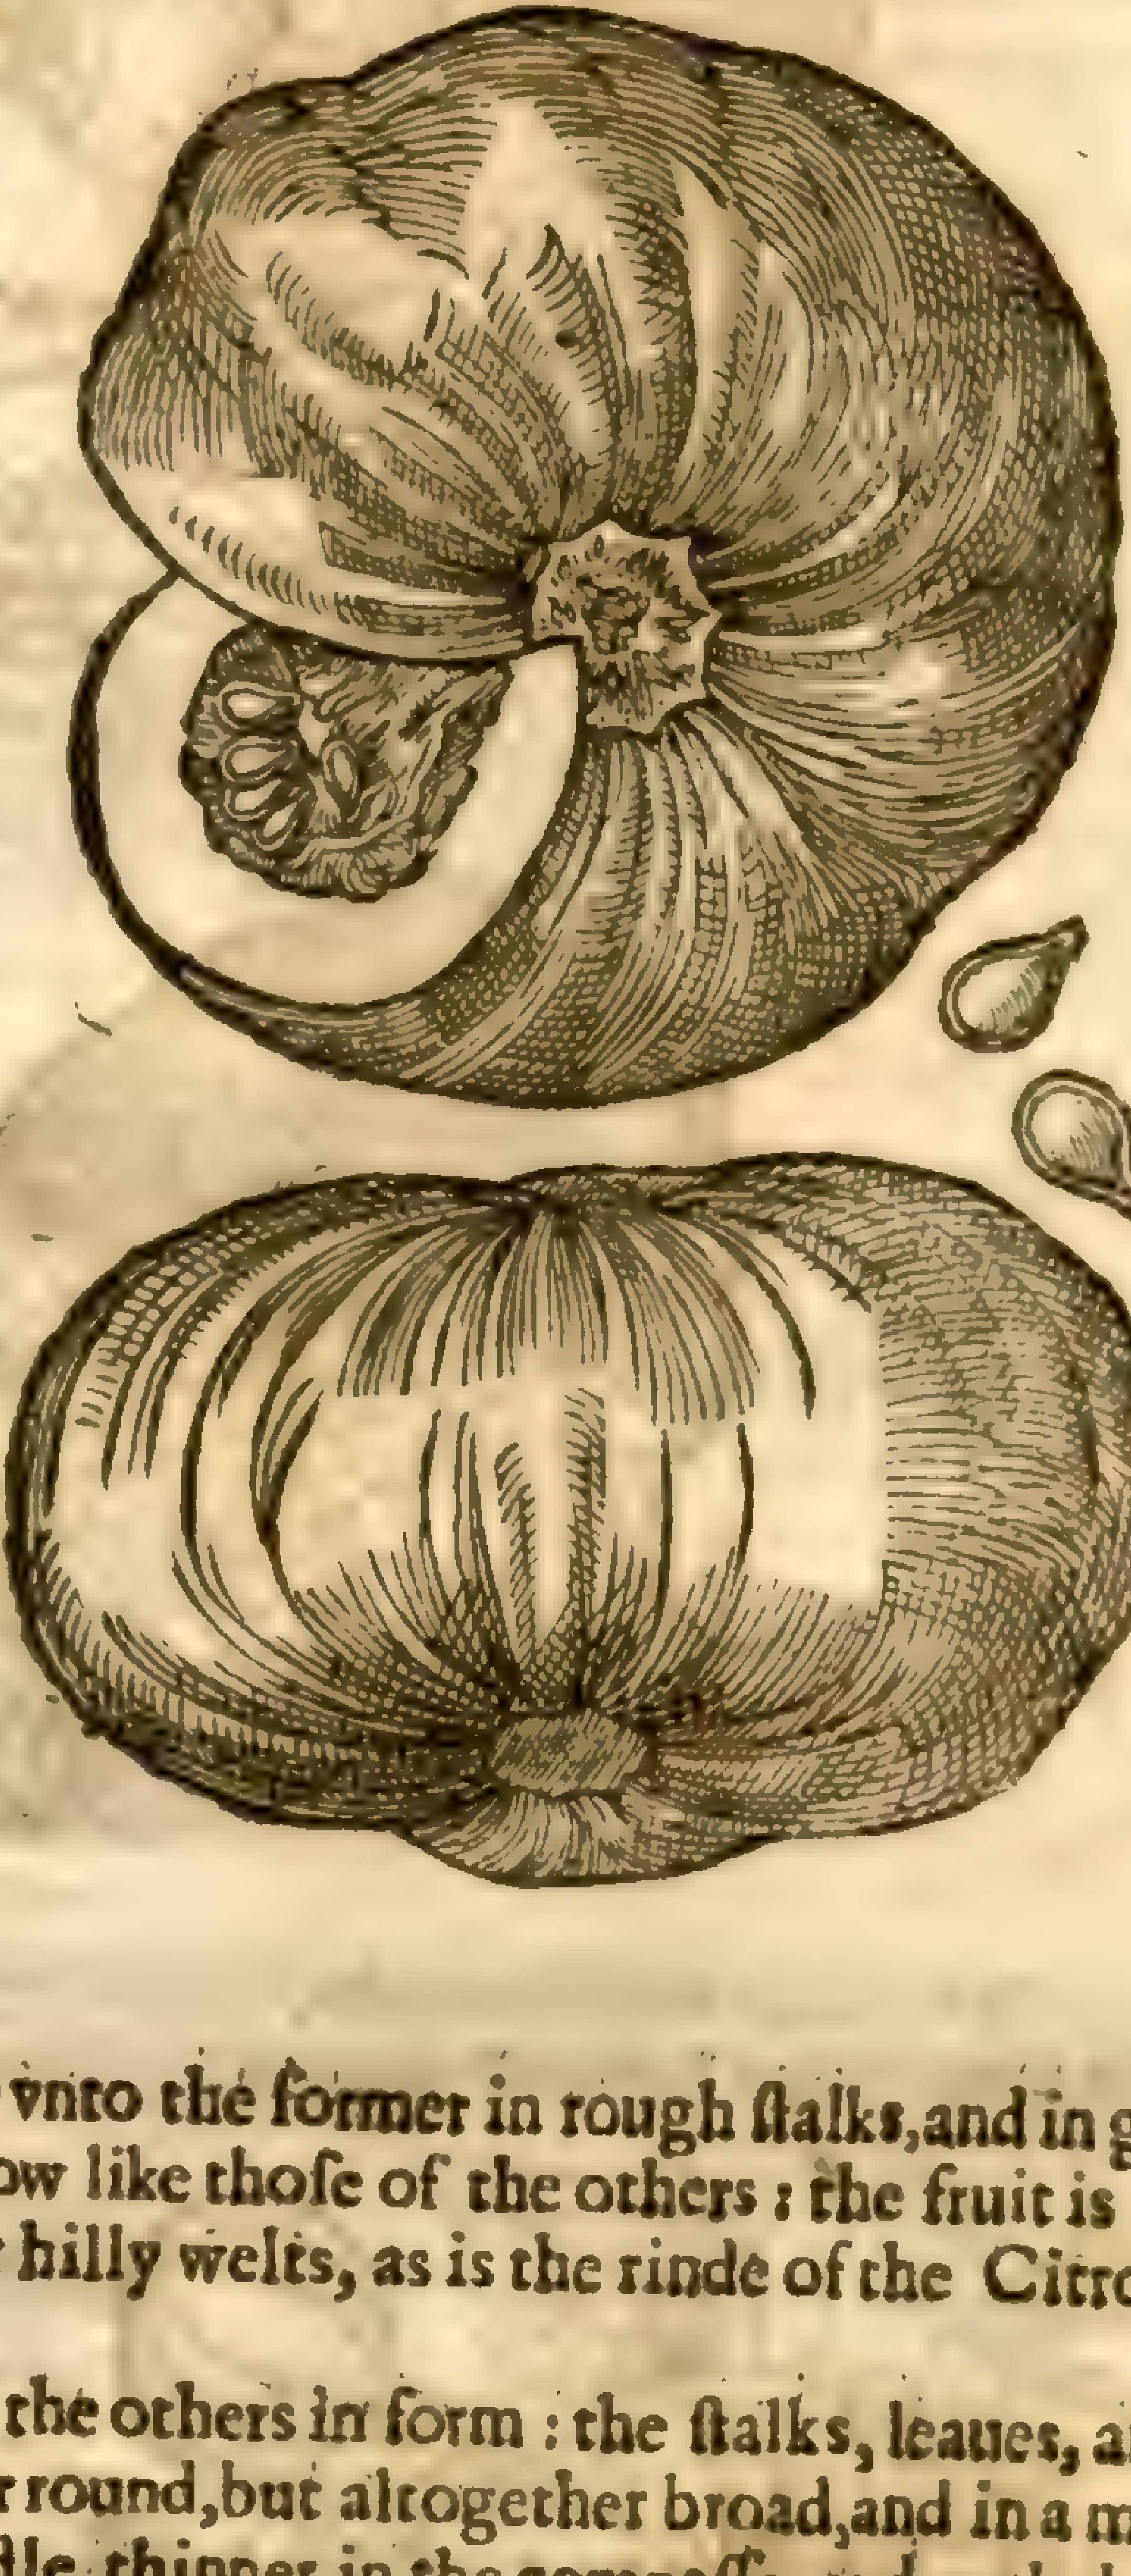
of a green colour, with an harder barke, now and then ſofter and whiter. The meat within is like the former: the ſeeds haue alſo the ſame forme, but are ſomewhat leſſe.

1 *Pepo maximus oblongus.*
The great long Pompion.



2 *Pepo maximus rotundus.*
The great round Pompion.

C. Pepo



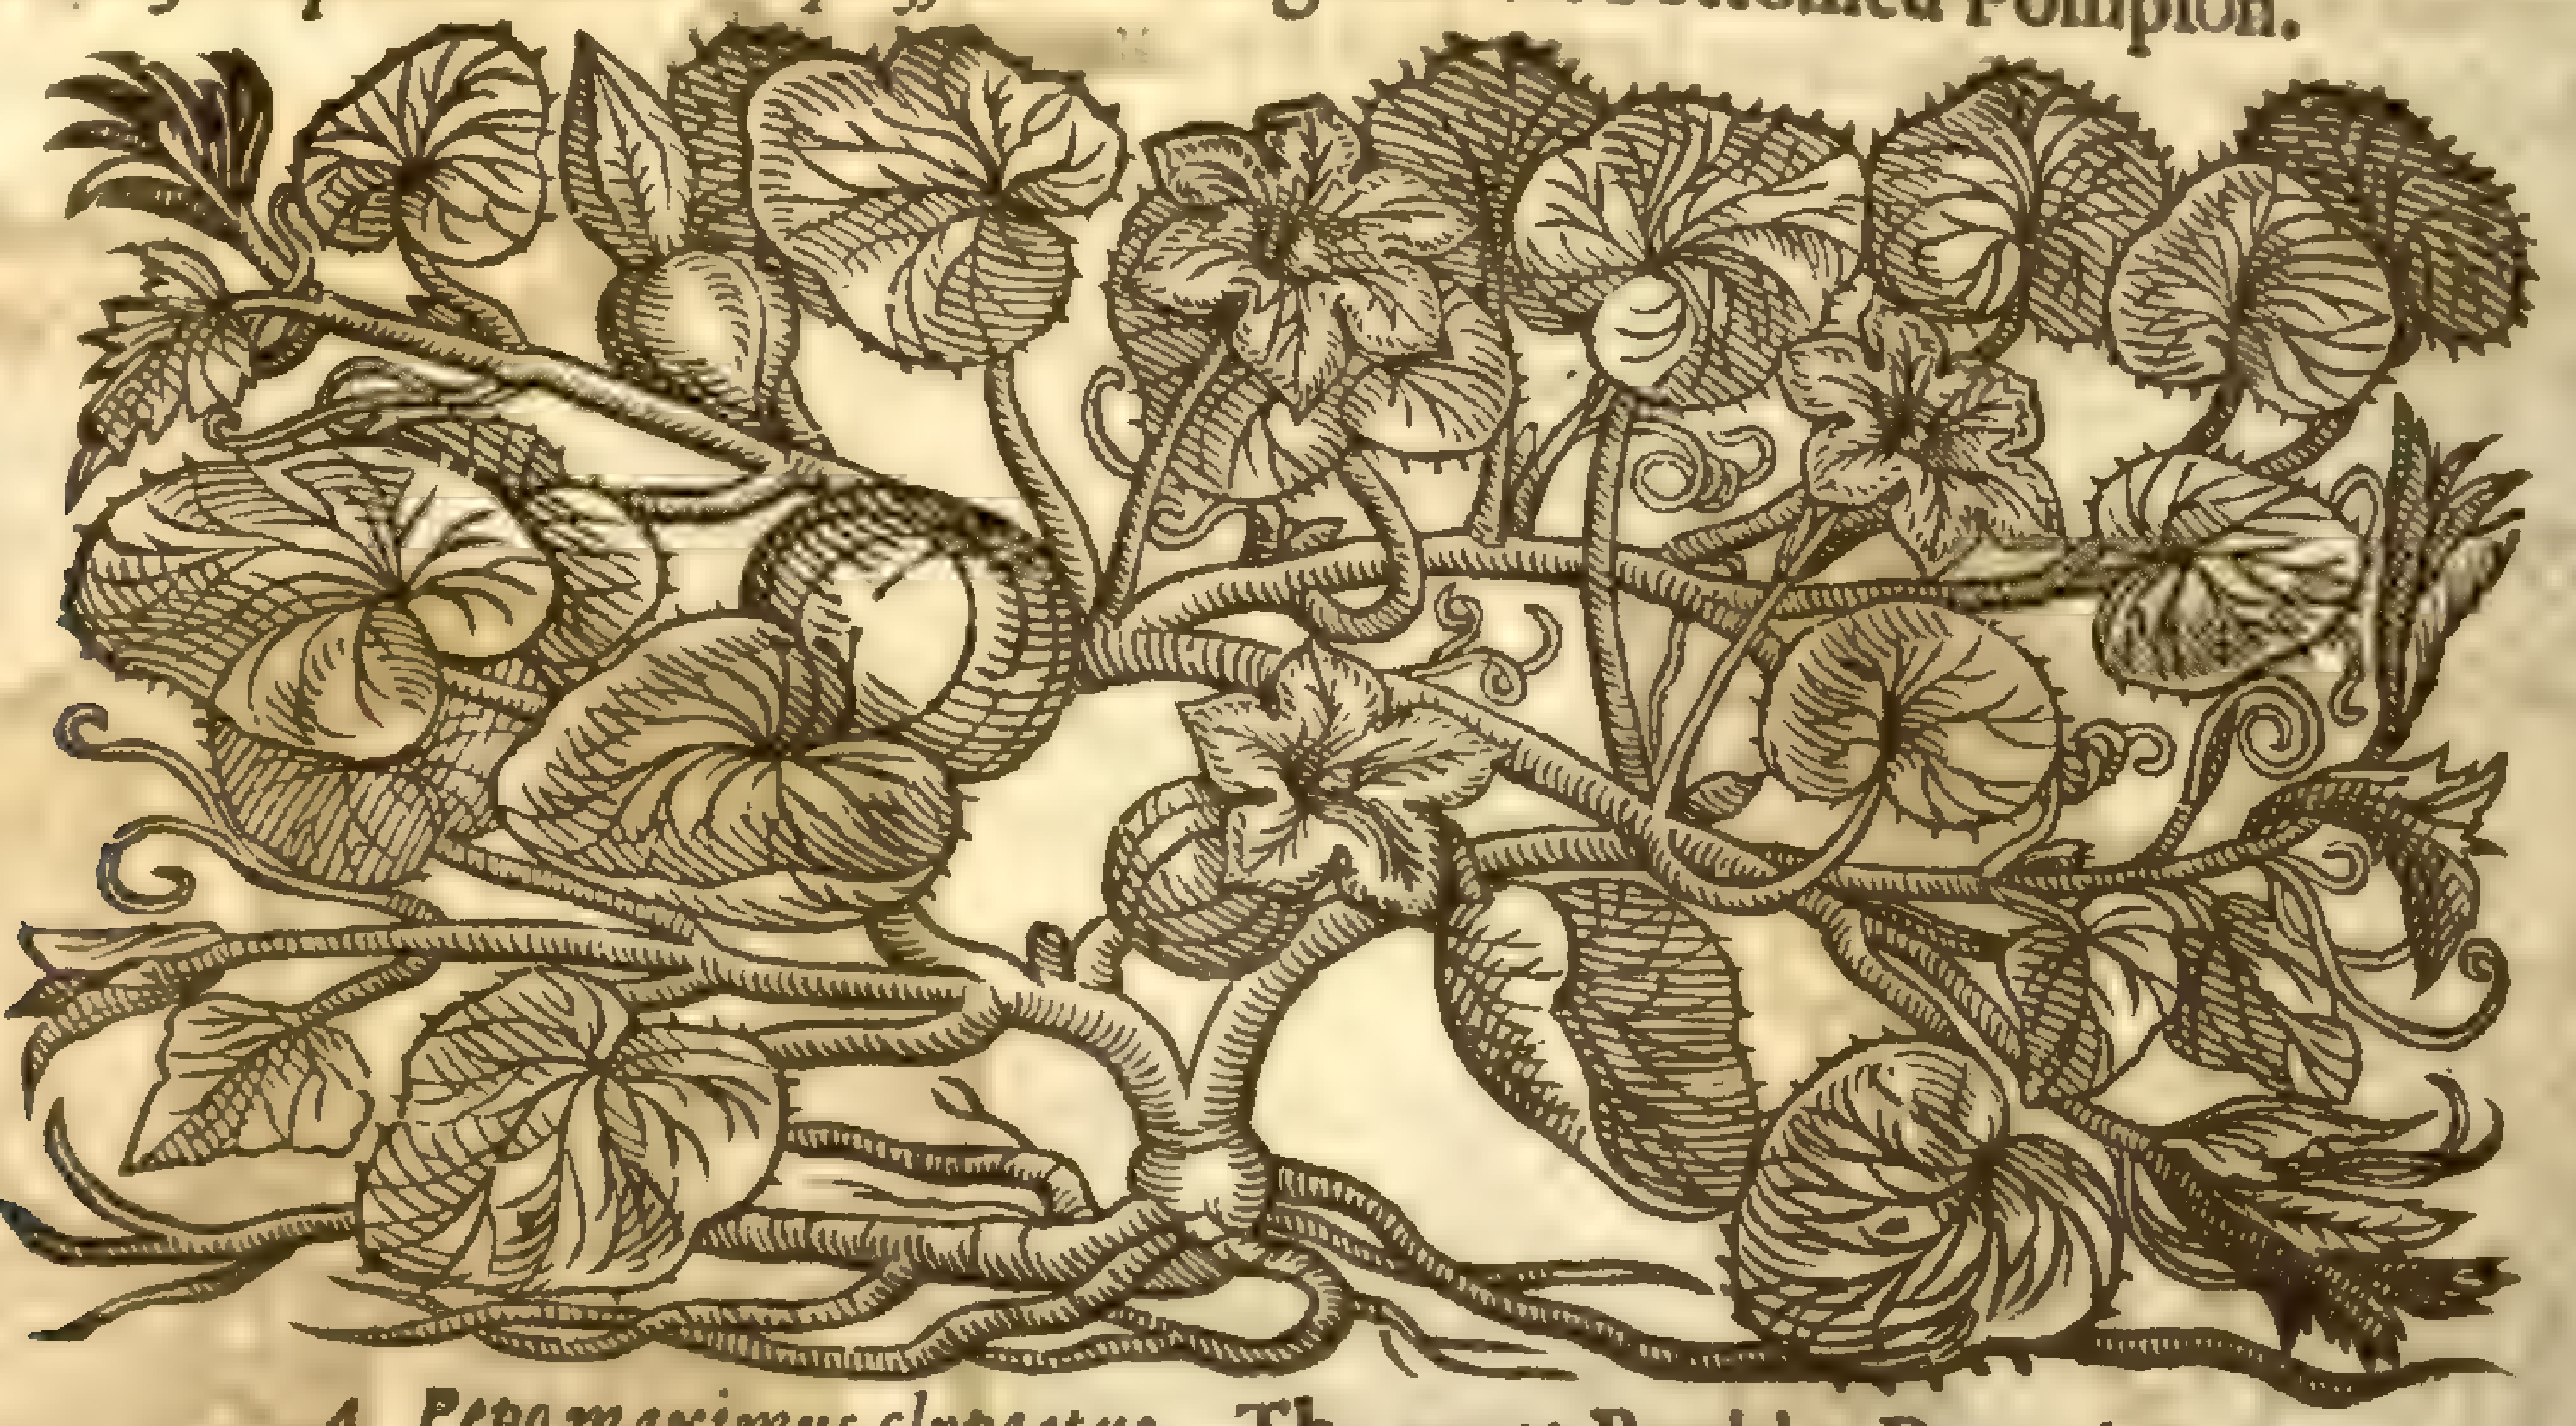
3 Of this kinde there is alſo another Pompion like vnto the former in rough ſtalks, and in gaſhed and nicked leaues: the floure is alſo great and yellow like thoſe of the others: the fruit is of a great bigneſſe, whoſe barke is full of little bunnies or hilly welts, as is the rinde of the Citron, which is in like manner yellow when it is ripe.

4 The fourth Pompion doth very much differ from the others in form: the ſtalks, leaues, and flours are like thoſe of the reſt, but the fruit is not long or round, but altogether broad, and in a maner flat like vnto a ſhield or buckler, thicker in the middle, thinner in the compaſſe, and curled or bumped in certain places about the edges, like the rugged or vneuen barke of the Pomecitron, the which rinde is very ſoft, thin, and white; the meat within is meetly hard and durable: the ſeed is greater than that of the common Cucumber, in forme and colour all one.

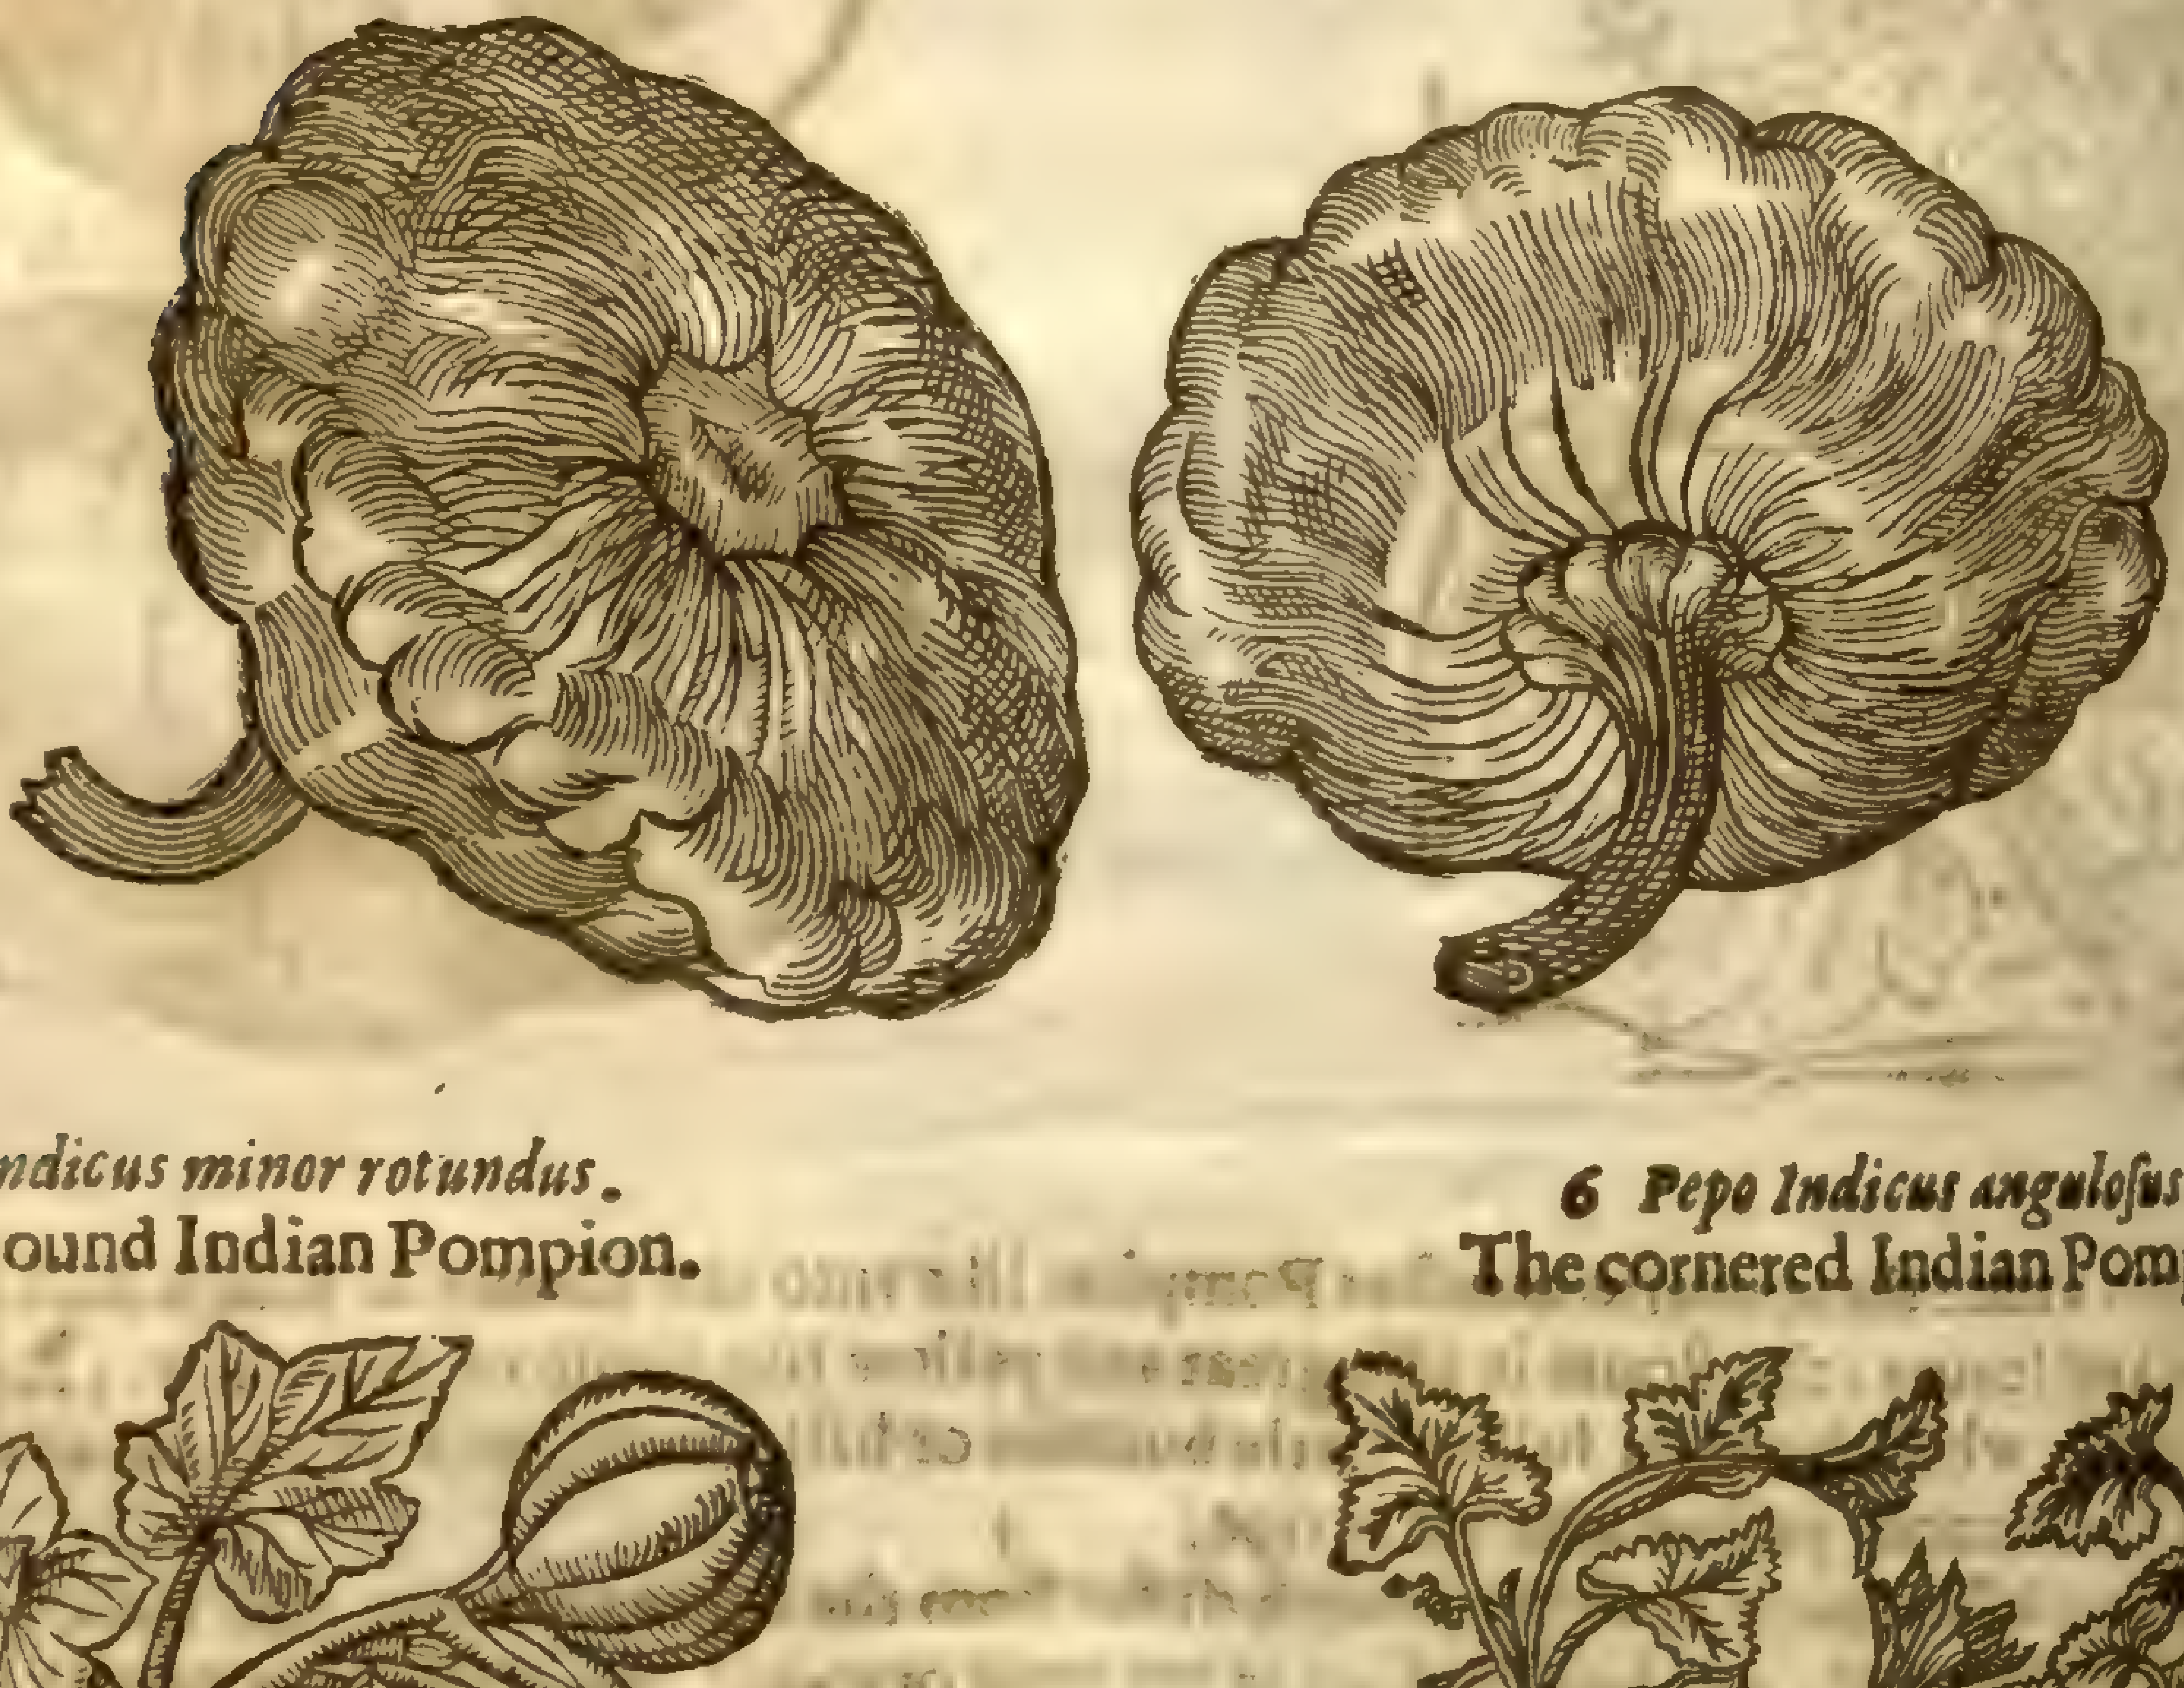
‡ *Macocks Virginiani, ſiue Pepo Virginianus.*
The Virginian Macock or Pompion.

‡ This hath rough cornered ſtraked trailing branches proceeding from the root, eight or nine foot long or longer, and thoſe again diuided into other branches of a blackiſh greene colour, trailing, ſpreading, or running alongſt the earth, couering a great deale of ground, ſending forth broad cornered rough leaues, on great groſſe long rough hairy footſtalks, like & fully as big as the leaues of the common Pompion, with claſping tendrels and great broad ſhriueled yellow flours alſo like thoſe of the common Pompion: the fruit ſucceedeth growing alongſt the ſtalks, commonly not neere the root, but towards the vpper part or tops of the branches, ſomewhat round, not extending in length, but flat like a bowle, but not ſo big as an ordinarie bowle, beeing ſeldome foure inches broad, and three inches long, of a blackiſh green colour when it is ripe. The ſubſtance or eatable part is of a yellowiſh white colour, containing in the middeſt a great deale of pulp or ſoft matter, wherein the ſeed lieth in certain rowes alſo, like the common Pompion, but ſmaller. The root is made of many whitiſh branches creeping far abroad in the earth, and periſh at the firſt approch of Winter.

3 *Pepo maximus compreſſus.* The great flat bottomed Pompion.

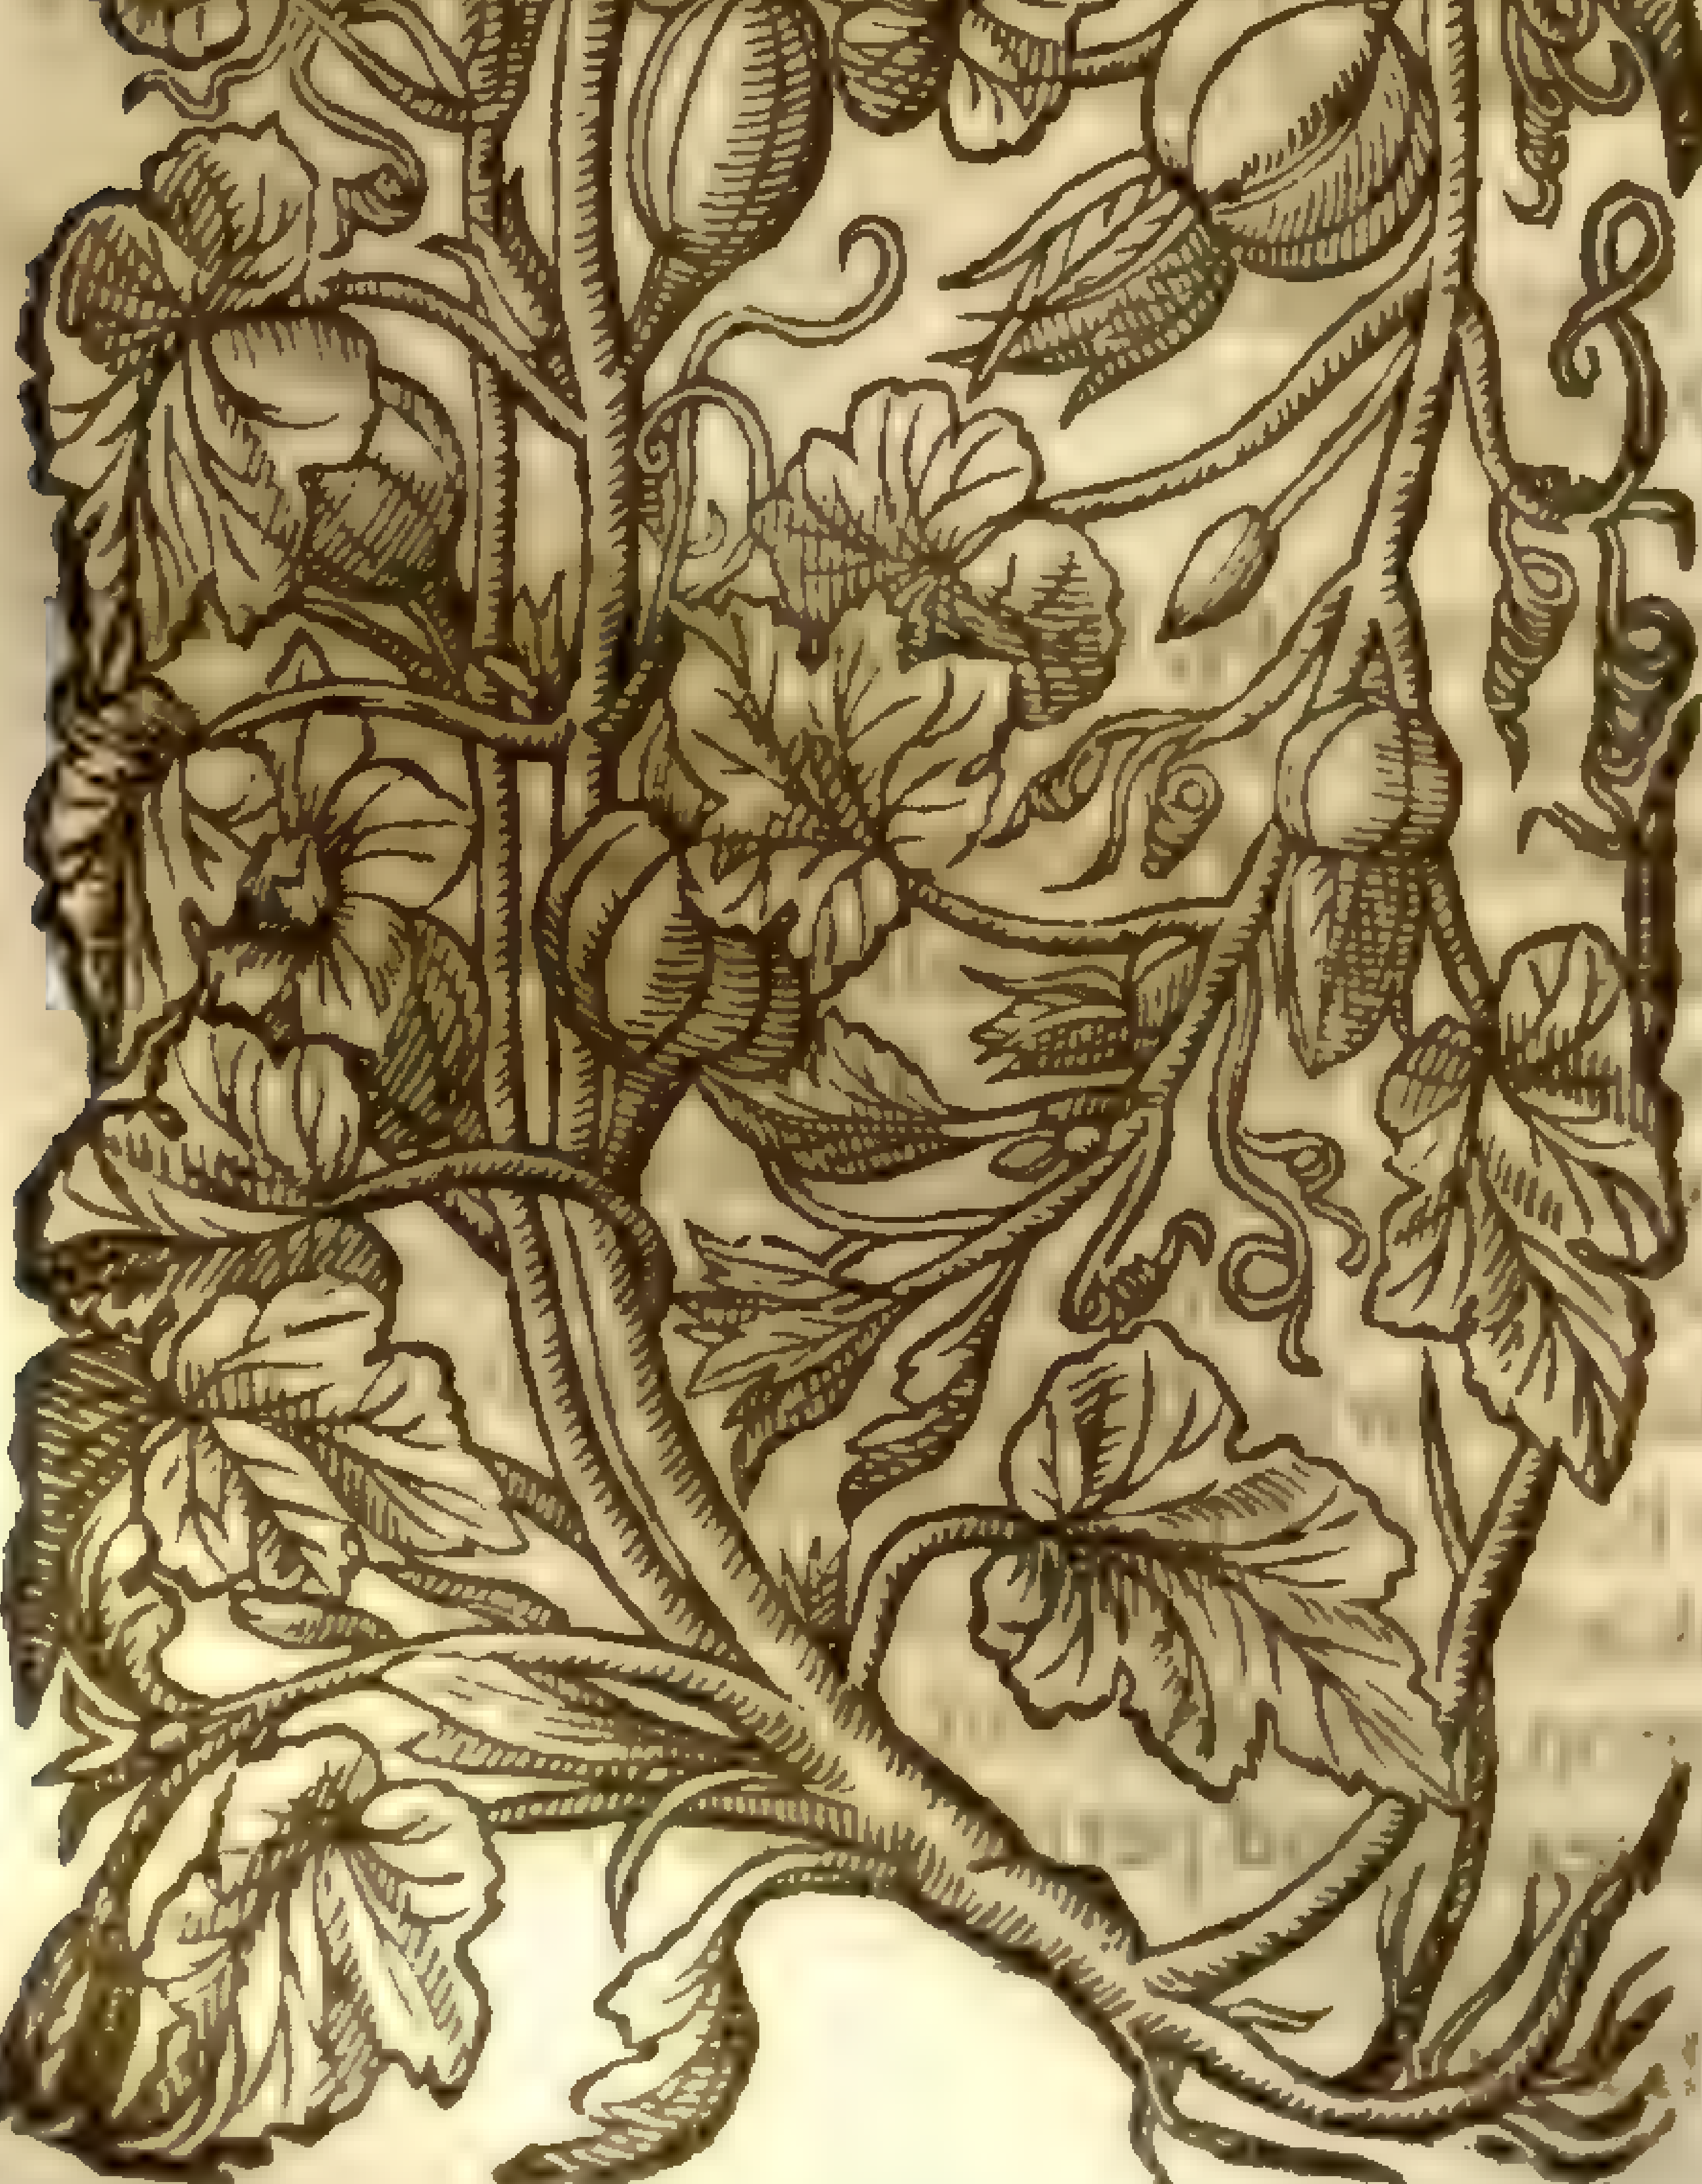


4 *Pepo maximus clypeatus.* The great Buckler Pompion.

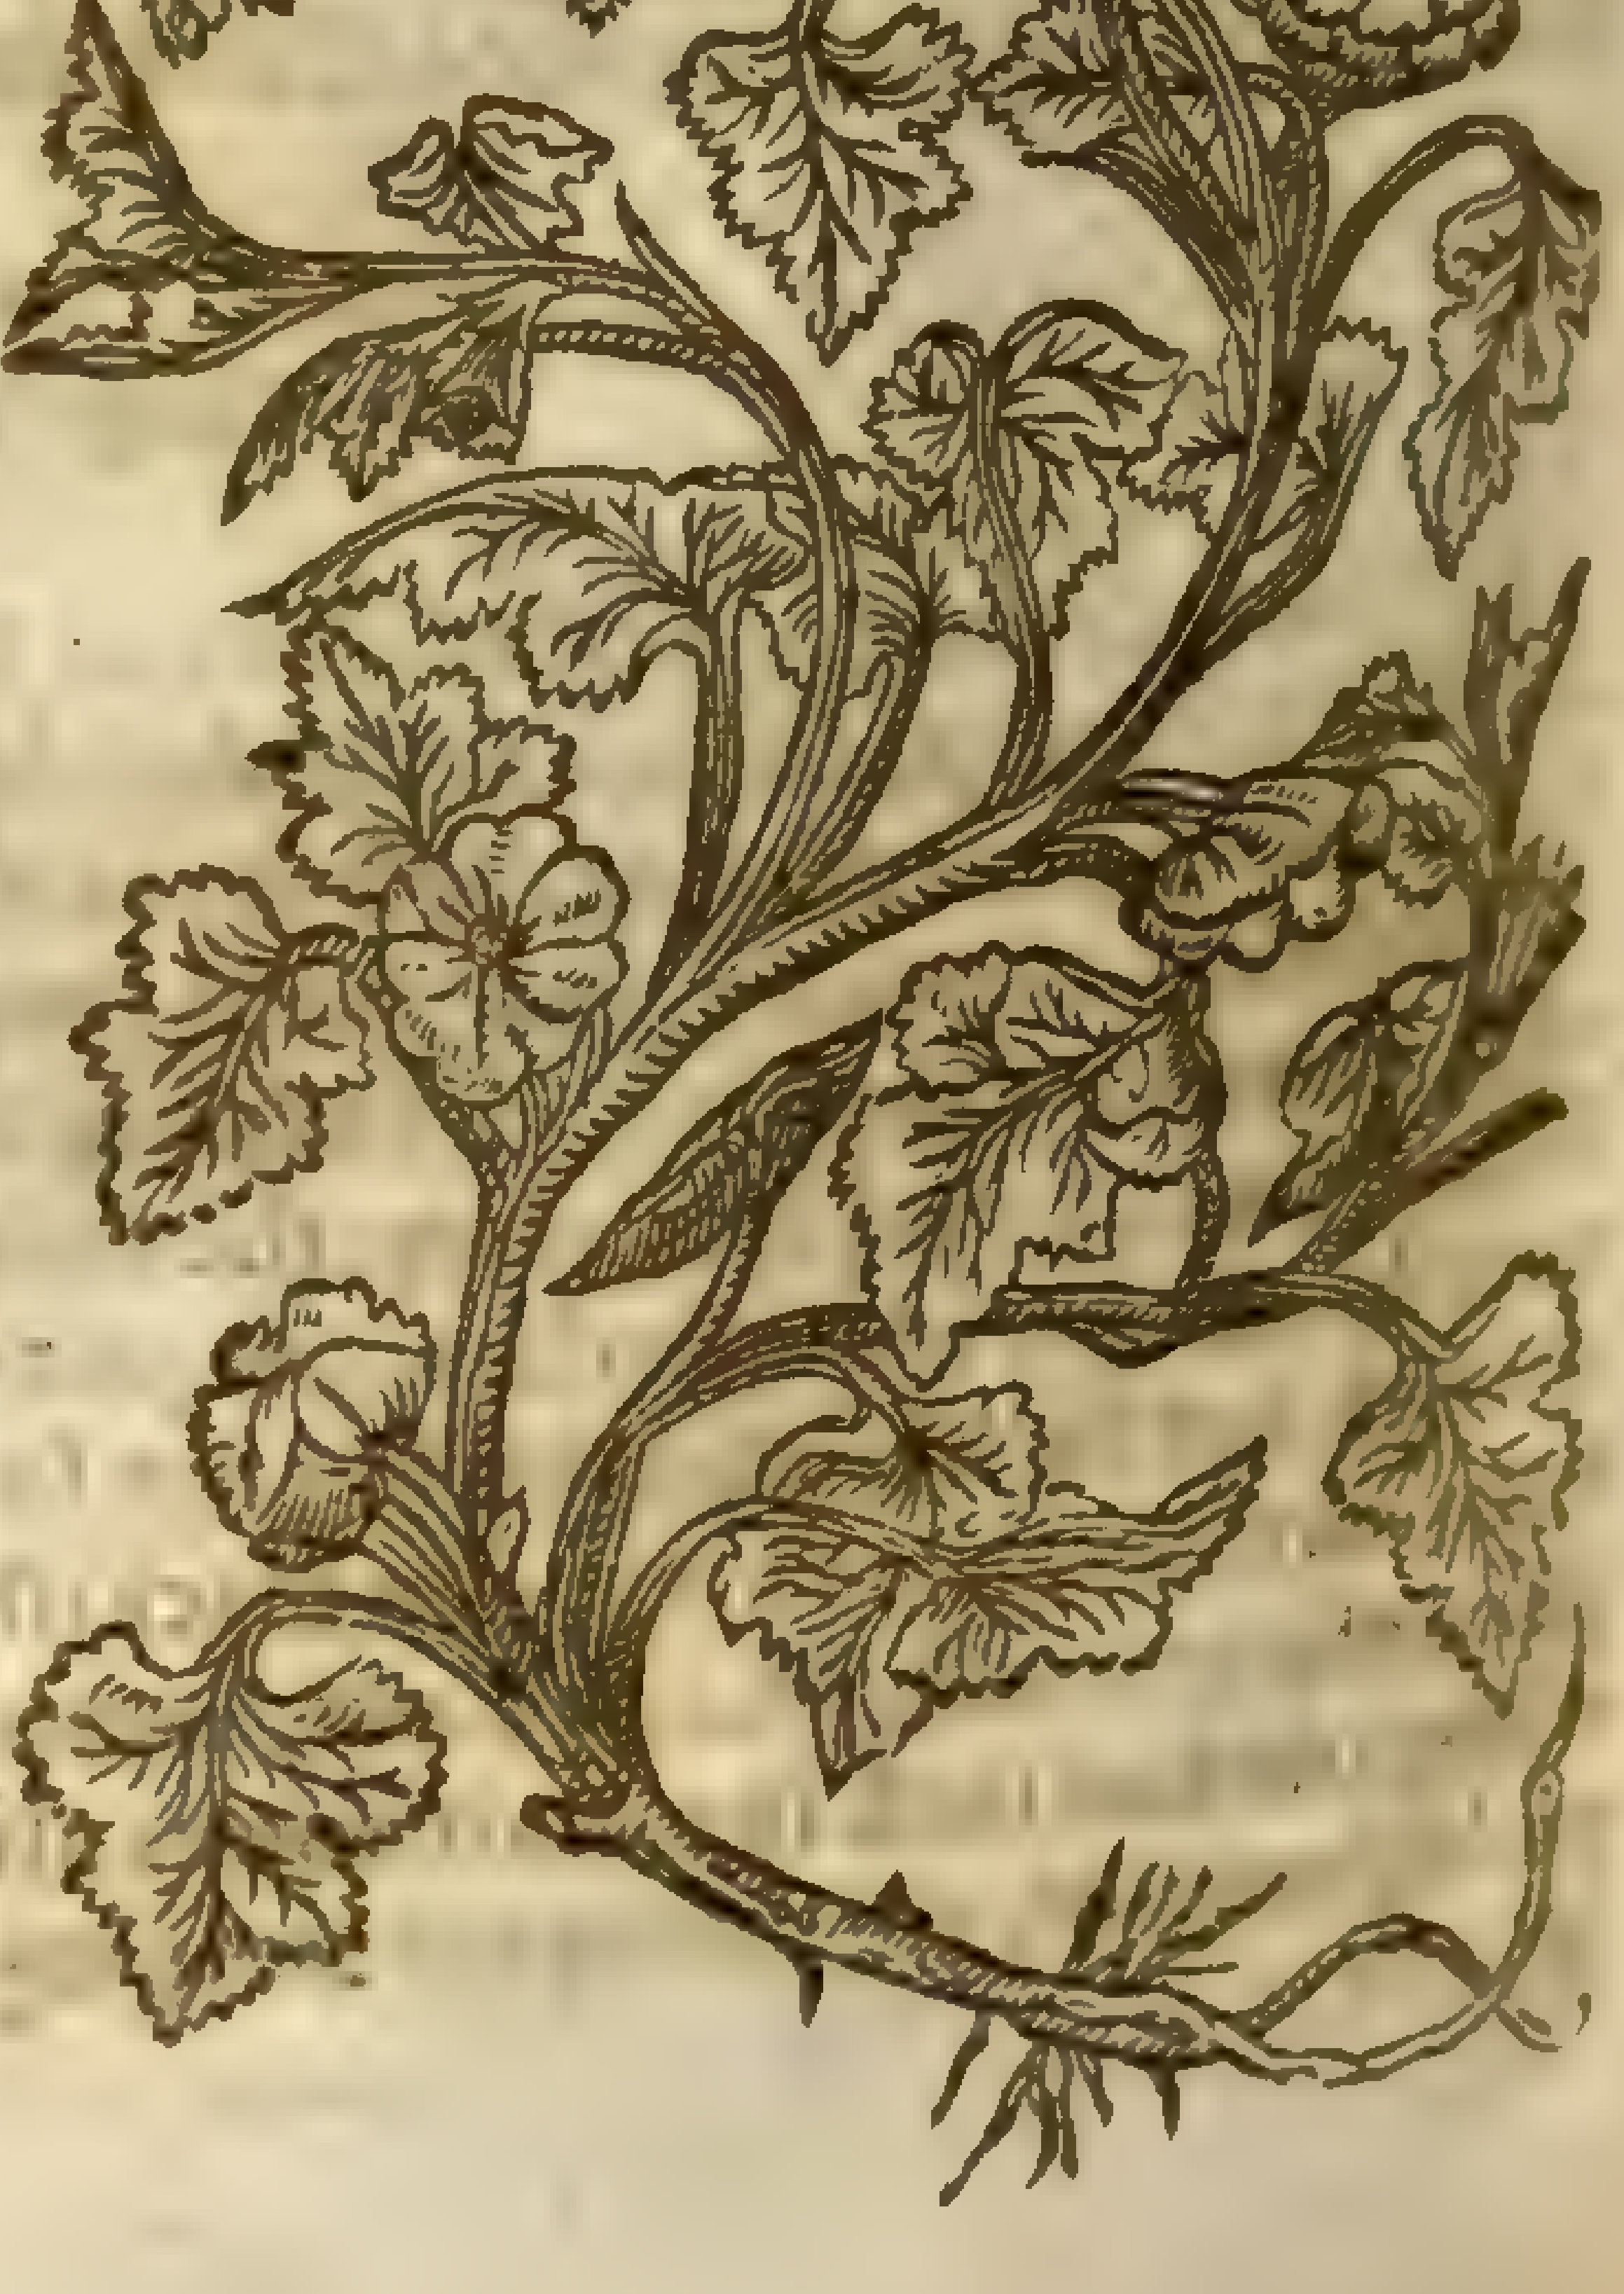


Cucurbita melopepo, L.
Vide dub.

5 *Pepo Indicus minor rotundus.*
The ſmall round Indian Pompion.



6 *Pepo Indicus anguloſus.*
The cornered Indian Pompion.



Melones aquatici edules Virginiani.
The Virginian water-Melon.

This Melon or Pompion is like and fully as big as the common Pompion, in ſpreading running creeping branches, leaues, floures, and claſping tendrels: the fruit is of a very blackiſh greene colour, and extendeth it ſelfe in length neere foure inches, and three inches broad, no bigger nor longer than a great apple, and grow alongſt the branches forth of the boſomes of the leaues, not farre from the root, euen to the tops of the branches, containing a ſubſtance, pulp, and flat ſeed like the ordinarie Pompion: the root is whitiſh, and diſperſeth it ſelfe very far abroad in the earth, and periſheth about the beginning of Winter. Octob. 10. 1621. *Iohn Goodyer.* ‡

¶ *The Place.*

All theſe Melons or Pompions be garden plants: they ioy beſt in a fruitfull ſoile, and are common in England, except the laſt deſcribed, which is as yet a ſtranger.

¶ *The Time.*

They are planted in the beginning of Aprill: they floure in Auguſt: the fruit is ripe in September.

¶ *The Names.*

The great Melon or Pompion is named in Greek Πέπων: in Latine likewiſe *Pepo*: the fruits of them all when they be ripe are called by a common name in Greeke, πέπονες: in Engliſh, Melons, or Pompions. Whereupon certain Phyſitions (ſaith *Galen*) haue contended, that this fruit ought to be called Σικυοπέπων, that is to ſay in Latine, *Pepo Cucumeralis*, or Cucumber. *Pliny, lib. 9. cap. 5.* writes, That *Cucumeres* when they exceed in greatneſſe are called *Pepones*: it is called in high-Dutch, **Pluher**: in low-Dutch, **Pepoenen**: in French, *Pompons.*

¶ *The Nature and Vertues.*

All the Melons are of a cold nature, with plenty of moiſture: they haue a certain clenſing qualitie, by means whereof they prouoke vrine, and do more ſpeedily paſſe through the body than doe either the Gourd, Citron, or Cucumber, as *Galen* hath written. A

The pulp of the Pompion is neuer eaten raw, but boiled; for ſo it doth more eaſily deſcend, making the belly ſoluble. The nouriſhment which comes hereof is little, thin, moiſt, and cold, bad, as *Galen* ſaith, and that eſpecially when it is not well digeſted; by reaſon whereof it maketh a man apt and ready to fall into the diſeaſe called the Cholericke paſſion, or Felonie. B

The ſeed clenſeth more than the meat, it prouoketh vrin, and is good for thoſe that are troubled with the ſtone of the kidnies. C

The fruit boiled in milke and buttered, is not only a good and wholſome meat for mans bodie, but ſo prepared, it is alſo a phyſical medicine for ſuch as haue an hot ſtomack, and the inward parts inflamed. D

The fleſh or pulp of the ſame ſliced and fried in a pan with butter, is alſo a good and wholſome meat: but baked with apples in an ouen, it fills the body with flatuous or windy belchings, and is food vtterly vnwholſome for ſuch as liue idlely; but vnto robuſtious and ruſticke people nothing hurteth that filleth the belly. E

Chap. 346. *Of wilde Pompions.*

¶ *The Deſcription.*

1 As there is a wilde ſort of Cucumbers, of Melons, Citrons, and Gourds, ſo likewiſe are there certain wilde Pompions that be ſo of their own nature. Theſe bring forth rough ſtalks ſet with ſharp thorny prickles: the leaues be likewiſe rough, the floures yellow, as be thoſe of the garden Melon, but euery part is leſſer: the root is thicke, round, and ſharpe pointed, hauing a hard green rinde; the pulpe or meat whereof, and the middle pith, with the ſeed, are like thoſe of the garden Pompion, but very bitter in taſte.

2 The ſecond is like vnto the former, but it is altogether leſſe, wherein conſiſts the difference.

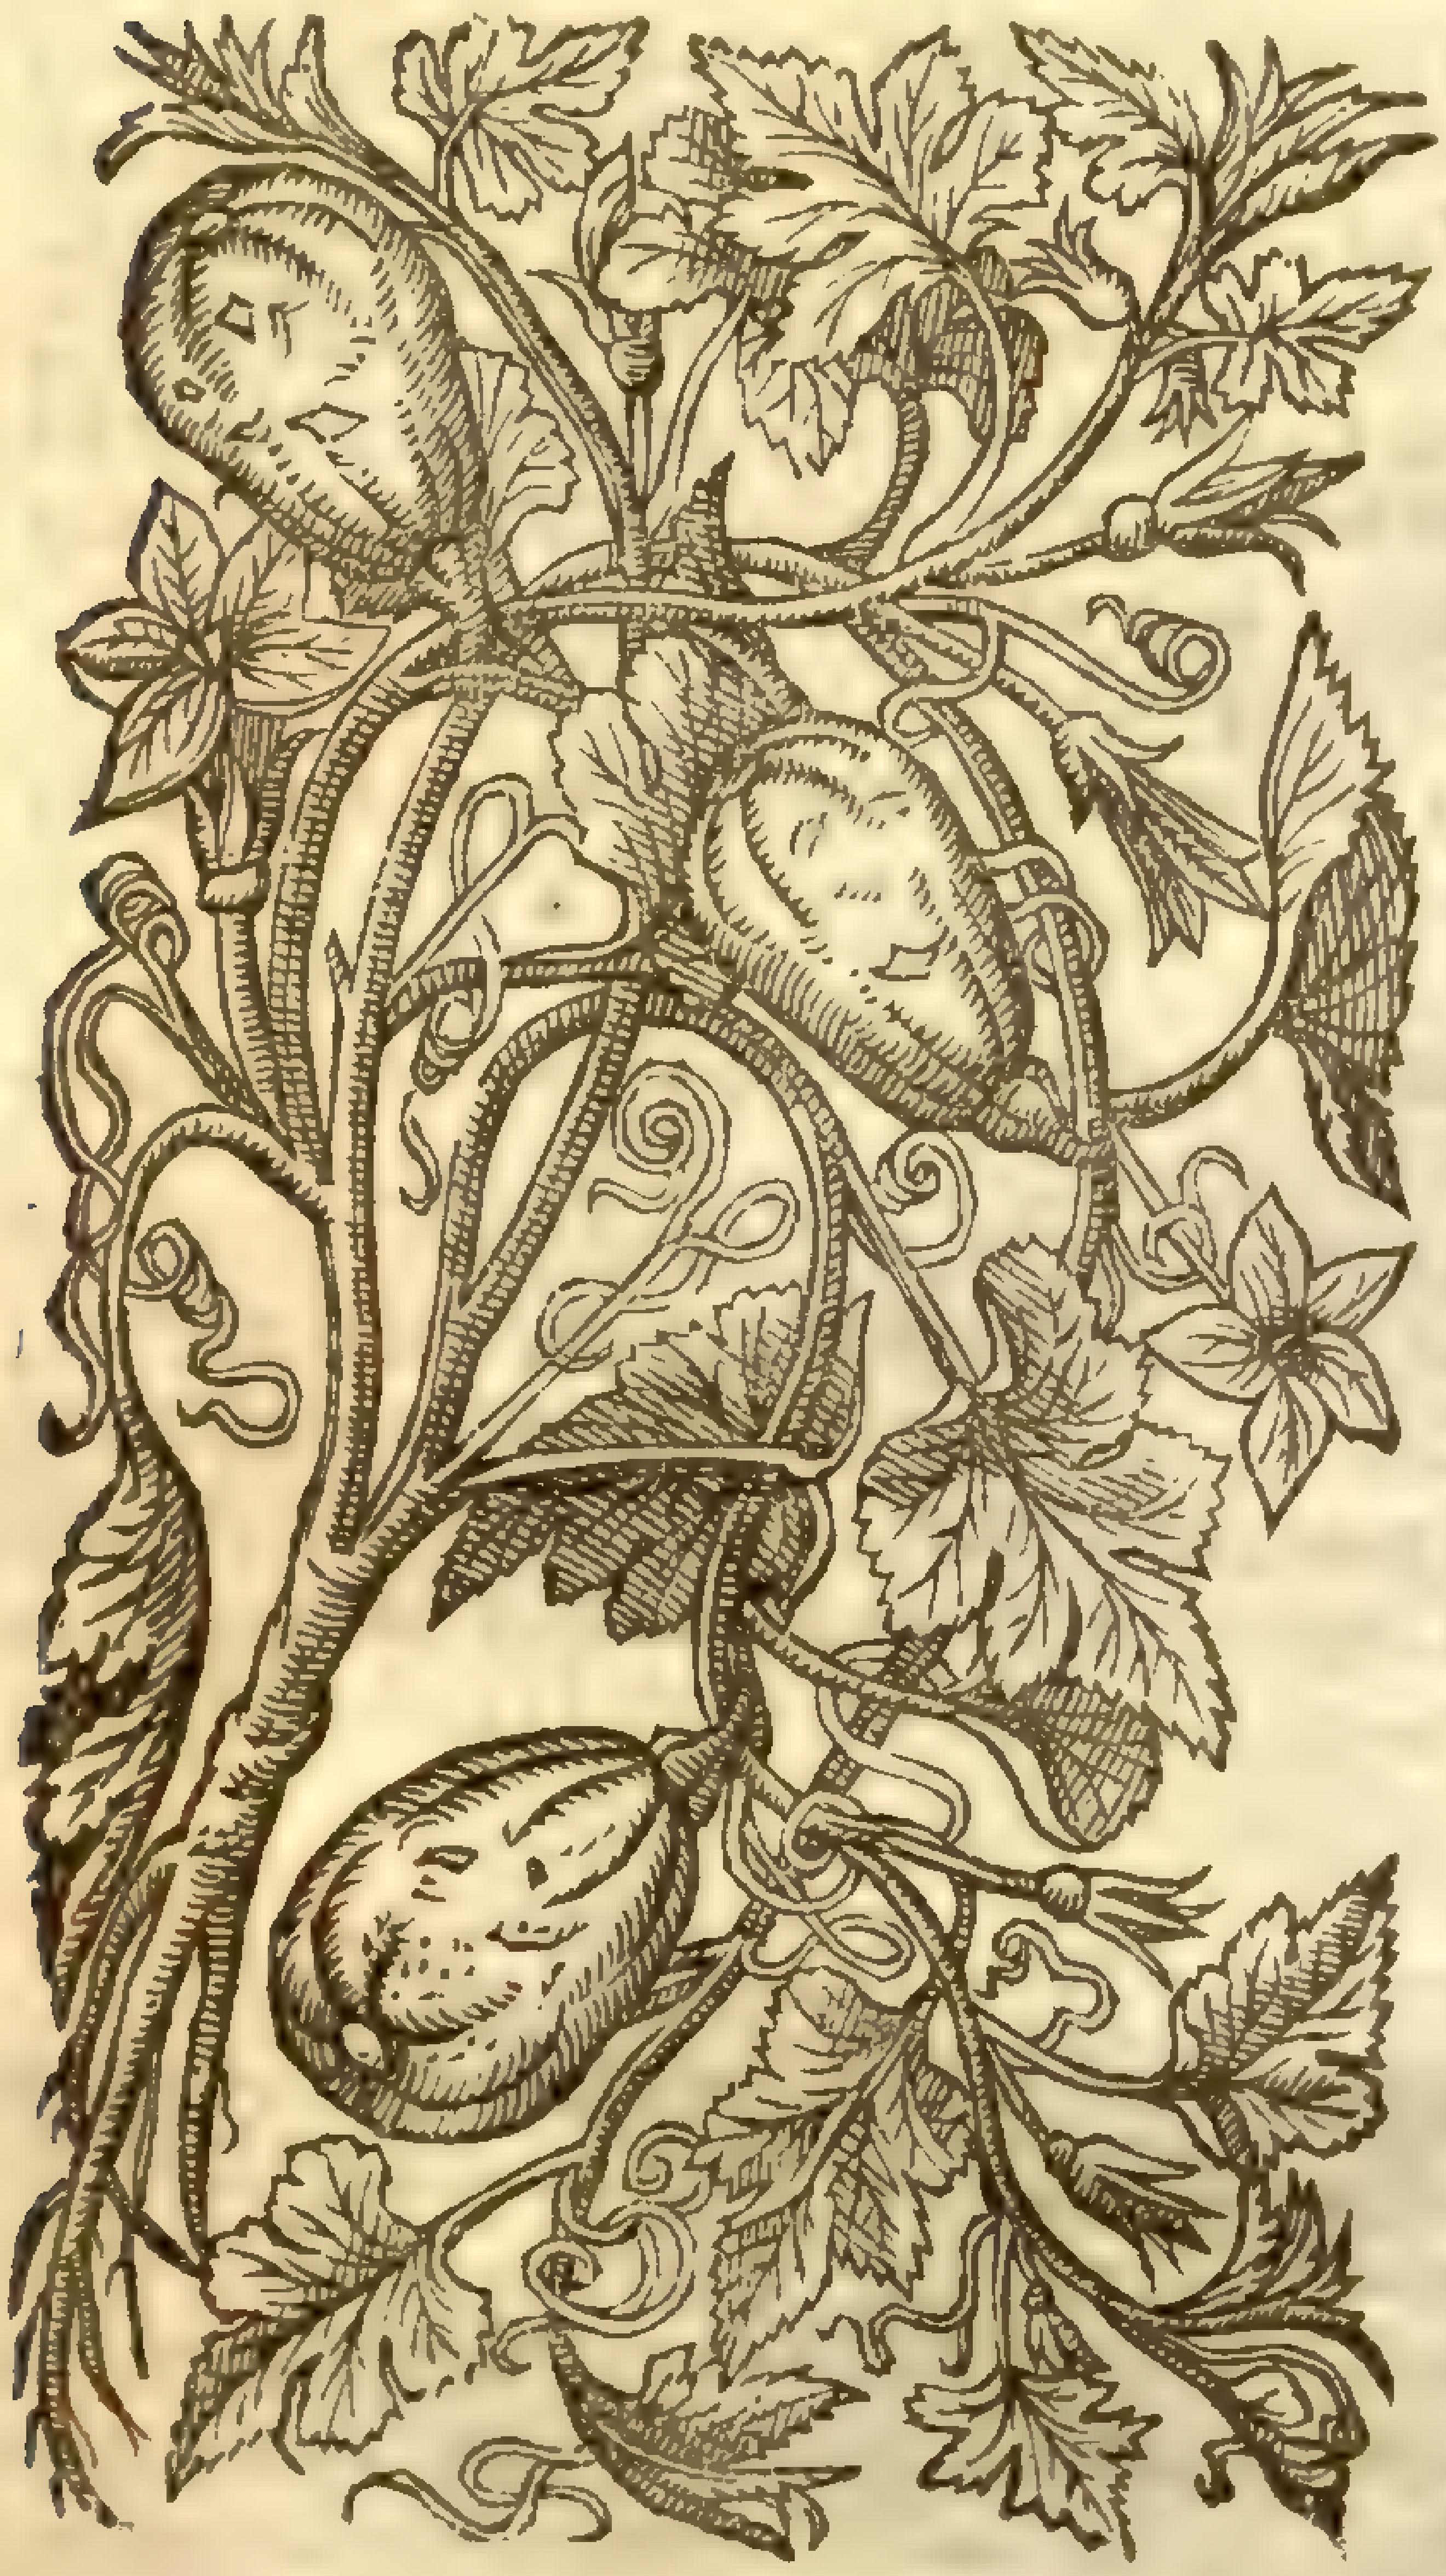
¶ *The Place.*

Theſe Melons grow wilde in Barbarie, Africa, and moſt parts of the Eaſt and Weſt Indies: they grow not in theſe parts, except they be ſowne.

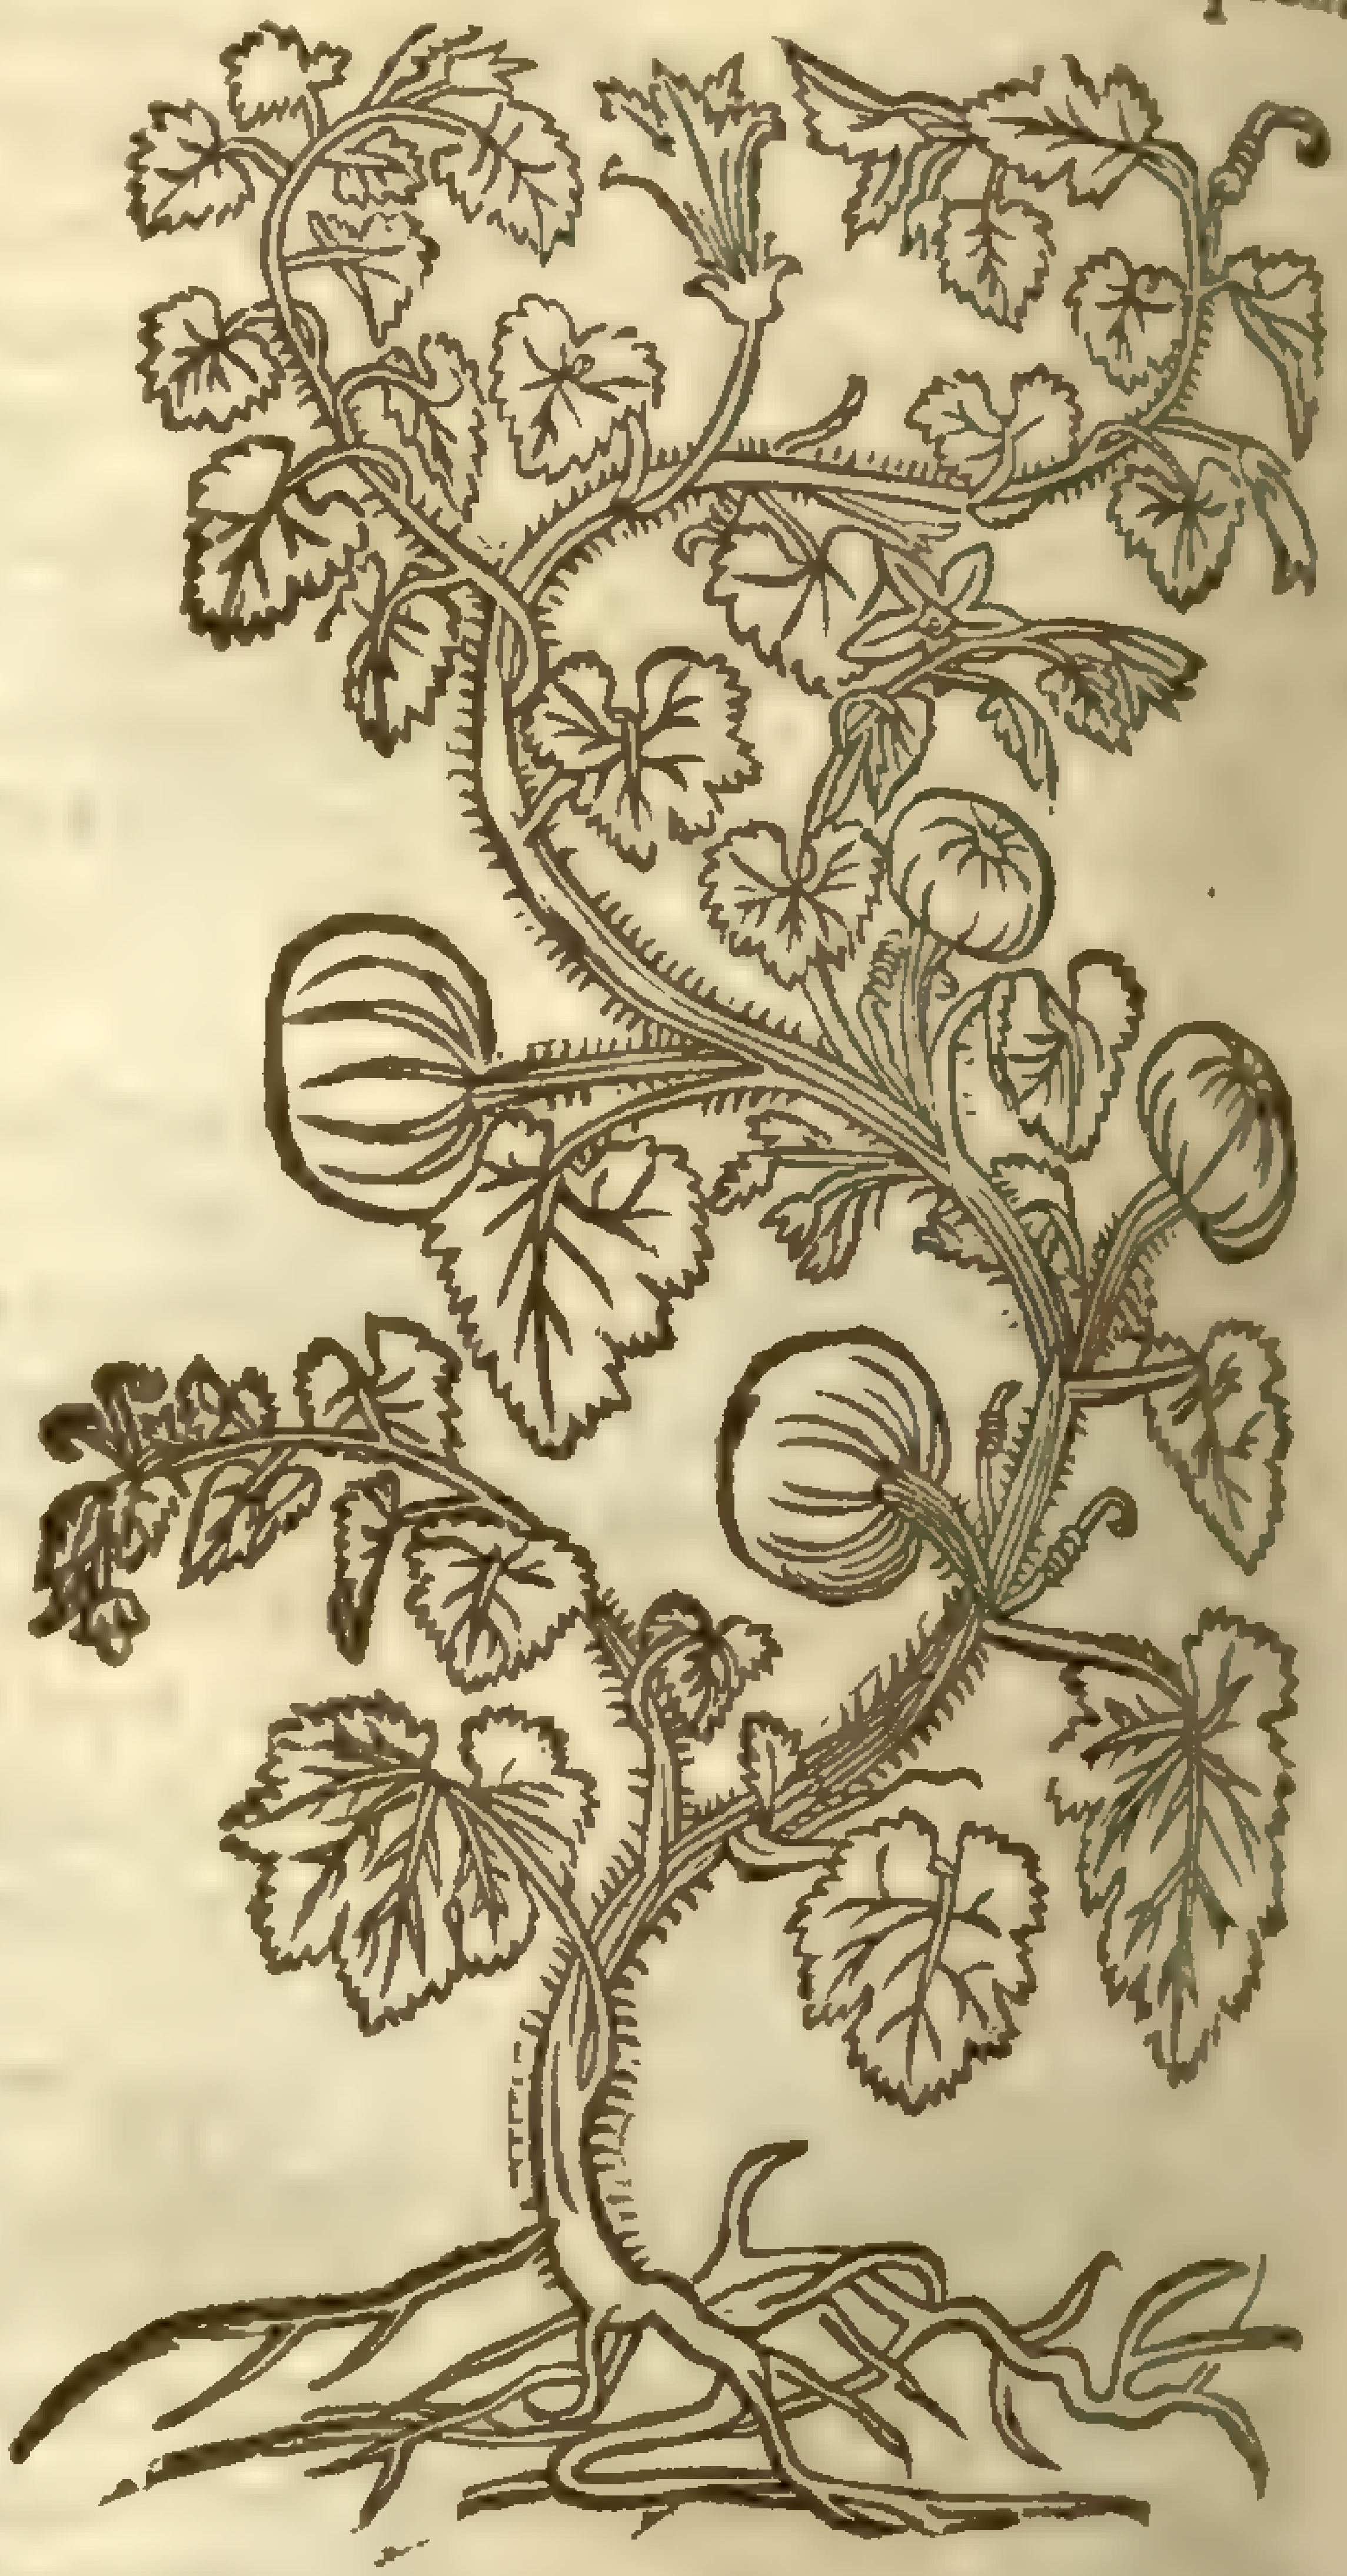
¶ *The Time.*

Their time of flouring and flouriſhing anſwers that of the garden Pompion.

1 *Pepo major ſylueſtris.*
The great wilde Pompion.



2 *Pepo minor ſylueſtris.*
The ſmall wilde Pompion.



¶ The Names.

Although the antient phyſitions haue made no mention of this plant, yet the thing it ſelf doth ſhew that there be ſuch, and ought to be called in Greeke Πέπονες ἄγριοι: in Latine, *Pepones ſylveſtres*: in Engliſh, wilde Melons or Pompions.

¶ The Temperature.

Like as theſe wild Melons be altogether of their owne nature very bitter, ſo be they alſo of temperature hot and dry, and that in the later end of the ſecond degree. They haue likewiſe a clenſing facultie, not inferior to the wilde Cucumbers.

¶ The Vertues.

A The wine which when the pith and ſeed is taken forth is poured into the rinde, and hath remained ſo long therein till ſuch time as it becommeth bitter, doth purge the belly, and bringeth forth flegmaticke and cholericke humors. To be briefe, the juice herof is of the ſame operation that the wilde Cucumber is, and being dried it may be vſed in ſtead of *Elaterium*, which is the dried juice of the wilde Cucumber.

CHAP. 347. *Of Gourds.*

¶ The Kindes.

There diuers ſorts of Gourds, ſome wilde, others tame of the garden: ſome bearing fruit like vnto a bottle; others long, bigger at the end, keeping no certain form or faſhion; ſome greater, others leſſe.

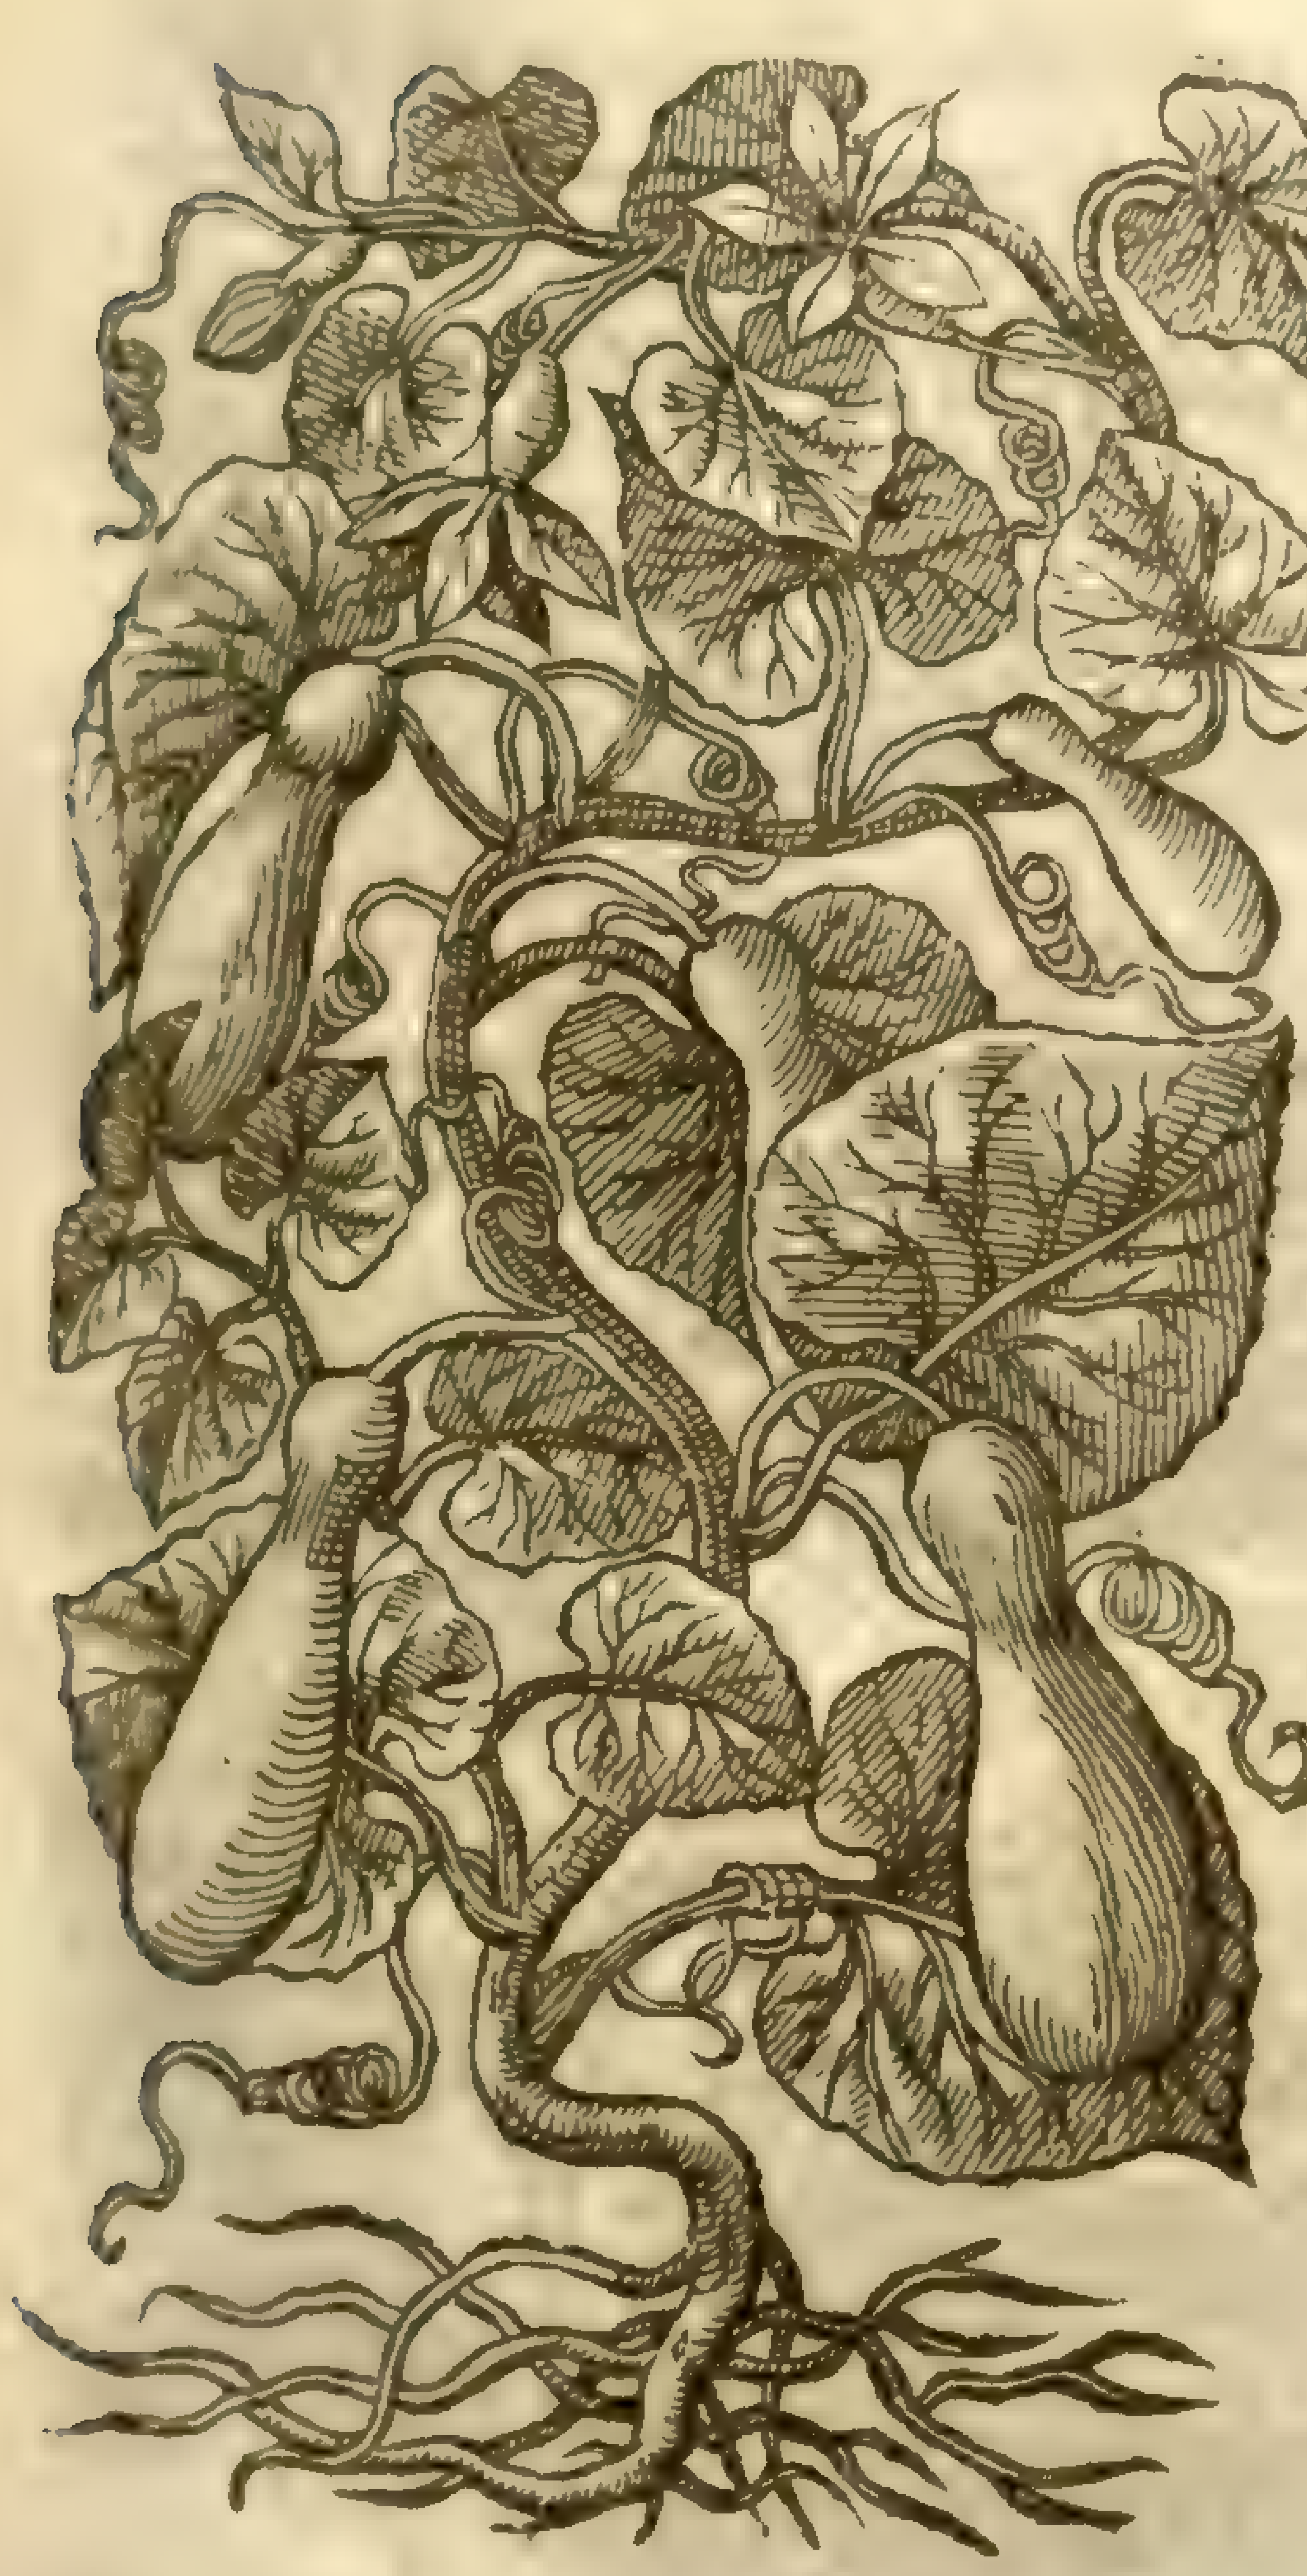
‡ I will only figure and deſcribe two or three of the chiefeſt, and ſo paſſe ouer the reſt, becauſe each one vpon the firſt ſight of them knowes to what kinde to refer them. ‡

¶ *The Deſcription.*

1 The Gourd bringeth forth very long ſtalks as be thoſe of the Vine, cornered and parted into diuers branches, which with his claſping tendrels taketh hold and clymeth vpon ſuch things as ſtand neere vnto it: the leaues bee very great, broad, and ſharpe pointed, almoſt as great as thoſe of the Clot-burre, but ſofter, and ſomwhat couered as it were with a white freeſe, as be alſo the ſtalkes and branches, like thoſe of the mariſh Mallow: the floures be white, and grow forth from the boſome of the leaues: in their places come vp the fruit, which are not all of one faſhion, for oftentimes they haue the forme of flagons and bottles, with a great large belly and a ſmall necke. The Gourd (ſaith *Pliny, lib. 19. cap. 5.*) groweth into any forme or faſhion that you would haue it; either like vnto a wreathed Dragon, the leg of a man, or any other ſhape, according to the mold wherein it is put while it is yong: being ſuffered to clyme vpon any arbor where the fruit may hang, it hath bin ſeen to be nine foot long, by reaſon of his great weight which hath ſtretched it out in the length: the rinde when it is ripe, is very hard, woody, and of a yellow colour: the meat or inward pulpe is white; the ſeed long, flat, pointed at the top, broad, below, with two peaks ſtanding out like hornes, white within, and ſweet of taſte.

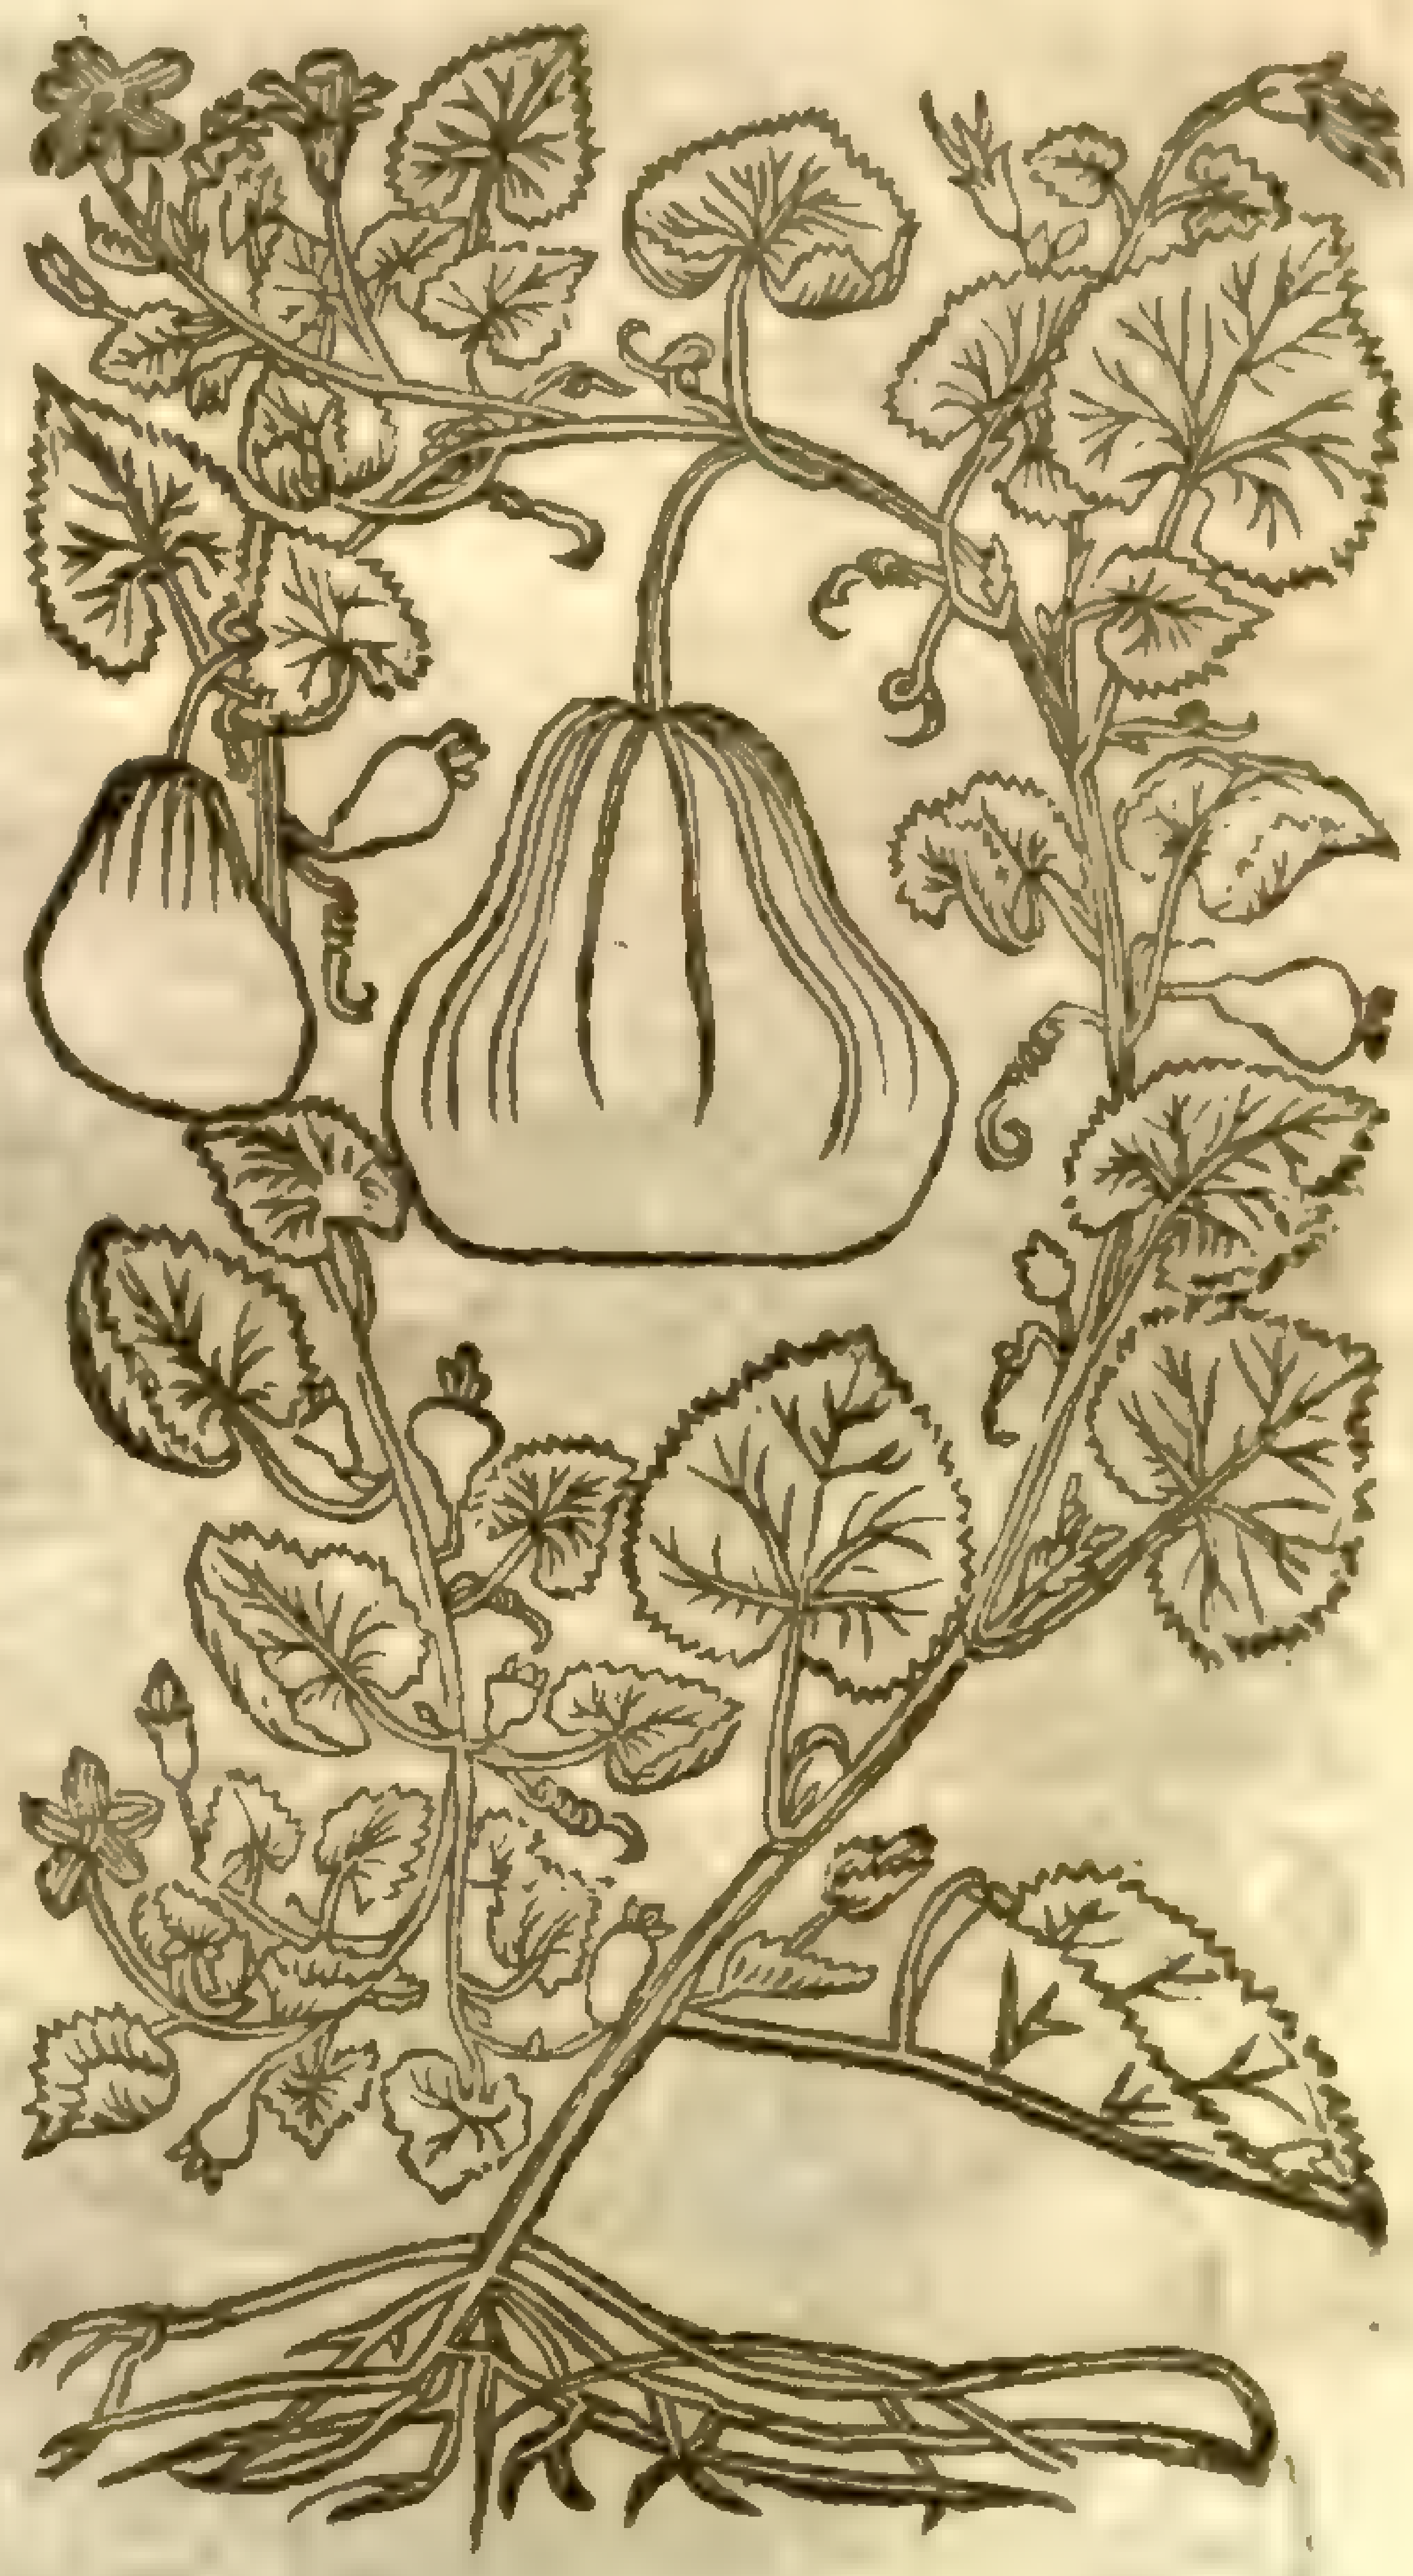
2 The ſecond differs not from the precedent in ſtalks, leaues, or floures: the fruit hereof is for the moſt part faſhioned like a flagon or bottle, wherein eſpecially conſiſteth the difference.

1 *Cucurbita anguina.*
Snakes Gourd.



Cucurbita l. lagenaria & mas dict.

2 *Cucurbita lagenaria.*
Bottle Gourds.



¶ *The Place.*

Gourds are cheriſhed in the gardens of theſe cold regions rather for pleaſure than profit: in the hot countries where they come to ripenes they are ſomtimes eaten, but with ſmall delight; eſpecially they are kept for the rinds, wherein they put turpentine, oile, hony, and alſo ſerue them as pales to fetch water in, and many other the like vſes.

¶ *The Time.*

They are planted in a bed of horſe dung in April, like as we haue taught the planting of cucumbers: they flouriſh in Iune and Iuly, the fruit is ripe in the end of Auguſt.

¶ *The Names.*

The Gourd is called in Greeke, κολόκυνθα ἥμερος: in Latine, *Cucurbita edulis, Cucurbita ſatiua*: of *Pliny*, *Cucurbita Cameraria*, becauſe it climeth vp, and is a couering for arbors, walking places, and banqueting houſes in gardens: he calls the other which climeth not vp, but lieth crawling on the ground, *Cucurbita plebeia*: in Italian, *Zucca*: in Spaniſh, *Calabazza*: in French, *Courge*: in high-Dutch, **Kurbs**: in low-Dutch, **Cauwoorden**: in Engliſh, Gourds.

¶ *The Temperature.*

The meat or inner pulp of the Gourd is of temperature cold and moiſt, euen in the ſecond degree.

¶ *The Vertues.*

A The juice being dropped into the eares with oile of Roſes is good for the paine thereof proceeding of an hot cauſe.

B The pulp or meat thereof mitigateth all hot ſwellings, if it be laid thereon in manner of a pultis, and vſed in like manner it takes away the head-ache and inflammation of the eies.

C The ſame Author affirmeth, that a long Gourd or Cucumber being laid in the cradle or bed by the yong infant whileſt it is aſleep and ſicke of an ague, it ſhall be very quickly made whole.

D The pulp alſo is eaten ſod, but becauſe it hath in it a wateriſh and thinne juice, it yeeldeth ſmall nouriſhment to the body, and the ſame cold and moiſt; but it eaſily paſſeth thorow, eſpecially being ſodden, which by reaſon of the ſlipperineſſe and moiſtneſſe alſo of his ſubſtance, mollifies the belly.

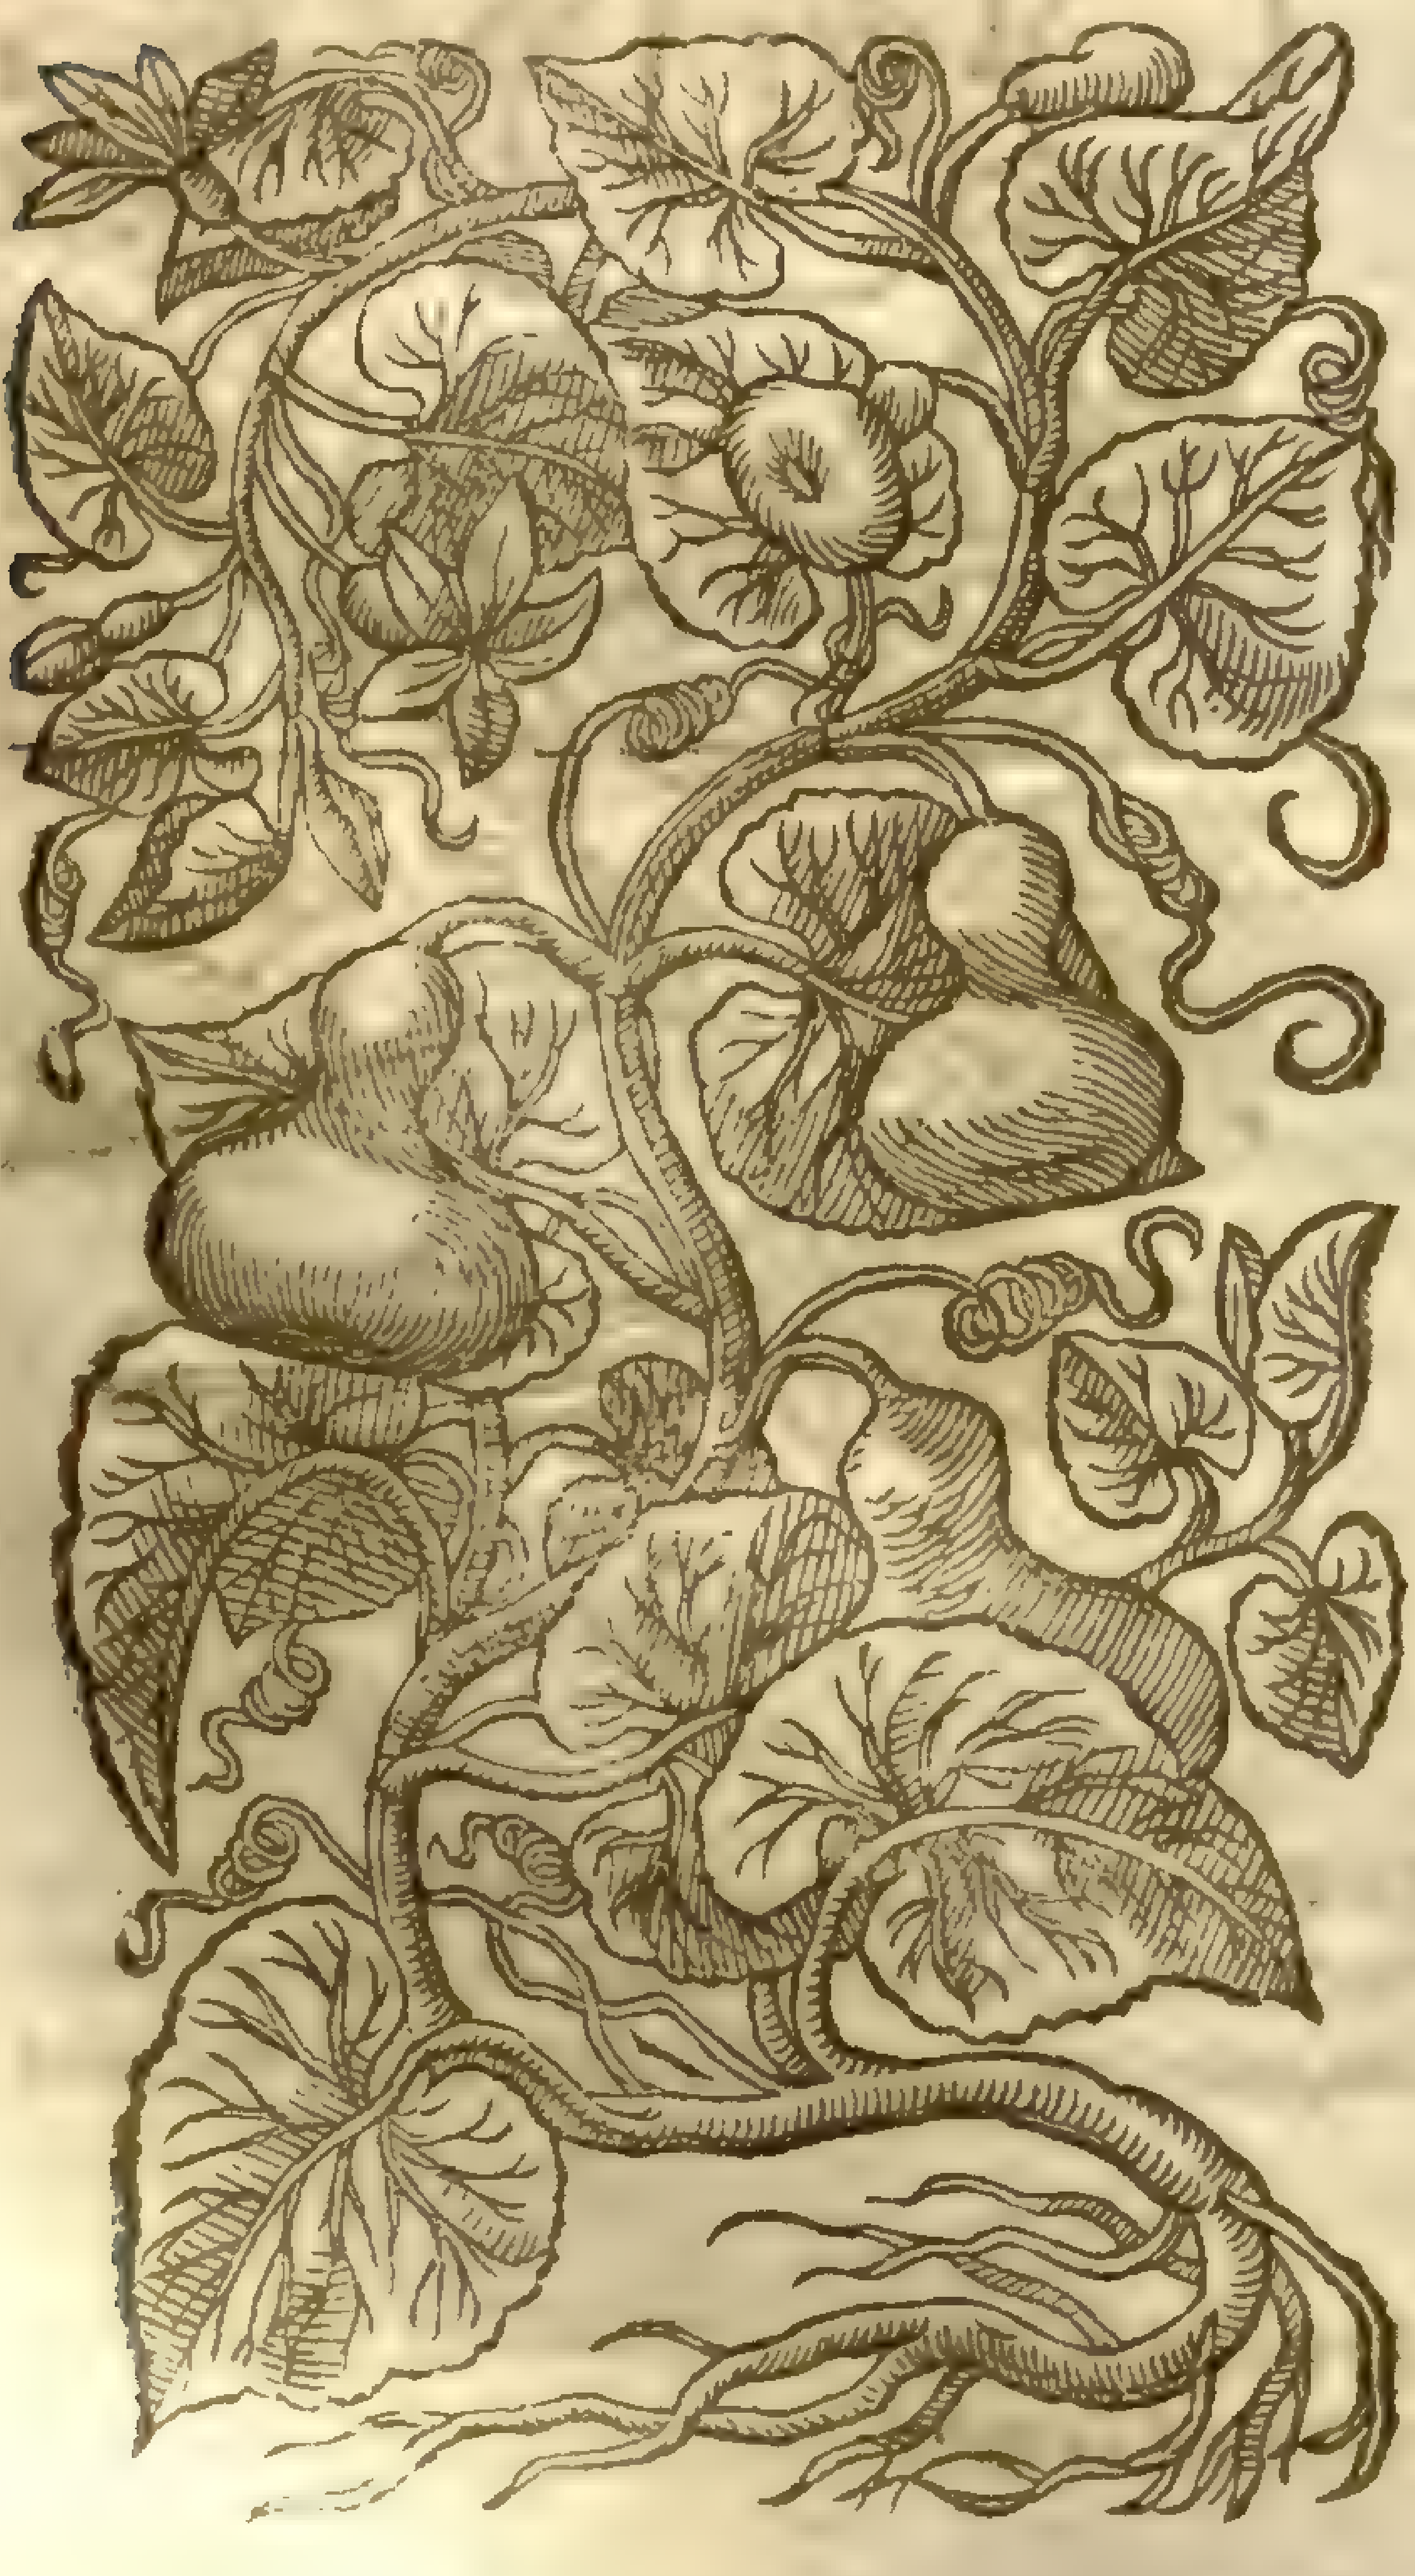
E But being boiled in an ouen or fried in a pan it loſeth moſt part of his naturall moiſture, wherefore it more ſlowly deſcendeth, and doth not mollifie the belly ſo ſoon.

F The ſeed allayes the ſharpneſſe of vrin, and brings down the ſame.

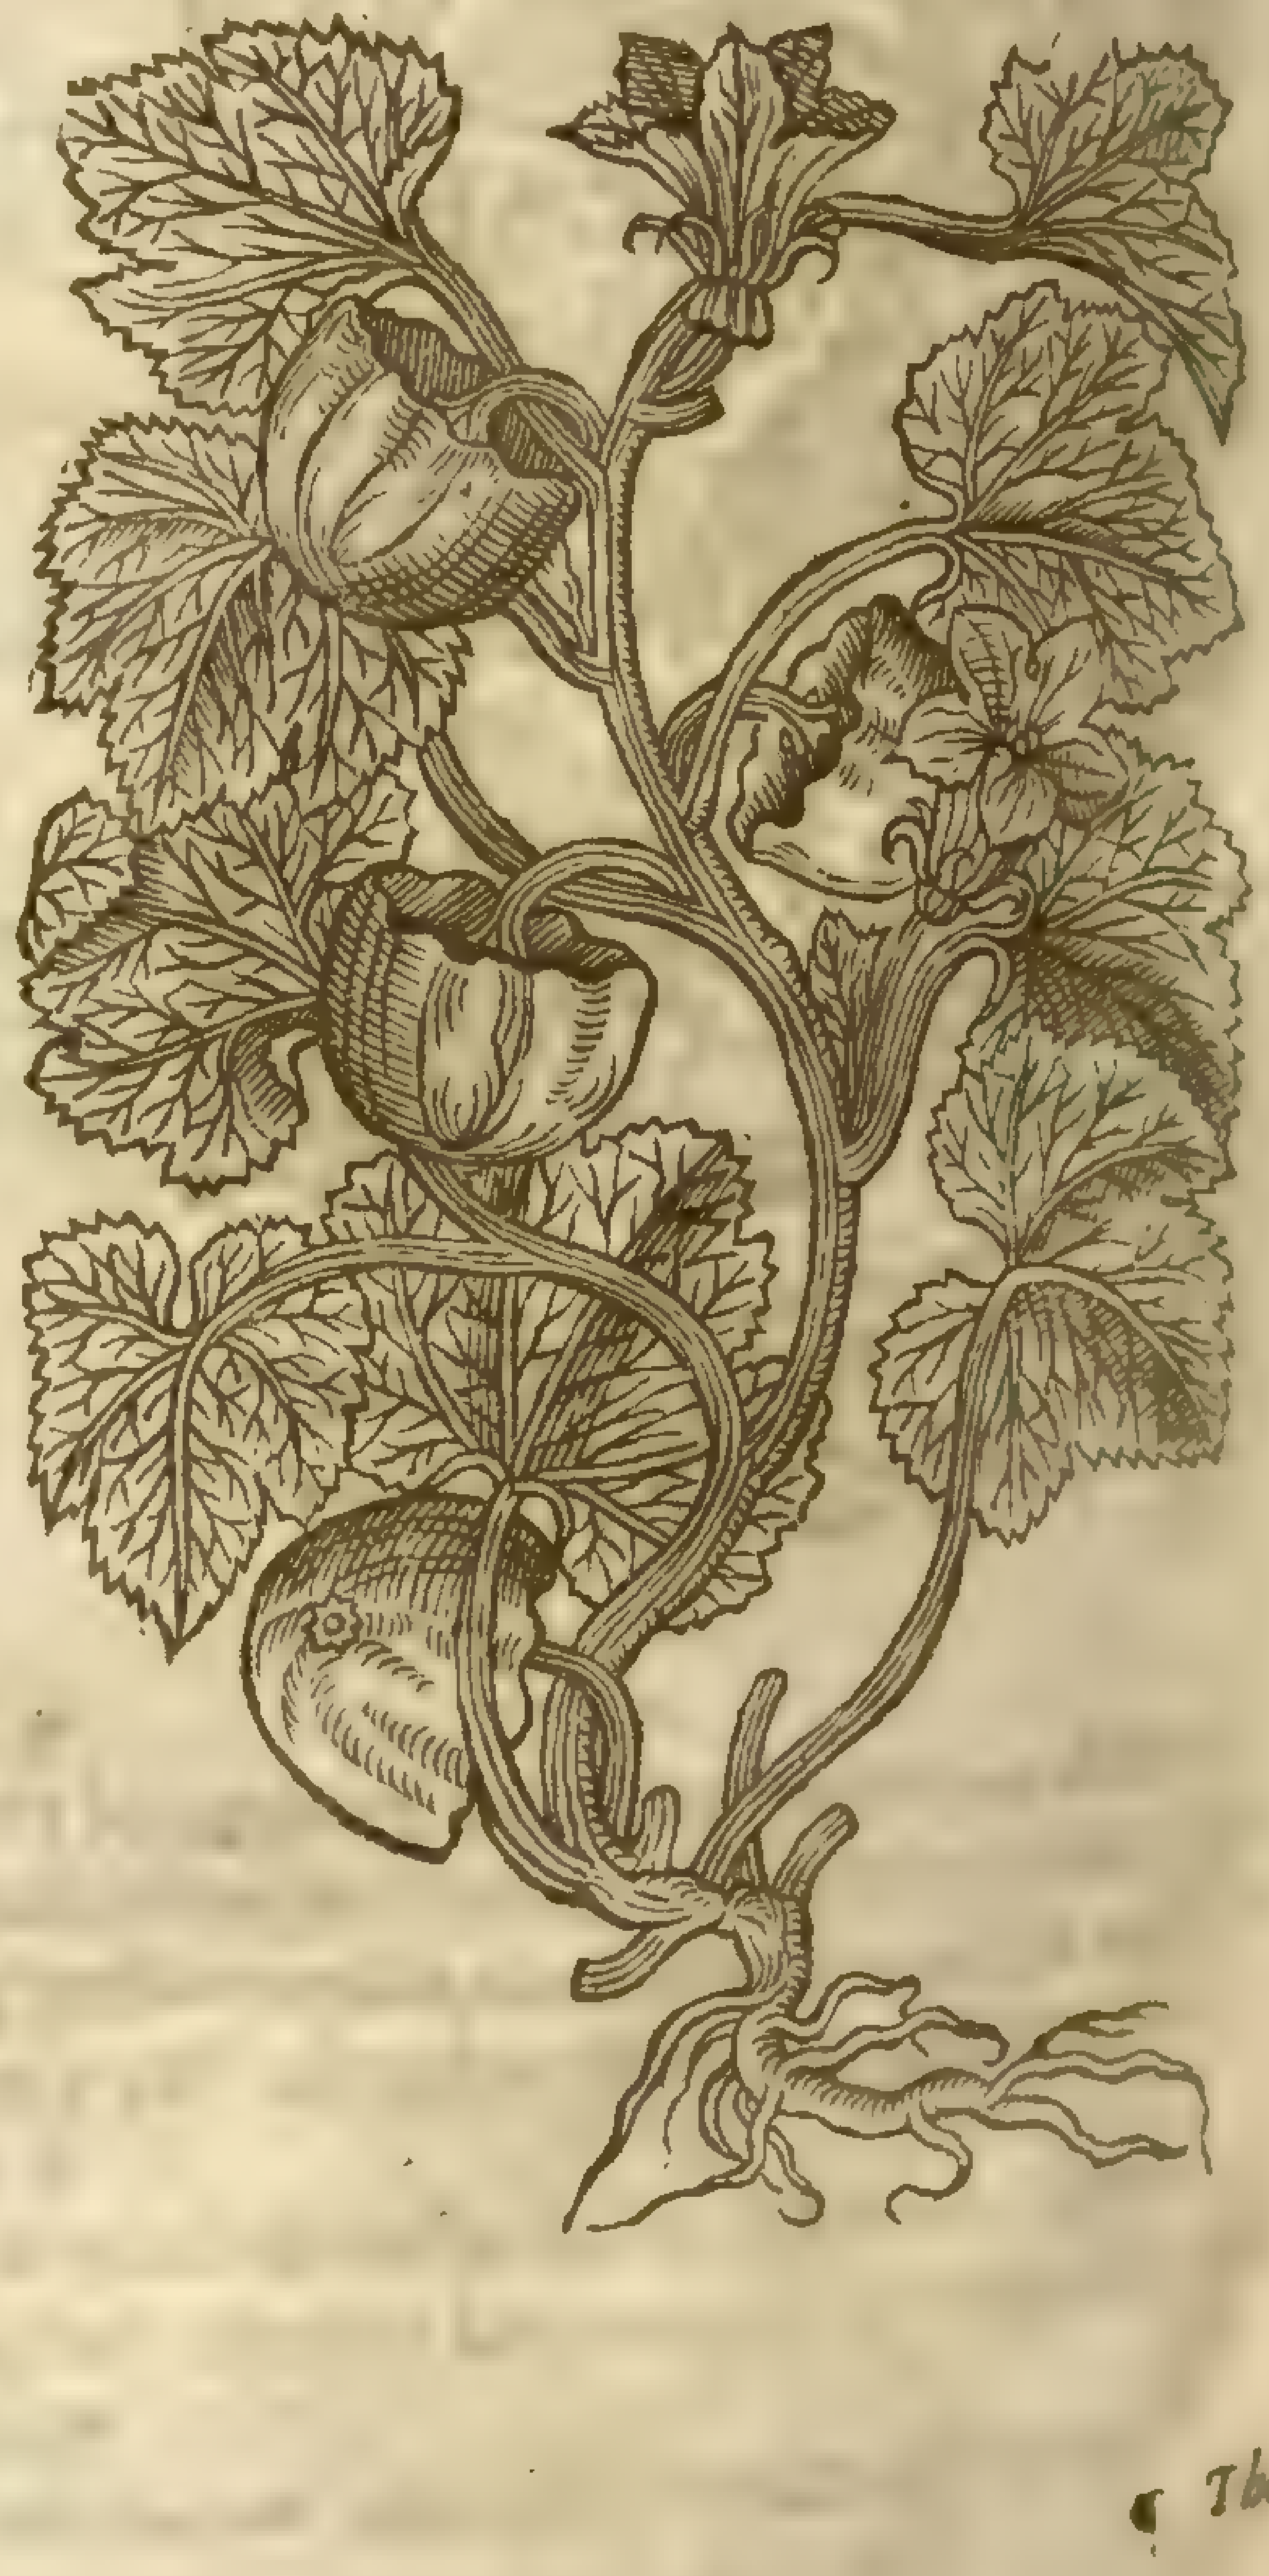
Chap. 348. *Of the wild Gourd.*

Cucurbitæ lagenariæ [illegible]

1 *Cucurbita lagenaria ſylueſtris.*
Wilde Bottle Gourd.



2 *Cucurbita ſylueſtris fungiformis.*
Muſhrom wilde Gourd.



¶ The

¶ *The Deſcription.*

1 There is beſides the former ones a certaine wilde Gourd: this is like the garden Gourd in clyming ſtalks, claſping tendrels, and ſoft leaues, and as it were downy, all and euery one of which things being far leſſe: this alſo clymbeth vpon arbours and banqueting houſes: the fruit repreſenteth the great bellied Gourd, and thoſe that be like vnto bottles in form, but in bigneſſe it is very far inferior, for it is ſmall, and ſcarce ſo great as an ordinarie Quince, and may be held within the compaſſe of a mans hand: the outward rinde at the firſt is green, afterward it is as hard as wood, and of the colour thereof: the inner pulp is moiſt and very full of juice, wherin lies the ſeed. The whole is as bitter as Coloquintida, which hath made ſo many errors, one eſpecially, in taking the fruit Coloquintida for the wilde Gourd.

2 The ſecond wilde Gourd hath likewiſe many trailing branches and claſping tendrels, wherwith it taketh hold of ſuch things as be neere vnto it: the leaues be broad, deepely cut into diuers ſections like thoſe of the Vine, ſoft and very downy, whereby it is eſpecially knowne to be one of the Gourds: the flours are very white, as are alſo thoſe of the Gourds: the fruit ſucceeds growing to a round forme, flat on the top like the head of a Muſhrome, whereof it tooke his ſyr-name.

¶ *The Place.*

They grow of themſelues wilde in hot regions: they neuer come to perfection of ripeneſſe in theſe cold countries.

¶ *The Time.*

The time anſwereth thoſe of the garden.

¶ *The Names.*

The wilde Gourd is called in Greeke, κολοκύνθη ἀγρία: in Latine, *Cucurbita ſylveſtris*, or wilde Gourd. *Pliny, lib.* 20. *cap.* 3. affirmeth, That the wilde Gourd is named of the Grecians, σόμφος, which is hollow, an inch thicke, not growing but among ſtones, the juice whereof being taken is very good for the ſtomacke. But the wilde Gourd is not that which is ſo deſcribed, for it is aboue an inch thick, neither is it hollow, but full of juice, and by reaſon of the extreme bitterneſſe offenſiue to the ſtomacke.

Some alſo there be that take this for Coloquintida, but they are far deceiued; for Colocynthis is the wilde Citrull Cucumber, whereof we haue treated in the chapter of Citruls.

¶ *The Temperature.*

The wilde Gourd is as hot and dry as Coloquintida, namely in the ſecond degree.

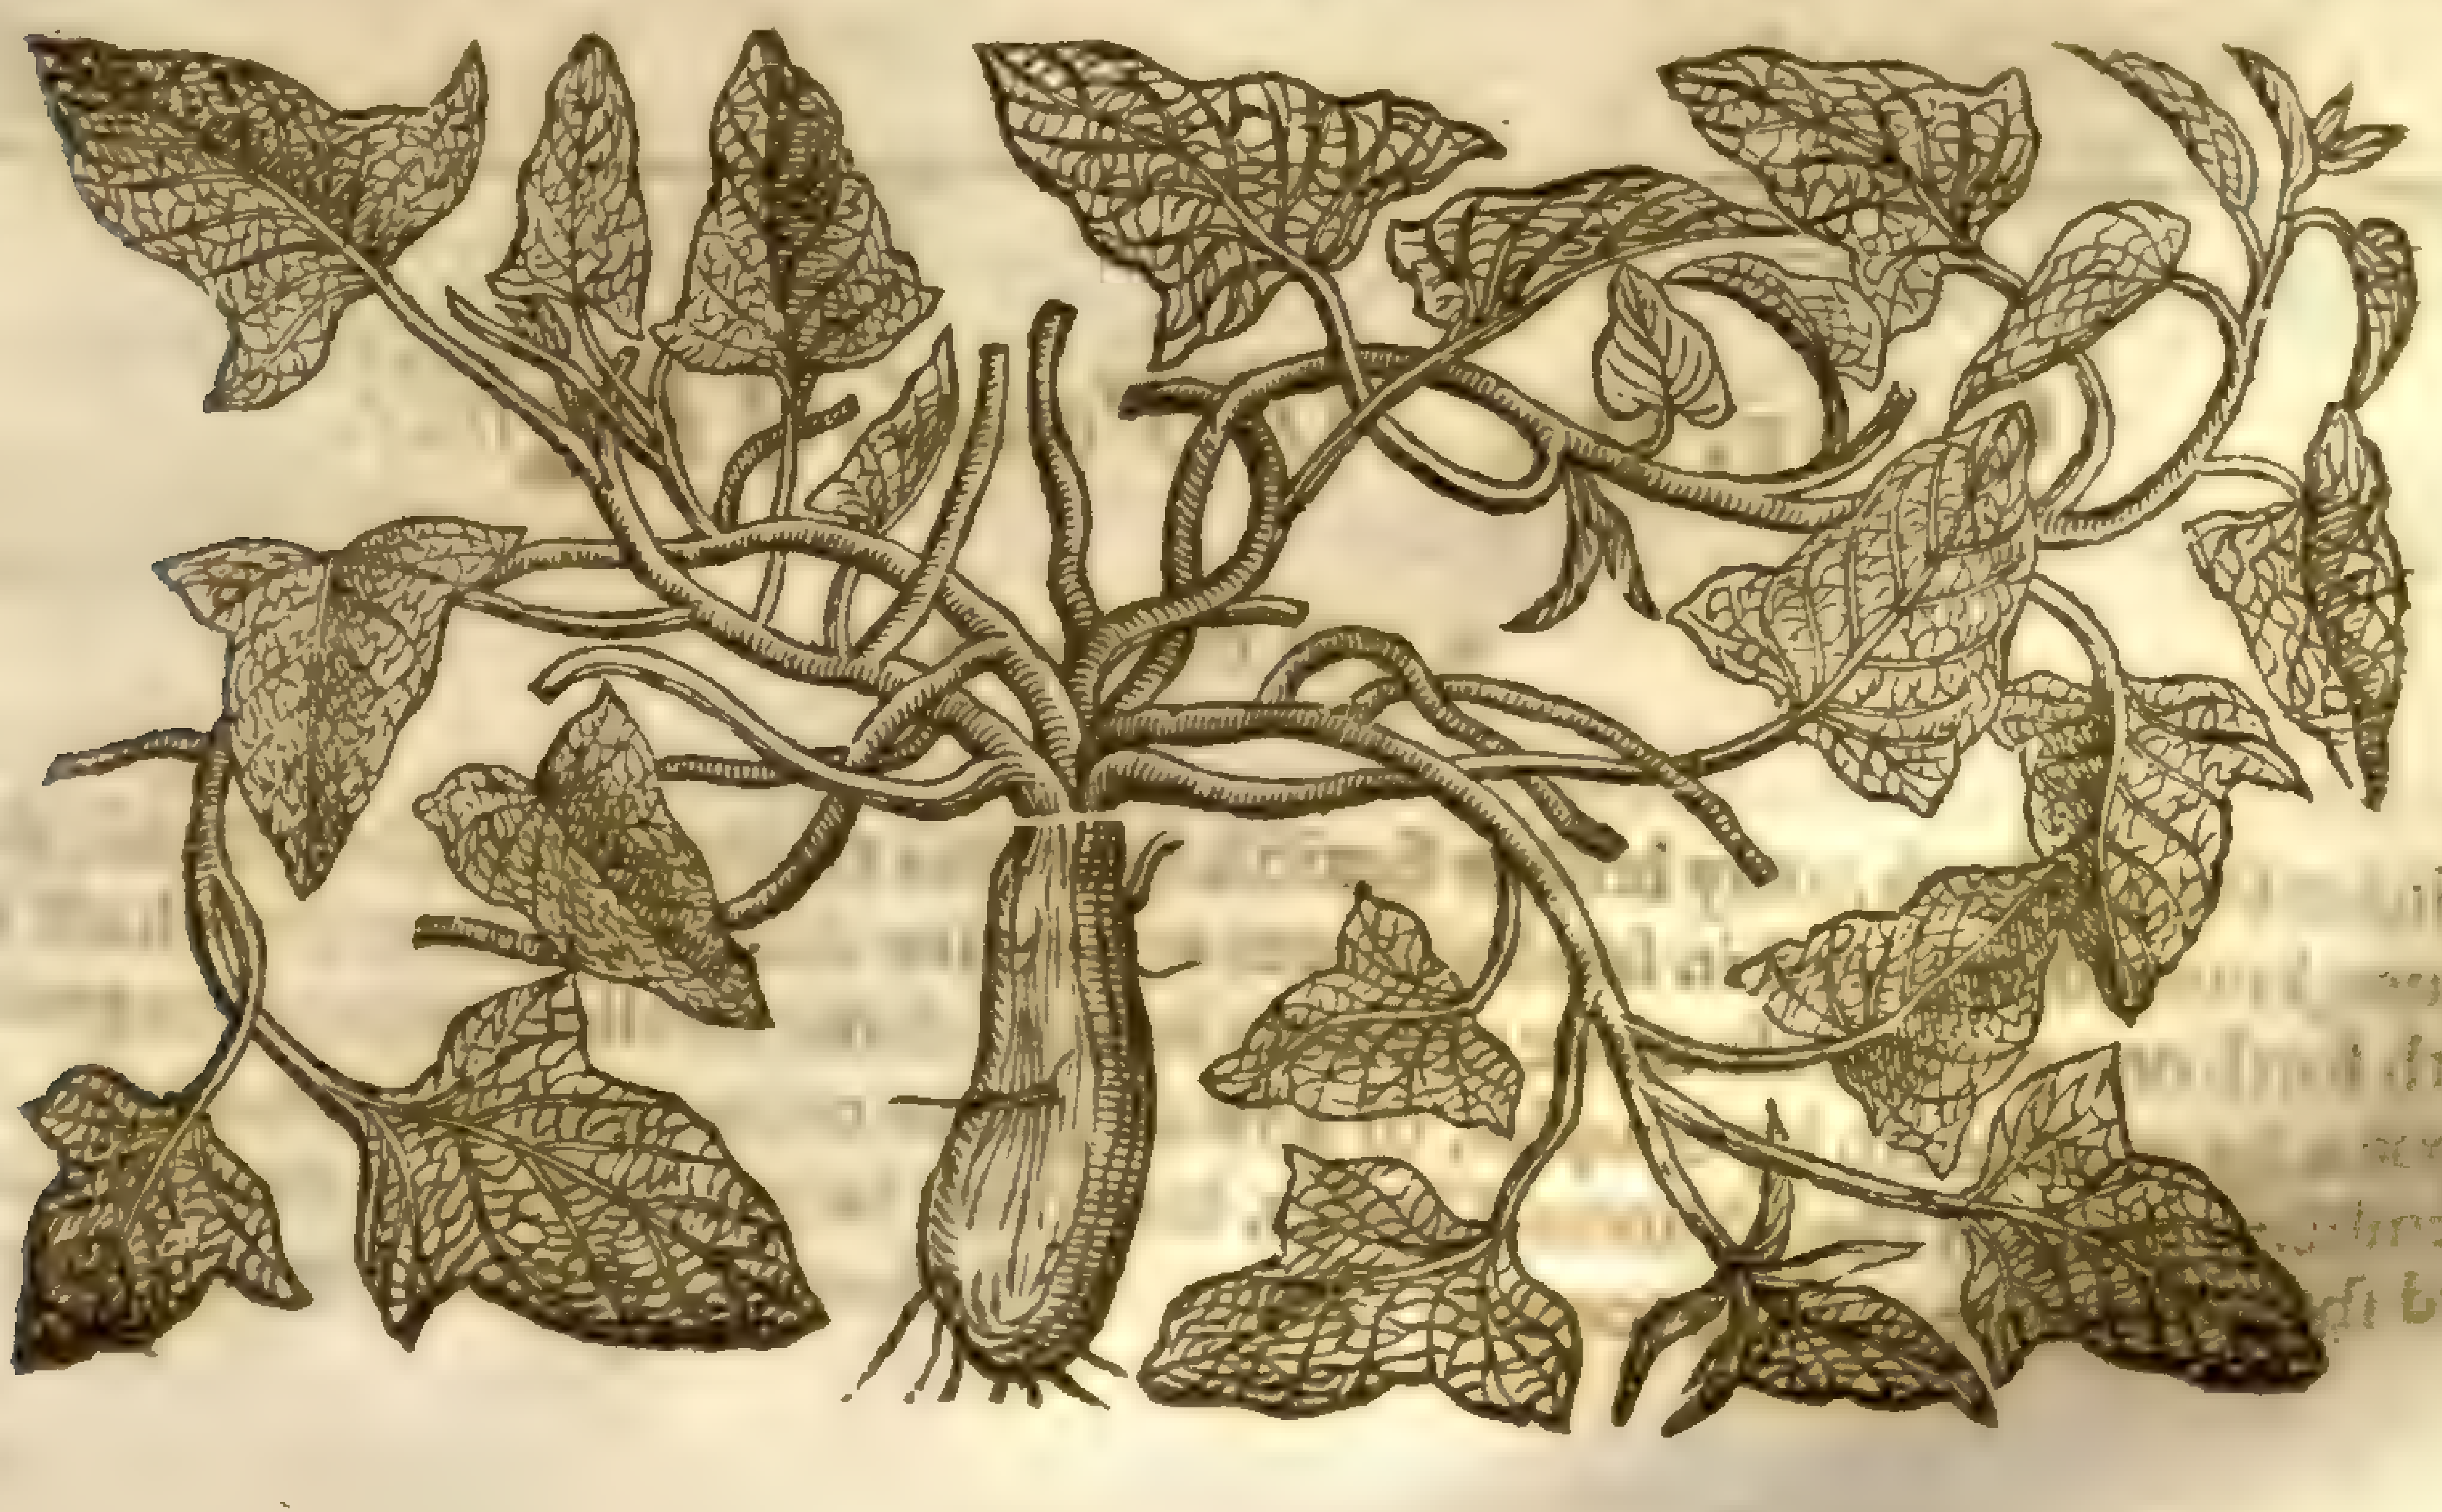
¶ *The Vertues.*

A The wild Gourd is extreme bitter, for which cauſe it opens and ſcoures the ſtopped paſſages of the body: it alſo purgeth downwards as do wilde Melons.

B Moreouer, the Wine which hath continued all night in this Gourd likewiſe purgeth the belly mightily, bringing forth cholericke and flegmaticke humors.

CHAP. 349. *Of Potato's.*

Siſarum Peruvianum, ſiue Batata Hiſpanorum.
Potatus, or Potato's.



¶ *The Deſcription.*

THis Plant (which is called of ſome, *Siſarum Peruvianum*, or Skyrrets of Peru) is generally of vs called Potatus or Potato's. It hath long rough flexible branches trailing vpon the ground like vnto thoſe of Pompions, whereupon are ſet greene three cornered leaues very like thoſe of the wilde Cucumber. There is not any that haue written of this plant, haue ſaid any thing of the floures; therefore I refer their deſcription vnto thoſe that ſhall hereafter haue further knowledge of the ſame. Yet haue I had in my garden diuers roots that haue flouriſhed vnto the firſt approch of Winter, and haue growne vnto a great length of branches, but they brought forth no floures at all; whether becauſe the Winter cauſed them to periſh before their time of flouring, or that they be of nature barren of floures, I am not certain. The roots are many, thicke, and knobby, like vnto the roots of Peonies, or rather of the white Aſphodill, joined together at the top into one head, in maner of the Skyrret, which being diuided into diuers parts and planted, do make a great increaſe, eſpecially if the greateſt roots be cut into diuers goblets, and planted in good and fertile ground.

¶ *The Place.*

The Potato's grow in India, Barbarie, Spaine, and other hot regions; of which I planted diuers roots (which I bought at the Exchange in London) in my garden, where they flouriſhed vntil winter, at which time they periſhed and rotted.

¶ *The Time.*

It flouriſheth to the end of September: at the firſt approch of great froſts the leaues together with the roots and ſtalks do periſh.

¶ *The Names.*

Cluſius calleth it *Batata*, *Camotes*, *Amotes*, and *Ignames*: in Engliſh, Potatoes, Potatus, and Potades.

¶ *The Nature.*

The leaues of Potato's are hot and dry, as may euidently appeare by the taſte: the roots are of a temperat qualitie.

¶ *The Vertues.*

A The Potato roots are among the Spaniards, Italians, Indians, and many other nations, ordinarie and common meat; which no doubt are of mighty and nouriſhing parts, and doe ſtrengthen and comfort nature; whoſe nutriment is as it were a mean between fleſh and fruit, but ſomewhat windie; yet being roſted in the embers they loſe much of their windineſſe, eſpecially being eaten ſopped in wine.

B Of theſe roots may be made conſerues no leſſe toothſome, wholeſome, and dainty, than of the fleſh of Quinces; and likewiſe thoſe comfortable and delicate meats called in ſhops, *Morſelli*, *Placentulæ*, and diuers other ſuch like.

C Theſe roots may ſerue as a ground or foundation whereon the cunning Confectioner or Sugar-Baker may worke and frame many comfortable delicat Conſerues and reſtoratiue ſweet-meats.

D They are vſed to be eaten roſted in the aſhes. Some when they be ſo roſted infuſe and ſop them in wine: and others to giue them the greater grace in eating, do boile them with prunes and ſo eat them: likewiſe others dreſſe them (being firſt roſted) with oile, vineger, and ſalt, euery man according to his owne taſte and liking. Notwithſtanding howſoeuer they be dreſſed, they comfort, nouriſh, and ſtrengthen the body, vehemently procuring bodily luſt.

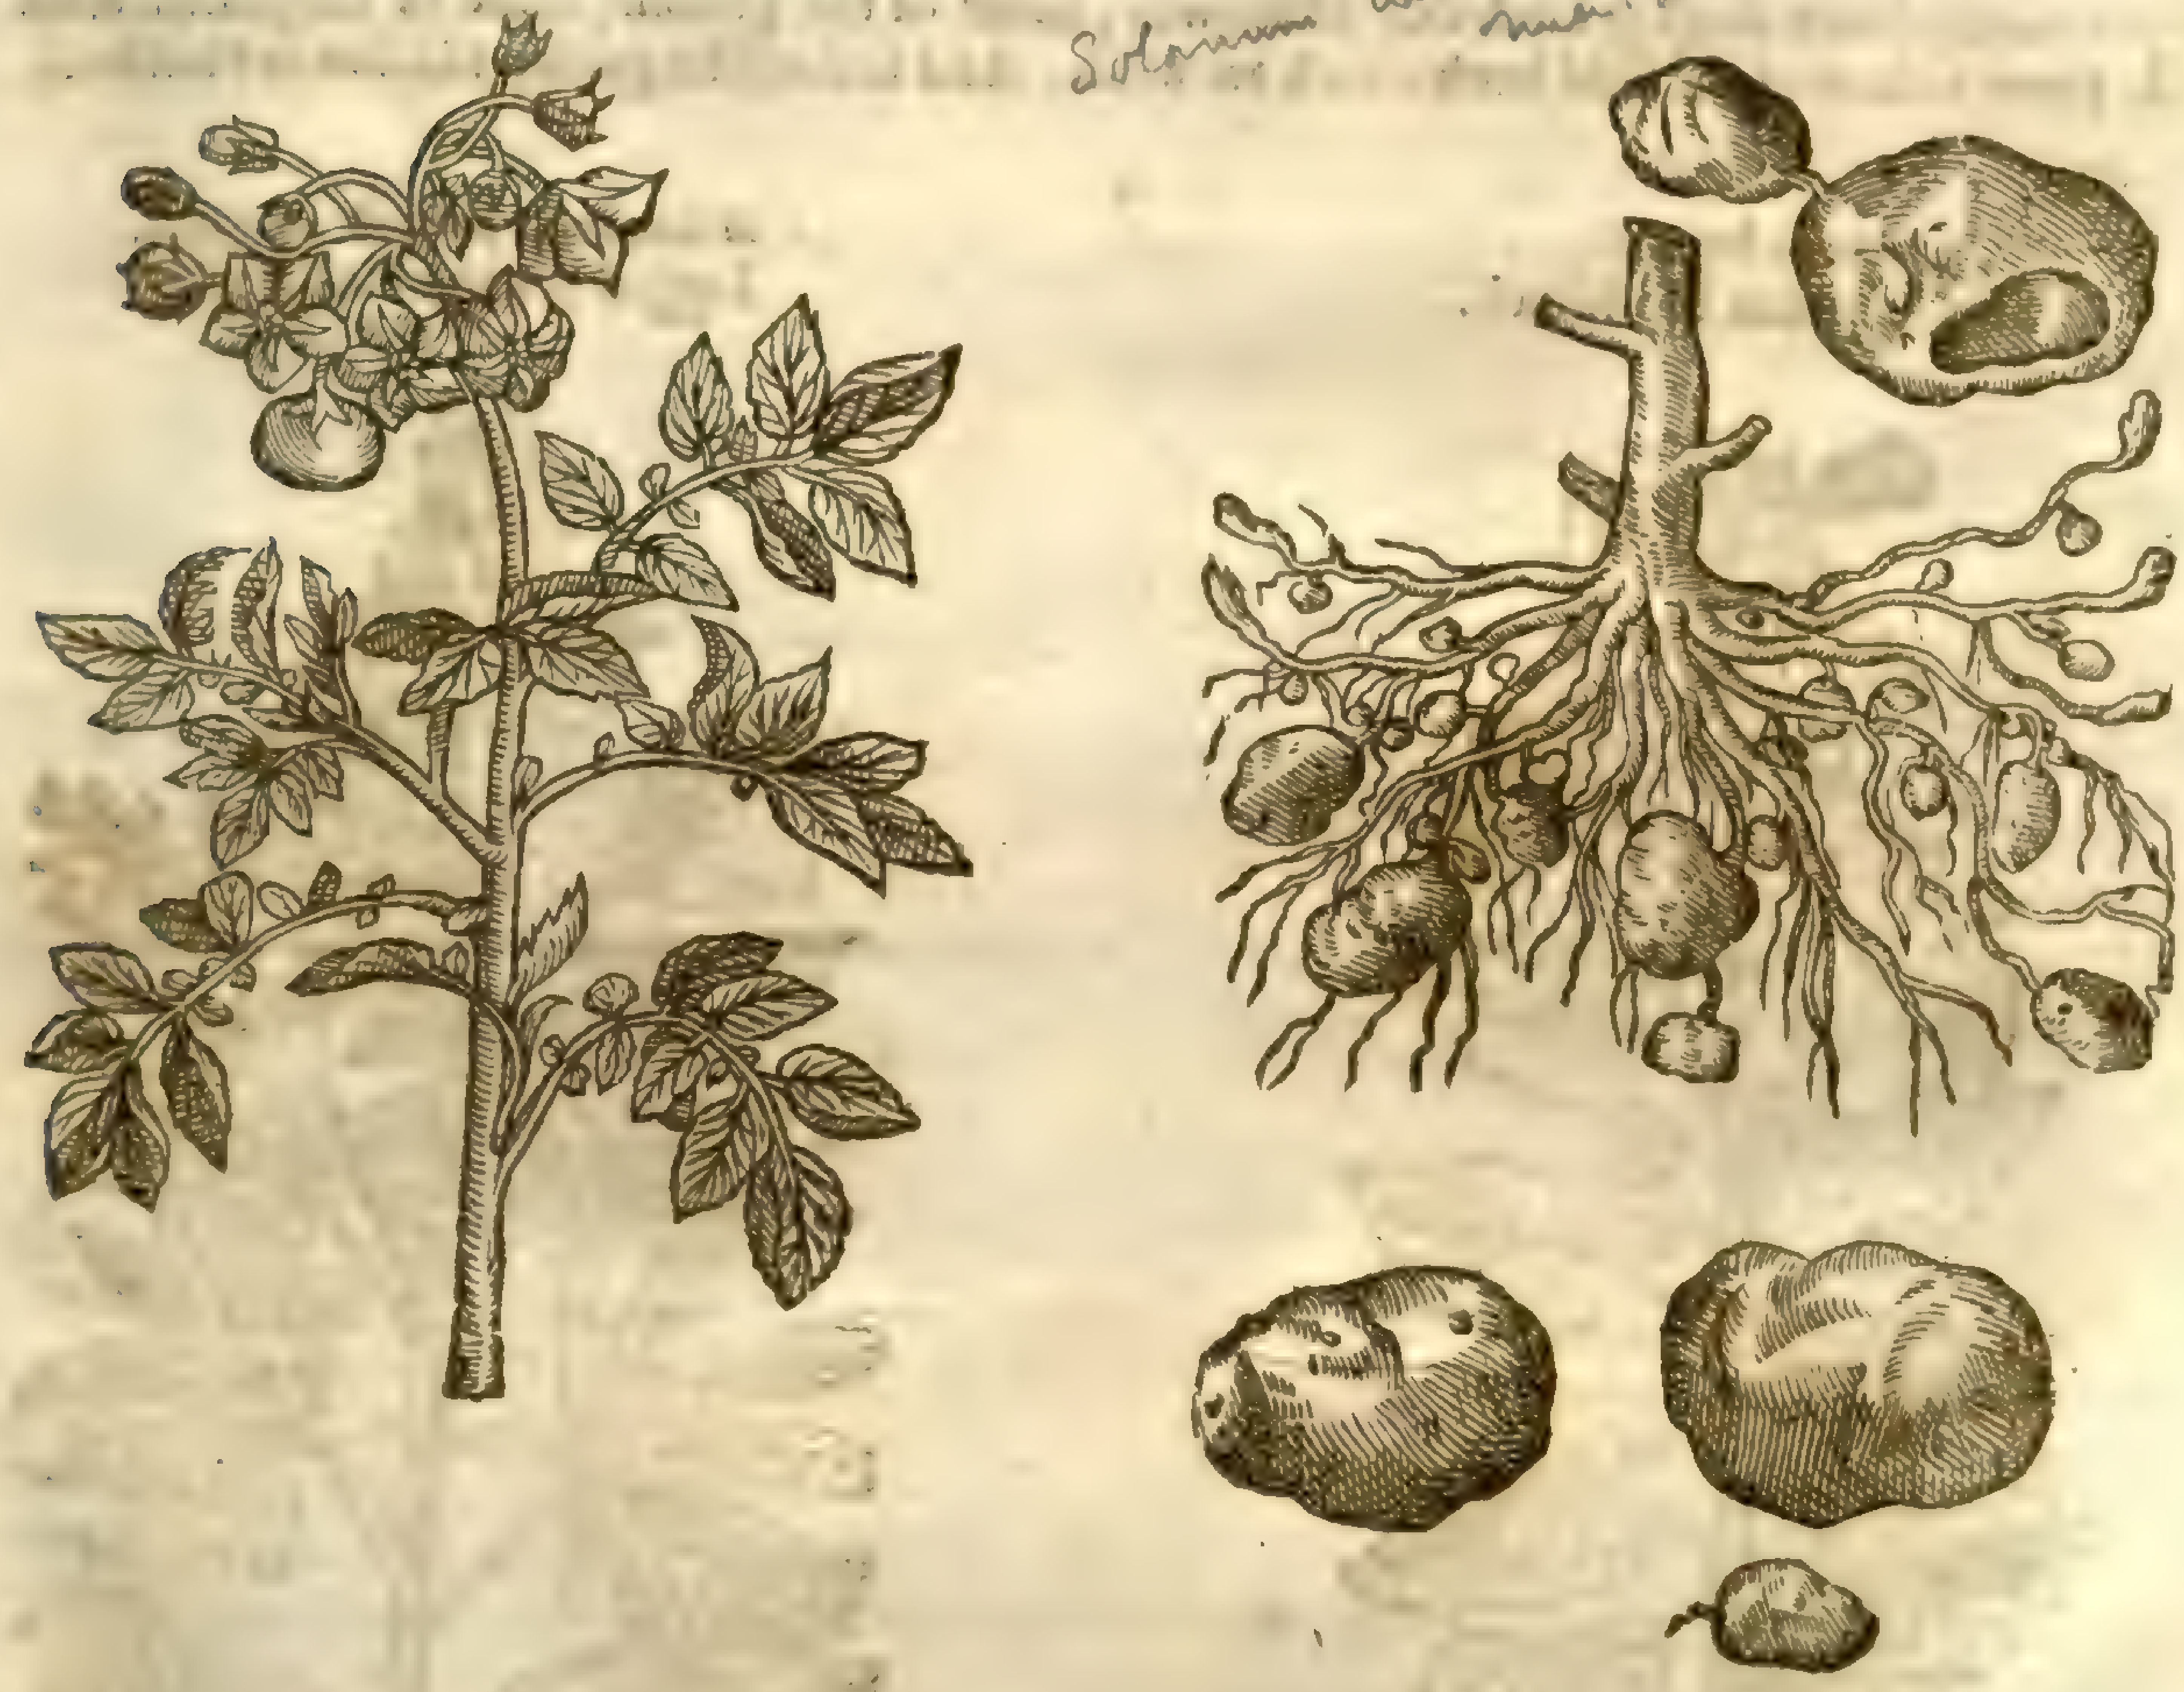
CHAP. 350. *Of Potato's of Virginia.*

¶ *The Deſcription.*

VIrginian Potato hath many hollow flexible branches trailing vpon the ground, three ſquare, vneuen, knotted or kneed in ſundry places at certaine diſtances: from the which knots commeth forth one great leafe made of diuers leaues, ſome ſmaller, and others greater, ſet together vpon a fat middle rib by couples, of a ſwart greene colour tending to redneſſe; the whole leafe reſembling thoſe of the Winter-Creſſes, but much larger; in taſte at the firſt like graſſe, but afterward ſharp and nipping the tongue. From the boſome of which leaues come forth long round ſlender footſtalkes, whereon grow very faire and pleaſant floures, made of one entire whole leafe, which is folded or plaited in ſuch ſtrange ſort, that it ſeemes to be a floure made of fiue ſundry ſmal leaues, which canot eaſily be perceiued, except the ſame be pulled open. The whole floure is of a light purple colour, ſtriped downe the middle of euery fold or welt with a light ſhew of yellowneſſe, as if purple and yellow were mixed together. In the middle of the floure thruſteth forth a thicke flat pointall yellow as gold, with a ſmall ſharp green pricke or point in the midſt thereof. The fruit ſucceeds the floures, round as a ball, of the bigneſſe of a little Bulleſſe or wilde plumme, green at the firſt, and blacke when it is ripe, wherein is contained ſmall white ſeed leſſer than thoſe of Muſtard: the root is thicke, fat, and tuberous, not much differing either in ſhape, colour, or taſte, from the common Potato's, ſauing that the roots hereof are not ſo great nor long, ſome of them are as round as a ball, ſome oual or egge-faſhion, ſome longer, and others ſhorter; the which knobby roots are faſtned vnto the ſtalks with an infinite number of threddy ſtrings.

Battata Virginiana ſiue Virginianorum, & Pappus,
Virginian Potatoes.

Solanum tuberosum – Linn. dict.



¶ *The Place.*

It groweth naturally in America, where it was firſt diſcouered, as reporteth *Cluſius*, ſince which time I haue receiued roots hereof from Virginia, otherwiſe called Norembega, which grow & proſper in my garden as in their owne natiue country.

¶ *The Time.*

The leaues thruſt forth of the ground in the beginning of May; the flours bud forth in Auguſt, the fruit is ripe in September.

¶ *The Names.*

The Indians call this plant *Pappus*, meaning the roots; by which name alſo the common Potatoes are called in thoſe Indian countries. Wee haue it's proper name mentioned in the title. Becauſe it hath not only the ſhape and proportion of Potato's, but alſo the pleaſant taſte and vertues of the ſame, we may call it in Engliſh, Potatoes of America or Virginia.

‡ *Cluſius* queſtions whether it be not the *Arachidna* of *Theophraſtus*: *Bauhine* hath referred it to the Nightſhades, and calls it *Solanum tuberoſum eſculentum*; and largely figures and deſcribes it in his *Prodromus, pag.* 89. ‡

The

¶ *The Temperature and Vertues.*

The temperature and vertues be referred to the common Potato's, being likewiſe a food, as alſo a meat for pleaſure, equall in goodneſſe and wholeſomneſſe to the ſame, being either roſted in the embers, or boiled and eaten with oile, vineger and pepper, or dreſſed ſome other way by the hand of a skilfull Cooke.

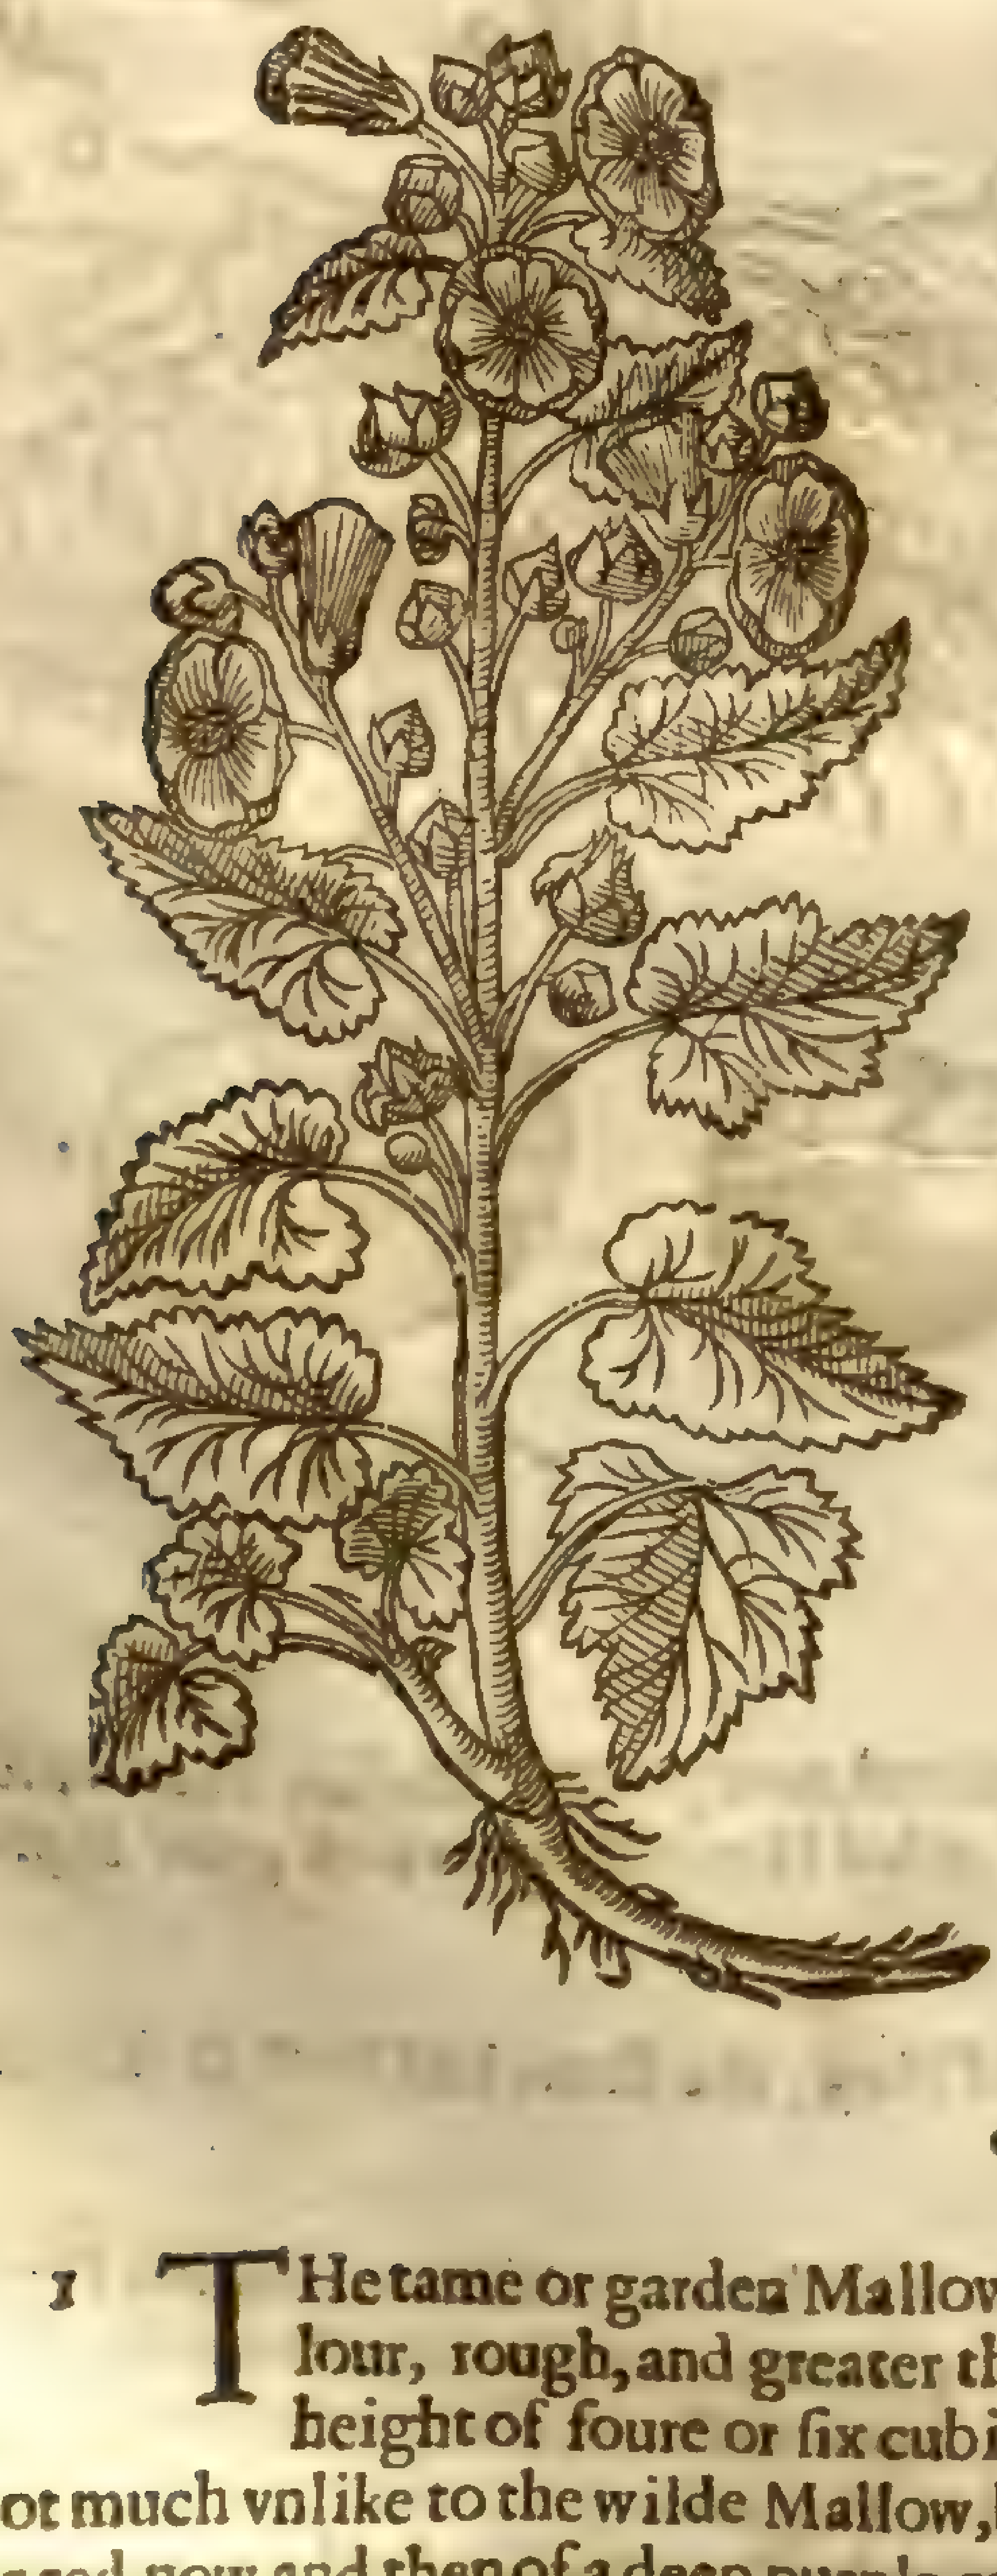
‡ *Bauhine* ſaith, That he heard that the vſe of theſe roots was forbidden in Bourgondy (where they call them Indian Artichokes) for that they were perſuaded the too frequent vſe of them cauſed the leproſie. ‡

Chap. 351.

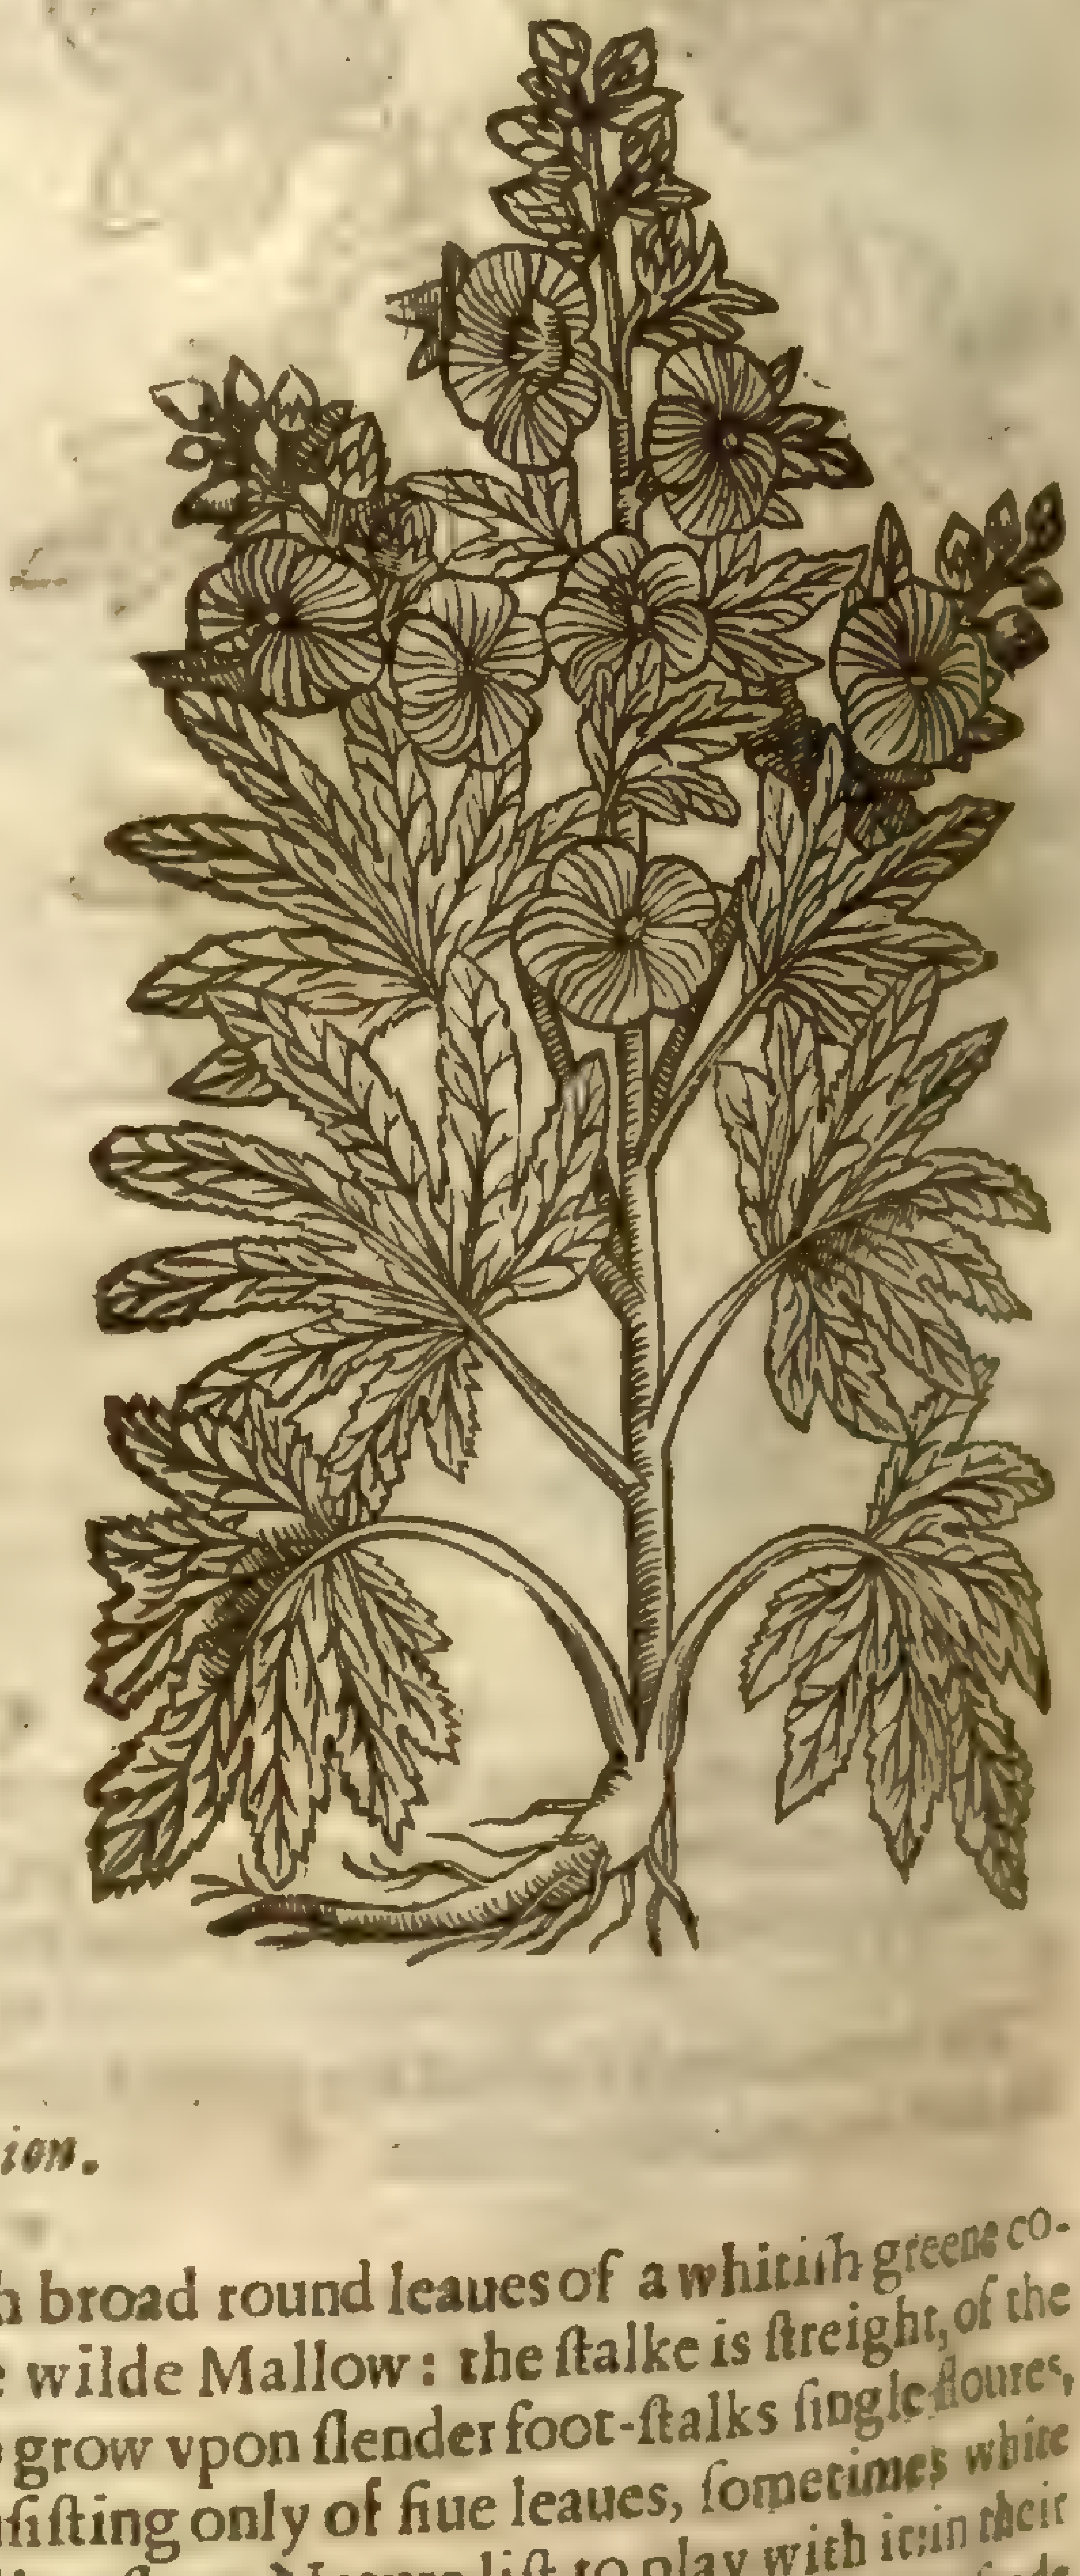
Of the garden Mallow called Hollyhocke.

¶ *The Kindes.*

There be diuers ſorts or kindes of Mallowes; ſome of the garden; ſome of the mariſh or ſea ſhore, others of the field, both which are wilde. And firſt of the garden Mallow or Hollihock.



1 *Malua hortenſis.*
Single garden Hollihock.



2 *Malua roſea ſimplex peregrina.*
Iagged ſtrange Hollihock.

¶ *The Deſcription.*

1 The tame or garden Mallow bringeth forth broad round leaues of a whitiſh greene colour, rough, and greater than thoſe of the wilde Mallow: the ſtalke is ſtreight, of the height of foure or ſix cubits; whereon do grow vpon ſlender foot-ſtalks ſingle floures, not much vnlike to the wilde Mallow, but greater, conſiſting only of fiue leaues, ſometimes white or red, now and then of a deep purple colour, varying diuerſly as Nature liſt to play with it: in their places groweth vp a round knop like a little cake, compact or made vp of a multitude of flat ſeeds like little cheeſes. The root is long, white, tough, eaſily bowed, and groweth deep in the ground.

2 The

3 *Malua purpurea multiplex.*
Double purple Hollihocke.

2 The ſecond being a ſtrange kinde of Hollihocke hath likewiſe broad leaues, rough and hoarie, or of an ouerworne ruſſet colour, cut into diuers ſections euen to the middle ribbe, like thoſe of Palma Chriſti. The floures are very ſingle, but of a perfect red colour, wherein conſiſteth the greateſt difference. ‡ And this may be called *Malua roſea ſimplex peregrina folio Ficus*, Iagged ſtrange Hollihocke. ‡

3 The double Hollihocke with purple floures hath great broad leaues, confuſedly indented about the edges, and likewiſe toothed like a ſaw. The ſtalke groweth to the height of foure or fiue cubits. The floures are double, and of a bright purple colour.

4 The Garden Hollihocke with double floures of the colour of skarlet, groweth to the height of fiue or ſix cubits, hauing many broad leaues cut about the edges. The ſtalke and root is like the precedent. ‡ This may be called *Multea hortenſis rubra multiplex*, Double red Hollihockes, or Roſe mallow. ‡

5 The tree mallow is likewiſe one of the Hollihockes; it bringeth forth a great ſtalke of the height of ten or twelue foot, growing to the forme of a ſmall tree, whereon are placed diuers great broad leaues of a ruſſet greene colour, not vnlike to thoſe of the great Clot Burre Docke, deepely indented about the edges. The floures are very great and double as the greateſt Roſe, or double Peiony, of a deepe red colour tending to blackeneſſe. The root is great, thicke, and of a wooddy ſubſtance, as is the reſt of the plant. ‡ This may be called *Malua hortenſis atrorubente multiplici flore.* ‡

¶ *The Place.*

Theſe Hollihockes are ſowne in gardens, almoſt euery where, and are in vaine ſought elſewhere.

¶ *The Time.*

The ſecond yeere after they are ſowne they bring forth their floures in Iuly and Auguſt, when the ſeed is ripe the ſtalke withereth, the root remaineth and ſendeth forth new ſtalkes, leaues and floures, many yeares after.

¶ *The Names.*

The Hollihocke is called in Greeke, [illegible]: of diuers, *Roſa vltra-marina*, or outlandiſh Roſe, and *Roſa hyemalis*, or Winter Roſe. And this is that Roſe which *Pliny* in his 21. book, 4. chapter, writes to haue the ſtalke of a mallow, and the leaues of a pot-herbe, which they cal *Moſceuton*: in high Dutch, **Garten pappelen**: in low Dutch, **Winter Rooſen**: in French, *Roſe d'outre mer*: in Engliſh, Hollihocke, and Hockes.

¶ *The Temperature.*

The Hollihocke is meetely hot, and alſo moiſt, but not ſo much as the wilde Mallow: it hath likewiſe a clammy ſubſtance, which is more manifeſt in the ſeed and root, than in any other part.

¶ *The Vertues.*

The decoction of the floures, eſpecially thoſe of the red, doth ſtop the ouermuch flowing of the monethly courſes, if they be boiled in red wine. A

The roots, leaues, and ſeeds ſerue for all thoſe things for which the wilde Mallowes doe, which are more commonly and familiarly vſed. B

Chap. 352. *Of the wilde Mallowes.*

¶ *The Deſcription.*

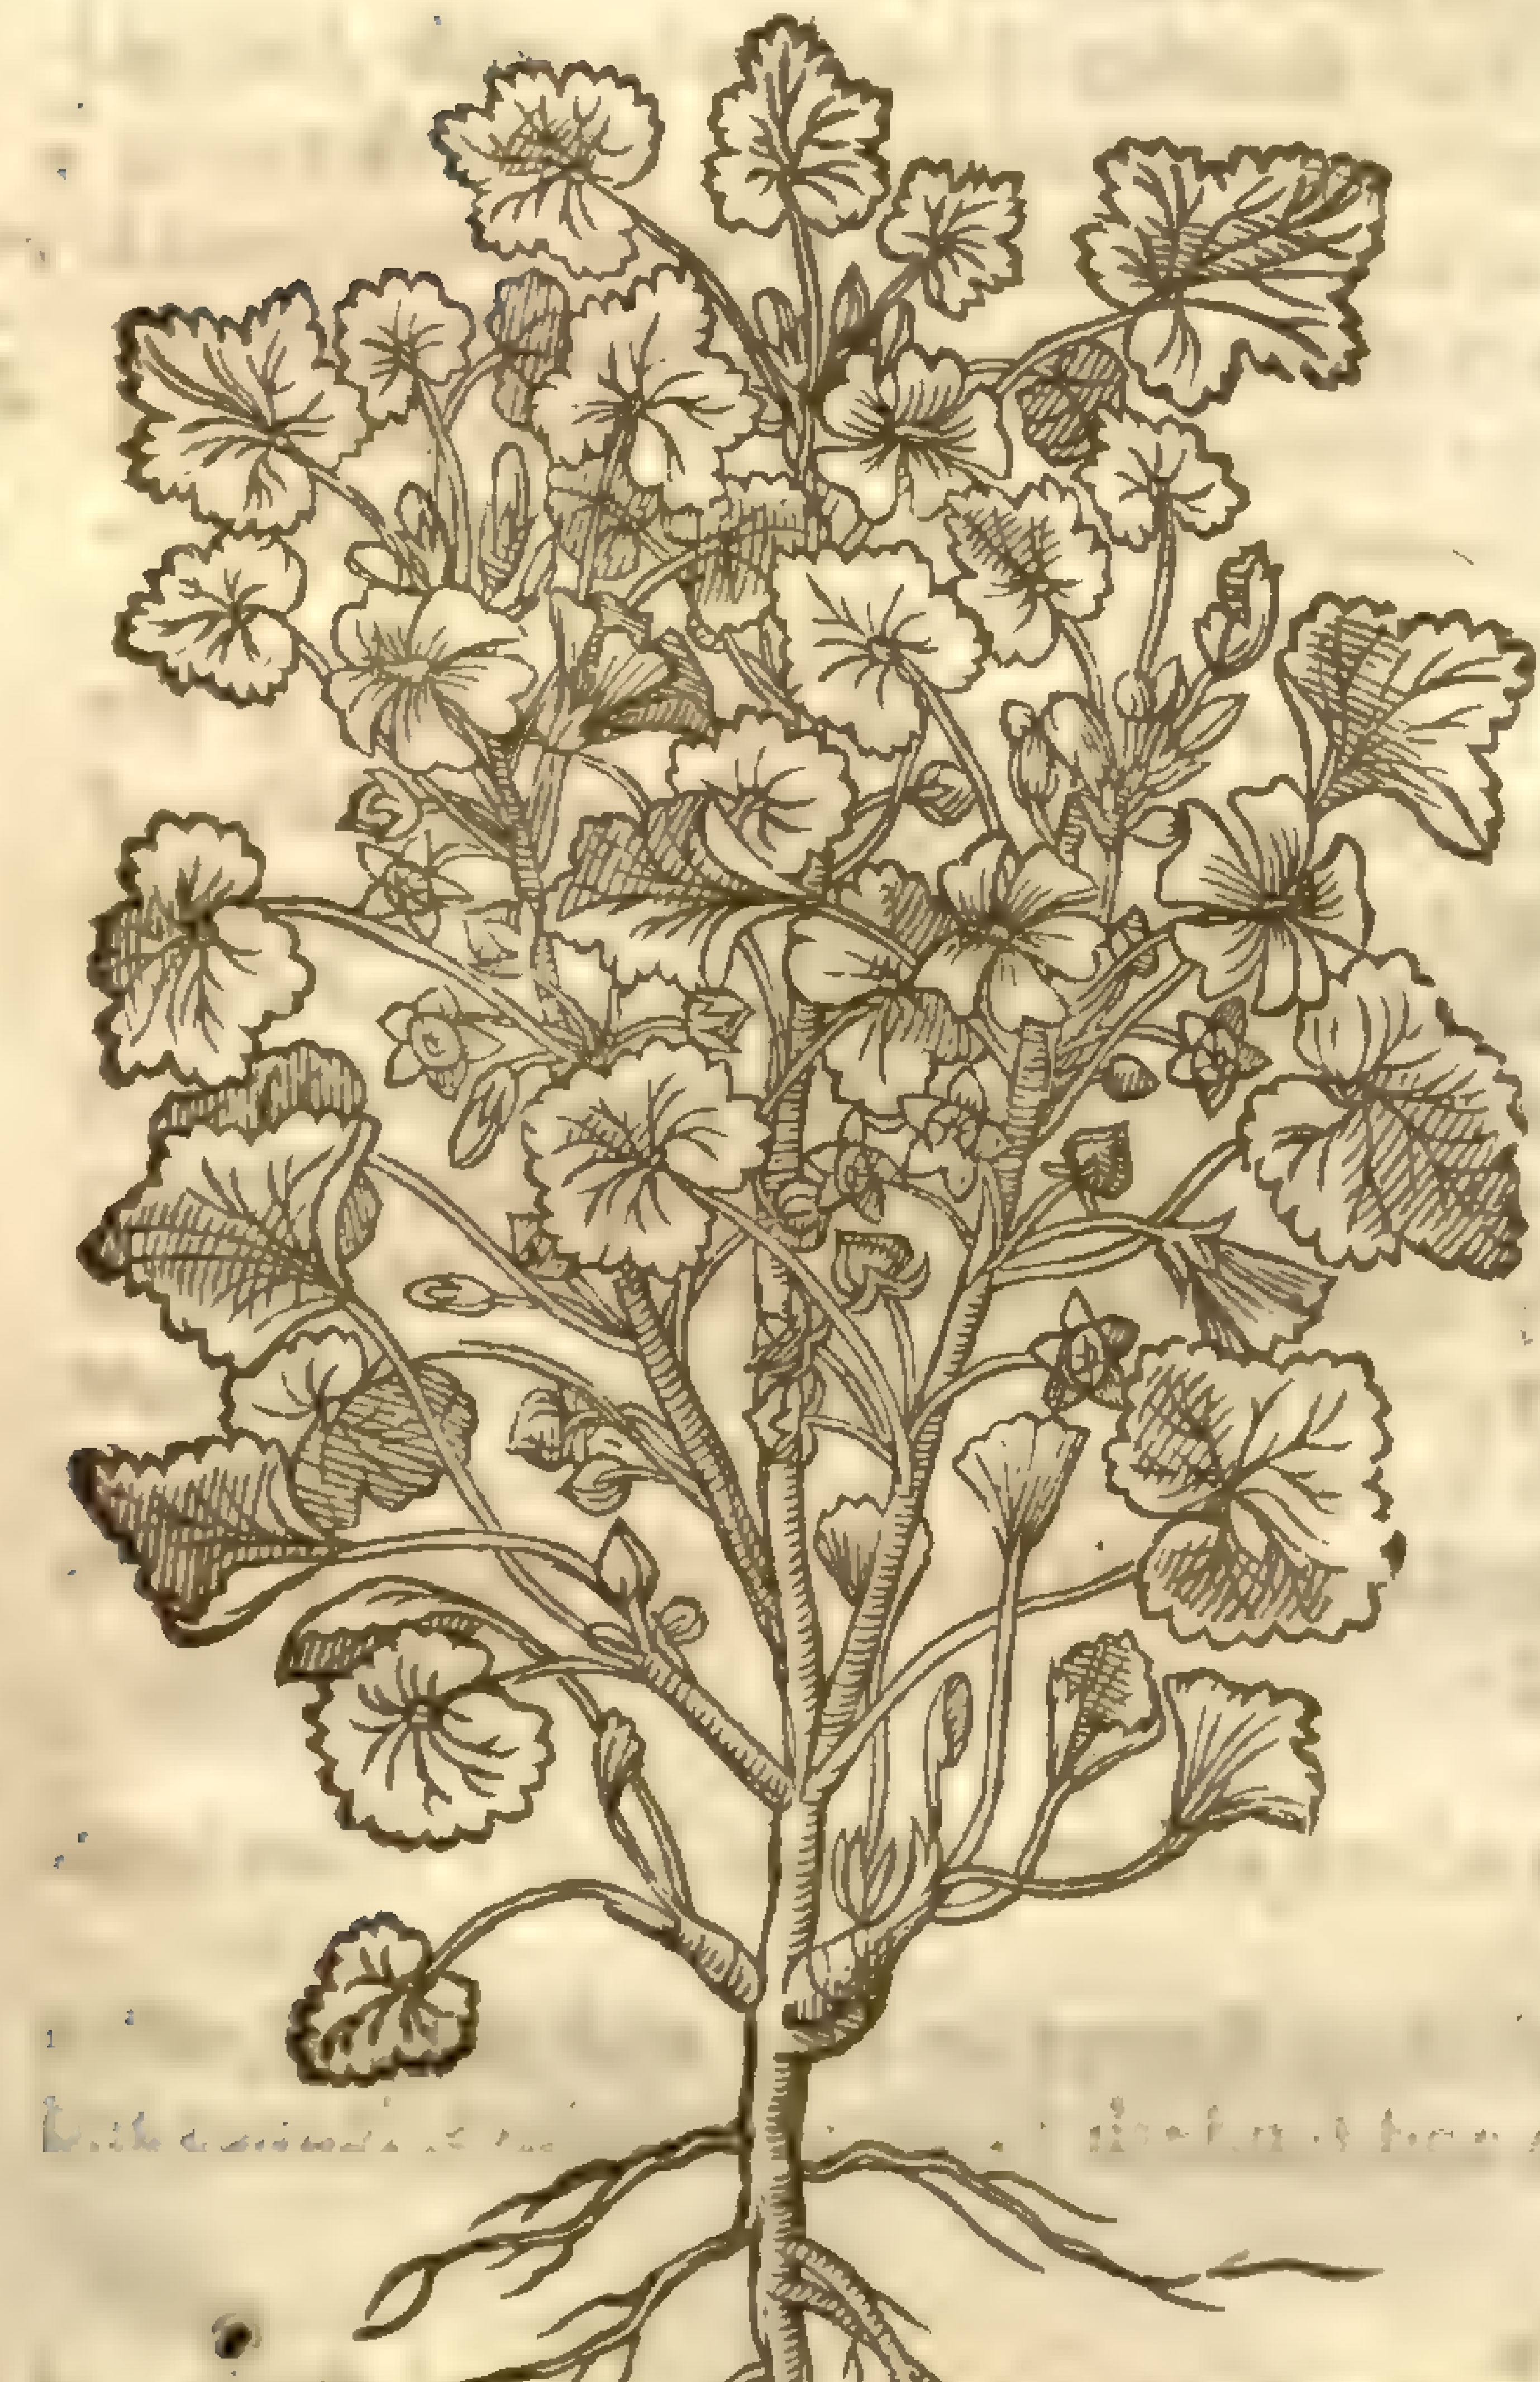
1 The Wilde Mallow hath broad leaues ſomewhat round and cornered, nickt about the edges, ſmooth, and greene of colour: among which riſe vp many ſlender tough ſtalkes,

clad with the like leaues, but ſmaller. The floures grow vpon little foot-ſtalkes of a reddiſh colour mixed with purple ſtrakes, conſiſting of fiue leaues, faſhioned like a bell: after which commeth vp a knap or round button, like vnto a flat cake, compact of many ſmall ſeeds. The root is white, tough, and full of a ſlimie juyce, as is all the reſt of the plant.

2 The dwarfe wilde Mallow creepeth vpon the ground: the ſtalkes are ſlender and weake, yet tough and flexible. The leaues be rounder, and more hoary than the other. The floures are ſmall, and of a white colour.

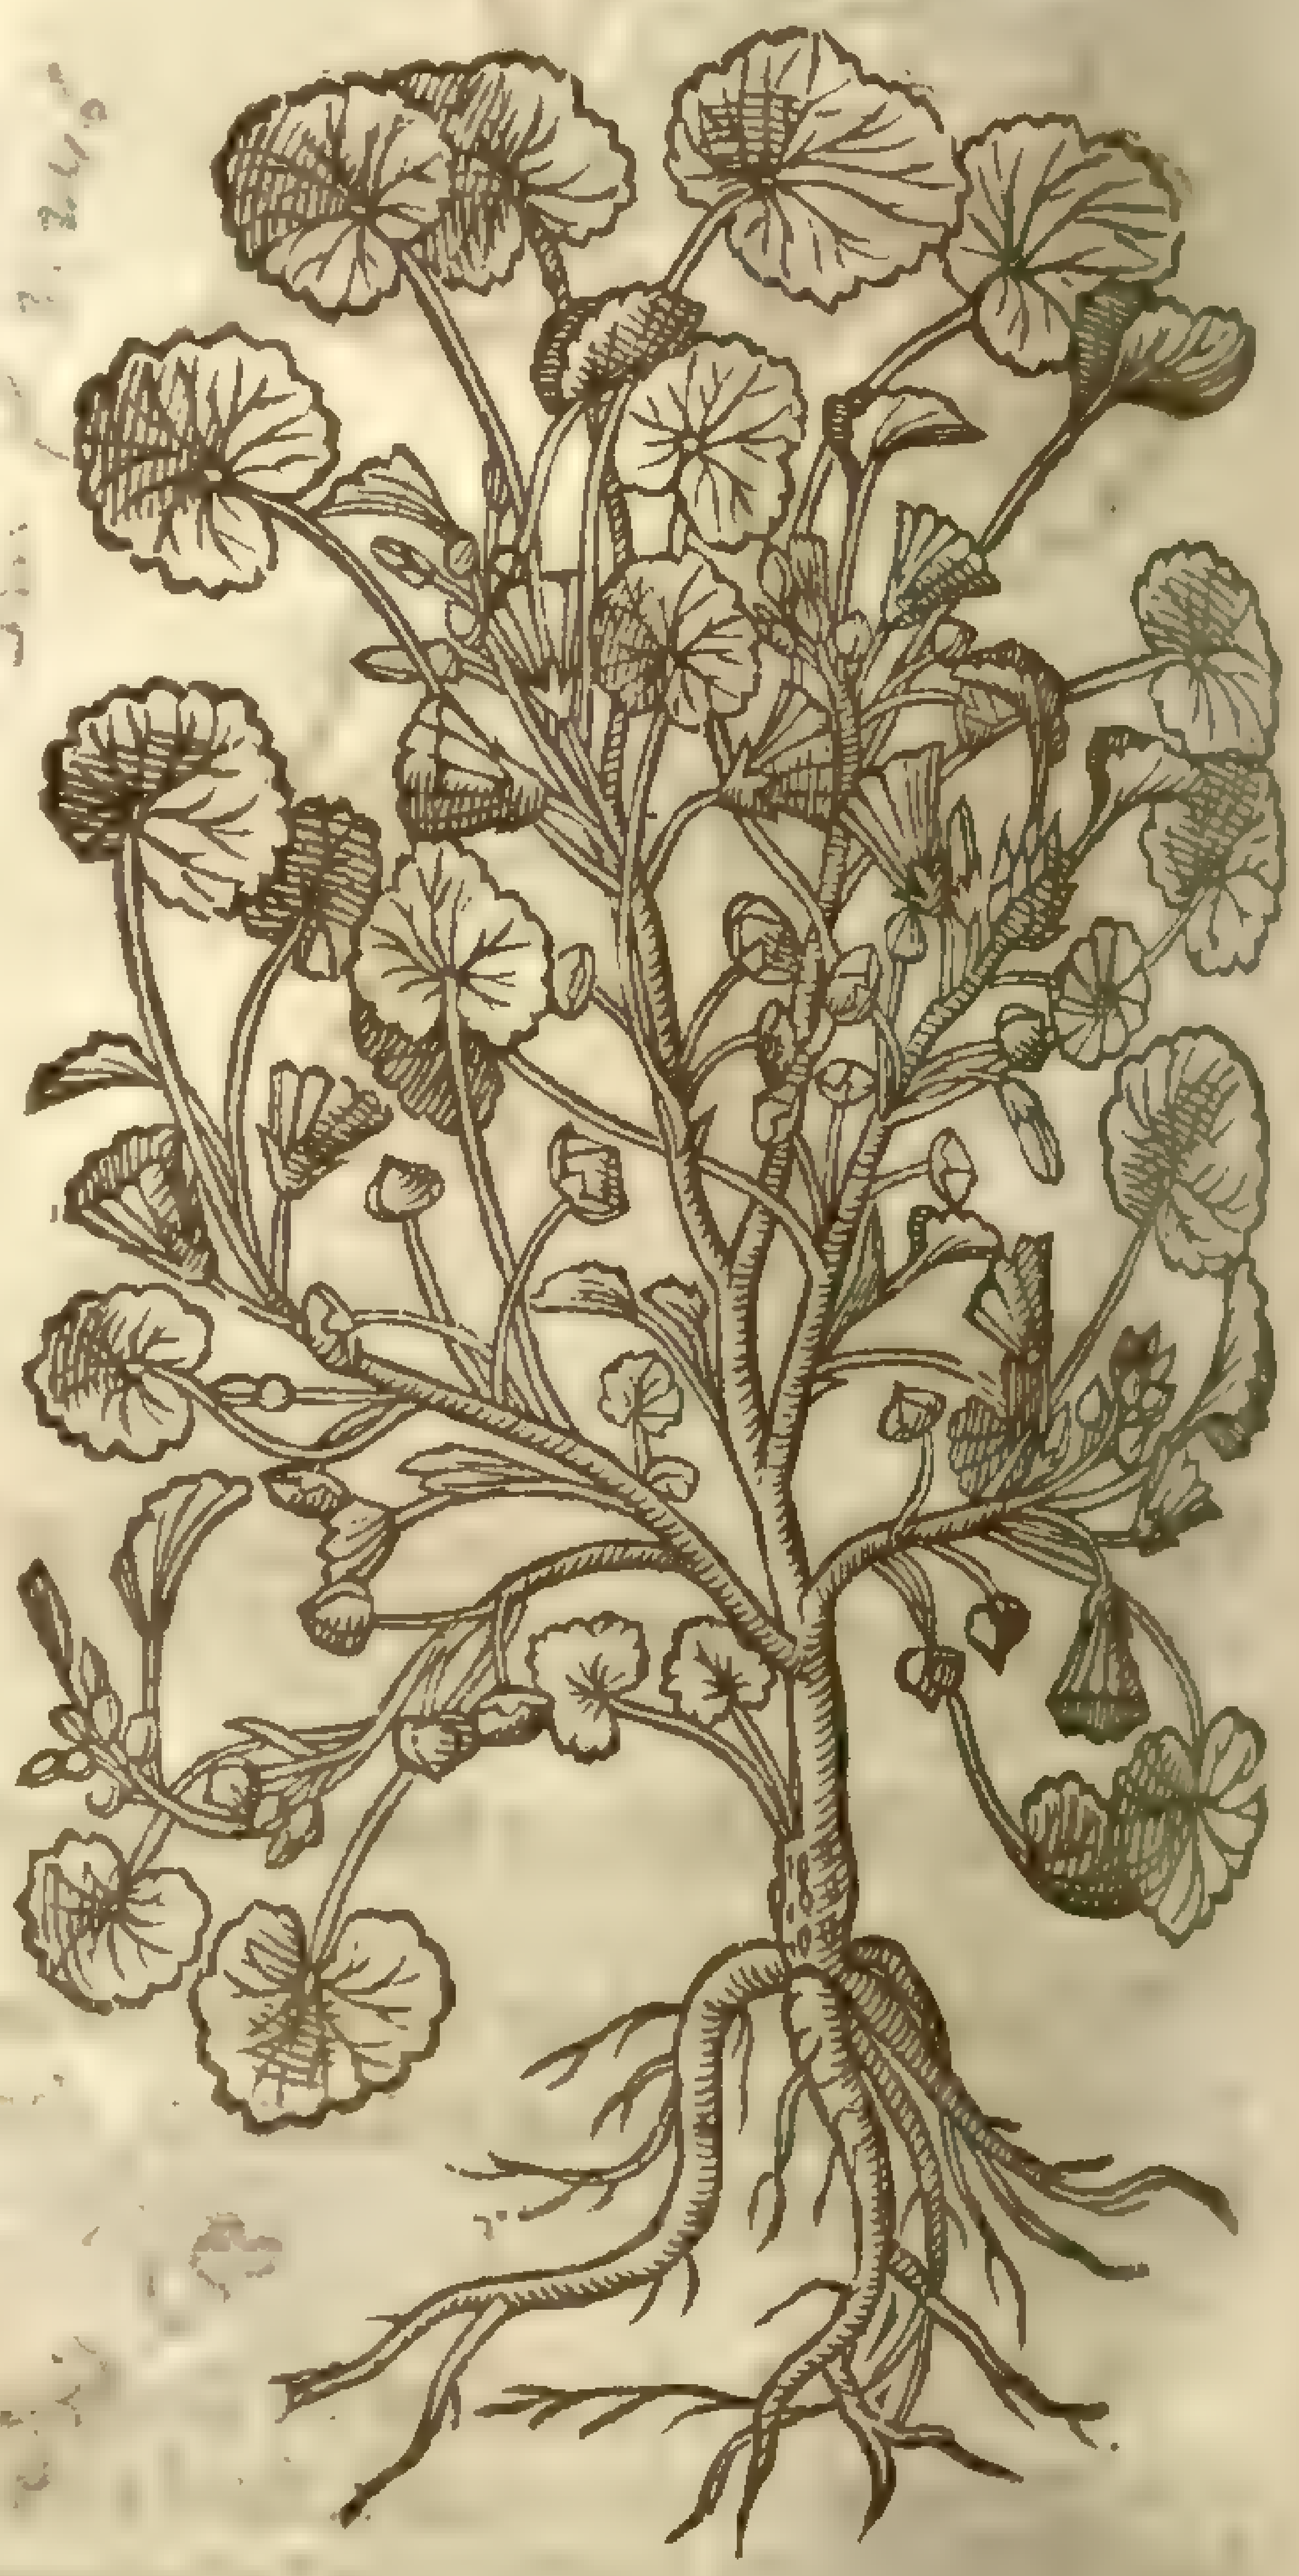
3 The criſpe or curled Mallow, called of the vulgar ſort French Mallowes, hath many ſmall vpright ſtalkes, growing to the height of a cubit, and ſometimes higher; whereon doe grow broad leaues ſomewhat round and ſmooth, of a light greene colour; plaited or curled about the brims like a ruffe. The floures be ſmall and white. The root periſheth when it hath perfected his ſeed.

1 *Malva ſylueſtris.*
The field Mallow.



M. sylvestris, L. [illegible]

2 *Malva ſylueſtris pumila.*
The wilde dwarfe Mallow.



Malva rotundifolia, L. [illegible]

4 The Veruaine Mallow hath many ſtraight ſtalkes, whereon doe grow diuers leaues deepely cut and jagged euen to the middle ribbe, not vnlike to the leaues of Veruaine, whereof it tooke his name: among which come forth faire and pleaſant floures like vnto thoſe of the common Mallow in forme, but of a more bright red colour, mixed with ſtripes of purple, which ſetteth forth the beautie. The root is thicke, and continueth many yeares. ‡ This is ſometimes though more rarely found with white floures. ‡

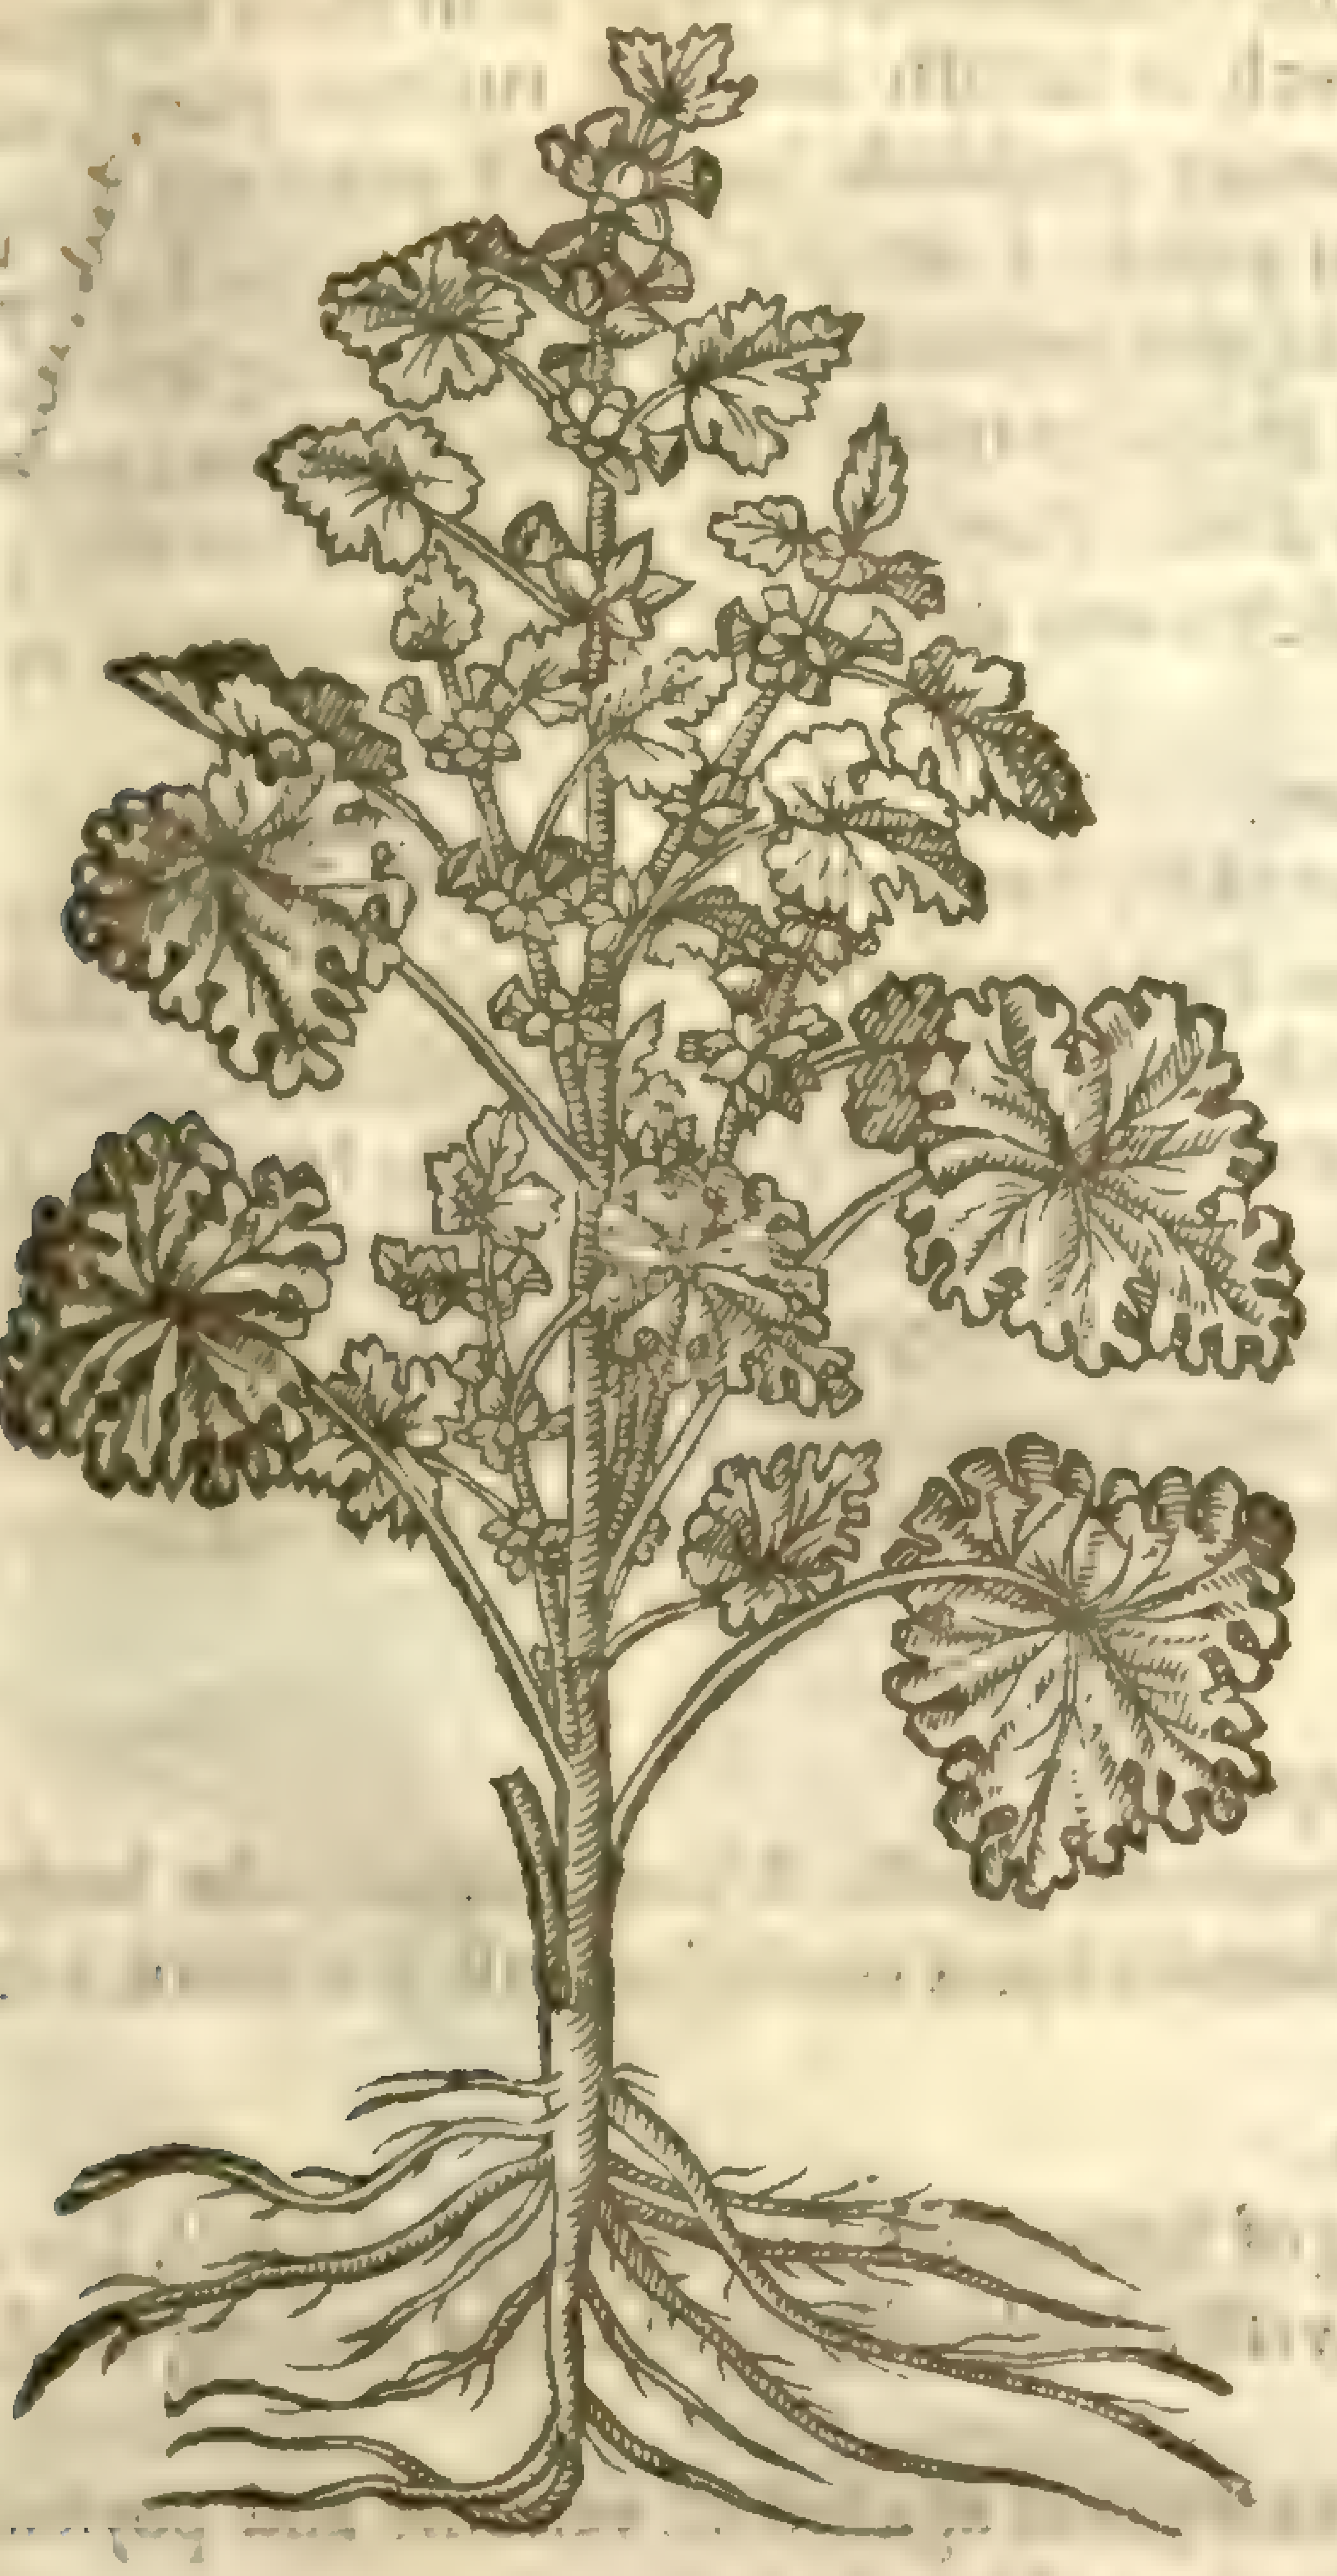
‡ 5 This annuall Mallow, called by *Cluſius*, *Malua trimeſtris*, is very like our common Mallow, ſending vp ſlender branched ſtalkes ſome three foot high; the bottome leaues are round, thoſe on the ſtalkes more ſharpe pointed, greene aboue, and whiter vnderneath: the floures conſiſt of fiue leaues of a light carnation colour, the ſeed is like that of the ordinary Mallow, but ſmaller; and ſuch alſo is the root which periſhes euery yeare as ſoone as the ſeed is ripe: it is ſowne in ſome gardens, and growes wilde in Spaine. ‡

¶ *The Place.*

The two firſt Mallowes grow in vntoiled places among pot-herbes, by high waies, and the borders of fields.

The French mallow is an excellent pot-herbe, for the which cauſe it is ſowne in gardens, and is not to be found wilde that I know of.

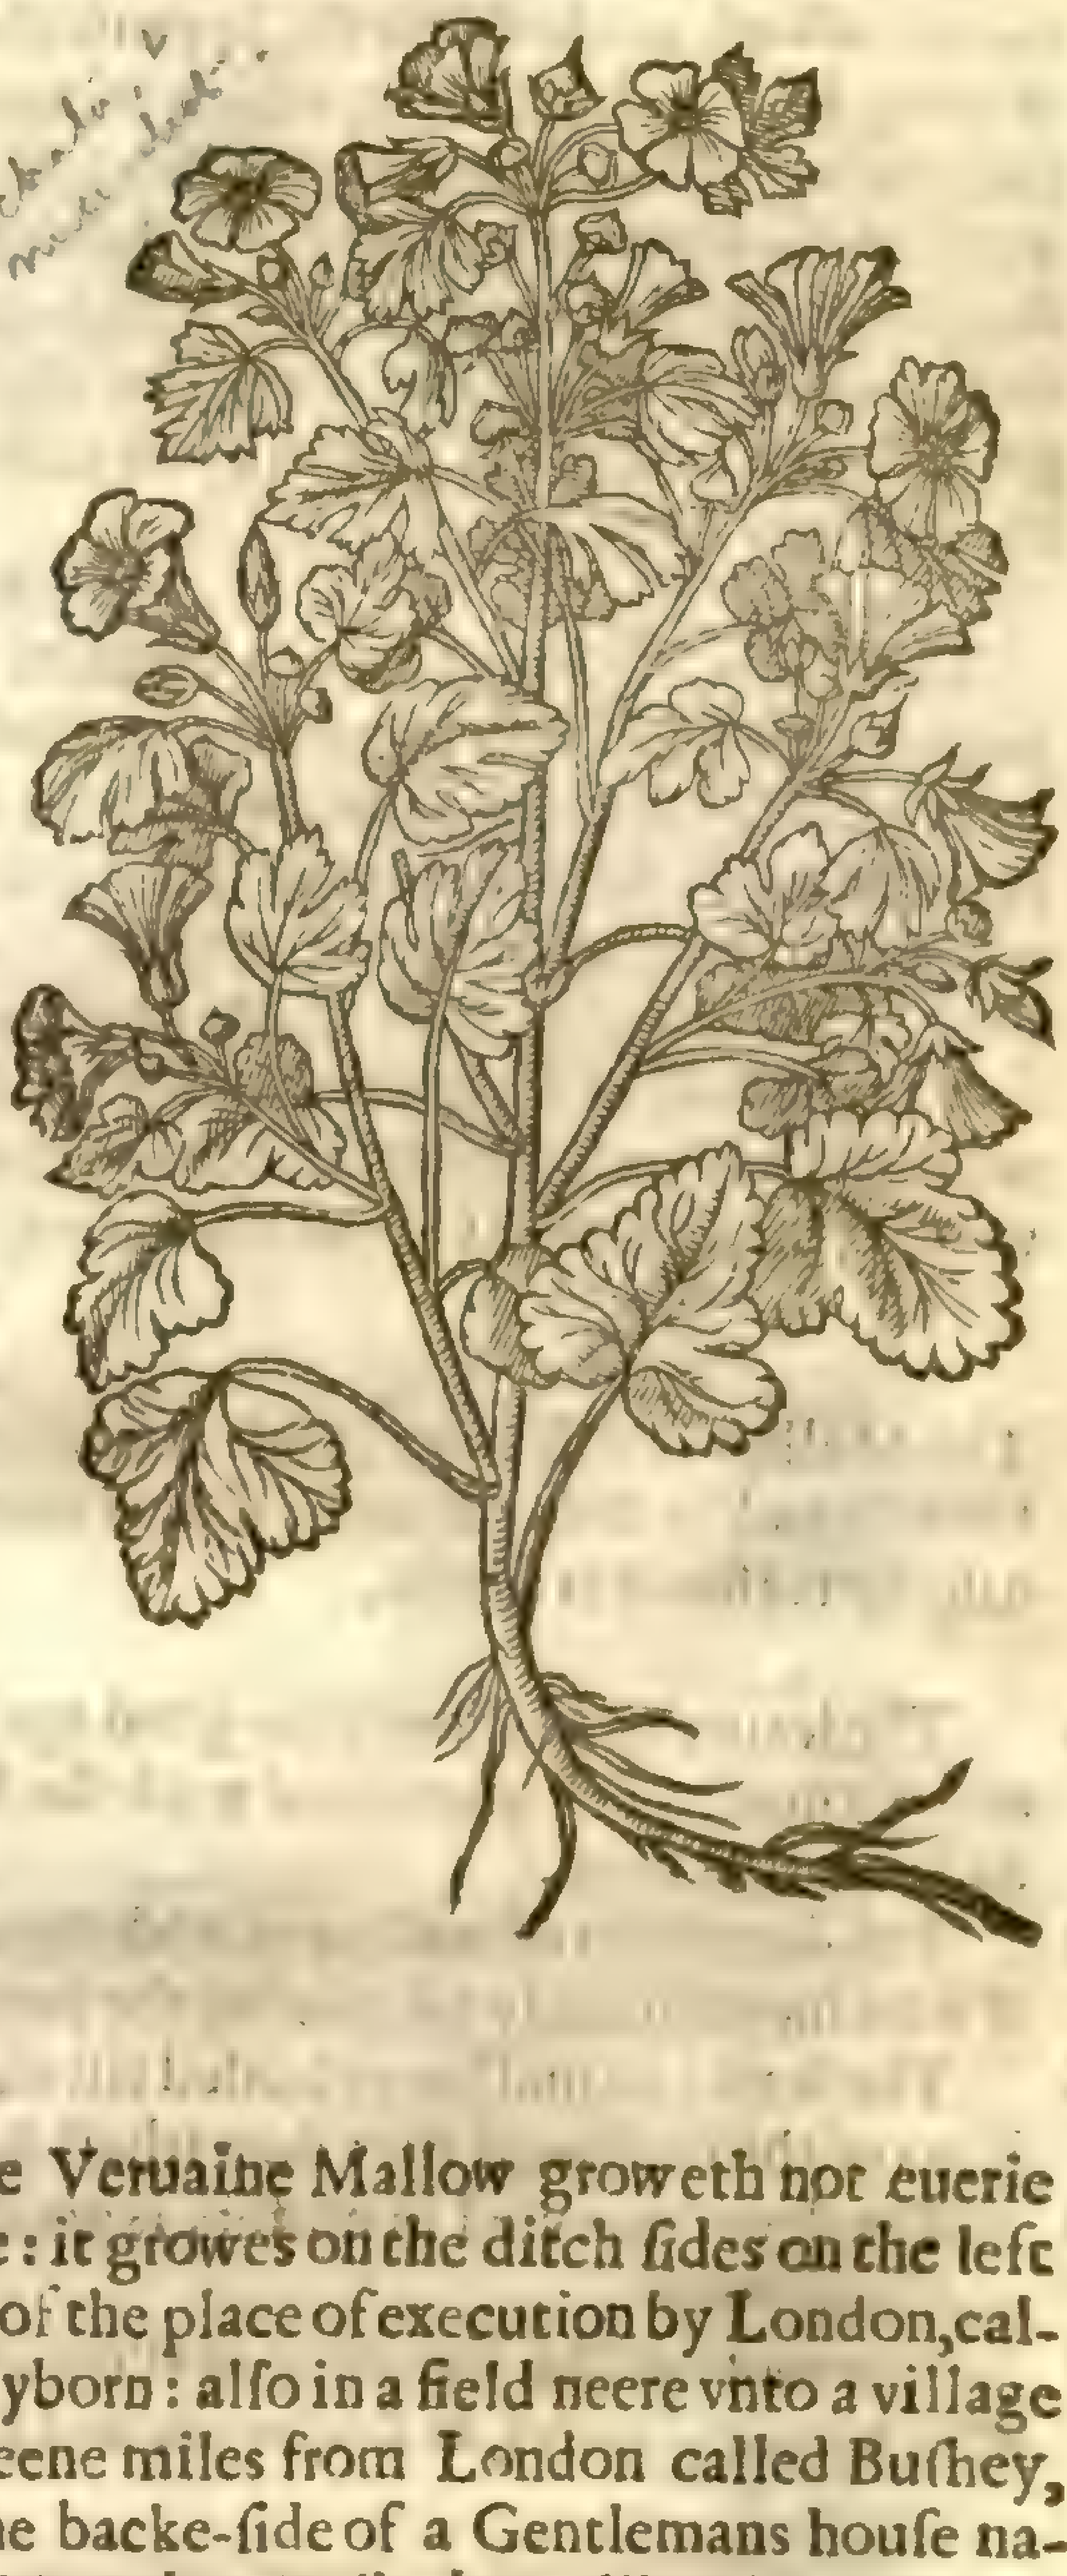
3 *Malua criſpa.*
The French curled Mallow.



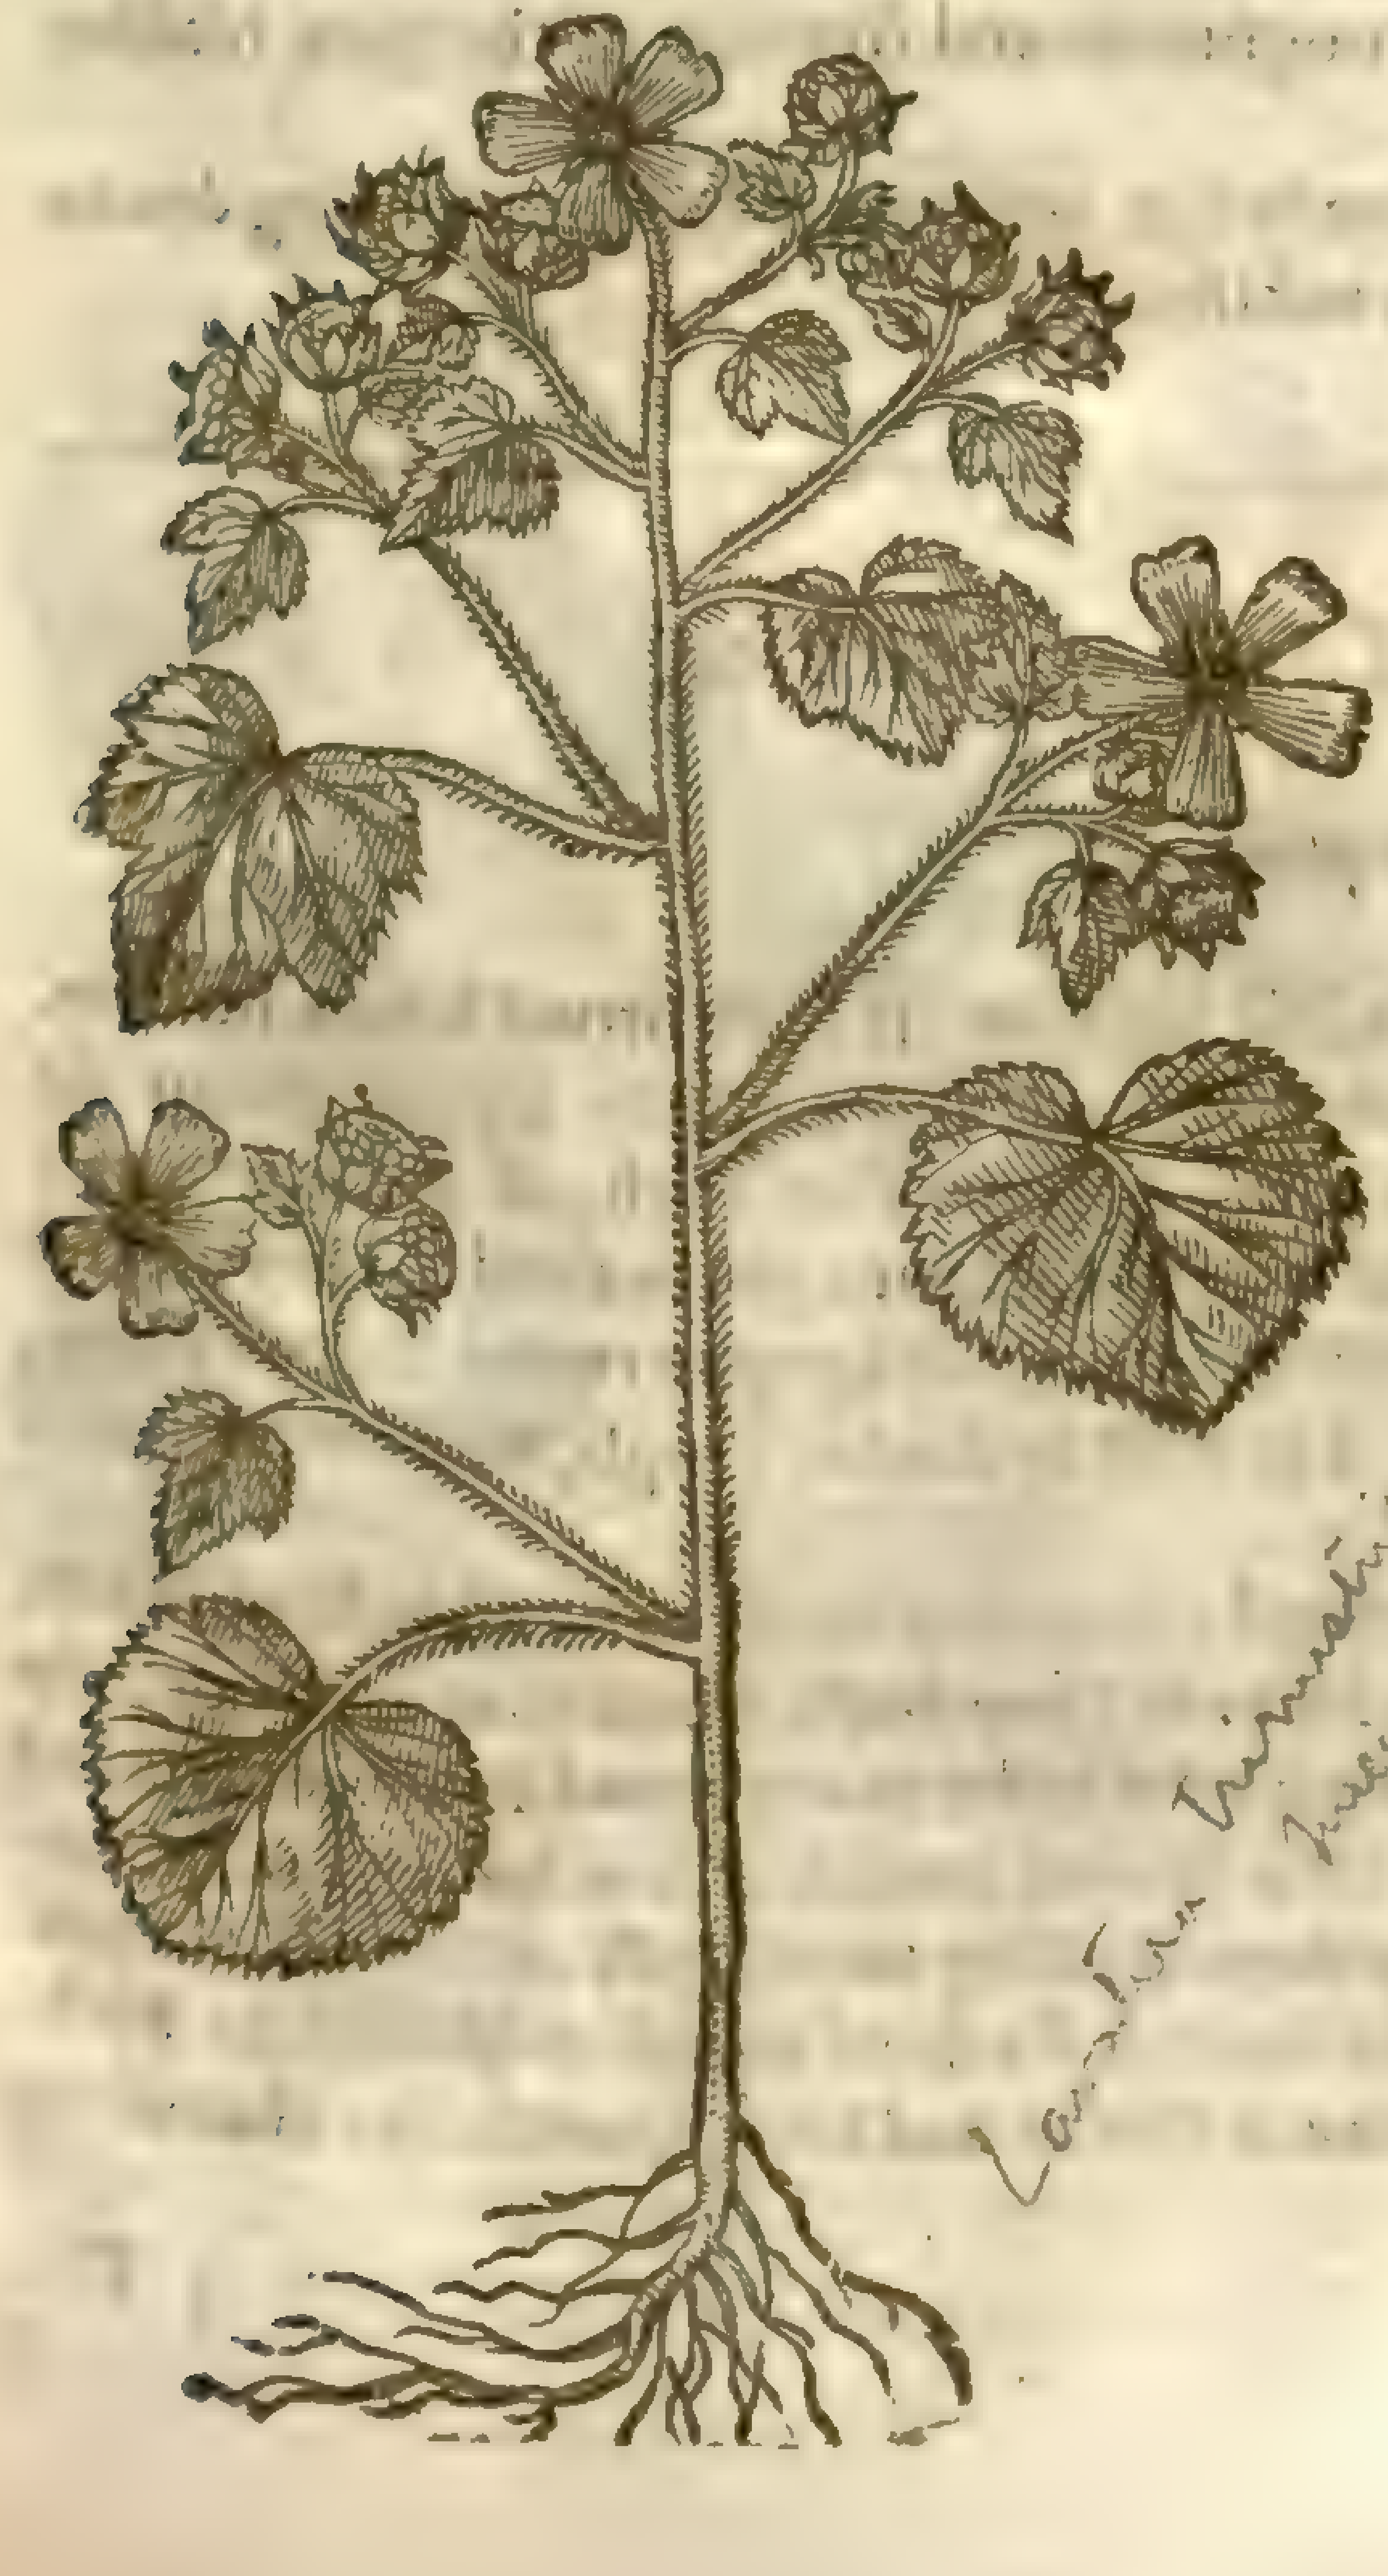
M. crispa, L. Juss. dict.

4 *Malua verbenaca.*
Veruaine Mallow.

M. moschata, L. Juss. dict.



‡ 5 *Malua æſtiua Hiſpanica.*
The Spaniſh Mallow.



Lavatera trimestris, L. Juss. dict.

The Veruaine Mallow groweth not euerie where: it growes on the ditch ſides on the left hand of the place of execution by London, called Tyborn: alſo in a field neere vnto a village fourteene miles from London called Buſhey, on the backe-ſide of a Gentlemans houſe named Mr. *Robert Wilbraham*: likewiſe amongſt the buſhes and hedges as you go from London to a bathing place called the Old Foord: and in the buſhes as you go to Hackny a village by London, in the cloſes next the town, and in diuers other places, as at Baſſingburne in Hartfordſhire, three miles from Roiſton.

‡ Mr. *Goodyer* found the Veruain Mallow with white floures growing plentifully in a cloſe neere Maple-durham in Hampſhire, called Aldercrofts. ‡

¶ *The Time.*

Theſe wilde Mallowes do floure from Iune till Summer be well ſpent: in the meane time their ſeed alſo waxeth ripe.

¶ *The Names.*

The wilde Mallow is called in Latine *Malua ſylueſtris*: in Greeke, μολόχη ἀγρία, or [illegible] and [illegible], as though they ſhould ſay a mitigator of paine: of ſome, *Oſiriaca*: in high Dutch, **Pappelin**: in low Dutch, **Maluwe**, and **Keeſkens cruit**: in Engliſh, Mallow.

The Veuaine Mallow is called of *Dioſcorides*, *Alcea*: in Greeke, ἀλκέα: of ſome, *Herba Hungarica*, and *Herba Simeonis*, or Simons Mallow: in Engliſh, Varuaine Mallow, and jagged Mallow.

The name of this herbe *Malua* ſeemeth to come from the Hebrewes, who call it in their tongue מלוח *Malluach*, of the ſaltneſſe, becauſe the Mallow groweth in ſaltiſh and old ruinous places, as in dung-hills and ſuch like, which in moſt abundant manner yeeldeth forth Salt-peter and ſuch like matter: for מלח *Melach* ſignifieth ſalt, as the learned know. I am perſuaded that the Latine word *Malua* commeth from the Chaldee name [illegible] *Mallucha*, the gutturall letter ח *Ch*, being left out for good ſounds ſake: ſo that it were better in this word *Malüa* to reade *u* as a vowell, that as a conſonant: which words are vttered by the learned Doctor *Rabbi Dauid Kimhi*, and ſeeme to carrie a great ſhew of truth: in Engliſh it is called, Mallow; which name commeth as neere as may be to the Hebrew word.

¶ *The Temperature.*

The wilde Mallowes haue a certaine moderate and middle heate, and moiſtneſſe withall: the juyce thereof is ſlimie, clammie, or gluing, the which are to be preferred before the garden Mallow or Hollihocke, as *Diphilus Siphinus* in *Athenæus* doth rightly thinke; who plainely ſheweth, that the wilde mallow is better than that of the garden: although ſome doe prefer the Hollihocke, whereunto we may not conſent, neither yet yeeld vnto *Galen*, who is partly of that minde, yet ſtandeth he doubtfull: for the wilde Mallow without controuerſie is fitter to be eaten, and more pleaſant than thoſe of the garden, except the French Mallow, which is generally holden the wholſomeſt, and amongſt the pot-herbes not the leaſt commended by *Heſiodo*: of whoſe opinion was *Horace*, writing in his ſecond Ode of his *Epodon*,

—— & graui
Maluæ ſalubres corpori.

The Mallow (ſaith *Galen*) doth nouriſh moderately, ingendreth groſſe bloud, keepeth the body ſoluble, and looſeth the belly that is bound. It eaſily deſcendeth, not onely becauſe it is moiſt, but alſo by reaſon it is ſlimie.

¶ *The Vertues.*

A The leaues of Mallowes are good againſt the ſtinging of Scorpions, Bees, Waſps, and ſuch like: and if a man be firſt annointed with the leaues ſtamped with a little oile, he ſhal not be ſtung at all, as *Dioſcorides* ſaith.

B The decoction of mallowes with their roots drunken are good againſt all venome and poyſon, if it be incontinently taken after the poyſon, ſo that it be vomited vp againe.

C The leaues of mallowes boiled till they be ſoft and applied, doe mollifie tumors and hard ſwellings of the mother, if they do withall ſit ouer the fume thereof, and bathe themſelues therewith.

D The decoction vſed in cliſters is good againſt the roughneſſe and fretting of the guts, bladder, and fundament.

E The roots of the Veruaine-mallow do heale the bloudy flix and inward burſtings, being drunke with wine and water, as *Dioſcorides* and *Paulus Ægineta* teſtifie.

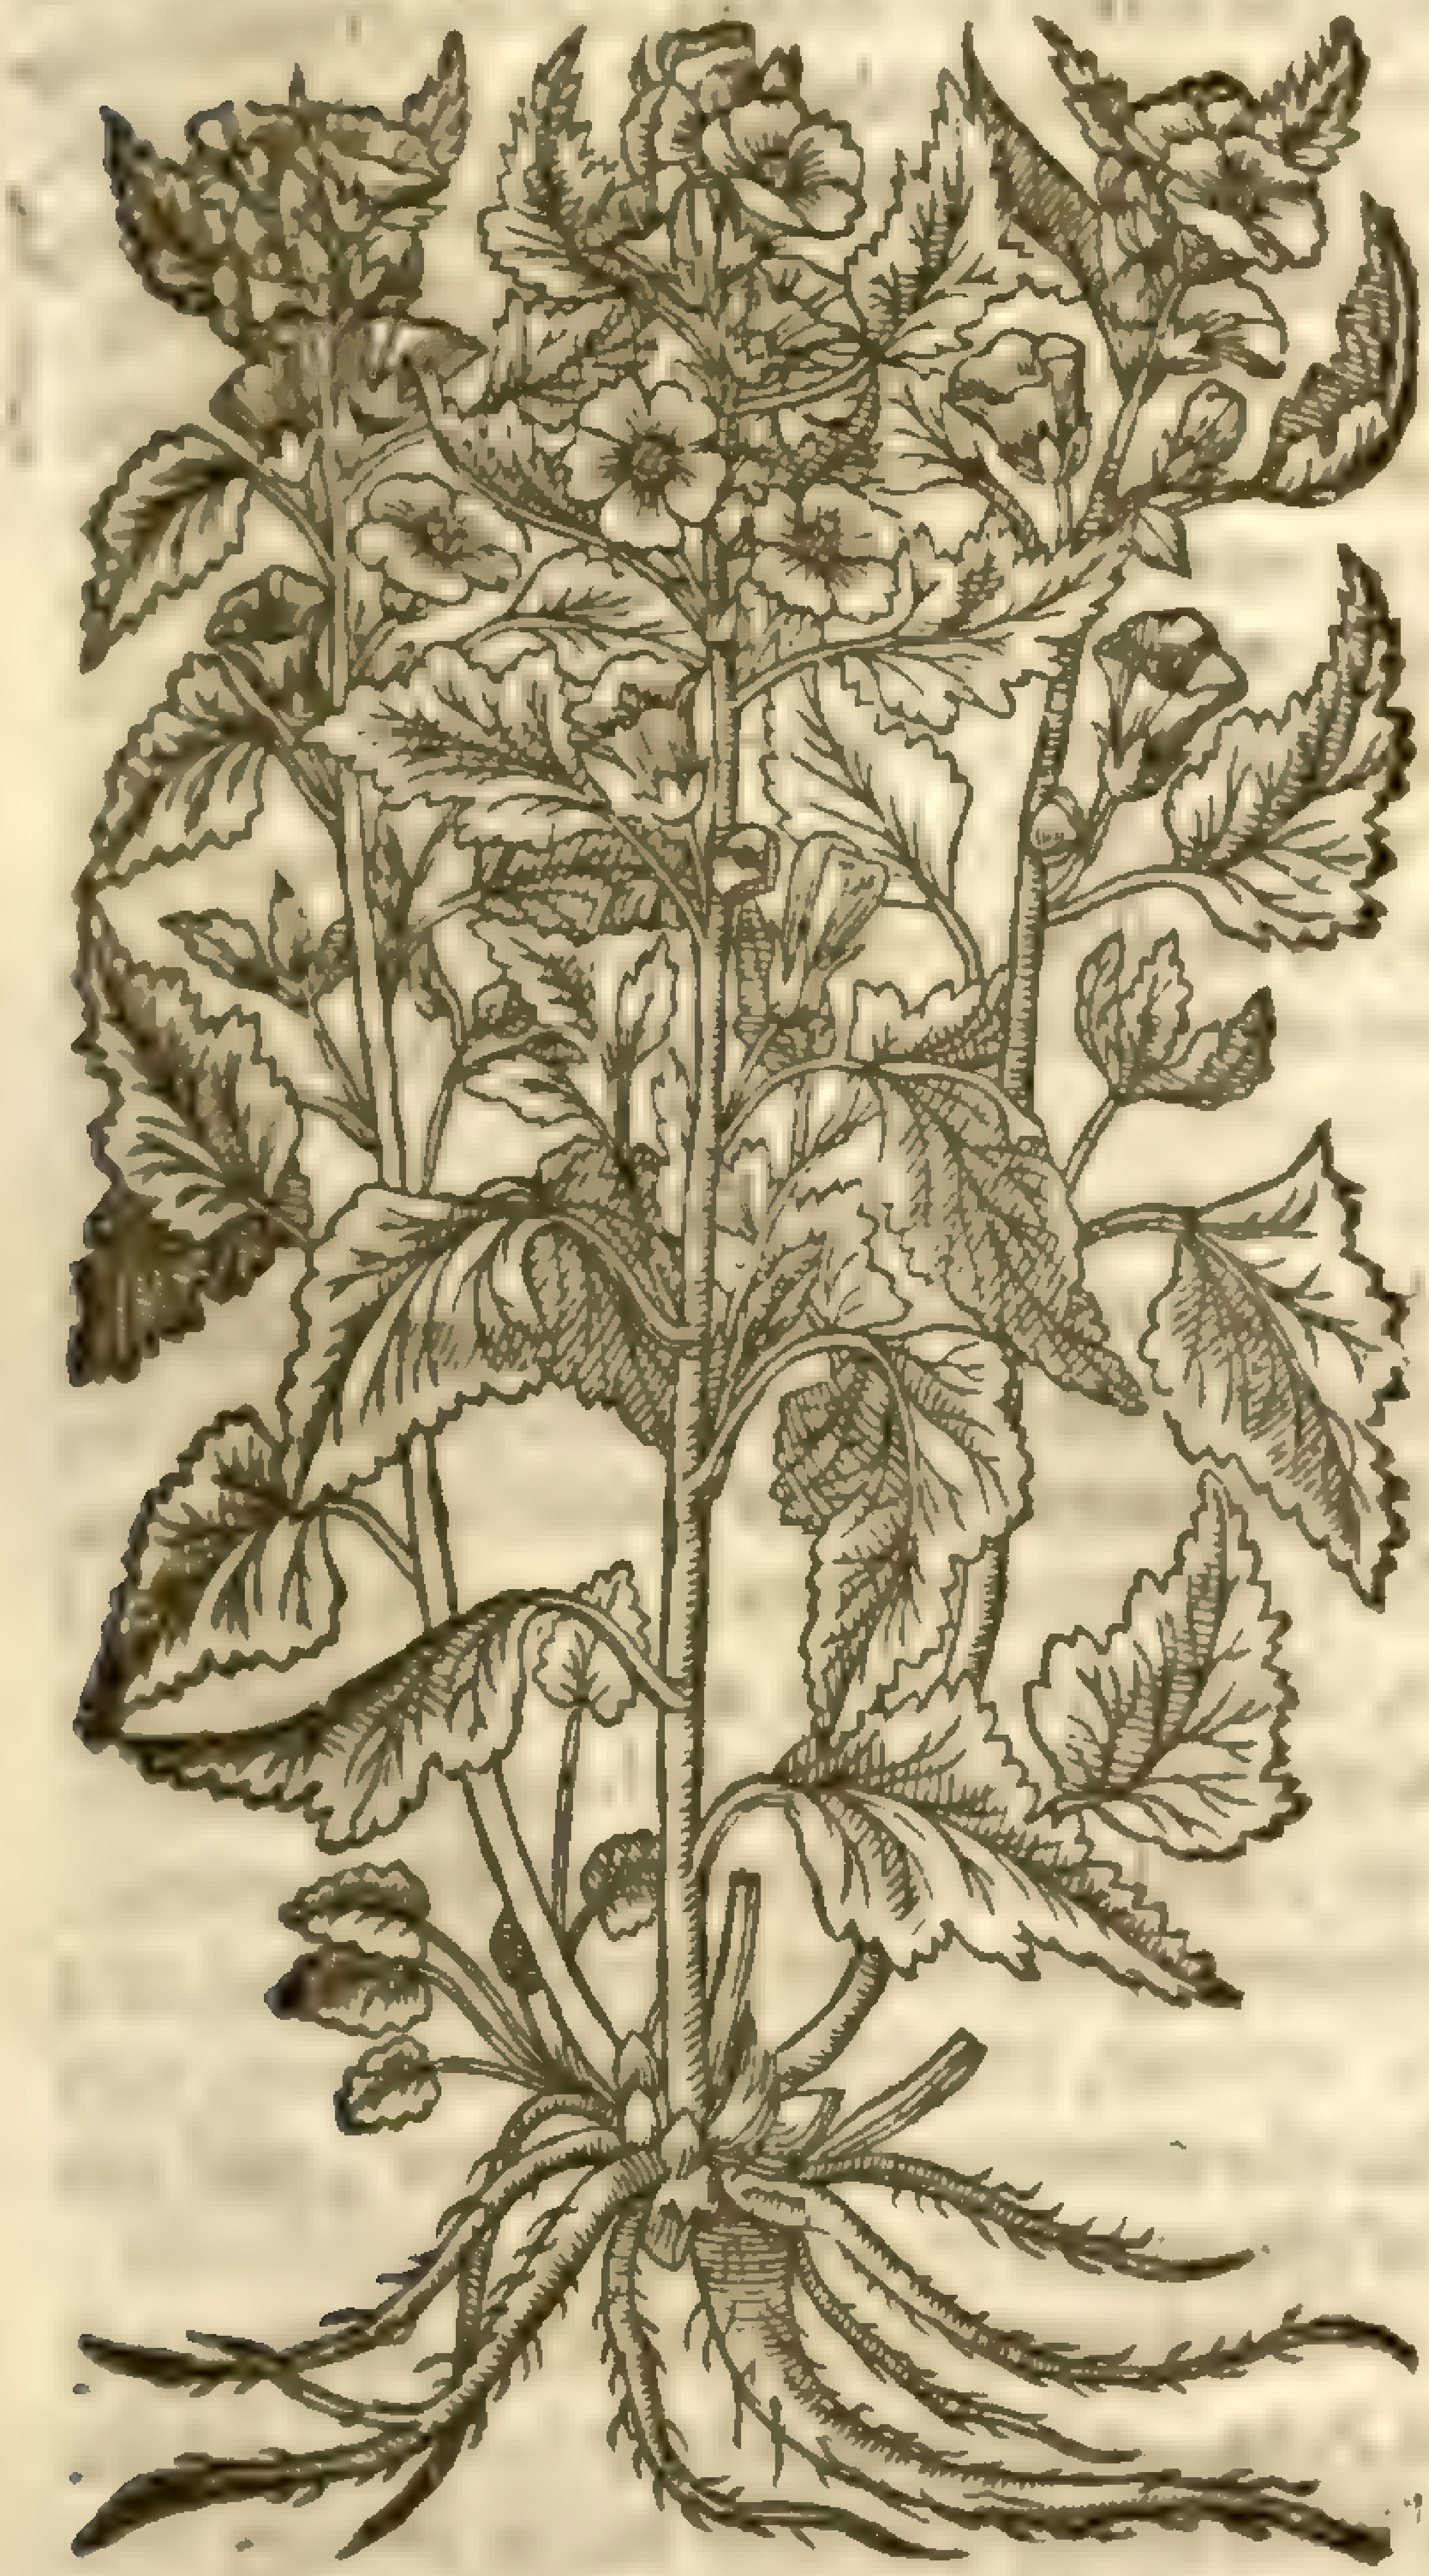
CHAP. 353. *Of Marſh Mallow.*

¶ *The Deſcription.*

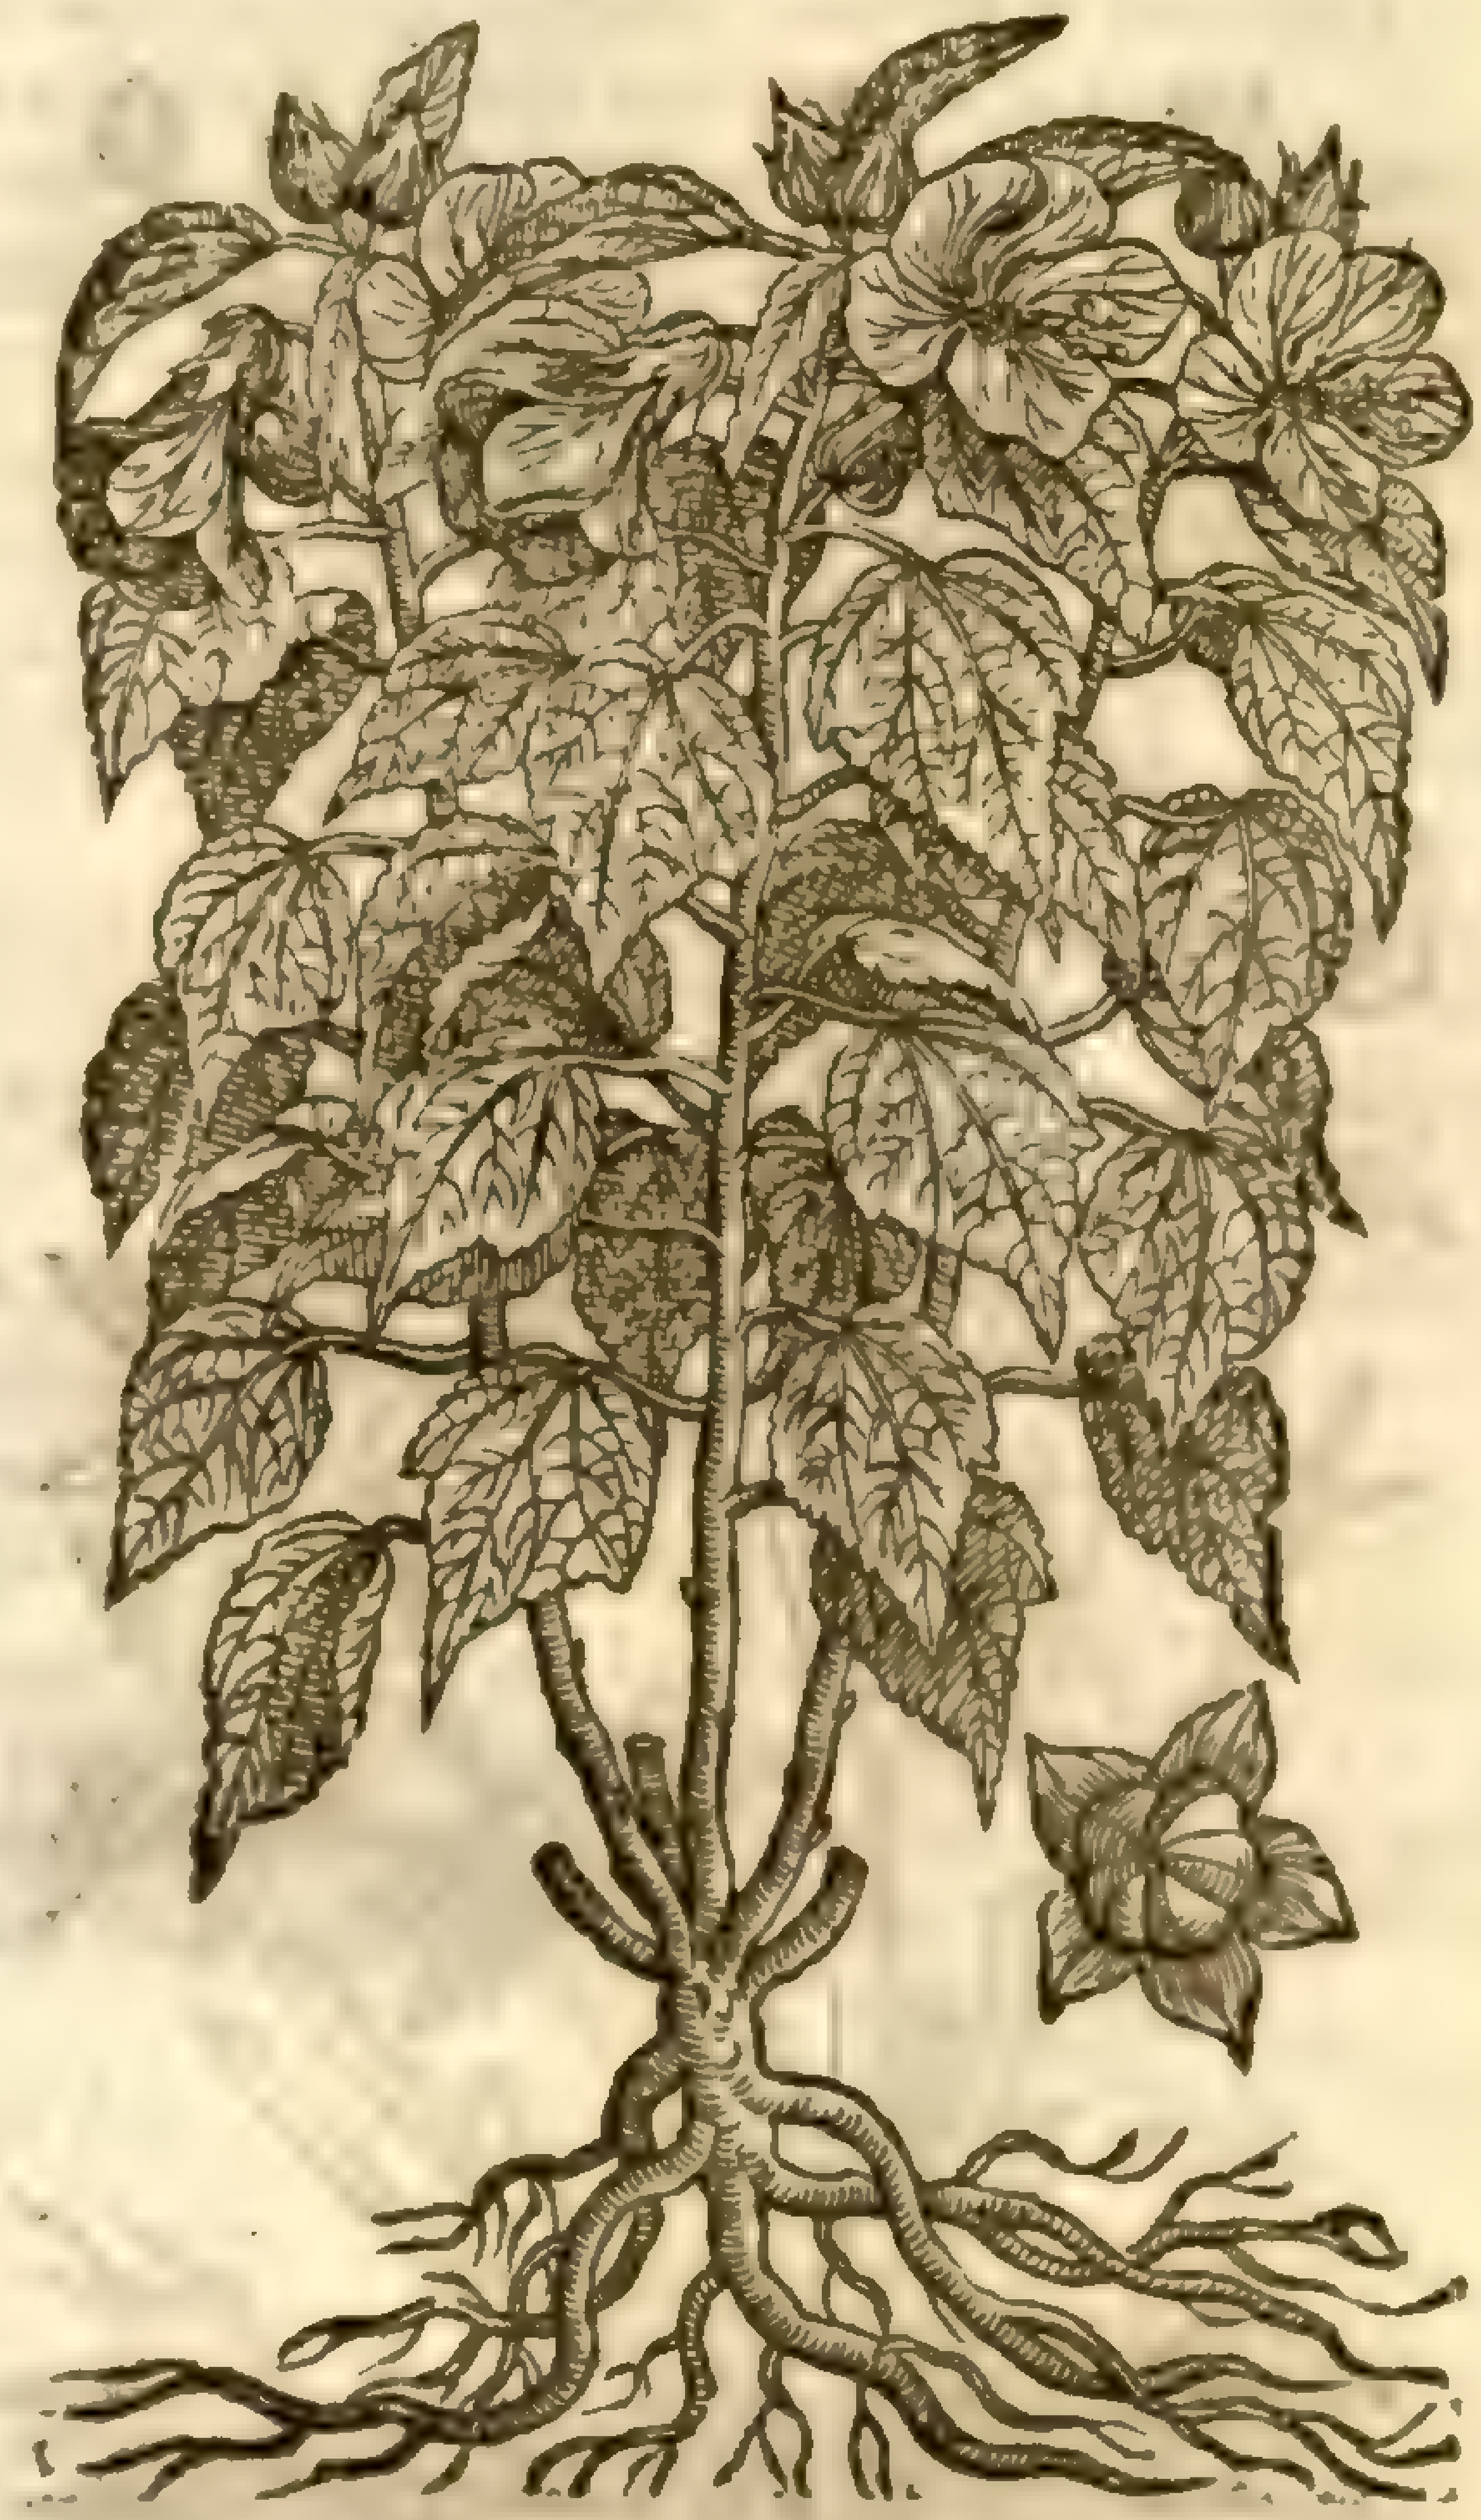
1 Marſh-Mallow is alſo a certaine kinde of wilde Mallow: it hath broad leaues, ſmall toward the point, ſoft, white, and freeſed or cottoned, and ſlightly nicked about the edges: the ſtalkes be round and ſtraight, three or foure foot high, of a whitiſh gray colour; whereon do grow floures like vnto thoſe of the wilde Mallowes, yet not red as they are, but commonly white, or of a very light purple colour out of the white: the knop or round button wherein the ſeeds lie is like that of the firſt wilde mallow. The root is thicke, tough, white within, and containeth in it a clammy and ſlimy juyce.

† 2 This ſtrange kinde of Mallow is holden amongſt the beſt writers to be a kinde of Marſh mallow: ſome excellent Herbariſts haue ſet it downe for *Sida Theophraſti*, whereto it doth not fully anſwer: it hath ſtalks two cubits high, whereon are ſet without order many broad leaues hoarie and whitiſh, not vnlike thoſe of the other Marſh mallow: the floures conſiſt of fiue leaues, and are larger than thoſe of the marſh mallow, and of a purple colour tending to redneſſe: after which there come round bladders of a pale colour, in ſhape like the fruit or ſeeds of round *Ariſtochia*, or Birthwort, wherein is contained round blacke ſeed. The root is thicke and tough, much like that of the common mallow.

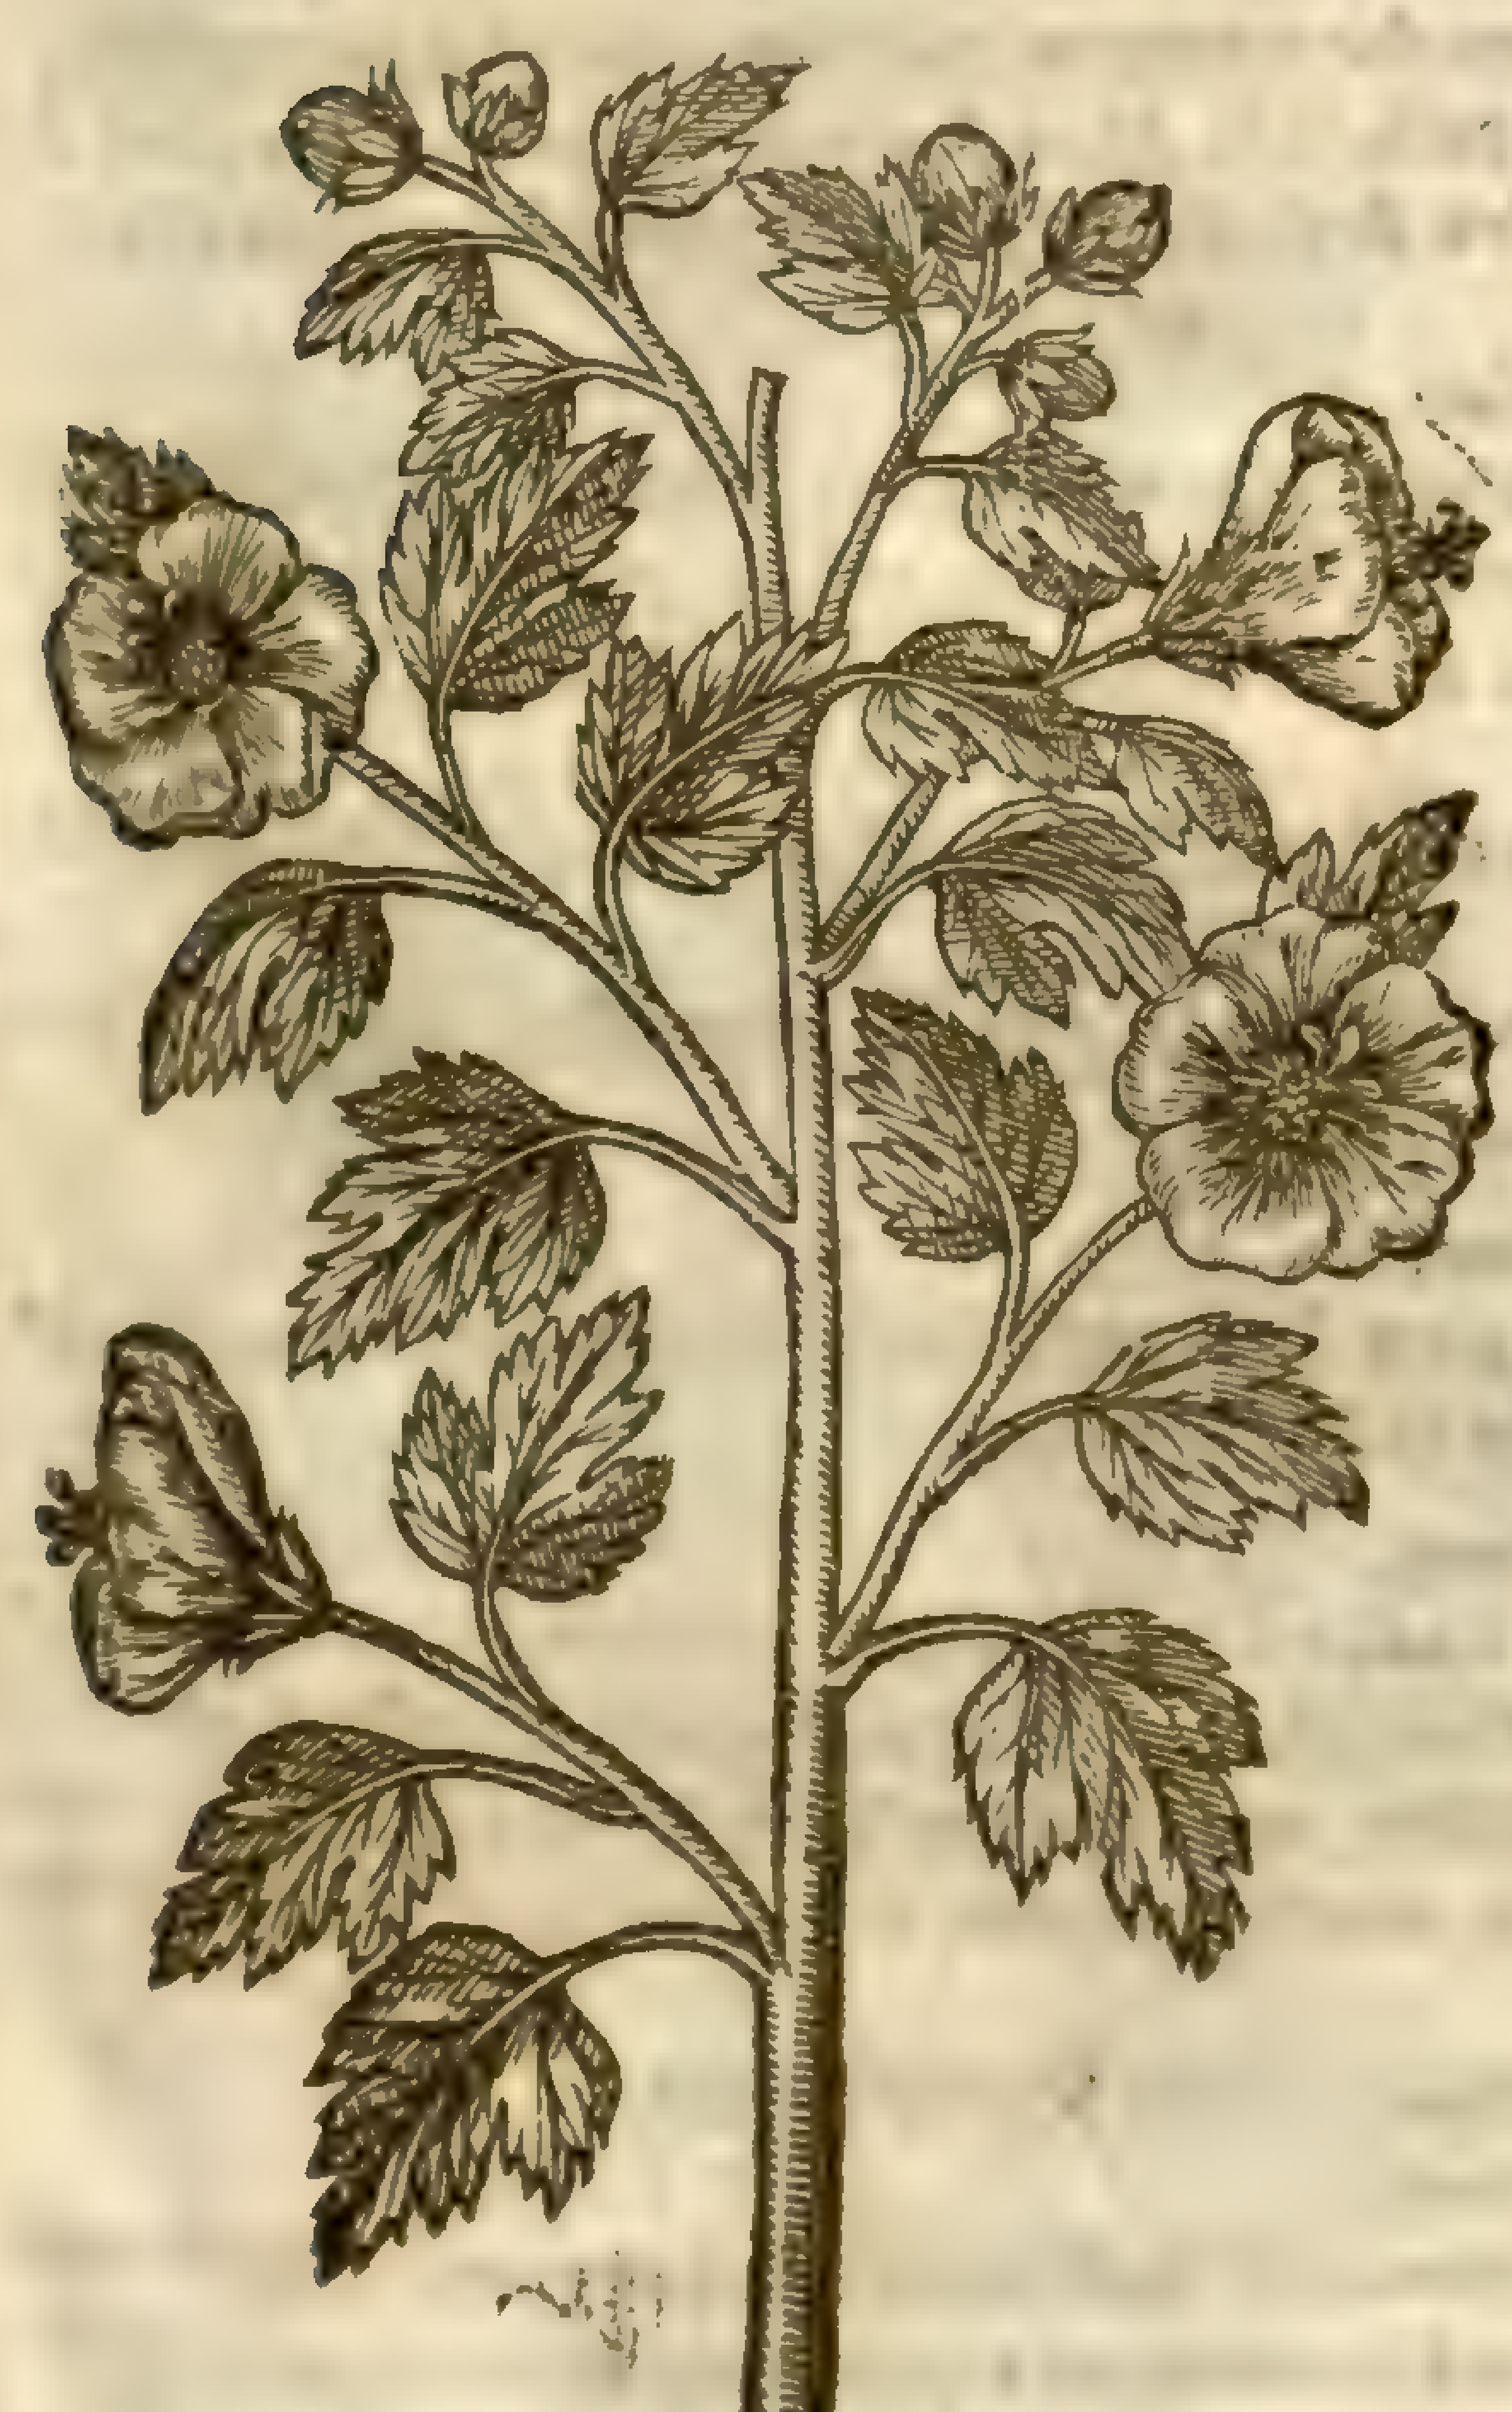
1 *Althaa, Ibiſcus.*
Marſh Mallow.



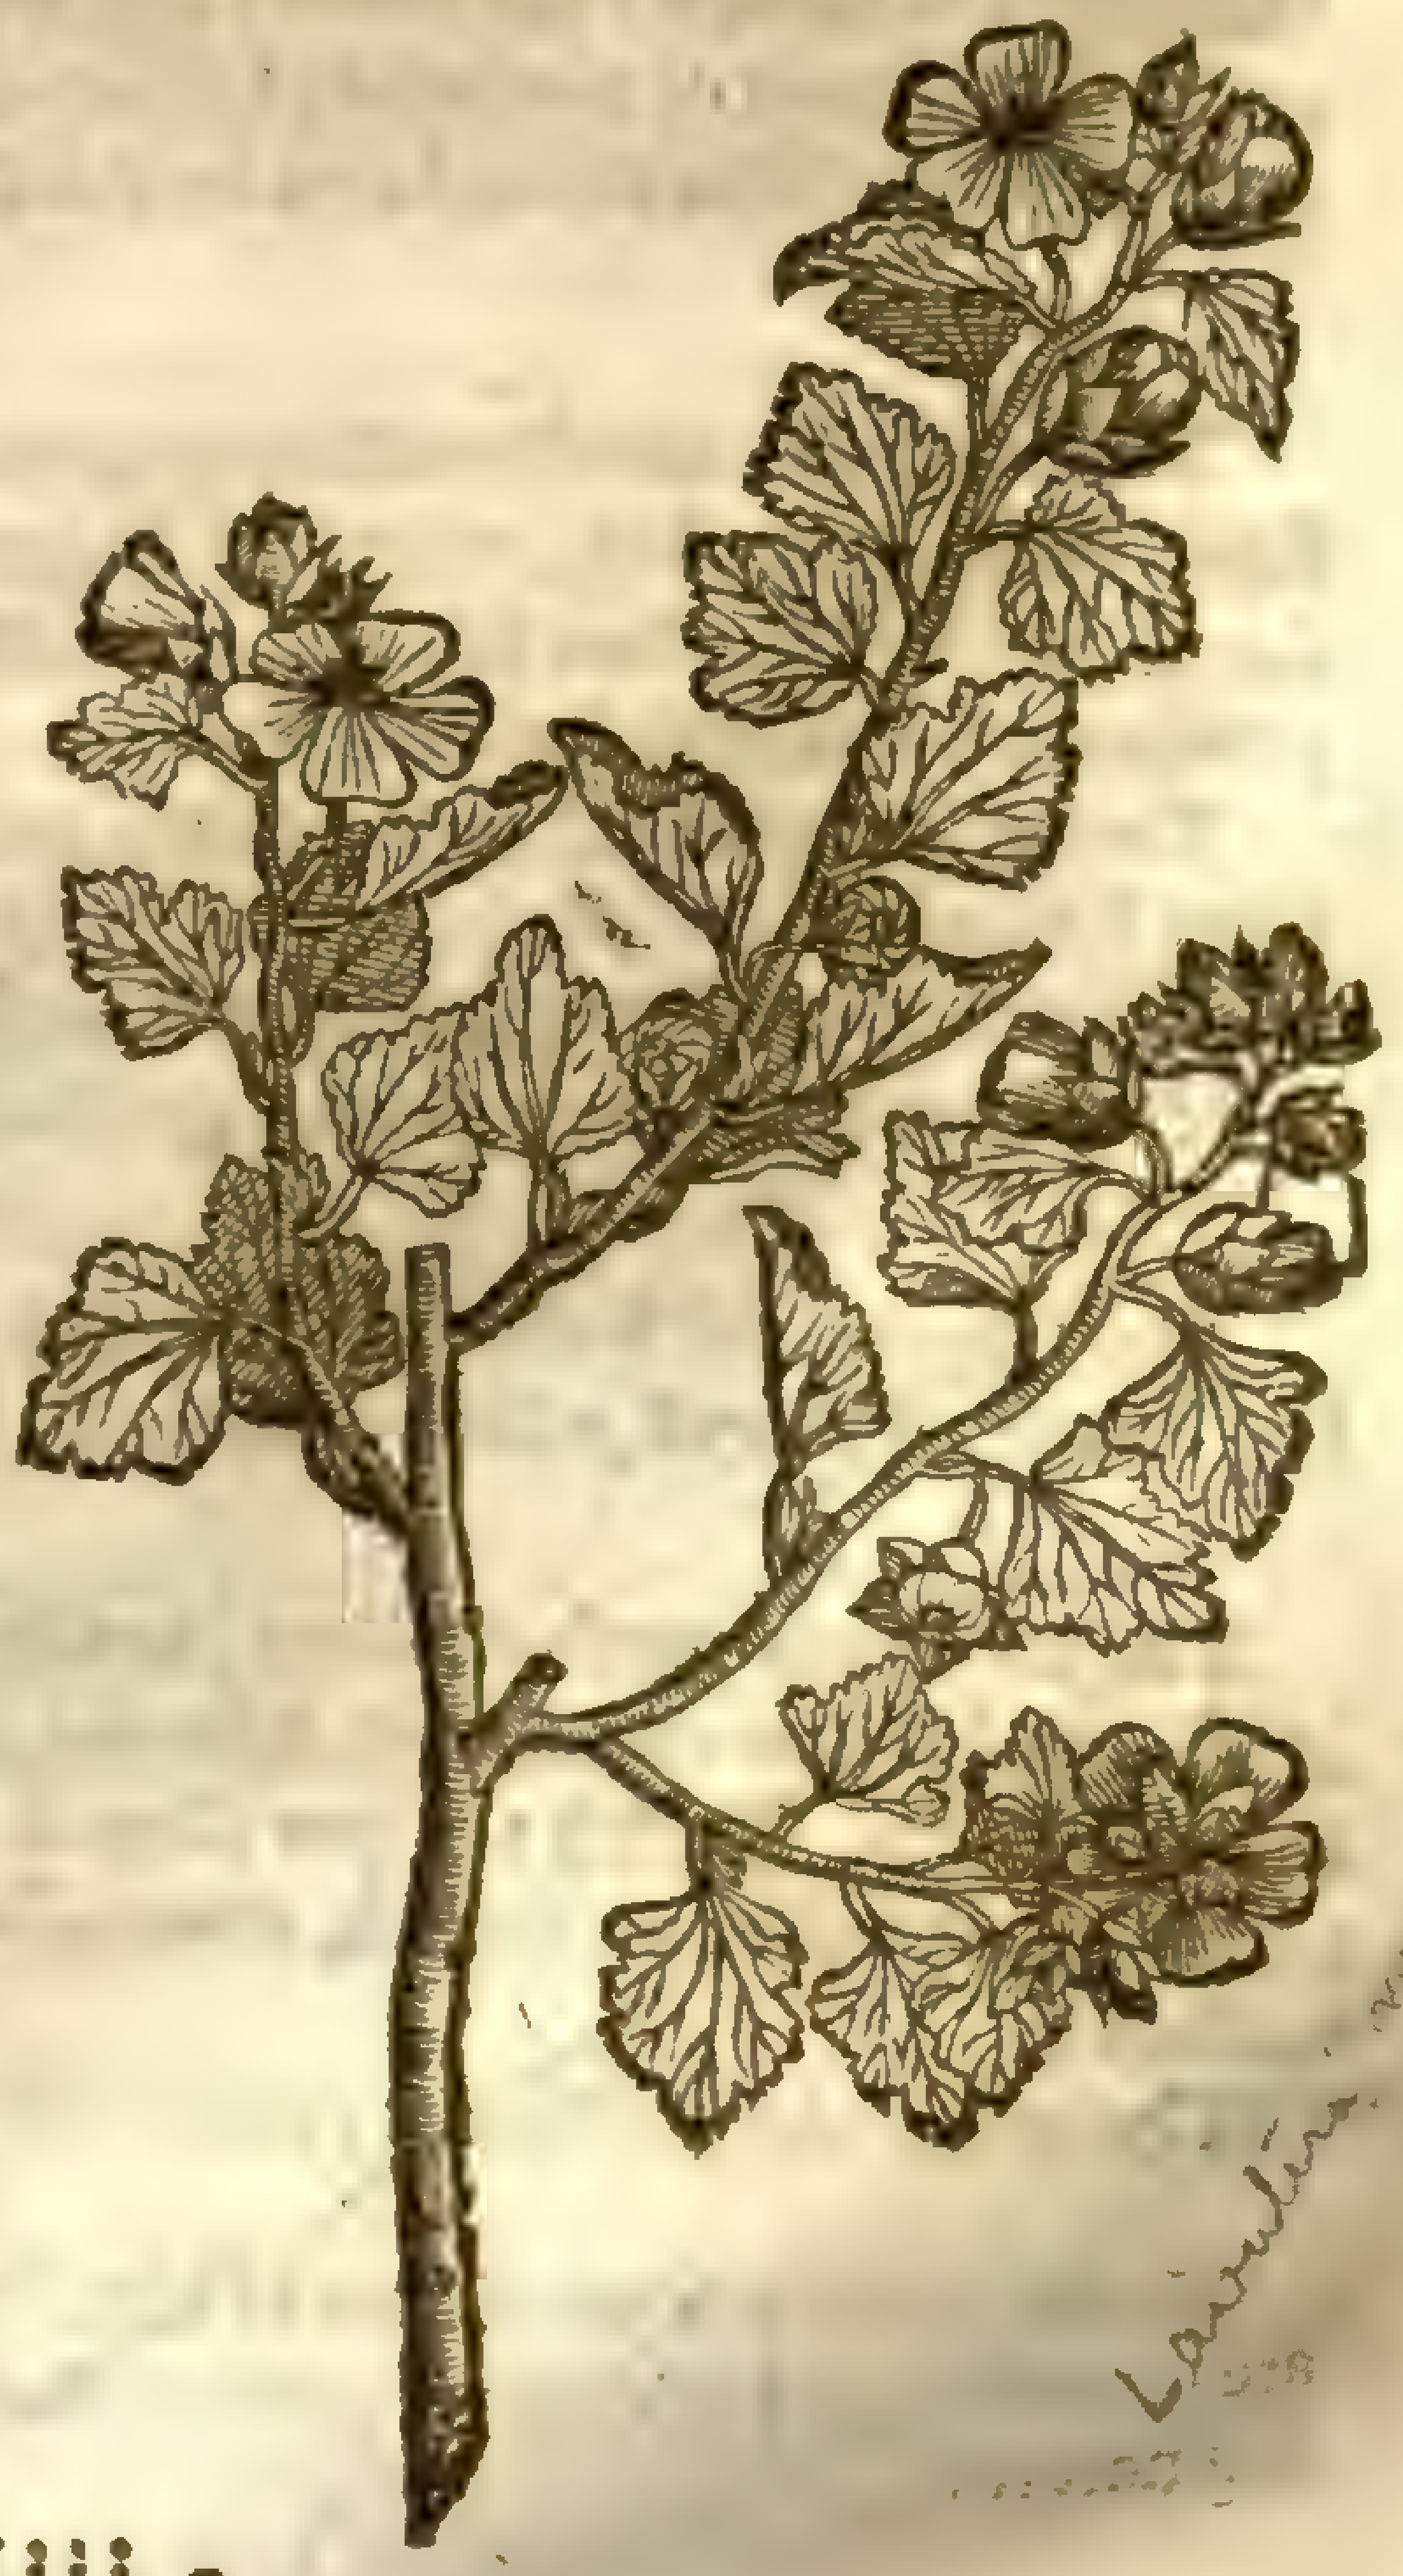
2 *Althæa paluſtris.*
Water Mallow.



3 *Althæa Arboreſcens.*
Tree-Mallow.



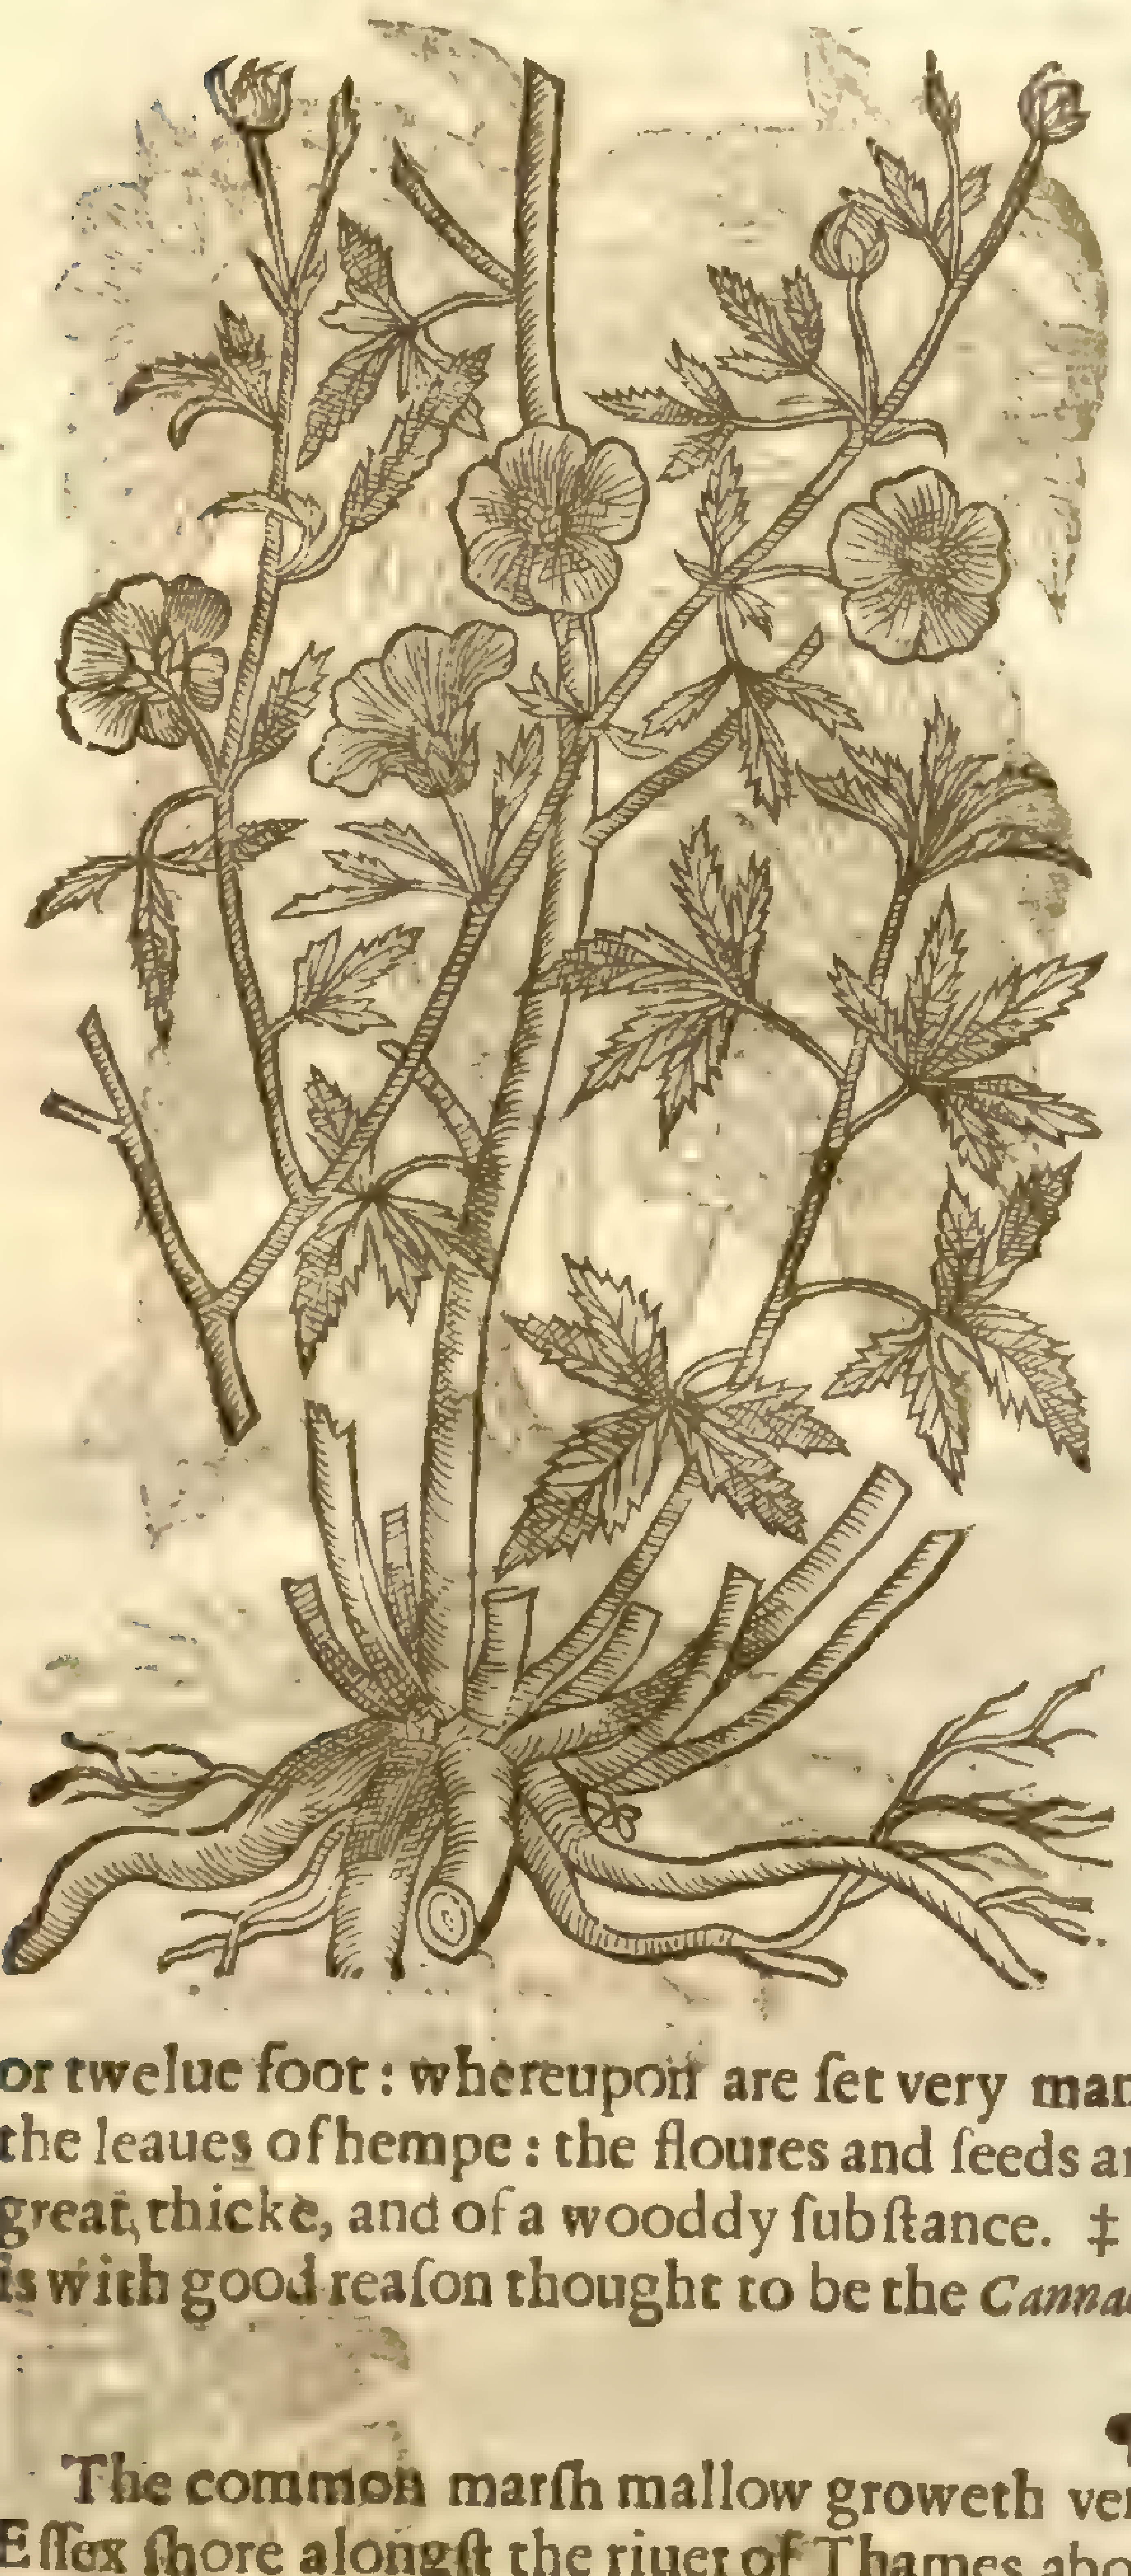
4 *Althæa frutex Cluſij.*
Shrubby Mallow.



Lavatera maritima Gou.
See Clus. 8, 24

[illegible]

‡ 5 *Alcea fruticoſa cannabina.*
Hempe-leaued Mallow.



Althaea Cannabina, L.
[illegible] 2. 25

3 This wilde Mallow is likewiſe referred vnto the kindes of marſh mallow, called generally by the name of *Althaa*, which groweth to the form of a ſmal hedge tree, approching neerer to the ſubſtance and nature of wood than any of the other; wherewith the people of Olbia and Narbone in France doe make hedges, to ſeuer or diuide their gardens and vine-yards (euen as wee doe with quick-ſets of priuet or thorne) which continueth long: the ſtalke whereof groweth vpright, very high, comming neere to the Willow in wooddineſſe and ſubſtance. The floures grow alongſt the ſame, in faſhion and colour of the common wilde mallow.

4 The ſhrubby mallow riſeth vp like vnto a hedge buſh, and of a wooddy ſubſtance, diuiding it ſelfe into diuers tough and limber branches, couered with a barke of the colour of aſhes; whereupon doe grow round pointed leaues, ſomewhat nickt about the edges, very ſoft, not vnlike to thoſe of the common marſh mallow, and of an ouerworne hoary colour. The floures grow at the top of the ſtalkes, of a purple colour, conſiſting of fiue liues, very like to the common wilde mallow, and the ſeed of the marſh mallow.

5 We haue another ſort of mallow, called of *Pena*, *Alcea fruticoſior petaphylla*: it bringeth forth in my Garden many twiggy branches, ſet vpon ſtiffe ſtalkes of the bigneſſe of a mans thumbe, growing to the height of ten or twelue foot: whereupon are ſet very many leaues deepely cut euen to the middle rib, like vnto the leaues of hempe: the floures and ſeeds are like vnto the common mallow: the root is exceeding great, thicke, and of a wooddy ſubſtance. ‡ *Cluſius* calls this *Alcea fruticoſa cannabino folio*: and it is with good reaſon thought to be the *Cannabis ſylueſtris* deſcribed by *Dioſcorides*, *lib.* 3. *cap.* 166. ‡

¶ *The Place.*

The common marſh mallow groweth very plentifully in the marſhes both on the Kentiſh and Eſſex ſhore alongſt the riuer of Thames, about Woolwych, Erith, Greenhyth, Grauesend, Tilbury, Lee, Colcheſter, Harwich, and in moſt ſalt marſhes about London: being planted in Gardens it proſpereth well, and continueth long.

The ſecond groweth in the moiſt and fenny places of Ferraria, betweene Padua in Italy, and the riuer Eridanus.

The others are ſtrangers likewiſe in England: notwithſtanding at the impreſſion hereof I haue ſowen ſome ſeeds thereof in my garden, expecting the ſucceſſe.

¶ *The Time.*

They floure and flouriſh in Iuly and Auguſt: the root ſpringeth ſorth afreſh euery yeare in the beginning of March, which are then to be gathered, or in September.

¶ *The Names.*

The common marſh mallow is called in Greeke, ἀλθαία, and ἰβίσκος: the Latines retaine the names *Althaa* and *Ibiſcus*: in ſhops, *Biſmalua*, and *Maluauiſcus*; as though they ſhould ſay *Malua Ibiſcus*: in high Dutch, **Ibiſch**: in low Dutch, **Witte Maluwe**, and **Witten Hemſt**: In Italian and Spaniſh, *Maluauiſco*: in French, *Guimaulue*: in Engliſh, marſh mallow, mooriſh mallow, and white mallow.

The reſt of the mallowes retaine the names expreſſed in their ſeuerall titles.

¶ *The Temperature.*

Marſh mallow is moderately hot, but drier than the other mallowes: the roots and ſeeds hereof are more dry, and of thinner parts, as *Galen* writeth; and likewiſe of a digeſting ſoftning or mollifying nature.

¶ *The*

¶ *The Vertues.*

A The leaues of Marſh mallow are of the power to digeſt, mitigate paine, and to concoct.

B They be with good effect mixed with fomentations and pulteſſes againſt paines of the ſides, of the ſtone, and of the bladder; in a bath alſo they ſerue to take away any manner of paine.

C The decoction of the leaues drunke doth the ſame, which doth not onely aſſwage paine, which proceedeth of the ſtone, but alſo is very good to cauſe the ſame to deſcend more eaſily, and to paſſe forth.

D The roots and ſeeds are profitable for the ſame purpoſe: moreouer, the decoction of the roots helpeth the bloudy flix, yet nor by any binding quality, but by mitigating the gripings and frettings thereof: for they doe not binde at all, although *Galen* otherwiſe thought, but they cure the bloudy flix, by hauing things added vnto them, as the roots of Biſtort, Tormentill, the floures and rindes of Pomegranates and ſuch like.

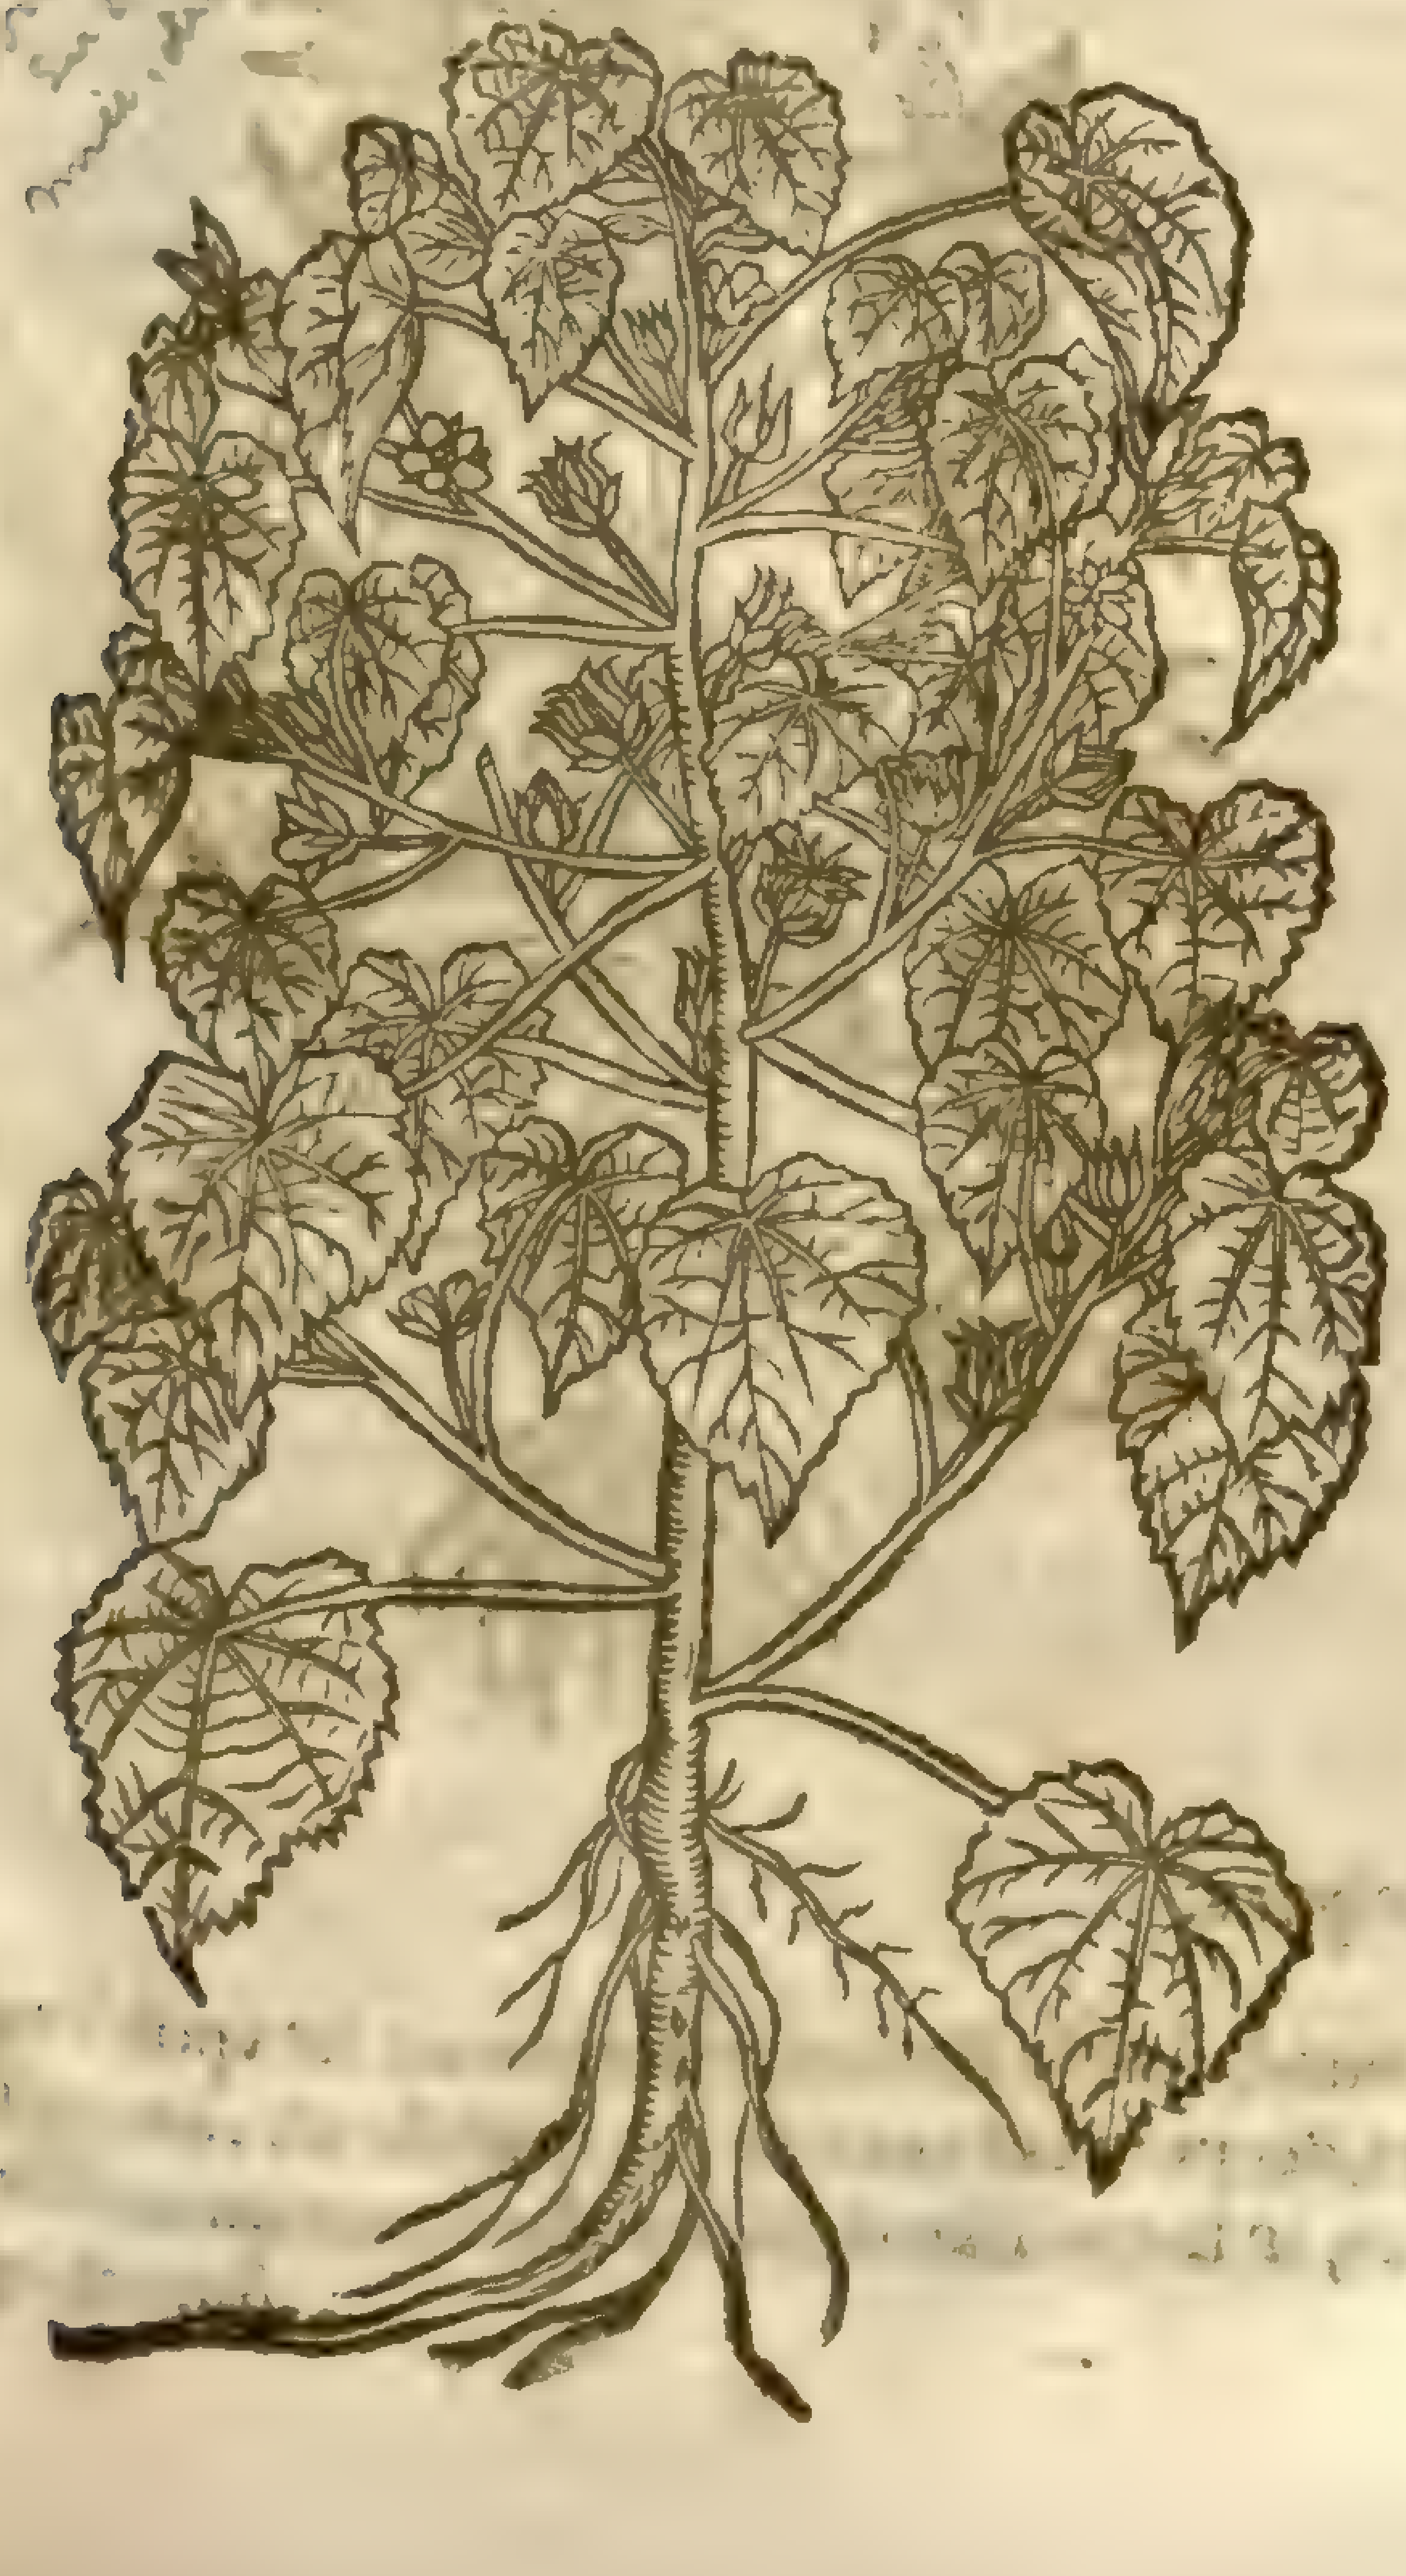
E The mucilage or ſlimie juyce of the roots, is mixed very effectually with all oiles, ointments, and plaiſters that ſlacken and mitigate paine.

F The roots boyled in wine, and the decoction giuen to drinke, expell the ſtone and grauell, helpe the bloudy flix, ſciatica, crampes and conuulſions.

G The roots of Marſh mallows, the leaues of common Mallowes, and the leaues of Violets, boiled in water vntill they be very ſoft, and that little water that is left drained away, ſtamped in a ſtone morter, adding thereto a certaine quantitie of Fenugreeke, and Lineſeed in pouder: the root of the black Bryony, and ſome good quantitie of Barrowes greaſe, ſtamped all together to the forme of a pultis, and applied very warme, mollifie and ſoften Apoſtumes and hard ſwellings, ſwellings in the joynts, and ſores of the mother: it conſumeth all cold tumors, blaſtings, and windie outgrowings; it cureth the rifts of the fundament; it comforteth, defendeth, and preſerueth dangerous greene wounds from any manner of accidents that may happen thereto, it helpeth digeſtion in them, and bringeth old vlcers to maturitie.

H The ſeeds dried and beaten into pouder and giuen to drinke, ſtop the bloudy flix and laske, and all other iſſues of bloud.

CHAP. 354. *Of the yellow Mallow.*



Althæa Lutea.
Yellow Mallow.

¶ *The Deſcription.*

THe yellow Mallow riſeth vp with a round ſtalke, ſomthing hard and wooddy, three or foure cubits high, couered with broad leaues ſomething round, but ſharpe pointed, white, ſoft, ſet with very fine haires like to the leaues of gourds, hanging vpon long tender foot-ſtalkes: from the boſome of which leaues come forth yellow floures, not vnlike to thoſe of the common Mallow in forme: the knops or ſeed veſſels are blacke, crooked, or wrinkled, made vp of many ſmall cods, in which is black ſeed: the root is ſmall, and dieth when it hath perfected his ſeed.

¶ *The Place.*

The ſeed hereof is brought vnto vs from Spaine and Italy: we doe yearely ſow it in our gardens, the which ſeldome or neuer doth bring his ſeed to ripeneſſe: by reaſon whereof, we are to ſeeke for ſeeds againſt the next yeare.

¶ *The Time.*

It is ſowne in the midſt of Aprill, it brings forth his floures in September.

¶ *The Names.*

Some thinke this to be *Abutilon*; whereupon that agreeth which *Auicen* writeth, that it is like to the Gourd, that is to ſay, in leafe, and to be named *Abutilon*, and *Arbutilon*: diuers take it to be that *Althaea* or Marſh mallow, vnto which *Theophraſtus* in his ninth booke of the Hiſtorie of Plants doth attribute *Florem* μήλινον, or a yellow floure: for the floure of the common Marſh mallow is not yellow, but white; yet may *Theophraſtus* his copy, which in diuers places is faultie, and hath many emptie and vnwritten places, be alſo faultie in this place; therefore it is hard to ſay, that this is *Theophraſtus* Marſh mallow, eſpecially ſeeing that *Theophraſtus* ſeemeth alſo to attribute vnto the root of Marſh mallow ſo much ſlime, as that water may be thickened therewith, which the roots of common Marſh mallow can very well doe: but the root of *Abutilon* or yellow mallow not at all: it may be called in Engliſh, yellow Mallow, and *Auicen* his Mallow.

¶ *The Temperature.*

The temperature of this Mallow is referred vnto the Tree-mallow.

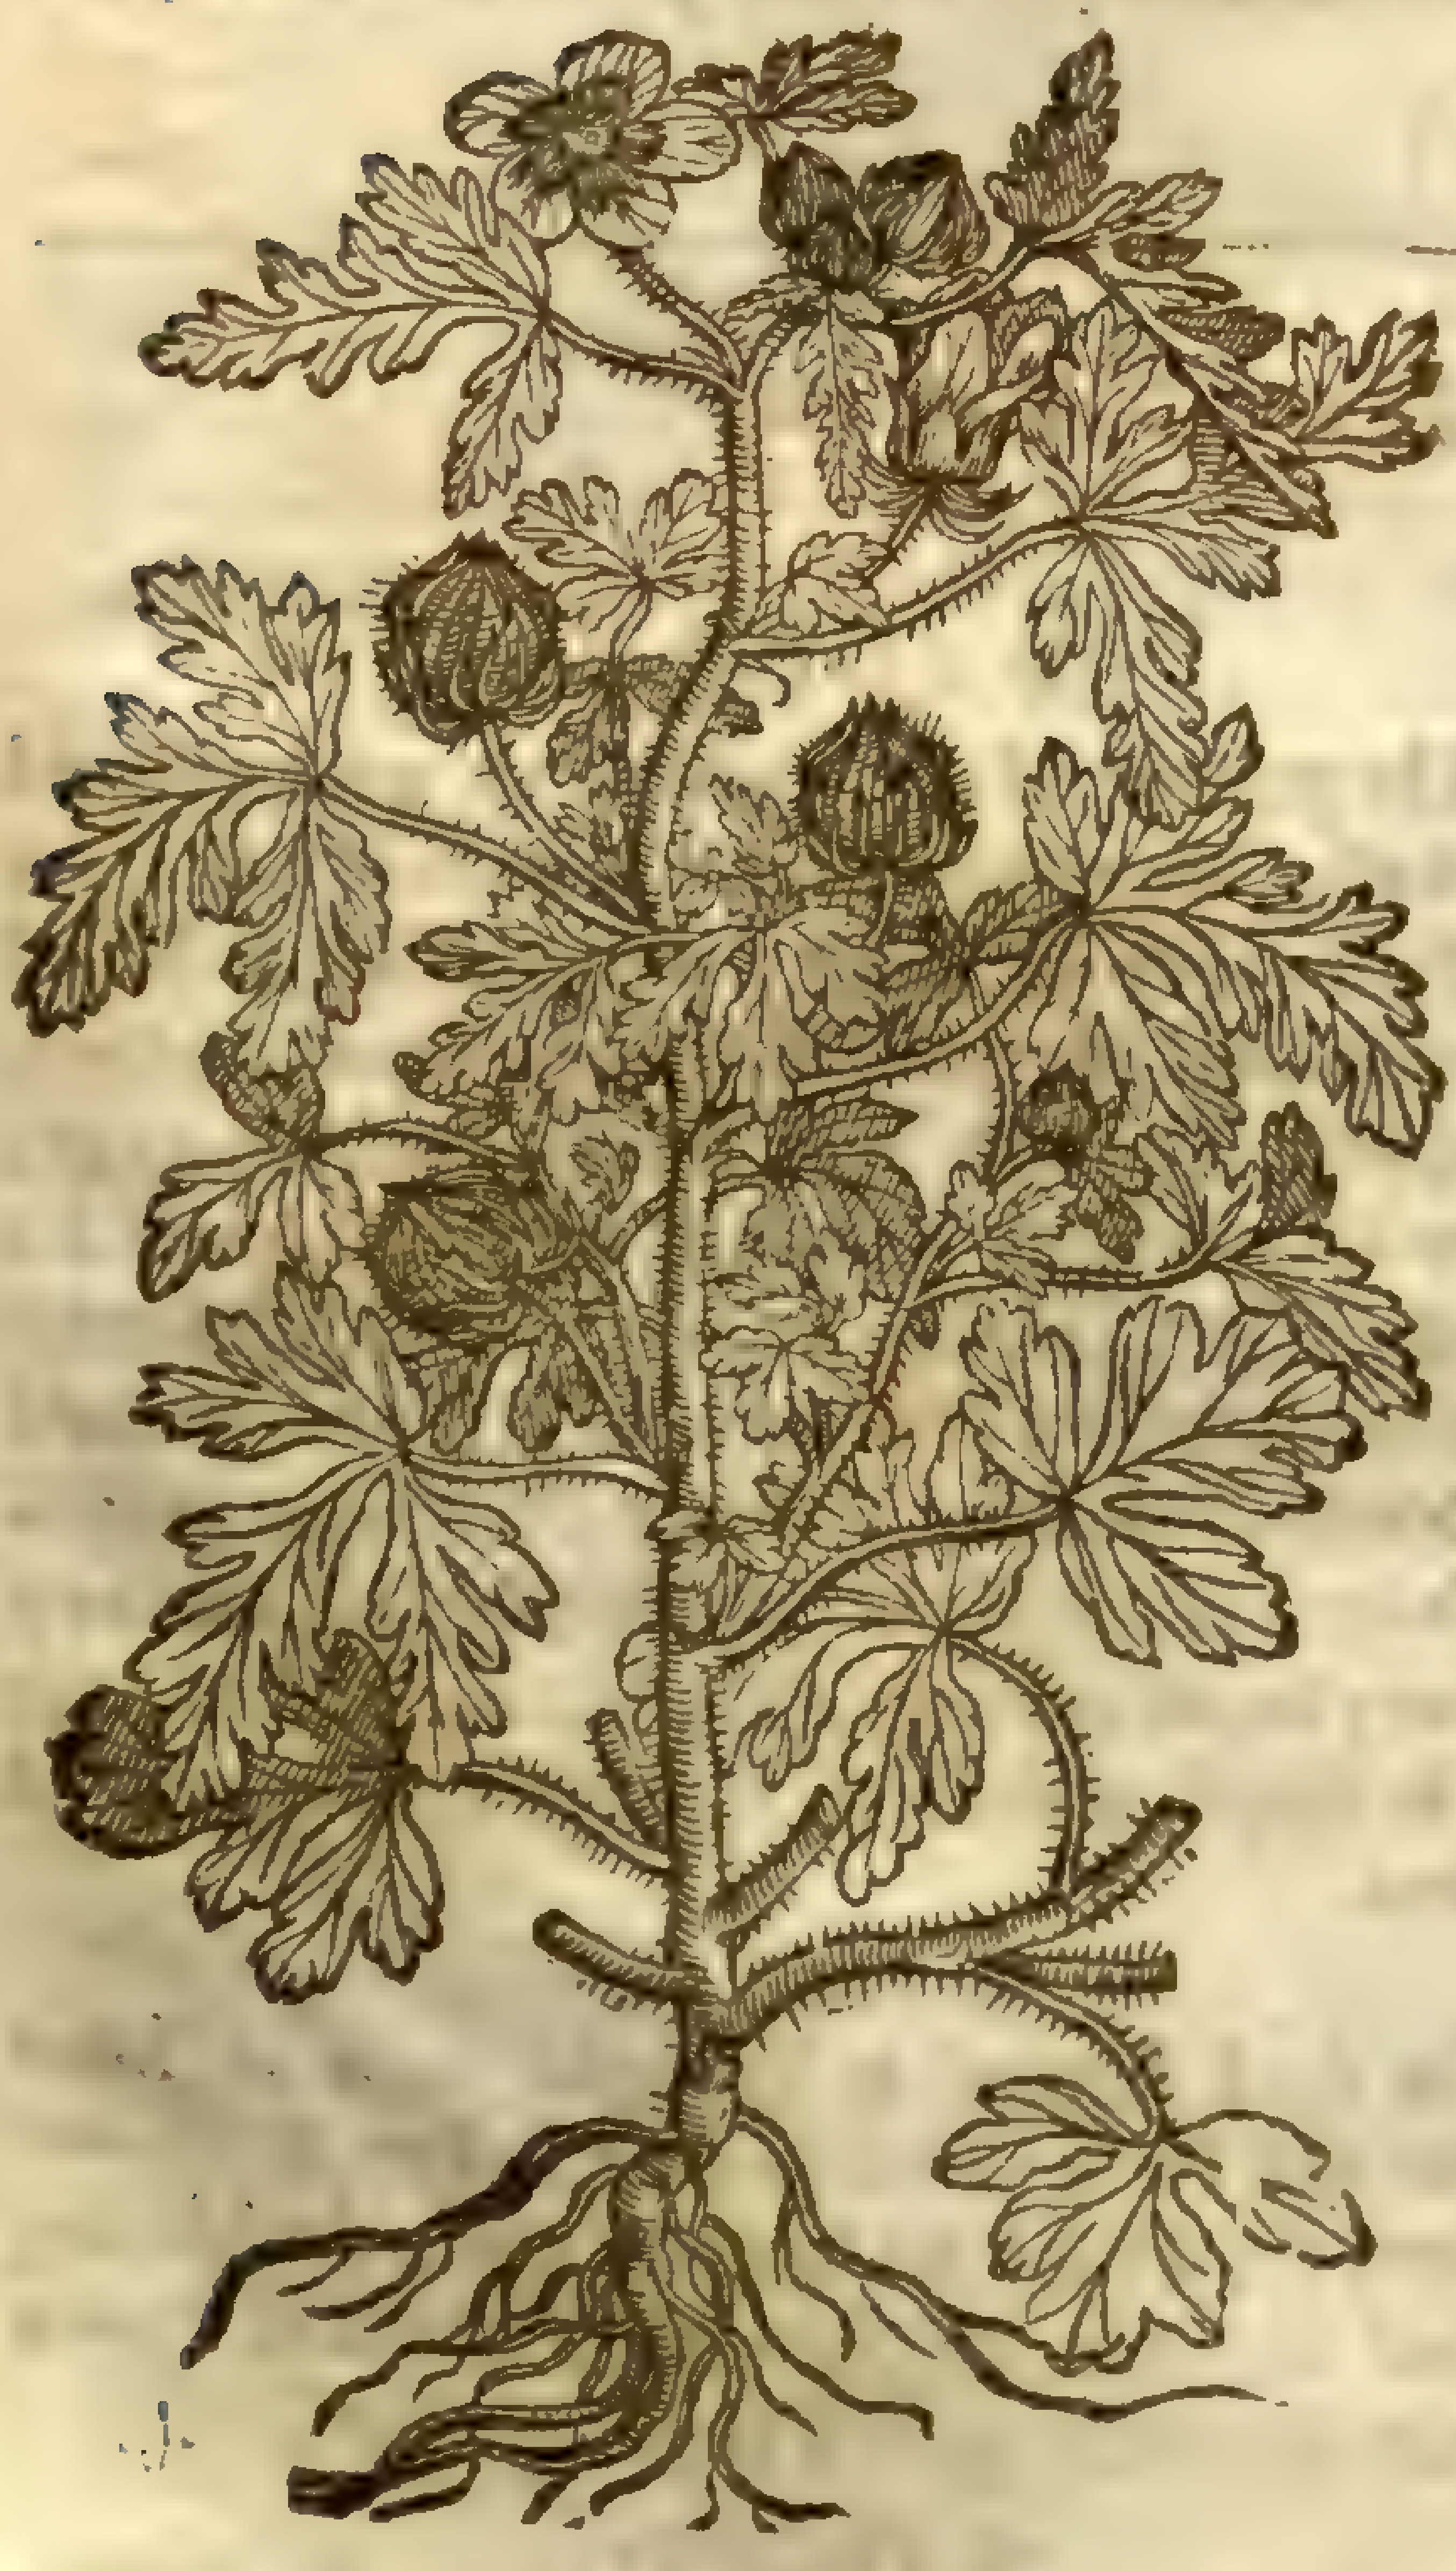
¶ *The Vertues.*

A *Auicen* ſaith, that *Abutilon* or yellow mallow, is held to be good for greene wounds, and doth preſently glew together and perfectly cure the ſame.

B The ſeed drunke in wine preuaileth mightily againſt the ſtone.

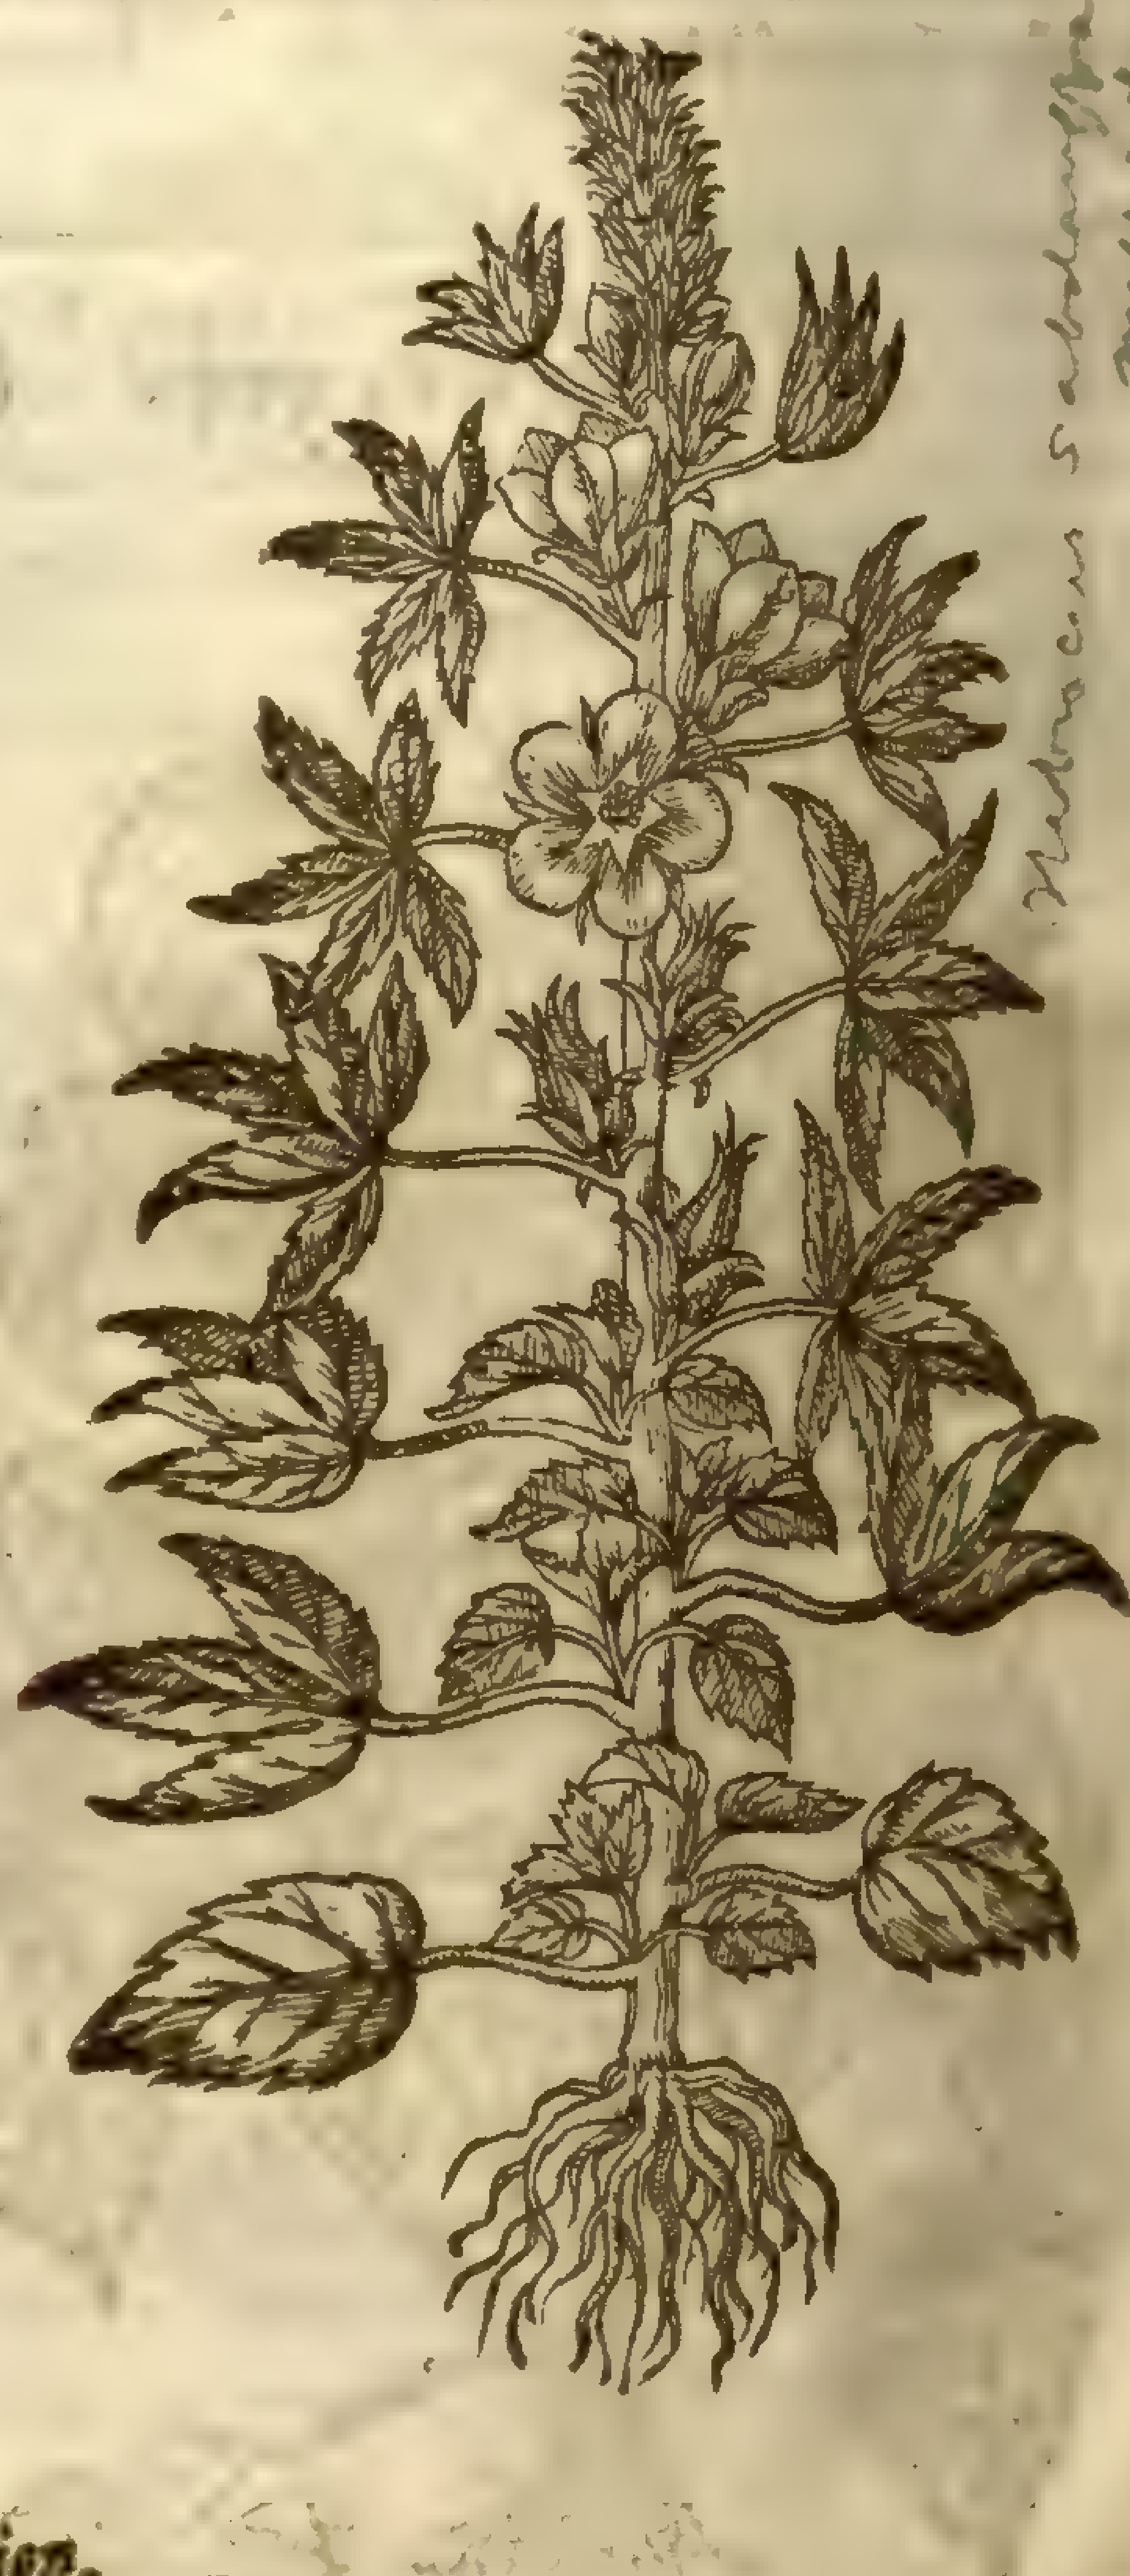
C *Bernardus Paludanus* of Anchuſen reporteth, that the Turks do drinke the ſeed to prouoke ſleep and reſt.

Chap. 355. *Of Venice Mallow, or Good-night at Noone.*



1 *Alcea Peregrina.*
Venice Mallow.

Hibiscus Trionum, L. mei. dict.



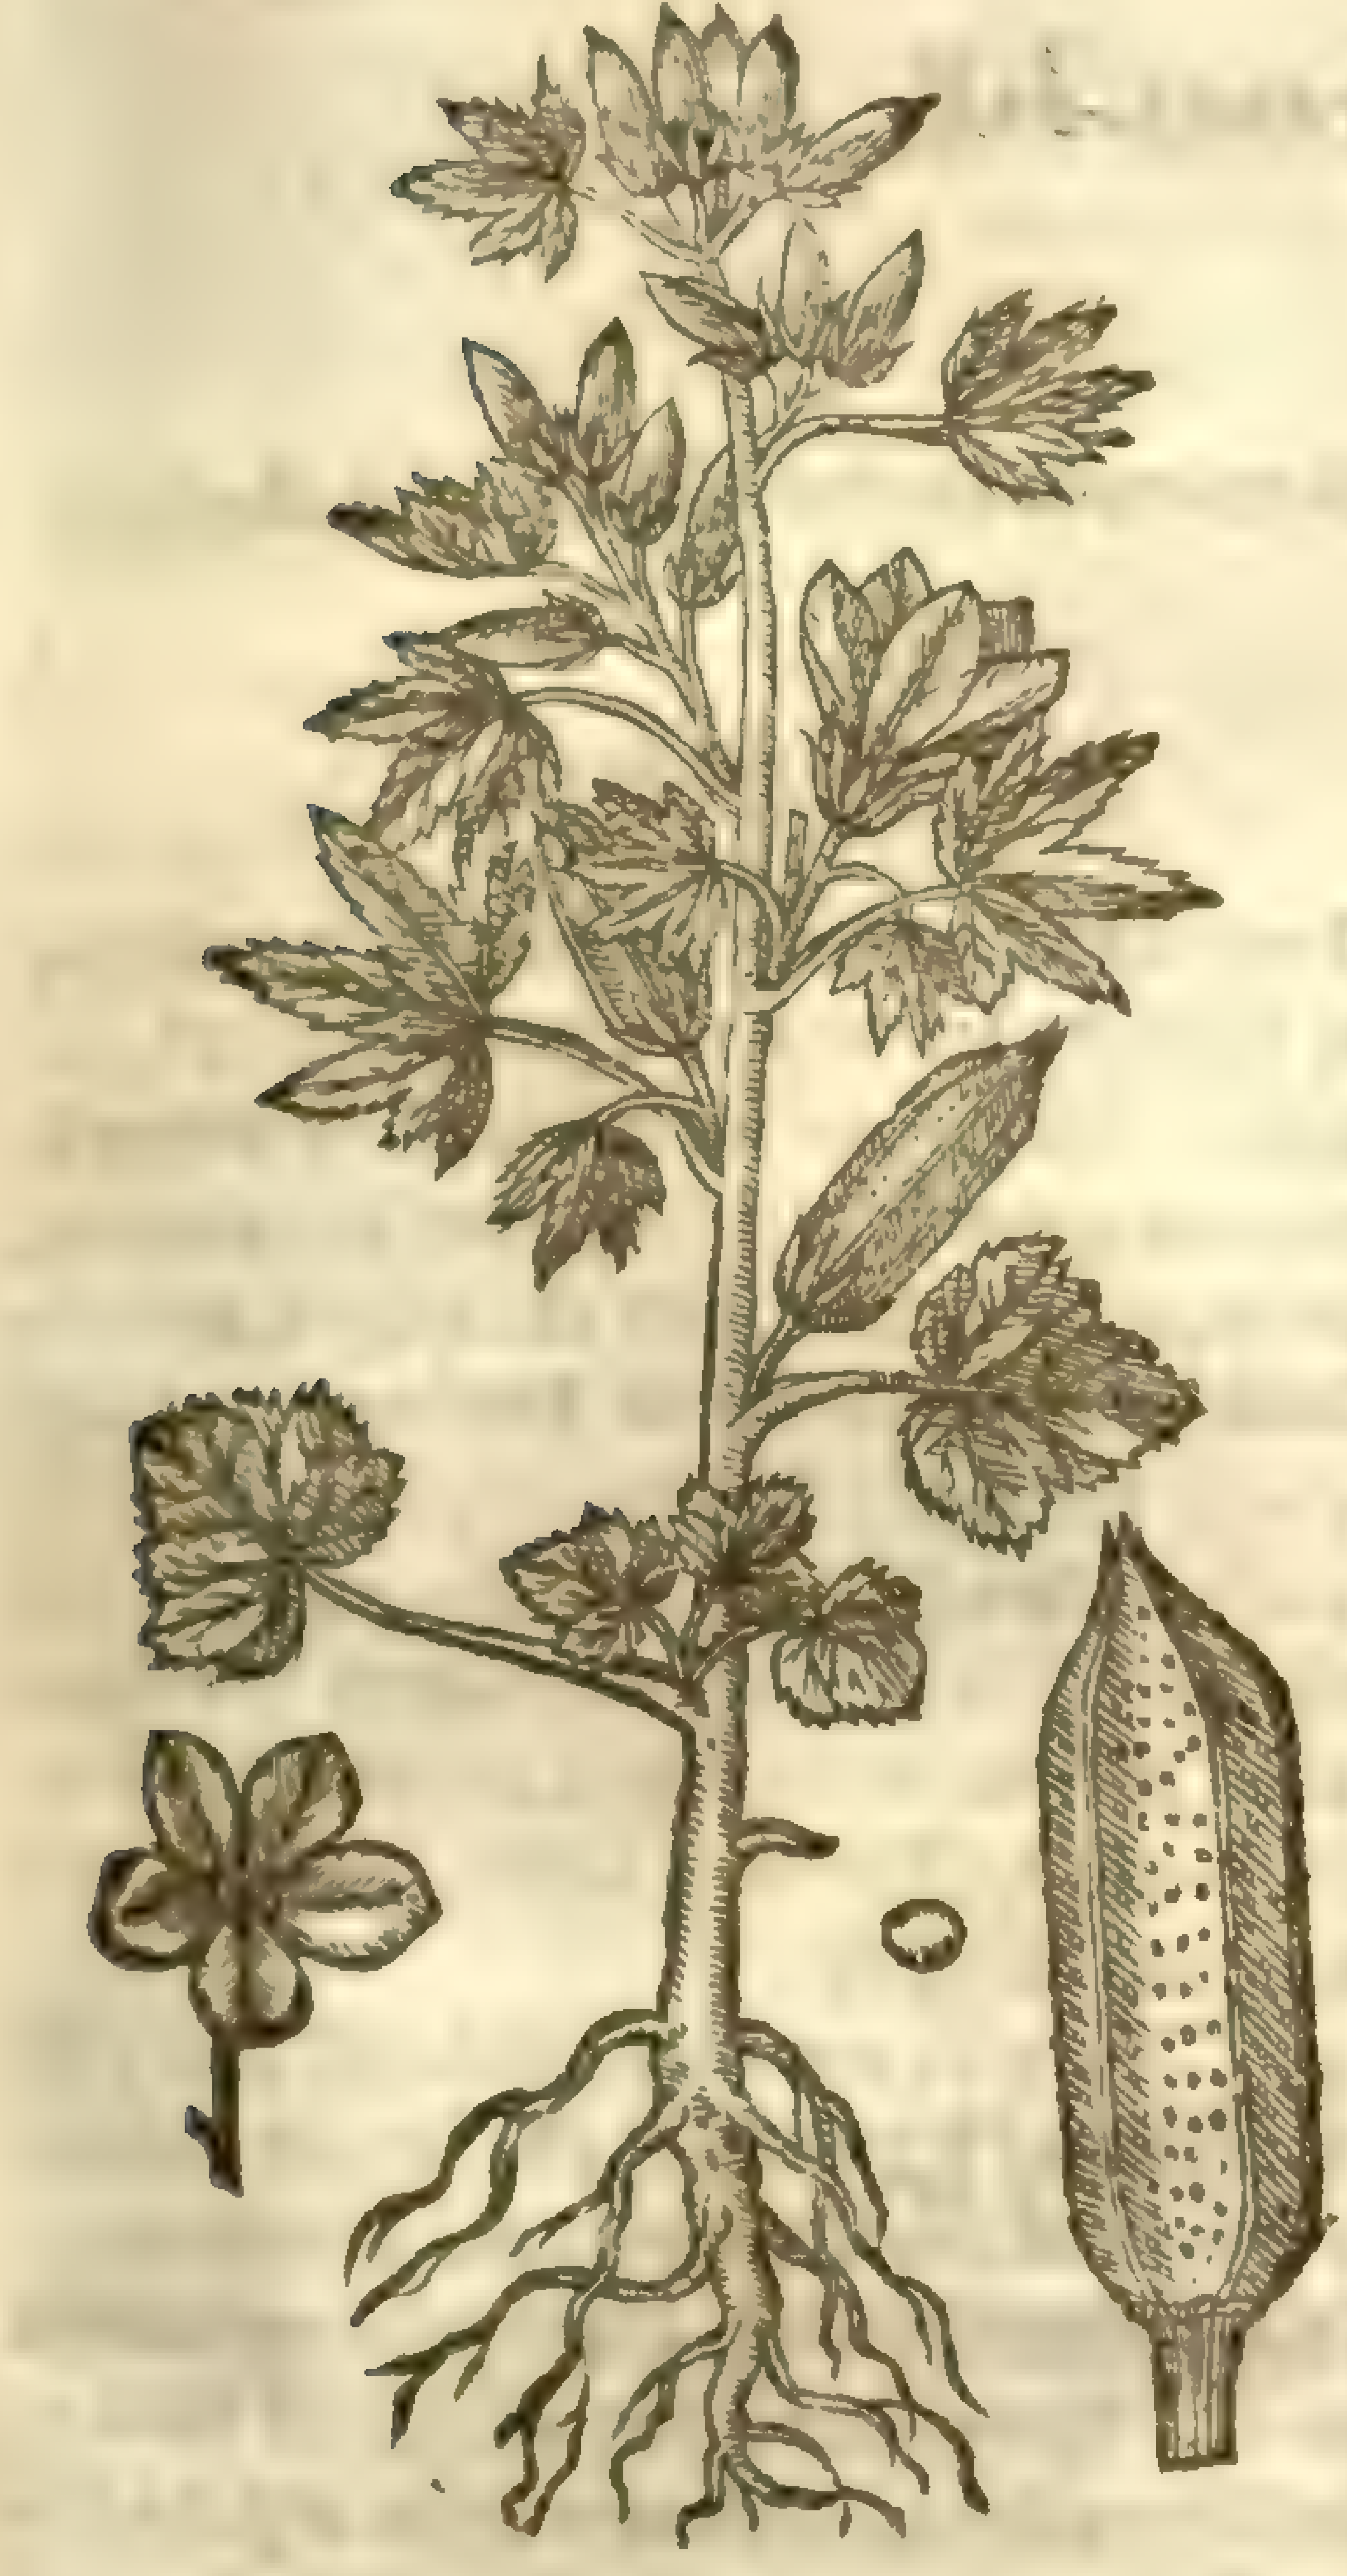
2 *Sabdariſa.*
Thorny Mallow.

Hibiscus Sabdariffa L. mei. dict.

¶ *The Deſcription.*

† 1 The Venice mallow riſeth vp with long, round, feeble ſtalkes, whereon are ſet vpon long ſlender foot-ſtalkes, broad jagged leaues, deepely cut euen to the middle rib: amongſt which come forth very pleaſant and beautifull floures, in ſhape like thoſe of the common mallow, ſomething

‡ 3 *Alcea Ægyptia.*
The Ægyptian Codded Mallow.



ſomething white about the edges, but in the middle of a fine purple: in the middeſt of this floure ſtandeth forth a knap or peſtel, as yellow as gold: it openeth it ſelfe about eight of the clocke, and ſhutteth vp againe at noone, about twelue a clock when it hath receiued the beams of the Sun, for two or three houres, whereon it ſhould ſeeme to reioyce to looke and for whoſe departure, being then vpon the point of declenſion, it ſeemes to grieue, and ſo ſhuts vp the floures that were open, and neuer opens them againe; whereupon it might more properly be called *Malva horaria*, or the Mallow of an houre: and this *Columella* ſeemeth to call *Moloche*, in this verſe;

— *Et Moloche, Prono ſequitur quæ vertice ſolem.*

The ſeed is contained in thicke rough bladders, whereupon *Dodonæus* calleth it *Alcea Veſicaria*: within theſe bladders or ſeed veſſels are contained blacke ſeed, not vnlike to thoſe of *Nigella Romana*. The root is ſmall and tender, and periſheth when the ſeed is ripe, and muſt be increaſed by new and yearely ſowing of the ſeed, carefully reſerued.

2 Thorn Mallow riſeth vp with one vpright ſtalk of two cubits high, diuiding it ſelfe into diuers branches, whereupon are placed leaues deeply cut to the middle rib, and likewiſe ſnipt about the edges like a ſaw: in taſte like Sorrel: the floures for the moſt part thruſt forth of the trunke or body of the ſmall ſtalke, compact of fiue ſmall leaues, of a yellowiſh colour; the middle part whereof is of a purple tending to redneſſe: the huske or cod wherein the floure doth ſtand is ſet or armed with ſharpe thornes: the root is ſmall, ſingle, and moſt impatient of our cold climate, inſomuch that when I had with great induſtry nouriſhed vp ſome plants from the ſeed, and kept them vnto the midſt of May; notwithſtanding one cold night chancing among many, hath deſtroied them all.

‡ 3 This alſo is a ſtranger cut leaued mallow, which *Cluſius* hath ſet forth by the name of *Alcea Ægyptia.* and *Proſper Alpinus* by the title of *Bammia*: the ſtalke is round, ſtraight, green, ſome cubit and halfe high: vpon which without order grow leaues at the bottome of the ſtalke, like thoſe of Mallow, cornered and ſnipt about the edges; but from the middle of the ſtalke to the top they are cut in with fiue deepe gaſhes like as the leaues of the laſt deſcribed: the floures grow forth by the ſides of the ſtalke, in forme and colour like thoſe of the laſt mentioned, to wit, with fiue yellowiſh leaues: after theſe follow long thicke fiue cornered hairy and ſharpe pointed ſeed veſſels, containing a ſeed like *Orobus*, couered with a little downineſſe: this growes in Ægypt, where they eat the fruit thereof as we do Peaſe and Beanes: *Alpinus* attributes diuers vertues to this plant, agreeable to thoſe of the common Marſh-mallow. ‡

¶ *The Plate.*

The ſeeds hereof haue been brought out of Spaine and other hot countries. The firſt proſpereth well in my garden from yeare to yeare.

¶ *The Time.*

They are to be ſowne in the moſt fertill ground and ſunnie places of the garden, in the beginning of May, or in the end of Aprill.

¶ *The Names.*

Their names haue beene ſufficiently touched in their ſeuerall deſcriptions. The firſt may be called in Engliſh, Venice-mallow, Good-night at noone, or the Mallow flouring but an houre: of *Matthiolus* it is called *Hypecoon*, or Rue Poppy, but vnproperly.

¶ *The Temperature and Vertues.*

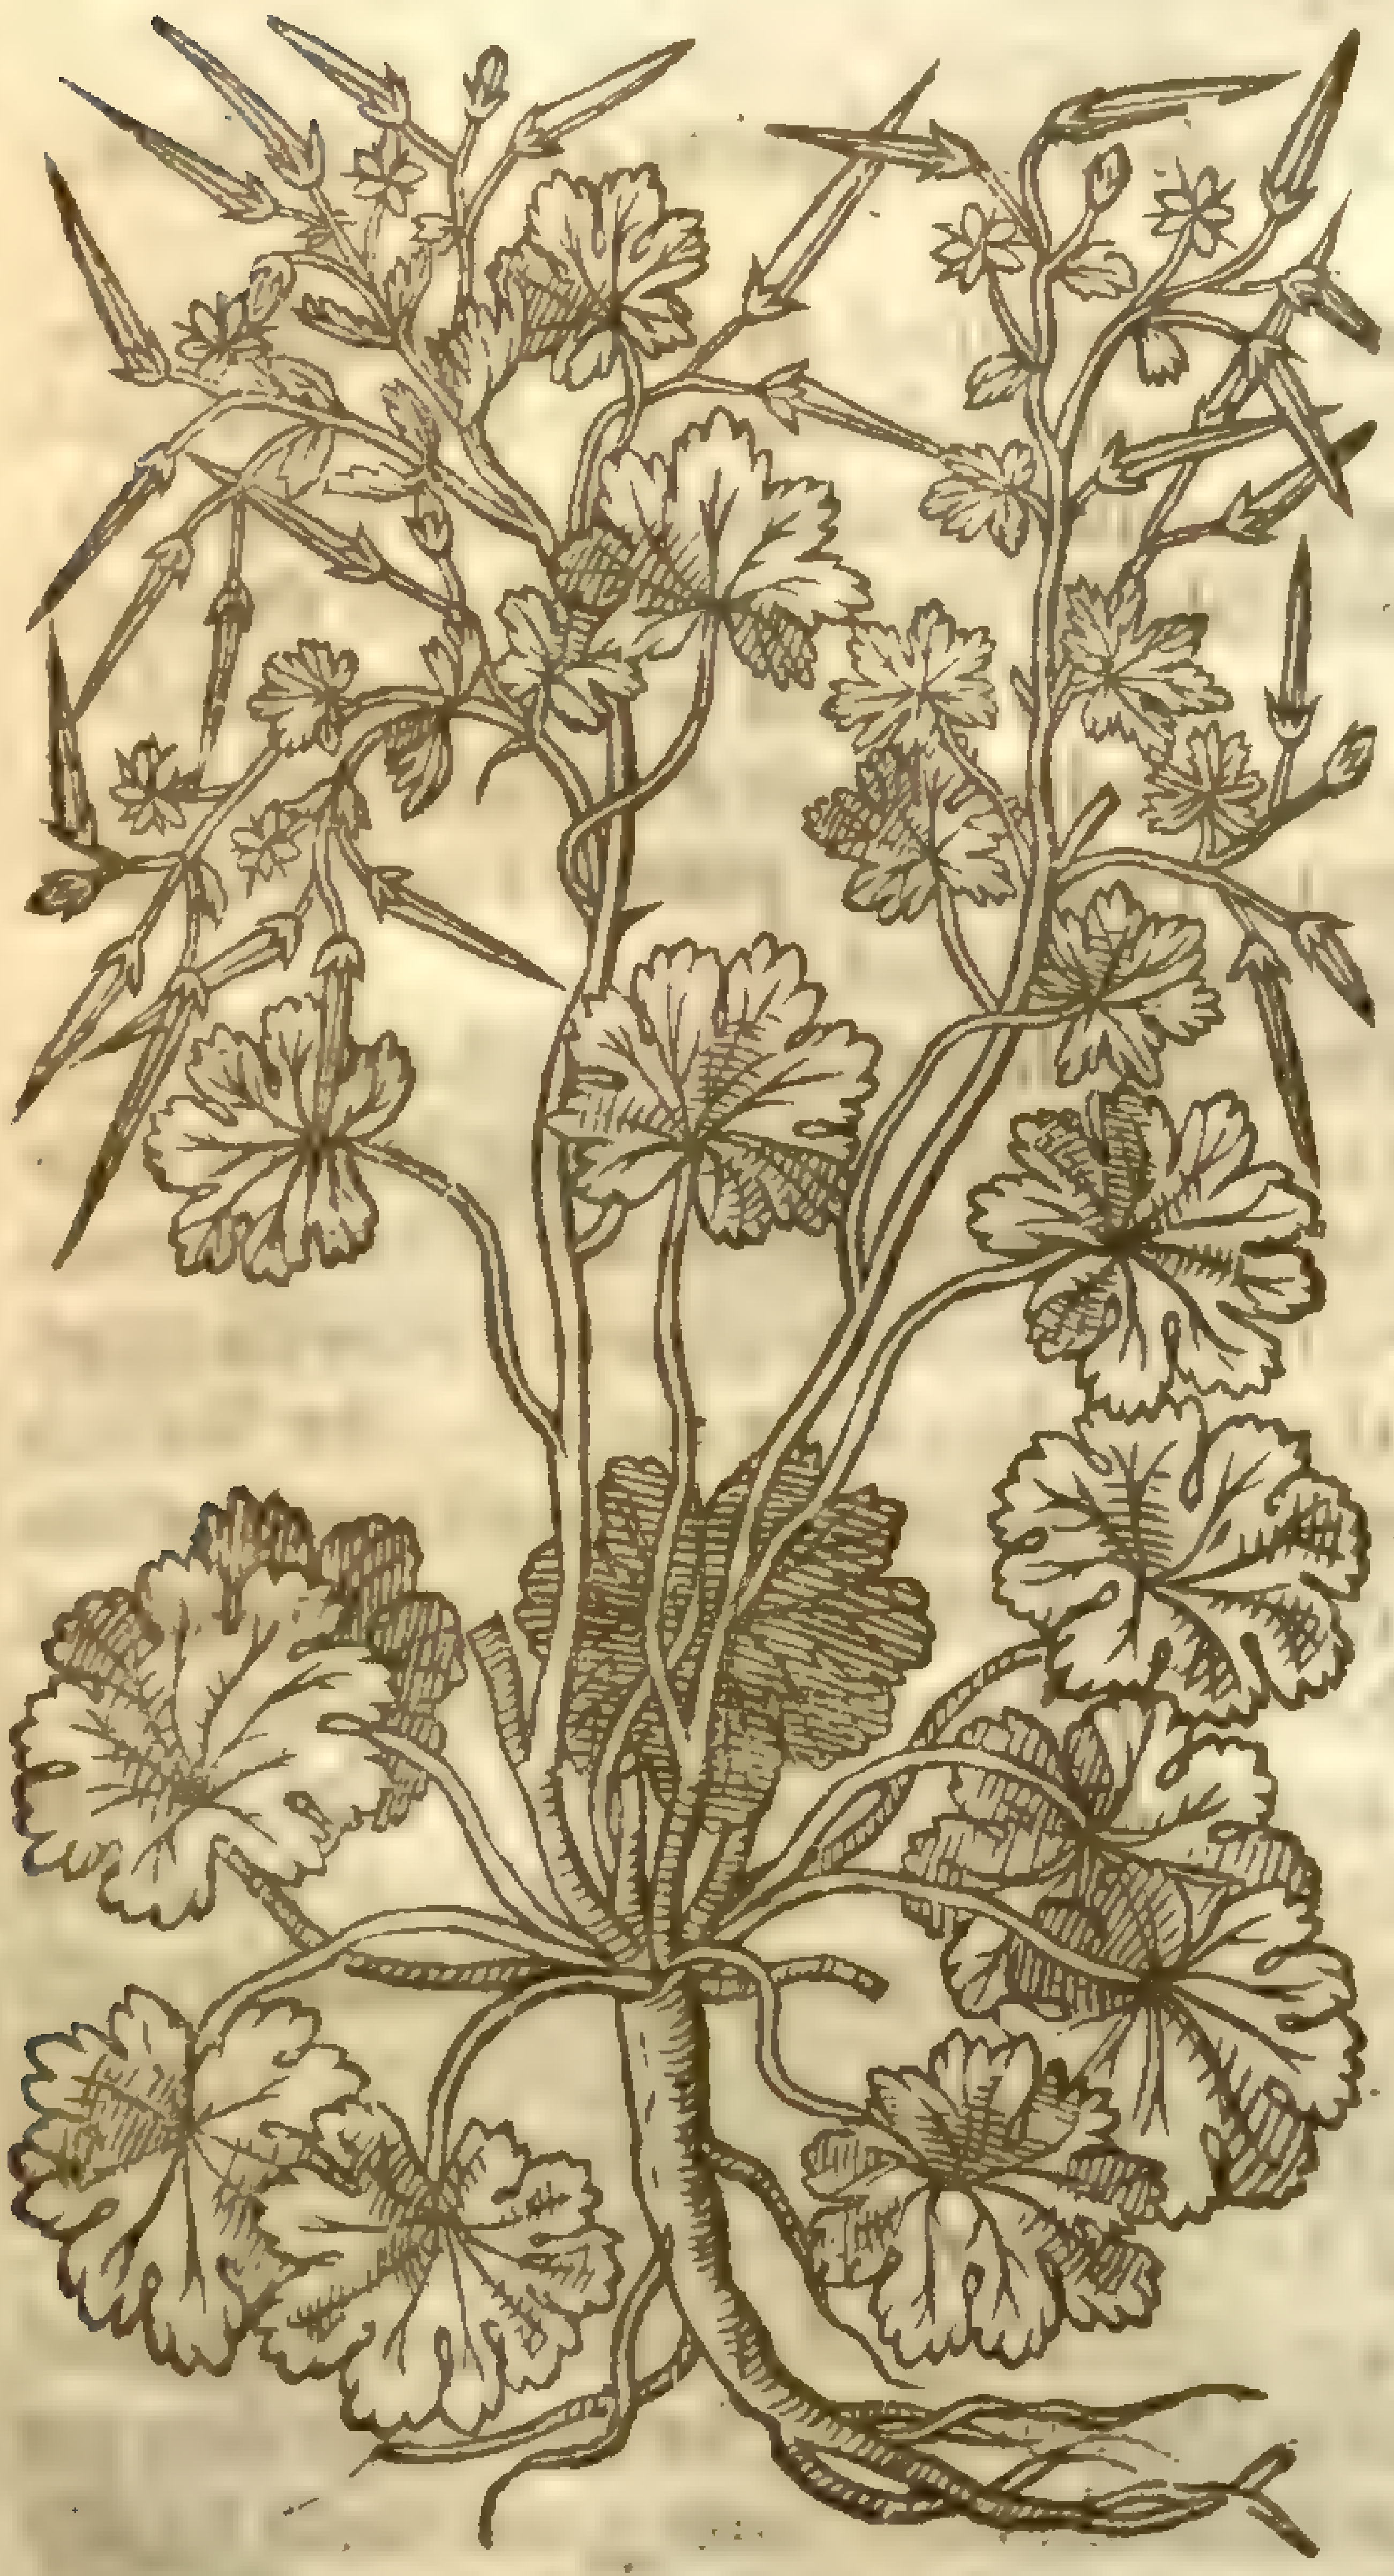
A There is a certaine clammie juyce in the leaues of the Venice-mallow, whereupon it is thought to come neere vnto the temperature of the common Mallow, and to be of a mollifying facultie: but his vſe in Phyſicke is not yet knowne, and therefore can there be no certainty affirmed.

CHAP. 356. Of Cranes-bill.

¶ The Kindes.

There be many kindes of Cranes-bil, whereof two were known to *Dioſcorides*, one with the knobby root, the other with the Mallow leafe.

Geranium Columbinum.
Doues foot, or Cranes-bill.



¶ The Deſcription.

Doues-foot hath many hairy ſtalks, trailing or leaning toward the ground, of a browniſh colour, ſomewhat kneed or joynted; wherupon do grow rough leaues of an ouerworn green color, round, cut about the edges, and like vnto thoſe of the common Mallow: amongſt which come forth the floures of a bright purple colour: after which is the ſeed, ſet together like the head and bill of a bird; wherupon it was called Cranes-bill, or Storks-bill, as are alſo all the other of his kind. The root is ſlender, with ſome fibres annexed thereto.

‡ 2 There is another kinde of this with larger ſtalkes and leaues, alſo the leaues are more deepely cut in or diuided, and the floures are either of the ſame colour as thoſe of the common kinde, or elſe ſomewhat more whitiſh. This may be called *Geranium columbinum majus diſſectis foliis*, Great Doues foot.

3 To this kinde may alſo fitly be referred the *Geranium Saxatile* of *Thalius*: the root is ſmal and threddy, the leaues are ſmoother, redder, more bluntly cut about the edges, and tranſparent than thoſe of the firſt deſcribed, yet round, and otherwiſe like them: the floures are ſmall and red, and the bills like thoſe of the former. Mr *Goodyer* found it growing plentifully on the bankes by the high way leading from Gilford towards London, neere vnto the townes end. ‡

¶ The Place.

It is found neere to common high waies, deſart places, vntilled grounds, and ſpecially vpon mud walls almoſt euery where.

¶ The Time.

It ſpringeth vp in March and Aprill: floureth in May, and bringeth his ſeed to ripeneſſe in Iune.

¶ The Names.

It is commonly called in Latine, *Pes Columbinus*: in High Dutch, **Scarter kraut**: in Low Dutch, **Duyuen voet**: in French, *Pied de Pigeon*: hereupon it may be called *Geranium Columbinum*: in Engliſh, Doues-foot, and Pigeons foot: of *Dioſcorides*, *Geranium alterum*: of ſome *Pulmonia*, and *Gruina*.

¶ The Temperature.

Doues foot is cold and ſomewhat drie, with ſome aſtriction or binding, hauing power to ſoder or joyne together.

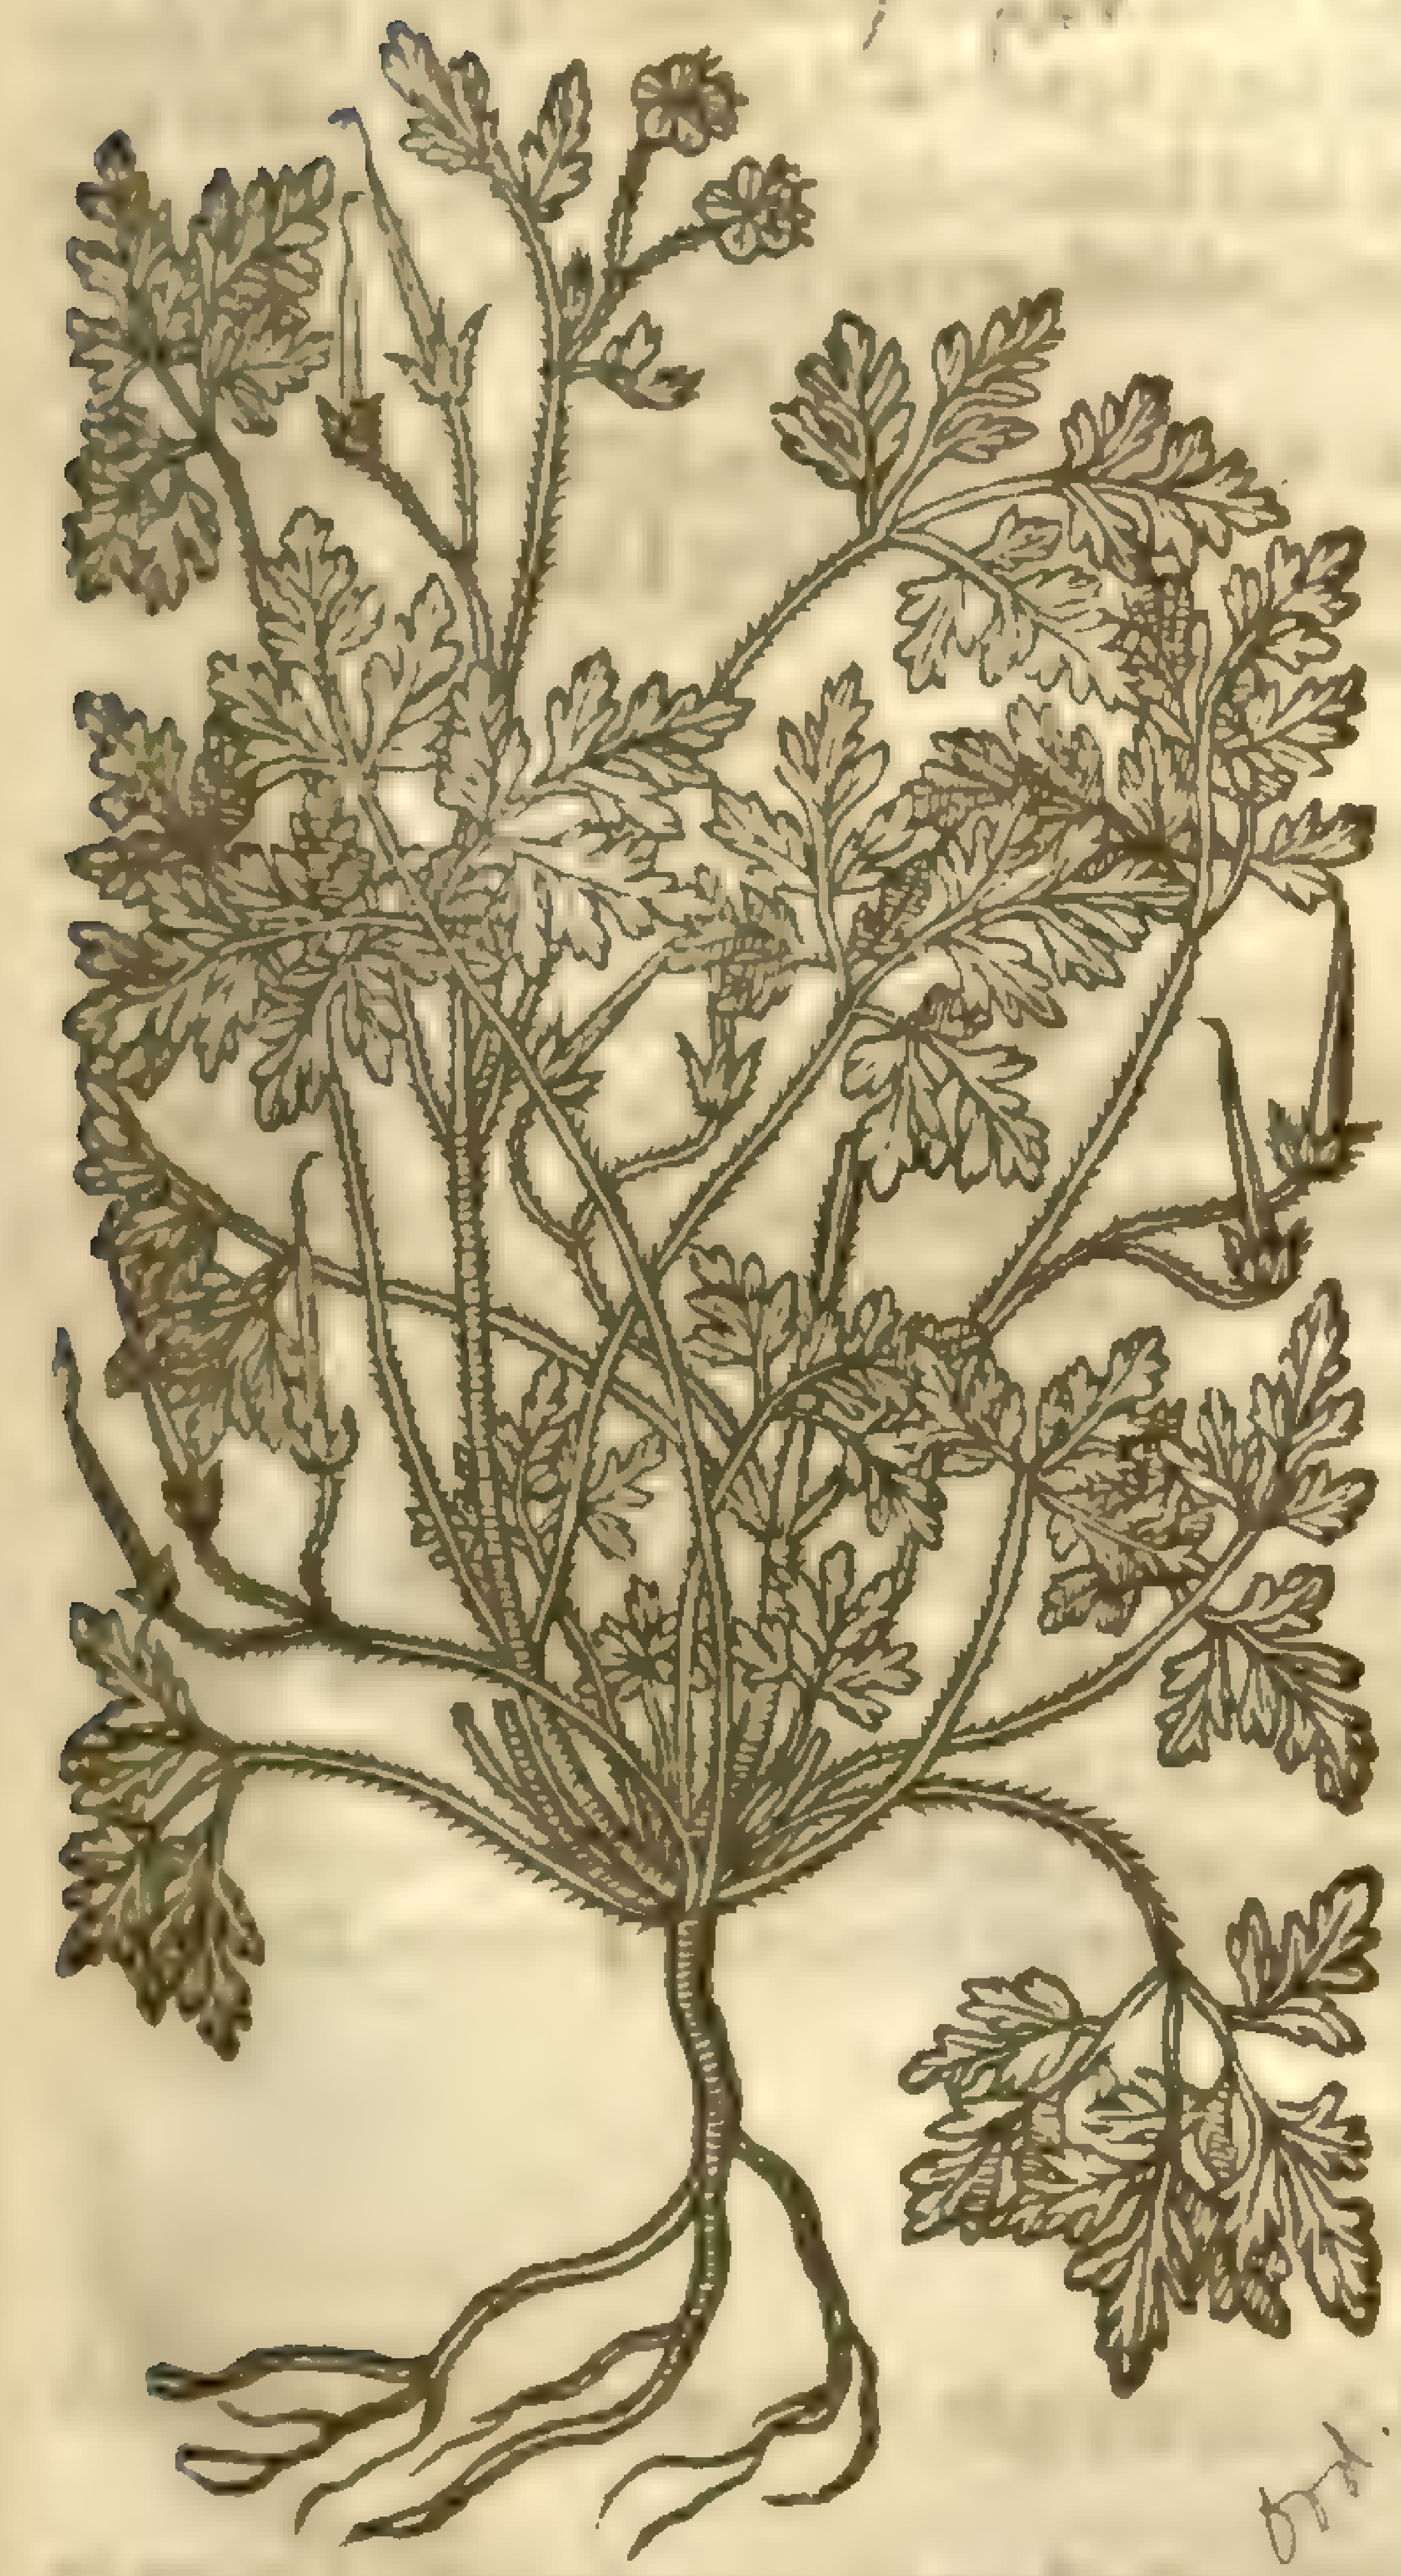
¶ The Vertues.

A It ſeemeth, ſaith my Author, to be good for greene and bleeding wounds, and aſſwageth inflammations or hot ſwellings.

The herbe and roots dried, beaten into moſt fine pouder, and giuen halfe a ſpoonfull faſting, and the like quantitie to bedwards in red wine, or old claret, for the ſpace of one and twenty daies together, cure miraculouſly ruptures or burſtings, as my ſelfe haue often proued, whereby I haue gotten crownes and credit: if the ruptures be in aged perſons, it ſhall be needfull to adde thereto the powder of red ſnailes (thoſe without ſhels) dried in an ouen in number nine, which fortifieth the herbes in ſuch ſort, that it neuer faileth, although the rupture be great and of long continuance: it likewiſe profiteth much thoſe that are wounded into the body, and the decoction of the herbe made in wine, preuaileth mightily in healing inward wounds, as my ſelfe haue likewiſe proued. B

CHAP. 357. *Of Herbe Robert.*

Geranium Robertianum,
Herbe Robert.



¶ *The Deſcription.*

Herbe Robert bringeth forth ſlender weake and brittle ſtalks, ſomewhat hairie, and of a reddiſh colour, as are oftentimes the leaues alſo, which are jagged and deepely cut, like vnto thoſe of Cheruile, of a moſt loathſome ſtinking ſmell. The flours are of a moſt bright purple colour; which being paſt, there follow certaine ſmal heads, with ſharpe beaks or bils like thoſe of birds: the root is ſmall and threddy.

¶ *The Place.*

Herb Robert groweth vpon old wals, as wel thoſe made of brick and ſtone, as thoſe of mud or earth: it groweth likewiſe among rubbiſh, in the bodies of trees that are cut downe, and in moiſt and ſhadowie ditch banks.

¶ *The Time.*

It floureth from Aprill till Summer be almoſt ſpent: the herbe is green in Winter alſo, and is hardly hurt with cold.

¶ *The Names.*

It is called in high Dutch, **Ruprechts kraut:** in low Dutch, **Robrechts kruit:** and thereupon it is named in Latine, *Ruberta,* and *Roberti herba: Ruellius* calleth it *Robertiana*; and we *Robertianum*: of *Tabernamontanus, Rupertianum*: in Engliſh, Herbe Robert. He that conferreth this Cranes-bill with *Dioſcorides* his third *Sideritis* ſhall plainely perceiue, that they are both one, and that this is moſt apparantly *Sideritis* 3. *Dioſcoridis*; for *Dioſcorides* ſetteth downe three *Sideritides*, one with the leafe of Horehound; the next with the leafe of Fearne; and the third groweth in walls and Vineyards: the natiue ſoile of Herbe Robert agree thereunto, and likewiſe the leaues, being like vnto Cheruile, and not vnlike to thoſe of Corianders, according to *Dioſcorides* deſcription.

¶ *The Temperature.*

Herbe Robert is of temperature ſomewhat cold: and yet both ſcouring and ſomewhat binding, participating of mixt qualities.

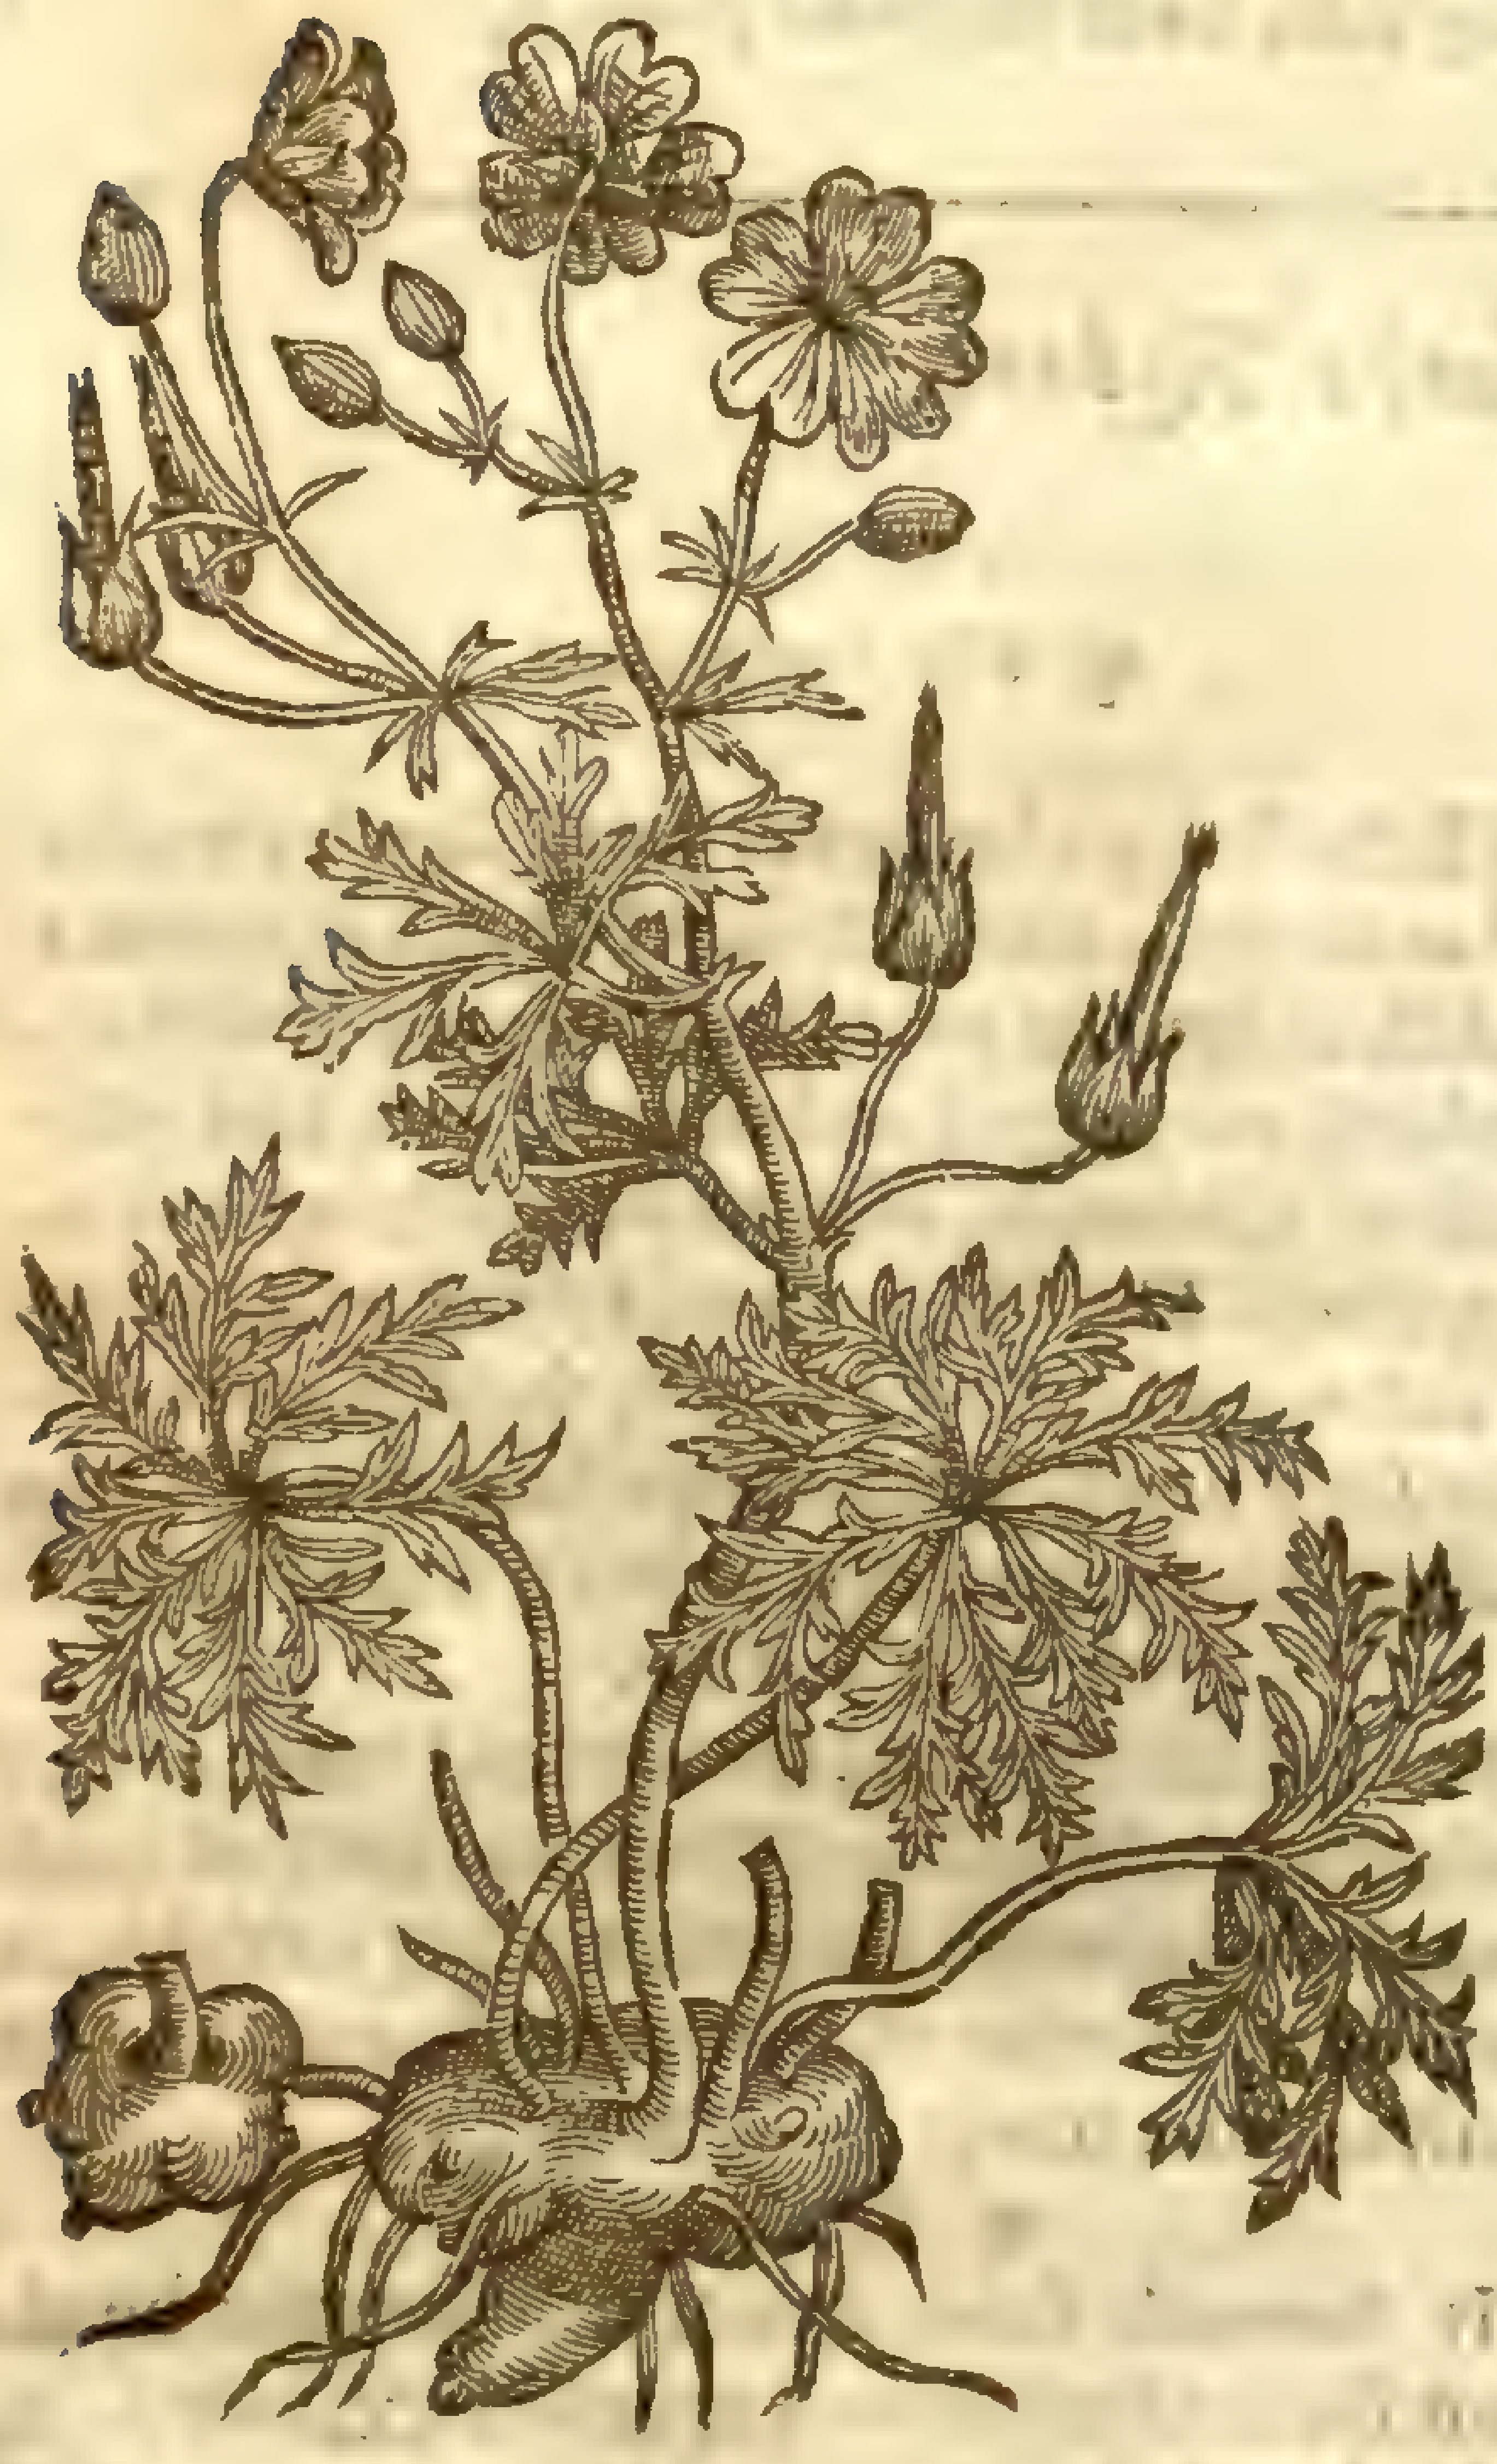
¶ *The Vertues.*

It is good for wounds and vlcers of the dugs and ſecret parts; it is thought to ſtanch bloud, which thing *Dioſcorides* doth attribute to his third *Sideritis*: the vertue of this, ſaith he, is applied to heale vp bloudy wounds. A

CHAP.

Chap. 358. *Of knobbed Cranes-bill.*

Geranium tuberoſum.
Knobbie Cranes-bill.



G. tuberosum, L.
Mill. Dict.

¶ The Deſcription.

This kinde of Cranes-bill hath many flexible branches, weake and tender, fat, and full of moiſture, wheron are placed very great leaues cut into diuers ſmall ſections or diuiſions, reſembling the leaues of the tuberous *Anemone*, or Wind-floure, but ſomewhat greater, of an ouer-worn greeniſh colour: among which come forth long foot-ſtalkes, whereon do grow faire flours, of a bright purple color, and like vnto the ſmalleſt brier Roſe in forme: which being paſt, there ſucceed ſuch heads and beaks as the reſt of the Cranes-bill haue: the root is thick, bumped or knobbed, which we call tuberous.

¶ The Place.

This kinde of Cranes-bill is a ſtranger in England, notwithſtanding I haue it growing in my Garden.

¶ The Time.

The time anſwereth the reſt of the Cranes-bills.

¶ The Names.

Cranes-bill is called in Greeke, γεράνιον: in Latine, *Gruinalis*, commonly *Roſtrum Gruis*, or *Roſtrum Ciconiæ*, of the likeneſſe of a Cranes-bill, or ſtorkes bill: of ſome, *Acus moſcata*: but that name doth rather belong to another of this kind: it is alſo called *Acus Paſtoris*: in Italian, *Roſtro di grua*: in French, *Bec de Grue*: in Spaniſh, *Pico di Ciquena, pico del grou*: in high Dutch, **Stoꝛckenſchnable**: in low Dutch, **Ooieuaers bek**: in Engliſh, Storks-bill, Cranes-bill, Herons-bill, and Pincke-needle: this is alſo called for diſtinctions ſake, *Geranium tuberoſum*, and *Geranium bulboſum*: it is likewiſe *Geranium primum Dioſcoridis*, or *Dioſcorides* his firſt Cranes-bill.

¶ The Temperature.

The roots of this Cranes-bill haue a little kinde of heat in them.

¶ The Vertues.

A *Dioſcorides* ſaith that the roots may be eaten, and that a dram weight of them drunk in wine doth waſte and conſume away the windineſſe of the Matrix.

B Alſo *Pliny* affirmeth, that the root hereof is ſingular good for ſuch as after weakeneſſe craue to be reſtored to their former ſtrength.

C The ſame Author affirmeth that the weight of a dram of it drunke in wine three times in a day, is excellent good againſt the Ptiſicke, or conſumption of the lungs.

Chap. 359. *Of Musked Cranes-bill.*

¶ The Deſcription.

Mvsked Cranes-bill hath many weake and feeble branches trailing vpon the ground; whereon doe grow long leaues, made of many ſmaller leaues, ſet vpon a middle rib, ſnipt or cut about the edges, of a pleaſant ſweet ſmell, not vnlike to that of Muske: among which come forth the floures ſet vpon tender foot-ſtalkes, of a red colour, compact of fiue ſmall leaues apiece: after the which appeare ſmall heads and pointed beakes or bills like the other kindes of Cranes-bills: the root is ſmall and threddy.

¶ The

hot ſwellings and inflammations: and with Beane meale diſſolue the Kings euill, wens, and hard lumpes.

The juice of the leaues mixed and laboured in a leaden mortar, with Ceruſe, Litharge of ſiluer, vineger, and oile of Roſes, cureth S. Anthonies fire, and takes away all inflammations whatſoeuer. F

The juice of the greene Coriander leaues, taken in the quantitie of foure dragmes, killeth and poiſoneth the body. G

The ſeeds of Coriander prepared with ſugar, preuaile much againſt the gout taken in ſome ſmal quantitie before dinner vpon a faſting ſtomack, and after dinner the like without drinking immediately after the ſame, or in three or foure houres. Alſo if the ſame be taken after ſupper, it preuaileth the more, and hath more ſuperiority ouer the diſeaſe. H

Alſo if it be taken with meat faſting, it cauſeth good digeſtion, and ſhuts vp the ſtomacke, keepeth away fumes from riſing vp out of the ſame: it taketh away the ſounding in the eares, drieth vp the rheume, and eaſeth the ſquinancie. I

Chap. 396. *Of Parſley.*

Apium hortenſe.
Garden Parſley.

¶ *The Deſcription.*

1 The leaues of garden Parſley are of a beautifull greene, conſiſting of many little ones faſtned together, diuided moſt commonly into three parts, and alſo ſnipt round about the edges: the ſtalke is aboue one cubit high, ſlender, ſomthing chamfered, on the top wherof ſtand ſpoked rundles, bringing forth very fine little floures, and afterwards ſmall ſeeds ſomwhat of a fiery taſt: the root is long & white, & good to be eaten.

2 There is another garden Parſley in taſt and vertue like vnto the precedent: the onely difference is, that this plant bringeth forth leaues very admirably criſped or curled like fannes of curled feathers, whence it is called *Apium criſpum, ſiue multifidum*, Curl'd Parſley.

‡ 3 There is alſo kept in ſome gardens another Parſley called *Apium ſiue Petroſelinum Virginianũ*, or Virginian parſley; it hath leaues like the ordinary, but rounder, and of a yellowiſh greene colour, the ſtalkes are ſome three foot high, diuided into ſundry branches wheron grow vmbells of whitiſh floures: the ſeeds are like, but larger than thoſe of the common Parſley, & when they are ripe they commonly ſow themſelues, and the old roots die, and the young ones beare ſeed the ſecond yeare after their ſowing. ‡

¶ *The Place.*

It is ſowne in beds in gardens; it groweth both in hot and cold places, ſo that the ground be either by nature moiſt, or bee oftentimes watered: for it proſpereth in moiſt places, and is delighted with water, and therefore it naturally commeth vp neere to fountaines or ſprings: *Fuchſius* writeth that it is found growing of it ſelfe in diuers fenny grounds in Germany.

¶ *The Time.*

It may be ſown in time but it ſlowly commeth vp: it may oftentimes be cut and cropped: it bringeth forth his ſtalks the ſecond yeare: the ſeeds be ripe in Iuly or Auguſt.

¶ *The Names.*

Euery one of the Parſleyes is called in Greeke σέλινον but this is named, σέλινον κηπαῖον, that is to ſay, *Apium hortenſe*: the Apothecaries and common Herbariſts name it *Petroſelinum*: in high Dutch. **Peterſilgen:**

terſilgen: in low Dutch, **Trimen Peterſelie**: in French, *du Perſil*: in Spaniſh, *Perexil Iuliuert*, and *Salſa*: in Italian, *Petroſello*: in Engliſh, Perſele, Parſely, common Parſley, and garden Parſley. Yet is it not the true and right *Petroſelinum* which groweth vpon rockes and ſtones, whereupon it tooke his name, and whereof the beſt is in Macedonia: therefore they are deceiued who think that garden Parſley doth not differ from ſtone Parſley, and that the only difference is, for that Garden Parſley is of leſſe force than the wild; for wild herbs are more ſtrong in operation than thoſe of the garden.

¶ *The Temperature.*

Garden Parſley is hot and dry, but the ſeed is more hot and dry, which is hot in the ſecond degree, and dry almoſt in the third: the root is alſo of a moderate heate.

¶ *The Vertues.*

A The leaues are pleaſant in ſauces and broth, in which beſides that they giue a pleaſant taſt, they be alſo ſingular good to take away ſtoppings, and to prouoke vrine: which thing the roots likewiſe do notably performe if they be boiled in broth: they be alſo delightfull to the taſte, and agreeable to the ſtomacke.

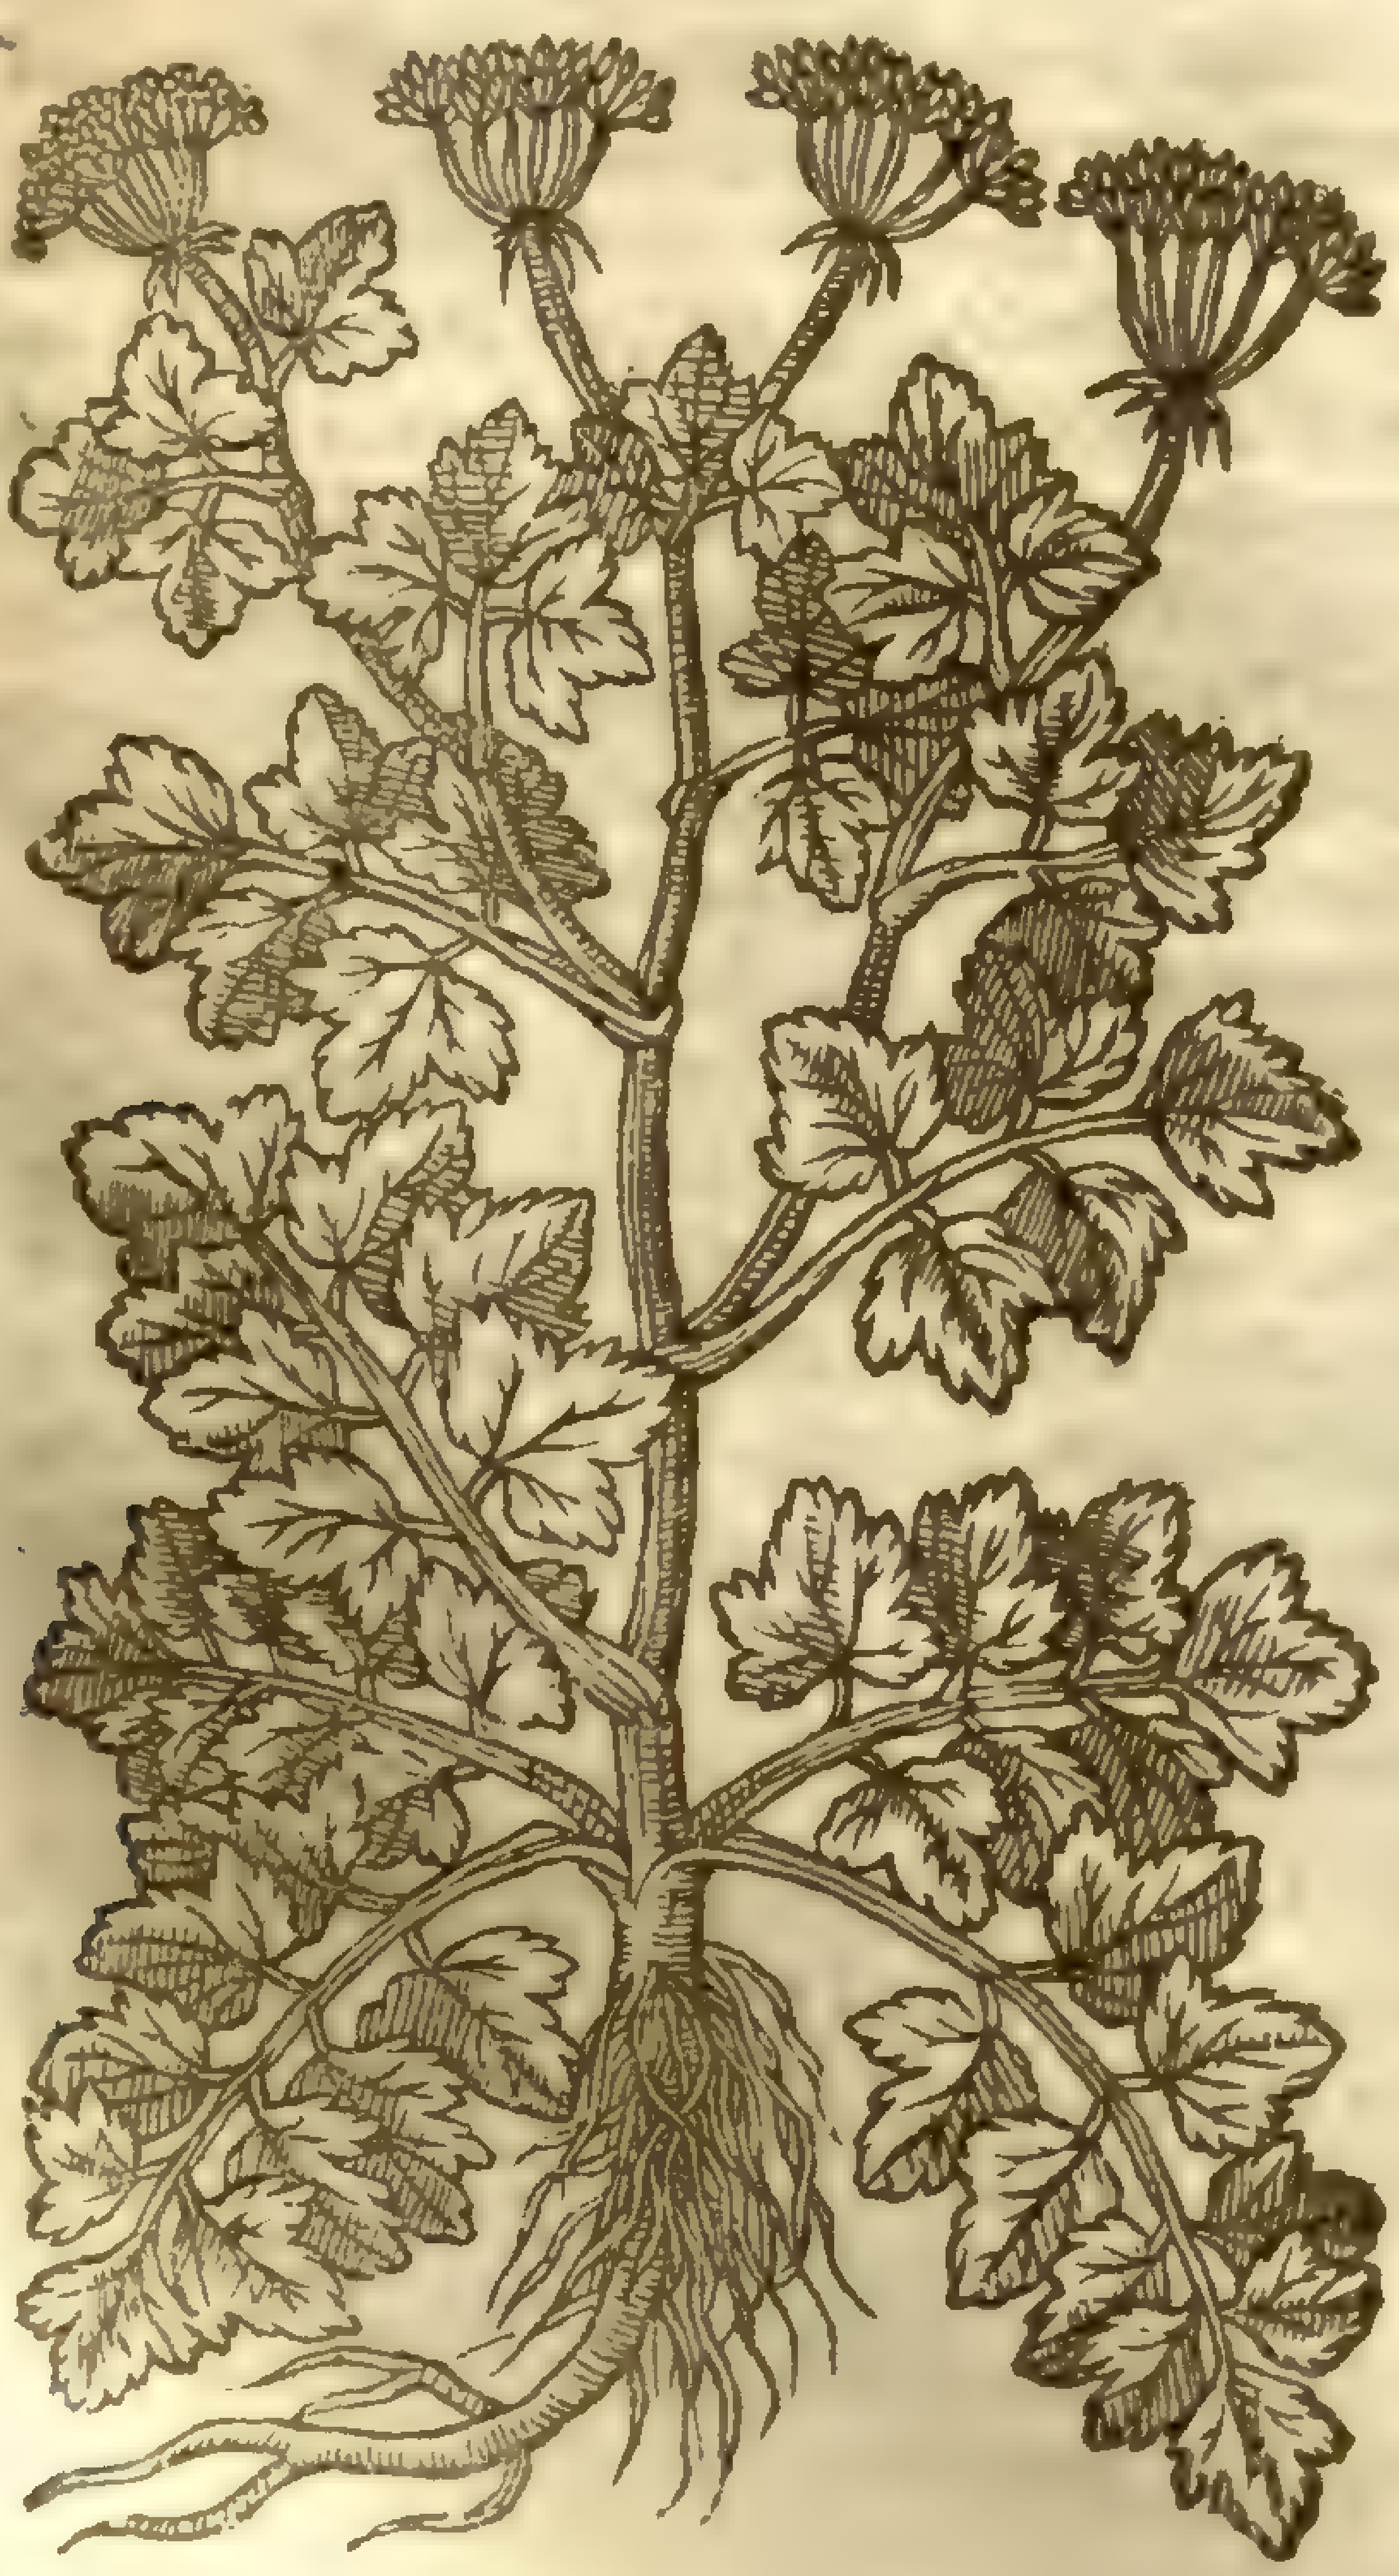
B The ſeeds are more profitable for medicine; they make thinne, open, prouoke vrine, diſſolue the ſtone, break and waſt away winde, are good for ſuch as haue the dropſie, draw downe menſes, bring away the birth, and after-birth: they be commended alſo againſt the cough, if they bee mixed or boiled with medicines made for that purpoſe: laſtly they reſiſt poiſons, and therefore are mixed with treacles.

C The roots or the ſeeds of any of them boiled in ale and drunken, caſt forth ſtrong venom or poiſon, but the ſeed is the ſtrongeſt part of the herbe.

D They are alſo good to be put into clyſters againſt the ſtone or torments of the guts.

Chap. 397. *Of water Parſley, or Smallage.*

Eleoſelinum, ſiue Paludapium.
Smallage.



Apium graveolens, L.
Linn. dict.
p. 226

Smith.

¶ *The Deſcription.*

Smallage hath green ſmooth and glittering leaues, cut into very many parcels, yet greater & broader than thoſe of common Parſley: the ſtalkes be chamfered and diuided into branches, on the tops whereof ſtand little white floures; after which do grow ſeeds ſomthing leſſer than thoſe of common Parſley: the root is faſtned with many ſtrings.

¶ *The Place.*

This kind of Parſley delighteth to grow in moiſt places, and is brought from thence into gardens. ‡ It growes wilde abundantly vpon the bankes in the ſalt marſhes of Kent and Eſſex. ‡

¶ *The Time.*

It flouriſhes when the garden Parſley doth, and the ſtalke likewiſe commeth vp the next yeare after it is ſown, and then alſo it bringeth forth ſeeds which are ripe in Iuly & Auguſt.

¶ *The Names.*

It is called in Greeke ἐλεοσέλινον: of *Gaza*, *Paludapium*: in ſhoppes, *Apium*, abſolutely without any addition: in Latine, *Paluſtre Apium*, and *Apium ruſticum*: in high Dutch, **Epffich**: in low Dutch, **Eppe**, & of diuers **Jouffrouwmerck**: in Spaniſh and Italian, *Apio*: in French *de L'ache*: in Engliſh, Smallage, Marſh Parſley, or water Parſley.

¶ *The Temperature.*

This Parſley is like in temperature and vertues to that of the garden, but it is both hotter and drier, and of more force in moſt things: this is ſeldome eaten, neither is it counted good for ſauce, but is very vnprofitable in medicine.

¶ *The Vertues.*

The juice thereof is good for many things, it clenſeth, openeth, attenuateth, or maketh thin; it remoueth obſtructions and prouoketh vrine, and therefore thoſe ſyrrups which haue this mixt with them, as that which is called *Syrupus Byzantinus*, open the ſtoppings of the liuer and ſpleen, and are a remedie for long laſting agues, whether they be tertians or quartans, and all other which proceed both of a cold cauſe and alſo of obſtructions or ſtoppings, and are very good againſt the yellow jaundiſe. A

The ſame juice doth perfectly cure the malitious and venomous vlcers of the mouth, and of the almonds of the throat, with the decoction of Barly and *Mel Roſarum* or hony of Roſes added, if the parts be waſhed therewith: it likewiſe helpeth all outward vlcers and foule wounds: with hony it is profitable alſo for cankers exulcerated, for although it cannot cure them yet it keeps them from putrifaction, and preſerueth them from ſtinking: the ſeed is good for thoſe things for which that of the garden Parſly is: yet is not the vſe thereof ſo ſafe, for it hurteth thoſe that are troubled with the falling ſickneſſe, as by euident prooſes it is very well knowne. B

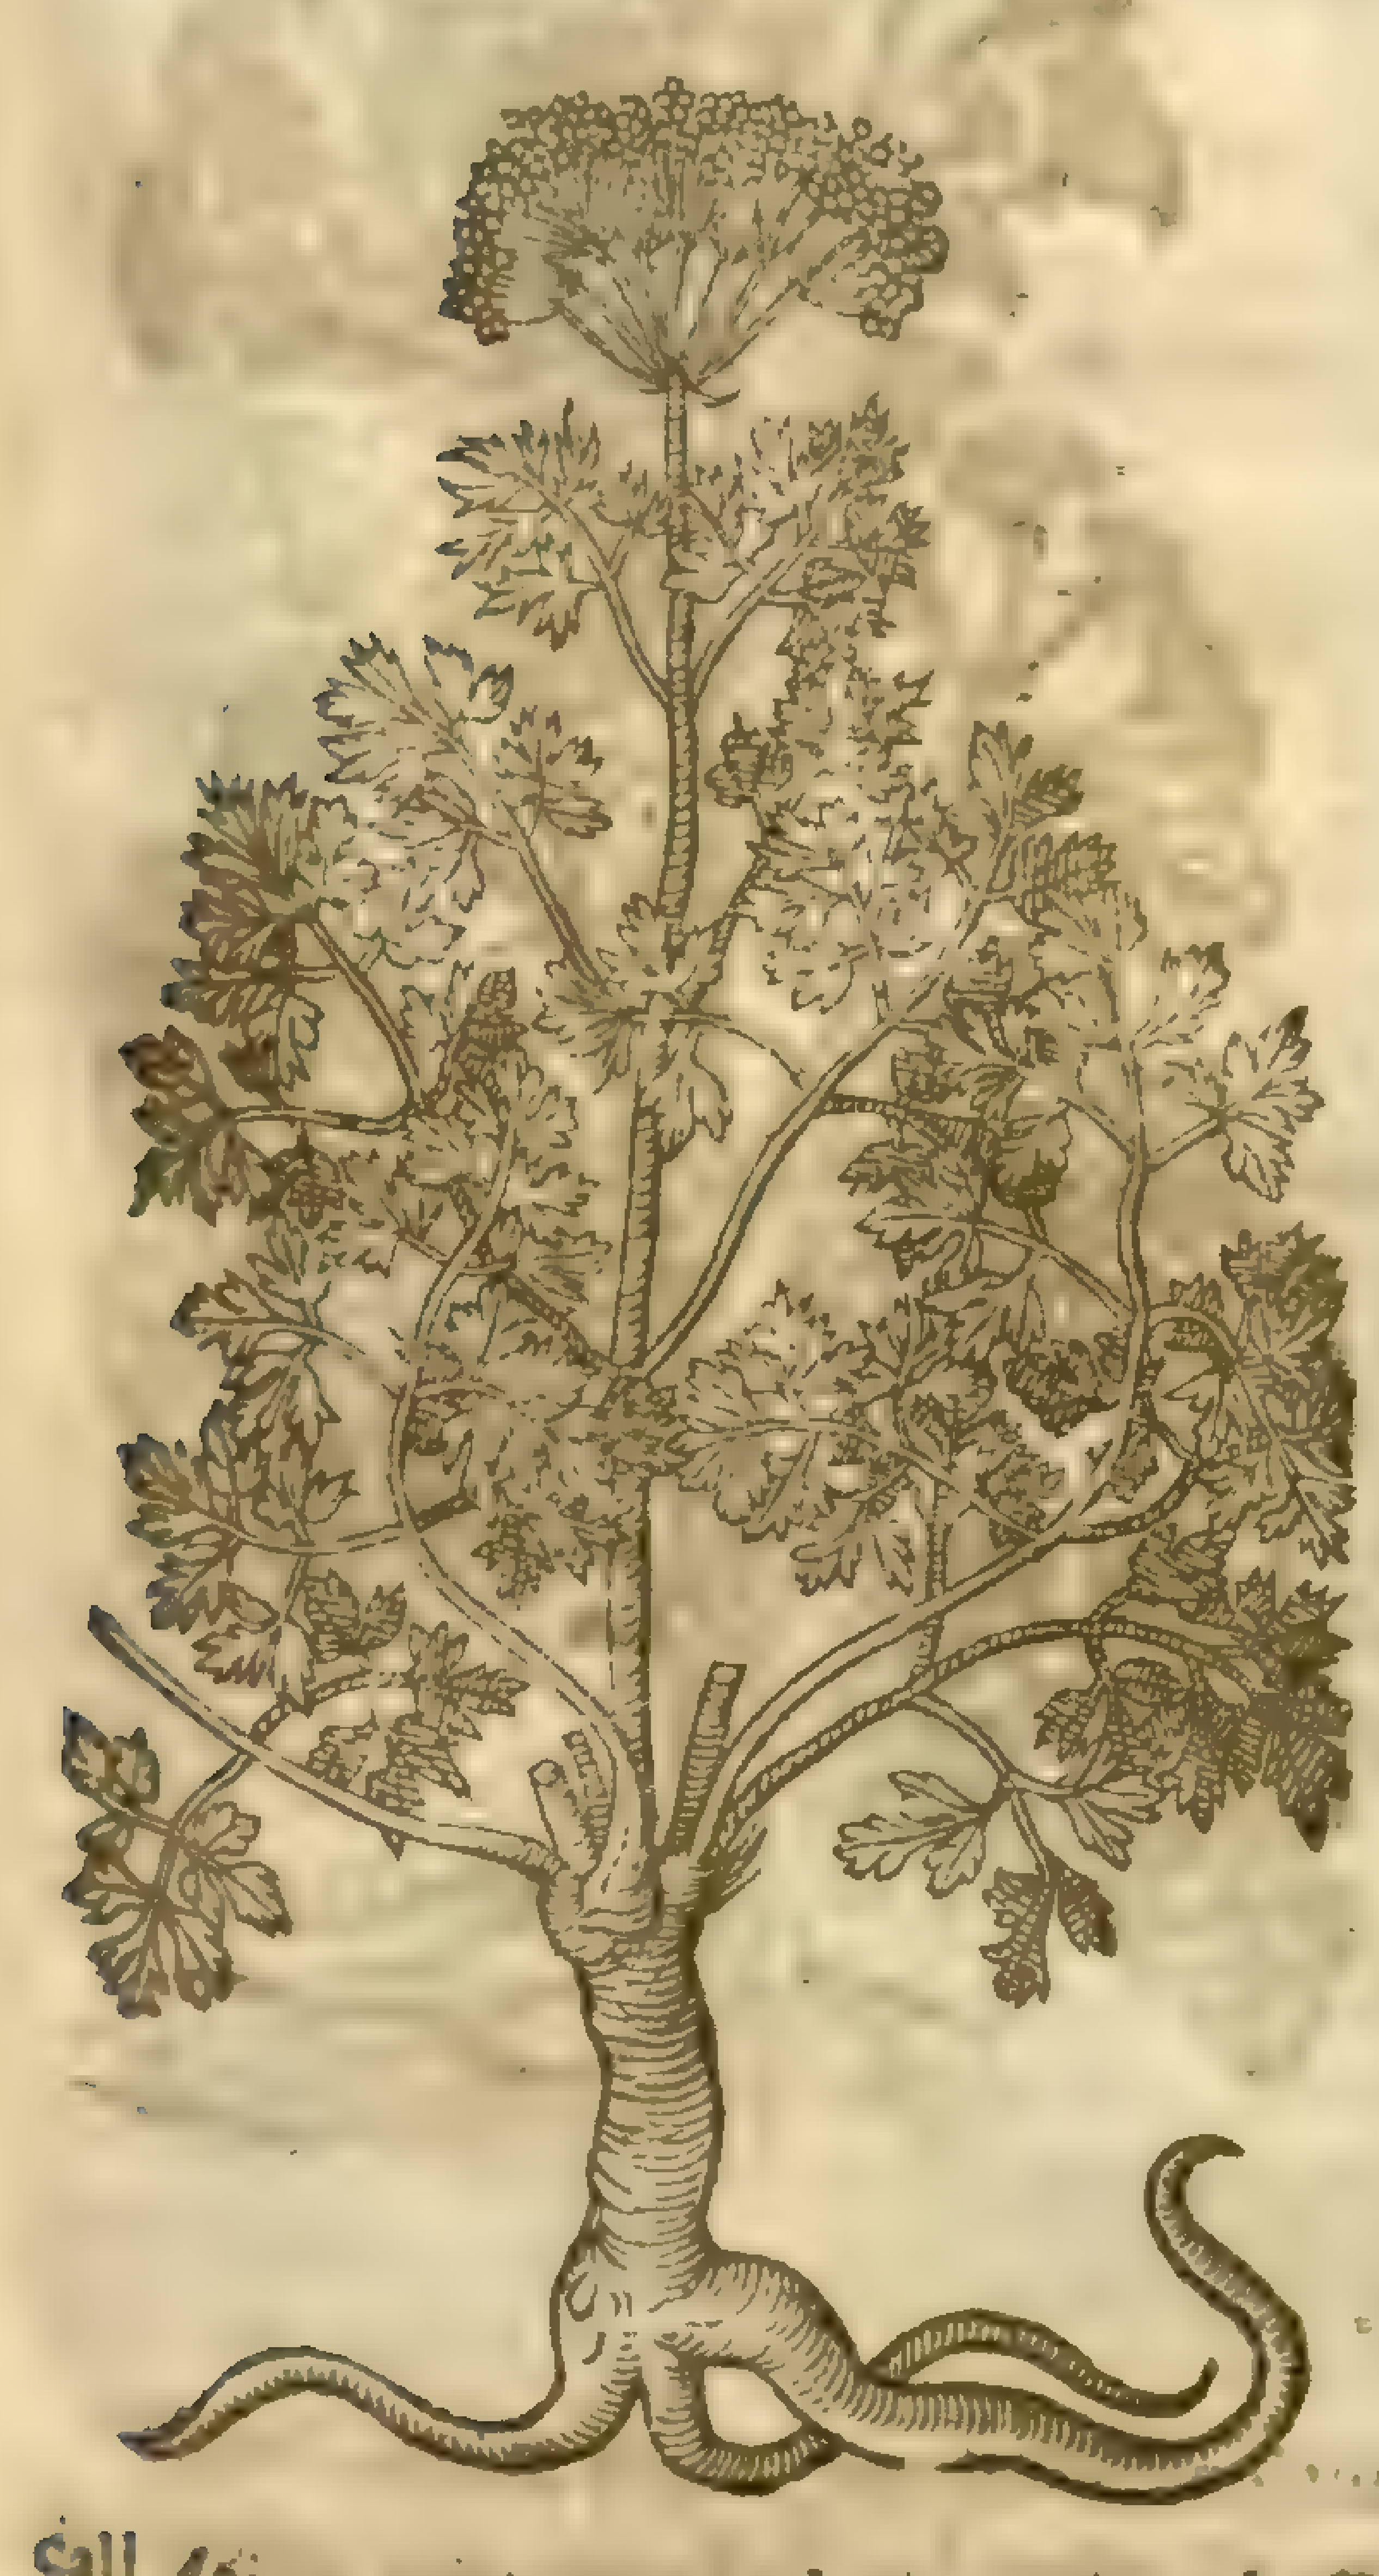
Smallage, as *Pliny* writeth, hath a peculiar vertue againſt the biting of venomous ſpiders. C

The juice of Smallage mixed with hony and bean floure, doth make an excellent mundificatiue for old vlcers and malignant ſores, and ſtayeth alſo the weeping of the cut or hurt ſinues in ſimple members, which are not very fatty or fleſhy, and bringeth the ſame to perfect digeſtion. D

The leaues boiled in hogs greaſe, and made into the forme of a pultis, take away the pain of felons and whitlowes in the fingers, and ripen and heale them. E

Chap. 398. *Of Mountaine Parſley.*

† *Oreoſelinum.*
Mountaine Parſley.



¶ *The Deſcription.*

The ſtalke of mountaine Parſley, as *Dioſcorides* writeth, is a ſpan high, growing from a ſlender root; vpon which are branches and little heads like thoſe of Hemlocke, yet much ſlenderer: on which ſtalks grow the ſeed, which is long, of a ſharp or biting taſte, ſlender, and of a ſtrong ſmell like vnto Cumin: but we canot find that this kinde of mountain Parſly is knowne in our age: the leaues of this we here giue are like thoſe of common Parſly, but greater & broader, conſiſting of many ſlender footſtalks faſtned vnto them: the ſtalke is ſhort, the floures on the ſpoked tufts be white, the ſeed ſmall; the root is white, and of a meane length or bigneſſe, in taſte ſomewhat biting and bitteriſh, and of a ſweet ſmell.

¶ *The Place.*

† *Dioſcorides* writeth, That mountain parſley groweth vpon rocks and mountains. And *Dodonæus* affirmeth that this herb deſcribed grows vpon the hills which diuide Sileſia from Morauia, called in times paſt the countrey of the Marcomans: alſo it is ſaid to be found on other mountains and hils in the North parts of England.

¶ *The Names.*

The Grecians do name it of the mountaines, ὀρεοσέλινον, which the Latines alſo for that cauſe do call *Apium montanum*, and *Montapium*: in Engliſh, mountaine Parſley: in Latine, *Apium*: but *Dioſcorides* maketh *Petroſelinum* or ſtone Parſley to differ from mountaine Parſley; for, ſaith hee, wee we muſt not be deceiued, taking mountaine Parſley to be that which groweth on rocks, for Rock Parſley is another plant: of ſome it is called **Veelgutta:** in Latine, *Multi-bona*: in Engliſh, Much Good, ſo named becauſe it is good and profitable for many things: and this is not altogether vnproperly named *Oreoſelinum*, or mountaine Parſley, for it growes, as we haue ſaid, on mountains, and is not vnlike to ſtone Parſley: the ſeed is not like that of Cumin, for if it were ſo, who would deny it to be *Oreoſelinum*, or *Dioſcorides* his mountaine Parſley.

¶ *The Temperature and Vertues.*

A *Oreoſelinum* or mountaine Parſley is, as *Galen* ſaith, like in facultie to Smallage, but more effectuall: *Dioſcorides* writeth, that the ſeed and root being drunke in wine prouoke vrine, bring downe the Menſes: and that they are mixed with counterpoiſons, diureticke medicines, and medicines that are hot.

B The root of *Veelgutta* or Much-good is alſo hot and dry, euen in the later end of the ſecond degree, it maketh thin, it cutteth, openeth, prouoketh, breaketh the ſtone and expelleth it, openeth the ſtopping of the liuer and ſpleen, and cureth the yellow Iaundice: being chewed it helps the tooth-ache, and brings much water out of the mouth.

---

† This whole Chapter was wholly taken from *Dodonæus, Pempt. 5. lib. 4 cap. 3.* wherefore I haue giuen his figure, which was agreeable to the hiſtorie; for the figure our Author here gaue was of the *Selinum montanum pumilum*, far different from this, as I ſhall hereafter ſhew you in the Chap. of *Peucedanum*.

Chap. 399. *Of ſtone Parſley or Macedonie.*

[illegible]

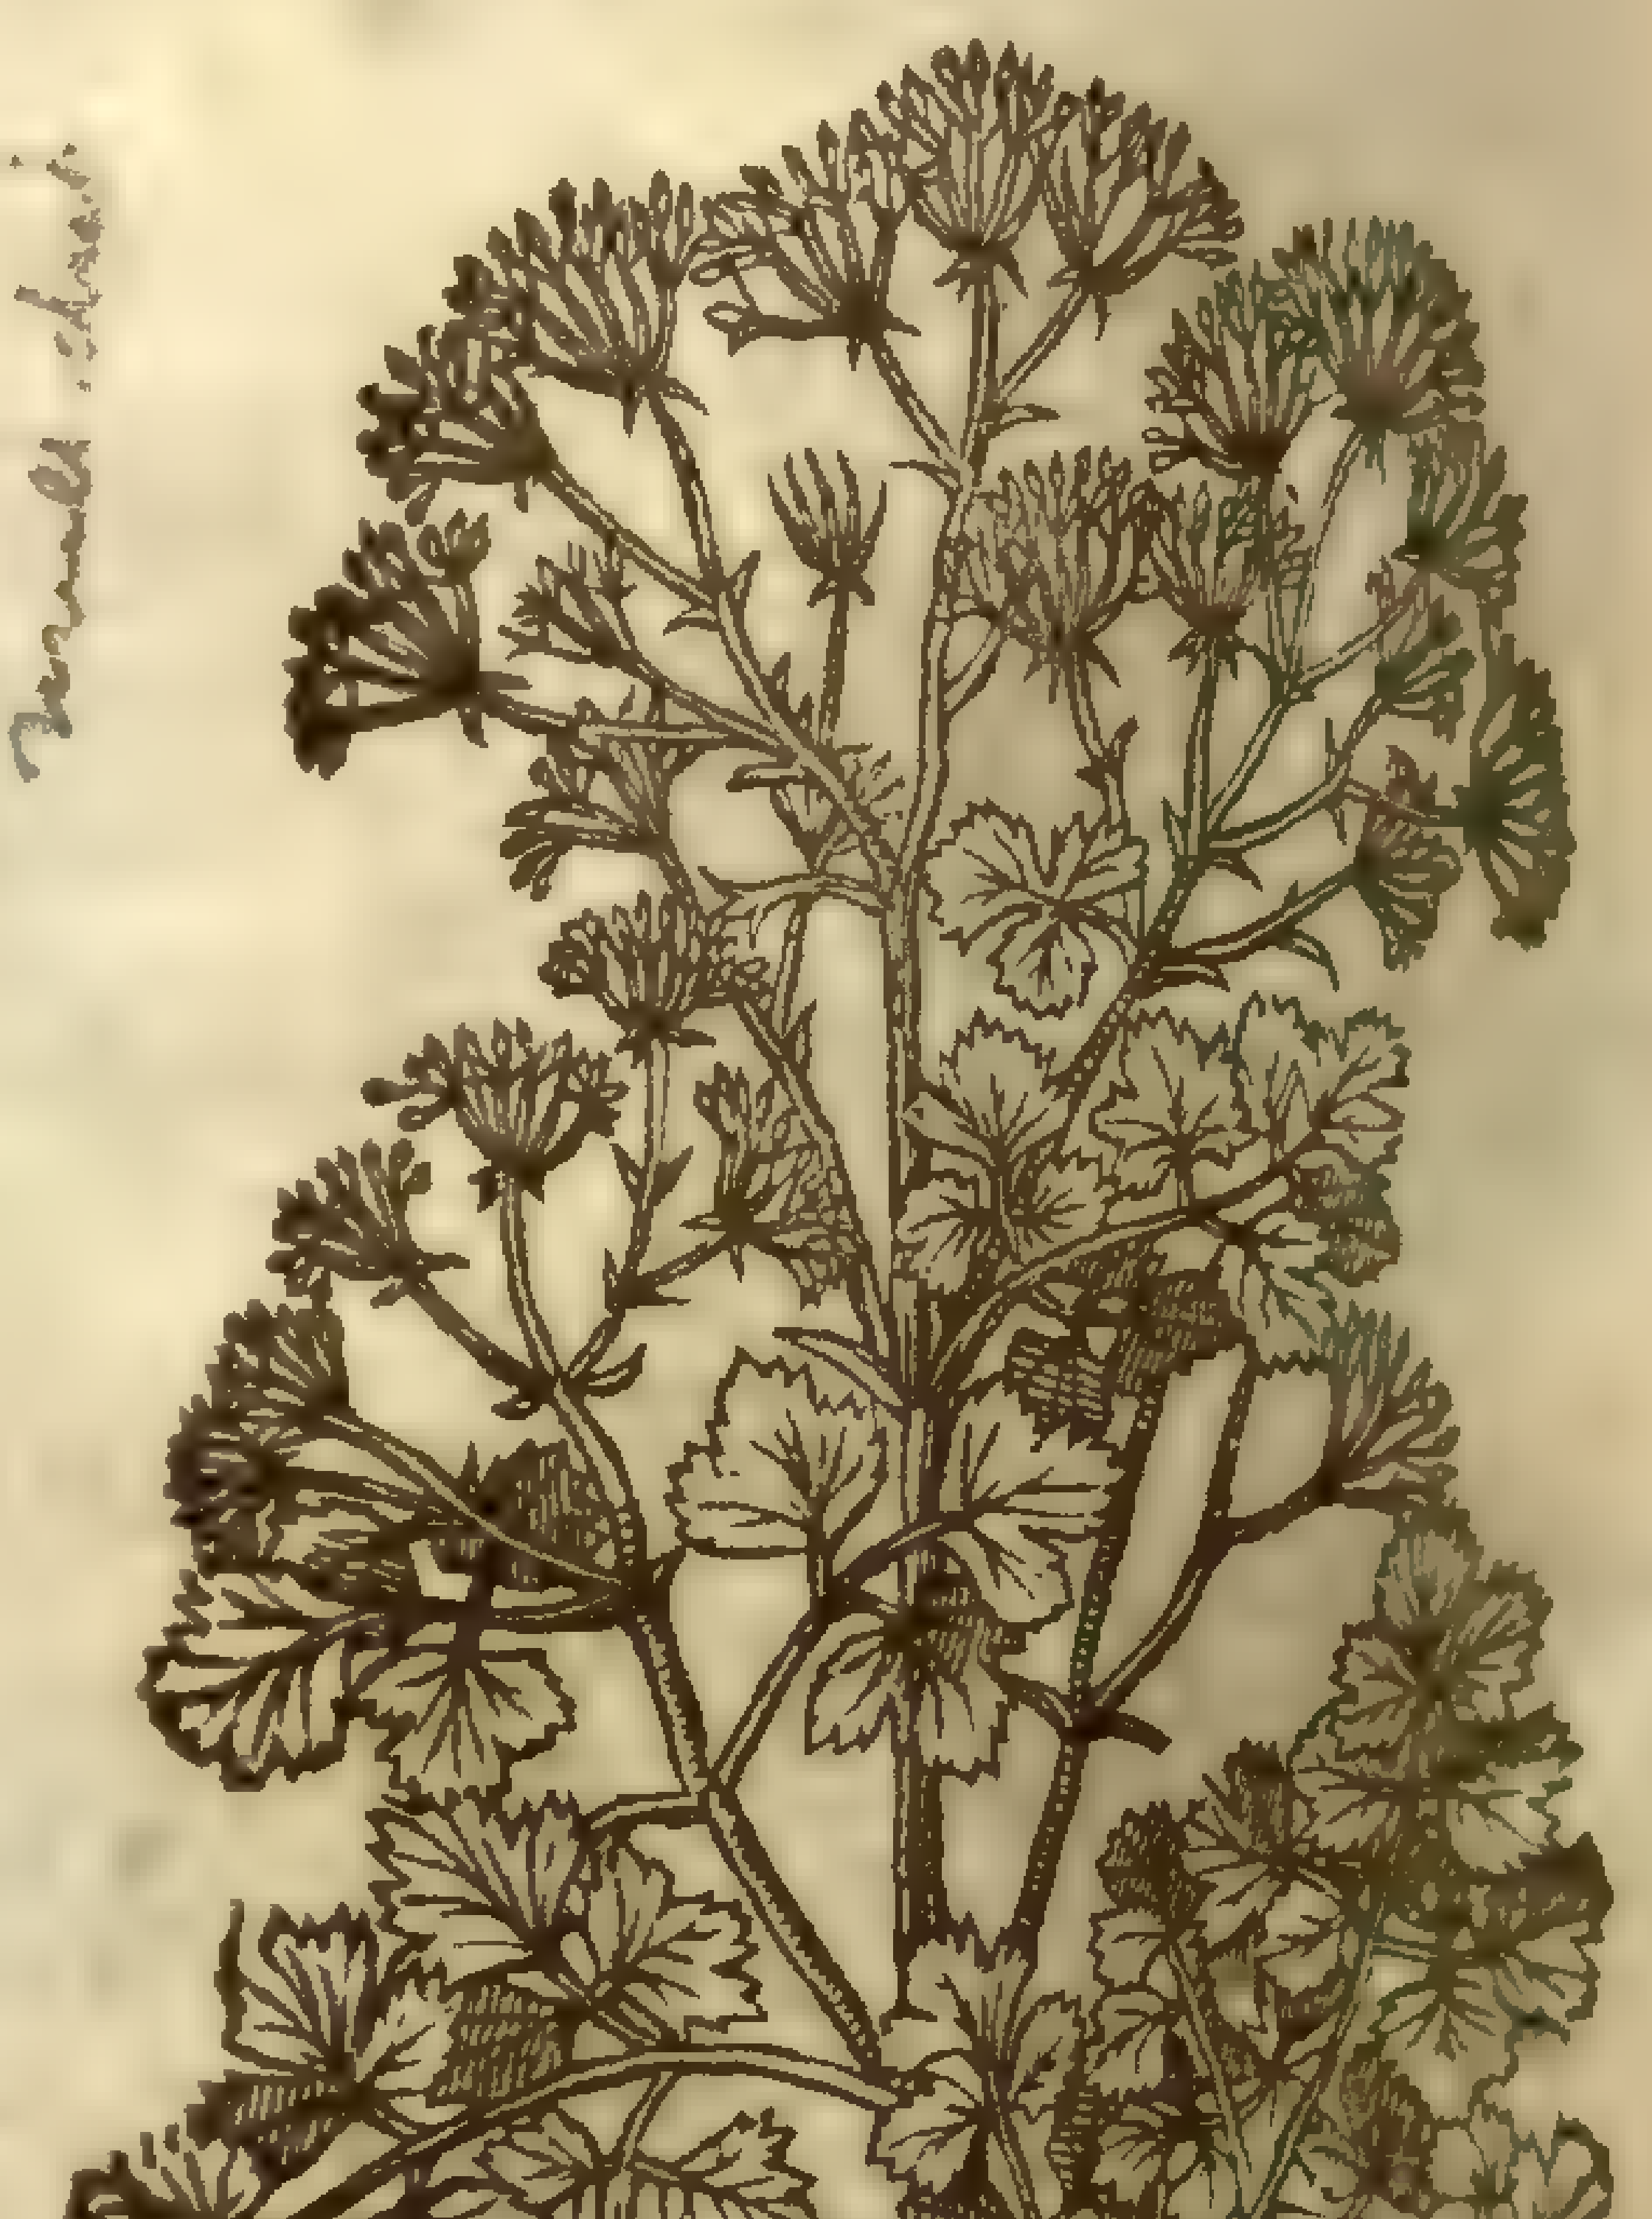
† 2 *Petroſelinum Macedonicum verum.*
The true Parſley of Macedonia.



Bubon macedonicum; L.
[illegible]

¶ *The Deſcription.*

OF ſtone-Parſley there is very little ſpoken by the antient Writers: onely *Dioſcorides* ſaith, That it hath ſeed like to that of Ameos, but of a more pleaſant ſmell, ſharpe, aromaticall, or ſpiced: touching the forme of the leaues, the colour of the floures, and the faſhion of the roots root he writeth nothing at all:and *Pliny* is more briefe ; as for *Theophraſtus* he doth not ſo much as name it,making mention only of Parſley, Alexander, Smallage,and mountaine Parſley.

1 For ſtone Parſley *Leonhartus Fuchſius* hath ſet down a plant,hauing leaues not ſpred and cut after the maner of garden Parſley,but long,and ſnipped round about, made vp and faſtened to a rib or ſtemme in the midſt,ſomthing like,but yet not altogether, to the firſt leaues of the leſſer Saxifrage;the ſtalke is ſlender, and a cubit and a halfe high ; the floures on the ſpokie tufts are white : the ſeed ſomthing blacke,like to that of Ameos,and garden Parſley,very ſweet of ſmell,ſomthing ſharp or biting:the root is ſlender and full of ſtrings.

2 *Lobel* alſo in ſtead of the right ſtone Parſley deſcribeth another, which the Venetians call ſtone Parſley of Macedonia:this hath leaues like thoſe of garden parſley,or rather of the Venetian Saxifrage which is the blacke herbe Frankincenſe formerly deſcribed : the ſtalke is a cubit high : the ſpokie tufts ſomthing white : the ſeed ſmall, quickly vading (as he ſaith) inferiour to that of garden Parſley in temperature and vertues:but whether this be the true and right ſtone Parſley, he addeth,he is ignorant.

¶ *The Place.*

It groweth on craggie rockes, and among ſtones : but the beſt in Macedonia,whereupon it beareth the ſyrname *Macedonicum*,of Macedonia.

¶ *The Time.*

It floureth in the ſummer moneths.

¶ *The Names.*

It is called in Greeke, πετροσέλινον, of the ſtony places where it groweth:in Latine, *Petrapium*.and *Petroſelinum Macedonicum*. in Engliſh, ſtone Parſley:the Apothecaries know it not:they are far deceiued that would haue the herbe which *Fuchſius* pictureth to be *Amomum* : for *Amomum* differeth from this,as it is very plaine by the deſcription thereof in *Dioſcorides* : but we hold this for the true ſtone Parſley,till ſuch time as we may learne ſome other more like in leaues to the Parſleyes, and in ſeed,ſuch as that of ſtone Parſley ought to be:and the very ſeed it ſelfe may cauſe vs to hold this opinion,being ſo agreeing to the deſcription as no herbe more ; for it is ſharp and biting,and of a ſweeter ſmell than is that of Ameos,and of a more ſpicy ſent ; yet doe not the leaues gaine ſay it, which though they haue not the perfect form of other Parſleyes,yet notwithſtanding are not altogether vnlike. ‡ The firſt of theſe is thought by *Anguillara*, *Turner*, *Geſner*, *Cordus*, and others to be the *Siſon* of *Dioſcorides*, & *Tragus* cals it *Amomum Germanicum*, & the ſeeds in ſhops retain the name of *Sem. Amomi*. The ſecond is thought by *Columna* to be the ſecond *Daucus* of *Dioſcorides*. ‡

¶ *The Nature.*

The ſeed of ſtone Parſley, which is moſt commonly vſed, is hot and dry, hauing withall a cutting quality.

¶ *The Vertues.*

It prouoketh vrine,and bringeth down the floures:it is profitable againſt wind in the ſtomack, and collicke gut,and gripings in the belly:for it is,as *Galen* ſaith, ἄφυσον, that is to ſay,a waſter or conſumer of wind:it is a remedy againſt pain in the ſides,kidnies,and bladder,it is alſo mixed in counterpoiſons : *Dioſcorides*. A

---

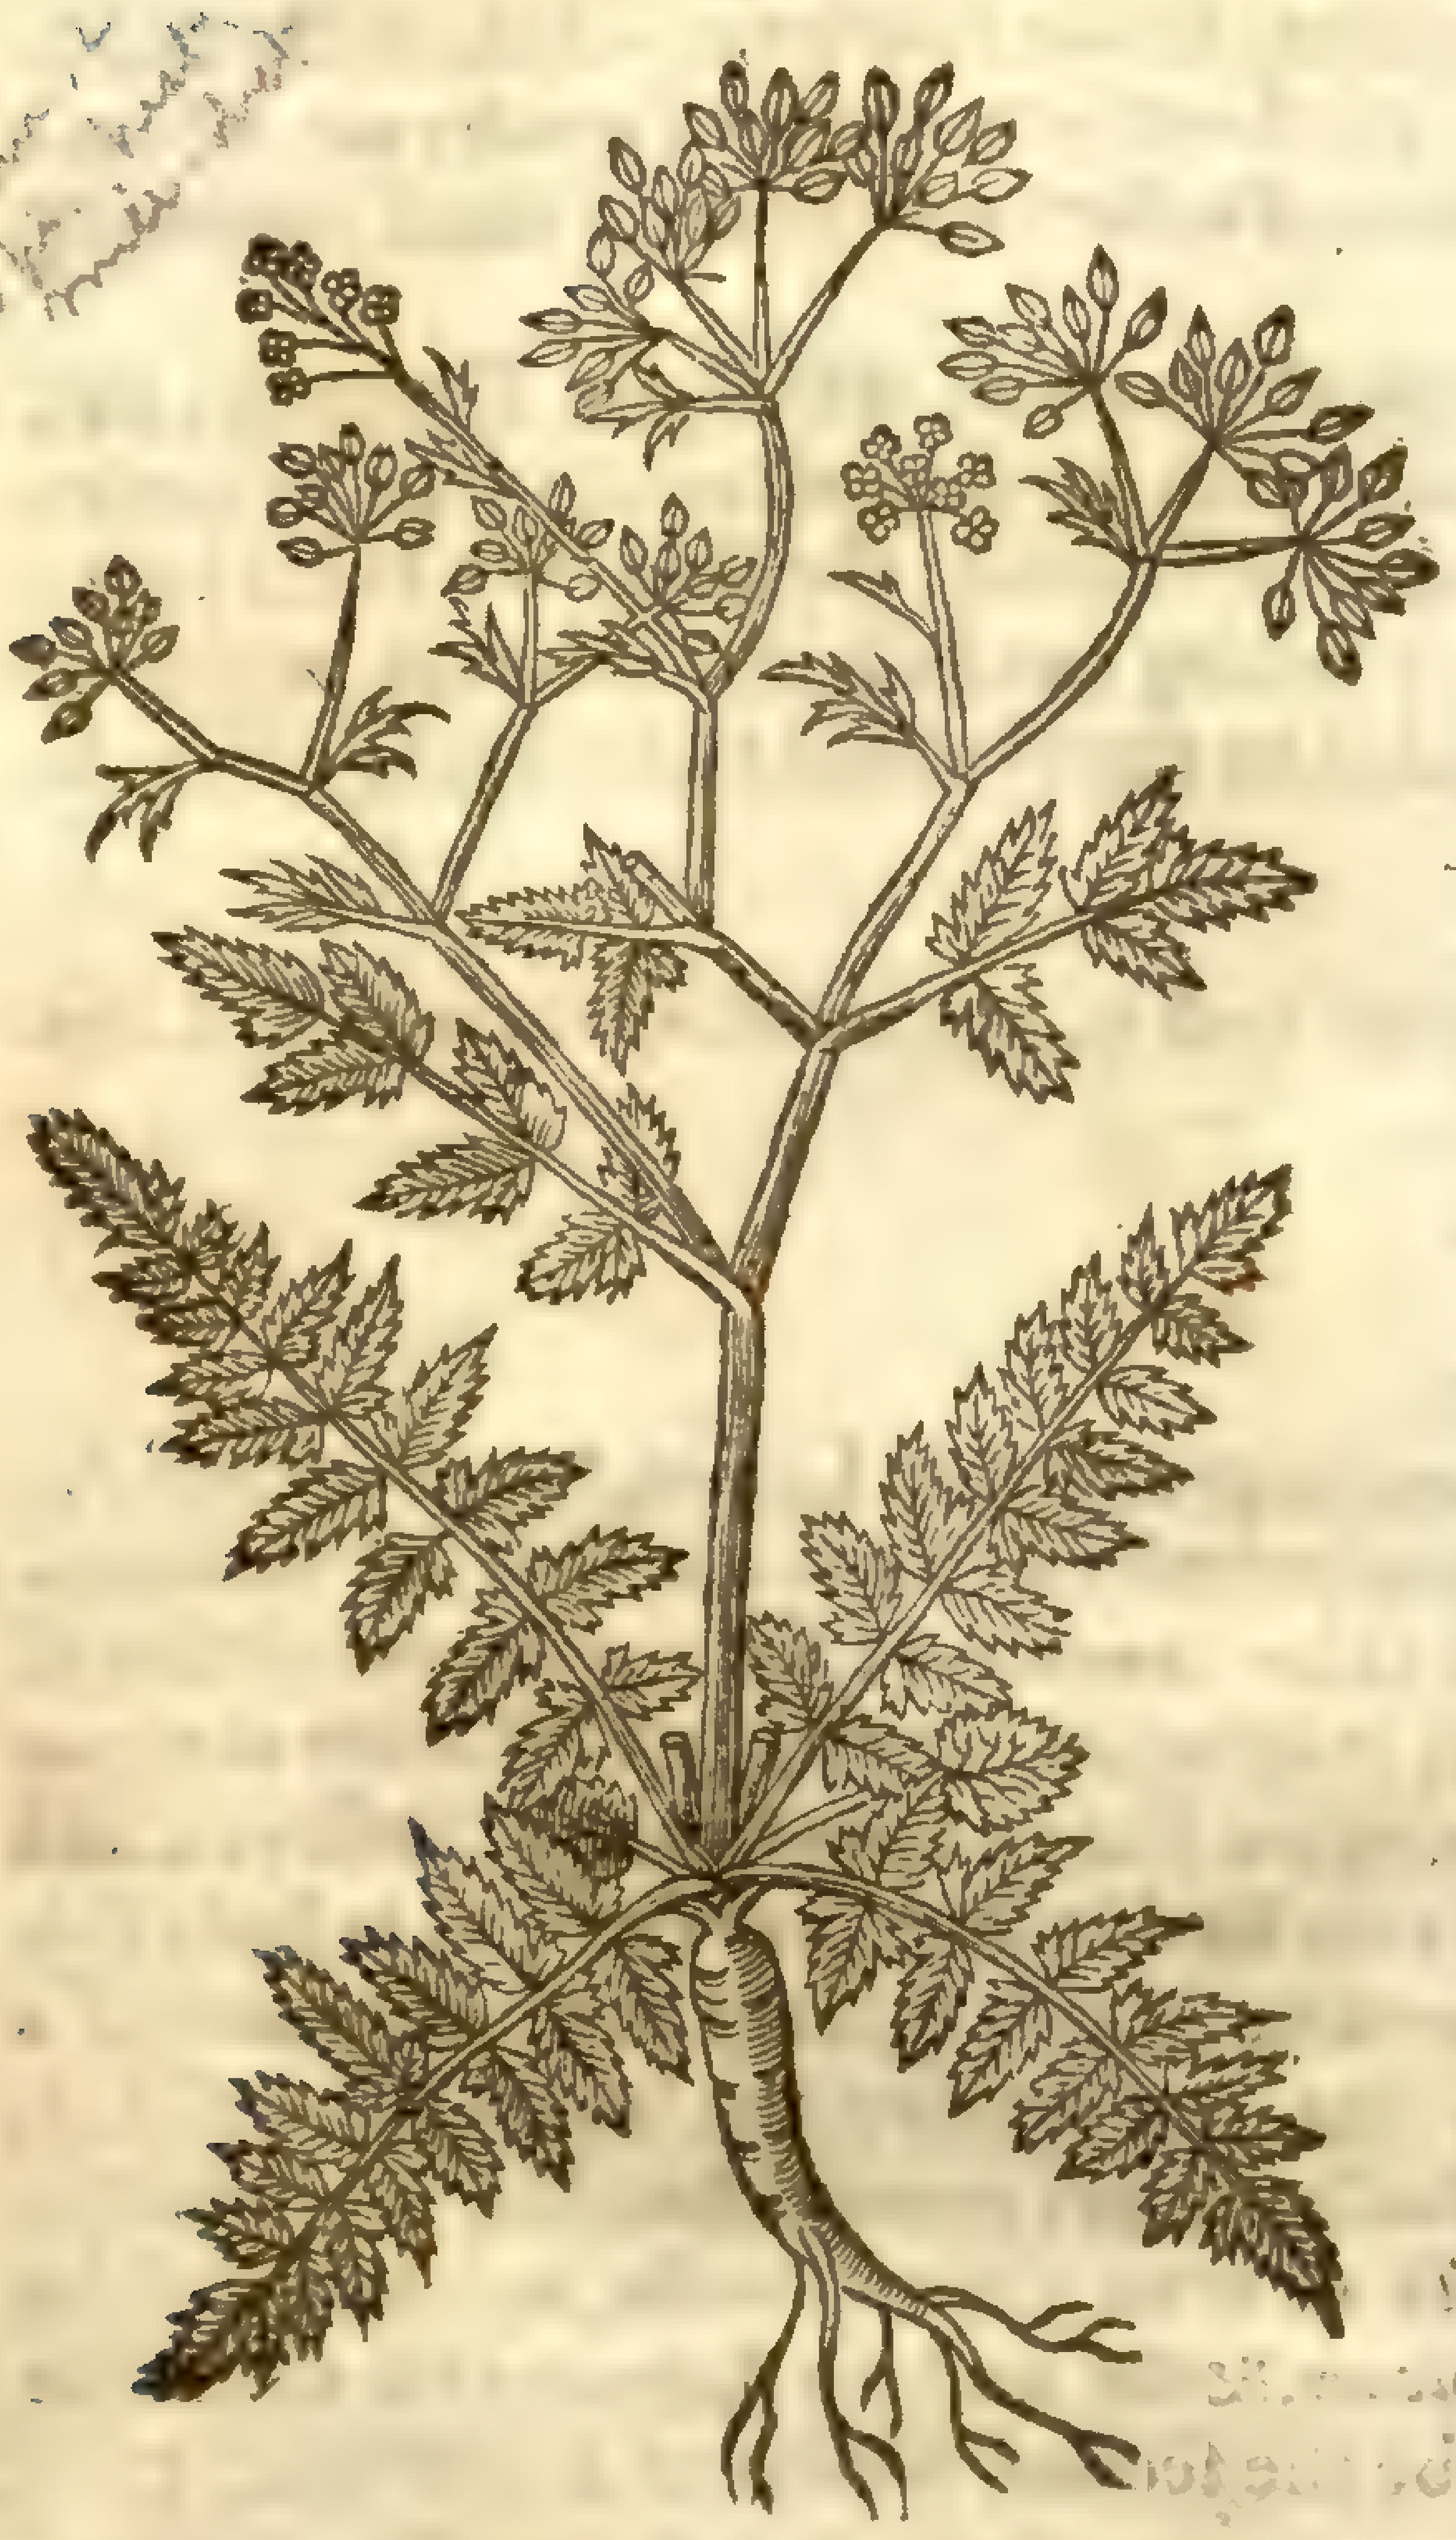
† The firſt figure that was formerly in this chapter ſhould haue beene in the ſecond place, and that in the ſecond place was of Alexanders, and ſhould haue been put in the following chapter.

‡ Chap. 400. *Of Corne Parſley, or Hone-wort.*

¶ *The Deſcription.*

THis Herbe commeth vp at the firſt from ſeed like Parſley,with two ſmall long narrow leaues, the next that ſpring are two ſmall round ſmooth leaues nickt about the edges, and ſo for two or three couples of leaues of the next growth there are ſuch round leaues growing on a middle rib by couples,and one round one,alſo at the top;after as more leaues ſpring vp,ſo the faſhion of them alſo change,that is to ſay, euery leafe hath about eight or nine ſmal ſmooth green leaues, growing on each ſide of a middle rib one oppoſit againſt another,and one growing by it ſelf at the top,and are finely ſnipt or indented about the edges, and in forme reſembling thoſe of *Sium oderatum Tragi*,but not ſo big,long, or at all browniſh;amongſt which riſe vp many ſmall round ſtraked ſtalks or branches,about two foot long,now and then aboue twenty from one root,ſomtimes growing vpright, ſometimes creeping not farre from the ground, joynted or kneed,and diuiding them-

‡ *Selinum Sij folijs.*
Hone-wort.



Sison Amomum L. [illegible]
Sm. fl. 2. 61

ſelues into very many branches;at euerie joint groweth one leafe ſmaller than the former, which together with the lowermoſt periſh,ſo that ſeldom one green leaf is to be ſeen on this herb when the ſeed is ripe;the floures are white, and grow moſt commonly at the tops of the branches, ſomtimes at moſt of the joints euen from the earth, in vneuen or vnorderly vmbells, euery floure hauing fiue exceeding ſmall leaues,flat,and broad at the top,and in the middle very ſmall cheiues with purple tops,the whole flour not much exceeding the bigneſſe of a ſmall pins head, which being paſt there comes vp in the place of euery floure two ſmall gray crooked ſtraked ſeeds,like parſley ſeeds,but bigger,in taſt hot and aromaticall. The rot is ſmall and whitiſh, with many threds not ſo big as Parſley roots. It begins to floure about the beginning of Iuly, and ſo continueth flouring a long time; part of the ſeede is ripe in Auguſt, and ſome ſcarſe in the beginning of October,mean while ſome fals whereby it renues it ſelfe,and grows with flouriſhing greene leaues all the winter.

I took the deſcription of this herb the yere,1620.but obſerued it long afore,not knowing any name for it:firſt I referred it to *Sium*,calling it,*Sium terreſtre,*& *Sium ſegetum & agrorum*;afterwards vpon ſight of *Selinum peregrinum primum Cluſij*,which in ſome reſpects reſembleth this herbe,I named it *Selinum Sij folijs*;yet wanting an Engliſh name, at length about the yeare 1625. I ſaw Miſtris *Vrſula Leigh* (then ſeruant to Miſtris *Bilſon* of Mapledurham in Hampſhire, and now (5.*Martij* 1632.wife to Mr.*William Mooring* Schoolemaſter of Petersfield,a town neer the ſaid Mapledurham)gather it in the wheat erſhes about Mapledurham aforeſaid(where in ſuch like grounds it ſtill groweth, eſpecially in clay grounds) who told mee it was called Hone-wort, and that her Mother miſtris *Charitie Leigh* late of Brading in the Iſland of Wight deceaſed,taught her to vſe it after the manner here expreſſed, for a ſwelling which ſhe had in her left cheeke,which for many yeares would once a yeare at the leaſt ariſe there,and ſwell with great heate,redneſſe,and itching, vntill by the vſe of this herbe it was perfectly cured,and roſe no more nor ſwelled,being now(5.*Martij* 1632)about twenty yeres ſince,only the ſcar remaineth to this day.This ſwelling her mother called by the name of a Hone,but asking whether ſuch tumors were in the ſaid Iſle vſually called Hones ſhe could not tell, by reaſon ſhe was brought from Brading aforeſaid young,and not being aboue twelue yeares old when ſhe vſed this medicine.

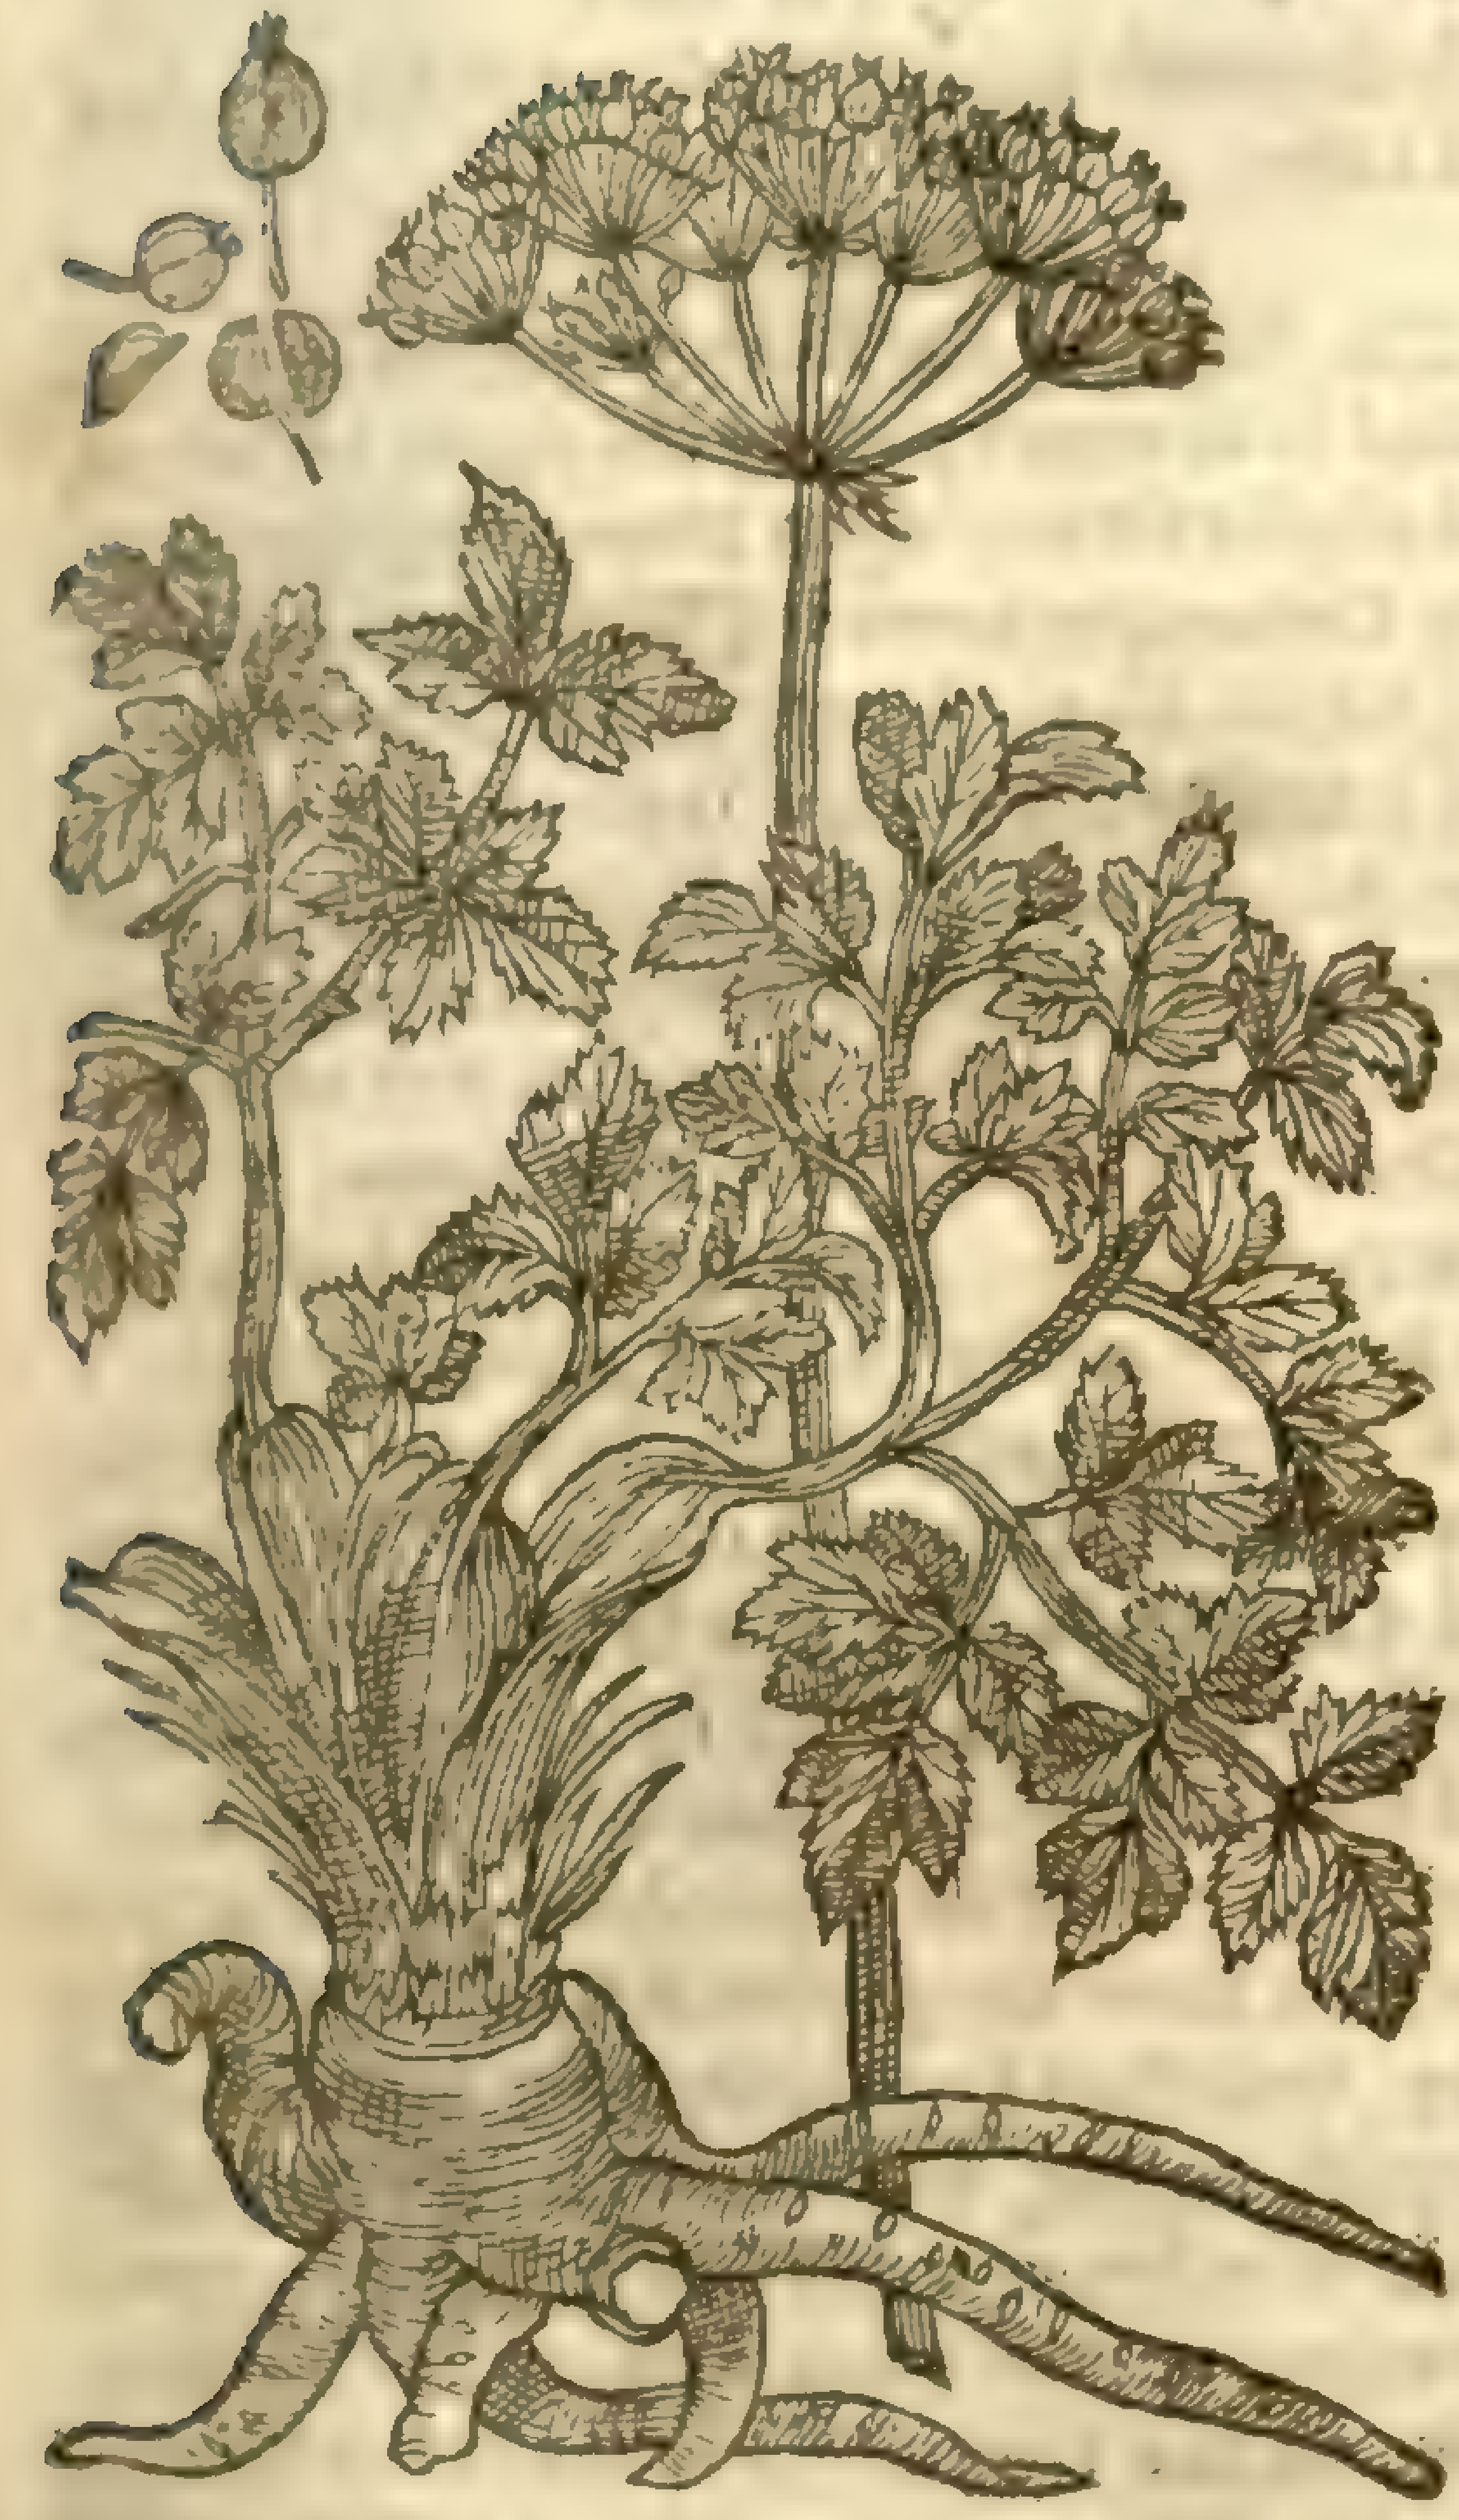
¶ *The Vertues.*

A Take one handfull of the greene leaues of this Hone-wort,and ſtamp them,put to it about halfe a pint or more of beer,ſtraine it,and drink it,and ſo continue to drink the like quantity euery morning faſting , till the ſwelling doth abate,which with or in her was performed in the ſpace of two weeks at the moſt.Auguſt,18.1620. *Iohn Goodyer.* ‡

Chap. 401. *Of Alexander.*

¶ *The Deſcription.*

THe leaues of Alexander are cut into many parcels like thoſe of Smallage, but they be much greater and broader,ſmooth alſo, and of a deep greene colour : the ſtalke is thick,oftentimes a cubit high:the floures be white,and grow vpon ſpokie tufts:the ſeed is thicke, long, blacke, ſomthing bitter,and of an aromaticall or ſpicy ſmell:the root is thicke, blacke without,and white within,and like to a little Radiſh, and is good to be eaten, out of which being broken or cut, there iſſues forth a juice that quickly waxeth thick, hauing in it a ſharp bitterneſſe,like in taſt to Myrrh: which thing alſo *Theophraſtus* hath noted,there iſſueth out of it,ſaith he,a juice like Myrrhe.



† *Hipposelinum.*
Alexanders.

¶ *The Place.*

Alexanders or great Parſley groweth in moſt places of England.

¶ *The Time.*

The ſeed waxeth ripe the ſecond yeare,in the Moneth of Auguſt.

¶ *The Names.*

It is called in Greeke, of the greatneſſe wherein it excelleth the other Parſleyes ἱπποσέλινον or Horſe Parſley; of *Gaza, Equapium*: it is alſo named *Olus atrum*, or the blacke potherbe; and of diuers *Syluestre Apium*, or wild Parſley; of *Galen* and certain others, σμύρνιον, by reaſon of the juice that iſſueth forth therof, that is, as wee haue ſaid, like vnto Myrrhe, which is called in Greeke σμύρνιον: there is alſo another *Smyrnium* of mount Aman, of which we do write in the 404.chapter:the Apothecaries cal it *Petroſelinum Macedonicum*:others *Petroſelinum Alexandrinum*: the Germaines, **Groſz Epſſich**; the Low-country-men, **Peterſelie van Macedonion**: in Spaniſh, *Perexil Macedonico*: the French, and Engliſhmen, Alexandre, Alexanders.

¶ *The Temperature.*

The ſeede and root of Alexanders, are no leſſe hot & dry than are thoſe of the garden Parſley, they clenſe and make thinne,being hot and dry in the third degree.

¶ *The Vertues.*

Dioſcorides ſaith,that the leaues and ſtalks are boiled and eaten, and dreſſed alone by themſelues or with fiſhes: that they are preſerued raw in pickle:that the root eaten both raw and ſod,is good for the ſtomack:the root hereof is alſo in our age ſerued to the table raw for a ſallad herbe. A

The ſeeds bring down the floures,expel the ſecondine,break and conſume wind,prouoke vrine, and are good againſt the ſtrangury:the decoction alſo of the root doth the ſame,eſpecially if it be made with wine. B

‡ The figure formerly here was of *Sphondilium*,and that belonging to this place was put in the foregoing chapter.

Chap. 402.

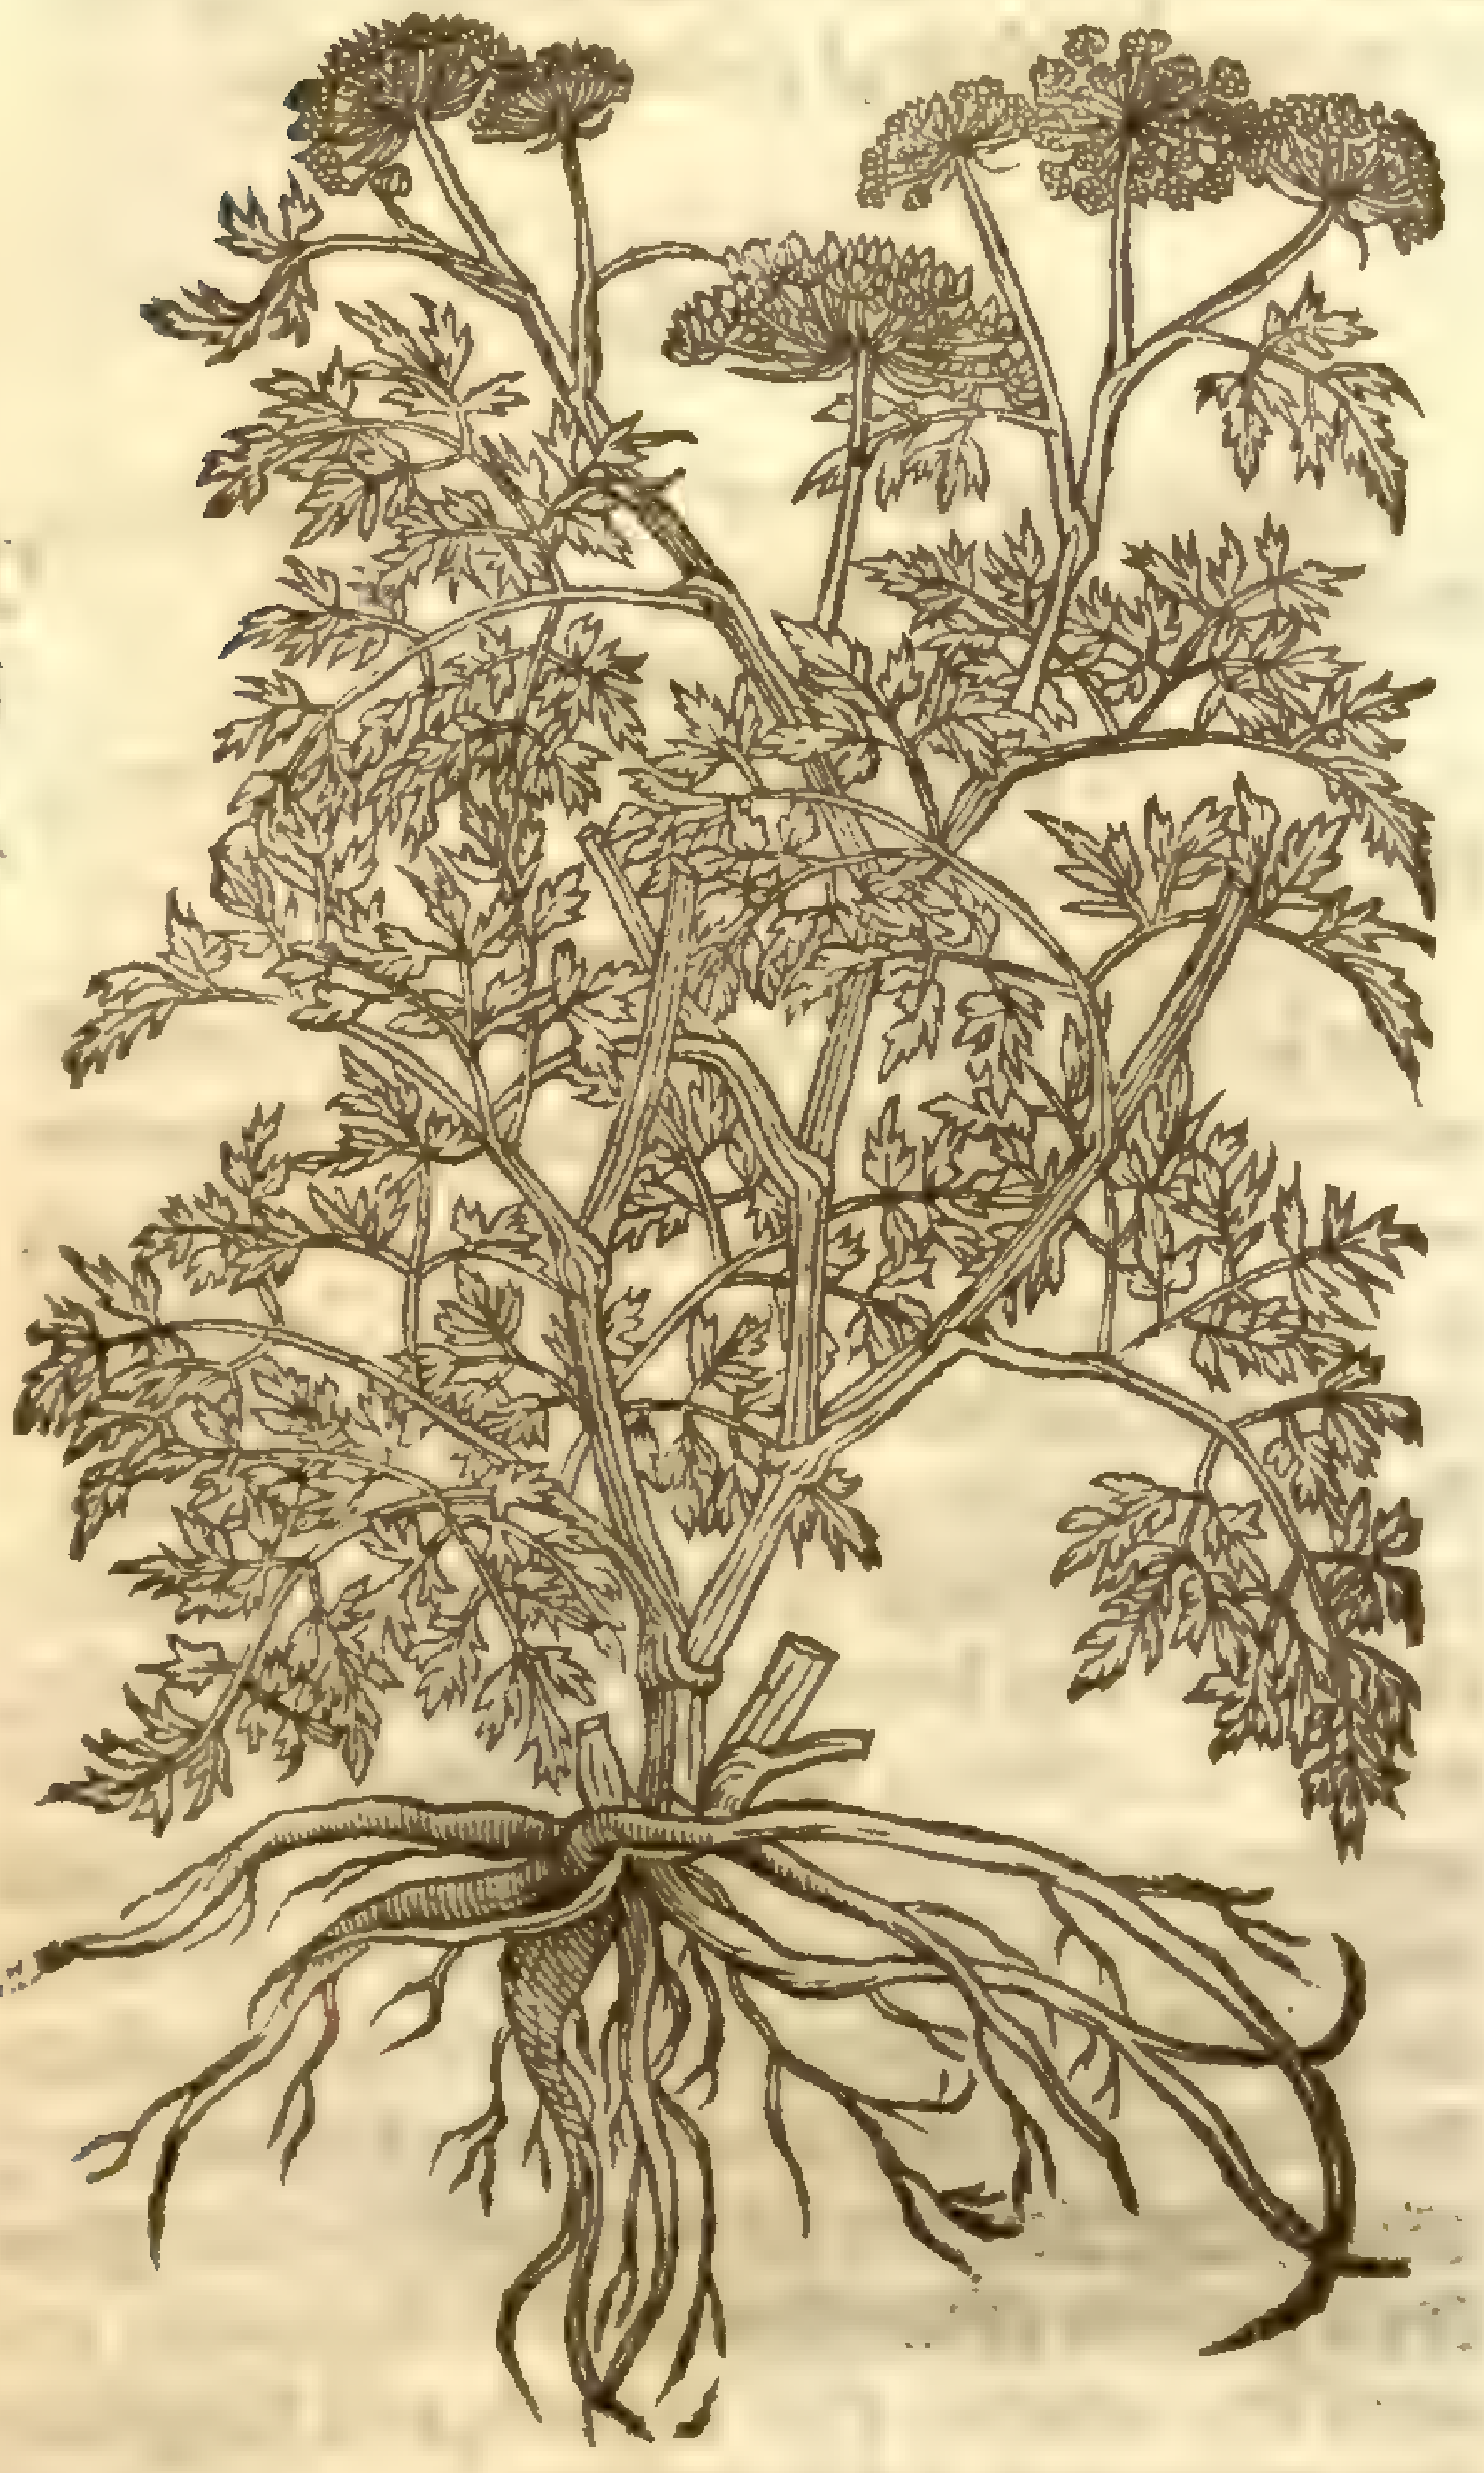
Of wilde Parſley.

¶ *The Deſcription.*

This is like to the kindes of Parſleyes in the ſundry cuts of the leaues, and alſo in the bignes; for they be broad,and cut into diuers parcels:the ſtalks are round, chamfred ſet with certain joints,hollow within,a cubit high or higher,two or three comming forth together out of one root,and in the nether part many times of a darke reddiſh colour. The floures be white and grow vpon ſpokie tufts:the ſeed is round,flat,like that of Dill:the root is white within,and diuided into many branches and ſtrings.This plant in what part ſoeuer it be cut or broken,yeelds forth a milky juice.

¶ The

† *Apium ſylueſtre ſiue Thiſſelium.*
Wilde Parſley.



Selinum palustre,

¶ *The Place.*

It is found by ponds ſides in moiſt and dankiſh places, in ditches alſo, hauing in them ſtanding waters, and oftentimes by old ſtocks of Alder trees.

‡ I haue not as yet obſerued this plant growing wilde with vs. ‡

¶ *The Time.*

It floureth and bringeth forth ſeed in Iune and Iuly.

¶ *The Names.*

The ſhops of the Low countries haue miſcalled it in times paſt by the name of *Meum*, and vſed it for the right Mew, or Spiknelwort. The Germains name it **Olſenich:** *Valerius Cordus, Olſenichium*: diuers in the Low countries call it **wilde Eppe:** that is to ſay, in Latine, *Apium ſylueſtre*, or wild Parſley: and ſome, **water Eppe**: that is, *Hydroſelinon*, or *Apium aquatile*, water Parſley: and oftentimes it is named, as we haue already written, *Eleoſelinum*, & *Sium*. It may be more rightly termed in Latine, *Apium ſylueſtre*, and in Engliſh, wilde Parſley.

Dioſcorides hath made mention of wild Parſley in the chapter of *Daucus* or wilde Carrot: and *Theophraſtus, lib.* 7. where hee maketh the Parſleyes to differ both in leaues and ſtalkes, and ſhews that ſome haue white ſtalks, others, purple, or elſe of ſundry colours, and that there is alſo a certaine wilde Parſley; for he ſaith that thoſe which haue the purple ſtalks, and the ſtalks of diuers colours, come neereſt of all to the wilde Parſley. And therefore ſeeing that *Olſenichium* or wilde Parſley, hath the lower part of the ſtalke of a purpliſh colour, and like in leaues to Parſley, which in times paſt we thought good rather to call *Apium ſylueſtre*, or wild Parſly, than to erre with the Apothecaries, and to take it for Mew. And after when we now know that it was held to bee *Thyſſelium Pliny*, and that wee could alleadge nothing to the contrary, wee alſo ſettled our ſelues to be of their opinion; and the rather, becauſe the faculties are agreeable. *Thyſſelium*, ſaith *Plin. lib.* 25. *cap.* 11. is not vnlike to Parſley: the root hereof purgeth flegme out of the head; which thing alſo the root of *Olſenichium* doth effectually performe, as we will forthwith declare: the name alſo is agreeable, for it ſeemeth to be called θυσσέλινον, becauſe it extendeth it ſelfe, in Greek, θύειν, thorow ἑλείων, or mariſh places.

¶ *The Temperature.*

The root hereof is hot and dry in the third degree.

¶ *The Vertues.*

A The root being chewed, bringeth by the mouth flegme out of the head, and is a remedy for the tooth-ach, and there is no doubt but that it alſo makes thin, cutteth and openeth, prouoketh vrine, and bringeth downe the floures, and doth likewiſe no leſſe but more effectually performe thoſe things that the reſt of the Parſleyes do.

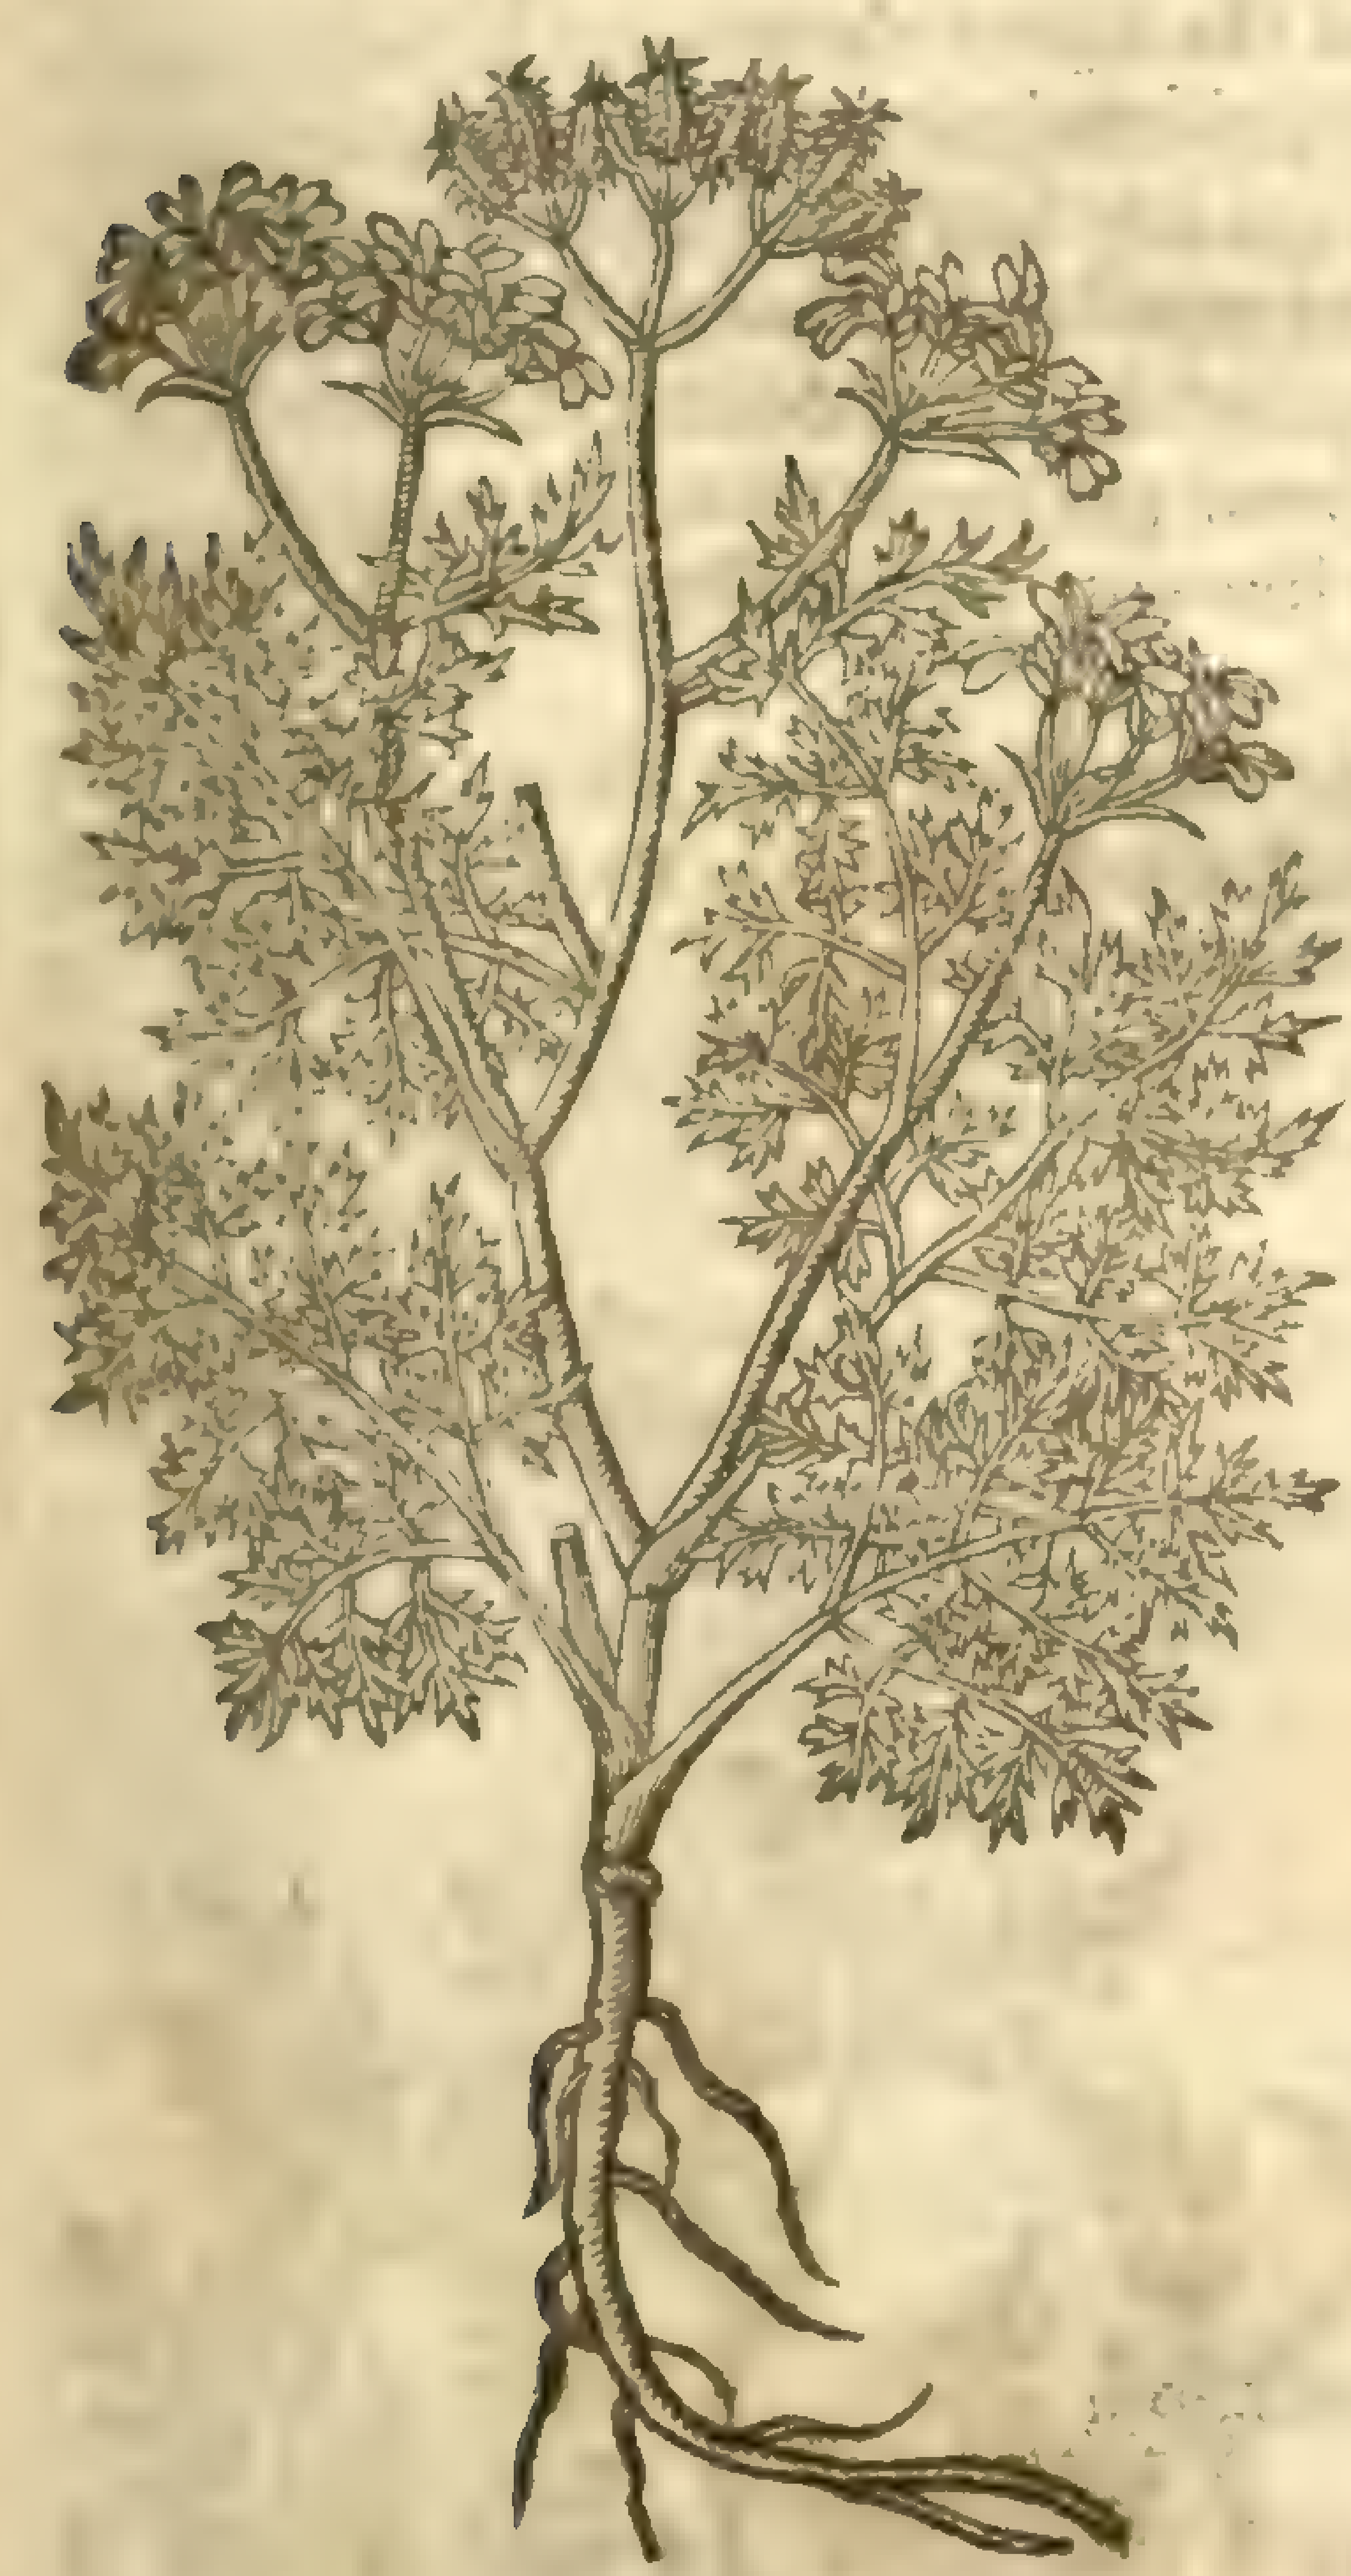
† The figure formerly put in this place was of the *Cerefolium ſylueſtre* of *Tabernamontanus*, whoſe hiſtory I intend hereafter to giue you.

CHAP. 403. *Of baſtard Parſley.*

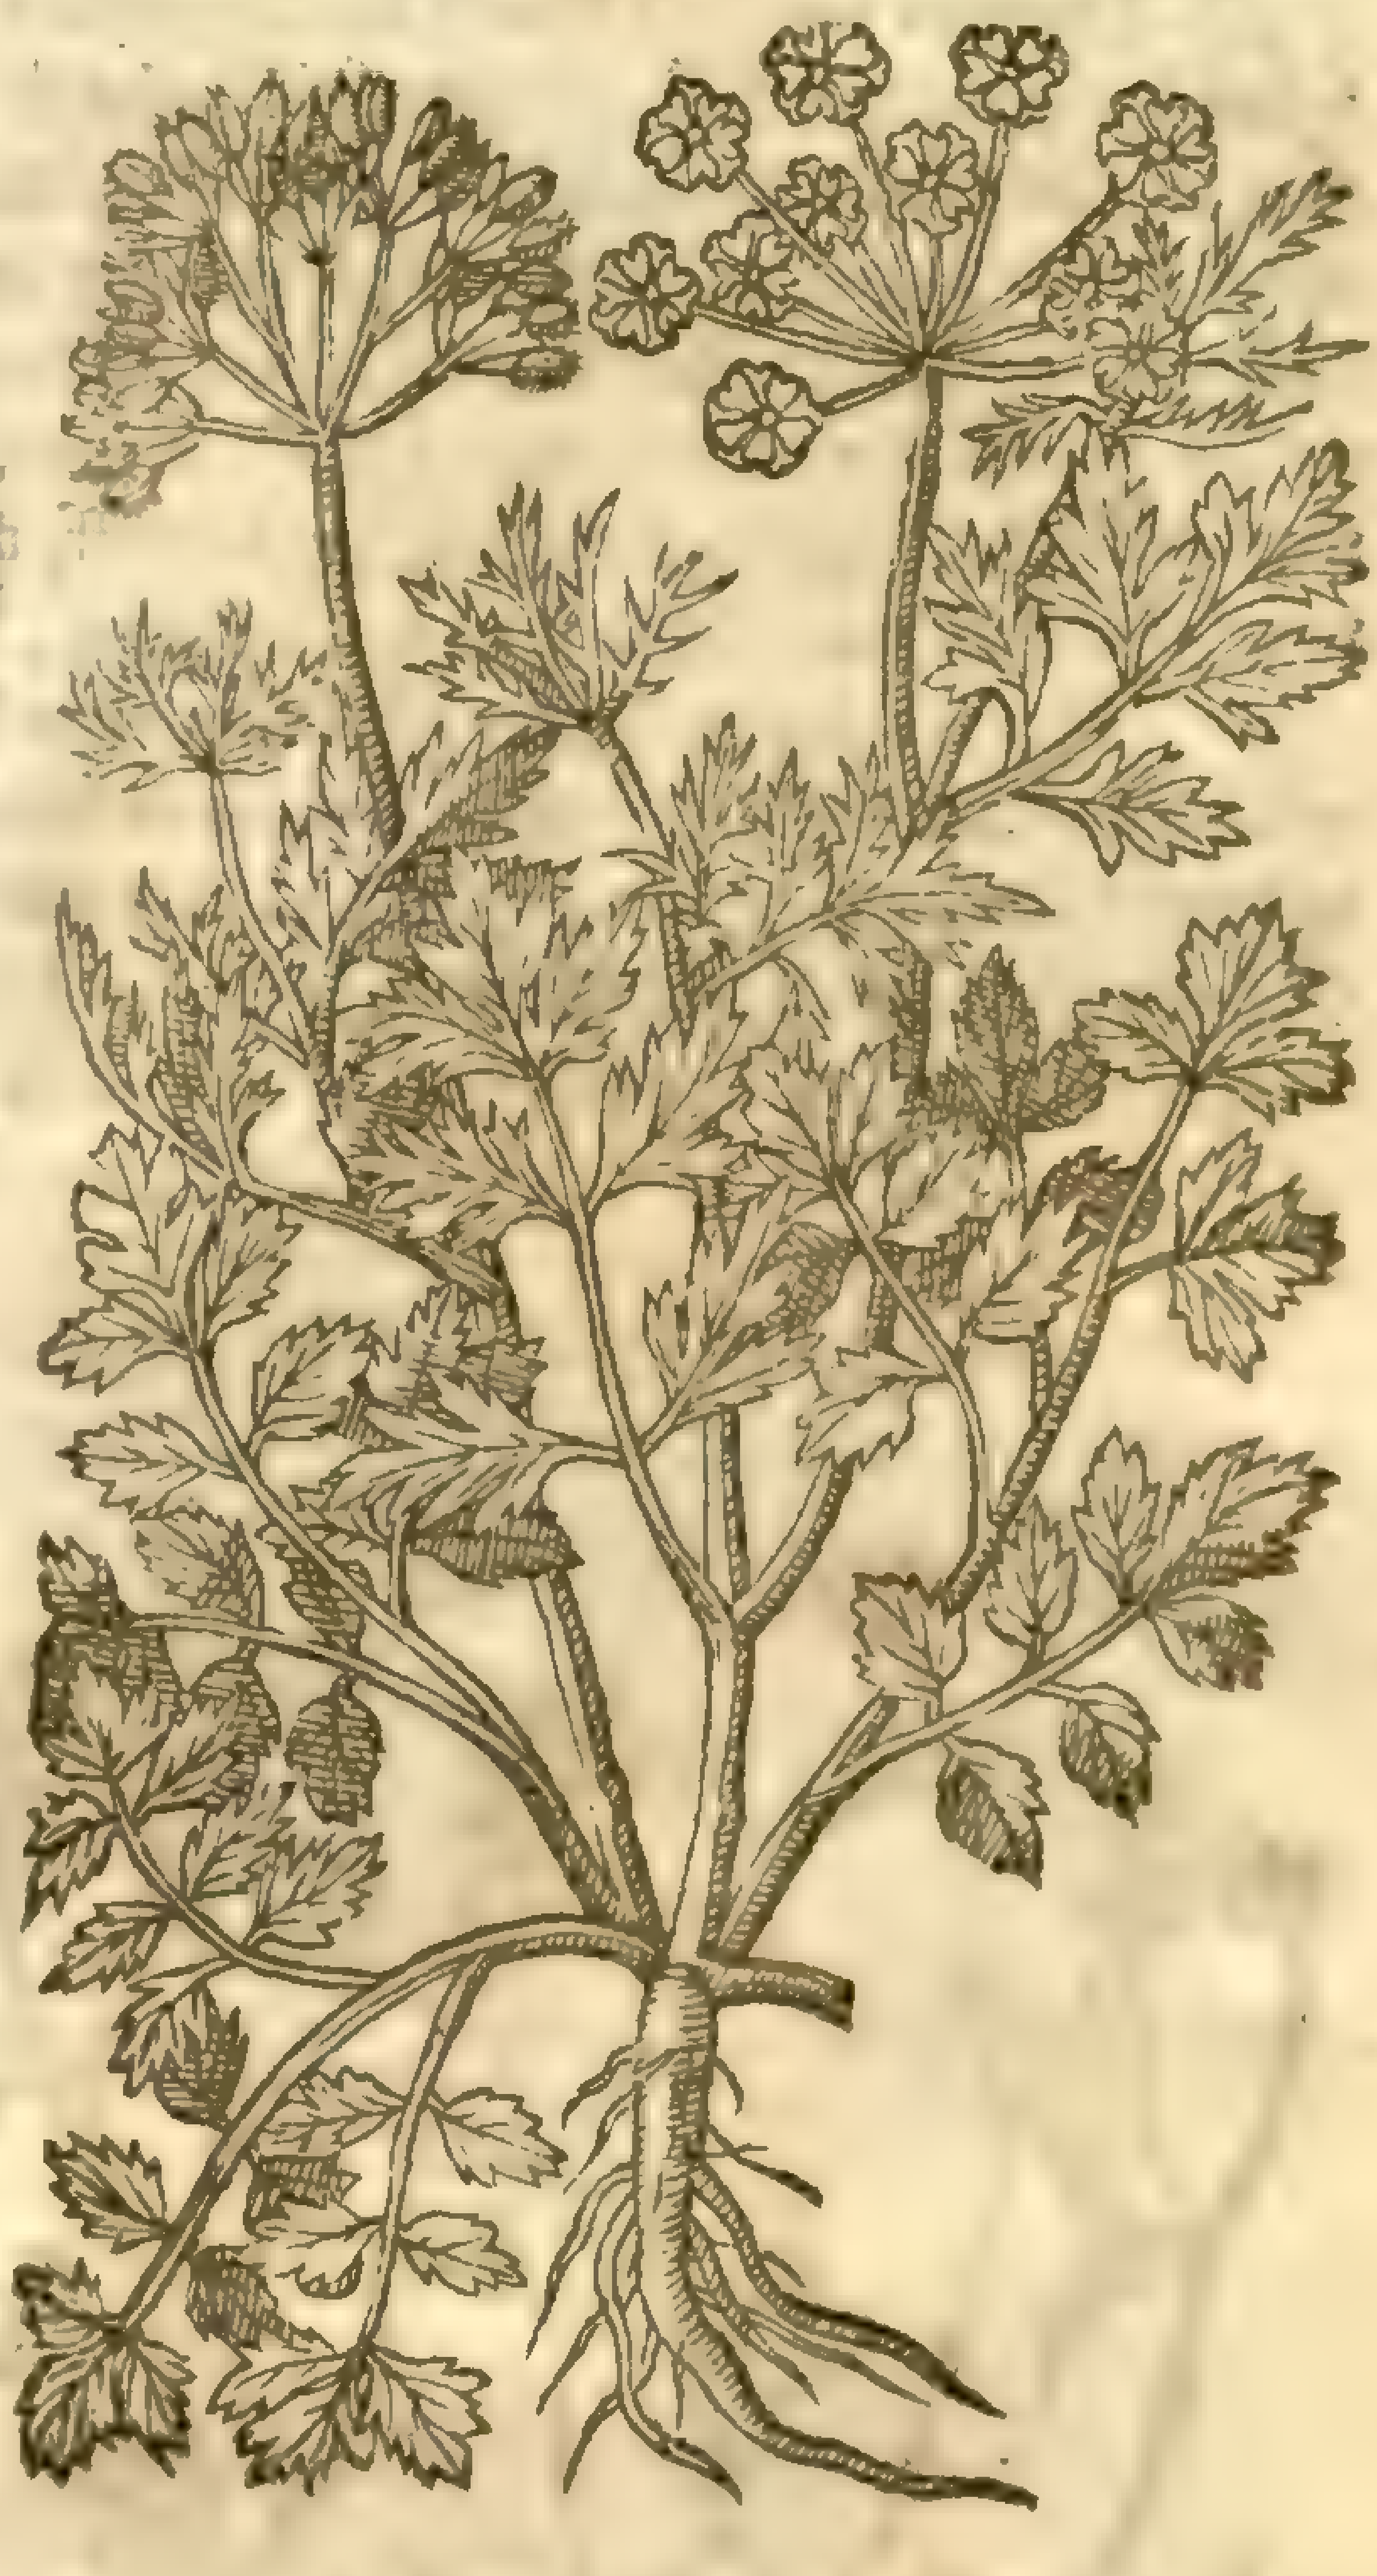
¶ *The Description.*

1 THe firſt kind of baſtard Parſley is a rough hairy herb, not much vnlike to Carrots: the leaues are like to thoſe of Corianders, but parted into many ſmall jags: at the top of the branches grow ſhadowie vmbels, or ſpokie rundles conſiſting of many ſmall white floures:

1 *Caucalis albis floribus.*
Baſtard Parſley with white floures.

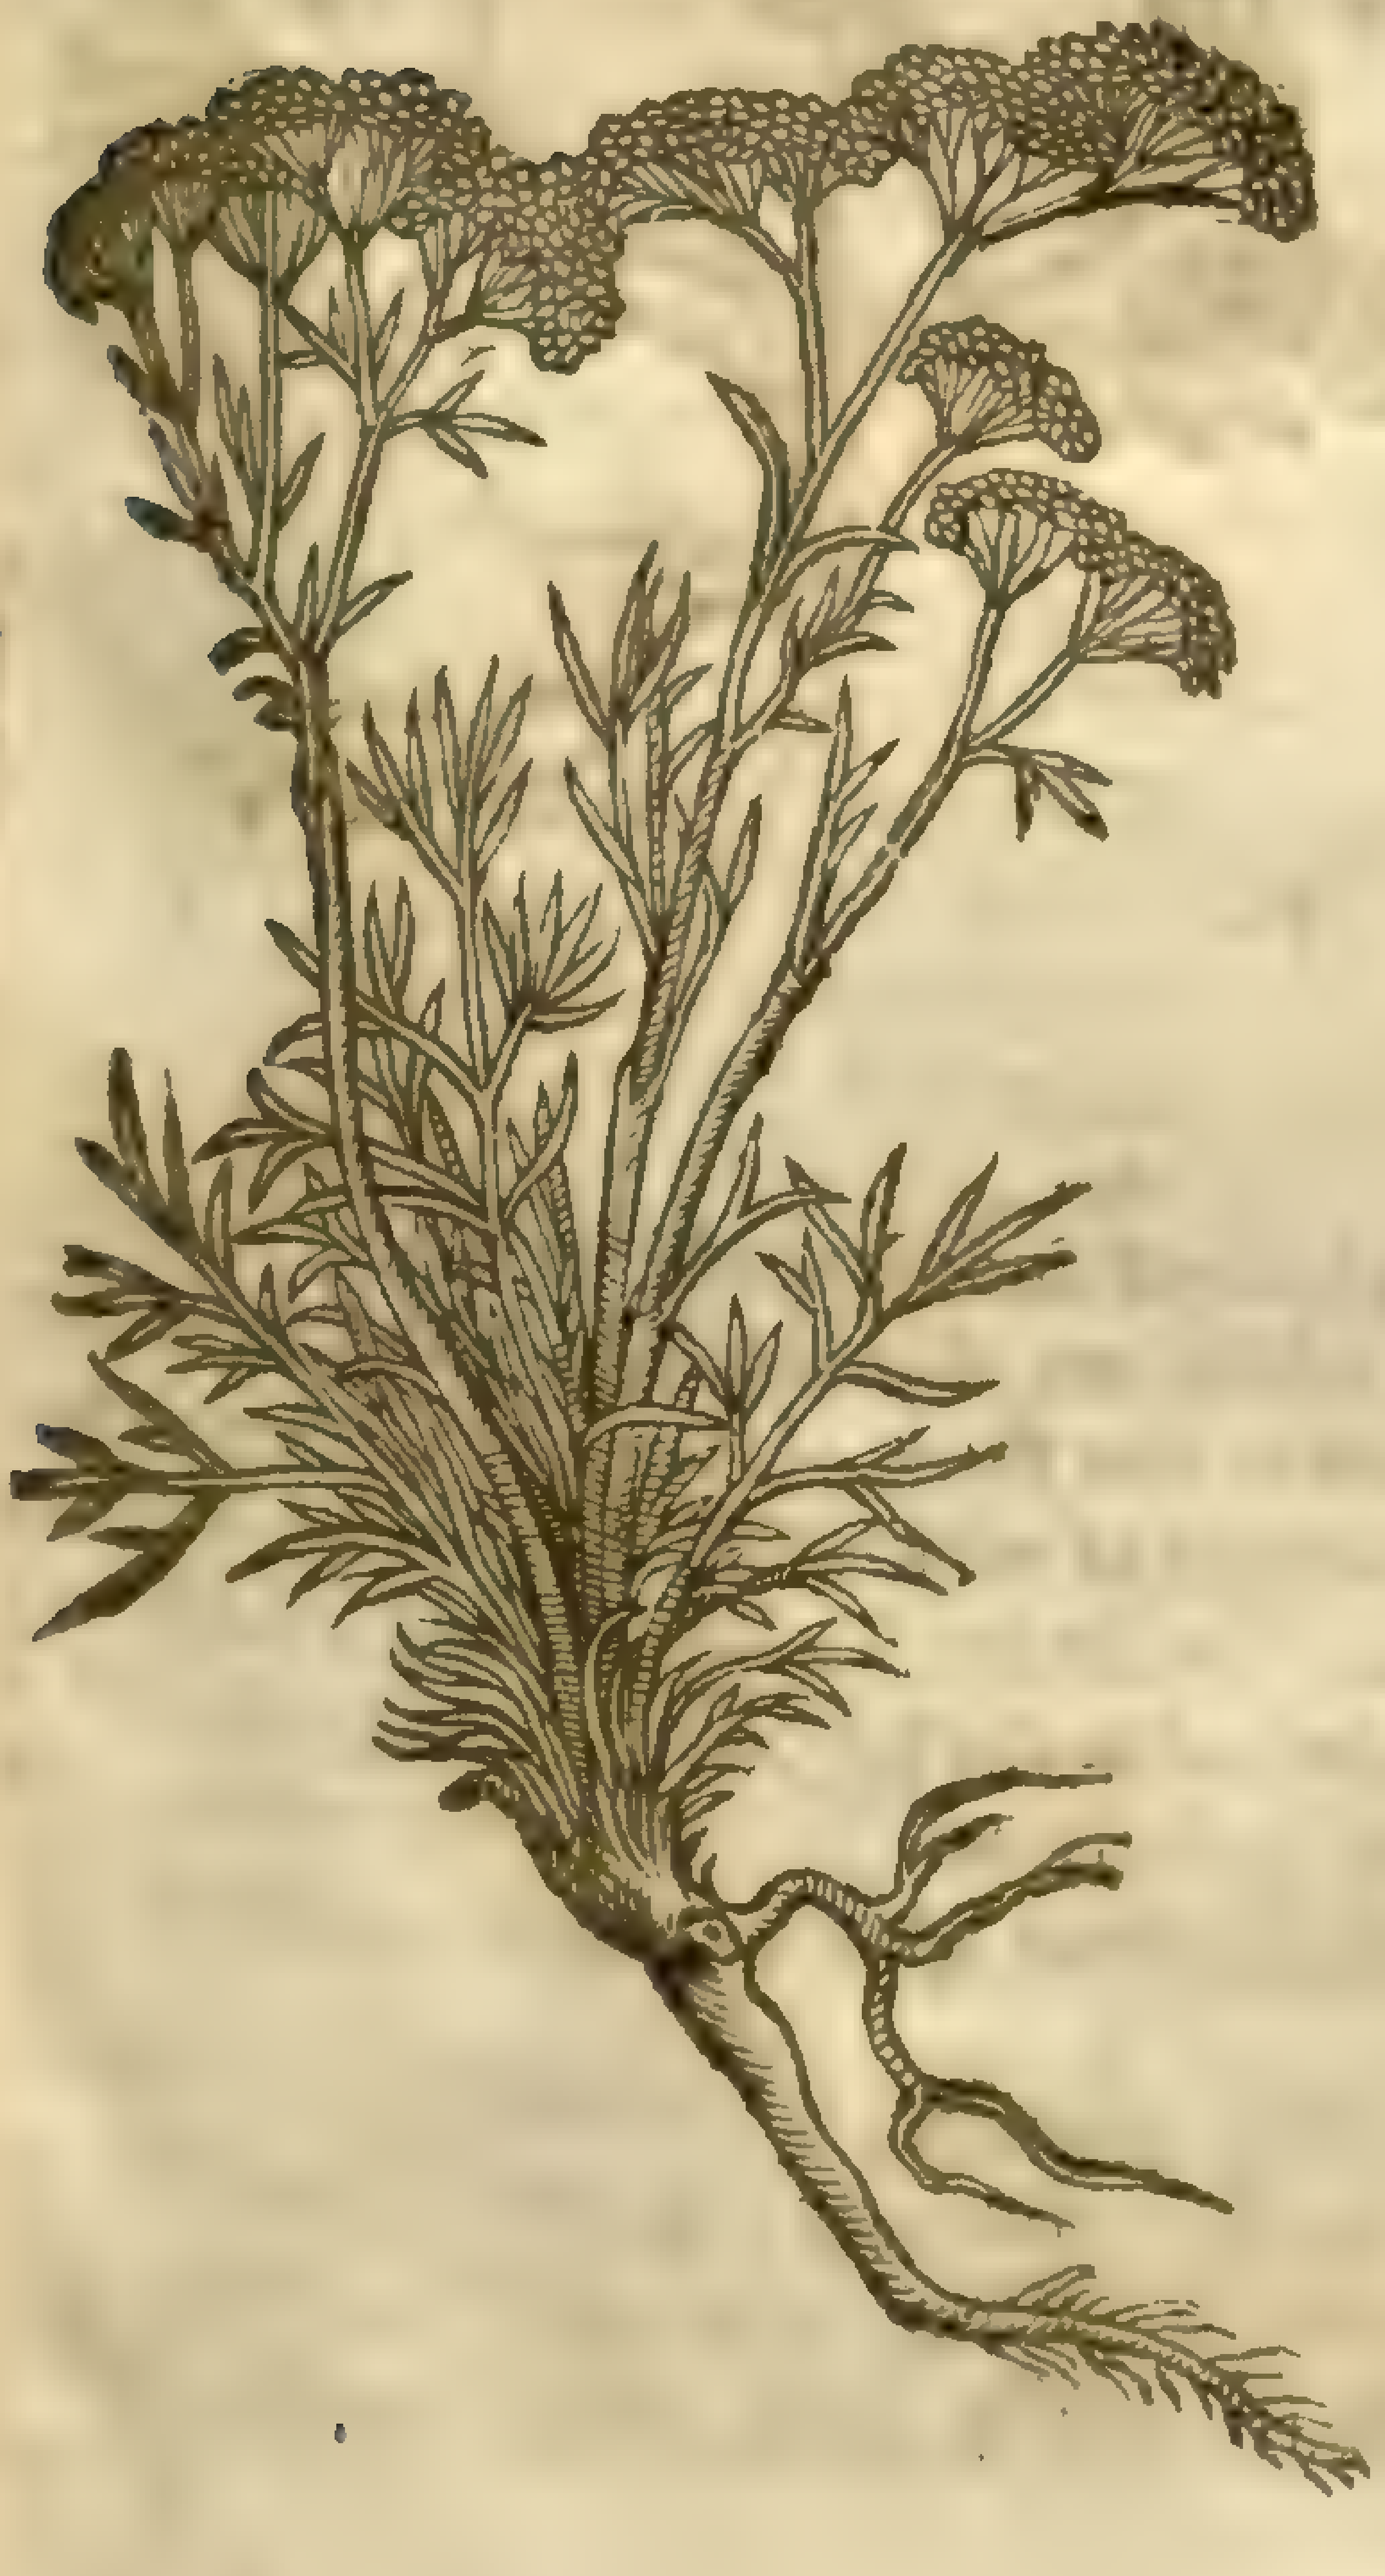


‡ 2 *Caucalis Apij folijs flore rubro.*
Baſtard Parſley with red floures.

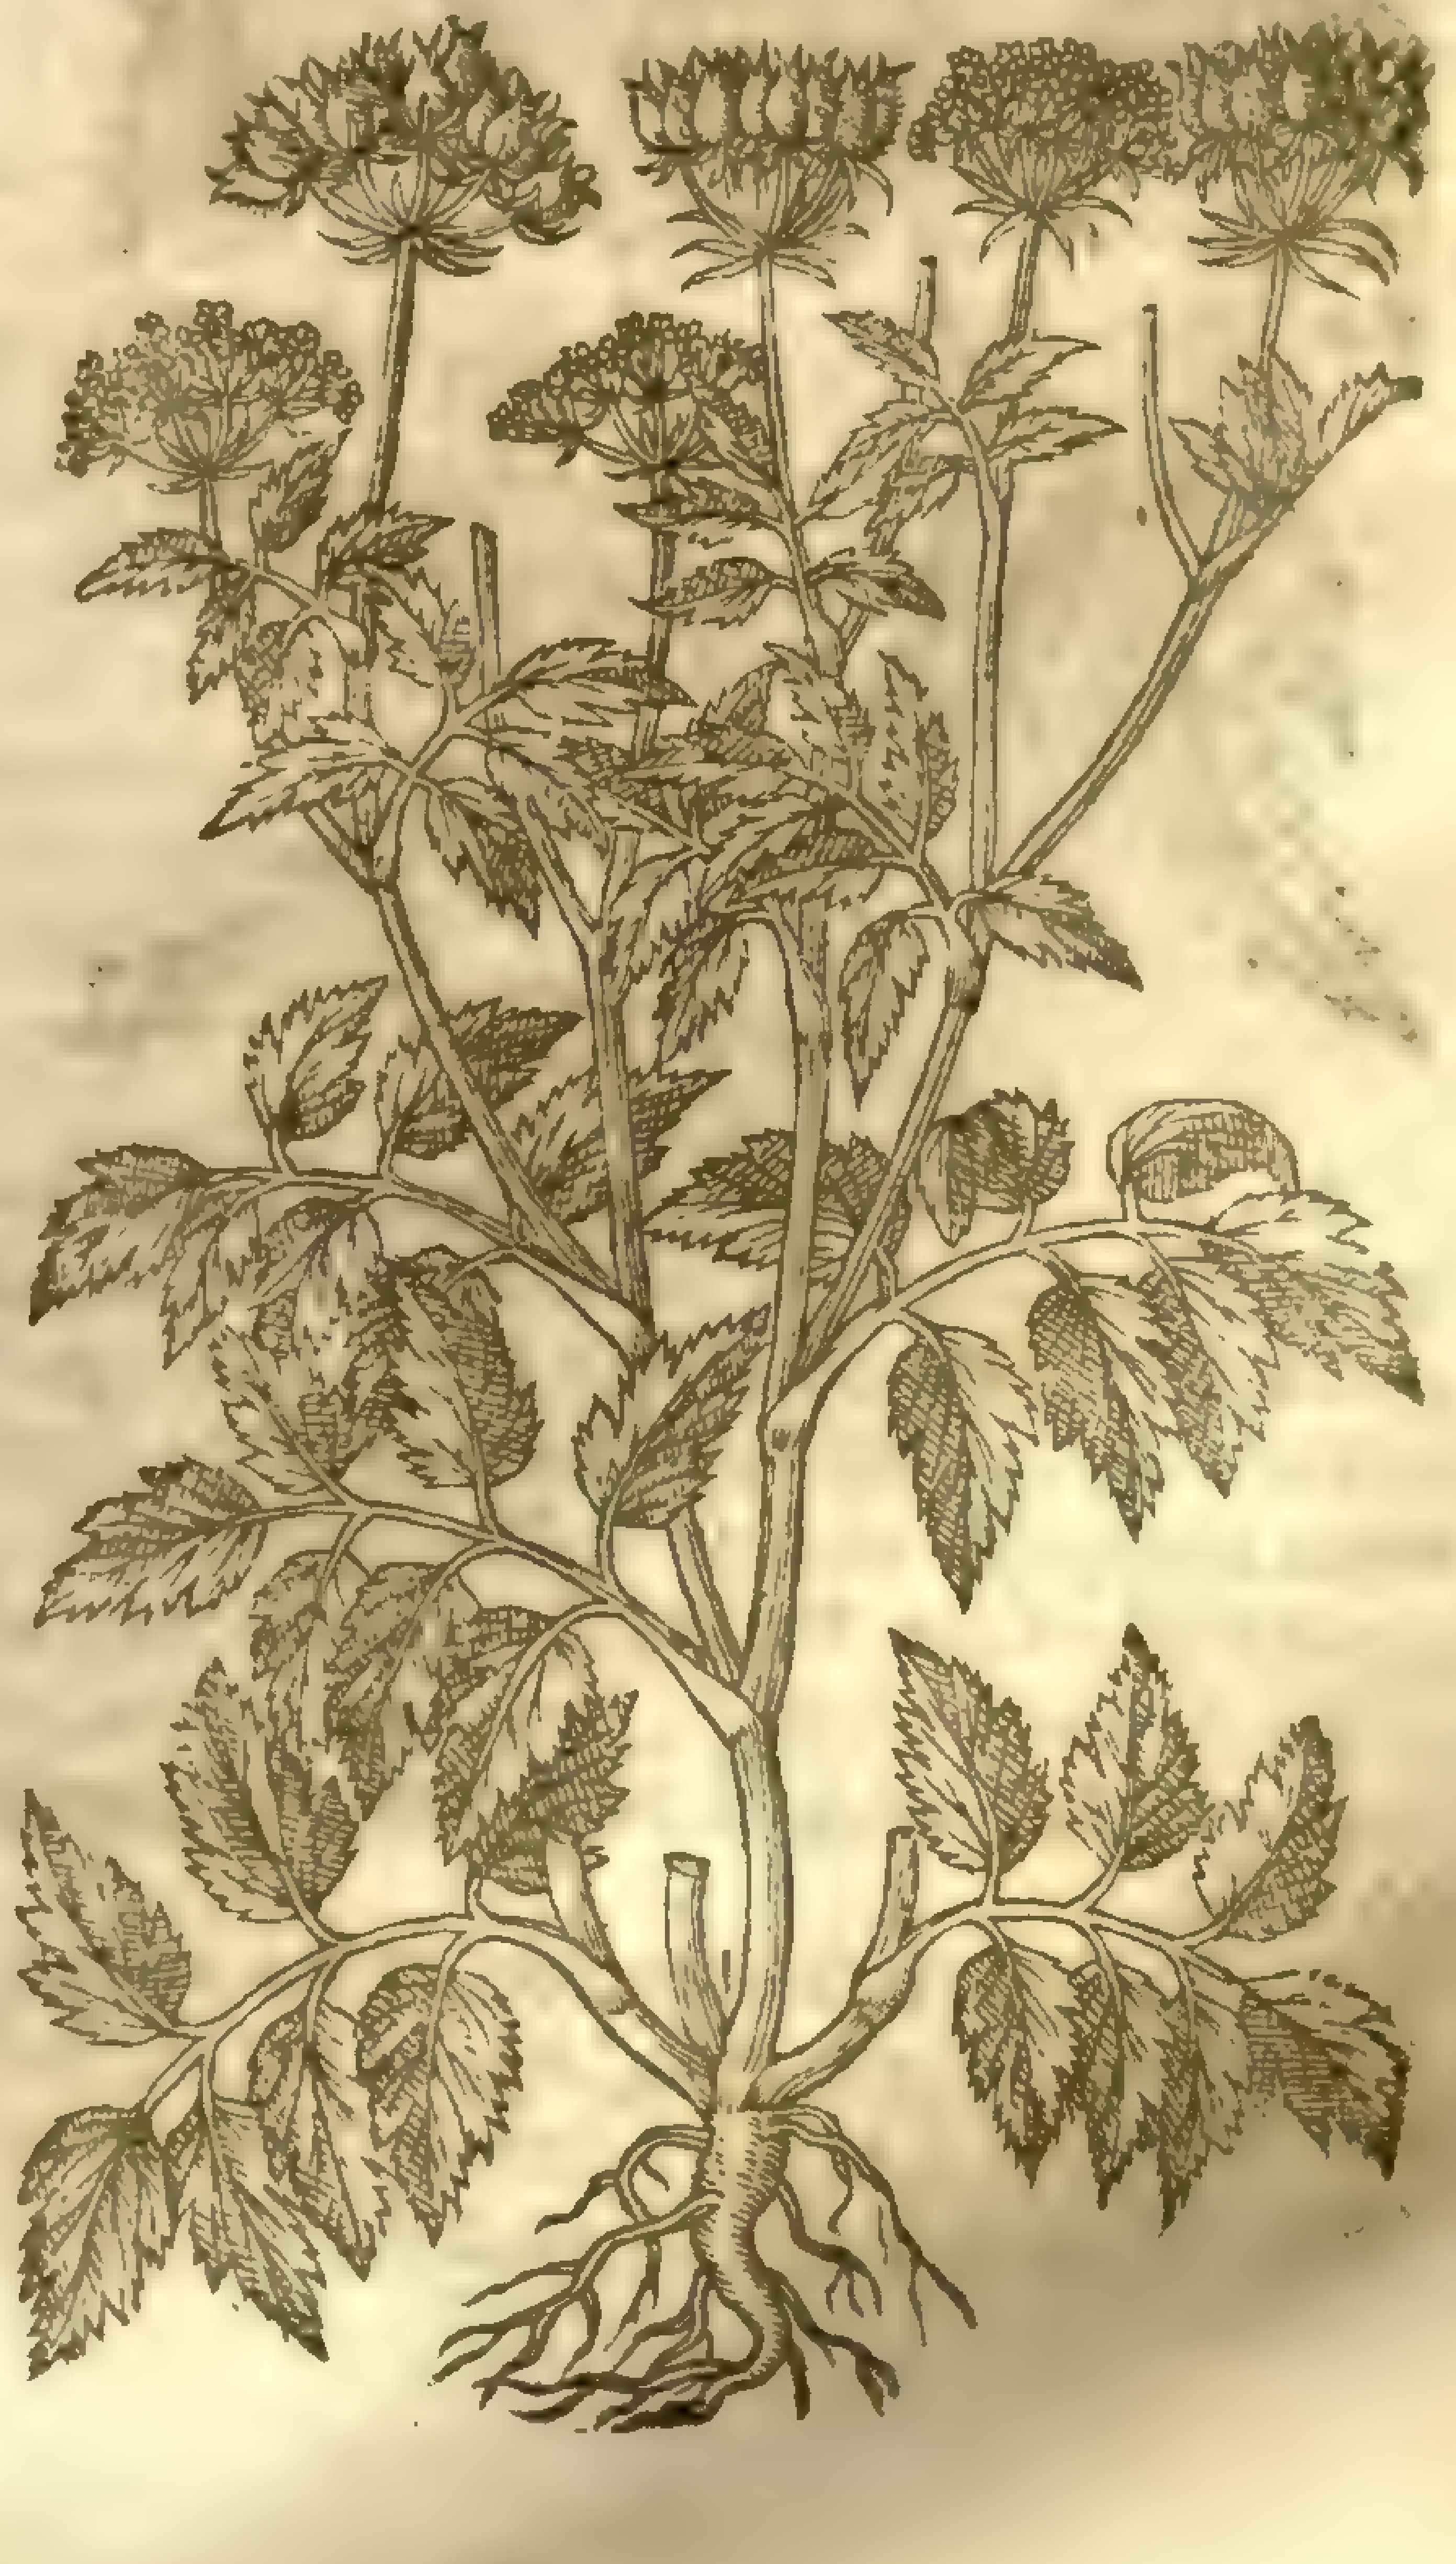


C. latifolia [illegible]

† 3 *Caucalis Peucedani folio.*
Hogs Parſley.



‡ 4 *Caucalis major Cluſ.*
Great rough Parſley.



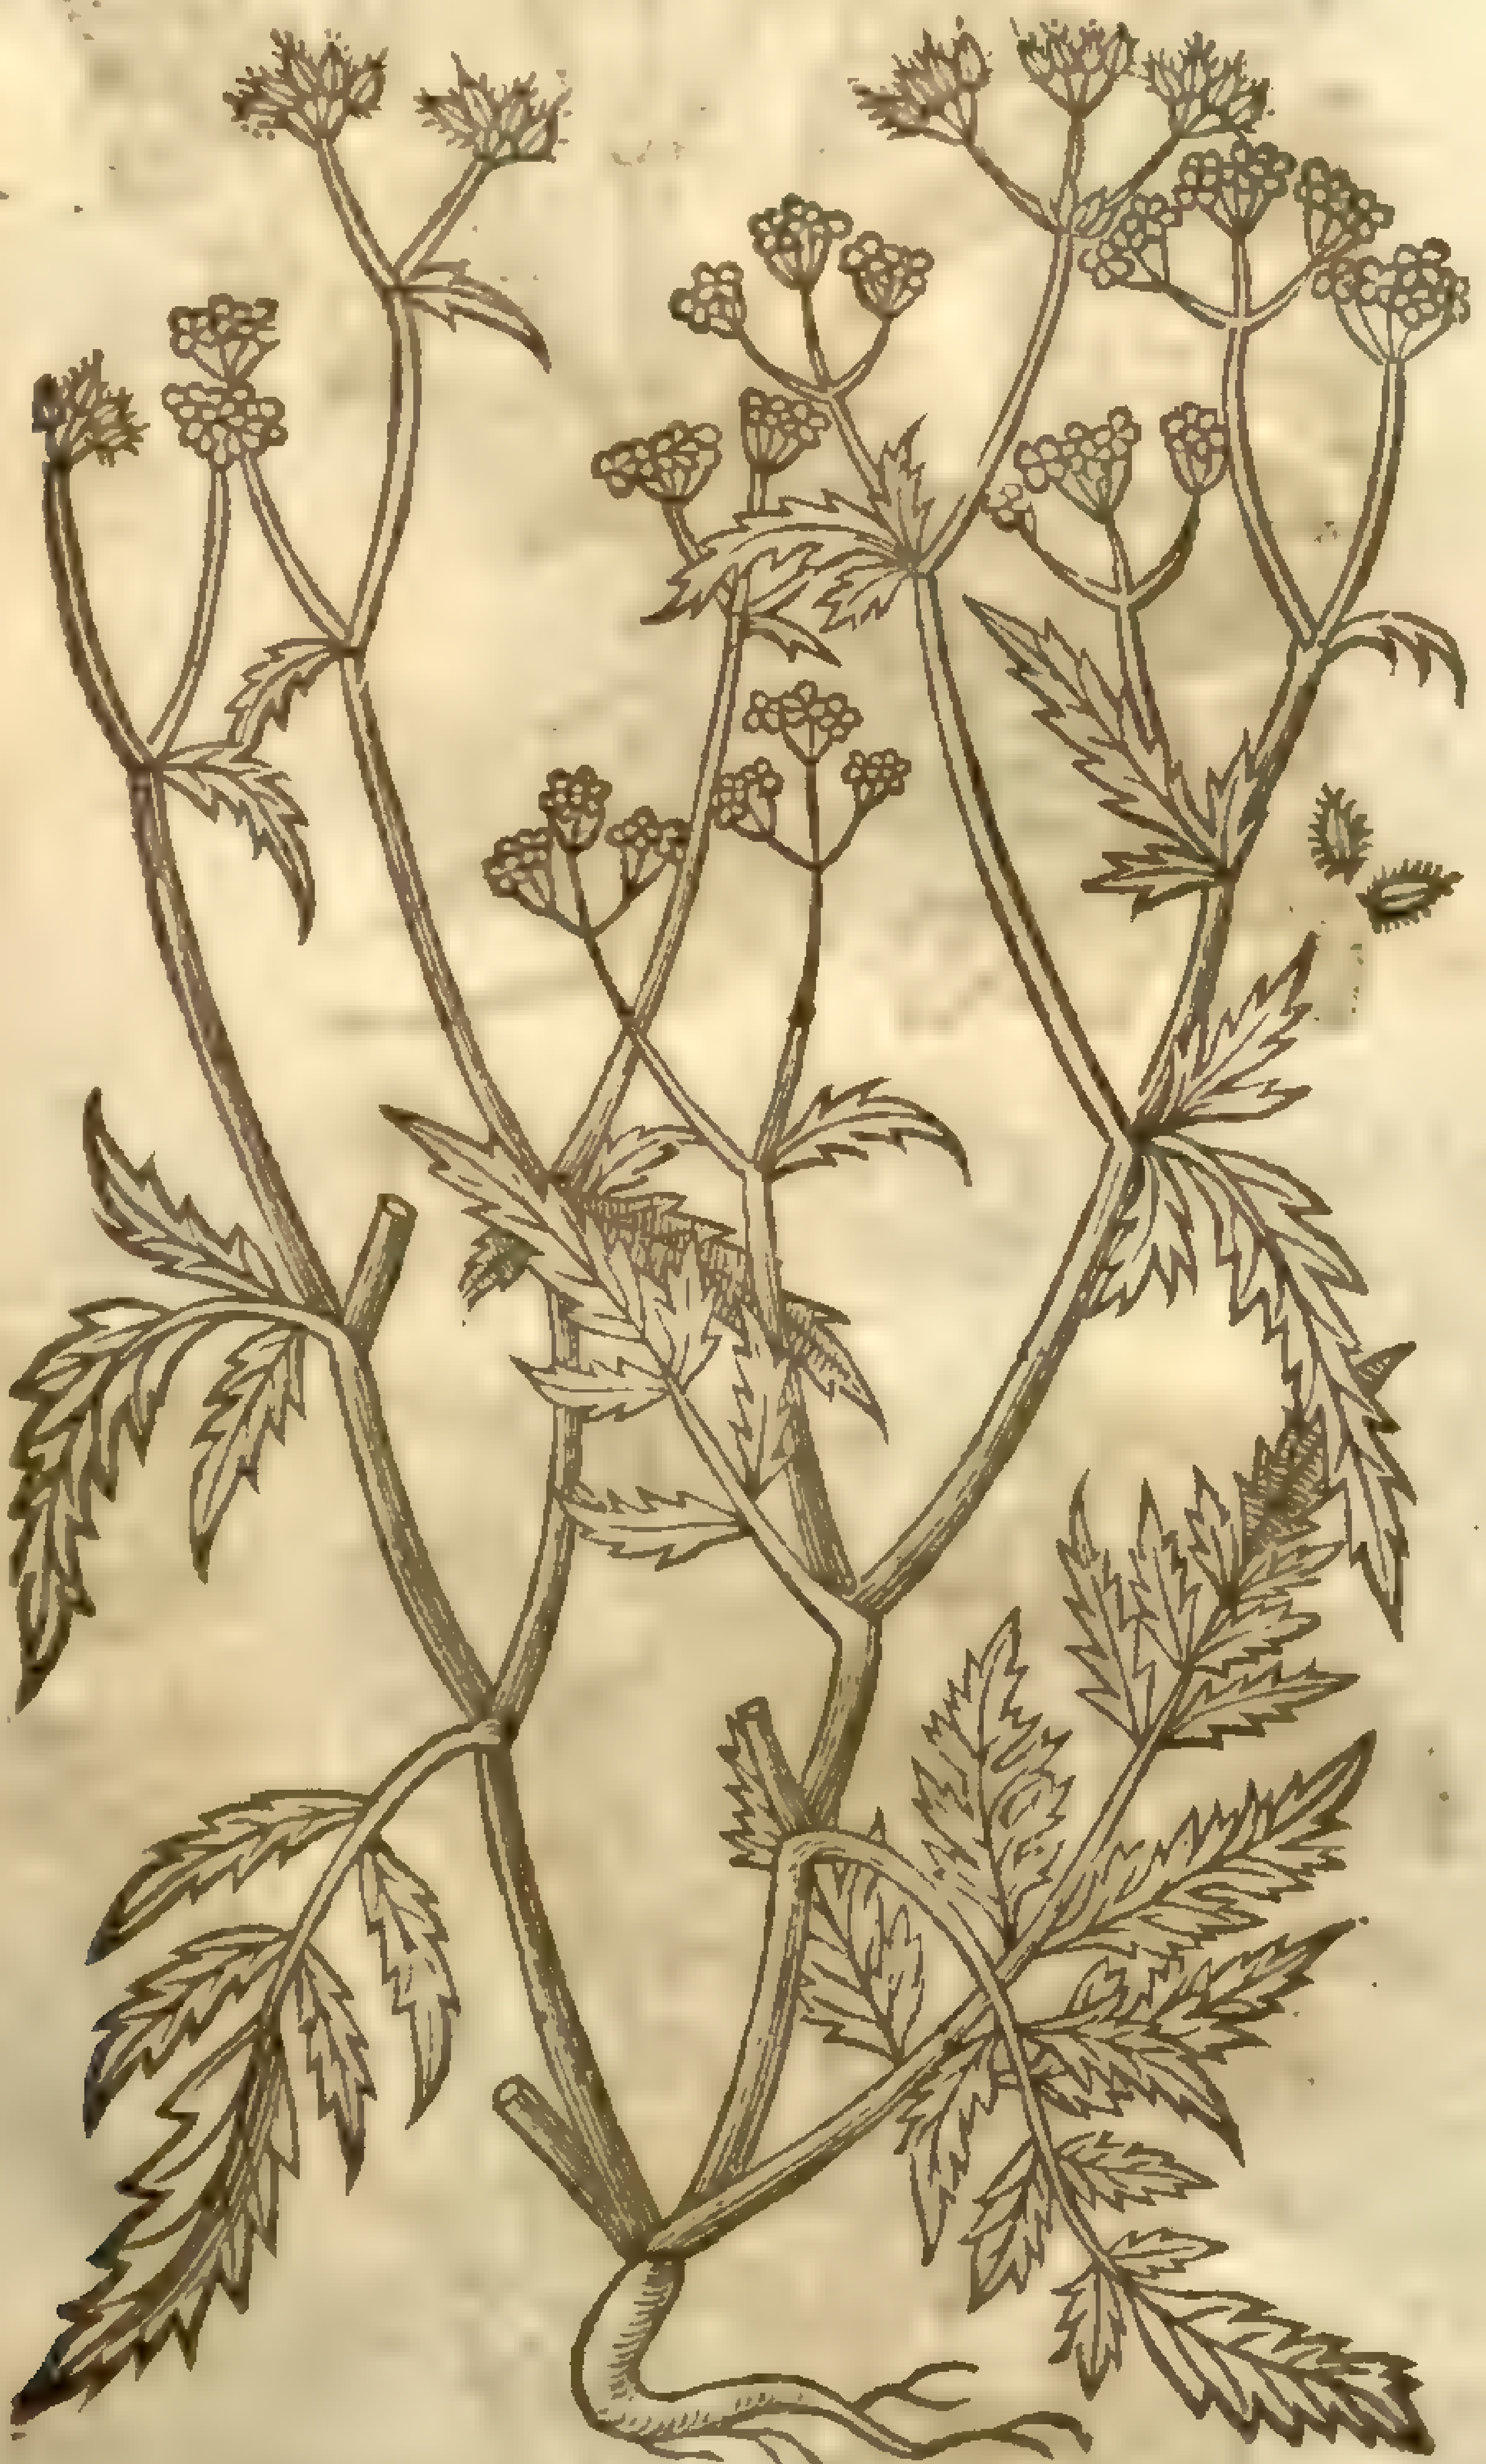
floures: the ſeed is long and rough, like the ſeed of Carrots, but greater: the root is ſtraight and ſingle, growing deepe into the ground, of a white colour, and in taſte like the Parſnep.

2 There is another ſort like vnto the former, ſauing that the leaues thereof are broader, and the floures are of a reddiſh colour: there hath great controuerſie riſen about the true determination of *Caucalis*, becauſe the Latine interpretation of *Dioſcorides* is greatly ſuſpected, containing in it ſelfe much ſuperfluous matter, not pertinent to the hiſtory: but wee deeme that this plant is the true *Caucalis*, the notes ſet downe declare it ſo to be: the floures, ſaith he, are reddiſh: the ſeeds couered with a rough huske ſet about with prickles, which cleaue vnto garments that it toucheth, as doe Burs; which roughneſſe being pilled off, the ſeed appeares like vnto hulled Otes, not vnpleaſant in taſte, all which do ſhew it to be the ſame.

3 There is likewiſe another ſort that hath a long ſingle root, thrummed about the vpper end with many thrummie threds of a browne colour: from which riſeth vp diuers ſtalkes full of joynts or knees, couered with a ſheath or skinnie filme, like vnto that of *Meum*: the leaues are finely cut or jagged, reſembling the leaues of our Engliſh Saxifrage: the floures grow at the top of the ſtalks in ſpokie rundles like Fennell: the ſeed is ſmall like that of Parſley.

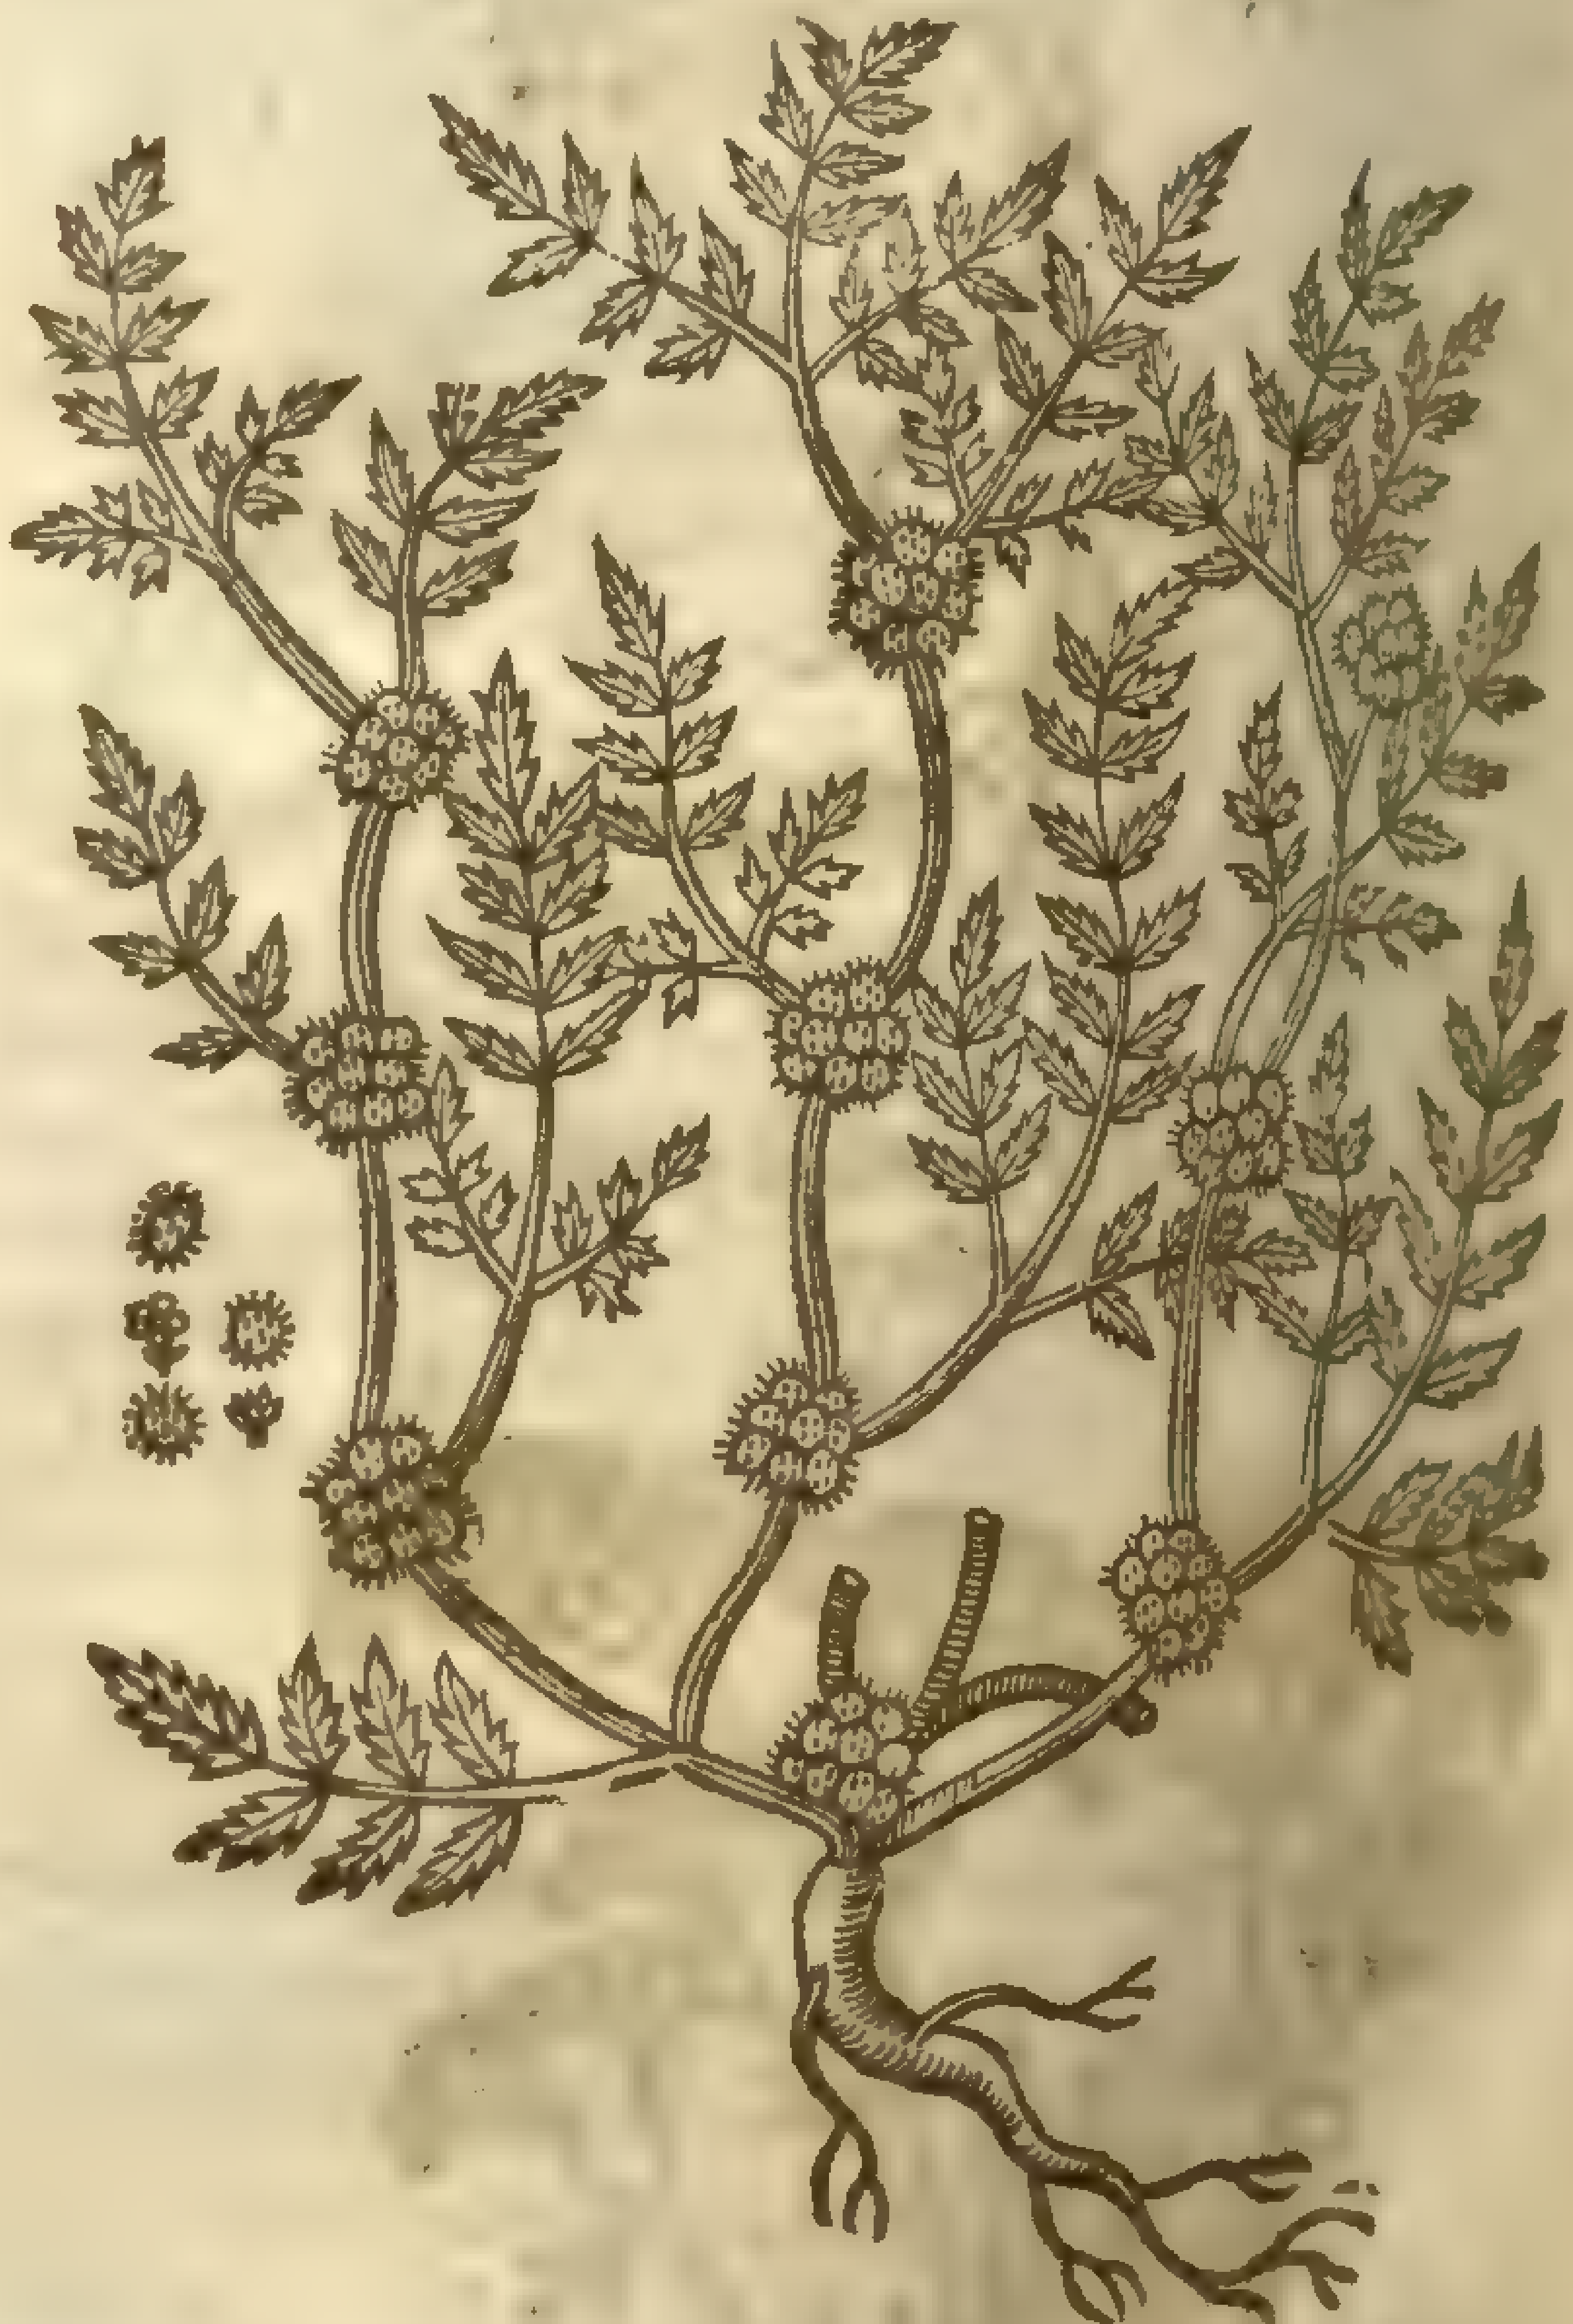
‡ 5 *Caucalis minor floſculis rubentibus.*
Hedge Parſley.

Caucalis Anthriscus, Huds. mic. dict', Sm. p. 243



‡ 6 *Caucalis nodoſa echinato ſemine.*
Knotted Parſley.

C. nodosa, Huds. mic. dict. Sm. Fl.



‡ 4 *Cluſius* vnder the name of *Caucalis major* hath deſcribed and figured this, which hath many creſted ſtraight ſtalkes ſome two cubits high or more, which are diuided into ſundry branches, and at each joynt ſend forth large and winged leaues ſomwhat like thoſe of Angelica, but rougher, and of a darker green; at the tops of the branches grow vmbels of whitiſh floures, being of ſomewhat a purpliſh or fleſh colour vnderneath; and theſe are ſucceeded by broad ſeed almoſt like thoſe of the Cow-Parſnep, but that they are rougher, and forked at the top, and prickly: the root is white, hard and wooddy. It floures in Iune, ripens the ſeed in Iuly and Auguſt, and then the root dies, and the ſeed muſt be ſowne in September, and ſo it will come vp and continue greene all the Winter.

5 Beſides theſe formerly deſcribed there are two others growing wilde with vs; the firſt of theſe, which I haue thought good to call Hedge, or field Parſley, (becauſe it growes about hedges, and in plowed fields very plentifully euery where) hath creſted hollow ſtalkes growing vp to ſome cubit and halfe high, whereon ſtand winged leaues made of ſundry little longiſh ones, ſet one

againſt another,ſnipt about the edges,and ending in a long and ſharp pointed leafe:theſe leaues as alſo the ſtalks are ſomewhat rough and harſh,and of a darke greene colour:the floures are ſmall and reddiſh, and grow in little vmbels, and are ſucceeded by longiſh little rough ſeed of ſomewhat a ſtrong and aromaticke taſt and ſmell. It is an annuall plant,and floures commonly in Iuly, and the ſeeds are ripe in Auguſt. *Cordus* and *Thalius* cal it *Daucoides minus*;and *Bauhine*, *Caucalis ſemine aſpero floſculis ſubrubentibus*. There is a bigger and leſſer varietie or ſort of this plant,for you ſhall finde it growing to the height of two cubits,with leaues and all the vpper parts anſwerable, and you may againe obſerue it not to exceed the height of halfe a foot.

6 This other, which *Bauhine* hath firſt ſet forth in writing by the name of *Caucalis nodoſa echinato ſemine*,hath a white & long root, from which it ſends vp ſundry ſmall creſted and rough branches which commonly lie along vpon the ground,and are of an vnequal length,ſome a cubit long, other ſome ſcarſe two handfulls:the leaues are ſmall,rough,winged, and deeply jagged,and at the ſetting on of each leafe, cloſe to the ſtalkes vſually vpon very ſhort foot-ſtalkes grow ſmall little flours of colour white,or reddiſh,and made of fiue little leaues apeece:after theſe follow the ſeed, round,ſmall,and rough,and they grow cloſe to the ſtalkes. It floures in Iune and Iuly, and growes wilde in ſundry places,as in the fields, and vpon the banks about S. Iames,and Pickadilla. *Fabius Columna* iudges it to be the true *Scandix* of the Antients. ‡

There is likewiſe one of theſe found in Spaine,called *Caucalis Hiſpanica*, like the firſt:but it is an annuall plant, which periſhes at the firſt approch of winter,the which I haue ſowne in my garden, but it periſhed before the ſeed was perfected.

¶ *The Place.*

Theſe plants do grow naturally vpon rocks and ſtony grounds:we haue the firſt and the third in our paſtures in moſt places of England:that with red floures is a ſtranger in England.

‡ I haue not heard that the third growes wilde with vs, but the ſecond was found growing in the corne fields on the hils about Bathe,by Mr. *Bowles*. ‡

¶ *The Time.*

They floure and flouriſh from May to the end of Auguſt.

¶ *The Names.*

Baſtard Parſley is called in Greeke καυκαλὶς: in Latine alſo *Caucalis* : of ſome, *Daucus ſylueſtris* : among the baſtard names of *Democritus*, βρίον : in Latine, *Pes Gallinaceus*, *Pes Pulli* : the Egyptians name it *Seſelis* : the countrey-men of Hetruria, *Petroſello ſaluatico* : in Engliſh, baſtard Parſley, and Hennes foot.

¶ *The Temperature and Vertues.*

A *Dioſcorides* ſaith,that baſtard Parſley is a pot-herbe which is eaten either raw or boiled,and prouoketh vrine.

B *Pliny* doth reckon it vp alſo among the pot-herbes : *Galen* addeth, that it is preſerued in pickle for ſallades in winter.

C The ſeed of baſtard Parſley is euidently hot and dry,and that in the ſecond degree:it prouoketh vrine,and bringeth downe the deſired ſickneſſe : it diſſolueth the ſtone and driueth it forth.

D It taketh away the ſtoppings of the liuer,ſpleen,and kidnies:it cutteth and concocteth raw and flegmaticke humors : it comforteth a cold ſtomacke,diſſolueth winde, quickneth the ſight,and refreſheth the heart,if it be taken faſting.

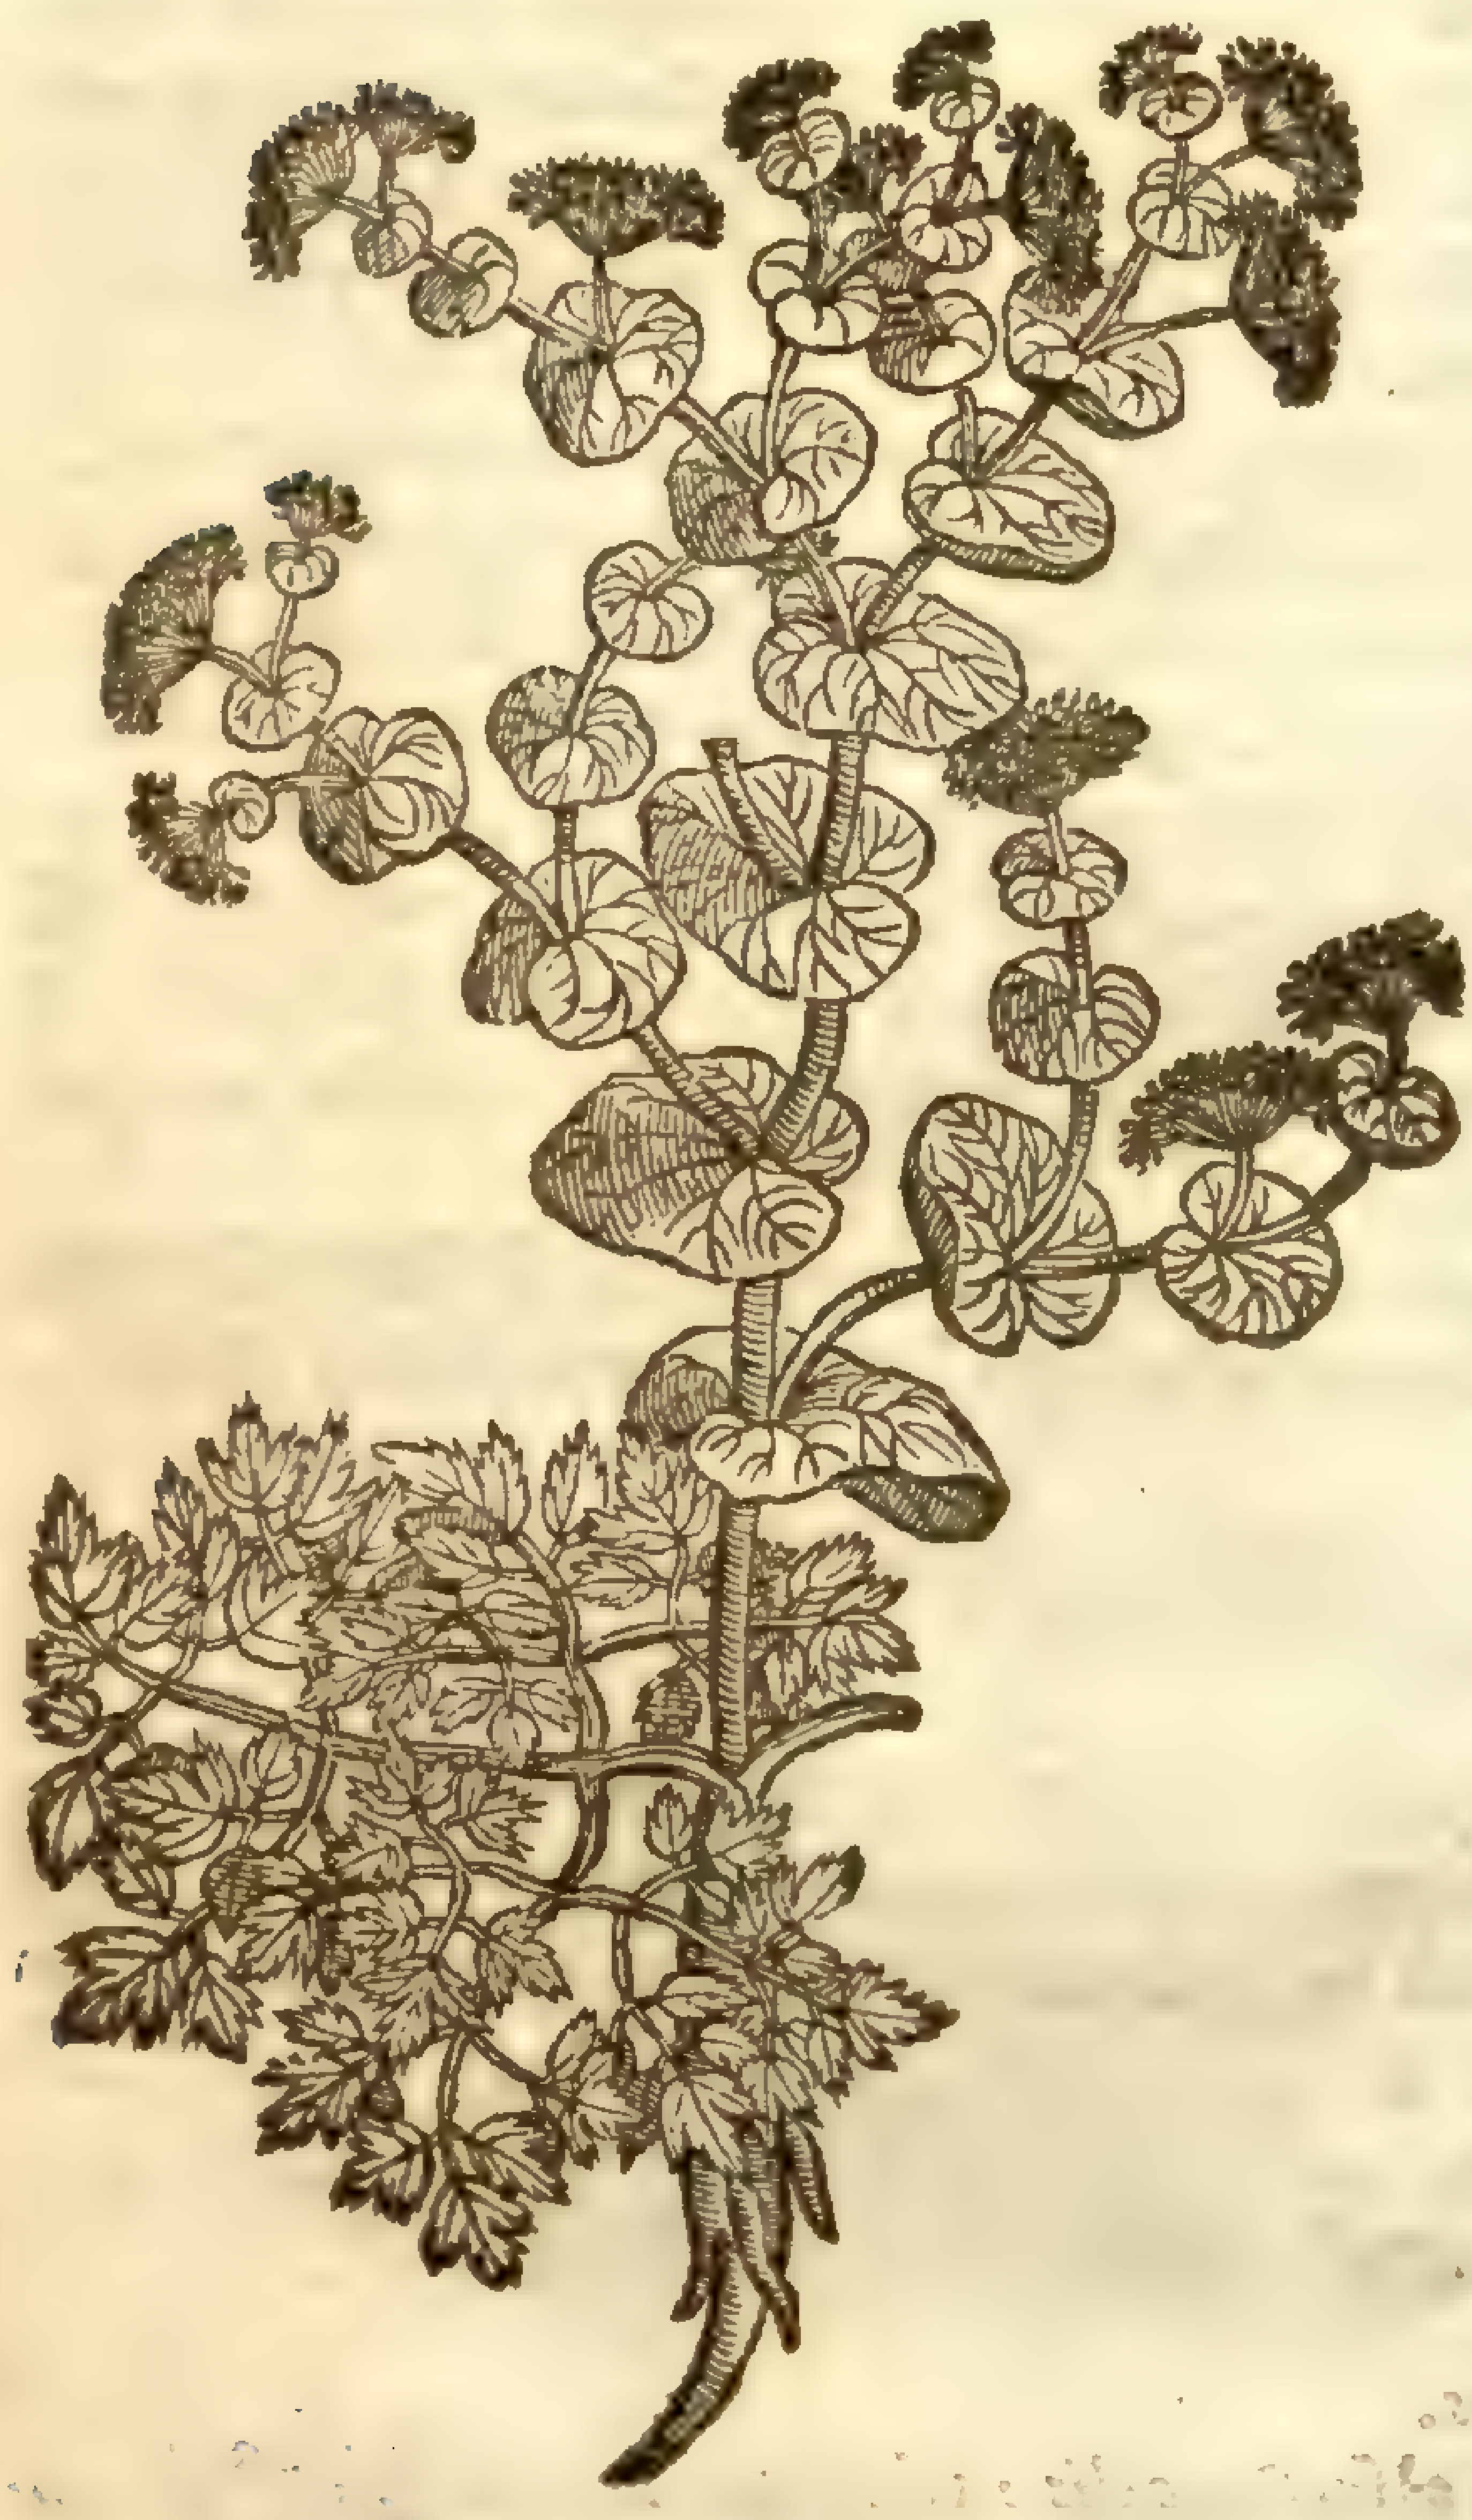
E *Matthiolus* in his Commentaries vpon *Dioſcorides*, *Lib*. 2. attributeth vnto it many excellent vertues,to prouoke venery and bodily luſt, and erection of the parts.

† The figure which belonged to the third deſcription in this chapter was formerly put for Engliſh Saxifrage.

Chap. 404. *Of Candy Alexanders.*

¶ *The Deſcription.*

Dioſcorides and *Pliny* haue reckoned *Smyrnium* among the kindes of Parſley, whoſe judgement, while this plant is young,and not growne vp to a ſtalke, may ſtand with very good reaſon,for that the young leaues next the ground are like to Parſley,but ſomwhat thicker and larger: among which riſeth vp a ſtalke a cubit high,and ſomewhat more,garniſhed with round leaues,farre different from thoſe next the ground , incloſing the ſtalke about like Thorow wax, or *Perfoliata*, which leaues are of a yellow colour,and doe rather reſemble the leaues of Fole-foot than Parſley:



Smyrnium Creticum.
Candy Alexander.

Smyrnium perfoliatum [illegible]

at the top of the ſtalkes doe grow round ſpoky tufts of a yellow color, after which comes round and blacke ſeed like Coleworts, of a ſharp & bitter taſt like Myrrh: the root is white and thicke, contrary to the opinion of *Dodonæus*, who ſaith it is blacke without, but I ſpeak that which I haue ſeen and proued.

¶ *The Place.*

Smyrnium groweth naturally vpon the hils and mountaines of Candy, and in my garden alſo in great plenty: alſo vpon the mountain Amanus in Cilicia.

¶ *The Time.*

Smyrnium floureth in Iune, and the ſeed is ripe in Auguſt.

¶ *The Names.*

This plant is called in Latine, *Smyrnium*: in Greek, σμύρνιον: in Cilicia, *Petroſelinū*, and as *Galen* teſtifies, ſome haue called it, *Hippoſelinum agreſte*: in Engliſh, Candy Alexanders, or Thorow bored Parſley.

¶ *The Temperature.*

Smyrnium is hot and dry in the third degree.

¶ *The Vertues.*

A The leaues of *Smyrnium* diſſolue wens and hard ſwellings, dry vp vlcers and excoriations, and glew wounds together.

B The ſeeds are good againſt the ſtoppings of the ſpleene, kidnies, and bladder.

C Candy Alexander hath force to digeſt and waſt away hard ſwellings, in other things it is like to garden Parſley, and ſtone Parſley, and therefore we vſe the ſeed hereof to prouoke the deſired ſickneſſe, and vrine, and to help thoſe that are ſtuffed in the lungs, as *Galen* writeth.

D The root is hot, ſo is the herbe and ſeed, which is good to be drunke againſt the biting of ſerpents: it is a remedy for the cough, and profitable for thoſe that cannot take their breath vnleſſe they do ſit or ſtand vpright: it helpeth thoſe that can hardly make their water: the ſeed is good againſt the infirmities of the ſpleen or milt, the kidnies and bladder: it is likewiſe a good medicine for thoſe that haue the dropſie, as *Dioſcorides* writeth.

CHAP. 405. *Of Parſneps.*

¶ *The Deſcription.*

1 THe leaues of the tame or Garden Parſneps are broad, conſiſting of many ſmall leaues faſtned to one middle rib like thoſe of the aſh tree: the ſtalk is vpright, of the height of a man: the floures ſtand vpon ſpokie tufts, of colour yellow; after which commeth the ſeed flat and round, greater than thoſe of Dil: the root is white, long, ſweet, and good to be eaten.

2 The wild Parſnep is like to that of the Garden, in leaues, ſtalke, tuft, yellow floures, flat and round ſeed, but altogether leſſer: the root is ſmall, hard, wooddy, and not fit to be eaten.

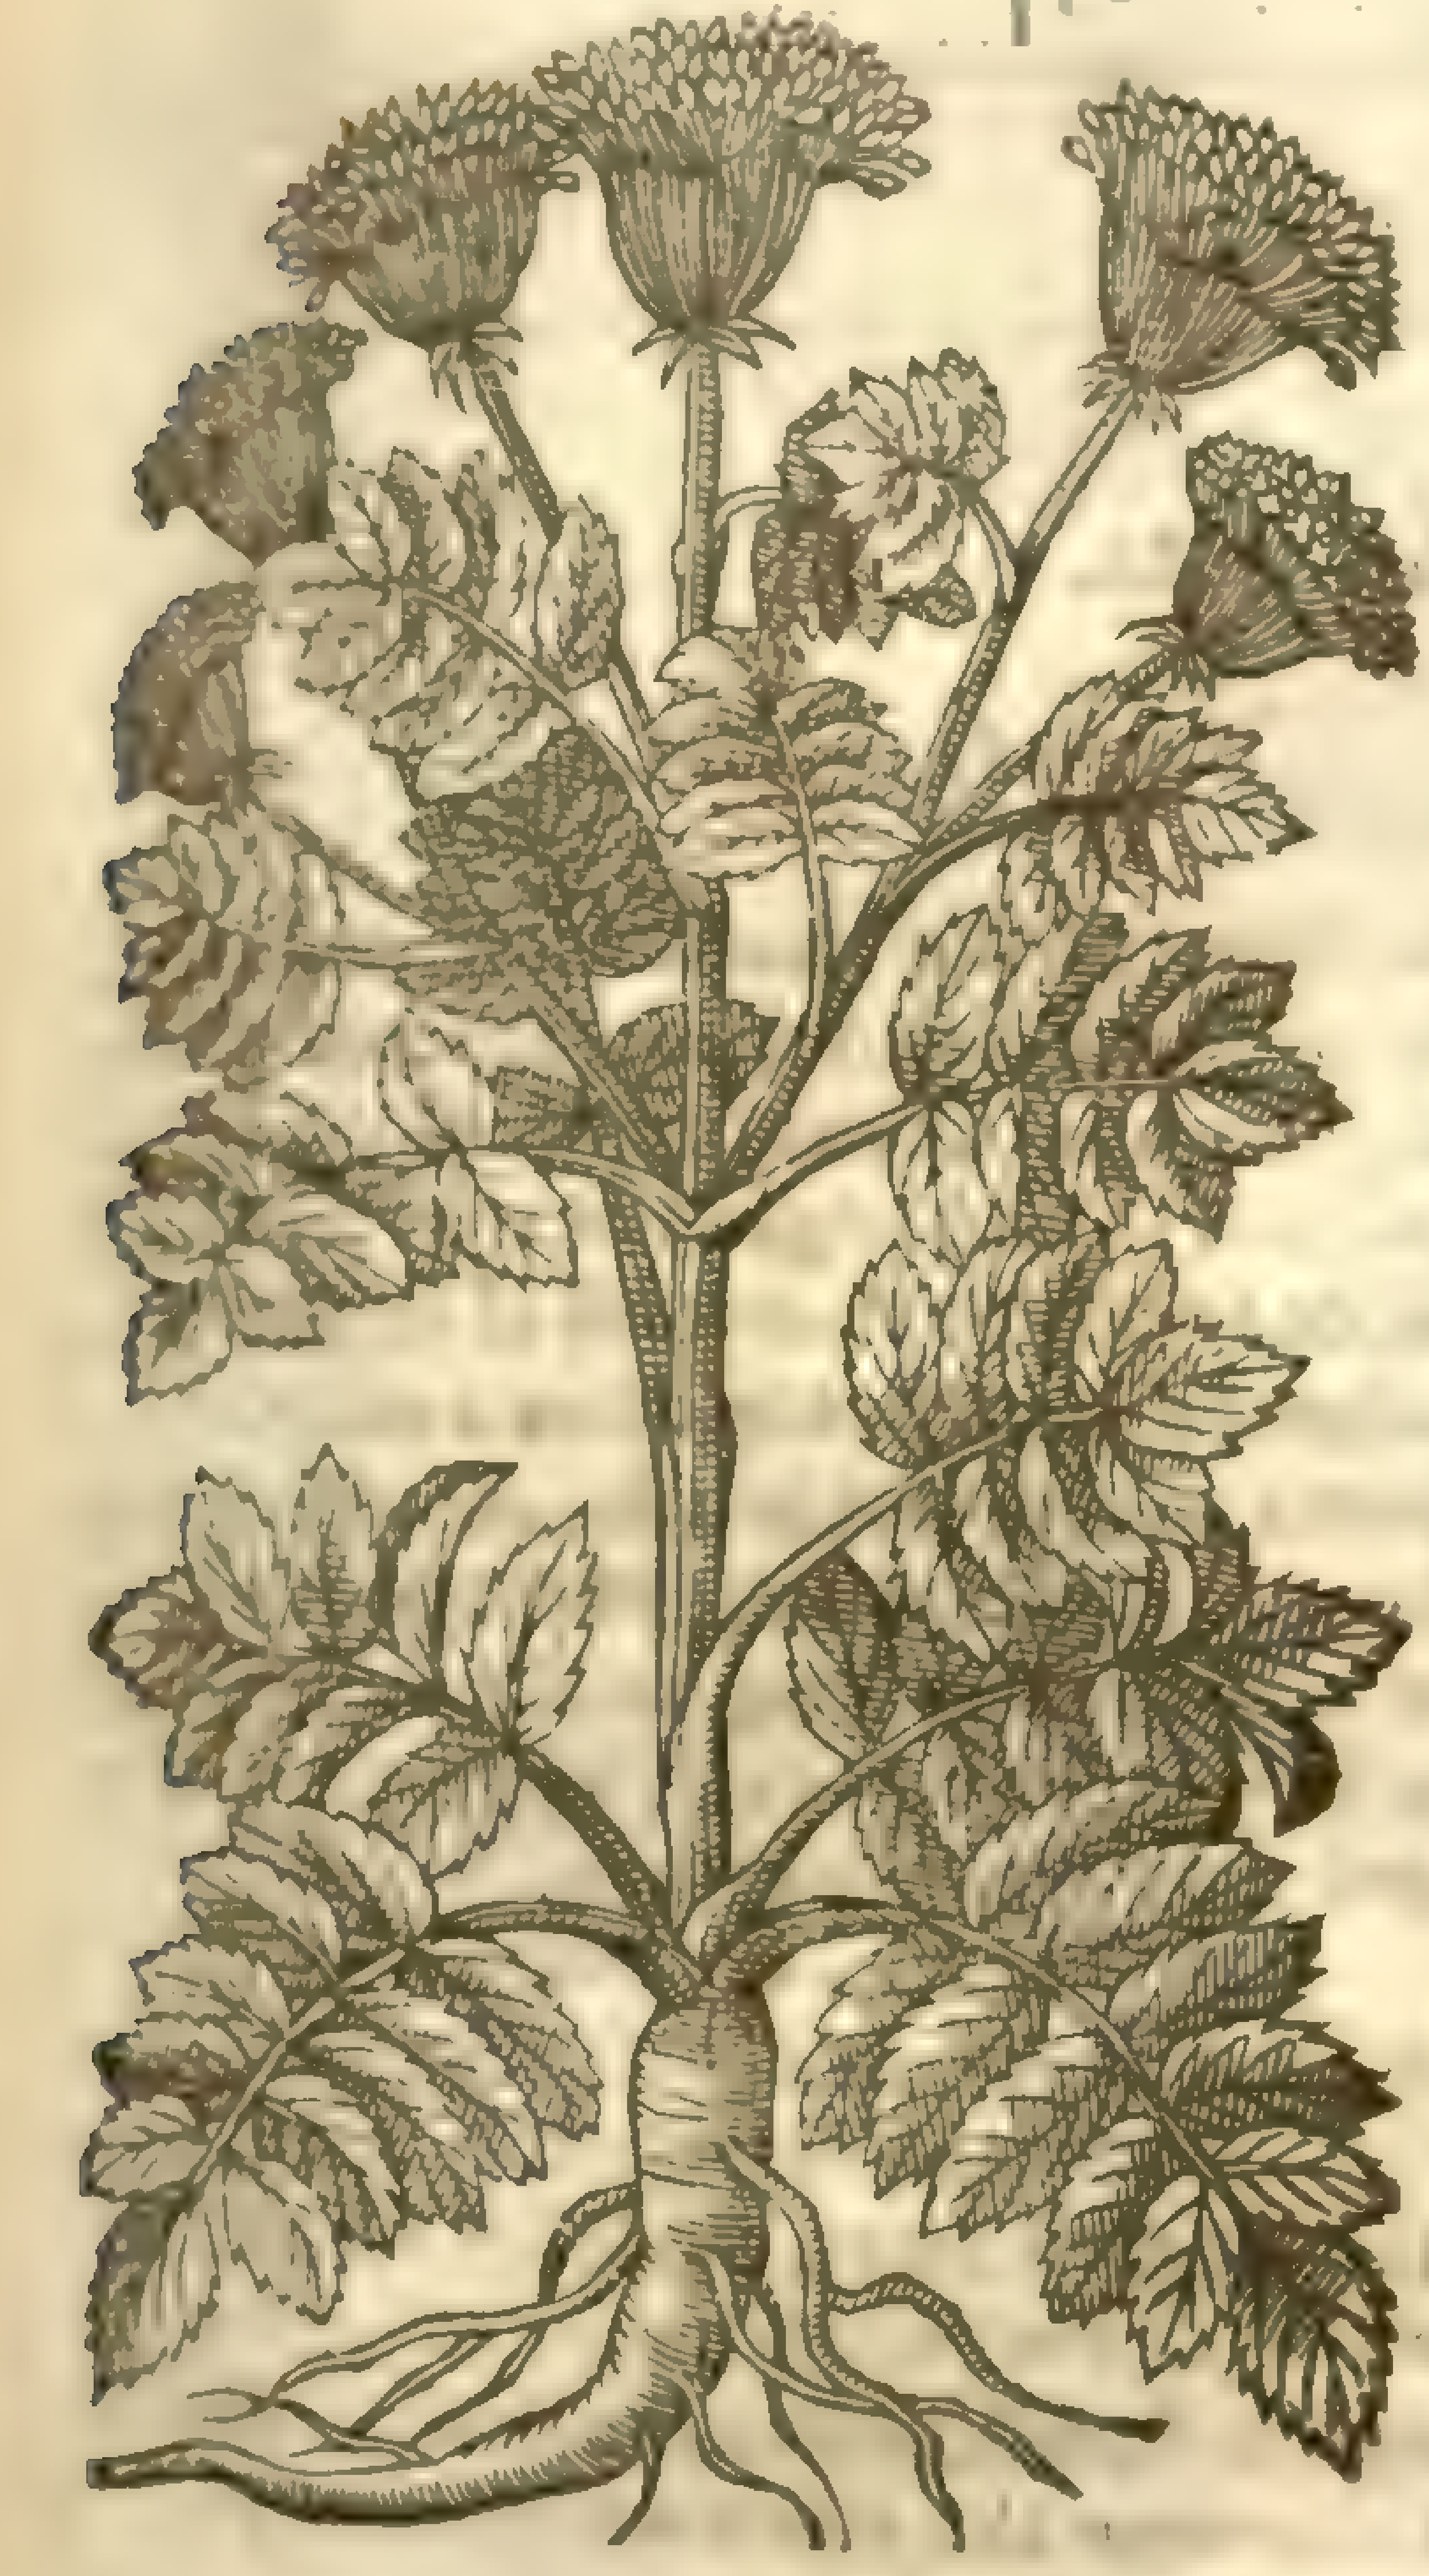
¶ *The Place.*

The garden Parſnep requireth a fat and looſe earth, and that that is digged vp deep.

The wilde Parſnep groweth in vntoiled places, eſpecially in the ſalt marſhes, vpon the bankes and borders of the ſame: the ſeed whereof being gathered and brought into the garden, and ſowed in

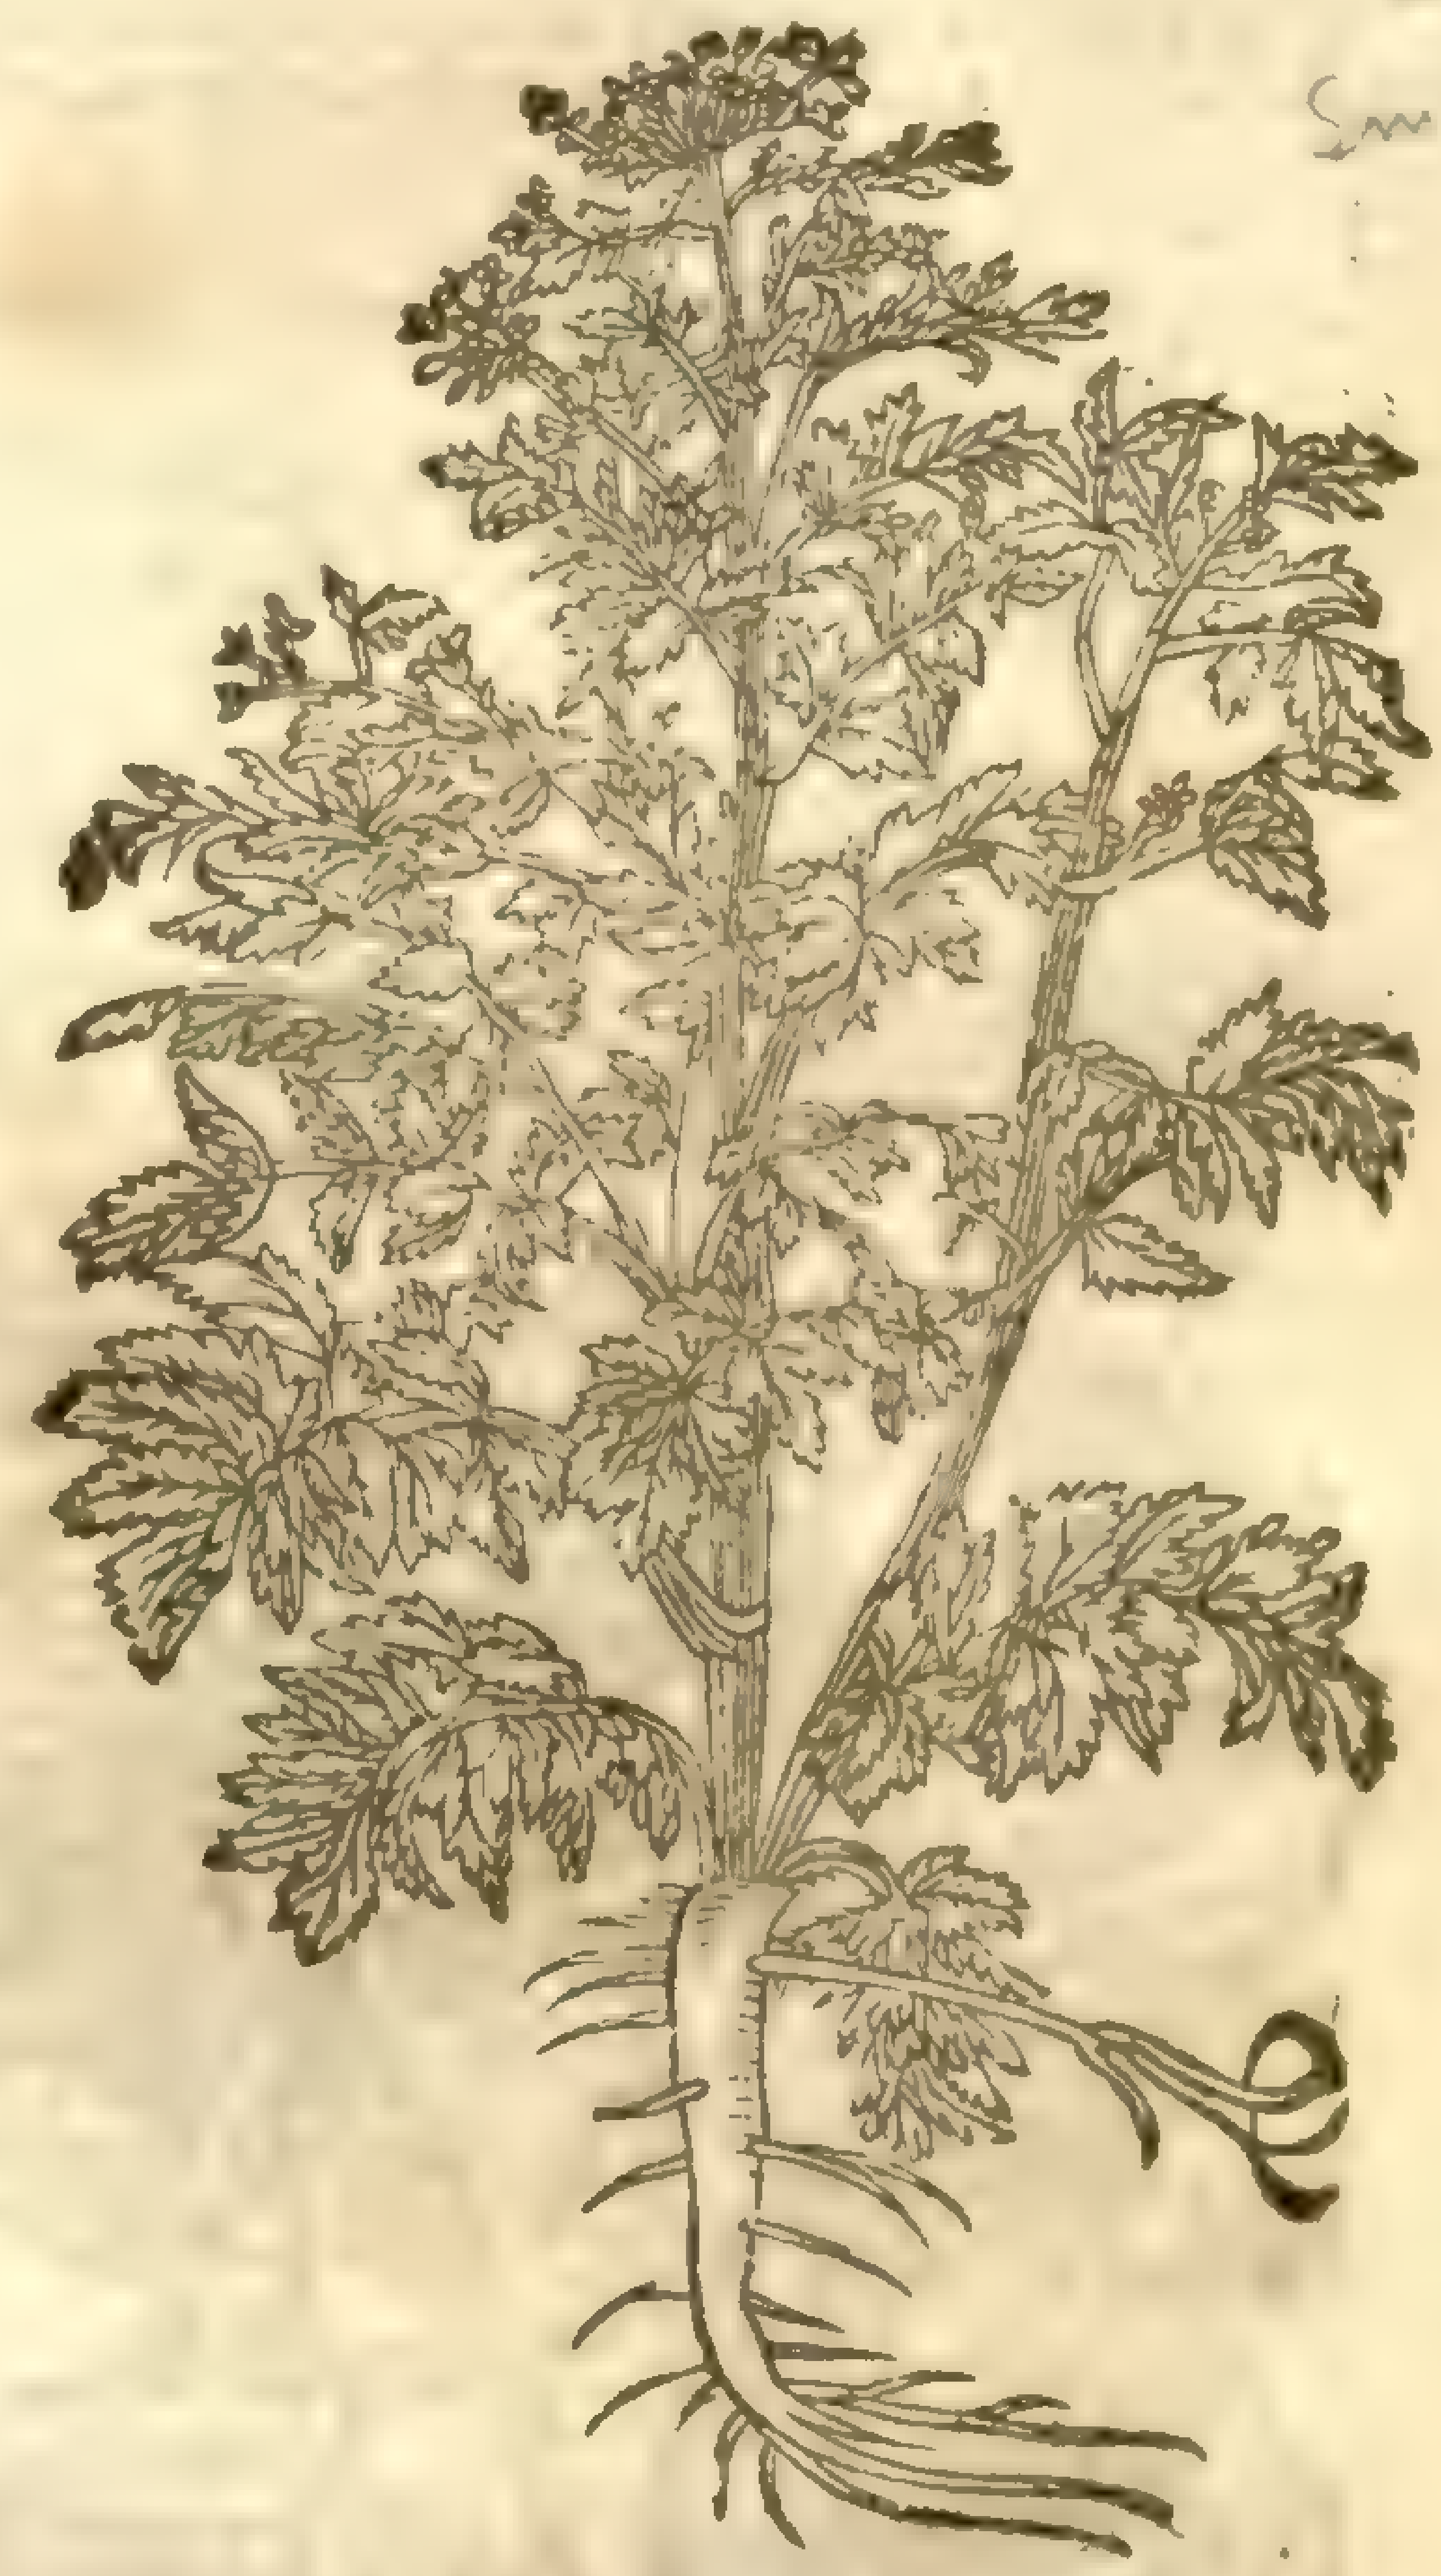
1 *Paſtinaca latifolia ſatiua.*
Garden Parſneps.

P. sativa, L. [illegible]



2 *Paſtinaca latifolia ſylueſtris.*
Wilde Parſneps.

P. sativa, L. [illegible]
Smi. fl. 2. 301



in fertill ground, do proue better roots, ſweeter and greater than they that are ſowne of ſeeds gathered from thoſe of the garden.

They floure in Iuly and Auguſt, and ſeed the ſecond yeare after they be ſowne.

¶ *The Names.*

The Herbariſts of our time do call the garden Parſneps σταφυλῖνος, and *Paſtinaca*, and therefore wee haue ſurnamed it *Latifolia*, or broad leafed, that it may differ from the other garden Parſenep with narrow leaues, which is truly and properly called *Stathylinus*, that is, the garden Carrot. Some Phyſitians doubting, and not knowing to what herbe of the Antients it ſhould be referred, haue fained the wilde kinde hereof to bee *Panacis ſpecies*, or a kinde of All-heale: diuers haue named it *Baucia*; others, *Branca Leonina*, but if you diligently marke, and confer it with *Elaphoboſcum* of *Dioſcorides*, you ſhall hardly finde any difference at all: but the plant called at Montpellier *Pabulum Ceruinum*: in Engliſh, Harts fodder, ſuppoſed there to bee the true *Elaphoboſcum*, differeth much from the true notes thereof. Now *Baucia*, as *Iacobus Manlius* reporteth in *Luminari maiore*, is *Dioſcorides*, and the old Writers *Paſtinaca*, that is to ſay, *Tenuifolia*, or Carrot: but the old Writers, and eſpecially, *Dioſcorides* haue called this wilde Parſnep by the name of *Elaphoboſcum*: and we do call them Parſneps and Mypes.

¶ *The Temperature.*

The Parſnep root is moderately hot, and more dry than moiſt.

¶ *The Vertues.*

The Parſneps nouriſh more than do the Turneps or the Carrots, and the nouriſhment is ſomewhat thicker, but not faulty nor bad; notwithſtanding they be ſomewhat windie: they paſſe through the body neither ſlowly nor ſpeedily: they neither binde nor looſe the belly: they prouoke vrine, and luſt of the body: they be good for the ſtomacke, kidnies, bladder, and lungs. A

There is a good and pleaſant food or bread made of the roots of Parſneps, as my friend Mr. *Plat* hath ſet forth in his booke of expermients, which I haue made no tryall of, nor meane to do. B

The ſeed is hotter and dryer euen vnto the ſecond degree, it mooueth vrine, and conſumeth winde. C

D It is reported, ſaith *Dioſcorides*, that Deare are preſerued from bitings of Serpents, by eateing of the herbe *Elaphoboſcum*, or wilde Parſnep, whereupon the ſeed is giuen with wine againſt the bitings and ſtingings of Serpents.

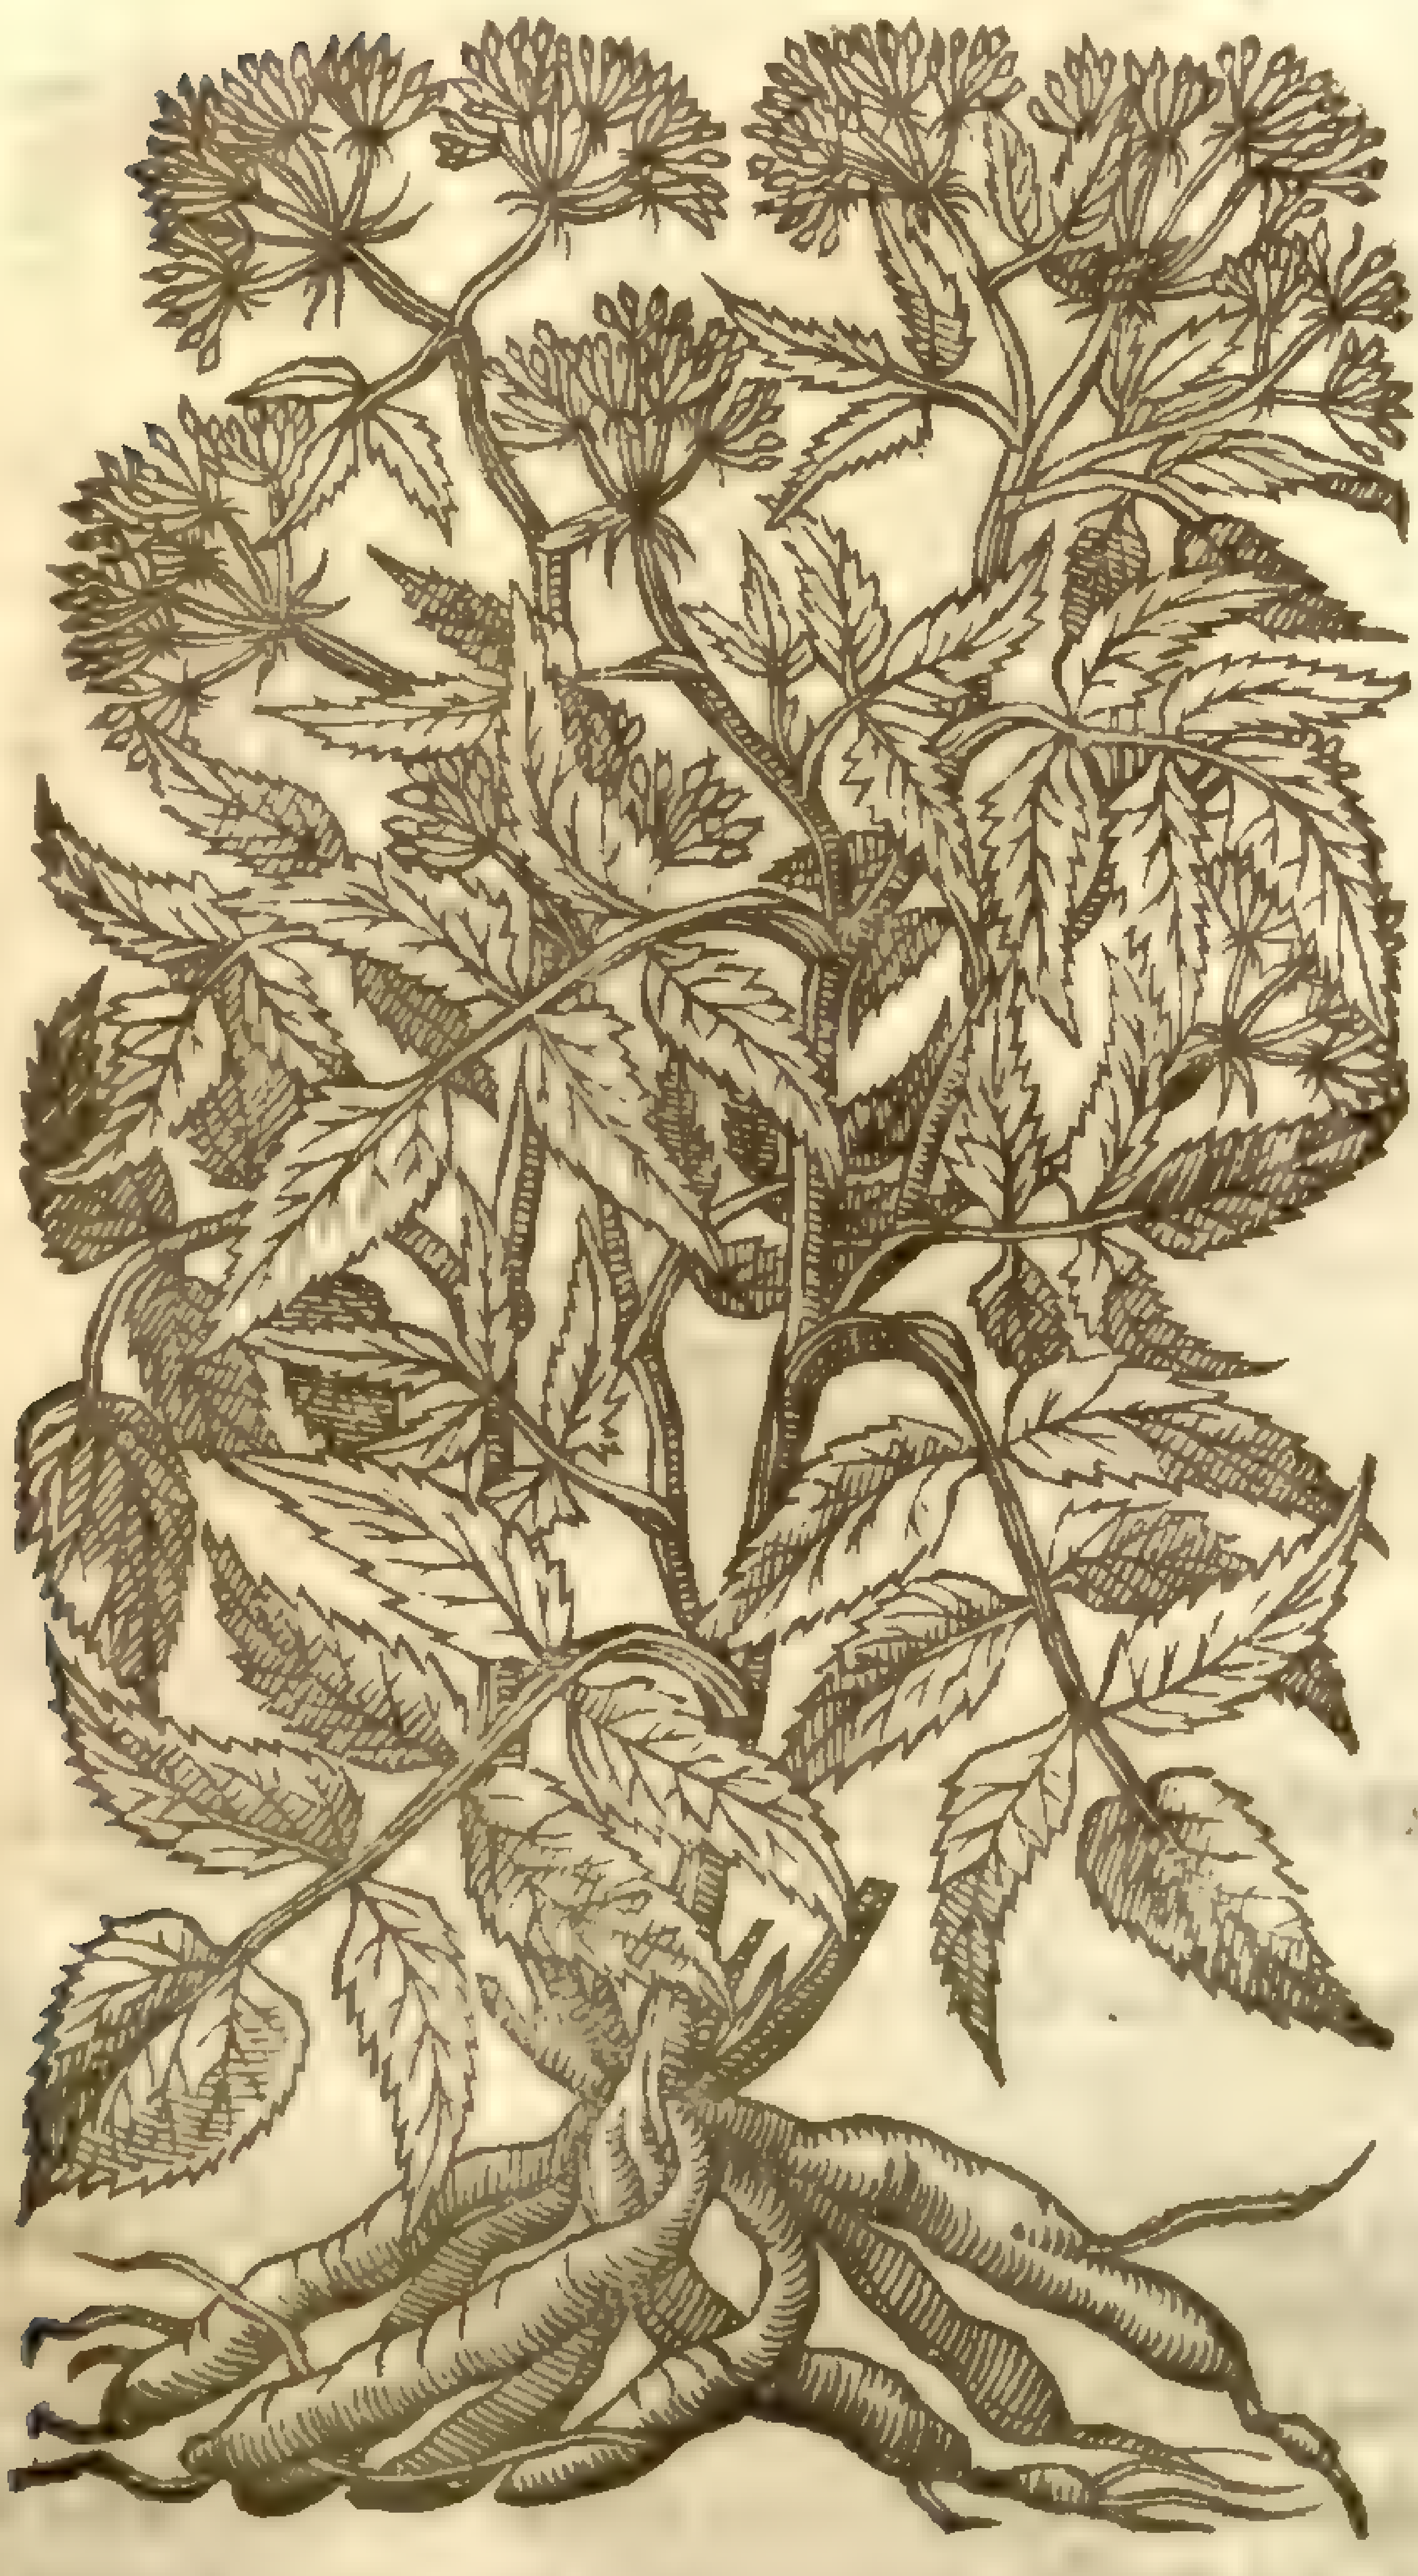
---

† Both the figures that formerly were in this chapter were of the Garden Parſneps; the firſt being that of *Lobel*, and the ſecond that of *Tabernamont.* that wh ſhould haue beene in the ſecond place, was formerly put for *Sphondylium*.

Chap. 406. *Of Skirrets.*

Sium Sisarum, L. [illegible]

Siſarum. Skirrets.



¶ *The Deſcription.*

The leaues of the Skirret do likewiſe conſiſt of many ſmall leaues faſtened to one rib, euery particular one whereof is ſomething nicked in the edges, but they are leſſer, greener, & ſmoother than thoſe af the Parſnep. The ſtalkes be ſhort, and ſeldome a cubit high; the floures in the ſpokie tufts are white, the roots bee many in number, growing out of one head an hand breadth long, moſt commonly not a finger thick, they are ſweet, white, good to be eaten, and moſt pleaſant in taſte.

¶ *The Place and Time.*

This skirret is planted in Gardens, and eſpecially by the root, for the greater and thicker ones being taken away, the leſſer are put into the earth againe: which thing is beſt to be done in March or Aprill, before the ſtalkes come vp, and at this time the roots which bee gathered are eaten raw, or boyled.

¶ *The Names.*

This herb is called in Latine, *Siſarum*, and alſo in Greeke, σίσαρον; the Latines do likewiſe call it *Siſer*; and diuers of the later Herbariſts *Seruillum* or *Cheruillum*, or *Seruilla*, the Germans name it, **Gierlin**: *Tragus*, **Zam garten Rapunkeln**: in the Low-countries, **Suycker wortelen**, that is to ſay, Sugar roots, and oftentimes, **Serillen**: in Spaniſh, *Cherinia*: in Italian, *Siſaro*: in French, *Cheruy*: in Engliſh, Skirret and Skirwort. And this is that *Siſer* or Skirret which *Tiberius* the Emperour commanded to bee conueied vnto him from Gelduba a caſtle about the riuer of Rhene, as *Pliny* reporteth in *lib.* 16. *cap.* 5. The Skirret is a medicinable herbe, and is the ſame that the foreſaid Emperour did ſo much commend, inſomuch that he deſired the ſame to be brought vnto him euery yeare out of Germany. It is not, as diuers ſuppoſe, *Serapio* his *Secacul*, of which he hath written in his 89. chapter: for *Secacul* is deſcribed by the leafe of *Iulben*, that is to ſay, of the peaſe, as *Matthiolus Syluaticus* expoundeth it: and it bringeth forth a blacke fruit of the bigneſſe of a Cichepeaſe, full of moiſture, and of a ſweet taſte, which is called *Granum Culcul*: But the Skirret hath not the leafe of the peaſe, neither doth it bring forth fruit like to the Ciche-peaſe; whereupon it is maniſeſt, that the Skirret doth very much differ from *Serapio* his *Seracul*: ſo farre is it from beeing the ſame.

¶ *The Temperature and Vertues.*

A The roots of the Skirret be moderately hot and moiſt; they be eaſily concocted; they nouriſh meanly, and yeeld a reaſonable good juyce: but they are ſomething windie, by reaſon whereof they alſo prouoke luſt.

B They be eaten boiled, with vineger, ſalt, and a little oyle, after the manner of a ſallad, and oftentimes they be fried in oile and butter, and alſo dreſſed after other faſhions, according to the skill of the cooke, and the taſte of the eater.

The women in Sueuia, ſaith *Hieronymus Heroldus*, prepare the roots hereof for their husbands, and know full well wherefore and why, &c. C

The juyce of the roots drunke with goats milke ſtoppeth the laske. The ſame drunke with wine putteth away windineſſe out of the ſtomacke, and gripings of the belly, and helpeth the hicket or yeoxing. They ſtirre vp appetite, and prouoke vrine. D

Chap. 407. *Of Carrots.*

¶ *The Deſcription.*

1 The leaues of the Garden Carrots are of a deepe greene colour, compoſed of many fine Fennell-like leaues, very notably cut or jagged; among which riſeth vp a ſtalke ſtraight and round, foure cubits high, ſomewhat hairie and hollow, hauing at the top round ſpoked tufts, in which do grow little white floures: in their places commeth the ſeed, rough and hairie, of a ſweet ſmell when it is rubbed. The root is long, thicke and ſingle, of a faire yellow colour, pleaſant to be eaten, and very ſweet in taſte.

1 *Paſtinaca ſativa tenuifolia.*
Yellow Carrot.

‡ 2 *Paſtinaca ſativa atro-rubens.*
Red Carrot.

2 There is another kinde hereof like to the former in all parts, and differeth from it only in the colour of the root, which in this is not yellow, but of a blackiſh red colour.

¶ *The Place.*

Theſe Carrots are ſowne in the fields, and in gardens where other pot-herbes are: they require a looſe and well manured ſoile.

¶ *The Time.*

They are to be ſowne in Aprill; they bring forth their floures and ſeed the yeare after they be ſowne.

¶ *The Names.*

The Carrot is properly called in Greeke, σταφυλῖνος, for that which we haue termed in Latine by the name of *Paſtinaca latioris folij*, or the Garden Parſenep, is deſcribed of the old Writers by another name: this Carrot is called in Latine likewiſe, *Paſtinaca ſativa*, but with this addition *tenuifolia*, that it may differ from the garden Parſnep with broad leaues, and white roots. *Theophraſtus* in the ninth booke of his Hiſtory of Plants nameth this *Staphylinus*, or Carrot, *δαῦκος*, and writeth that it groweth in Arcadia, and ſaith that the beſt is found in *Spartenſi Achaia*, but doubtleſſe hee meant that *Daucus* which we call *Cretenſis*, that may be numbred among the Carrots: *Galen* in his booke of the faculties of Simple medicines doth alſo make it to be *Daucus*, but yet not ſimply *Daucus*; for hee addeth alſo *Staphilinus* or *Paſtinaca*: in high Dutch it is called **Geelruben**: in low Dutch, **Geel Peen**, **Geel Pooten**, and **Geel Wortelen**: in French, *Carrotte*, and *Racine jaulne*: in Italian, *Paſtinaca*: in Spaniſh, *Canahoria*: in Engliſh, Yellow Carrots: the other is called red Carrot, and blacke Carrot.

¶ *The Temperature and Vertues.*

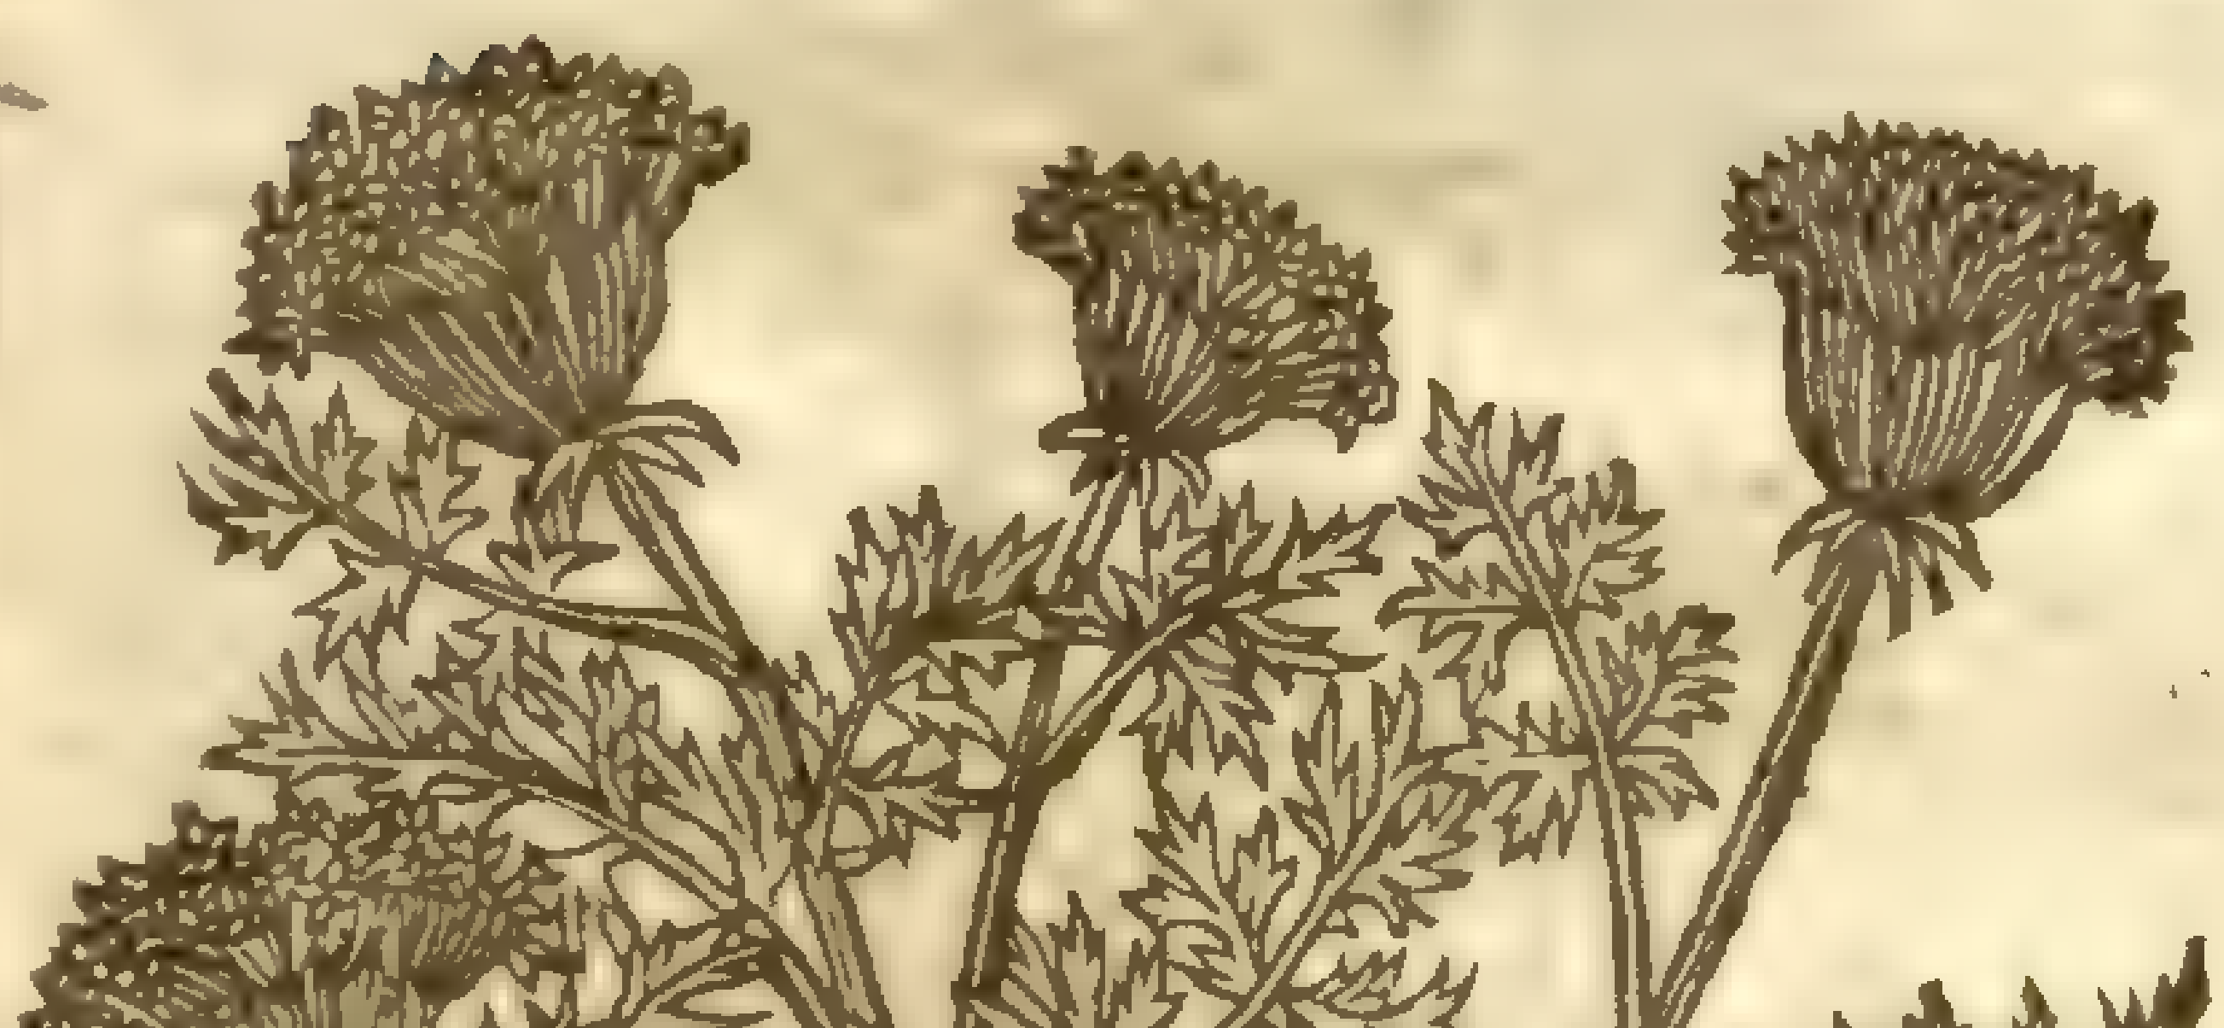
A The root of the yellow Carrot is moſt commonly boyled with fat fleſh and eaten: it is temperately hot and ſomething moiſt. The nouriſhment which commeth hereof is not much, and not very good: it is ſomething windie, but not ſo much as be the Turneps, and doth not ſo ſoon as they paſſe through the body.

B The red Carrot is of like facultie with the yellow. The ſeed of them both is hot and dry, it breaketh and conſumeth windineſſe, prouoketh vrine, as doth that of the wilde Carrot.

Chap. 408. *Of Wilde Carrot.*

Paſtinaca ſylueſtris tenuifolia.
Wilde Carrot, or Bees-neſt.

Daucus Carota, L. Inde. dict. Sm. p. 2 ?



¶ *The Deſcription.*

The leaues of the wilde Carrot are cut into diuers ſlender narrow parcels, very like vnto thoſe of the garden Carrots, but they bee ſomewhat whiter and more hairy: the ſtalkes be likewiſe hairie and ſomewhat rough: the floures are little, and ſtand vpon broad ſpoked tufts, of a white color, of which tuft of floures the middlemoſt part is of a deepe purple: the whole tuft is drawne together when the ſeed is ripe, reſembling a birds neſt; whereupon it hath beene named of ſome, Birds-neſt: the root is ſlender, and of a meane length.

¶ *The Place.*

It groweth of it ſelfe in vntoyled places, in fields, and in the borders thereof, almoſt euery where.

¶ *The Time.*

It floures and flouriſhes in Iune and Iuly, the ſeed is ripe in Auguſt.

¶ *The Names.*

The wilde Carrot is called in Greeke, σταφυλῖνος ἄγριος: in Latine, *Paſtinaca ſylueſtris tenuifolia*: in ſhops, *Daucus*: and it is vſed in ſtead of the true *Daucus*, and not amiſſe nor vnprofitably: for *Galen* alſo in his time doth teſtifie that it was taken for *Daucus*, or baſtard Parſly, and is without doubt *Dauci ſylueſtris genus*, or a wilde kinde of baſtard parſly, ſo called of *Theophraſtus*: in high Dutch it is named, **Wild Paſtenen**, **Vogol neſt**: in low Dutch, **Vogels neſt**, and **Wilde Carotten Crookens cruyt**: in French, *Paſtena de Sauvage*: in Engliſh, wilde Carrot, and after the Dutch, Birds-neſt, and in ſome places Bees-neſt.

Athenæus citing *Diphilus* for his Author ſaith, That the Carrot is called φίλτρον, becauſe it ſerueth for loue matters; and *Orpheus*, as *Pliny* writeth, ſaid, that the vſe hereof winneth loue: which things be written of wilde Carrot,the root whereof is more effectuall than that of the garden,and containeth in it,as *Galen* ſaith, a certaine force to procure luſt.

¶ *The Temperature and Vertues.*

A The ſeed of this wilde Carrot,and likewiſe the root is hot and dry in the ſecond degree,and doth withall open obſtructions.

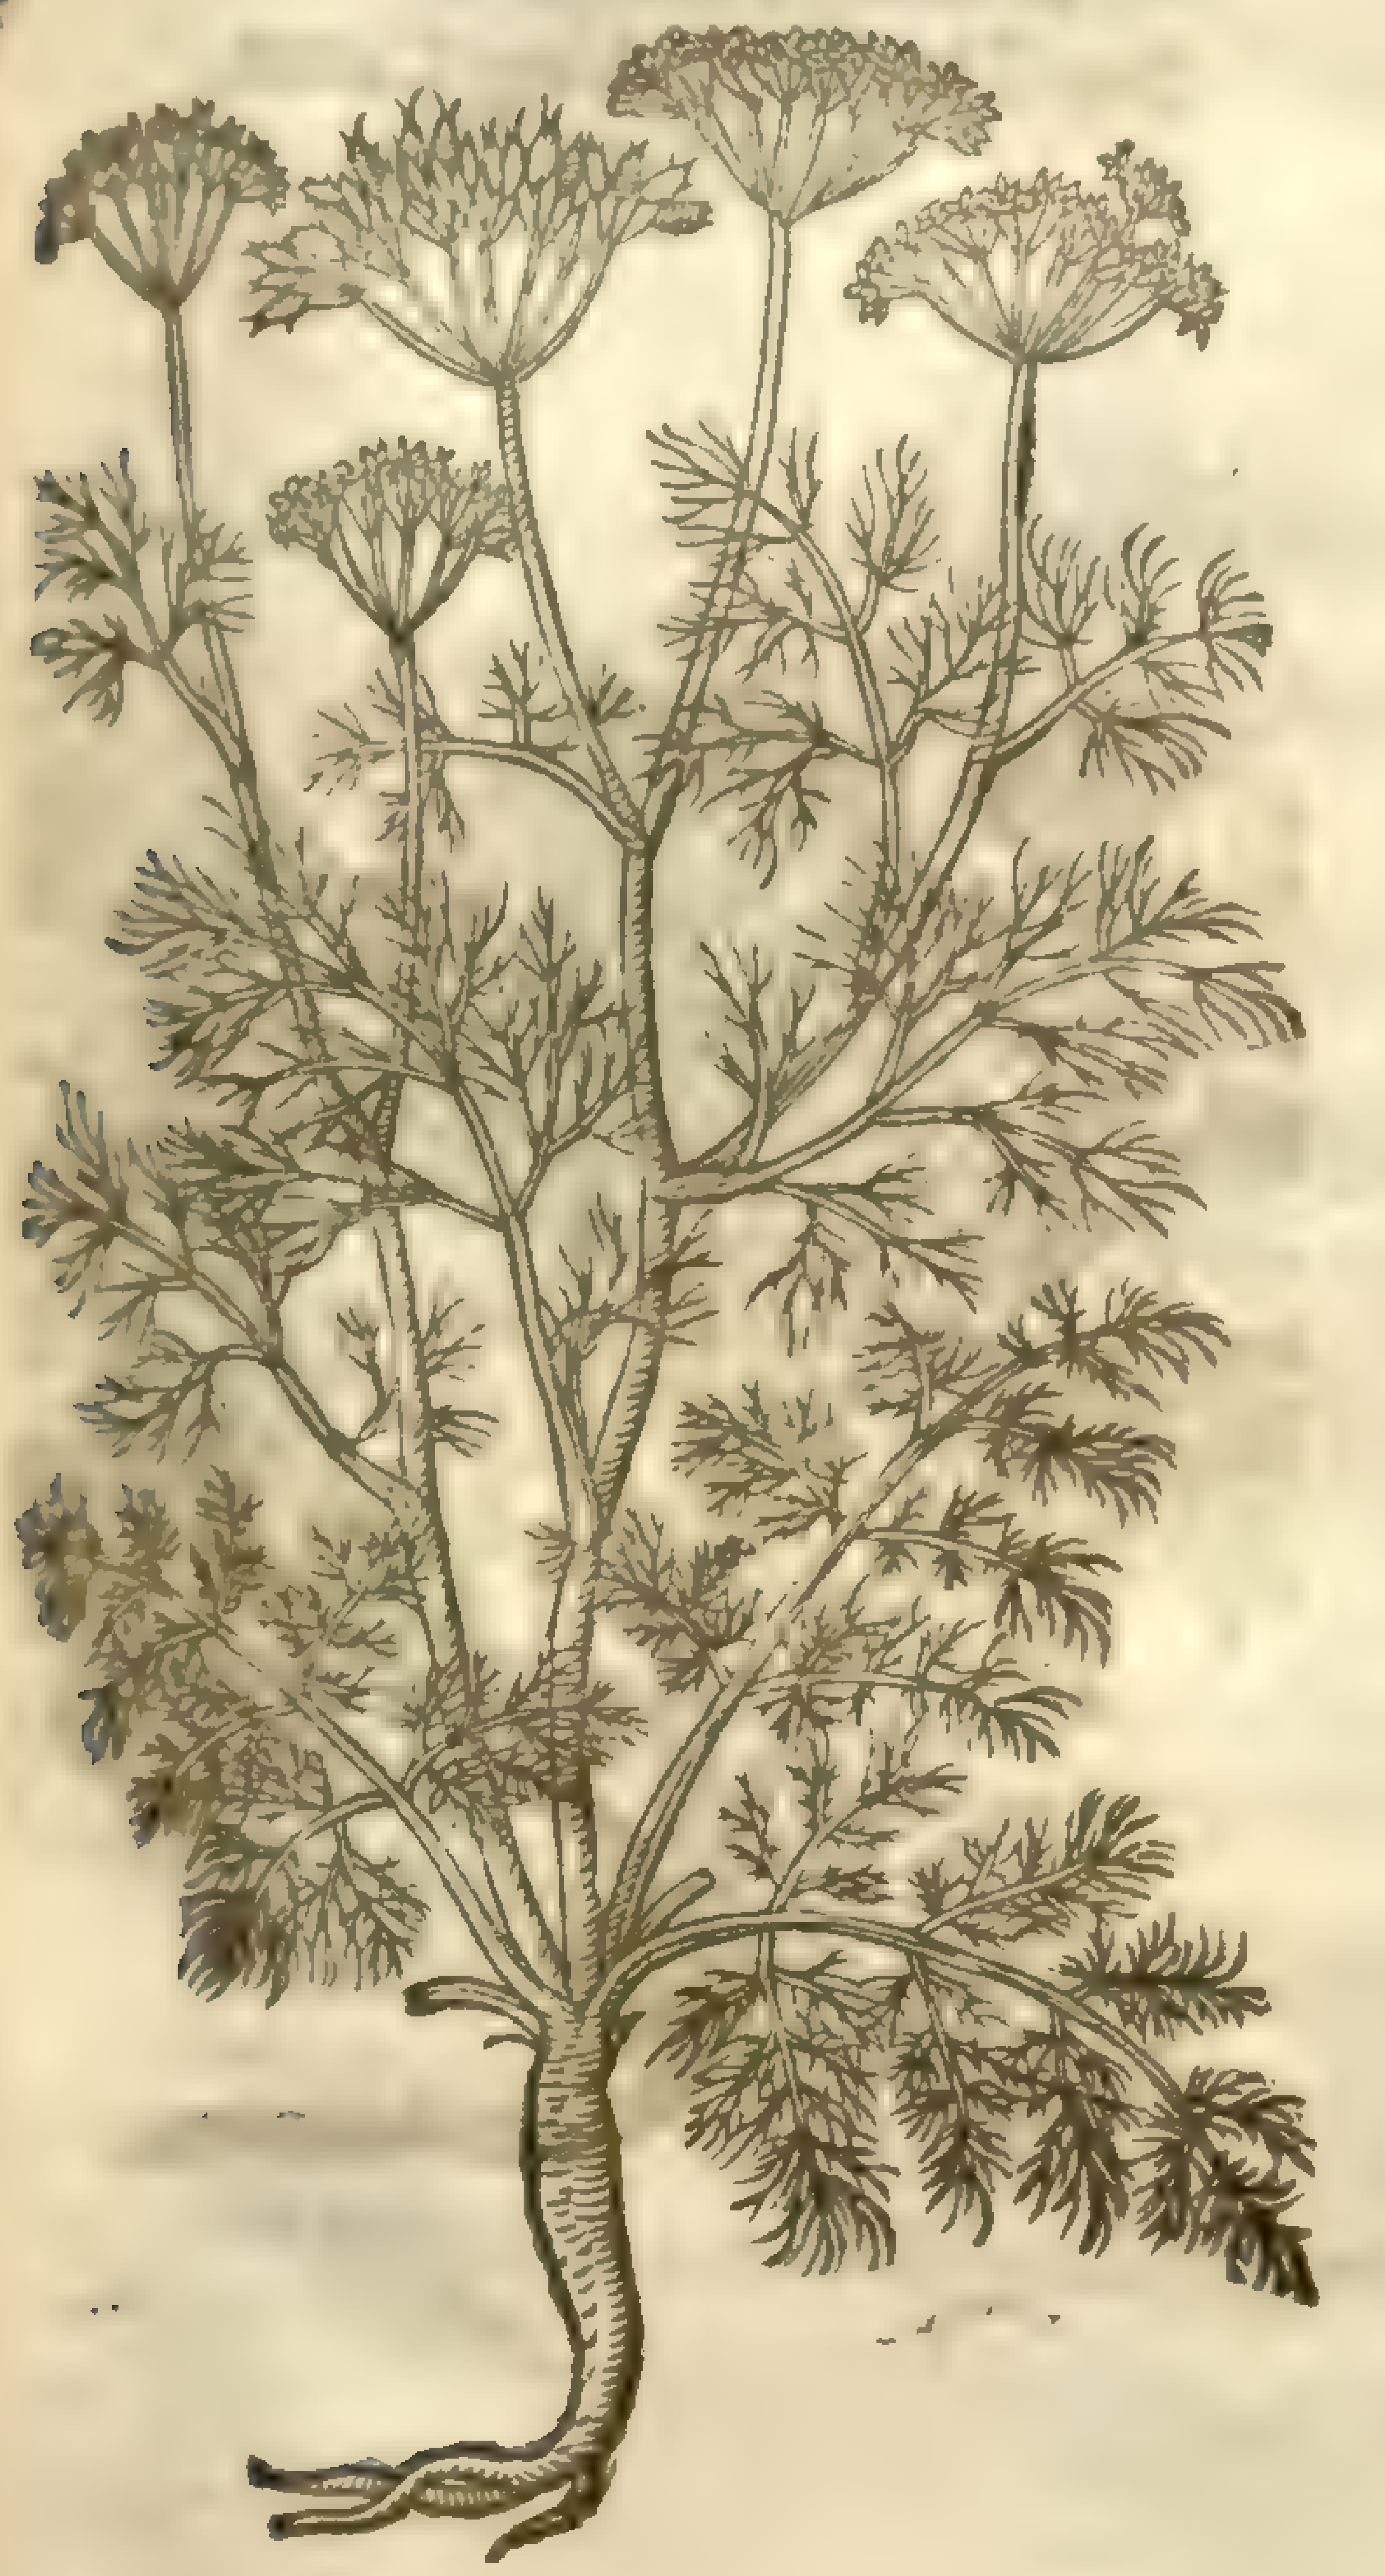
B The root boiled and eaten, or boiled in wine, and the decoction drunke prouoketh vrine, expelleth the ſtone,bringeth forth the birth; it alſo procureth bodily luſt.

C The ſeed drunke bringeth downe the deſired ſickneſſe, it is good for them that can hardly make water,it breaketh and diſſolueth winde,it remedieth the dropſie,it cureth the collick and ſtone,being drunke in wine.

D It is alſo good for the paſſions of the mother,and helpeth conception: it is good againſt the bitings of all manner of venomous beaſts: it is reported,ſaith *Dioſcorides*,that ſuch as haue firſt taken of it are not hurt by them.

Chap. 409. Of Candie Carrots.

Daucus Cretenſis verus.
Candie Carrots.



¶ *The Deſcription.*

This *Daucus Cretenſis*,being the true *Daucus* of *Dioſcorides*,doth not grow in Candy only,but is found vpon the mountains of Germany,and vpon the hills and rockes of Iura about Geneua, from whence it hath beene ſent and conueied by one friendly Herbariſt vnto another, into ſundry regions: it beareth leaues which are ſmall, and very finely jagged, reſembling either Fennel or wild Carrot: among which riſeth vp a ſtalke of a cubit high, hauing at the top white ſpokie tufts, and the floures of Dill:which being paſt, there come great plentie of long ſeed, well ſwelling, not vnlike the ſeed of Cumin, ſaue that it is whitiſh, with a certaine moſſineſſe, and a ſharpe taſte, and is in greater vſe than any part of the plant. The root alſo is right good in medicine, being leſſer than the root of a Parſenep, but hotter in taſte, and of a fragrant ſmell.

¶ *The Time.*

This floures in Iune and Iuly, his ſeed is ripe in Auguſt.

¶ *The Names.*

There is ſufficient ſpoken in the deſcription as touching the name.

¶ *The Nature.*

Theſe plants are hot and dry, eſpecially the ſeed of *Daucus Creticus*,which is hot and dry in the third degree: but the ſeed of the wilde Carrot is hot and dry in the ſecond degree.

¶ *The Vertues.*

A The ſeed of *Daucus* drunken is good againſt the ſtangurie, and painefull making of water, it preuaileth againſt the grauell and ſtone,and prouoketh vrine.

B It aſſuageth the torments and gripings of the belly,diſſolueth windineſſe,cureth the collick,and ripeneth an old cough.

C The ſame beeing taken in Wine, is very good againſt the bitings of beaſts, and expelleth poiſon.

D The ſeed of *Daucus Creticus* is of great efficacy and vertue being put into Treacle, Mithridate, or any antidotes againſt poyſon or peſtilence.

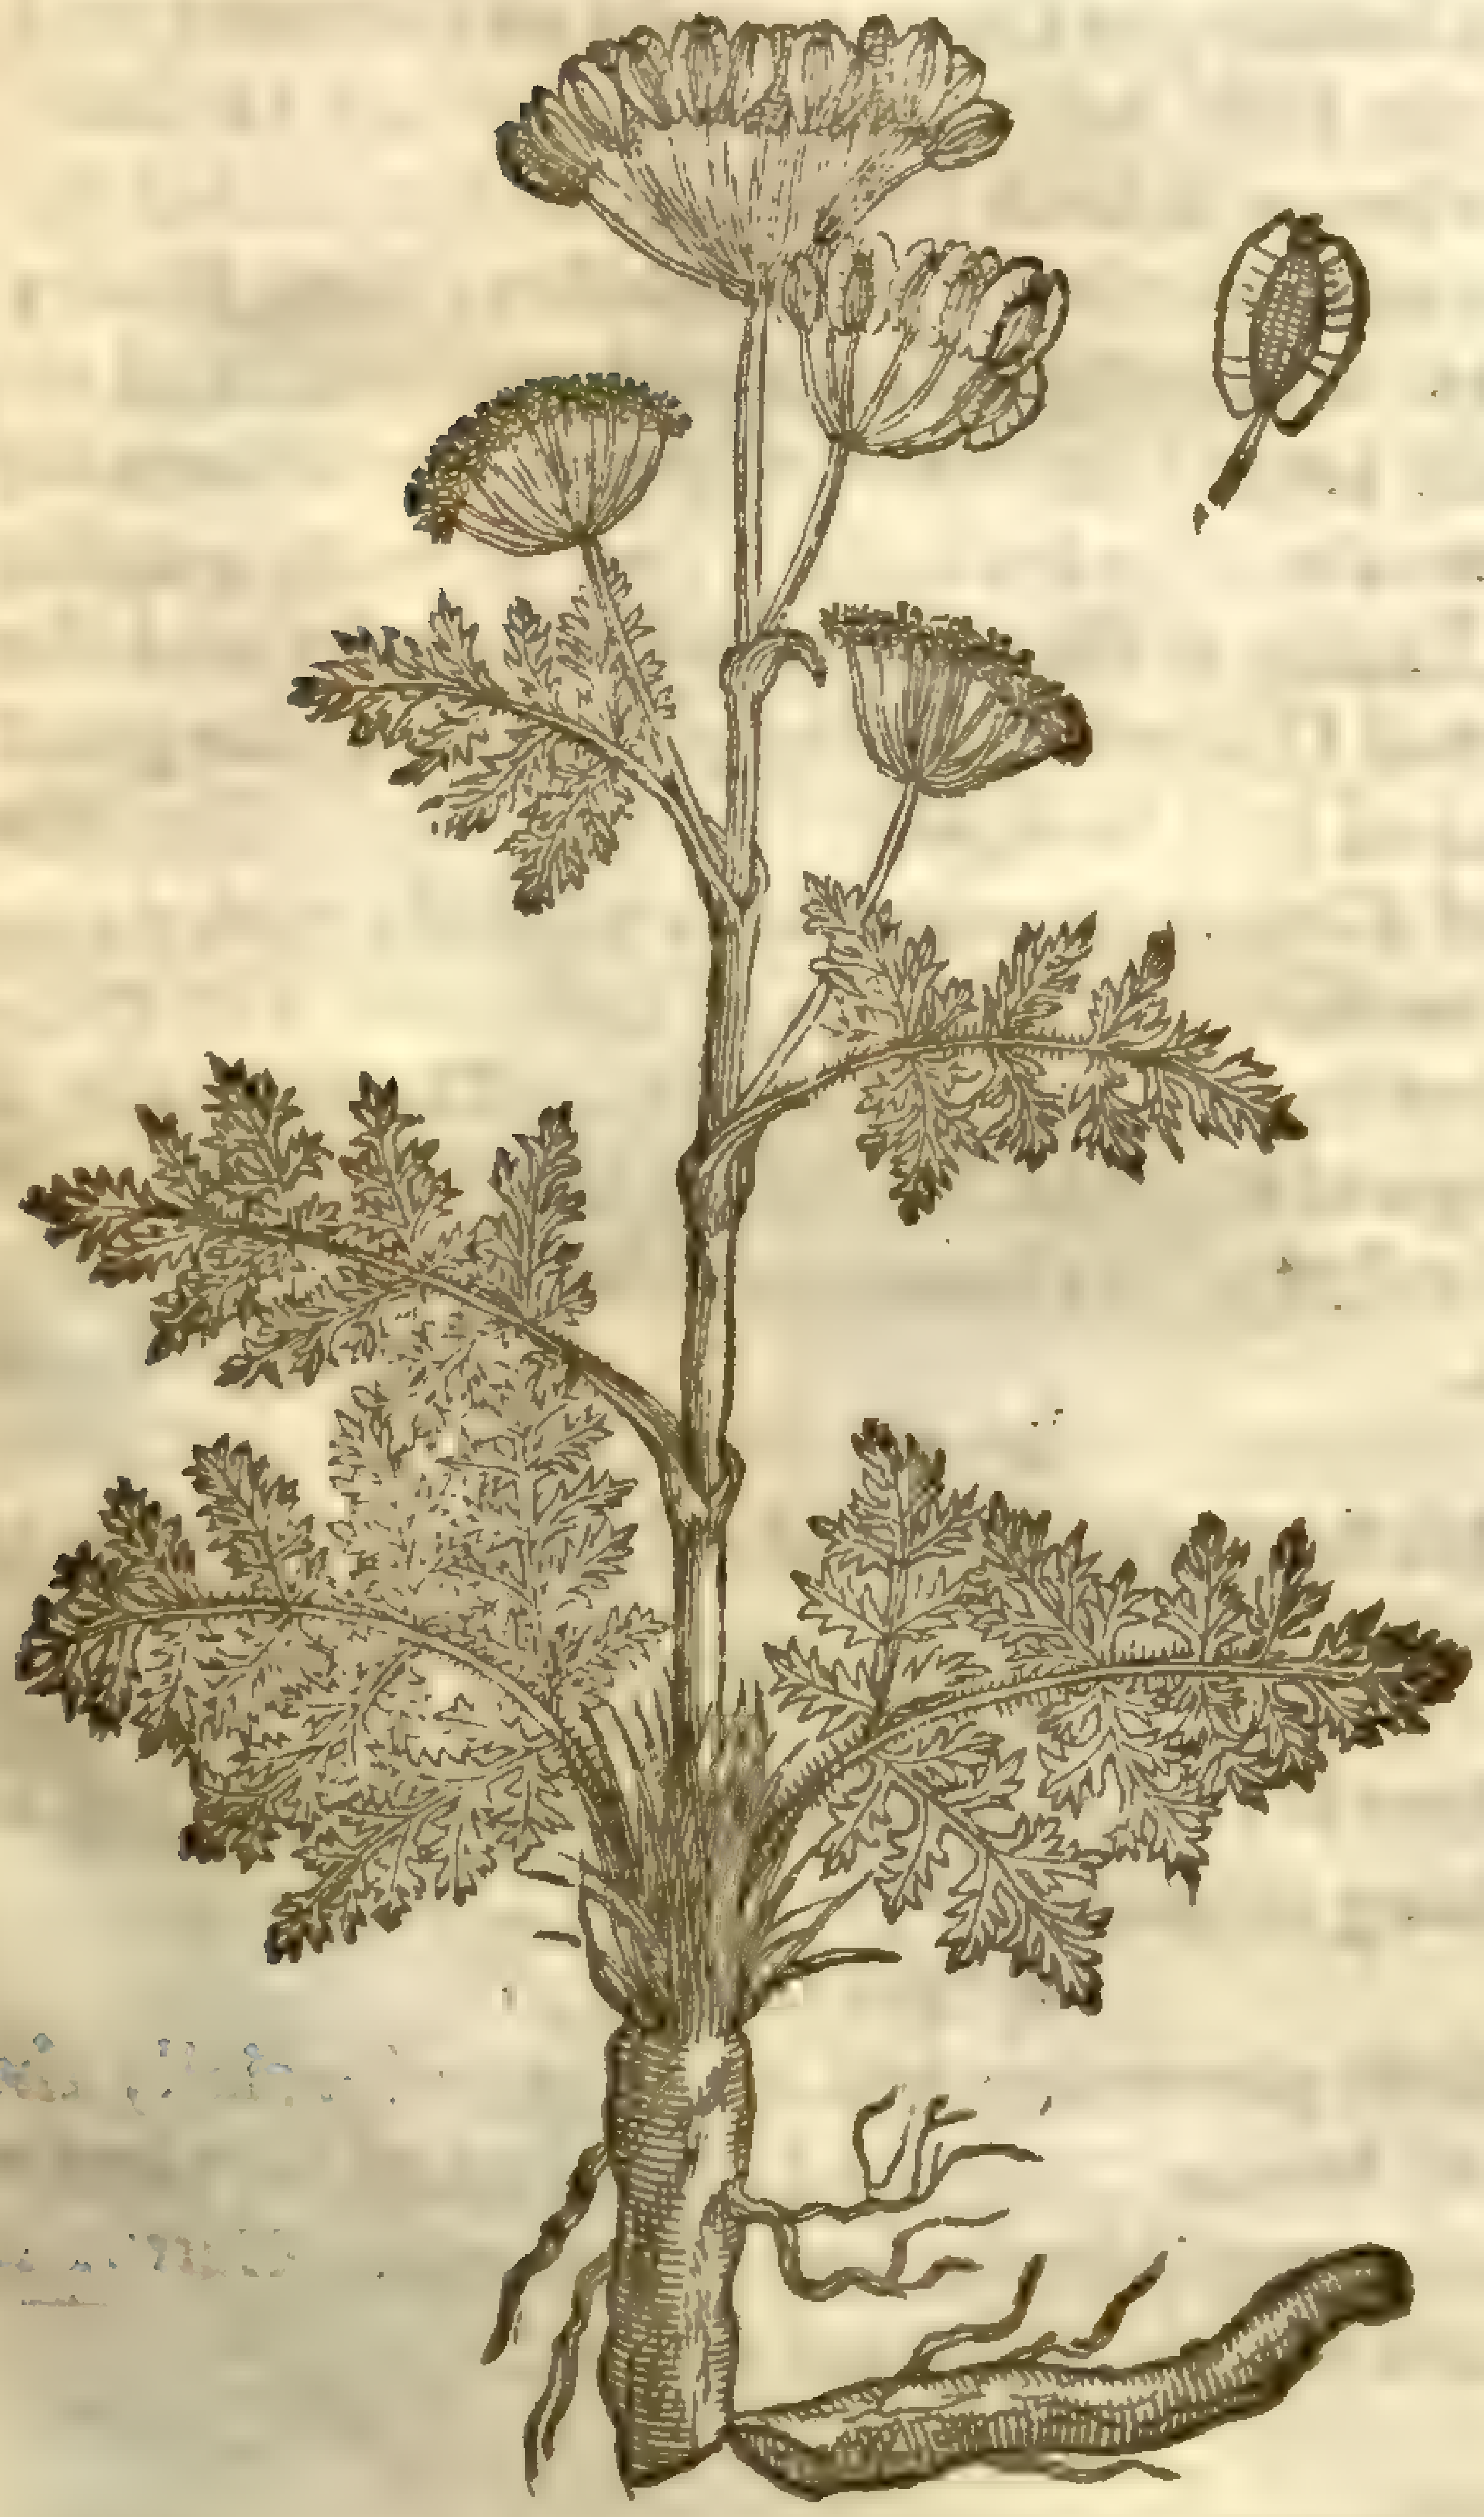
E The root thereof drunke in wine ſtoppeth the laske, and is alſo a ſoueraigne remedy againſt venome and poyſon.

Chap. 410. *Of ſtinking and deadly Carrots.*

¶ *The Deſcription.*

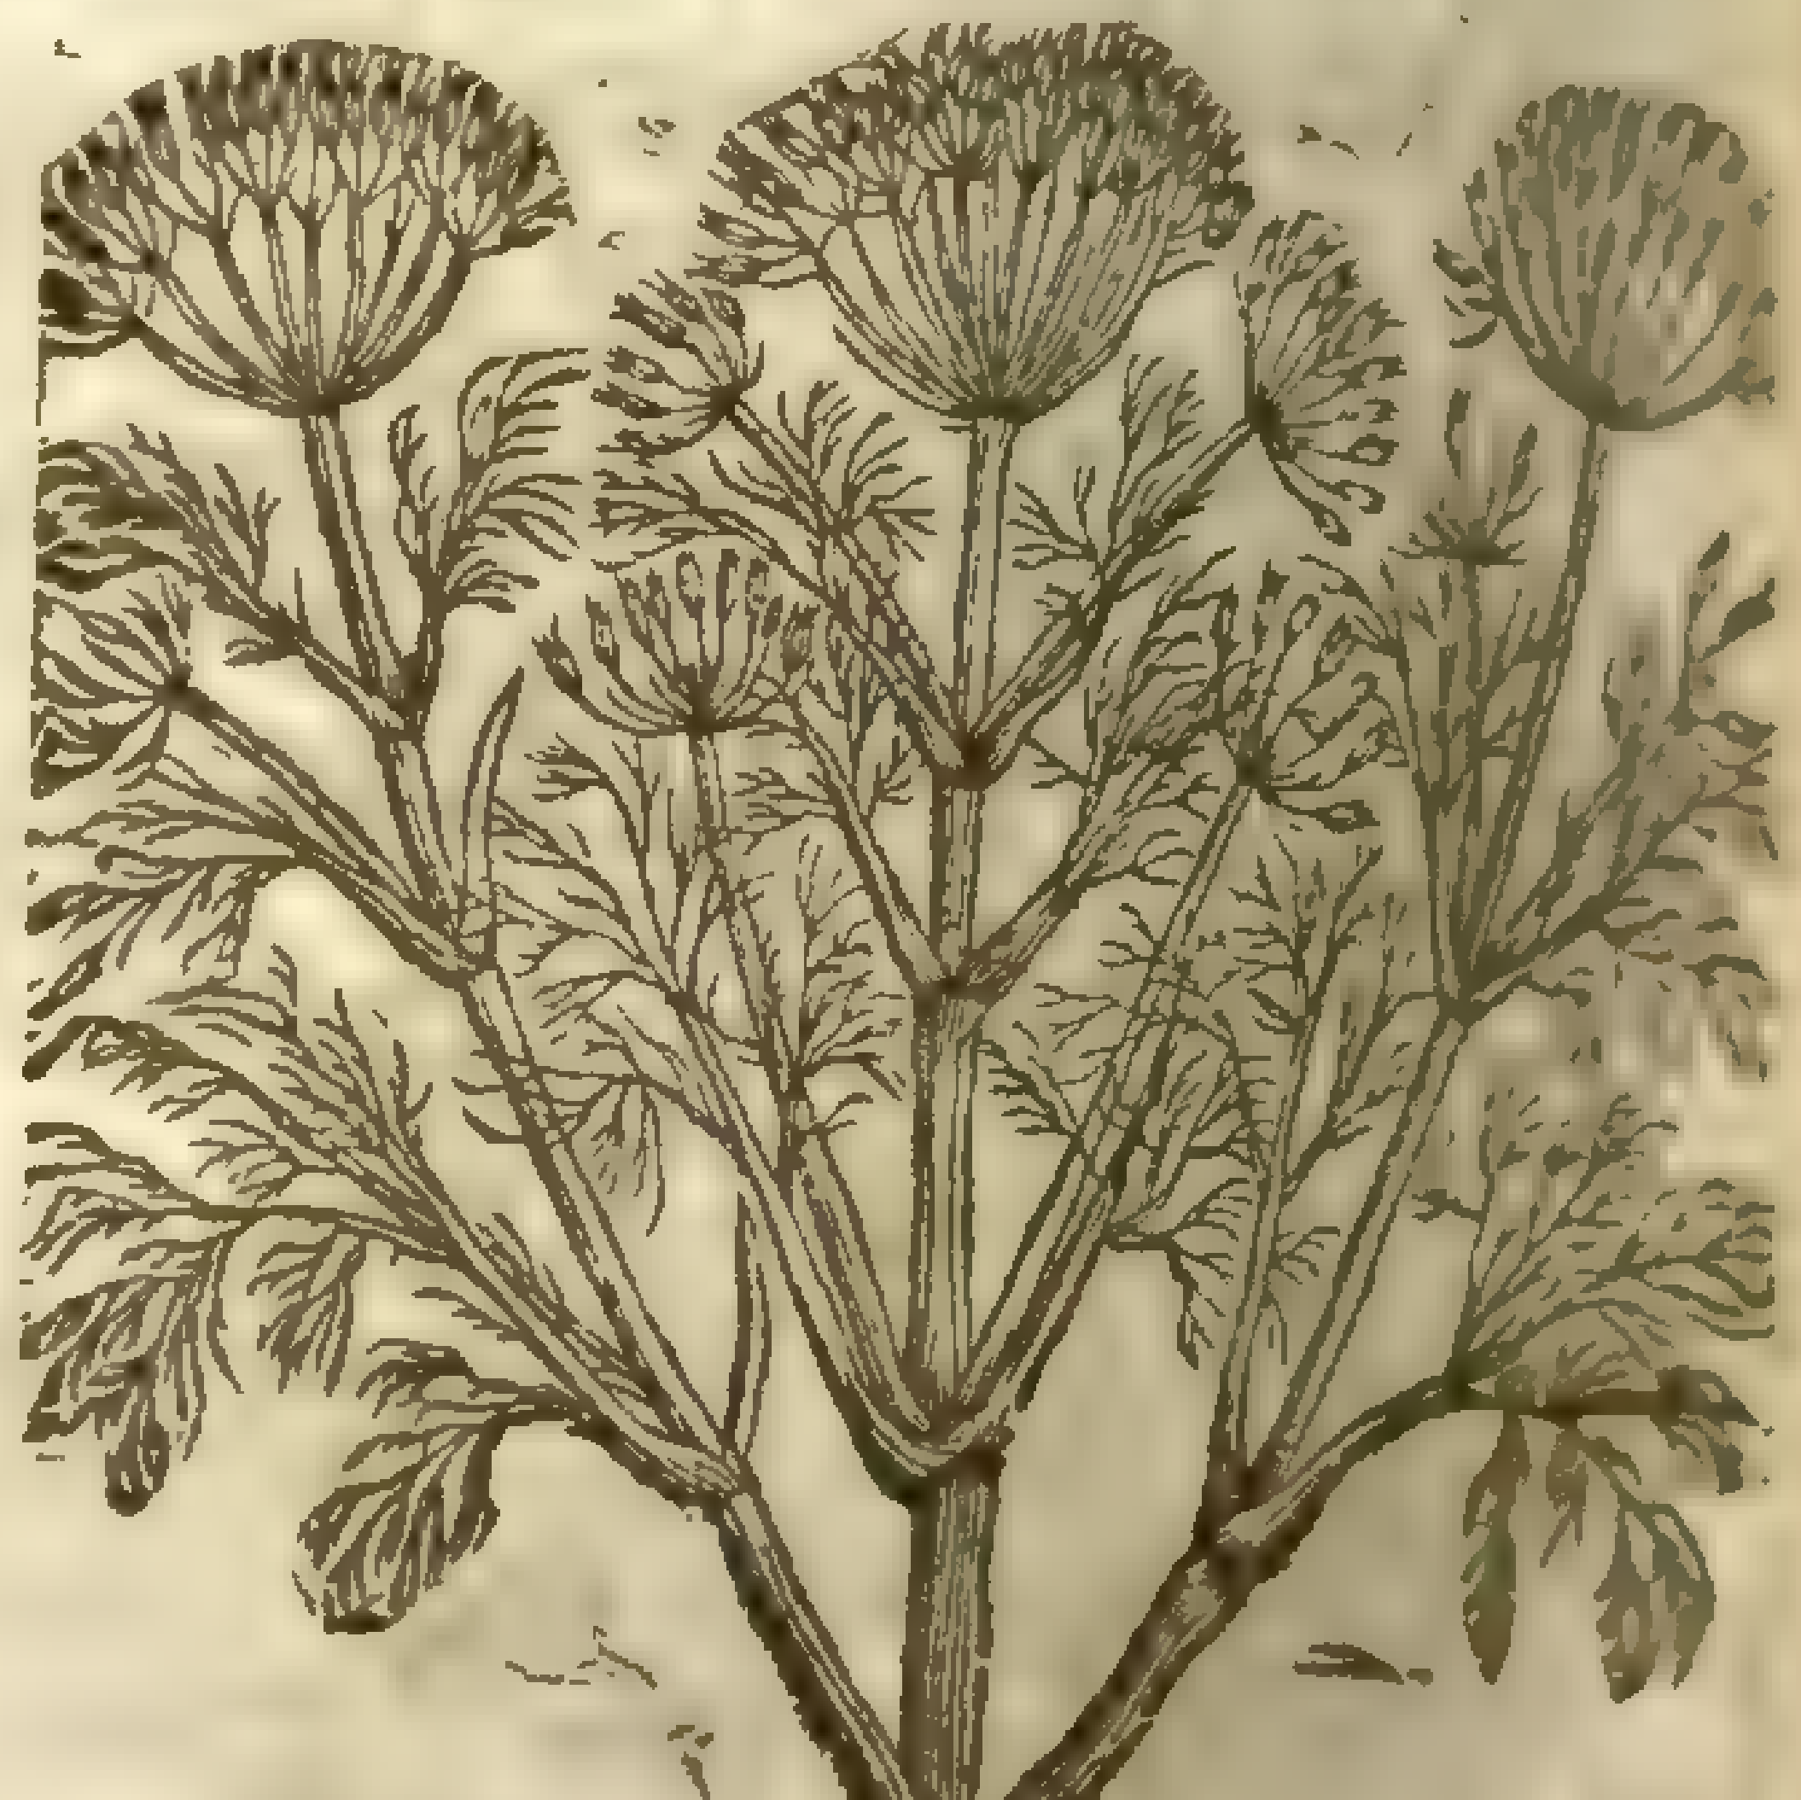
1 THe great ſtinking Carrot hath very great leaues, ſpred abroad like wings, reſembling thoſe of Fennell gyant (whereof ſome haue taken it to be a kinde, but vnproperly) of a bright greene colour, ſomewhat hairy: among which riſeth vp a ſtalke of the height of two cubits, and of the bigneſſe of a mans finger; hollow and full of a ſpungious pith; whereupon are ſet at certaine joynts, leaues like thoſe next the ground, but ſmaller. The floures are yellow, ſtanding at the top of the ſtalke in ſpokie rundles, like thoſe of Dill: after which commeth the ſeed, flat and broad like thoſe of the Parſnep, but much greater and broader. The root is thicke, garniſhed at the top with certaine capillaments or hairy threds, blacke without, white within, full of milky juyce, of a moſt bitter, ſharpe, and lothſome taſte and ſmell, inſomuch that if a man do ſtand where the winde doth blow frow the plant, the aire doth exulcerate and bliſter the face, and euery other bare or naked place that may be ſubject to his venomous blaſt, and poiſonous quality.

1 *Thapſia latifolia Cluſij.*
Stinking Carrots.



[illegible]

2 *Thapſia tenuifolia.*
Small leafed ſtinking Carrot.



2 This ſmall kind of ſtinking or deadly Carrot is like to the laſt deſcribed in each reſpect, ſauing that the leaues are thinner and more finely minced or jagged, wherein conſiſts the difference.

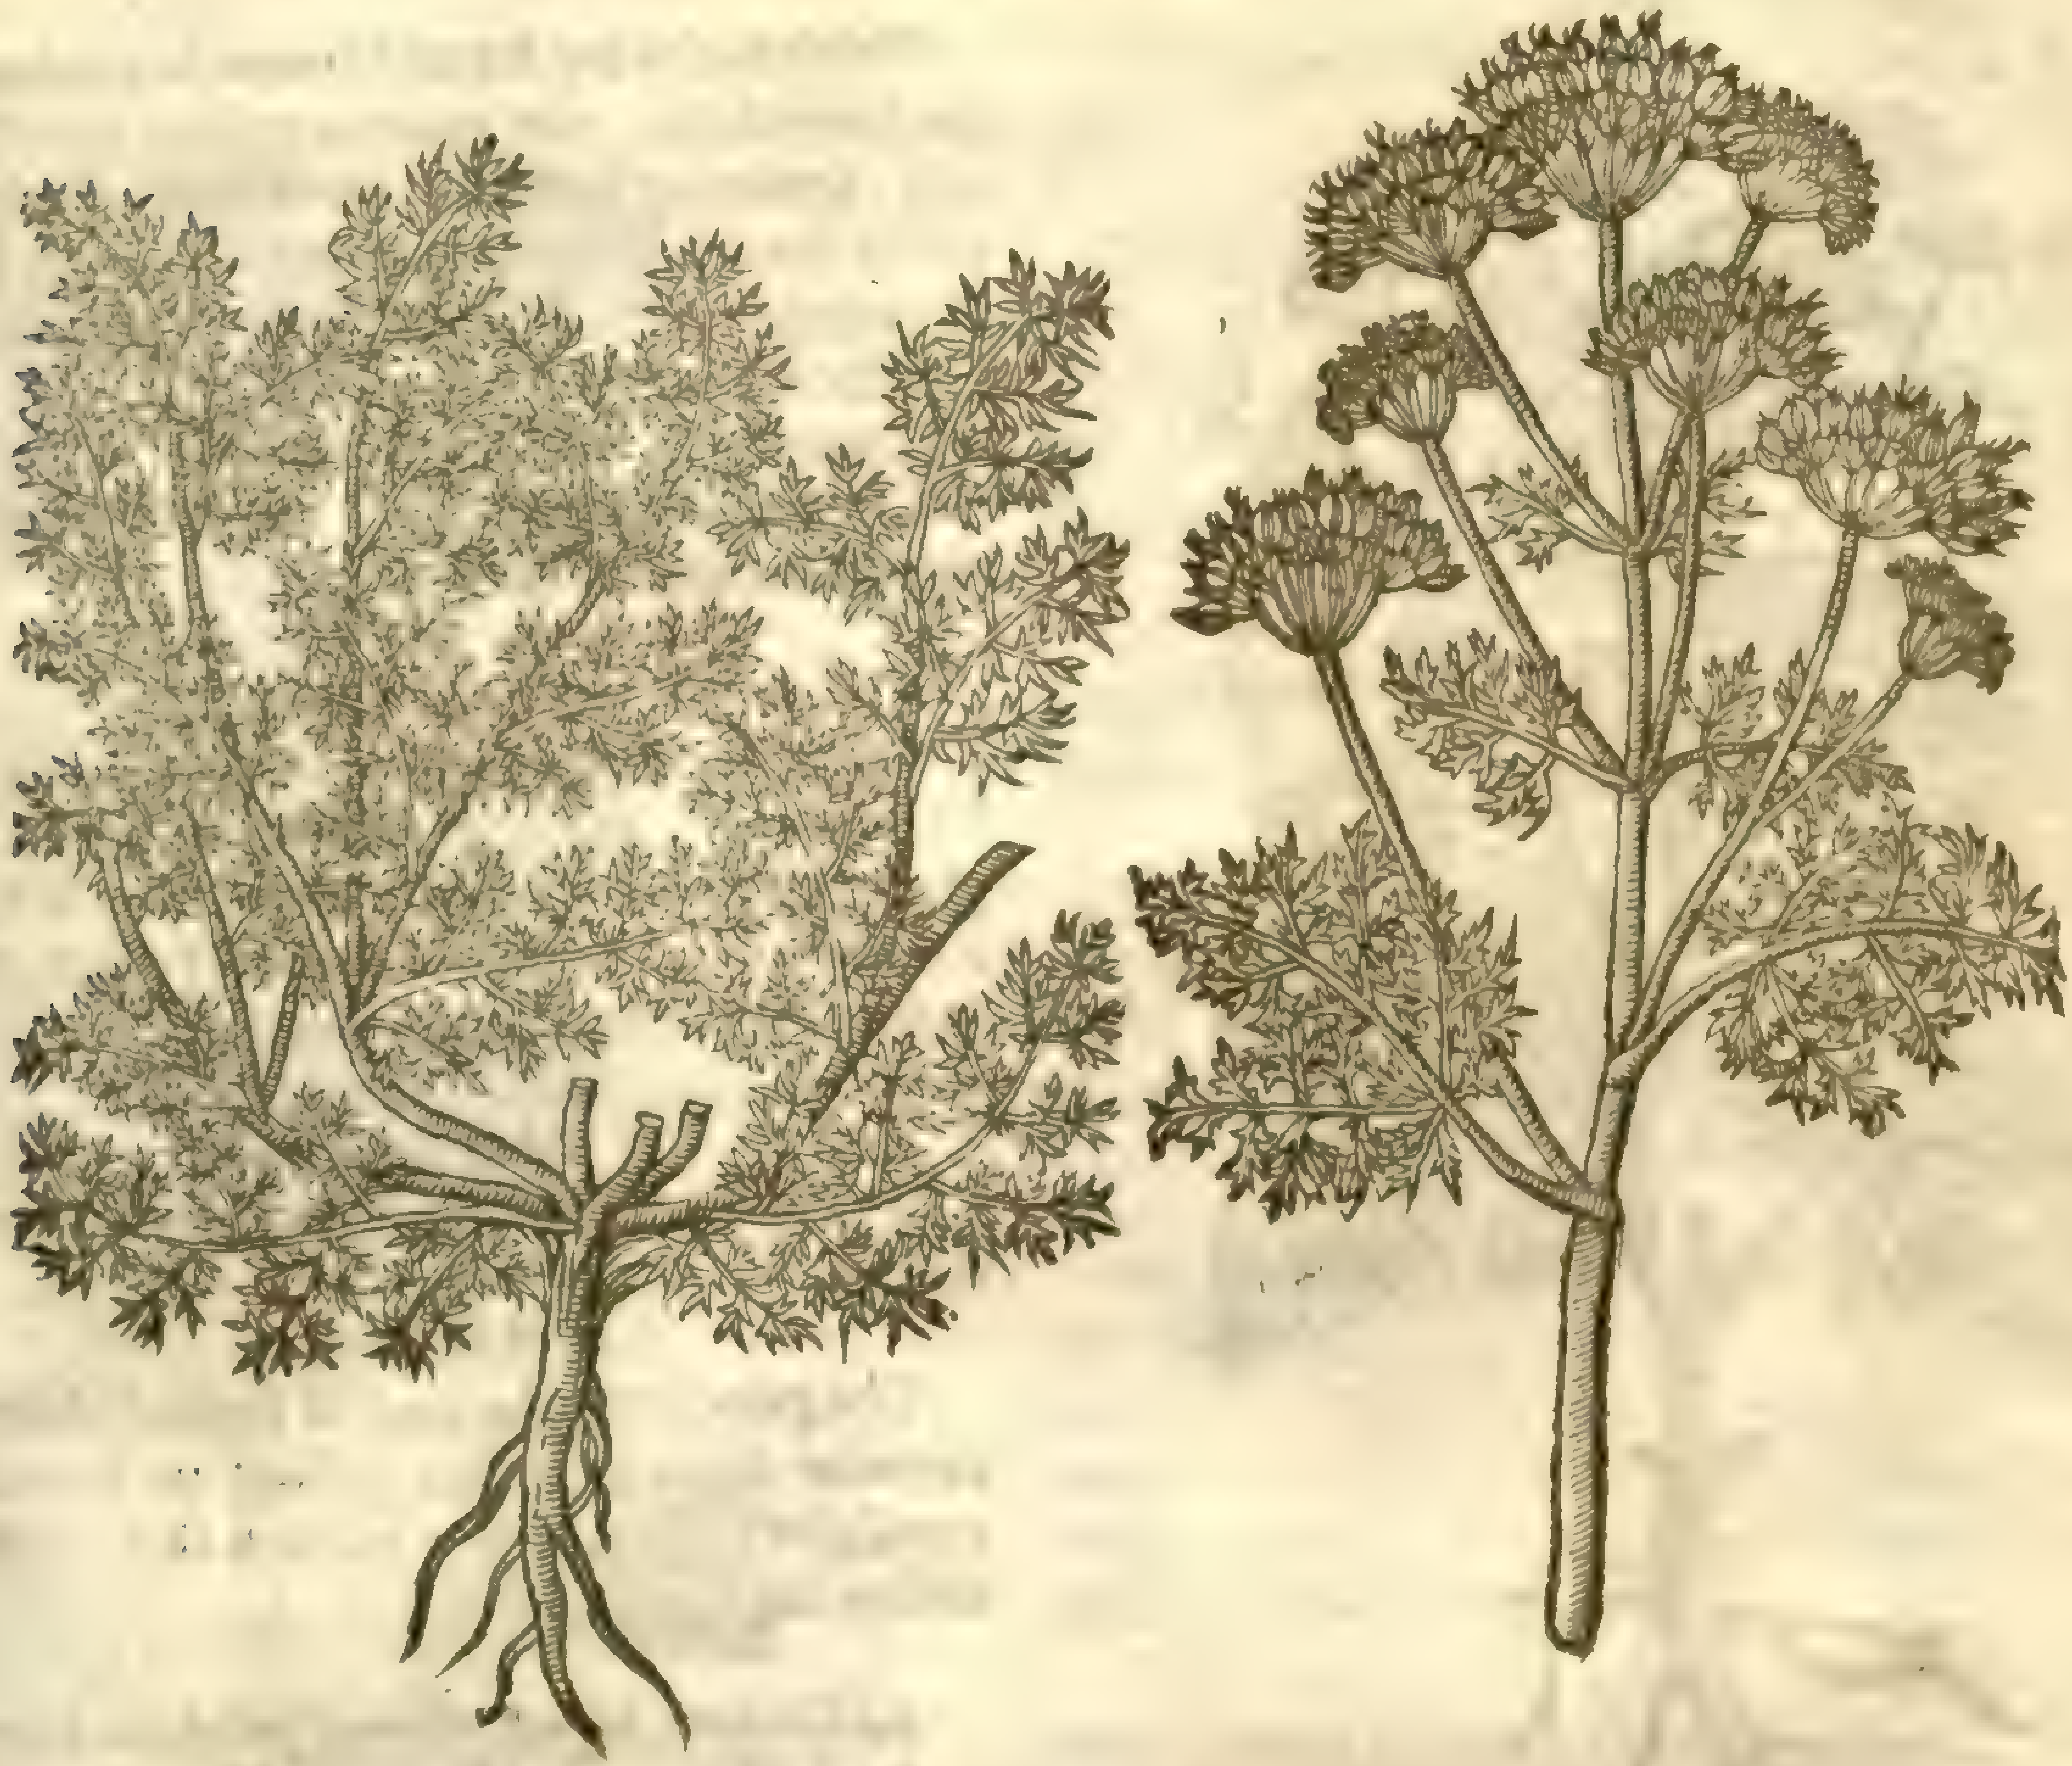
3 The common deadly Carrot is like vnto the precedent, ſauing that he doth more neerely reſemble the ſtalkes and leaues of the garden carrot, and is not garniſhed with the like buſh of haire about the top of the ſtalkes: otherwiſe in ſeed, root, and euill ſmell, taſte and quality like.

¶ *The Place.*

Theſe pernicious plants delight in ſtony hills and mountaines: they are ſtrangers in England.

¶ The

3 Thapſia vulgaris.
Deadly Carrots.



¶ *The Time.*

They floure in Auguſt or ſomewhat after.

¶ *The Names.*

The French Phyſitians haue accepted the root of *Thapſia* for a kinde of Turbith, calling it *Turpetum Cineritium*; notwithſtanding vpon better conſideration they haue left the vſe thereof, eſpecially in purging, for it mightily hurteth the principall parts, and doth often cauſe cruell gripings in the guts and belly, with convulſions and cramps: neuertheleſſe the venomous quality may be taken away with thoſe correctiues which are vſed in mitigating the extreme heate and virulent quality of *Sarcocolla*, *Hammoniacum*, and *Turpetum*: but where there be ſo many wholeſome Simples, and likewiſe compounds they are not to be vſed.

Of ſome it is called *Turpetum Griſeum*: it is called *Thapſia*, as ſome thinke, of the Iſland Thapſus, where it was firſt found.

Of the people of Sicilia and Apulia it is called *Ferulacoli*, where it doth grow in great aboundance.

¶ *The Temperature and Vertues.*

The temperature and faculties in working haue beene touched in the deſcription, and likewiſe in the names.

Chap. 411. *Of Fennell.*

¶ *The Deſcription.*

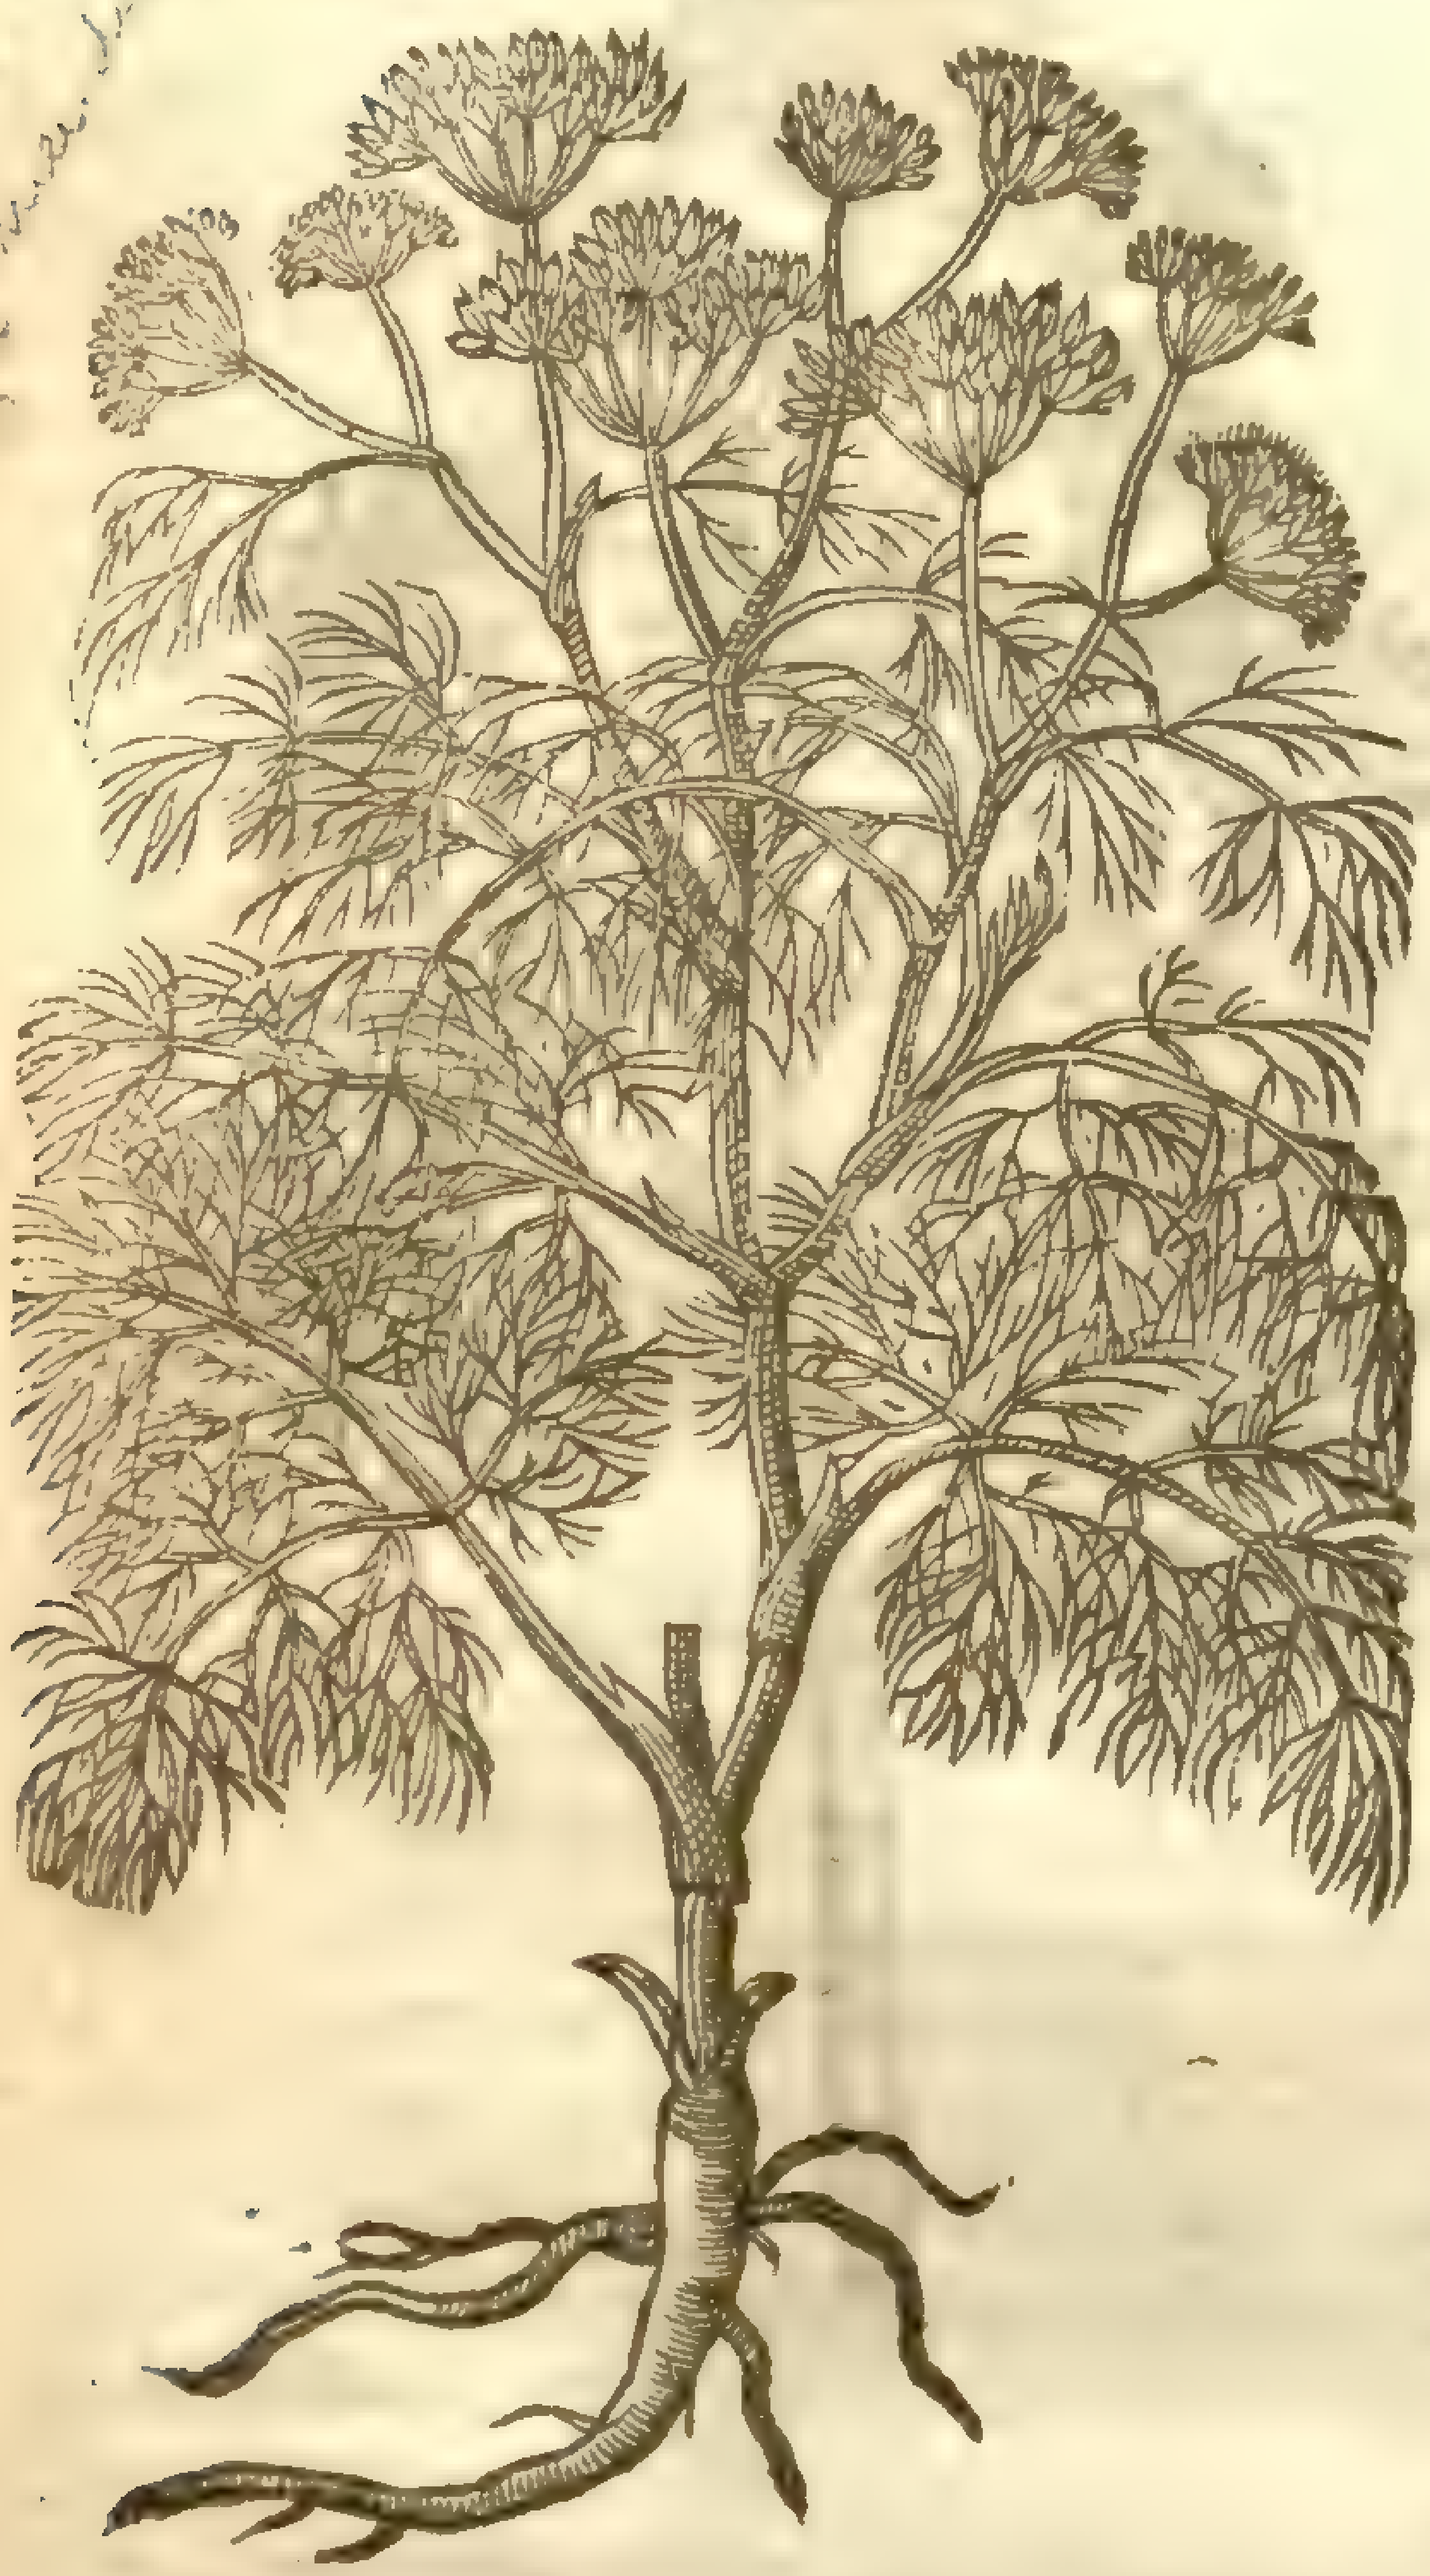
1 The firſt kinde of Fennell, called in Latine, *Fœniculum*: in Greeke, Μάραθρον, is ſo well knowne amongſt vs, that it were but loſt labour to deſcribe the ſame.

2 The ſecond kinde of Fennell is likewiſe well knowne by the name of Sweet Fennell, ſo called becauſe the ſeeds therof are in taſte ſweet like vnto Anniſe ſeeds, reſembling the common Fennell, ſauing that the leaues are larger and fatter, or more oleous: the ſeed greater and whiter, and the whole plant in each reſpect greater.

¶ *The*

Fœniculum vulgare.
Common Fennell.

[illegible]



¶ *The Place.*

Theſe herbs are ſet and ſowne in gardens; but the ſecond doth not proſper well in this Countrey: for being ſowne of good and perfect ſeed, yet in the ſecond yeare after his ſowing it will degenerate from the right kinde, and become common Fennell.

¶ *The Time.*

They floure in Iune and Iuly, and the ſeed is ripe in the end of Auguſt.

¶ *The Names.*

Fennell is called in Greeke, Μάραθρον: in Latine, *Marathrum*, and *Fœniculum*: in high Dutch, **Fenckell**: in low Dutch, **Venckell**: in Italian, *Finocchio*: in Spaniſh, *Hinoio*: in French, *Fenoil*: in Engliſh, Fennell, and Fenckell.

¶ *The Temperature.*

The ſeed of Fennel is hot and dry in the third degree.

¶ *The Vertues.*

A The pouder of the ſeed of Fennell drunke for certaine daies together faſting preſerueth the eye-ſight: whereof was written this Diſtichon following:

Fœniculum, Roſa, Verbena, Chelidonia, Ruta,
Ex his fit aqua quæ lumina reddit acuta.

Of Fennell, Roſes, Veruain, Rue, and Celandine,
Is made a water good to cleere the ſight of eine.

B The greene leaues of Fennell eaten, or the ſeed drunke made into a Ptiſan, do fill womens breſts with milke.

C The decoction of Fennell drunke eaſeth the paines of the kidnies, cauſeth one to auoid the ſtone, and prouoketh vrine.

D The roots are as effectuall, and not onely good for the intents aforeſaid, but againſt the dropſie alſo, being boiled in wine and drunken.

E Fennell ſeed drunke aſſwageth the paine of the ſtomacke, and wambling of the ſame, or deſire to vomit, and breaketh winde.

F The herbe, ſeed, and root of Fennell are very good for the lungs, the liuer, and the kidnies, for it openeth the obſtructions or ſtoppings of the ſame, and comforteth the inward parts.

G The ſeed and herbe of ſweet Fennell is equall in vertues with Anniſe ſeed.

Chap. 412. Of Dill.

¶ *The Deſcription.*

Dill hath a little ſtalke of a cubit high, round and ioynted: whereupon doe grow leaues very finely cut, like to thoſe of Fennell, but much ſmaller: the floures be little and yellow, ſtanding in a ſpokie tuft or rundle: the ſeed is round, flat and thin: the whole plant is of a ſtrong ſmell: the root is threddy.

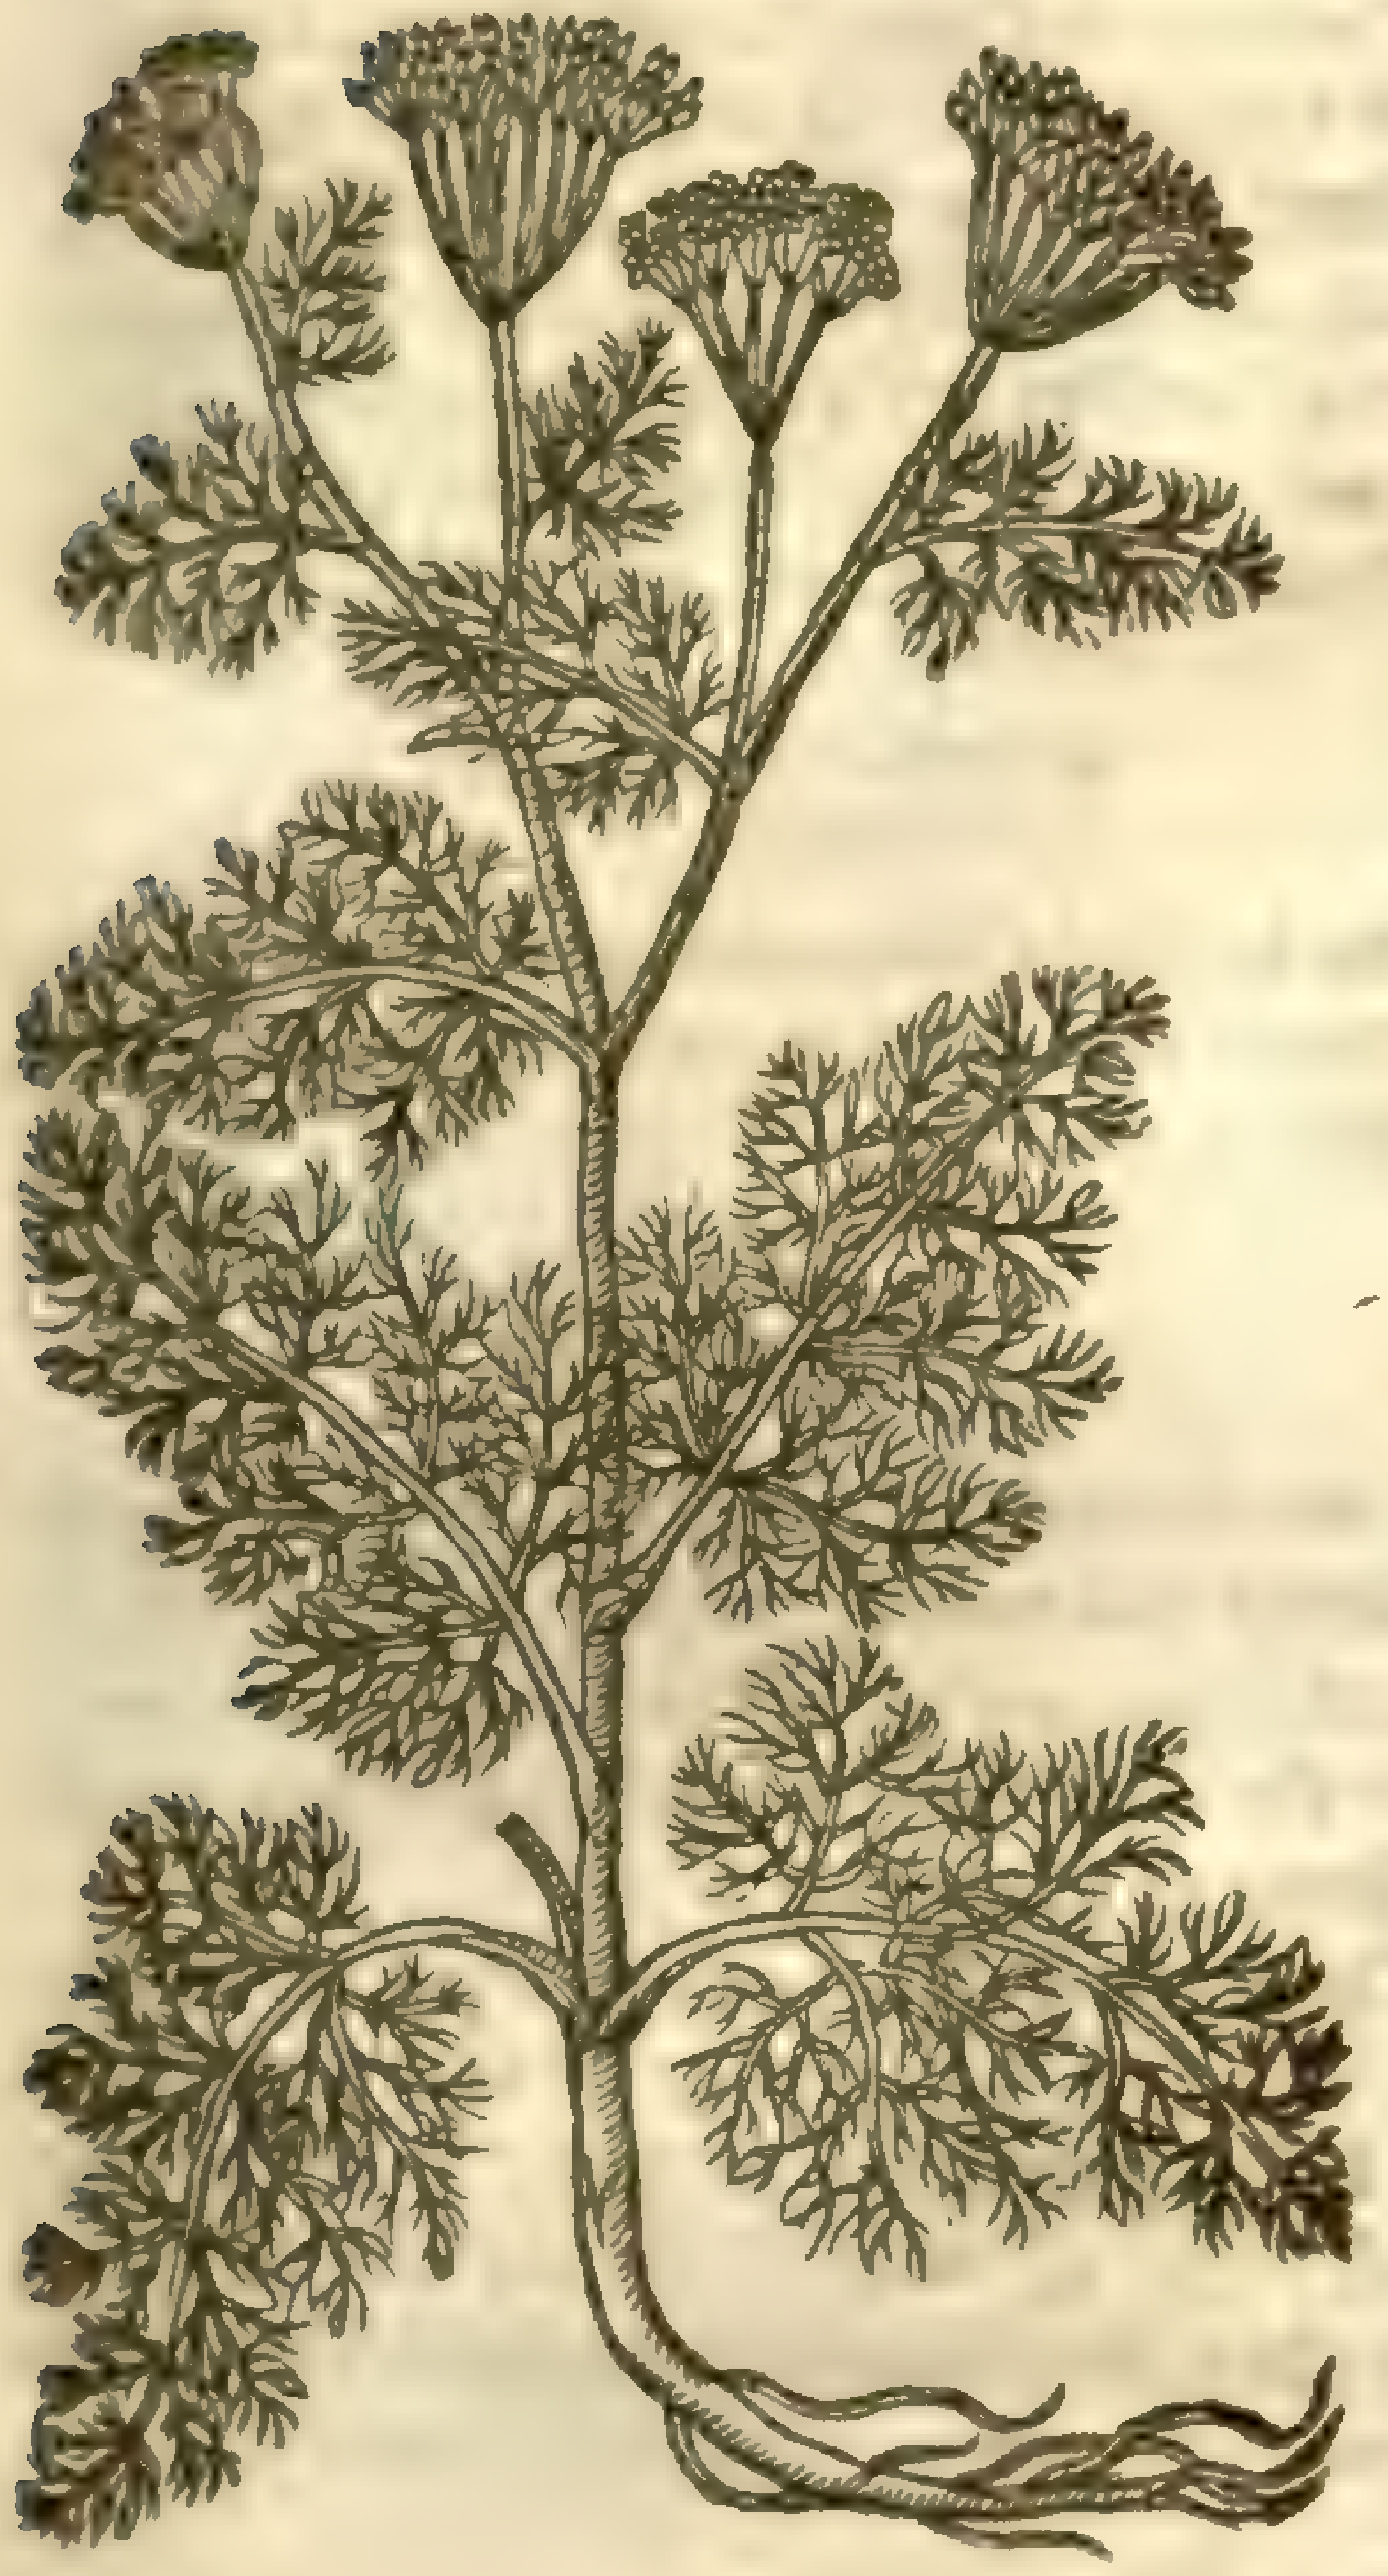
¶ *The Place.*

It is ſowne in gardens, and is alſo ſometimes found wilde.

¶ The

Anethum.
Dill.

[illegible] graveolens [illegible]



¶ *The Time.*

It bringeth forth floures and ſeed in Auguſt.

¶ *The Names.*

Dil is called in Greek, *Ἄνηθον*: in Latine likewiſe *Anethum*, and *Anetum*: in high Dutch, **Dyllen**: in low Dutch, **Dille**: in Italian *Anetho*: in Spaniſh, *Eneldo*: in French, *Anet*: in Engliſh, Dill, and Anet.

¶ *The Temperature.*

Dill, as *Galen* ſaith, is hot in the end of the ſecond degree, and dry in the beginning of the ſame, or in the end of the firſt degree.

¶ *The Vertues.*

A The decoction of the tops of dried Dil, and likewiſe of the ſeed, being drunke, engendreth milke in the breſts of nurſes, allaieth gripings and windineſſe, prouoketh vrine, increaſeth ſeed, ſtayeth the yeox, hicket, or hicquet, as *Dioſcorides* teacheth.

B The ſeed likewiſe if it be ſmelled vnto ſtayeth the hicket, eſpecially if it bee boyled in wine, but chiefely if it be boyled in Worme-wood Wine, or Wine and a few branches of Worme-wood, and Roſe-leaues, and the ſtomacke bathed therewith.

C *Galen* ſaith, that being burnt and layd vpon moiſt vlcers, it cureth them, eſpecially thoſe in the ſecret parts, and likewiſe thoſe *ſub Præputio*, though they be old and of long continuance.

D Common oyle, in which Dill is boyled or ſunned, as we do oyle of Roſes, doth digeſt, mitigate paine, procureth ſleepe, bringeth raw and vnconcocted humors to perfect digeſtion, and prouoketh bodily luſt.

E Dill is of great force or efficacie againſt the ſuffocation or ſtrangling of the mother, if the woman doe receiue the fume thereof being boiled in wine, and put vnder a cloſe ſtoole or hollow ſeat fit for the purpoſe.

CHAP. 413. *Of Caruwaies.*

¶ *The Deſcription.*

CAruwaies haue an hollow ſtalke foure ſquare, of two cubits high, full of knots or joynts; from which proceed ſundry other ſmall branches, ſet full of leaues very finely cut or jagged, like vnto thoſe of Carrots or Dill: at the top of the ſtalkes grow ſpokie white tufts like thoſe of Dill: after which commeth the ſeed, ſharpe in eating, yet of a pleaſant taſte: the root is like that of Parſley, often white, ſeldome yellow, and in taſte like vnto the Carrot.

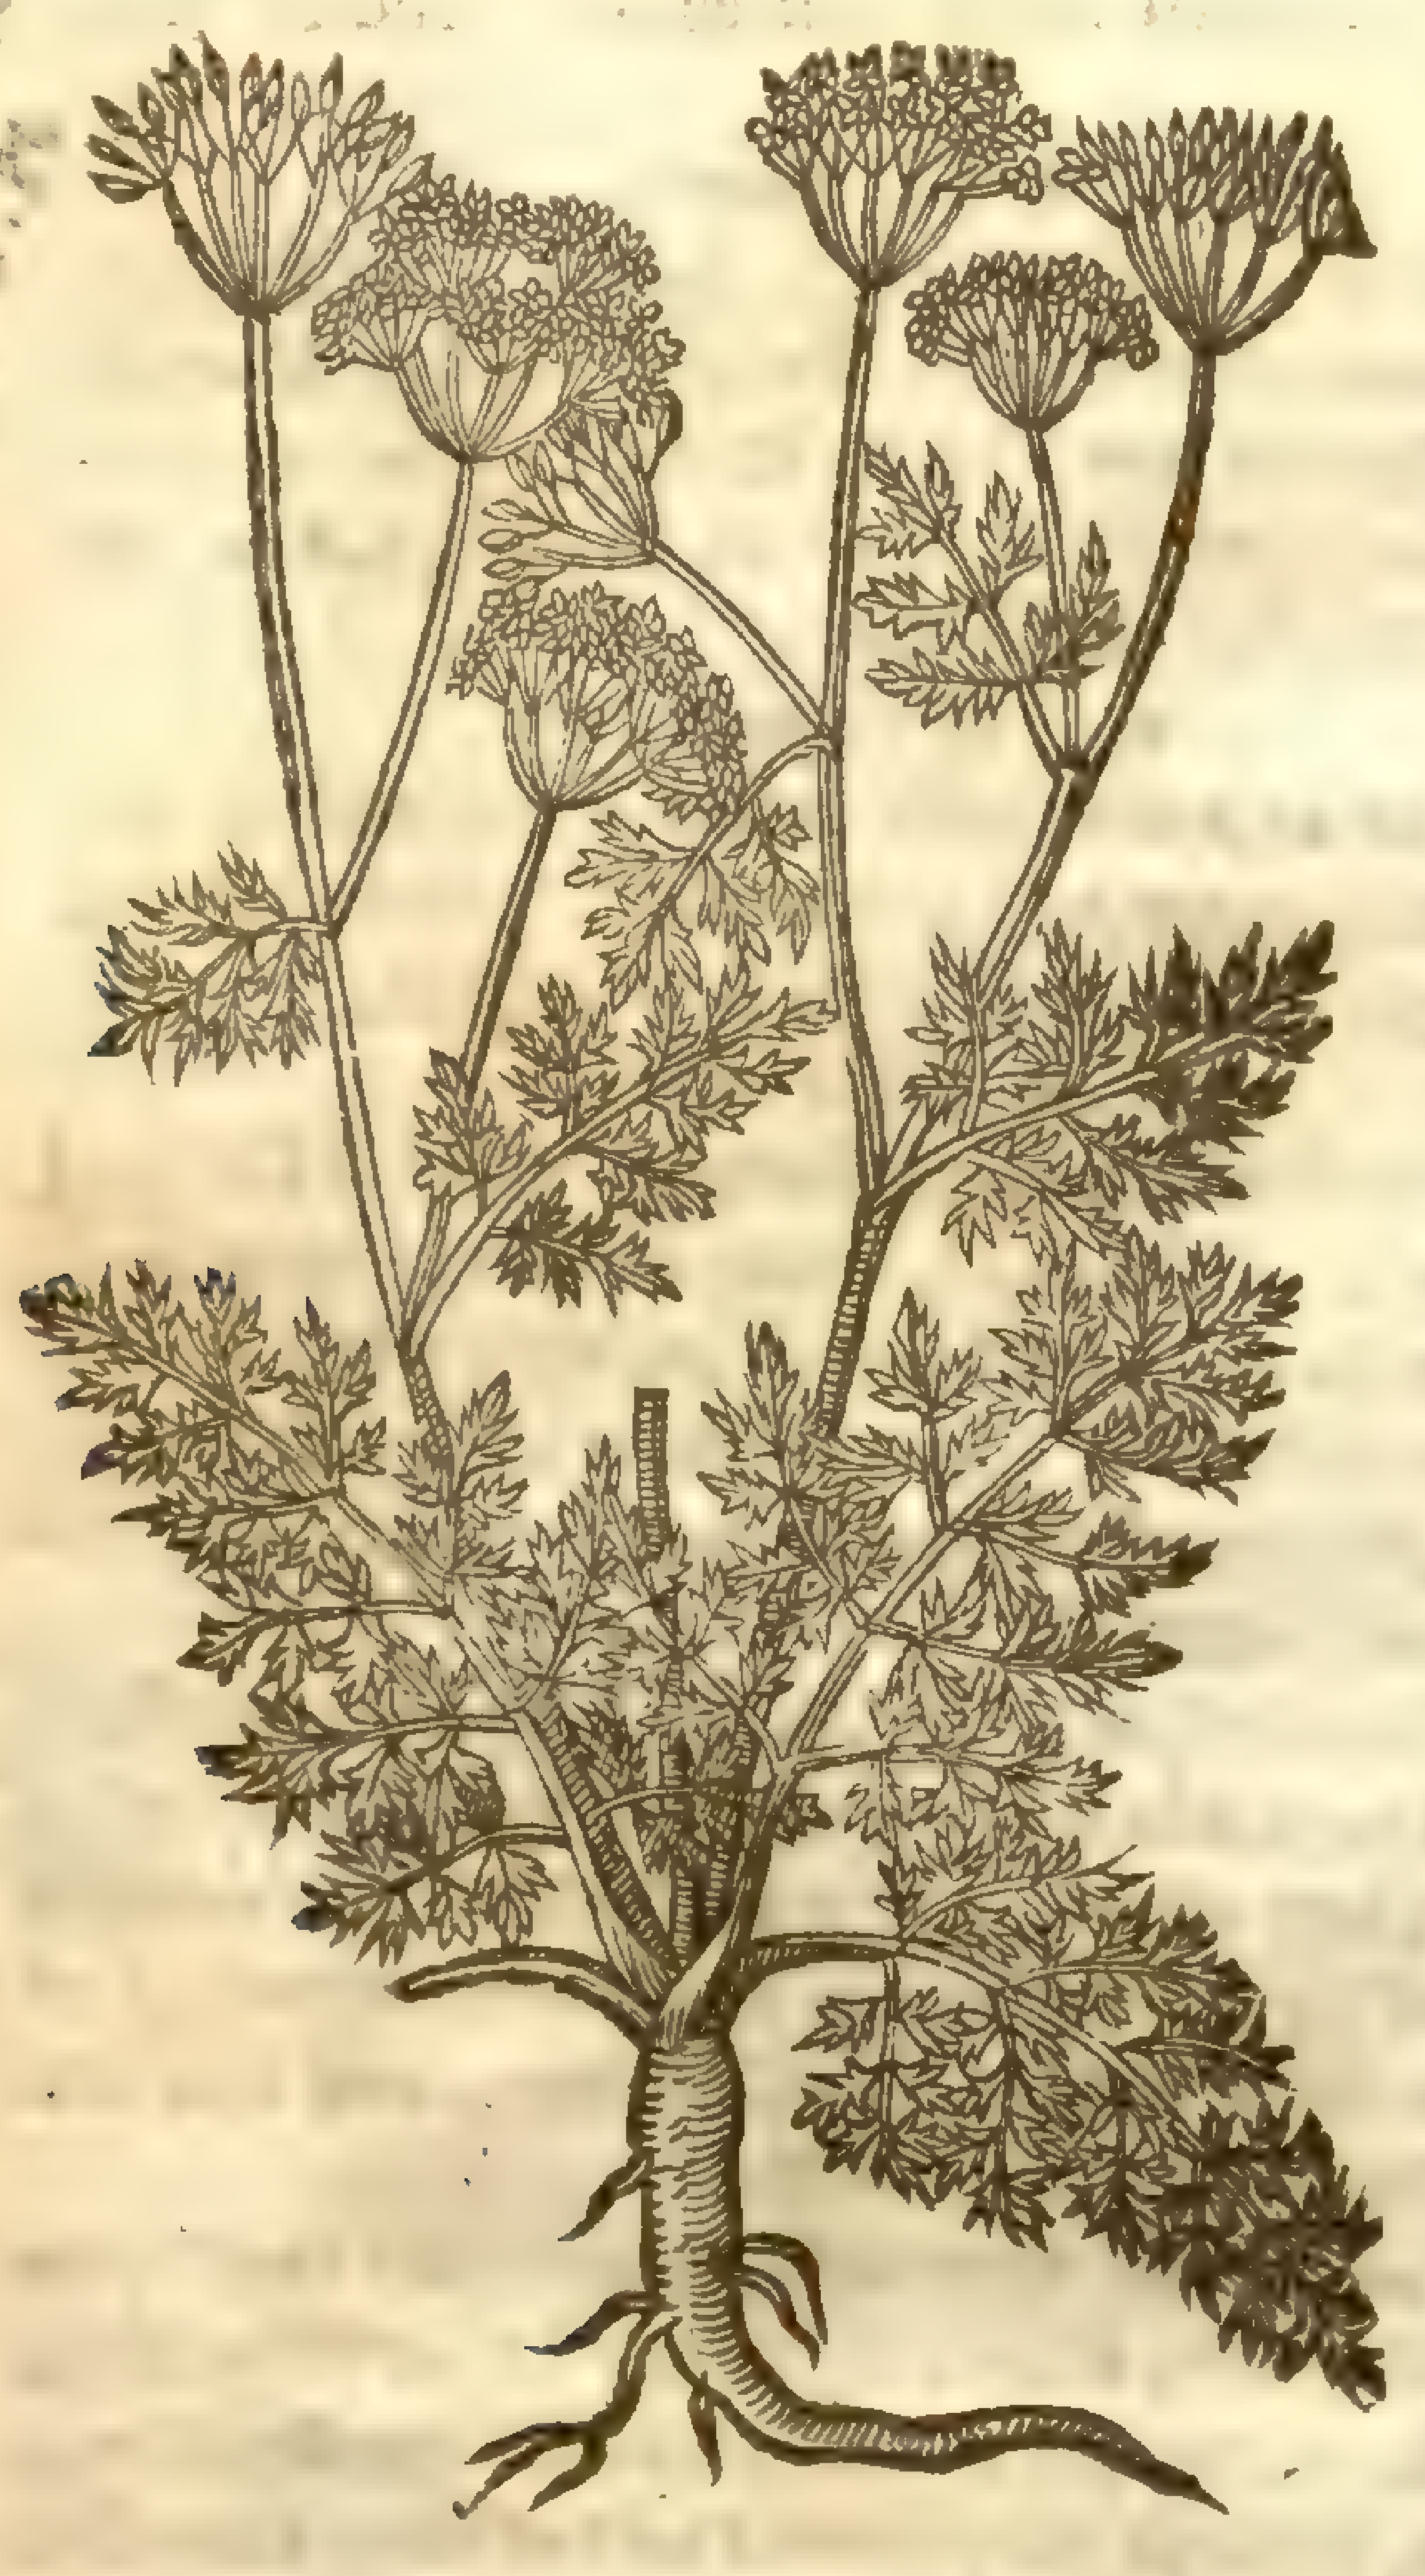
¶ *The Place.*

It groweth almoſt euery where in Germany and in Bohemia, in fat and fruitfull fields, and in medowes that are now and then ouer-run with water: it groweth alſo in Caria, as *Dioſcorides* ſheweth, from whence it tooke his name.

¶ *The Time.*

It floureth and ſeedeth from May to the end of Auguſt.

Carum, ſiue Careum.
Caruwaie.



¶ *The Names.*

It is called in Greeke, *κάρος*: in Latine, *Carum* and *Careum*: in ſhops, *Carui*. *Simeon Zethy* calleth it *Carnabadion*: in high Dutch, **Kym**, and **Kymmel**: in low Dutch, **Caruy ſaet**: in French, *du Caruy*: in Italian, *Caro*: in Spaniſh, *Carauea*, and an article being ioyned vnto it, *Alkarauea*: in Engliſh, Caruwaie, and the ſeed is called Caruwaie ſeed.

¶ *The Temperature.*

The ſeed of Caruwaies, as *Galen* ſaith, is hot and dry in the third degree, and hath a moderate biting qualitie.

¶ *The Vertues.*

It conſumeth winde, it is delightfull to the ſtomacke and taſte, it helpeth concoction, prouoketh vrine, and is mixed with counterpoiſons: the root may be ſodden, and eaten as the Parſenep or Carrot is.

The ſeeds confected, or made with ſugar into Comfits, are very good for the ſtomacke they helpe digeſtion, prouoke vrine, aſſwage and diſſolue all windineſſe: to conclude in a word, they are anſwerable to Aniſe ſeed in operation and vertues.

Chap. 414. *Of Anniſe.*

¶ *The Deſcription.*

1 THe ſtalke of Anniſe is round and hollow, diuided into diuers ſmall branches, ſet with leaues next the ground ſomewhat broad and round: thoſe that grow higher are more jagged, like thoſe of young Parſley, but whiter: on the top of the ſtalkes do ſtand ſpokie rundles or tufts of white floures, and afterward ſeed, which hath a pleaſant taſte as euery one doth know.

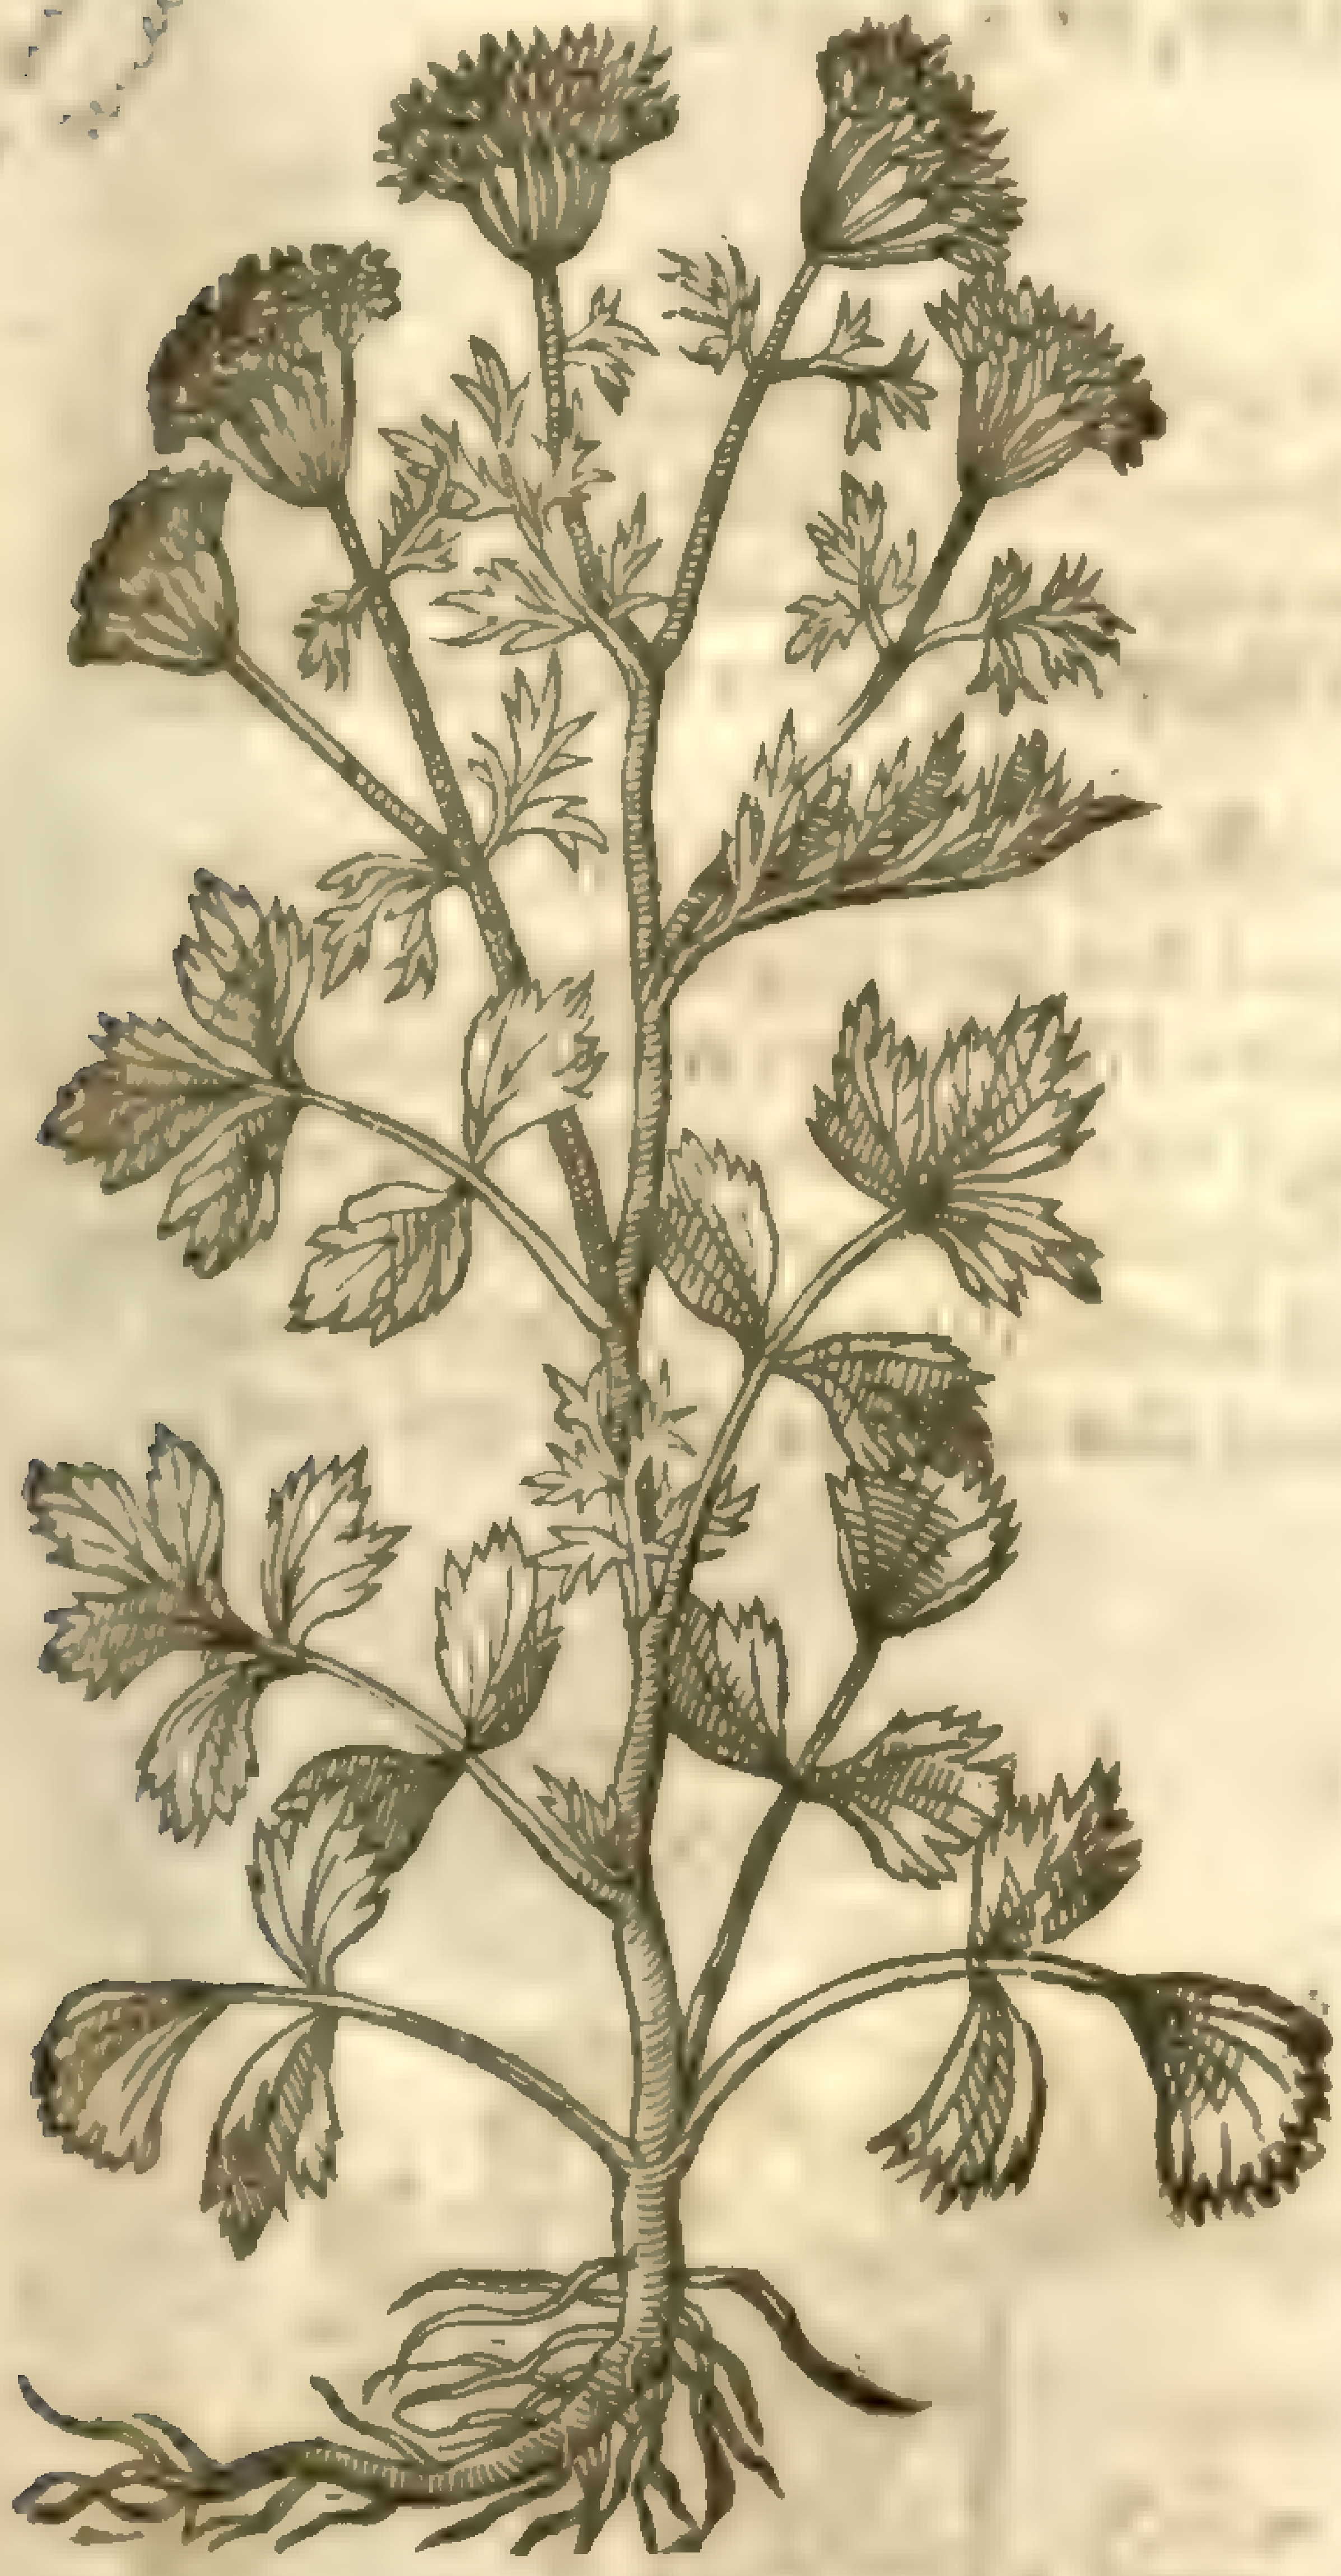
‡ 2 This other Anniſe (whoſe vmbels *Cluſius* had out of England from Maſter *Morgan* the Queenes Apothecarie, and *Iames Garret*, and which were brought from the Philippines by Mr. *Tho. Candiſh* in his voyage when he incompaſſed the world) is thus deſcribed by *Cluſius*: The vmbels were large, no leſſe than thoſe of the Archangelica, made of diuers thicke ſtiffe foot-ſtalkes, each whereof carried not double ſeed as the common Anniſe, but more, in a round head ſome inch ouer, made of cods ſet ſtar faſhion, ſix, eight, or more, of a dusky colour, wrinkled, diuided into two equall parts, and open aboue: moſt of theſe huskes were empty, yet ſome of them contained one ſmooth ſhining aſh coloured ſeed, of the bigneſſe of that of *Orobus*; the taſte and ſmell was the ſame with our common Aniſe ſeed, wherefore they which ſent it to *Cluſius* called it Anniſe: yet in the place where it grew it was called *Damor*; for Mr. *Candiſh* had the name ſo written in the China characters, after their manner of writing. ‡

¶ *The Place.*

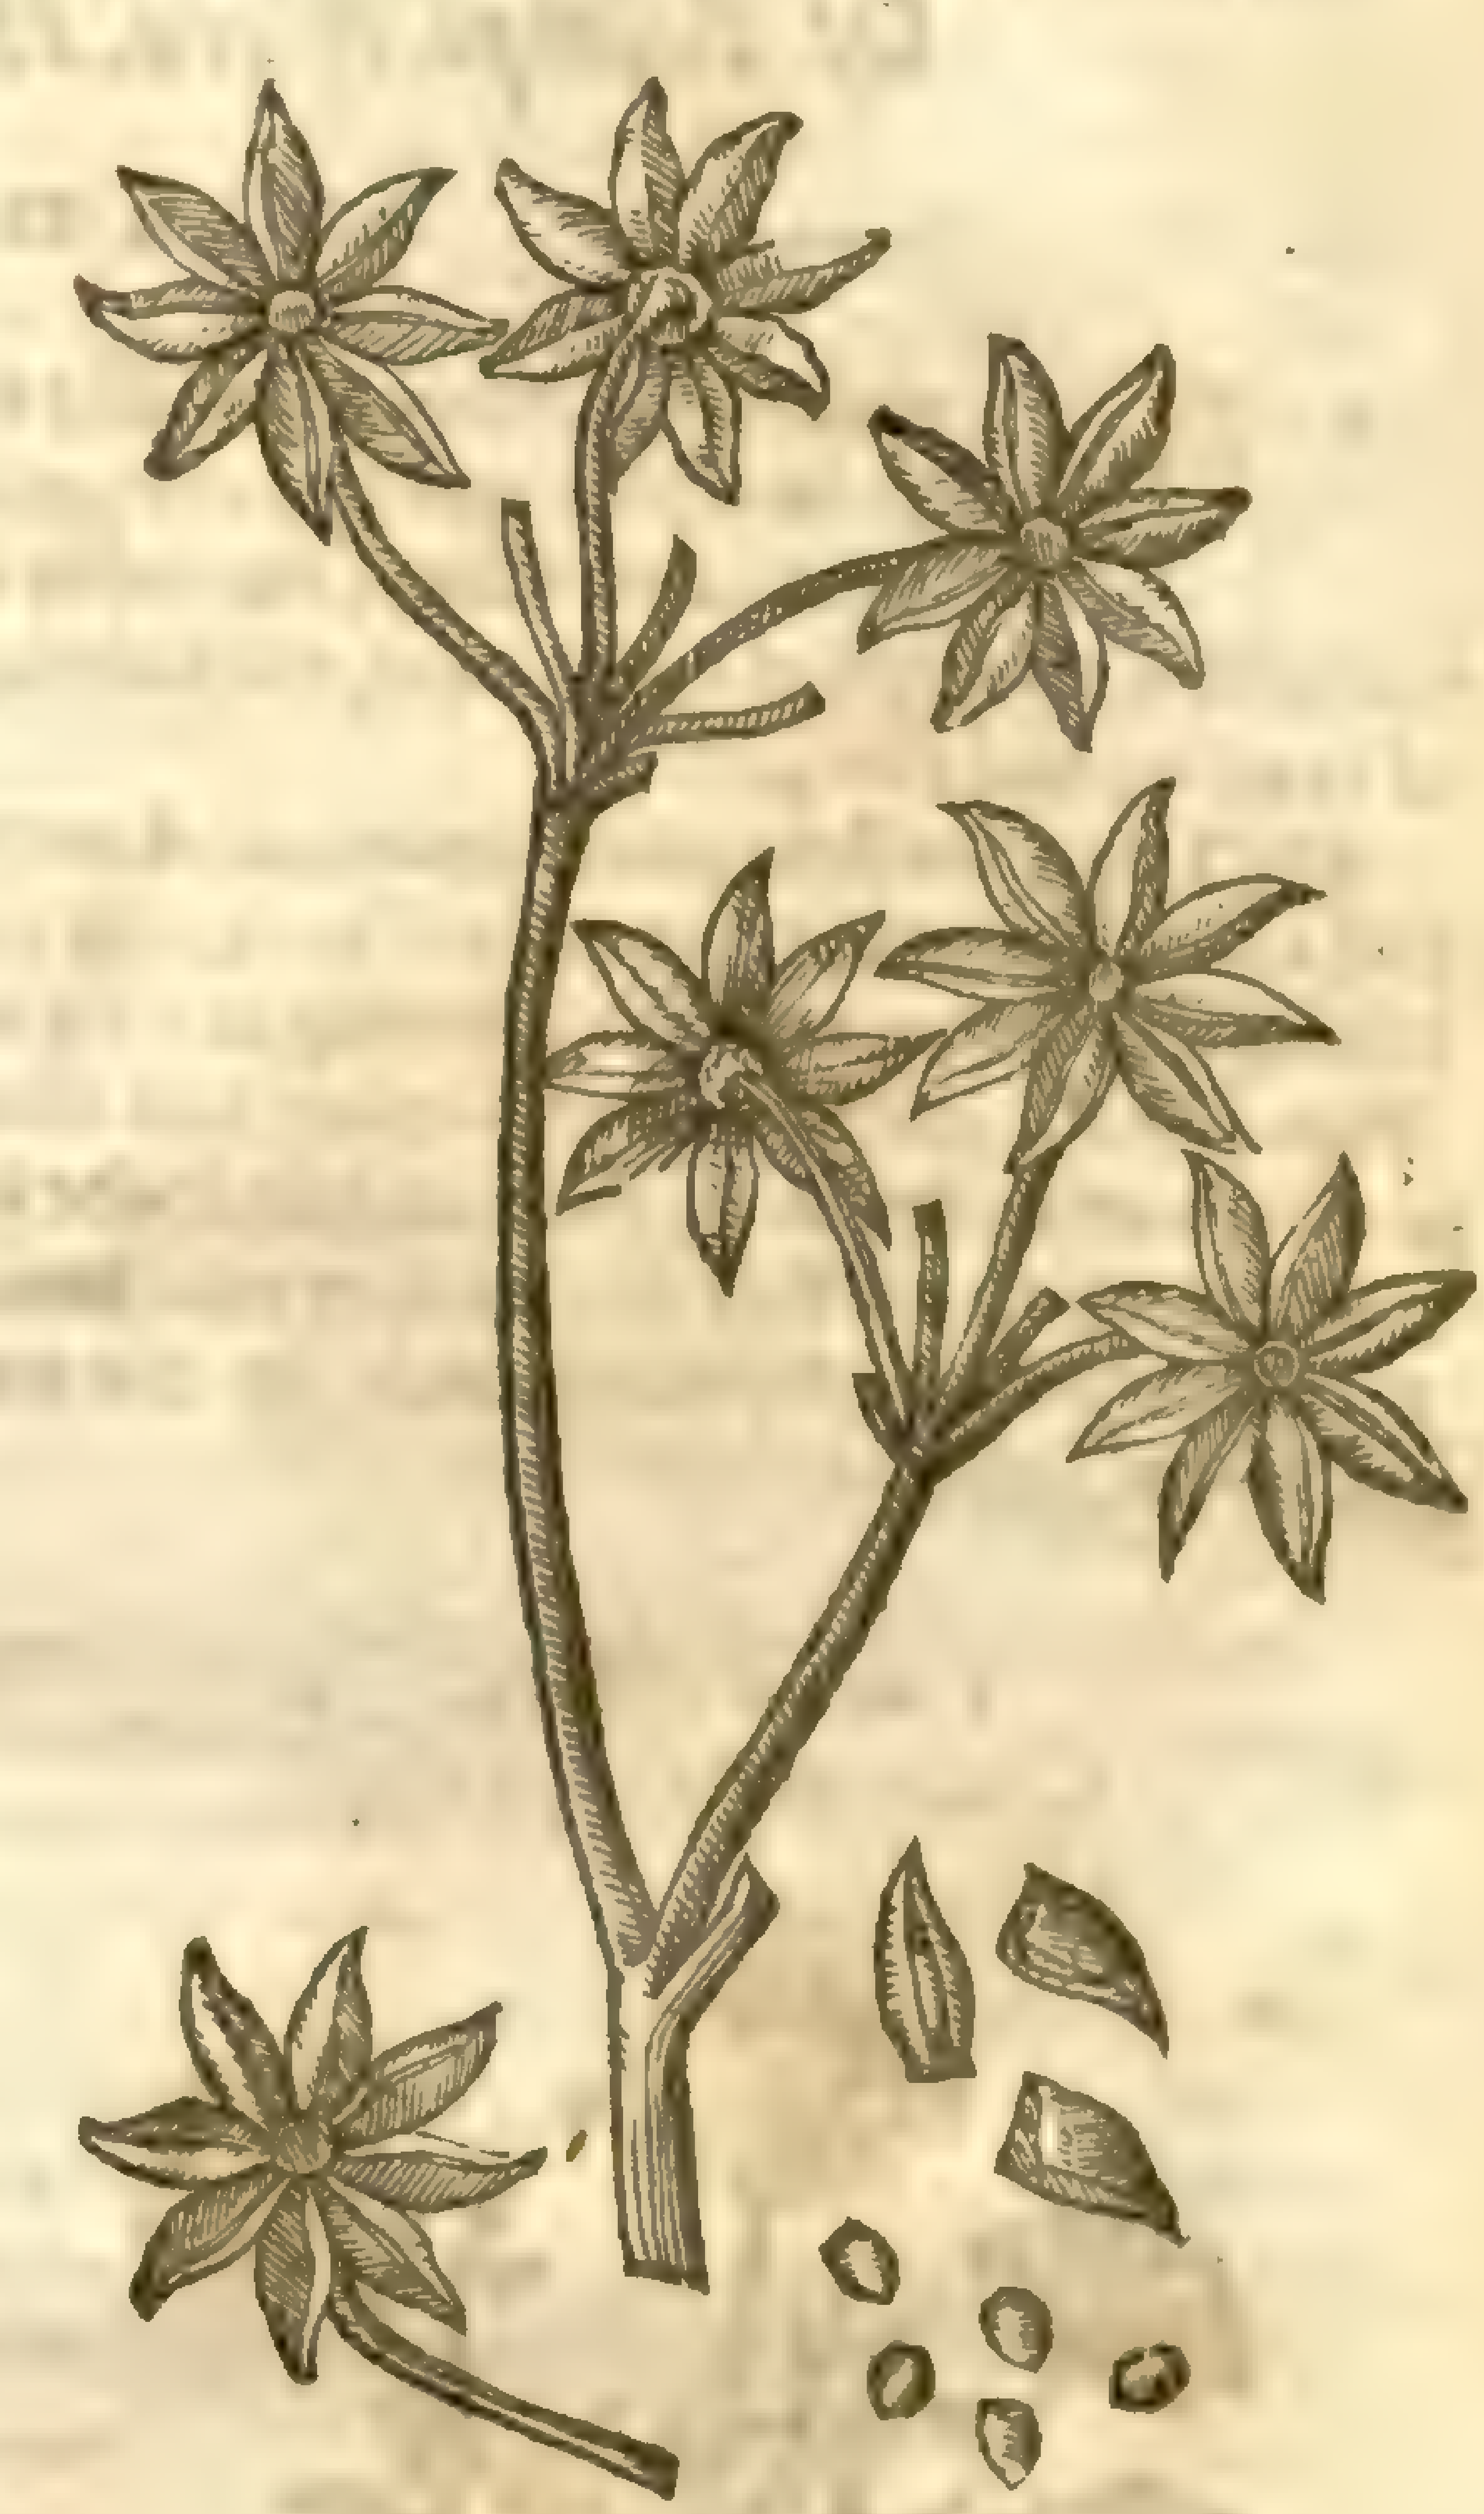
It groweth plentifully in Candy, Syria, Ægypt, and other countries of the Eaſt. I haue often ſowne it in my garden, where it hath brought forth his ripe ſeed when the yeare hath fallen out to be temperate.

¶ *The*

1 *Aniſum.*
Aniſe.



‡ 2 *Aniſum Indicum ſtellatum.*
Starry headed Aniſe.



¶ *The Time.*

It is to be ſowne in theſe cold regions in the moneth of May: the ſeed is ripe in Auguſt.

¶ *The Names.*

It is called in Latine, *Aniſum*: in Greeke, Ἄνισον: in high Dutch, **Aniſz**: in low Dutch, **Aniſſaet**: in Italian, *Aniſo*: in Spaniſh, *Matahalua*: in French, *Anis*: in Engliſh, Aniſe, and Anniſe ſeed.

¶ *The Temperature.*

Galen writeth, That the ſeed of Aniſe is hot and dry in the third degree: after others, it is hot in the ſecond degree, and much leſſe than dry in the ſecond degree; for it ingendreth milke, which it could not doe if it were very dry, as *Galen* in his chapter of Fennell doth whether hee will or no declare and teſtifie; in that it doth ingender milke, his opinion is that it is not hot aboue the firſt degree: which thing alſo may be in Aniſe ſeed, both by this reaſon, and alſo becauſe it is ſweet. Therefore to conclude, Aniſe ſeed is dry in the firſt degree, and hot in the ſecond.

¶ *The Vertues.*

The ſeed waſteth and conſumeth winde, and is good againſt belchings and vpbraidings of the ſtomacke, allaieth gripings of the belly, prouoketh vrine gently, maketh abundance of milke, and ſtirreth vp bodily luſt: it ſtayeth the laske, and alſo the white flux in women. A

Being chewed it makes the breath ſweet, and is good for them that are ſhort winded, and quencheth thirſt, and therefore it is fit for ſuch as haue the dropſie: it helpeth the yeoxing or hicket, both when it is drunken or eaten dry: the ſmell thereof doth alſo preuaile very much. B

The ſame being dried by the fire and taken with honey clenſeth the breſt very much from flegmaticke ſuperfluities: and if it be eaten with bitter Almonds it doth helpe the old cough. C

It is to be giuen to young children and infants to eat which are like to haue the falling ſicknes, or to ſuch as haue it by patrimony or ſucceſſion. D

It taketh away the ſquinancie or Quincie, (that is, a ſwelling in the throat) being gargled with hony, vinegre, and a little Hyſſop gently boyled together. E

Chap. 415.

Of Biſhops Weed, Herbe-William, or Ameos.

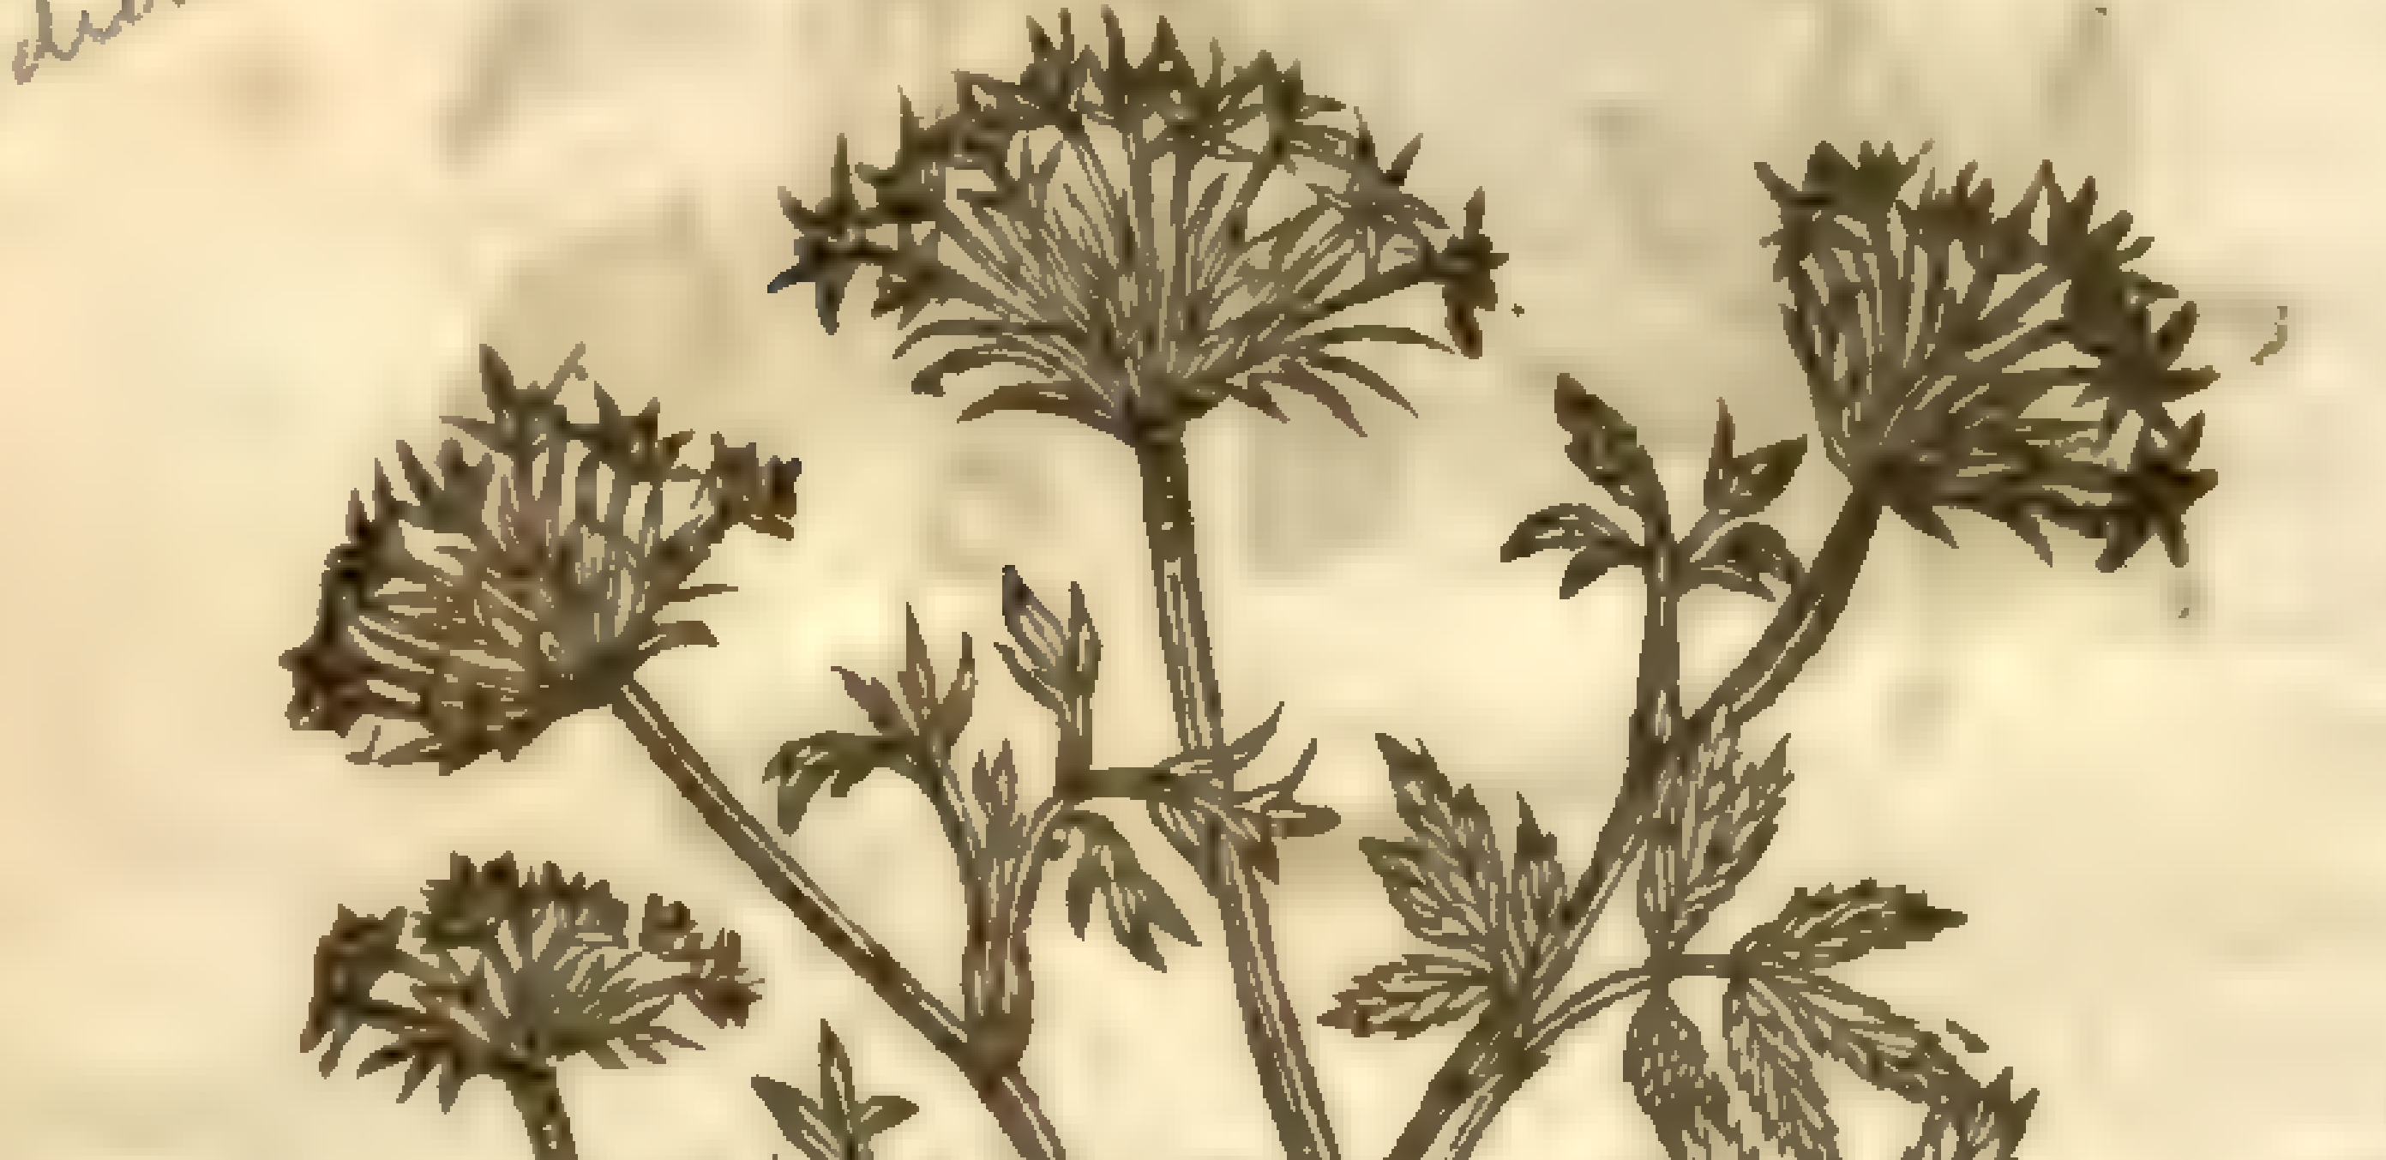
¶ *The Deſcription.*

1 The common Ameos, eſpecially with vs here in England, hath round greene ſtalks, with diuers boughes and branches, and large long leaues, diuided into diuers other narrow long and ſmall leaues, dented or ſnipt about the edges, hauing at the top of the ſtalke white floures in great ſpoky tufts, which bring forth a little ſharpe and bitter ſeed: the root thereof is white and threddy.

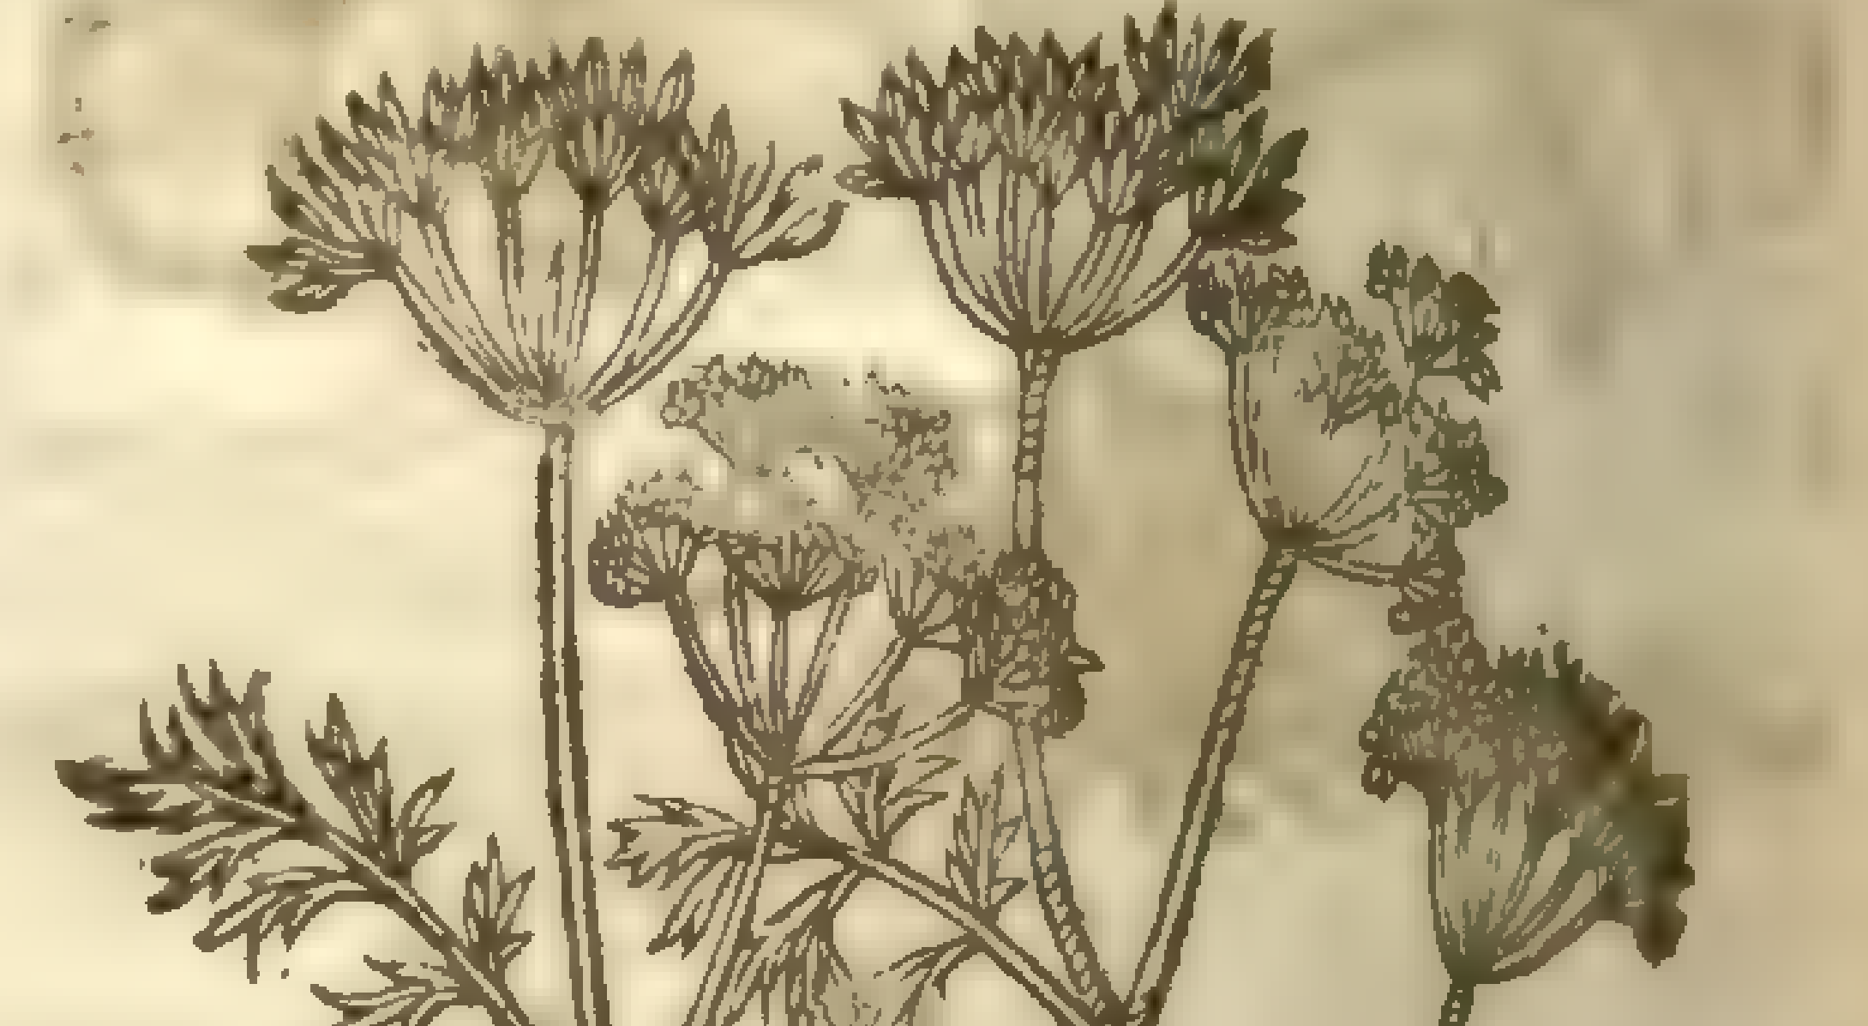
2 This excellent and aromaticall Ameos of Candy hath tufts and leaues like *Daucus Creticus*, and a root like vnto the garden Carrot, of a yellow colour, and hot ſeed like *Origanum*, of an excellent ſpicie ſauour or ſmell, growing in ſpokie tufts or roundles like *Carum*: it hath beene brought from Candy and Syria into Venice, and from Venice into France, Flanders, and England, where we haue often ſowne it; but without doubt we haue beene beguiled therein by the deceitfull drugmaſters, who haue firſt boyled it, or vſed ſome other falſe and deceitfull deuiſe, to bring greater admiration vnto the Venice treacle, for the confection whereof this ſeed is a chiefe and moſt principall ingredient.

1 *Ammi vulgare.*
Common Biſhops-weed.

A majus. & minus. dict.



† 2 *Ammi Creticum.*
Candy Biſhops-weed.



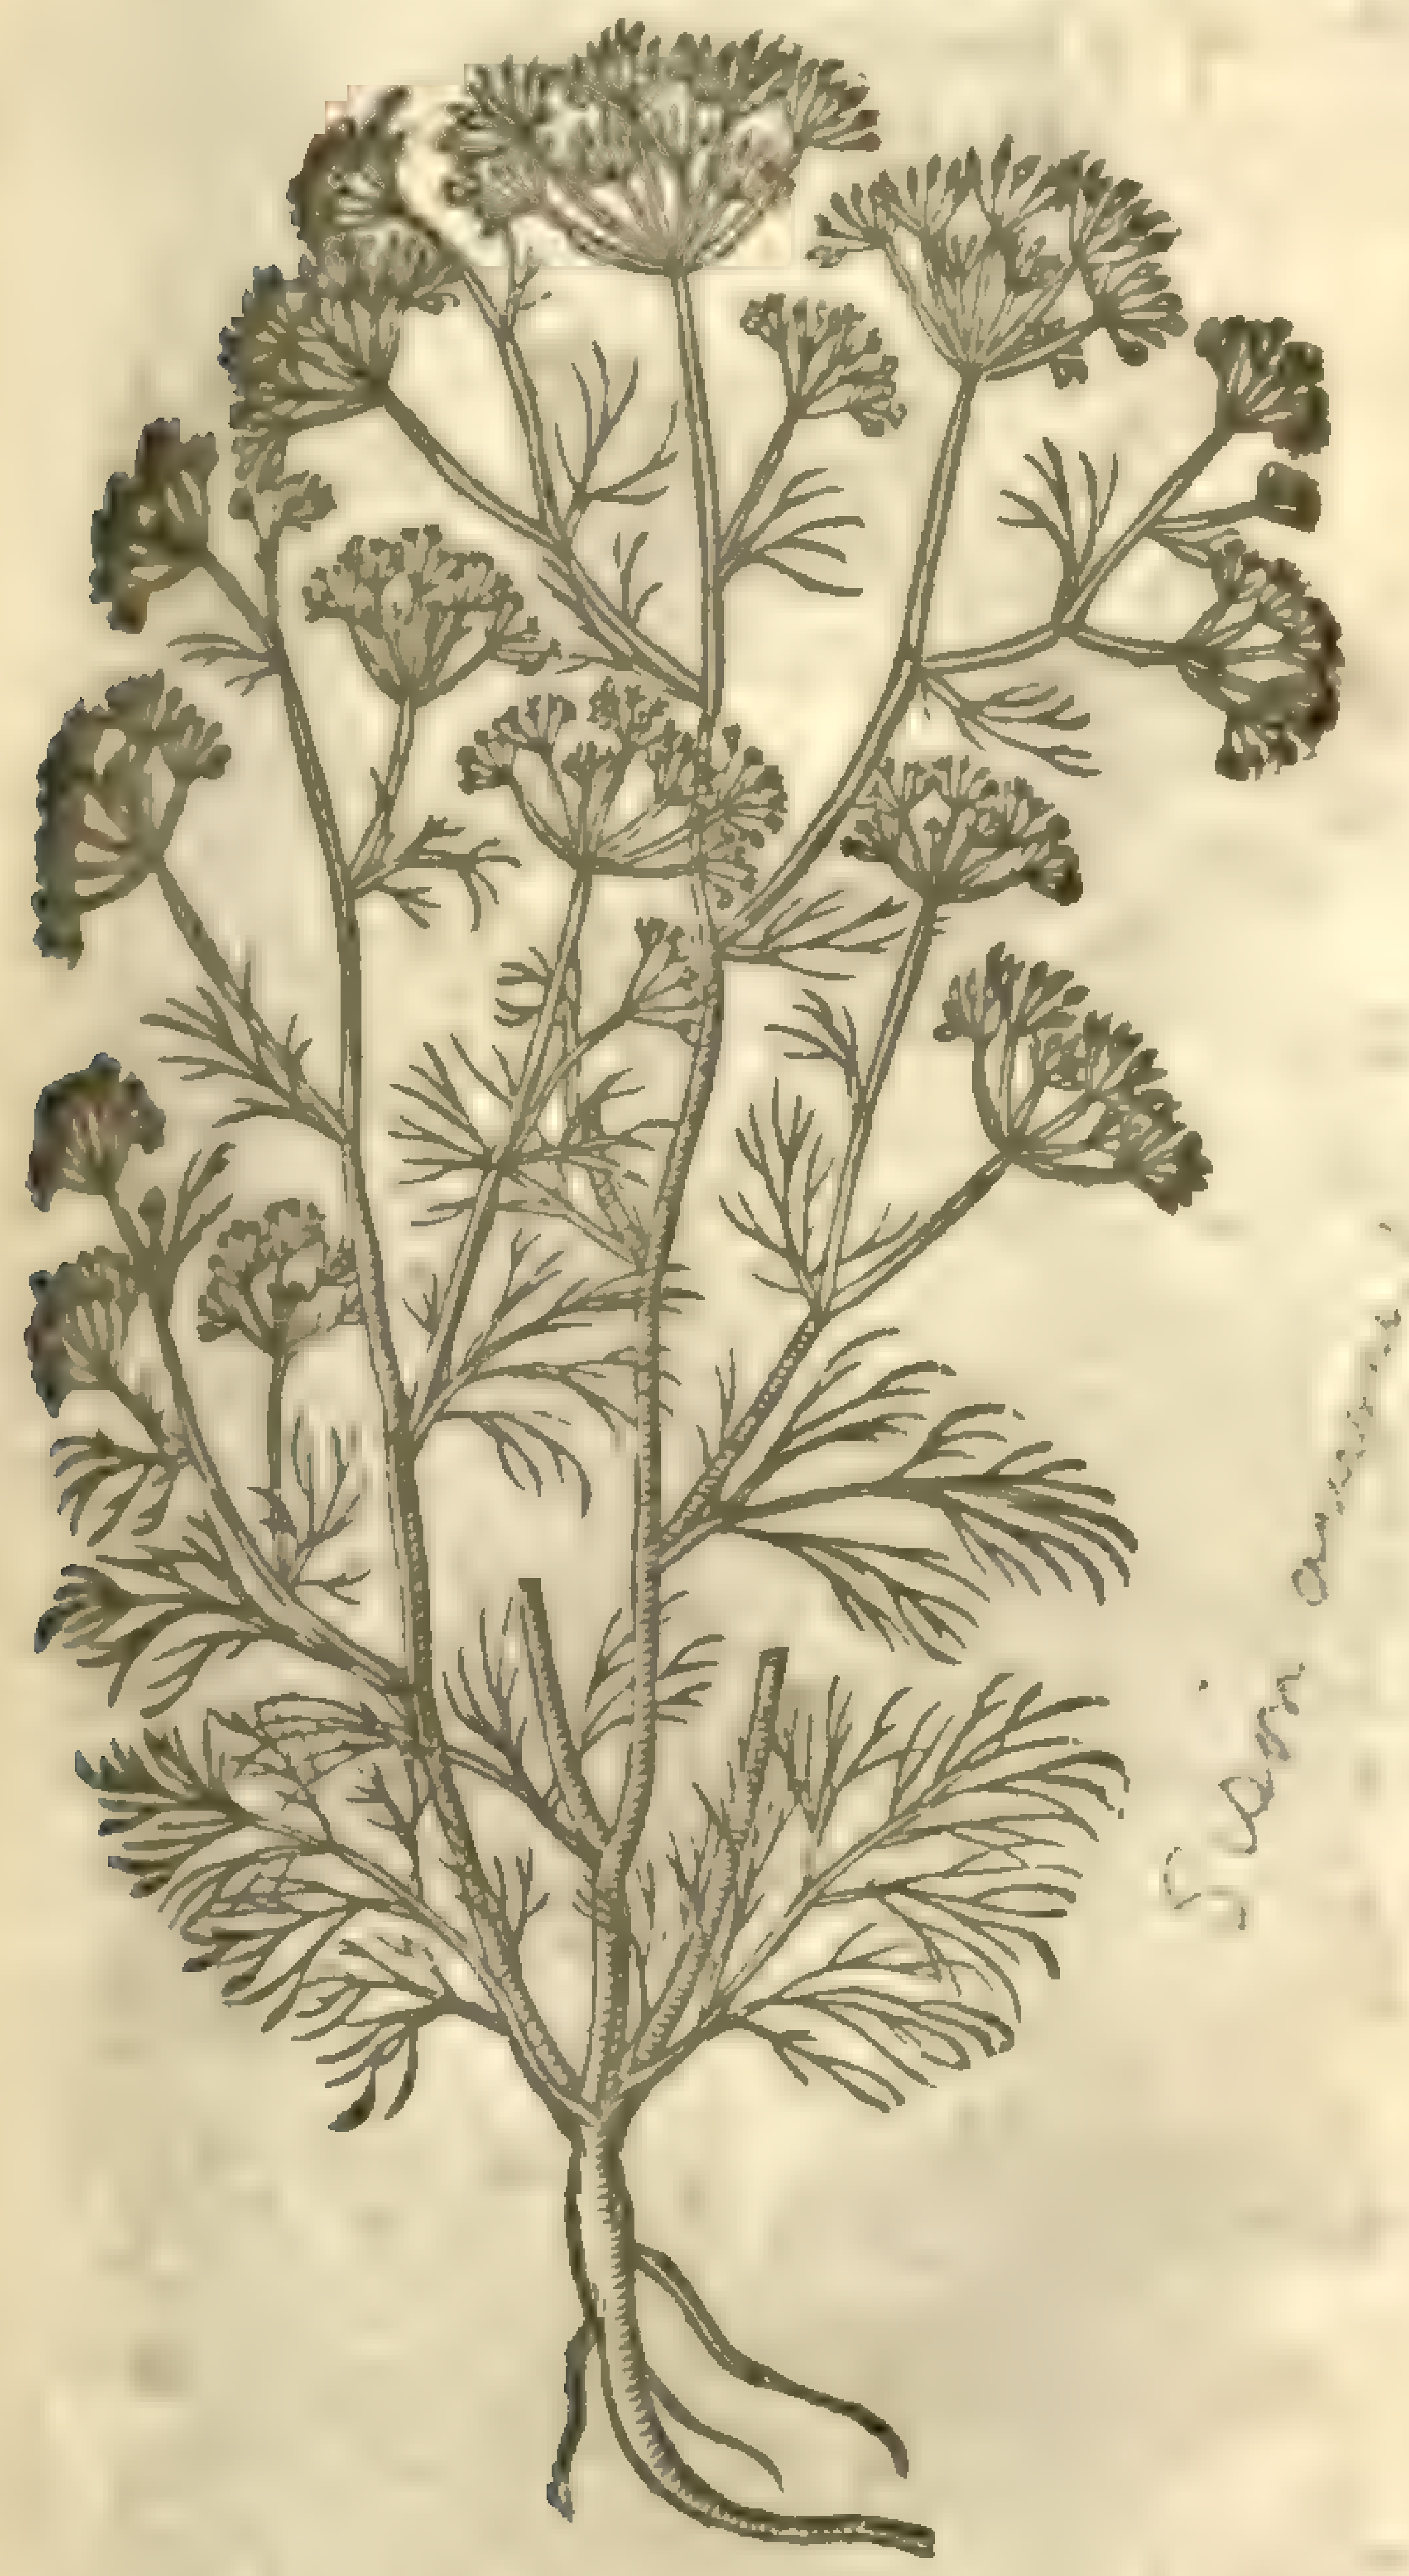
3 There is another kinde of Ameos, which is an herbe very ſmall and tender, hauing ſtalkes a foot and a halfe high, very ſmall and tender, beſet with leaues like vnto Dill, finely jagged, and ſomwhat ſlender; and at the top of the ſtalkes grow little tufts or ſpokie white rundles, which afterwards do turne into ſmall gray ſeed, hot, and ſharpe in taſte. The toot is ſmall and ſlender.

¶ *The Place.*

Theſe plants do all grow in my garden, except *Ammi Creticum*, whereof hath beene ſufficiently ſpoken in the deſcription.

¶ The

‡ 3 *Ammi perpuſillum.*
Small Biſhops-weed.



¶ *The Time.*

They floure in Iune and Iuly, and yeeld their ſeed in the end of Auguſt.

¶ *The Names.*

The Græcians call it ἄμμι: the Latines alſo *Ammi*: diuers call it *Cuminum Æthiopicum*: others, *Cuminum Regium*, or Comin Royall: in ſhops, *Ammios*, or *Ameos* in the Genitiue caſe: the Germanes, **Amey**: in Engliſh, Ameos, or Ammi: of ſome, Herbe-William, Bullwort, and Biſhops-weed.

¶ *The Temperature.*

The ſeed of Ameos is hot and dry in the later end of the third degree.

¶ *The Vertues.*

A It auaileth againſt gripings of the belly in making of vrine, againſt the biting of ſerpents taken in wine, and alſo it bringeth downe the floures: beeing applied with honey it taketh away blacke and blew ſpots which come of ſtripes: the ſeed of *Siſon* doth alſo the like, for it is hot and dry, and that in the third degree; likewiſe of thin parts, prouoking vrine, and bringing downe the deſired ſickneſſe.

B The ſeed of Ameos is good to bee drunken in wine againſt the biting of all manner of venomous beaſts, and hath power againſt all maner of poyſon & peſtilent feuers, or the plague, and is vſed in the correcting of Cantharides, whereby thoſe flies are made medicinable to be applied to the body without danger.

C Ameos brayed and mingled with hony ſcattereth congealed bloud, and putteth away blacke and blew markes which come by ſtripes or falls, if it be applied thereto in manner of a plaiſter.

† The figure which was formerly in the ſecond place was of the *Hippomarathrum album* of *Tabernamontanus*.

Chap. 416. *Of Cheruill.*

¶ *The Deſcription.*

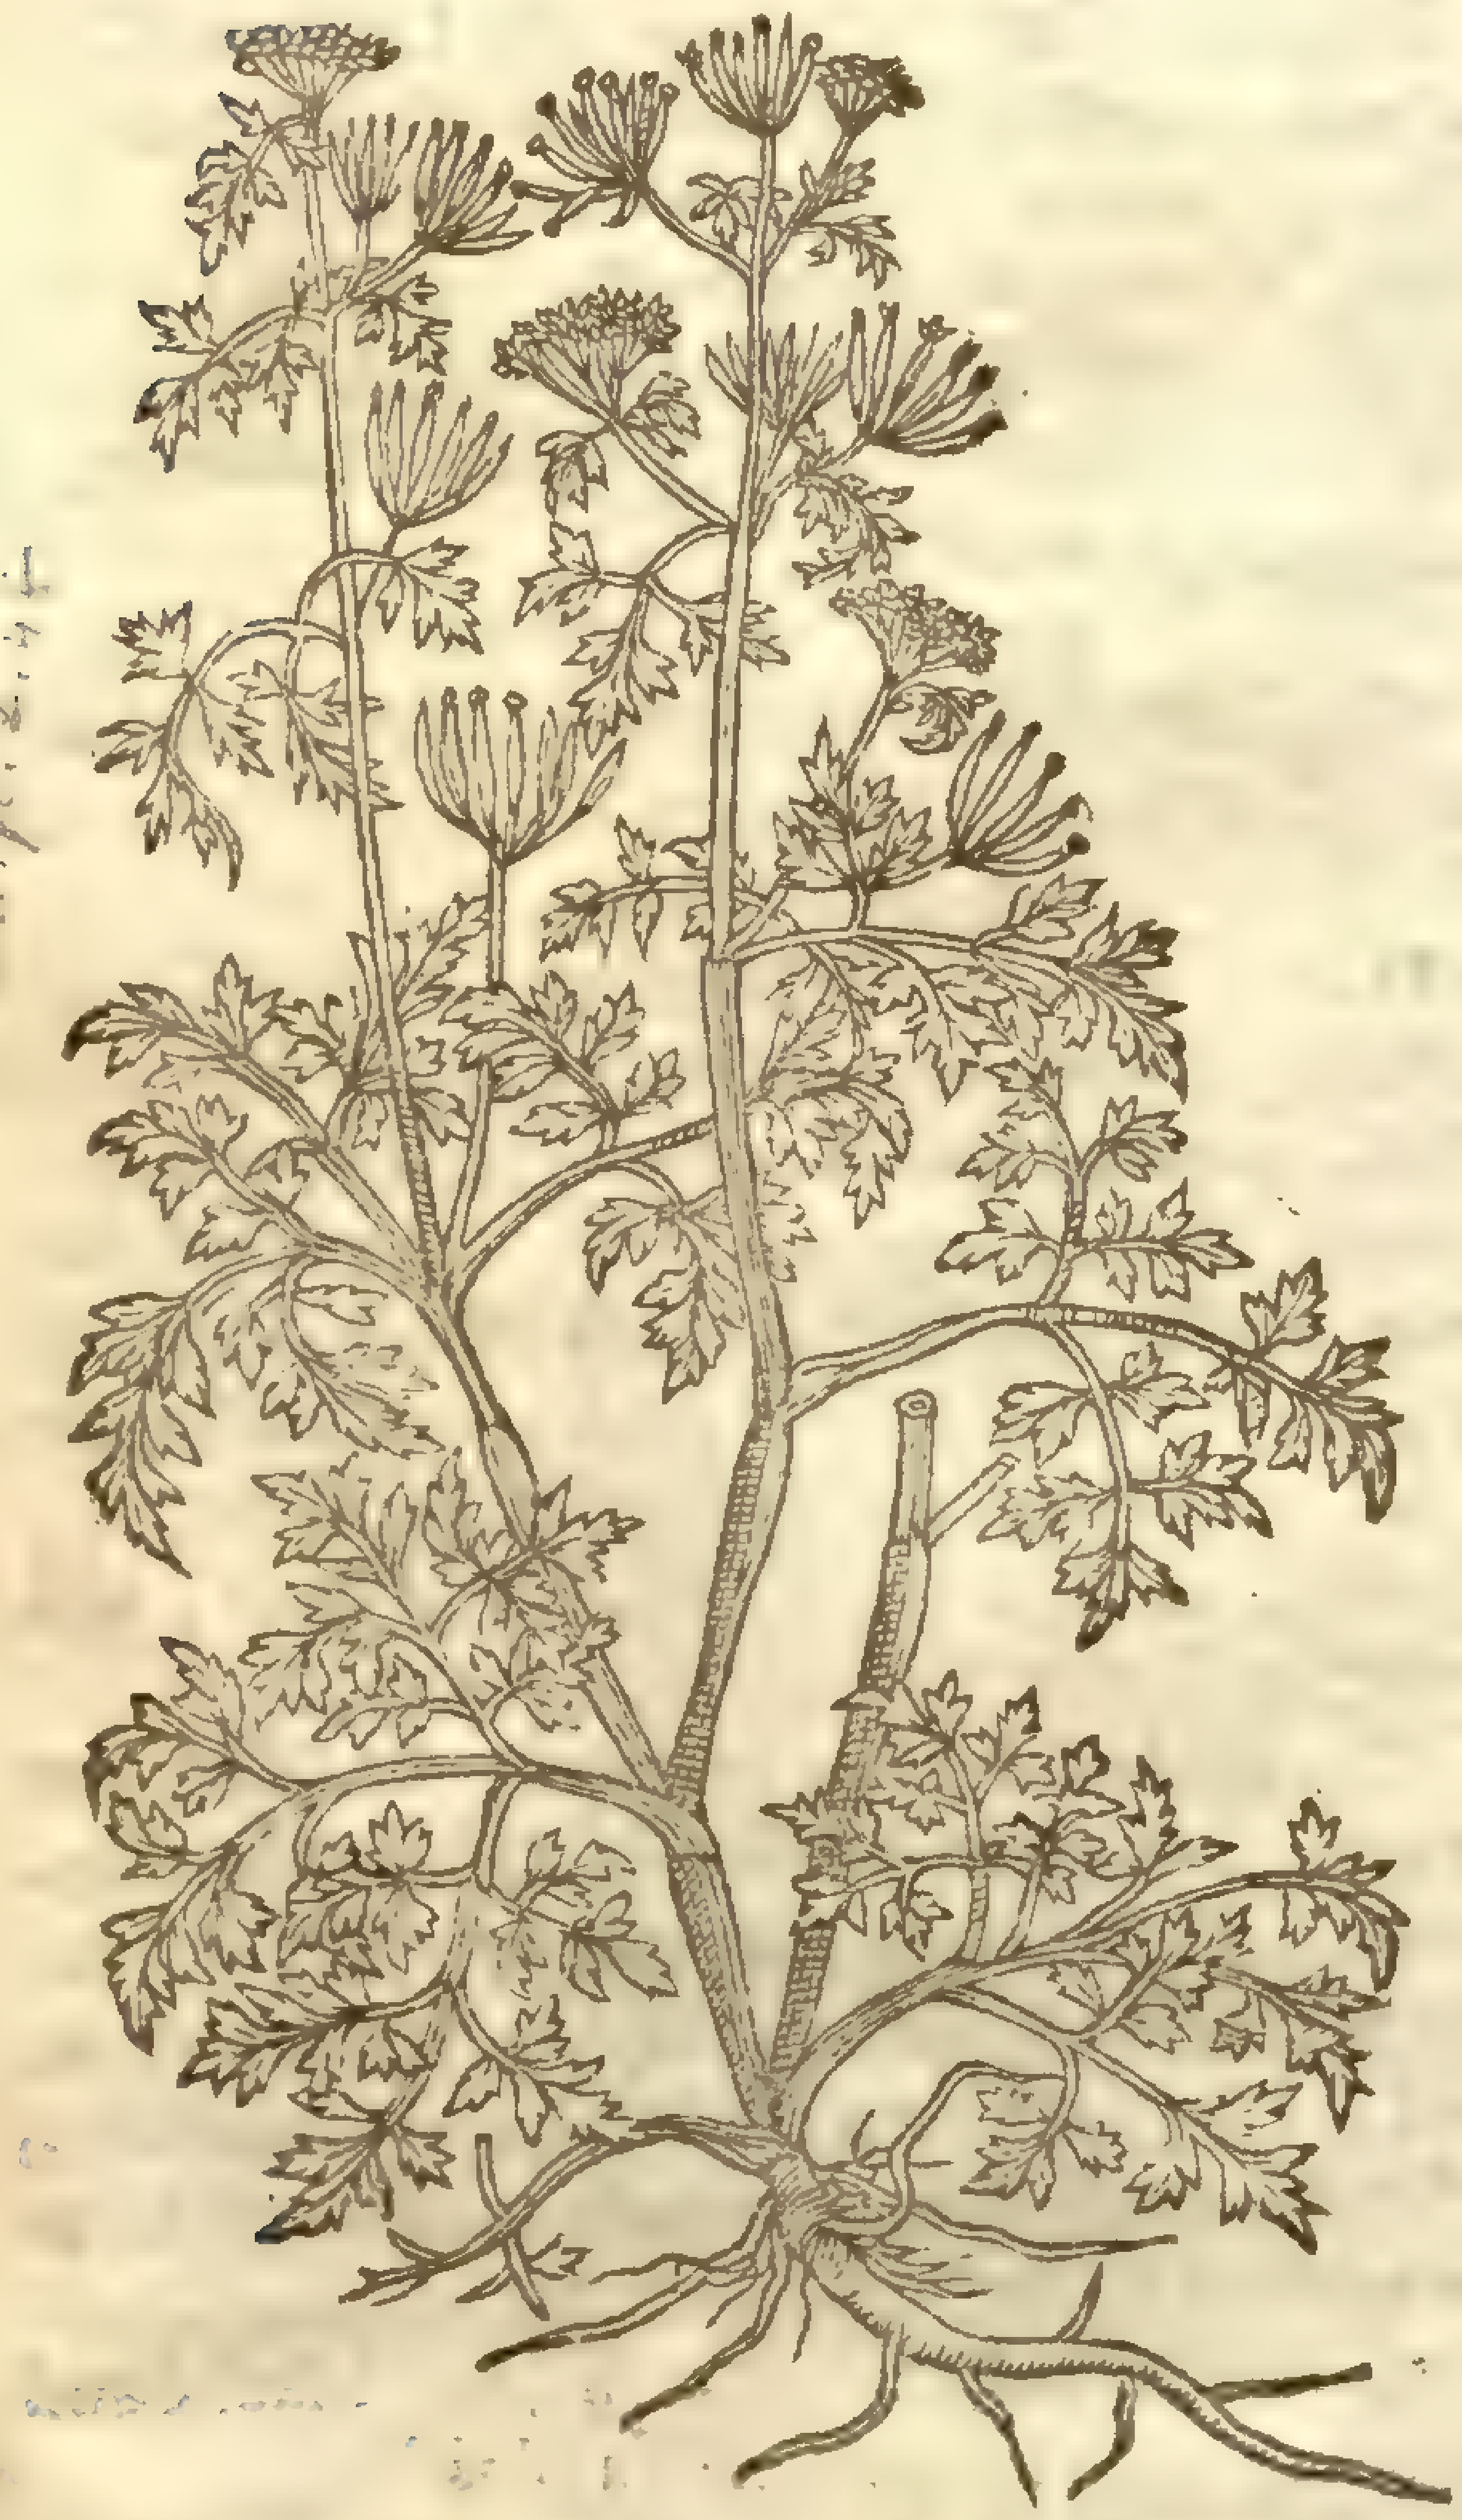
1 The leaues of Cheruill are ſlender, and diuerſly cut, ſomething hairy, of a whitiſh greene: the ſtalkes be ſhort, ſlender, round, and hollow within, which at the firſt together with the leaues are of a whitiſh green, but tending to a red when the ſeeds are ripe: the floures be white, and grow vpon ſcattered tufts. The ſeed is long, narrow, ſlender, ſharpe pointed: the root is full of ſtrings.

‡ 2 There is found in Iune and Iuly, almoſt in euery hedge, a certaine plant which *Tabernamontanus* and *Bauhine* fitly call *Chærophyllum*, or *Cerefolium ſylueſtre*, and the figure was vnfitly giuen by our Author for *Thyſſelinum*: It hath a whitiſh wooddy root, from which ariſe round red and hairy ſtalkes ſome two cubits high, ſometimes more, and oft times ſomewhat big and ſwolne about the joynts, and they are not hollow but full of pith: toward the top it is diuided into ſundry branches which on their tops carry vmbels of ſmall pure white little floures, which are ſucceded by longiſh ſeeds. The leaues are vſually parted into three chiefe parts, and theſe againe ſubdiuided into fiue, and they are ſnipt about the edges, ſoft and hairy, of a darke greene or elſe reddiſh colour. It floureth in Iune and Iuly, and then ripens the ſeed. ‡

3 Great Cheruill hath large leaues deepely cut or jagged, in ſhew very like vnto Hemlockes, of a very good and pleaſant ſmell and taſte like vnto Cheruill, and ſomething hairy, which hath cauſed vs to call it ſweet Cheruill. Among theſe leaues riſeth vp a ſtalke ſomewhat creſted or furrowed, of the height of two cubits, at the top whereof grow ſpokie tufts or rundles with white

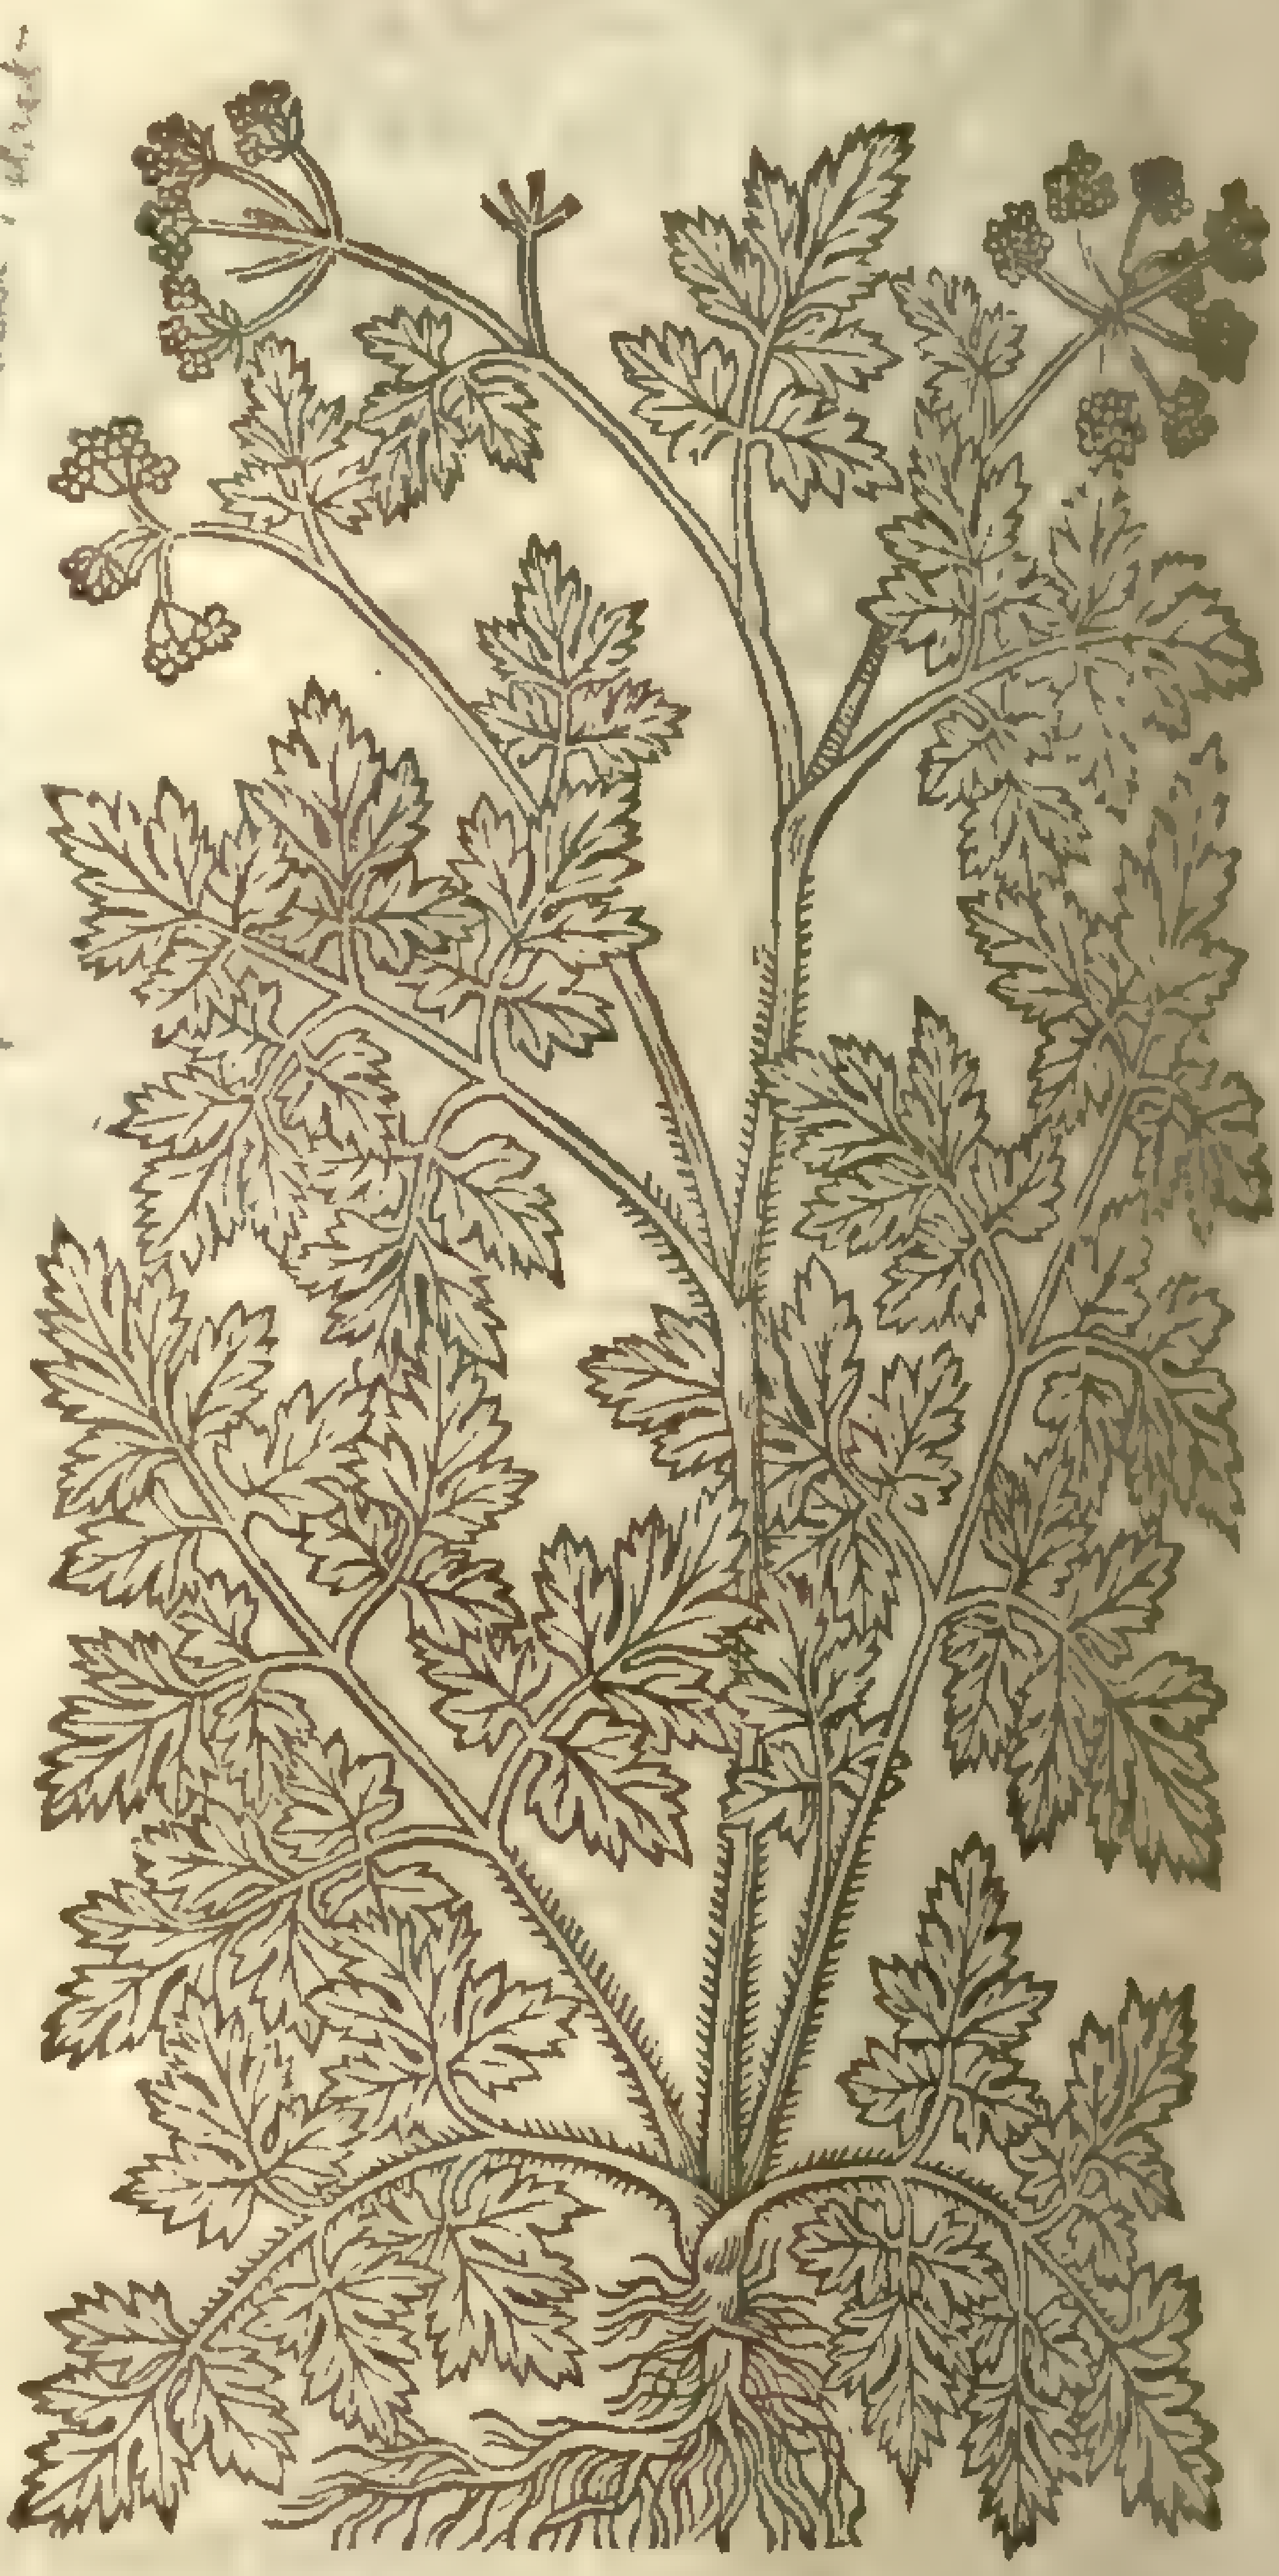
floures, which doe turne into long browne creſted and ſhining ſeed, one ſeed being as big as foure Fennell ſeeds, which being greene do taſte like anniſe ſeed. The root is great, thicke, and long, as big as *Enula Campana*, exceeding ſweet in ſmell, and taſting like vnto Aniſe ſeeds.

1 *Cerefolium vulgare ſatiuum.*
Common Cheruill.



Scandix Cerefolium [illegible] Sm. fl. 2. 4

† 2 *Cerefolium ſylueſtre.*
Hedge Cheruill.



Chaerophyllum temulum [illegible] Sm. fl. 2. 5

‡ 4 There is found in ſome part of the Alps, as about Genua and in other places, another *Myrrhis*, which in the leaues and vmbels is like that of the laſt deſcribed, but the whole plant is leſſe; the ſeed is long, ſmall, ſmooth, and ſhaped like an Oat, and in taſte ſomewhat like that of the *Daucus Creticus*, *Lobel* hath this by the ſame name as we here giue it you.

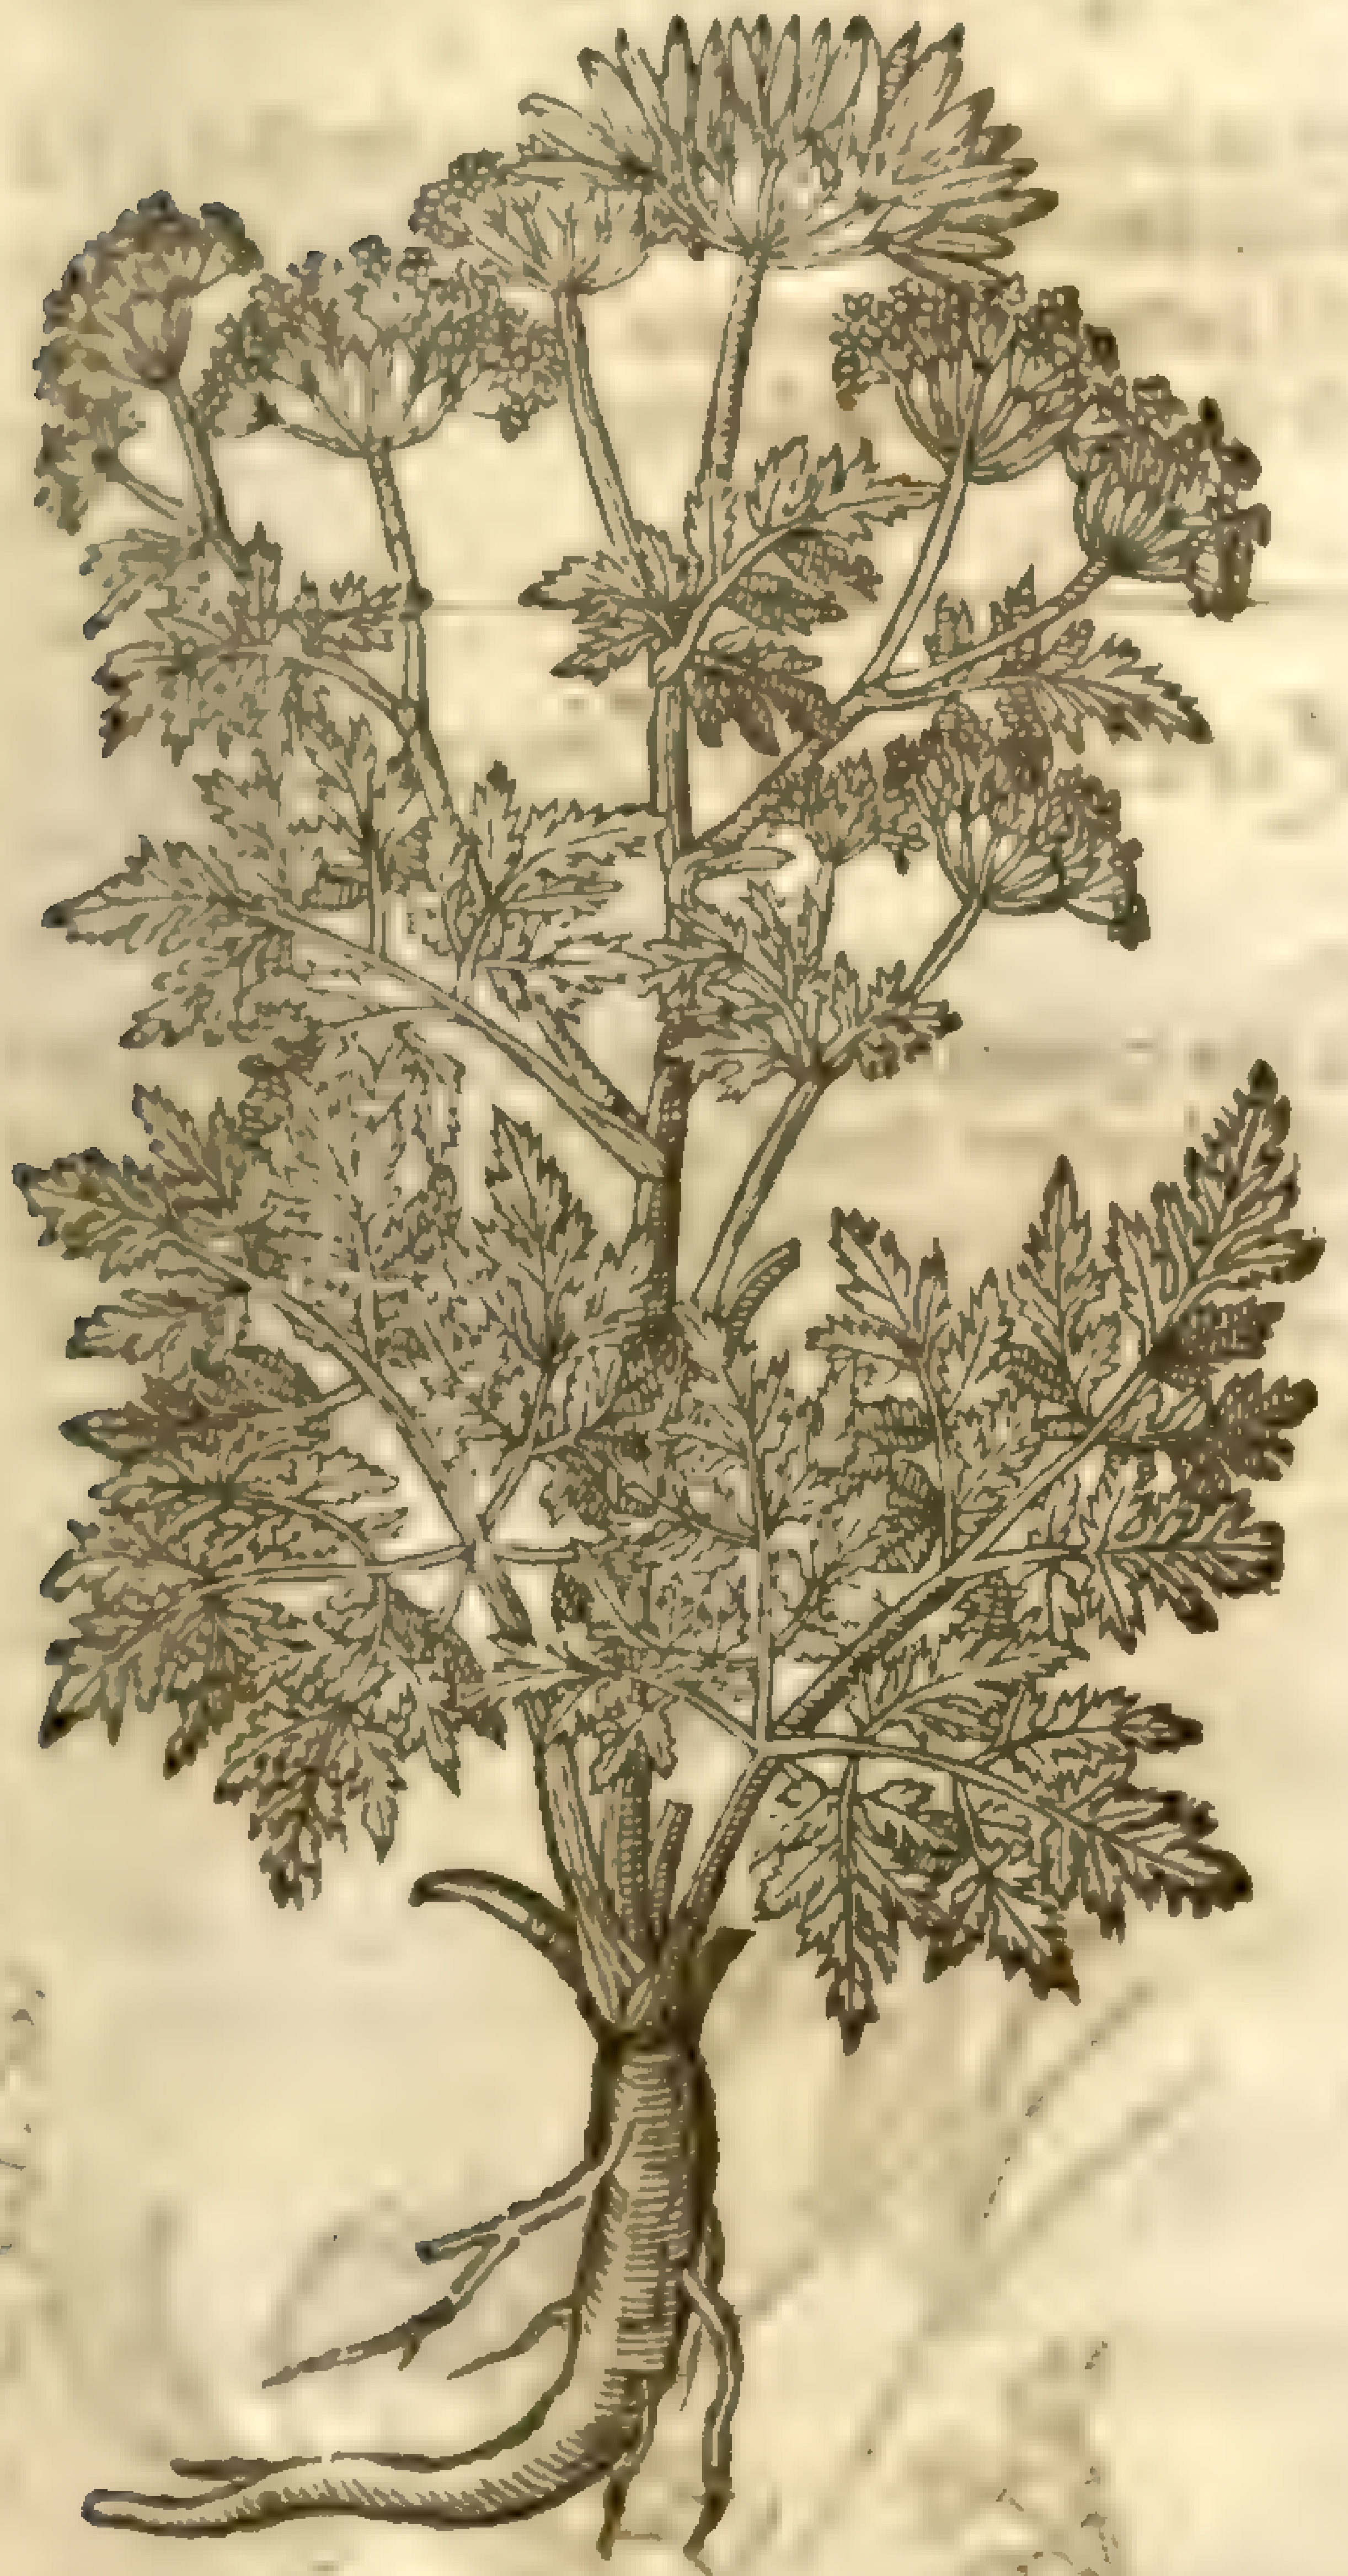
5 About mud walls, high-waies, and ſuch places, here about London, and in diuers other places, is found growing a ſmall plant, which in all things but the ſmell and height agrees with that referred to this kinde by *Fabius Columna*, and called *Myrrhis Æquicolorum nova*. The root hereof is ſmall and white, periſhing euery yeare when it hath perfected his ſeed: the ſtalkes are ſlender, hollow, ſmooth, and not hairy, ſeldome exceeding the height of a cubit, or cubit and halfe; it is diuided into ſundry branches, vpon the ſeeds whereof againſt the ſetting on of the leaues, or out of their boſomes, grow forth the ſtalkes, which carry vmbels of ſmall white floures: after which follow the ſeeds, growing two together, and theſe longiſh, rough, round, and hairy, about the bigneſſe of Aniſe ſeeds. The leaues are ſmall, and finely cut or diuided like thoſe of Hemlocke, but of a whitiſh colour, and hairy: it comes vp in March, floures in May, and ripens his ſeed in Iune. In Italy they eate the young leaues in ſallads, and call it wilde Cheruile: we may in Engliſh for diſtinction ſake call it ſmall Hemlocke Cheruill.

S. Scandix anthriscus [illegible]

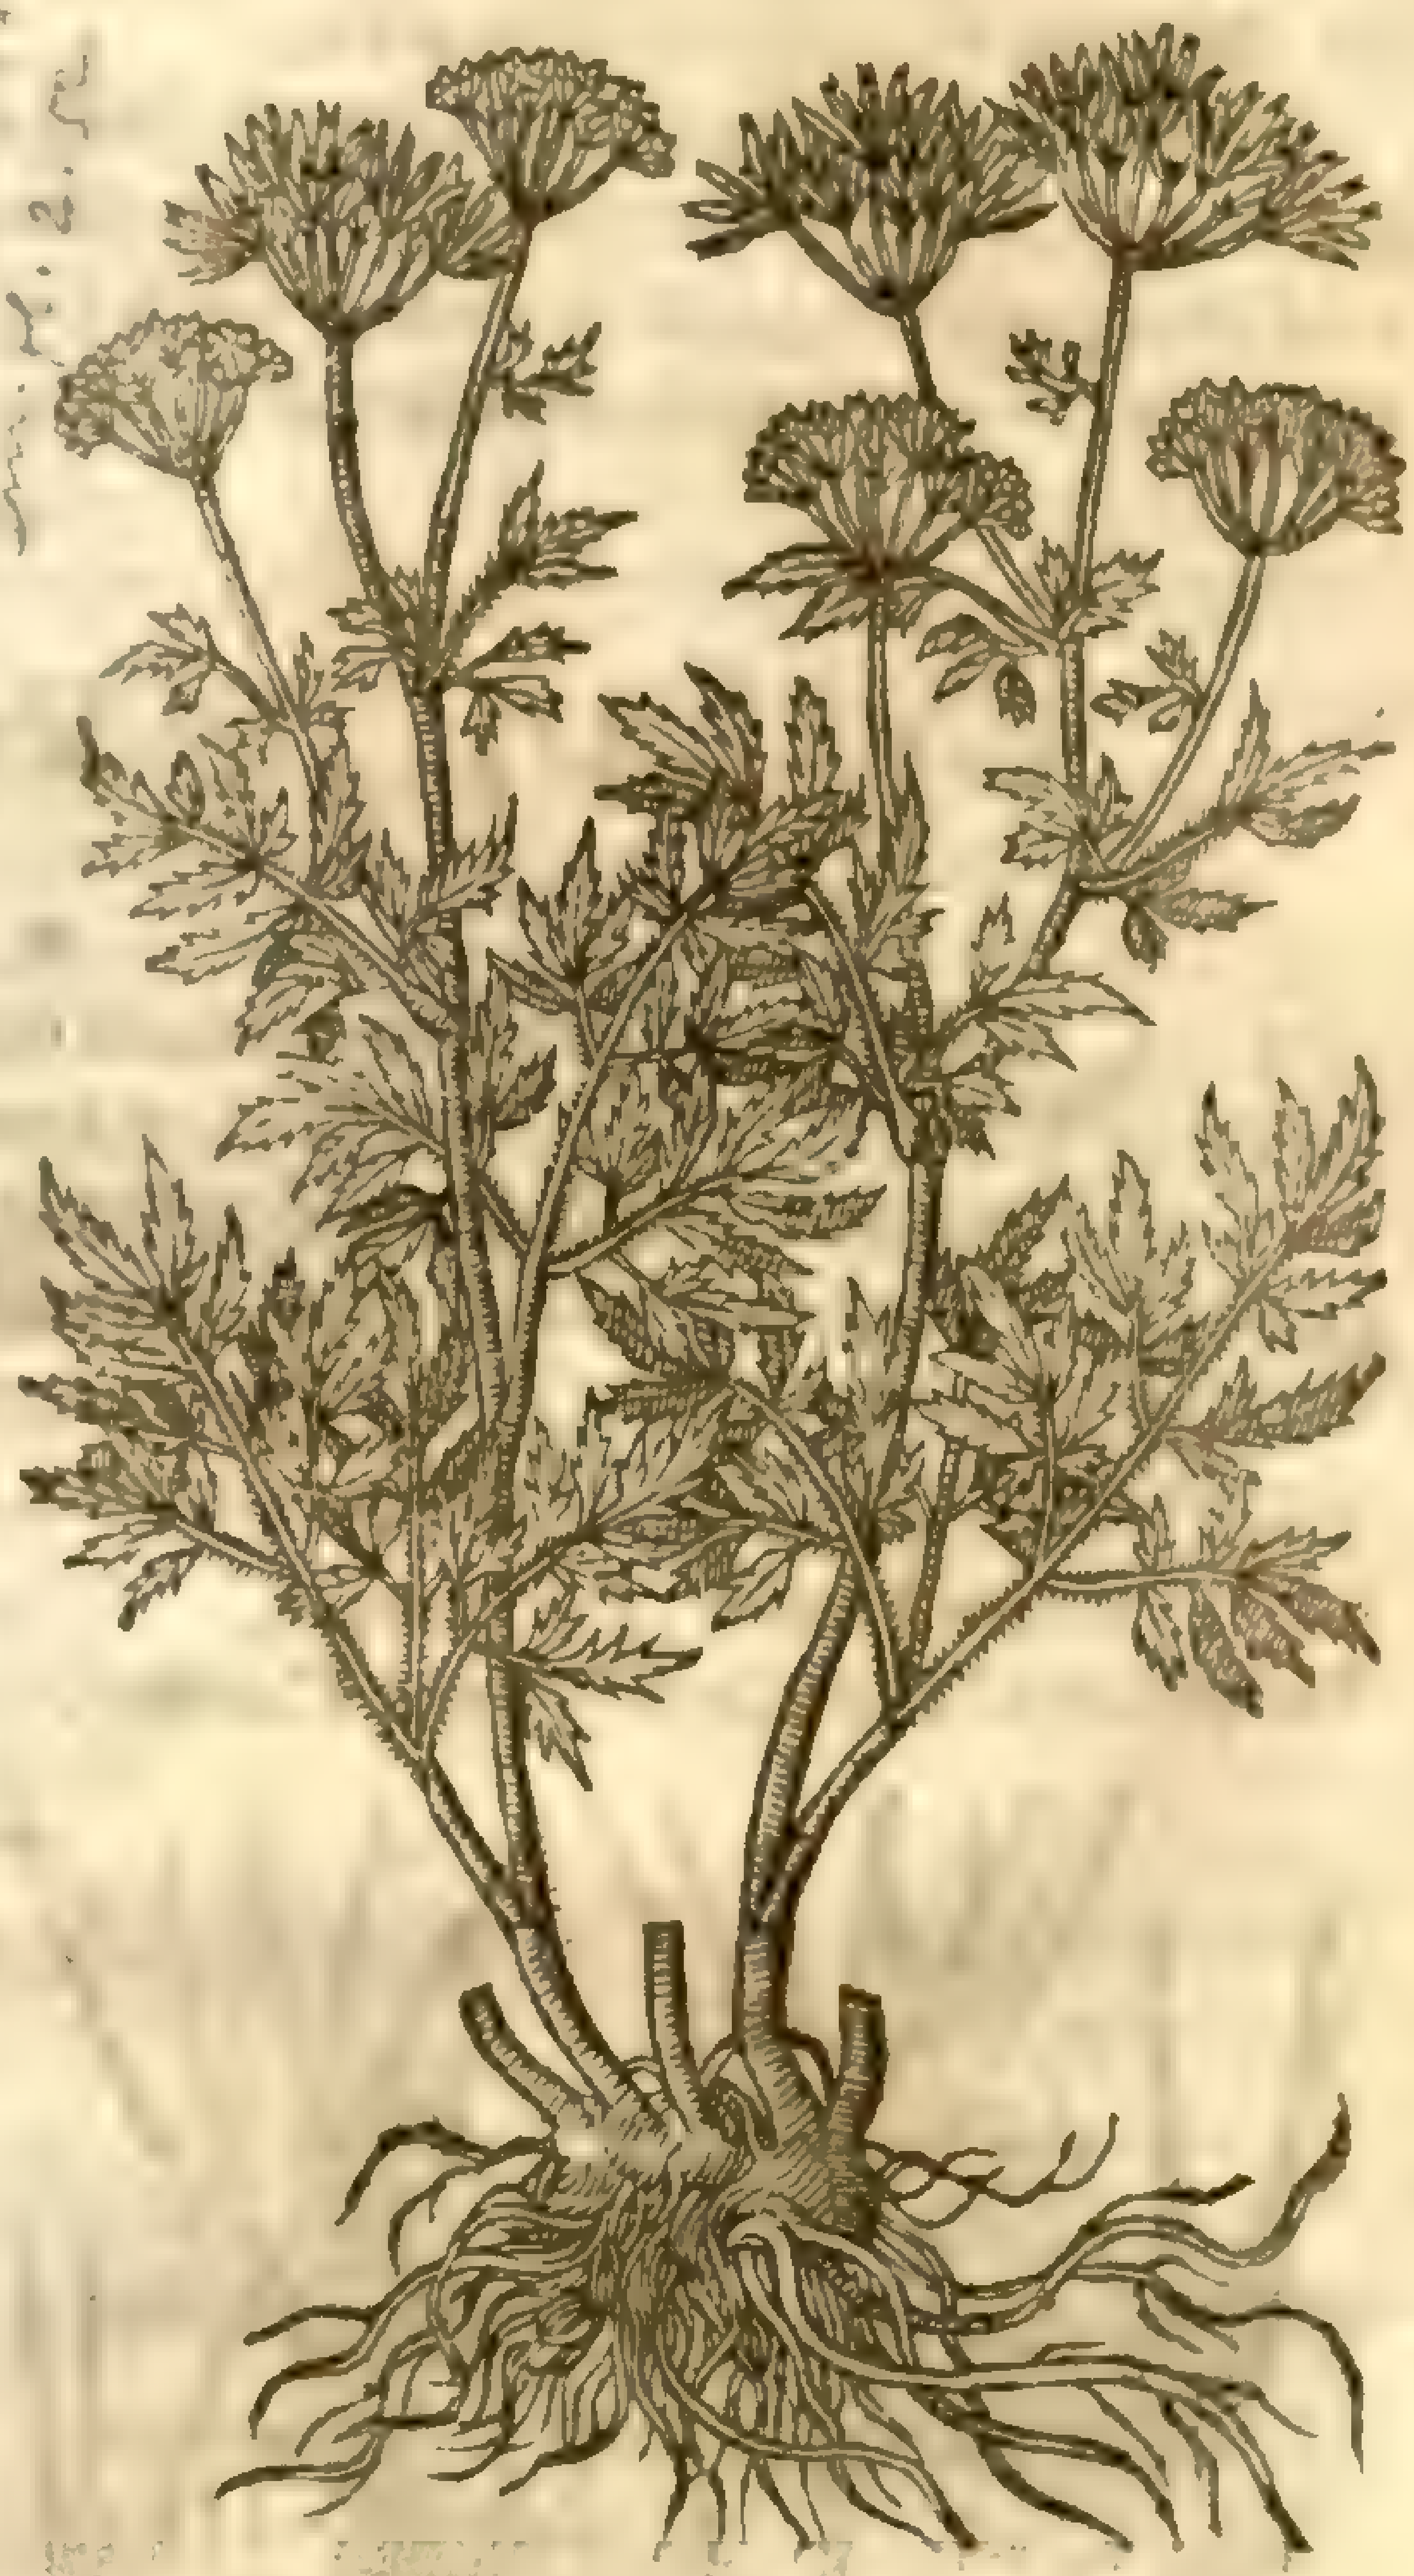
6 To theſe we may fitly adde that plant which in the *Hiſt. Lugd.* is called *Cicutaria alba*, and by *Camerarius*, *Cicutaria paluſtris*; for it floures at the ſame time with the laſt mentioned, and is found in floure and ſeed in May and Iune very frequently almoſt in all places; but afterwards his ſtalkes die downe, yet his roots liue, and the leaues are greene all the yeare. The root of this is very large, and diuided into ſundry parts, white alſo and ſpungie, of a pleaſant ſtrong ſmell, with a hot and biting taſte: the ſtalkes grow vp in good ground to be ſome three cubits high, and they are hollow, joynted, pretty thicke, greene, and much creſted, ſending forth of the boſomes of the leaues many branches, which vpon their tops carry vmbels compoſed of many white floures, each floure conſiſting of fiue little leaues, whereof the loweſt is twice as big as the reſt, the two ſide-ones leſſe, and the vppermoſt the leaſt of all. The leaues are large like thoſe of *Myrrhis*, but of a dark greene colour,

and thoſe that grow vpon the tops of the ſtalks are commonly diuided into three parts, and theſe ſubdiuided into ſundry long ſharp pointed and ſnipt leaues like as in *Myrrhis*. The ſeeds grow two together, being longiſh, round, ſharp pointed, blacke, and ſhining. We may fitly terme this plant wilde Cicely, for that it ſo much reſembles the *Myrrhis* or garden Cicely, not only in ſhape, but if I be not deceiued, in vertues alſo.

3 *Cerfolium magnum, ſiue Myrrhis.*
Great Cheruill or Myrrhe.



‡ 4 *Myrrhis altera parua.*
Small ſweet Cheruill.



Chaerophyllum annuum, [illegible]

¶ *The Place.*

The common Cheruill groweth in gardens with other pot-herbes: it proſpers in a ground that is dunged and ſomewhat moiſt. The great ſweet Cheruill groweth in my garden, and in the gardens of other men who haue bin diligent in theſe matters.

¶ *The Time.*

Theſe herbs floure in May, and their ſeed is ripe in Iuly.

¶ *The Names.*

Cheruill is commonly called in Latine *Cerefolium*, and as diuers affirme, *Chærefolium*, with *o* in the ſecond ſyllable. *Columella* nameth it *Chærephyllum*, and it is thought to be ſo called, becauſe it delights to grow with many leaues, or rather in that it cauſeth ioy and gladneſſe: in high-Dutch, **Korffelkraut**: in low-Dutch, **Kervell**: in Italian, *Cerefoglio*: in French, *Du Cerfueil*: in Engliſh, Cheruell and Cheruill.

Myrrhis is alſo called *Myrrha*, taken from his pleaſant ſauor of Myrrh: of ſome, *Conila*, as it is found noted among the baſtard names. It is alſo by reaſon of the ſimilitude it hath with Hemlocke, called by moſt later writers *Cicutaria*. Of this *Pliny* maketh mention, *lib.* 24. *cap.* 16. where he reporteth that it is called *Smyrrhiza*: in Engliſh it is called Cheruill, ſweete Cheruill, or ſweete Cicely.

¶ *The Nature and Vertues.*

Cheruill is held to be one of the pot-herbs, it is pleaſant to the ſtomack and taſte, it is of a temperat heate and moderat drineſſe, but nothing ſo much as the Parſlies. A

It prouoketh vrine, eſpecially being boiled in Wine, and applied hot to the ſhare or nethermoſt part of the belly, and the wine drunke in which it was boiled. B

It hath in it a certain windineſſe, by means whereof it procureth luſt. C

It is vſed very much among the Dutch people in a kinde of Loblolly or hotchpot which they do eat, called Warmus. D

The

E The leaues of ſweet Cheruill are exceeding good, wholeſome and pleaſant among other ſallad herbs, giuing the taſte of Aniſe ſeed vnto the reſt.

F The root, ſaith *Galen*, is hot in the ſecond degree, hauing a thinneſſe of ſubſtance joyned with it.

G *Dioſcorides* teacheth, That the root drunke in wine is a remedie againſt the bitings of the venomous ſpiders called in Latine *Phalangia*; and that it bringeth downe the menſes and ſecondines; and being boiled and drunk it is good for ſuch as haue the Ptyſick and conſumption of the lungs.

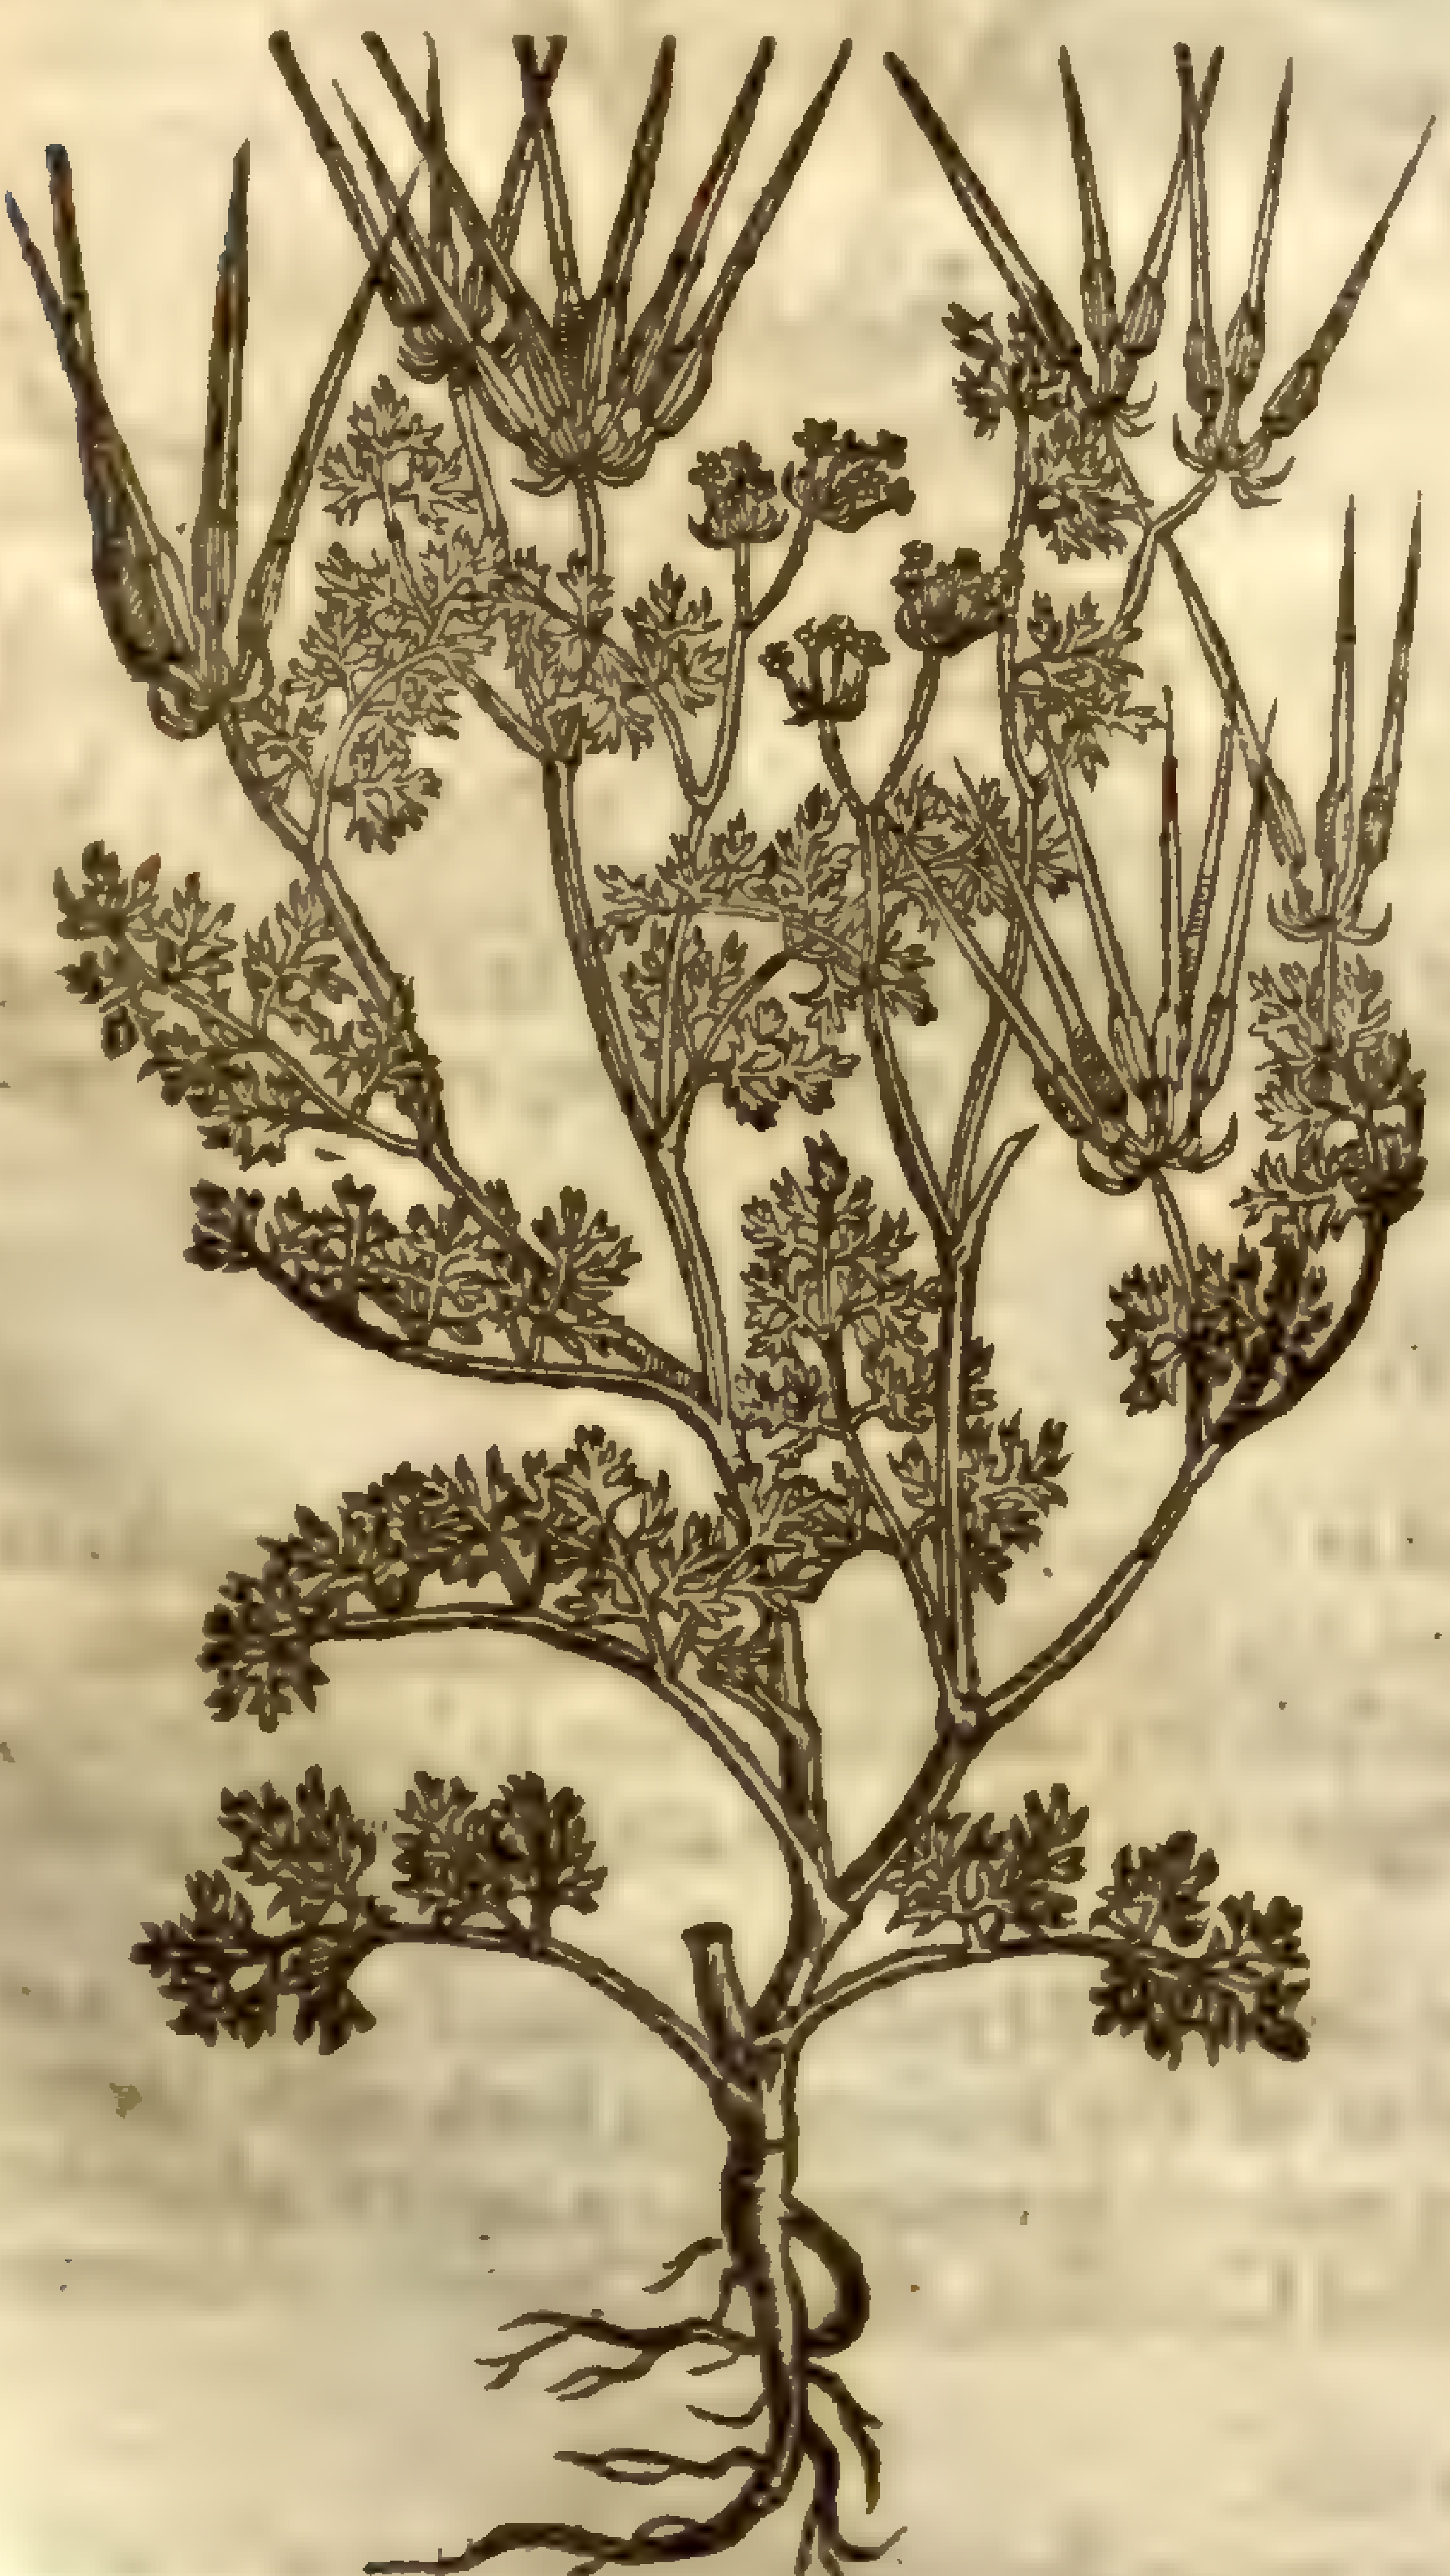
H The ſeeds eaten as a ſallad whiles they are yet green, with oile, vineger, and pepper, exceed all other ſallads by many degrees, both in pleaſantneſſe of taſte, ſweetneſſe of ſmell, and wholſomneſſe for the cold and feeble ſtomacke.

I The roots are likewiſe moſt excellent in a ſallad, if they be boiled and afterwards dreſſed as the cunning Cooke knoweth how better than my ſelfe: notwithſtanding I vſe to eat them with oile and vineger, being firſt boiled; which is very good for old people that are dull and without courage: it rejoiceth and comforteth the heart, and increaſeth their luſt and ſtrength.

Chap. 417. *Of Shepheards Needle or wilde Cheruill.*

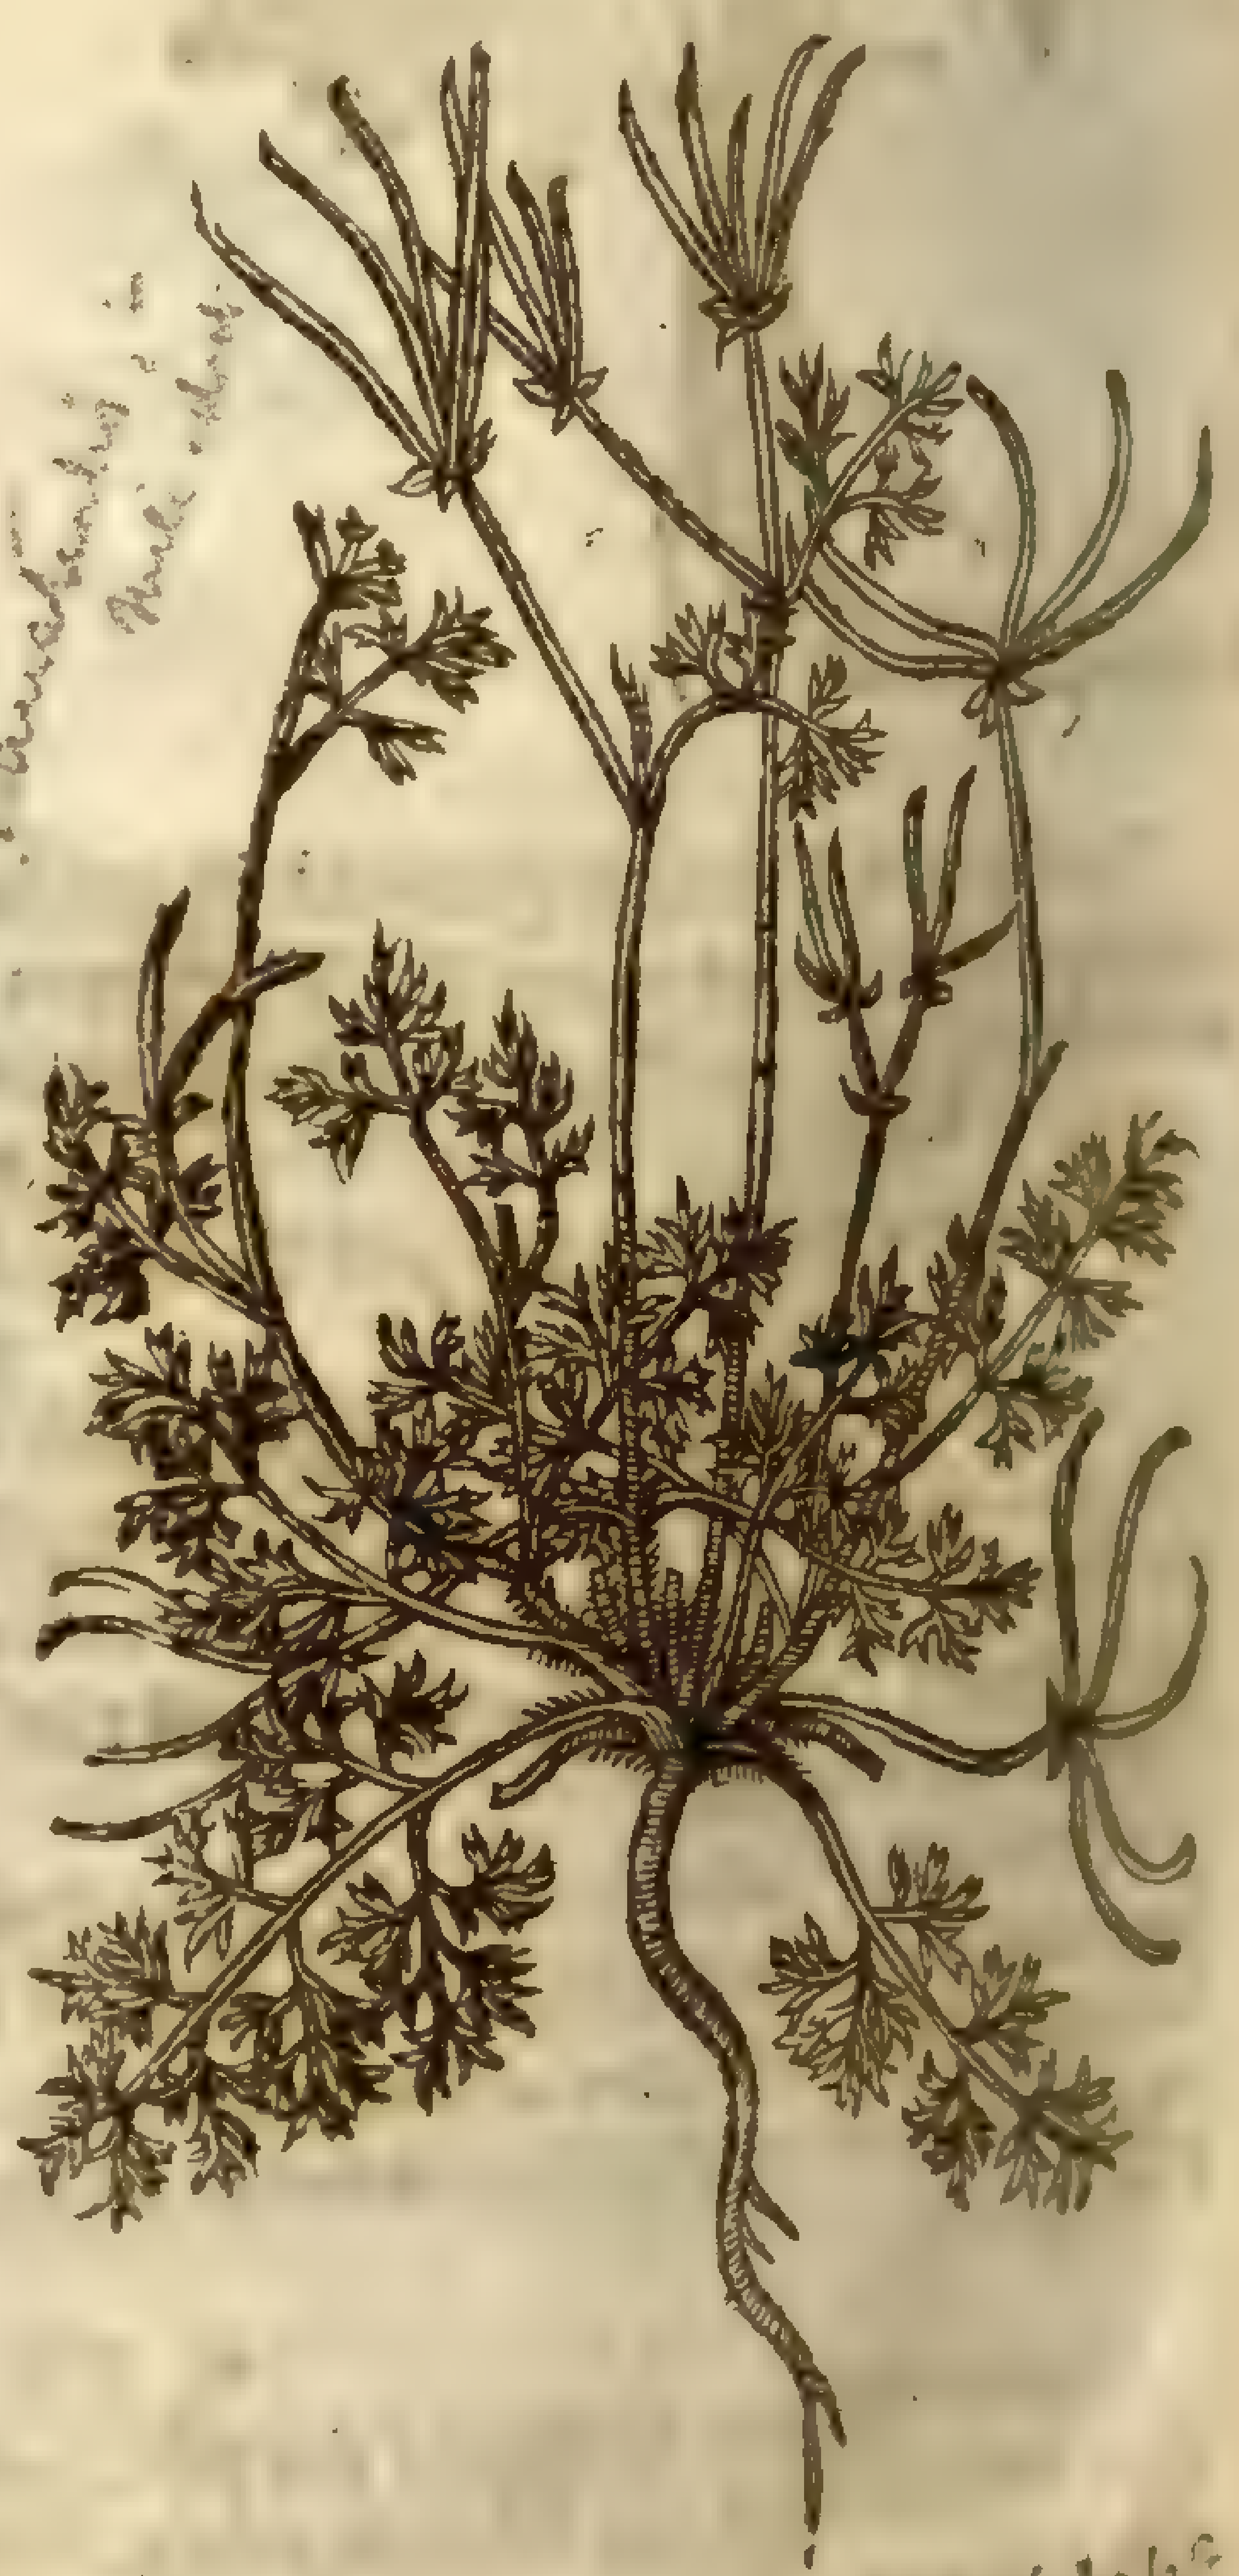
¶ *The Deſcription.*

1 *Scandix* or *Pecten Veneris* doth not much differ in the quantitie of the ſtalkes, leaues, and floures, from Cheruill; but *Scandix* hath no ſuch pleaſant ſmell as Cheruill hath. The leaues be leſſer, more finely cut, and of a brown green colour: the flours grow at the top of the ſtalks in ſmall white tufts; after which come vp long ſeeds very like vnto pack-needles, orderly ſet one by another like the great teeth of a combe, whereof it tooke the name *Pecten Veneris*, Venus combe, or Venus needle: the root is white, a finger long.



1 *Pecten Veneris, ſiue Scandix.*
Shepheards Needle or Venus Combe.

Scandix pecten Veneris. L.
Linn. Sm. fl. 2. 4?



‡ 2 *Scandix minor, ſiue Anthriſcus.*
Small Shepheards Needle.

S. australis? Linn. [illegible]

‡ 2 This from a ſlender long and whitiſh root ſends vp many ſmal leaues like thoſe of the laſt deſcribed, but of a pleaſing ſmell, and taſte ſomething like that of the common Cheruill: among ſt theſe leaues grow vp ſlender ſtalks a little hairy, diuided into ſhort green and ſlender branches carrying little vmbels, conſiſting of fiue, ſix, ſeuen, or eight ſmal white floures, compoſed of fiue leaues

apiece,with a darke purpliſh chiue in the middle:the floures are ſucceeded by,or rather grow vpon long ſlender cods,which become ſome inch long,and reſemble thoſe of the laſt deſcribed:it flours in Iune, as *Cluſius* affirmeth, who giues vs the hiſtory of it; and he receiued it from *Honorius Bellus* out of Candy; who writes,that in the Spring time it is much vſed in ſallads, and deſired,for that it much excites to Venery. He alſo thinks this plant to be the *Anthriſcus* of *Pliny*,and by the ſame name *Cluſius* ſets it forth.*Columna* hath called it *Aniſo-marathrum*,becauſe the ſmell and taſte is betweene that of Aniſe and Fennell. ‡

¶ *The Place.*

It groweth in moſt corne fields in England,eſpecially among wheat and barley.

¶ *The Time.*

It floureth in May: the ſeed is ripe in Auguſt with corne.

¶ *The Names.*

The Latines call it *Scandix*,hauing borrowed that name of the Grecians,who call it Σκάνδιξ: we finde among the baſtard words,that the Romans did call it *Scanaria*, and *Acula*,of the ſeed that is like vnto a needle. *Ruellius* deſcribeth it vnder the name *Pecten Veneris*: of others,*Acus Veneris*, and *Acus paſtoris*, or Shepheards Needle, wilde Cheruill,and Ladies combe: in high Dutch, **Naelde Karuel**: This is that herbe (ſaith *Pliny*,*lib.22.cap.22.*) which *Ariſtophanes* obiected in ſport to the Poet *Euripides*,that his mother was wont to ſell no right pot-herbe but *Scandix*,or Shepheards needle;meaning,as I take it,*Viſnaga*,wherwith the Spaniards do picke their teeth when they haue eaten no meat at all except a few oranges or ſuch a like trifle,called alſo *Scandix*.

¶ *The Temperature.*

Shepheards needle,ſaith *Galen*,is an herbe ſomewhat binding, and bitter in taſte,inſomuch that it is hot and dry either in the later end of the ſecond degree,or in the beginning of the third.

¶ *The Vertues.*

Dioſcorides ſaith it is eaten both raw and boiled, and that it is an vnwholſome pot-herbe among the Greekes; but in theſe dayes it is of ſmall eſtimation or value, and taken but for a wilde Wort, as appeareth by *Ariſtophanes* taunting of *Euripides*,as aforeſaid. A

The decoction thereof is good for the bladder, kidneyes, and liuer; but as I deeme hee meant Cheruill,when he ſet the ſame downe to be vſed in phyſicke. B

Chap. 418. *Of Tooth-picke Cheruill.*

¶ *The Deſcription.*

1 The firſt of theſe Tooth-pick Cheruils beareth leaues like wild Turneps,a round ſtalke furrowed,ioynted,blackiſh,and hairy,diuided into many branches,on the tops wherof grow ſpokie tufts,beſet round about with many ſmall leaues. The floures thereof are whitiſh: after commeth the ſeed, which being once ripe doe cluſter, and are drawne together, in a round thick tuft like a ſmal birds neſt,as be thoſe of the wild Carrot;whoſe ſeeds whoſo toucheth, they will cleaue and ſticke to his fingers,by reaſon of the glutinous or ſlimie matter they are poſſeſſed with. The root is ſmall and whitiſh,bitter in taſte,as is all the reſt of the plant.

2 The Spaniſh Tooth-picke hath leaues, floures, and knobby ſtalkes like vnto wilde carrots, ſauing that the leaues are ſomwhat finer,cut or jagged thicker,and tenderer,but not rough or hairy at all as is the former, of a bitter taſte, and a reaſonable good ſmell: among which riſe vp buſhie rundles or ſpokie tufts like thoſe of the wilde Carrot or Birds neſt, cloſely drawne together when the ſeed is ripe; at what time alſo the ſharpe needles are hardned, fit to make Tooth-pickes, and ſuch like,for which purpoſe they do very fitly ſerue.

¶ *The Place.*

Both of them grow in Syria, and moſt commonly in Cilicia: the later likewiſe is to be found in Spaine almoſt euery where; and I haue it likewiſe in my garden in great plentie.

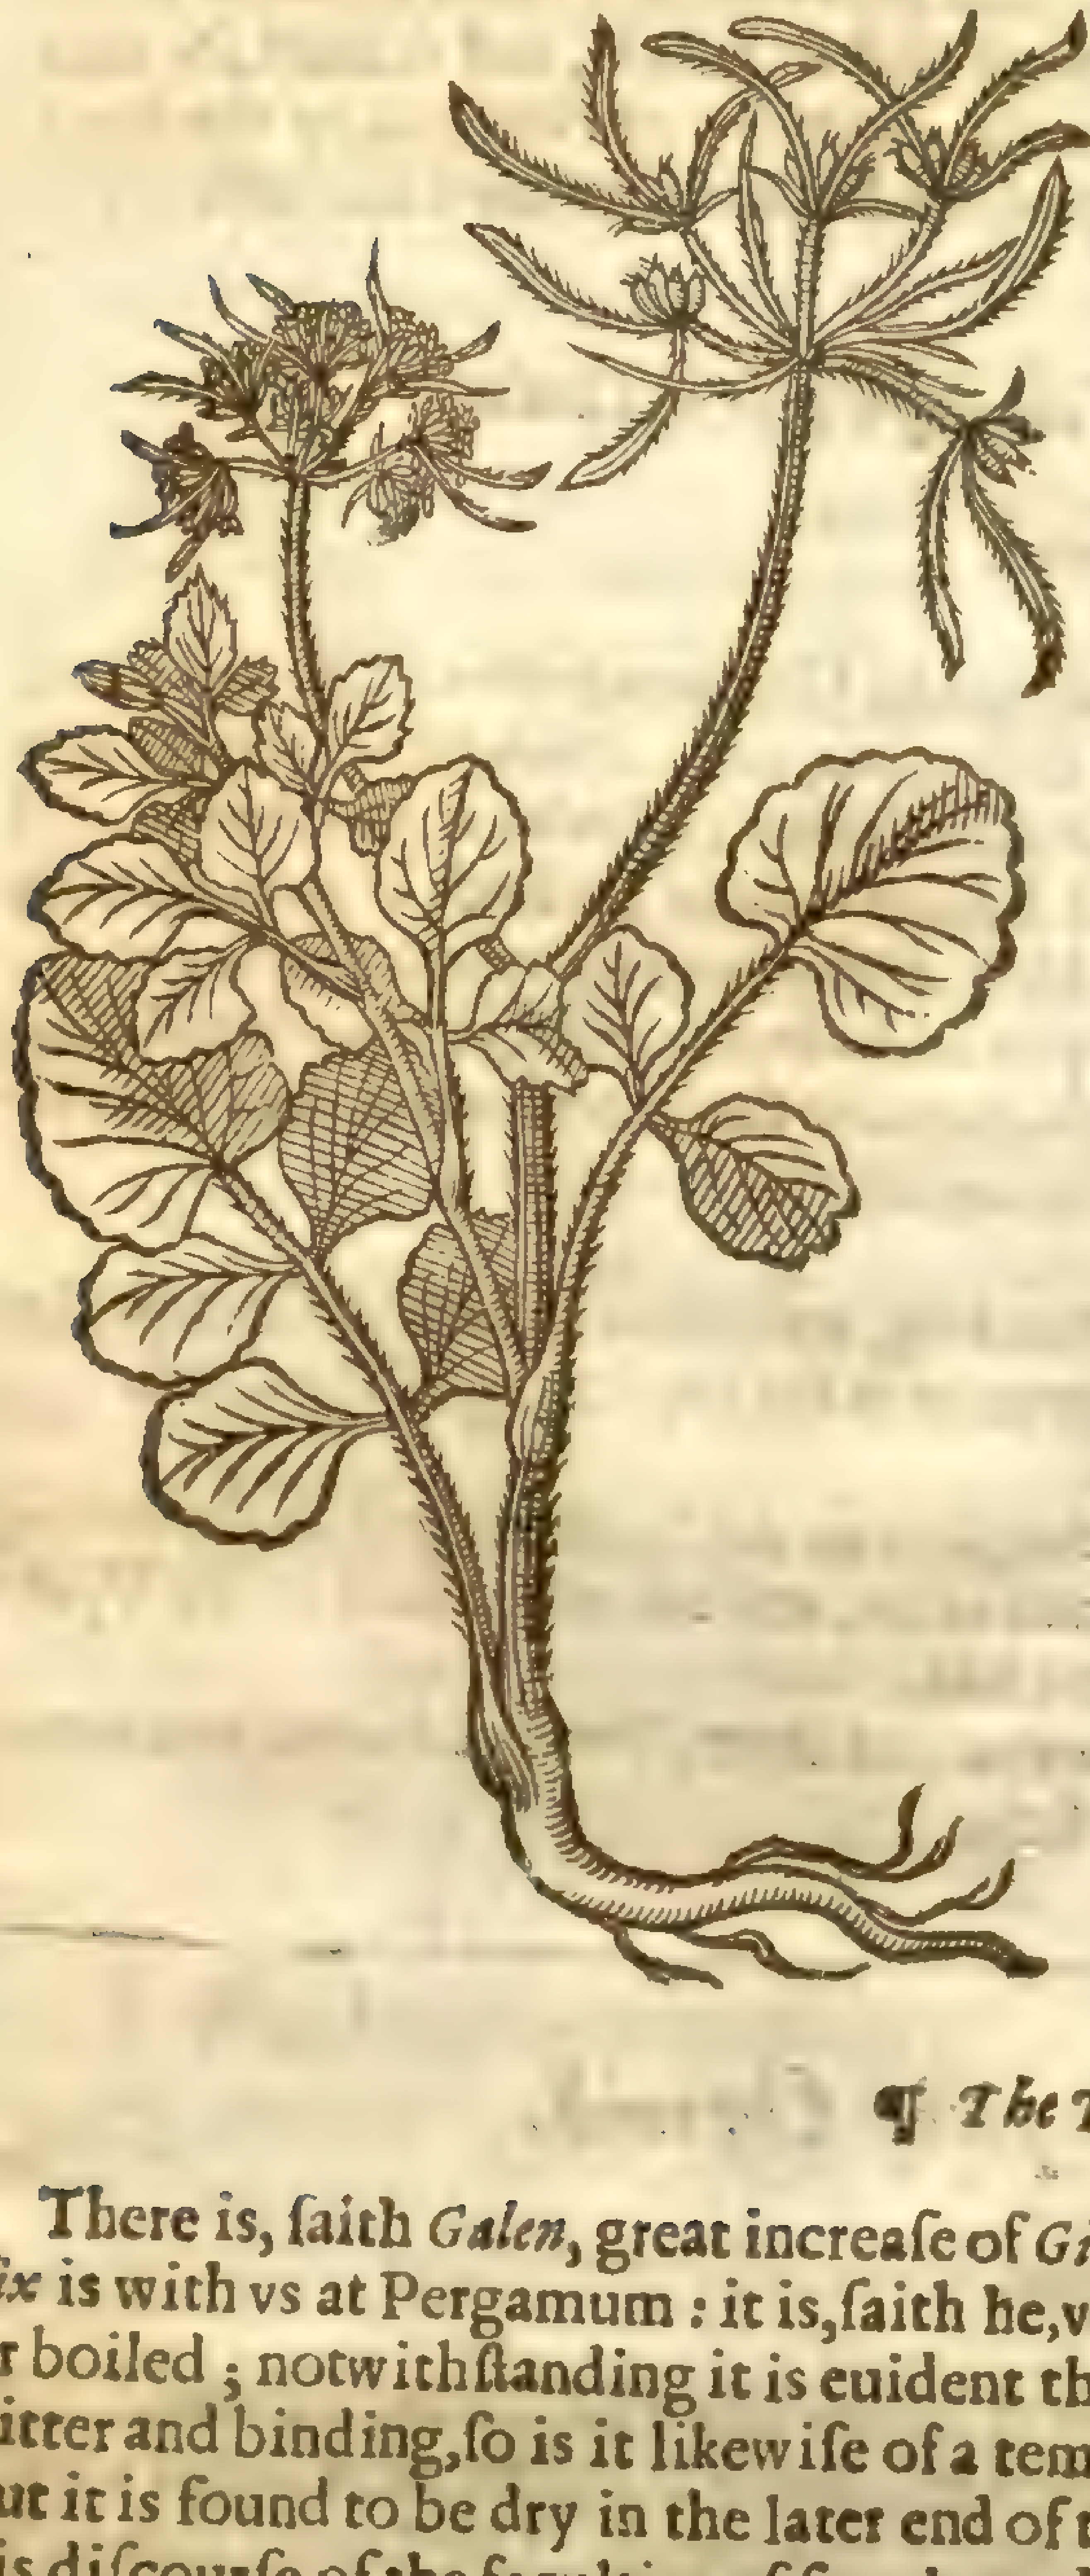
¶ *The Time.*

They floure in my garden about Auguſt,and deliuer their ſeed in October.

¶ *The Names.*

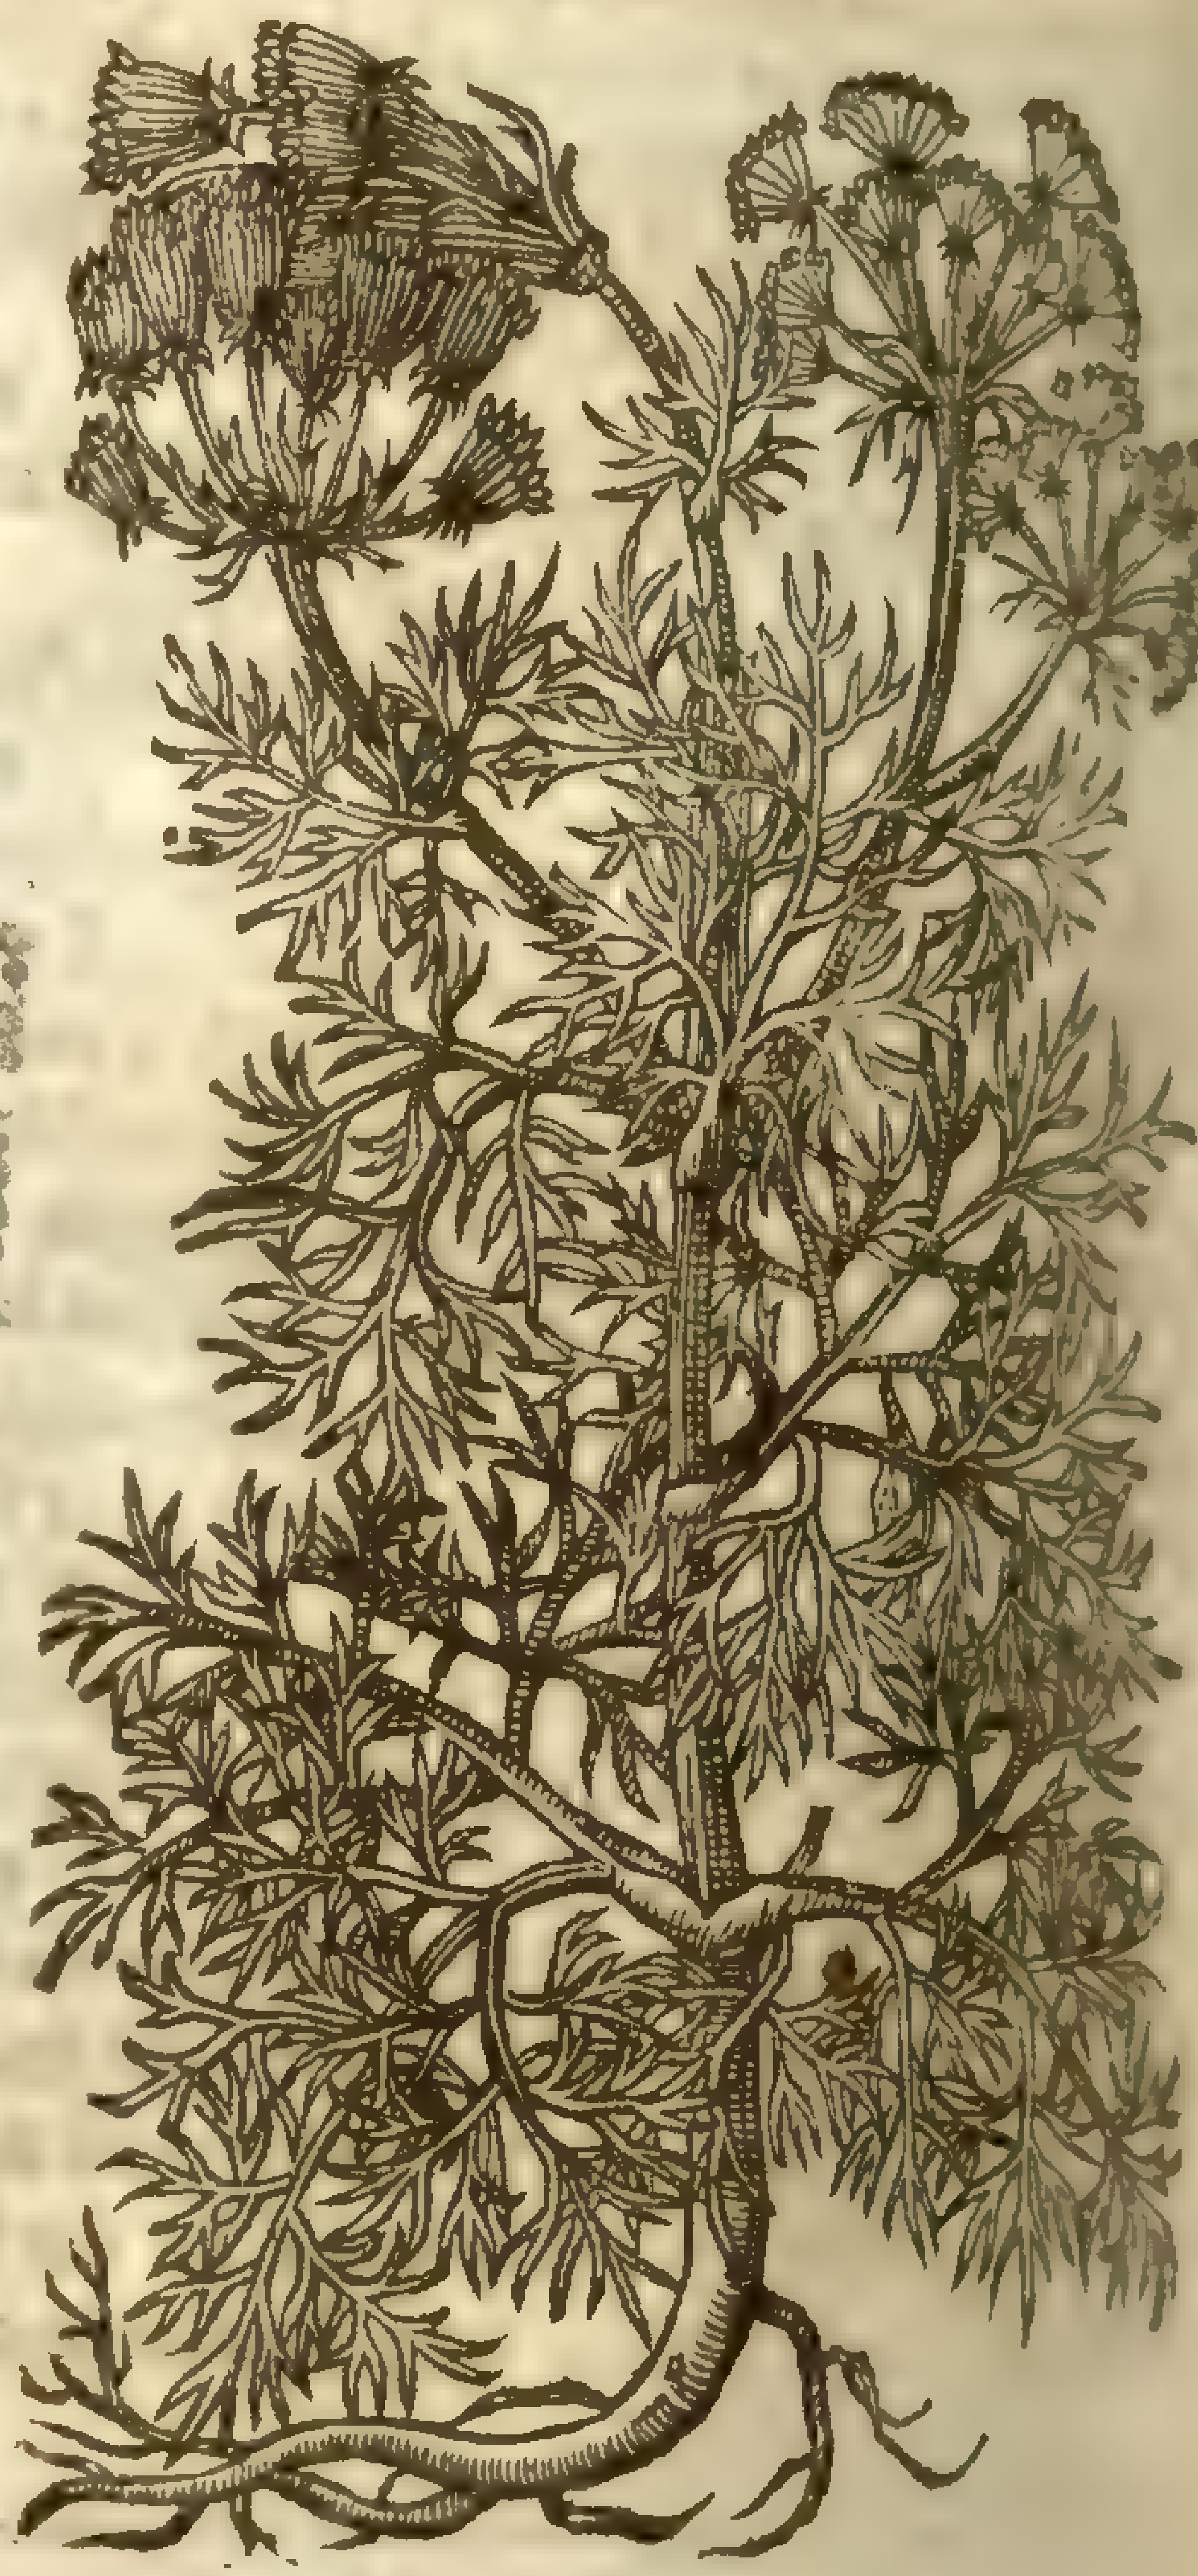
That which the Grecians call γιγγίδιον,the Latines do likewiſe name *Gingidium*: and it is called in Syria,*Lepidium*: yet is there another *Lepidium*. It is reported among the baſtard names to be called by the Romans,*Biſacutum*: of which name ſome ſhew remaines among the Syrians, who commonly call the later,*Gingidium*,*Viſnaga*: this is named in Engliſh, Tooth-picke Cheruill,

1 *Gingidium latifolium.*
Broad Tooth-picke Cheruill.



Daucus v[illegible]
[illegible]

2 *Gingidium Hiſpanicum.*
Spaniſh Tooth-picke Cheruill.



¶ *The Temperature and Vertues.*

A There is, ſaith *Galen*, great increaſe of *Gingidium* in Syria, and it is eaten no otherwiſe than *Scandix* is with vs at Pergamum: it is, ſaith he, very wholſome for the ſtomack, whether it be eaten raw or boiled; notwithſtanding it is euident that it is a medicine rather than a nouriſhment. As it is bitter and binding, ſo is it likewiſe of a temperate heat and drines. The heat is not very apparant, but it is found to be dry in the later end of the ſecond degree, as alſo the ſaid Author alledgeth in his diſcourſe of the faculties of ſimple medicines.

B *Dioſcorides* doth alſo write the ſame: This pot-herbe (ſaith he) is eaten raw, ſodden, and preſerued with great good to the ſtomack; it prouoketh vrine, and the decoction therof made with wine and drunke, is profitable to ſcoure the bladder, prouoketh vrine, and is good againſt the grauell and ſtone.

C The hard quils whereon the ſeeds do grow are good to clenſe the teeth and gums, and do eaſily take away all filth and baggage ſticking in them, without any hurt vnto the gums, as followeth after many other Tooth-picks, and they leaue a good ſent or ſauor in the mouth.

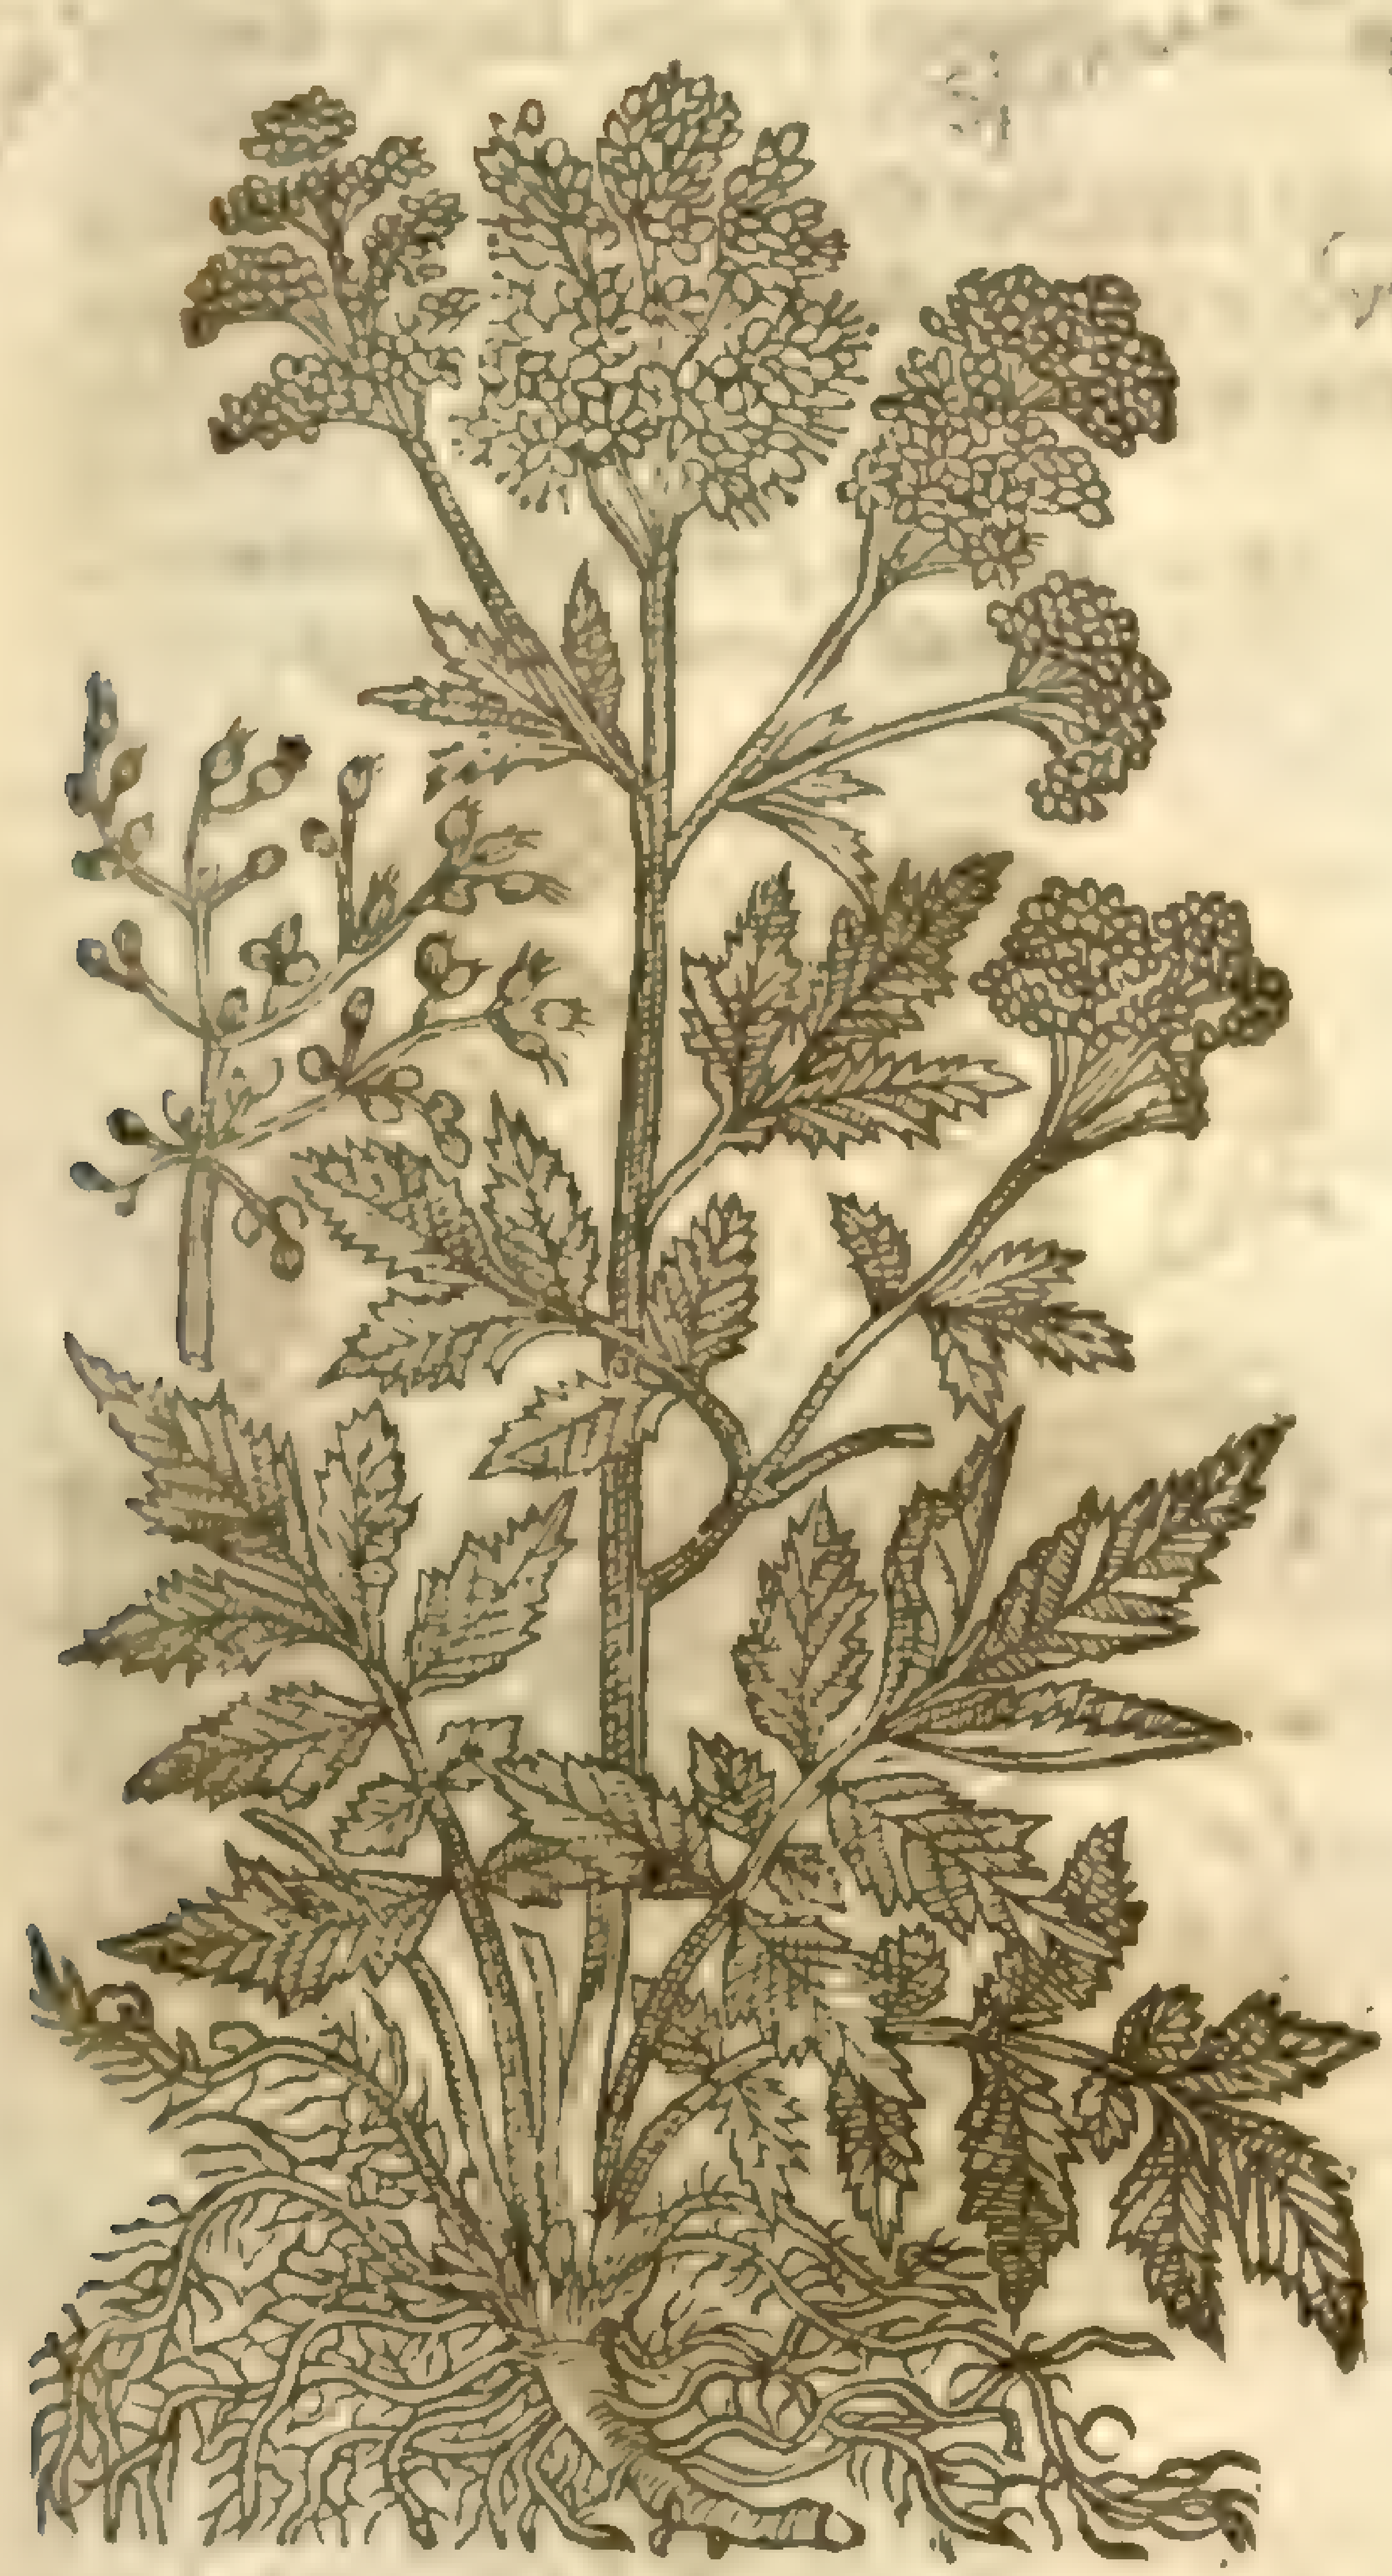
Chap. 419. *Of Mede-ſweet, or Queene of the Medowes.*

¶ *The Deſcription.*

1 This herbe hath leaues like Agrimony, conſiſting of diuers leaues ſet vpon a middle rib like thoſe of the aſh tree, euery ſmall leaf ſleightly ſnipt about the edges, white on the inner ſide, and on the vpper ſide crumpled or wrinkled like vnto thoſe of the Elme tree; whereof it tooke the name *Vlmaria*, of the ſimilitude or likeneſſe that the leaues haue with the Elme leaues. The ſtalke is three or foure foot high, rough, and very fragile or eaſie to bee broken, of a reddiſh purple colour: on the top whereof are very many little floures cluſtering and growing together, of a white colour tending to yellowneſſe, and of a pleaſant ſweet ſmell.

1 *Regina prati.*
Queene of the Medow.

p. 2. 369



ſmell, as are the leaues likewiſe: after which come the ſeeds, ſmall, crookedly turning or winding one with another, made into a fine little head: the root hath a ſweet ſmell, ſpreading far abroad, black without, & of a darkiſh red color within.

‡ 2 There is alſo another which by *Fuchſius*, *Tragus Lonicerus*, *Geſner*, and others, is called *Barba Capri*: it hath large woody roots, leaues of the bigneſſe, and growing ſomwhat after the maner of the wild Angelica: the ſtalks are creſted, and diuided into ſundry branches, which cary long bending ſpikes or eares of white floures and ſeeds ſomewhat like thoſe of the common kind: this flours at the ſame time as the former, & I haue not yet heard of it wild with vs, but only ſeene it growing with Mr. *Tradeſcant*. ‡

¶ *The Place.*

It groweth in the brinkes of waterie ditches and riuers ſides, and alſo in medowes: it liketh watery and moiſt places, and groweth almoſt euery where.

¶ *The Time.*

It floureth and flouresheth in Iune, Iuly, and Auguſt.

¶ *The Names.*

It is called of the later age *Regina prati*, and *Barba Capri*: of ſome, *Vlmaria, à foliorum Vlmi ſimilitudine*, for the likeneſſe it hath with the Elme tree leafe: in high Dutch, **Geiſbart**. It is called *Barba Hirci*, which name belongeth to the plant which the Grecians do cal *Tragopogon*: of *Anguillara*, *Potentilla major*. It hath ſome likeneſſe with *Rhodora Plinij*, but yet we cannot affirme it to be the ſame. It is called in low Dutch, **Reinette**: in French, *Barbe de Cheure*, *Reine des Praiz*: in Engliſh, Meadſ-ſweet, Medow-ſweet, and Queen of the medowes. *Camerarius* of Noremberg ſaith it is called of the Germanes his countrimen, **Wurme kraut**: becauſe the roots, ſaith he, ſeeme to be eaten with wormes. I rather ſuppoſe they call it ſo, becauſe the antient hackny men and horſeleaches do giue the decoction thereof to their horſes and aſſes, againſt the bots and worms, for the which it is greatly commended.

¶ *The Nature.*

Mede-ſweet is cold and dry, with an euident binding qualitie adioined.

¶ *The Vertues.*

The root boiled, or made into pouder and drunke, helpeth the bloudy flix, ſtaieth the lask, and all other fluxes of bloud in man or woman. A

It is reported, that the floures boiled in wine and drunke, do take away the fits of a quartaine ague, and make the heart merrie. B

The leaues and floures farre excell all other ſtrowing herbes, for to decke vp houſes, to ſtraw in chambers, halls, and banqueting houſes in the Summer time; for the ſmell thereof makes the heart merrie, delighteth the ſenſes: neither doth it cauſe head-ache, or lothſomeneſſe to meat, as ſome other ſweet ſmelling herbes do. C

The diſtilled water of the floures dropped into the eies, taketh away the burning and itching thereof, and cleareth the ſight. D

Chap. 420. *Of Burnet Saxifrage.*

¶ *The Deſcription.*

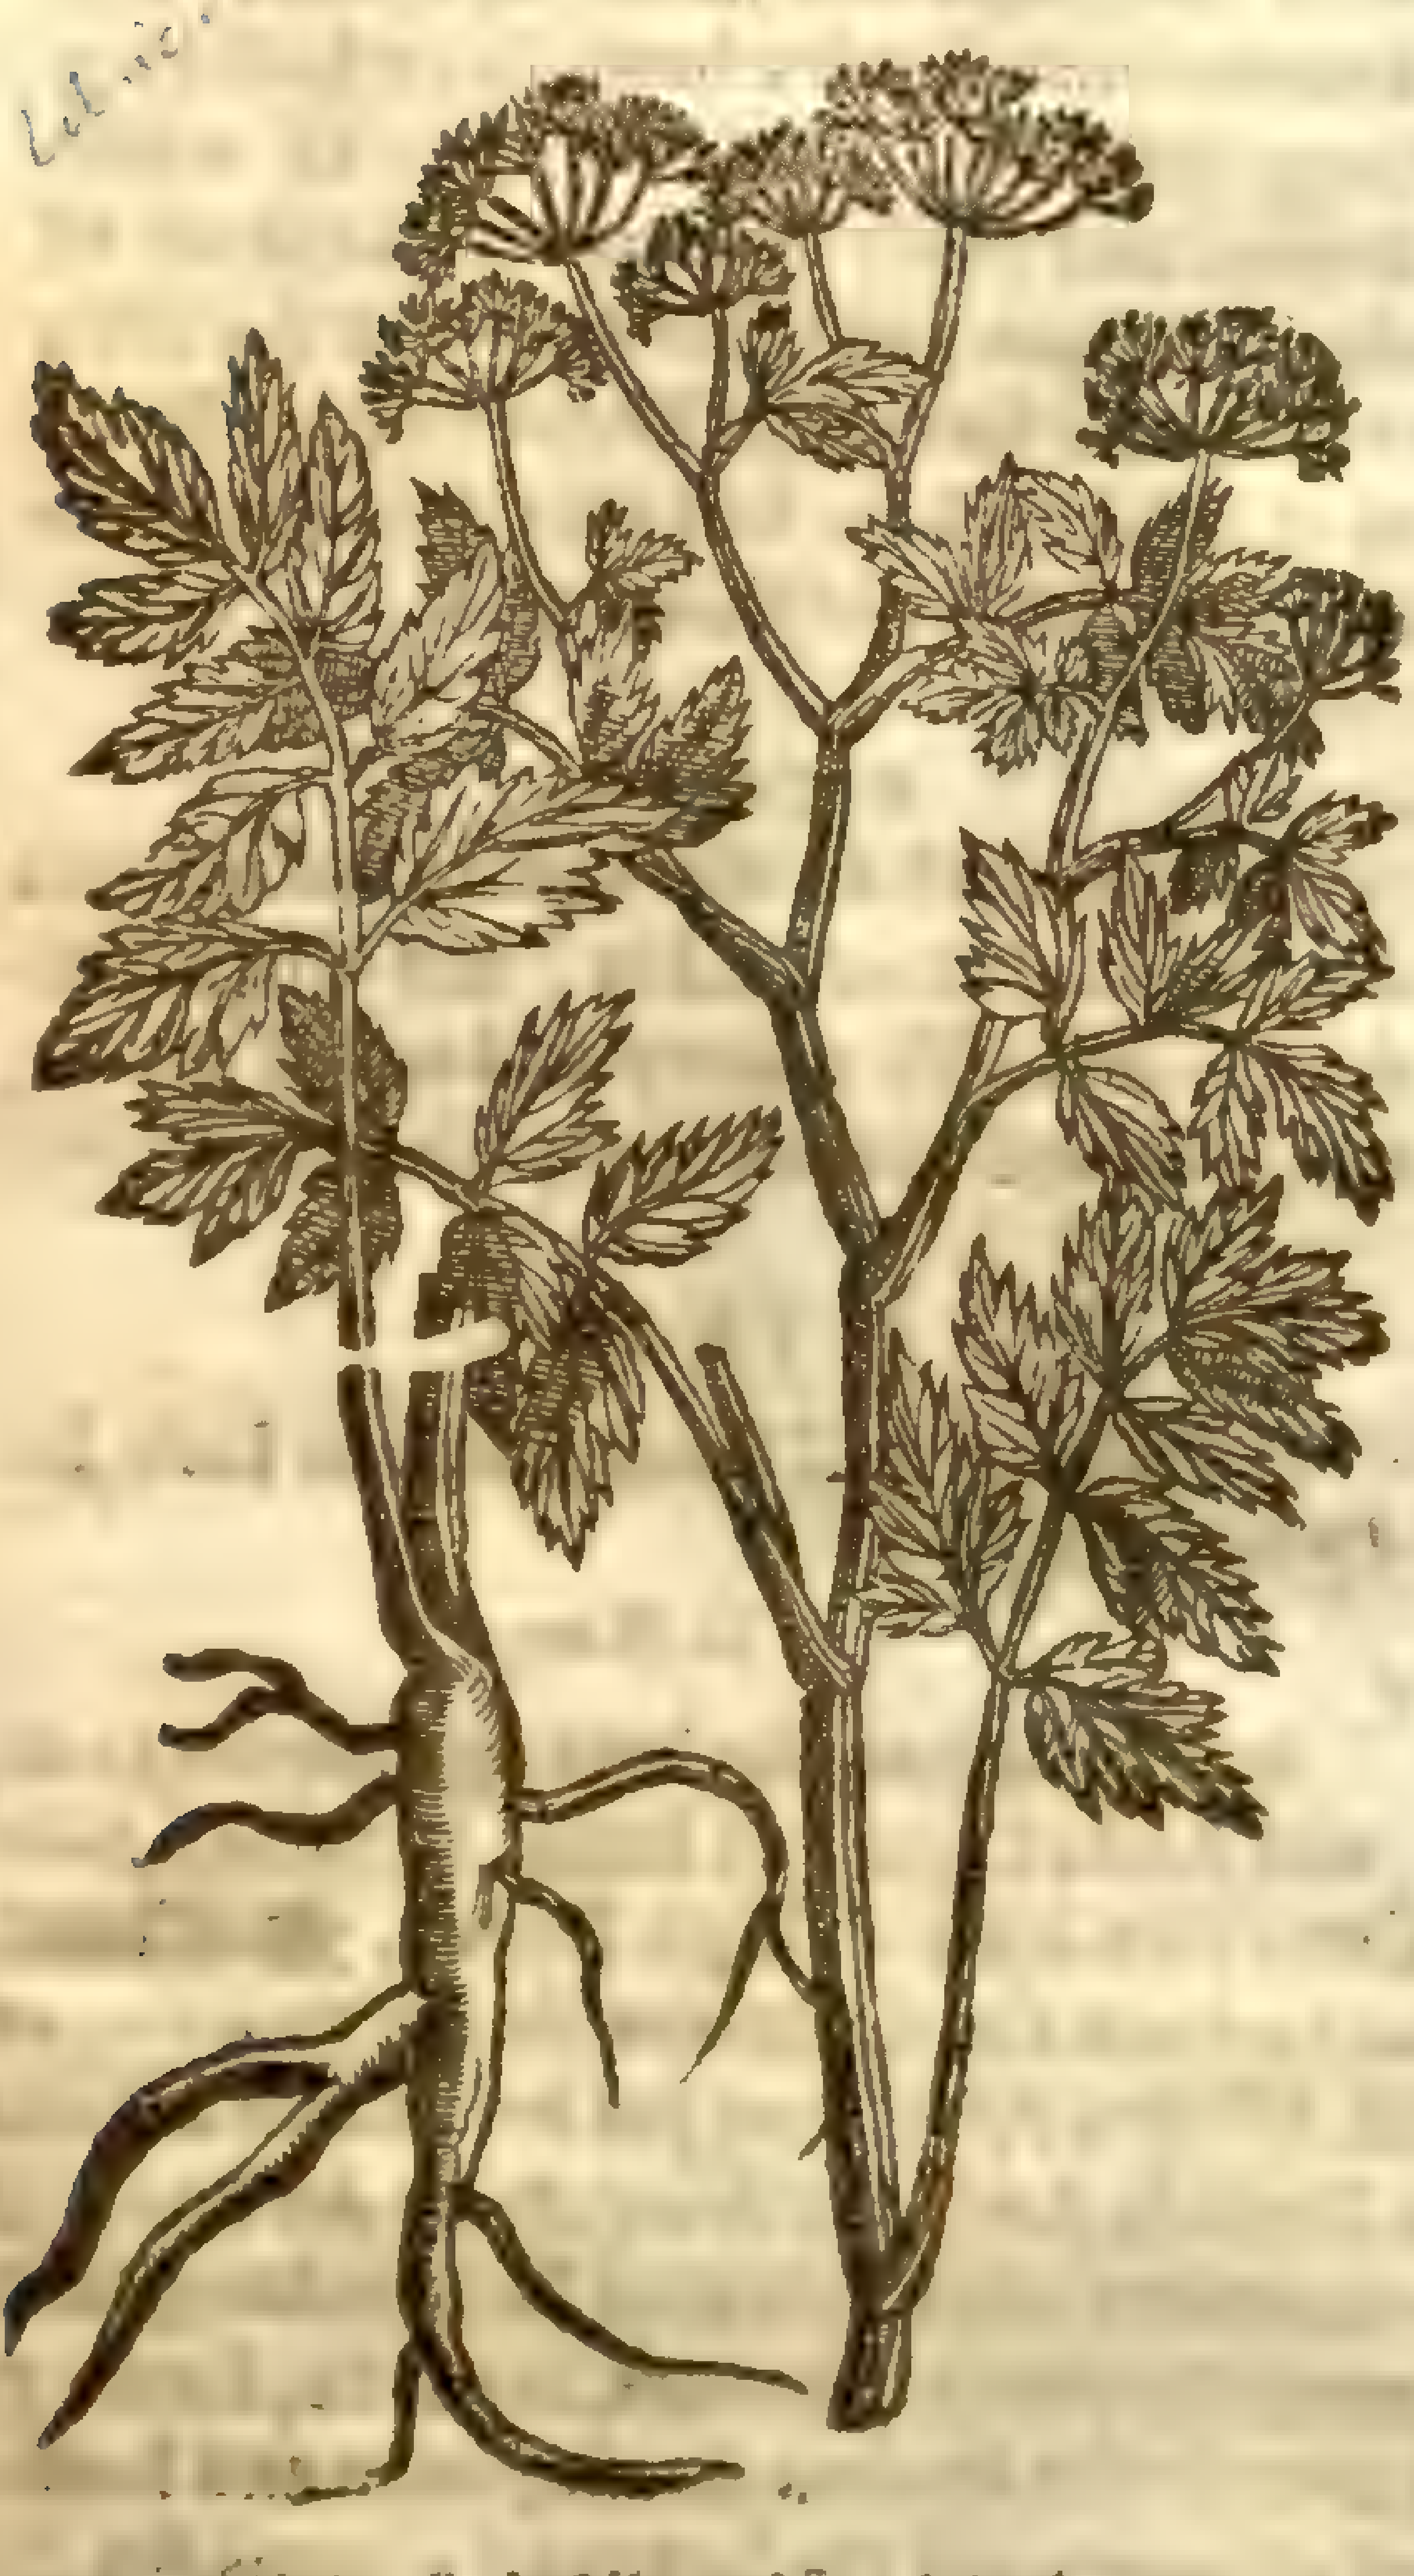
1 This great kinde of Pimpinell, or rather Saxifrage, hath great and long roots, faſhioned like a Parſnep, of an hot and biting taſte like Ginger: from which riſeth vp an hollow

ſtalke with joints and knees two cubits high,beſet with large leaues,which do more neerely repreſent Smallage than Pimpernell,or rather the garden Parſnep. This plant conſiſteth of many ſmall leaues growing vpon one ſtem,ſnipt or dented about the edges like a ſaw : the floures doe grow at the top of the ſtalkes in white round tufts : the ſeed is like the common Parſley, ſauing that it is hotter and biting vpon the tongue.

‡ There is a bigger and leſſer of this kinde,which differ little,but that the ſtalkes and veins of the leaues of the leſſer are of a purpliſh colour, and the root is hotter. Our Author formerly gaue the figure of the leſſer in the ſecond place,in ſtead of that of *Bipinella*. ‡

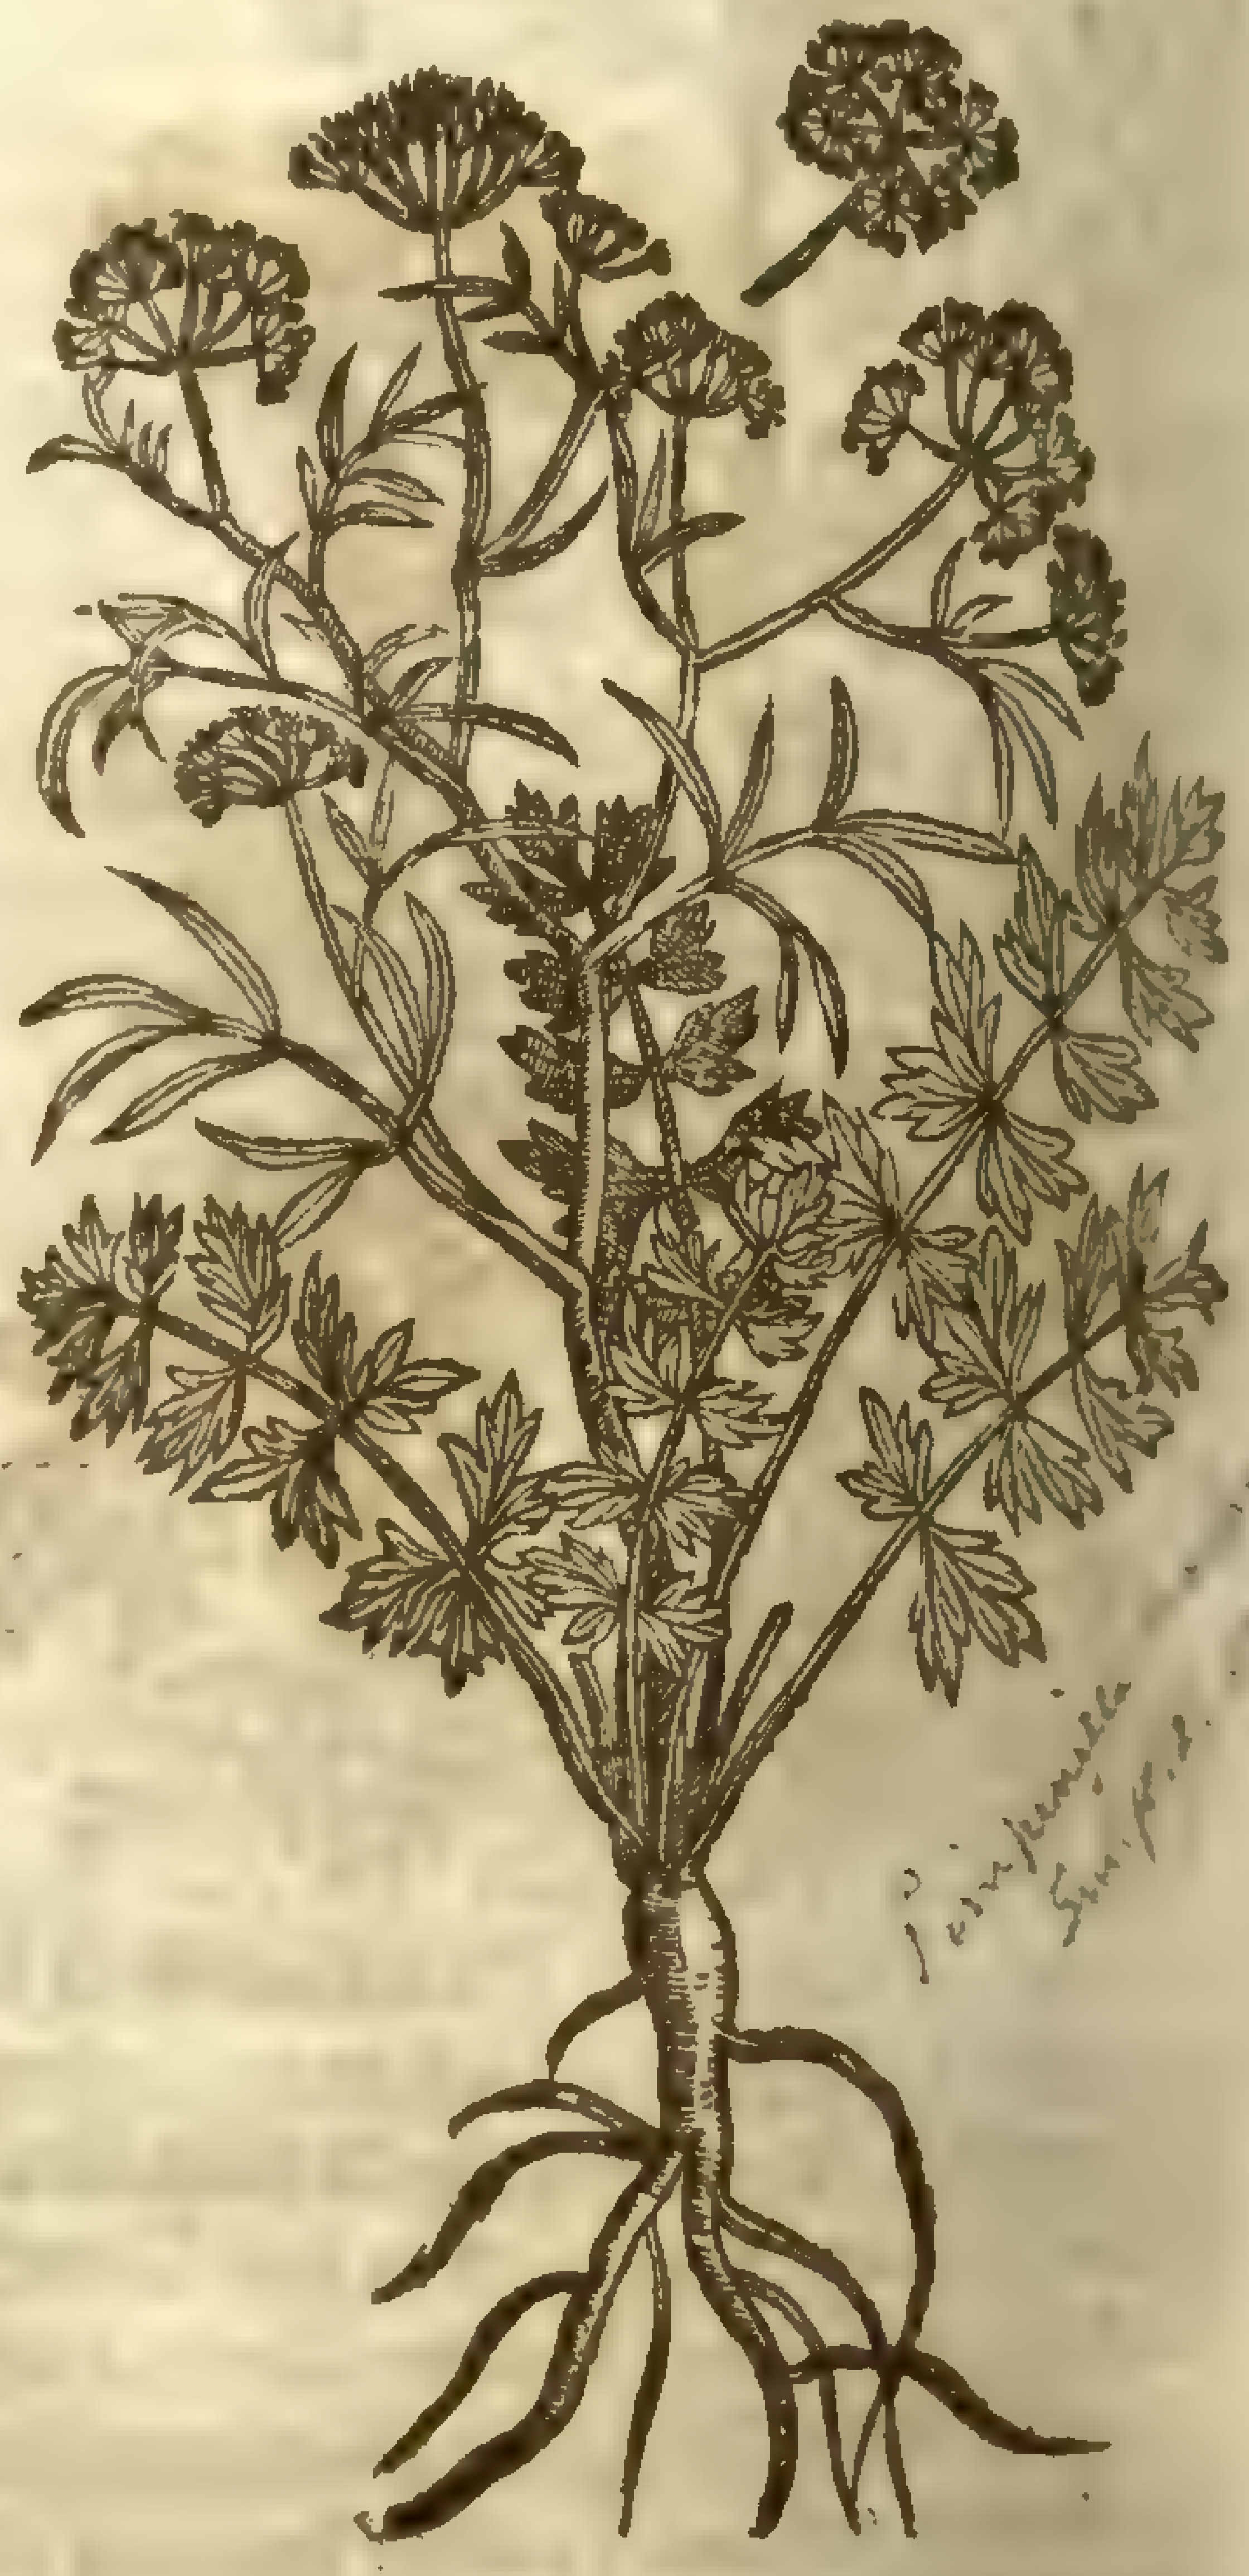
1 *Pimpinella Saxifraga.*
Burnet Saxifrage.

Lob. ic. 720



P. magna. = Umb. descr. Syn. pl. 2. 90

† 2 *Bipinella, ſiue Saxifraga minor.*
Small Burnet Saxifrage.



Pimpinella Syn. pl. 2

2 *Bipinella* is likewiſe a kind of Burnet or Pimpinell,vpon which *Pena* hath beſtowed this addition *Saxifraga minor* : vnder which name *Saxifraga* are comprehended diuers herbes of diuers kinds, and the one very vnlike to the other : but that kinde of Saxifrage which is called *Hircina*, which is rough or hairy Saxifrage,of others *Bipinella*, is beſt known, and the beſt of all the reſt, like vnto the ſmall Burnet,or common Parſley,ſauing that it is void of haires,as may appeare by the old Latine, verſe,

> *Pimpinella pilos,Saxifraga non habet vllos.*
> Pimpinell hath haires ſome,but Saxifrage hath none.

Notwithſtanding, I haue found a kinde hereof growing in our paſtures adioining to London, the leaues whereof if you take and tenderly breake with your hands, you may draw forth ſmall threds, like the web of a ſpider,ſuch as you may draw from the leaues of Scabious. The ſtalke is hollow, diuiding it ſelfe from the joints or knees, into ſundry other ſmall branches,at the top whereof do grow ſmall tufts or ſpokie rundles,of a white colour : after which commeth the ſeed like to *Carui*, or Caruwaies,of a ſharp taſte : the root is alſo ſharp and hot in taſte.

¶ *The Place.*

Theſe plants do grow in dry paſtures and medowes in this countrey very plentifully.

¶ *The Time.*

They floure from Iune to the end of Auguſt.

¶ *The Names.*

That which *Fuchſius* calleth *Pimpinella major*, *Dodonæus* termeth *Saxifragia major*, which kinde of Saxifrage more abſolutely anſwereth the true *Phellandrium* of *Pliny*, than any other plant whatſoeuer:

ſoeuer: wherein the Phyſitions of Paris haue bin deceiued, calling or ſuppoſing the medow Rue to be the right *Phellandrium*, whereunto it is not like either in ſhape or faculty: for it is nothing ſo effectuall in breaking the ſtone, or prouoking of vrine, as either of theſe plants, eſpecially *Pimpinella Hircina*, which is not ſo called becauſe it hath any rammiſh ſmell of a Goat, but becauſe practitioners haue vſed to feed goats with it, whoſe fleſh and bloud is ſingular good againſt the ſtone: but we rather take it to be named *Hircina*, of *Hercinea ſylua*, where it growes in great aboundance, the ſauor of the herb not being vnpleaſant, ſomewhat reſembling the ſmell and taſt of *Daucus*, *Liguſtrum*, and *Paſtinaca*: ſo to conclude, both theſe are called *Saxifragia*. The ſmaller is called of ſome, *Petrefindula*, *Bipinella*, and *Bipenula*: of *Baptiſta Sardus*, and alſo of *Leonardus Fuchſius*, *Pimpinella maior*: Diuers call it *Pimpinella ſaxifraga*; for there is alſo another *Pimpinella*, called *Pimpinella ſanguiſorba*: notwithſtanding the verſe before rehearſed ſheweth a difference between *Pimpinella* and *Saxifraga*: in high Dutch it is called **Bibernel**: in low-Dutch, **Bauenaert**: in Engliſh the greater may be called great Saxifrage, and the other ſmall Saxifrage.

Bipinella is called *Saxifragia minor*: in Engliſh, ſmall Saxifrage, as *Pimpinella* is called great Saxifrage. ‡ *Columna* iudges it to be the *Tragium* of *Dioſcorides*. ‡

¶ *The Nature.*

Saxifrage of both kinds, with their ſeed, leaues, and roots are hot and dry in the third dagree, and of thin and ſubtill parts.

¶ *The Vertues.*

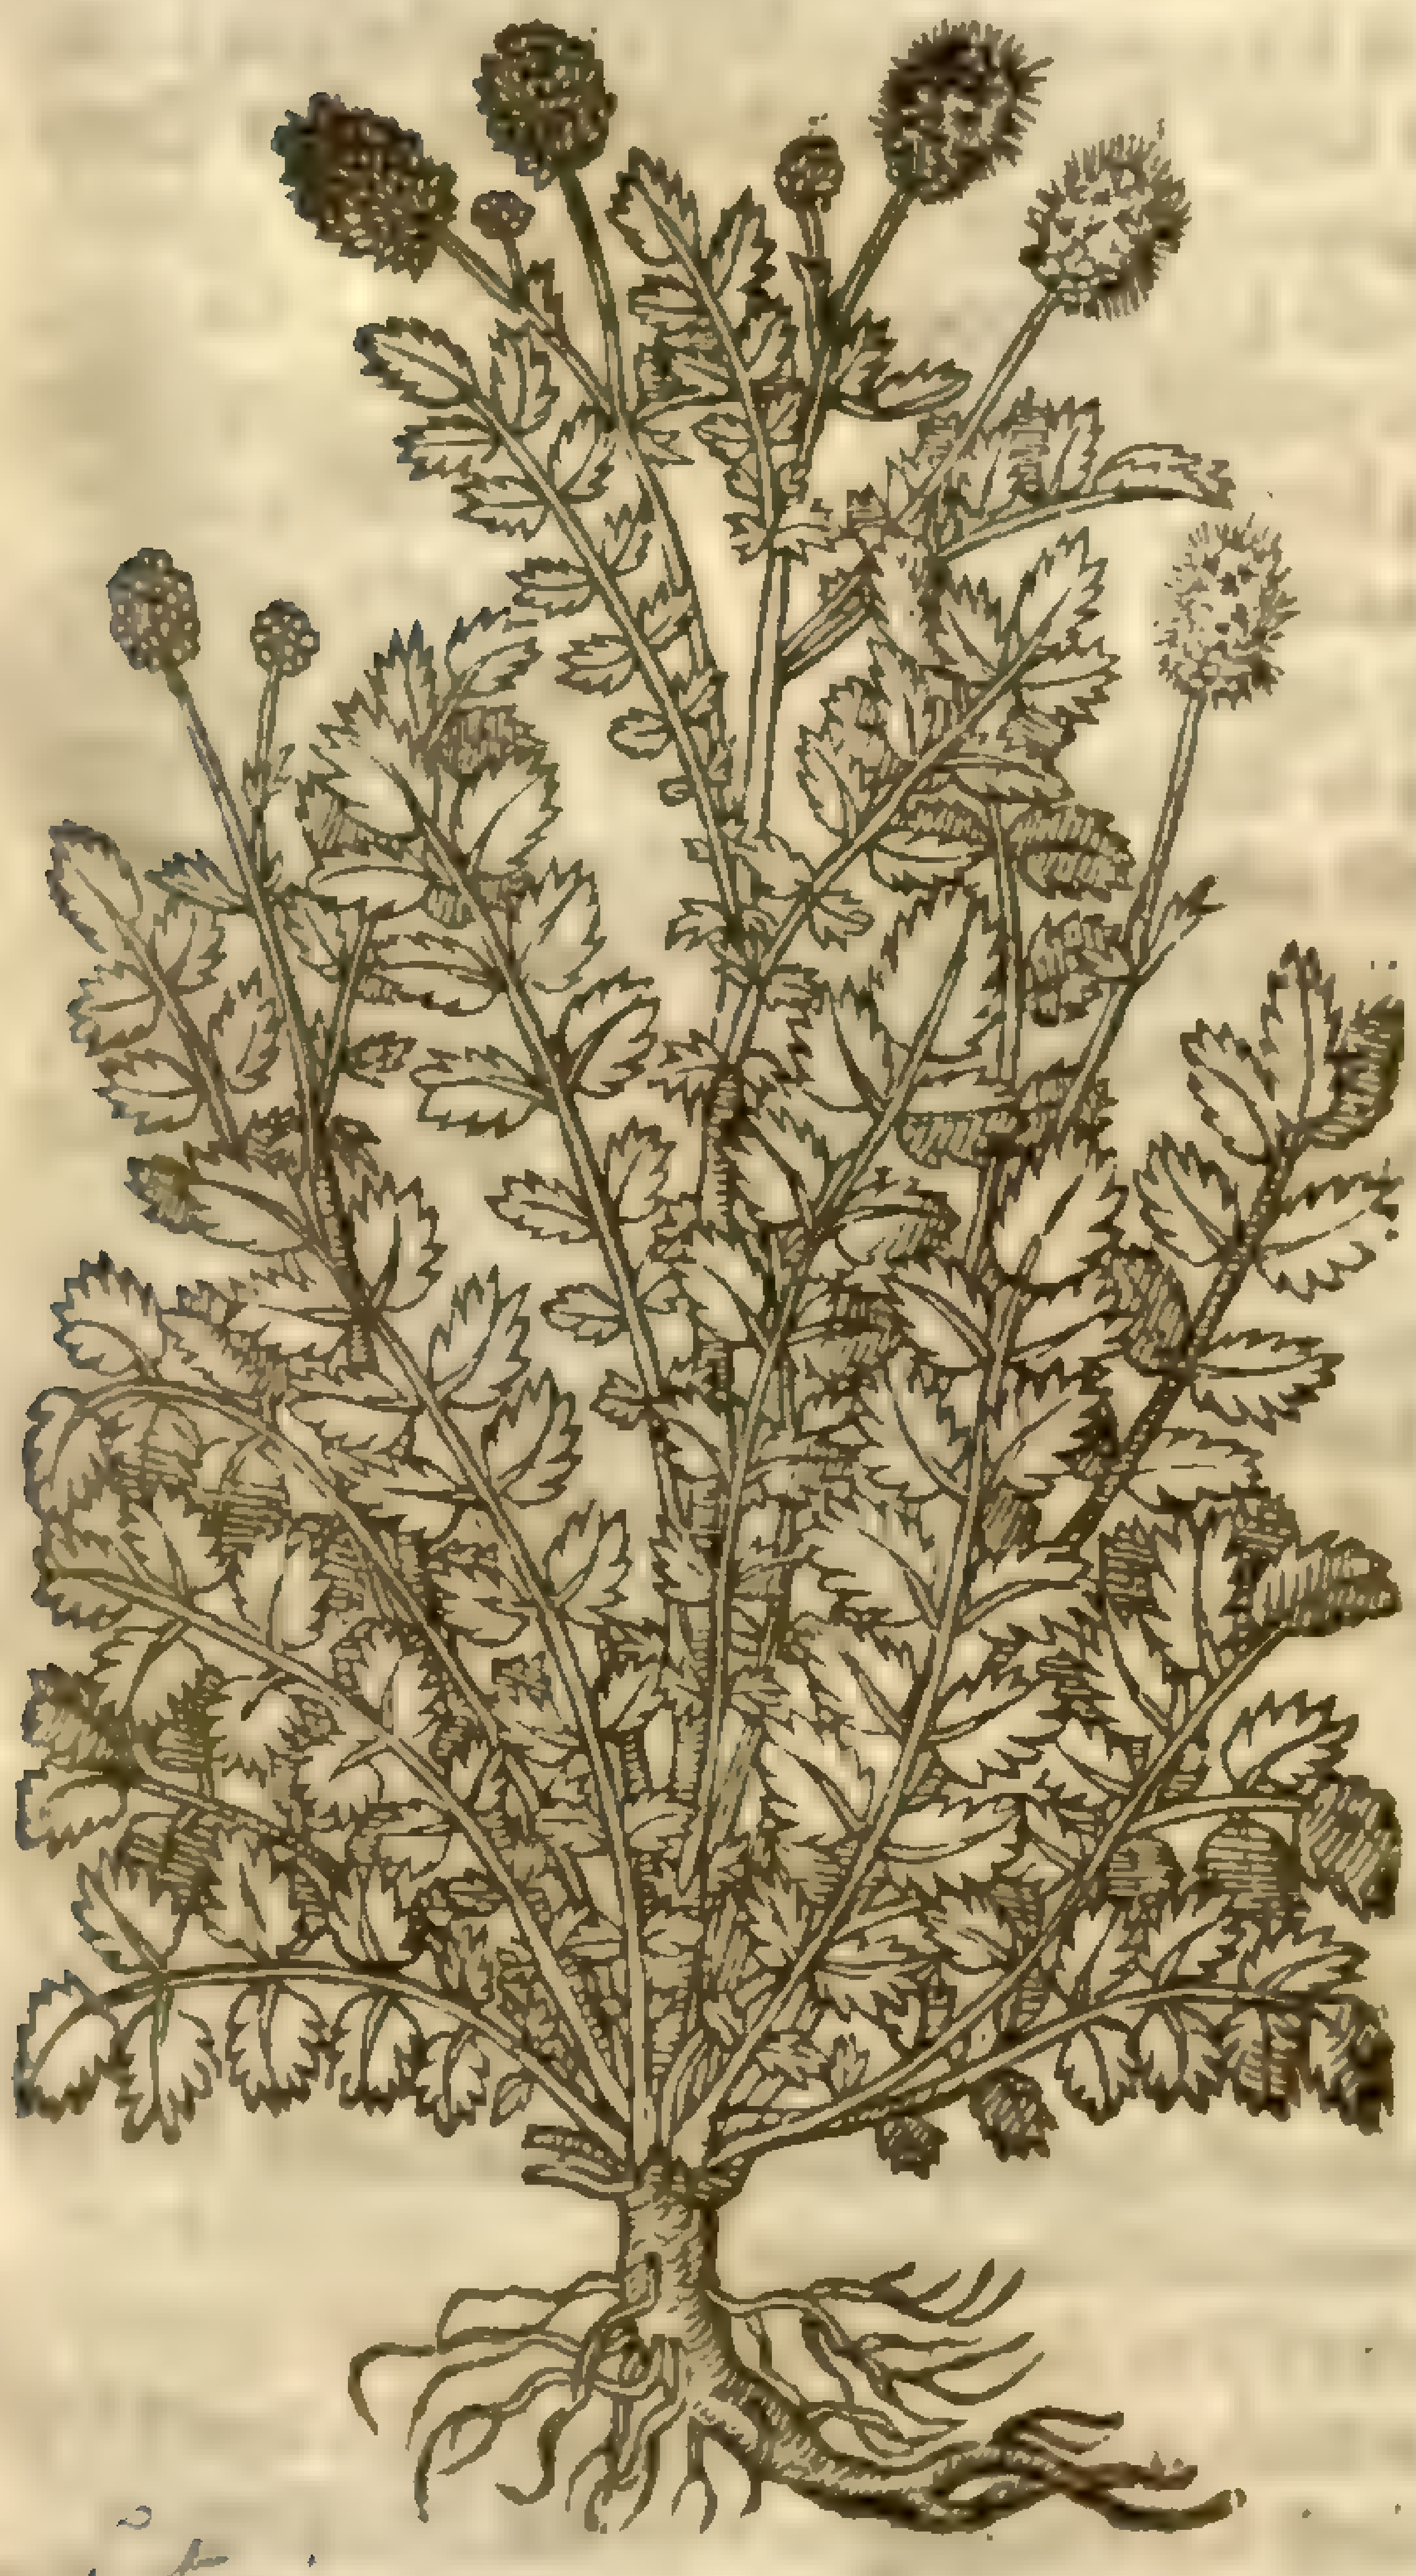
The ſeed and root of Saxifrage drunk with wine, or the decoction thereof made with wine, cauſeth to piſſe well, breaketh the ſtone in the kidnies and bladder, and is ſingular againſt the ſtrangurie and ſtoppings of the kidnies and bladder; whereof it took the name *Saxifragia*, or Break-ſtone. A

The juice of the leaues of Saxifrage doth clenſe and take away all ſpots and freckles of the face and leaueth a good colour. B

The diſtilled water thereof mingled with ſome vineger in the diſtillation, cleareth the ſight, and taketh away all obſcuritie and darkneſſe of the ſame. C

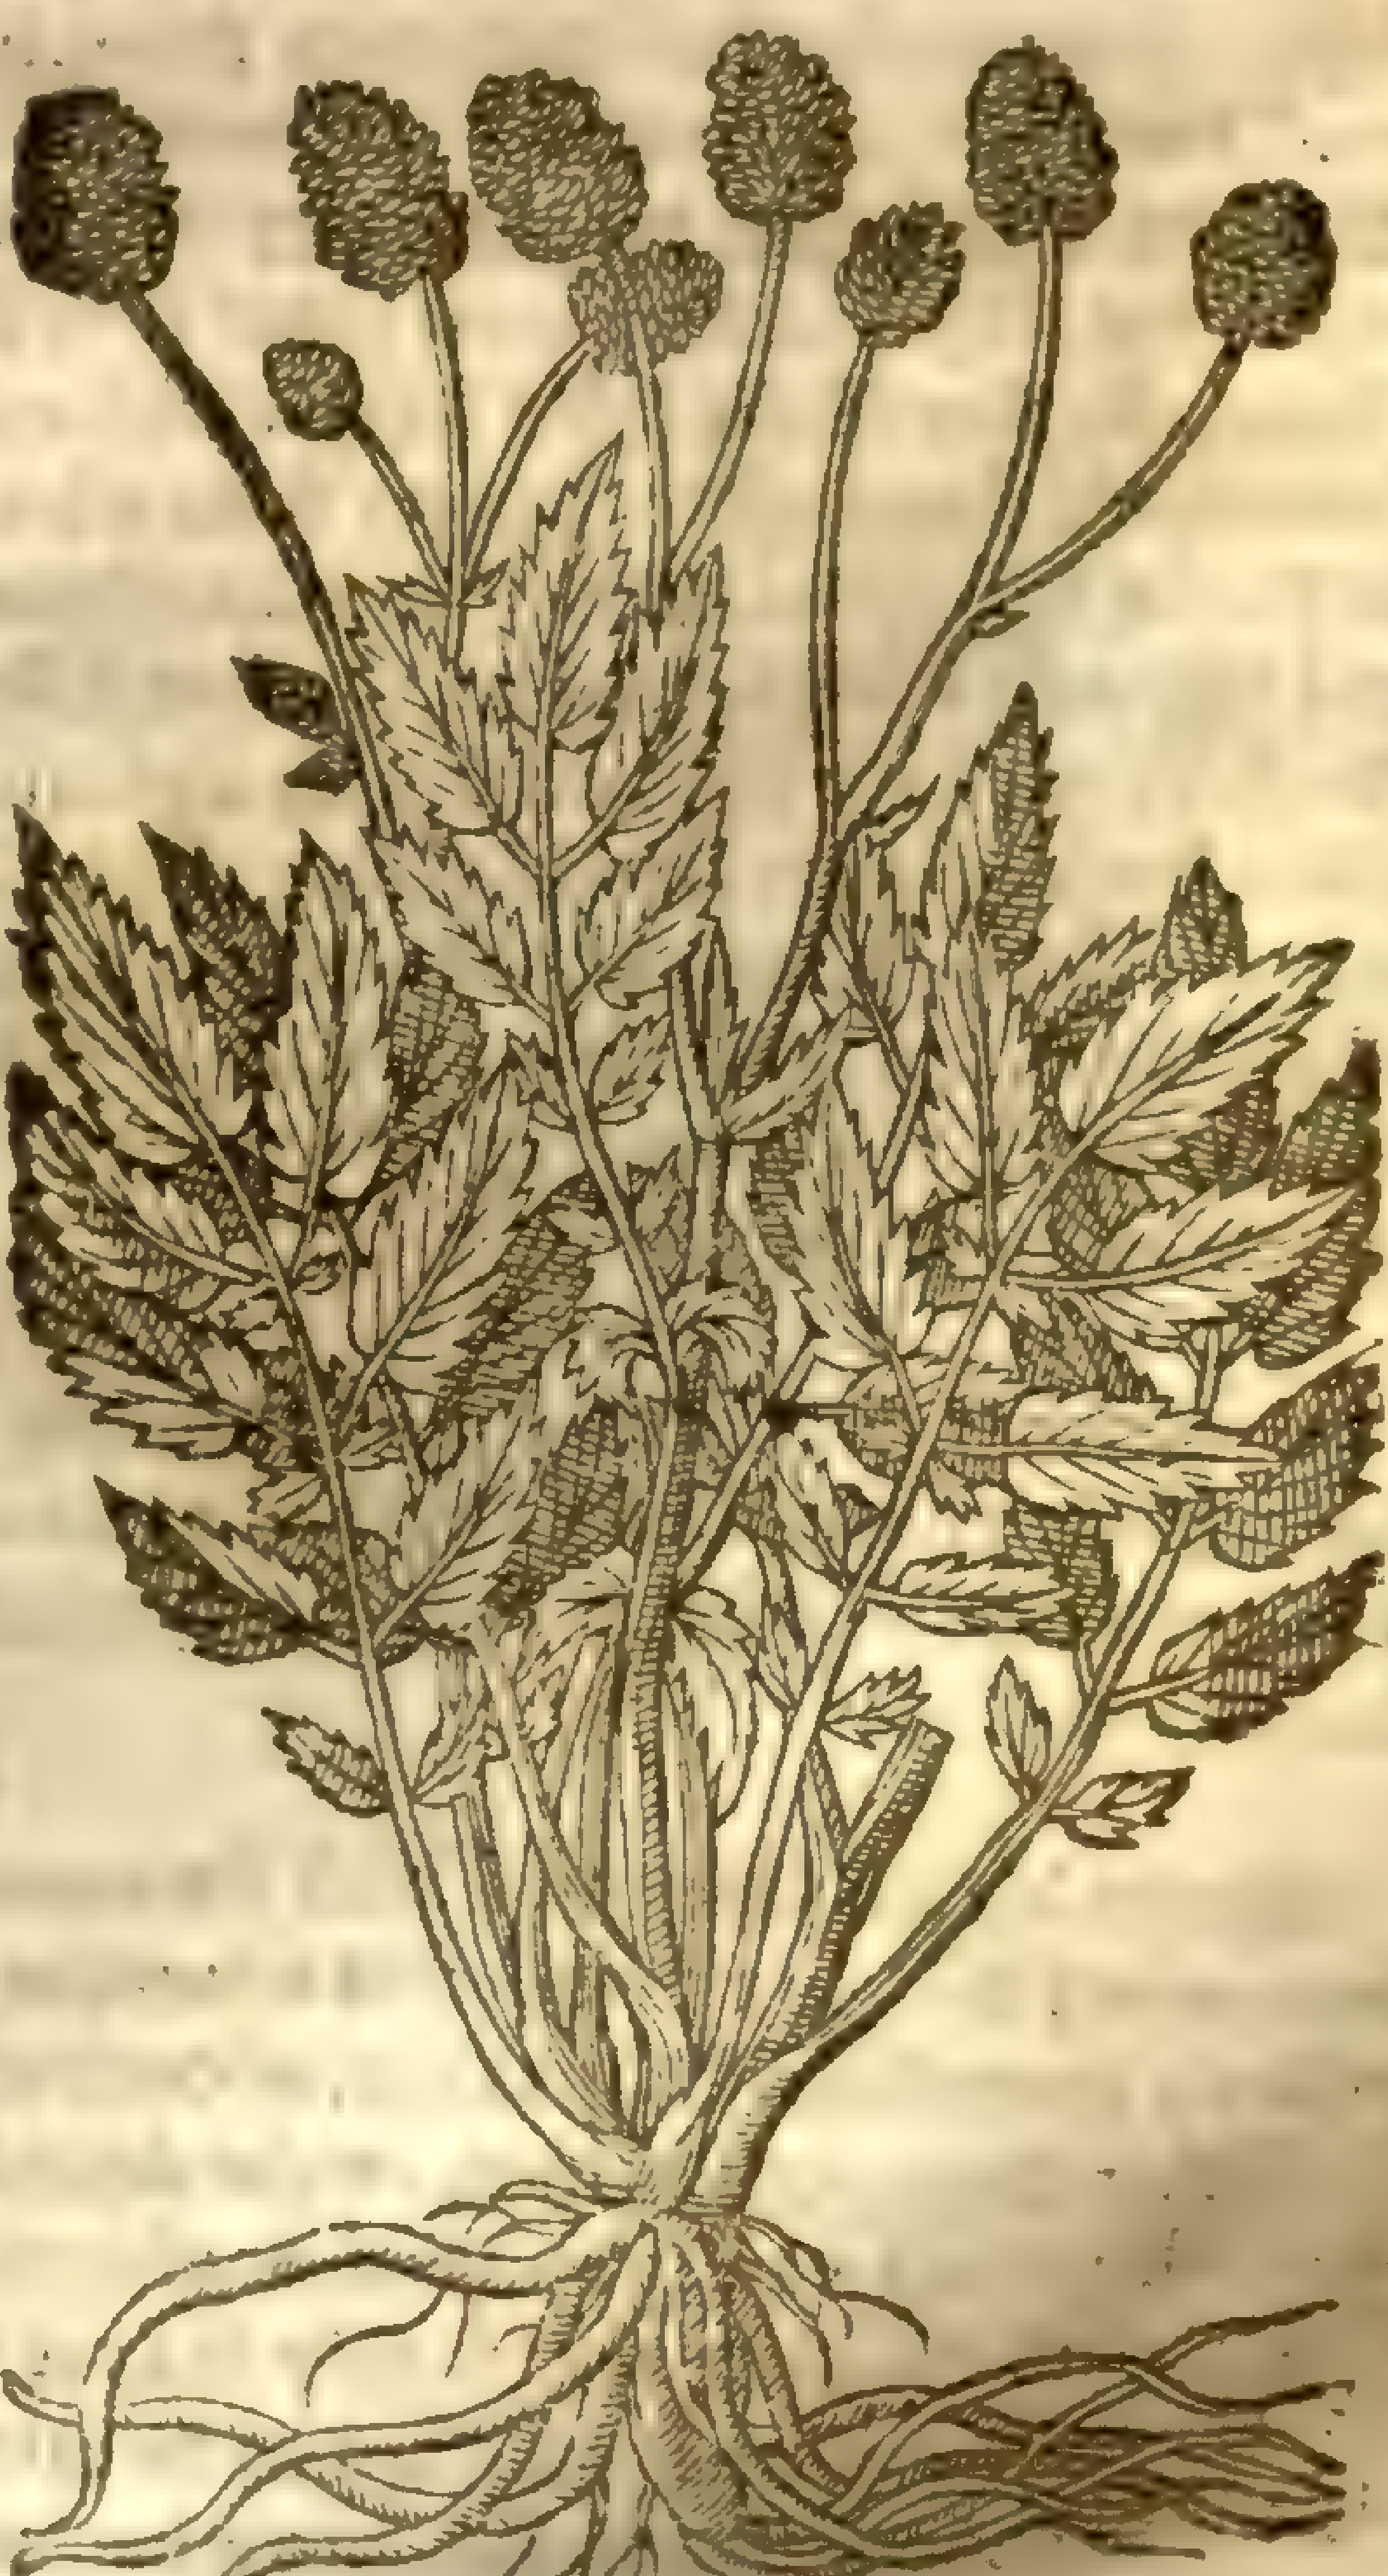
Chap. 421. *Of Burnet.*

1 *Pimpinella hortenſis.*
Garden Burnet.



Poterium sanguisorba, Linn. dict. (Sm. fl. 4. 147)

2 *Pimpinella ſylueſtris.*
Wilde Burnet.



Sanguisorba officinalis, Linn. dict. Sm. fl. 1. 310

¶ *The Kindes.*

BVrnet of which we will intreat, doth differ from *Pimpinella*, which is alſo called *Saxifraga.* One of the Burnets is leſſer, for the moſt part growing in gardens, notwithſtanding it groweth in barren fields, where it is much ſmaller: the other greater, is altogether wilde.

¶ *The Deſcription.*

1 GArden Burnet hath long leaues made vp together of a great many vpon one ſtem, euery one whereof is ſomething round, nicked on the edges, ſomewhat hairy: among theſe riſeth a ſtalke that is not altogether without leaues, ſomething chamfered: vpon the tops whereof grow little round heads or knaps, which bring forth ſmall floures of a browne purple colour, and after them cornered ſeeds, which are thruſt vp together. The root is long: the whole plant doth ſmell ſomething like a Melon, or Cucumber.

2 Wilde Burnet is greater in all parts, it hath wider and bigger leaues than thoſe of the former: the ſtalke is longer, ſometimes two cubits high: the knaps are greater, of a darke purple colour, and the ſeed is likewiſe cornered and greater: the root longer, but this Burnet hath no pleaſant ſmell at all.

‡ 3 There is kept in ſome gardens another of this kinde, with very large leaues, ſtalkes, and heads, for the heads are ſome inch and halfe long, yet but ſlender conſidering the length, and the floures (as I remember) are of a whitiſh colour: in other reſpects it differs not from the precedent: it may fitly be called *Pimpinella ſanguiſorba hortenſis maxima*, Great Garden Burnet. ‡

3 Sanguis [illegible]

¶ *The Place.*

The ſmall Pimpinell is commonly planted in Gardens, notwithſtanding it doth grow wild vpon many barren heaths and paſtures.

The great wilde Burnet groweth (as Mr. *Lyte* ſaith) in dry medowes about Viluord, and my ſelfe haue found it growing vpon the ſide of a cauſey which croſſeth the one halfe of a field, whereof the one part is earable ground, and the other part medow, lying betweene Paddington and Lyſſon green neere vnto London, vpon the high way.

¶ *The Time.*

They floure from Iune, vnto the end of Auguſt.

¶ *The Names.*

The later herbariſts doe call Burnet *Pimpinella ſanguiſorba*, that it may differ from the other, and yet it is called by ſeuerall names, *Sanguiſorba*, and *Sanguinaria*: *Geſner* had rather it ſhould be called *Peponella* of the ſmell of Melons or Pompions, to which it is like, as we haue ſaid: of others it is named *Pimpinella*, or *Bipennula*: of moſt men, *Solbaſtrella*: in high Dutch, **Kolbleſkraut, her Gots Bartlin, Blutkraut, megelkraut:** in French, *Pimpennelle, Sanguiſorbe*: in Engliſh, Burnet. It agreeth *cum altera Dioſcoridis Sideritide*, that is to ſay, with *Dioſcorides* his ſecond Iron-wort: the leafe (and eſpecially that of the leſſer ſort) which we haue written to conſiſt of many nicks in the edges of the leaues; and this may be the very ſame which *Pliny* in his 24 book, chapter 17. reporteth to be named in Perſia, *Siſſitieptris*, becauſe it made them merry; he alſo calleth the ſame *Protomedia*, and *Caſignета*, and likewiſe *Dionyſionymphas*, for that it doth maruellouſly agree with wine; to which alſo this *Pimpinella* (as we haue ſaid) doth giue a pleaſant ſent: neither is that repugnant, that *Pliny* in another place hath written, *De Sideritibus*, of the Iron-worts; for it often falleth out that he intreateth of one and the ſelfe ſame plant in diuers places, vnder diuers names: which thing then hapneth ſooner when the writers themſelues do not well know the plant, as that *Pliny* did not well know *Sideritis*, or Iron-wort, it is euen thereby manifeſt, becauſe hee ſetteth not downe his owne opinion hereof, but other mens.

¶ *The Temperature.*

Burnet, beſides the drying and binding faculty that it hath, doth likewiſe meanly coole: and the leſſer Burnet hath likewiſe withall a certaine ſuperficiall, ſleight, and temperate ſent, which when it is put into the wine it doth leaue behind it: this is not in the dry herbe, in the juyce, nor in the decoction.

¶ *The Vertues.*

A Burnet is a ſingular good herb for wounds (which thing *Dioſcorides* doth attribute to his ſecond Iron-wort) and commended of a number: it ſtancheth bleeding, and therefore it was named *Sanguiſorba*, as well inwardly taken, as outwardly applied.

B Either the juyce is giuen, or the decoction of the pouder of the dry leaues of the herbe, beeing bruiſed, it is outwardly applied, or elſe put among other externall medicines.

C It ſtaieth the laske and bloudy flix: it is alſo moſt effectuall to ſtop the monethly courſe.

D The leſſer Burnet is pleaſant to be eaten in ſallads, in which it is thought to make the heart mery and glad, as alſo being put into wine, to which it yeeldeth a certaine grace in the drinking.

The decoction of Pimpinell drunken, cureth the bloudy flix, the ſpitting of bloud, and all other fluxes of bloud in man or woman. F

The herbe and ſeed made into pouder, and drunke with wine, or water wherein yron hath beene quenched doth the like. G

The leaues of Pimpinell are very good to heale wounds, and are receiued in drinks that are made for inward wounds. H

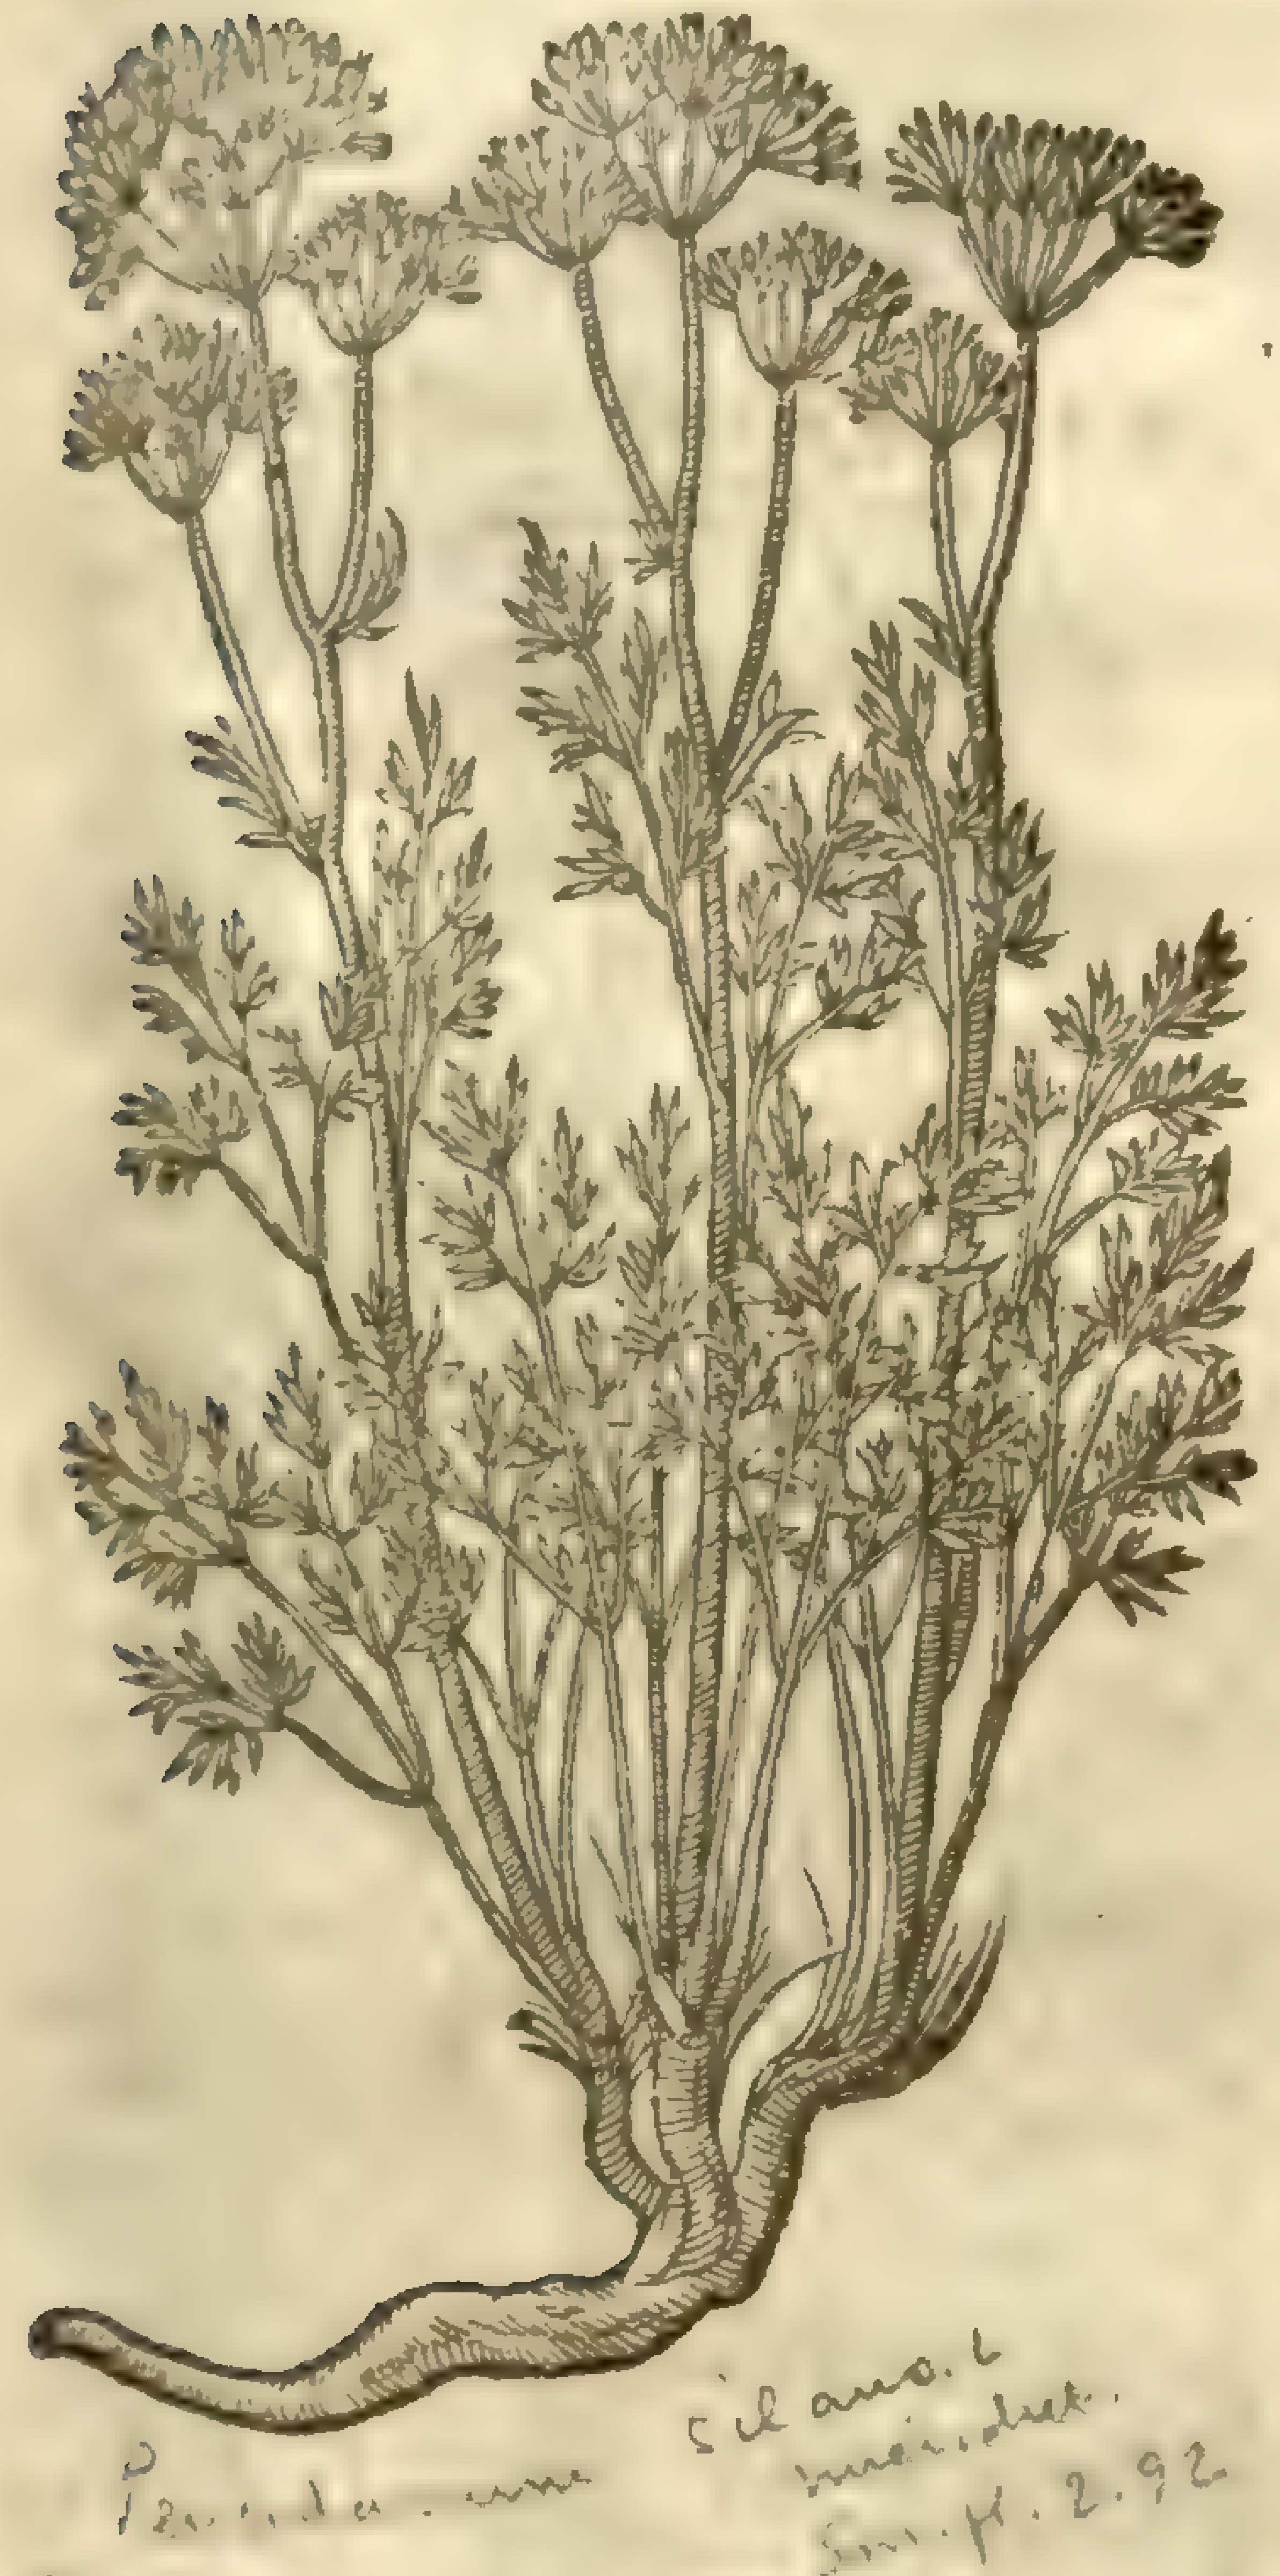
The leaues of Burnet ſteeped in wine and drunken, comfort the heart, and make it merry, and are good againſt the trembling and ſhaking thereof. I

CHAP. 387. *Of Engliſh Saxifrage.*

¶ *The Deſcription.*

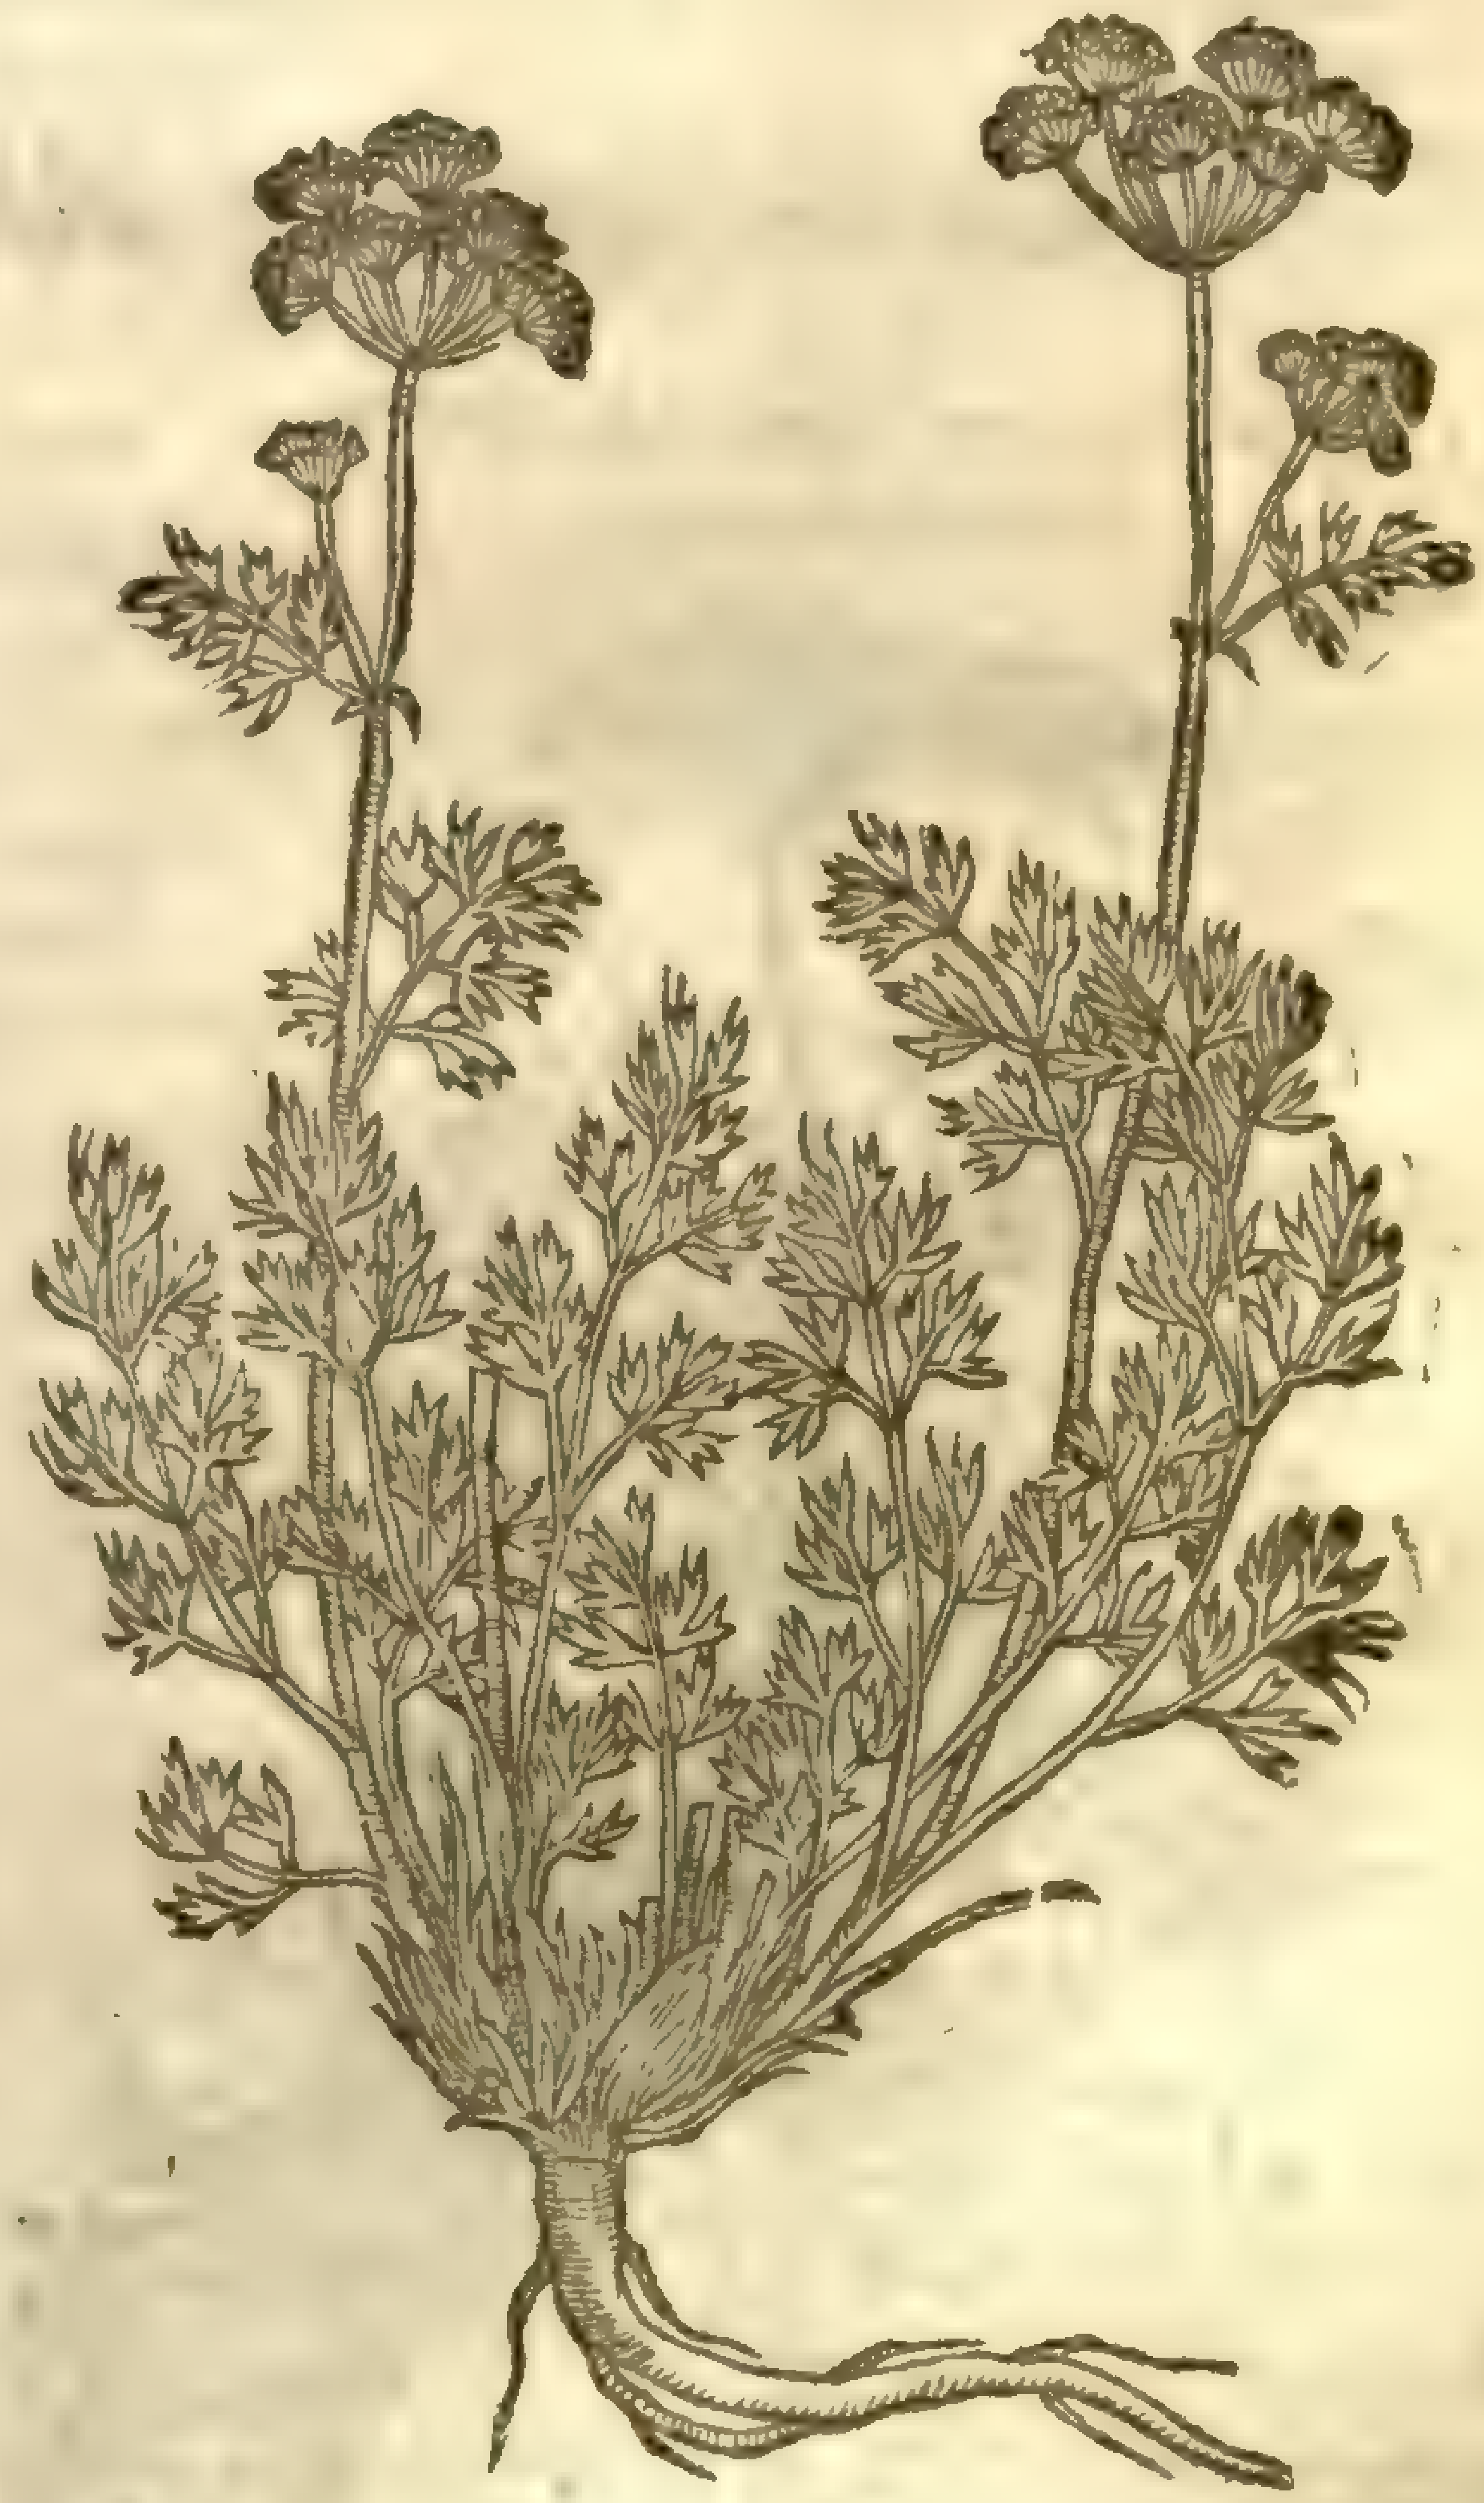
1 THis kinde of Saxifrage our Engliſh women Phyſitions haue in great vſe, and is familiarly knowne vnto them, vouchſafing that name vnto it of his vertues againſt the ſtone: it hath the leaues of Fennell, but thicker and broader, very like vnto *Seſeli pratenſe Monſpelienſium* (which addition *Pena* hath beſtowed vpon this our Engliſh Saxifrage) among which riſeth vp a ſtalke, of a cubit high or more, bearing at the top ſpokie rundles beſet with whitiſh yellow floures: the root is thicke, blacke without, and white within, and of a good ſauour.

† 1 *Saxifraga Anglicana facie Seſeli pratenſis.*
Engliſh Saxifrage.



Peucedanum Silaus. L. [illegible] Sm. fl. 2.92

‡ 2 *Saxifraga Pannonica Claſij.*
Auſtrian Saxifrage.



‡ 2 *Cluſius* hath ſet forth another plant not much different from this our common Saxifrage and called it *Saxifraga Pannonica*, which I haue thought fit here to inſert: the leaues, ſaith hee, are much ſhorter than thoſe of Hogs-Fennell, & ſomwhat like to thoſe of Fumitory: the ſtalks are ſome foot high, ſlender, hauing ſome few ſmall leaues, and at the top carrying an vmbell of white floures: the root is not much vnlike that of Hogs-Fennell, but ſhorter and more acride; it is hairy at the top

thereof, whence the ſtalkes and leaues come forth: it growes vpon ſome hills in Hungary and Auſtria, and floures in Iuly. ‡

¶ *The Place.*

Saxifrage groweth in moſt fields and medowes euery where throughout this our Kingdome of England.

¶ *The Time.*

It floureth from the beginning of May to the end of Auguſt.

¶ *The Names.*

Saxifraga Anglicana is called in our mother tongue Stone-breake or Engliſh Saxifrage: Pena and *Lobel* call it by this name *Saxifraga Anglicana*: for that it groweth more plentifully in England than in any other countrey.

¶ *The Temperature.*

Stone-breake is hot and dry in the third degree.

¶ *The Vertues.*

A A decoction made with the ſeeds and roots of Saxifrage, breaketh the ſtone in the bladder and kidnies, helpeth the ſtrangury, and cauſeth one to piſſe freely.

B The root of ſtone-breake boiled in wine, and the decoction drunken, bringeth downe womens ſickeneſſe, expelleth the ſecondine and dead childe.

C The root dried and made into pouder, and taken with ſugar, comforteth and warmeth the ſtomacke, cureth the gnawing and griping paines of the belly.

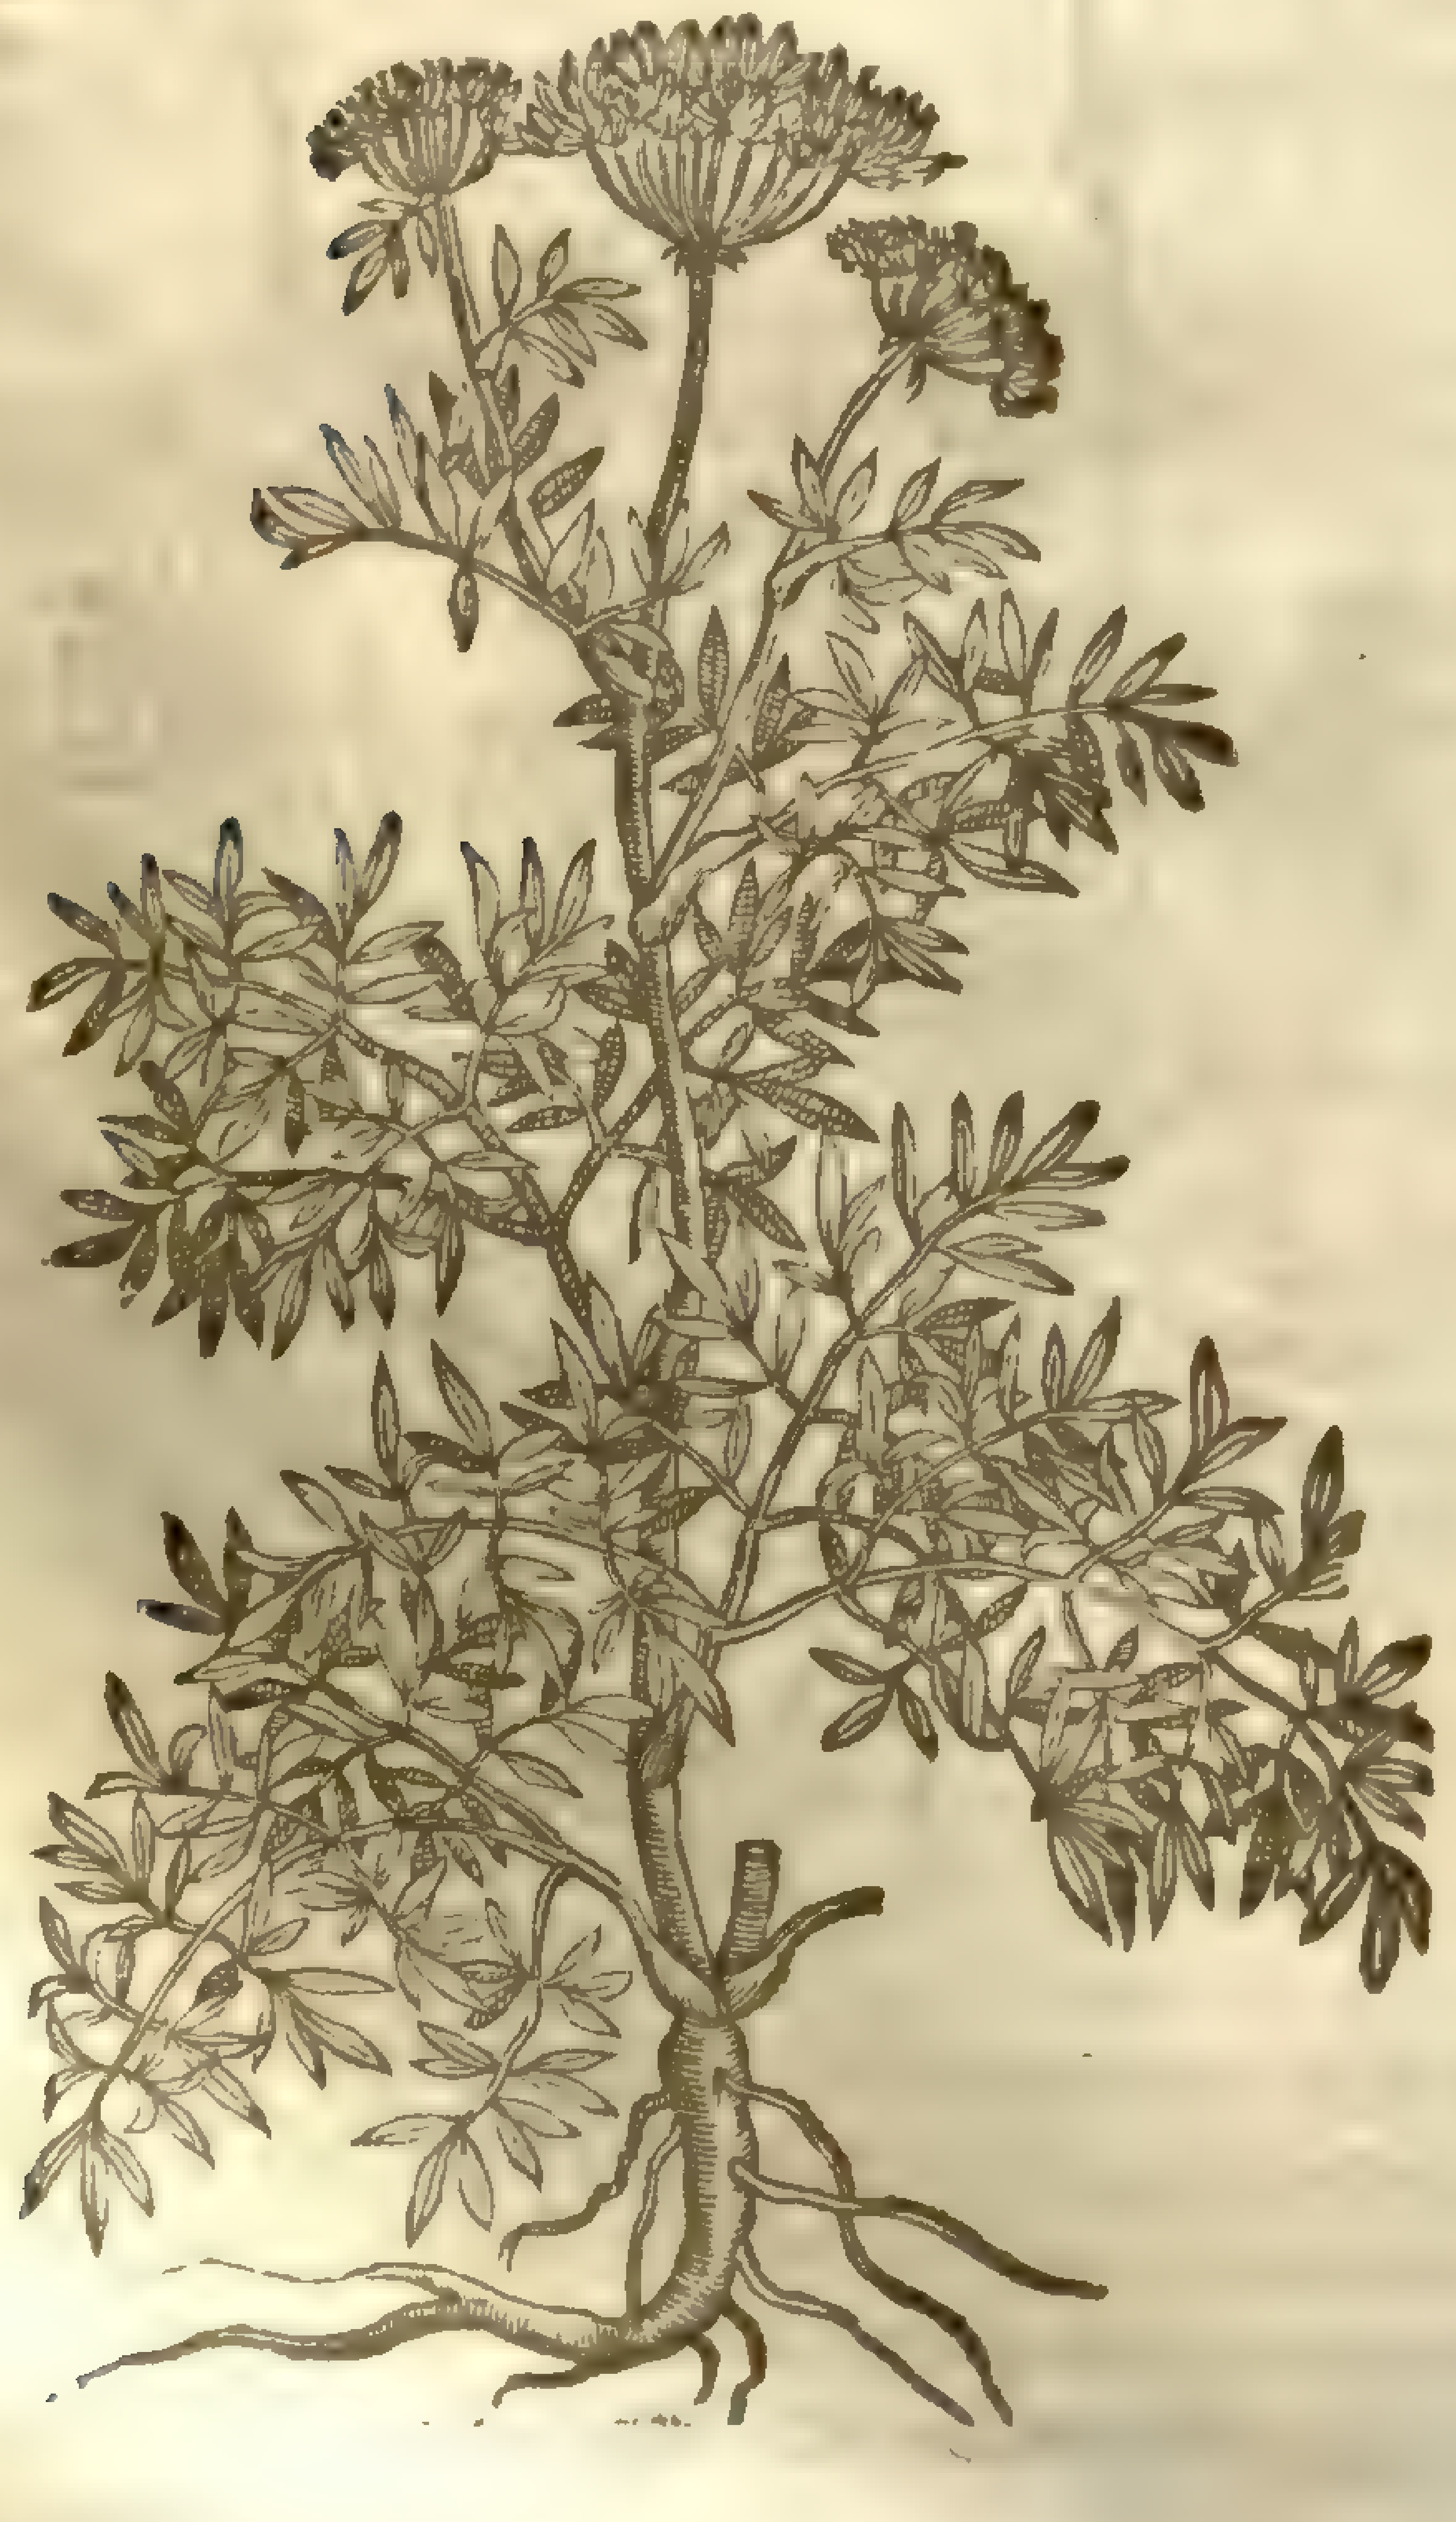
D It helpeth the collicke, and driueth away ventoſities or windineſſe.

E Our Engliſh women vſe to put it in their running or rennet for cheeſe, eſpecially in Cheſhire (where I was borne) where the beſt cheeſe of this Land is made.

† I haue formerly Chap.·88 deliuered the hiſtory of the *Saxifraga maior* of *Matthiolus*, and *Saxifraga Antiquorum* of *Lobel*; not thinking that our Author had put their deſcription here amongſt the *Vmbelliferæ*, for if I had, I ſhould haue ſpared my labour there beſtowed, and haue giuen the figures here to the deſcriptions of our Author, which are now omitted. The figure formerly here was of the *Caucalis*, deſcribed in the third place of the 403. chapter.

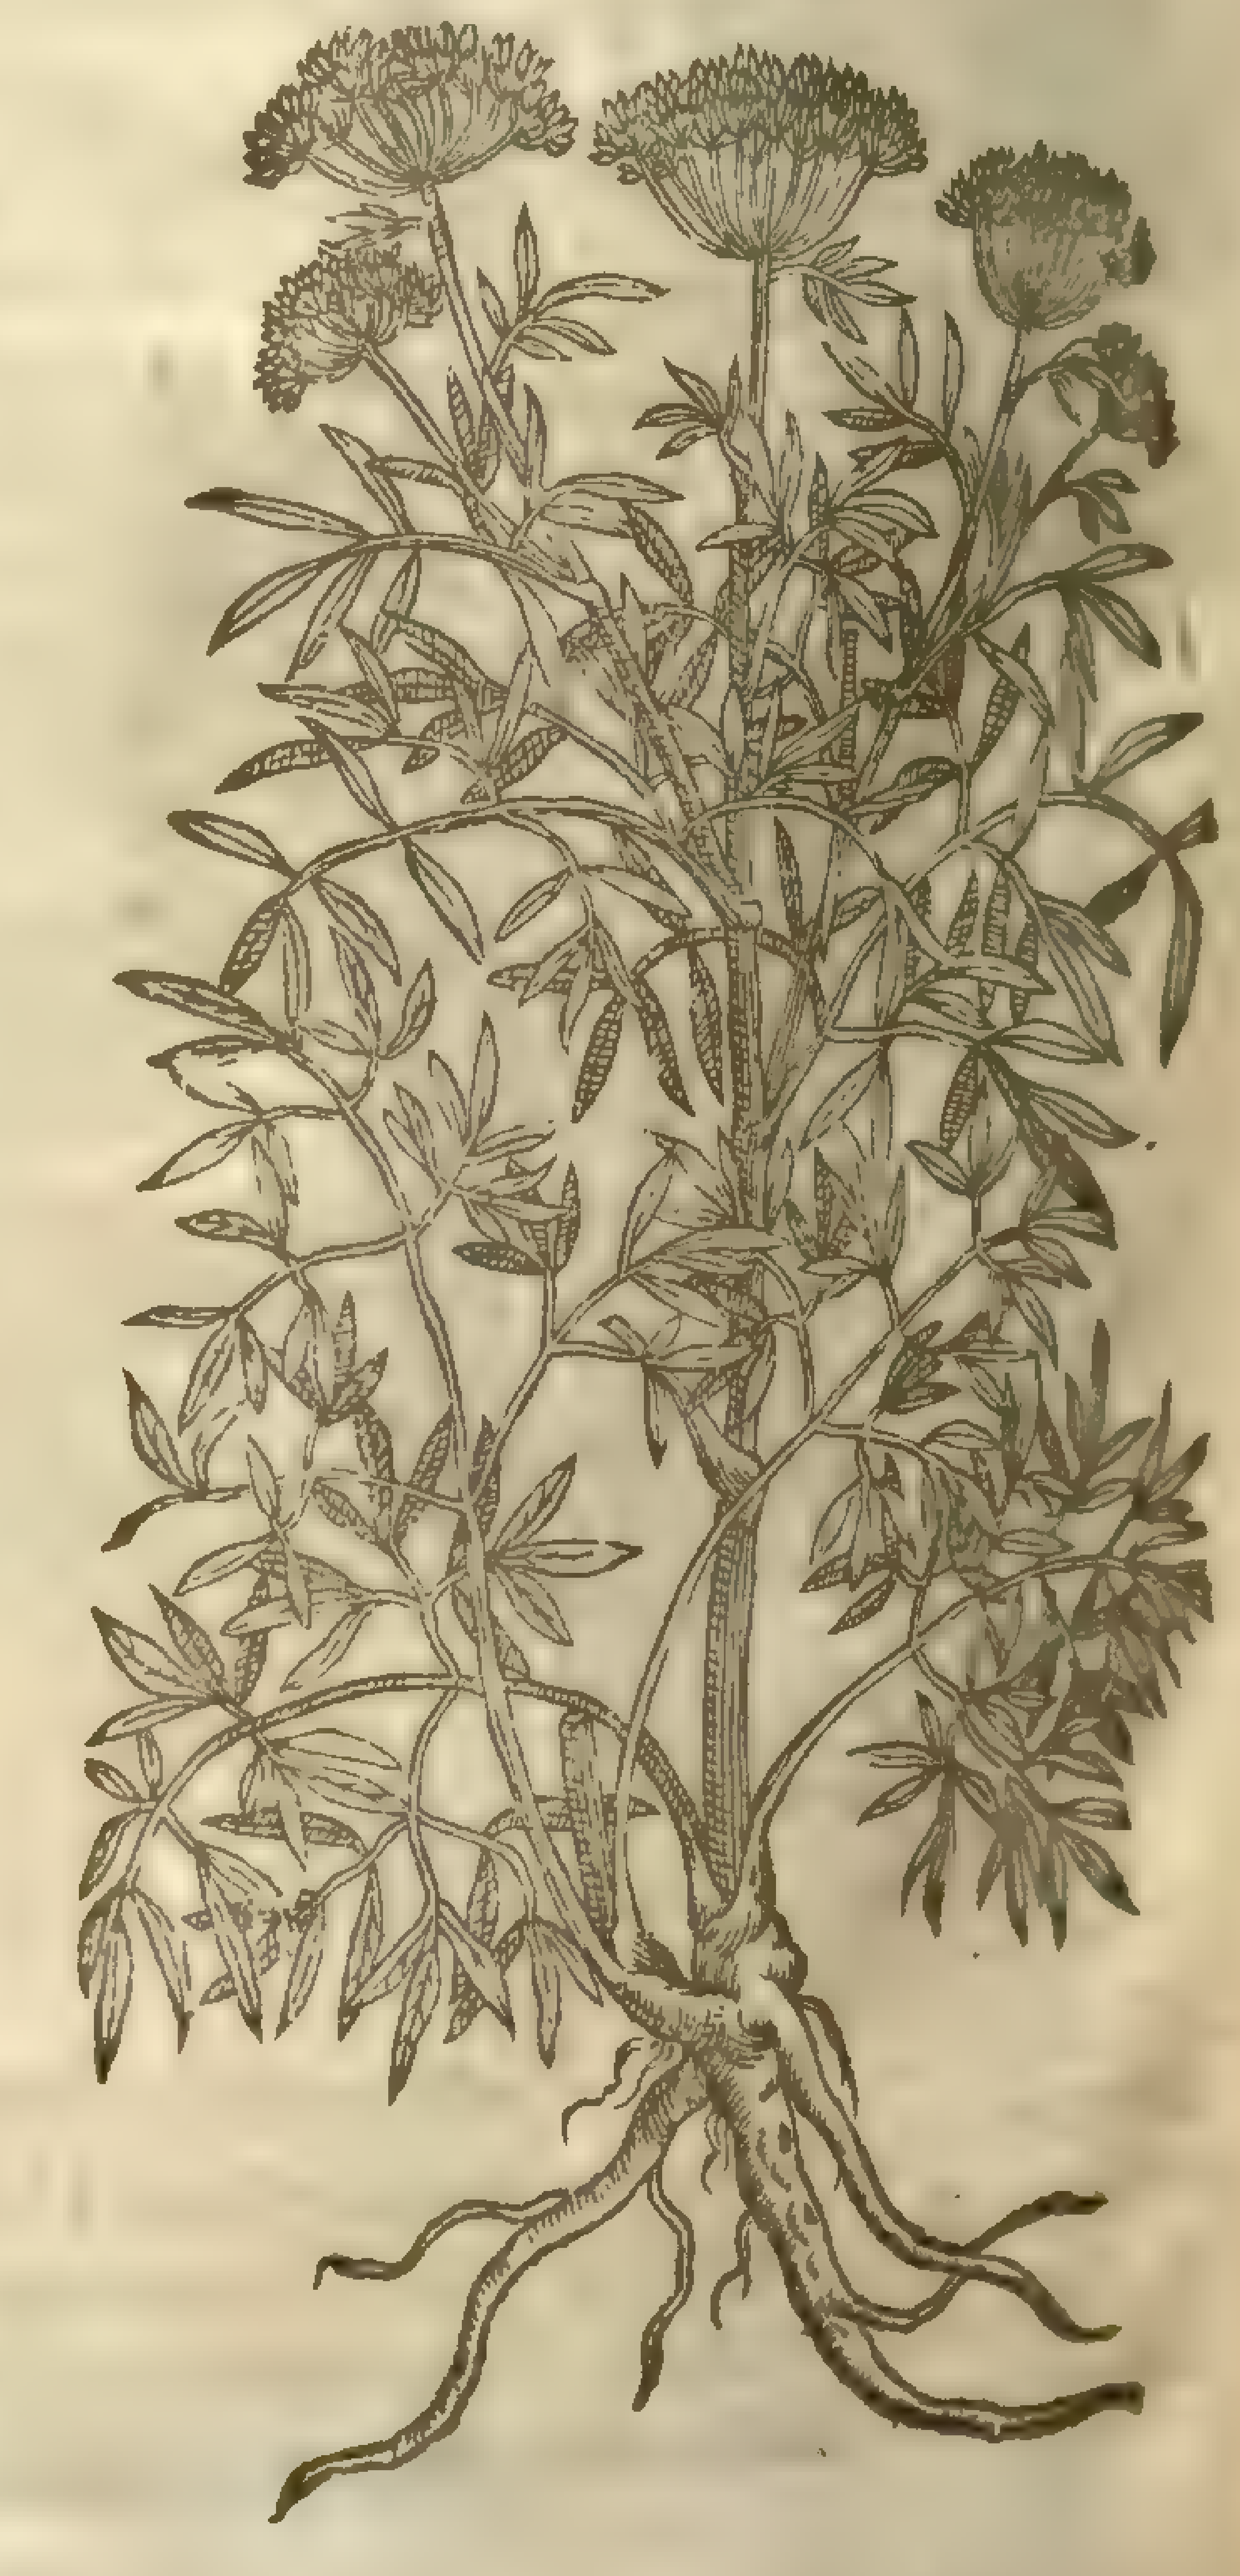
Chap. 423. *Of Siler Mountaine, or baſtard Louage.*

† 1 *Siler montanum Officinarum.*
Baſtard Louage.



Laserpitium siler & mill. dict.

† 2 *Seſeli pratenſe Monſpelienſium.*
Horſe Fennell.



Peucedanum Silaus. mill. dict.

¶ The Deſcription.

1 THe naturall plants of *Seſeli*, being now better knowne than in times paſt, eſpecially among our Apothecaries, is called by them *Siler montanum*, and *Seſeleos*: this plant they haue retained to very good purpoſe and conſideration; but the errour of the name hath cauſed diuers of our late writers to erre, and to ſuppoſe that *Siler montanum*, called in ſhops *Seſeleos*, was no ther then *Seſeli Maſsilienſium* of *Dioſcorides*. But this plant containeth in his ſubſtance much more acrimony, ſharpeneſſe, and efficacy in working, than any of the plants called *Seſelios*. It hath ſtalkes like Ferula, two cubits high. The root ſmelleth like *Liguſticum*: the leaues are very much cut or diuided, like the leaues of Fennell or *Seſeli Maſsilienſe*, and broader than the leaues of *Peucedanum*. At the top of the ſtalkes grow ſpokie tufts like Angelica, which bring forth a long and leafie ſeed like Cumine, of a pale colour; in taſte ſeeming as though it were condited with ſugar, but withall ſomewhat ſharpe, and ſharper than *Seſeli pratenſe*.

2 There is a ſecond kinde of *Siler* which *Pena* and *Lobel* ſet forth vnder the title of *Seſeli pratenſe Monſpelienſium*, which *Dodonæus* in his laſt edition calleth *Siler pratenſe alterum*, that is in ſhew very like the former. The ſtalkes thereof grow to the height of two cubits, but his leaues are ſomewhat broader and blacker; there are not ſo many leaues growing vpon the ſtalke, and they are leſſe diuided than the former, and are of a little ſauour. The ſeed is ſmaller than the former, and ſauouring very little or nothing. The root is blacke without, and white within, diuiding it ſelfe into ſundry diuiſions.

¶ The Place.

It groweth of it ſelfe in Liguria, not far from Genua in the craggy mountaines, and in the gardens of diligent Herbariſts.

¶ The Time.

Theſe plants do floure from Iune to the end of Auguſt.

¶ The Names.

It is called commonly *Siler Montanum*: in French and Dutch by a corrupt name *Ser-Montain*: in diuers ſhops, *Seſeleos*, but vntruly; for it is not *Seſeli*, nor a kinde thereof: in Engliſh, Siler mountaine, after the Latine name, and baſtard Louage. ‡ The firſt is thought to be the *Liguſticum* of the Antients, and it is ſo called by *Matthiolus* and others. ‡

¶ The Temperature.

This plant with his ſeed is hot and dry in the third degree.

¶ The Vertues.

The ſeeds of *Siler* drunke with Wormewood Wine, or Wine wherein Wormewood hath beene ſodden, moueth womens diſeaſes in great abundance: cureth the ſuffocation and ſtrangling of the matrix, and cauſeth it to returne vnto the naturall place againe. A

The root ſtamped with hony, and applied or put into old ſores, doth cure them, and couer bare and naked bones with fleſh. B

Being drunke it prouoketh vrine, eaſeth the paines of the guts or entrails proceeding of crudity or rawneſſe, it helpeth concoction, conſumeth winde, and ſwelling of the ſtomacke. C

The root hath the ſame vertue of operation, but not ſo effectuall, as not being ſo hot and dry. D

‡ The figure which formerly was here was of the *Seſeli Maſſilienſe* deſcribed in the next chapter in the fourth place, and that which belonged to this place was our common Louage. Alſo that figure which belonged to the ſecond deſcription was formerly vnder the title of *Fæniculum dulce*.

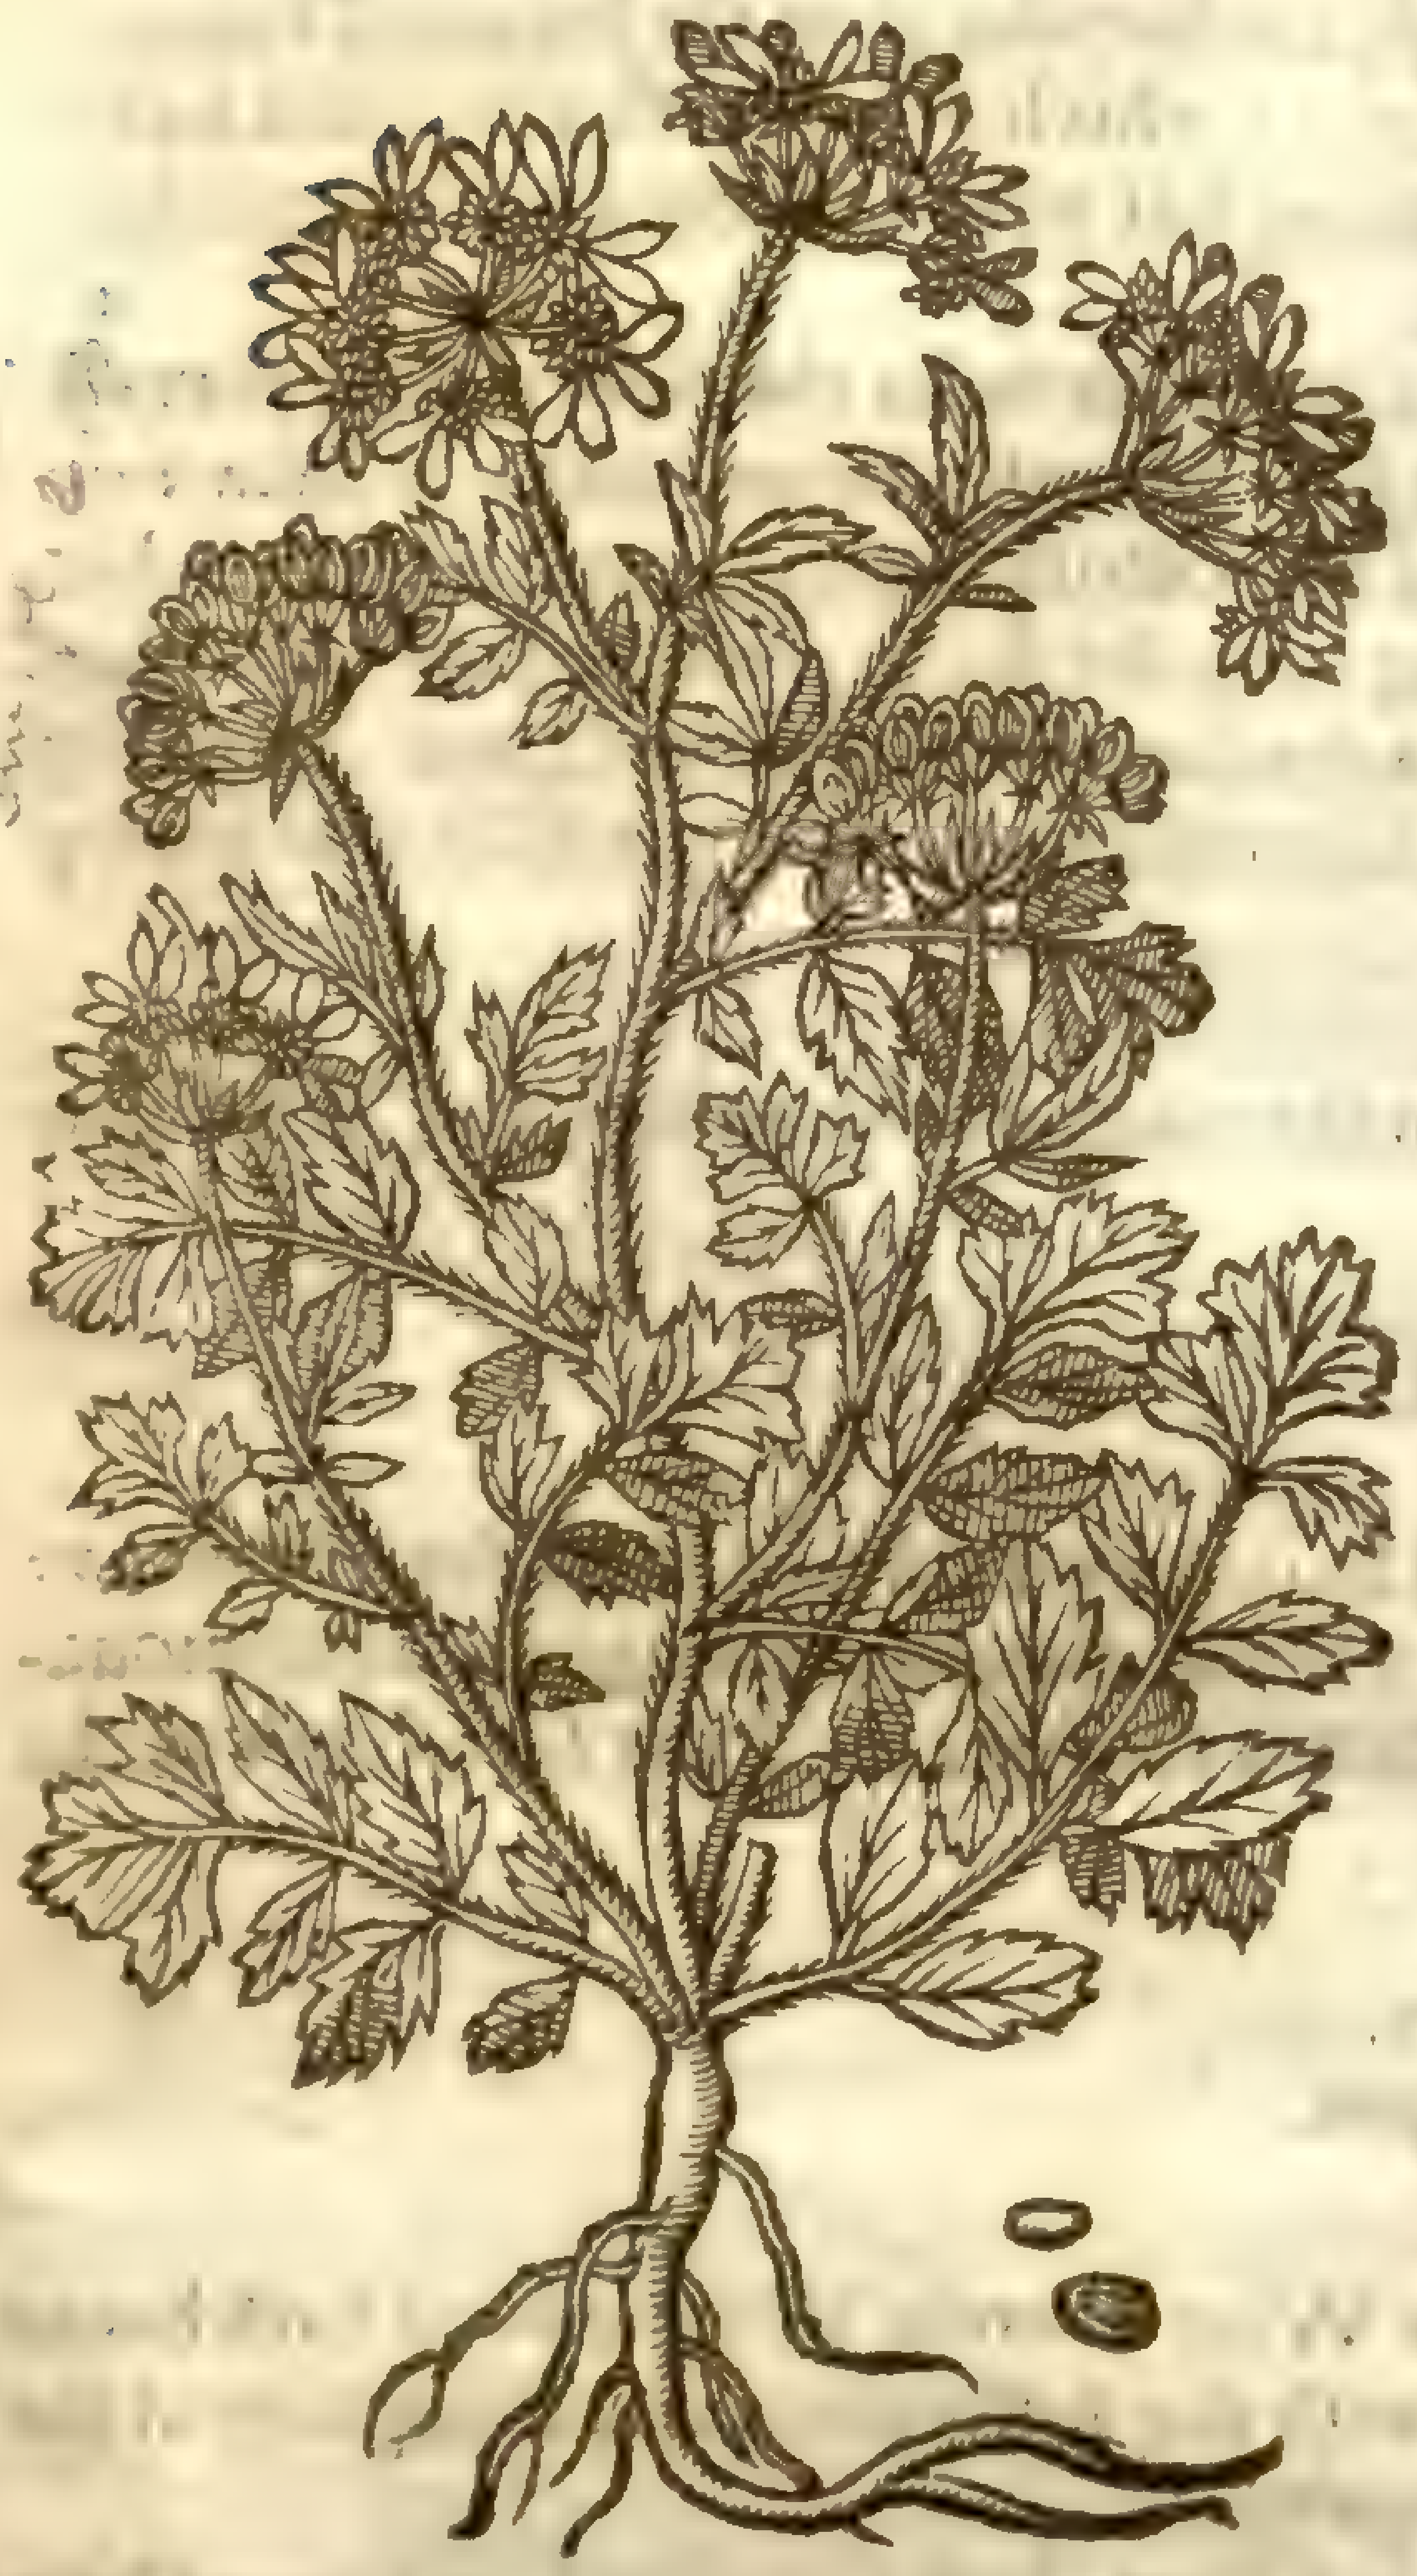
CHAP. 424. *Of Seſelios, or Hart-worts of Candy.*

¶ The Deſcription.

1 THis plant beeing the *Seſeli* of Candy, and in times paſt not elſewhere found, tooke his ſurname of that place where it was firſt found, but now adaies it is to be ſeene in the corne fields about Narbone in France, from whence I had ſeeds, which proſper well in my garden. This is but an annuall plant, and increaſeth from yeare to yeare by his owne ſowing. The leaues grow at the firſt euen with the ground, ſomewhat hairy, of an ouerworne greene colour, in ſhape much like vnto Cheruill, but thicker: among which riſeth vp an hairy rough ſtalke, of the height of a cubit, bearing at the top ſpokie tufts with white floures: which being vaded, there followeth round and flat ſeed, compaſſed and cunningly wreathed about the edges like a ring.

The ſeed is flat like the other, joyned two together in one, as you may ſee in the ſeed of Ferula or Angelica, in ſhape like a round target, in taſte like *Myrrhis*. *Matthiolus* did greatly miſtake this plant.

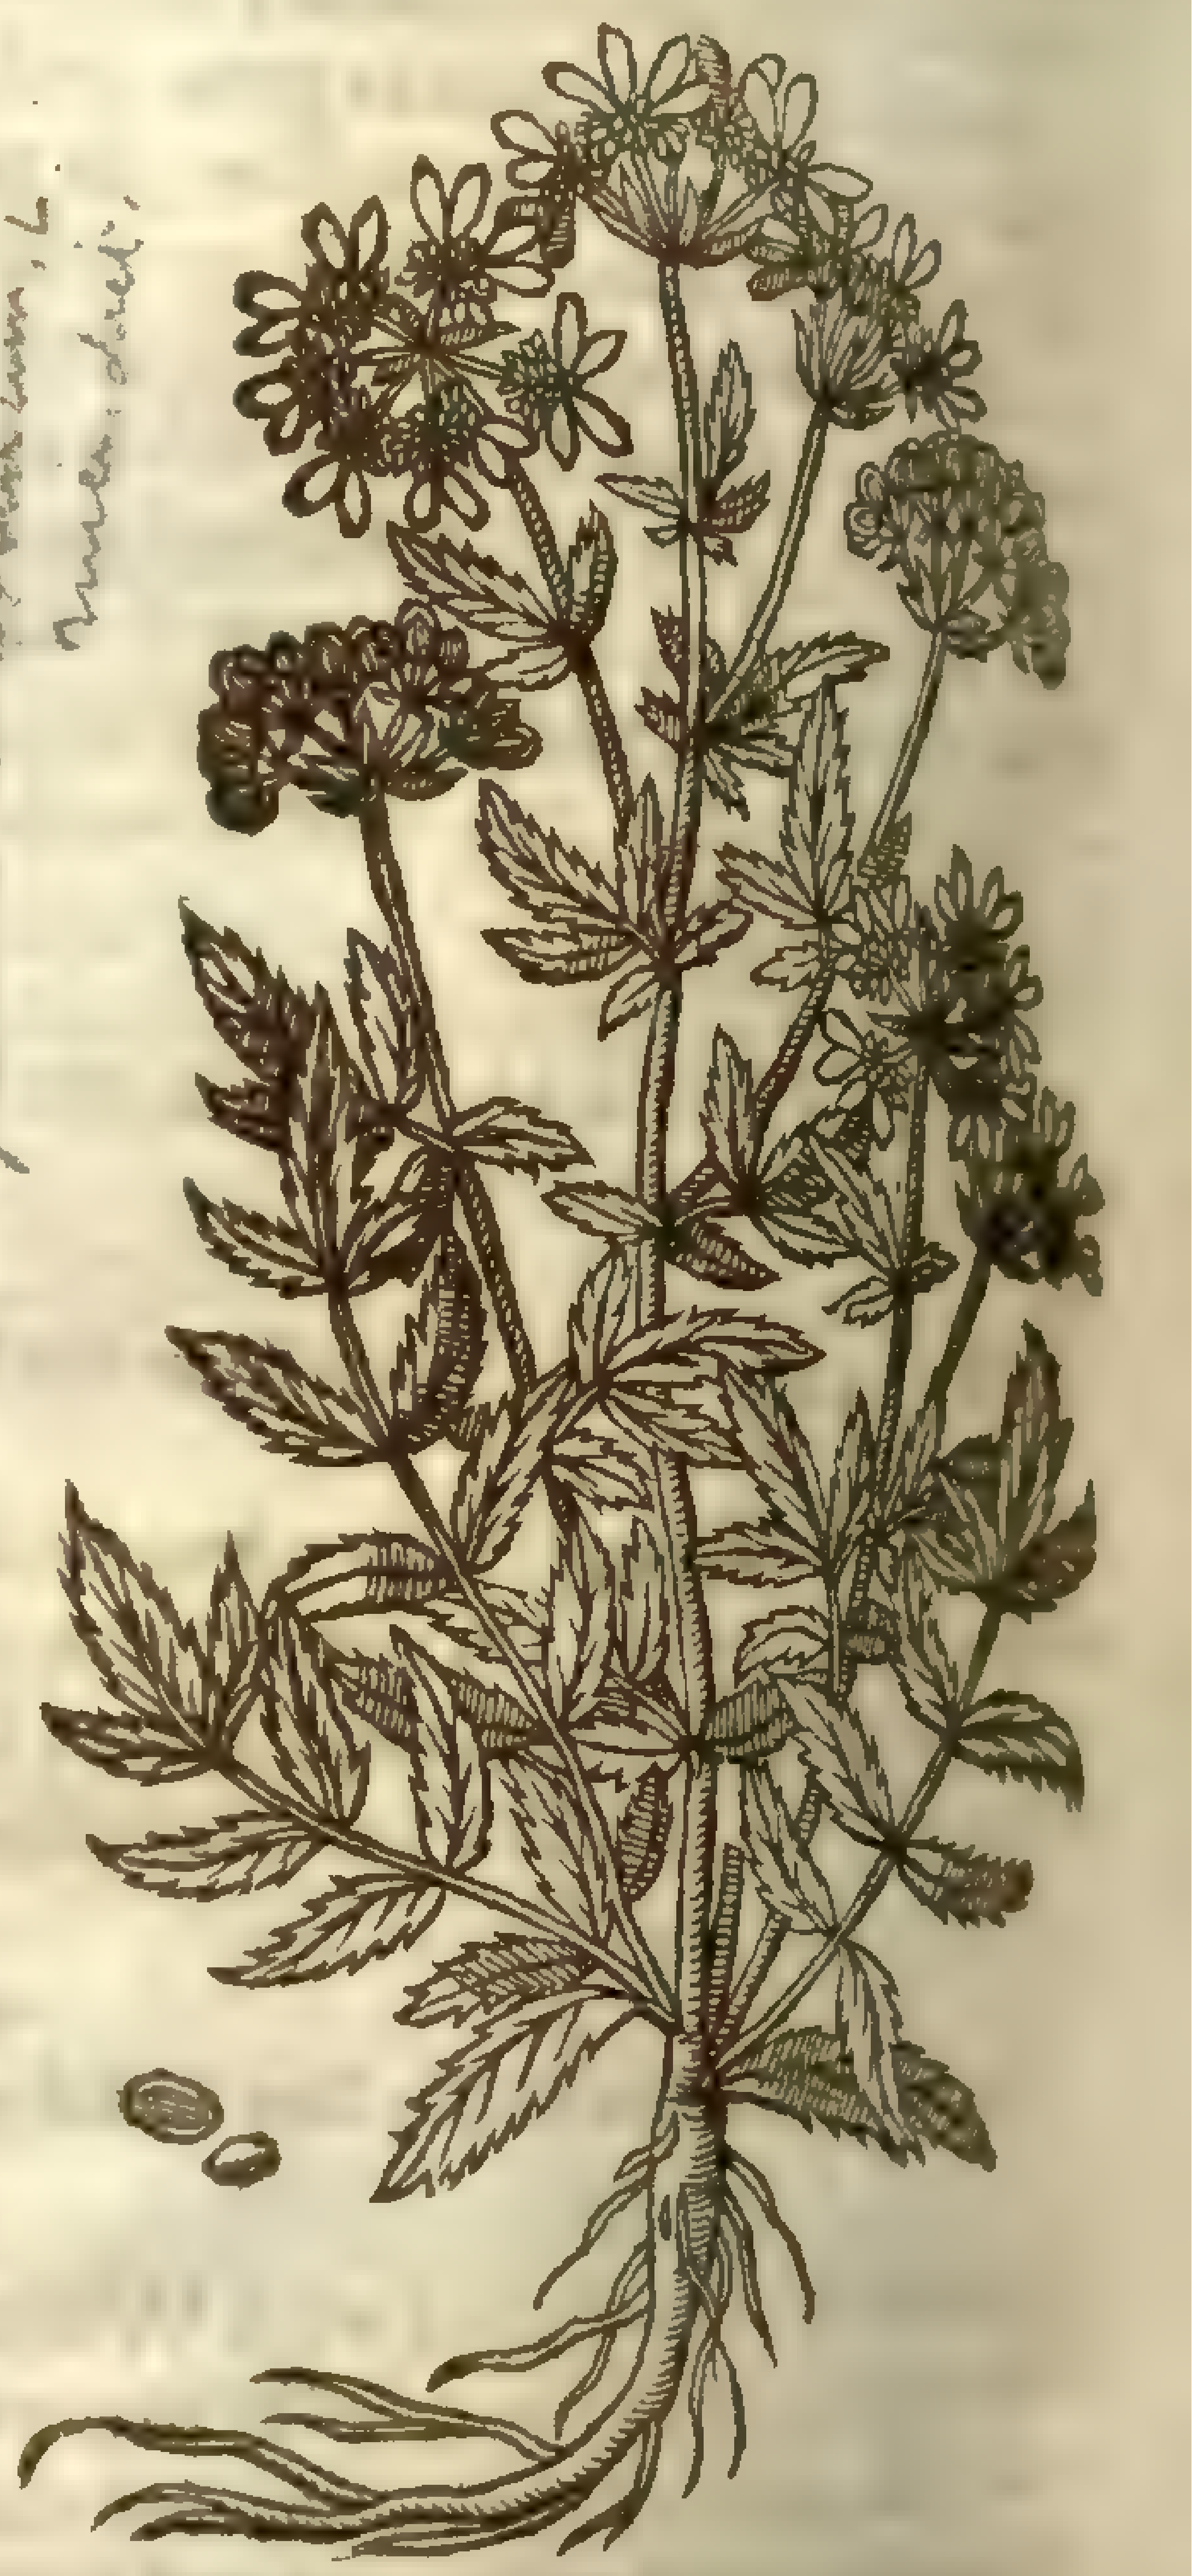
2 There is a kinde of *Seſeli Creticum*, called alſo *Tordylion*: and is very like vnto the former, ſauing that his leaues are more like vnto common Parſneps than Cheruil, and the whole plant is bigger than the former.



1 *Seſeli Creticum minus.*
Small Seſeleos of Candie.

Tordylium Officinale [illegible]

Tordylium maximum, L. [illegible]

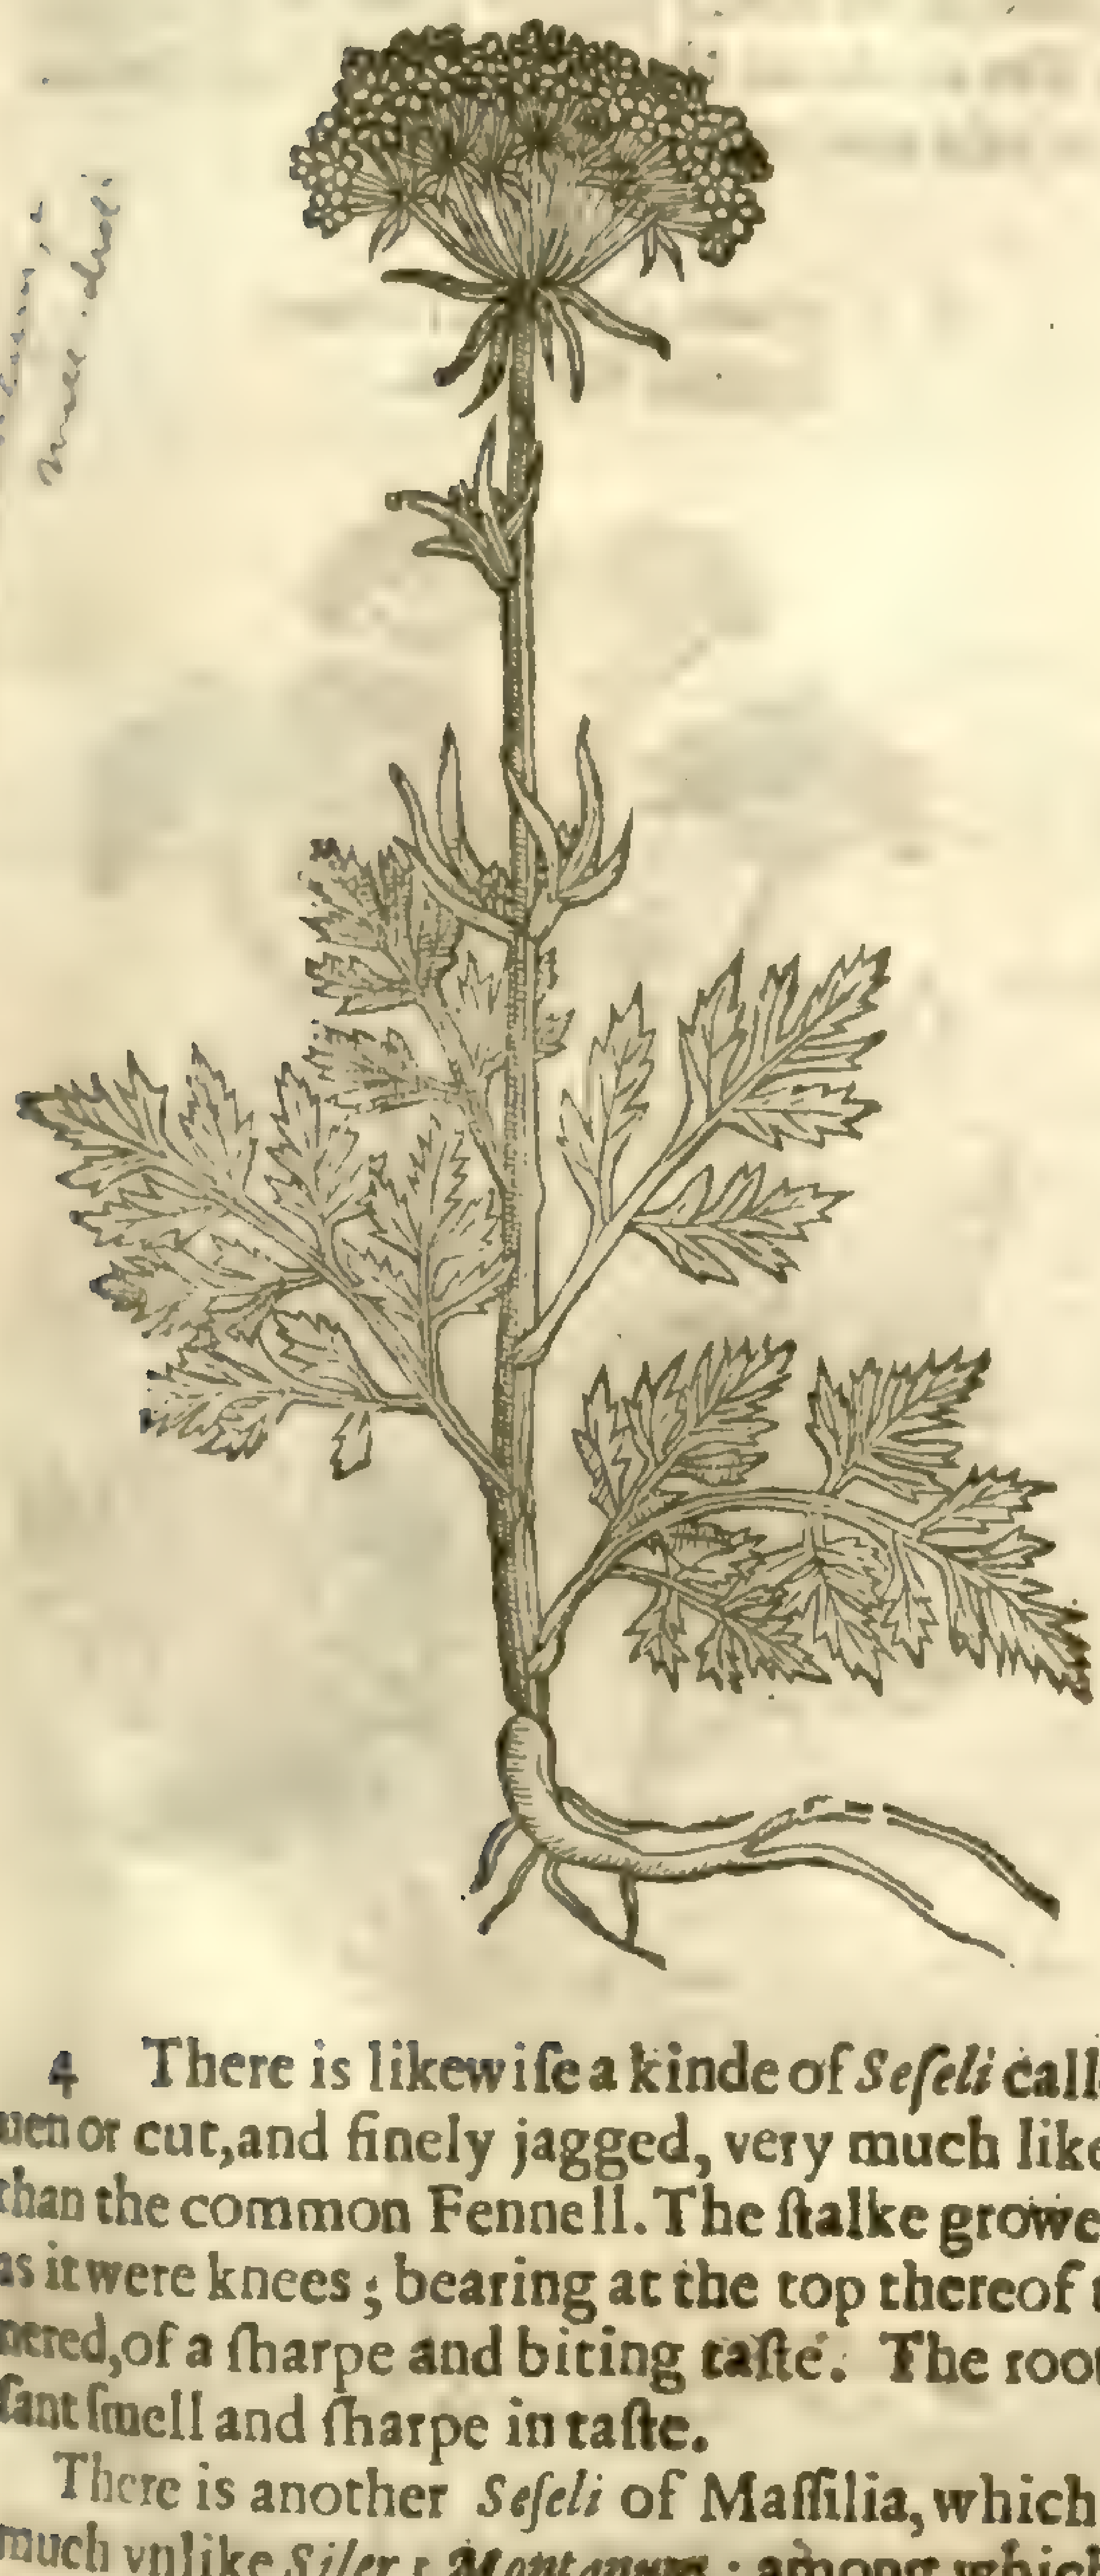


‡ 2 *Seſeli Creticum majus.*
Great Seſelios of Candie.

3 There is likewiſe a kinde of *Seſeli* that hath a root as bigge as a mans arme, *eſpecially* if the plant be old, but the new and young plants beare roots an inch thicke, with ſome *knobs* and tuberous ſprouts, about the lower part, the root is thicke, rough, and couered ouer with a thicke barke, the ſubſtance whereof is firſt gummie, afterward ſharpe, and as it were full of ſpattle; from the vpper part of the root proceed many knobs or thicke ſwelling roots, out of which there iſſueth great and large wings or branches of leaues, ſome whereof are notched or dented round about, growing vnto one ſide or rib of the leafe, ſtanding alſo one oppoſite vnto another, of a darke and delaid green colour, and ſomwhat ſhining aboue, but vnderneath of a grayiſh or aſh-colour: from amongſt theſe leaues theree ariſeth a ſtraked or guttered ſtalke, a cubit and a halfe high, ſomtimes an inch thick, hauing many joynts or knees, and many branches growing about them, and vpon each joynt leſſer branches of leaues. At the top of the ſtalkes, and vpper ends of the branches grow little cups or vmbels of white floures; which being vaded, there commeth in place a ſeed, which is very like *Siler montanum*. ‡ I take this here deſcribed to be the *Seſeli montanum* 1. of *Cluſius*, or *Liguſticum alterum Belgarum* of *Lobel*: and therefore I haue giuen you *Cluſius* his figure in this place. ‡

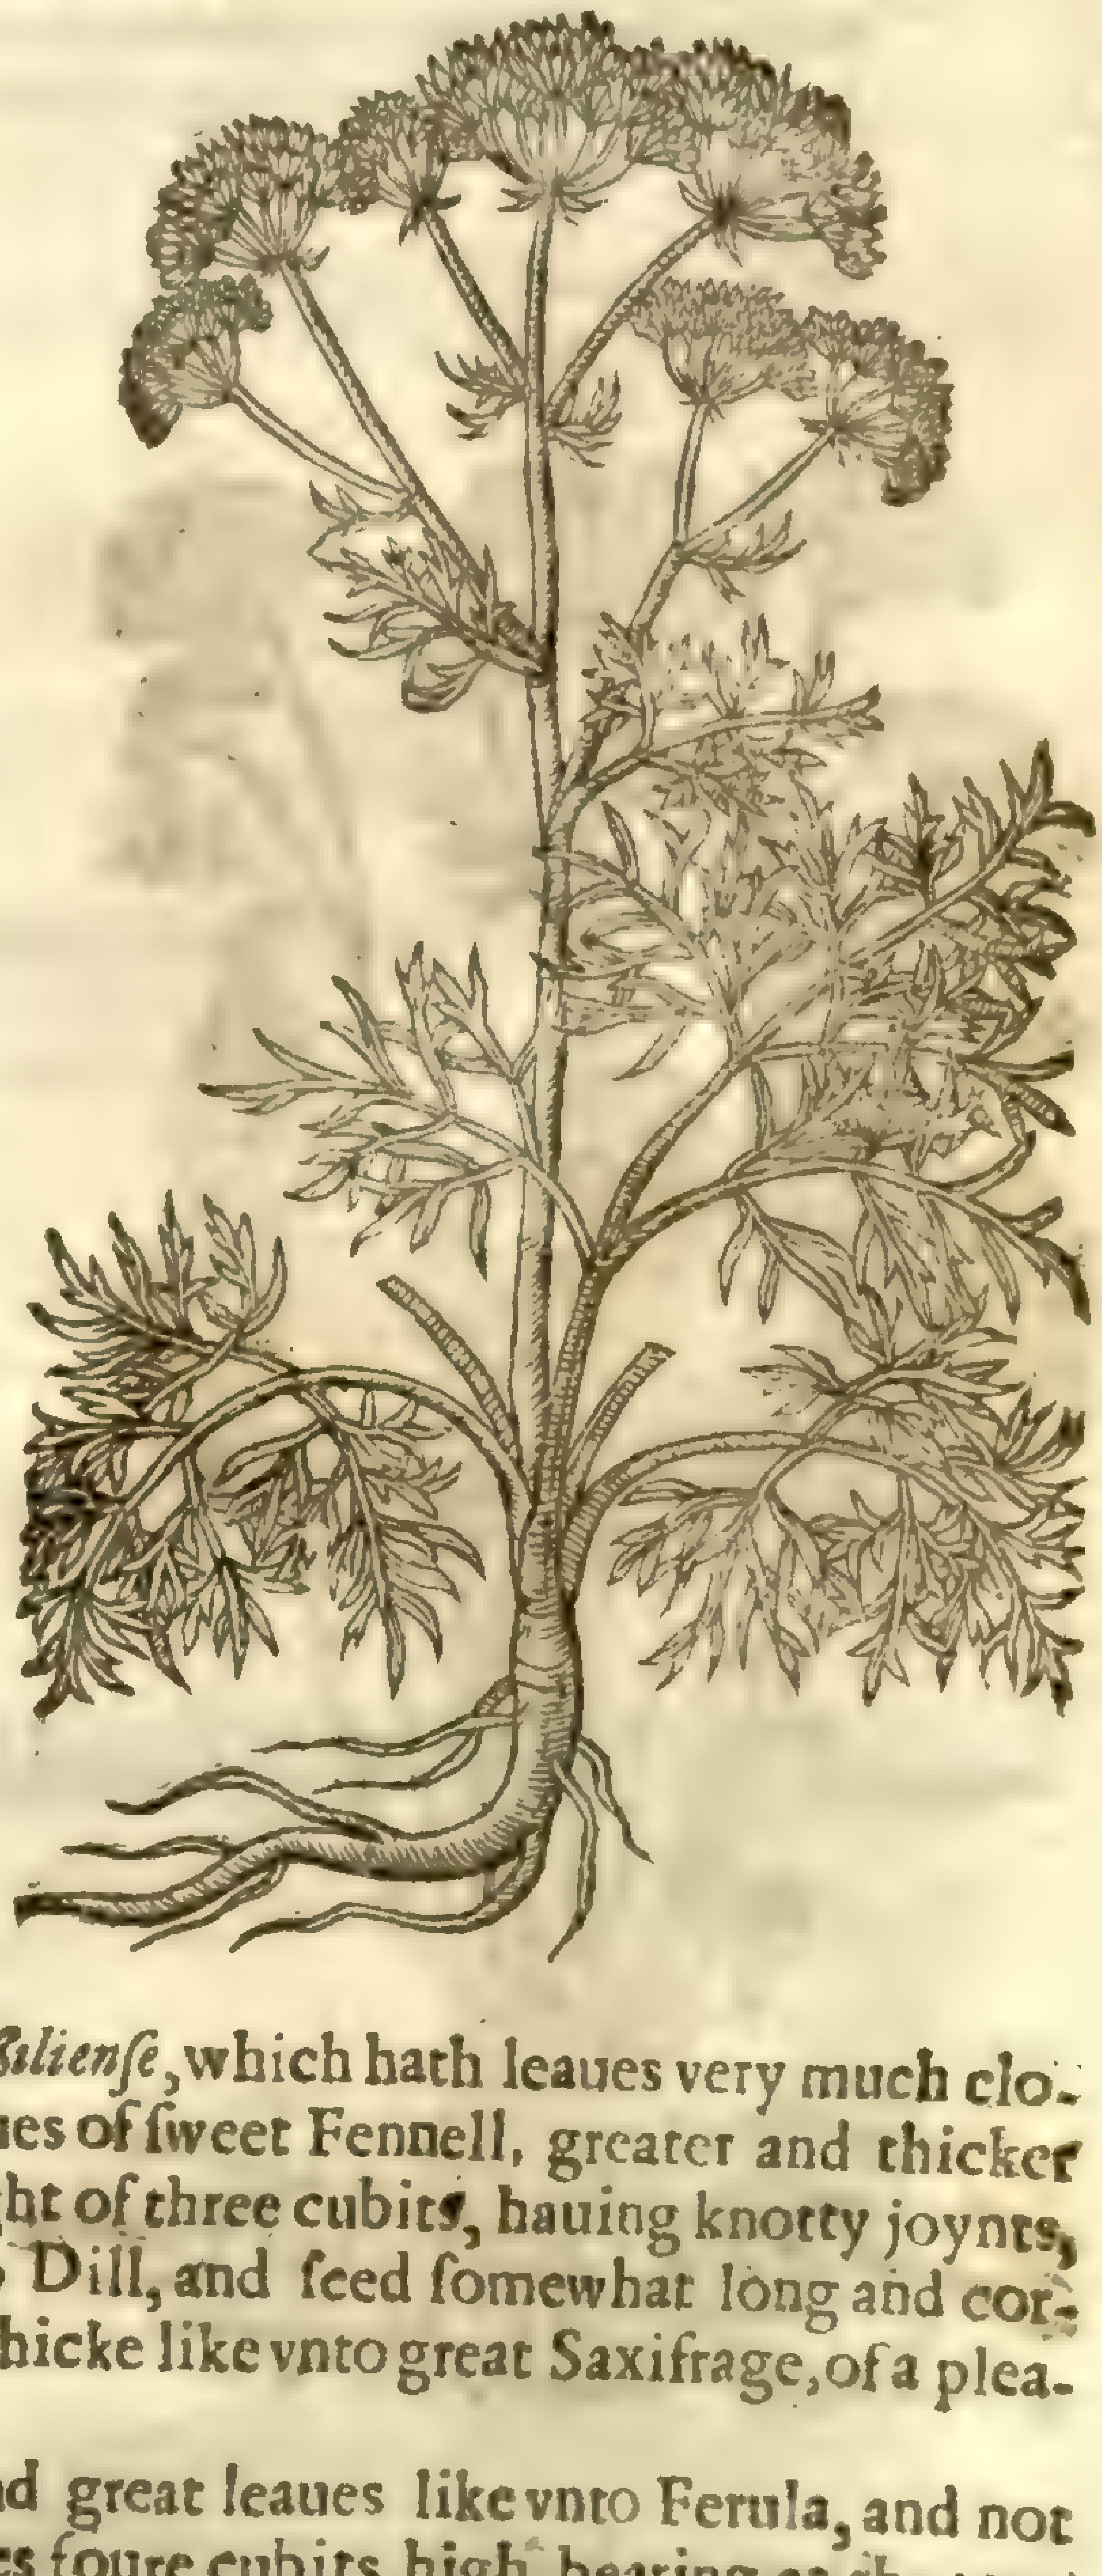
There is alſo a kind of *Seſeli*, which *Pena* ſetteth forth for the firſt kinde of *Daucus*, whereof I take it to be a kinde, growing euery where in the paſtures about London, that hath large leaues, growing for a time euen with the earth, and ſpred thereupon, and diuided into many parts, in manner almoſt like to the former for the moſt part in all things, in the round ſpokie tufts or vmbels, bearing ſtiffe and faire white floures in ſhape like them of Cinkefoile; in ſmell like *Sambucus* or Elder. When the floure is vaded, there commeth in place a yellow guttered ſeed, of a ſpicie and very hot taſte. The root is thicke, and blacke without, which rotteth and periſheth in the ground (as wee may ſee in many gummie or Ferulous plants) after it hath ſeeded, neither will it floure before the ſecond or third yeare after it is ſowne. ‡ I am ignorant what our Author meanes by this deſcription. ‡

‡ 3 *Seſeli montanum majus.*
Mountaine Seſelios.



[illegible]

† 4 *Seſeli Maſsilienſe.*
Seſelios of *Marſeilles.*



4 There is likewiſe a kinde of *Seſeli* called *Seſeli Maſsilienſe*, which hath leaues very much clouen or cut, and finely jagged, very much like vnto the leaues of ſweet Fennell, greater and thicker than the common Fennell. The ſtalke groweth to the height of three cubits, hauing knotty joynts, as it were knees; bearing at the top thereof tufts like vnto Dill, and ſeed ſomewhat long and cornered, of a ſharpe and biting taſte. The root is long and thicke like vnto great Saxifrage, of a pleaſant ſmell and ſharpe in taſte.

There is another *Seſeli* of Maſſilia, which hath large and great leaues like vnto Ferula, and not much vnlike *Siler Montanum*: among which riſe vp ſtalkes foure cubits high, bearing at the tops ſpokie tufts like vnto the laſt before rehearſed, of a good ſauour. The root is like vnto the former in ſhape, ſubſtance, and ſauour, but that it is greater.

¶ *The Place.*

Theſe plants are ſtrangers in England, notwithſtanding I haue them in my garden.

¶ *The Time.*

They floure and flouriſh in September.

¶ *The Names.*

Their names haue beene touched in their ſeuerall deſcriptions.

¶ *The Temperature and Vertues.*

A It prouoketh vrine, and helpeth the ſtrangury, bringeth downe the ſickeneſſe and dead birth: it helpeth the cough and ſhortneſſe of breath, the ſuffocation of the mother, and helpeth the falling ſickeneſſe.

B The ſeed drunke with wine concocteth raw humours, taketh away the griping and torments of the belly, and helpeth the ague, as *Dioſcorides* ſaith.

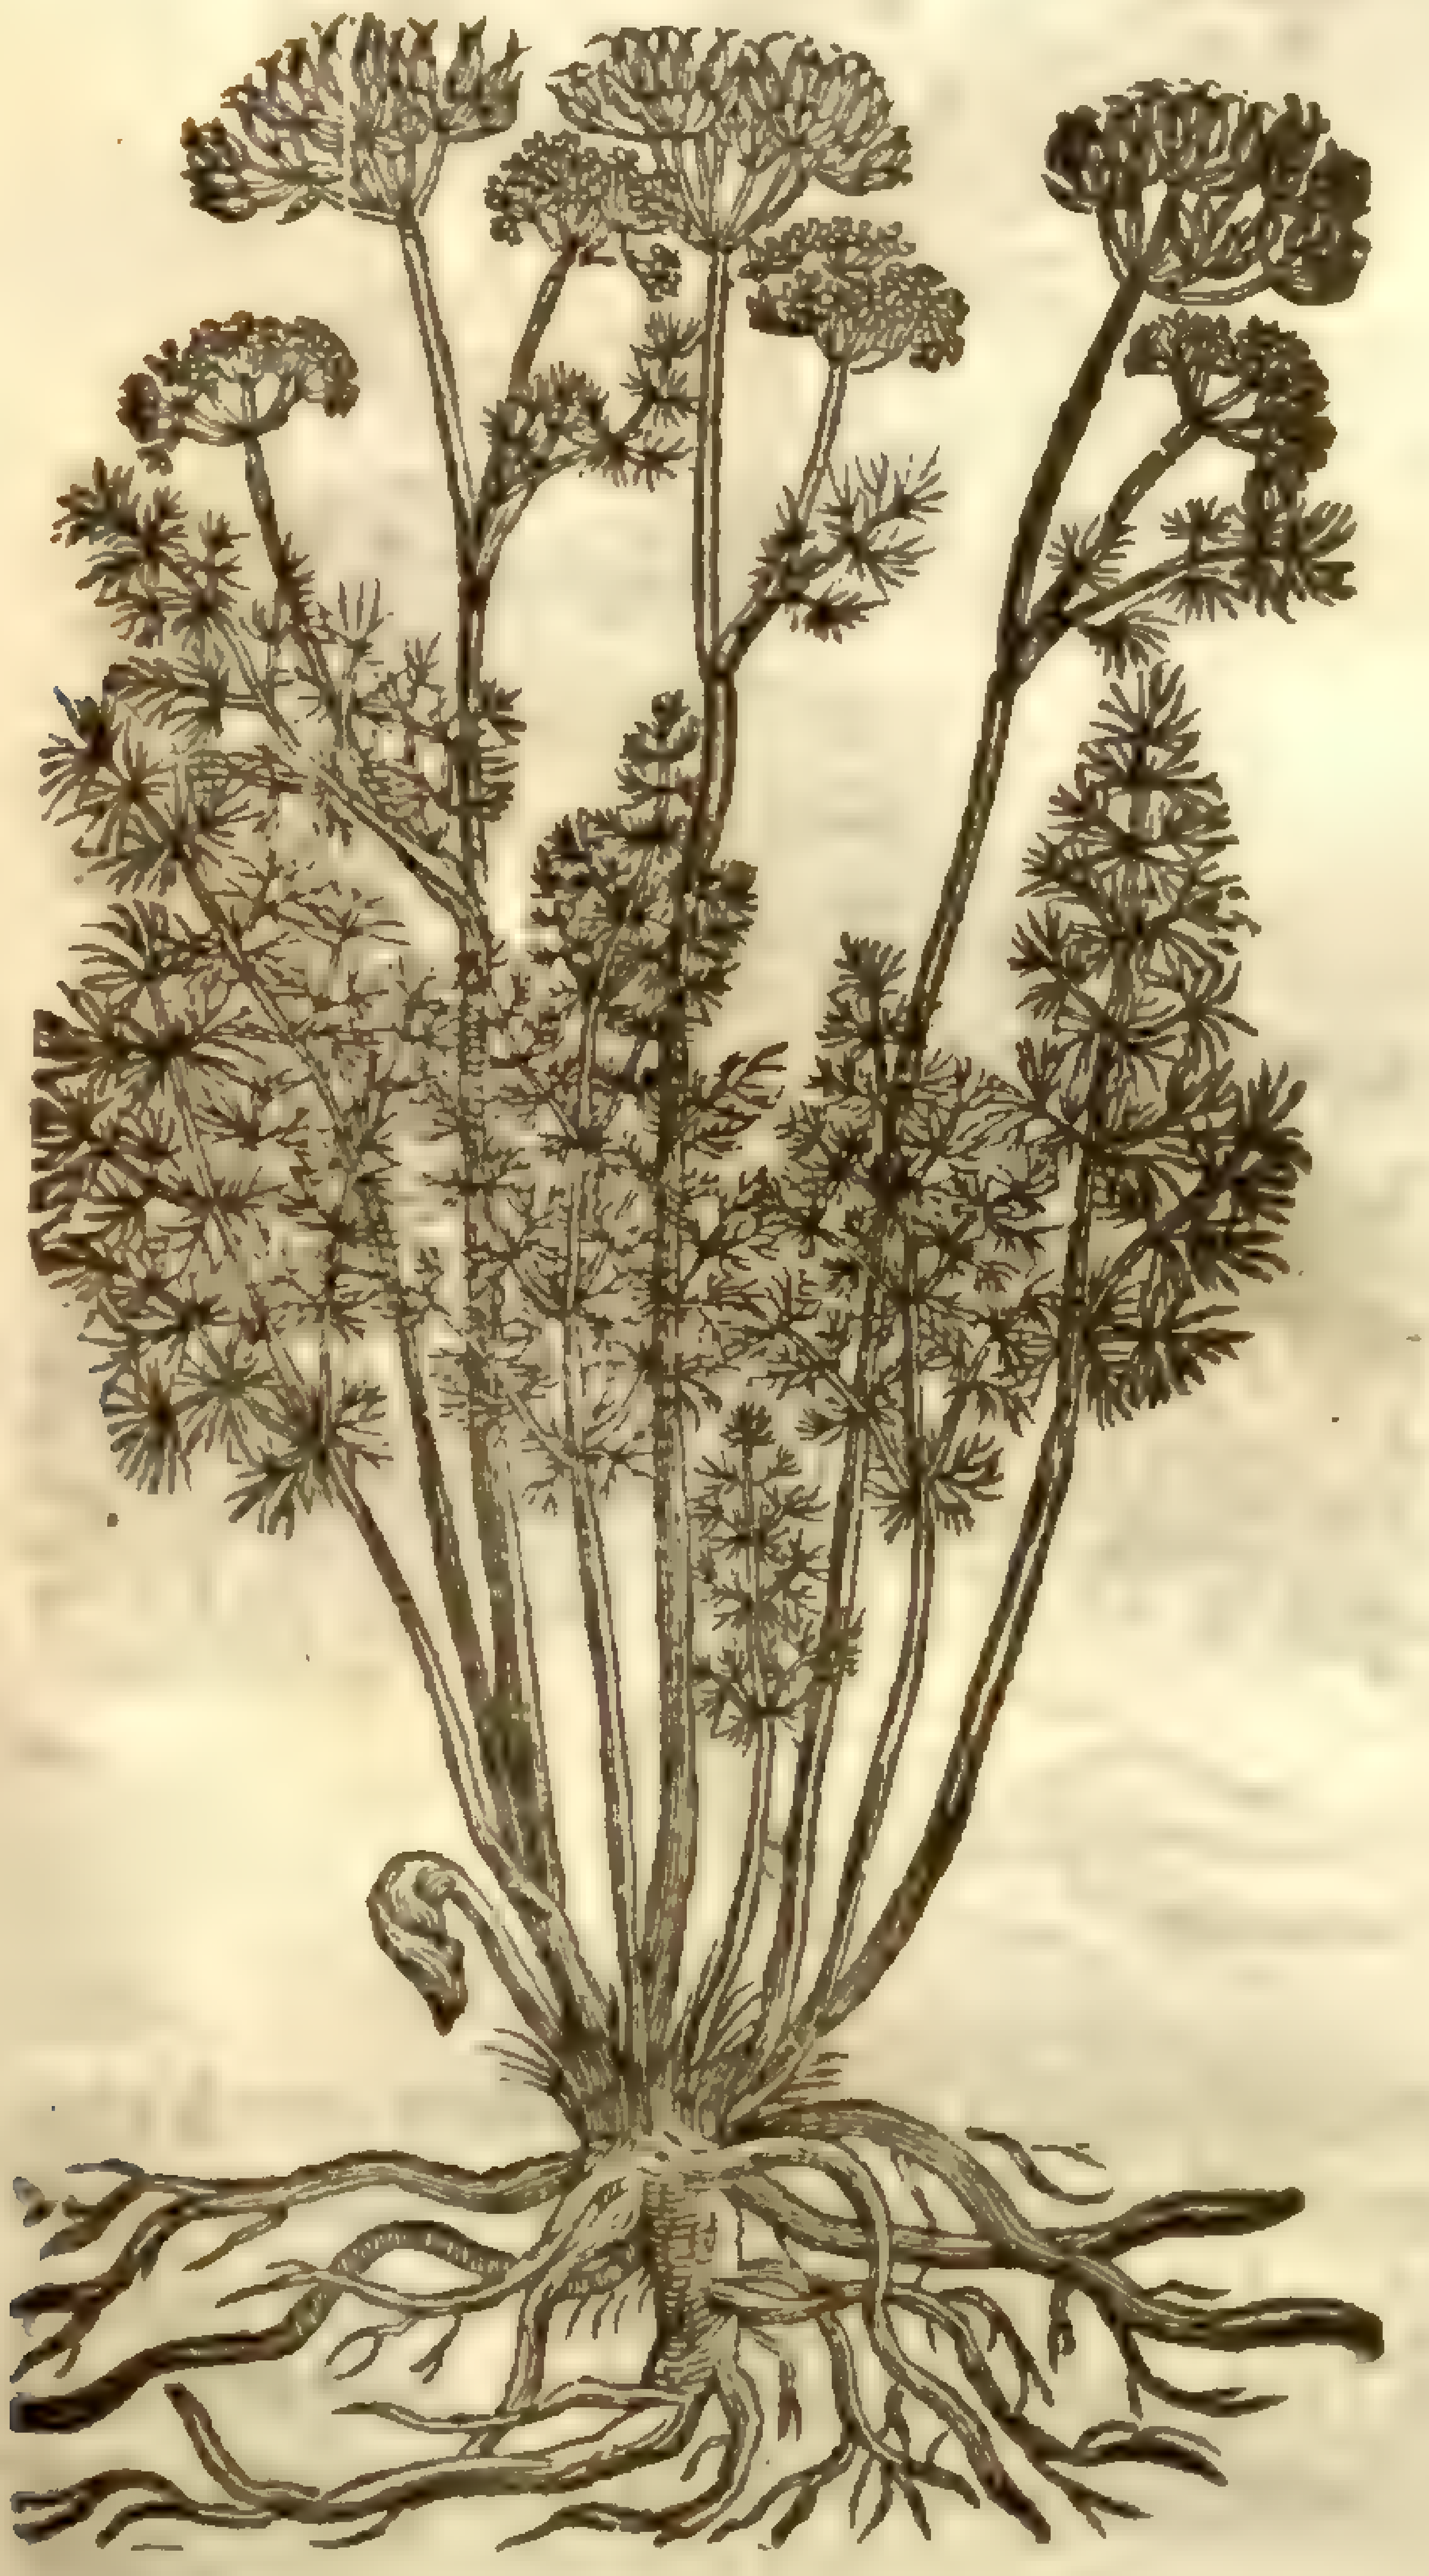
C The juyce of the leaues is giuen to Goats and other cattell to drinke, that they may the ſooner be deliuered of their young ones, as the ſame Author reporteth.

CHAP. 425. *Of Spignell, Spicknell, or Mewe.*

¶ *The Deſcription.*

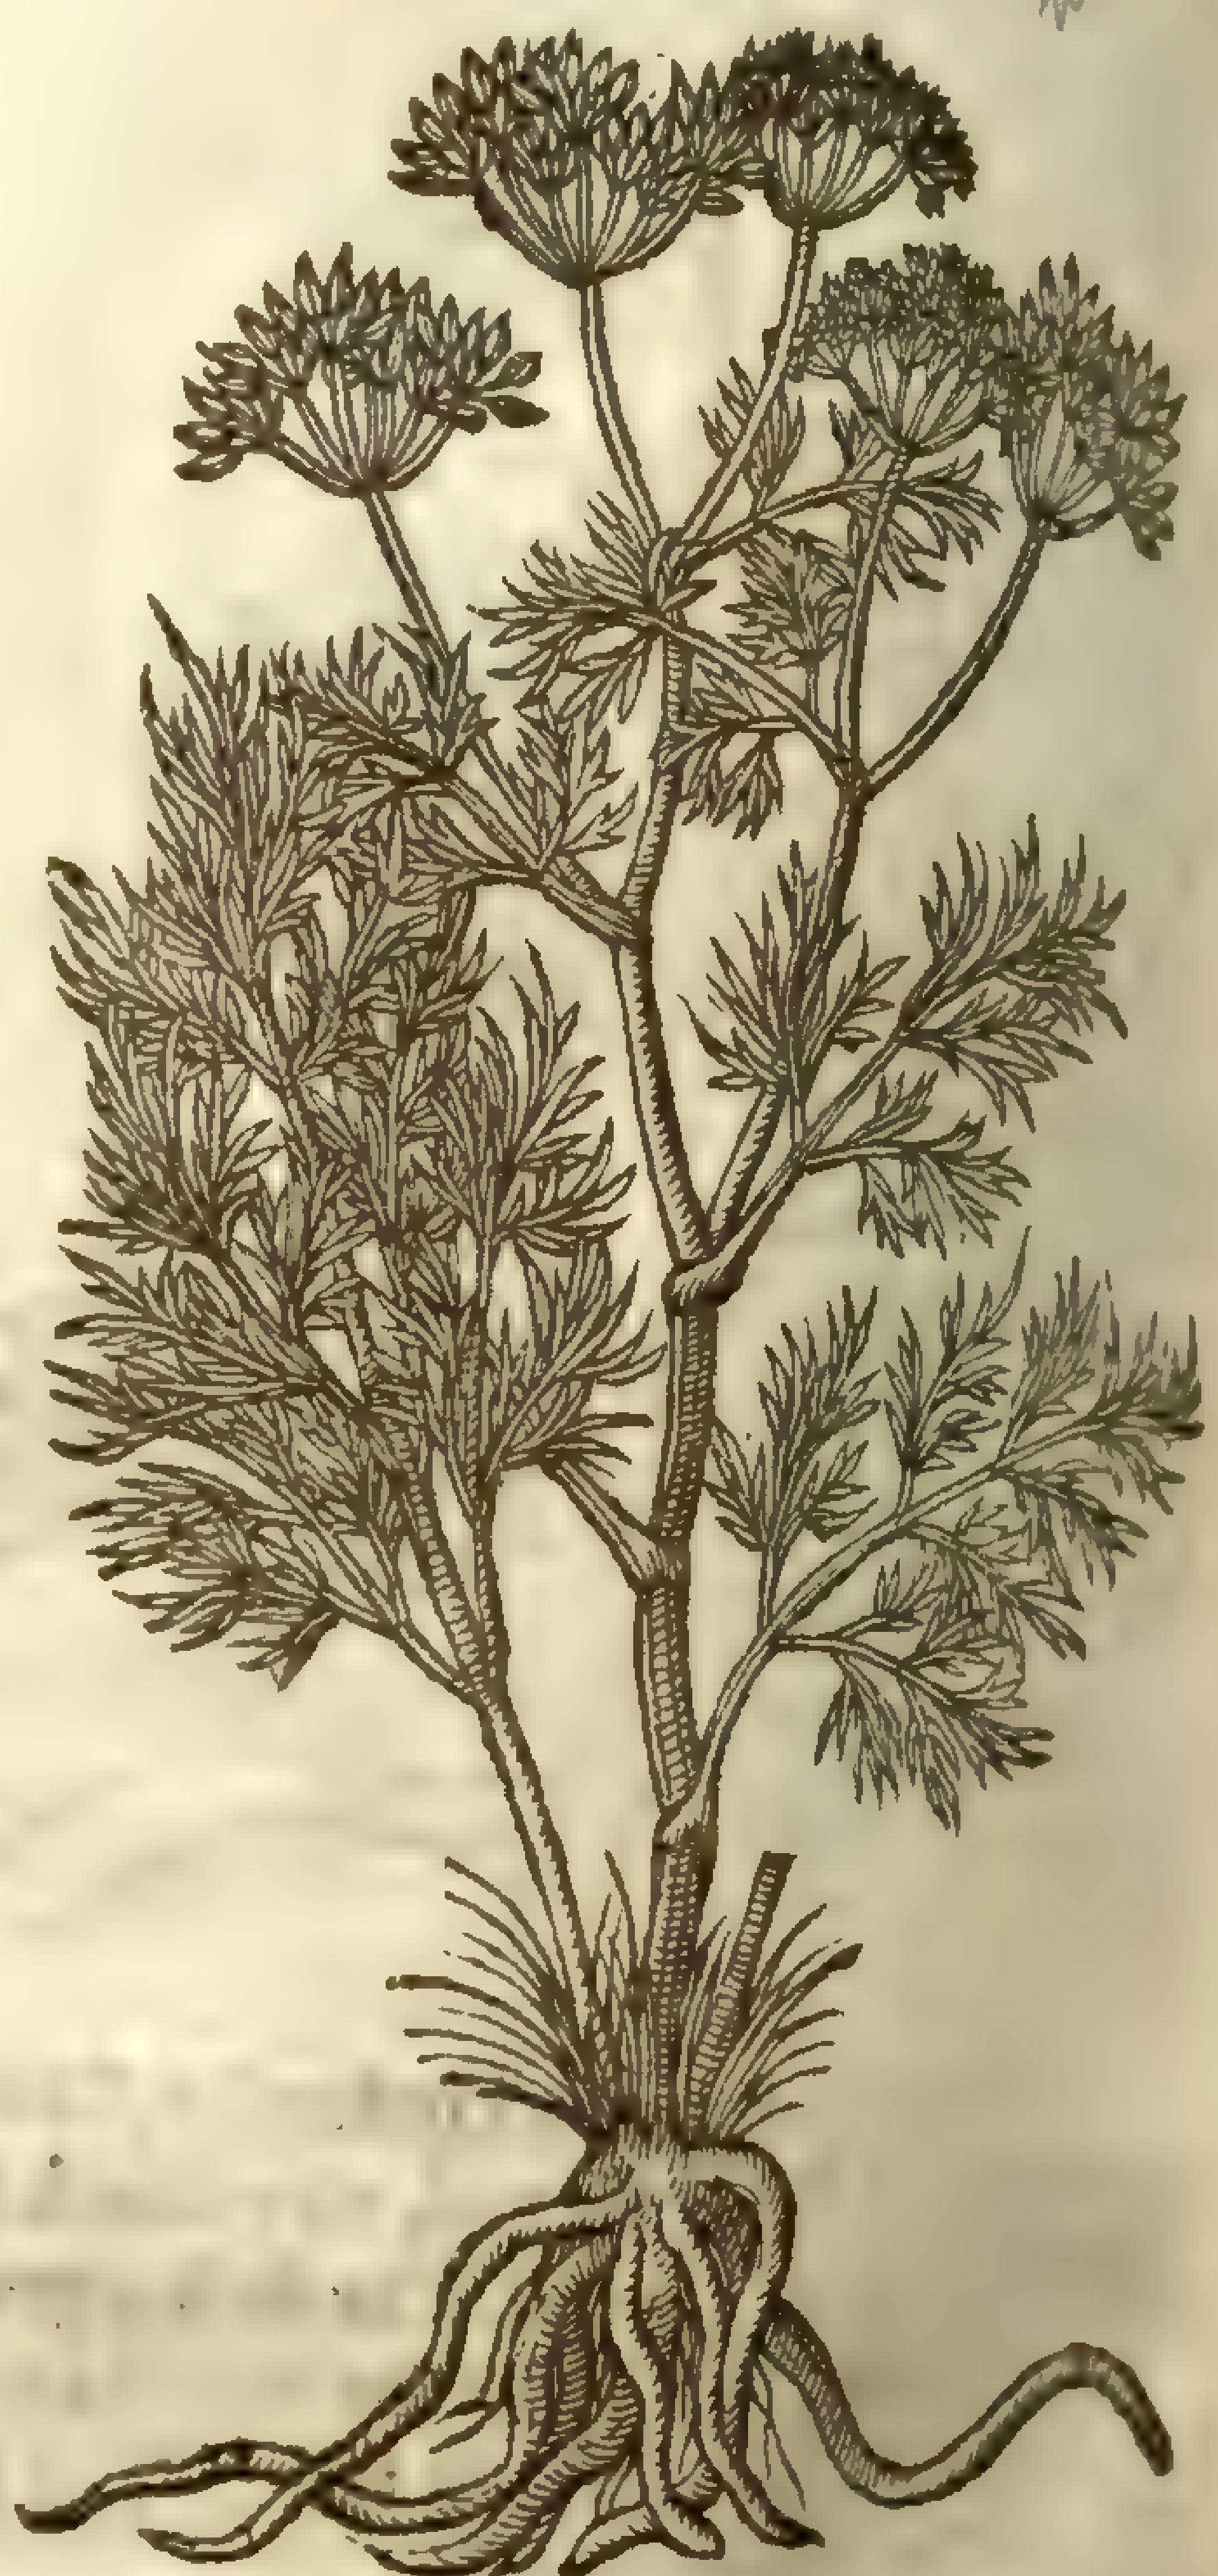
1 SPignell hath ſtalks riſing vp to the height of a cubit and a halfe, beſet with leaues reſembling Fennell or Dill, but thicker, more buſhie, and more finely jagged; and at the top of the ſtalkes do grow ſpokie tufts like vnto Dil. The roots are thicke, and full of an oleous ſubſtance, ſmelling well, and chaſing or heating the tongue, of a reaſonable good ſauour.

1 *Meum.*
Spignell.



‡ 2 *Meum alterum Italicum.*
Italian Spignell.

Seseli montanum [illegible]



Athamanta meum, L. [illegible]

2 There is a baſtard kinde of Spignell like vnto the former, ſauing that the leaues are not ſo finely cut or jagged: the floures are tufted more thicker than the former: the roots are many, thicke, and full of ſap.

¶ *The Place.*

Mew, or Meon groweth in Weſtmerland, at a place called Round-twhat betwixt Aplebie and Kendall, in the pariſh of Orton.

Baſtard Mewe, or *Meum*, groweth in the waſte mountaines of Italy, and the Alpes, and (as it hath been told me) vpon Saint Vincents rocke by Briſtow, where I ſpent two daies to ſeeke it, but it was not my hap to finde it, therefore I make ſome doubt of the truth thereof.

¶ *The Time.*

Theſe herbes do floure in Iune and Iuly, and yeeld their ſeed in Auguſt.

¶ *The Names.*

It is called of the Græcians, μεῶν: or μῆον: likewiſe of the Latines, *Meum*: of the Italians, *Meo*: in Apulia, as *Matthiolus* declareth, it is called *Imperatrix*: in diuers places of Spaine, *Siſtra*: in others, *Pinello*: in high Dutch, **Beerewurtz**: in French, *Siſtre*: *Ruellius* ſaith that it is named in France *Anethum tortuoſum*, and *ſylueſtre*, or writhed Dill, and wilde Dill: alſo it is called in Engliſh, Spignell, or Spicknell, of ſome Mew, and Bearewort.

The ſecond may be called baſtard Spicknell.

¶ *The Temperature.*

Theſe herbes, eſpecially the roots of right Meon, is hot in the third degree, and dry in the ſecond.

¶ *The Vertues.*

A The roots of Meon, boyled in water and drunke, mightily open the ſtoppings of the kidnies and bladder, prouoke vrine and bodily luſt, eaſe and helpe the ſtrangury, and conſume all windineſſe and belchings of the ſtomacke.

B The ſame taken with hony doth appeaſe the griefe of the belly, and is exceeding good againſt all Catarrhes, rheumes, and aches of the joynts, as alſo any phlegme which falls vpon the lungs.

C If the ſame be laied plaiſterwiſe vpon the bellies of children, it maketh them to piſſe well.

D They clenſe the entrals, and deliuer them of obſtructions or ſtoppings: they prouoke vrine, driue forth the ſtone, and bring downe the floures: but if they be taken more than is requiſite, they cauſe the head-ache; for ſeeing they haue in them more heat than drineſſe, they carry to the head raw moiſture and windie heat, as *Galen* ſaith.

CHAP. 426. *Of Horeſtrange, or Sulpherwort.*

¶ *The Deſcription.*

1 Svlphurwort or Hogs-fennell hath a ſtiffe and hard ſtalke full of knees or knots, beſet with leaues like vnto Fennell, but greater, comming neerer vnto Ferula, or rather like the leaues of wilde Pine-tree, and at the top of the ſtalkes round ſpokie tufts full of little yollow floures, which doe turne into broad browne ſeed. The root is thicke and long: I haue digged vp roots thereof as big as a mans thigh, blacke without, and white within, of a ſtrong and grieuous ſmell, and full of yellow ſap or liquor, which quickely waxeth hard or dry, ſmelling not much vnlike brimſtone, called *Sulphur*; which hath induced ſome to call it Sulphurwort; hauing alſo at the top toward the vpper face of the earth, a certaine buſh of haire, of a browne colour, among which the leaues and ſtalkes do ſpring forth.

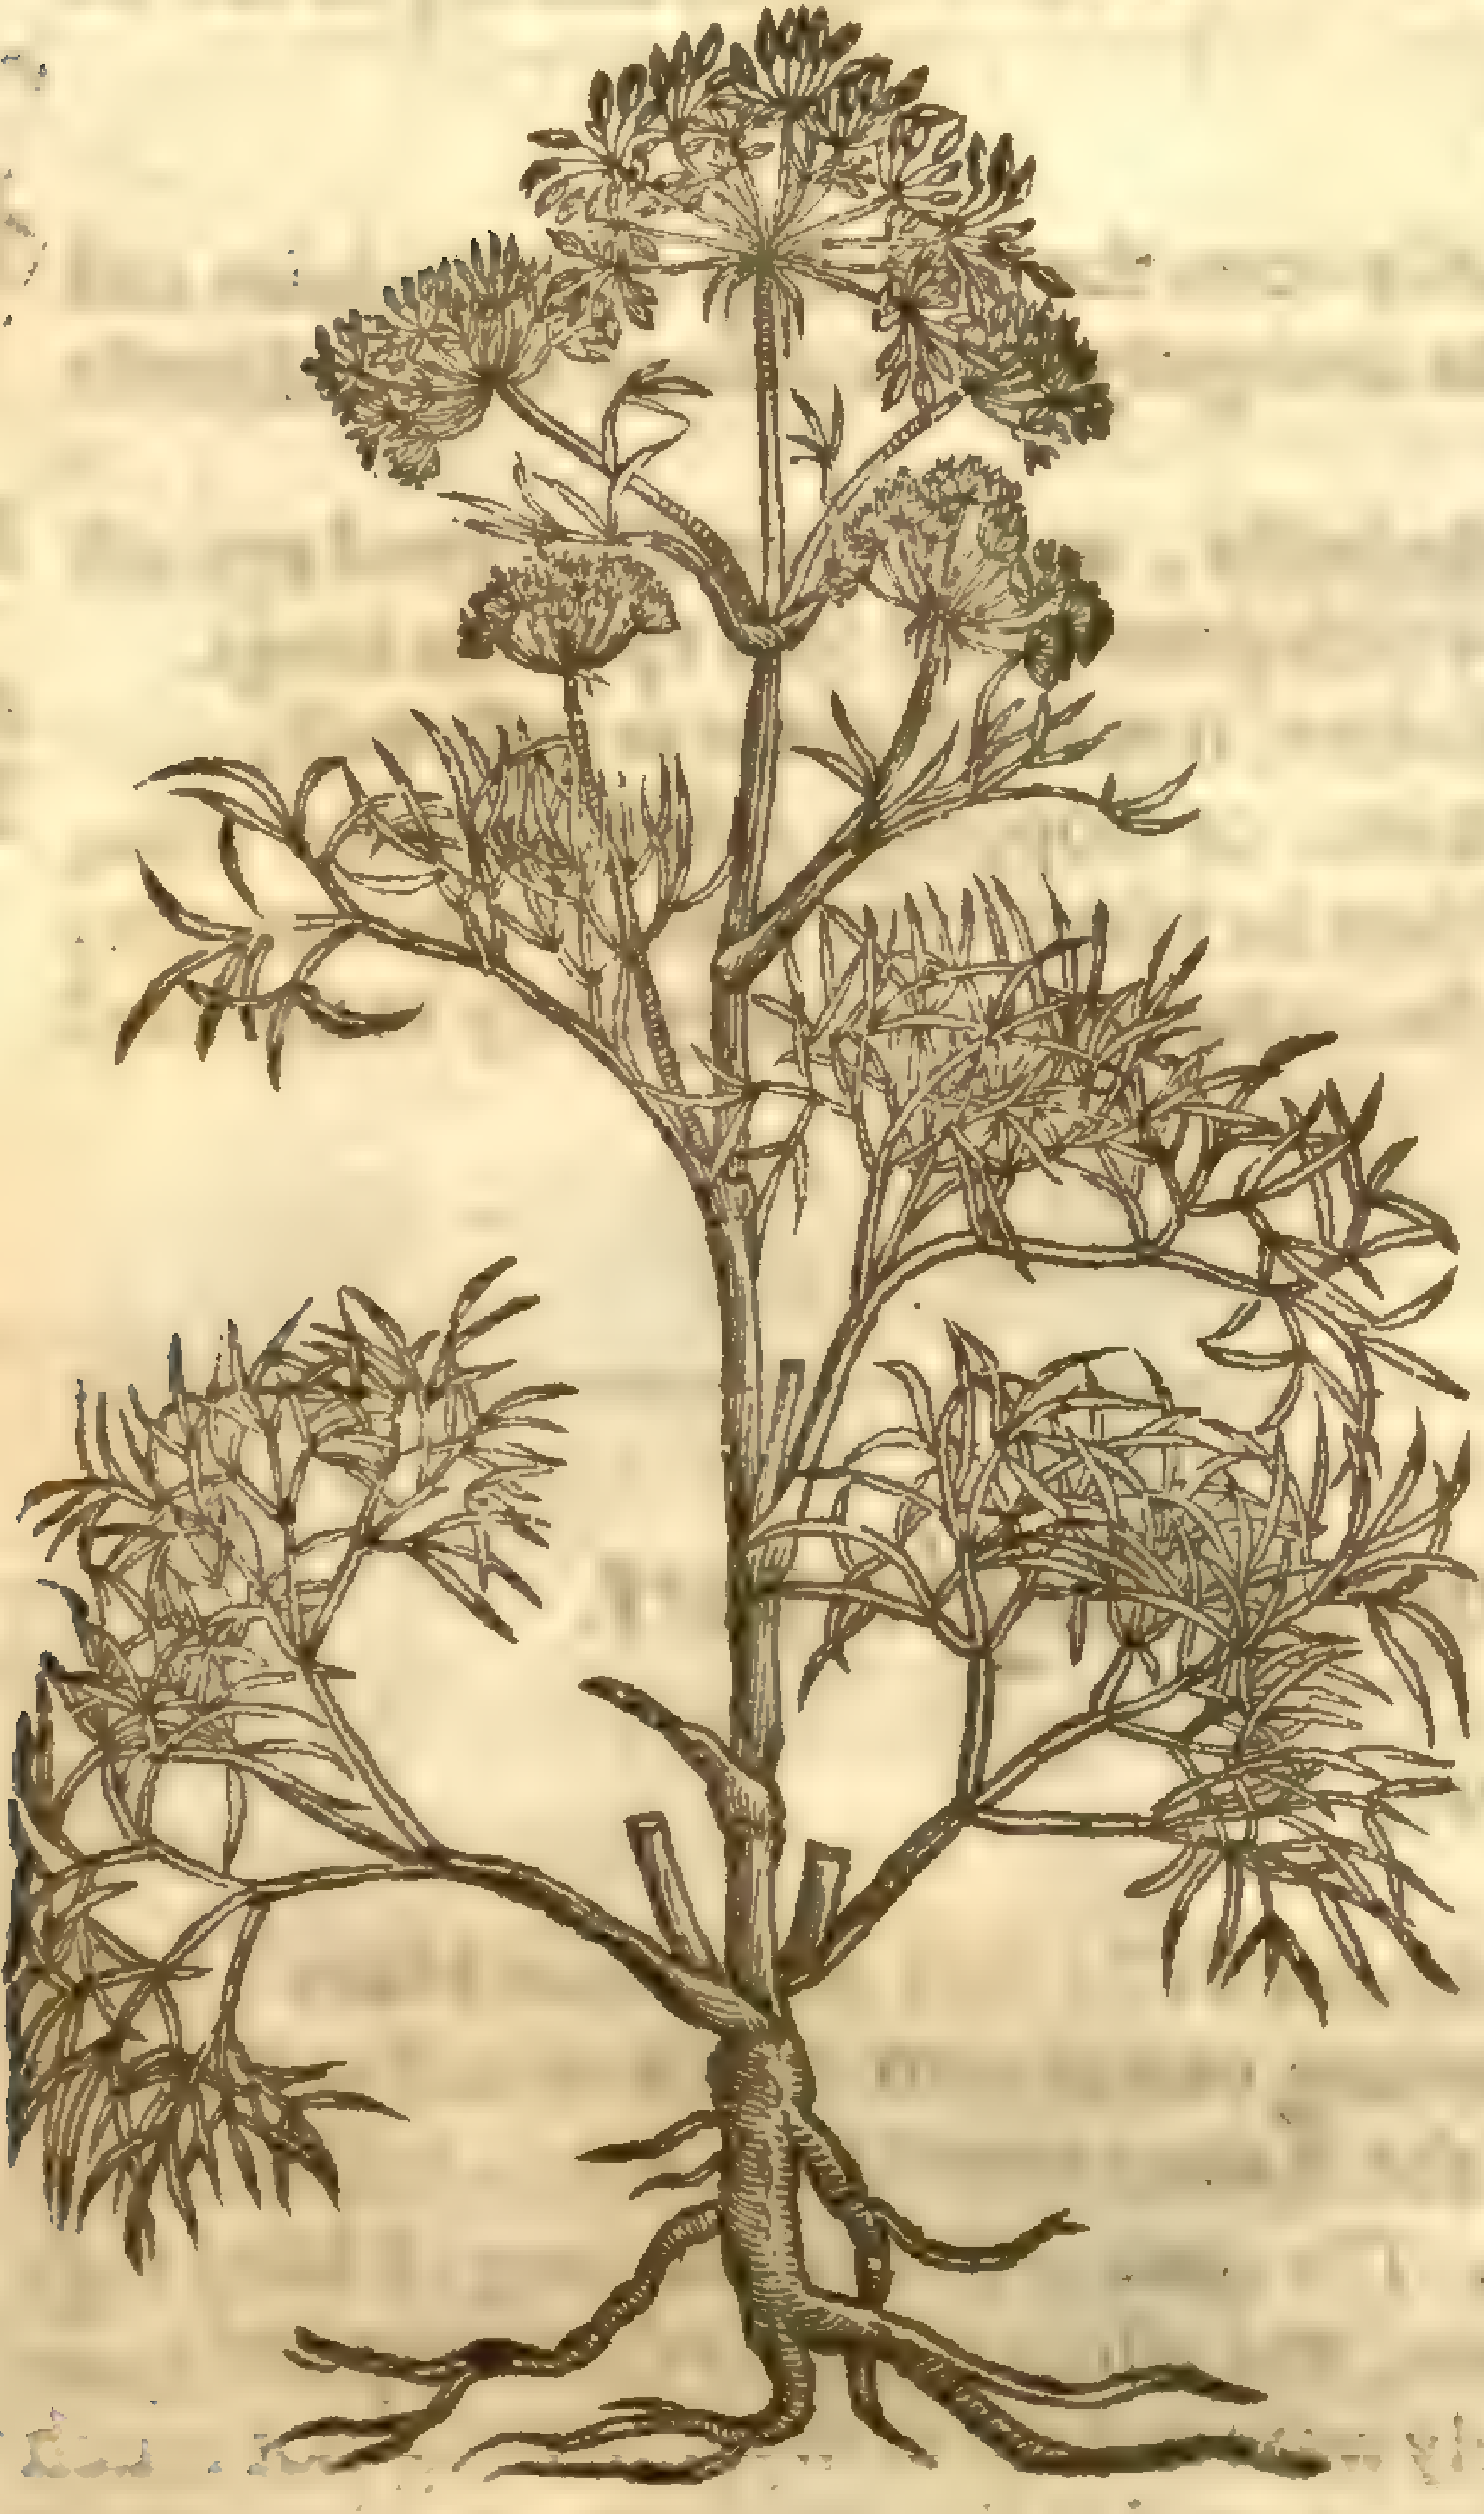
2 The ſecond kinde of *Peucedanum* or Hogs-fennell is very like vnto the former, ſauing that the leaues be like Ferula: the roots are nothing ſo great as the former, but all the reſt of the plant doth far exceed the other in greatneſſe.

3 There is another kinde of *Peucedanum* or Hogs-Fennell, which *Pena* found vpon Saint Vincents rock by Briſtow, whoſe picture he hath ſet forth in his *Aduerſaria*, which that famous Engliſh Phyſition of late memory, D^{r}. *Turner* found there alſo, ſuppoſing it to be the right and true *Peucedanum*, whereof no doubt it is a kinde: it groweth not aboue a foot high, and is in ſhape and leaues like the right *Peucedanum*, but they be ſhorter and leſſer; growing ſomwhat like the writhed Fennell of Maſſilia, but the branches are more largely writhed, and the leaues are of the colour of the branches, which are of a pale greene colour. At the top of the branches grow ſmall white tufts, hauing ſeed like Dill, but ſhorter and ſlenderer, of a good taſte, ſomewhat ſharpe. The root is thicker than the ſmalneſſe of the herbe will well beare. Among the people about Briſtow, and the rocke aforeſaid, this hath beene thought good to eat.

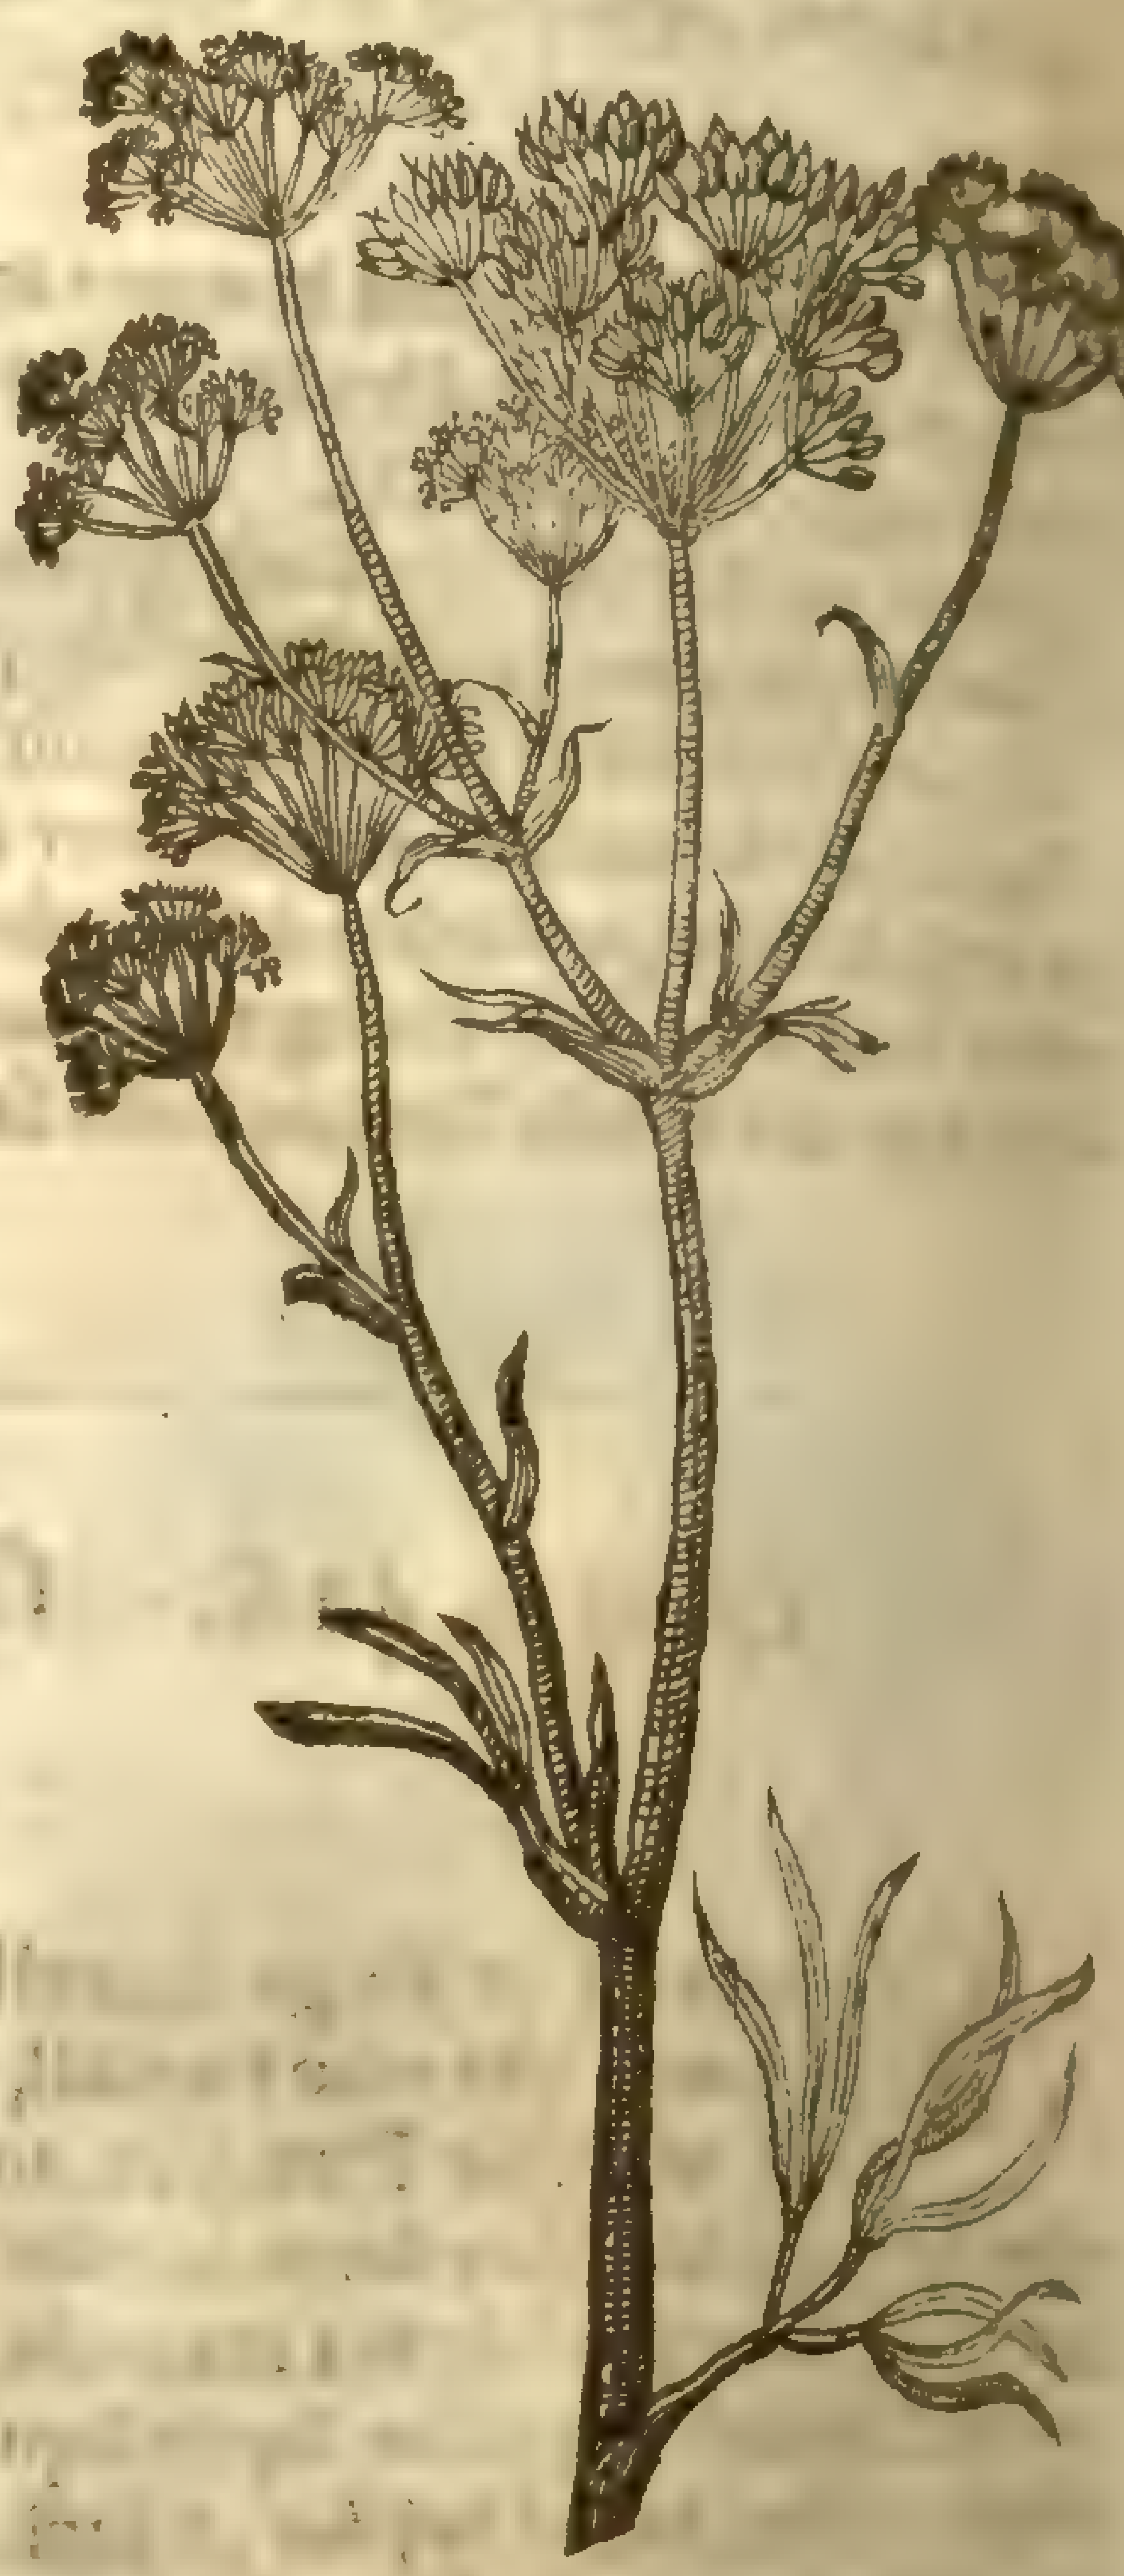
‡ The figure of this our Author formerly gaue (yet vnfitly, it not agreeing with that deſcription) for *Oreoſelinum*: it may be he thought it the ſame with that of *Dodon.* his deſcription, becauſe he found it vnder the ſame title in *Tabernamontanus*. This is the *Selinum montanum pumilum* of *Cluſius*; and the *Peucedani facie puſilla planta* of *Pena* and *Lobel*; wherefore *Bauhine* was miſtaken in his *Pinax*, whereas he refers that of *Lobel* to his third *Peucedanum*: the root of this is blacke without, and white within, but ſhort, yet at the top about the thickeneſſe of ones finger: the leaues are ſmall and greene, commonly diuided into fiue parts; and theſe again ſubdiuided by threes: the ſtalke is ſome ſix inches or halfe a foot high, diuided into ſundry branches, creſted, broad, and at the toppes of the branches, euen when they firſt ſhoot vp, appeare little vmbels of white floures very ſmall, and conſiſting of fiue leaues apiece. The ſeed is blacke, ſhining and round, two being joyned together, as in moſt vmbelliferous plants. It floures in May, and ripens the ſeed in Iuly: I receiued in Iuly 1632, ſome plants of this from Briſtow, by the meanes of my oft mentioned friend Maſter *George Bowles*, who gathered it vpon Saint Vincents Rocke, whereas the Authors of the *Adeerſaria* report it to grow. ‡

P. Alpinum [illegible]

1 *Peucedanum.*
Sulphurwort.

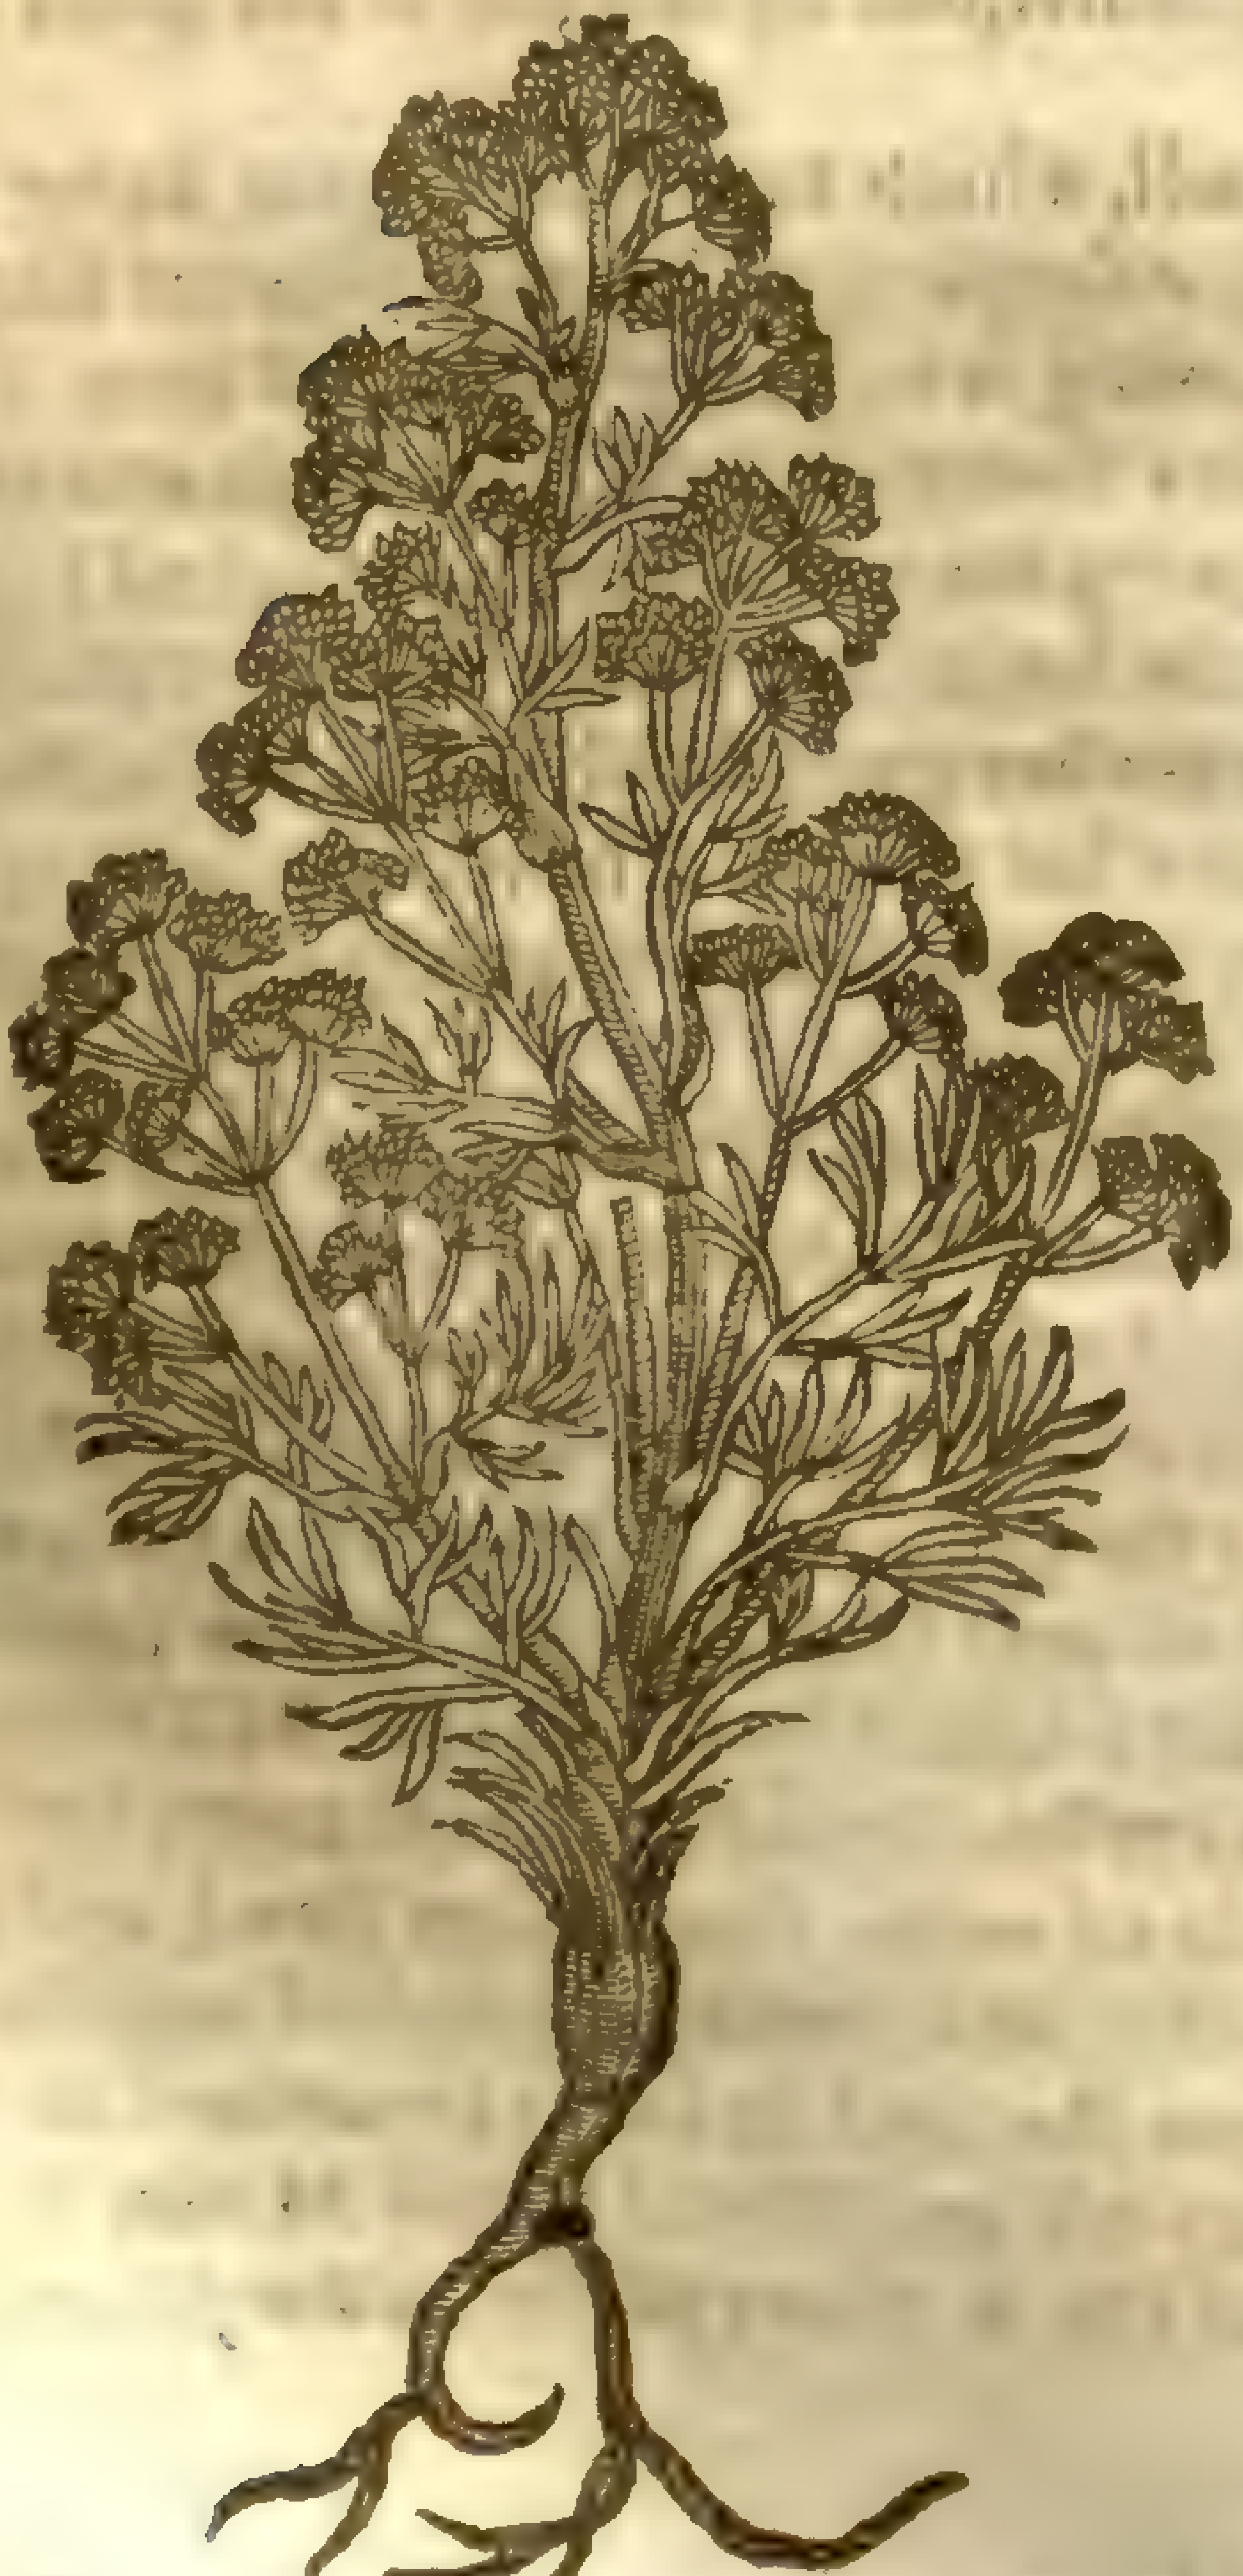


2 *Peucedanum majus.*
Great Sulphurwort.



‡ 3 *Peucedanum pumilum.*
Dwarfe Hogs-Fennell.

Pimpinella dioica, L. [illegible] 2.90



¶ *The Place.*

The firſt kinde of *Peucedanum* or Hogs Fennell groweth very plentifully on the South ſide of a wood belonging to Waltham, at the Naſe in Eſſex by the high-way ſide; alſo at Whitſtable in Kent, in a medow neere to the ſea ſide, ſometime belonging to Sir *Henry Criſpe*, and adjoyning to his houſe there. It groweth alſo in great plenty at Feuerſham in Kent, neere vnto the hauen vpon the bankes thereof, and in the medowes adjoyning.

The ſecond kinde groweth vpon the ſea coaſts of Montpellier in France, and in the coaſts of Italy.

¶ *The Time.*

Theſe plants do floure in Iune, Iuly, and Auguſt.

¶ *The Names.*

The Græcians call it, πευκέδανος: the Latines in like manner, *Peucedanos*, or *Peucedanum*, and alſo *Pinaſtellum*: moſt of the ſhops, and likewiſe the common people name it *Fœniculum Porcinum*: of diuers, *Stataria*: of the Prophets, ἀγαθὸς δαίμων: that is to ſay, a good Angell or Ghoſt: in high Dutch, **Harſtrang, Schweffel wurtzel, Sewfenckel**: in Italian and French, *Peucedano*: in Spaniſh, *Herbatum*: in Engliſh, Hore-ſtrange, and Hore-ſtrong, Sow-Fennell, or Hogs Fennell, Sulpher-wort, or Brimſtone-wort. It is called *Peucedanum* and *Pinaſtellum*, of the Greeke and Latine words, πεύκη and *Pinus*.

¶ *The Temperature.*

Theſe herbes, eſpecially the yellow ſap of the root, is hot in the ſecond degree, and dry in the beginning of the third.

¶ *The Vertues.*

A The yellow ſap of the root of Hogs Fennell, or as they call it in ſome places of England, Hore-ſtrange, taken by it ſelfe, or with bitter Almonds and Rue, is good againſt the ſhortneſſe of breath, it aſſwageth the griping paines of the belly, diſſolueth and driueth away ventoſitie or windineſſe of the ſtomacke; it waſteth the ſwelling of the milt or ſpleene, looſeth the belly gently, and purgeth by ſiege both flegme and choler.

B The ſame taken in manner aforeſaid prouoketh vrine, eaſeth the paine of the kidnies and bladder, cauſeth eaſie deliuerance of childe, and expelleth the ſecondine, or after-birth, and the dead childe.

C The ſap or juyce of the root mixed with oyle of Roſes, or Vineger, and applied, eaſeth the palſie, crampes, contraction or drawing together of ſinewes, and all old cold diſeaſes, eſpecially the Sciatica.

D It is vſed with good ſucceſſe againſt the rupture or burſtings in young children, and is very good to be applied vnto the nauels of children that ſtand out ouer much.

E The decoction of the root drunke is of like vertue vnto the juyce, but not altogether ſo effectuall againſt the foreſaid diſeaſes.

F The root dried and made into pouder doth mundifie and clenſe old ſtinking and corrupt ſores and vlcers, and healeth them: it alſo draweth forth the corrupt and rotten bones that hinder the ſame from healing, and likewiſe ſplinters and other things fixed in the fleſh.

G The ſaid pouder or juyce of the root mixed with oyle of Roſes, cauſeth one to ſweat, if the body be annointed therewith, and therefore good to be put into the vnction or ointment for the French diſeaſe.

H The congealed liquor tempered with oile of Roſes, and applied to the head after the manner of anointment, is good for them that haue the Lethergie, that are franticke, that haue dizzineſſe in the head, that are troubled with the falling ſickeneſſe, that haue the palſie, that are vexed with conuulſions and cramps, and generally it is a remedy for all infirmities of the ſinewes, with vineger and oyle as *Dioſcorides* teacheth.

I The ſame being ſmelt vnto reuiueth and calleth them againe that be ſtrangled with the mother, and that lie in a dead ſleepe.

K Being taken in a reare egge it helpeth the cough and difficulty of breathing, gripings and windineſſe, which, as *Galen* addeth, proceedeth from the groſſeneſſe and clammineſſe of humours.

L It purgeth gently, it diminiſheth the ſpleene, by cutting, digeſting and making thin humours that are thicke: it cauſeth eaſie trauell, and openeth the matrix.

M A ſmall piece of the root holden in the mouth is a preſent remedy againſt the ſuffocation of the mother.

Chap.

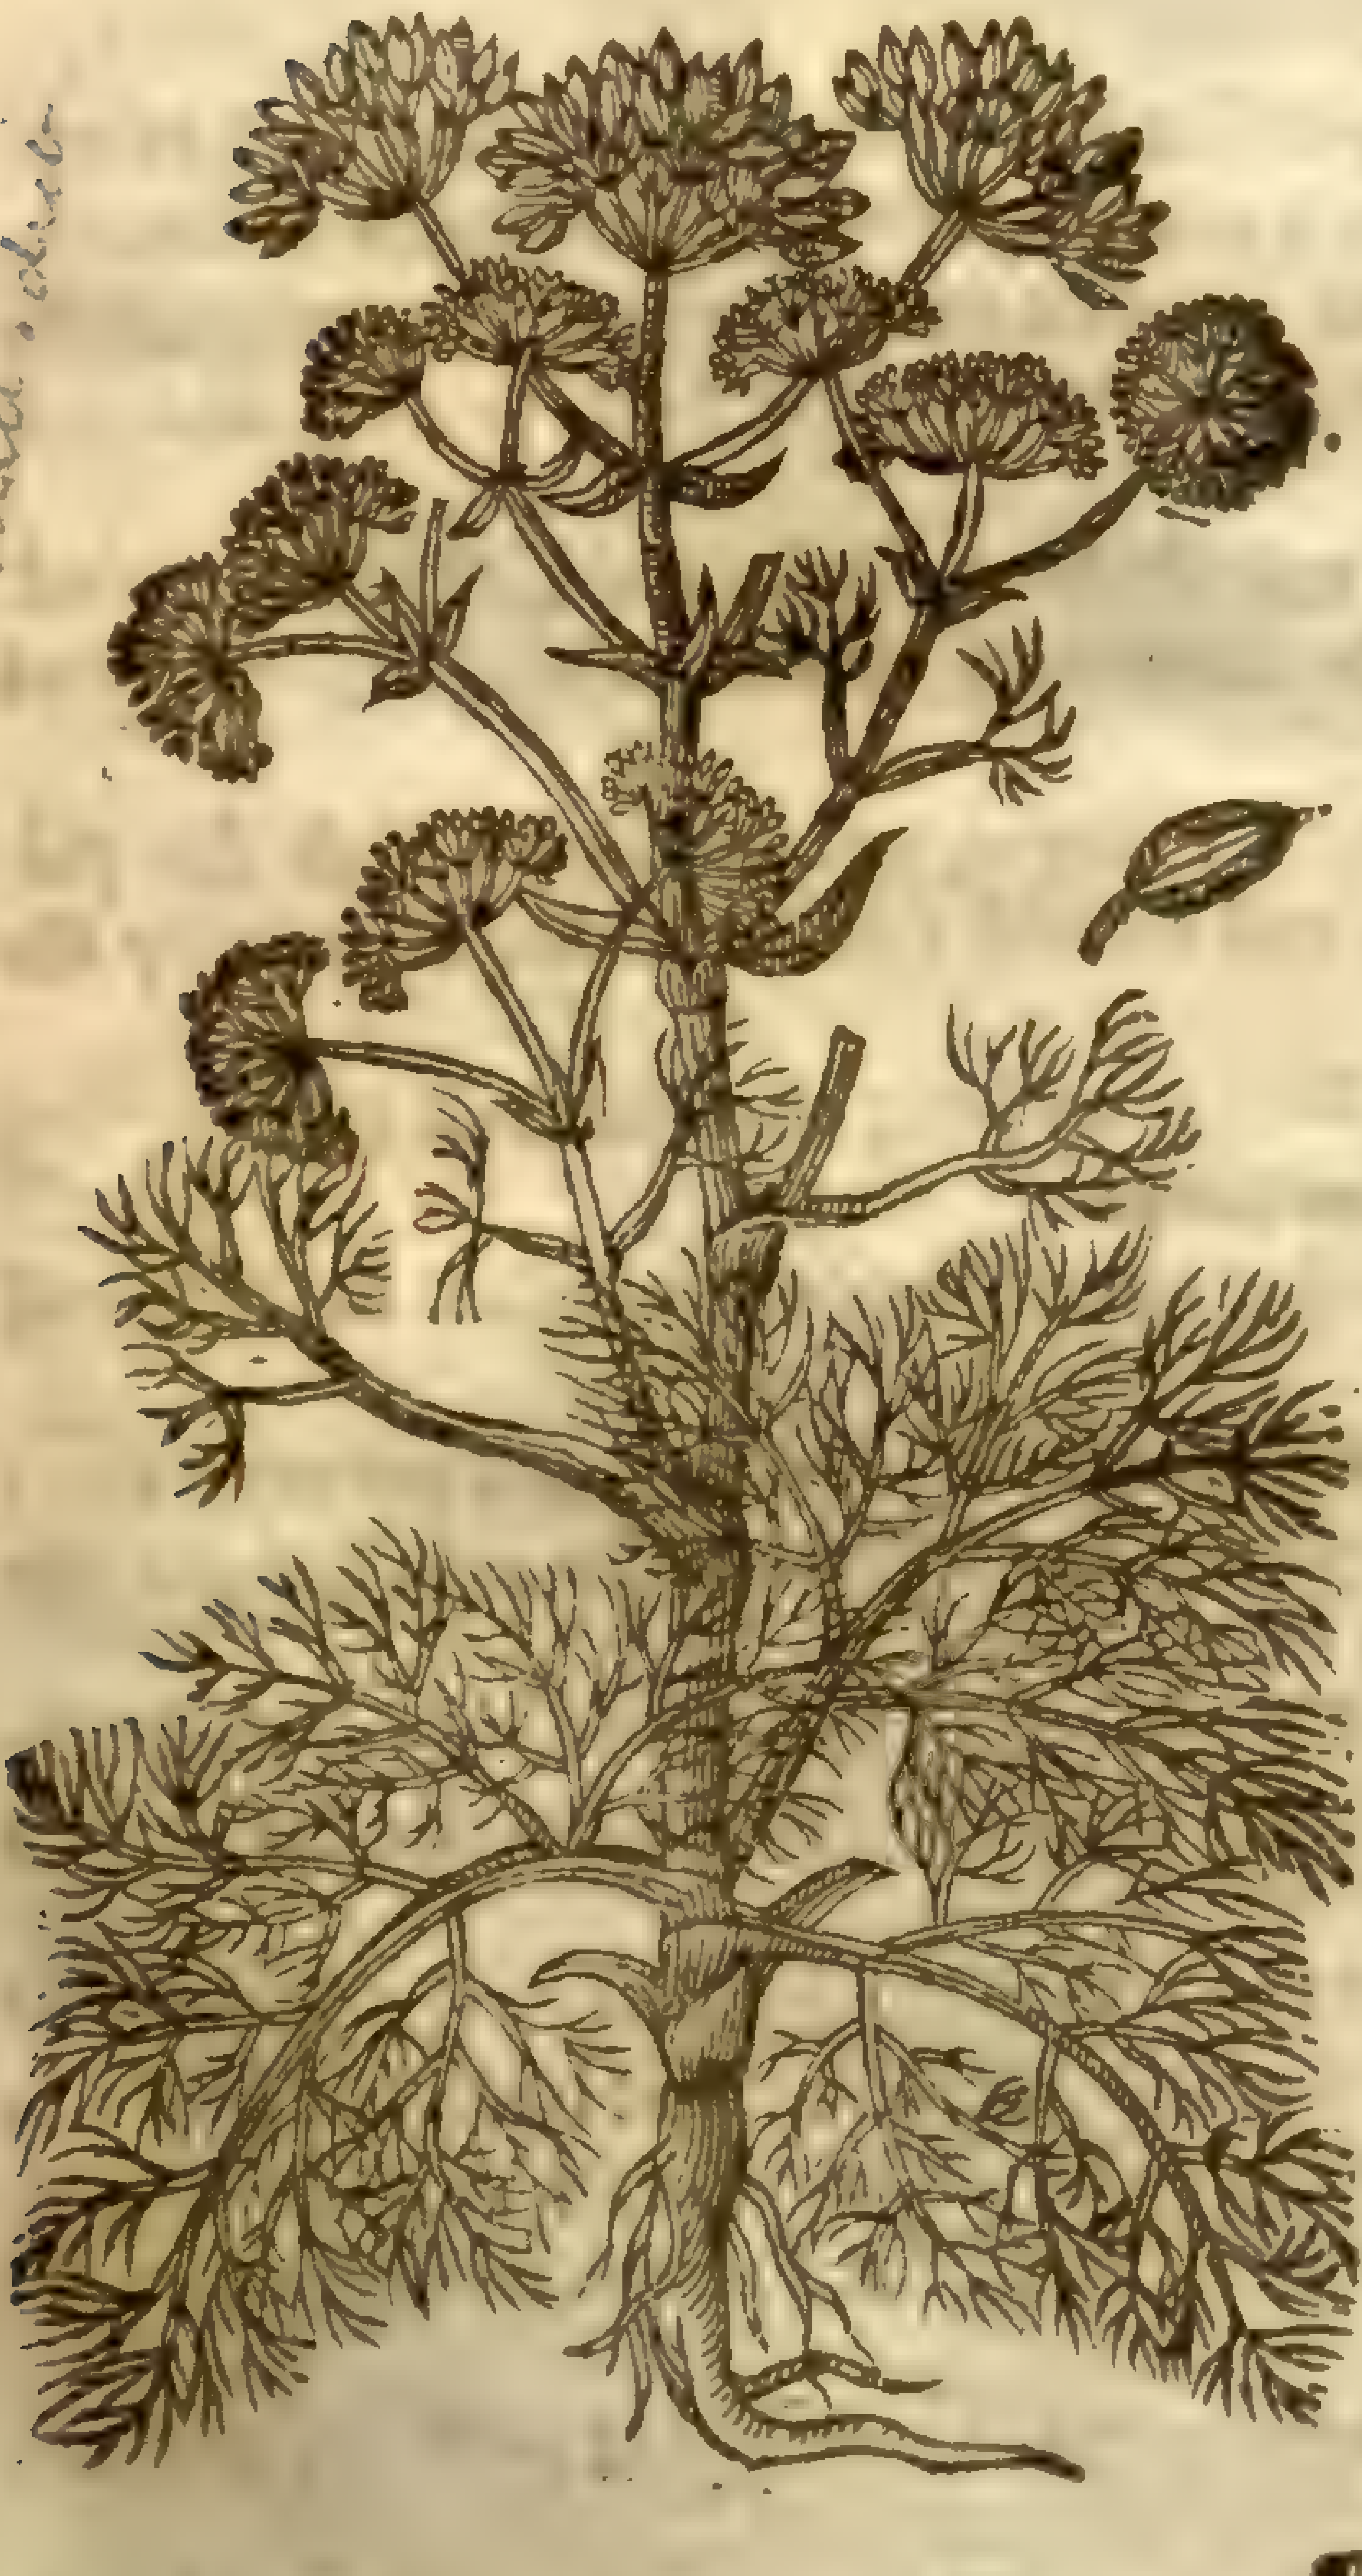
Chap. 472.

Of Herbe Ferula, or Fennell Gyant.

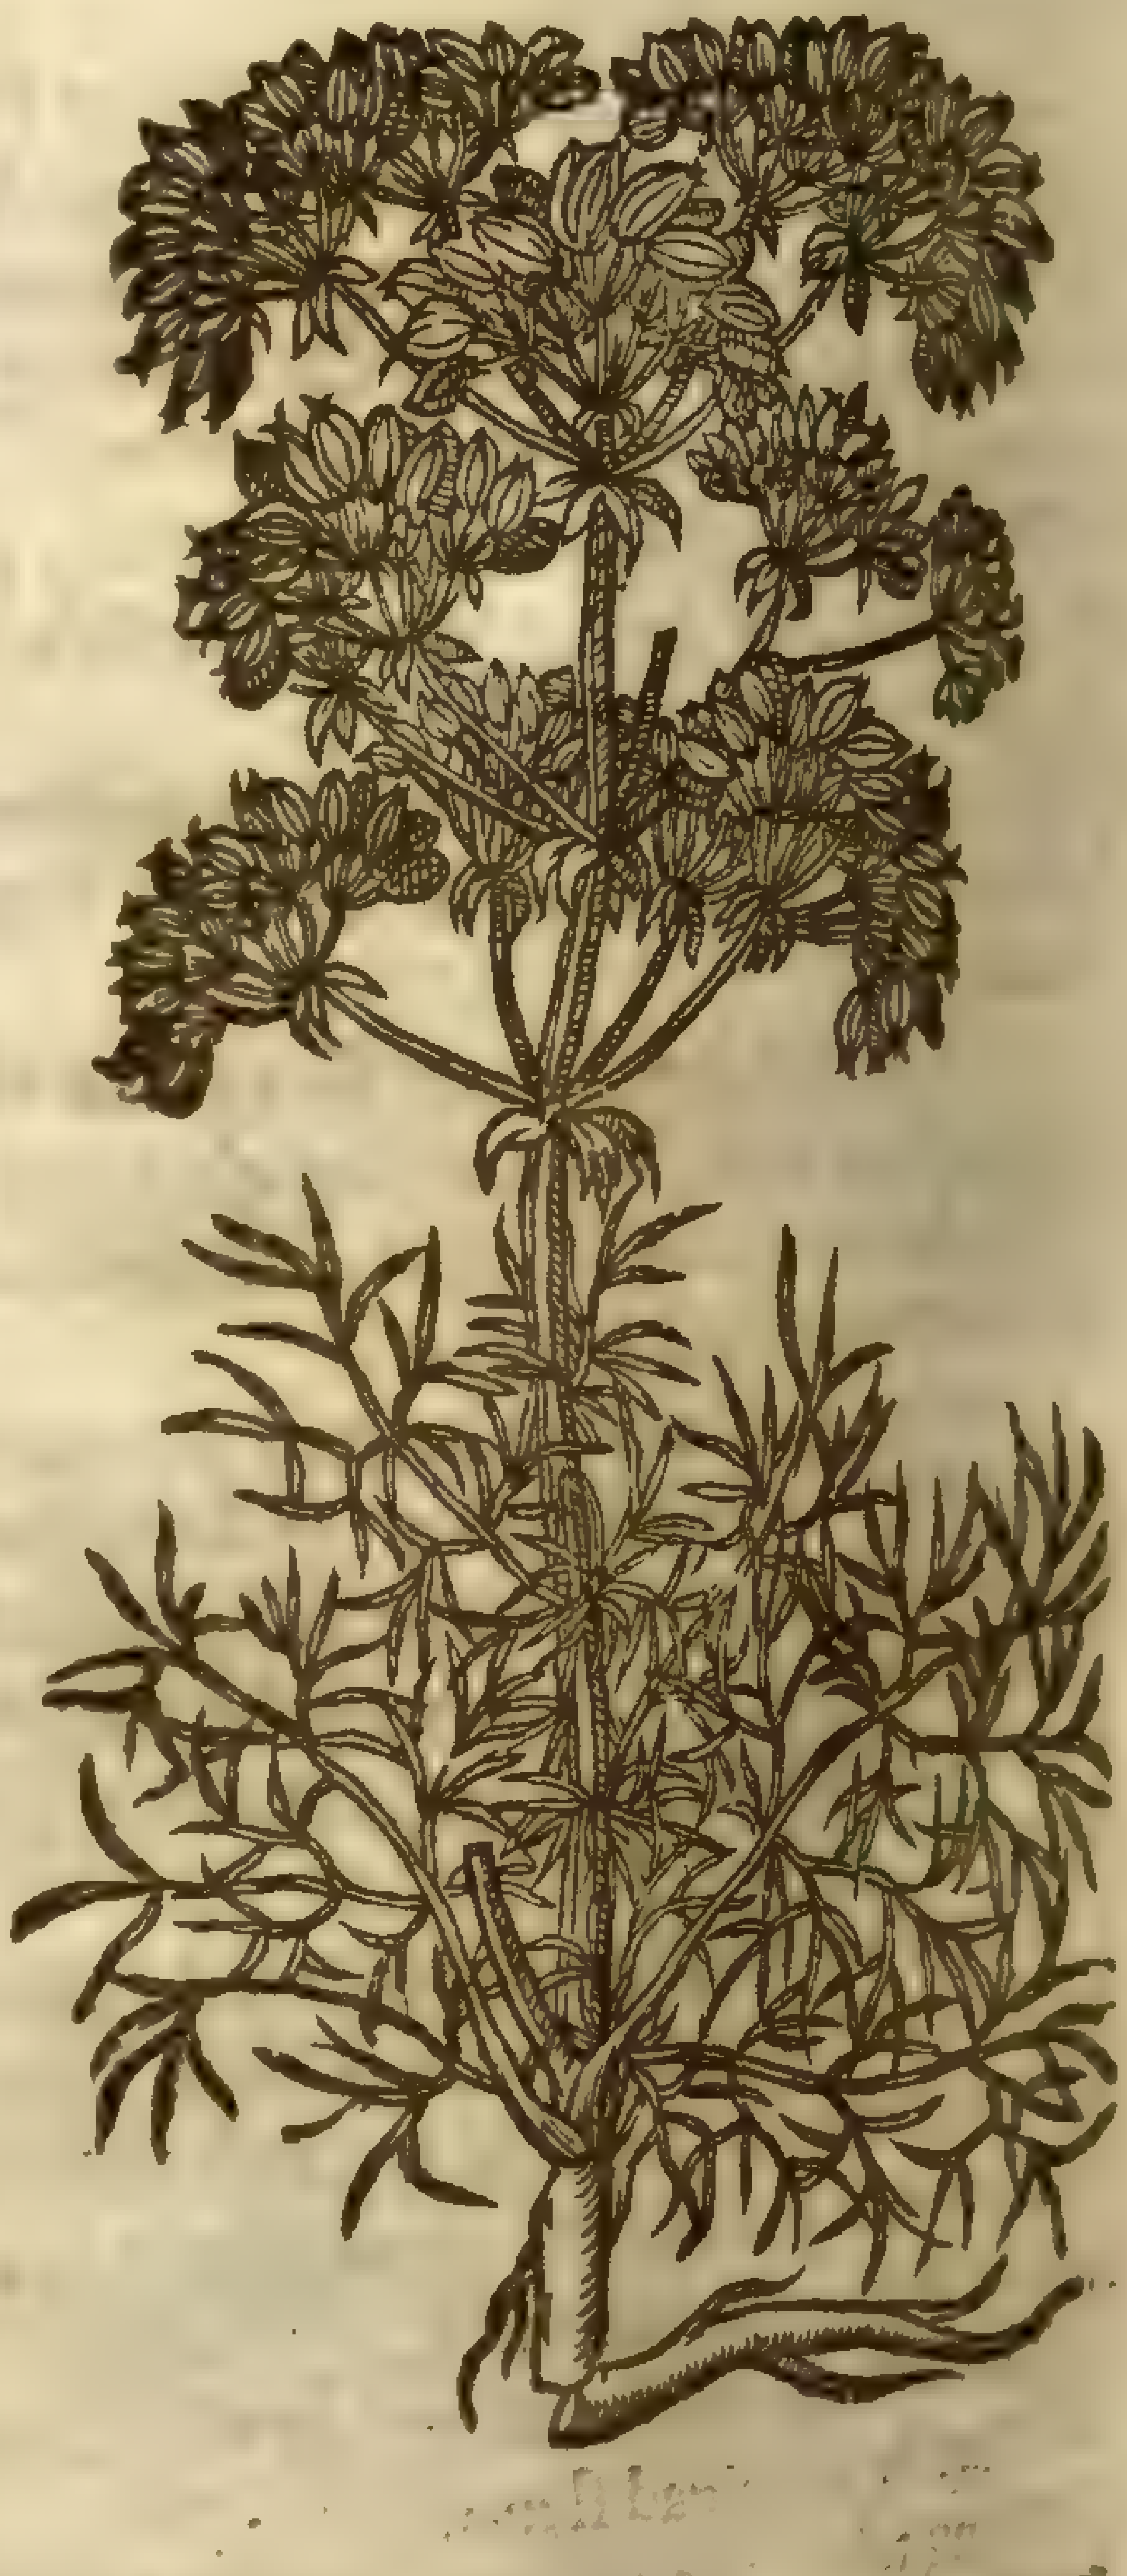
¶ *The Kindes.*

Dioſcorides maketh mention of a *Ferula*, out of which is gathered the Gum *Sagapene*; and alſo he declareth, that the Gums *Galbanum* and *Ammoniacum* are liquors of this herb *Ferula*: but what difference there is in the liquors, according to the clymate or countrey where it groweth, he doth not ſet downe; for it may be that out of one kinde of *Ferula* ſundry juyces may be gathered, that is to ſay, according to the diuerſitie of the countries where they grow, as we haue ſaid: for as in Laſer, the juyce of Laſerwort that groweth in Cyrene doth differ from that liquor which groweth in Media and Syria; ſo it is likewiſe that the herbe *Ferula* doth bring forth in Media *Sagapenum*, in Cyrene *Ammoniacum*, and in Syria *Galbanum*. *Theophraſtus* ſaith that the herbe *Ferula* is diuided into mo kindes, and he calleth one great, by the name of *Ferula*; and another little, by the name *Ferulago*.

1 *Ferula.*
Fennell-Gyant.



‡ 2 *Ferulago.*
Small Fennell-Gyant.

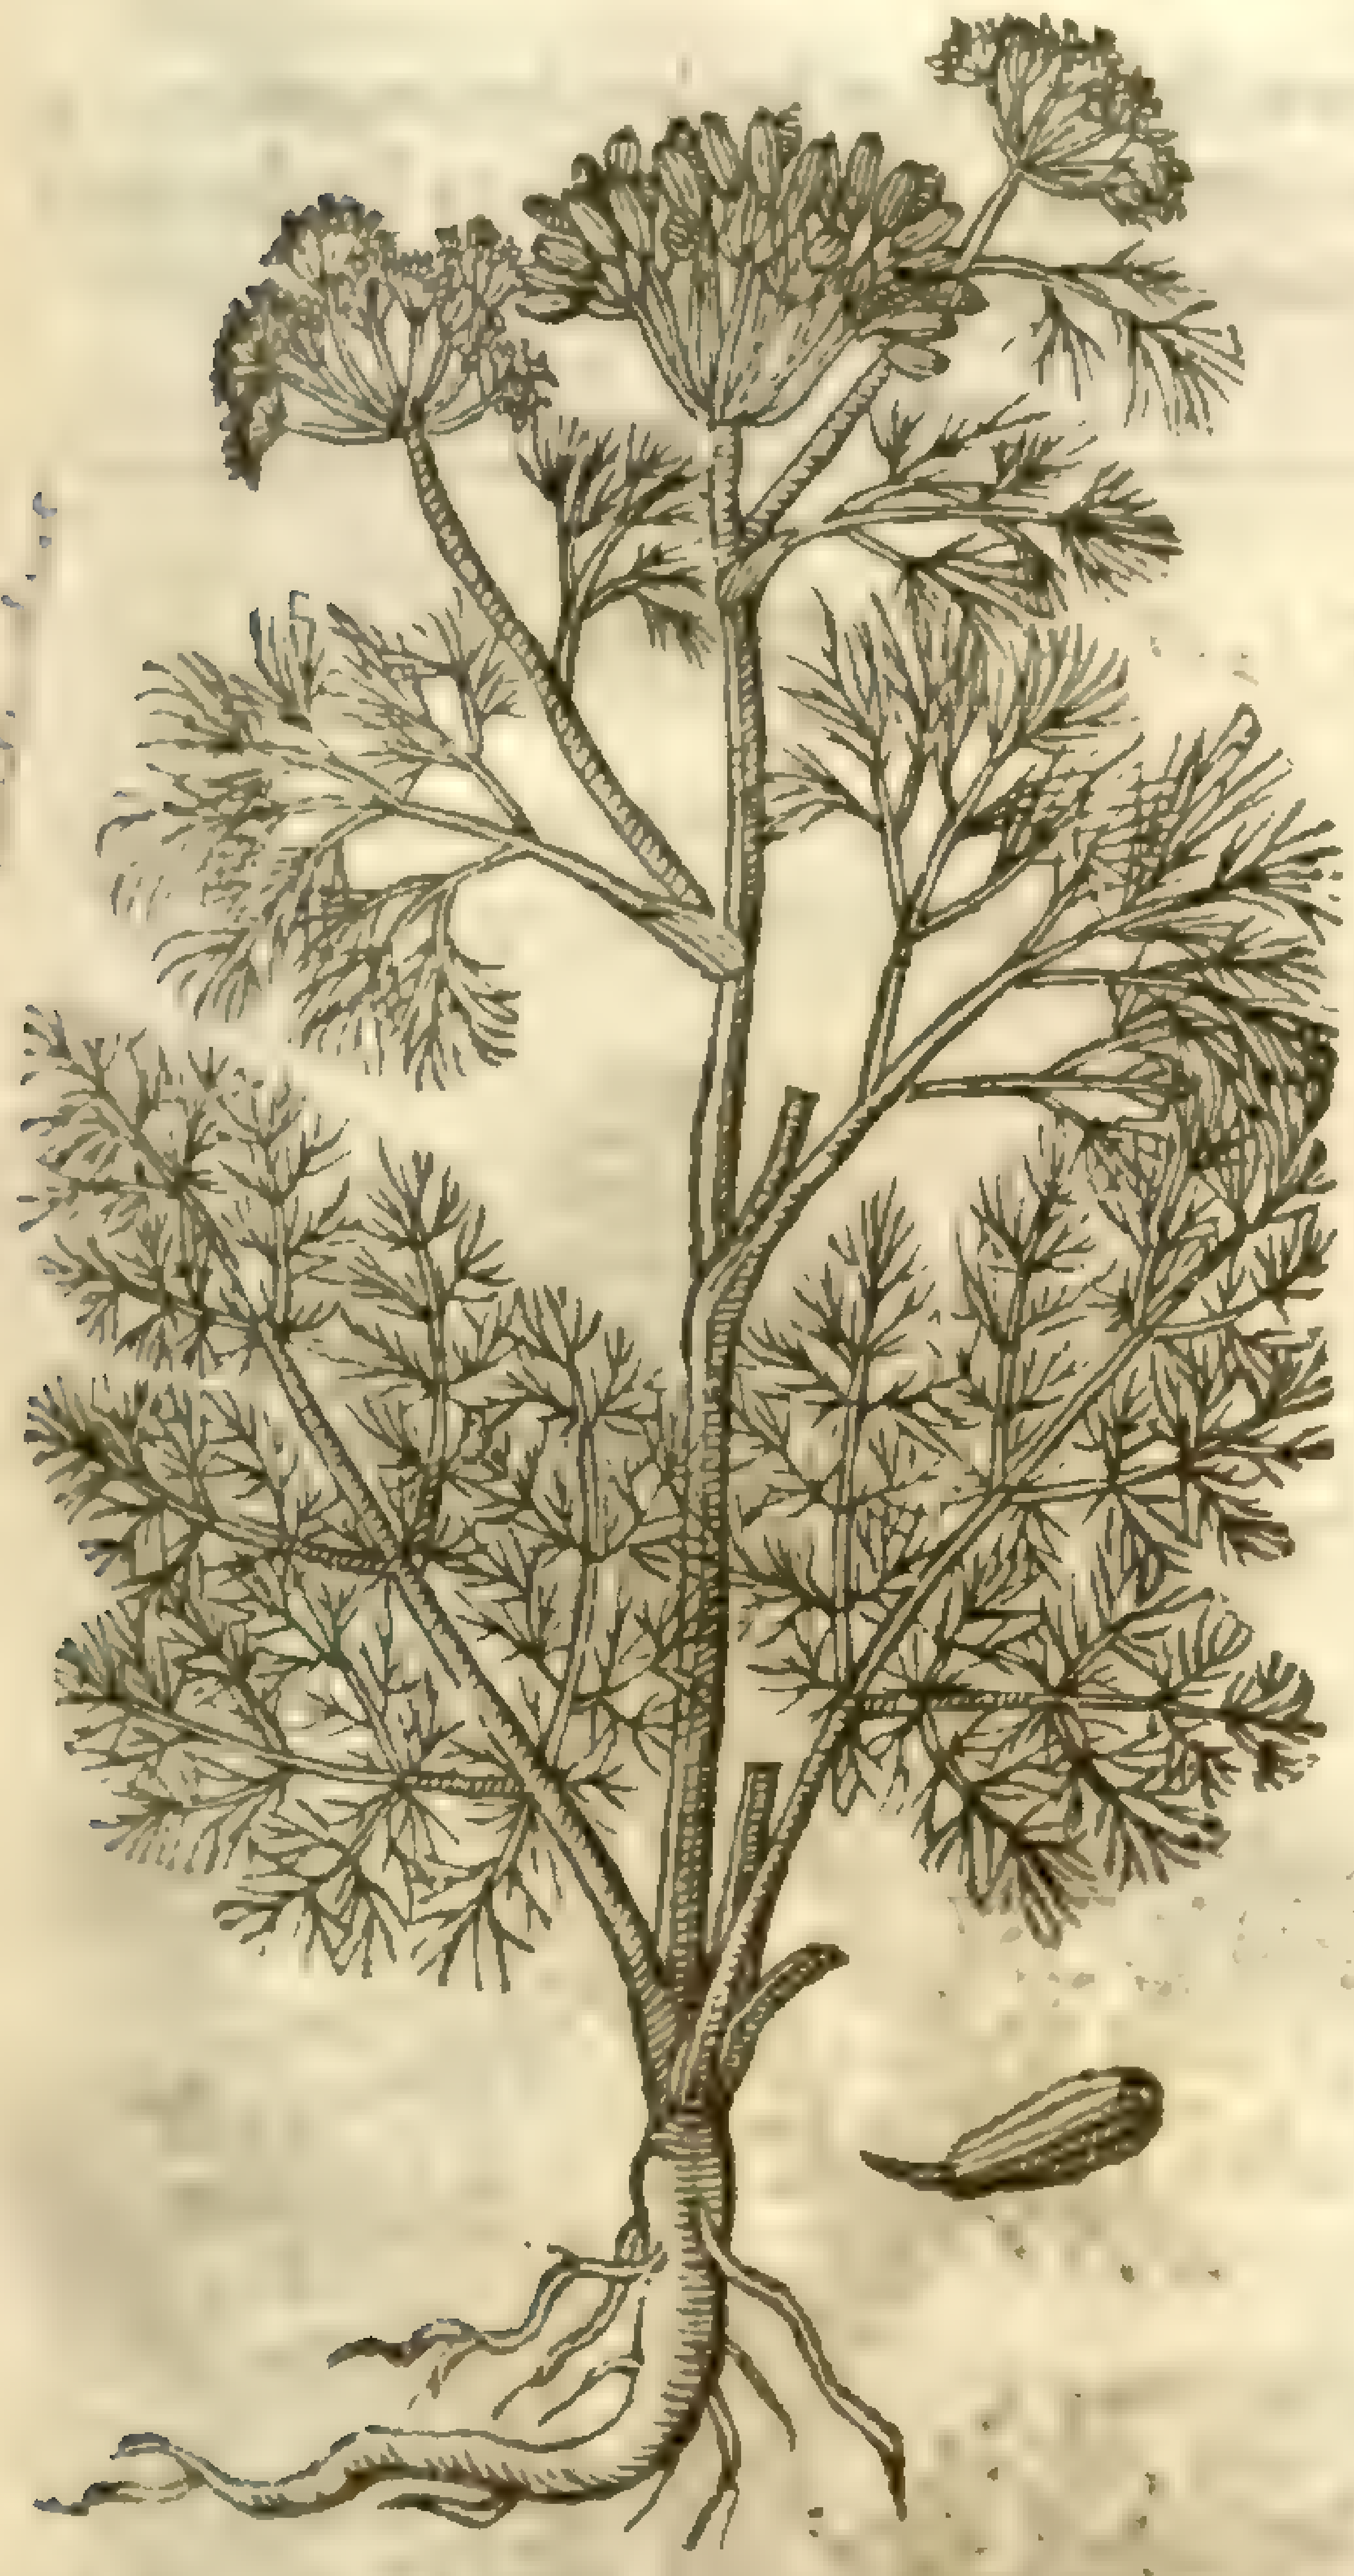


¶ *The Deſcription.*

1 Ferula, or Fennell Gyant, hath very great and large leaues of a deepe greene colour, cut and jagged like thoſe of Fennell, ſpreading themſelues abroad like wings: amongſt which riſeth vp a great hollow ſtalke, ſomewhat reddiſh on that ſide which is next vnto the Sun, diuided into certaine ſpaces, with joynts or knees like thoſe of Hemlocks or Kexes, of the bigneſſe of a mans arme in the wreſt, of the height of foure or fiue cubits where it groweth naturally, as in Italy, Greece, and other hot countries; notwithſtanding it hath attained to the height of foureteene or fifteene foot in my Garden, and likewiſe groweth fairer and greater than from whence it came, as it fareth with other plants that come hither from hot regions: as for example our great Artichoke, which firſt was brought out of Italy into England, is become (by reaſon of the great moiſture which our countrey is ſubject vnto) greater and better than thoſe of Italy;

inſomuch that diuers Italians haue ſent for ſome plants of our Artichokes, deeming them to be of another kinde; neuertheleſſe in Italy they are ſmall and dry as they were before. Euen ſo it hapneth to this *Ferula*, as we haue ſaid. This foreſaid ſtalke diuideth it ſelfe toward the top into diuers other ſmall branches, whereon are ſet the like leaues that grow next the ground, but much leſſer. At the top of the branches at the firſt budding of the floures appeare certaine bundles incloſed in thin skins, like the yolke of an egge, which diuers call *Corculum Ferulæ*, or the little heart of *Ferula*, which being brought to maturitie, open themſelues into a tuft or vmbell like that of Dill, of a yellowiſh colour: after which come the ſeed, in colour and faſhion like thoſe of the Parſnep, but longer and greater, alwaies growing two together, ſo cloſely ioyned, that it cannot be diſcerned to be more than one ſeed vntill they be diuided: the root is very thicke and great, full of a certaine gummie iuyce, that floweth forth, the root being bruiſed, broken, or cut; which being dried or hardned, is that gum which is called *Sagapenum*, and in ſome ſhops *Serapinum*.

‡ 3 *Panax Aſclepium Ferulæ facie.*
Æſculapius his All-heale.



2 There is likewiſe another ſmaller *Ferula* like vnto the former in each reſpect, ſauing that it is altogether leſſe: the root likewiſe being wounded yeeldeth forth a ſap or iuyce, which when it is hardened is called *Galbanum*: of the Aſſyrians, *Metopium*.

I haue likewiſe another ſort ſent mee from Paris, with this title *Ferula nigra*; which proſpereth exceeding well in my Garden, but difference I cannot finde any from the former, ſauing that the leaues are of a more blacke or ſwart colour.

‡ 3 I know not where more fitly than in this place to giue you the Hiſtory of that *Ferula* or Ferulaceous plant that *Dodonæus*, *Lobel*, and others haue ſet downe vnder the name of *Panax Aſclepium*. The ſtalke hereof is ſlender, a cubit high, creſted and ioynted, and from theſe ioynts proceed leaues bigger than thoſe of Fennell, and alſo rougher, and of a ſtrong ſmell: at the tops of the branches grow vmbels of yellow floures: the ſeed is flattiſh, like that of the other *Ferula*: the root long, white, and of a ſtrong ſmell. This growes naturally in Iſtria. ‡

¶ *The Place.*

Theſe plants are not growing wilde in England; I haue them all in my garden.

¶ *The Time.*

They floure in Iune and Iuly; they perfect their ſeed in September; not long after, the ſtalke with his leaues periſh: the root remaineth freſh and greene all Winter.

¶ *The Names.*

The firſt is called in Greeke, νάρθηξ: in Latine, *Ferula*: in Italian, *Ferola*: in Spaniſh, *Cananheia*: in Engliſh, Herbe Ferula, and Fennell Gyant.

¶ *The Temperature.*

Theſe plants with their Gums are hot in the third degree, and dry in the ſecond.

¶ *The Vertues.*

The pith or marrow, called *Corculum Ferulæ*, as *Galen* teacheth, is of an aſtringent or binding qualitie, and therefore good for them that ſpit bloud, and that are troubled with the flix. A

Dioſcorides ſaith, that beeing put into the noſthrils it ſtaieth bleeding, and is giuen in Wine to thoſe that are bitten with Vipers. B

It is reported to be eaten in Apulia roſted in the embers, firſt wrapped in leaues or in old clouts, with pepper and ſalt; which, as they ſay, is a pleaſant ſweet food, that ſtirreth vp luſt, as they report. C

The ſeed doth heate, and attenuate or make thinne: it is a remedy againſt cold fits of an Ague, by procuring ſweat, being mixed with oyle, and the body annointed therewith. D

A dram of the iuyce of *Ferula* which beareth *Sagapenum*, purgeth by ſiege tough and ſlimie humors, E mors, and all groſſe flegme and choler, and is alſo good againſt all old and cold diſeaſes which are hard to be cured; it purgeth the braine, and is very good againſt all diſeaſes of the head, againſt the Apoplexie and Epilepſie.

F Being taken in the ſame manner, it is good againſt crampes, palſies, ſhrinkings and paines of the ſinewes.

G It is good againſt the ſhortneſſe of breath, the cold and long cough, the paine in the ſide and breſt, for it mundifieth and cleanſeth the breſt from all cold flegme and rheumaticke humors.

H *Sagapenum* infuſed or ſteeped in vineger all night, and ſpread vpon leather or cloath, ſcattereth, diſſolueth, and driueth away all hard and cold ſwellings, tumors, botches, and hard lumps growing about the ioynts or elſewhere, and is excellent good to be put into or mingled with all oyntments or emplaiſters which are made to mollifie or ſoften.

I The iuyce of *Ferula Galbanifera*, called *Galbanum*, drunke in wine with a little myrrhe, is good againſt all venome or poyſon that hath beene taken inwardly, or ſhot into the body with venomous darts, quarrels, or arrowes.

K It helps womens painfull trauell, if they do take thereof in a cup of wine the quantitie of a bean.

L The perfume of *Galbanum* helpeth women that are grieued with the riſing of the mother, and is good for thoſe that haue the falling ſickeneſſe.

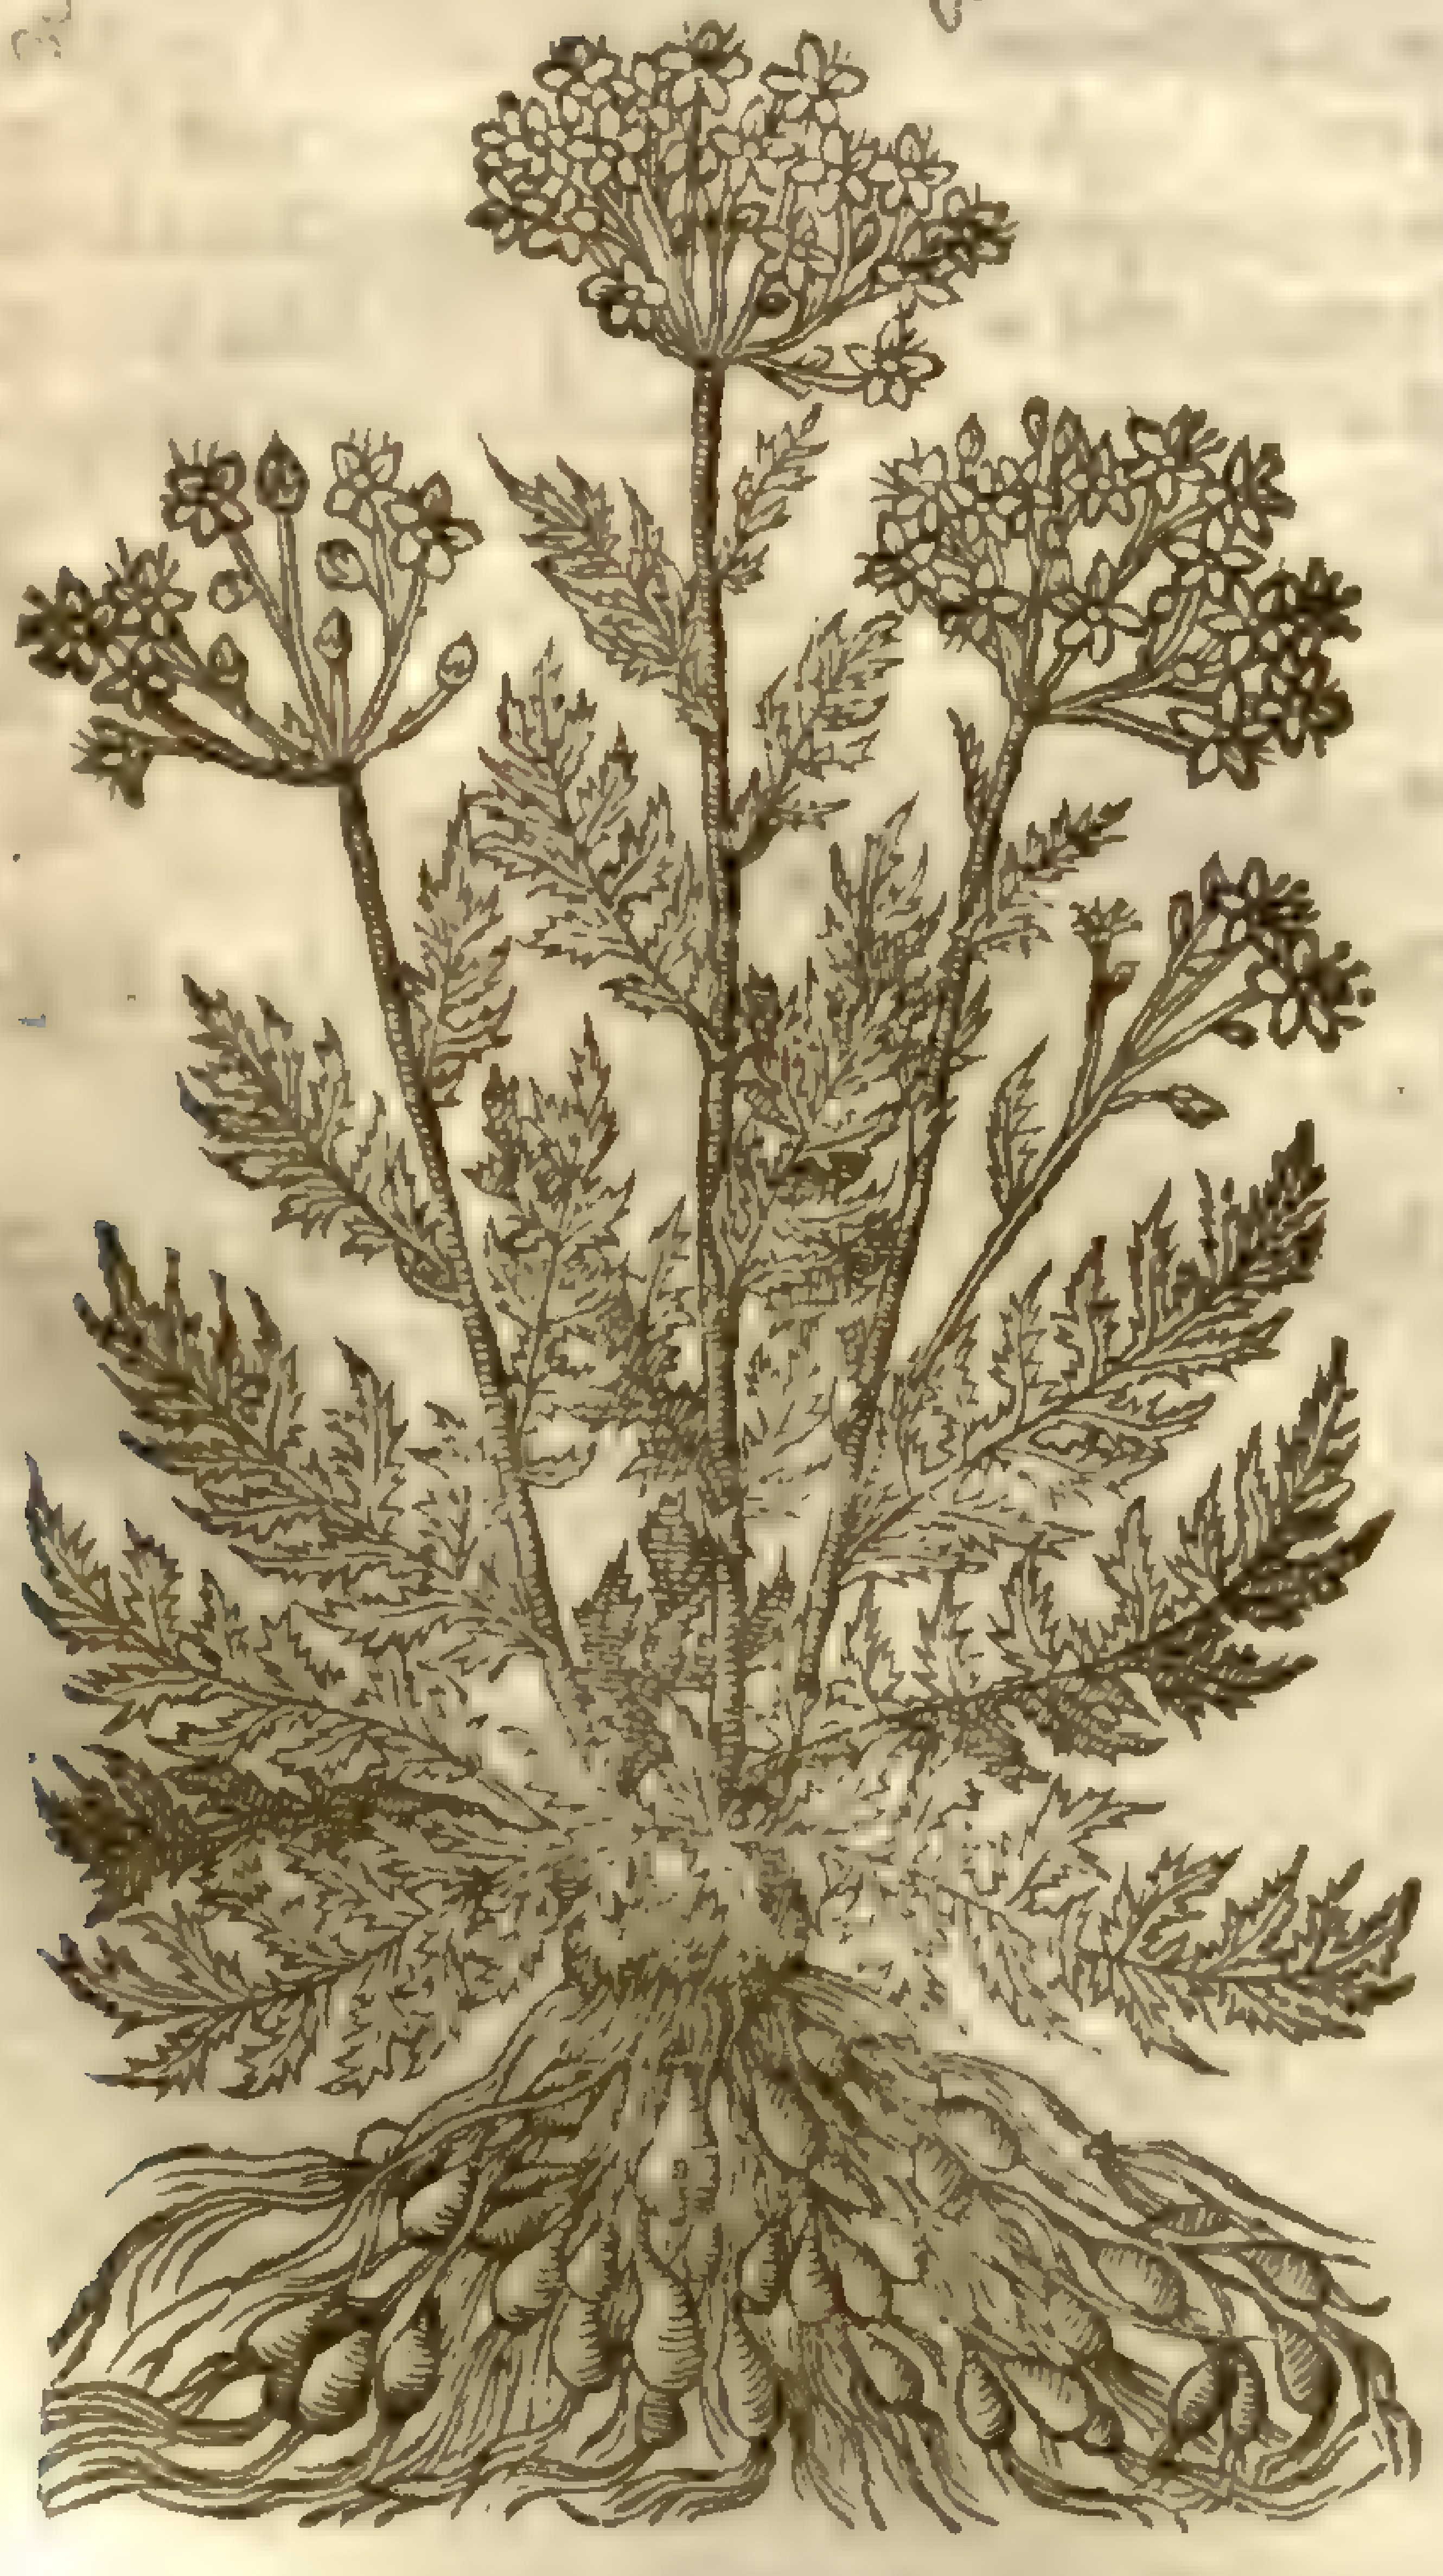
M *Galbanum* ſoftneth, mollifieth, and draweth forth thornes, ſplinters, or broken bones, and conſumeth cold and phlegmaticke humors, ſeruing in ſundry oyntments and emplaiſters for the vſe of Surgerie, and hath the ſame phyſicall vertues that are attributed vnto *Sagapenum*.

CHAP. 428. *Of Drop-wort, or Filipendula.*

1 *Filipendula.*
Drop-wort.

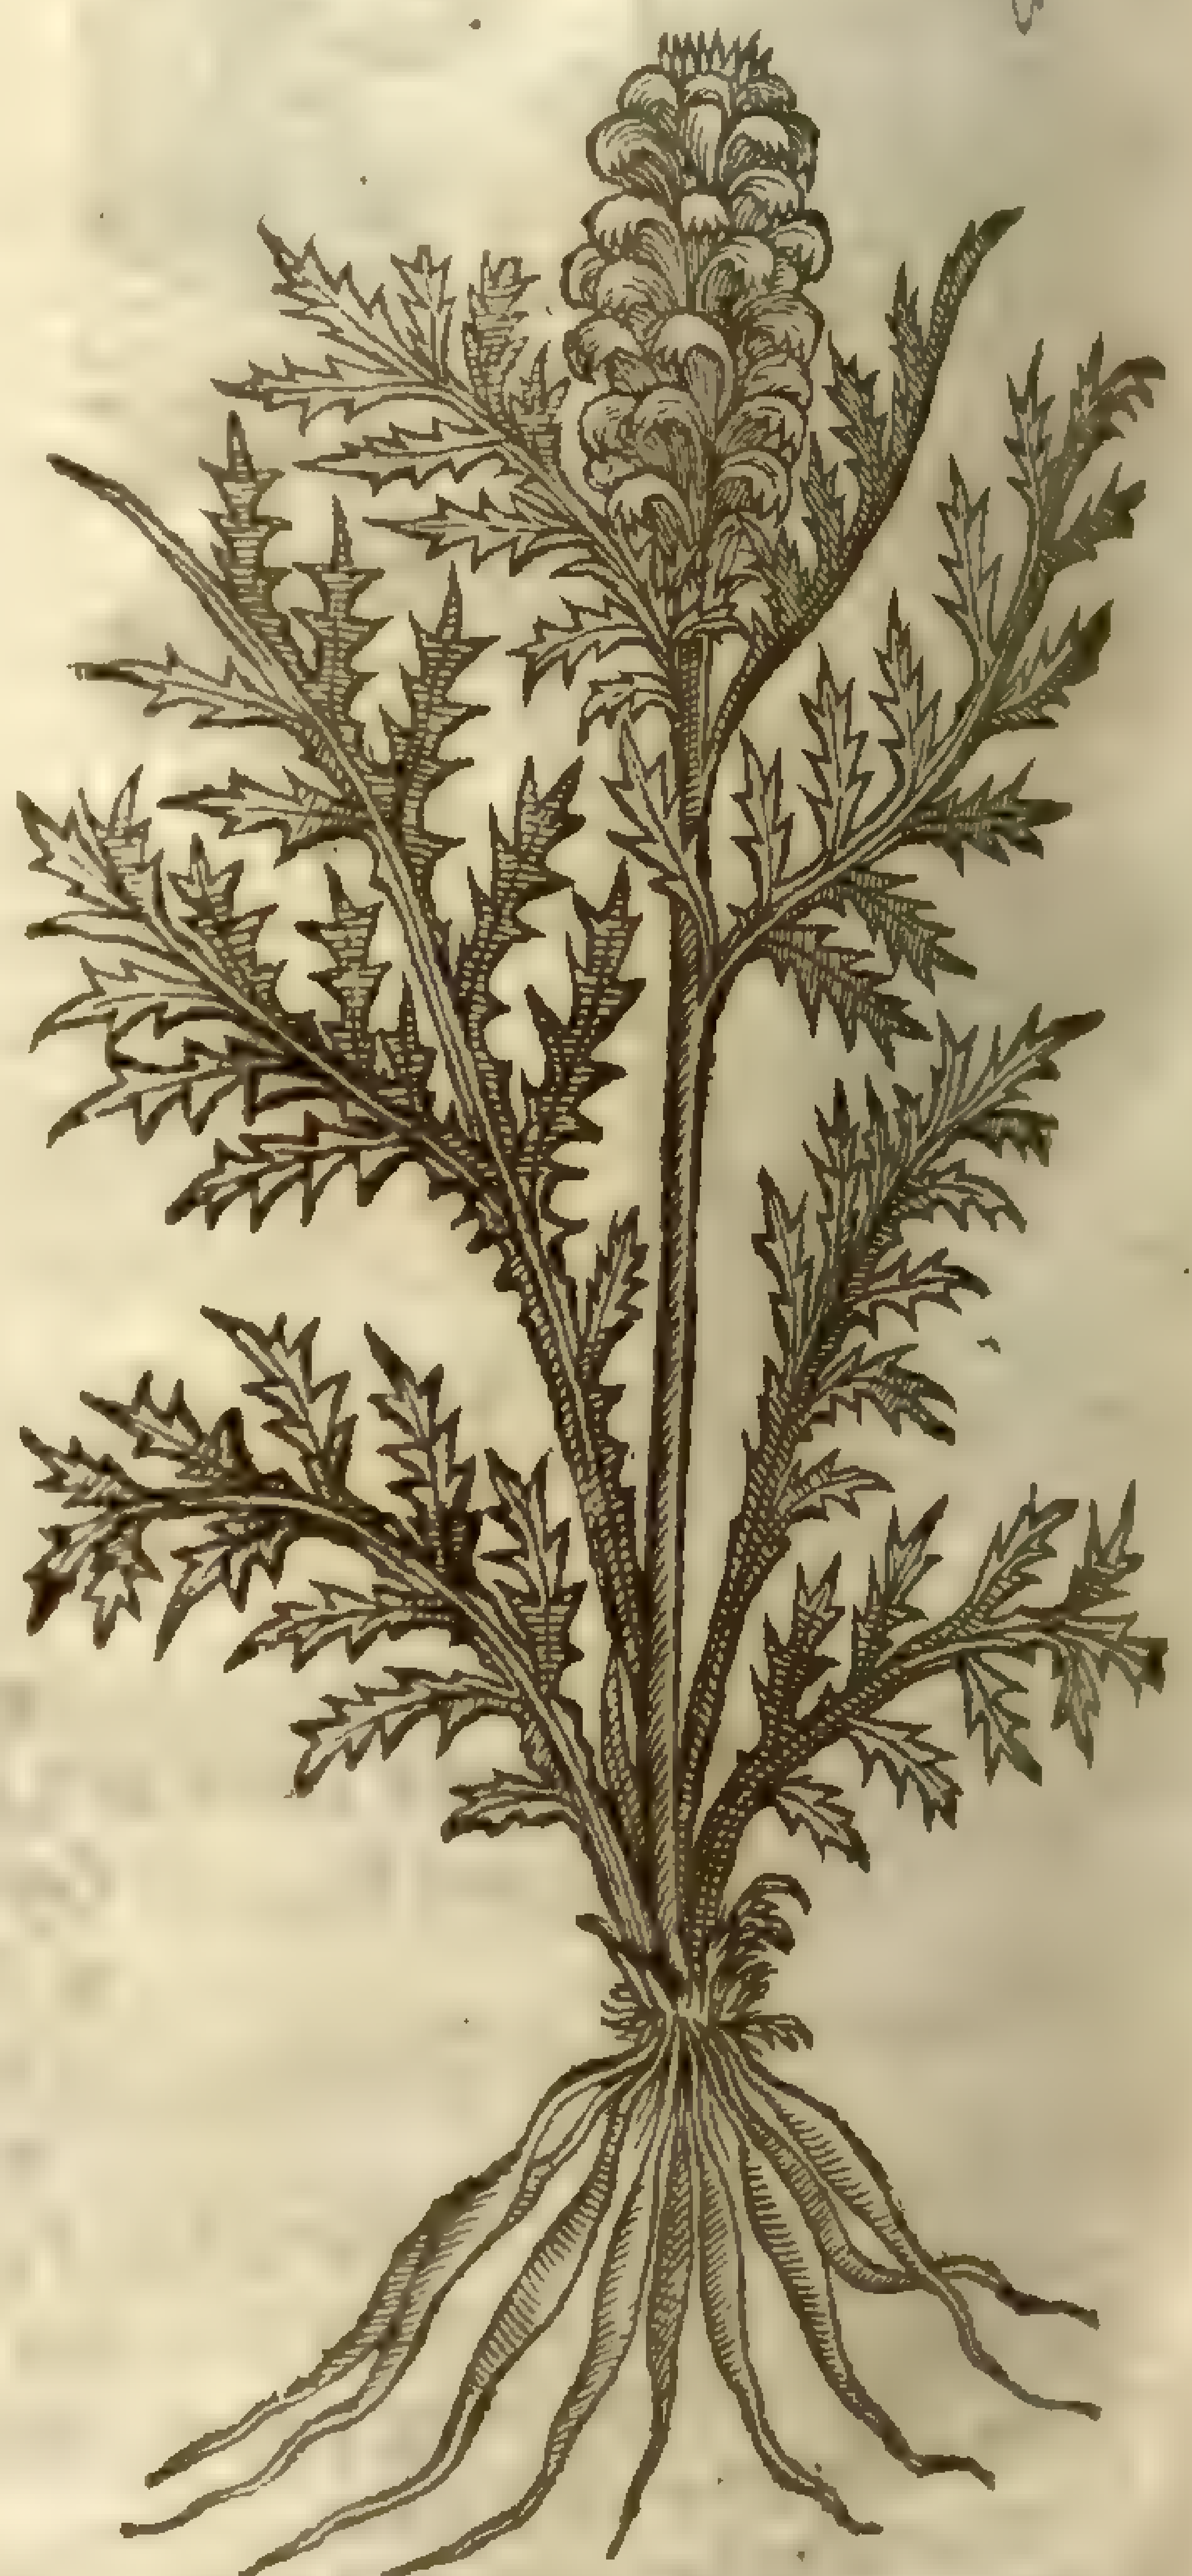
Spiraea filipendula L. [illegible]

Lob. ic. 729



2 *Filipendula montana.*
Mountaine Drop-wort.

Lob. ic. 22



¶ *The Kindes.*

THere be diuers ſorts of Drop-worts, ſome of the champion or fertill paſtures, ſome of more moiſt and dankiſh grounds, and ſome of the mountaine.

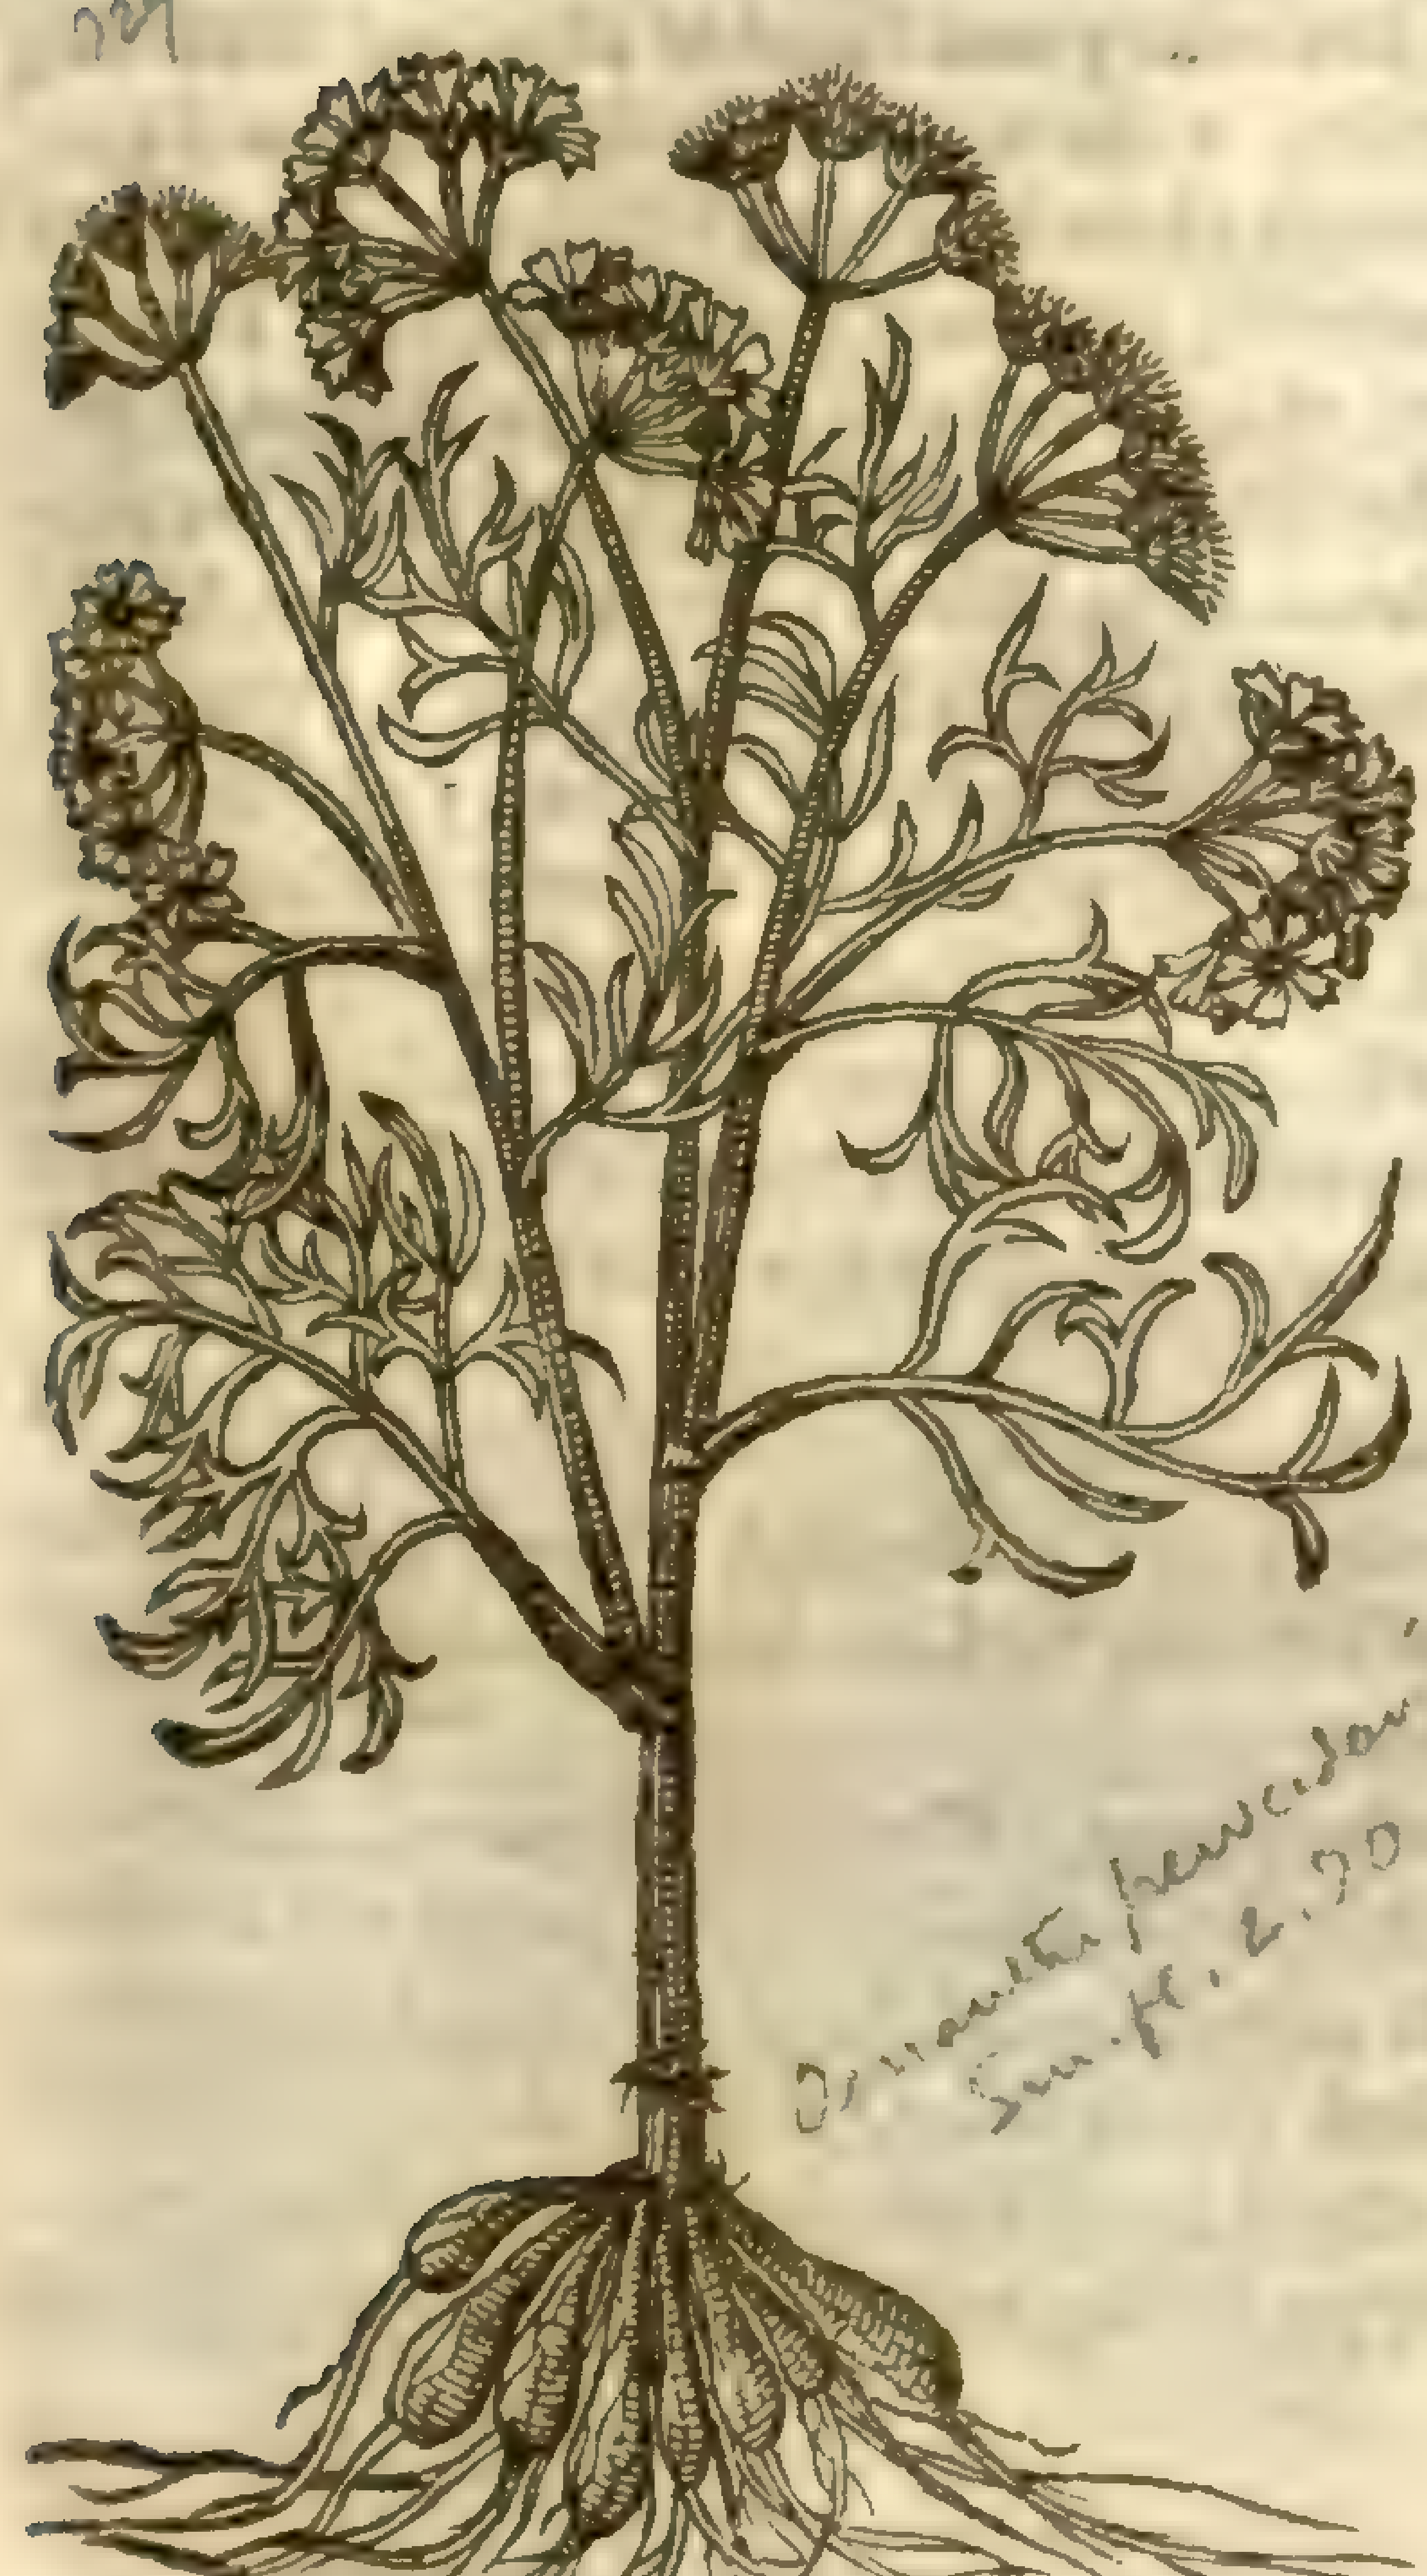
¶ *The Deſcription.*

1 The firſt kinde of Filipendula hath leaues growing and ſpred abroad like feathers, each leafe conſiſting of ſundry ſmall leaues dented or ſnipt round about the edges, growing to the ſtalke by a ſmall and ſlender ſtem: theſe leaues reſemble wilde Tanſie or Burnet, but that they be longer and thicker, ſet like feathers, as is aforeſaid: among theſe riſe vp ſtalkes a cubit and a halfe high, at the top whereof grow many faire white floures, each ſmall floure conſiſting of ſix ſlender leaues, like a little ſtar, buſhing together in a tuft like the floures of Medeſweet, of a ſoft ſweet ſmell: the ſeed is ſmall, and groweth together like a button: the roots are ſmall and blacke, whereupon depend many little knops or blacke pellets, much like the roots of the female Peonie, ſauing that they be a great deale ſmaller.

2 The ſecond kinde of Filipendula, called of *Pena* in his Obſeruations, *Oenanthe, ſive Philipendula altera montana*, is neither at this day very well knowne, neither did the old Writers heretofore once write or ſpeake of it: but *Pena* that painefull Herbariſt found it growing naturally in Narbone in France, neere vnto Veganium, on the top of the high hills called *Paradiſus Dei*, and neere vnto the mountaine Calcaris: this rare plant hath many knobby long roots, in ſhape like to *Aſphodelus luteus*, or rather like the roots of *Corruda*, or wilde Aſparagus; from which riſeth vp a ſtalke a foot high, and more, which is thicke, round, and chanelled, beſet full of leaues like thoſe of common Filipendula, but they be not ſo thicke ſet or winged, but more like vnto the leaues of a Thiſtle, conſiſting of ſundry ſmall leaues, in faſhion like to *Coronopus Ruellij*, that is, *Ruellius* his Buckes-horne: round about the tops of the ſtalke there groweth a very faire tuft of white floures, reſembling fine ſmall hoods, growing cloſe and thicke together like the floures of *Pedicularis*, that is, Red Rattle; called of *Carolus Cluſius*, *Alectorolophos*; whereof he maketh this plant a kinde, but in my judgement and opinion it is rather like *Cynoſorchis*, a kinde of Satyrion.

3 *Filipendula anguſtifolia.*
Narrow leaued Drop-wort.

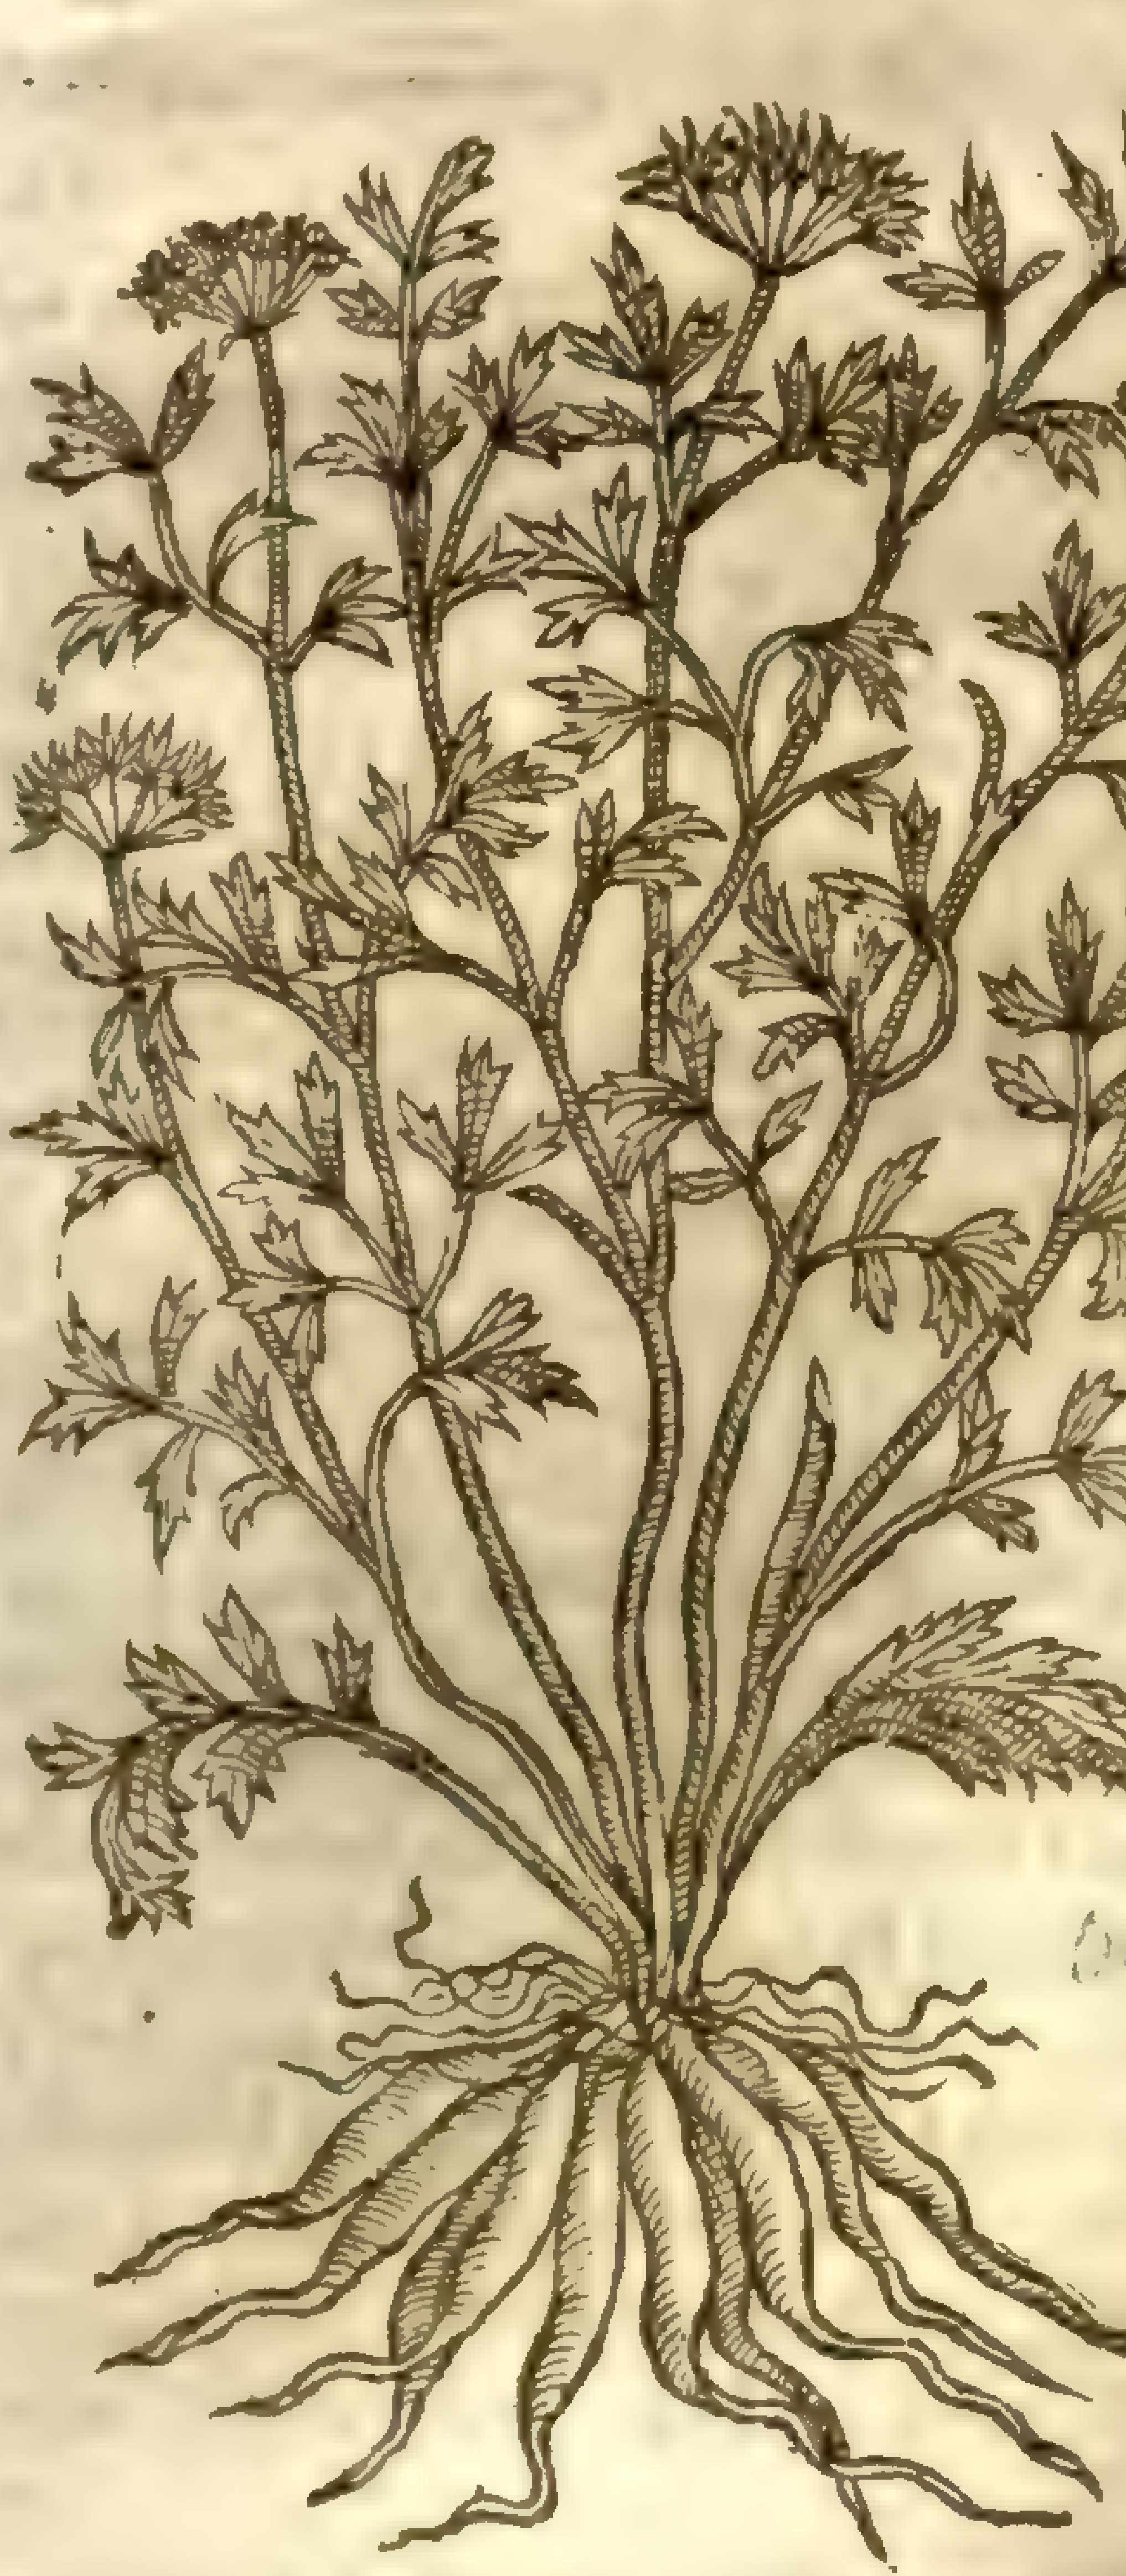
229



Oenanthe peucedanifolia. Willd.
Sm. fl. 2.90

† 4 *Filipendula Cicutæ facie.*
Hemlocke Drop-wort.

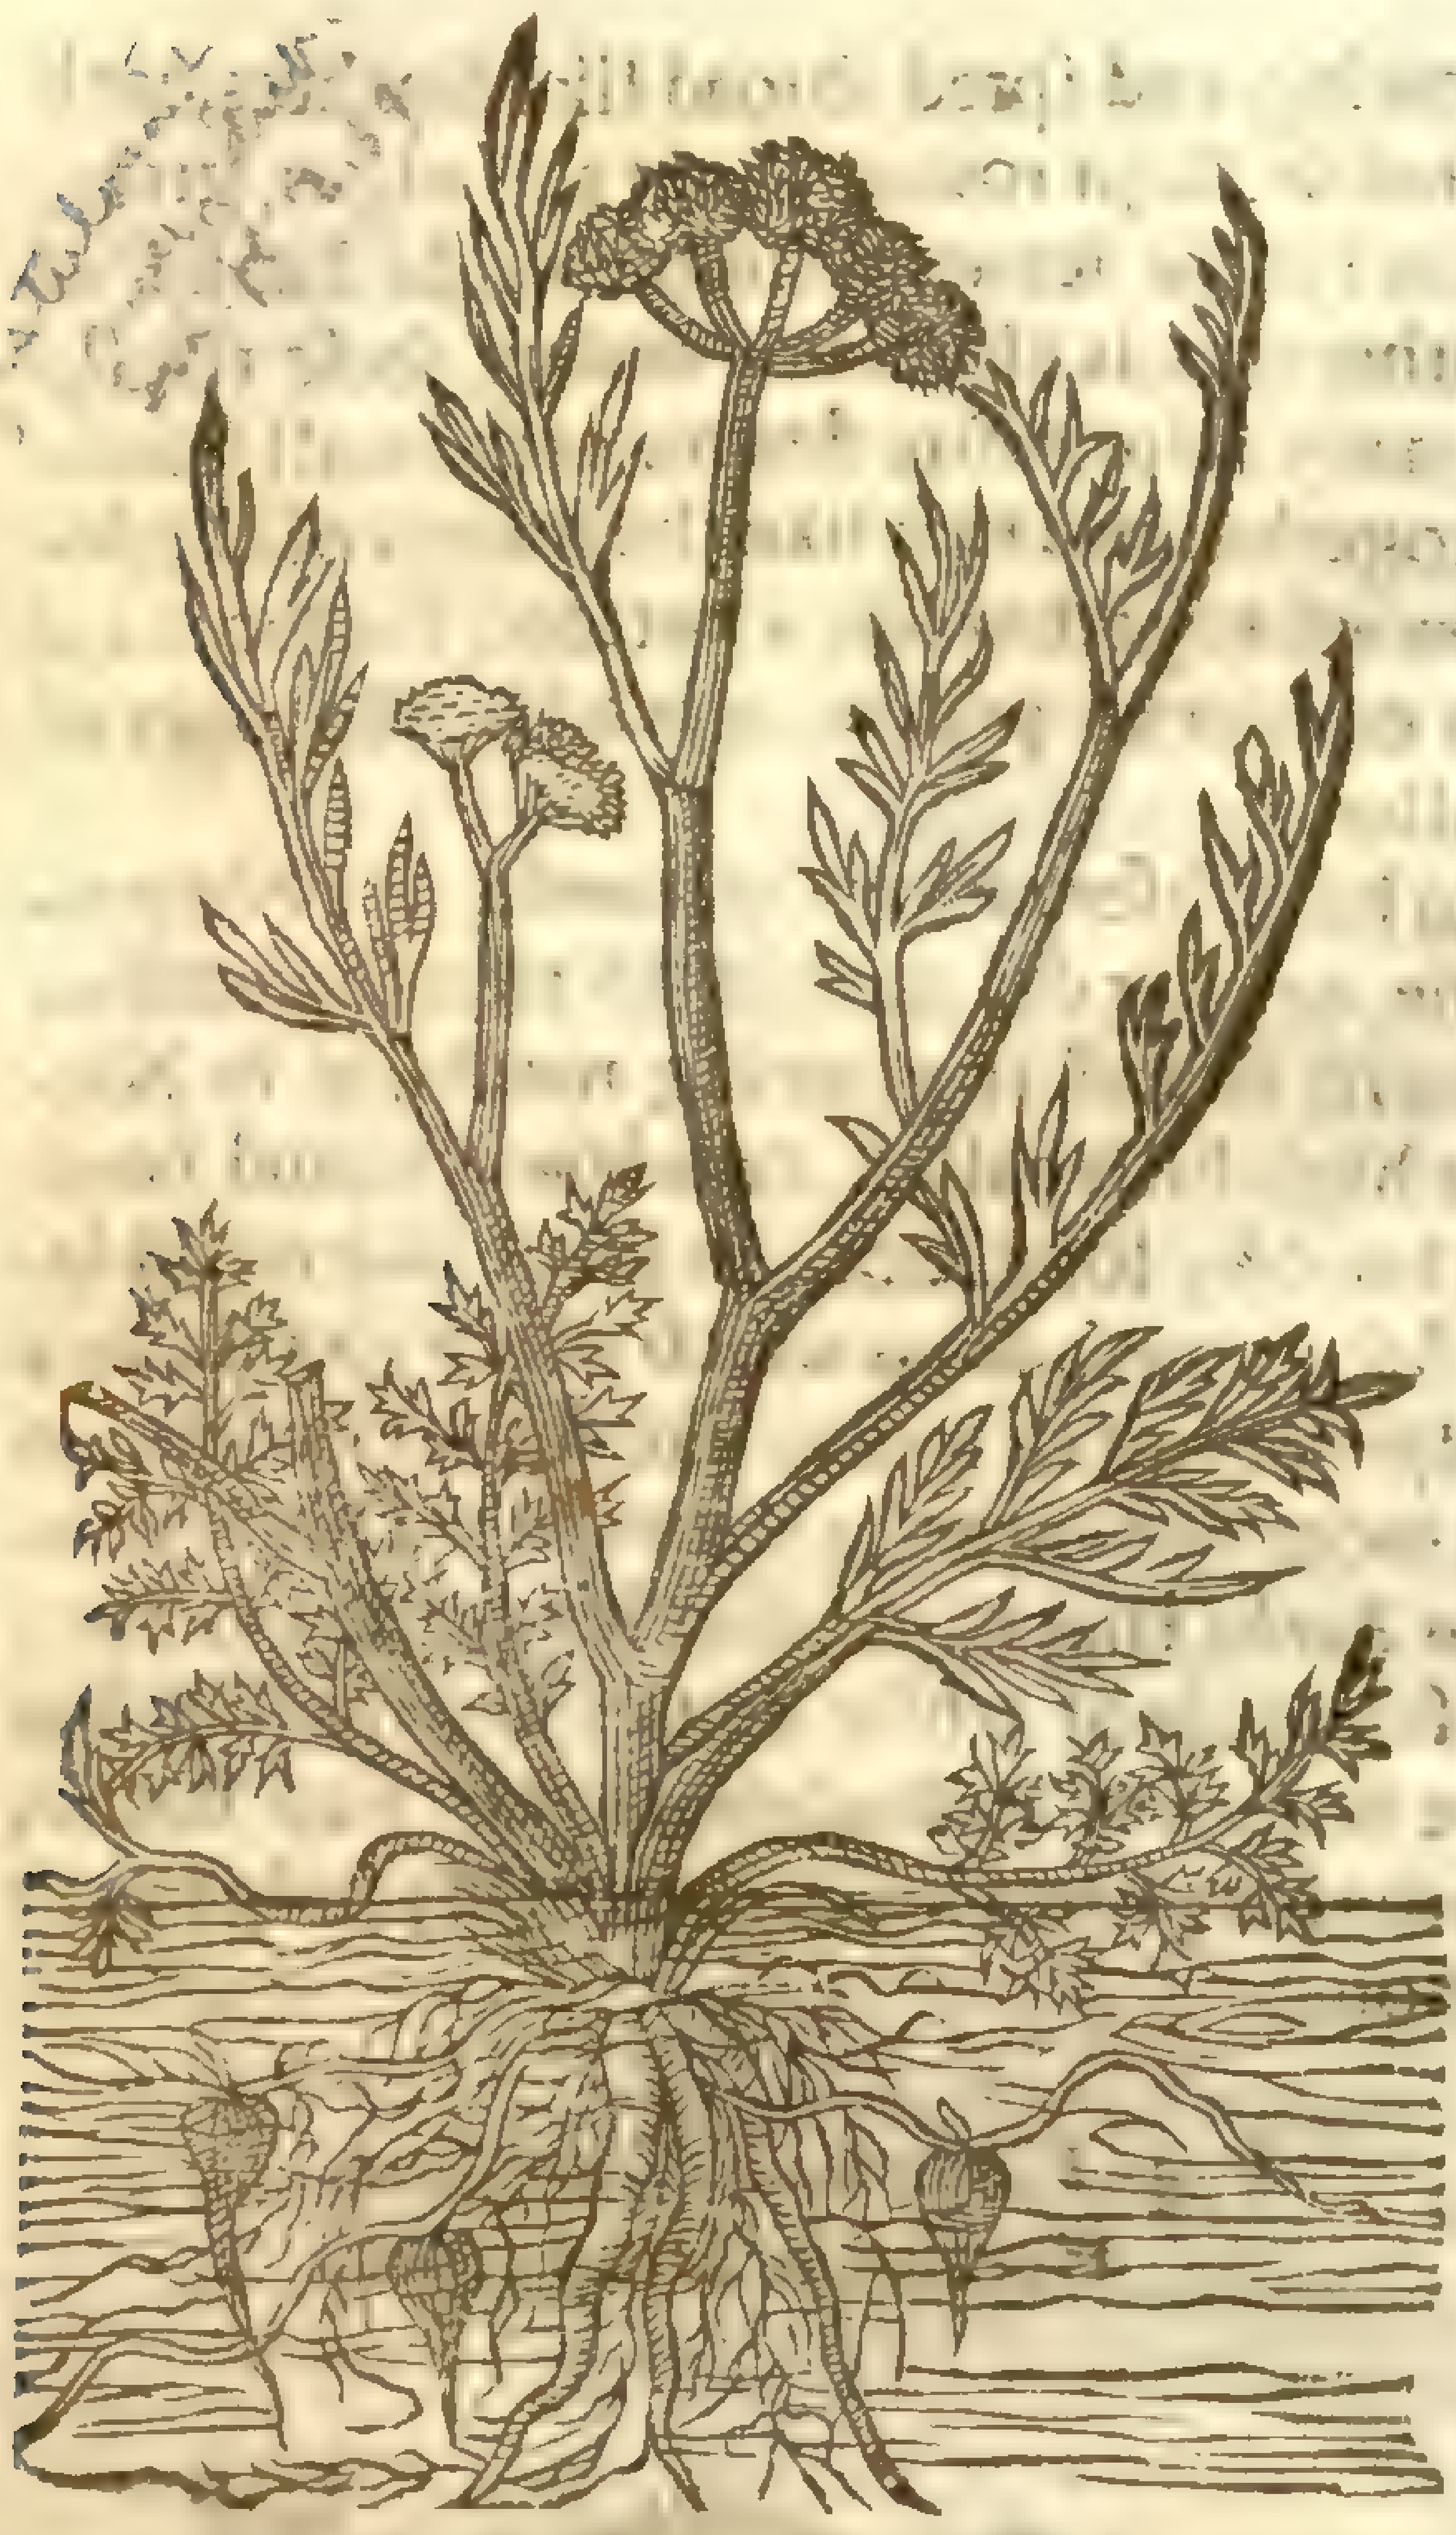
Lob. ic. 130



Oenanthe crocata!
Sm. fl. 2.91

3 There is another kinde of Filipendula ſet forth vnder the name of *Oenanthe*, that hath many tuberous and thicke roots like thoſe of Drop-wort, but white of colour, and euery one of thoſe knobs hath a certaine ſtring or fibre annexed thereto; from whence ariſeth a creſted ſtalke two foot high,

5 *Filipendula aquatica.*
Water Drop-wort.



high, diuiding it ſelfe toward the top into ſundry arms or branches: from the hollow place or boſome of euery joynt (out of which doe grow thoſe branches) the leaues doe alſo proceed, very much cut or jagged like Fennell: at the top of thoſe branches come forth ſpokie rundles of white floures faſhioned like ſtars.

‡ 4 The fourth kinde of Filipendula is as ſtrange a plant as the former, eſpecially with vs here in England, except in the watery places and rills in the North, where *Paludapium* or water Smallage groweth; wherevnto in leaues it is not vnlike, but more like *Ruta pratenſis*. it hath many large branches, a naughty ſauour, and in color & ſhape like *Cicuta*, that is, Hemlocke. The ſtalkes are more than two cubits high, comming from a root which exceedingly multiplies it ſelfe into bulbes, like *Aſphodelus albus*. The ſmell of this plant is ſtrong and grieuous; the taſte hot and biting, it being full of a juyce, at firſt milky, but afterward turning yellow. The ſpoky tufts or rundles growing at the top are like *Cicuta*, yea, it much reſembleth Hemlocke in property and qualities, and ſo do they affirme that haue proued and ſeene the experience of it: for being eaten in ſallads it did well nigh poyſon thoſe which ate of it, making them giddie in their heads, waxing very pale, ſtaggering and reeling like drunken men. Beware and take good heed of this and ſuch like Simples; for there is no Phyſitian that wil giue it, becauſe there be many other excellent good Simples which God hath beſtowed vpon vs from the preuenting and curing of diſeaſes. ‡ Pernitious and not excuſable is the ignorance of ſome of our time, that haue bought and (as one may probably conjecture) vſed the roots of this plant in ſtead of thoſe of Peionie; and I know they are dayly by the ignorant women in Cheape-ſide ſold to people more ignorant than themſelues, by the name of water Louage; *Caueat Emptor*. The danger that may enſue by vſing them may be gathered by that which our Author hath here ſet downe, being taken out of the *Aduerſaria, pag.* 326. ‡

5 The fifth and laſt kinde of Filipendula, which is the fourth according to *Matthiolus* his account, hath leaues like water Smallage, which *Pliny* calleth *Sylaus*, the leaues very much reſembling thoſe of *Lauer Crateua*: among which riſeth vp a ſmall ſtalke deepely furrowed or creſted, bearing at the top whereof ſpokie or buſhie rundles of white floures thicke thruſt together. The roots are compact of very many filaments or threds; among which come forth a few tuberous or knobbie roots like vnto the ſecond.

¶ *The Place and Time.*

The firſt groweth plentifully vpon ſtonie rockes or mountaines, and rough places, and in fertile paſtures. I found great plenty thereof growing in a field adjoyning to Sion houſe, ſomtime a Nunnerie, neere London, on the ſide of a medow called Sion Medow.

The ſecond hath beene ſufficiently ſpoken of in the deſcription. The third groweth neere vnto brookes and riuers ſides. The fourth groweth betweene the plowed lands in the moiſt and wet furrowes of a field belonging to Batterſey by London. ‡ It alſo groweth in great abundance in many places by the Thames ſide; as amongſt the oyſiers againſt Yorke houſe, a little aboue the Horſeferrey, againſt Lambeth, &c. ‡ The fifth groweth neere the ſides of riuers and water-ſtreames, eſpecially neere the riuer of Thames or Tems, as in S. Georges fields, and about the Biſhop of Londons houſe at Fulham, and ſuch like places.

They floure from May to the end of Iune.

¶ *The Names.*

They are commonly called *Filipendula*. The firſt is called of *Nicolaus Myrepſus*, *Philipendula*: of ſome, *Saxifraga rubra*, and *Millefolium ſylueſtre*: of *Pliny*, *Molon*: in Italian and Spaniſh, *Filipendula*: in Engliſh, Filipendula and Drop-wort. Water Filipendula is called *Filipendula aquatica*, *Oenanthe aquatica*, and *Silaus Plinij*.

The fourth, whoſe leaues are like to Homlocks, is as ſome thinke called of *Cordus*, *Olſenichium*: in Engliſh, Homlocke Filipendula.

¶ *The Nature.*

Theſe kinds of Filipendula are hot and dry in the third degree, opening and clenſing, yet with a little aſtriction or binding. All the kindes of Onanthes haue the ſame facultie, except the fourth, whoſe pernitiouſneſſe we haue formerly touched.

¶ *The Vertues.*

The root of common Filipendula boiled in wine and drunken, is good againſt all pains of the bladder, cauſeth one to make water, and breaketh the ſtone. The like *Dioſcorides* hath written of Oenanthe: the root, ſaith he, is good for them that piſſe by drops. A

The pouder of the roots of Filipendula often vſed in meat, will preſerue a man from the falling ſickneſſe. B

---

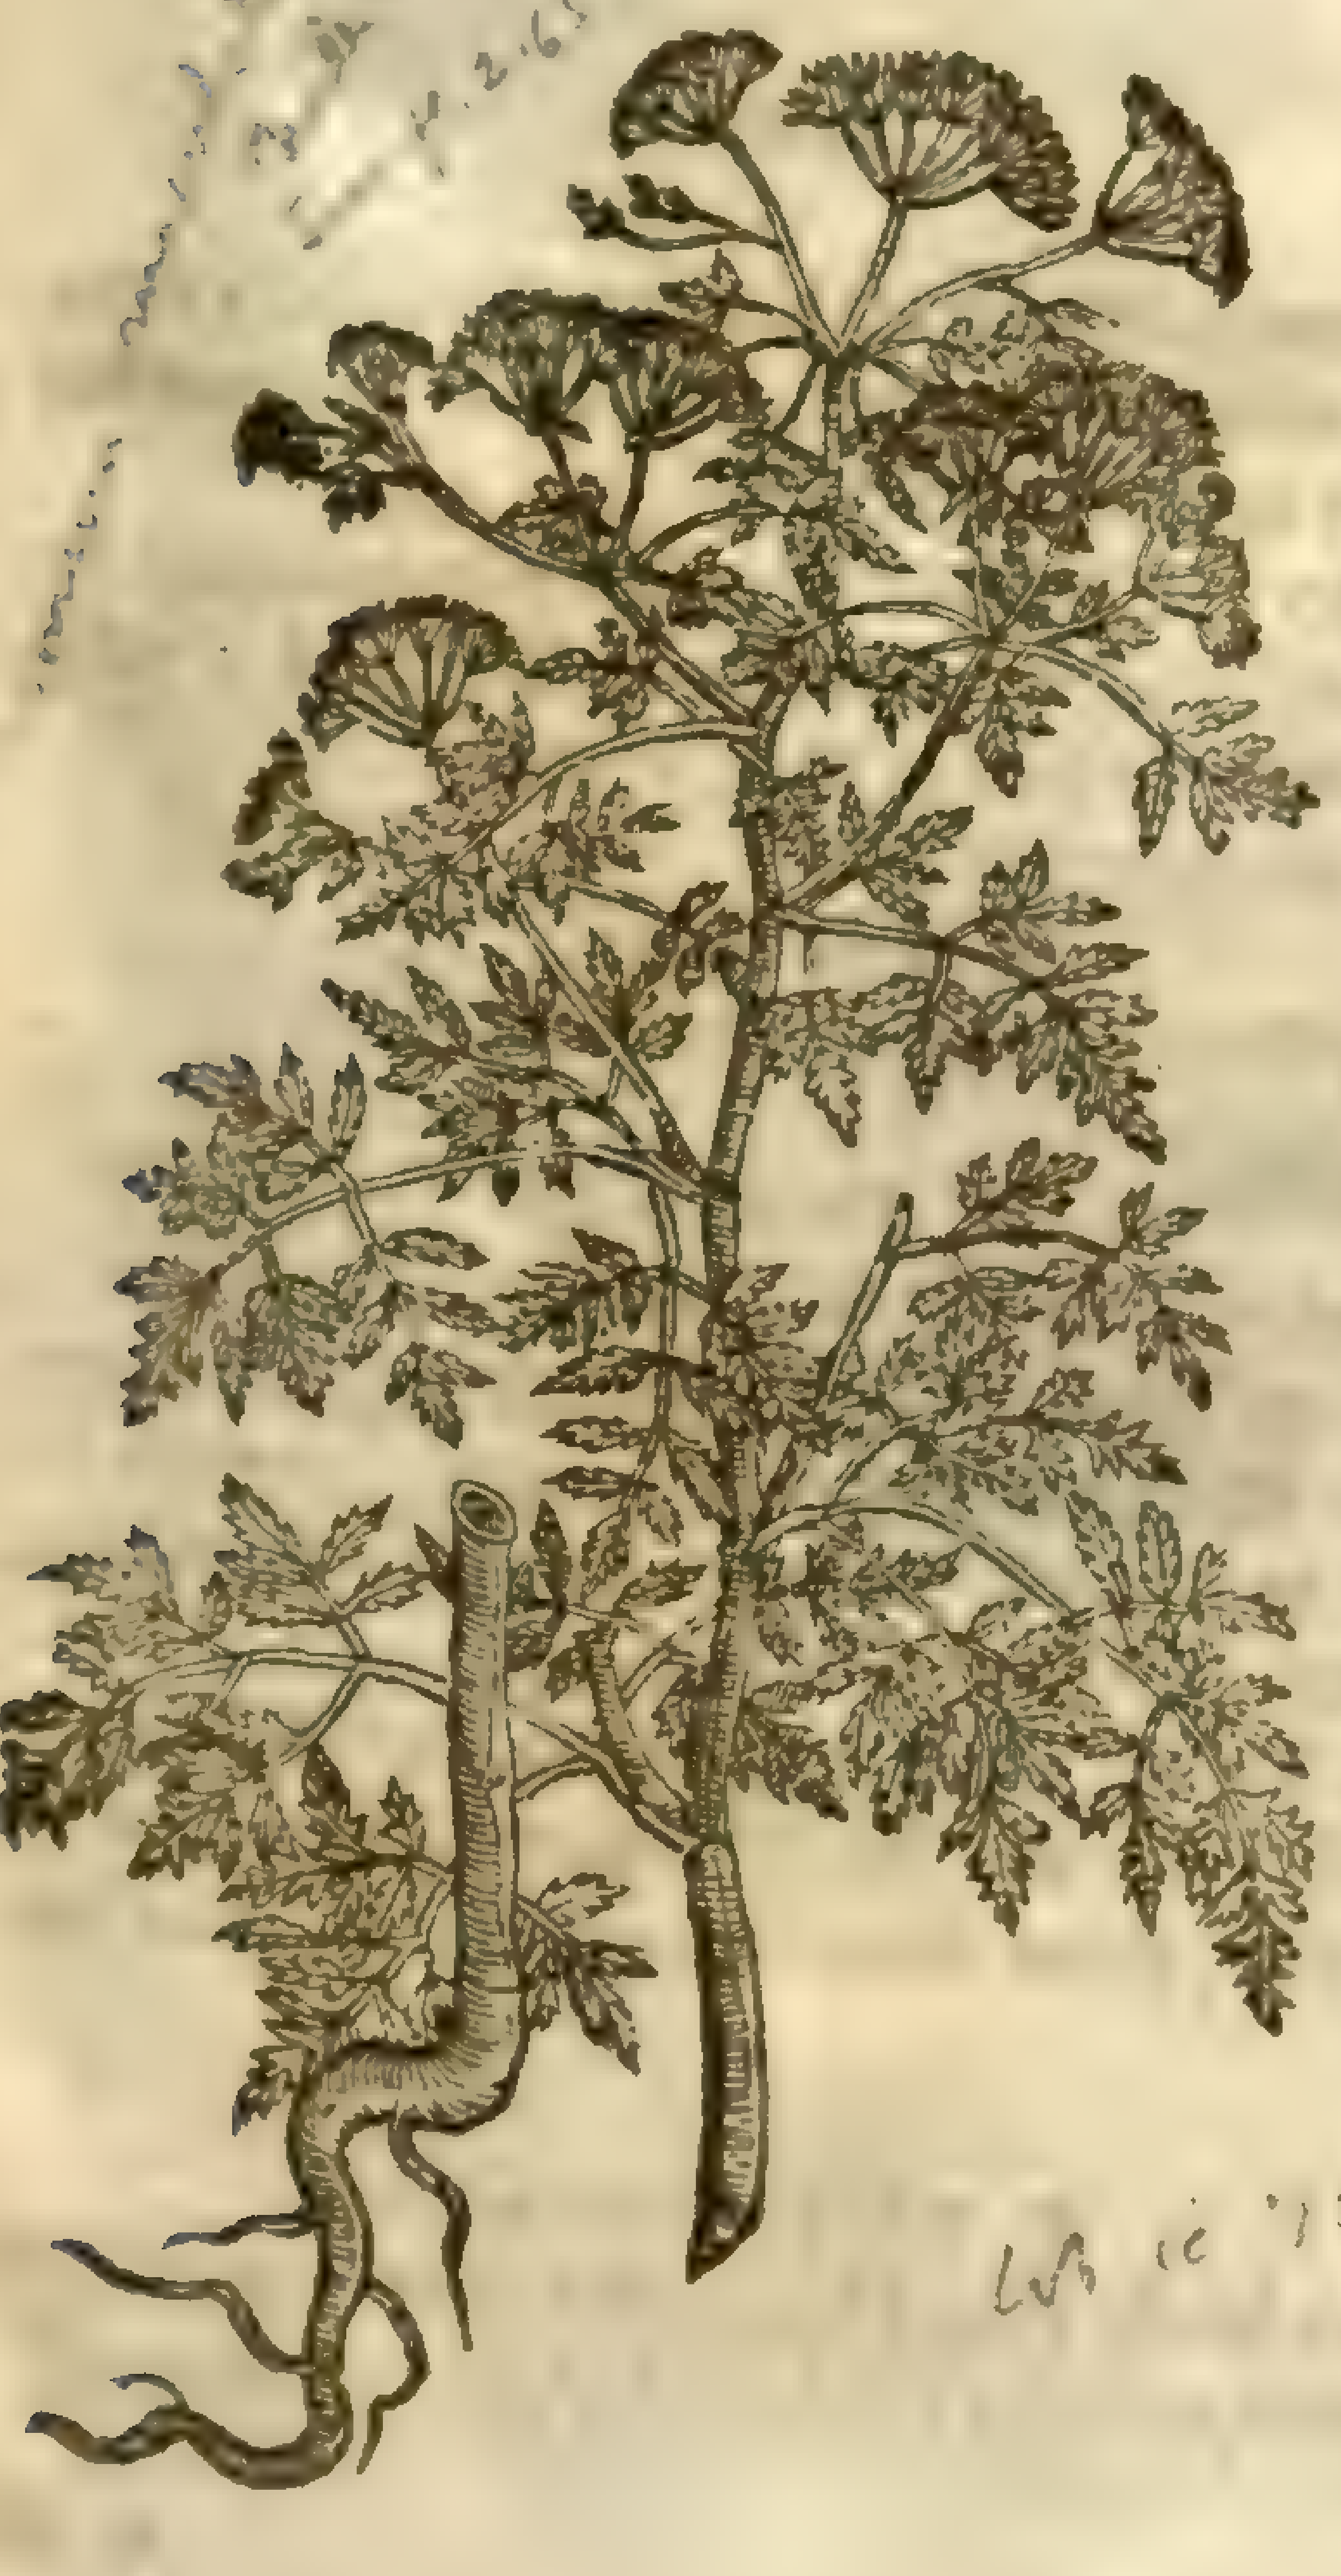
‡ The figures that were formerly in the fourth and fifth places were both of the plant deſcribed in the fifth place. I haue giuen you in the fourth place the figure which *Lobel* and others haue giuen for the plant there deſcribed; but it is not well expreſt, for the leaues are large like thoſe of Smallage, the ſtalke, branches, and vmbels very large, and like thoſe of Hemlocke, but rather bigger.

Chap. 429. *Of Homlocks or herb Bennet.*

¶ *The Deſcription.*

1 The firſt kind of Hemlocke hath a long ſtalke fiue or ſix foot high, great and hollow, ful of joints like the ſtalks of Fennell, of an herby colour, poudered with ſmall red ſpots almoſt like the ſtems of Dragons: the leaues are great, thick, and ſmal cut or jagged like the leaues of Chervill, but much greater, and of a very ſtrong vnpleaſant ſauor: the flours are white, growing by tufts or ſpoky tops, which do change and turne into a white flat ſeed: the root is ſhort and ſomwhat hollow within.

1 *Cicuta.*
Hemlocks.

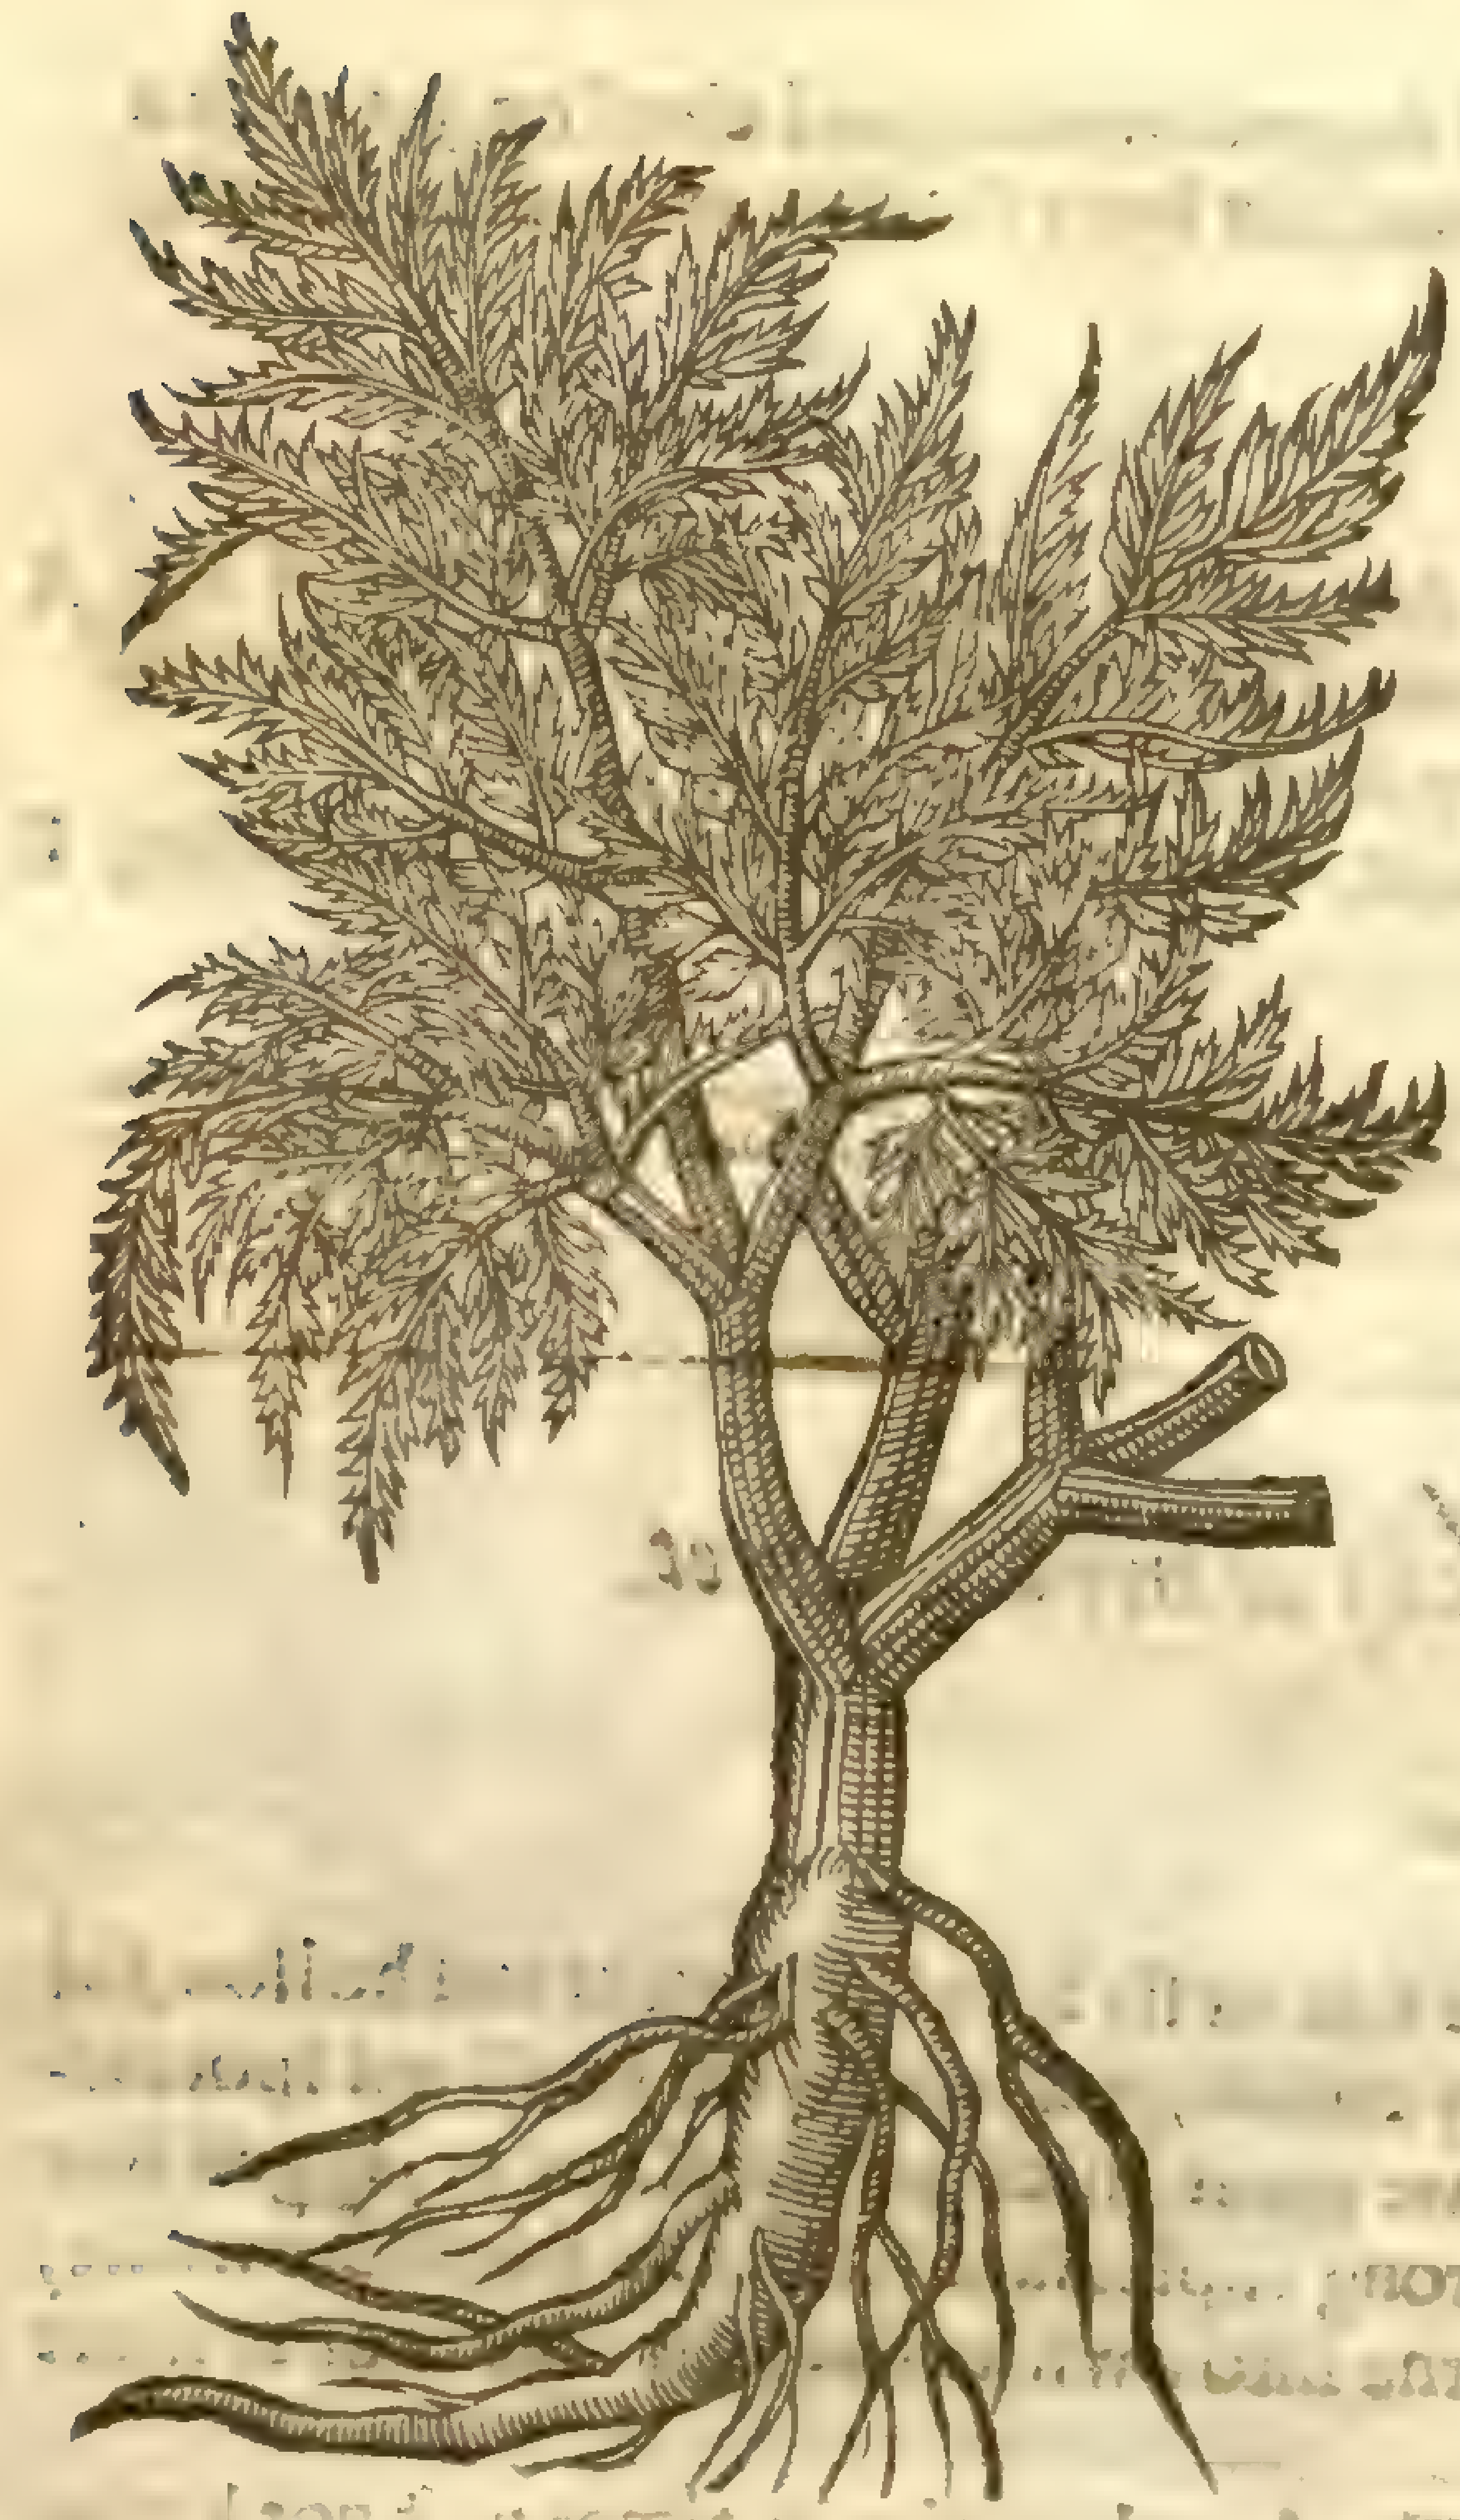


Lob ic 732

2 The Apothecaries in times paſt not knowing the right *Seſeli Peloponnenſe*, haue erroniouſly taken this *Cicuta latifolia* for the ſame: the leaues whereof are broad, thicke, and like vnto *Cicutaria*, but not the ſame. They called it *Seſeli Peloponnenſe cum folio Cicutæ*, the faculties whereof deny and refute that aſſertion and opinion; yea, and the plant it ſelfe, which beeing touched, yeeldeth or breatheth out a moſt virulent or loathſome ſmell. Theſe things ſufficiently argue, that it is not a kinde of *Seſeli*; beſides the reaſons following: *Seſeli* hath a reaſonable good ſauour in the whole plant: the root is bare and ſingle, without fibres, like a Carrot. But *Cicuta* hath not onely a loathſome ſmell, but his roots are great, thicke, and knobbie, like the roots of *Myrrhis*: The whole plant doth in a manner reſemble the leaues, ſtalks, and floures of *Myrrhis odorata*, whoſe ſmall white floures do turn into long and crooked ſeeds, growing at the top of the branches, three cubits high.

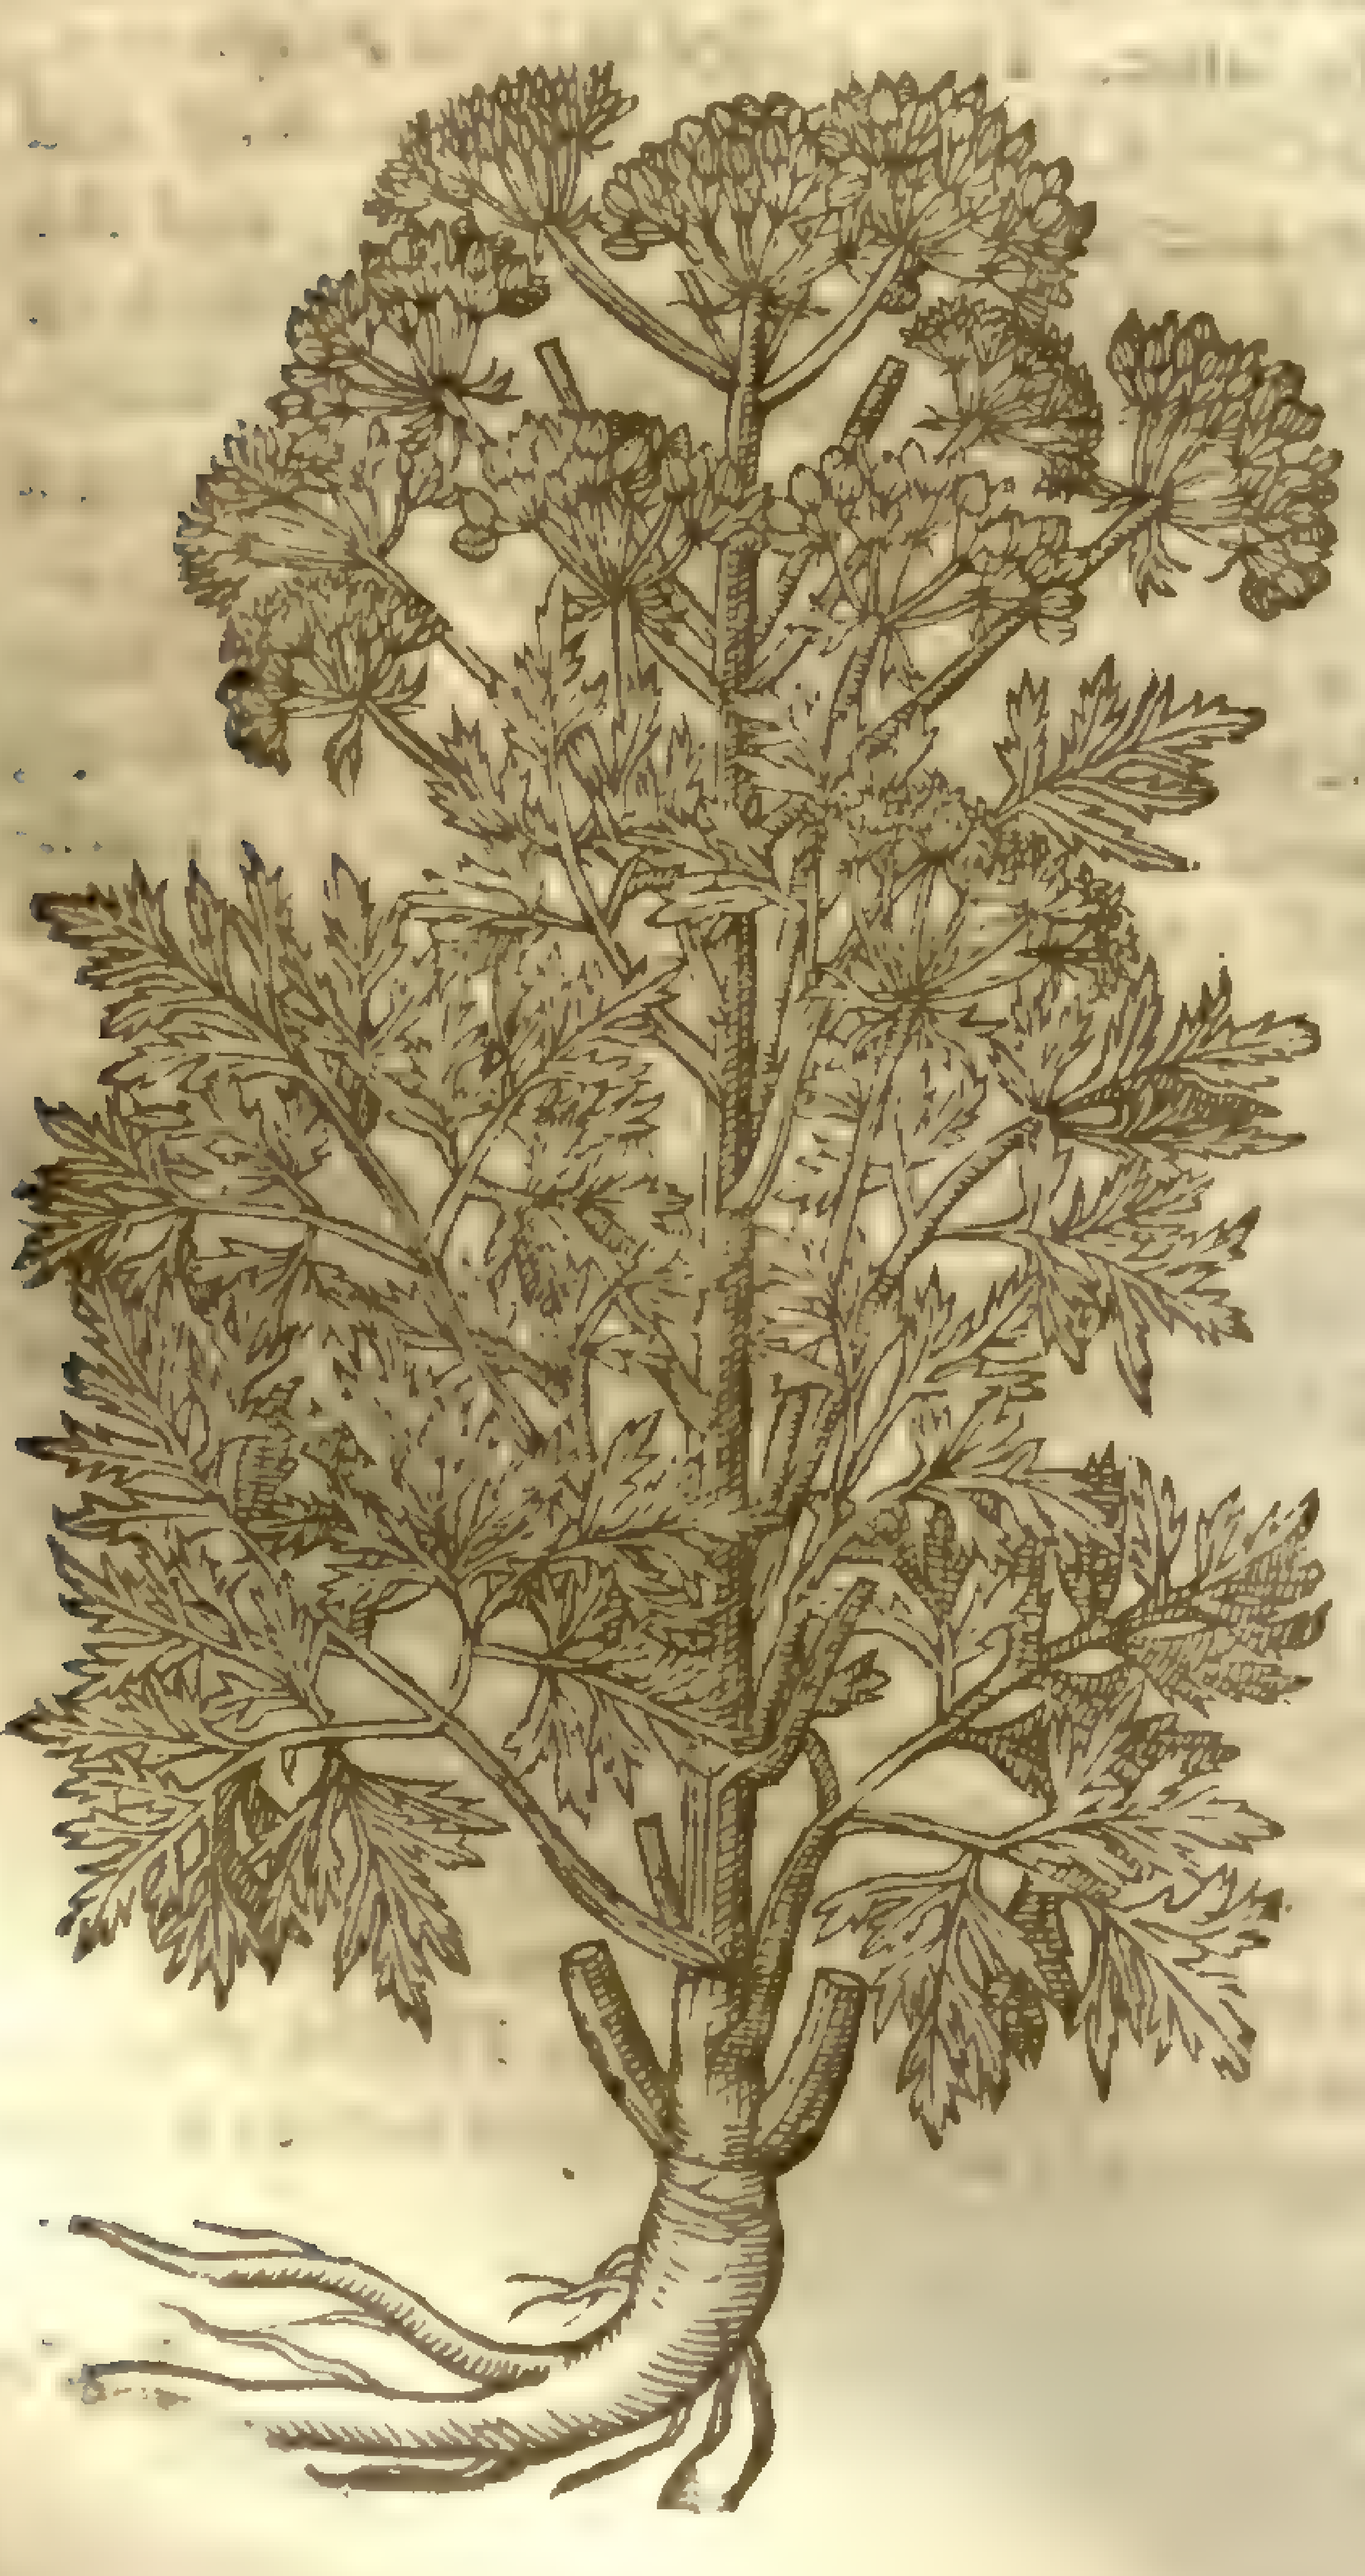
‡ 3 This in leaues, ſtalkes, and roots is larger than the laſt deſcribed, the ſtalkes equalling or exceeding the height of a man: the ſmel is ſtrange and grieuous, and in all the parts thereof it is like vnto the other plants of this kinde. *Lobel* figures it by the name of *Cicutaria maxima Brancionis*, and queſtioneth whether it be not the *Thapſia tertia Salamanticenſium* of *Cluſius*: but *Cluſius* denies it ſo to bee ‡

2. *Cicuta latifolia fœtidiſſima.*
Broad leafed ſtinking Hemlocke.



[illegible]

‡ 3. *Cicuta latifolia altera.*
Gyant Hemlocke.



¶ *The Place.*

Common Hemlock growes plentifully about towne walls and villages, in ſhadowie places and fat ſoiles neere ditches.

The ſecond groweth vpon mountains and deſart places, and is a ſtranger in England: yet I haue plants thereof in my garden.

¶ *The Time.*

They flouriſh and feed in September.

¶ *The Names.*

Hemlocke is called in Greeke κώνειον: in Latine, *Cicuta*: in high-Dutch, **Schirling**: in Low-Dutch, **Scheerlinck**: in Spaniſh, *Ceguta, Canaheia*: in French, *Cigue*: in Engliſh, Hemlocke, Homlock, Kexe, and herb Bennet.

The ſecond is called *Cicuta latifolia*, and *Cicutaria latifolia*, and *Seſeli Peloponnenſe quorundam*: In Engliſh, great Hemlockes, and garden Hemlocks.

¶ *The Temperature.*

Galen ſaith, that Hemlocke is extreme cold in operation, euen in the fourth degree of coldneſſe.

¶ *The Vertues.*

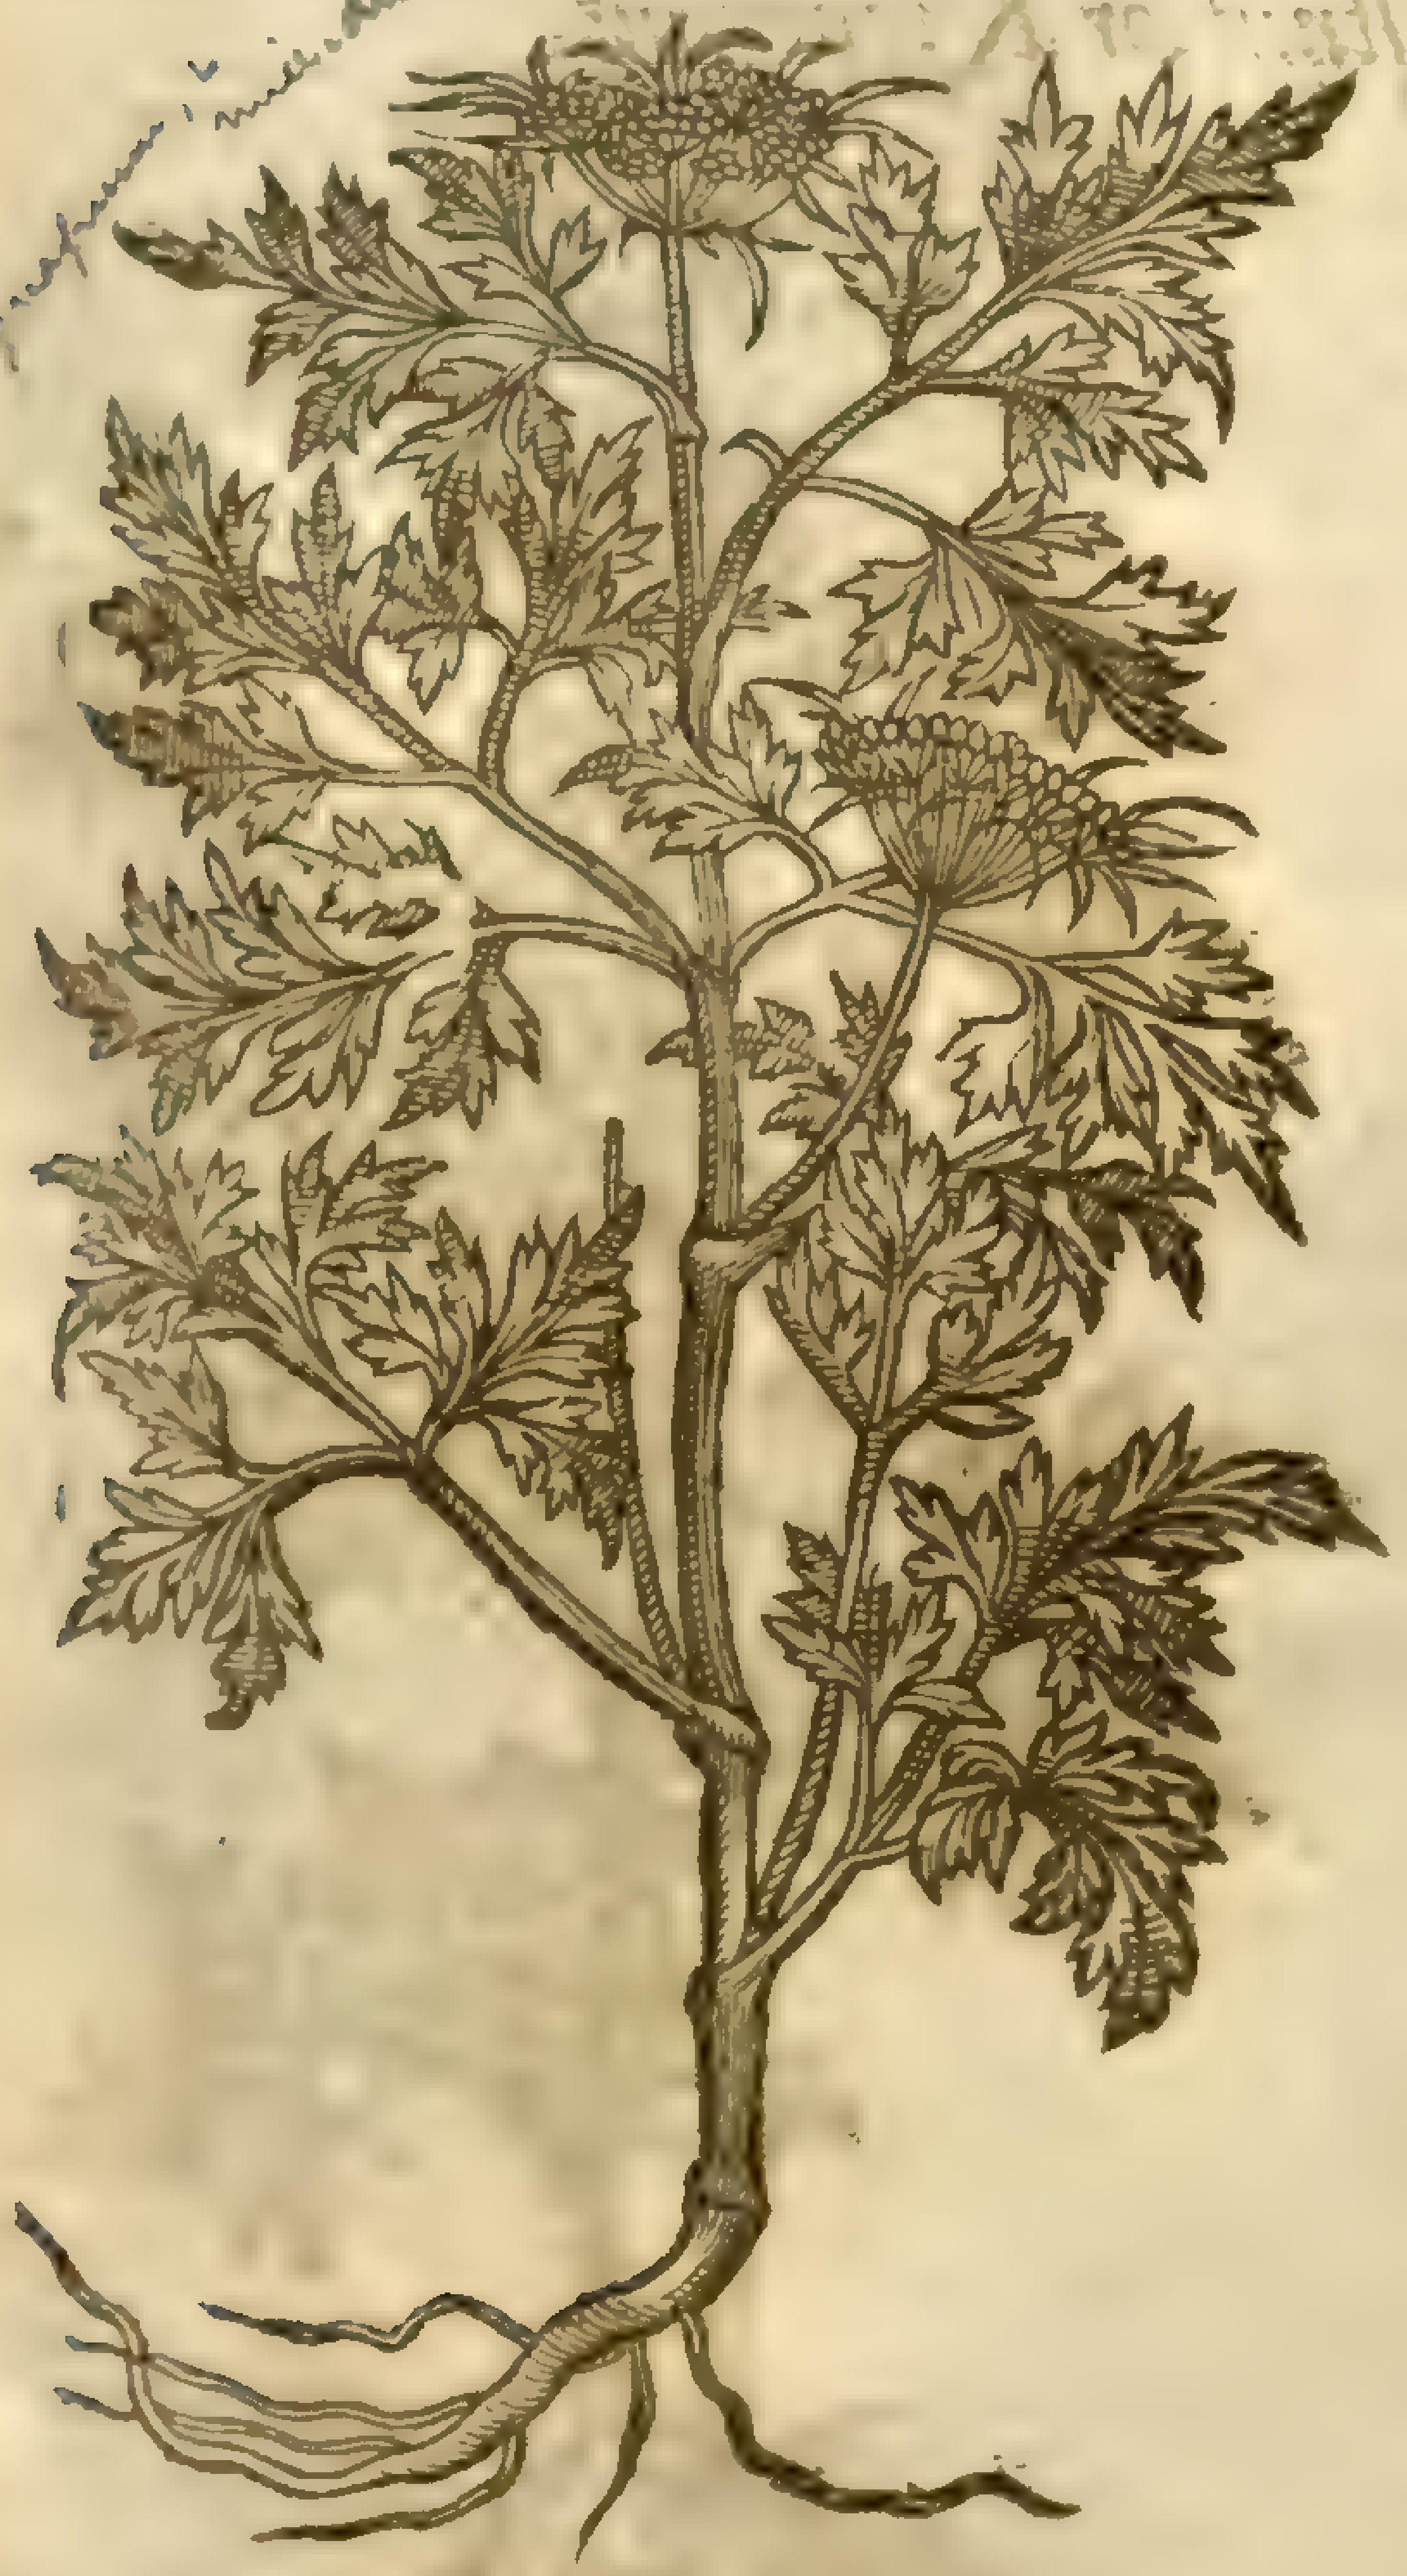
A It is therefore a very raſh part to lay the leaues of Hemlocke to the ſtones of yong boyes, or virgins breſts, by that means to keep thoſe parts from growing great; for it doth not only eaſily cauſe thoſe members to pine away, but alſo hurteth the heart and liuer, being outwardly applied, & muſt of neceſſitie hurt more being inwardly taken; for it is one of the deadly poiſons which killeth by his cold qualitie, as *Dioſcorides* writeth, ſaying, Hemlocke is a very euill, dangerous, hurtfull, and poyſonous herbe, inſomuch that whoſoeuer taketh of it into his body, dieth remedileſſe, except the party drinke ſome wine, that is naturally hot, before the venom hath taken the heart, as *Pliny* ſaith: but being drunke with wine, the poiſon is with greater ſpeed carried to the heart, by reaſon whereof it killeth preſently: therefore not to be applied outwardly, much leſſe taken inwardly into the body.

B The great Hemlocke doubtleſſe is not poſſeſſed with any good faculty, as appeares by his lothſome ſmell and other apparant ſignes, and therefore not to be vſed in phyſicke.

CHAP. 430. *Of wilde and water Hemlocks.*

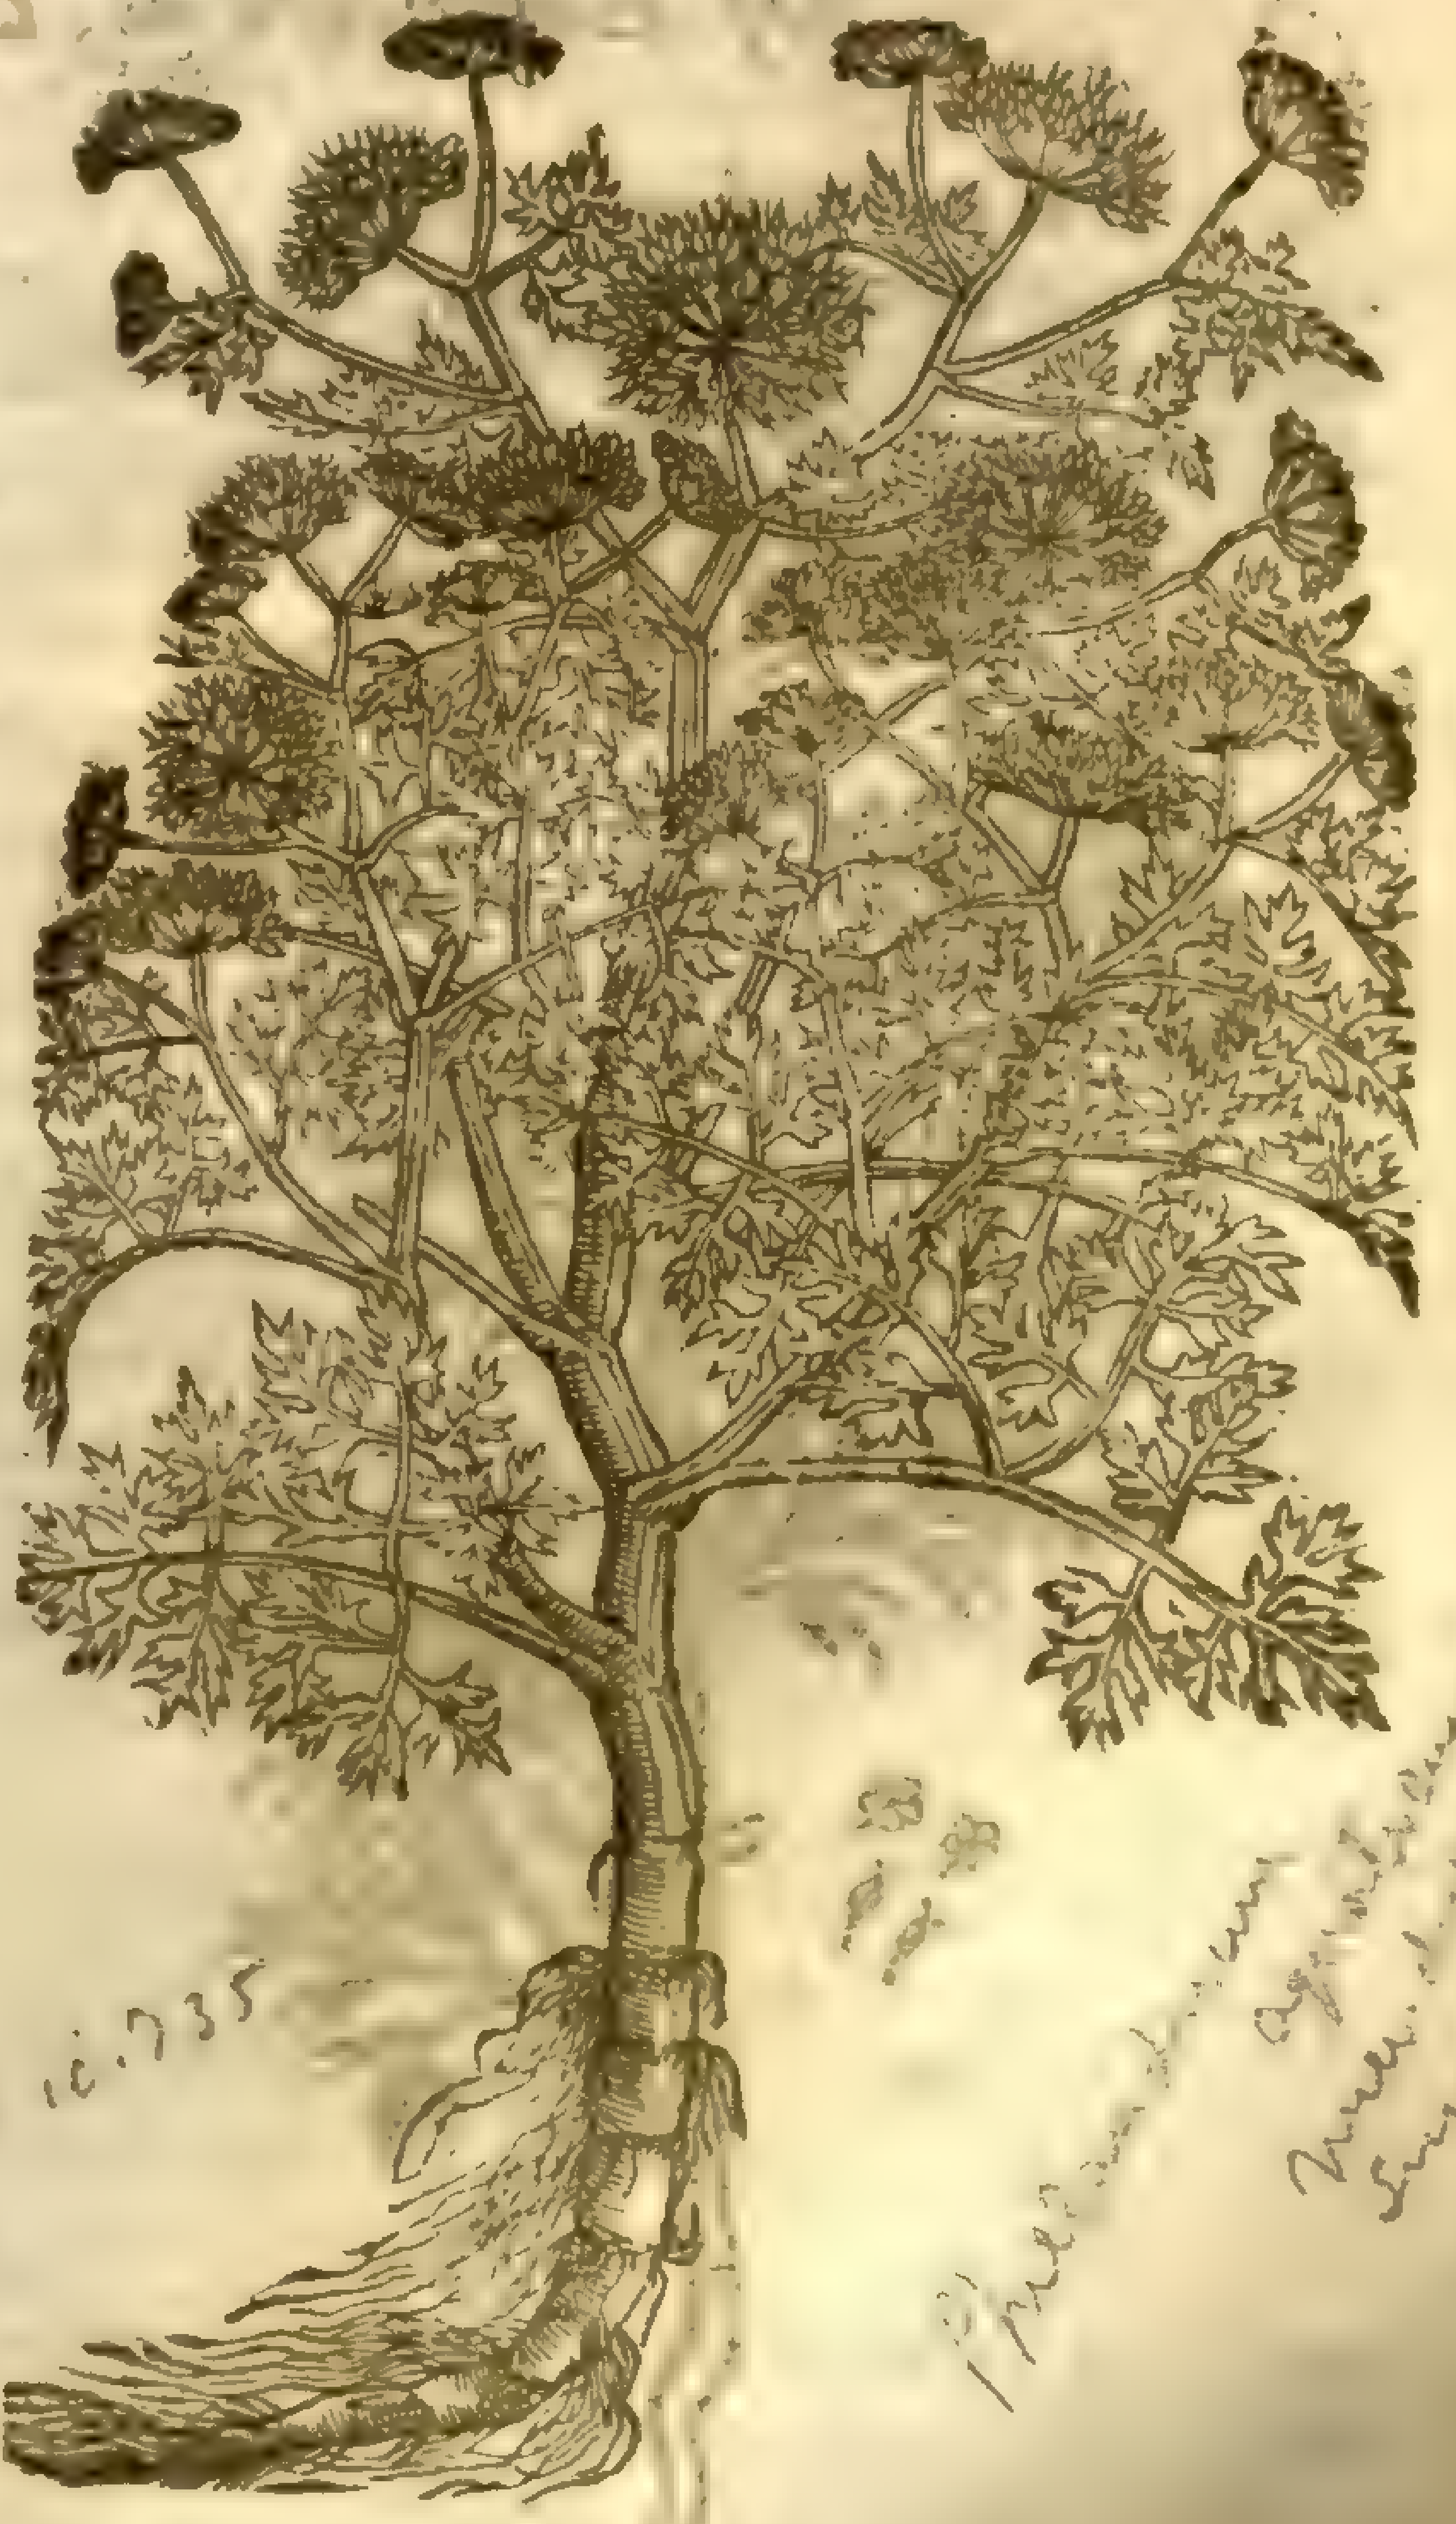
¶ *The Deſcription.*

† 1 THis wilde kinde of Hemlocke hath a ſmall tough white root, from which ariſe vp diuers ſtiffe ſtalks, hollow, ſomwhat reddiſh toward the Sunne, jointed or kneed at certain diſtances: from which joints ſpring forth long leaues very green, and finely minced or jagged like the common Cheruil or Parſly: the floures ſtand at the tops of the ſtalks in ſmall ſpoky vmbels, with little longiſh greene leaues about them: the ſeed followes like thoſe of Hemlocke, or as they grow together on the tops of the ſtalkes they reſemble Coriander ſeeds, but leſſer: the whole plant is of a naughty ſmell.



† 1 *Cicutaria tenuifolia.*
Then leafed wilde Hemlocke.

[illegible]



2 *Cicutaria paluſtris.*
Wilde water Hemlocke.

Lob ic. 735

Phellandrium aquaticum [illegible]

2 Water Hemlock, which *Lobel* calleth *Cicutaria paluſtris*; *Cluſius* and *Dodonæus*, *Phellandrium*, riſeth vp with a thicke fat and empty hollow ſtalke, full of knees or joints, creſted, chamfered, or

furrowed, of a yellowiſh green colour: the leaues ſhoot forth of the joints and branches, like wilde Hemlocke, but much thicker, fatter, and oilous, very finely cut or jagged almoſt like thoſe of the ſmalleſt *Viſnaga* or Spaniſh Tooth-picks: the floures ſtand at the top of the ſtalkes in ſmall white tufts: the ſeed followes, blackiſh, of the bigneſſe of Aniſe ſeed, & of a ſweet ſauor: the root is thick and long, within the water, very ſoft and tender, with very many ſtrings faſtned thereto.

¶ *The Place.*

1 This groweth amongſt ſtones and rubbiſh by the walls of cities and townes almoſt euerie where.

The other groweth in the middeſt of water ditches and ſtanding pooles and ponds, in moſt places of England: it groweth very plentifully in the ditches by a cauſey as you go from Redriffe to Detford neere London, and in many other places.

¶ *The Time.*

They floure and flouriſh in Iuly and Auguſt.

¶ *The Names.*

‡ 1 This is *Petroſelini vitium* of *Tragus*; and *Dauci inutilis genus* of *Geſner*: *Thalius* calls it *Apium cicutarium*: *Lobel*, *Cicutaria fatua*: *Tabern*. *Petroſelinum Caninum*; which we may fitly Engliſh, Dogs Parſly.

2 This is *Liguſticum ſyl.* & *Fœminicum ſyl.* of *Tragus*: *Cicutaria paluſtris* of *Lobel* and others. *Dodonæus* thinks it *Plinies Phellandrion*; and *Caſalpinus* iudges it his *Silaus*. ‡

¶ *The Nature and Vertues.*

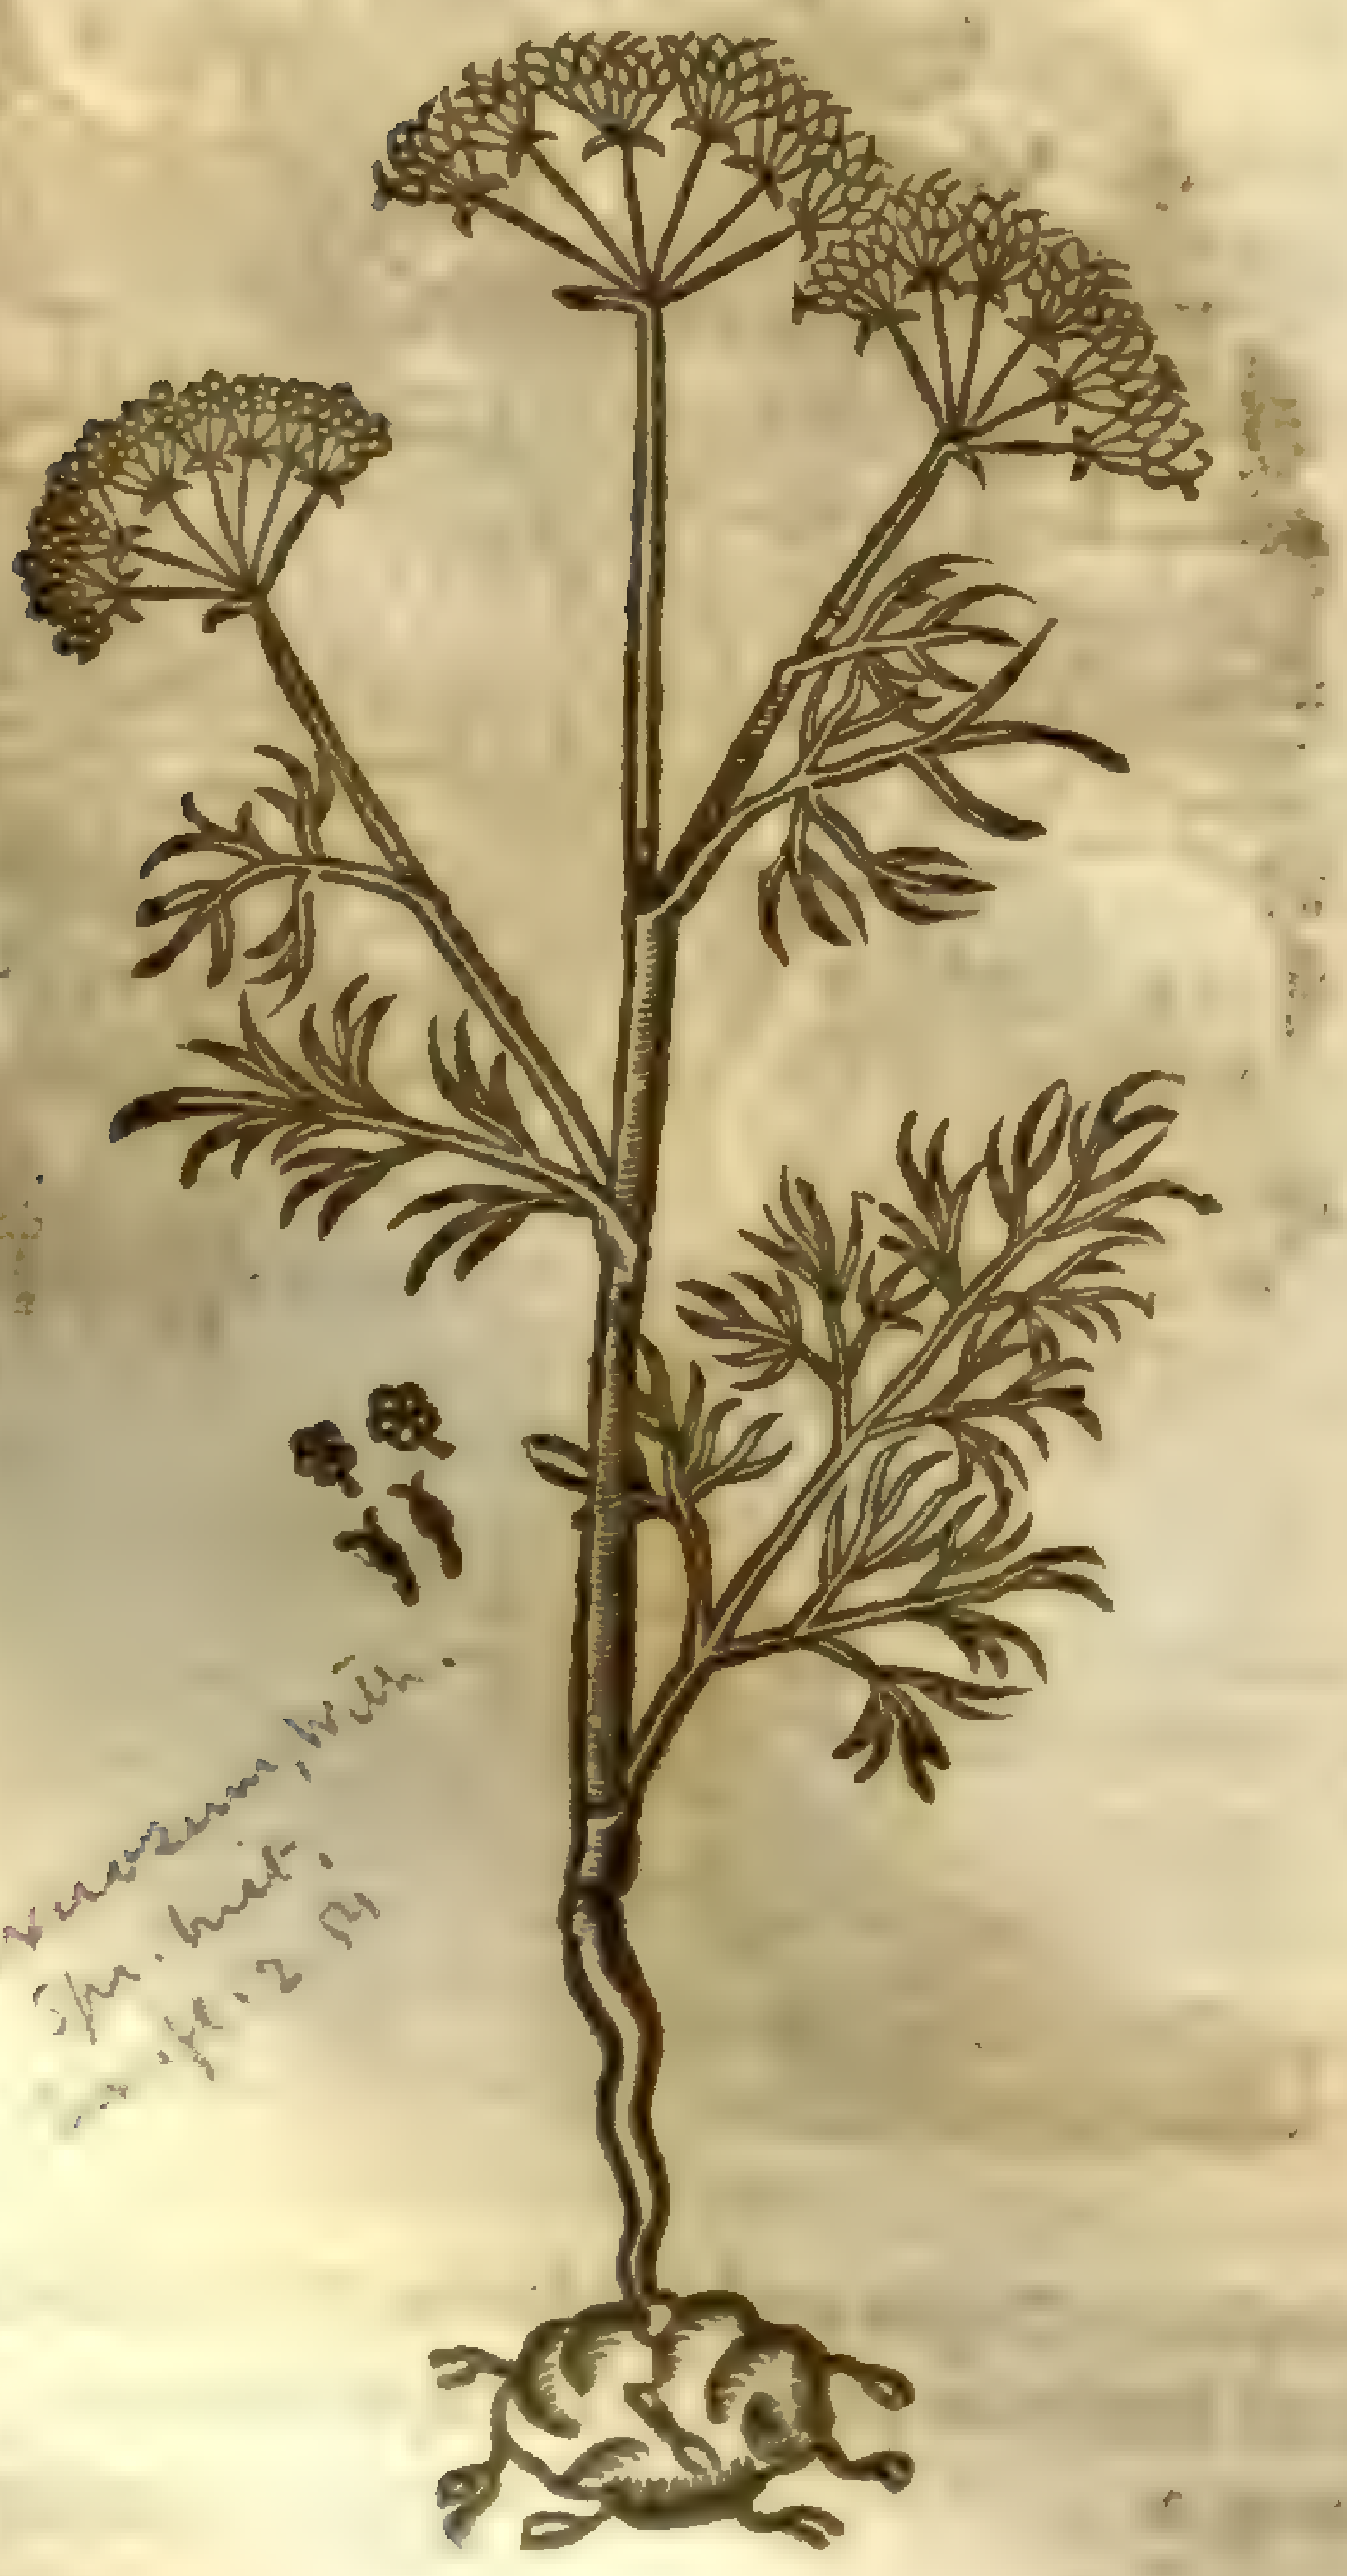
Their temperature and faculties are anſwerable to the common Hemlocke, and haue no vſe in Phyſicke.

† The figure formerly in the firſt place was of *Myrrhis*; the deſcription I thinke was intended, but not fully agreeing with that I here giue you, wherefore I haue a little altered it.

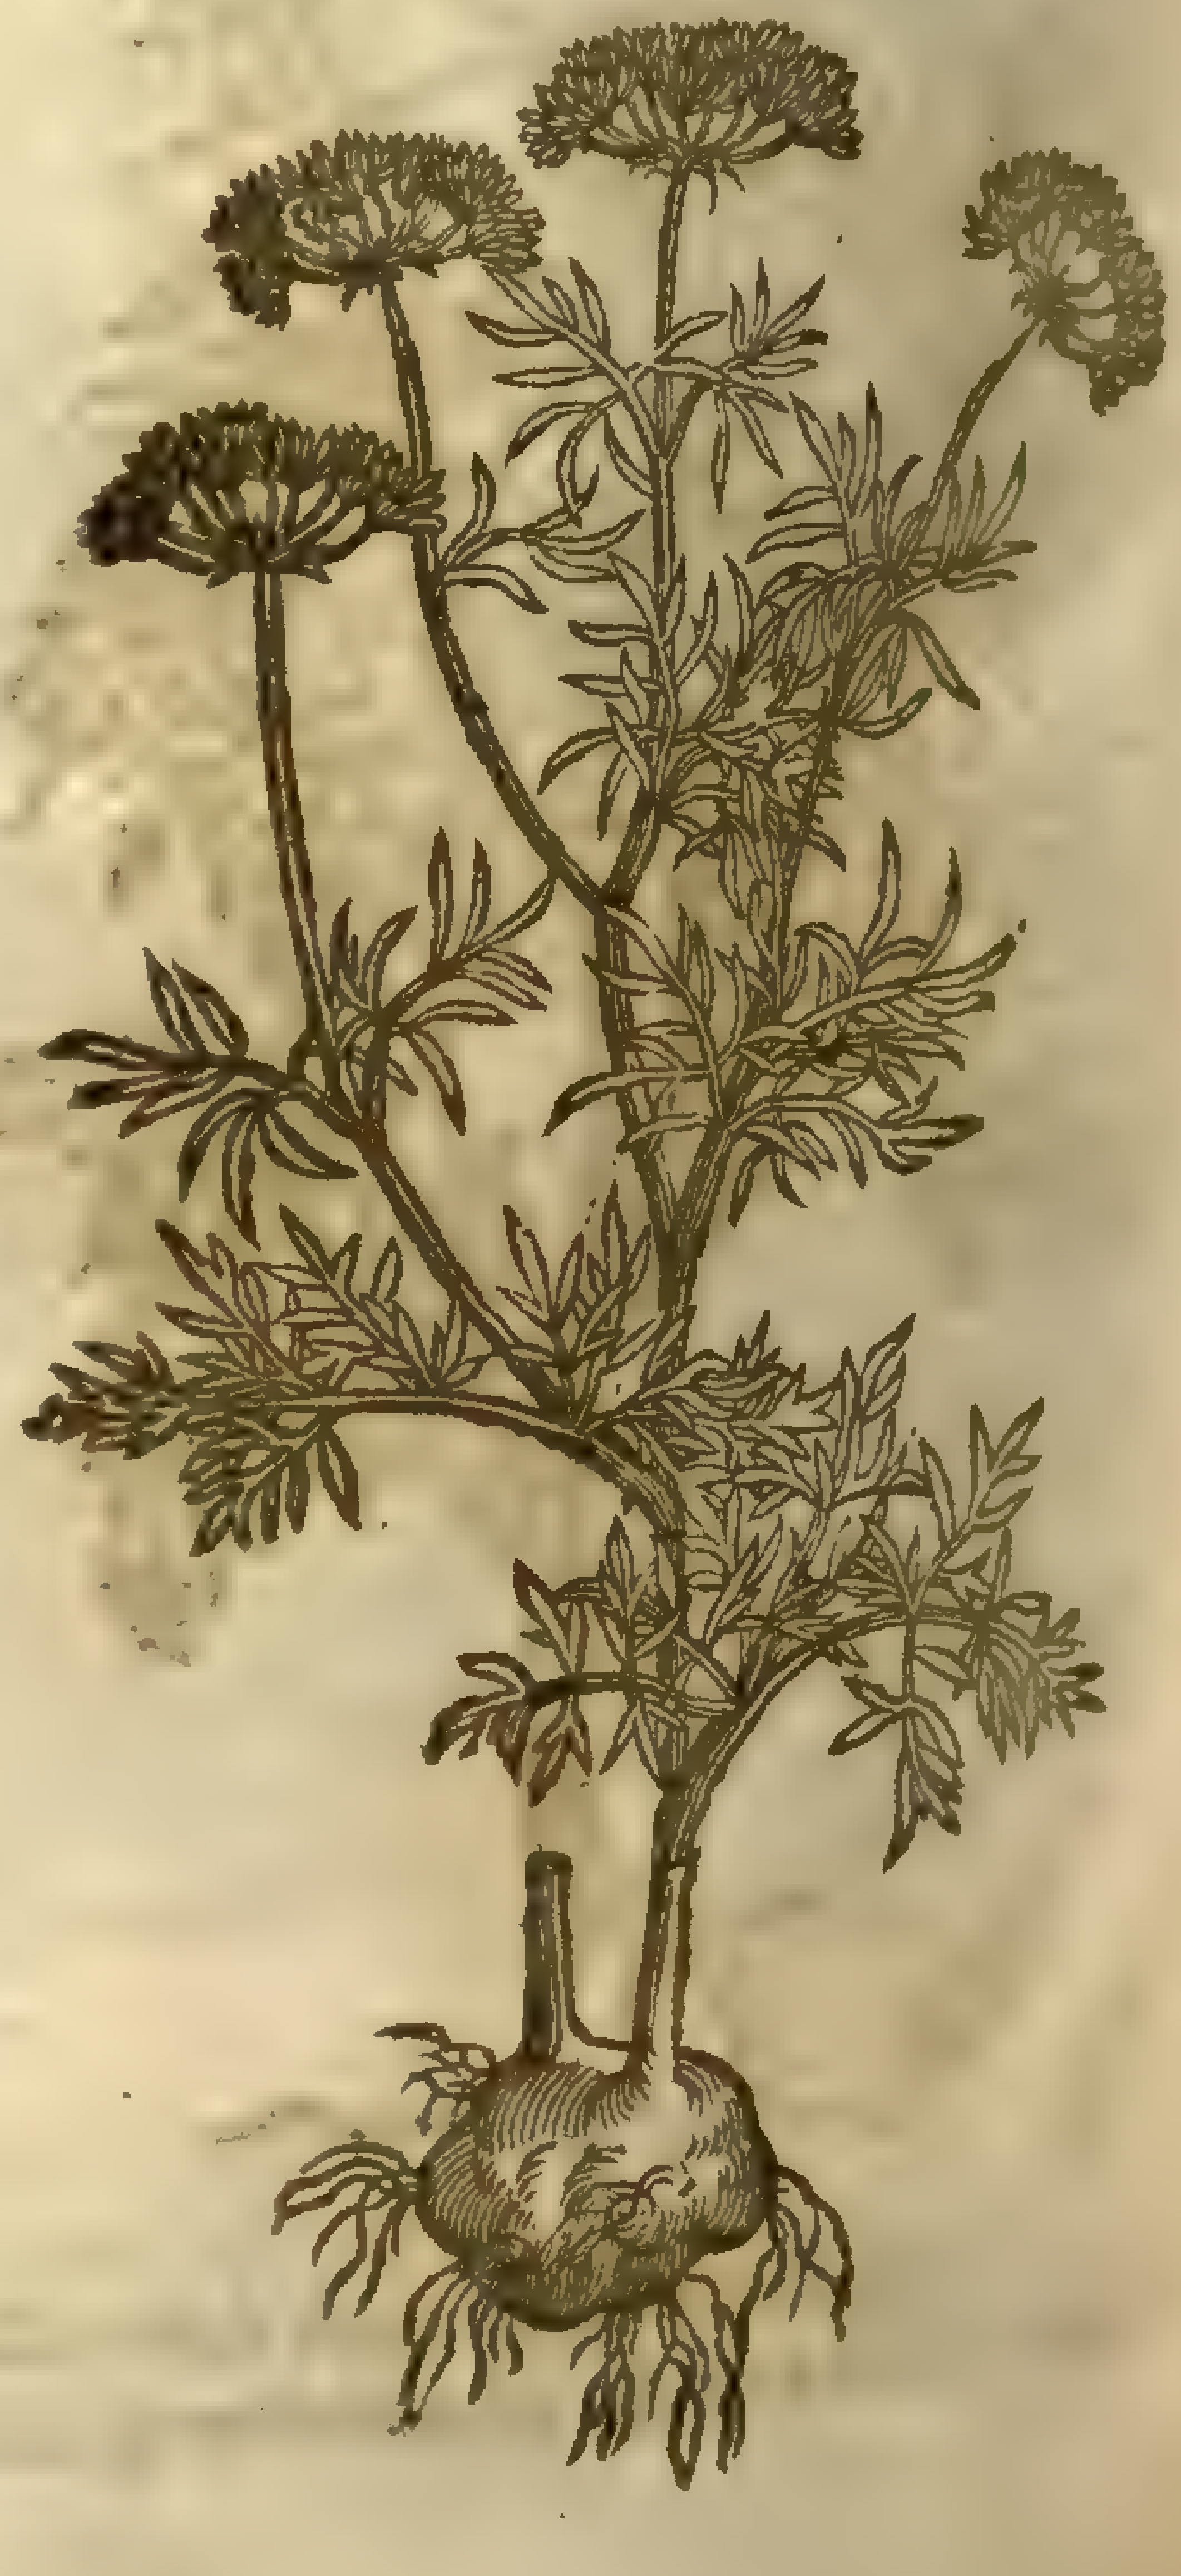
Chap. 431.

Of Earth-Nut, Earth Cheſtnut, or Kippernut.

† 1 *Bulbocaſtanon minus.*
Small Earth-nut.



2 *Bulbocaſtanon majus.*
Great Earth-nut.



[illegible] With.
Sp. hist.
[illegible]

Bunium bulbocastanum, &
both [illegible]

¶ *The Deſcription.*

1 Earth-nut or Kipper-nut, called after *Lobelius Nucula terreſtris*, hath ſmall euen creſted ſtalks a foot or ſomewhat more high: whereon grow next the ground, leaues like thoſe of Parſley, and thoſe that do grow higher like vnto thoſe of Dill; the white floures do ſtand on the top of the ſtalks in ſpokie rundles, like the tops of Dill, which turne into ſmall ſeed, growing together by couples, of a very good ſmell, not vnlike to thoſe of Fennell, but much ſmaller: the root is round, knobbed, with certaine eminences or bunchings out; browne without, white within, of a firme and ſollid ſubſtance, and of a taſte like the Cheſſe-nut, or Cheſt-nut, whereof it tooke his name.

2 There is alſo another Earth-nut that hath ſtalkes a foot high, whereon grow jagged leaues like thoſe of Engliſh Saxifrage, of a bright green colour: the floures grow at the top of the branches, in ſmall ſpokie tufts conſiſting of little white floures: the root is like the other, bulbous faſhion, with ſome few ſtrings hanging at the bottome, of a good and pleaſant taſte. ‡ This differs from the former, in that the leaues are larger and greener: the root alſo is not ſo far within the ground, and it alſo ſends forth ſome leaues from the bulb it ſelfe; whereas our common kind hath onely the end of a ſmall root that carries the ſtem and leaues vpon it, faſtned vnto it as you ſee it expreſt in the former figure. ‡

¶ *The Place.*

Theſe herbes do grow in paſtures and corne fields almoſt euery where: there is a field adjoining to High-gate, on the right ſide of the middle of the village, couered ouer with the ſame; and likewiſe in the next field to the conduit heads by Maribone, neer the way that leads to Padington by London, and in diuers other places. ‡ I haue not yet obſerued the ſecond to grow wild with vs. ‡

¶ *The Time.*

They floure in Iune and Iuly: the ſeed commeth to perfection afterward.

¶ *The Names.*

Alexander Trallianus hath made mention of βολβοκάστανον, *Lib.* 7. reckoning it vp among thoſe kindes of meat or ſuſtenances which be good for ſuch as haue rotten lungs: of ſome it is called *Agriocaſtanon.*

Guinterius thought the word was corrupted, and that *Balanocaſtanon* ſhould be read: but this is as ſtrange a word as *Bolbocaſtanon*, which was deriued of the form of a bulb, and the taſt of a Cheſt-nut: of ſome, *Nucula terriſtris*, or the little Earth-nut: it is thought to be *Bunium Dioſcoridis* of ſome; but we think not ſo: of Dr. *Turner*, *Apios*: yet there is another *Apios*, being a kind of *Tithymale*: of *Matthiolus*, *Oenanthe*, making it a kind of Filipendula: in high-Dutch, **Eerdnuſz**: in low Dutch, **Eertnoten**: the people of Sauoy cal it *Fauerottes*: in Engliſh, Earth-nuts, Kipper-nuts, & Earth cheſtnuts.

¶ *The Nature.*

The roots of Earth-nuts are moderately hot and dry, and alſo binding: but the ſeed is both hotter and drier.

¶ *The Vertues.*

The ſeed openeth and prouoketh vrine, and ſo doth the root likewiſe. A

The root is good for thoſe that ſpit and piſſe bloud, if the root be eaten raw, or roſted in the embers. B

The Dutch people doe vſe to eat them boiled and buttered, as we do Parſeneps and Carrots, which ſo eaten comfort the ſtomacke, and yeeld nouriſhment that is good for the bladder and kidneyes. C

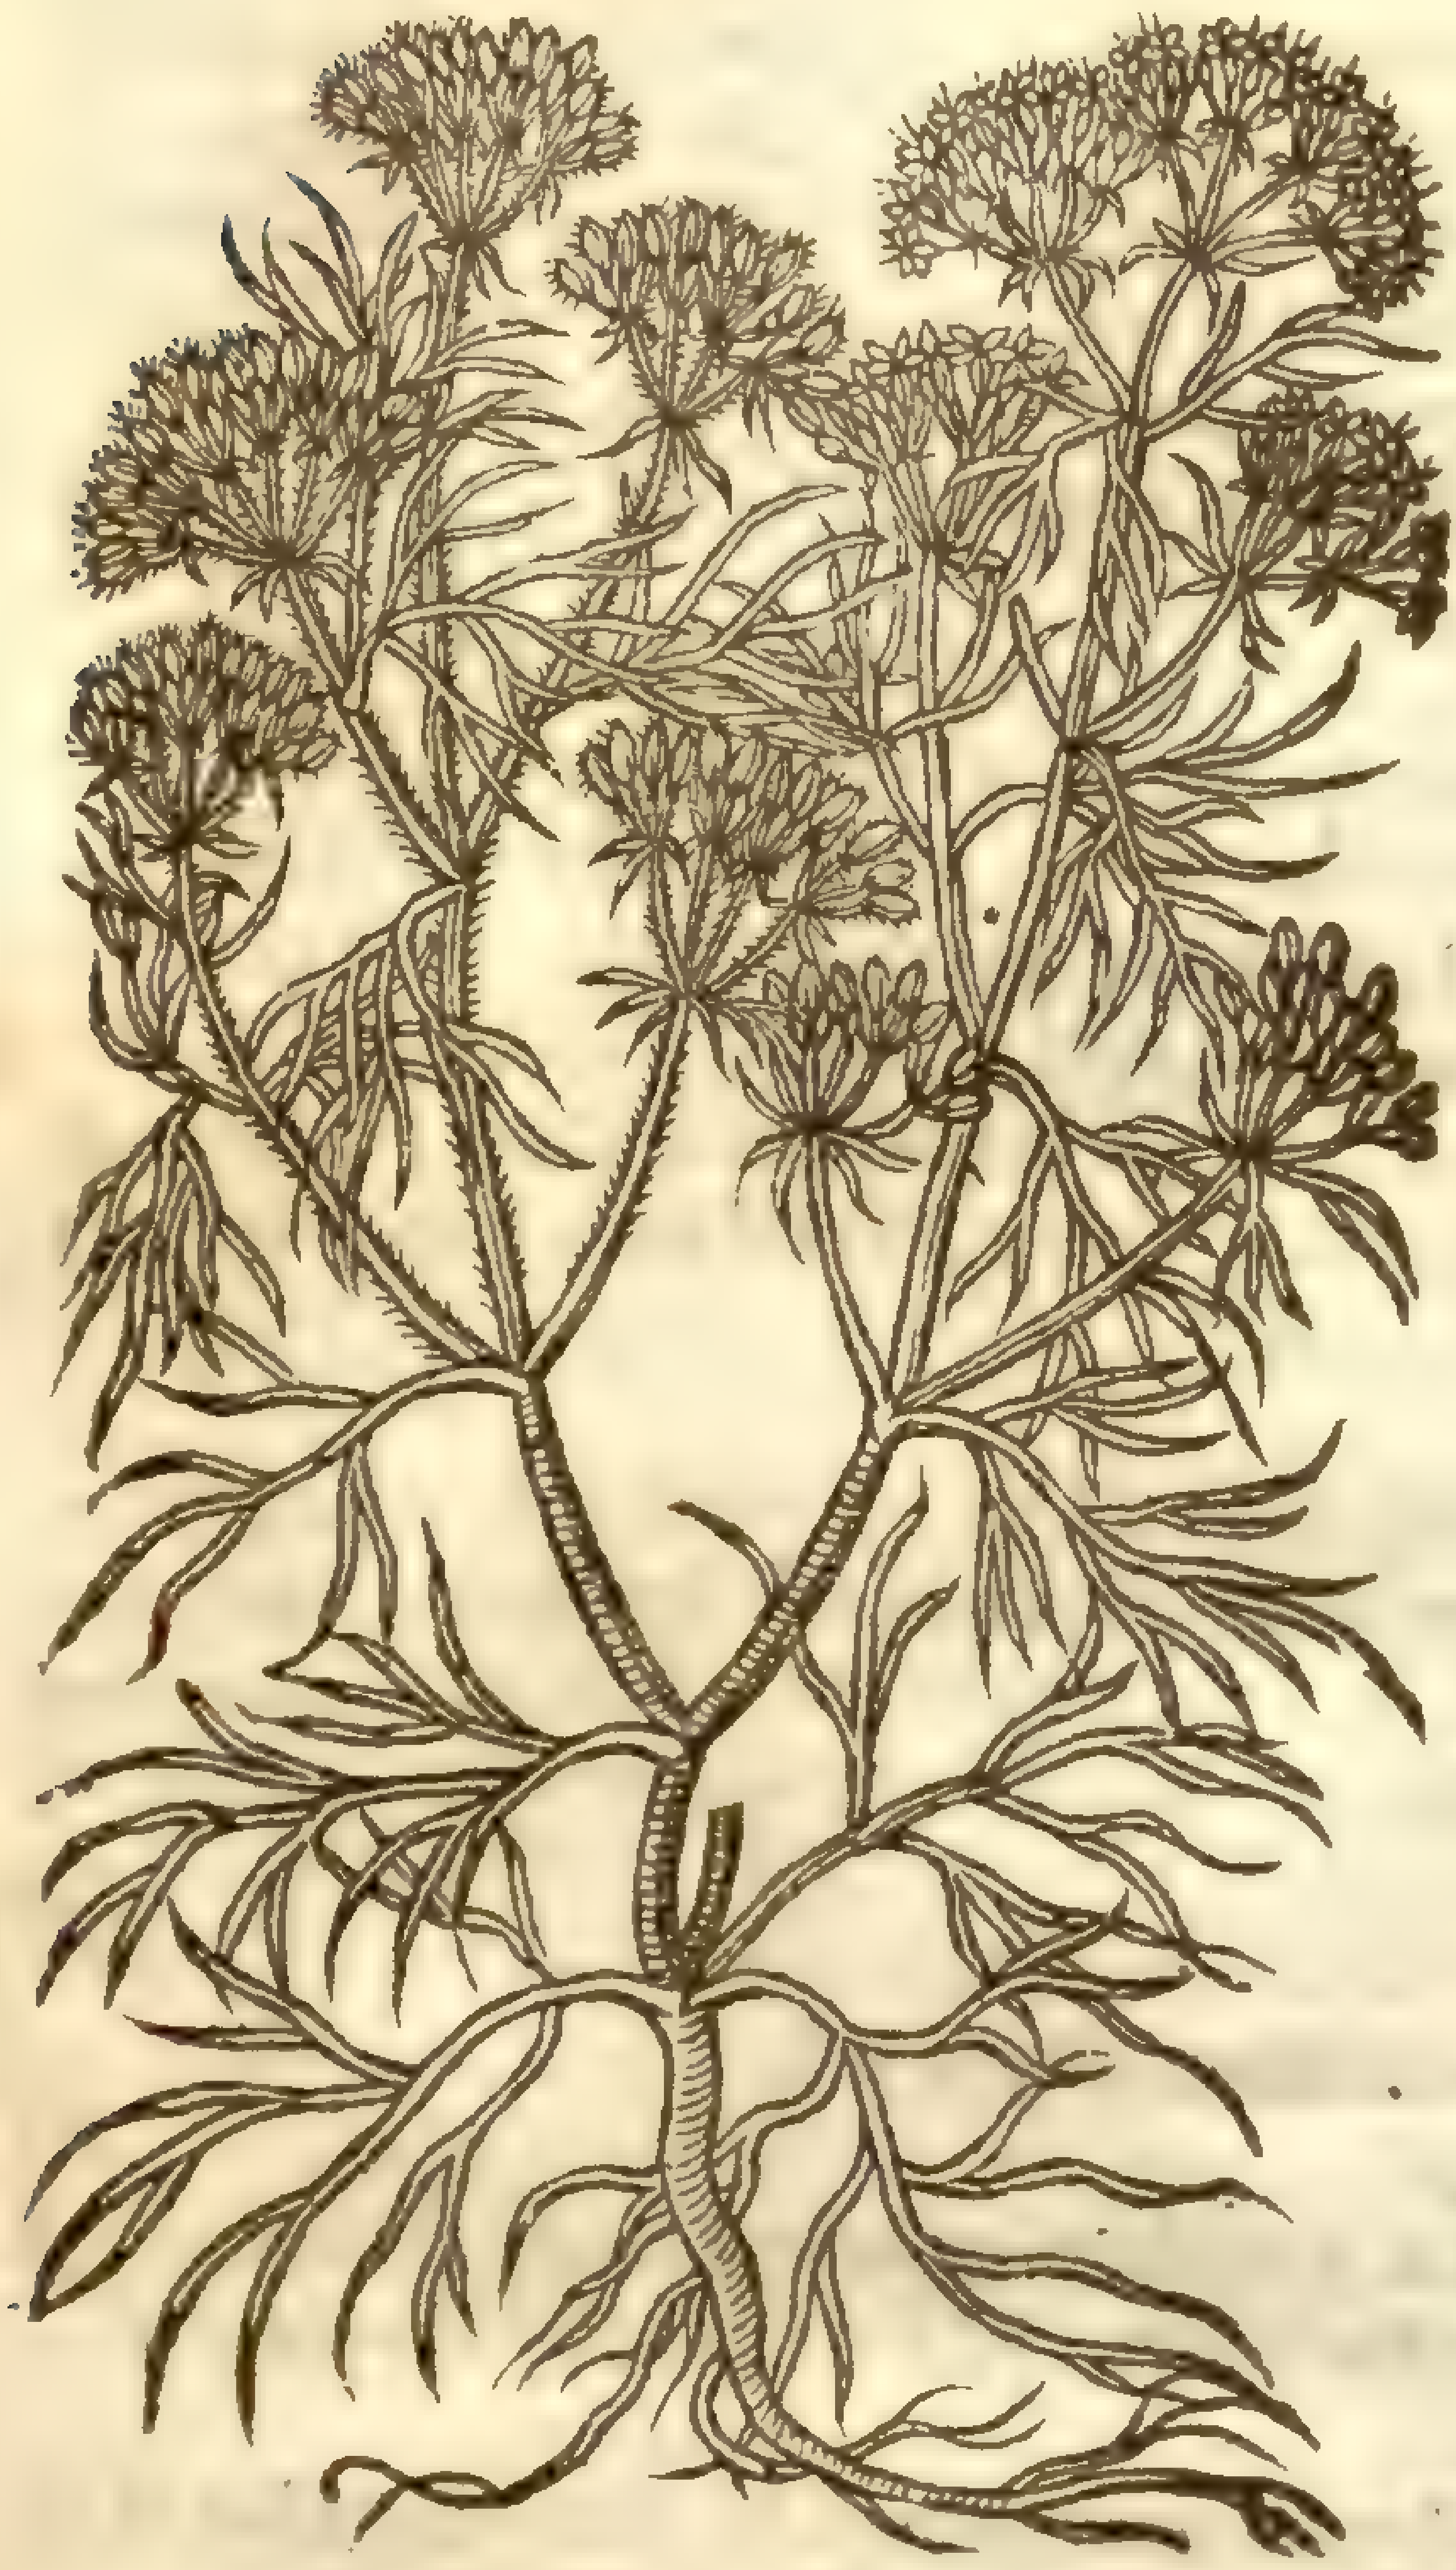
There is a plaiſter made of the ſeeds hereof, whereof to write in this place were impertinent to our hiſtorie. D

CHAP. 432. *Of Cumin.*

¶ *The Deſcription.*

This garden Cumin is a low or baſe herbe of a foot high: the ſtalk diuideth it ſelf into diuers ſmall branches, whereon doe grow little jagged leaues very finely cut into ſmall parcels, like thoſe of Fennell, but more finely cut, ſhorter and leſſer, the ſpoky tufts grow at the top of the branches and ſtalkes, of a red or purpliſh colour: after which come the ſeed, of a ſtrong or rancke ſmell, and biting taſte: the root is ſlender, which periſheth when it hath ripened his ſeed.

Cuminum ſativum Dioſcoridis.
Garden Cumin.



C. Cyminum, L.
[illegible]

¶ *The Place*

Cumin is husbanded and ſowne in Italy and Spaine, and is very common in other hot countries, as in Æthiopia, Egypt, Cilicia, and all the leſſer Aſia.

It delights to grow eſpecially in putrified and hot ſoiles: I haue proued the ſeeds in my garden, where they haue brought forth ripe ſeed much fairer and greater than any that comes from beyond the ſeas.

¶ *The Time.*

It is to be ſown in the middle of the ſpring; a ſhowre of rain preſently following much hindereth the growth thereof, as *Ruellius* ſaith.

My ſelf did ſow it in the midſt of May, which ſprung vp in ſix daies after: and the ſeed was ripe in the end of Iuly.

¶ *The Names.*

It is called in Greeke κύμινον ἥμερον, that is, tame or garden Cumin, that it may differ from the wild ones: it is named in Latine *Cuminum*: in ſhops, *Cyminum*: in high-Dutch, **Roomiſch kymmel**: in Italian, *Comino*: in Spaniſh, *Comachos*: in French, *Comin*: in Engliſh, Cumin.

¶ *The Temperature.*

The ſeed of garden Cumin, as *Galen* ſaith, is hot and dry in the third degree: *Dioſcorides* ſaith that it hath in it alſo a binding quality.

¶ *The Vertues.*

A The ſeed of Cumin ſcattereth and breaketh all the windineſſe of the ſtomacke, belly, guts, and matrix: it is good againſt the griping torments, gnawing or fretting of the belly, not only receiued inwardly by the mouth, but alſo in clyſters, and outwardly applied to the belly with wine and barley meale boiled together to the forme of a pultis.

B Being handled according to art, either in a cataplaſm, pultis, or plaiſter, or boiled in wine and ſo applied, it taketh away blaſtings, ſwellings of the cods or genitors: it conſumeth windie ſwellings in the joints, and ſuch like.

C Being taken in a ſupping broth it is good for the cheſt and cold lungs, and ſuch as are oppreſſed with abundance of raw humors.

D It ſtancheth bleeding at the noſe, being tempered with vineger and ſmelt vnto.

E Being quilted in a little bag with ſome ſmall quantitie of Bay ſalt, and made hot vpon a bedpan with fire or ſuch like, and ſprinkled with good wine vineger, and applied to the ſide very hot, it taketh away the ſtitch and paines thereof, and eaſeth the pleuriſie very much.

CHAP. 420. *Of wilde Cumin.*

¶ *The Kindes.*

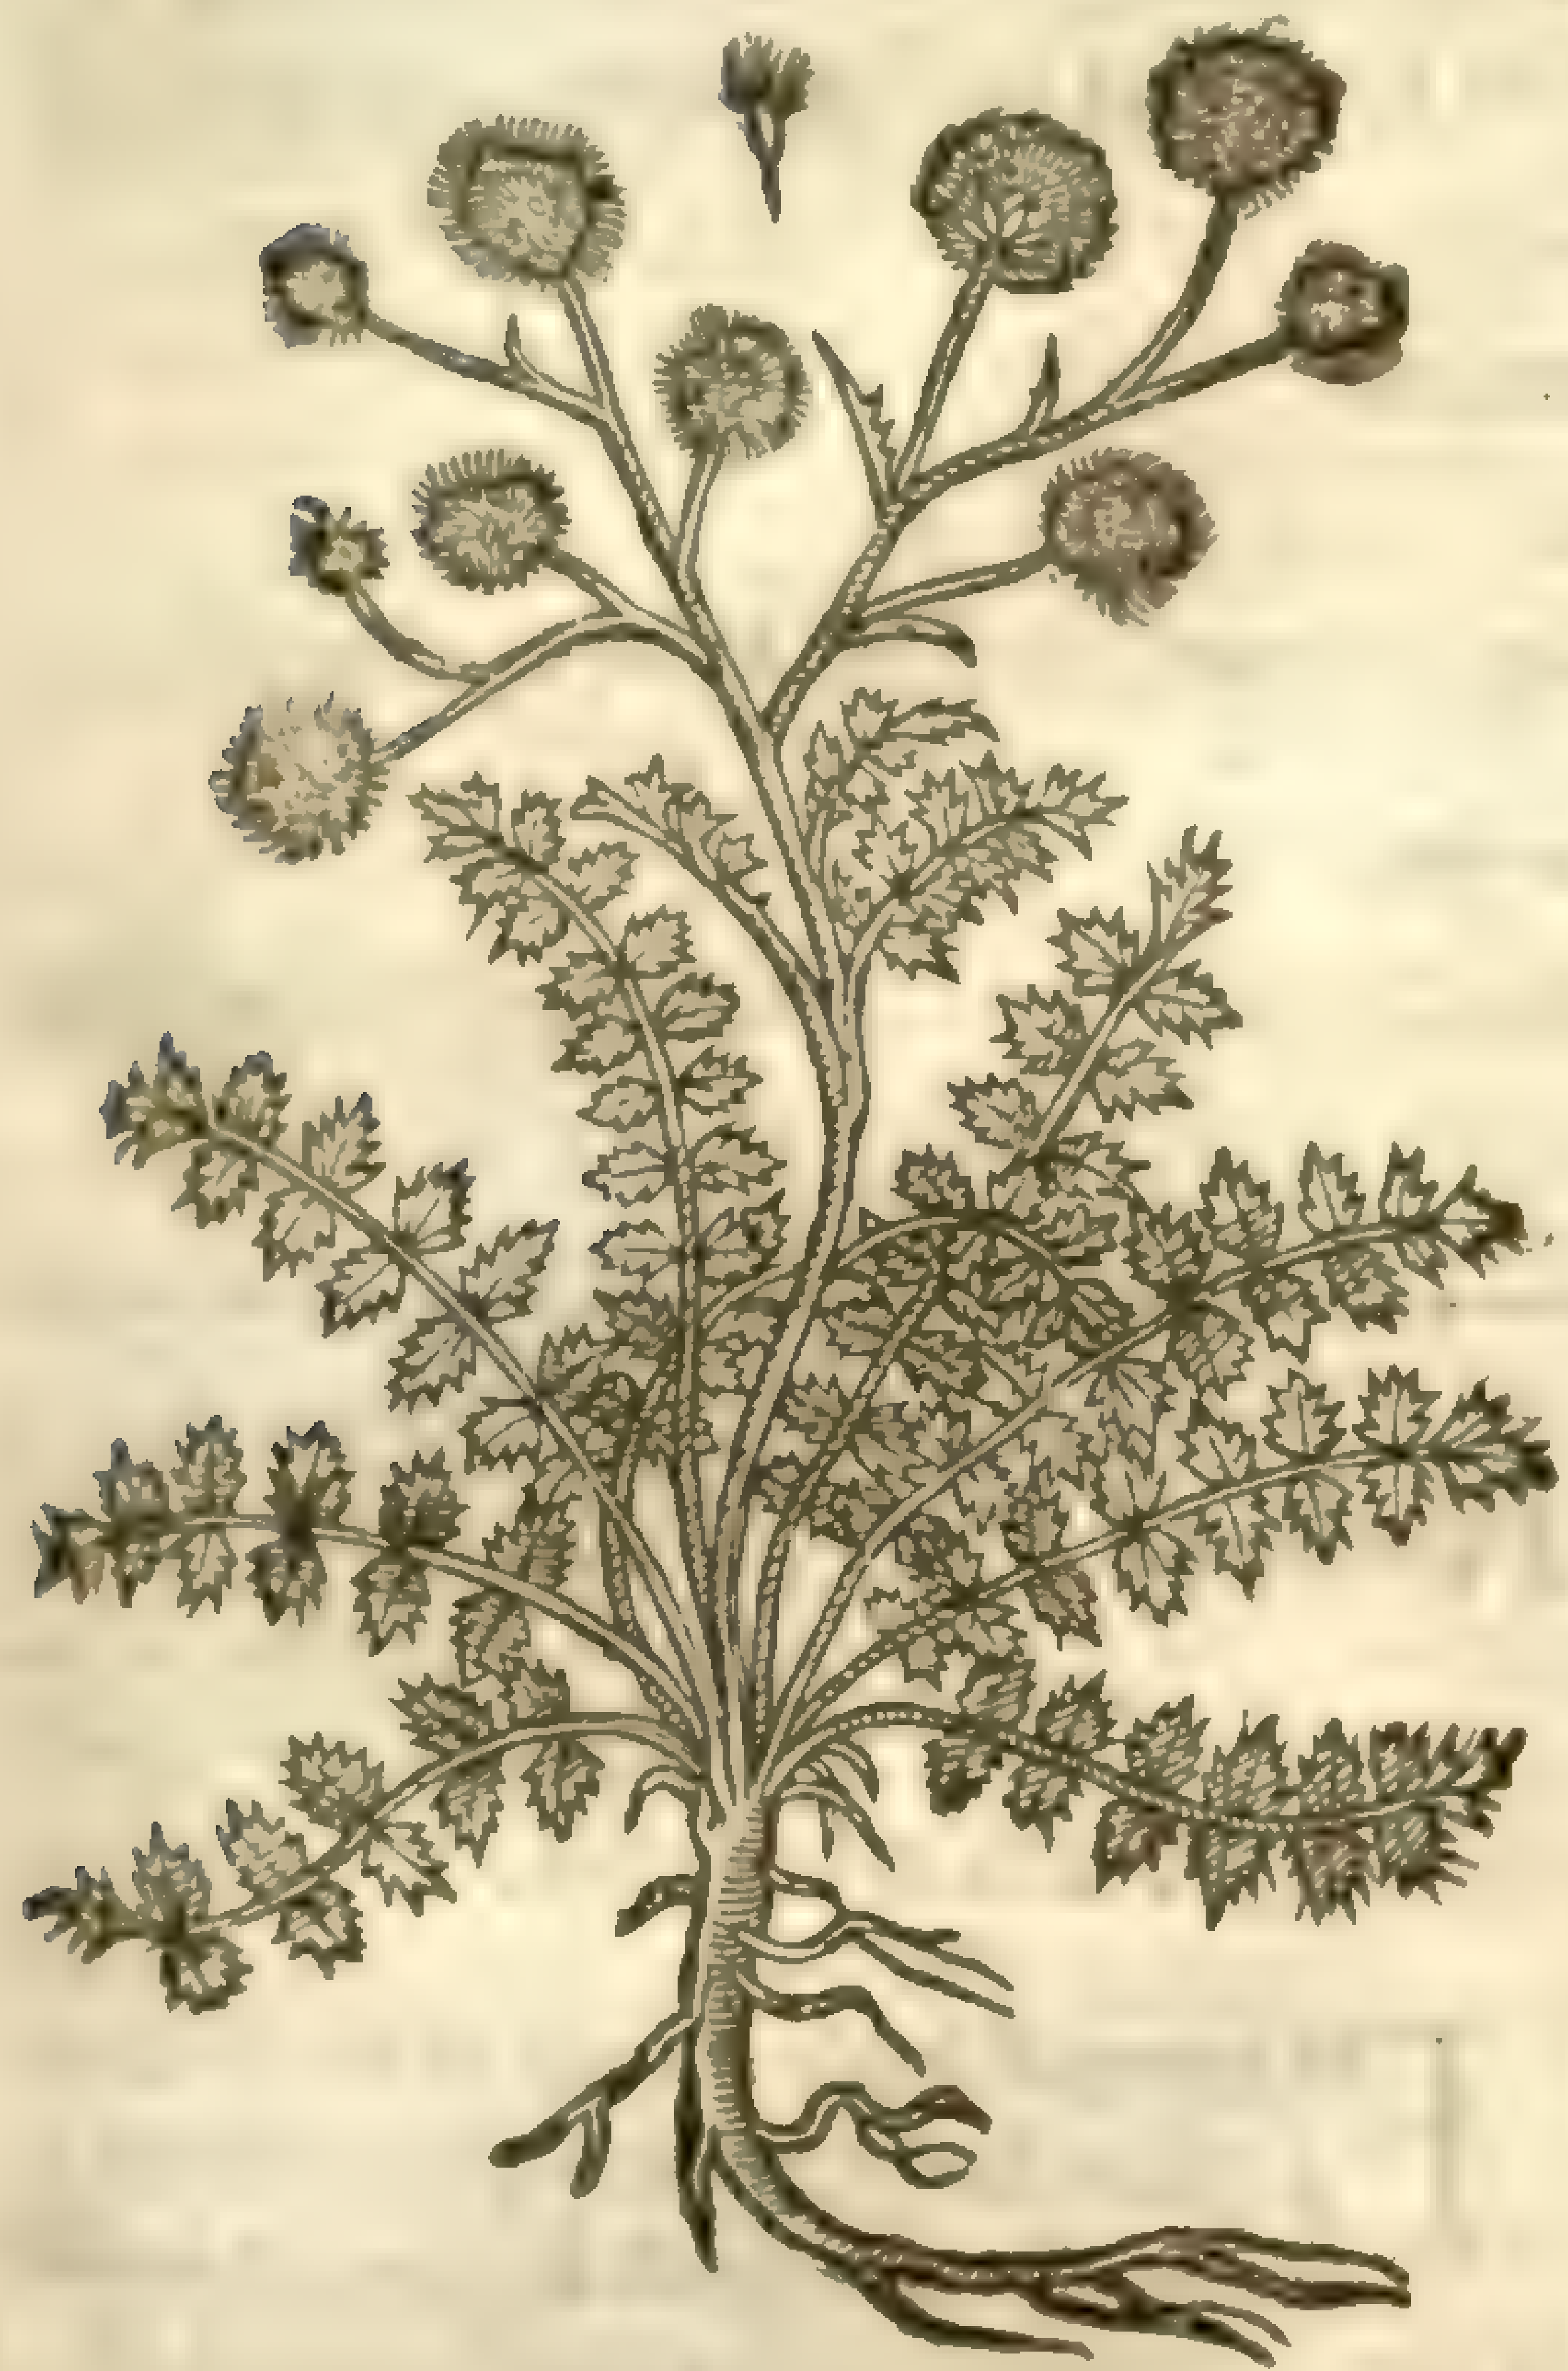
THere be diuers plants differing very notably one from another in ſhape, and yet all comprehended vnder the wilde Cumin.

¶ *The Deſcription.*

1 THe wild Cumin hath ſmall white roots with ſome fibres thereto appendant; from the which ariſe ſundry little jagged leaues, conſiſting of many leſſer leaues, finely dented about the edges, in faſhion like the ſmalleſt leaues of wild parſnep: among which ſpringeth vp a ſlender bending ſtalk a foot high, like vnto *Pecten Veneris*, bearing at the top therof white round

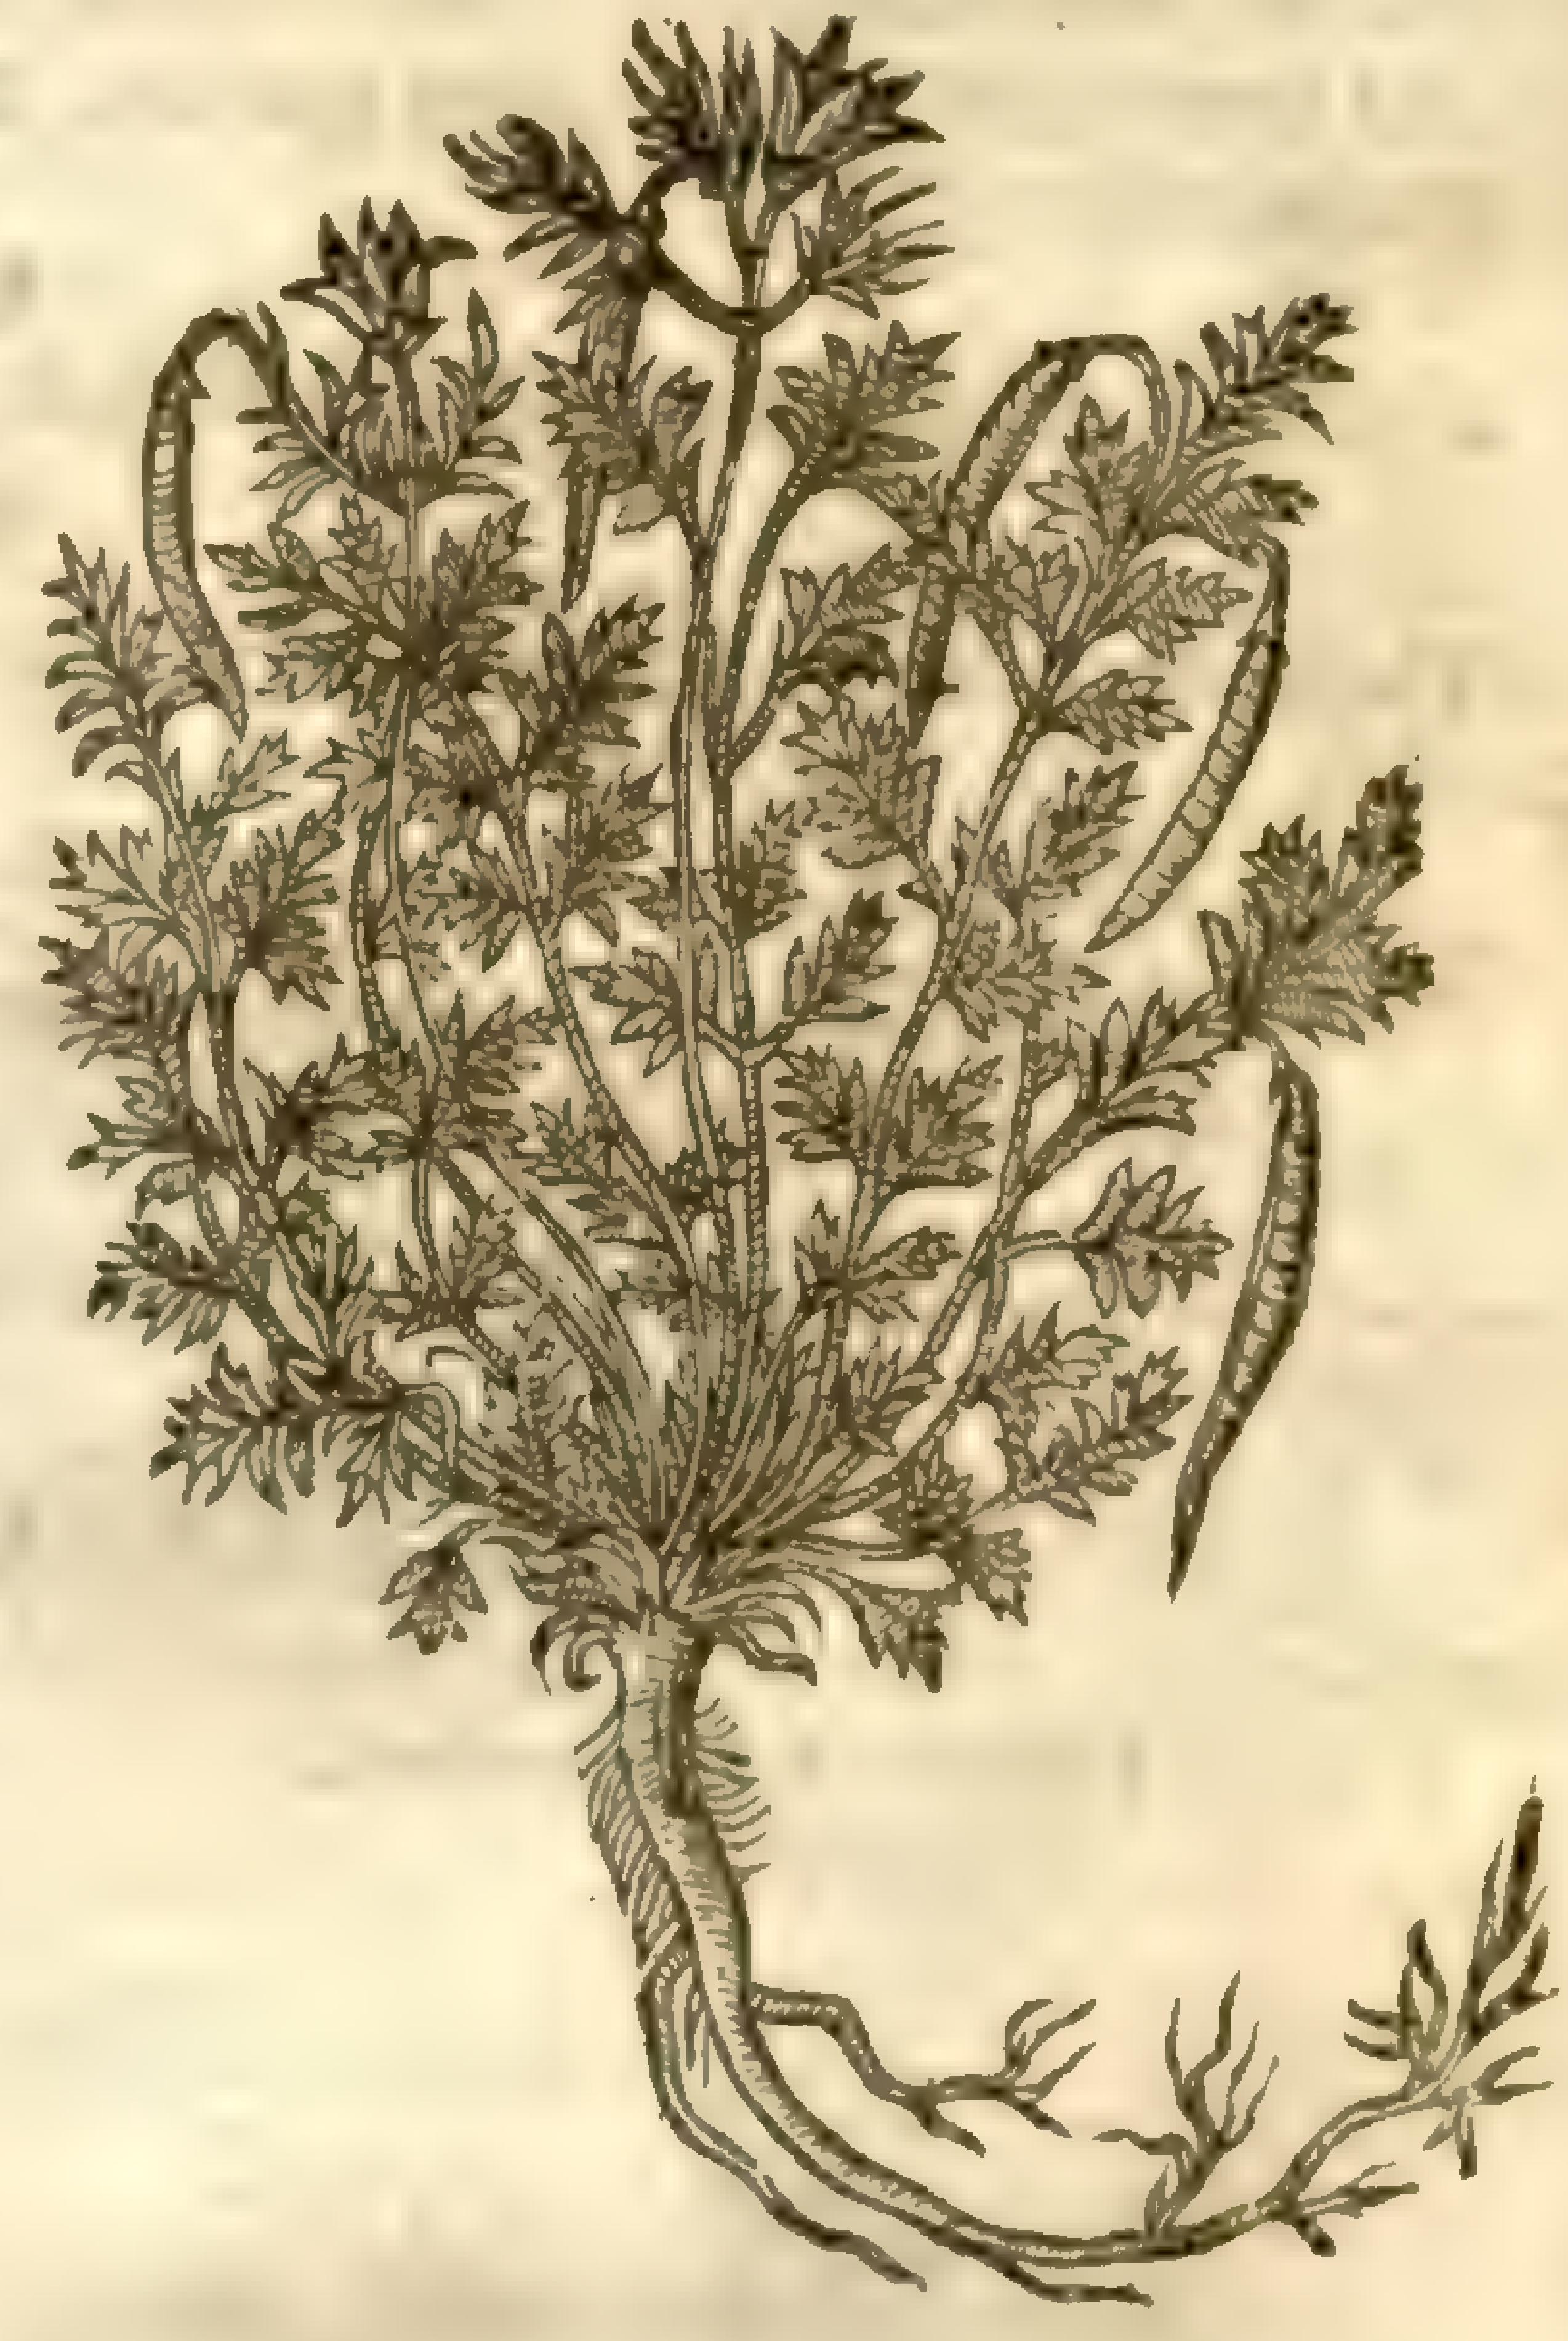
1 *Cuminum ſylueſtre.*
Wilde Cumin.

Lagoecia cuminoides. - Miss. dict

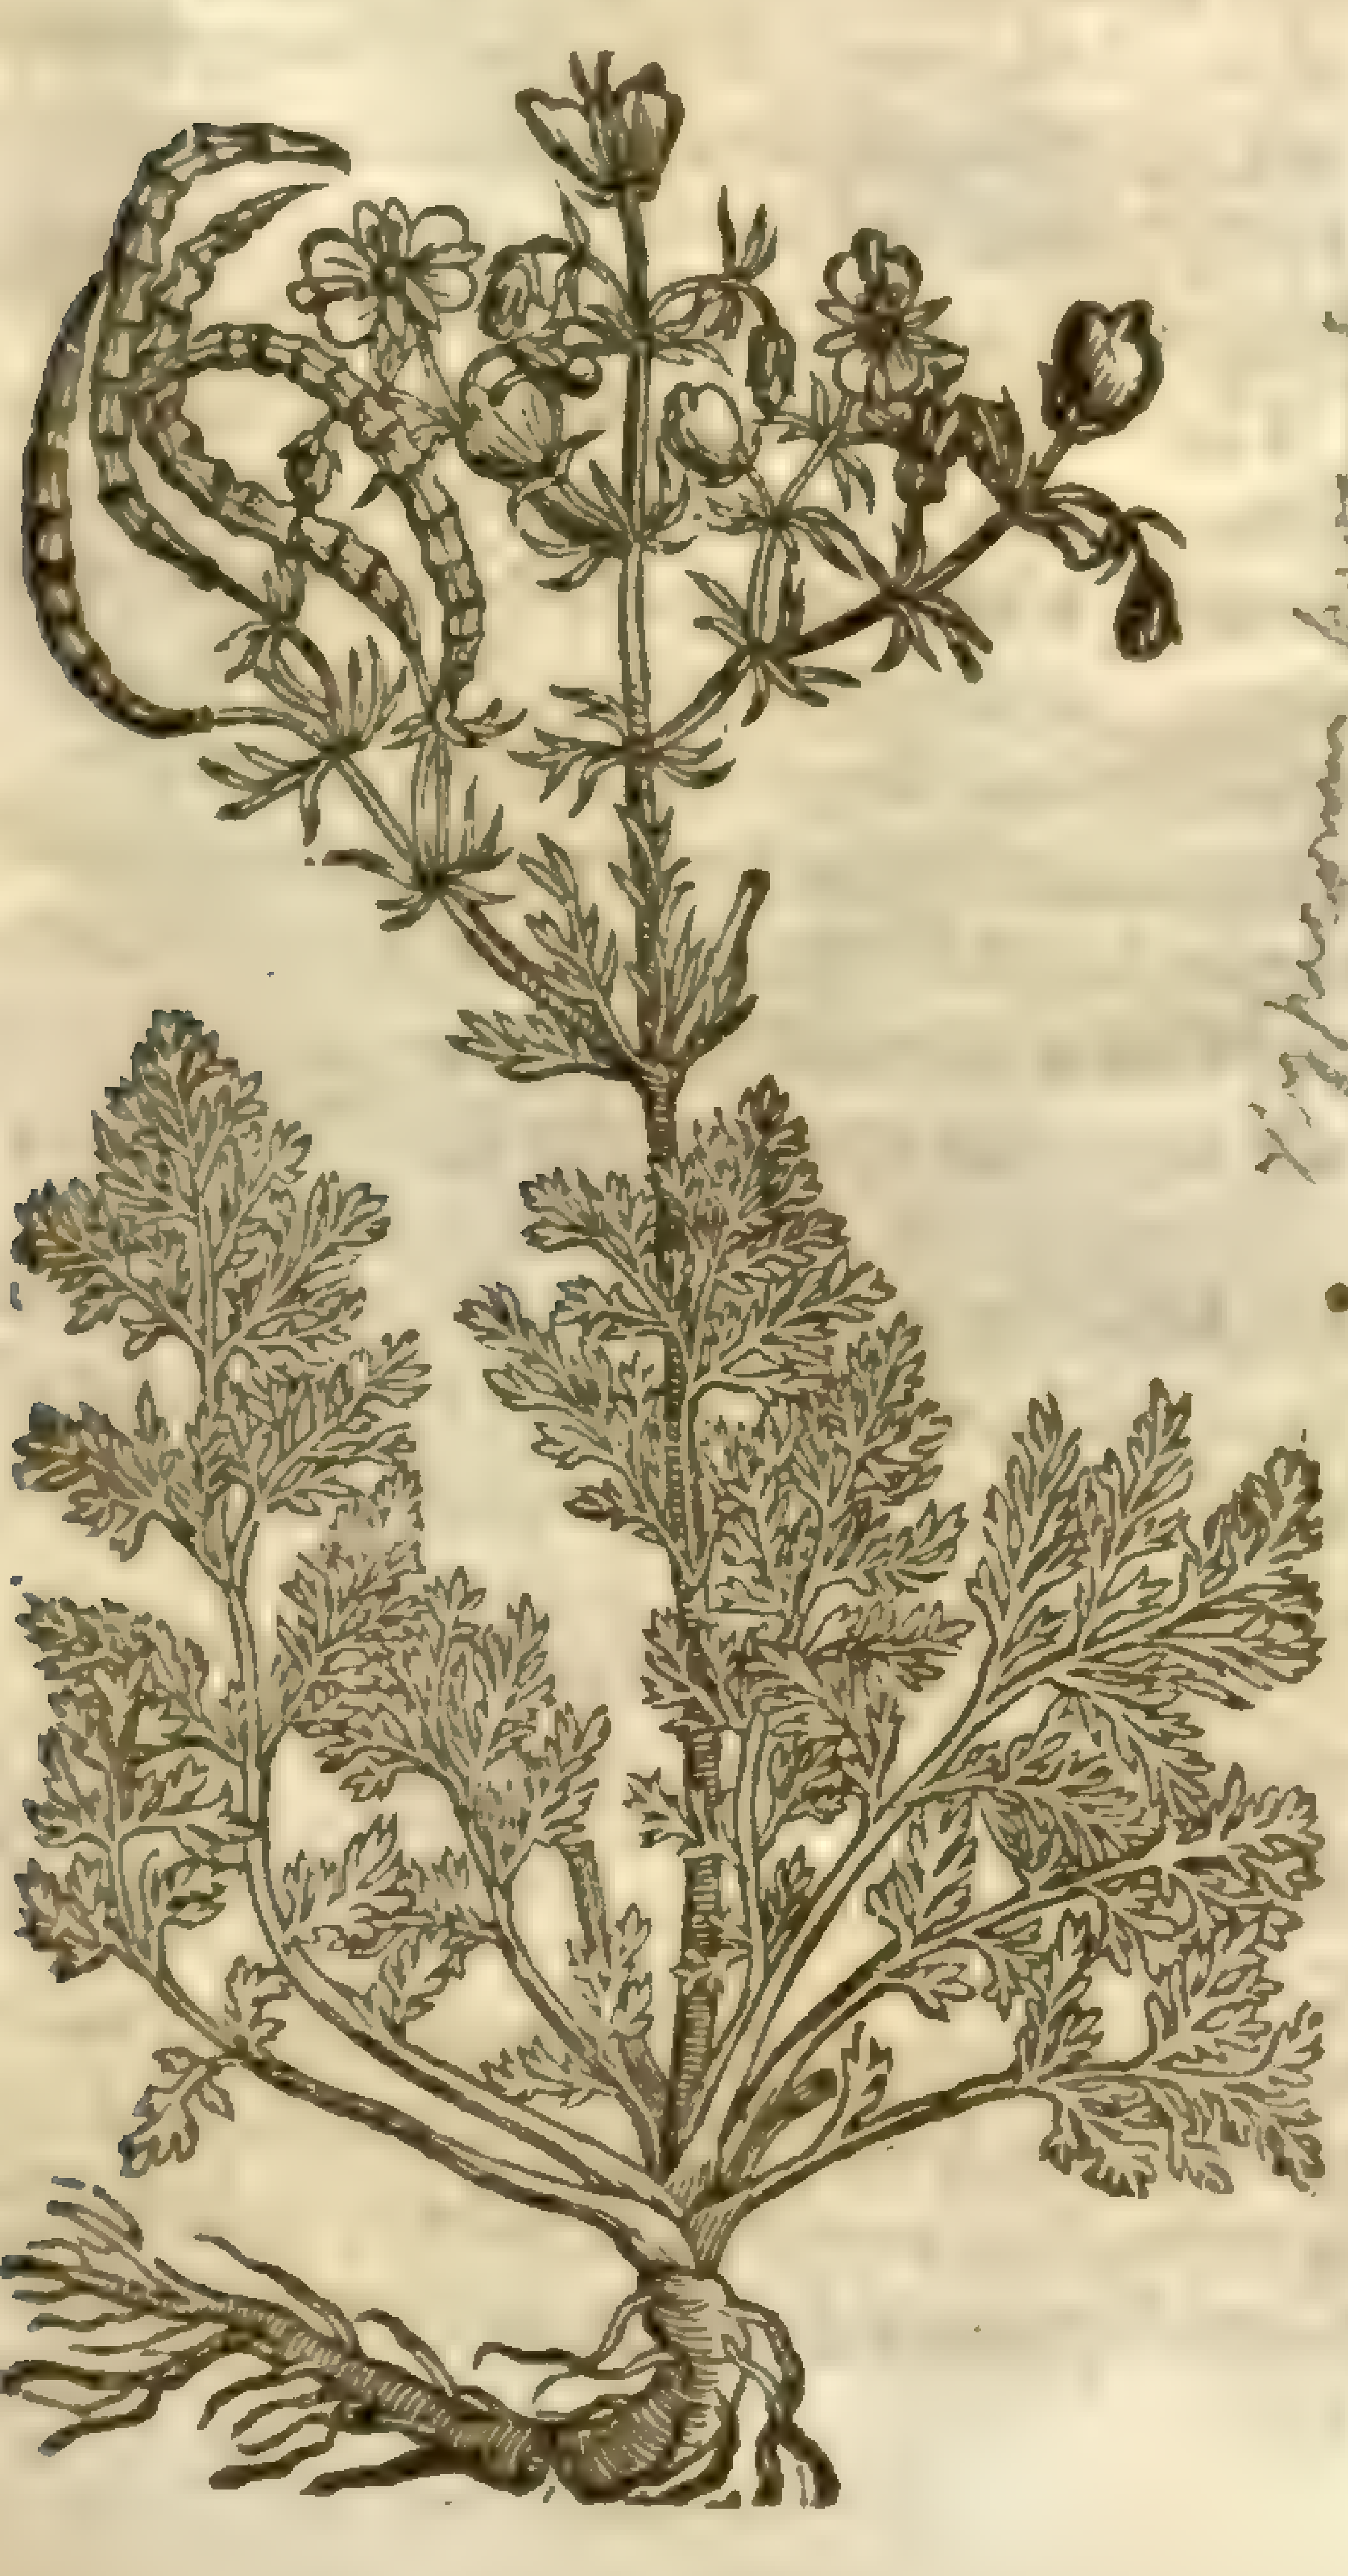


2 *Cuminum ſiliquoſum.*
Codded wilde Cumin.

Hypecoum pendulum. - Miss. dict.



3 *Cuminum corniculatum, ſiue Hypecoum Cluſij.*
Horned wild Cumin.



Hypecoum procumbens - Miss. dict.

round and hairie buttons or knops, like *Arction*, as *Dioſcorides* hath right wel obſerued: within which knops is contained a tender downie ſubſtance, among which is the ſeed, like the ſeed of *Dens Leonis*, but much leſſer.

2 The ſecond kinde of Cumin is verie like to the foreſaid wilde Cumin, ſaue that it beareth a number of horned or crooked cods, after the maner of *Scorpioides*, but thicker, and leſſe crooked, and the ſeeds within the cods are ſeuerally diſtinct & ſeparated one from another by equall partitions, in ſmall croſſes, yellow of color, and ſomwhat long: the ſtalkes are little and tender, beſet with leaues much like vnto the ſmall leaues of *Carui*, or *Pecten Veneris*: and at the top of the ſtalks there grow pretty yellow floures, like thoſe of great Celandine or Rocket, ſauing that they be ſomwhat leſſer.

† 3 The third kind of Cumin is very like vnto the laſt before mentioned, but the leaues are much greater, more ſlender, and more finely cut or jagged, like the leaues of *Seſeli* of *Maſſylia*: among which riſeth vp a ſtalke a cubit high or ſomewhat more, very ſmooth & whitiſh: at the top wherof ſpring forth fine yellow flours, not like the former, but conſiſting of ſix leaues apiece, whereof two are large, and edged with greene on the

outſide: the other foure are ſmall ones, and grow two on a ſide between the two larger leaues: theſe floures being vaded, there ſucceed crooked cods, greater, and more full of knots or diuiſions than the former, wherein is contained a ſmall and flat yellow ſeed like *Galega*: the root is long, thick, and ſingle.

¶ *The Place.*

Theſe wilde Cumins do grow in Lycia, and Galatia, a prouince of Aſia, and in Carthage a citie of Spaine; ſeldome ſeen in theſe Northerne parts: notwithſtanding at the impreſſion hereof, the laſt did floure and flouriſh in my garden. ‡ Theſe grow in Prouince in France, and in diuers parts of Spaine. ‡

¶ *The Time.*

They floure in Auguſt, and perfect their ſeed in September.

¶ *The Names.*

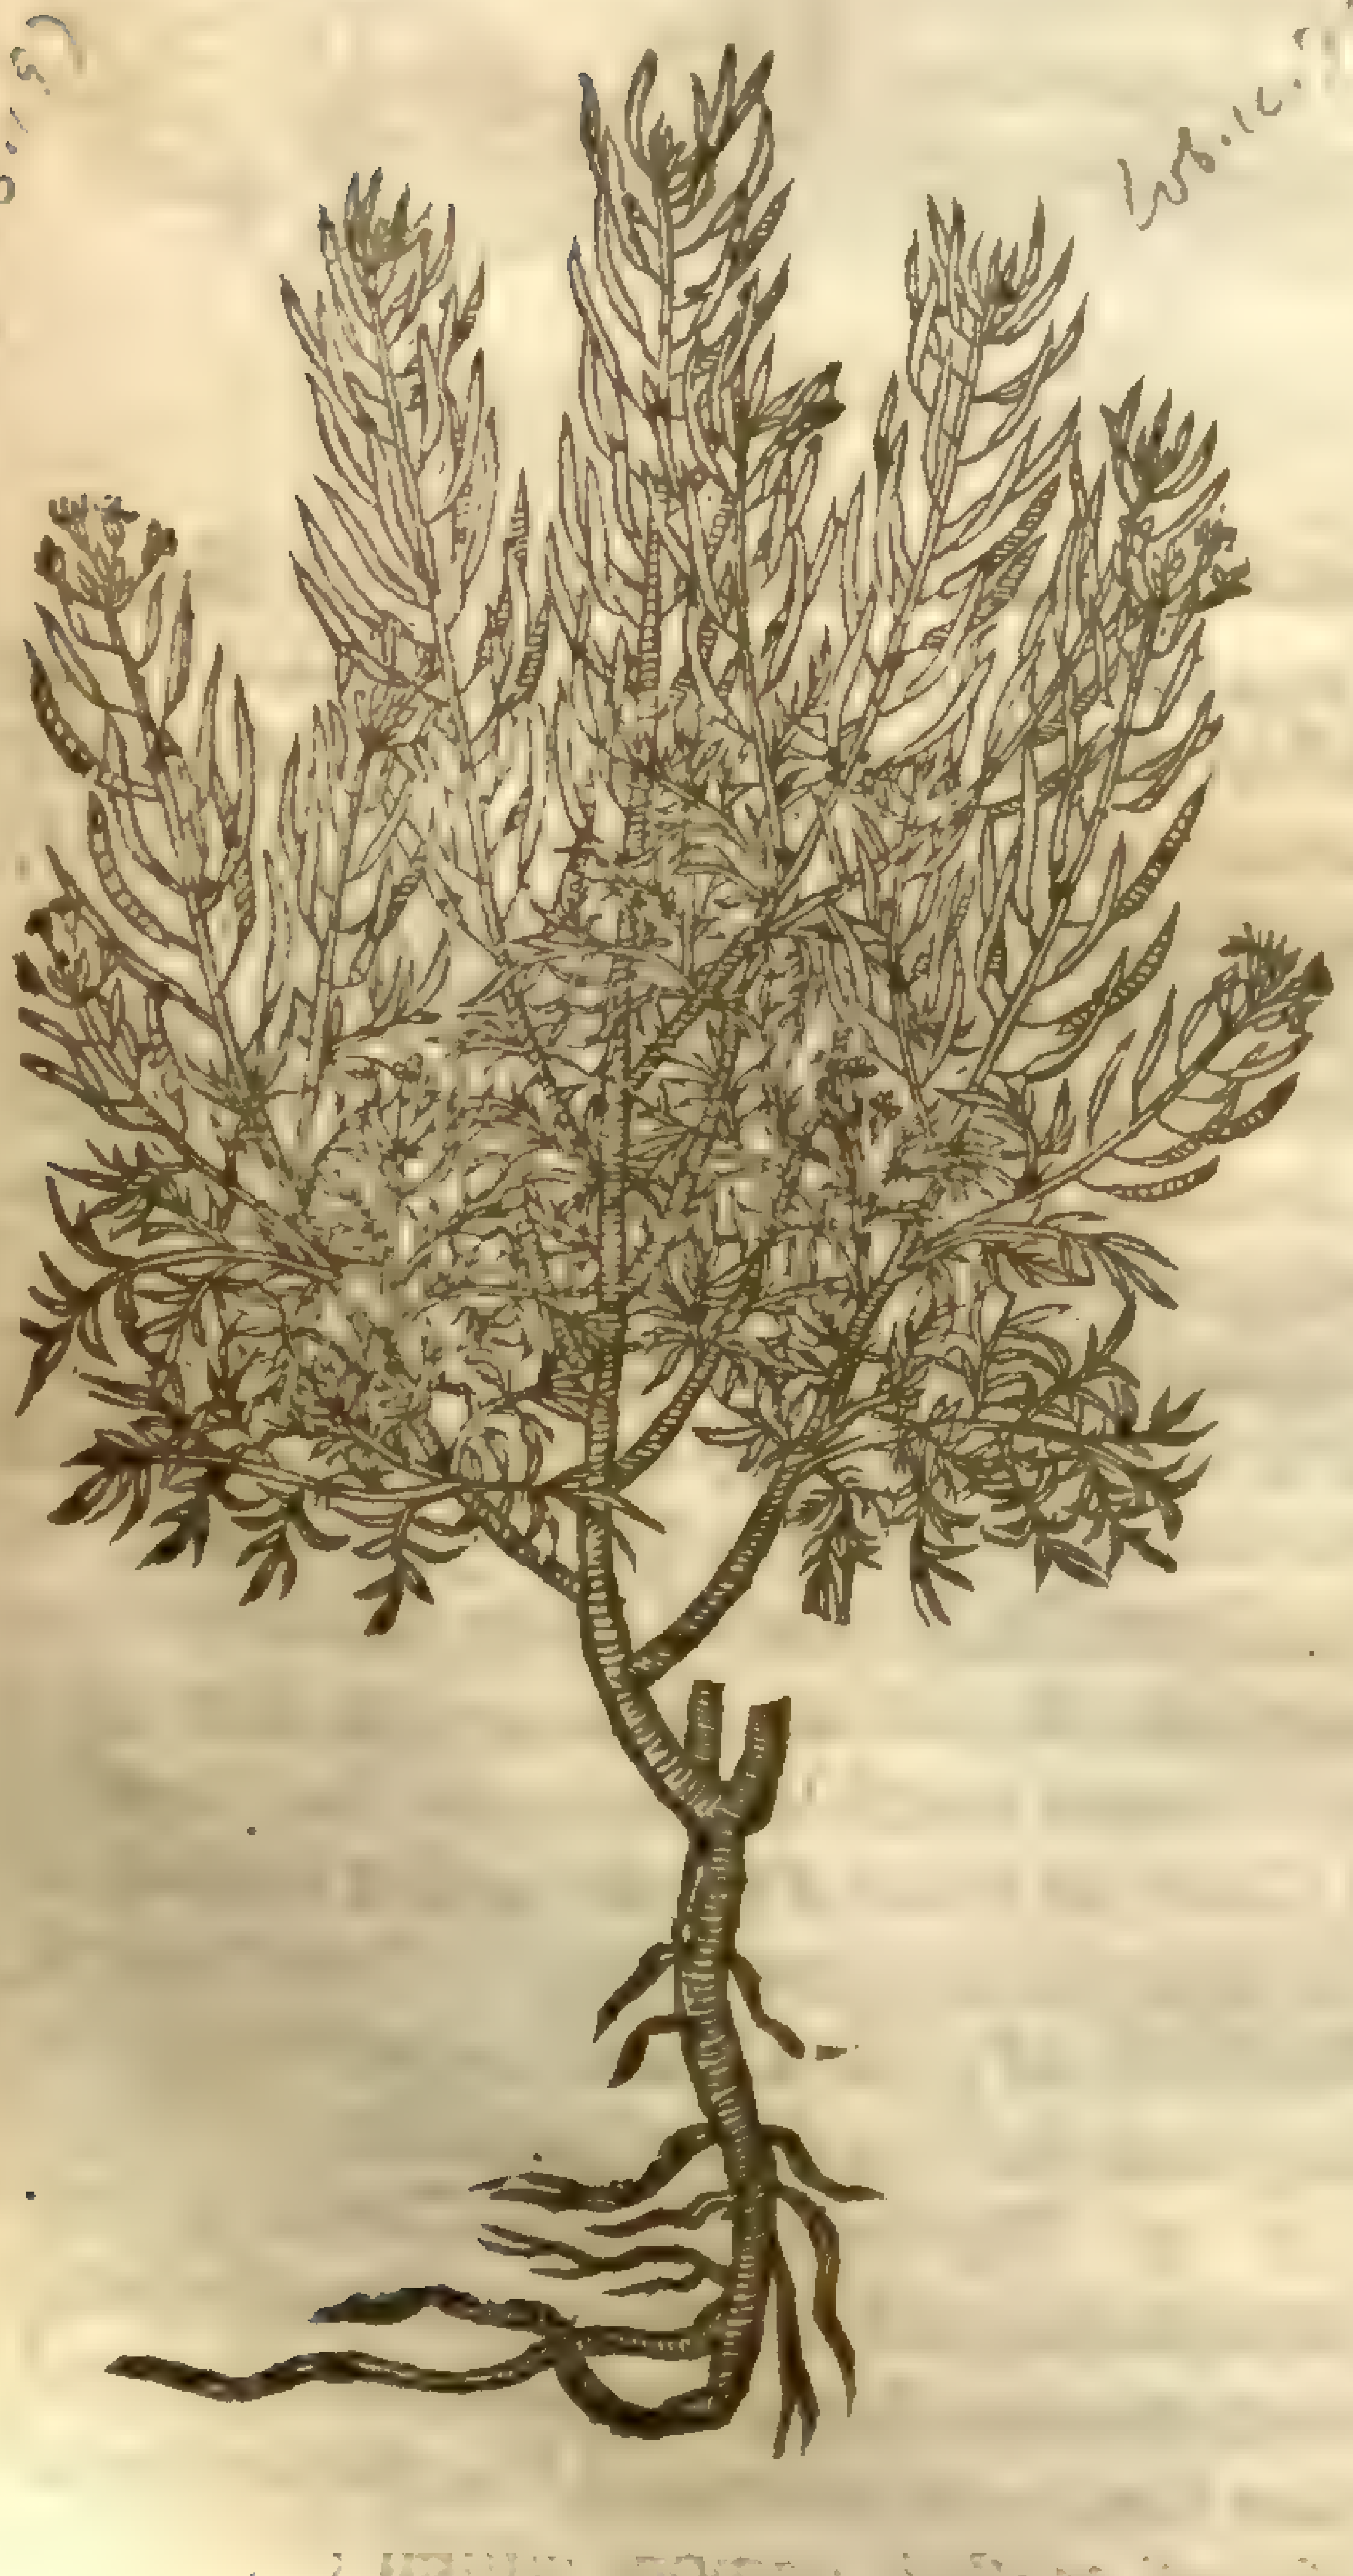
Their names hath been touched in their titles in as ample manner as hath been ſet down by my Author.

¶ *The Nature and Vertues.*

Their temperature and vertues are referred to the garden Cumin; notwithſtanding I cannot read in any Author of their vſe in Phyſicke.

Chap. 434. *Of Flixweed.*

1 *Sophia Chirurgorum.*
Flixweed.



Wb. 10. 1858

Sisymbrium Sophia, Linnæi dict. Lin. sp. 3.[illegible]

¶ *The Deſcription.*

1 Flixweed hath round & hard ſtalks, a cubit and a halfe high, whereon do grow leaues moſt finely cut and diuided into innumerable fine jags, like thoſe of the ſea Wormwood called *Seriphium*, or *Abſinthium tenuifolium*, but much finer and ſmaller, drawing neer vnto the ſmalleſt leaues of Corianders, of an ouerworne green colour: the flours grow alongſt the tops of the ſpriggy branches, of a dark yellow colour: after which come long cods full of ſmall red ſeeds: the root is long, ſtraight, and of a wooddie ſubſtance.

2 The ſecond ſort differeth not from the precedent, ſauing that the leaues of this plant are broader, wherein eſpecially conſiſteth the difference; notwithſtanding in mine opinion *Tabernamontanus* found this ſecond ſort growing in ſome fertil place, whereby the leaues did grow broader and greater, which moued him to make of this a ſecond ſort, whereas in truth they are both but one and the ſelfe ſame plant.

¶ *The Place.*

This Flixeweede groweth in moſt places of England, almoſt euery where in the ruines of old buildings, by high waies, and in filthie obſcure baſe places.

¶ *The Time.*

It floureth and ſeedeth from Iune to the end of September.

¶ *The Names.*

Flixweed is called *Thalietrum*; and of ſome, *Thalictrum*, but vnproperly; for *Thalictrum* belongs to Engliſh Rubarbe: the Paracelſians doe vaunt and brag very much of an herbe called *Sophia*, adding thereto the ſyrname *Paracelſi*, wherewith they imagine to doe wonders, whether this be the ſame plant it is diſputable, the controuerſie not as yet decided; neuertheleſſe we muſt be content to accept of this for the true *Sophia*, vntill ſome diſciple or other of his doe ſhew or ſet forth the plant wherewith their Maſter *Paracelſus* did ſuch great matters: in Engliſh we call it Flixweed, of his faculties againſt the flix.

¶ *The Temperature.*

Sophia drieth without any manifeſt ſharpneſſe or heate.

¶ *The Vertues.*

A The ſeed of *Sophia* or Flix-weed drunke with with wine or ſmiths water, ſtoppeth the bloudy flix, the laske, and all other iſſues of bloud.

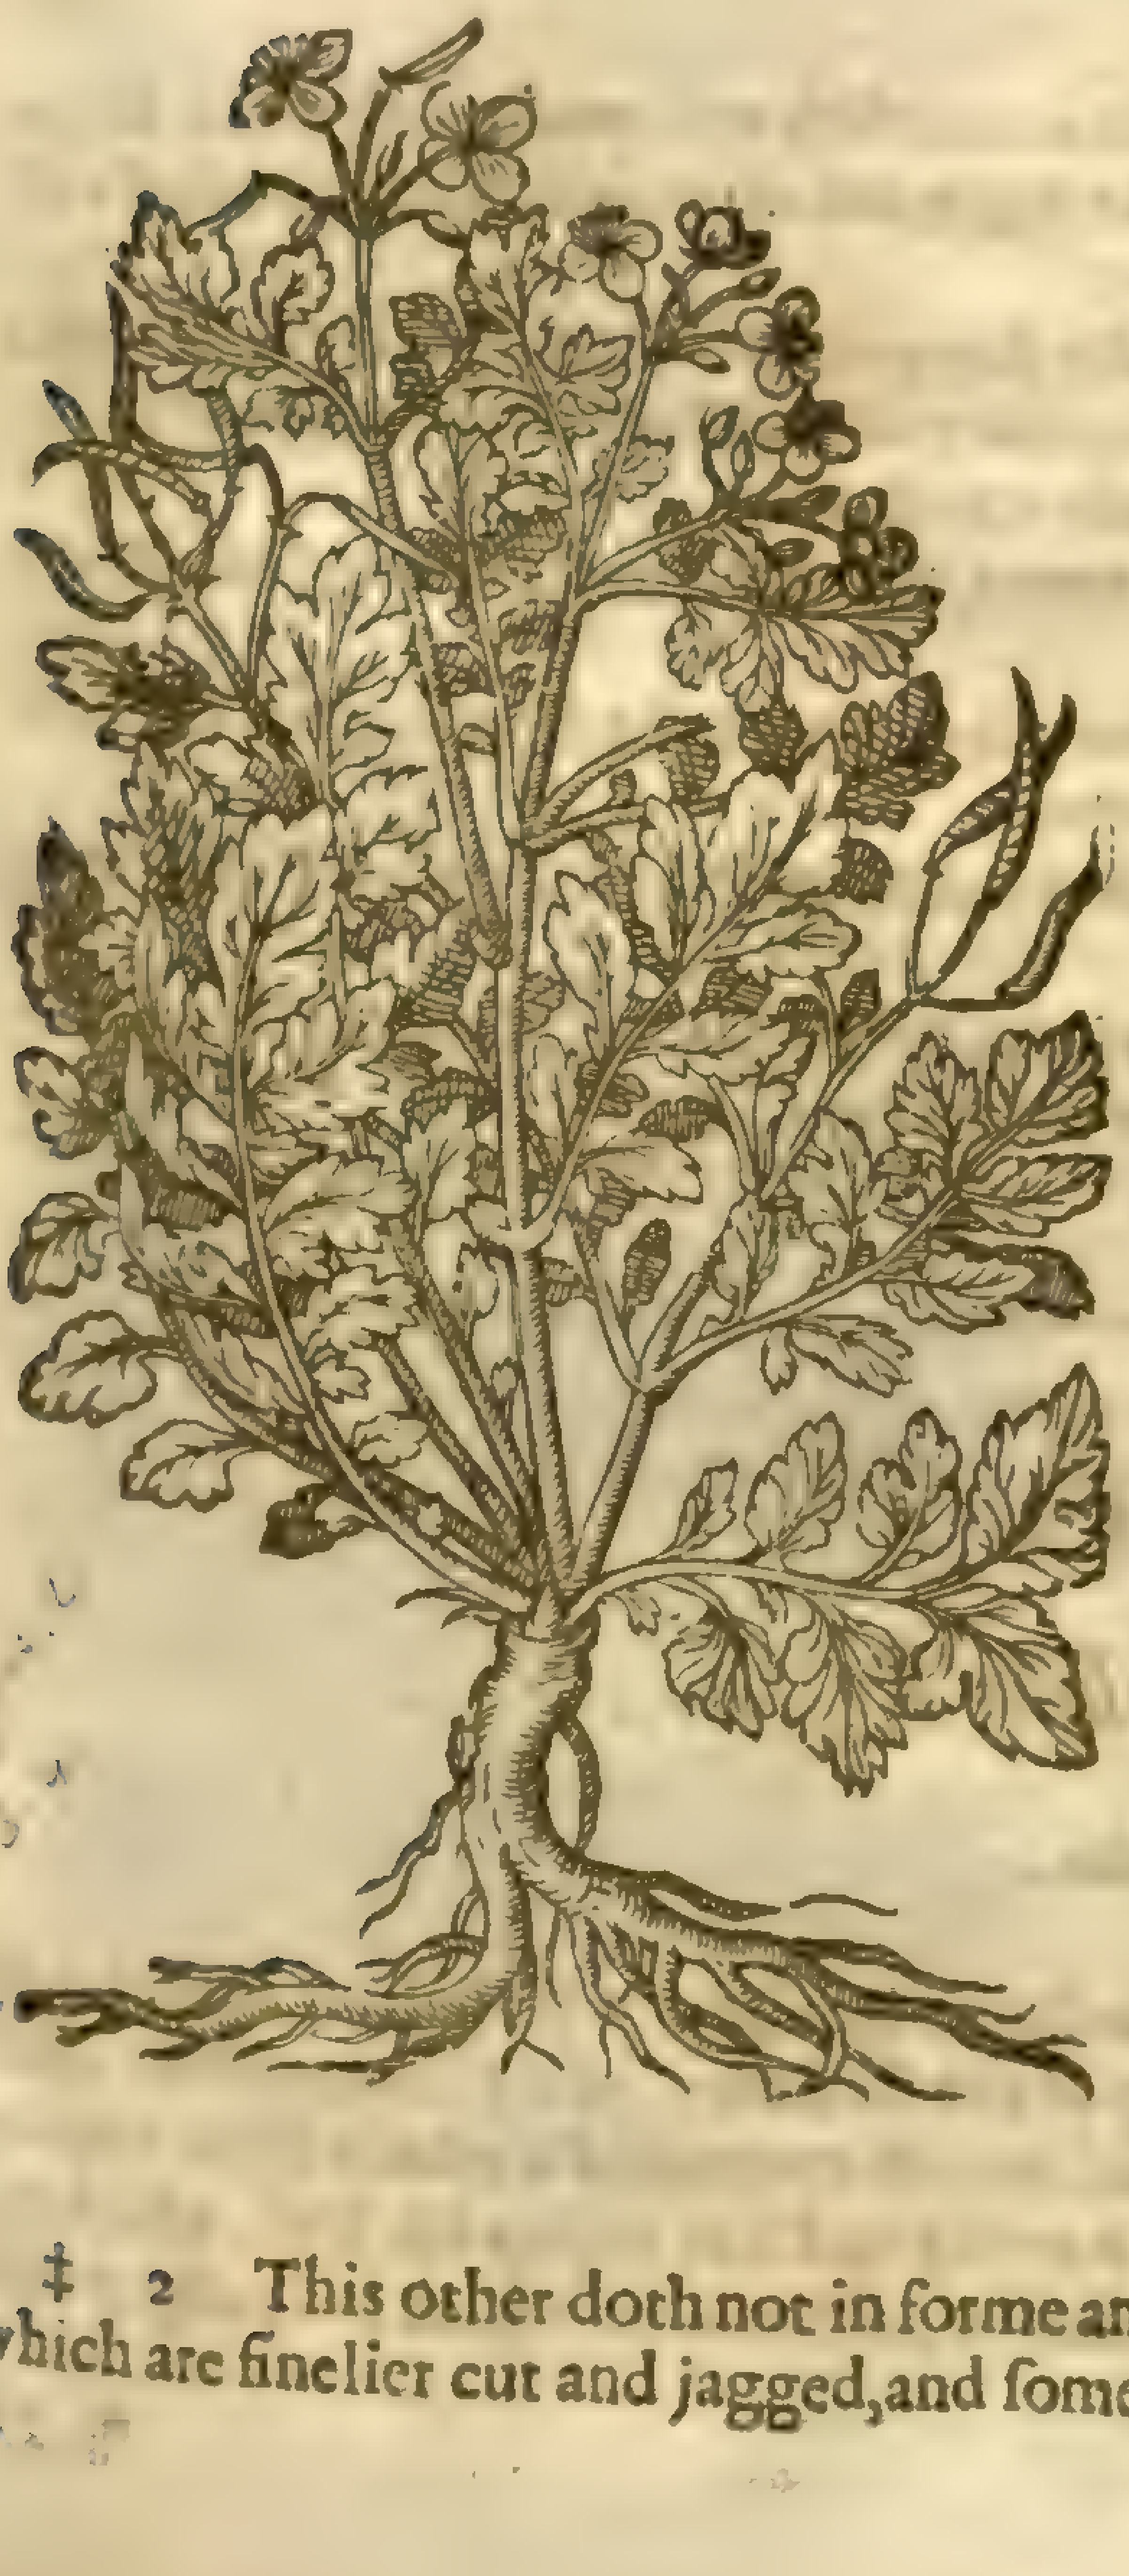
B The herb bruiſed or put into vnguents cloſeth and healeth vlcers, or old ſores and wounds, as *Paracelſus* ſaith; and that becauſe it drieth without acrimonie or ſharpneſſe.

CHAP. 435. *Of the great Celandine or Swallow-wort.*

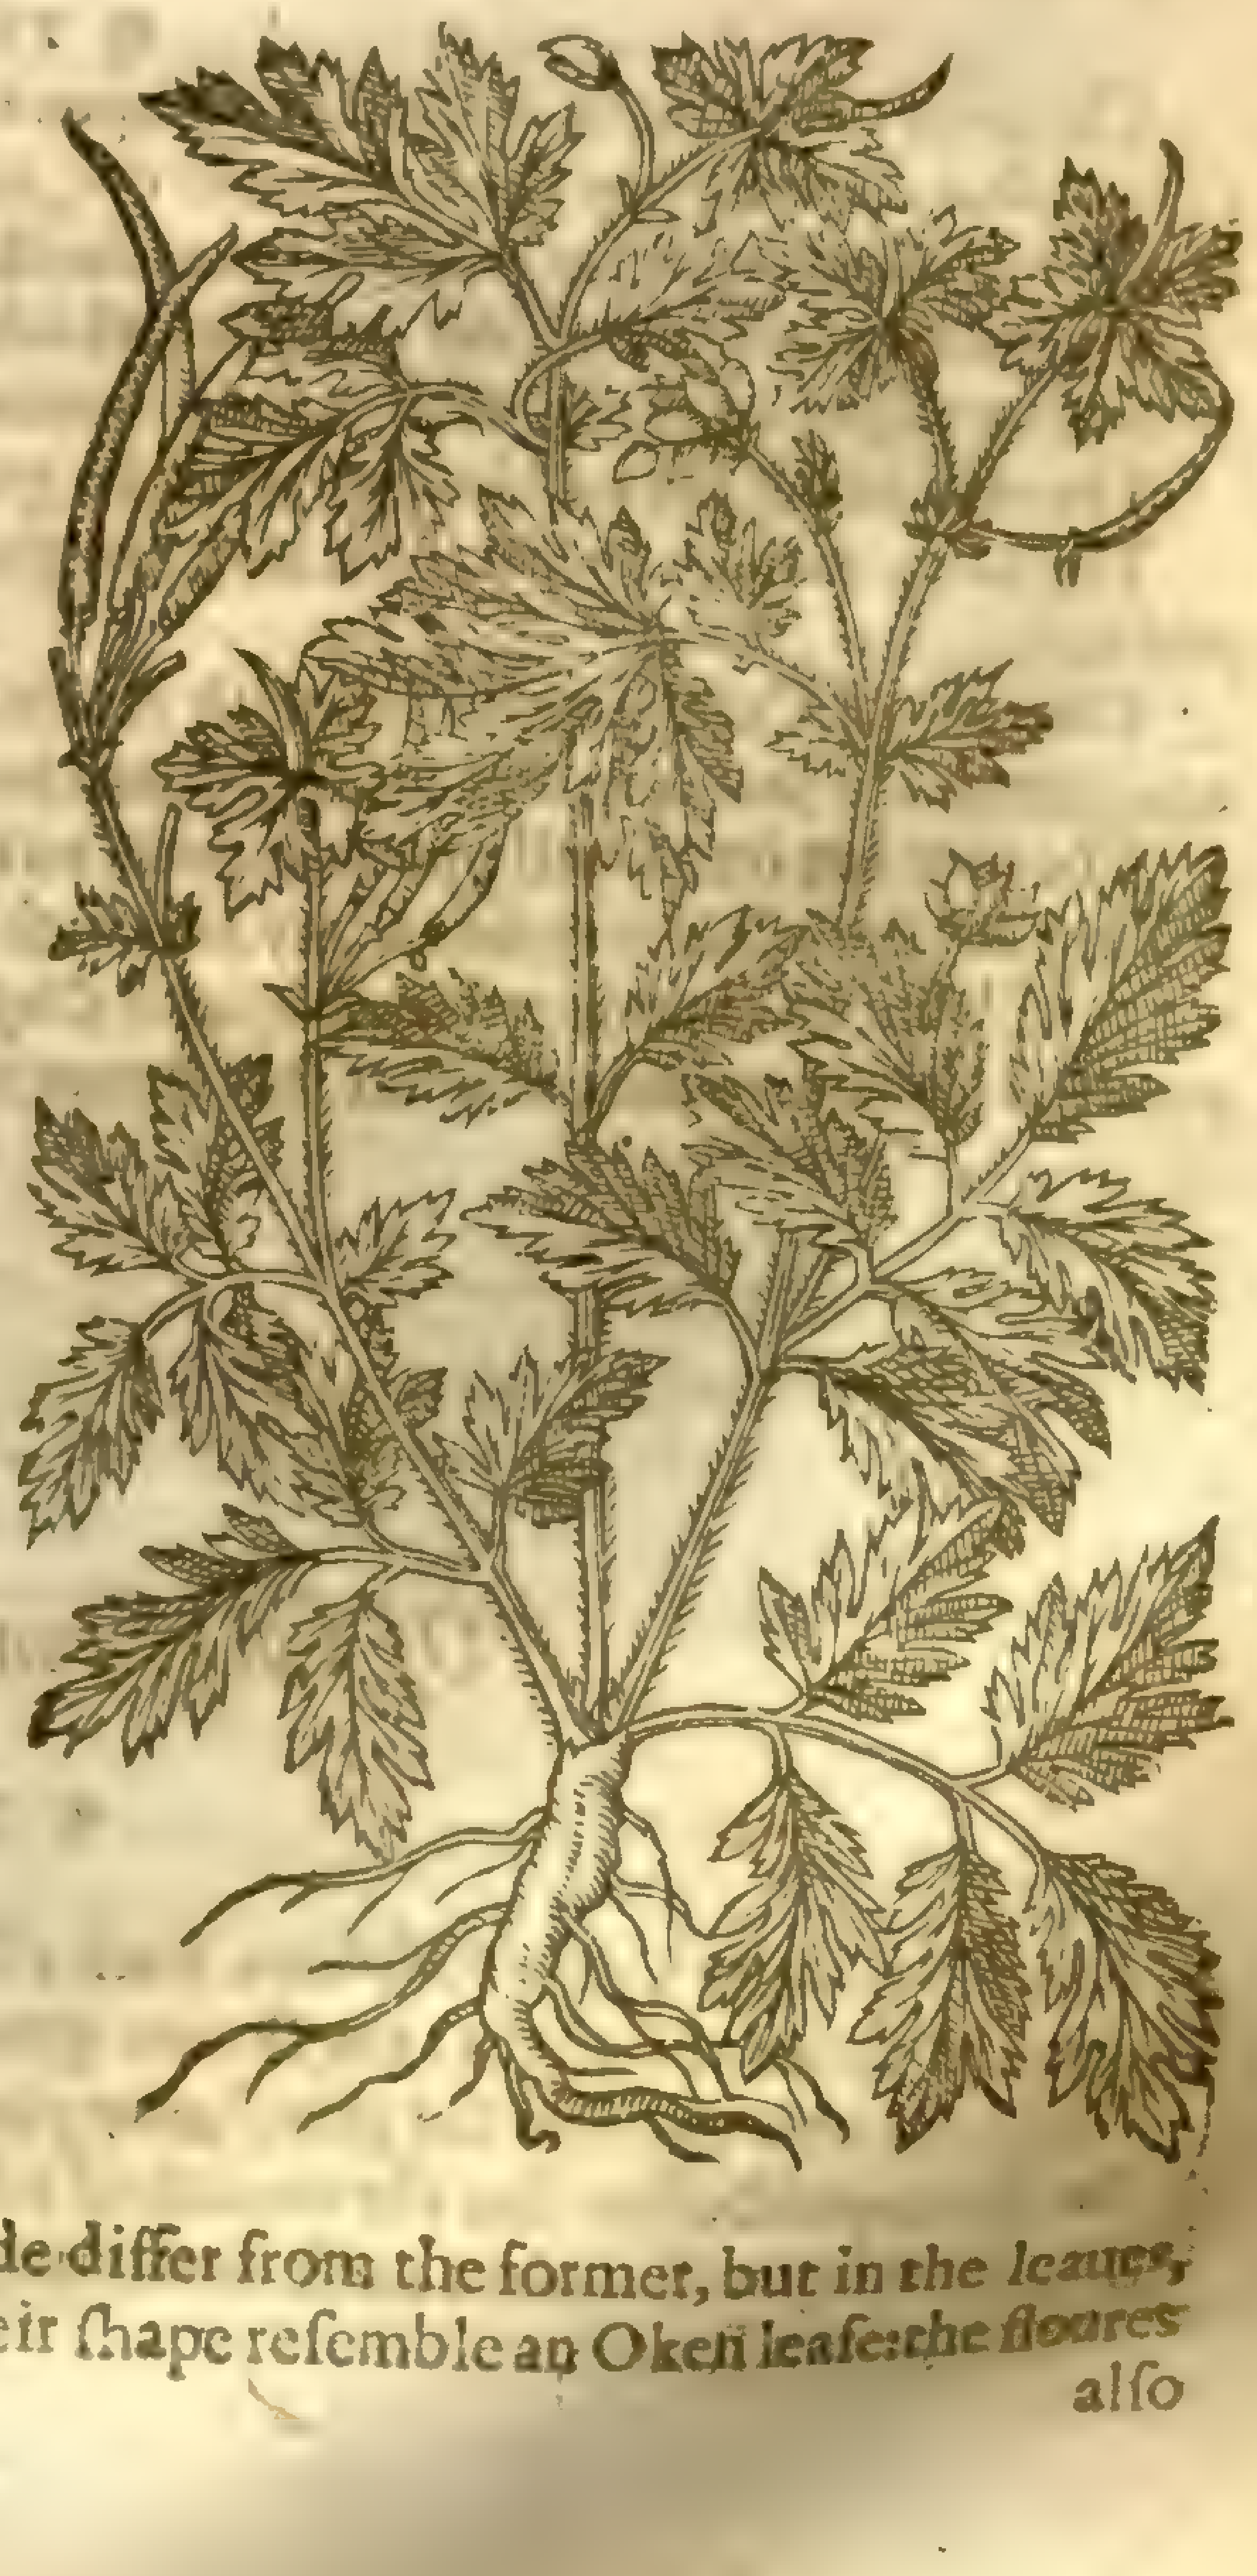
¶ *The Deſcription.*

1 The great Celandine hath a tender brittle ſtalke, round, hairy, and full of branches, each whereof hath diuers knees or knotty joints ſet with leaues not vnlike to thoſe of Columbine, but tenderer, and deeper cut or jagged, of a grayiſh green vnder, and greene on the other ſide tending to blewneſſe: the floures grow at the top of the ſtalks, of a gold yellow colour, in ſhape like thoſe of the Wal-floure: after which come long cods full of bleak or pale ſeeds: the whole plant is of a ſtrong vnpleaſant ſmell, and yeeldeth a thicke juice of a milky ſubſtance, of the colour of Saffron: the root is thicke and knobby, with ſome threds anexed thereto, which beeing broken or bruiſed, yeeldeth a ſap or juice of the colour of gold.

1 *Chelidonium majus.*
Great Celandine.



‡ 2 *Chelidonium majus folio magis diſſecto.*
Great Celandine with more cut leaues.



Chelidonium majus. [illegible]
[illegible]
[illegible] 3.

‡ 2 This other doth not in forme and magnitude differ from the former, but in the *leaues*, which are finelier cut and jagged, and ſomewhat in their ſhape reſemble an Oken leafe: the floures

alſo are a little jagged or cut about the edges; and in theſe two particulars conſiſts the whole difference. *Cluſius* calls it *Cheledonium majus laciniato flore*: and *Bauhine*, *Cheledonium majus folijs quernis*. ‡

¶ *The Place.*

It groweth in vntilled places by common way ſides, among briers and brambles, about old wals, and in the ſhade rather than in the Sun.

¶ *The Time.*

It is greene all the yeare: it floureth from Aprill to a good part of Summer: the cods are perfected in the mean time.

¶ *The Names.*

It is called in Greeke χελιδόνιον: in Latine, *Chelidonium majus*, and *Hirundinarium major*: amongſt the Apothecaries, *Chelidonia*: diuers miſcall it by the name *Chelidonium*: it is named in Italian, *Celidonia*: in Spaniſh, *Celidubenha*, *Yerva de las golundrinhas*: in high-Dutch, **Groſz Scholwurtz**: in low-Dutch, **Stinkende Gouwe**: in French, *Eſclere*, or *Eſclayre*, and *Celidoine*: in Engliſh, Celandine, or great Celandine, Swallow-wort, and Tetter-wort.

It is called Celandine not becauſe it firſt ſpringeth at the comming in of Swallowes, or dieth when they go away, (for as we haue ſaid, it may be found all the yere) but becauſe ſome hold opinion, that with this herb the dams reſtore ſight to their yong ones when they cannot ſee. Which things are vain and falſe; for *Cornelius Celſus, lib. 6.* witneſſeth, That when the ſight of the eies of diuers yong birds is put forth by ſome outward means, it will after a time be reſtored of it ſelfe, and ſooneſt of all the ſight of the Swallow: whereupon (as the ſame Author ſaith) the tale grew, how thorow an herb the dams reſtore that thing which healeth of it ſelfe. The very ſame doth *Ariſtotle* alledge, *lib. 6. de Animal.* The eies of Swallowes (ſaith he) that are not fledge, if a man do pricke them out, do afterwards grow againe and perfectly recouer their ſight.

¶ *The Nature.*

The great Celandine is manifeſtly hot and dry, and that in the third degree, and withall ſcoures and clenſeth effectually.

¶ *The Vertues.*

A The juice of the herbe is good to ſharpen the ſight, for it clenſeth and conſumeth away ſlimie things that cleaue about the ball of the eye, and hinder the ſight, and eſpecially being boiled with hony in a braſen veſſell, as *Dioſcorides* teacheth.

B The root cureth the yellow jaundice which comes of the ſtopping of the gall, eſpecially when there is no ague adjoined with it, for it opens and deliuers the gall and liuer from ſtoppings.

C The root being chewed is reported to be good againſt the tooth-ache.

D The juice muſt be drawn forth in the beginning of Summer, and dried in the ſunne, ſaith *Dioſcorides*.

E The root of Celandine boiled with Aniſe ſeed in white wine, opens the ſtoppings of the liuer, and cureth the jaundice very ſafely, as hath been often proued.

F The root cut into ſmall pieces is good to be giuen vnto Hauks againſt ſundry diſeaſes, whereunto they are ſubiect, as wormes, Cray, and ſuch like.

G ‡ I haue by experience found (ſaith *Cluſius*) that the juice of the great Celandine dropped into ſmall greene wounds of what ſort ſoeuer, wonderfully cures them. ‡

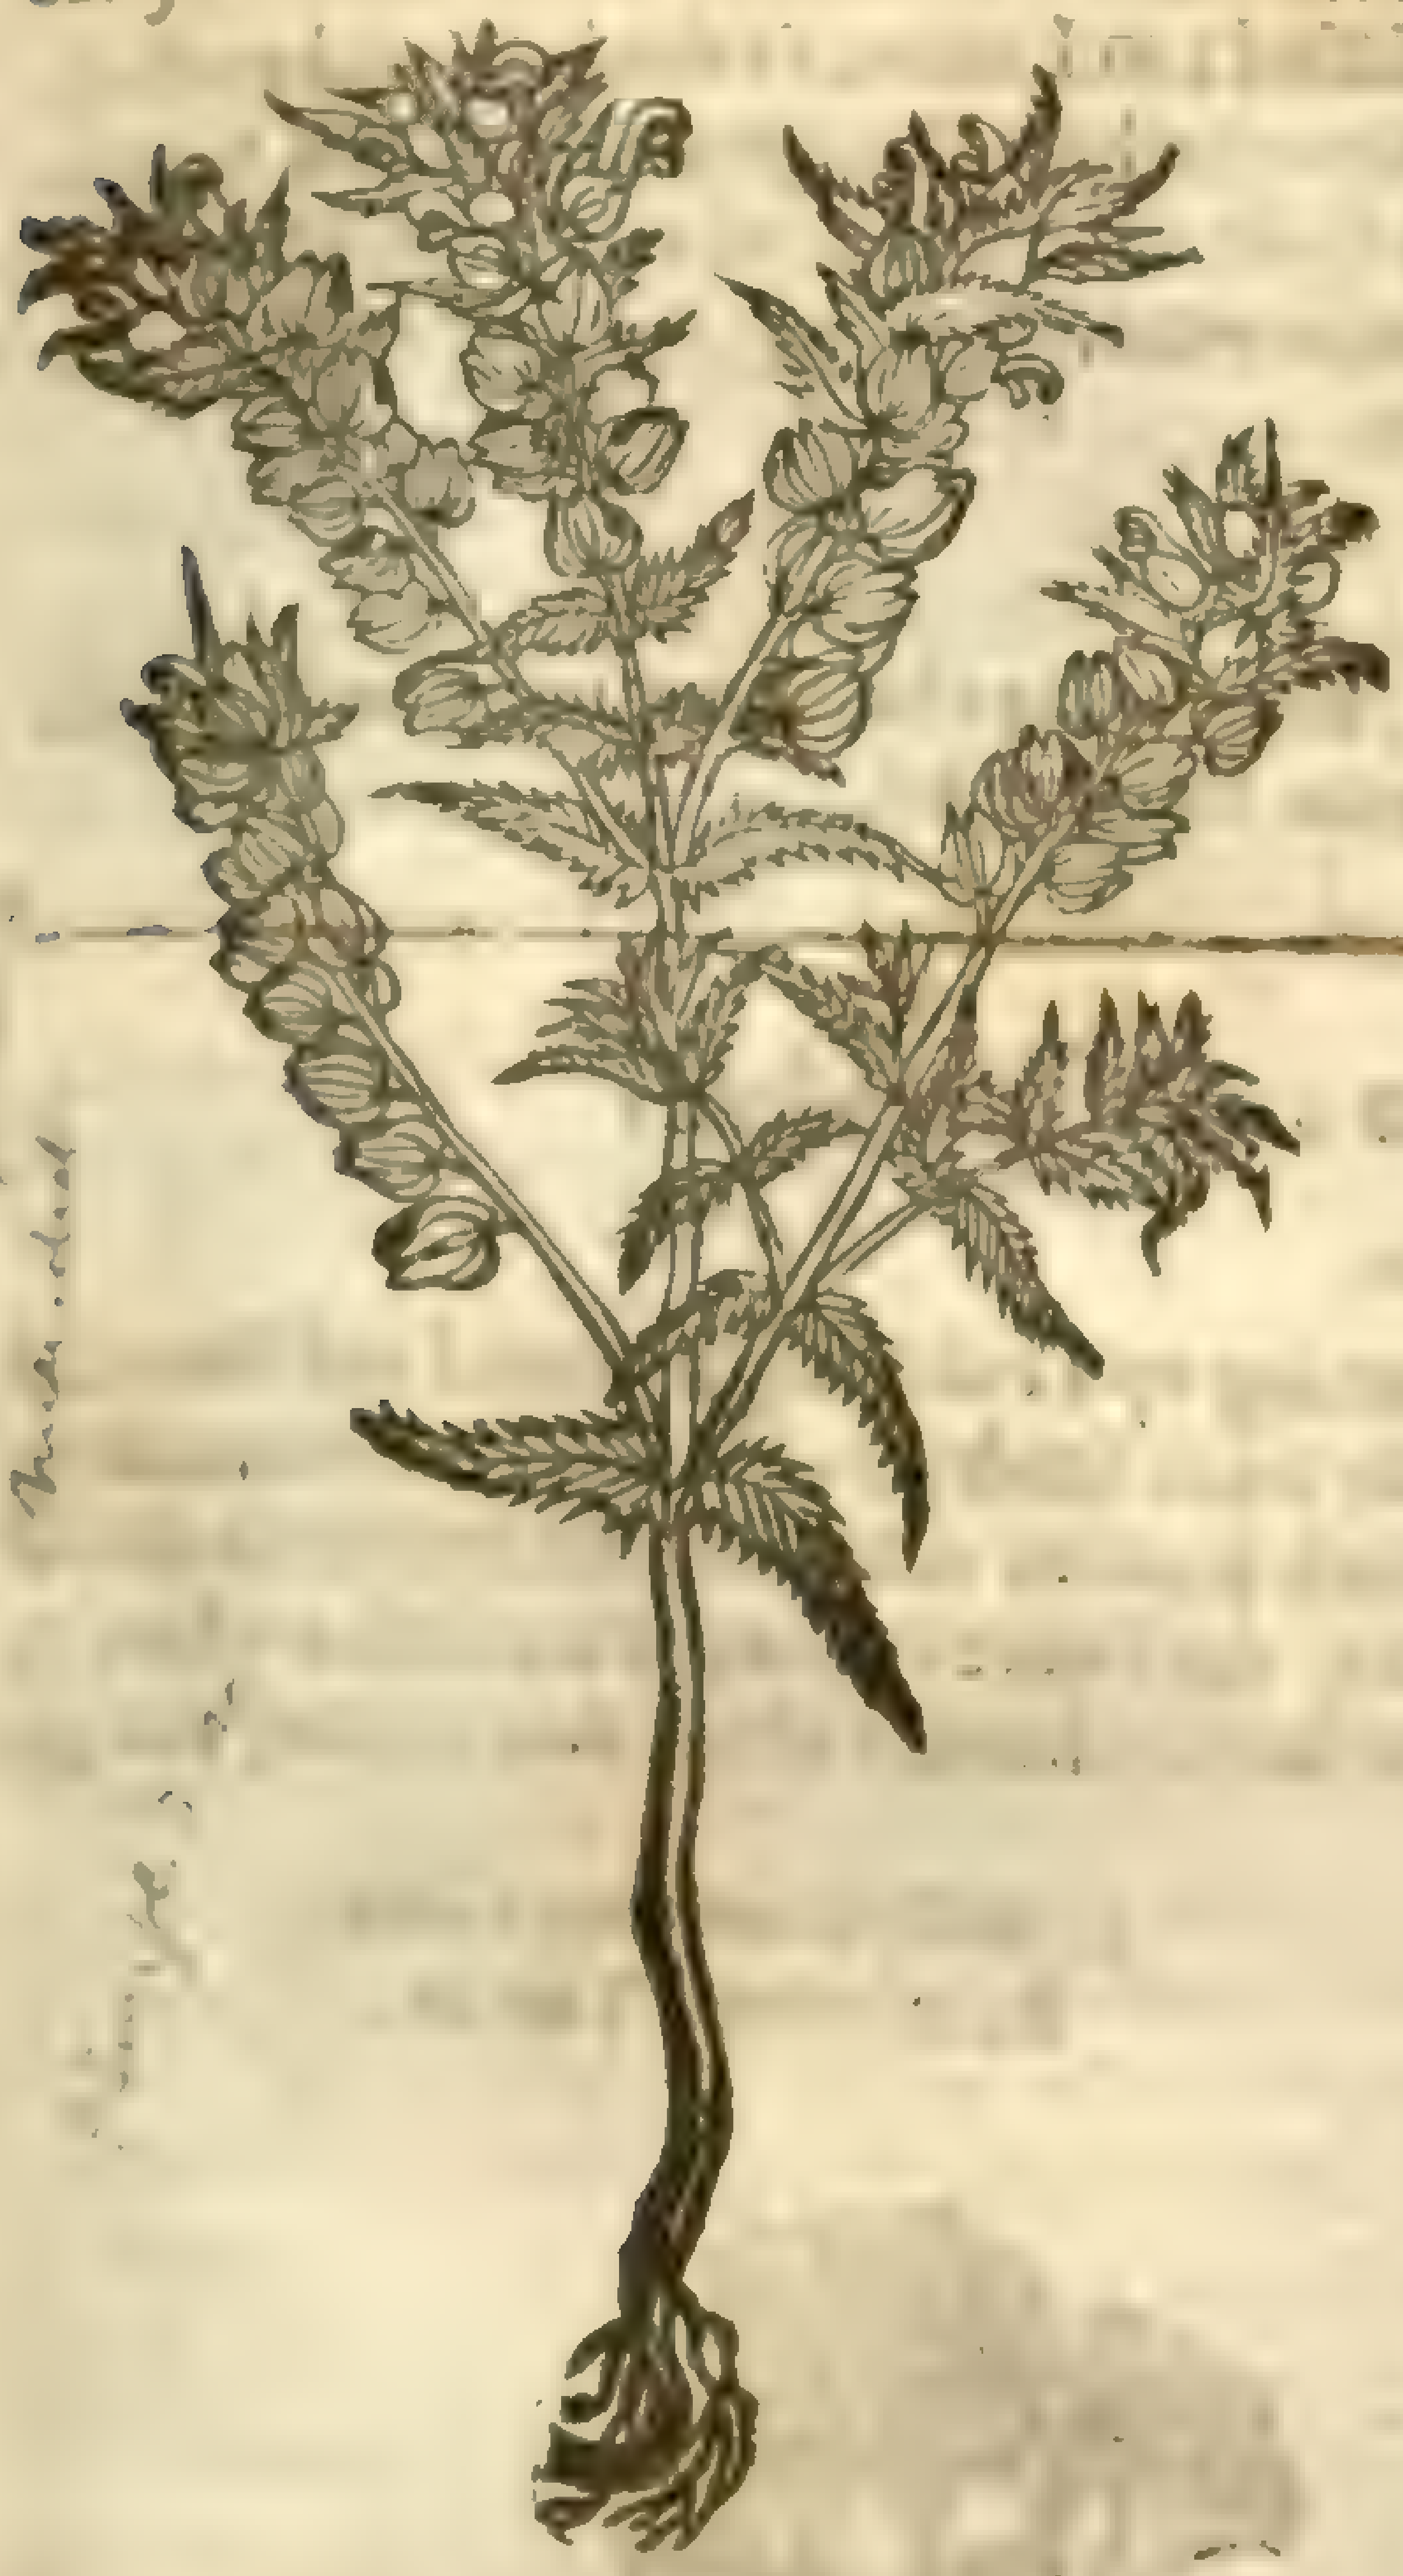
CHAP. 436.

Of Cocks-combe or yellow Rattle.

¶ *The Deſcription.*

CHriſta Galli, or Griſta Gallinacea*, hath a ſtrait vpright ſtalke ſet about with narrow leaues ſnipt round about the edges: the floures grow at the top of the ſtemmes, of a yellow colour; after which come vp little flat pouches or purſes, couered ouer or contained within a little bladder or flat skin, open before like the mouth of a fiſh, wherin is contained flat yellowiſh ſeed, which being ripe and dry will make a noiſe or rattling when it is ſhaken or moued, of which property it took the name yellow Rattle.

Chriſti Galli. Yellow rattle or Coxcomb.



Rhinanthus [illegible]

¶ *The Place.*

It growes in dry medowes and paſtures and is to them a great anoyance.

¶ *The Time.*

It floureth moſt part of the Summer.

¶ *The Names.*

It is called in low-Dutch, **Ratelen**, and **Geele Ratelen**: commonly in Latine, *Criſta Galli*, and *Gallinacea Chriſti*: In Engliſh, Coxcombe, Penny-graſſe, yellow or white Rattle: in high-Dutch it is called **geel Rodel**: in French, *Creſte de Coc*: diuers take it to be the old writers *Alectorolophos*.

‡ Some thinke it to be the *Mimmulus*: or as others (and that more fitly) reade it, *Nummulus*, mentioned by *Pliny*, *lib.* 18. *cap.* 28. ‡

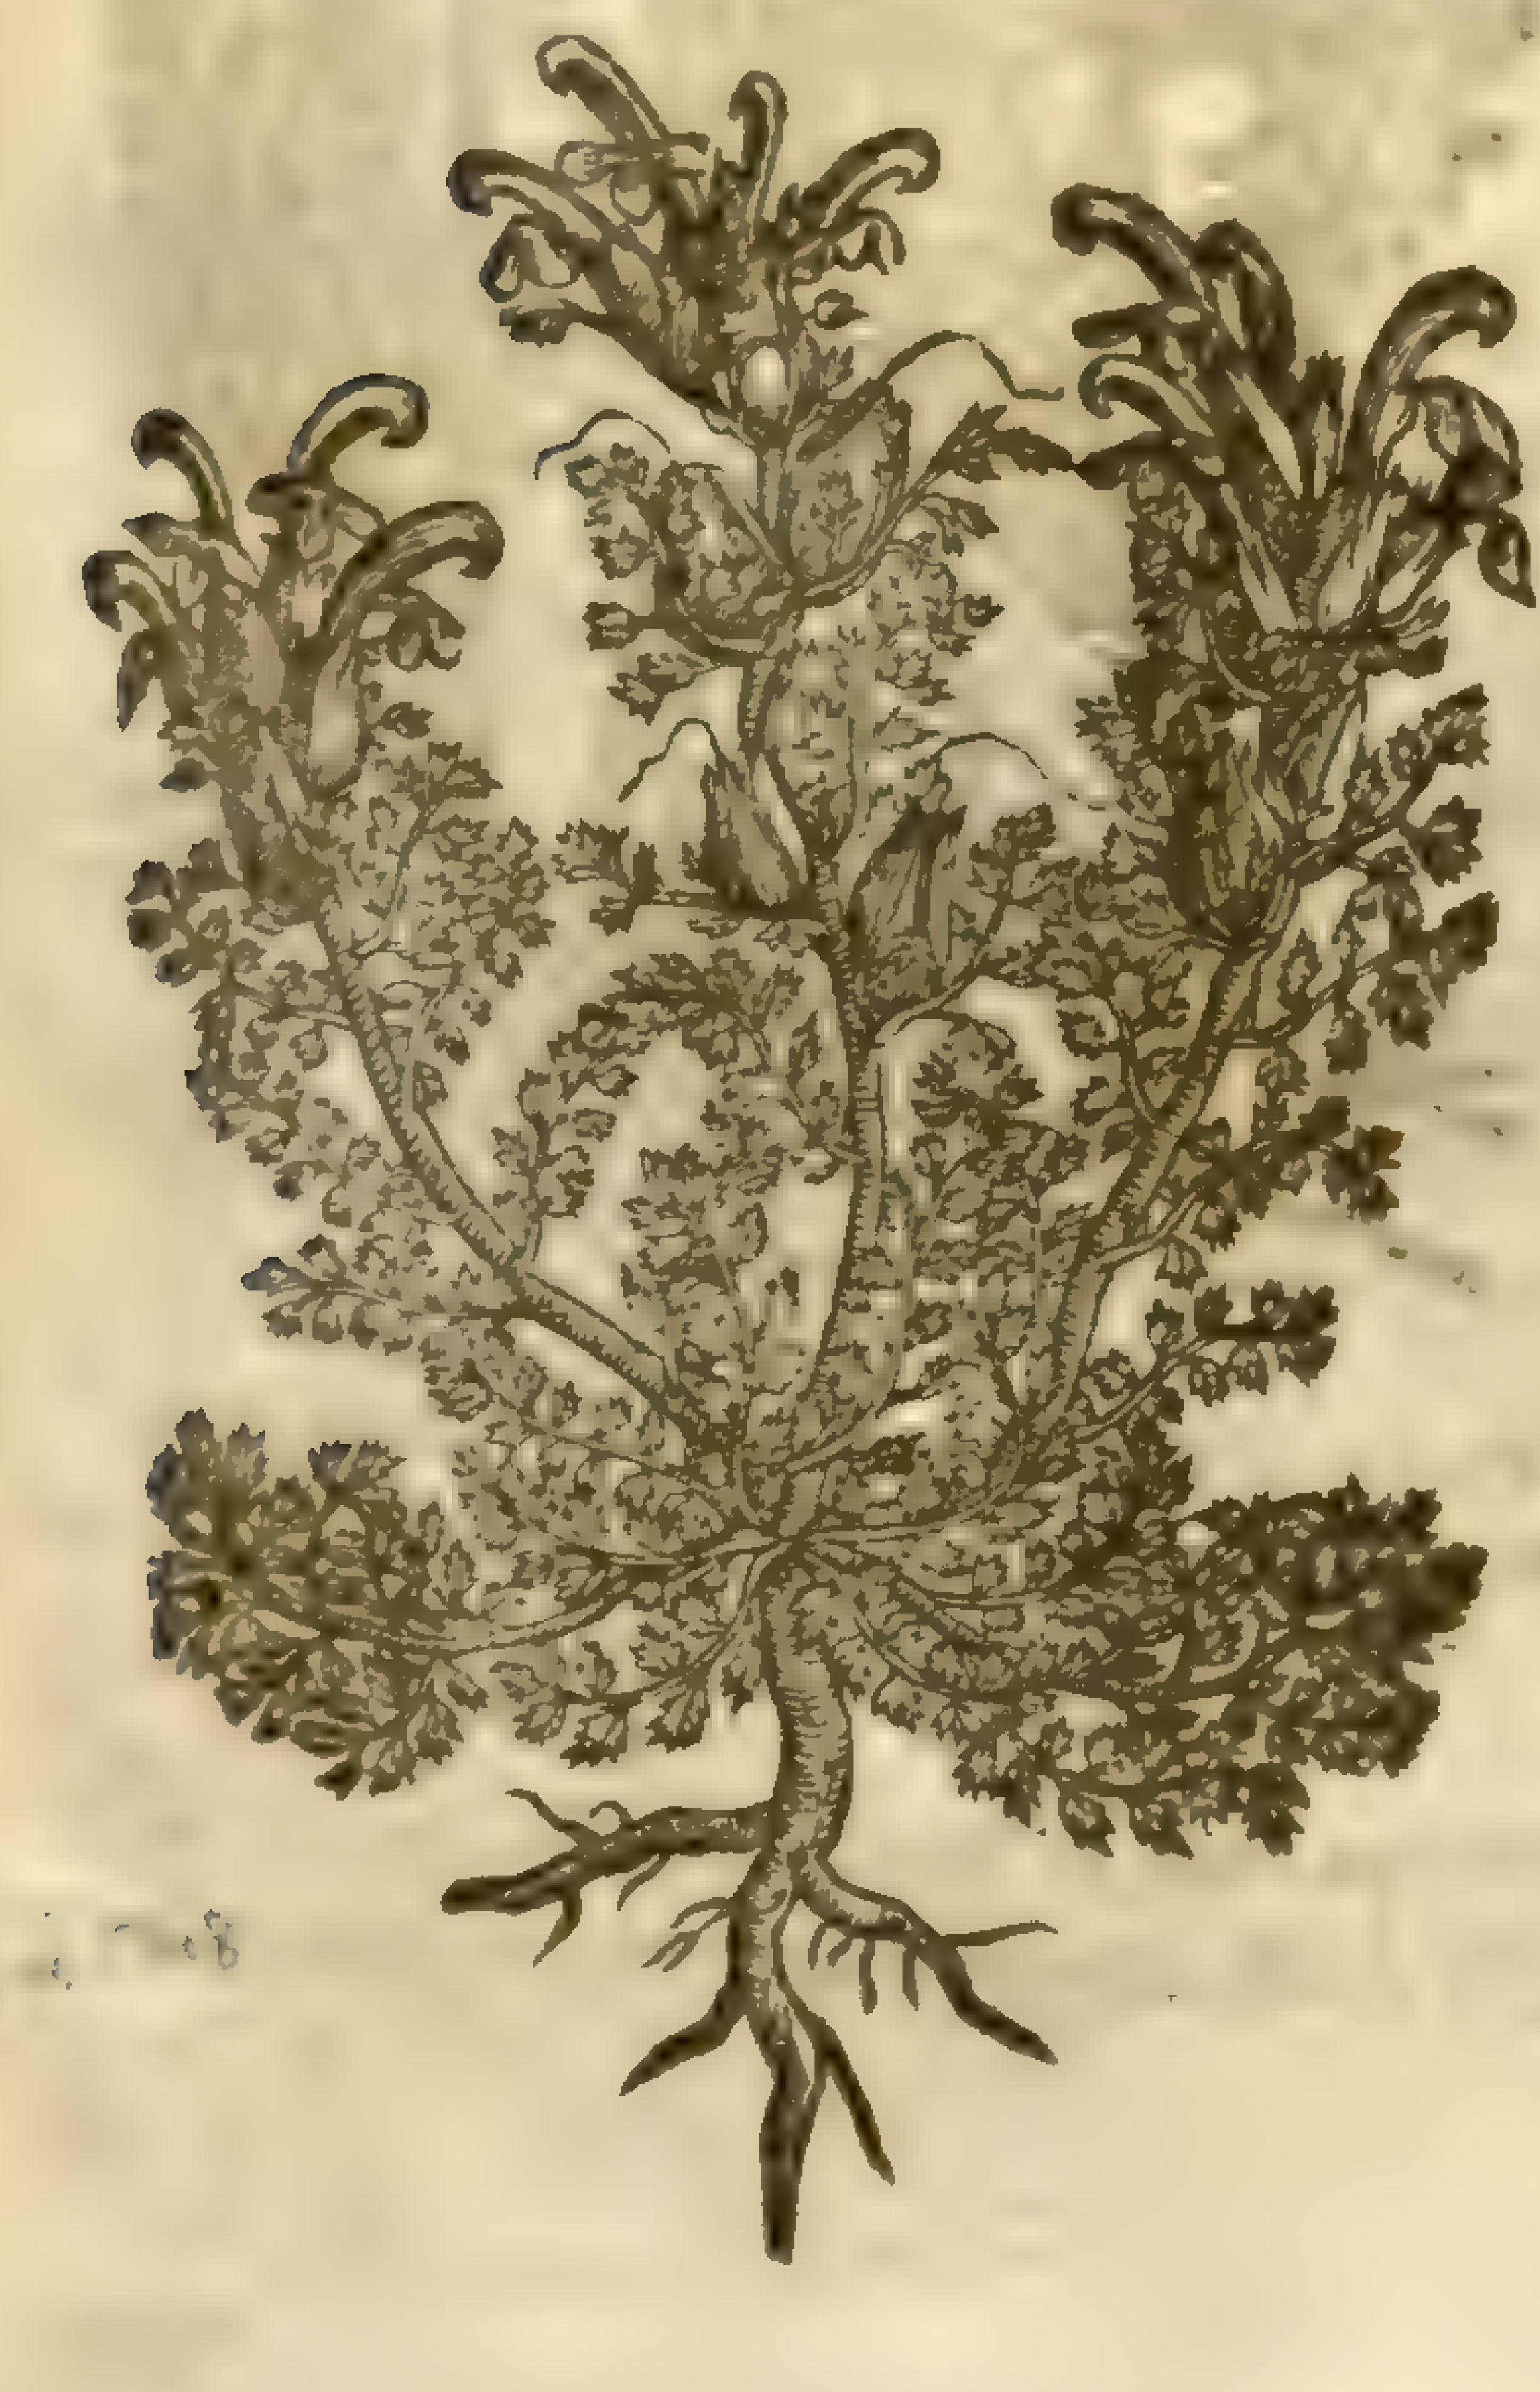
¶ *The Nature and Vertues.*

What temperature or vertue this herb is of, men haue not as yet been carefull to know, ſeeing it is accounted vnprofitable.

Chap. 437. *Of Red Rattle or Louſe-wort.*

[illegible]

Pedicularis.
Louſe-wort, or red-Rattle.



¶ *The Deſcription.*

Red Rattle (of *Dodonæus* called *Fiſtularia*, and according to the opinion and cenſure of *Cluſius*, *Pena*, and others, the true *Alectorolophos*) hath very ſmall rent or jagged leaues of a brown red colour, and weake ſmall and tender ſtalks, wherof ſome lie along trailing vpon the ground: in very mooriſh medows they grow a cubit high and more: but in moiſt and wet heaths and ſuch like barren grounds not aboue an handfull high: the floures grow round about the ſtalke, from the midſt thereof euen to the top, of a brown colour, in ſhape like the floures of dead Nettle: which being paſt, there ſucceed little flat pouches, wherein is contained flat and blackiſh ſeed, in ſhew very like to the former: the root is ſmall, white, and tender.

¶ *The Place.*

It growes in moiſt and mooriſh medows: the herb is not only vnprofitable, but alſo hurtful to medowes

¶ *The Time.*

It is found with the floures and ſtalks in May and Iune.

¶ The

¶ *The Names.*

It is called in Greeke, φθειρῖον : in high-Dutch, **Braun Rodel** : in Latine, *Pedicularis*, of the effect, becauſe it filleth ſheep and other cattell that feed in medowes where this groweth, full of lice: diuers of the later herbariſts call it *Piſtularia* : of ſome, *Criſti Galla* : and ſome take it to be *Mimmulus herba* : in Engliſh, Rattle-graſſe, red Rattle-graſſe, and Louſe-wort.

¶ *The Nature.*

It is cold and dry, and aſtringent.

¶ *The Vertues.*

A It is held to be good for fiſtulaes and hollow vlcers, and to ſtay the ouermuch flowing of the menſes or any other flux of bloud, if it be boiled in red wine and drunke.

Chap. 438. *Of Yarrow or Noſe-bleed.*

¶ *The Deſcription.*

1 Common Yarrow hath very many ſtalks comming vp a cubit high, round and ſomwhat hard, about which ſtand long leaues cut in the ſides ſundry wiſe, and as it were made vp of many ſmal jagged leaues, euery one of which ſeem to reſemble the ſlender leaues of Coriander : there ſtand at the top tufts or ſpoked rundles, the floures whereof are either white or purple, which being rubbed do yeeld a ſtrong vnpleaſant ſmel : the root ſends down many ſtrings.

1 *Milleſolium terreſtre vulgare.*
Common Yarrow.

Achillea millefolium L.
Mill. dict.
Linn. sp. pl. 3. 1262
Syst.

2 *Milleſolium flore rubro.*
Red floured Yarrow.

2 The ſecond kinde of Milfoile or Yarrow hath ſtalkes, leaues, and roots like the former, ſaue that his ſpoky tufts are of an excellent faire red or crimſon colour, and being a little rubbed in the hand, of a reaſonable good ſauor.

¶ *The Place.*

The firſt groweth euery where in dry paſtures and medowes : red Milfoile growes in a field by Sutton in Kent, called Holy-Deane, from whence I brought thoſe plants that grow in my garden: but it is not common euery where as the other is.

¶ *The Time.*

They floure from May to the end of October.

¶ The

¶ *The Names.*

Yarrow is called of the Latine Herbariſts *Millefolium*: it is *Dioſcorides* his ἀχίλλειος: in Latine, *Achillea*, and *Achillea ſideritis*; which thing he may very plainely ſee that will compare with that deſcription which *Dioſcorides* hath ſet downe: this was found out, ſaith *Pliny* in his 25. booke, chap. 5. by *Achilles*, *Chirons* diſciple, which for that cauſe is named *Achilleios*: of others, *Sideritis*: among vs, *Millefoleum*: yet be there other *Sideritides*, and alſo another *Panaces Heracleion*, whereof we haue intreated in another place: *Apuleius* ſetteth downe diuers names hereof, ſome of which are alſo found among the baſtard names in *Dioſcorides*: in Latine it is called *Militaris*, *Supercilium Veneris*, *Acrum*, or *Acorum ſyluaticum*: of the French men, *Millefueille*: in high Dutch, **Garben, ſcharſſgras**: in low Dutch, **Geruwe**: in Italian, *Millefoglio*: in Spaniſh, *Milhojas yerua*: in Engliſh, Yarrow, Noſebleed, common Yarrow, red Yarrow, and Milfoile.

¶ *The Temperature.*

Yarrow as *Galen* ſaith, is not vnlike in temperature to the *Sideritides*, or Iron worts, that is to ſay, clenſing, and meanely cold, but it moſt of all bindeth.

¶ *The Vertues.*

The leaues of Yarrow do cloſe vp wounds, and keepe them from inflammation, or fiery ſwelling: it ſtancheth bloud in any part of the body, and it is likewiſe put into bathes for women to ſit in: it ſtoppeth the laske, and being drunke it helpeth the bloudy flix. A

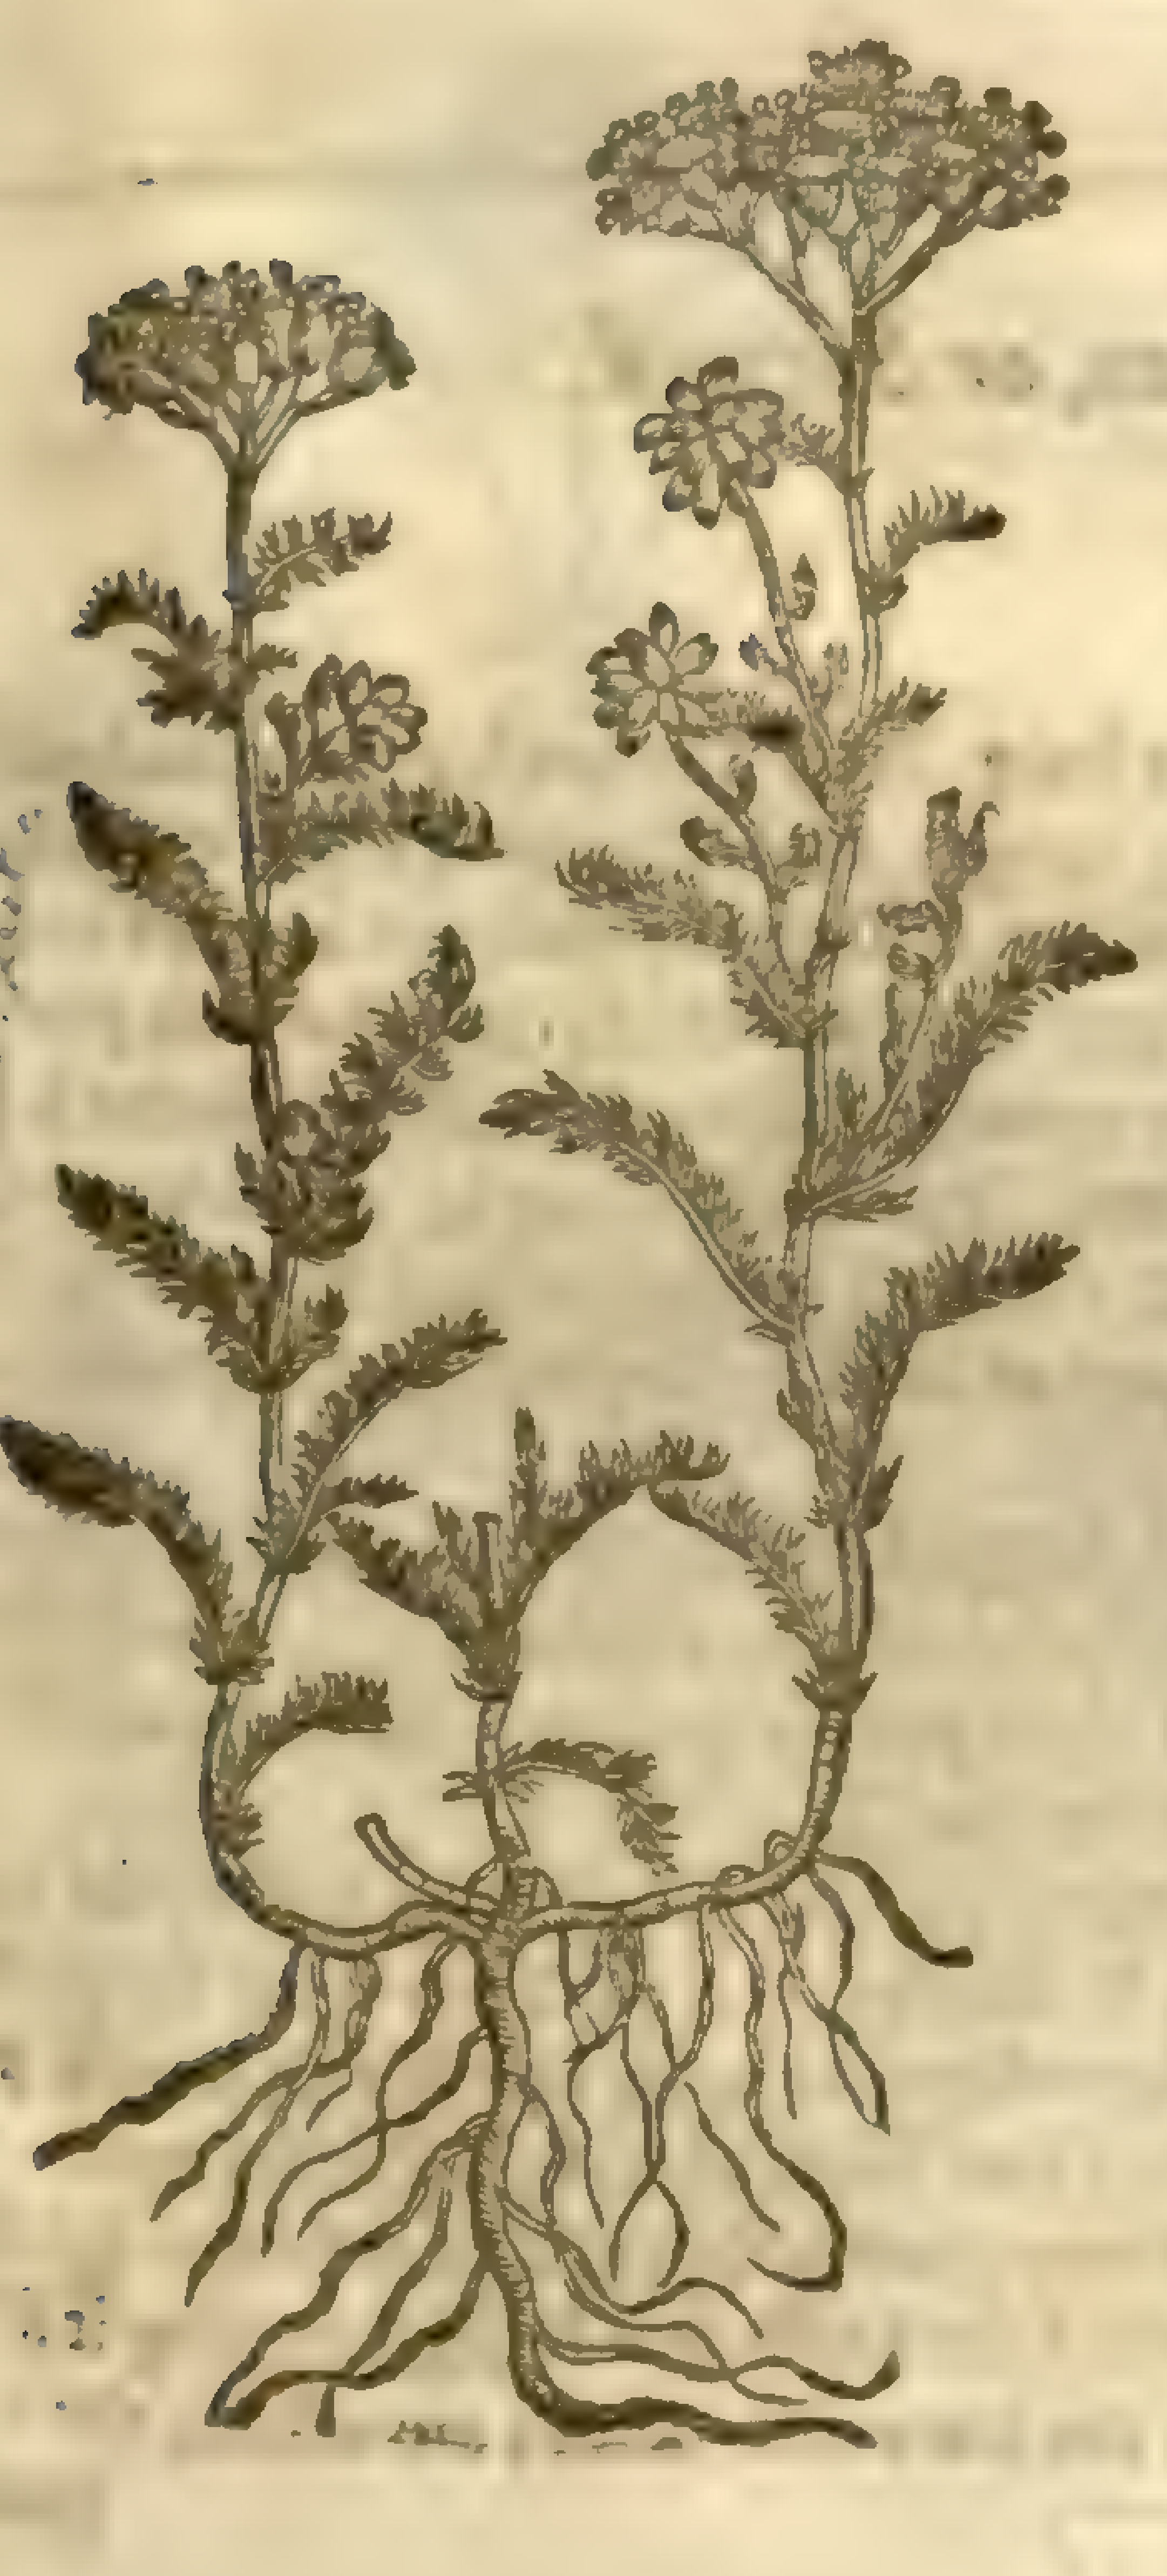
Moſt men ſay that the leaues chewed, and eſpecially greene are a remedy for the tooth ache. B

The leaues being put into the noſe, do cauſe it to bleed, and eaſe the paine of the megrim. C

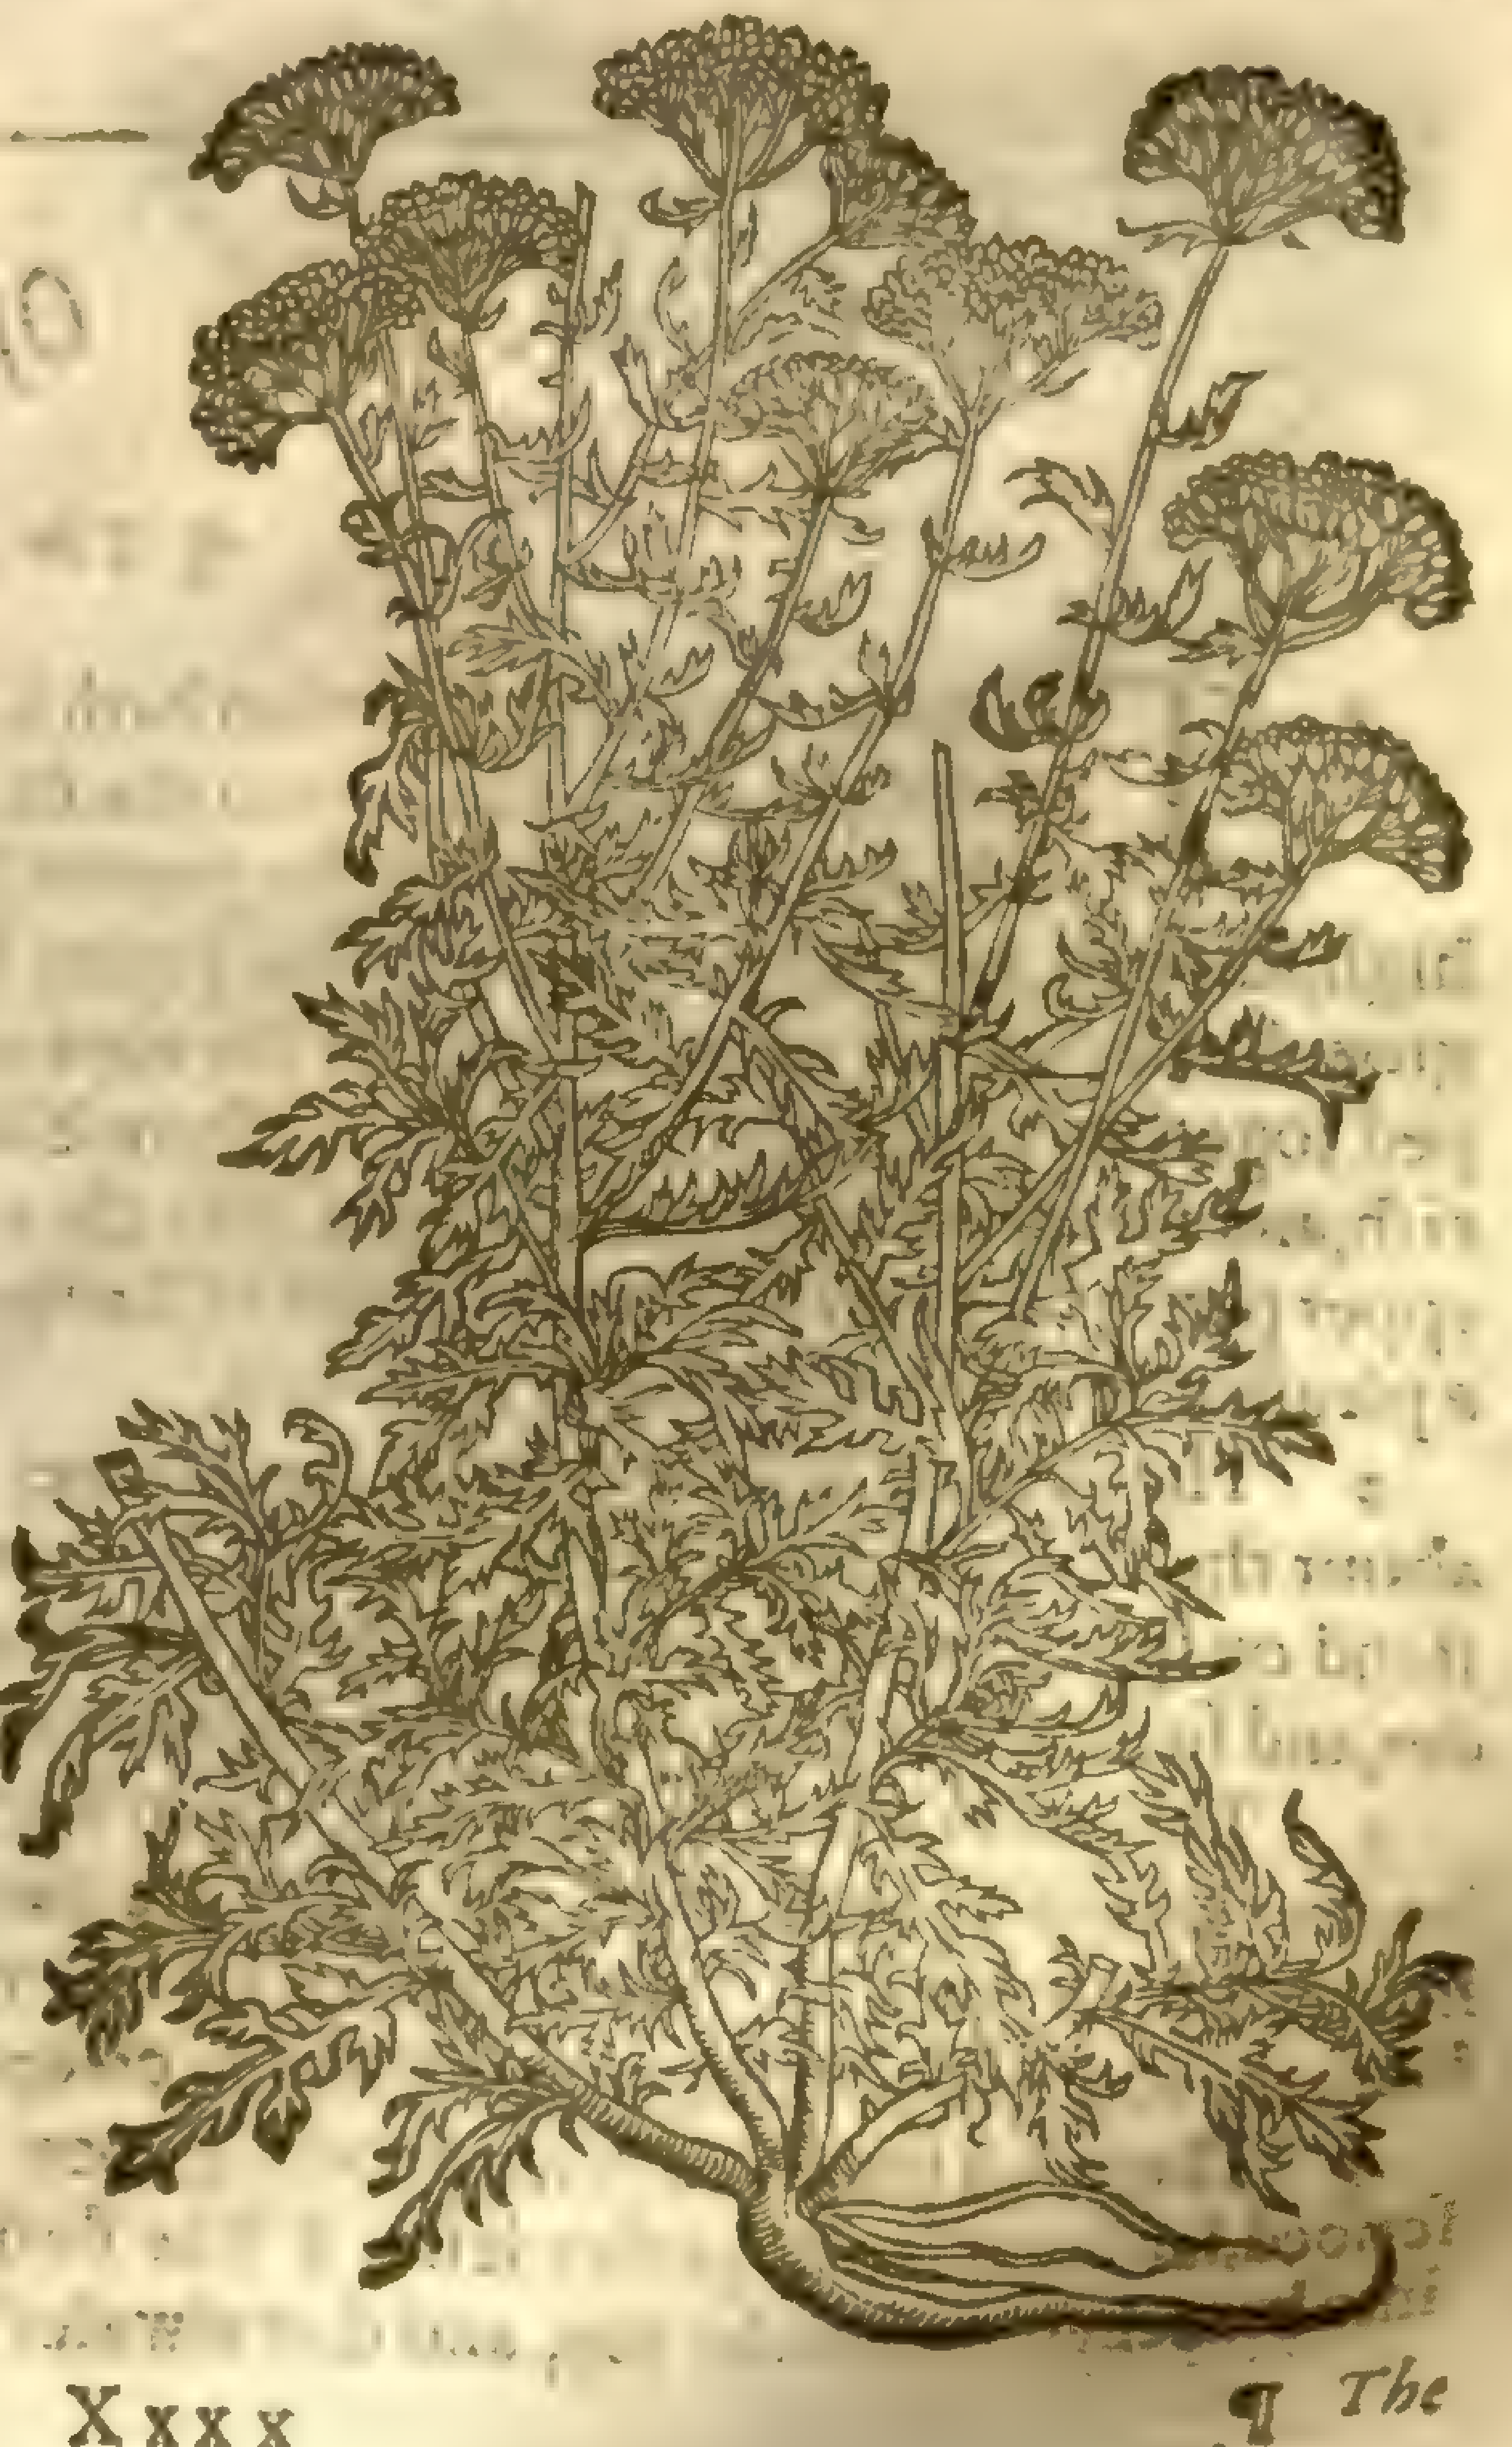
It cureth the inward excorations of the yard of a man, comming by reaſon of pollutions or extreme flowing of the ſeed, although the iſſue doe cauſe inflammation and ſwelling of thoſe ſecret parts, and though the ſpermaticke matter do come downe in great quantity, if the juyce be injected with a ſyringe, or the decoction. This hath been proued by a certaine friend of mine, ſometimes a Fellow of Kings Colledge in Cambridge, who lightly bruſed the leaues of common Yarrow, with Hogs-greaſe, and applied it warme vnto the priuie parts, and thereby did diuers times helpe himſelfe and others of his fellowes, when he was a ſtudent and a ſingle man liuing in Cambridge. D

One dram in pouder of the herbe giuen in wine, preſently taketh away the paines of the colicke. E

Chap. 439. *Of yellow Yarrow, or Milfoile.*



1 *Millefolium luteum.*
Yellow Yarrow.



† 2 *Achillea, ſiue Millefolium nobile.*
Achilles Yarrow. a. nobilis
mill. dict.

¶ *The Deſcription.*

1 Yellow Yarrow is a ſmall plant ſeldome aboue a ſpan high: the ſtalkes whereof are couered with long leaues, very finely cut in the edges like feathers in the wings of little birds: the tufts or ſpokie rundles bring forth yellow floures, of the ſame ſhape and forme of the common Yarrow: the root conſiſteth of threddy ſtrings.

2 Achilles Yarrow, or noble Milfoile, hath a thicke and tough root, with ſtrings faſtened thereto: from which immediatly riſe vp diuers ſtalkes, very greene and creſted, whereupon do grow long leaues compoſed of many ſmall jagges, cut euen to the middle rib: the floures ſtand on the top of the ſtalkes with ſpokie vmbels or tufts, of a whitiſh colour, and pleaſant ſmell.

¶ *The Place.*

Theſe kinds of Yarrow are ſeldome found: they grow in a fat and fruitfull ſoile, and ſometimes in medowes, and are ſtrangers in England.

¶ *The Time.*

They floure from May vntill Auguſt.

¶ *The Names.*

Dioſcorides deſcription doth ſufficiently declare, that this herbe is *Stratiotes Millefolium*: in Greeke, στρατιώτης χιλιόφυλλος: the height of the herbe ſheweth it, the forme of the leaues agree; there is ſome ambiguitie or doubt in the colour of the floures, which *Dioſcorides* deſcribeth to be white, as the vulgar copies haue; but *Andreas Lacuna* addeth out of the old booke of a yellow colour: it is named of the later age, *Millefolium minus*, or little Yarrow, and *Millefolium luteum*, yellow Yarrow, or Noſe bleed: the Apothecaries and common people know it not.

¶ *The Temperature.*

Yarrow is meanely cold and ſomewhat binding.

¶ *The Vertues.*

A It is a principall herbe for all kinde of bleedings, and to heale vp new and old vlcers and greene wounds: there be ſome, ſaith *Galen*, that vſe it for fiſtulaes.

This plant *Achillea* is thought to be the very ſame wherewith *Achilles* cured the wounds of his ſouldiers, as before in the former chapter.

† The plant here figured and deſcribed in the ſecond place, was alſo figured and deſcribed formerly in the fifth place of the 209 chapter of this booke, by the title of *Tanacetum minus album*, but the figure of *Lobels* which is put there being ſomewhat imperfect, I thought it not amiſſe here to giue you that of *Dodonæus* which is ſomewhat more exquiſite, otherwiſe both the figure and hiſtory might in this place haue beene omitted.

Chap. 440. *Of Valerian, or Setwall.*

¶ *The Deſcription.*

1 The tame or garden Valerian hath his firſt leaues long, broad, ſmooth, greene, and vndiuided; and the leaues vpon the ſtalkes greater, longer, and deepely gaſhed on either ſide, like the leaues of the greater Parſenep, but yet leſſer: the ſtalke is aboue a cubit high, ſmooth, and hollow, with certaine joynts farre diſtant one from another: out of which joynts grow forth a couple of leaues, and in the tops of the ſtalkes vpon ſpokie rundles ſtand floures heaped together, which are ſmall, opening themſelues out of a long little narrow necke, of colour whitiſh, and ſometimes withall of a light red: the root is an inch thicke, growing aſlope, faſtned on the vpper part of the earth by a multitude of ſtrings, the moſt part of it ſtanding out of the ground, of a pleaſant ſweet ſmell when it is broken.

2 The greater wilde Valerian hath leaues diuided and jagged as thoſe of the former; thoſe about the ſtalke hereof are alſo ſmooth, hollow, and joynted, and aboue a cubit high: the floures ſtand on ſpokie rundles like to thoſe of the former, but of a light purple colour: the roots are ſlender, and full of ſtrings and ſmall threds, not altogether without ſmell.

3 The other wilde one is much like in forme to the garden Valerian, but farre leſſer: the firſt leaues thereof be vndiuided, the other are parted and cut in ſunder: the ſtalkes a ſpan long: the floures which ſtand on ſpokie rundles are like to thoſe of the others, of a light whitiſh purple colour: the roots be ſlender, growing aſlope, creeping, and full of fine ſmall threds, of little ſmell.

4 There is a ſmall Valerian growing vpon rockes and ſtony places, that is like vnto the laſt deſcribed, ſauing it is altogether leſſe. ‡ The ſtalk is ſome halfe foot high, and ſtrait, diuiding it ſelfe into branches toward the top, and that alwaies by couples: the bottome leaues are whole, the top leaues

1 *Valeriana hortenſis.*

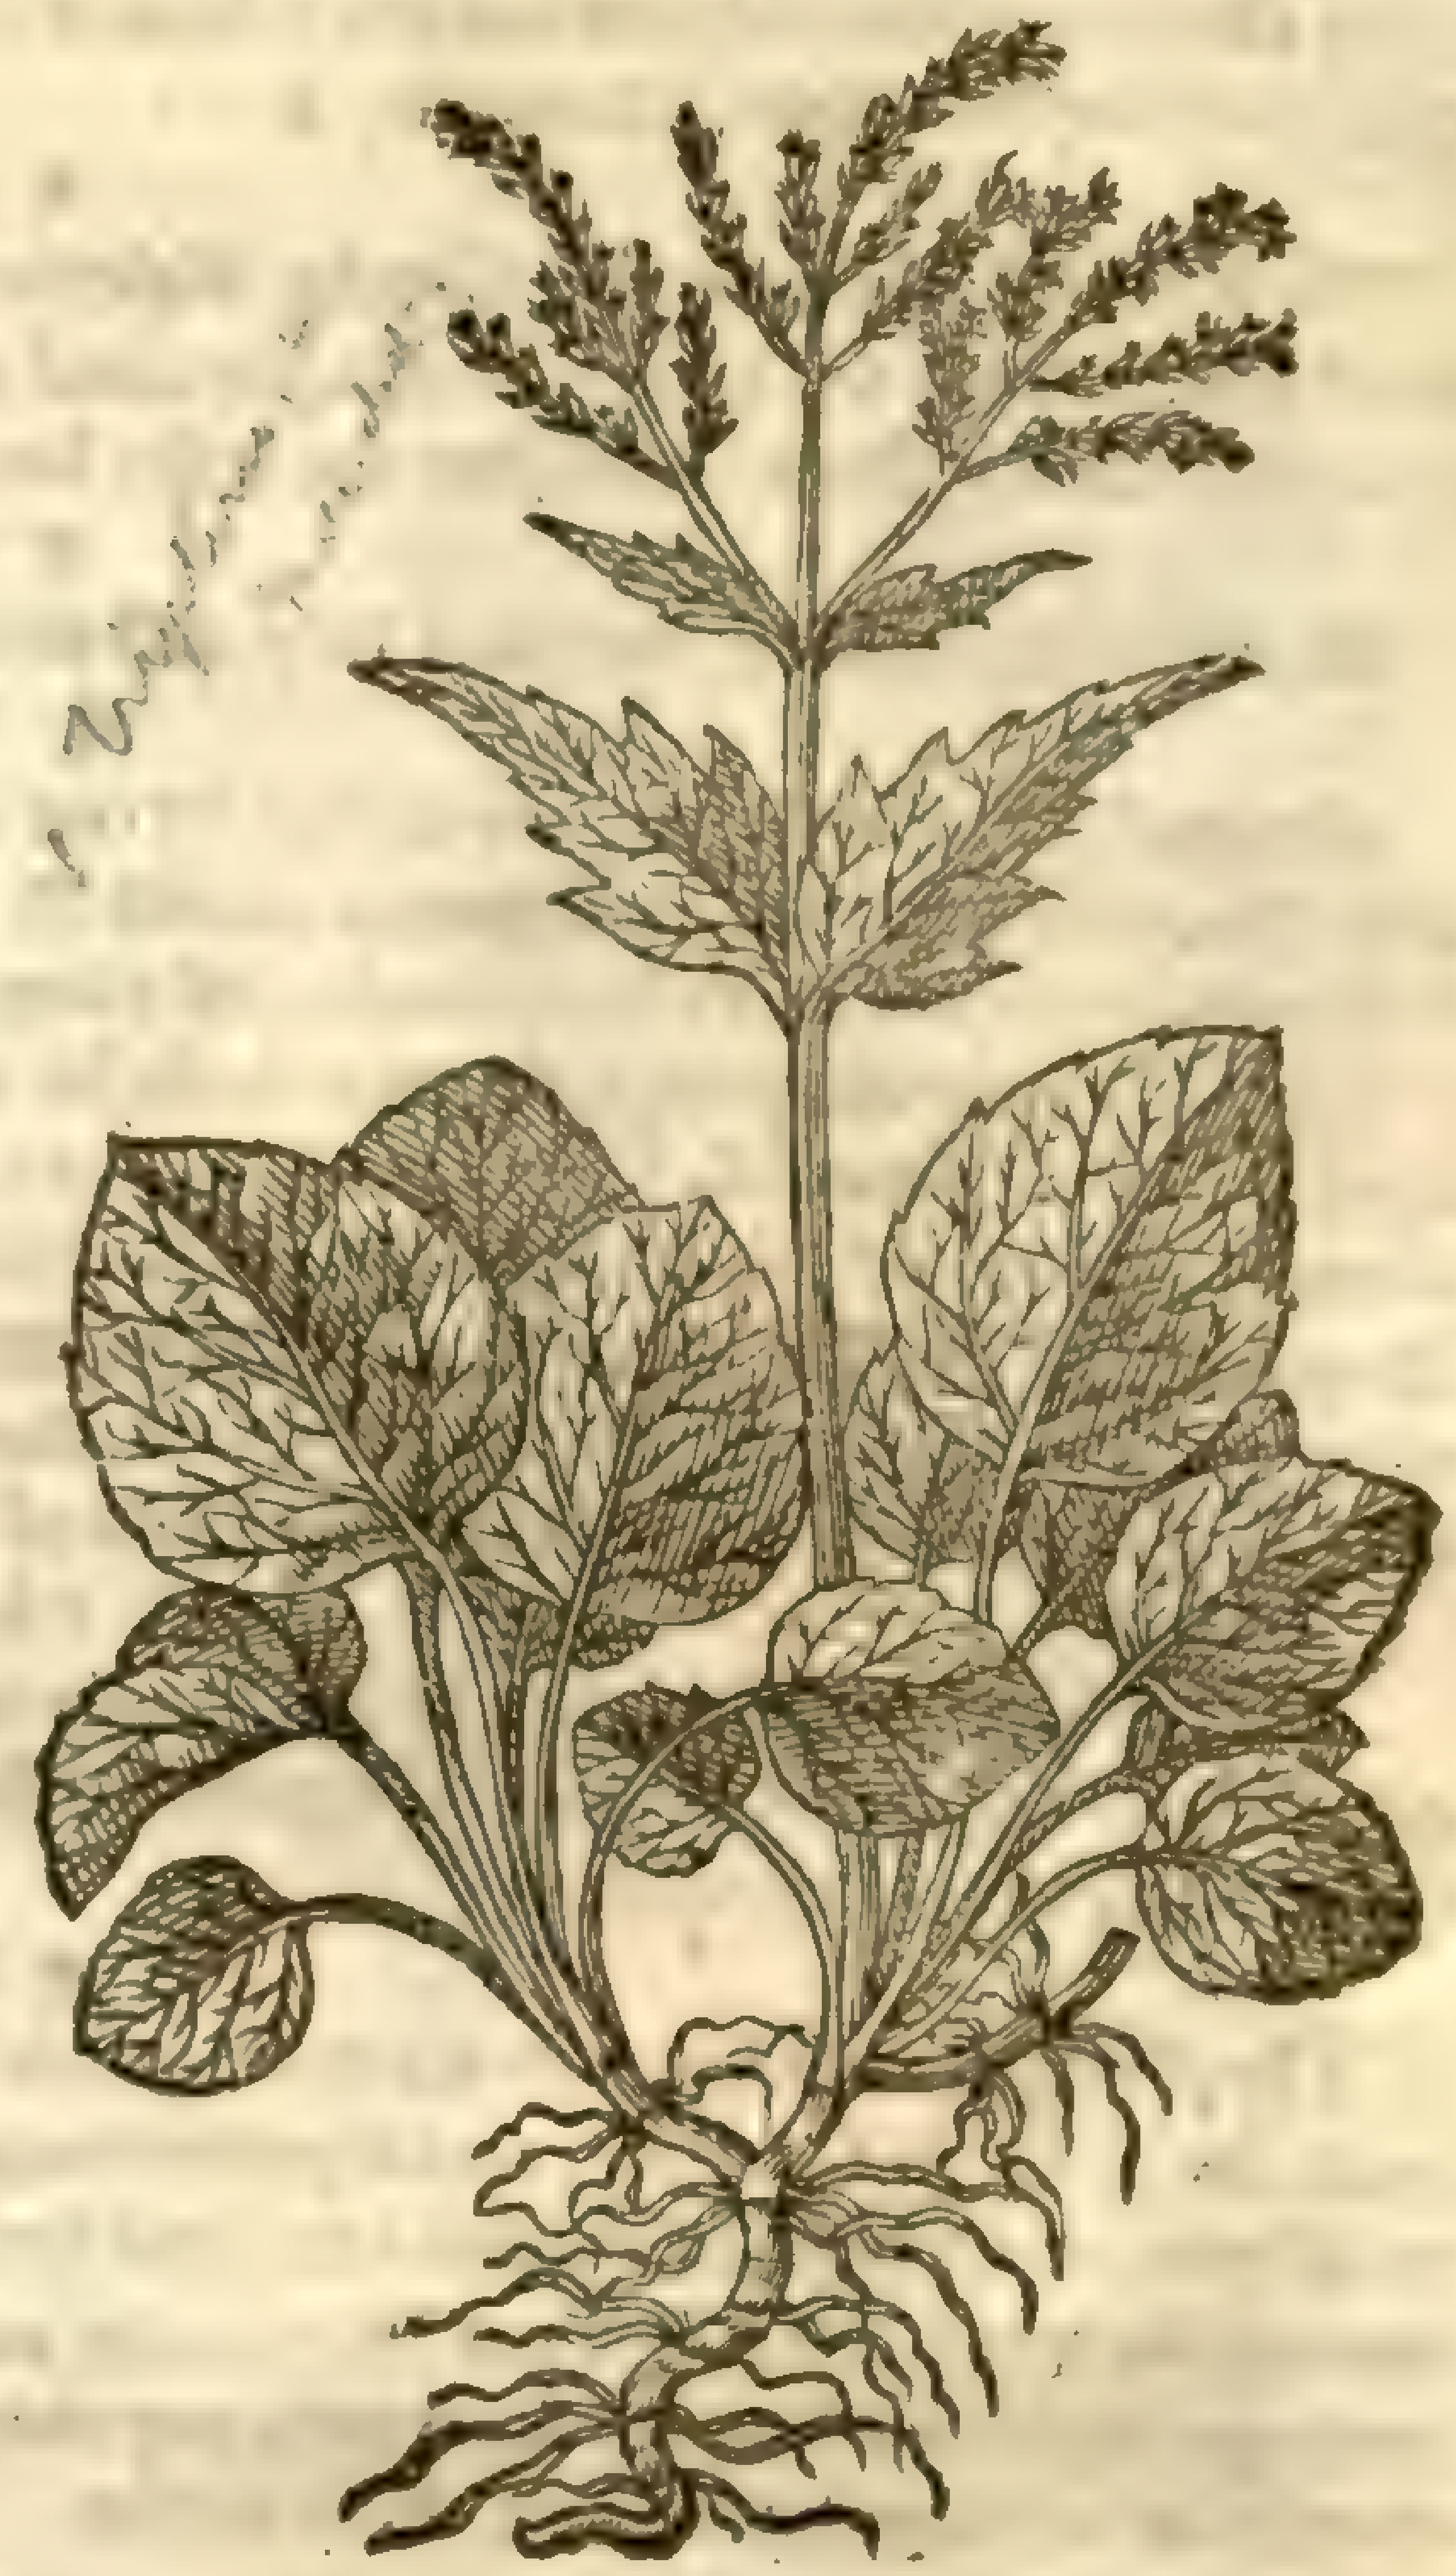
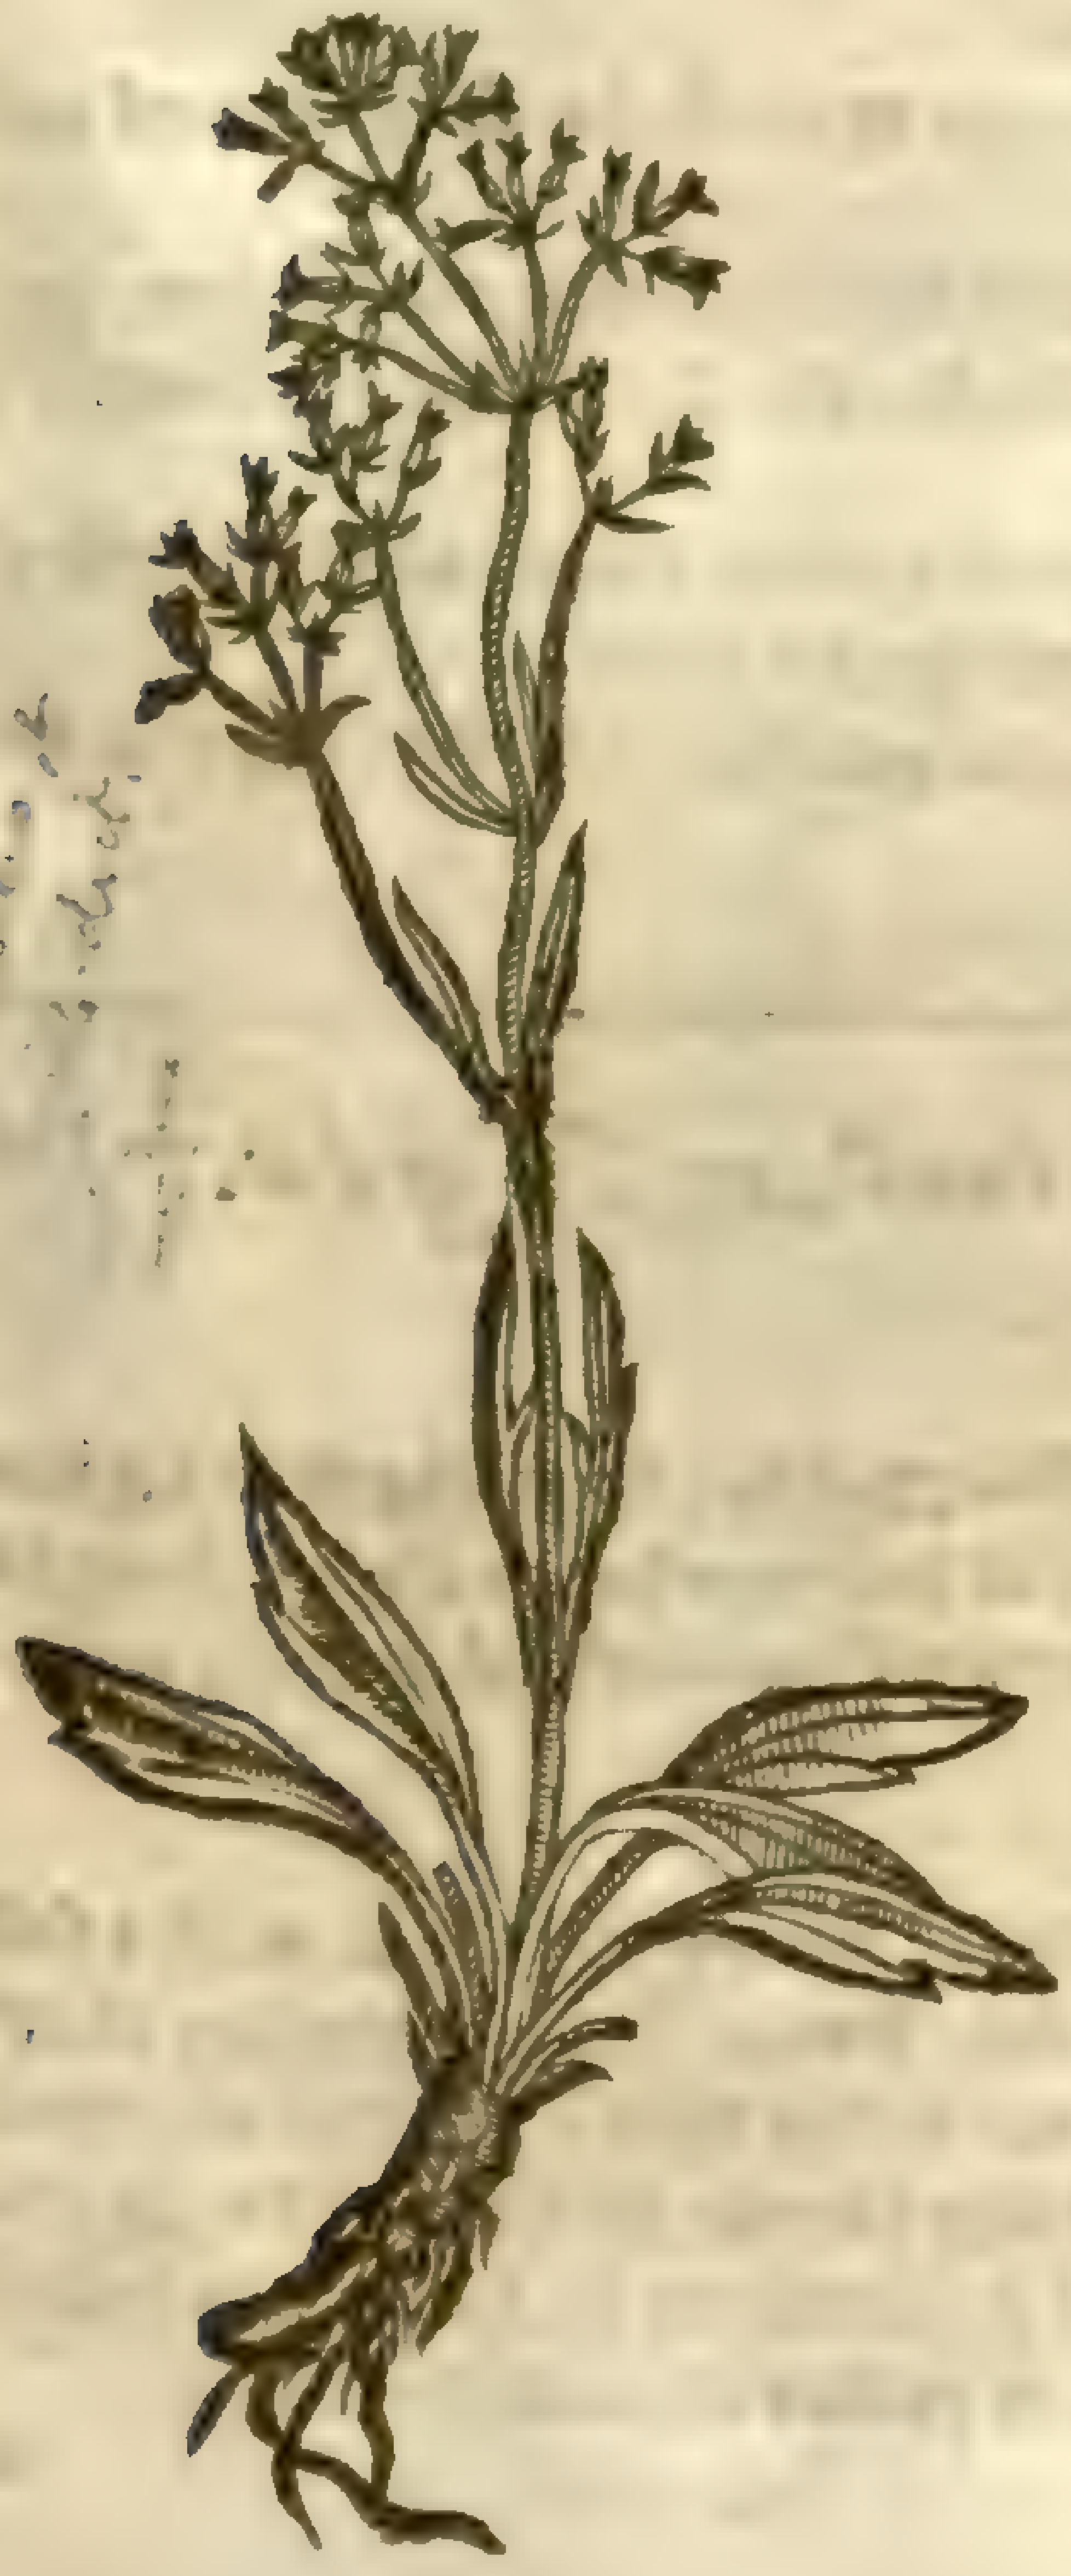
Broad leaued Setwall of the Alps.



‡ 10 *Valeriana Alpina anguſtifolia.*
Small Alpine Set-wall.



and not vnlike thoſe of the Star-Thiſtle: among theſe riſe vp ſome round hollow branched ſtalks two cubits high: at each ioynt grow forth two leaues leſſer, yet like the lower: at the tops of the branches grow the floures as it were in little vmbels conſiſting of fiue leaues apiece; and theſe of a light red, or fleſh colour: and then theſe as it were vmbels grow into longiſh branches bearing ſeed almoſt like, yet leſſe than the red Valerian: it floures in Iuly, and periſheth when it hath ripened the ſeed. *Cluſius* hath ſet this forth by the name of *Valeriana annua altera* ‡

9 The ſame Author hath alſo giuen vs the hiſtorie of ſome other Plants of this kinde; and this he cals *Valeriana ſyl. Alpina 1 latifol.* the ſtalk hereof is ſome foot high, round, greene, and creſted: vpon which ſtand leaues longiſh, ſharpe pointed, and cut in with two or three deepe gaſhes: but the bottome leaues are more round and larger, comming neere to thoſe of *Trachelium*, yet leſſer, ſlenderer, and bitter of taſte: the floures which are white of colour, and the ſeed, are like thoſe of the other Valerians: the root is ſmall, creeping, fibrous, white and aromatick: it growes vpon the Alpes, and floures in Iune and Iuly.

10 This ſends forth leaues like thoſe of the mountaine Daiſie: out of the midſt of which

riſeth vp a ſtalk ſome foot high, joynted, and at the top diuided into little branches, carrying white floures like the other Valerians: the root is as aromaticke as that of the laſt mentioned; and grows in the chinkes of the Alpine rockes, where it floures in Iune and Iuly. *Cluſius* hath it by the name of *Valeriana ſylueſtris Alpin. 2. Saxatilis*, ‡

¶ *The Place.*

The firſt and likewiſe the Greeke Valerian are planted in gardens; the wilde ones are found in moiſt places hard to riuers ſides, ditches, and watery pits; yet the greater of theſe is brought into gardens where it flouriſheth, but the leſſer hardly proſpereth.

¶ *The Time.*

Theſe floure in May, Iune, and Iuly, and moſt of the Summer moneths.

¶ *The Names.*

Generally the Valerians are called by one name, in Latine, *Valeriana*: in Greeke, φοῦ: in ſhoppes alſo *Phu*, which for the moſt part is meant by the garden Valerian, that is called of *Dioſc.* ἀγρία, in Latine, *Sylueſtris*, or *Ruſtica Nardus*: of *Pliny*, *Nardus Cretica*: which names are rather referred to thoſe of the next chapter, although theſe be reckoned as wilde kindes thereof: of certaine in our age, *Marinella*, *Amantilla*, *Valentiana*, *Genicularis*, *Herba Benedicta*, and *Theriacaria*: in moſt ſhops, *Valeriana Domeſtica*: of *Theophraſtus Paracelſus*, *Terdina*: in high Dutch, **Groſz baldrian**: in low Dutch, **Speercruyt**, **S. Joris cruyt**, and **Valeriane**: in Engliſh, Valerian, Capons taile, and Setwall; but vnproperly, for that name belongeth to *Zedoaria*, which is not Valerian: what hath beene ſet downe in the titles ſhall ſerue for the diſtinctions of the other kindes.

¶ *The Temperature.*

The garden Valerian is hot, as *Dioſcorides* ſaith, but not much, neither the green root, but the dried ones; for the greene is eaſily perceiued to haue very little heate, and the dried to be hotter, which is found by the taſte and ſmell.

¶ *The Vertues.*

A The dry root as *Dioſcorides* teacheth, prouoketh vrine, bringeth downe the deſired ſickeneſſe, helpeth the paine in the ſides; and is put into counterpoyſons and medicines preſeruatiue againſt the peſtilence, as are treacles, mithridates, and ſuch like: whereupon it hath been had (and is to this day among the poore people of our Northerne parts) in ſuch veneration amongſt them, that no broths, pottage or phyſicall meats are worth any thing, if Setwall were not at an end: whereupon ſome woman Poët or other hath made theſe verſes.

They that will haue their heale,
Muſt put Setwall in their keale.

B It is vſed generally in ſleight cuts, wounds, and ſmall hurts.

C The extraction of the roots giuen, is a moſt ſingular medicine againſt the difficulty of making water, and the yellow jaundiſe.

D Wilde Valerian is thought of the later Herbariſts to be good for them that are burſten, for ſuch as be troubled with the crampe and other conuulſions, and alſo for all thoſe that are bruiſed with falls.

E The leaues of theſe and alſo thoſe of the garden, are good againſt vlcers and ſoreneſſe of the mouth and gums, if the decoction thereof be gargarized or held in the mouth.

F Some hold opinion that the roots of wilde Valerian dried and poudered, and a dramme weight thereof taken with wine, do purge vpward and downeward.

CHAP. 441. *Of Mountaine Setwall, or Nardus.*

¶ *The Deſcription.*

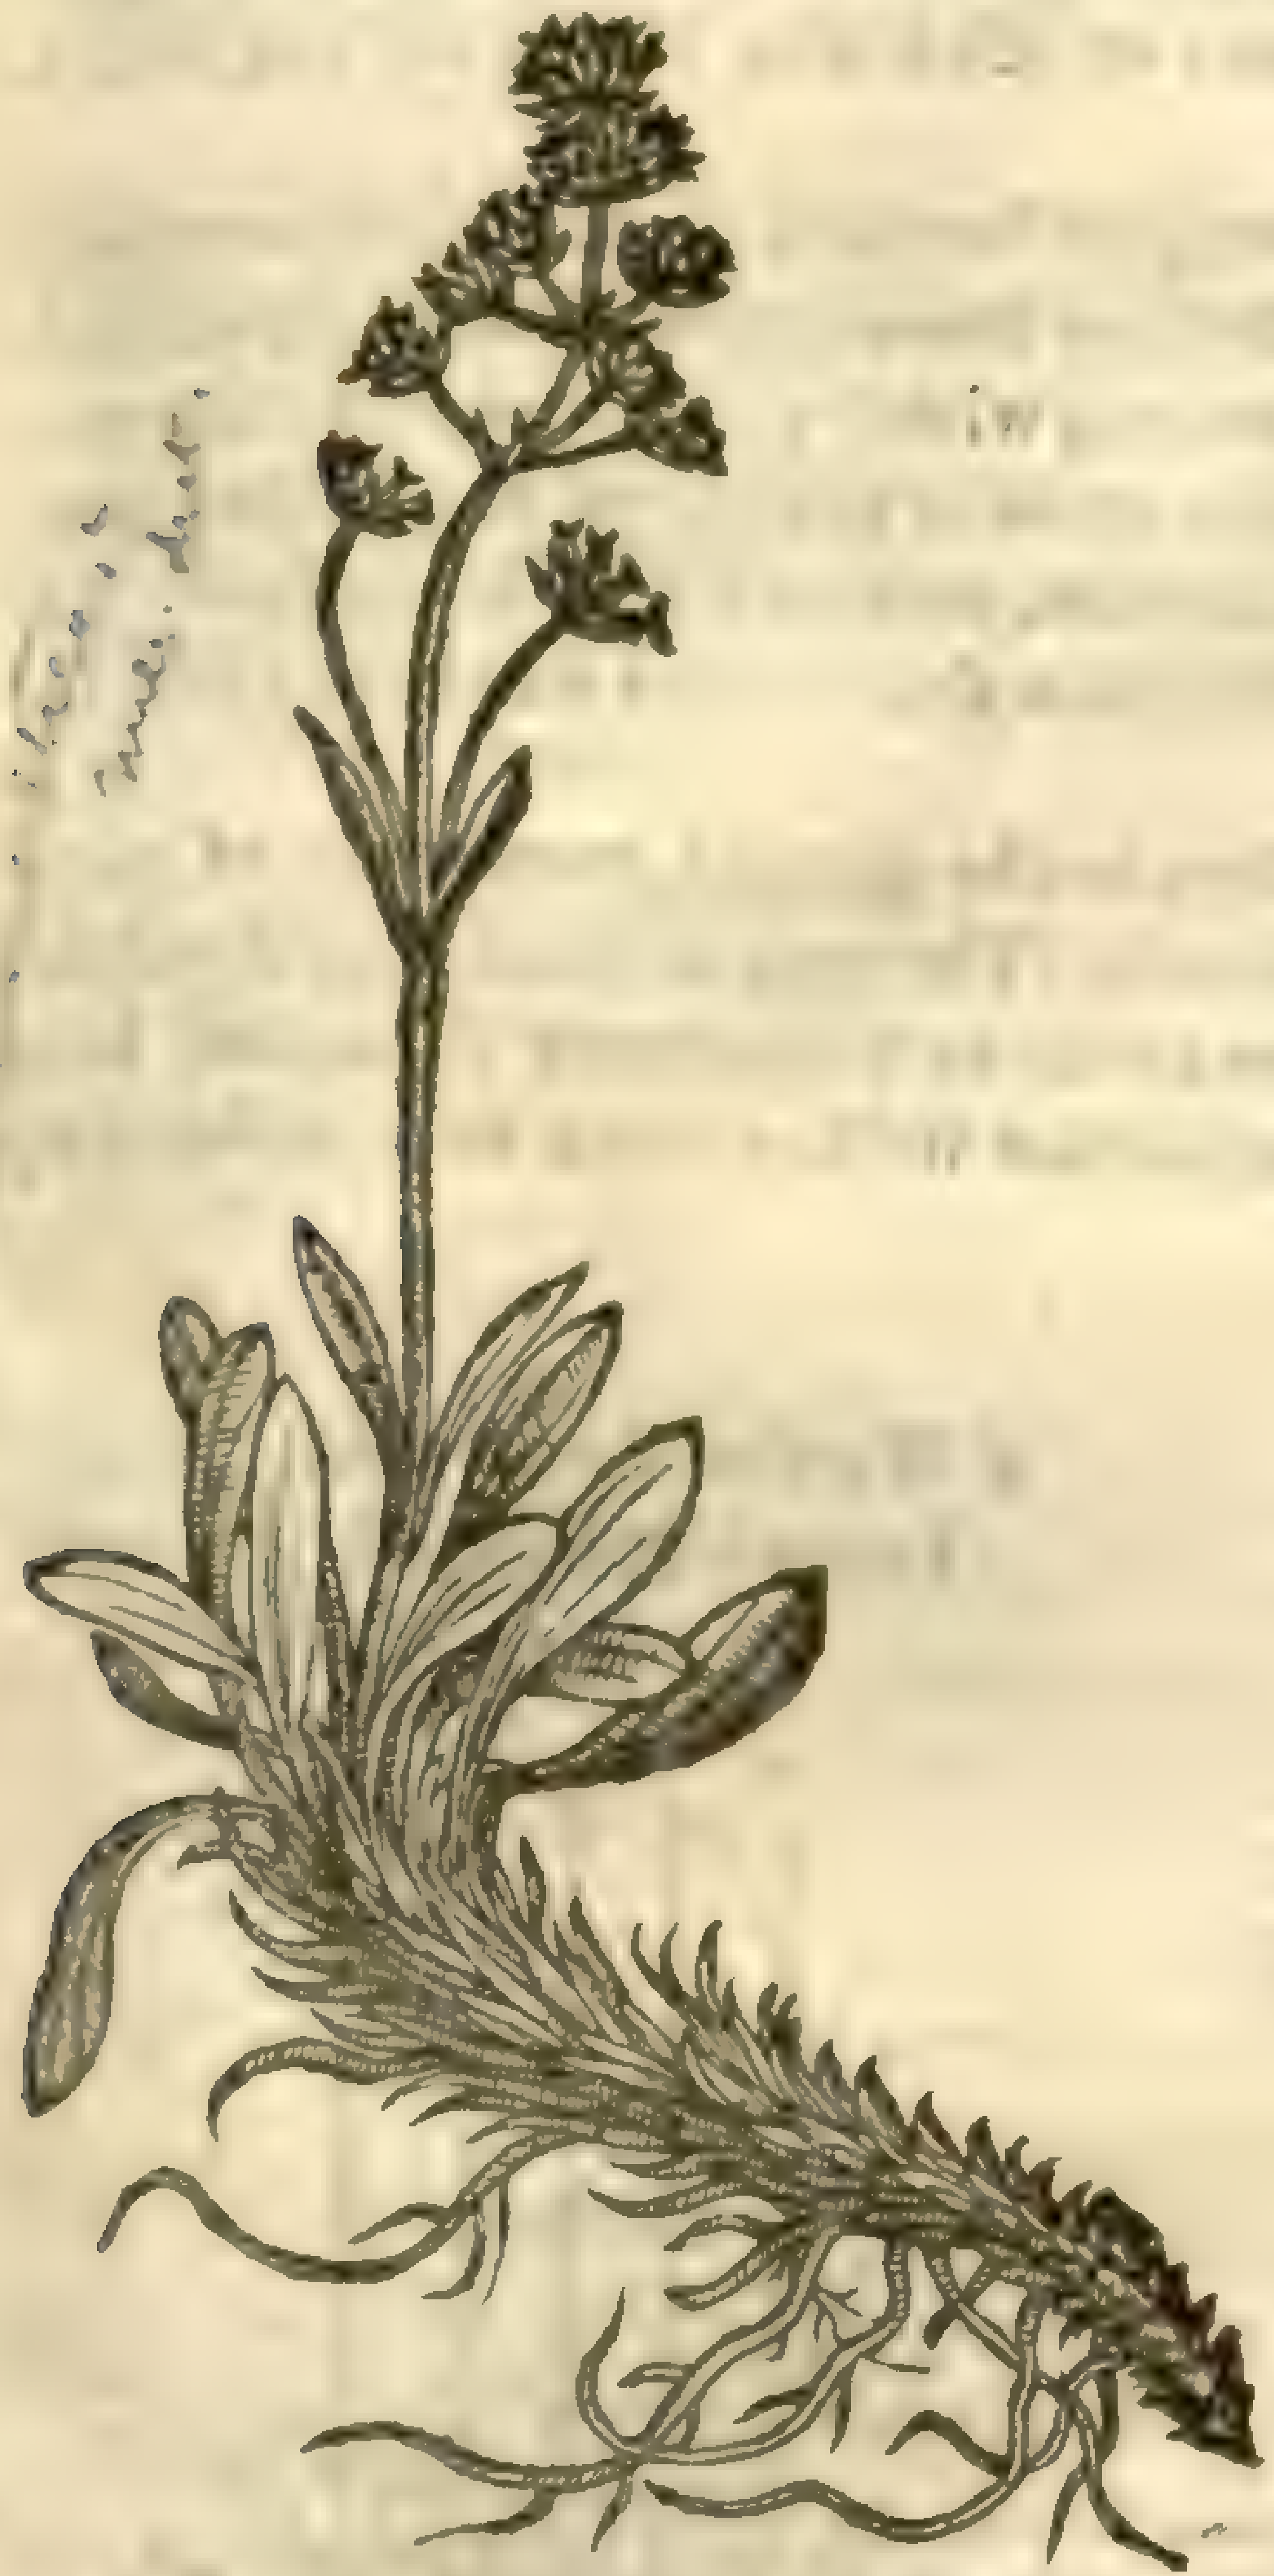
1 The *Nardus* named *Celtica*, but now by ſome, *Liguſtica Nardus*, flouriſheth in high mountaines. The Valleſians in their mother tongue call it *Selliga*; whence *Geſner* thought it to be *Saliunca*; neither do I doubt, but that it is the ſame which *Virgil* ſpeaketh of in theſe verſes:

Puniceis humilis quantum Saliunca roſetis,
Iudicio noſtro tantum tibi cedit Amintas.

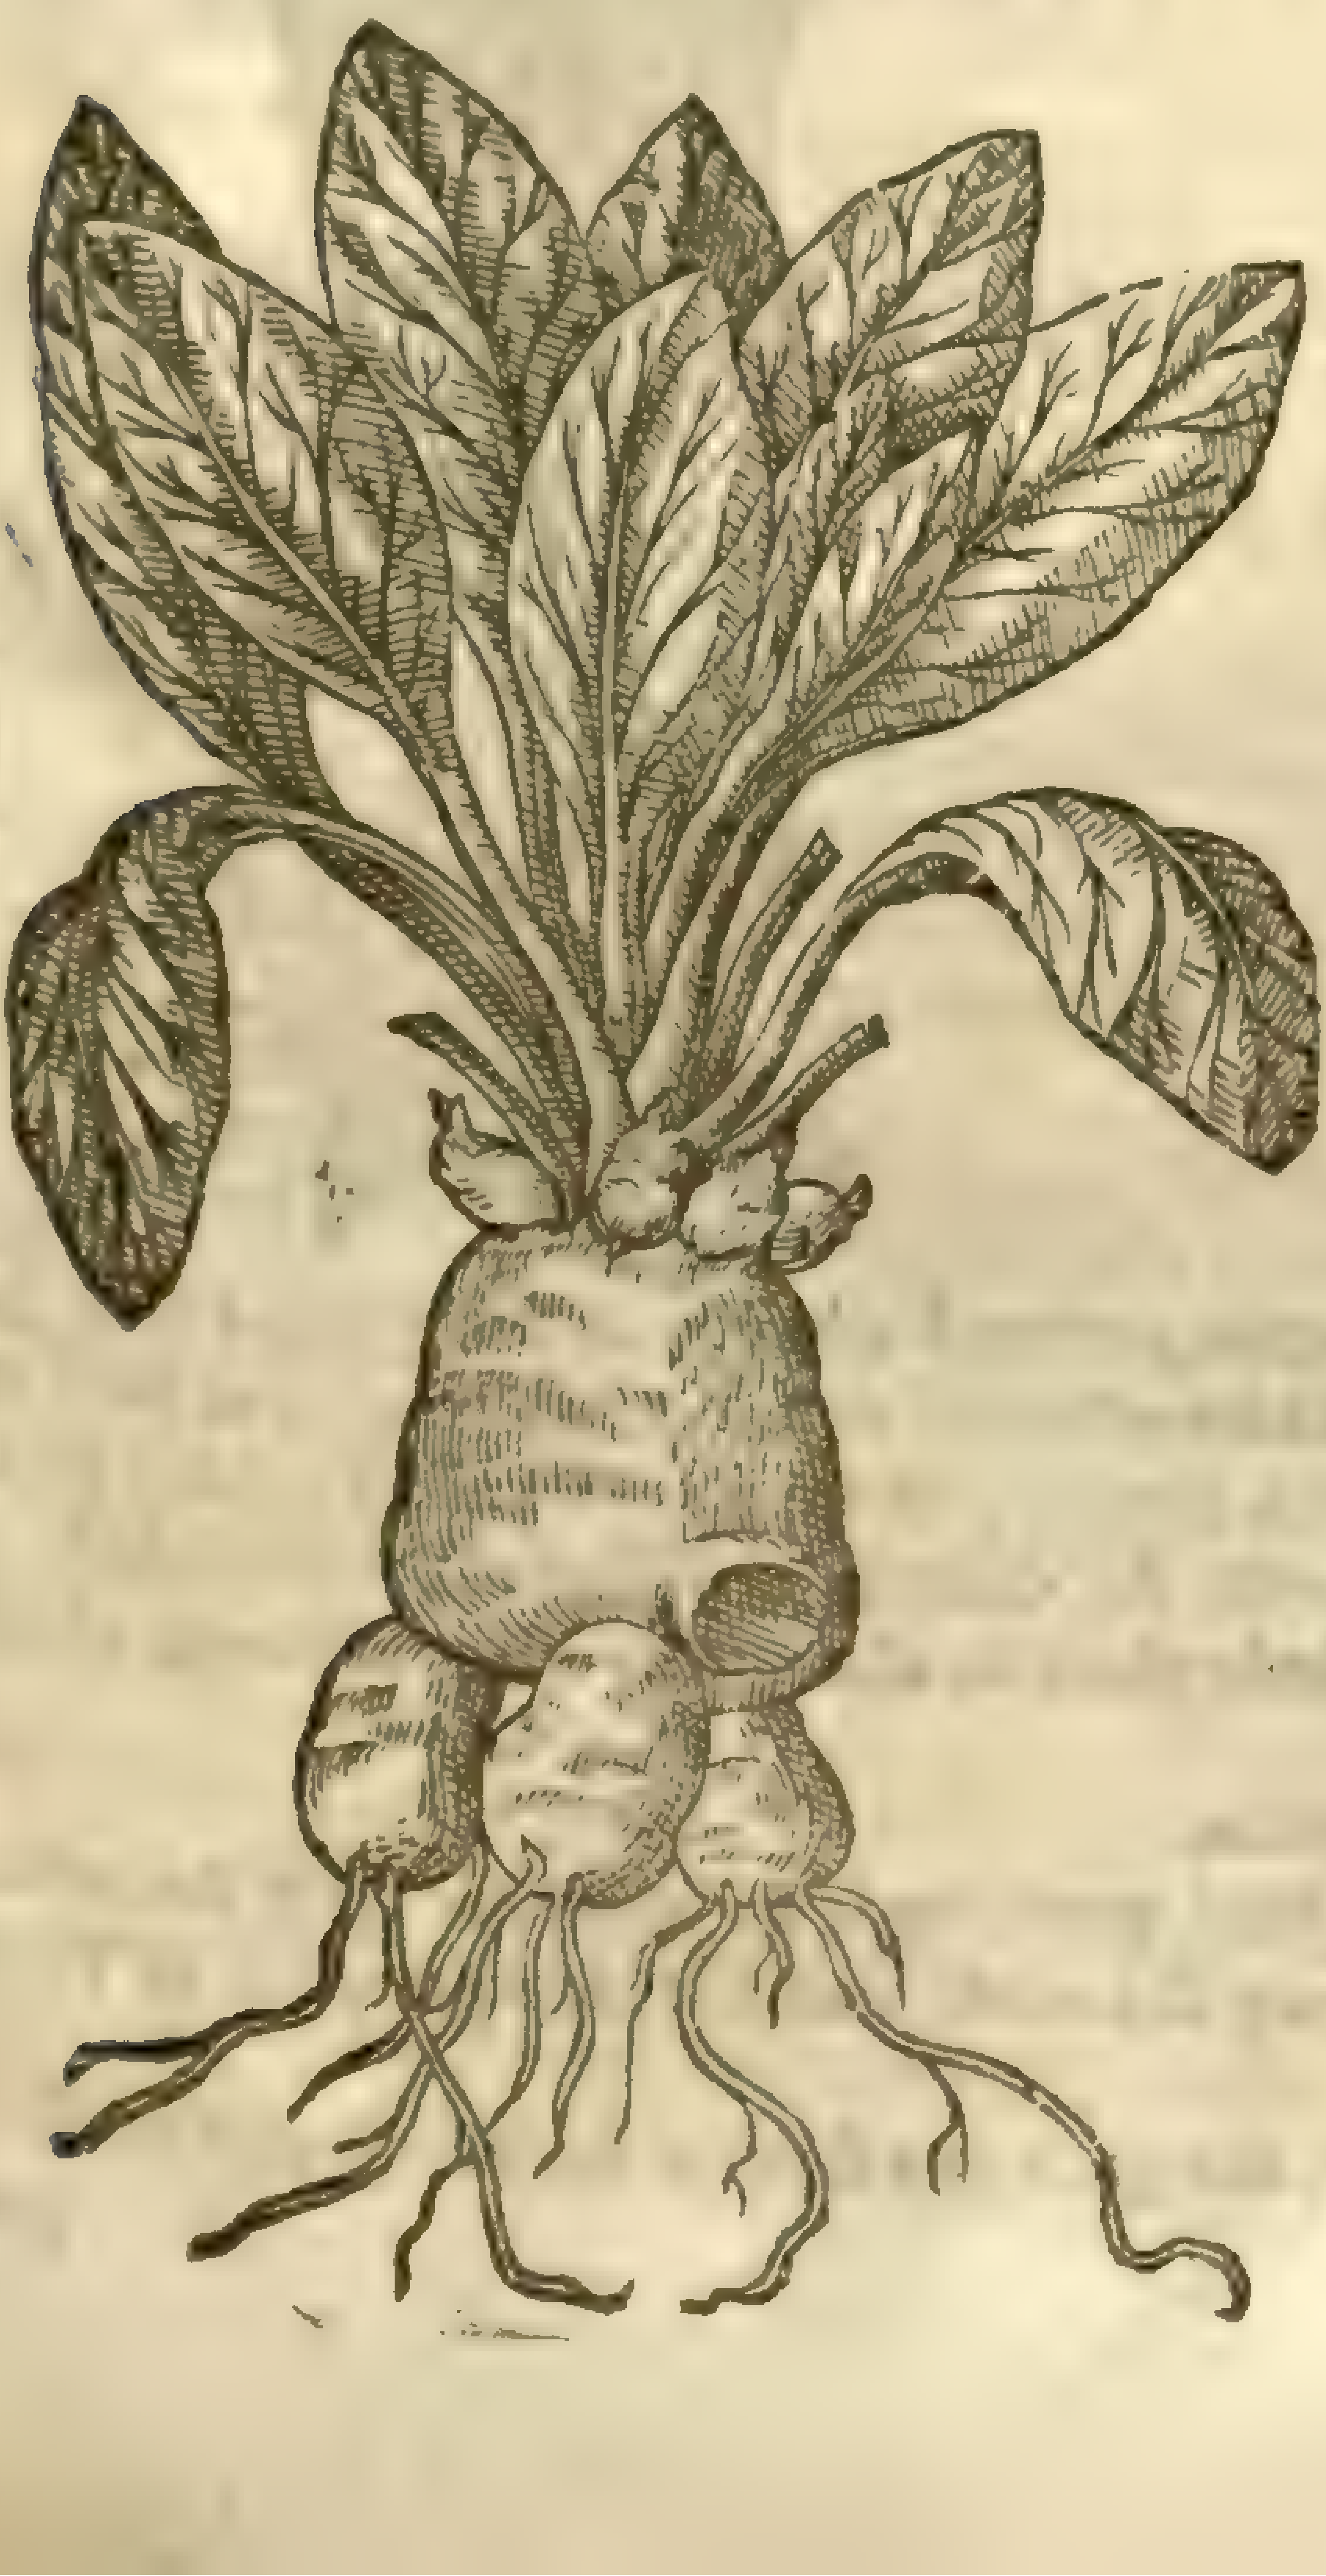
For it is a very little herbe creeping on the ground, and afterward lifting vp it ſelfe with a ſtalke of a handfull high; whereupon from the lower part grow ſmall thin leaues, firſt greene, but afterwards ſomewhat yellowiſh: vpon the roughneſſe of the root there are many ſcales, platted one vpon another; but vnder the root there are many browne ſtrings and hairy threds, in ſmell like the roots of *Aſtrabacca*, or rather the wilde mountaine Valerian, whereof it ſeemes to be a kinde, in taſte ſharpe and bitter. The floures grow along the vpper branches, white or yellowiſh, and very ſmall.

2 The

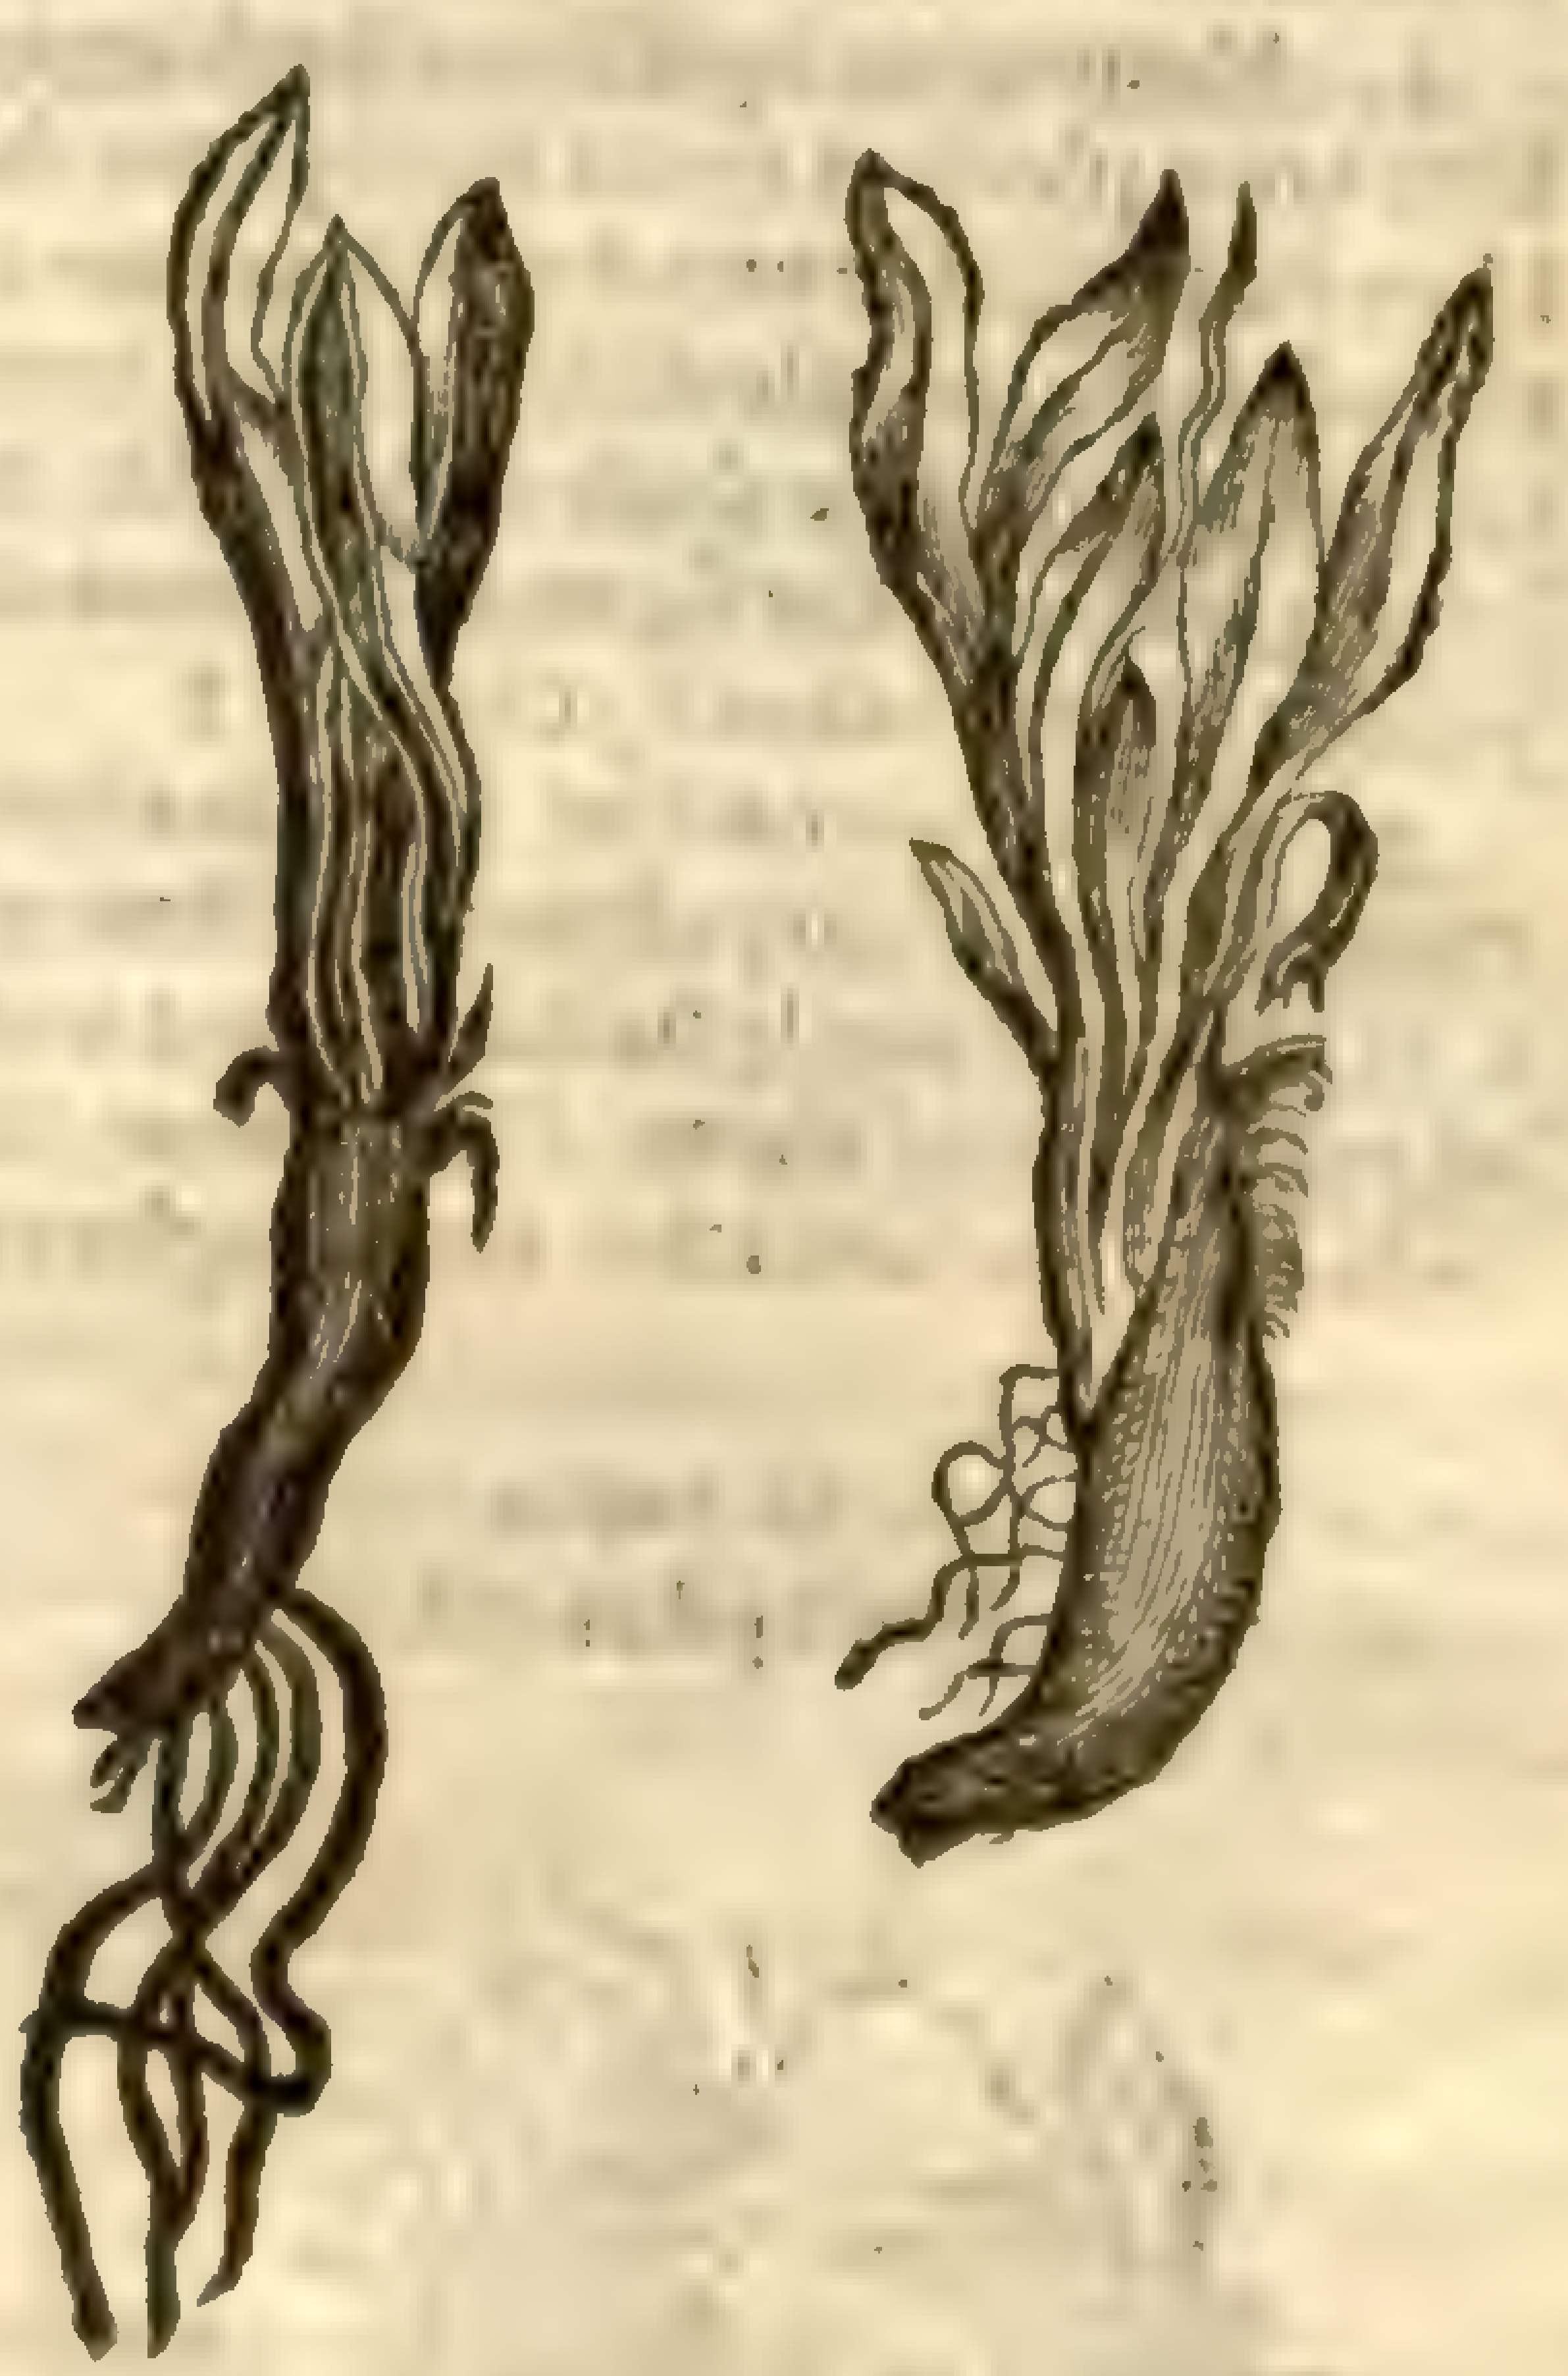
1 *Nardus Celtica.*
Celticke Spikenard.



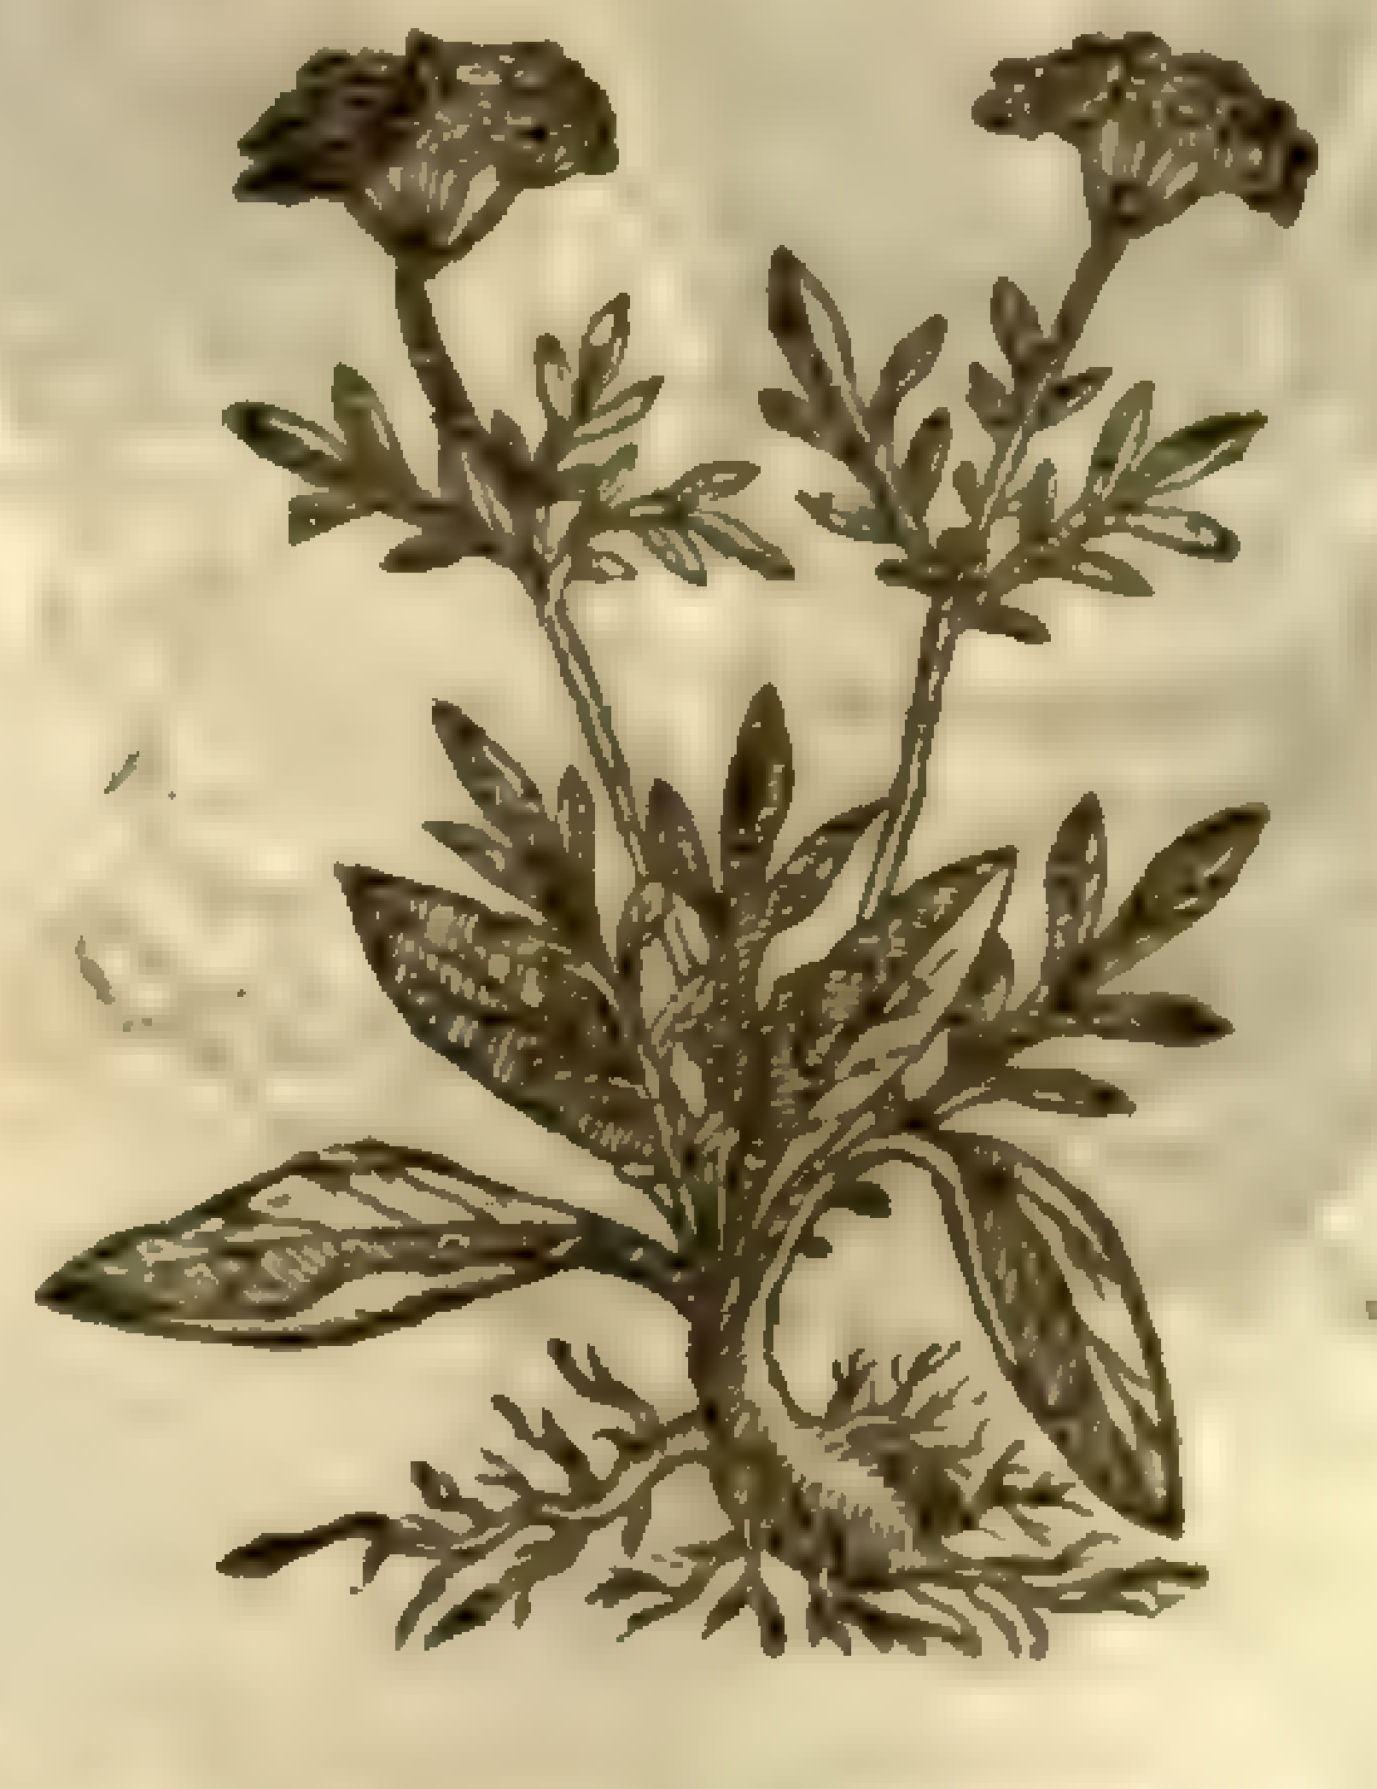
‡ 4 *Nardus montana germinans.*
Mountaine Nard at the firſt ſpringing vp.



3 *Hirculus.*
Vrine-wort.



4 *Nardus montana.*
Mountaine Spikenard.



2 The ſecond ſort of Spike-nard hath many threddy roots, from the which riſe vp many ſcaly rough and thicke ſtalkes, hauing at the top certain flat hoary leaues growing vpon ſmall and tender foot-ſtalks. The whole plant is of a pleaſant ſweet ſmell.

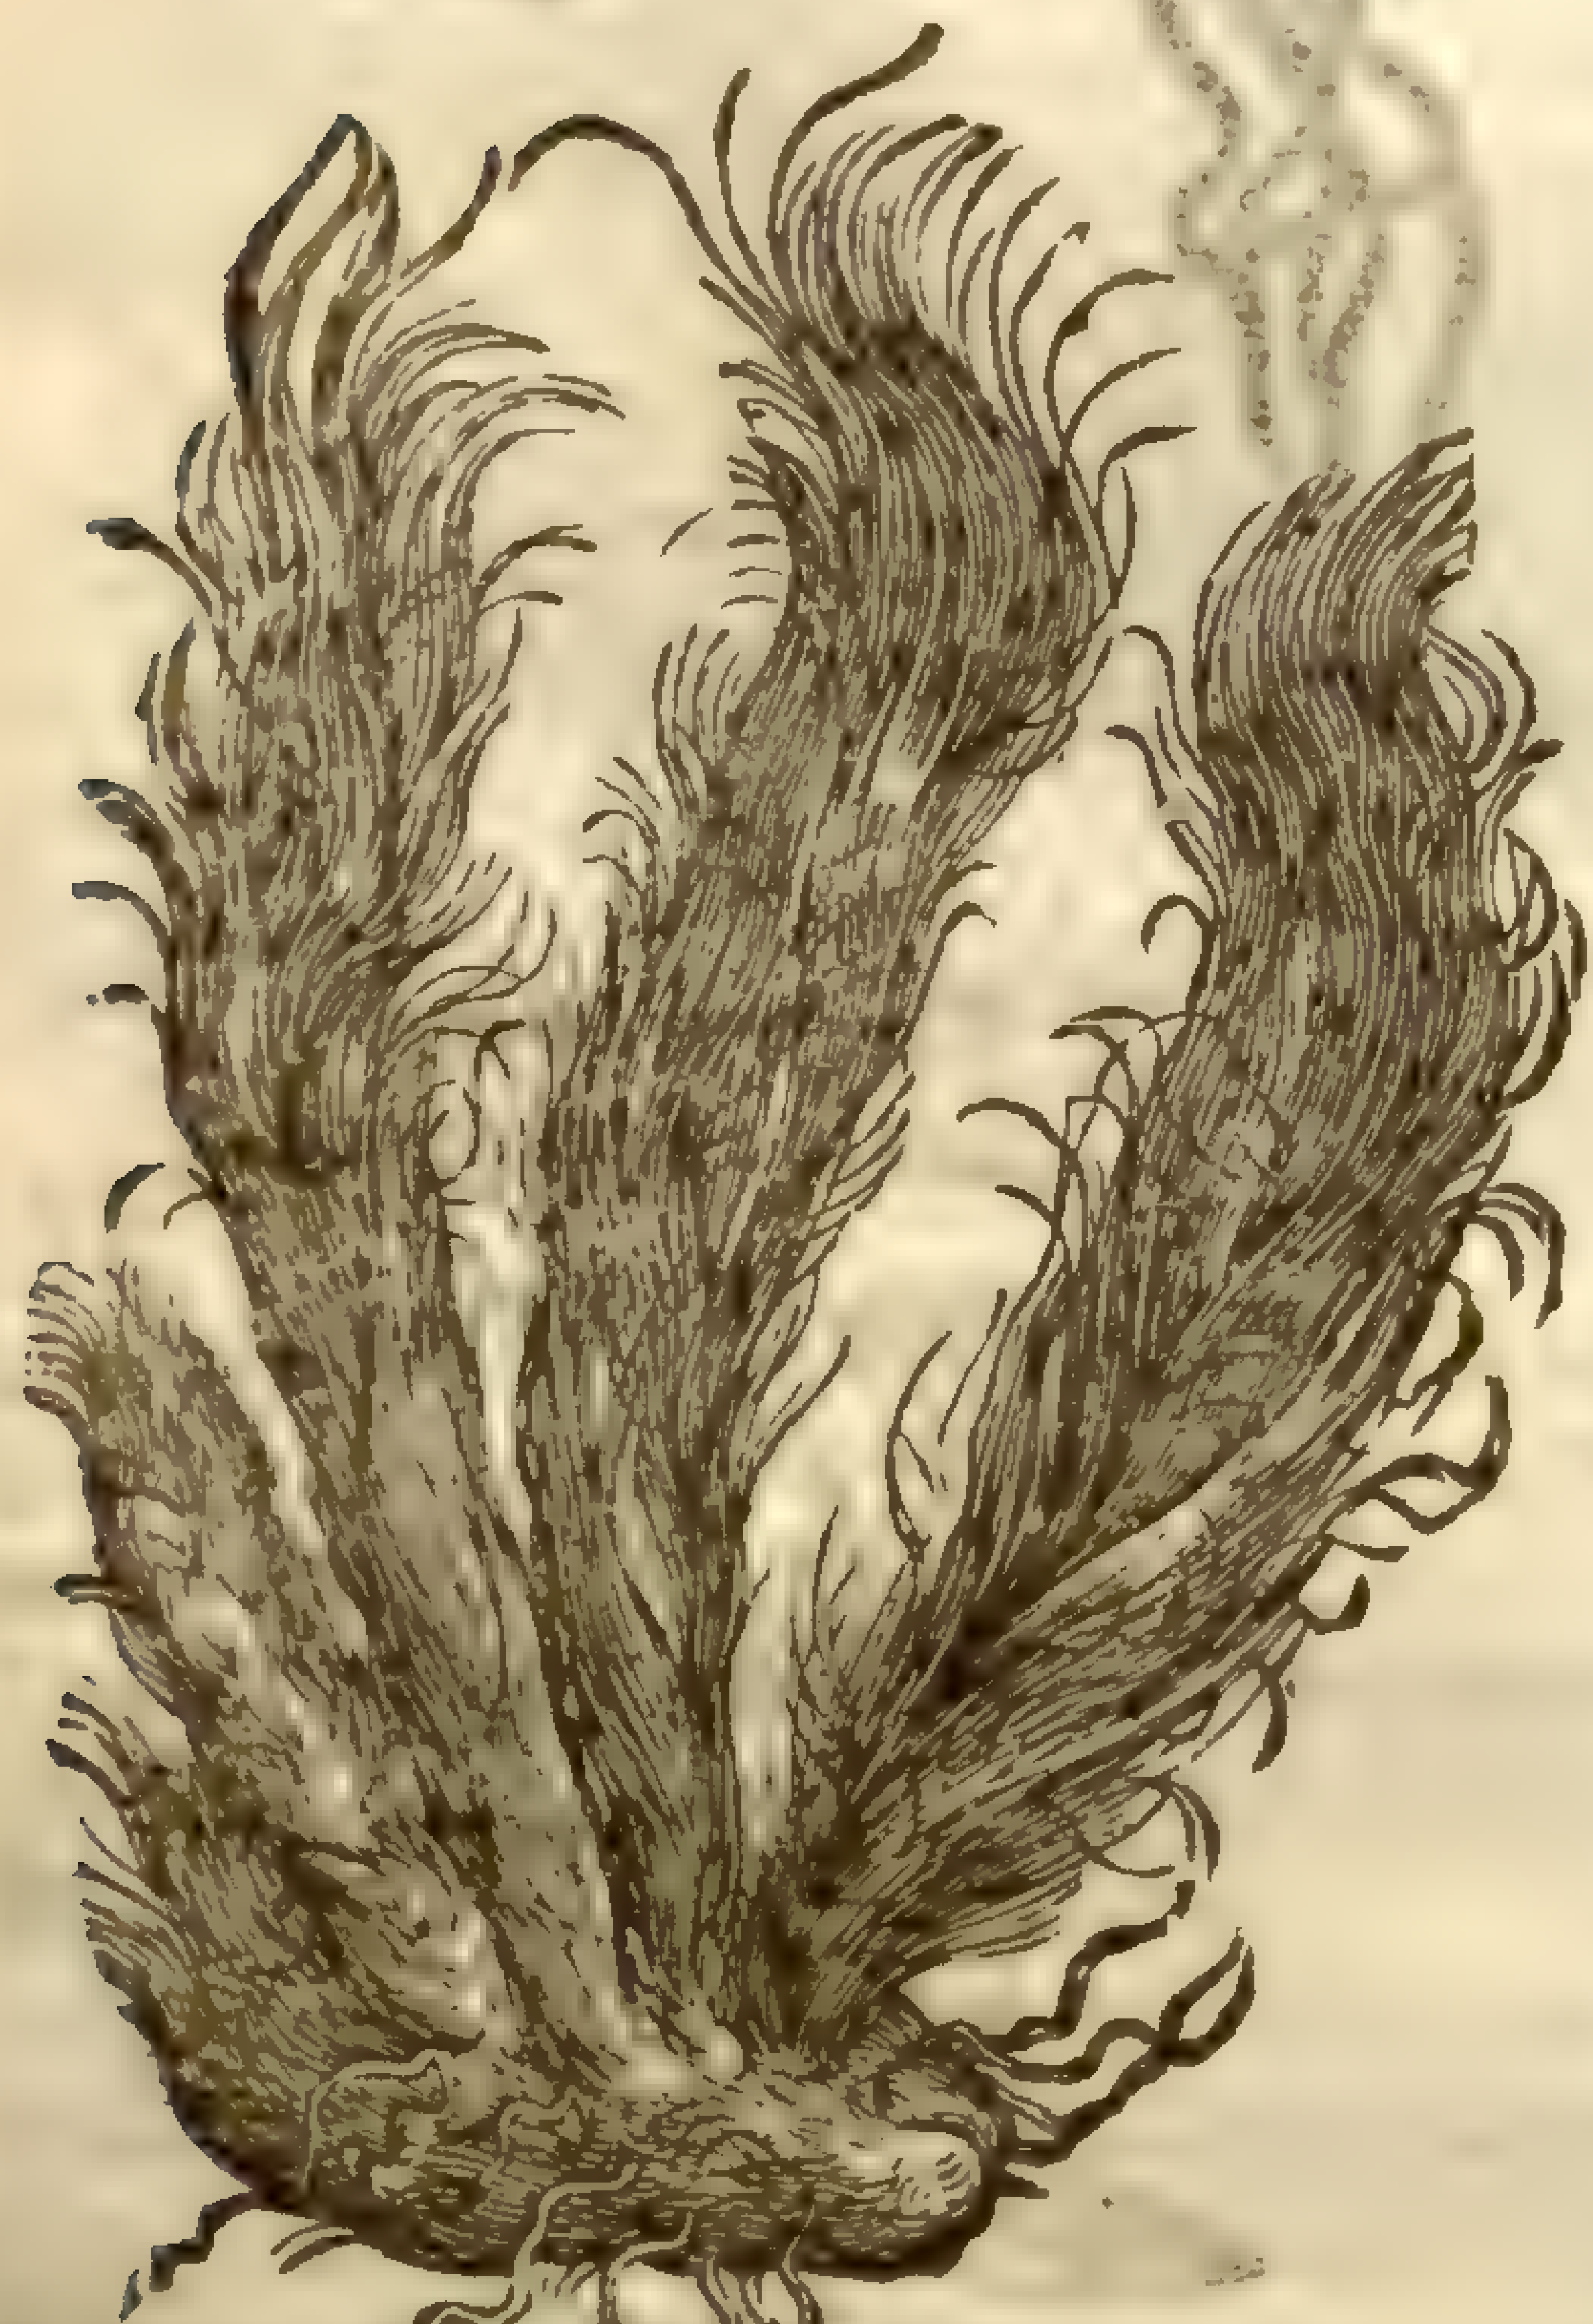
3 *Hirculus* is a plant very rare, which as yet I neuer ſaw, notwithſtanding wee are greatly beholding to *Carolus Cluſius* the father of forreine Simples, who finding this plant among many bunches or handfulls of mountaine *Spikenard*, hath made it knowne vnto *poſteritie*, as he hath done many other rare plans, in

tranſlating of *Garcias* the Luſitanian Phyſitian, he ſetteth it forth with a light deſcription, ſaying, It is a baſe and low herbe two handfuls high, bringing forth leaues without any ſtalks at all, ‡ very hairy about the root, and blackiſh, hauing no pleaſant ſent at all. The leaues chewed yeeld no aromaticke taſte, but are clammie, or viſcide; whereas the leaues of Celticke Narde are hot, with a little aſtriction, and of a pleaſant ſmell and taſte. ‡

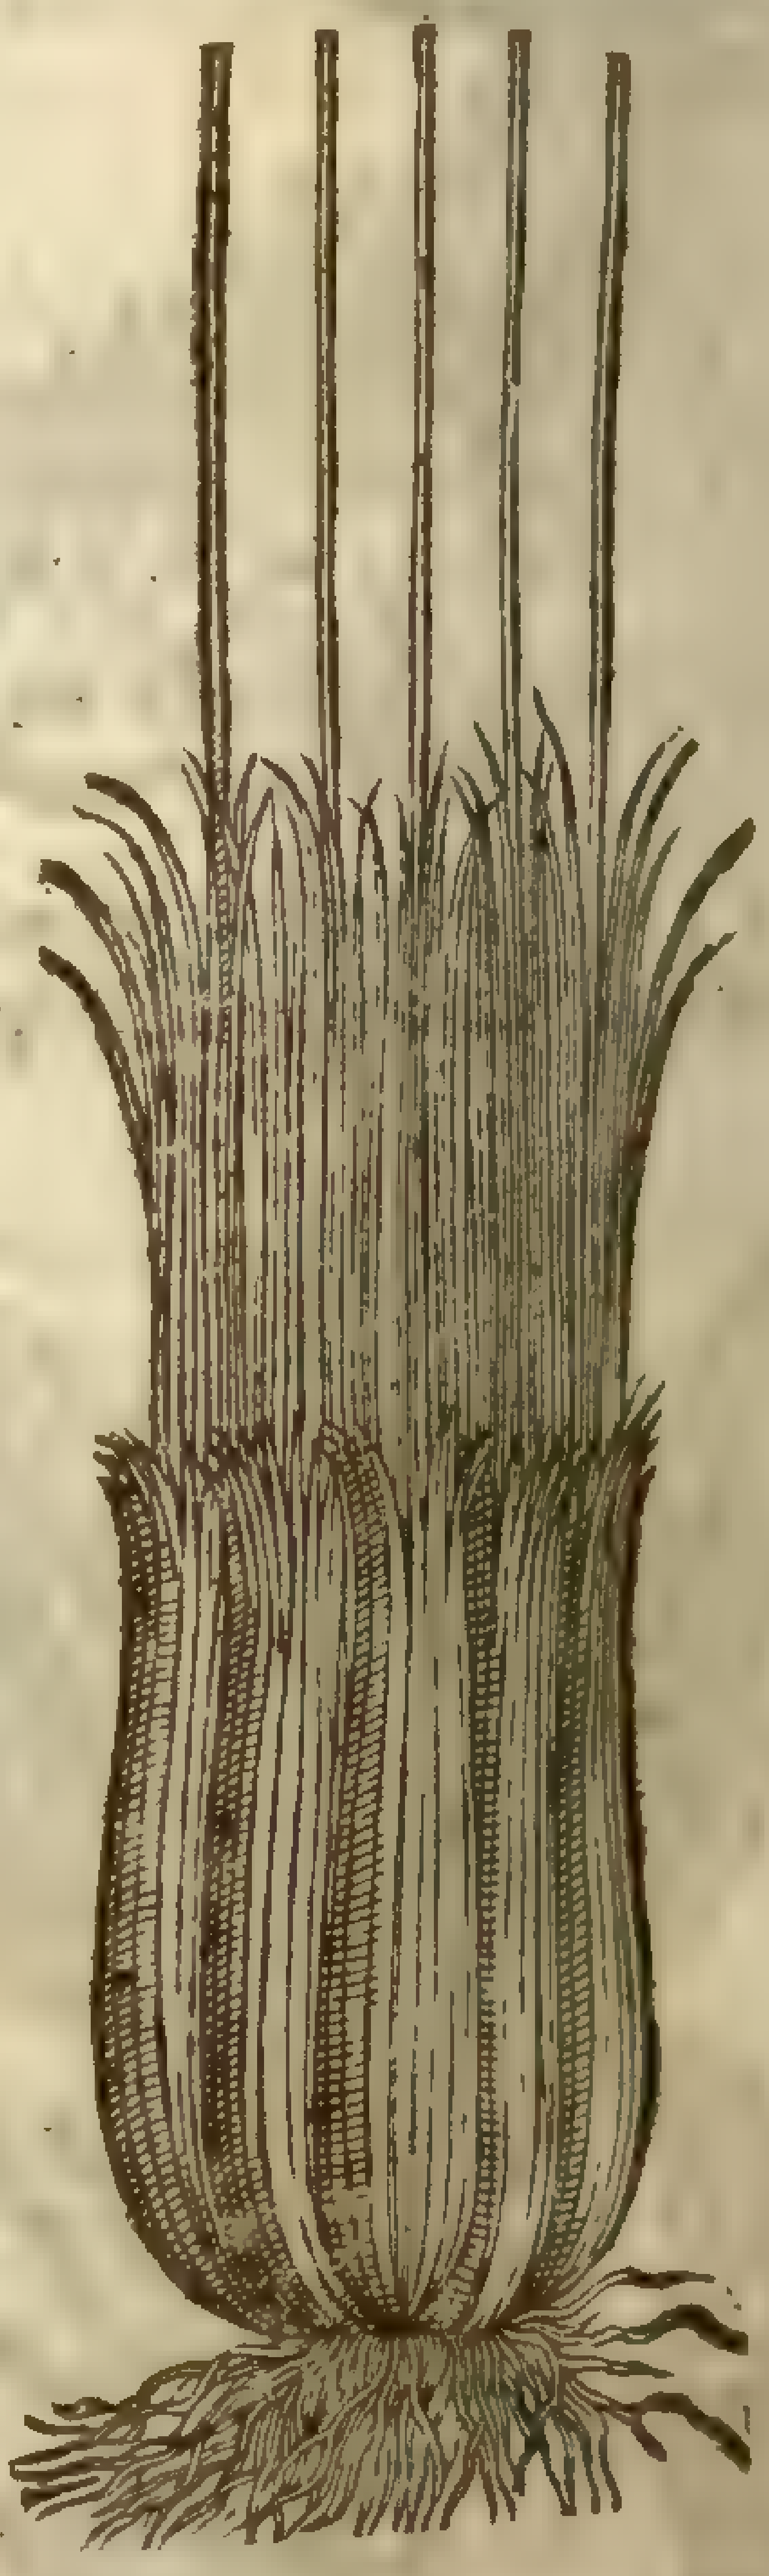
4 Mountaine Spikenard hath a great thicke knobbed root, ſet here and there with ſome tender fibres, of a pleaſant ſweet ſmell; from the which come forth three or foure ſmooth broad leaues, and likewiſe jagged leaues deepely cut euen to the middle rib: among which riſe vp naked ſtalkes, garniſhed in the middle with a tuft of jagged leaues. The floures grow at the top of the ſtalkes, in an vmbel or tuft like thoſe of the wilde Valerian in ſhape and colour, and ſuch alſo is the ſeed. ‡ I haue giuen you the figure of the root and whole leaues as they ſhew themſelues when they firſt appeare, as it was taken by *Cluſius*. ‡

5 The Spikenard of India is a low plant, growing cloſe vnto the ground, compoſed of many rough browne hairy cloues, of a ſtrong, yet not vnpleaſant ſmell. The root is ſmall and threddie. ‡ It hath certainely ſtalkes, floures, and ſeeds; but none of our Indian Writers or Trauellers haue as yet deſcribed them. I haue ſeene little pieces of ſlender hollow ſtalkes ſome two inches long faſtned to the roots that are brought to vs. ‡

5 *Nardus Indica.*
Indian Spikenard.



6 *Nardus Narbonenſis.*
French Spikenard.



† 6 This French Spikenard, being a baſtard kinde, groweth cloſe vpon the ground like the precedent, compact of ſcaly rough leaues: in the middle whereof commeth forth a great buſh of round greene ſtiffe and ruſhy leaues: among the which ſhoot vp diuers round ſtalkes a cubit high, ſet from the middle to the top with greeniſh little cods, ſtanding in chaffie huskes like thoſe of Schœnanth. The root is ſmall and threddy: the whole plant is altogether without ſmell, which ſheweth it to be a baſtard kinde of Spikenard.

¶ *The Place.*

Theſe plants [the firſt foure] are ſtrangers in England, growing in great plenty vpon the mountaines of Iudenberg and Heluetia, on the rockes among the moſſe, and in the mountaines of Tiroll and Saltsburg.

The firſt and ſecond, if my memorie faile me not, doe grow in a field in the North part of England

land,called Crag cloſe, and in the foot of the mountaine called Ingleborow Fels. ‡ The fourth may be found in ſome gardens with vs. The fifth growes in the Eaſt Indies, in the Prouinces of Mandou and Chito in the kingdome of Lengala and Decan. The laſt growes in Prouince in France,neere a little city called Gange. ‡

¶ *The Time.*

The leaues grow to withering in September, at which time they ſmell more pleaſantly than when they flouriſhed and were greene.

¶ *The Names.*

Nardus is called in Pannonia or Hungary,of the countrey people,*Speick* : of ſome,*Bechi ſin* ; that is,the herbe of Vienna, becauſe it doth grow there in great abundance, from whence it is brought into other countries : of *Geſner*,*Saliunca* : in Engliſh,Celticke Spikenard : of the Valletians, *Selliga*, and *Nardus Celtica*.

¶ *The Temperature and Vertues.*

A Celticke Narde mightily prouokes vrine, as recordeth *Rondeletius* ; who trauelling through the deſart countrey, chanced to lodge in a monaſtery where was a Chanon that could not make his water, but was preſently helped by the decoction of this herbe, through the aduice of the ſaid *Rondeletius*.

B ‡ The true Spikenard or Indian Nard hath a heating and drying facultie, being (according to *Galen*) hot in the firſt degree [yet the Greeke copy hath the third] and dry in the ſecond. It is compoſed of a ſufficiently aſtringent ſubſtance, and not much acride heate, and a certaine light bitterneſſe. Conſiſting of theſe faculties, according to reaſon, both inwardly and outwardly vſed it is conuenient for the liuer and ſtomacke.

C It prouoketh vrine,helps the gnawing paines of the ſtomacke, dries vp the defluxions that trouble the belly and intrails ,as alſo that moleſt the head and breſt.

D It ſtaies the fluxes of the belly, and thoſe of the wombe, being vſed in a peſſarie, and in a bath it helpes the inflammation thereof.

E Drunke in cold water, it helpes the nauſeouſneſſe, gnawings, and windineſſe of the ſtomacke, the liuer,and the diſeaſes of the kidnies,and it is much vſed to be put into Antidotes.

F It is good to cauſe haire to grow on the eye-lids of ſuch as want it,and is good to be ſtrewed vpon any part of the body that abounds with ſuperfluous moiſture,to dry it vp.

G The Celticke-Nard is good for all the forementioned vſes, but of leſſe efficacie, vnleſſe in the prouoking of vrine. It is alſo much vſed in Antidotes.

H The mountaine Nard hath alſo the ſame faculties, but is much weaker than the former, and not in vſe at this day that I know of. ‡

CHAP. 442. *Of Larks heele or Larks claw.*

¶ *The Deſcription.*

1 THe garden Larks ſpur hath a round ſtem ful of branches,ſet with tender jagged leaues very like vnto the ſmall Sothernwood : the floures grow alongſt the ſtalks toward the tops of the branches,of a blew colour,conſiſting of fiue little leaues which grow together and make one hollow floure,hauing a taile or ſpur at the end turning in like the ſpur of Todeflax. After come the ſeed, very blacke, like thoſe of Leekes : the root periſheth at the firſt approch of Winter.

2 The ſecond Larks ſpur is like the precedent, but ſomewhat ſmaller in ſtalkes and leaues : the floures are alſo like in forme,but of a white colour,wherein eſpecially is the difference. Theſe floures are ſometimes of a purple colour, ſometimes white, murrey, carnation, and of ſundry other colours,varying infinitely,according to the ſoile or country wherein they liue.

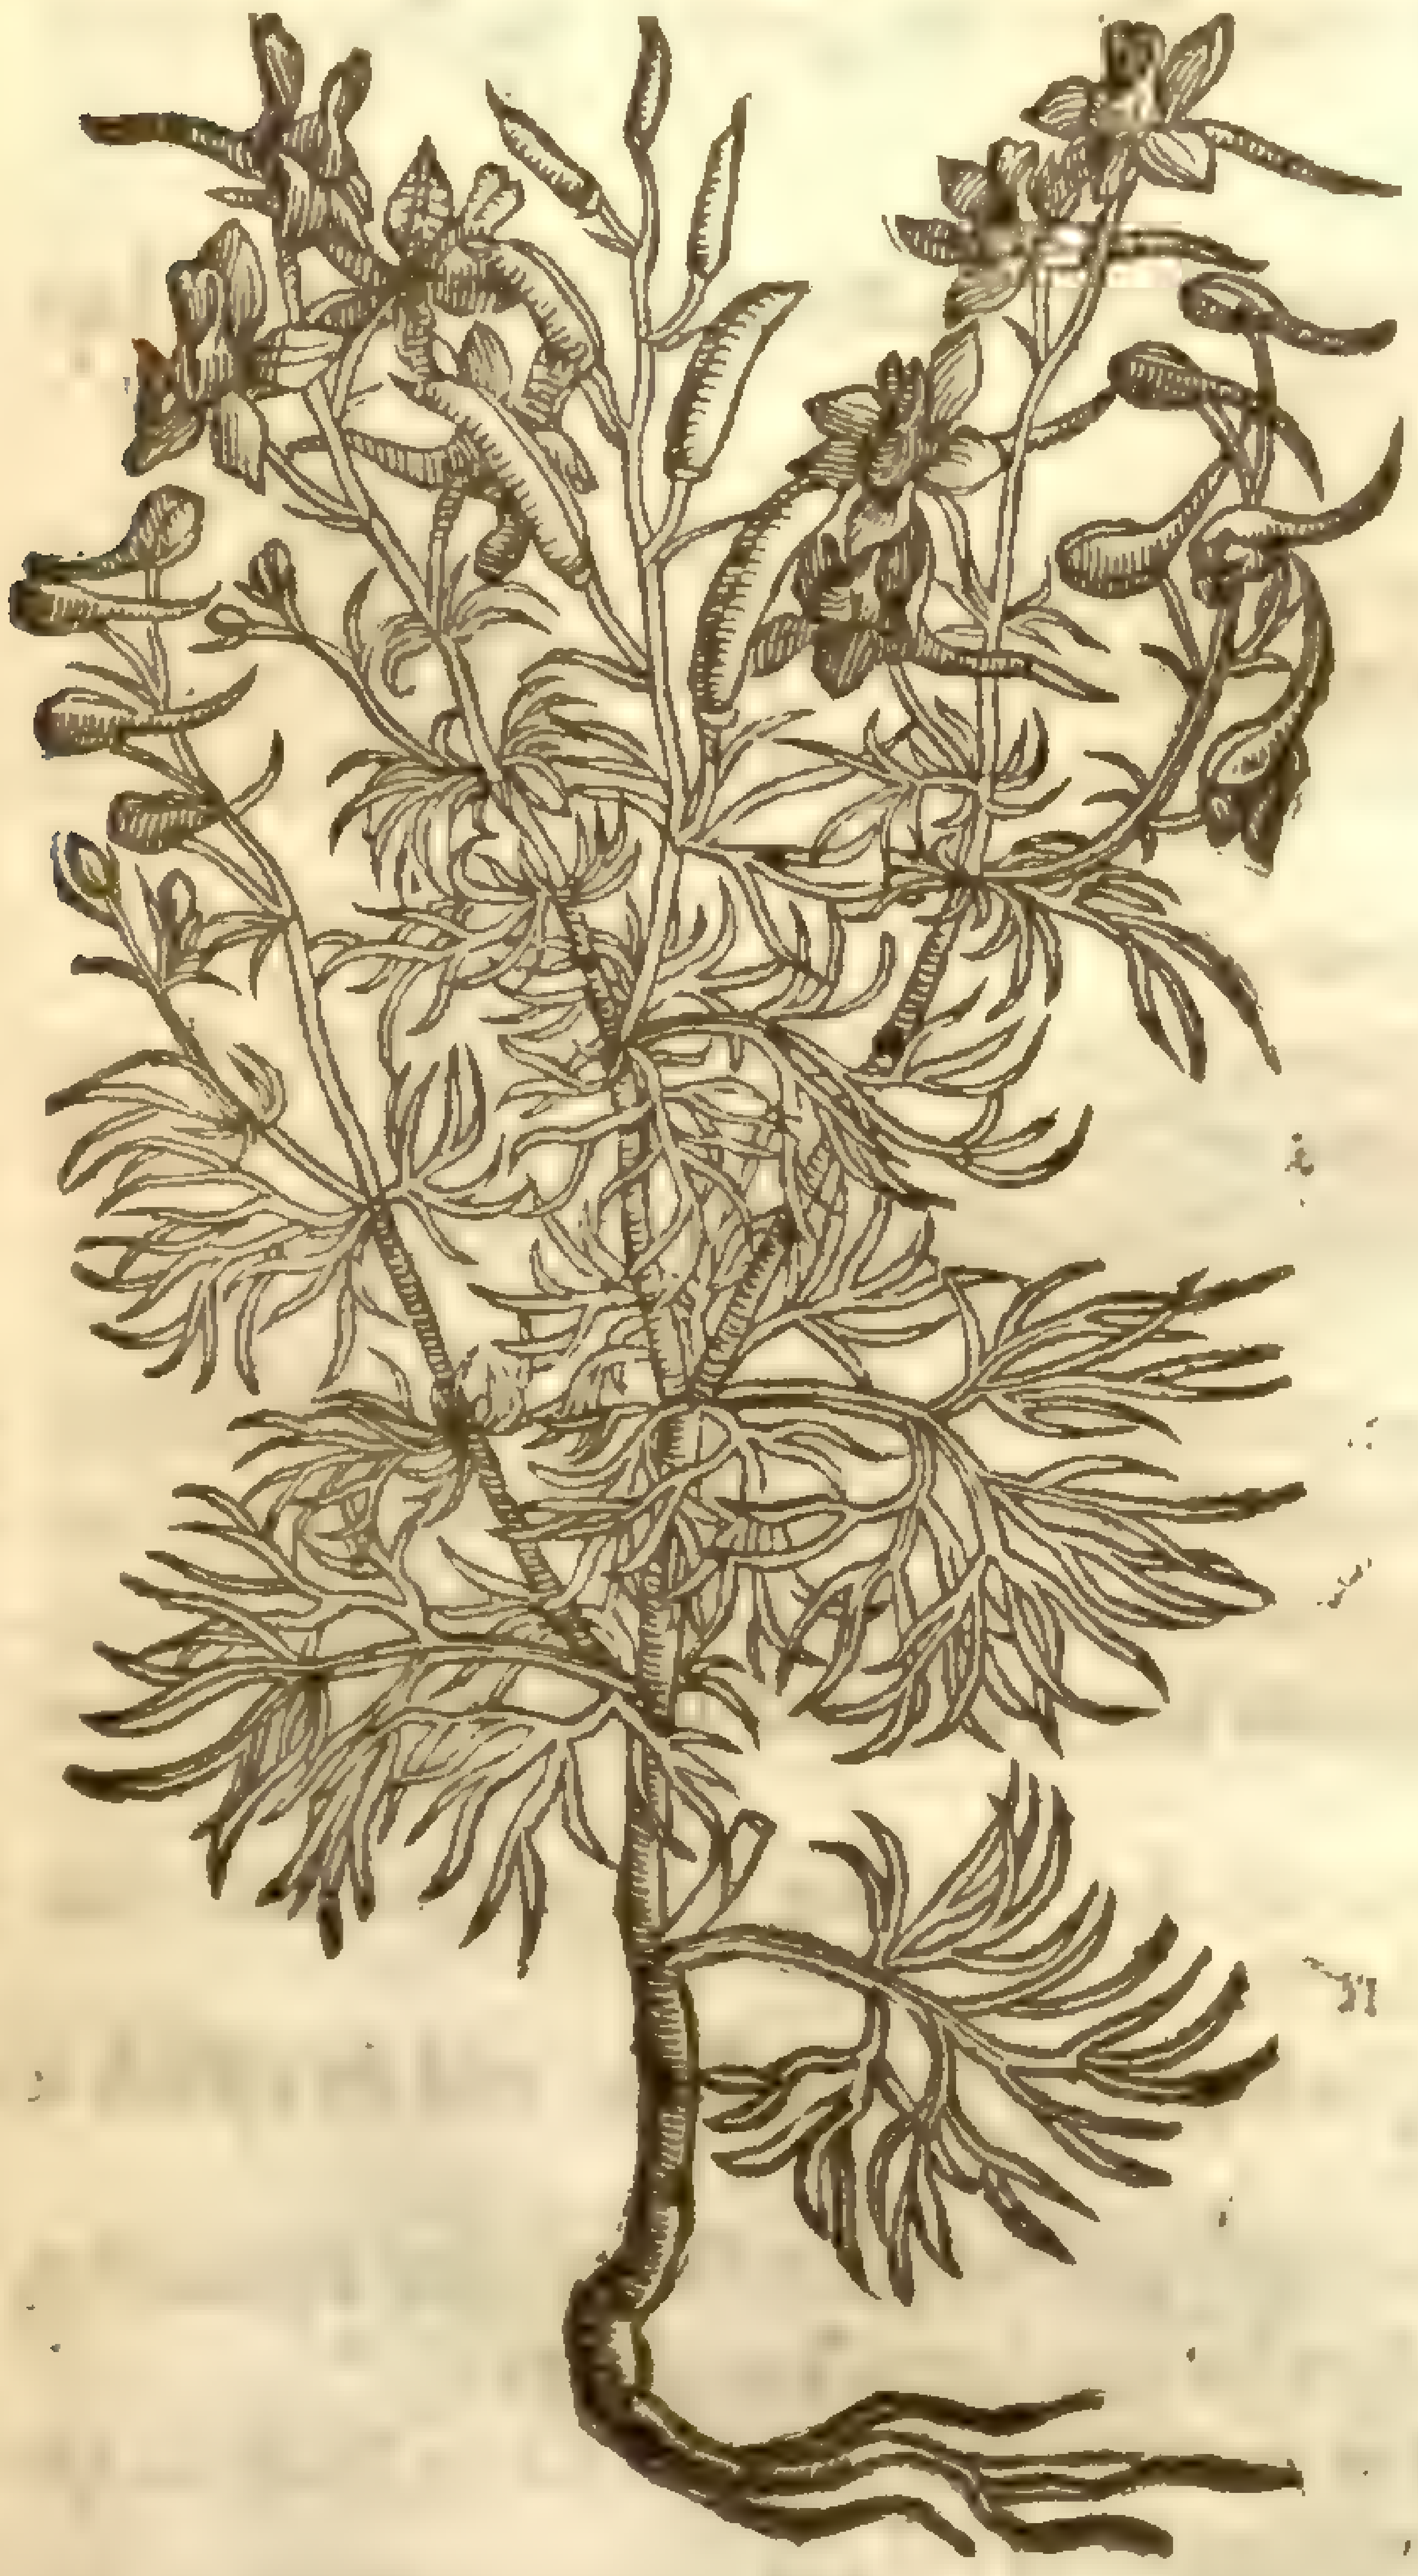
‡ 3 Larks ſpur with double flours hath leaues, ſtalkes,roots, and ſeeds like the other ſingle kinde, but the floures of this are double ; and hereof there are as many ſeuerall varieties as there be of the ſingle kinde,to wit,white,red,blew,purple,bluſh,&c.

4 There is alſo another variety of this plant, which hath taller ſtalkes and larger leaues than the common kinde : the floures alſo are more double and larger,with a leſſer heele : this kinde alſo yeeldeth vſually leſſe ſeed than the former. The colour of the floure is as various as that of the former,being either blew,purple,white,red,or bluſh,and ſometimes mixed of ſome of theſe. ‡

5 The wilde Larks ſpur hath moſt fine jagged leaues, cut and hackt into diuers parts, confuſedly ſet vpon a ſmall middle tendrell : among which grow the floures, in ſhape like the others, but

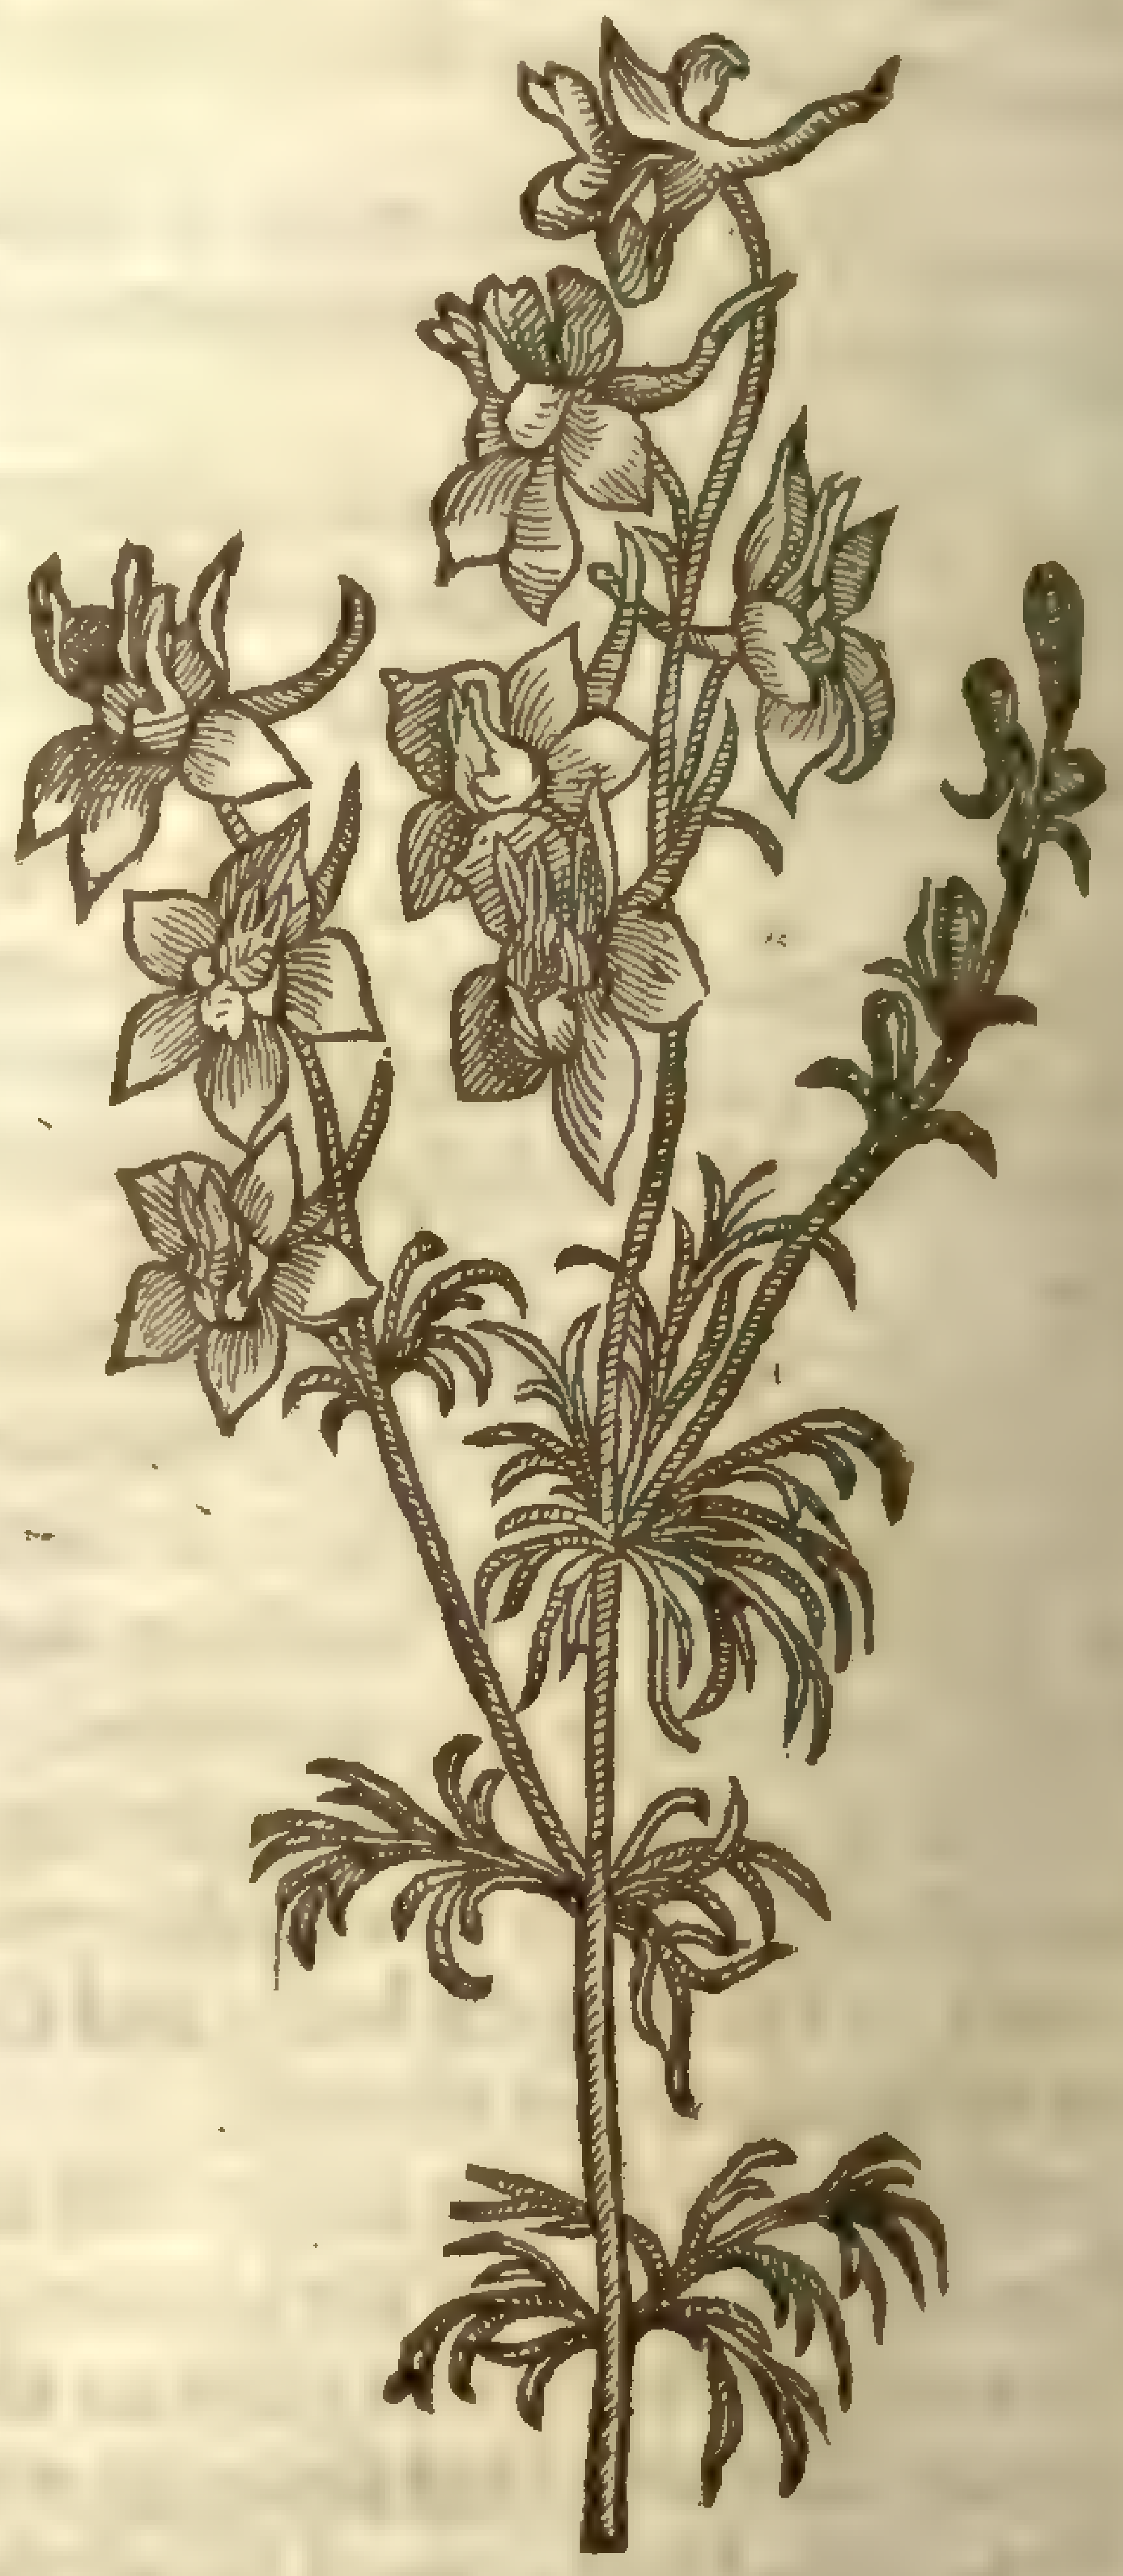
a great

1 *Conſolida regalis ſatiua.*
Garden Larks heele.

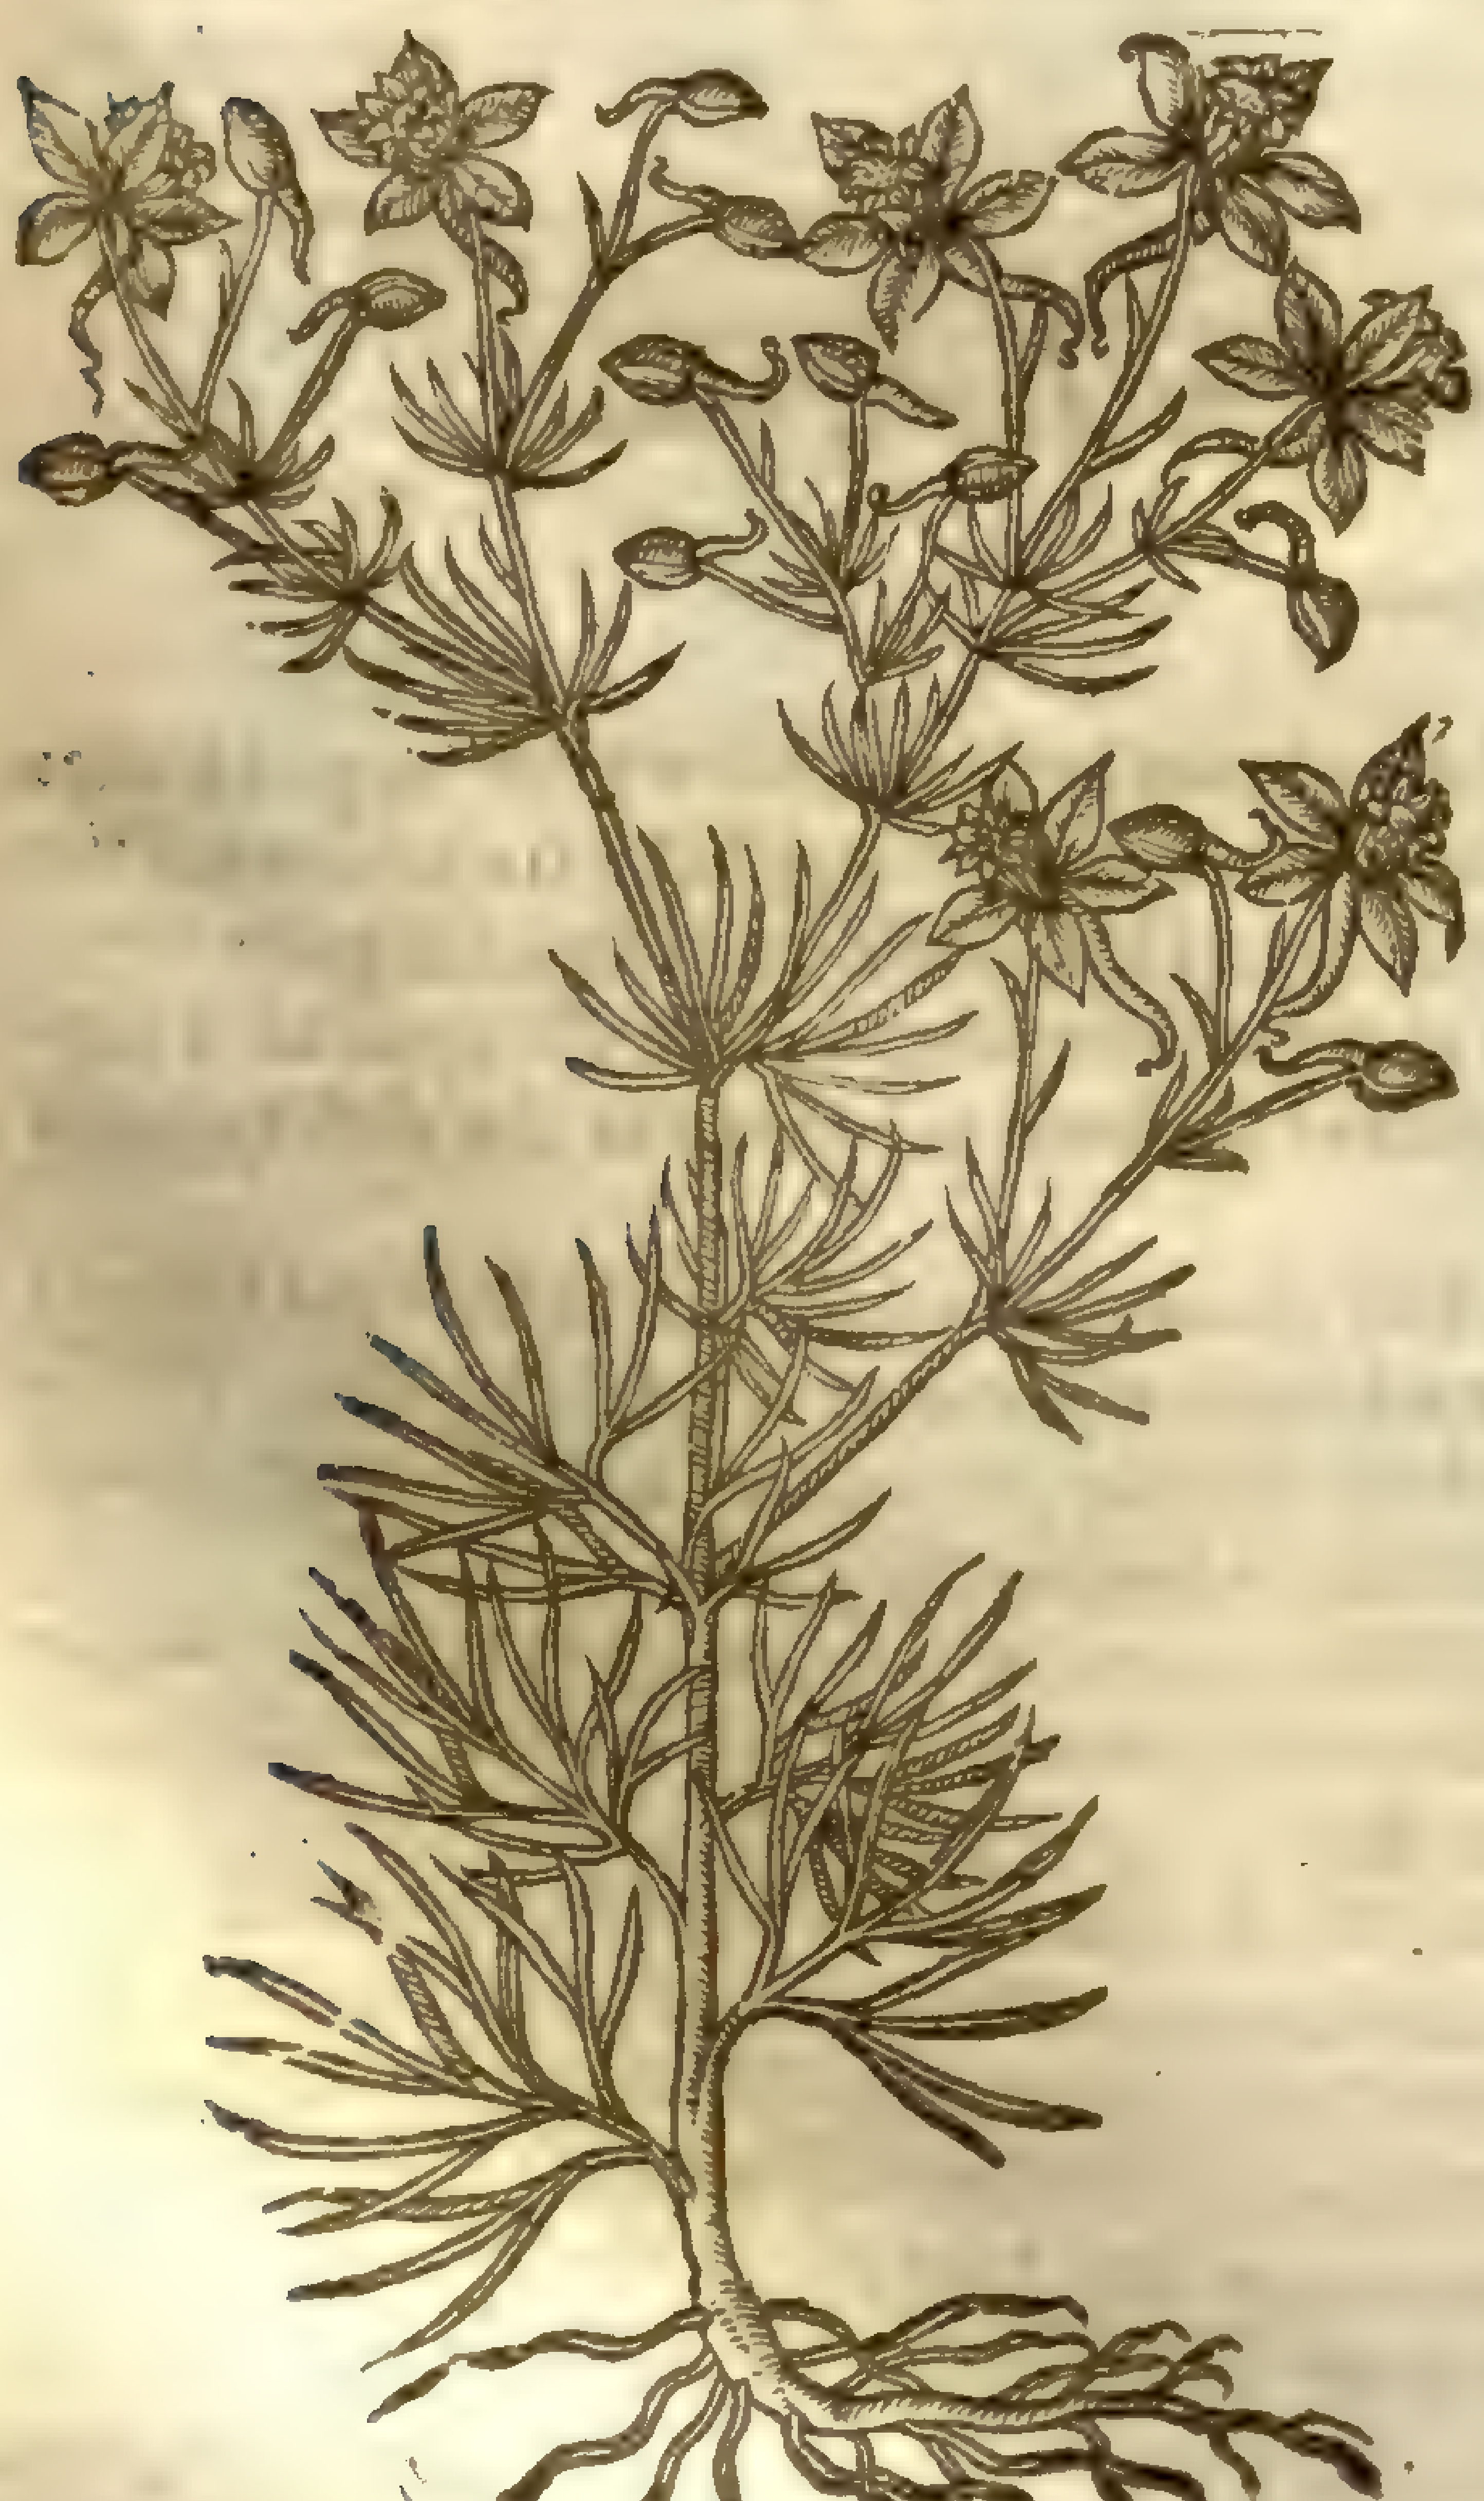


Delphinium Consolida, & [illegible]
Sm. fl. 3. 53

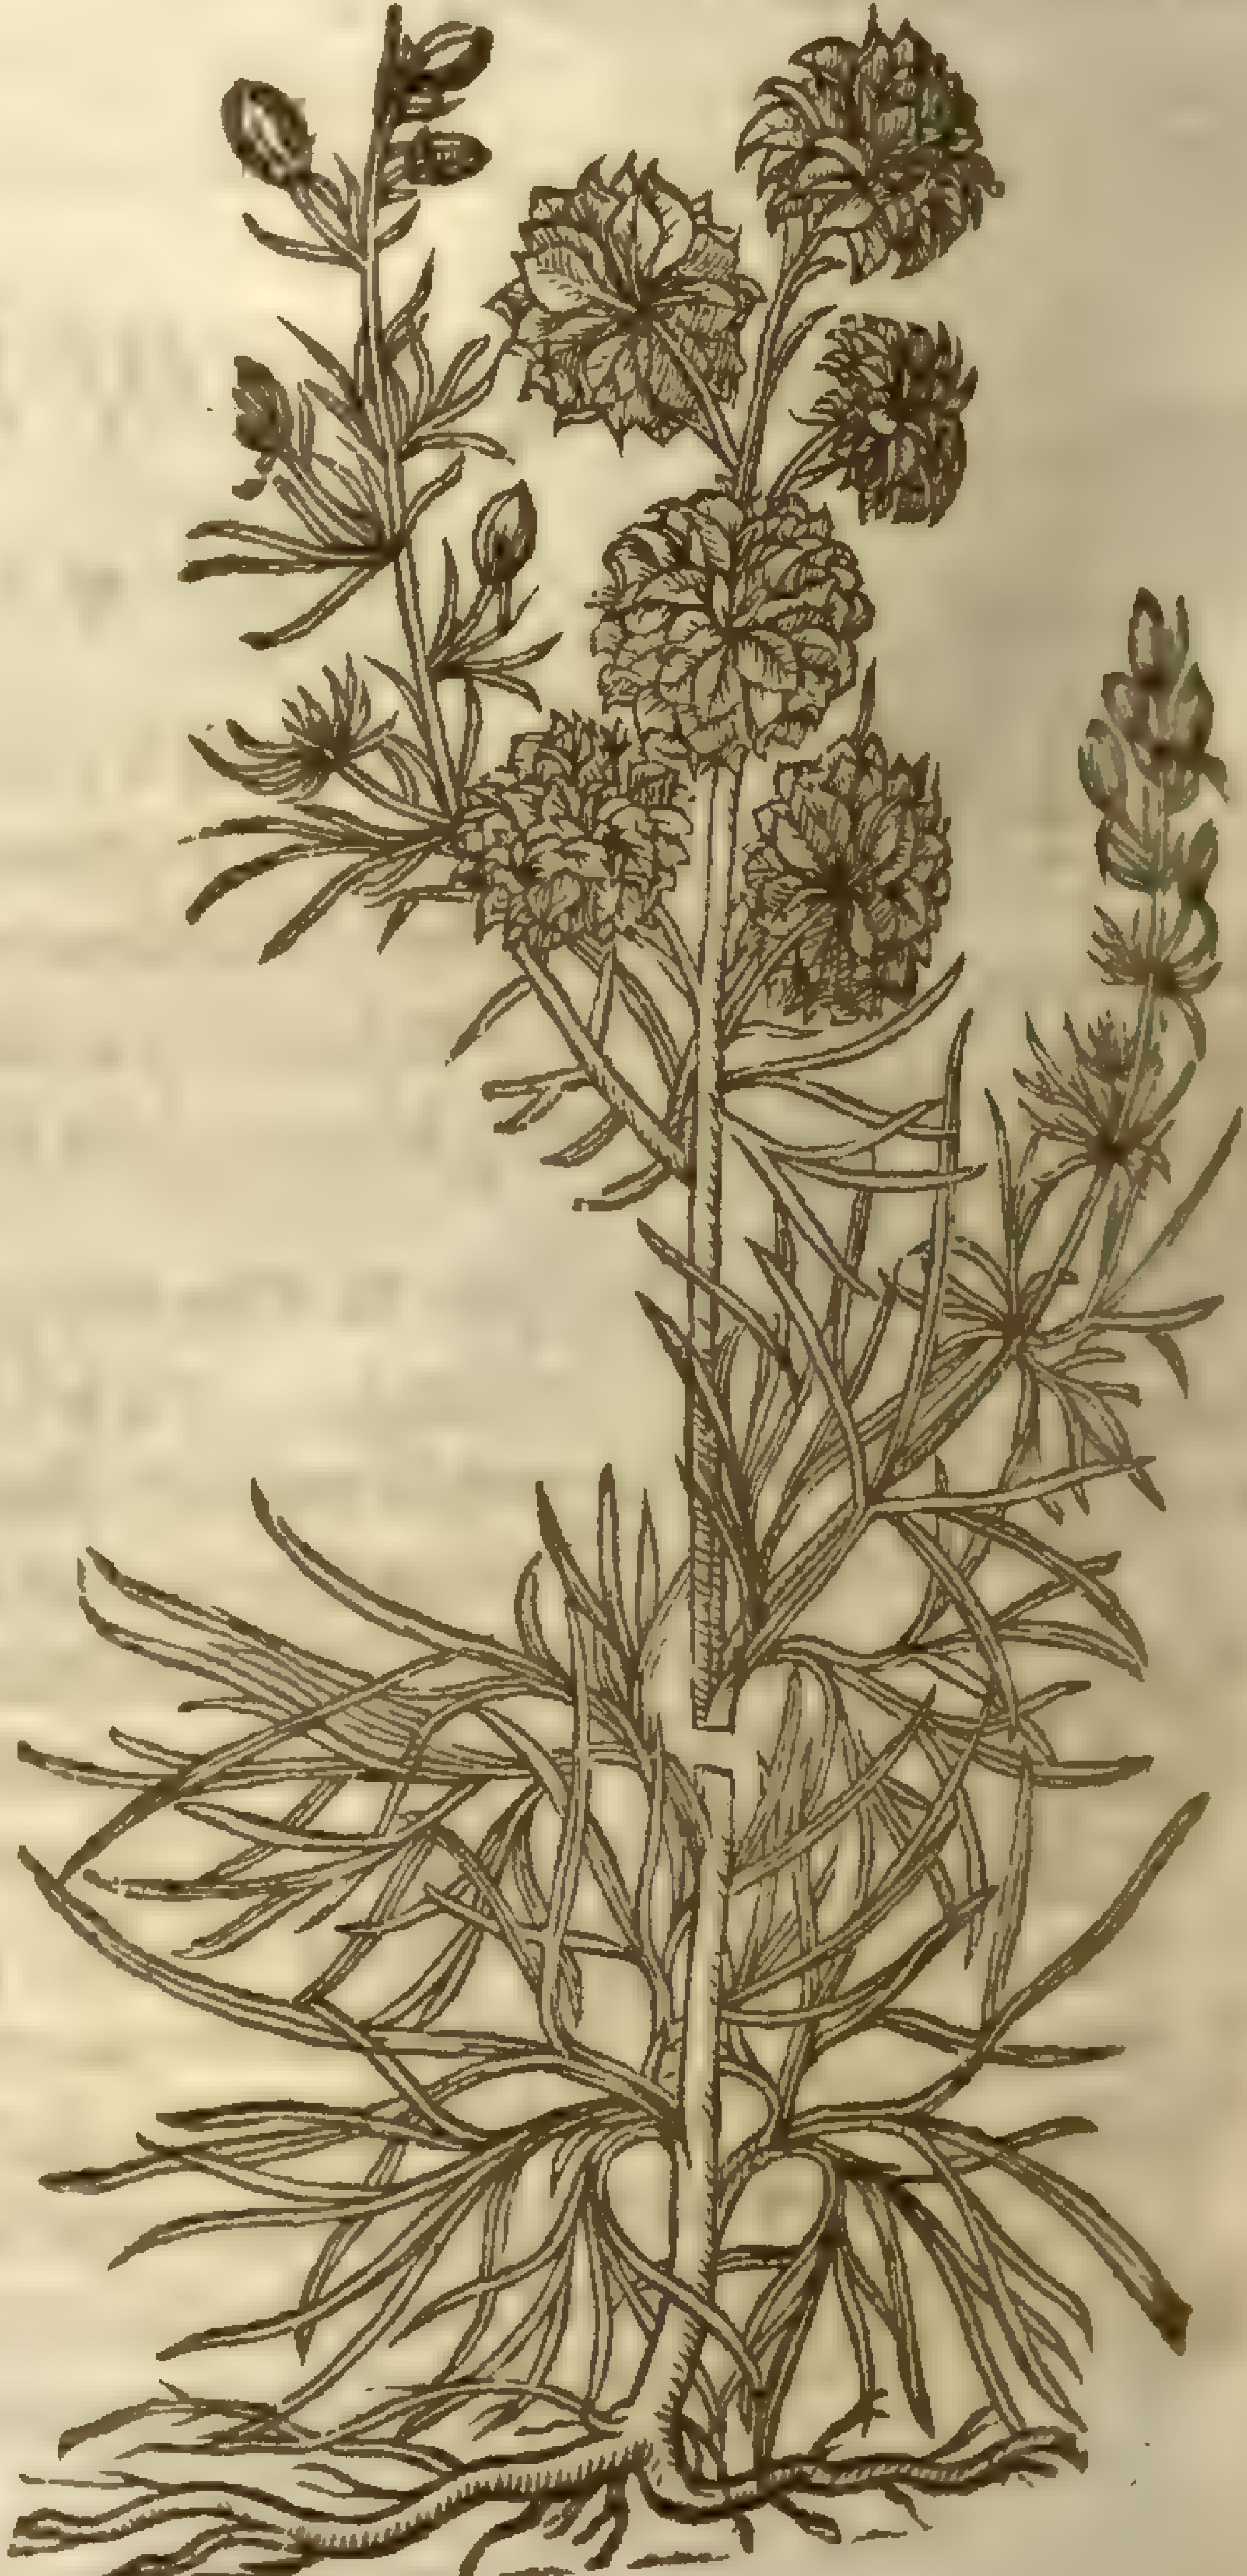
2 *Conſolida ſatiua flore albo vel rubro.*
White or red Larks ſpur.



‡ 3 *Conſolida regalis flore duplici.*
Double Larks ſpur.

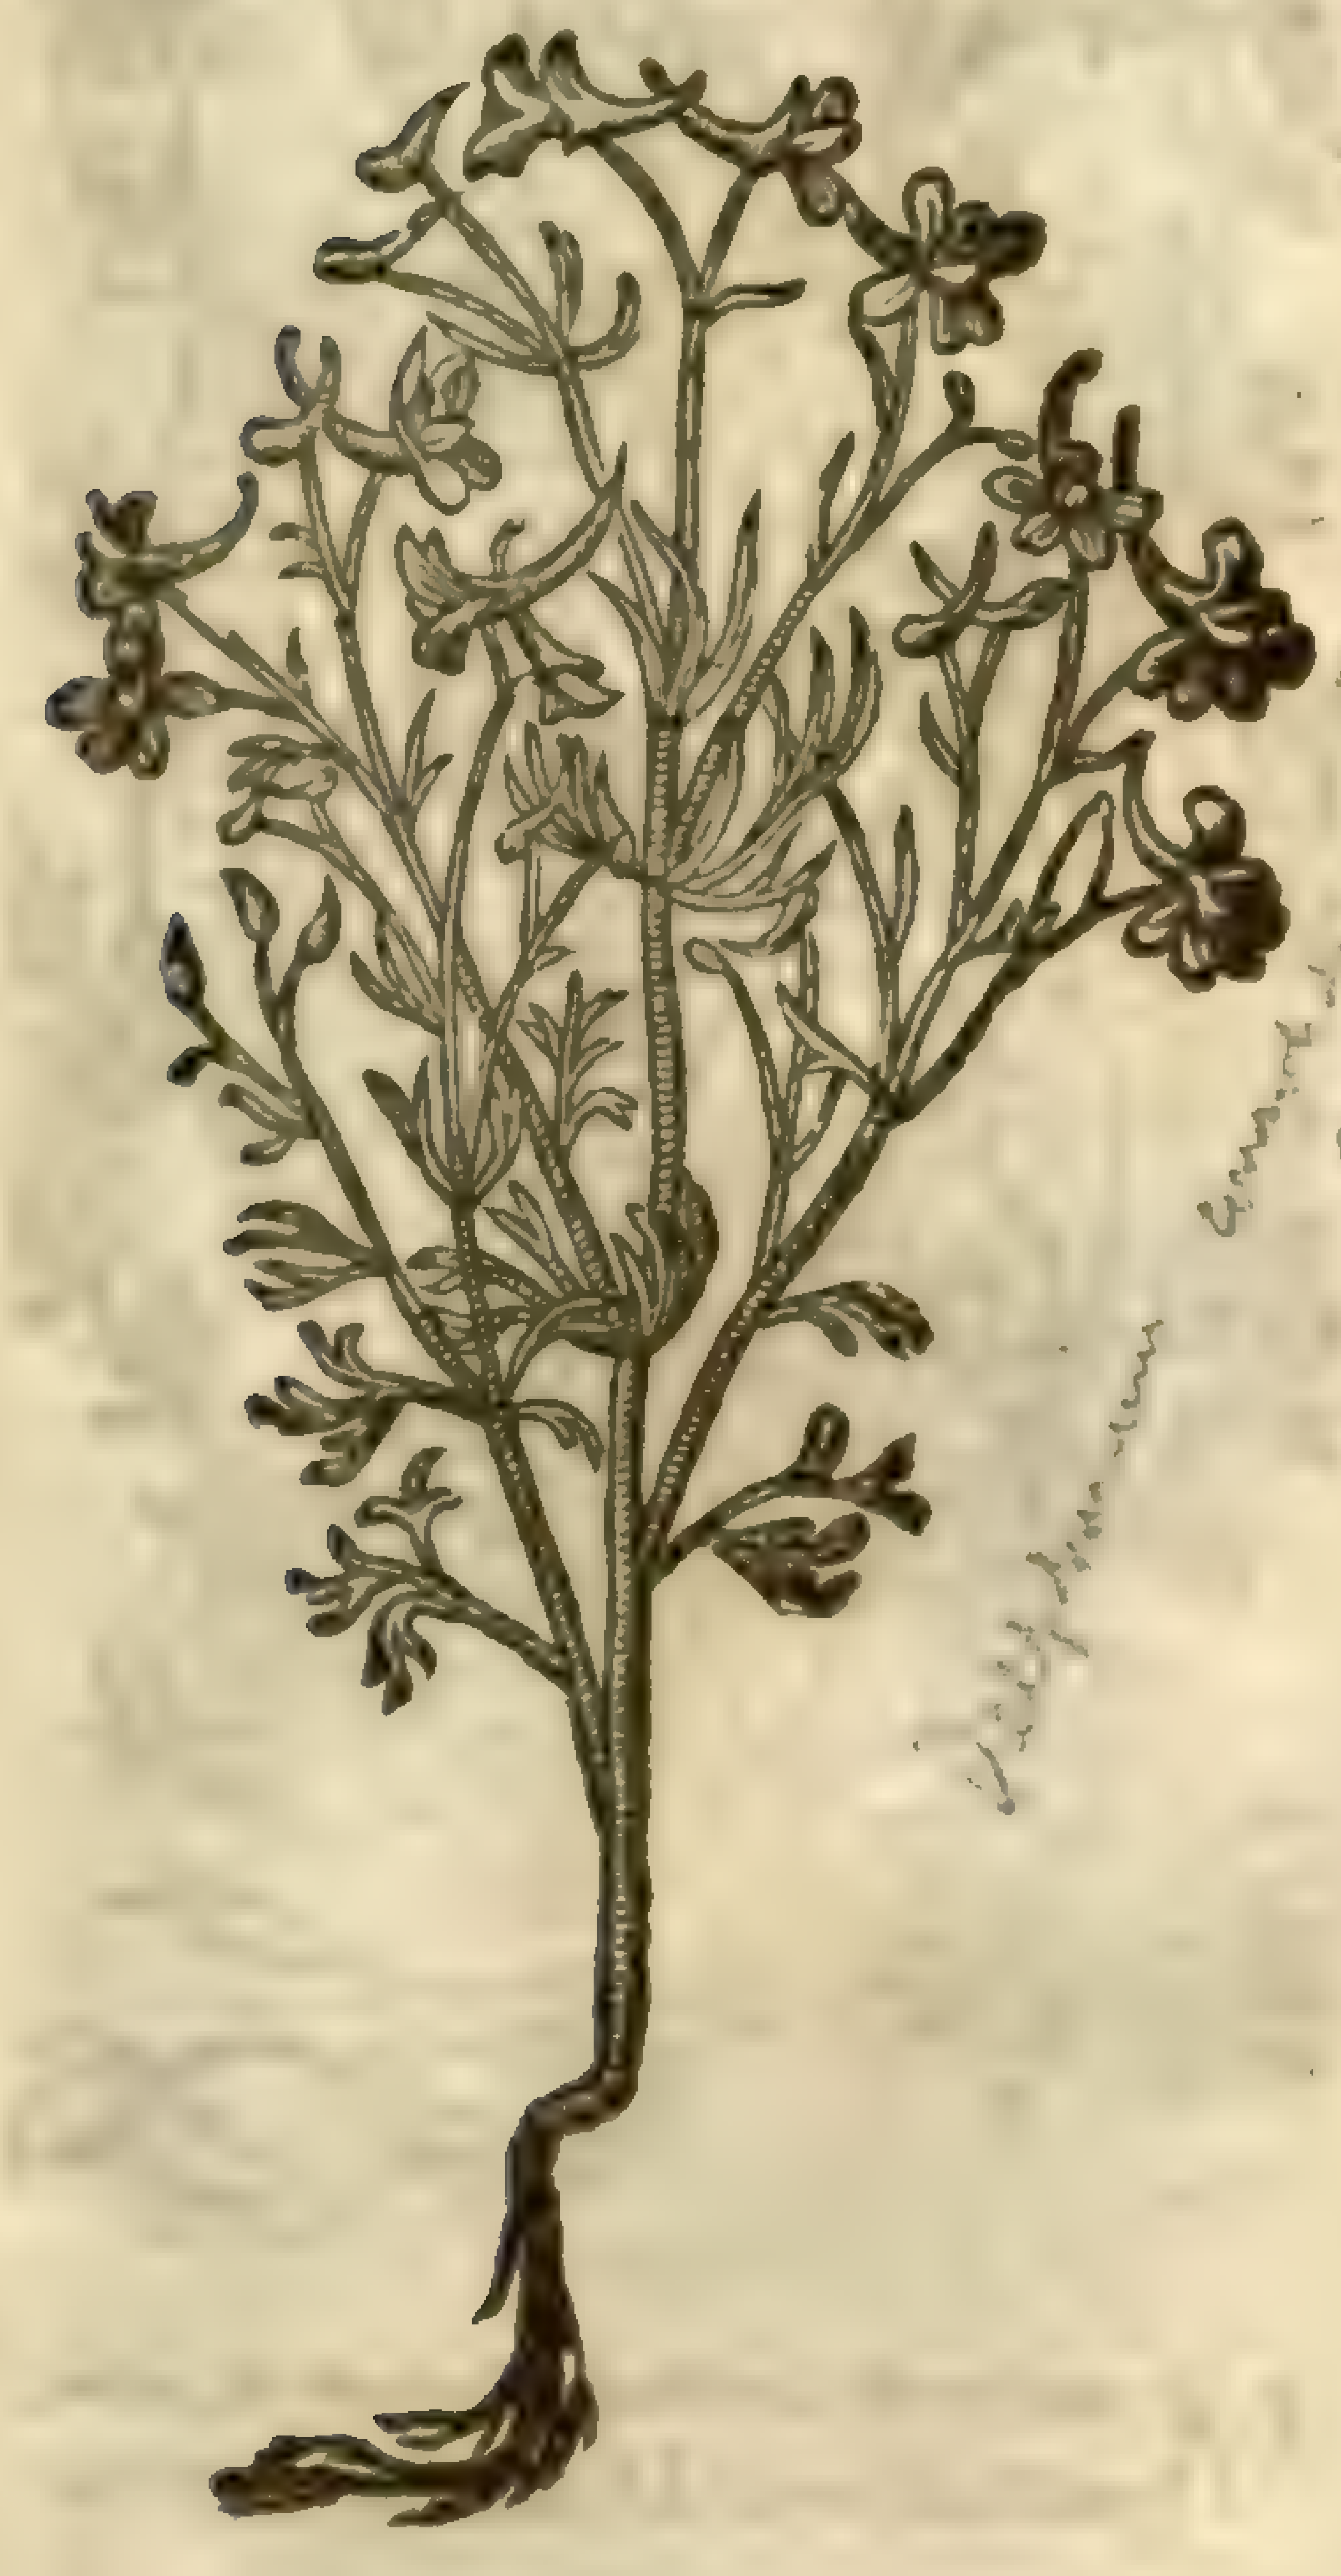


‡ 4 *Conſolida reg. elatior flo. pleno.*
Great double Larks ſpur.



a great deale leſſer, ſometimes purple, otherwhiles white, and often of a mixt colour. The root is ſmall and threddy.

5 *Conſolida regalis ſylueſtris.*
Wilde Larkes heele.



¶ *The Place.*

Theſe plants are ſet and ſowne in gardens: the laſt groweth wilde in corne fields, and where corn hath grown, ‡ but not with vs, that I haue yet obſerued; though it be frequently found in ſuch places in many parts of Germanie. ‡

¶ *The Time.*

They floure for the moſt part all Summer long, from Iune to the end of Auguſt, and oftimes after.

¶ *The Names.*

Larks heele is called *Flos Regius*: of diuers, *Conſolida regalis*: who make it one of the Confounds or Comfreyes. It is alſo thought to be the *Delphinium* which *Dioſcorides* deſcribes in his third booke; wherewith it may agree. It is reported by *Gerardus* of Veltwijcke, who remained Lieger with the great Turke from the Emperor *Charles* the fifth, That the ſaid *Gerard* ſaw at Conſtantinople a copy which had in the chap. of *Delphinium*, not leaues but floures like Dolphins: for the floures, and eſpecially before they be perfected, haue a certaine ſhew and likeneſſe of thoſe Dolphins, which old pictures and armes of certain antient families haue expreſſed with a crooked and bending figure or ſhape, by which ſigne alſo the heauenly Dolphine is ſet forth. And it ſkilleth not, though the chapter of *Delphinium* be thought to be falſified and counterfeited; for although it bee ſome other mans, and not of *Dioſcorides*, it is notwithſtanding ſome one of the old Writers, out of whom it is taken, and foiſted into *Dioſcorides* his bookes: of ſome it is called *Bucinus*, or *Bucinum*: in Engliſh, Larks ſpur, Larks heele, Larks toes, and Larks claw: in high Dutch, **Ridder ſpooren**, that is, *Equitis Calcar*, Knights ſpur: in Italian, *Sperone*: in French, *Pied d'alouette*.

¶ *The Temperature.*

Theſe herbes are temperate and warme of nature.

¶ *The Vertues.*

A We finde little extant of the vertues of Larks heele, either in the antient or later writers, worth the noting, or to be credited; yet it is ſet downe, that the ſeed of Larks ſpur drunken is good againſt the ſtingings of Scorpions; whoſe vertues are ſo forceable, that the herbe onely throwne before the Scorpion or any other venomous beaſt, cauſeth them to be without force or ſtrength to hurt, inſomuch that they cannot moue or ſtirre vntill the herbe be taken away: with many other ſuch trifling toyes not worth the reading.

Chap. 443. Of Gith, or Nigella.

¶ *The Kindes.*

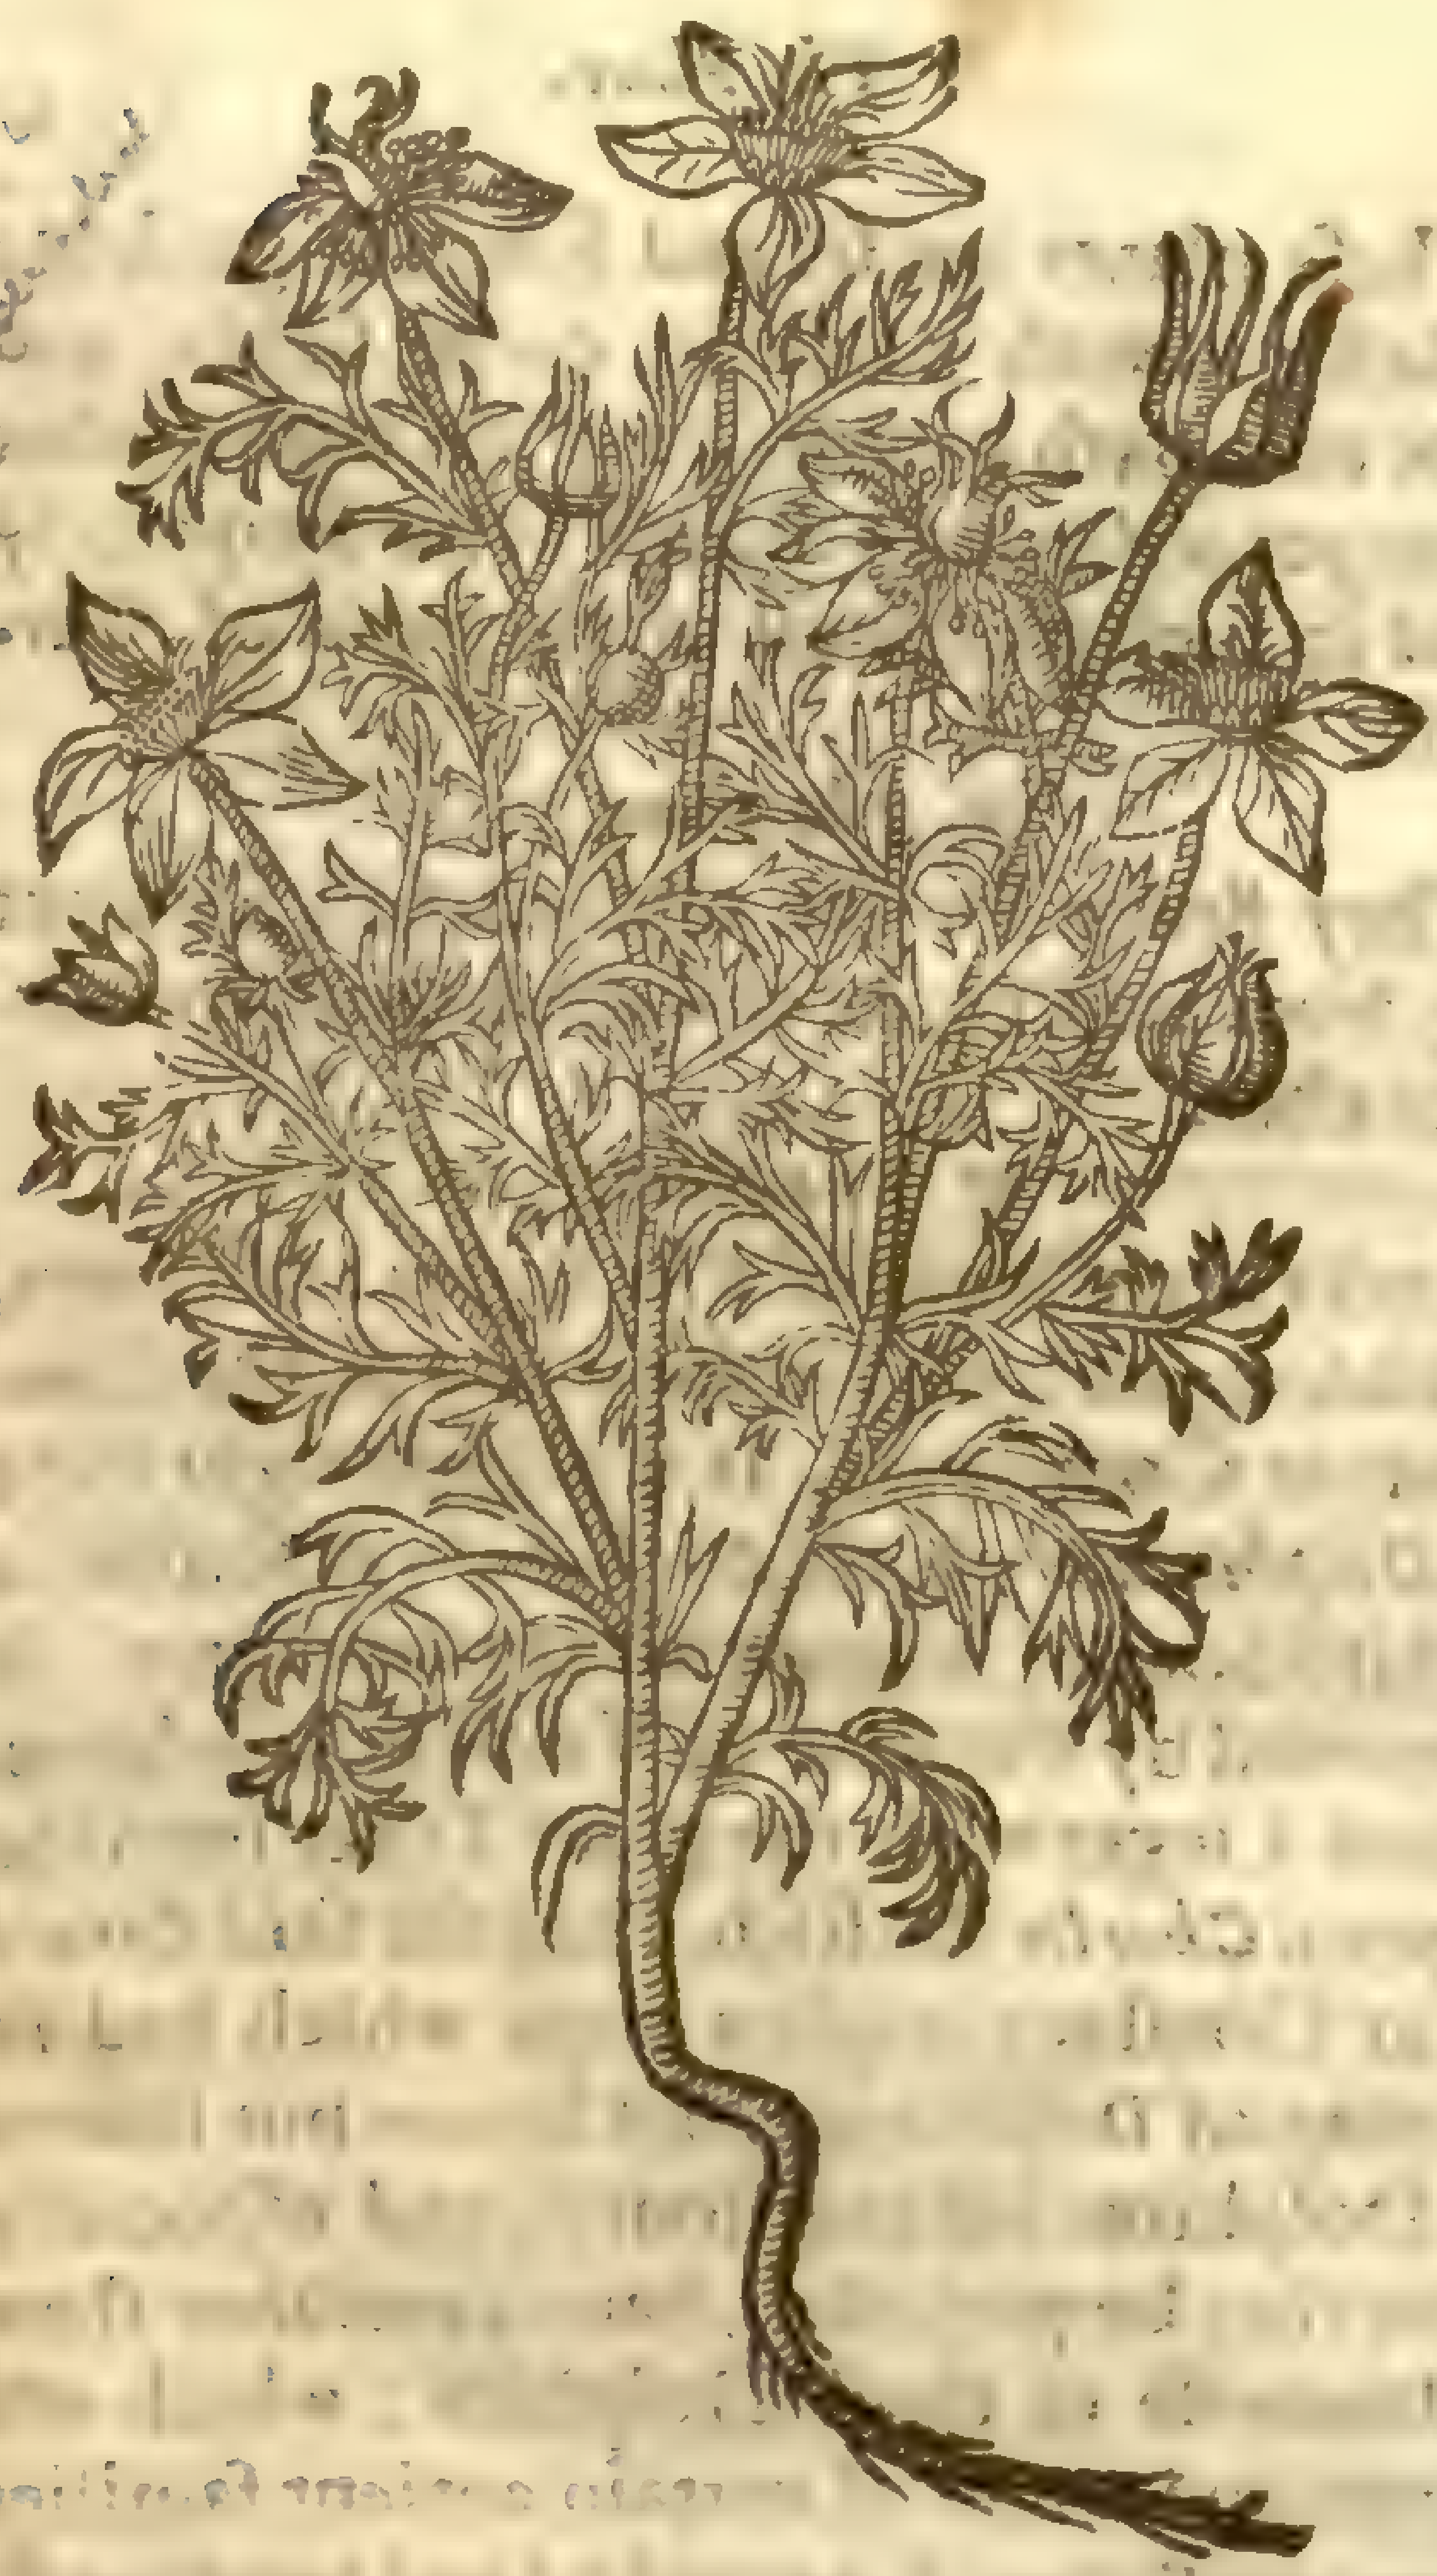
There be diuers ſorts of Gith or Nigella, differing ſome in the colour of the floures, others in the doubleneſſe thereof, and in ſmell of the ſeed.

¶ *The Deſcription.*

1 The firſt kind of Nigella hath weake and brittle ſtalks of the height of a foot, full of branches, beſet with leaues very much cut or jagged, reſembling the leaues of Fumiterie, but much greener: the floures grow at the top of the branches, of a whittiſh blew colour, each floure being

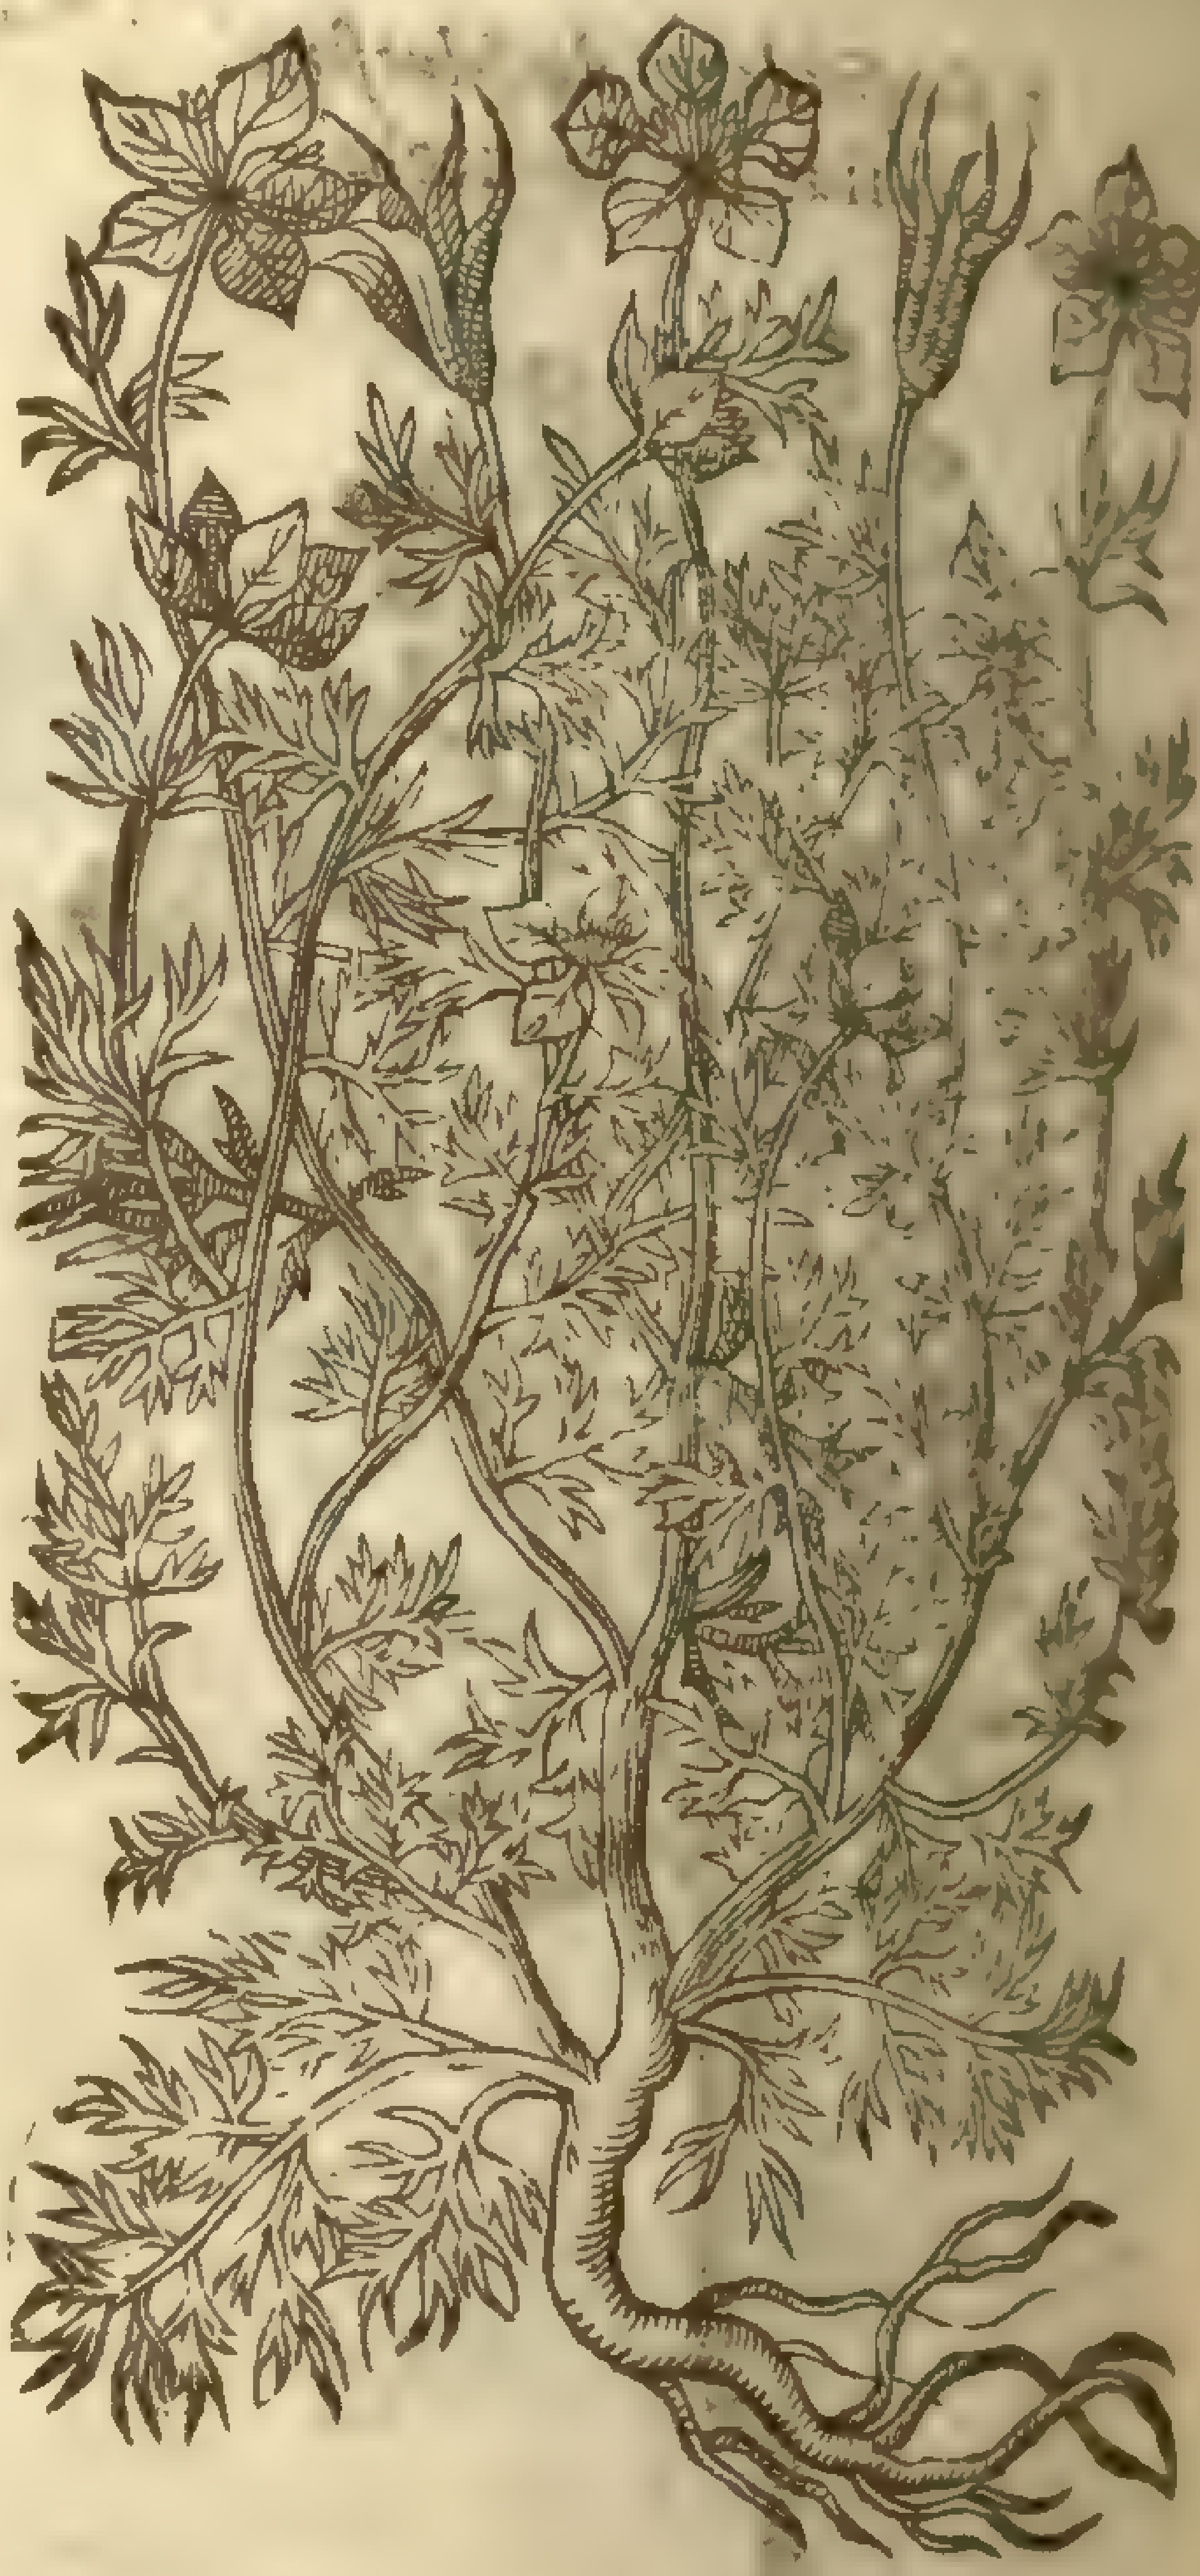
1 *Melanthium.*
Garden Nigella.

Nigella sativa L.
Miller dict.



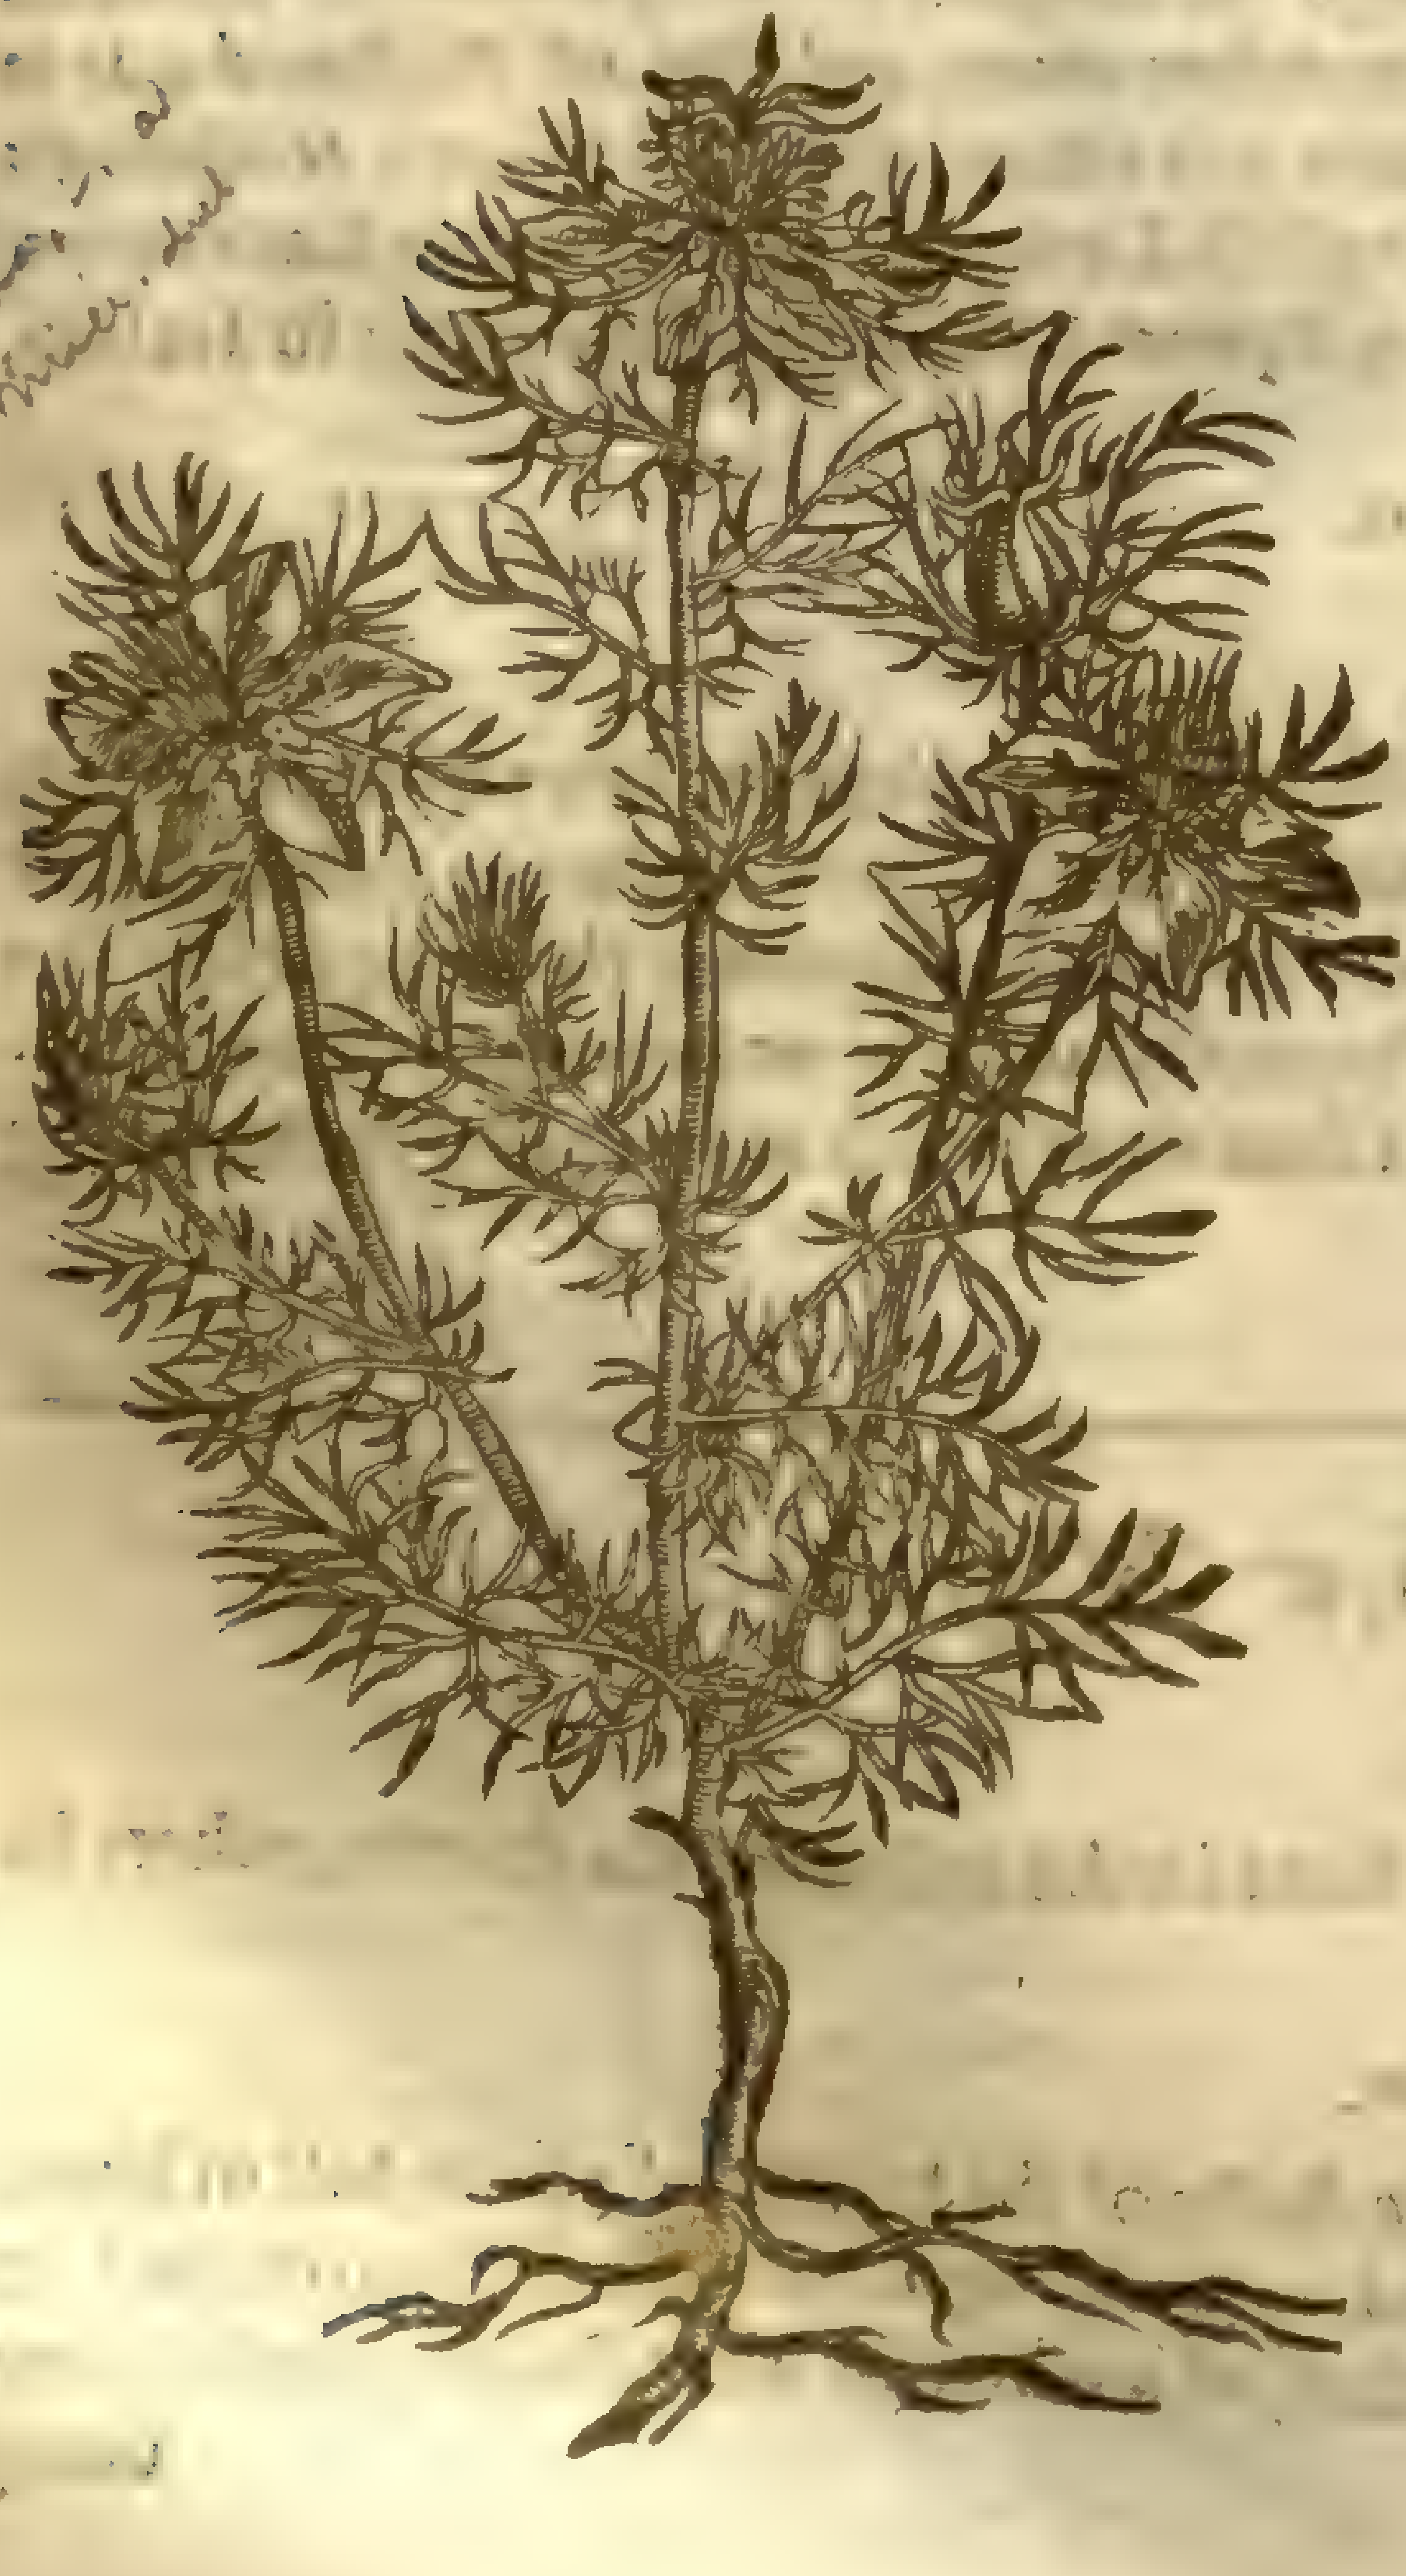
2 *Melanthium ſylveſtre.*
Wilde Nigella.

Nigella [illegible] Miller dict.

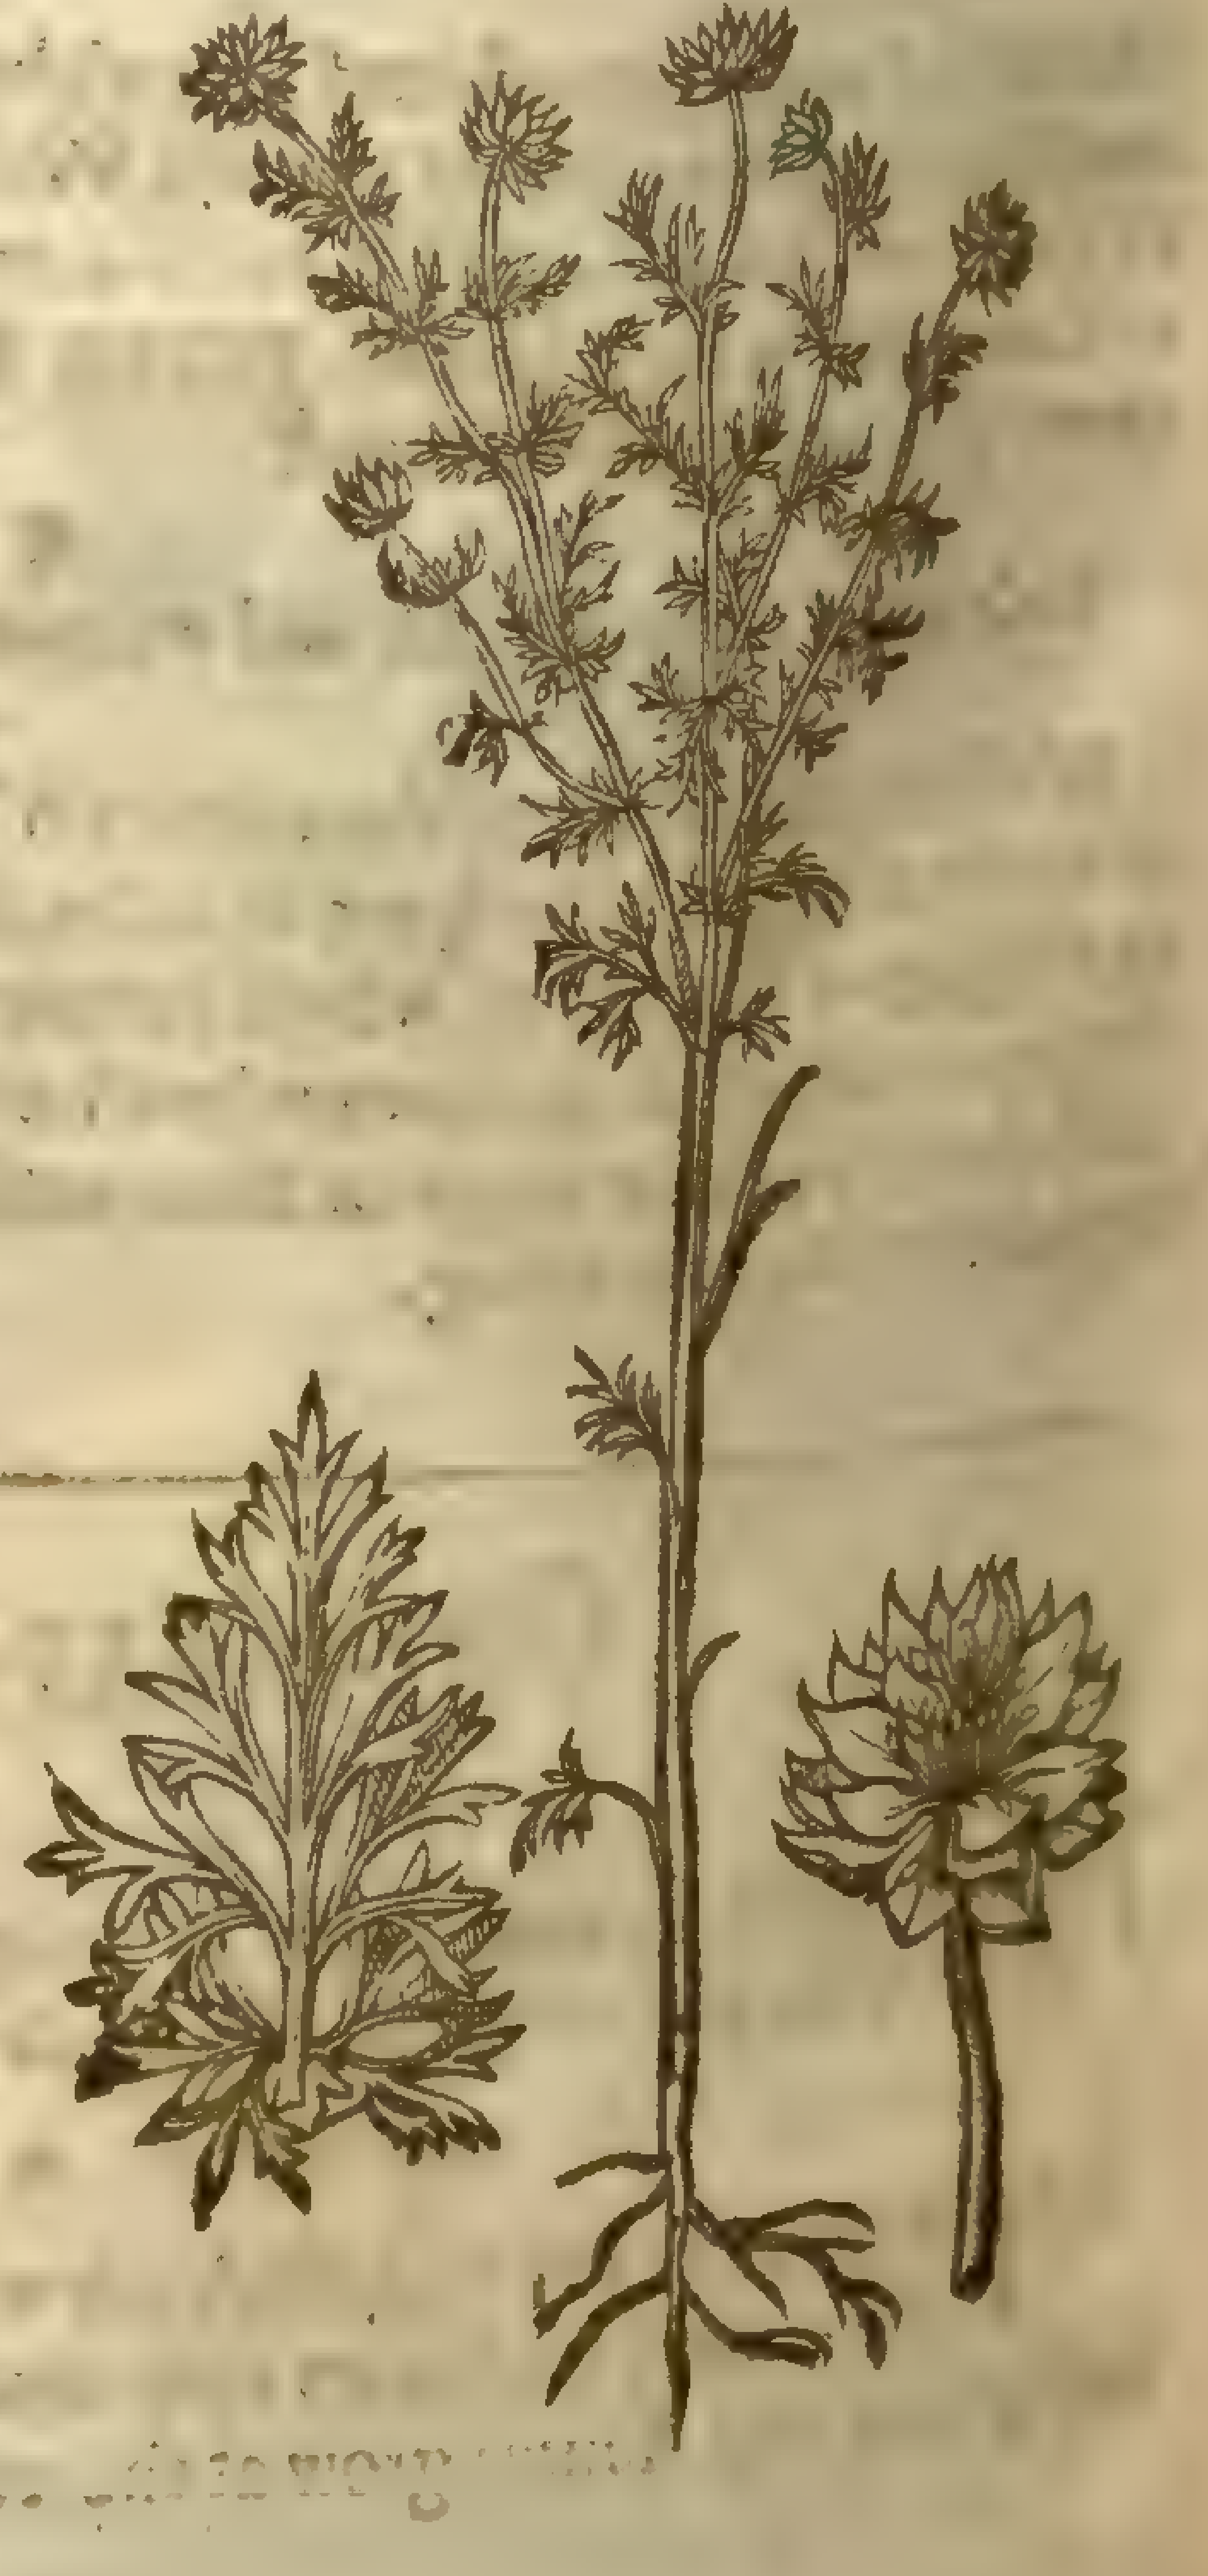


3 *Melanthium Damaſcenum.*
Damaske Nigella.

Nigella damascena L. et
Miller dict.



‡ 4 *Melanthium Damaſcenum flo. pleno.*
Double floured Damaske Nigella.

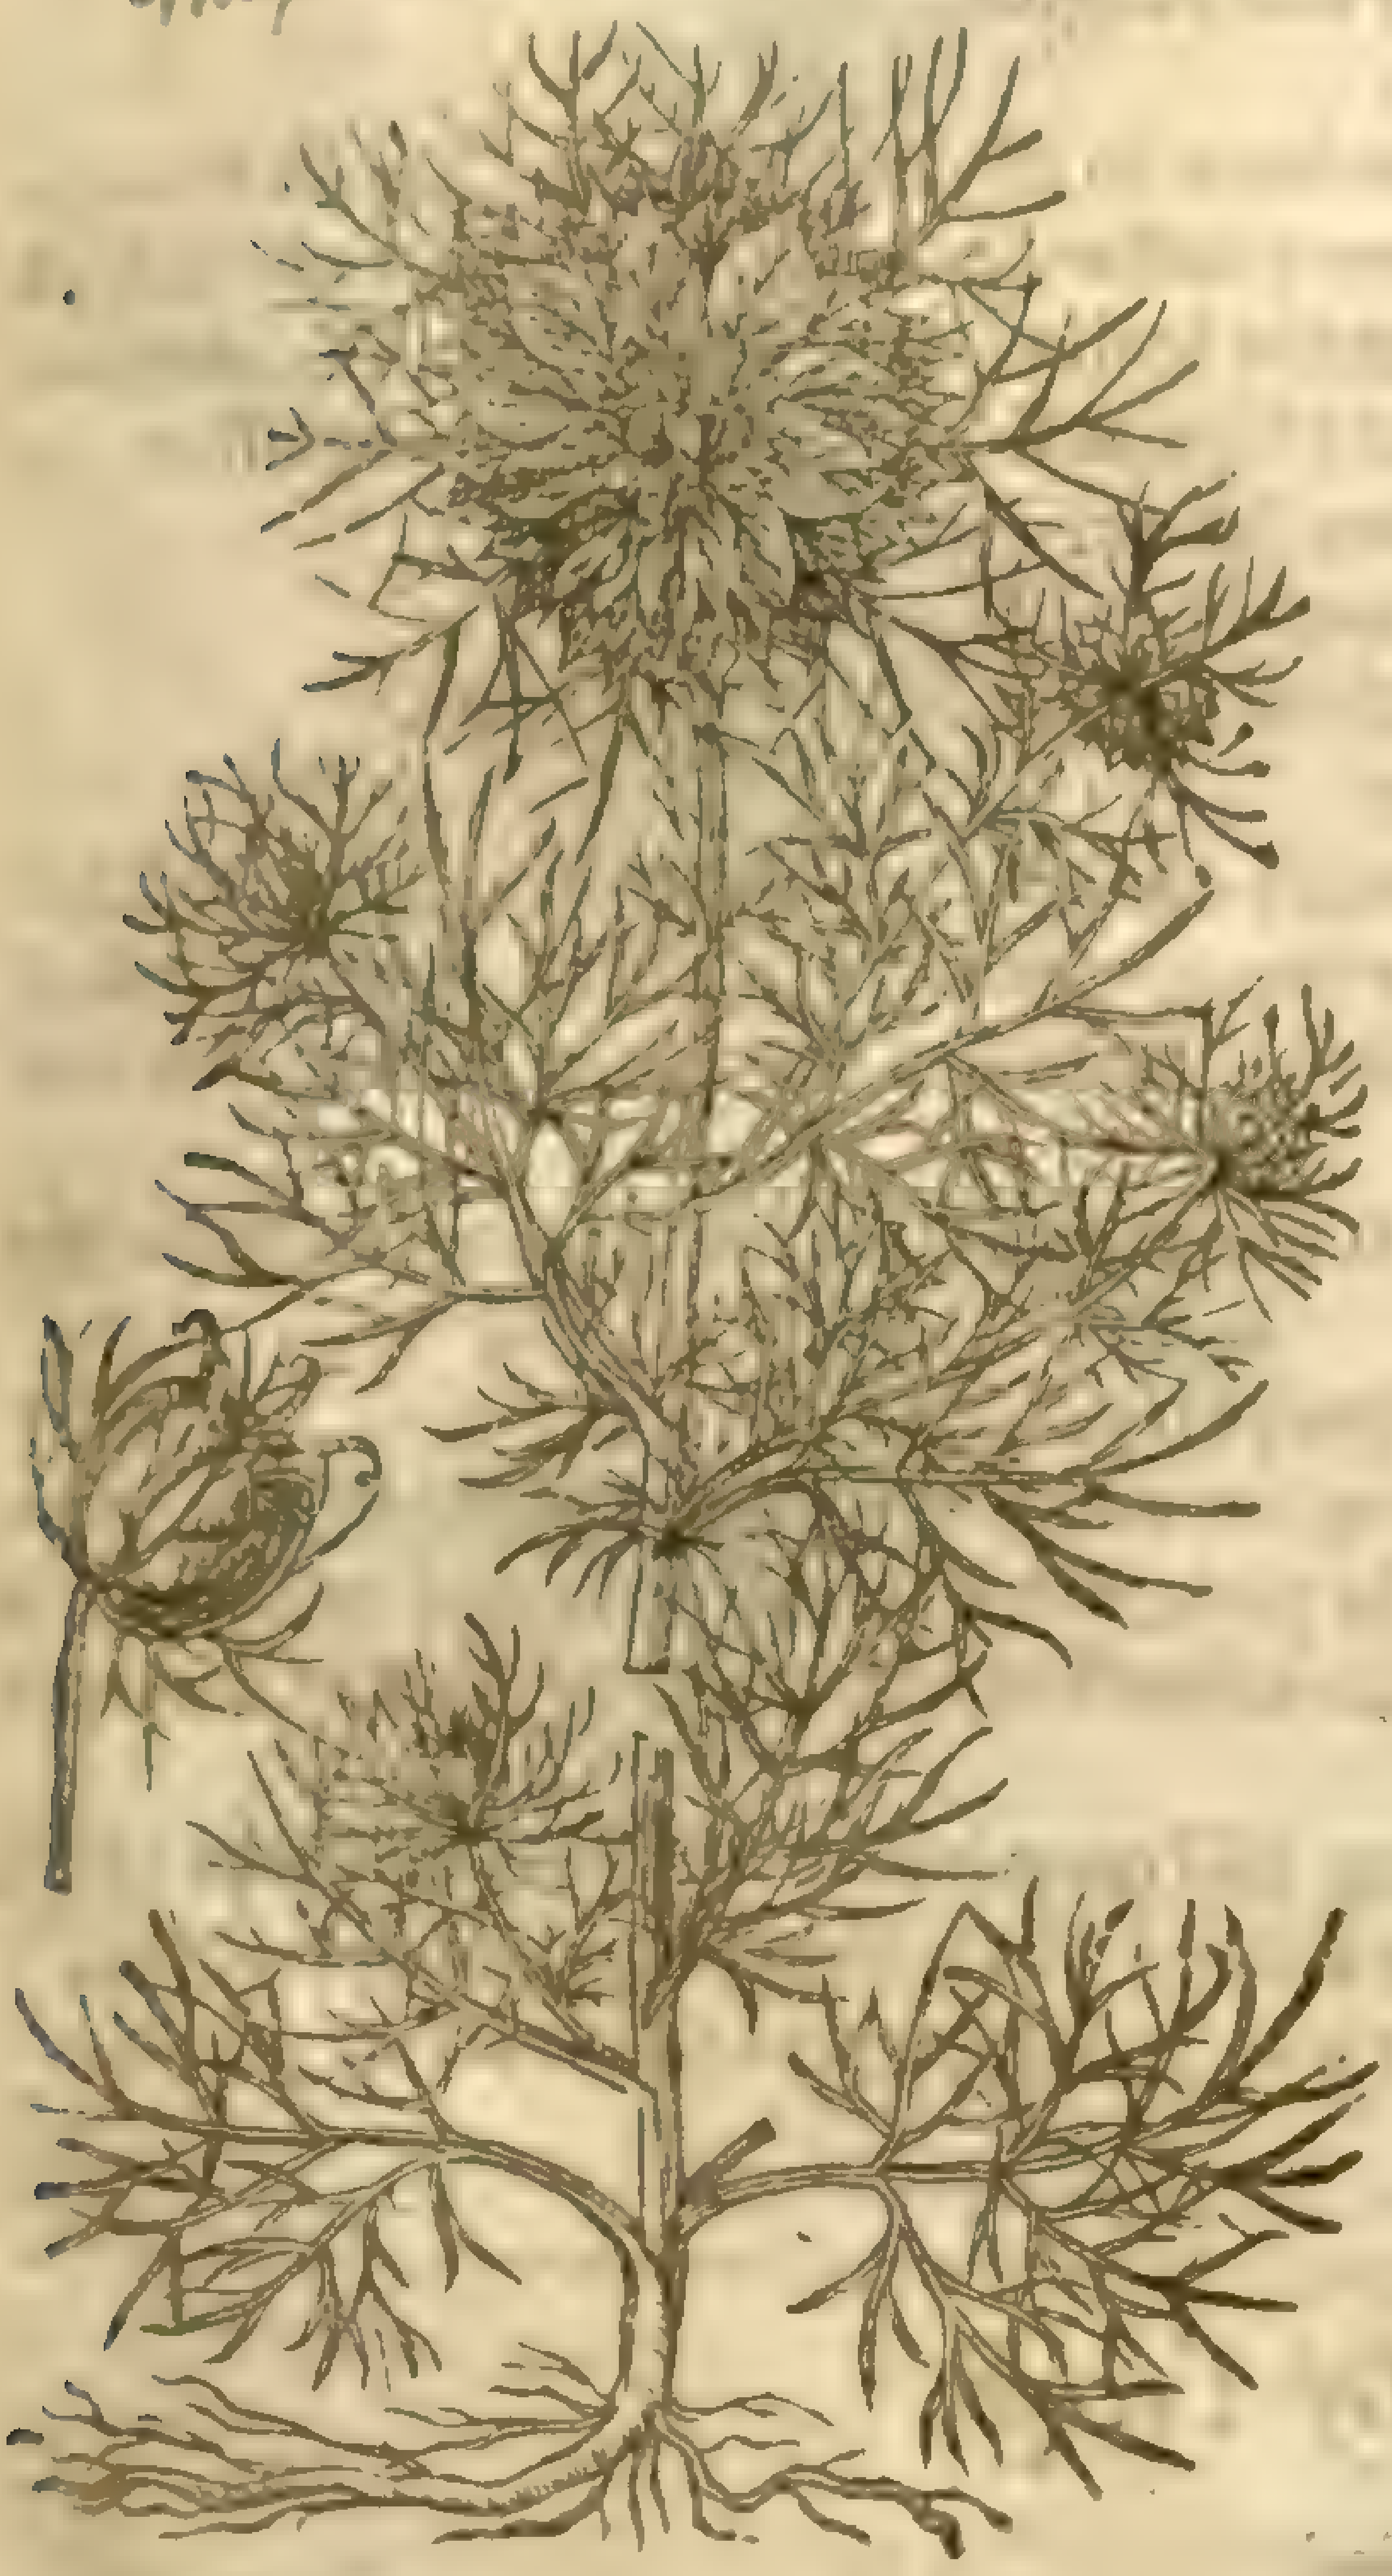


being parted into fiue ſmall leaues, ſtarre-faſhion: the floures being vaded, there come vp ſmall knobs or heads, hauing at the end thereof fiue or ſix little ſharpe hornes or pointals, and euery knob or head is diuided into ſundry ſmall cels or partitions, wherein the ſeed is contained, which is of a blackiſh colour, very like vnto Onion ſeed, in taſte ſharpe, and of an excellent ſweet ſauour.

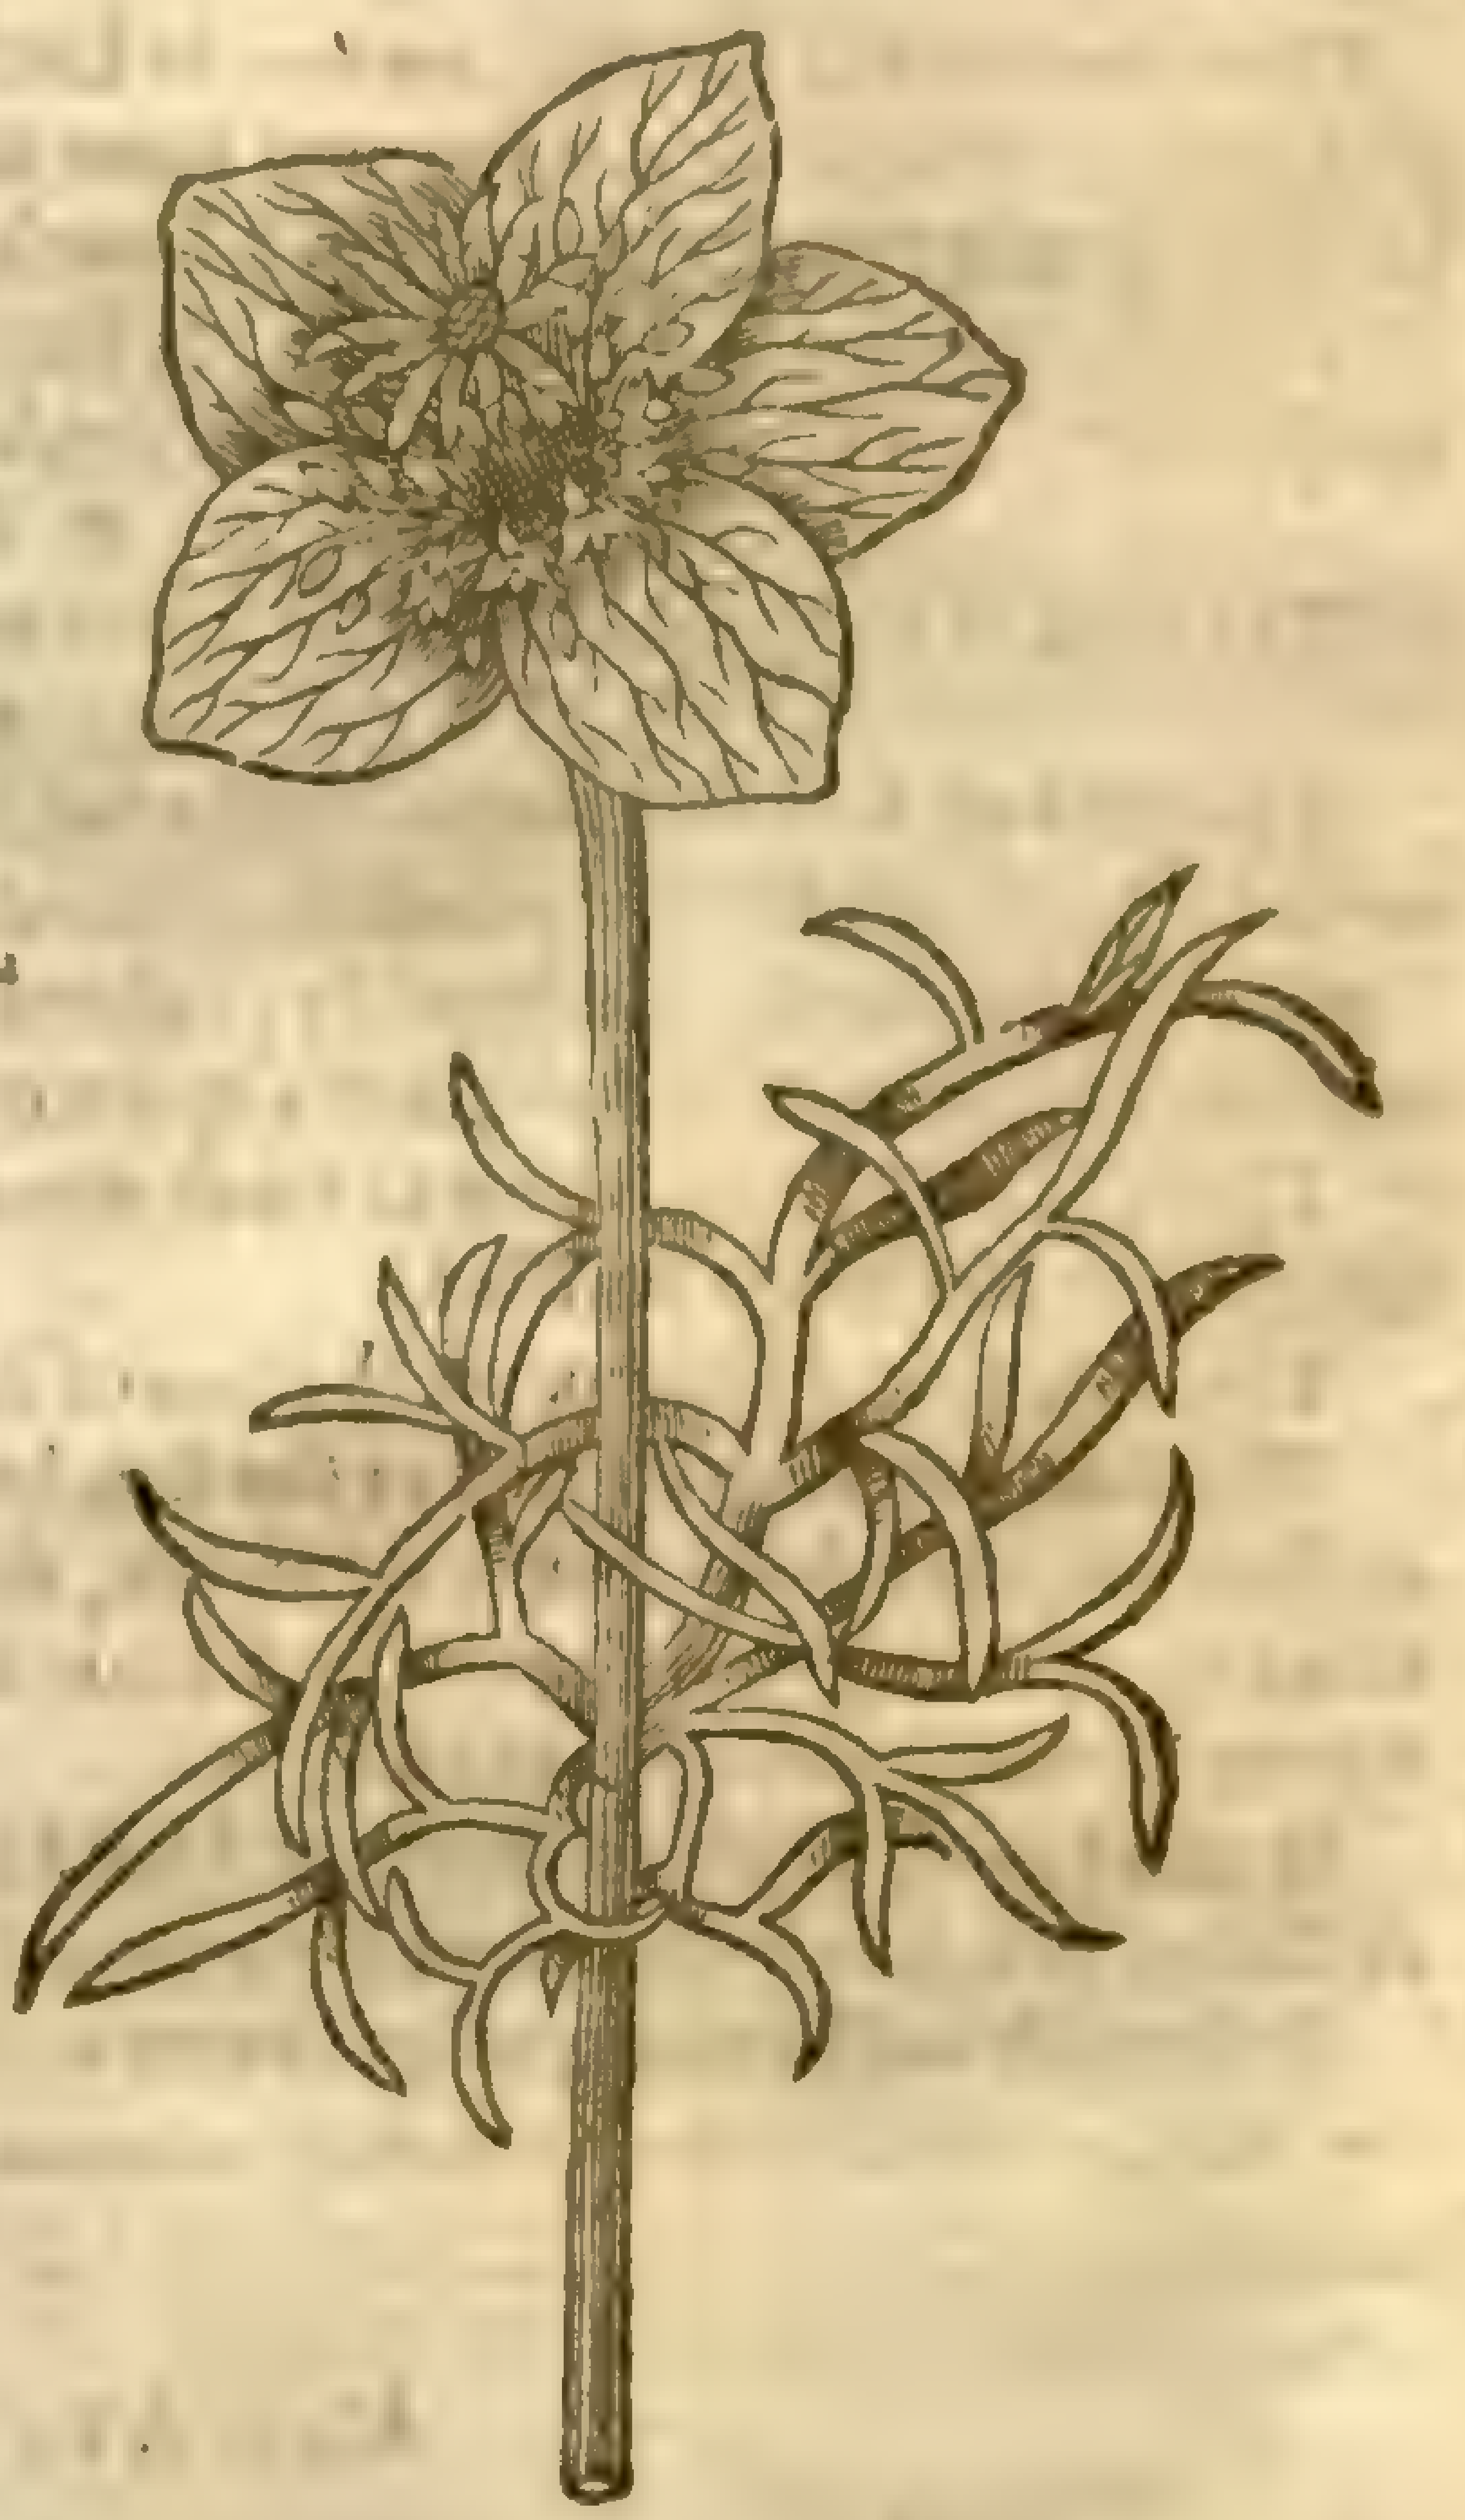
2 The wilde Nigella hath a ſtreaked ſtalke a foot or more high, beſet full of grayiſh leaues, very finely jagged, almoſt like the leaues of Dill: the floures are like the former, ſaue that they are blewer: the cods or knops are like the heads or huskes of Columbines, wherein is conteined the ſweet and pleaſant ſeed, like the former.

5 *Nigella flore albo multiplici.*
Damaske Nigella.

Nigella [illegible]



‡ 6 *Nigella Hiſpanica flore amplo.*
Great Spaniſh Nigella.



3 The third kinde of Nigella, which is both faire and pleaſant, called Damaske Nigella, is very like vnto the wilde Nigella in his ſmall cut and jagged leaues, but his ſtalke is longer: the flours are like the former, but greater, and euery floure hath fiue ſmall greene leaues vnder him, as it were to ſupport and beare him vp: which floures being gone, there ſucceed and follow knops and ſeed like the former, but without ſmell or ſauour.

‡ 4 This in the ſmalneſſe, and ſhape of the leaues and the manner of growing is like to the laſt deſcribed hauing ſmall leaues growing vnder the floure, which is not ſingle, as in the laſt deſcribed, but double, conſiſting of fiue or more rankes of little blewiſh leaues, which are ſucceeded by ſuch cornered heads as thoſe of the former, hauing in them a blacke ſeed without any manifeſt ſmell. ‡

5 The fifth kinde of Nigella hath many ſmall and ſlender ſtalkes, ſet full of ſlender and thinne leaues deepely cut or jagged, of a faint yellowiſh greene colour: the floures grow at the top of the ſtalkes, of a whitiſh colour, and exceeding double: which being vaded, there ſucceed bowles or knobs, full of ſweet blacke ſeed like the former: the root is ſmall and tender.

‡ 6 The root of this is ſlender, and yellowiſh; the ſtalke is ſome cubit high, round, green, creſted, and toward the top diuided into ſundry branches, the leaues toward the bottome are ſomewhat ſmall cut, but ſomewhat larger vpon the ſtalkes. The floure is much larger than any of the former, compoſed of fiue leaues, of a light blew aboue, and ſomewhat whitiſh vnderneath, with

large veines running about them: in the middle ſtands vp the head, encompaſſed with blackiſh threds, and ſome 7. or 8. little gaping blewiſh floures at the bottomes of them; the leaues of the floures decaying the head becomes bigger, hauing at the tops thereof 6. 7. or 8. longiſh twined hornes growing, in a ſtar faſhion; the inſide is parted into cels conteining a yellowiſh green, or elſe blackiſh ſeed. It is ſet forth in the *Hortus Eyſtettenſis* by the name of *Melanthium Hiſpanicum majus*; by Mr. *Parkinſon* it is called *Nigella Hiſpanica flore ſimplici*; and *Bauhine* in his *Prodromus* hath it by the name of *Nigella latifolia flore maiore ſimplici cæruleo*. It is an annuall plant, and floures in Iuly; it is ſometimes to be found in the gardens of our Floriſts.

¶ *The Place.*

The tame are ſowne in gardens: the wilde ones doe grow of themſelues among corne and other graine, in diuers countries beyond the ſeas.

¶ *The Time.*

The ſeed muſt be ſowne in Aprill: it floureth in Iuly and Auguſt.

¶ *The Names.*

Gith is called in Greeke, μελάνθιον: in Latine alſo *Melanthium*: in ſhops, *Nigella*, and *Nigella Romana*: of diuers, *Gith*, and *Saluſandria*, and ſome among the former baſtard names, *Papauer nigrum*: in high Dutch, **Swartzkymmich**: in low Dutch, **Nardus ſaet**: in Italian, *Nigella*: in Spaniſh, *Axenuz*, *Alipiure*: in French, *Nielle odorante*: in Engliſh, Gith, and Nigella Romana, in Cambridgeſhire, Biſhops wort: and alſo *Diua Catherinæ flos*, Saint Katharines floure.

¶ *The Temperature.*

The ſeed of the garden Nigella is hot and dry in the third degree, and of thin parts.

¶ *The Vertues.*

A The ſeed of *Nigella Romana* drunke with wine, is a remedy againſt the ſhortneſſe of breath, diſſolueth and putteth forth windineſſe, prouoketh vrine, the menſes, increaſeth milke in the breſts of nurſes if it be drunke moderately; otherwiſe it is not onely hurtfull to them, but to any that take thereof too often, or in too great a quantity.

B The ſeed killeth and driueth forth wormes, whether it be taken with wine or water, or laid to the nauell in manner of a plaiſter.

C The oyle that is drawne forth thereof hath the ſame property.

D The ſeed parched or dried at the fire, brought into pouder, and wrapped in a piece of fine lawne or ſarcenet, cureth all murs, catarrhes, rheumes, and the poſe, drieth the braine, and reſtoreth the ſence of ſmelling vnto thoſe which haue loſt it, being often ſmelled vnto from day to day, and made warme at the fire when it is vſed.

E It takes away freckles, ſcurfs, and hard ſwellings, being laid on mixed with vineger. To be briefe, as *Galen* ſaith, it is a moſt excellent remedy where there is need of clenſing, drying, and heating.

F It ſerueth well among other ſweets to put into ſweet waters, bagges, and odoriferous pouders.

† The figures of the third and fourth of the former edition were tranſpoſed.

Chap. 444. *Of Cockle.*

¶ *The Deſcription.*

Cockle is a common and hurtfull weed in our Corne, and very well knowne by the name of Cockle, which *Pena* calleth *Pſeudomelanthium*, and *Nigellaſtrum*, by which name *Dodonæus* and *Fuchſius* do alſo terme it; *Mutonus* calleth it *Lolium*; and *Tragus* calleth it *Lychnoides ſegetum*. This plant hath ſtraight, ſlender and hairy ſtems, garniſhed with long hairy and grayiſh leaues, which grow together by couples, incloſing the ſtalke round about: the floures are of a purple colour, declining to redneſſe, conſiſting of fiue ſmall leaues, in proportion very like to wilde Campions; when the floures be vaded there follow round knobs or heads full of blackiſh ſeed, like vnto the ſeed of *Nigella*, but without any ſmell or ſauour at all.

¶ *The Place and Time.*

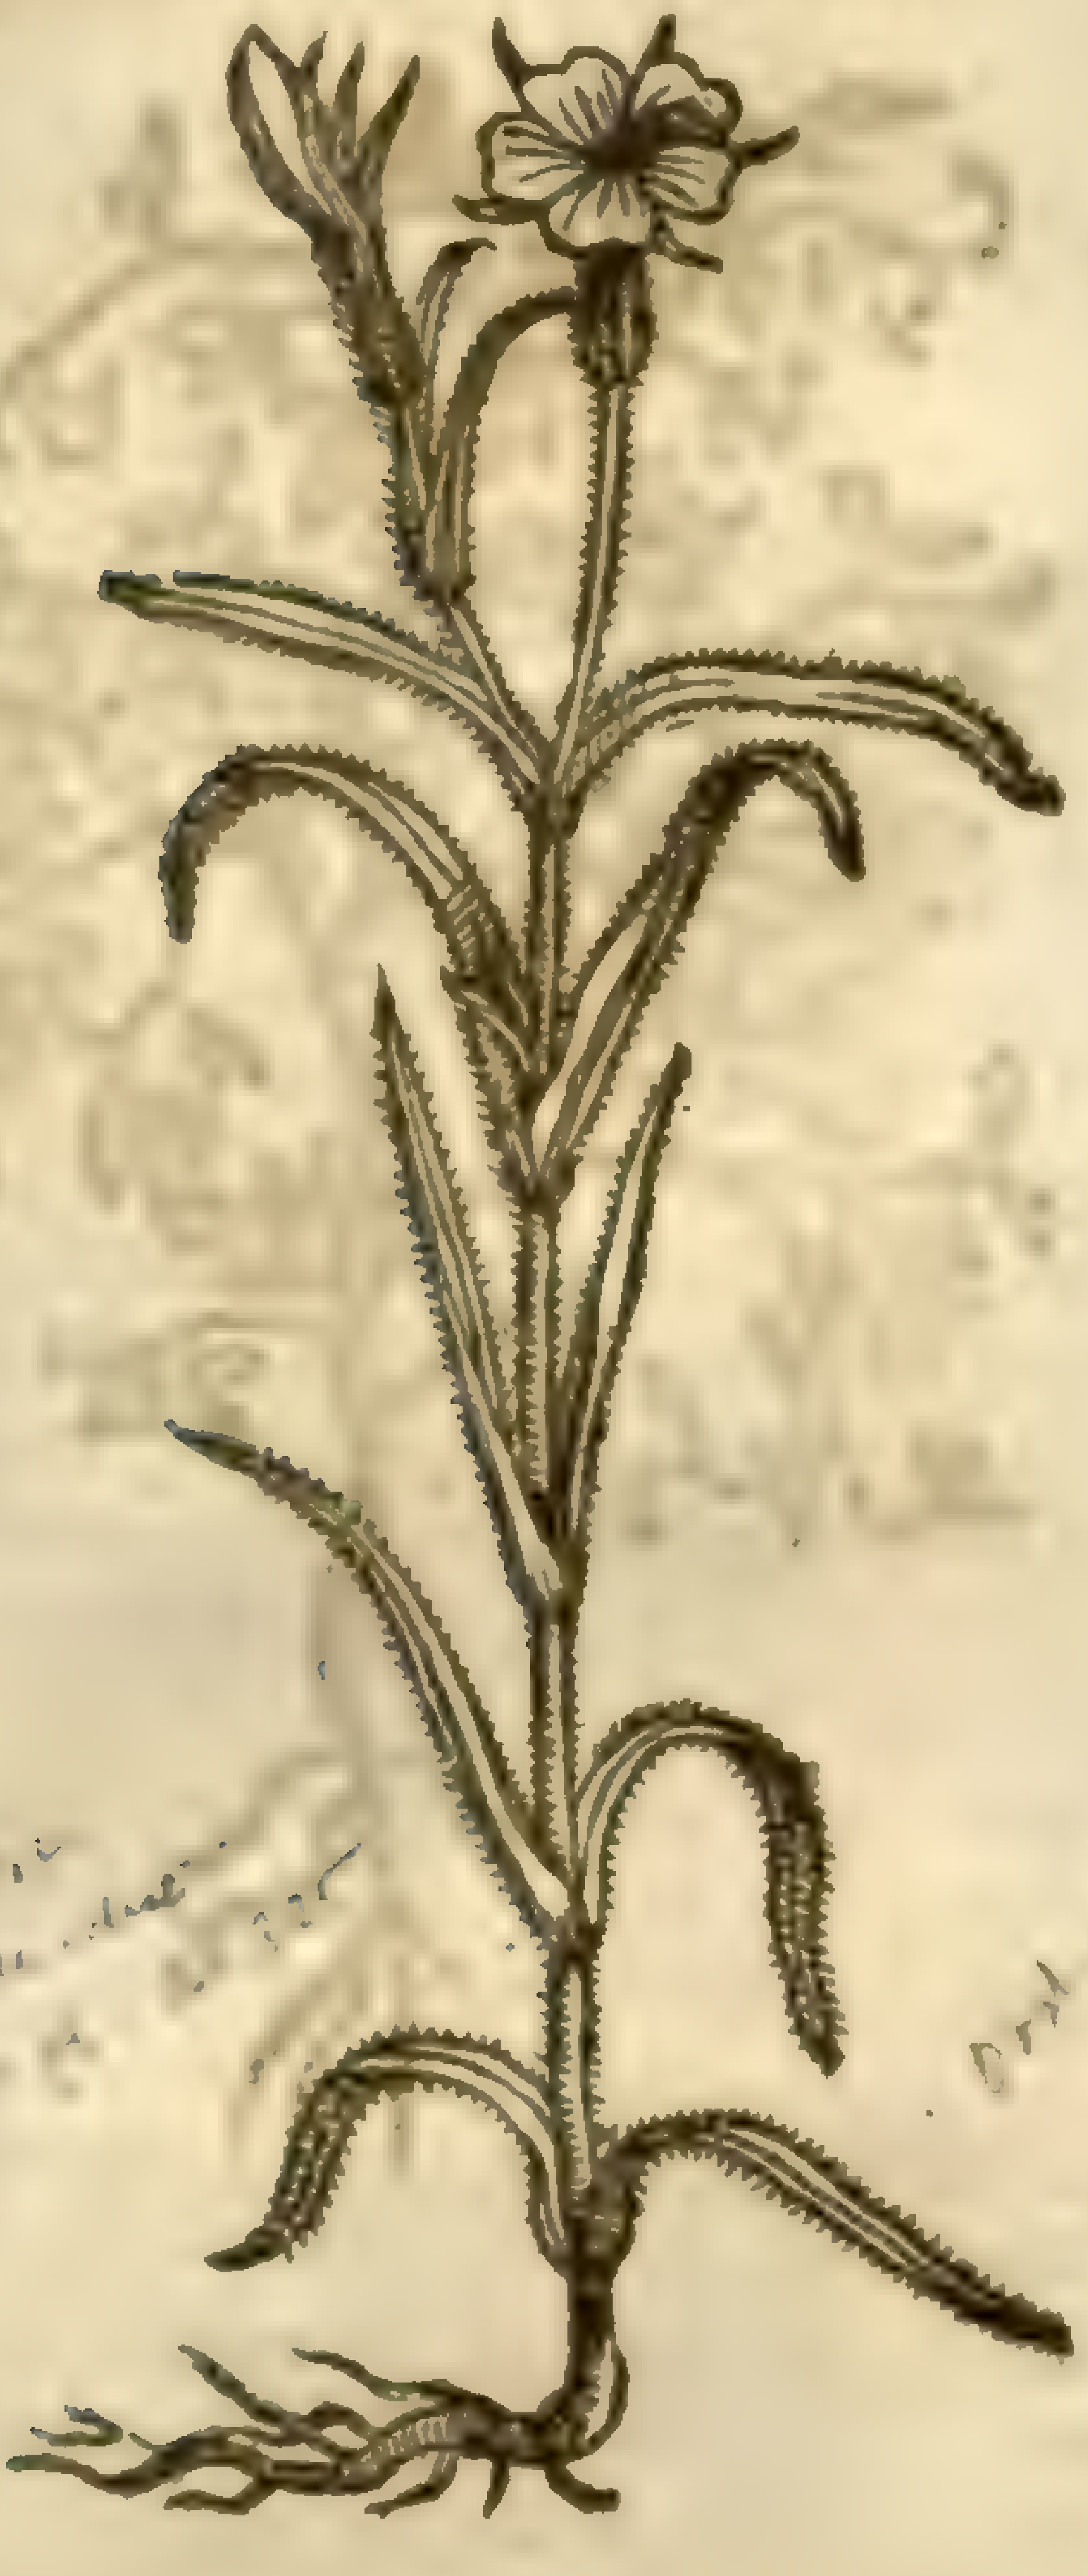
The place of his growing and time of his flouring, are better knowne than deſired.

¶ *The Names.*

Cockle is called *Pſeudomelanthium*, and *Nigellaſtrum*, wilde or baſtard Nigella; of *Fuchſius*, *Lolium*: of *Mouton*, *Lychnoides ſegetum*: of *Tragus*, *Githago*: in high Dutch, **Kornegele**: in low Dutch, **Corne rooſen**: in French, *Nielle des Bledz*: in Engliſh, Cockle, field Nigella, or wilde Nigella: in Italian, *Githone*; whereupon moſt Herbariſts being moued with the likeneſſe of the word, haue thought it to be the true Gith or *Melanthium*; but how farre they are deceiued it is better knowne, than needfull to be confuted: for it doth not onely differ in leaues from the true Gith, but alſo in other properties, and yet it is called Gith or *Melanthium*, and that is of the blackeneſſe of the ſeed, yet not properly, but with a certaine addition, that it may differ from the true *Melanthium*: for

Hippocrates

Pſeudomelanthium.
Baſtard Nigella, or Cockle.



Hippocrates calleth it *Melanthium ex tritico*, of Wheat: *Octavius Horatianus* calleth that Gith which groweth among corne: and for the ſame cauſe it is named of the Learned of this our time, *Nigellaſtrum*, *Gigatho*, and *Pſeudomelanthium*. *Ruellius* ſaith it is called in French *Niele*, & *Flos Micancalus*.

¶ *The Temperature.*

The ſeed of Cockle is hot and dry in the later end of the ſecond degree.

¶ *The Vertues.*

The ſeed made in a peſſarie or mother ſuppoſitorie, with hony put vp, bringeth down the deſired ſickneſſe, as *Hippocrates* witneſſeth in his booke of womens diſeaſes. A

Octavius Horatianus giues the ſeed parched and beaten to pouder, to be drunk againſt the yellow Iaundice. B

Some ignorant people haue vſed the ſeed of this for the ſeed of Darnel, to the great danger of thoſe who haue receiued the ſame. What hurt it doth among corne, the ſpoile of bread, as well in colour, taſte, and vnwholeſomneſſe, is better knowne than deſired. C

CHAP. 445. *Of Fumitorie.*

¶ *The Kindes.*

THere be diuers herbs comprehended vnder the title of Fumitorie; ſome wilde, and others of the garden; ſome with bulbous or tuberous roots, and others with fibrous or threddy roots: and firſt of thoſe whoſe roots are nothing but ſtrings.

¶ *The Deſcription.*

1 FVmitorie is a very tender little herbe: the ſtalkes thereof are ſlender, hauing as it were little knots or joints ful of branches, that ſcarce grow vp from the ground without proppings, but for the moſt part grow ſidelong: the leaues round about are ſmall, cut on the edges as thoſe of Coriander, which as well as the ſtalks are of a whitiſh green: the flours be made vp in cluſters at the tops of the ſmall branches, of a red purple colour: then riſe vp huskes round and little, in which lieth the ſmall ſeed, the root is ſlender, and groweth ſtraight downe. ‡ This is alſo found with floures of a purple violet colour, and alſo ſometimes with them white. ‡

2 The ſecond kinde of Fumitorie hath many ſmall long and tender branches, wherupon grow little leaues vſually ſet together by threes or fiues, in colour and taſte like the former, hauing at the tops of the branches many ſmall claſping tendrels, with which it taketh hold vpon hedges, buſhes, and whatſoeuer groweth next to it: the flours are ſmall, and cluſtering together, of a white colour, with a little ſpot in their middles; after which ſucceed cods containing the ſeed: the root is ſingle, and of a fingers length.

3 The third kinde of Fumitorie hath a very ſmal root, conſiſting of diuers little ſtrings, from which ariſe ſmall and tender branches trailing here and there vpon the ground, beſet with many ſmall and tender leaues moſt finely cut and jagged like the little leaues of Dill, of a deepe greene colour tending to blewneſſe, the floures ſtand at the tops of the branches in bunches or cluſters, thicke thruſt together, like thoſe of the medow Claver or three leaued graſſe, of a moſt bright red colour, and very beautifull to behold: the root is very ſmall and threddy.

1 *Fumaria purpurea.*
Common or purple Fumitory.

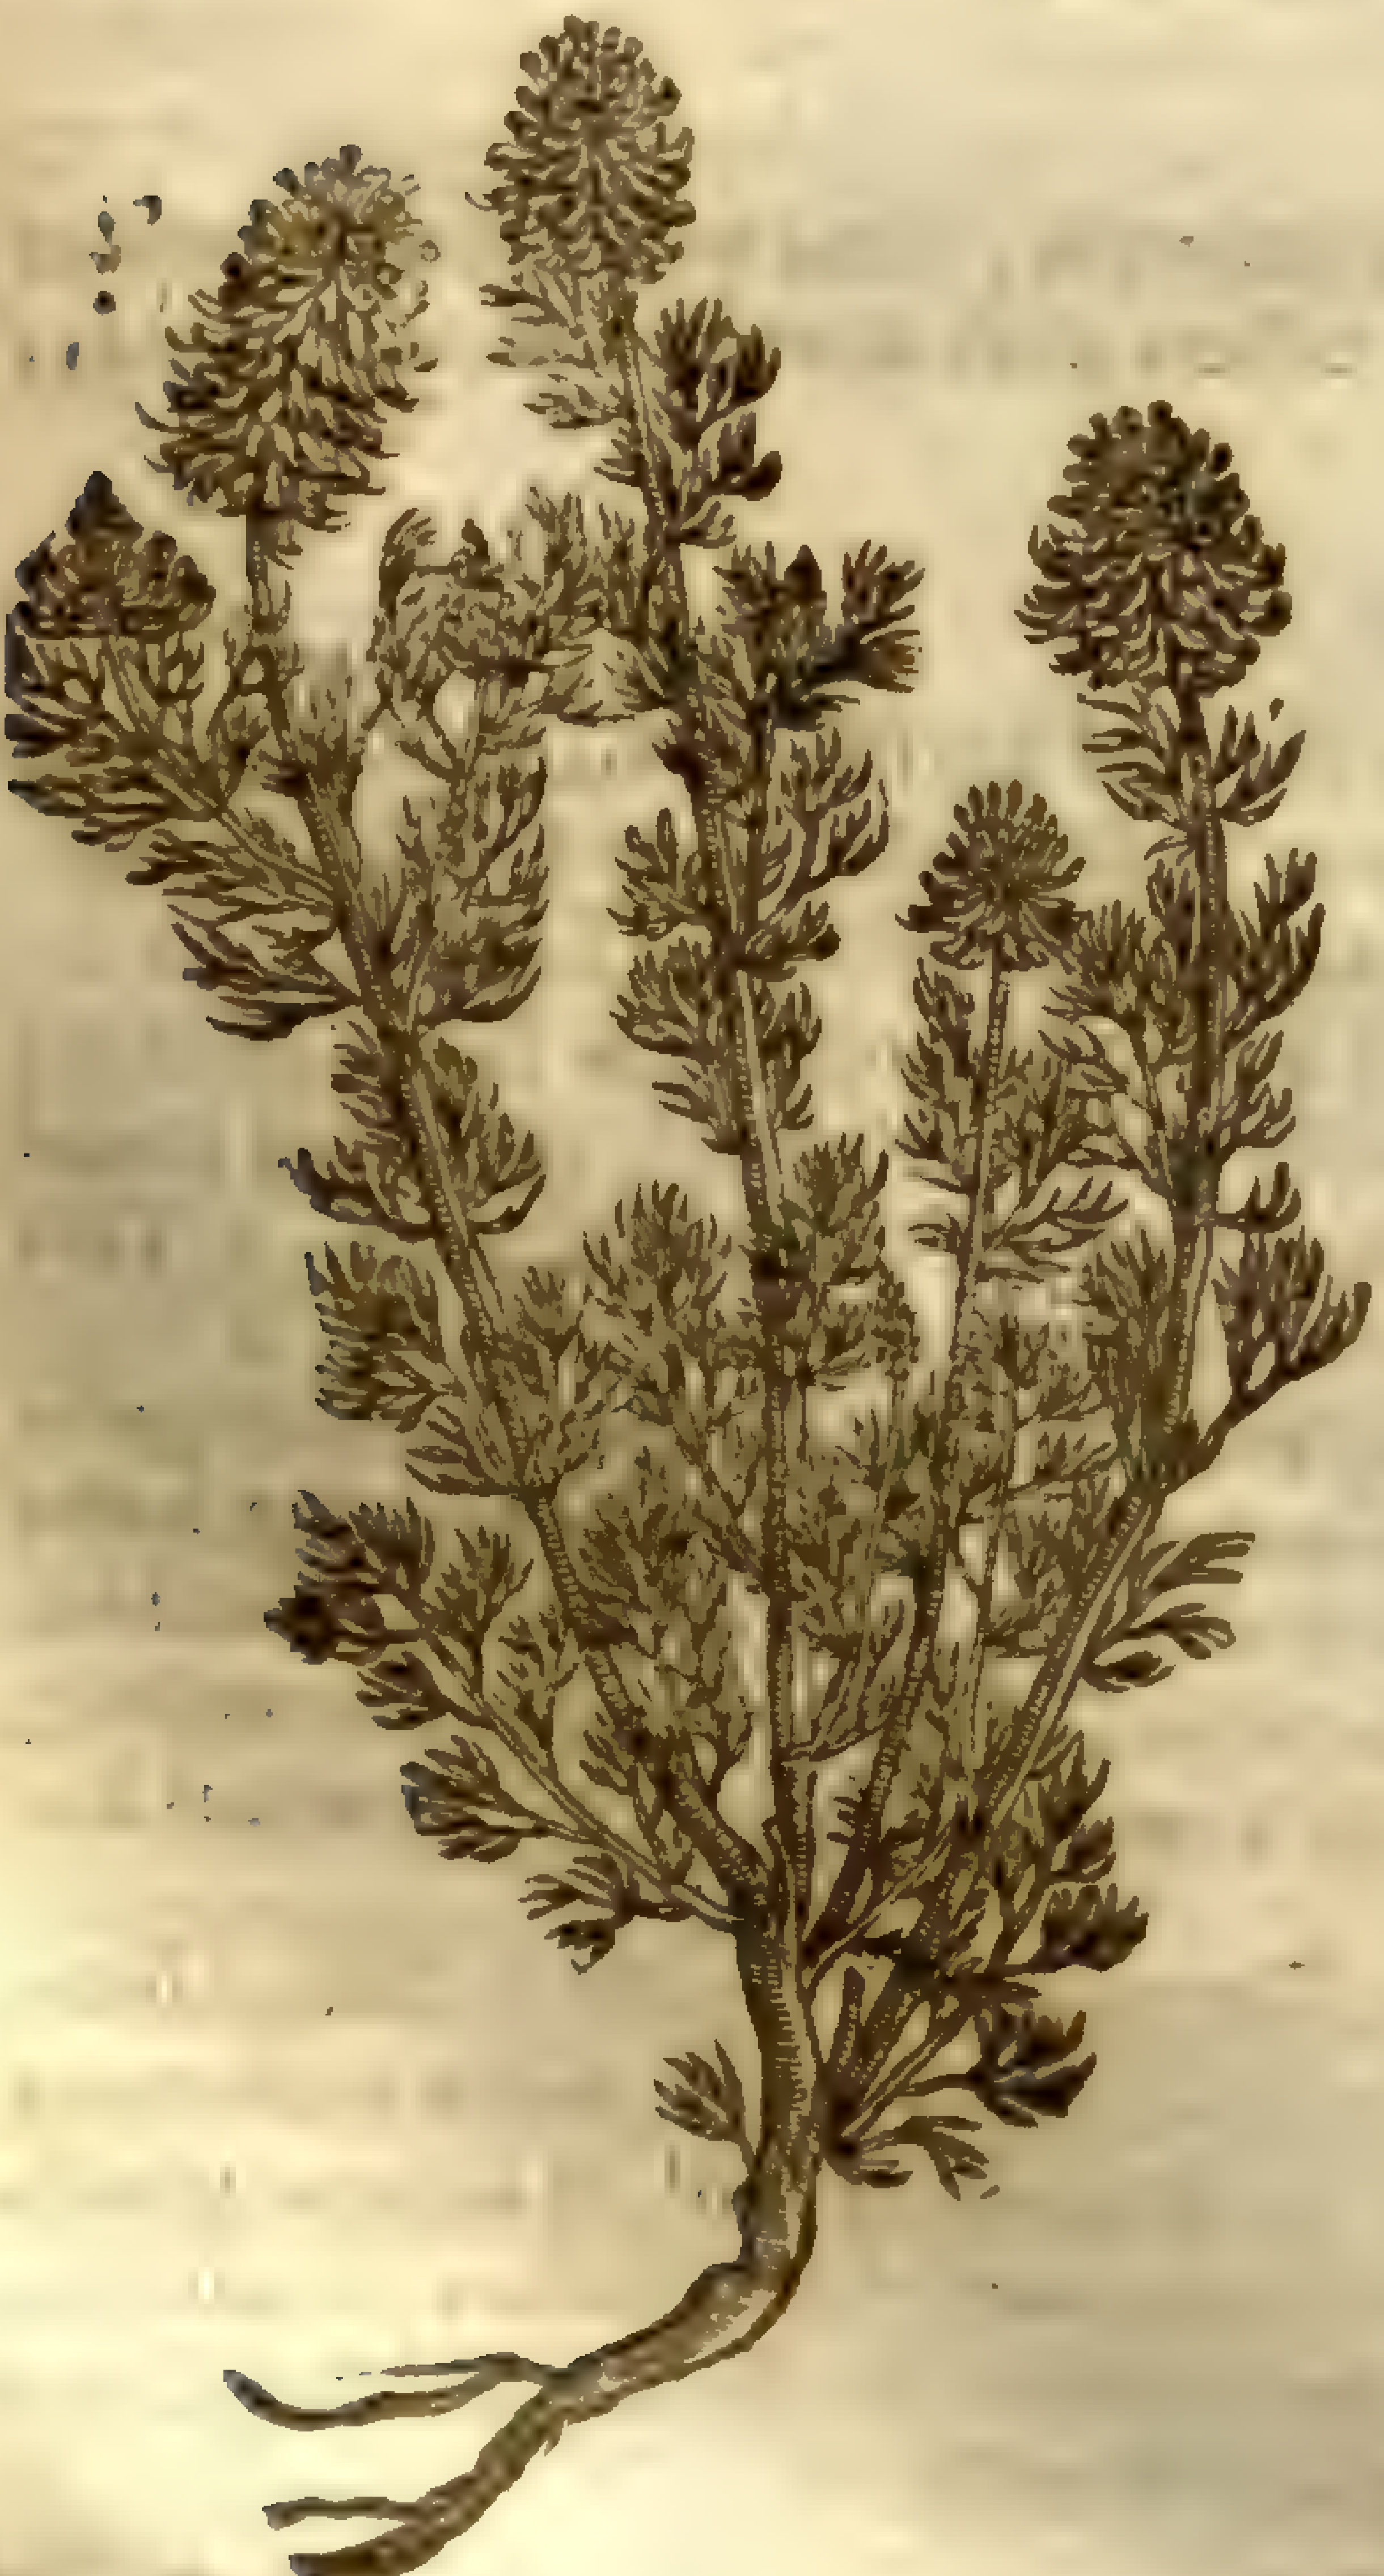
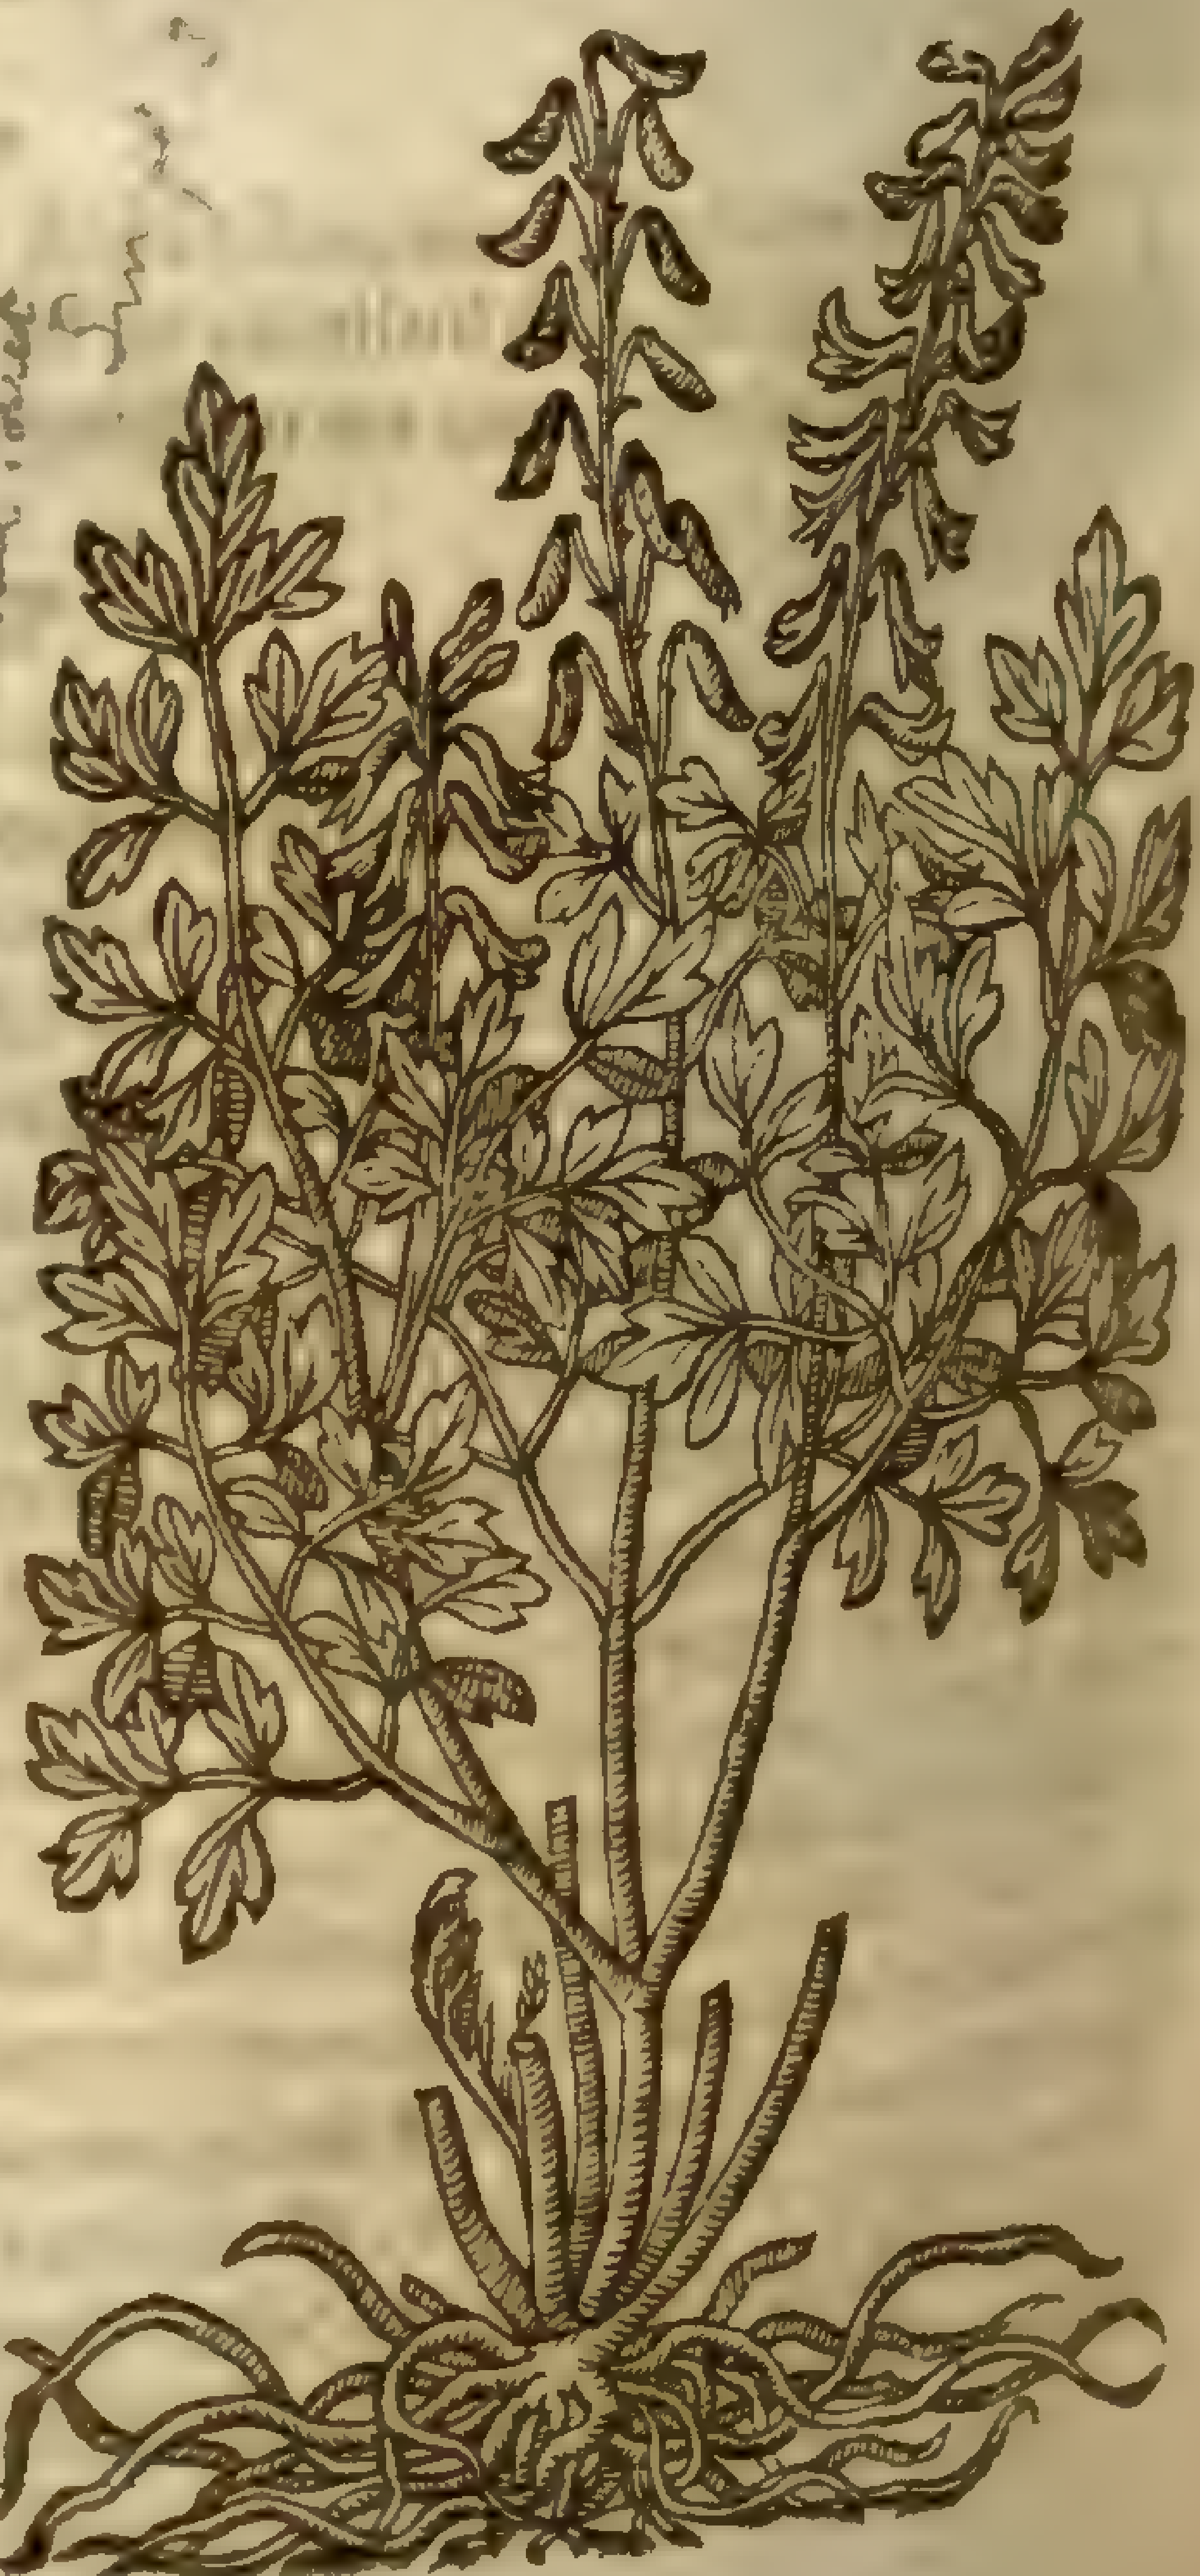
3 *Fumaria tenuifolia.*
Fine leafed Fumitory.



4 *Fumaria lutea.*
Yellow Fumitorie.



F. lutea, L. [illegible] dict. Sm. pt. 3. [illegible]

4 The yellow Fumitorie hath many crambling threddy roots, ſomwhat thicke, groſſe, and fat, like thoſe of *Aſparagus*: from which riſe diuers vpright ſtalkes a cubit high, diuiding themſelues toward the top into other ſmaller branches, whereon are confuſedly placed leaues like thoſe of *Thalictrum*, or Engliſh Rubarb, but leſſer and thinner: alongſt the tops of the branches grow yellow floures, reſembling thoſe of Sage: which being paſt, there followeth ſmall ſeed like vnto duſt.

¶ *The Place.*

The Fumitories grow in corne fields among Barley and other graine; in vineyards, gardens, and ſuch like manured places. I found the ſecond and third growing in a corne field betweene a ſmall village called Charleton and Greenwhich.

¶ *The Time.*

Fumitory is found with his floure in the beginning of May, and ſo continues to the end of ſummer. When it is in floure is the beſt time to gather it to keep dry, or to diſtill.

¶ *The Names.*

Fumitorie is called in Greeke Καπνὸς, and Κάπνιον, and often Καπνίτης: in Latine, *Fumaria*: of *Pliny*, *Capnos*: in ſhops, *Fumus terræ*: in high Dutch, **Erdtrauch**: in low Dutch, **Griſſecom, Duyuen, Kernel**: in Spaniſh, *Palomilha*: in French and Engliſh, Fumiterre.

¶ *The Temperature.*

Fumitorie is not hot, as ſome haue thought it to be, but cold and ſomething dry; it openeth and clenſeth by vrine.

¶ *The Vertues.*

It is good for all them that haue either ſcabs or any other filthe growing on the ſkinne, and for them alſo that haue the French diſeaſe. A

It remoueth ſtoppings from the liuer and ſpleene: it putrifieth the bloud, and is oft times good for them that haue a quartane ague. B

The decoction of the herbe is vſed to be giuen, or elſe the ſyrrup that is made of the juyce: the diſtilled water thereof is profitable againſt the purpoſes aforeſaid. C

It is oftentimes boyled in whay, and in this manner it helpeth in the end of the Spring and in Summer time thoſe that are troubled with ſcabs. D

Paulus Ægineta ſaith that it plentifully prouoketh vrine, and taketh away the ſtoppings of the liuer, and feebleneſſe thereof; that it ſtrengthneth the ſtomacke, and maketh the belly ſoluble. E

Dioſcorides affirmeth, that the juice of Fumitorie, of that which groweth among Barley, as *Ægineta* addeth, with gum Arabicke, doth take away vnprofitable haires that pricke the eyes, growing vpon the eye lids, the haires that pricke being firſt plucked away, for it will not ſuffer others to grow in their places. F

The decoction of Fumitorie drunken driueth forth by vrine and ſiege all hot chollericke burnt and hurtfull humors, and is a moſt ſingular digeſter of ſalt and pituitous humors. G

† There were formerly ſix figures and deſcriptions in this chapter; whereof the two firſt figures were of the common Fumitorie, the one with purple, the other with white floures; and the two later were of the *Fumaria latifolia clauiculata*, differing only in the largeneſſe and ſmallneſſe of the leafe. The deſcription in the ſecond place belonged to the *Fumaria clauiculata*, which alſo was againe deſcribed in the fifth and ſixth places, yet not to much purpoſe; wherefore I haue put the figure to the ſecond, and omitted the other as ſuperfluous.

CHAP. 446. *Of bulbous Fumitorie, or Hollow-root.*

¶ *The Deſcription.*

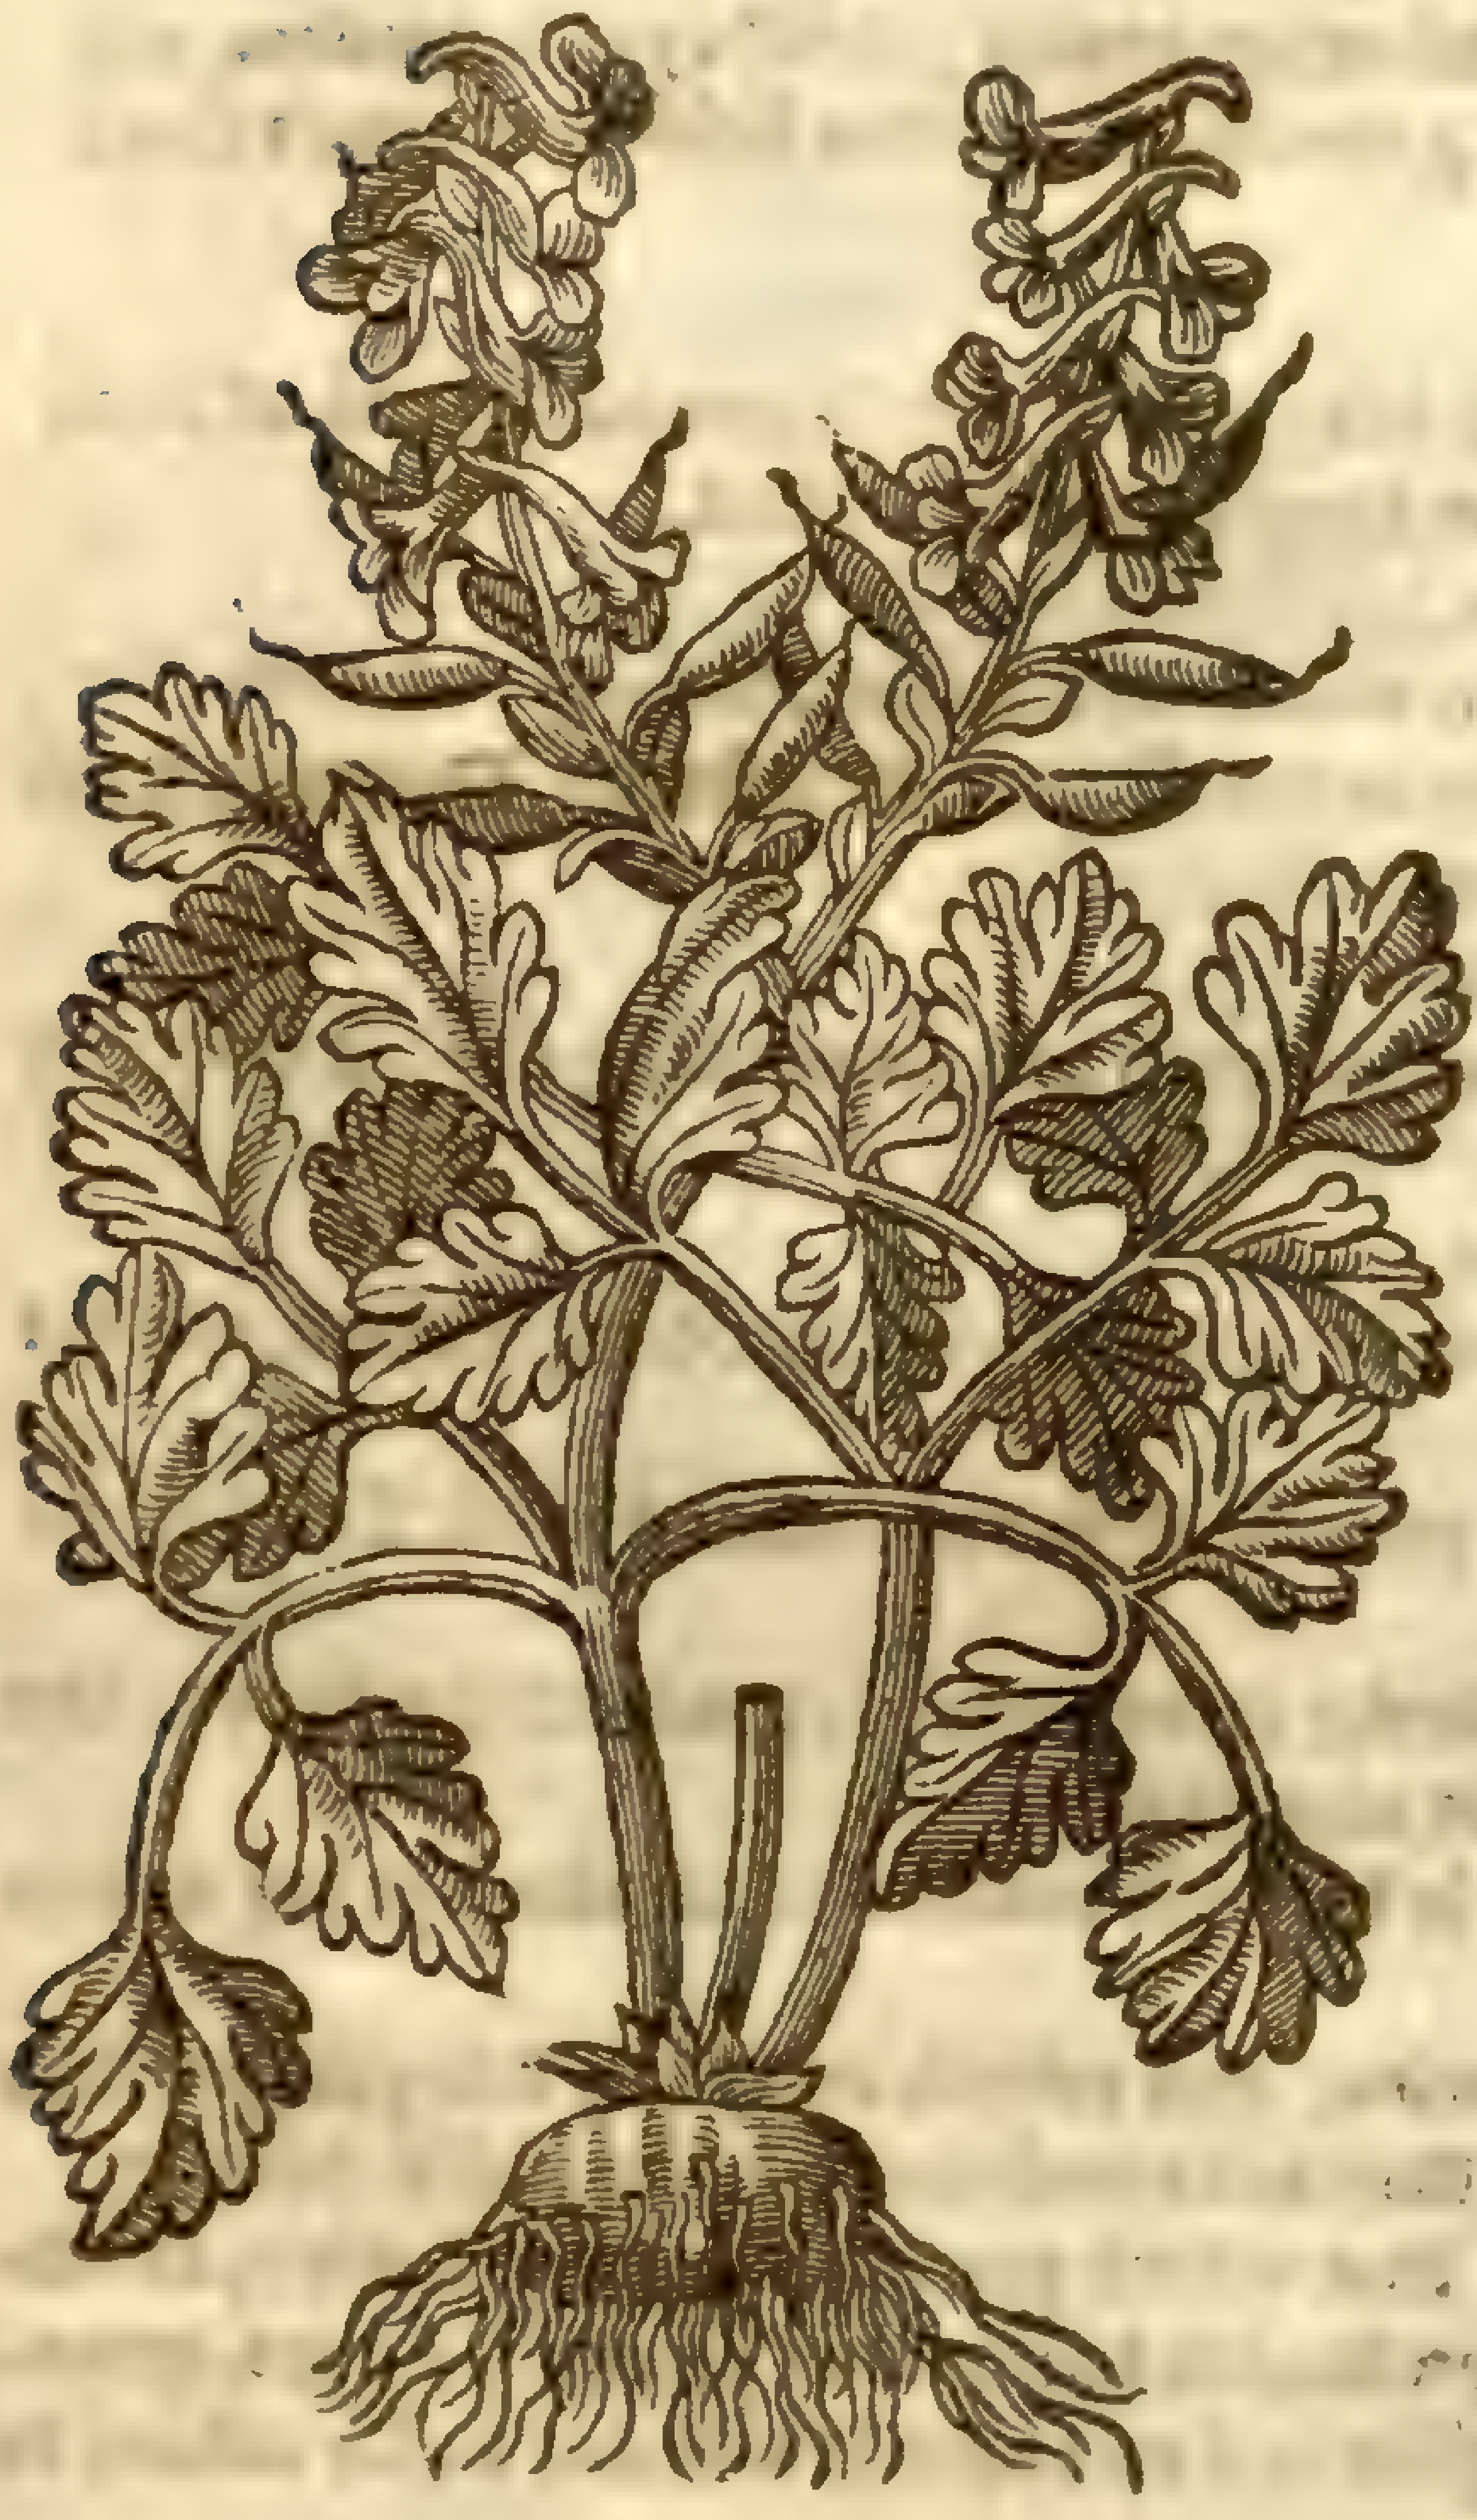
1 THe leaues of great Hollow-root are jagged and cut in ſunder, as be thoſe of Coriander, of a light greeniſh colour, that is to ſay, like the gray colour of the leaues of Columbine, whereunto they be alſo in forme like, but leſſer: the ſtalks be ſmooth, round, and ſlender, an handfull long; about which on the vpper part ſtand little floures orderly placed, long, with a little horne at the end like the floures of Tode-flax, of a light red tending to a purple colour: the ſeed lieth in flat cods, very ſoft and greeniſh when it is ready to yeeld vp his black ſhining ripe ſeed: the root is bumped or bulbous, hollow within, and on the vpper part preſſed down ſomewhat flat, couered ouer with a dark yellow skin or barke, with certaine ſtrings faſtned thereto, and of a bitter and auſtere taſt.

2 The ſecond is like vnto the firſt in each reſpect, ſauing that it bringeth floures of a white colour, and the other not ſo.

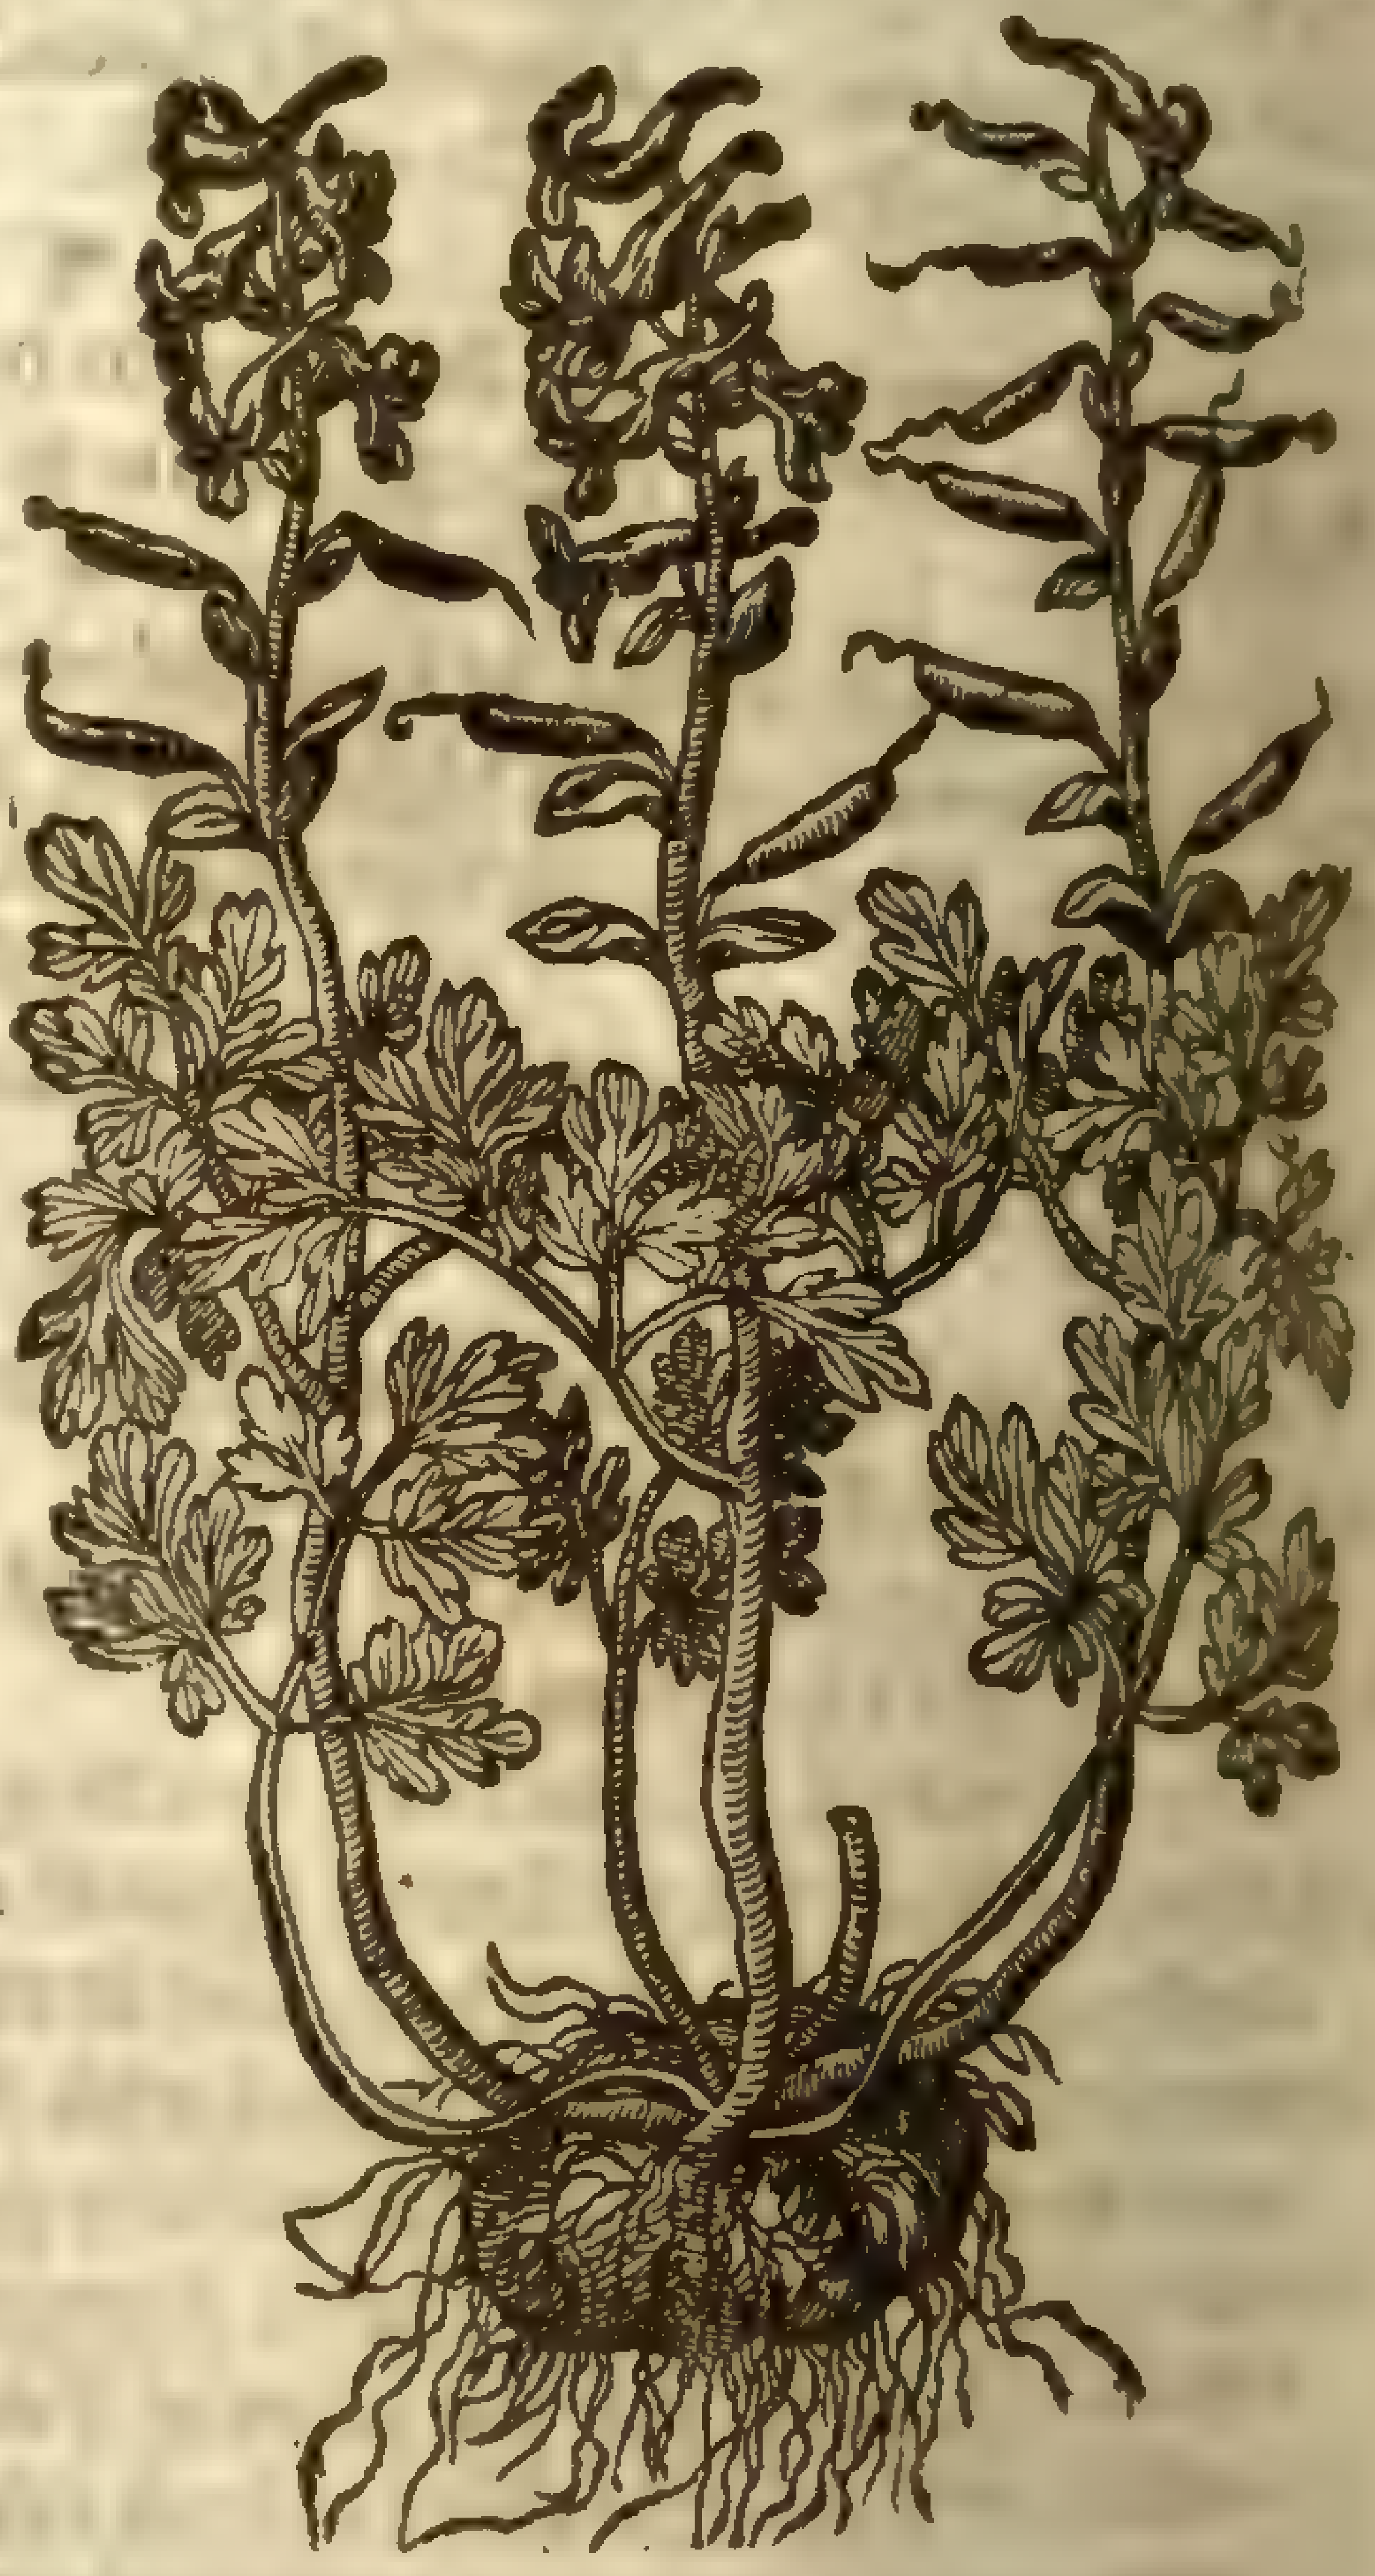
3 The ſmall purple Hollow-root hath roots, leaues, ſtalkes, floures, and ſeeds like the precedent, the eſpeciall difference is, that this plant is ſomwhat leſſe.

4 The ſmall white Hollow-root likewiſe agreeth with the former in each reſpect, ſauing tha this plant bringeth white floures, and the other not ſo.

1 *Radix caua major purpurea.*
Great purple Hollow-root.



2 *Radix caua major alba.*
Great white Hollow-root.



Fumaria bulboſa, [illegible]

5 This kinde of Hollow-root is alſo like the laſt deſcribed, ſauing that the floures hereof are mixed with purple and white, which maketh it to differ from the others.

6 There is no difference in this, that can poſſibly be diſtinguiſhed from the laſt deſcribed, ſauing that the floures hereof are of a mixt colour, white and purple, with ſome yellow in the hollowneſſe of the ſame, wherein conſiſteth the difference from the precedent.

7 This thin leafed Hollow-root hath likewiſe an hollow-root, couered ouer with a yellow pilling, ~~of the bigneſſe~~ of a tenniſe ball: from which ſhoot vp leaues ſpred vpon the ground, very like vnto the leaues of Columbines, as well in forme as colour, but much thinner, more jagged, and altogether leſſer: among which riſe vp ſmall tender ſtalkes, weake and feeble, of an handfull high, bearing from the middle thereof to the top very fine floures, faſhioned vnto one peece of the Columbine floure, which reſembleth a little bird of a purple colour.

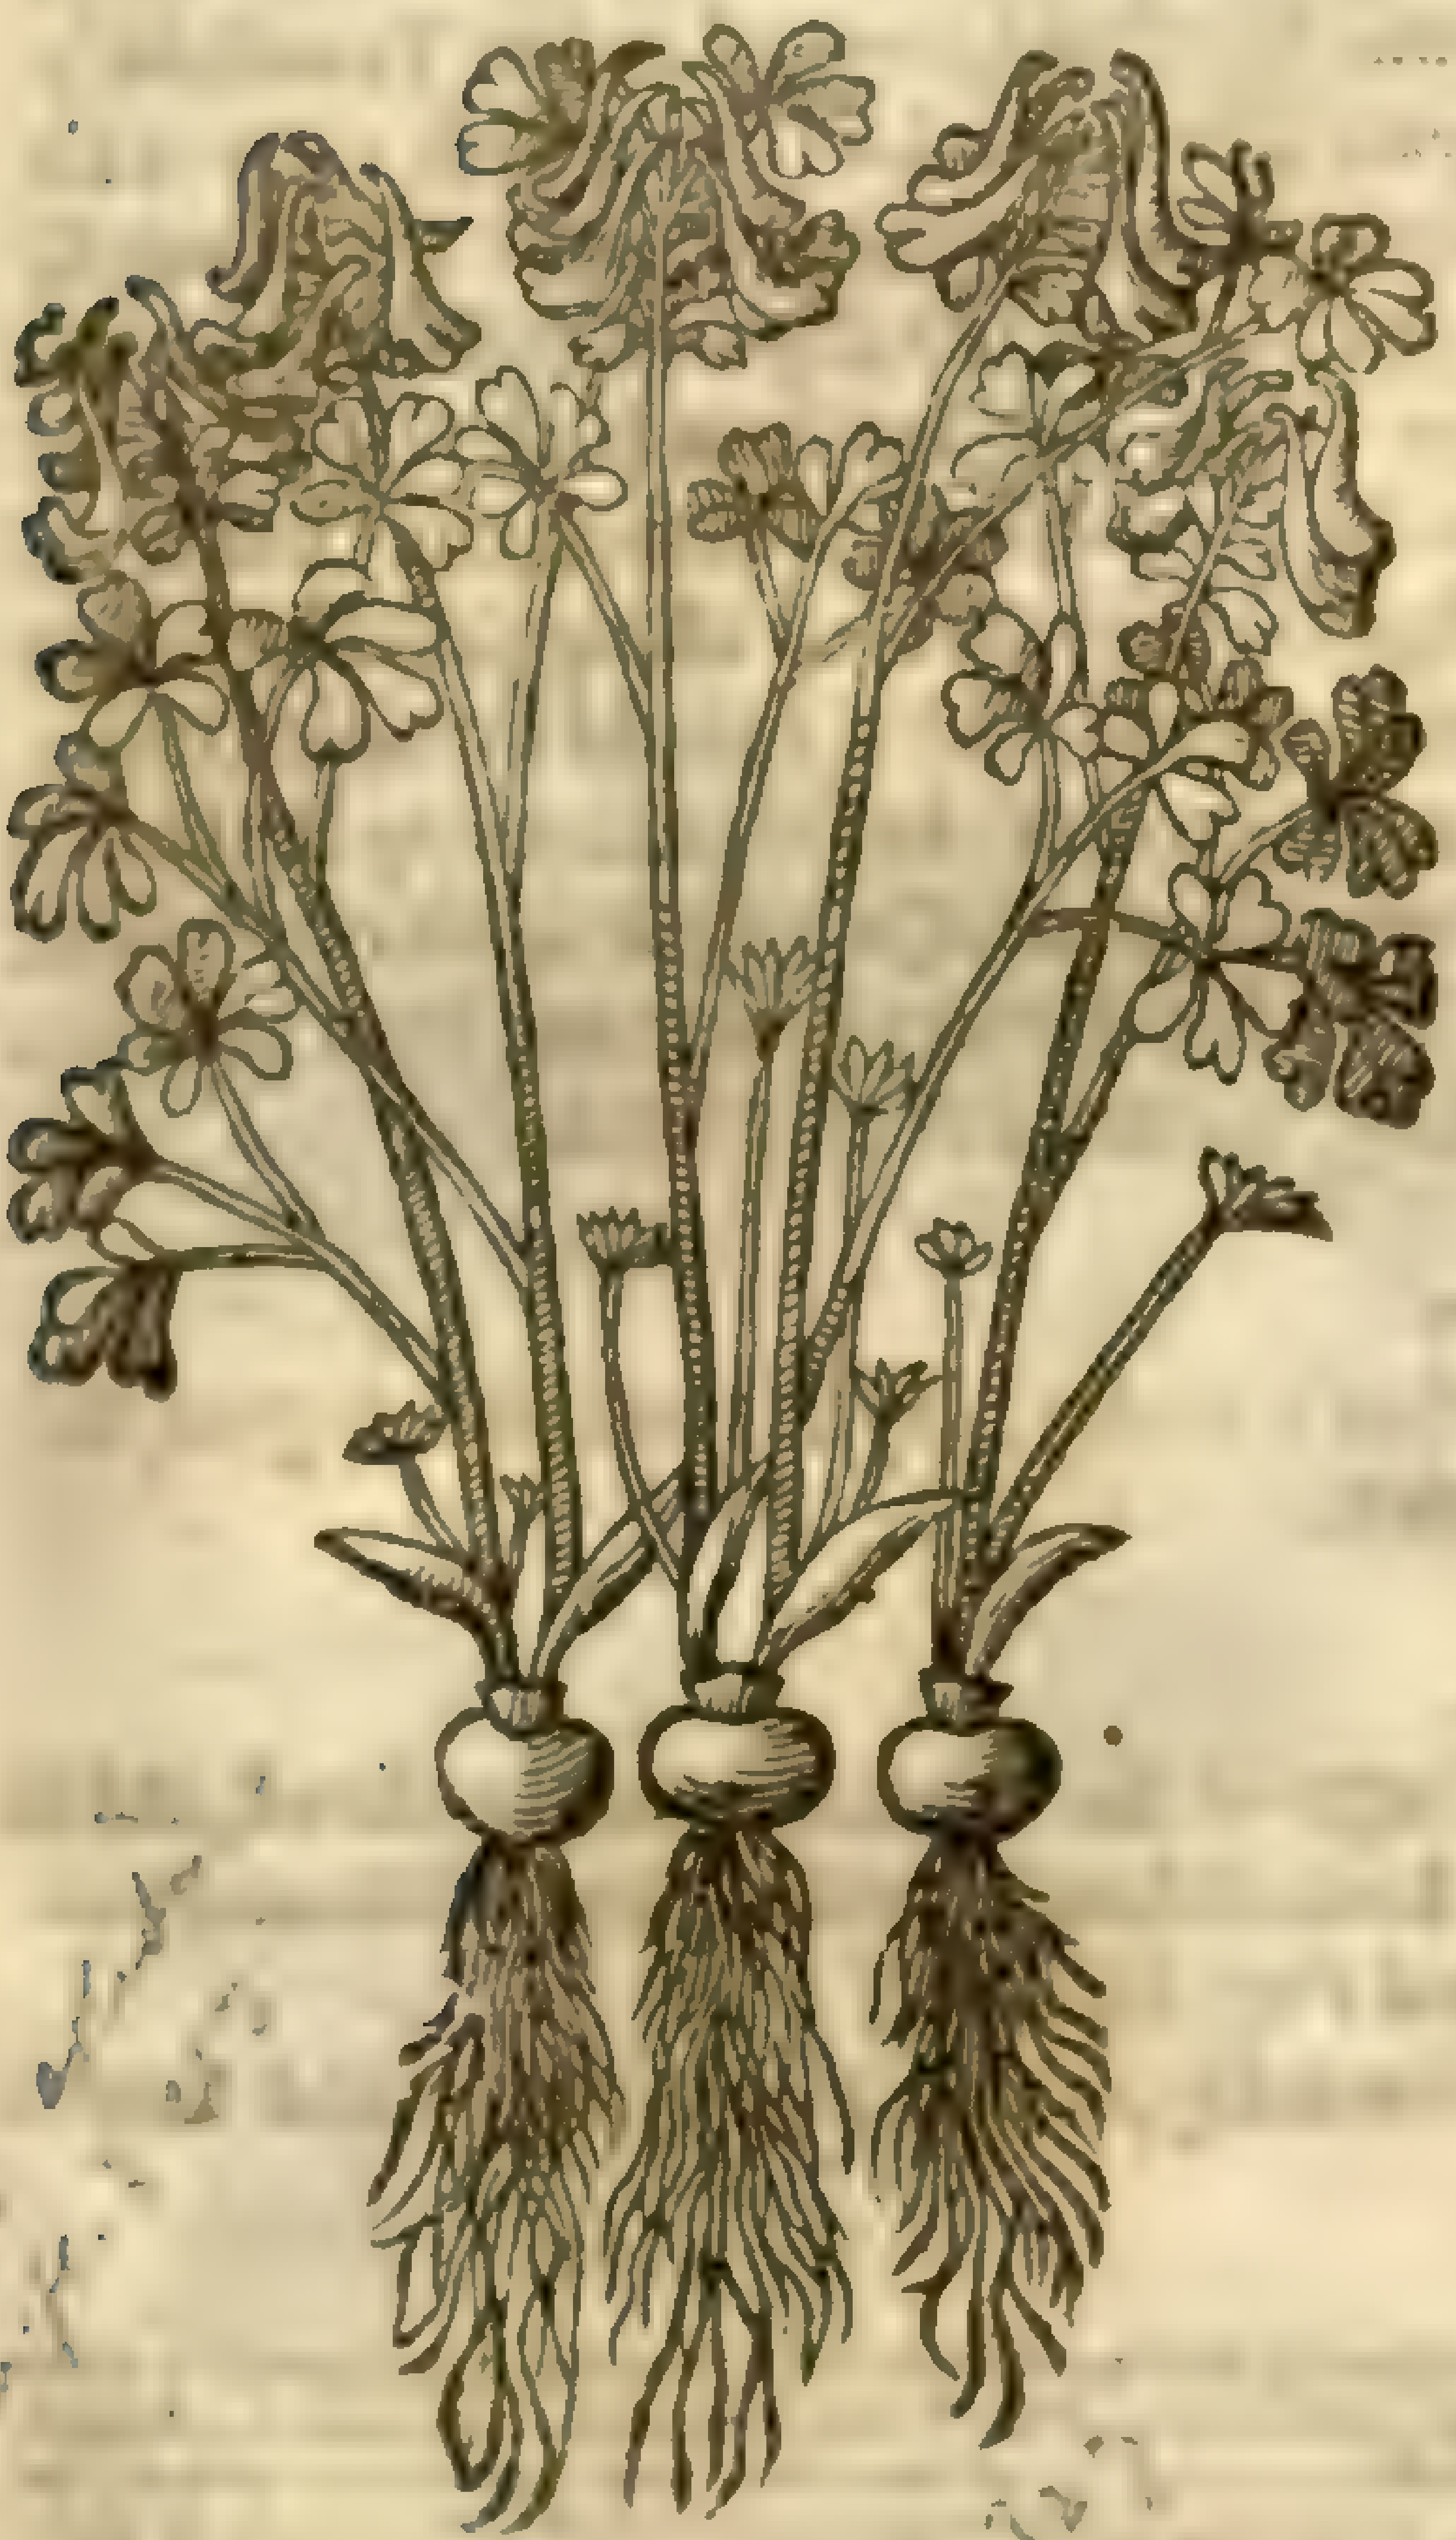
8 This other thin leafed Hollow-root is like the precedent, ſauing that this plant brings forth white floures tending to yellowneſſe, or as it were of the colour of the field Primroſe.

9 **Bunnykens holwortele**, as the Dutch men do call it, hath many ſmall jagged leaues growing immediately from the ground, among which riſe vp very ſlender ſtalks, whereon do grow ſuch leaues as thoſe next the ground: on the top of the branches ſtand faire purple floures like vnto the others of his kinde, ſauing that the floures hereof are as it were ſmall birds, the bellies or lower parts whereof are of a white colour: wherein it differeth from all the reſt of the Hollow-roots.

10 The laſt and ſmall Hollow-root is like the laſt deſcribed, ſauing that it is altogether leſſe, and the floures hereof are of a green colour, not vnlike in ſhape to the floures of Cinkfoile. ‡ This plant, whoſe figure our Author here gaue with this ſmall deſcription, is that which from the ſmell of musk is called *Moſchatella*, by *Cordus* and others: it is the *Denticulata* of *Daleſchampius* · the *Fumaria bulboſa tuberoſa minima* of *Tabernamontanus*: and the *Ranunculus minimus ſeptentrionalium herbido muſcoſo flore* of *Lobel*. The root hereof is ſmal and toothed, or made of little bulbs reſembling teeth and ending in white hairy fibres: it ſends vp diuers little branches ſome two or three inches high. the leaues are ſomwhat like thoſe of the yellow Fumitorie, or *Radix caua*, but much leſſe: the flours

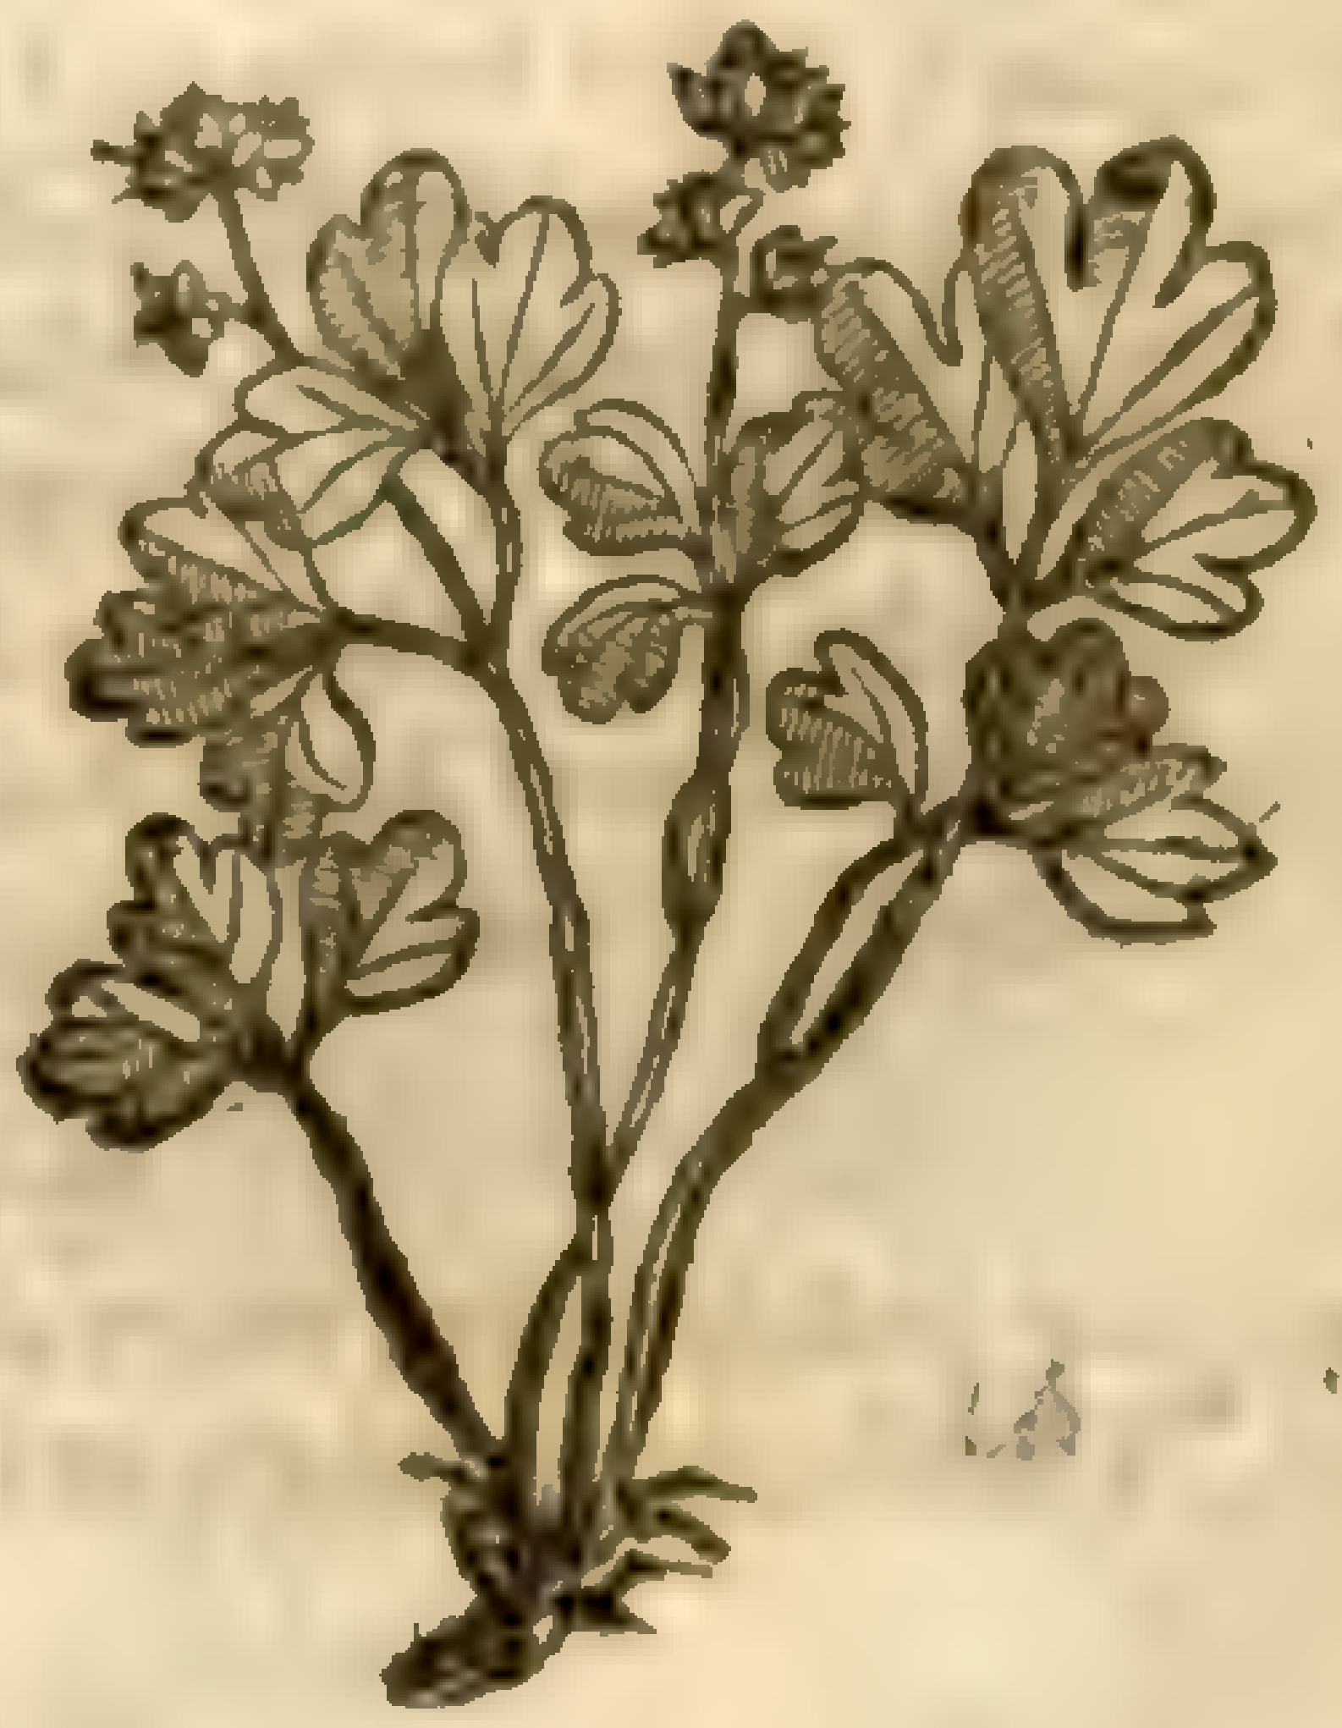
grow cluſtering on the top of the ſtalke, commonly fiue or ſeuen together, each of them made of foure yellowiſh greene leaues with ſome threds in them ; it floures in Aprill, and is to be found in diuers places among buſhes at that time, as in Kent about Chiſleburſt, eſpecially in *Pits* his wood, and at the further end of Cray heath, on the left hand vnder a hedge among bryers and brambles, which is his proper ſeat. ‡

9 *Radix caua minor.*
Bunnikens Holwoort.



10 *Radix caua minima viridi flore.*
Small Bunnikens Holwoort.

Adoxa moschatellina, L



¶ *The Place.*

Theſe plants do grow about hedges, brambles, and in the borders of fields and vineyards, in low and fertile grounds, in Germanie and the Low-countries, neuertheleſſe the two firſt, and alſo the two laſt deſcribed do grow in my garden.

¶ *The Time.*

Theſe do floure in March, and their ſeed is ripe in Aprill : the leaues and ſtalks are gone in May, and nothing remaining ſaue only the roots, ſo little a while do they continue.

¶ *The Names.*

Hollow root is called in high Dutch **Holwurtz** : in low Dutch, **Hoolwortele**, that is, *Radix caua* : in Engliſh, Hollow root, and Holewoort : it is vſed in ſhops in ſtead of *Ariſtolochia*, or round Birthwnort ; which errour is better knowne than needfull to be confuted : and likewiſe their error is apparant, who raſhly judge it to be *Piſtolochia*, or little Birthwort. It ſhould ſeem the old Writers knew it not ; wherefore ſome of our later Authors haue made it *Leontopetali ſpecies*, or a kind of Lions Turnep : others, *Eriphium* : and otherſome, *Theſium* : moſt men, *Capnos Chelidonia* : it ſeemeth to agree with *Leontopetalon* in bulbed roots, and ſomewhat in leaues, but in no other reſpects, as may be perceiued by *Dioſcorides* and *Plinies* deſcription of *Leontopetalon*. And if *Eriphium* haue his name ἀπὸ τοῦ ἦρος, that is to ſay of the Spring, then this root may be not vnproperly *Eriphium*, and *Veris Planta* : or the plant of the Spring : for it is euident that it appeareth and is green in the Spring onely : ſome think it hath been called *Eriphium*, *ab Hædo*, or of the Goat: but this *Eriphion* is quite another plant, as both *Apuleius* writeth, and that book alſo mentioneth which is attributed to *Galen*, and dedicated to *Paternianus*. In the booke which is dedicated to *Paternianus*, there be read theſe words ; [*Eriphion* is an herbe which is found vpon high mountaines, it hath leaues like Smallage, a fine floure like the Violet, and a root as great as an onion: it hath likewiſe other roots which ſend forth roots after roots. Whereby it is euident that this root whereof we intreat is not this kinde of *Er-phium*. Concerning *Theſium* the old Writers haue written but little: *Theophraſtus* ſaith, that the root thereof is bitter, and being ſtamped purgeth the belly. *Pliny*, *lib*.21.*cap*.17.ſheweth, that the root which is called *Theſium*, is like the bulbed plants, and is rough in taſte: *Athenæus* citing *Timachida* for an Author ſaith, that *Theſium* is called a floure, of which *Ariadnes* garland was made. Theſe things ſeem well to agree with Hollow root, for it is bumped or bulbous, of taſt bitter, and auſtere, or ſomthing rough, which is alſo thought to purge: but what certainty can be affirmed, ſeeing the old Writers are ſo briefe? what manner of herbe *Capnos Chelidonia* is, which groweth by hedges, and hereupon is ſyrnamed φράγμιτις, *Aetius* doth not expound, only the name thereof is found in his ſecond Tetrab. the third booke, chap. 110. in *Martianus* his *Collyrium*, and in his Tetrab. *lib*.3. *cap*.2. among ſuch things as ſtrengthen the liuer. But if *Capnos Chelidonia* be that which *Pliny* in his 25. booke, chap. 13, doth call *Prima Capnos*, or the firſt *Capnos*, and commendeth it for the dimneſſe of the ſight, it is plaine enough that *Radix caua*, or the Hollow root, is not *Capnos Chelidonia*: for *Plinies* firſt *Capnos* is branched, and foldeth it ſelfe vpon hedges: but Hollow root hath no ſuch branches growing on it, and is a low herbe, and is not held vp with props, nor needeth them. But if *Aetius* his *Capnos Chelidonia* be another herb differing from that of *Pliny* (which thing perchance was the cauſe why it ſhould be ſyrnamed *Chelidonia*) there is ſome reaſon why it ſhould be called *Capnos Chelidonia*; for it is ſomwhat like Fumitorie in leaues, though greater, and commeth vp at the firſt Spring, which is about the time when the Swallows do come in; neuertheleſſe it doth not follow, that it is true, and right *Capnos Chelidonia*, for there be alſo other herbes comming vp at the ſame ſeaſon, and periſh in ſhort time after, which notwithſtanding are not called *Chelidonia*.

¶ *The Temperature.*

Hollow root is hot and drie, yet more drie than hot, that is to ſay, dry in the third degree, and hot in the ſecond; it bindeth, clenſeth, and ſomwhat waſteth.

¶ *The Vertues.*

A Hollow root is good againſt old and long laſting ſwellings of the Almonds in the throat, and of the jawes: it likewiſe preuaileth againſt the pains of the hemorrhoides, which are ſwoln and painfull being mixed with the ointment of Poplar buds, called *Vng. Populeon*.

B It is reported that a dram weight hereof being taken inwardly, doth purge by ſiege, and drawes forth flegme.

† I haue reduced the eight figures which were formerly here put to the firſt 8. deſcriptions, beeing all of one and the ſame plant, to two, yet haue I left the deſcriptions, which in my opinion might haue been as well ſpared as the figures, for excepting the various colour of the floures, there are but two diſtinct differences of the *Fumaria bulboſa maior*, the one hauing a hollowneſſe in the bottome of the root, and the other wanting it; and this which hath the ſollid root hath alſo the greene leaues betweene the floures cut in or diuided, the floures alſo are leſſe, more in number, and of an elegant red purple colour; and ſeldome found of any other colour, whereas the other varies much in the colour of the floures.

Chap. 447. *Of Columbine.*

¶ *The Deſcription.*

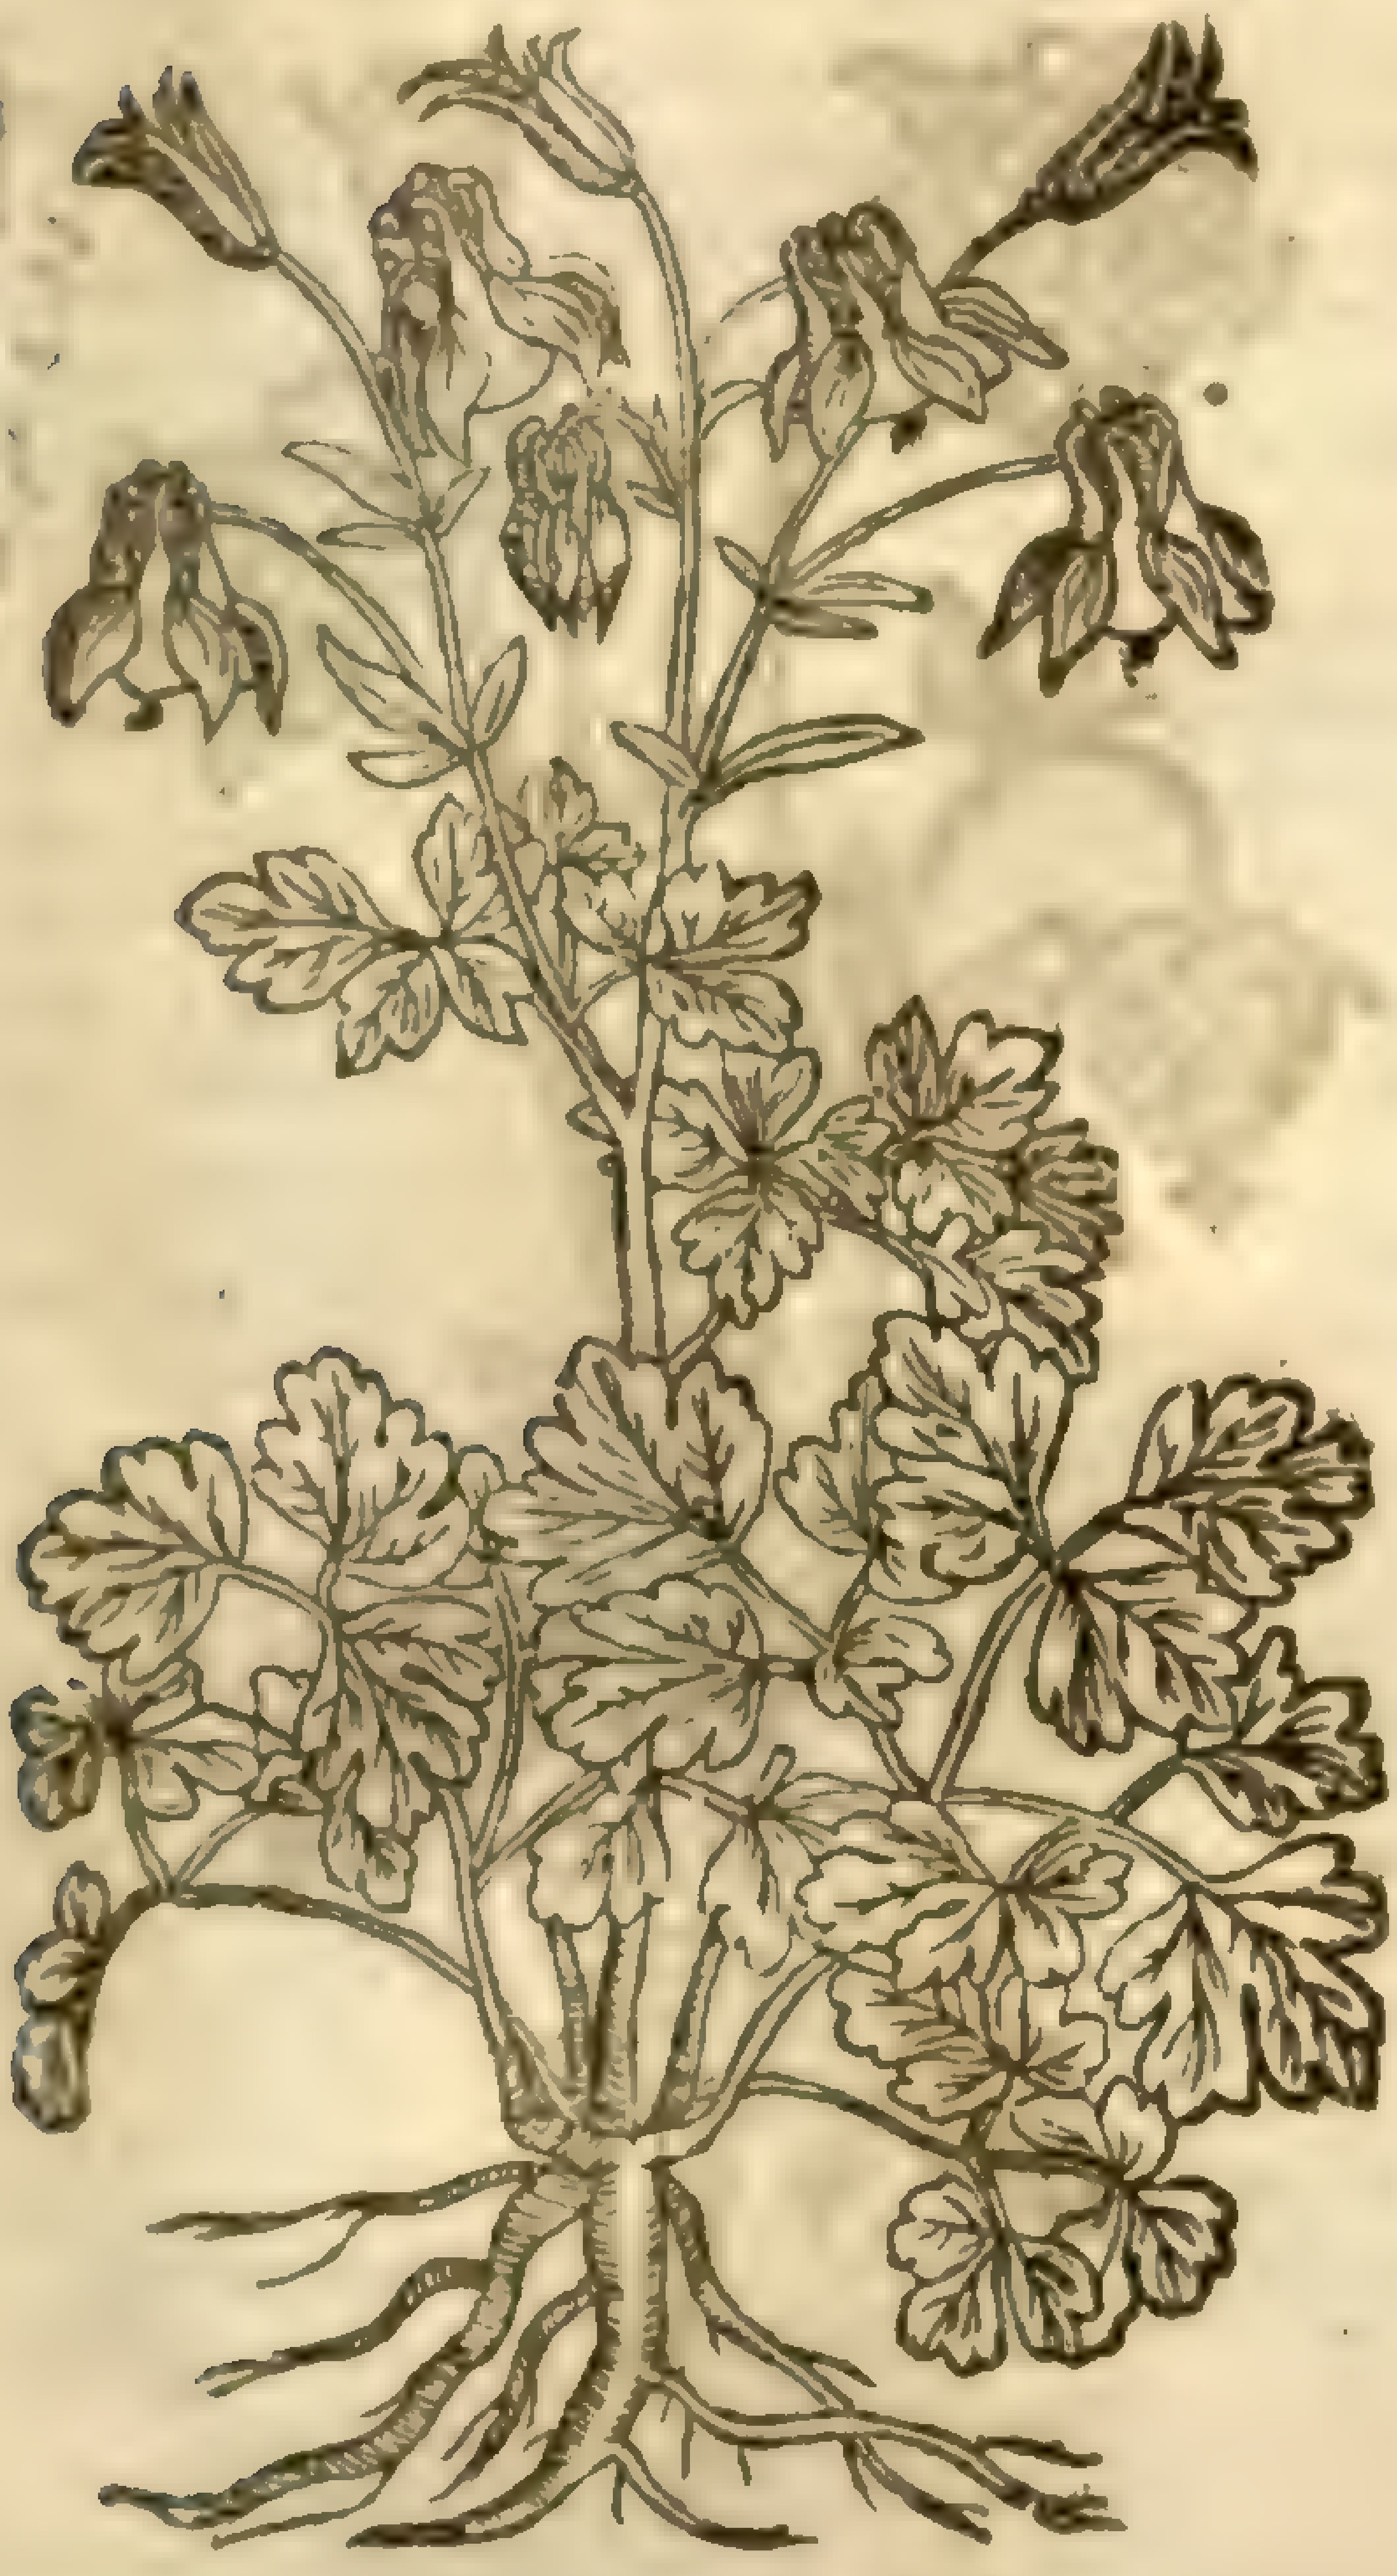
1 The blew Columbine hath leaues like the great Celandine, but ſomewhat rounder, indented on the edges, parted into diuers ſections, of a blewiſh green colour, which beeing broken, yeeld forth little juice or none at all: the ſtalke is a cubit and a halfe high, ſlender, reddiſh, and ſleightly haired: the ſlender ſprigs whereof bring forth euerie one one floure with fiue little hollow hornes, as it were hanging forth, with ſmall leaues ſtanding vpright, of the ſhape of little birds: theſe floures are of colour ſomtimes blew, at other times of a red or purple, often white, or of mixt colours, which to diſtinguiſh ſeuerally were to ſmall purpoſe, being things ſo familiarly known to all: after the floures grow vp cods, in which is contained little black and glittering ſeed: the roots are thicke, with ſome ſtrings thereto belonging, which continue many yeres.

2 The ſecond doth not differ ſauing in the colour of the floures; for like as the others are deſcribed to be blew, ſo thoſe are of a purple red, or horſe-fleſh colour, which maketh the difference.

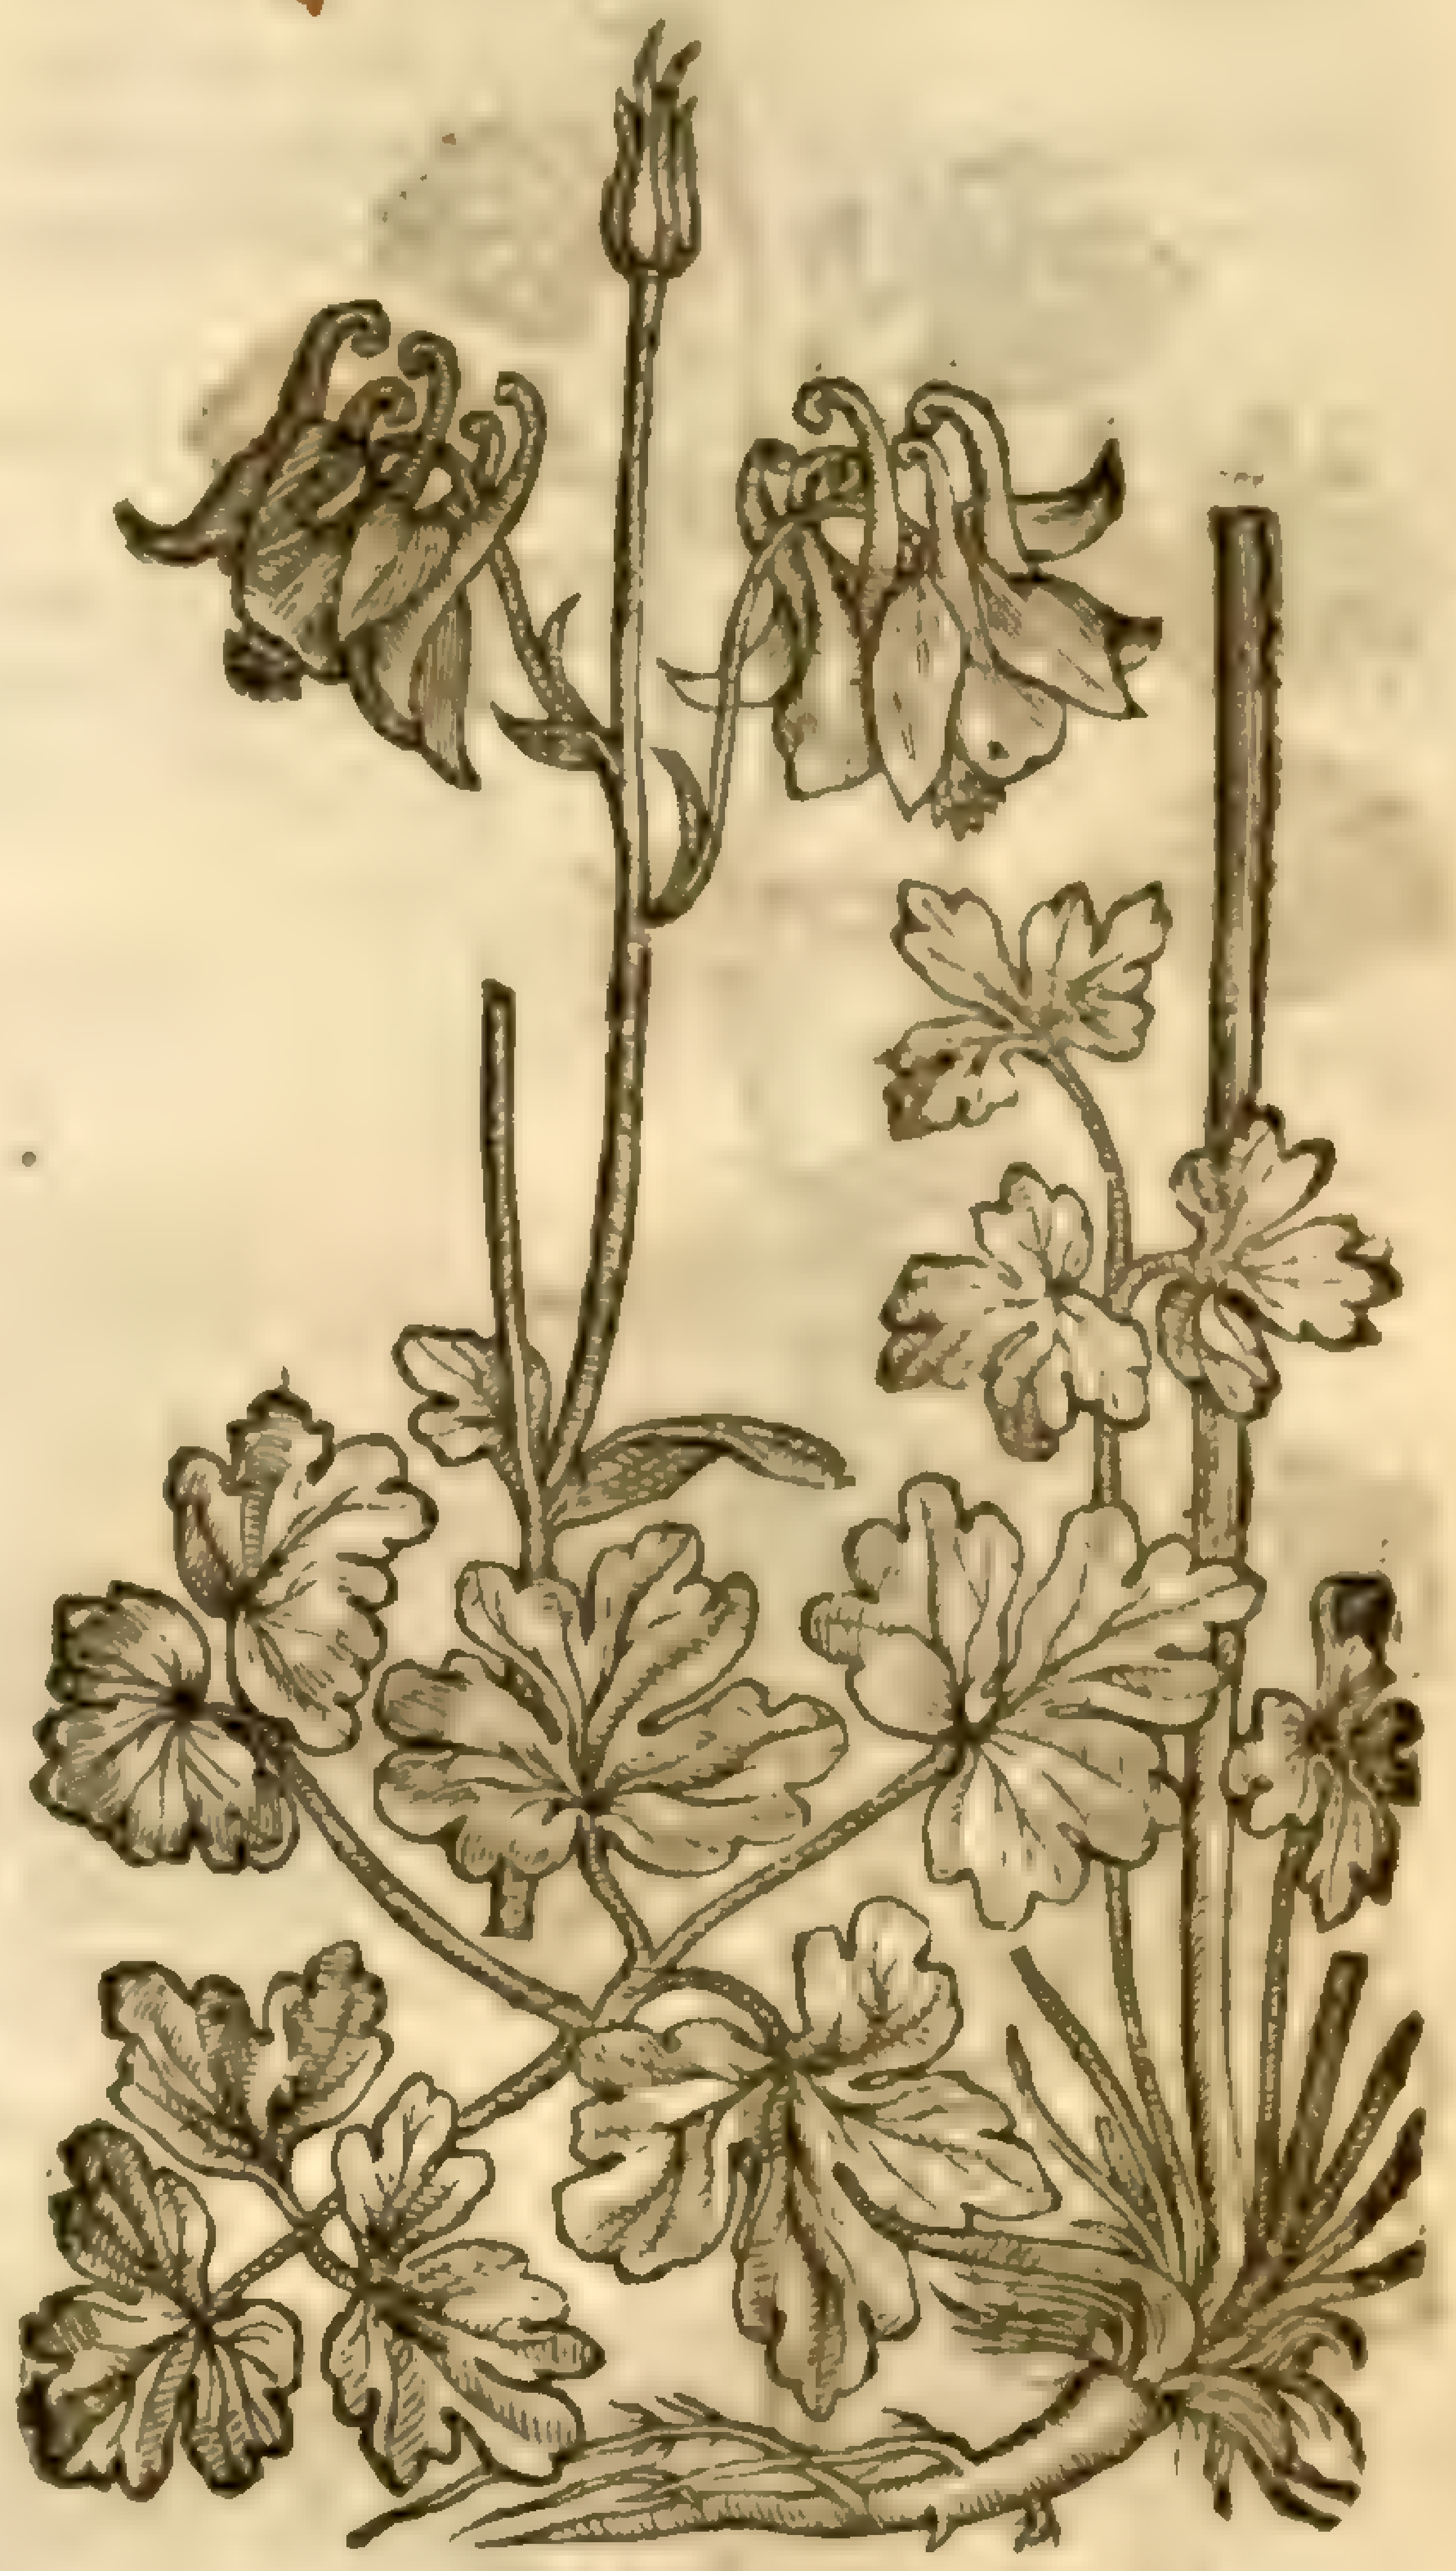
3 The double Columbine hath ſtalks, leaues, and roots, like the former: the floures hereof are very double, that is to ſay, many of thoſe little floures (hauing the forme of birds) are thruſt one into the belly of another, ſometimes blew, often white, and otherwhiles of mixt colours, as nature liſt to play with her little ones, differing ſo infinitely, that to diſtinguiſh them apart would require

more

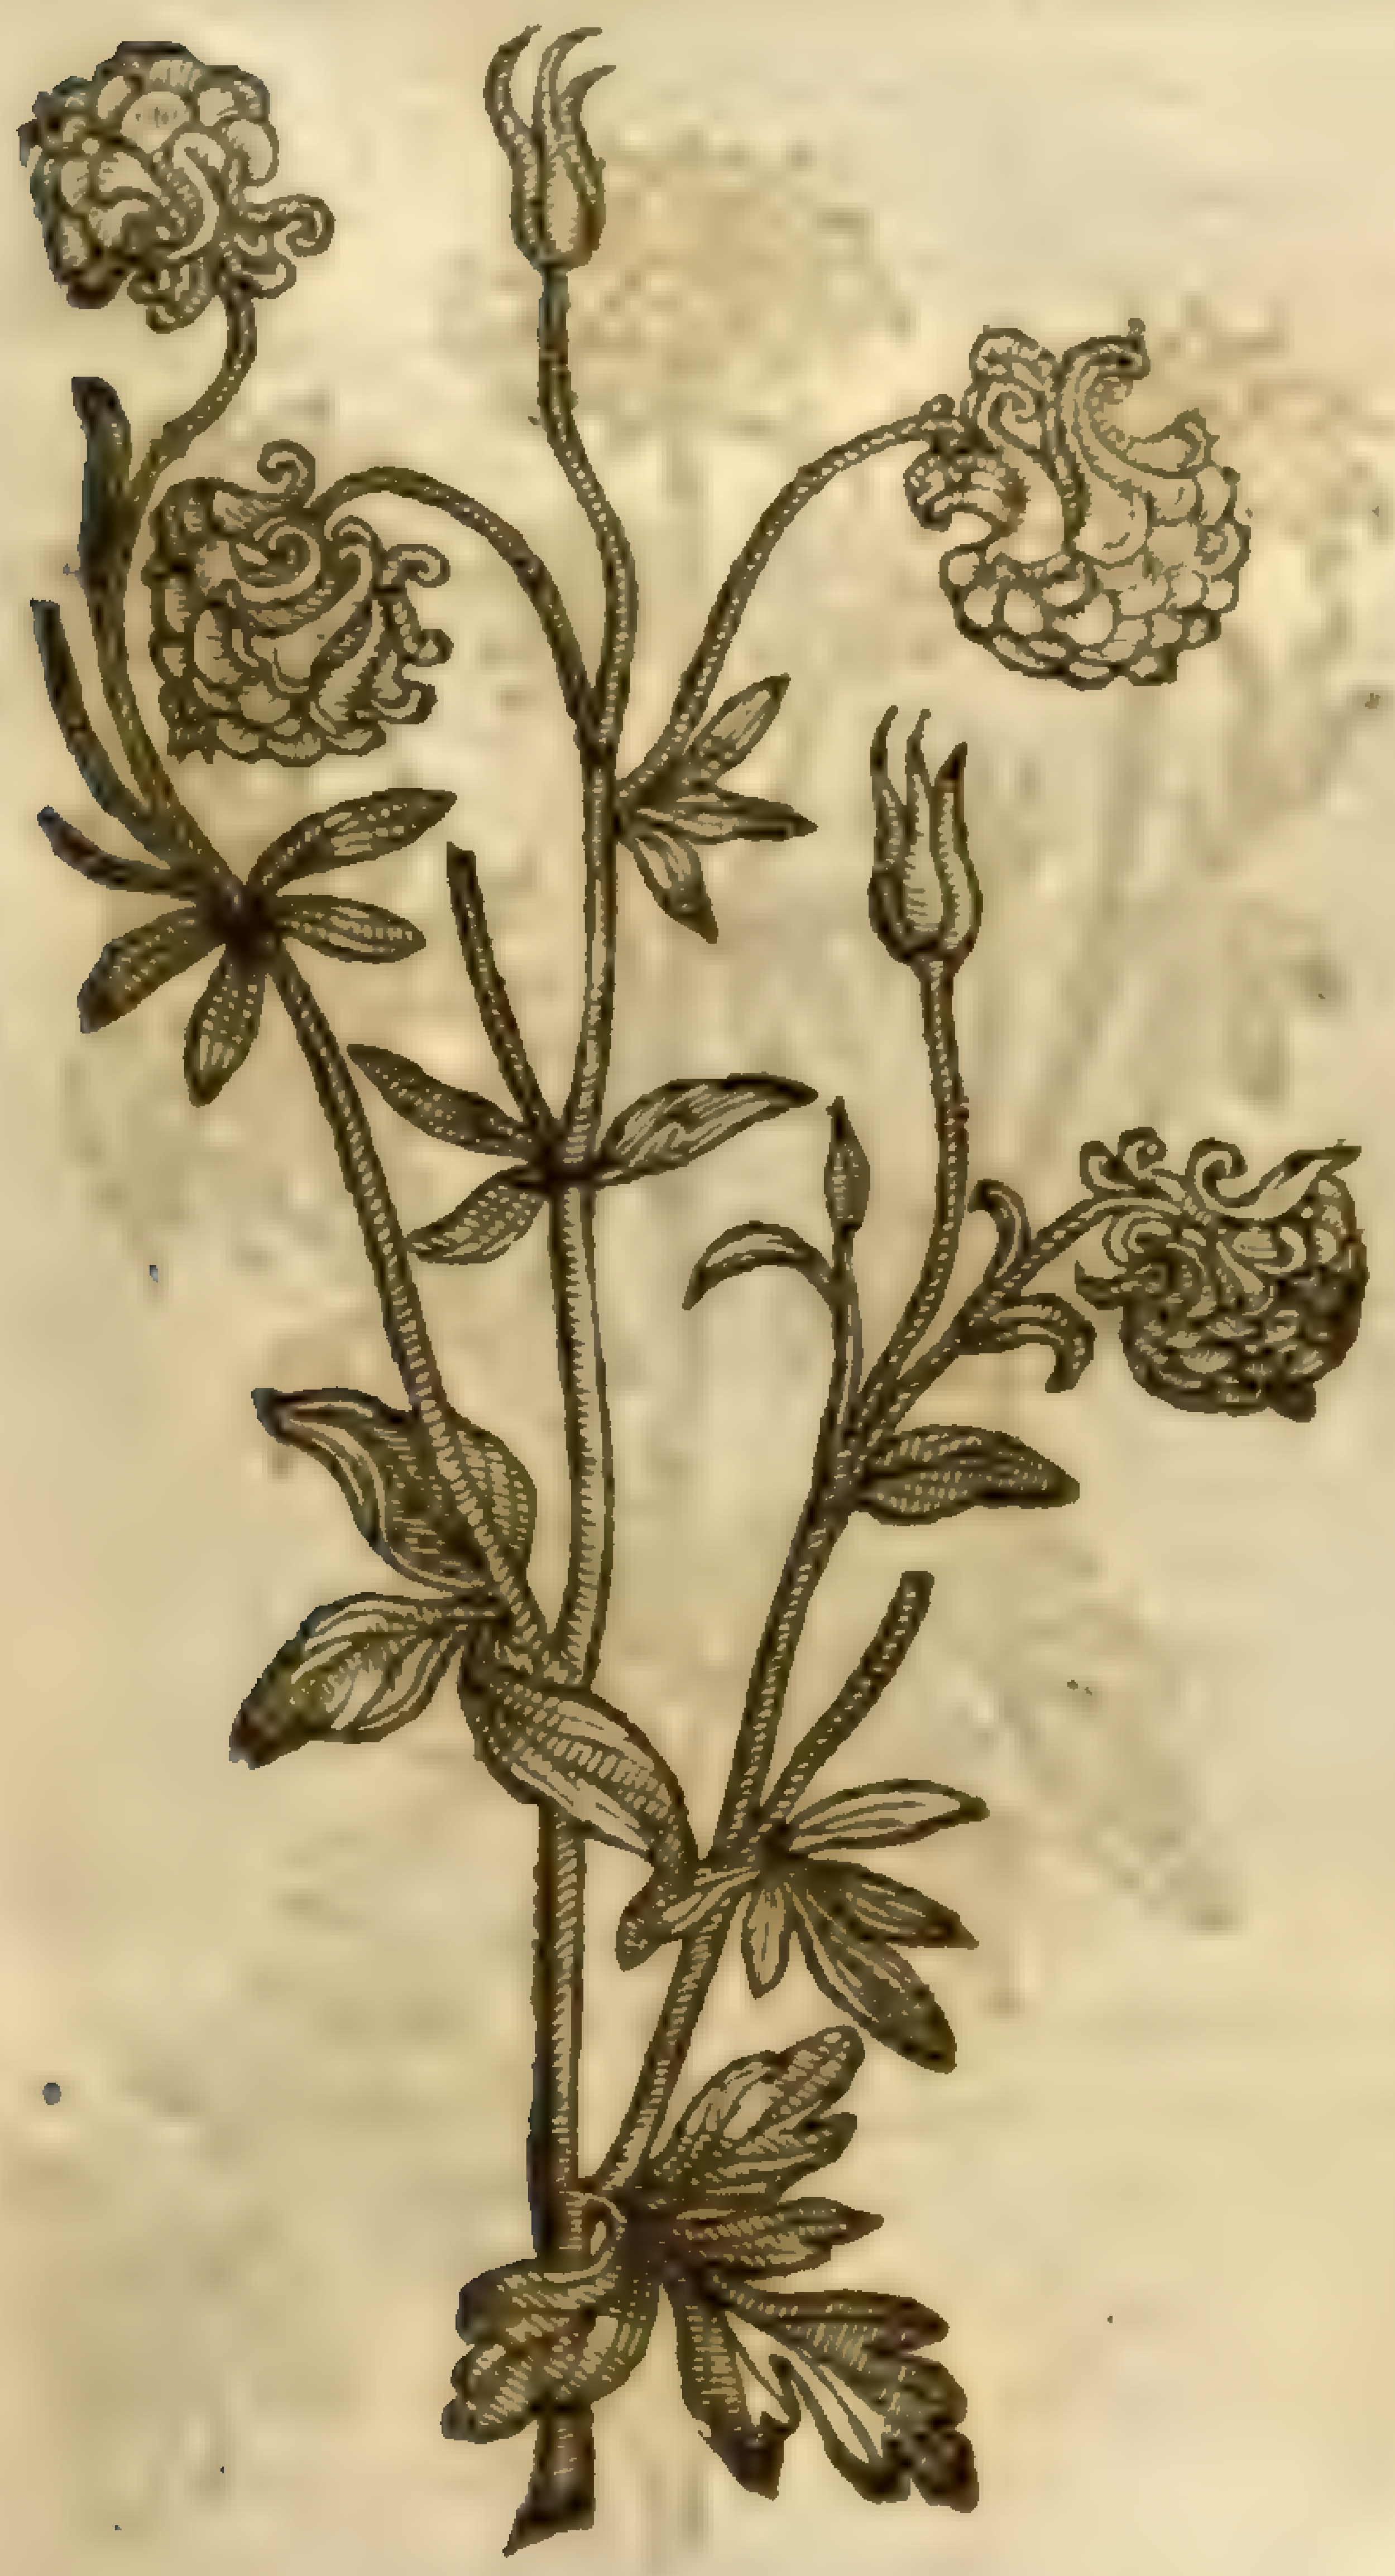
1 *Aquilegia cærulea.*
Blew Columbines.



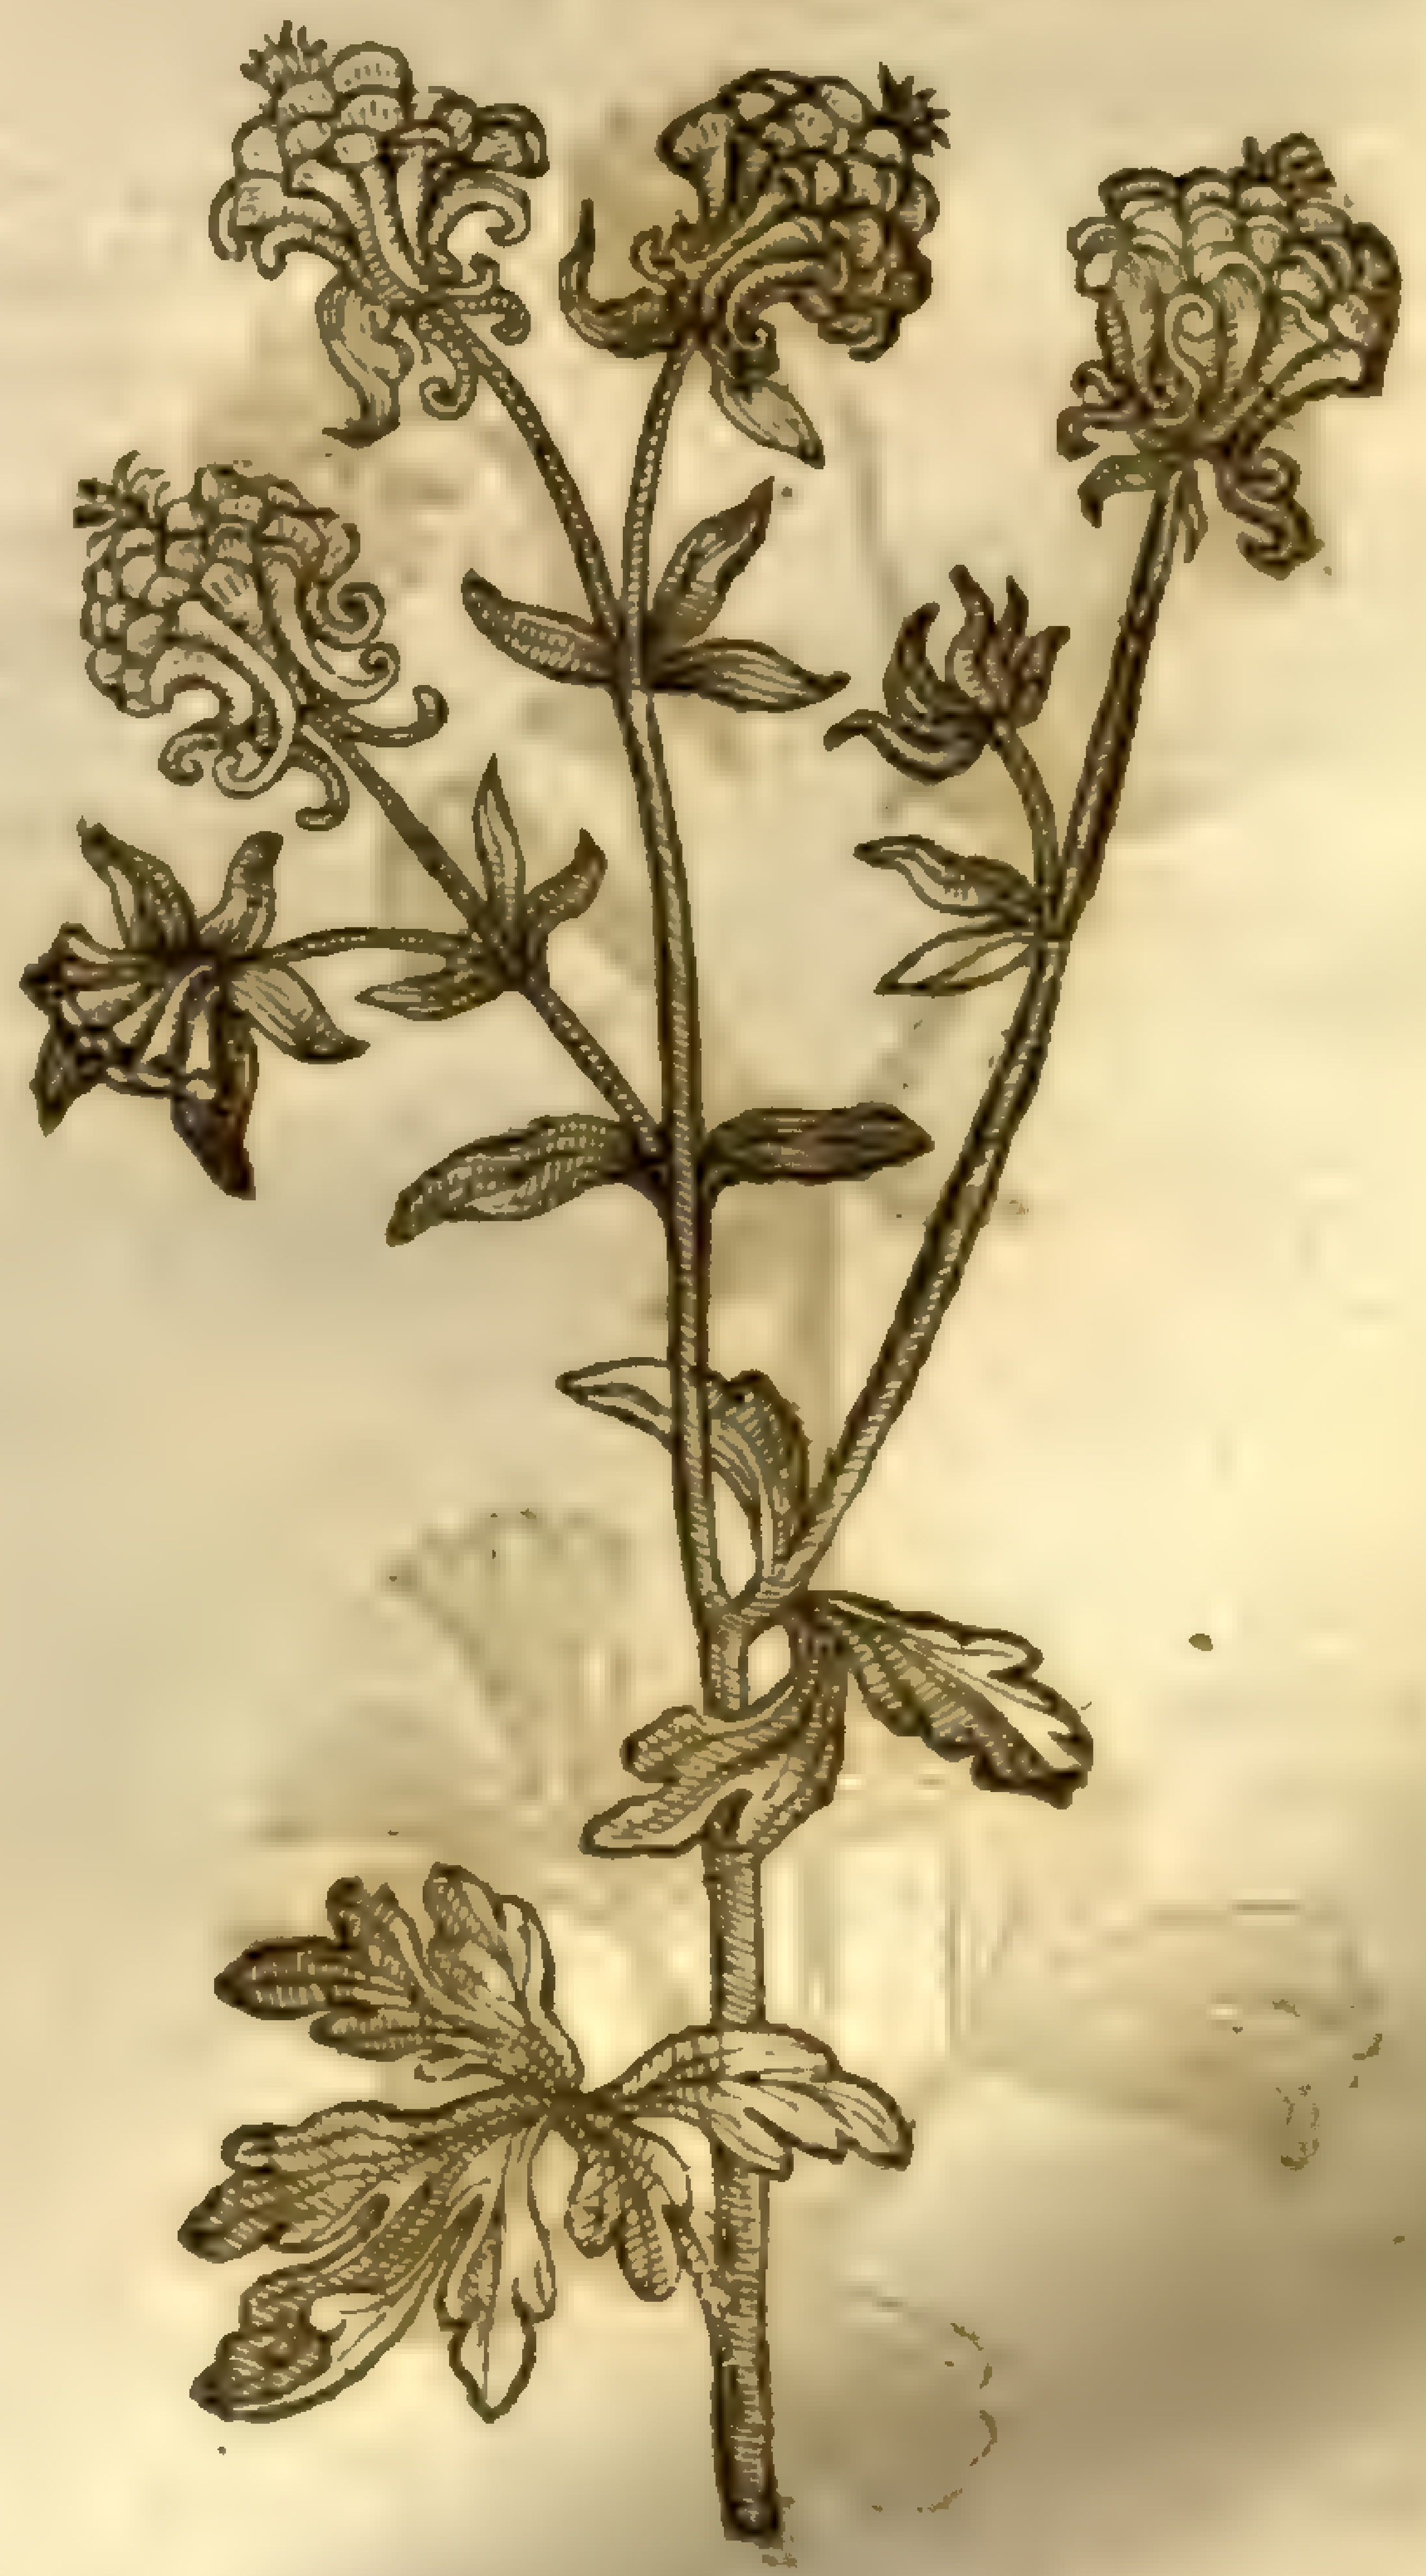
2 *Aquileia rubra.*
Red Columbines.



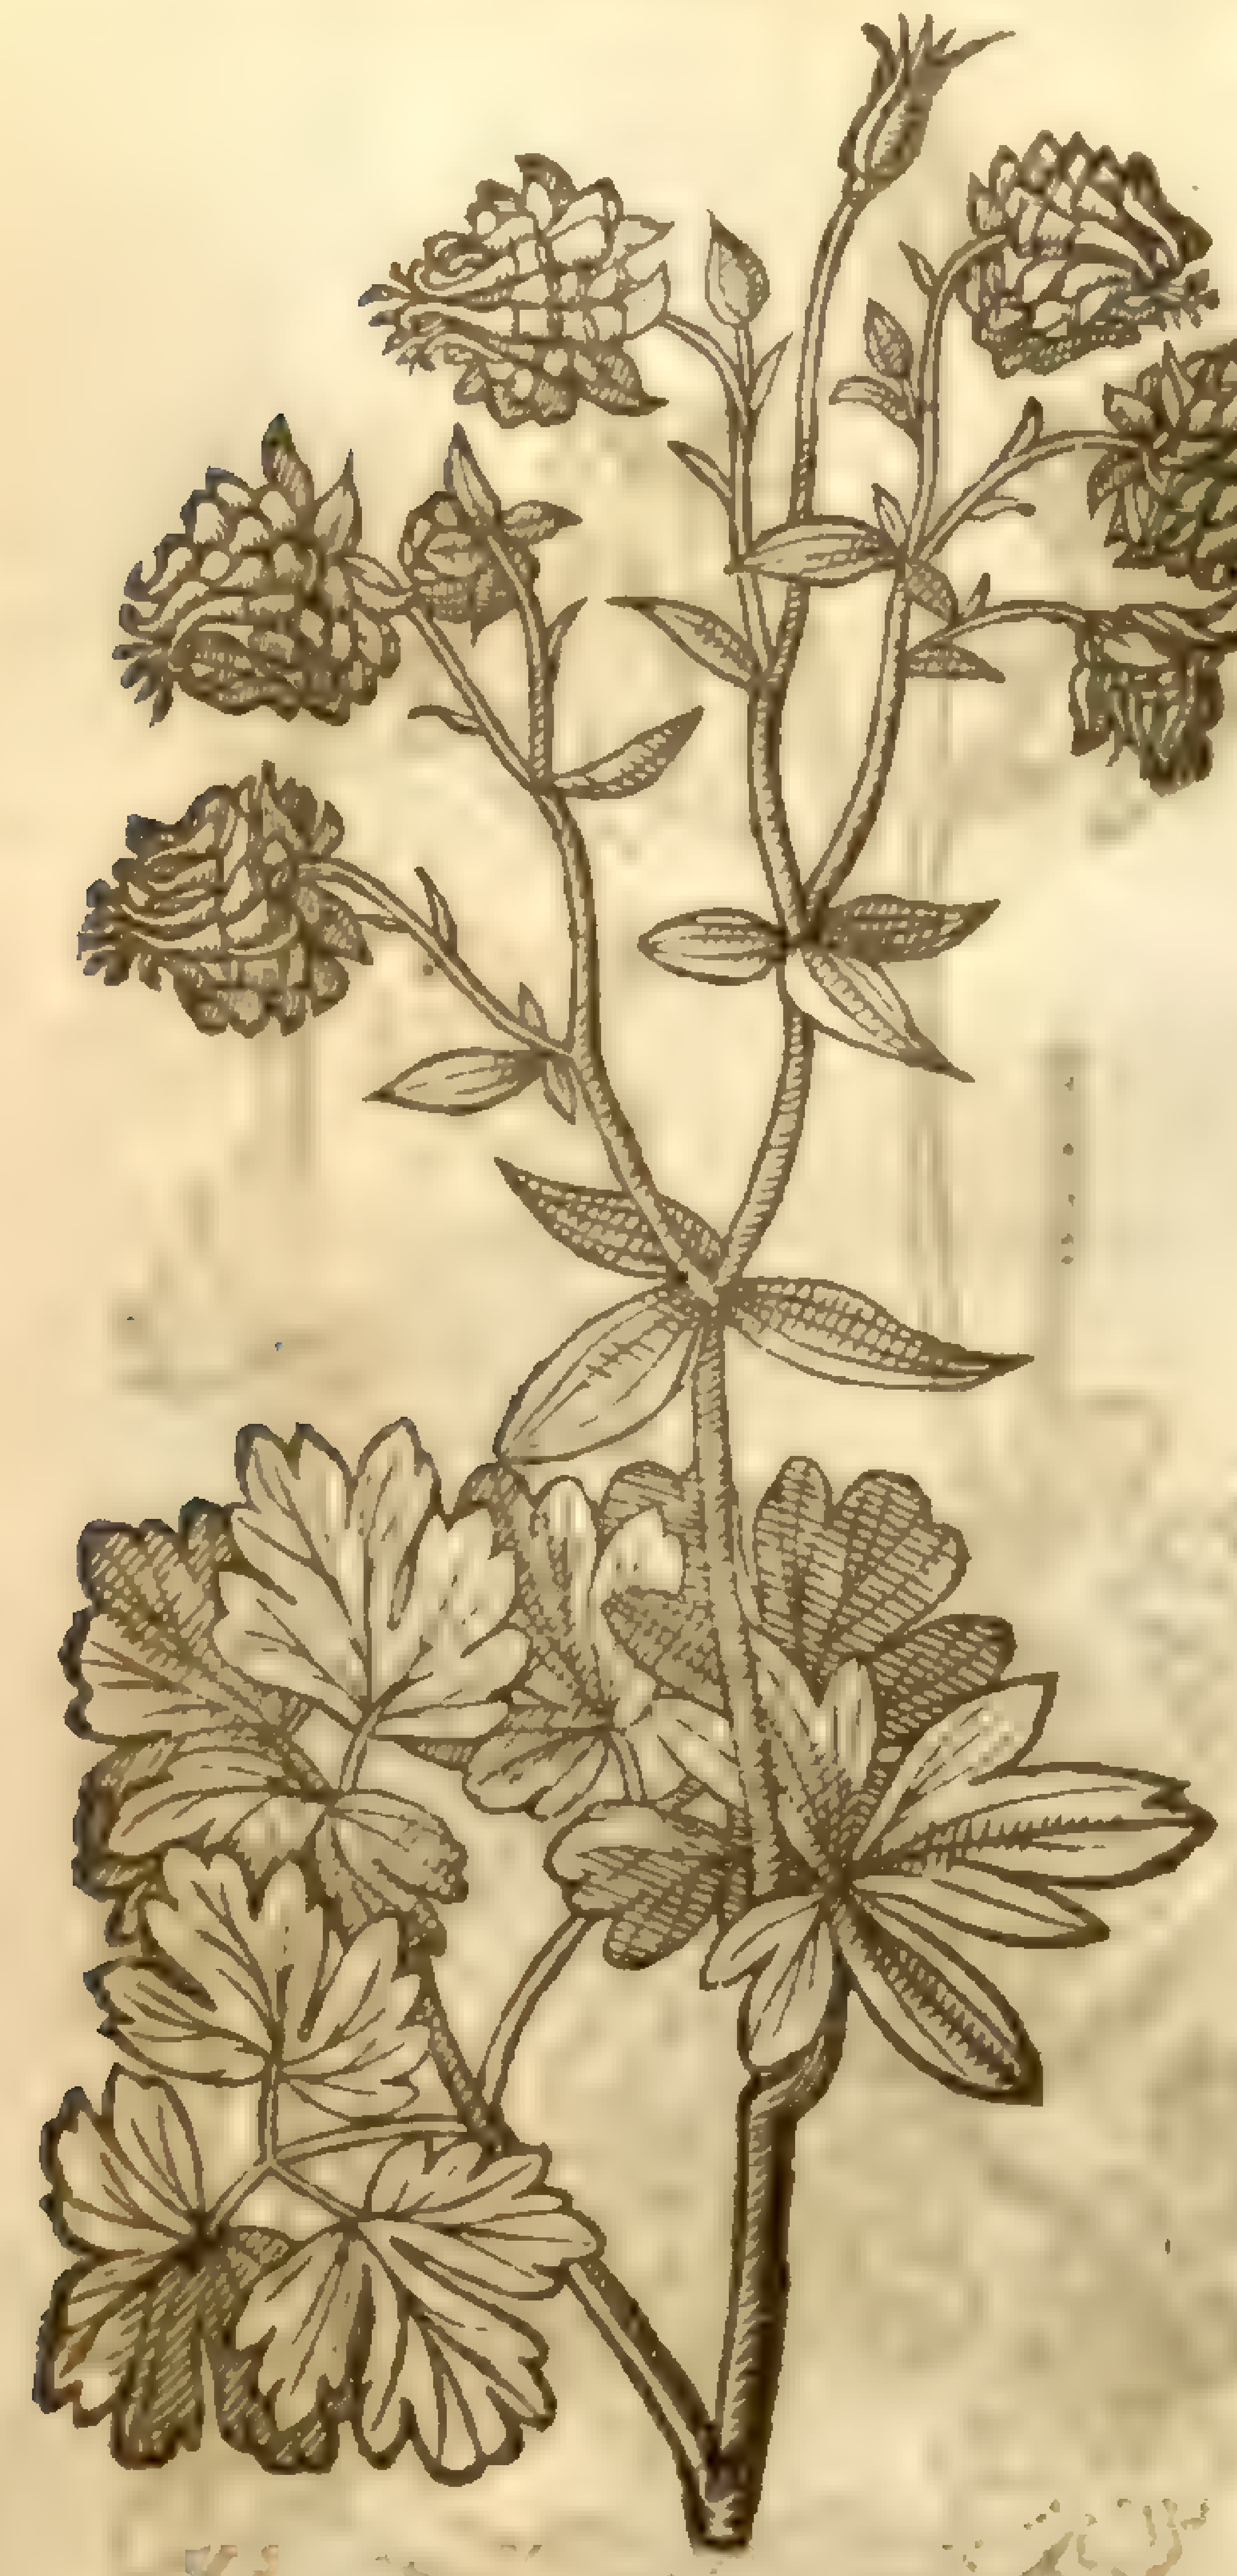
3 *Aquilina multiplex.*
Double Columbines.



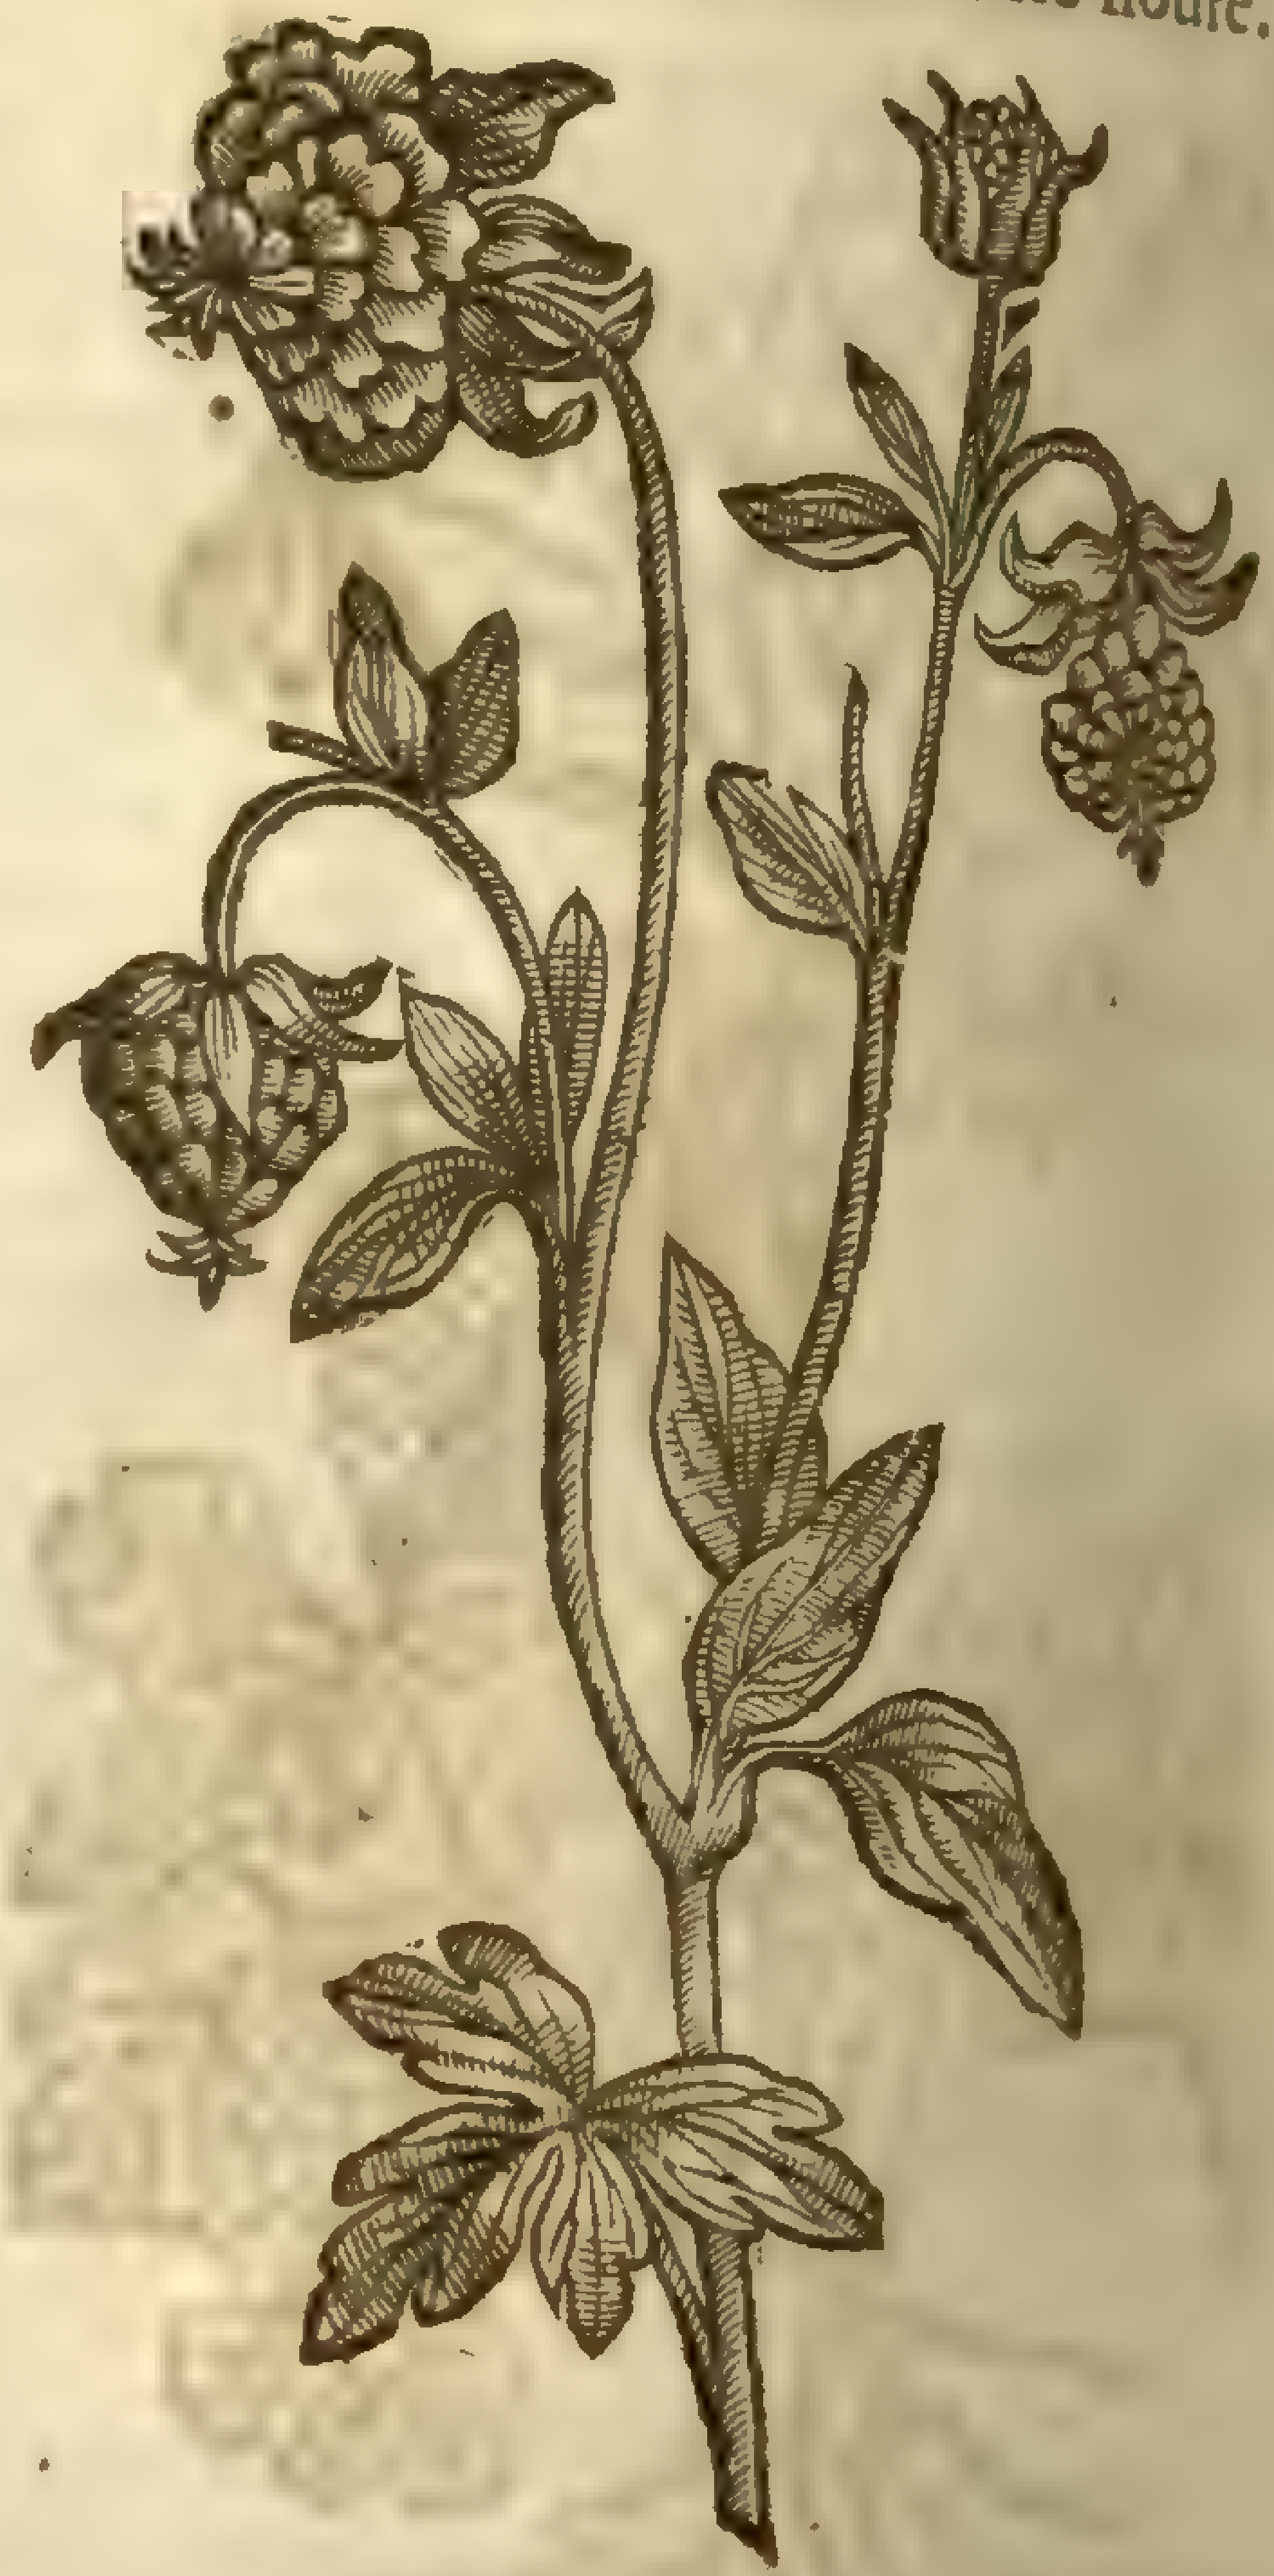
‡ 4 *Aquilegia variegata.*
Variegated Columbine.



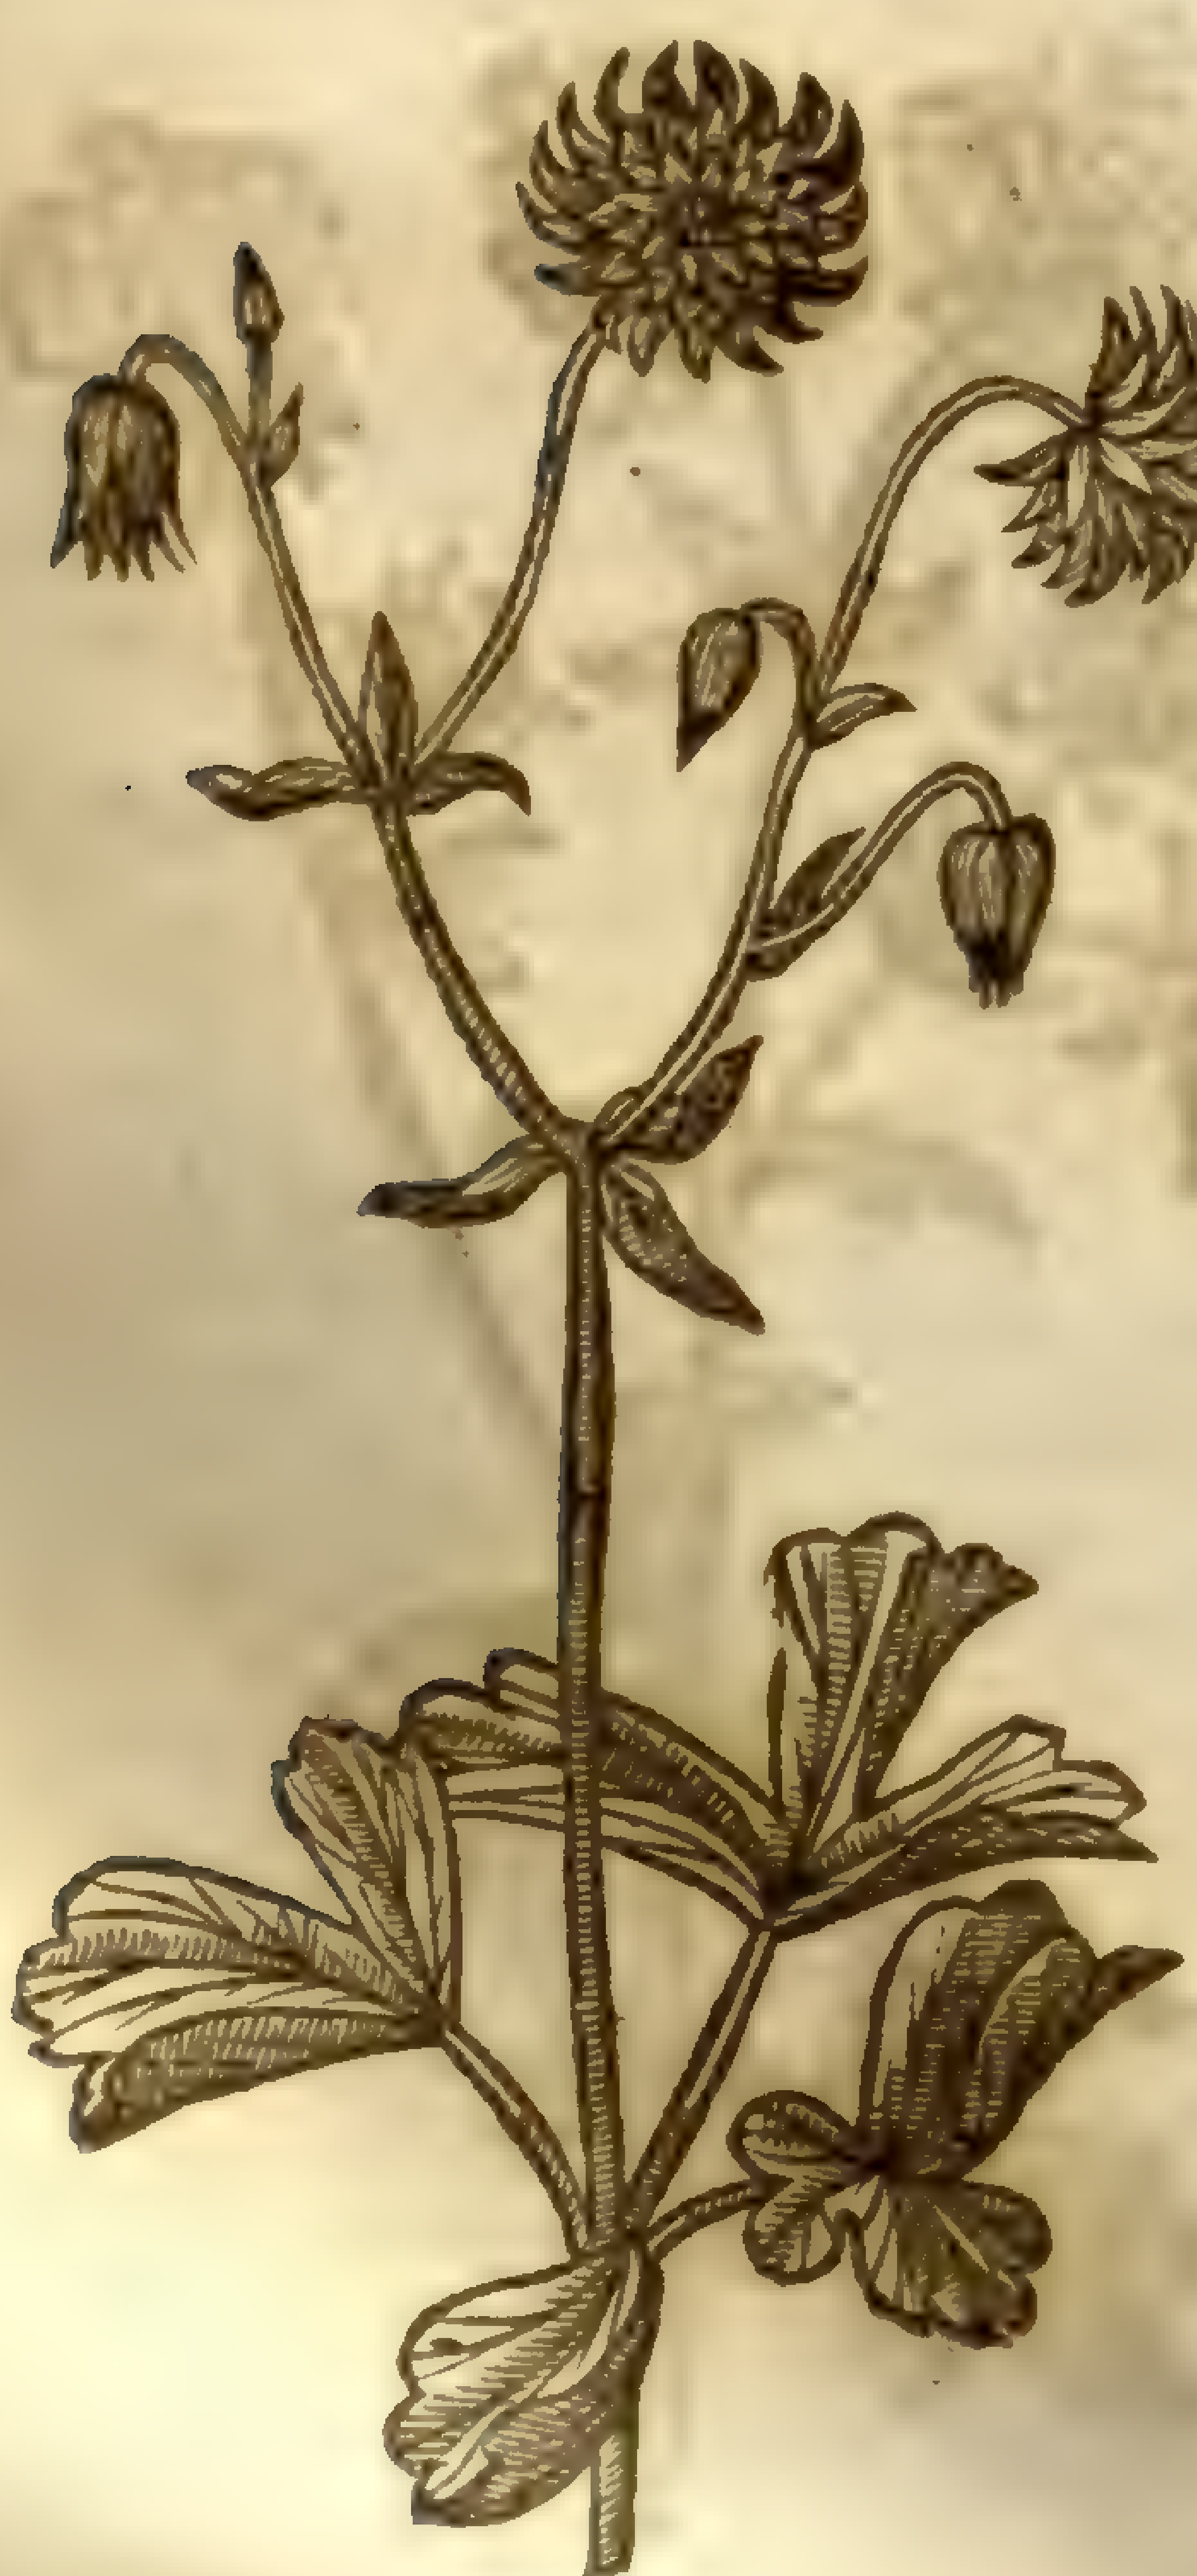
‡ 5 *Aquilegia flo. inverſo rubro.*
Columbine with the inverted red floure.



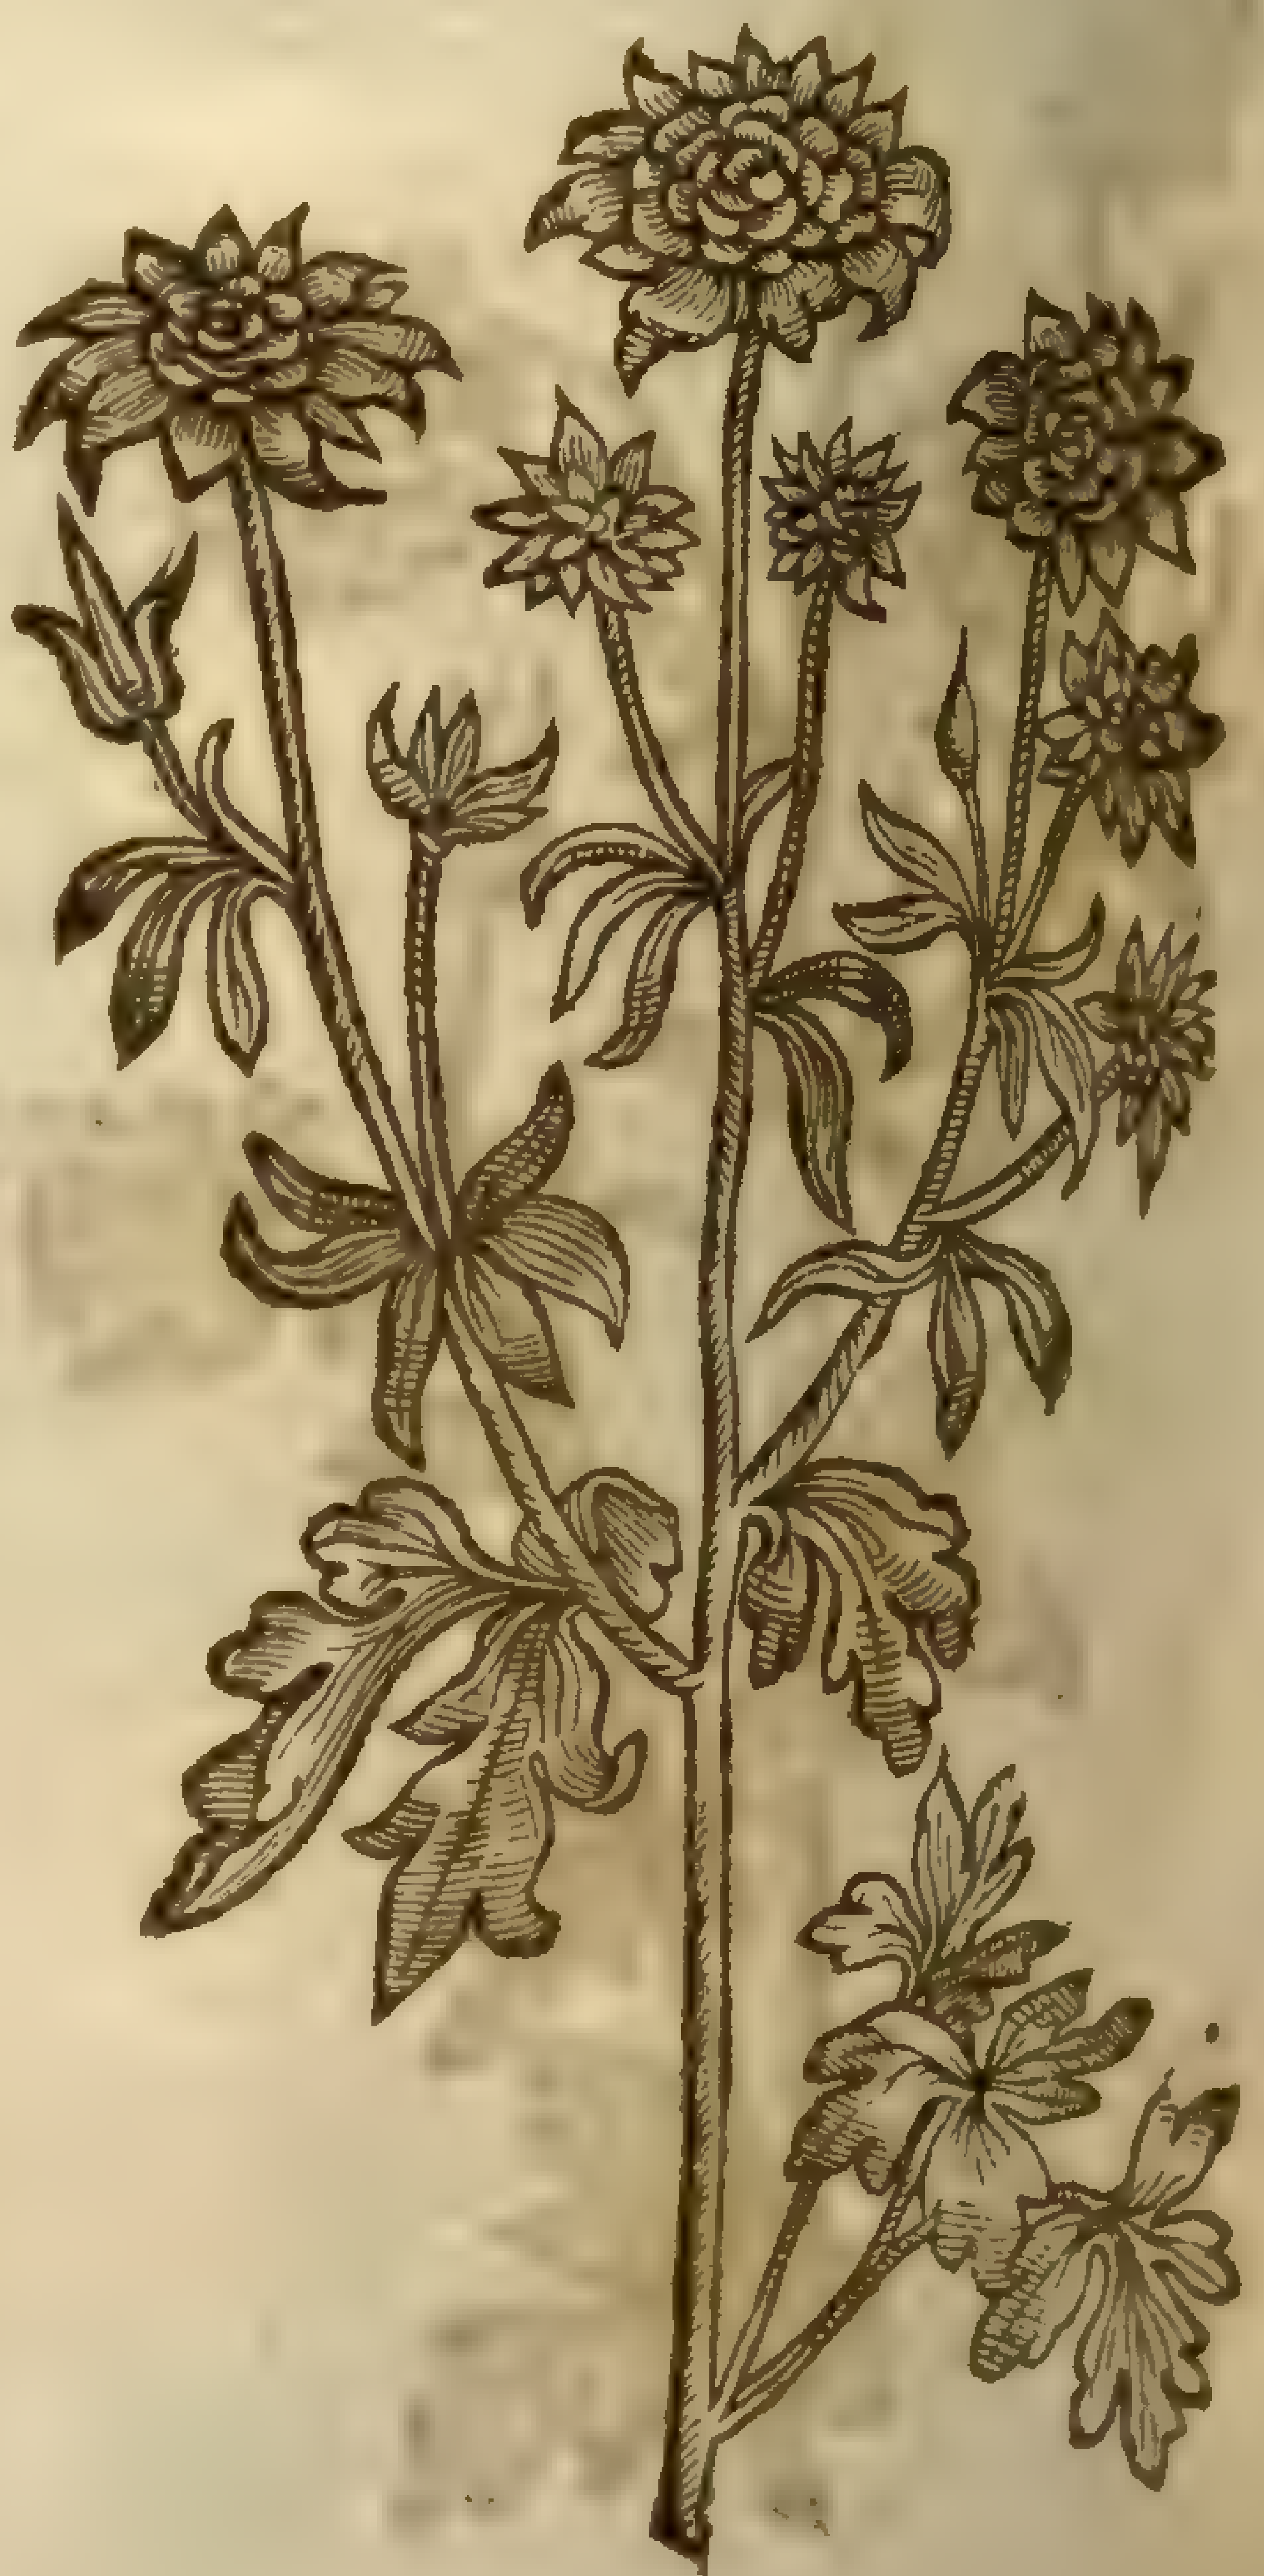
‡ 6 *Aquilegia flo. inverſo albo.*
Inverted Columbine with the white floure.



‡ 7 *Aquilegia flore roſeo.*
Roſe Columbine.



‡ 8 *Aquilegia degener.*
Degenerate Columbine.



more time than were requiſite to leeſe: and therefore it ſhall ſuffice what hath beene ſaid for their deſcriptions.

‡ 4 There are alſo other varieties of this double kinde, which haue the floures of diuers or partie colours, as blew and white, and white and red variouſly marked or ſpotted.

5 This kinde hath the floures with their heeles or ſpurres turned outward or in the middle of the floure, whence it is called *Aquilina inverſa*: the floures of this are commonly reddiſh, or of a light or darke purple colour, and double.

6 This differs from the laſt in the colour of the floures which are white, yet double, and inverted as the former.

The roots, leaues, and ſtalks of this are not vnlike that of the precedent, but the floure is much different in ſhape; for it hath no heels or ſpurs, but it is made of ſundry long leaues lying flat open, being ſometimes more ſingle, and otherwhiles more double. The colour of the floure is either red, white, blew, or variouſly mixt of theſe as the former.

8 This though it be termed degenerate, is a kinde of it ſelfe, and it differs from the laſt deſcribed in that the vtmoſt leaues are the largeſt, and the colour thereof is commonly greene, or greene ſomewhat inclining to purple. ‡

¶ *The Place.*

They are ſet and ſowne in gardens for the beautie and variable colour of the floures.

¶ *The Time.*

They floure in May, Iune, and Iuly.

¶ *The Names.*

Columbine is called of the later Herbariſts, *Aquileia*, *Aquilina*, and *Aquilegia*: of *Coſteus*, *Pothos*: of *Geſner*, *Leontoſtomum*: of *Daleſchampius*, *Iovis flos*: of ſome, *Herba Leonis*, or the herbe wherein the Lion doth delight: in high Dutch, **Agley**: in low Dutch, **Akelepen**: in French, *Ancoiles*: in Engliſh, Columbine. ‡ *Fabius Columna* iudges it to be the *Iſopyrum* deſcribed by *Dioſcorides*. ‡

¶ *The Temperature.*

Columbines are thought to be temperate betweene heate and moiſture.

¶ *The Vertues.*

A Notwithſtanding what temperature or vertues Columbines haue is not yet ſufficiently known; for they are vſed eſpecially to decke the gardens of the curious, garlands and houſes: neuertheleſſe *Tragus* writeth, that a dram weight of the ſeed, with halfe a ſcruple or ten graines of Saffron giuen in wine, is a good and effectuall medicine for the ſtopping of the liuer, and the yellow jaundiſe; but he ſaith, that whoſo hath taken it muſt be well couered with cloathes, and then ſweat.

B Moſt in theſe daies following others by tradition, do vſe to boyle the leaues in milke againſt the ſoreneſſe of the throat, falling and excoriation of the uvula: but the antient writers haue ſaid nothing hereof: *Ruellius* reporteth, that the floures of Columbines are not vſed in medicine: yet ſome there be that do affirme they are good againſt the ſtopping of the liuer, which effect the leaues doe alſo performe.

C ‡ *Cluſius* ſaith, that Dr. *Francis Rapard* a Phyſition of Bruges in Flanders, told him that the ſeed of this common Columbine very finely beaten to pouder, and giuen in wine, was a ſingular medicine to be giuen to women to haſten and facilitate their labour, and if the firſt taking it were not ſufficiently effectuall, that then they ſhould repeate it againe. ‡

CHAP. 448. *Of Wormewood.*

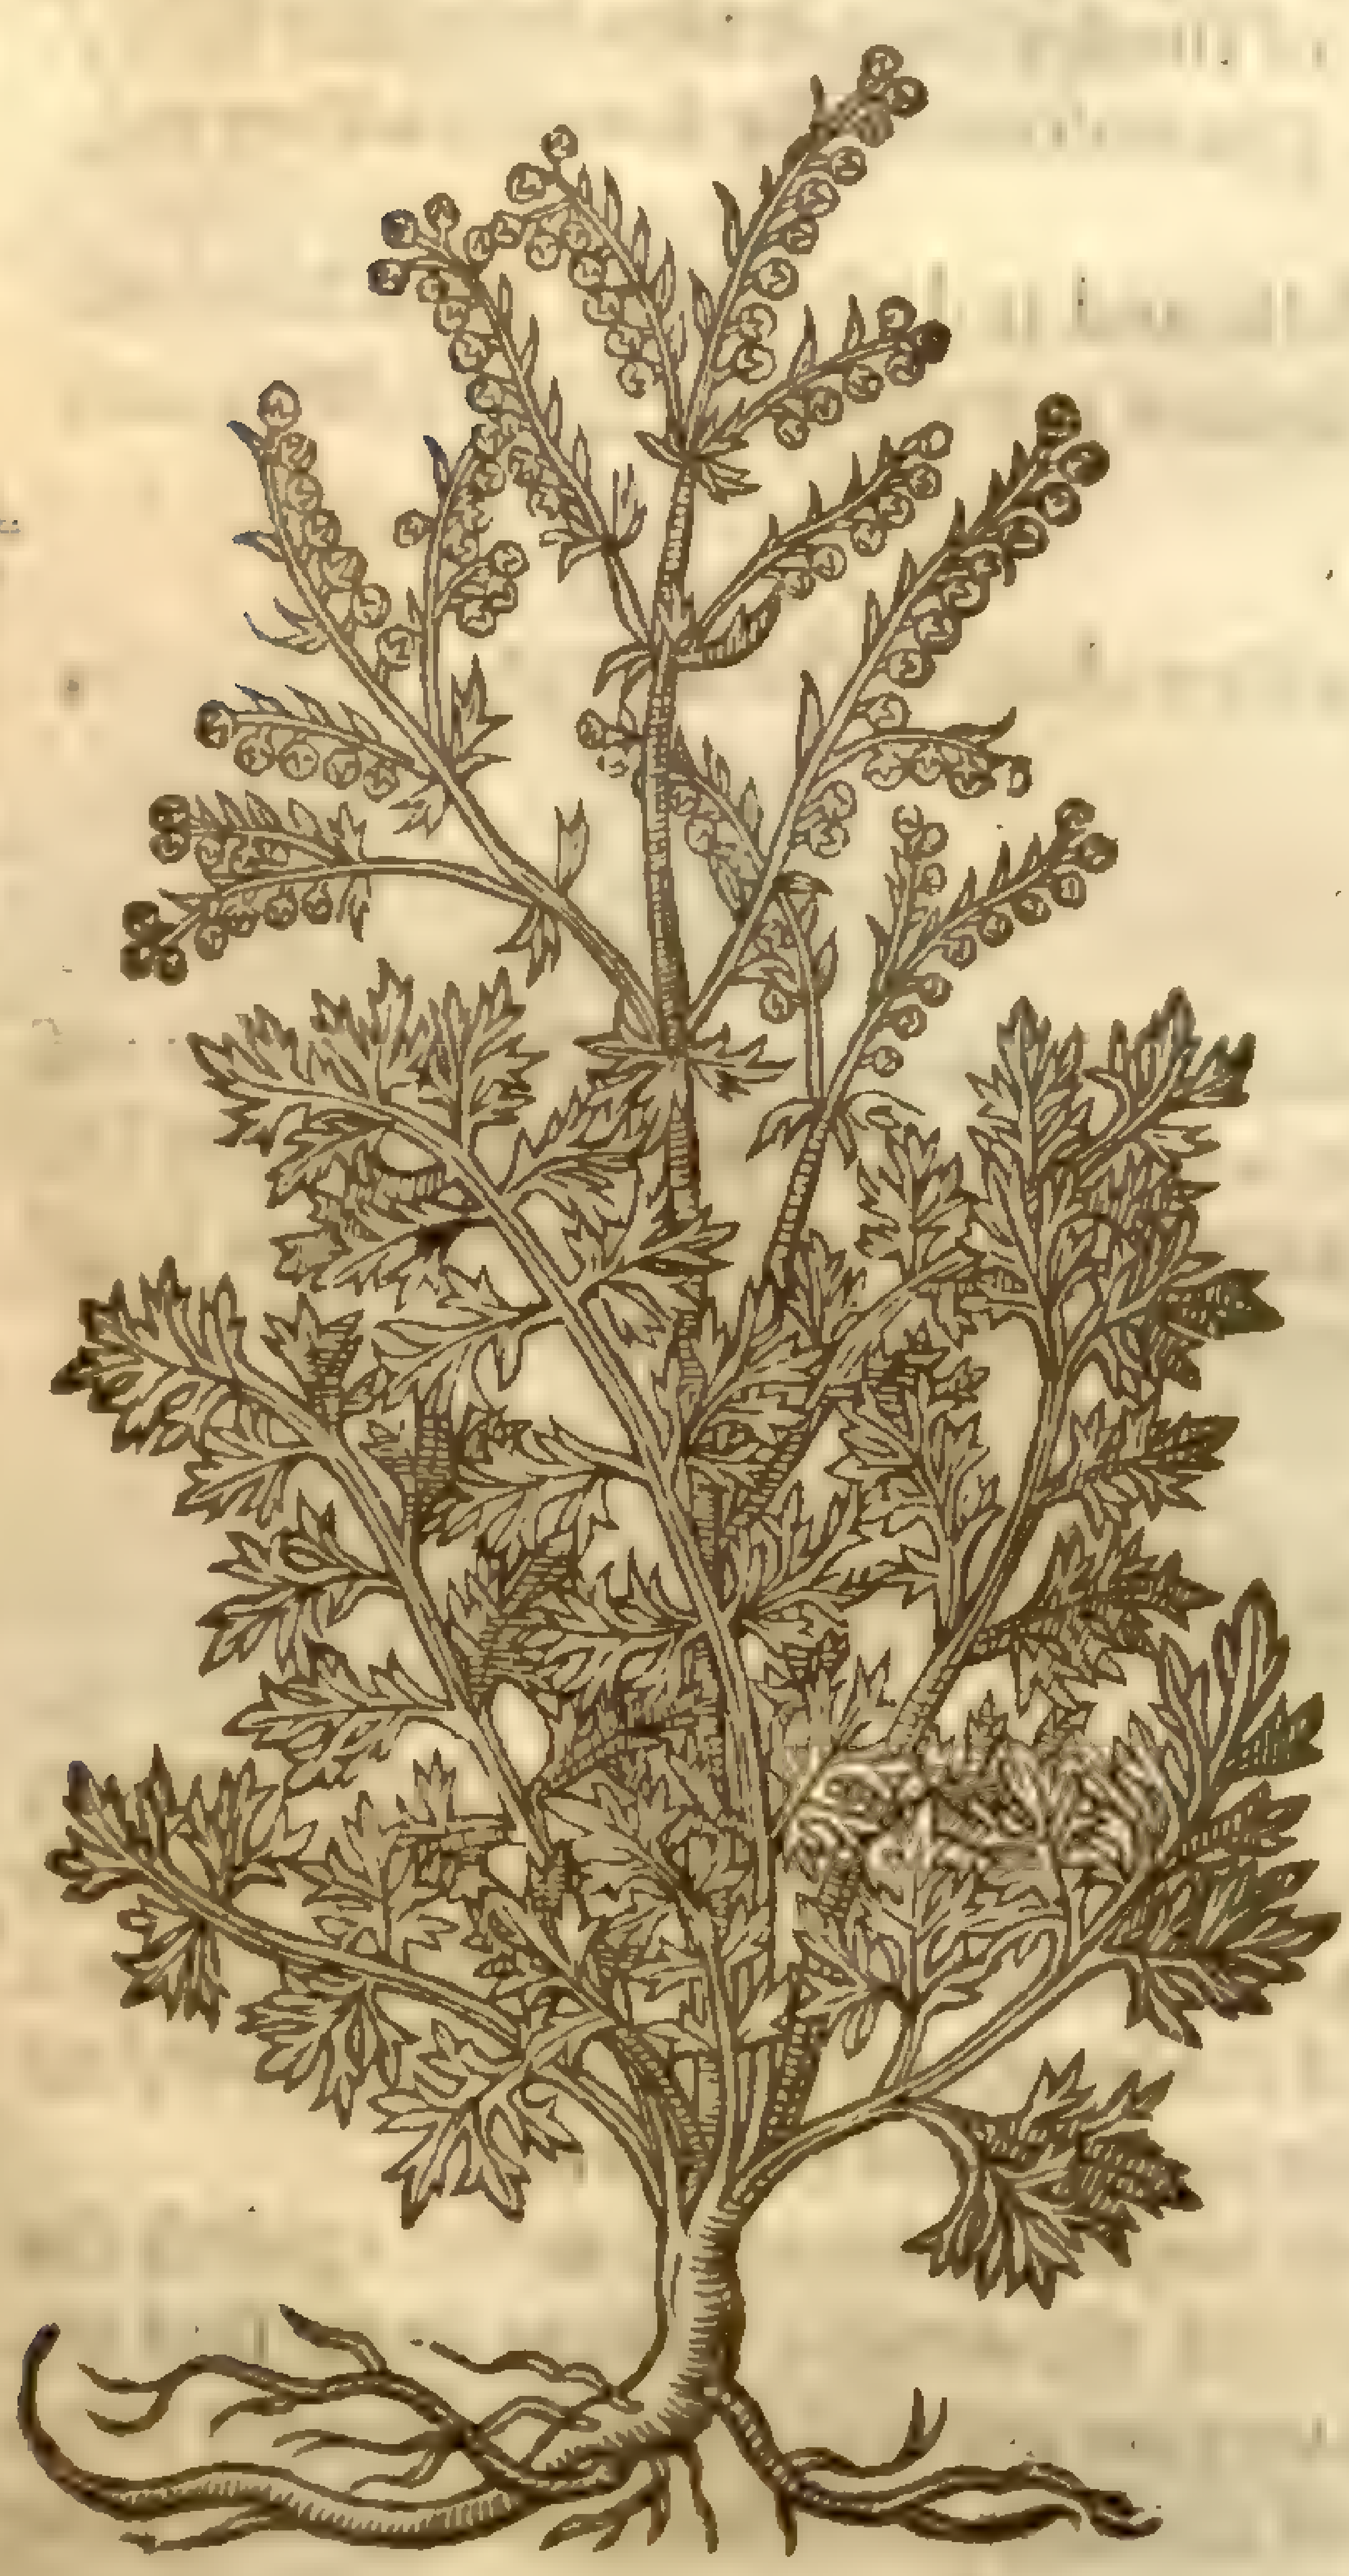
¶ *The Deſcription.*

1 THe firſt kind being our common and beſt knowne Wormwood, hath leaues of a grayiſh colour, very much cut or jagged, and very bitter: the ſtalks are of a wooddy ſubſtance, two cubits high, and full of branches, alongſt which doe grow little yellowiſh buttons, wherein is found ſmall ſeed like the ſeed of Tanſey, but ſmaller: the root is likewiſe of a wooddy ſubſtance, and full of fibres.

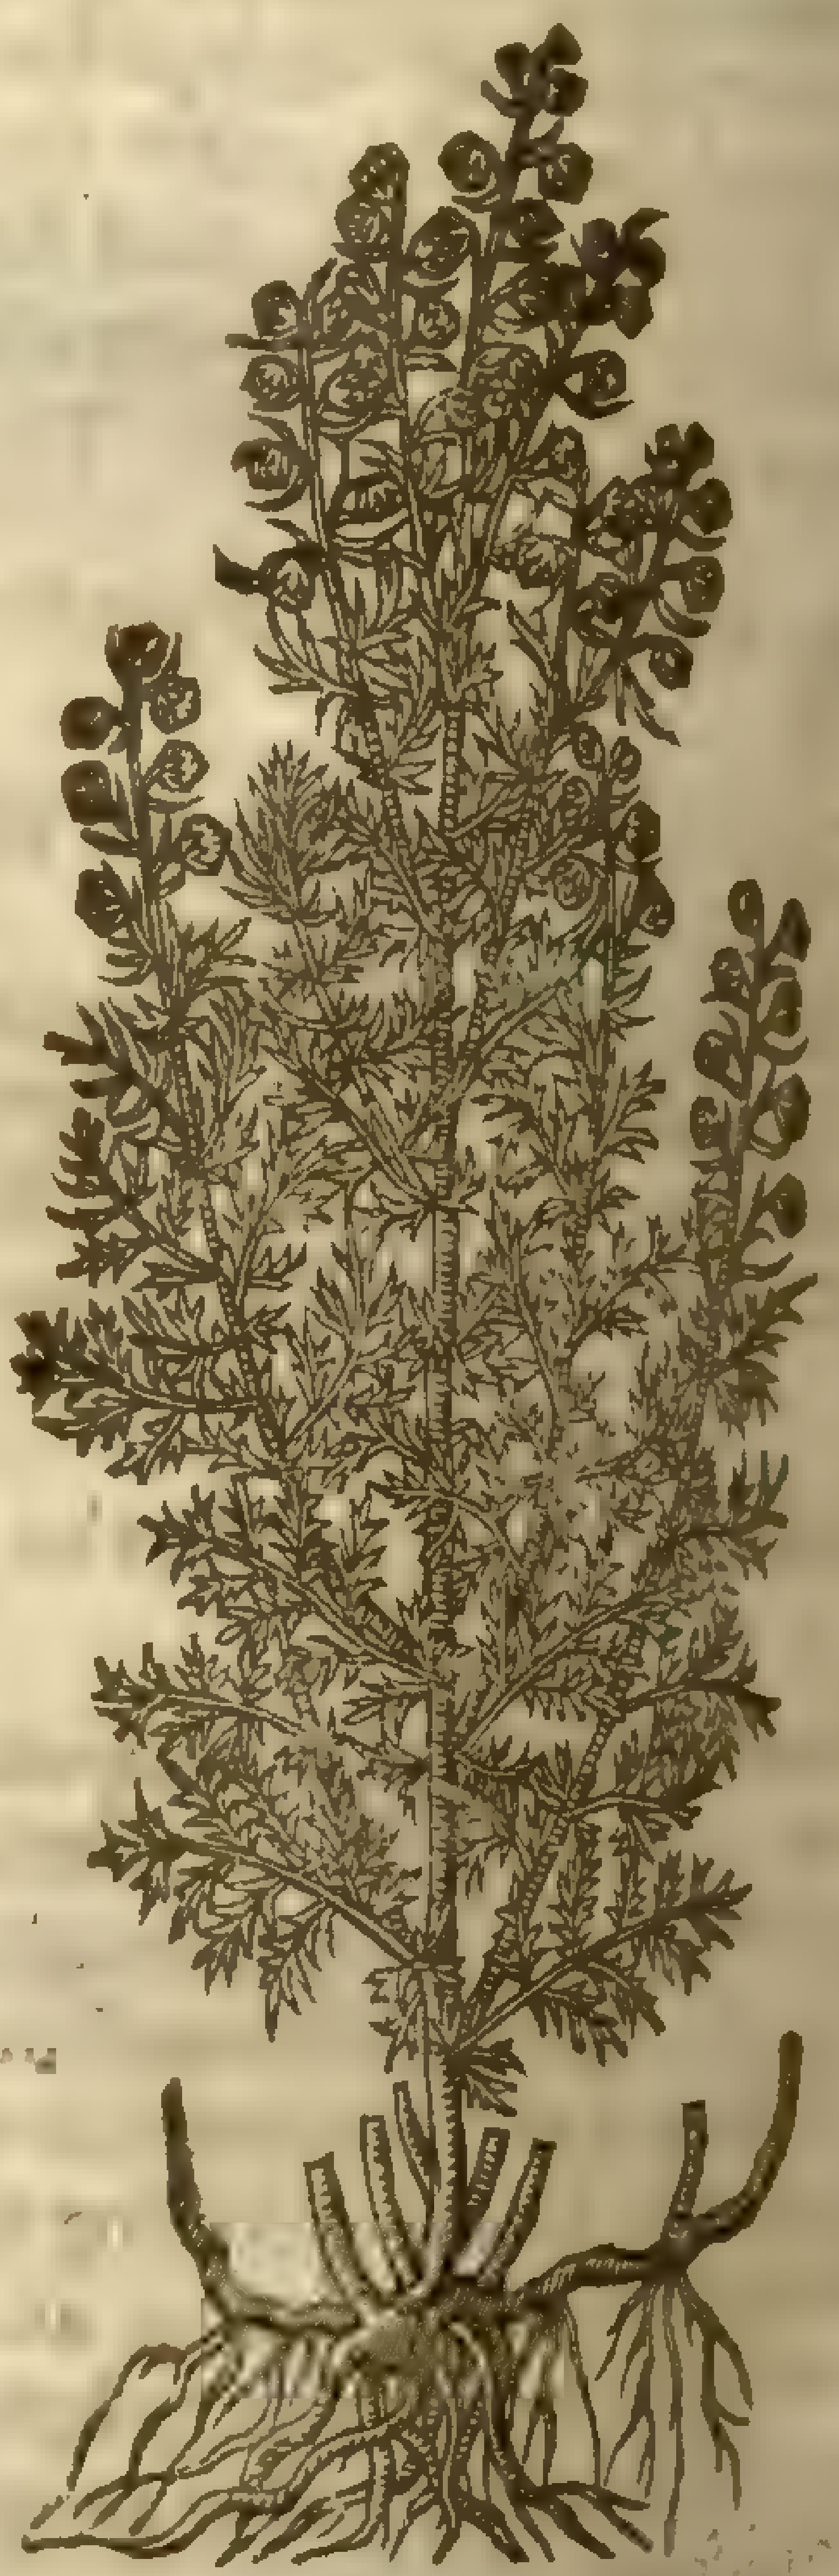
2 The ſecond kind of Wormewood bringeth forth ſlender ſtalkes about a foot high or ſomewhat more, garniſhed with leaues like the former, but whiter, much leſſer, and cut or jagged into moſt fine and ſmall cuts or diuiſions: the floures are like the former, hanging vpon ſmall ſtemmes with their heads downeward: the roots are whitiſh, ſmall and many, crawling and crambling one ouer another, and thereby infinitely do increaſe, of ſauour leſſe pleaſant than the common Wormwood.

wood. Some haue termed this plant *Abſinthium ſantonicum*, but they had ſlender reaſon ſo to do: for if it was ſo called becauſe it was imagined to grow in the Prouince of Saintoinge, it may very we appeare to the contrary; for in the Alpes of Galatia, a countrey in Aſia *minor*, it groweth in grea plenty, and therefore may rather be called *Galatium Sardonicum*, and not *Santonicum*: but leauin controuerſies impertinent to the Hiſtory, it is the Ponticke Wormwood of *Galens* deſcription, an ſo holden of the learned *Paludane* (who for his ſingular knowledge in plants is worthy triple honor) and likewiſe many others.

1 *Abſinthium latifolium ſive Ponticum.*
Broad leafed Wormwood.



† 2 *Abſinthium tenuifolium Ponticum Galen.*
Small Ponticke Wormwood.



¶ *The Place.*

This broad leafed Wormewood delighteth to grow on rockes and mountaines, and in vntilled places; it groweth moſt vpon dry bankes, it is common euery where in all countries: the beſt, ſaith *Dioſcorides*, is found in Pontus, Cappadocia, and on mount Taurus: *Pliny* writeth, that Ponticke Wormwood is better than that of Italy: *Ovid* in theſe words doth declare the Ponticke Wormewood to be extreme bitter.

Turpia deformes gignunt Abſinthia campi,
Terraque de fructu, quam ſit amara docet.

Vntilled barren ground the lothſome Wormwood yeelds,
And knowne it's by the fruit how bitter are the fields.

And *Bellonius* in his firſt booke of Singularities, chap. 76. doth ſhew, that there is alſo a broad leafed Wormwood like vnto ours, growing in the Prouinces of Pontus, and is vſed in Conſtantinople by the Phyſitions there, it is likewiſe found in certaine cold places of Switzerland, which by reaſon of the chilneſſe of the aire riſeth not vp, but creepeth vpon the ground, whereupon diuers call it creeping Wormewood.

¶ *The Time.*

The little floures and ſeeds are perfected in Iuly and Auguſt, then may Wormewood be gathered and laied vp for profitable vſes.

¶ *The Names.*

It is called in Greeke, ἀψίνθιον: it is named of *Apuleius*, *Abſinthium ruſticum*, country Wormwood, or peſants Wormewood: we haue named it *Abſinthium latifolium*, broad leafed Wormewood, that it may differ from the reſt: the interpreters of the Arabians call the better ſort, which *Dioſcorides* nameth Ponticke Wormewood, *Romanum Abſinthium*, Roman Wormwood: and after theſe, the barbarous Phyſitions of the later age: the Italians name Wormewood, *Aſſenſo*: the Spaniards, *Axenxios*, *Aſſenſios*, moſt of them *Donzell*: the Portingales, *Aloſna*: in high Dutch, **Weronmut**, **Wermut**: in French, *Aluyne*: in Engliſh, common Wormewood.

Victor Trincauilla, a ſingular Phyſition, in his practiſe tooke it for *Abſinthium Ponticum*.

2 This is commonly called *Abſinthium Romanum*: and in low Dutch, **Roomſche Alſene**: by which name it is knowne to very many Phyſitons and Apothecaries, who vſe this in ſtead of Ponticke wormwood: furthermore, it hath a leafe and floure far leſſe that the other wormwoods: likewiſe the ſmell of this is not onely pleſant, but it yeeldeth alſo a ſpicie ſent, whereas all the reſt haue a ſtrong and lothſome ſmell: and this Ponticke Wormewood doth differ from that which *Dioſcorides* commendeth: for *Dioſcorides* his Pontick Wormwood is accounted among them of the firſt kind, or of broad leafed wormwood; which thing alſo *Galen* affirmeth in his ſixt booke of the Faculties of medicines in the chapter of Sothernwood. There be three kinds of Wormwood (ſaith he) whereof they vſe to call one by the generall name, and that is eſpecially Pontick: whereby it is manifeſt that *Galen* in this place hath referred Ponticke to no other than to the firſt Wormwood; and therefore many not without cauſe maruell, that *Galen* hath written in his booke of the Method of curing, how Ponticke Wormwood is leſſe in floure and leafe: many excuſe him, and lay the fault vpon the corruption of the booke, and in his 9. booke of Method, the leſſer they would haue the longer: therefore this wormwood with the leſſer leafe is not the right Ponticke Wormwood, neither againe the Arabians Romane wormewood, who haue no other Romane than Ponticke of the Græcians. Alſo many beleeue that this is called *Santonicum*, but this is not to be ſought for in Myſia, Thracia, or other countries Eaſtward, but in France beyond the Alps, if we may beleeue *Dioſcorides* his copies, there be that would haue it grow not beyond the Alps of Italy, but in Galatia a country in Aſia, & in the region of the Sardines, which is in the leſſer Aſia; whereupon it was called in Greeke Σαρδόνιον, which was changed into the name *Santonicum* through the errour of the tranſlators: *Dioſcorides* his copies keep the word *Sardonium*, & *Galens* copies *Santonicum*, which came to poſterity as it ſeemeth, is called in Engliſh, Romane Wormewood, garden or Cypres Wormewood, and French Wormewood.

¶ *The Temperature.*

Wormewood is of temperature hot and dry, hot in the ſecond degree and dry in the third: it is bitter and clenſing, and likewiſe hath power to binde or ſtrengthen.

¶ *The Vertues.*

A It is very profitable to a weake ſtomacke that is troubled with choler, for it clenſeth it through his bitterneſſe, purgeth by ſiege and vrine: by reaſon of the binding quality, it ſtrengthneth and comforteth the ſtomacke, but helpeth nothing at all to remoue flegme contained in the ſtomacke, as *Galen* addeth.

B If it be taken before a ſurfeit it keepeth it off, and remoueth lothſomneſſe, ſaith *Dioſcorides*, and it helpeth not only before a ſurfeit, but alſo it quickly refreſheth the ſtomack and belly after large eating and drinking.

C It is oftentimes a good remedy againſt long and lingring agues, eſpecially tertians: for it doth not onely ſtrengthen the ſtomacke and make an appetite to meat, but it yeeldeth ſtrength to the liuer alſo, and riddeth it of obſtructions or ſtoppings, clenſing by vrine naughty humours.

D Furthermore, Wormewood is excellent good for them that vomit bloud from the ſpleene, the which hapneth when the ſpleene being ouercharged and filled vp with groſſe bloud doth vnburden it ſelfe and then great plenty of bloud is oftentimes caſt vp by vomite. It happeneth likewiſe that ſtore of blacke and corrupt bloud mixed with excrements paſſeth downewards by the ſtoole, and it oftentimes hapneth that with violent and large vomiting the ſicke man fainteth or ſwouneth, or when he is reuiued doth fall into a difficult and almoſt incurable tympanie, eſpecially when the diſeaſe doth often happen; but from theſe dangers Wormewood can deliuer him, if when he is refreſhed after vomite, and his ſtrength any way recouered, he ſhall a good while vſe it, in what manner ſoeuer he himſelfe ſhall thinke good.

E Againe, Wormewood voideth away the wormes of the guts, not onely taken inwardly, but applied outwardly: it withſtandeth all putrifactions; it is good againſt a ſtinking breath; it keepeth garments alſo from the mothes; it driueth away gnats, the body being annointed with the oyle thereof.

F Likewiſe it is ſingular good in pulteſſes and fomentations to binde and to dry.

G Beſides all this, *Dioſcorides* declareth, that it is good alſo againſt windineſſe and griping pains of the ſtomacke and belly, with Seſeli and French Spikenard: the decoction cureth the *yellow jaundies* or the infuſion, if it be drunke thriſe a day ſome ten or twelue ſpoonfuls at a time.

H It helpeth them that are ſtrangled with eating of Muſhromes, or toad ſtools, if it be drunke wi vinegre.

I And being taken in wine, it is good againſt the poyſon of *Ixia* (being a viſcous matter proce ding from the thiſtle *Chamælion*) and of Hemlocke, and againſt the biting of the ſhrew mouſe and of the Sea Dragon: it is applied to the ſquincie or inflammations of the throat with hony and ter; and with water to night wheales, and with hony to ſwartiſh markes that come vpon bruſes.

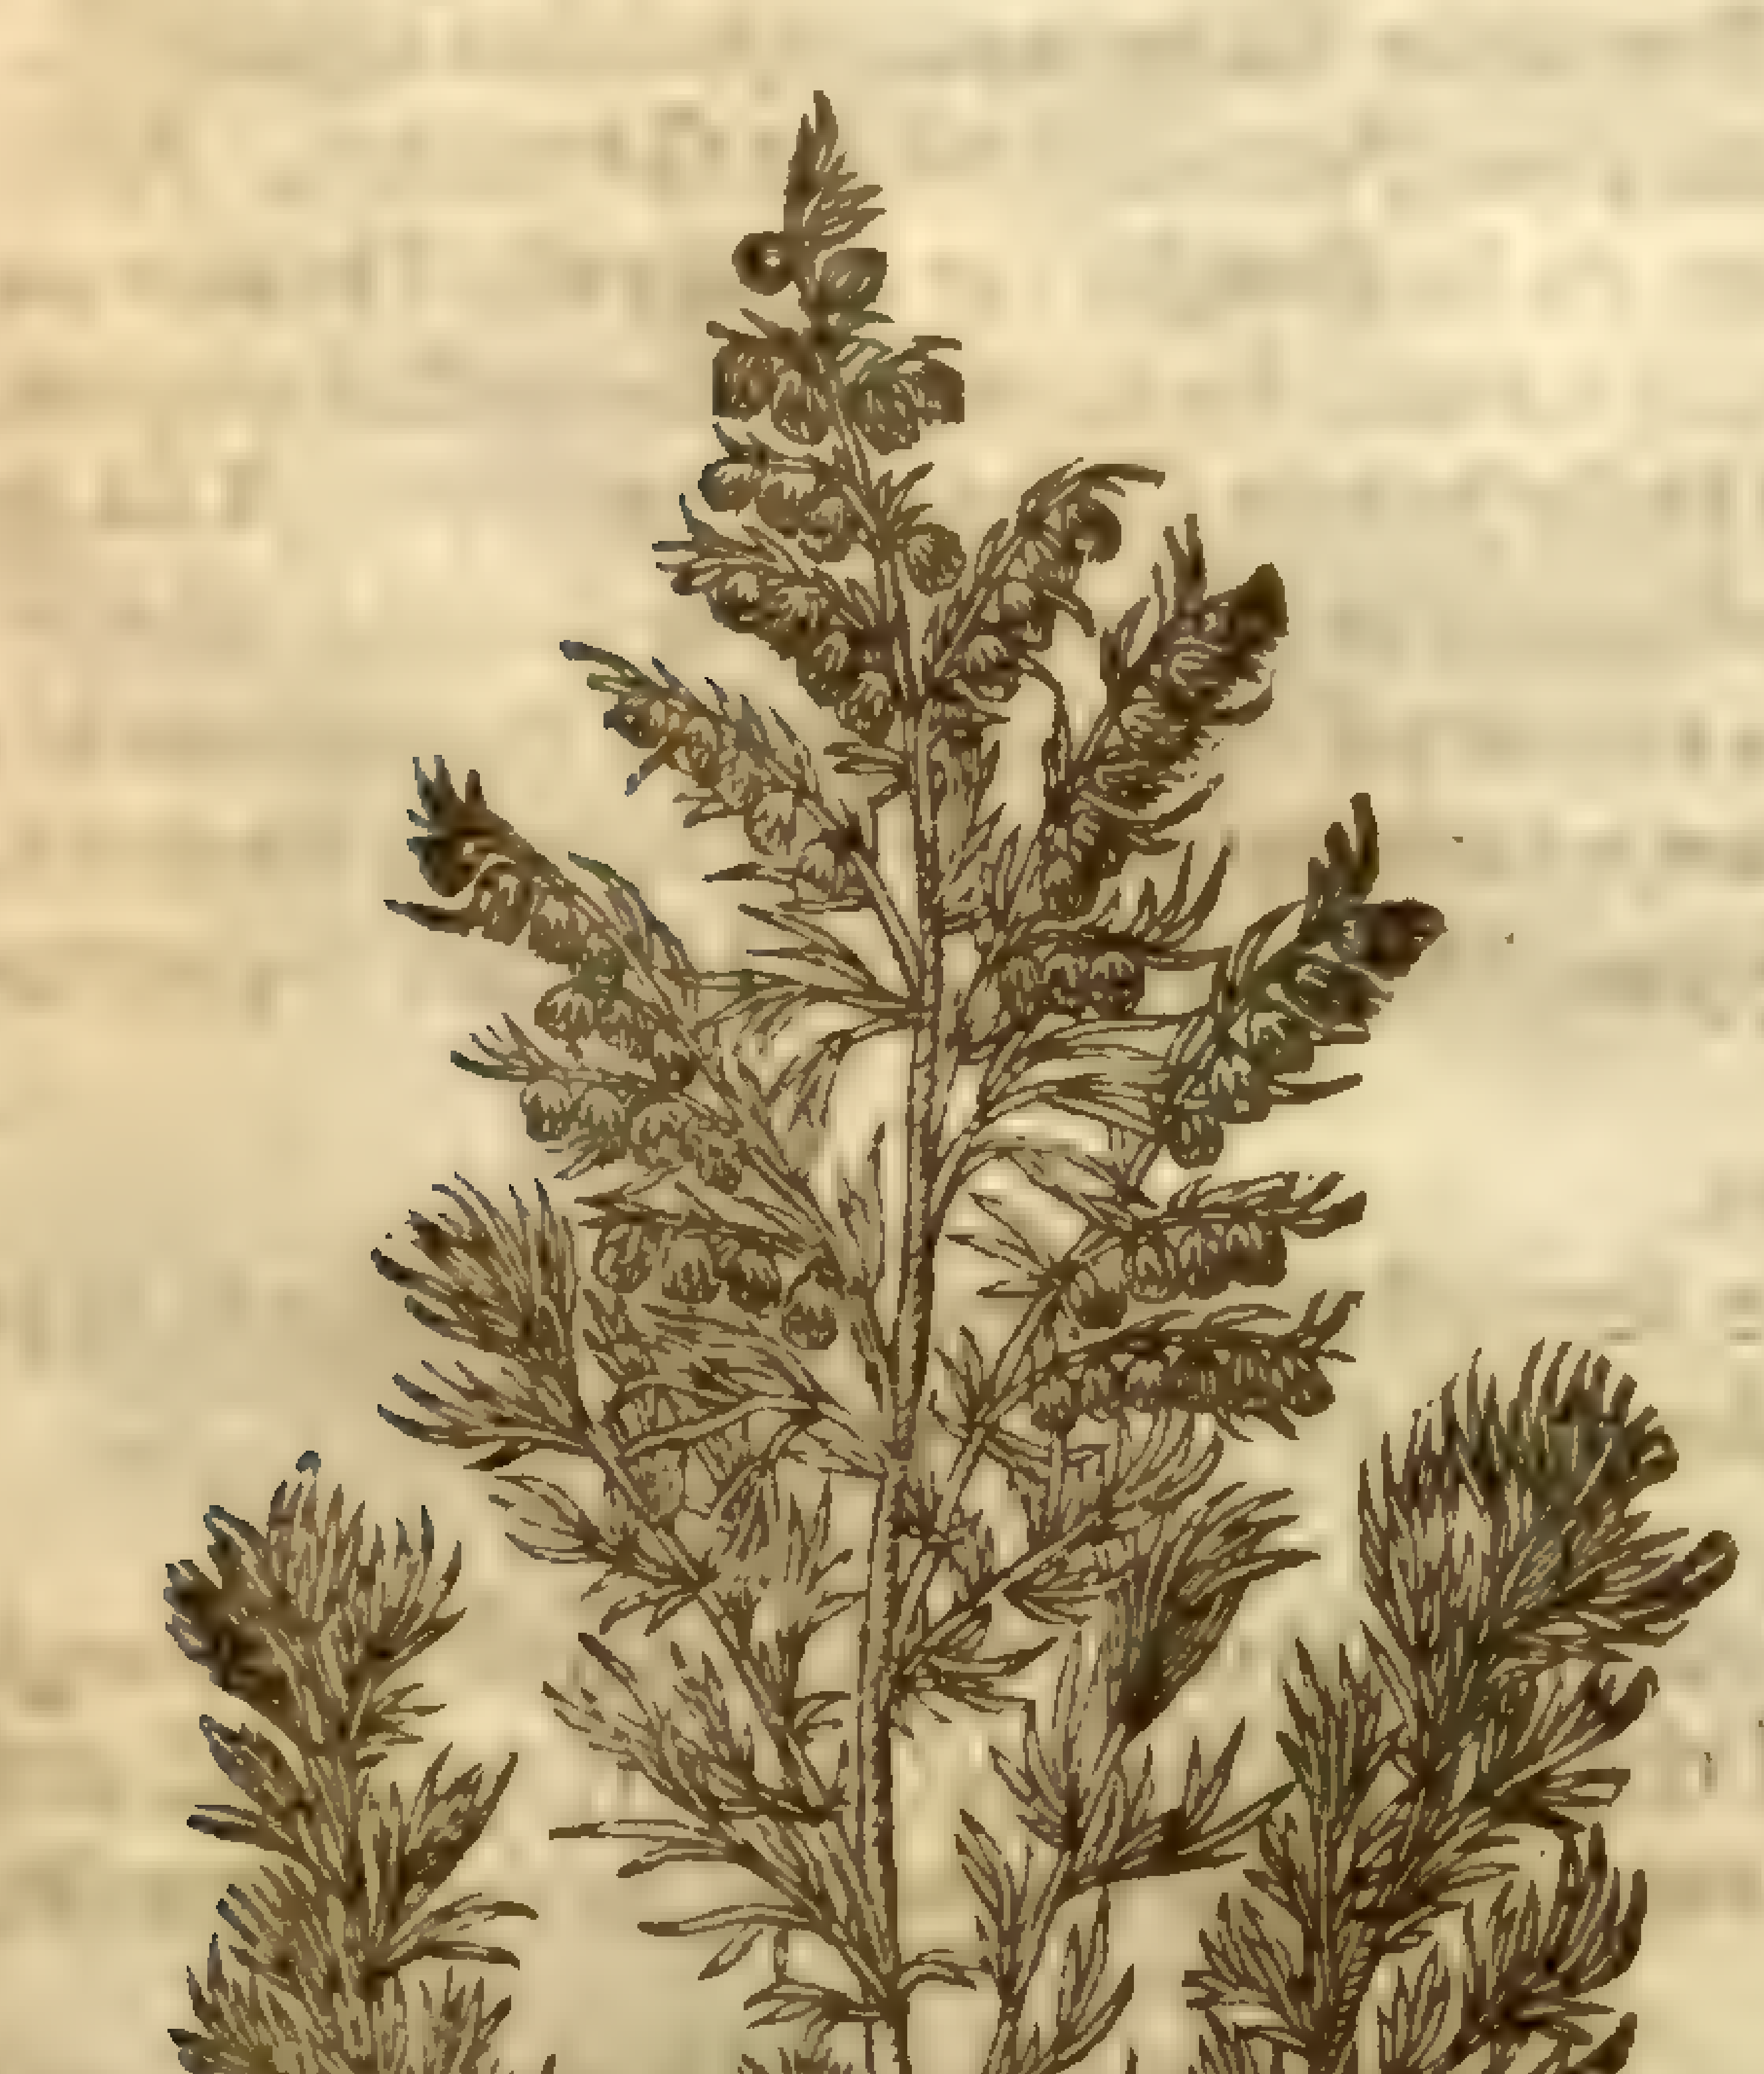
K It is applied after the ſame manner to dim eies, and to mattering eares.

L *Ioachimus Camerarius* of Noremberg commendeth it greatly againſt the jaundiſe, giuing of the floures of Wormewood, Roſemarie, Sloes, of each a ſmall quantitie, and a little Saffron, boiled in wine, the body firſt being purged and prepared by the learned Phyſition.

† The figure which formerly was in the ſecond place, was of a ſmall Wormewood not different from the common kinde, but onely in the ſmalneſſe, and maticke taſte; it growes on mountainous places, and *Geſner* calls it *Abſinthium commune minus, vel Alpinum*: now our Authors deſcription was intended for figure we haue giuen you, for it is the *Abſinthium ſantonicum*, of ſome, as *Ruellius* and *Ceſalpinus*; and the *Galatium Sardonium* of *Pena* and *Lobel*.

Chap. 449. *Of Small leafed Worme-wood.*

Abſinthium tenuifolium Auſtriacum.
Auſtrian Wormewood.



¶ *The Deſcription.*

Small leafed Wormwood bringeth forth very many little branches, ſlender, a ſpan or a foot high, full of leaues, leſſe by a great deale, and tenderer than the former, moſt finely and nicely minced: the floures like thoſe of the former, hang vpon the little branches & ſprigs: the roots are ſmall, creeping ouerthwart, from whence do riſe a great number of yong ſprouts: this Wormwood alſo is ſomewhat white, and no leſſe bitter than the broad leafed one, and hath not ſo ranke, or ſo vnpleaſant a ſmell, but rather delightfull.

¶ *The Place.*

It grows plentifully in Myſia, Thracia, Hungarie, and Auſtria, and in other regions neere, adjoyning: it is alſo found in Bohemia, and in many vntilled places of Germany; it is a garden plant in the low Countries, and in England.

¶ *The Time.*

It bringeth forth floures and ſeed in Autumne: a little while after when Winter commeth, the herbe withereth away, but the root remaineth aliue, from which leaues and ſtalkes do come againe in the Spring.

¶ *The Names.*

‡ This *Lobel* calls *Abſinthium Ponticum Tridentinum Herbariorum*: *Cluſius*, *Abſinthium tenuifolium Auſtriacum*: *Tabernamontanus*, *Abſinthium Nabathæum Auicennæ*: wee may call it in Engliſh, ſmall leafed Wormewood. ‡

¶ *The Nature.*

Small leafed Wormewood is of facultie hot and dry, it is as bitter alſo as the broad leafed one, and of like facultie.

¶ *The Vertues.*

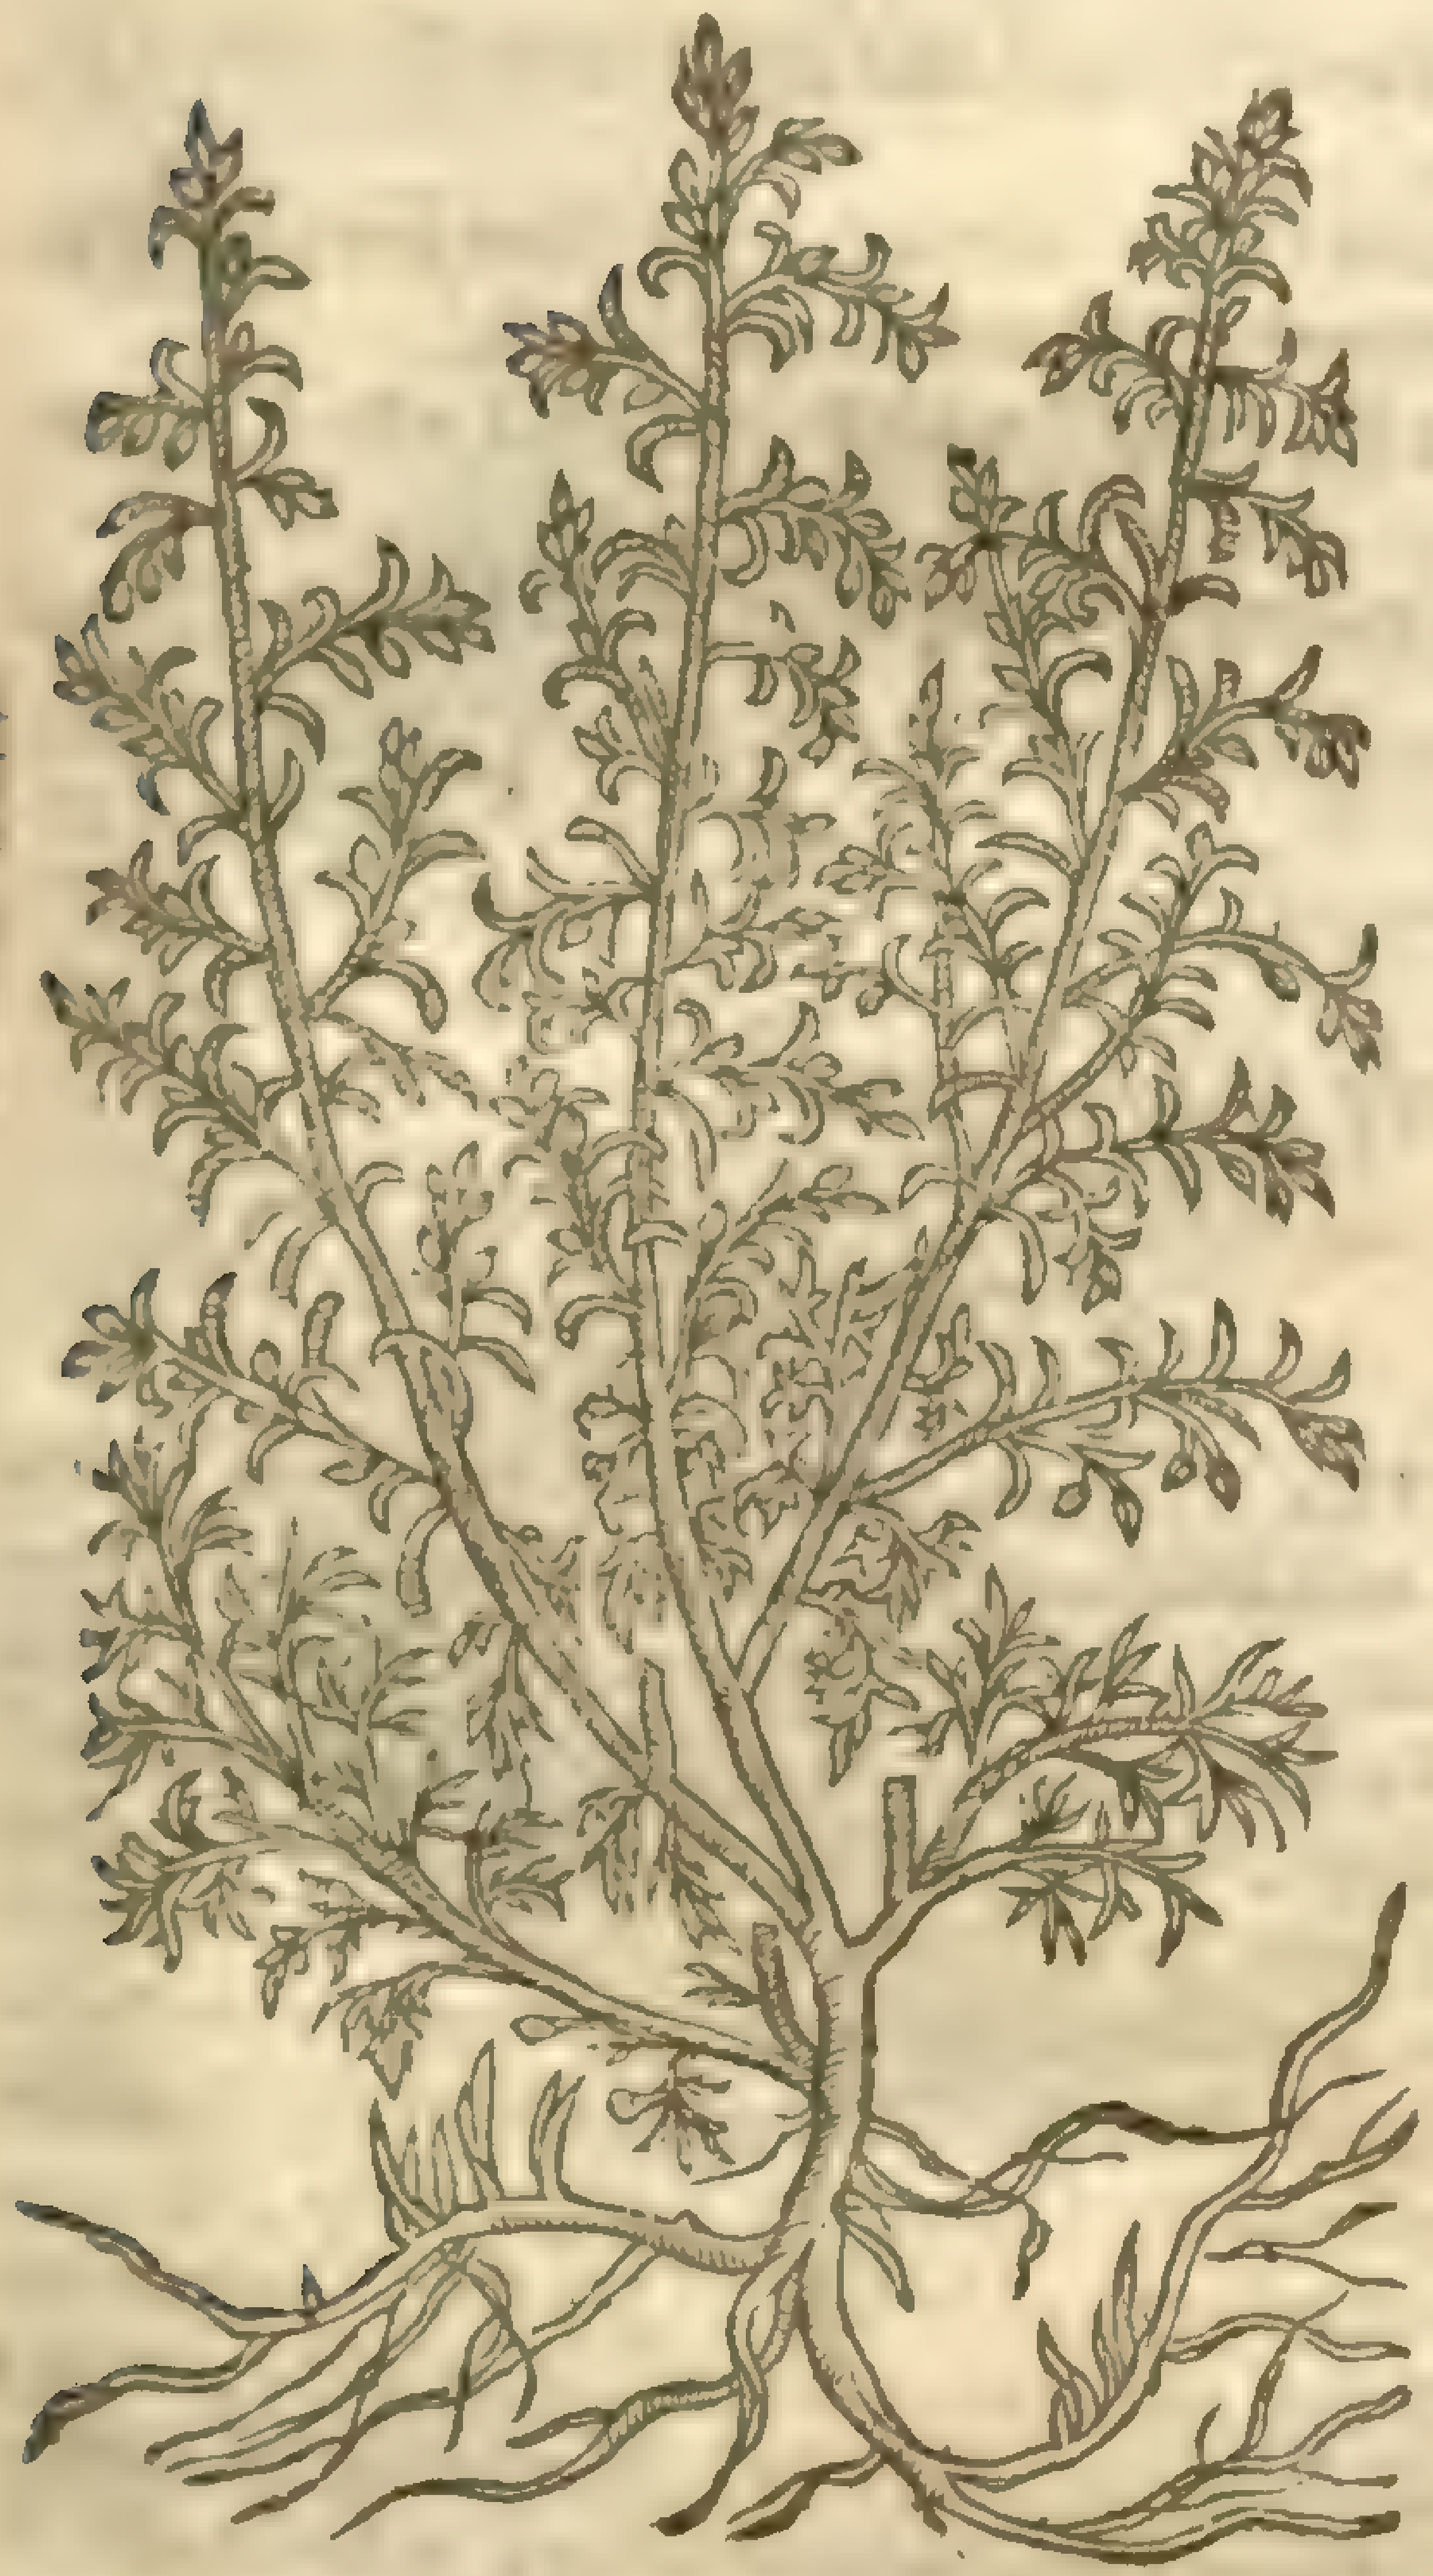
The faculties are referred vnto the common Wormewood.

Chap. 450. *Of Sea Worme-wood.*

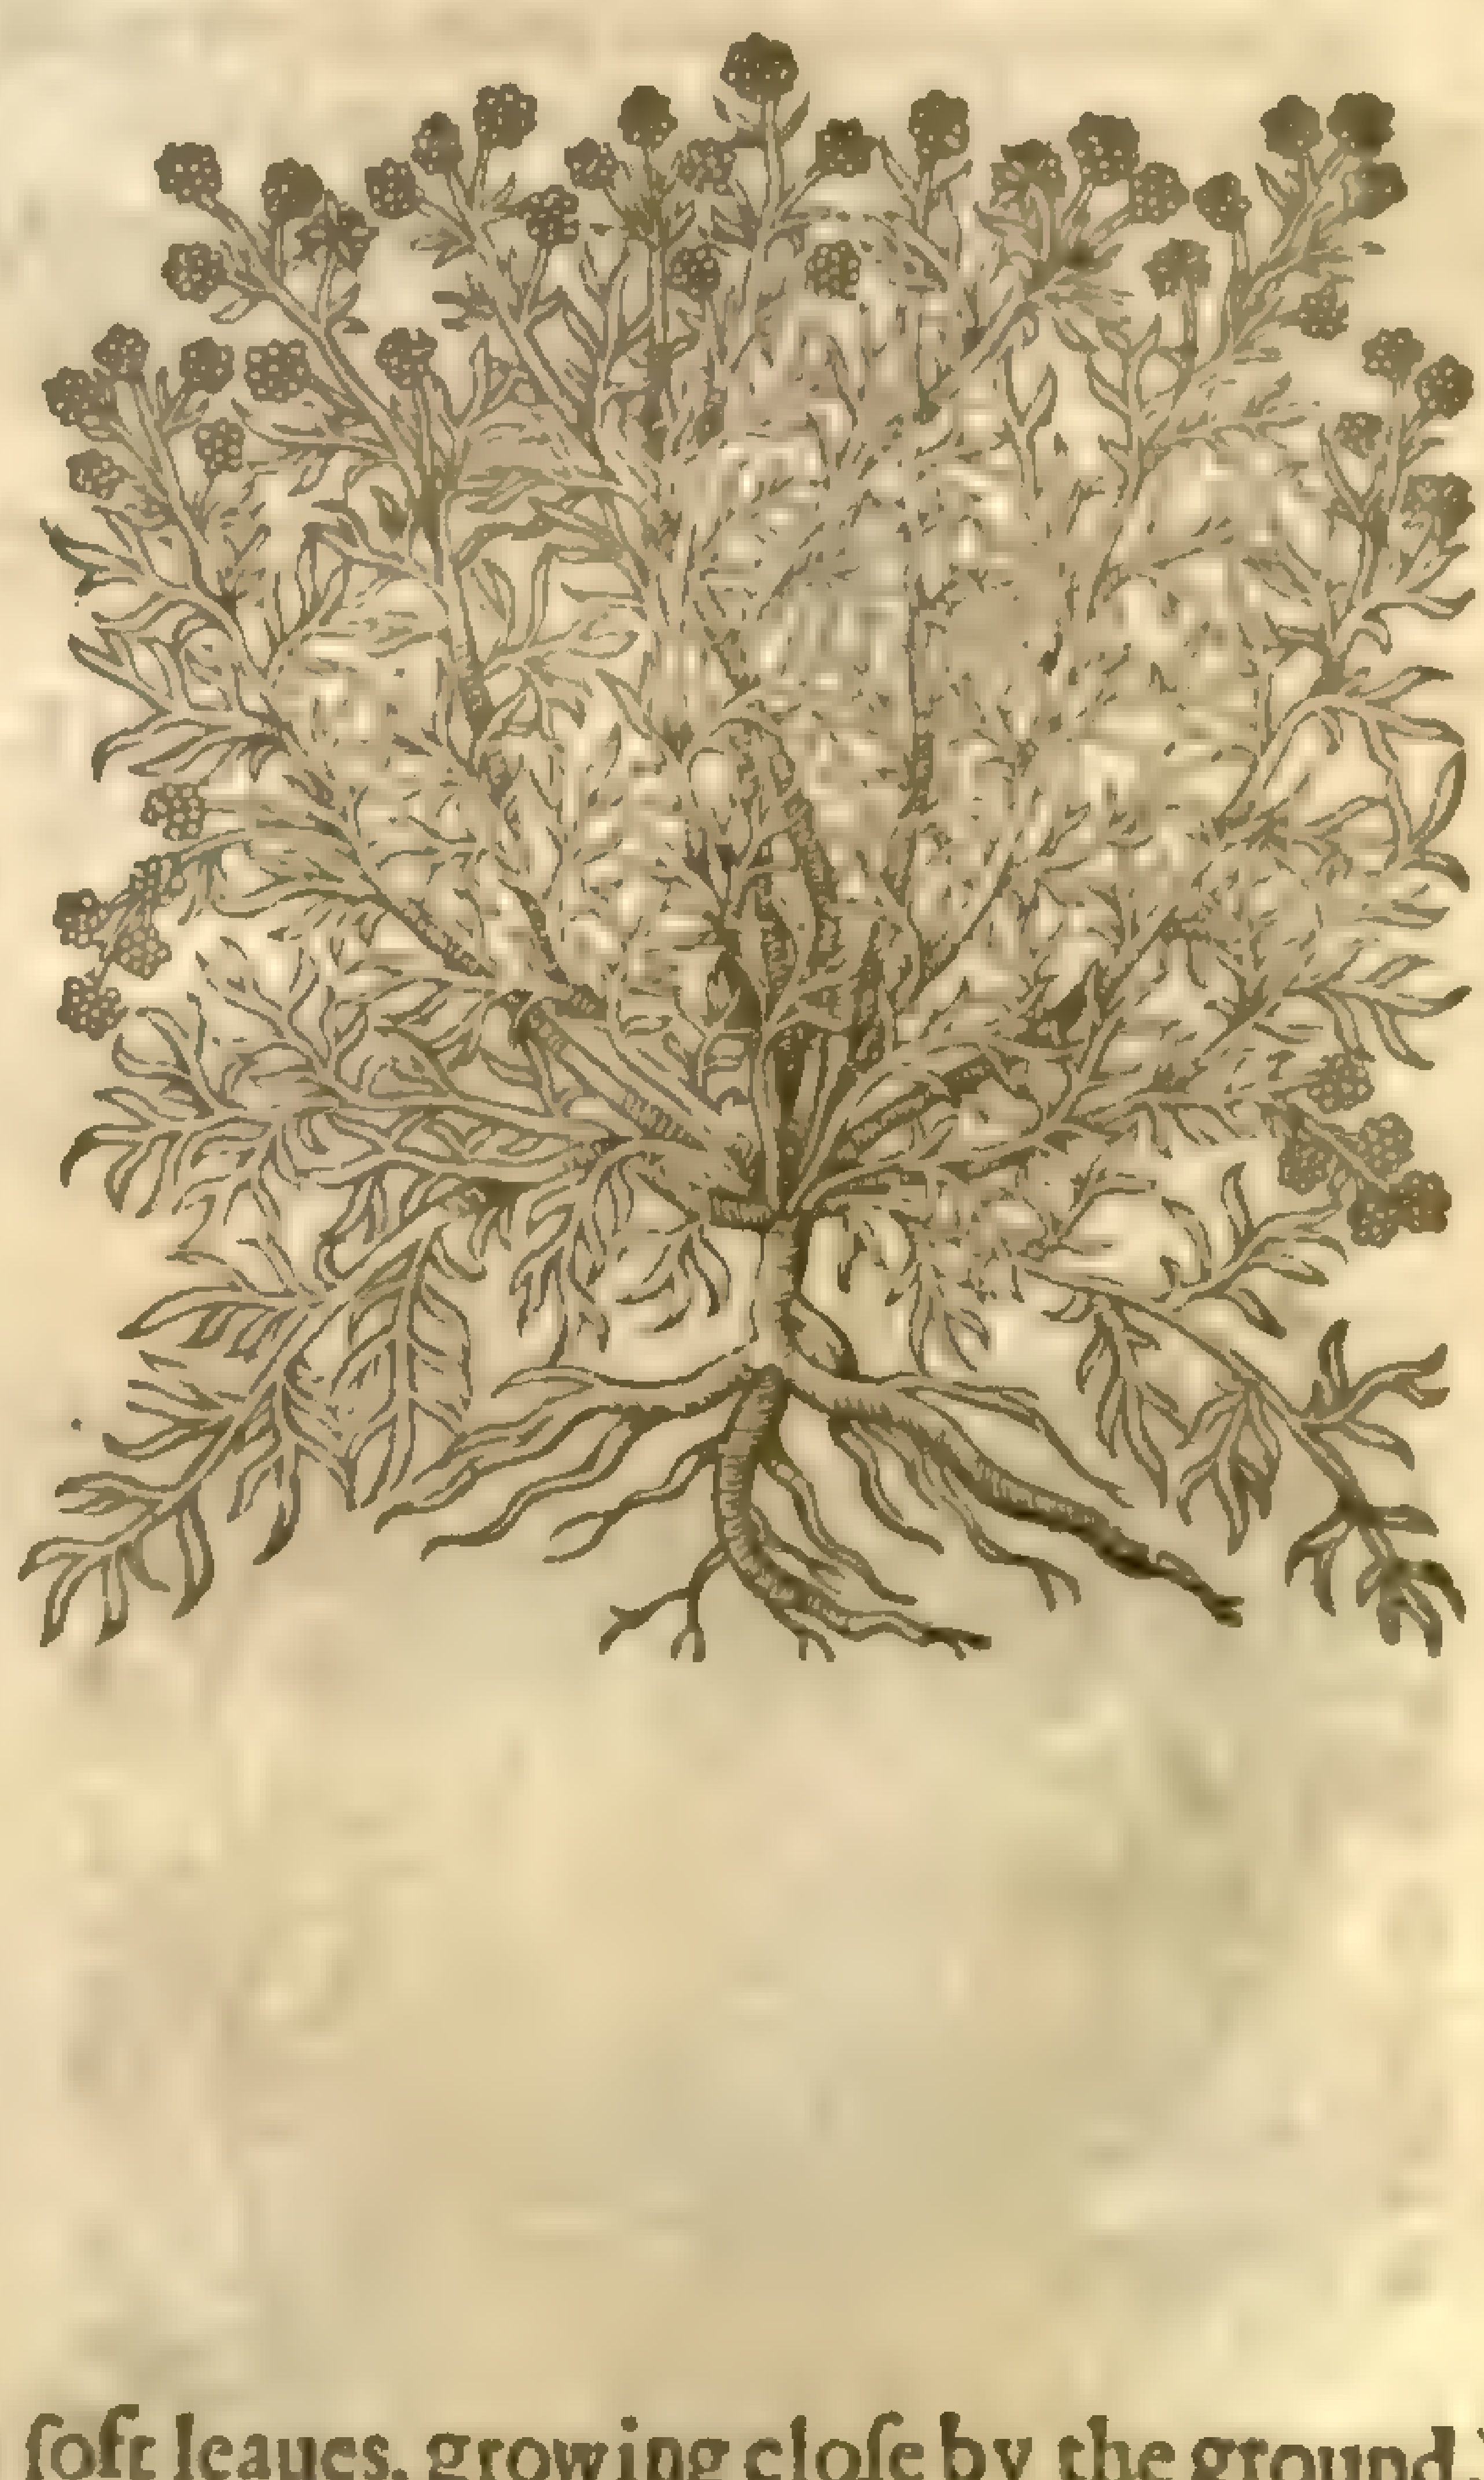
¶ *The Deſcription.*

1 The white or common Sea Wormwood hath many leaues cut and diuided into infinite fine jags, like thoſe of Sothernwood, of a white hoarie colour and ſtrong ſmell, but not vnpleaſant: among which riſe vp tough hoarie ſtalks ſet with the like leaues, on the top whereof do grow ſmall yellowiſh floures: the root is tough, and creepeth far abroad, by means whereof it greatly increaſeth.

1 *Abſinthium marinum album.*
White Sea Wormwood.



2 *Abſinthium marinum repens.*
Creeping Sea Wormwood.



2 The broad leafed Sea Wormwood hath very many ſoft leaues, growing cloſe by the ground, of a darke ſwart colour, nothing ſo finely cut or jagged as the other of his kinds: the floures grow vpon the tops of the ſtalks, of a yellowiſh colour: the root is tough and creeping. ‡ This hath many weake ſlender branches commonly two foot long at their ful growth, red of colour and creeping vpon the ground: the leaues are ſmall, narrow, long and jagged, or parted towards their ends into ſundry parcels: they are greene aboue, and grayiſh vnderneath: the toppes of the branches are ſet with many little ſtalkes, ſome inch long: which vpon ſhort foot-ſtalkes comming out of the boſomes of little longiſh narrow leaues carry ſmall round knops, like as in other plants of this kinde: the taſte is a little bitteriſh, and the ſmell not vnpleaſant: this growes with M^{r}. *Parkinſon* and others, and (as I remember) it was firſt ſent ouer from the Iſle of Rees by M^{r}. *Iohn Tradeſcant*. *Lobel* in his Obſeruations mentions it by the name of *Abſinth. Ponticum ſupinum Herbariorum*; and *Tabern.* ſets it forth by the title of *Abſinthium repens.* ‡

¶ *The Place.*

Theſe Wormwoods doe grow vpon the raiſed grounds in the ſalt marſhes neere vnto the ſea, in moſt places of England; which being brought into gardens doth there flouriſh as in his naturall place, and retaineth his ſmell, taſte and naturall qualitie, as hath beene often proued. ‡ I haue not heard that the later growes wilde with vs in England. ‡

¶ *The Time.*

Theſe bring forth floures and ſeeds when the other Wormwoods do. ‡ The later ſcarce ſeeds with vs, it floures ſo late in the yeare. ‡

¶ *The Names.*

Sea Wormwood is called in Grkke, ἀψίνθιον θαλάσσιον: in Latine, *Abſinthium marinum*, and likewi *Scriphium*: in Dutch, See Alſene: of diuers, *Santonicum*, as witneſſeth *Dioſcorides*: neuertheleſ there is another *Santonicum* differing from Sea Wormewood: in Engliſh of ſome Women in the country, Garden Cypreſſe.

¶ *The Temperature.*

Sea Wormwood is of nature hot and dry, but not ſo much as the common.

¶ *The Vertues.*

A *Dioſcorides* affirmeth, that being taken of it ſelfe, or boyled with Rice, and eaten with hony, it killeth the ſmall wormes of the guts, and gently looſeth the belly, the which *Pliny* doth alſo affirme.

B The juyce of ſea Wormwood drunke with wine reſiſteth poiſon, eſpecially the poiſon of Hemlockes.

C The leaues ſtamped with figs, ſalt-peter, and the meale of Darnel, and applied to the belly, ſides, or flankes, helpe the dropſie, and ſuch as are ſpleneticke.

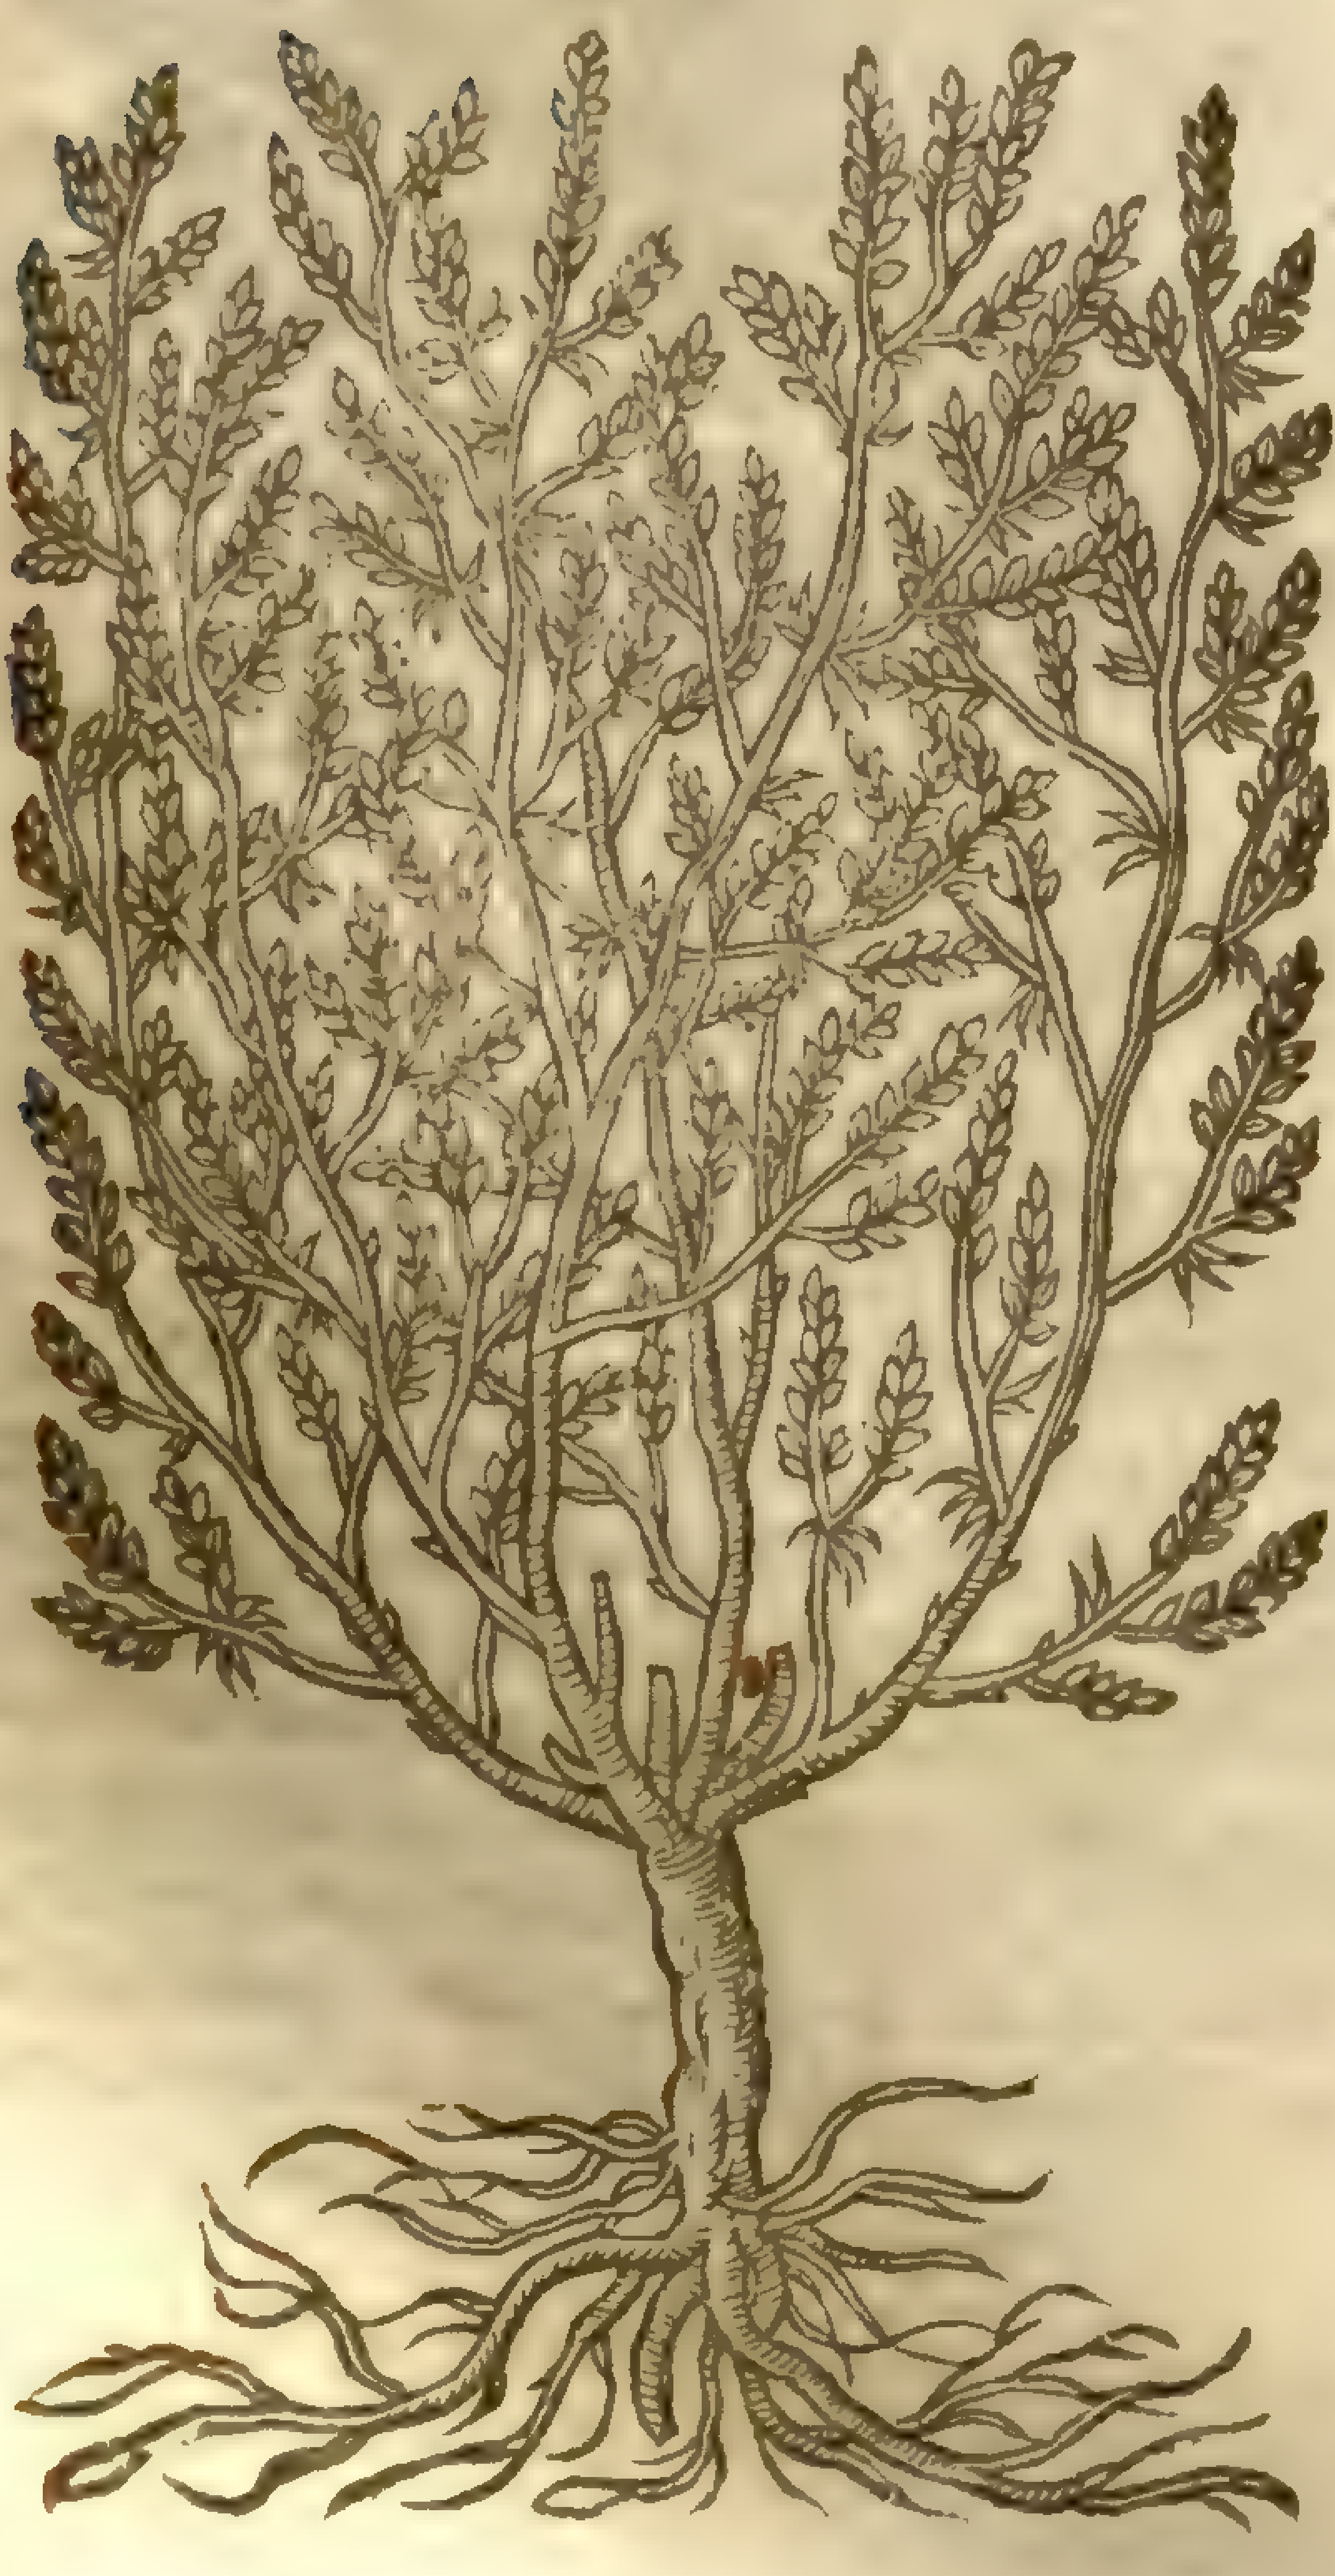
D The ſame is ſingular againſt all inflammations, and heat of the ſtomacke and liuer, exceeding all the kindes of Wormwood for the ſame purpoſes that common Wormwood ſerueth.

E It is reported by ſuch as dwell neere the ſea ſide, that the cattell which doe feed where it groweth become fat and luſty very quickly.

F The herbe with his ſtalks laid in cheſts, preſſes, and ward-robes, keepeth clothes from moths and other vermine.

Chap. 451. *Of Holy Wormewood.*

Sementina.
Holy Wormewood.



¶ *The Deſcription.*

This Wormewood called *Sementina*, and *Semen ſanctum*, which we haue Engliſhed, Holy, is that kinde of Wormwood which beareth that ſeed which we haue in vſe, called Wormeſeed: in ſhops, *Semen Santolinum*: about which there hath been great controuerſies amongſt writers: ſome holding that the ſeed of *Santonicum Galaticum* to be the true Wormeſeed: others deeming it to be that of *Romanum Abſinthium*: it doth much reſemble the firſt of the ſea Wormwoods in ſhape and proportion: it riſeth vp with a wooddy ſtalke, of the height of a cubite, diuided into diuers branches and wings; whereupon are ſet very ſmall leaues: among which are placed cluſters of ſeeds in ſuch abundance, that to the firſt view it ſeemeth to be a plant conſiſting all of ſeed.

¶ *The Place.*

It is a forreine plant: the ſeeds being ſowne in the gardens of hot regions doe proſper well; in theſe cold countries it will not grow at all. Neuertheles there is one or two companions about London, who haue reported vnto me that they had great ſtore of it growing in their Gardens yearely, which they ſold at a great price vnto our London Apothecaries, and gained much mony thereby; one of the men dwelling by the Bagge and Bottle neere London, whoſe name is *Cornewall*; into whoſe garden I was brought to ſee the thing that I would not beleeue; for being often told that there it did grow, I ſtill perſiſted it was not true: but when I did behold this great quantitie of Wormewood, it was nothing elſe but common *Ameos*. How many Apothecaries haue been deceiued, how many they haue robbed of their mony, and how many children haue beene nothing the better for taking it, I refer it to the iudgement of the ſimpleſt, conſidering their owne report, to haue ſold many hundreth pounds weight of it; the more to their ſhame be it ſpoken, and the leſſe wit or skill in the Apothecaries: therefore haue I ſet downe this as a caueat vnto thoſe that buy of theſe ſeeds, firſt to taſte and trie the ſame before they giue it to their children, or commit it to any other vſe. ‡ Certainly our Author was either miſinformed, or the people of theſe times were very ſimple, for I dare boldly ſay there is not any Apothecary, or ſcarce any other ſo ſimple as to be thus deceiued now. ‡

¶ *The Time.*

It floureth and bringeth forth his ſeed in Iuly and Auguſt.

¶ *The Names.*

The French men call it *Barbotine*; the Italians, *Semen Zena*: whereupon alſo the Latine name *Sementina* came: the ſeed is called euery where *Semen ſanctum*: Holy ſeed; and *Semen contra Lumbricos*: in Engliſh, Wormſeed; the herbe it ſelfe is alſo called Wormſeed, or Wormſeed-wort: ſome name it *Semen Zedoariæ*, Zedoarie ſeed, becauſe it hath a ſmell ſomewhat reſembling that of Zedoarie.

¶ *The Temperature.*

The ſeed is very bitter, and for that cauſe of nature hot and dry.

¶ *The Vertues.*

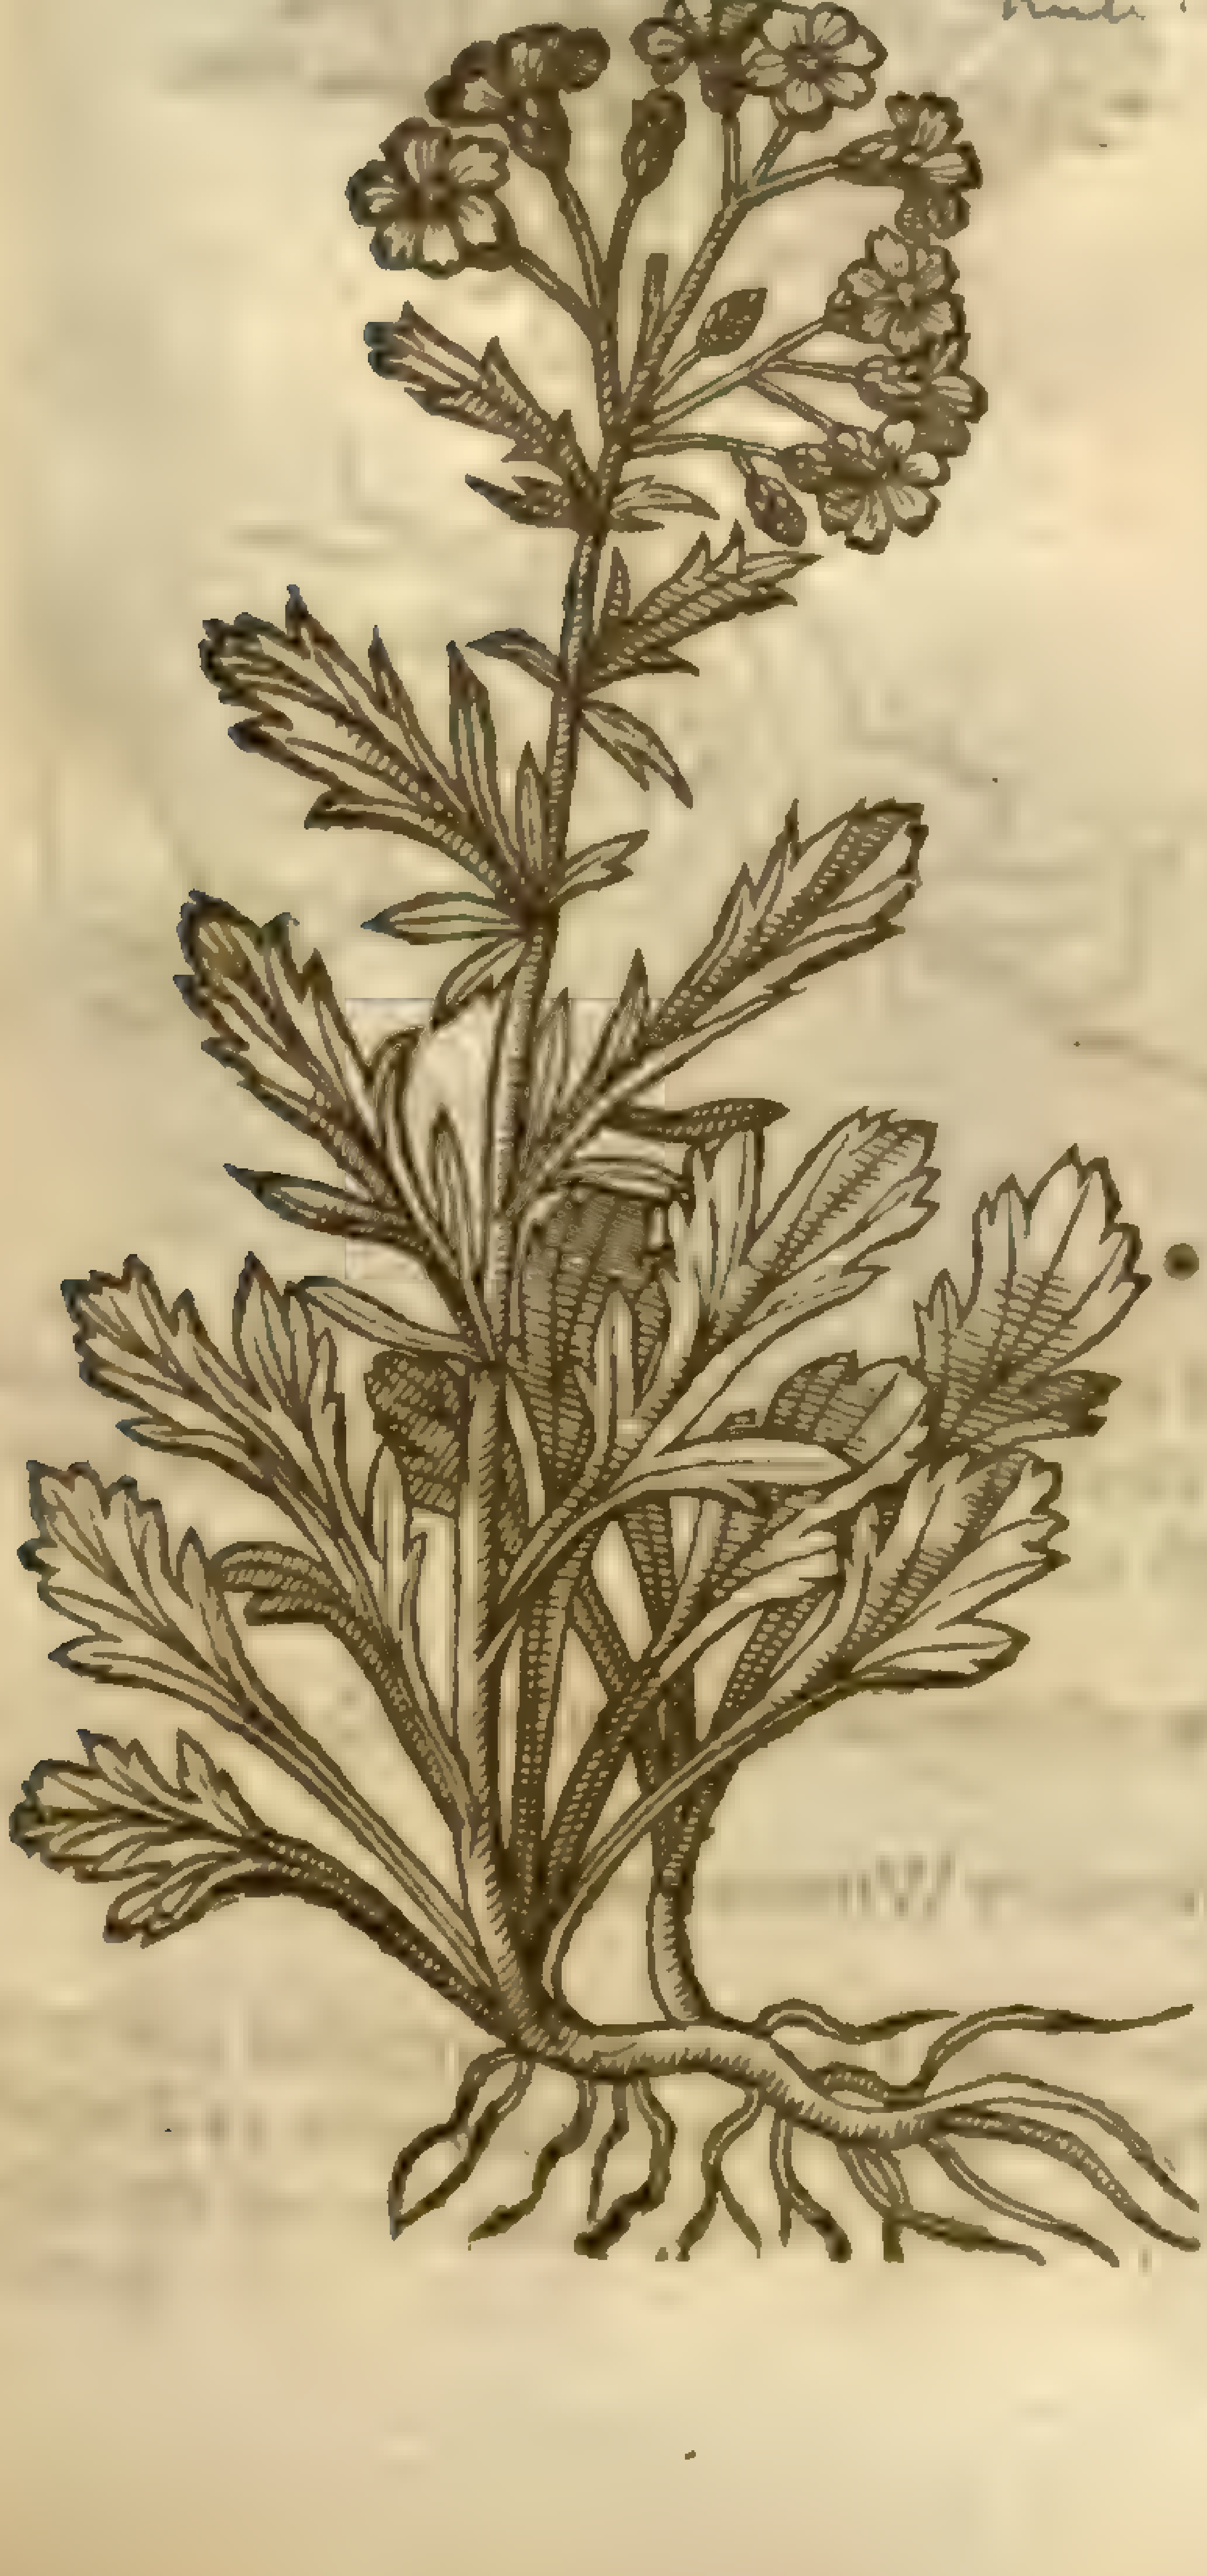
It is good againſt wormes of the belly and entrailes, taken any way, and better alſo if a little Rubarbe be mixed withall, for ſo the wormes are not onely killed, but likewiſe they are driuen downe by the ſiege, which thing muſt alwaies be regarded. A

The ſeed mixed with a little *Aloe ſuccotrina*, and brought to the forme of a plaiſter, and applied to the nauell of a childe doth the like. B

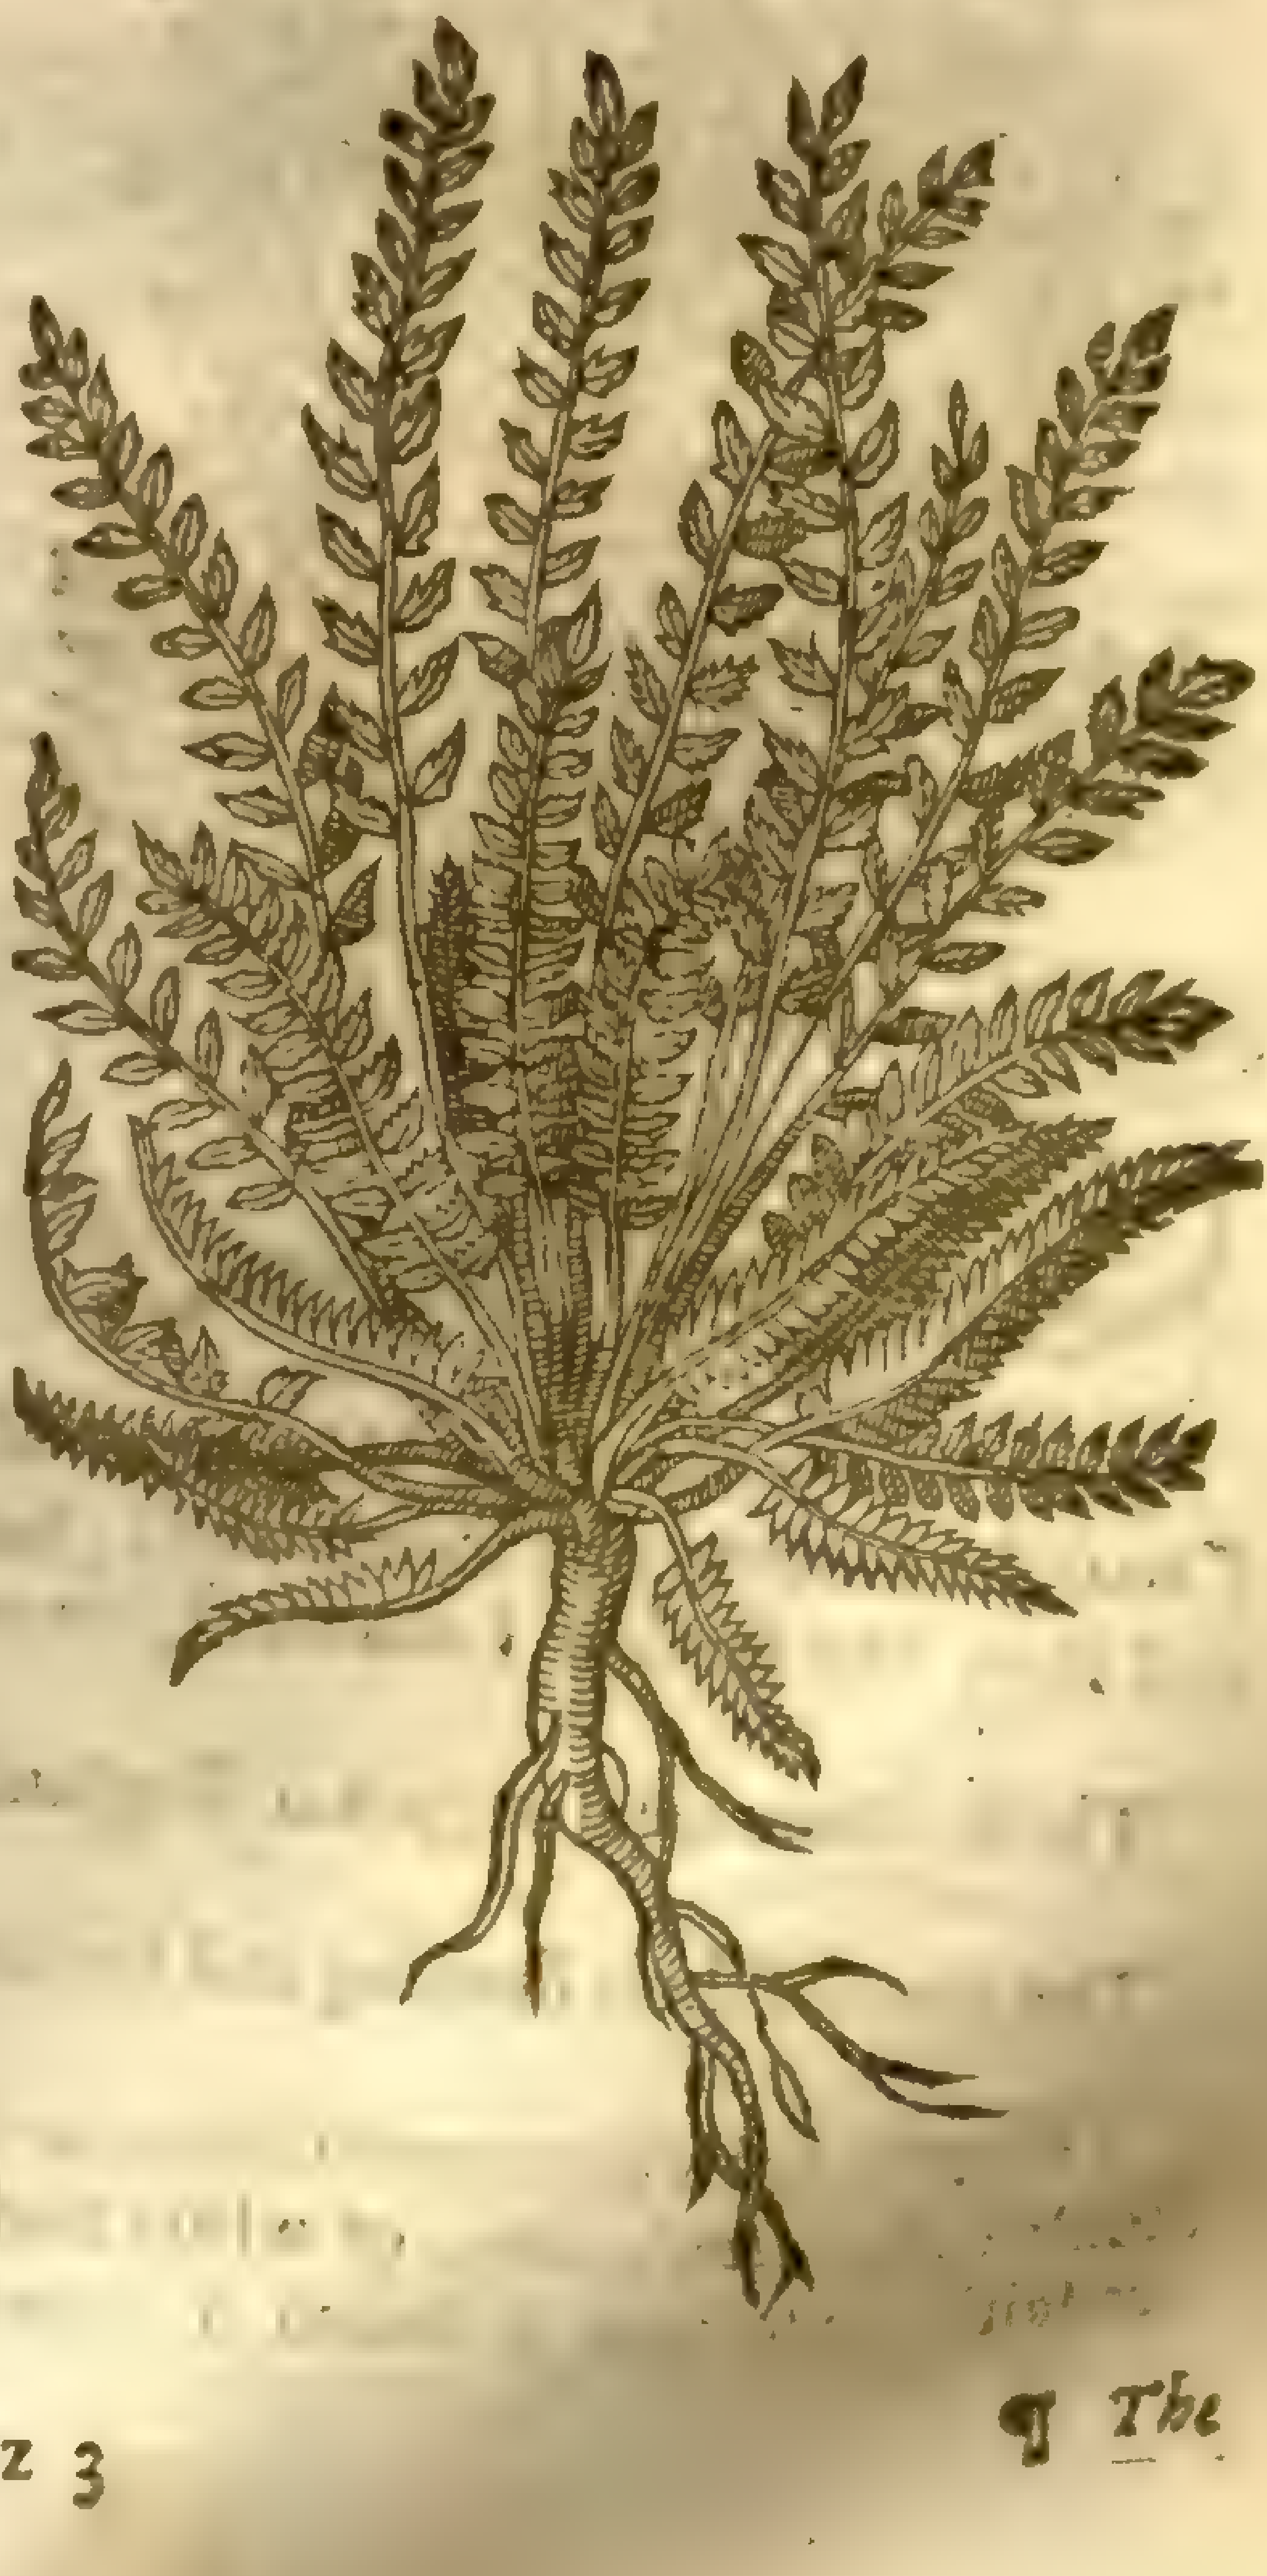
CHAP. 452. *Of forreine and Baſtard Wormewoods.*

1 *Abſinthium album.*
White Wormwood.

Achillea Clavennae, L
Mill. dict.



2 *Abſinthium Ægyptium.*
Wormwood of Ægypt.

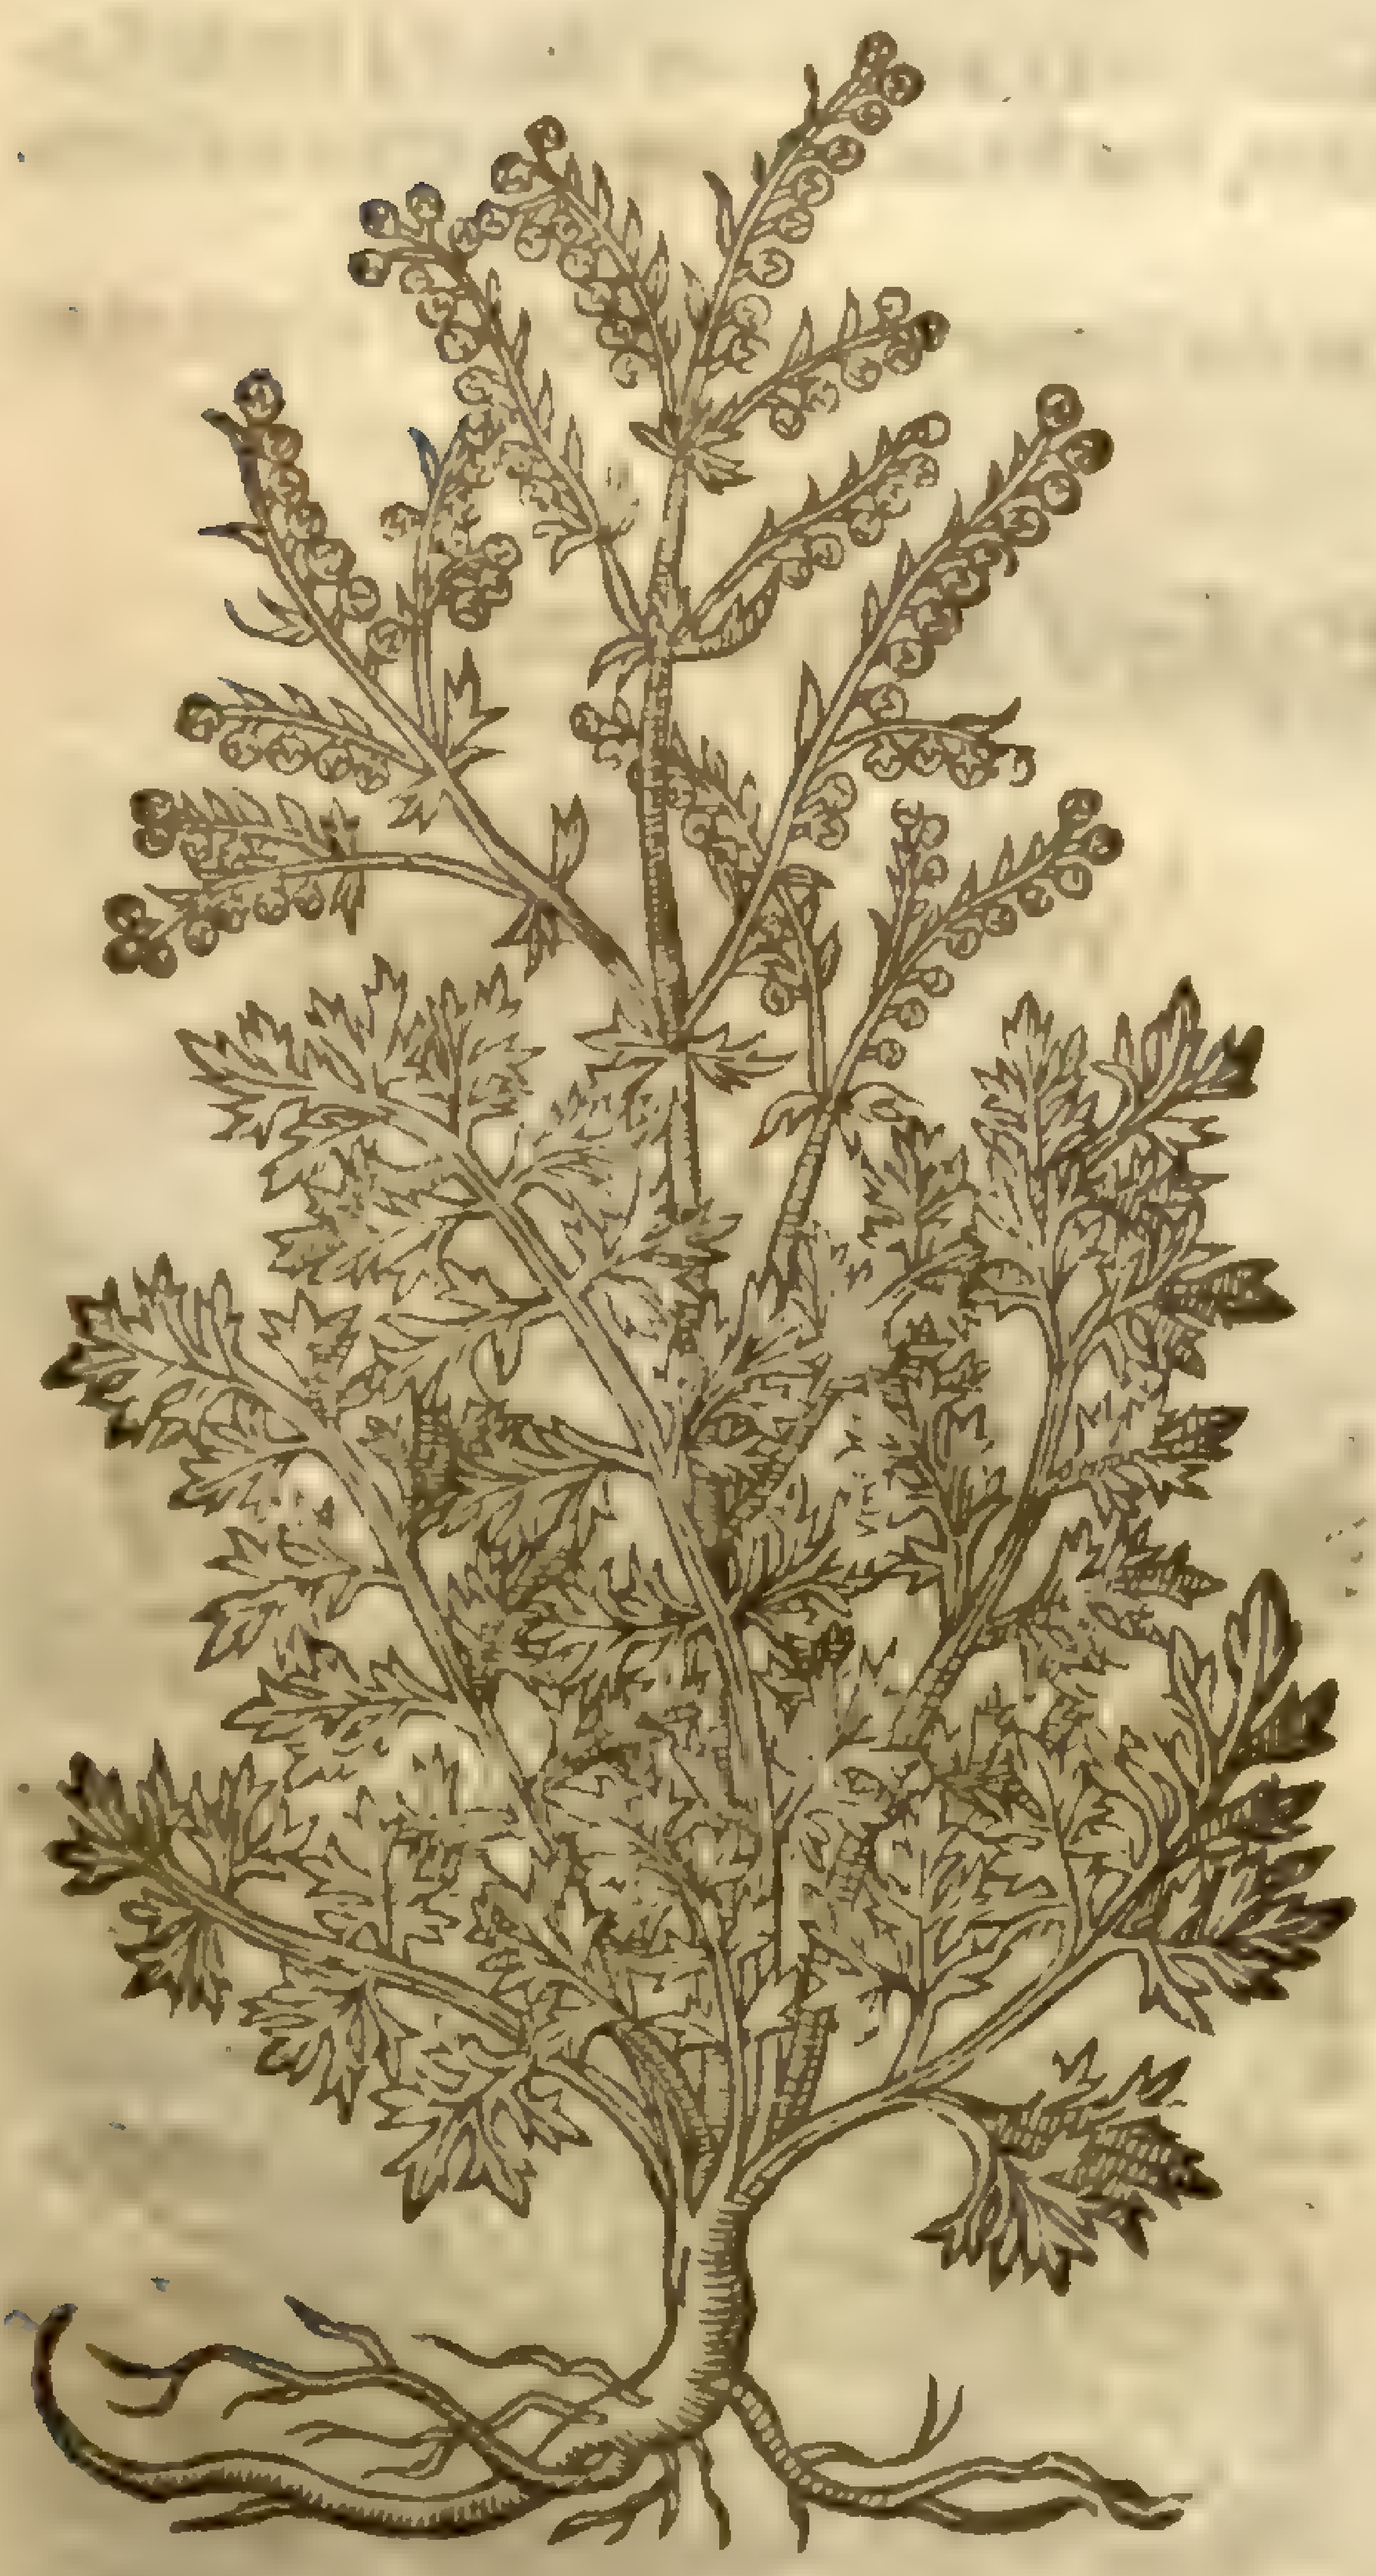


¶ *The Deſcription.*

† 1 A*Bſinthium album* hath ſtraight and vpright ſtalkes, a foot high, beſet with broad leaues, but very deeply cut or clouen, in ſhew like vnto thoſe of the great Daiſie, but white of colour: at the top of the ſtalkes, out of ſcaly heads, as in an vmbell grow floures, compact of ſix ſmall white leaues: the root is long, with ſome fibres annexed to it.

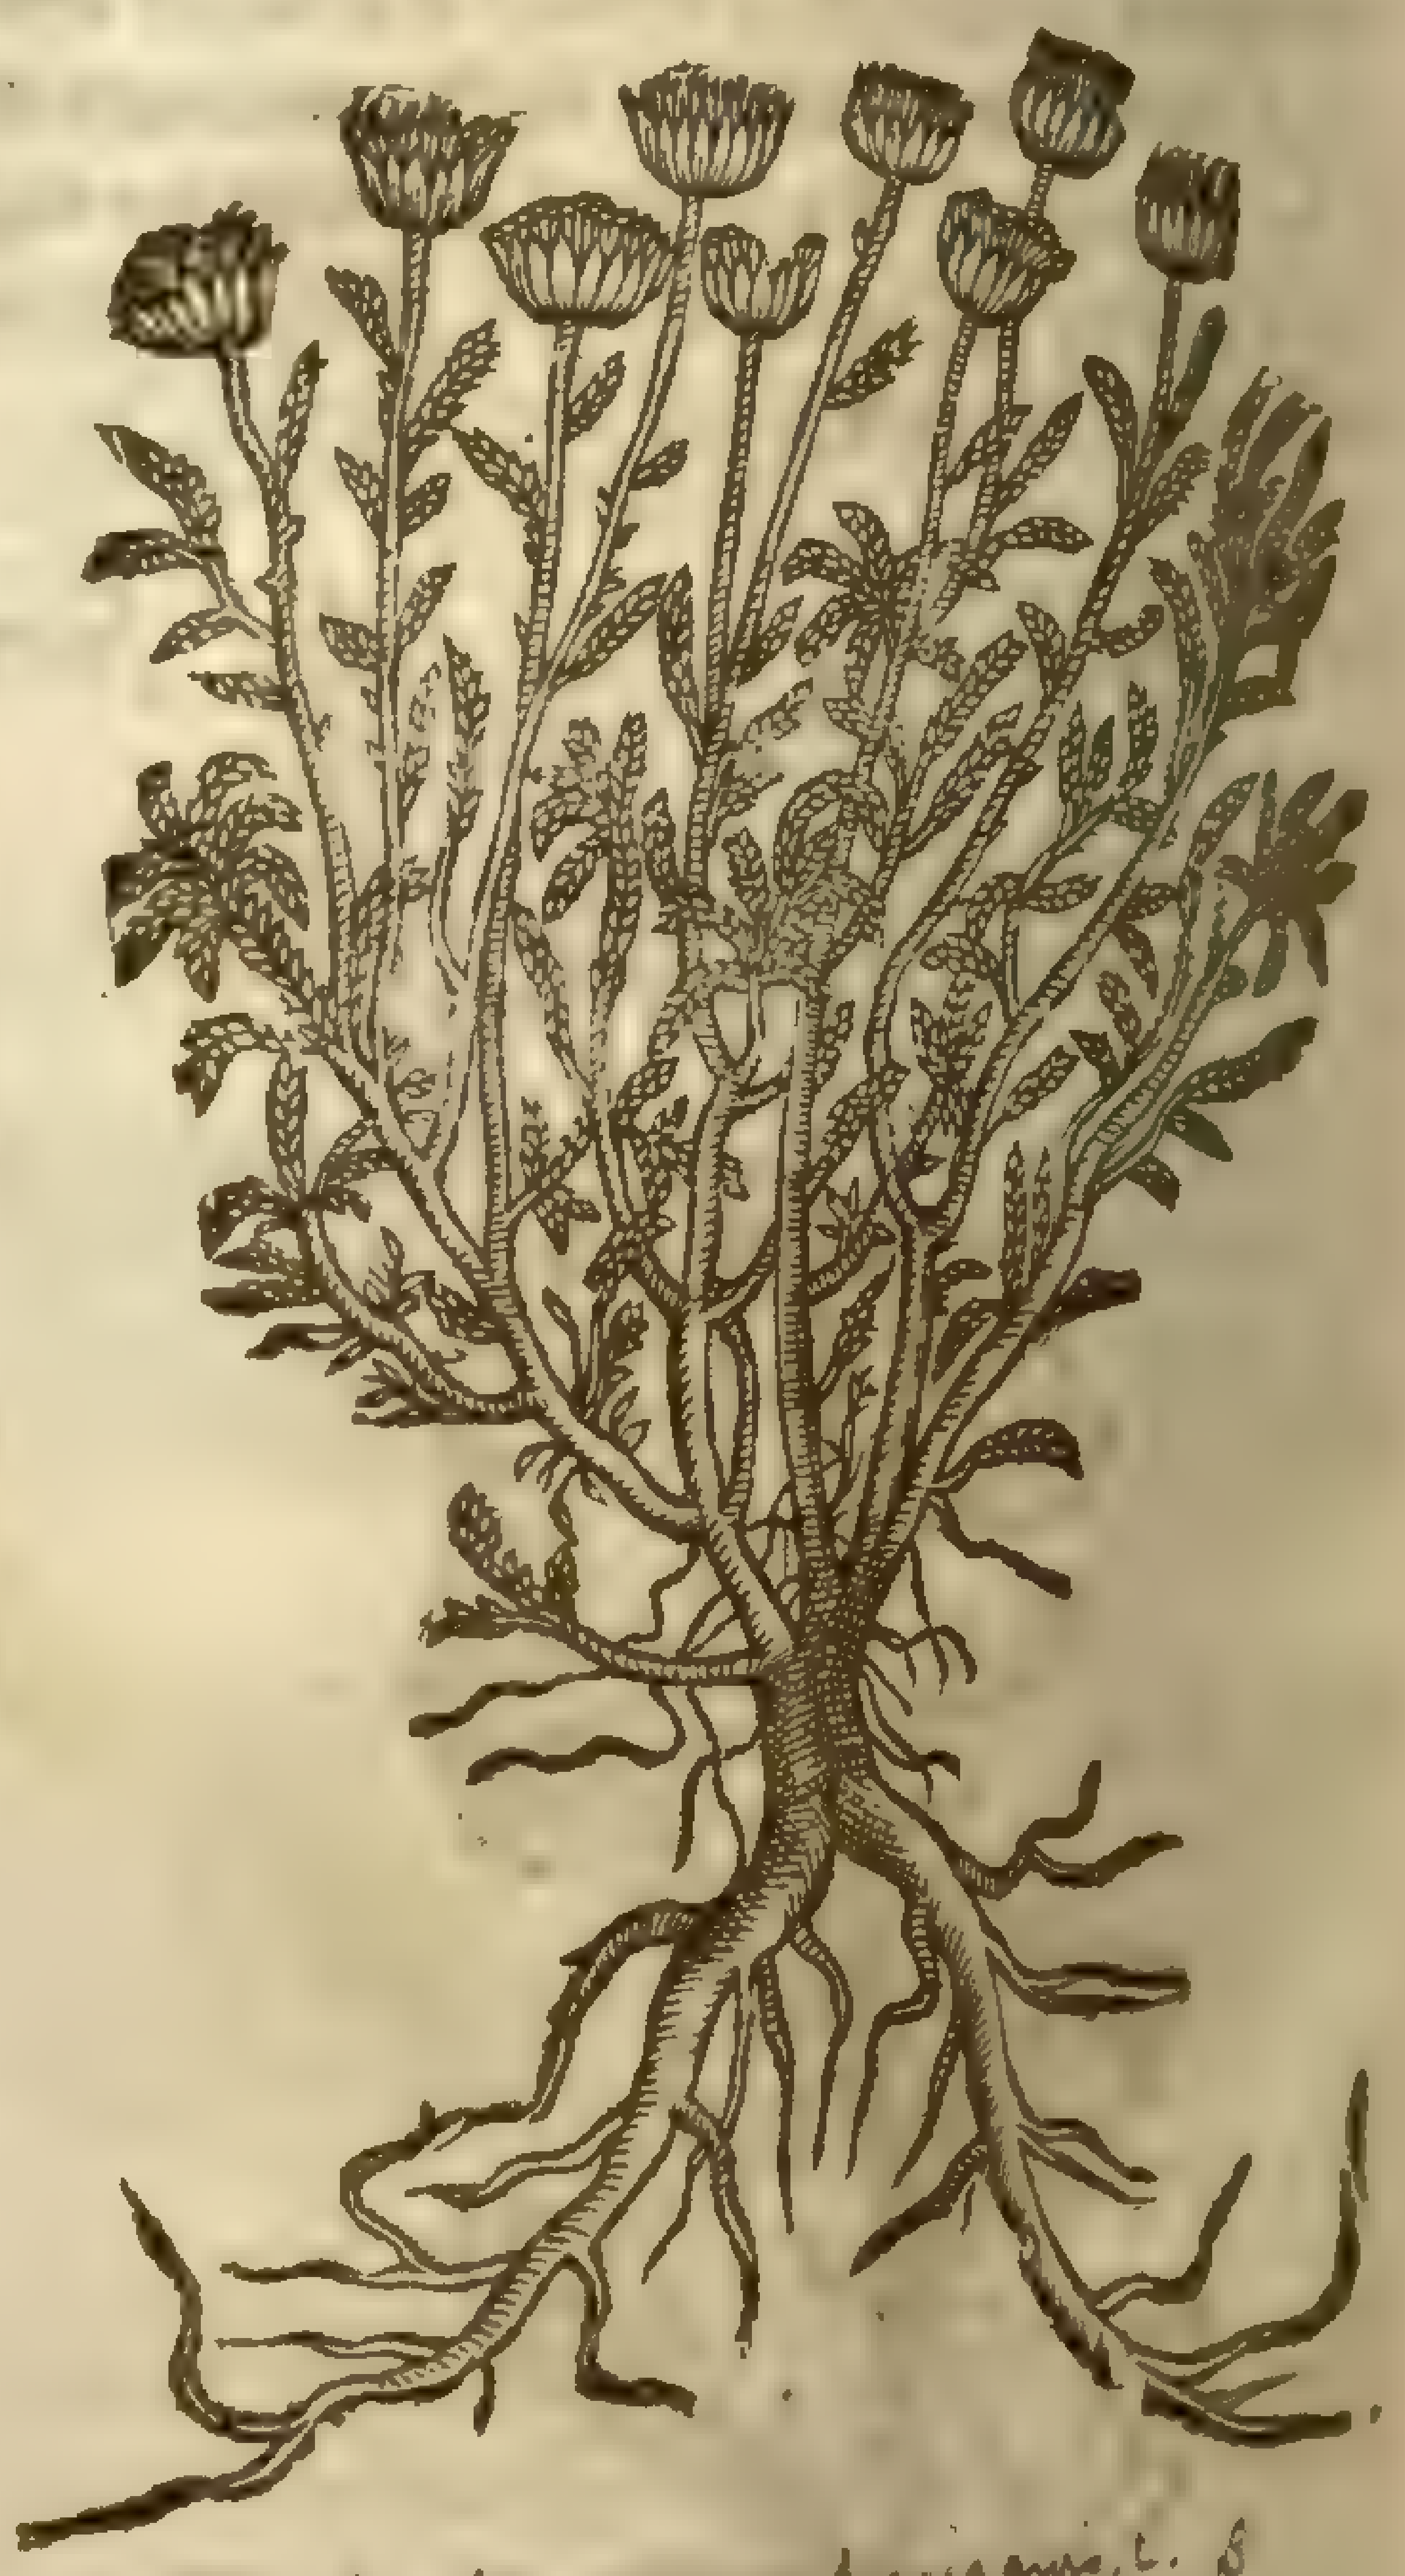
2 This kinde of Wormewood *Geſner* and that learned Apothecarie *Valerandus Donraz*, called *Abſinthium Ægyptium*: the leaues of this plant are very like to the leaues of *Trichomanes*, which is our common Maiden haire, of a white colour, euery ſmall leafe ſtanding one oppoſite againſt another, and of a ſtrong ſauour.

3 This Wormewood, which *Dodonæus* calleth *Abſinthium inodorum*, and *Inſipidum*, is very like vnto the Sea Wormewood, in his ſmall and tender leaues: the ſtalke beareth floures alſo like vnto the foreſaid Sea Wormewood, but it is of a ſad or deepe colour, hauing neither bitter taſte, nor any ſauour at all; whereupon it was called, and that very fitly, *Abſinthium inodorum*, or *Abſinthium inſipidum*: in Engliſh, Fooliſh, or vnſauoury Wormwood. ‡ *Dodonæus* ſaith not that his *Abſinthium inſipidum* is like the ſea Wormwood, but that it is very like our common broad leaued Wormwood, and ſo indeed it is, and that ſo like, that it is hard to be diſcerned therefrom, but onely by the want of bitterneſſe and ſmell. ‡



3 *Abſinthium inodorum.*
Vnſauorie Wormewood.

Artemisia absinthium, L. Sp.
Mill. dict.



4 *Abſinthium marinum, Abrotani fœminæ facie.*
Small Lauander Cotton.

Santolina chamaecyparissus, L. Sp.
Mill. dict.

4 This kinde of Sea Wormewood is a ſhrubby and wooddy plant, in face and ſhew like to Lauander Cotton, of a ſtrong ſmell; hauing floures like thoſe of the common Wormwood, at the firſt ſhew like thoſe of Lauander Cotton: the root is tough and wooddy.

¶ *The Place.*

Theſe plants are ſtrangers in England, yet we haue a few of them in Herbariſts gardens.

¶ *The Time.*

The time of their flouring and ſeeding is referred to the other Wormwoods.

¶ *The Names.*

The White Wormewood *Conradus Geſnerus* nameth *Seriphium fœmina*, and ſaith that it is commonly called *Herba alba*, or white herbe: another had rather name it *Santonicum*: for as *Dioſcorides* ſaith, *Santonicum* is found in France beyond the Alpes, and beareth his name of the ſame countrey where it groweth; but that part of Swiſſerland which belongeth to France is accounted of the Romans to be beyond the Alps; and the Prouince of Santon is far from it: for this is a part of Guines, ſcituate vpon the coaſt of the Ocean, beneath the floud Gerond Northward: therefore Santon Wormwood, if it haue his name from the Santons, groweth farre from the Alps: but if it grow neere adjoyning to the Alps, then hath it not his name from the Santons.

¶ *The Temperature and Vertues.*

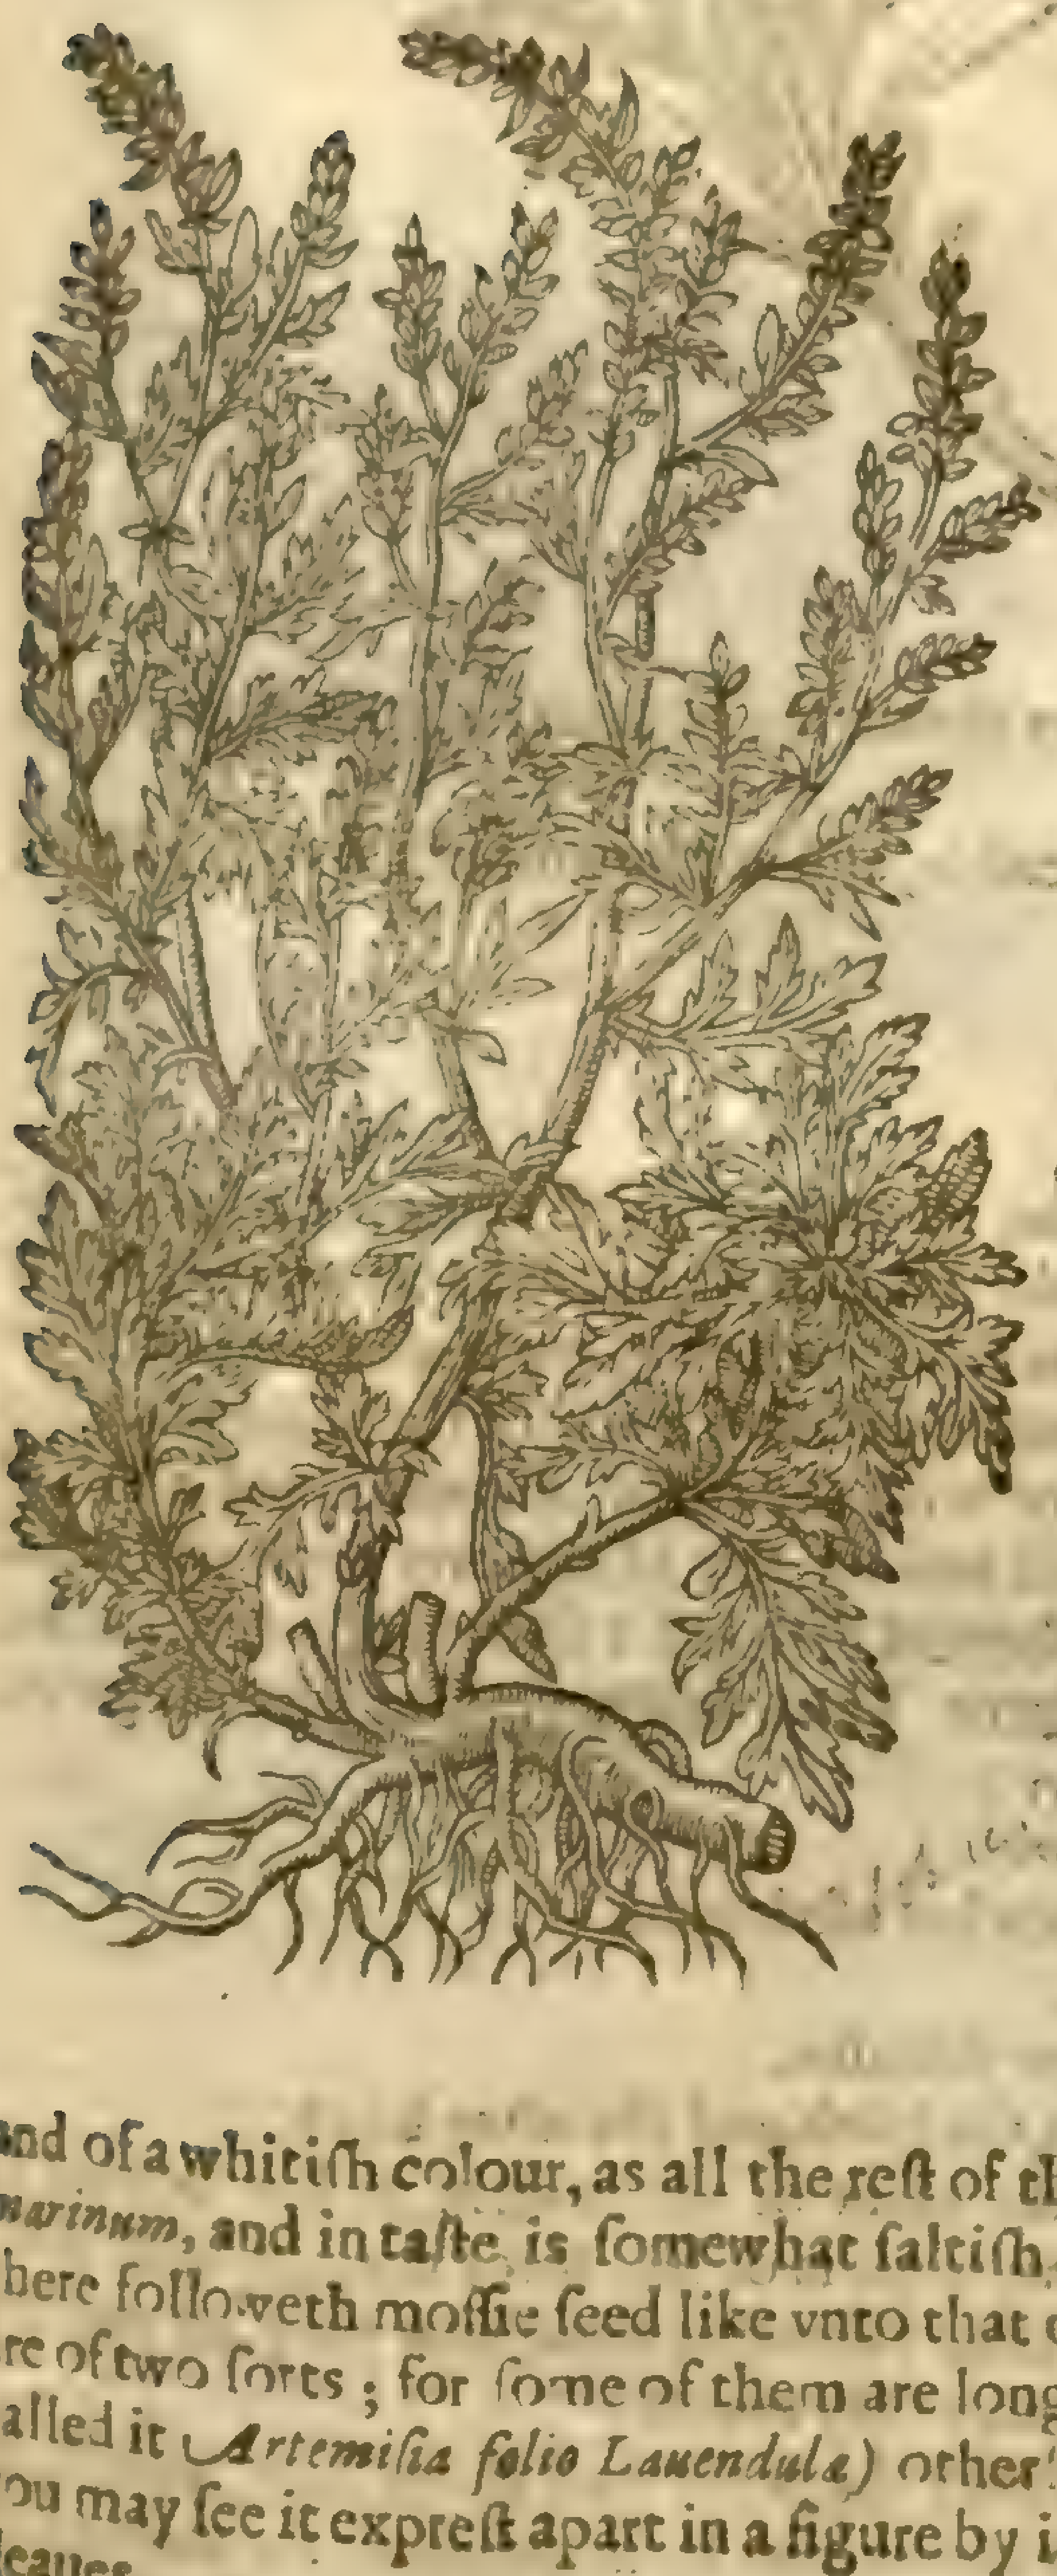
White Wormewood is hot and ſomewhat dry.

A Vnſauourie Wormewood, as it is without ſmell and taſte, ſo is it ſcarſe of any hot quality, much leſſe hath it any ſcouring faculty. Theſe are not vſed in Phyſicke, where the others may be had, being as it were wilde or degenerate kindes of Wormwood; ſome of them participating both of the forme and ſmell of other plants.

† The figure which was here formerly in the firſt place, by the name of *Abſinthium arboreſcens*, is the firſt of the next chapter ſaue one, where you may ſee more thereof. The white Wormewood mentioned here in the Names, but no where elſe in the chapter, is either the ſame with, or one very like our Sea Wormewood. Let ſuch as are curious looke into *Edmerarius* his *Hort. Med.* in the title of *Abſinthium Santonicum*: and in *Dodonæus*, *Pempt.* 1. *lib.* 2. *cap.* 5 where the firſt deſcription is of this Wormewood.

CHAP. 453. *Of Mugwort.*

1 *Artemiſia, mater Herbarum.*
Common Mugwort.



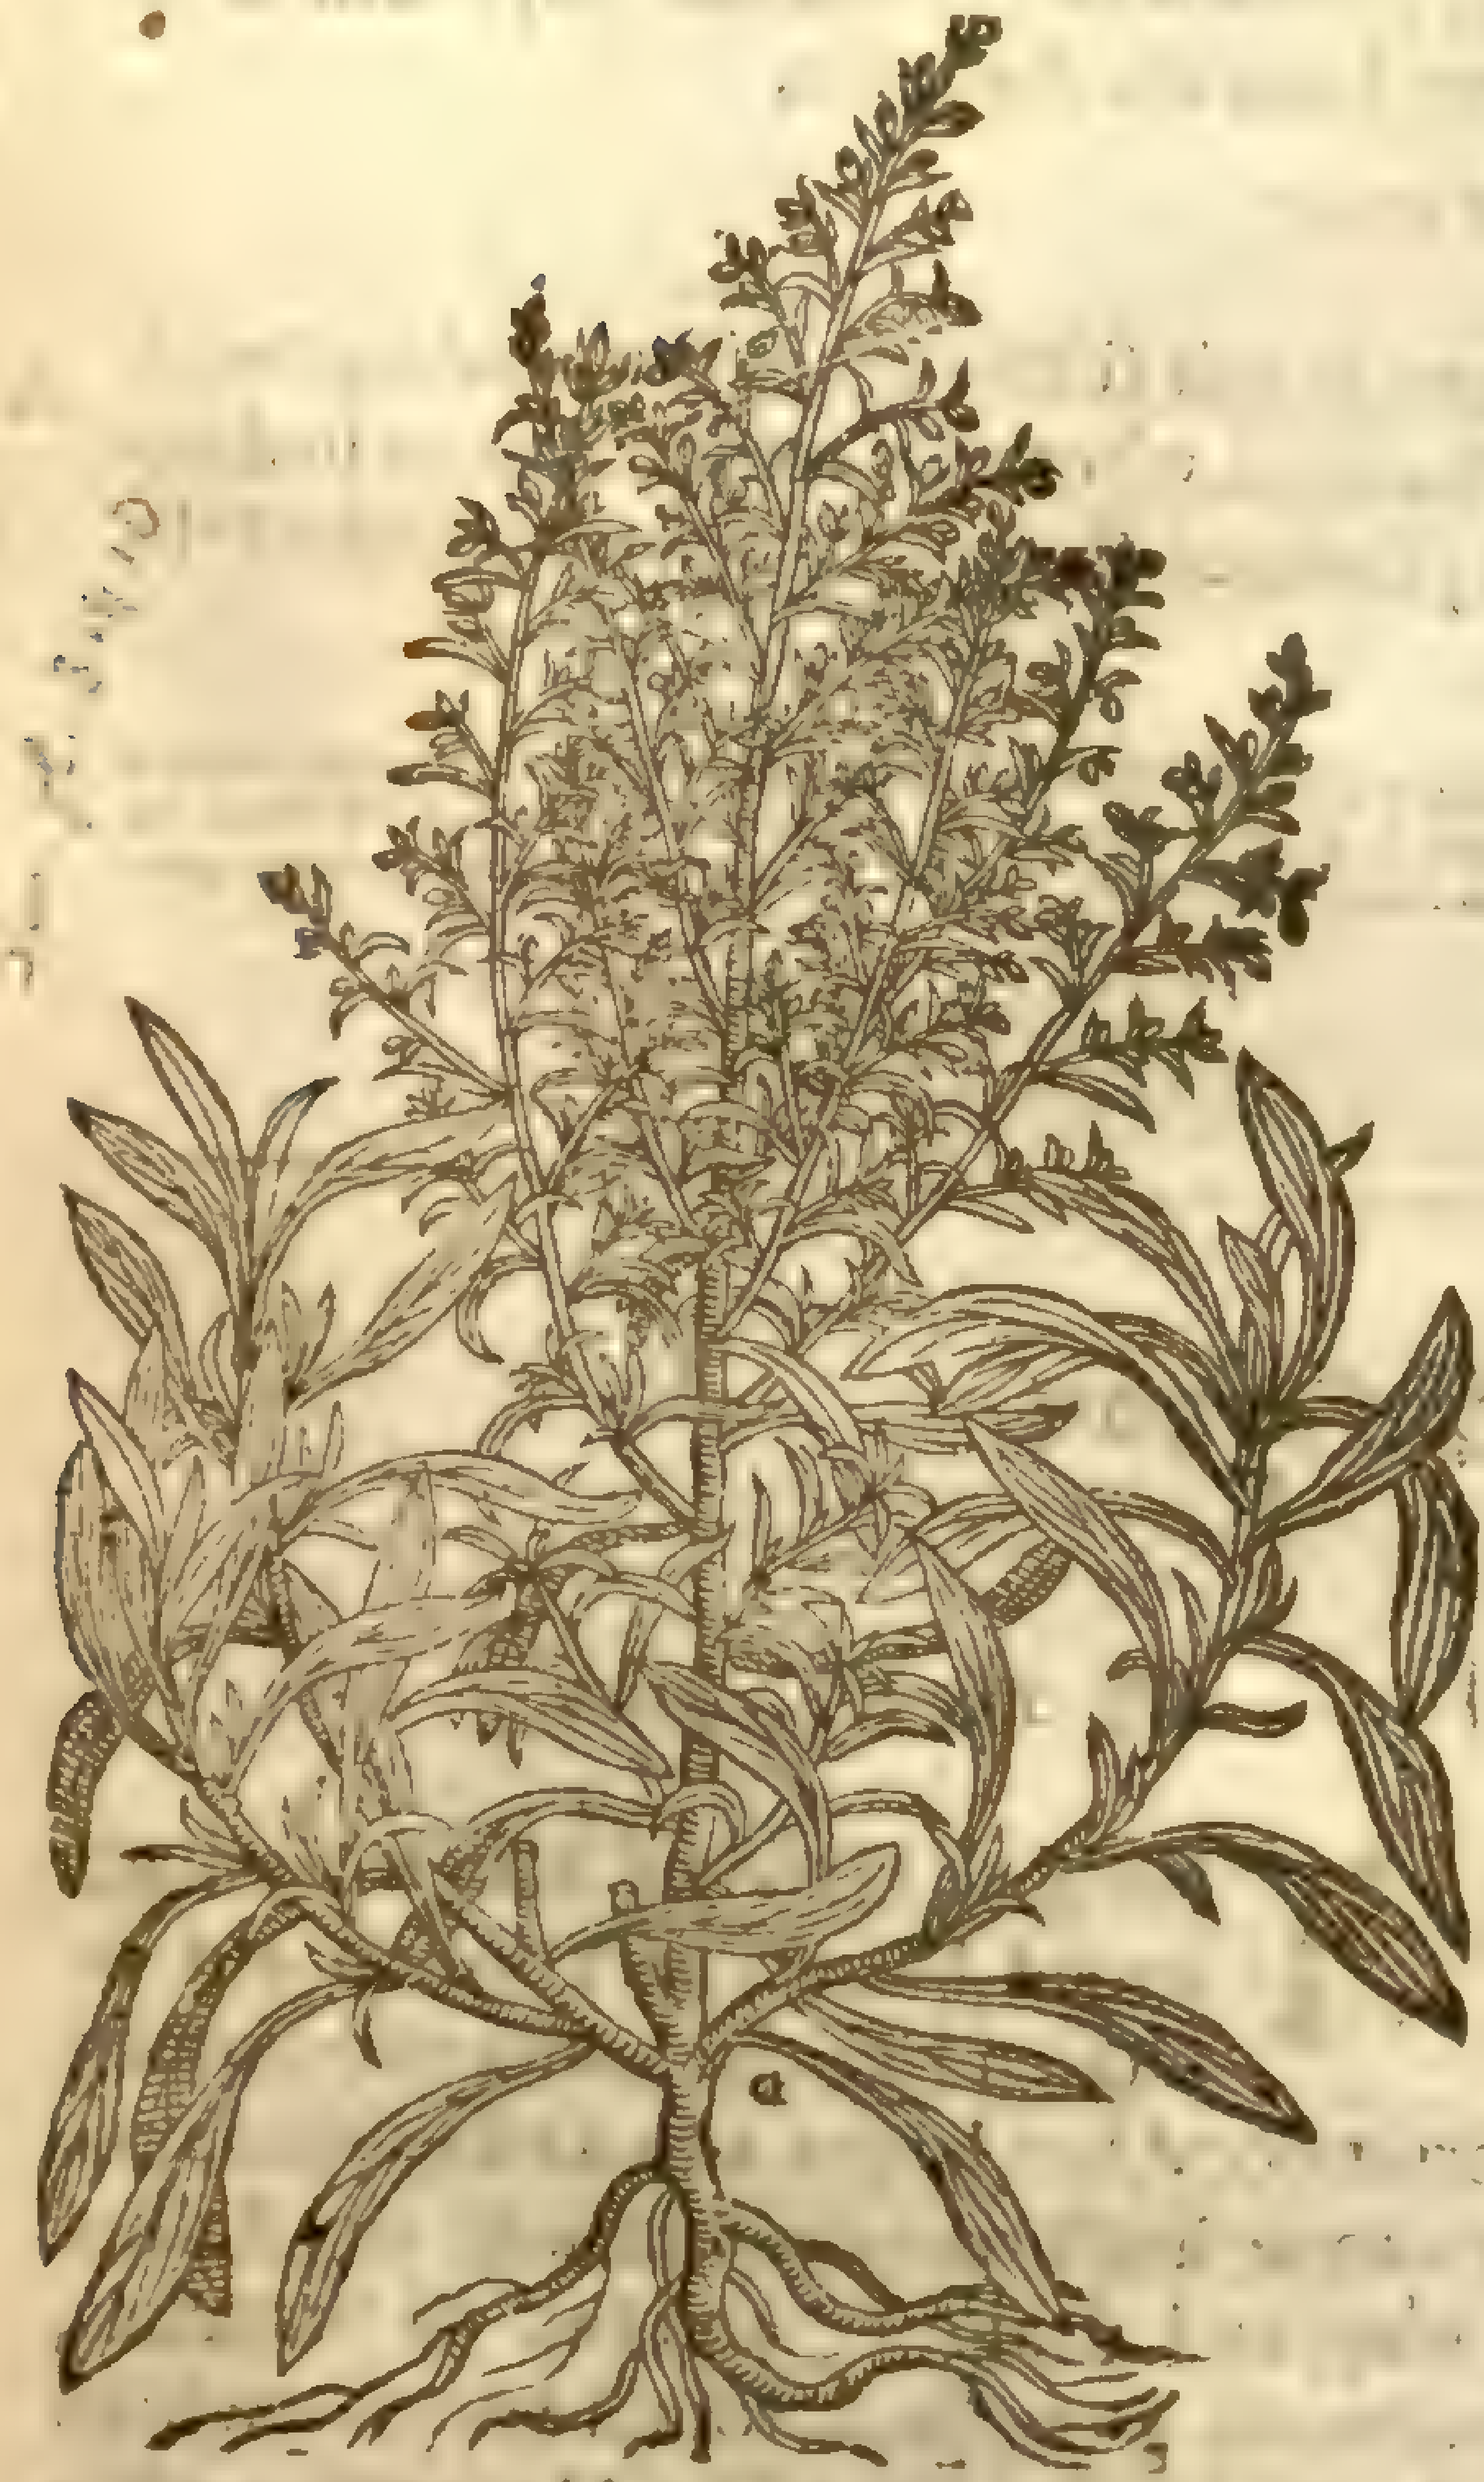
¶ *The Deſcription.*

1 THe firſt kinde of Mugwort hath broad leaues, very much cut or clouen like the leaues of common Wormewood, but larger, of a darke greene colour aboue, and hoarie vnderneath: the ſtalkes are long and ſtraight, and full of branches, whereon do grow ſmall round buttons, which are the floures, ſmelling like Marjerome when they wax ripe: the root is great, and of a woodie ſubſtance.

2 The ſecond kinde of Mugwort hath a great thicke and woody root, from whence ariſe ſundry branches of a reddiſh colour, beſet full of ſmall and fine jagged leaues, very like vnto ſea Sothernwood: the ſeed groweth alongſt the ſmall twiggie branches, like vnto little berries, which fall not from their branches in a long time after they be ripe. ‡ I know not how this differeth from the former, but only in the colour of the ſtalke and flours, which are red or purpliſh; whereas the former is more whitiſh. ‡

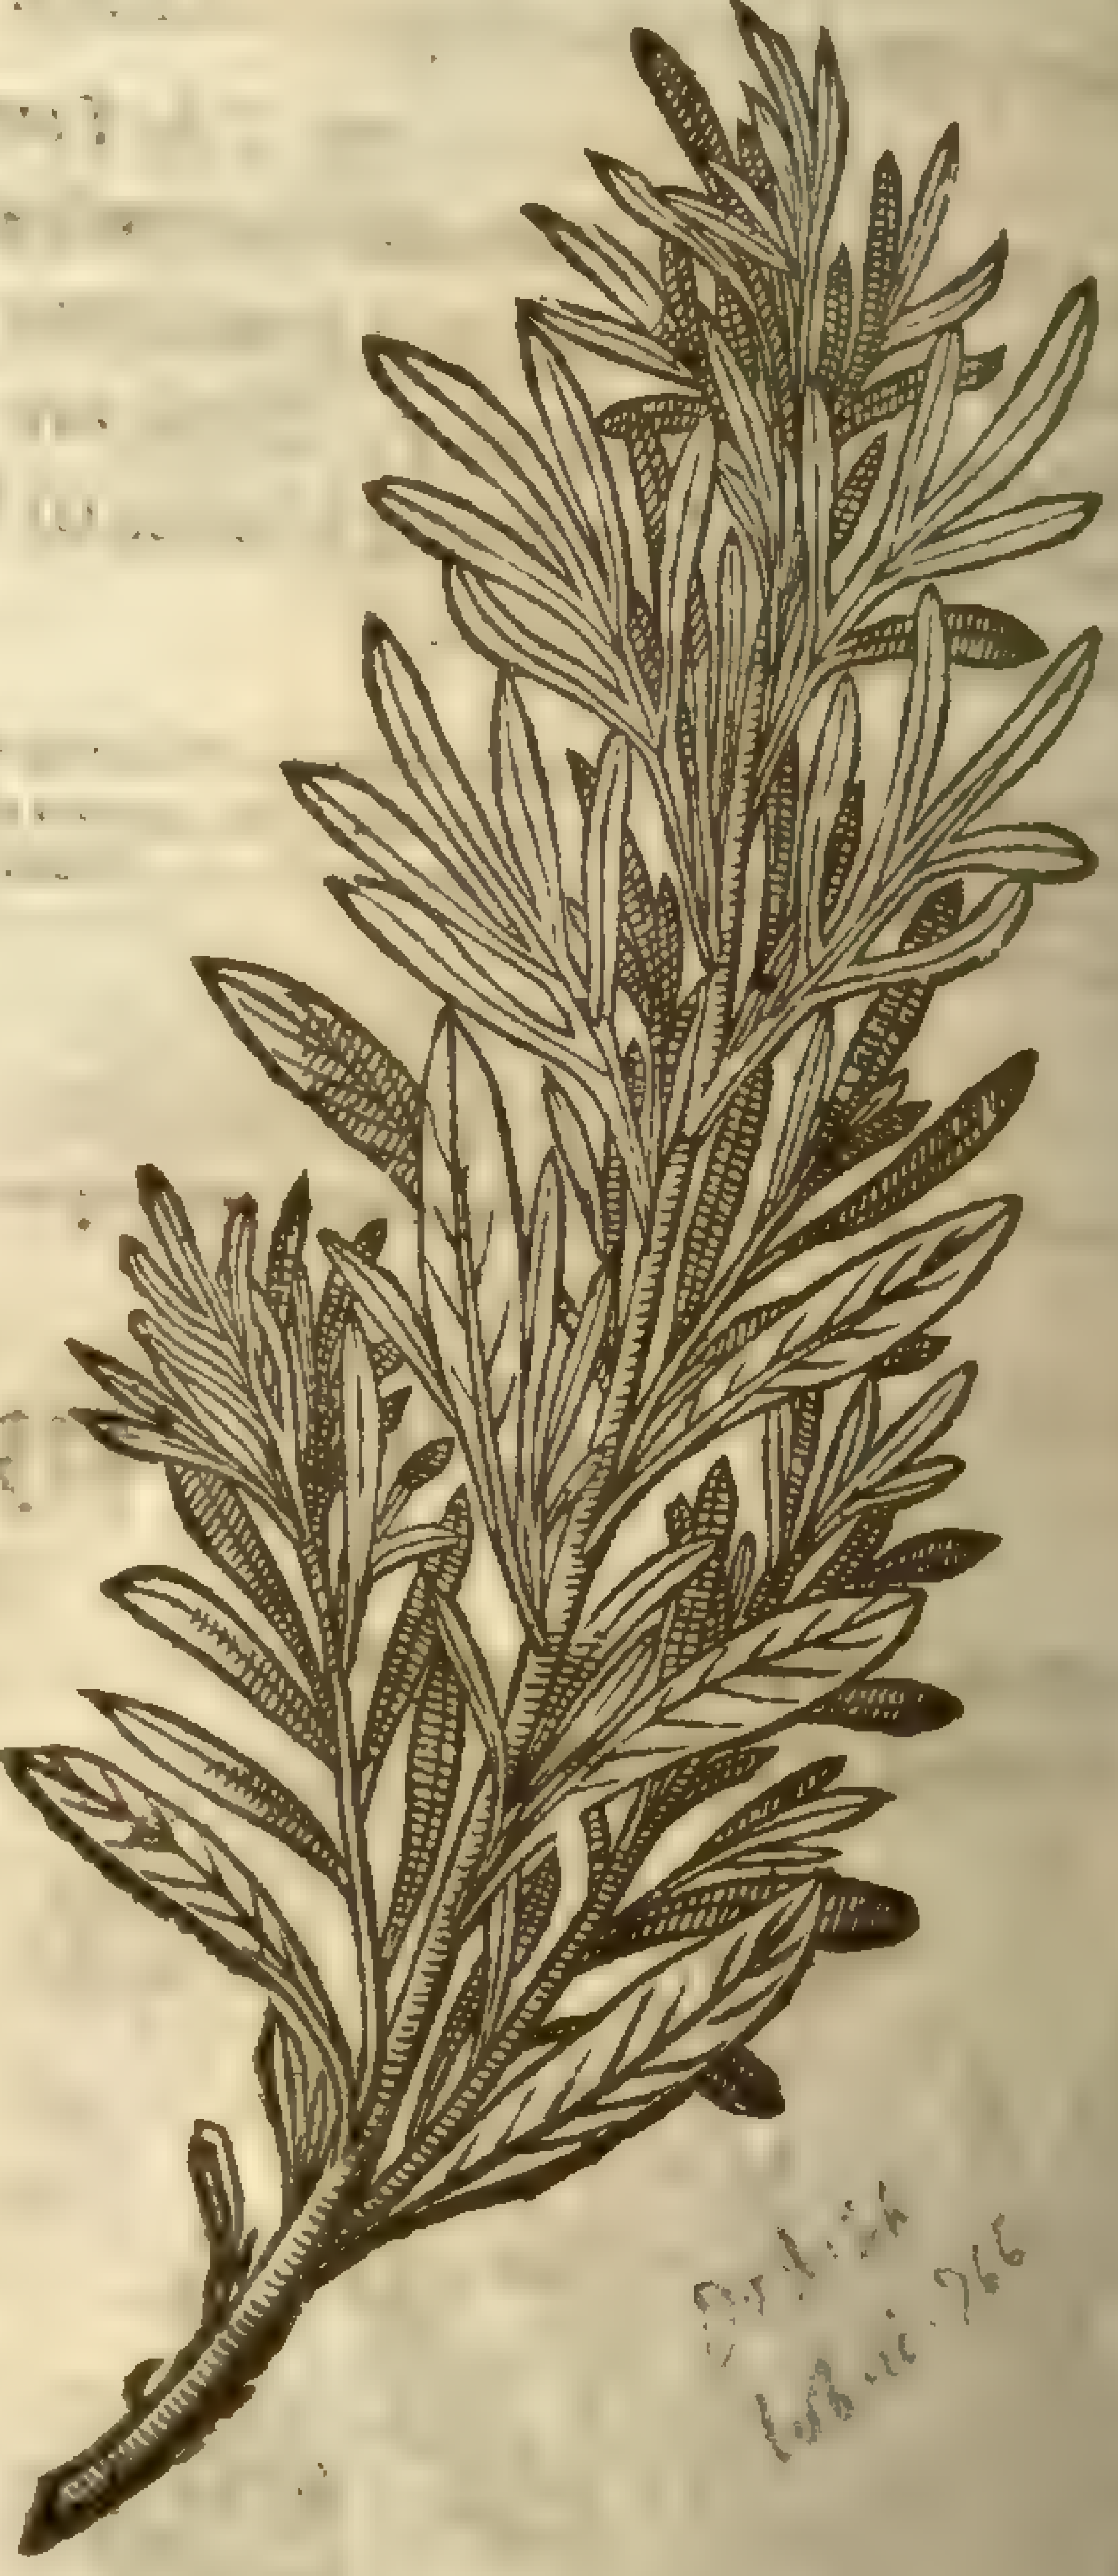
3 There is alſo another Mugwort, which hath many branches riſing from a wooddie root, ſtanding vpright in diſtances one from another, of an aſhie colour, beſet with leaues not much vnlike ſea Purſlane, about the lower part of the ſtalkes, and toward the top of the branches they are narrower and leſſer, and cut with great and deep jagges, thicke in ſubſtance, and of a whitiſh colour, as all the reſt of the plant is: it yeeldeth a pleaſant ſmell like *Abrotanum marinum*, and in taſte is ſomewhat ſaltiſh: the floures are many and yellow: which being vaded, there followeth moſſie ſeed like vnto that of the common Wormwood. ‡ The leaues of this plant are of two ſorts; for ſome of them are long and narrow, like thoſe of Lauander (whence *Cluſius* hath called it *Artemiſia folio Lauendulæ*) other ſome are cut in or diuided almoſt to the middle rib; as you may ſee it expreſt apart in a figure by it ſelfe, which ſhewes both the whole, as alſo the diuided leaues.

3 *Artemiſia marina.*
Sea Mugwort.



Lob. ic. 765

‡ *Artemiſiæ marinæ ramulus, folia integra & diſſecta exprimens.*
A branch ſhewing the cut and vncut leaues.



Lob. ic. 766

¶ *The Place.*

The common Mugwort groweth wilde in ſundry places about the borders of fields, about high waies, brooke ſides, and ſuch like places.

Sea Mugwort groweth about Rie and Winchelſea caſtle, and at Portſmouth by the Iſle of Wight.

¶ *The Time.*

They floure in Iuly and Auguſt.

¶ *The Names.*

Mugwort is called in Greeke, Ἀρτεμισία and alſo in Latine, *Artemiſia*, which name it had of *Artemiſia* Queene of Halicarnaſſus, and wife of noble *Mauſolus* King of Caria, who adopted it for her owne herbe: before that it was called παρθένις, *Parthenis* as *Pliny* writeth. *Apuleius* affirmeth that it was likewiſe called *Parthenion*: who hath very many names for it, and many of them are placed in *Dioſcorides* among the baſtard names: moſt of theſe agree with the right *Artemiſia*, and diuers of them with other herbes, which now and then are numbred among the Mugworts: it is alſo called *Mater Herbarum*: in high Dutch, **Beifuſz**, and **Sant Johanus Gurtell**: in Spaniſh and Italian, *Artemiſia*: in French, *Armoiſa*: in low Dutch, **Bijuoet, Sint Jans kruyt**: in Engliſh, Mugwort, and common Mugwort.

¶ *The Temperature.*

Mugwort is hot and dry in the ſecond degree, and ſomewhat aſtringent.

¶ *The Vertues.*

A *Pliny* ſaith, That Mugwort doth properly cure womens diſeaſes.

B *Dioſcorides* writeth, That it bringeth downe the termes, the birth, and the after-birth.

C And that in like manner it helpeth the mother, and the paine of the matrix, to bee boyled as bathes for women to ſit in; and that being put vp with myrrh, it is of like force that the bath is of. And that the tender tops are boyled and drunke for the ſame infirmities; and that they are applied in manner of a pulteſſe to the ſhare, to bring downe the monethly courſe.

D *Pliny* ſaith, That the traueller or wayfaring man that hath the herbe tied about him feeleth no wearisomneſſe at all; and that he who hath it about him can be hurt by no poyſonſome medicines, nor by any wilde beaſt, neither yet by the Sun it ſelfe; and alſo that it is drunke againſt *Opium*, or the juyce of blacke Poppy. Many other fantaſticall deuices inuented by Poëts are to be ſeene in the Works of the Antient Writers, tending to witchcraft and ſorcerie, and the great diſhonour of God; wherefore I do of purpoſe omit them, as things vnworthy of my recording, to your reuiewing.

Mugwort pound with oyle of ſweet almonds, and laid to the ſtomacke as a plaiſter, cureth all the paines and griefes of the ſame. E

It cureth the ſhakings of the joynts, inclining to the palſie, and helpeth the contraction or drawing together of the nerues and ſinewes. F

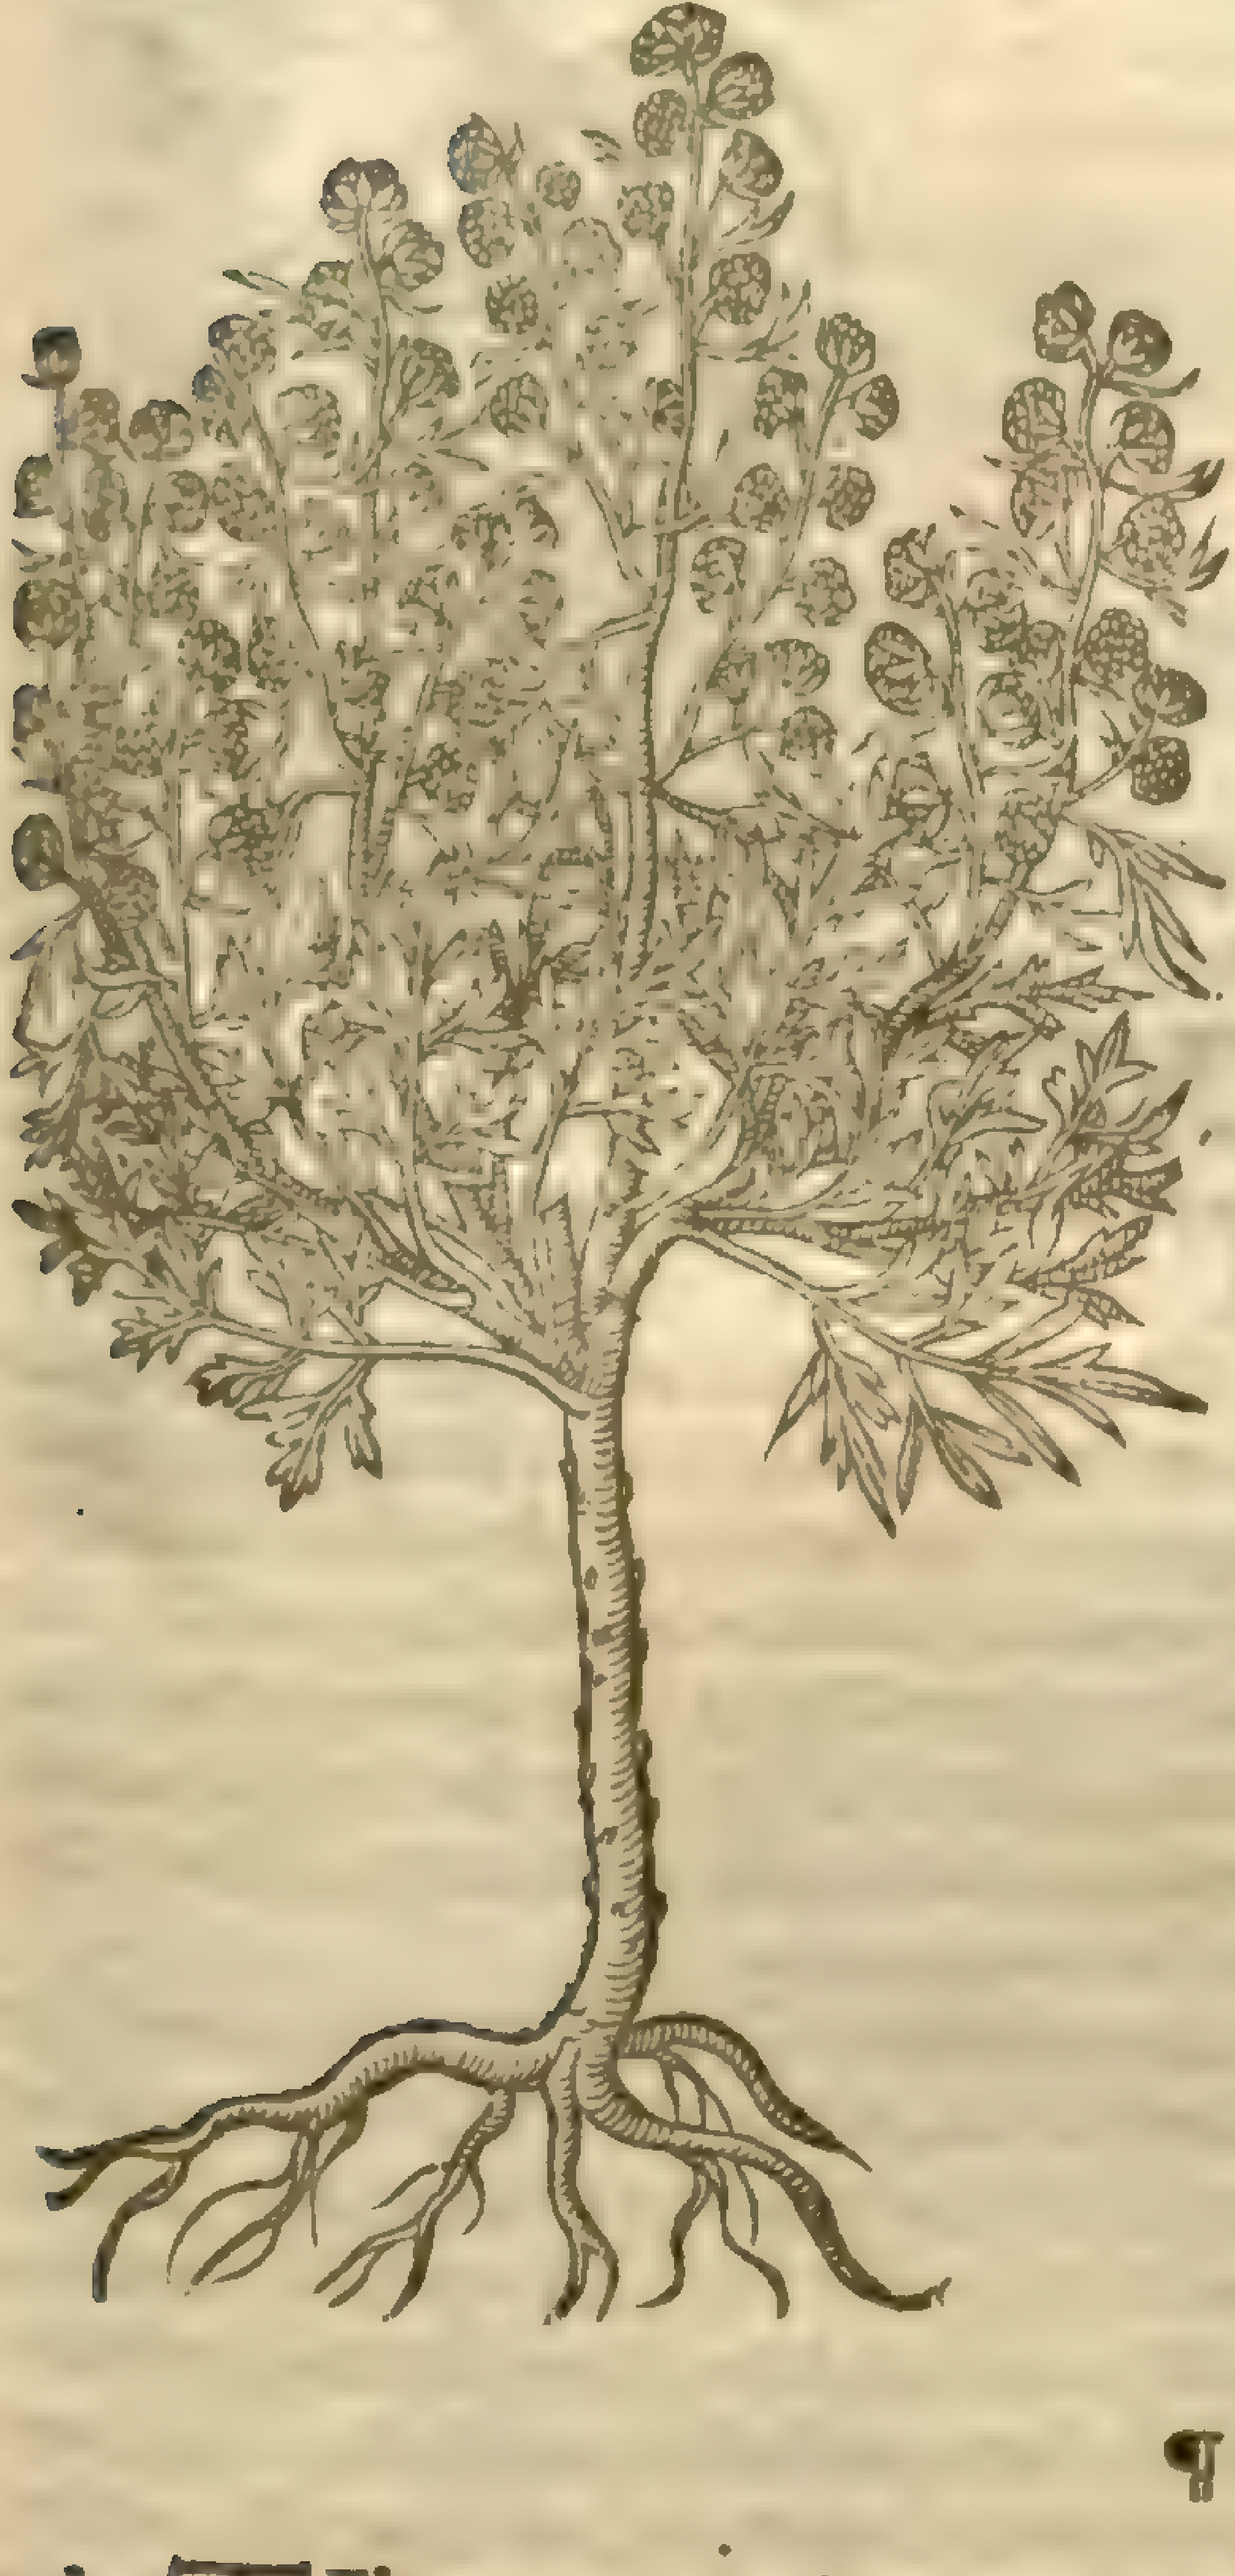
† There were formerly two deſcriptions of the *Artemiſia marina*; wherefore I omitted the former, being the more vnperfect.

CHAP. 454. *Of Sothernwood.*

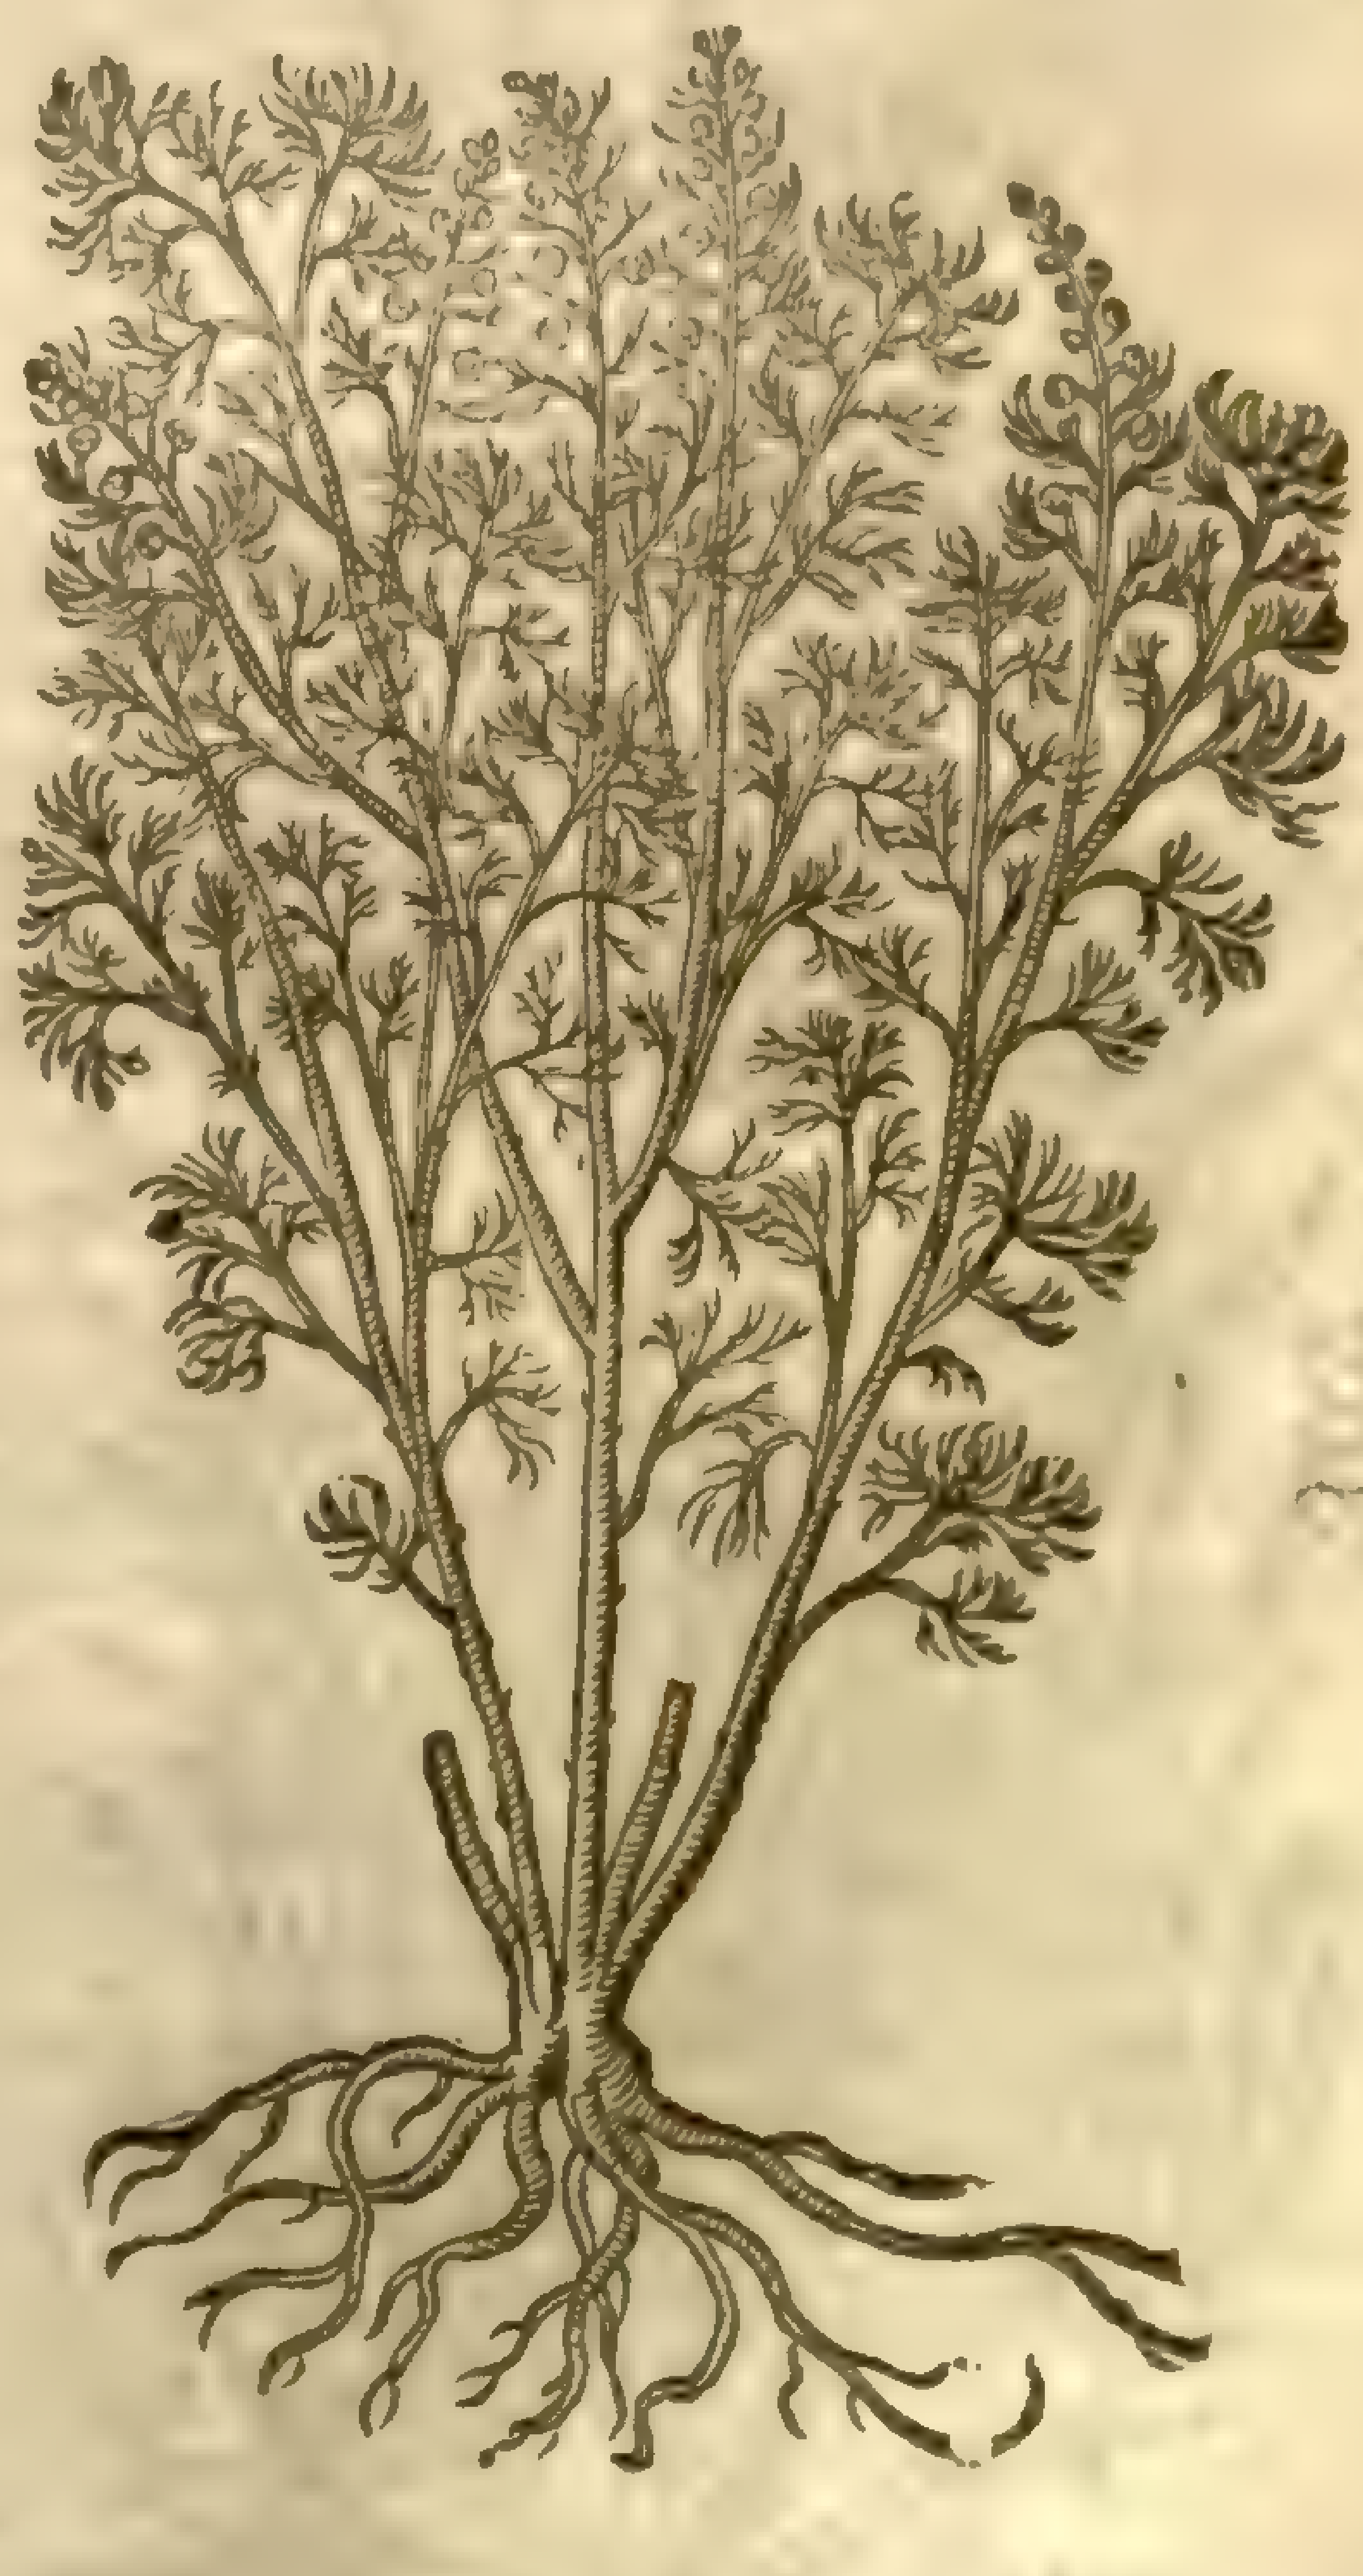
¶ *The Kindes.*

D*Ioſcorides* affirmeth that Sothernwood is of two kindes, the female and the male, which are euery where known by the names of the greater and of the leſſer; beſides theſe there is a third kind, which is of a ſweeter ſmell, and leſſer than the others, and alſo others of a baſtard kinde.

† 1 *Abrotanum fœmina arboreſcens.*
Female Sothernwood.



2 *Abrotanum mas,*
Male Sothernwood.

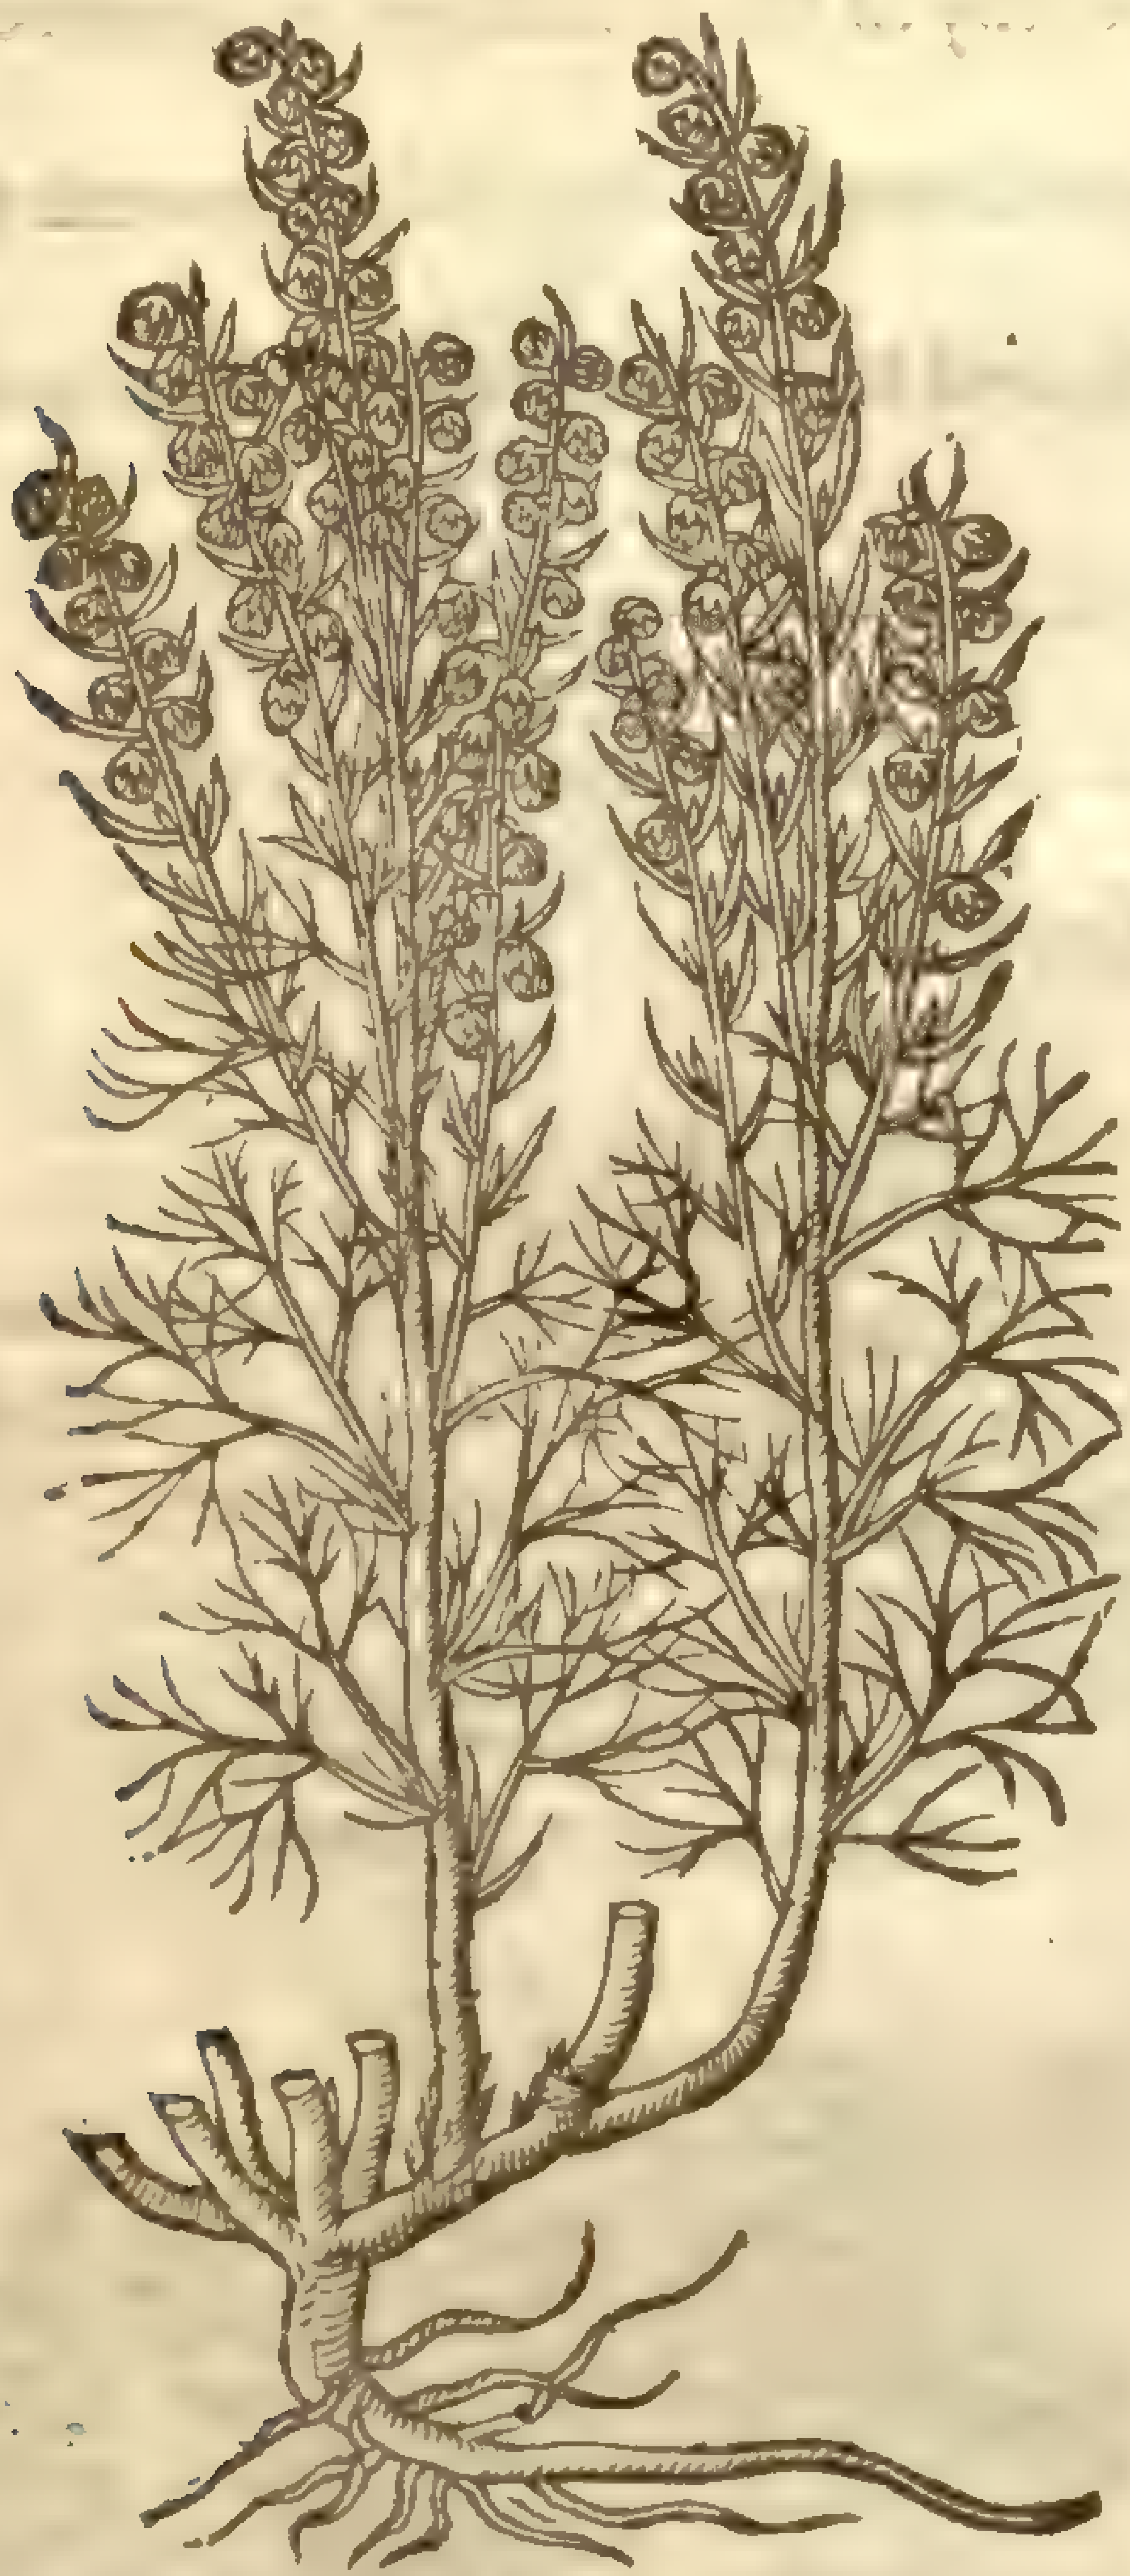


¶ *The Deſcription.*

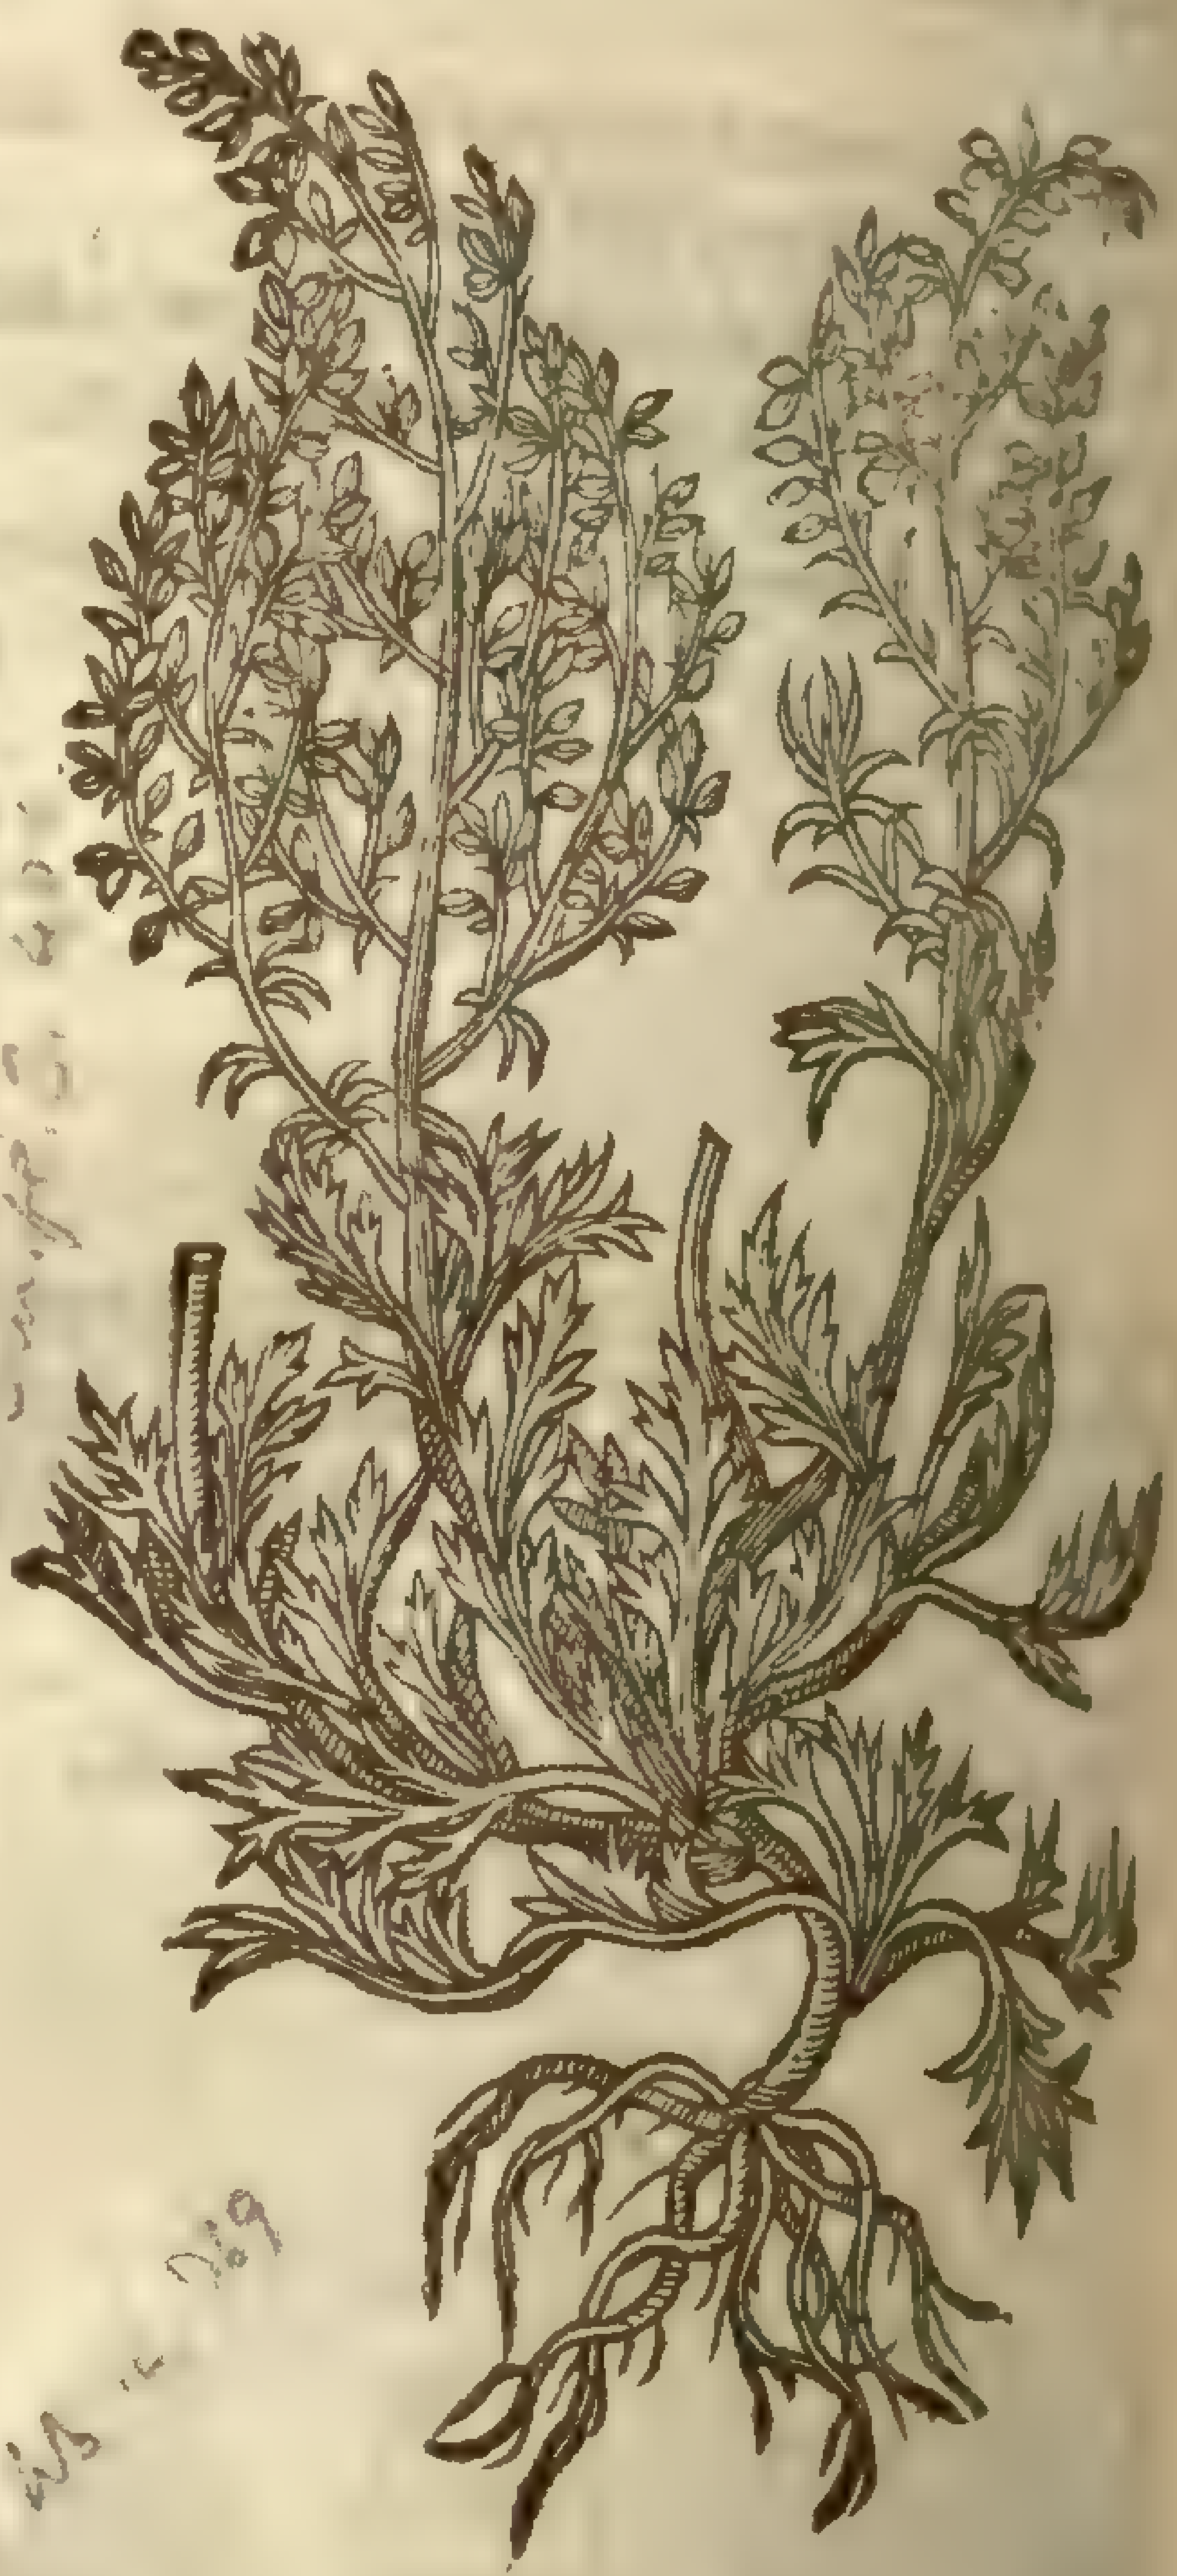
1 TThe greater Sothernwood by carefull manuring doth oftentimes grow vp in manner of a ſhrub, and commeth to be as high as a man, bringing forth ſtalkes an inch thicke, or more; out of which ſpring very many ſprigs or branches, ſet about with leaues diuerſly jagged and finely indented, ſomewhat white, and of a certaine ſtrong ſmell: in ſtead of floures, little ſmall cluſters of buttons doe hang on the ſprigs, from the middle to the very top, of colour yellow, and at the length turne into ſeed. The root hath diuers ſtrings.

2 The

3 *Abrotanum humile.*
Dwarfe Sothernwood.



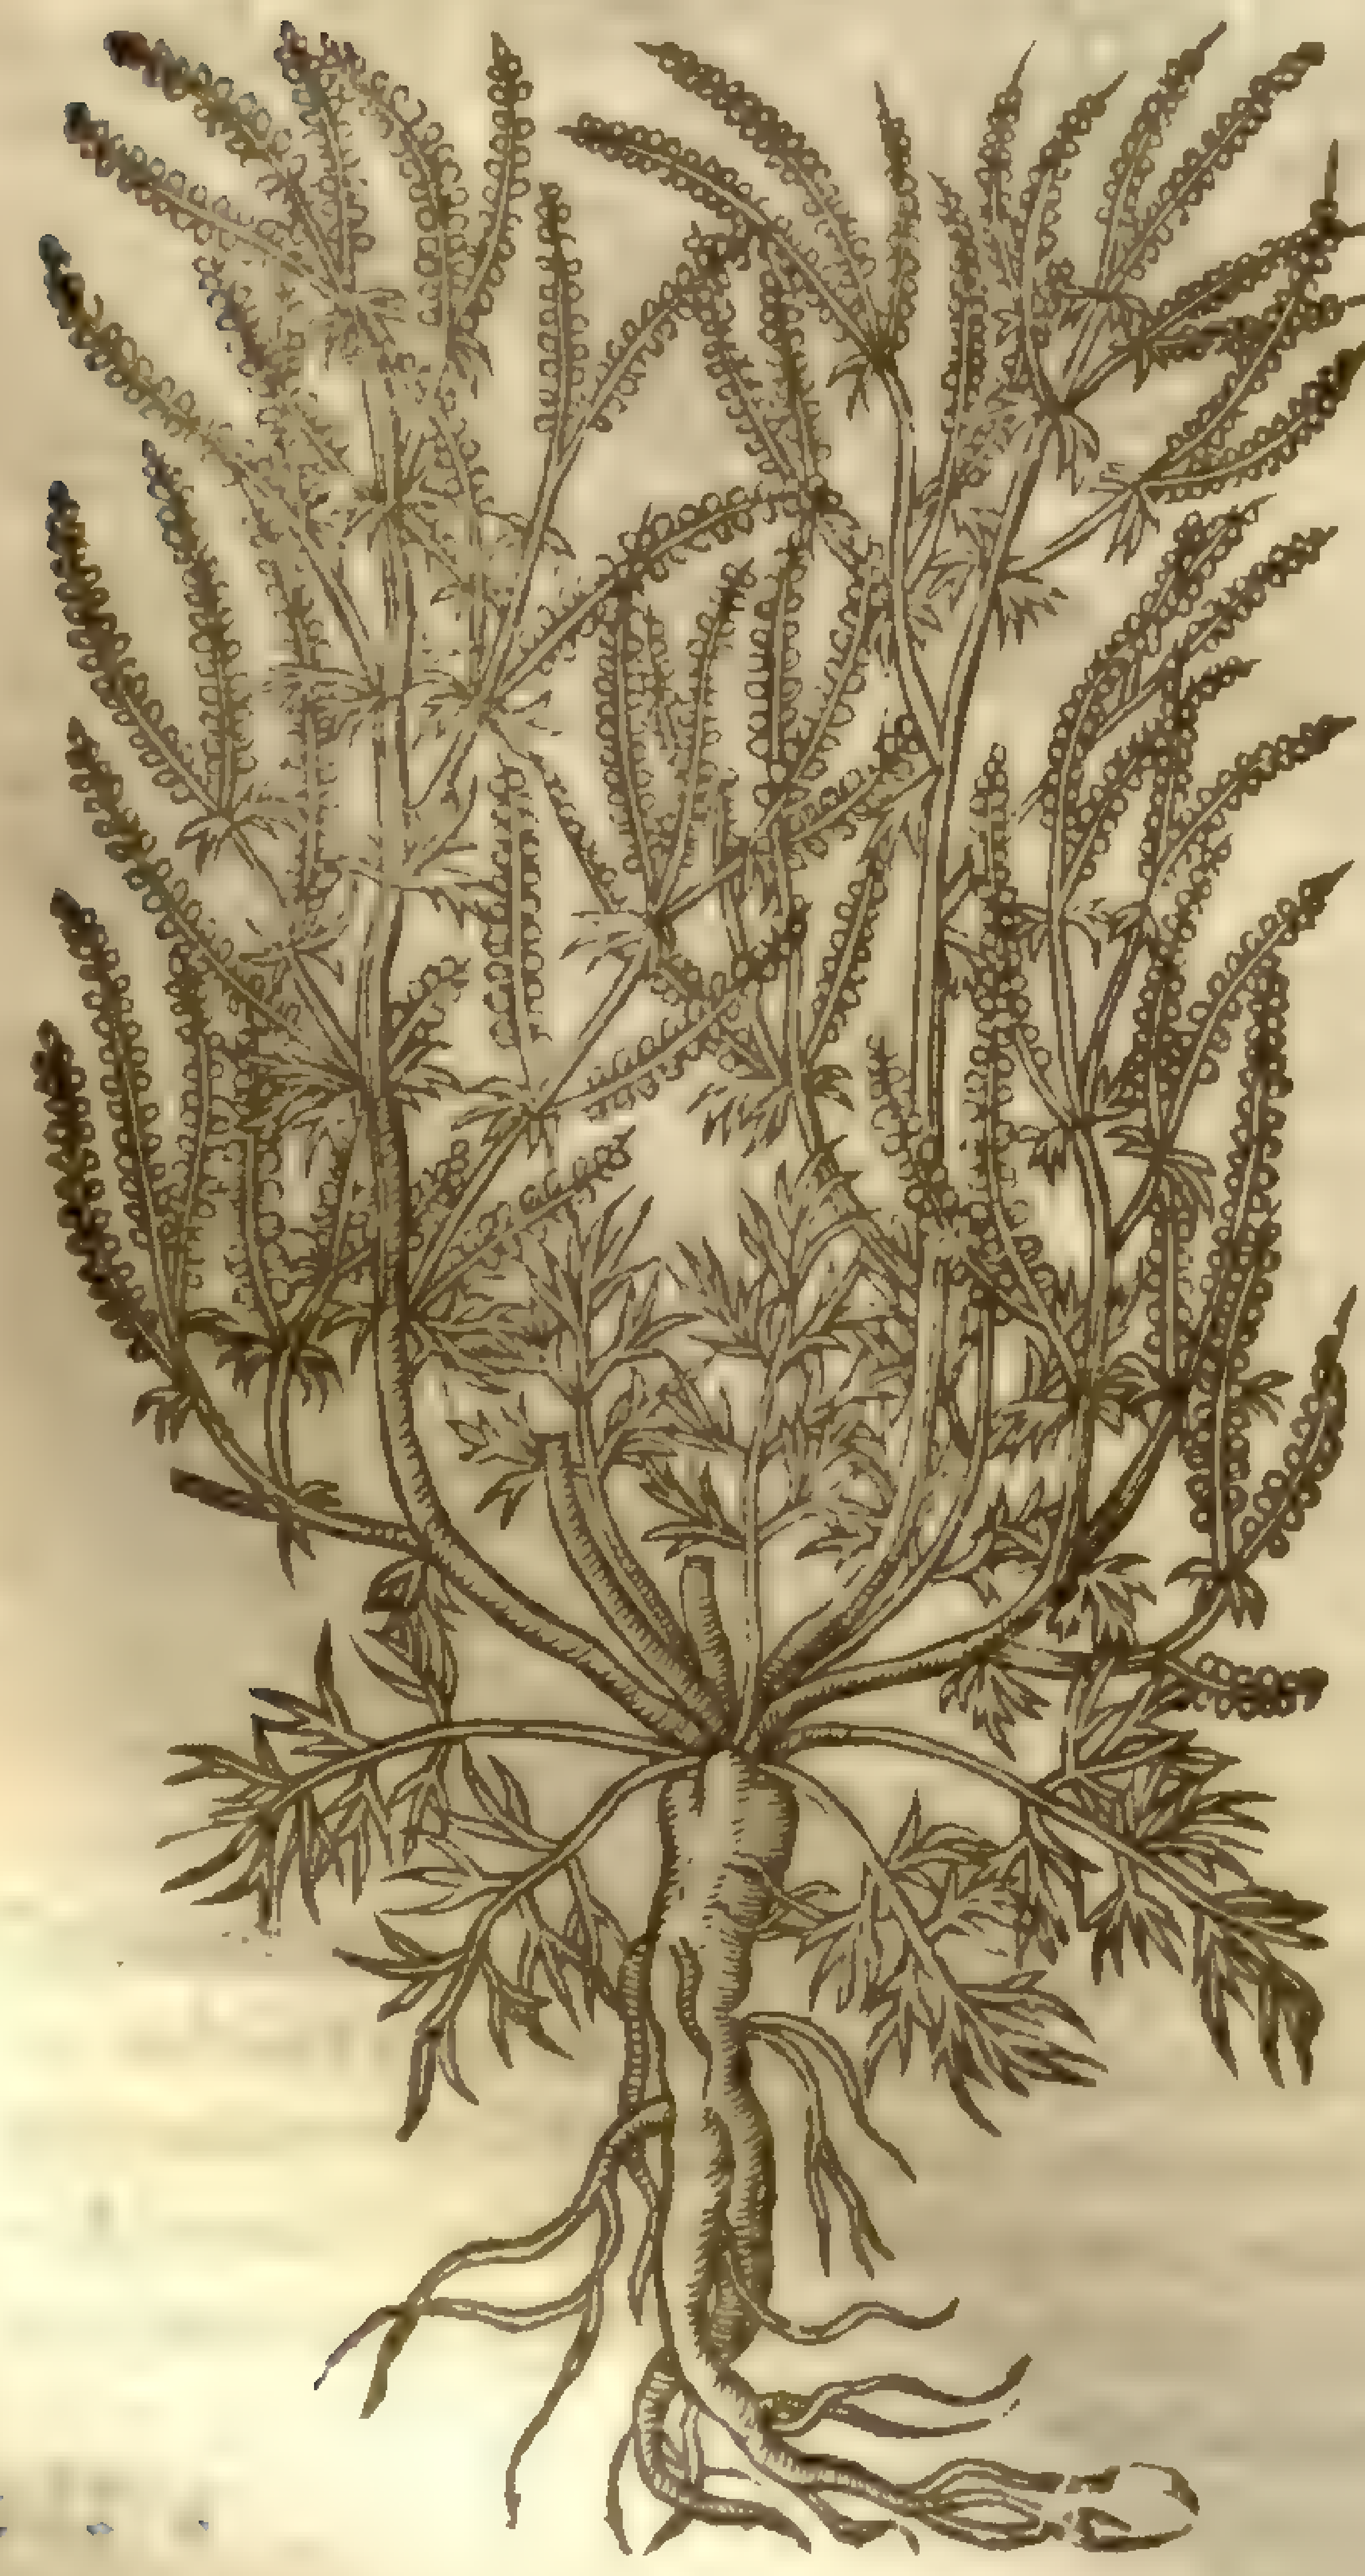
4 *Abrotanum inodorum.*
Vnſauorie Sothernwood.



Artemisia campestris, L.
[illegible]

hb. [illegible] 269

5 *Abrotanum campeſtre.*
Wilde Sothernwood.



Artemisia campestris, L.
[illegible] dut.

2 The leſſer Sothernwood groweth low, ful of little ſprigs of a wooddy ſubſtance: the leaues are long, and ſmaller than thoſe of the former, not ſo white: it beareth cluſtering buttons vpon the top of the ſtalkes: the root is made of many ſtrings.

3 The third kind is alſo ſhorter: the leaues hereof are jagged and deeply cut after the maner of the greater Sothernwood, but they are not ſo white, yet more ſweet, wherein they are like vnto Lauander cotton. This kinde is very full of ſeed: the buttons ſtand alongſt on the ſprigs, euen to the very top, and be of a glittering yellow. The root is like to the reſt.

4 The vnſauorie Sothernwood groweth flat vpon the ground, with broad leaues deepely cut or jagged in the edges like thoſe of the common Mugwort: among which riſe vp weake and feeble ſtalkes trailing likewiſe vpon the ground, ſet confuſedly here and there with the like leaues that grow next the ground, of a grayiſh or hoary colour, altogether without ſmell. The floures grow alongſt the ſtalkes, of a yellowiſh colour, ſmall and chaffie: the root is tough and wooddy, with ſome ſtrings annexed thereto.

5 This wilde Sothernwood hath a great long thicke root, tough and wooddy, couered

ouer with a ſcaly barke like the ſcaly backe of an Adder, and of the ſame colour: from which riſe very many leaues like thoſe of Fennell, of an ouerworne greene colour: among which grow ſmall twiggy branches on the tops, and alongſt the ſtalkes doe grow ſmall cluſtering floures of a yellow colour: the whole plant is of a darke colour, as well leaues as ſtalkes, and of a ſtrong vnſauourie ſmell.

¶ *The Place.*

Theophraſtus ſaith that Sothernwood delighteth to grow in places open to the Sun: *Dioſcorides* affirmeth that it groweth in Cappadocia, and Galatia a countrey in Aſia, and in Hierapolis a city in Syria: it is planted in gardens almoſt euery where: that of Sicilia and Galatia is moſt commended of *Pliny*.

¶ *The Time.*

The buttons of Sothernwood doe flouriſh and be in their prime in Auguſt, and now and then in September.

¶ *The Names.*

It is called in Greeke, *ἀβρότονον*: the Latines and Apothecaries keepe the ſame name *Abrotanum*: the Italians and diuers Spaniards call it *Abrotano*: and other Spaniards, *Yerua lombriguera*: in high Dutch, **Stabwurtz**: in low Dutch, **Aueroone**, and **Auercruijt**: the French, *Aurone*, and *Auroeſne*: the Engliſh men, Sothernwood: it hath diuers baſtard names in *Dioſcorides*; the greater kinde is *Dioſcorides* his *Fœmina*, or female Sothernewood; and *Pliny* his *Montanum*, or mountaine Sothernewood: the mountaine Sothernwood we take for the female, and the champion for the male. There be notwithſtanding ſome that take Lauander Cotton to be the female Sothernwood; grounding thereupon, becauſe it bringeth forth yellow floures in the top of the ſprigs like cluſter buttons: but if they had more diligently pondered *Dioſcorides* his words, they would not haue beene of this opinion: the leſſer Sothernewood is *Mas*, the male, and is alſo *Plinies* champion Sothernwood; in Latine, *Campeſtre*. The third, as we haue ſaid, is likewiſe the female, and is commonly called ſweet Sothernwood, becauſe it is of a ſweeter ſent than the reſt. *Dioſcorides* ſeemeth to call this kinde *Siculum*, Sicilian Sotherwood.

¶ *The Temperature.*

Sothernewood is hot and dry in the end of the third degree: it hath alſo force to diſtribute and to rarifie.

¶ *The Vertues.*

The tops, floures, or ſeed boyled, and ſtamped raw with water and drunke, helpe them that cannot take their breaths without holding their neckes ſtraight vp, and is a remedie for the cramp and for ſinewes ſhrunke and drawne together; for the ſciatica alſo, and for them that can hardly make water; and it is good to bring downe the termes. A

It killeth wormes, and driueth them out: if it be drunke with wine it is a remedy againſt deadly poyſons. B

Alſo it helpeth againſt the ſtinging of Scorpions and field ſpiders, but it hurts the ſtomacke. C

Stamped and mixed with oyle it taketh away the ſhiuering cold that commeth by the ague fits, and it heateth the body if it be annointed therewith before the fits do come. D

If it be pouned with barley meale and laid to puſhes it taketh them away. E

It is good for inflammations of the eies, with the pulpe of a roſted Quince, or with crummes of bread, and applied pultis wiſe. F

The aſhes of burnt Sothernwood, with ſome kinde of oyle that is of thin parts, as of *Palma Chriſti*, Raddiſh oyle, oyle of ſweet Marjerome, or Organie, cure the pilling of the haire of the head, and make the beard to grow quickely: being ſtrewed about the bed, or a fume made of it vpon hot embers, it driueth away ſerpents: if but a branch be laid vnder the beds head they ſay it prouoketh venerie. G

The ſeed of Sothernwood made into pouder, or boyled in wine and drunke, is good againſt the difficultie and ſtopping of vrine; it expelleth, waſteth, conſumeth, and digeſteth all cold humours, tough ſlime and flegme, which do vſually ſtop the ſpleene, kidnies, and bladder. H

Sothernwood drunke in wine is good againſt all venome and poiſon. I

The leaues of Sothernwood boyled in water vntill they be ſoft, and ſtamped with barley meale and barrowes greaſe vnto the forme of a plaiſter, diſſolue and waſte all cold tumors and ſwellings, being applied or laid thereto. K

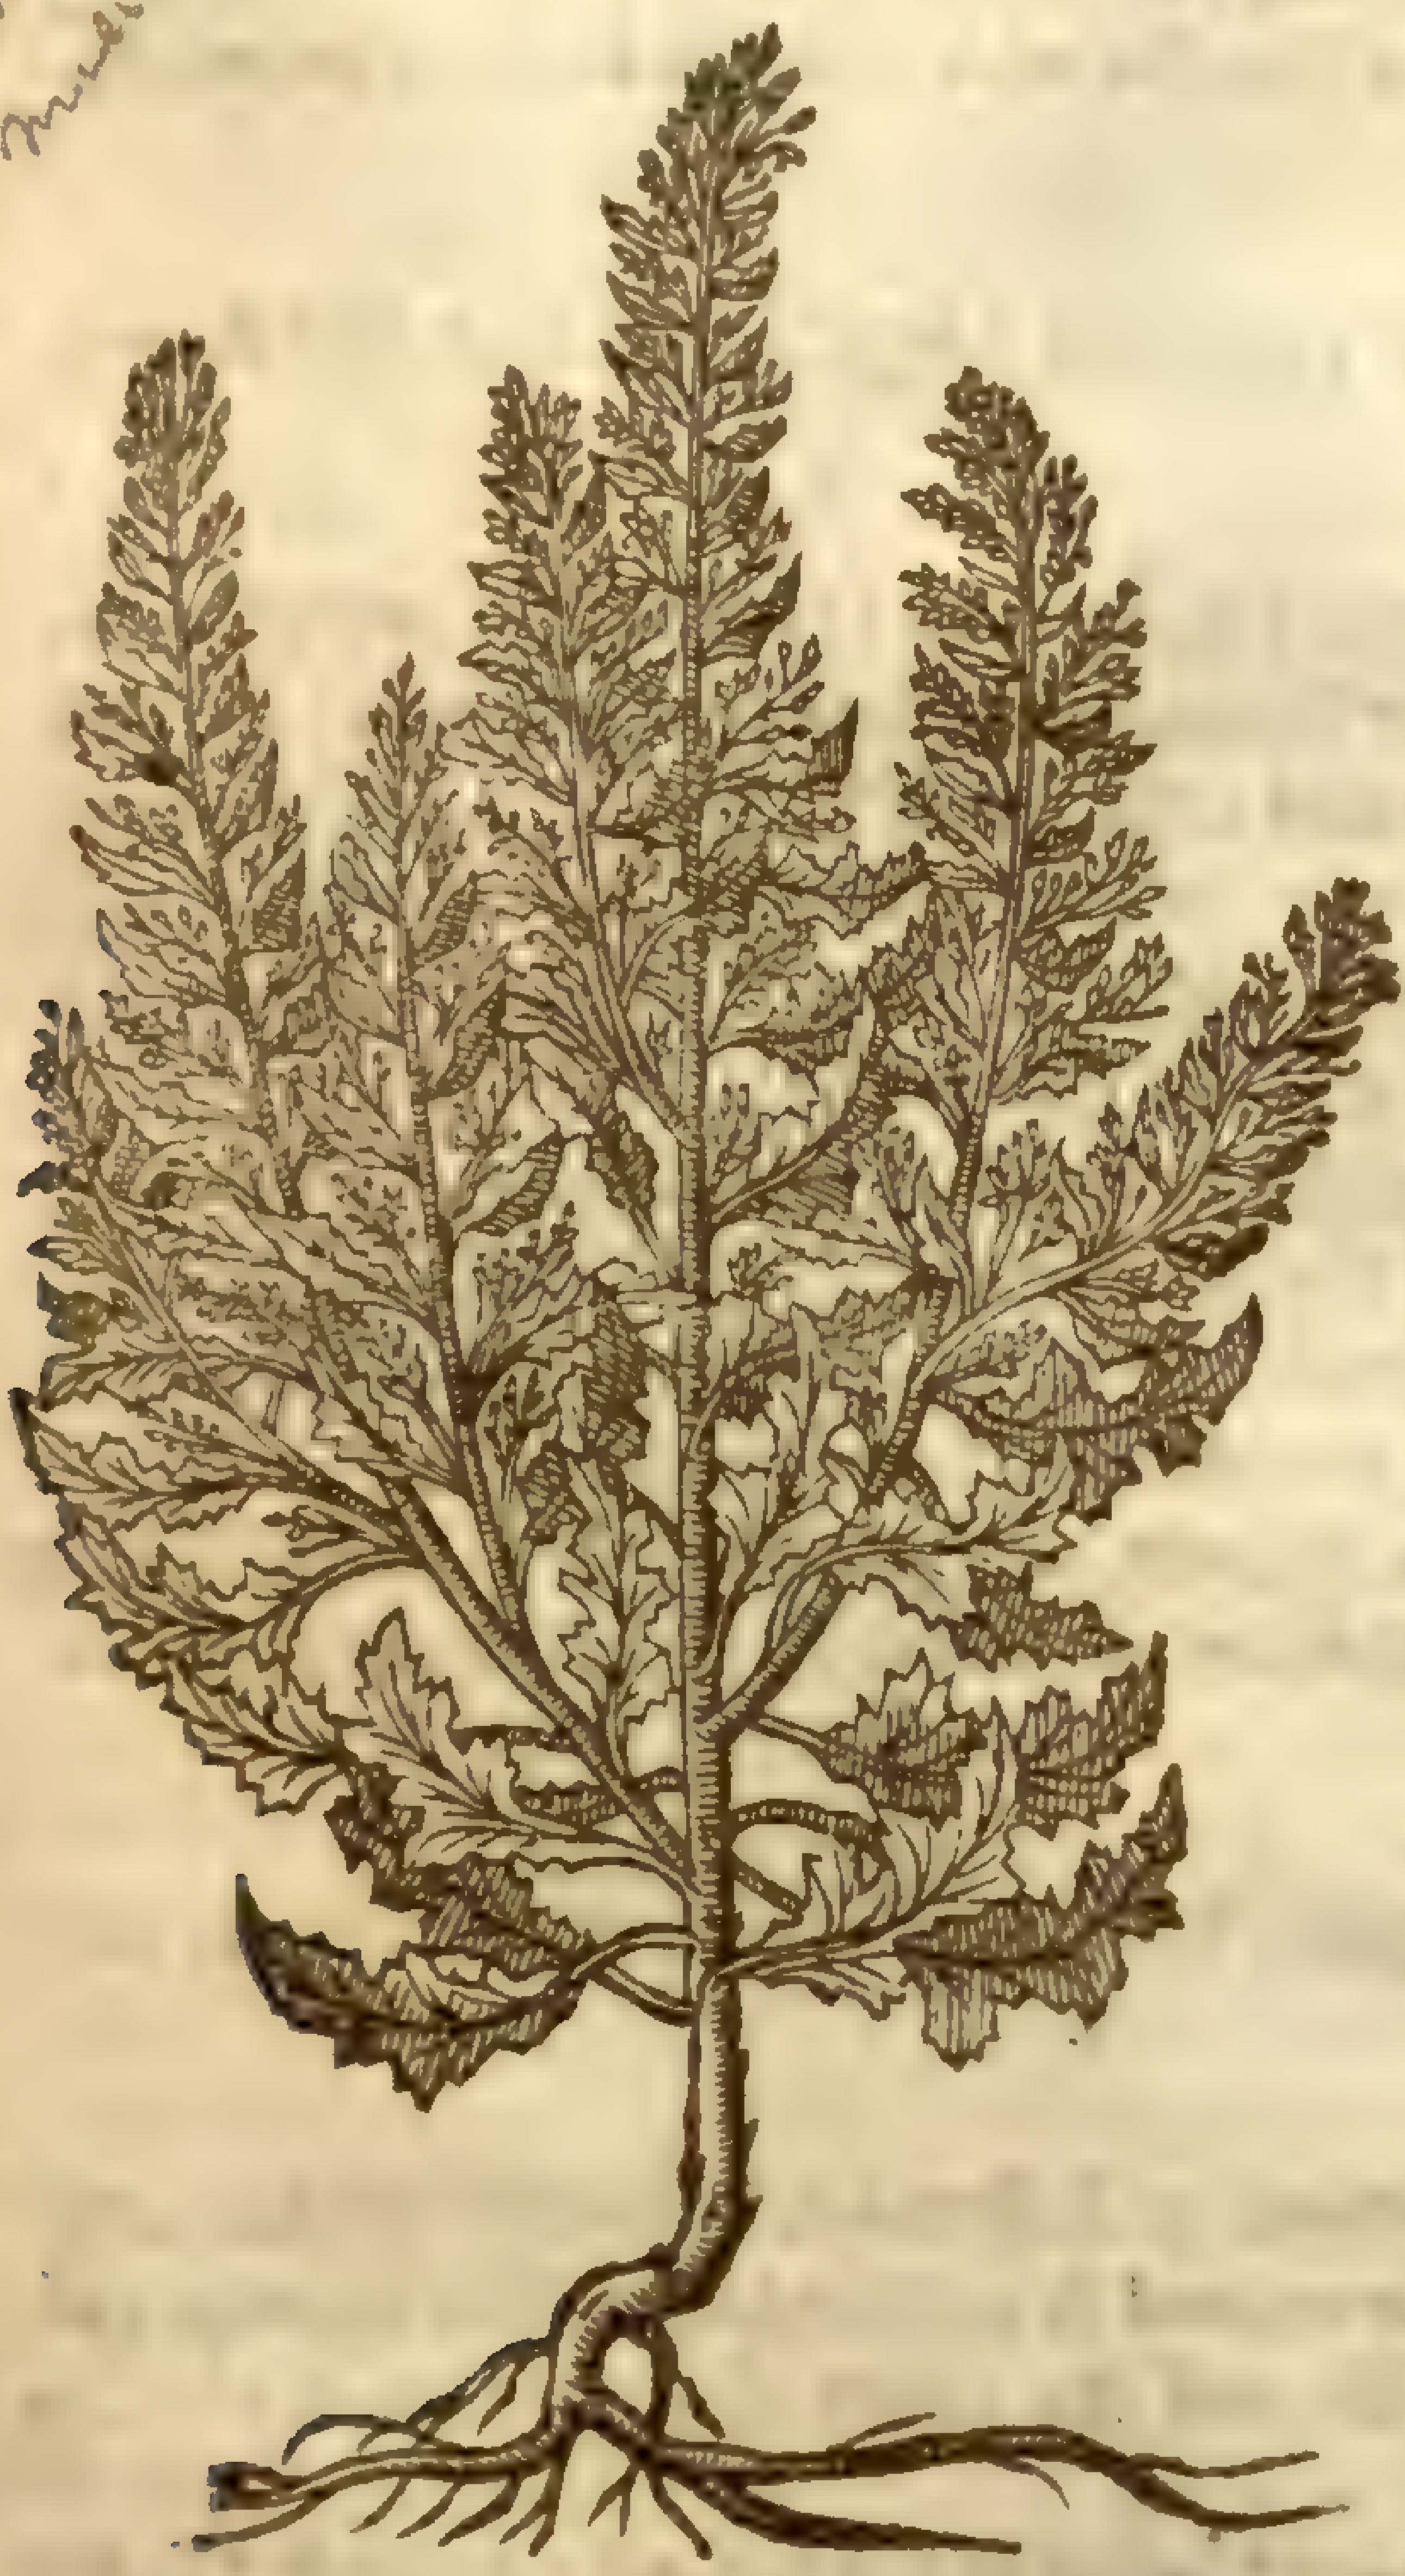
† The deſcription here in the firſt place is that of the *Abrotanum fœmina arboreſcens* of *Dodonæus*, being the very firſt in his *Pemptades*. The figure which our Author put thereto was of the Lauander Cotton, which ſhould haue beene in the next chapter ſaue one: Now the figure that hee ſhould haue put here was put two chapters before, by the name of *Abſinthium arboreſcens*, by which name *Lobel* alſo calls it: but I haue thought it fitter to put it here, becauſe here was the better deſcription, and the plant is the better referred to this kinde.

CHAP. 455.

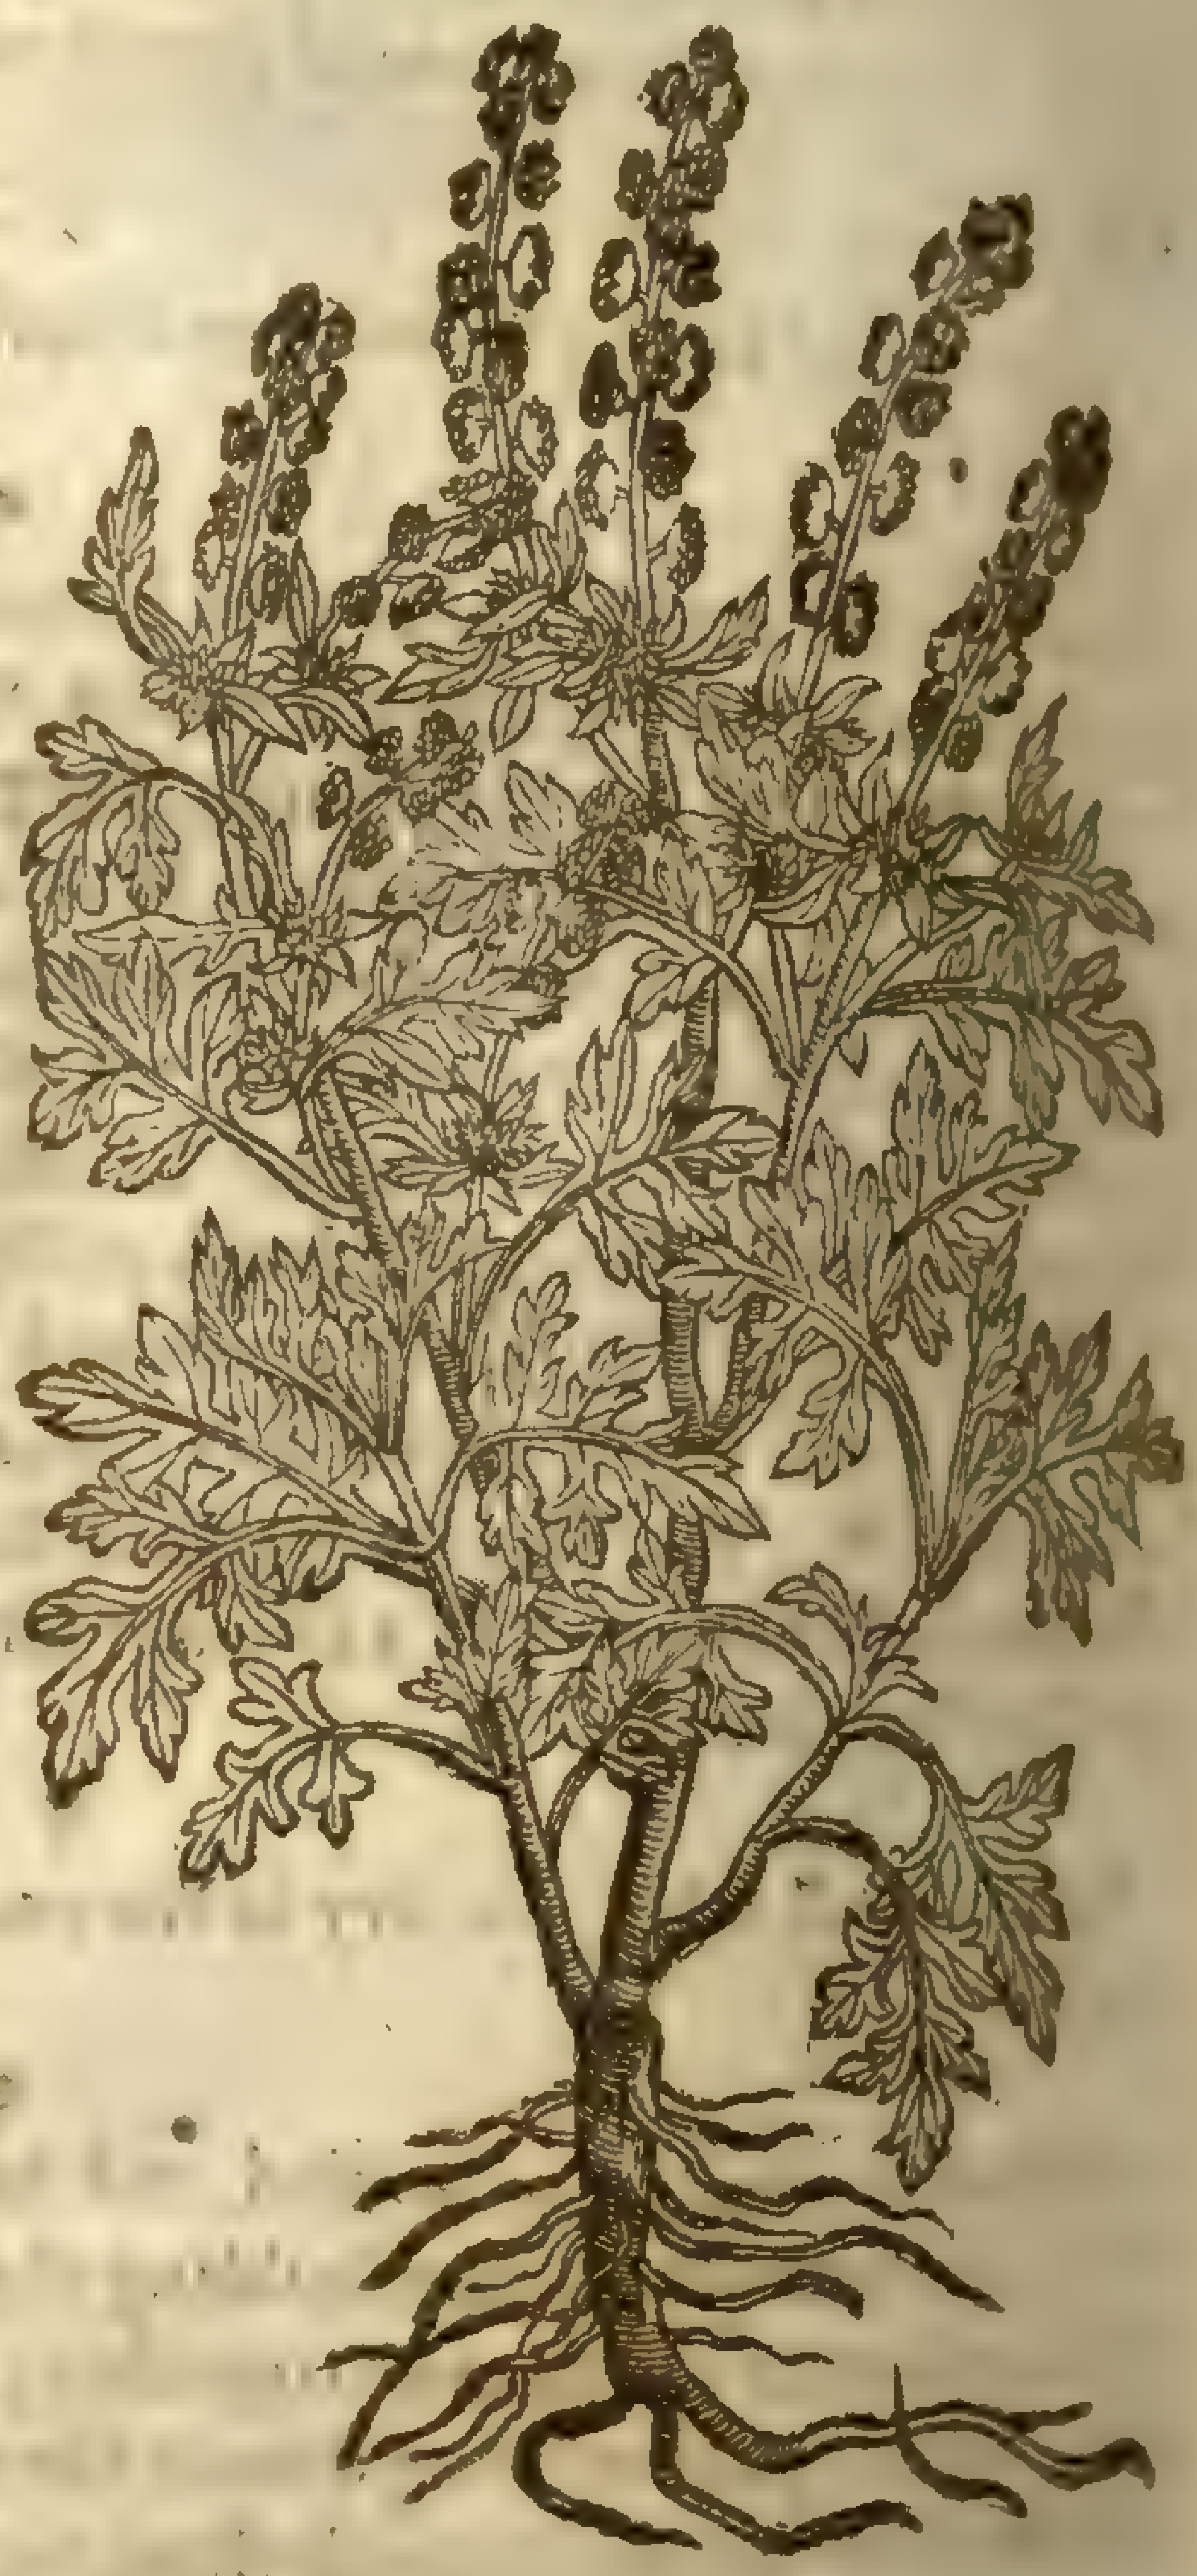
Of Oke of Ieruſalem, and Oke of Cappadocia.

Chenopodium botrys
med.

1 *Botrys.*
Oke of Ieruſalem.



2 *Ambroſia.*
Oke of Cappadocia.



¶ *The Deſcription.*

1 OKe of Ieruſalem, or *Botrys*, hath ſundry ſmall ſtems a foot and a halfe high, diuiding themſelues into many ſmall branches, beſet with ſmall leaues deeply cut or jagged, very much reſembling the leafe of an Oke, which hath cauſed our Engliſh women to call it Oke of Ieruſalem; the vpper ſide of the leafe is of a deepe greene, and ſomewhat rough and hairy, but vnderneath it is of a darke reddiſh or purple colour: the ſeedie floures grow cluſtering about the branches, like the yong cluſters or blowings of the Vine: the root is ſmall and threddy: the whole herbe is of a pleaſant ſmell and ſauour, and of a feint yellowiſh colour, and the whole plant dieth when the ſeed is ripe.

2 The fragrant ſmell that this kinde of *Ambroſia* or Oke of Cappadocia yeeldeth, hath moued the Poëts to ſuppoſe that this herbe was meate and food for the gods: *Dioſcorides* ſaith it groweth three handfuls high: in my garden it groweth to the height of two cubits, yeelding many weake crooked and ſtreaked branches, diuiding themſelues into ſundry other ſmall branches, hauing from the middeſt to the top thereof many moſſie yellowiſh floures not much vnlike common Wormewood, ſtanding one before another in good order; and the whole plant is as it were couered ouer with bran or a mealy duſt: the floures doe change into ſmall prickly cornered buttons, much like vnto *Tribulus terreſtris*; wherein is contained blacke round ſeed, not vnpleaſant in taſte and ſmell: the leaues are in ſhape like the leaues of Mugwort, but thinner and more tender: all the whole plant is hoary, and yeeldeth a pleaſant ſauour: the whole plant periſhed with me at the firſt approch of Winter.

¶ *The Place.*

Theſe plants are brought vnto vs from beyond the ſeas, eſpecially from Spaine and Italy.

¶ *The Time.*

They floure in Auguſt, and the ſeed is ripe in September.

¶ *The Names.*

Oke of Ieruſalem is called in Greeke Βότρυς : in Latine, *Botrys* : in Italian, *Botri* : in Spaniſh, *Bien Granada* : in high-Dutch, **Traukenkraut**, and **Krottenkraut** : in French and low-Dutch, *Pyment* : in Engliſh, Oke of Ieruſalem, and of ſome, Oke of Paradiſe.

Oke of Cappadocia is called in Greeke Ἀμβροσία : in Latine, *Ambroſia*, neither hath it any other knowne name. *Pliny* ſaith, *Ambroſia* is a wandering name, and is giuen vnto other herbs : for *Botrys* (Oke of Ieruſalem, as we haue written) is of diuers alſo called *Ambroſia*. In Engliſh it is called oke of Cappadocia.

¶ *The Temperature.*

Theſe plants are hot and dry in the ſecond degree, and conſiſt of ſubtill parts.

¶ *The Vertues.*

Theſe plants be good to be boiled in wine, and miniſtred to ſuch as haue their breſts ſtopt, and are ſhort winded and cannot eaſily draw their breath; for they cut and waſt groſſe humors & tough flegm. The leaues are of the ſame force, beeing made vp with ſugar they commonly call it a Conſerue. A

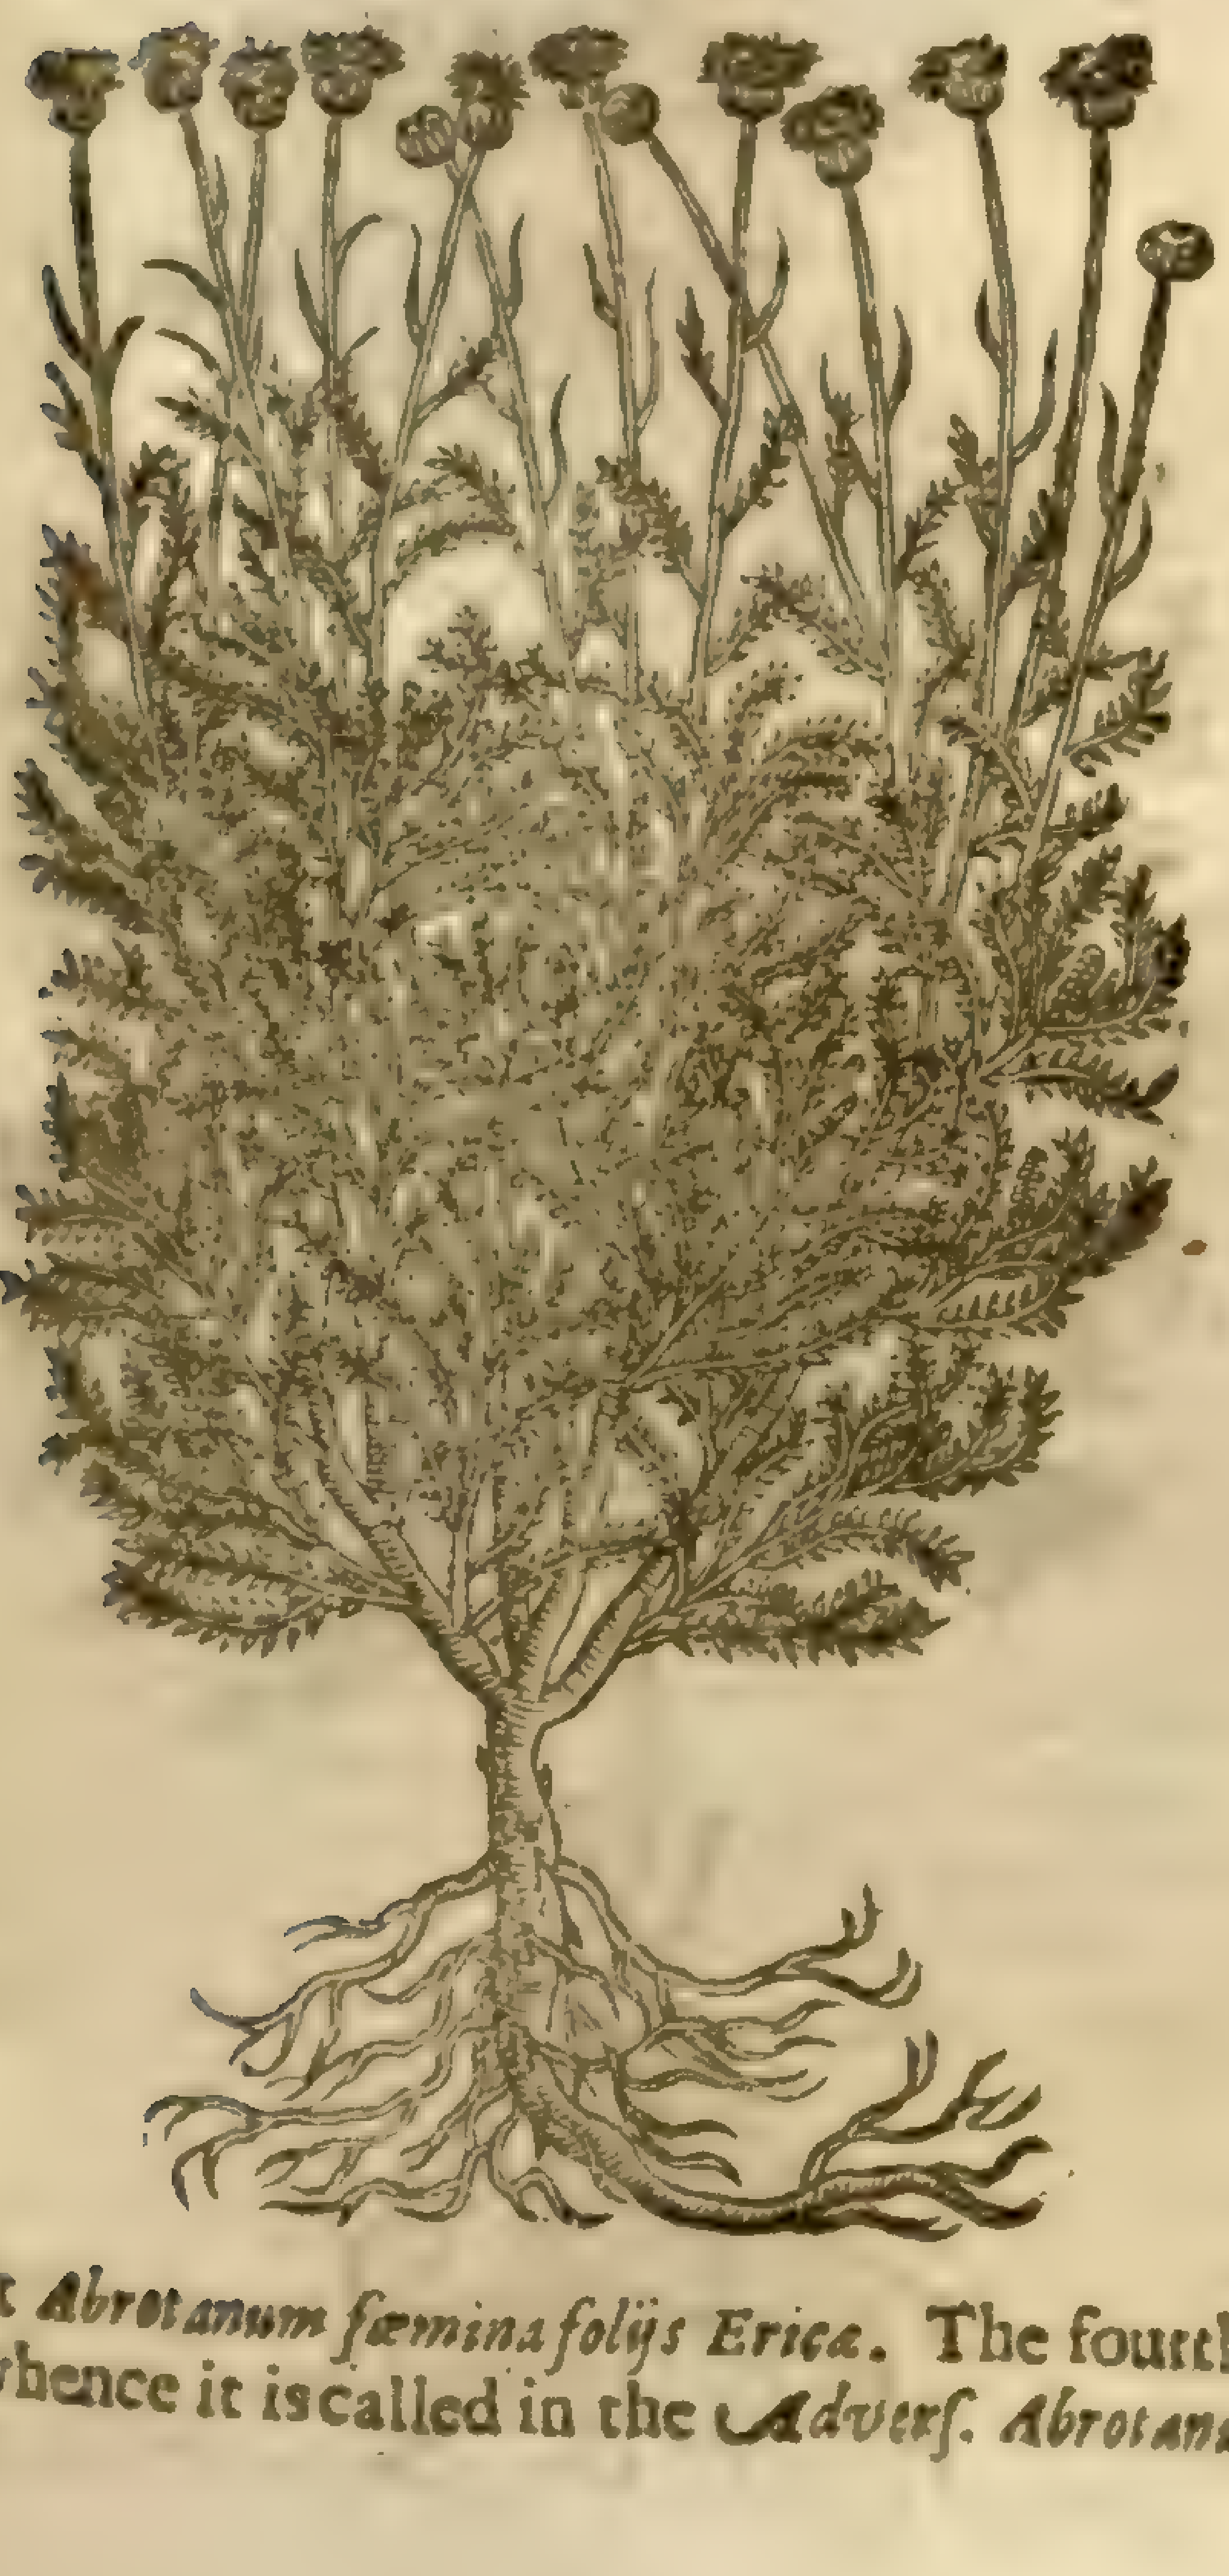
It giueth a pleaſant taſte to fleſh that is ſodden with it, and eaten with the broth. B

It is dried and laid among garments, not onely to make them ſmell ſweet, but alſo to preſerue them from moths and other vermin, which thing it doth alſo performe. C

† There were formerly two more deſcriptions in this Chapter, both which were made by looking vpon the figures in *Lobels Icons*; the former being of his *Ambroſia ſpontanea ſtrigoſior*, which is nothing elſe but the *Coronopus Ruellij* or Swines Creſſes. The later was of his *Ambroſia tenuifolia*, which our Authour in the laſt Chapter ſet forth by the name of *Abrotanum campeſtre*.

Chap. 456. *Of Lavander Cotton.*

† *Chamæcypariſſus.*
Lavander Cotton.



¶ *The Deſcription.*

Lavander Cotton bringeth forth cluſtred buttons of a golden colour, and of a ſweet ſmel, and is often vſed in garlands and houſes. It hath a wooddy ſtocke, out of which grow forth branches like little boughes, ſlender, very many, a cubit long, ſet about with little leaues, long, narrow, purled or crumpled : on the tops of the branches ſtand vp floures, one alone on euery branch, made vp with ſhort threds thruſt cloſe together, like to the flours of Tanſie, and to the middle buttons of the floures of Cammomill, but yet ſomething broader, of colour yellow, which be changed into ſeed of an obſcure colour : the root is of a wooddy ſubſtance ; the ſhrub it ſelfe is white both in branches and leaues, and hath a ſtrong ſweet ſmell.

‡ There are ſome varieties of this plant, which *Matthiolus*, *Lobel*, and others refer to *Abrotanum fœmina*, and ſo cal it; and by the ſame name our Author gaue the figure thereof in the laſt Chapter ſaue one, though the deſcription did not belong thereto, as I haue formerly noted. Another ſort thereof our Author, following *Tabernamontanus* and *Lobel*, ſet forth a little before by the name of *Abſinthium marinum Abrotani fœminæ facie*, which *Dodonæus* calls *Santolina prima*; and this here figured, *Santolina altera*. He alſo mentions three other differences thereof, which chiefely conſiſt in the leaues; for his third hath very ſhort and ſmall leaues like thoſe of Heath; whence *Bauhine* calls it *Abrotanum fœmina folijs Ericæ*. The fourth hath the leaues leſſe toothed, and more like Cypres, whence it is called in the *Adverſ. Abrotanum peregrinum cupreſsi folijs*. The fift hath not the ſtalkes

growing vpright, but creeping; the leaues are toothed, more thicke and hoary than the reſt, in other reſpects alike. *Bauhine* calls it *Abrotanum fœmina repens caneſcens.*

¶ The Place.

Lavander Cotton groweth in gardens almoſt euerie where.

¶ The Time.

They floure in Iuly and Auguſt.

¶ The Names.

They are called by one name *Santolina*, or Lavander Cotton: of moſt, *Chamæcypariſſus*: but *Pliny* concerning *Chamæcypariſſus* is ſo ſhort and brief, that by him their opinions can neither be rejected nor receiued.

They are doubtleſſe much deceiued that would haue Lavander Cotton to be *Abrotanum fœmina*, or the female Sothernwood; and likewiſe they are in the wrong who take it be *Seriphium*, ſea wormwood; and they who firſt ſet it abroch to be a kinde of Sothernwood, we leaue to their errours, becauſe it is not abſolutely to be referred to one, but a plant participating both of Wormwood and Sothernwood.

¶ The Nature.

The ſeed of Lavander Cotton hath a bitter taſte, being hot and dry in the third degree.

¶ The Vertues.

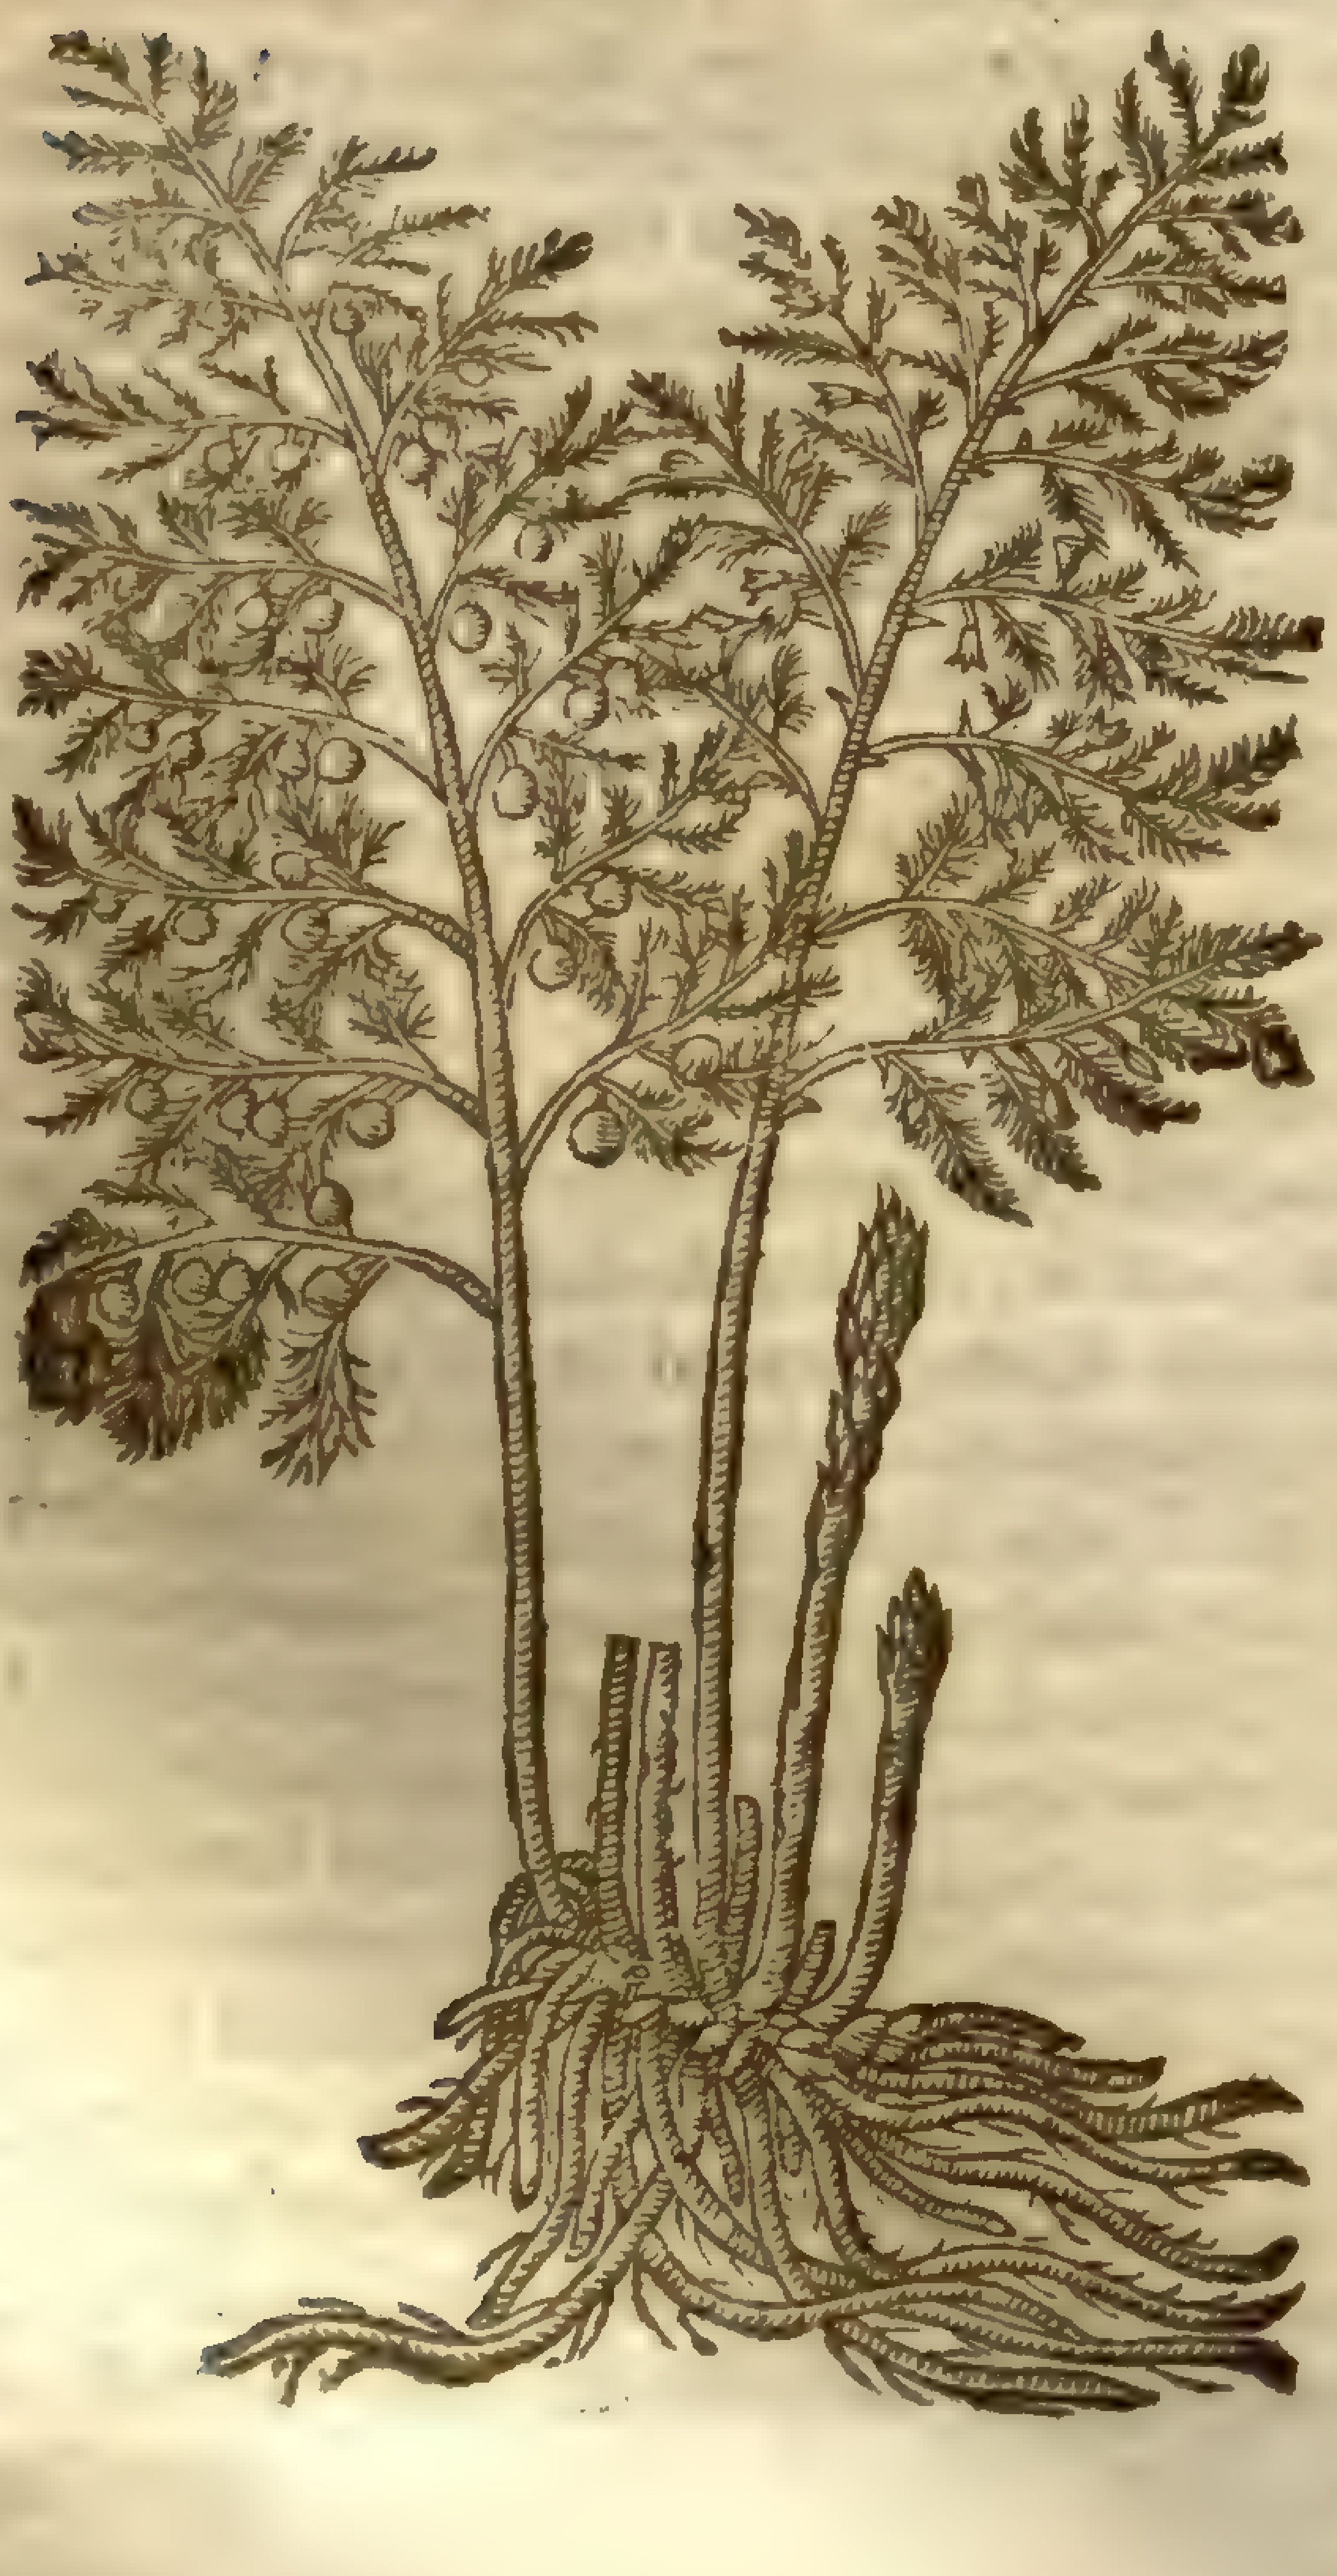
A *Pliny* ſaith, That the herb *Chamæcypariſſus* being drunke in wine is a good medicine againſt the poiſon of all ſerpents and venomous beaſts.

B It killeth wormes either giuen greene or dry, and the ſeed hath the ſame vertue againſt wormes, but avoideth them with greater force. It is thought to be equall with the vſuall wormſeed.

† The figure which formerly was in this place was a kinde of Moſſe, which *Tragus* ſet forth by the name of *Savina ſylveſtris*: *Turner* and *Tabernæmontanus* called it *Chamæcypariſſus*. See more thereof in the Moſſes.

Chap. 457. *Of Sperage or Aſparagus.*

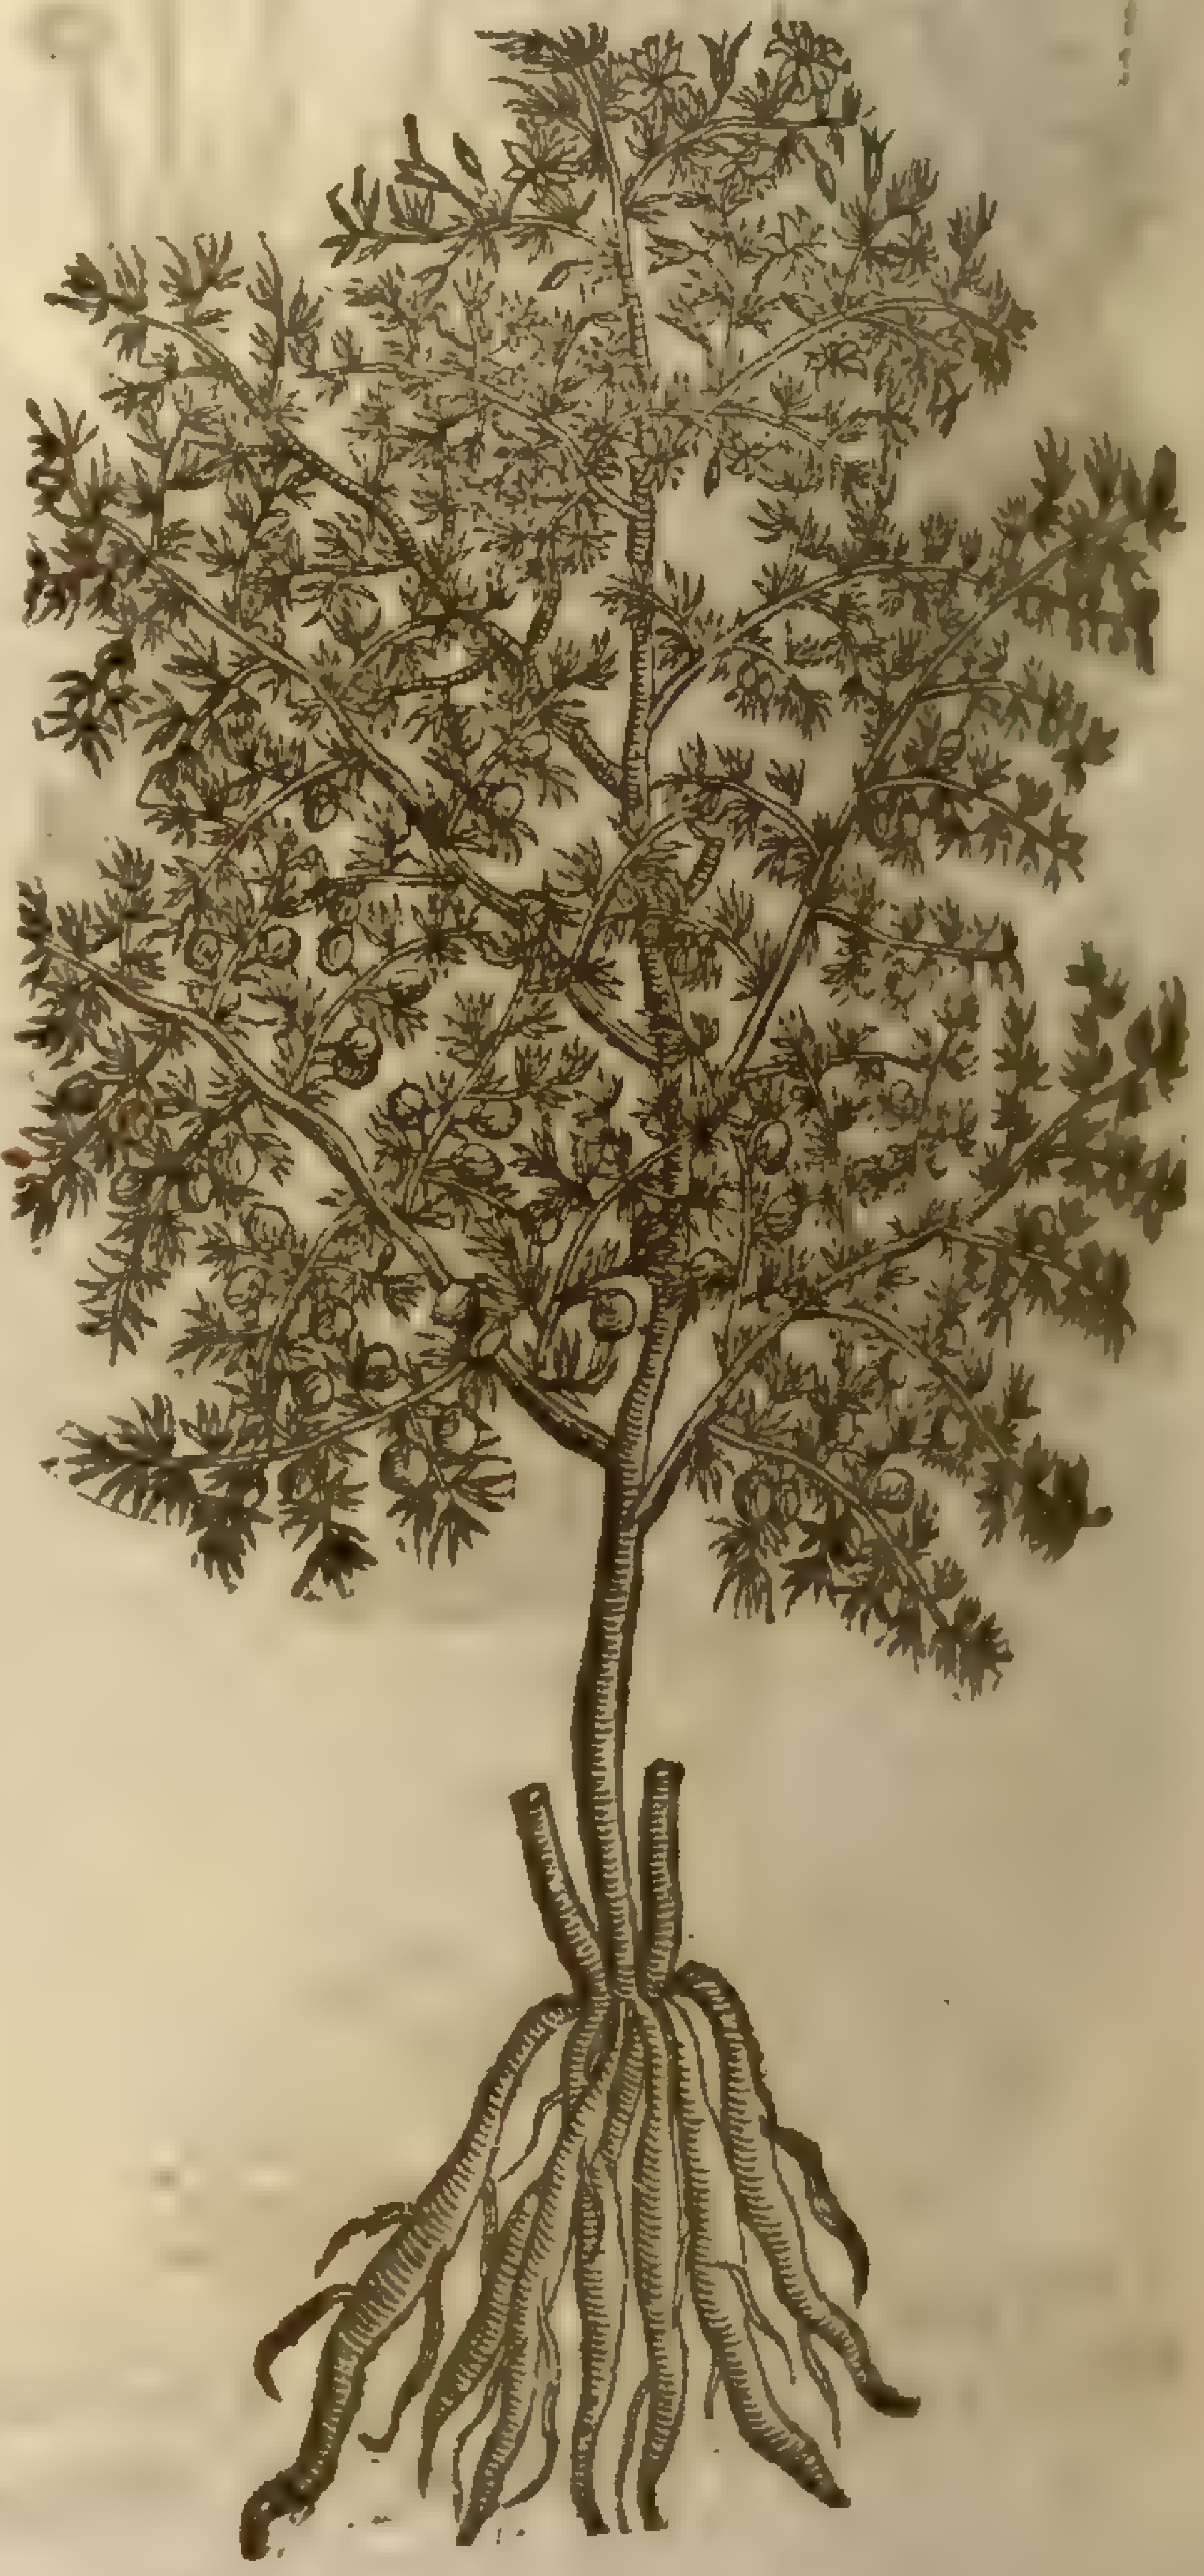
1 *Aſparagus ſativus.*
Garden Sperage.



A. officinalis, L.
Mill. Dict.

2 *Aſparagus petræus.*
Stone or Mountaine Sperage.

A. acutifolius, L.
Mill. Dict.



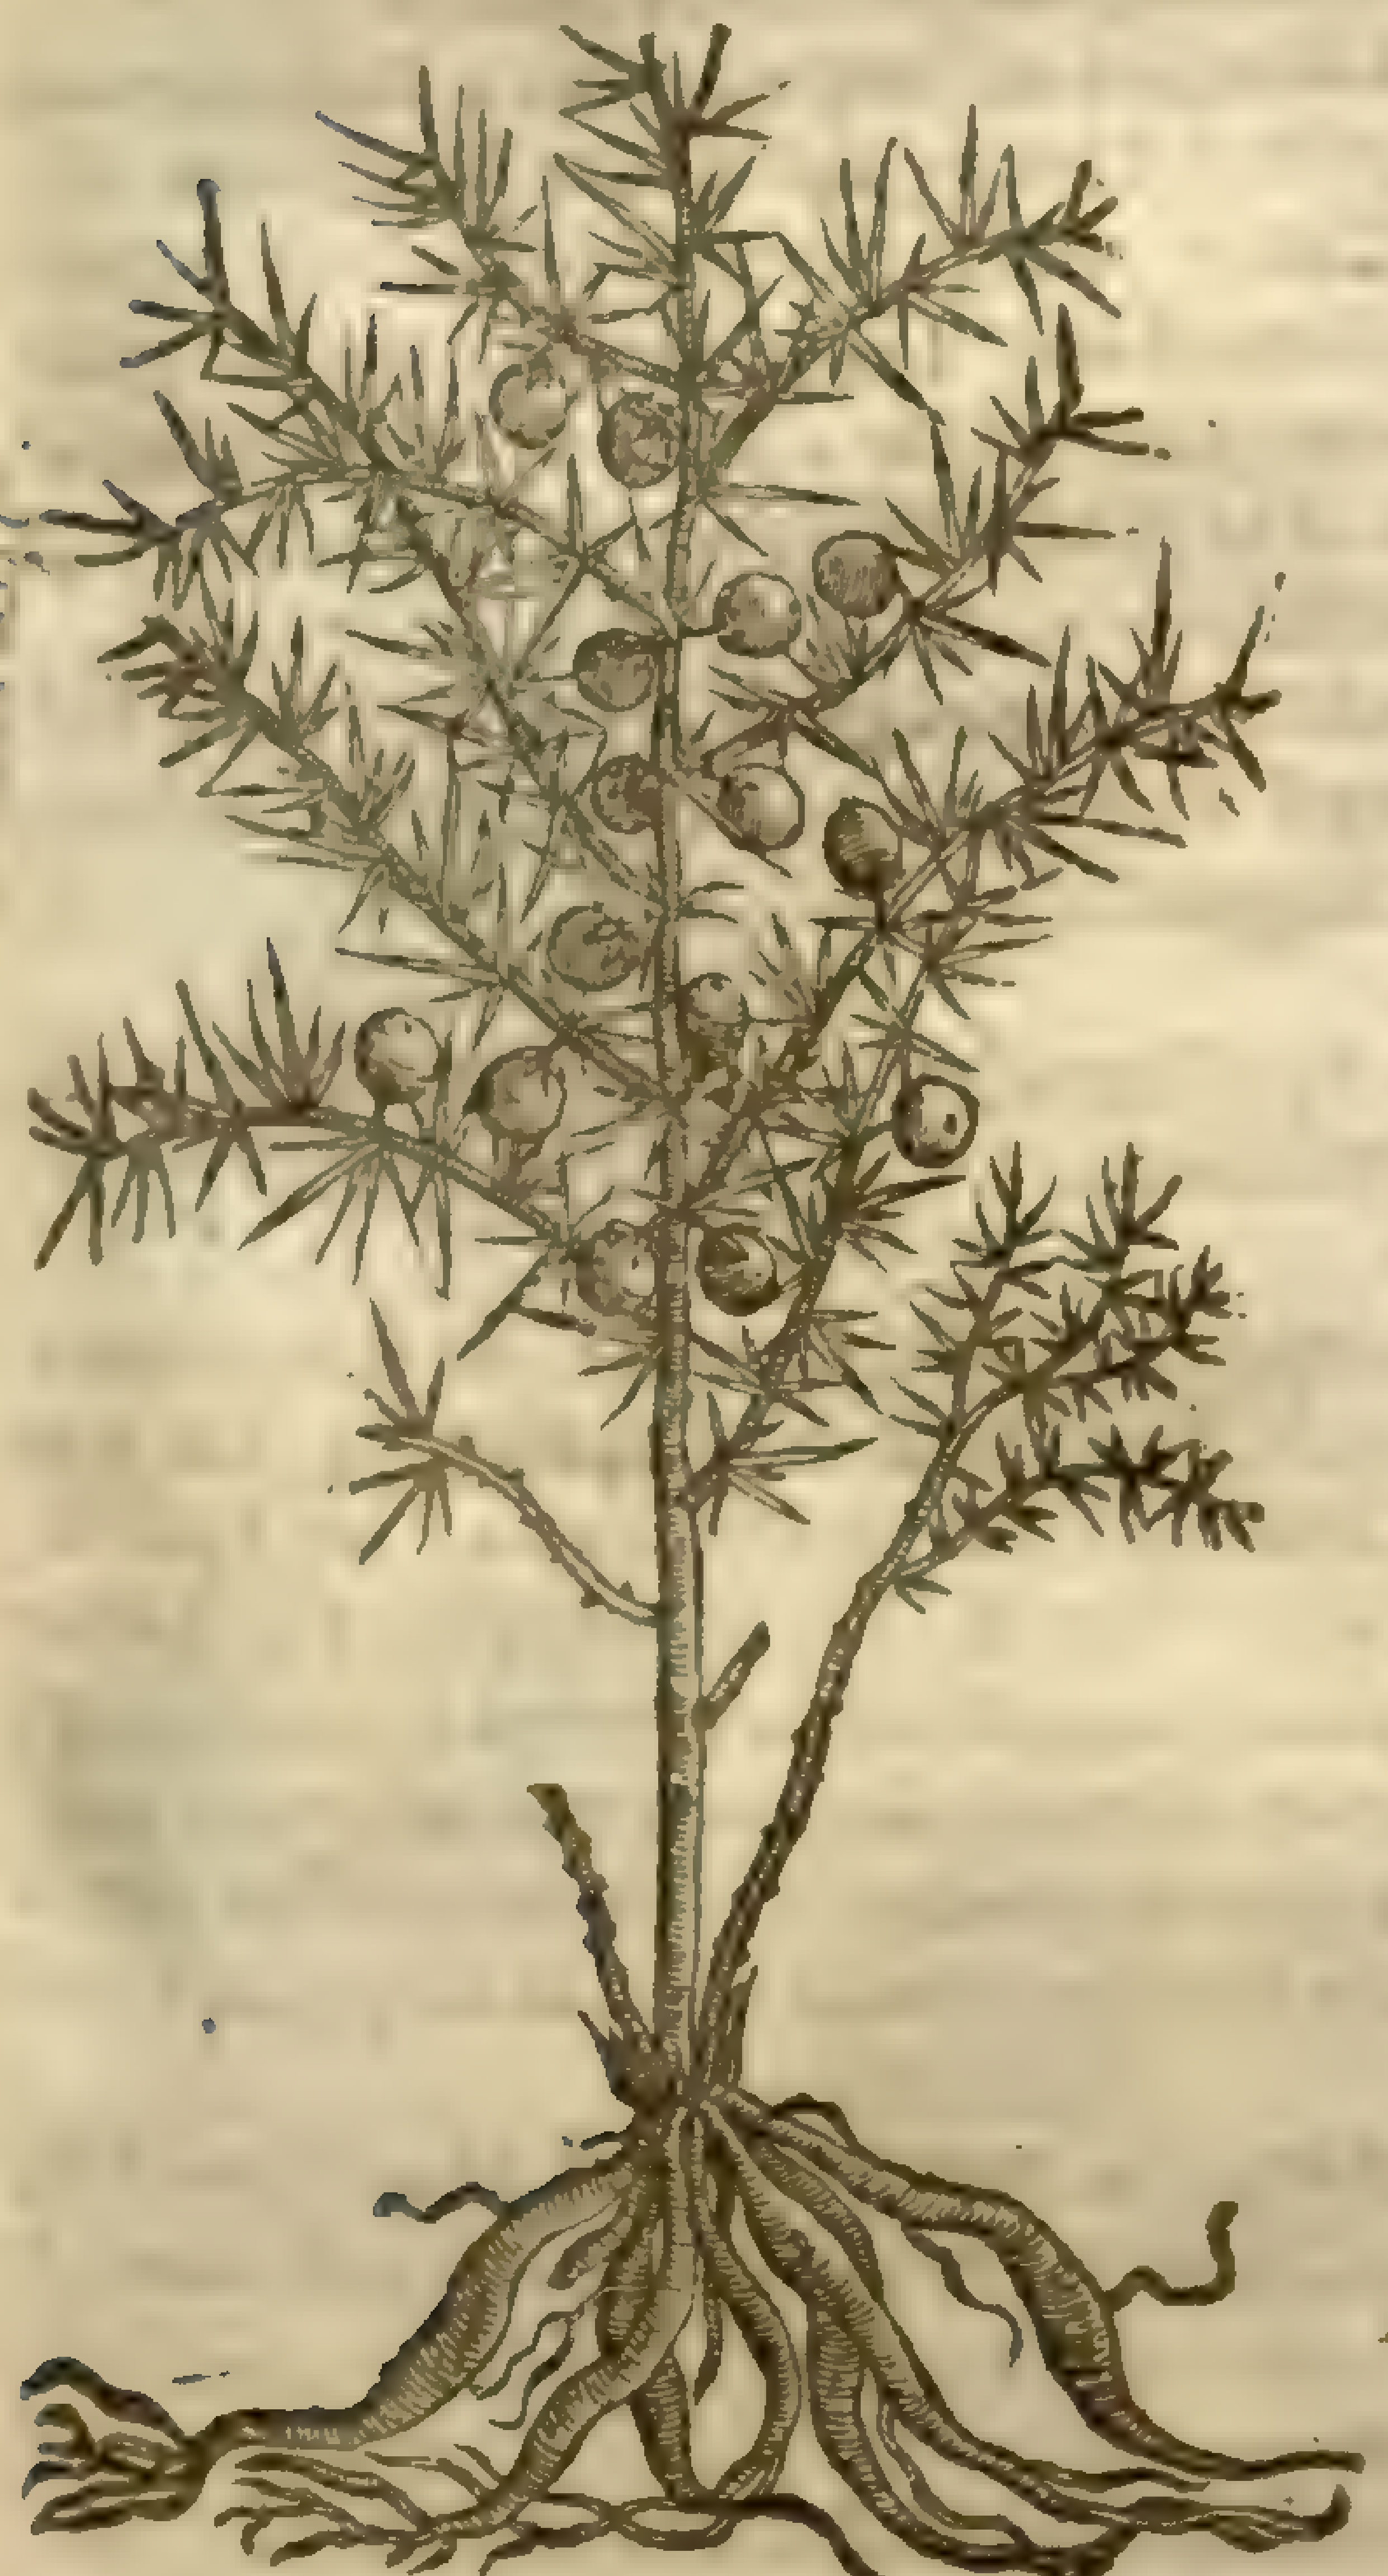
¶ *The Deſcription.*

1 THe firſt being the manured or garden Sperage, hath at his firſt riſing out of the ground thicke tender ſhoots very ſoft and brittle, of the thickneſſe of the greateſt ſwans quill, in taſte like the green bean, hauing at the top a certaine ſcaly ſoft bud, which in time groweth to a branch of the height of two cubits, diuided into diuers other ſmaller branches, wheron are ſet many little leaues like haires, more fine than the leaues of Dill: amongſt which come forth ſmall moſſie yellowiſh floures which yeeld forth the fruit, green at the firſt, afterward as red as Corall, of the bigneſſe of a ſmall peaſe; wherein is contained groſſe blackiſh ſeed exceeding hard, which is the cauſe that it lieth ſo long in the ground after his ſowing, before it ſpring vp: the roots are many thicke ſoft and ſpongie ſtrings hanging downe from one head, and ſpred themſelues all about, whereby it greatly increaſeth.

2 We haue in our mariſh and low grounds neere vnto the ſea, a Sperage of this kinde which differeth a little from that of the garden, and yet in kinde there is no difference at all, but onely in manuring, by which all things or moſt things are made more beautifull and larger. This may bee called *Aſparagus paluſtris*, mariſh Sperage.

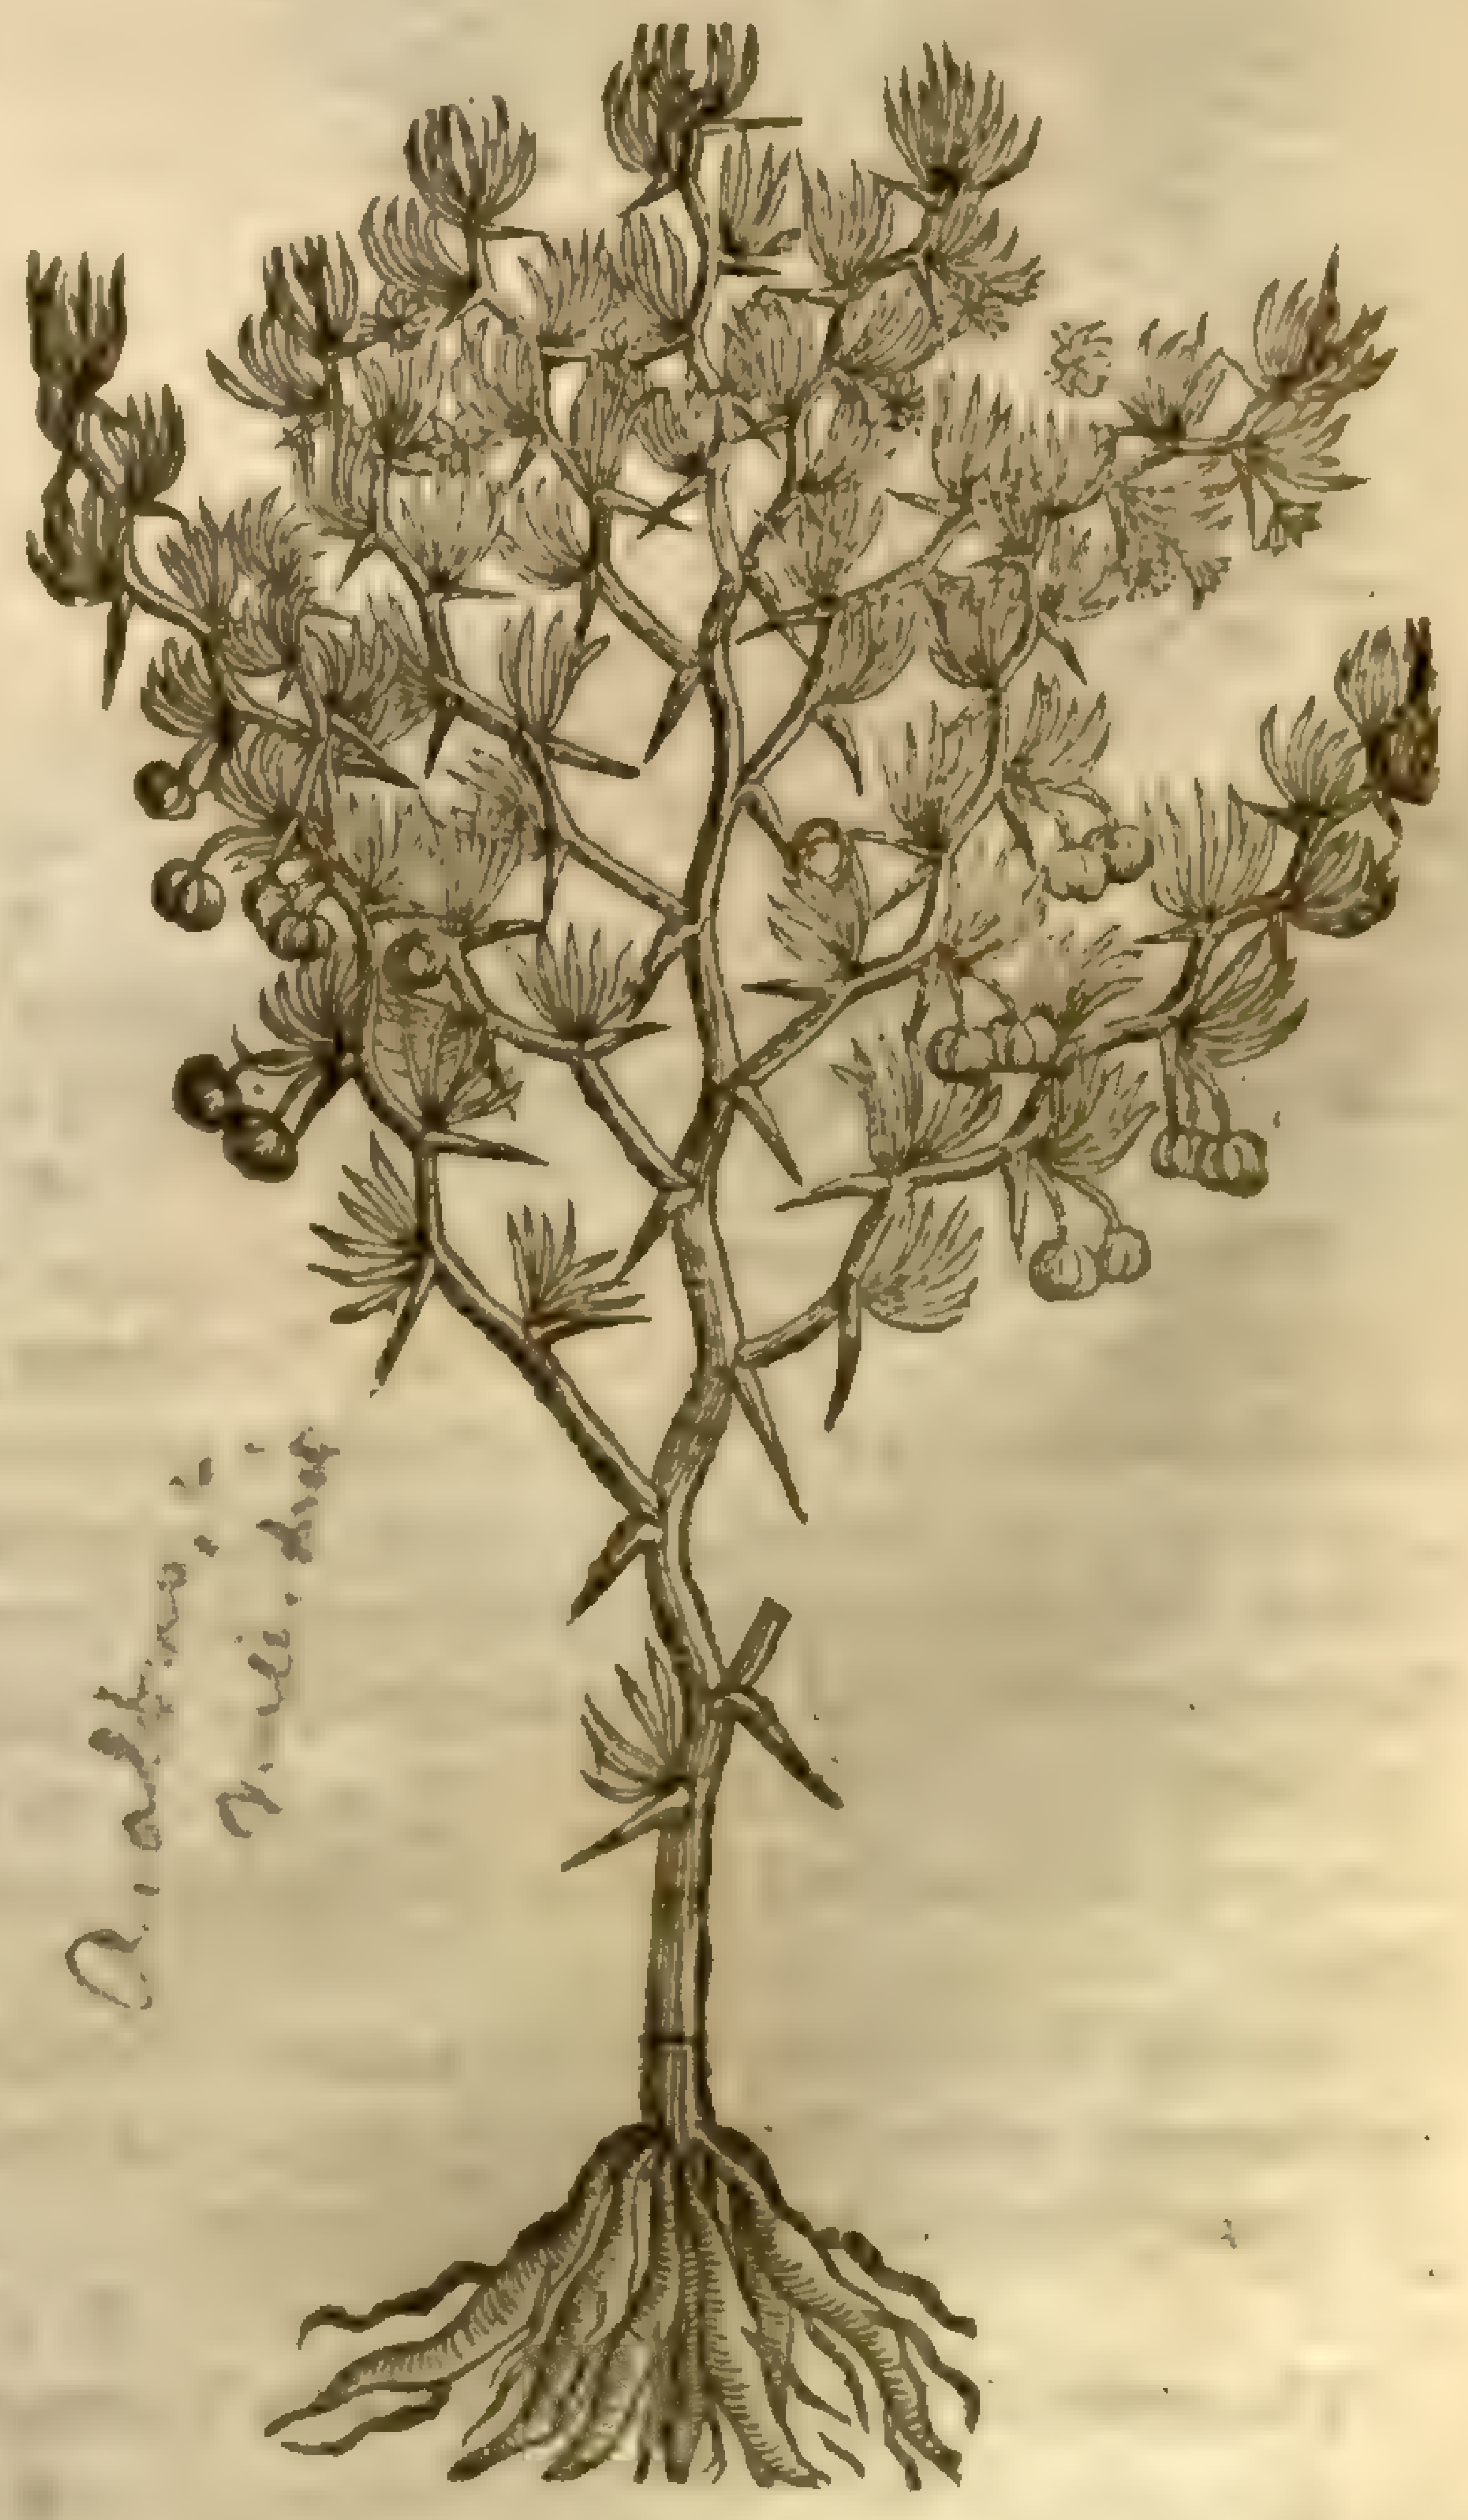
4 *Aſparagus ſylveſtris aculeatus.*
Wilde prickly Sperage.

a aspt. yellow, 6 [illegible]



5 *Aſparagus ſylveſtris ſpinoſus Cluſij.*
Wilde thorny Sperage.

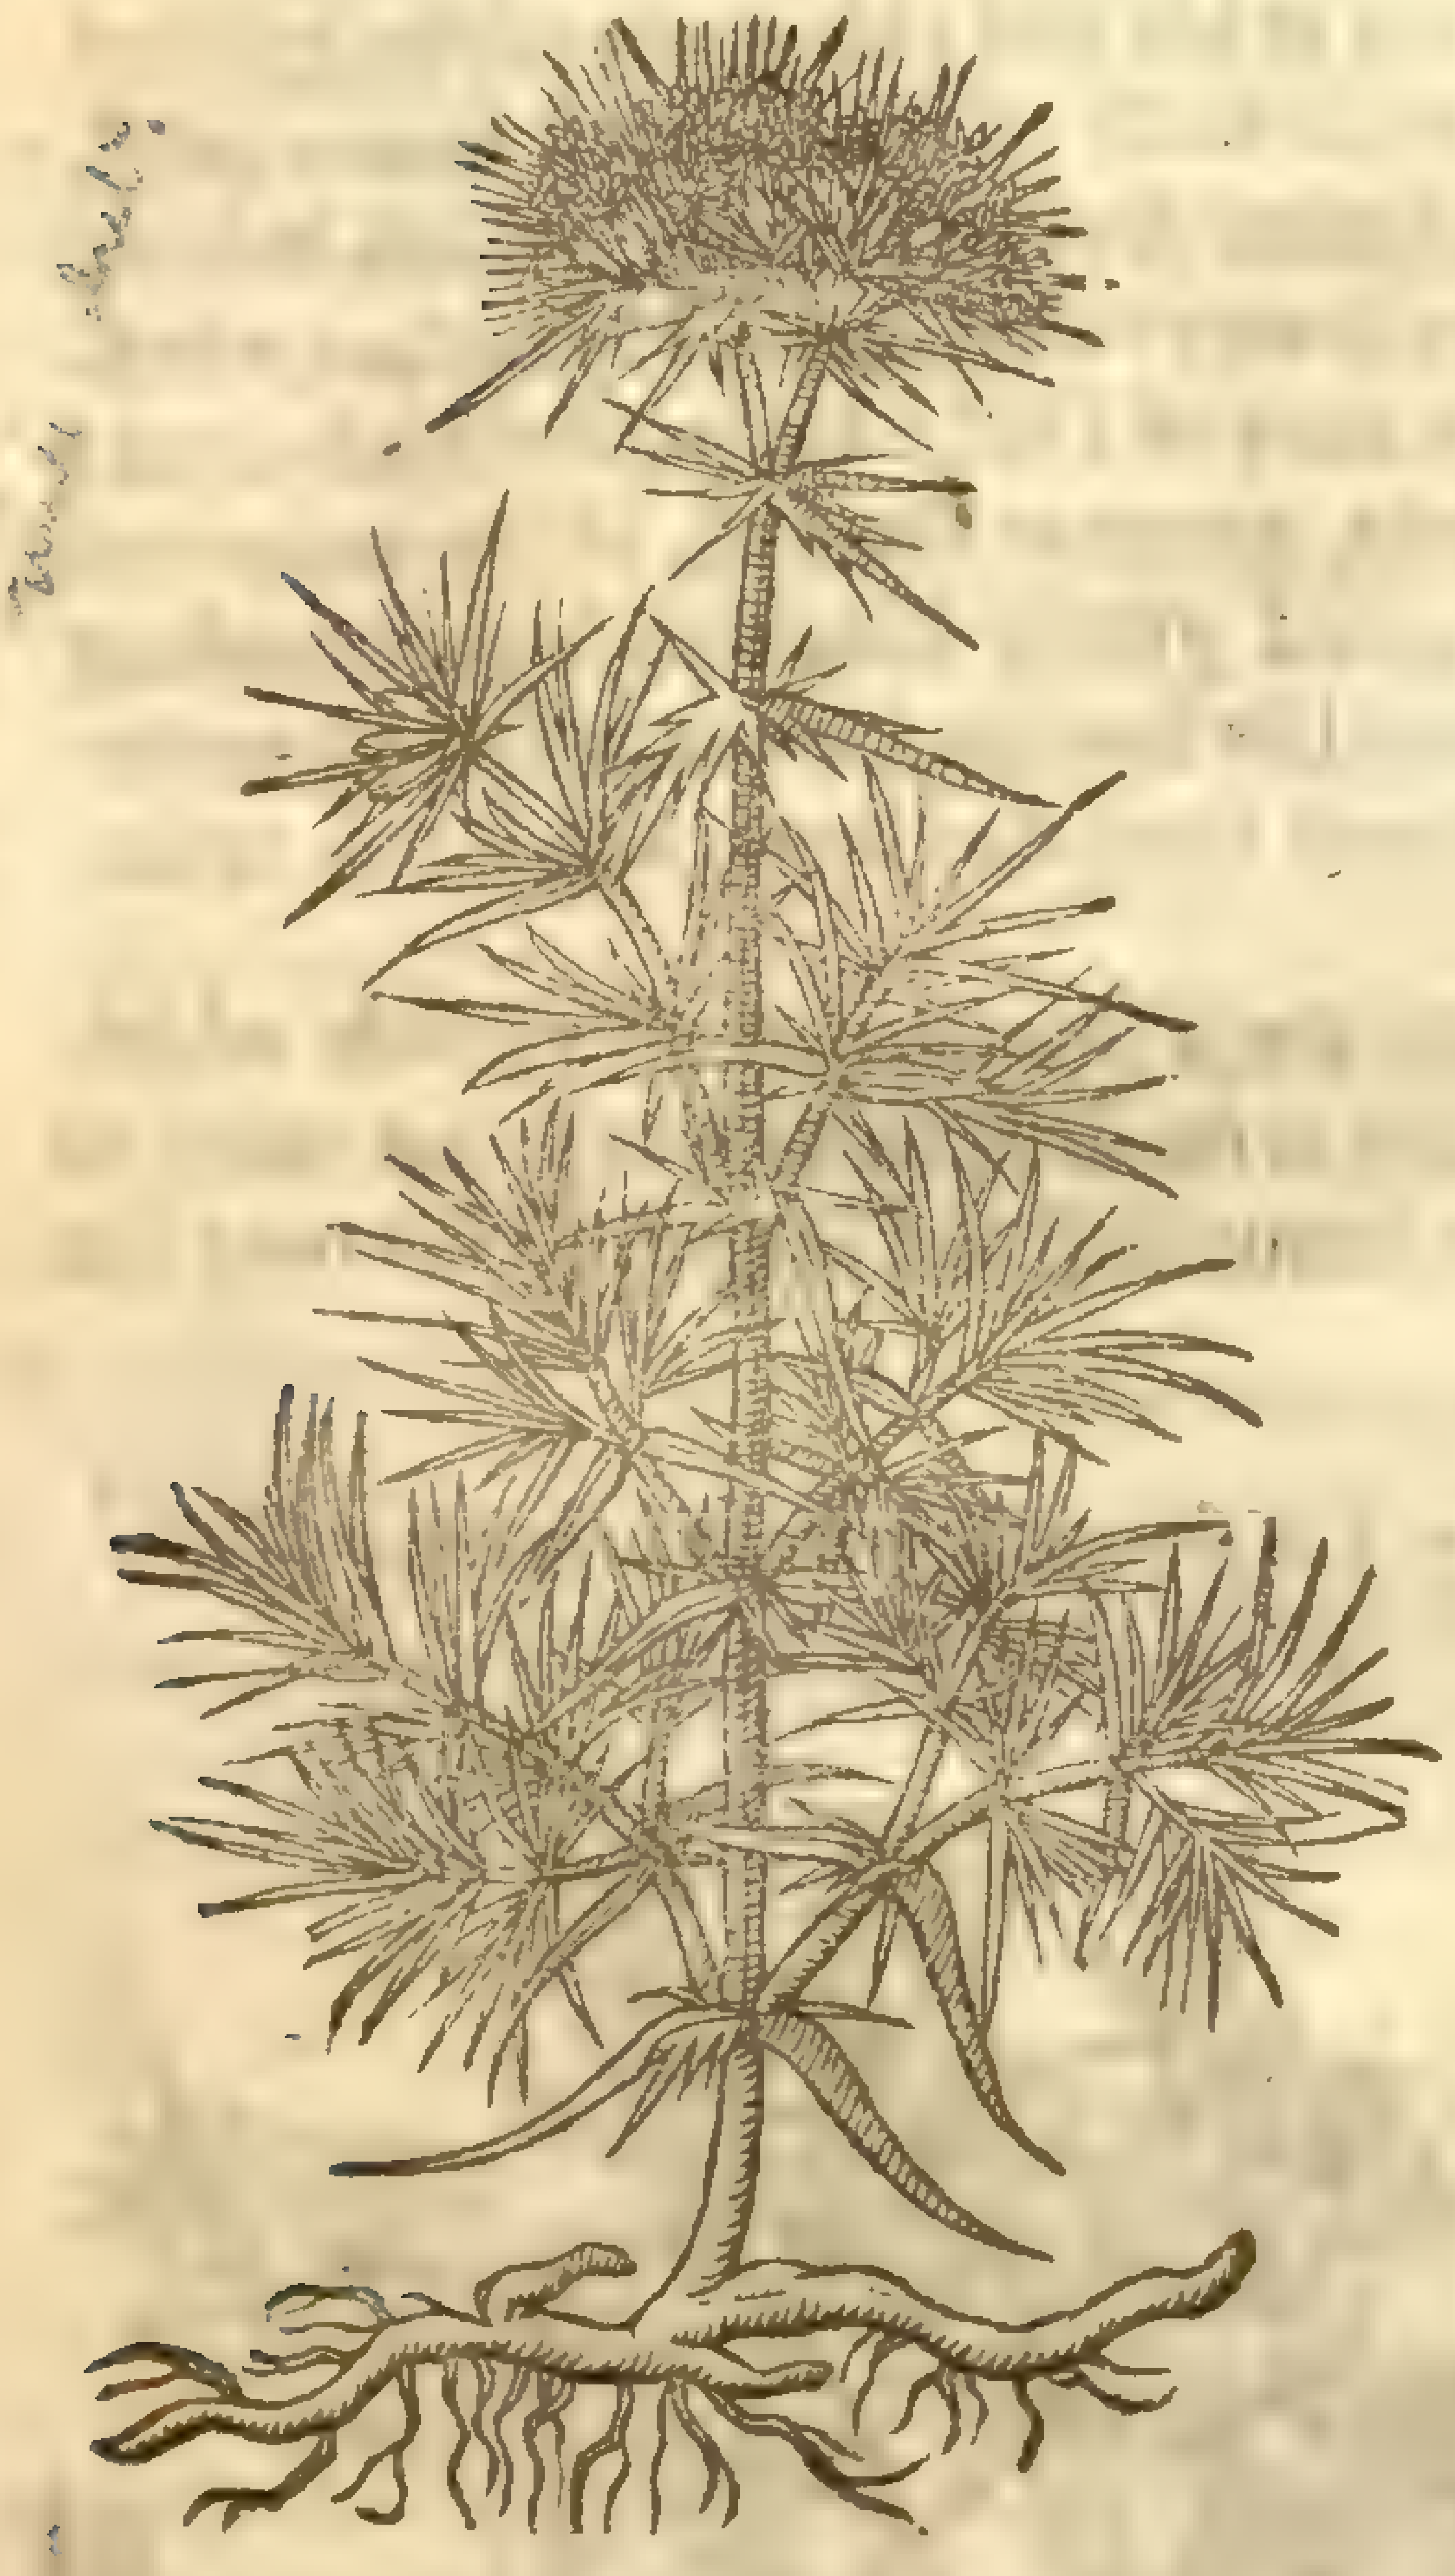
[illegible]



3 Stone or mountain Sperage is one of the wild ones, ſet forth vnder the title of *Corruda*, which *Lobel* calls *Aſparagus petræus*; and *Galen*, *Myacanthinus*, that doth very well reſemble thoſe of the garden in ſtalks, roots, and branches, ſauing that thoſe fine hairy leaues which are in the garden Sperage are ſoft, blunt, and tender; and in this wild Sperage, ſharp hard and pricking thornes, though they be ſmall and ſlender: the root hereof is round, of the bigneſſe of a peaſe, and of a black color: the roots are long, thicke, fat, and very many.

4 This fourth kind differeth from the laſt deſcribed, being a wild Sperage of Spain and Hungarie: the plant is altogether ſet with ſharpe thornes, three or foure comming forth together, as are the branches of Whinnes, Goes, and Furſen: the fruit is black when it is ripe, and ful of a greeniſh pulpe, wherein lie hard and blacke ſeeds, ſometimes one, otherwhiles two in a berry: the roots are like the others, but greater and tougher.

‡ 6 *Drypis.*
Sperage Thiſtle.



5 *Carolus Cluſius* deſcribes alſo a certain wild Sperage with ſharp prickles all alongſt the ſtalks, orderly placed at euery joint one, hard, ſtiffe, and whitiſh, the points of the thornes pointing downward: from the which joints alſo doe grow out a few long greene leaues faſtened together, as alſo a little yellow floure and one berry three cornered, of a blacke colour, wherein is contained one black ſeed, ſeldom more: the roots are like the other.

6 *Drypis* beeing likewiſe a kinde hereof, hath long and ſmall roots creeping in the ground like Couch-graſſe; from which ſpring vp branches a cubit high, ful of knotty joints: the leaues are ſmal like Iuniper, not much differing from *Corruda* or *Nepa*: the floures grow at the top of the ſtalke in ſpoky tufts or roundles, of a white colour, cloſely thruſt together: the ſeed before it is taken out of the huske is like vnto Rice; being taken out, like that of Melilot, of a ſaffron colour.

¶ *The Place.*

The firſt being our garden Aſparagus, groweth wilde in Eſſex, in a medow neere to a mill, beyond a village called Thorp; and alſo at Singleton not far from Carby, and in the medowes neere Moulton in Lincolnſhire. Likewiſe it growes in great plenty neere Harwich, at a place called Bandamar lading, and at North Moulton in Holland a part of Lincolnſhire.

The wilde Sperages grow in Portugal and Biſcay amongſt ſtones; one of which, *Petrus Bellonius* maketh mention to grow in Candy, *lib.* 1. *cap.* 18. of his Singularities.

¶ *The Time.*

The bare naked tender ſhoots of Sperage ſpring vp in Aprill, at what time they are eaten in ſallads; they floure in Iune and Iuly, the fruit is ripe in September.

¶ *The Names.*

The garden Sperage is called in Greeke Ἀσπάραγος: in Latine likewiſe *Aſparagus*: in ſhops, *Sparagus* and *Speragus*: in high-Dutch, **Spargen**: in low-Dutch, **Aſpargeſ**, and **Coꝛalcruyt**, that is to ſay, *Herba Coralli*, or Coral-wort, of the red berries, which beare the colour of Corall: in Spaniſh, *Aſparragos*: in Italian, *Aſparago*: in Engliſh, Sperage, and likewiſe Aſparagus after the Latine name: in French, *Aſperges*. It is named Aſparagus, of the excellency, becauſe *aſparagi*, or the ſprings hereof are preferred before thoſe of other plants whatſoeuer: for this Latine word *Aſparagus* doth properly ſignifie the firſt ſpring or ſprout of euery plant, eſpecially when it is tender, and before it do grow into an hard ſtalk, as are the buds, tendrels, or yong ſprings of wild Vine or hops, and ſuch like.

Wild Sperage is properly called in Greeke μυάκανθα, which is as much to ſay as Mouſe-prickle; and Ἀσπάραγος πετραῖος, that is to ſay, *Petræus Aſparagus*, or ſtone Sperage: it is alſo named in Latine *Aſparagus ſylveſtris*, or *Corruda*.

¶ *The Temperature.*

The roots of the garden and wilde Sperage do clenſe without manifeſt heate and drineſſe.

¶ *The Vertues.*

A The firſt ſprouts or naked tender ſhoots hereof be oftentimes ſodden in fleſh broth and eaten; or boiled in faire water, and ſeaſoned with oile, vineger, ſalt, and pepper, then are ſerued vp as a ſallad: they are pleaſant to the taſte, eaſily concocted, and gently looſe the belly.

B They ſomwhat prouoke vrin, are good for the kidnies and bladder, but they yeeld little nouriſhment to the body, and the ſame moiſt, yet not faulty: they are thought to increaſe ſeed and ſtir vp luſt.

† The *Nepa* formerly mentioned in this Chapter, but now omitted, was againe ſet forth by our Author among the Furſes, where you may [illegible]

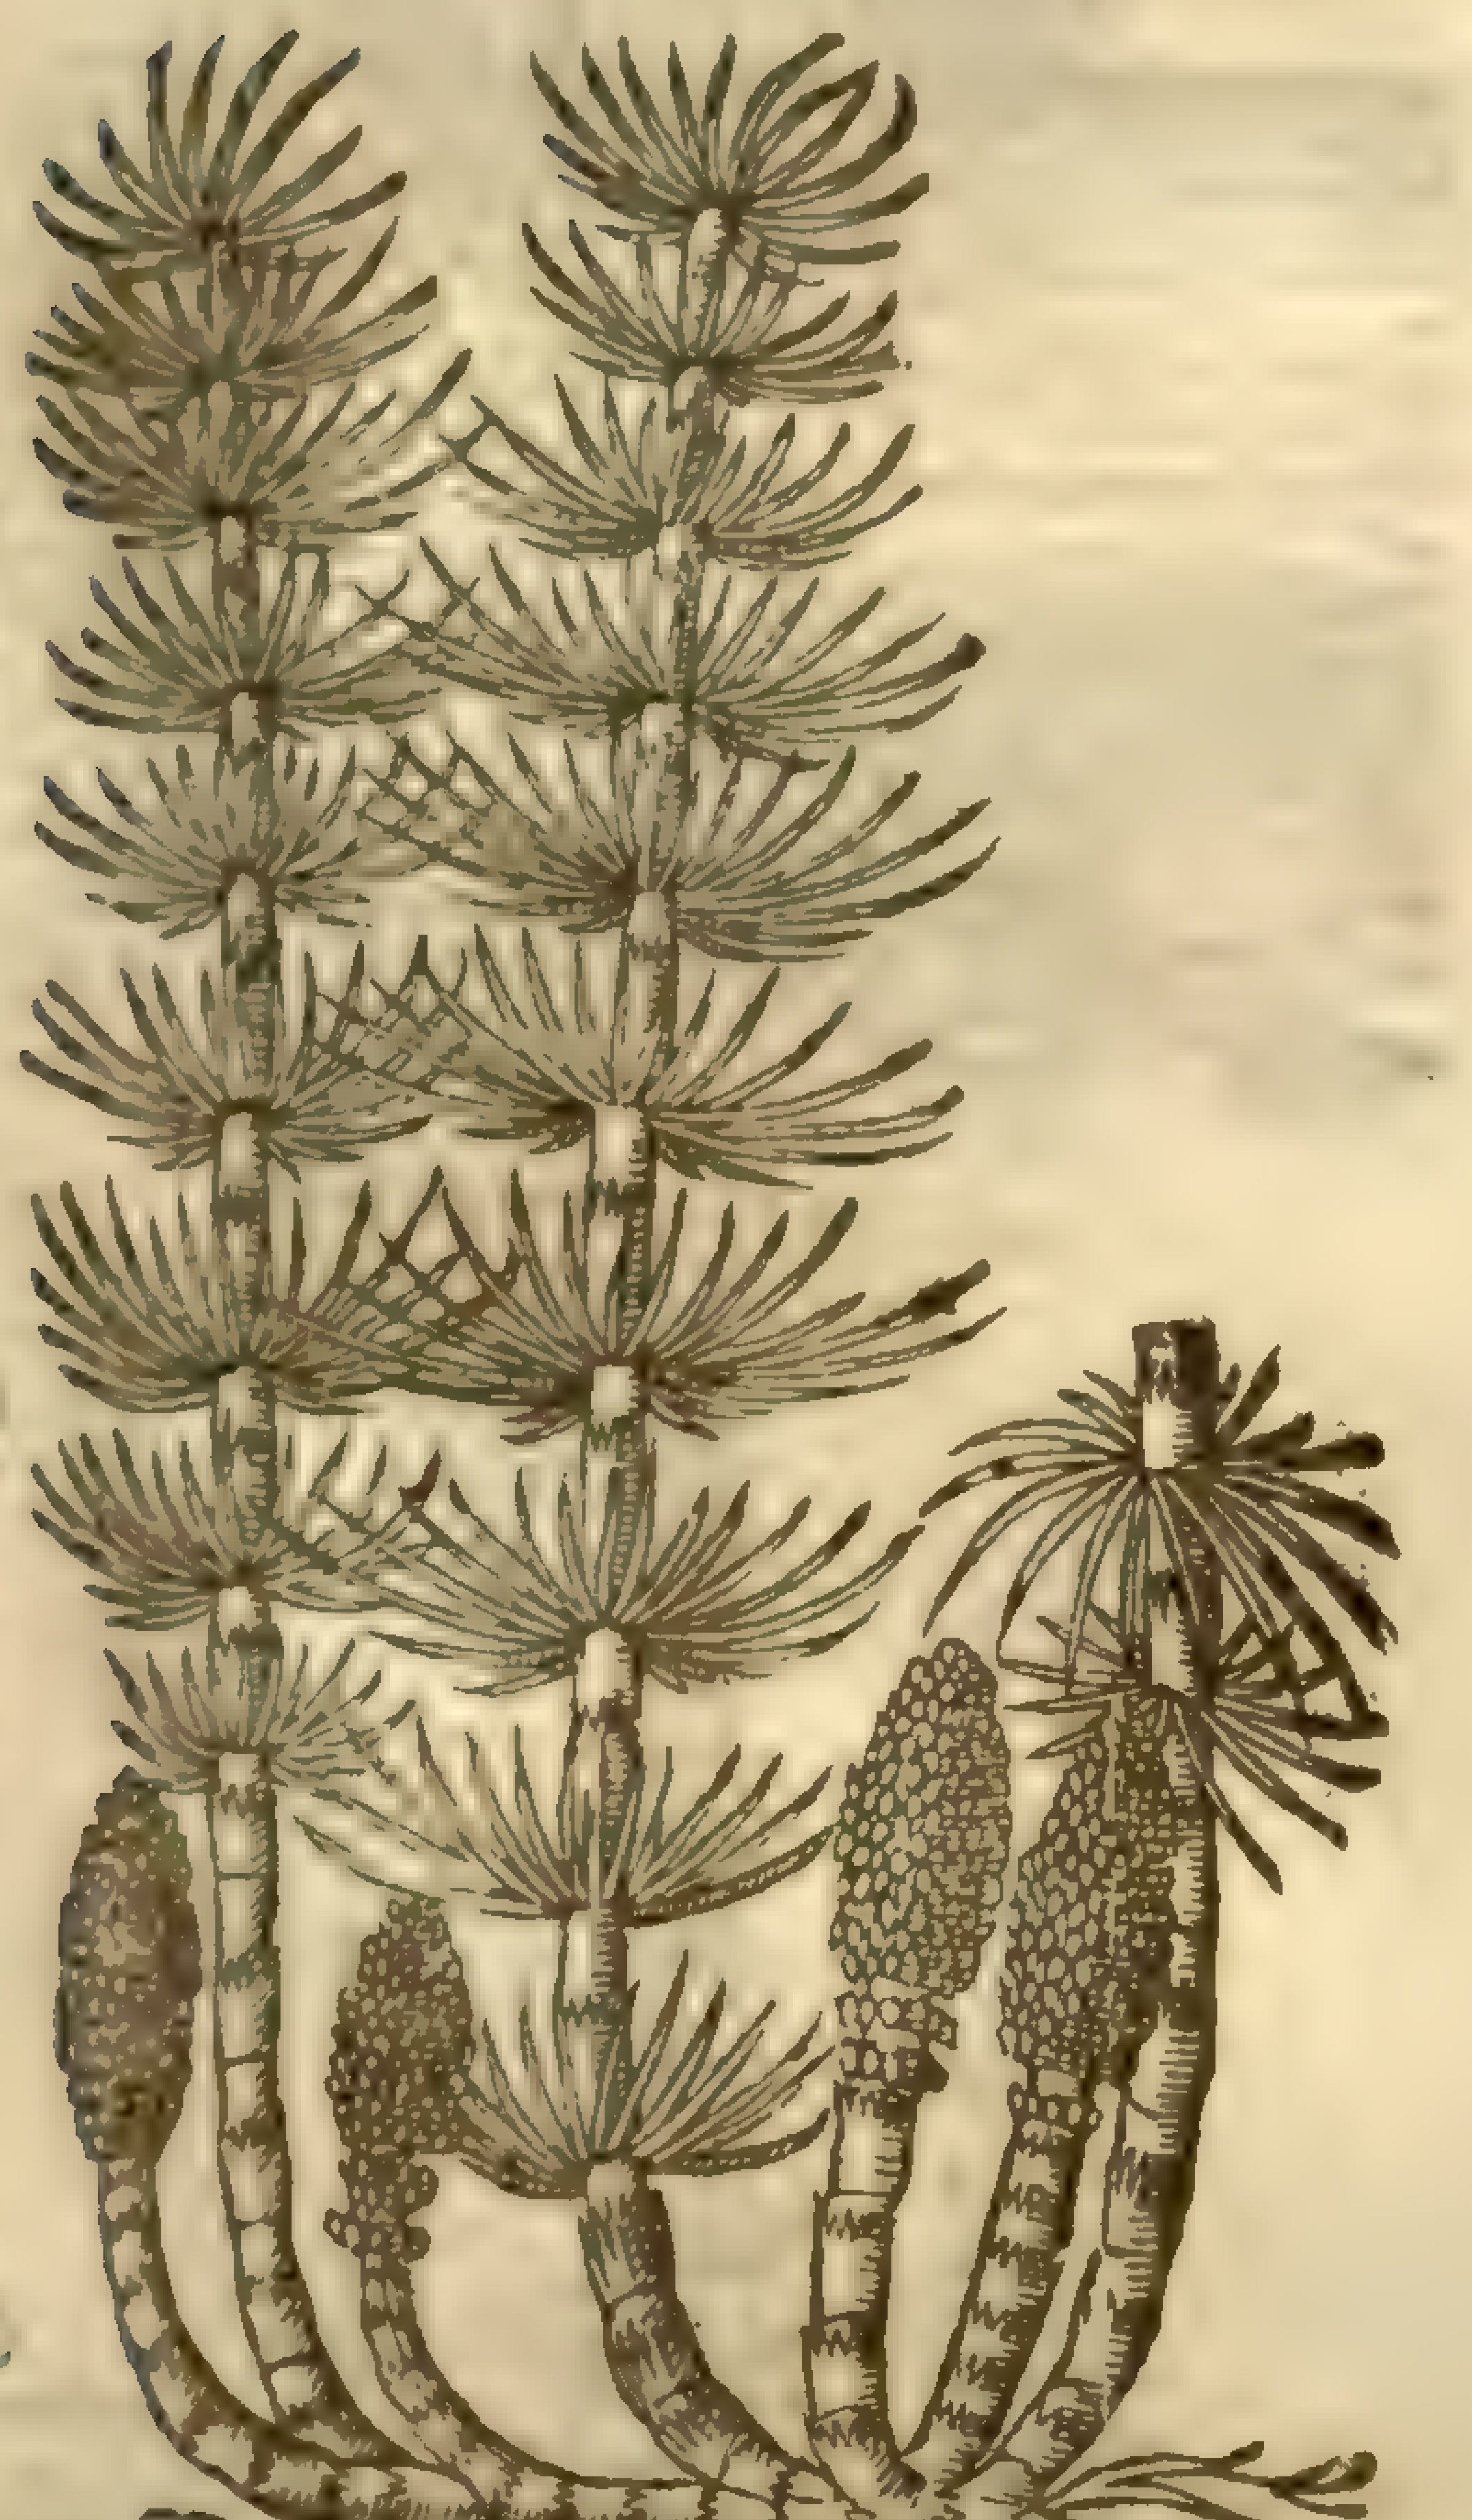
Chap.

Chap. 458. *Of Horſe-taile or Shaue-graſſe.*

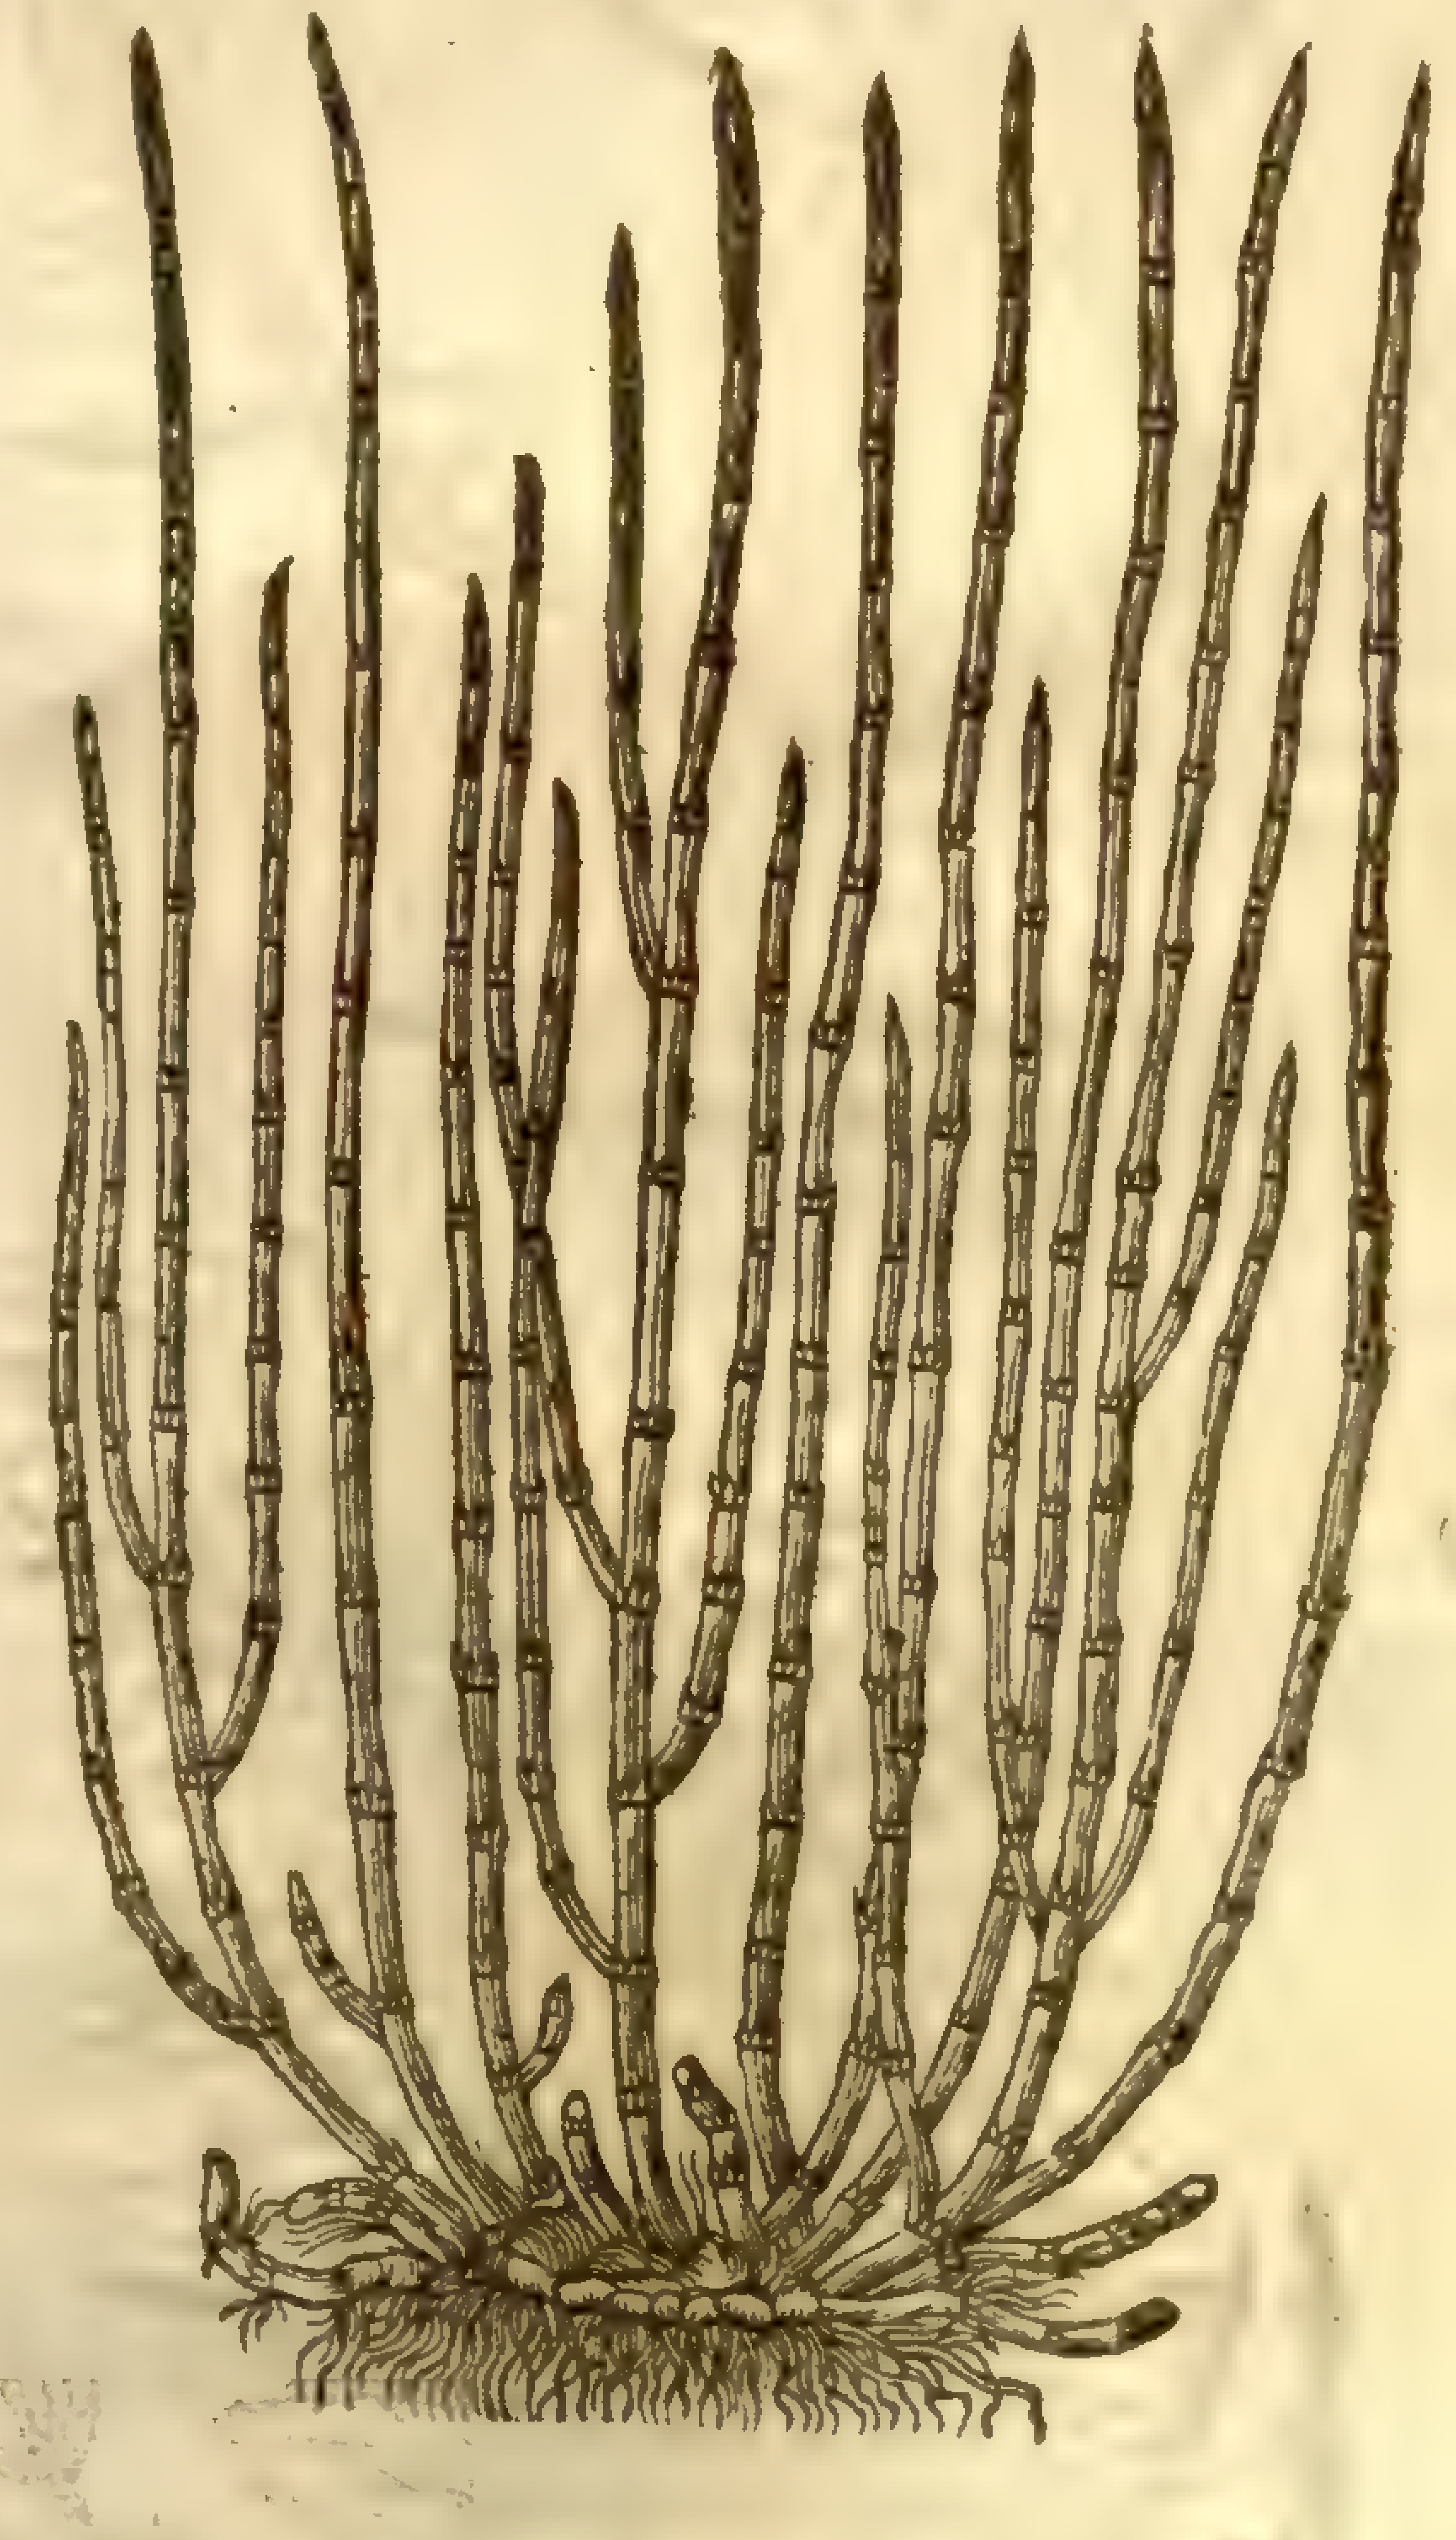
¶ *The Deſcription.*

1 Great Horſe-taile riſeth vp with a round ſtalke hollow within like a reed, a cubit high, compact as it were of many ſmall pieces one put into the end of another, ſomtimes of a reddiſh colour, very rough, and ſet at euery joint with many ſtiffe Ruſh-like leaues, or rough briſtles, which maketh the whole plant to reſemble the taile of a horſe, whereof it tooke his name: on the top of the ſtalke do ſtand in ſtead of floures cluſtered and thicke catkins, not vnlike to the firſt ſhoots of Sperage, which is called *Myacantha*: the root is jointed, and creepeth in the ground.

2 This ſmall and naked Shaue-graſſe, wherewith Fletchers and Combe-makers doe rub and poliſh their worke, riſeth out of the ground like the firſt ſhoots of Aſparagus, jointed or kneed by certain diſtances like the precedent, but altogether without ſuch briſtly leaues, yet exceeding rough and cutting: the root groweth aſlope in the earth like thoſe of the Couch-graſſe.



1 *Equiſetum majus.*
Great Horſe-taile.



2 *Equiſetum nudum.*
Naked Horſe-taile.

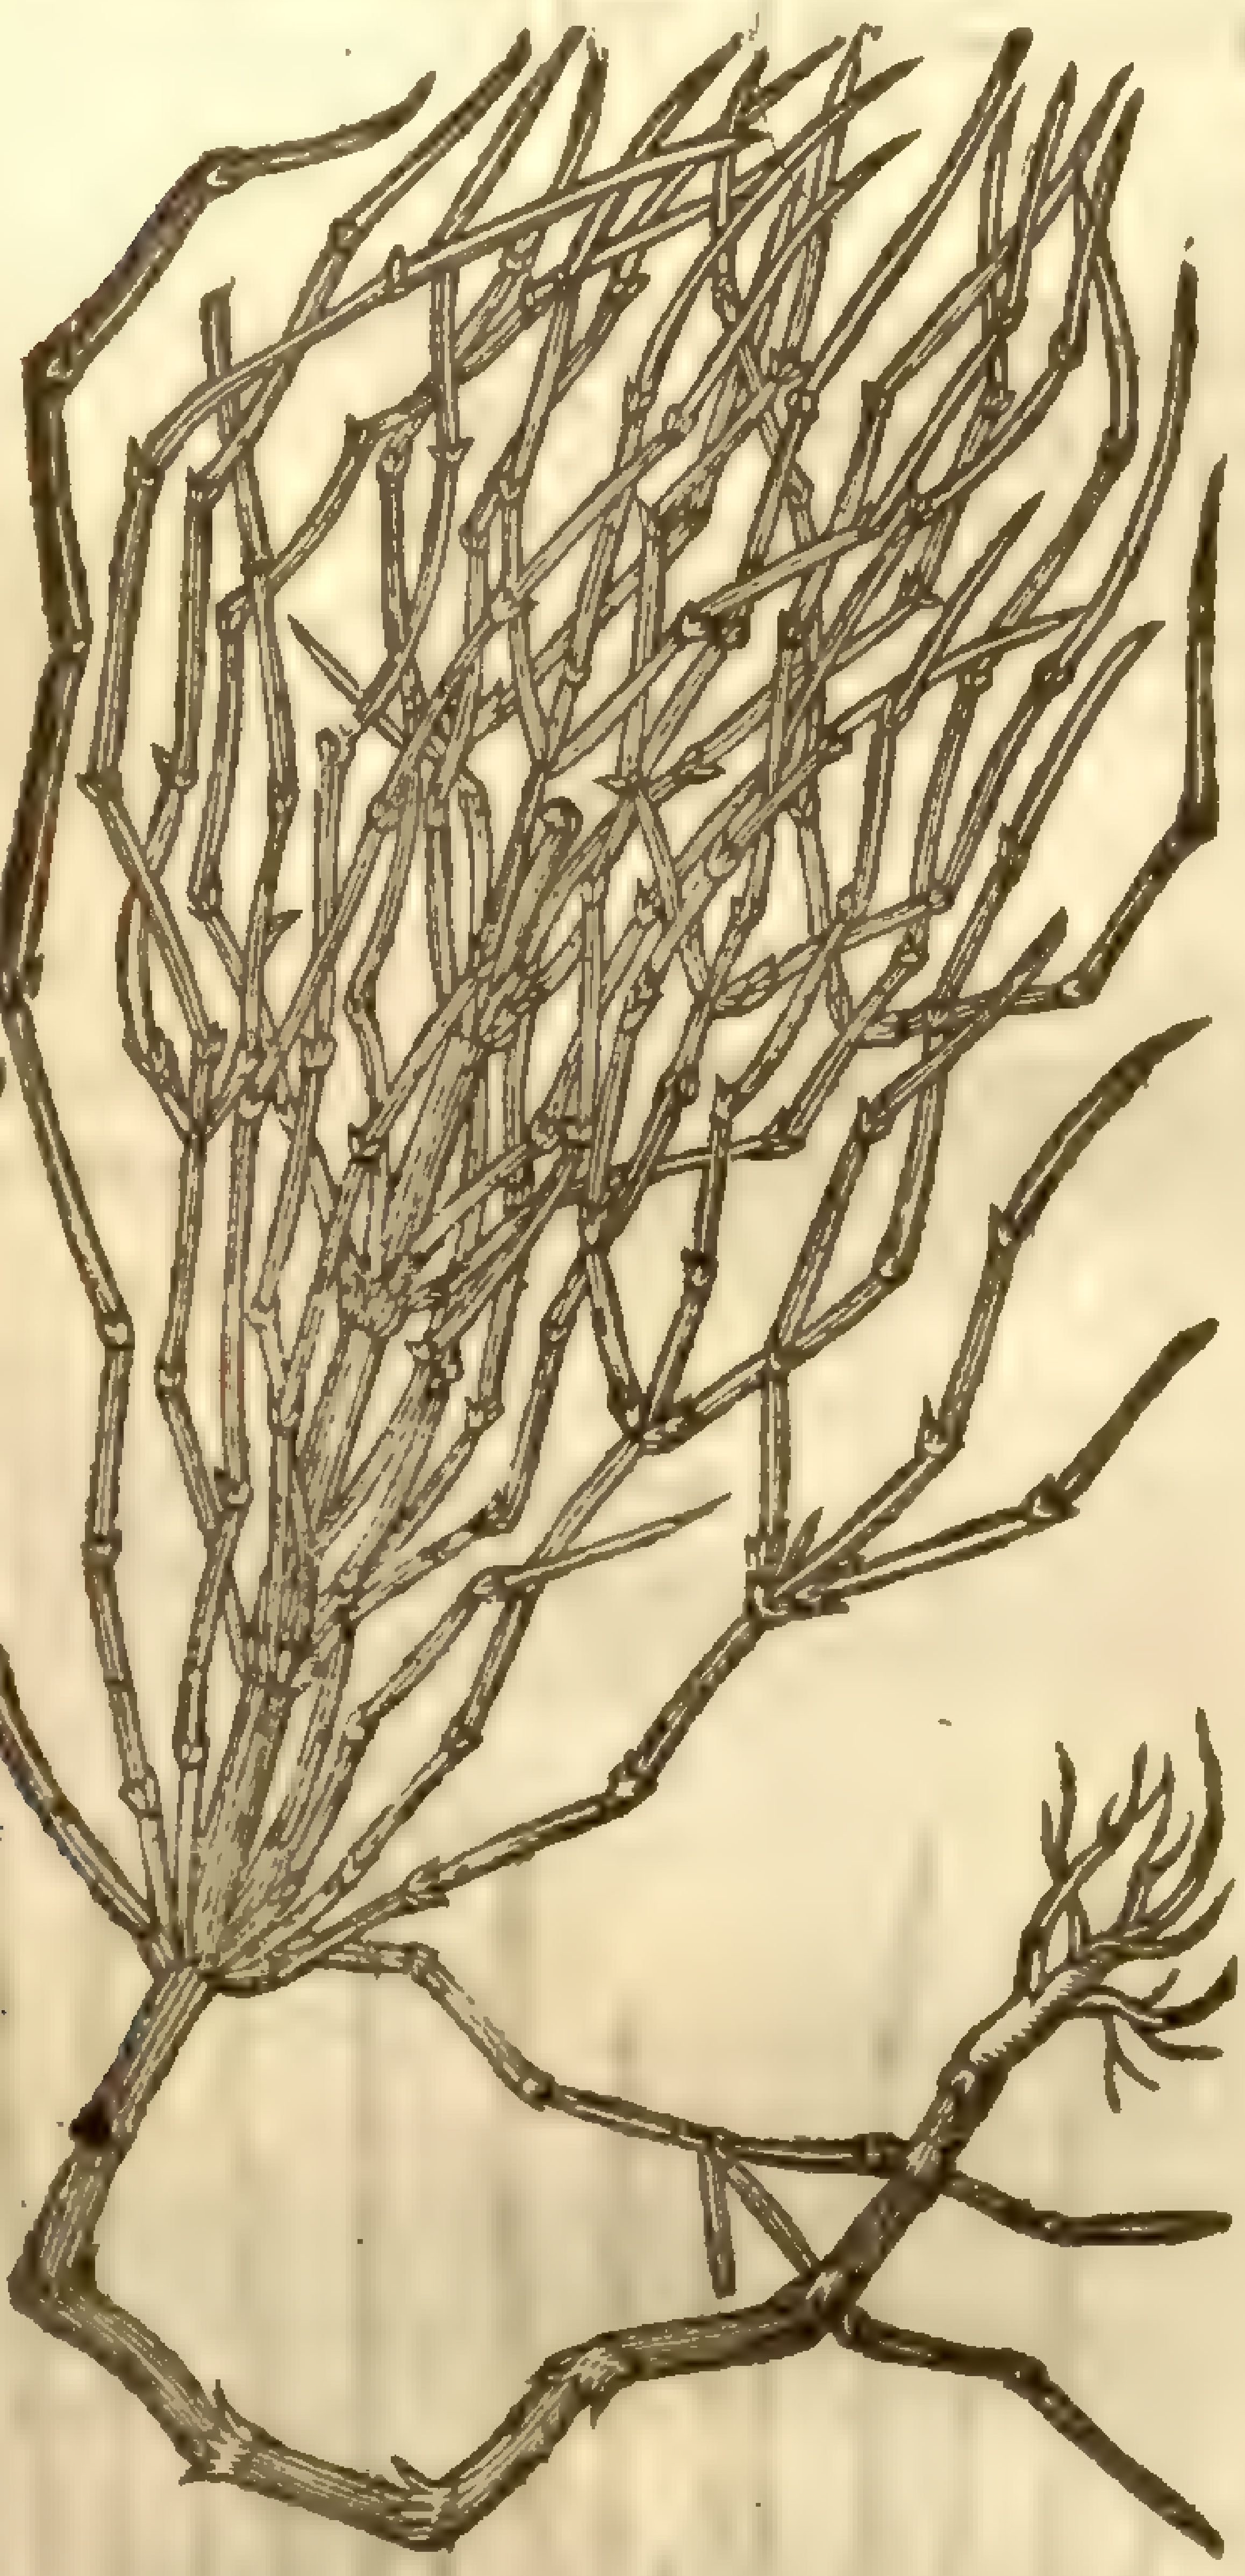
E. hyemale, L. [illegible]

3 Horſe-taile which for the moſt part groweth among corn and where corn hath been, hath a very ſlender root and ſingle; from which riſe vp diuers jointed ſtalks, whereon doe grow very long rough narrow jointed leaues, like vnto the firſt deſcribed, but thicker and rougher, as is the reſt of the plant.

4 Water Horſe-taile, that growes by the brinks of riuers and running ſtreams, and often in the middeſt of the water, hath a very long root according to the depth of the water, groſſe, thicke, and jointed, with ſome threds anexed thereto: from which riſeth vp a great thicke jointed ſtalk whereon grow long rough ruſhy leaues pyramide or ſteeple-faſhion. The whole plant is alſo tough, hard and fit to ſhaue and rub woodden things as the other.

5 This kinde of Horſe-taile that growes in woods and ſhadowie places, hath a ſmall root and ſingle, from which riſeth vp a rough chamfered ſtalke jointed by certaine ſpaces, hauing at each joint two buſhes of rough briſtly leaues, ſet one againſt another like the other of his kinde.

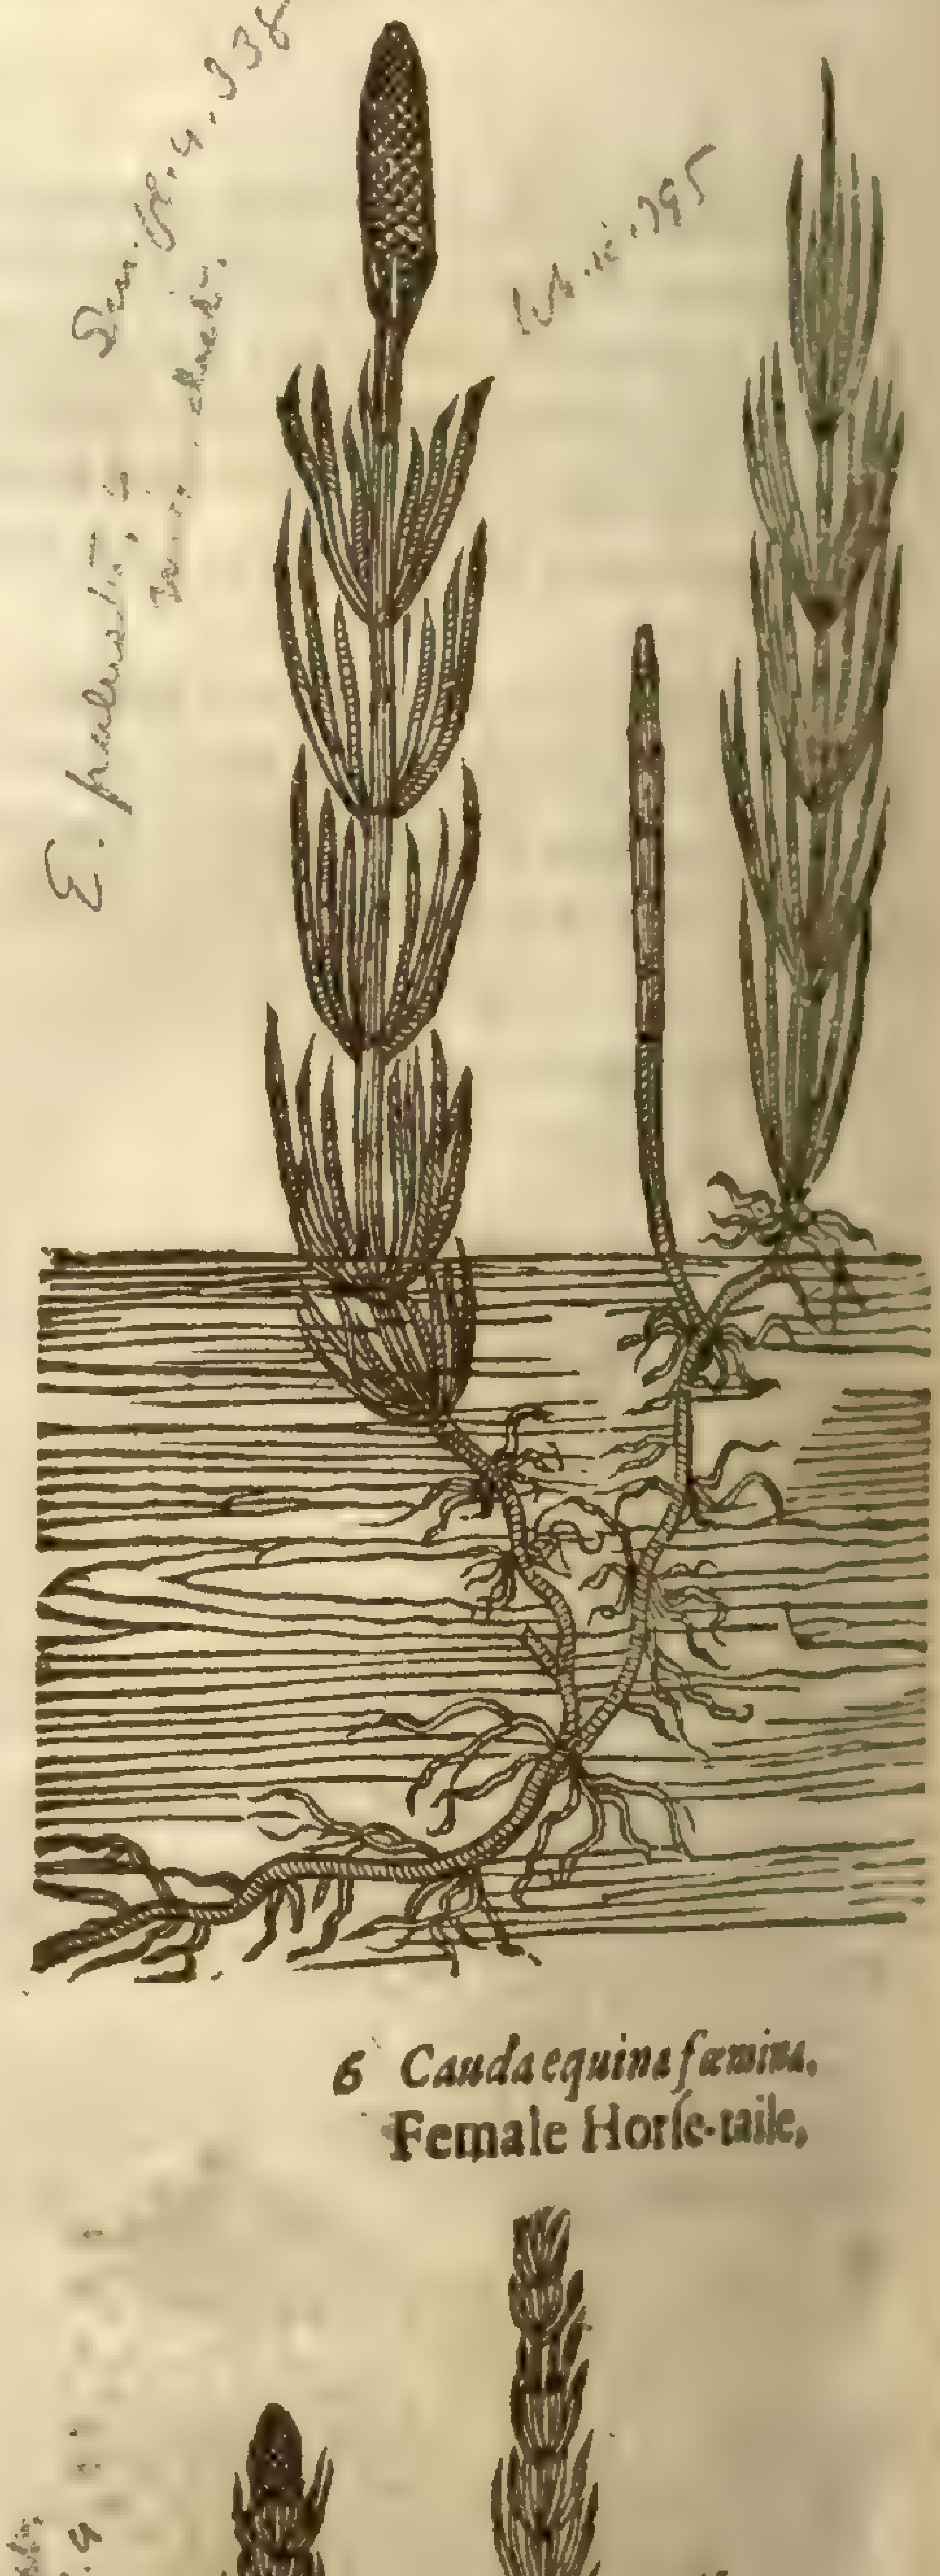
3 *Equiſetum ſegetale.*
Corne Horſe-taile.



E. arvense, L.
Unic. dist.
Sm. fl. 4. 33[illegible]

Lob. ic. 794
Dod. 73

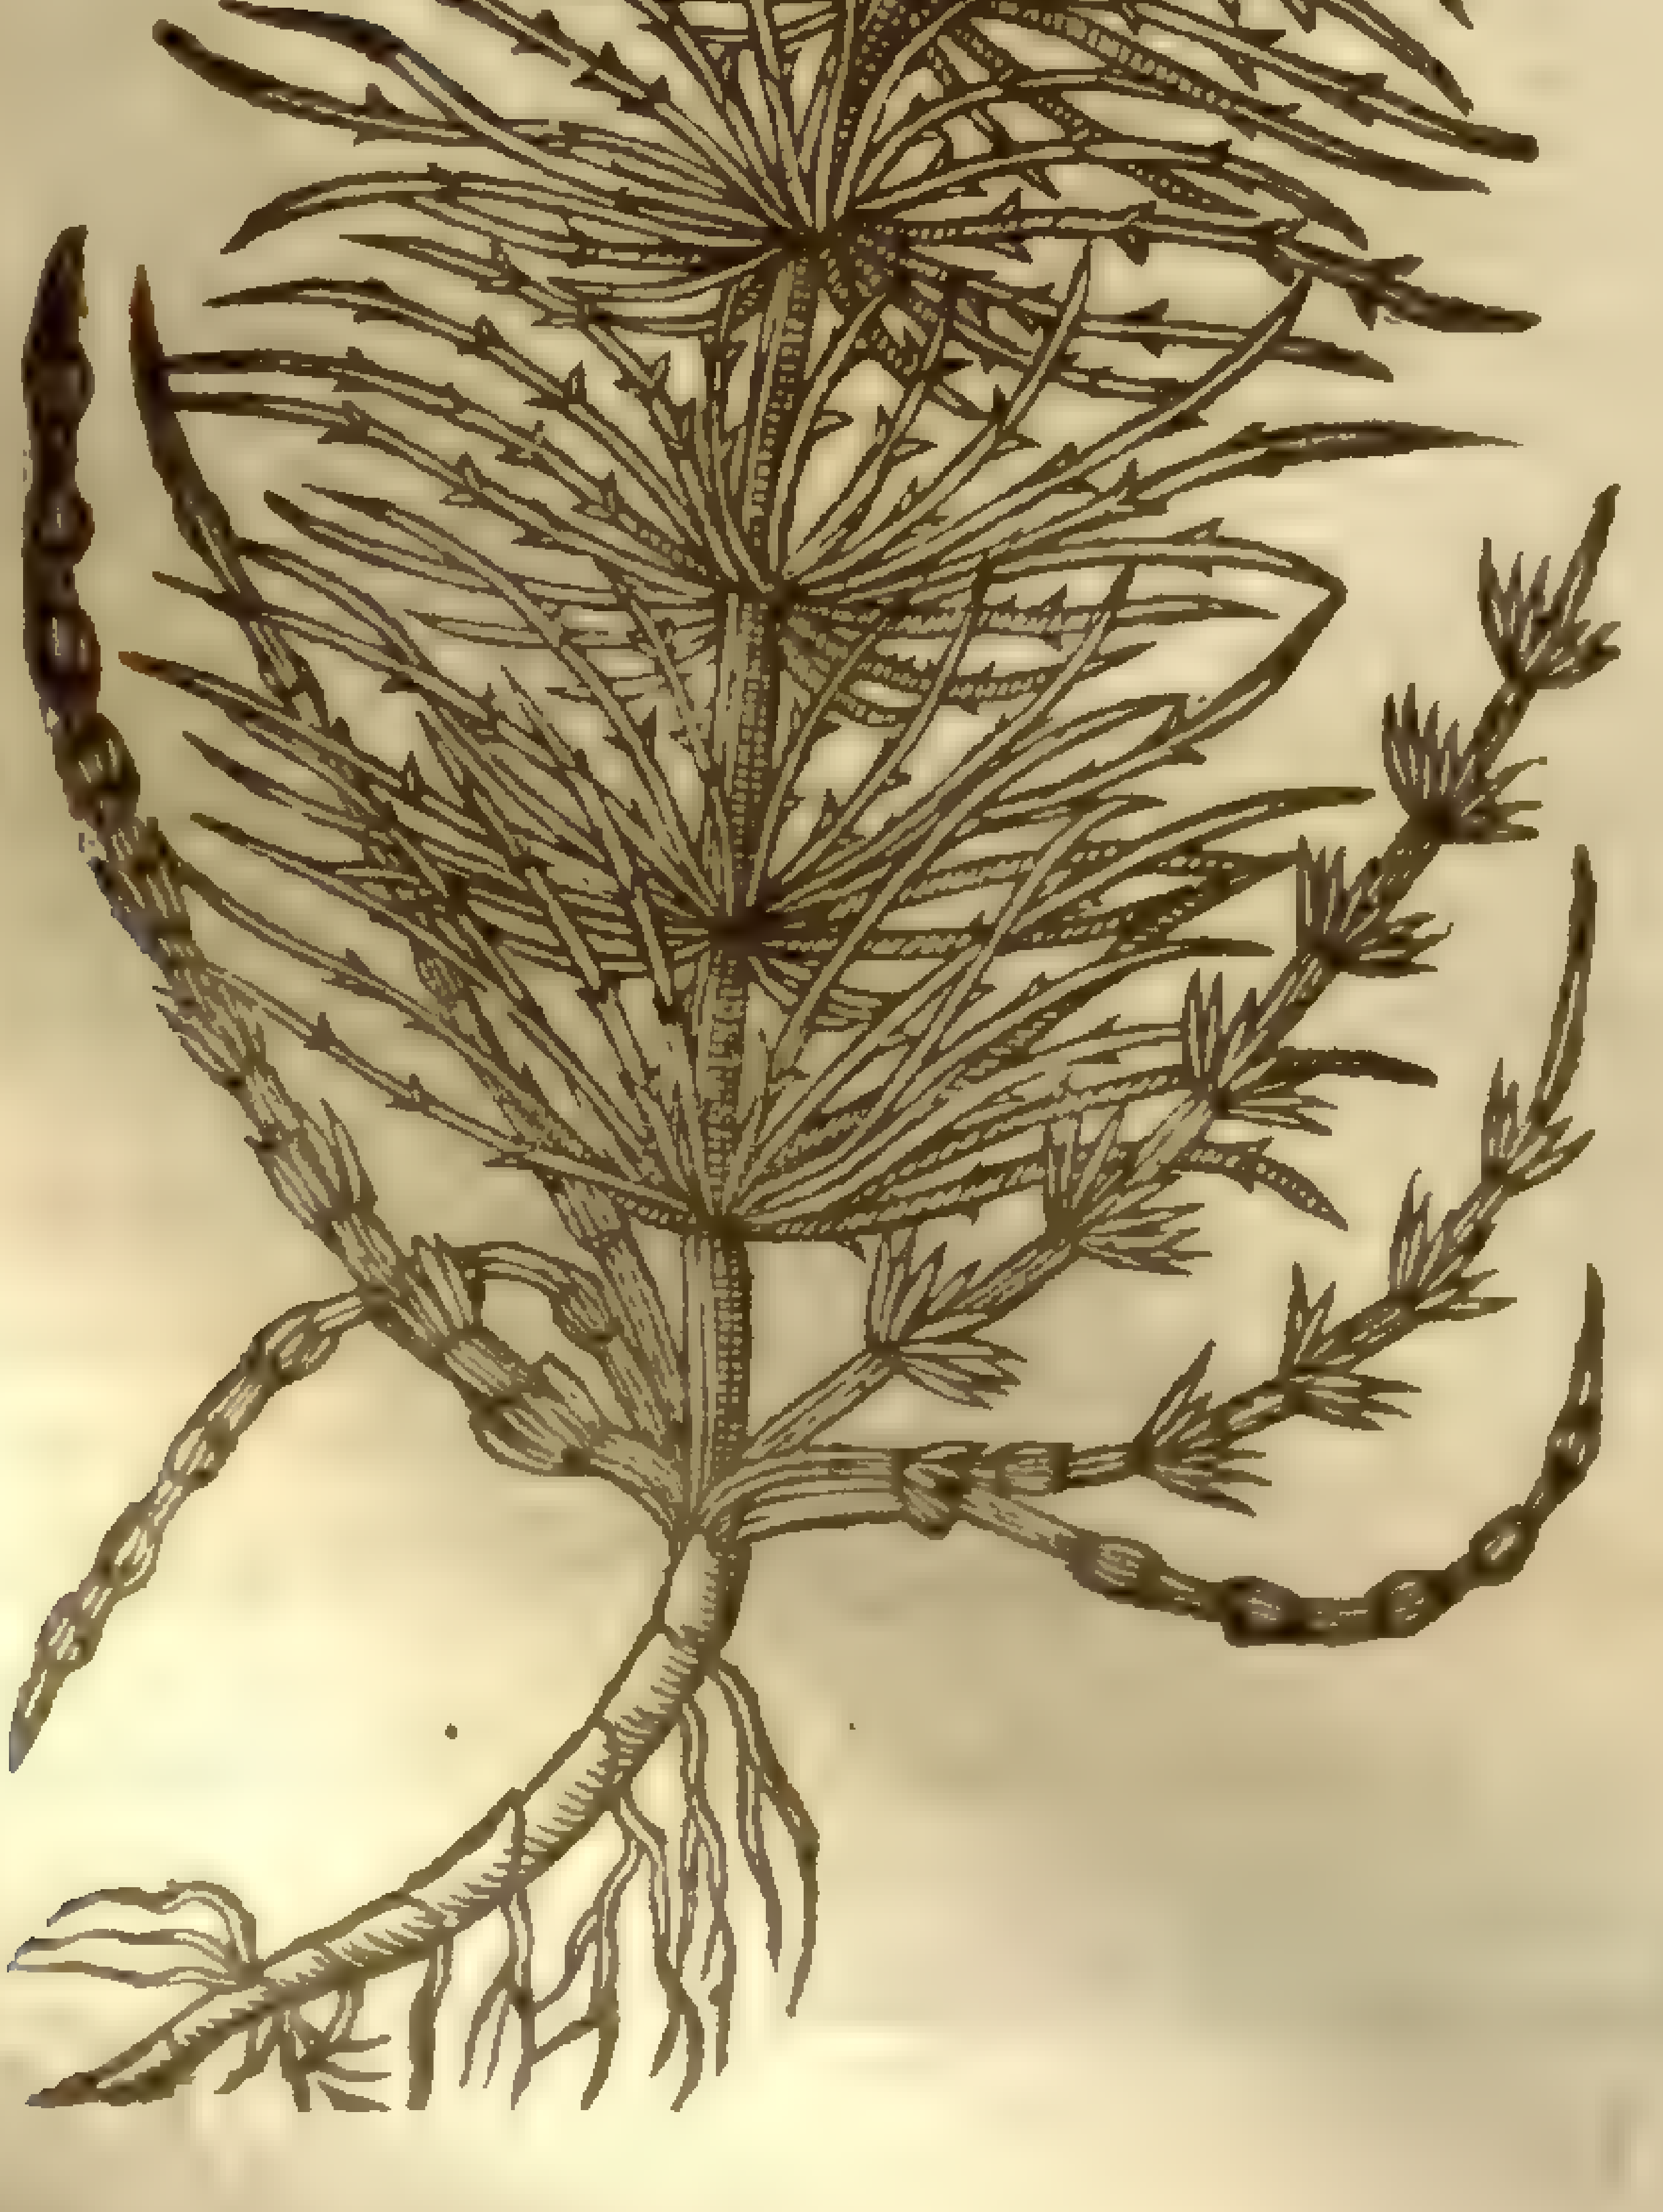
4 *Equiſetum paluſtre.*
Water Horſe-taile.



E. palustre, L.
Unic. dist.
Sm. fl. 4. 338

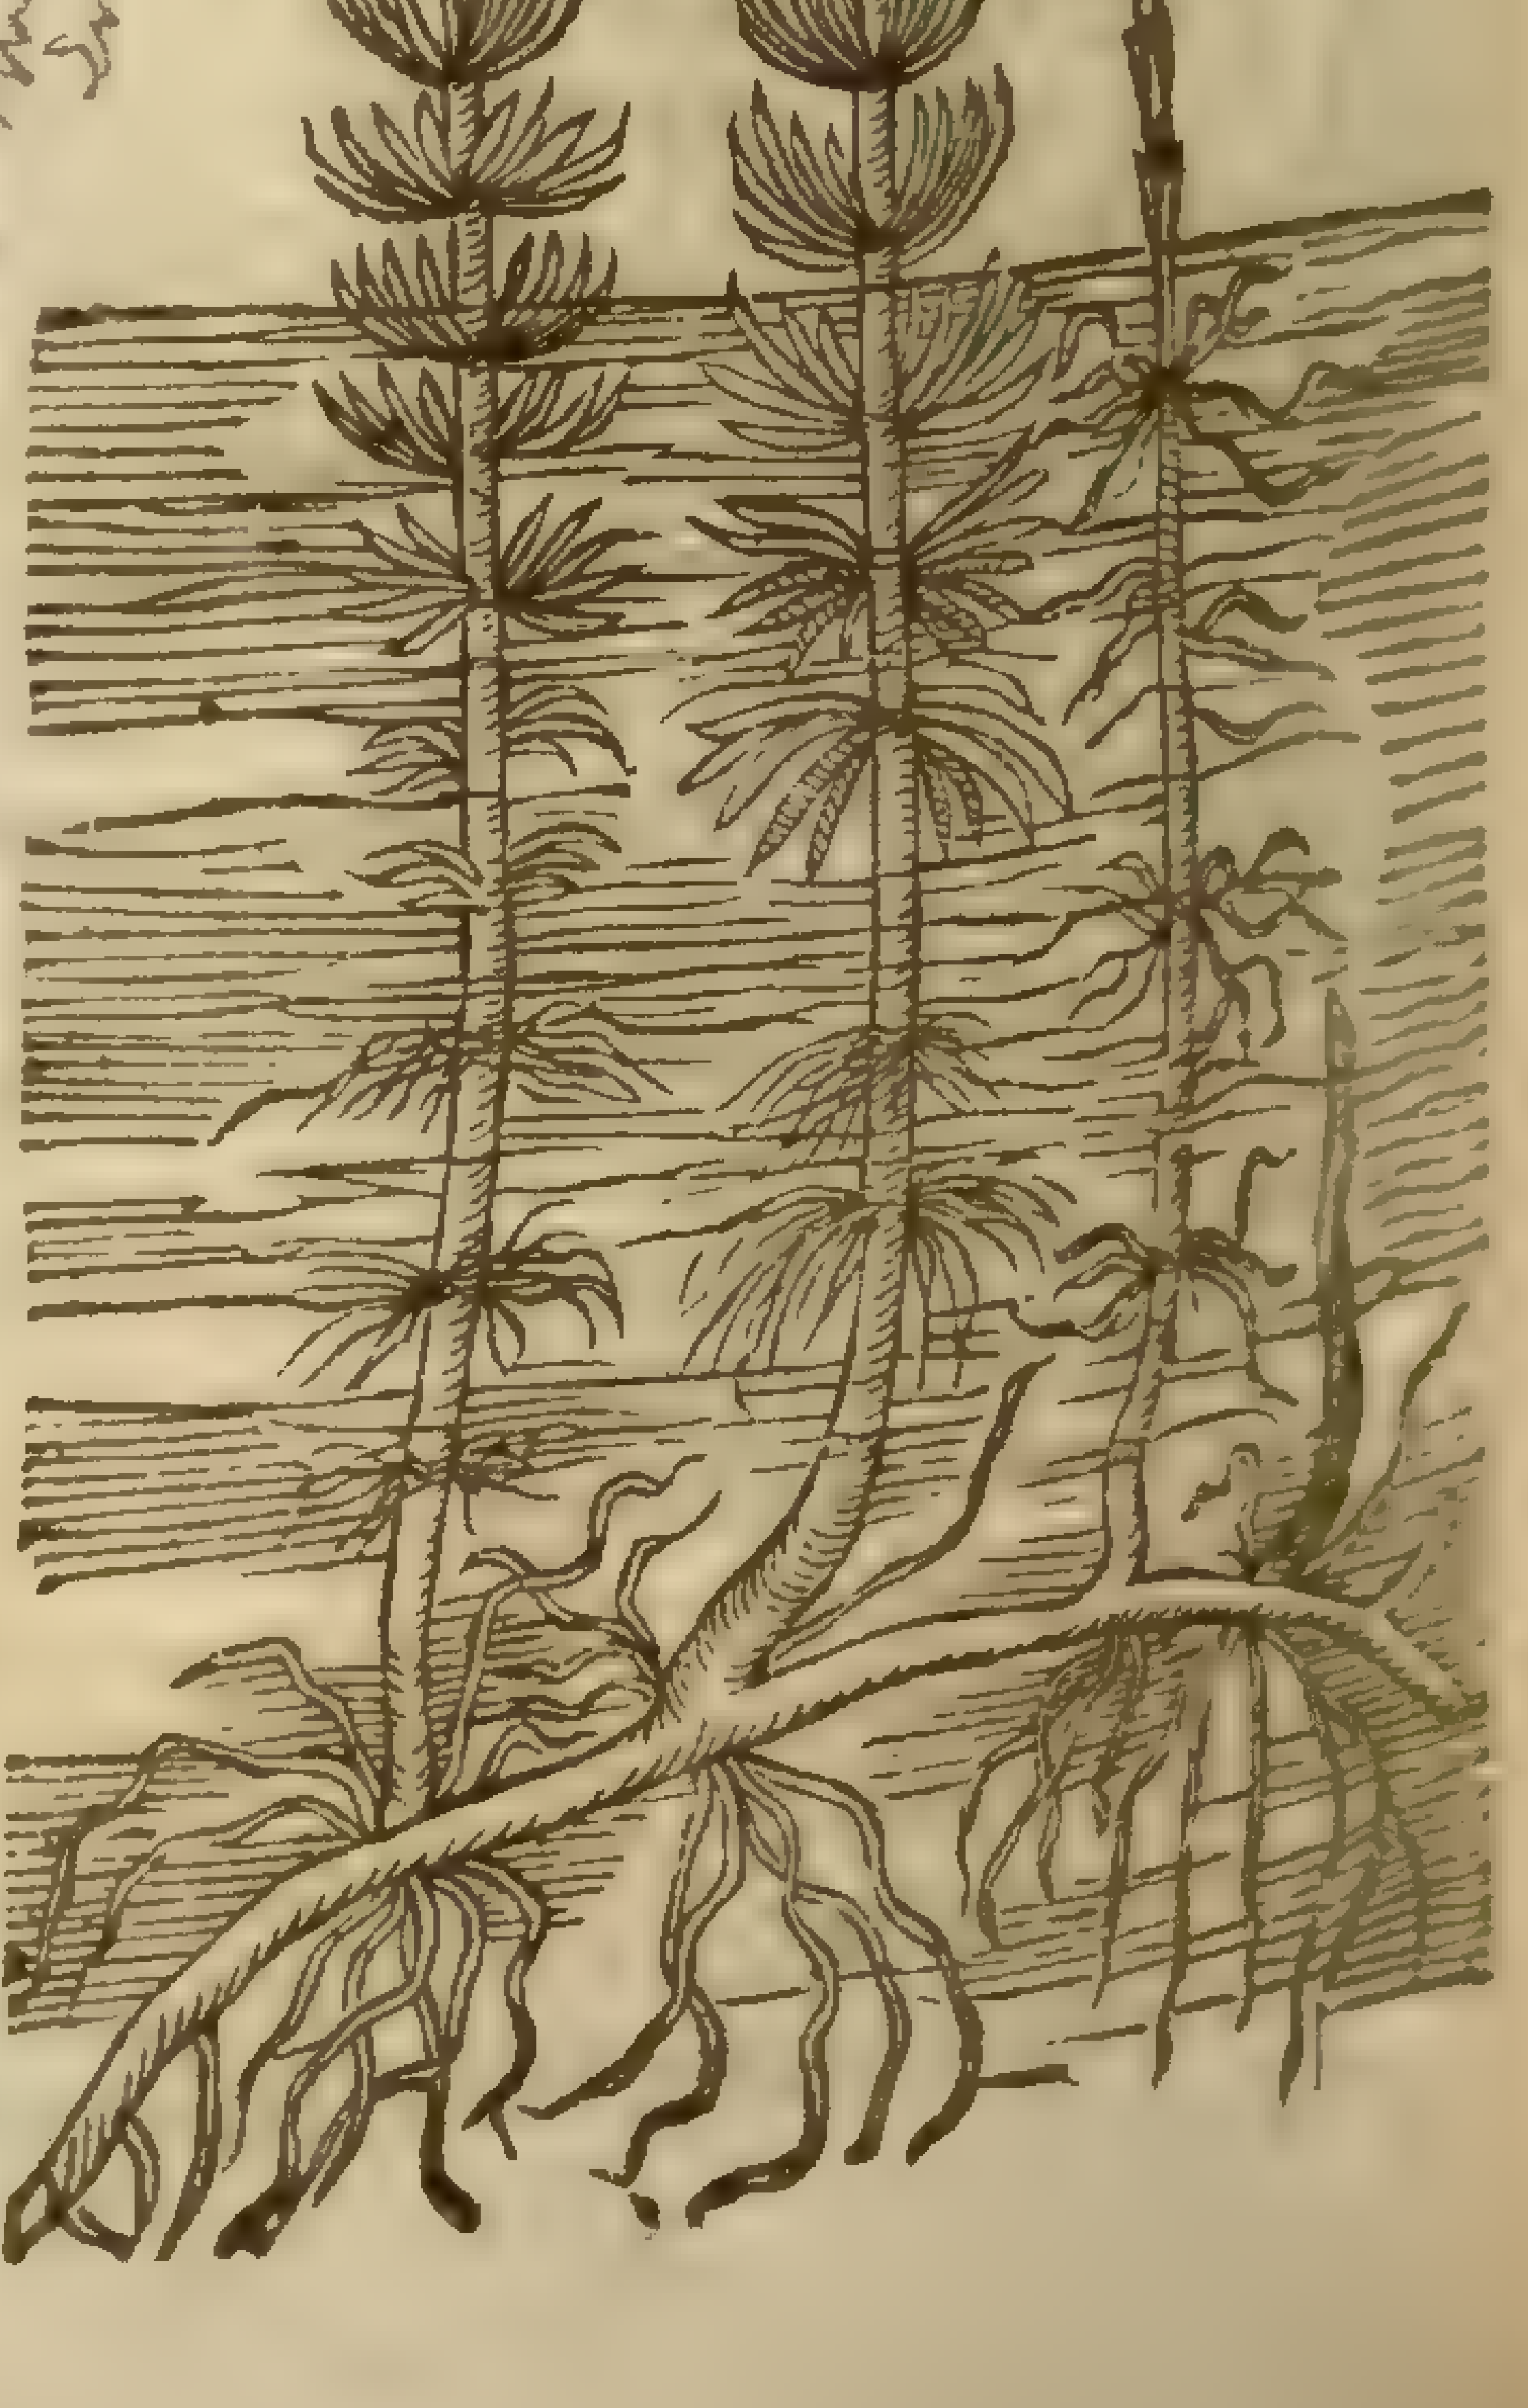
Lob. ic. 795

5 *Equiſetum ſylvaticum.*
Wood Horſe-taile.



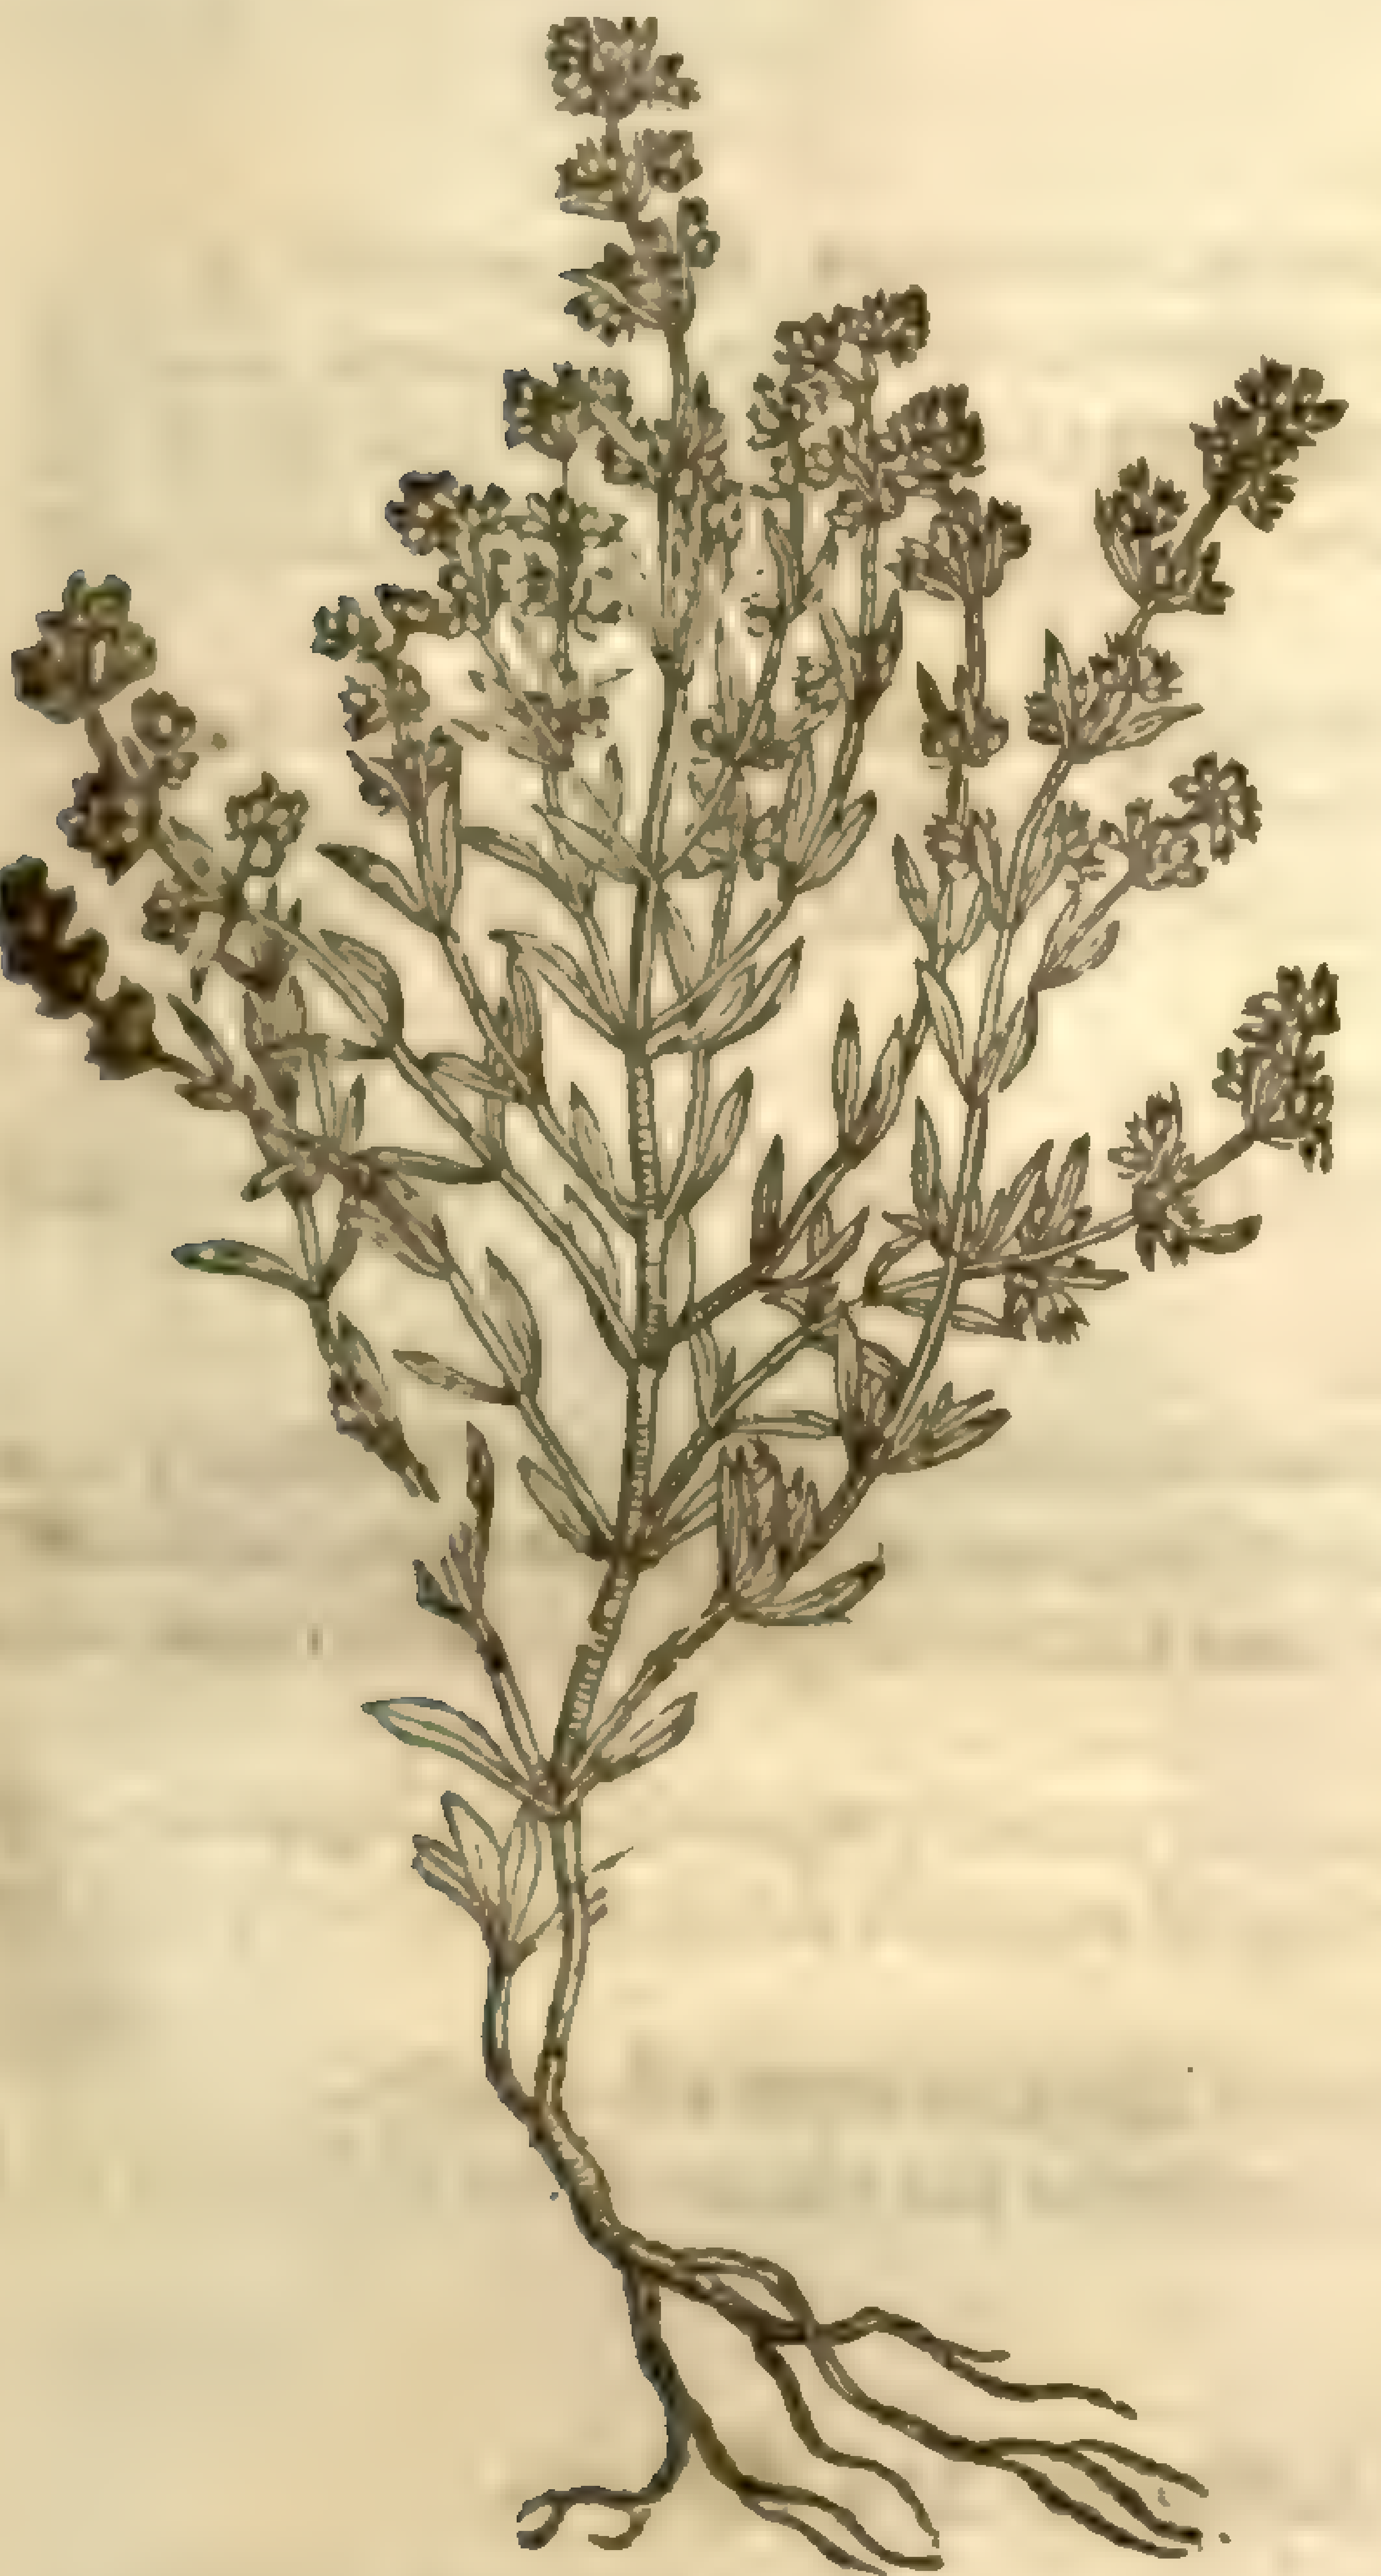
E. sylvaticum, L.
Unic. dist.

6 *Cauda equina fœmina.*
Female Horſe-taile.



Hippuris vulgaris L.
Unic. dist.
Sm. fl. 1. 4

9 *Iuncaria Salmanticenſis.*
Italian ruſhy Horſe-taile.



6 The female Horſe-taile groweth for the moſt part in wateriſh places,and by the brinks of ſmall rills and pirling brooks: it hath a long root like that of Couch-graſſe,from which riſe vp diuers hollow ſtalks,ſet about at certaine diſtances with ſmall leaues in rundles like thoſe of Woodroofe,altogether barren of ſeed and floure, wherof it was called by *Lobel*, *Polygonon fœmina ſemine Vidua.* ‡ This is ſometimes found with ten or more ſeeds at each joint; whence *Bauhine* hath called it *Equiſetum paluſtre brevioribus folijs polyſpermon.* ‡

‡ 7 In ſome boggy places of this kingdom is found a rare and pretty *Hippuris* or Horſe-taile, which growes vp with many little branches ſome two or three inches high, putting forth at each joint many little leaues, cluſtering cloſe about the ſtalke,and ſet after the maner of other Horſe-tailes:towards the top of the branches the joints are very thicke: the colour of the whole plant is gray, a little inclining to greene,very brittle, and as it were ſtony or grauelly like Coralline, and will craſh vnder your feet as if it were frozen;and if you chew it you ſhall finde it all ſtony and grauelly. My friend Mr *Leonard Buckner* was the firſt that found this plant and brought it to me: hee had it three miles beyond Oxford,a little on this ſide Euenſham ferry,in a bog vpon a common by the Beacon hill neere Cumner wood, in the end of Auguſt, 1632. Mr *Bowles* hath ſince found it growing vpon a bog not far from Chiſelhurſt in Kent. I queſtion whether this be not the *Hippuris lacuſtris quædam folijs manſu arenoſis* of *Geſner.* But if *Geſners* be that which *Bauhine* in his *Prodromus,* pag.24. ſets forth by the name of *Equiſetum nudum minus variegatum*, then I iudge it not to be this of my deſcription: for *Bauhines* differs from this,in that it is without leaues,and oft times bigger: the ſtalks of his are hollow,theſe not ſo. This may be called *Hippuris Coralloides*, Horſe-taile Coralline.

8 Toward the later end of the yere,in diuers ditches,as in S.*Iames* his Parke, in the ditches on the backe of Southwarke toward S.*Georges* fields, &c. you may finde couered ouer with water a kinde of ſtinking Horſe-taile; it growes ſometimes a yard long, with many joints and branches, and each joint ſet with leaues,as in the other Horſe-tailes,but they are ſomewhat jagged or diuided towards the tops. I take this to be the *Equiſetum fœtidum ſub aqua repens*, deſcribed in the fifth place of *Bauhines Prodromus*. We may call in Engliſh,ſtinking water Horſe-taile. ‡

9 *Cluſius* hath ſet forth a plant that he referreth vnto the ſtocke of Horſe-tailes, which he thus deſcribeth; It hath many twiggy or ruſhy ſtalks,whereupon it was called *Iuncaria*,and may be Engliſhed,Ruſh weed: the leaues grow vpon the branches like thoſe of flax;on the tops of the ſtalks grow ſmall chaffie floures of a whitiſh colour. The ſeed is ſmall and blacke of colour, the root little and white: the whole plant is ſweetiſh in taſte.

10 *Dodonæus* ſets forth another Horſe-taile,which he called climing Horſe-tail, or Horſe-tail of Olympus. There is (ſaith he) another plant like Horſe-taile,but greater and higher; it riſeth vp oftentimes with a ſtalke as big as a mans arme, diuided into many branches, out of which there grow long ſlender ſprigs very full of joints like to the firſt Horſe-taile: the floures ſtand about the joints,of a moſſie ſubſtance,ſmall as are thoſe of the Cornel tree; in places whereof grow vp red fruit full of ſoure juice,not vnlike to little Mulberries,in which is the ſeed. The root is hard and woody. This growes now and then to a great height,and ſometimes lower. *Bellonius* writes in his Singularities, That it hath bin ſeen to be equall in height with the Plane tree: it comes vp lower neere to ſhorter and leſſer trees and ſhrubs,yet doth it not faſten it ſelfe to the trees with any tendrels or claſping aglets,much leſſe doth it winde it ſelfe about them, yet doth it delight to ſtand neere and cloſe vnto them.

¶ *The Place.*

The titles and deſcriptions ſhew the places of their growing. The laſt *Bellonius* reports to grow in diuers vallies of the mountaine Olympus, and not far from Raguſa a city in Sclavonia.

¶ *The Time.*

They floure from Aprill to the end of Summer.

¶ *The Names.*

Horſe-taile is called in Greeke Ἵππουρις, *Hippuris*: in Latine, *Equiſetum*, and *Equinalis*: of *Plin*, *lib*.15. *cap*.28. *Equiſetis*, of the likeneſſe of a horſe haire: of ſome, *Salix equina*: in ſhops, *Cauda Equina*: in high-Dutch, **Schaffthew**: in low-Dutch, **Peertſteert**: in Italian, *Coda di Cavallo*: in Spaniſh, *Coda de mula*: in French, *Queve de Cheval*, and *Caqueve*: in Engliſh, Horſe-taile, Shave-graſſe, and in ſome places, Ioynts.

Shaue-graſſe is not without cauſe named *Aſprella*, of his ruggedneſſe, which is not vnknowne to women, who ſcoure their pewter and wodden things of the kitchen therewith, which the Germane women call **Kannenkraut**: and therefore ſome of our huſwiues do call it Pewter-wort. Of ſome the tenth is called *Ephedra*, *Anobaſis*, and *Caucon*.

¶ *The Temperature.*

Horſe-taile (as *Galen* ſaith) hath a binding facultie with ſome bitterneſſe, wherefore it mightily drieth, and that without biting.

¶ *The Vertues.*

A *Dioſcorides* ſaith, that Horſe-taile being ſtamped and laid to, doth perfectly cure wounds, yea although the ſinues be cut in ſunder, as *Galen* addeth. It is of ſo great and ſingular vertue in healing wounds, as that it is thought and reported for truth, to cure the wounds of the bladder and other bowels, and helpeth ruptures and burſtings.

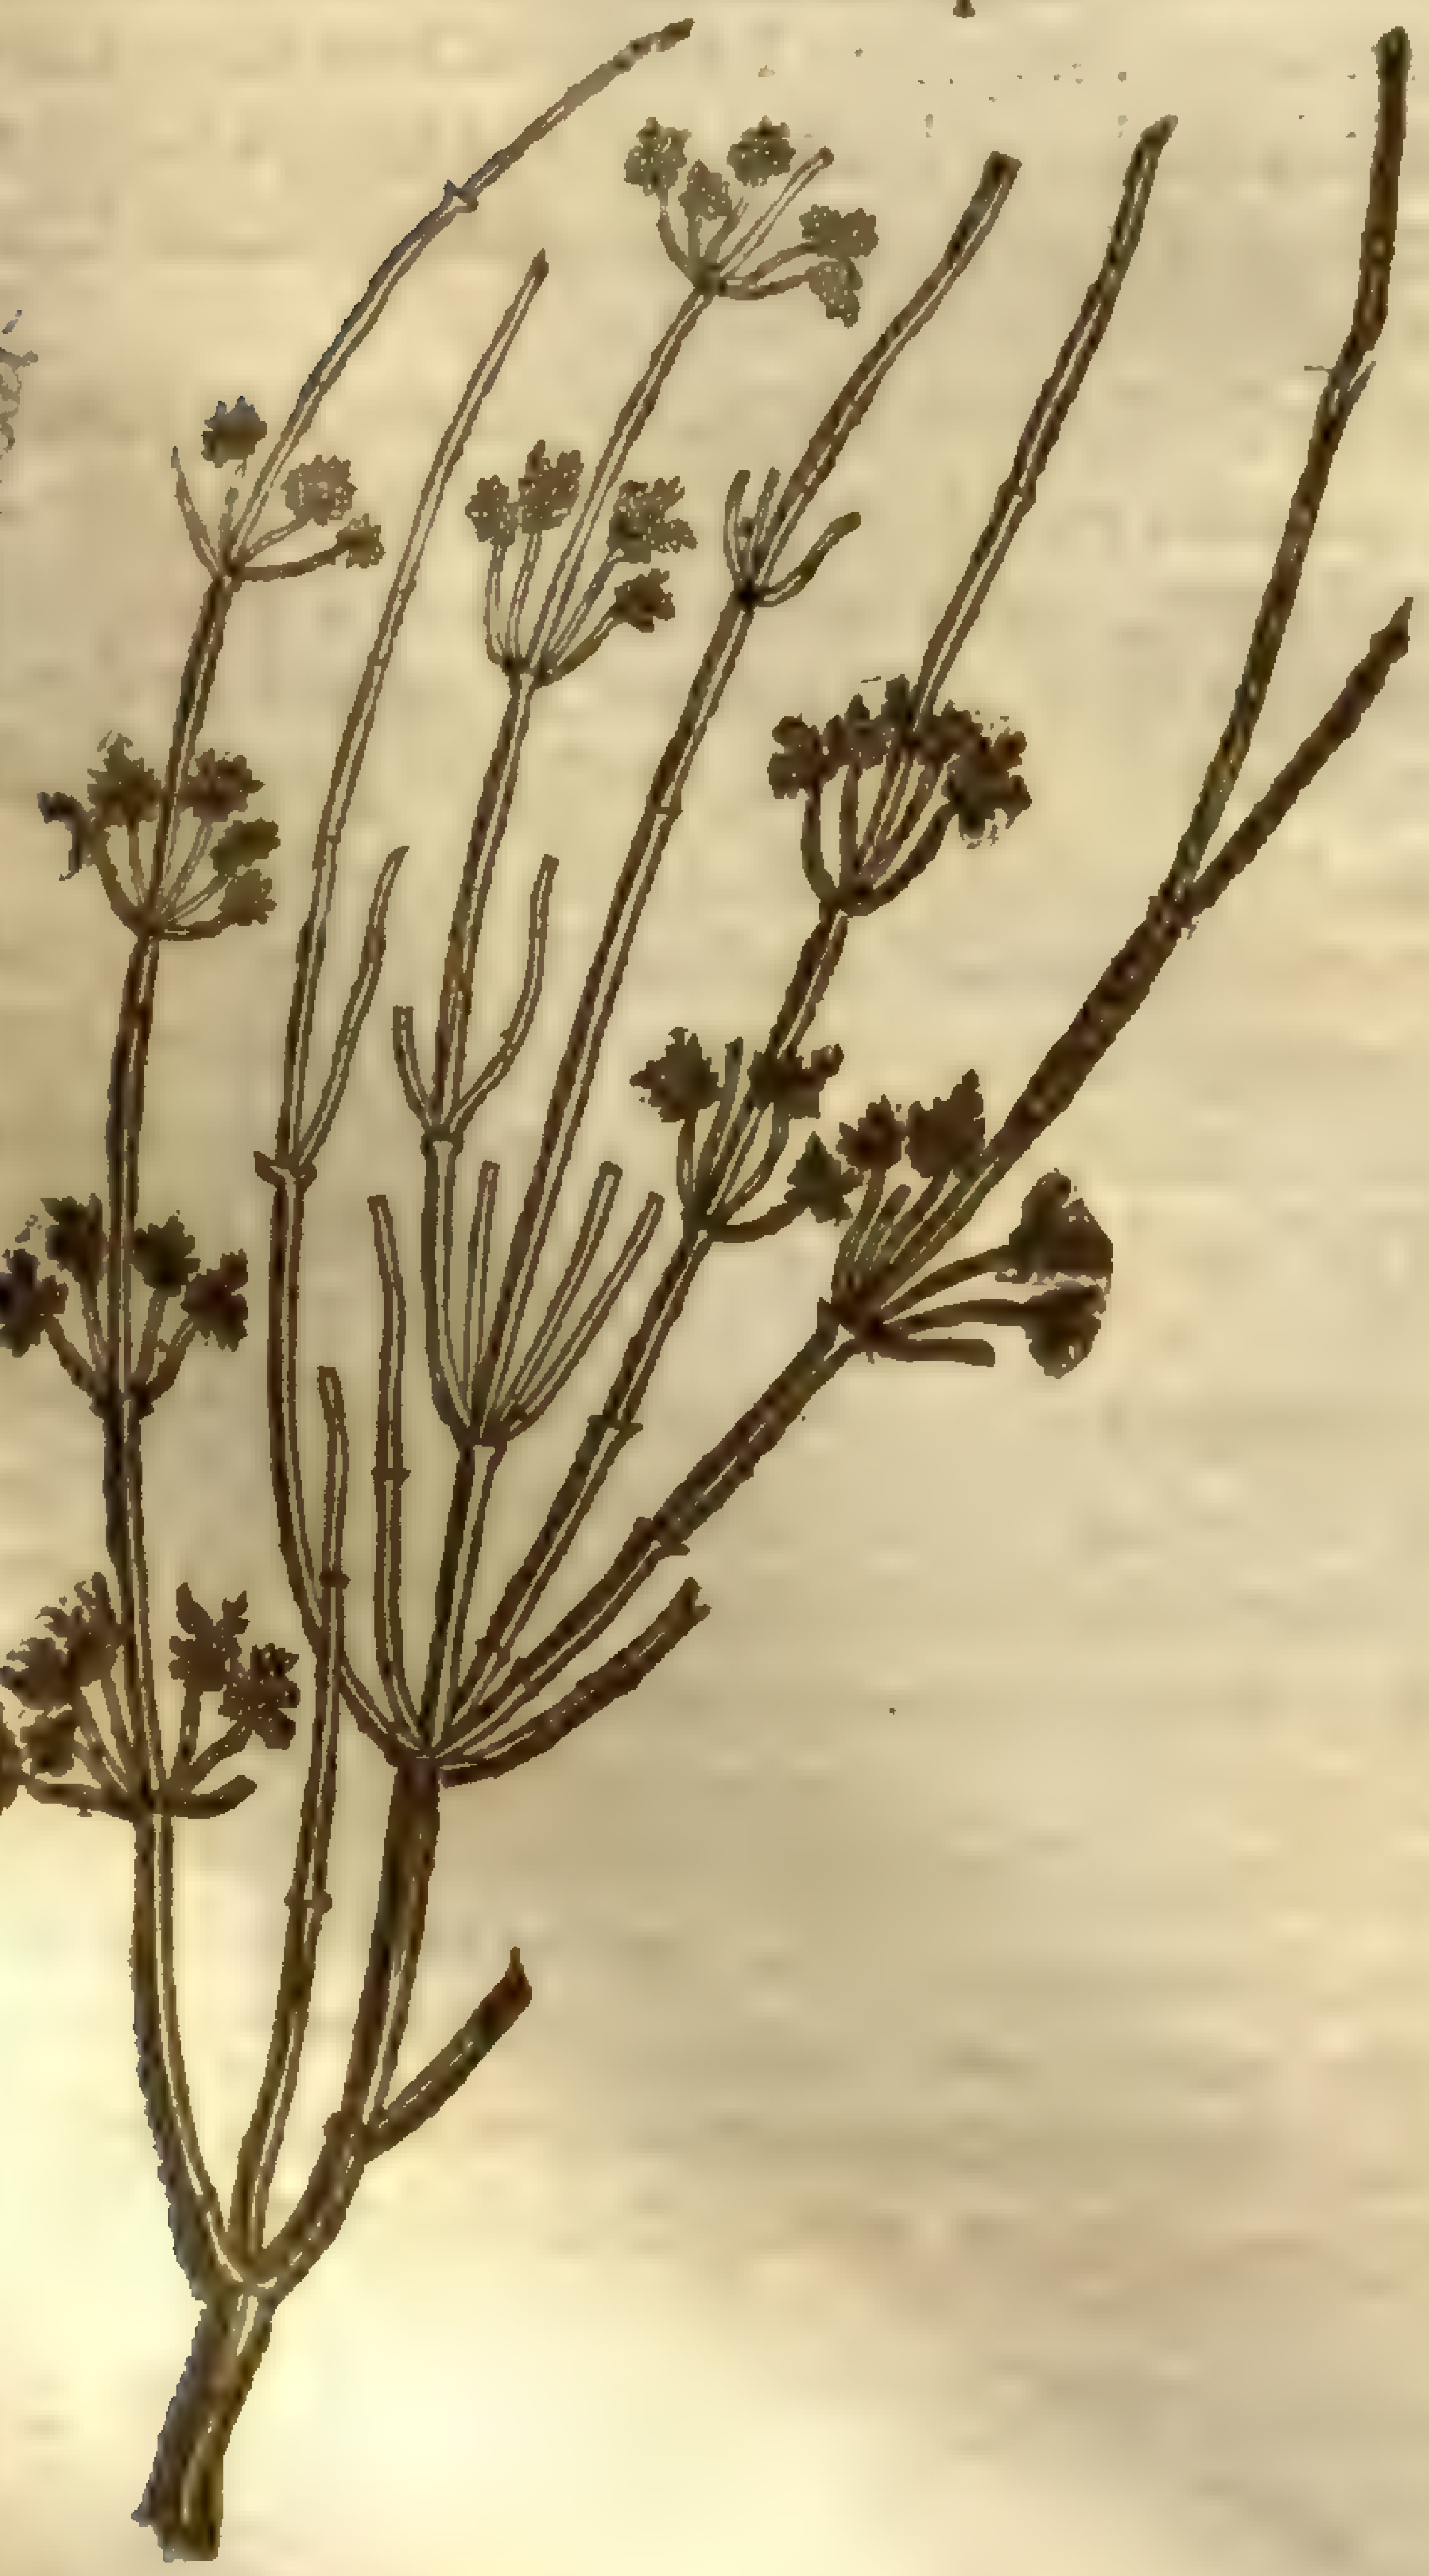
B The herb drunke either with water or wine, is an excellent remedy againſt bleeding at the noſe, and other fluxes of bloud: it ſtayeth the ouermuch flowing of womens floures, the bloudy flix, and other fluxes of the belly.

C The juice of the herb taken in the ſame manner doth the like, and more effectually.

D Horſe-taile with his roots boiled in wine is very profitable for the vlcers of the kidnies & bladder, the cough, and difficultie of breathing.

CHAP. 459. *Of Sea Cluſter or Sea Raiſon.*

† 1 *Vva marina minor.*
The ſmall ſea Grape.



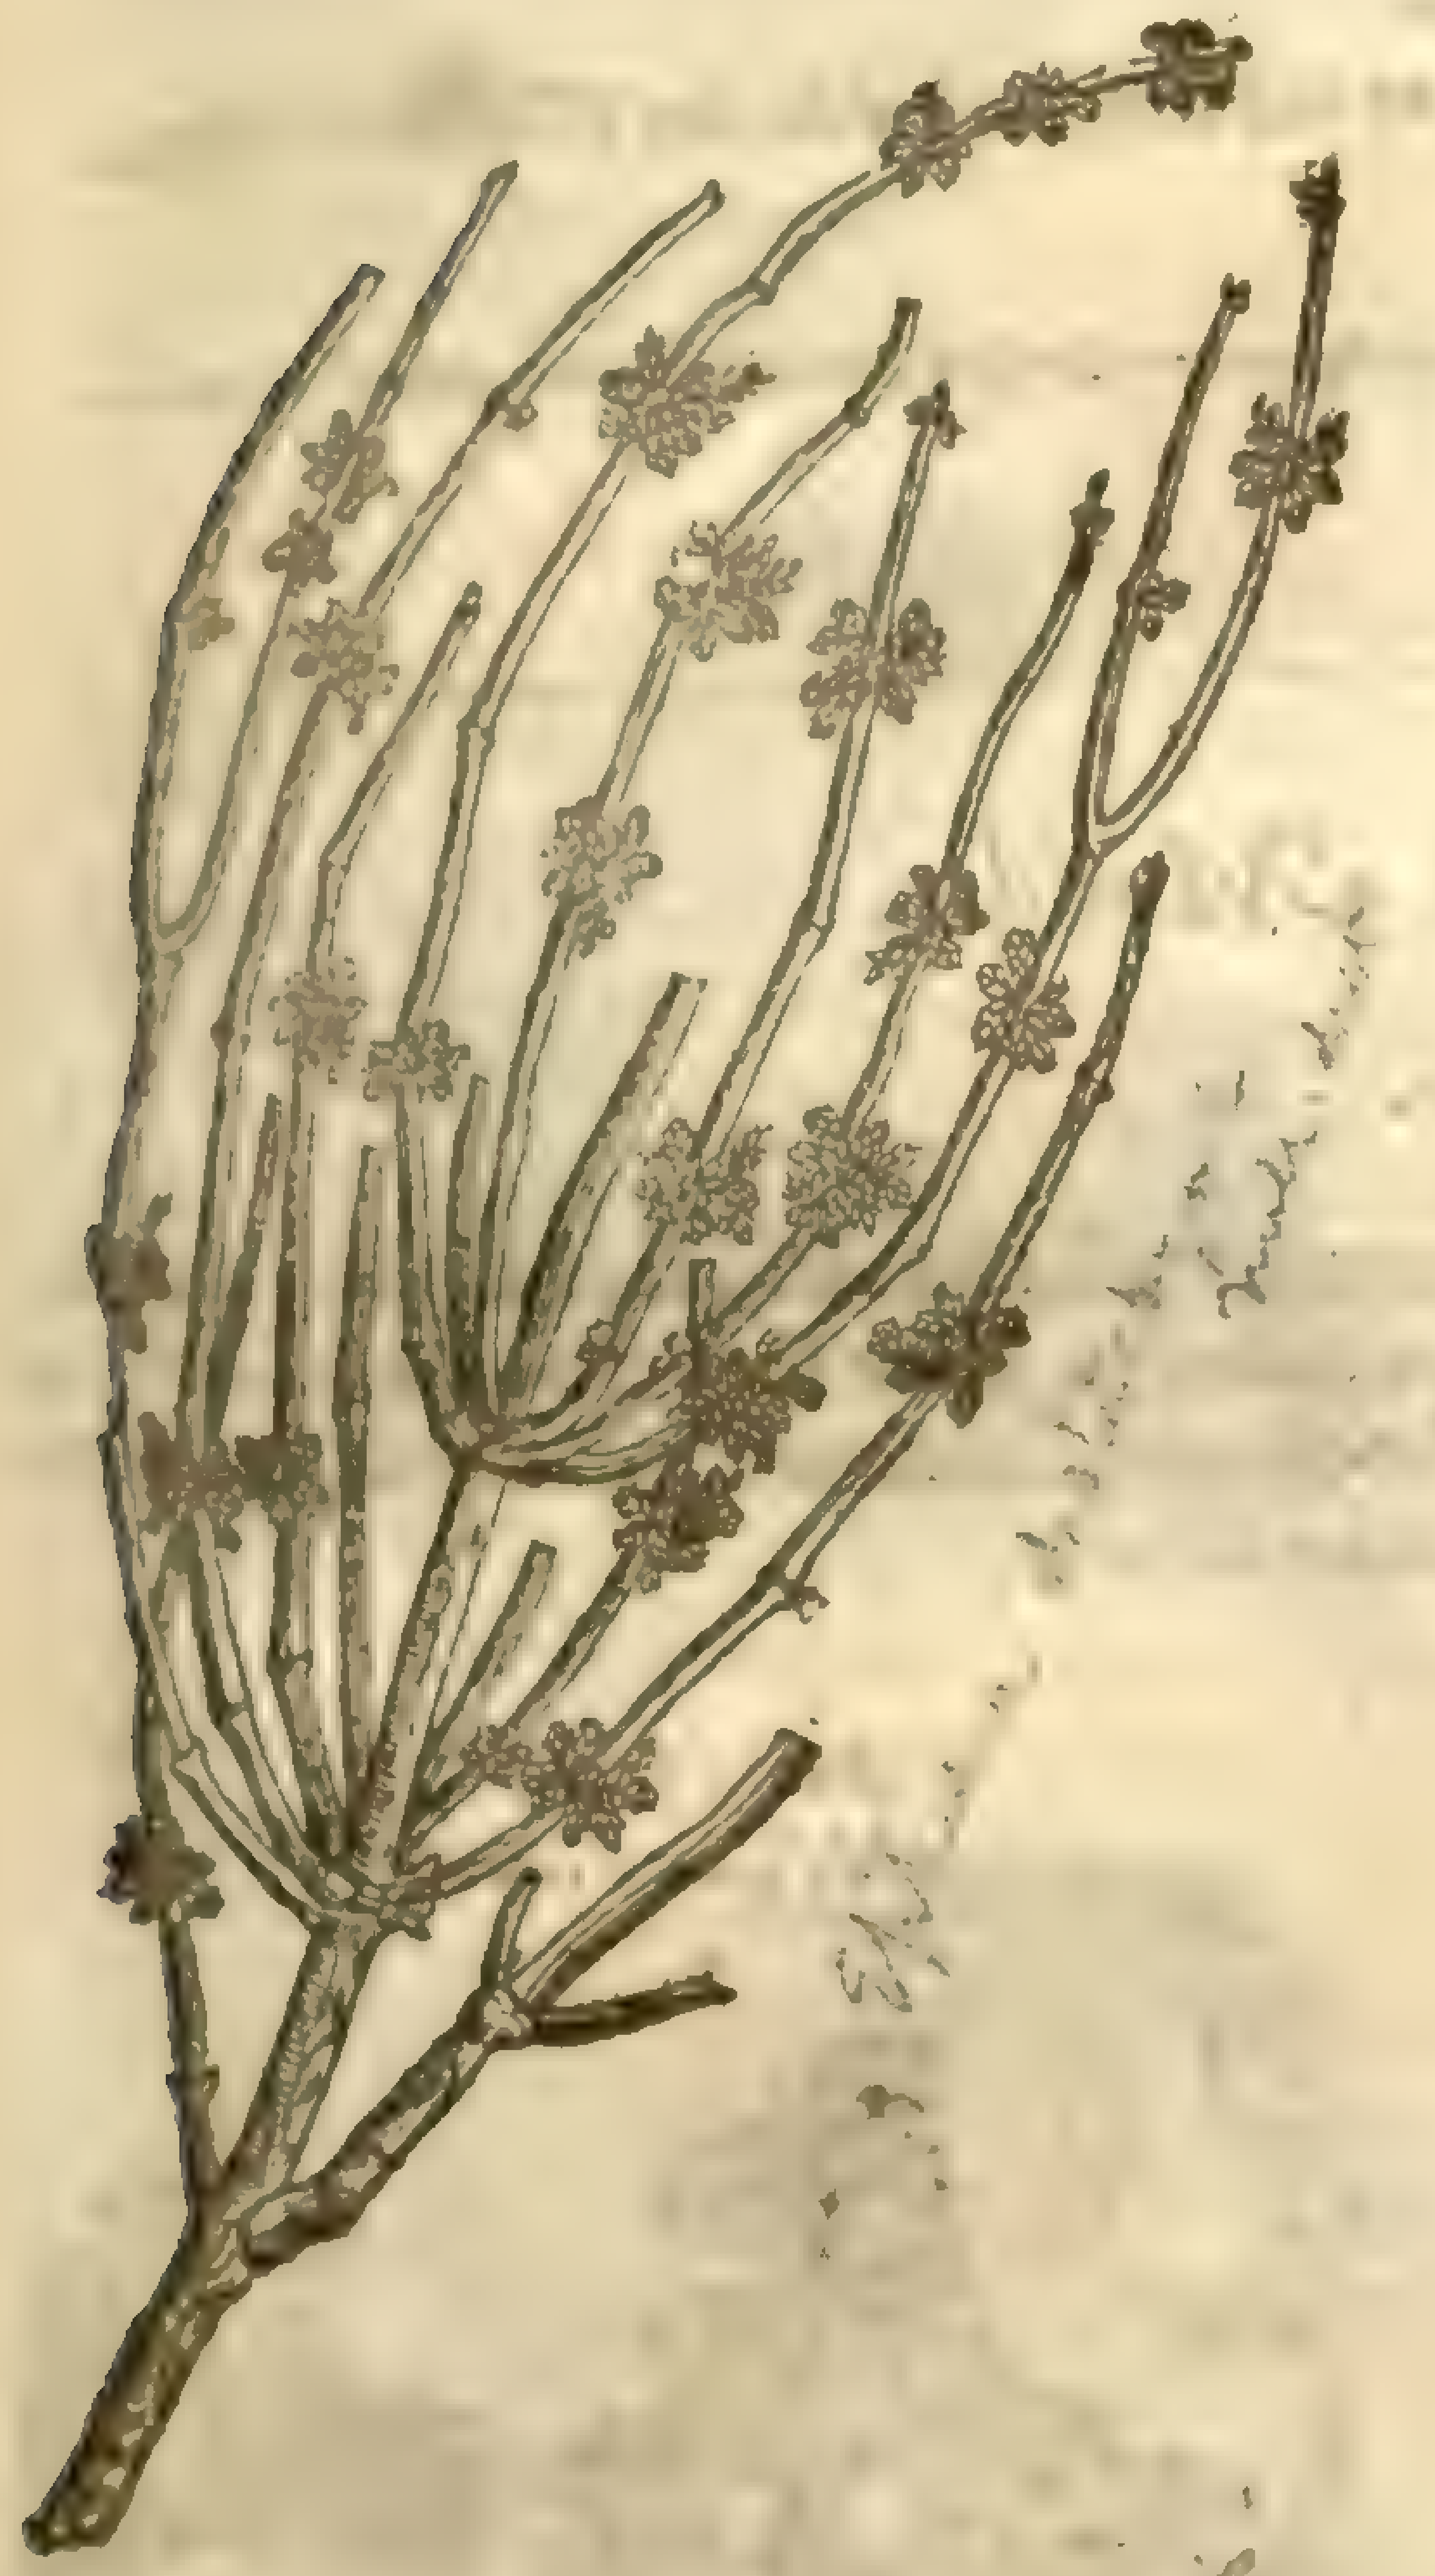
Ephedra distachya, L. [illegible]

¶ *The Deſcription.*

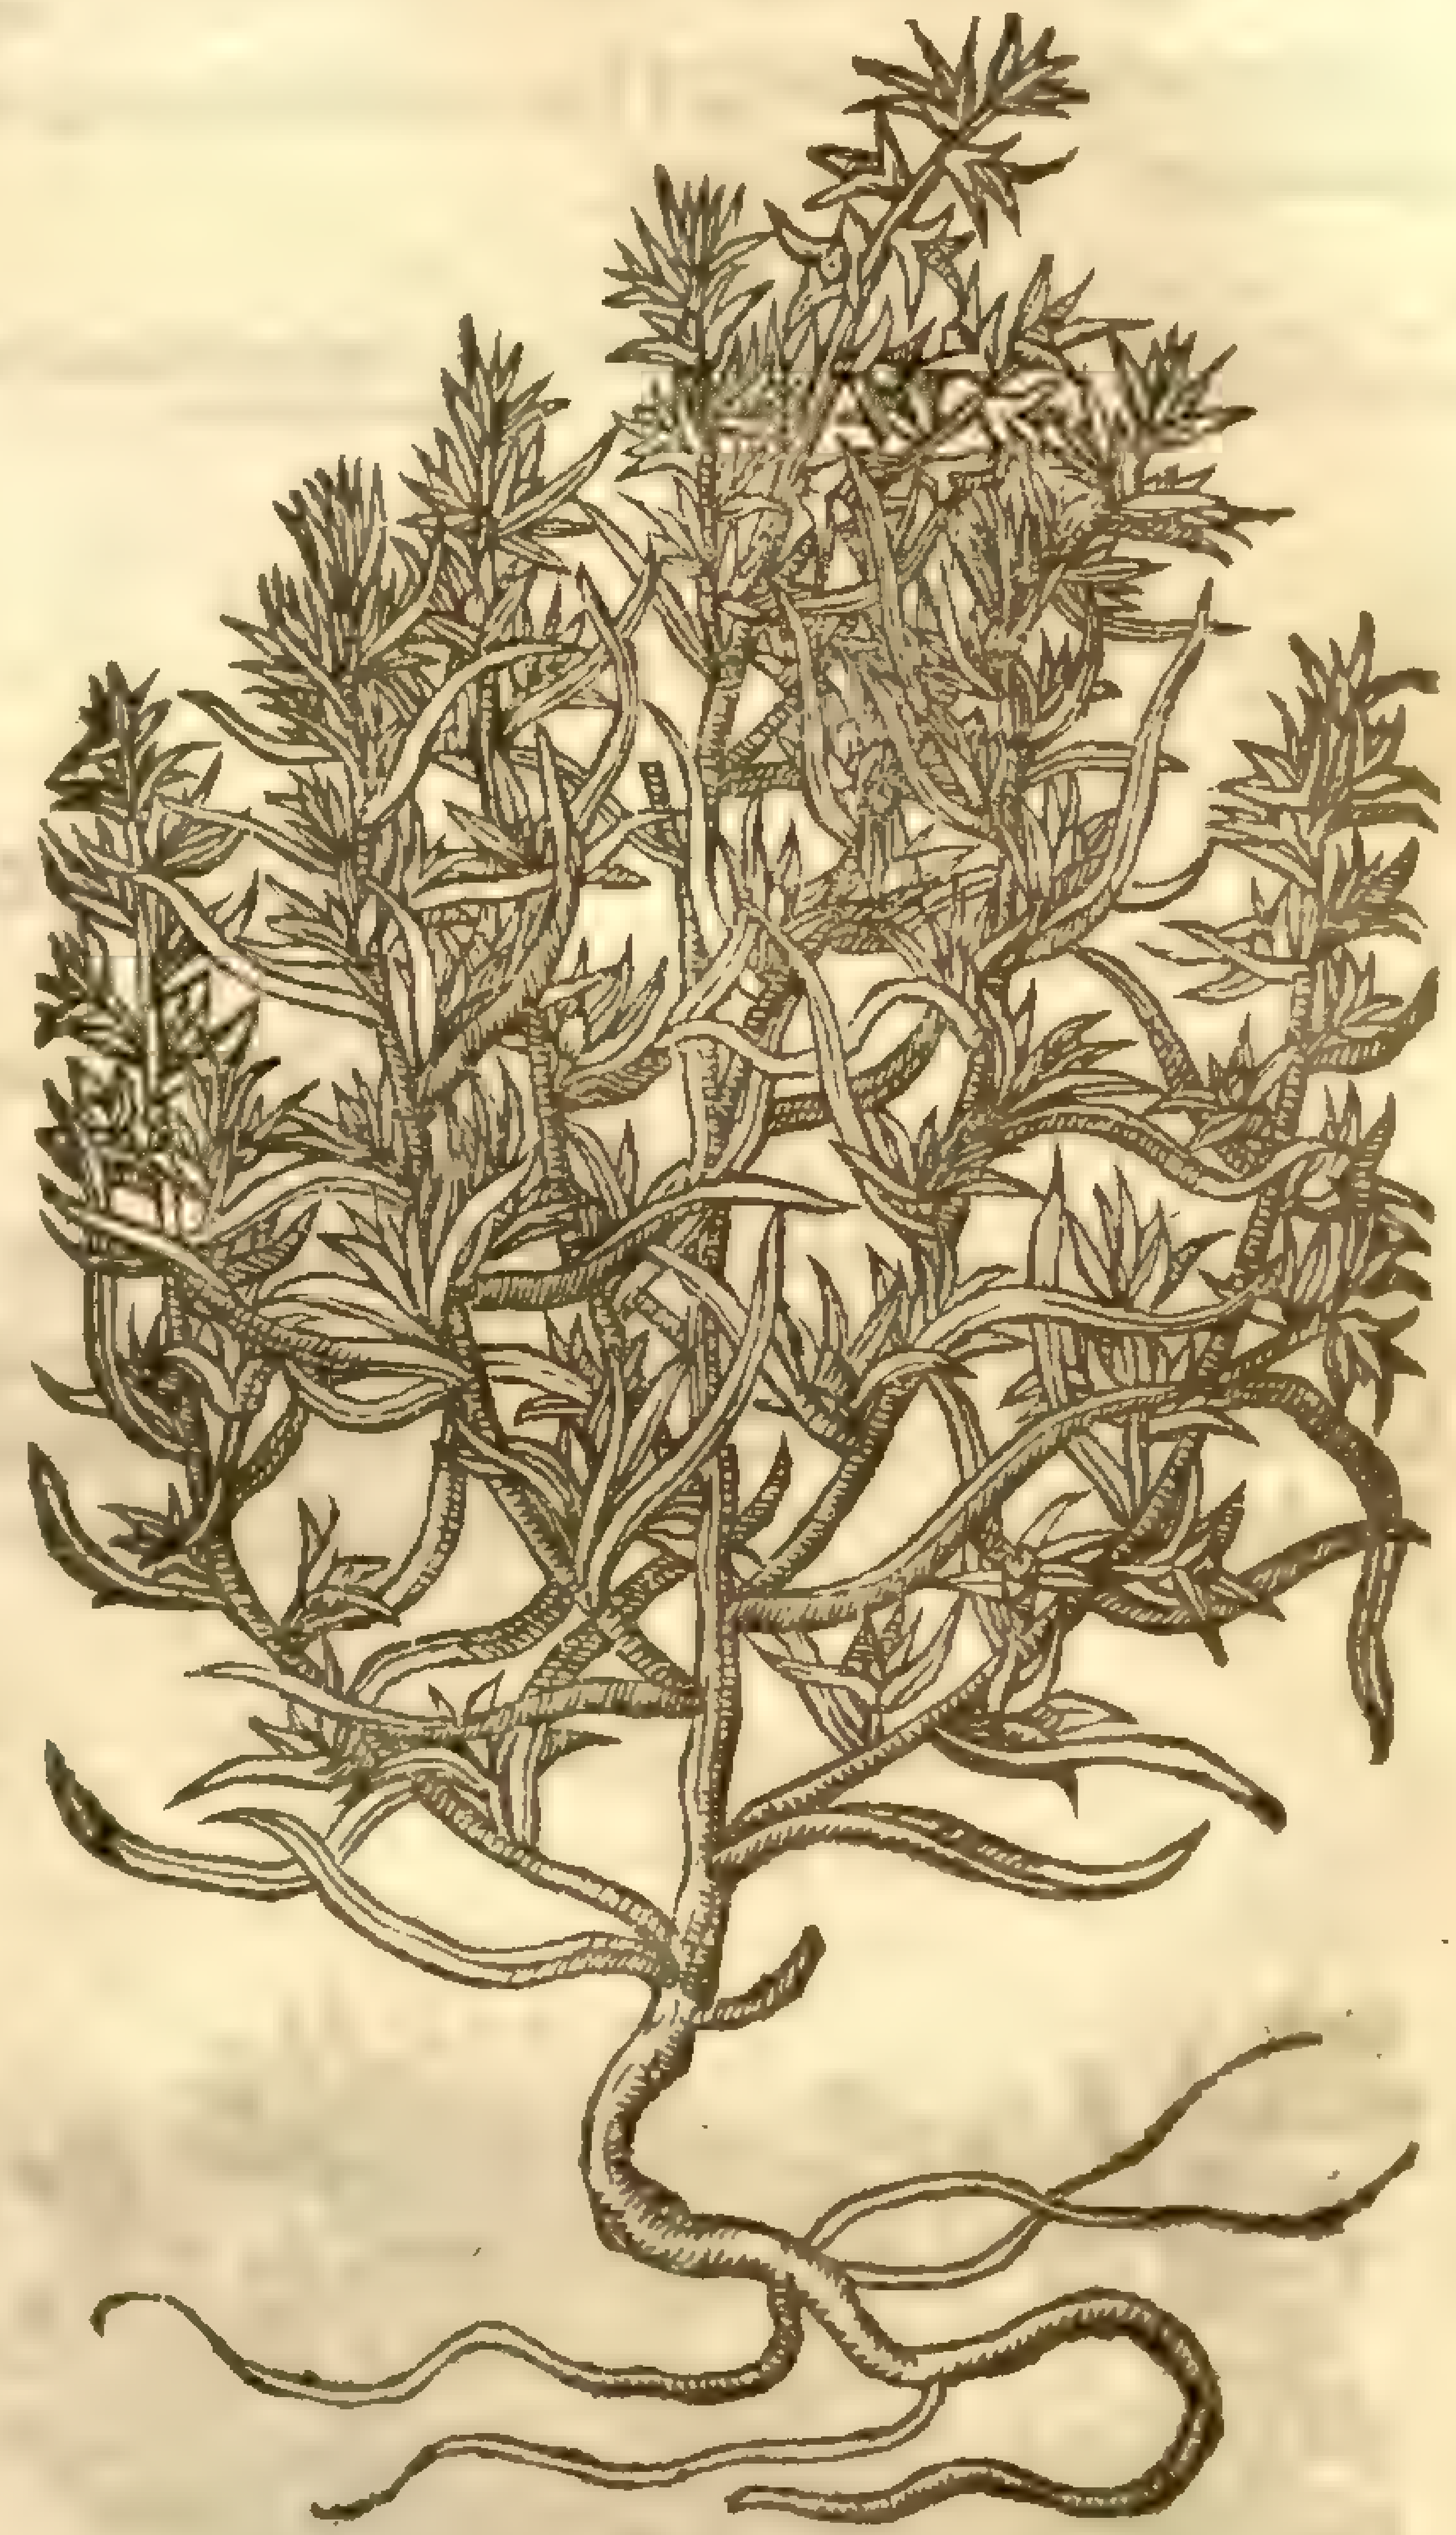
1 Small ſea Grape is not vnlike to Horſe-taile; it bringeth forth ſlender ſtalks almoſt like Ruſhes, ſet with many little joints, ſuch as thoſe are of the Horſ-taile, and diuided into many wings or branches, the tops whereof are ſharpe pointed, ſomewhat hard and pricking. It is without leaues: the floures grow in cluſters out of the joints, with little ſtemmes, they are ſmall, and of a whitiſh green colour: The fruit conſiſteth of many little pearles, like to the vnripe berries of Raſpis or Hind-berry: when it is ripe it is red, with a ſaffron colour, in taſt ſweet and pleaſant: the ſeed or kernell is hard, three ſquare, ſharp on euery ſide, in taſte binding: the root is jointed, long, and creeps aſlope: the plant it ſelfe alſo doth rather lie on the ground, than ſtand vp. It growes all full of ſmall ſtalks and branches, caſting themſelues all abroad.

2 *Carolus Cluſius* hath ſet forth another ſort of ſea Grape, far different from the precedent. It riſeth vp to the height of a man, hauing many branches of a wooddy ſubſtance, in forme like to Spaniſh Broom, without any leaues at all; whereupon doe grow cluſters of floures vpon ſlender foot-ſtalks of a yellowiſh moſſie or herby colour, like thoſe of the Cornell tree: after which come the fruit like vnto the Mulberry, of a reddiſh colour and ſowre taſte, wherein lieth hid one or two

ſeeds like thoſe of Mullet, blacke without and white within: the root is hard, tough, and wooddy.



2 *Vua marina major.*
Great ſhrubby ſea Grape.



3 *Tragos Matthioli.*
Baſtard ſea Grape.

3 *Tragon Matthioli*, or rather *Tragos improbus Matthioli*, which hee vnaduiſedly called *Tragon*, is without controuerſie nothing elſe but a kinde of *Kali*: this plant riſeth vp out of the ground with ſtalks ſeldom a cubit high, diuided into ſundry other groſſe thicke and writhen branches, ſet or armed with many pricking leaues of the colour and ſhape of *Aizoon*, and ſomwhat thick and fleſhy: among which come forth ſuch prickly buds as are to be ſeen in *Tribulus terreſtris*, as that it is hard for a man to touch any part thereof without pricking his fingers: the flours are of an herby colour, bringing forth flat ſeed like vnto *Kali*: the root is ſlender, and ſpredeth vnder the turf of the earth: the whole plant is full of clammy juice, not any thing aſtringent, ſomwhat ſaltiſh, and of no ſingular vertue as yet knowne: wherefore I may conclude, that this cannot be *Tragos Dioſcoridis*, and the rather, for that this *Tragos* of *Matthiolus* is an herb, and not a ſhrub, as I haue before ſpoken in *Vua marina*, neither beareth it any berries or grains like wheat, neither is it pleaſant in taſte or ſmell, or any thing aſtringent, all which are to be found in the right *Tragos* before expreſſed; which (as *Dioſcorides* ſaith) is without leaues, neither is it thorny, as *Tragos improbus Matthioli* is: this plant I haue found growing in the Iſle of Shepey, in the tract leading to the houſe of Sr *Edward Hobby*, called Sherland.

¶ *The Place.*

It loueth to grow vpon dry banks and ſandy places neere the ſea: it is found in Languedoc not far from Montpelier, and in other places by the ſea ſide, but is a ſtranger in England.

¶ *The Time.*

When it growes naturally the fruit is ripe in Autumne: the plant it ſelfe remaines long green, for all the cold in winter.

¶ *The Names.*

It is called of the later herbariſts *Vuamarina*: in French, *Raiſin de mer*, of the pearled fruit, and the likeneſſe it hath with the Raſpisberry, which is as it were a Raiſin or Grape, conſiſting of many little ones: it is named in Greeke τράγος, but is not called *Tragus* or *Tragos* of a Goat, (for ſo ſignifieth the Greeke word) or of his ranke and rammiſh ſmell, but becauſe it brings forth fruit fit to be eaten; of the Verb τρώγω, which ſignifies to eat: it may be called Scorpion, becauſe the ſprigs thereof are ſharp pointed like a Scorpions taile.

¶ *The Temperature.*

The berries or Raiſins, and eſpecially the ſeed that is in them, haue a binding qualitie, as we haue ſaid, and are dry in the later end of the ſecond degree.

¶ *The Vertues.*

A *Dioſcorides* writeth, That the Raiſins of ſea grape ſtay the flix, and alſo the Whites in women when they much abound.

---

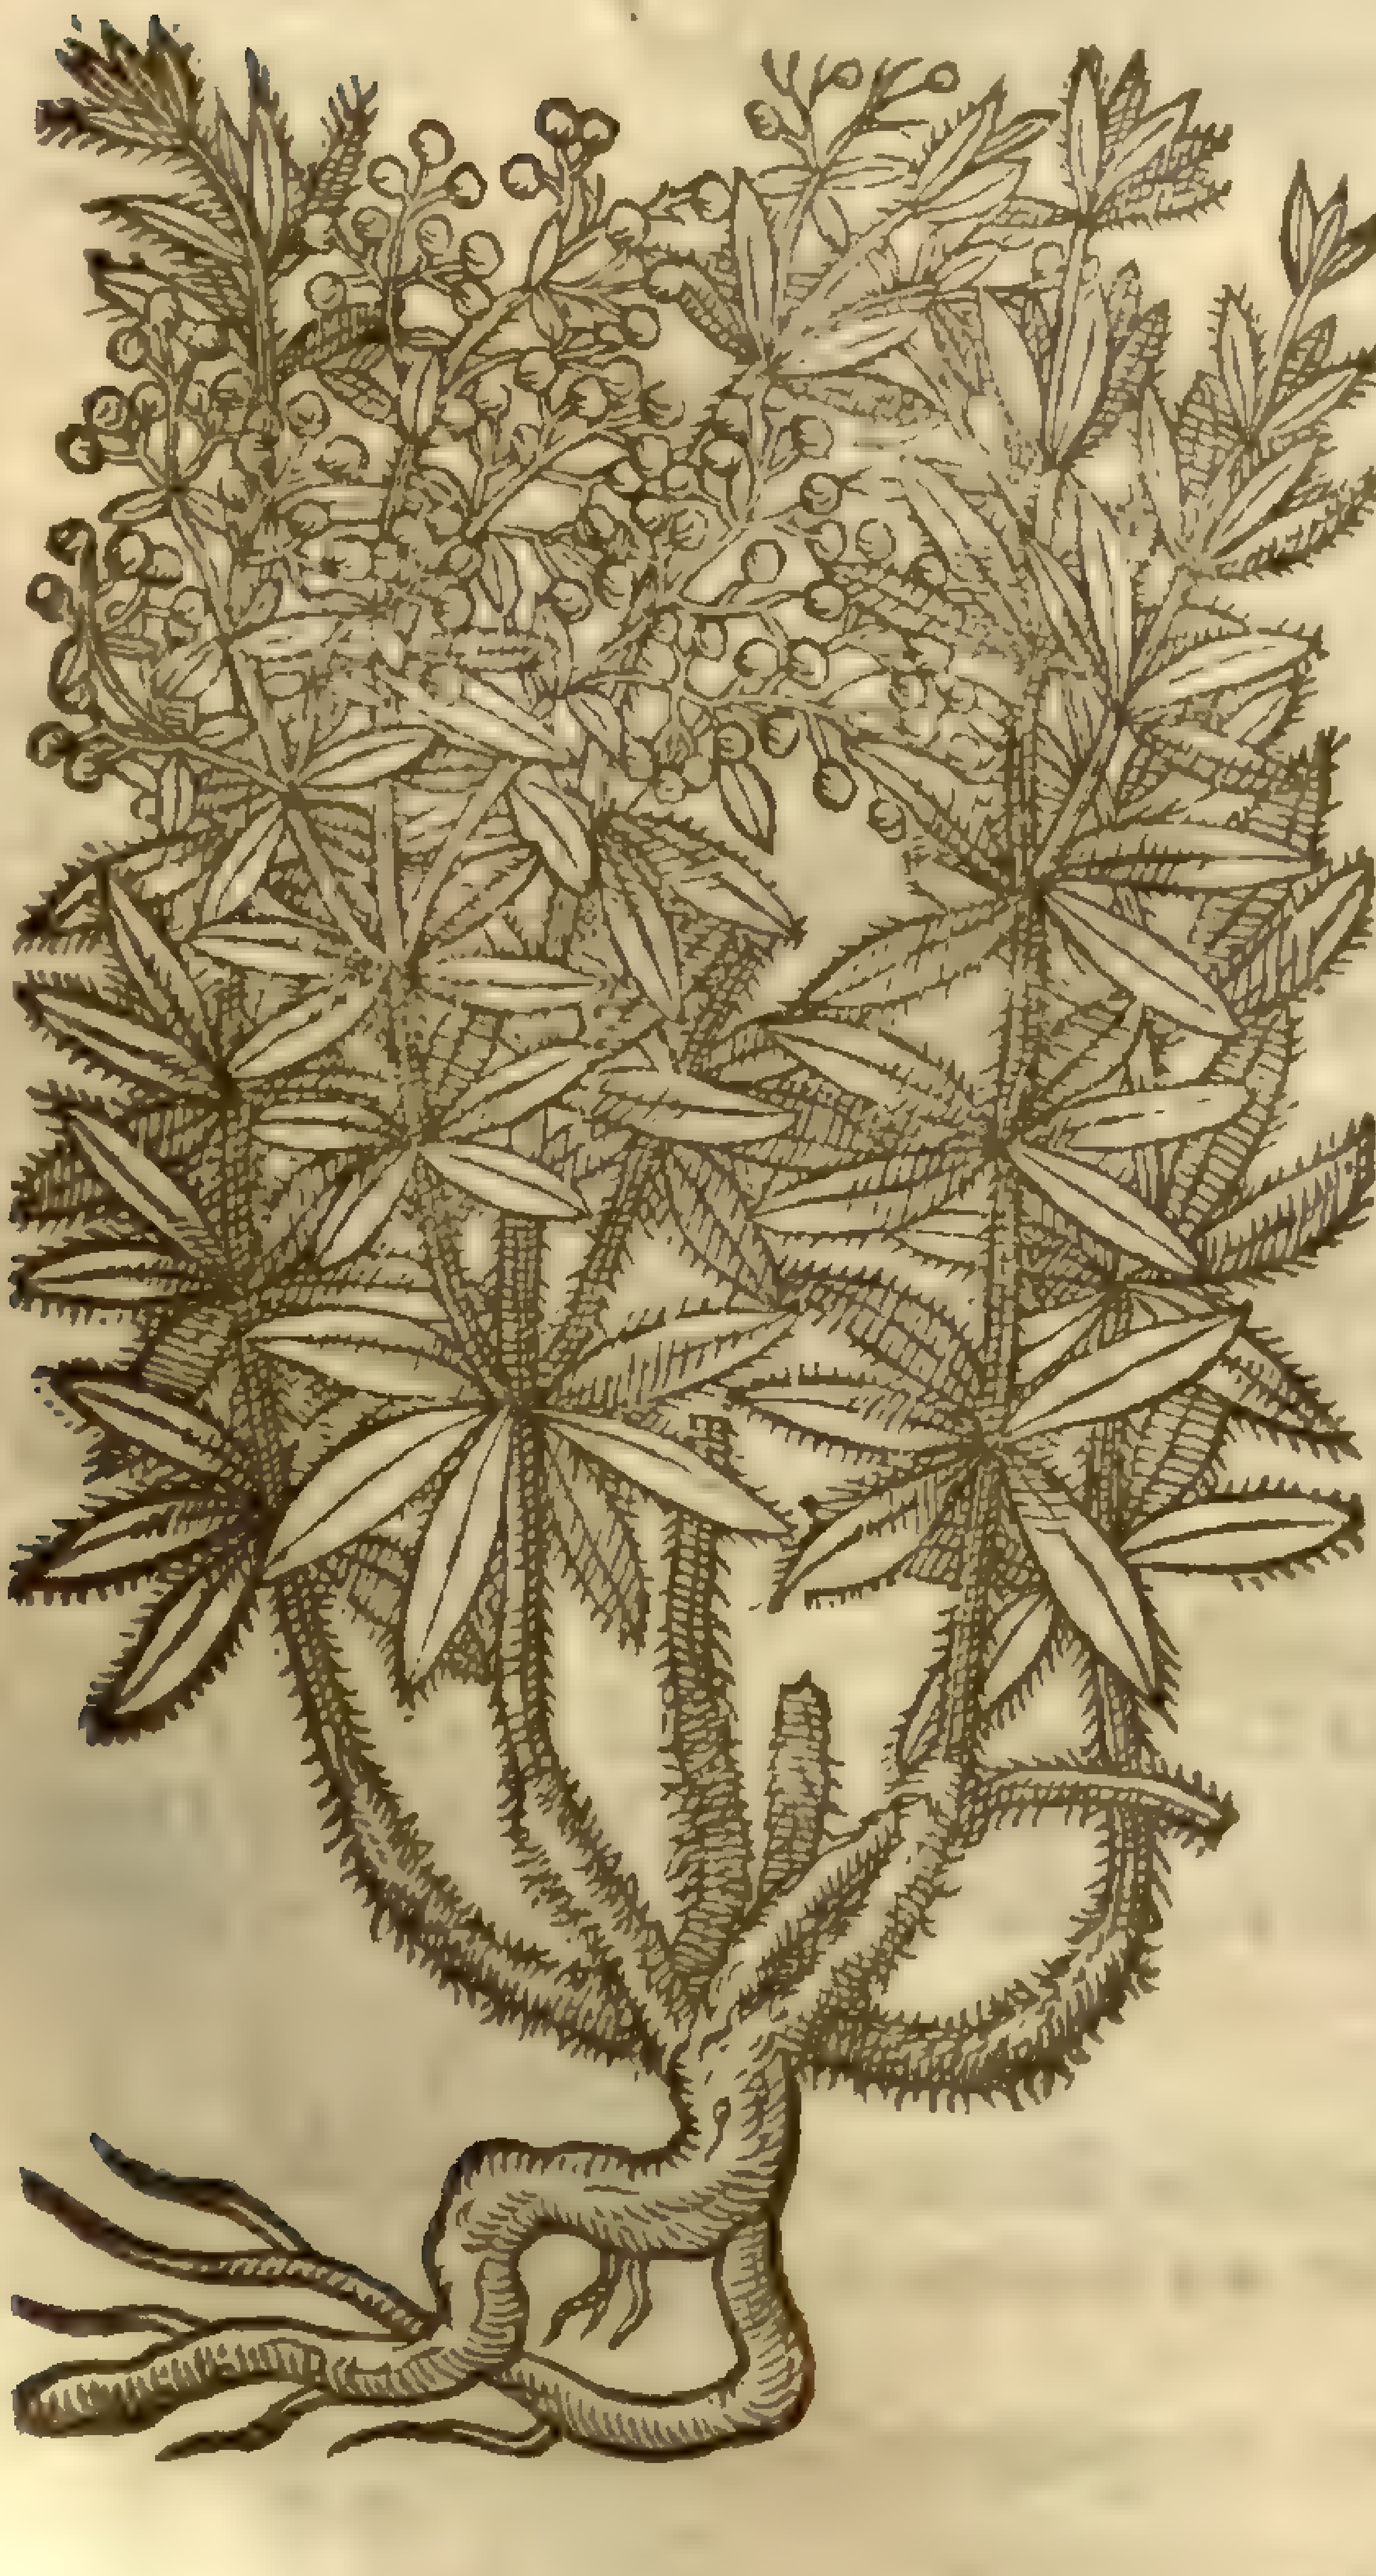
† Our Author, as you ſee, gaue the hiſtorie of the leſſer in the firſt place, but formerly the figure was in the third place, and another figure of the ſame in the ſecond place, and the figure of the greater was in the firſt place.

Chap. 460. *Of Madder.*

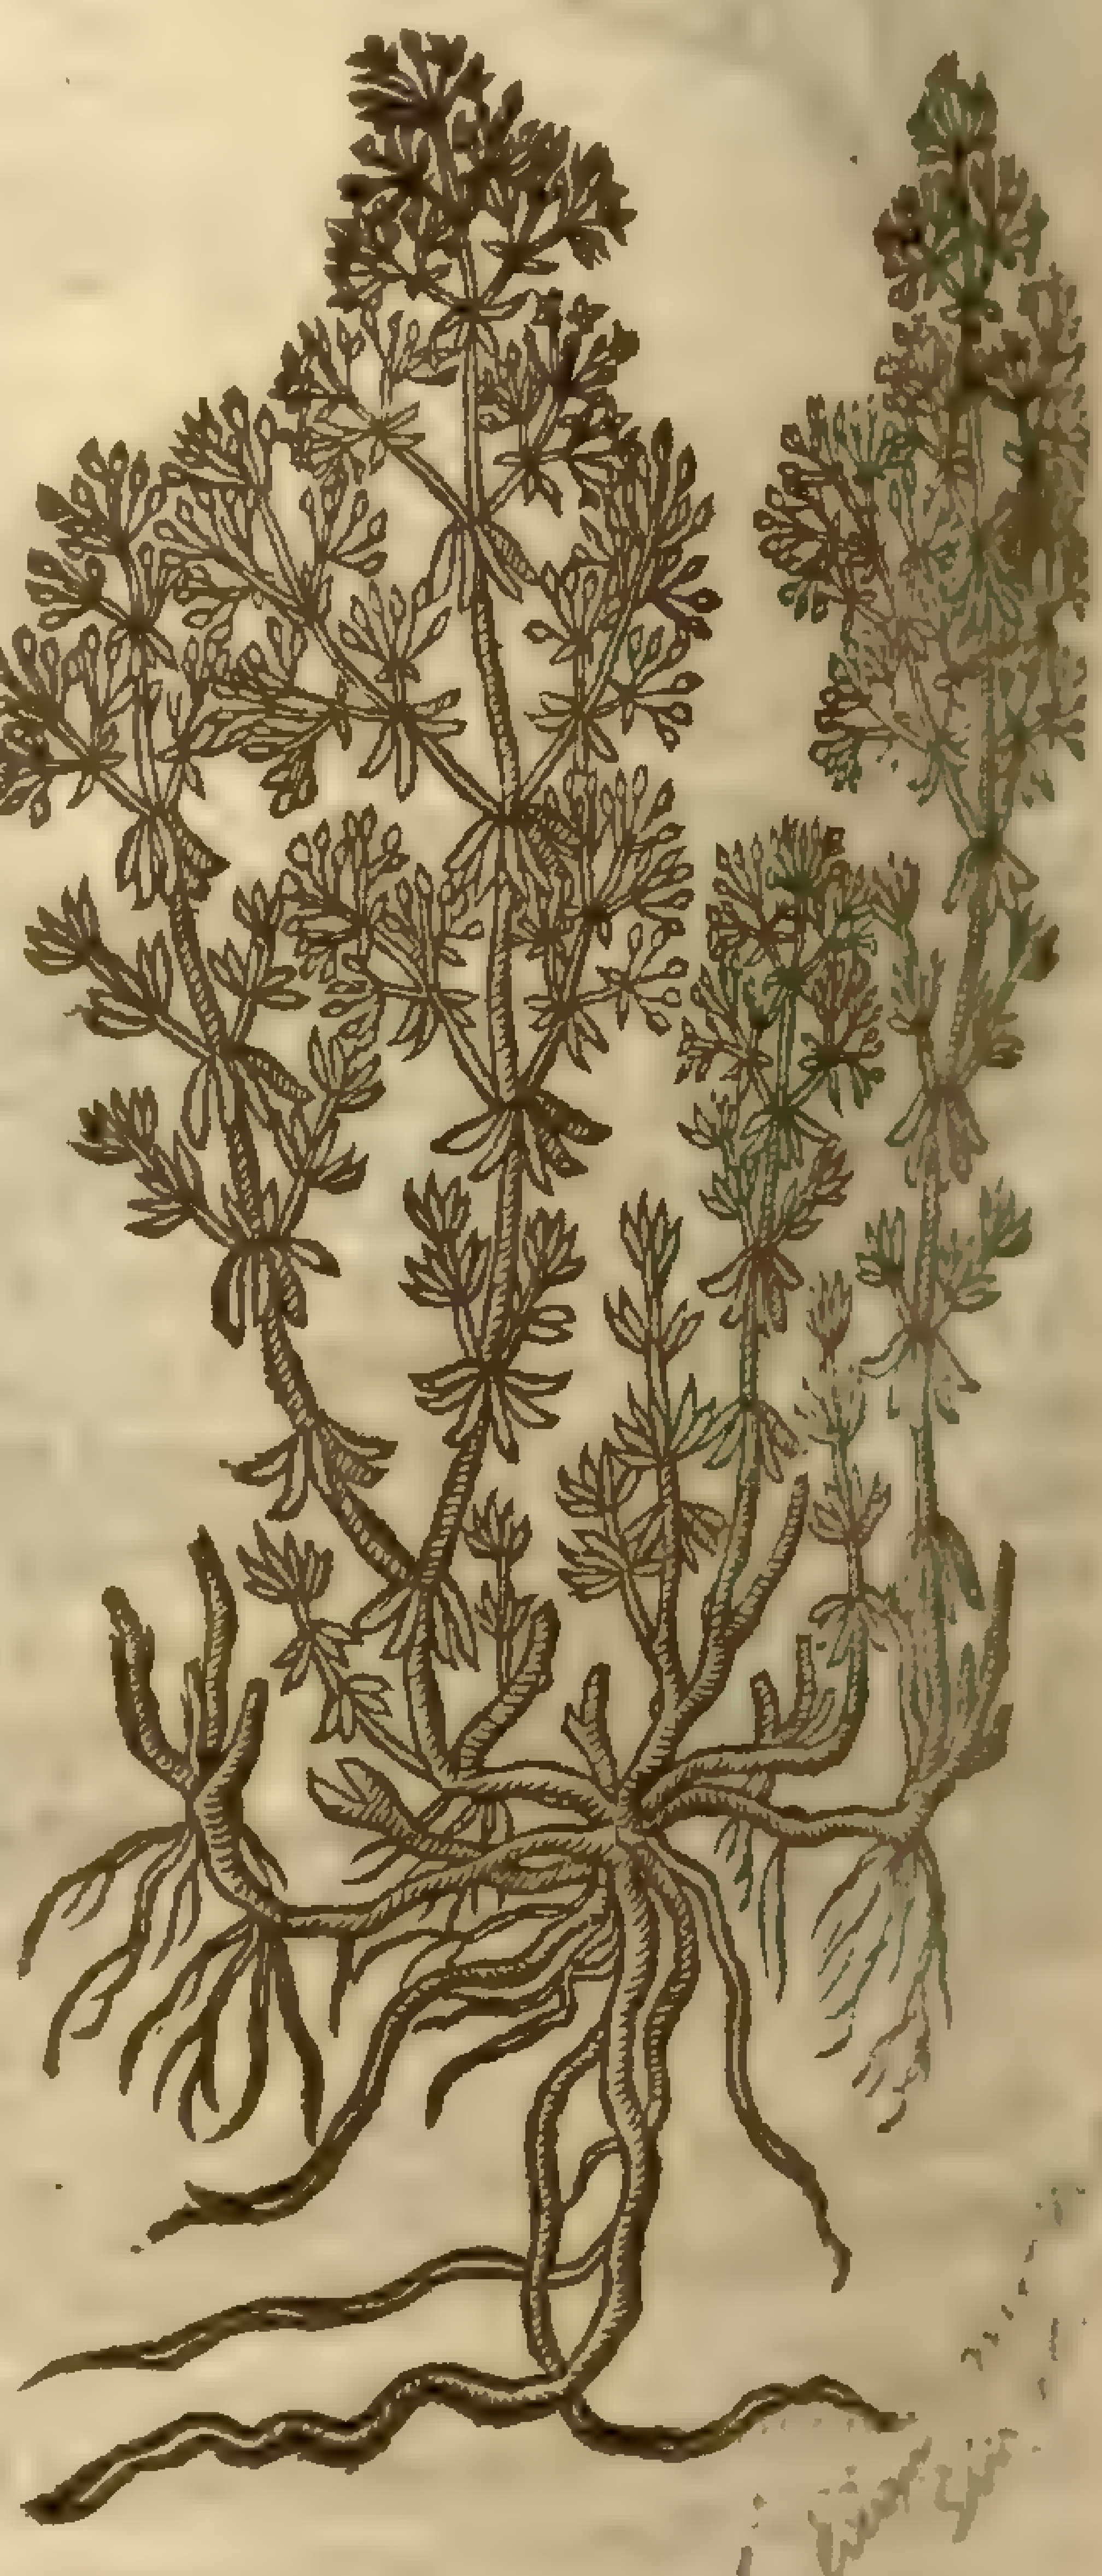
¶ *The Kindes.*

THere is but one kinde of Madder only which is manured or ſet for vſe, but if all thoſe that are like it in leaues and manner of growing were referred thereto, there ſhould be many ſorts, as Gooſe-graſſe, ſoft Cliuer, our Ladies Bedſtraw, Woodroofe, and Croſſe-wort; all which are like to Madder in leaues, and therefore thought to be wilde kindes thereof.

R. tinctorum, L.
[illegible]



1 *Rubia tinctorum.*
Red Madder.



2 *Rubia ſylveſtris.*
Wilde Madder.

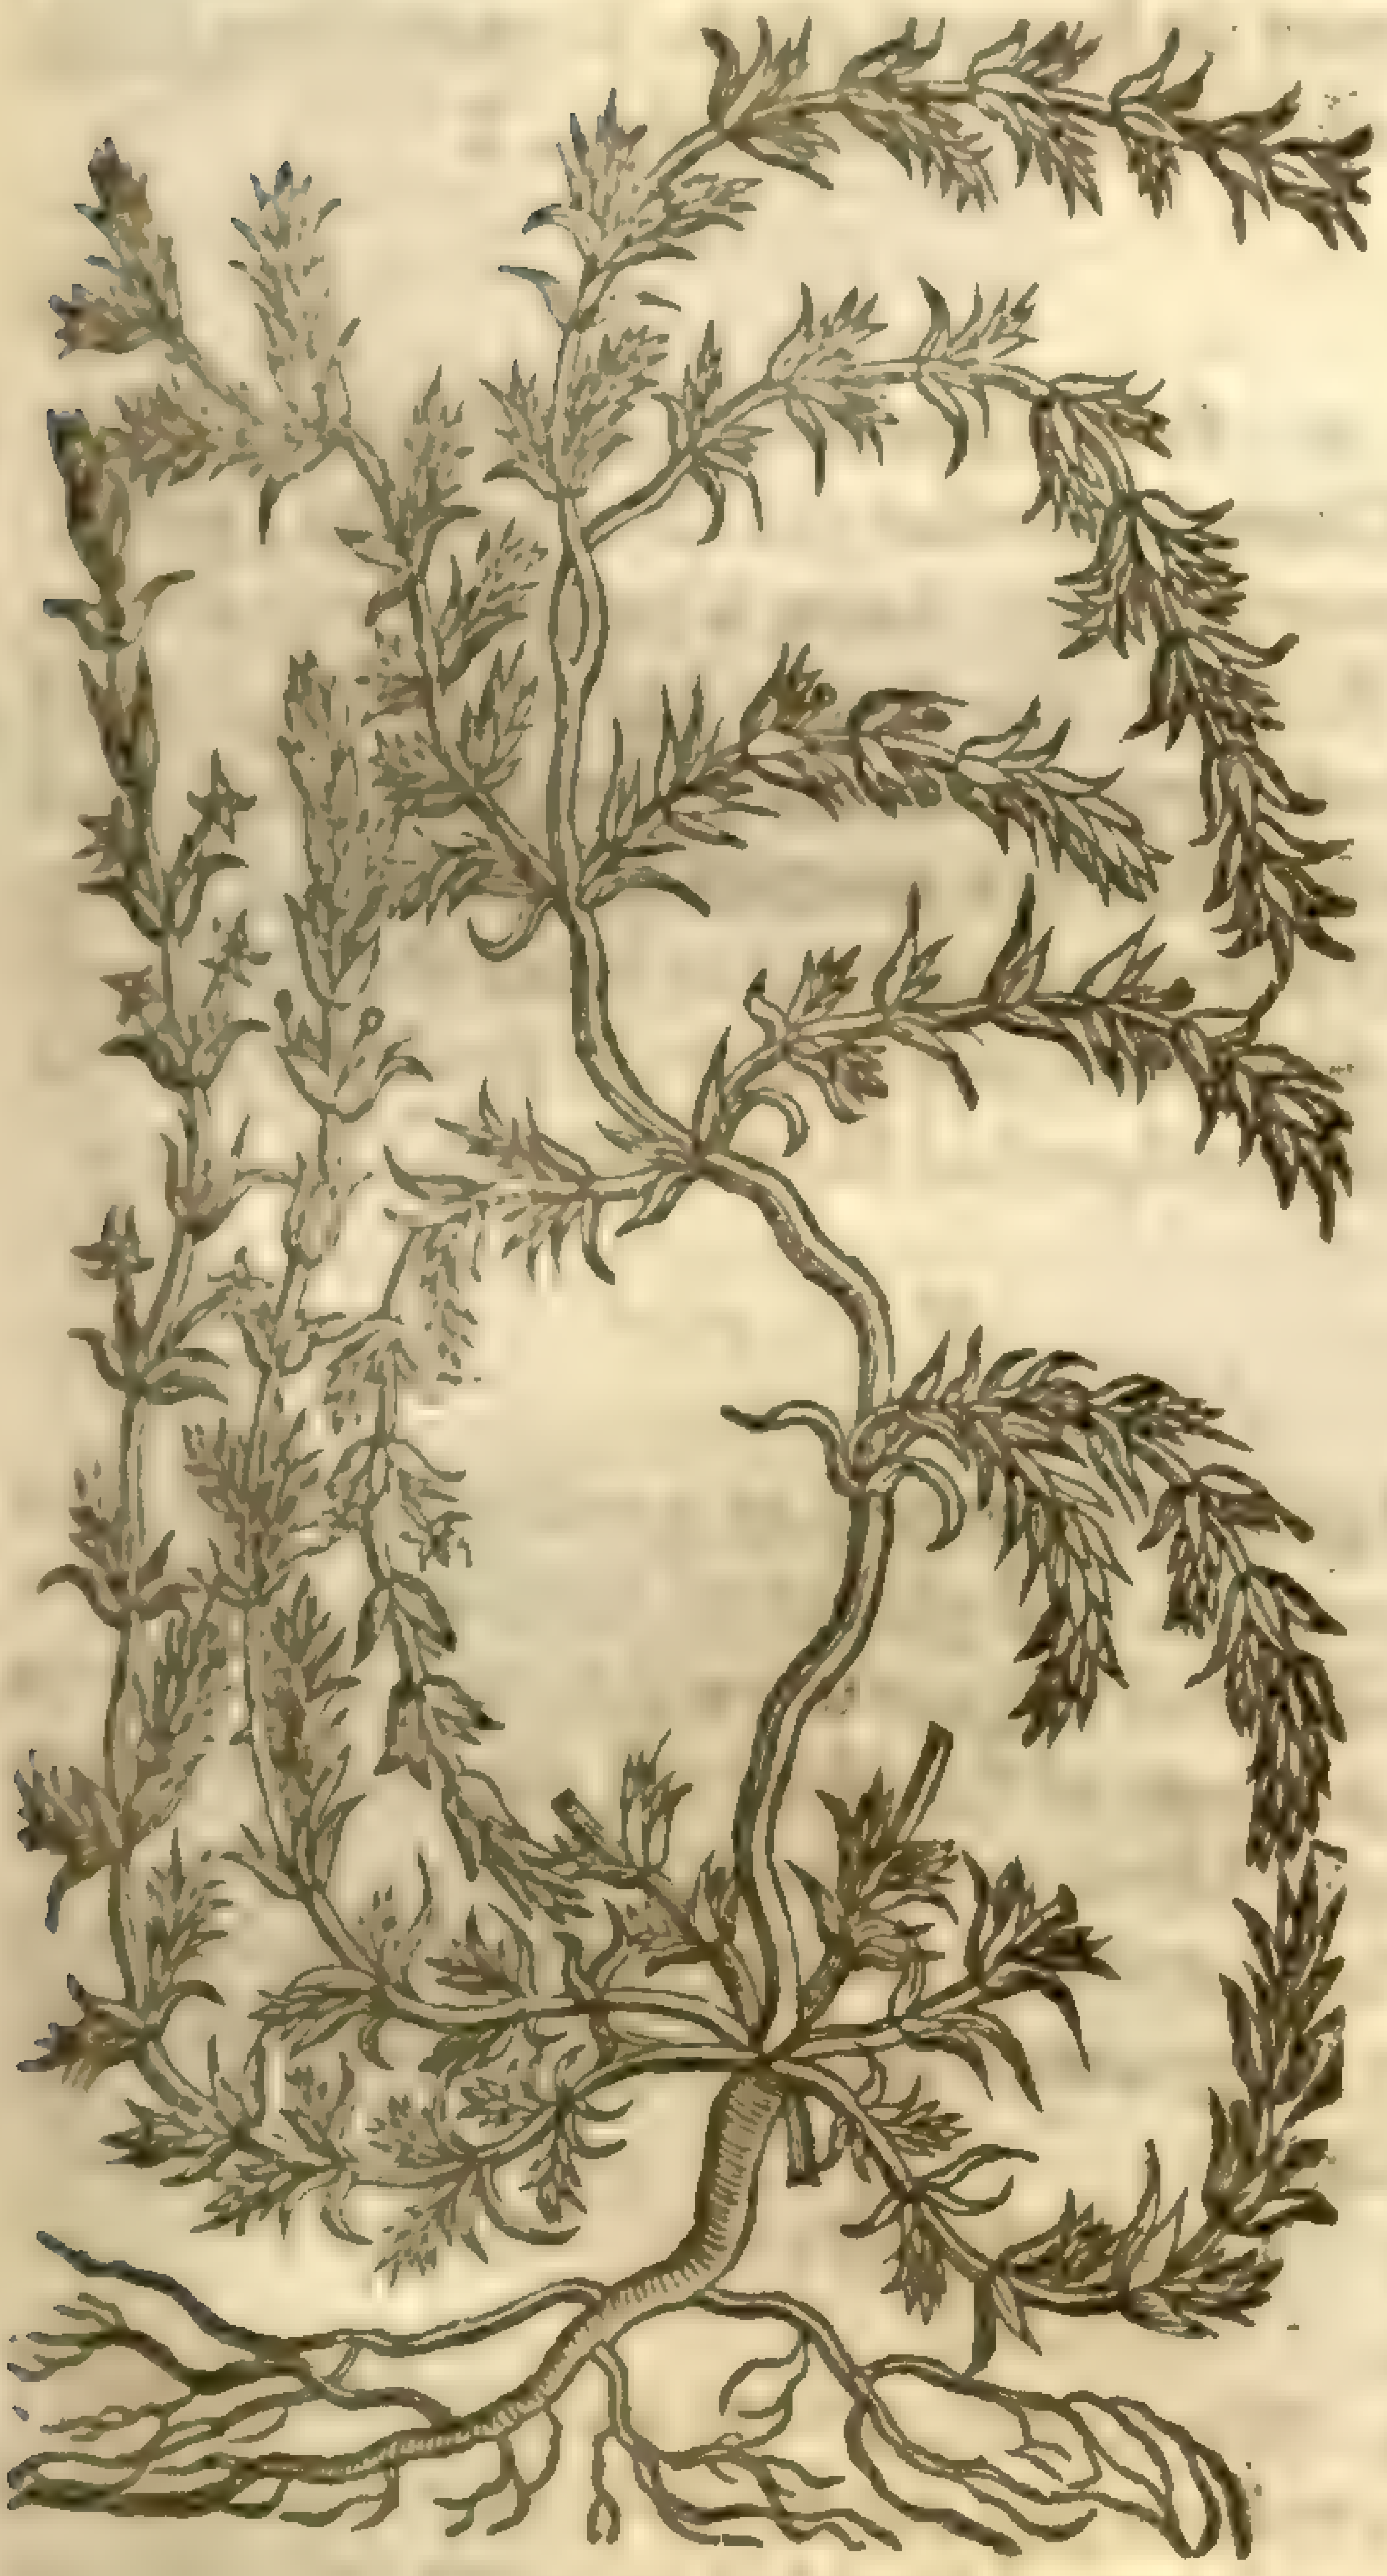
Galium [illegible]

¶ *The Deſcription.*

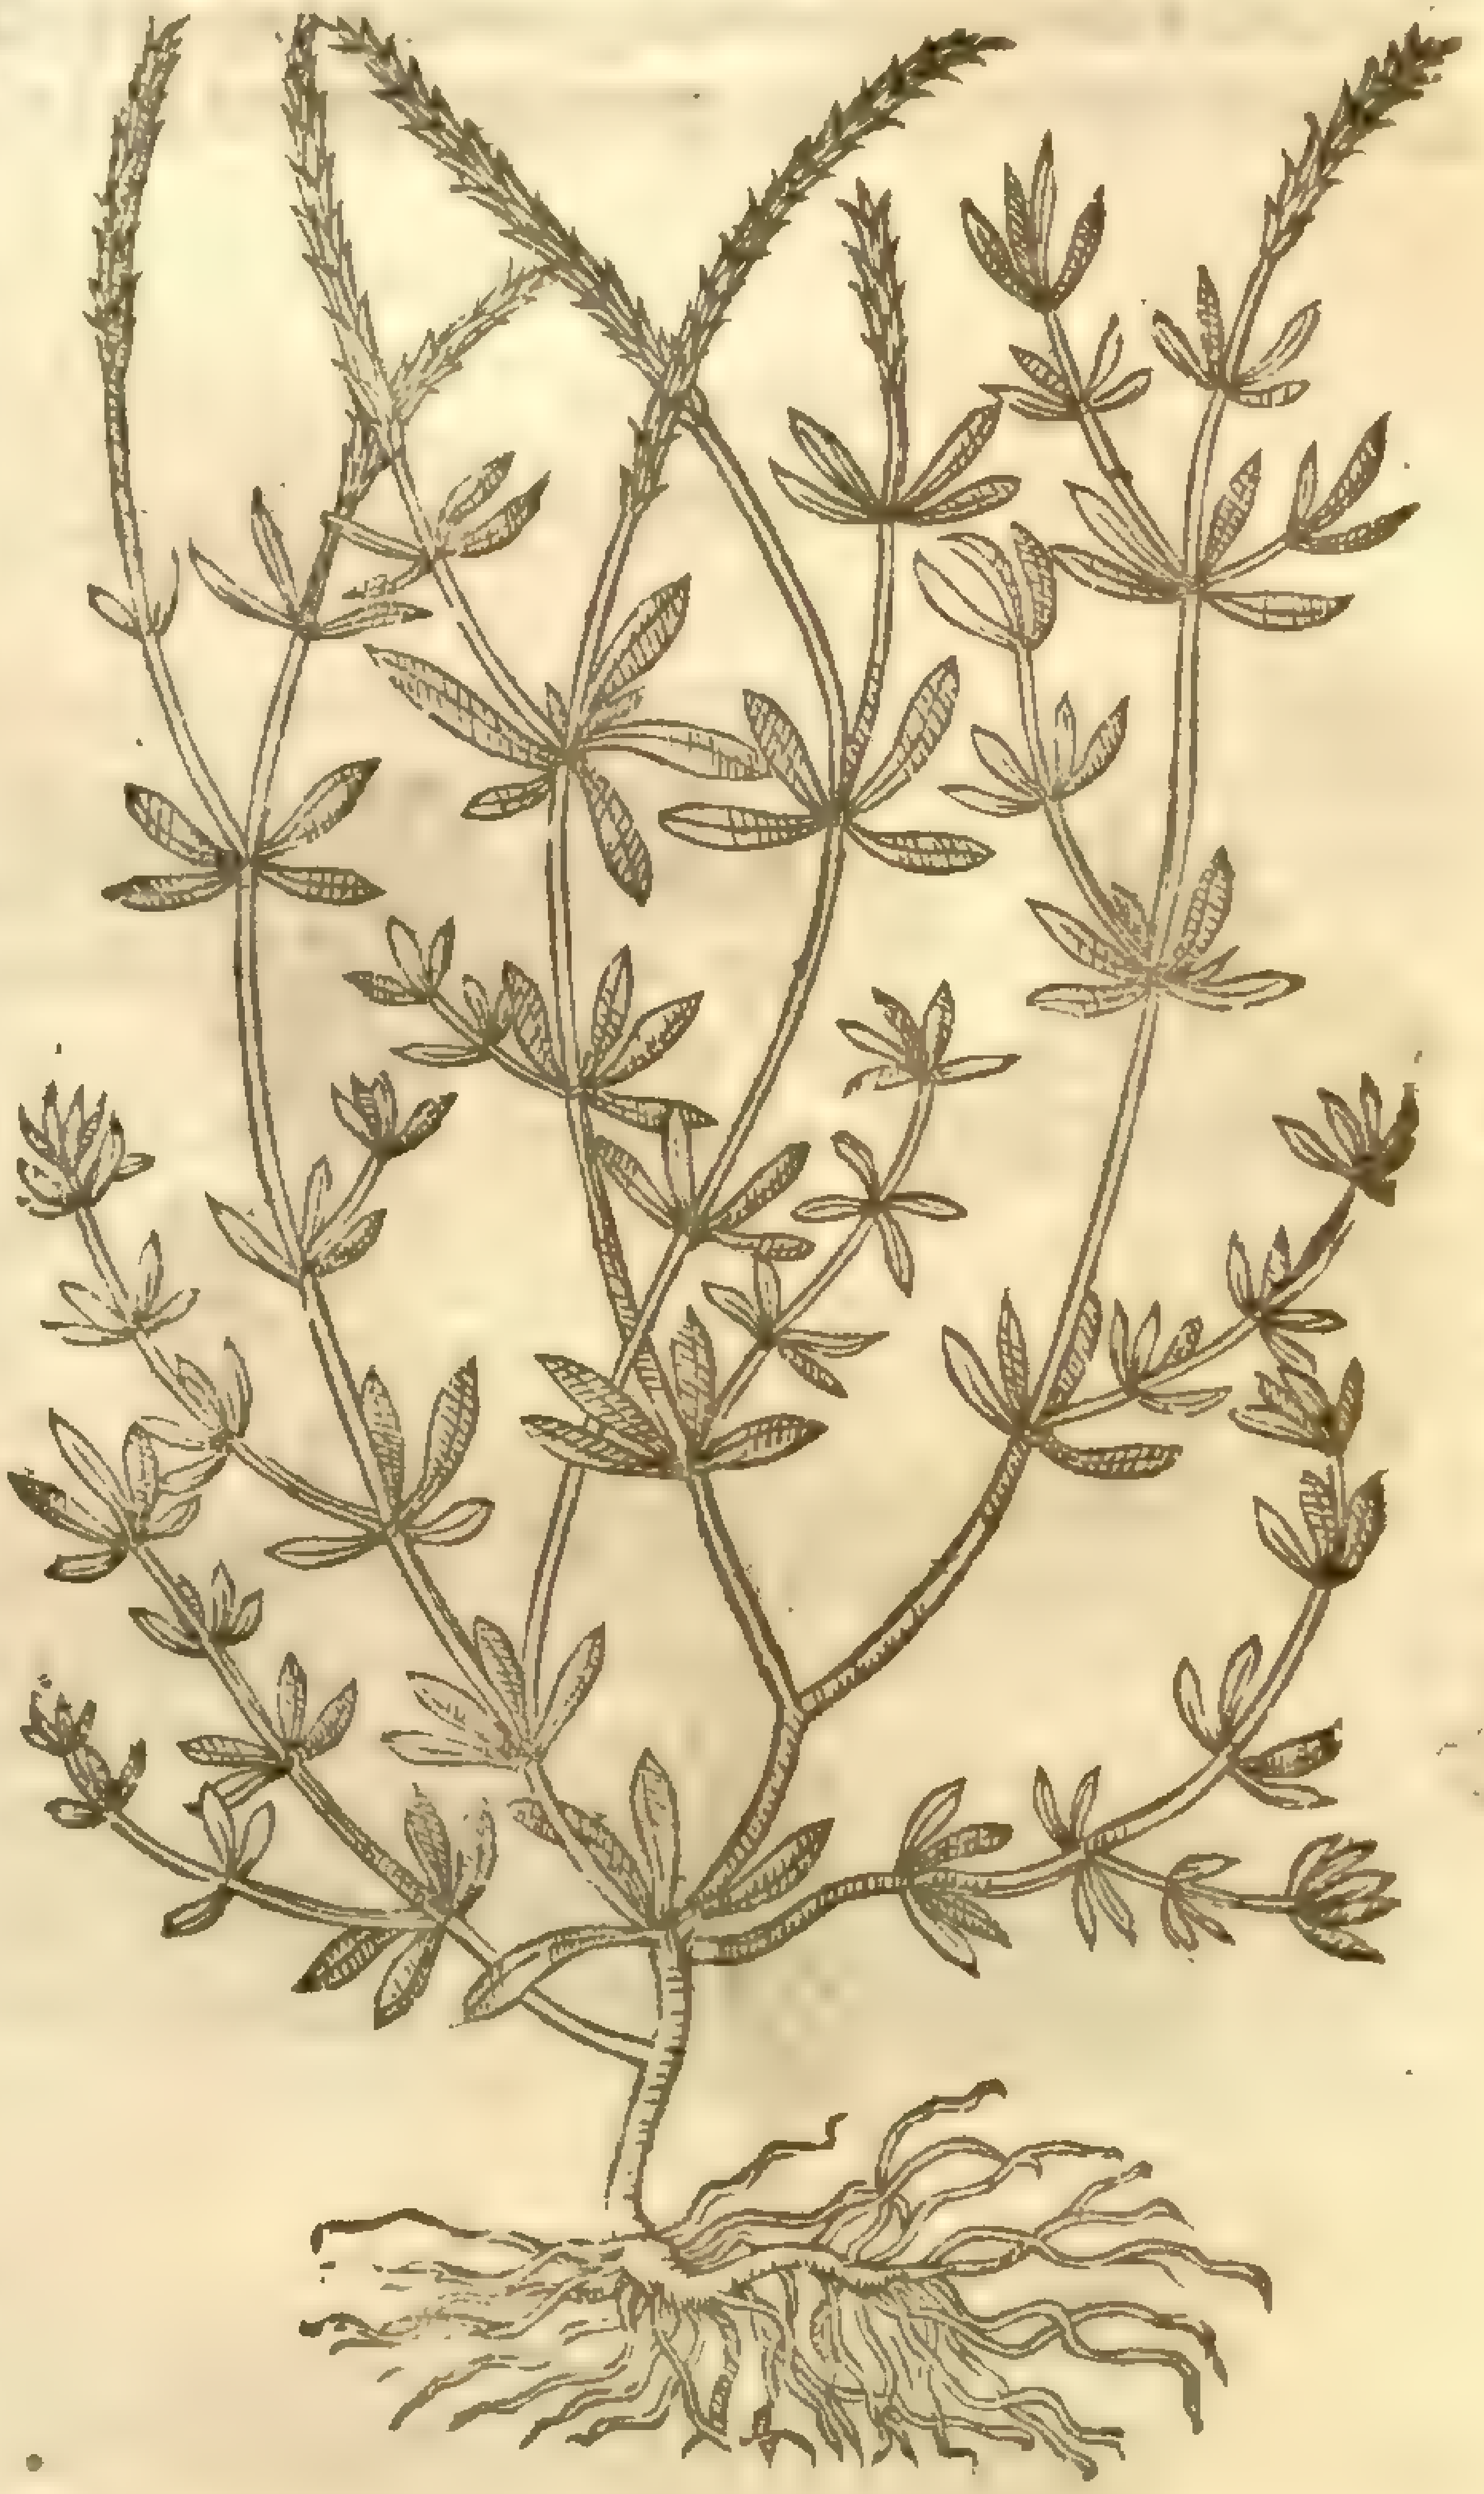
1 THe garden or mannured Madder hath long ſtalkes or trailing branches diſpierſed farre abroad vpon the ground, ſquare, rough, and full of joints, at euery joint ſet round with greene rough leaues in manner of a ſtarre, or like thoſe of Woodroofe: the floures grow at the top

of the branches, of a feint yellow colour: after which come the ſeed, round, green at the firſt, afterward red and laſtly of a black colour: the root, long, fat, ful of ſubſtance, creepeth far abroad within the vppermoſt cruſt of the earth, and is of a reddiſh colour when it is green and freſh.

2 Wilde Madder is like in forme to that of the garden, but altogether ſmaller, and the leaues are not ſo rough, but ſmooth and ſhining: the floures are white: the root is very ſmall and tender and oftentimes of a reddiſh colour.



3 *Rubia marina.*
Sea Madder.



‡ 4 *Rubia ſpicata Cretica.*
Small Candy Madder.

3 Sea Madder hath a root two foot long, with many dry threds hanging thereat, of a reddiſh colour like Alkanet, on the out ſide of the ſame forme and bigneſſe, but within of the colour of the ſcrapings of Iuniper or cedar wood, ſending forth diuers ſlender ſtalks round and ful of joints; from which come forth ſmall thin leaues ſtiffe and ſharp pointed, ſomewhat hairy, in number commonly foure, ſtanding like a Burgonian Croſſe: from the boſome of which come forth certaine tufts of ſmaller leaues thruſt together vpon a heape: the floures grow at the top of the ſtalkes, of a pale yellowiſh colour.

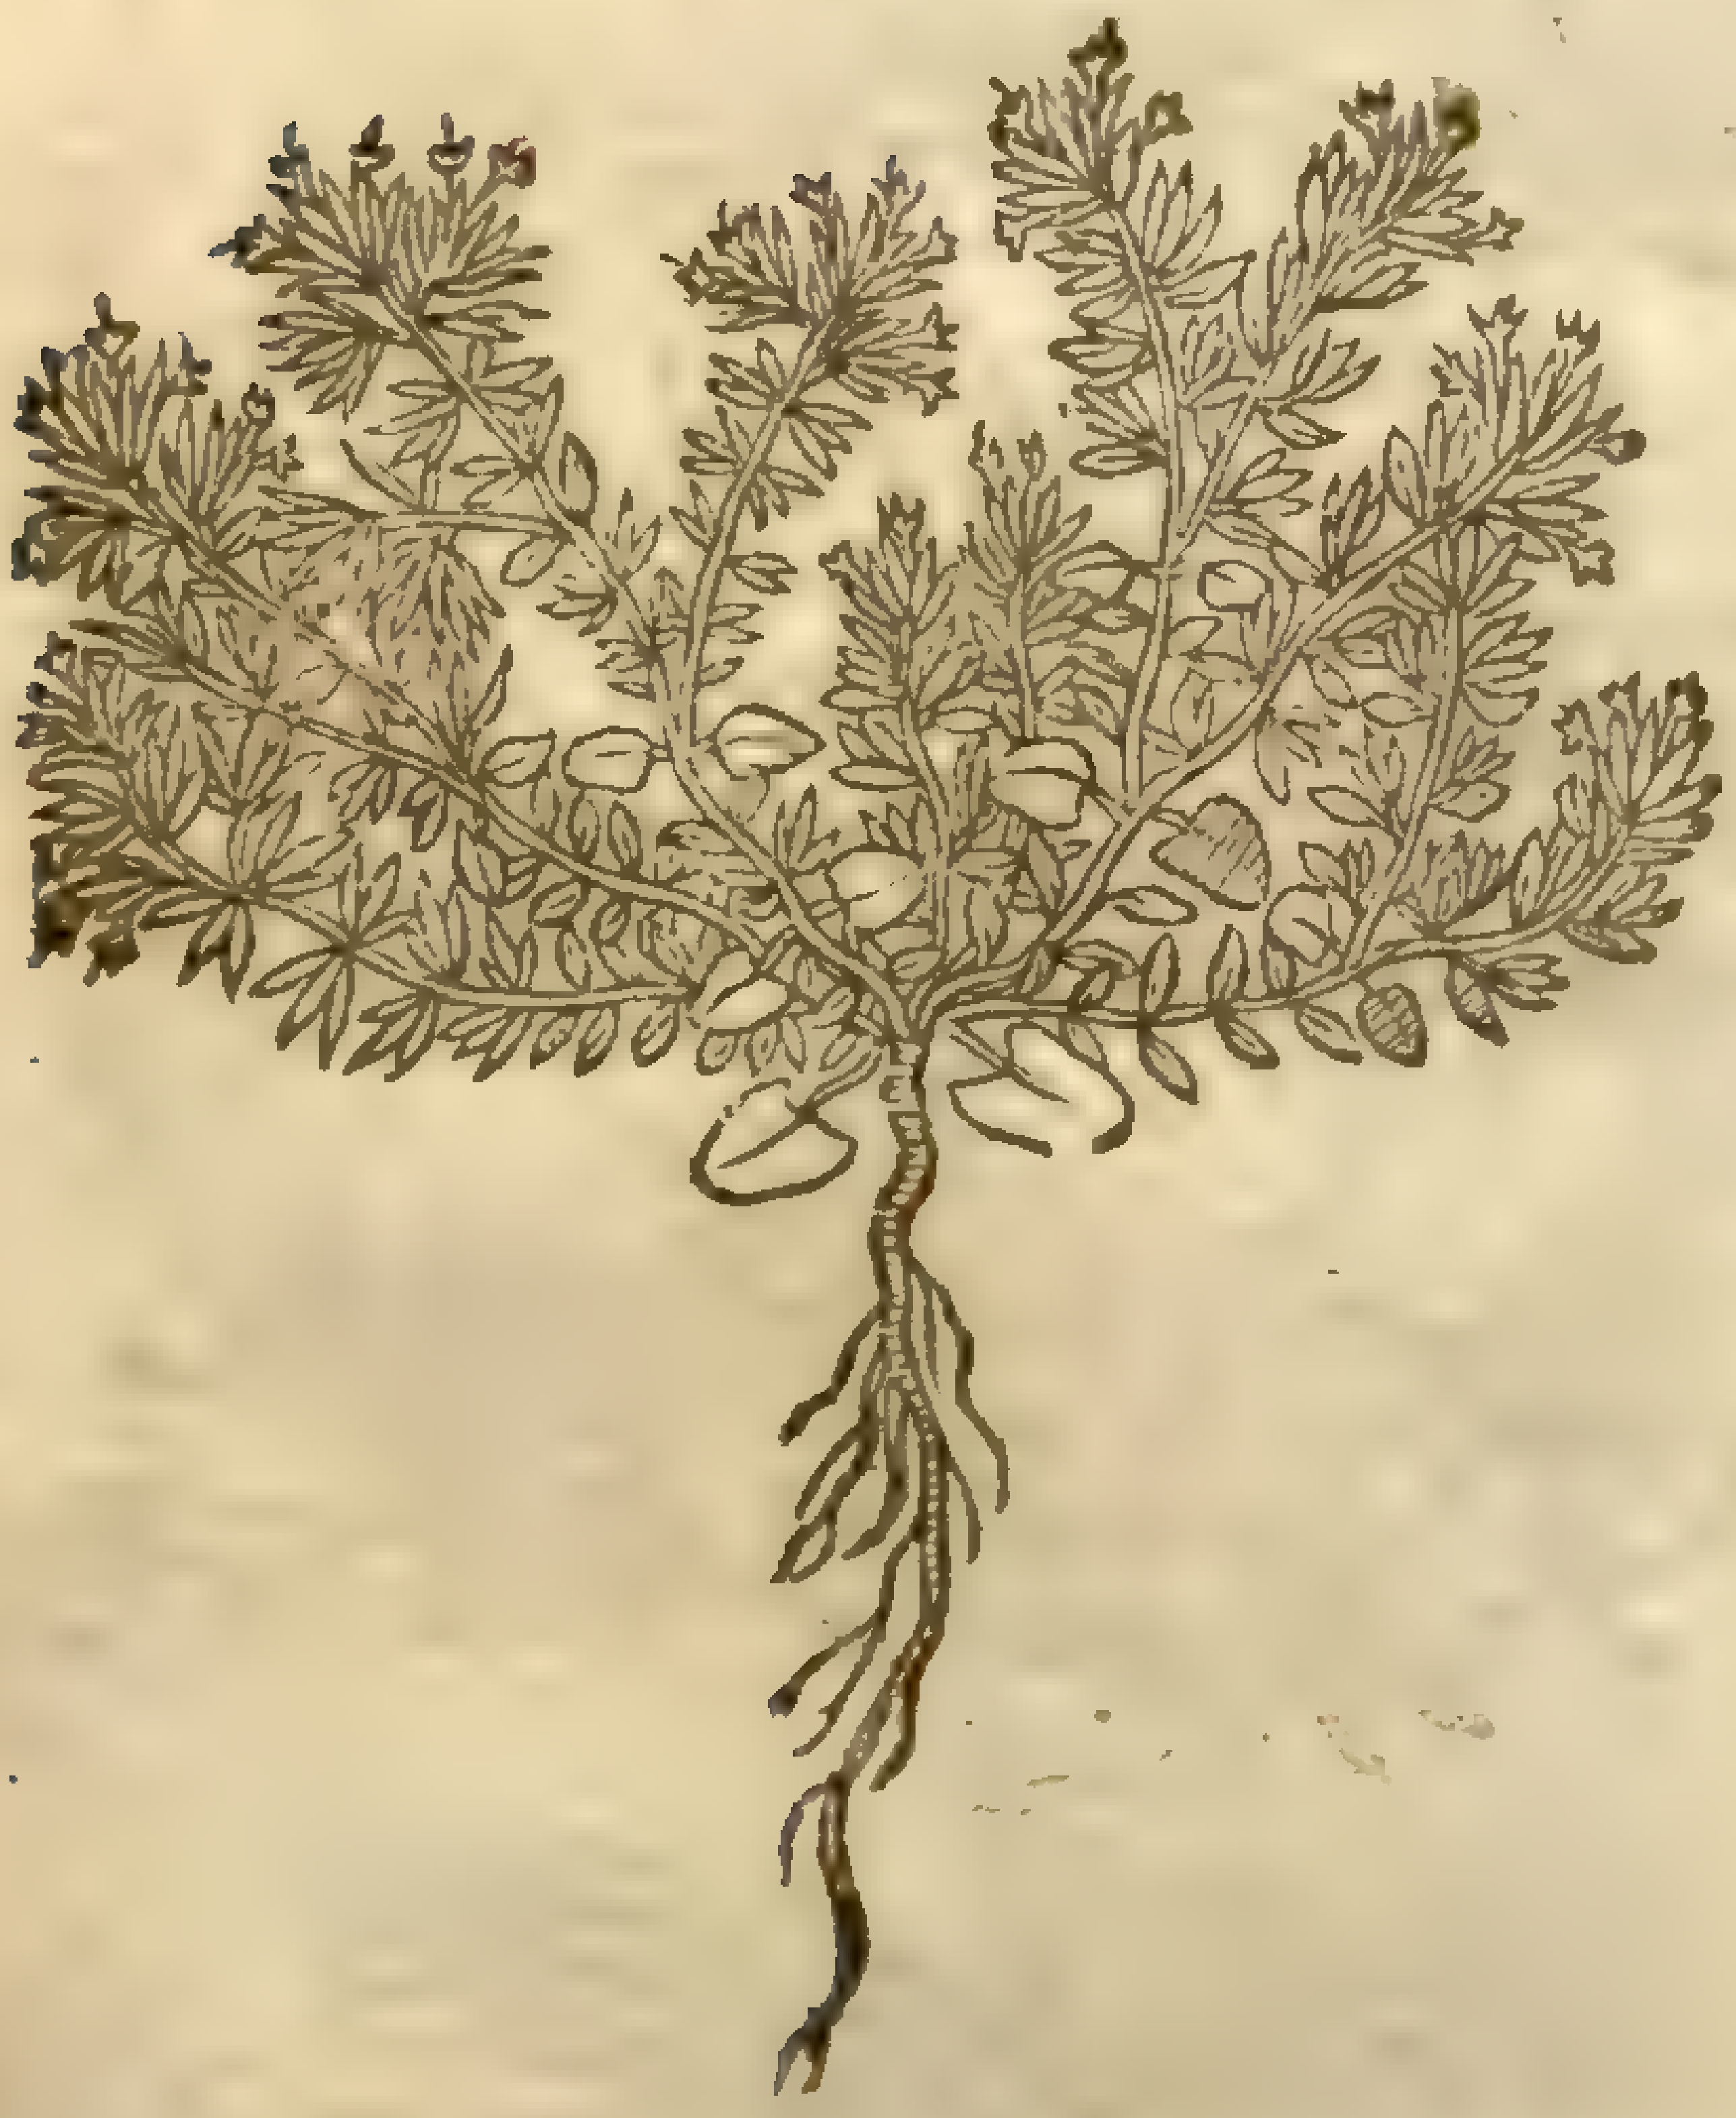
‡ *Rubia ſpicata Cretica Cluſij.*

4 This hath proceeding from the root many knotty foure ſquare rough little ſtalkes, a foot high, diuided immediatly from the root into many branches, hauing but one ſide branch growing forth of one joint; about which joints grow ſpred abroad, foure or fiue, ſomtimes ſix narrow ſhort ſharpe pointed leaues, ſomewhat rough: the tops of the ſtalks and branches are nothing but long ſmall foure ſquare ſpikes or eares, made of three leafed green husks: out of the top of each huske groweth a very ſmall greeniſh yellow floure, hauing foure exceeding ſmal leaues ſcarce to be ſeen: after which followeth in each huske one ſmall blackiſh ſeed, ſomwhat long, round on the one ſide, with a dent or hollowneſſe on the other. The root is ſmal, hard, wooddy, crooked or ſcragged, with many little branches or threds, red without, and white within, and periſheth when the ſeed is ripe. *Iuly* 19. 1621.

Synanchica Lug. p.1185. asperula cynanchica, L. Sm. fl. 1.195

5 The root is crooked, blackiſh without, yellow vnderneath the skinne, white within that and wooddy, about fiue or ſix inches long, with many hairy ſtrings: from the root ariſe many foure ſquare branches trailing vpon the ground, ſometimes reddiſh toward the root. The leaues are ſmal and ſharp pointed like thoſe of *Gallium*, and grow along the ſtalke on certain knees or joints, foure or fiue together, ſometimes fewer: from thoſe joints the ſtalke diuideth it ſelfe towards the top into many parts, wheron grow many floures, each floure hauing foure leaues, ſomtimes white, ſomtimes of a fleſh colour, and euerie leafe of theſe fleſh coloured leaues is artificially ſtraked in the middle and neere the ſides with three lines of a deeper red, of no pleaſant ſmel: after which comes the ſeed, ſomething round, growing two together like ſtones: it floureth all the Summer long, and groweth in dry chalky grounds aboundantly. *August* 13. 1619. *Iohn Goodyer.* ‡

‡ 6 *Rubia minima.*
Dwarfe Madder.



‡ 6 *Lobel* thus deſcribes this dwarf Madder: There is another (ſaith he) which I gathered, growing vpon Saint Vincents rocks, not far from Briſtoll: the leaues are of the bigneſſe of thoſe of Rupture-woort, ſharpe pointed, and growing after the manner of thoſe of Madder, vpon little creeping ſtalkes ſome inch and halfe high, whereon grow yellowiſh ſmall flours. The root is ſmall, and of the colour of Corall. ‡

¶ *The Place.*

Madder is planted in gardens, and is verie common in moſt places of England. Mr *George Bowles* found it growing wilde on Saint *Vincents* rock, and out of the cliffes of the rocks of Aberdovie in Merioneth ſhire.

The ſecond groweth in moiſt medowes in mooriſh grounds, and vnder buſhes almoſt euerie where.

3 This growes by the ſea ſide in moſt places.

‡ The fourth growes only in ſome few gardens with vs, but the fift may be found wilde in many places. I found it in great plenty on the hil beyond Chattam in the way to Canterbury. ‡

¶ *The Time.*

They flouriſh from May vnto the end of Auguſt: the roots are gathered and dried in Autumne, and ſold to the vſe of Diers and medicine.

¶ *The Names.*

Madder is called in Greeke ἐρυθρόδανον, *Erythrodanum*: in Latine, *Rubia*, and *Rubeia*: in ſhops, *Rubia tinctorum*: *Paulus Ægineta* ſheweth that it is named *Thapſon* which the Diers vſe, and the Romanes call it *Herba rubia*: in Italian, *Rubbia*, and *Robbia*: in Spaniſh, *Ruvia*, *Roya*, and *Granza*: in French, *Garance*: in high-Dutch, **Rotte**: in low-Dutch, **Mee**, and **Mee Crappen**: in Engliſh, Madder, and red Madder.

¶ *The Temperature.*

Of the temperature of Madder it hath been diſputed among the Learned, and as yet not cenſured, whether it binde or open: ſome ſay both: diuers diuerſly deem. A great Phyſition (I do not ſay the great learned) called me to account as touching the faculties hereof, although he had no commiſſion ſo to doe: notwithſtanding I was content to be examined vpon the point, what the nature of Madder was, becauſe I haue written that it performeth contrarie effects, as ſhall be ſhewed: the roots of Madder, which both the Phyſitians and Diers do vſe, as they haue an obſcure binding power and force; ſo be they likewiſe of nature and temperature cold and dry: they are withall of diuers thin parts, by reaſon whereof their colour doth eaſily pierce: yet haue they at the firſt a certaine little ſweetneſſe, with an harſh binding quality preſently following it; which not onely wee our ſelues haue obſerued, but alſo *Auicen* the prince of phyſitions, who in his 58. chapter hath written, that the root of Madder hath a rough and harſh taſte: now Mr. Doctor, whether it binde or open I haue anſwered, attending your cenſure: but if I haue erred, it is not with the multitude, but with thoſe of the beſt and beſt learned.

¶ *The Vertues.*

A The decoction of the root of Madder is euery where commended for thoſe that are burſten, bruiſed, wounded, and that are fallen from high places.

B It ſtencheth bleeding, mitigateth inflammations, and helpeth thoſe parts that bee hurt and bruiſed.

C For theſe cauſes they be mixed with potions, which the later Phyſitians call wound drinkes: in which there is ſuch force and vertue, as *Matthiolus* alſo reporteth, that there is likewiſe great hope of curing of deadly wounds in the cheſt and intrails.

D Our opinion and iudgement is confirmed by that moſt expert man, ſometimes Phyſition of Louaine, *Iohannes Spiringus*, who in his *Rapſodes* hath noted, that the decoction of Madder giuen with *Triphera*, that great compoſition is ſingular good to ſtay the reds, the hemorrhoids and bloudy flix, and the ſame approued by diuers experiments: which confirmeth Madder to be of an aſtringent and binding qualitie.

E Of the ſame opinion as it ſeemeth is alſo *Eros Iulia* her freed man (commonly called *Trotula*) who in a compoſition againſt vntimely birth doth vſe the ſame: for if he had thought that Madder were of ſuch a quality as *Dioſcorides* writeth it to be of, hee would not in any wiſe haue added it to thoſe medicines which are good againſt an vntimely birth.

F For *Dioſcorides* reporteth, that the root of Madder doth plentifully prouoke vrine, and that groſſe and thicke, and oftentimes bloud alſo, and it is ſo great an opener, that being but onely applied, it bringeth downe the menſes, the birth, and after-birth: but the extreme redneſſe of the vrine deceiued him, that immediately followeth the taking of Madder, which rednes came as he thought from bloud mixed therewith, which notwithſtanding commeth no otherwiſe than from the colour of the Madder.

G For the root hereof taken any manner of way doth by and by make the vrine extreme red: no otherwiſe than Rubarb doth make the ſame yellow, not changing in the meane time the ſubſtance thereof, nor making it thicker than it was before, which is to bee vnderſtood in thoſe which are in perfect health, which thing doth rather ſhew that it doth not open, but binde, no otherwiſe than Rubarbe doth: for by reaſon of his binding quality the wateriſh humors do for a while keep their colour. For colours mixed with binding things do longer remaine in the things coloured, and do not ſo ſoone vade: this thing they will know that gather colours out of the juyces of floures and herbes, for with them they mixe allume, to the end that the colour may be retained and kept the longer, which otherwiſe would bee quickely loſt. By theſe things it manifeſtly appeareth that Madder doth nothing vehemently either clenſe or open, and that *Dioſcorides* hath raſhly attributed vnto it this kinde of quality, and after him *Galen* and the reſt that followed, ſtanding ſtiffely to his opinion.

H *Pliny* ſaith, that the ſtalkes with the leaues of Madder, are vſed againſt ſerpents.

I The root of Madder boyled in Meade or honied water, and drunken, openeth the ſtopping of the liuer, the milt and kidnies, and is good againſt the jaundiſe.

K The ſame taken in like manner prouoketh vrine vehemently, inſomuch that the often vſe thereof cauſeth one to piſſe bloud, as ſome haue dreamed.

L *Langius* and other excellent Phyſitions haue experimented the ſame to amend the lothſome colour of the Kings-euill, and it helpeth the vlcers of the mouth, if vnto the decoction be added a little allume and hony of Roſes.

M ‡ 5 The fifth being the *Synanchica* of *Daleſchampius*, dries without biting, and it is excellent againſt ſquinancies, either taken inwardly, or applied outwardly, for which cauſe they haue called it *Synanchica, Hiſt. Lugd.* ‡

Chap. 461. *Of Gooſe-graſſe, or Cliuers.*

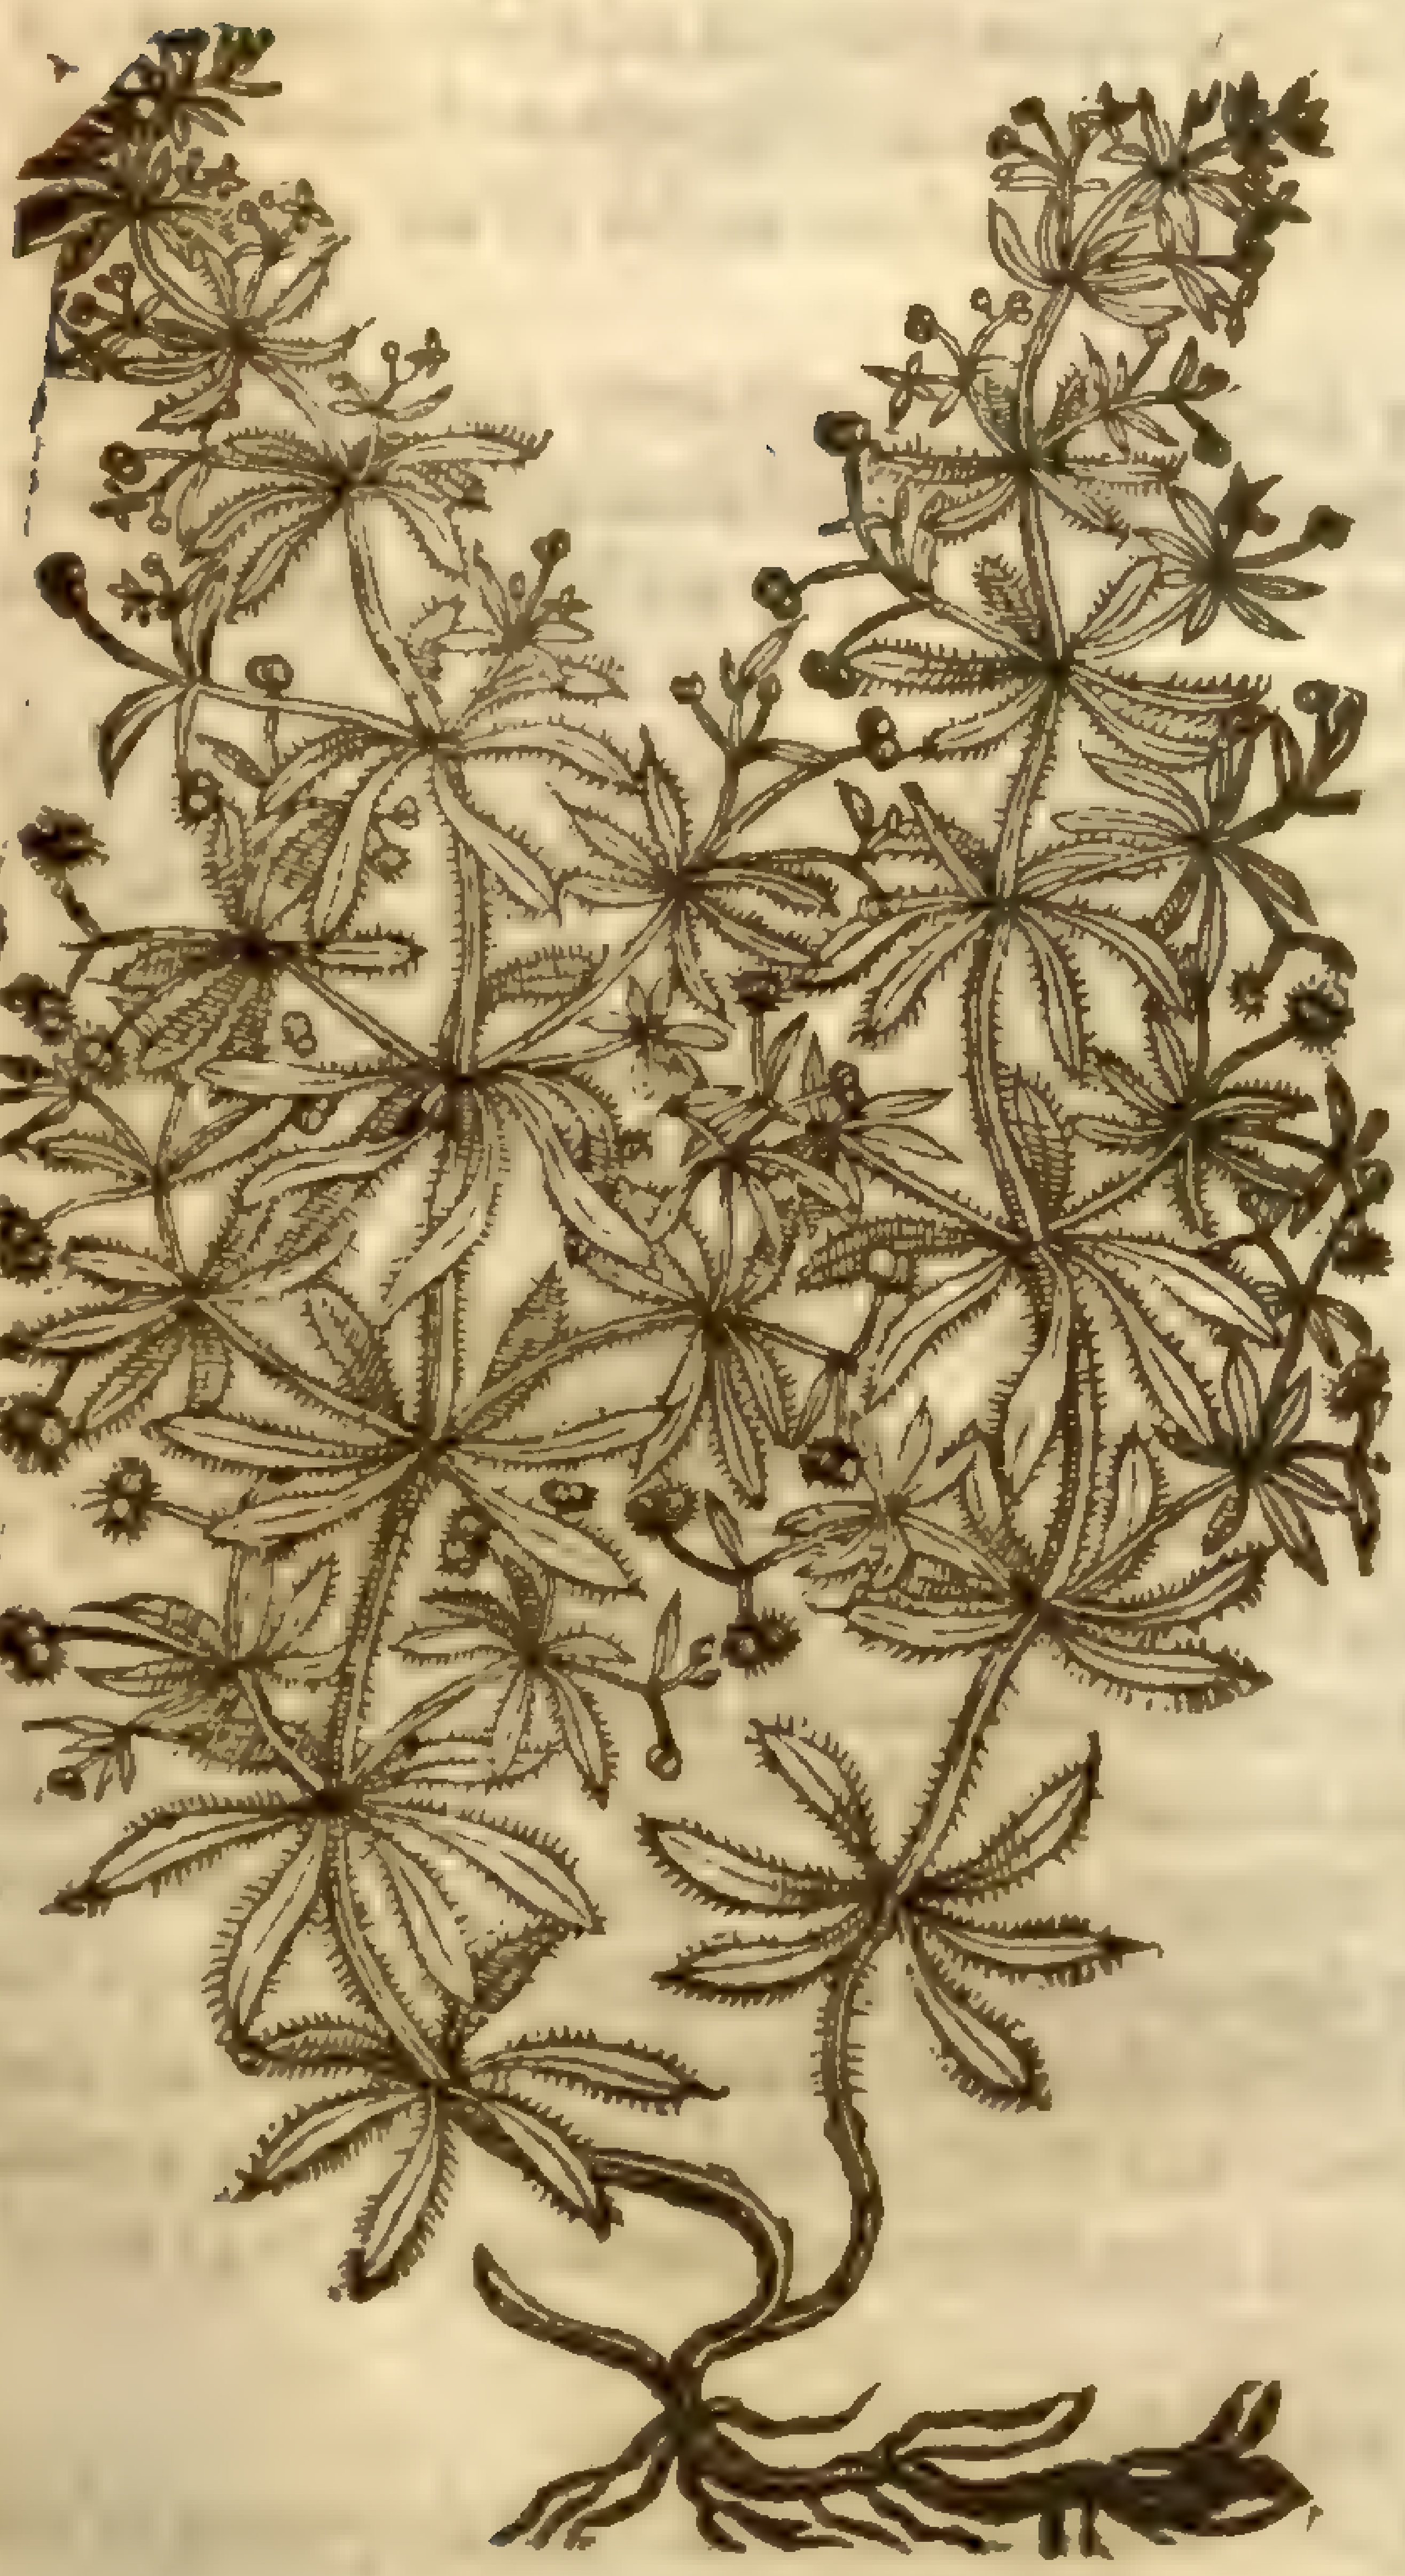
¶ *The Deſcription.*

1 A*Parine*, Cliuers or Gooſe-greaſe, hath many ſmall ſquare branches, rough and ſharpe, full of joynts, beſet at euery joint with ſmall leaues ſtar faſhion, and like vnto ſmall Madder:

the floures are very little and white, pearking on the tops of the ſprigs: the ſeeds are ſmall, round a little hollow in the middeſt in manner of a nauell, ſet for the moſt part by couples: the roots ſlender and full of ſtrings: the whole plant is rough, and his ruggedneſſe taketh hold of mens veſtures and woollen garments as they paſſe by: being drawne along the tongue it fetcheth bloud: *Dioſcorides* reports, that the ſhepheards in ſtead of a Cullender do vſe it to take haires out of milke, if any remaine therein.

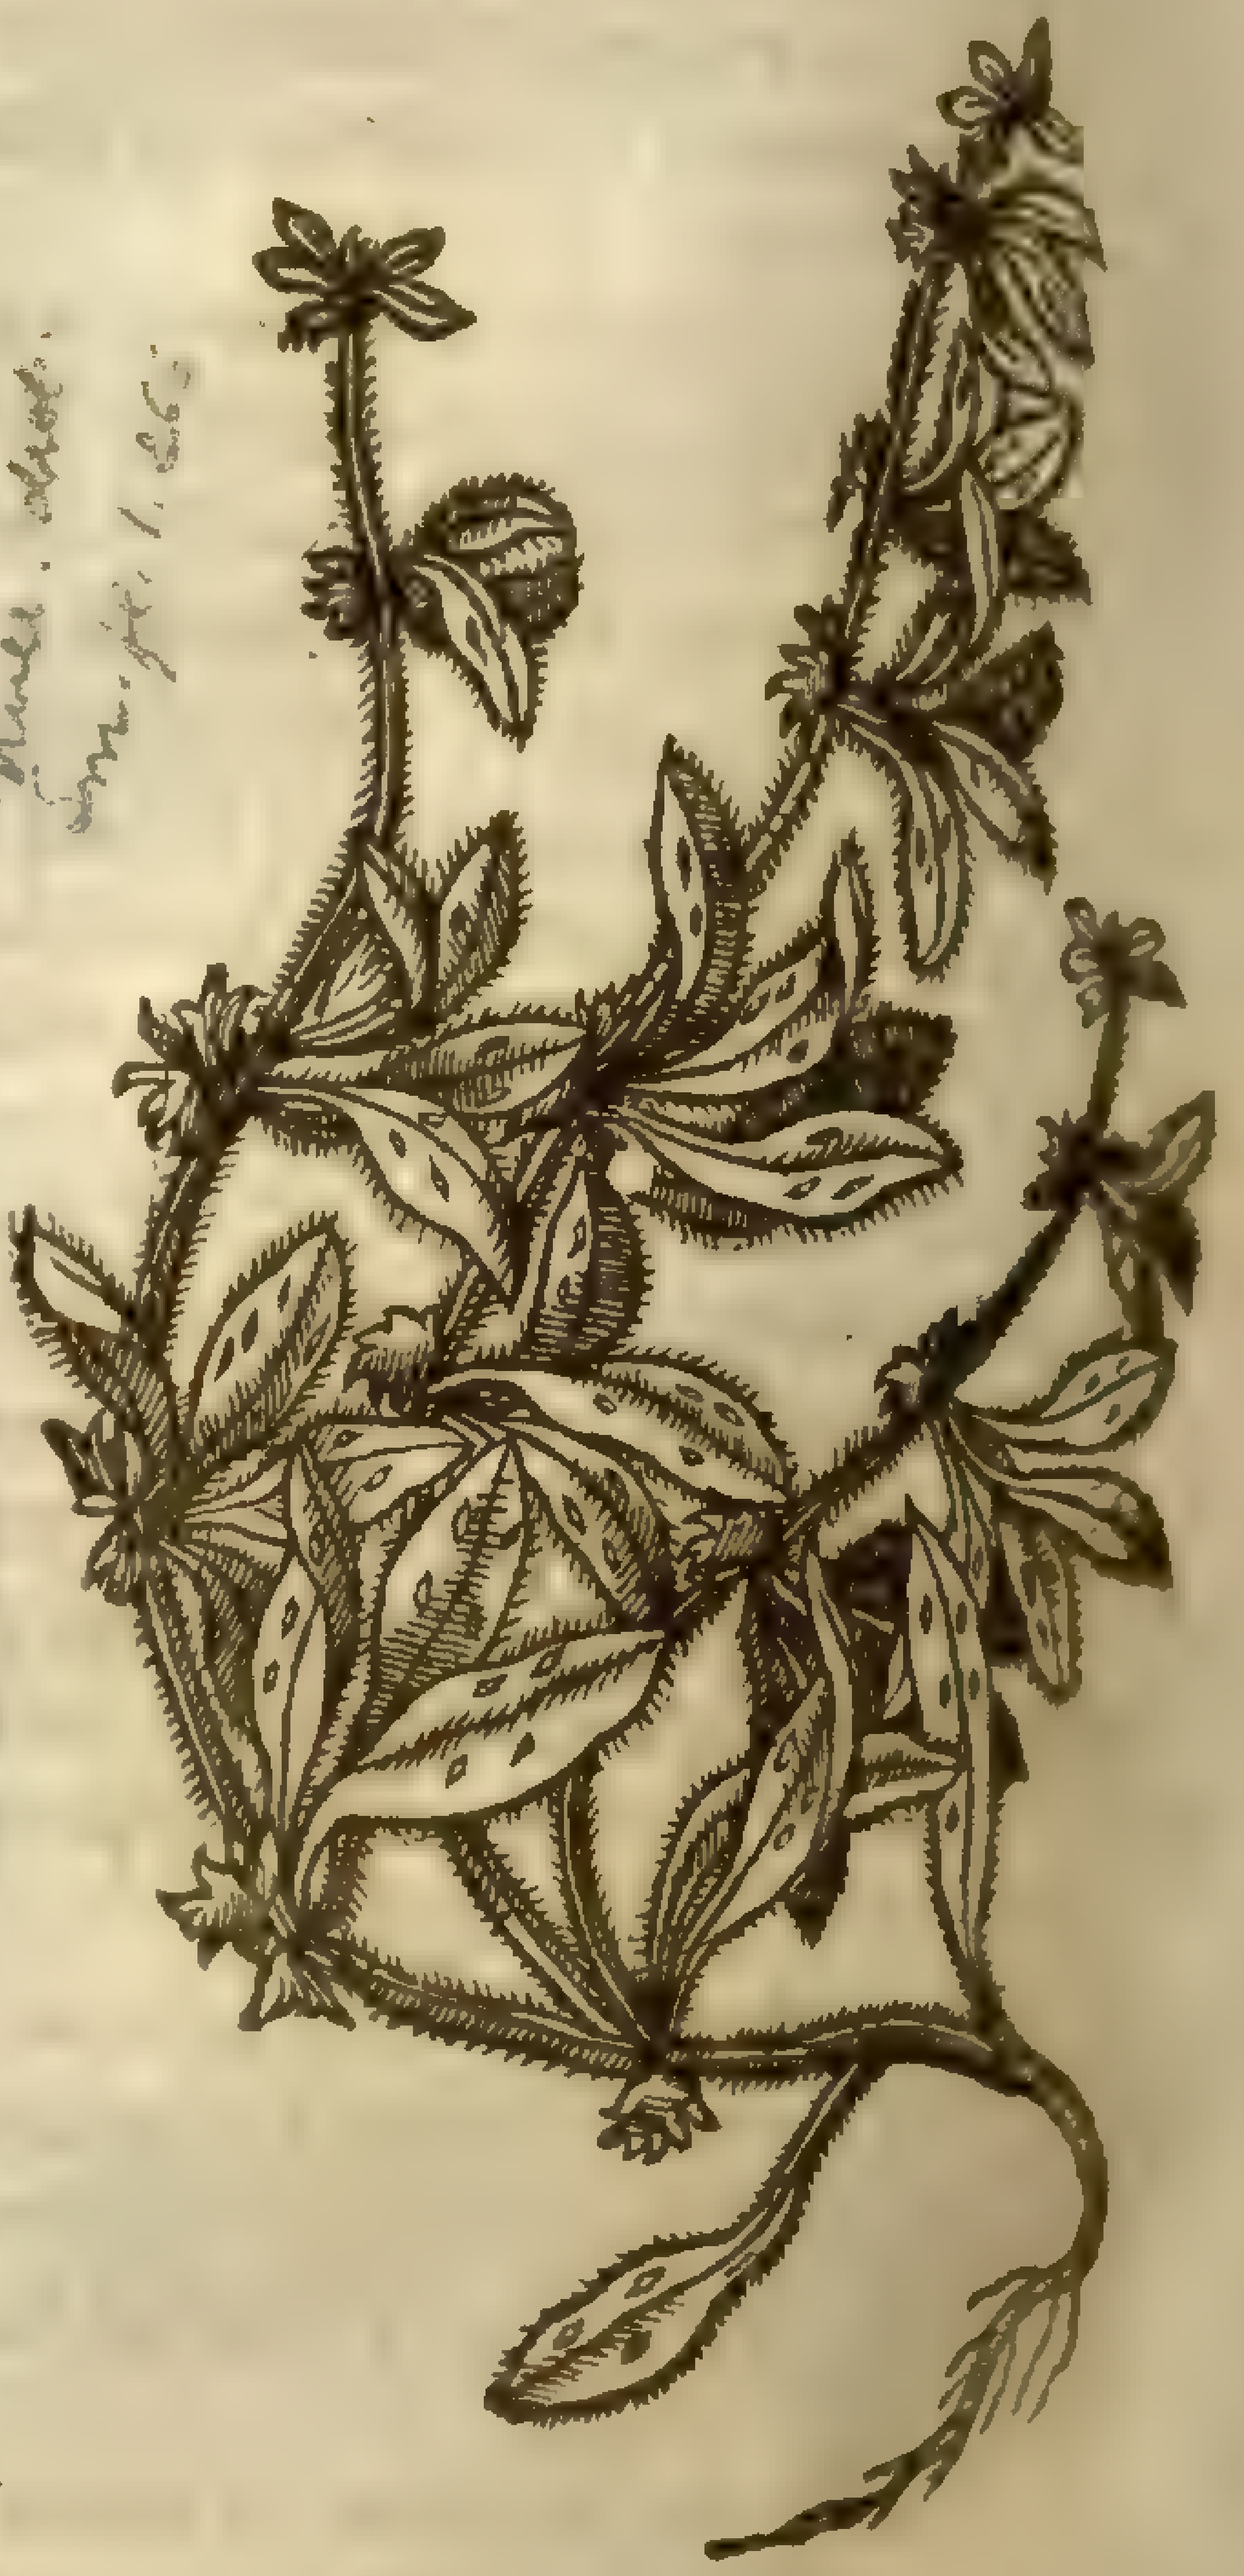
2 The great Gooſe-graſſe of *Pliny* is one of the Moone-worts of *Lobel*, it hath a very rough tender ſtalke, whereupon are ſet broad leaues ſomewhat long, like thoſe of Scorpion graſſe, or *A* *ſon Galeni*, *Galens* Moonewort, very rough and hairy, which grow not about the joynts, but three or foure together on one ſide of the ſtalke: the floures grow at the top of the branches, of a blew colour: after which commeth rough cleauing ſeed, that doth ſtick to mens garments which touch it: the root is ſmall and ſingle.

1 *Aparine.*
Gooſe-graſſe, or Cleuers.



Galium aparine, L.
Smith. Bot.
Sm. fl. l. 210

2 *Aparine major Plinij.*
Great Gooſe-graſſe.



Asperugo procumbens, L.
Smith. Bot.
Sm. fl. l. 256

¶ *The Place.*

Gooſe-graſſe groweth neer the borders of fields, and oftentimes in the fields themſelues mixed with the corne; alſo by common waies, ditches, hedges, and among thornes: *Theophraſtus* and *Galen* write, that it groweth among Lentles, and with hard embracing it doth choke it, and by that meanes is burdenſome and troubleſome vnto it.

¶ *The Time.*

It is found plentifully euery where in Summer time.

¶ *The Names.*

It is named in Greeke, ἀπαρίνη: *Aparine*: in Latine, *Lappa minor*, but not properly: *Pliny* affirmeth it to be *Lappaginis ſpeciem*: of ſome, *Philanthropos*, as though he ſhould ſay a mans friend, becauſe it taketh hold of mens garments; of diuers alſo for the ſame cauſe, *Philadelphos*: in Italian, *Speronella*: in Spaniſh, *Preſera*, or *amor di Hortalano*: in high Dutch, **Kleeb kraut**: in French, *Roble, ou Graterон*: in low Dutch, **Kleefcruyt**: in Engliſh, Gooſe-ſhare, Gooſe-graſſe, Cleuer, or Clauer.

¶ *The Temperature.*

It is, ſaith *Galen*, moderately hot and dry, and ſomewhat of thin parts.

¶ The

¶ *The Vertues.*

The juyce which is preſſed out of the ſeeds, ſtalkes, and leaues, as *Dioſcorides* writeth, is a remedie for them that are bitten of the poiſonſome ſpiders called in Latine *Phalangia*, and of vipers, if it be drunke with wine. A

And the herbe ſtamped with ſwines greaſe waſteth away the kernels by the throte. B

Pliny teacheth that the leaues being applied doe alſo ſtay the abundance of bloud iſſuing out of wounds. C

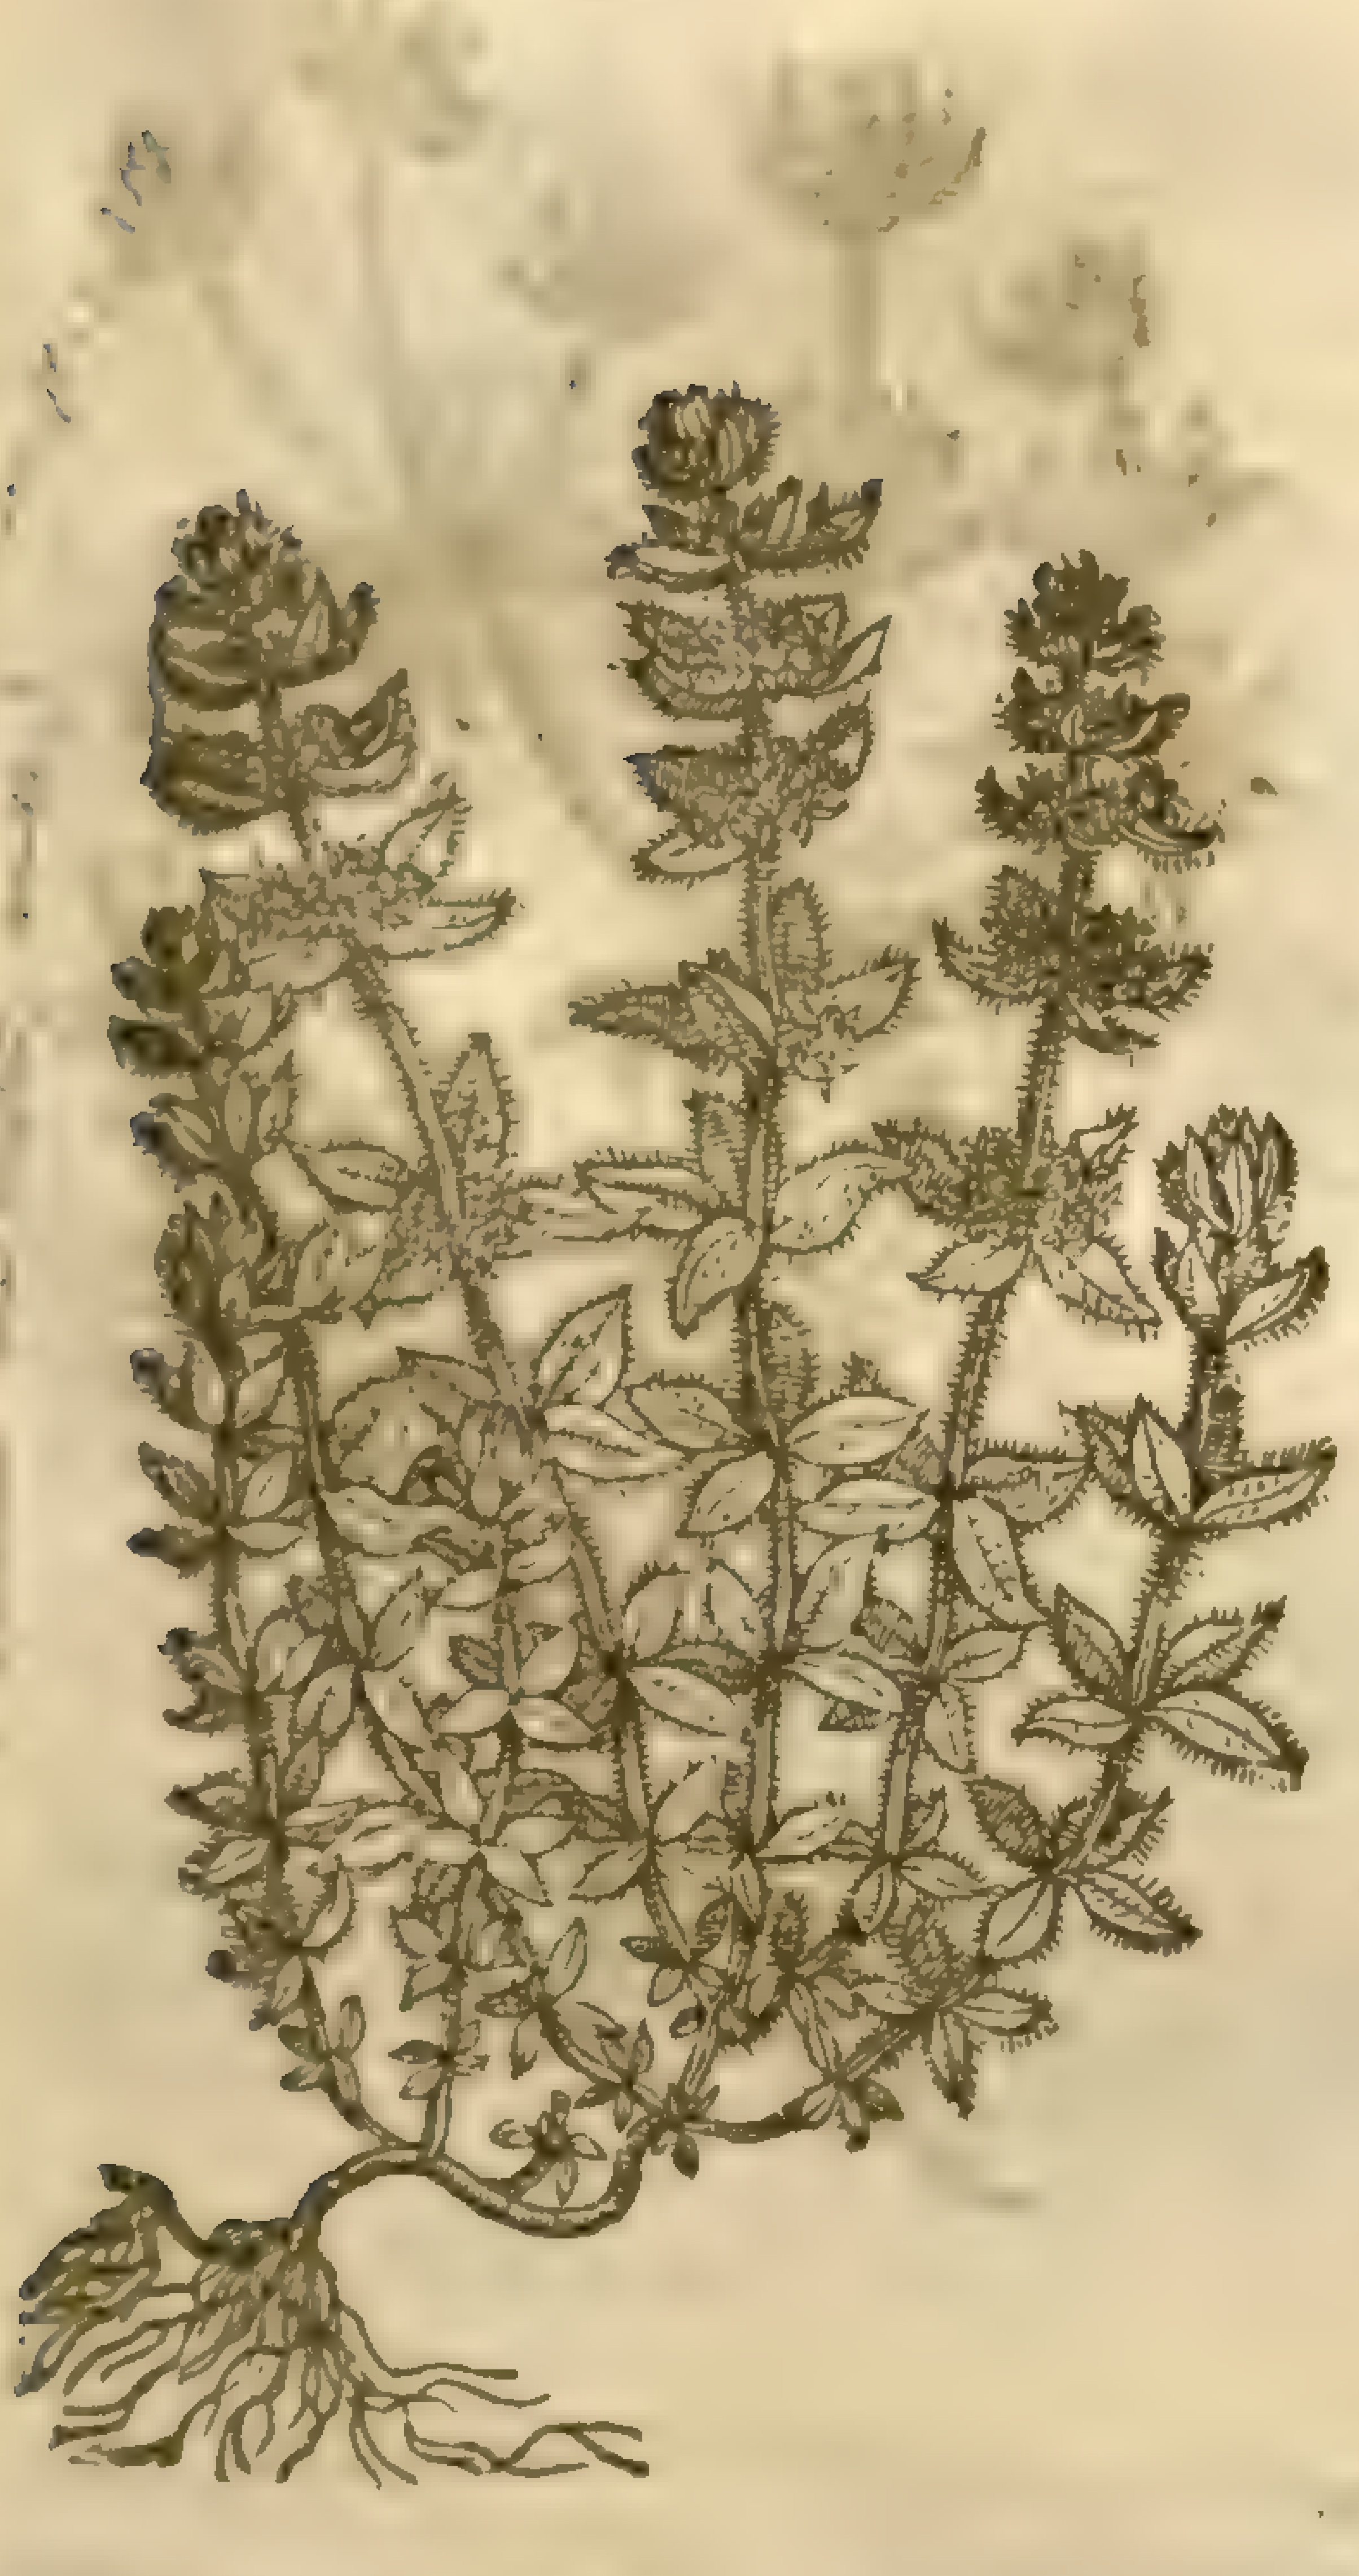
Women do vſually make pottage of Cleuers with a little mutton and Otemeale, to cauſe lankneſſe, and keepe them from fatneſſe. D

Chap. 462. *Of Croſſe-wort.*

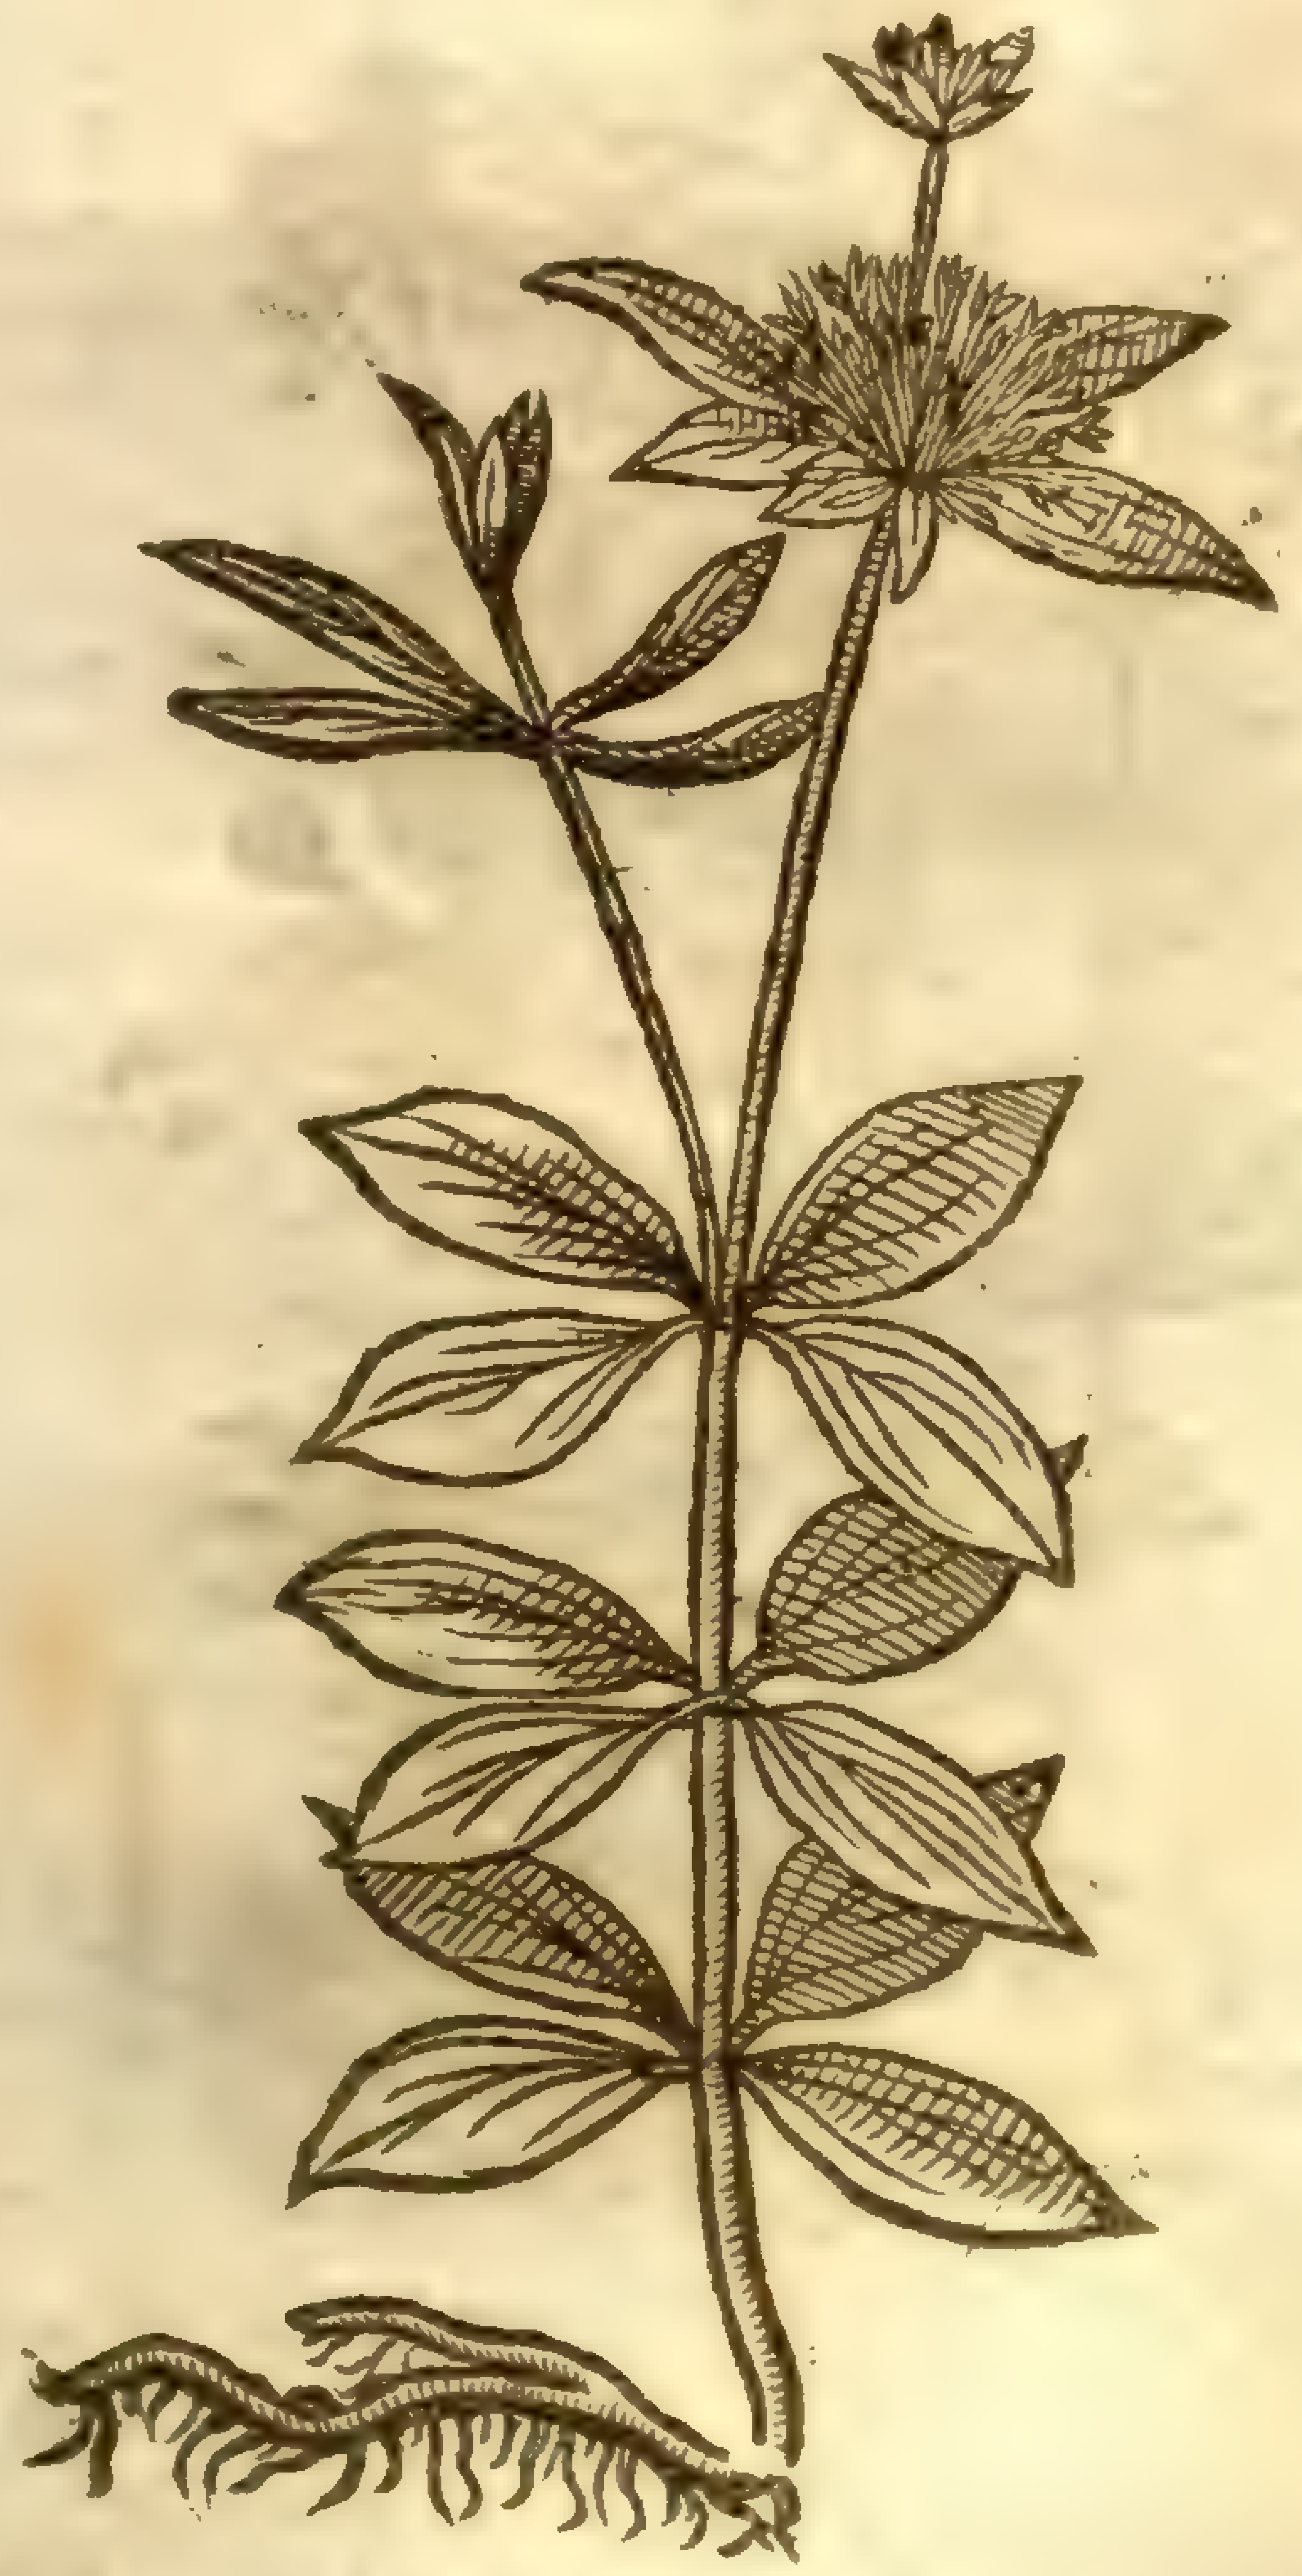
¶ *The Deſcription.*

1 Croſſe-wort is a low and baſe herbe, of a pale greene colour, hauing many ſquare feeble rough ſtalks full of joynts or knees, couered ouer with a ſoft downe: the leaues are little, ſhort, & ſmal, alwaies foure growing together, and ſtanding croſſewiſe one right againſt another, making a right Burgunion croſſe: toward the top of the ſtalke, and from the boſome of thoſe leaues come forth very many ſmall yellow floures, of a reaſonable good ſauour, each of which is alſo ſhaped like a Burgunion croſſe: the roots are nothing elſe but a few ſmall threds or fibres.

1 *Cruciata.*
Croſſe-wort.



‡ 2 *Rubia Cruciata lævis.*
Croſſe-wort Madder.



‡ 2 This in mine opinion may be placed here as fitly as any where elſe; for it hath the leaues ſtanding croſſe-waies foure at a joynt, ſomewhat like thoſe of the largeſt Chickeweed: the ſtalkes are betweene a foot and a halfe and two cubits high. The white Starre-faſhioned floures ſtand in roundles about the tops of the ſtalkes. It growes plentifully in Piemont, on the hills not farre from Turine. *Lobel* ſets it forth by the name of *Rubia Lævis Taurinenſium.* ‡

¶ *The Place.*

Cruciata, or Croſſewort, groweth in moiſt and fertile medowes; I found the ſame growing in the Churchyard of Hampſtead neere London, and in a paſture adjoyning thereto, by the mill: alſo it groweth in the Lane or high way beyond Charlton, a ſmall village by Greenewich, and in ſundry other places.

¶ *The Time.*

It floureth for the moſt part all Summer long.

¶ *The Names.*

It is called *Cruciata*, and *Cruciatis*, of the placing of the leaues in manner of a Croſſe: in Engliſh, Croſſe-wort, or Golden Mugweet.

¶ *The Temperature.*

Croſſe-wort ſeemeth to be of a binding and dry quality.

¶ *The Vertues.*

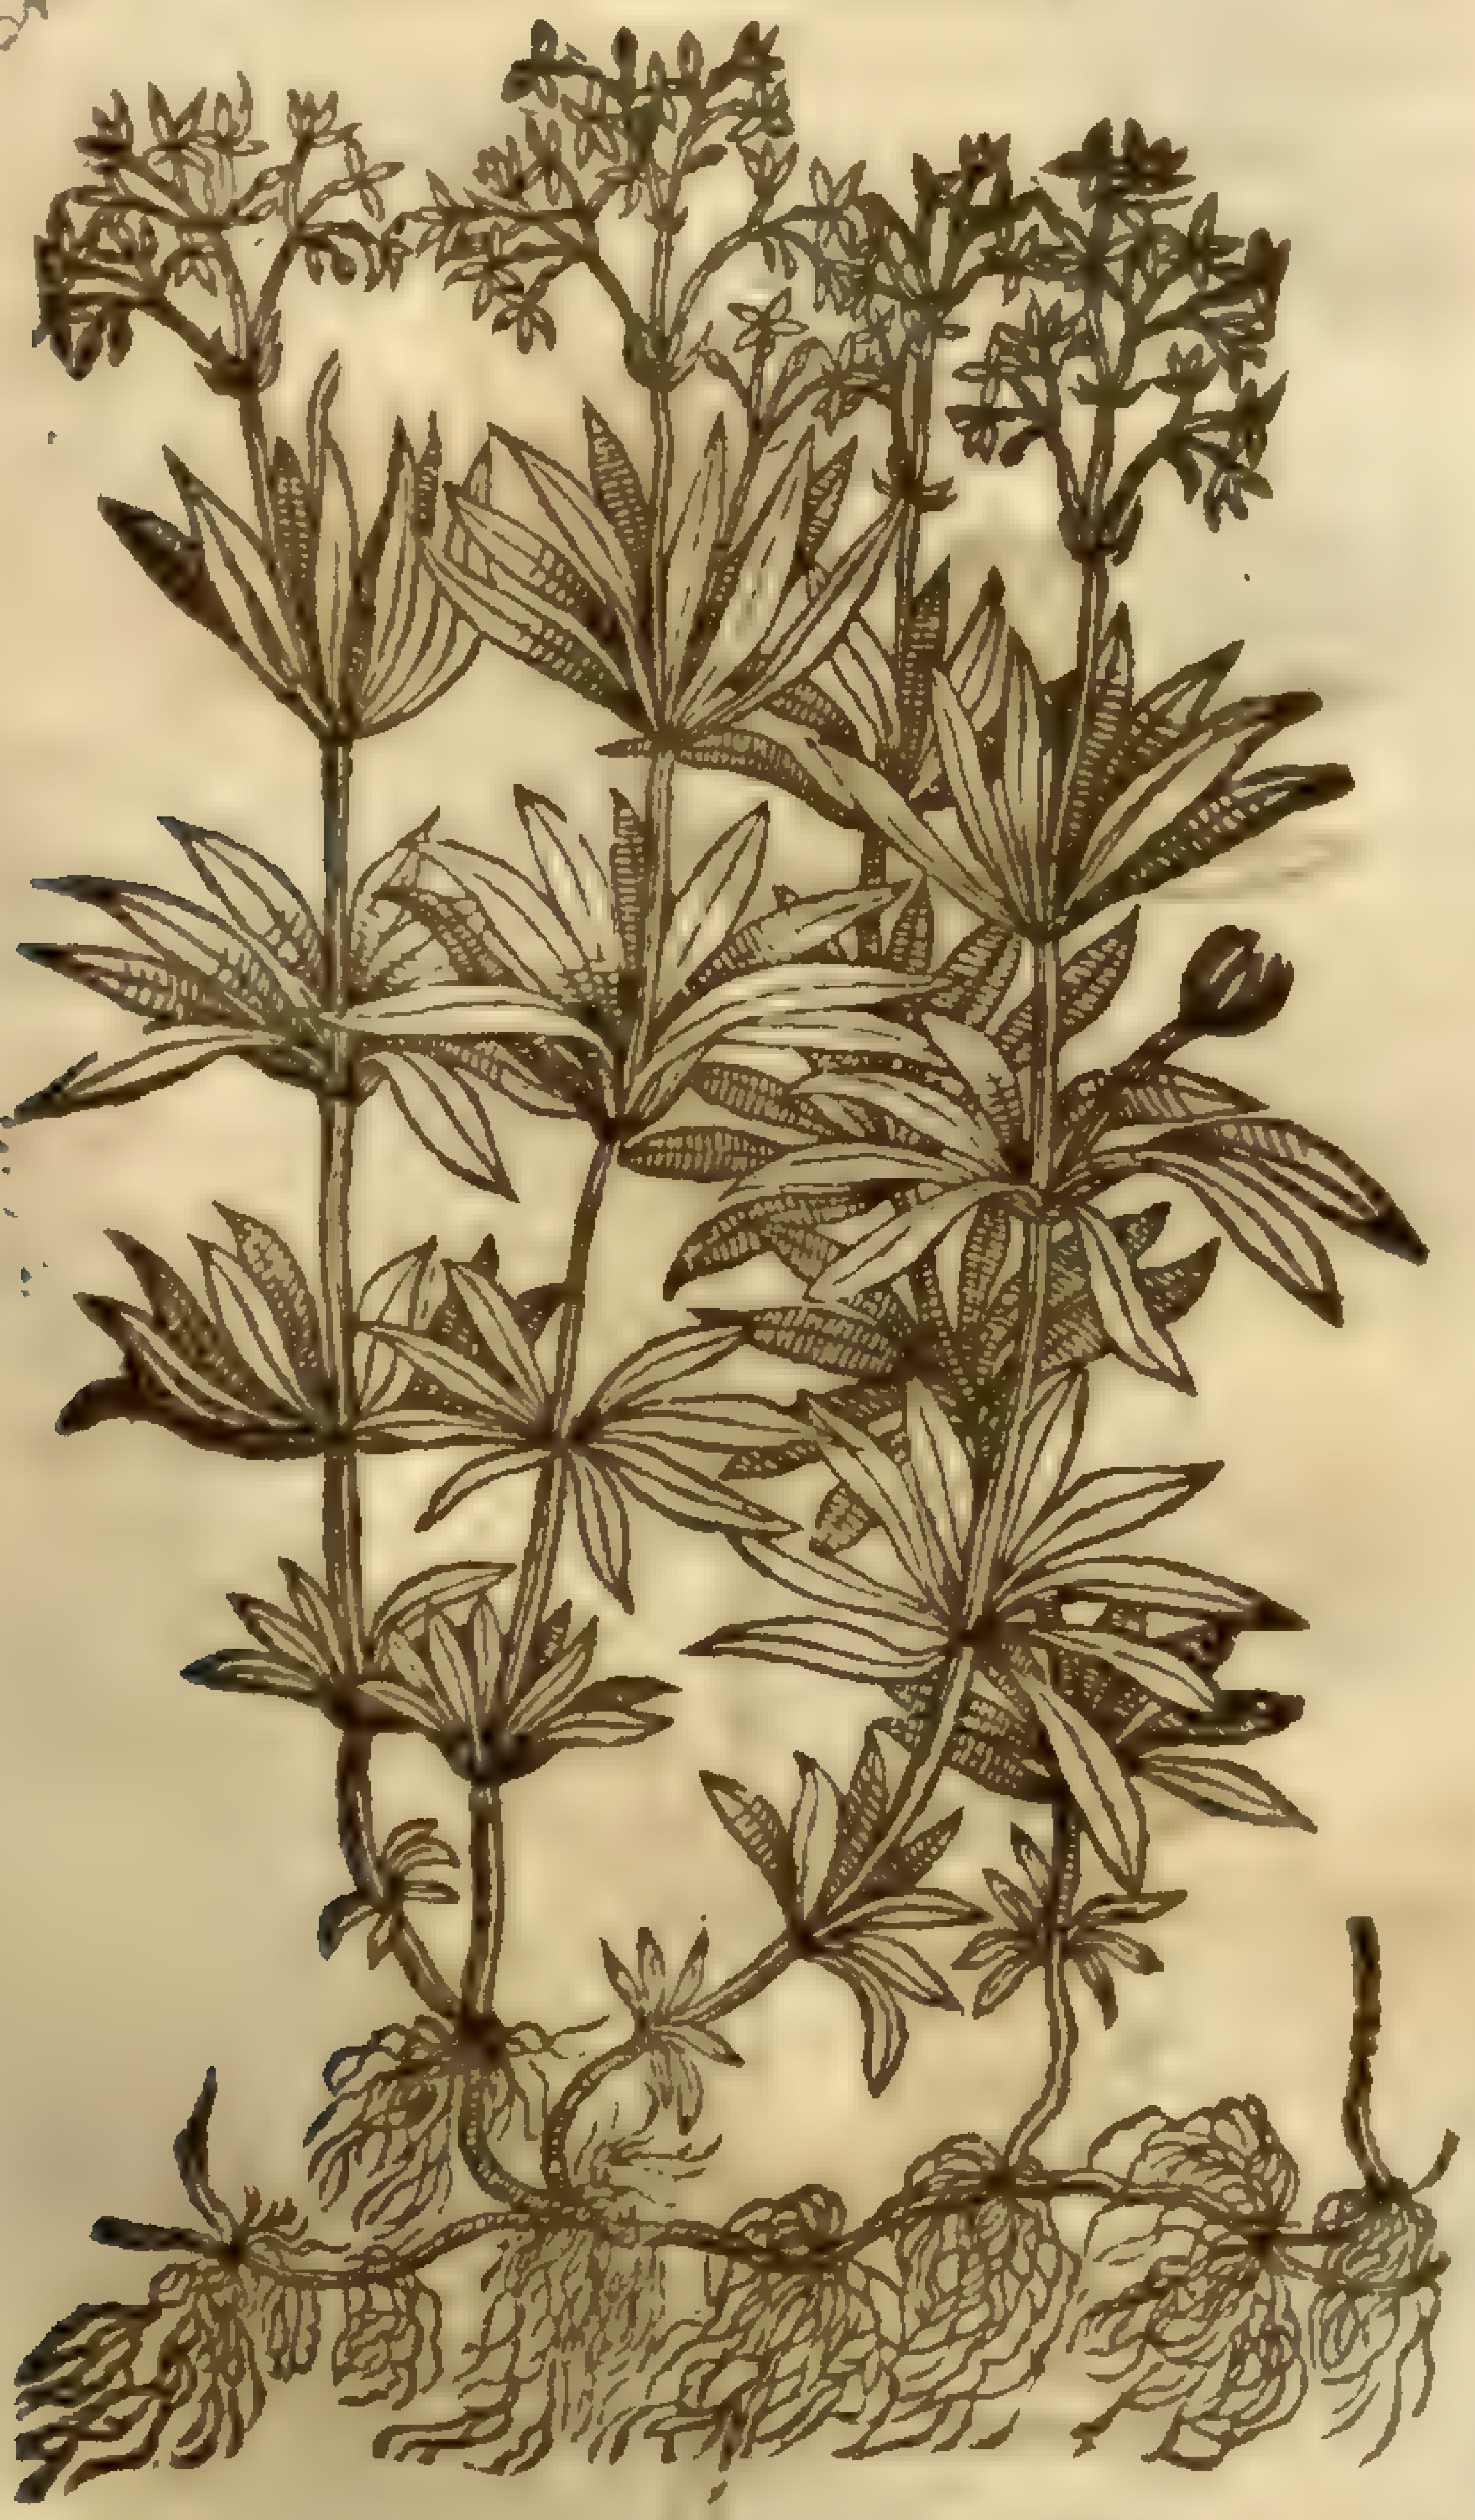
A Croſſe-wort hath an excellent property to heale, joyne, and cloſe wounds together, yea it is very fit for them, whether they be inward or outward, if the ſaid herbe be boyled in wine and drunke.

B The decoction thereof is alſo miniſtred with good ſucceſſe to thoſe that are burſten: and ſo is the herbe, being boyled vntill it be ſoft, and laied vpon the burſten place in manner of a pultis.

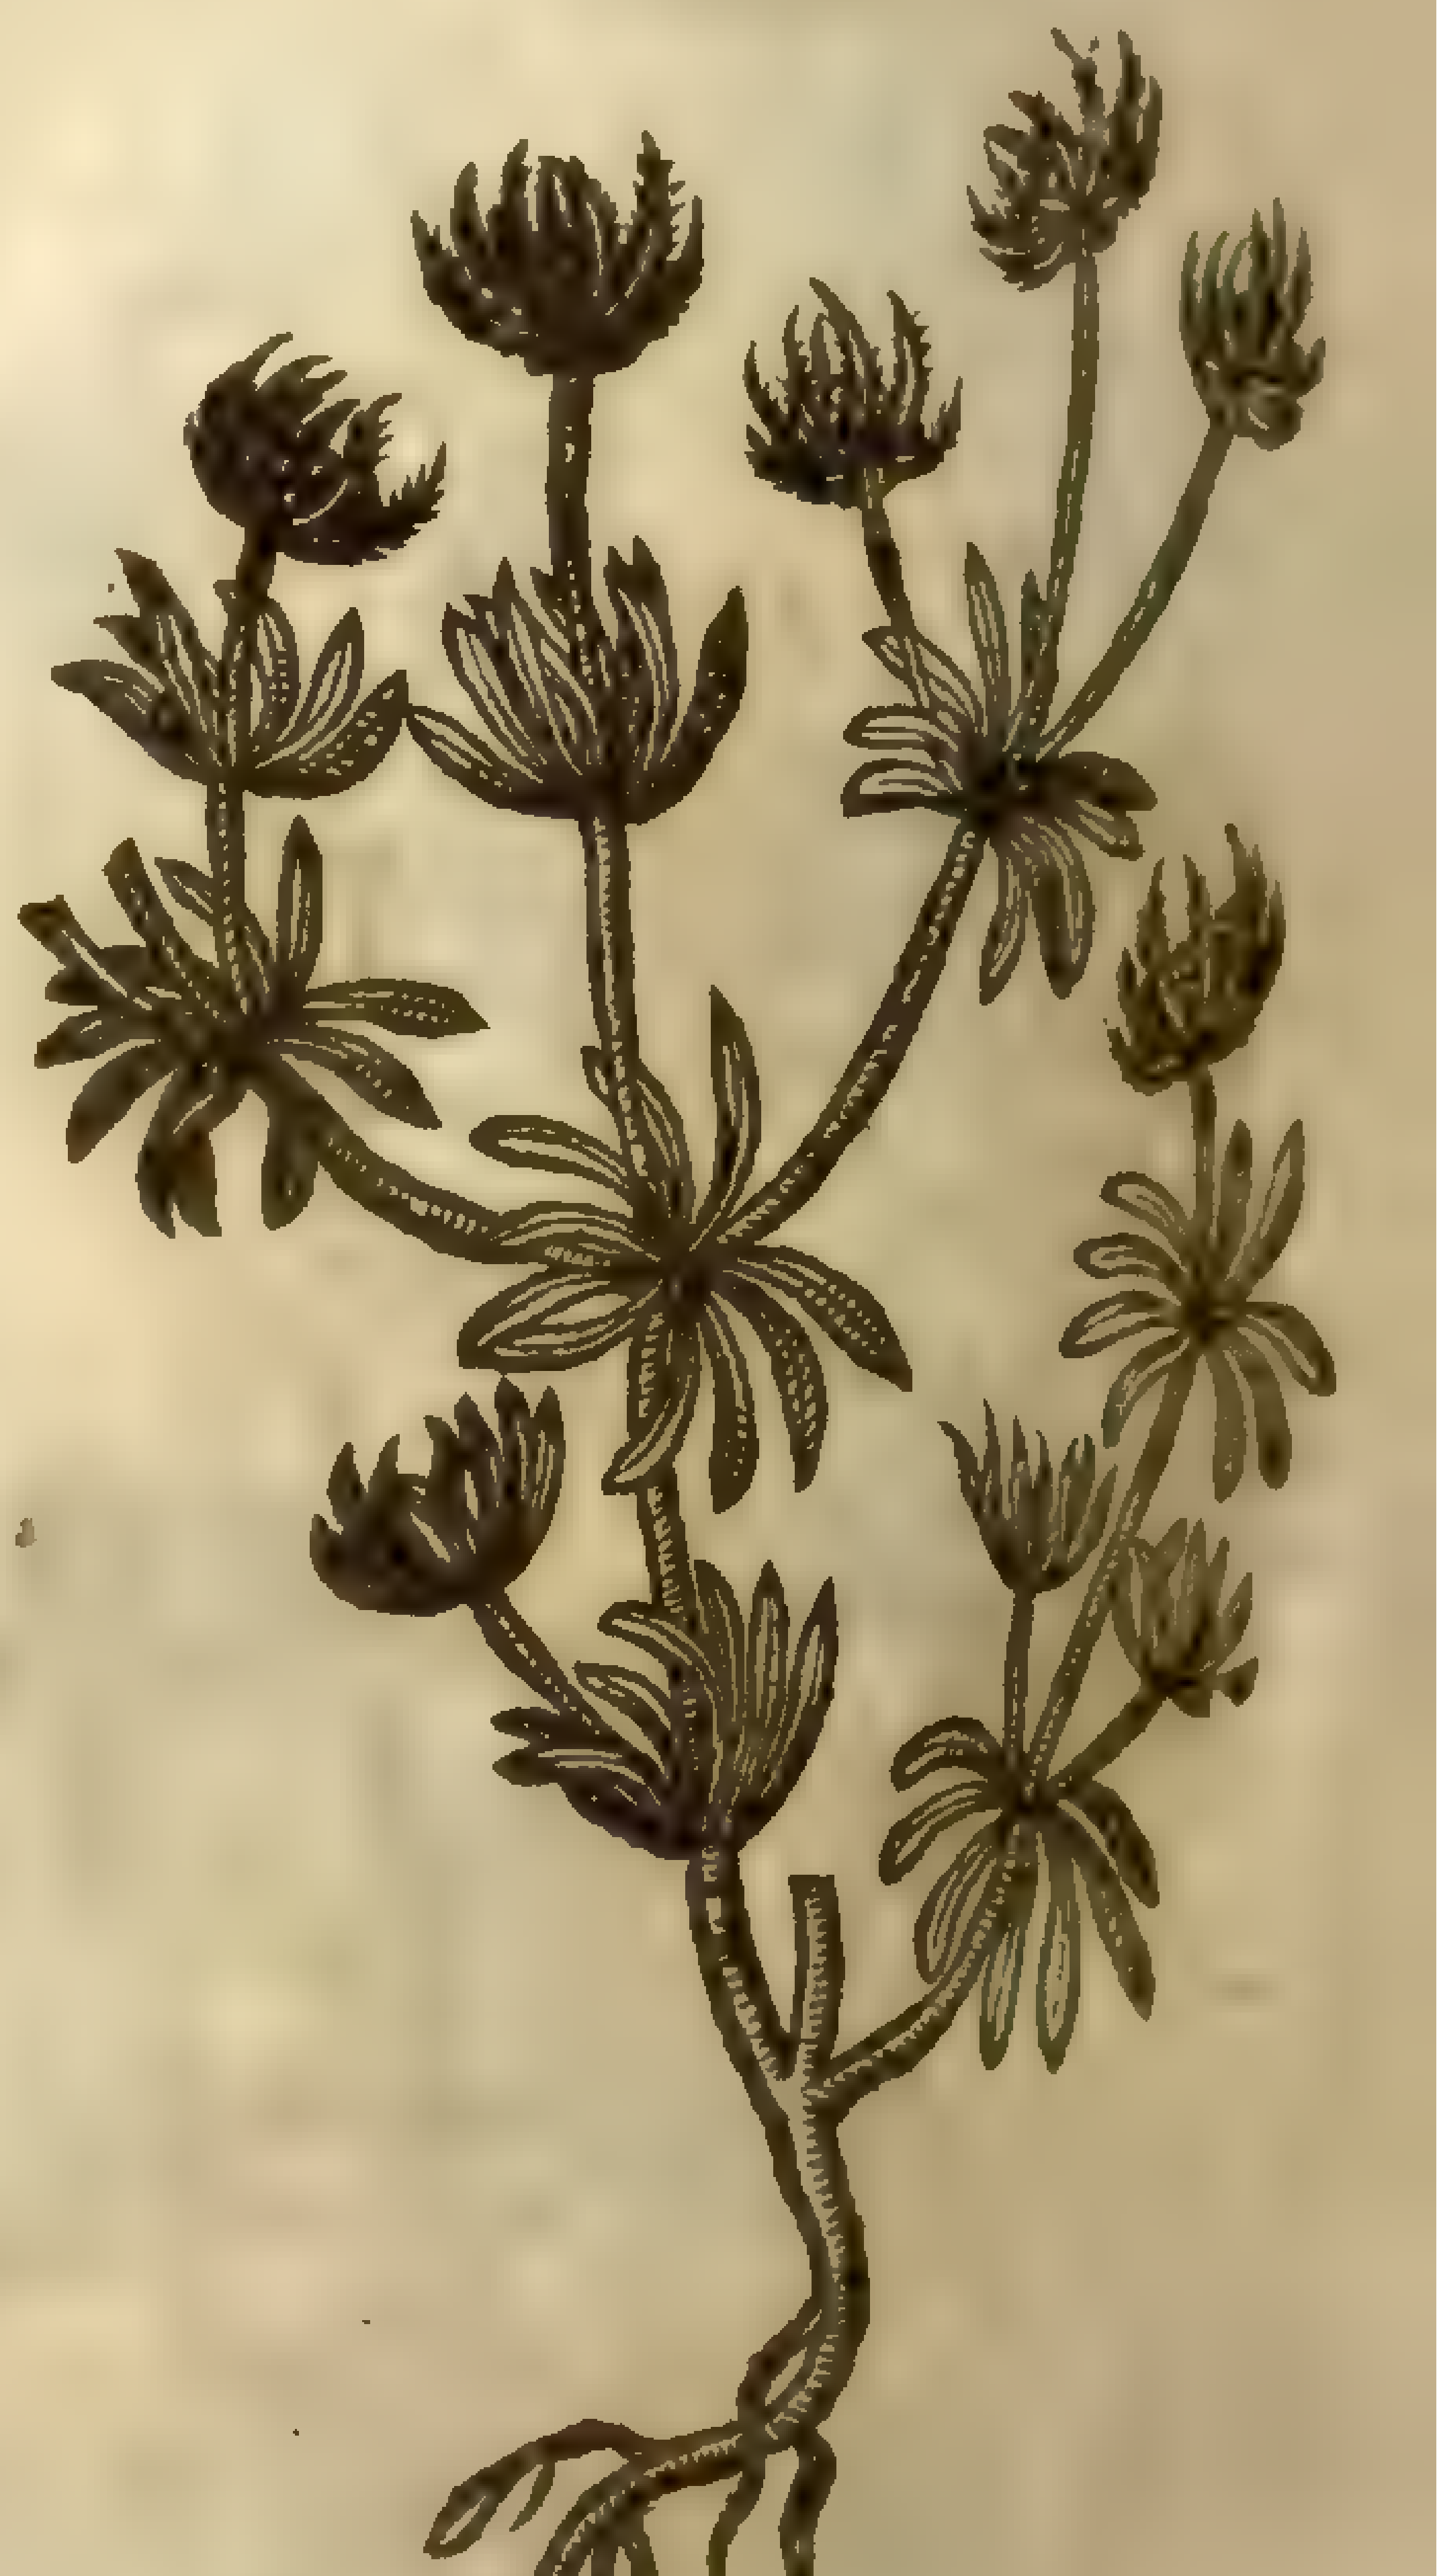
Chap. 463. *Of Wodrooffe.*

A. odorata i.
mille. dict.
Sm. fl. 1. 198

1 *Aſperula.*
Woodrooffe.



‡ 2 *Aſperula flore cæruleo.*
Blew Woodrooffe.



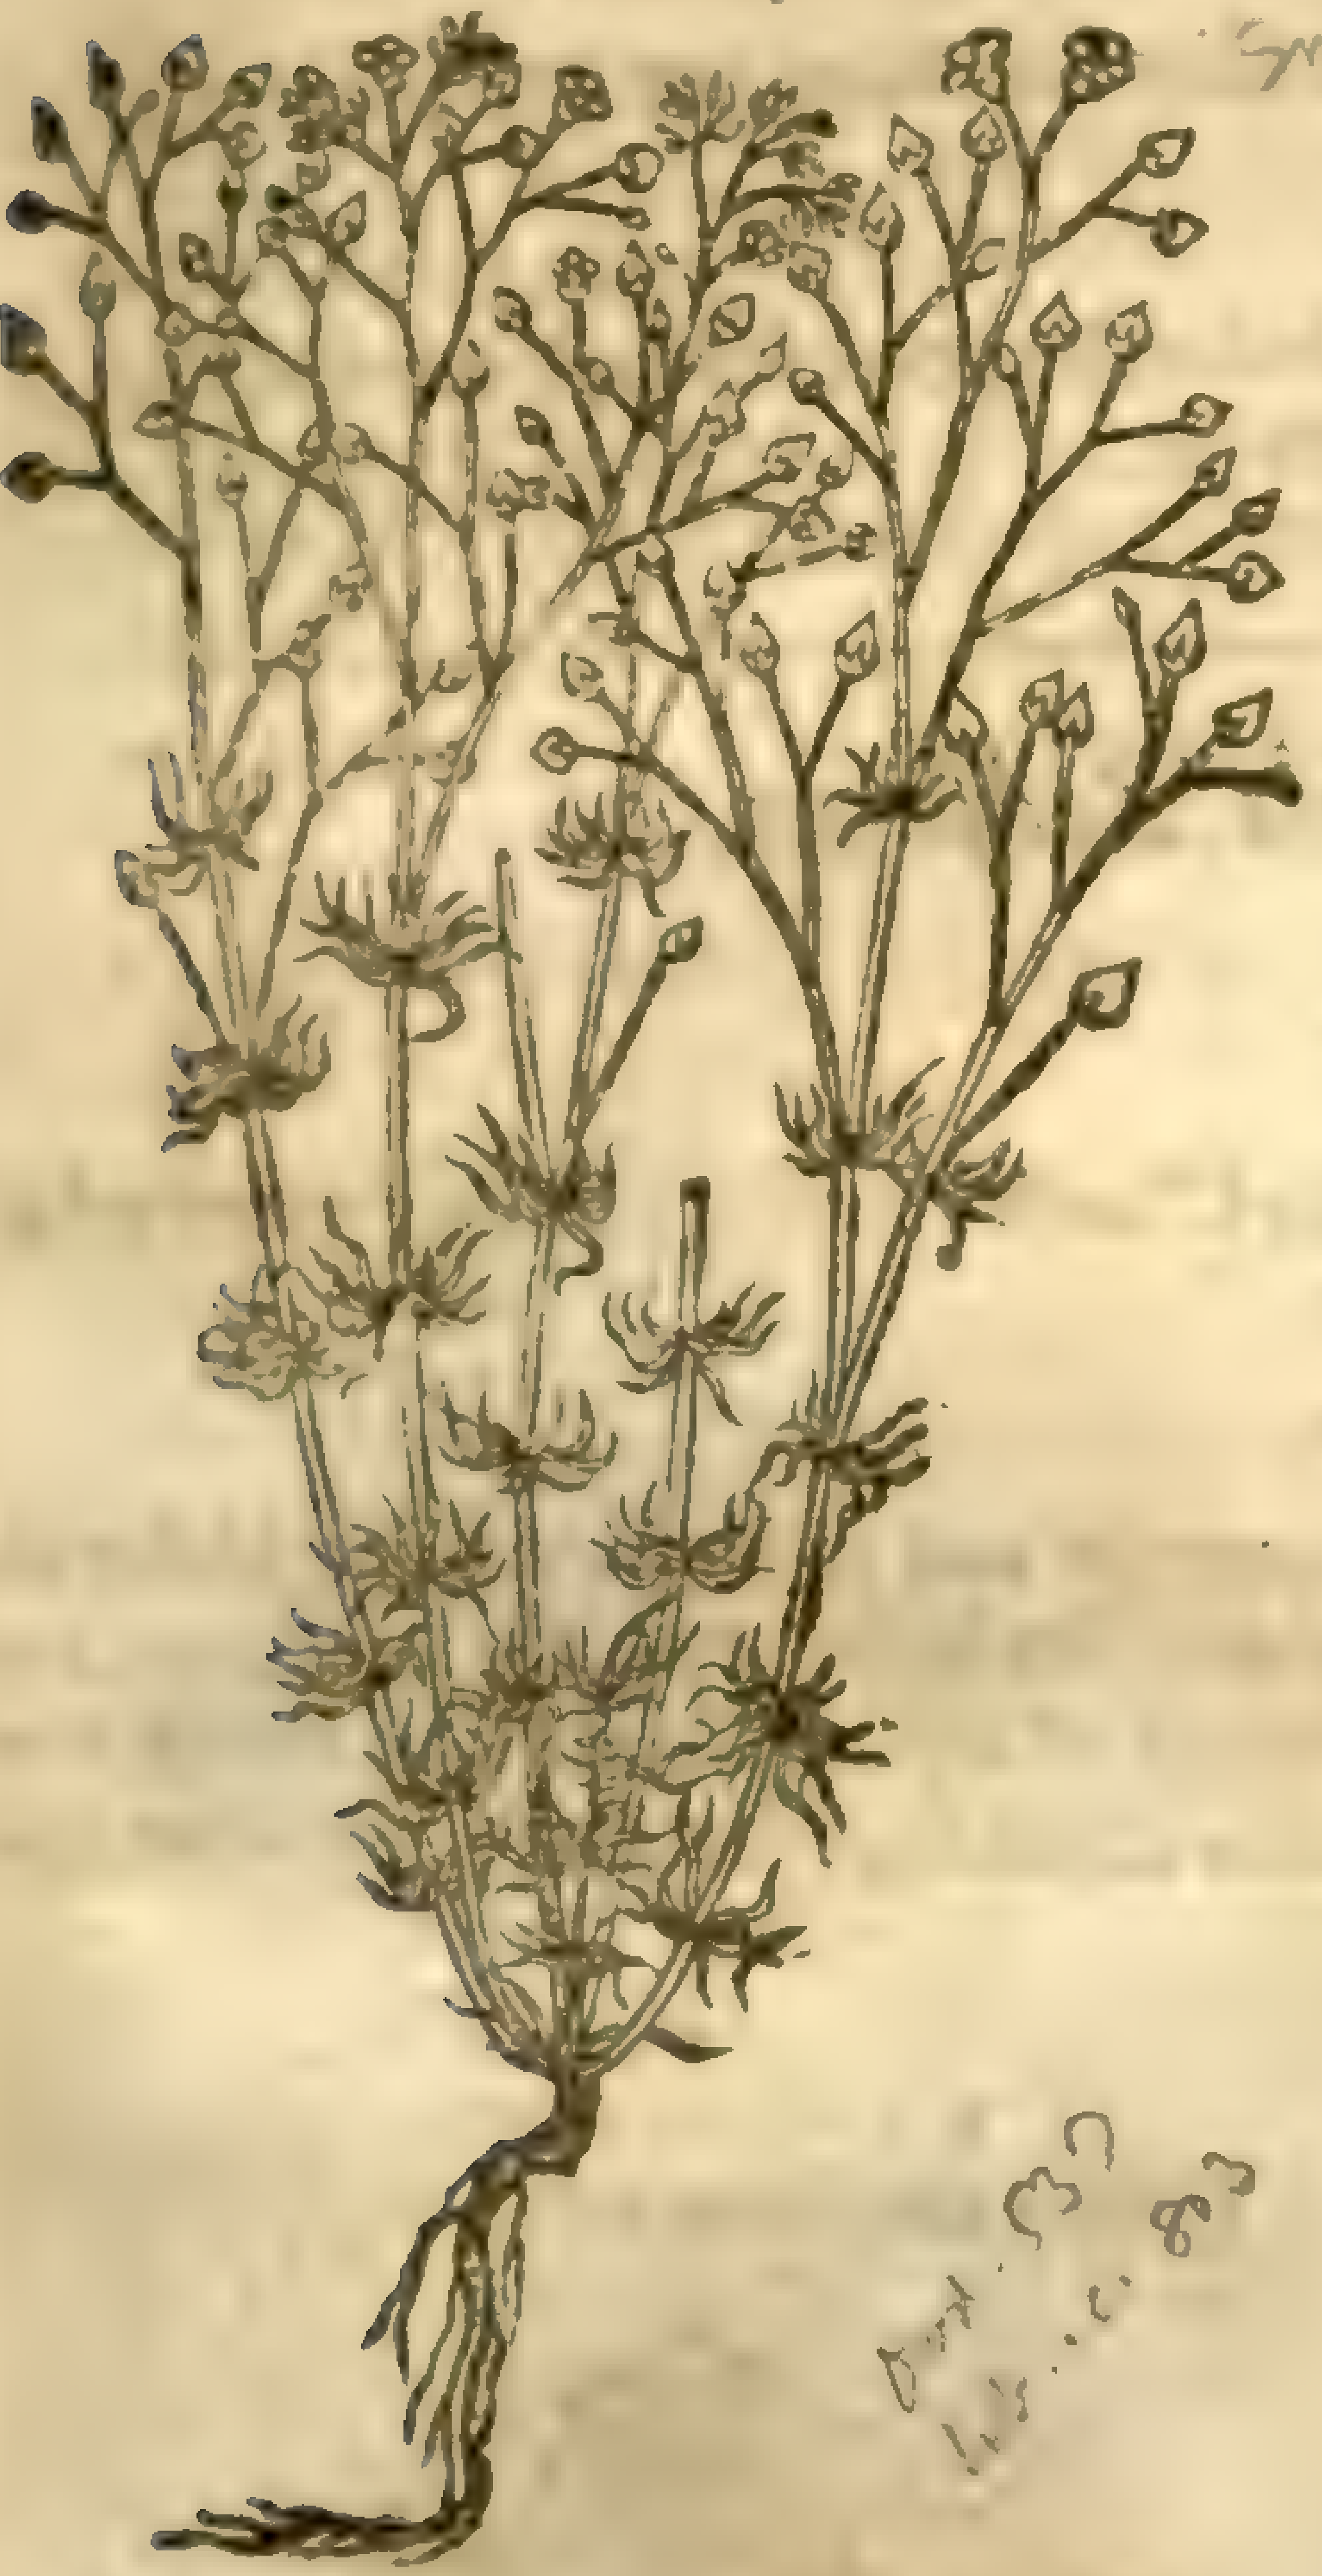
¶ *The Deſcription.*

1 Woodrooffe hath many ſquare ſtalkes full of joynts, and at euery knot or joynt ſeuen or eight long narrow leaues, ſet round about like a ſtar, or the rowell of a ſpurre: the floures grow at the top of the ſtems, of a white colour, and of a very ſweet ſmell, as is the reſt of the herbe, which being made vp into garlands or bundles, and hanging vp in houſes in the heat of Summer, doth very well attemper the aire, coole and make freſh the place, to the delight and comfort of ſuch as are therein.

2 There

‡ 3 *Sagina Spergula.*
Spurrey.

Spergula arvensis [illegible]



2 There is another ſort of Woodrooffe called *Aſperula Cærulea*, or blew Woodrooffe; it is an herbe of a foot high, ſoft, hairy, and ſomething branched, with leaues & ſtalks like thoſe of white Woodrooffe: the floures thereof are blew, ſtanding vpon ſhort ſtems on the tops of the ſtalks: the ſeed is ſmall, round, and placed together by couples: the root is long and of a red colour.

3 There is another herbe called *Sagina ſpergula*, or Spurry, which is ſown in Brabant, Holland, and Flanders, of purpoſe to fatten cattel, and to cauſe them to giue much milke, and there called Spurrey, and Franke Spurrey: it is a baſe and low herbe, very tender, hauing many jointed ſtalks, whereupon do grow leaues ſet in round circles like thoſe of Woodrooffe, but leſſer and ſmoother, in forme like the rowell of a ſpur: at the top of the ſtalks do grow ſmall white floures; after which come round ſeed like thoſe of Turneps: the root is ſmall and threddie.

‡ 4 There are one or two plants more, which may fitly be here mentioned: the firſt of them is the *Spergula marina* of *Daleſchampius*, which from a pretty large woody and roughiſh root ſends vp jointed ſtalks ſome foot long: at each joint come forth two long thick round leaues, and out of their boſomes other leſſer leaues: the top of the ſtalks is diuided into ſundry branches, bearing floures of a faint reddiſh colour, compoſed of fiue little leaues, with yellowiſh threds in the middle: after which follow cups or ſeed veſſels, which open into foure parts, and containe a little flat reddiſh ſeed: it grows in the ſalt marſhes about Dartford, and other ſuch places; floures in Iuly and Auguſt, and in the meane ſpace ripens his ſeed. We may call this in Engliſh, Sea Spurrie.

5 This other hath a large root, conſidering the ſmalneſſe of the plant; from which ariſe many weak ſlender branches ſome three or foure inches long, ſomtimes more, lying commonly flat on the ground, hauing many knots or joints: at each whereof vſually grow a couple of white ſcaly leaues, and out of their boſomes other ſmall ſharpe pointed little greene leaues: at the tops of the branches grow little red floures, ſucceeded by ſuch, yet leſſer heads than thoſe of the former: it floures in Iuly and Auguſt, and growes in ſandy grounds, as in Tuthill-fields nigh Weſtminſter: the figure ſet forth in *Hiſt. Lugd. p.* 2179, by the title of *Chamæpeuce Plinij; Camphorata minor Daleſchampij*, ſeems to be of this plant, but without the floure: *Bauhine* in his *Prodromus* deſcribes it by the name of *Alſine Spergulæ facie*. This may be called Chickweed Spurrey, or ſmall red Spurrey. ‡

¶ *The Place.*

White Woodrooffe groweth vnder hedges, and in woods almoſt euery where: the ſecond groweth in many places of Eſſex, and diuers other parts in ſandy grounds. The third in Corne fields.

¶ *The Time.*

They floure in Iune and Iuly.

¶ *The Names.*

Moſt haue taken Woodrooffe to be *Pliny* his *Alyſſos*, which as he ſaith, doth differ from *Erythrodanum*, or Garden Madder, in leaues onely, and leſſer ſtalkes: but ſuch a one is not only this, but alſo that with blew floures: for *Galen* doth attribute to *Alyſſos*, a blew floure: notwithſtanding *Galens* and *Plinies Alyſſos* are thought to differ by *Galens* owne words, writing of *Alyſſos* in his ſecond booke of Counterpoyſons, in *Antonius Cous* his compoſition, in this maner: *Alyſſos* is an herbe very like vnto Horehound, but rougher and fuller of prickles about the circles: it beareth a floure tending to blew.

Woodrooffe is named of diuers in Latine *Aſperula odorata*, and of moſt men *Aſpergula odorata*: of others, *Cordialis*, and *Stellaria*: in high Dutch, **Hertzfreydt**: in low Dutch, **Leuerkraut**: that is to ſay *Iecoraria*, or *Hepatica*, Liuerwort: in French, *Muguet*: in Engliſh, Woodrooffe, Woodrowe, and Woodrowell.

¶ *The Temperature.*

Woodrooffe is of temperature ſomthing like vnto our Ladies Bedſtraw, but not ſo ſtrong, being in a meane betweene heate and drineſſe.

¶ *The Vertues.*

A It is reported to be put into wine, to make a man merry, and to be good for the heart and liuer: it preuaileth in wounds, as *Cruciata*, and other vulnerary herbes do.

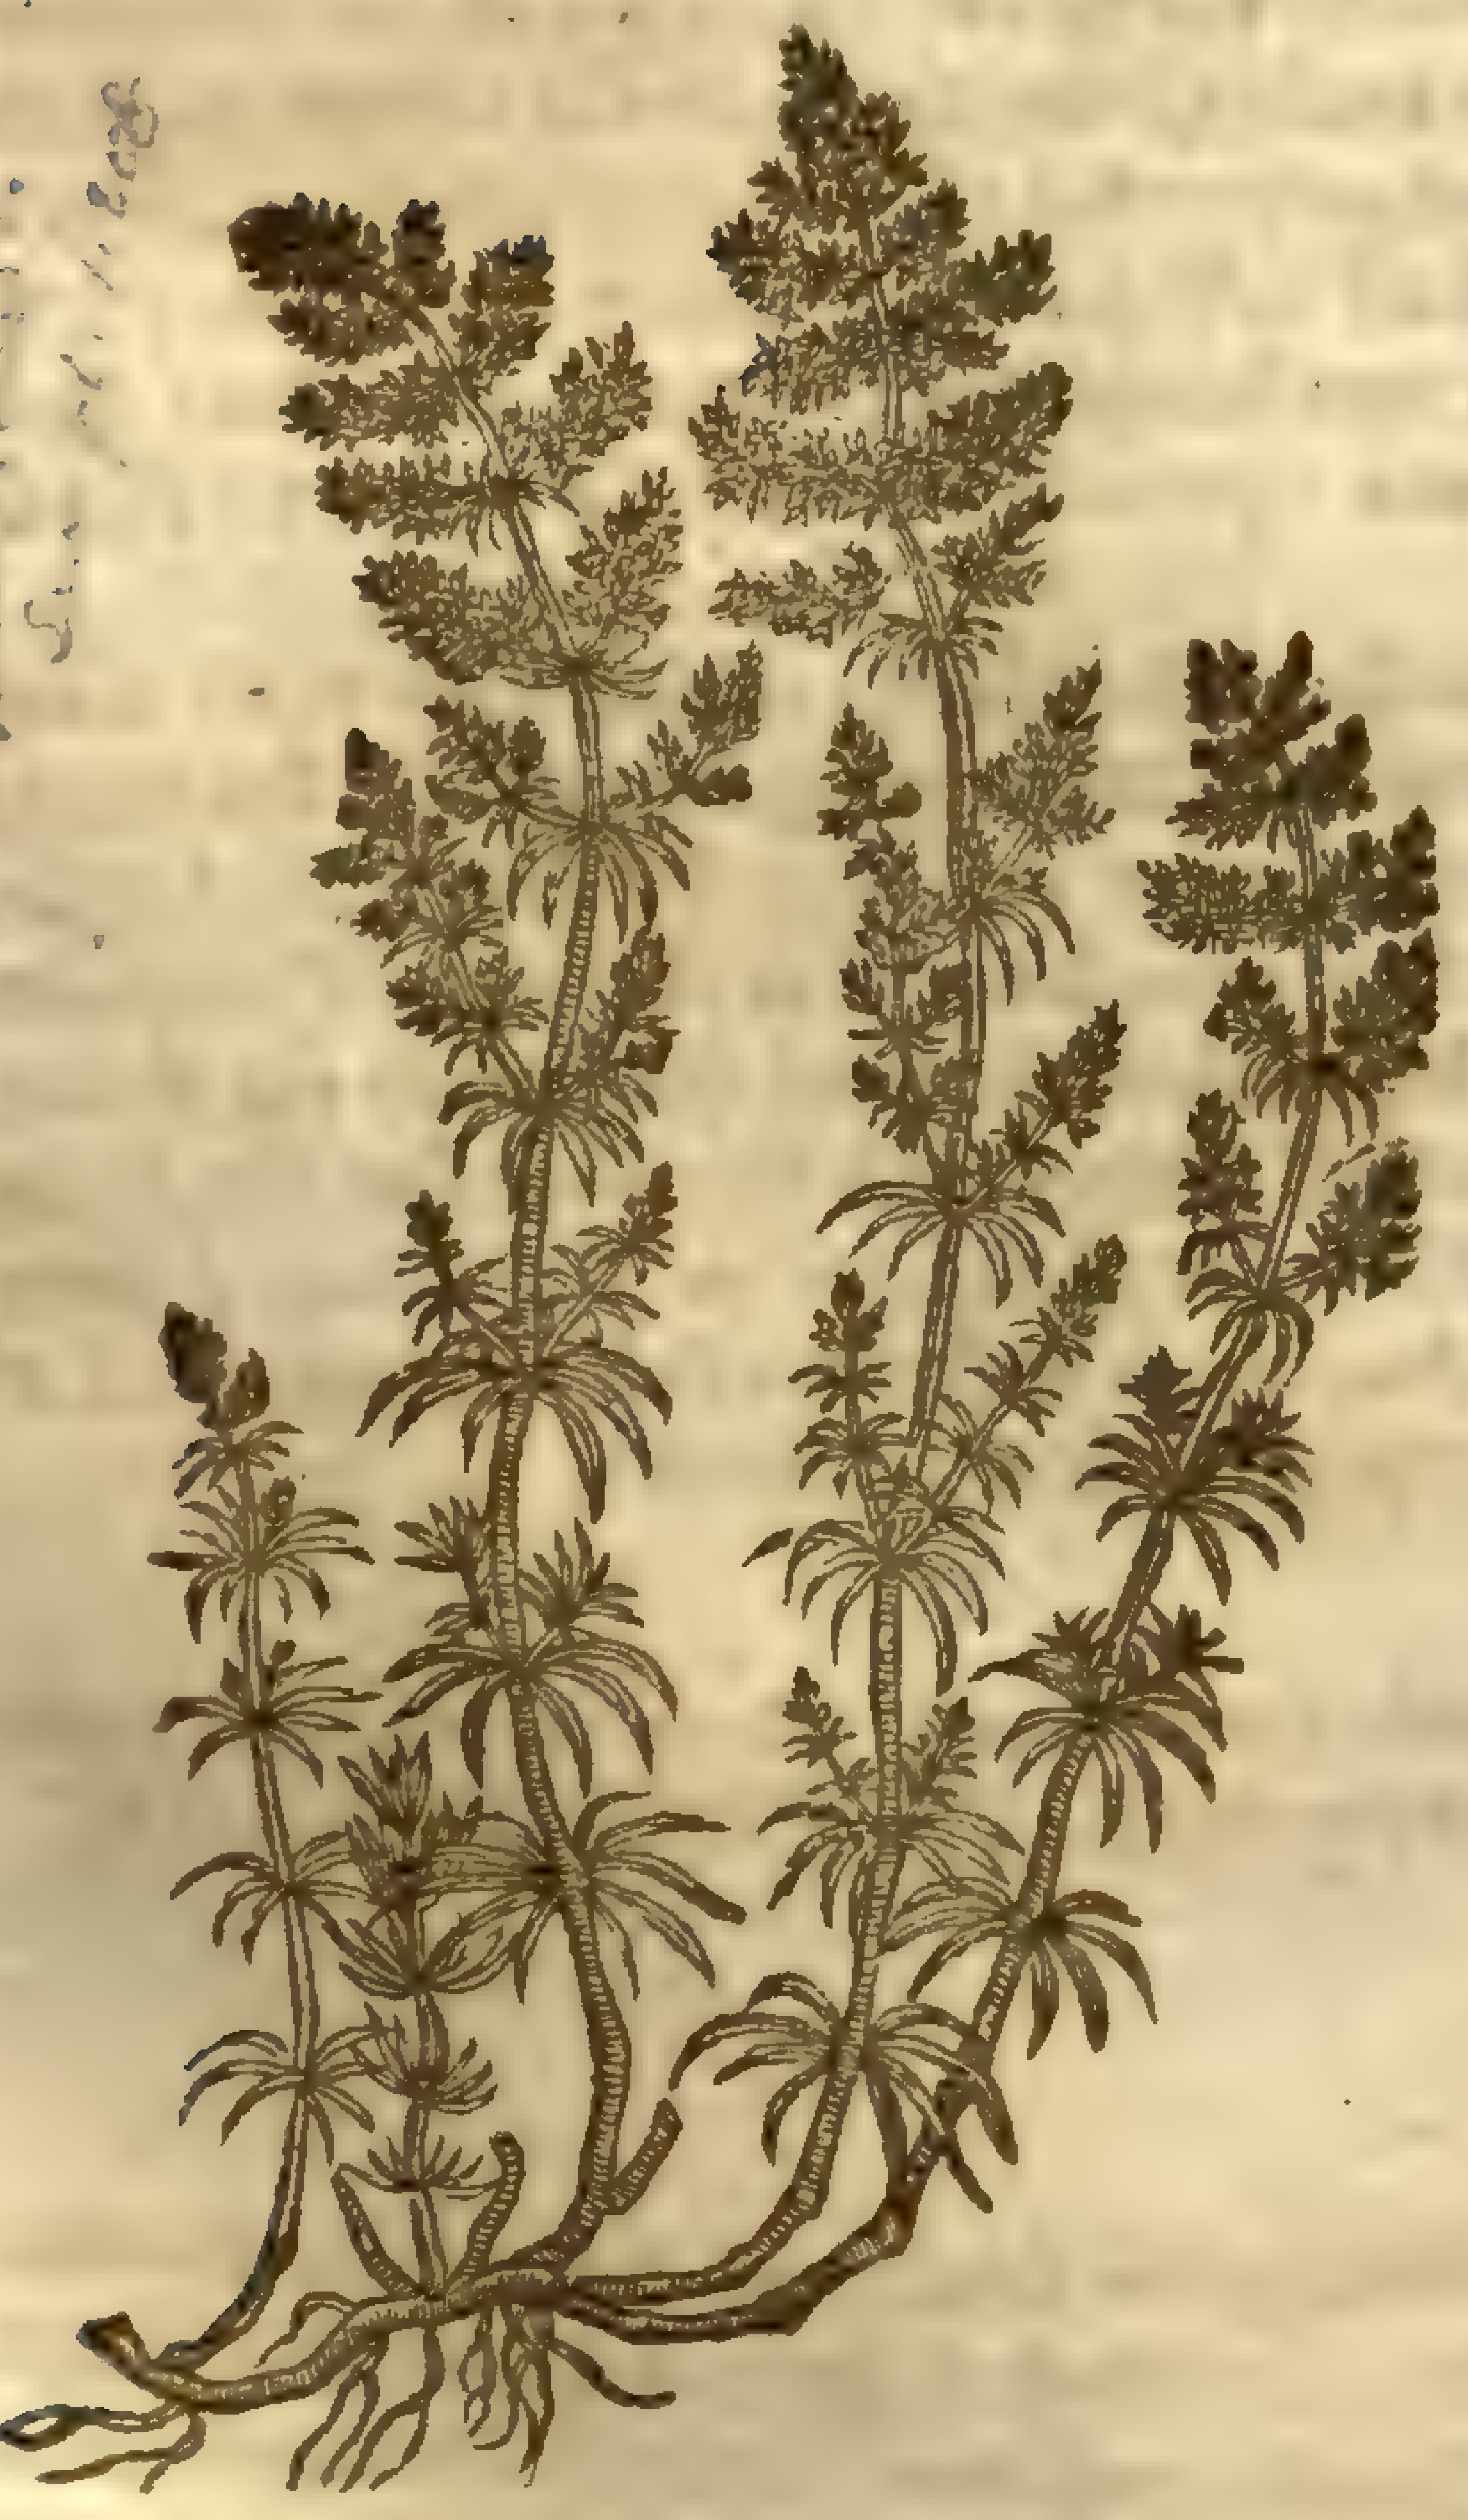
Chap. 464. *Of Ladies Bedſtraw.*

¶ *The Kindes.*

There be diuers of the herbes called Ladies Bedſtraw, or Cheeſe-renning; ſome greater, others leſſe; ſome with white floures, and ſome with yellow.

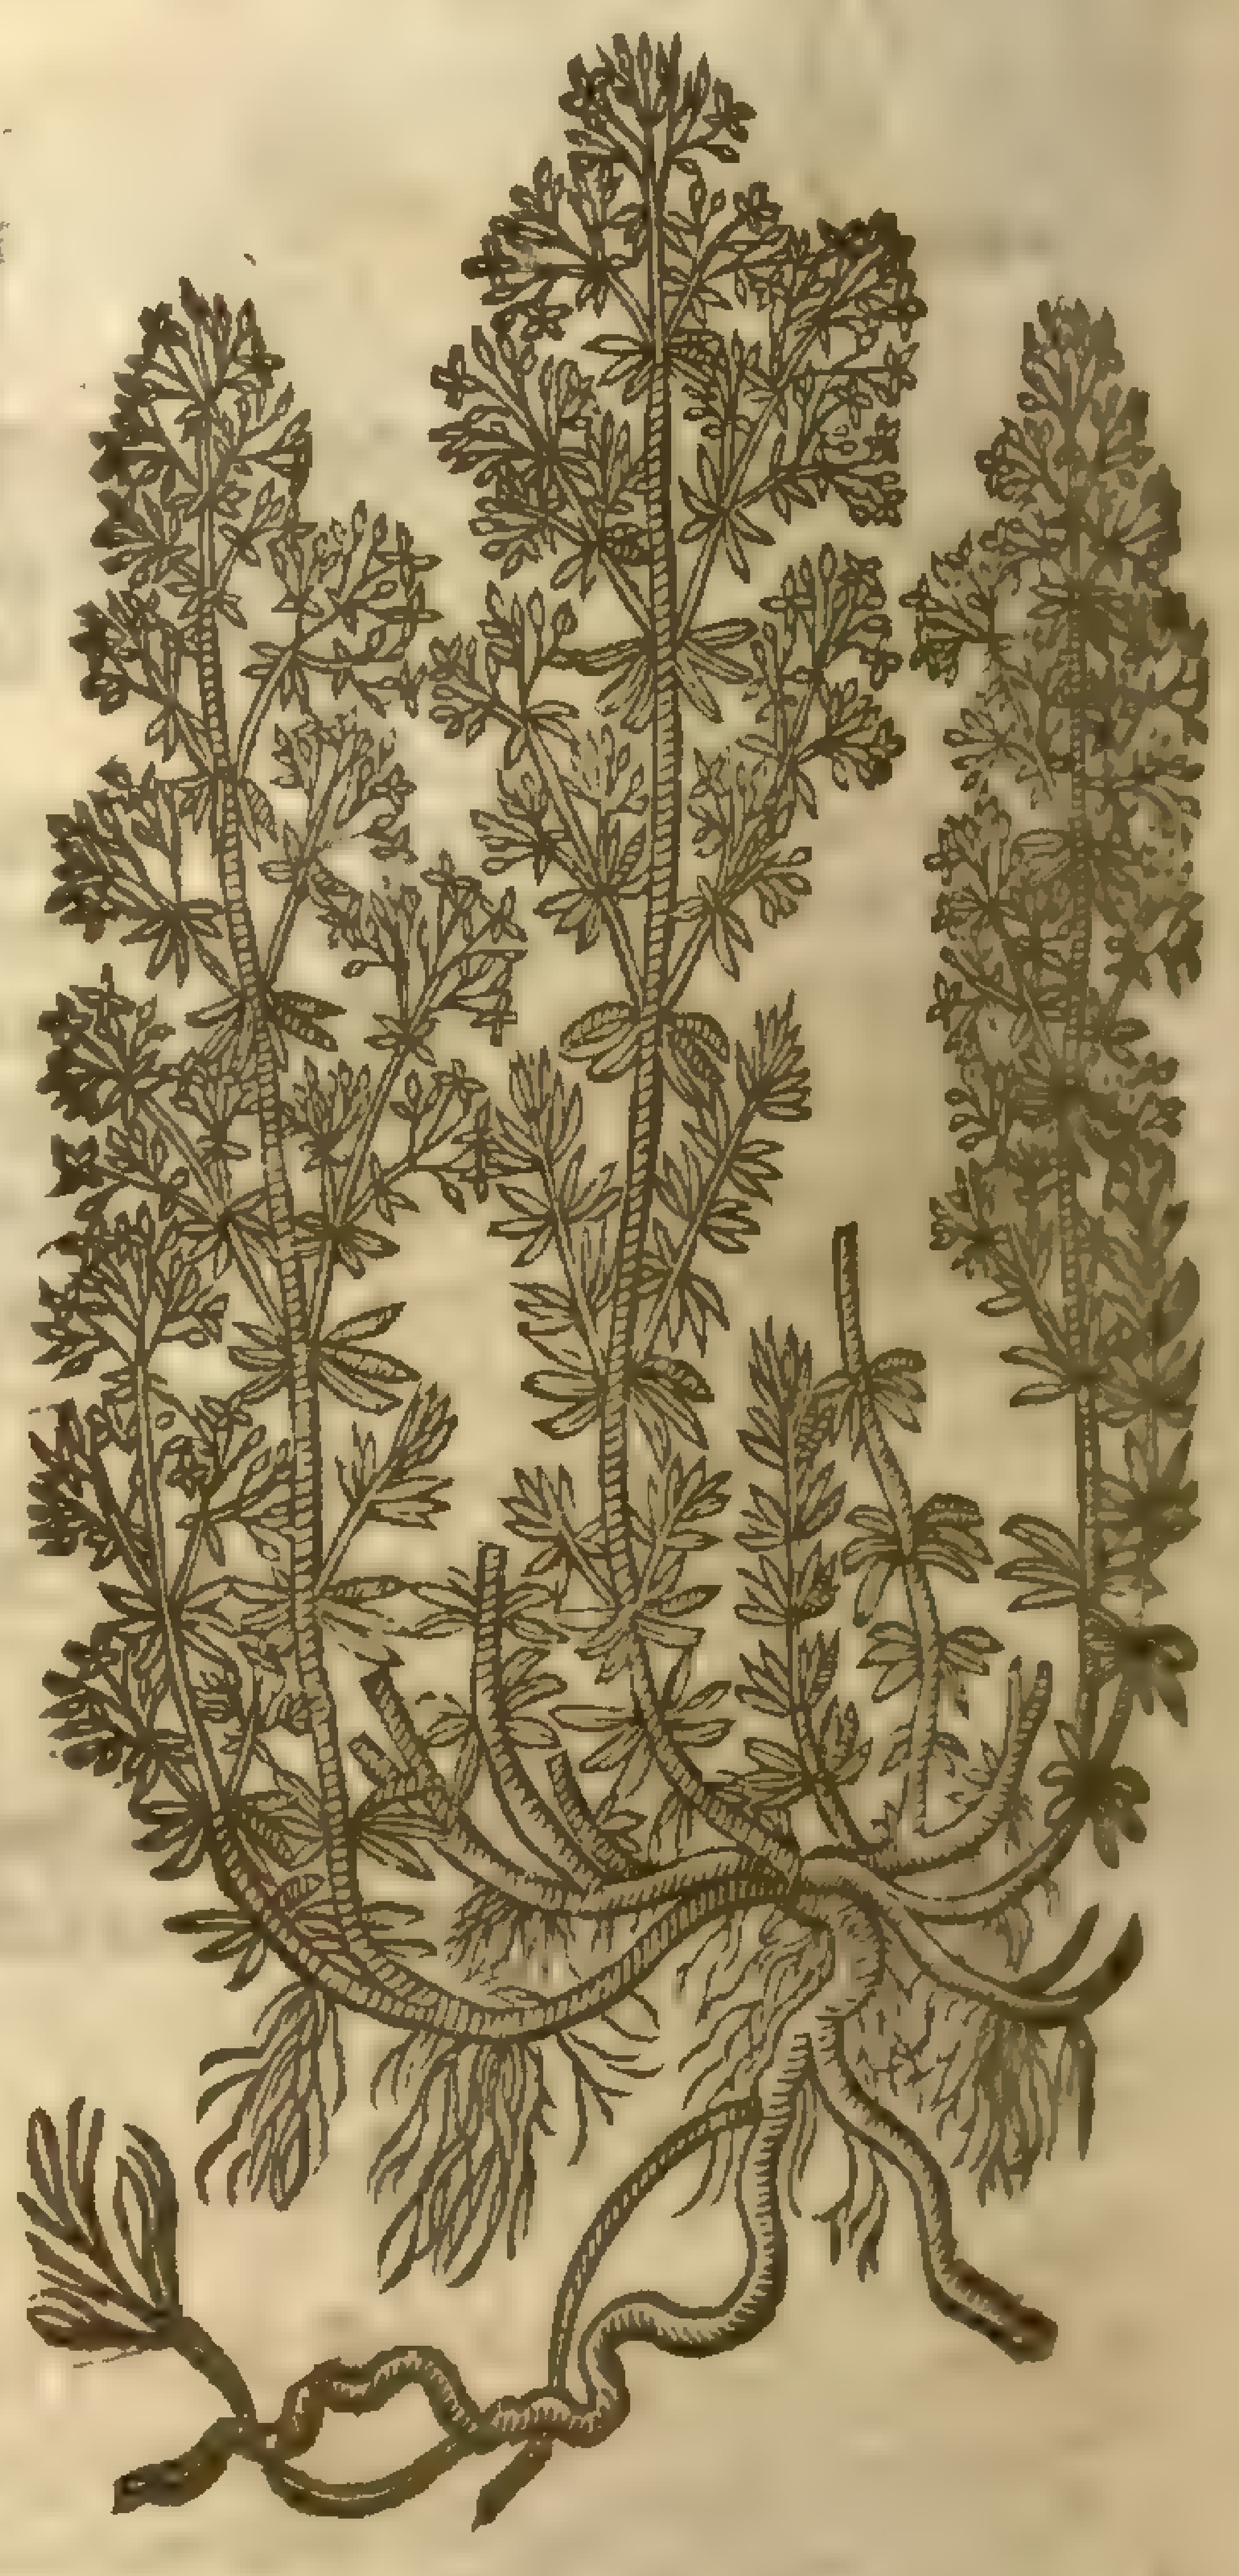
¶ *The Deſcription.*

1 Ladies Bedſtraw hath ſmall round euen ſtalkes, weake and tender, creeping hither and thither vpon the ground: whereupon do grow very fine leaues, cut into ſmall jags, finer than thoſe of Dill, ſet at certaine ſpaces, as thoſe of Woodrooffe: among which come forth floures of a yellow colour, in cluſters or bunches thicke thruſt together, of ſtrong ſweet ſmell but not vnpleaſant: the root is ſmall and threddy.



1 *Gallium luteum.*
Yellow Ladies Bedſtraw.

Galium verum, L. [illegible]



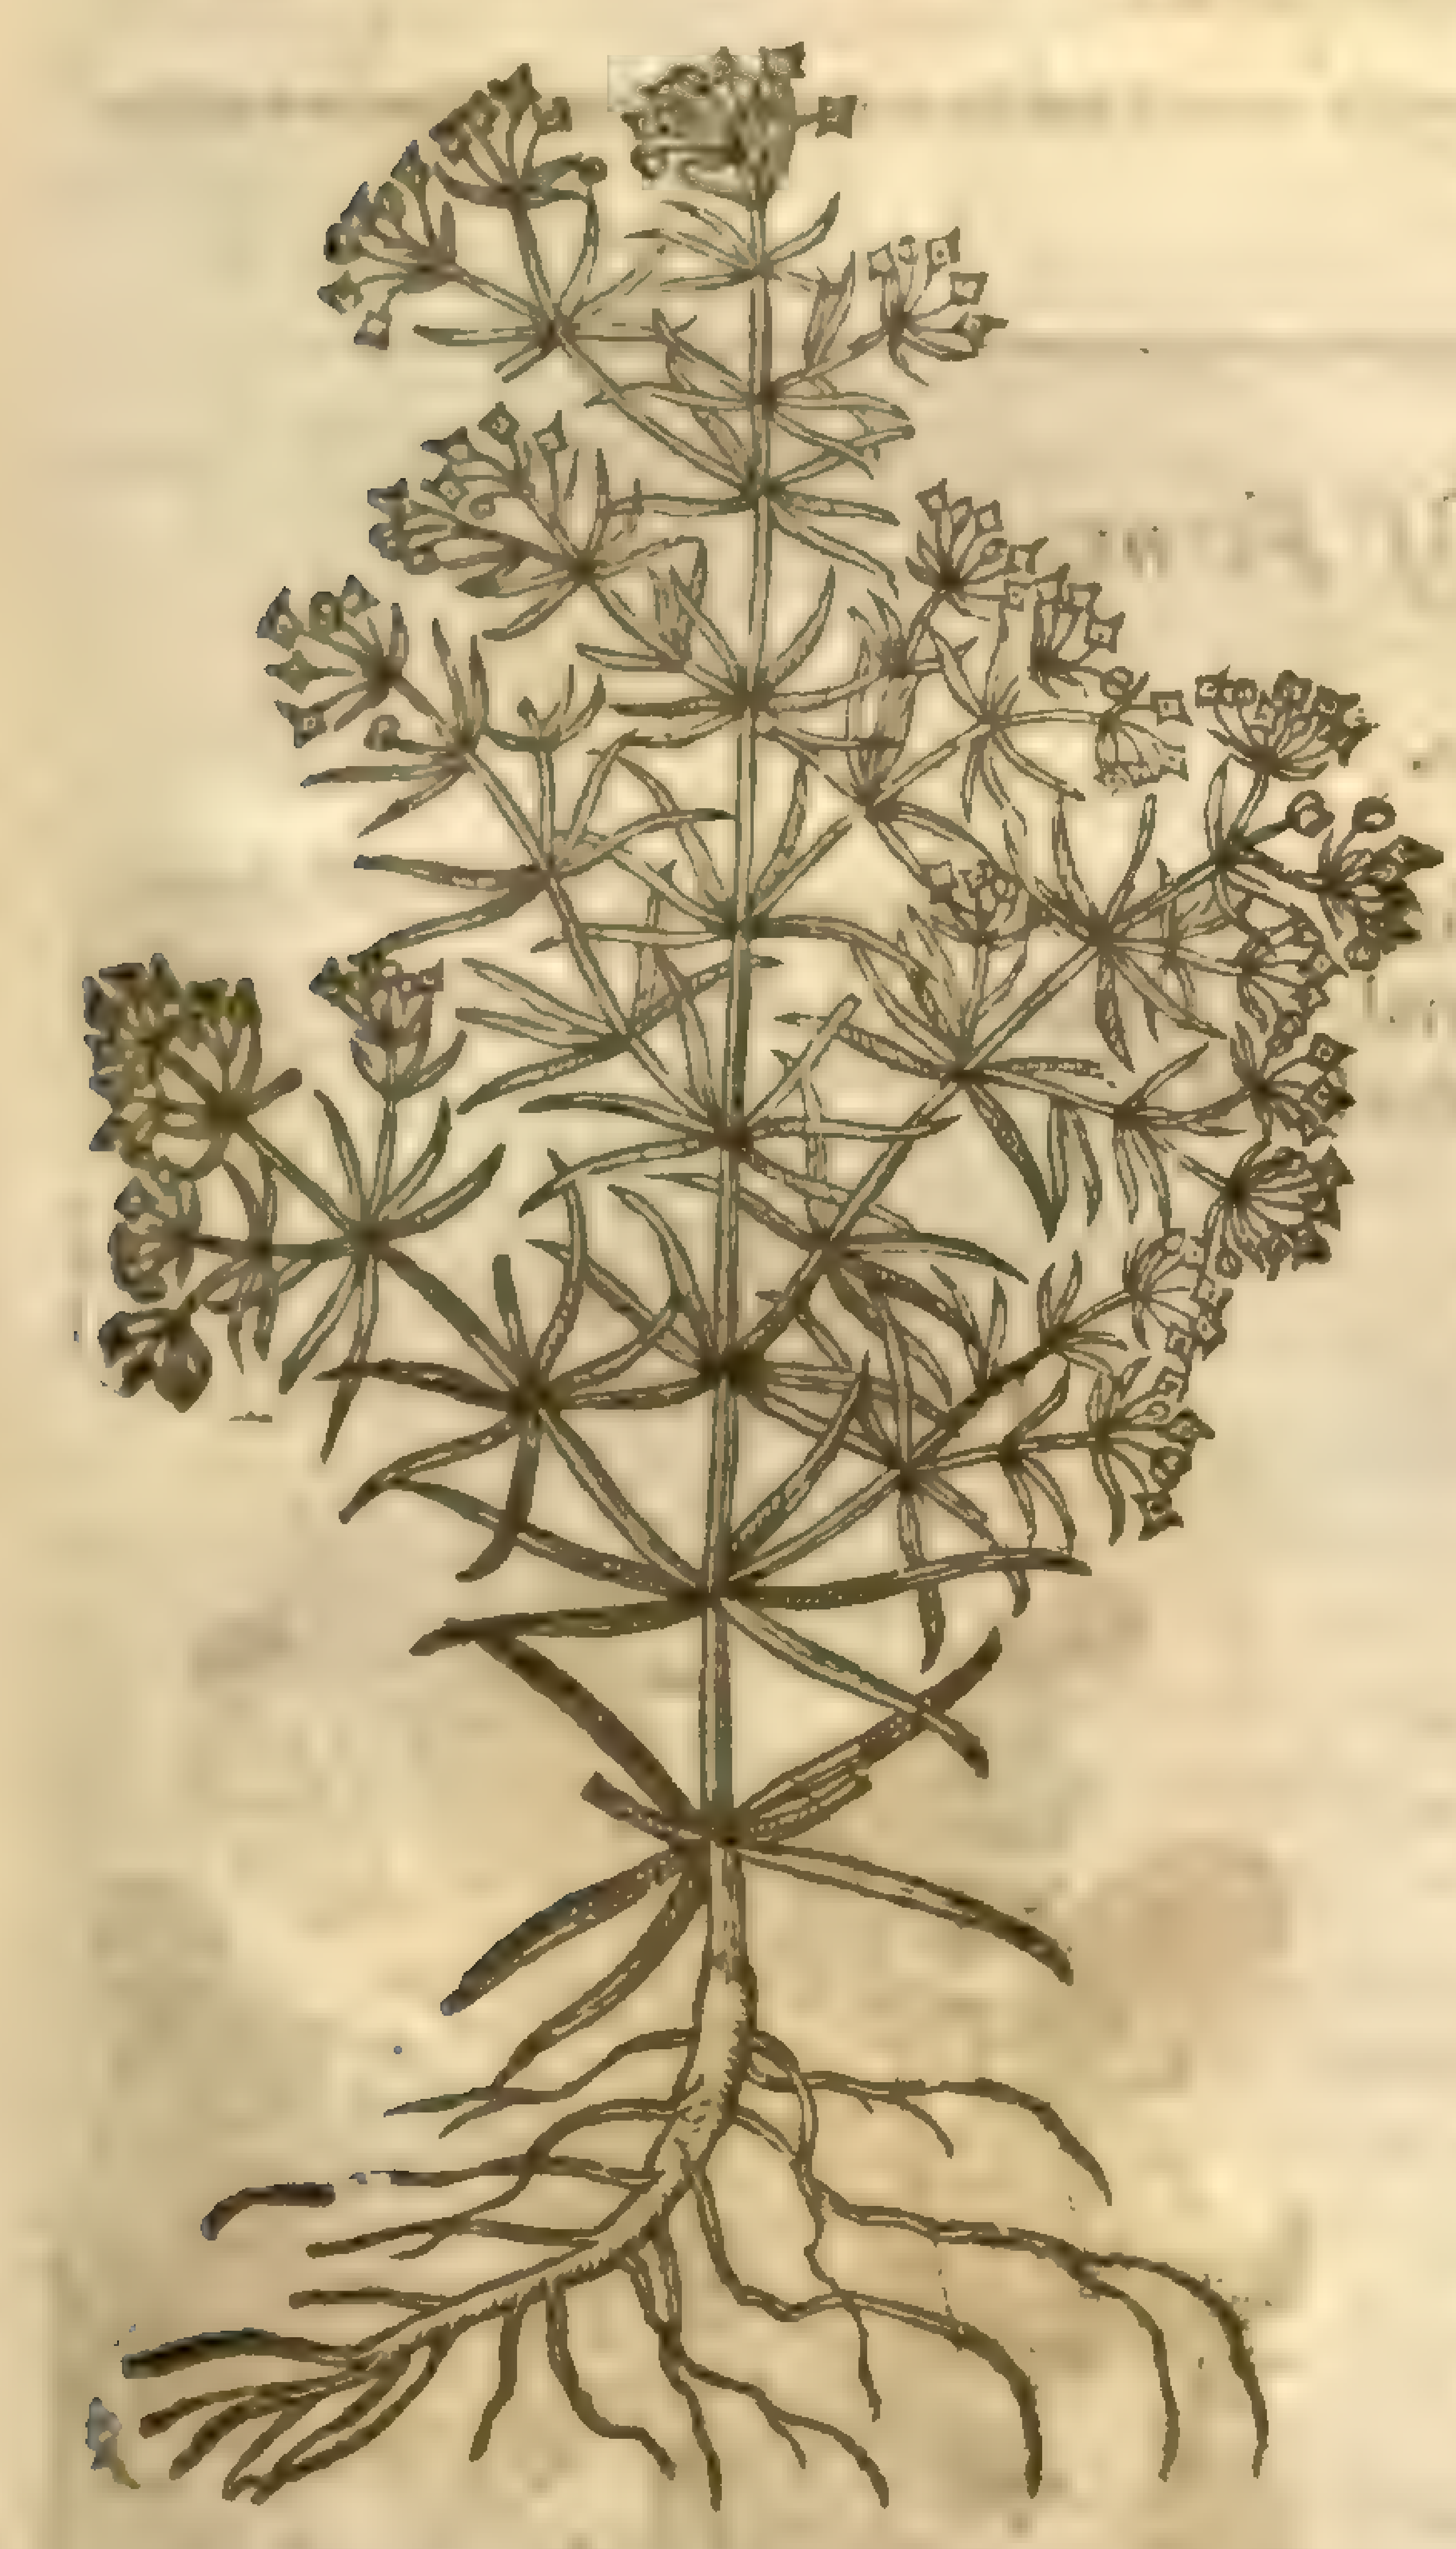
2 *Gallium album.*
Ladies Bedſtraw with white floures.

2 Galium [illegible]

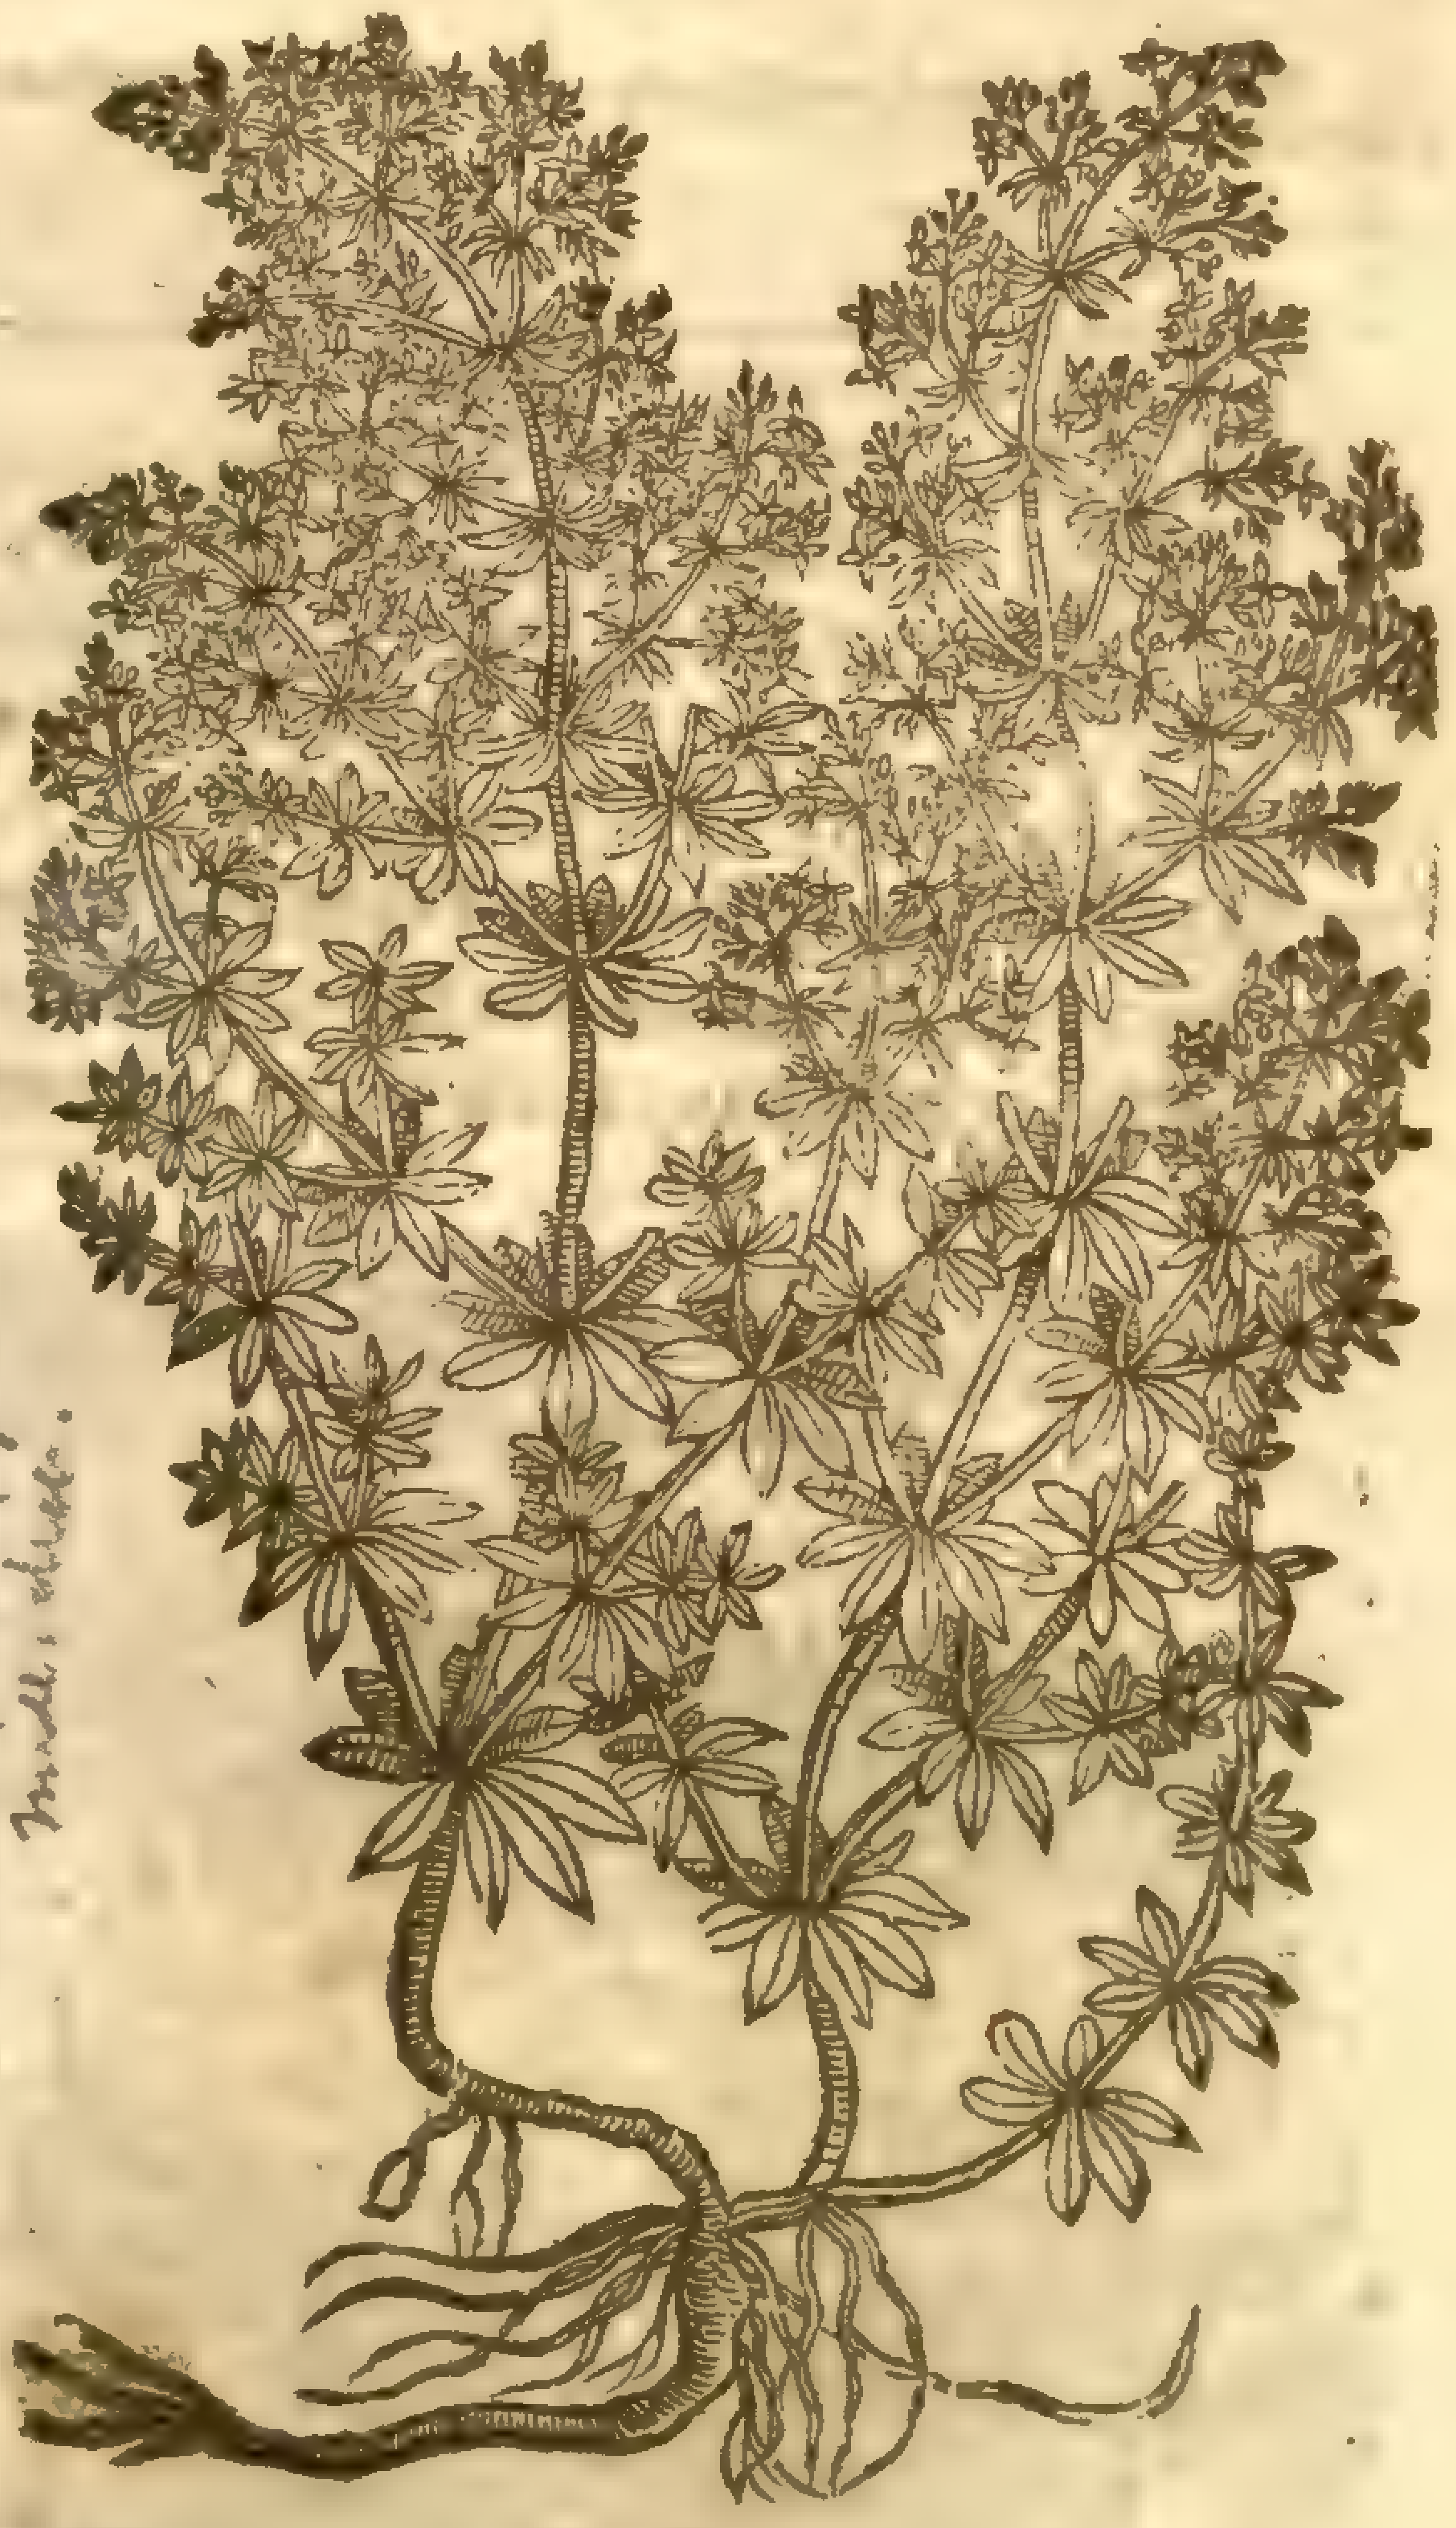
2 Ladies Bedſtraw with white floures is like vnto Cleauers or Gooſe-graſſe, in leaues, ſtalkes, and manner of growing, yet nothing at all rough, but ſmooth and ſoft: the floures be white, the ſeed round: the roots ſlender, creeping within the ground: the whole plant rampeth vpon buſhes, ſhrubs, and all other ſuch things as ſtand neere vnto it: otherwiſe it cannot ſtand, but muſt reele and fall to the ground.

3 This ſmall *Gallium*, or Ladies little red Bedſtraw, hath beene taken for a kind of wilde Madder; neuertheleſſe it is a kinde of Ladies Bedſtraw, or Cheeſe-renning, as appeareth both by his vertues in turning milke to cheeſe, as alſo by his forme, being in each reſpect like vnto yellow *Gallium*, and differs in the colour of the floures, which are of a dark red colour, with a yellow pointal in the middle, conſiſting of foure ſmall leaues: the ſeed hereof was ſent me from a Citiſen of Strauſburg in Germany, and it hath not beene ſeene in theſe parts before this time.

4 There is likewiſe another ſort of *Galliam* for diſtinctions ſake called *Mollugo*, which hath ſtalks that need not to be propped vp, but of it ſelfe ſtandeth vpright, and is like vnto the common white *Gallium*, but that it hath a ſmoother leafe. The floures thereof be alſo white, and very ſmall. The root is blackiſh.



† 3 *Gallium rubrum.*
Ladies Bedſtrow with red floures.



4 *Gallium, ſiue Mollugo montana.*
Great baſtard Madder.

Galium mollugo, L.
Mill. dict.

¶ *The Place.*

The firſt groweth vpon ſunnie bankes neere the borders of fields, in fruitfull ſoiles almoſt euery where.

The ſecond groweth in mariſh grounds and other moiſt places.

The third groweth vpon mountaines and hilly places, and is not yet found in England.

The fourth and laſt groweth in hedges among buſhes in moſt places.

¶ *The Time.*

They floure moſt of the Summer moneths.

¶ *The Names.*

The firſt is called in Greeke, γάλιον: it hath that name of milke, called in Greeke, γάλα, into which it is put as cheeſe-renning: in Latine likewiſe *Gallium*: in high Dutch, **Magerkraut, Walſtroo**: in low Dutch, **Walſtroo**: in French, *Petit Muguet*: in Italian, *Galio*: in Spaniſh, *Coaia leche yerua*: in Engliſh, our Ladies Bedſtrow, Cheeſe-renning, Maids haire, and pety Mugwet.

The others are *Species Lappaginis*, or kindes of ſmall Burres, ſo taken of the Antients: The laſt, of the ſoftneſſe and ſmoothneſſe of the leaues, is commonly called *Mollugo*: diuers take it for a kind of wilde Madder, naming it *Rubia ſylueſtris*, or wilde Madder.

¶ *The Temperature.*

Theſe herbes, eſpecially that with yellow floures, is dry and ſomething binding, as *Galen* ſaith.

¶ The

¶ *The Vertues.*

A The floures of yellow Maids haire, as *Dioſcorides* writeth, is vſed in ointments againſt burnings, and it ſtancheth bloud: it is put into the Cerote or Cere-cloath of Roſes: it is ſet a ſunning in a glaſſe, with Oyle Oliue, vntill it be white: it is good to annoint the wearied Traueller: the root thereof drunke in wine ſtirreth vp bodily luſt: and the floures ſmelled vnto worke the ſame effect.

B The herbe thereof is vſed for Rennet to make cheeſe, as *Matthiolus* reporteth, ſaying, That the people of Tuſcanie or Hetruria doe vſe to turne their milke, that the Cheeſe which they make of Sheeps and Goats milke might be the ſweeter and more pleaſant in taſte, and alſo more wholſome, eſpecially to breake the ſtone, as it is reported.

C The people in Cheſhire, eſpecially about Namptwich, where the beſt Cheeſe is made, doe vſe it in their Rennet, eſteeming greatly of that Cheeſe aboue other made without it.

D We finde nothing extant in the antient writers, of the vertues and faculties of the white kinde: but are as herbes neuer had in vſe either for Phyſicke or Surgerie.

† The figure that was formerly in the third place was of the *Gallium album minus* of *Tabern.* which commonly hath but two leaues at a ioynt, yet ſometimes it is found with three.

CHAP. 465. *Of Ferne.*

¶ *The Kindes.*

THere be diuers ſorts of Ferne, differing as well in forme as place of growing; whereof there be two ſorts according to the old writers, the male and the female; and theſe be properly called Ferne: the others haue their proper names, as ſhall be declared.

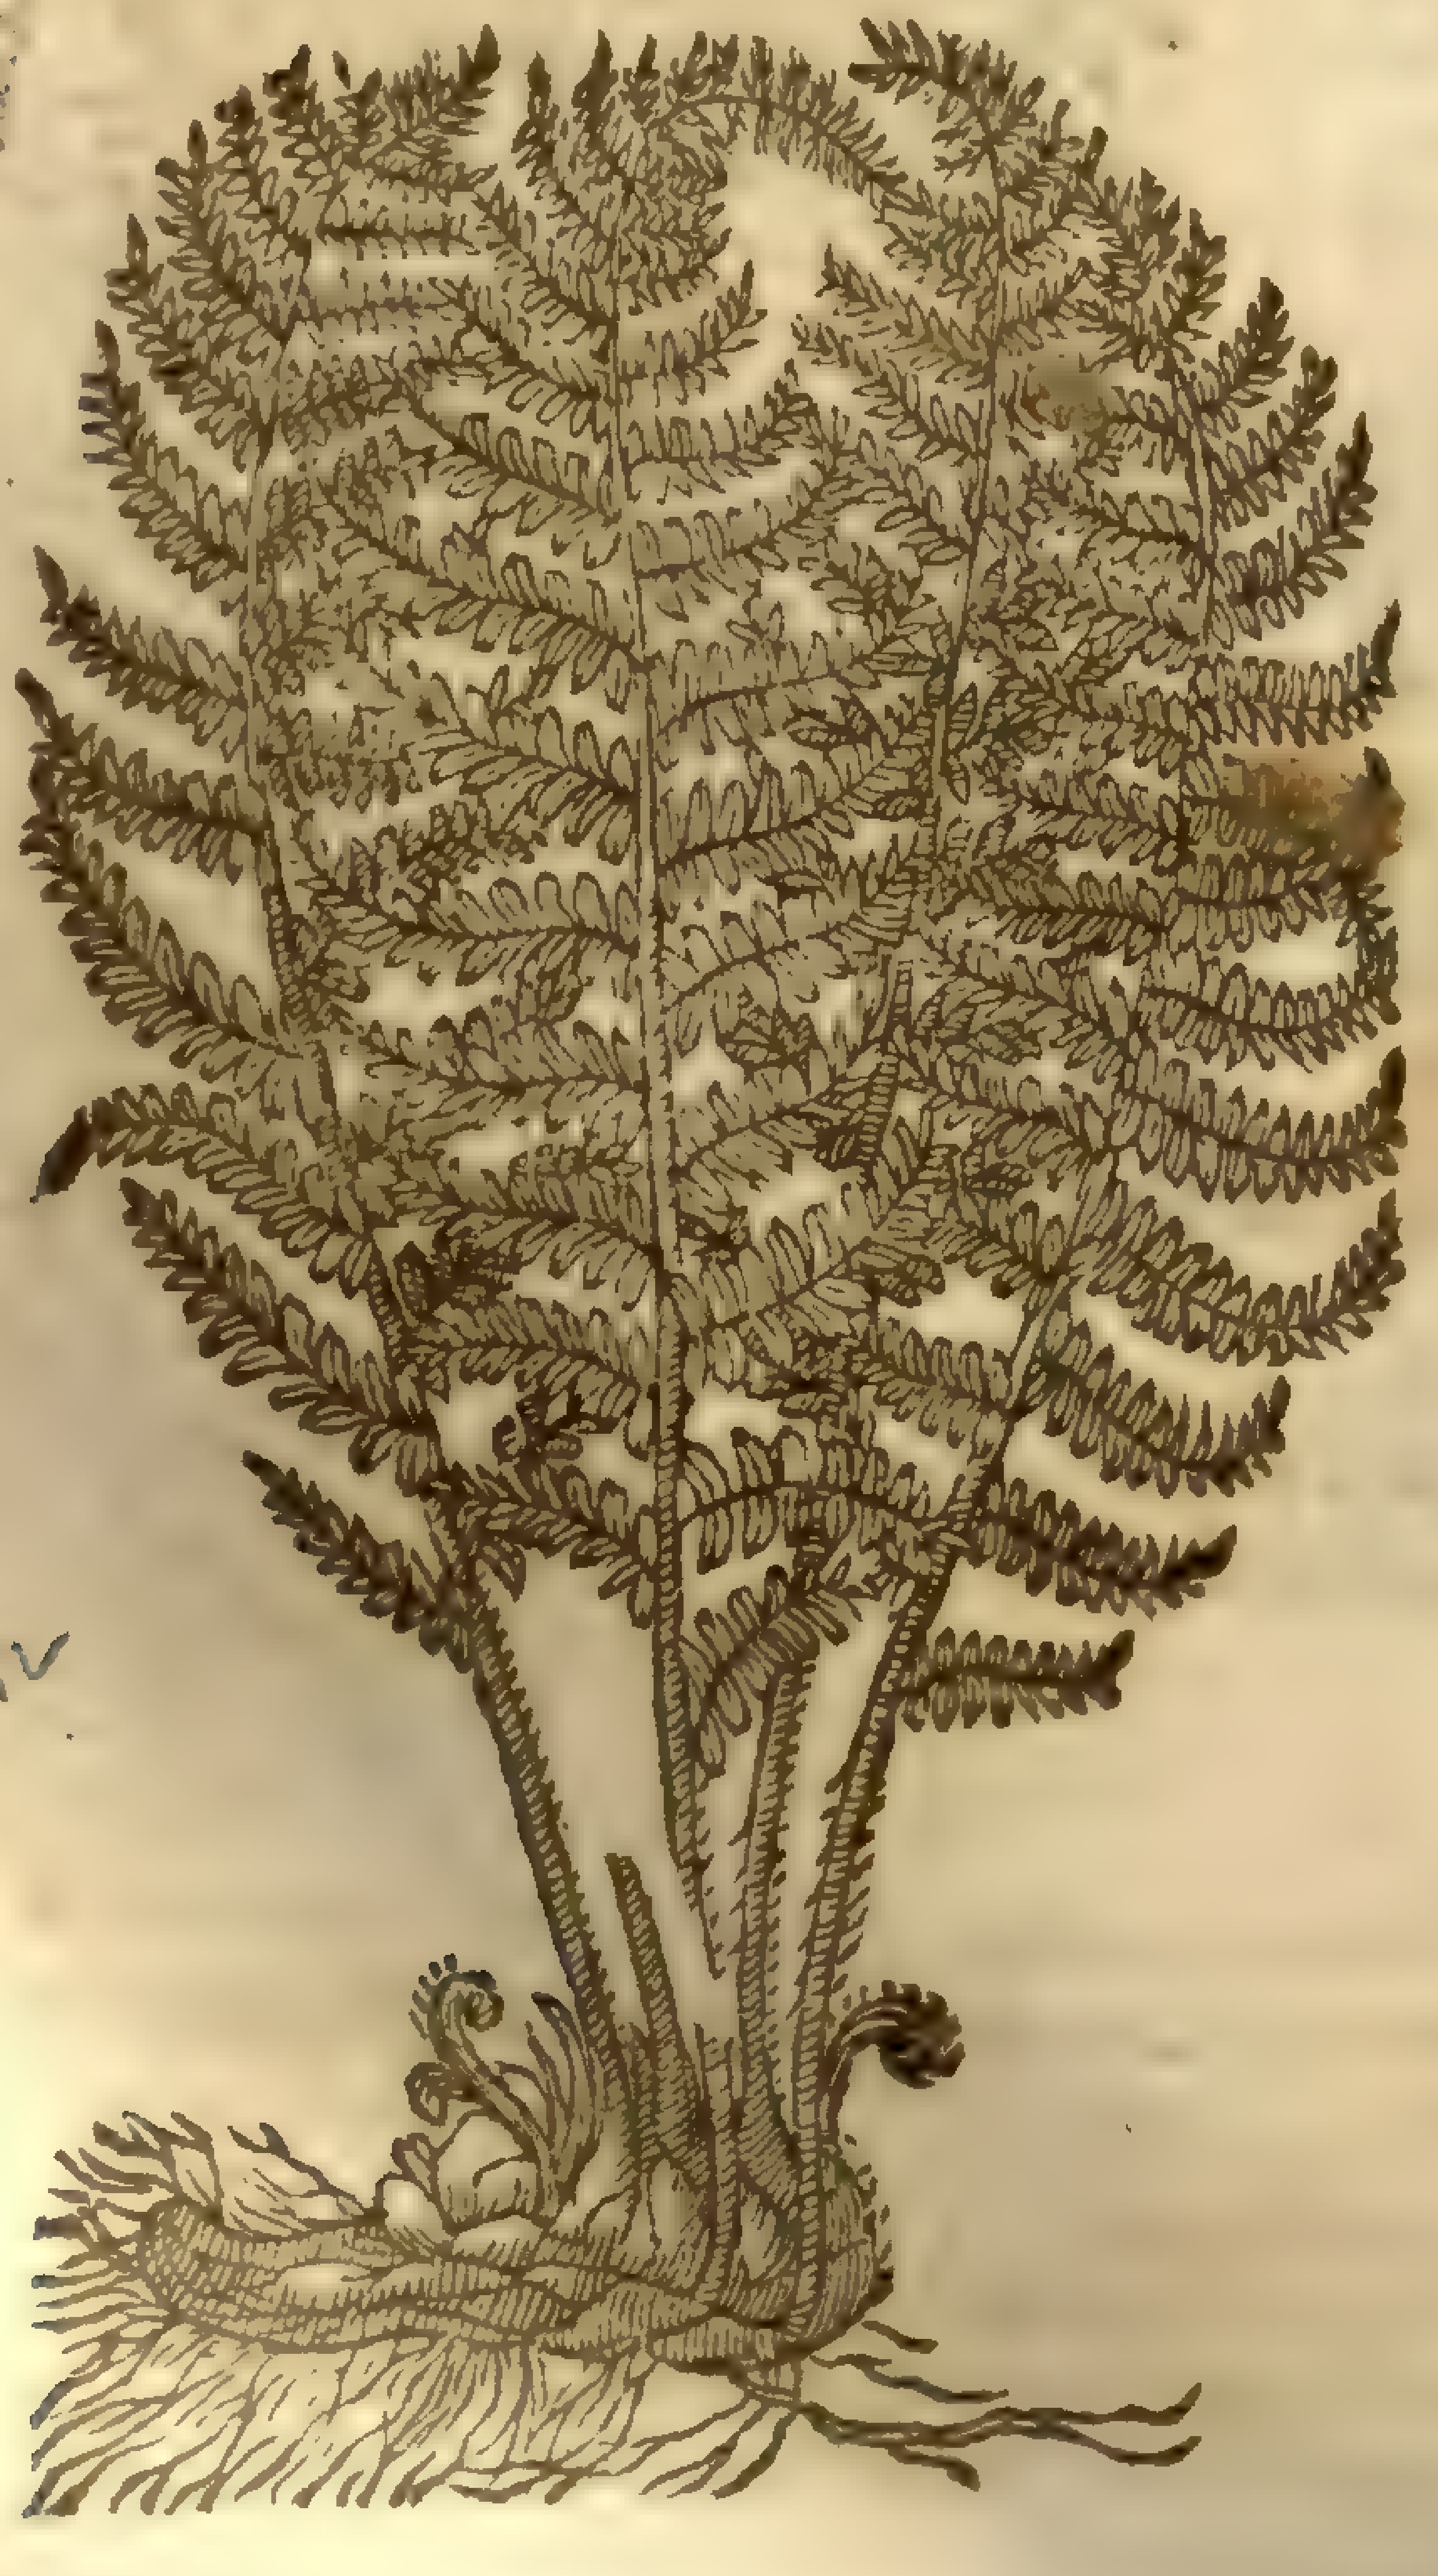
Pteris aquilina [illegible]

Polypodium filix mas [illegible]

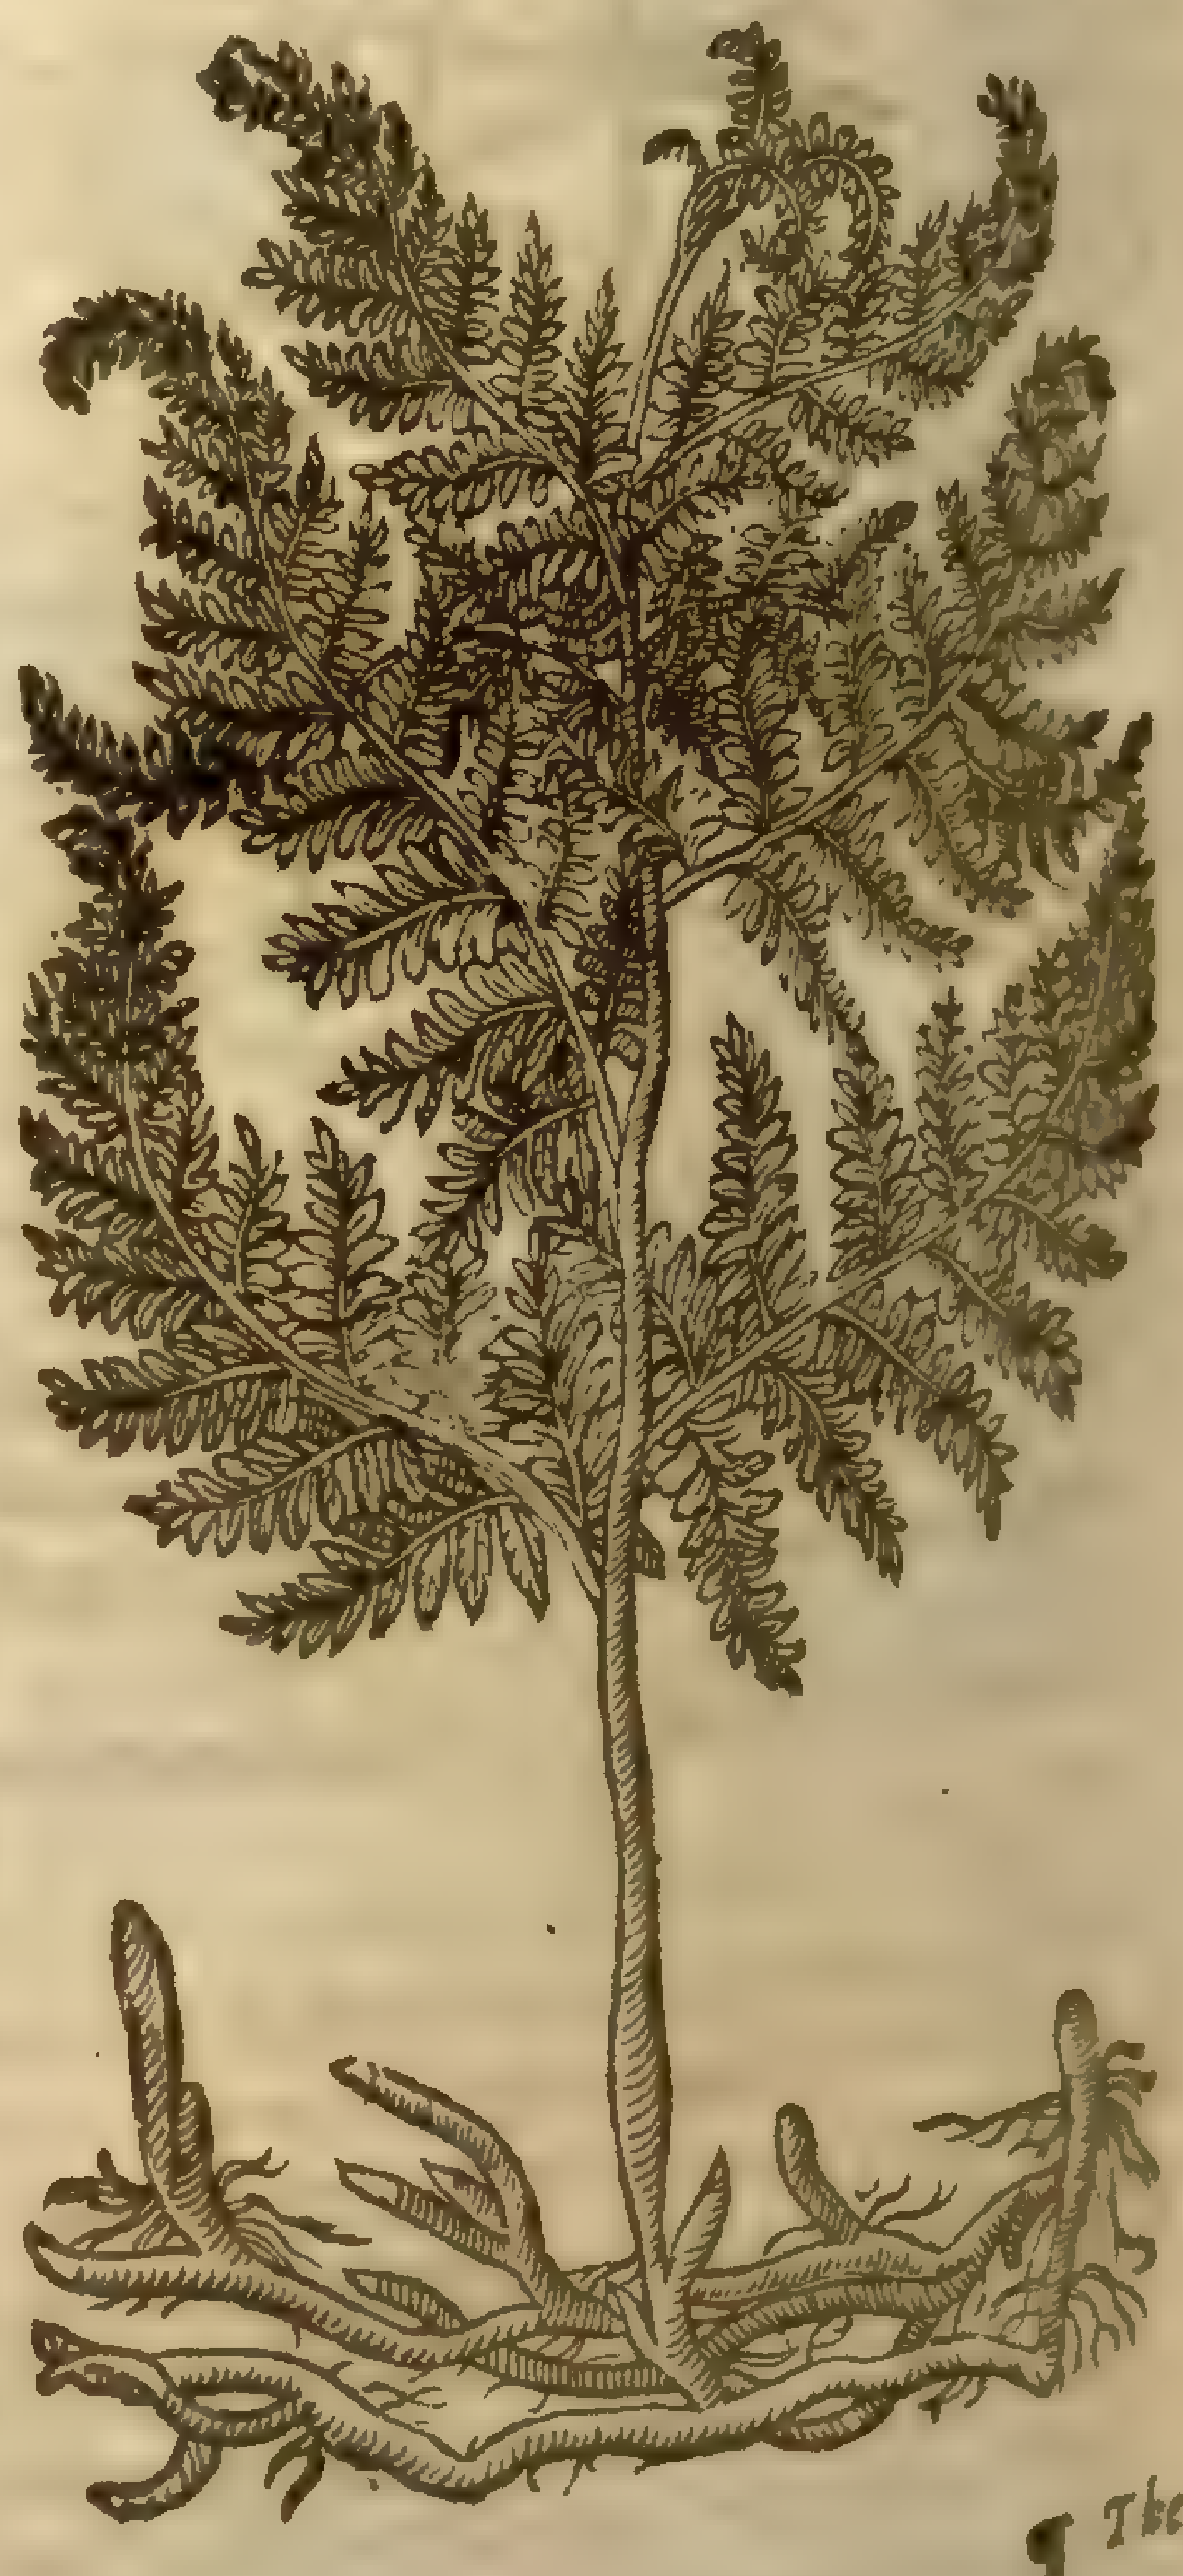
Eng. fl. 4. 268

Lob. ic. 812

1 *Filix mas.*
Male Ferne.



2 *Filix fœmina.*
Female Ferne or Brakes.



¶ The

¶ *The Deſcription.*

1 THe female Ferne bringeth forth preſently from the root broad leaues and rough, ſomewhat hard, eaſie to be broken, of a light greene colour, and ſtrong ſmell, more than a cubit long, ſpred abroad like wings, compounded as it were of a great number ſtanding vpon a middle rib, euery one whereof is like a feather, nicked in the edges and on the backeſide are ſprinkled as it were with a very fine earthy coloured duſt or ſpots, which many raſhly haue taken for ſeed: the root conſiſteth of a number of tufts or threds, and is thicke and blacke, and is without ſtalke and ſeed, and altogether barren.

‡ *Filicis (vulgo) maris varietas & differentia.*
Differences of the male Ferne.

I haue obſerued foure ſorts of Ferne, by moſt writers eſteemed to be the male Ferne of *Dioſcorides*: by *Anguillara*, *Geſner*, *Cæſalpinus*, and *Cluſius*, accounted to bee the female, and ſo indeed doe I thinke them to be, though I call them the male with the multitude. If you looke on theſe Fernes according to their ſeuerall growths and ages, you may make many more ſorts of them than I haue done; which I am afraid hath beene the occaſion of deſcribing more ſorts than indeed there are in nature. Theſe deſcriptions I made by them when they were in their perfect growths.

1 *Filix mas ramoſa pinnulis dentatis.* Polypodium cristatum, [illegible]

The roots are nothing but an abundance of ſmall blacke hairy ſtrings, growing from the lower parts of the maine ſtalkes (for ſtalkes I will call them) where thoſe ſtalkes are joyned together. At the beginning of the Spring you may perceiue the leaues to grow forth of their folding cluſters, couered with browniſh ſcales at the ſuperficies of the earth, very cloſely joyned together: a young plant hath but a few leaues; an old one ten, twelue, or more: each ſtalke at his lower end neere the joyning to his fellowes, at his firſt appearing, before he is an inch long hauing ſome of thoſe blacke fibrous roots for his ſuſtenance. The leaues being at their full growth hath each of them a threefold diuiſion, as hath the Ferne which is commonly called the female: the maine ſtalke, the ſide branches growing from him, and the nerues growing on thoſe ſide branches bearing the leaues: the maine ſtalke of that plant I deſcribe was fully foure foot long (but there are vſually from one foot to foure in length) full of thoſe browniſh ſcales, eſpecially toward the root, firme, one ſide flat, the reſt round, naked fully one and twenty inches, to the firſt paire of ſide branches. The ſide branches, the longeſt being the third paire from the root, were nine inches long, and ſhorter and ſhorter towards the top, in number about twenty paire; for the moſt part towards the root they grow by couples, almoſt oppoſite, the neerer the top the further from oppoſition: the nerues bearing the leaues, the longeſt were two inches and a quarter long, and ſo ſhorter and ſhorter toward the tops of the ſide branches; about twenty in number on each ſide of the longeſt ſide branch. The leaues grow for the moſt part by couples on the nerue, eight or nine paire on a nerue; each leafe being gaſhed by the ſides, the gaſhes ending with ſharpe points, of a deepe greene on the vpper ſide, on the vnder ſide paler, and each leafe hauing two rowes of duſty red ſcales, of a browne or blackeſh colour: toward the top of the maine ſtalke thoſe ſide branches change into nerues, bearing onely the leaues. When their leaues are at their full growth, yo[illegible]ay ſee in the middeſt of them at their roots the ſaid ſcaly folding cluſter; and as the old leaues with their blacke threddy roots wholly periſh, they ſpring vp; moſt yeares you may finde many of the old leaues greene all the Winter, eſpecially in warme places. This groweth plentifully in the boggie ſhadowie moores neere Durford Abbey in Suſſex, and alſo on the moiſt ſhadowie rockes by Mapledurham in Hampſhire, neer Peters-field; and I haue found it often on the dead putrified bodies and ſtems of old rotten okes, in the ſaid moores; neere the old plants I haue obſerued very many ſmall young plants growing, which came by the falling of the ſeed from thoſe duſty ſcales: for I beleeue all herbes haue ſeeds in themſelues to produce their kindes, *Gen.* 1. 11. & 12.

The three other haue but a twofold diuiſion, the many ſtalkes and the nerues bearing the leaues. The roots of them all are blacke fibrous threds like the firſt, their maine ſtalkes grow many thicke and cloſe together at the root, as the firſt doth: the difference is in the faſhion of their leaues, and manner of growing, and for diſtinctions ſake I haue thus called them.

2 *Filix mas non ramoſa pinnulis latis denſis minutim dentatis.*

The leaues are of a yellowiſh greene colour on both ſides, ſet very thicke and cloſe together on the nerue, that you cannot ſee betweene them, with maruellous ſmall nickes by their ſides, and on their round tops: each leafe hath alſo two rowes of duſty ſeed ſcales; the figures ſet forth by *Lob.*, *Tabern.* and *Gerard*, vnder the title of *Filix mas*, do well reſemble this Ferne. This growes plentifully in moſt places in ſhadowie woods and copſes.

3 *Filix mas non ramoſa pinnulis anguſtis, raris, profunde dentatis.*

The leaues are of a deepe greene, not cloſely ſet together on the nerue, but you may farre off ſee betwixt them, deeply indented by the ſides, ending with a point not altogether ſharpe; each leafe hath alſo two rowes of duſty ſeed ſcales. I haue not ſeene any figure well reſembling this plant. This groweth alſo in many places in the ſhade.

4 *Filix mas non ramoſa pinnulis latis auriculatis ſpinoſis.*

The leaues are of a deeper greene than either of the two laſt deſcribed, placed on the nerue not very cloſe together, but that you may plainely ſee betweene them; each leafe (eſpecially thoſe next the ſtalk) hauing on that ſide fartheſt off the ſtalke a large eare or outgrowing ending, with a ſharpe pricke like a haire, as doth alſo the top of the leafe: ſome of the ſides of the leaues are alſo nicked, ending with the like pricke or haire. Each leafe hath two rowes of duſty ſeed ſcales. This I take to be *Filix mas aculeata major Bauhini*. Neither haue I ſeene any figure reſembling this plant. It groweth abundantly on the ſhadowie moiſt rockes by Maple-durham neere Peters-field in Hampſhire. *John Goodyer.* Iuly 4. 1633. ‡

2 The female Ferne hath neither floures nor ſeed, but one onely ſtalke, chamfered, ſomething edged, hauing a pith within of diuers colours, the which being cut aſlope, there appeareth a certaine forme of a ſpred-Eagle: about this ſtand very many leaues which are winged, and like to the leaues of the male Ferne, but leſſer: the root is long and blacke, and creepeth in the ground, being now and then an inch thicke, or ſomewhat thinner. This is alſo of a ſtrong ſmell, as is the male.

¶ *The Place.*

Both the Fernes are delighted to grow in barren dry and deſart places: and as *Horace* teſtifieth;

Neglectis vrenda Filix innaſcitur agris.

It comes not vp in manured and dunged places, for if it be dunged (as *Theophraſtus, lib.* 8. *cap.* 8. reporteth) it withereth away.

The male joyeth in open and champion places, on mountaines and ſtony grounds, as *Dioſcorides* ſaith. ‡ It growes commonly in ſhadowie places vnder hedges. ‡

The female is often found about the borders of fields vnder thornes, and in ſhodowie woods.

¶ *The Time.*

Both theſe Fernes wither away in Winter: in the Spring there grow forth new leaues, which continue greene all Summer long.

¶ *The Names.*

The former is called in Greeke, πτερὶς: *Nicander* in his diſcourſe of Treacle nameth it βλῆχρον: in Latine, *Filix mas*: in Italian, *Felce*: in Spaniſh, *Helecho*, *Falguero*, and *Feyto*: in high Dutch, **Waldt Farne**: in French, *Fougere*, or *Feuchiere maſle*: in low Dutch, **Waren Manneken**: in Engliſh, male Ferne.

The ſecond kinde is called in Greeke, θηλυπτερὶς: that is, *Filix fœmina*, or female Ferne: in Latine, as *Dioſcorides* noteth among the baſtard names, *Lingua ceruina*: in high Dutch, **Waldt Farn weiblin**, and **Grosz Farnkraut**: in low Dutch, **Waren Wijfken**: in French, *Fougere femelle*: in Engliſh Brake, common Ferne, and female Ferne.

¶ *The Temperature.*

Both the Fernes are hot, bitter and dry, and ſomething binding.

¶ *The Vertues.*

A The root of the male Ferne being taken to the weight of halfe an ounce, driueth forth long flat wormes out of the belly, as *Dioſcorides* writeth, being drunke in Mede or honied water; and more effectually, if it be giuen with two ſcruples or two third parts of a dram of Scamonie, or of blacke Hellebor: they that will vſe it, ſaith he, muſt firſt eate Garlicke. After the ſame manner, as *Galen* addeth, it killeth the childe in the mothers wombe. The root hereof is reported to be good for them that haue ill ſpleenes: and being ſtamped with ſwines greaſe and applied, it is a remedy againſt the pricking of the reed: for proofe hereof, *Dioſcorides* ſaith the Ferne dieth if the Reed be planted about it; and contrariwiſe, that the Reed dieth if it bee compaſſed with Ferne: which is vaine to thinke, that it hapneth by any antipathy or naturall hatred, and not by reaſon this Ferne proſpereth not in moiſt places, nor the Reed in dry.

B The female Ferne is of like operation with the former, as *Galen* ſaith. *Dioſcorides* reports, That this bringeth barrenneſſe, eſpecially to women; and that it cauſeth women to be deliuered before their time: hee addeth, that the pouder hereof finely beaten is laid vpon old vlcers, and healeth the galled neckes of oxen and other cattell: it is alſo reported, that the root of Ferne caſt into an hogshead of wine keepeth it from ſouring.

C The root of the male Ferne ſodden in Wine is good againſt the hardneſſe and ſtopping of the milt: and being boyled in water, ſtayeth the laske in young children, if they be ſet ouer the decoction thereof to eaſe their bodies by a cloſe ſtoole.

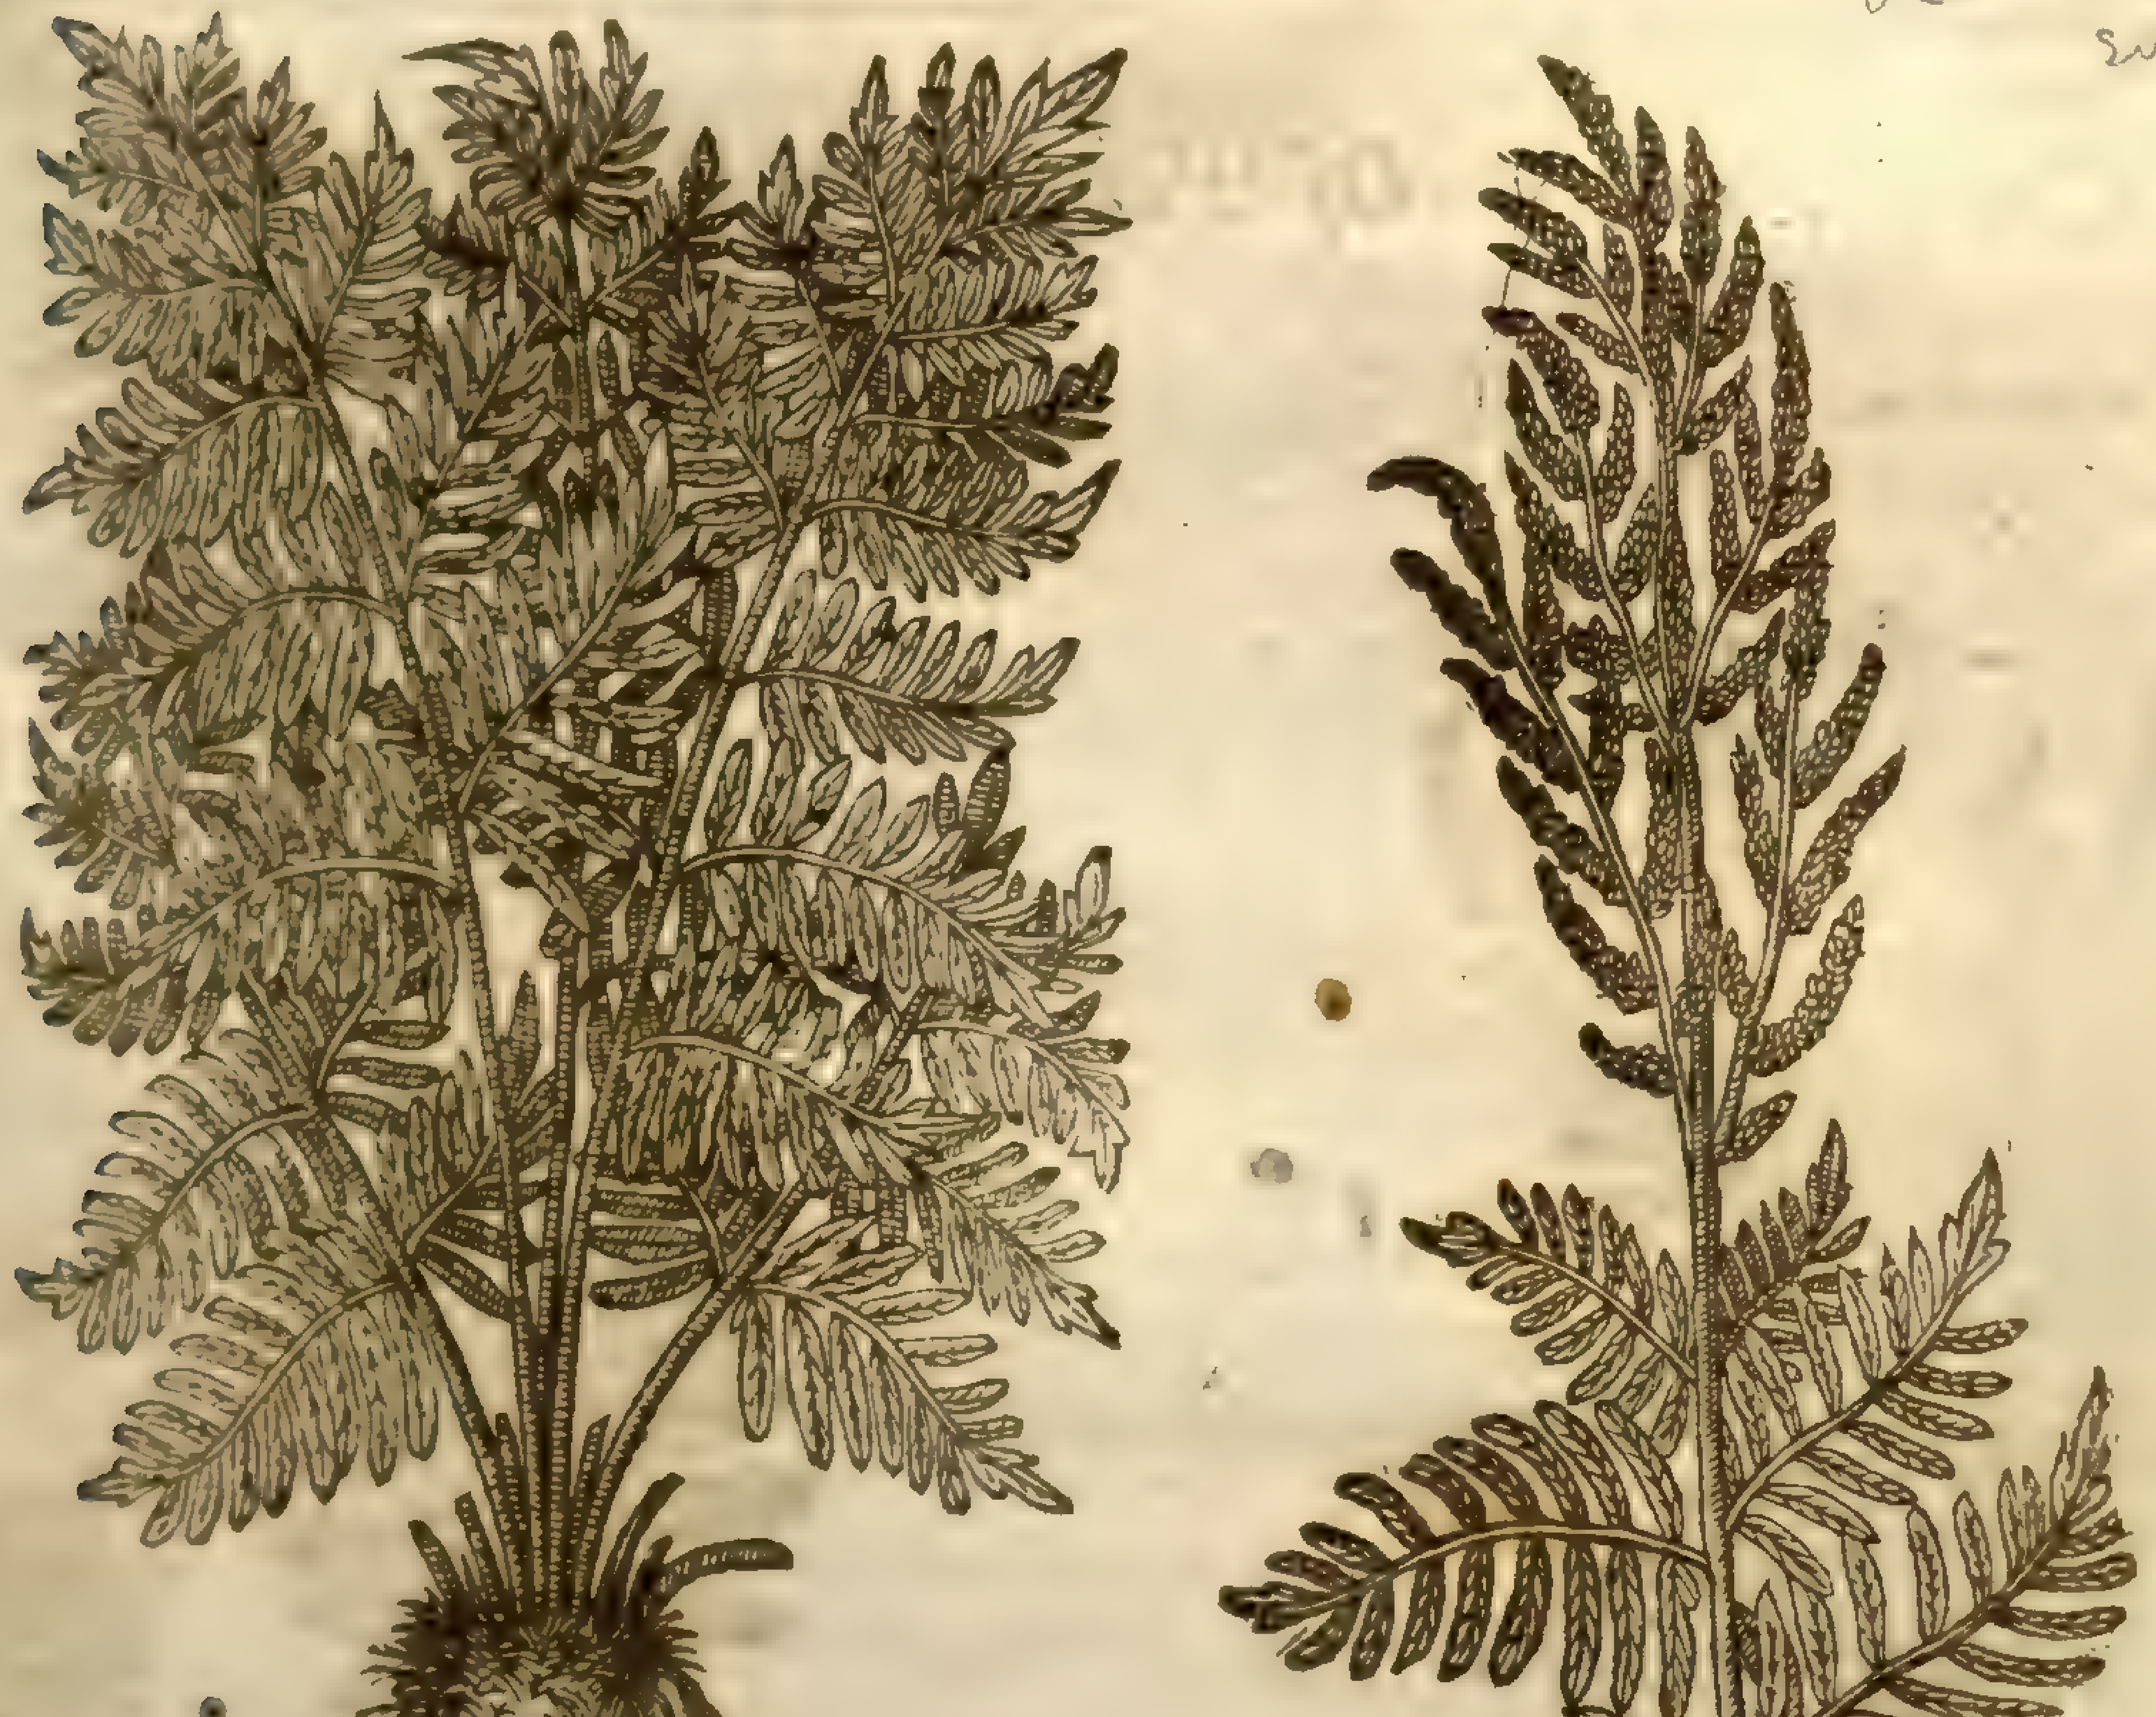
Chap. 466. *Of Water-Ferne, or* Oſmund *the water-man.*

¶ *The Deſcription.*

Water-Ferne hath a great triangle ſtalke two cubits high, beſet vpon each ſide with large leaues ſpred abroad like wings, and dented or cut like Polypody: theſe leaues are like the large leaues of the Aſh-tree; for doubtleſſe when I firſt ſaw them a far off it cauſed me to wonder thereat, thinking that I had ſeene young Aſhes growing vpon a bog; but beholding it a little neerer, I might eaſily diſtinguiſh it from the Aſh, by the browne rough and round graines that grew on the top of the branches, which yet are not the ſeed thereof, but are very like vnto the ſeed. The root is great and thicke, folded and couered ouer with many ſcales and interlacing roots, hauing in the middle of the great and hard wooddy part thereof ſome ſmall whiteneſſe, which hath beene called the heart of *Oſmund* the water-man.

Filix florida, ſiue Oſmunda Regalis.
Water-Ferne, or Oſmund Royall.

Osmunda Regalis [illegible]
[illegible] 463
[illegible]
[illegible]



Dod. 463

¶ *The Place.*

It groweth in the midſt of a bog at the further end of Hampſted heath from London, at the bottome of a hill adjoyning to a ſmall cottage, and in diuers other places, as alſo vpon diuers bogges on a heath or a common neere vnto Bruntwood in Eſſex, eſpecially neere vnto a place there that ſome haue digged, to the end to finde a neſt or mine of gold; but the birds were ouer fledge, and flowne away before their wings could be clipped. ‡ It did grow plentifully in both theſe places, but of late it is all deſtroyed in the former. ‡

¶ The

¶ The Time.

It flouriſheth in Summer, as the former Fernes: the leaues decay in Winter: the root continueth freſh and long laſting; which being brought into the Garden proſpereth as in his natiue ſoile, as my ſelfe haue proued.

¶ The Names.

It is called in Latine, *Oſmunda*: it is more truly named *Filix paluſtris*, or *aquatilis*: ſome terme it by the name of *Filicaſtrum*: moſt of the Alchimiſts call it *Lunaria major*: *Valerius Cordus* nameth it *Filix latifolia*: it is named in high Dutch, **Groſz Farn**: in low Dutch, **Groot Varen**, **wilt Varen**: in Engliſh, Water-Ferne, Oſmund the Water-man: of ſome, Saint Chriſtophers herbe, and Oſmund.

¶ The Temperature.

The root of this alſo is hot and dry, but leſſer than they of the former ones.

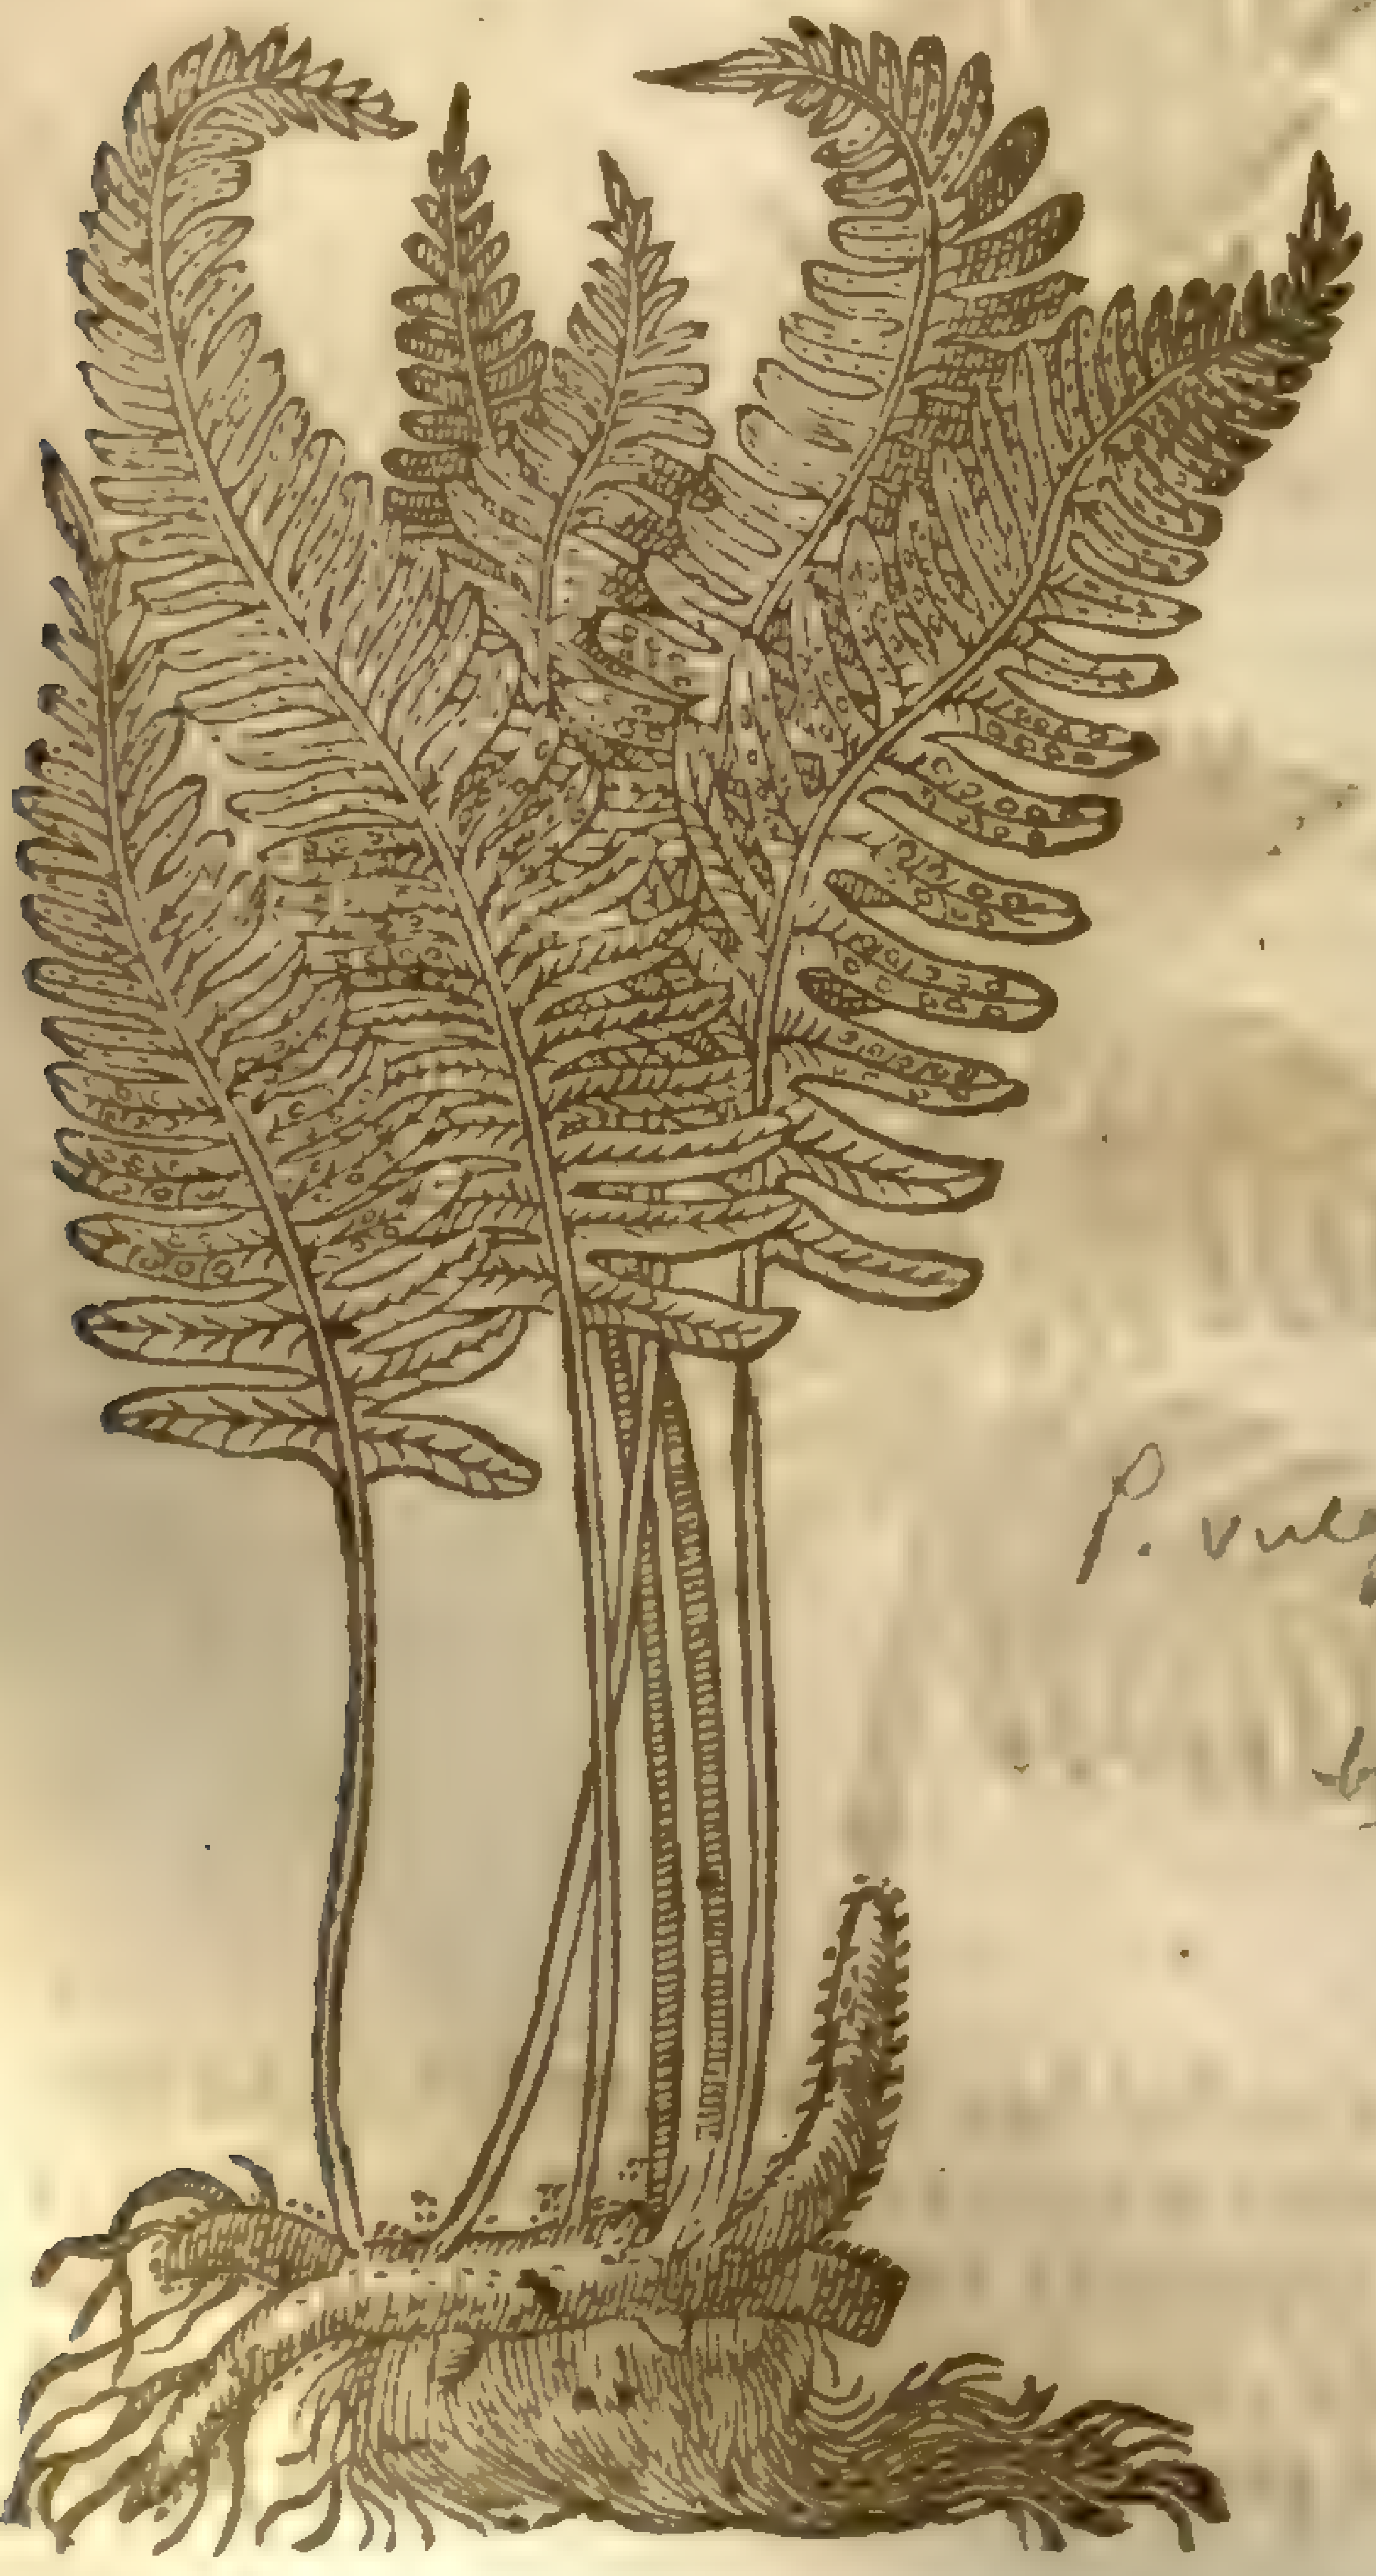
¶ The Vertues.

A The root and eſpecially the heart or middle part thereof, boyled or elſe ſtamped, and taken with ſome kinde of liquor, is thought to be good for thoſe that are wounded, dry-beaten and bruiſed; that haue fallen from ſome high place: and for the ſame cauſe the Empericks do put it in decoctions, which the later Phyſitians doe call wound-drinkes: ſome take it to be ſo effectuall, and of ſo great a vertue, as that it can diſſolue cluttered bloud remaining in any inward part of the body, and that it alſo can expell or driue it out by the wound.

B The tender ſprigs thereof at their firſt comming forth are excellent good vnto the purpoſes aforeſaid, and are good to be put into balmes, oyles, and conſolidatiues, or healing plaiſters, and into vnguents appropriate vnto wounds, punctures, and ſuch like.

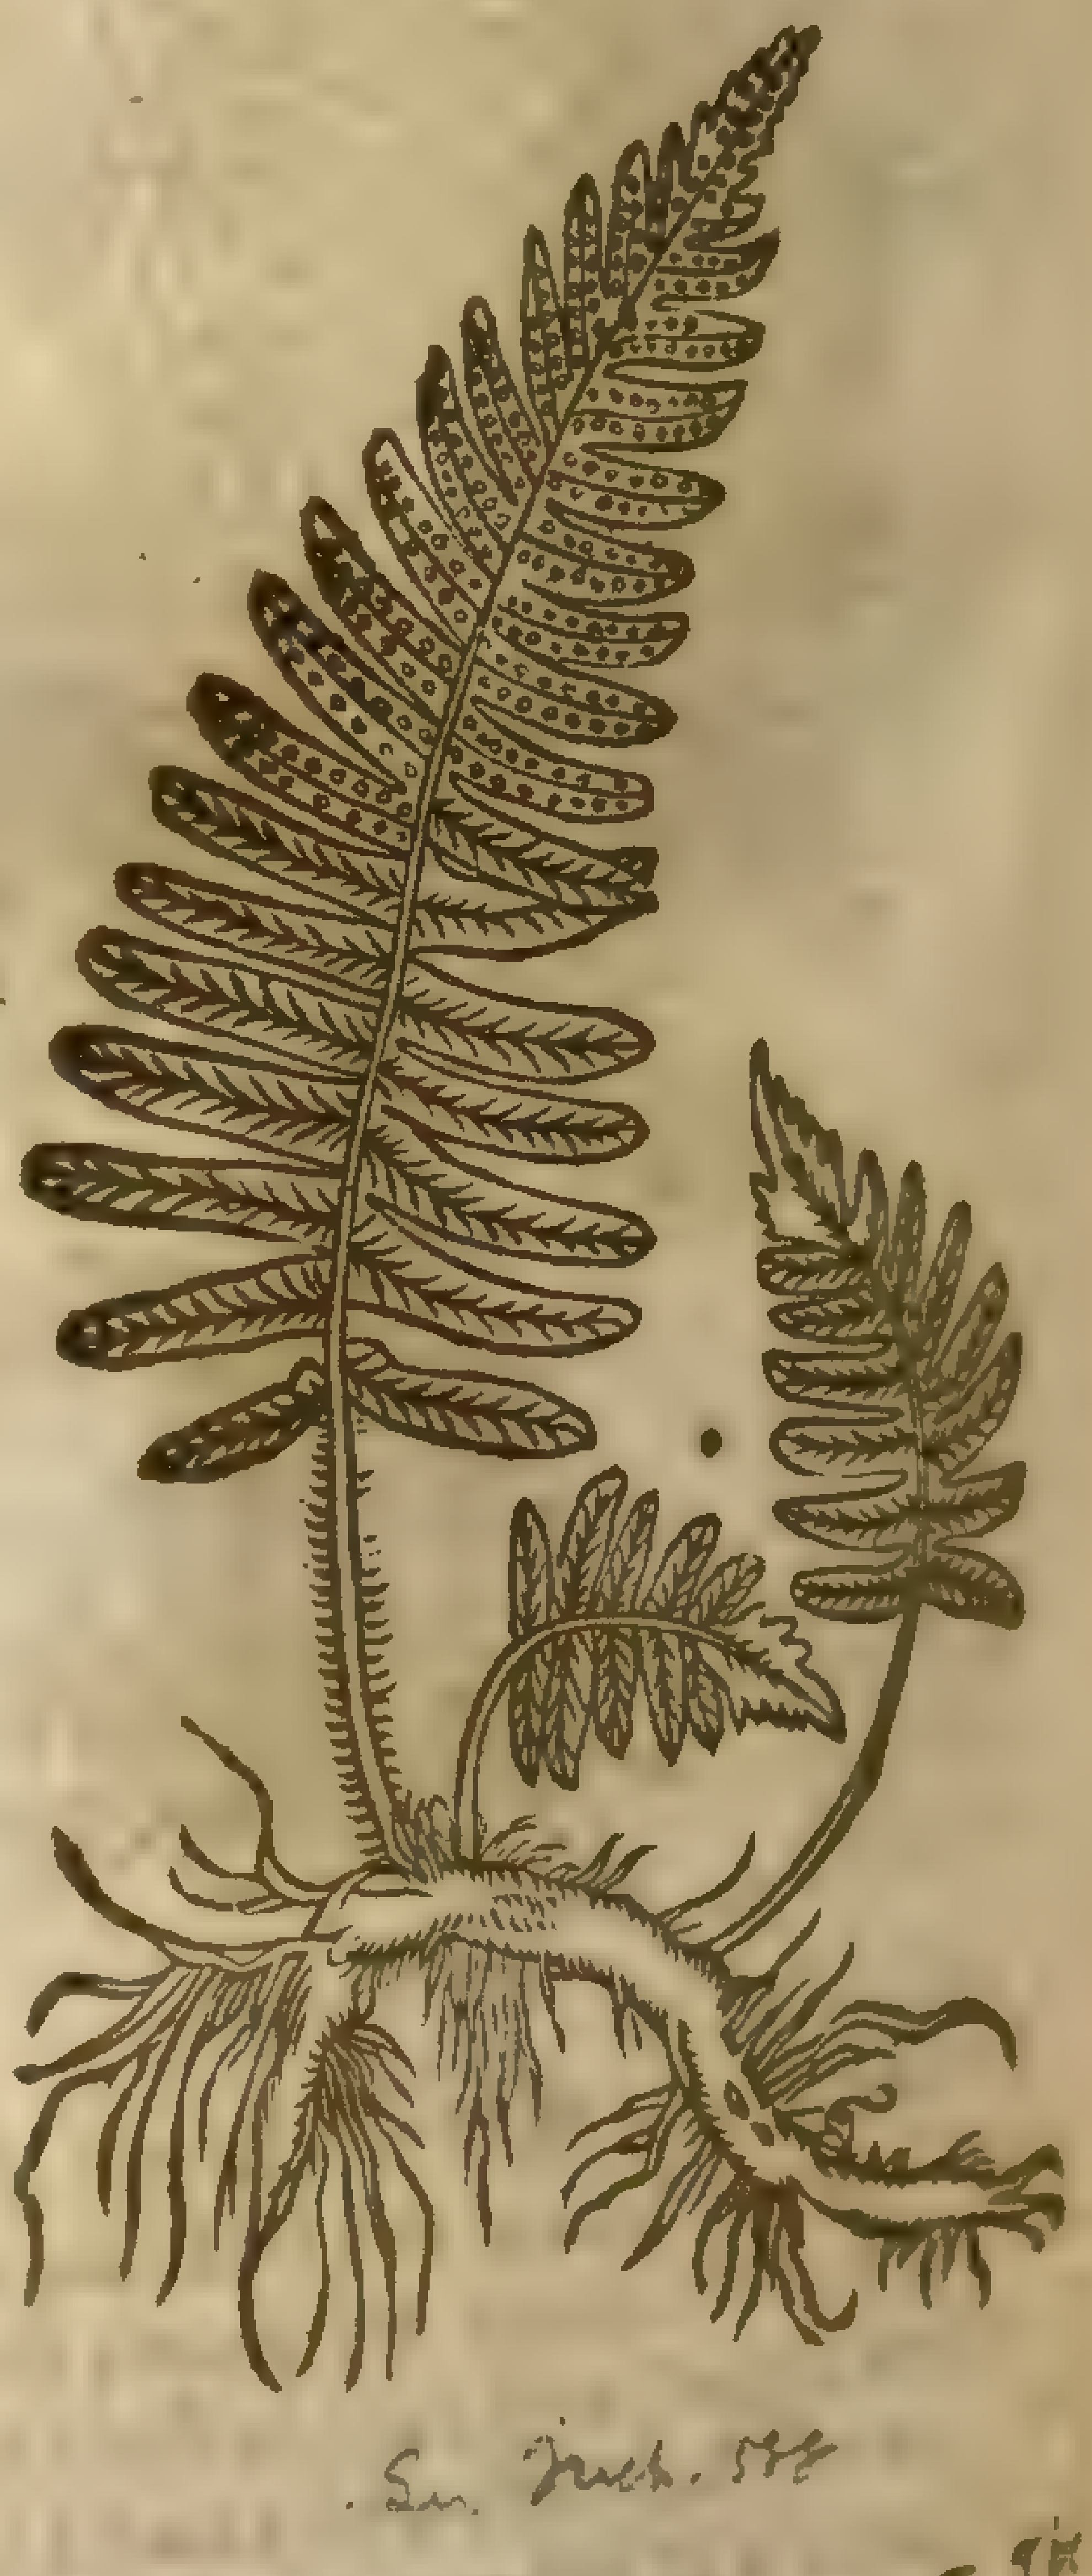
Chap. 467. Of Polypodie or Wall-Ferne.

1 *Polypodium.*
Wall Ferne, or Polypodie of the wall.



P. vulgare, L.
Nuil. dup
bot
Sm. fl. l. 280

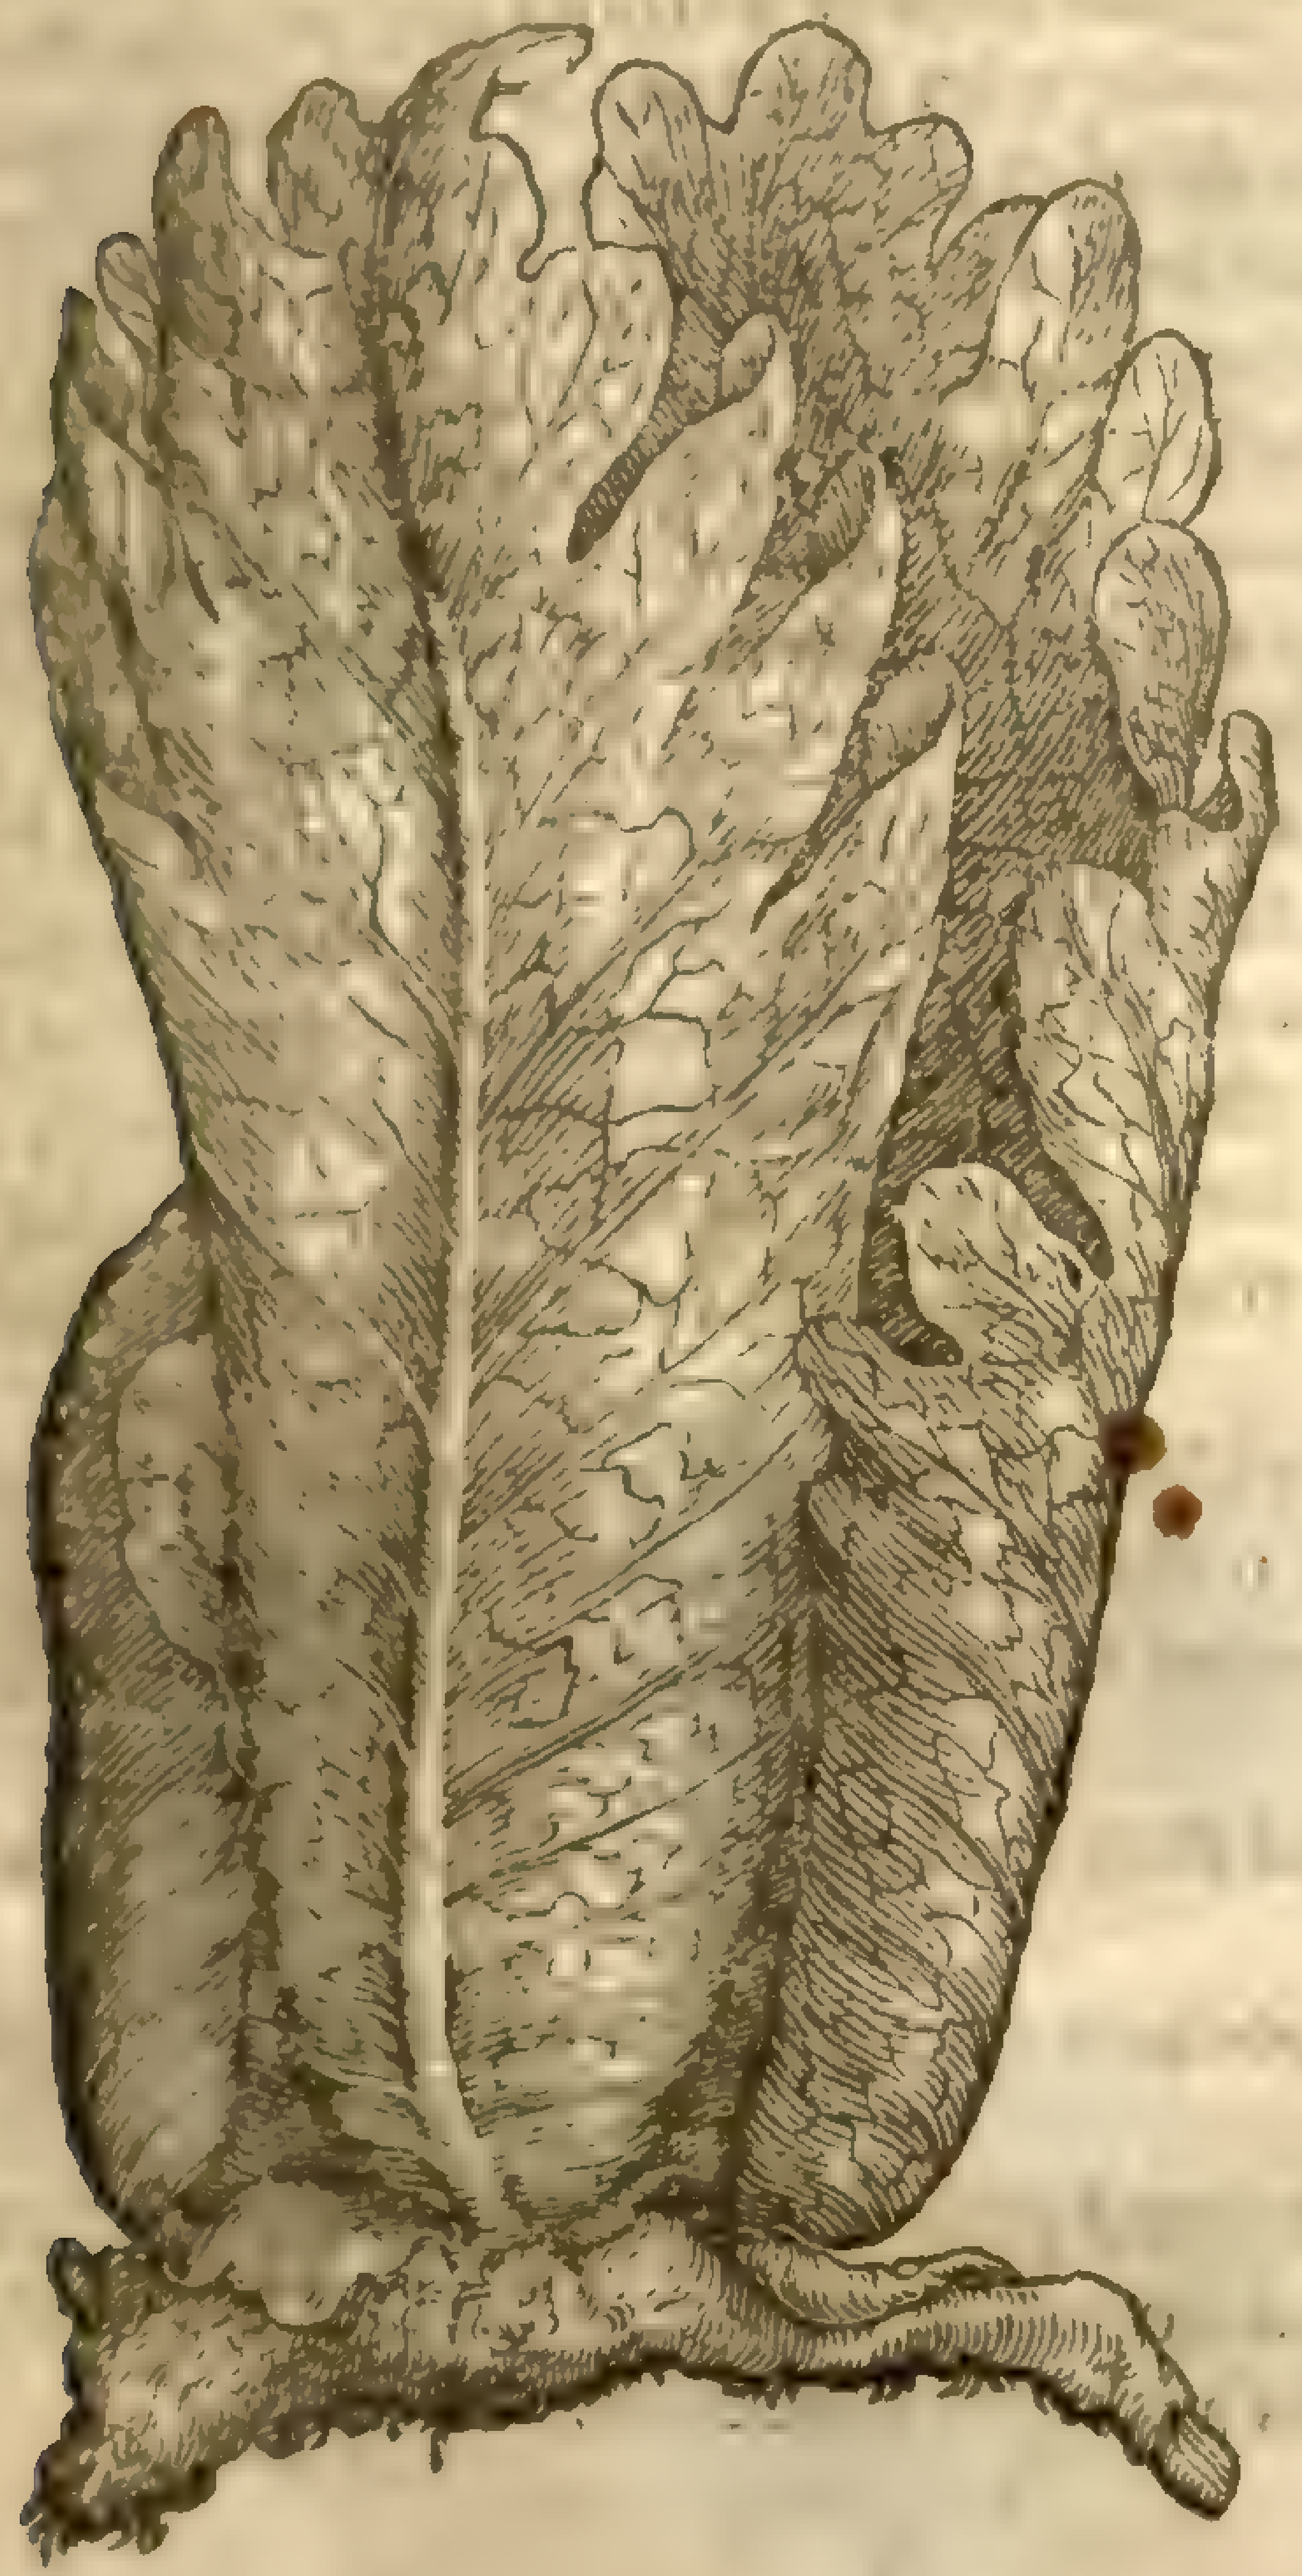
2 *Polypodium quercinum.*
Polypody of the Oke.



Sm. Inch. 588

¶ The

‡ 3 *Polypodium Indicum.*
Indian Polypodie.



¶ *The Deſcription.*

1 THe leaues of Polypodie might be thought to be like thoſe of male Ferne, but that they are far leſſer, and not nicked at all in the edges: theſe doe preſently ſpring vp from the root, being cut on both the edges with many deepe gaſhes euen hard to the middle rib: on the vpper ſide they are ſmooth, on the nether ſide they are lightly poudered as it were with duſty marks: the root is long, not a finger thicke, creeping aſlope; on which are ſeen certain little buttons like thoſe pits and dents that appeare in the tailes of cuttle fiſhes: this hath in it a certaine ſweetneſſe, with a taſte ſomwhat harſh: this kind of Ferne likewiſe wanteth not only floures and ſeed, but ſtalks alſo.

2 Polypodie of the oke is much like that of the wall, yet the leaues of it are more finely cut, ſmooth on the vpper ſide, of a pale greene colour, together with the ſtalkes and middle ribs; on the nether ſide rough like thoſe of Ferne. This Ferne alſo liueth without a ſtalke: it groweth without ſeed: the root hath many ſtrings faſtned to it, one folded within another, of a meane bigneſſe, and ſweet in taſte: it ſendeth forth here & there new dodkins or ſprings whereby it increaſeth.

‡ 3 *Cluſius* in his *Exoticks, lib. 4. cap. 7.* giueth vs the hiſtorie of an Indian Fern or Polypodie found amongſt the papers of Dʳ *Nicolas Colie* a Dutch phyſitian, who died in his return from the Eaſt Indies: the root of it was ſix inches long, and almoſt one thicke, of the ſame ſhape & colour as the ordinarie one is: from this came vp three leaues, of which the third was leſſer than the other two. the two larger were eleuen inches long, and their bredth from the middle rib (which was very large) was on each ſide almoſt fiue inches; the edges were diuided almoſt like an oken leafe, from the middle rib came other veins that ran to the ends of the diuiſions, and betweene theſe be ſmaller veines variouſly divaricated and netted, which made the leafe ſhew prettily: the colour of it was like that of a dry oken leafe. Where Dʳ *Colie* gathered this it was vncertaine, for he had left nothing in writing. ‡

¶ *The Place.*

It growes on the bodies of old rotten trees, and alſo vpon old walls, and the tops of houſes. It is likewiſe found among rubbiſh neere the borders of fields, eſpecially vnder trees and thornes, and now and then in woods; in ſome places it groweth ranke and with a broader leafe, in others not ſo ranke, and with a narrower leafe.

That which growes on the bodies of old okes is preferred before the reſt: in ſtead of this moſt do vſe that which is found vnder the okes, which for all that is not to be termed *Quircinum*, or Polypodie of the Oke.

¶ *The Time.*

Polypodie is green all the yeare long, and may be gathered at any time: it bringeth forth new leaues in the firſt Spring.

¶ *The Names.*

The Grecians call it πολυπόδιον, of the holes of the fiſhes *Polypi* appearing in the roots: it is called in Latine *Polypodium*, after the Greek name, and many times *Filicula*, as though they ſhould ſay *parua Filix*, or little Ferne: the Italians name it *Polipodio*: the Spaniards, *Filipodio*, and *Polypodio*: in high-Dutch, **Engelſuſz, Baumfarn, Dropſwourtz**: in low-Dutch, **Boom varen**: in French, *Polypode*: and we of England, Polypodie; that which groweth vpon the wall wee call Polypodie of the wall; and that on the Oke, Polypodie of the Oke.

¶ *The Temperature.*

Polypodie doth dry, but yet without biting, as *Galen* teacheth.

¶ *The*

¶ *The Vertues.*

A *Dioſcorides* writeth, That it is of power to purge, and to draw forth choler and flegme. *Actuarius* addeth, That it likewiſe purgeth Melancholy: others ſuppoſe it to be without any purging force at all, or elſe very little; of which minde is *Iohannes Monardus*, who thinketh it purgeth very gently; which thing is confirmed by Experience, the Miſtreſſe of things. For in very deed, Polypody it ſelfe doth not purge at all, but only ſerueth a little to make the belly ſoluble, being boiled in the broth of an old cocke, with Beets or Mallowes, or other-like things that moue to the ſtoole by their ſlipperineſſe. *Iohannes Meſue* reckoneth vp Polypodie among thoſe things that do eſpecially dry & make thin: peraduenture he had reſpect to a certain kind of *Arthritis* or ache in the ioints, in which not one only part of the body, but many together are moſt commonly touched: for which it is very much commended by the Brabanders and other inhabitants about the riuer Rhene and the Maze. In this kinde of diſeaſe the hands, the feet, and the joints of the knees and elbowes doe ſwell. There is joined withall a feebleneſſe in mouing, through the extremitie of the pain: ſome times the vpper parts are leſſe grieued, and the lower more; the humors do alſo eaſily run from one place to another, and then ſettle. Againſt this diſeaſe the Geldres and Cleuelanders doe vſe the decoction of Polypodie, whereby they hope the ſuperfluous humors may be waſted and dried vp, and that not by and by, but in continuance of time; for they appoint that this decoction ſhould be taken for certain daies together.

B But this kinde of gout is ſooner taken away either by blood-letting or purgations, or by both and afterwards by ſweat: neither is it hard to be cured, if theſe generall remedies be vſed in time, for the humors do not remaine fixed in thoſe joints, but are rather gathered together, than ſettled about them.

C Therefore the body muſt out of hand be purged, and then that which remaines is to be waſted and conſumed away by ſuch thiugs as procure ſweat.

D Furthermore, *Dioſcorides* ſaith that the root of Polypodie is very good for members out of ioint, and for chaps between the fingers.

E The root of Polypody boiled with a little hony, water, and pepper, and the quantity of an ounce giuen, emptieth the belly of cholericke and pituitous humors. Some boile it in water and wine, and giue to the quantitie of three ounces for ſome purpoſes with good ſucceſſe.

Chap. 468. *Of Oke-Ferne.*

‡ OVr Author here (as in many other places) knit knots ſomewhat intricate to looſe; for firſt he confounds in the Names and Nature the Polypodie of the Oke or leſſer Polypodie, with the *Dryopteris* or Oke-Ferne; but that I haue now put backe to the former chapter, his fit place. Then in the ſecond place did he giue the Deſcription of the *Dryopteris* of the *Adverſar.* taken from thence, *pag.* 363. Then were the Place, Time, Names, &c. taken out of the Chapter of *Dryopteris candida* of *Dodonæus*, being *Pempt.* 3. *lib.* 5. *cap.* 4. but the figure was of the *Filicula fœm. ra petræa* 4. of *Tabernamontanus*. Now I will in this chapter giue you the *Dryopteris* of the *Adverſaria*. then that of *Dodonæus*, and thirdly that of *Tragus*; for I take them to be different, and this laſt to be that figured by our Author out of *Tabernamontanus*. ‡

¶ *The Deſcription.*

1 THis kinde of Ferne, called *Dryopteris* or *Filix querna*, hath leaues like vnto the female Ferne before ſpoken of, but much leſſer, ſmaller, and more finely cut or jagged, & is not aboue a foot high, being a very ſlender and delicate tender herb. The leaues are ſo finely jagged, that in ſhew they reſemble feathers, ſet round about a ſmall rib or ſinue; the backe ſide being ſprinkled not with ruſſet or browne markes or ſpeckes as the other Fernes are, but as it were painted with white ſpots or marks, not ſtanding out of the leaues in ſcales, as the ſpots in the male Ferne, but they are double in each leafe cloſe vnto the middle rib or ſinue. The root is long, browne, and ſomewhat hairy, very like vnto Polypody, but much ſlenderer, of a ſharpe and cauſticke taſte. ‡ *Rondeletius* affirmed that he found the vſe of this deadly, being put into medicines in ſtead of Polypodie, by the ignorance of ſome Apothecaries in Dauphenie in France. Mr *Goodyer* hath ſent me an accurat deſcription, together with a plant of this Ferne, which I haue thought good here alſo to ſet forth.

‡ 1 *Dryopteris Adverſ.*

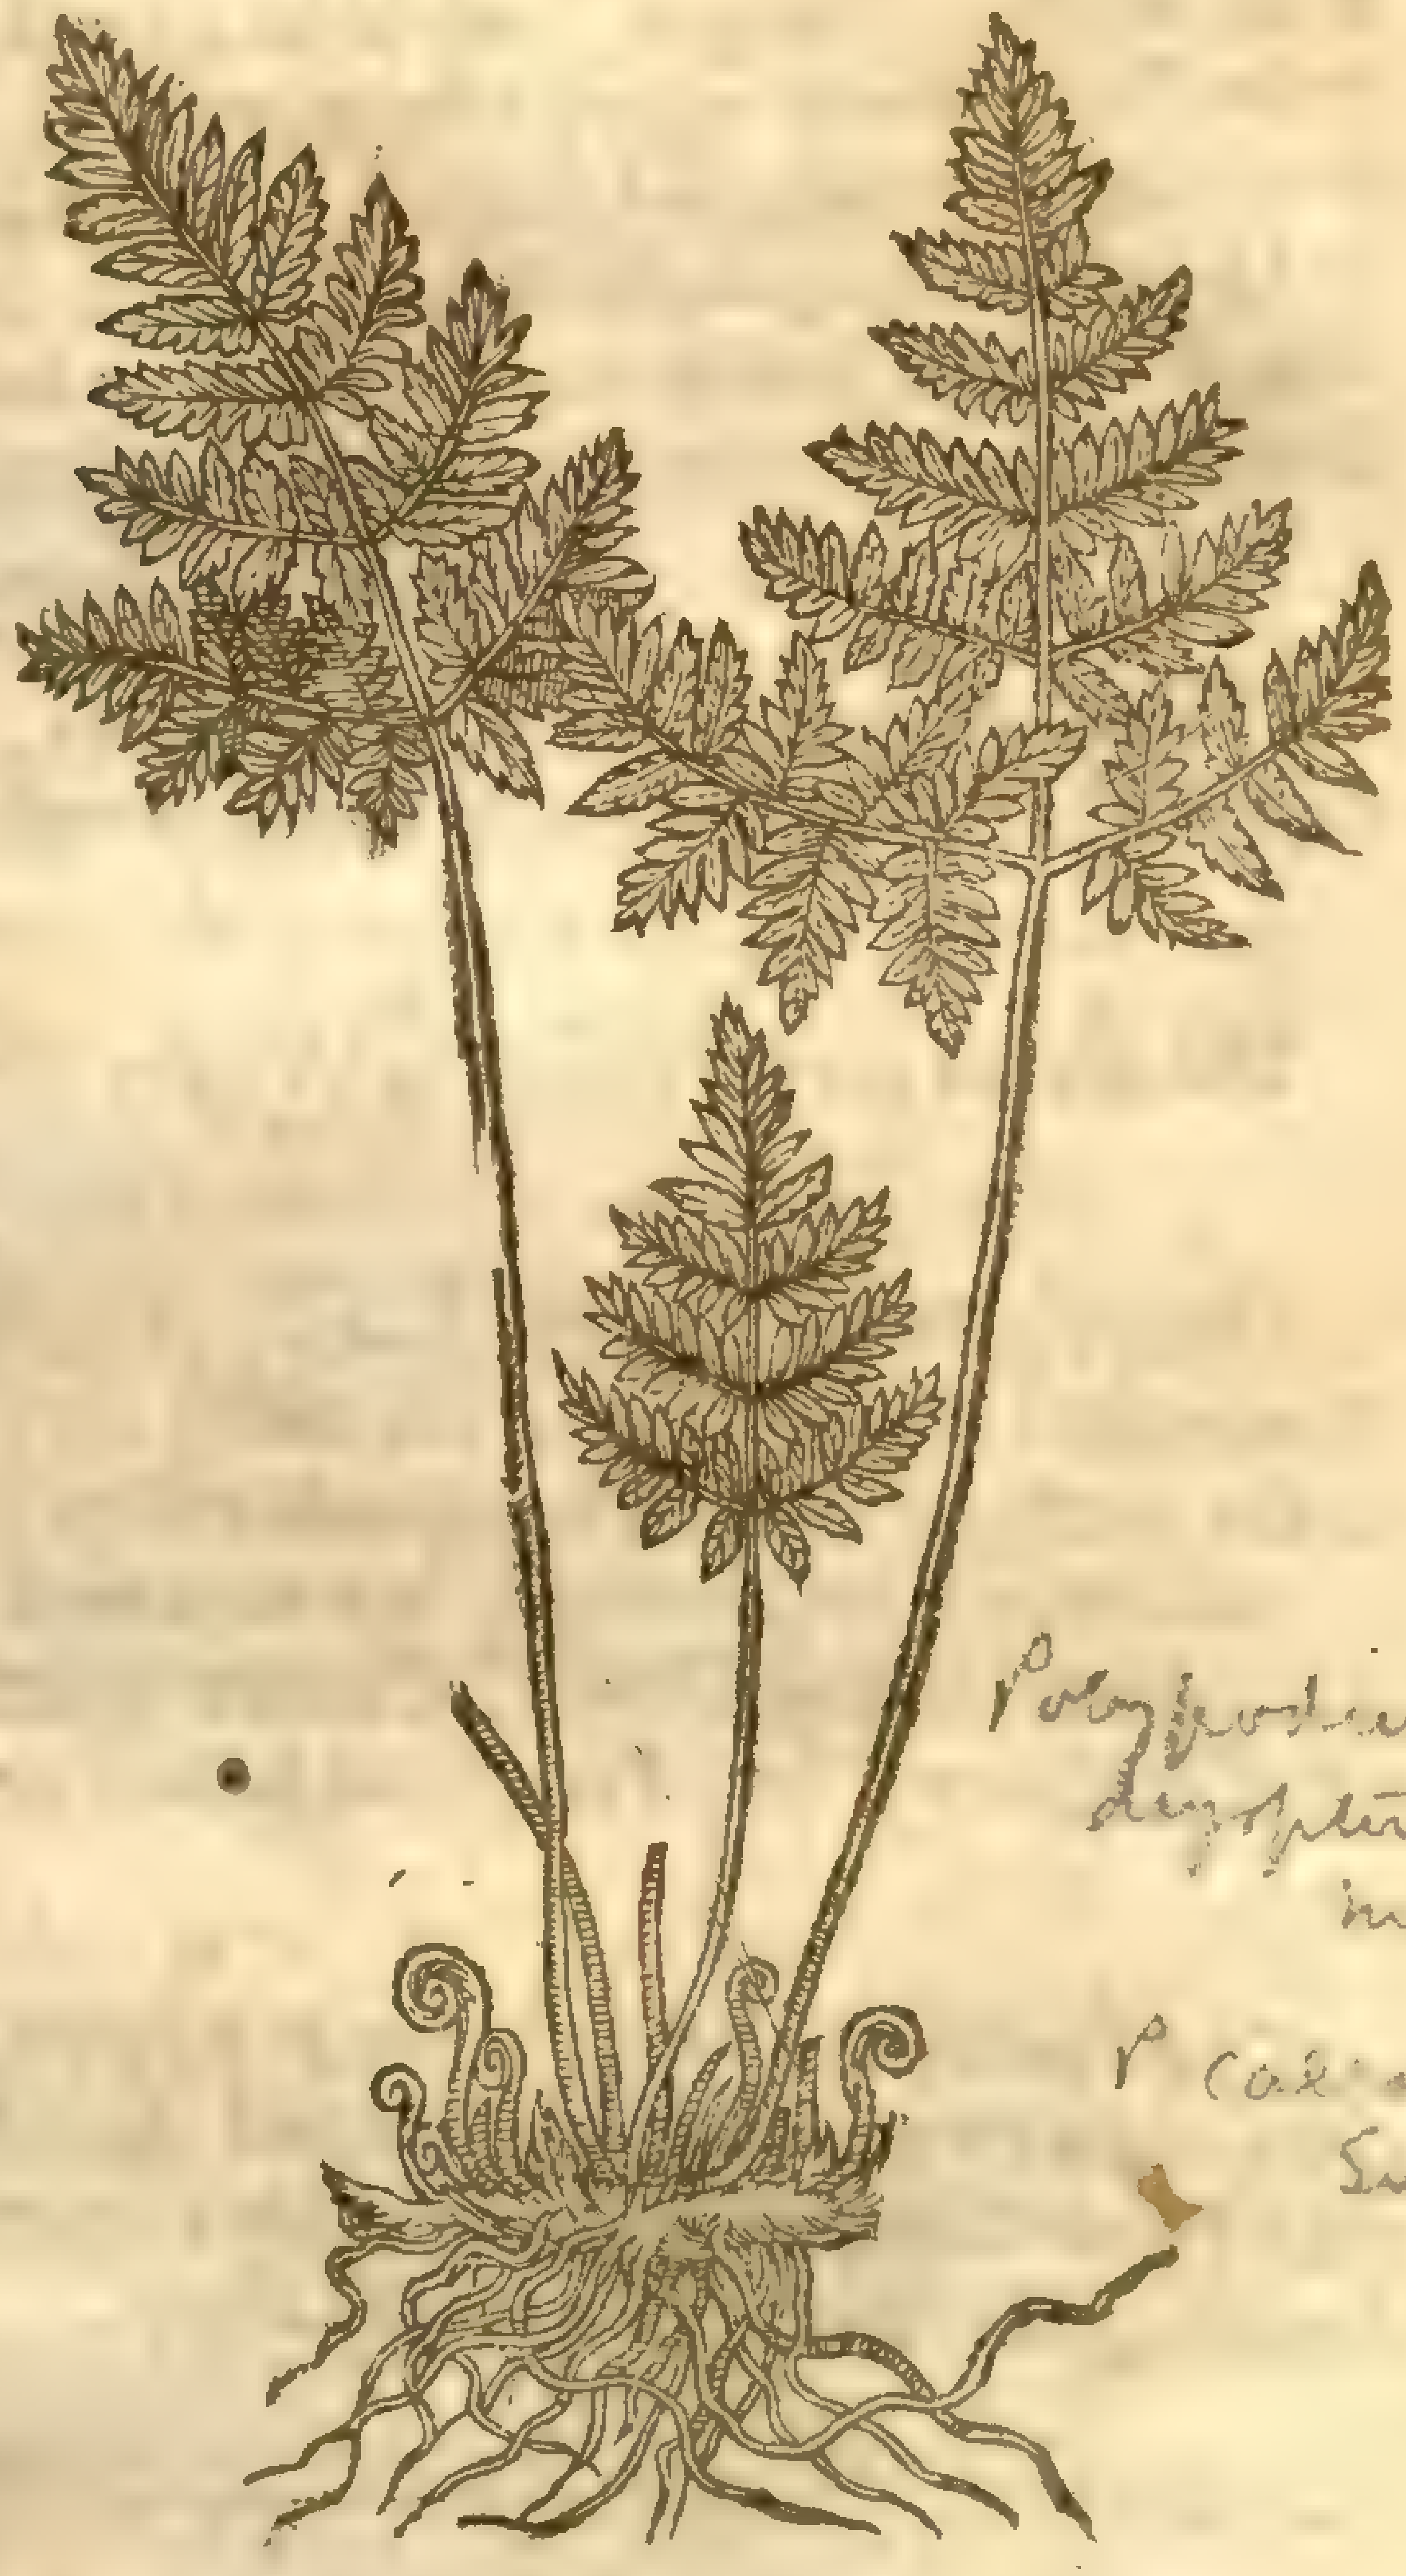
‡ 3 *Dryopteris Tragi.*
Tree Ferne.



Polypodium
dryopteris, b
mus. dact.

P. Calcareum
Sm. fl. b.

Dryopteris Penæ & Lobelij.

The roots creepe in the ground or myre neere the turfe or vpper part thereof, and fold amongſt themſelues as the roots of *Polypodium* do, almoſt as big as a wheat ſtraw, and about fiue, ſix, or ſeuen inches long, cole blacke without, and white within, of a binding taſte inclining to ſweetneſſe, with an innumerable company of ſmall blacke fibres like haires growing thereunto. The ſtalkes ſpring from the roots in ſundry places, in number variable, according to the length and increaſe of the root: I haue ſeen ſmall plants haue but one or two, and ſome bigger plants fourteene or fifteene: they haue but a twofold diuiſion, the ſtalke growing from the root, and the nerue bearing the leaues: the ſtalk is about fiue, ſix, or ſeuen inches long, no bigger than a bennet or ſmal graſſe ſtalk, one ſide flat, as are the male Fernes, the reſt round, ſmooth, and green. The firſt paire of nerues grow about three inches from the root, and ſo do all the reſt grow by couples, almoſt exactly one againſt another, in number about eight, nine, or ten couples, the longeſt ſeldome exceeding an inch in length. The leaues grow on the nerues alſo by couples, eight or nine couples on a nerue, without any nicks or indentures, of a yellowiſh green colour. The Ferne may be ſaid to be like *Polypodium* in his creeping root, like the male Fern in his ſtalk, and like the female Fern in his nerues & leaues. I could finde no ſeed-ſcales on the back ſides of any of the leaues of this Ferne. Many yeares paſt I found this ſame in a very wet moore or bog, being the land of *Richard Auſten*, called White-row Moore, where Peate is now digged, a mile from Peters-field in Hampſhire: and this ſixth of Iuly, 1633, I digged vp there many plants, and by them made this deſcription. I neuer found it growing in any other place: the leaues periſh at Winter, and grow vp againe very late in the ſpring. *Iohn Goodyer.* Iuly *6. 1633.*

2 *Dodonæus* thus deſcribes his: *Dryopteris* (ſaith he) doth much reſemble the male Fern, but the leaues are much ſmaller and more finely cut, ſmooth on the fore ſide, and of a yellowiſh greene together with the ſtalks and middle nerues: on the backe ſide it is rough like the other Fernes, and alſo liueth without ſtalke or ſeed. The root conſiſts of fibres intricately folded together, of an indifferent thickneſſe, here and there putting vp new buds. This is the *Adianthum* of the *Adverſ.* who affirme the vſe thereof to be ſafe, and not pernitious and deleterie, as that of *Dryopteris*. It thus differs from the former; the leaues of this are not ſet directly one oppoſit to another, the diuiſions of the leaues are larger and more diuided. The root is more threddy, and creeps not ſo far as that of the former.

3 This (which is *Cluſius* his *Filix pumila ſaxatilis prima*, and which I take to be the *Dryopteris*, or *Filix arborea* of *Tragus*) hath blacke ſlender long creeping roots, with few ſmall hard hairy fibres faſtned to them, of a very aſtringent taſte: from theſe riſe vp ſundry ſtalks a foot high, diuided into certaine branches of winged leaues, like to thoſe of the female Ferne, but much leſſe, tenderer, and finer cut, and hauing many blackiſh ſpots on their lower ſides. This differs from the two former, in that the leaues are branched, which is a chiefe difference; and *Bauhinus* did very well obſerue it, if he had as well followed it, when he diuided *Filix* into *ramoſa* and *non ramoſa*. ‡

¶ *The Place.*

It is oftentimes found in ſunny places, in the vallies of mountaines and little hills, and in the tops of the trunks of trees in thicke woods.

¶ *The Time.*

The leaues hereof periſh in Winter, in the Spring new come forth.

¶ *The Names.*

This is called in Greeke Δρυοπτερὶς: in Latine, *Querna Filix*: *Oribaſius, lib.* 11. of Phyſicall Collections, calls it *Bryopteris*, of the moſſe with which it is found: for as *Dioſcorides* writeth, it groweth in the moſſe of Okes. The Apothecaries in times paſt miſcalled it by the name of *Adiantum*; but they did worſe in putting it in compound medicines in ſtead of *Adiantum*. *Valerius Cordus* calleth it *Pteridion*: in low-Dutch, **Eijcken varen**: the Spaniards, *Helecho de Roble*: it is named in Engliſh, Oke Ferne, Petty Ferne, and it may moſt fitly be called Moſſe-Ferne.

¶ *The Nature and Vertues.*

A Oke Ferne hath many taſtes, it is ſweet, biting, and bitter, it hath in the root a harſh or choking taſte, and a mortifying qualitie, and therefore it taketh away haires. *Dioſcorides* ſaith further, That Oke Ferne ſtamped roots and all is a remedie to root vp haires, if it be applied to the bodie after ſweating, the ſweat being wiped away.

Chap. 469. *Of blacke Oke-Ferne.*

¶ *The Deſcription.*

1 There is alſo a certaine other kinde of Ferne like to the former Oke-Ferne of *Dodonæus* his deſcription, but the ſtalks and the ribs of the leaues are blackiſh, and the leaues of a deeper green colour: this groweth out alſo immediatly from the root, and is likewiſe diuerſly but not ſo finely indented: the root is made vp of many ſtrings, not vnlike the male Fern, but much leſſer.

2 The female blacke Fern is like to the male, ſauing his leaues are not ſo ſharp at the points, more white and broad than the male, wherein conſiſteth the difference.

¶ *The Place.*

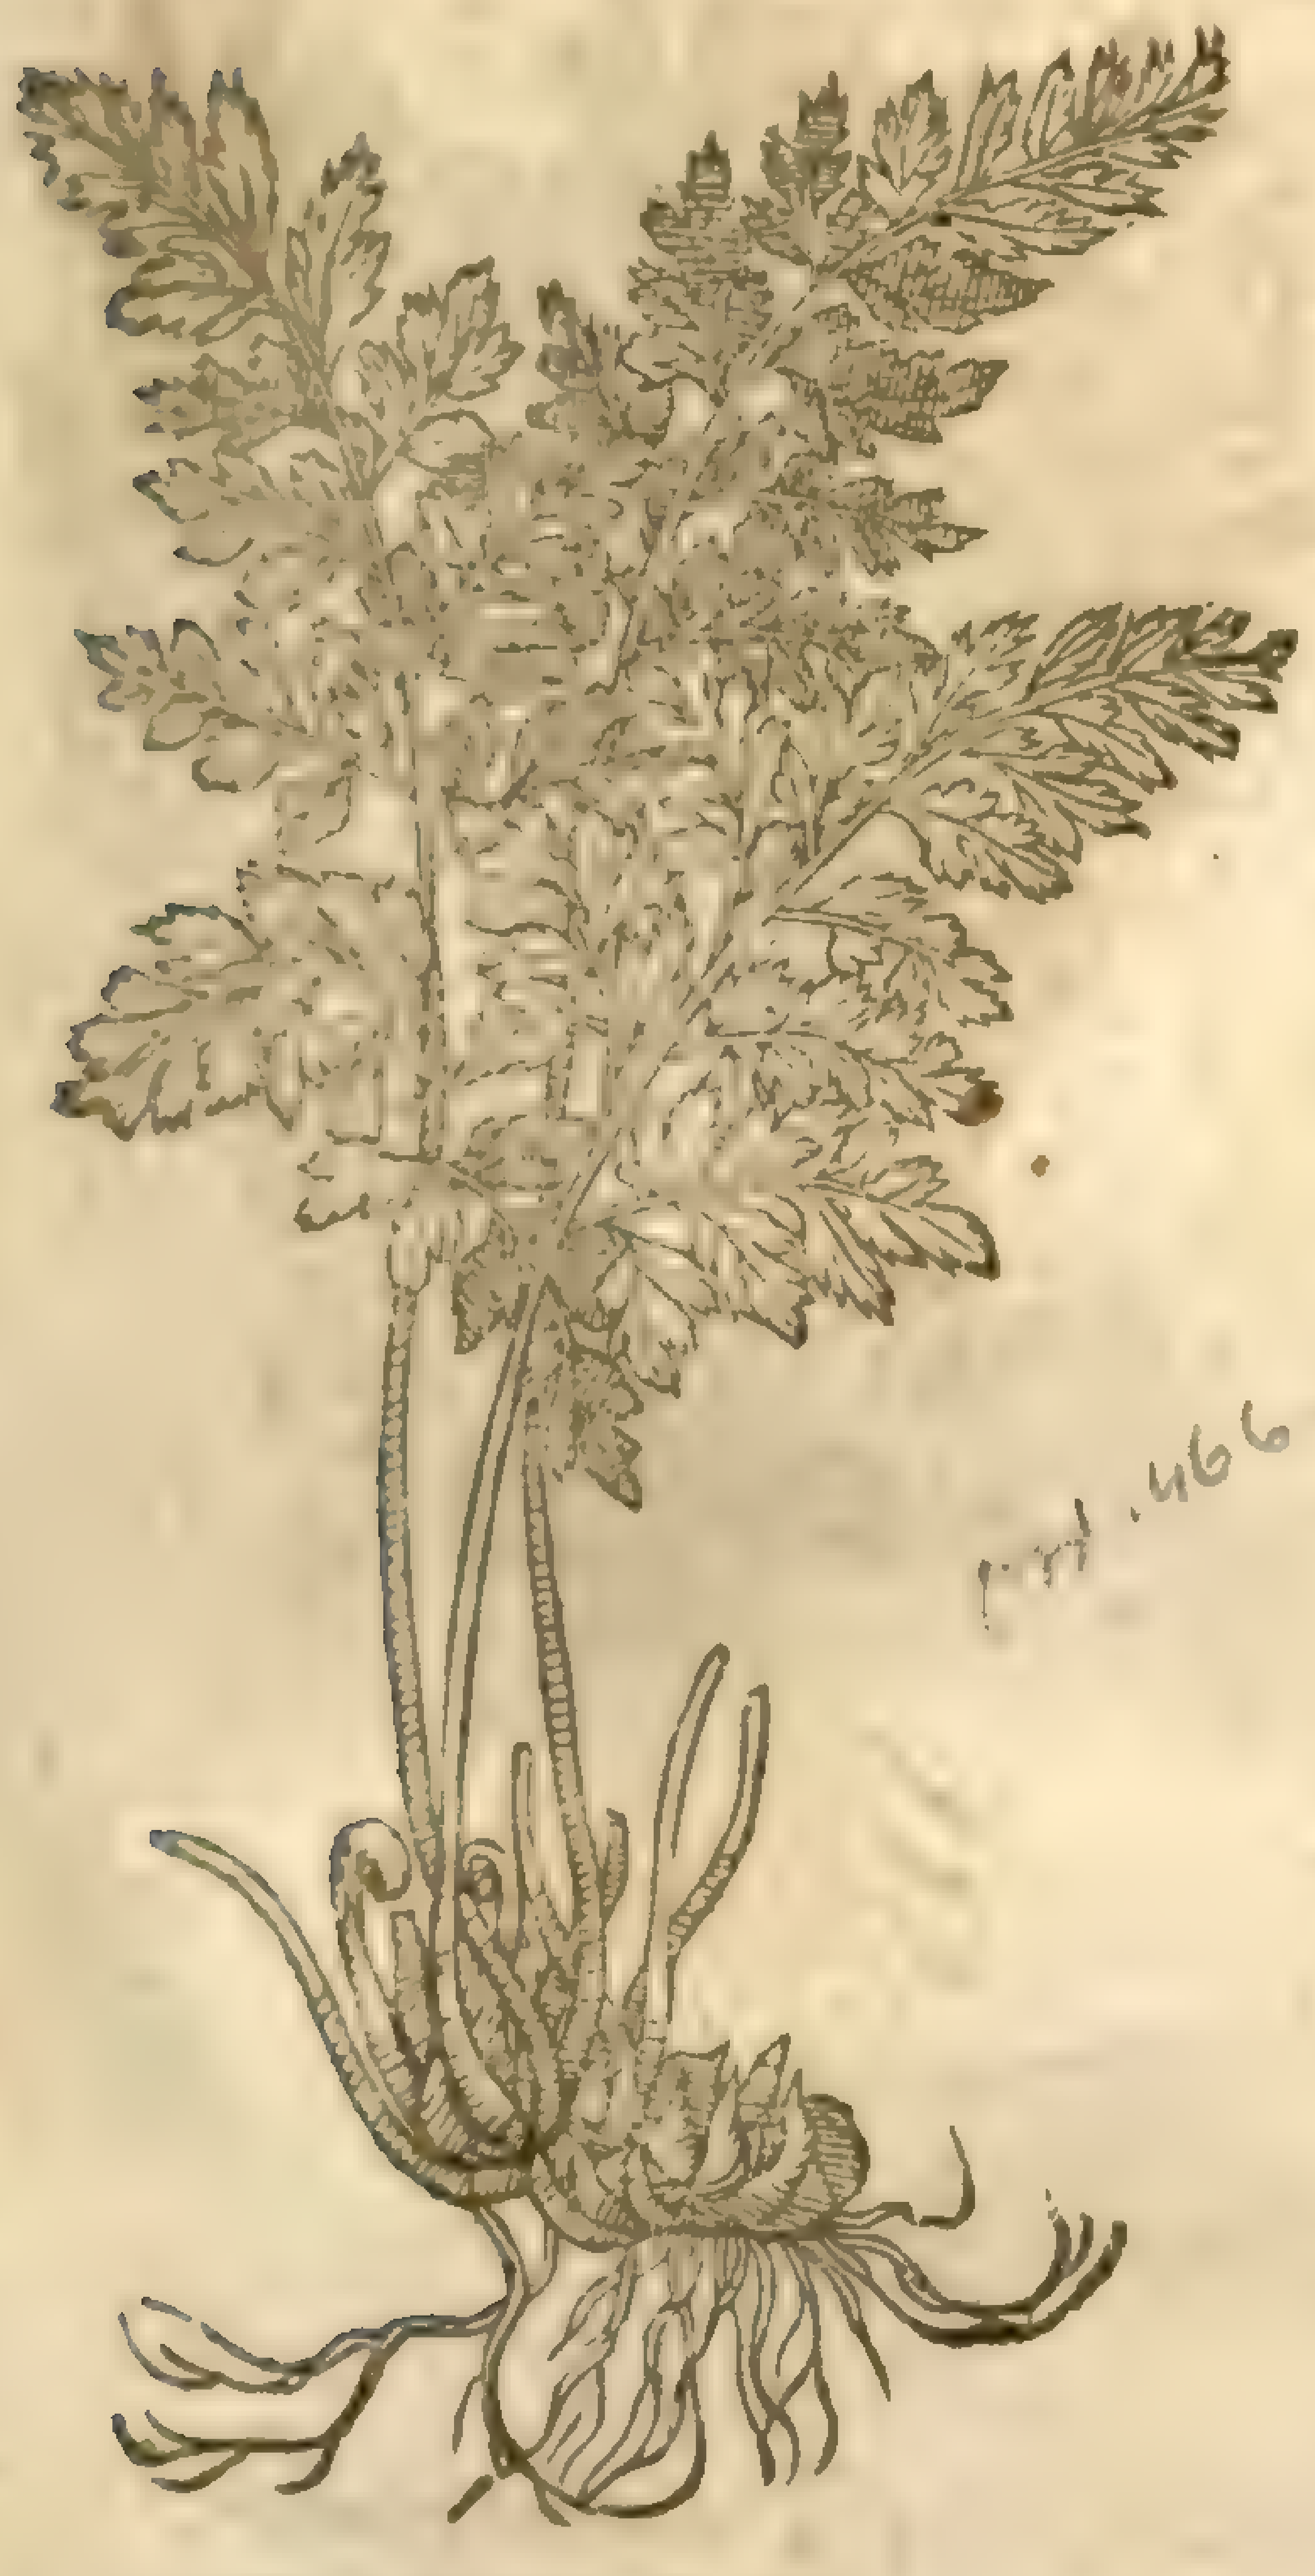
They grow likewiſe vpon trees in ſhadowie woods, and now and then in ſhadowie ſandy bankes and vnder hedges.

Asplenium adiantum nigrum

[illegible]

Sm. fl. 4. 310

1 *Onopteris mas.*
The male blacke Ferne.



466

¶ *The Time.*

They remaine greene all the yeare long, otherwiſe than Polypodie and Maidens haire do; yet do they not ceaſe to bring forth new leaues in Summer: they are deſtitute of flours and ſeed, as is the former.

¶ *The Names.*

This is called of diuers of the later herbariſts, *Dryopteris nigra*, or blacke Oke-Ferne, of the likeneſſe it hath with *Dryopteris*; which we haue called in Engliſh, Oke-Ferne or Moſſe-Ferne: of others, *Adiantum nigrum* or black Maiden-hair, that it may differ from the former, which is falſly called *Adiantum*. There are of the later Herbariſts who would haue it to bee *Lonchitis aſpera*, or rough Spleen-wort: but what likeneſſe hath it with the leaues of *Scolopendrium?* none at all: therfore it is not *Lonchitis aſpera*, much leſſe *Adiantum Plinij*, which differs not from *Adiantum Theophraſti*; for what he hath of *Adiantum* he taketh out of *Theophraſtus*: the right *Adiantum* we wil deſcribe hereafter. Notwithſtanding blacke Oke-Ferne was vſed of diuers vnlearned Apothecaries of France and Germany for *Adiantum* or Maiden-haire of Lumbardy: but theſe men did erre in doing ſo, yet not ſo much as they who take Polypody of the Oke for the true Maiden-haire.

¶ *The Temperature and Vertues.*

The black Oke-Ferne hath no ſtipticke qualitie at all, but is like in faculty to *Trichomanes* or Engliſh Maiden-haire.

Chap. 470 *Of Harts-Tongue.*

¶ *The Deſcription.*

1 THe common kinde of Harts tongue, called *Phyllitis*, that is to ſay, a plant conſiſting only of leaues, bearing neither ſtalk, floure, nor ſeed, reſembling in ſhew a long tongue, whereof it hath bin and is called in ſhops *Lingua Ceruina*, that is, Harts tongue: theſe leaues are a foot long ſmooth and plaine vpon one ſide, but vpon that ſide next the ground ſtraked ouerthwart with certain long rough marks like ſmall wormes, hanging on the back ſide thereof. The root is blacke, hairy and twiſted, or ſo growing as though it were wound together.

2 The other kinde of Fern, called *Phyllitis multifida* or *Laciniata*, that is, jagged Harts tongue, is very like the former, ſauing that the leaues therof are cut or iagged like a mans hand, or the palm and brow antles of a Deare, bearing neither ſtalke, floure, nor ſeed.

3 There is another kinde of Harts tongue called *Hemionitis*, which hath bred ſome controuerſie among writers, for ſome haue taken it for a kind of Harts tongue, as it is indeed: others deſcribe it as a proper plant by it ſelfe, called *Hemionitis*, of ἡμίονος, that is *Mulus*, a Mule, becauſe Mules do delight to feed thereon. It is barren in ſeeds, ſtalks, and floures, and in ſhape it agreeth very well with our Harts-tongue. The roots are compact of many blackiſh haires; the leaues are ſpotted on the back ſide like the common Harts tongue, and differ in that, that this *Hemionitis* in the baſe or loweſt parts of the leaues is arched after the manner of a new Moon or a forked arrow, the yongeſt and ſmalleſt leaues being like vnto the great Bindweed called *Volubilis*.

4 There is a kinde of Ferne called alſo *Hemionitis ſterilis*, which is a very ſmall and baſe herbe not aboue a finger high, hauing foure or fiue ſmall leaues of the ſame ſubſtance and colour, ſpotted on the backe part, and in taſte like vnto Harts-tongue; but the leaues beare the ſhape of them of *Tota-bona*, or good *Henry*, which many of our Apothecaries do abuſiuely take for Mercury. The roots are very many, ſmooth, blacke, and threddy, bearing neither ſtalke, floure, nor ſeed. This plant

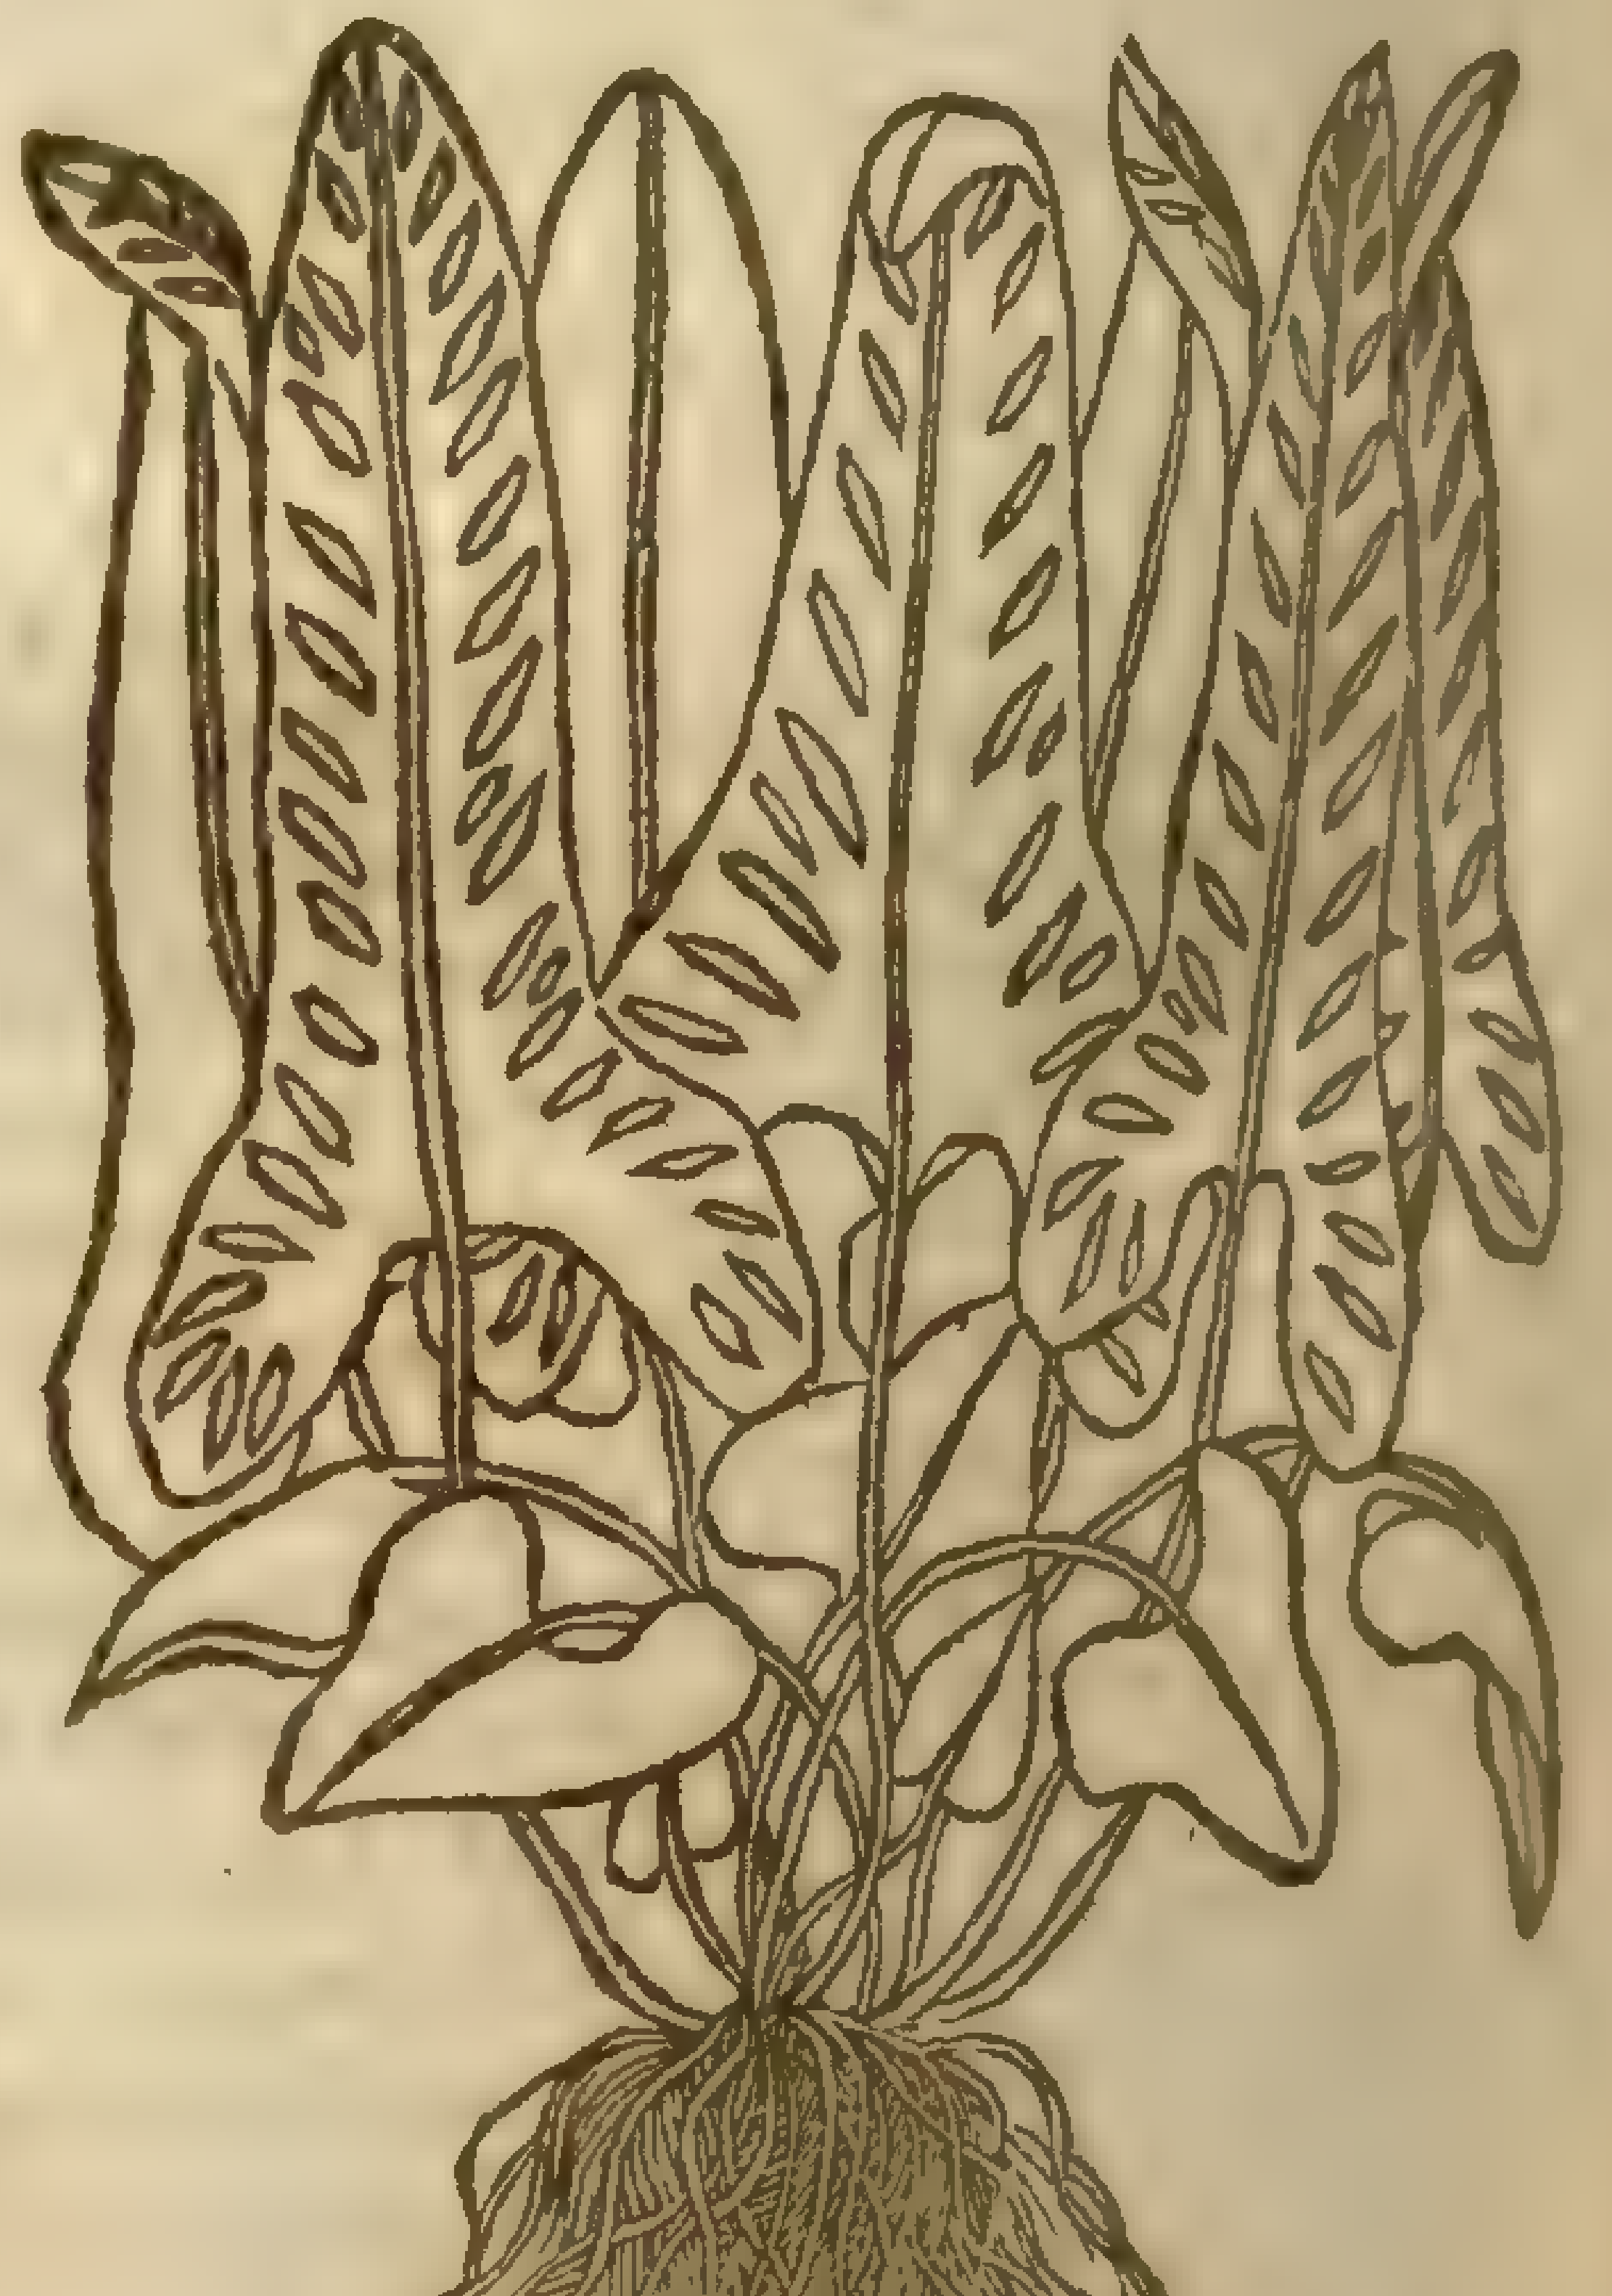
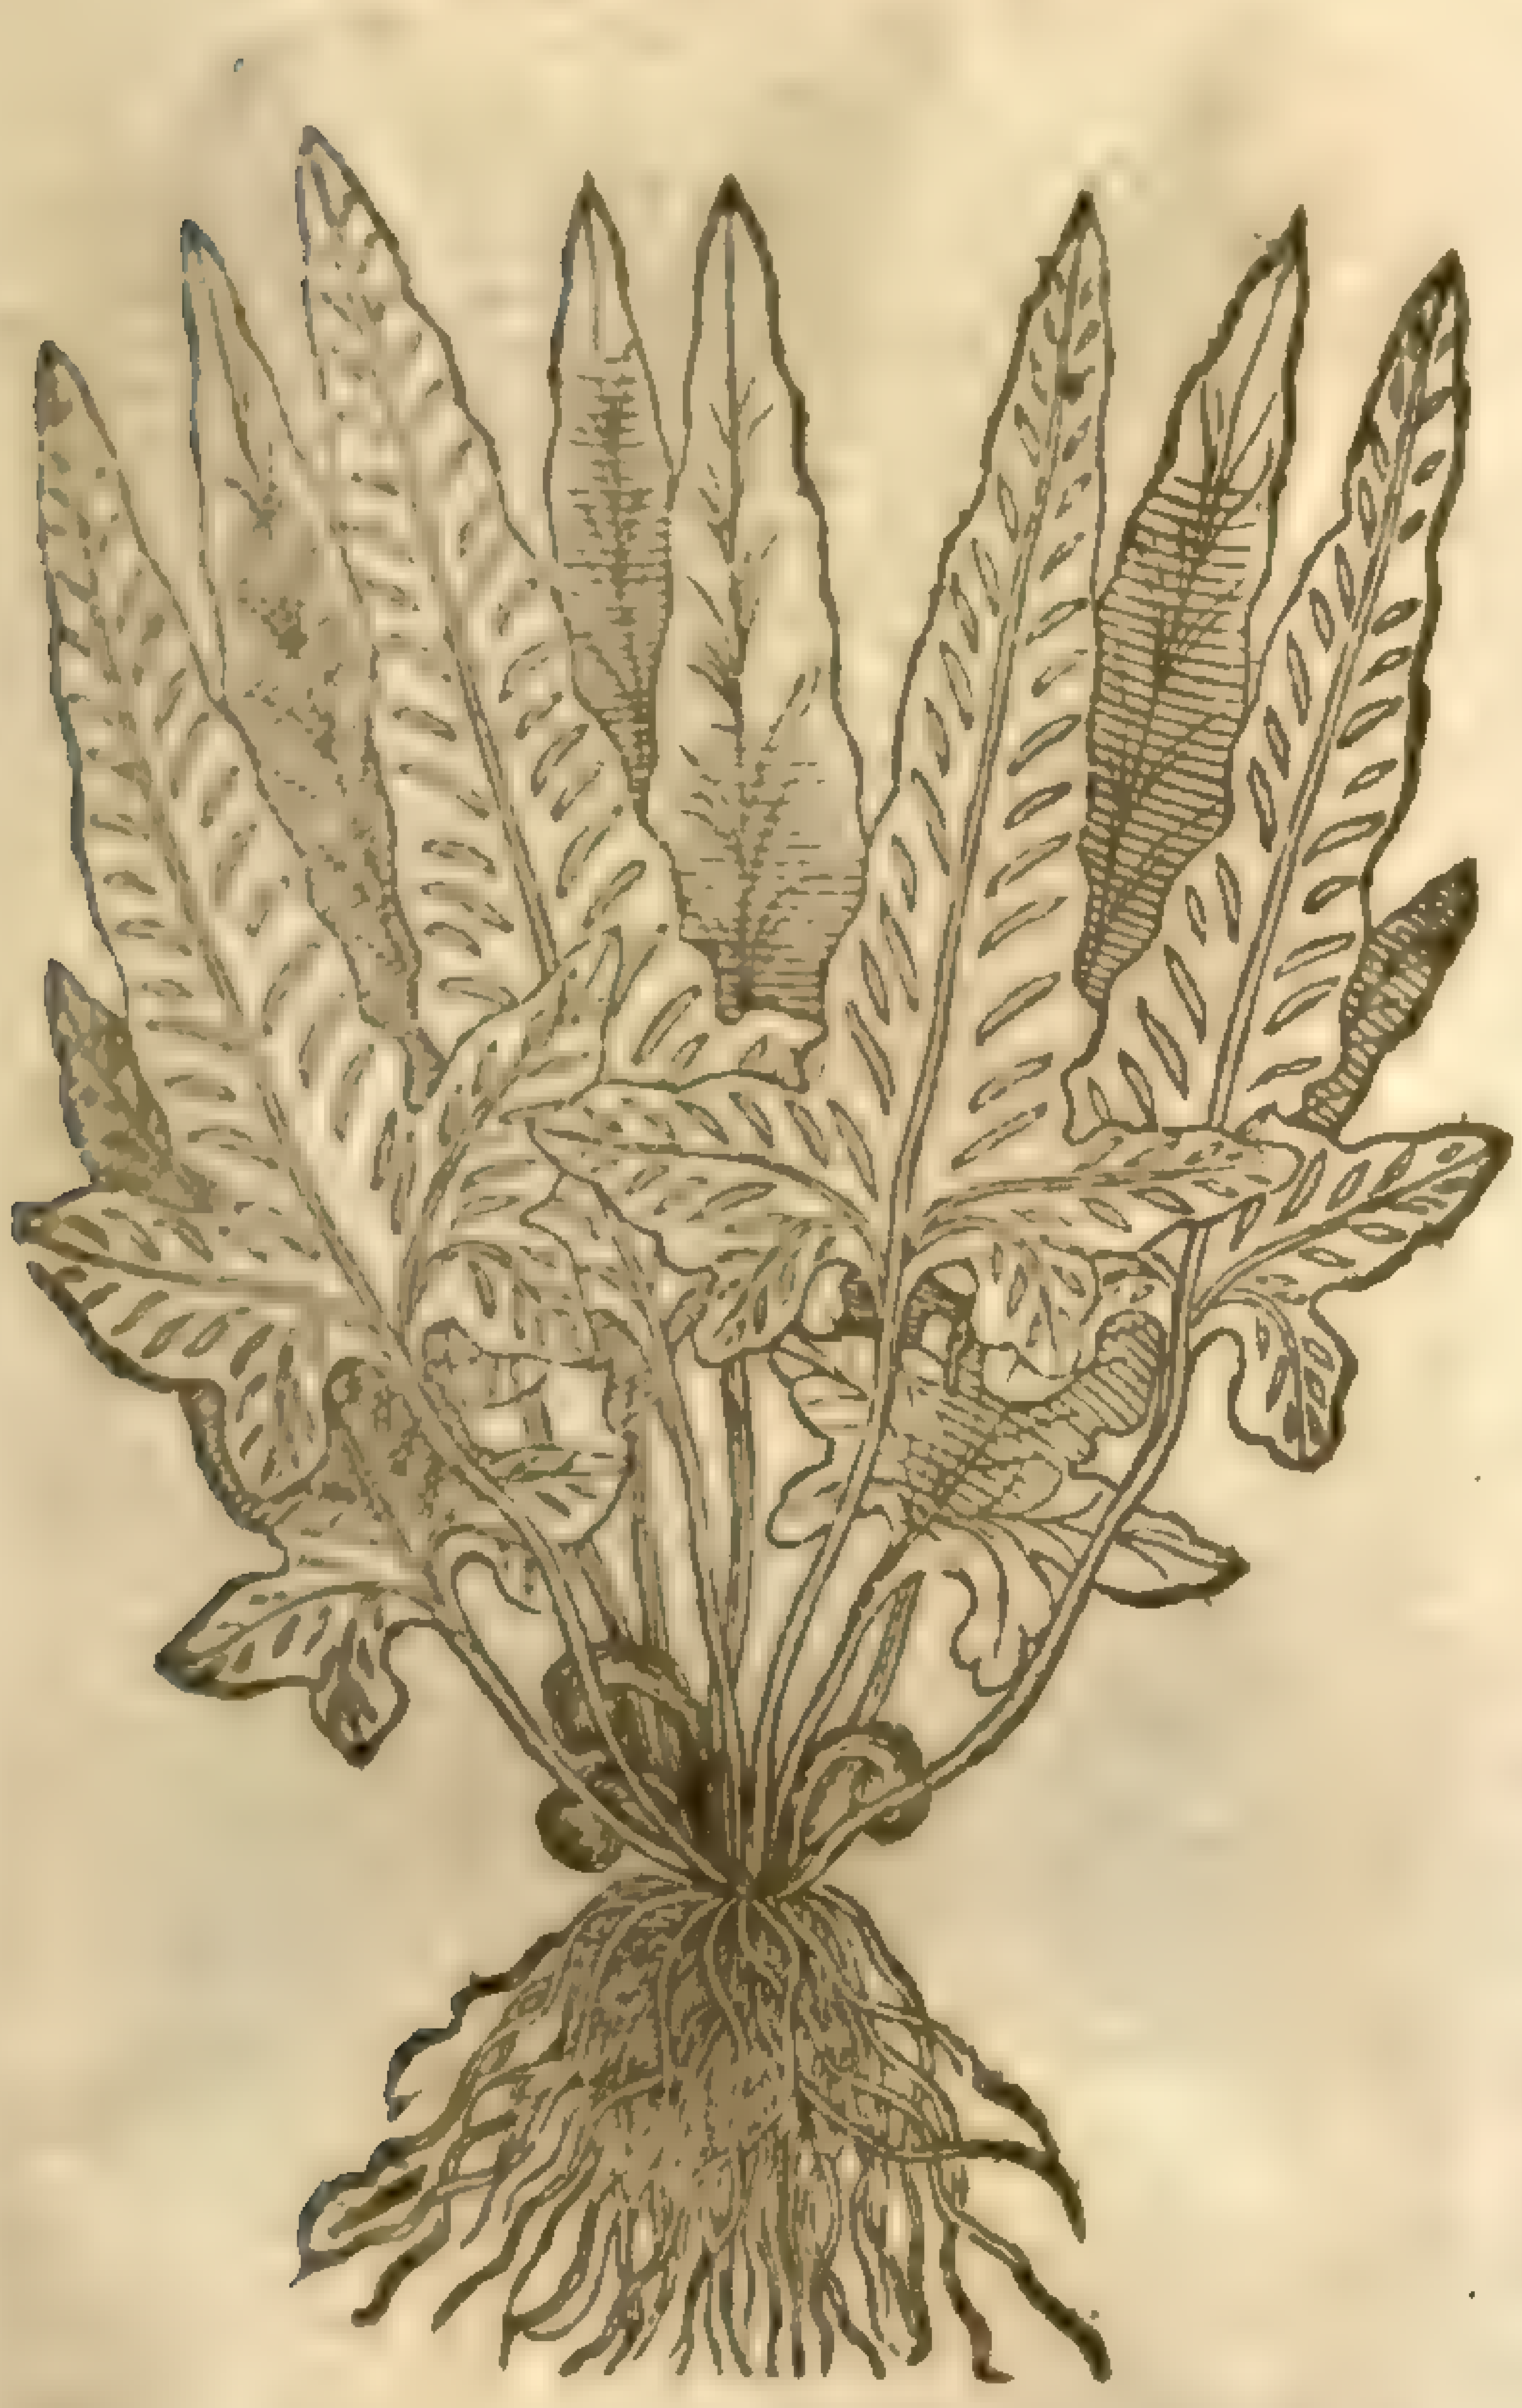
Small Moon-Ferne.



‡ 5 *Hemionitis peregrina.*
Handed Moon-Ferne.



my very good friend Mʳ *Nicolas Belſon* found in a grauelly lane in the way leading to Oxey park neer Watford, fifteen miles from London. It groweth likewiſe on the ſtone walls of Hampton court, in the garden of Mʳ *Huggens* keeper of the ſaid houſe.

5 There is a kinde of Fern called alſo *Hemionitis*, but with this addition *peregrina*, that is very ſeldome found, and hath leaues very like vnto Harts-tongue, but that it is palmed or branched in the part next the ground in manner of the ſecond *Phyllitis* at the top of the leaues, otherwiſe they reſemble one another in nature and fome.

¶ *The Place.*

The common Harts-tongue growes by the way ſides in great plenty, as you trauell from London to Exceſter, in ſhadowie places and moiſt ſtony vallies and wells, and is much planted in gardens.

The ſecond I found in the garden of Mʳ *Cranwich* a ſurgeon dwelling at Much-Dunmow in Eſſex, who gaue me a plant for my garden.

‡ Mʳ *Goodyer* found it wilde in the bankes of a lane neer Swaneling, not many miles from Southhampton. ‡

It groweth vpon Ingleborow hils, and in diuers other mountaines of the North of England.

¶ *The Time.*

It is green all the yeare long, yet leſſe green in winter: in ſummer it now and then brings forth new leaues.

¶ *The Names.*

It is called in Greeke, φυλλῖτις: in Latine alſo *Phyllitis*: in ſhops, *Lingua Cervina*, and falſly *Scolopendria*: for it differs much from the right *Scolopendria* or ſtone Ferne: it is called in high Dutch, **Hirſzong**: in low-Dutch, **Herſtonge**: in Spaniſh, *Lengua cervina*: in French, *Langue de cerf*: in Engliſh, Harts tongue; of ſome, Stone Harts tongue. *Apuleius, cap.* 83. nameth it *Radiolus*.

¶ *The Nature.*

It is of a binding and drying facultie.

¶ *The Vertues.*

Common Harts tongue is commended againſt the laske and bloudy flix: *Dioſcorides* teacheth, That being drunke in wine it is a remedie againſt the bitings of Serpents. A

It opens the hardneſſe and ſtopping of the ſpleen and liuer, and all other griefes proceeding of opilations or ſtoppings whatſoeuer. B

Chap. 471.

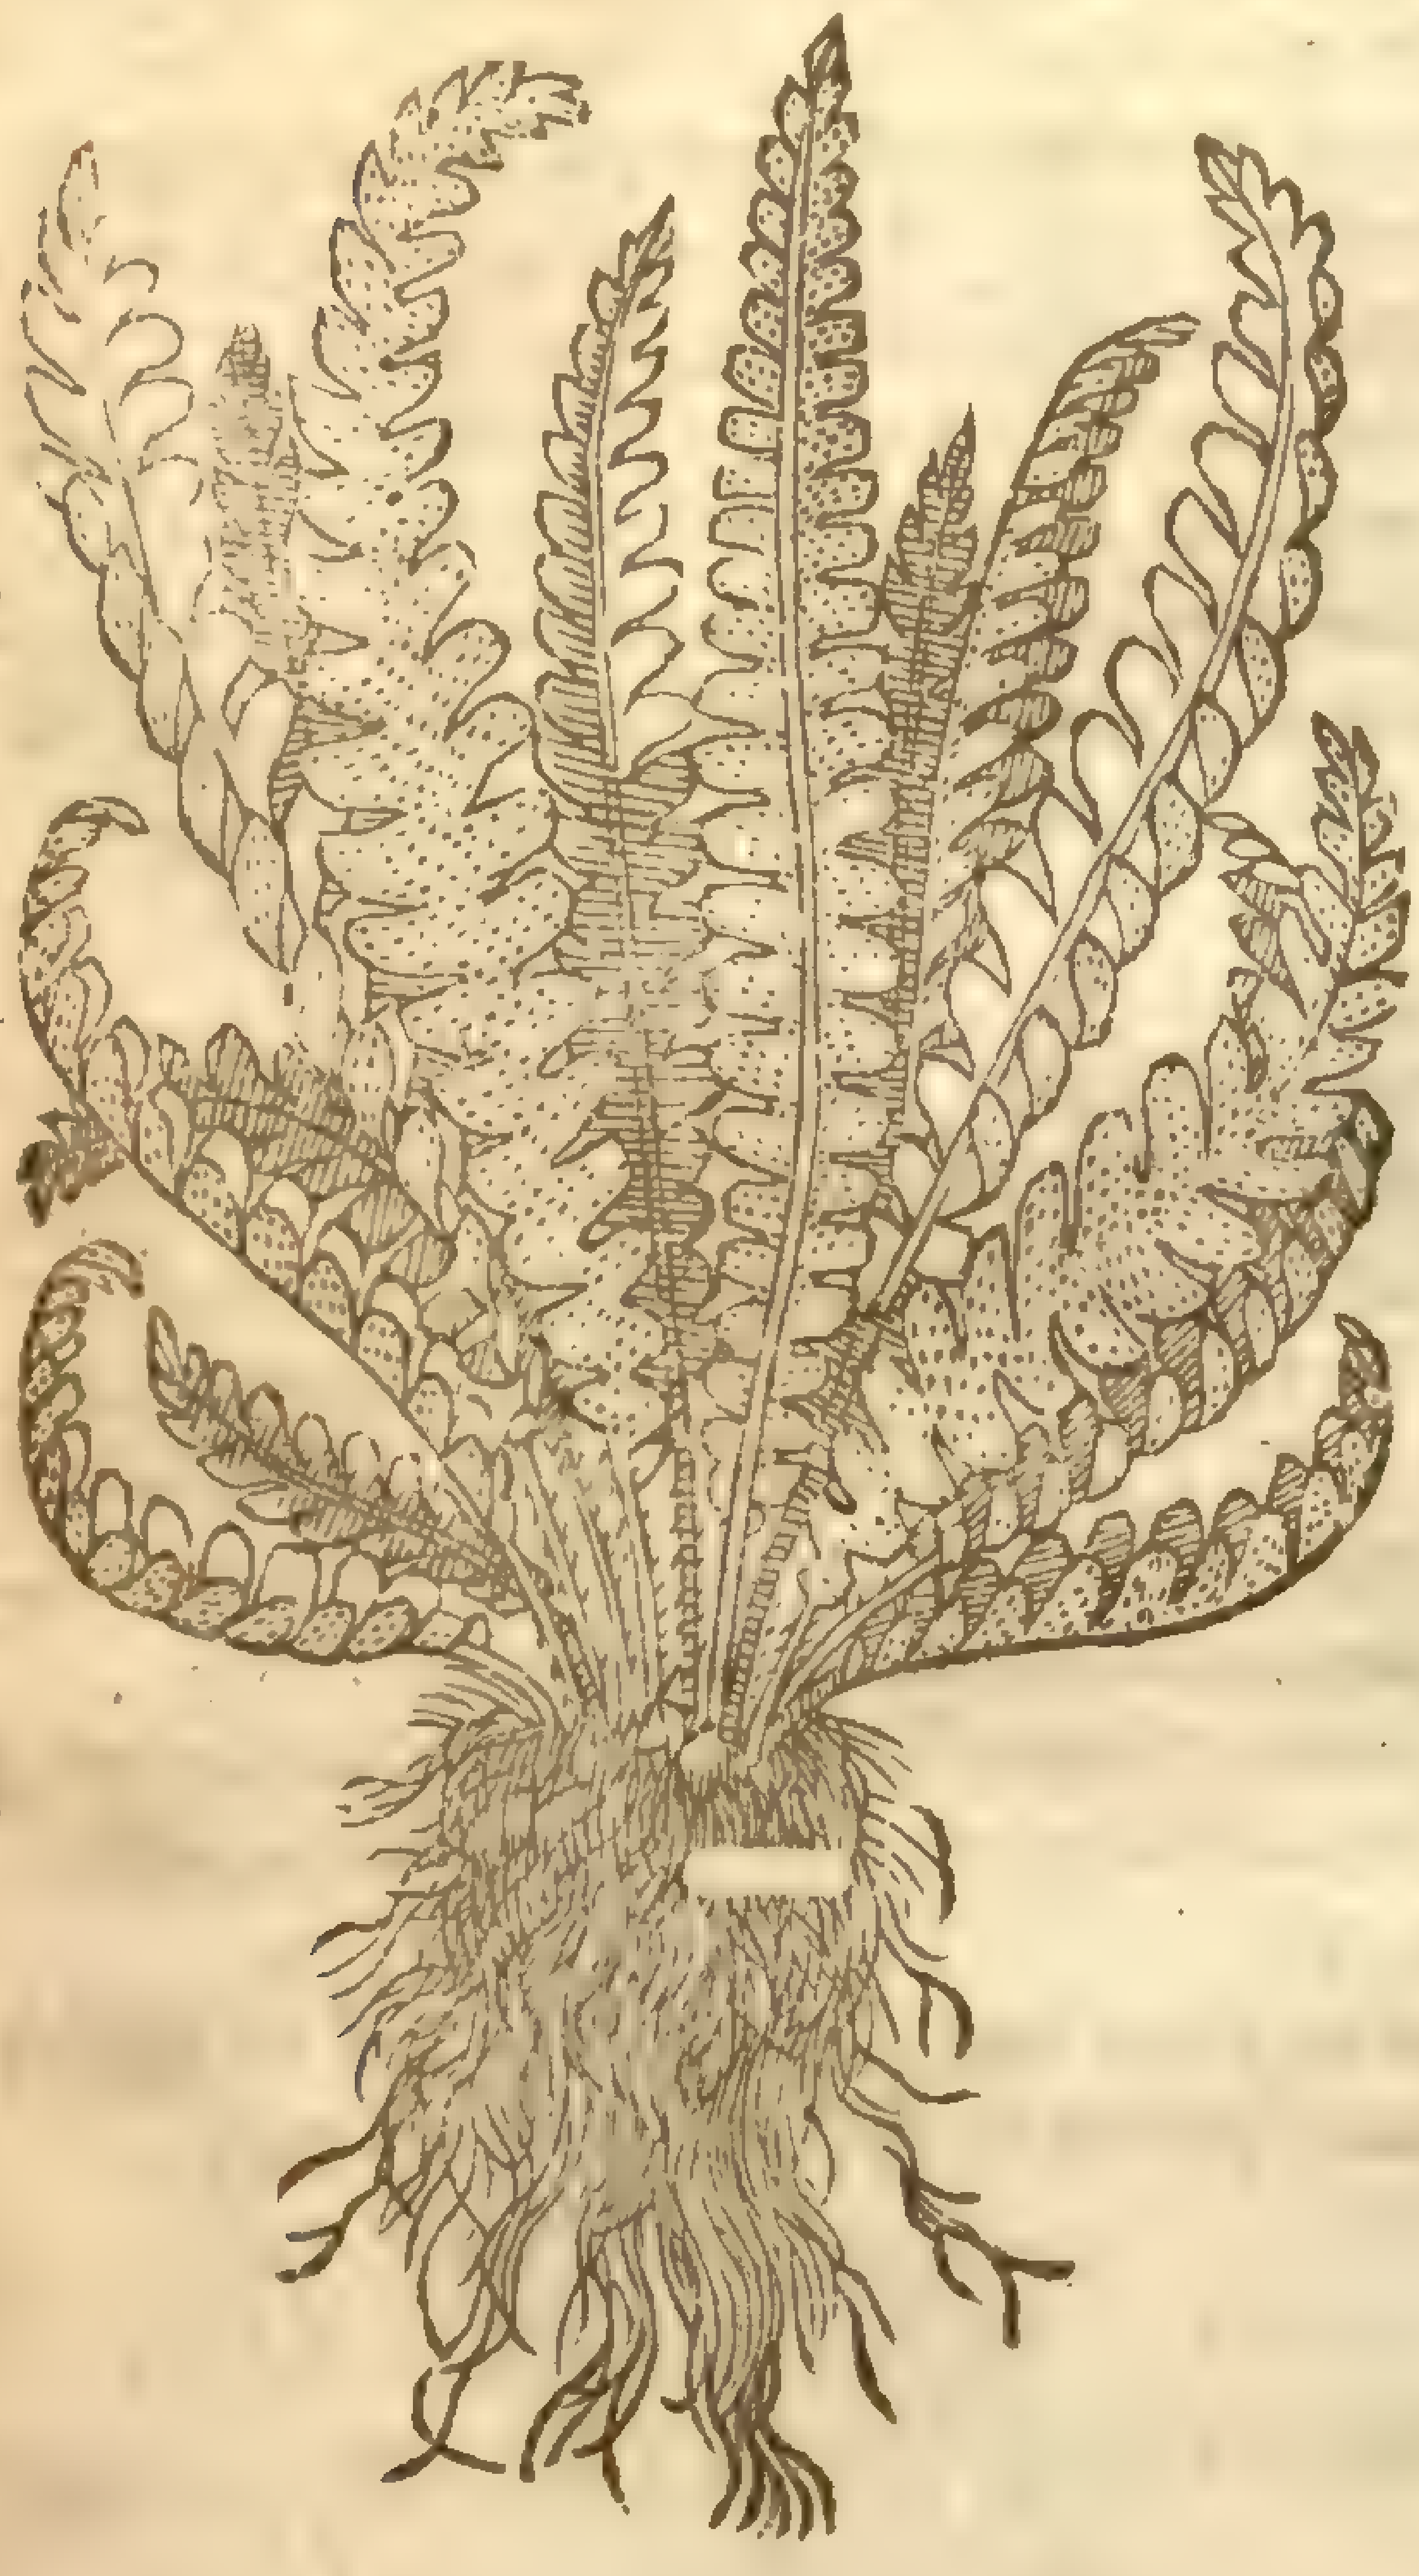
Of Spleene-woort or Milt-waſte.

¶ *The Deſcription.*

1 Spleen-wort, being that kinde of Fern called *Aſplenium* or *Ceterach*, and the true *Scolopendria*, hath leaues a ſpan long, jagged or cut vpon both ſides, euen hard to the middle rib, euery cut or inciſure being as it were cut halfe round (whereby it is knowne from the rough Spleenwort) not one cut right againſt another, but one beſides the other, ſet in ſeueral order, being ſlipperie and green on the vpper ſide, ſoft and downy vnderneath; which when they bee withered are folded vp together like a ſcrole, and hairy without, much like to the rough Bear-worme wherewith men bait their hooks to catch fiſh. The root is ſmall, blacke, and rough, much platted or interlaced, hauing neither ſtalke, floure, nor ſeeds.

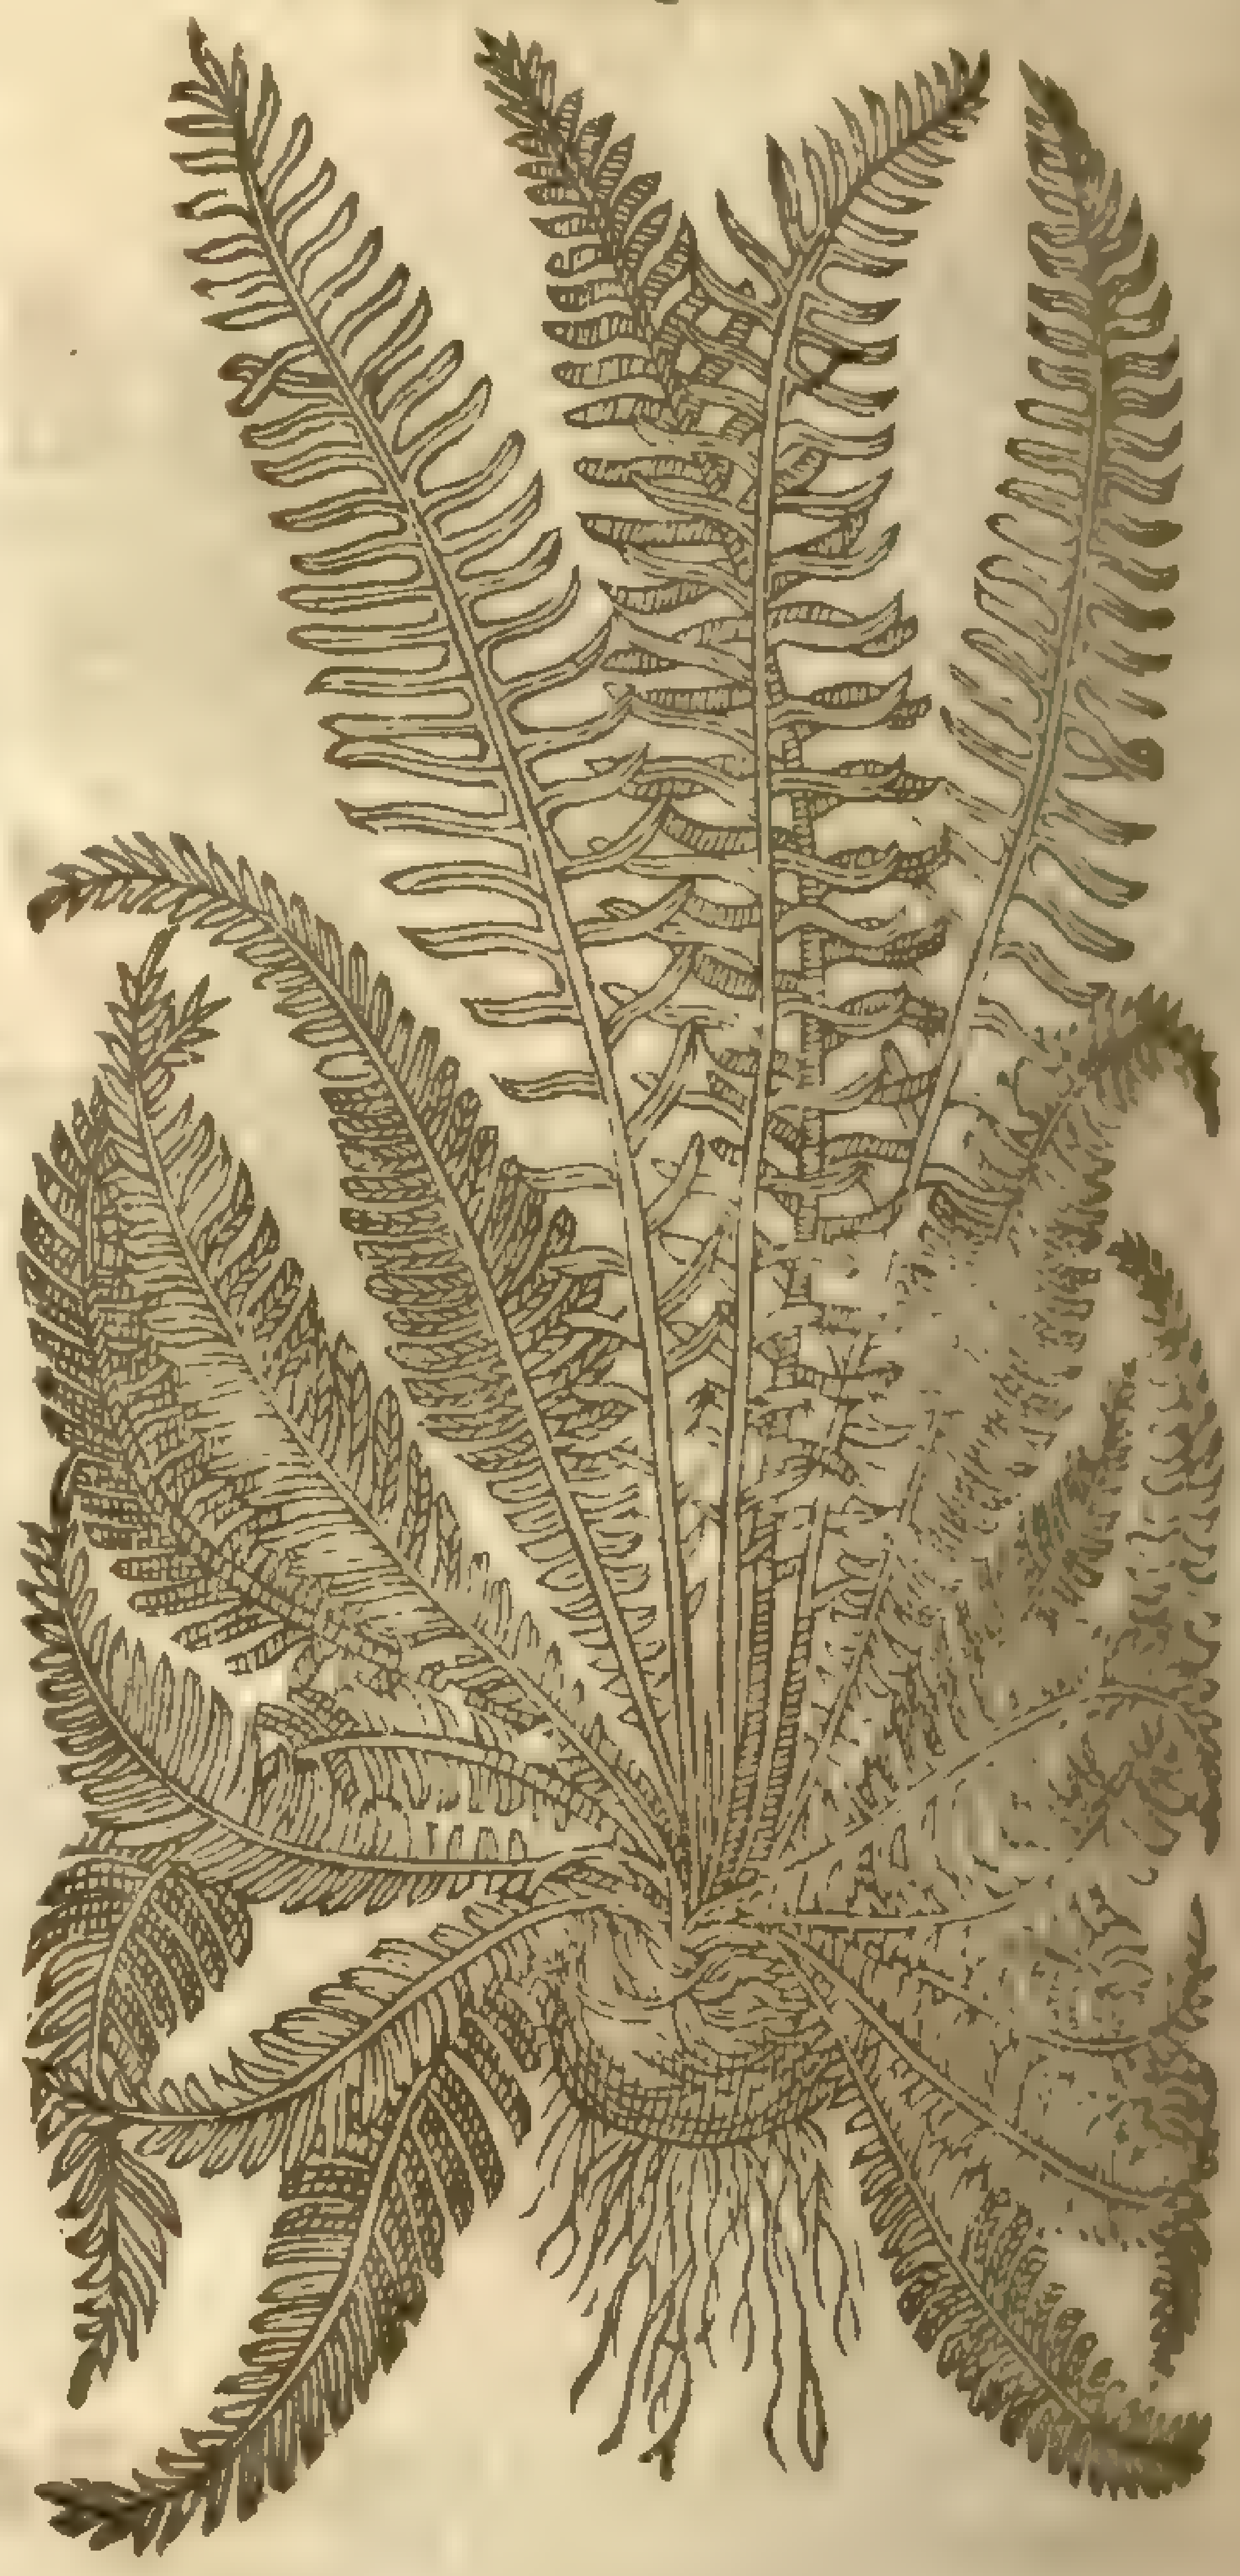
1 *Aſplenium, ſive Ceterach.*
Spleen-wort or Milt-waſte.

Aſplenium Ceterach: [illegible]
Sin. pl. 4, 3, 15
Ibid. 509



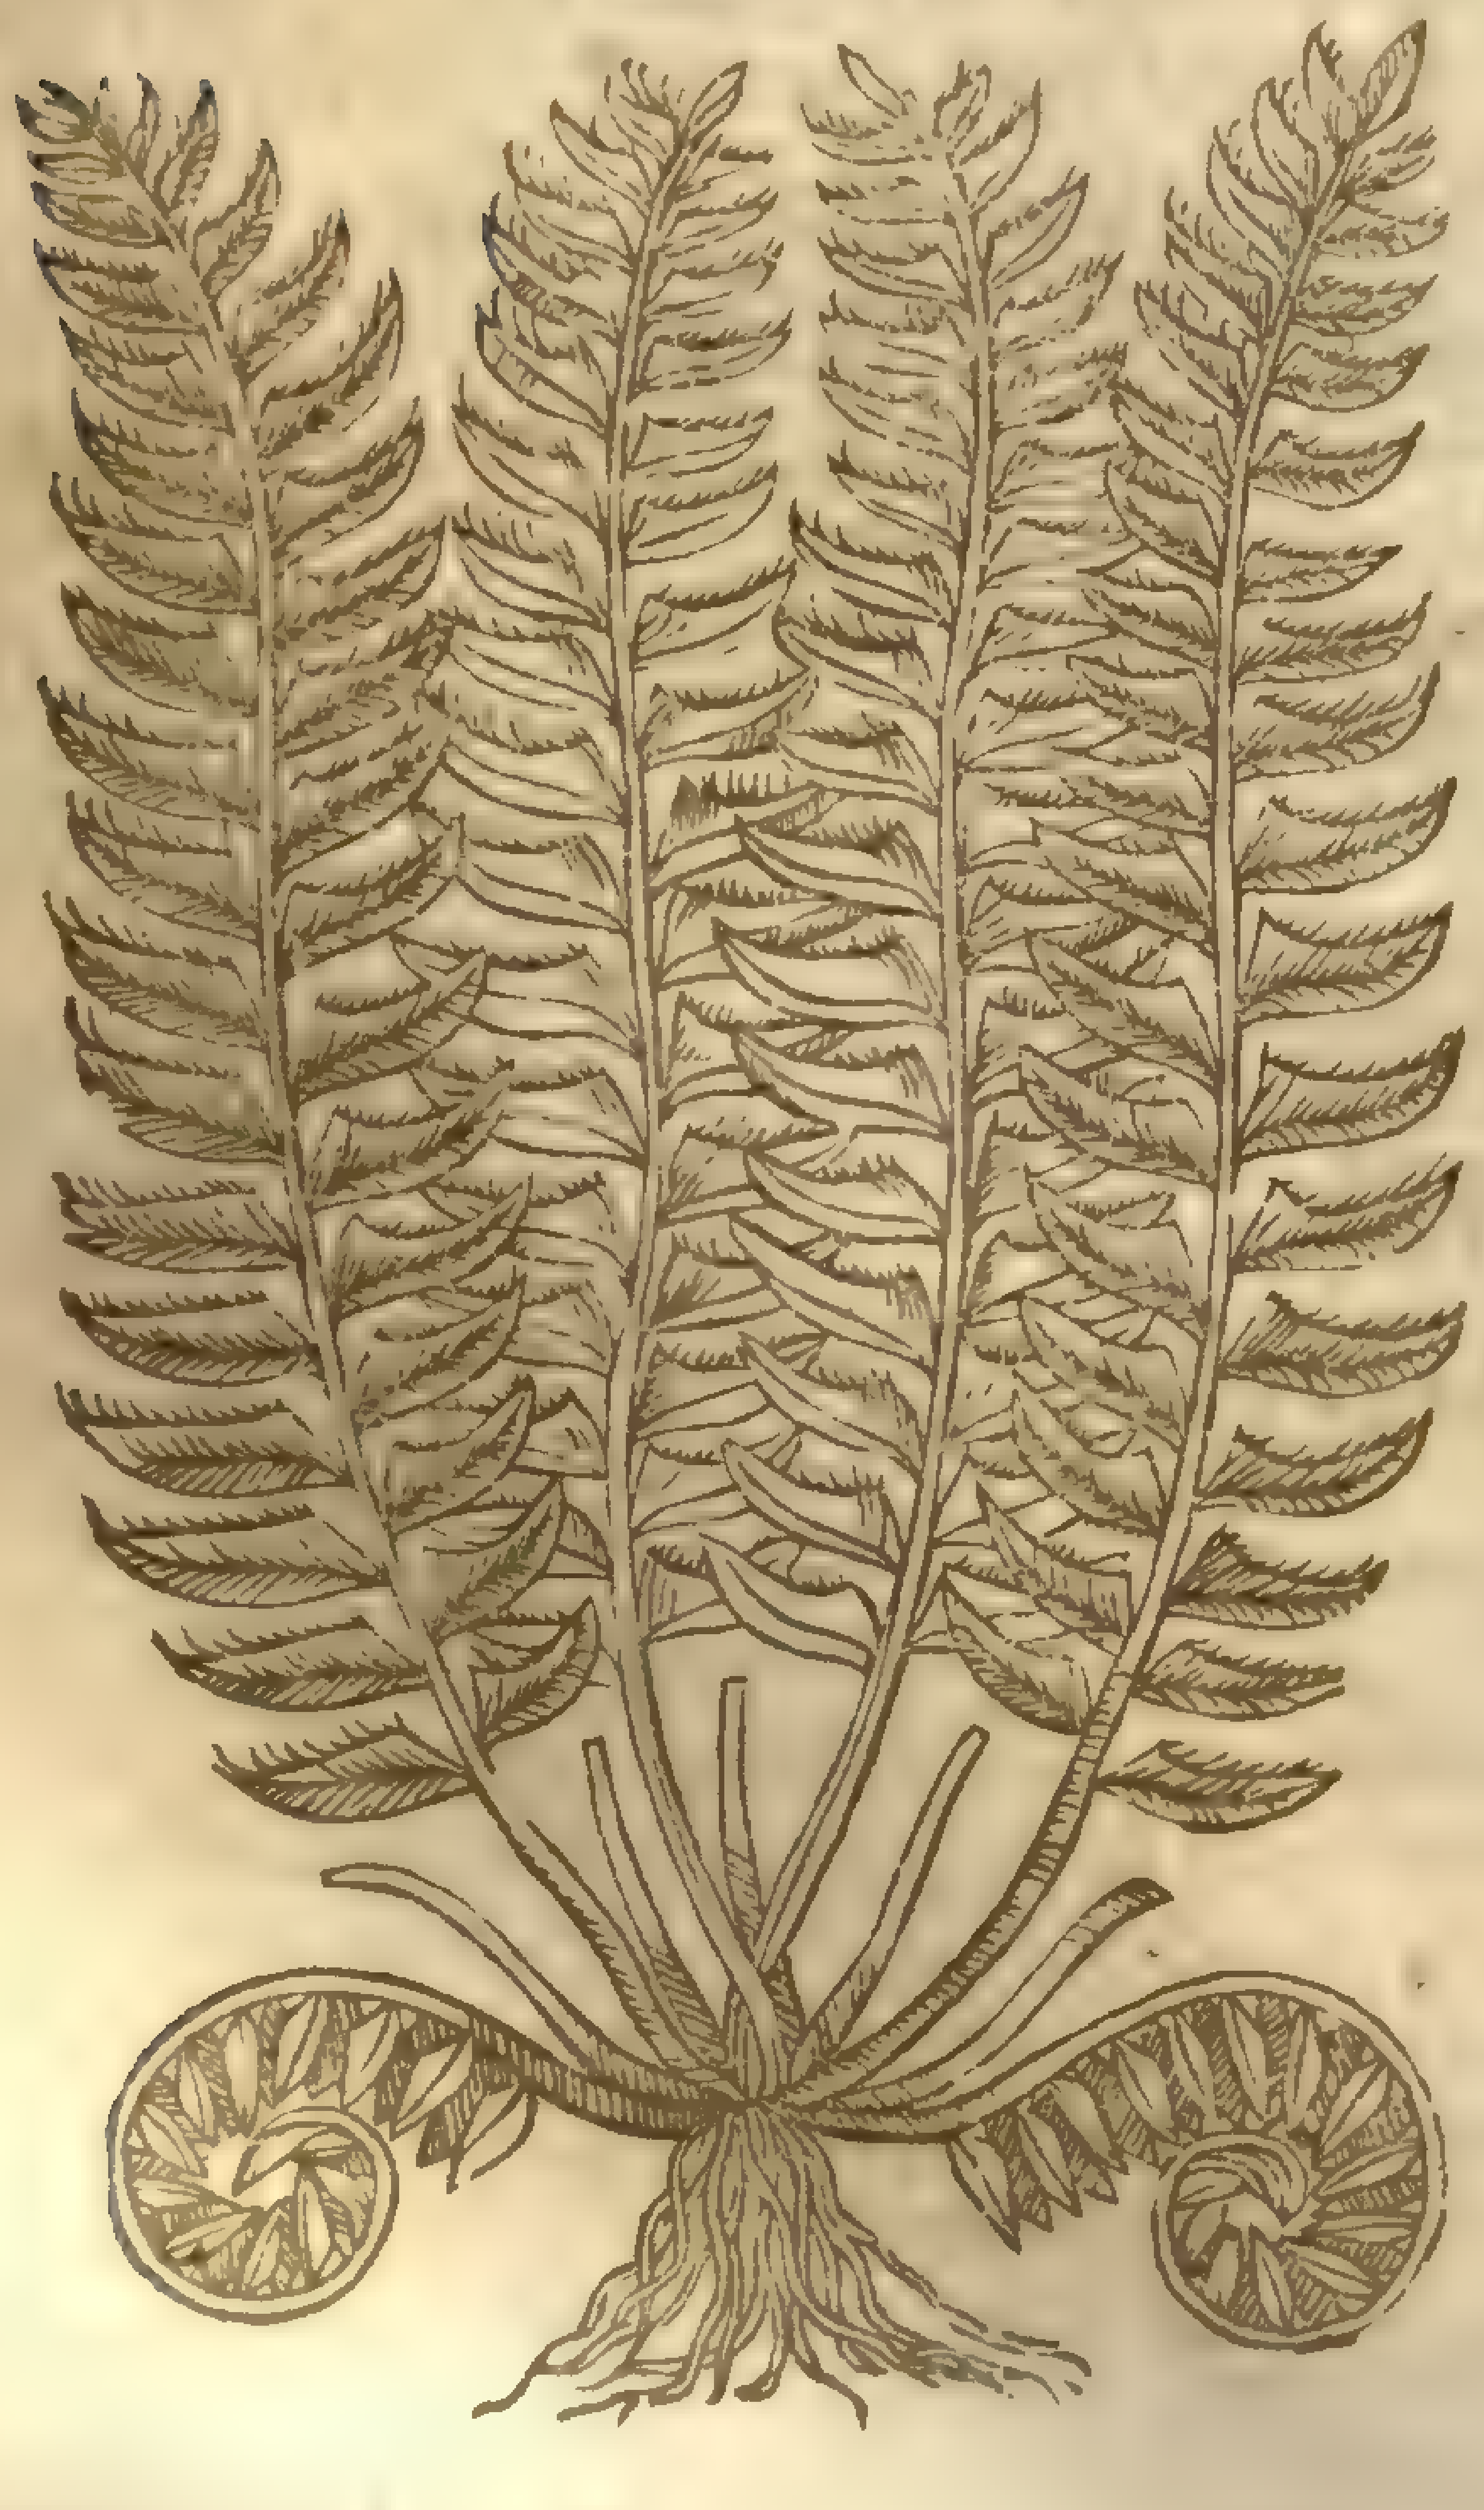
2 *Lonchitis aſpera.*
Rough Spleenwort.

Osmunda spicant; [illegible]
Sin. pl. 4, 3, 17

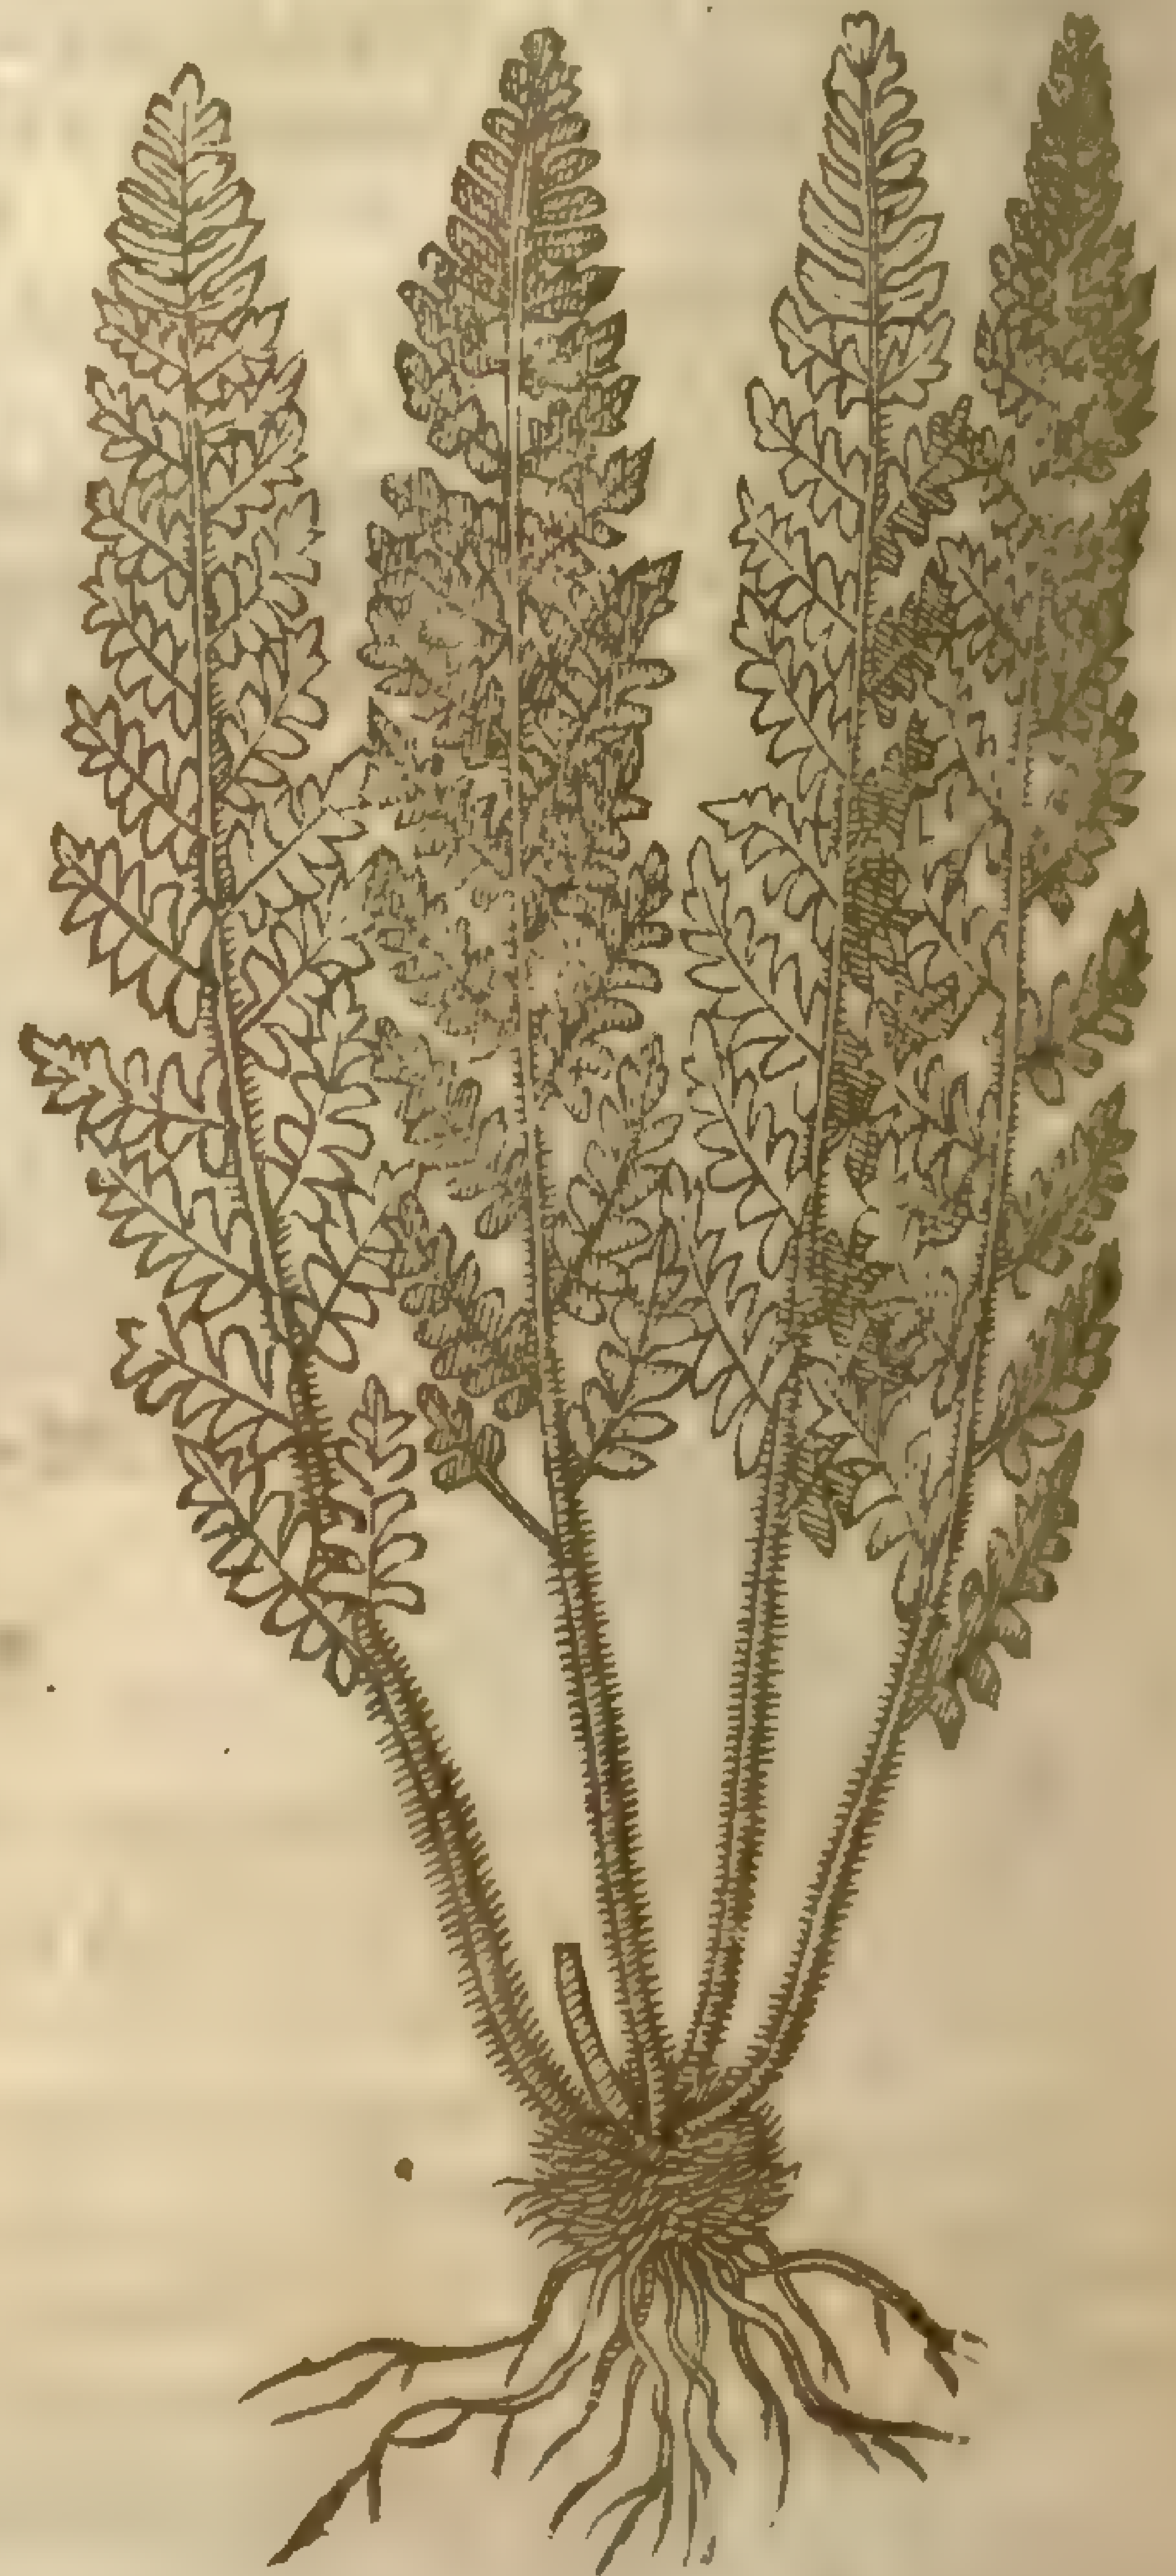


† 3 *Lonchitis aſpera major.*
Great rough Spleen-wort.

Polypodium Lonchitis: [illegible]
Sin. pl. 4. 284



† 4 *Lonchitis Maranthæ.*
Baſtard Spleen-wort.



2 Rough Spleenwort is partly like the other Ferns in ſhew, and beareth neither ſtalk nor ſeed, hauing narrow leaues a foot long and ſomewhat longer, ſlaſhed on the edges euen to the middle rib, ſmooth on the vpper ſide, and of a ſwart green colour vnderneath, rough, as is the leaues of Polypodie: the root is blacke, and ſet with a number of ſlender ſtrings.

‡ 3 This greater Spleenwort hath leaues like Ceterach, of a ſpan long, ſomwhat reſembling thoſe of Polypodie, but that they are more diuided, ſnipt about the edges, and ſharpe pointed: the root is fibrous and ſtringy. This growes on the rocks and mountainous places of Italy, and is the *Lonchitis aspera maior* of *Matthiolus* and others. ‡

4 This kinde of Spleenwort is not only barren of ſtalkes and ſeeds, but alſo of thoſe ſpots and marks wherewith the others are ſpotted: the leaues are few in number, growing pyramide or ſteeple faſhion, great and broad below, and ſharper toward the top by degrees: the root is thick, black and buſhy as it were a Crowes neſt.

¶ *The Place.*

Ceterach groweth vpon old ſtone walls and rocks in darke and ſhadowie places throughout the West parts of England, eſpecially vpon the ſtone walls by Briſtow, as you go to S. *Vincents* rocke, and likewiſe about Bathe, Wells, and Salisbury, where I haue ſeen great plenty thereof.

The rough Spleenwort groweth vpon barren heaths, dry ſandy bankes, and ſhadowie places in moſt parts of England, but eſpecially on a heath by Lonon called Hampſted heath, where it grows in great aboundance.

¶ *The Names.*

Spleenwort or Milt-waſte is called in Greeke Ἀσπλήνιον: in Latine likewiſe *Aſplenium*, and alſo *Scolopendria*: of *Gaza*, *Mula herba*: in ſhops, *Ceterach*: in high-Dutch, **Steynfarne**: in low-Dutch, **Steynuaren**, and **Miltcruyt**: in Engliſh, Spleenwort, Milt-waſte, Scale-Fern, and Stone-Fern: it is called *Aſplenion*, becauſe it is eſpeciall good againſt the infirmities of the Spleene or Milt; and *Scolopendria*, of the likeneſſe it hath with the Beare-worme before remembred.

Rough Milt-waſte is called of diuers of the later writers, *Aſplenium ſylveſtre*, or wild Spleenwort: of ſome, *Aſplenium magnum*, or great Spleenwort. *Valerius Cordus* calls it *Strutiopteris*: and *Dioſcorides Lonchitis aſper*, or rough Spleenwort: in Latine, according to the ſame Author, *Longina*, and *Calabrina*: in Engliſh, rough Spleenwort or Milt-waſte.

¶ *The Nature.*

Theſe plants are of thin parts, as *Galen* witneſſeth, yet are they not hot, but in a meane.

¶ *The Vertues.*

Dioſcorides teacheth, that the leaues boiled in wine and drunke by the ſpace of forty daies, take away infirmities of the ſpleen, help the ſtrangury and yellow jaundice, cauſe the ſtone in the bladder to moulder and paſſe away; all which are performed by ſuch things as be of thinne or ſubtile parts. He addeth likewiſe, that they ſtay the hicket or yeoxing, and alſo hinder conception, either inwardly taken, or hanged about the party: and therefore, ſaith *Pliny*, Spleenwort is not to bee giuen to women, becauſe it bringeth barrenneſſe. A

There be Empericks or blinde practitioners of this age who teach, that with this herb not onely the hardneſſe and ſwelling of the ſpleene, but all infirmities of the liuer alſo may be effectually, and in very ſhort time remoued, inſomuch that the ſodden liuer of a beaſt is reſtored to his former conſtitution againe, that is, made like vnto a raw liuer, if it be boiled again with this herb. B

But this is to be reckoned among the old Wiues fables, and that alſo which *Dioſcorides* tells of, touching the gathering of Spleene-wort in the night, and other moſt vain things, which are found here and there ſcattered in old books: from which moſt of the later Writers do not abſtaine, who many times fill vp their pages with lies and frivolous toyes, and by ſo doing do not a little deceive yong Students. C

---

‡ Formerly vnder the title of *Lonchitis Maranthæ* was put the figure now in the third place, and the figure which ſhould haue bin there was in the third place of the next Chapter, vnder the title of *Filicula petræa mas*.

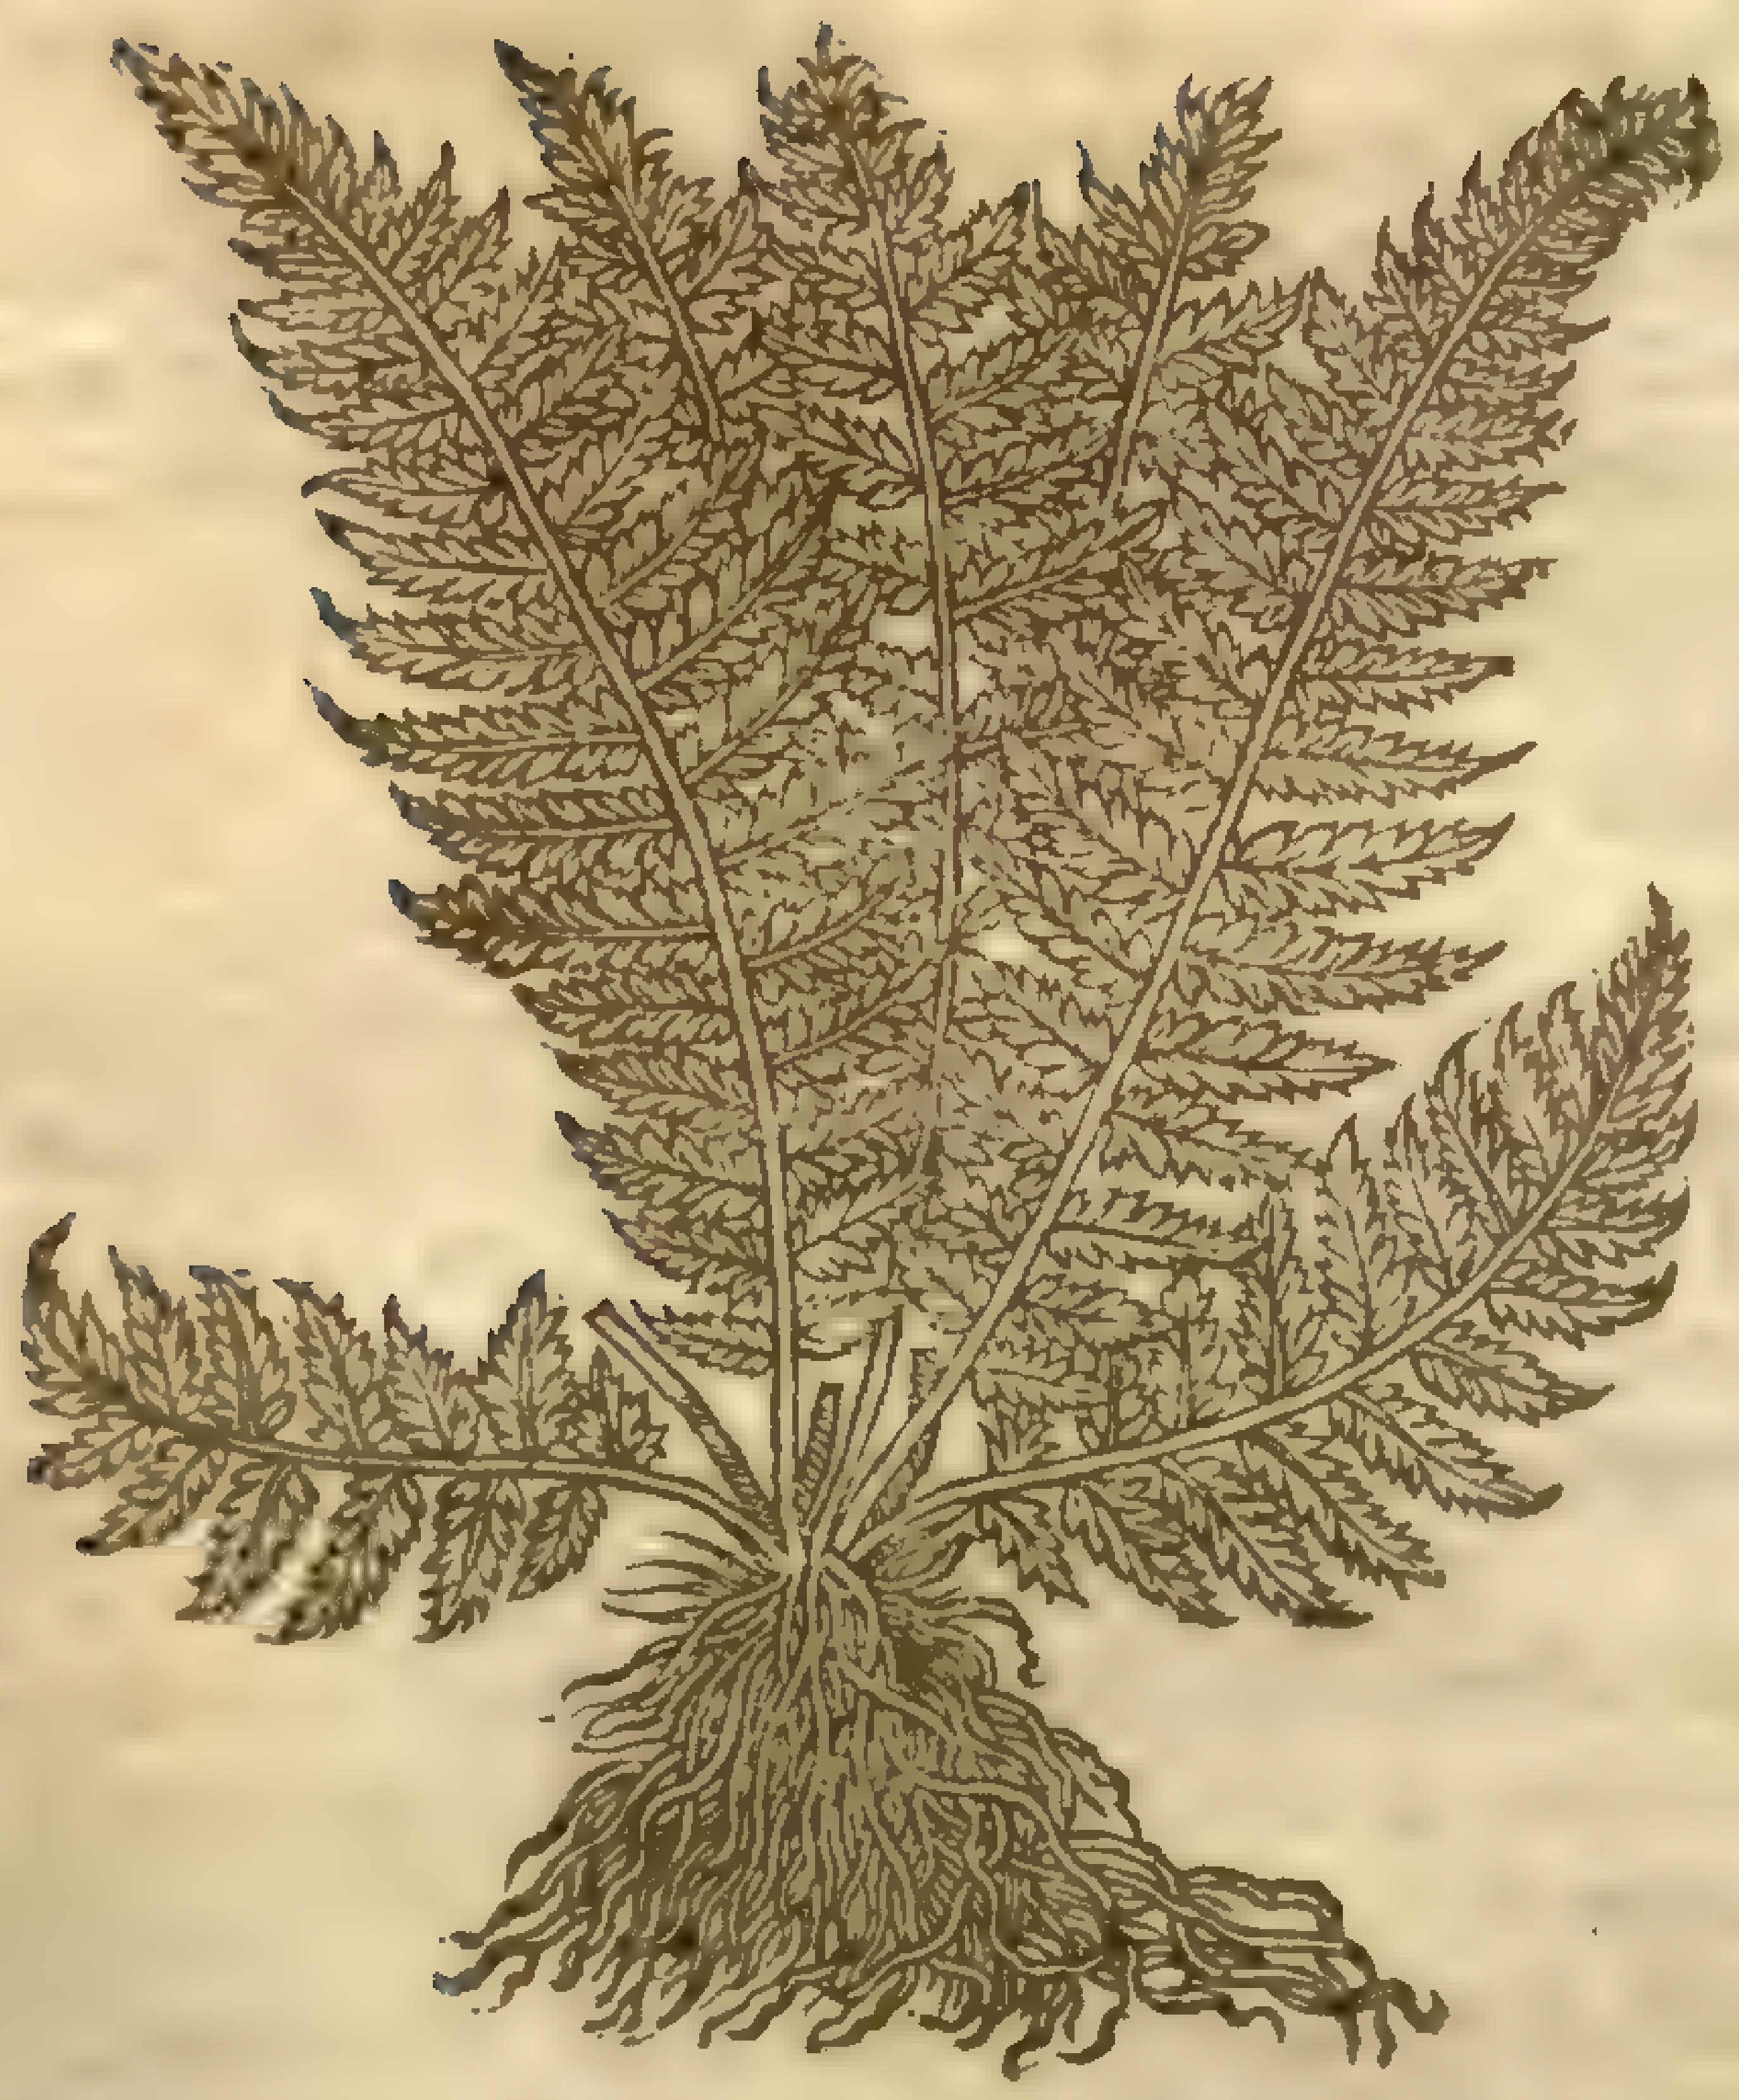
CHAP. 472: *Of diuers ſmall Fernes.*

¶ *The Deſcription.*

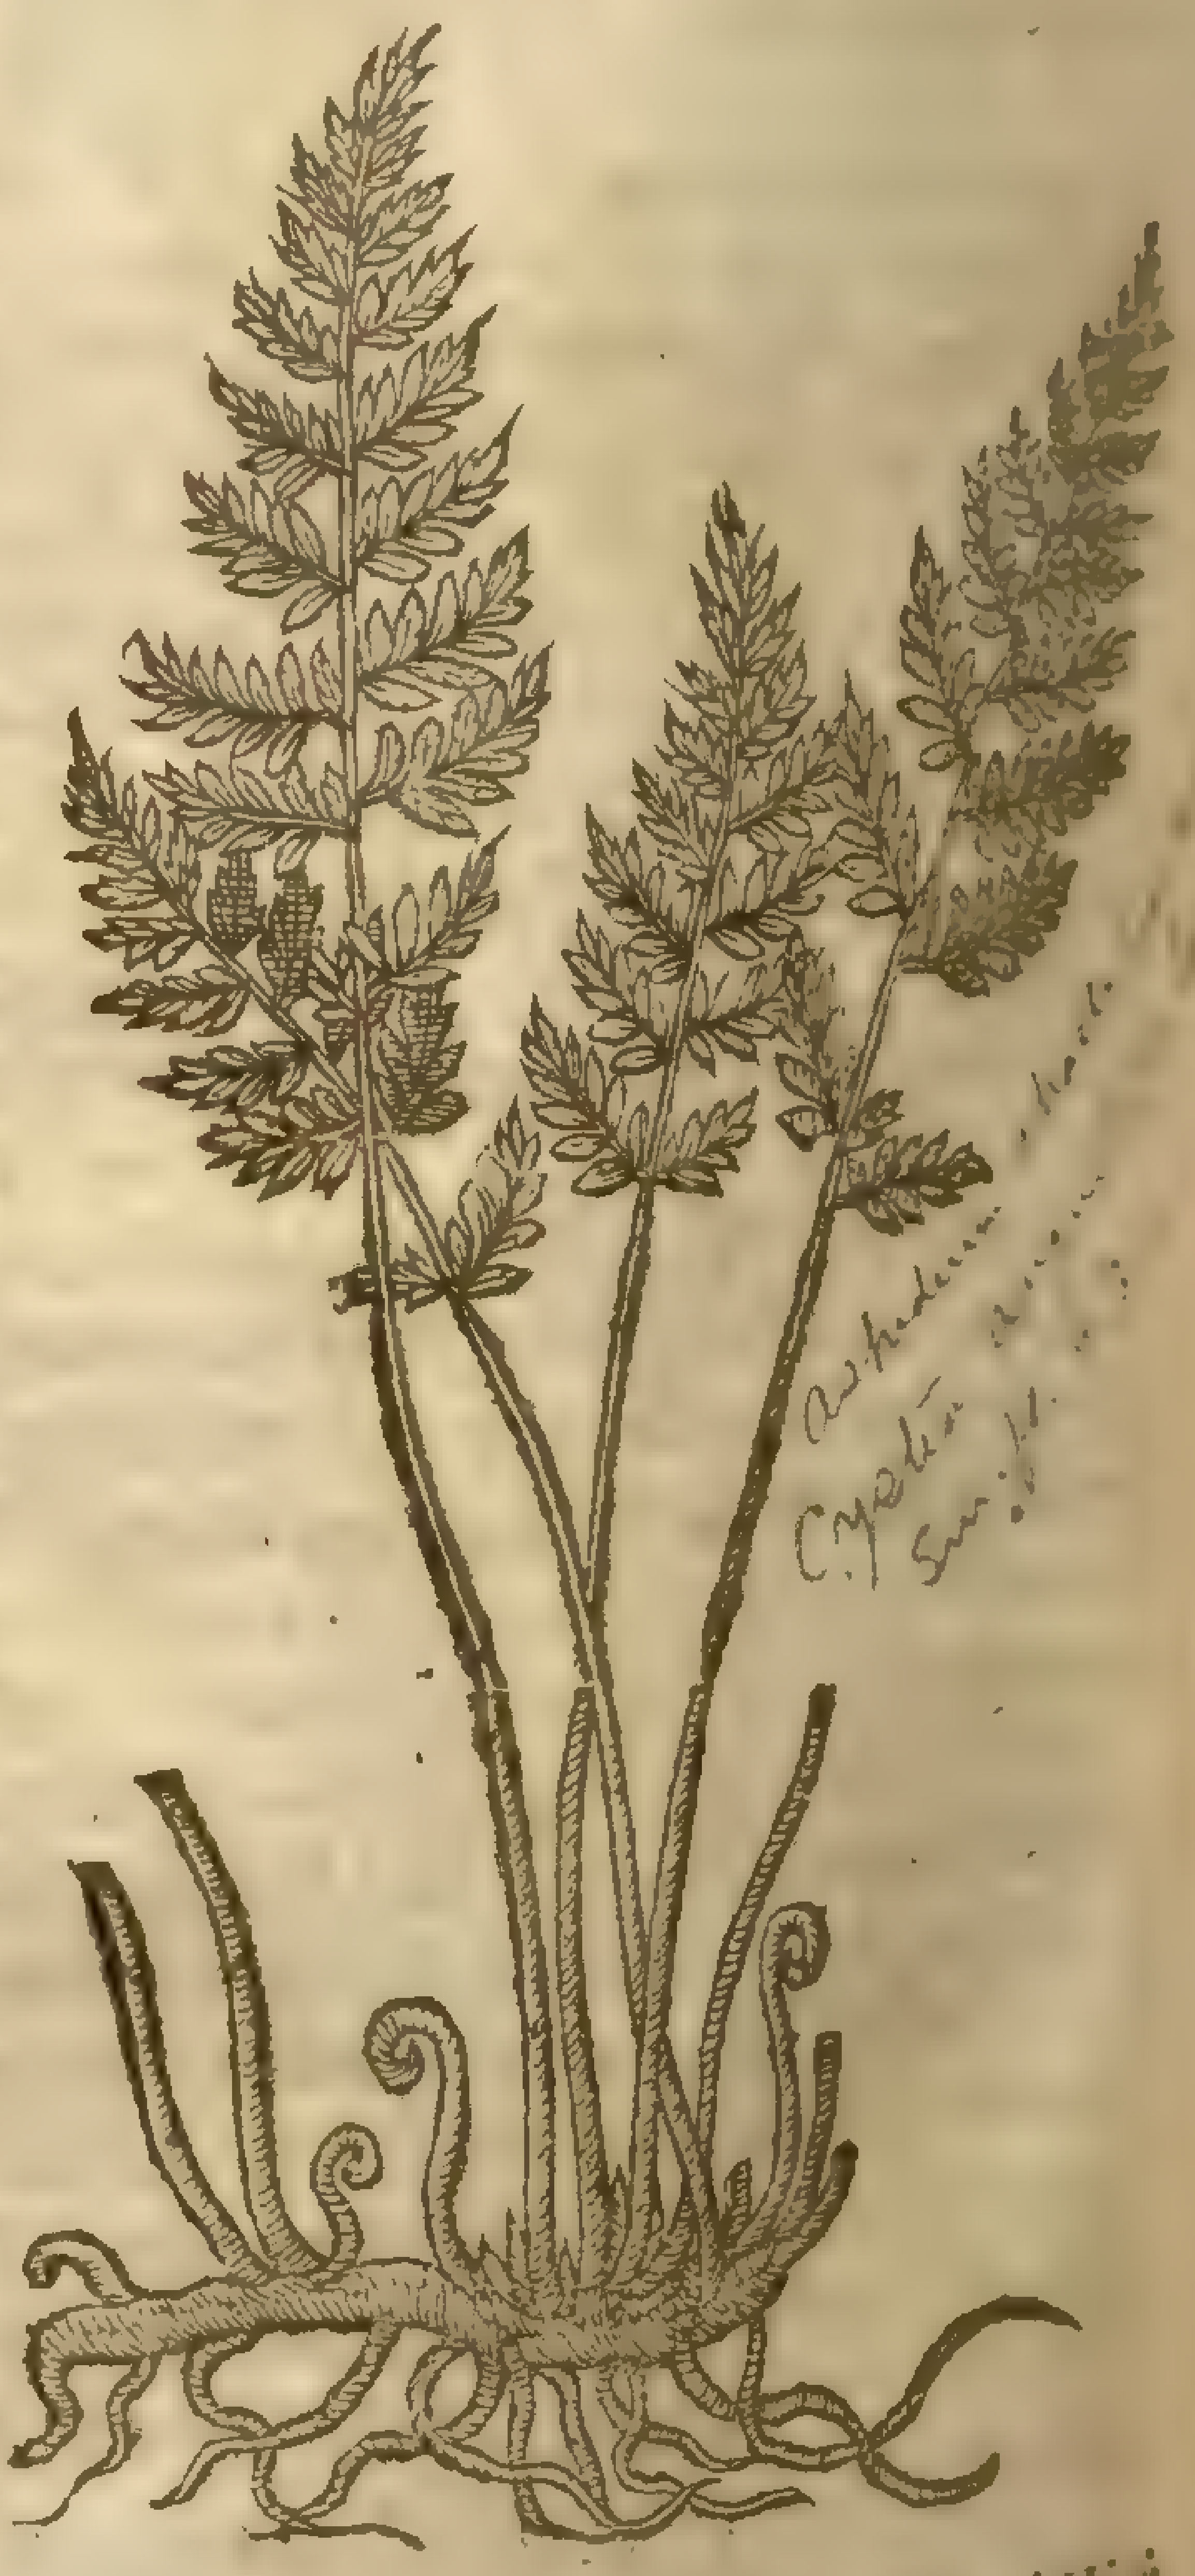
1 THis ſmall or dwarfe Ferne, which is ſeldome found except in the banks of ſtony fountains, wells, and rocks bordering vpon riuers, is very like the common Brakes in leaues, but altogether leſſer. The root is compoſed of a bundle of blacke threddy ſtrings.

2 The female, which is found likewiſe by running ſtreams, wells, and fountaines vpon rockes and ſtony places, is like the precedent, but is a great deale ſmaller, blacker of colour, fewer roots, and ſhorter.

1 *Filicula fontana mas.*
The male fountaine Ferne.



† 3 *Filicula petraea mas.*
The male dwarfe ſtone Ferne.



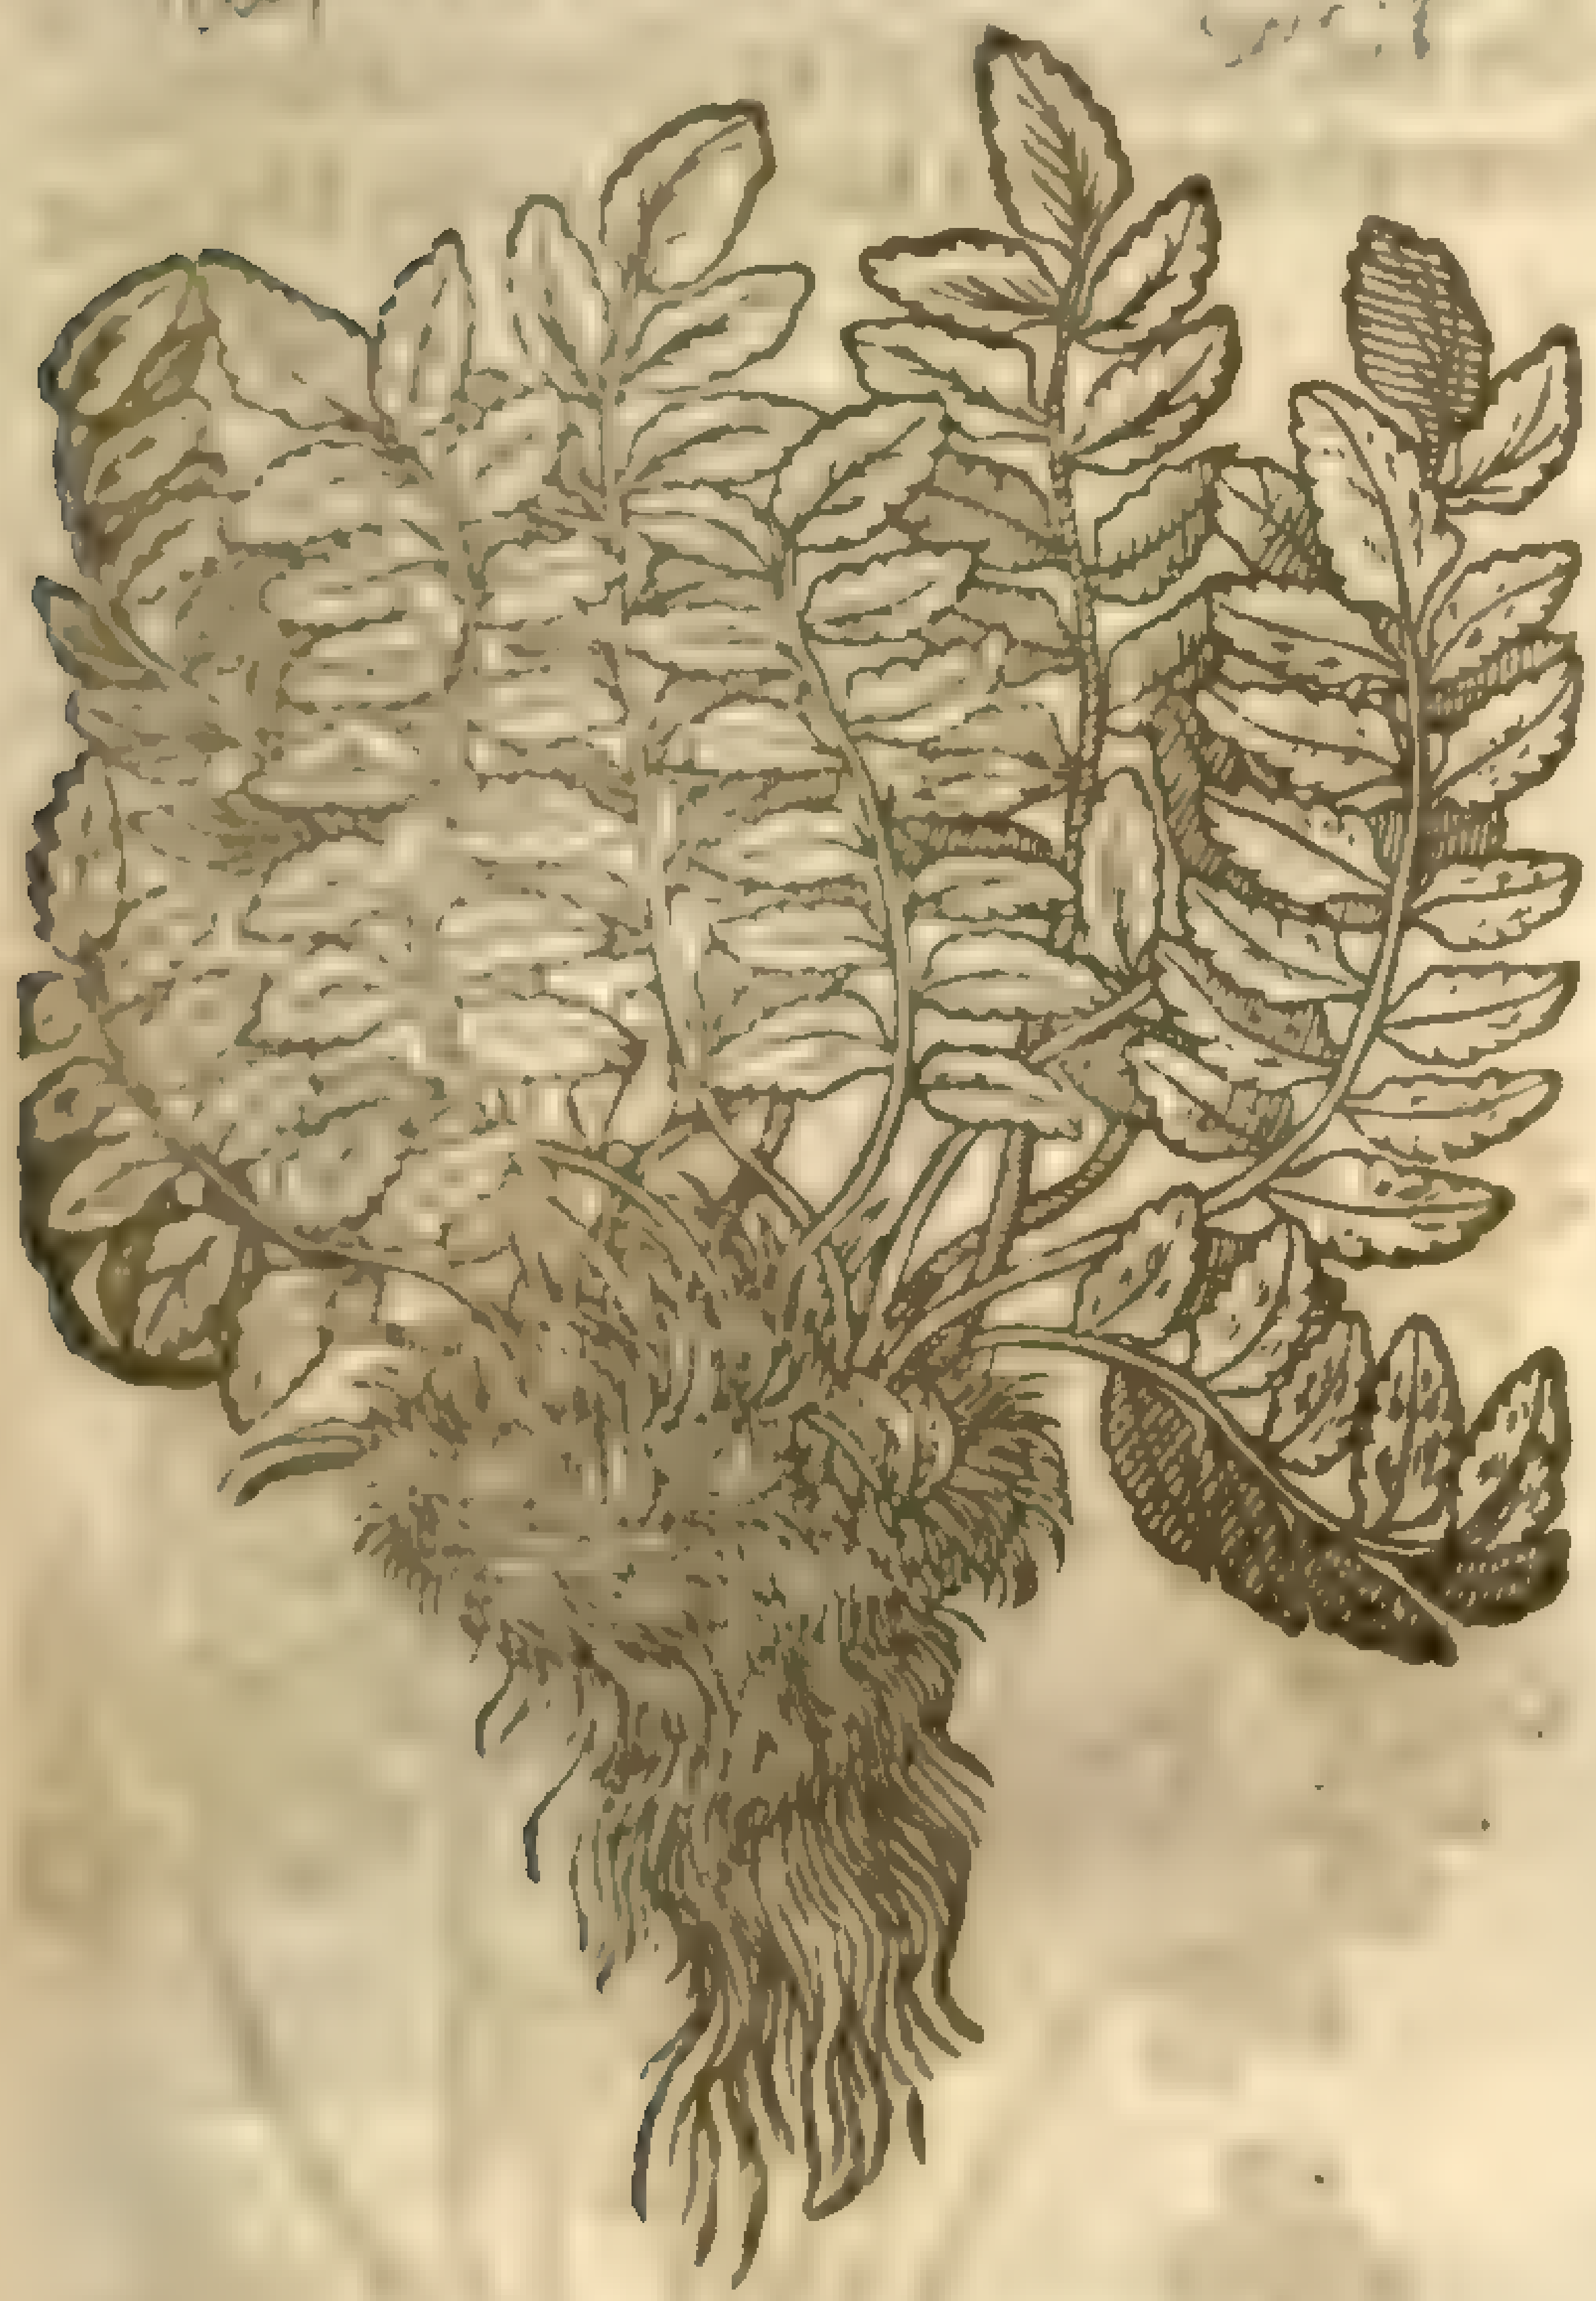
Aspidium [illegible]
Cystopteris [illegible]
[illegible]

3 The male dwarfe Ferne, that groweth vpon the ſtony mountaines of the North and West parts of England, eſpecially toward the ſea, and alſo in the joints of ſtone walls among the moun- hath ſmall leaues deeply cut on both ſides, like vnto *Ceterach* or Spleen-wort, barren both of ſeeds and ſtalks, as alſo of thoſe ſpots or marks that are to be ſeen vpon the back part of the other Fe the root creepeth along, ſet with ſome few hairy ſtrings reſembling thoſe of the Oke-Ferne cal *Dryopteris.*

4 The female ſtone Ferne hath diuers long leaues riſing from a threddy root, contrary to of the male, compoſed of many ſmall leaues finely minced or cut like the teeth of a ſaw, of a riſh green colour, without any ſpots or marks at all, ſeeds, or ſtalks, which groweth vnder rockes and craggy mountaines in moſt places. ‡ From a ſmall root compoſed of ma hairy and intricately folding ſtrings, come vp many leaues two or three inches high, darke greene, and ſhining: in the diuiſion, growth, poſition, ſhape and taſte it reſembles Ferne, and hath alſo ruſty ſpots on the backe: the middle ribbe and ſtalke is of a ſhining

4 *Filicula Petræa fœmina; ſiue Chamæfilix marina Anglica.*
The female dwarfe ſtone Ferne.

[illegible]



niſh ſilken colour: it growes in the chinkes of the Rocks by the Sea ſide in Cornewall.

¶ *The Place.*

The place is ſufficiently touched in the deſcription.

¶ *The Time.*

They flouriſh both Winter and Summer; for when the leaues wither by reaſon of age, there ariſe young to ſupply the place, ſo that they are not to be ſeen without greene and withered leaues both at once.

¶ *The Names.*

It ſufficeth what hath bin ſaid of the names in their ſeuerall titles: notwithſtanding the laſt deſcribed wee haue called *Chamæfilix marina Anglica*: which groweth vpon the rockie cliffe neere Harwich, as alſo at Douer, among the Sampire that there groweth.

¶ *The Temperature and Vertues.*

A Their temperature and faculties in working are referred vnto the kinds of black Oke Ferns, called *Dryopteris*, and *Onopteris*.

---

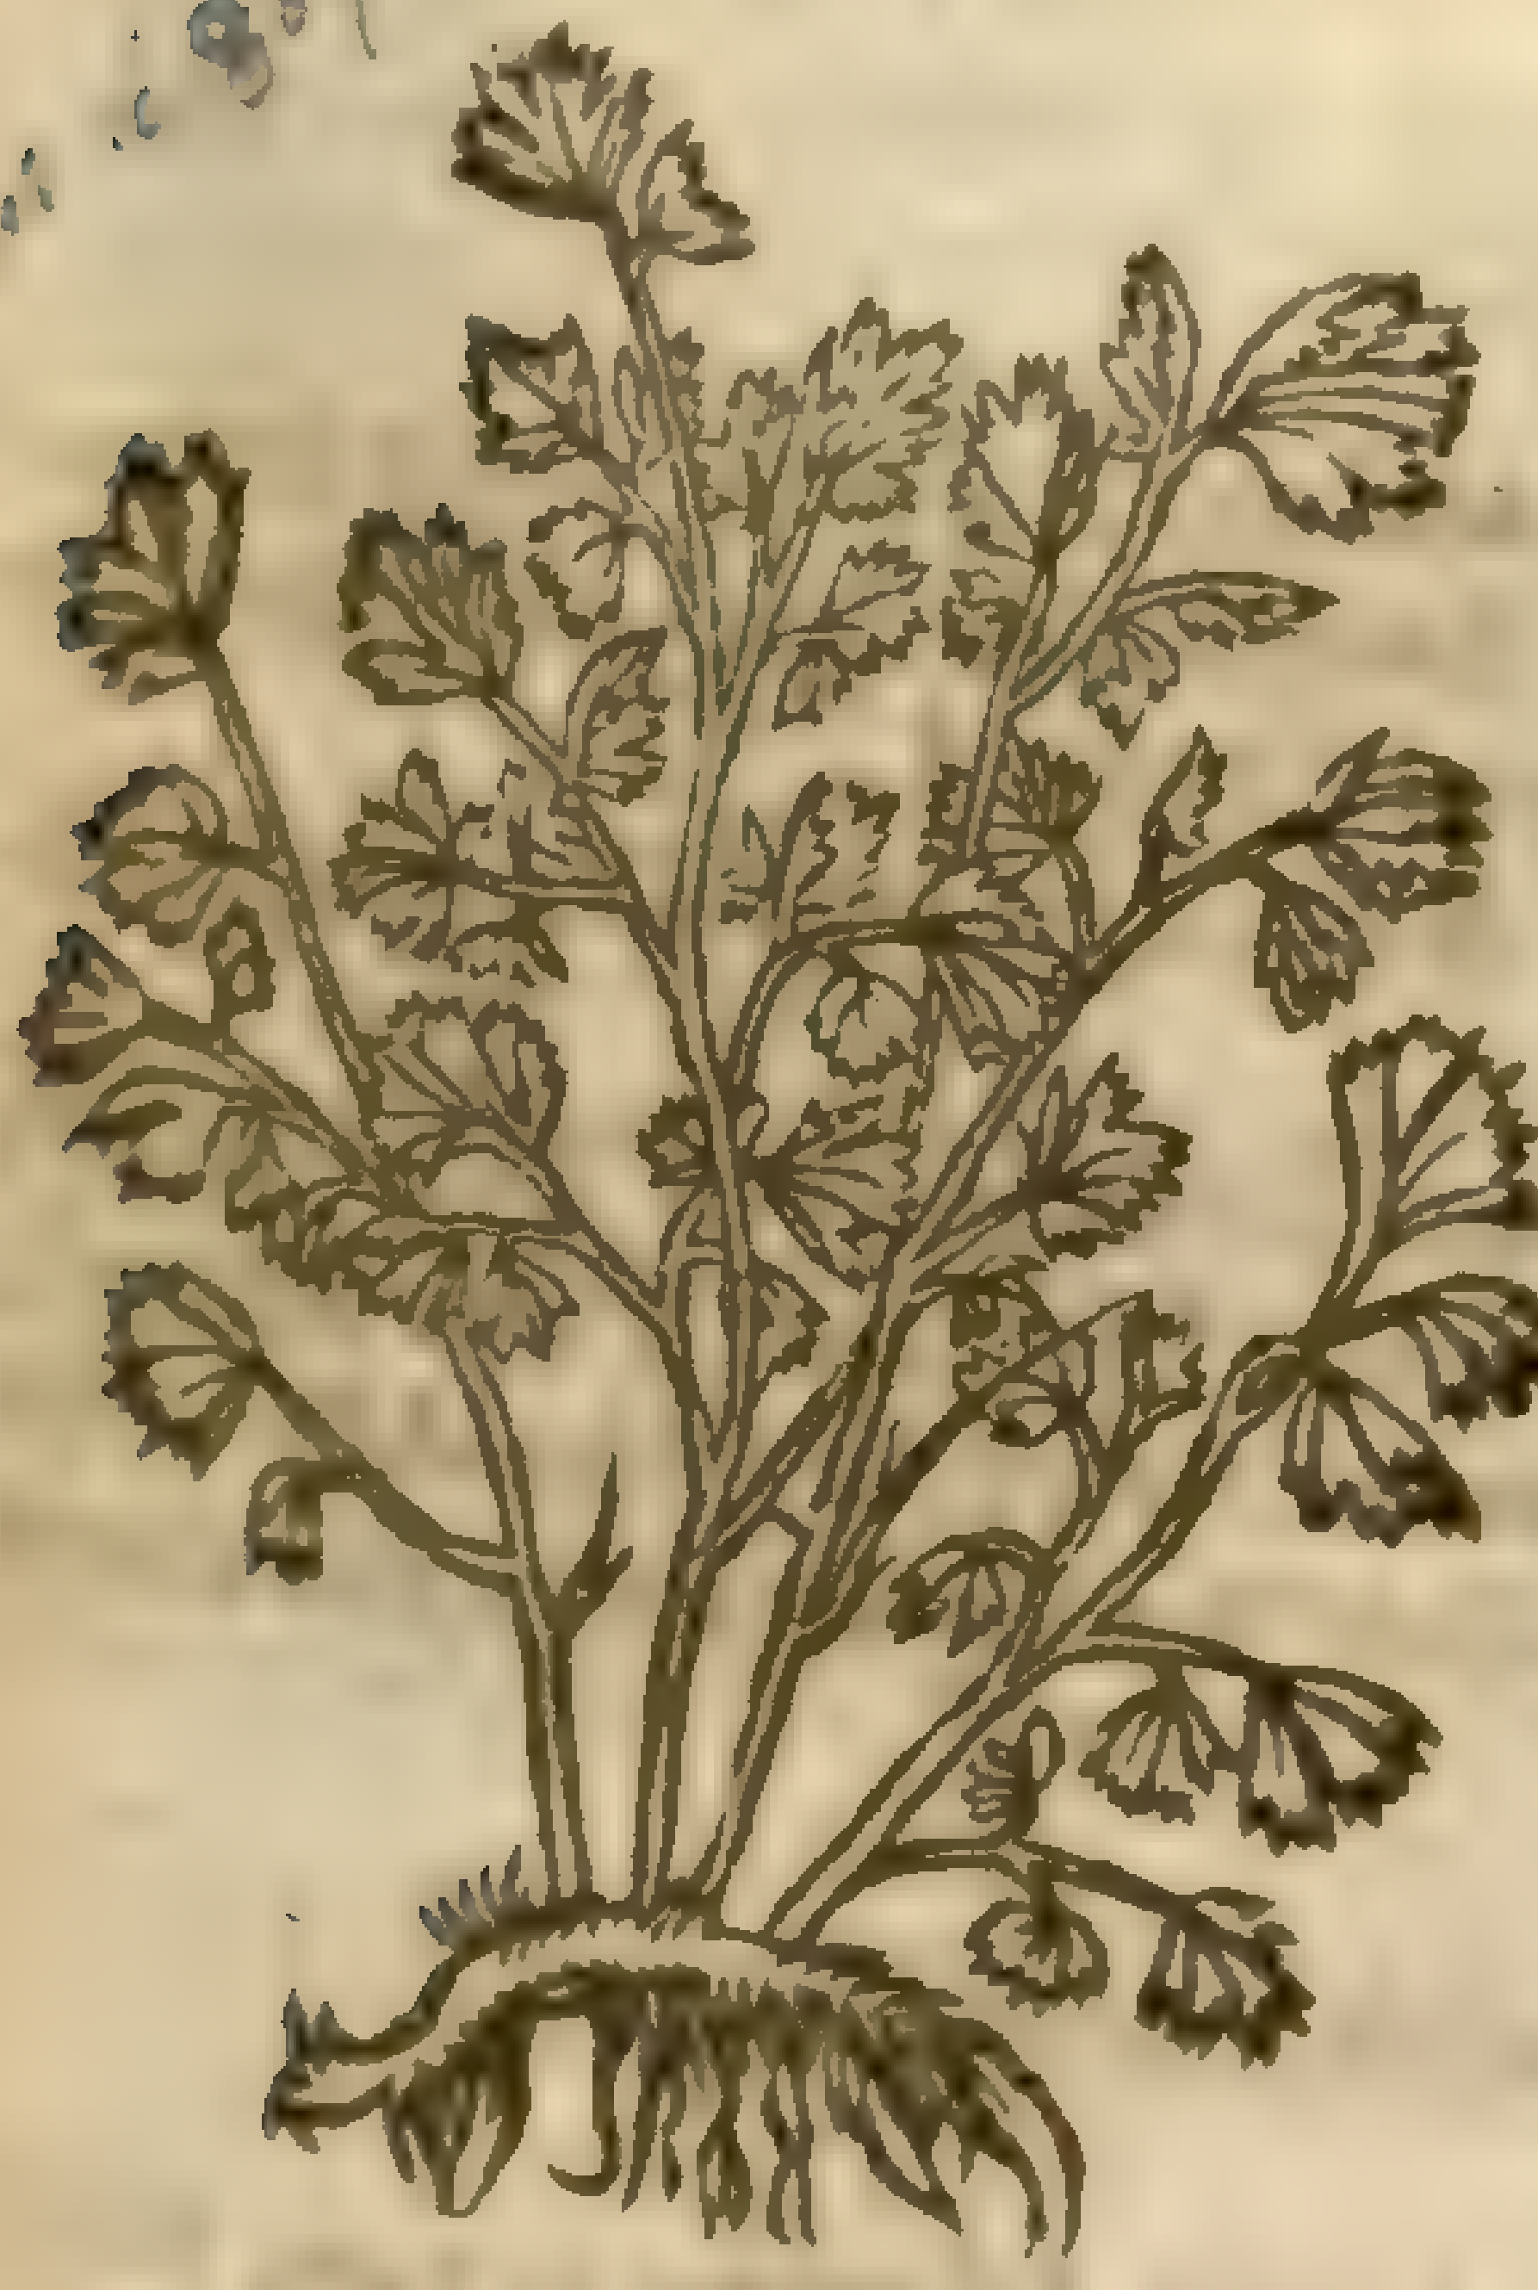
† It is hard to ſay what our Author in this chapter meant, by his figures and deſcriptions, wherefore I haue left his deſcriptions as I found them: the ſecond figure which was very like the firſt I haue omitted: for the third, which was of the *Lonchitis Maranthæ*, mentioned in the foregoing chapter, I haue put *Cluſius* his figure of his *Filix ſaxatilis* 2. which growes in ſuch places, and reaſonable well fits our Authors deſcription: in the fourth place I haue put *Lobels Chamæfilix marina Anglica*, and his deſcription, which our Author as I iudge, intended in that place to haue giuen vs.

CHAP. 473. *Of true Maiden-haire.*

¶ *The Kindes.*

THeophraſtus and *Pliny* haue ſet downe two Maiden-haires, the blacke and the white, whereunto may be added another called *Ruta muraria*, or wall Rue, equall to the others in facultie, whereof we will intreat.

1 *Capillus Veneris verus.*
True Maiden-haire.



Adianthum [illegible]

Sp. pl. [illegible] 21

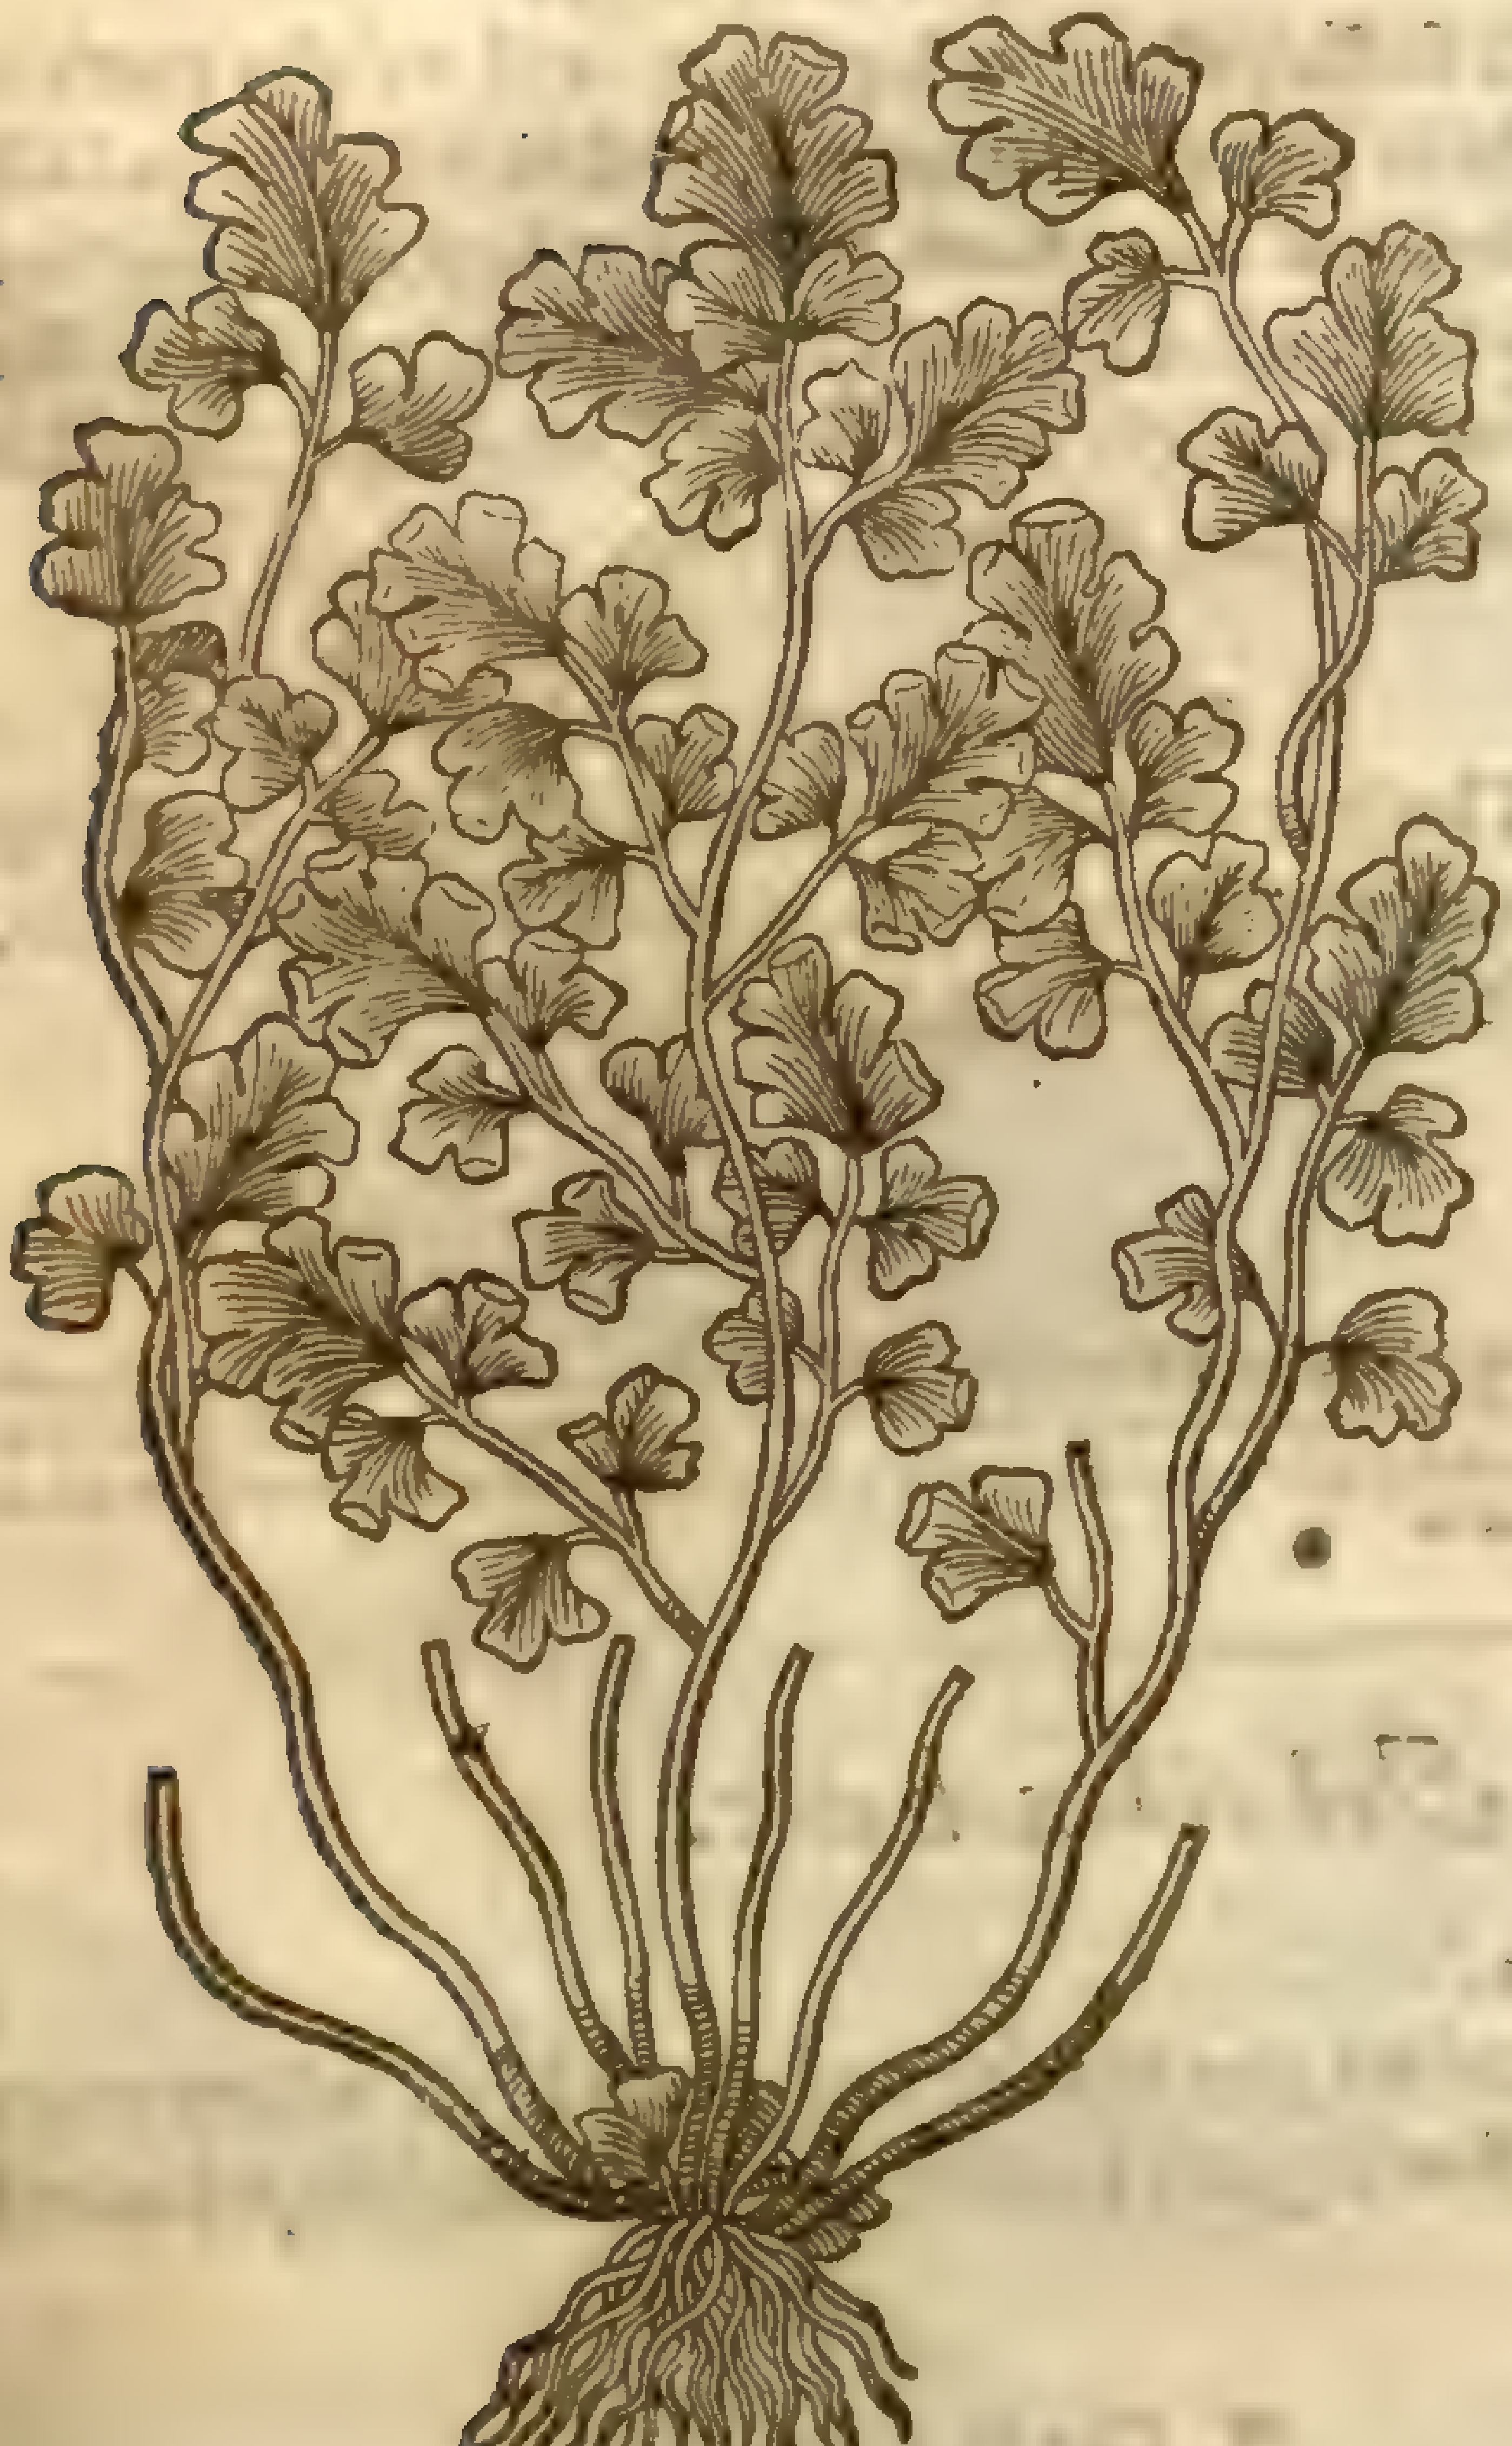
¶ *The Deſcription.*

1 WHoſo will follow the variable opinions of Writers concerning the Fern called *Adianthum verum*, or *Capillus Veneris verus*, muſt of neceſſitie be brought into a Labyrinth of doubts, conſidering the diuers opinions thereof: but this I know that Venus-haire, or Maidenhaire, is a low herb growing an hand high, ſmooth, of a darke crimſon colour, and glittering withall; the leaues be ſmal, cut in ſunder, and nicked in the edges ſomething like thoſe of Coriander, confuſedly or without order placed, the middle rib whereof is of a blacke ſhining colour: the root conſiſteth of manie ſmall threddy ſtrings.

2 This Aſſyrian Maiden-haire is likewiſe a baſe or low herbe, hauing leaues, flat, ſmooth, and plaine, ſet vpon a blackiſh middle rib, like vnto that of the other Maiden-haire, cut or notched in the edges, nature keeping no certain forme, but making one leafe of this faſhion, and another far different from it: the root is tough and threddie.

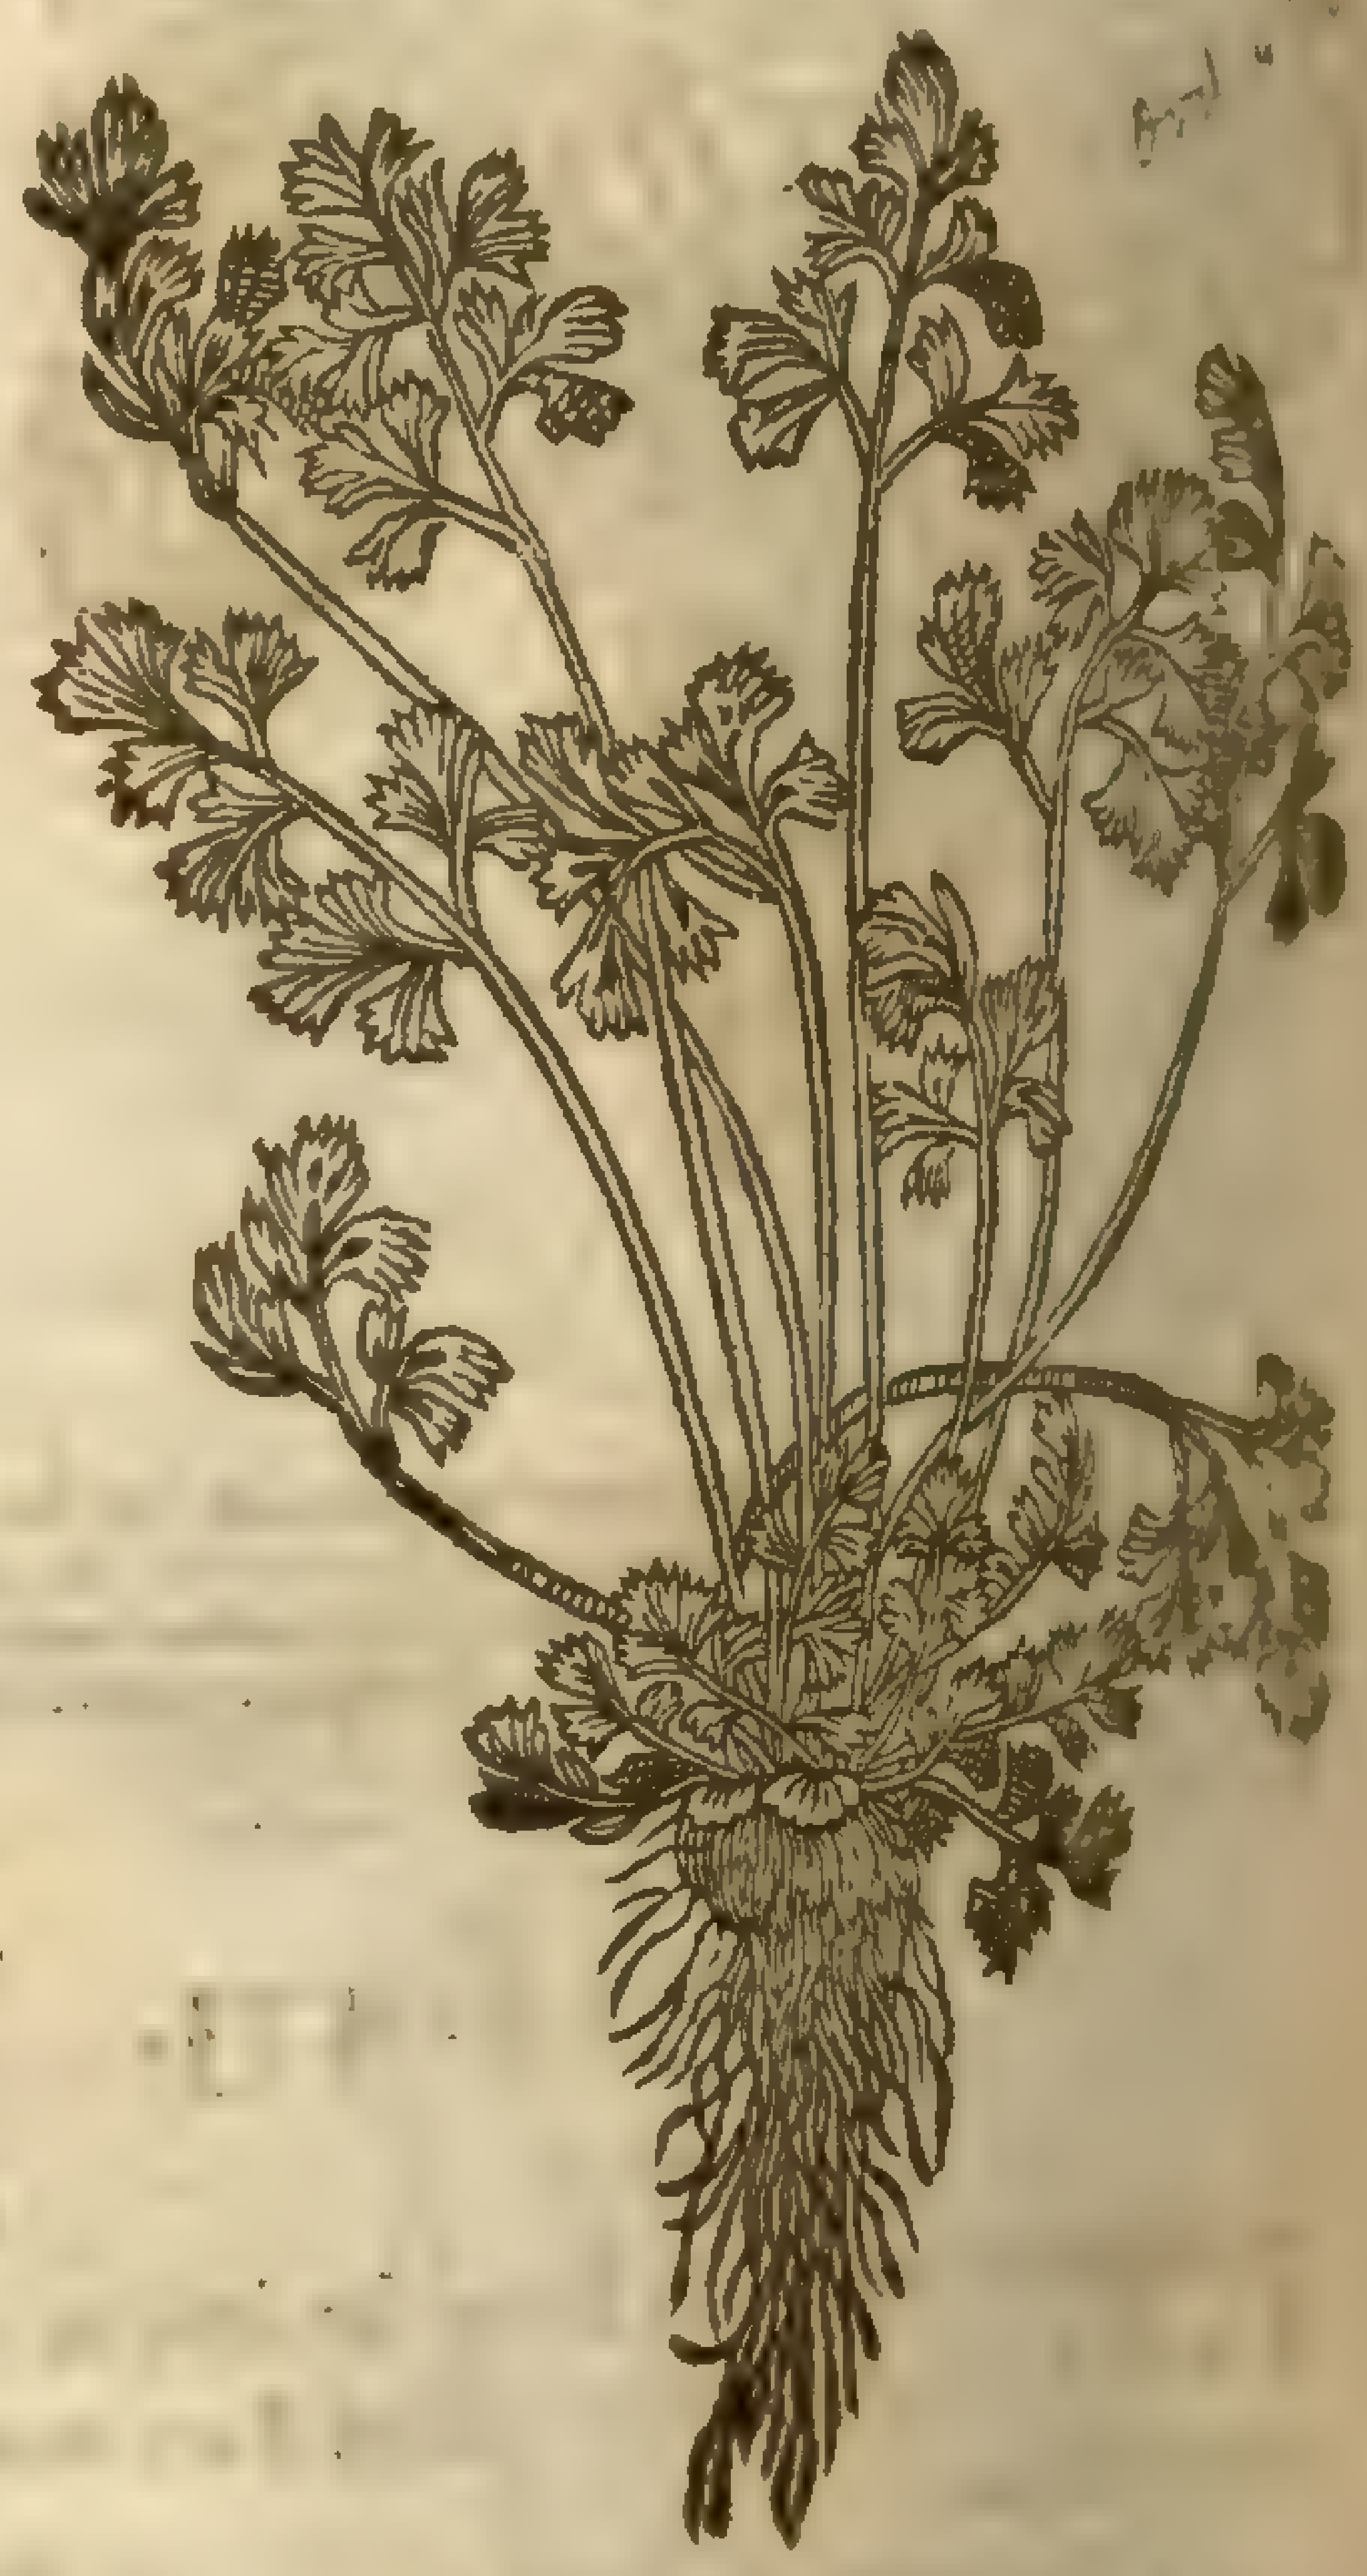
3 This plant which we haue inſerted among the Adianthes as a kinde thereof, may without error ſo paſſe, which is in great requeſt in Flanders and Germanie, where the practitioners in phyſicke do vſe the ſame in ſtead of *Capillus Veneris*, and with better ſucceſſe than any of the Capillare herbes,

herbs, although *Matthiolus* and *Dioſcorides* himſelfe hath made this wall Rue to be a kind of *Par*-*nychia* or Nailewort: notwithſtanding the Germans will not leaue the vſe thereof, but receiue it as the true Adianth, eſteeming it equall, if not far better, than either *Ceterach*, *Capillus Veneris verus*, or *Trichomanes*, called alſo *Polytrichon*: it brings forth very many leaues round and ſlender, cut into two or three parts, very hard in handling, ſmooth and green on the out ſide, and of an ilfauored dead color vnderneath, ſet with little fine ſpots, which euidently ſheweth it to be a kind of Fern. The root is blacke and full of ſtrings.



2 *Capillus Veneris Syriaca.*
Aſſyrian Maiden-haire.

Asplenium ruta muraria.



3 *Ruta muraria, ſiue Saluia vita.*
Wall Rue or Rue Maiden-haire.

¶ *The Place.*

The right Maiden-haire groweth vpon walls in ſtony ſhadowie and moiſt places, neere to fountaines and where water droppeth: it is a ſtranger in England; yet I haue heard it reported by ſome of good credit, that it growes in diuers places of the Weſt country of England.

The Aſſyrian Maiden-haire taketh name of his natiue country Aſſyria, being a ſtranger in Europe.

Stone Rue groweth vpon old walls neere vnto waters, Wells, and fountaines: I found it vpon the wall in the Churchyard of Dartford in Kent, hard by the riuer ſide where people ride through, and alſo vpon the wals of the Churchyard of Sittingburn in the ſame county, in the middle of the towne, hard by a great lake of water, and alſo vpon the Church walls of Railey in Eſſex, and diuers other places.

¶ *The Time.*

Theſe plants are green both winter and ſummer, and yet haue neither floures nor ſeed.

¶ *The Names.*

Maiden-haire is called in Greeke Ἀδίαντον: *Theophraſtus* and *Pliny* name it *Adiantum nigrum*, blac Maiden-haire; for they ſet downe two Maiden-haires, the blacke and the white, making this the blacke, and the Rue of the wall the white: it is called in Latine, *Polytrichum*, *Callitrichum*, *Cin* *Terræ Capillus*, *Supercilium terræ*: of *Apuleius*, *Capillus Veneris*, *Capillaris*, *Crinita*: and of diuers *Cr* *andrum putei*: the Italians keep the name *Capillus Veneris*: in Engliſh, black Maiden-haire and *nus* haire, and it may be called our Ladies haire.

It is called *Adianton* becauſe the leafe, as *Theophraſtus* ſaith, is neuer wet, for it caſteth off water that falleth thereon, or being drowned or couered in water, it remaineth ſtill as if it were dry, as *Pliny* likewiſe writeth; and is termed *Callitricon* and *Polytricon*, of the effect it hath in dying haire, and maketh it to grow thicke.

Wall Rue is commonly called in Latine, *Ruta muraria*, or *Ruta muralis*: of ſome, *Salvia vita*, but wherefore I know not, neither themſelues, if they were liuing: of the Apothecaries of the Low-Countries *Capillus Veneris*, or Maiden haire, and they haue vſed it a long time for the right Maiden-haire; it is that kind of *Adiantum* which *Theophraſtus* termed *Adiantum Candidum*, or white Maiden-haire, for hee maketh two, one blacke, and the other white, as we haue ſaid. *Pliny* doth likewiſe ſet downe two kindes, one he calleth *Polytricon*; the other, *Tricomanes*, or Engliſh Maiden-haire, whereof we will intreate in the chapter following, which he hath falſely ſet downe for a kinde of *Adiantum*, for *Tricomanes* doth differ from *Adiantum*.

Some there be that thinke Wall-Rue is *Paronichia Dioſcoridis*, or *Dioſcorides* his Whitlow-wort, wherein they haue been greatly deceiued: it is called in high Dutch, **Mauerrauten**: in low Dutch, **Steenruyt**: in French, *Rue de maraille*: in Engliſh, Wall-Rue, and white Maiden haire.

¶ *The Temperature and Vertues.*

The true Maiden-haire, as *Galen* teſtifieth, doth dry, make thin, waſte away, and is in a meane betweene heate and coldneſſe: *Meſues* ſheweth that it conſiſteth of vnlike or diſagreeing parts, and that ſome are watery and earthy, and the ſame binding, and another ſuperficially hot and thinne: And that by this it taketh away obſtructions or ſtoppings, maketh things thinne that are thicke, looſeneth the belly, eſpecially when it is freſh and greene: for as this part is thin, ſo is it quickely reſolued, and that by reaſon of his binding and earthy parts: it ſtoppeth the belly, and ſtaieth the laske and other fluxes. A

Being drunke it breaketh the ſtone, and expelleth not onely the ſtones in the kidnies, but alſo thoſe which ſticke in the paſſages of the vrine. B

It raiſeth vp groſſe and ſlimie humors out of the cheſt and lungs, and alſo thoſe which ſticke in the conduits of the winde pipe, it breaketh and raiſeth them out by ſpitting, if a loch or licking medicine be made thereof. C

Moreouer, it conſumeth and waſteth away the Kings-euill, and other hard ſwellings, as the ſame Author affirmeth, and it maketh the haire of the head or beard to grow, that is fallen and pilled off. D

Dioſcorides reckoneth vp many vertues and operations of this Maiden-haire, which do not onely differ, but are alſo contrary one to another. Among others he ſaith, that the ſame ſtancheth bloud: and a little before, that it draweth away the ſecondines, and bringeth downe the deſired ſickeneſſe: which words do confound one another with contrarieties; for whatſoeuer things do ſtanch bloud, the ſame do alſo ſtay the termes. E

He addeth alſo in the end, that it is ſowne about ſheepe-folds for the benefit of the ſheepe, but what that benefit ſhould be he ſheweth not. F

Beſides, that it cannot be ſowne, by reaſon it is without ſeed, it is euident, neither can it fitly bee remoued. Therefore in this place it ſeemeth that many things are tranſpoſed from other places, and falſly added to this chapter: and peraduenture ſome things are brought hither out of diſcourſe of *Cytiſus*, or Milke Trefoile, whereof here to write were to ſmall purpoſe. G

Wall-Rue is not much vnlike to blacke Maiden-haire in temperature and faculty. H

Wall-Rue is good for them that haue a cough, that are ſhort winded, and that be troubled with ſtitches and paine in their ſides. I

Being boyled, it cauſeth concoction of raw humors which ſticke in the lungs; it taketh away the paine of the kidnies and bladder, it gently prouoketh vrine, and driueth forth ſtones. K

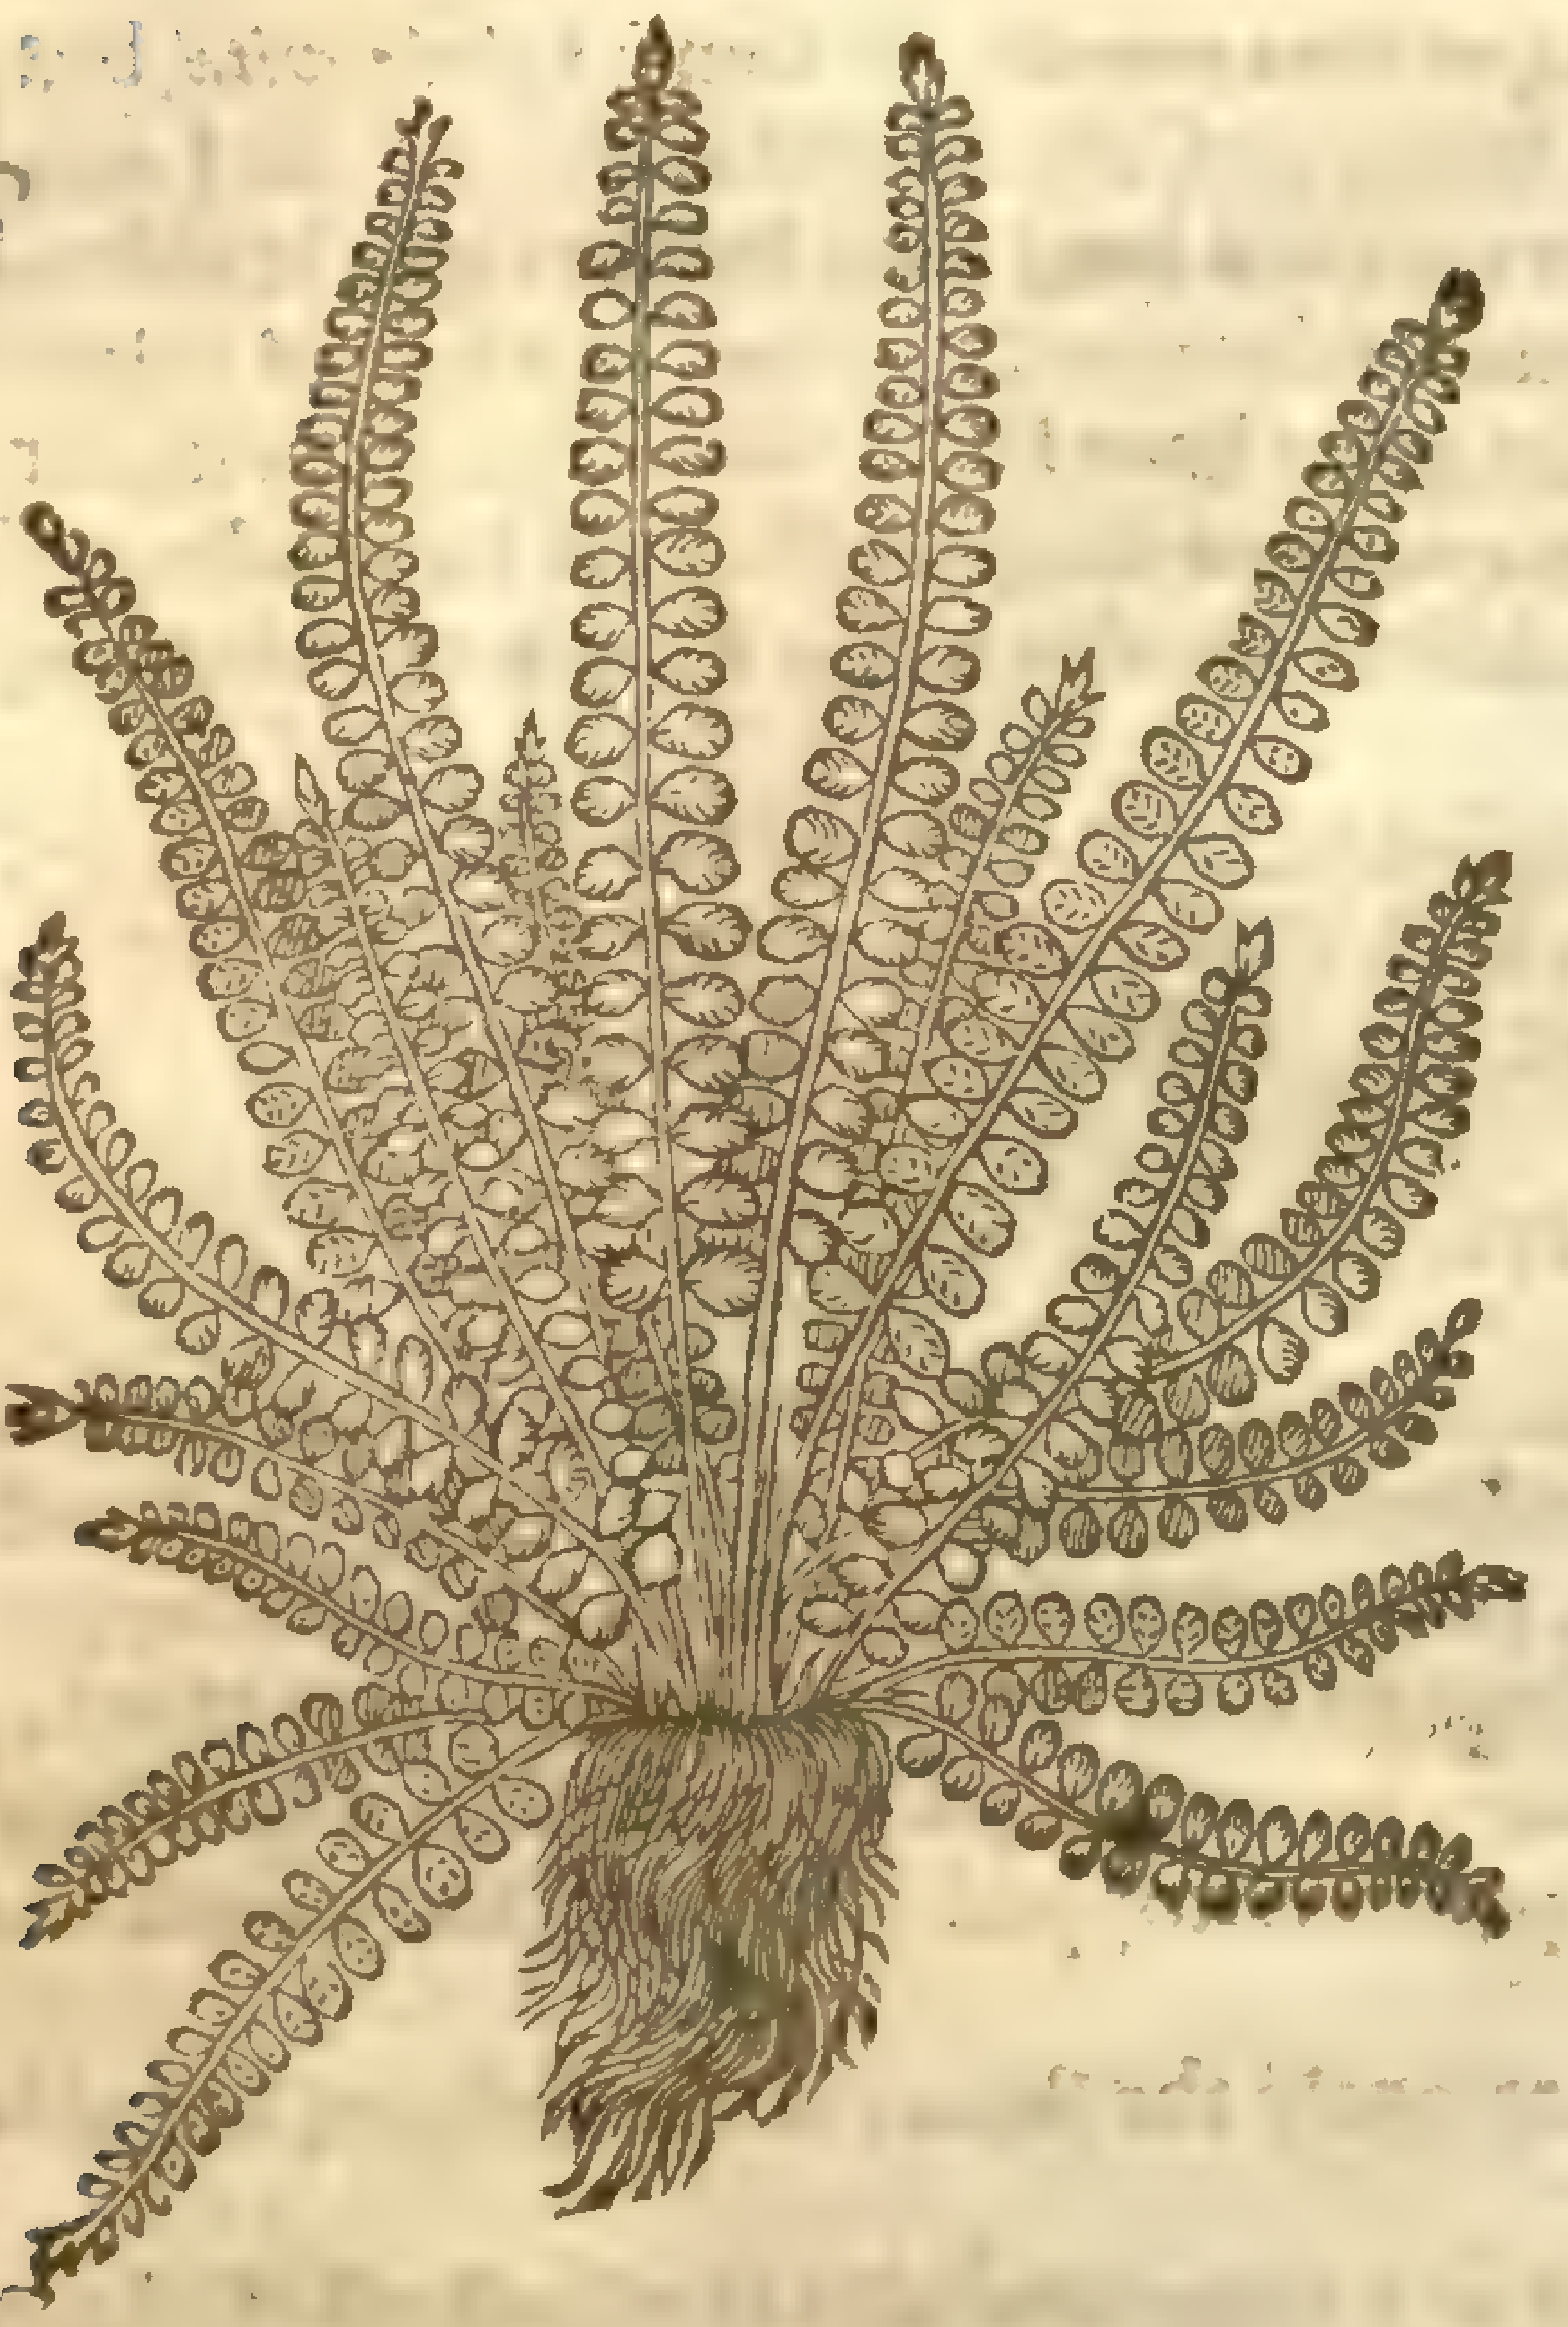
It is commended againſt ruptures in young children, and ſome affirme it to be excellent good, if the pouder thereof be taken continually for forty daies together. L

CHAP. 474. *Of Engliſh, or common Maiden-haire.*

¶ *The Deſcription.*

1 ENgliſh Maiden-haire hath long leaues of a darke green colour, conſiſting of very many ſmall round leaues ſet vpon a middle rib, of a ſhining blacke colour, daſhed on the nether ſide with ſmall rough markes or ſpeckes, of an ouerworne colour: the roots are ſmall and threddy.

1 *Trichomanes mas.*
The Male Engliſh Maiden-haire.



2 The female Engliſh Maiden hai like vnto the precedent, ſauing that it is le and wanteth thoſe ſpots or markes that ar the other, wherein conſiſteth the differe ‡ Our Authors figure was of the *Trichom fœmina* of *Tabernamontanus*, which expreſſ variety with branched leaues, and therein o was the difference. ‡

¶ *The Place.*

It growes for the moſt part neer vnto ſpring and brookes, and other moiſt places, vpon o ſtone walls and rocks: I found it growing in a ſhadowie ſandie lane in Betſome, in the pari of Southfleet in Kent, vpon the ground where- as there was no ſtones or ſtony ground neer vnto it, which before that time I did neuer ſe it groweth likewiſe vpon ſtone walls at her Majeſties palace of Richmond, & in moſt ſto wals of the Weſt and North parts of Englan ‡ M^r^.*Goodyer* ſaith, that in Ianuary, 1624. he ſaw enough to lade an horſe growing on the bancks in a lane, as he rode betweene Rake and Headly in Hampſhire neere Wollmer Foreſt. ‡

¶ *The Time.*

It continueth a long time, the coldneſſe of Winter doth it no harme, it is barren as the other Fernes are, whereof it is a kinde.

¶ *The Names.*

It is called in Greeke, τριχομανὲς: in Latine, *Filicula,* as though we ſhould ſay, *Parua Filix,* or little Ferne; alſo *Capillaris*: in ſhops, *Capillus Veneris. Apuleius* in his 51 chapter maketh it all one with *Callitrichon*: of ſome it is called *Polytrichon*: in Engliſh, common Maiden-haire.

¶ *The Temperature and Vertues.*

A These as *Dioſcorides* and *Galen* do write, haue all the faculties belonging to *Adiantum,* or blacke Maiden-haire.

B The decoction made in wine and drunke, helpeth them that are ſhort winded, it helpeth the cough, ripeneth tough flegme, and auoideth it by ſpitting.

C The lie wherein it hath beene ſodden, or laid to infuſe, is good to waſh the head, cauſing the ſcurfe and ſcales to fall off, and haire to grow in places that are pild and bare.

Chap. 475. *Of Thiſtles.*

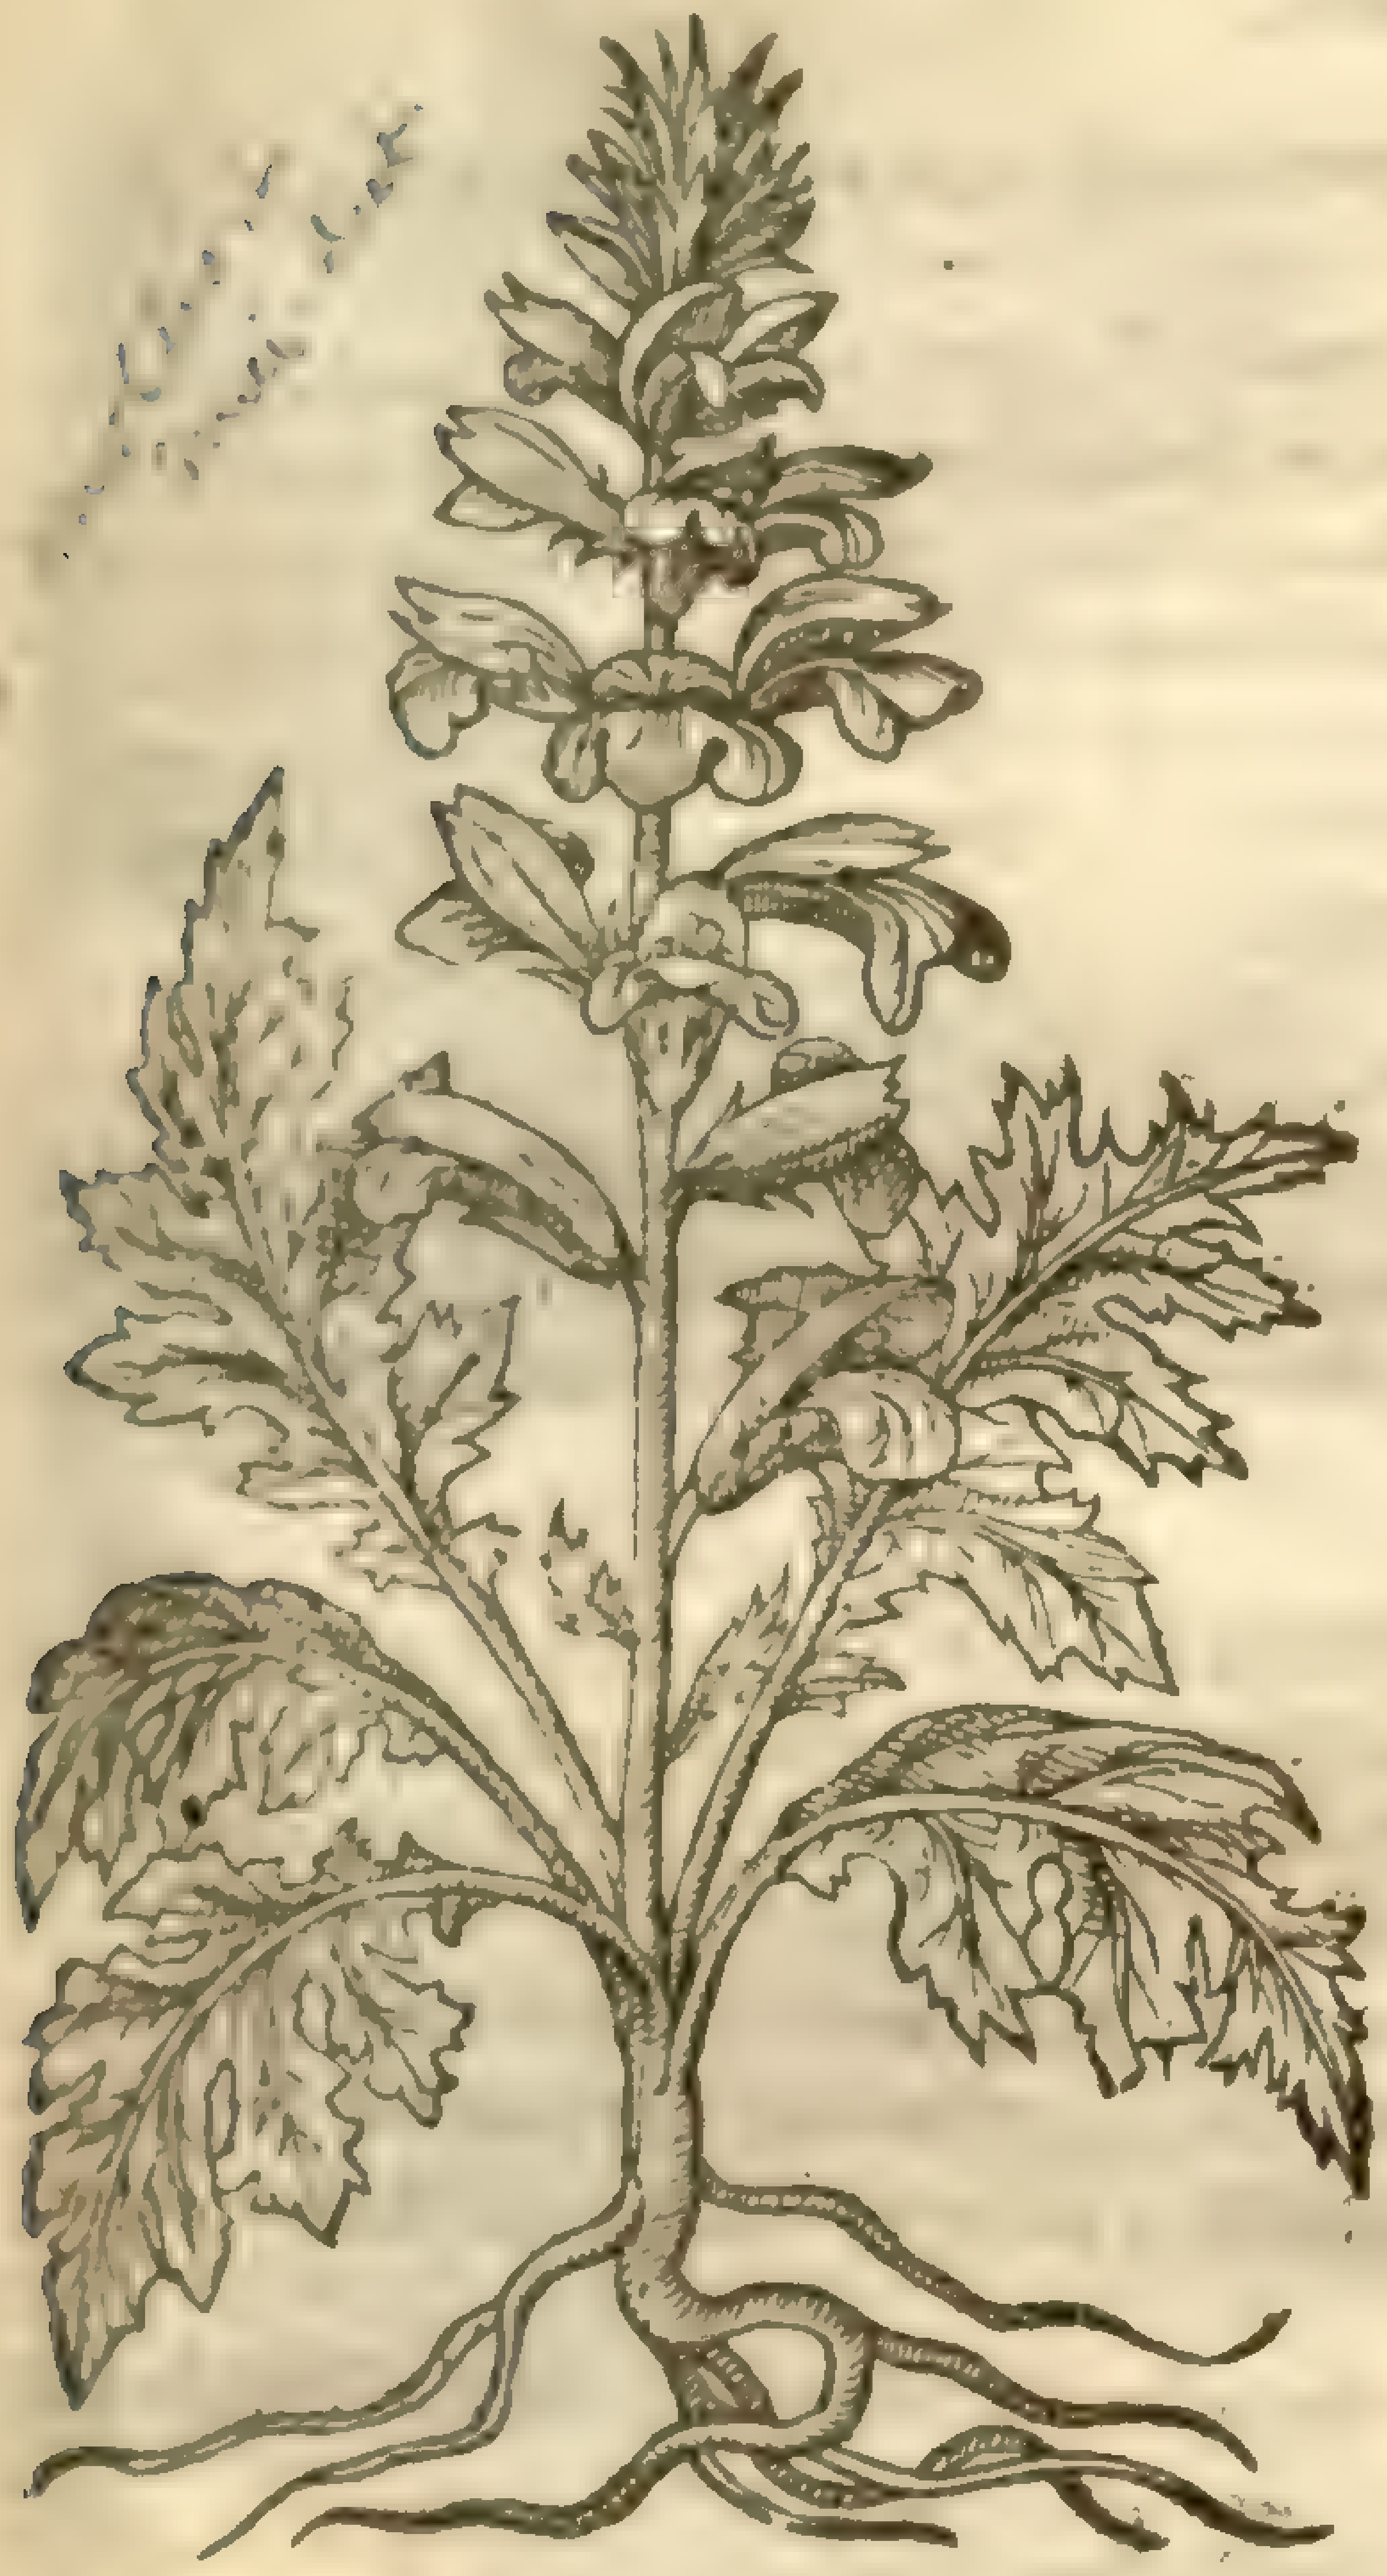
¶ *The Kindes.*

The matter of the Thiſtles is diuers, ſome Thiſtles ſerue for nouriſhment, as the Artichoke without prickles, and the Artichoke with prickles; other for medicine, as the root of Carline which is good for many things; the bleſſed Thiſtle alſo, otherwiſe called *Carduus benedictus*; Sea Huluer, and diuers others: ſome are poiſonſome, as *Chamæleon niger*; one ſmooth, plaine, and without prickles, as the Thiſtle called Beares Breech, or *Acanthus ſatiuus*, whereof there is another with prickles, which we make the wilde, of the which two we intend to write in this chapter.

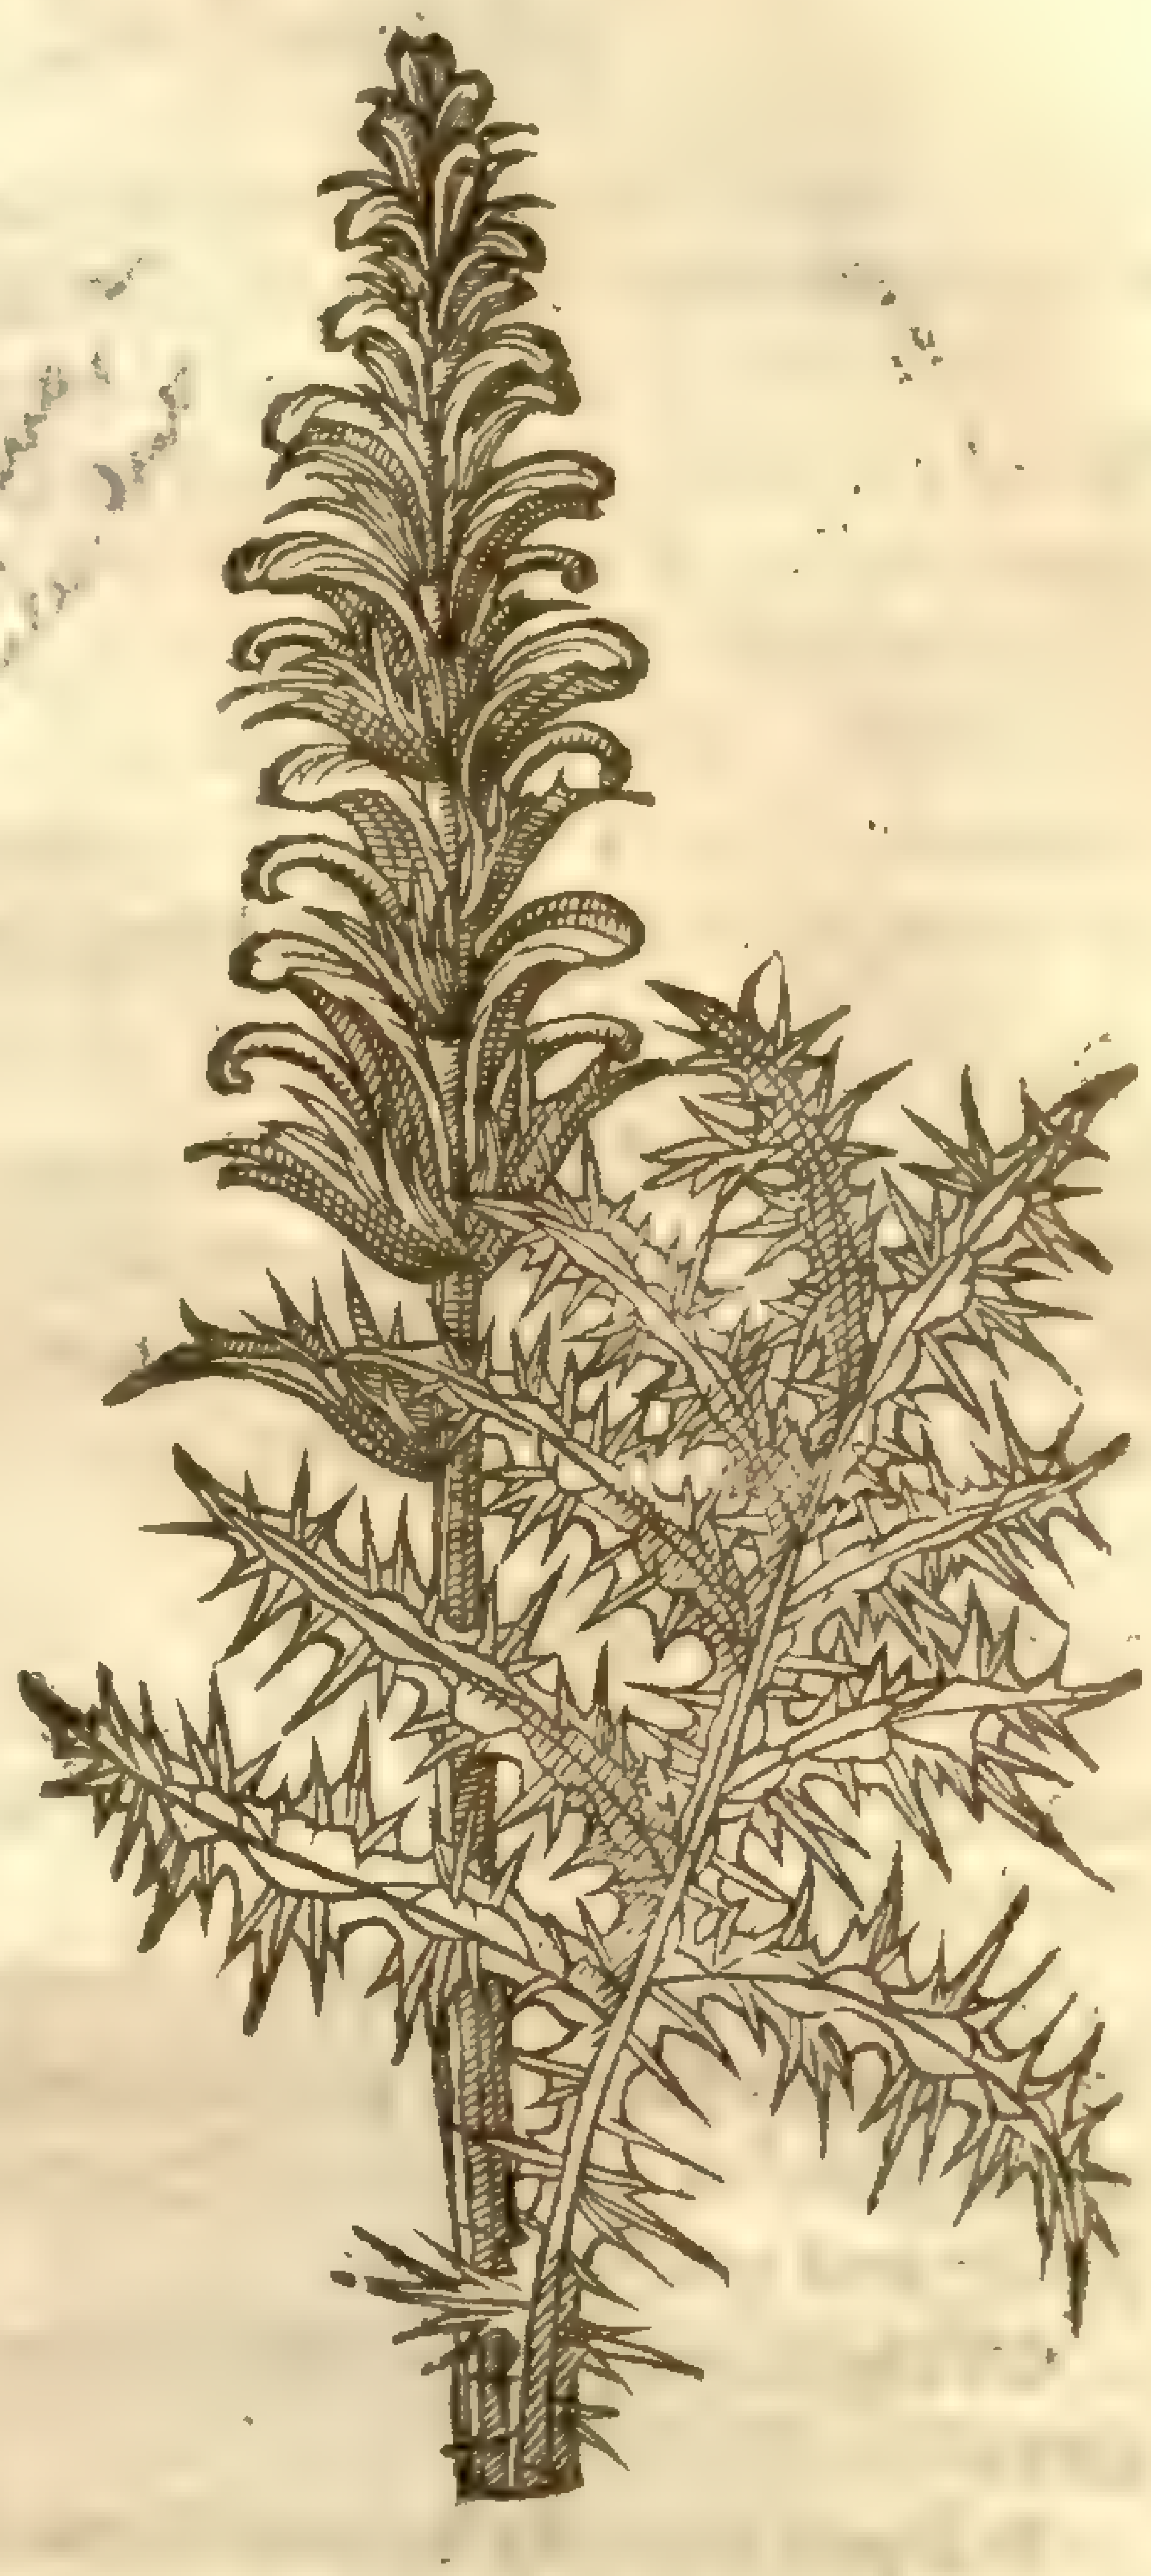
¶ *The Deſcription.*

1 Beares breech of the garden hath broad leaues, ſmooth, ſomewhat blacke, gaſhed on both the edges, and ſet with many cuts and fine nickes: between which riſeth vp in the midſt a big ſtalke brauely deckt with flours, ſet in order from the middle vpward, of color white, of forme long, which are armed as it were with two catkins, one higher, another lower: after them grow forth the husks, in which is found broad ſeed: the roots be blacke without, and white within,

in,and full of clammie juyce, and are diuided into many off-ſprings, which as they creepe far,ſo do they now and then bud forth and grow afreſh : theſe roots are ſo full of life, that how little ſoeuer of them remaine, it oftentimes alſo bringeth forth the whole plant.



1 *Acanthus ſatiuus.*
Garden Beares-breech.



‡ 2 *Acanthus ſyl.aculeatus.*
Prickly Beares-breech.

2 Wilde Beares-breech,called *Acanthus ſylueſtris,Pena* ſetteth forth for *Chamæleonta Monſpelienſium*, and reporteth that he found it growing amongſt the grauelly and moiſt places neere to the walls of Montpellier, and at the gate of Aegidia, betweene the fountane and the brooke neere to the wall: this thiſtle is in ſtalke, floures, colour of leaues and ſeed like the firſt kinde, but ſhorter and lower,hauing large leaues,dented or jagged with many cuts and inciſions, not only in ſome few parts of the leaues,as ſome other thiſtles,but very thickly dented or clouen,and hauing many ſharp, large,white and hard prickles about the ſides of the diuiſions and cuts,not very eaſie to be handled or touched without danger to the hand and fingers.

¶ *The Place.*

Dioſcorides writeth,that garden Branke Vrſine groweth in moiſt and ſtony places,and alſo in gardens : it were vnaduiſedly done to ſeeke it in either of the Germaines any where, but in gardens onely ; in my garden it doth grow very plentifully.

The wilde was found in certaine places of Italy neer to the ſea, by that notable learned man *Alfonſus Pancius*,Phyſition to the Duke of Ferrara,and profeſſor of ſimples and Phyſicke,and is a ſtranger in England. ‡ I haue ſeene it growing in the garden of Mr. *Iohn Parkinſon.* ‡

¶ *The Time.*

Both the Branke Vrſines do floure in the Summer ſeaſon, the ſeed is ripe in Autumne : the root remaineth freſh ; yet now and then it periſhes in Winter in both the Germaines,if the weather be too cold : but in England the former ſeldome or neuer dieth.

¶ *The Names.*

It is called in Greeke, ἄκανθα: the Latines keepe the ſame name *Acanthus* : yet doth *Acanthus* ſignifie generally all kinde of Thiſtles,and that is called *Acanthus* by the figure *Antonomaſia* : the Engliſh name is,Branke Vrſine,and Beares-breech.

The tame or garden Branke Vrſine is named in Latine,*Satiuus*,or *Hortenſis Acanthus* : in Greeke, ἥμερος: and of *Galen*, *Oribaſius*, and *Pliny*, παιδέρως: *Pliny* alſo calleth this *Acanthus læuis*, or ſmooth

Branke Vrſine,and reporteth it to be a city herbe, and to ſerue for arbors: ſome name it *Branca Vr-ſina* (others vſe to call Cow-Parſnep by the name of *Branca Vrſina*,but with the addition *Germanica*) the Italians call it *Acantho*, and *Branca Orſina*: the Spaniards,*Yerva Giguante*: the Ingrauers of old time were wont to carue the leaues of this Branke Vrſine in pillers,and other workes,and alſo vpon the eares of pots; as among others *Virgil* teſtifieth in the third Eclog of his Bucolicks:

Et nobis idem Alcimedon duo pocula fecit,
Et molli circum eſt anſas amplexus Acantha.

‡ I take *Virgils Acanthus* to be that which we now commonly call *Pyracantha*, as I ſhall hereafter ſhew when I come to treat thereof. ‡

The other Branke Vrſine is named in Greeke, ἄγρια ἄκανθα: and in Latine, *Syluestris Acanthus*, or wild Branke Vrſine, and they may be called properly *Acantha*, or *Spina*, a prickle; by which name it is found called of moſt Herbariſts, *Acanthus*: yet there is alſo another *Acanthus* a thorny ſhrub: the liquor which iſſueth forth of it, as *Herodotus* and *Theophraſtus* affirme, is a gumme: for difference whereof peraduenture this kinde of *Acanthus* is named *Herbacantha*: There is likewiſe found among the baſtard names of *Acanthus* the word *Mamolaria*,and alſo *Crepula*, but it is not expreſſed to which of them,whether to the wilde or tame it ought to be referred.

¶ *The Temperature.*

The leaues of the garden Branke Vrſine conſiſt in a meane as it were betweene hot and cold,being ſomwhat moiſt,with a mollifying and gentle digeſting faculty,as are thoſe of the Mallow, and therefore they are profitably boyled in clyſters,as well as Mallow leaues. The root,as *Galen* teacheth,is of a more drying quality.

¶ *The Vertues.*

A *Dioſcorides* ſaith,that the roots are a remedy for lims that are burnt with fire,and that haue beene out of joynt,if they be laied thereunto: that being drunke they prouoke vrine, and ſtop the belly: that they helpe thoſe that be broken,and be troubled with the crampe, and be in a conſumption of the lungs.

B They are good for ſuch as haue the ptiſicke and ſpet bloud withall; for thoſe that haue faln from ſome high place,that are bruiſed and dry beaten, and that haue ouerſtrained themſelues, and they are as good as the roots of the greater Comfrey, whereunto they are very like in ſubſtance, tough juyce,and quality.

C Of the ſame root is made an excellent plaiſter againſt the ache and numneſſe of the hands and feet.

D It is put into clyſters with good ſucceſſe againſt ſundry maladies.

Chap. 476. *Of the Cotton Thiſtle.*

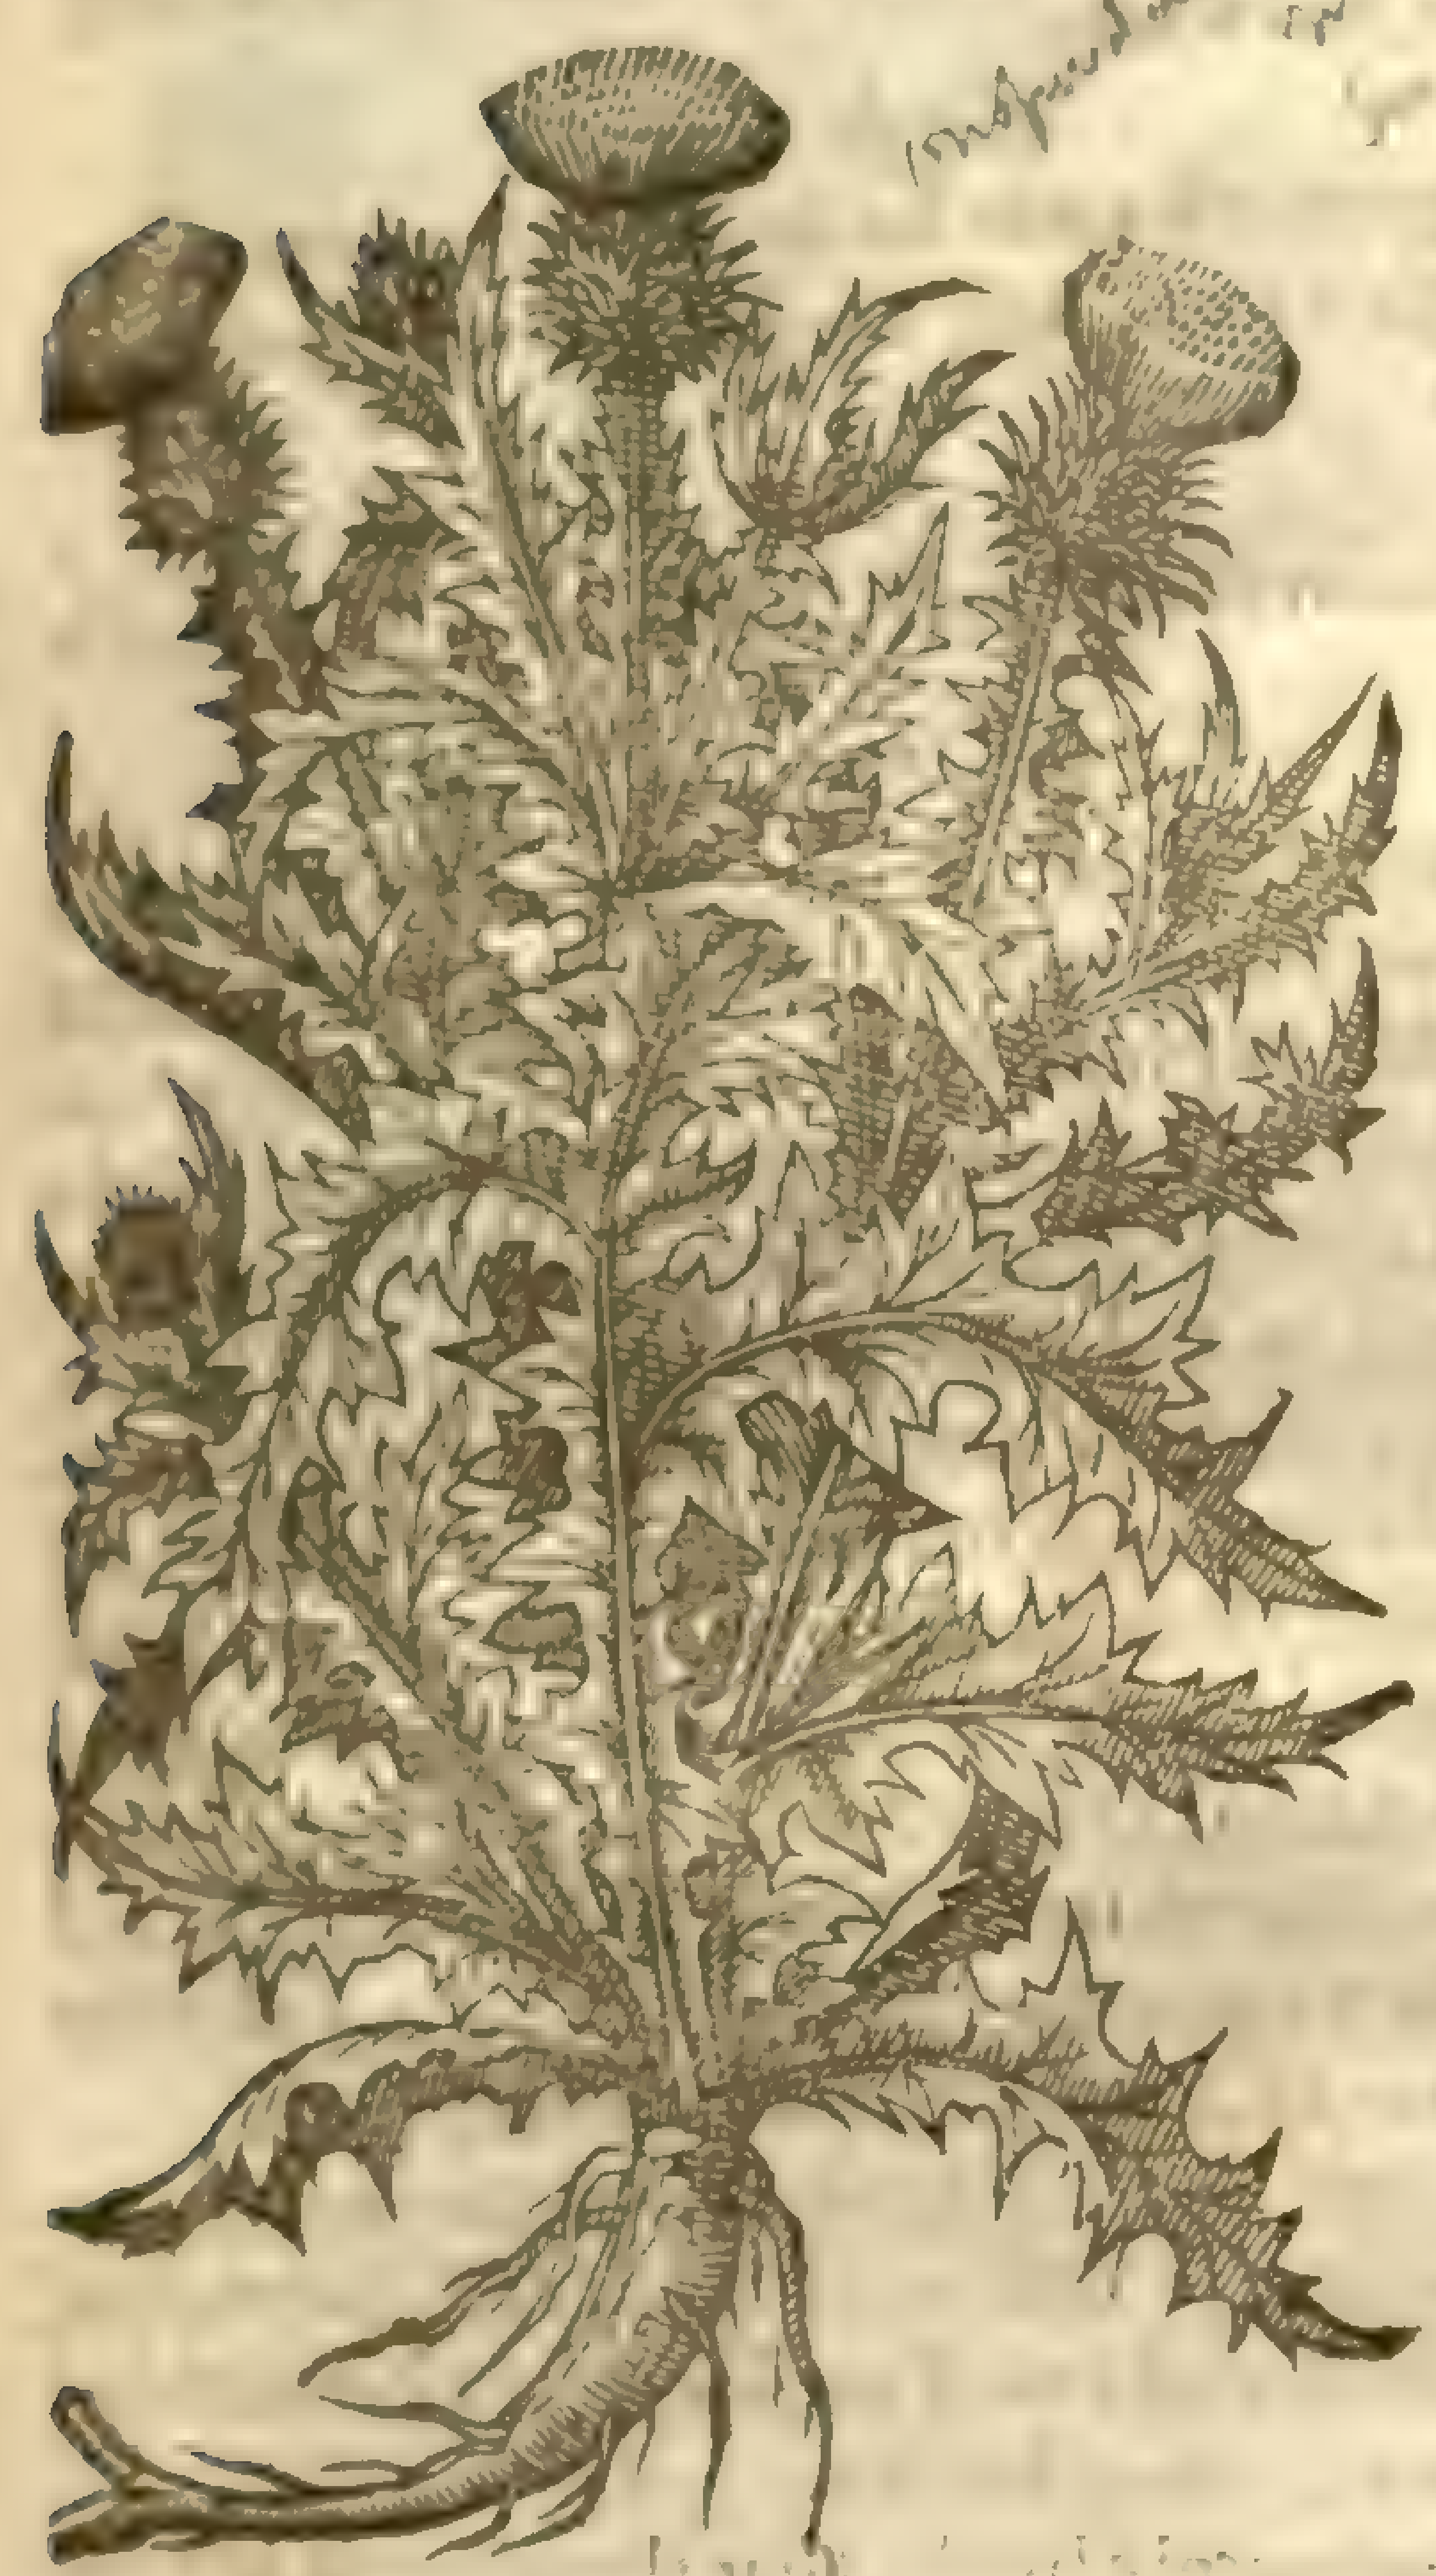
¶ *The Deſcription.*

1 The common Thiſtle,whereof the greateſt quantity of down is gathered for diuers purpoſes,as well by the poore to ſtop pillowes, cuſhions, and beds for want of feathers, as alſo bought of the rich vpholſters to mix with the feathers and down they do ſell,which deceit would be looked vnto: this Thiſtle hath great leaues, long and broad, gaſhed about the edges,and ſet with ſharpe and ſtiffe prickles all alongſt the edges, couered all ouer with a ſoft cotton or downe: out from the middeſt whereof riſeth vp a long ſtalke about two cubits high, cornered,and ſet with filmes,and alſo full of prickles: the heads are likewiſe cornered with prickles,and bring forth floures conſiſting of many whitiſh threds: the ſeed which ſucceedeth them is wrapped vp in downe; it is long, of a light crimſon colour, and leſſer than the ſeed of baſtard Saffron: the root groweth deep in the ground,being white,hard,wooddy,and not without ſtrings.

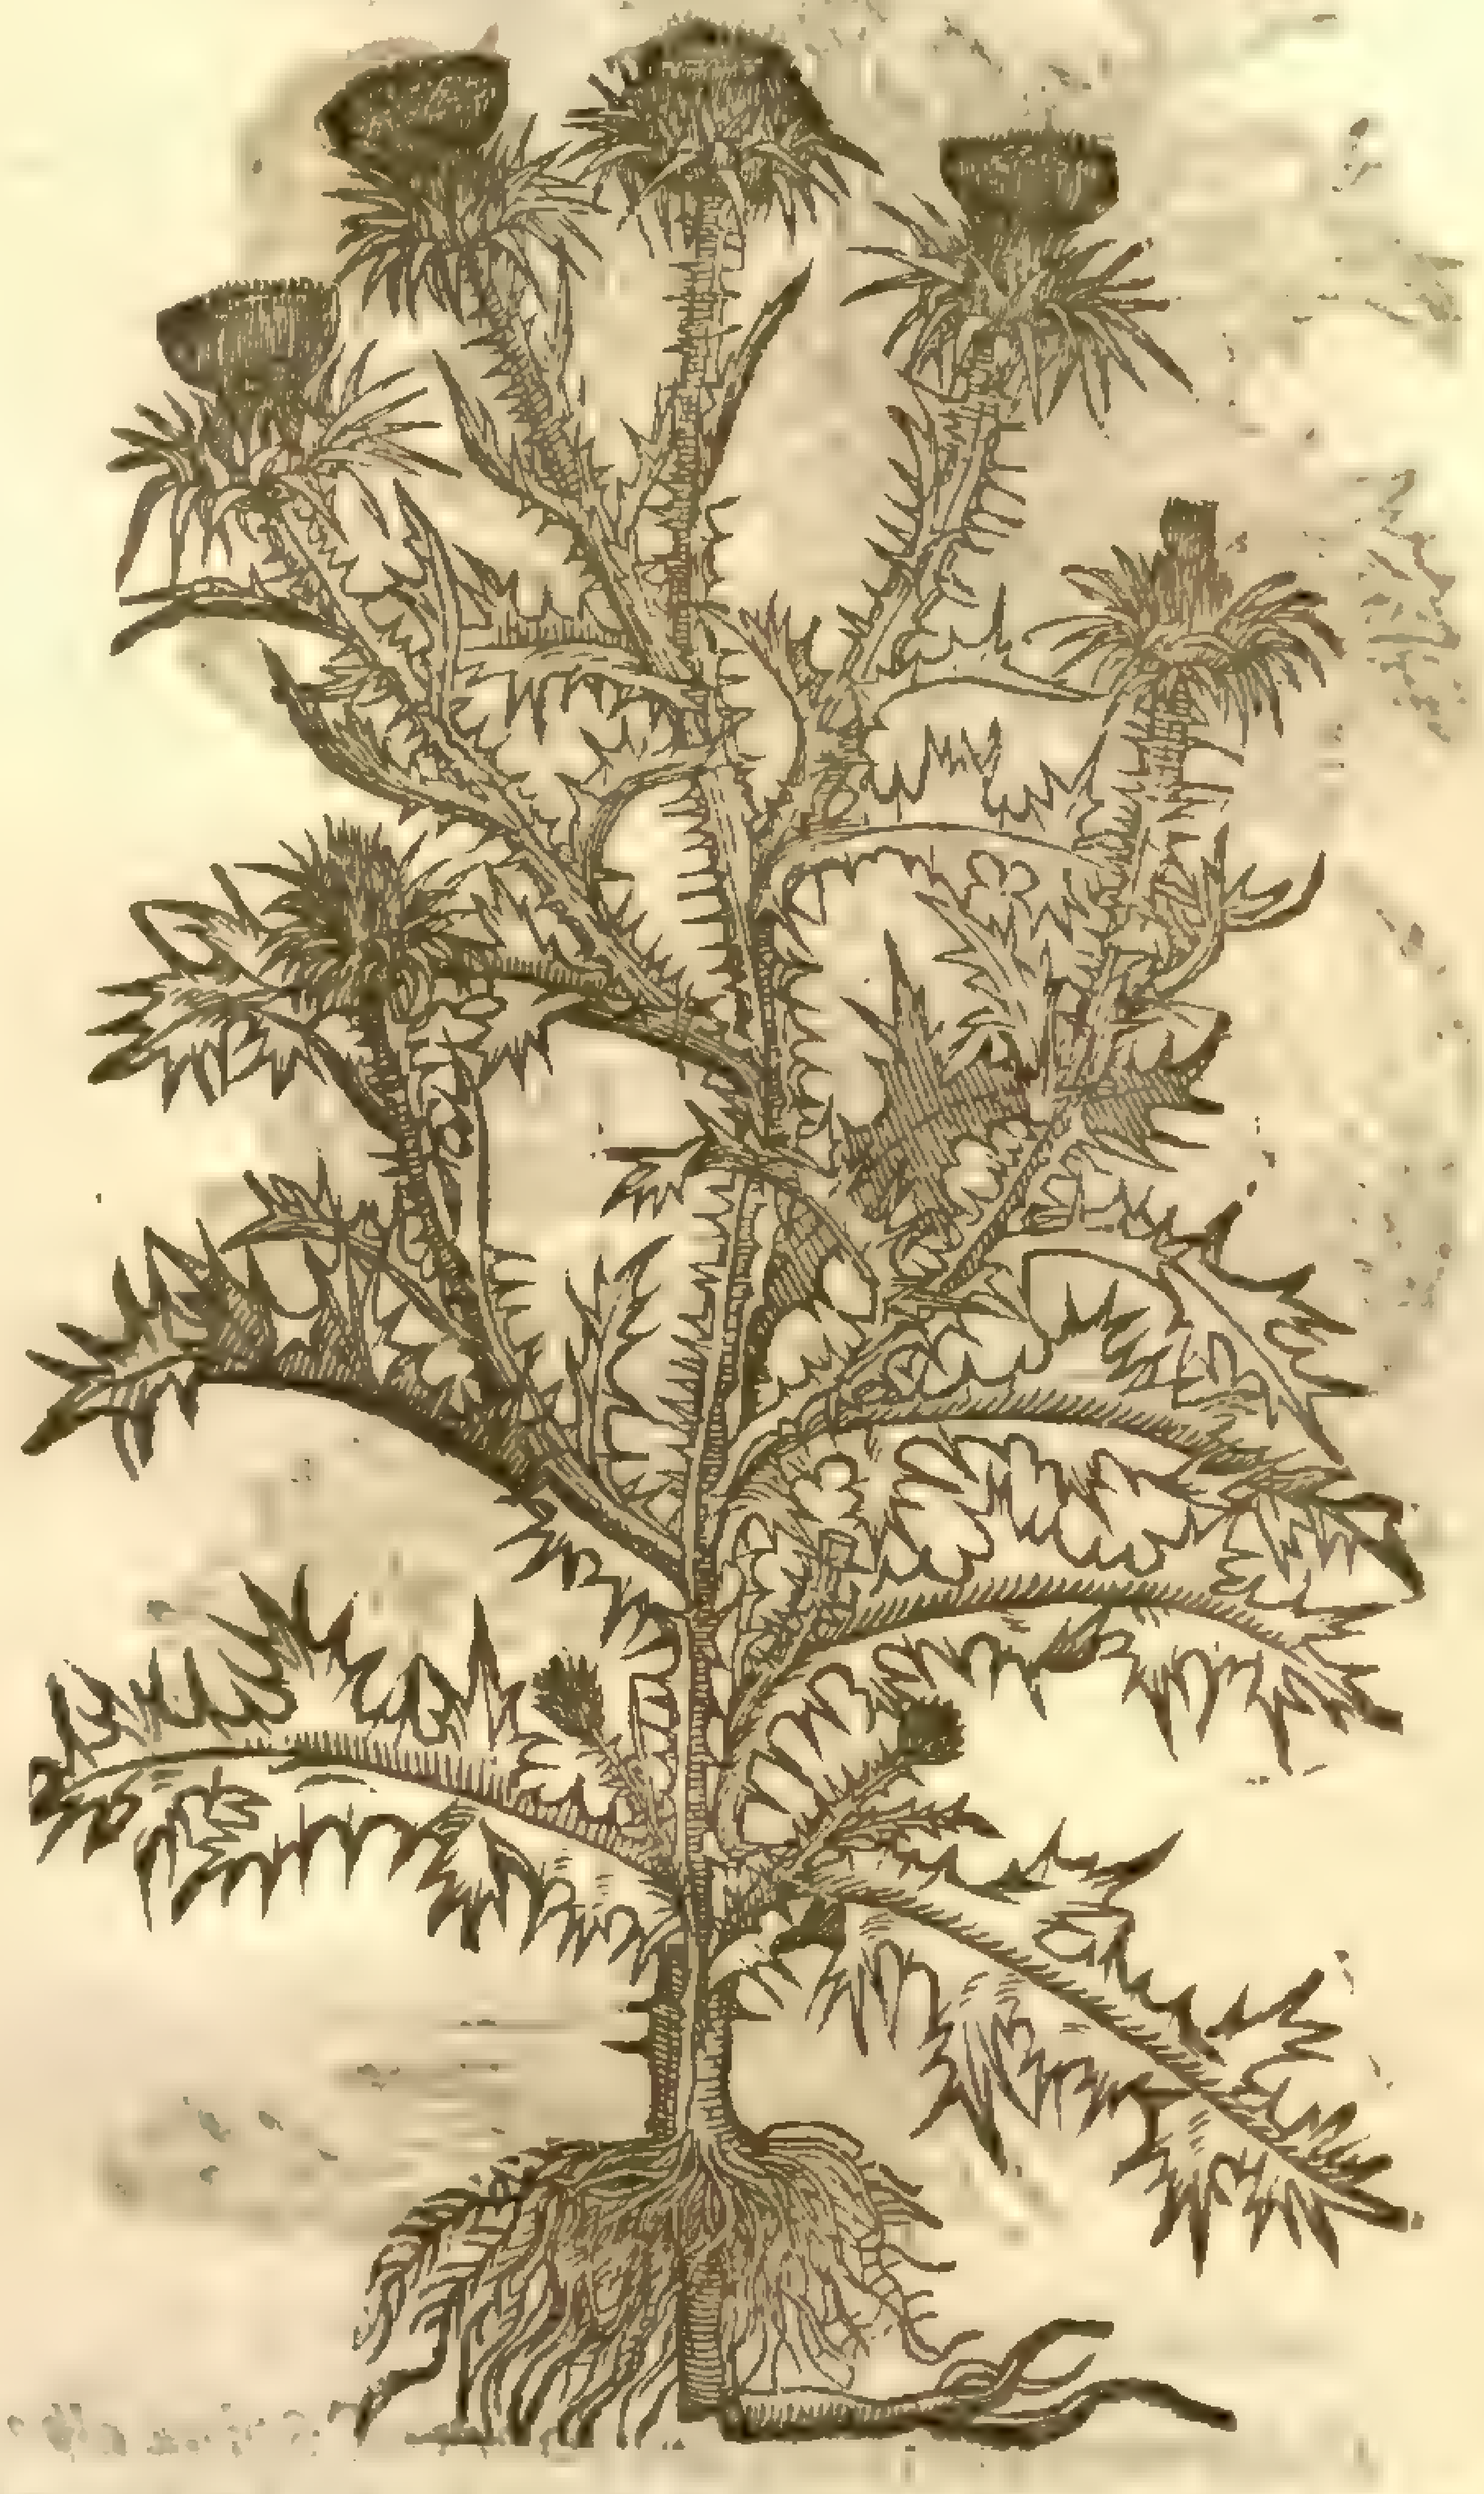
2 The Illyrian cotton thiſtle hath a long naked root,beſet about the top with a fringe of many ſmall threds or jags:from which ariſeth a very large and tall ſtalke,higher than any man,rather like a tree than an annuall herbe or plant: this ſtalke is garniſhed with ſcroles of thinne leaues, from the bottome to the top, ſet full of moſt horrible ſharpe prickes, and ſo is the ſtalke and euery part of the plant, ſo that it is impoſſible for man or beaſt to touch the ſame without great hurt or danger: his leaues are very great, far broader and longer than any other Thyſtle whatſoeuer, couered with an hoarie cotton or downe like the former: the floures doe grow at the top of the ſtalkes,

which is diuided into ſundry branches, and are of a purple colour, ſet or armed round about with the like, or rather ſharper thornes than the aforeſaid.

1 *Acanthium album.*
The white Cotton Thiſtle.



2 *Acanthium Illyricum purpureum.*
The purple Cotton Thiſtle.



¶ *The Place.*

Theſe Thiſtles grow by high waies ſides, and in ditches almoſt euery where.

¶ *The Time.*

They floure from Iune vntill Auguſt, the ſecond yeare after they be ſowne: and in the mean time the ſeed waxeth ripe, which being thorow ripe the herbe periſheth, as doe likewiſe moſt of the other Thiſtles, which liue no longer than till the ſeed be fully come to maturity.

¶ *The Names.*

This Thiſtle is taken for that which is called in Greeke, ἀκάνθιον, which *Dioſcorides* deſcribeth to haue leaues ſet with prickles round about the edges, and to be couered with a thin downe like a copweb, that may be gathered and ſpun to make garments of, like thoſe of ſilke: in high Dutch it is called, **Weiſzwege diſtill**: in low Dutch, **Witte Wech diſtel**: in French, *Chardon argentin*: in Engliſh, Cotton-Thiſtle, white Cotton-Thiſtle, wilde white Thiſtle, Argentine or the Siluer Thiſtle.

¶ *The Temperature and Vertues.*

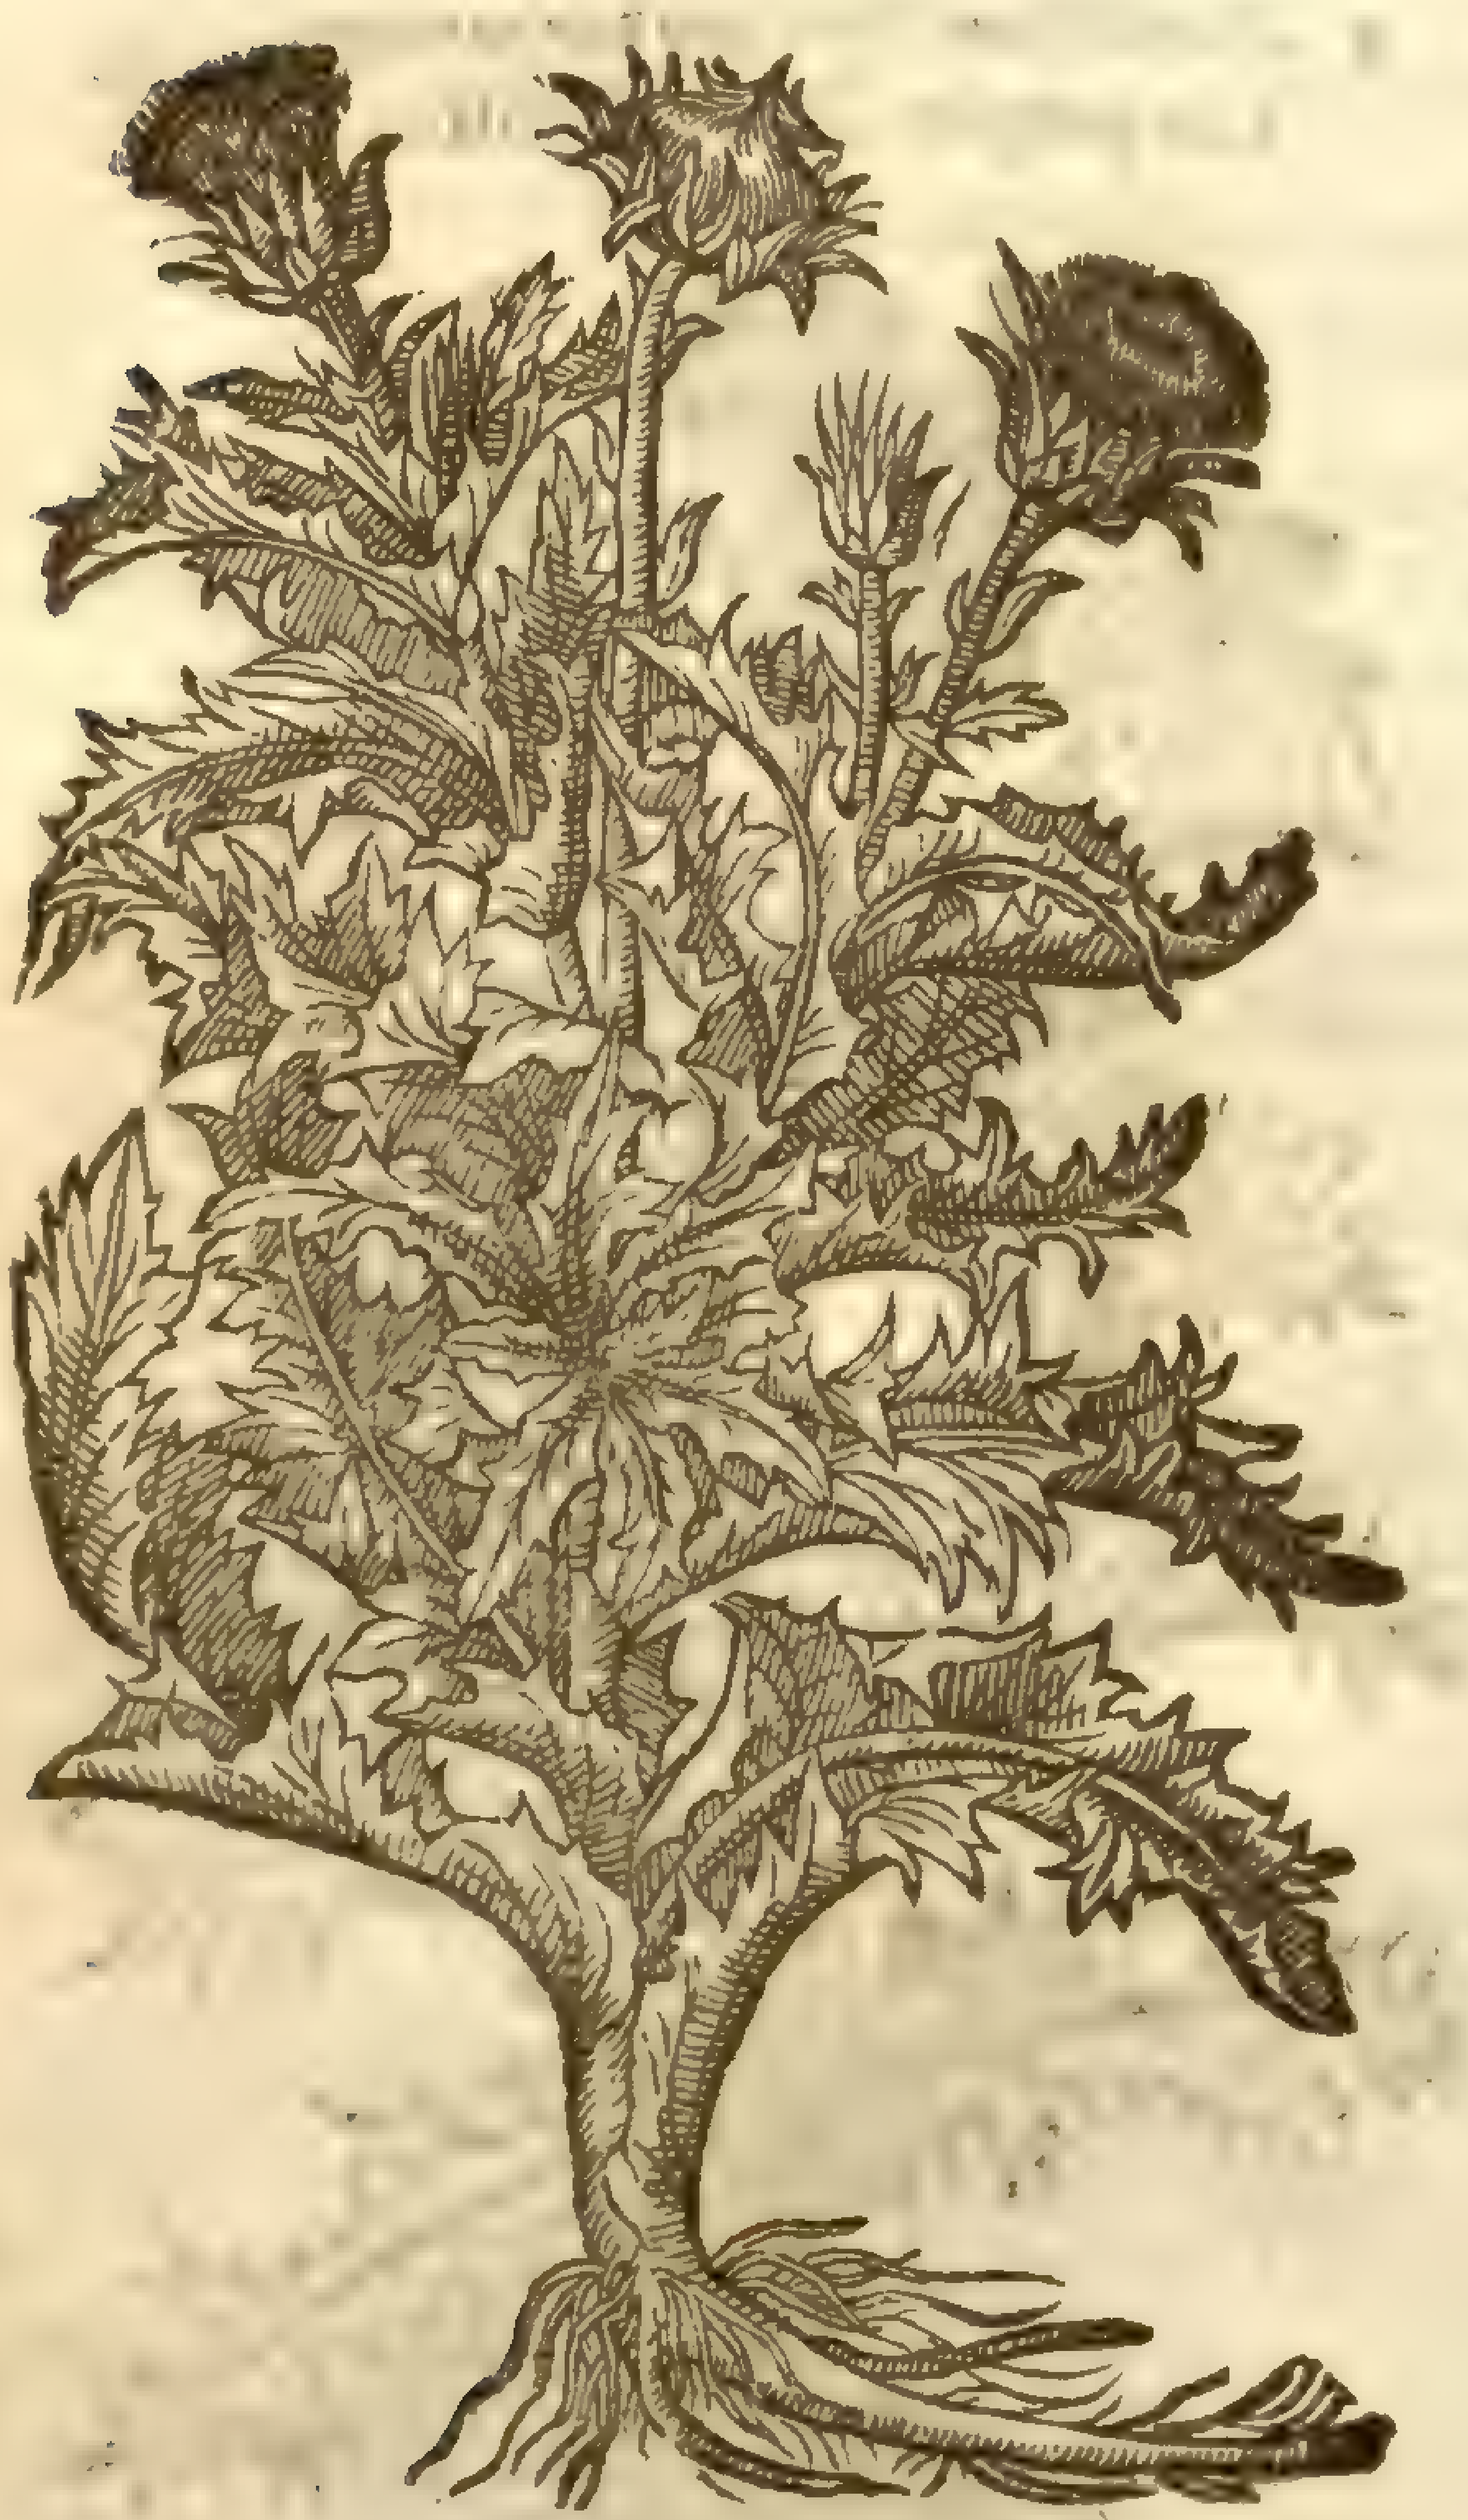
Dioſcorides ſaith, That the leaues and roots hereof are a remedy for thoſe that haue their bodies drawne backwards; thereby *Galen* ſuppoſeth that theſe are of temperature hot. A

CHAP. 477. *Of our Ladies-Thiſtle.*

¶ *The Deſcription.*

THe leaues of our Ladies-Thiſtle are as bigge as thoſe of white Cotton-Thiſtle: for the leaues thereof be great, broad, large, gaſhed in the edges, armed with a multitude of ſtiffe and ſharpe prickles, as are thoſe of Ote-Thiſtle, but they are without down, altogether ſlippery, of a light greene

Carduus Mariæ.
Ladies Thiſtle.



C. marianus
Eng. pl. 3. 363 [illegible]

green and ſpeckled, with white and milky ſpots and lines drawne diuers waies: the ſtalk is high, and as bigge as a mans finger: the floures grow forth of heads full of prickles, being threds of a purple colour: the ſeed is wrapped in downe like that of Cotton Thiſtle: the root is long, thicke, and white.

¶ *The Place.*

It groweth vpon waſte and common places by high waies, and by dung-hils almoſt euery where.

¶ *The Time.*

It floureth and ſeedeth when Cotton-Thiſtle doth.

¶ *The Names.*

It is called in Latine, *Carduus Lacteus*, and *Carduus Mariæ*; in high Dutch, **Onſer Vrouwen Diſtell**: in French, *Chardon de noſtre dame*: in Engliſh, our Ladies Thiſtle: it may properly be called *Leucographus*, of the white ſpots and lines that are on the leaues: *Pliny* in his 27. booke, chap. 11. maketh mention of an herb called *Leucographis*, but what maner of one it is he hath not expreſſed; therefore it would be hard to affirme this to be the ſame that his *Leucographis* is; and this is thought to be *Spina alba*, called in Greeke ἄκανθα λευκή, or white Thiſtle, Milke Thiſtle, and *Carduus Ramptarius*: of the Arabians, *Bedeard*, or *Bedeguar*, as *Matthæus Syluaticus* teſtifieth.

¶ *The Temperature and Vertues.*

A The tender leaues of *Carduus Leucographus*, the prickles taken off, are ſometimes vſed to bee eaten with other herbes.

B *Galen* writeth, that the roots of *Spina alba* do dry and moderately binde, that therefore it is good for thoſe that be troubled with the laske and the bloudy flix, that it ſtaieth bleeding, waſteth away cold ſwellings; eaſeth the paine of the teeth if they be waſhed with the decoction thereof.

C The ſeed thereof is of a thin eſſence and hot facultie, therefore he ſaith that it is good for thoſe that be troubled with cramps.

D *Dioſcorides* affirmeth that the ſeeds being drunke are a remedy for infants that haue their ſinews drawne together, and for thoſe that be bitten of ſerpents: and that it is thought to driue away ſerpents, if it be but hanged about the necke.

CHAP. 478. *Of the Globe-Thiſtle.*

¶ *The Deſcription.*

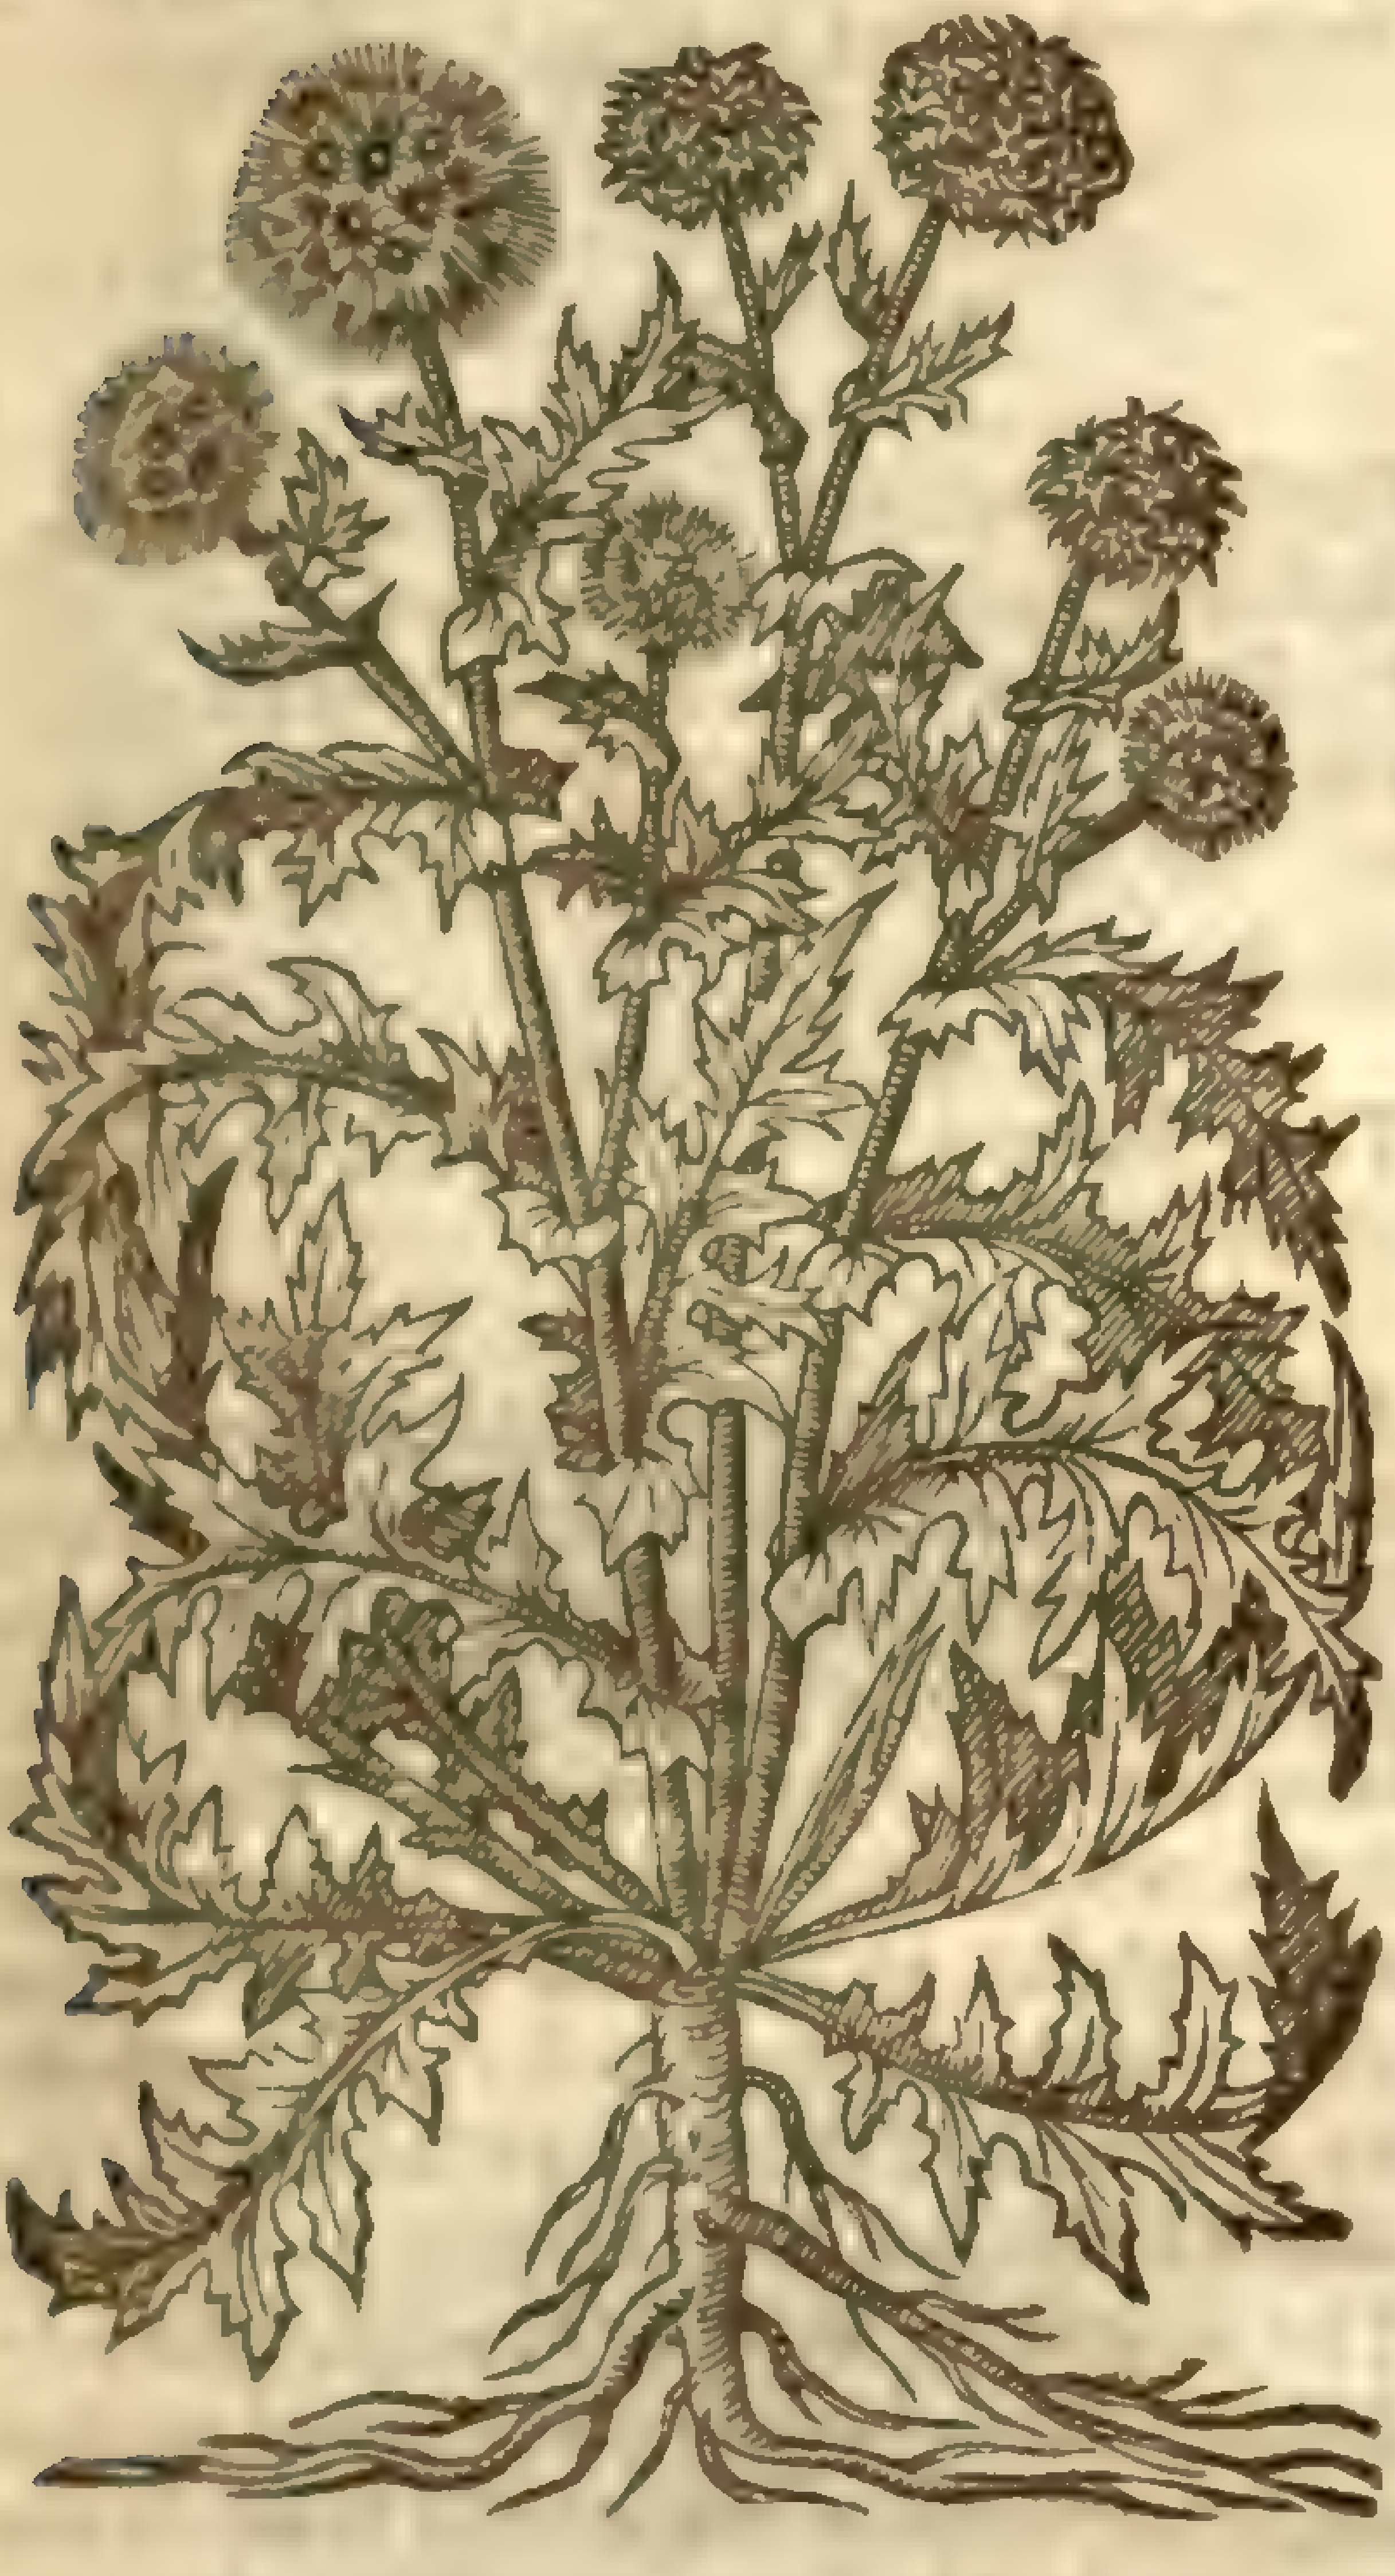
1 GLobe Thiſtle hath a very long ſtalke, and leaues jagged, great, long, and broad, deepely gaſhed, ſtrong of ſmell, ſomewhat greene on the vpper ſide, and on the nether ſide whiter and downy: the floures grow forth of a round head like a globe, which ſtandeth on the tops of the ſtalkes; they are white and ſmall, with blew threds in the midſt: the ſeed is long, with haires of a meane length: the root is thicke and branched.

2 There is another Globe Thiſtle that hath leſſer leaues, but more full of prickles, with round heads alſo: but there groweth out of them beſides the floures, certaine long and ſtiffe prickles.

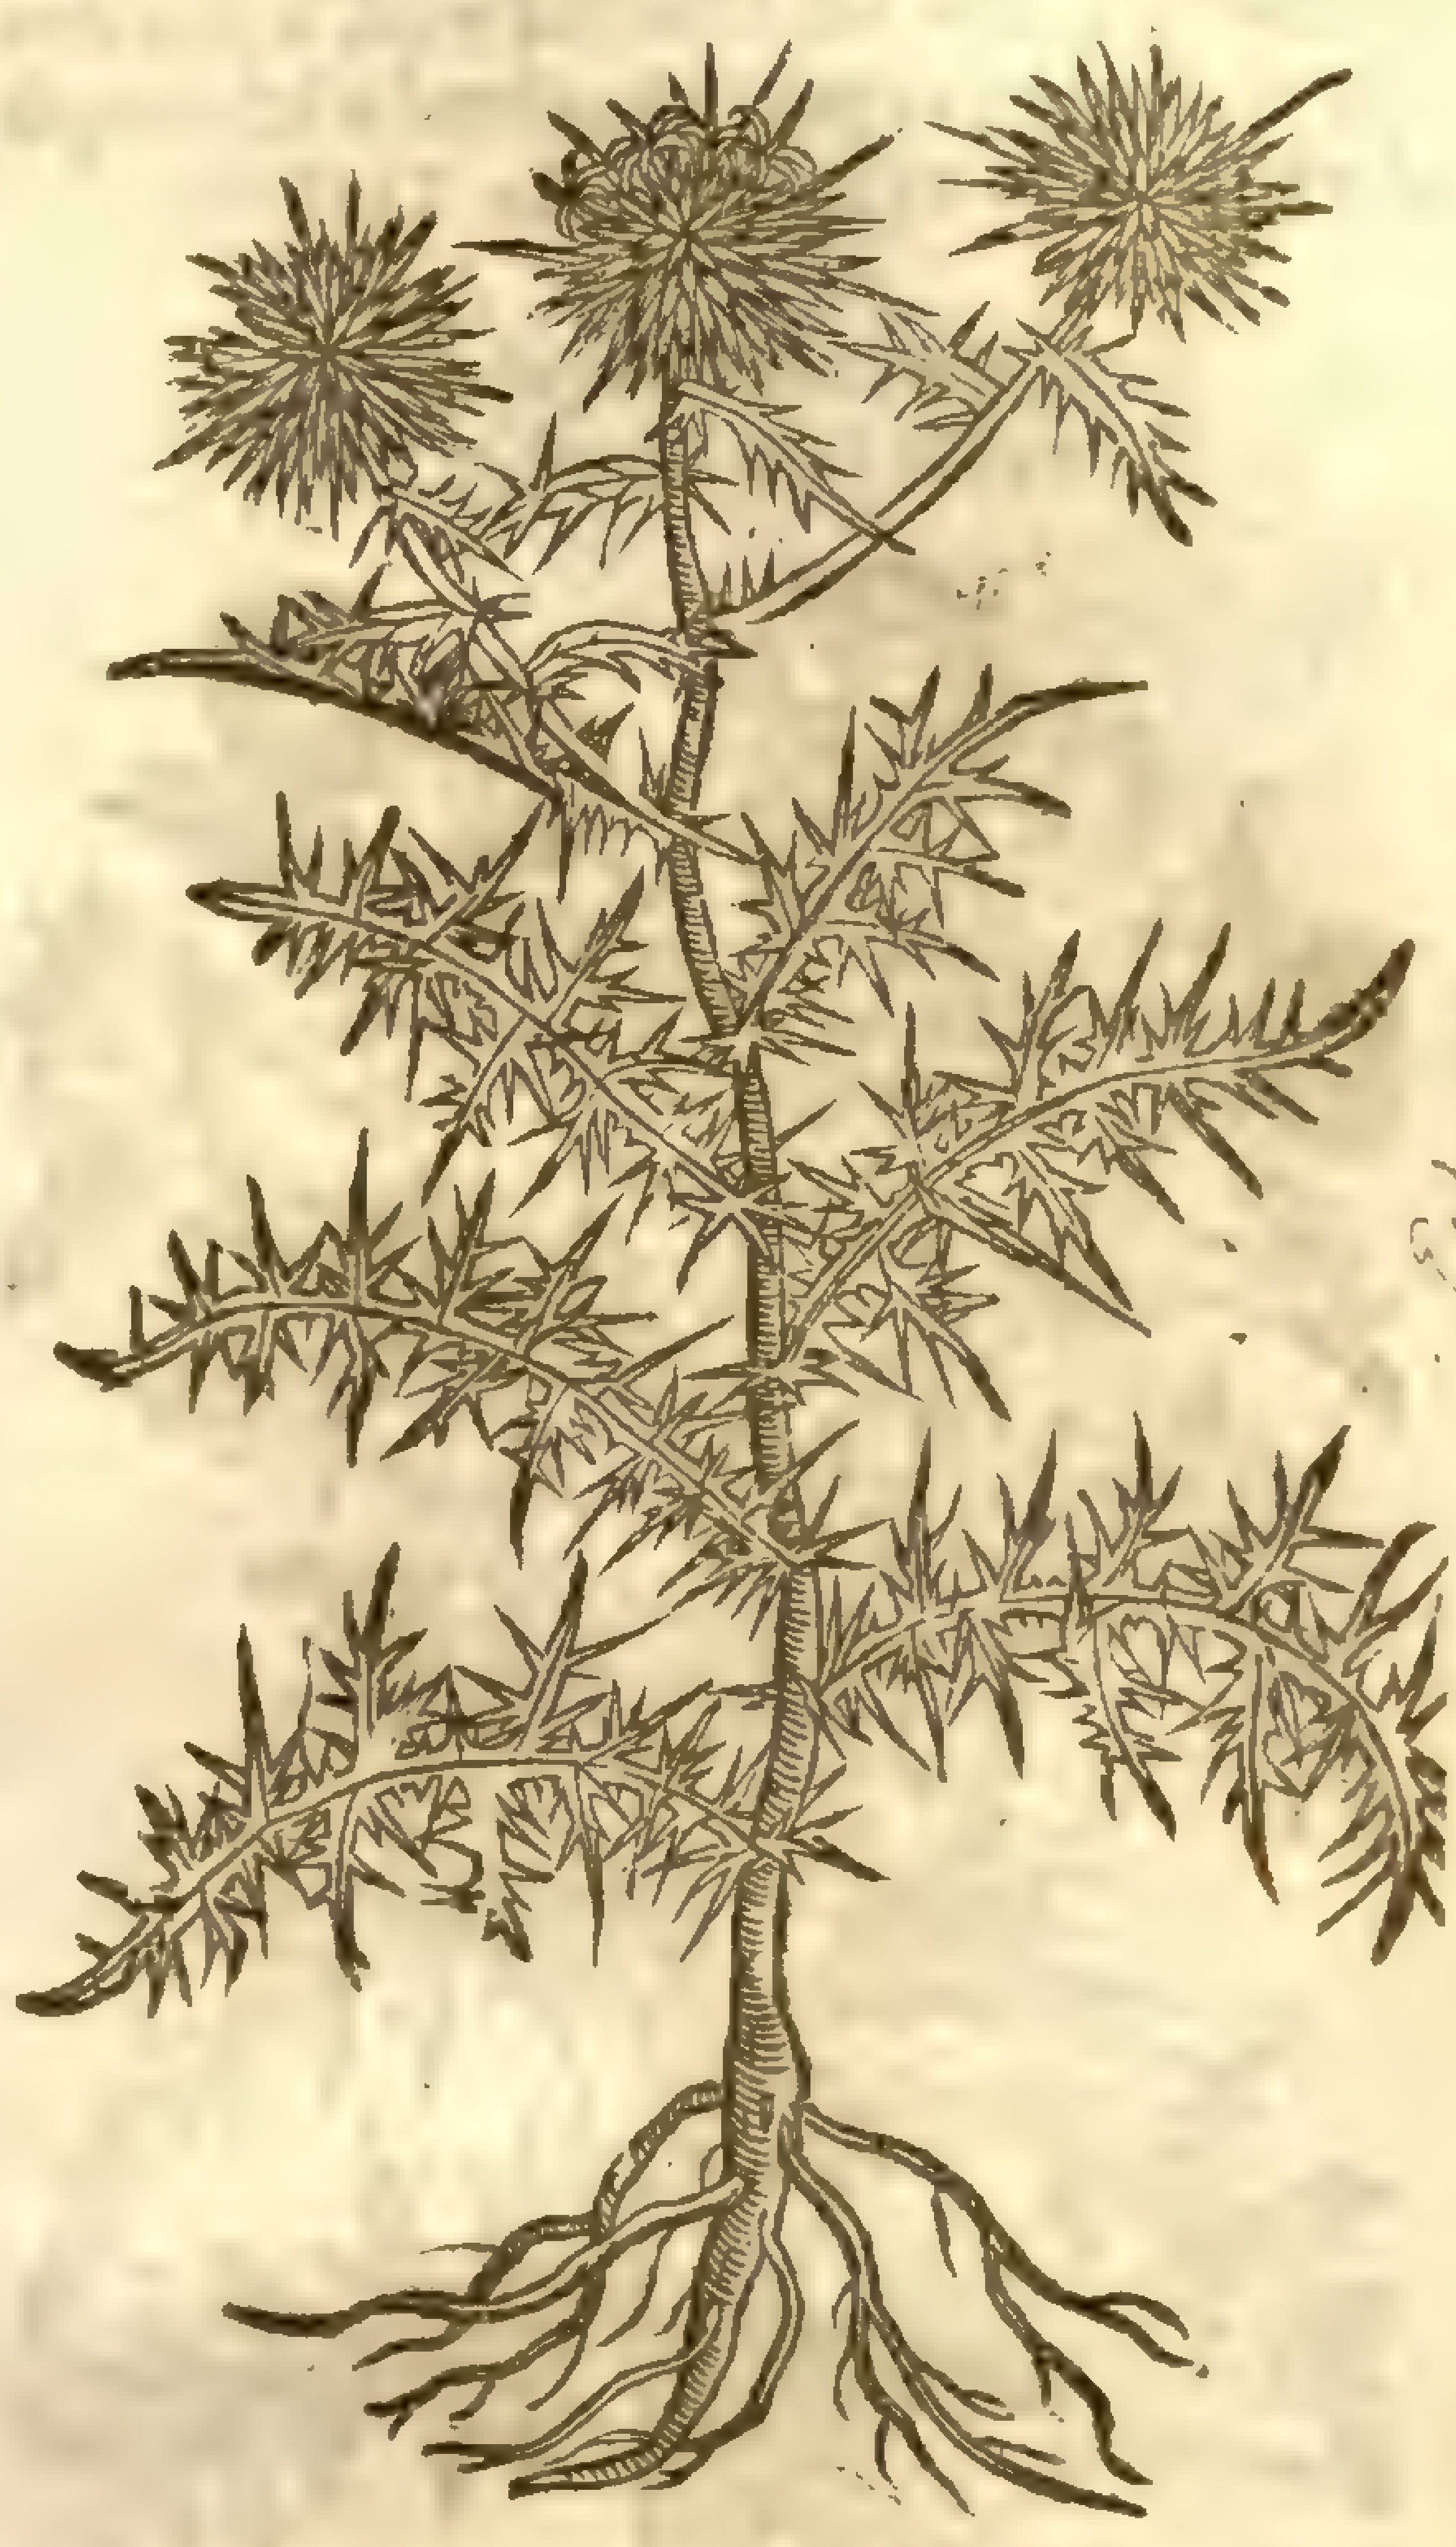
3 There is likewiſe another kinde reſembling the firſt in forme and figure, but much leſſer, and the floures thereof tend more to a blew.

4 There is alſo another Globe Thiſtle, which is the leaſt, and hath the ſharpeſt prickles of all the reſt: the head is ſmall, the floures whereof are white, like to thoſe of the firſt.

1 *Carduus globoſus.*
The Globe-Thiſtle.

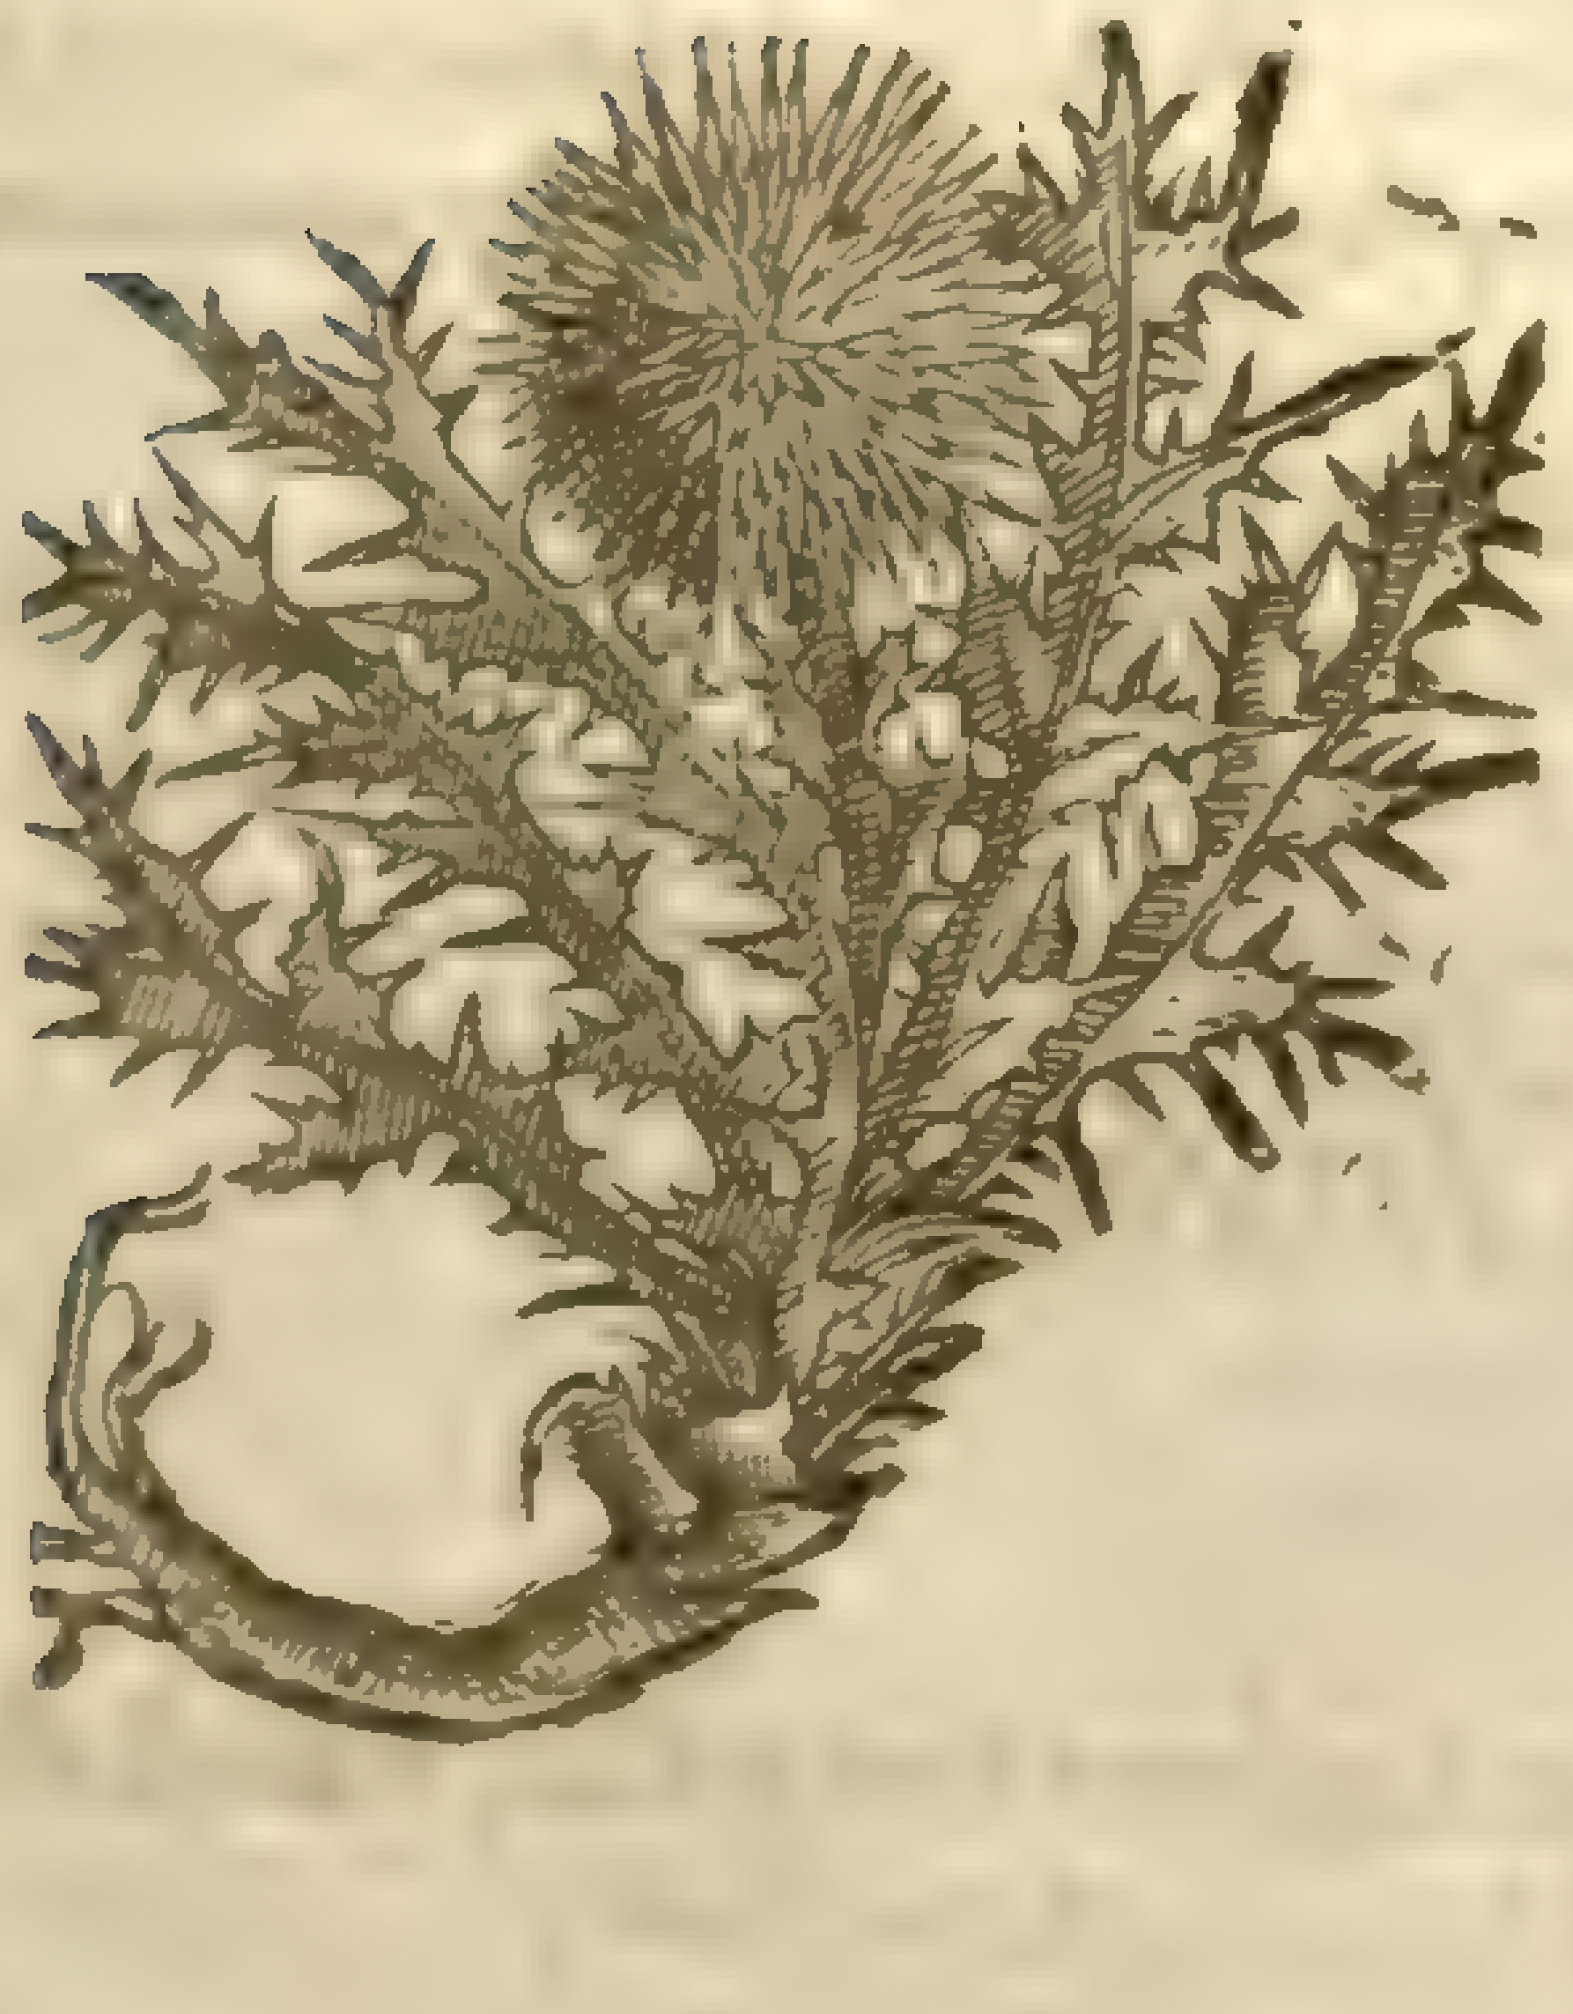


‡ 2 *Carduus globoſus acutus.*
Prickly headed Globe-Thiſtle.

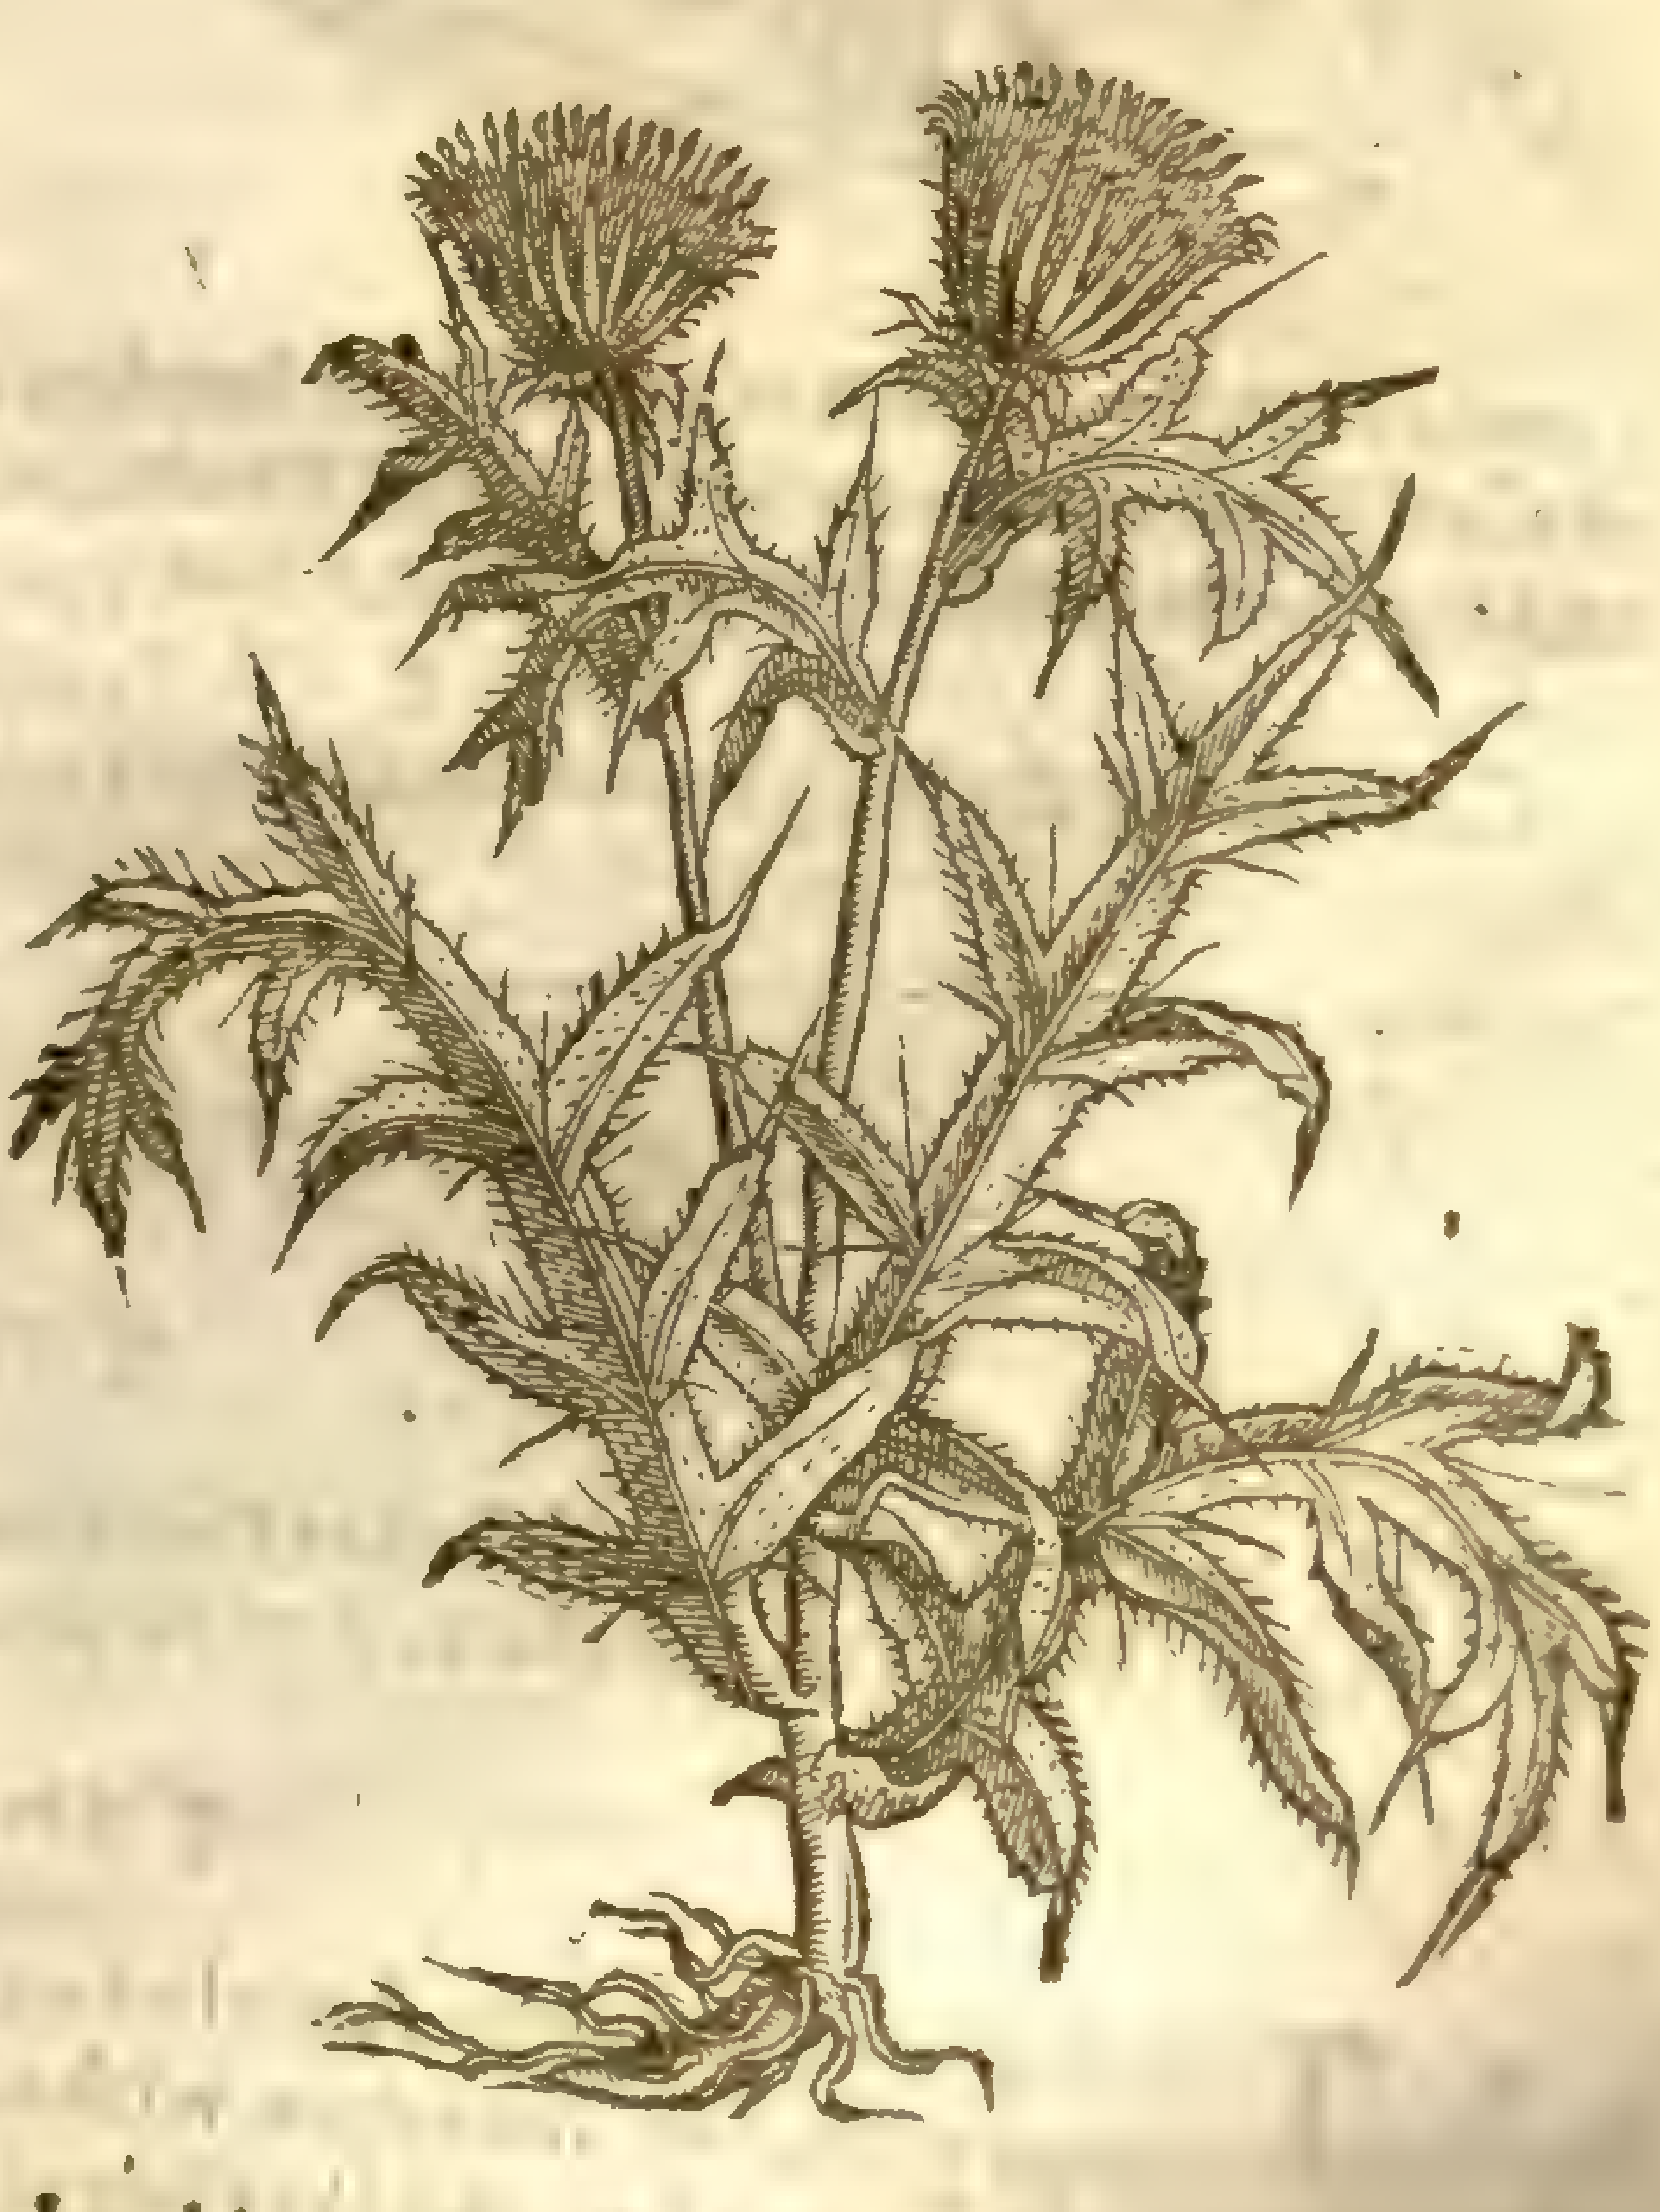


Echinops spinosus

‡ 3 *Carduus globoſus minor.*
Small Globe-Thiſtle.



‡ 5 *Carduus globoſus capitulo latiore.*
Flat headed Globe-Thiſtle.



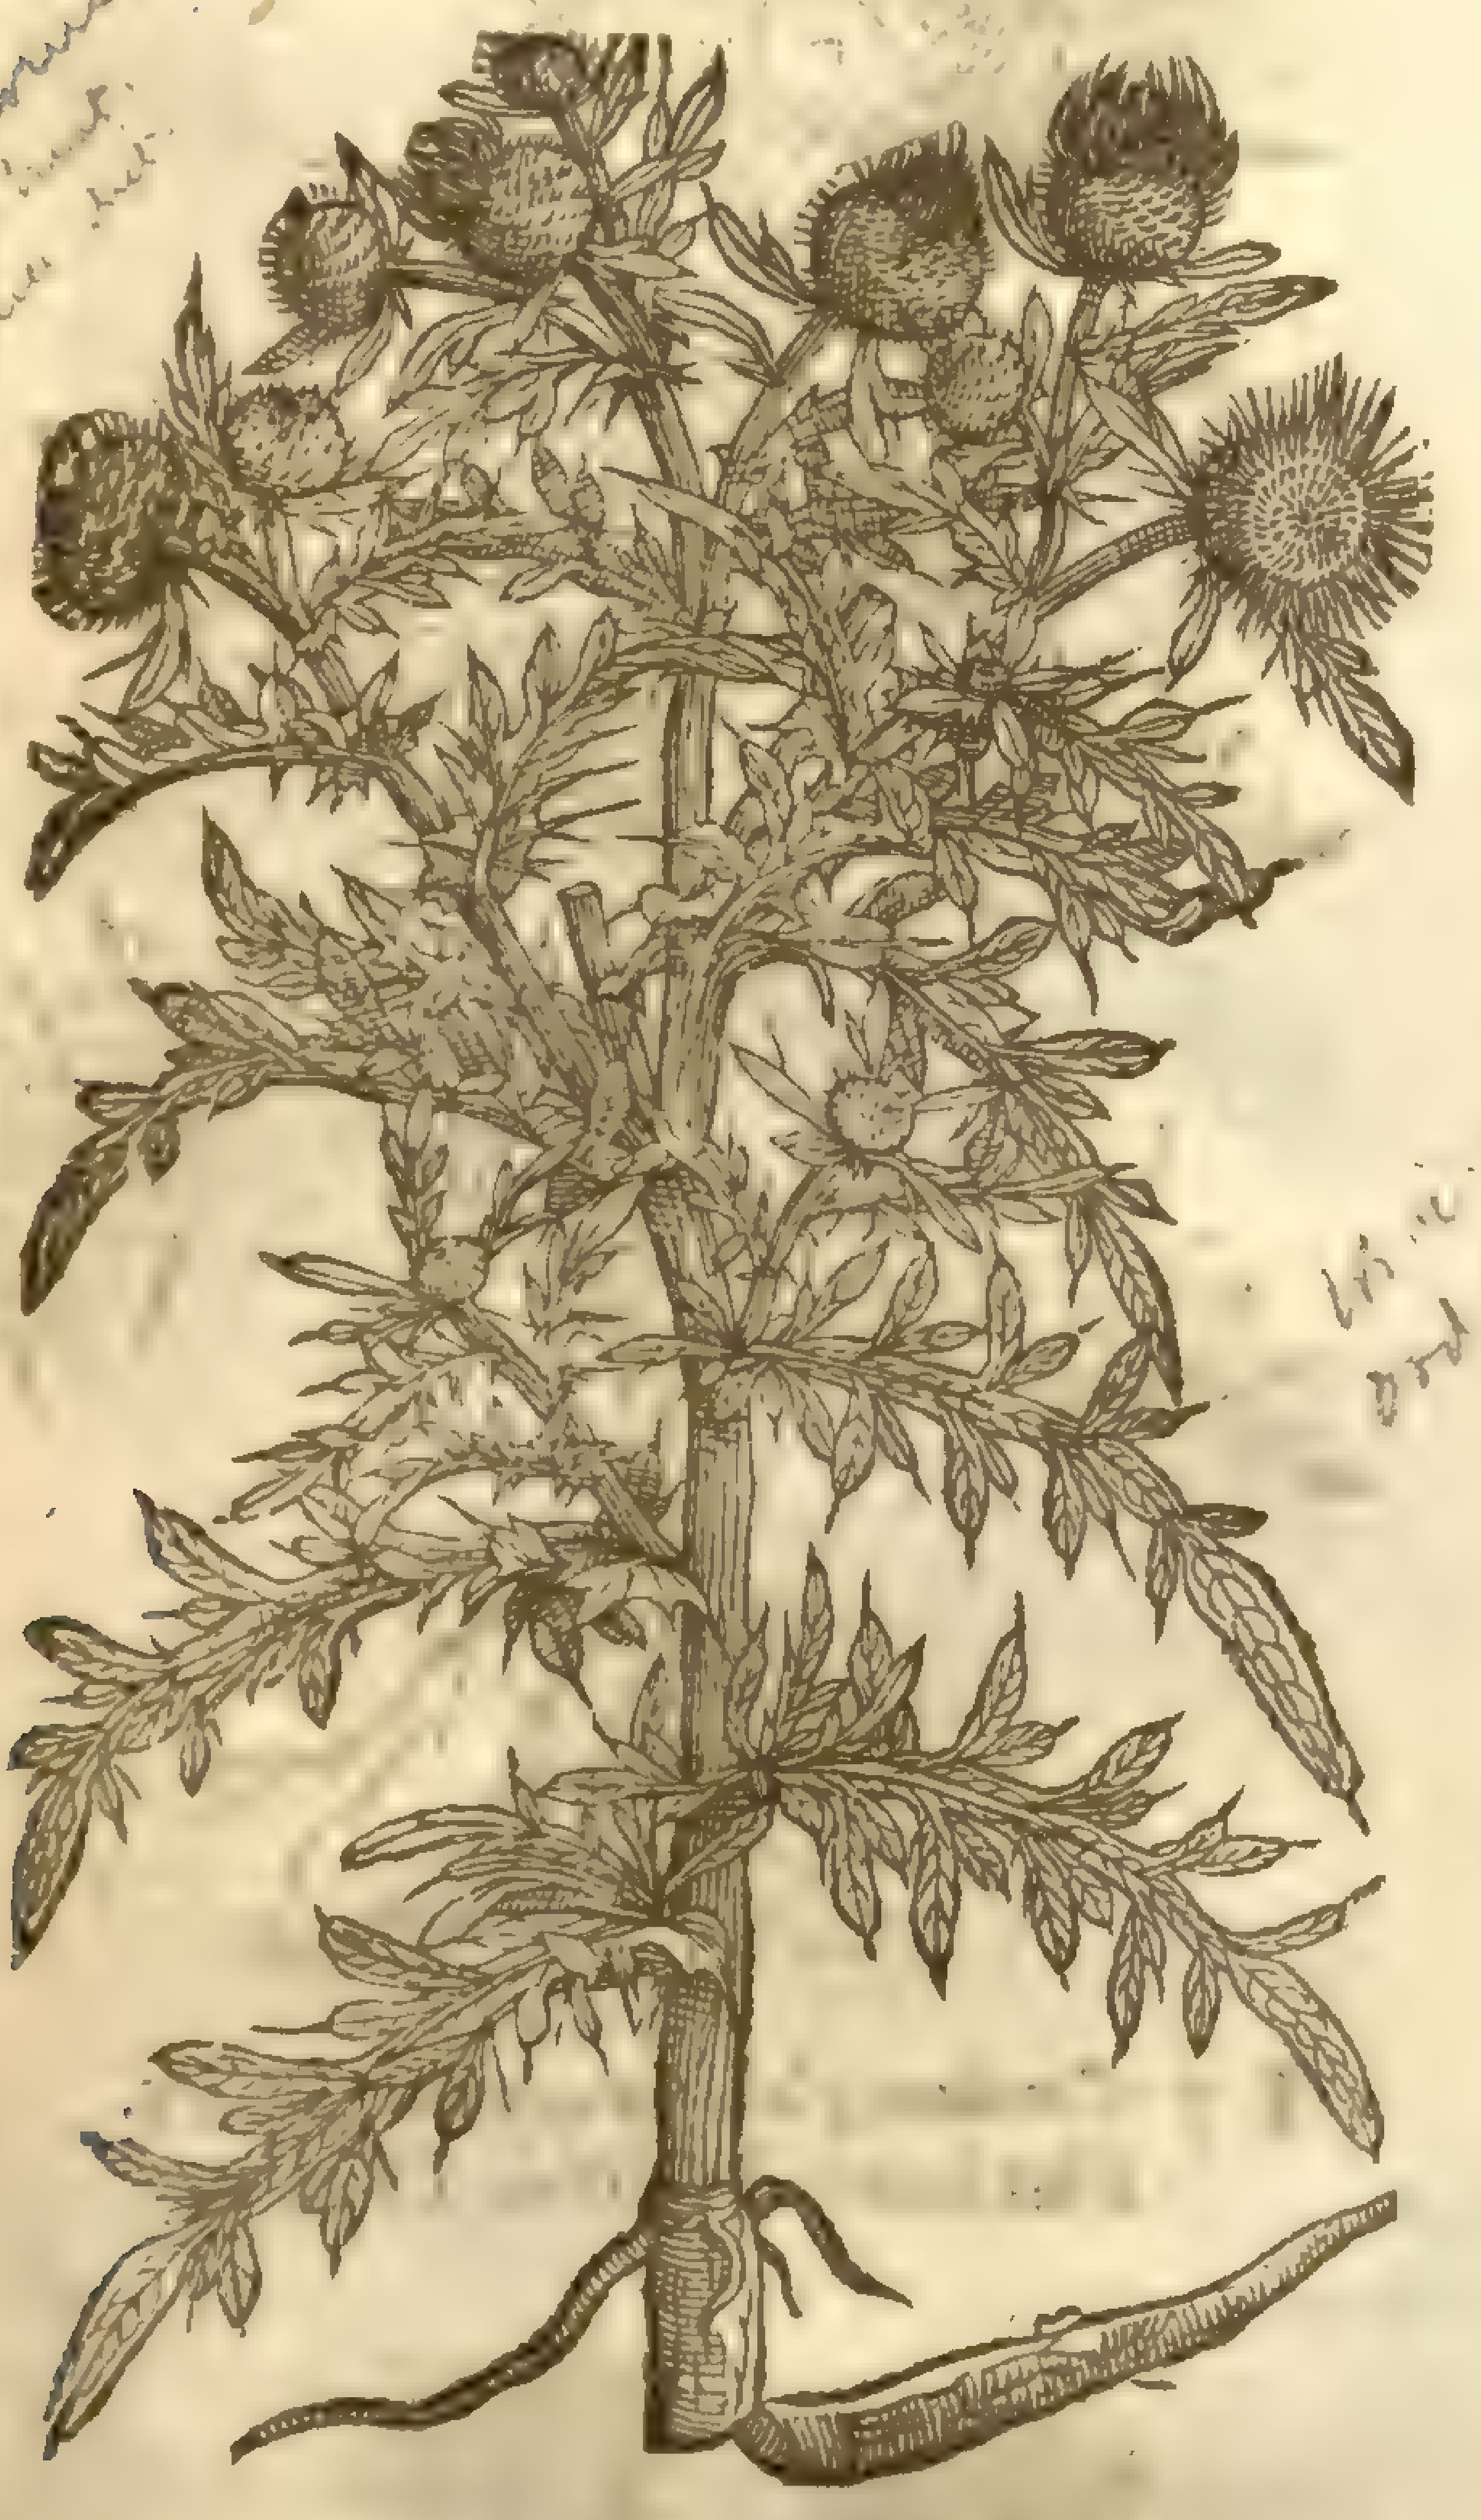
5 There is a certaine other kinde hereof, yet the head is not ſo round, that is to ſay, flatter and broader aboue; out of which ſpring blew floures: the ſtalke hereof is ſlender, and couered with a white thin downe: the leaues are long, gaſhed likewiſe on both ſides, and armed in euery corner with ſharpe prickles.

6 There is another called the Down-Thiſtle, which riſeth vp with thicke and long ſtalks. The leaues thereof are jagged, ſet with prickles, white on the nether ſide: the heads be round and many in number, and are couered with a ſoft downe, and ſharpe prickles ſtanding forth on euery ſide, being on the vpper part fraughted with purple floures all of ſtrings: the ſeed is long, and ſhining, as doth the ſeed of many of the Thiſtles.

‡ 6 *Carduus eriocephalus.*
Woolly headed Thiſtle.

Cnicus eriophorus. Spec. plant. Linn. [illegible]

Lin. ii. 2.9 ord. 923



¶ *The Place.*

Theſe are ſown in gardens, and do not grow in theſe countries that we can finde.

‡ I haue found the ſixth by Pocklington and in other places of the Woldes in Yorkeſhire. Mr. *Goodyer* alſo found it in Hampſhire. ‡

¶ *The Time.*

They floure and flouriſh when the other Thiſtles do.

¶ *The Names.*

Fuchſius did at the firſt take it to bee *Chamaleon niger*; but afterwards being better aduiſed, he named it *Spina peregrina*, and *Carduus globoſus*. *Valerius Cordus* doth fitly call it *Sphærocephalus*: the ſame name doth alſo agree with the reſt, for they haue a round head like a ball or globe. Moſt would haue the firſt to be that which *Matthiolus* ſetteth downe for *Spina alba*: this Thiſtle is called in Engliſh, Globe Thiſtle, and Ball-Thiſtle.

The downe or woolly headed Thiſtle is called in Latine, beeing deſtitute of another name, *Eriocephalus*, of the woolly head: in Engliſh, Downe Thiſtle, or woolly headed Thiſtle. It is thought of diuers to be that which *Bartholomæus Vrbeveteranus* and *Angelus Pales*, Franciſcan Friers, report to be called *Corona Fratrum*, or Friers Crowne: but this Thiſtle doth far differ from that, as is euident by thoſe things which they haue written concerning *Corona Fratrum*; which is thus: In the borders of the kingdome of Aragon towards the kingdome of Caſtile we finde another kinde of Thiſtle, which groweth plentifully there by common wayes, and in wheate fields, &c. *Vide Dod. Pempt.* 5. *lib.* 5. *cap.* 5.

¶ *The Temperature and Vertues.*

Concerning the temperature and vertues of theſe Thiſtles we can alledge nothing at all.

Chap. 479. *Of the Artichoke.*

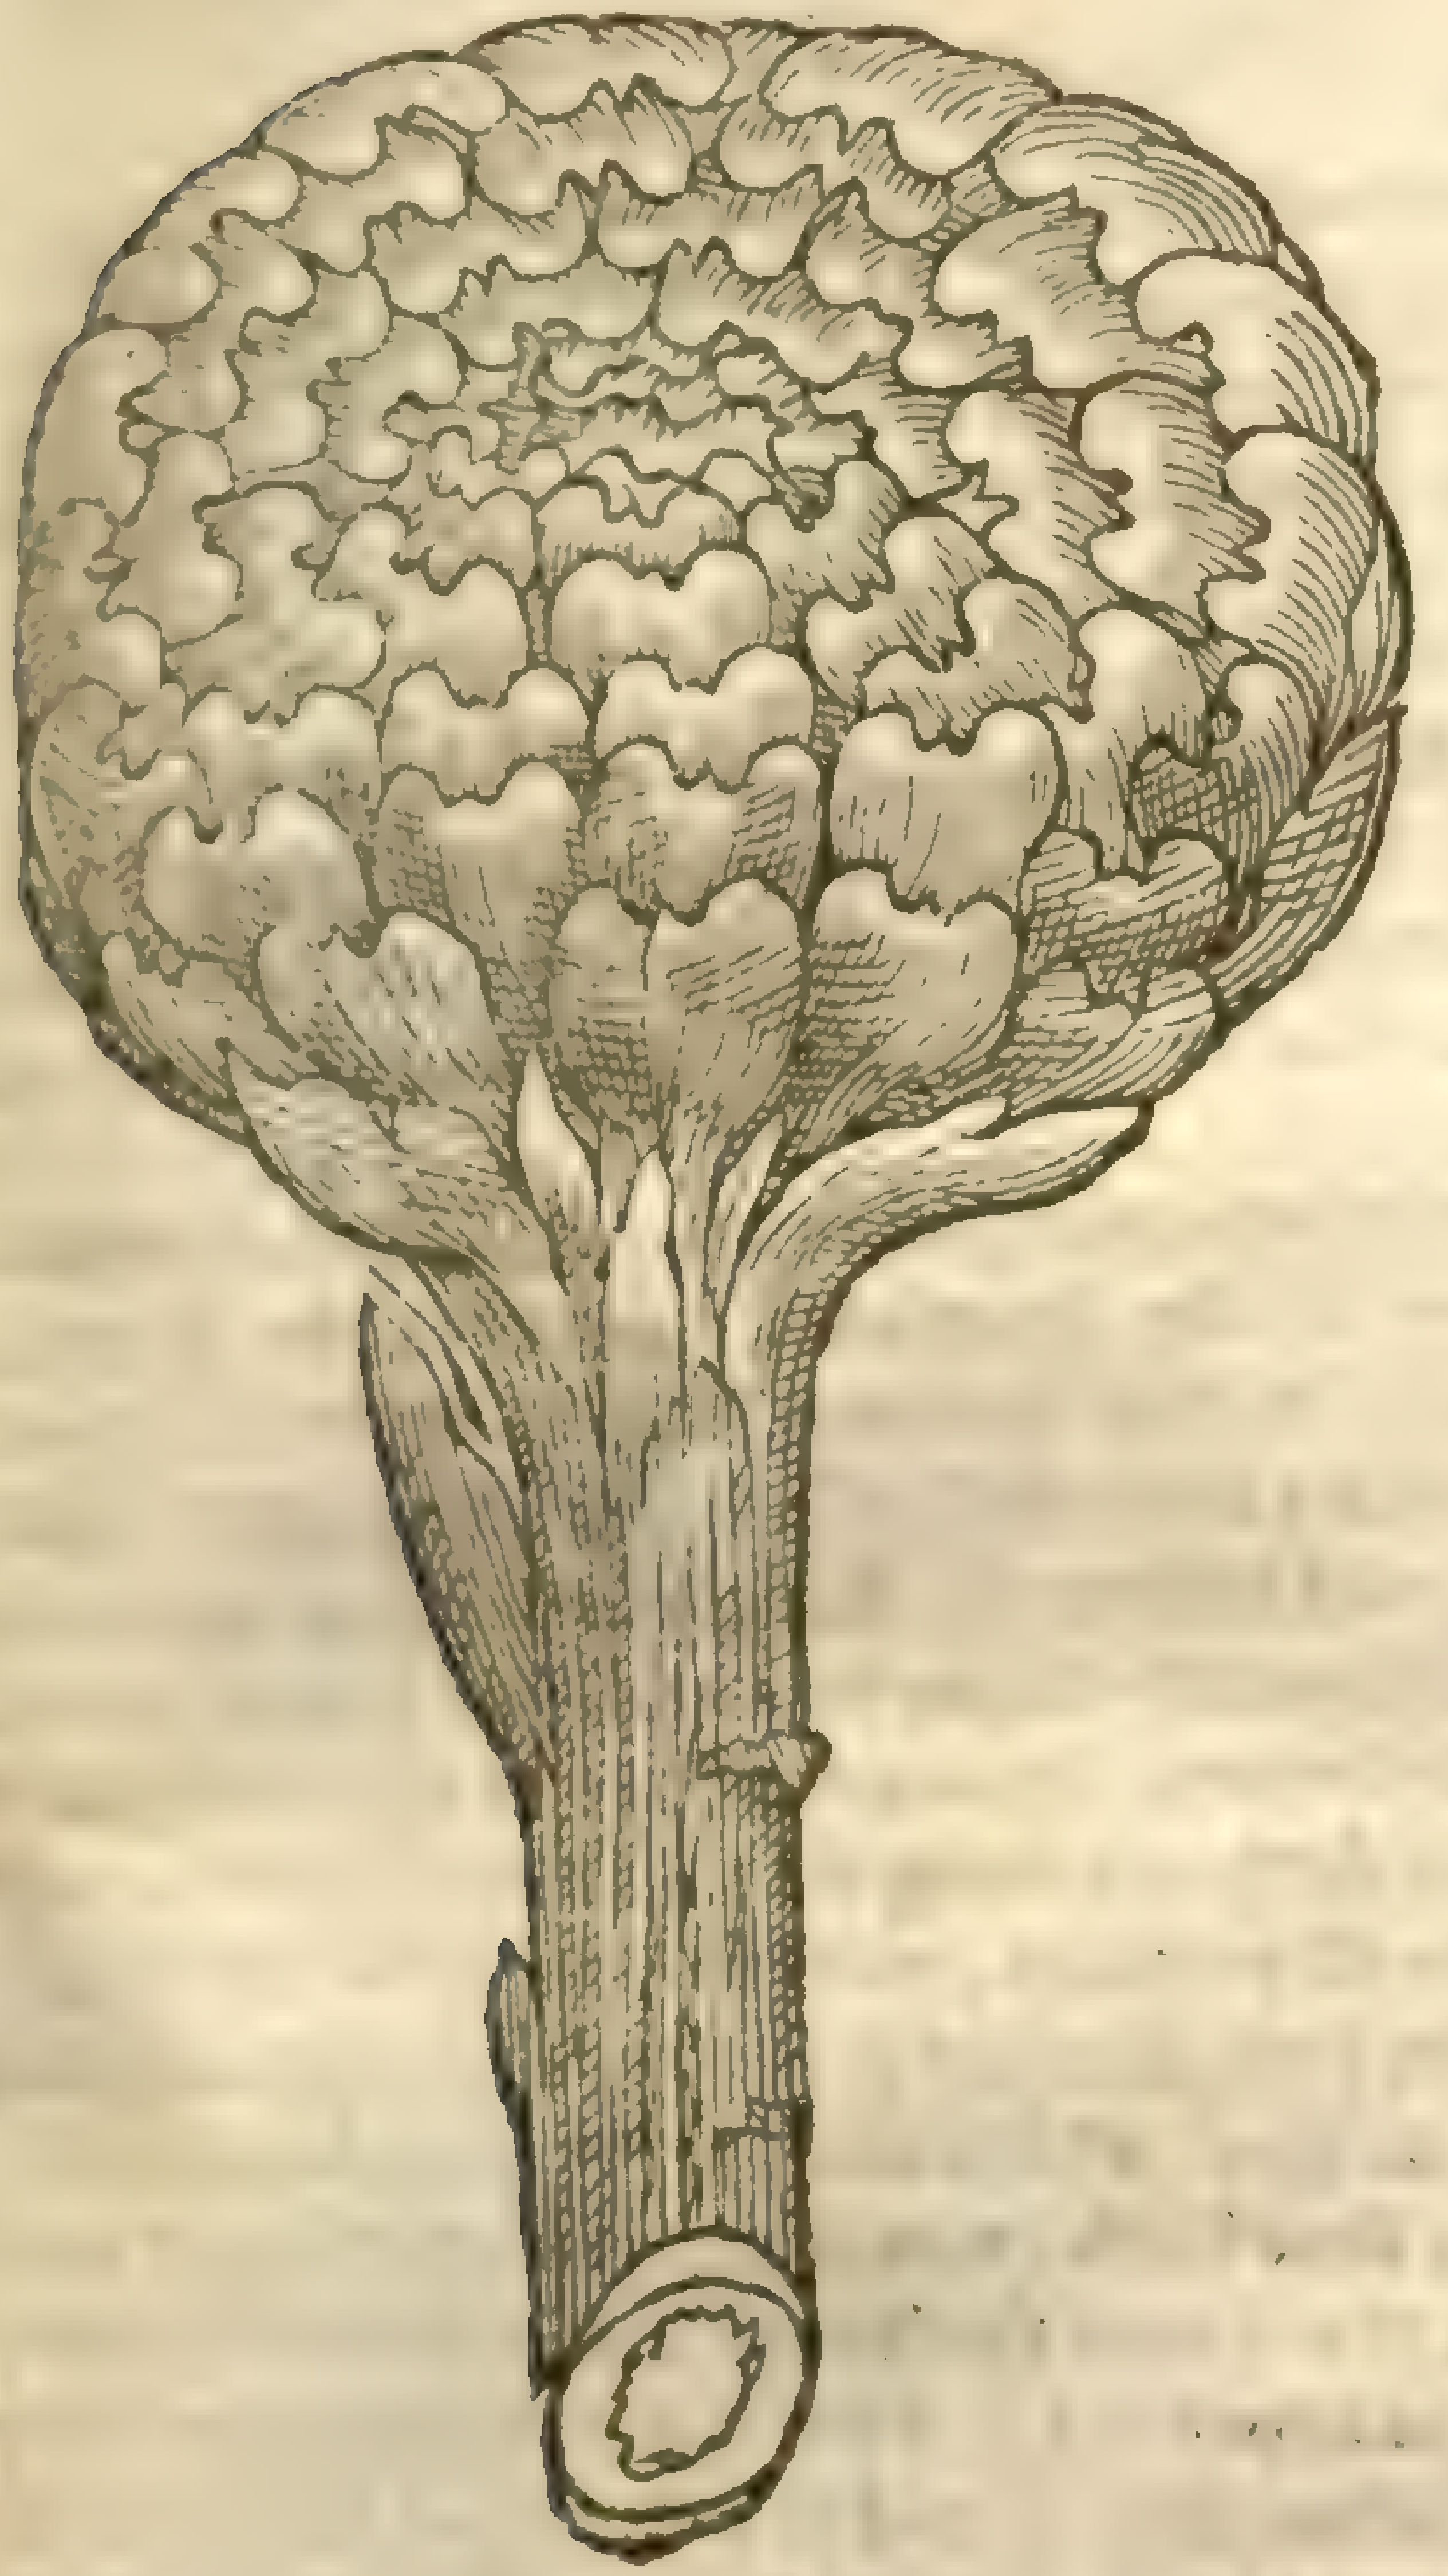
¶ *The Kindes.*

There be three ſorts of Artichokes, two tame or of the garden; and one wilde, which the Italian eſteemeth greatly of, as the beſt to be eaten raw, which he calleth *Cardune*.

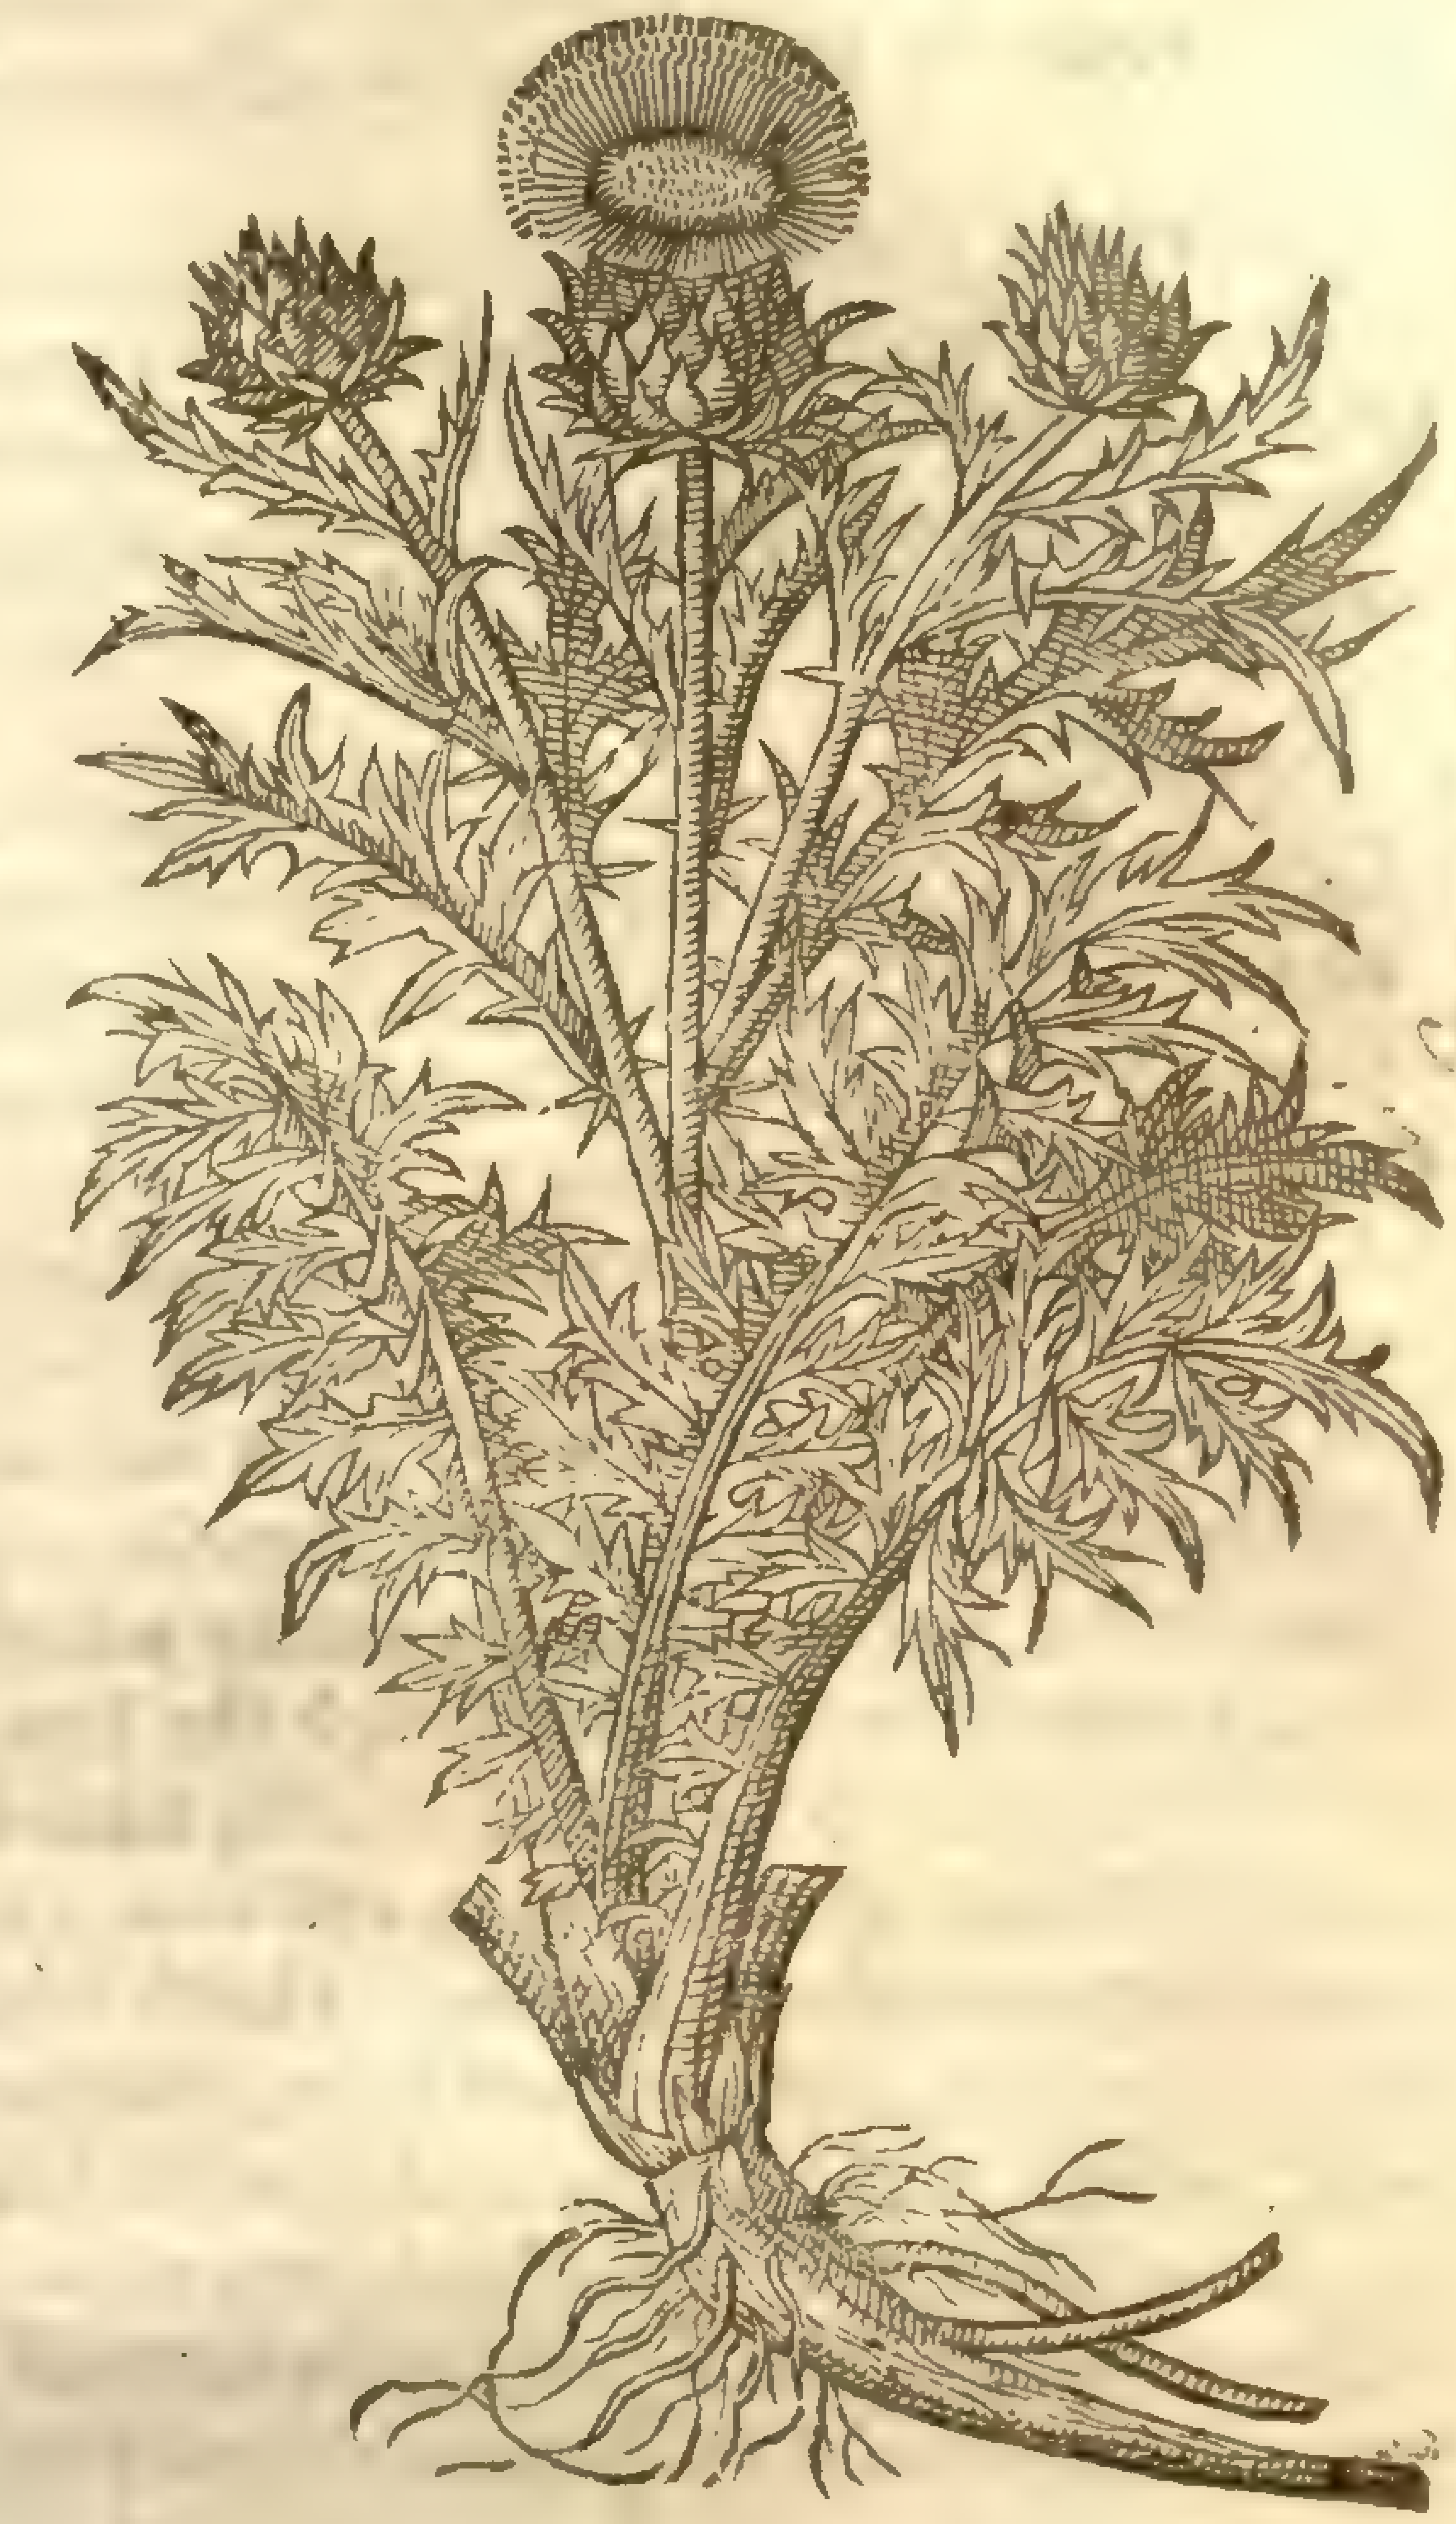
¶ *The Deſcription.*

1 The leaues of the great Artichoke, called in Latine *Cinara*, are broad, great, long, ſet with deepe gaſhes in the edges, with a deepe channell or gutter alongſt the middle, hauing no prickles at all, or very few, and they bee of a greene aſh colour: the ſtalke is aboue a cubit high, and bringeth forth on the top a fruit like a globe, reſembling at the firſt a cone or Pine apple, that is to ſay, made vp of many ſcales; which is when the fruit is great or looſed of a greeniſh red colour within, and in the lower part full of ſubſtance and white; but when it opens it ſelfe there growes alſo

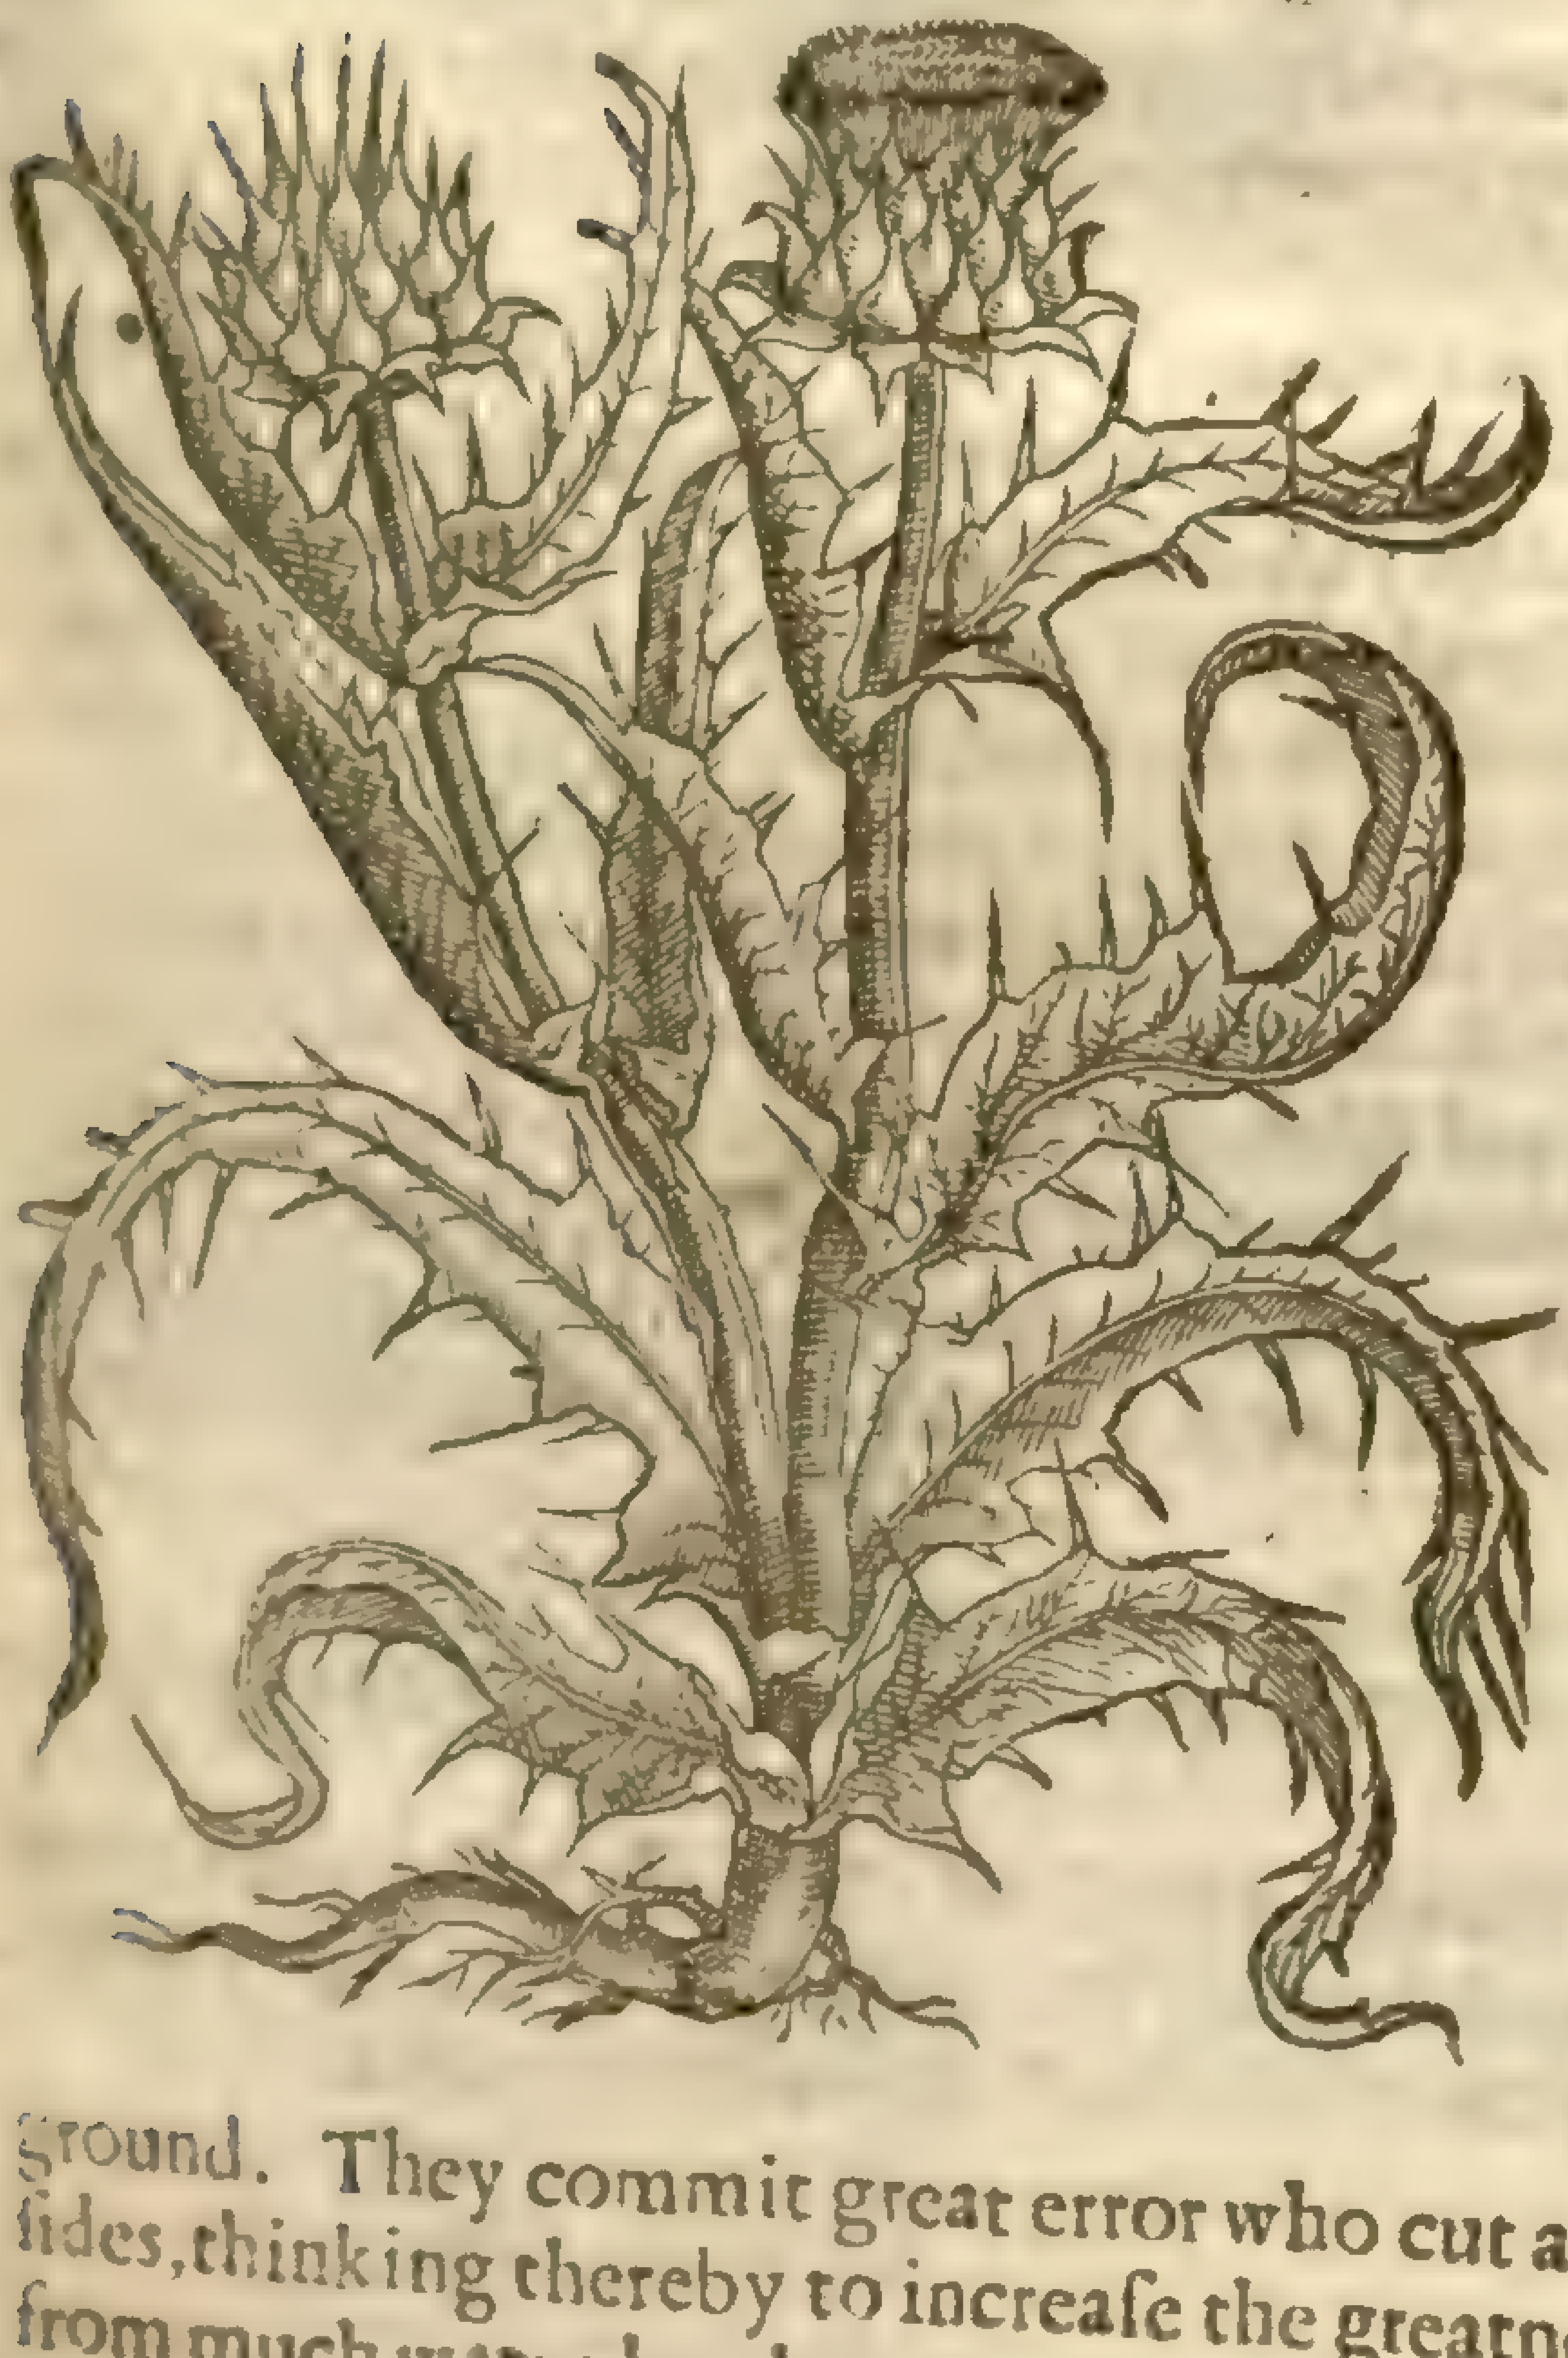
1 *Cinara maxima Anglica.*
The great red Artichoke.



2 *Cinara maxima alba.*
The great white Artichoke.



3 *Cinara ſylneſtris.*
Wilde Artichocke.



alſo vpon the cone a floure all of threds, of a gallant purple tending to a blew colour. The ſeed is long, greater and thicker than that of our Ladies thiſtle, lying vnder ſoft and downy haires which are contained within the fruit. The root is thicke, and of a meane length.

2 The ſecond great Artichoke differeth from the former in the colour of the fruit, otherwiſe there is little difference, except the fruit hereof dilateth it ſelfe further abroad, and is not ſo cloſely compact together, which maketh the difference.

3 The prickly Artichoke, called in Latine *Carduus*, or *Spinoſa Cinara*, differeth not from the former, ſaue that all the corners of the leaues hereof, and the ſtalkes of the cone or fruit, are armed with ſtiffe and ſharpe prickles, whereupon it beareth well the name of *Carduus*, or Thiſtle.

¶ *The Place.*

The Artichoke is to be planted in a fat and fruitfull ſoile: they doe loue water and moiſt ground. They commit great error who cut away the ſide or ſuperfluous leaues that grow by the ſides, thinking thereby to increaſe the greatneſſe of the fruit, when as in truth they depriue the root from much water by that meanes, which would nouriſh it to the feeding of the fruit; for if you marke the trough or hollow channell that is in euery leafe, it ſhall appeare very euidently, that the

Creator in his ſecret wiſedome did ordaine thoſe furrows, euen from the extreme point of the leafe to the ground where it is faſtned to the root, for no other purpoſe but to guide and leade that water which falls farre off, vnto the root; knowing that without ſuch ſtore of water the whole plant would wither, and the fruit pine away and come to nothing.

¶ *The Time.*

They are planted for the moſt part about the Kalends of Nouember, or ſomewhat ſooner. The plant muſt bee ſet and dunged with good ſtore of aſhes, for that kinde of dung is thought beſt for planting thereof. Euery yeare the ſlips muſt be torne or ſlipped off from the body of the root, and theſe are to be ſet in April, which will beare fruit about Auguſt following, as *Columella*, *Paladius*, and common experience teacheth.

¶ *The Names.*

The Artichoke is called in Latine, *Cinara*, of *Cinis*, Aſhes, wherewith it loueth to be dunged. *Galen* calleth it in Greeke, Κύναρα: but with *k* and *v* in the firſt ſyllable: of ſome it is called *Cactos*: it is named in Italian, *Carcioffi*, *Archiocchi*: in Spaniſh, *Alcarroſa*: in Engliſh, Artichoke: in French, *Artichaux*: in low Dutch, **Artichoken**; whereupon diuers call it in Latine, *Articocalus*, and *Articoca*: in high Dutch, **Strobildorn.**

The other is named in Latine commonly not onely *Spinoſa cinara*, or prickly Artichoke, but alſo of *Palladius*, *Carduus*: of the Italians, *Cardo*, and *Cardino*: of the Spaniards, *Cardos*: of the French-men, *Chardons*: *Leonhartus Fuchſius* and moſt writers take it to be *Scolymus Dioſcoridis*; but *Scolymus Dioſcoridis* hath the leafe of Chameleon or *Spina alba*, with a ſtalke full of leaues, and a prickly head. but neither is *Cinara* the Artichoke which is without prickles, nor the Artichoke with prickles any ſuch kinde of herbe; for though the head haue prickles, yet the ſtalke is not full of leaues, but is many times without leaues, or elſe hath not paſt a leafe or two. *Cynara* doth better agree with that which *Theophraſtus* and *Pliny* call Κάκτος, *Cactus*, and yet it doth not bring forth ſtalkes from the root creeping alongſt the ground: it hath broad leaues ſet with prickles; the middle ribs of the leaues, the skin pilled off, are good to be eaten, and likewiſe the fruit, the ſeed and downe taken away; and that which is vnder is as tender as the braine of the Date tree: which things *Theophraſtus* and *Pliny* report of *Cactus*. That which they write of the ſtalkes, ſent forth immediately from the root vpon the ground, which are good to be eaten, is peraduenture the ribs of the leaues: euery ſide taken away (as they be ſerued vp at the table) may be like a ſtalke, except euen in Sicilia, where they grew only in *Theophraſtus* time. It bringeth forth both certaine ſtalkes that lie on the ground, and another alſo ſtanding ſtraight vp; but afterwards being remoued and brought into Italy or England, it bringeth forth no more but one vpright: for the ſoile and clyme do much preuaile in altering of plants, as not onely *Theophraſtus* teacheth, but alſo euen experience it ſelfe declareth: and of *Cactus*, *Theophraſtus* writeth thus; Κάκτος (*Cactus*) groweth onely in Sicilia: it bringeth forth preſently from the root ſtalkes lying along vpon the ground, with a broad and prickly leafe: the ſtalkes being pilled are fit to be eaten, being ſomewhat bitter, which may be preſerued in brine: it bringeth forth alſo another ſtalke, which is likewiſe good to be eaten.

¶ *The Temperature and Vertues.*

A The nailes, that is, the white and thicke parts which are in the botome of the outward ſcales or flakes of the fruit of the Artichoke, and alſo the middle pulpe whereon the downy ſeed ſtands, are eaten both raw with pepper and ſalt, and commonly boyled with the broth of fat fleſh, with pepper added, and are accounted a dainty diſh, being pleaſant to the taſte, and good to procure bodily luſt: ſo likewiſe the middle ribs of the leaues being made white and tender by good cheriſhing and looking to, are brought to the table as a great ſeruice together with other junkets: they are eaten with pepper and ſalt as be the raw Artichokes: yet both of them are of ill juyce; for the Artichoke containeth plenty of cholericke juyce, and hath an hard ſubſtance, inſomuch as of this is ingendred melancholy juyce, and of that a thin and cholericke bloud, as *Galen* teacheth in his booke of the faculties of nouriſhments. But it is beſt to eate the Artichoke boyled: the ribbes of the leaues are altogether of an hard ſubſtance: they yeeld to the body a raw and melancholy juyce, and containe in them great ſtore of winde.

B It ſtayeth the inuoluntary courſe of the naturall ſeed either in man or woman.

C Some write, that if the buds of yong Artichokes be firſt ſteeped in wine, and eaten, they prouoke vrine, and ſtirre vp the luſt of the body.

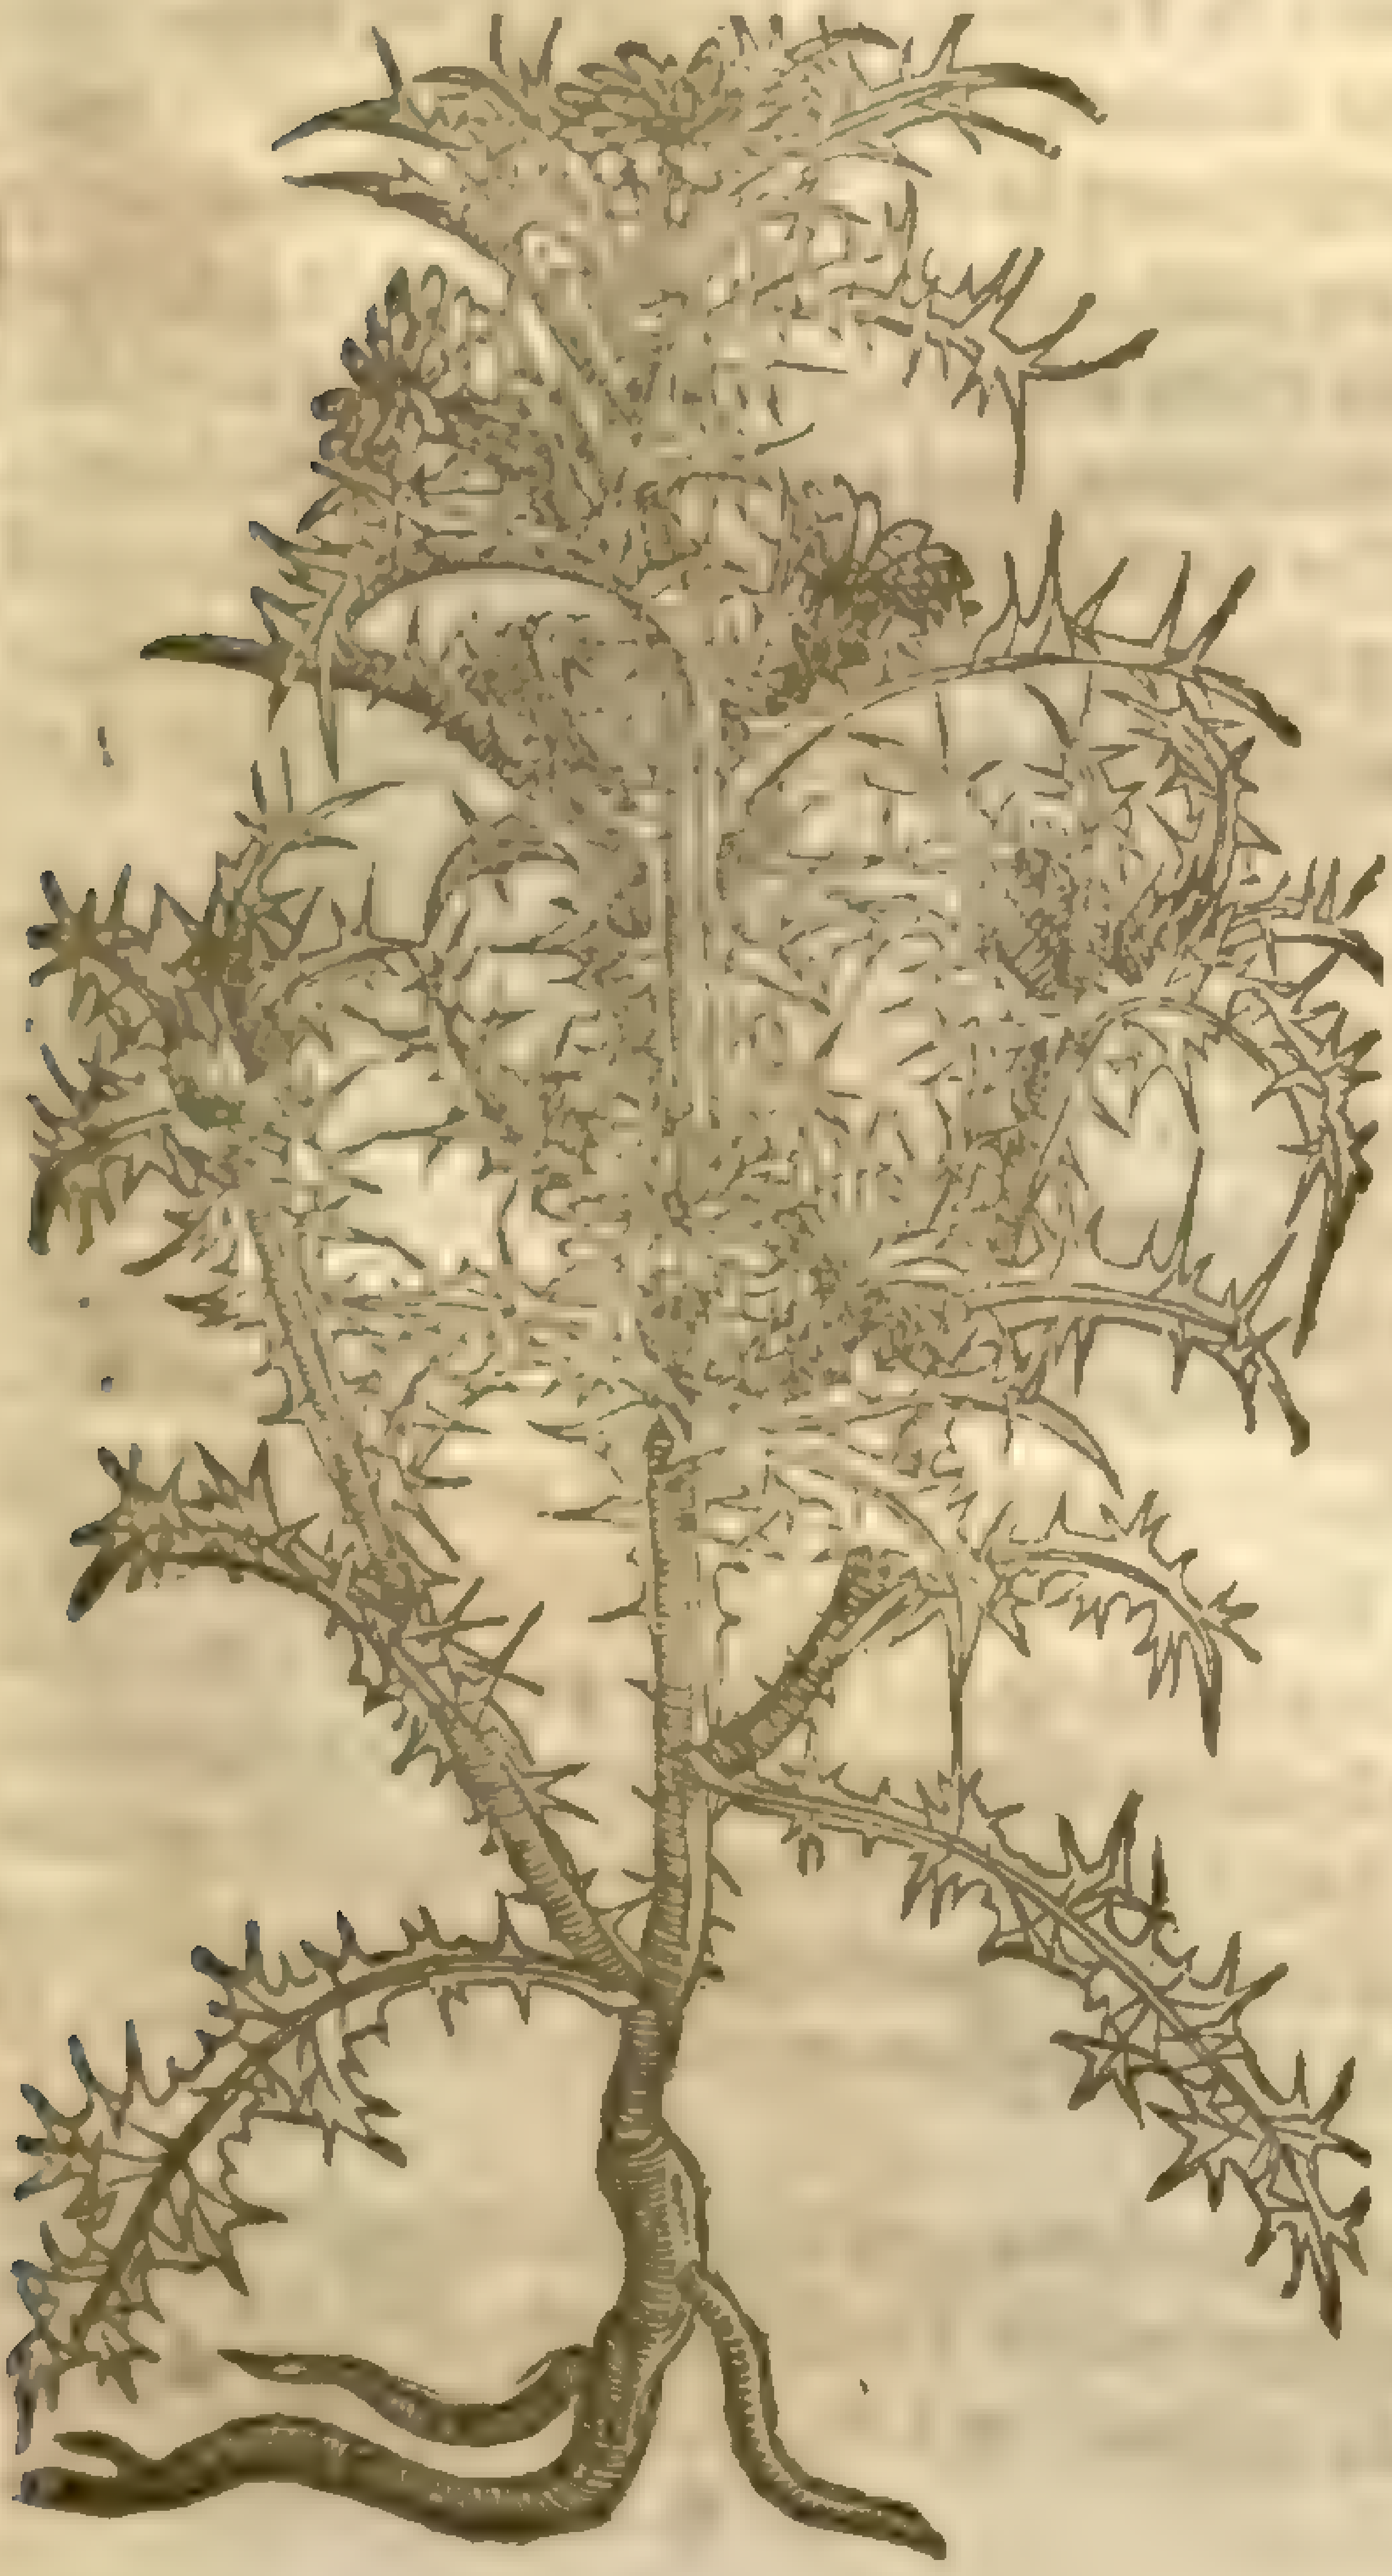
D I finde moreouer, That the root is good againſt the ranke ſmell of the arme-holes, if when the pith is taken away the ſame root bee boyled in wine and drunke: for it ſendeth forth plenty of ſtinking vrine, whereby the ranke and rammiſh ſauour of the whole body is much amended.

CHAP. 480. *Of Golden Thiſtle.*

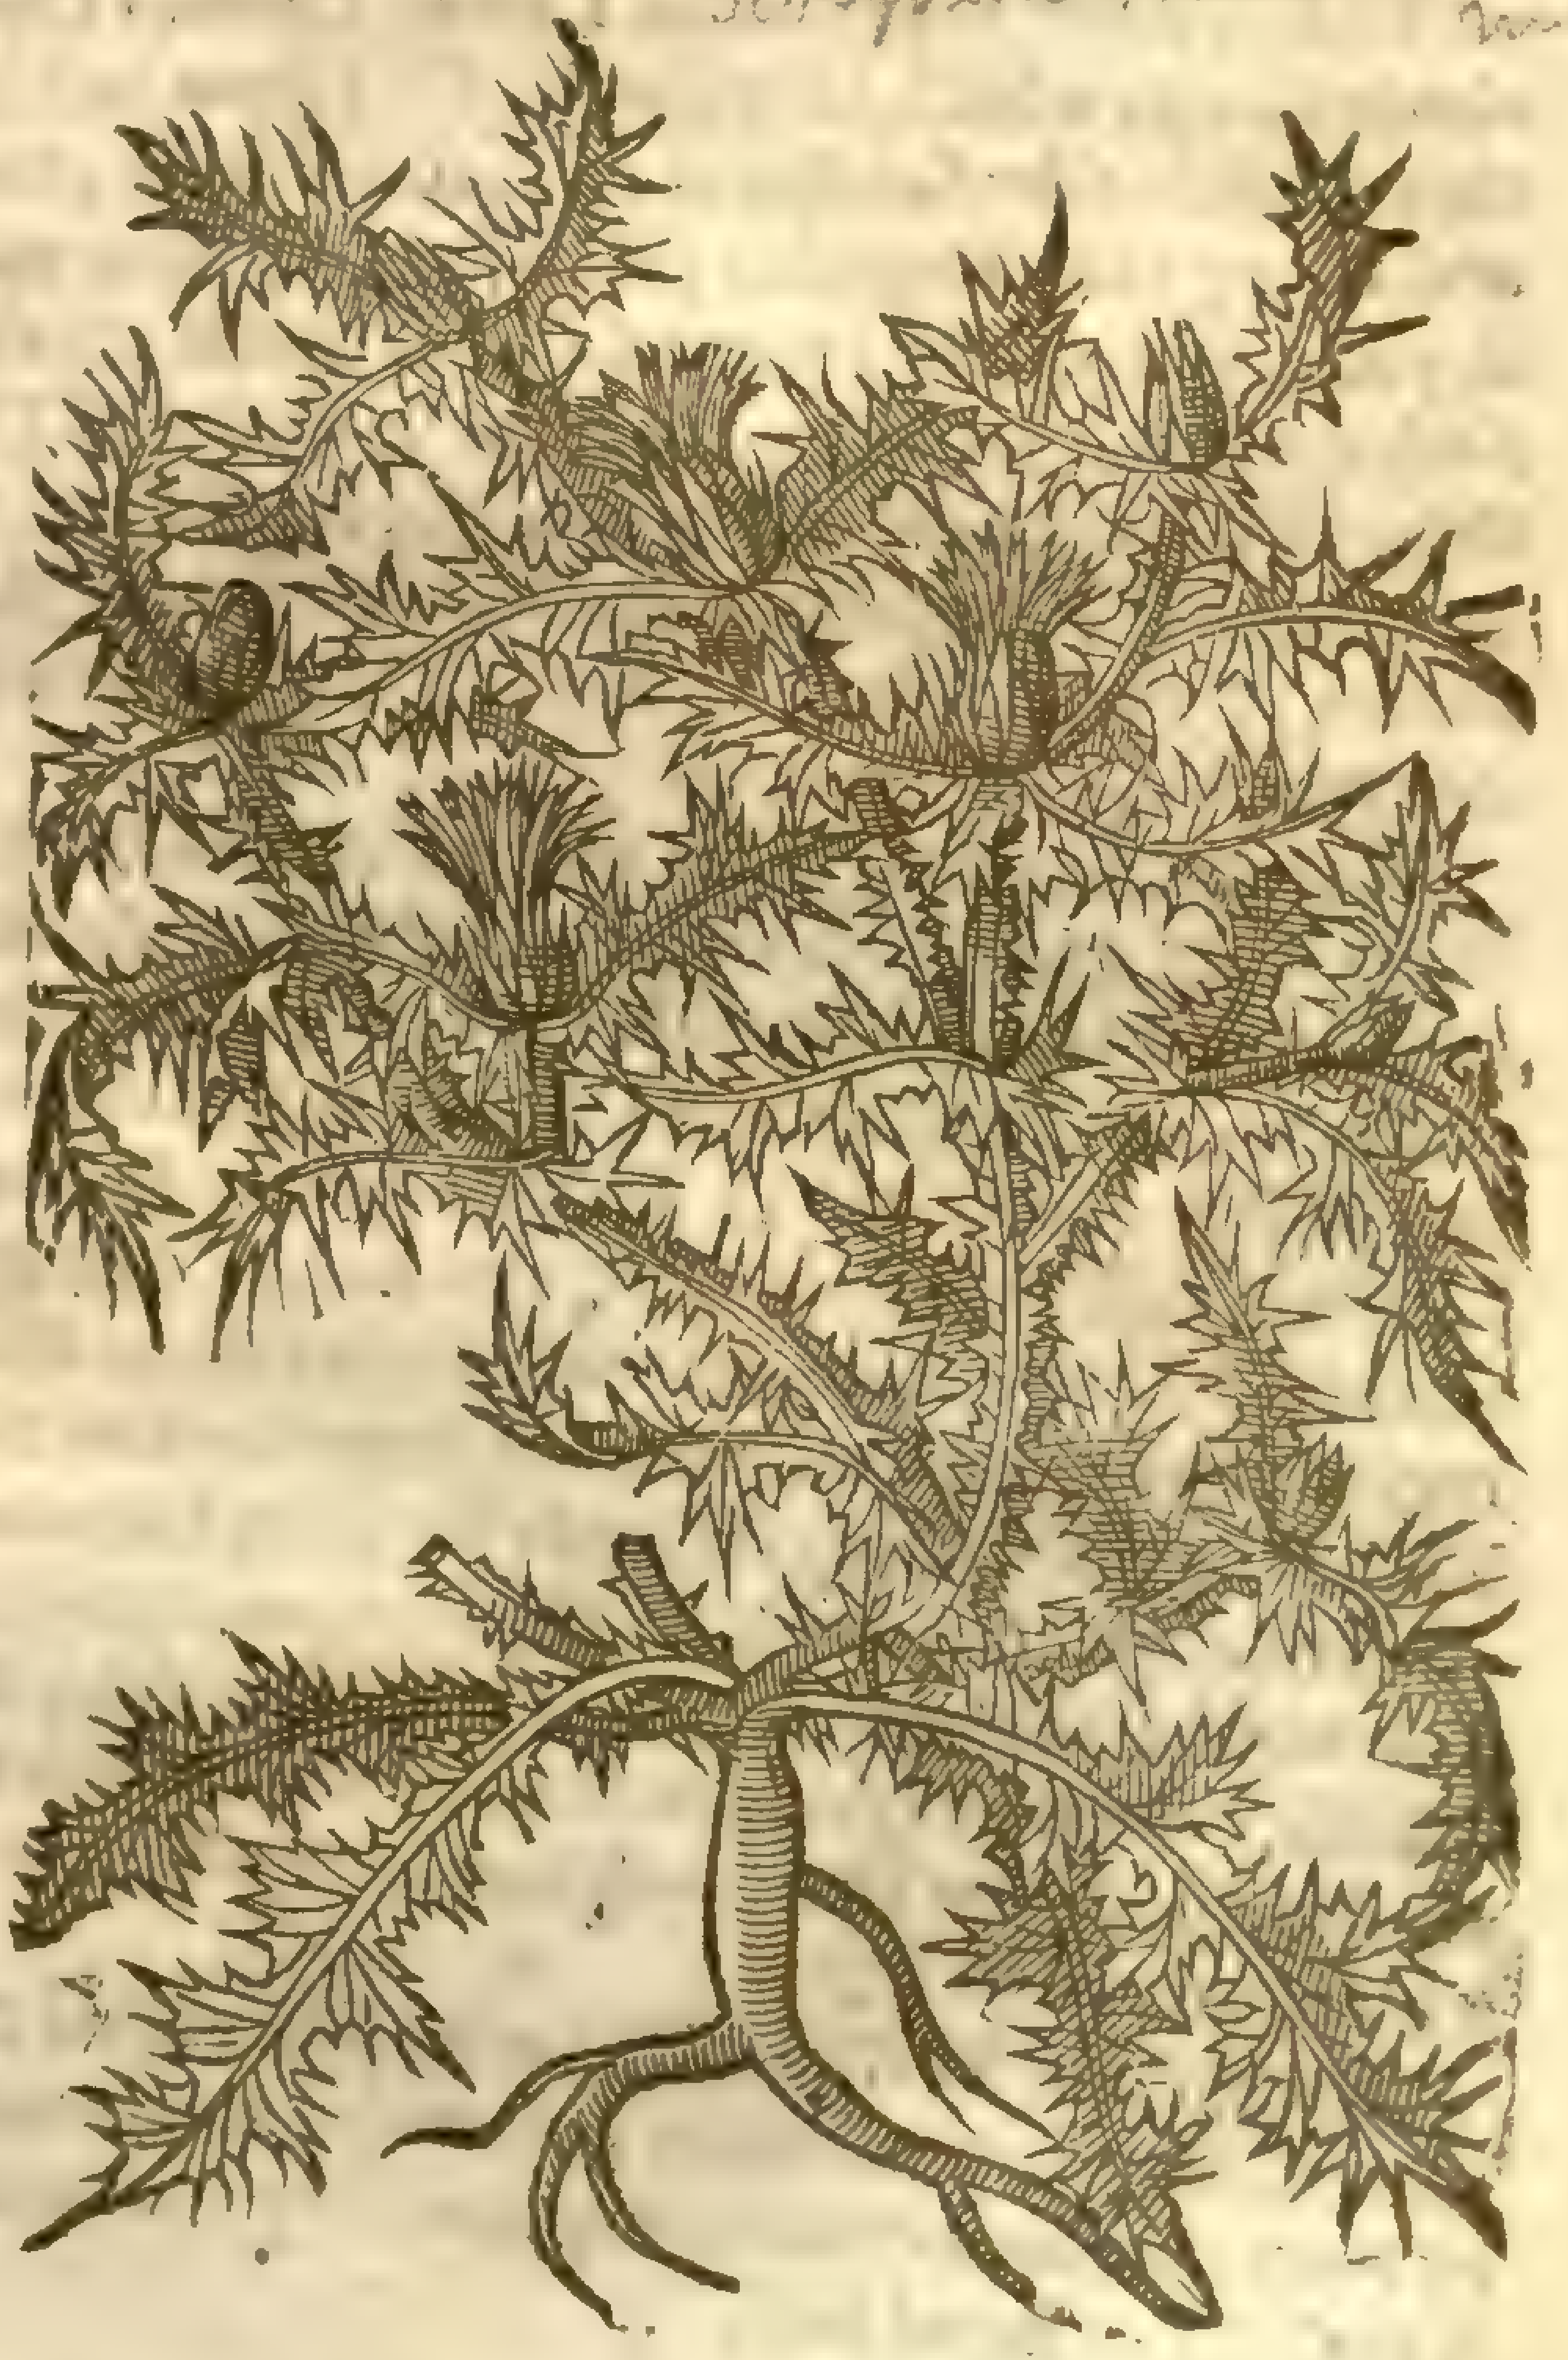
¶ *The Deſcription.*

1 THe ſtalkes of Golden Thiſtle riſe vp forthwith from the root, being many, round, and branched. The leaues are long, of a beautifull greene, with deepe gaſhes on the edges, and ſet with moſt ſharpe prickles: the floures come from the boſome of the leaues, ſet in a ſcaly chaffie knap, very like to Succory floures, but of colour as yellow as gold: in their places come vp broad flat and thin ſeeds, not great, nor wrapped in downe: the root is long, a finger thicke, ſweet, ſoft, and good to be eaten, wherewith ſwine are much delighted: there iſſueth forth of this Thiſtle in what part ſoeuer it is cut or broken, a juyce as white as milke.

‡ There is ſome variety of this Thiſtle; for it is found much larger about Montpelier than it is in Spaine, with longer branches, but fewer floures: the leaues alſo are ſpotted or ſtreaked with white like as the milke Thiſtle: whence *Cluſius*, whom I here follow, hath giuen two figures thereof; the former by the name of *Scolymus Theophraſti Hiſpanicus*; and the other by the title of *Scolymus Theophraſti Narbonenſis*. This with white ſpots I ſaw growing this yere with Mr. *Tradeſcant* at South Lambeth. ‡



1 *Carduus Chryſanthemus Hiſpanicus.*
The Spaniſh golden Thiſtle.



‡ *Carduus Chryſanthemus Narbonenſis.*
The French golden Thiſtle.

Scolymus maculatus [illegible]

2 The golden Thiſtle of Peru, called in the Weſt Indies, *Fique del Inferno*, a friend of mine brought it vnto me from an Iſland there called Saint Iohns Iſland, among other ſeeds. What reaſon the inhabitants there haue to call it ſo, it is vnto me vnknowne, vnleſſe it bee becauſe of his fruit, which doth much reſemble a fig in ſhape and bigneſſe, but ſo full of ſharpe and venomous prickles, that whoſoeuer had one of them in his throat, doubtleſſe it would ſend him packing either to heauen or to hell. This plant hath a ſingle wooddy root as big as a mans thumbe, but ſomewhat long: from which ariſeth a brittle ſtalke, full of joynts or knees, diuiding it ſelfe into ſundry other ſmall branches, ſet full of leaues like vnto the milke Thiſtle, but much ſmaller, and ſtraked with many white lines or ſtreakes: and at the top of the ſtalkes come forth faire and goodly yellow floures, very like vnto the ſea Poppy, but more elegant, and of greater beauty, hauing in the midſt

thereof a ſmall knop or boll, ſuch as is in the middle of our wilde Poppy, but full of ſharpe thorn and at the end thereof a ſtaine or ſpot of a deepe purple: after the yellow floures be fallen, this foreſaid knop groweth by degrees greater and greater, vntill it come to full maturity, which openet it ſelfe at the vpper end, ſhewing his ſeed, which is very blacke and round like the ſeed of muſtar The whole plant and each part thereof doth yeeld very great abundance of milky juyce, which i of a golden colour, falling and iſſuing from any part thereof, if it be cut, or bruiſed: the whole pla periſheth at the approch of Winter. The vertues hereof are yet vnknowne vnto me, wherefore I purpoſe not to ſet downe any thing thereof by way of conjecture, but ſhall, God willing, be ready to declare that which certaine knowledge and experience either of mine owne or others, ſhall make manifeſt vnto me.

¶ *The Place.*

The golden Thiſtle is ſowne in gardens of the Low-Countries. ***Petrus Bellonius*** writes, That it groweth plentifully in Candy, and alſo in moſt places of Italy: ***Cluſius*** reporteth that he found it in the fields of Spaine, and of the kingdome of Caſtile, and about Montpelier, with fewer branches, and of a higher growth.

The Indian Thiſtle groweth in Saint Iohns Iſland in the Weſt Indies, and proſpereth very well in my garden.

¶ *The Time.*

They floure from Iune to the end of Auguſt: the ſeed of the Indian golden Thiſtle muſt bee ſowne when it is ripe, but it doth not grow vp vntill May next after.

¶ *The Names.*

This Thiſtle is called in Latine, *Carduus Chryſanthemus*: in Greeke of *Theophraſtus*, Σκόλυμος: for thoſe things which he writeth of *Scolymus* in his ſixth and ſeuenth bookes doe wholly agree with this Thiſtle *Chryſanthemus*: which are theſe; *Scolymus*, doth floure in the Summer Solſtice, brauely and a long time together; it hath a root that may be eaten both ſod and raw, and when it is broken it yeeldeth a milky juyce: *Gaza* nameth it *Carduus*. Of this *Pliny* alſo makes mention *lib.21.cap.16.* *Scolymus*, ſaith he, differs from thoſe kindes of Thiſtles, *viz. Acarna*, and *Atractilis*, becauſe the root thereof may bee eaten boyled. Againe, *lib.22.cap.22.* The Eaſt Countries vſe it as a meate: and he calleth it by another name Λειμώνιον. Which thing alſo *Theophraſtus* ſeemeth to affirme, in his firſt booke; for when hee reckoneth vp herbes whoſe leaues are ſet with prickles, he addeth *Scolymus*, or *Limonia*.

Notwithſtanding, *Pliny* maketh mention likewiſe of another *Scolymus*, which he affirmeth to bring forth a purple floure, and betweene the middle of the prickes to wax white quickely, and to fall off with the winde; in his twentieth booke, *cap.23.* Which Thiſtle doubtleſſe doth not agree with *Carduus Chryſanthemus*, that is, with *Theophraſtus* his *Scolymus*, and with that which we mentioned before: ſo that there be in *Pliny* two *Scolymi*; one with a root that may be eaten, and another with a purple floure, turning into downe, and that ſpeedily waxeth white. *Scolymus* is likewiſe deſcribed by *Dioſcorides*; but this differs from *Scolymus Theophraſti*, and it is one of thoſe which *Pliny* reckoneth vp, as we will more at large declare hereafter. But let vs come againe to *Chryſanthemus*: This the inhabitants of Candy, keeping the markes of the old name, do call *Aſcolymbros*: the Italians name it *Anconitani Rinci*: the Romans, *Spina borda*: the Spaniards, *Cardon lechar*, and of diuers it is alſo named *Glycyrrhizon*, that is to ſay, *dulcis Radix*, or ſweet root: it is called in Engliſh, golden Thiſtle: ſome would haue it to be that which *Vegetius* in *Arte Veterinaria* calls *Eryngium*: but they are deceiued; for that *Eryngium* whereof *Vegetius* writeth, is *Eryngium marinum*, or ſea Huluer, of which we will intreat.

The golden Thiſtle of India may be called *Carduus Chryſanthemus*, of his golden colour, adding thereto his natiue country *Indianus*, or *Peruanus*, or the golden Indian Thiſtle, or the golden Thiſtle of Peru: the ſeed came to my hands by the name *Fique del Inferno*: in Latine, *Ficus infernalis*, the infernall fig, or fig of hell.

¶ *The Temperature and Vertues.*

A The root and tender leaues of this *Scolymus*, which are ſometimes eaten, are good for the ſtomacke, but they containe very little nouriſhment, and the ſame thinne and waterie, as *Galen* teacheth.

B *Pliny* ſaith that the root hereof was commended by *Eratoſthenes*, in the poore mans ſupper, and that it is reported alſo to prouoke vrine eſpecially; to heale tetters and dry ſcurfe, being taken with vinegre; and with wine to ſtir vp fleſhly luſt, as *Heſiod* and *Alcæus* teſtifie; and to take away the ſtench of the arme-holes, if an ounce of the root, the pith picked out, be boyled in three parts of wine, till one part be waſted, and a good draught taken faſting after a bath, and likewiſe after meat which later words *Dioſcorides* likewiſe hath concerning his *Scolymus* : out of whom *Pliny* is thought to haue borrowed theſe things,

† The plant our Author here deſcribes in the ſecond place,is that which I deſcribed and figured formerly *pag.*401 ,by the name of *Papauer ſpinoſum*. I muſt confeſſe, I there ſhould haue omitted it,becauſe it is here ſet forth ſufficently by our Authour, whereof indeed I had a little remembrance, and therefore at that time ſought his Index by all the names I could remember, but not making it a *Carduus*, I at that time miſſed thereof ; but here finding it,I haue let the hiſtory ſtand as it was, and onely omitted the figure which you may finde before,and ſomething alſo in the hiſtory not here deliuered.

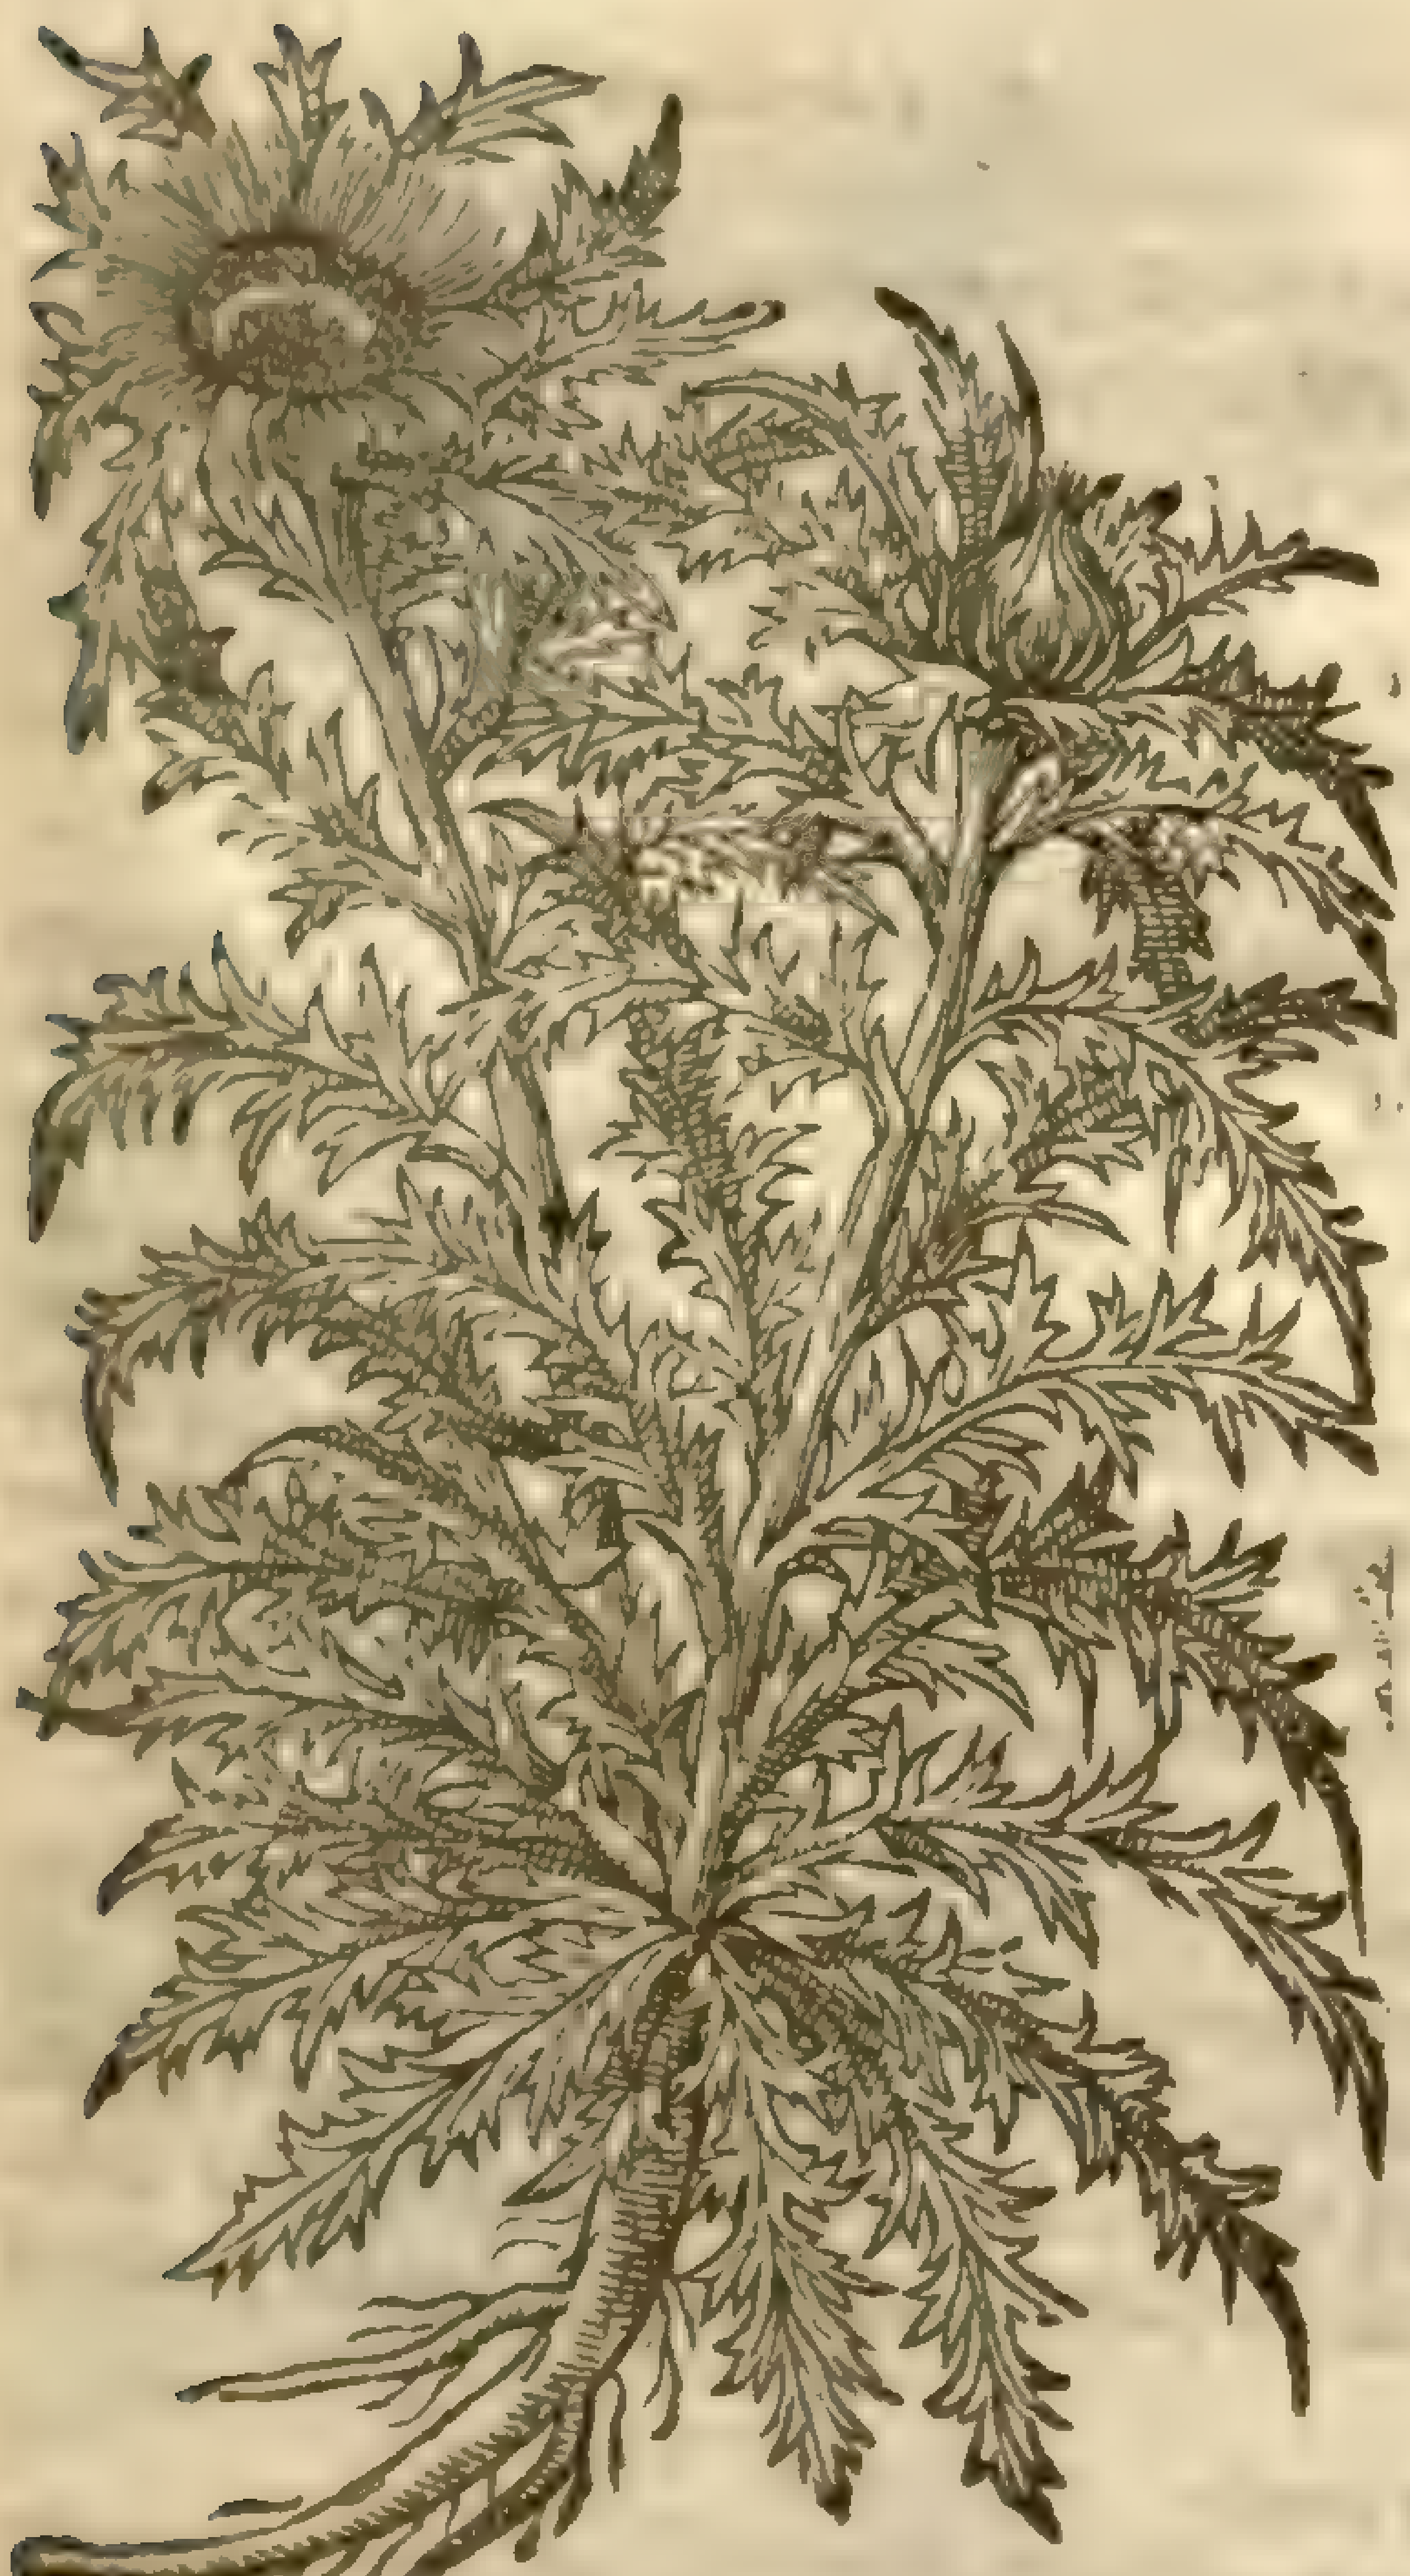
CHAP. 481. *Of white Carline Thiſtle of* Dioſcorides.

¶ *The Deſcription.*

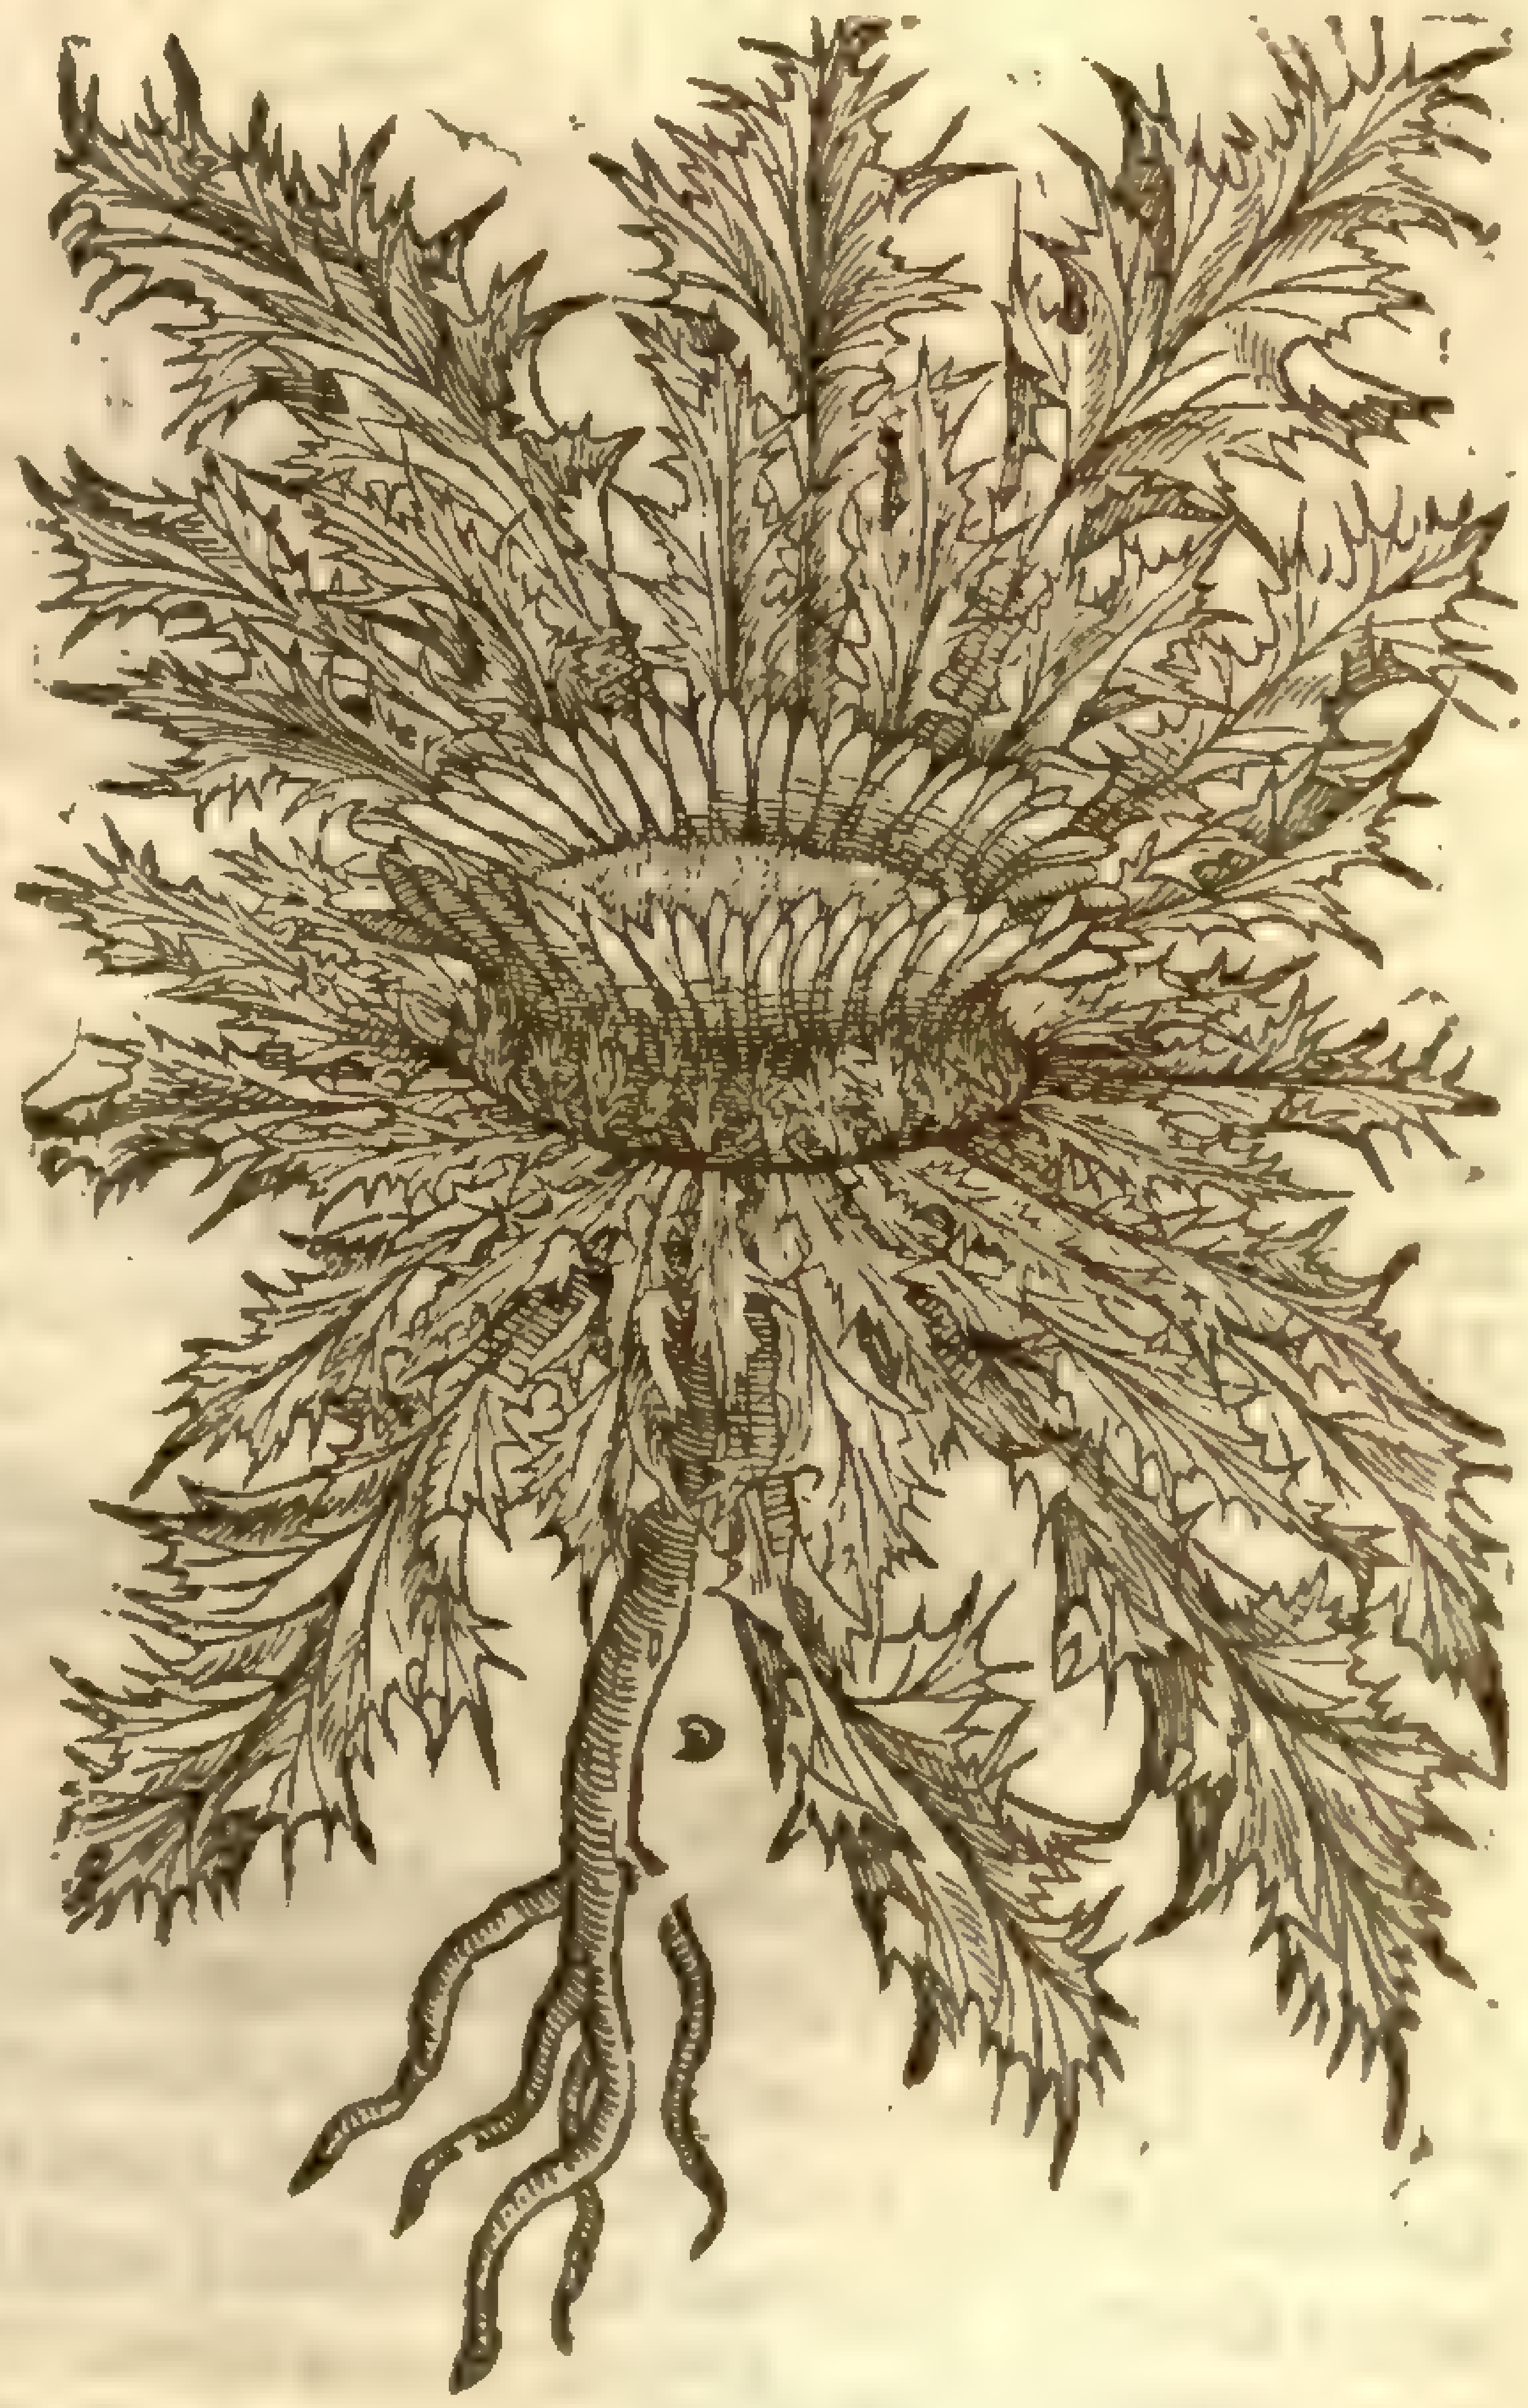
1 THe leaues of Carline are very full of prickles, cut on both edges with a multitude of deepe gaſhes,and ſet along the corners with ſtiffe and very ſharpe prickles ; the middle ribs whereof are ſometimes red : the ſtalke is a ſpan high or higher, bringing forth for the moſt part onely one head or knap being full of prickles,on the outward circumference or compaſſe like the Vrchin huske af a cheſnut : and when this openeth at the top, there groweth forth a broad floure,made vp in the middle like a flat ball,of a great number of threds, which is compaſſed about with little long leaues, oftentimes ſomewhat white, very ſeldome red : the ſeed vnderneath is ſlender and narrow, the root is long,a finger thicke, ſomething blacke, ſo chinked as though it were ſplit in ſunder, ſweet of ſmell,and in taſte ſomewhat bitter.

‡ 1 *Carlina caulescens magno flore.*
Tall Carline Thiſtle.

See [illegible] 927



2 *Carlina, ſeu Chamæleon albus* Dioſcoridis.
The white Carline Thiſtle of *Dioſcorides*
with the red floure.

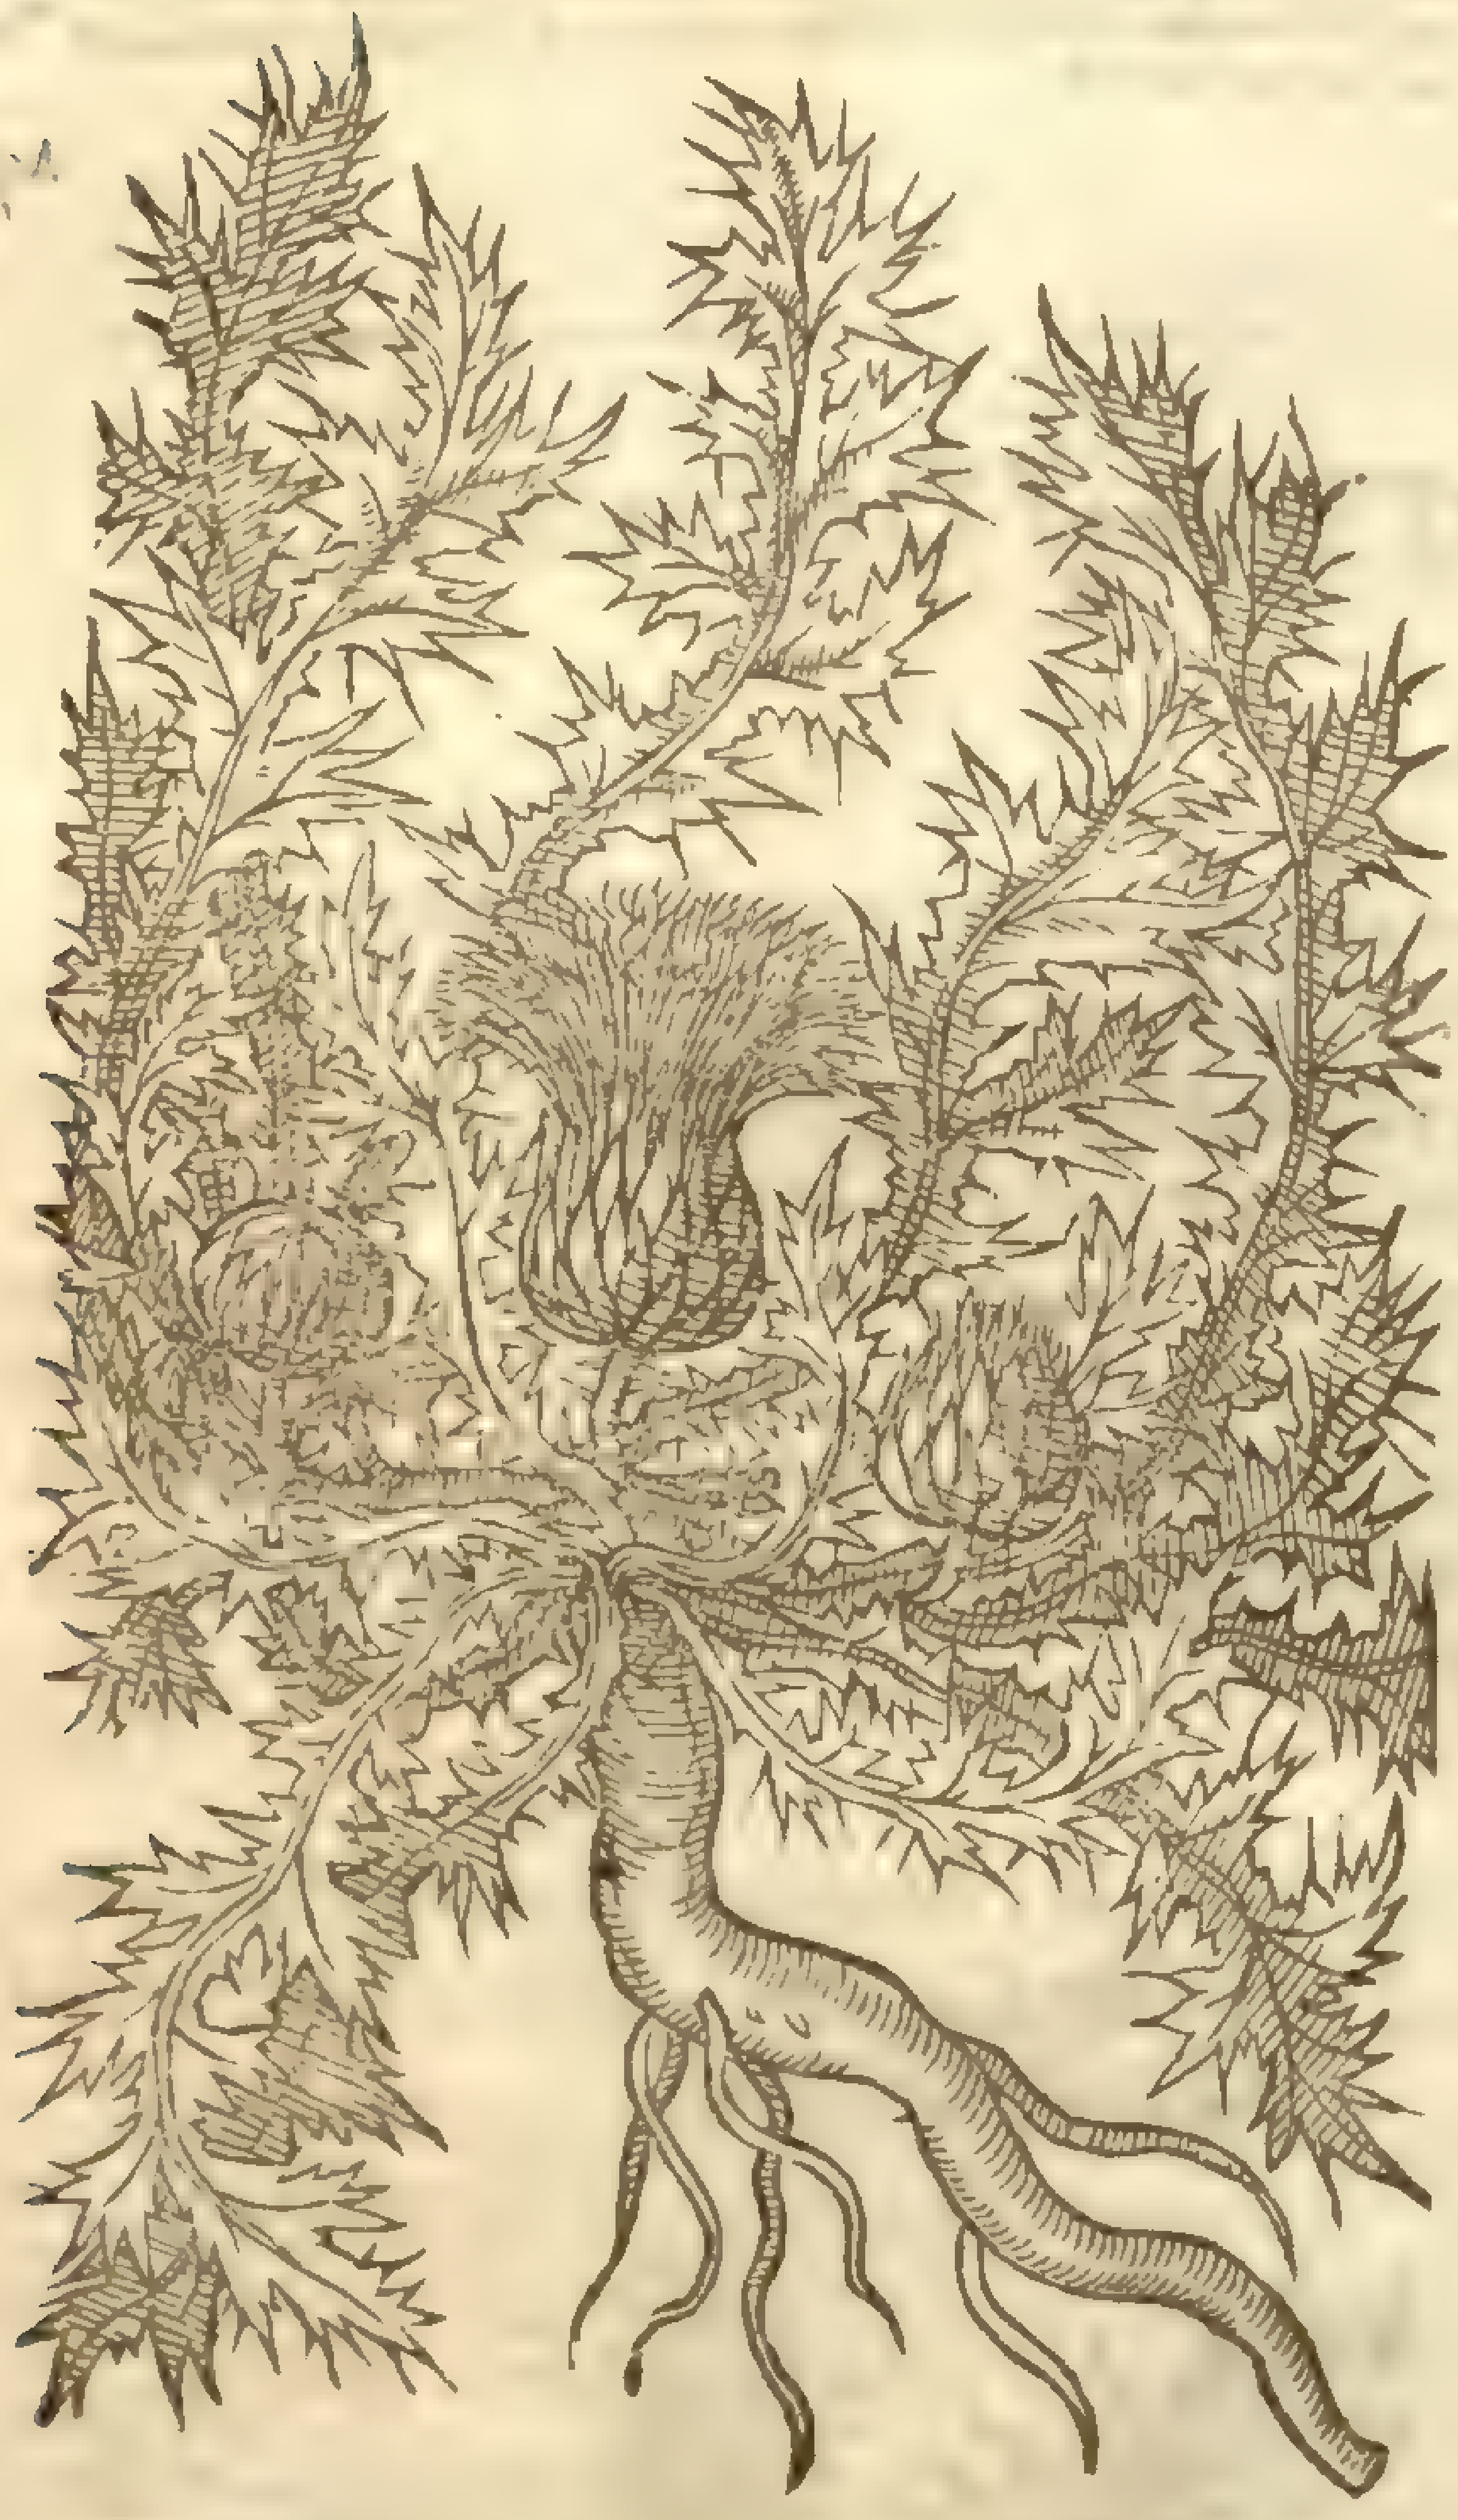


C. acaulis, [illegible]

3 There is alſo another hereof without a ſtalke, with leaues alſo very full of prickles, like almoſt to thoſe of the other, lying flat on the ground on euery ſide : among which there groweth forth in the middle a round head or knap,ſet with prickles without after the ſame manner,but greater:the floure whereof in the middle is of ſtrings,and paled round about with red leaues, and ſometimes with white, in faire and calme weather the floures both of this and alſo of the other lay

‡ 3 *Carlina acaulos minor flore purp.*
Dwarfe Carline Thiſtle.

Carduus acaulis
Sm. fl. 3.394



themſelues wide open, and when the weather is foule and miſty, are drawne cloſe together: the root hereof is long, and ſweet of ſmell, white, ſound, not nicked or ſplitted as the other.

‡ 3 This ſmall purple Carline Thiſtle hath a pretty large root diuided oft times at the top into diuers branches, from which riſe many greenleaues lying ſpred vpon the ground, deeply cut and ſet with ſharpe prickles; in the midst of theſe leaues come vp ſometimes one, but otherwhiles more ſcaly heads, which carry a pretty large floure compoſed of many purple threds like that of the Knapweed, but larger, and of a brighter colour; theſe heads grow vſually cloſe to the leaues, yet ſometimes they ſtand vpon ſtalkes three or foure inches high: when the floure is paſt they turne into down, and are carried away with the winde: the ſeed is ſmall and grayiſh. This growes vpon Blacke-Heath, vpon the chalky hils about Dartford, and in many ſuch places. It floures in Iuly and Auguſt. *Tragus* calls it *Chamæleon albus, vel exiguus*; *Lobel*, *Carduus acaulis, Septentrionalium*, and *Chamæleon albus, Cordi*; *Cluſius*, *Carlina minor purpureo flore*, and hee ſaith, in the opinion of ſome it ſeemes not vnlike to the *Chamæleon* whereof *Theophraſtus* makes mention, *lib. 6. cap. 3. Hiſt. plant.* ‡

¶ *The Place.*

They both grow vpon high mountaines in deſart places, and oftentimes by highway ſides: but that which bringeth forth a ſtalke groweth euery where in Germany, and is a ſtranger in England.

¶ *The Time.*

They floure and ſeed in Iuly and Auguſt, and many times later.

¶ *The Names.*

The former is called in Latine, *Carlina*, and *Cardopatium*; and of diuers, *Carolina*, of *Charlemaine*, the firſt Romane Emperor of that name, whoſe army (as it is reported) was in times paſt through the benefit of this root deliuered and preſerued from the plague: it is called in high Dutch **Eberwurtz**: in low Dutch, French, and other Languages, as likewiſe in Engliſh, *Carline*, and Carline Thiſtle: it is *Dioſcorides* his *Leucacantha*, the ſtrong and bitter roots ſhew the ſame; the Faculties alſo are anſwerable, as forthwith we will declare: *Leucacantha* hath alſo the other names, but they are counterfeit, as among the Romanes *Gniacardus*; and among the Tuſcans, *Spina alba*, or White Thiſtle, yet doth it differ from that Thiſtle which *Dioſcorides* calleth *Spina alba*, of which hee alſo writeth apart, doth likewiſe attribute to both of them their owne proper faculties and operations, and the ſame differing.

The later writers do alſo call the other *Carlina altera*, and *Carlina humilis*, or *minor*, low or little Carline; but they are much deceiued who goe about to referre them both to the Chamæleons; for in Italy, Germany, or France, *Chamæleones*, the Chamæleons doe neuer grow, as there is one witneſſe for many, *Petrus Bellonius*, in his fifth booke of Singularities, who ſufficiently declareth what difference there is betweene the Carlines and the Chamæleons; which thing ſhall be made manifeſt by the deſcription of the Chamæleons.

¶ *The Temperature and Vertues.*

A The root of Carline, which is chiefely vſed, is hot in the later end of the ſecond degree, and dry in the third, with a thinneſſe of parts and ſubſtance; it procureth ſweat, it driueth forth all kinde of wormes of the belly, it is an enemy to all maner of poyſons, it doth not onely driue away infections of the plague; but alſo cureth the ſame if it be drunke in time.

B Being chewed it helpeth the tooth-ache; it openeth the ſtoppings of the liuer and ſpleene.

C It prouoketh vrine, bringeth downe the menſes, and cureth the dropſie.

D And it is giuen to thoſe that haue been dry beaten, and fallen from ſome high place.

The like operations *Dioſcorides* hath concerning *Leucacantha*, ſaying, that it hath a root like Cyperus, bitter and ſtrong, which being chewed eaſeth the pain of the teeth : the decoction of it with a draught of wine is a remedie againſt pains of the ſides, and is good againſt the Sciatica or ache in the huckle bones, as alſo the crampe. E

The juice alſo being drunke is of like Vertues. F

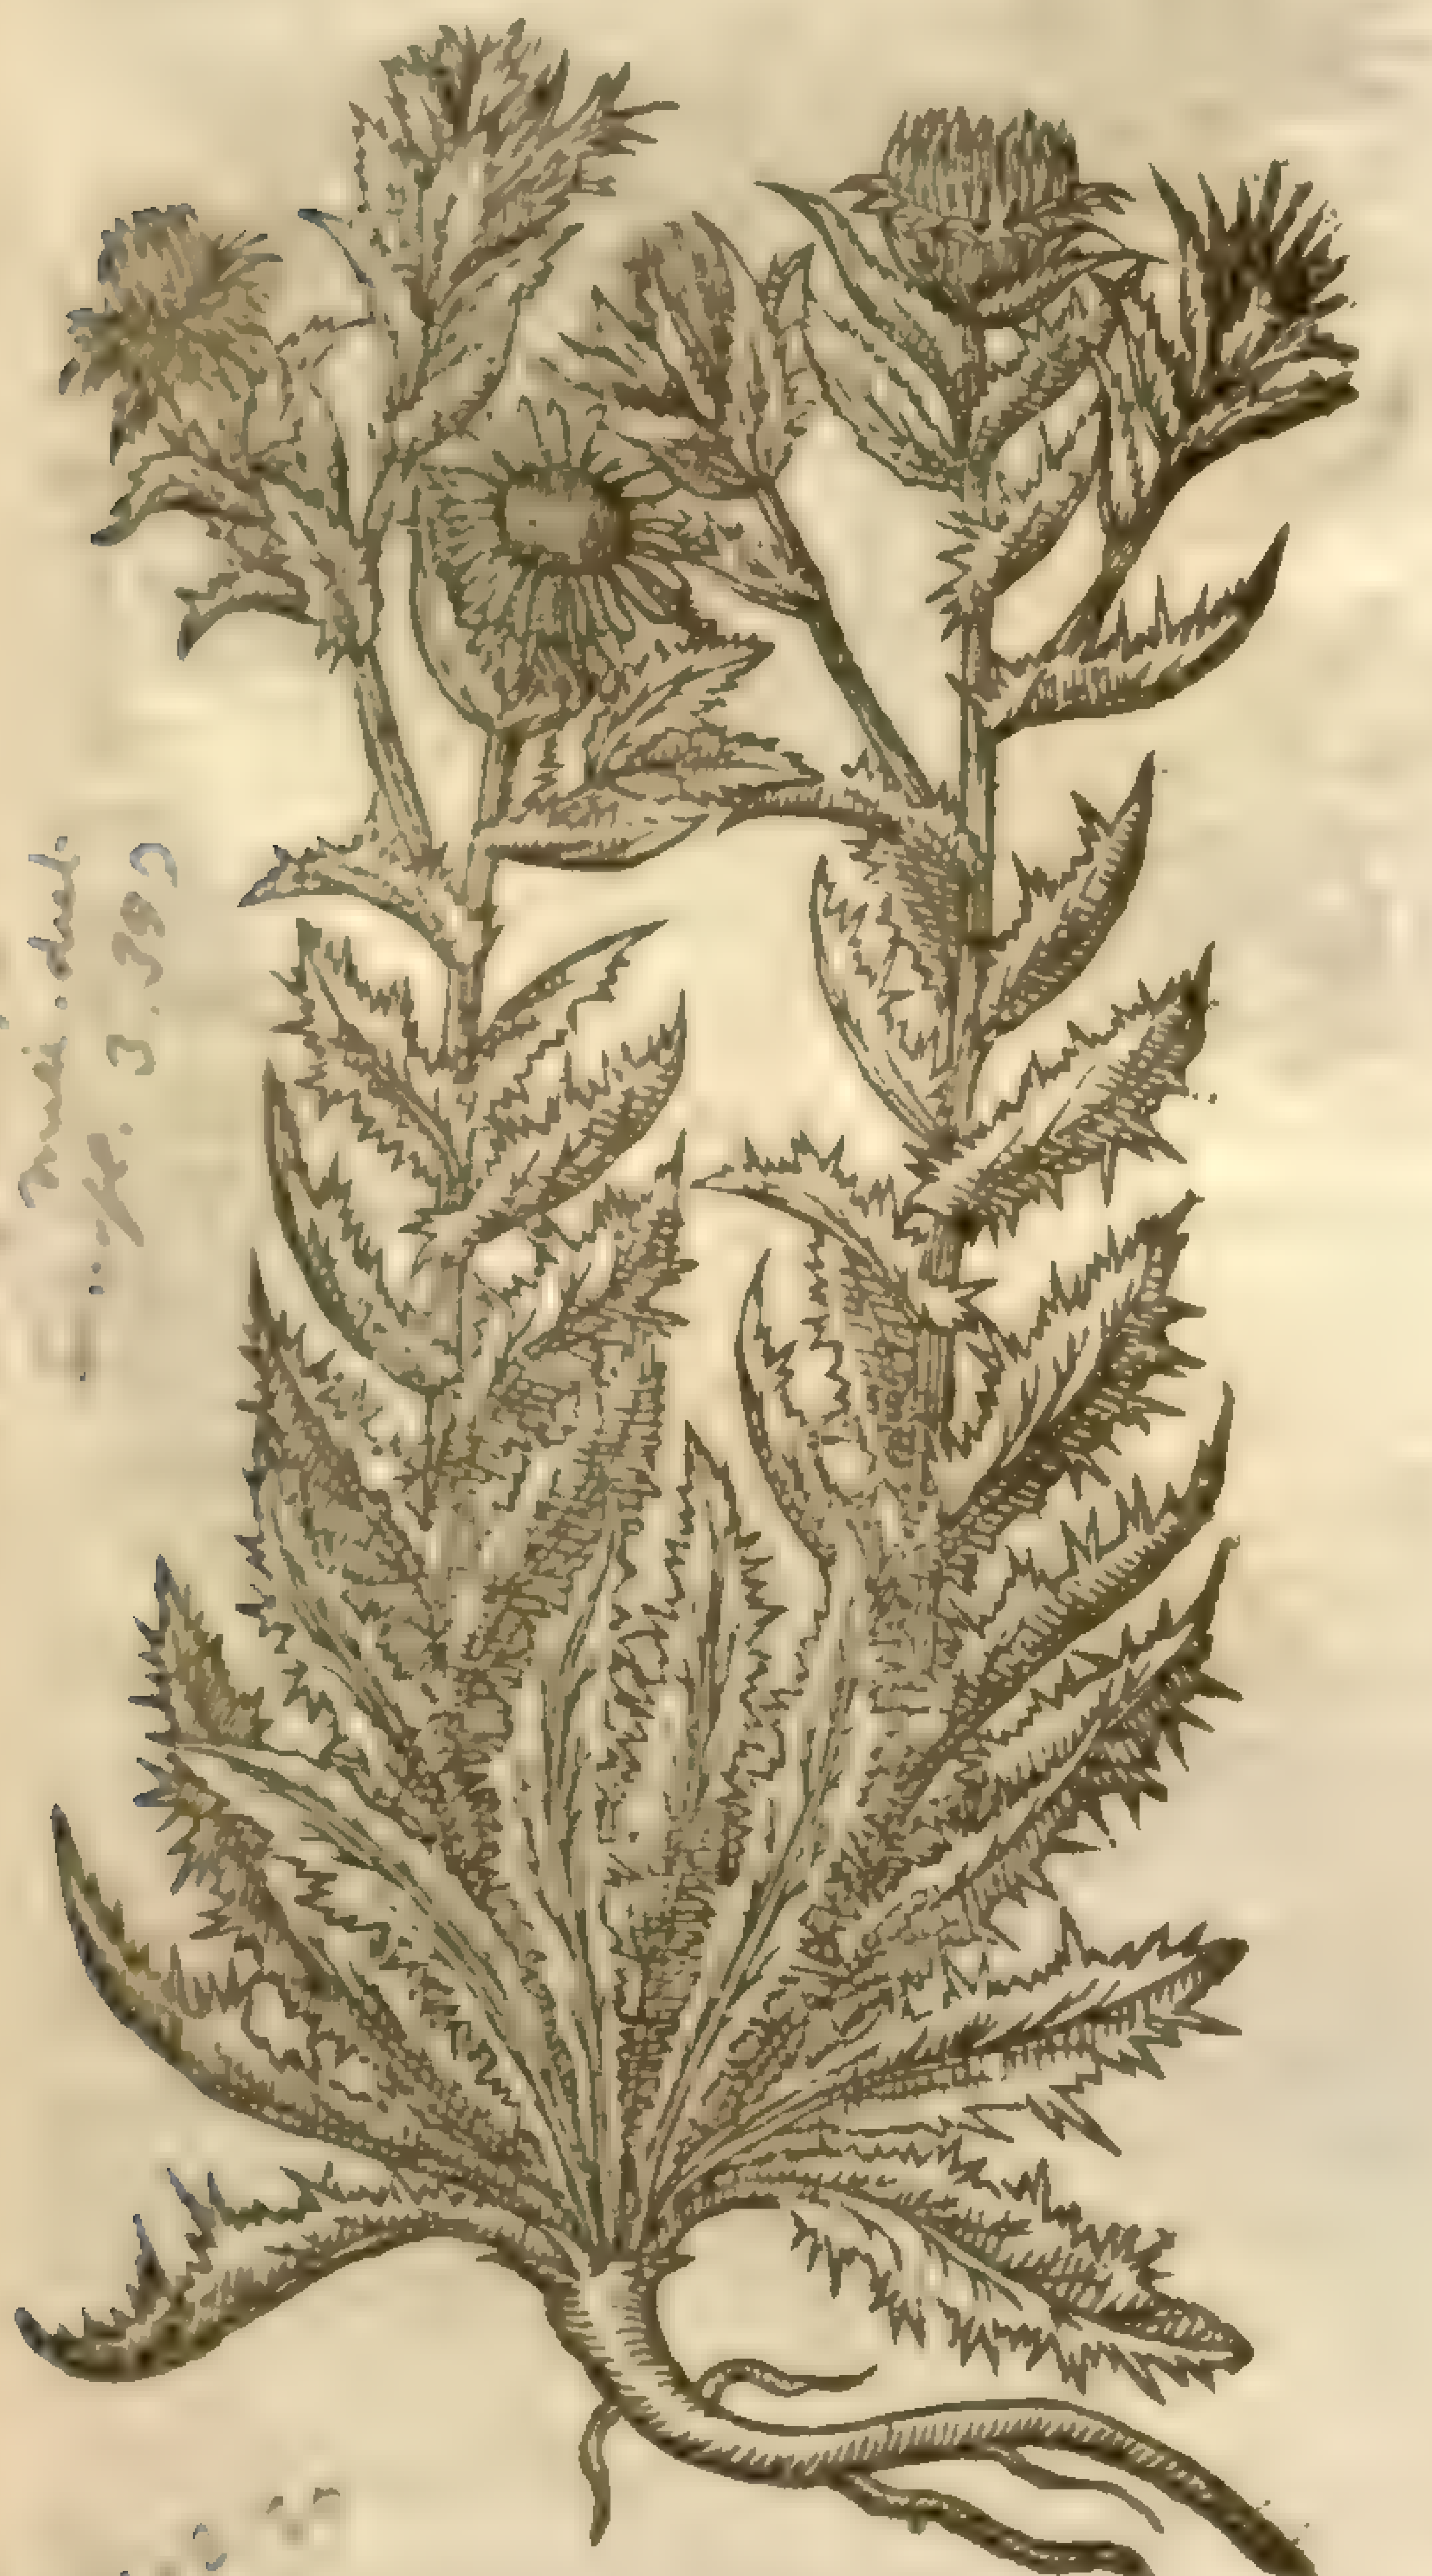
Chap. 482. *Of wilde Carline Thiſtle.*

¶ *The Deſcription.*

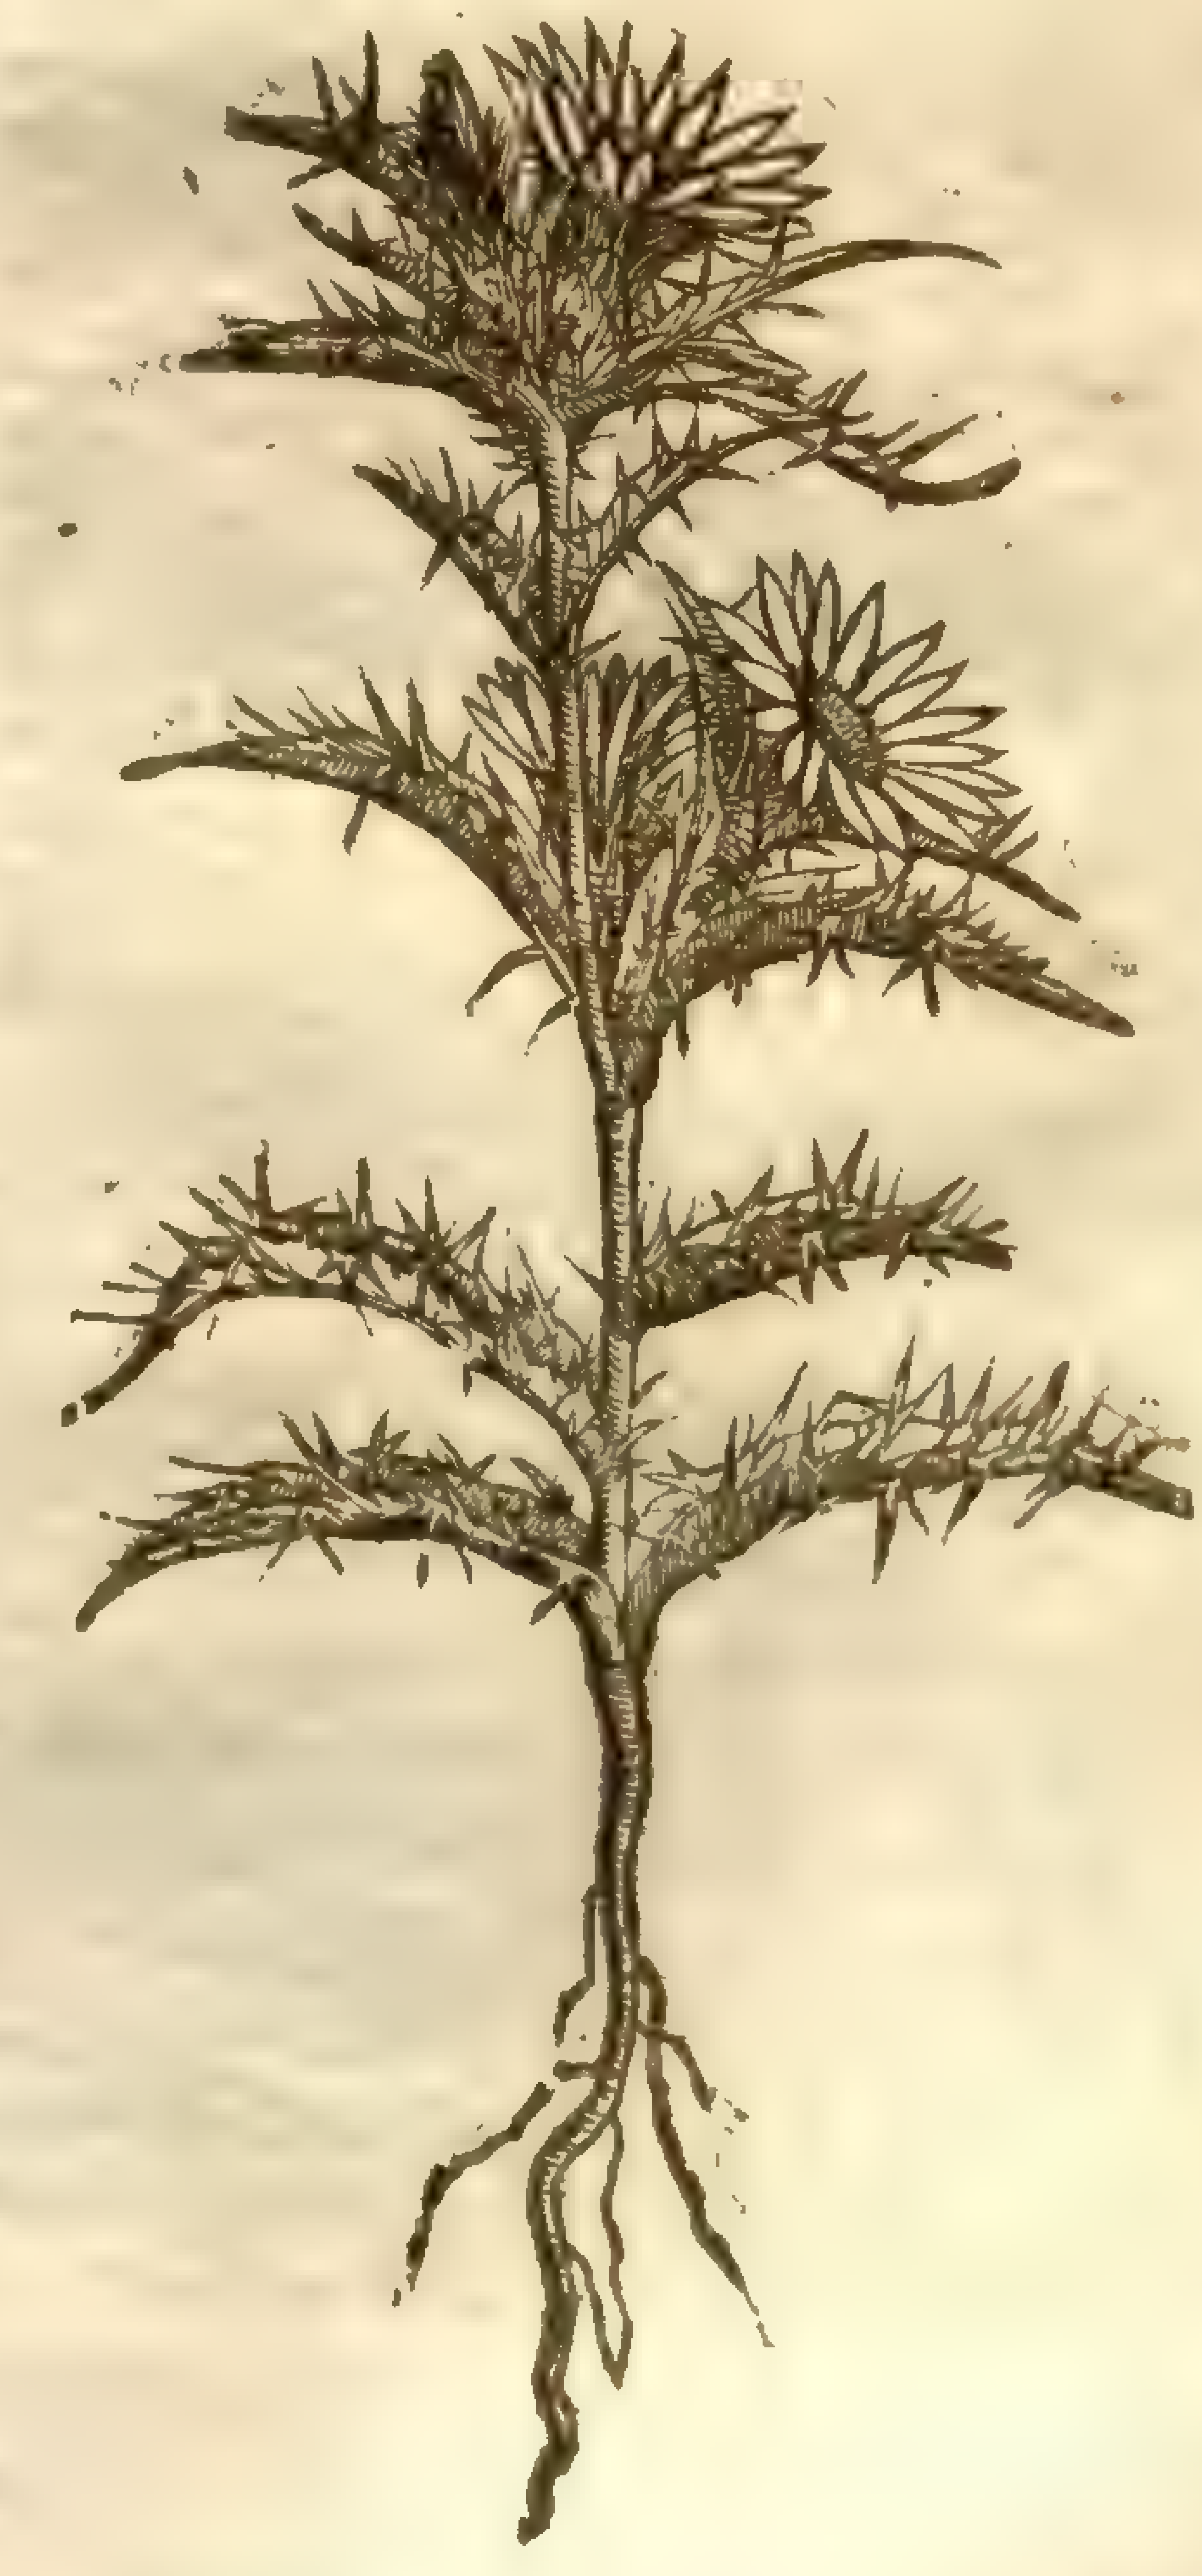
1 THe great wilde Carline Thiſtle riſeth vp with a ſtalke a cubit high or higher, diuided into certaine branches : the leaues are long, and very full of prickles in the edges like thoſe of Carline: the floures grow alſo vpon a prickely head, being ſet with threds in the midſt, and paled round about with little yellowiſh leaues: the root is ſlender, and hath a twinging taſte.

2 *Cluſius* deſcribeth a certain other alſo of this kinde, with one only ſtalke, ſlender, ſhort, and not aboue an handfull high, with prickly leaues like thoſe of the other, but leſſer, both of them couered with a certain hoary down : the heads or knaps are for the moſt part two, they haue a pale downe in the midſt, and leaues ſtanding round about, being ſomewhat ſtiffe and yellow: the root is ſlender, and of a reddiſh yellow.

1 *Carlina ſylveſtris major.*
The great wilde Carline Thiſtle.



2 *Carlina ſylveſtris minor.*
The little wilde Carline Thiſtle.



¶ *The Place.*

The great Carline is found in vntoiled and deſart places, and oftentimes vpon hils. ‡ It growes vpon Black-heath, and in many other places of Kent. ‡

The leſſer Carline *Cluſius* writeth that he found growing in dry ſtony and deſart places, about Salmantica a city of Spain.

¶ *The Time.*

They floure and flouriſh in Iune and Iuly.

¶ *The Names.*

It is commonly called in Latine,and that not vnfitly,*Carlina ſylveſtris*,for it is like to Carline in floures,and is not very vnlike in leaues. And that this is Ἄκορνα, it is ſo much the harder to affirm,by how much the briefer *Theophraſtus* hath written herof; for he ſaith that this is like baſtard ſafron, of a yellow colour and fat juice: and *Acorna* differs from *Acarna*: for *Acarna*, as *Heſychius* ſaith, is the Bay tree,but *Acorna* is a prickly plant.

¶ *The Nature and Vertues.*

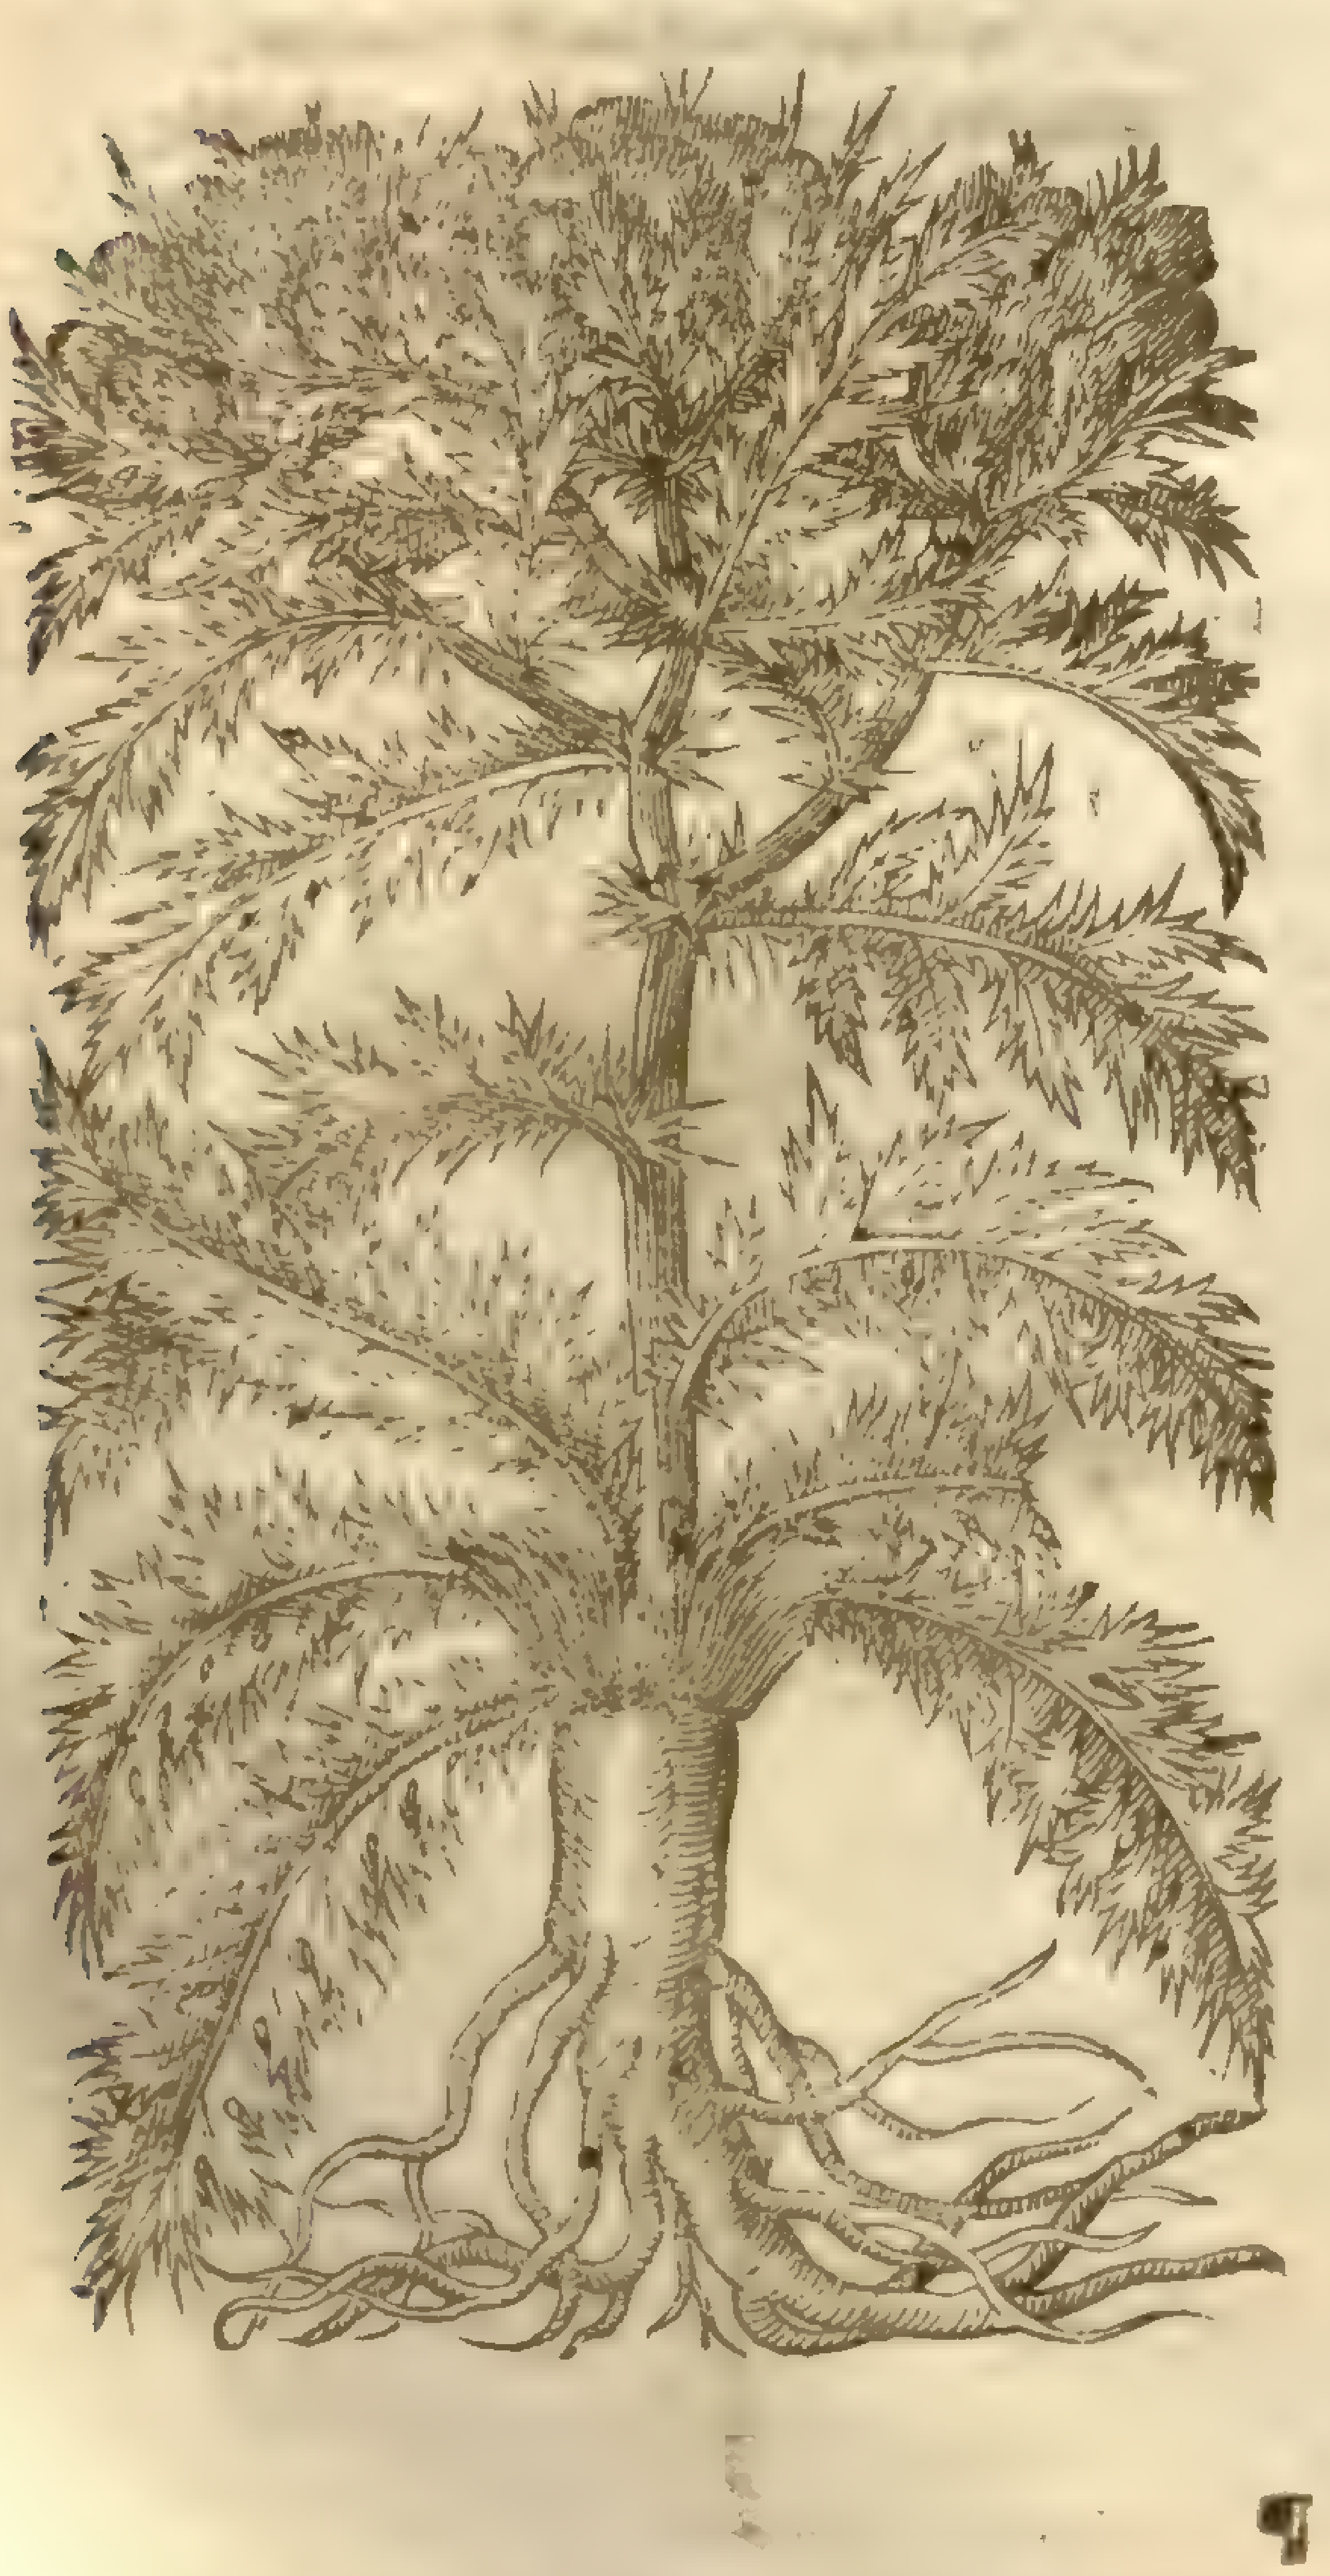
It is hot,eſpecially in the root, the twinging taſte thereof doth declare; but ſeeing it is of no vſe,the other faculties be vnſearched out.

Chap. 483. *Of Chamæleon Thiſtle.*

¶ *The Kindes.*

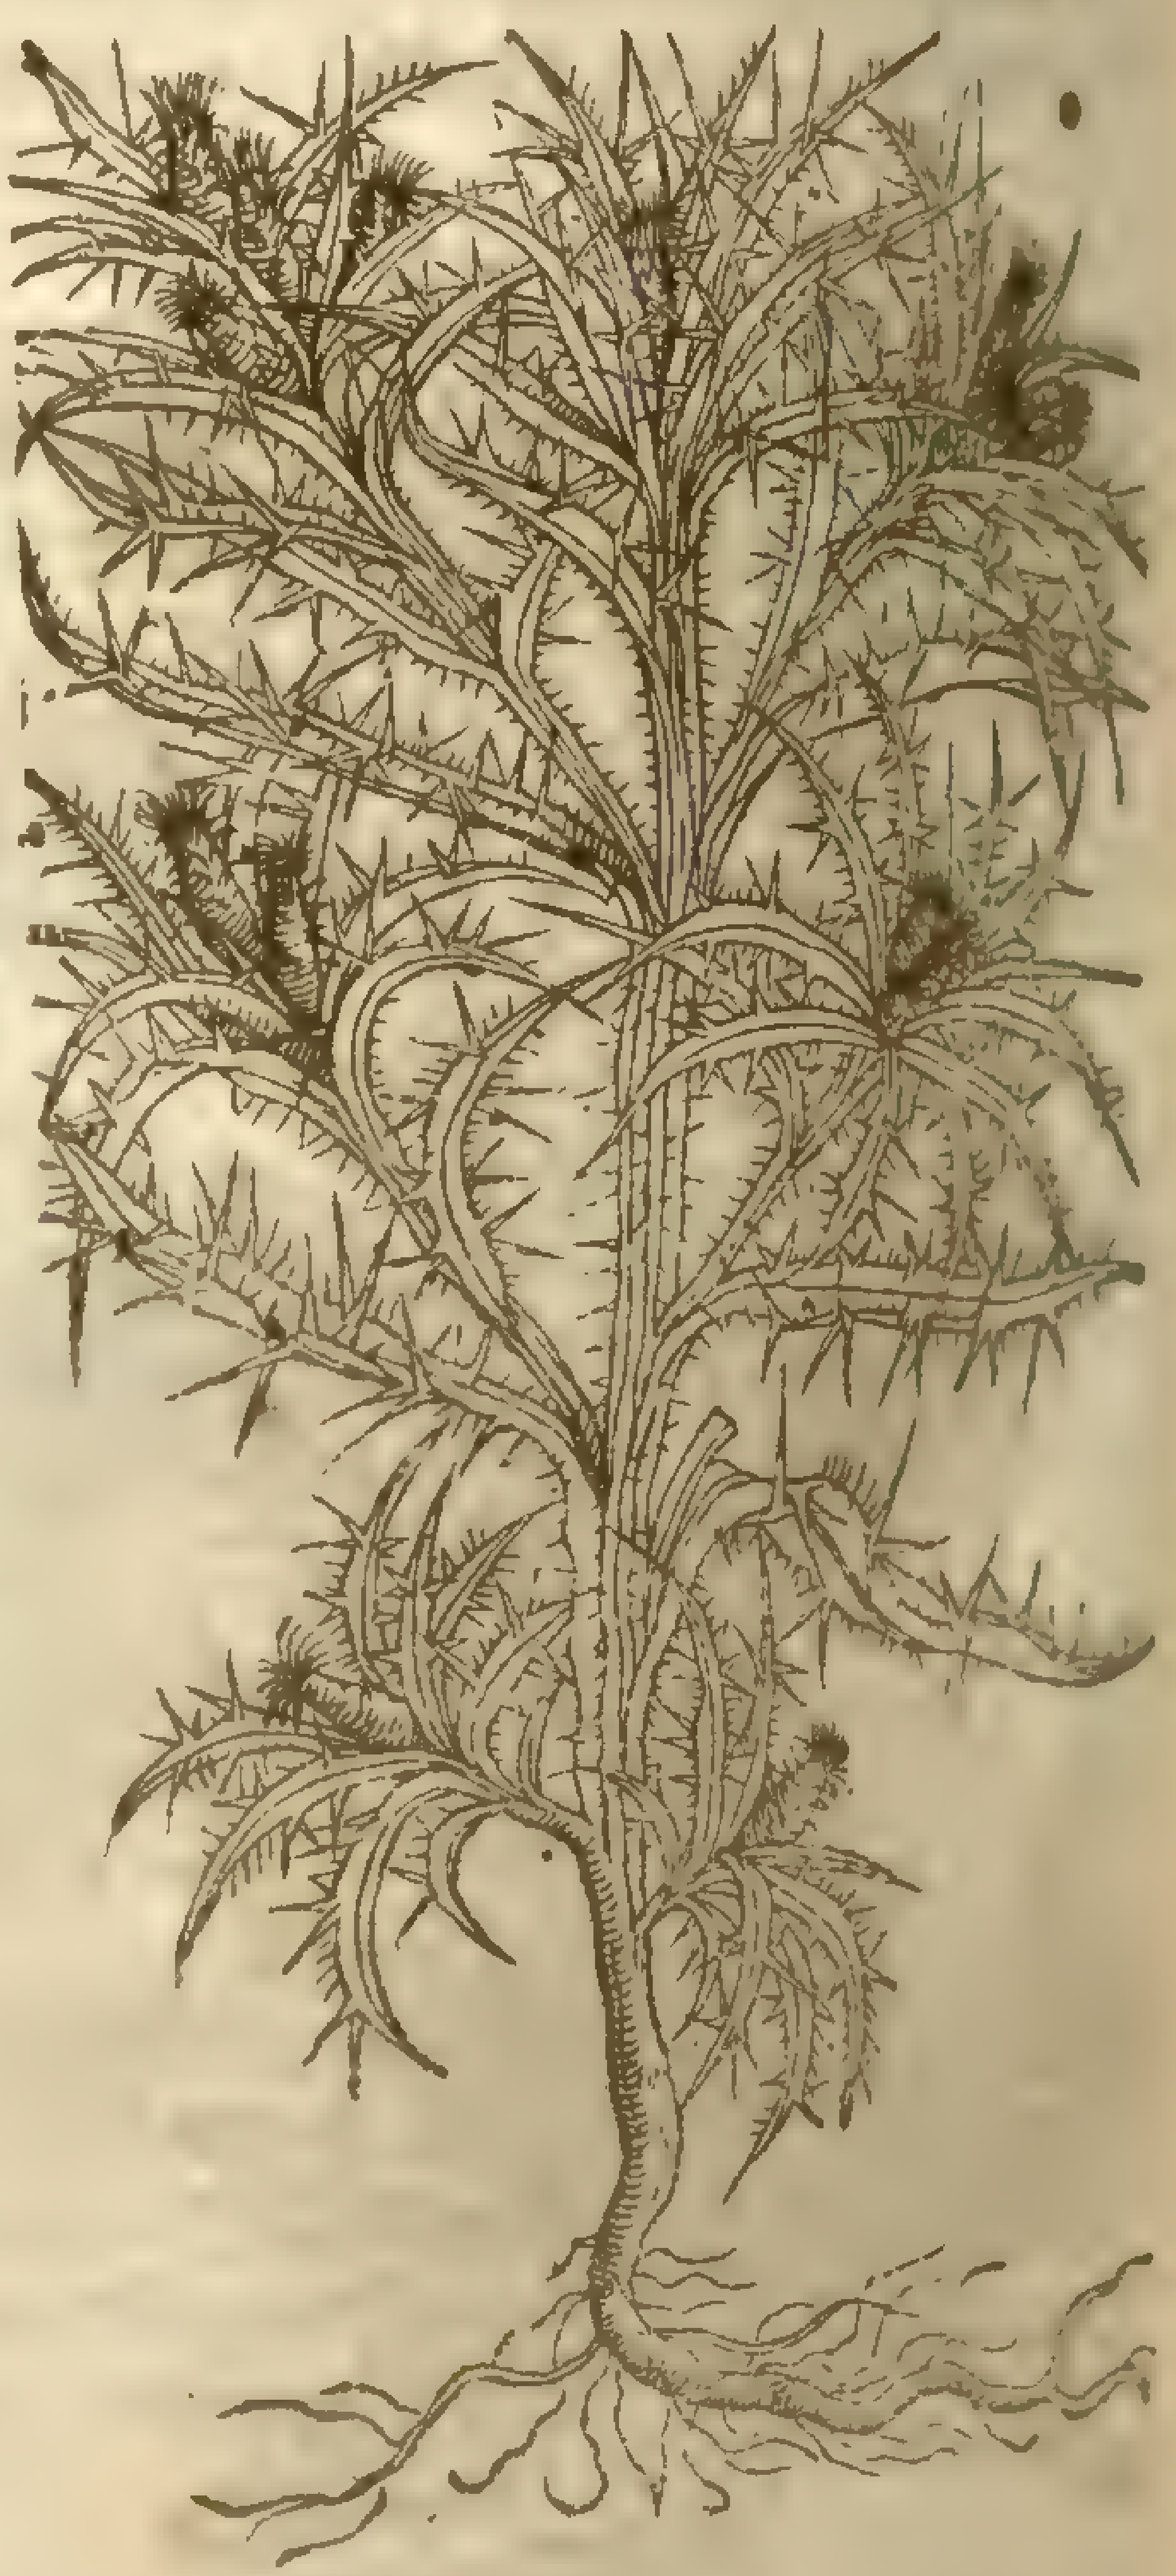
There be two Chamæleons,and both black, the vertue of their roots do differ, and the roots alſo differ in kinde,as *Theophraſtus* declareth.

† 1 *Chamæleon niger.*
The blacke Chamæleon Thiſtle.



2 *Chamæleon niger Salmanticenſis.*
The Spaniſh blacke Chamæleon.

Cnicus acarna
[illegible]



¶ *The Deſcription.*

1 The leaues of blacke Chamæleon are leſſer and ſlenderer than thoſe of the prickly Artichoke,and ſprinkled with red ſpots: the ſtalke is a cubit high,a finger thicke,& ſomwhat red: it beareth a tufted rundle, in which are ſlender prickly flours of a blew colo like the Hyacinth. The root is thicke,black without,of a cloſe ſubſtance,ſometimes eaten away; which being cut is of a yellowiſh colour within,and being chewed it bites the tongue.

2 The

2 This blacke Chamæleon hath many leaues long and narrow, very full of prickles, of a light green in a manner white: the ſtalk is chamfered, a foot high, and diuided into branches, at the tops whereof ſtand purple floures growing forth of prickly heads: the root is blacke, and ſweet in taſt. This is deſcribed by *Cluſius* in his Spaniſh Obſeruations by the name of *Chamaleon Salmanticenſis*, of the place wherein he found it; for he ſaith that this growes plentifully in the territorie of Salmantica a city of Spain: but it is very manifeſt that this is not blacke Chamæleon, neither doth *Cluſius* affirme it.

¶ *The Place.*

It is very common, ſaith *Bellonius*, in Lemnos, where it beareth a floure of ſo gallant a blew, as it ſeems to contend with the sky in beauty; and that the floure of Blew-bottle being of this colour, ſeemes in compariſon of it to be but pale. It groweth alſo in the fields neere Abydum, and hard by the riuers of Helleſpont; and in Heraclea in Thracia.

Chamaleon Salmanticenſis growes plentifully in the territorie of Salmantica a city in Spain.

¶ *The Time.*

They floure and flouriſh when the other Thiſtles do.

¶ *The Names.*

The blacke Chamæleon is called in Greeke, χαμαιλέων μέλας: in Latine, *Chamaleon niger*: of the Romans, *Carduus niger*, and *Vernilago*: of ſome, *Crocodilion*: in Engliſh, the Chamæleon Thiſtle, or the Thiſtle that changeth it ſelfe into many ſhapes and colours.

¶ *The Temperature and Vertues.*

A The root hereof, as *Galen* ſaith, containeth in it a deadly quality: it is alſo by *Nicander* numbred among the poiſonous herbs, in his booke of Treacles; by *Dioſcorides, lib. 6.* and by *Paulus Ægineta*. Wherefore it is vſed only outwardly, as for ſcabs, morphews, tettars, and to be briefe, for all ſuch things as ſtand in need of clenſing: moreouer, it is mixed with ſuch things as do diſſolue and mollifie, as *Galen* ſaith.

† The figure which was formerly in the firſt place did not agree with the hiſtorie (which was taken out of *Dodonæus*) though *Tabern.* gaue it for *Chamaleon niger*; for it is the *Picnomos Creta, &c.* of *Lobel*. You ſhall finde it hereafter with the *Acarna Valerandi*.

Chap. 484. *Of Sea Holly.*

¶ *The Kindes.*

Dioſcorides maketh mention only of one ſea Holly. *Pliny, lib. 22. cap. 7.* ſeemes to acknowledge two, one growing in rough places, another by the ſea ſide. The Phyſitions after them haue obſerued more.

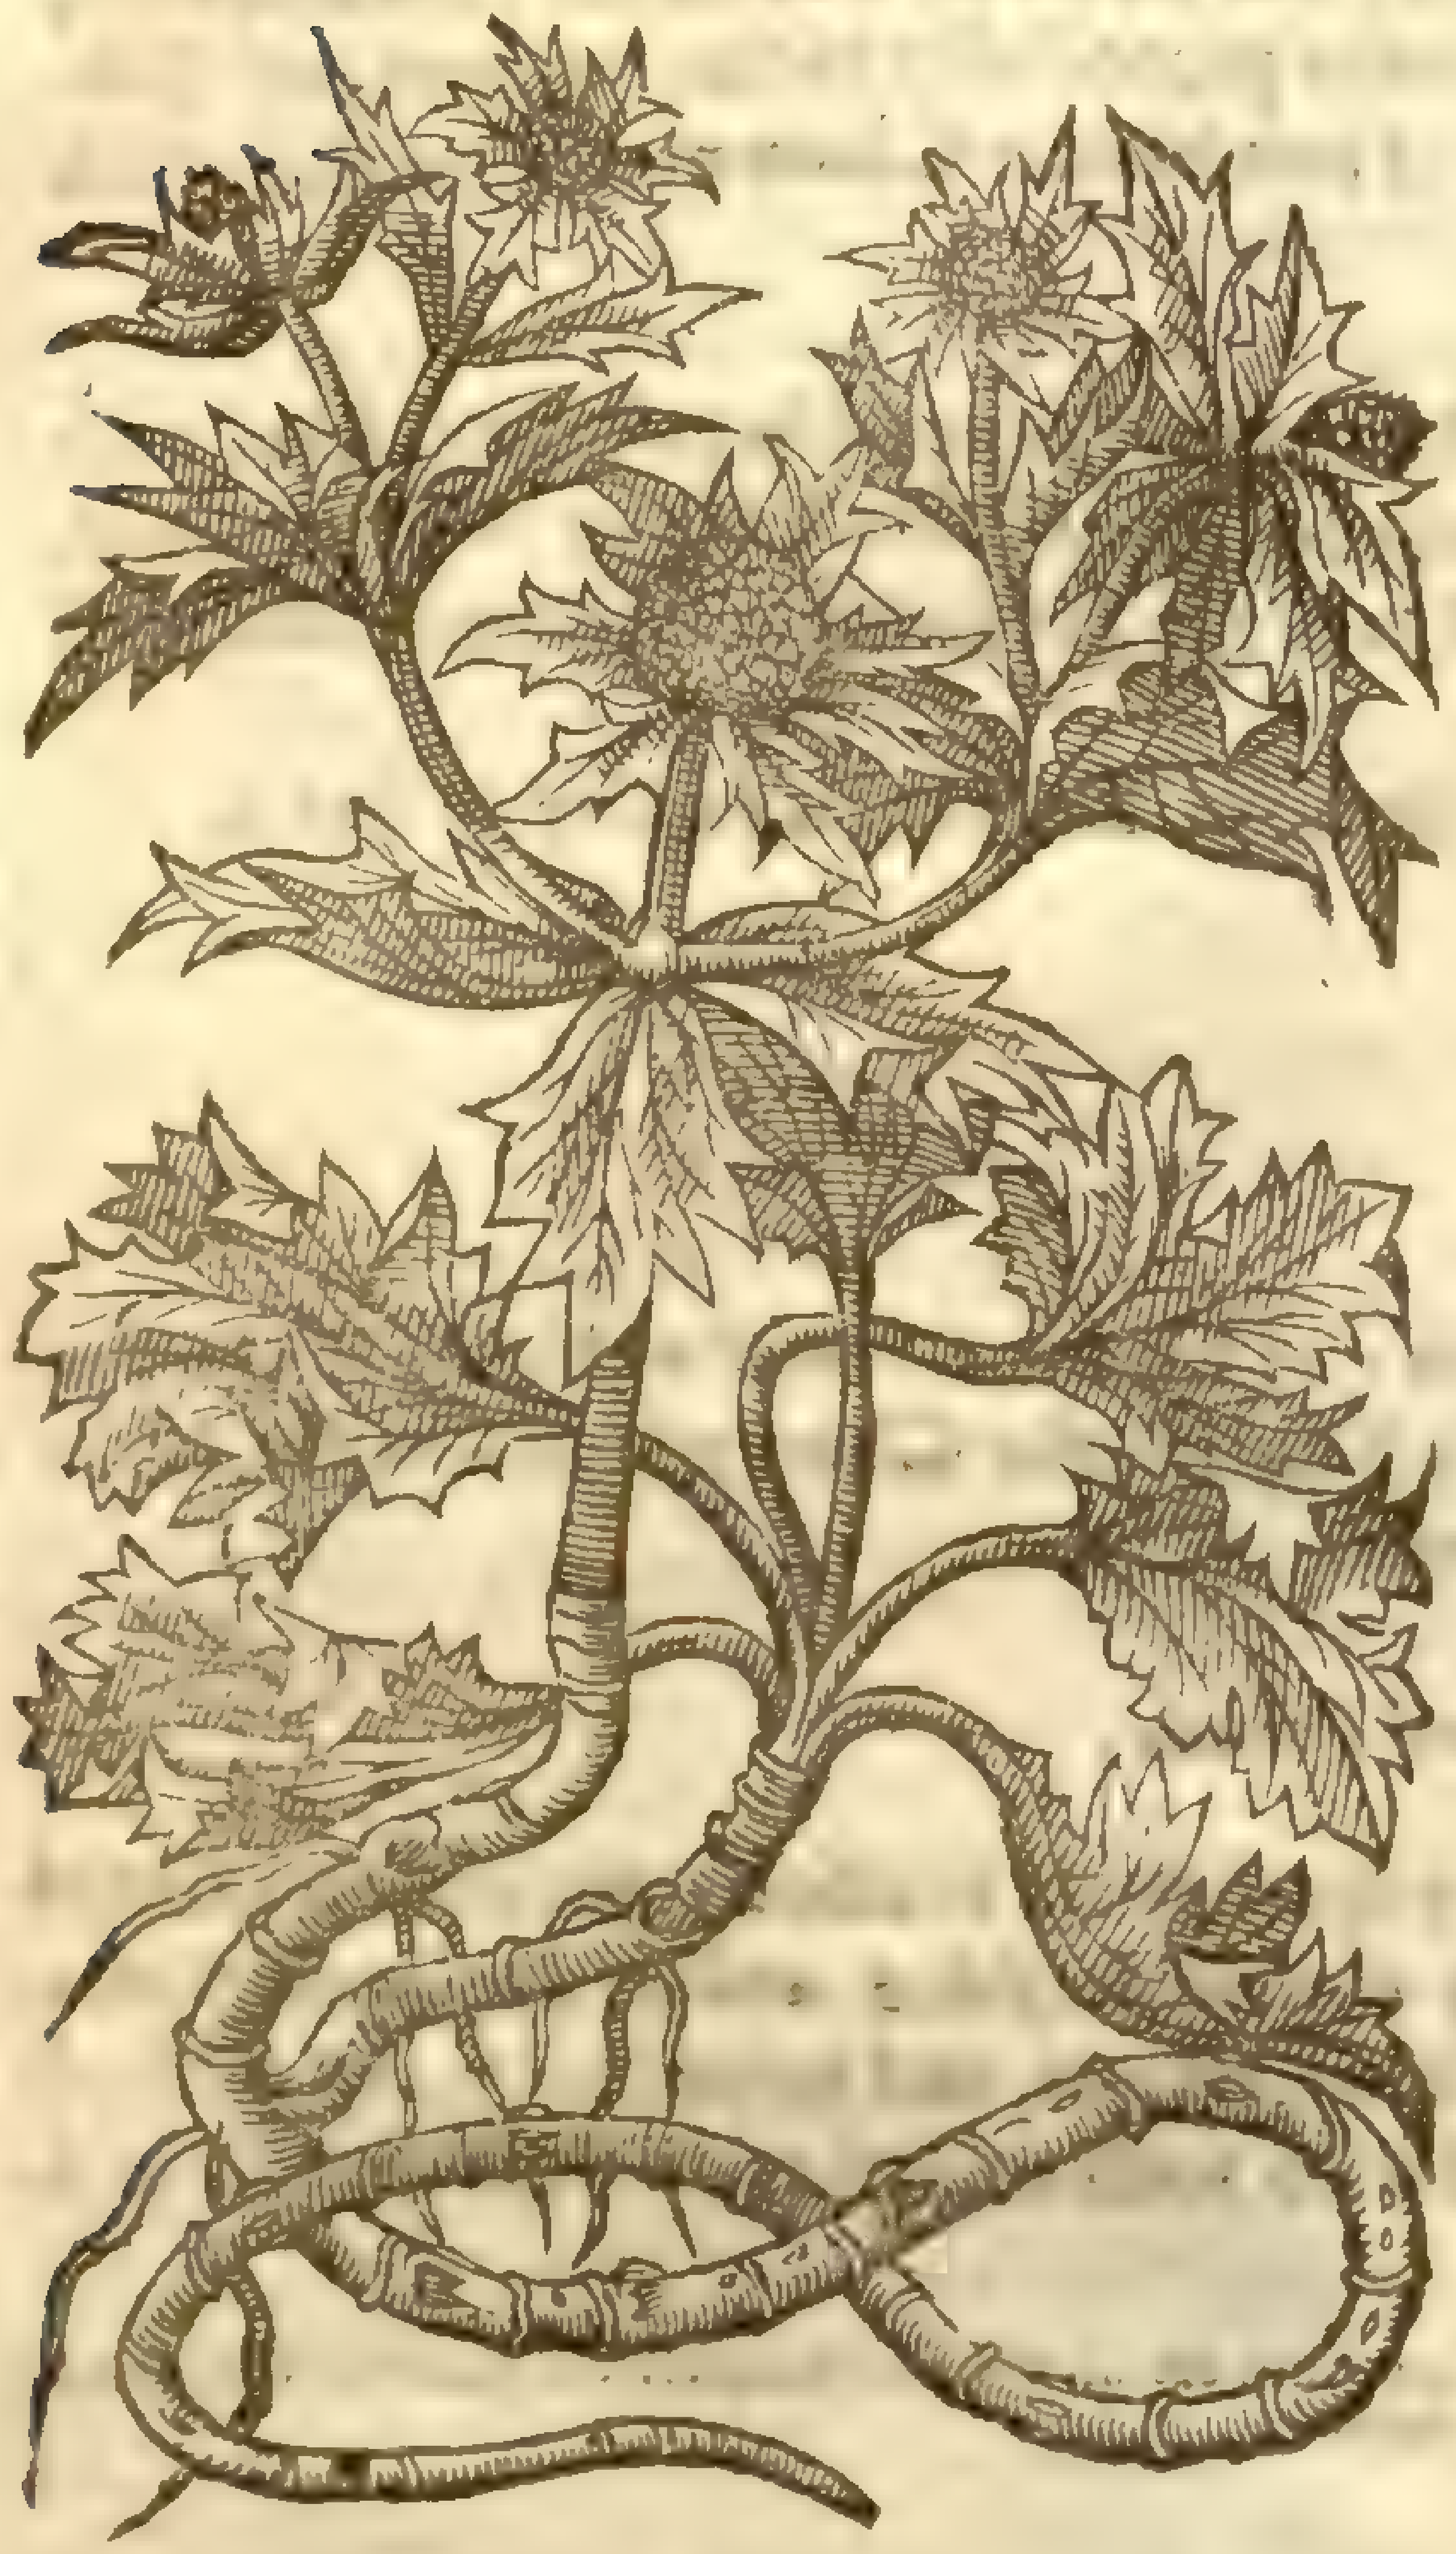
¶ *The Deſcription.*

1 Sea Holly hath broad leaues almoſt like to Mallow leaues, but cornered in the edges, and ſet round about with hard prickles, fat, of a blewiſh white, and of an aromatical or ſpicy taſte: the ſtalke is thick, about a cubit high, now and then ſomwhat red below: it breaketh forth in the tops into prickly round heads or knops, of the bigneſſe of a Wall-nut, held in for the moſt part with ſix prickly leaues compaſſing the top of the ſtalke round about; which leaues as well as the heads are of a gliſtering blew: the floures forth of the heads are likewiſe blew, with white threds in the midſt: the root is of the bigneſſe of a mans finger, ſo very long, as that it cannot be all plucked vp but very ſeldome; ſet here and there with knots, and of taſte ſweet and pleaſant.

2 The leaues of the ſecond ſea Holly are diuerſly cut into ſundry parcels, being all ful of prickles alongſt the edges: the ſtalke is diuided into many branches, and brings forth prickely heads, but leſſer than thoſe of the other: from which there alſo grow forth blew floures, ſeldome yellow: there ſtand likewiſe vnder euerie one of theſe, ſix rough and prickly leaues like thoſe of the other, but thinner and ſmaller: the root hereof is alſo long, blacke without, white within, a finger thick, of taſte and ſmell like that of the other, as be alſo the leaues, which are likewiſe of an aromaticall or ſpicy taſte, and being new ſprung vp and as yet tender, be alſo good to be eaten.

¶ The

1 *Eryngium marinum.*
Sea Holly.

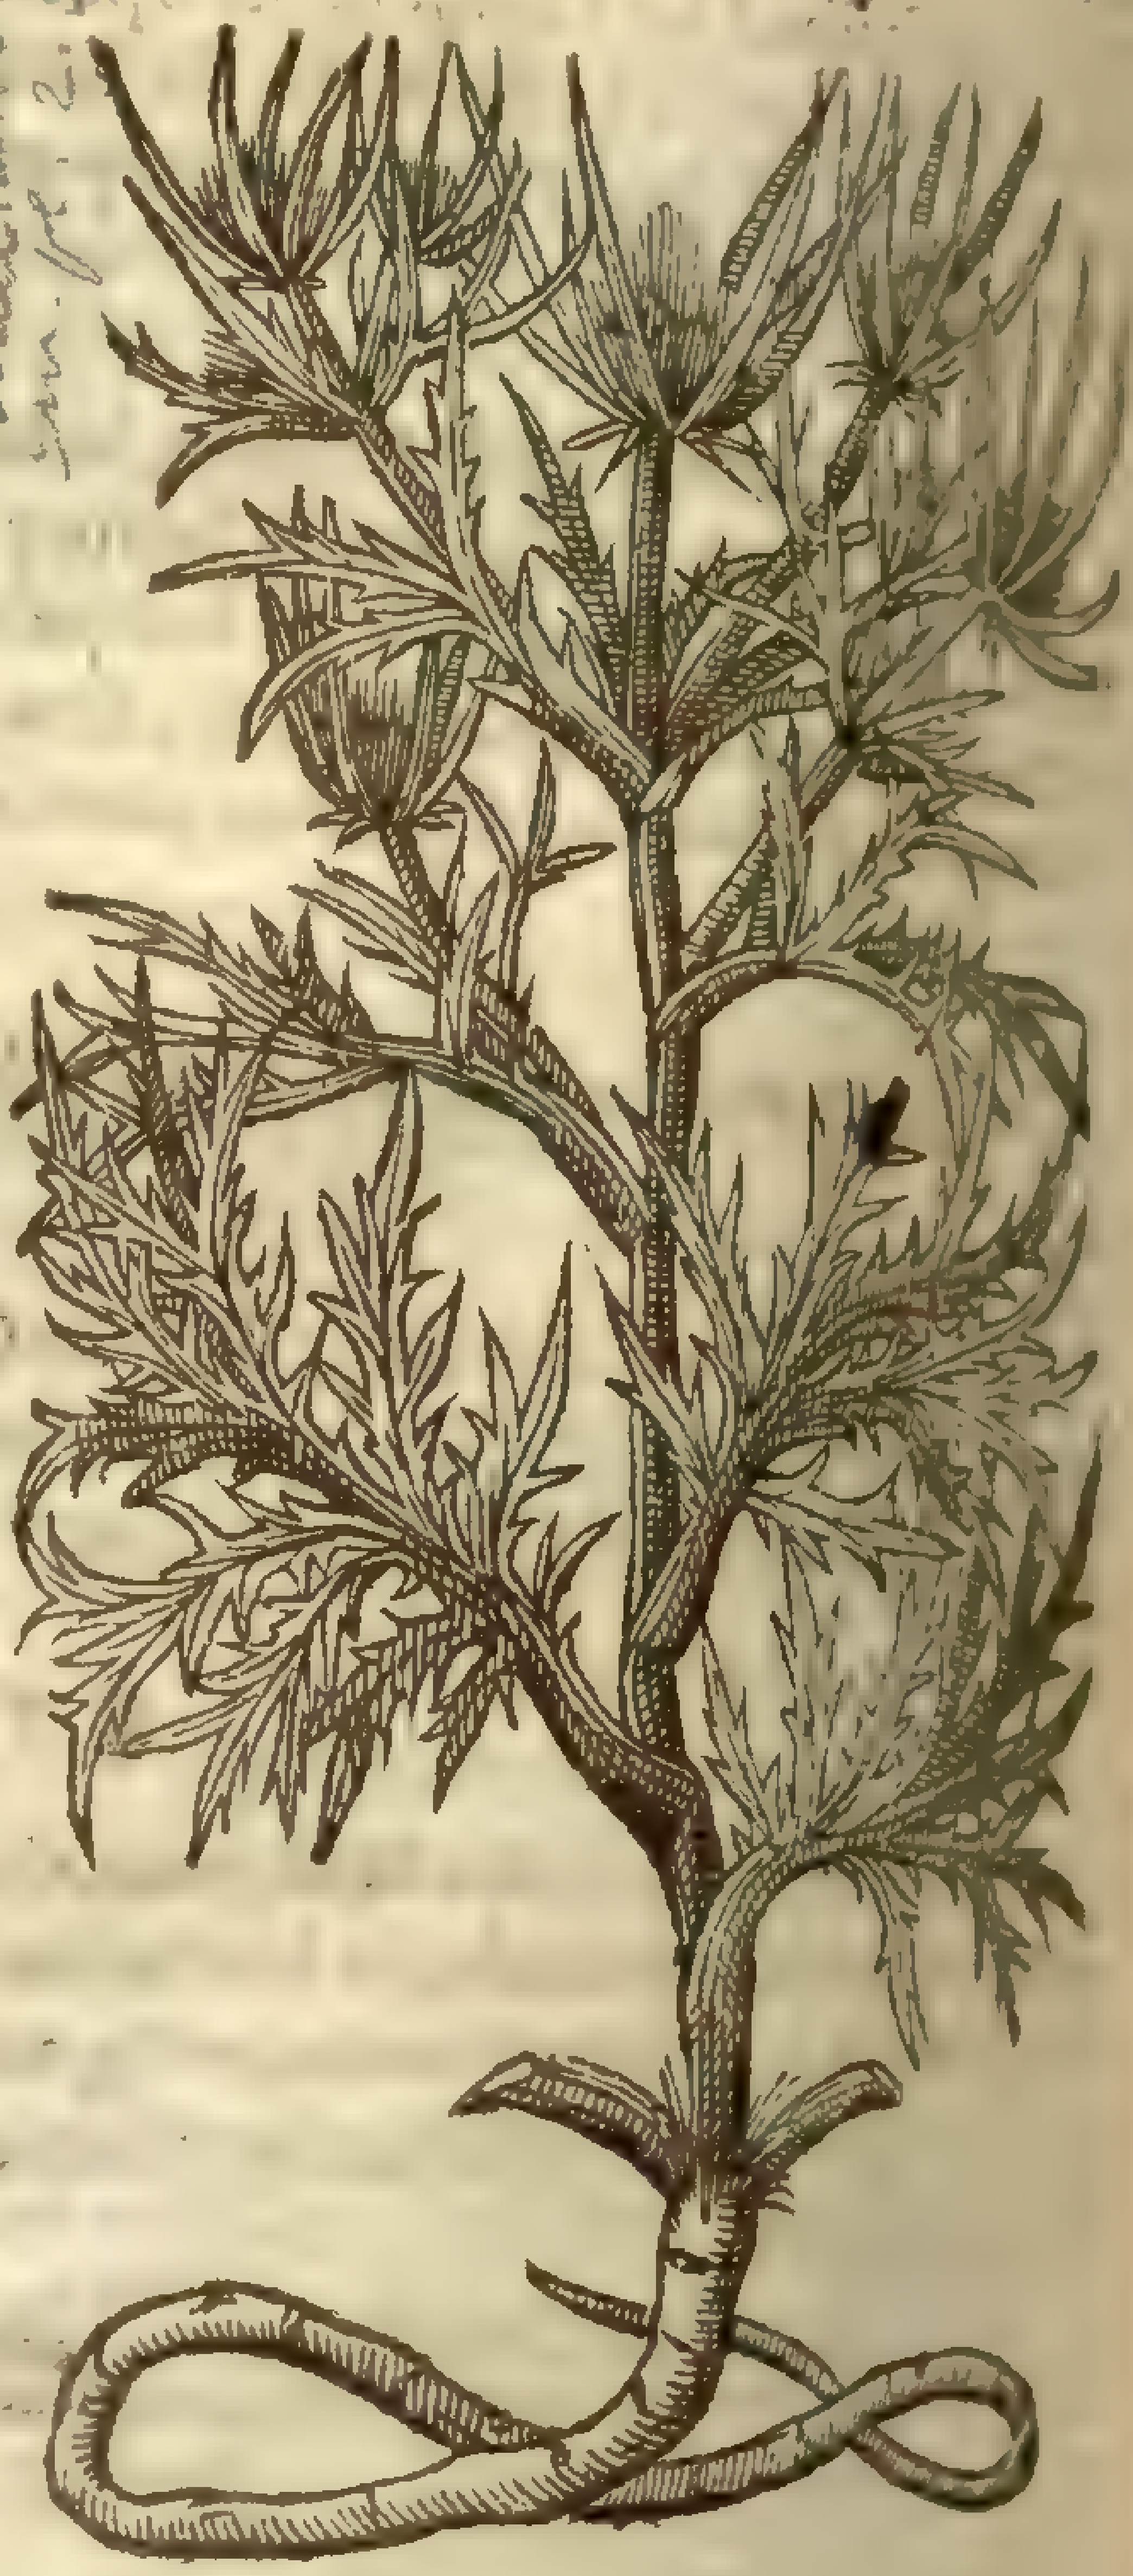


E. maritimum; — vide: dict. Sem. p. 213

2 *Eryngium Mediterraneum.*
Levant ſea Holly.

5

E. Campestre; vide: dict. Sem. p. 2



¶ *The Place.*

Eryngium marinum growes by the ſea ſide vpon the baich and ſtony ground. I found it growing plentifully at Whitſtable in Kent, at Rie and Winchelſea in Suſſex, and in Eſſex at Landamer lading, at Harwich, and vpon Langtree point on the other ſide of the water, from whence I brought plants for my garden.

Eryngium campeſtre groweth vpon the ſhores of the Mediterranean ſea, and in my garden alſo.

¶ *The Time.*

Both of them do floure after the ſummer Solſtice, and in Iuly.

¶ *The Names.*

This Thiſtle is called in Greeke ἠρύγγιον: and likewiſe in Latine *Eryngium*: and of *Pliny* alſo *Eryngе*: in ſhops, *Eryngus*: in Engliſh, ſea Holly, ſea Holme, or ſea Hulver.

The firſt is called in Latine, *Eryngium marinum*: in low-Dutch euery where, **Cruys diſtel, Eindeloos, Meerwortele**: in Engliſh, ſea Holly.

The ſecond is named of *Pliny, lib.* 22. *cap.* 8. *Centum Capita*, or hundred headed Thiſtle: in high-Dutch, **Manſztrew, Brachen diſtil, Radendiſtel**: in Spaniſh, *Cardo corredor*: in Italian, *Eringo* and *Iringo*: it is ſyrnamed *Campeſtre*, or champian ſea Holly, that it may differ from the other.

¶ *The Temperature.*

The roots of them both are hot, and that in a mean, and a little dry alſo, with a thinneſſe of ſubſtance, as *Galen* teſtifieth.

¶ *The Vertues.*

A The roots of ſea Holly boiled in wine and drunke, are good for them that are troubled with the Collicke, it breaketh the ſtone, expelleth grauel, and helpeth all the infirmities of the kidnies, prouoketh vrine, greatly opening the paſſages, being drunke fifteen daies together.

B The roots themſelues haue the ſame propertie if they be eaten, and are good for thoſe that are liuer-ſicke, and for ſuch as are bitten with any venomous beaſt: they eaſe cramps, convulſions, and the falling ſickneſſe, and bring down the termes.

C The roots condited or preſerued with ſugar as hereafter followeth, are exceeding good to be giuen to old and aged people that are conſumed and withered with age, and which want natural moiſture: they are alſo good for other ſorts of people that haue no delight or appetite to venery, nouriſhing and reſtoring the aged, and amending the defects of nature in the yonger.

¶ *The manner to condite Eringos.*

D Refine ſugar fit for the purpoſe, and take a pound of it, the white of an egge, and a pinte of cleer water, boile them together and ſcum it, then let it boile vntil it be come to good ſtrong ſyrrup, and when it is boiled, as it cooleth adde thereto a ſaucer full of roſe water, a ſpoone-full of Cinnamon water, and a grain of muske, which haue been infuſed together the night before, and now ſtrained: into which ſyrrup being more than halfe cold, put in your roots to ſoke and infuſe vntill the next day; your roots being ordered in manner hereafter following:

Theſe your roots being waſhed and picked, muſt be boiled in faire water by the ſpace of foure houres, til they be ſoft: then muſt they be pilled clean as ye pil parſneps, & the pith muſt be drawn out at the end of the root: but if there be any whoſe pith cannot be drawn out at the end, then you muſt ſlit them and ſo take it out: theſe you muſt alſo keep from much handling, that they may be clean: let them remain in the ſyrrup till the next day, and then ſet them on the fire in a faire broad pan vntill they be very hot, but let them not boile at all: let them remain ouer the fire an houre or more, remoouing them eaſily in the pan from one place to another with a wooden ſlice. This done, haue in a readineſſe great cap or royall papers, whereupon ſtrow ſome ſugar, vpon which lay your roots, hauing taken them out of the pan. Theſe papers you muſt put into a ſtouve or hot-houſe to harden; but if you haue not ſuch a place, lay them before a good fire: in this maner if you condite your roots, there is not any that can preſcribe you a better way. And thus you may condite any other root whatſoeuer, which will not only be exceeding delicat, but very wholſome, and effectual againſt the diſeaſes aboue named.

E *Aetius* ſaith, a certain man affirmed, that by the continual vſe of ſea Holly he neuer after voided any ſtone, when as before he was very often tormented with that diſeaſe.

F It is drunke, ſaith *Dioſcorides*, with Carrot ſeed againſt very many infirmities, in the weight of a dram.

G The juice of the leaues preſſed forth with wine, is a remedy for thoſe that are troubled with the running of the reins.

H They report of the herb ſea Holly, if one goat take it into her mouth, it cauſeth her firſt to ſtand ſtill, and afterwards the whole flocke, vntill ſuch time as the ſheepheard take it from her mouth. *Plutarch.*

Chap. 485. *Of baſtard Sea Hollies.*

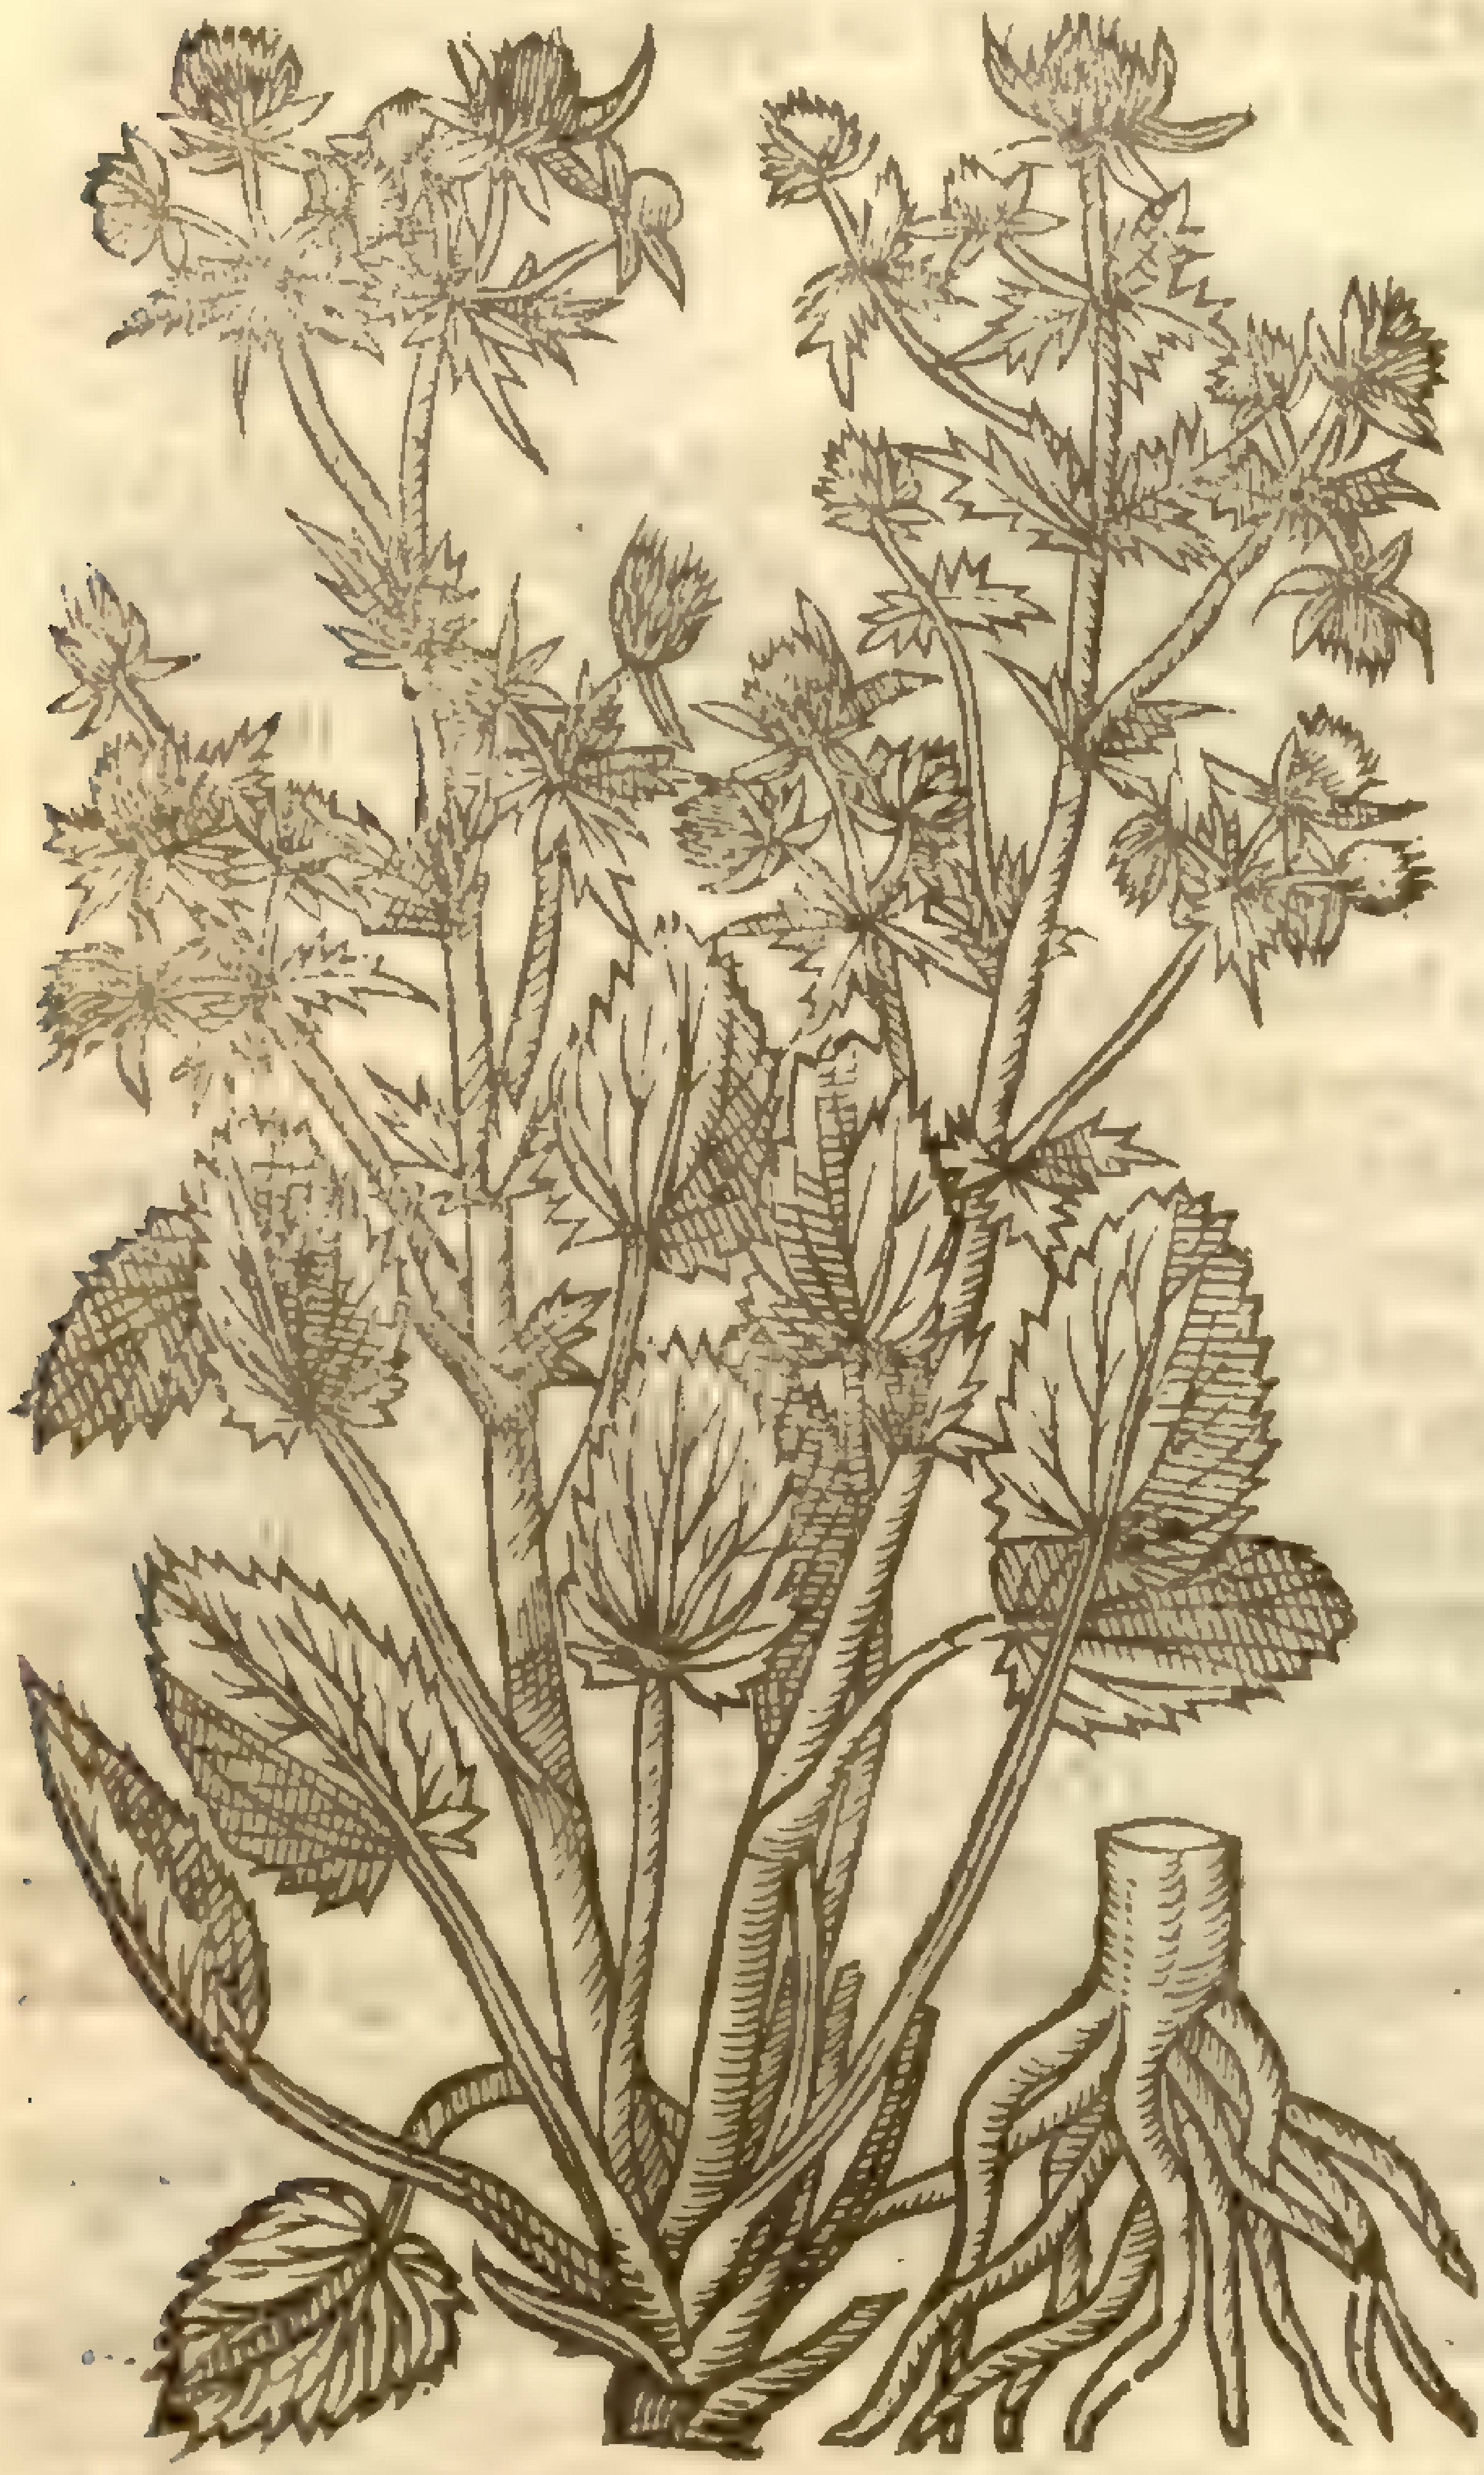
¶ *The Deſcription.*

1 THis *Eryngium*, which *Dodonæus* in his laſt edition calleth *Eryngium planum*; and *Pena* more fitly and truly, *Eryngium Alpinum cæruleum*, hath ſtalks a cubit and a half high, hauing ſpaces between euery joint: the lower leaues are greater and broader, and notched about the edges, but thoſe aboue are leſſe, compaſſing or enuironing each joint ſtar-faſhion, beſet with ſoft tender pricks not much hurtfull to the hands of ſuch as touch them: the knobs or heads are alſo prickly, in colour blew. The root is bunchy or knotty like that of Elecampane, black without, white within, like the Eringes in ſweetneſſe and taſte.

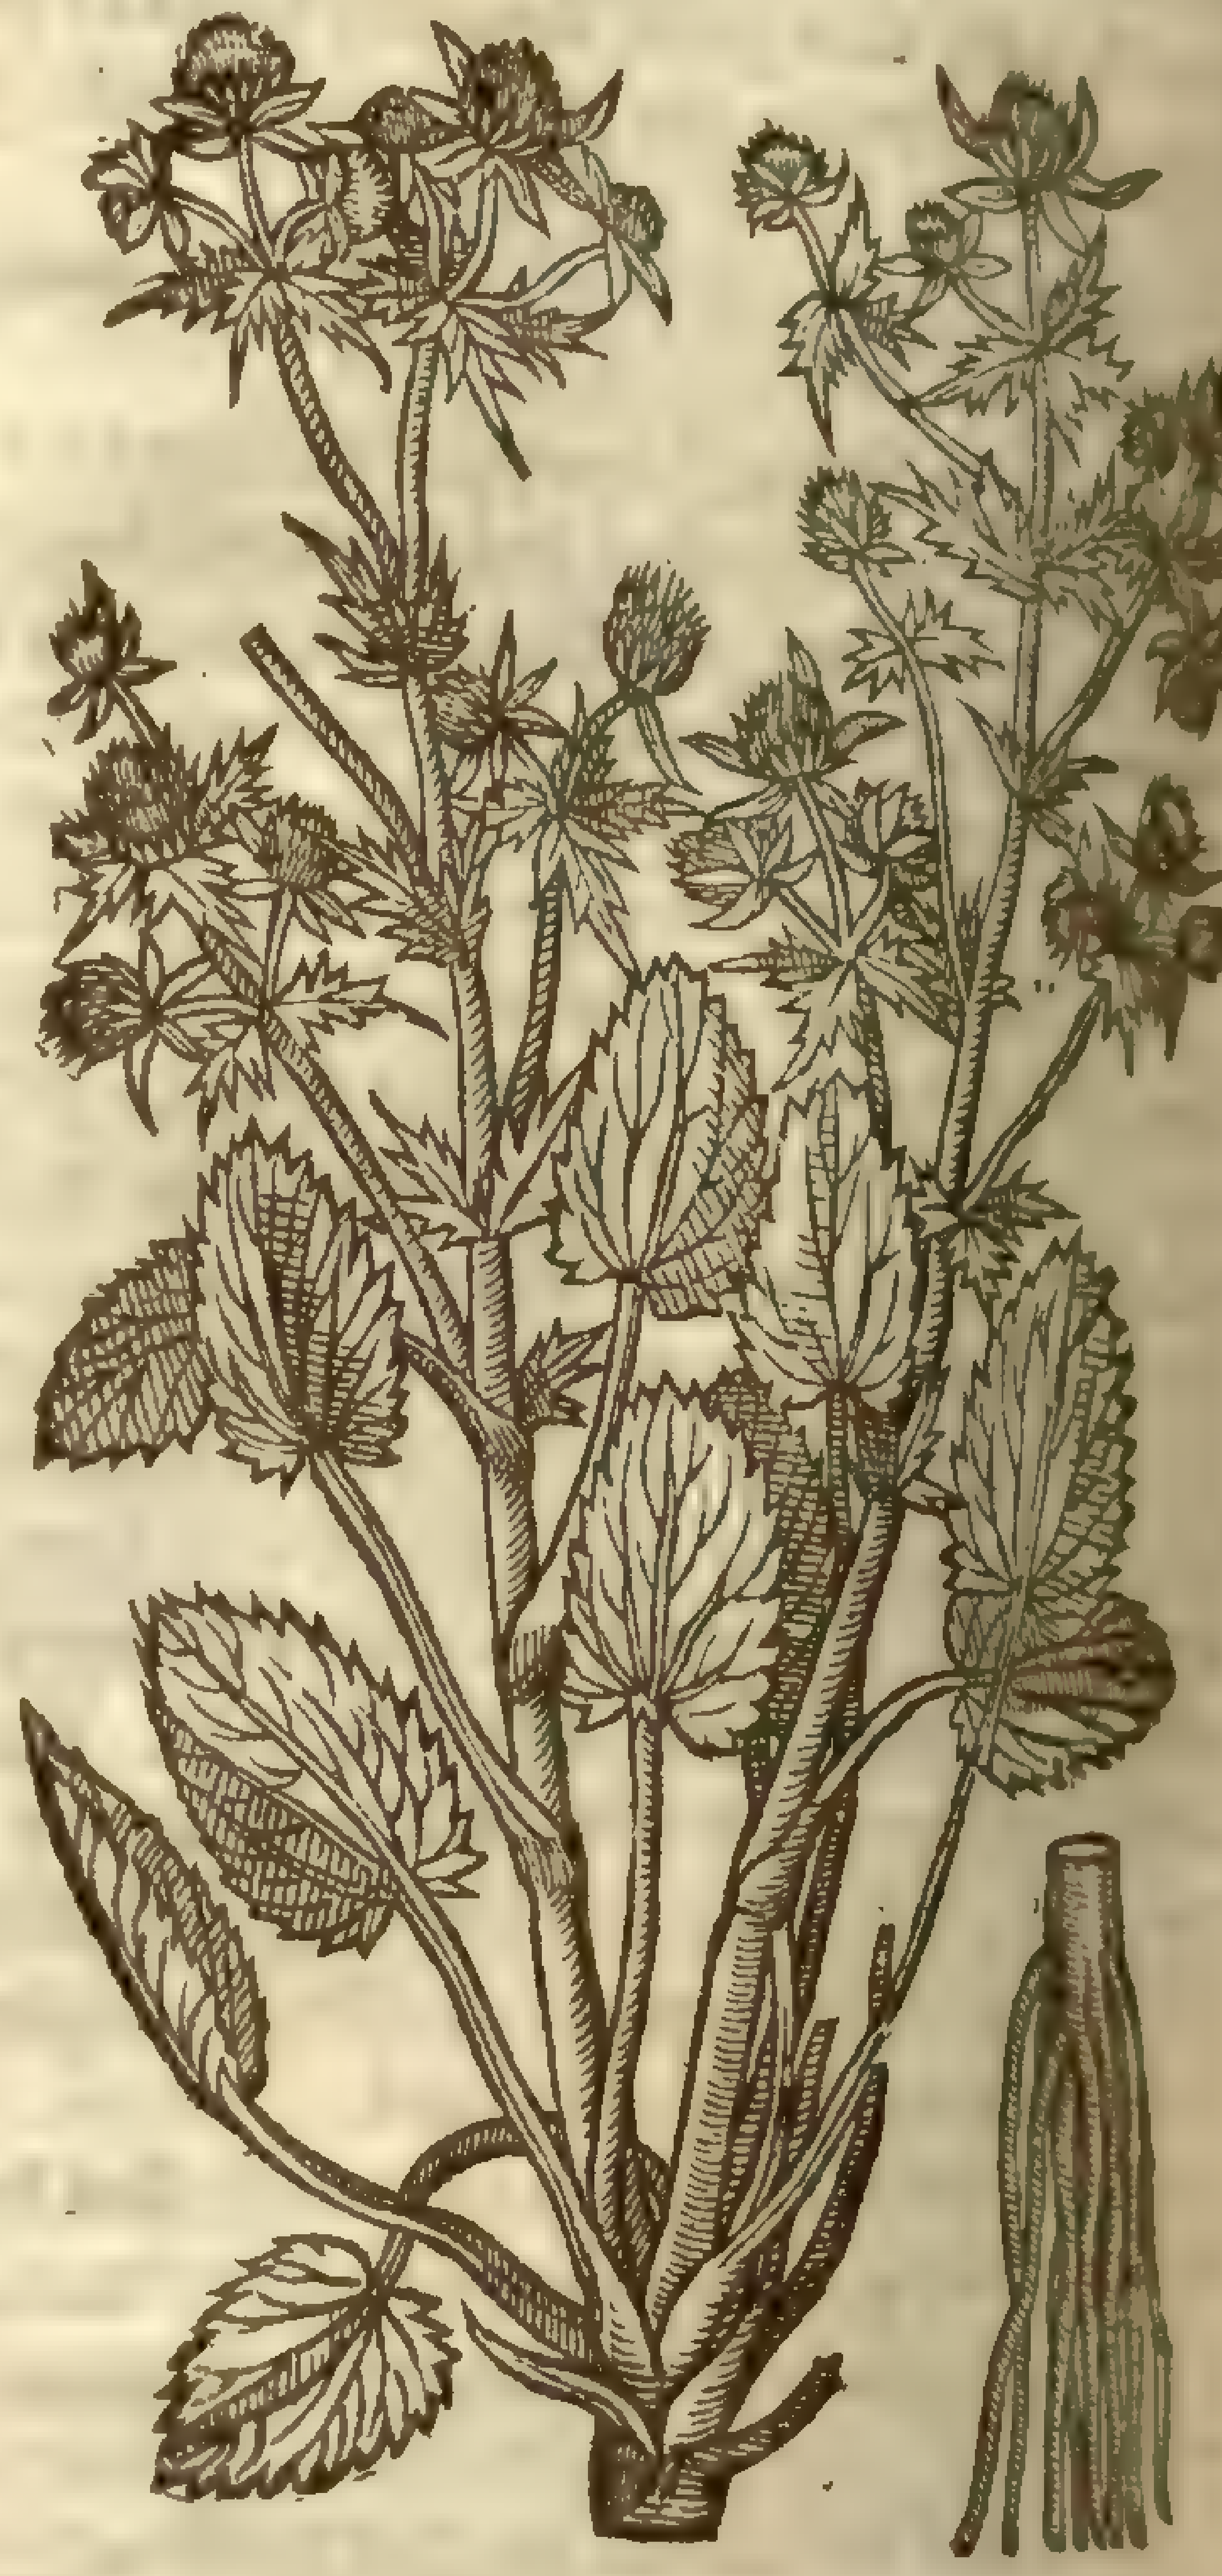
2 The ſecond baſtard ſea Holly, whoſe picture is ſet forth in *Dodonæus* his laſt edition verie gallantly, being alſo a kinde of Thiſtle, hath leaues like the former Erynges, but broader next the roots, than thoſe that grow next the ſtalks, ſomwhat long, greeniſh, ſoft, and not prickly, but lightly creuiſed or notched about the edges, greater than Quince leaues. The ſtalks grow more than a cubit high, on the tops whereof there hang downwards fiue or ſix knobs or heads, in colour and flours like the other; hauing three or foure whitiſh roots of a foot long.

3 This third kinde of baſtard *Eryngium* hath his firſt leaues (which do grow next the ground) great, broad, and ſoft, growing as it were in a rundle about the root. The ſtalke is ſmall and ſlender, diuided into ſome branches, which beare many little leaues turning or ſtanding many waies, which be

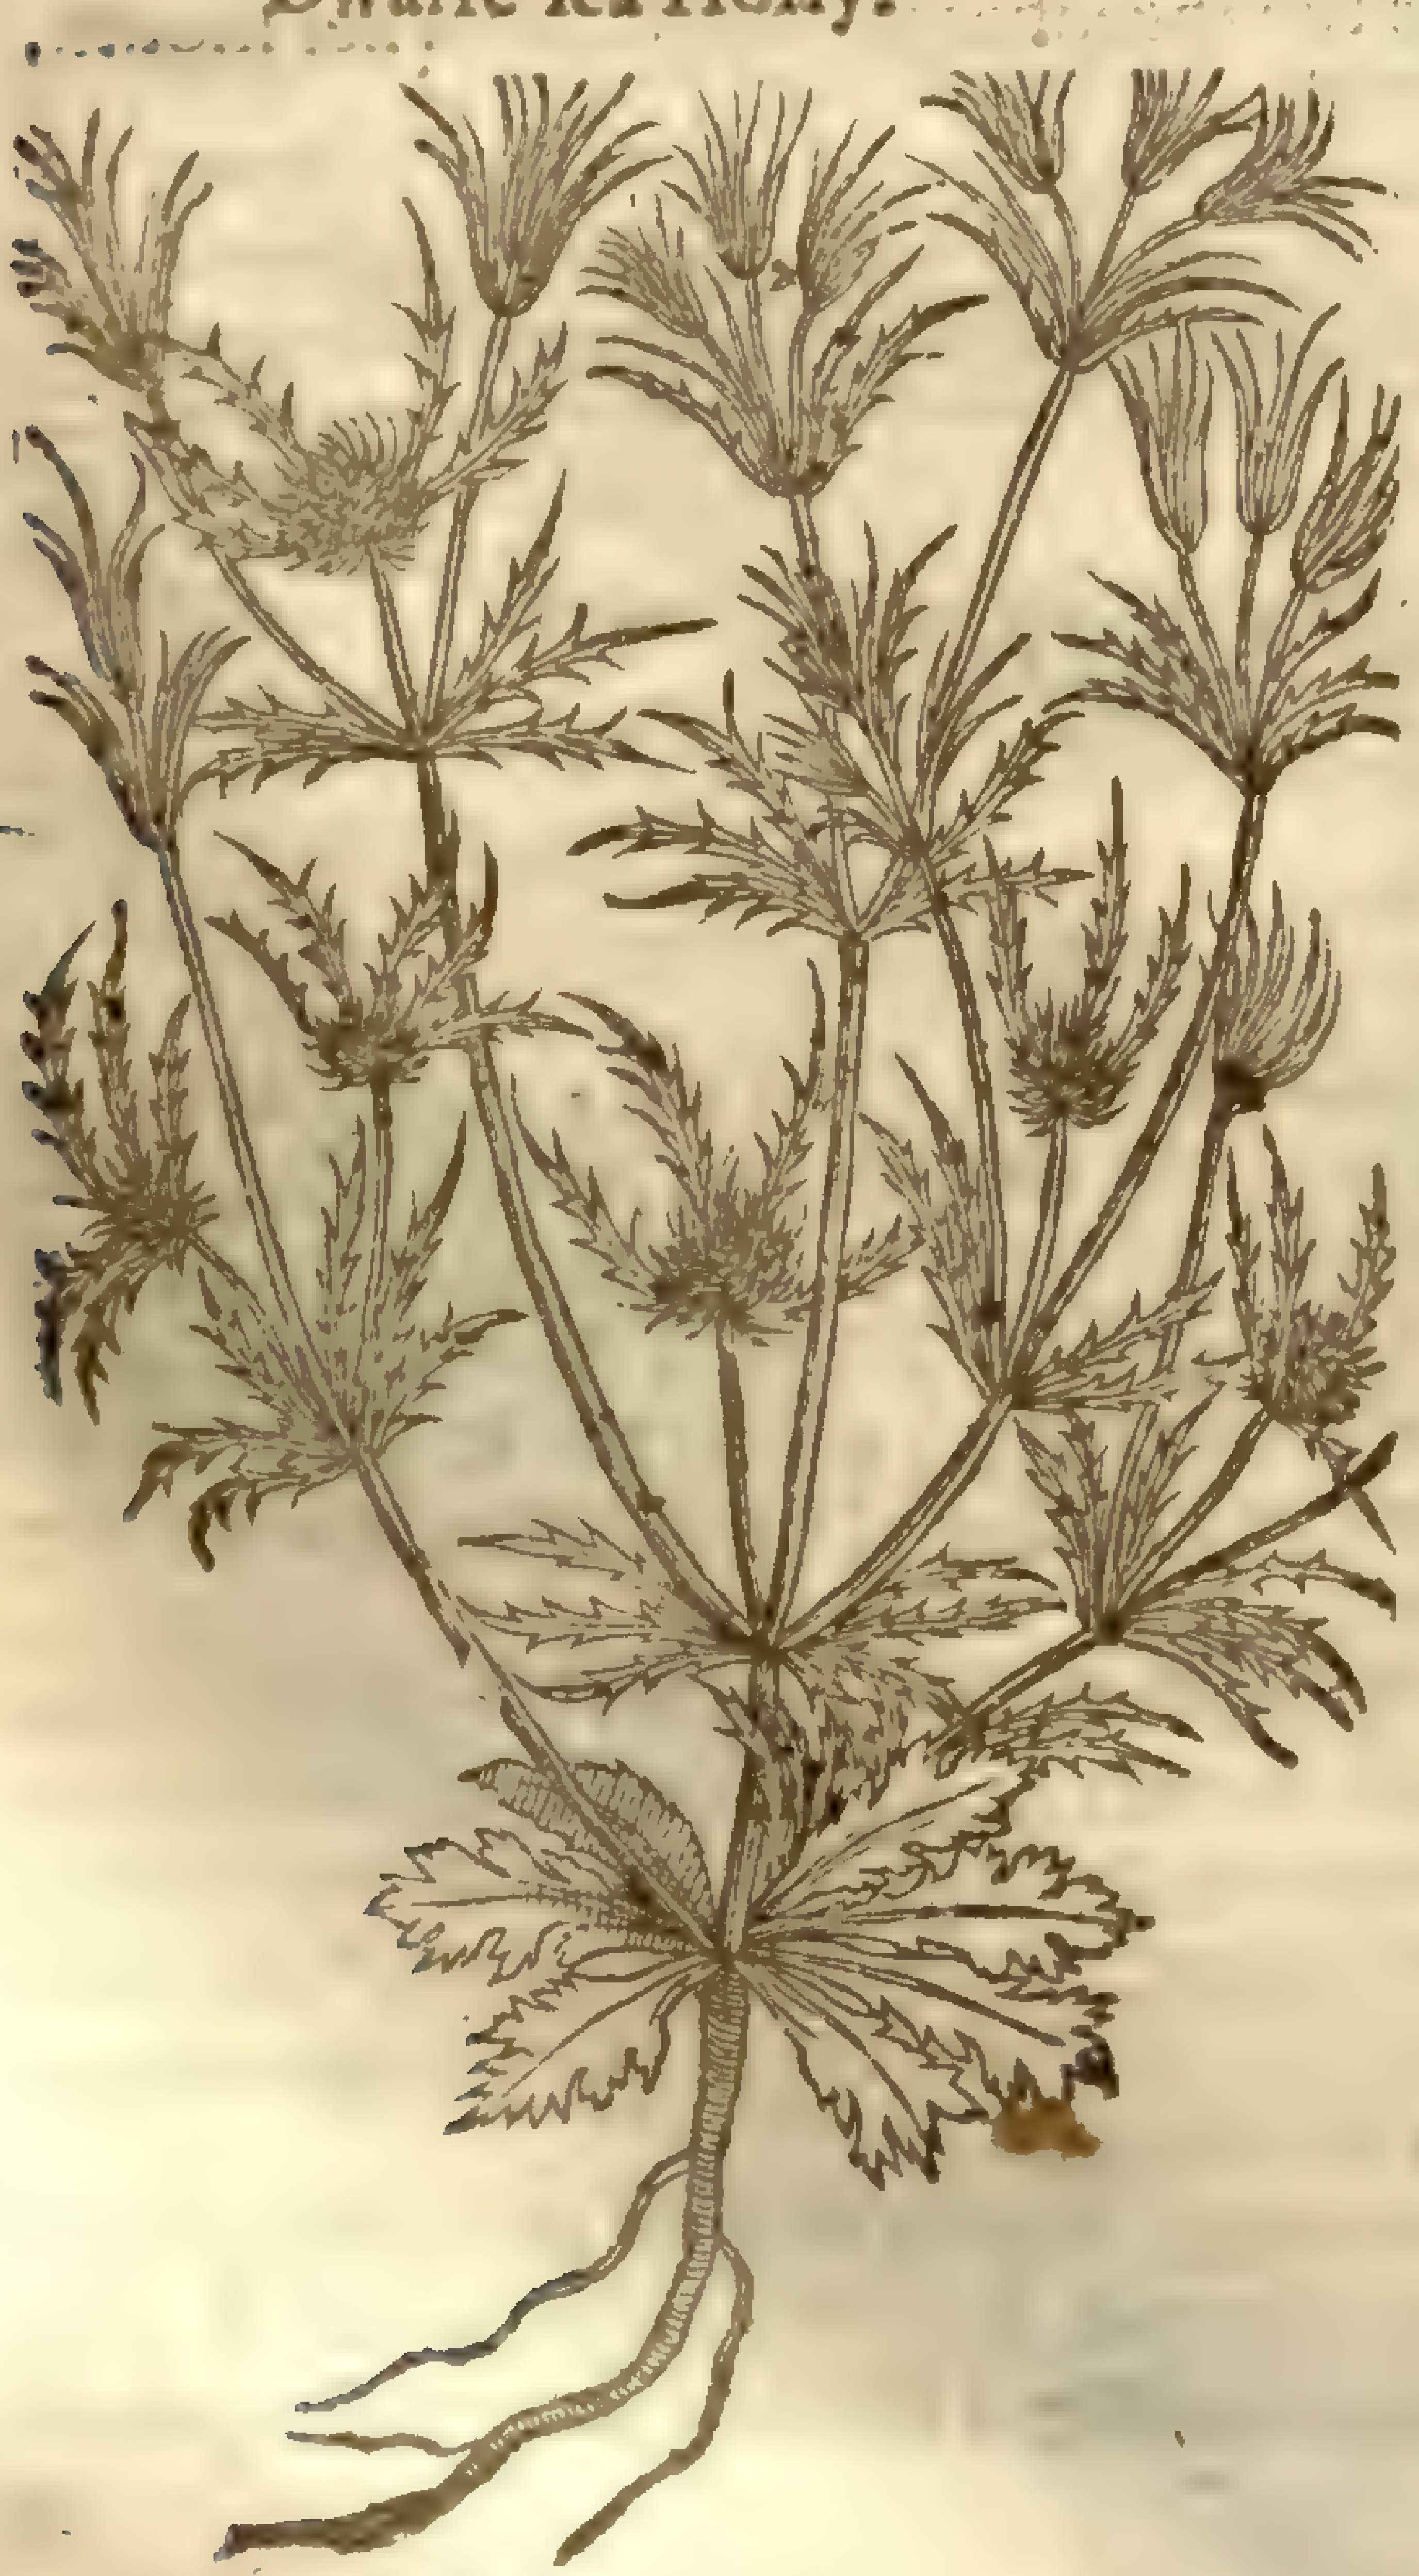
1 *Eryngium cæruleum.*
Blew ſea Holly.



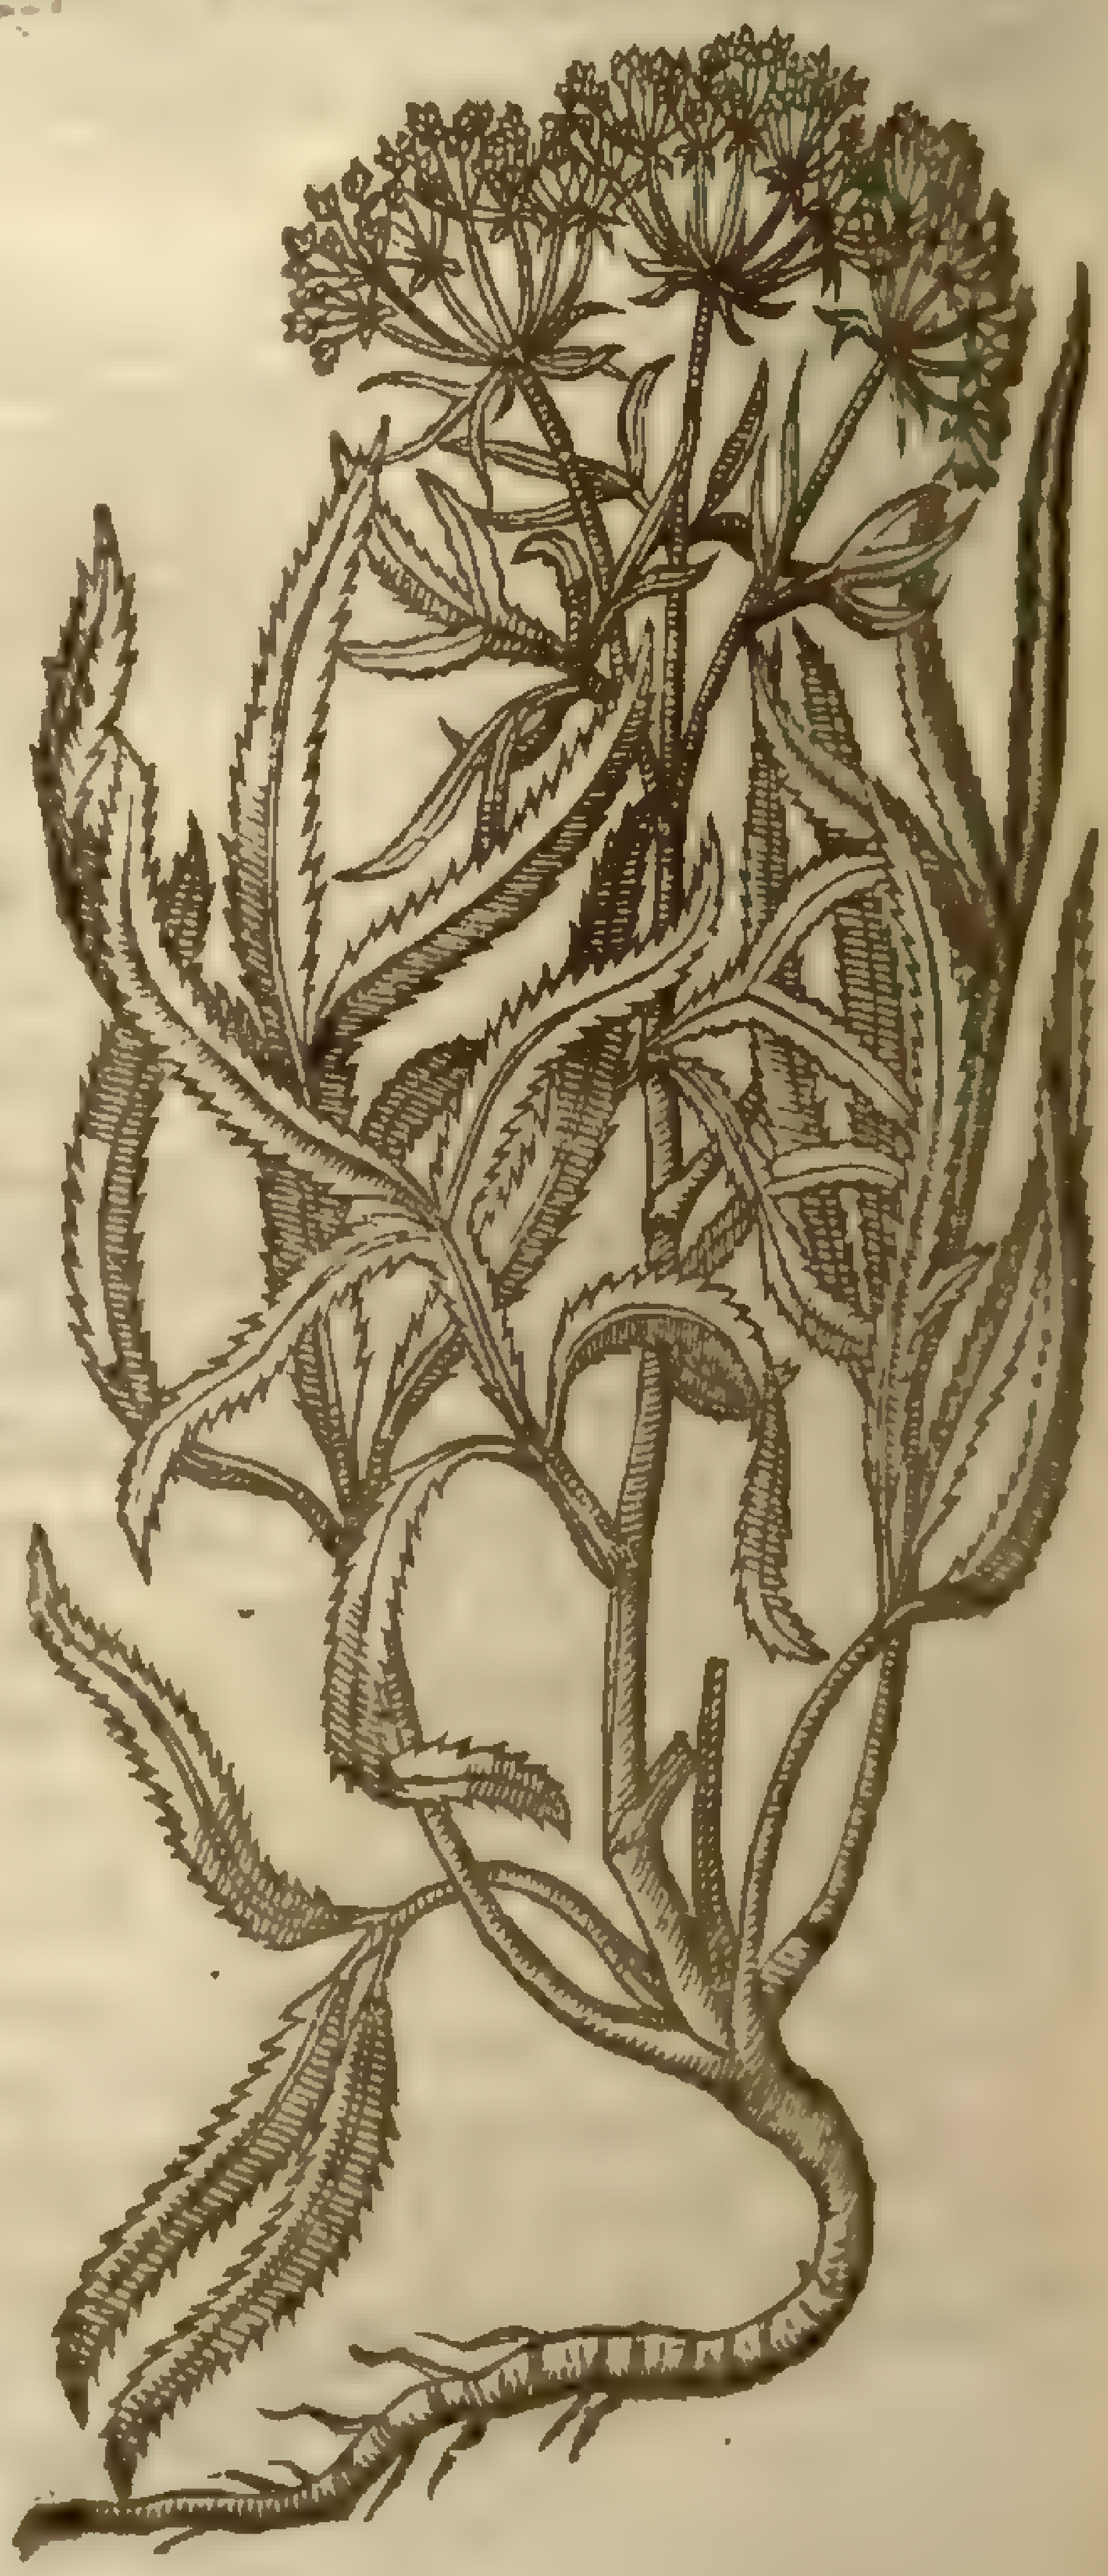
2 *Eryngium ſpurium primum Dod.*
Baſtard ſea Holly.



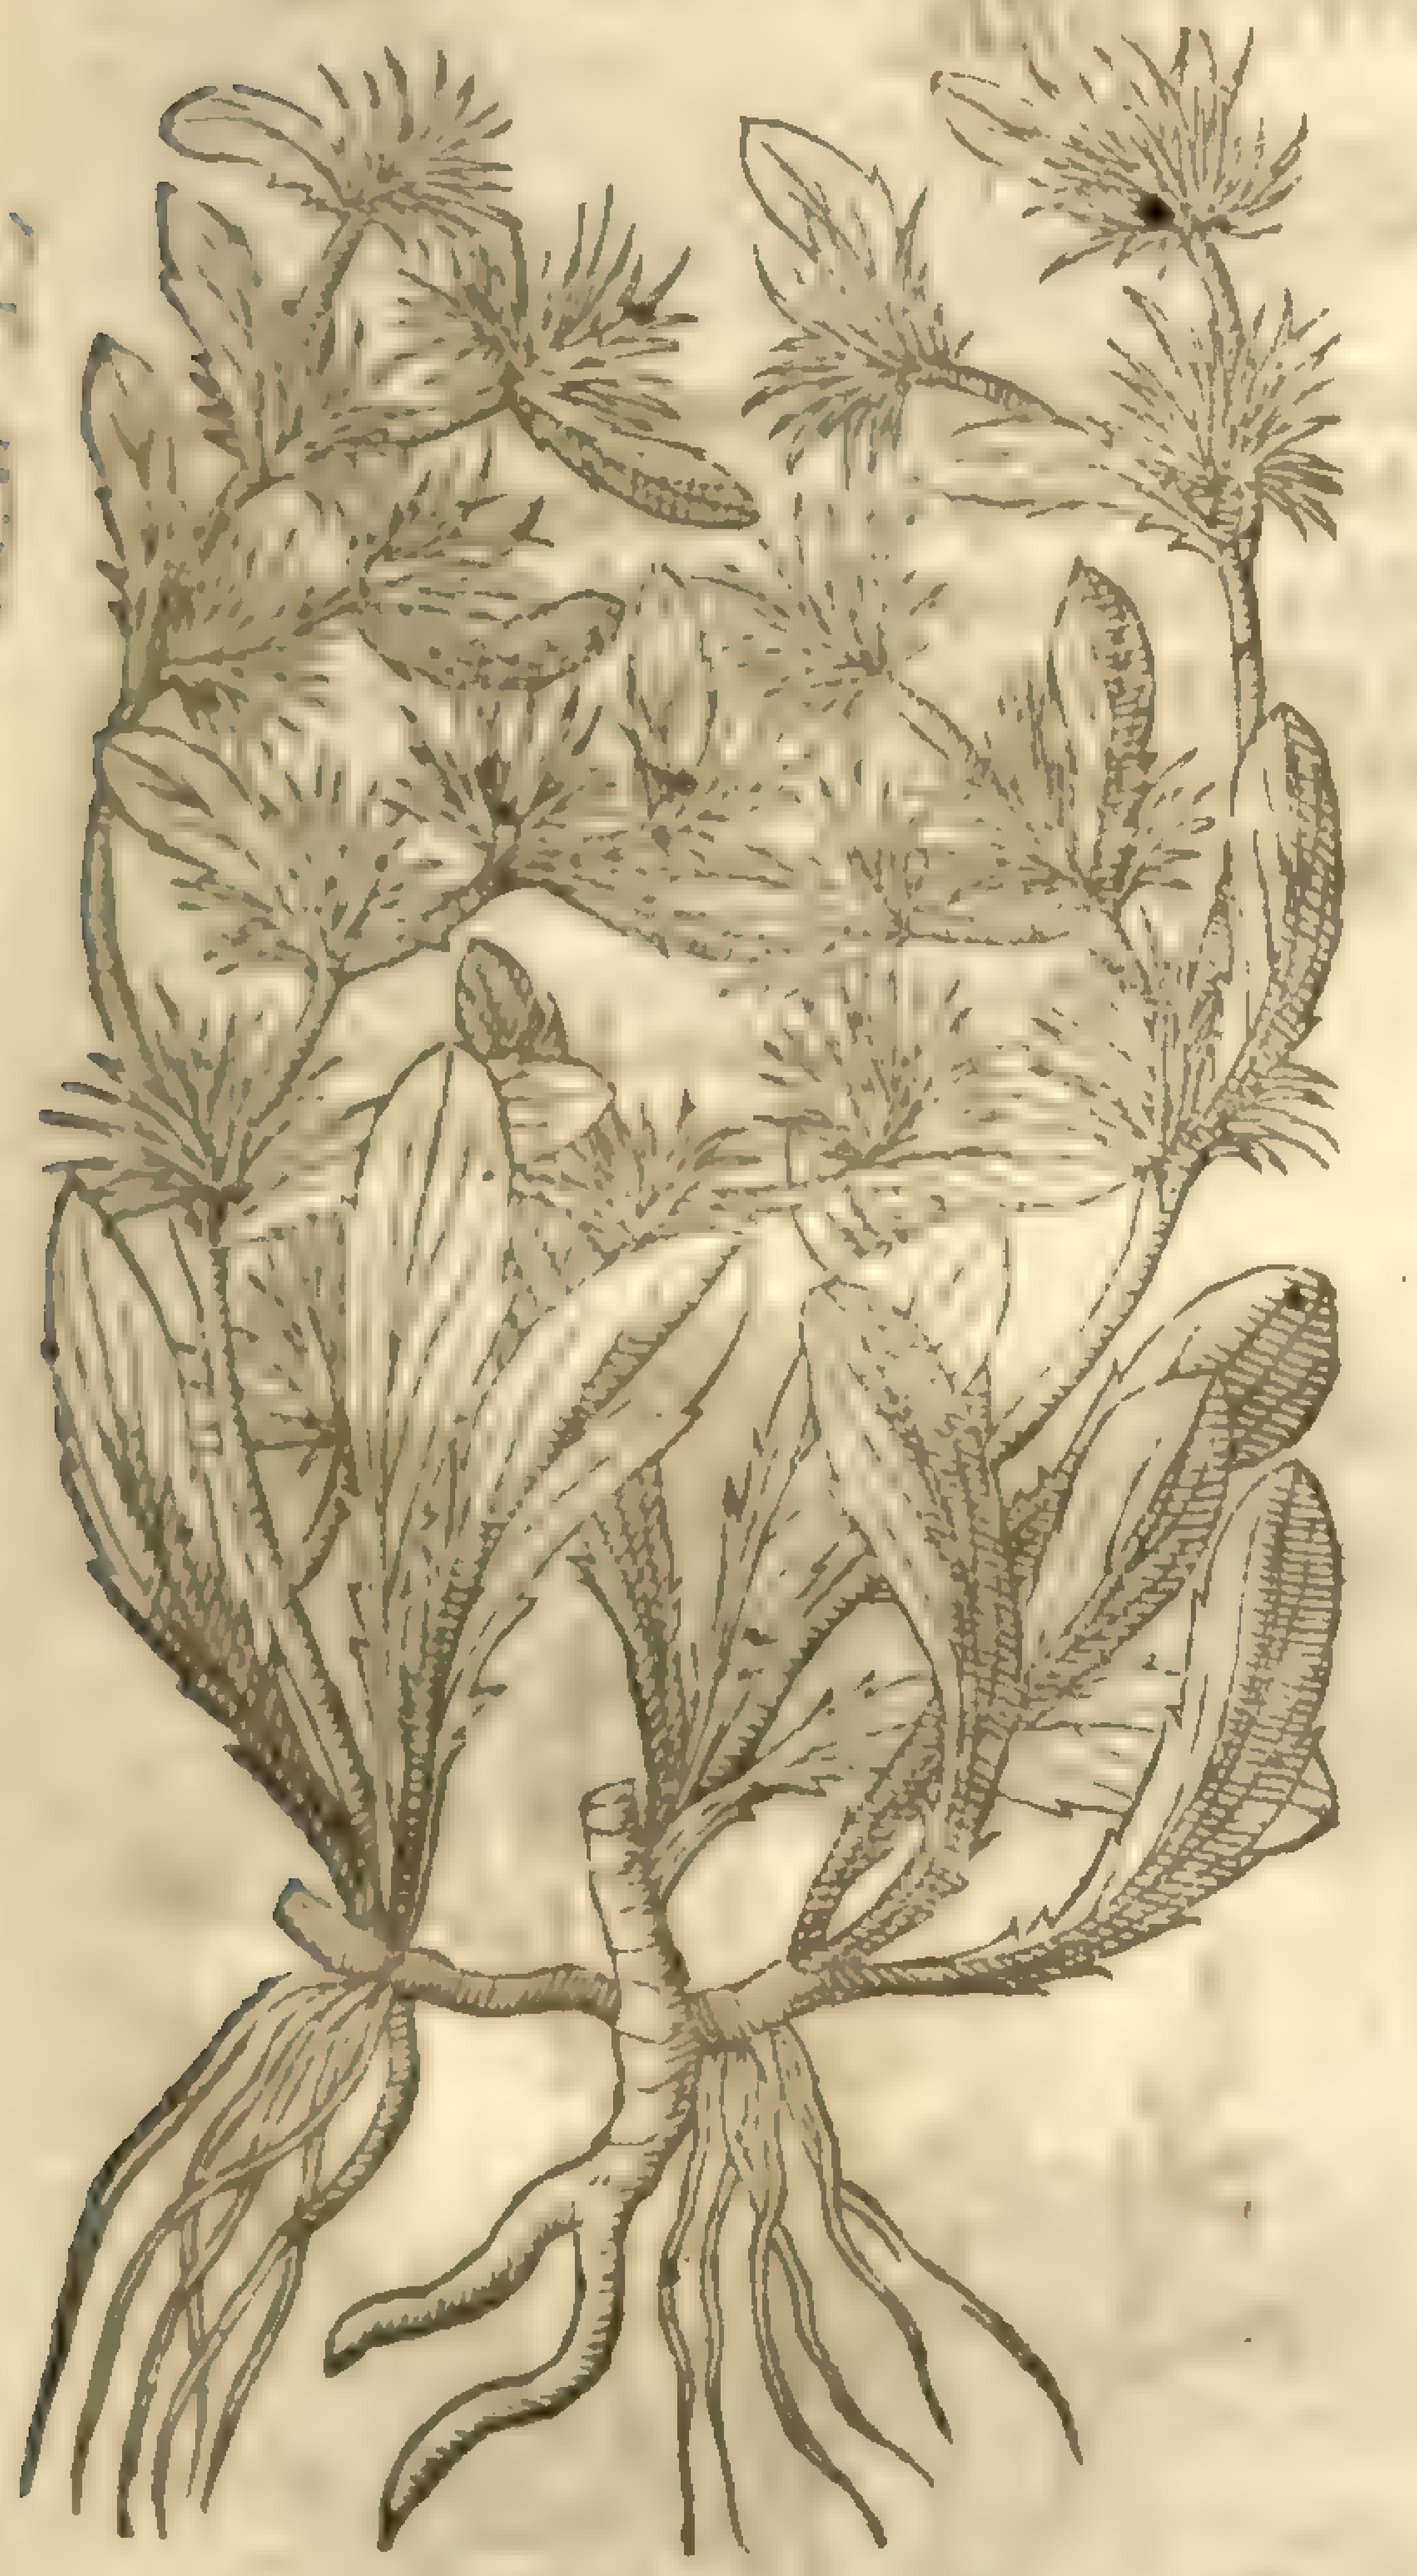
3 *Eryngium pumilum Cluſij.*
Dwarfe ſea Holly.



4 *Eryngium Montanum.*
Mountaine ſea Holly.



‡ 5 *Eryngium puſillum planum.*
Small ſmooth ſea Holly.



be alſo ſlender, prickly, and ſet about the ſtalks ſtar-faſhion. The knobs or heads growing at the tops of the branches are round and prickely, bearing little blew flours and leaues which compaſſe them about: the root is ſlender, and laſts but one yeare.

4 The fourth kinde of baſtard ſea-Holly, which *Pena* calleth *Eryngium montanum recentiorum*, and is the fourth according to *Dodonæus* his account, is like the Erynges not in ſhape but in taſte: this beareth a very ſmall and ſlender ſtalke of a meane height, wheron grow three or foure leaues, and ſeldom fiue, made of diuers leaues ſet vpon a middle rib, narrow, long, hard, and of a darke green colour, dented vpon both edges of the leafe like a ſaw: the ſtalke is a cubit high, iointed or kneed, and diuiding it ſelfe into many branches, on the tops whereof are round tufts or vmbels wherein are contained the floures, and after they be vaded, the ſeeds, which are ſmall, ſomewhat long, well ſmelling, and ſharp in taſte: the root is white and long, not a finger thicke, in taſte ſweet, but afterwards ſomewhat ſharpe, and in ſent and ſauor not vnpleaſant: when the root is dried it may be crumbled in pieces, and therefore quickly braied

‡ 5 This is a low plant preſently from the root diuided into ſundry branches, ſlender, round, & lying on the ground: at each joint grow leaues without any certain order, broad toward their ends, and narrower at their ſetting on, ſnipt about their edges. Thoſe next the root were ſome inch broad, and two or more long, of a yellowiſh green colour: the ſtalks are parted into ſundry branches, and at each joynt haue little leaues, and rough green heads with blewiſh flours in them: the roots creep and are ſomwhat like thoſe of Aſparagus. This neither *Cluſius* nor *Lobel* found wilde, but it grew in the garden of *Iohn Mouton* of Tournay, a learned Apothecarie very skilfull in the knowledge of plants: wherupon they both called it *Eryngium puſillum planum Moutoni*. ‡

¶ *The Place.*

Theſe kinds of ſea Holly are ſtrangers in England, we haue the firſt and ſecond in our London gardens.

¶ *The Time.*

They floure and flouriſh when the Thiſtles do.

¶ *The Names.*

Theſe plants be *Eryngia ſpuria*, or baſtard ſea Hollies, being but lately obſerued, & therfore haue no old names.

The firſt may be called in Latine, *Eryngium Boruſſicum*, or *Non ſpinoſum*; ſea Holly without prickles.

The ſecond is called by *Matthiolus*, *Eryngium planum*, or flat ſea Holly: others had rather name it *Alpinum Eryngium*, or ſea Holly of the Alps.

The third is rightly called *Eryngium pumilum*, little ſea Hulver.

Matthiolus makes the fourth to be *Crithmum quartum*, or the fourth kind of Sampier: others, as *Dodonæus* and *Lobel*, haue made it a kinde of ſea Hulver.

¶ *The Nature and Vertues.*

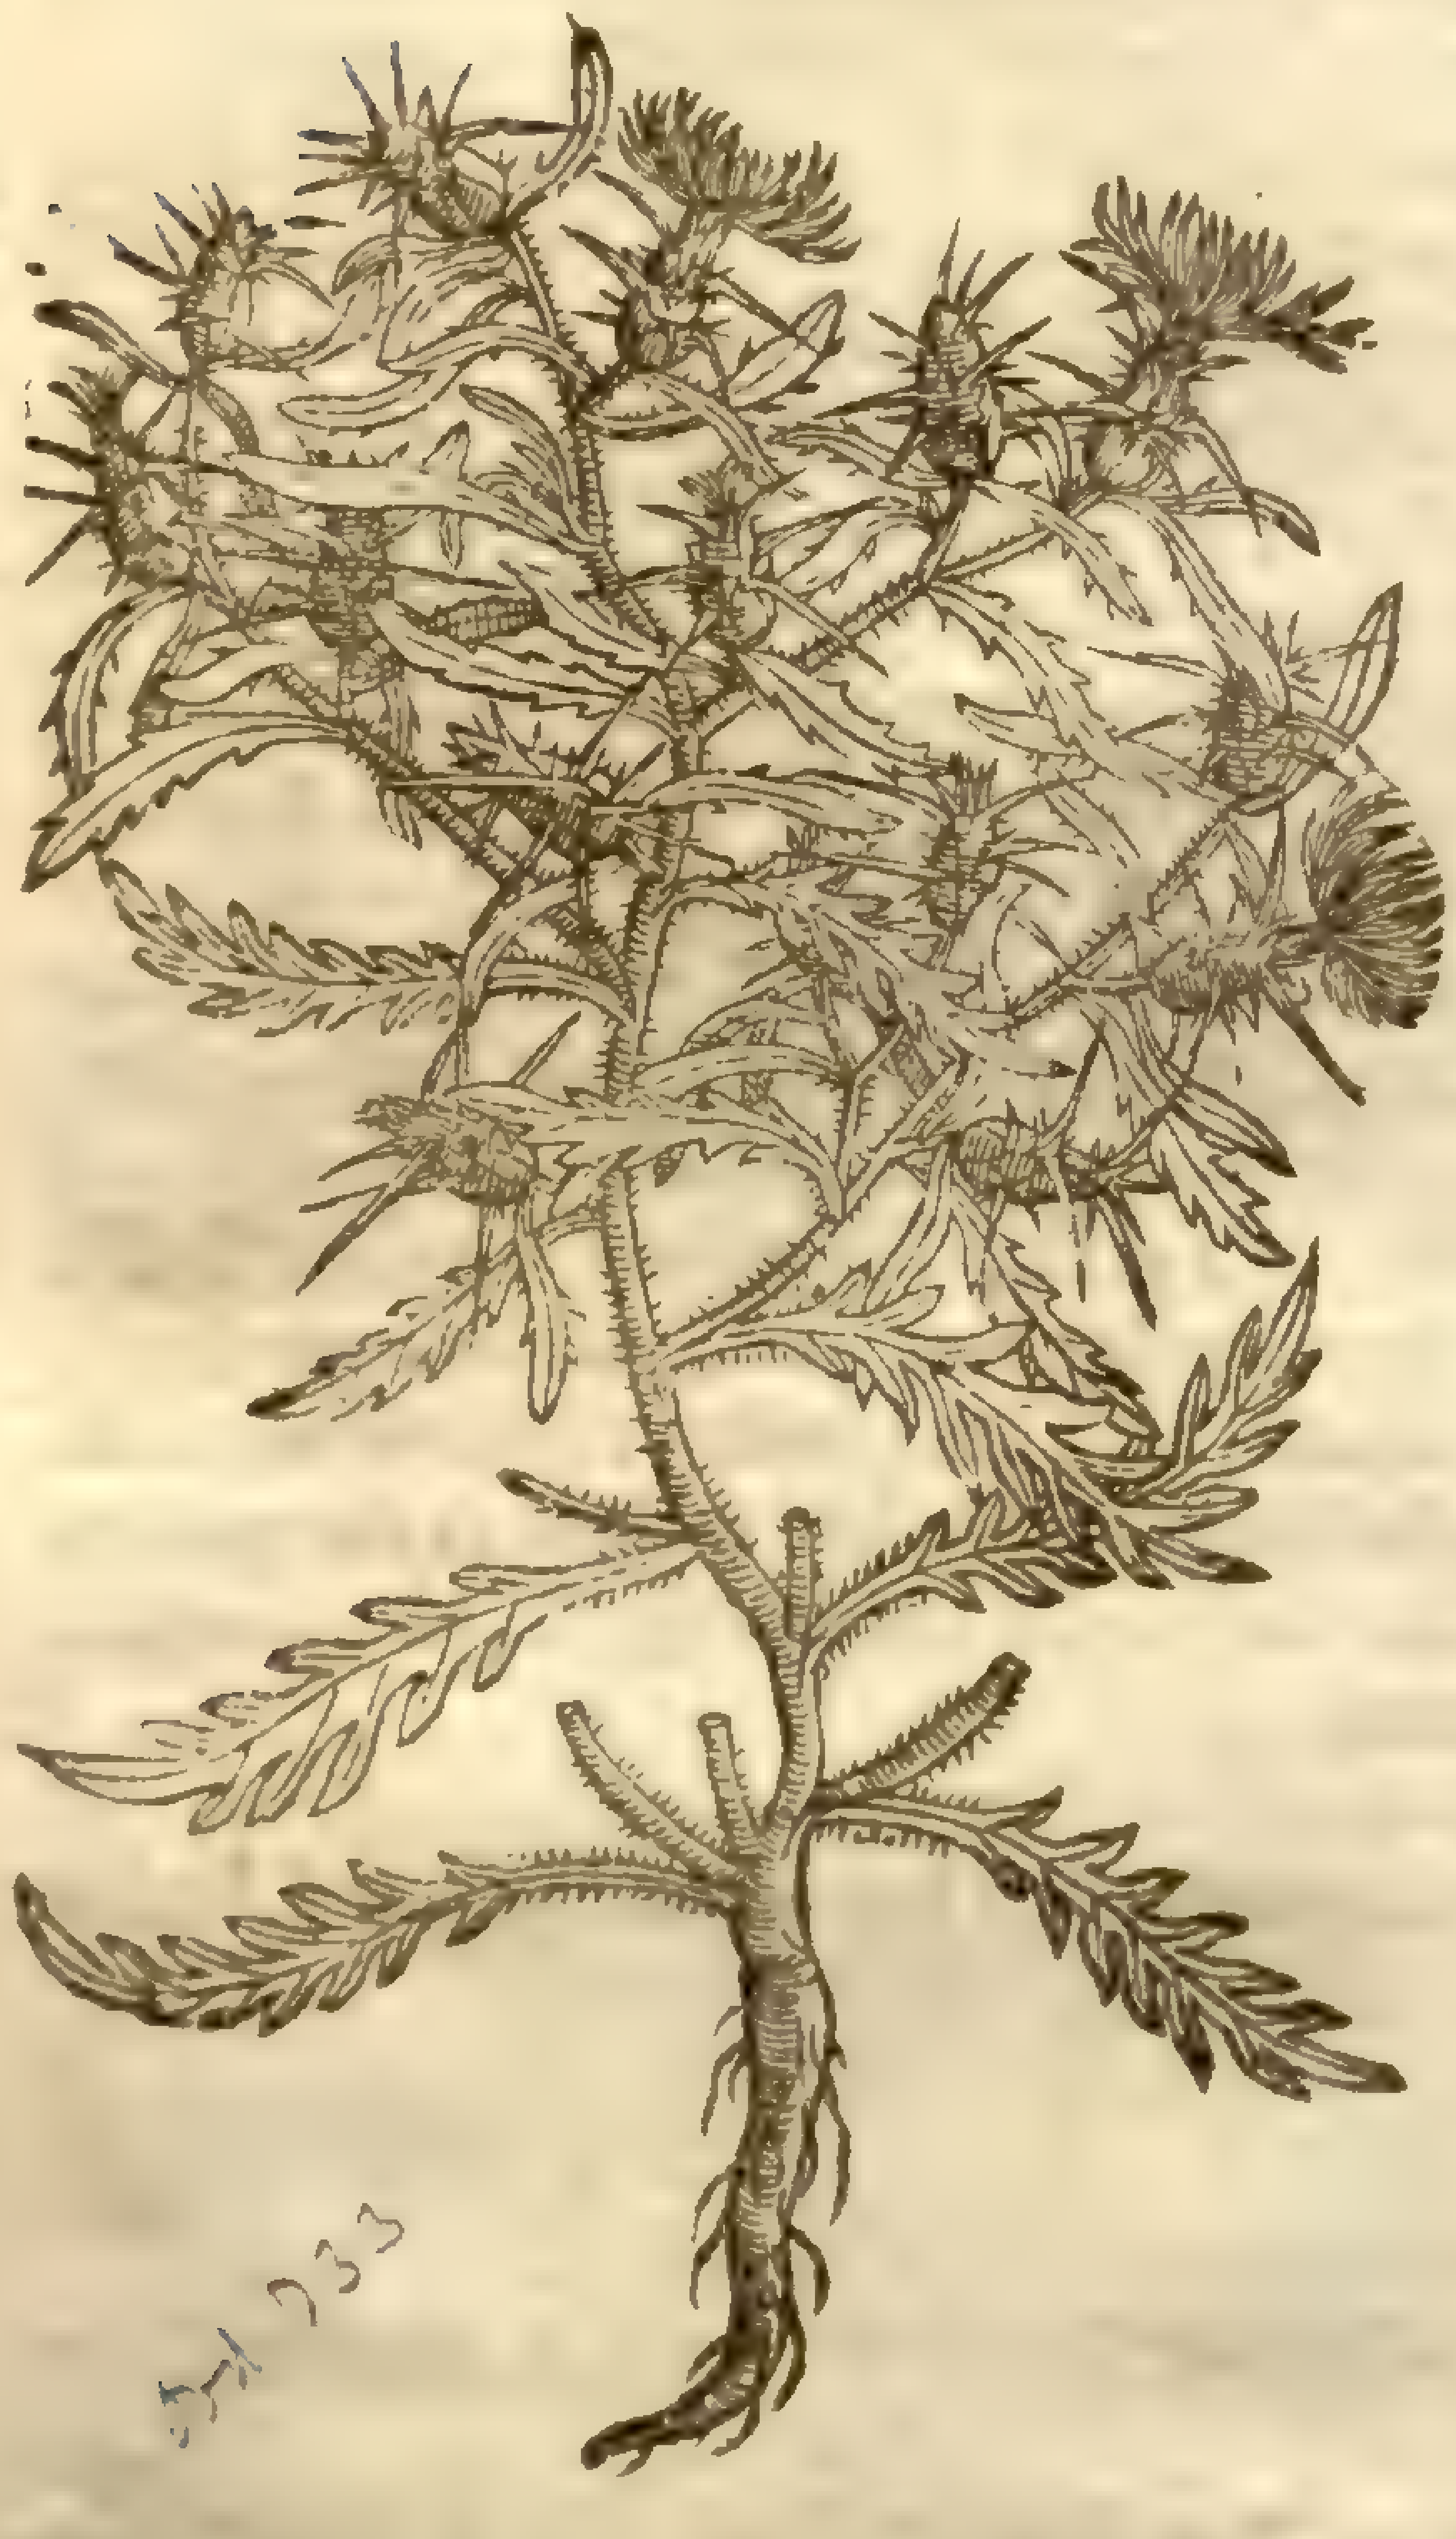
Touching the faculties hereof we haue nothing to ſet downe, ſeeing they haue as yet no vſe in meat or medicine. But that they be hot the very taſte doth declare.

Chap. 486. *Of Starre Thiſtle.*

¶ *The Deſcription.*

1 The Star Thiſtle, called *Carduus ſtellatus*, hath many ſoft frizled leaues, deepely cut or gaſht, altogether without prickles: among which riſeth vp a ſtalke, diuiding it ſelf into many other branches, growing two foot high; on the tops whereof are ſmall knops or heads like the other Thiſtles, armed round about with many ſharpe prickles, faſhioned like a blaſing ſtarre, which at the beginning are of a purple colour, but afterwards of a pale bleake or whitiſh colour: the ſeed is ſmall, flat, and round; the root is long and browne without.

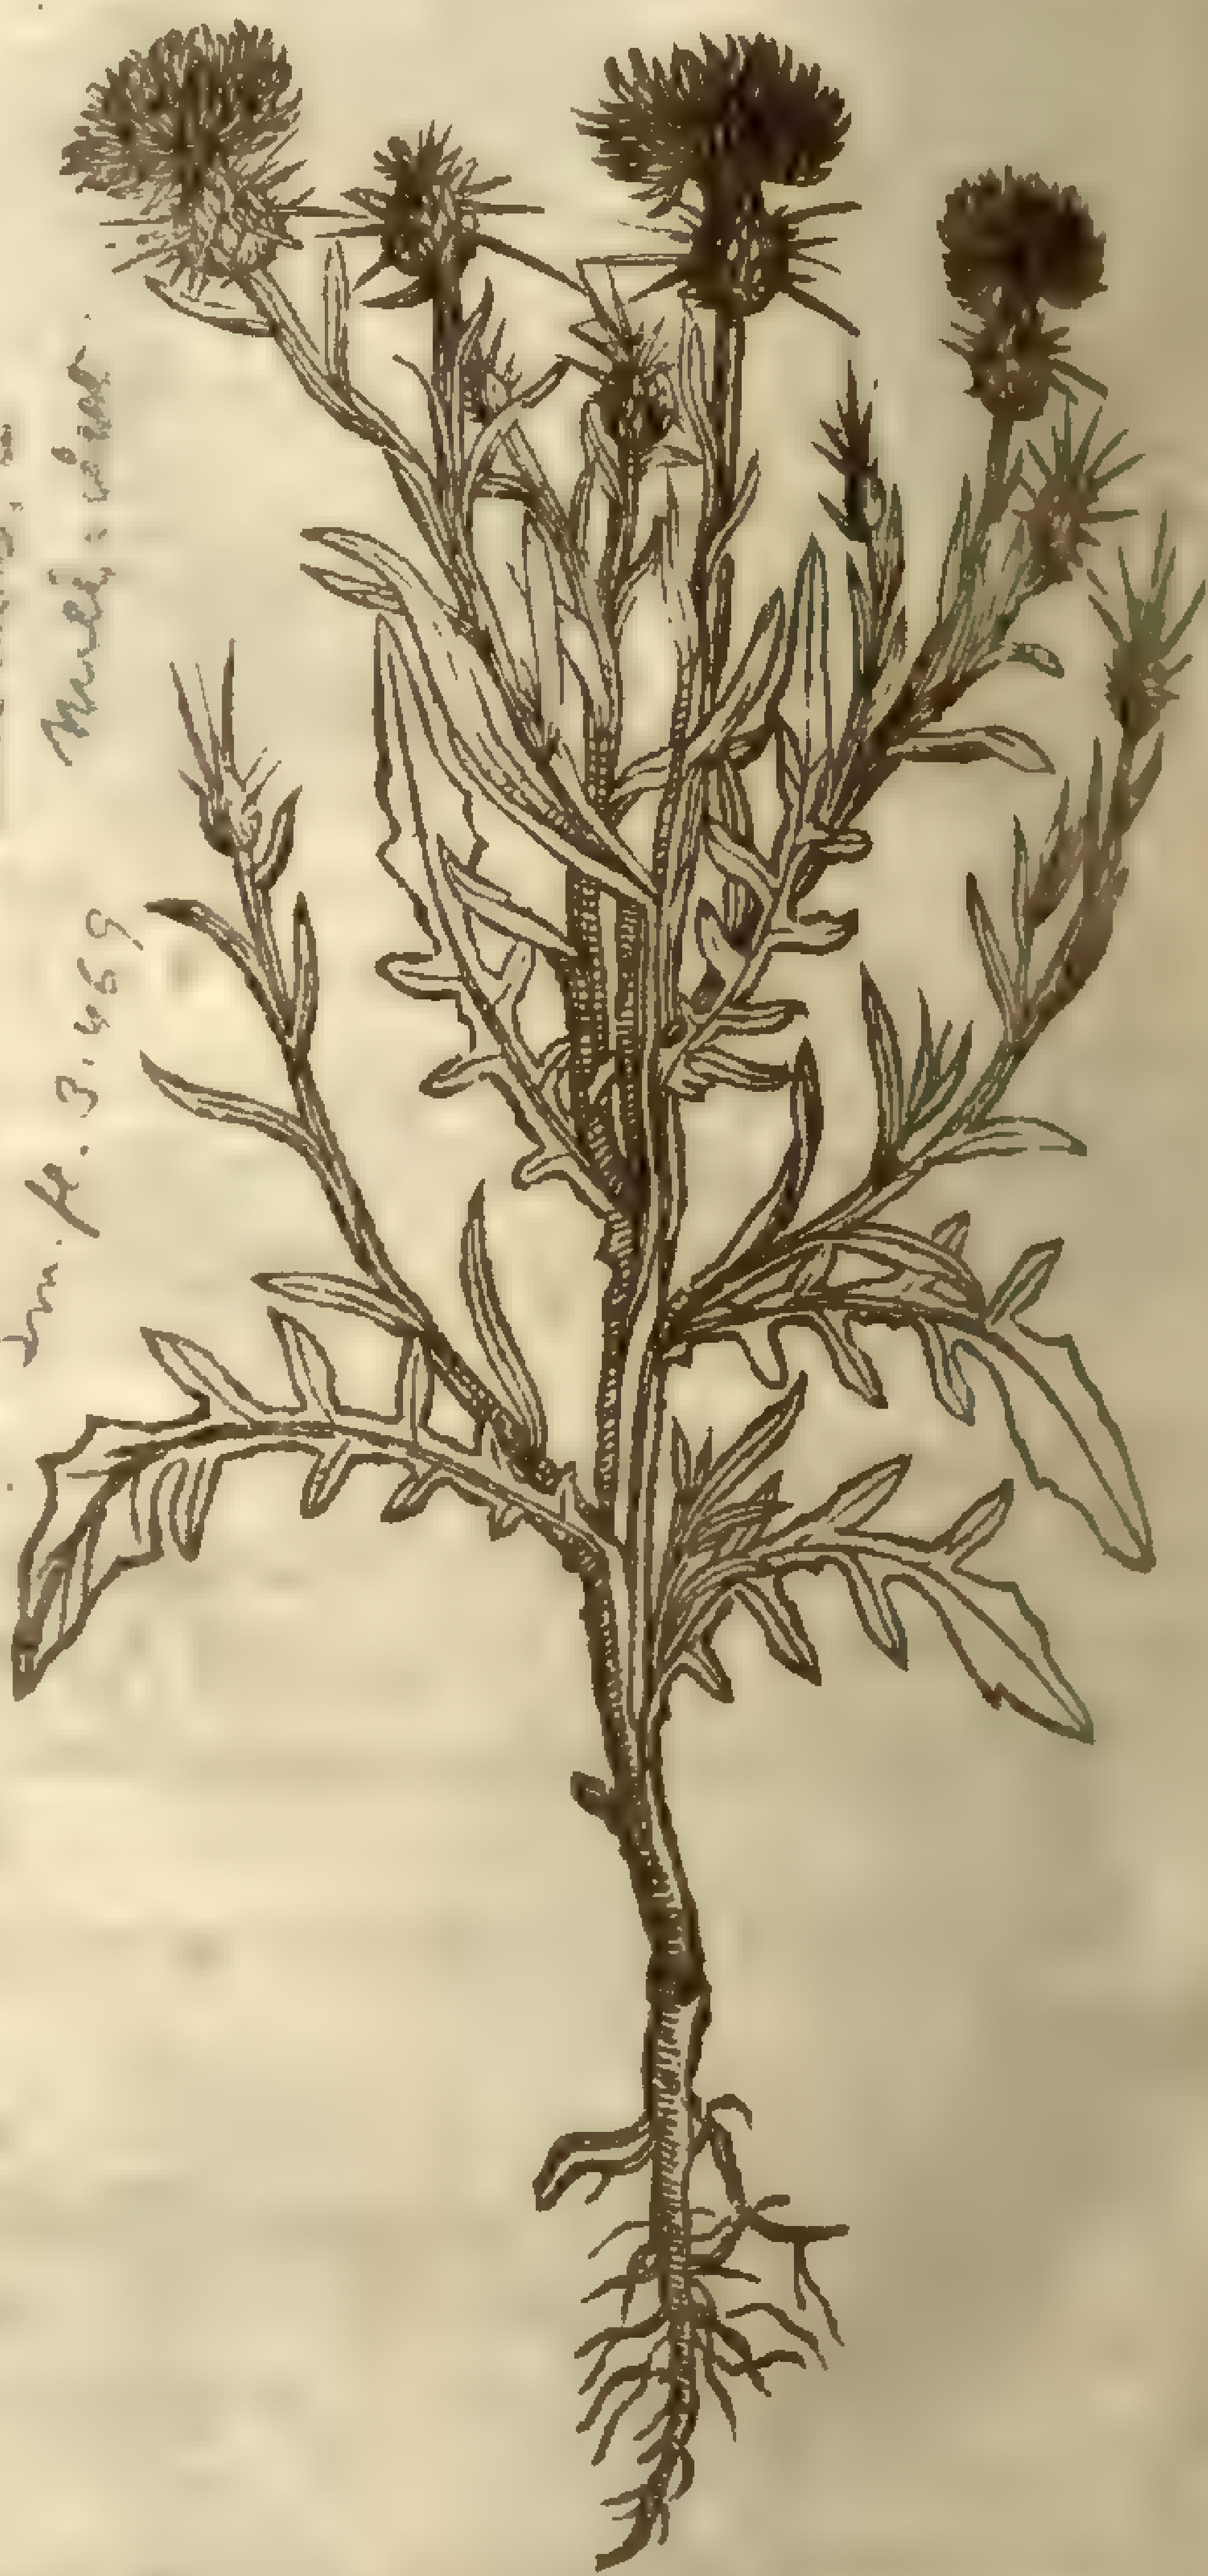
1 *Carduus ſtellatus.*
The Star-Thiſtle.



Centaurea Calcitrapa, L. Mill. dict. Sm. fl. 3. 468

Syl. 733

† 2 *Carduus Solſtitialis.*
S. Barnabies Thiſtle.



Centaurea solstitialis, L. Mill. dict. Sm. fl. 3. 469

2 S. Barnabies Thiſtle is another kinde of Star-Thiſtle, notwithſtanding it hath prickles no where ſaue in the head only, and the prickles ſtand forth of it in manner of a ſtar: the ſtalks are two cubits high, parted into diuers branches ſofter than are thoſe of Star-Thiſtle: which ſtalkes haue velms or thin skins cleauing vnto them all in length, by which they ſeem to be foure ſquare. The leaues are ſomewhat long, ſet with deep gaſhes on the edges: the floures are yellow, and conſiſt of threds, the ſeed is little, the root long and ſlender.

¶ *The Place.*

The two firſt grow vpon barren places neere cities and townes, almoſt euery where.

¶ *The Time.*

They floure and flouriſh eſpecially in Iuly and Auguſt.

¶ *The Names.*

The firſt is called in Latine *Stellaria*, as alſo *Carduus ſtellatus*, and *Carduus Calcitrapa*: but they are deceiued who take it for *Eryngium*, or ſea Holly, or any kinde thereof. *Matthiolus* ſaith it is called in Italian, *Calcatrippa*: in high-Dutch, **Wallen diſtel**: in low-Dutch, **Sterre diſtell**: in French, *Chauſſetrappe*: in Engliſh, ſtar Thiſtle.

S. Barnabies Thiſtle is called in Latine, *Solſtitialis ſpina*, becauſe it floureth in the ſummer Solſtice, as *Geſner* ſaith, or rather becauſe after the Solſtice the prickles thereof be ſharpeſt: of *Guillandinus, Eryngium*, but not properly, and *Stellaria Horatij Augerij*, who with good ſucceſſe gaue it againſt the ſtone, dropſies, green ſickneſſe, and quotidian feuers. It is called in Engliſh as aboue ſaid, Saint Barnabies Thiſtle.

¶ *The Temperature.*

The Star-Thiſtle is of a hot temperature.

¶ *The Vertues.*

The ſeed is commended againſt the ſtrangurie: it is reported to driue forth the ſtone, if it bee drunke with wine. A

Baptiſta Sardus affirmeth, that the diſtilled water of this Thiſtle is a remedy for thoſe that are infected with the French Pox, and that the vſe of this is good for the liuer, that it taketh away the ſtoppings thereof. B

That it clenſeth the bloud from corrupt and putrified humours. C

That it is giuen with good ſucceſſe againſt intermitting feuers: whether they be quotidian or tertian. D

As touching the faculties of Saint Barnabies Thiſtle, which are as yet not found out, we haue nothing to write. E

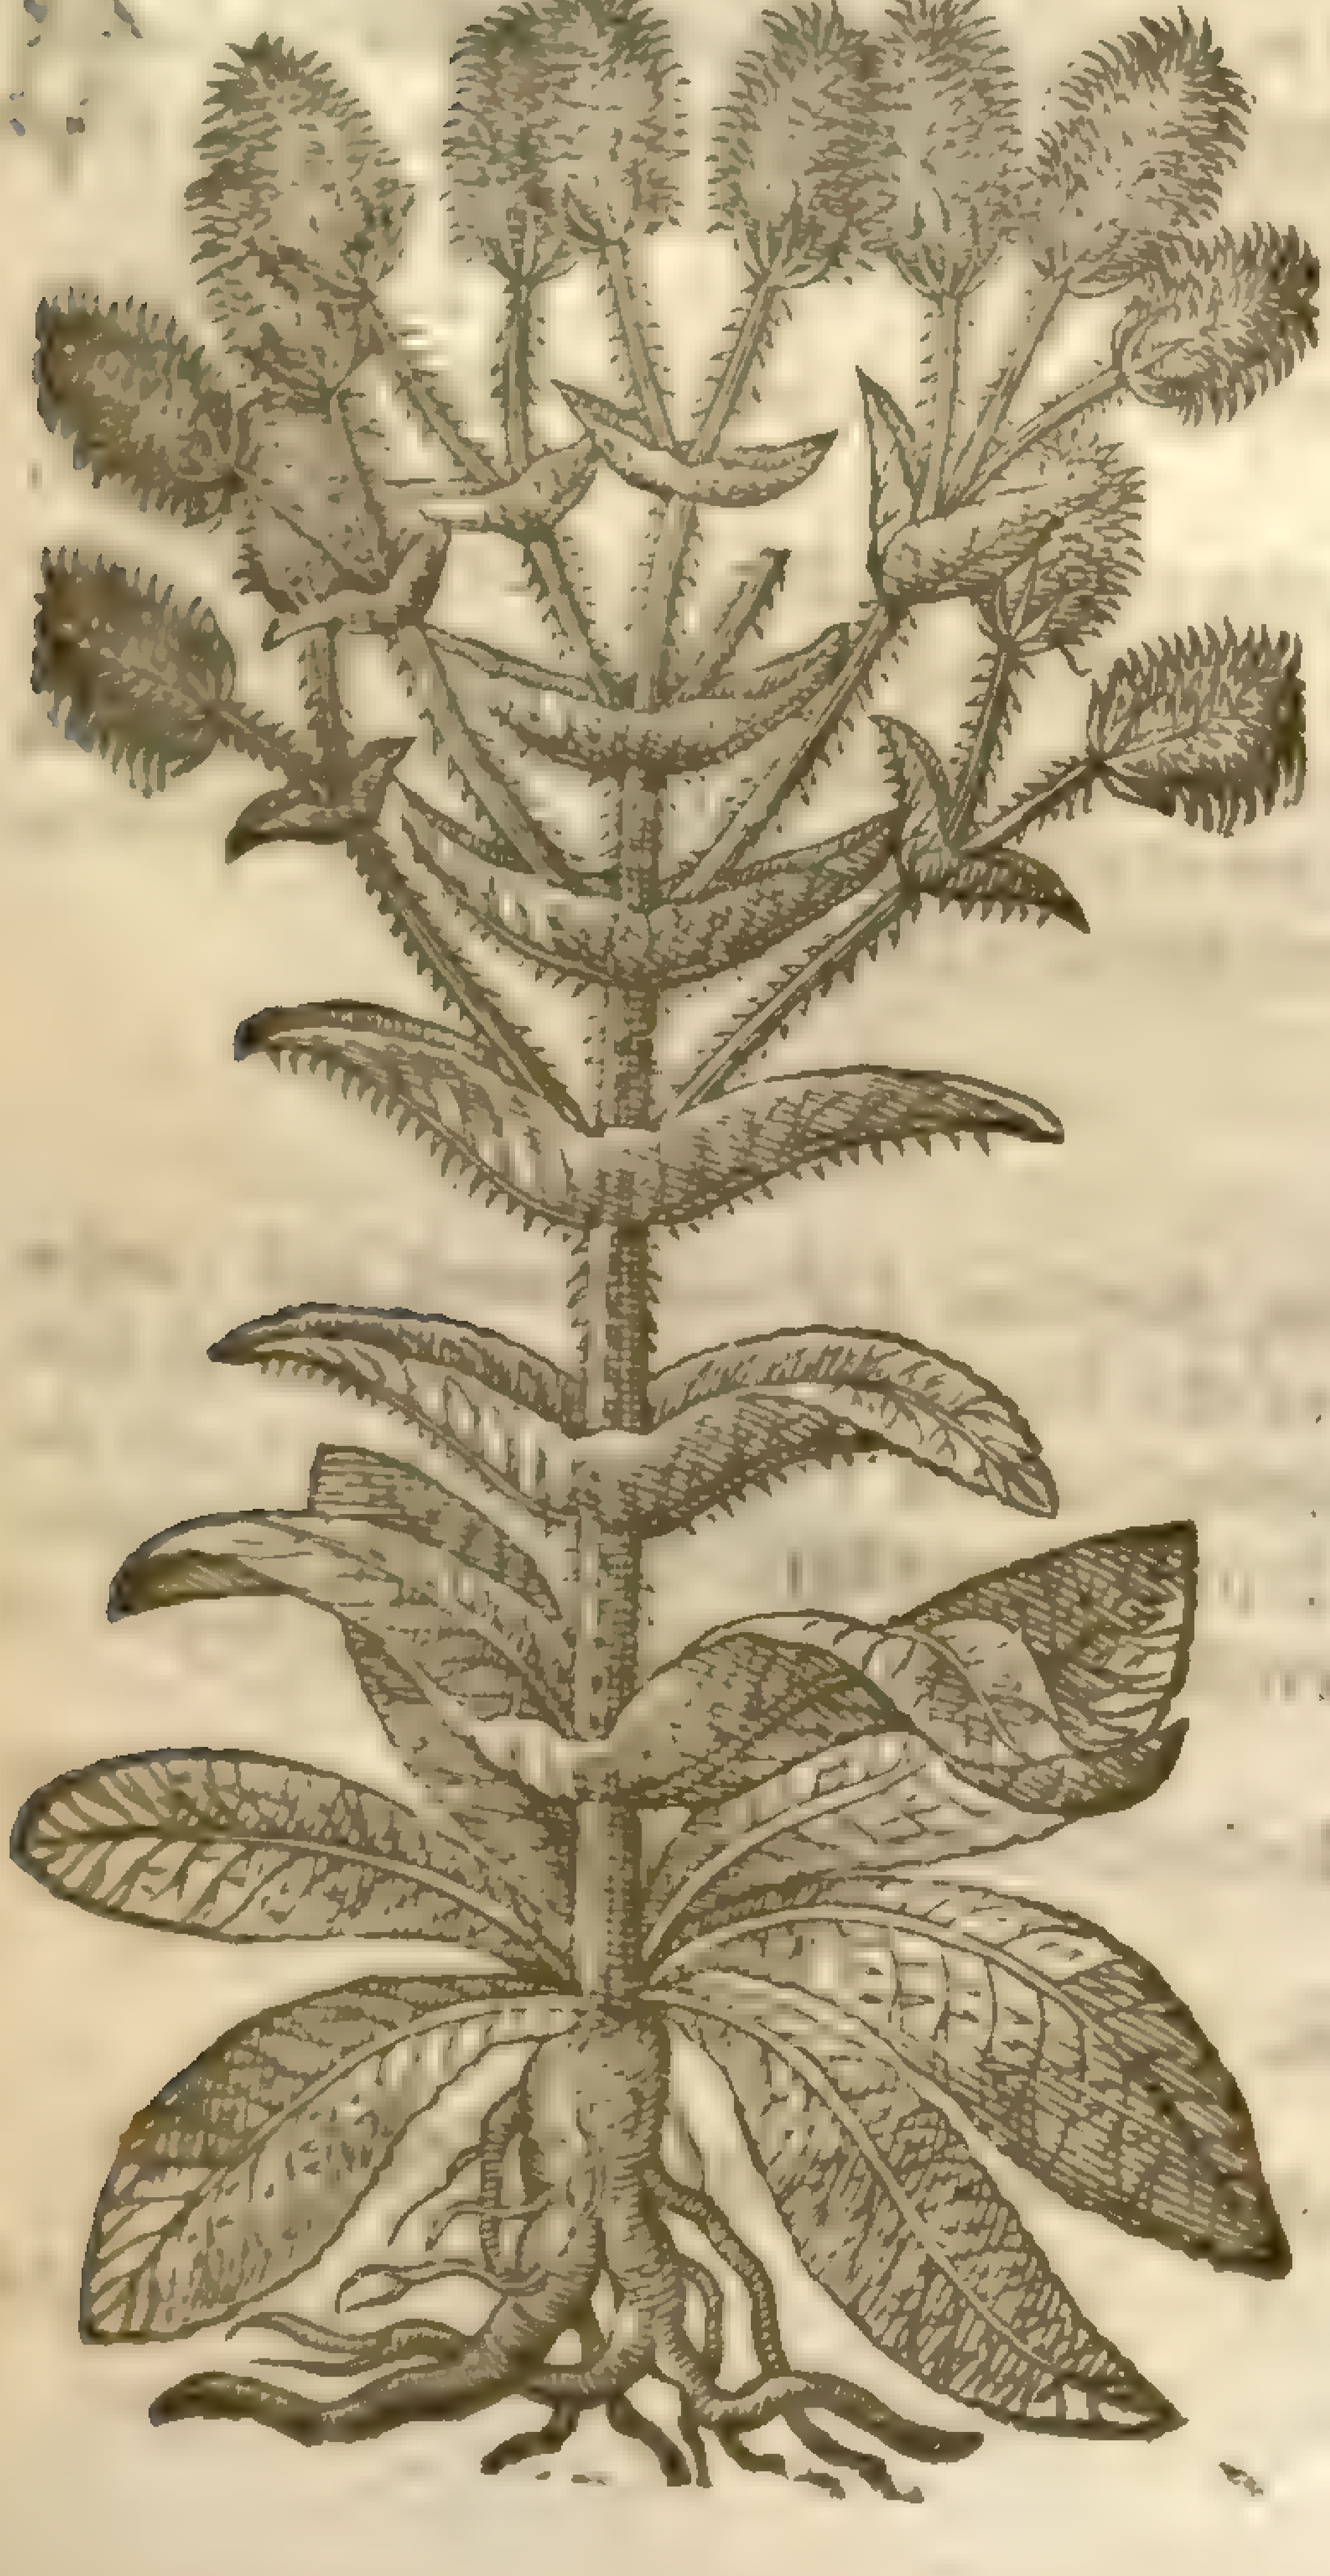
† There were formerly three figures and deſcriptions in this chapter, and all of them out of the 14. and 15. chapter of the fifth booke, and fifth *Pemptas* of *Dodonæus*, but the firſt and ſecond figures were both of the firſt deſcribed, the third figure was of the *Acanthium peregrinum* of *Tabernamontanus*, which *Bauhine* knowes not what to make of, but I thinke it was drawne for, and (if the tuberous clogs of the roots were ſomewhat large) might very well ſerue for the *Cirſium maximum Aſphodeli radice*, whoſe figure as I drew it from the plant I will hereafter giue you: the third deſcription was of the *Iacea maior lutea*, deſcribed in the third place of the 249. Chap. pag. 727.

CHAP. 487. *Of Teaſels.*

¶ *The Kindes.*

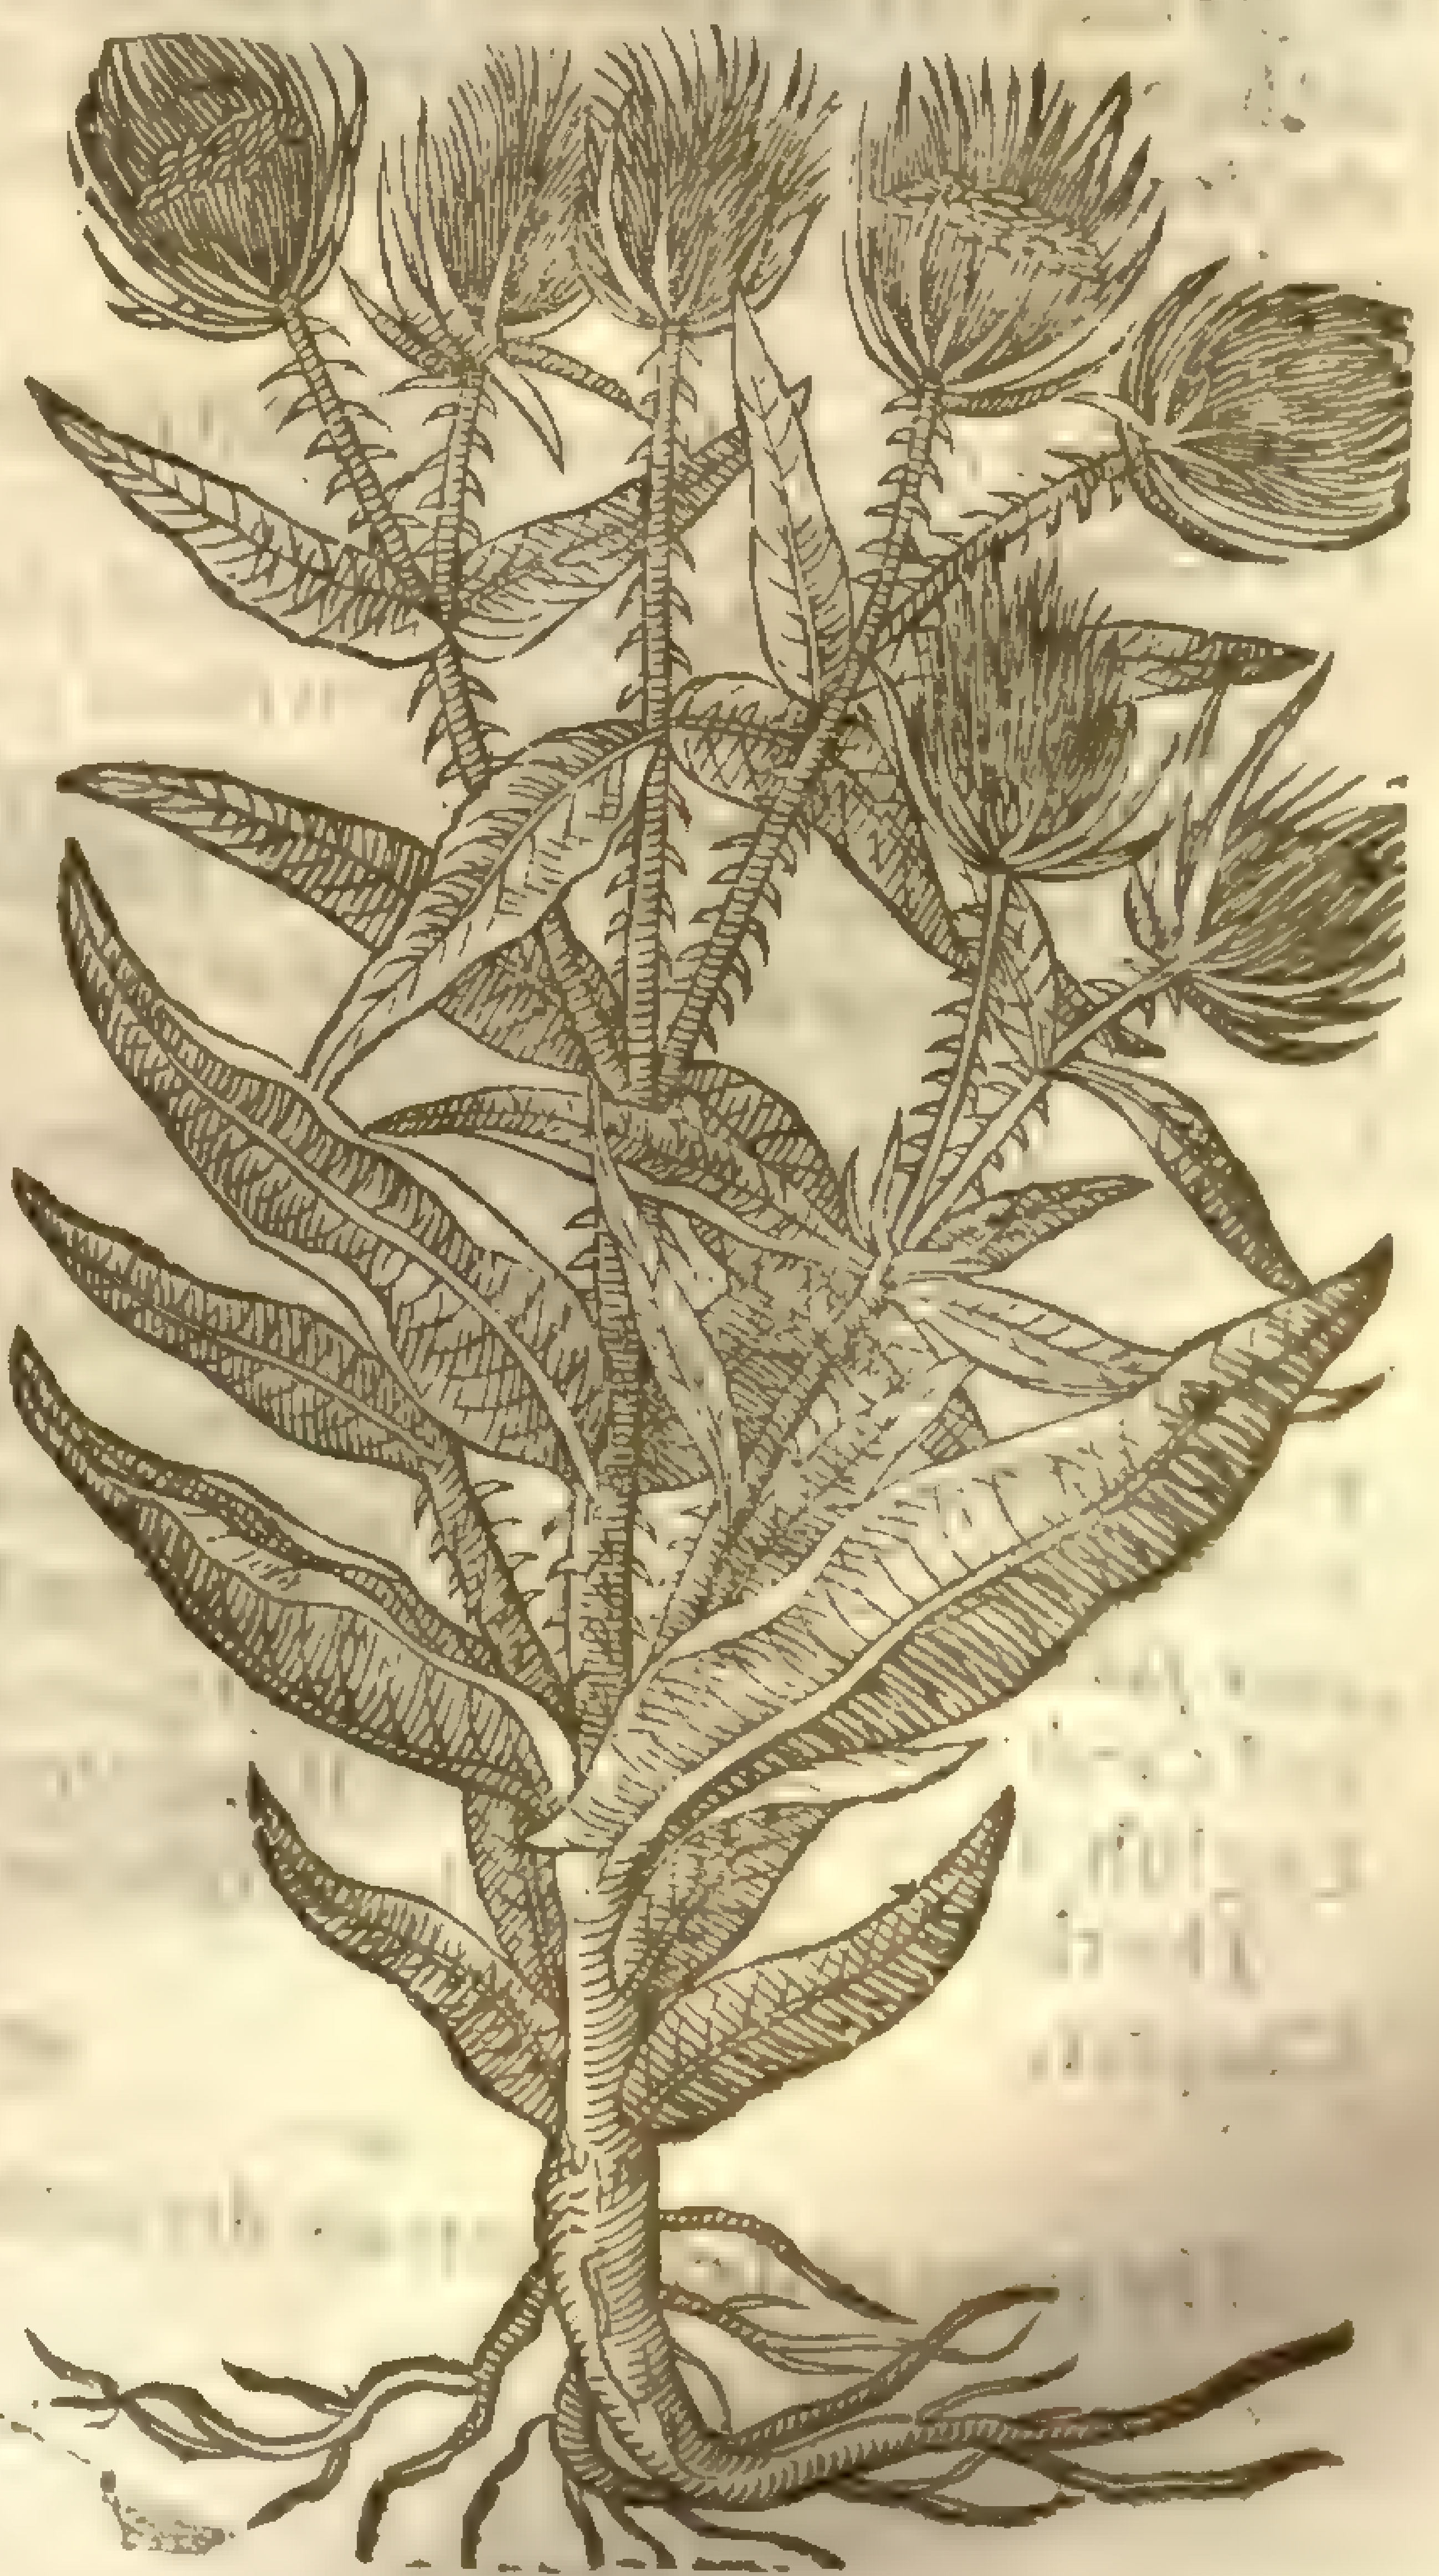
Ovrage hath ſet downe two kindes of Teaſels: the tame, and the wilde. Theſe differ not ſaue onely in the husbanding; for all things that are planted and manured doe more flouriſh, and become for the moſt part fitter for mans vſe.

1 *Dipſacus ſatiuus.*
Garden Teaſell.

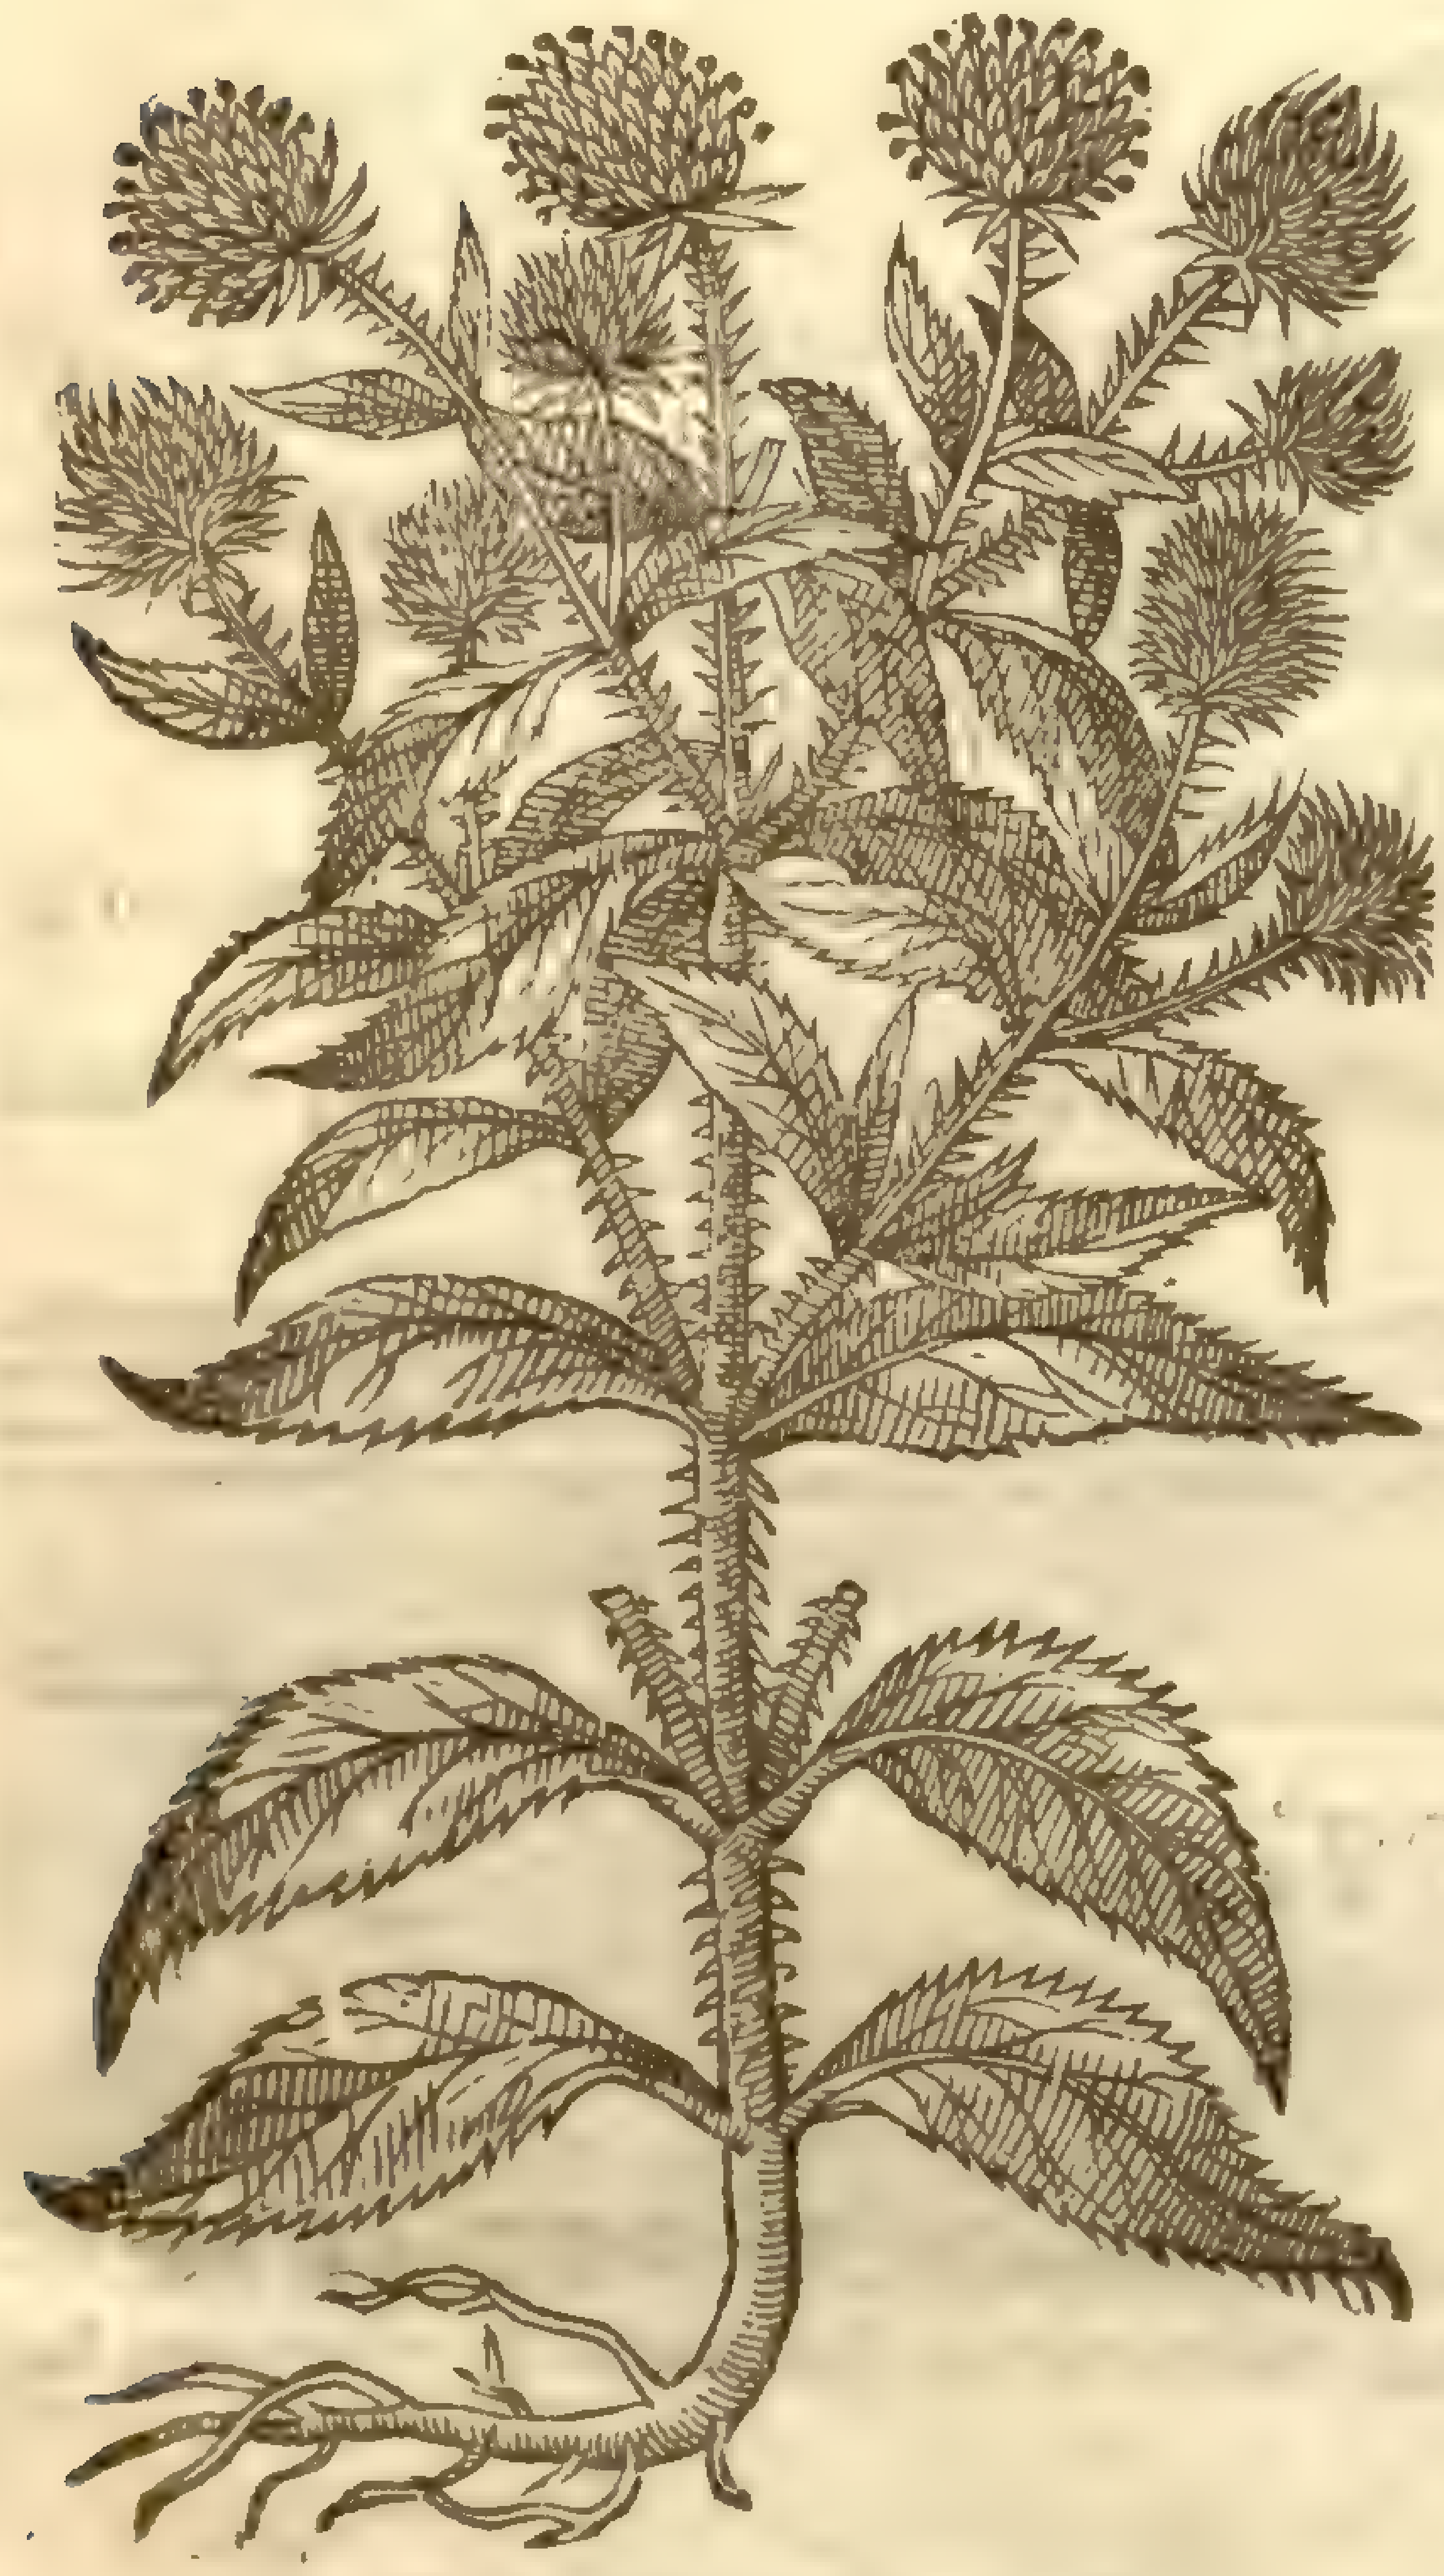


2 *Dipſacus ſylueſtris.*
Wilde Teaſell.

D. [illegible]



‡ 3 *Dipſacus minor, ſiue Virga paſtoris.*
Shepheards rod.



¶ *The Deſcription.*

1 GArden Teaſell is alſo of the numbe of the Thiſtles; it bringeth forth ſtalke that is ſtraight, very long iointed, and ful of prickles: the leaues grow forth of the ioynts by couples, not onely oppoſite o ſet one right againſt another, but alſo compa ſing the ſtalke about, and faſtened together; an ſo faſtened, that they hold dew and raine wate in manner of a little baſon: theſe be long, of a light greene colour, and like to thoſe of Lettice, but full of prickles in the edges, and haue on the outſide all alongſt the ridge ſtiffer prickles: on the tops of the ſtalkes ſtand heads with ſharpe prickles like thoſe of the Hedge-hog, and crooking backward at the point like hookes: out of which heads grow little floures: The ſeed is like Fennell-ſeed, and in taſte bitter: the heads wax white when they grow old, and there are found in the midſt of them when they are cut, certaine little magots: the root is white, and of a meane length.

2 The ſecond kinde of Teaſell which is alſo a kinde of Thiſtle, is very like vnto the former, but his leaues are ſmaller and narrower: his floures of a purple colour, and the hooks of the Teaſell nothing ſo hard or ſharpe as the other, nor good for any vſe in dreſſing of cloath.

3 There is another kinde of Teaſell, being a wilde kinde thereof, and accounted among theſe Thiſtles, growing higher than the reſt of his kindes; but his knobbed heads are no bigger than a Nutmeg, in all other things elſe they are like to the other wilde kindes. ‡ This hath the lower leaues deeply cut in with one gaſh on each ſide at the bottome of the leafe, which little eares are omitted in the figure: the leaues alſo are leſſe than the former, and narrower at the ſetting on, and hold no water as the two former do: the whole plant is alſo much leſſe. ‡

¶ *The Place.*

The firſt called the tame Teaſell is ſowne in this country in gardens, to ſerue the vſe of Fulle and Clothworkers.

The ſecond kinde groweth in moiſt places by brookes, riuers, and ſuch like places.

The third I found growing in moiſt places in the high way leading from Braintree to Henningham caſtle in Eſſex, and not in any other place except here and there a plant vpon the high way from Much-Dunmow to London. ‡ I found it growing in great plenty at Edgecombe by Croydon, cloſe by the gate of the houſe of my much honoured friend Sir *Iohn Tunſtall.* ‡

¶ *The Time.*

Theſe floure for the moſt part in Iune and Iuly.

¶ *The Names.*

Teaſell is called in Greeke, Δίψακος, and likewiſe in Latine, *Dipſacus*, *Labrum Veneris*, and *Cardu Veneris*: it is termed *Labrum Veneris*, and *Lauer Lauacrum*, of the forme of the leaues made vp in faſhion of a baſon, which is neuer without water: they commonly call it *Virga paſtoris minor*, and *Carduus fullonum*: in high Dutch, 𝔎𝔞𝔯𝔡𝔢𝔫 𝔇𝔦𝔰𝔱𝔢𝔩𝔩: in low Dutch, 𝔎𝔞𝔢𝔯𝔡𝔢𝔫: in Spaniſh, *Cardencha* and *Cardo Penteador*: in Italian, *Diſſaco*, and *Cardo*: in French, *Chardon de foullon*, *Verge à bergier*: in Engliſh, Teaſell, Carde Teaſell, and Venus baſon.

The third is thought to be *Galedragon Plinÿ*: of which he hath written in his 27. booke, the tent Chapter.

¶ *The Temperature.*

The roots of theſe plants are dry in the ſecond degree, and haue a certaine clenſing faculty.

¶ Th

¶ *The Vertues.*

There is ſmall vſe of Teaſell in medicines: the heads (as we haue ſaid) are vſed to dreſſe woollen cloth with. A

Dioſcorides writeth, That the root being boyled in wine, and ſtamped till it is come to the ſubſtance of a ſalue, healeth chaps and fiſtulaes of the fundament, if it be applied thereunto; and that this medicine muſt bee reſerued in a box of copper, and that alſo it is reported to be good for all kindes of warts. B

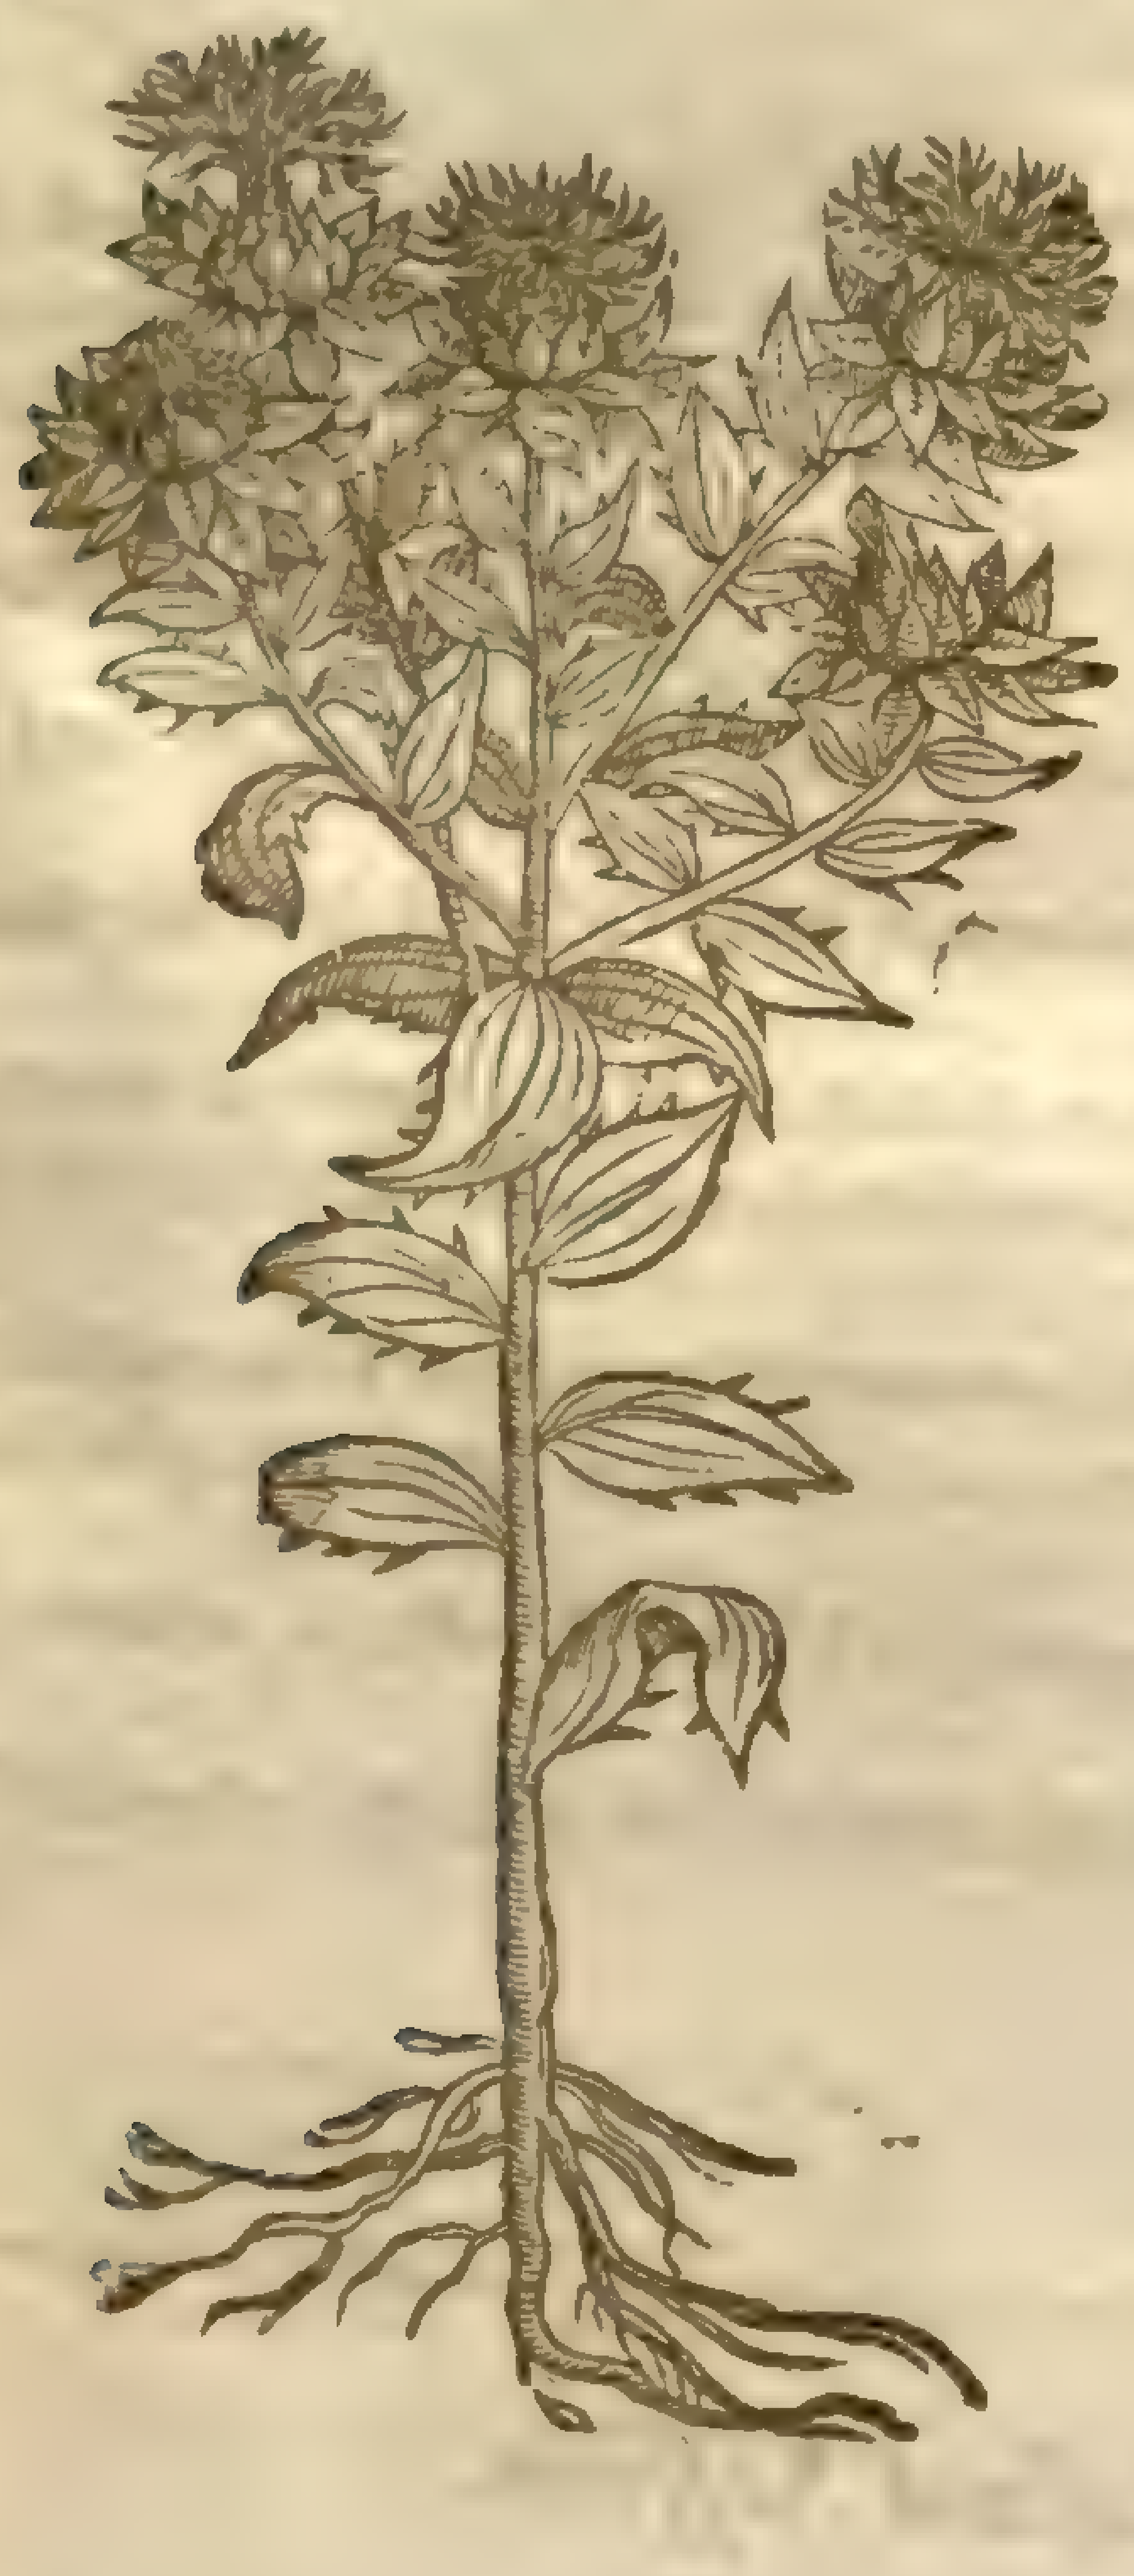
It is needleſſe here to alledge thoſe things that are added touching the little wormes or magots found in the heads of the Teaſell, and which are to be hanged about the necke, or to mention the like thing that *Pliny* reporteth of Galedragon: for they are nothing elſe but moſt vaine and trifling toies, as my ſelfe haue proued a little before the impreſſion hereof, hauing a moſt grieuous ague, and of long continuance: notwithſtanding Phyſicke charmes, theſe worms hanged about my neck, ſpiders put into a walnut ſhell, and diuers ſuch fooliſh toies that I was conſtrained to take by fantaſticke peoples procurement, notwithſtanding, I ſay, my helpe came from God himſelfe, for theſe medicines and all other ſuch things did me no good at all. C

† The figure which formerly was put into the ſecond place, was of the *Dipſacus ſecundus* of *Tabernamontanus*, which differs from our common one, in that the leaues are deeply diuided, or cut in on their edges.

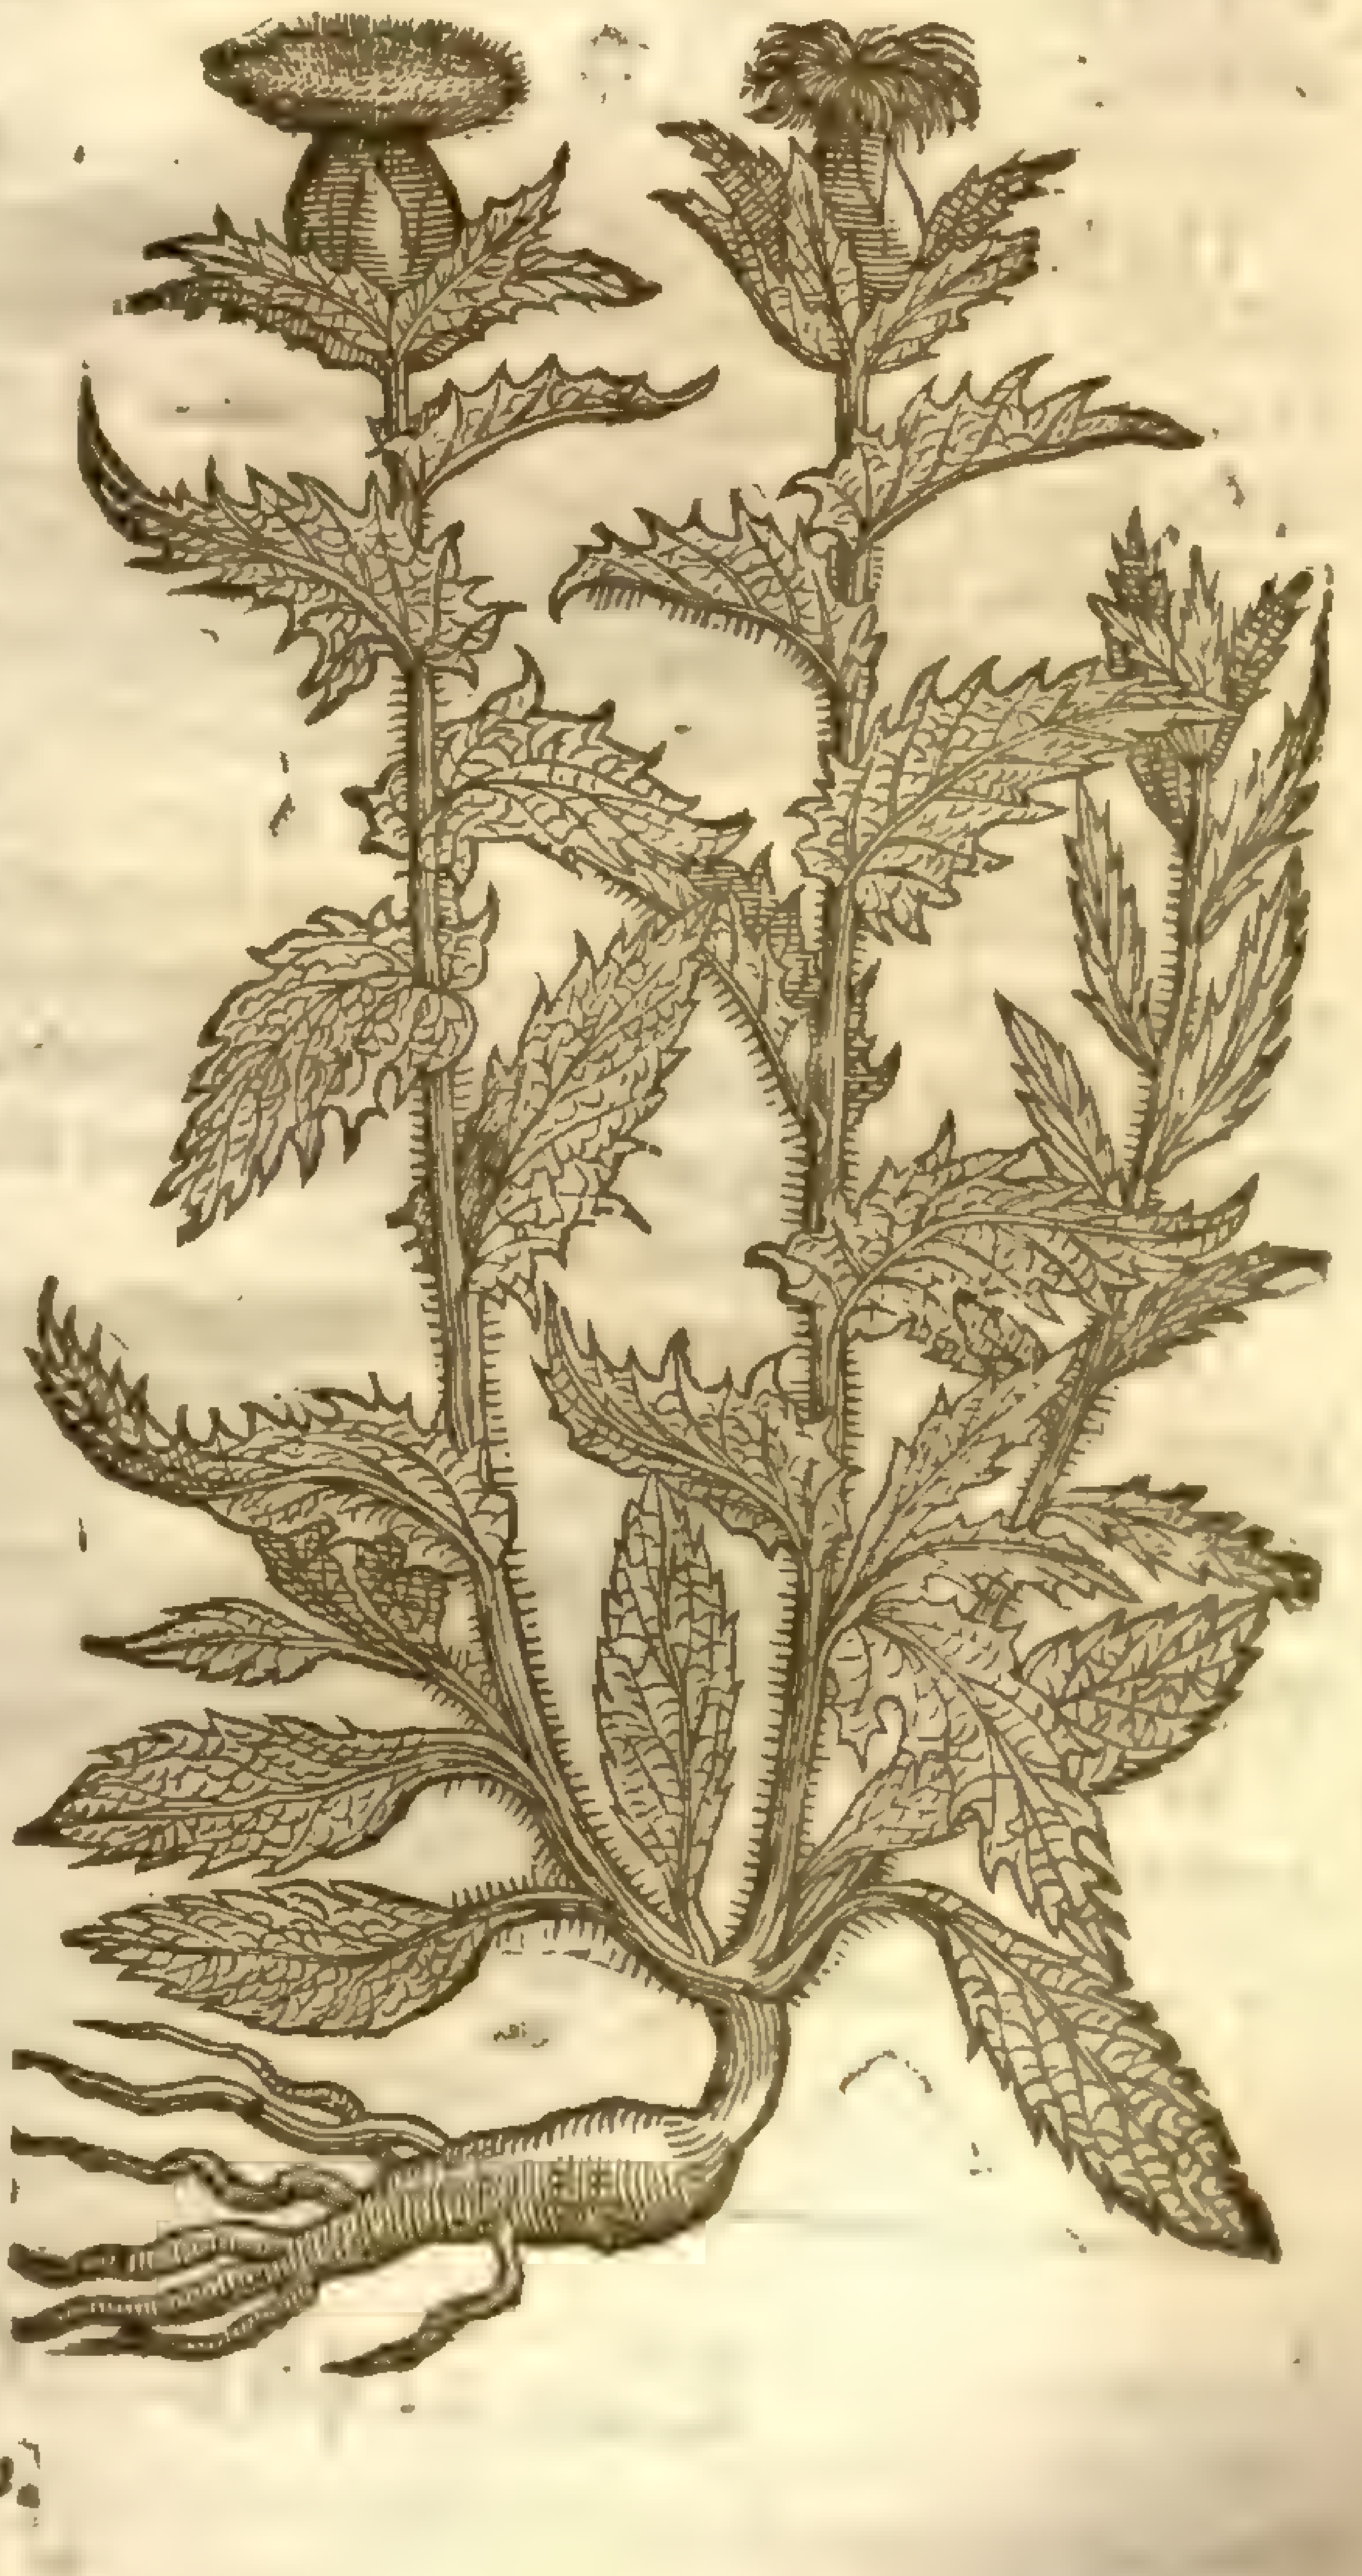
CHAP. 488. *Of Baſtard Saffron.*

Carthamus [illegible]

‡ 1 *Carthamus ſiue Cnicus.*
Baſtard Saffron.



† 2 *Cnicus alter cæruleus.*
Blew floured Baſtard Saffron.



¶ *The Deſcription.*

1 CNicus, called alſo baſtard Saffron, which may very wel be reckoned among the Thiſtles, riſeth vp with a ſtalke of a cubite and a halfe high, ſtraight, ſmooth, round, hard, and woody, & branched at the top: it is defended with long leaues, ſomthing broad, ſharp

pointed; and with prickles in the edges; from the tops of the ſtalks ſtand out little heads or knops of the bigneſſe of an Oliue or bigger, ſet with many ſharp pointed and prickly ſcales: out of which come forth floures like threds, cloſely compact, of a deepe yellow ſhining colour, drawing neere to the colour of Saffron: vnder them are long ſeeds, ſmooth, white, ſomewhat cornered, bigger than a Barly corne, the huske whereof is ſomething hard, the inner pulpe or ſubſtance is fat, white, ſweet in taſte: the root ſlender and vnprofitable.

2 There is alſo another kinde of Baſtard Saffron, that may very well be numbred amongſt the kindes of Thiſtles, and is very like vnto the former, ſauing that his flockie or threddy floures are of a blew colour: the root is thicker, and the whole plant is altogether more ſharpe in prickles: the ſtalkes are alſo more creſted and hairy.

¶ *The Place.*

It is ſowne in diuers places of Italy, Spaine, and France, both in Gardens and in Fields: *Pliny lib.* 25. *cap.* 15. ſaith, that in the raigne of *Veſpaſian* this was not knowne in Italy: being in Ægypt onely of good account, and that they vſed to make oyle of it, and not meat.

¶ *The Time.*

The floures are perfected in Iuly and Auguſt: the root after the ſeed is ripe, the ſame yeare it is ſowne withereth away.

¶ *The Names.*

It is called in Greeke, κνίκος: in Latine alſo *Cnicus*, or *Cnecus*: in ſhops, *Cartamus*, or *Carthamum*: of diuers, *Crocus hortenſis*, and *Crocus Saracenicus*: in Italian, *Zaffarano Saracineſco*, and *Zaffarano ſaluatico*: in Spaniſh, *Alaſor*, and *Semente de papagaios*: in high Dutch, **Wilden Zaffron**: in French, *Saffran Sauuage*: in Engliſh, Baſtard Saffron: of ſome, Mocke Saffron, and Saffron D'orte, as though you ſhould ſay, Saffron *de horto*, or of the garden. *Theophraſtus* and *Pliny* call it *Cnicus vrbana*, and *ſatiua*, or tame and garden baſtard Saffron, that it may differ from *Atractylis*, which they make to be a kinde of *Cnicus ſylueſtris*, or wilde Baſtard Saffron, but rather a *ſpecies* of the Holy Thiſtle.

¶ *The Temperature.*

We vſe, ſaith *Galen*, the ſeed only for purgations: it is hot, and that in the firſt degree, as *Meſues* writeth.

¶ *The Vertues.*

A The juyce of the ſeed of baſtard Saffron bruiſed and ſtrained into honied water or the broth of a chicken, and drunke, prouoketh to the ſtoole, and purgeth by ſiege ſlimy flegme, and ſharp humors: Moreouer it is good againſt the collicke, and difficulty of taking breath, the cough, and ſtopping of the breſt, and is ſingular againſt the dropſie.

B The ſeed vſed as aforeſaid, and ſtrained into milke, cauſeth it to curdle and yeeld much cruds, and maketh it of great force to looſe and open the belly.

C The floures drunke with honied water open the liuer, and are good againſt the jaundiſe: and the floures are good to colour meat in ſtead of Saffron.

D The ſeed is very hurtfull to the ſtomacke, cauſing deſire to vomit, and is of hard ſlow digeſtion, remaining long in the ſtomacke and entrails.

E Put to the ſame ſeed things comfortable to the ſtomacke, as Anniſe ſeed, Galingale, or Maſtick, Ginger, *Sal gemma*, and it ſhall not hurt the ſtomacke at all, and the operation thereof ſhall be the more quicke and ſpeedy.

F Of the inward pulpe or ſubſtance hereof is made a moſt famous and excellent compoſition to purge water with, commonly called *Diacarthamon*, a moſt ſingular and effectuall purgation for thoſe that haue the dropſie.

G The perfect deſcription hereof is extant in *Guido* the Surgion, in his firſt Doctrine, and the firſt Tractat.

H We haue not read, or had in vſe that Baſtard Saffron with the blew floure, and therefore can ſay nothing of his vertues.

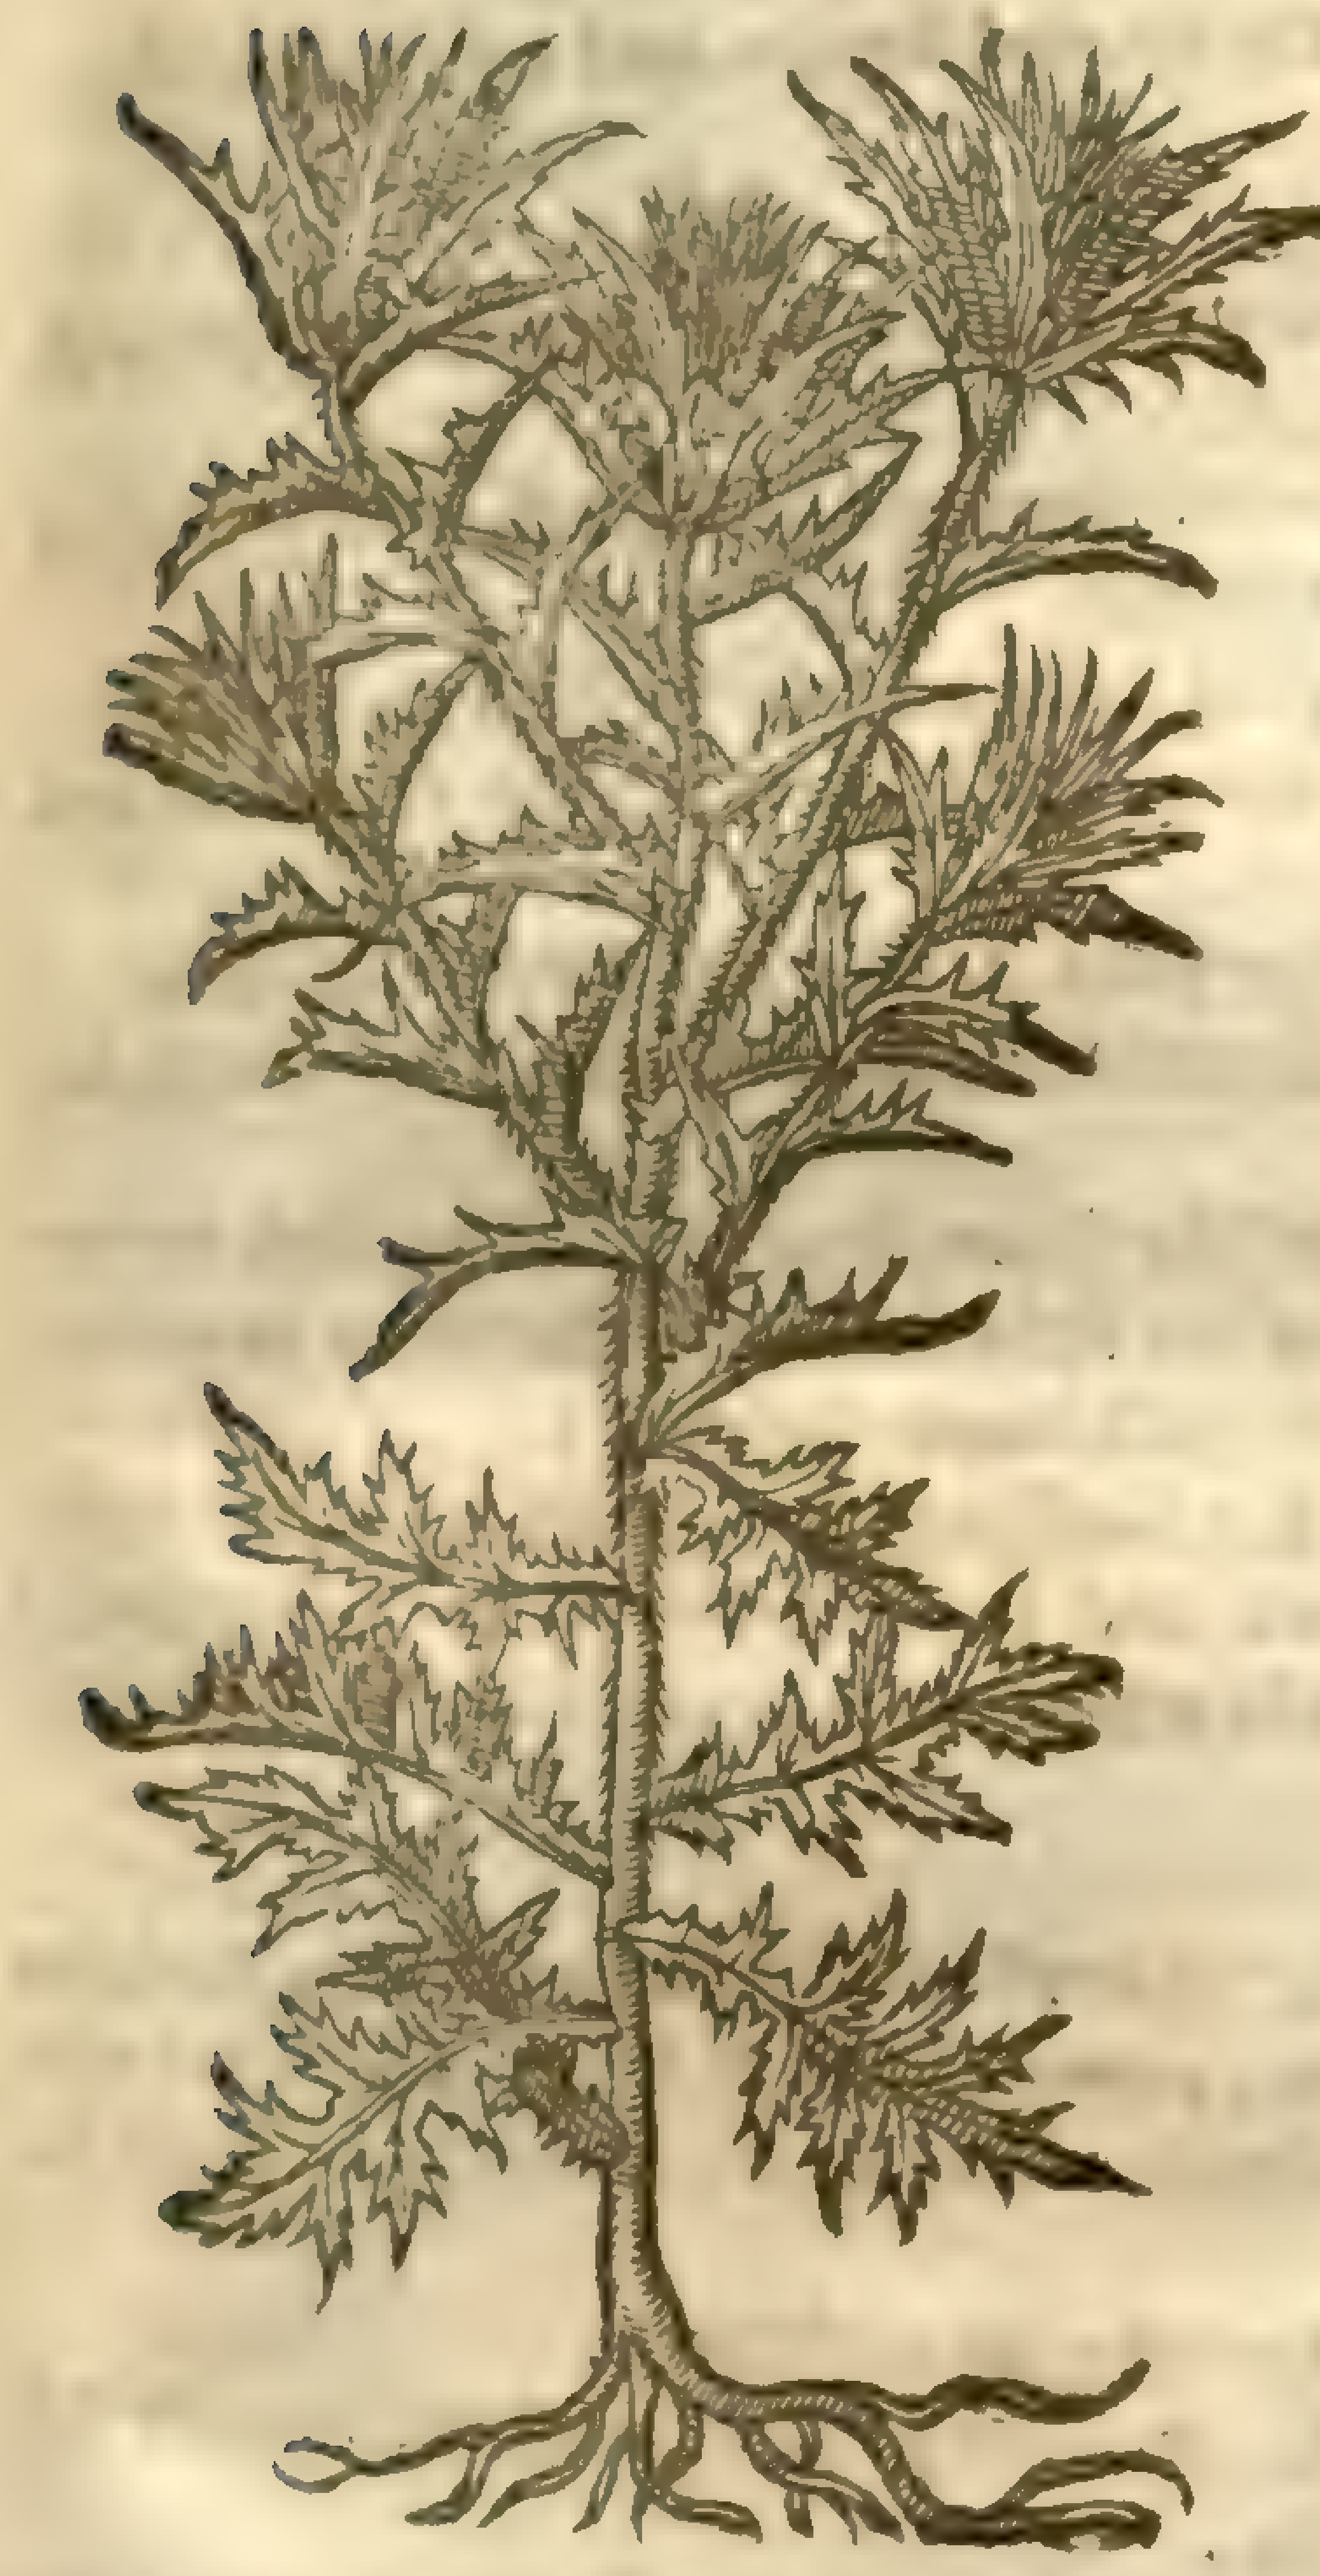
† The figure formerly was of the *Cnicus cæruleus*.

Chap. 489. *Of Wilde Baſtard Saffron.*

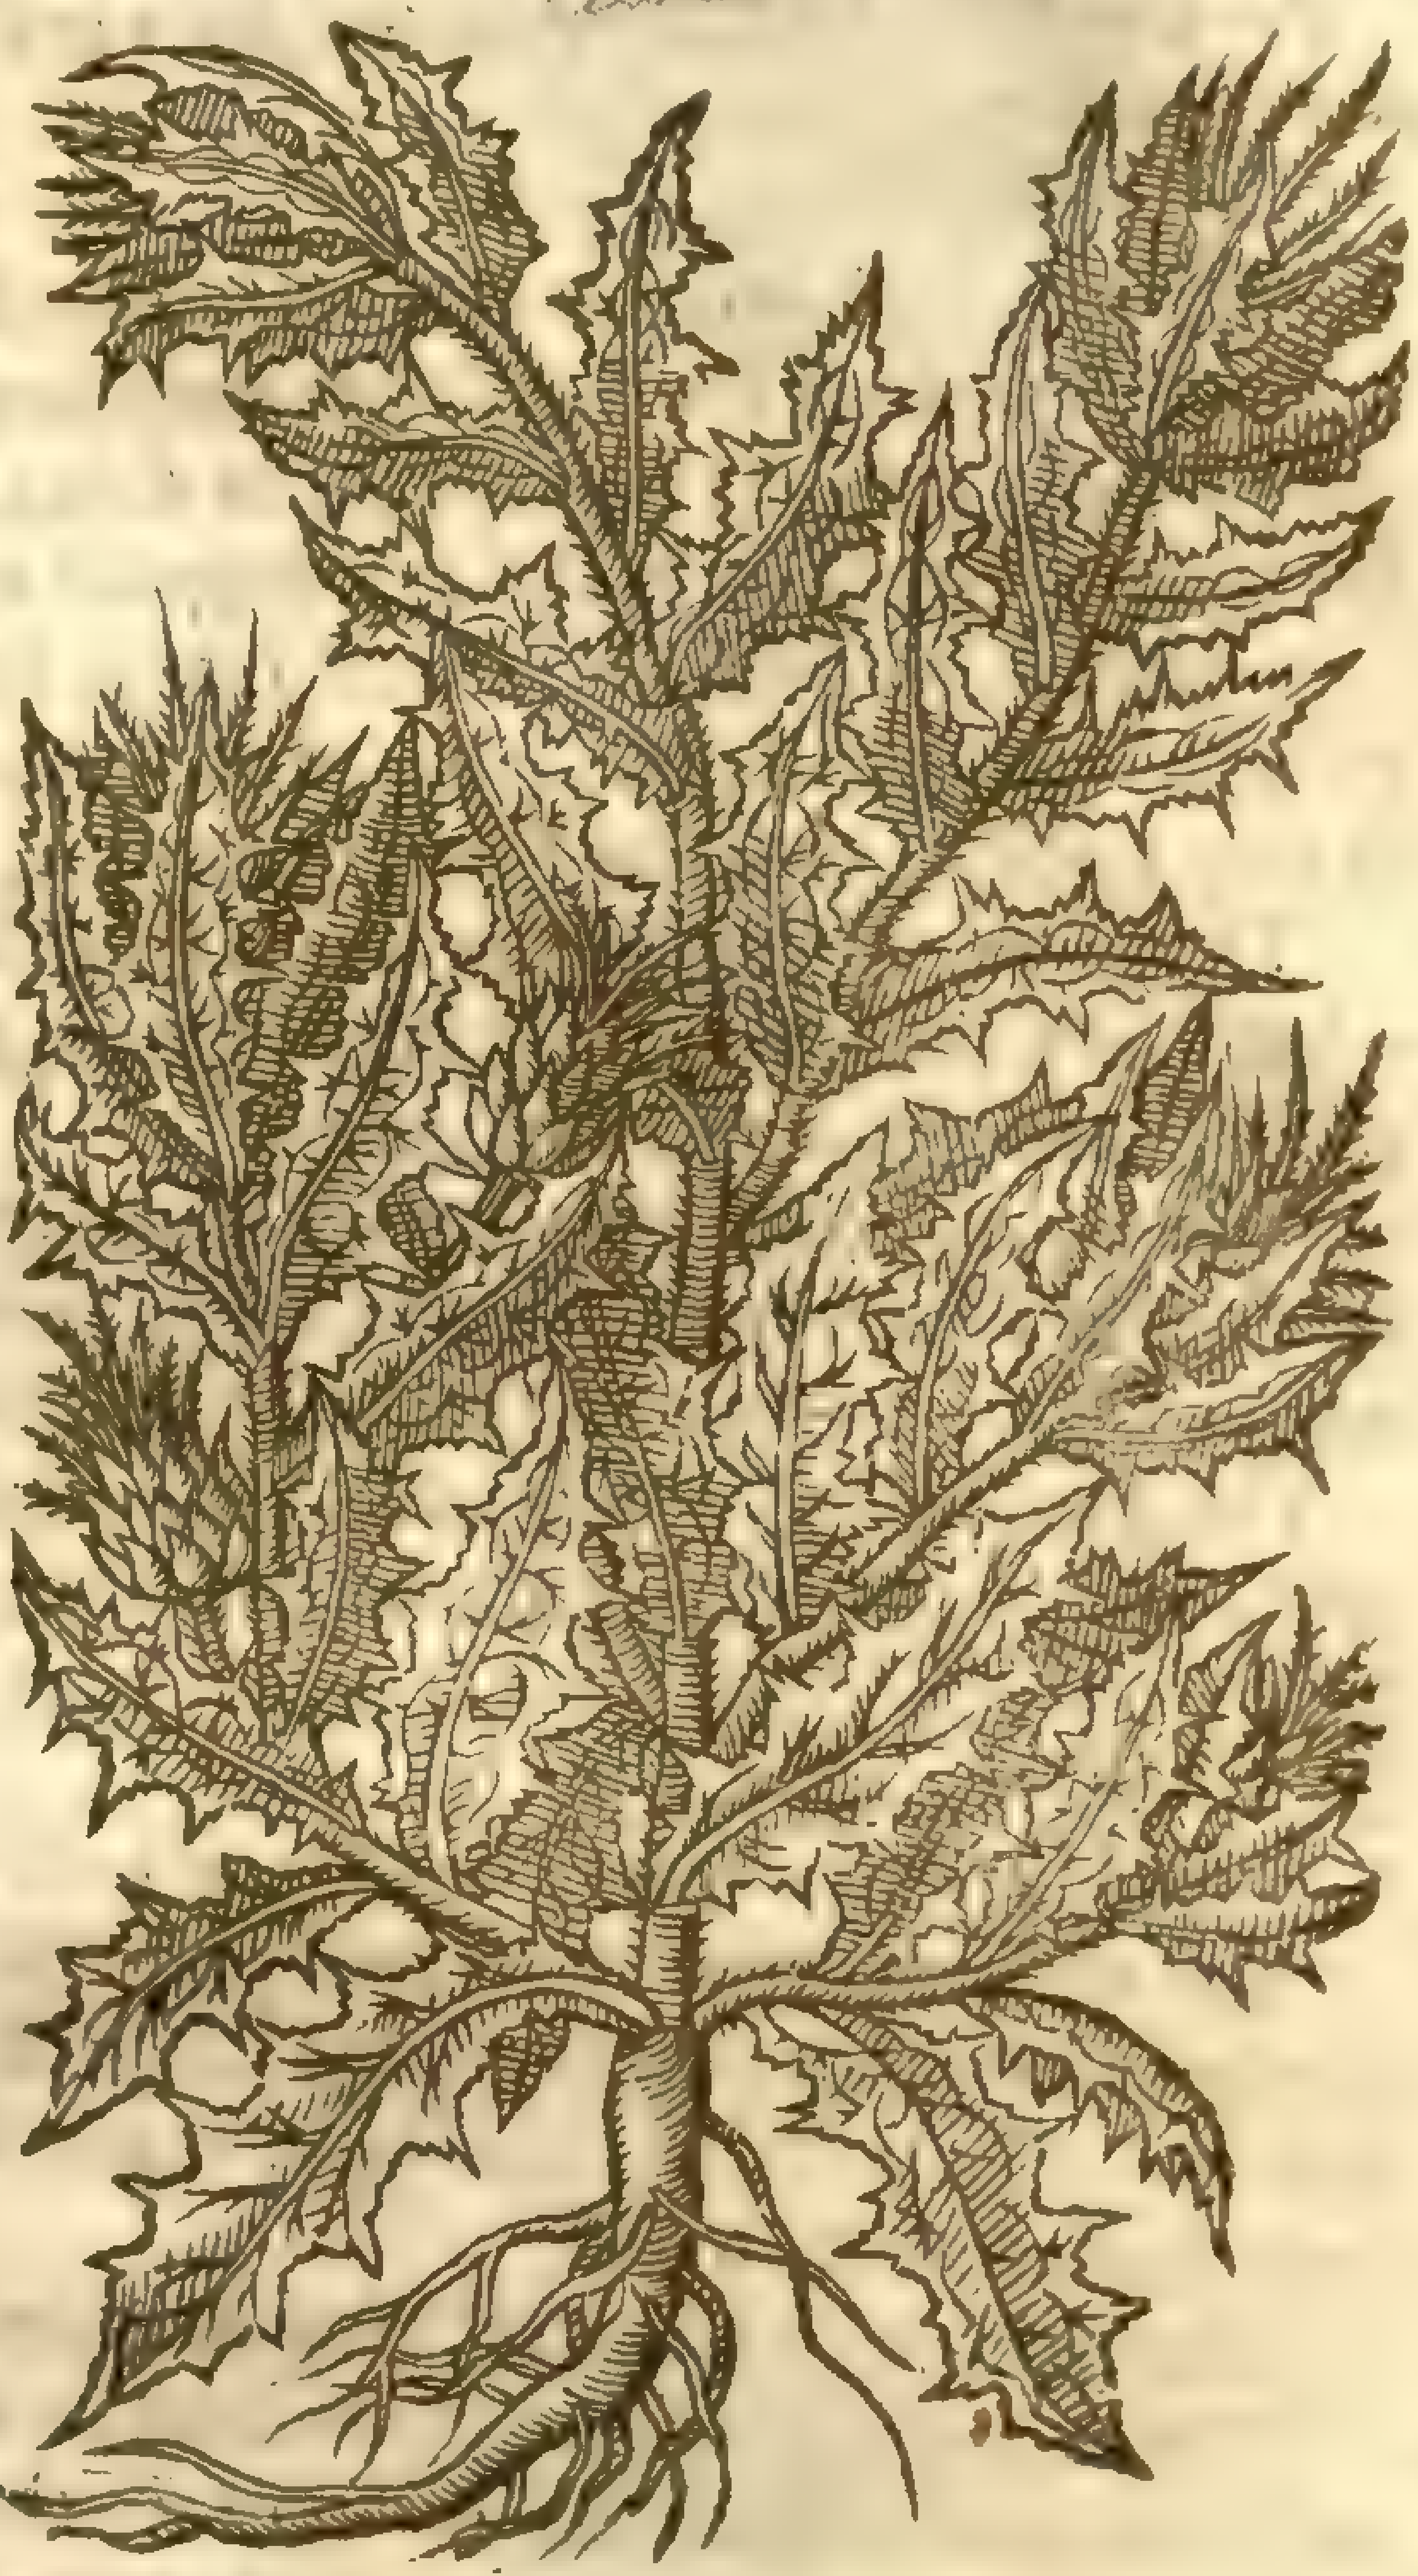
¶ *The Deſcription.*

1 A*Tractylis*, otherwiſe called wilde Baſtard Saffron, bringeth forth a ſtraight and firme ſtalke, very fragile or brittle, diuided at the toppe into certaine branches: it hath long,

long jagged leaues ſet with prickles: the heads on the tops of the branches are very full of ſharpe prickles: out of which grow flours all of threds, like thoſe of baſtard Saffron, but they are of a light yellow colour, and ſometimes purple: the ſeed is ſomwhat great, browne, and bitter, otherwiſe like that of baſtard Saffron: the root is of a meane bigneſſe.



1 *Atractylis.*
Wilde Baſtard Thiſtle.



2 *Carduus Benedictus.*
The Bleſſed Thiſtle.

Centaurea benedicta

2 The ſtalkes of *Carduus Benedictus*, or Bleſſed Thiſtle, are round, rough and pliable, and being parted into diuers branches, do lie flat on the ground: the leaues are jagged round about, and full of harmleſſe prickles in the edges: the heads on the tops of the ſtalkes are ſet with prickles, and inuironed with ſharpe prickling leaues, out of which ſtandeth a yellow floure: the ſeed is long, and ſet with haires at the top like a beard: the root is white, and parted into ſtrings: the whole herb, leaues and ſtalkes, and alſo the heads, are couered with a ſoft and thin downe.

¶ *The Place.*

Atractylis groweth in Candie, and in diuers prouinces and Iſlands of Greece, and alſo in Languedocke: and is an herbe growing in our Engliſh gardens.

Carduus Benedictus is found euery where in Lemnos, an Iſland of the Midland Sea, in Champion grounds, as *Petrus Bellonius* teſtifieth: it is diligently cheriſhed in Gardens in theſe Northerne parts.

¶ *The Time.*

Atractylis is very late before it floureth and ſeedeth.

Carduus Benedictus floureth in Iuly and Auguſt, at which time it is eſpecially to be gathered for Phyſicke matters.

¶ *The Names.*

Atractylis is called in Greeke, Ἀτρακτυλὶς ἀγρία: of the Latines likewiſe, *Atractylis*, and *Cnycus ſylueſtris*; and becauſe women in the old time were wont to vſe the ſtiffe ſtalke therof *pro fuſo aut colo*, for a ſpindle or a diſtaffe, it is named *Fuſus agreſtis*, and *Colus Ruſtica*; which thing *Petrus Bellonius* reporteth the women in Greece do alſo euen at this day; who call *Atractylis* by a corrupt name *Ardactyla*; diuers of the later herbariſts name it *Sylueſtris Carthamus*: that is to ſay in low Dutch, **wilden Carthamus**: and in Engliſh, wilde Baſtard Saffron, or Spindle Thiſtle.

Bleſſed Thiſtle is called in Latine euery where *Carduus Benedictus*, and in ſhops by a compound word, *Cardo-benedictus*: it is moſt plaine, that it is *Species Atractylidis*, or a kind of wilde baſtard Saffron: it is called *Atractylis hirſutior*, hairie wilde baſtard Saffron: *Valerius Cordus* nameth it *Ca ſupinus*: it is called in high Dutch, **Beſeegnete diſtell, Kardo Benedict**: the later name whereof is known to the Low Country-men: in Spaniſh it is called *Cardo Sancto*: in French, *Chardon beniſt*, or *beneiſt*: in the Iſle Lemnos, *Garderacantha*: in Engliſh, Bleſſed Thiſtle, but more commonly by the Latine name *Carduus Benedictus*.

¶ *The Temperature.*

Wilde baſtard Saffron doth dry and moderately digeſt, as *Galen* witneſſeth.

As *Carduus benedictus* is better, ſo is it alſo hot and dry in the ſecond degree, and withall clenſing and opening.

¶ *The Vertues.*

A The tops, ſeed, and leaues of *Atractylis*, ſaith *Dioſcorides*, being beaten and drunke with pepper and wine, are a remedy for thoſe that are ſtung of the Scorpion.

B Bleſſed Thiſtle taken in meat or drinke, is good for the ſwimming and giddineſſe of the head, it ſtrengthneth memory, and is a ſingular remedy againſt deafeneſſe.

C The ſame boiled in wine and drunke hot, healeth the griping paines of the belly, killeth and expelleth wormes, cauſeth ſweat, prouoketh vrine, and driueth out grauell; clenſeth the ſtomacke, and is very good againſt the Feuer quartaine.

D The juyce of rhe ſaid *Carduus* is ſingular good againſt all poyſon, as *Hierome Bocke* witneſſeth, in what ſort ſoeuer the medicine be taken; and helpeth the inflammation of the liuer, as reporteth *Ioachimus Camerarius* of Noremberg.

E The pouder of the leaues miniſtred in the qnantitie of halfe a dram, is very good againſt the peſtilence, if it be receiued within 24. houres after the taking of the ſickeneſſe, and the party ſweat vpon the ſame: the like vertue hath the wine, wherein the herbe hath beene ſodden.

F The greene herb pounded and laid to, is good againſt all hot ſwellings, as *Eryſipelas*, plague-ſores, and botches, eſpecially thoſe that proceed of the peſtilence, and is alſo good to be laid vpon the bitings of mad dogs, ſerpents, ſpiders, or any venomous beaſts whatſoeuer; and ſo is it likewiſe if it be inwardly taken.

G The diſtilled water thereof is of leſſe vertue.

H It is reported that it likewiſe cureth ſtubborne and rebellious vlcers, if the decoction be taken for certaine daies together; and likewiſe *Arnoldus de Villa noua* reporteth, that if it be ſtamped with Barrows greaſe to the form of an vnguent, adding thereto a little wheat floure, it doth the ſame, being applied twice a day.

I The herbe alſo is good being ſtamped and applied, and ſo is the juyce thereof.

K The extraction of the leaues drawne according to Art, is excellent good againſt the French diſeaſe, and quartaine ague, as reporteth the foreſaid *Camerarius*.

L The ſame Author reporteth, that the diſtilled water taken with the water of Louage, and Dodder, helpeth the ſauce-flegme face, if it be drunke for certaine daies together.

Chap. 490.

Of Thiſtle vpon Thiſtle, and diuers other Wilde Thiſtles.

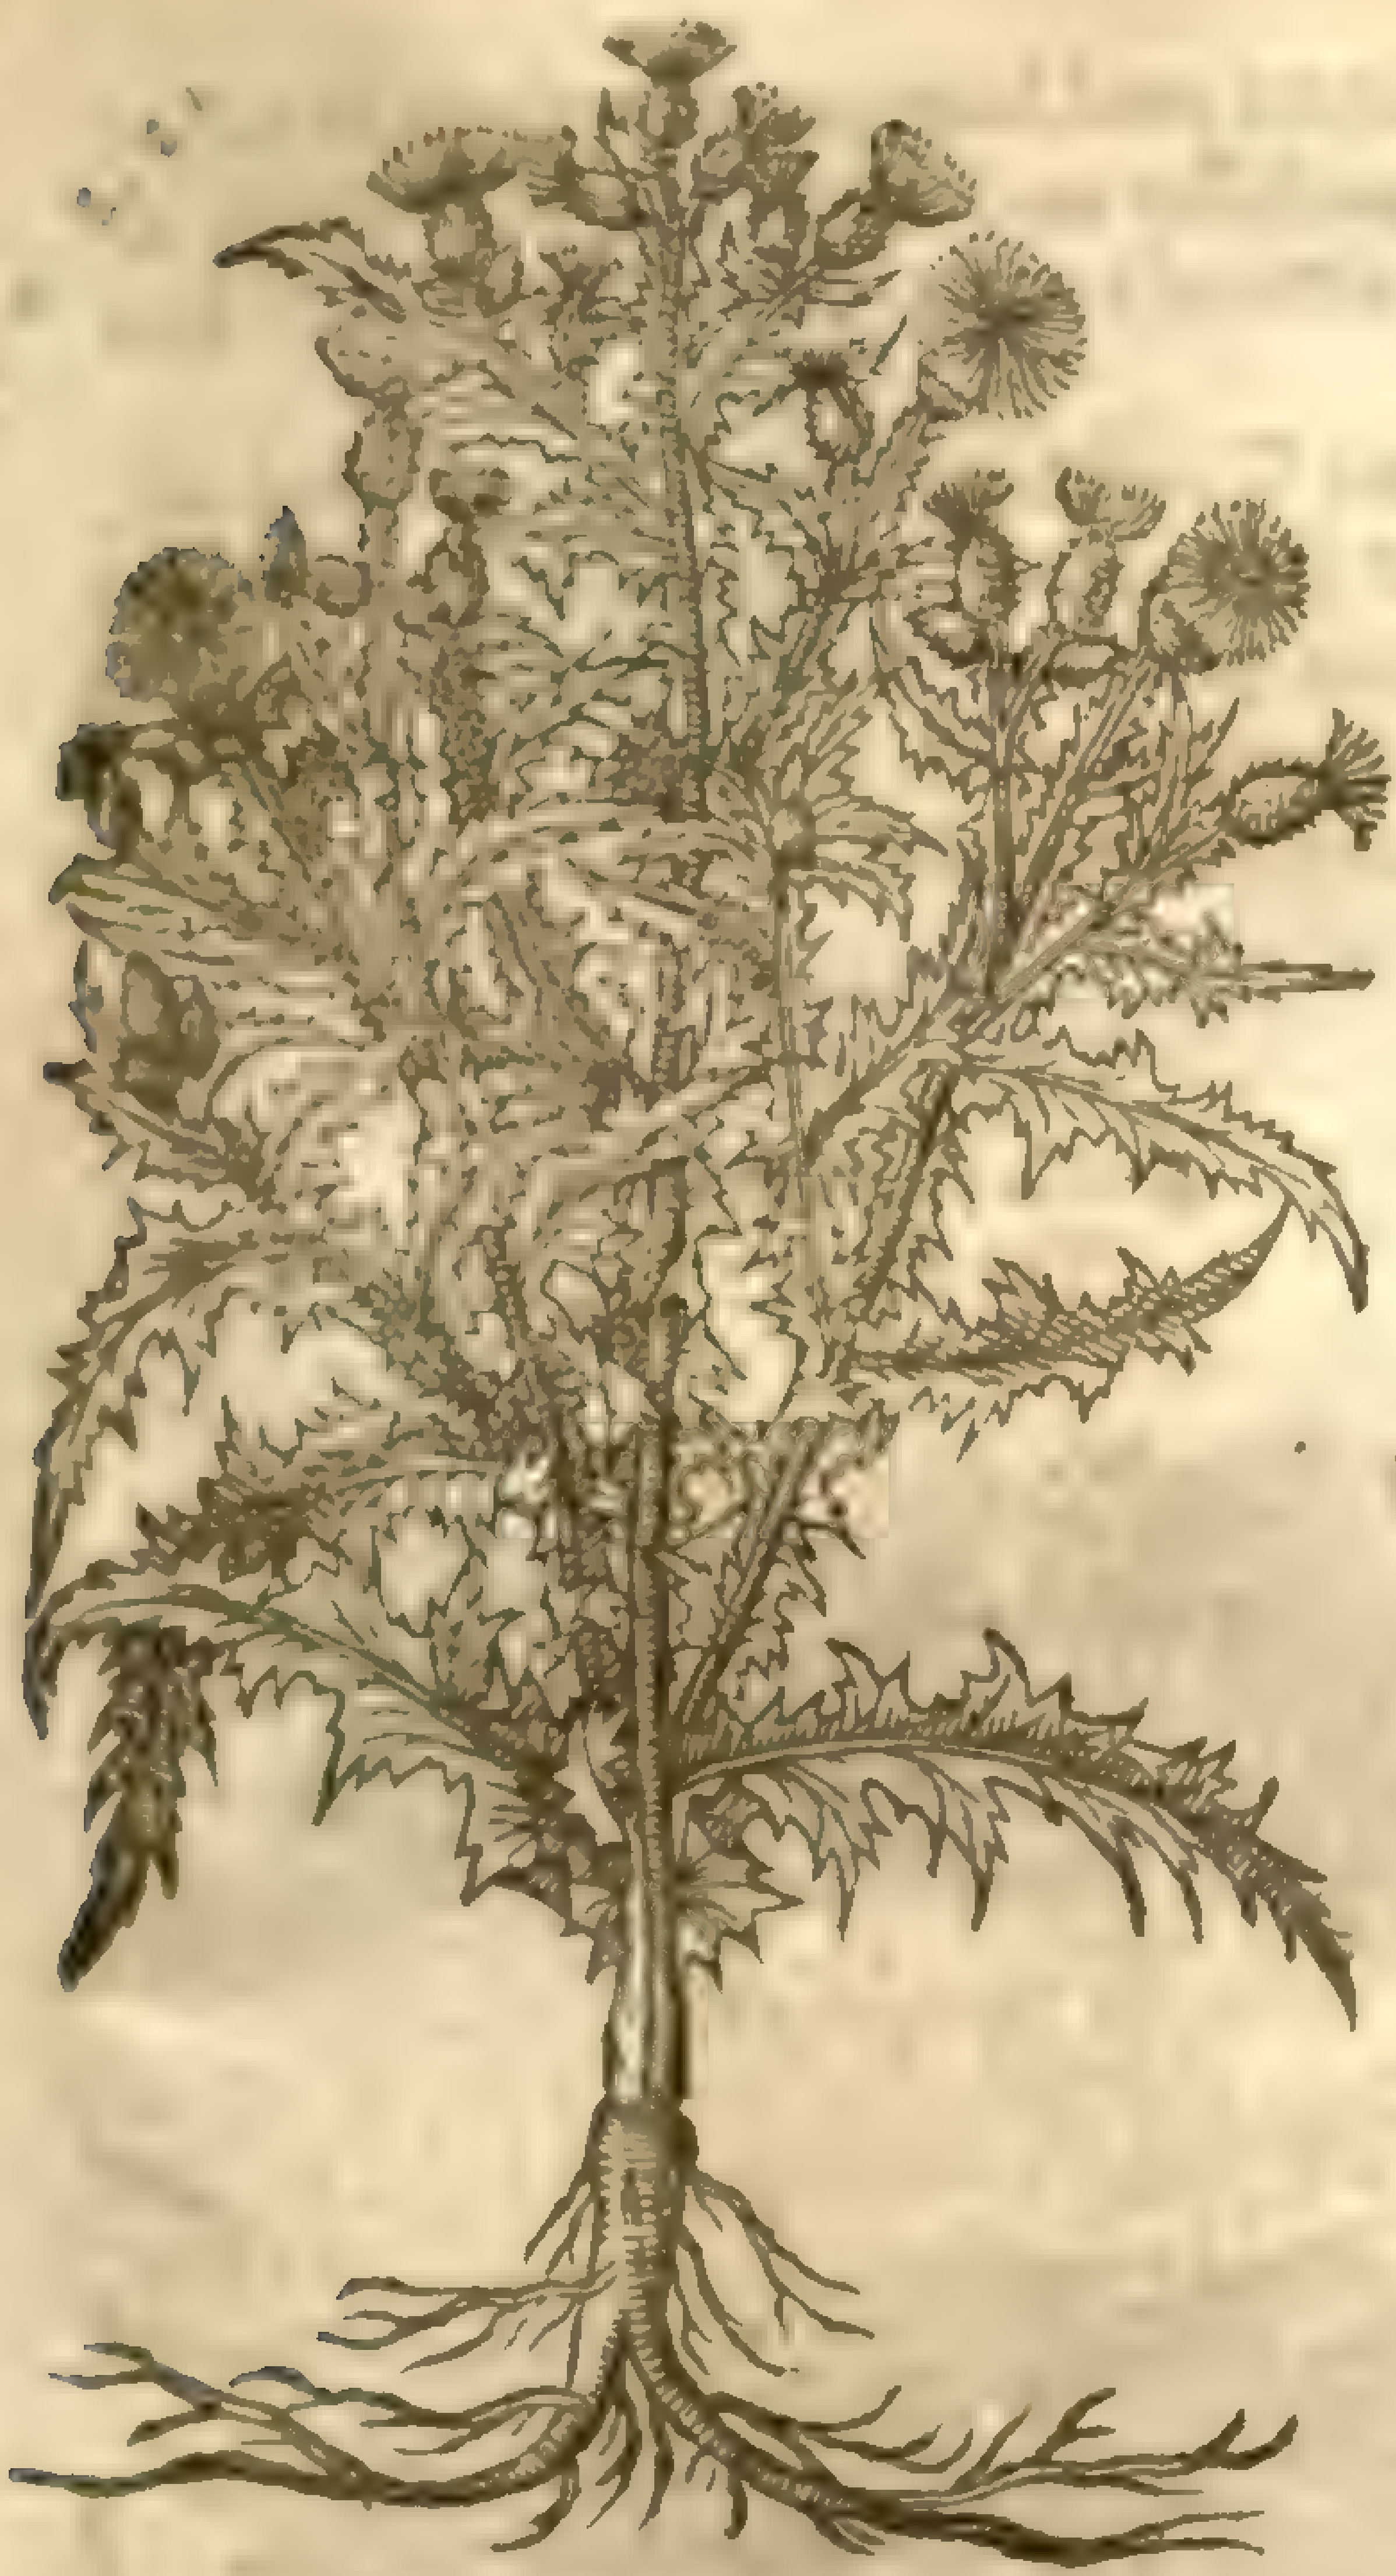
¶ *The Description.*

1 Among all the Thornes and Thiſtles, this is moſt full of prickles; the ſtalks thereof are very long, and ſeeme to be cornered by reaſon of certaine thin skins growing to them, being ſent downe forth of the leaues: the leaues are ſet round about with many deepe gaſhes, being very full of prickles as well as the ſtalks: the heads are very thicke ſet in euery place with ſtiffe prickles, and conſiſt of a multitude of ſcales; out of which grow purple floures, as they do out of other Thiſtles, ſeldome white: the root is almoſt ſtraight, but it groweth not deep.

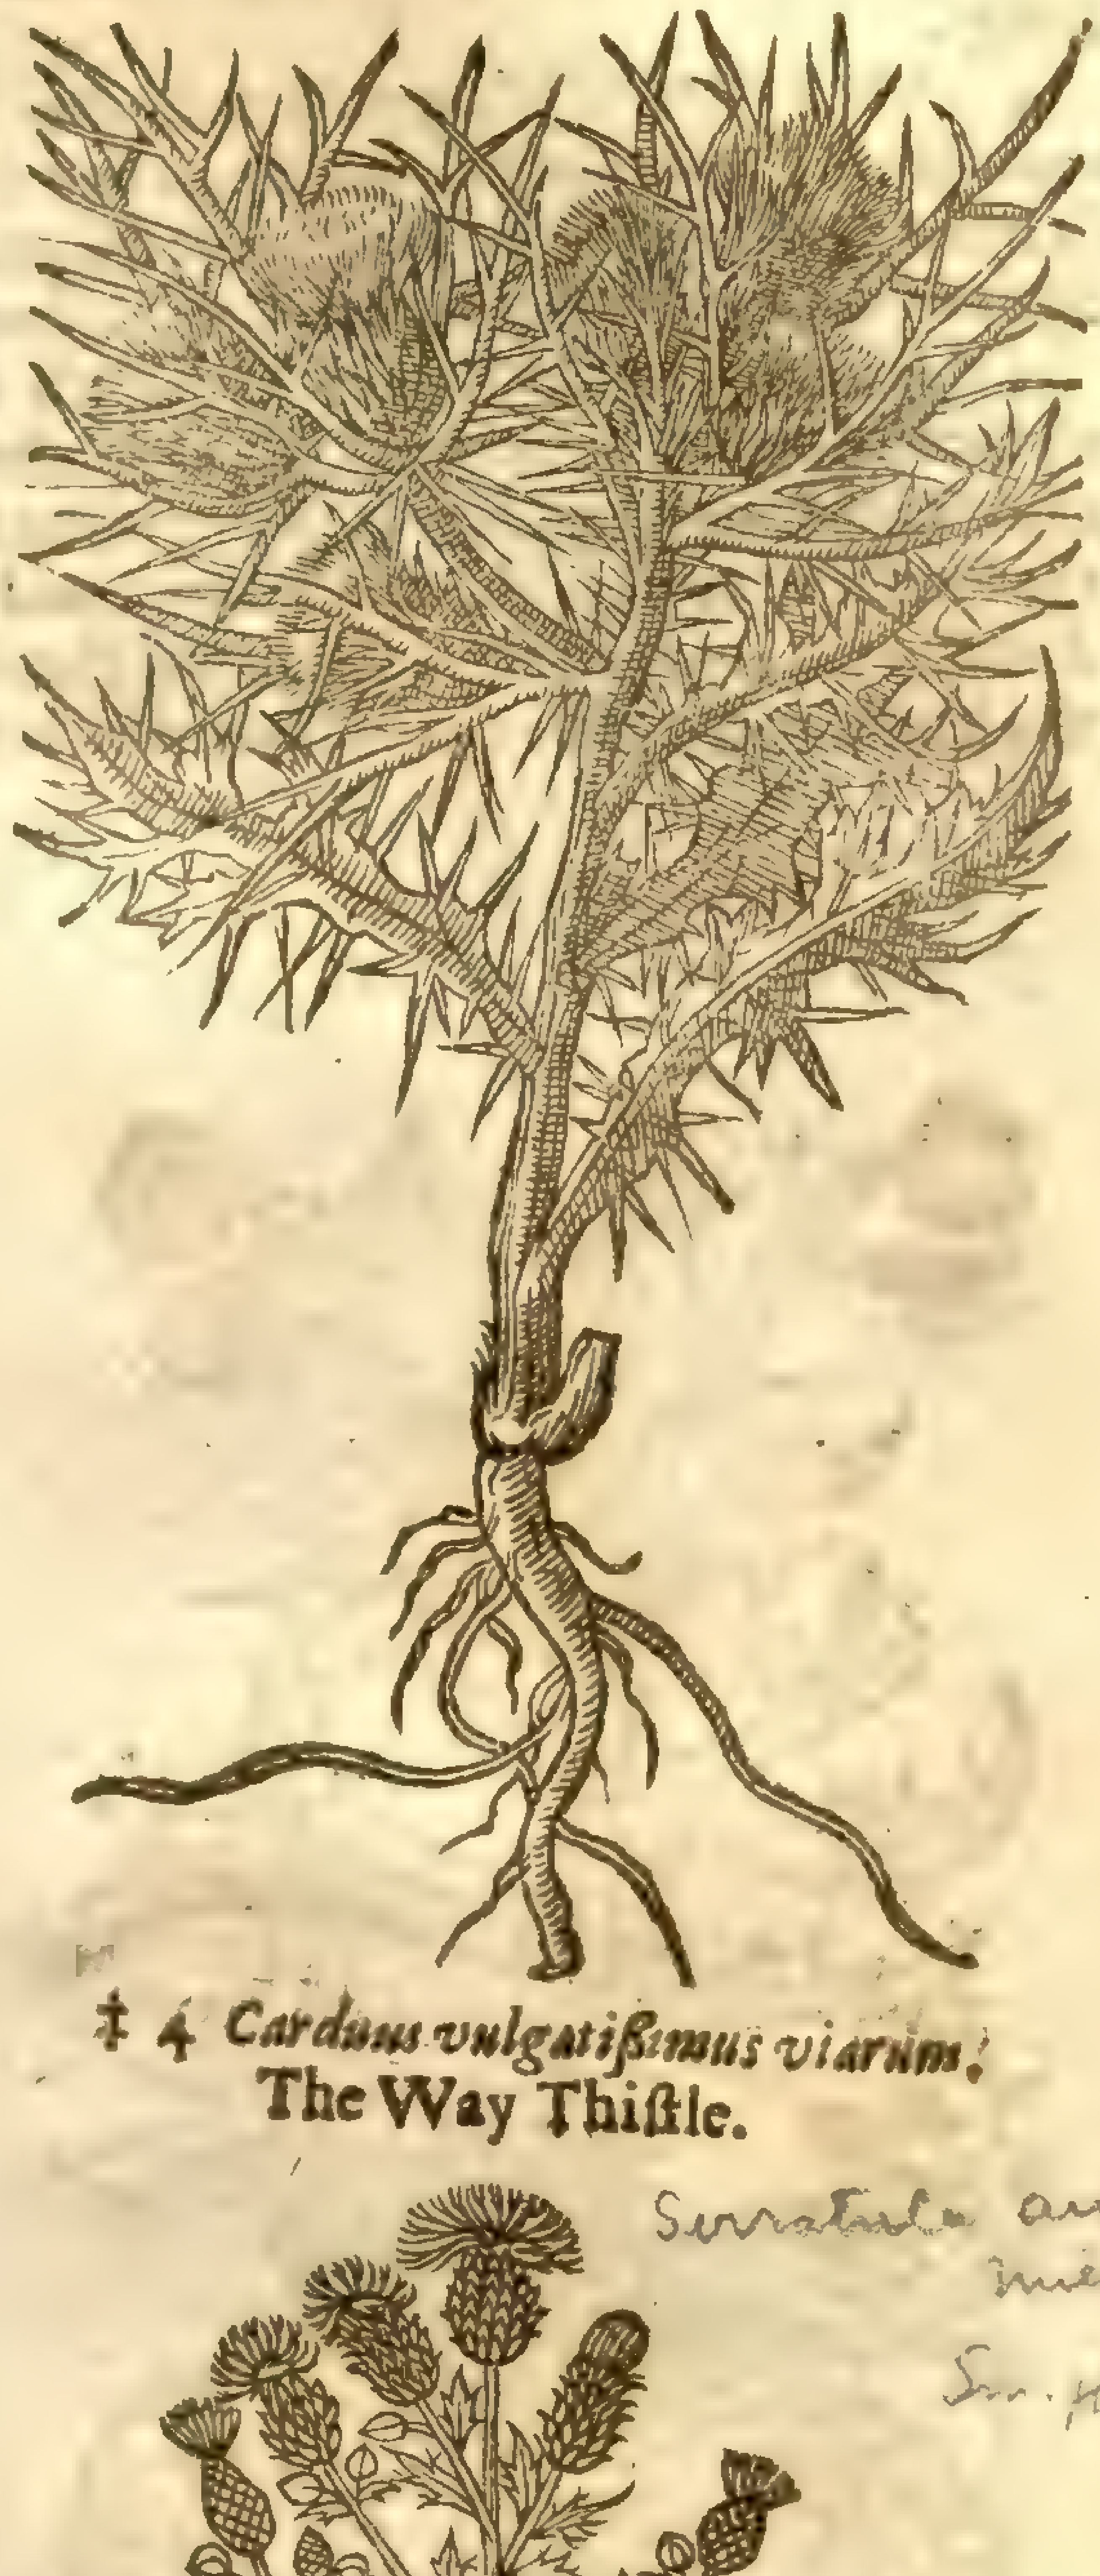
2 To this alſo may be referred that which *Lobel* writeth to be named of the Italians *Leo*, and *Carduus ferox*, for it is ſo called of the wonderfull ſharpe and ſtiffe prickles, wherewith the whole plant aboundeth; the ſtalke thereof is ſhort, ſcarce a handfull high; the floure groweth forth of a prickly head, and is of a pale yellow colour, like that of wilde baſtard Saffron, and it is alſo inuironed and ſet round about on euery ſide with long hard thornes and prickles.

3 The third groweth ſeldome aboue a cubit or two foot high: it bringeth forth many round ſtalkes, parted into diuers branches; the leaues are like thoſe of white Cotton Thiſtle, but leſſer, and blacker, and not couered with downe or Cotton; vpon the tops of the ſtalks grow little heads like

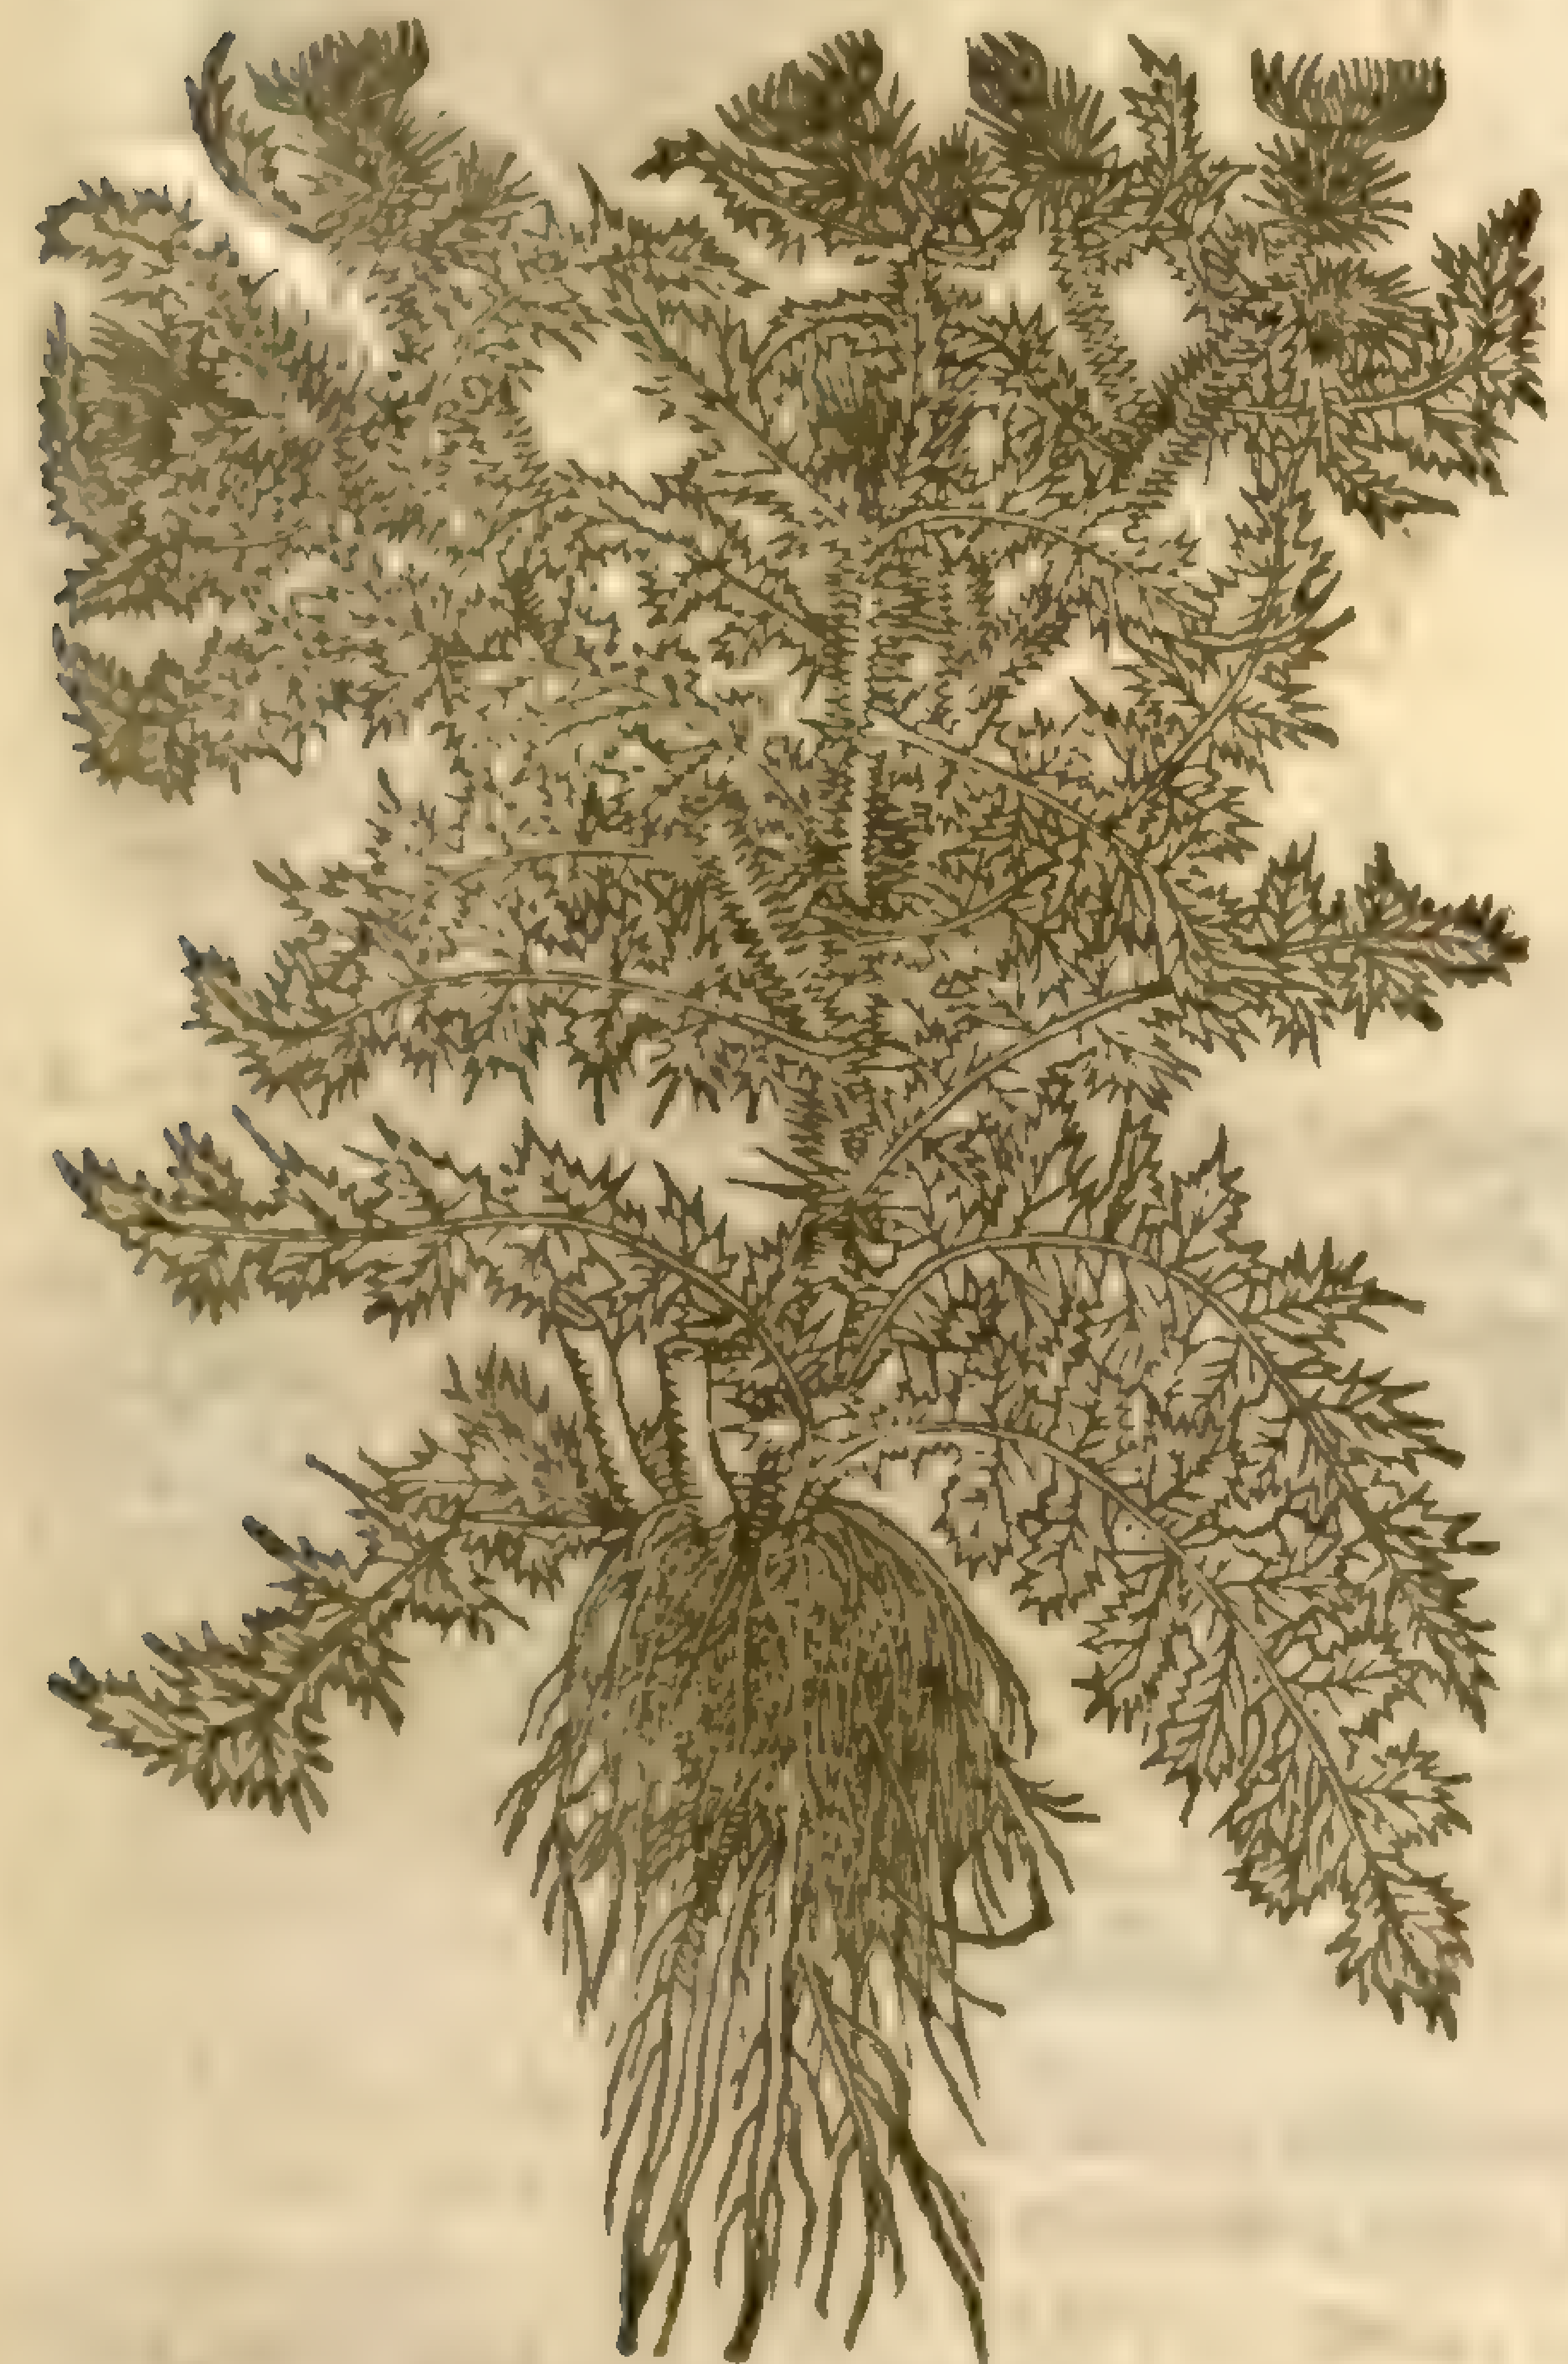
† 1 *Polyacanthos.*
Thiſtle vpon Thiſtle.



2 *Carduus ferox.*
The cruell Thiſtle.



† 3 *Carduus Aſinius ſive Onopyxos.*
The Aſſes Thiſtle, or Aſſes box.

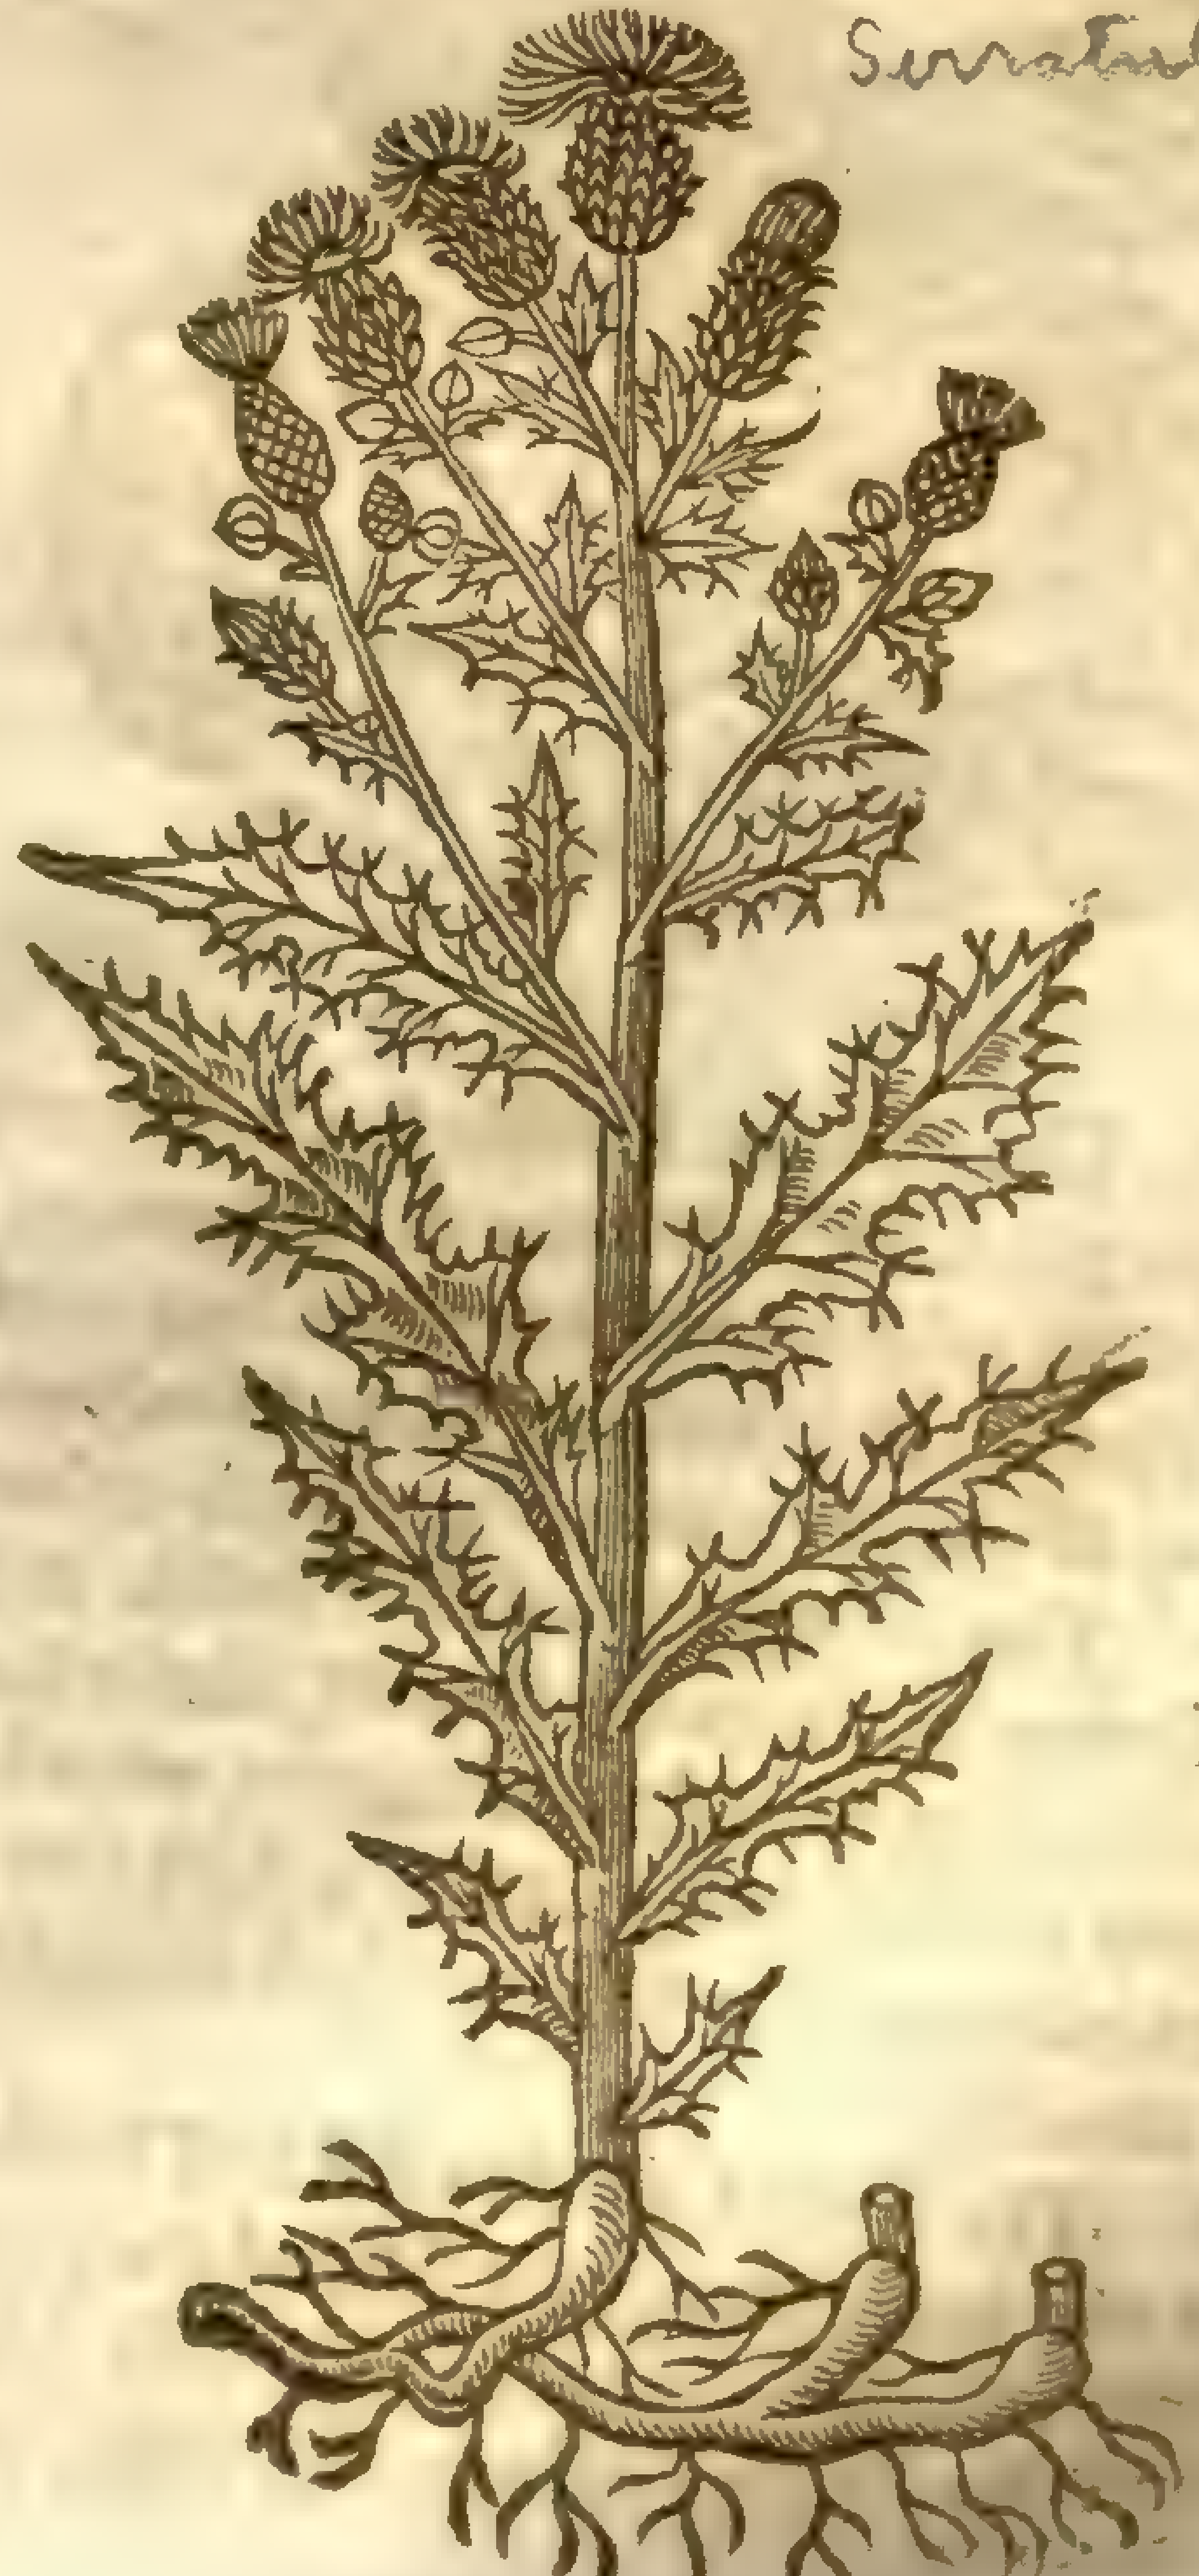


C. [illegible] With.
mihi dict

‡ 4 *Carduus vulgatiſsimus viarum.*
The Way Thiſtle.

Serratula arvensis, a
mihi dict

Sm. Fl. B. [illegible]

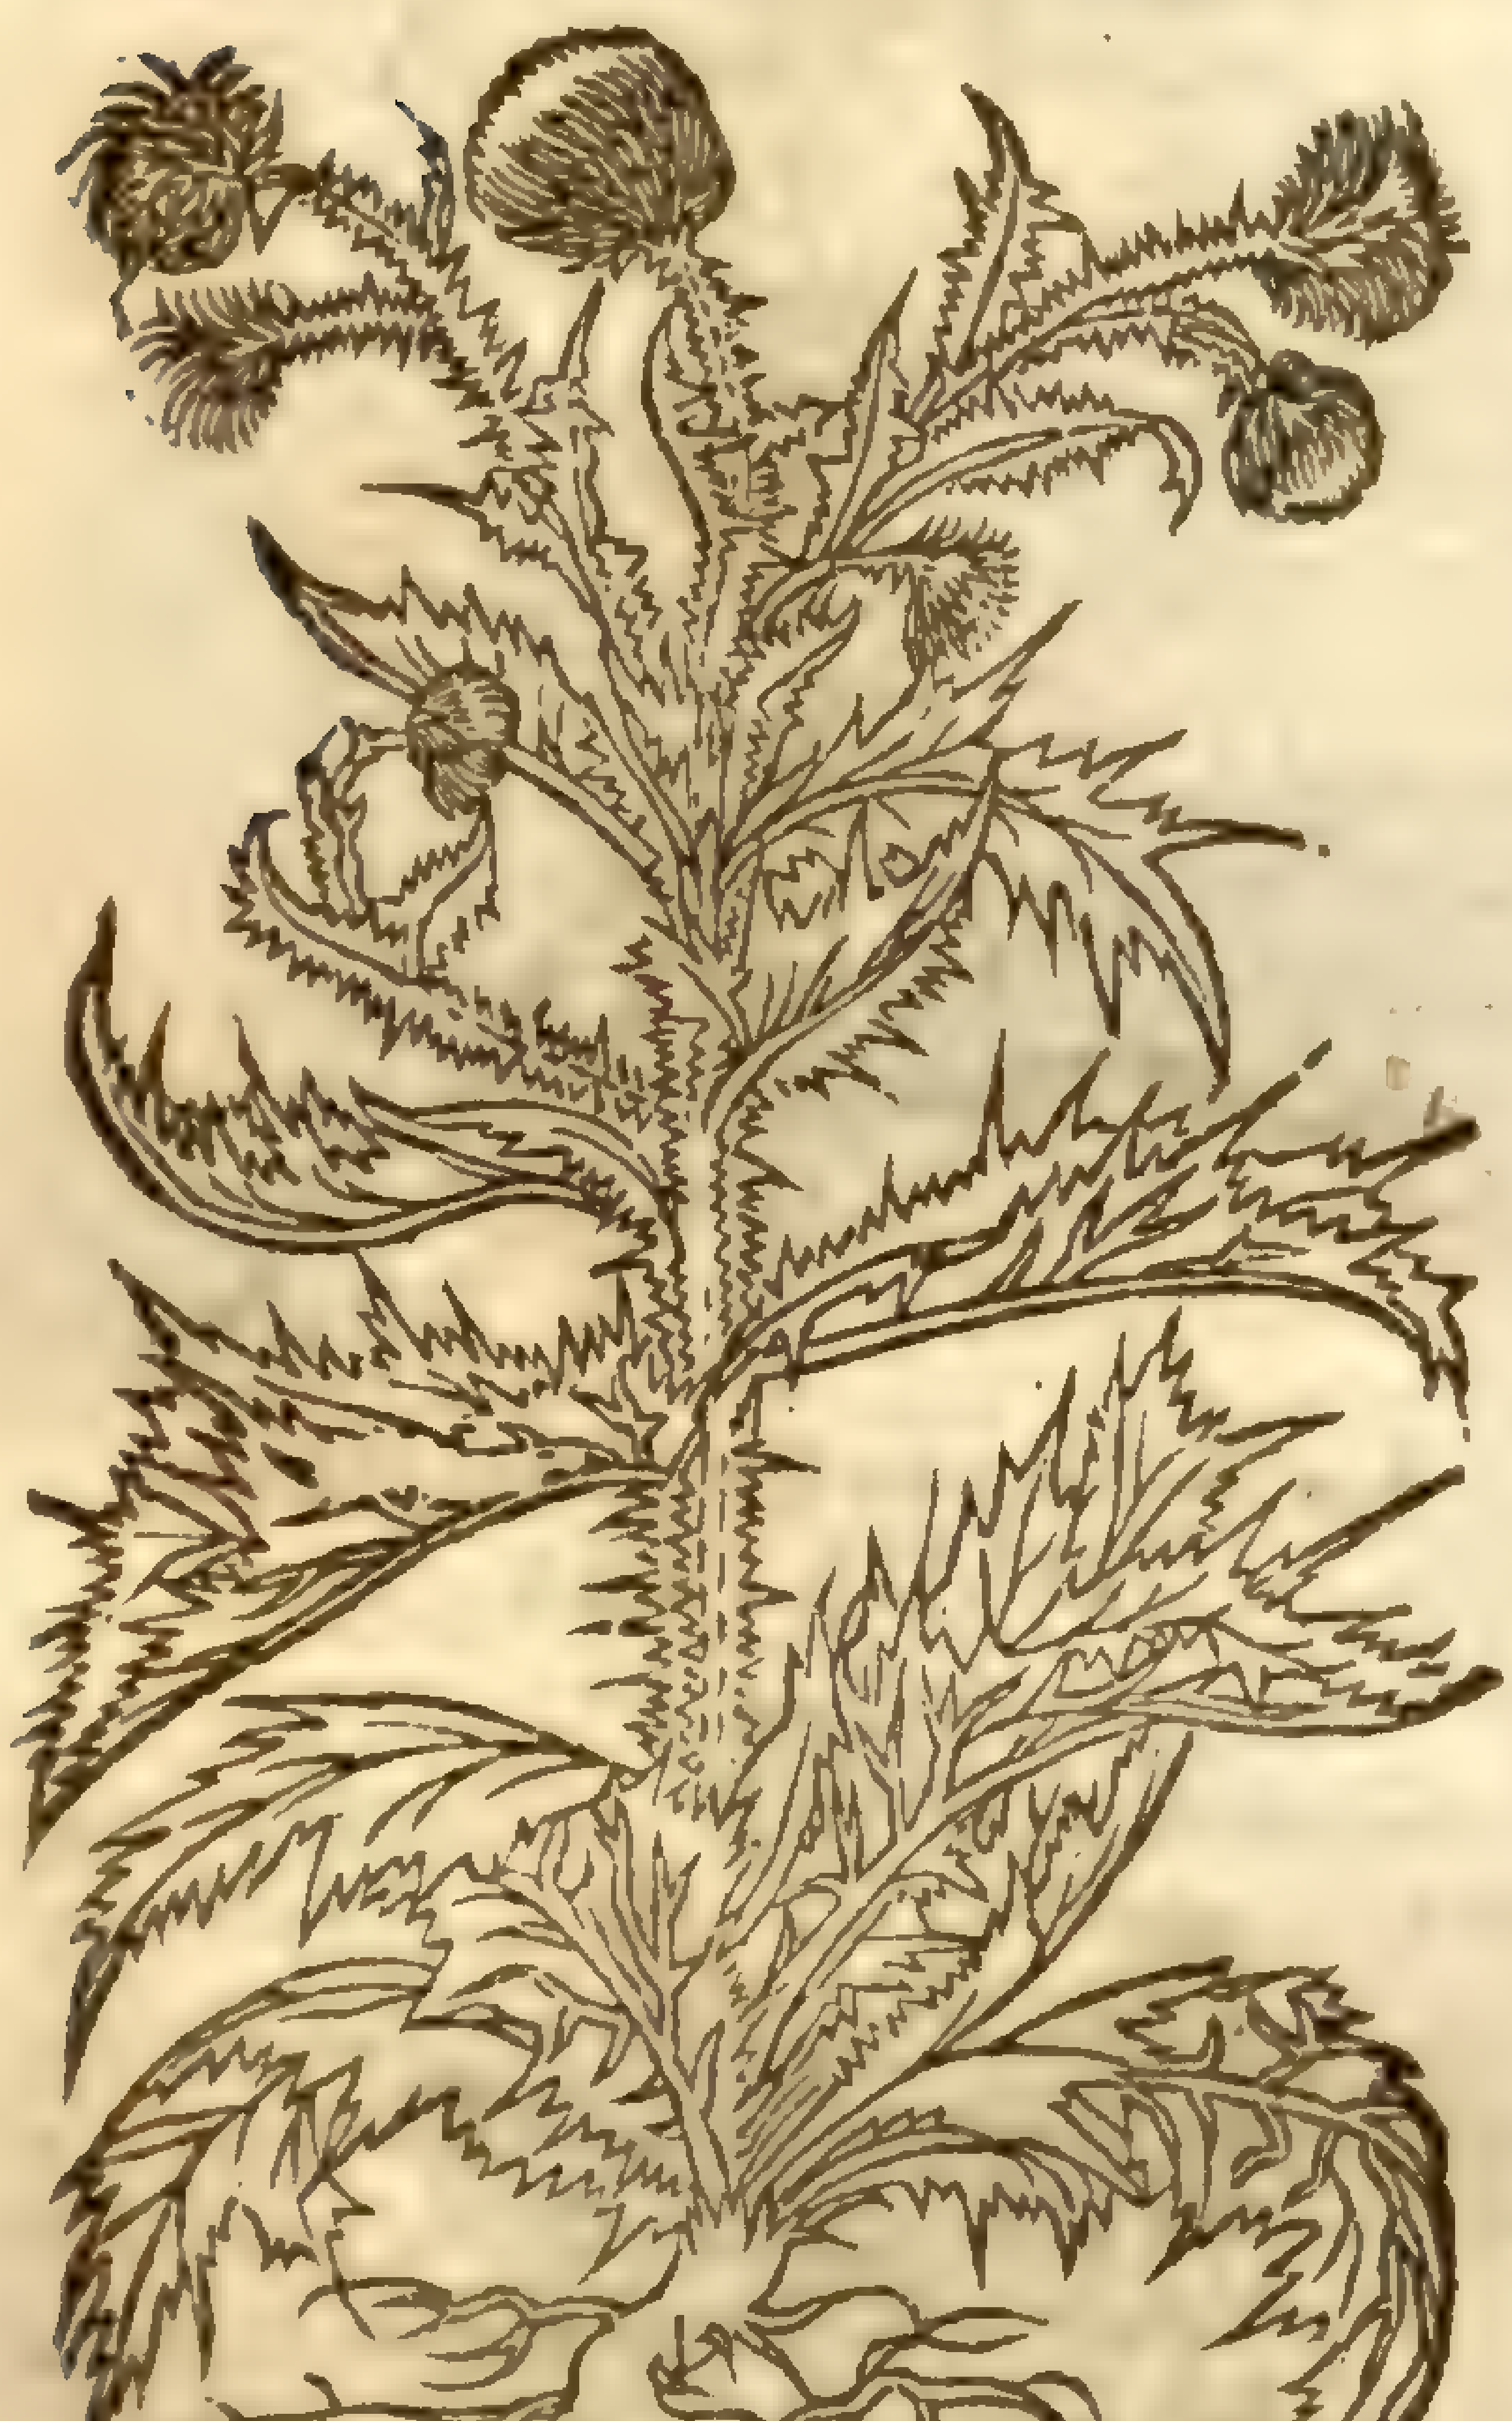


like Hedge-hogs, out of which ſpring gallant purple floures, that at length are turned into downe, leauing ſeeds behinde them like thoſe of the other Thiſtles: the root conſiſteth of many ſmall ſtrings.

4 The fourth riſeth vp with an higher ſtalke, now and then a yard long, round and not ſo full of branches nor leaues, which are ſharpe and full of prickles, but leſſer and narrower: the heads be alſo leſſer, longer, and not ſo full of ſtiffe prickles: the floures are of a white colour, and vaniſh into downe: the root is blacke, and of a foot long.

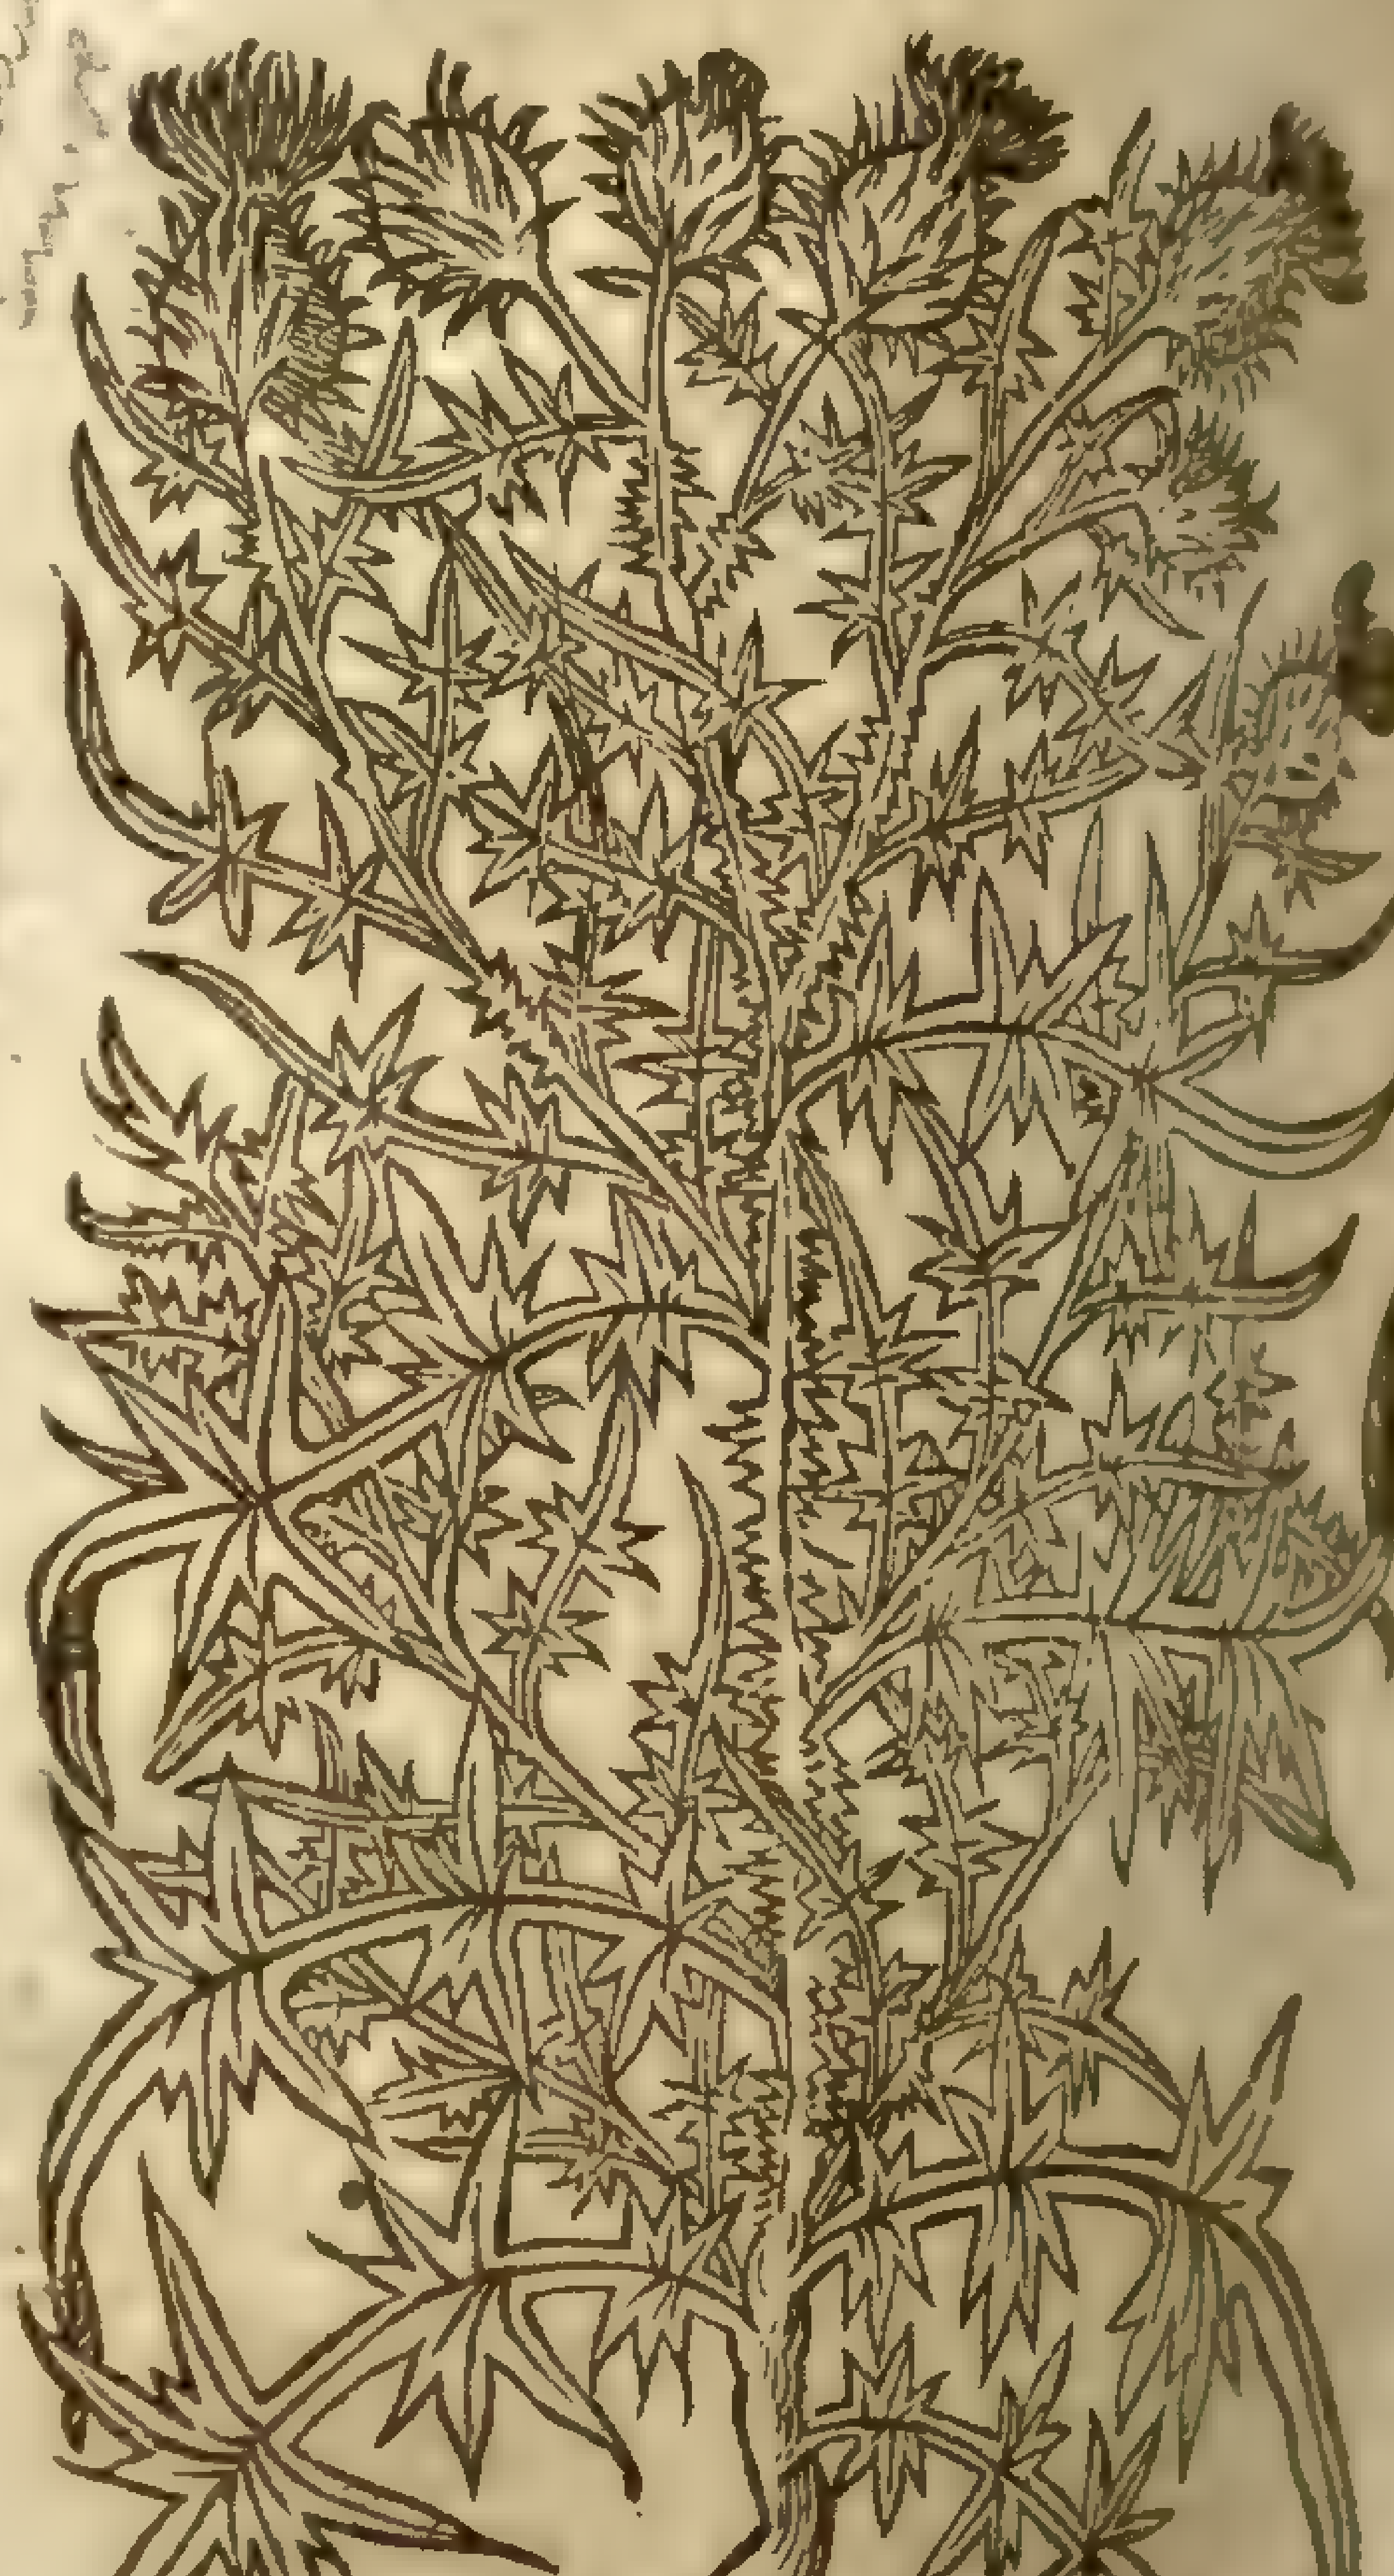
5 This wilde Thiſtle which groweth in the fields about Cambridge, hath an vpright ſtalke, whereon do grow broad prickly leaues: the floures grow at the tops of the branches, conſiſting of a flockie downe, of a white colour tending to purple, of a moſt pleaſant ſweet ſmell, ſtriuing with the ſauour of muske: the root is ſmall, and periſheth at the approch of Winter. ‡ I had no figure directly fitting this; wherefore I put that of *Dodonæus* his *Onopordon*, which may well ſerue for it, if the leaues were narrower, and more diuided. ‡

† 5 *Carduus Muſcatus.*
The musked Thiſtle.



Onopordon acanthium, L. [illegible]

6 *Carduus lanceatus.*
The Speare Thiſtle.



C. lanceolatus, L. [illegible]

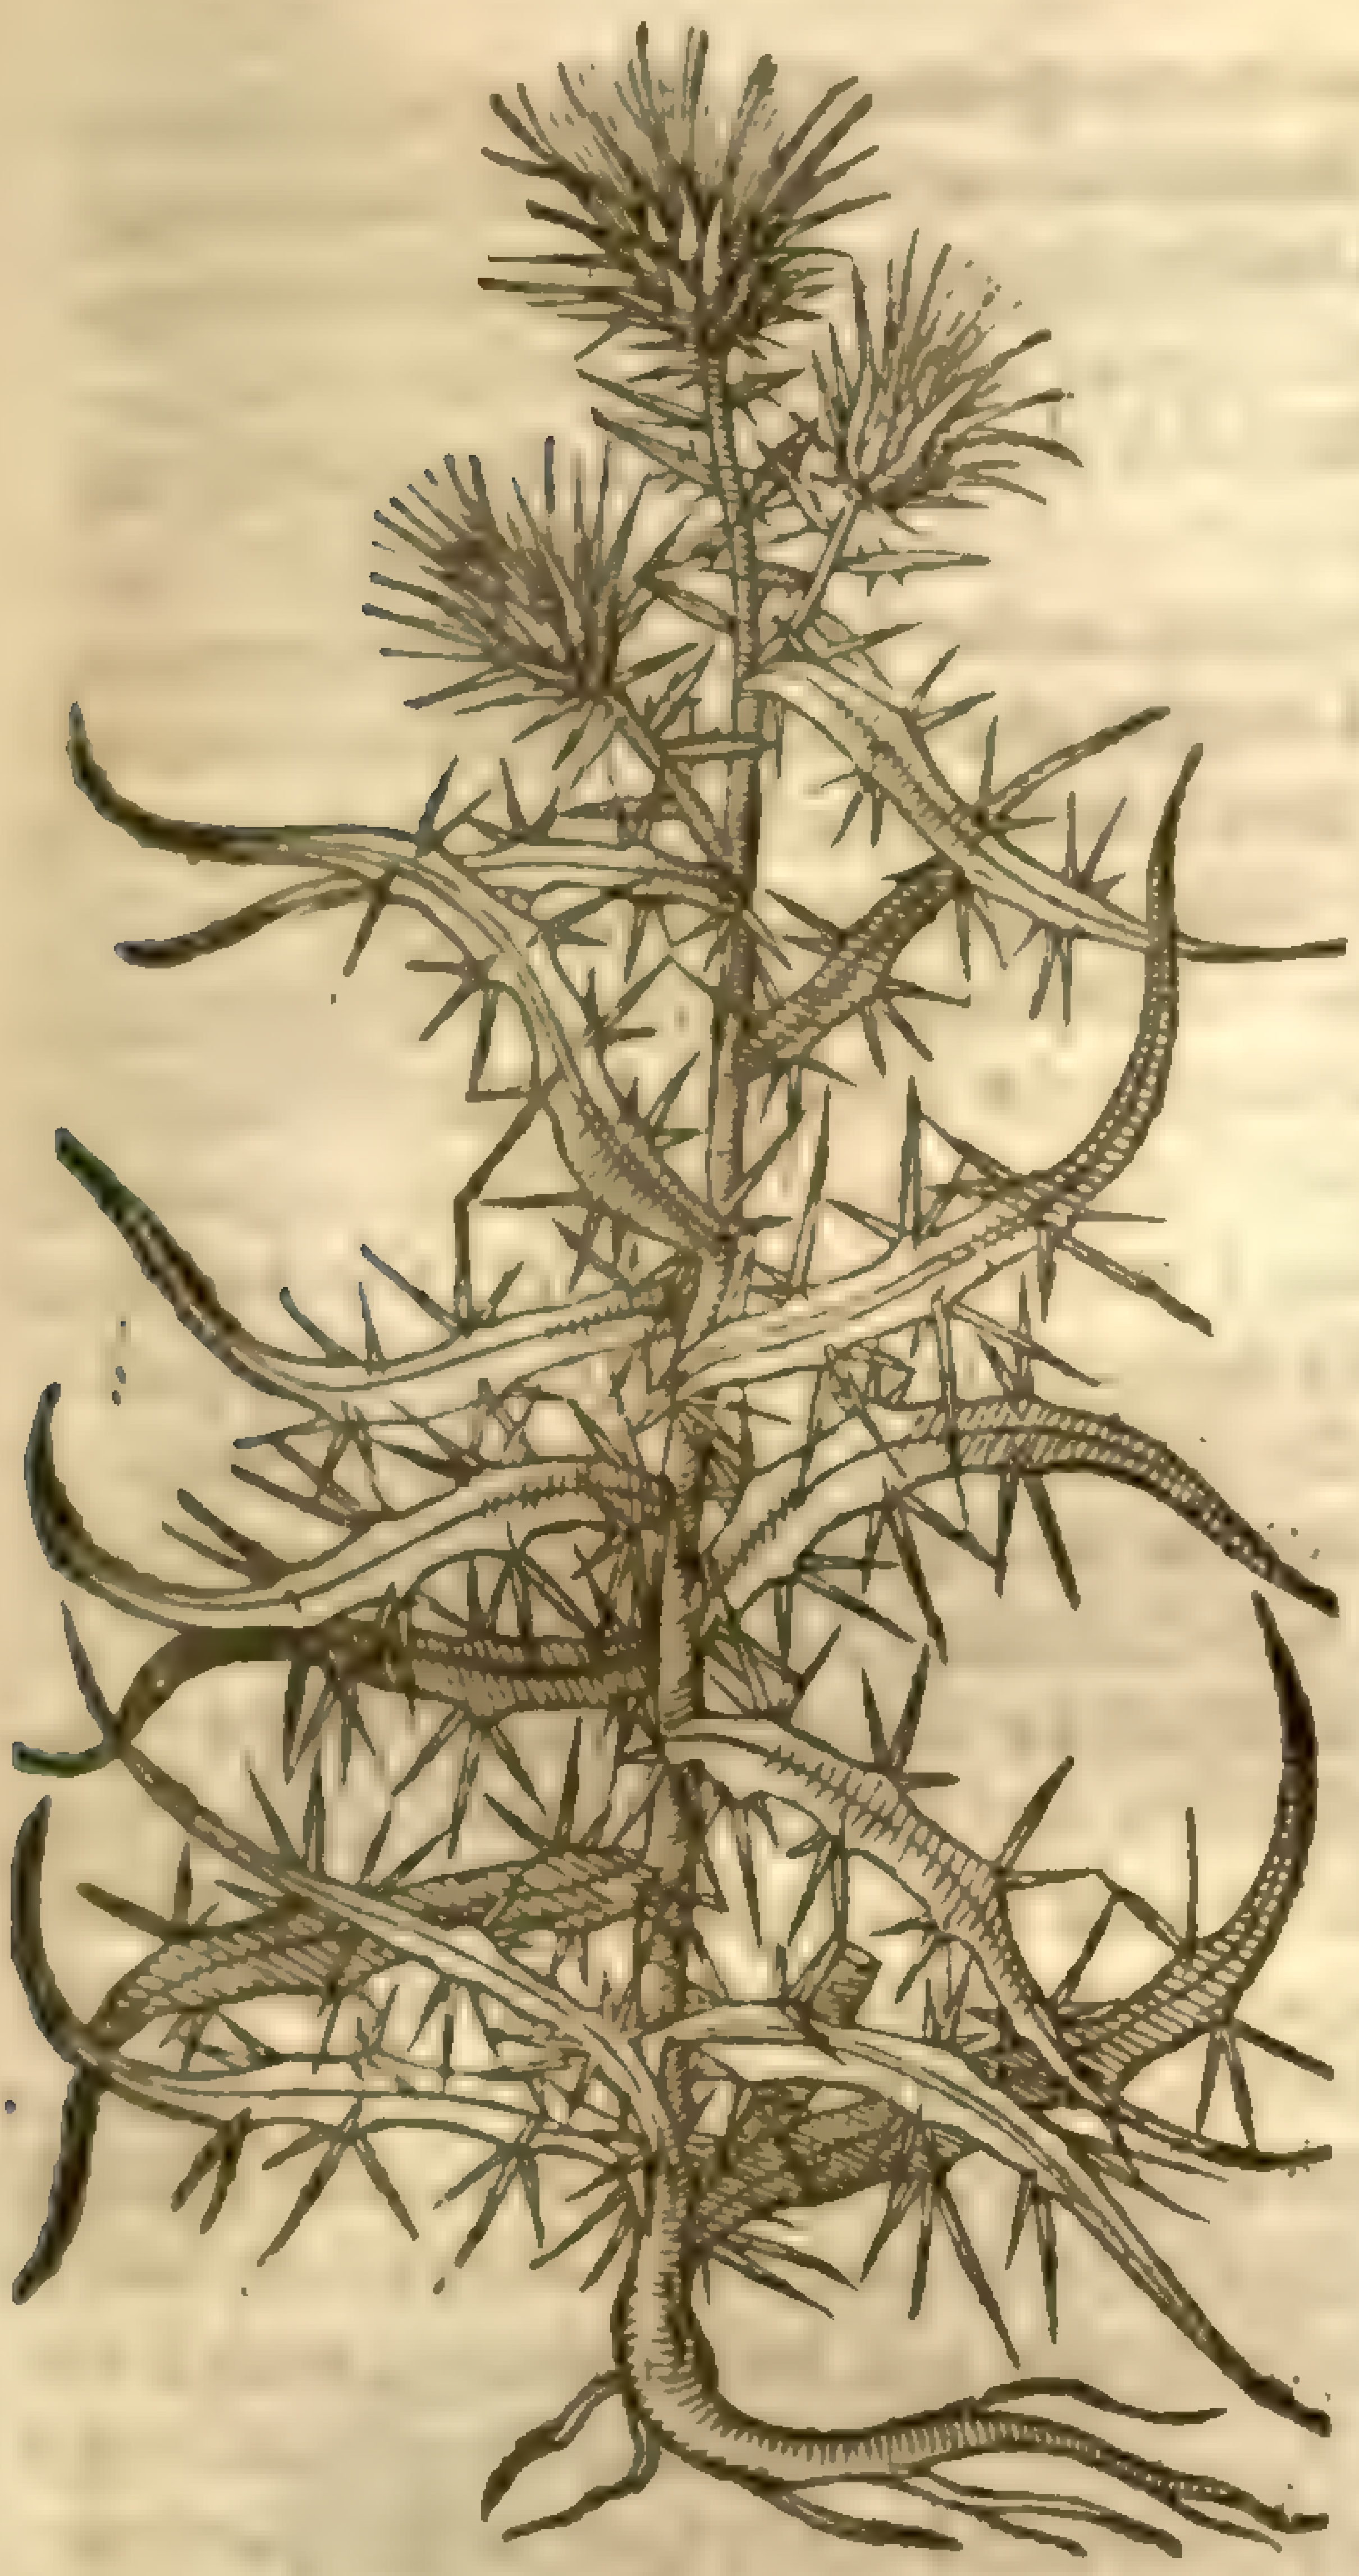
C. lanceolatus, [illegible] 3.386

6 The Speare Thiſtle hath an vpright ſtalke, garniſhed with a skinnie membrane, full of moſt ſharpe prickles: whereon do grow very long leaues, diuided into diuers parts with ſharp prickles; the point of the leaues are as the point of a ſpeare, whereof it tooke his name: the floures grow on the tops of the branches, ſet in a ſcaly prickly head, like vnto the heads of Knapweed in forme, conſiſting of many threds of a purple colour: the root conſiſteth of many tough ſtrings.

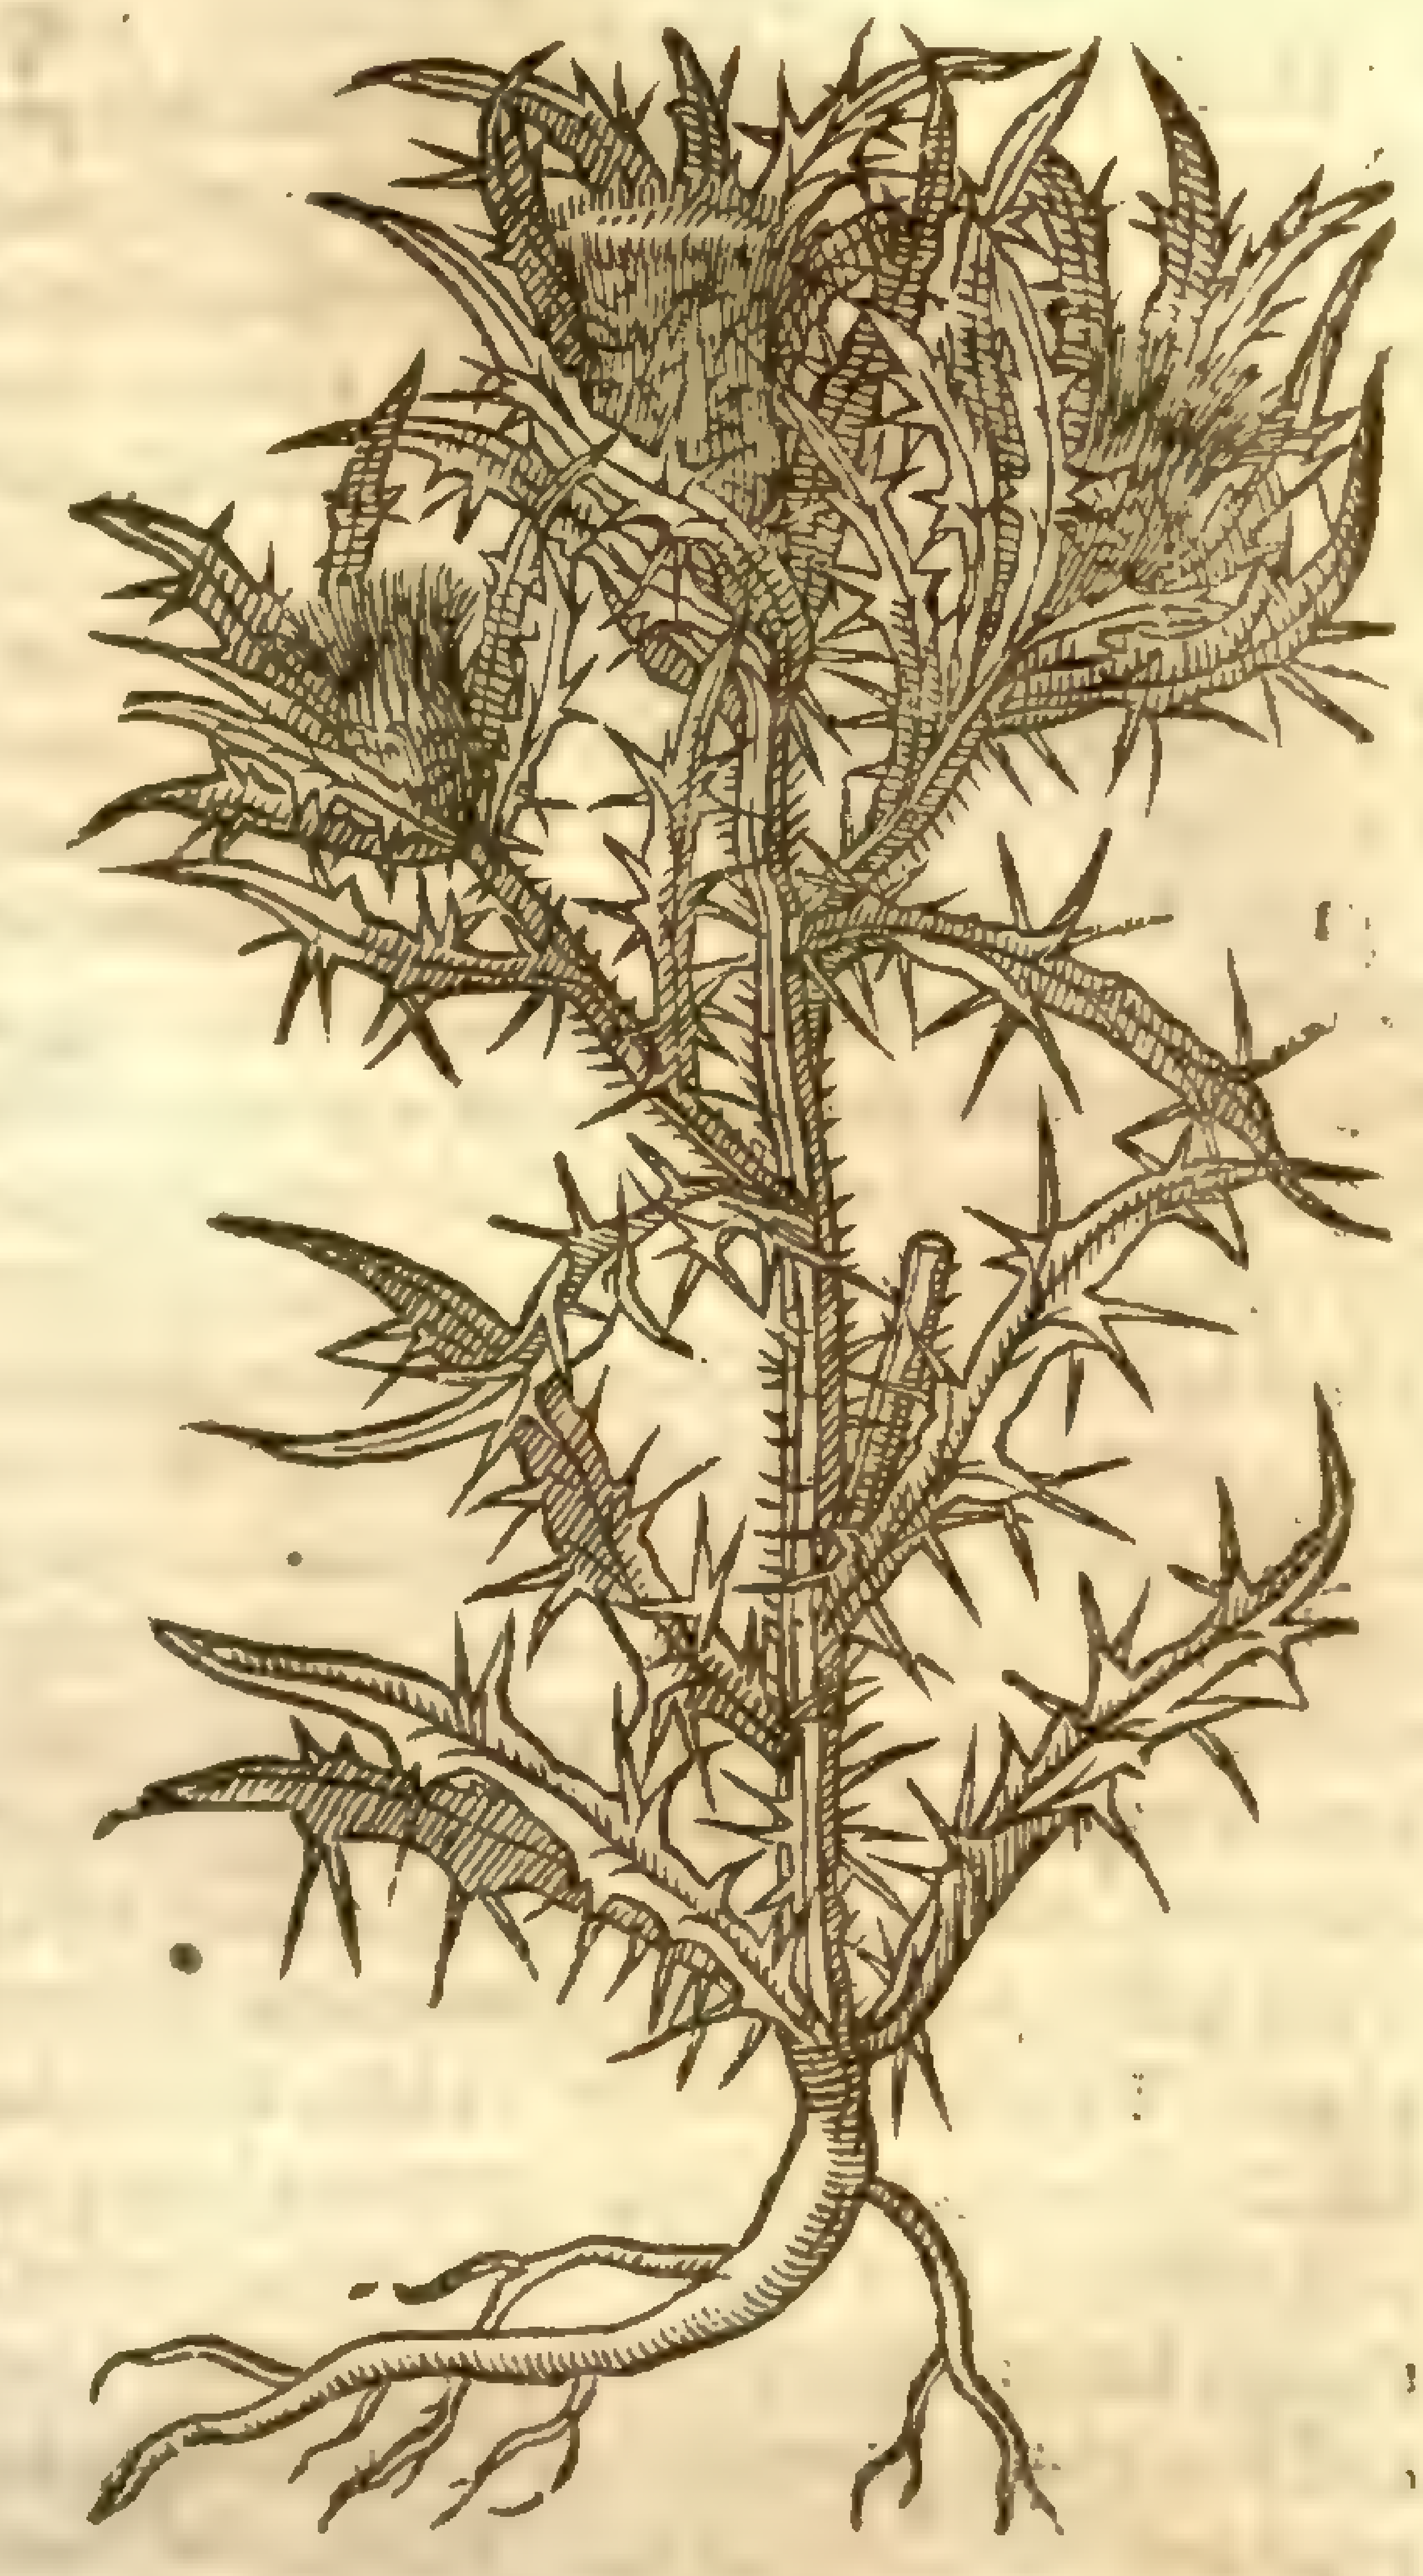
7 *Theophraſtus* his fiſh Thiſtle called *Acarna*, which was brought from Illyria to Venice, by the learned *Valerandus Donrez*, deſcribed by *Theophraſtus*, hath horrible ſharpe yellow prickles, ſet vpon his greene indented leaues, which are cornered on the backe ſide with an hoary downe (as all the reſt of the plant) hauing a ſtalke of a cubit and a halfe high, and at the top certaine ſcaly knops containing yellow thrummie floures, armed or fenced with horrible ſharp prickles: the root is long and threddy.

8 The other kinde of fiſh Thiſtle, being alſo another *Acarna* of *Valerandus* deſcription, hath long and large leaues, ſet full of ſharp prickles, as though it were ſet full of pins: all the whole plant is couered with a certain hoarineſſe, like the former: there ariſeth vp a ſtalke nine inches long, yea in ſome fertile grounds a cubit high, bearing the floure of *Carduus benedictus*, ſtanding thicke together, but leſſer.

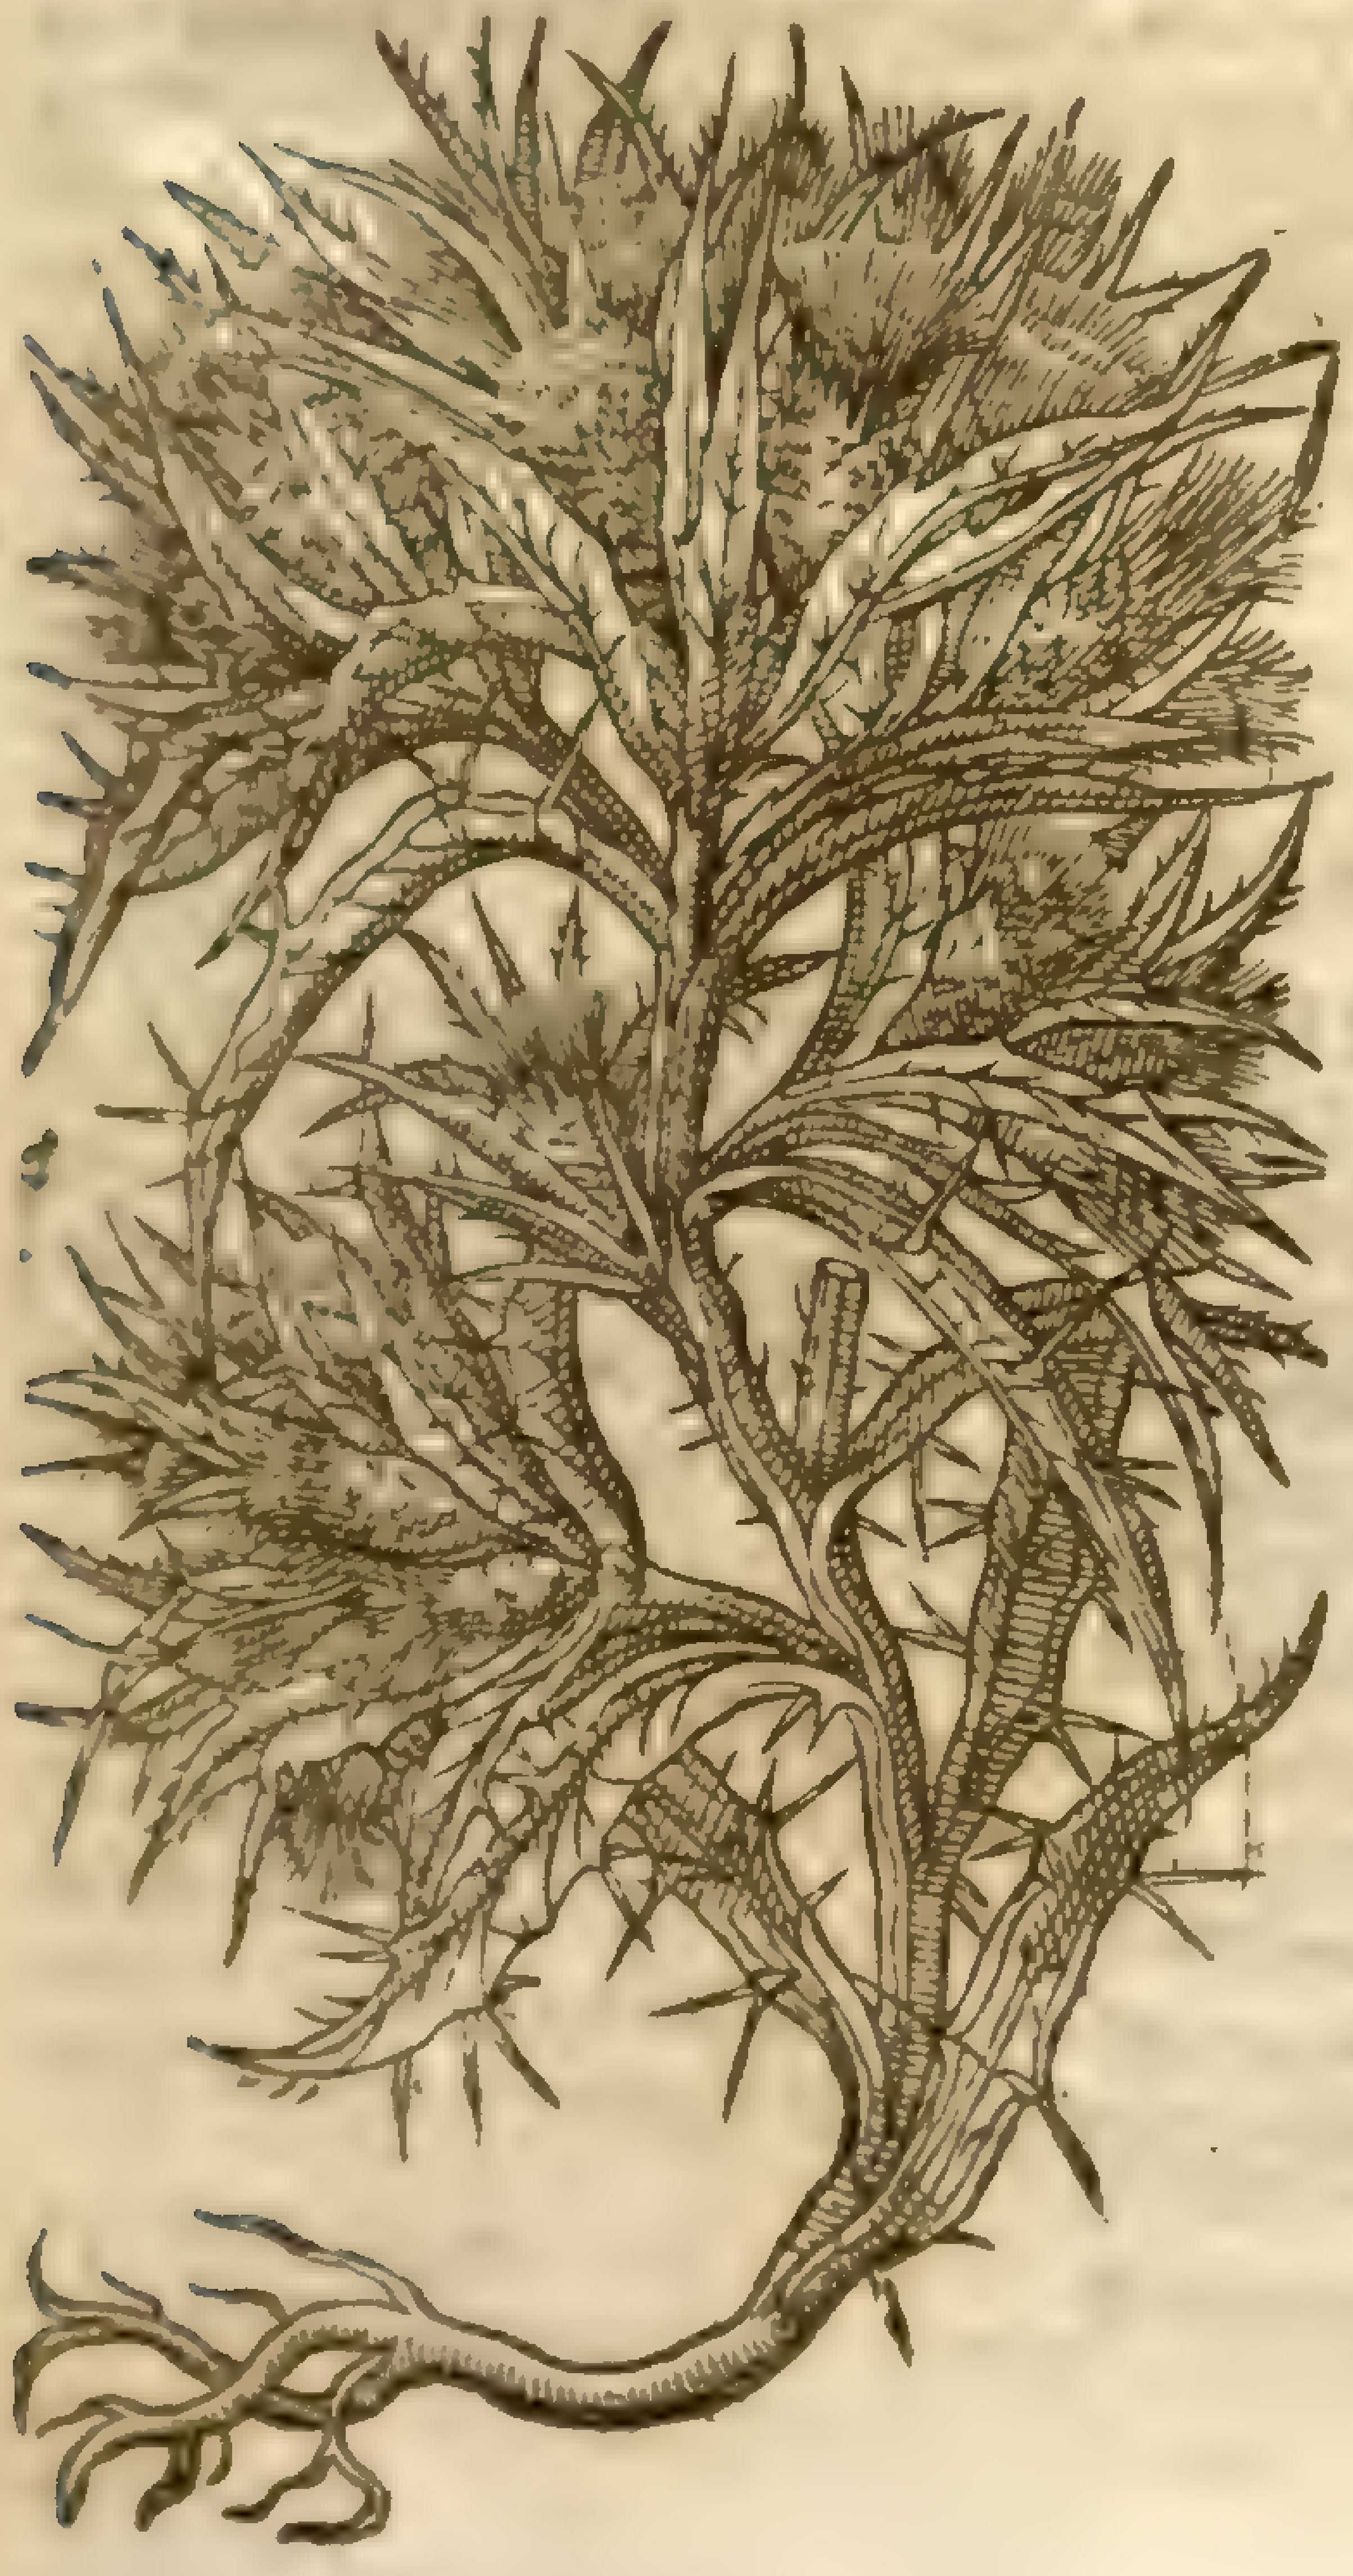
7 *Acarna* Theophraſti.
Theophraſtus his fiſh Thiſtle.



8 *Acarna Valerandi* Donrez.
Donrez his fiſh Thiſtle.



† 9 *Picnomos.*
The thicke or buſh headed Thiſtle.



‡ 9 This Thiſtle in the opinion of *Bauhine*, whereto I much incline, is the ſame with the former. The root is ſmall, the leaues long, welting the ſtalks at their ſetting on, and armed on the edges with ſharpe prickles: the ſtalkes lie trailing on the ground like thoſe of the ſtar-Thiſtle, ſo ſet with prickles, that one knoweth not where to take hold thereof: it hath many cloſely compact vmbels, conſiſting of pale yellowiſh little floures like thoſe of Groundſwell: the ſeed is like that of *Carthamus*, ſmal and chaffie. *Pena* and *Lobel* call this *Picnomos Cretæ Salanenſis*, of a place in Prouince where they firſt found it, called the Crau. being not farre from the city Salon. *Tabernamontanus* ſet it forth for *Chamæleon niger*, and our Author formerly gaue the figure hereof by the ſame title, though his hiſtorie belonged to another, as I haue formerly noted. ‡

¶ *The Place.*

The two firſt grow on diuers banks not farre from mount Apennine, and ſometimes in Italy, but yet ſeldome.

The way Thiſtles grow euery where by highwaies ſides and common paths in great plenty.

The places of the reſt haue beene ſufficiently ſpoken of in their deſcriptions.

¶ *The Time.*

Theſe kindes of Thiſtles do floure from the beginning of Iune vntill the end of September.

¶ *The Names.*

Theſe Thiſtles comprehended in this preſent chapter are by one generall name called in Latine *Cardui ſylueſtres*, or wilde Thiſtles; and that which is the ſecond in order is named *Scolymus*: but not that *Scolymus* which *Theophraſtus* declareth to yeeld a milky juyce (of which we haue written before) but one of thoſe which *Pliny* in his twentieth booke, *cap*.23. deſcribeth: of ſome they are taken for kindes of Chamæleon: their ſeuerall titles doe ſet forth their ſeuerall Latine names, and alſo the Engliſh.

‡ There was formerly much confuſion in this chapter, both in the figures and hiſtory, which I will here endeauour to amend, and giue as much light as I can, to the obſcuritie of our Authour and ſome others; to which end I haue made choiſe of the names as the fitteſt place.

1 This deſcription was taken out of *Dodonæus*, and the title alſo of *Onopordon* which was formerly put ouer the figure, and they belong to the Thiſtle our Author before deſcribed by the name of *Acanthium purp. Illyricum*, *cap*.476. I haue therefore changed the title, yet let the deſcription ſtand, for it reaſonable well agrees with the figure which is of the *Carduus ſpinoſiſſimus vulgaris* of *Lobel*, and *Polyacantha Theophraſti* of *Tabern.* of this Thiſtle I obſerue three kindes: the firſt is a Thiſtle ſome two cubits and a halfe high, with many ſlender ſtalkes and branches exceeding prickly, hauing commonly fiue prickly welts running alongſt the ſtalkes: the leaues on the vpper ſides as alſo the ſtalkes are of a reaſonable freſh greene colour, but the vnderſide of the leafe is ſomwhat whitiſh: the heads conſiſt of ſundry hairy greene threds which looke like prickles; but they are weake, and not prickly: the floure is of the bigneſſe, and of the like colour and ſhape as the common Knapweed, yet ſomewhat brighter: it growes on ditch ſides, and floures in Iuly. This I take to be the *Aculeoſa Gaſa* of the *Aduerſ. pag*.374. but not that which *Lobel* figures for it in his *Icones*. This is that which *Tabernamontanus* figures for *Polyacantha*, and our Authour gaue his figure in this place. The ſecond of theſe I take to be that which *Lobel* hath figured for *Polyacantha*, and *Dodonæus* for *Carduus ſyl*.3. (which figure we here giue you) and in the *Hiſt. Lugd. pag*.1473. It is both figured and deſcribed by the name of *Polyacanthos Theophraſti*. In the figure there is little difference: in the things themſelues this; the ſtalkes of this are as high as thoſe of the laſt, but ſlenderer, with fewer and ſtraighter branches, and commonly edged with foure large welts, which haue fewer, yet longer prickles than thoſe of the former: the leaues and ſtalkes of this are of a grayiſh or whitiſh colour: the heads are longiſh, but much ſmaller than thoſe of the former, and they ſeldome open or ſpred abroad their floures, but only ſhew the tops of diuers reddiſh threds of a feint colour. This growes as frequently as the former, and commonly in the ſame places. The third, which I thinke may fitly be referred vnto theſe, growes on wet heaths and ſuch like places, hauing a ſtalke ſometimes foure or fiue cubits high, growing ſtraight vp, with few branches, and thoſe ſhort ones: the floures are of an indifferent bigneſſe, and commonly purple, yet ſometimes white. I thinke this may be the *Onopyxos alter Lugdunenſ.* or the *Carduus paluſtris* deſcribed in *Bauhinus* his *Prodromus, pag*.156.

2 The ſecond which is a ſtranger with vs, is the *Phœnix*, *Leo & Carduus ferox* of *Lobel* and *Dod.* *Bauhine* hath refer'd it to *Acarna*, calling it *Acarna minor caule non folioſo*.

3 The third deſcription was alſo out of *Dodonæus*, being of his *Carduus ſylueſtris primus*, or the *Onopyxos Dodonæi* of the *Hiſt. Lugd.* The figures formerly both in the third and fourth place of this Chapter were of the *Acanthium Illyricum* of *Lobel*; or the *Onopordon* of *Dodonæus*, formerly mentioned.

4 This deſcription alſo was out of *Dodonæus*, being of his *Carduus ſylueſtris alter*, agreeing in all things but the colour of the floures, which ſhould be purple. *Lobel* in his Obſeruations deſcribeth the ſame Thiſtle by the name of *Carduus vulgatiſſimus viarum*: but both he and *Dodonæus*, giue the figure of *Carlina ſylueſtris* for it: but neither the floures nor the heads of that agree with that deſcription. I iudge this to be the Thiſtle that *Fabius Columna* hath ſet forth for the *Ceanothos* of *Theophraſtus*; and *Tabern.* for *Carduus arvenſis*: and our Author, though vnfitly, gaue it in the next place for *Carduus muſcatus*.

5 The Muske-Thiſtle I haue ſeene growing about Deptford, and (as far as my memory ſerues me) it is very like to the third here deſcribed: it growes better than a cubit high, with reaſonable large leaues, and alſo heads which are a little ſoft or downy, large, with purple floures: the heads before the floures open ſmell ſtrong of muske. I haue found no mention of this but only in *Geſner. de Collectione in parte*, where hee hath theſe words; *Carduus arvenſis major purpureo flore (qui flore nondum nato Moſchum olebat) floret Iulio.* Our Author formerly gaue an vnfit figure for this, as I formerly noted.

There is ſufficient of the reſt in their titles and deſcriptions. ‡

¶ The

¶ *The Temperature and Vertues.*

A These wild Thiſtles (according to *Galen*) are hot and dry in the ſecond degree, and that through the propertie of their eſſence they driue forth ſtinking vrine, if the roots be boyled in Wine and drunke; and that they take away the ranke ſmell of the body and arme-holes.

B *Dioſcorides* ſaith, that the root of the common Thiſtle applied plaiſterwiſe correcteth the filthy ſmell of the arme-holes and whole body.

C And that it workes the ſame effect if it be boyled in wine and drunke, and that it expelleth plentie of ſtinking vrine.

D The ſame Author affirmeth alſo, that the herbe being as yet greene and tender is vſed to be eaten among other herbes after the manner of Aſparagus.

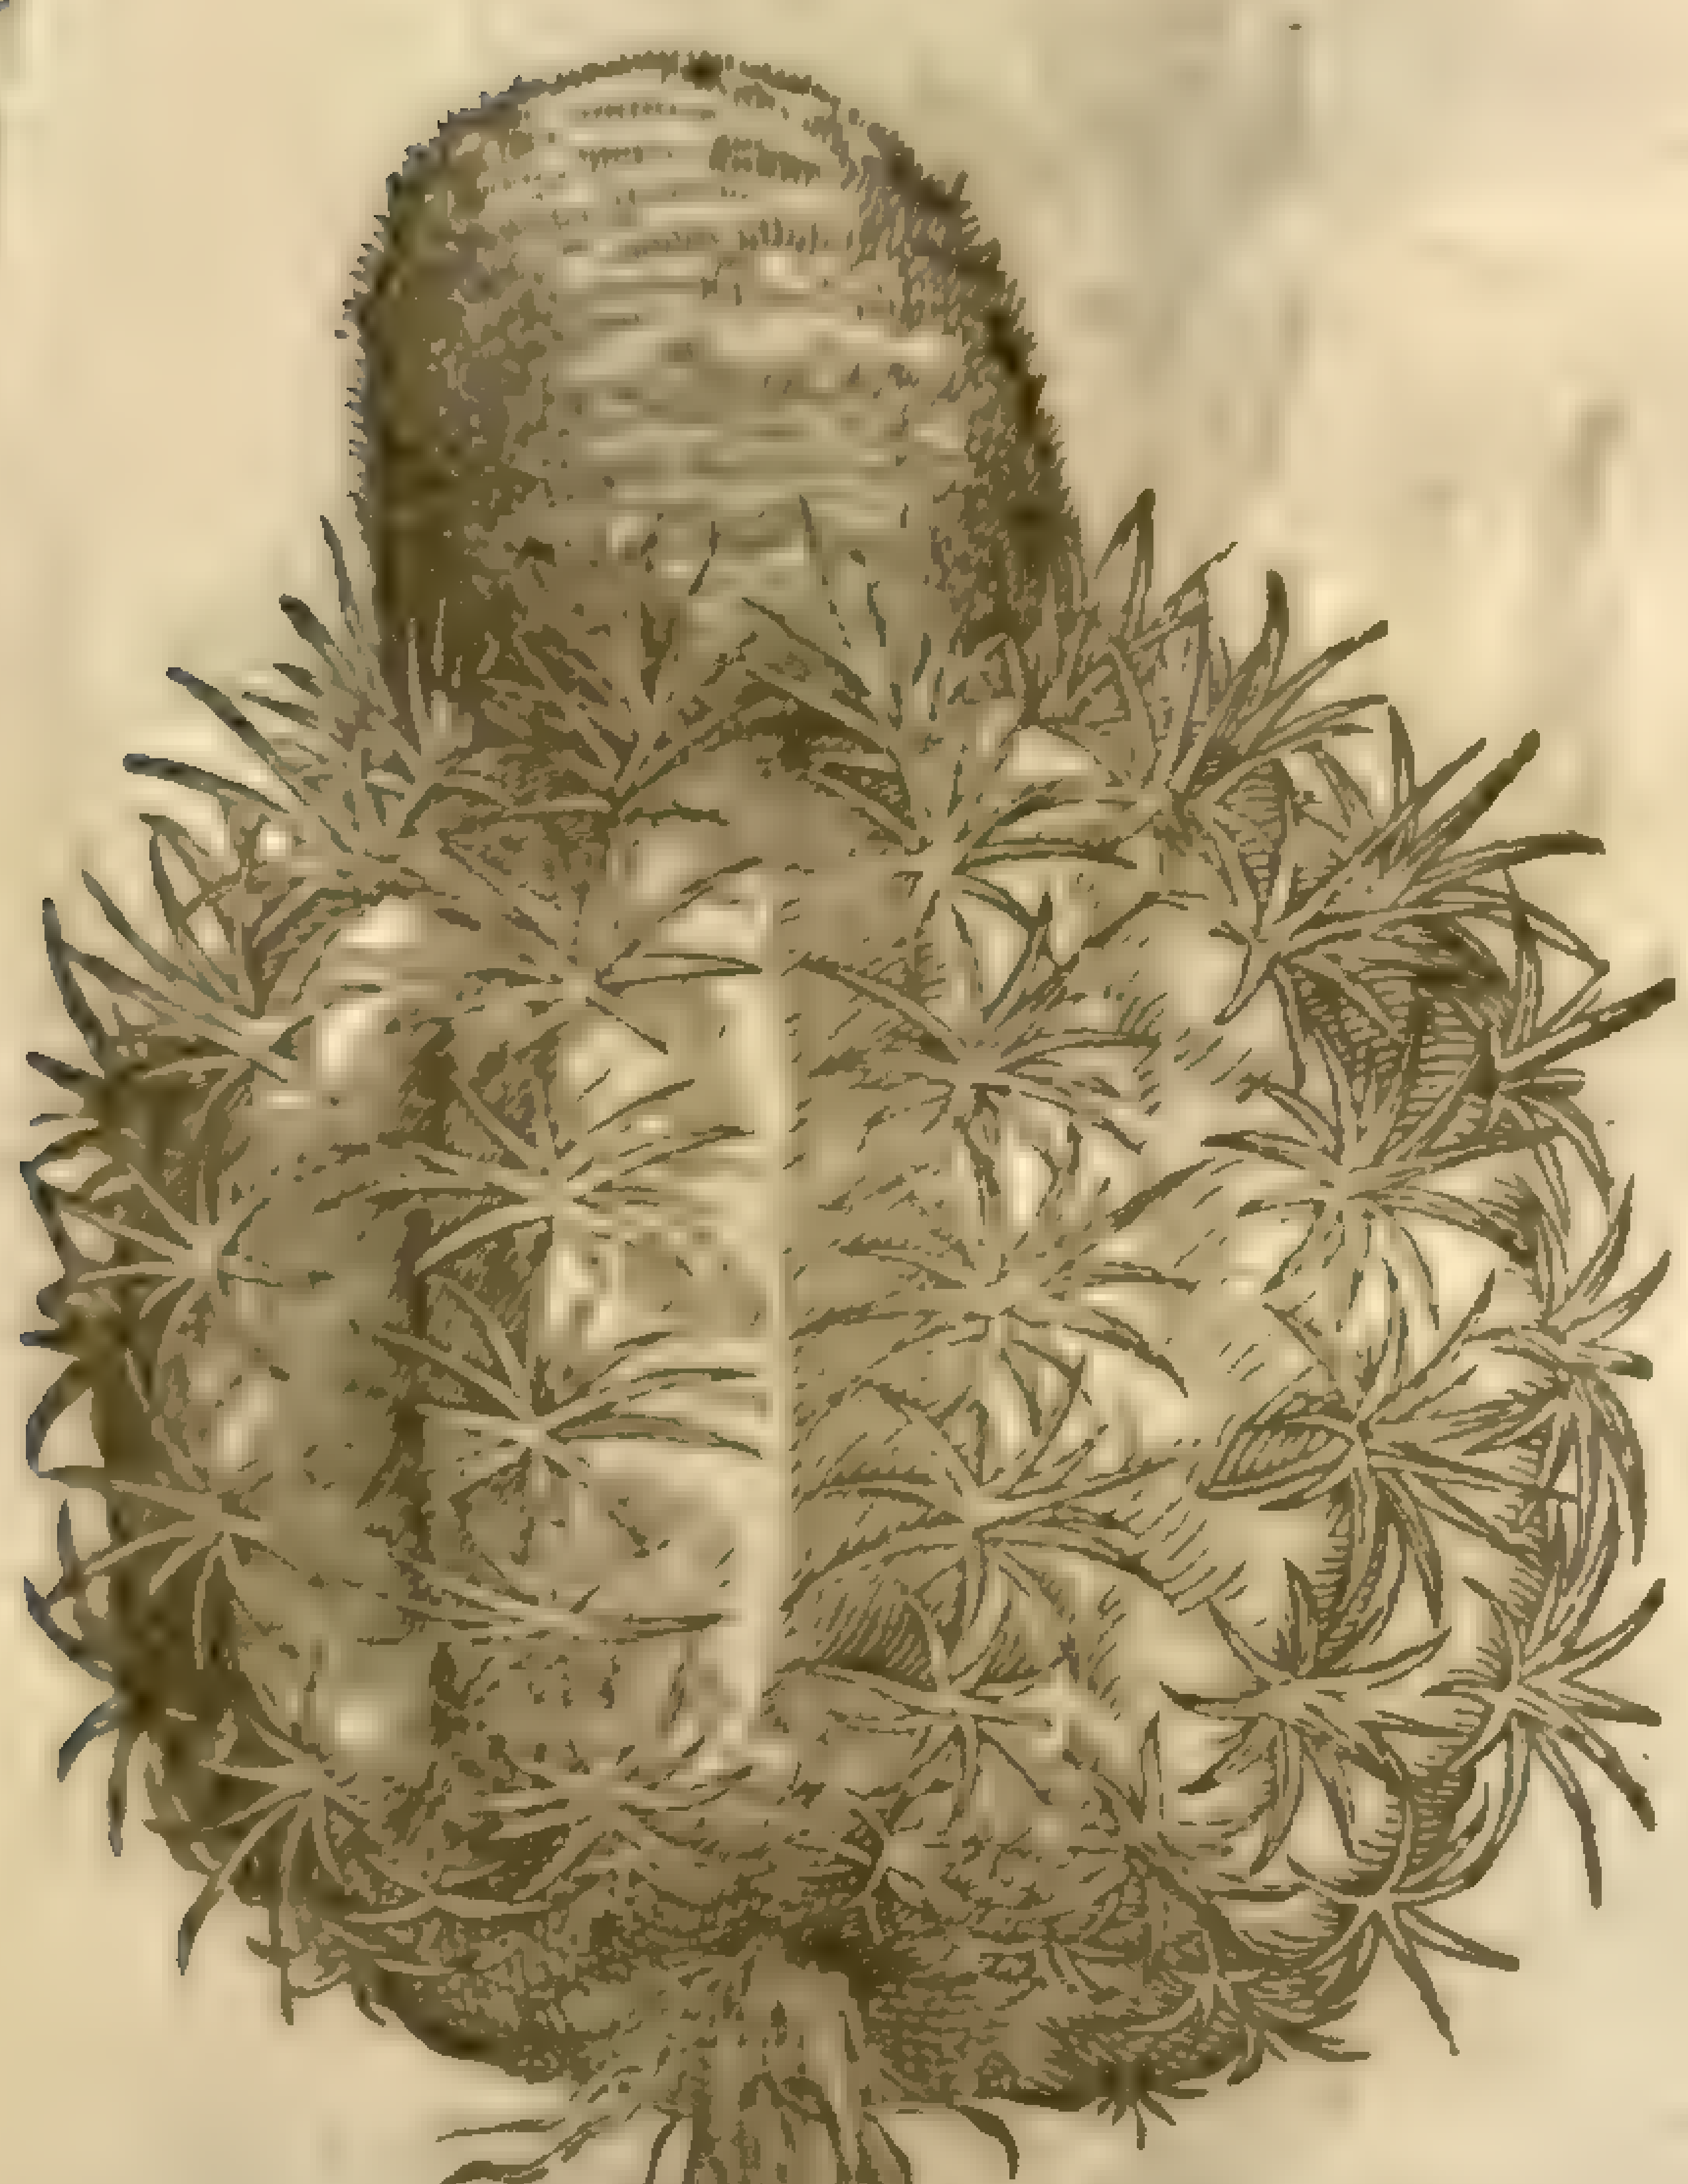
E This being ſtamped before the floure appeareth, ſaith *Pliny*, and the juyce preſſed forth, cauſeth haire to grow where it is pilled off, if the place be bathed with the juyce.

F The root of any of the wilde Thiſtles being boyled in water and drunke, is reported to make them dry that drinke it.

G It ſtrengtheneth the ſtomacke, and it is reported (if we beleeue it) that the ſame is alſo good for the matrix, that boyes may be engendred: for ſo *Chereas* of Athens hath writien, and *Glaucias*, who is thought to write moſt diligently of Thiſtles.

H This Thiſtle being chewed is good againſt a ſtinking breath. Thus farre *Pliny*, in his twentieth booke, *cap.* 23.

Chap. 491. *Of the Melon or Hedge-hog Thiſtle.*



Melocarduus Echinatus Pena & Lob.
The Hedge-hog Thiſtle.

¶ *The Deſcription.*

Who can but maruel at the rare and ſingular workemanſhip which the Lord God almighty hath ſhewed in this Thiſtle, called by the name *Echino-Melocactos*, or *Melo-carduus Echinatus*? This knobby or bunchy maſſe or lump is ſtrangely compact and context together, containing in it ſundry ſhapes, and formes, participating of a Pepon or Melon, and a Thiſtle, both being incorporate in one body; which is made after the forme of a cock of hay, broad and flat below, but ſharp toward the top, as bigge as a mans body from the belly vpward; on the outſide hereof are fourteene hard ribbes, deſcending from the crowne to the loweſt part, like the bunchy or out ſwelling rib of a Melon ſtanding out, and chanelled betweene: at the top or crowne of the plant iſſueth forth a fine ſilken cotton, wherewith it is full fraught: within which cotton or flockes lie hid certain ſmal ſheaths or cods, ſharpe at the point, and of a deep ſanguine colour, anſwering the cods of *Capſicum* or Indian pepper, not in ſhew only, but in colour, but the cods are ſomewhat ſmaller. The furrowed or chanelled ribs on the outſide are garniſhed or rather armed with many prickly ſtars, ſtanding in a compaſſe like ſharp crooked hornes or hookes, each ſtar conſiſting of ten or twelue prickes, wherewith the outward barke or pilling is garded, ſo that without hurt to the fingers it cannot be touched: this rinde is hard, thicke and like vnto Aloes, of the colour of the Cucumber: the fleſh or inner pulpe is white, fat, wateriſh, of taſte ſoure, vnſauory and cooling, much like vnto the meat of a raw Melon or Pompion. This plant groweth without leafe or ſtalke, as our Northerne Thiſtle doth, called *Carduus Acaulos*, and is bigger than the largeſt

Pompion: the roots ars ſmall, ſpreading farre abroad in the ground, and conſiſting of blacke and tough twigs, which cannot endure the injury of our cold clymate.

¶ *The Place.*

This admirable Thiſtle groweth vpon the cliffes and grauelly grounds neere vnto the ſea ſide, in the Iſlands of the Weſt-Indies, called S. *Margarets* and S. *Iohns* Iſle, neere vnto *Puerto rico*, or *Porto rico*, and other places in thoſe countries, by the relation of diuers trauellers that haue journied into thoſe parts, who haue brought me the plant it ſelfe with his ſeed; the which would not grow in my garden by reaſon of the coldneſſe of the clymate.

¶ *The Time.*

It groweth, floureth, and flouriſheth all the yeare long, as doe many other plants of thoſe Countries.

¶ *The Names.*

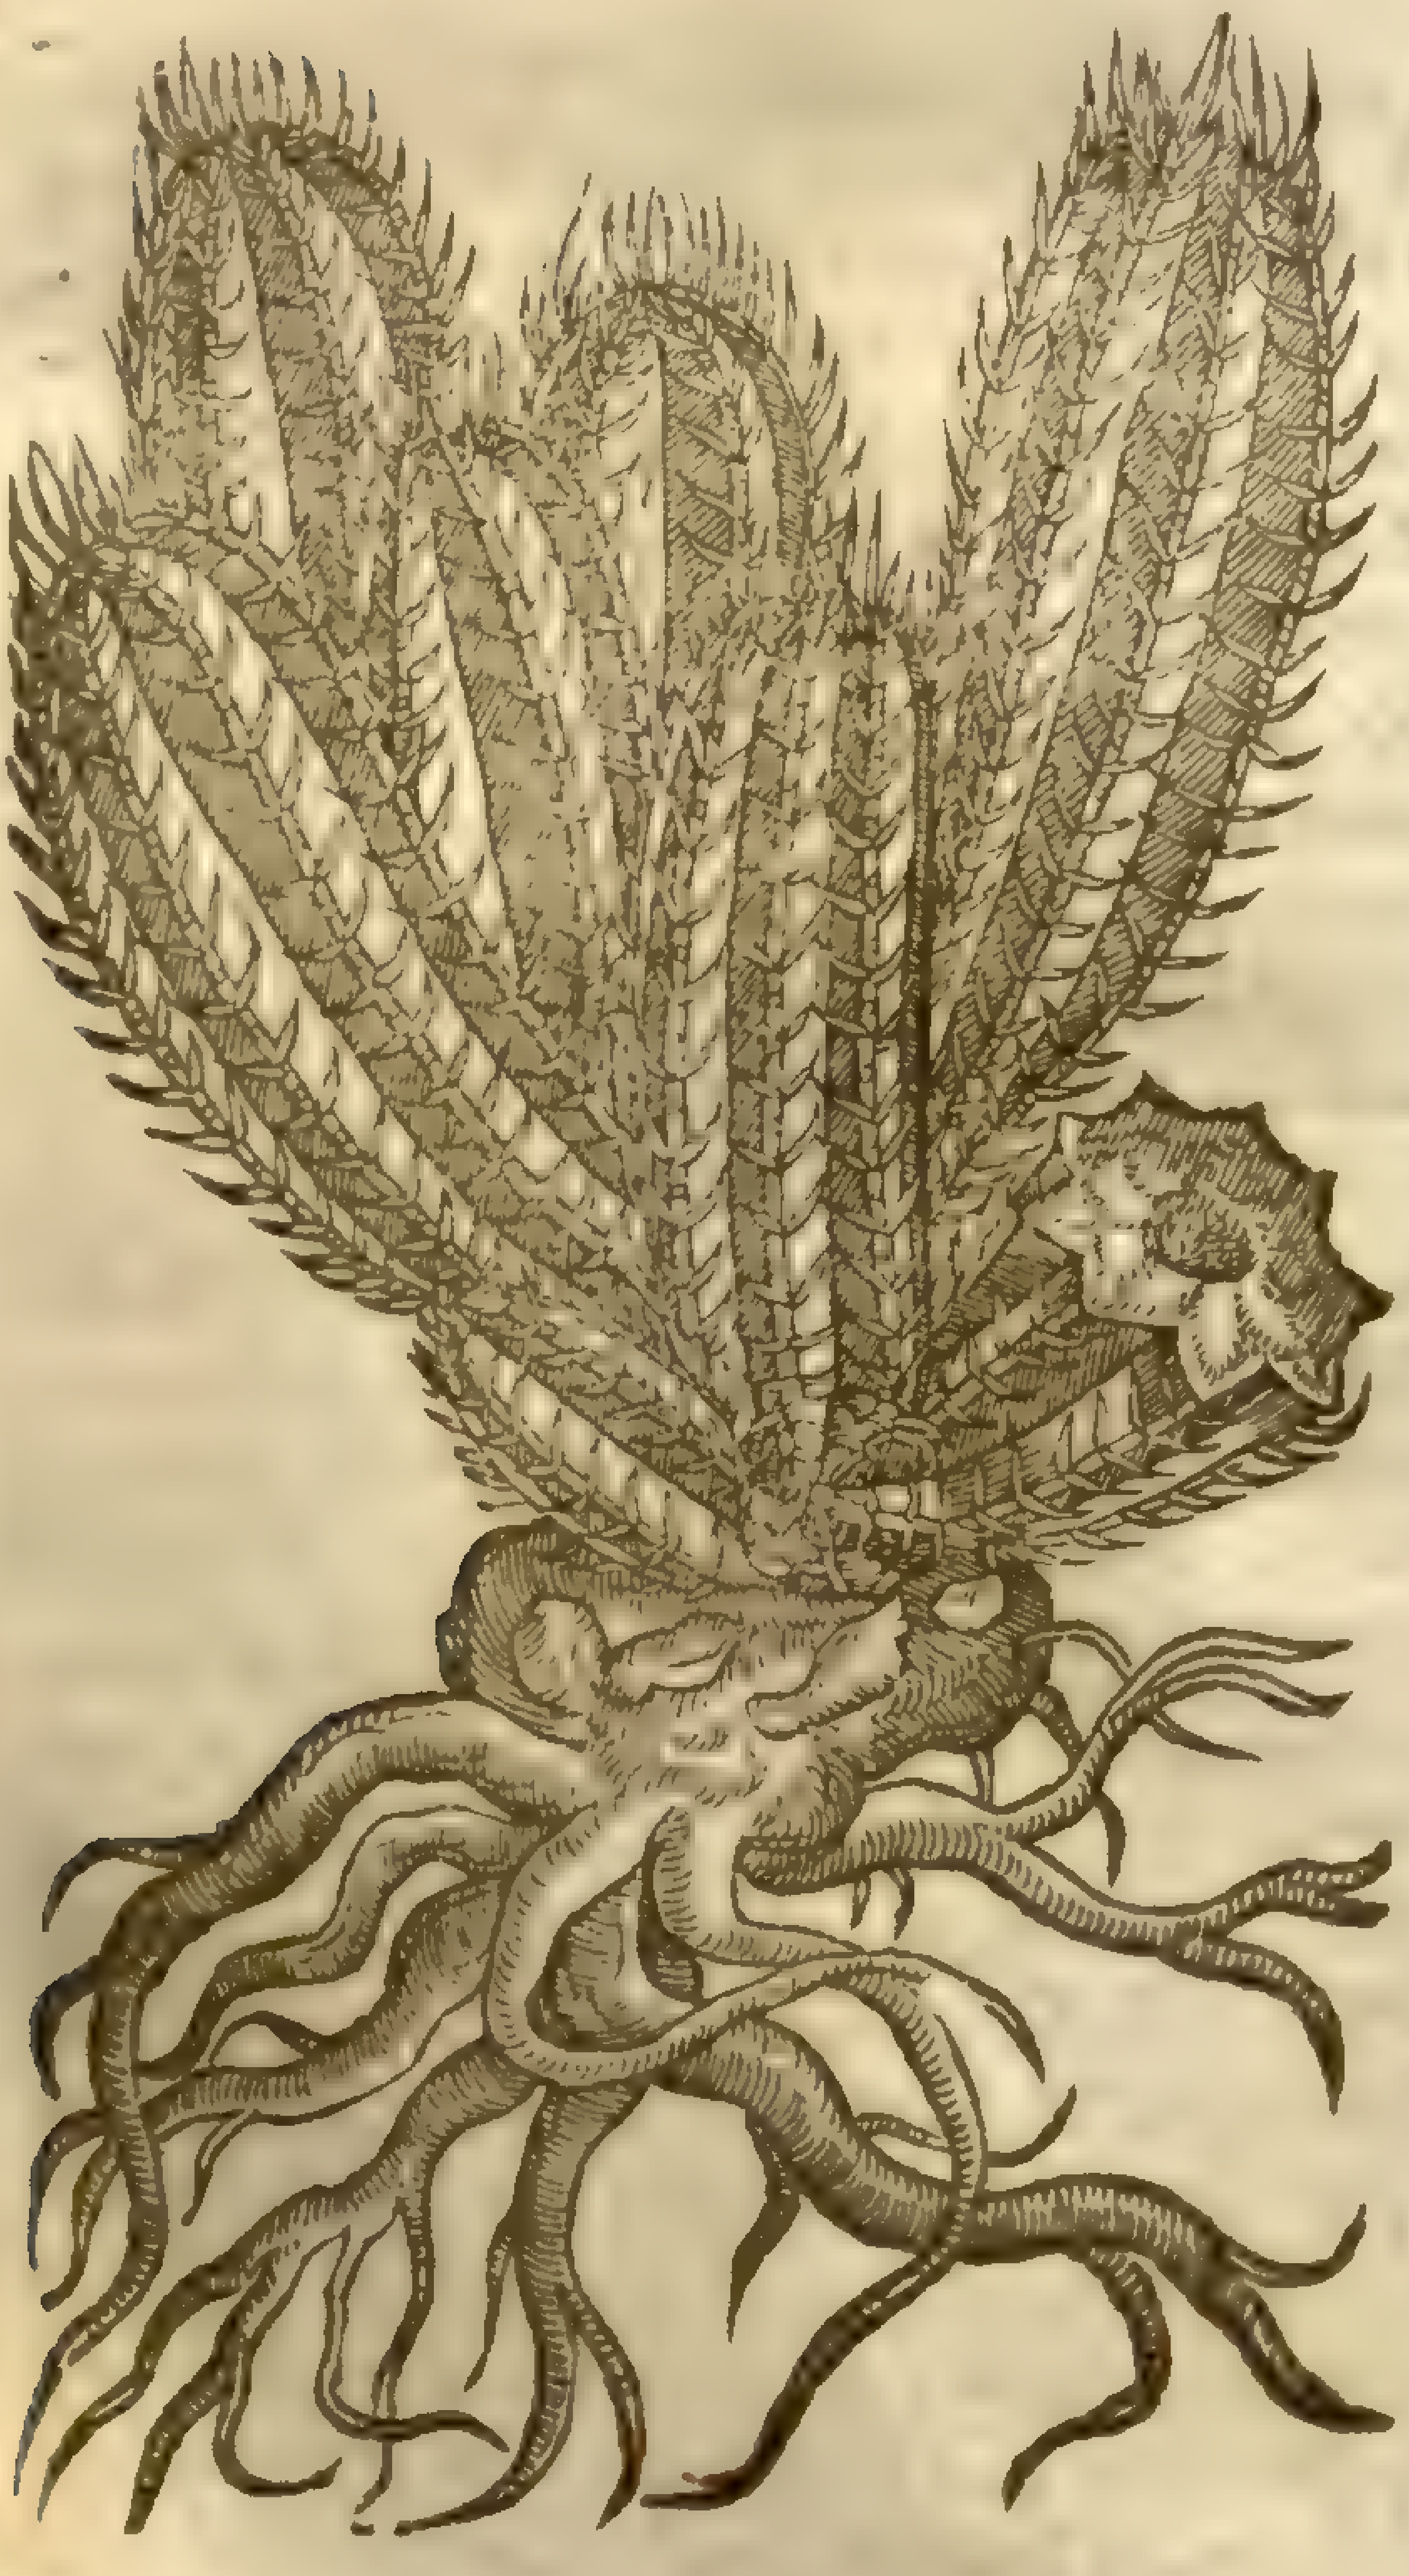
It is called, *Carduus Echinatus*, *Melocarduus Echinatus*, and *Echino Melocactos*: in Engliſh, the Hedge-hog Thiſtle, or prickly Melon Thiſtle. ‡ Such as are curious may ſee more hereof in *Cluſius* his *Exoticks, lib. 4. cap. 24.* ‡

¶ *The Temperature and Vertues.*

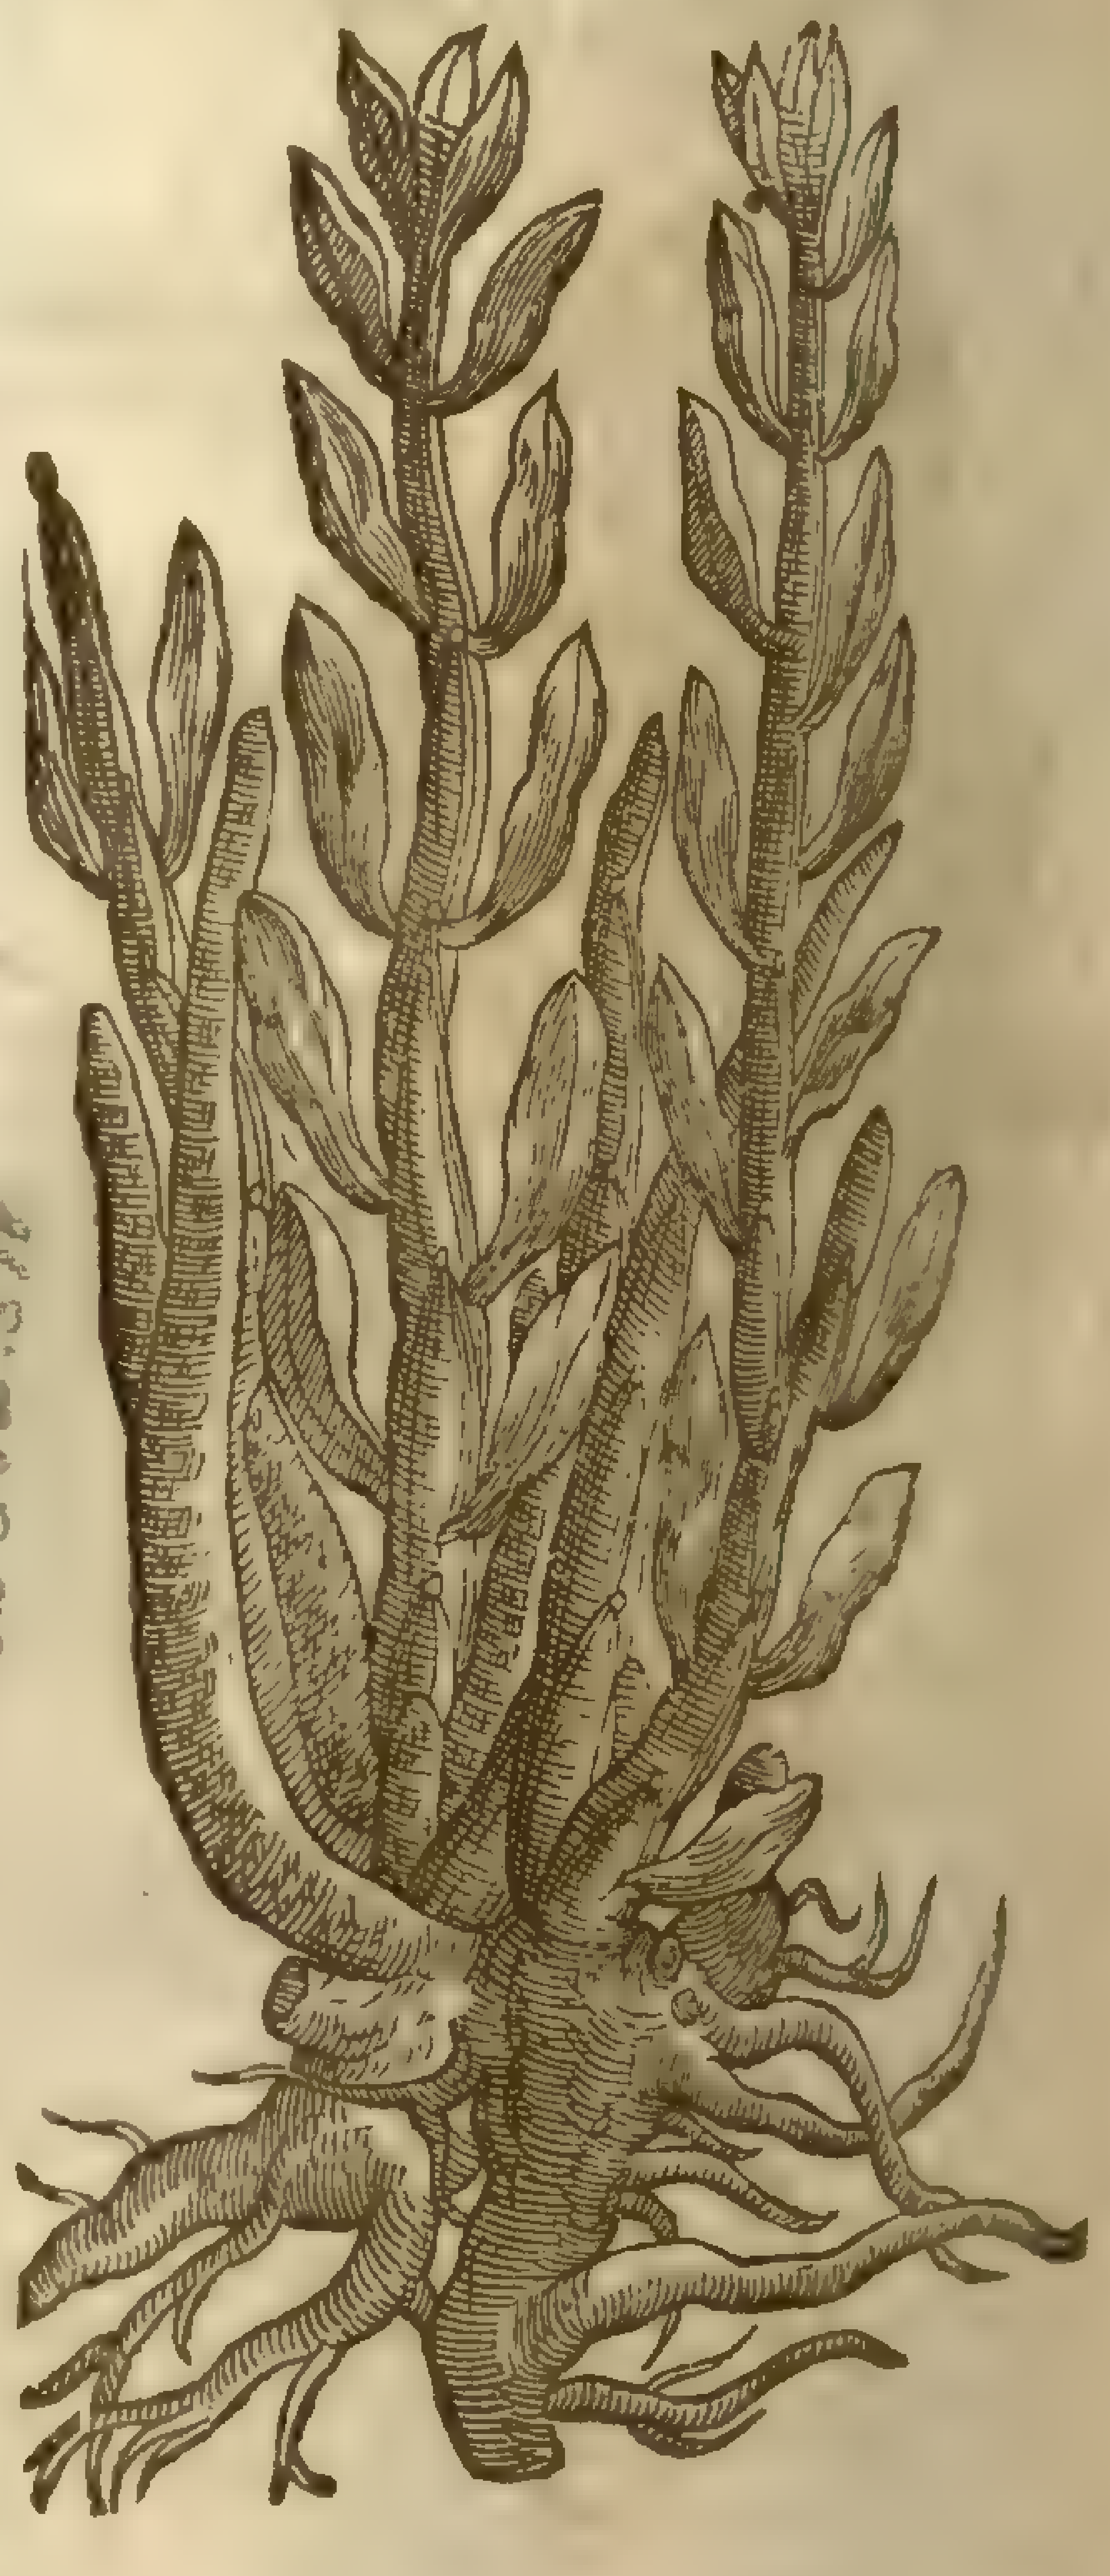
There is not any thing extant ſet forth of the antient or of the later Writers, neither by any that haue trauelled from the Indies themſelues: therefore we leaue it to a further conſideration.

Chap. 492. *Of the gummie Thiſtle, called Euphorbium.*

[illegible]



1 *Euphorbium.*
The poyſonous gum Thiſtle.



2 *Anteuphorbium.*
The Antidote againſt the poyſonous Thiſtle.

Cacalia antieuphorbium, Ex Dod. 378

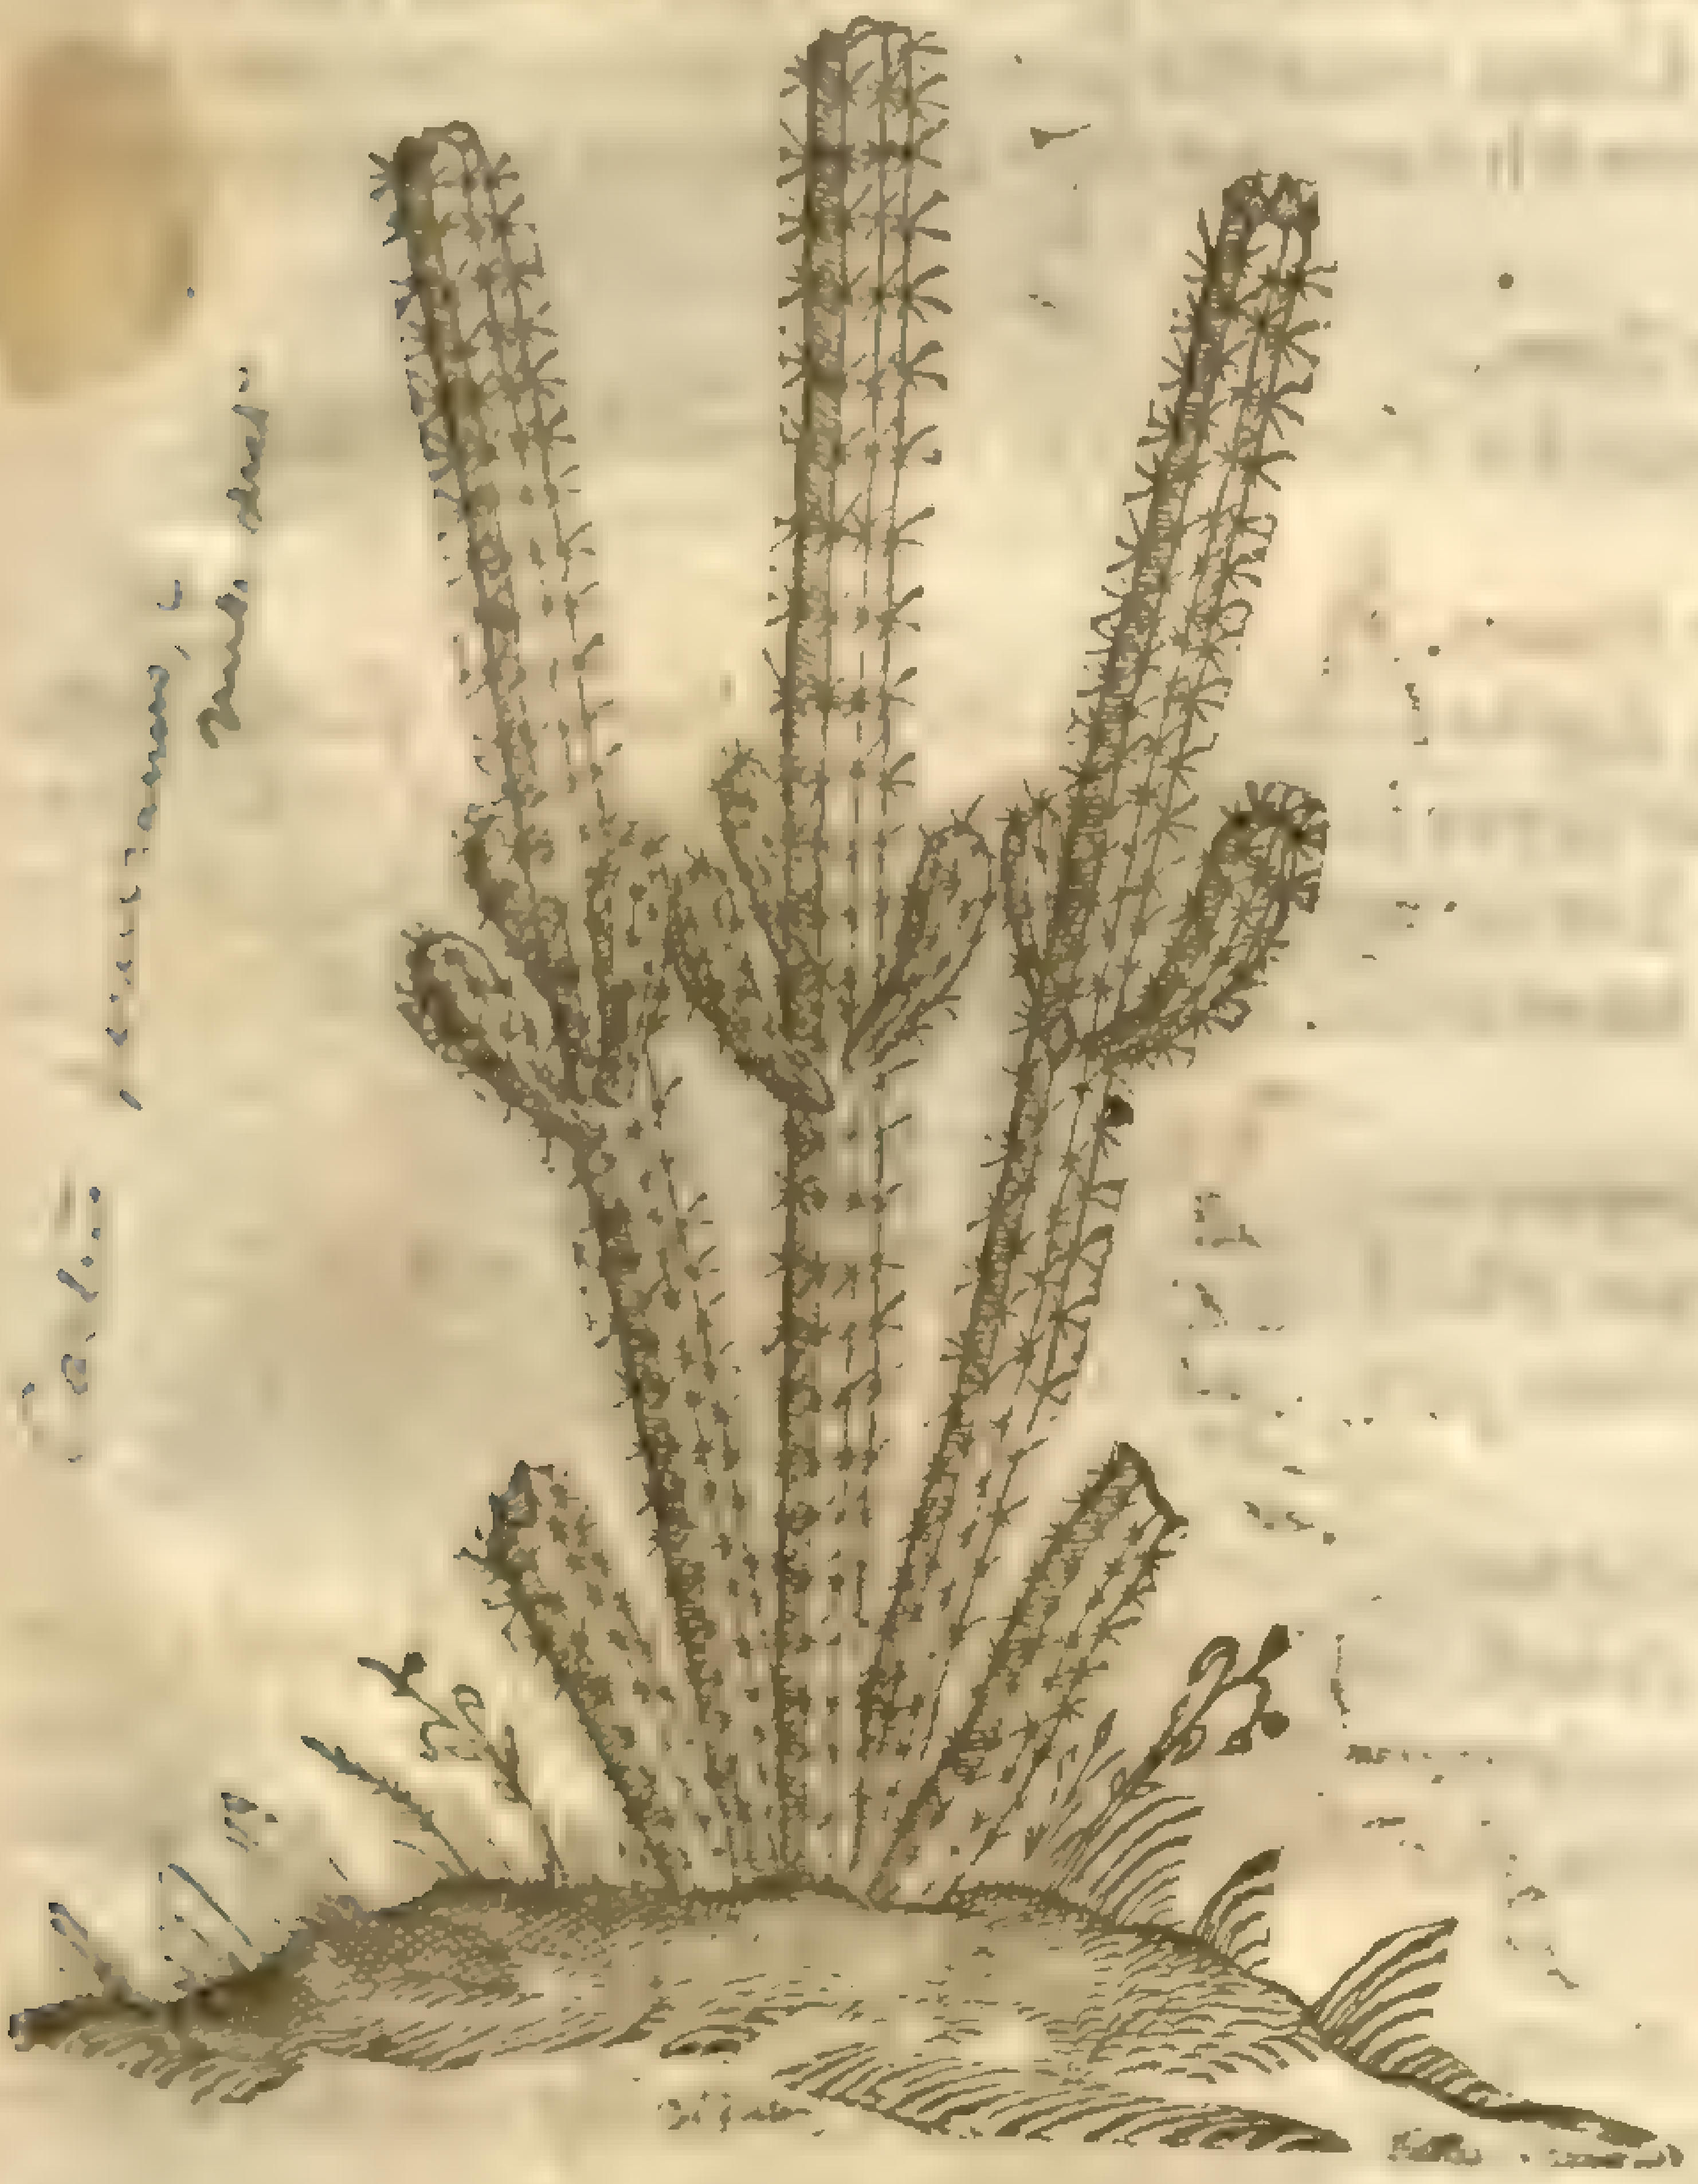
¶ *The Deſcription.*

1 Euphorbium (whereout that liquor or gum called in ſhops *Euphorbium* is extracted) hath very great thicke groſſe and ſpreading roots, diſperſed far abroad in the ground: from which ariſe long and round leaues, almoſt like the fruit of a great Cucumber, a foot and a halfe long, ribbed, walled, and furrowed like vnto the Melon: theſe branched ribs are ſet or

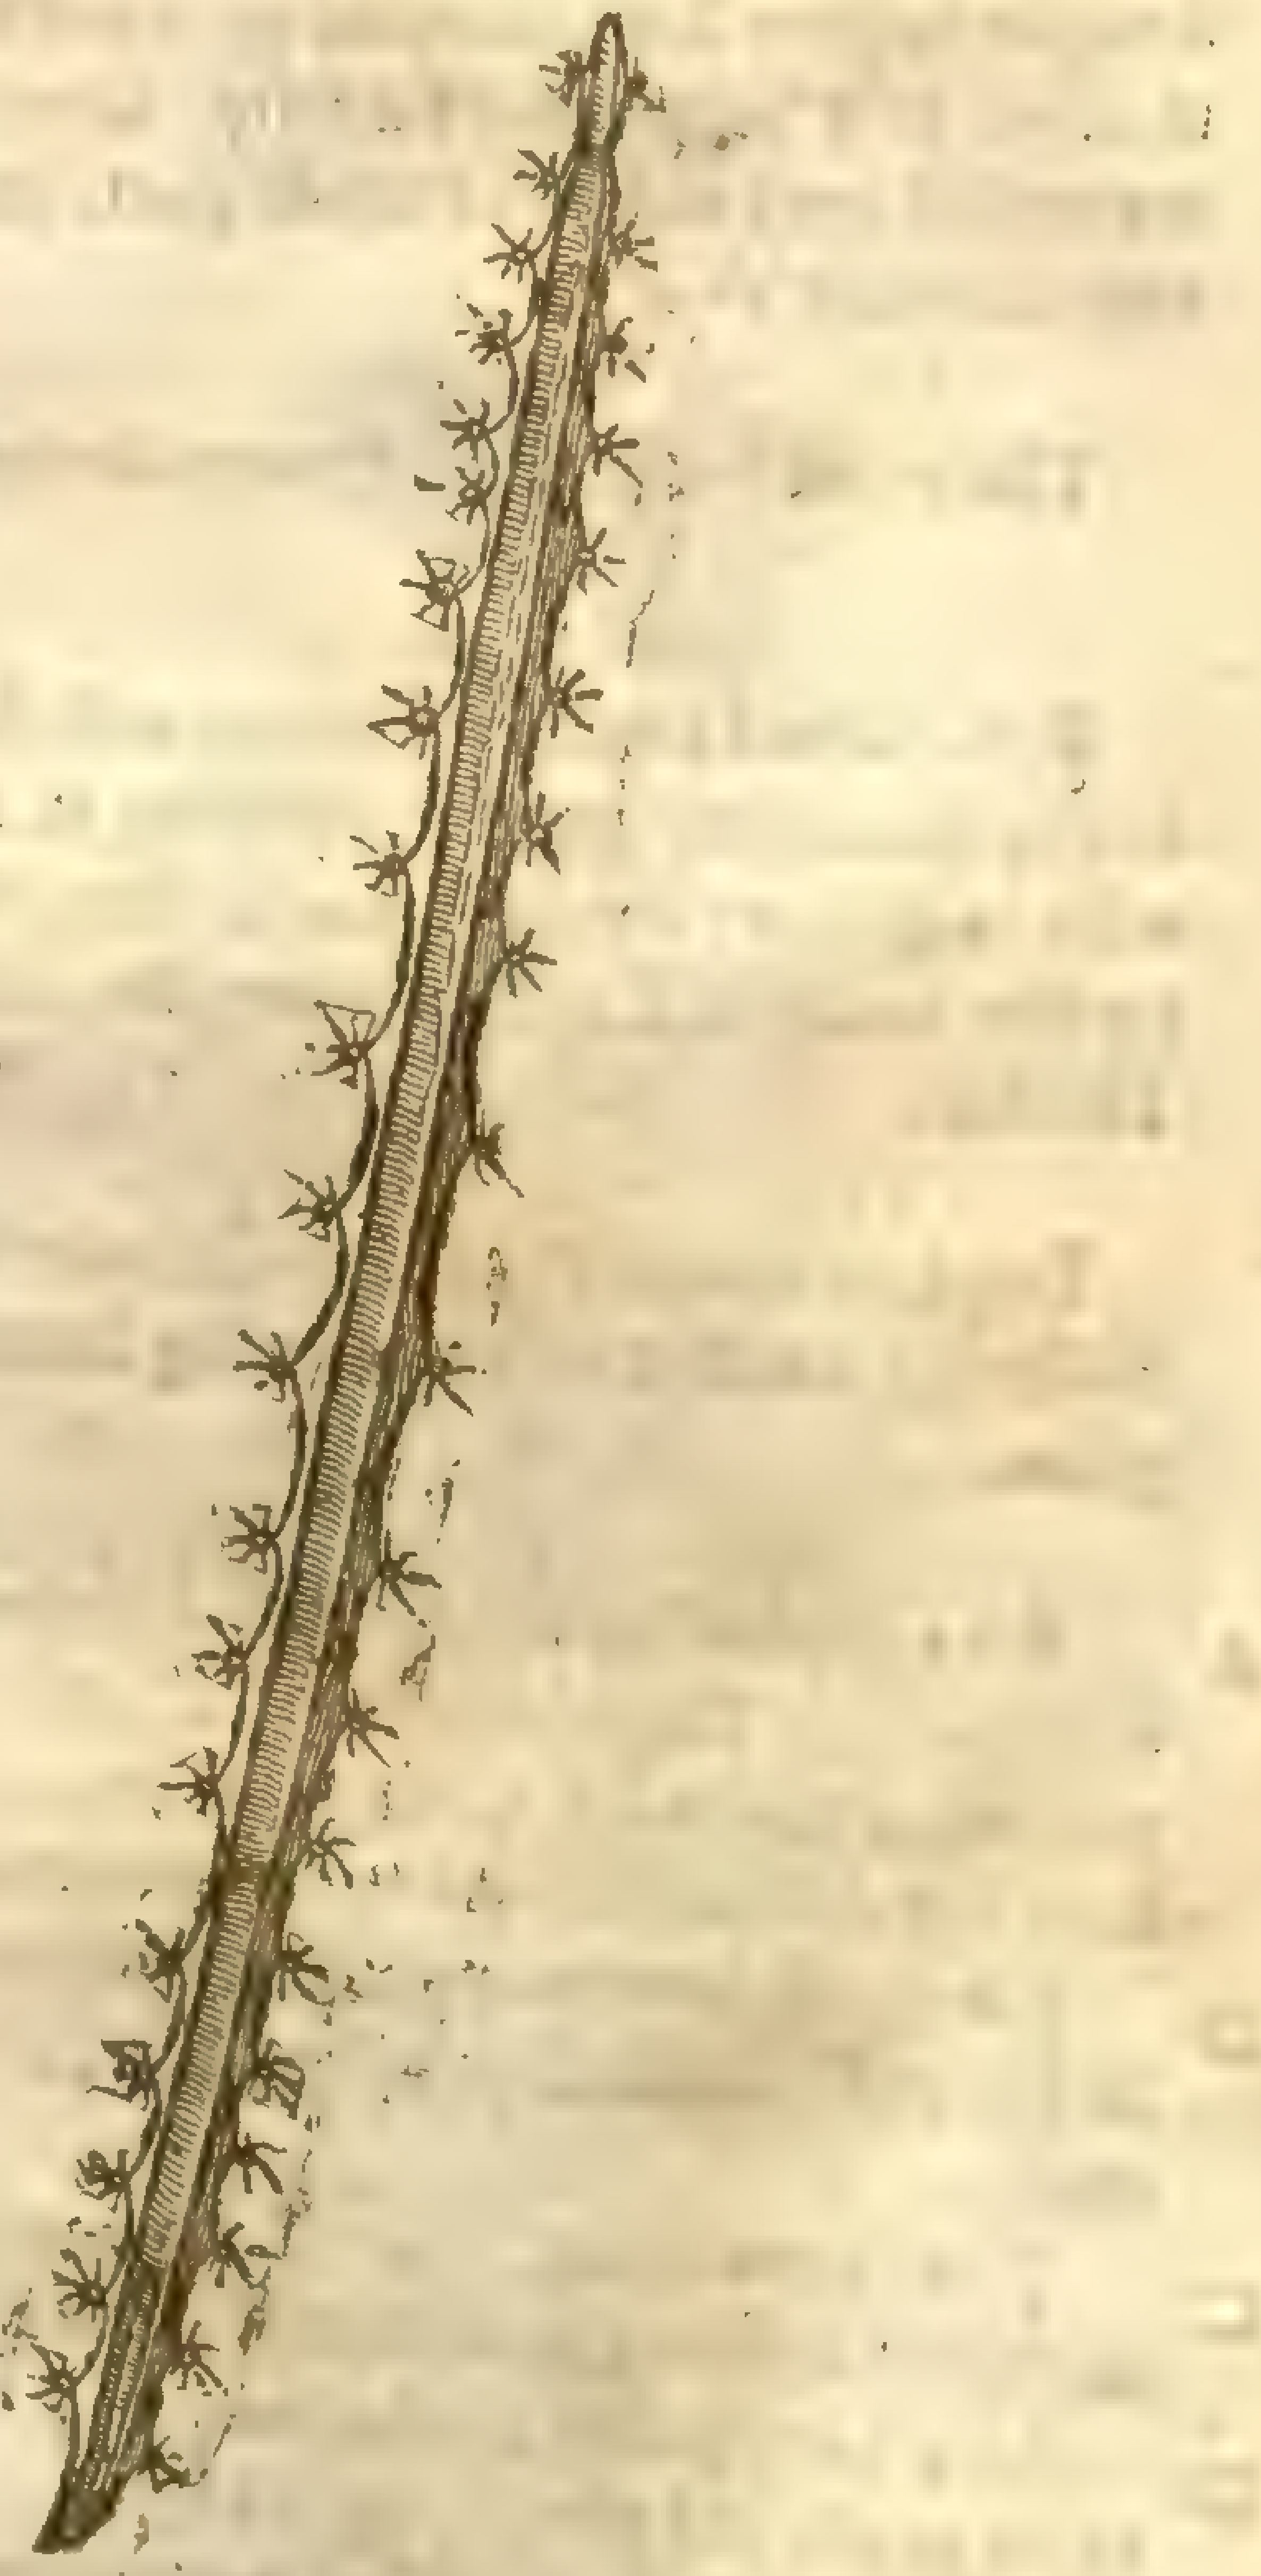
armed for the moſt part with certaine prickles ſtanding by couples, the point or ſharpe end of one garding one way, and the point of another looking directly a cleane contrary way: theſe prickes are often found in the gumme it ſelfe, which is brought unto vs from Libya and other parts: the leaues hereof being planted in the ground will take root well, and bring forth great increaſe, which thing I haue proued true in my garden: it hath periſhed againe at the firſt approch of Winter. The ſap or liquor that is extracted out of this plant is of the colour and ſubſtance of the Creame of Milke; it burneth the mouth extremely, and the duſt or pouder doth very much annoy the head and the parts thereabout, cauſing great and vehement ſneeſing.

1 This rare plant called *Anteuphorbium* hath a very thicke groſſe and farre ſpreading root, very like vnto *Euphorbium*; from which riſeth vp many round greene and fleſhie ſtalkes, whereupon doe grow thicke leaues like Purſlane, but longer, thicker, and fatter: the whole plant is full of cold and clammie moiſture, which repreſſeth the ſcortching force of *Euphorbium*; and it wholly ſeemes at the firſt view to be a branch of greene Corall.

3 *Cereus Peruvianus ſpinoſus Lobelij.*
The Torch-Thiſtle or thorny Euphorbium.



4 *Calamus Peruvianus ſpinoſus Lobelij.*
The thorny reed of Peru.



3 There is not among the ſtrange and admirable plants of the world any one that giues more cauſe of maruell, or more moueth the minde to honor and laud the Creator, than this plant, which is called of the Indians in their mother tongue *Vragua*, which is as much to ſay, a torch, taper, or wax candle; whereupon it hath been called in Latine by thoſe that vnderſtood the Indian tongue, *Cereus*, or a Torch. This admirable plant riſeth vp to the height of a ſpeare of twenty foot long, although the figure expreſſe not the ſame; the reaſon is, the plant when the figure was drawne came to our view broken: it hath diuers bunches and vallies, euen as is to be ſeene in the ſides of the Cucumber, that is, furrowed, guttered, or chamfered alongſt the ſame, and as it were laid by a direct line, with a welt from one end vnto the other: vpon which welt or line doe ſtand ſmall ſtar-like Thiſtles, ſharpe as needles, and of the colour of thoſe of the Melon Thiſtle, that is to ſay, of a browne colour: the trunke or body is of the bigneſſe of a mans arme, or a cable rope; from the middle whereof thruſt forth diuers knobby elbowes of the ſame ſubſtance, and armed with the like prickles that the body of the trunke is ſet withall: the whole plant is thicke, fat, and full of a fleſhie ſubſtance, hauing much juyce like that of Aloes, when it is hardned, and of a bitter taſte: the

floures grow at the top or extreme point of the plant: after which follow fruit in ſhape like a fig, full of a red juyce, which being touched ſtaineth the hands of the colour of red leade: the taſte is not vnpleaſant.

4 There hath been brought from the Indies a prickly reed of the bigneſſe of a good big flaſk, of the length of ſix or eight foot, chamfered and furrowed, hauing vpon two ſides growing vnto it an vneuen membrane or skinny ſubſtance, as it were a jag or welt ſet vpon the wing of a garment, and vpon the very point of euery cut or jagge armed with moſt ſharpe prickles: the whole trunk is filled full of a ſpongeous ſubſtance, ſuch as is in the hollownes of the brier or bramble; amongſt the which is to be ſeene as it were the pillings of Onions, wherin are often found liuing things that at the firſt ſeeme to be dead. The plant is ſtrange, and brought dry from the Indies, therefore wee cannot write ſo abſolutely hereof as we deſire; referring what more might be ſaid to a further conſideration or ſecond edition.

¶ *The Place.*

Theſe plants grow vpon Mount Atlas, in Lybia, in moſt of the Iſlands of the Mediterranean ſea, in all the coaſt of Barbary, eſpecially in S. Crux neere vnto the ſea ſide, in a barren place there called by the Engliſh-men Halfe Hanneken, which place is appointed for Merchants to confer of their buſineſſe, euen as the Exchange in London is: from which place my friend Mr. *William M*, a right expert Surgeon, did procure me the plants of them for my garden, by his ſeruant that he ſent thither as a Surgeon of a ſhip. Since which time I haue receiued plants of diuers others that haue trauelled into other of thoſe parts and coaſts: notwithſtanding they haue not endured the cold of our extreme Winter.

¶ *The Time.*

They put forth their leaues in the Spring time, and wither away at the approch of Winter.

¶ *The Names.*

It is called both in Greeke and Latine, Εὐφόρβιον, *Euphorbium*: *Pliny* in one place putteth the herbe in the feminine gender, naming it *Euphorbia*: the juyce is called alſo *Euphorbion*, and ſo it is likewiſe in ſhops: we are faine in Engliſh to vſe the Latine word, and to call both the herbe and juyce by the name of Euphorbium, for other name we haue none: it may be called in Engliſh, the gum Thiſtle.

¶ *The Temperature.*

Euphorbium (that is to ſay, the congealed juyce which we vſe) is of a very hot, and, as *Galen* teſtifieth, cauſticke or burning faculty, and of thinne parts: it is alſo hot and dry in the fourth degree.

¶ *The Vertues.*

A An emplaiſter made with the gumme Euphorbium, and twelue times ſo much oyle, and a little wax, is very ſingular againſt all aches of the joynts, lameneſſe, palſies, crampes, and ſhrinking of ſinewes, as *Galen, lib.4. de medicamentis ſecundum genera*, declareth at large, which to recite at this preſent would but trouble you ouermuch.

B Euphorbium mingled with oyle of Bay and Beares greaſe cureth the ſcurfe and ſcalds of the head, and pildneſſe, cauſing the haire to grow againe, and other bare places, being annointed therewith.

C The ſame mingled with oyle, and applied to the temples of ſuch as are very ſleepy, and troubled with the lethargie, doth waken and quicken their ſpirits againe.

D If it be applied to the nuque or nape of the necke, it bringeth their ſpeech againe that haue loſt it by reaſon of the Apoplexie.

E Euphorbium mingled with vinegre and applied taketh away all foule and ill-fauoured ſpots, in what part of the body ſoeuer they be.

F Being mixed with oyle of Wall-floures, as *Meſues* ſaith, and with any other oyle or oyntments, it quickely heateth ſuch parts as are ouer cold.

G It is likewiſe a remedy againſt old paines in the huckle bones, called the Sciatica.

H *Aëtius*, *Paulus*, *Actuarius*, and *Meſue* doe report, That if it bee inwardly taken it purgeth by ſiege water and flegme; but withall it ſetteth on fire, ſcorcheth and fretteth, not onely the throat and mouth, but alſo the ſtomacke, liuer, and the reſt of the entrals, and inflames the whole body.

I For that cauſe it muſt not be beaten ſmall, and it is to be tempered with ſuch things as allay the heate and ſharpeneſſe thereof, and that make glib and ſlippery; of which things there muſt bee ſuch a quantitie, as that it may bee ſufficient to couer all ouer the ſuperficiall or outward part thereof.

K But it is a hard thing ſo to couer and fold it vp, or to mix it, as that it will not burne or ſcorch. For though it be tempered with neuer ſo much oyle, if it be outwardly applied it raiſeth bliſters, eſpecially in them that haue ſoft and tender fleſh, and therefore it is better not to take it inwardly.

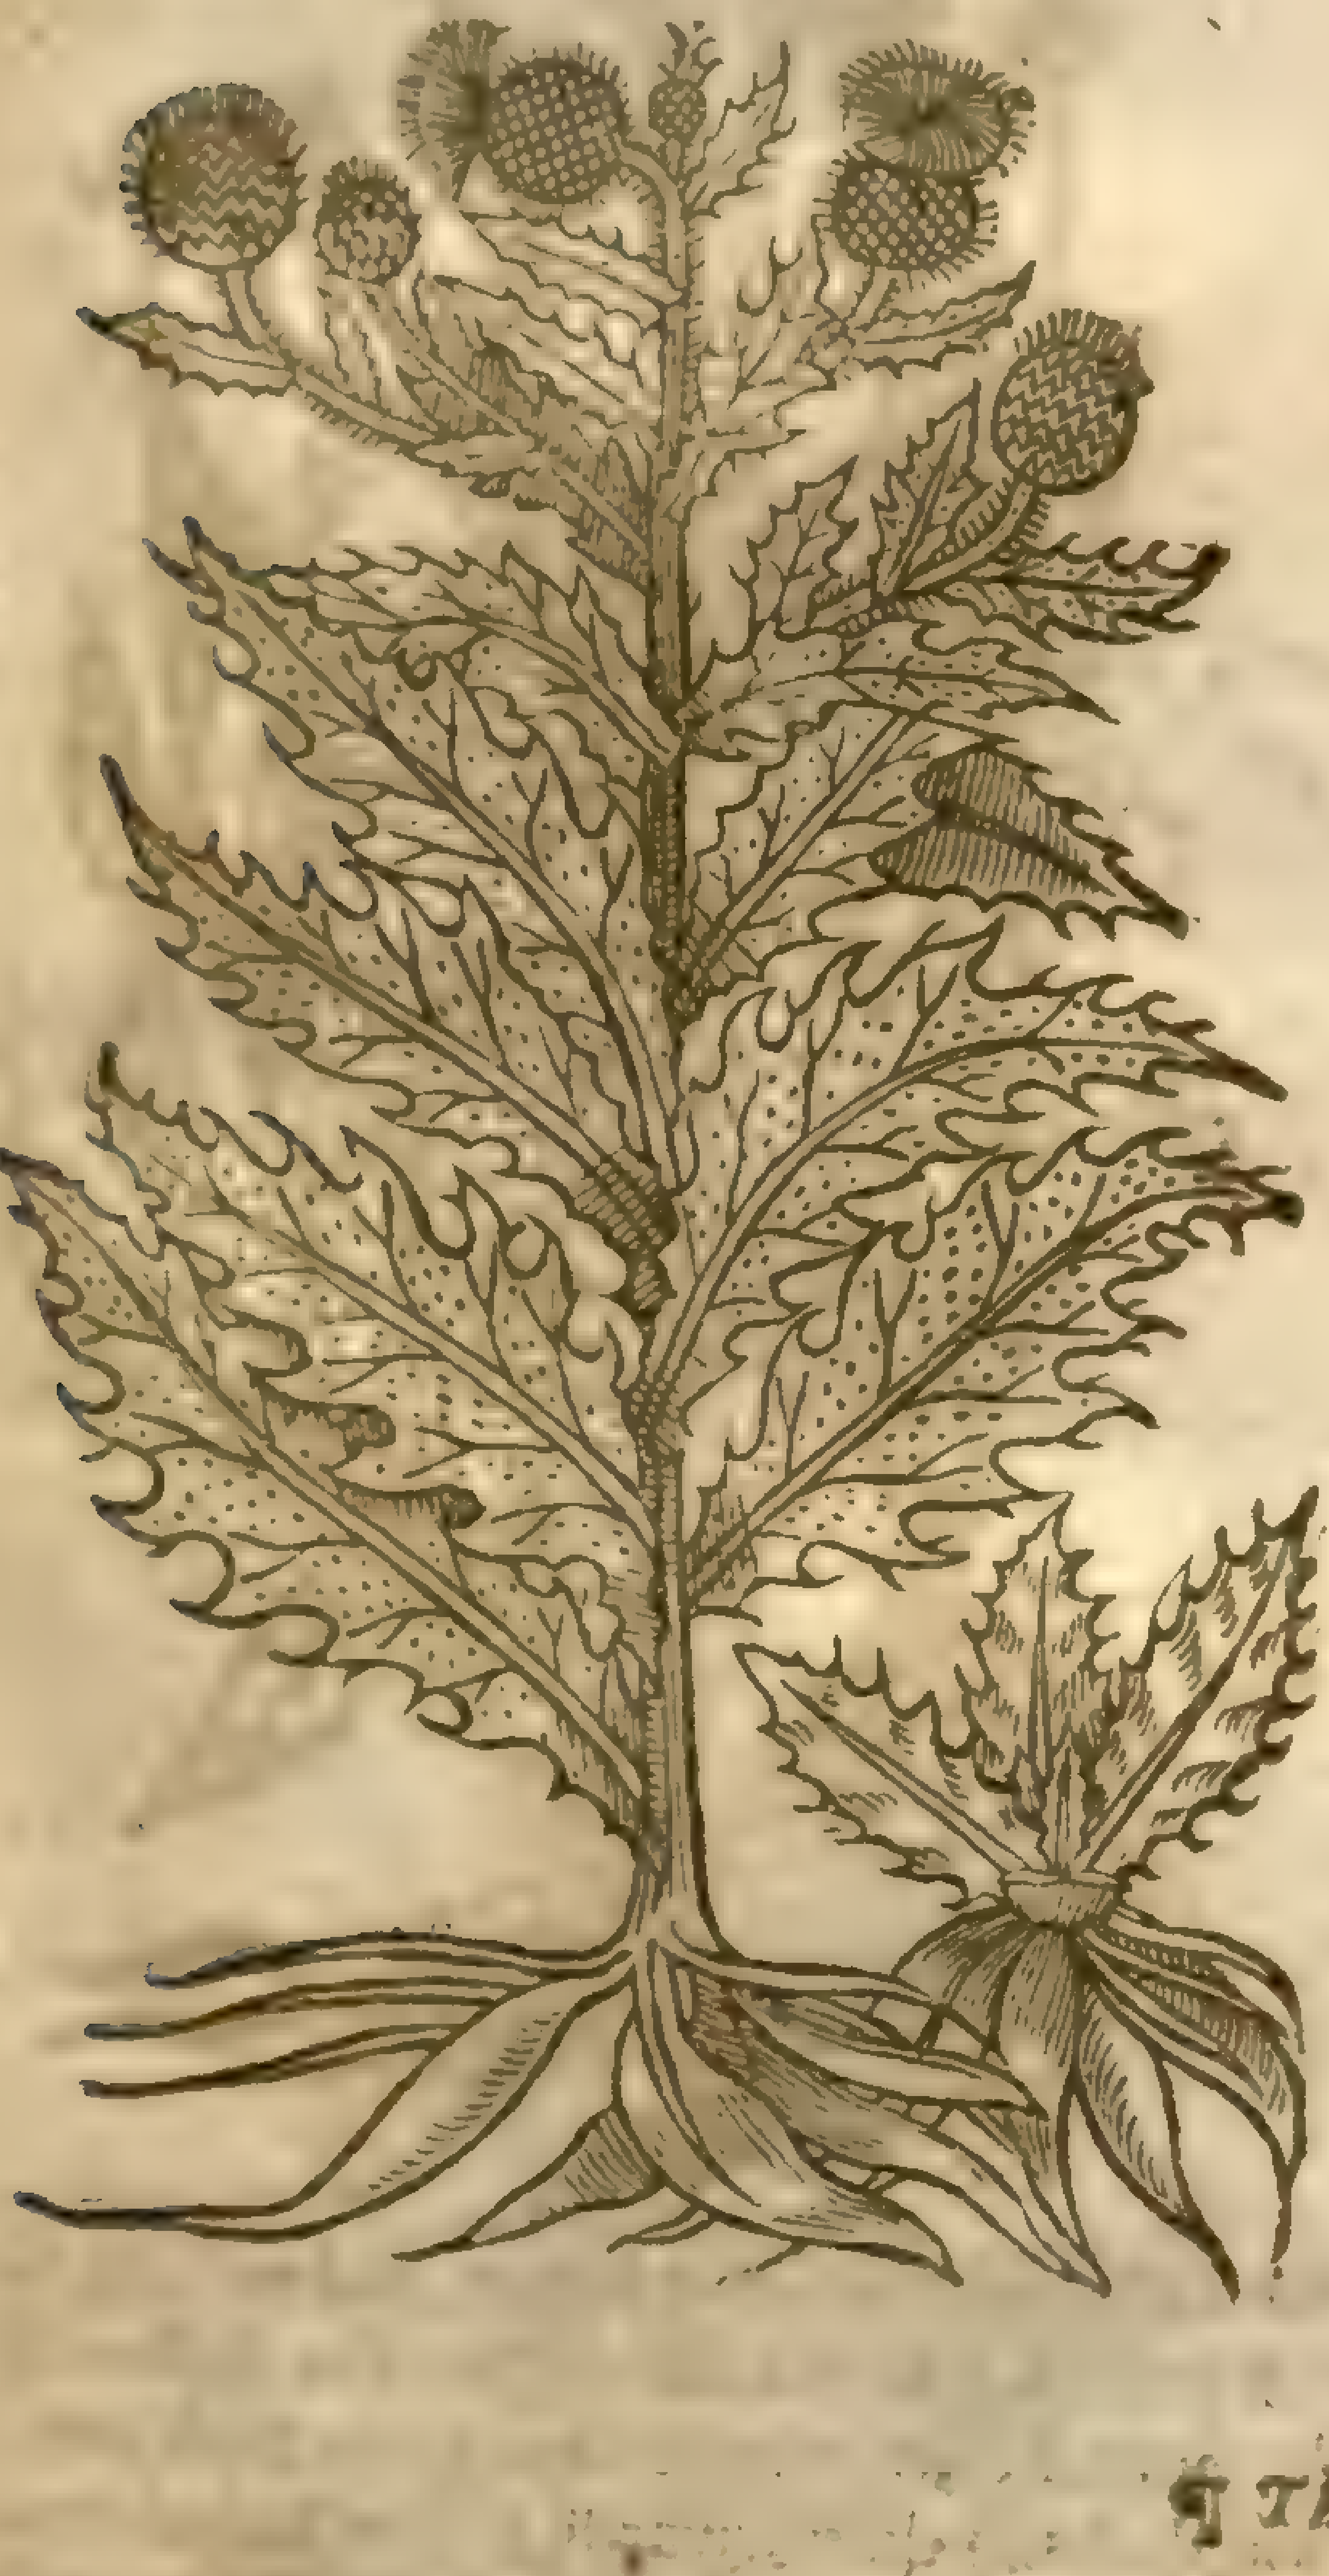
It is troubleſome to beat it, vnleſſe the noſthrils be carefully ſtopt and defended; for if it hap- L
pen that the hot ſharpneſſe thereof do enter into the noſe, it cauſeth itching, and moueth neeſing, and after that by reaſon of the extremitie of the heate, it drawes out aboundance of flegme and filth, and laſt of all bloud, not without great quantitie of teares.

But againſt the hot ſharpneſſe of Euphorbium, it is reported that the inhabitants are remedied M
by a certaine herb, which of the effect and contrarie faculties is named *Anteuphorbium*. This plant alſo is full of juice, nothing at all hot and ſharpe, but coole and ſlimy, allaying the heat and ſharpneſſe of *Euphorbium*. We haue not yet learned That the old Writers haue ſet downe any thing as touching this herb: notwithſtanding it ſeems to be a kinde of Orpine, which is the antidote or counterpoiſon againſt the venomous poiſon of *Euphorbium*.

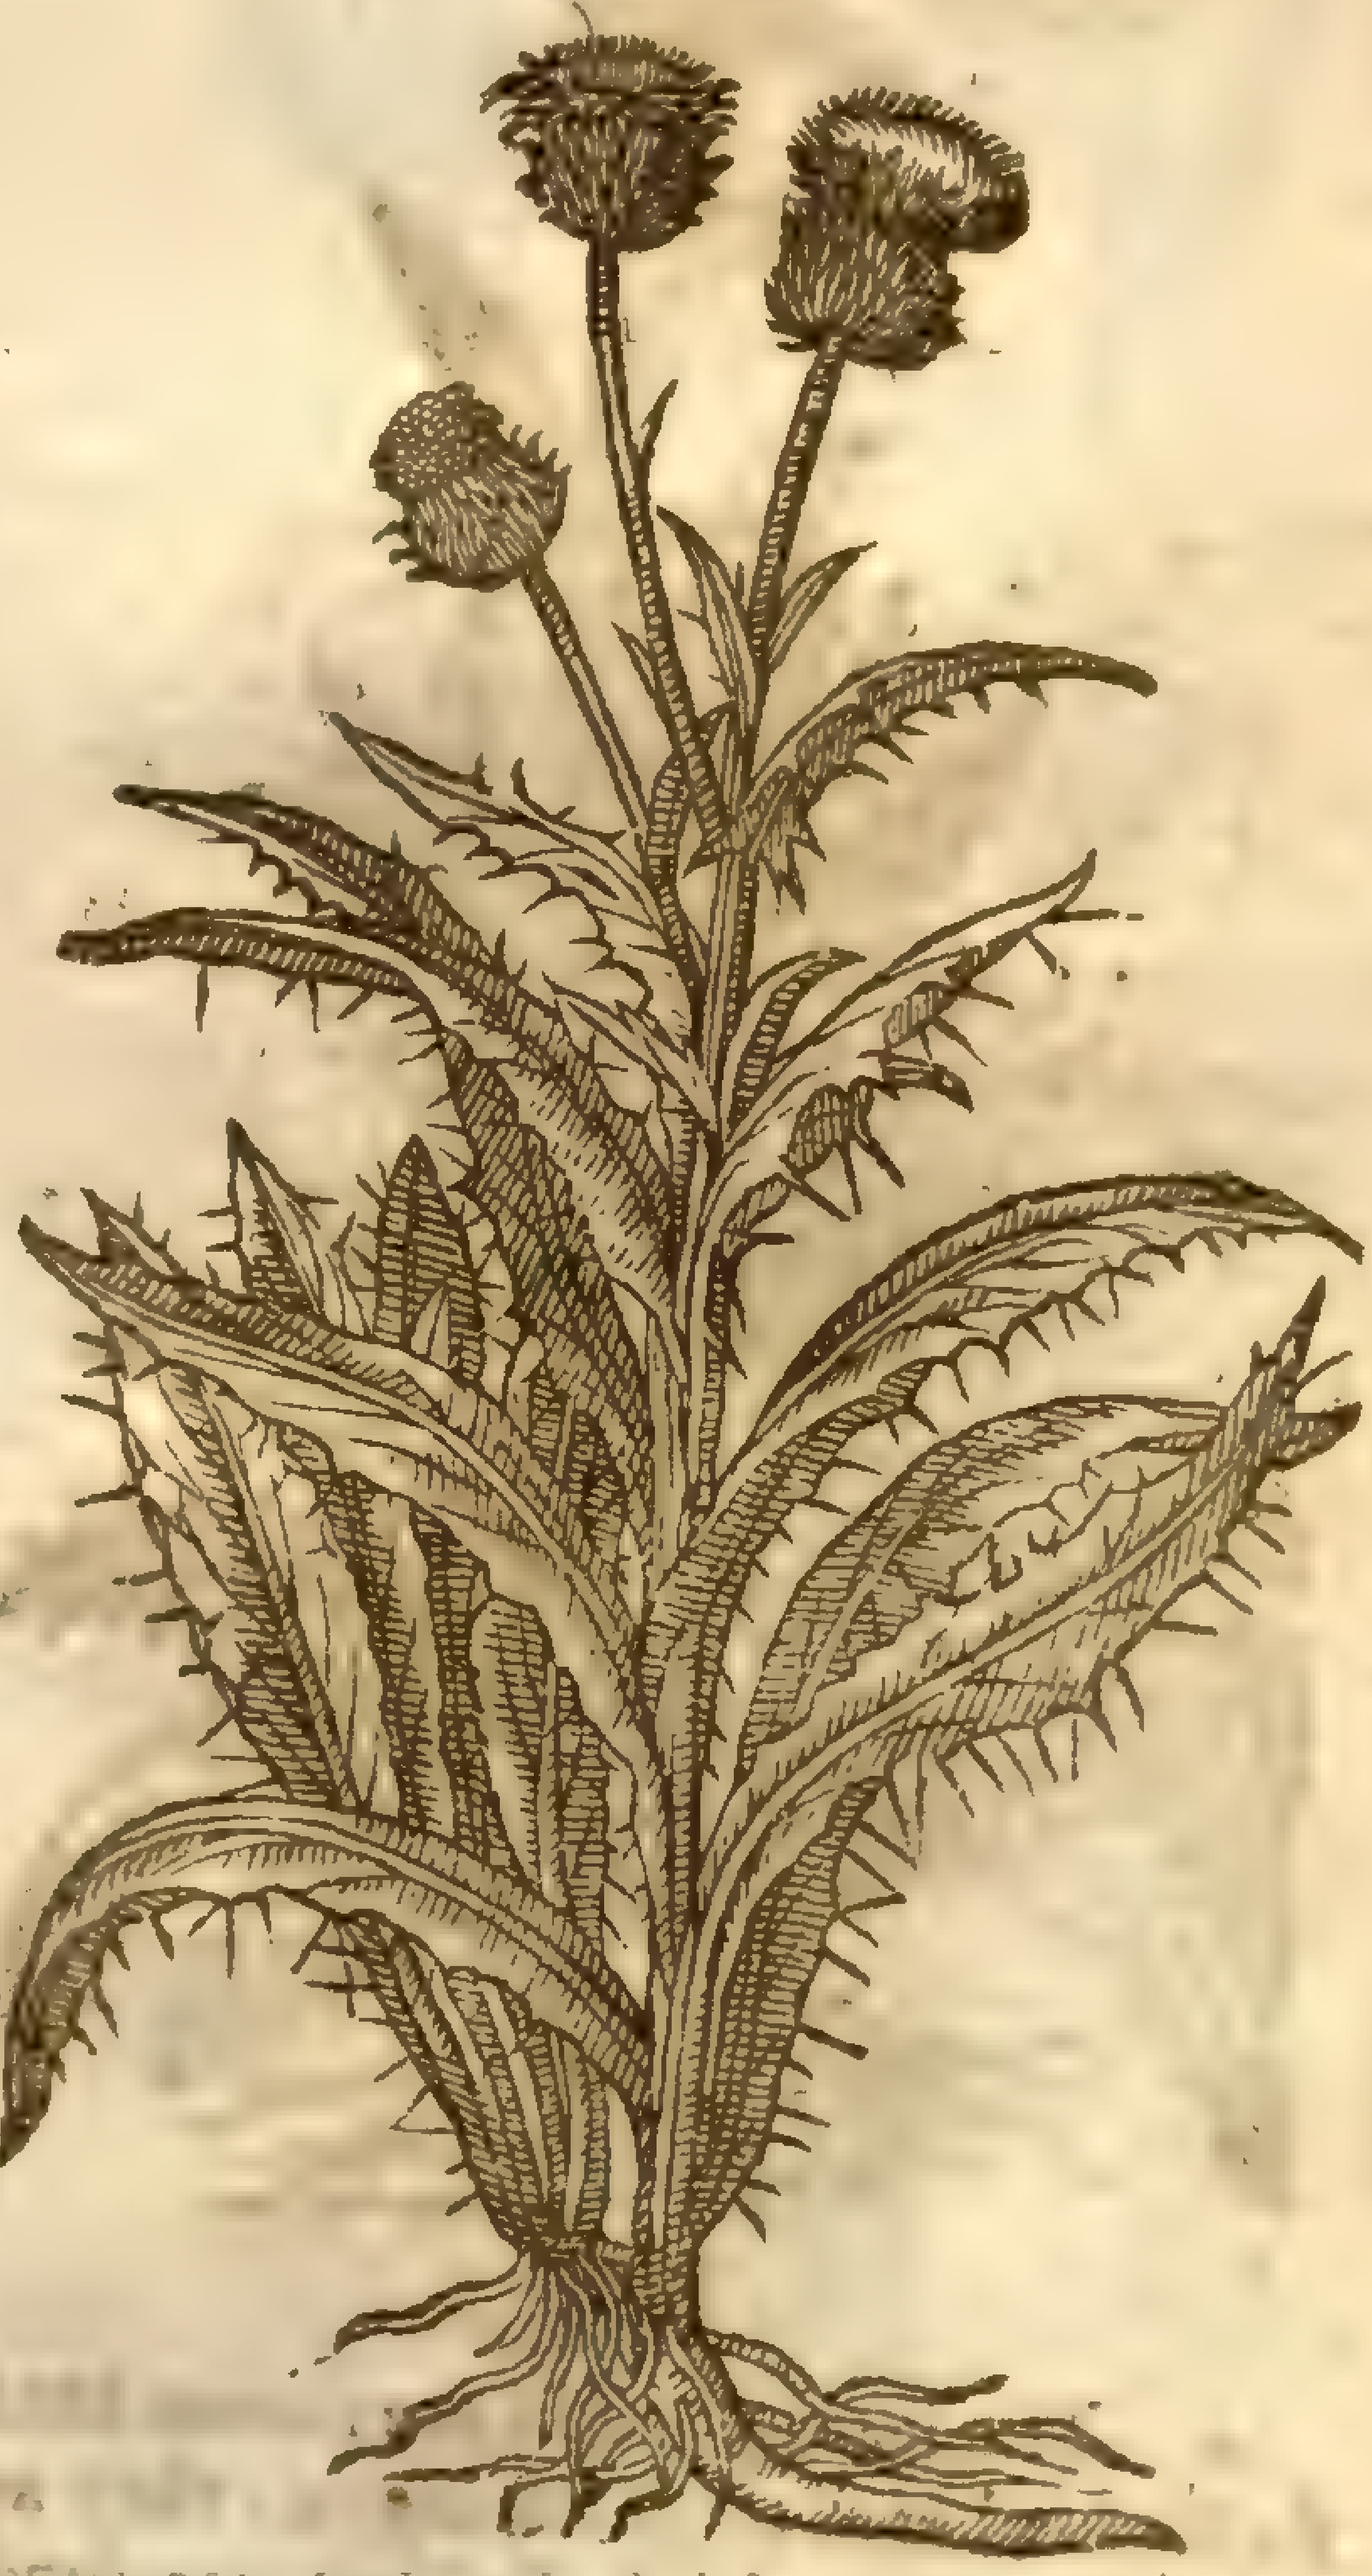
‡ Chap. 493. *Of ſoft Thiſtles and Thiſtle gentle.*

‡ There are certain other plants by moſt writers referred to the Thiſtles: which beeing omitted by our Author, I haue thought fit here to giue you.

‡ 1 *Cirſium maximum Aſphodeli radice.*
Great ſoft bulbed Thiſtle.



2 *Cirſium majus alterum.*
Great ſoft Thiſtle.



¶ *The Deſcription.*

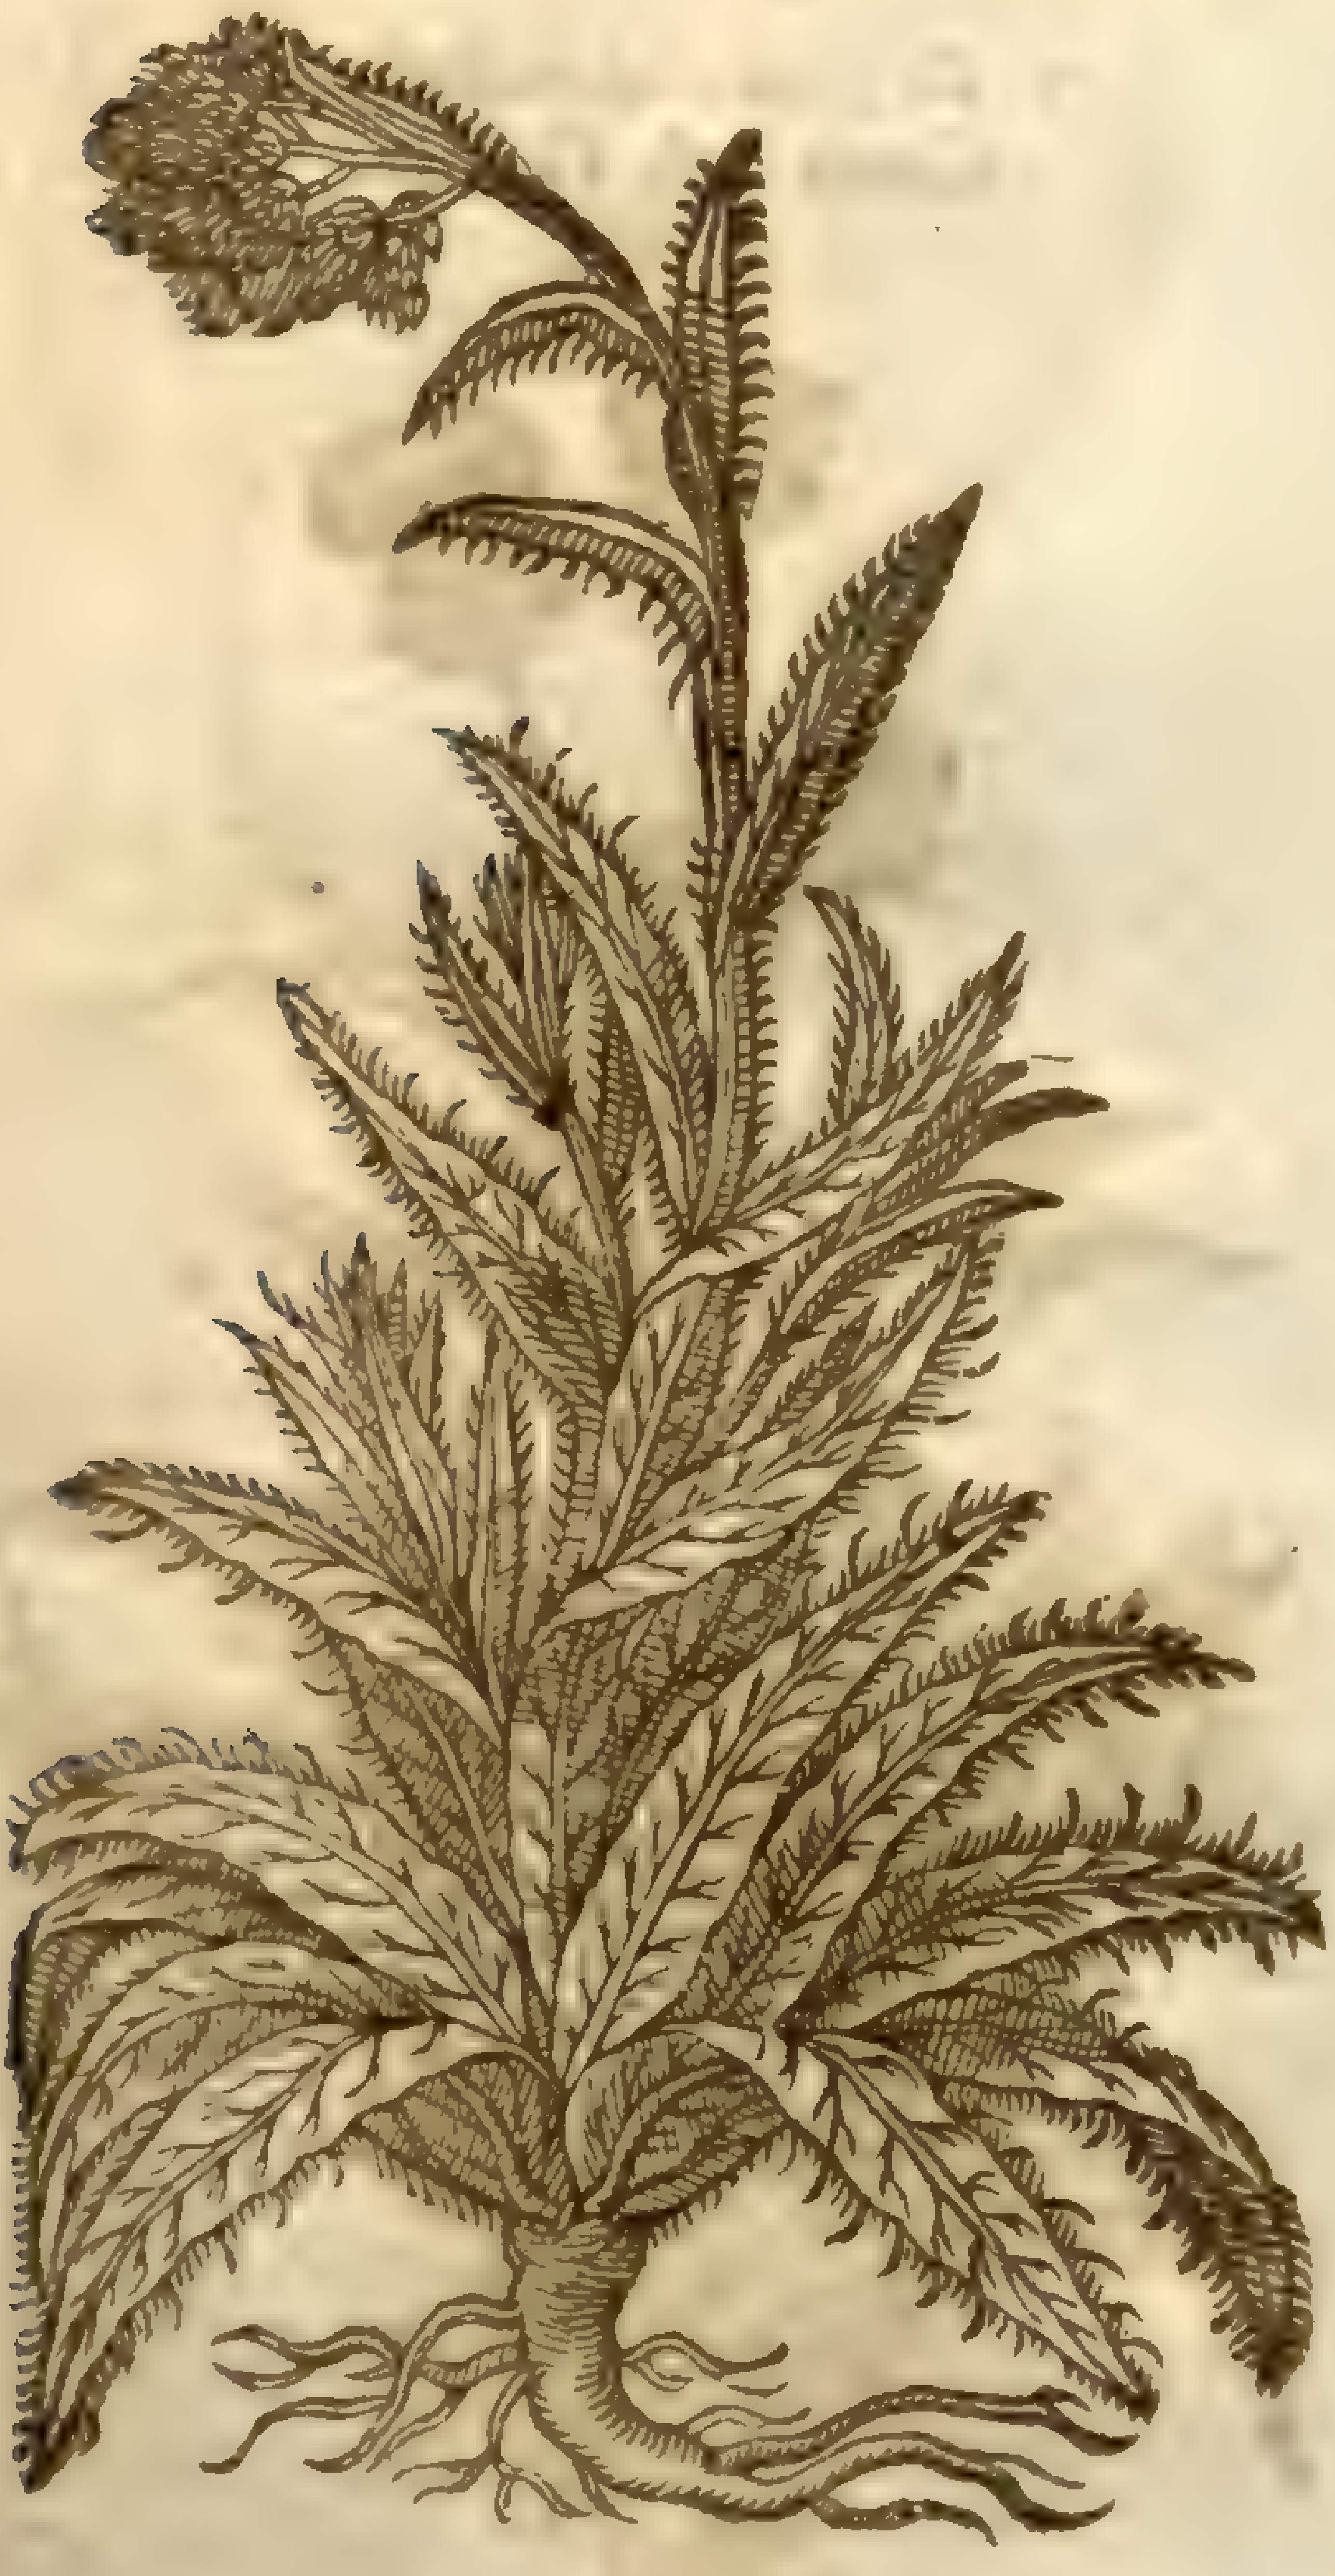
1 The firſt and largeſt of theſe hath leaues conſiſting of great longiſh bulbs like thoſe of the Aſphodil; from whence ariſe many large ſtalks three or foure cubits high, creſted and downy: the leaues are very long and large, juicy, greeniſh, cut about the edges, and ſet with ſoft prickles. At the tops of the ſtalks and branches grow heads round and large, out of which come flours conſiſting of aboundance of threds of a purple color, which fly away in down. This growes wilde in the mountainous medowes and in ſome wet places of Auſtria. I haue ſeen it growing in the garden of Mr *Iohn Parkinſon*, and with Mr *Tuggye*. It floures in Iuly. *Cluſius* hath called it *Cirſium maximum mont. incano folio bulboſa radice*. But hee gaue no figure thereof, nor any elſe, vnleſſe the *Acanthium peregrinum* in *Tabernam*. (which our Author formerly, as I before noted,

gaue by the name of *Solſtitialis lutea peregrina*) were intended for this plant, as I verily thinke it was I haue giuen you a figure which I drew ſome yeares ago by the plant it ſelfe.

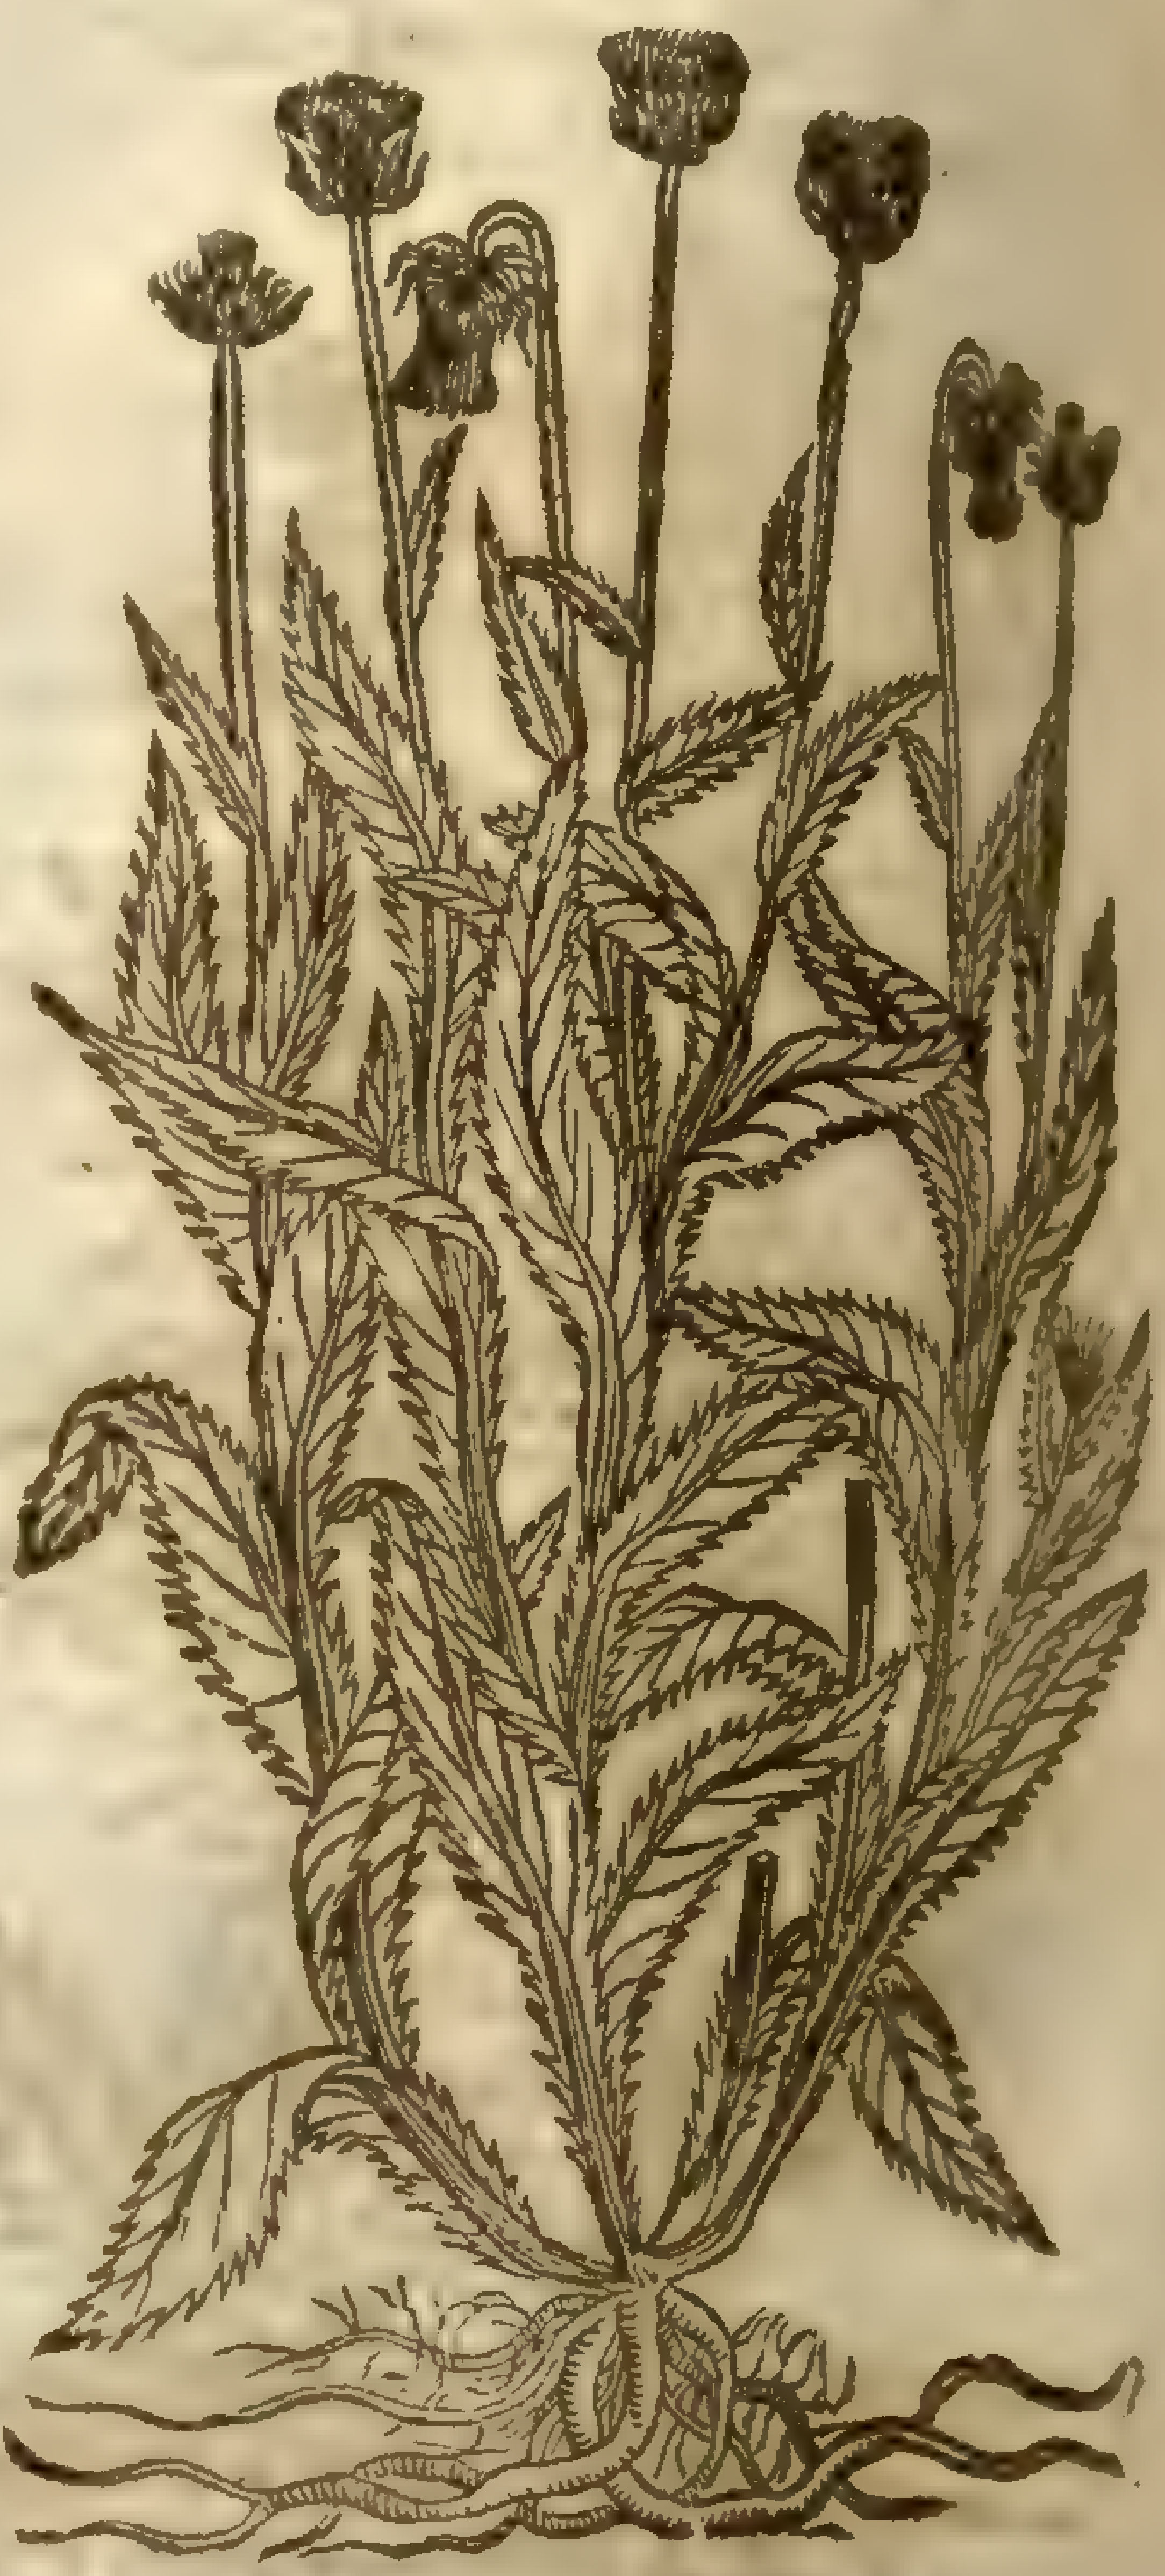
2 The root of this is long, yet ſending forth of the ſides creeping fibres, but not bulbous: the leaues are like thoſe of the laſt mentioned, but leſſe, & ſet with ſharp prickles of a greeniſh colour with the middle rib white: the heads ſometimes ſtand vpright, and otherwhiles hang down; they are very prickely, and ſend forth floures conſiſting of many elegant purple threds. The ſtalkes are thicke, creſted and welted with the ſetting on of the leaues. This growes wilde vpon the ſea coaſts of Zeeland, Flanders, and Holland: it floures in Iune and Iuly. It is the *Cirſium tertium* of *Dodonæus* and *Cirſium majus* of *Lobel*.

3 This, whoſe root is fibrous and liuing, ſendeth forth leſſer, narrower, and ſofter leaues than thoſe of the former, not jagged or cut about their edges, nor hoary, yet ſet about with prickles; the ſtalks are creſted: the heads are ſmaller*, and grow three or foure together, carrying ſuch purple floures as the former. This is that which *Matthiolus*, *Geſner*, and others haue ſet forth for *Cirſium*. *Dodonæus* for *Cirſium* 2. and *Cluſius* hath it for his *Cirſium quartum*, or *Montanum ſecundum*.

‡ 3 *Cirſium folijs non hirſutis.*
Soft ſmooth leaued Thiſtle.



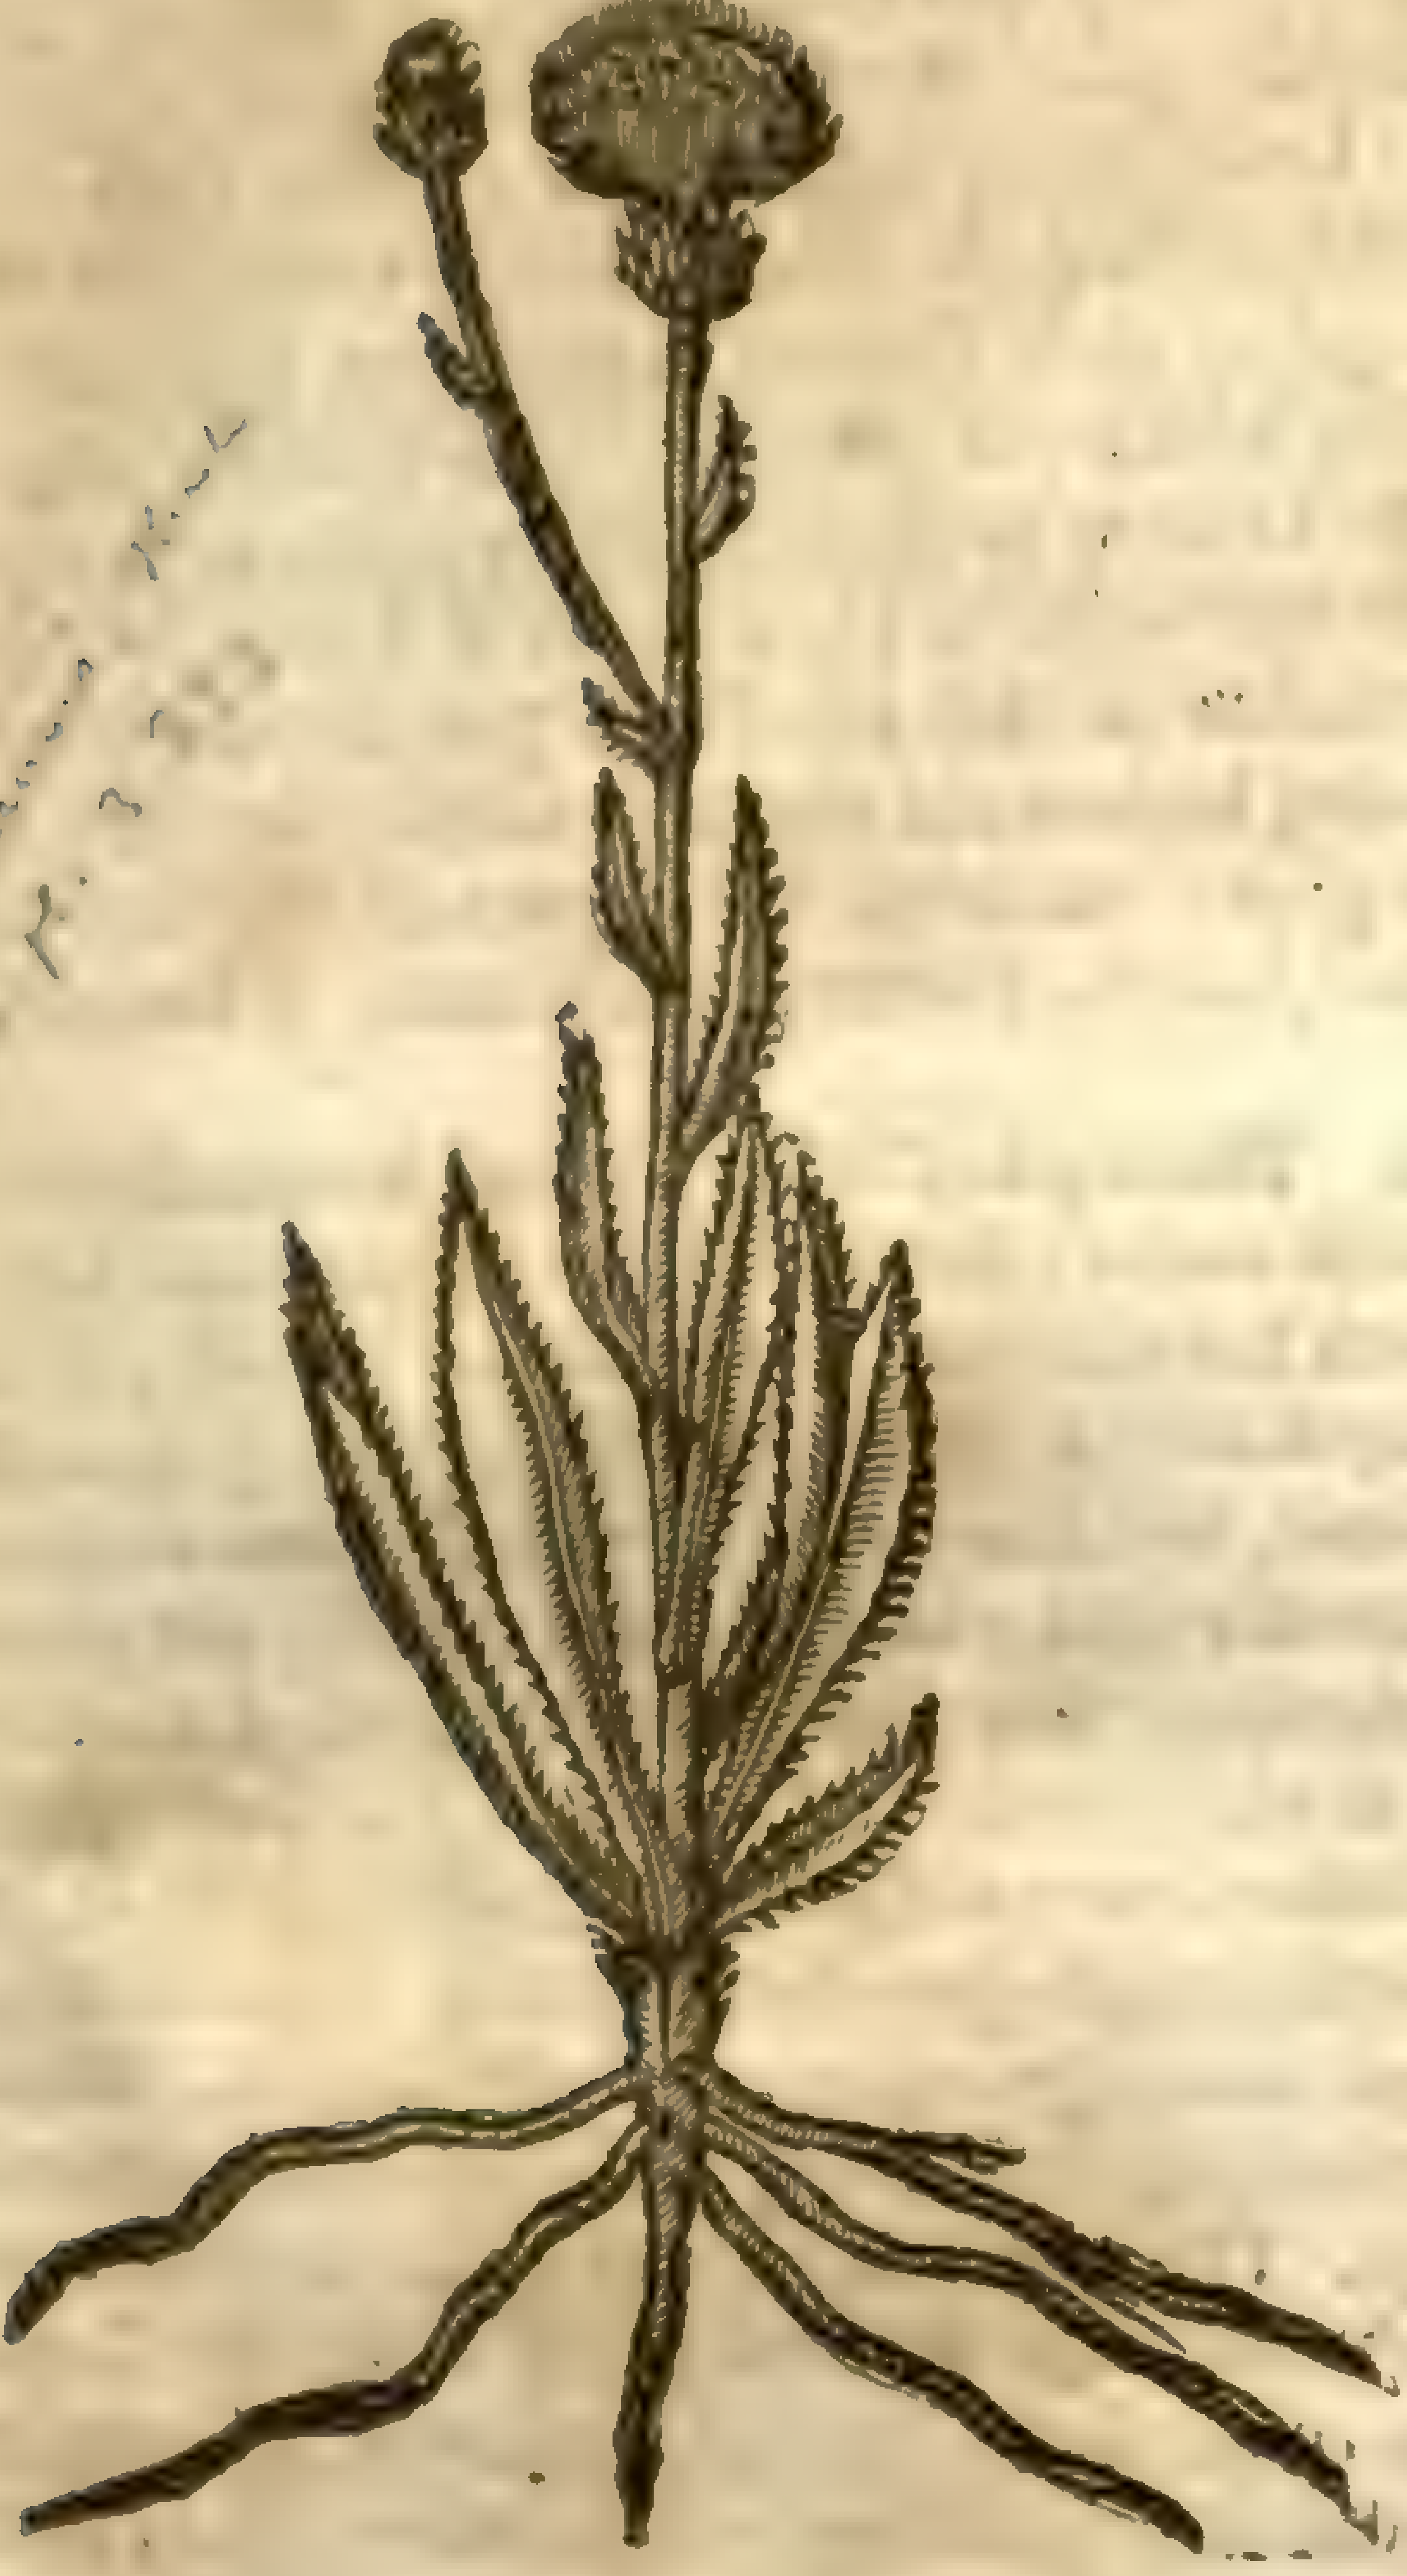
‡ 4 *Cirſium montanum capitulis parvis.*
Small Burre Thiſtle.



4 The leaues of this are ſomewhat like thoſe of the laſt deſcribed, but larger, and welting the ſtalks further at their ſetting on: they are alſo ſet with prickles about the edges: the ſtalkes are ſome two cubits high, diuided into ſundry long ſlender branches, on whoſe tops grow little rough prickly heads, which after the floures come to perfection, do hang downewards, and at length turne into down; amongſt which lies hid a ſmooth ſhining ſeed. This growes wilde in diuers wooddy places of Hungarie and Auſtria. It is the *Cirſium* of *Dodonæus*: the *Cirſium* 2. or *Montanum* 1. of *Cluſius*: and *Cirſium alterum* of *Lobel*. It floures in Iune: the root is about the thickneſſe of ones little finger, fibrous alſo and liuing.

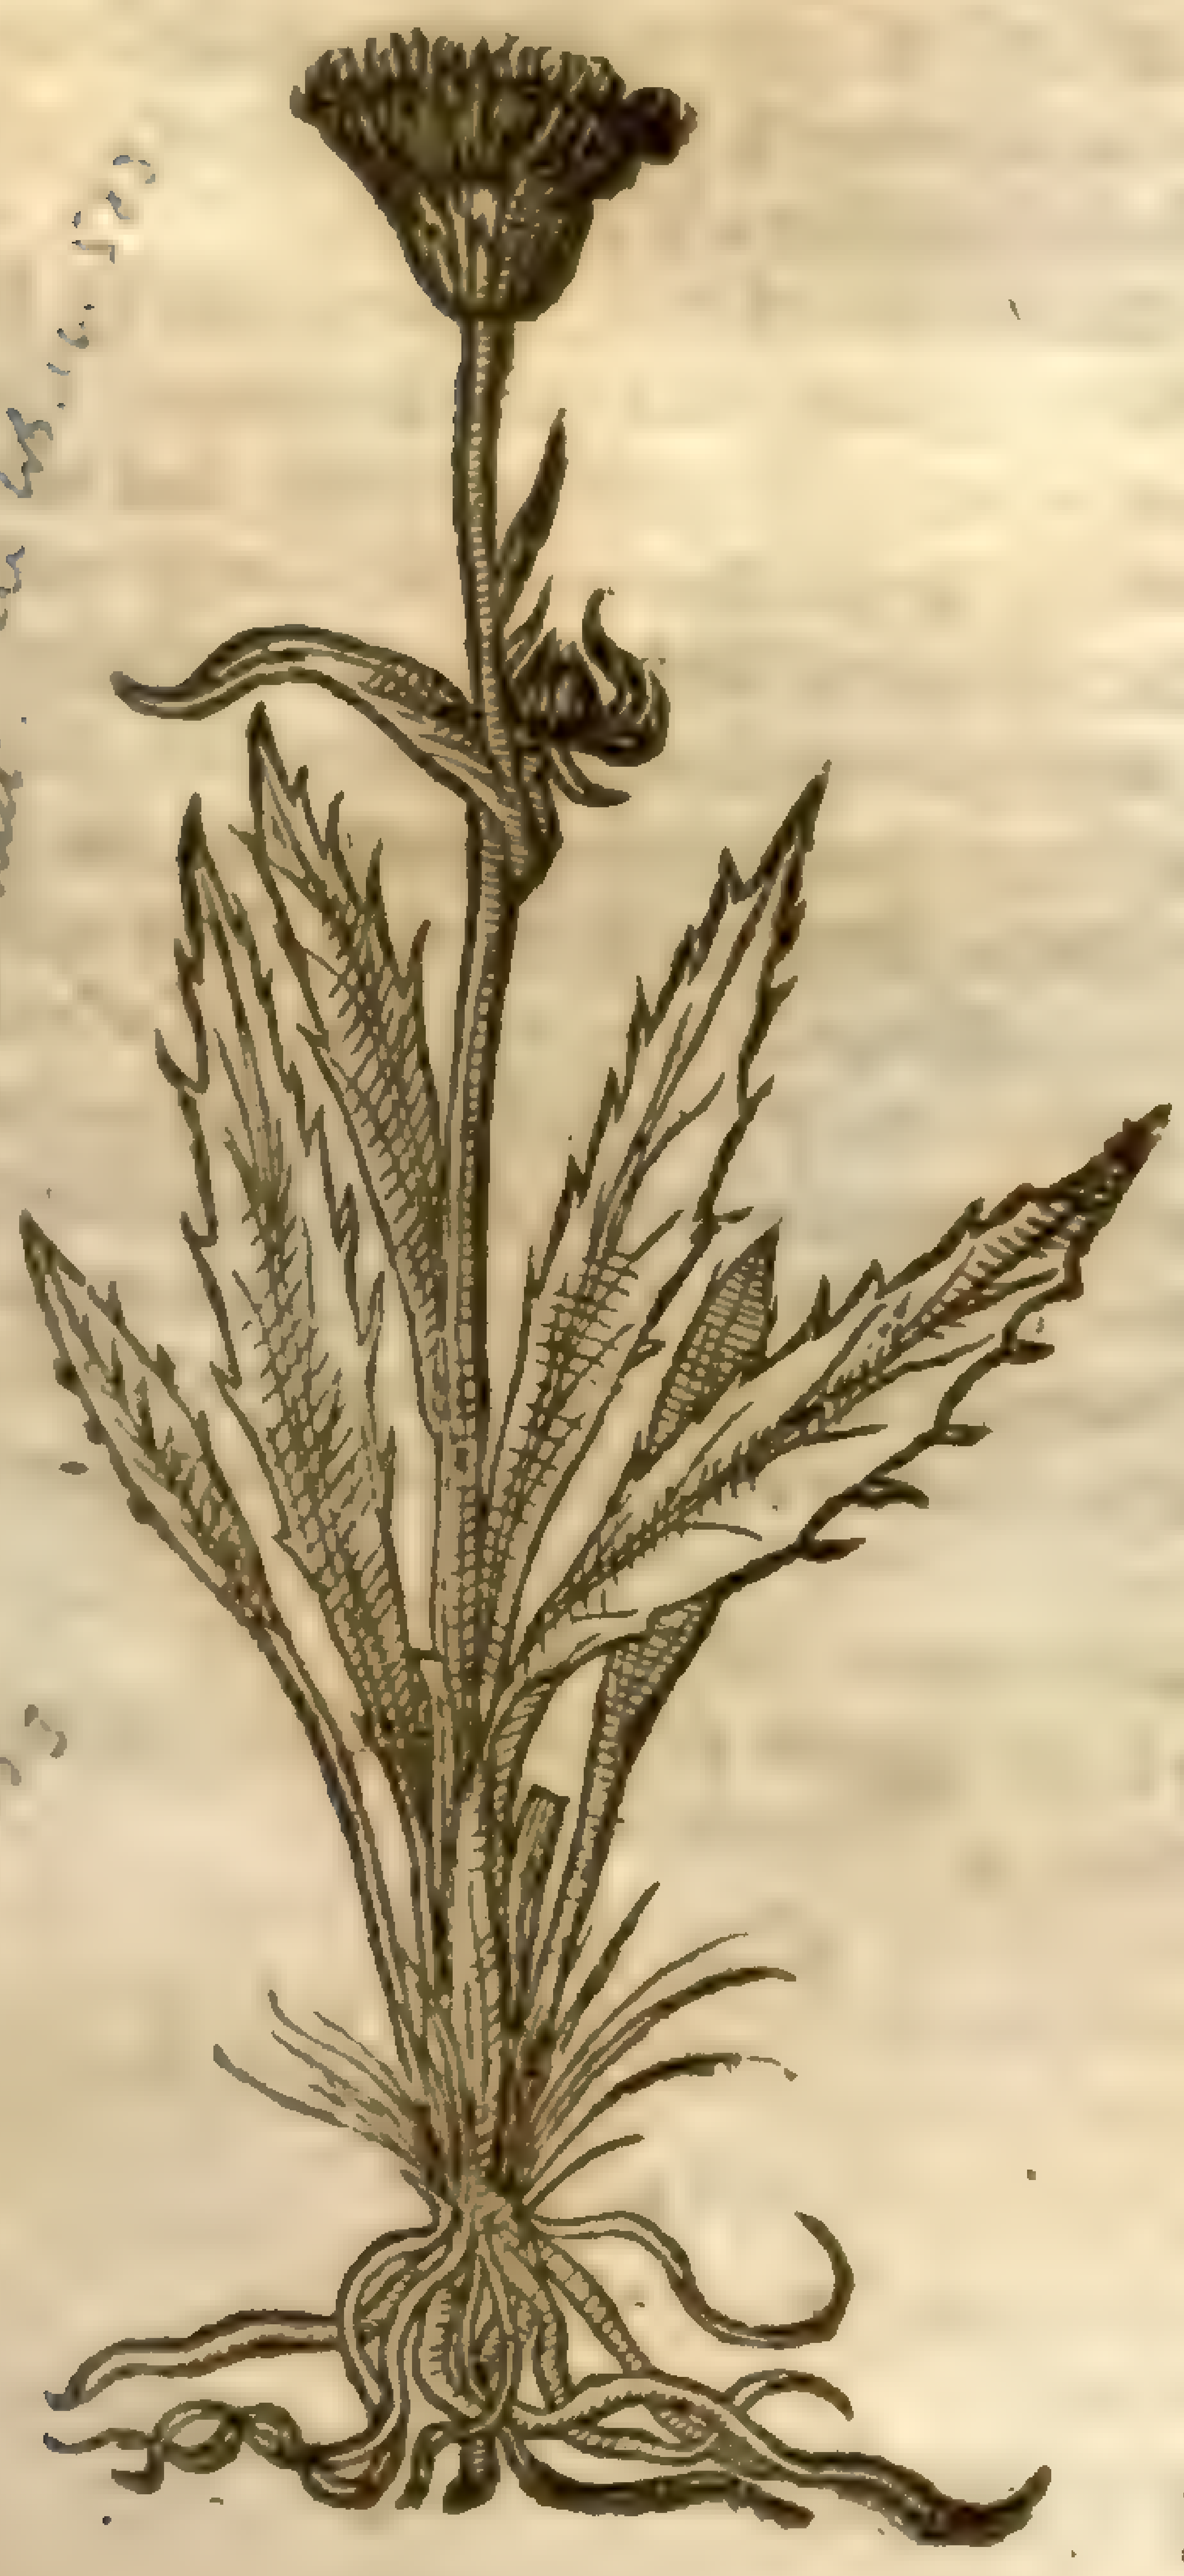
5 This ſends vp long narrow leaues, hairy, and ſet about the edges with ſlender prickles: out of the middeſt of theſe leaues groweth vp a ſtalke, ſomtimes a foot, otherwhiles a cubit high, ſlender, ſtiffe, and downy :*vpon which grow leaues ſomwhat broad at their ſetting on, and there alſo a little nicked or cut in. This ſtalke ſometimes hath no branches, otherwhiles to or three long ſlender ones, at the tops wheriof grow out of ſcaly heads ſuch floures as the common Knap-weed, which

‡ 5 *Cirſium montanum Anglicum.*
Single headed Thiſtle.



[illegible] pl. 3 353

‡ *Cirſij Anglici Icon Lobelij.*
Lobels figure of the ſame.



Carduus [illegible] [illegible] [illegible] pl. 3 353

‡ *Cirſij Anglici alia Icon* Pennei.

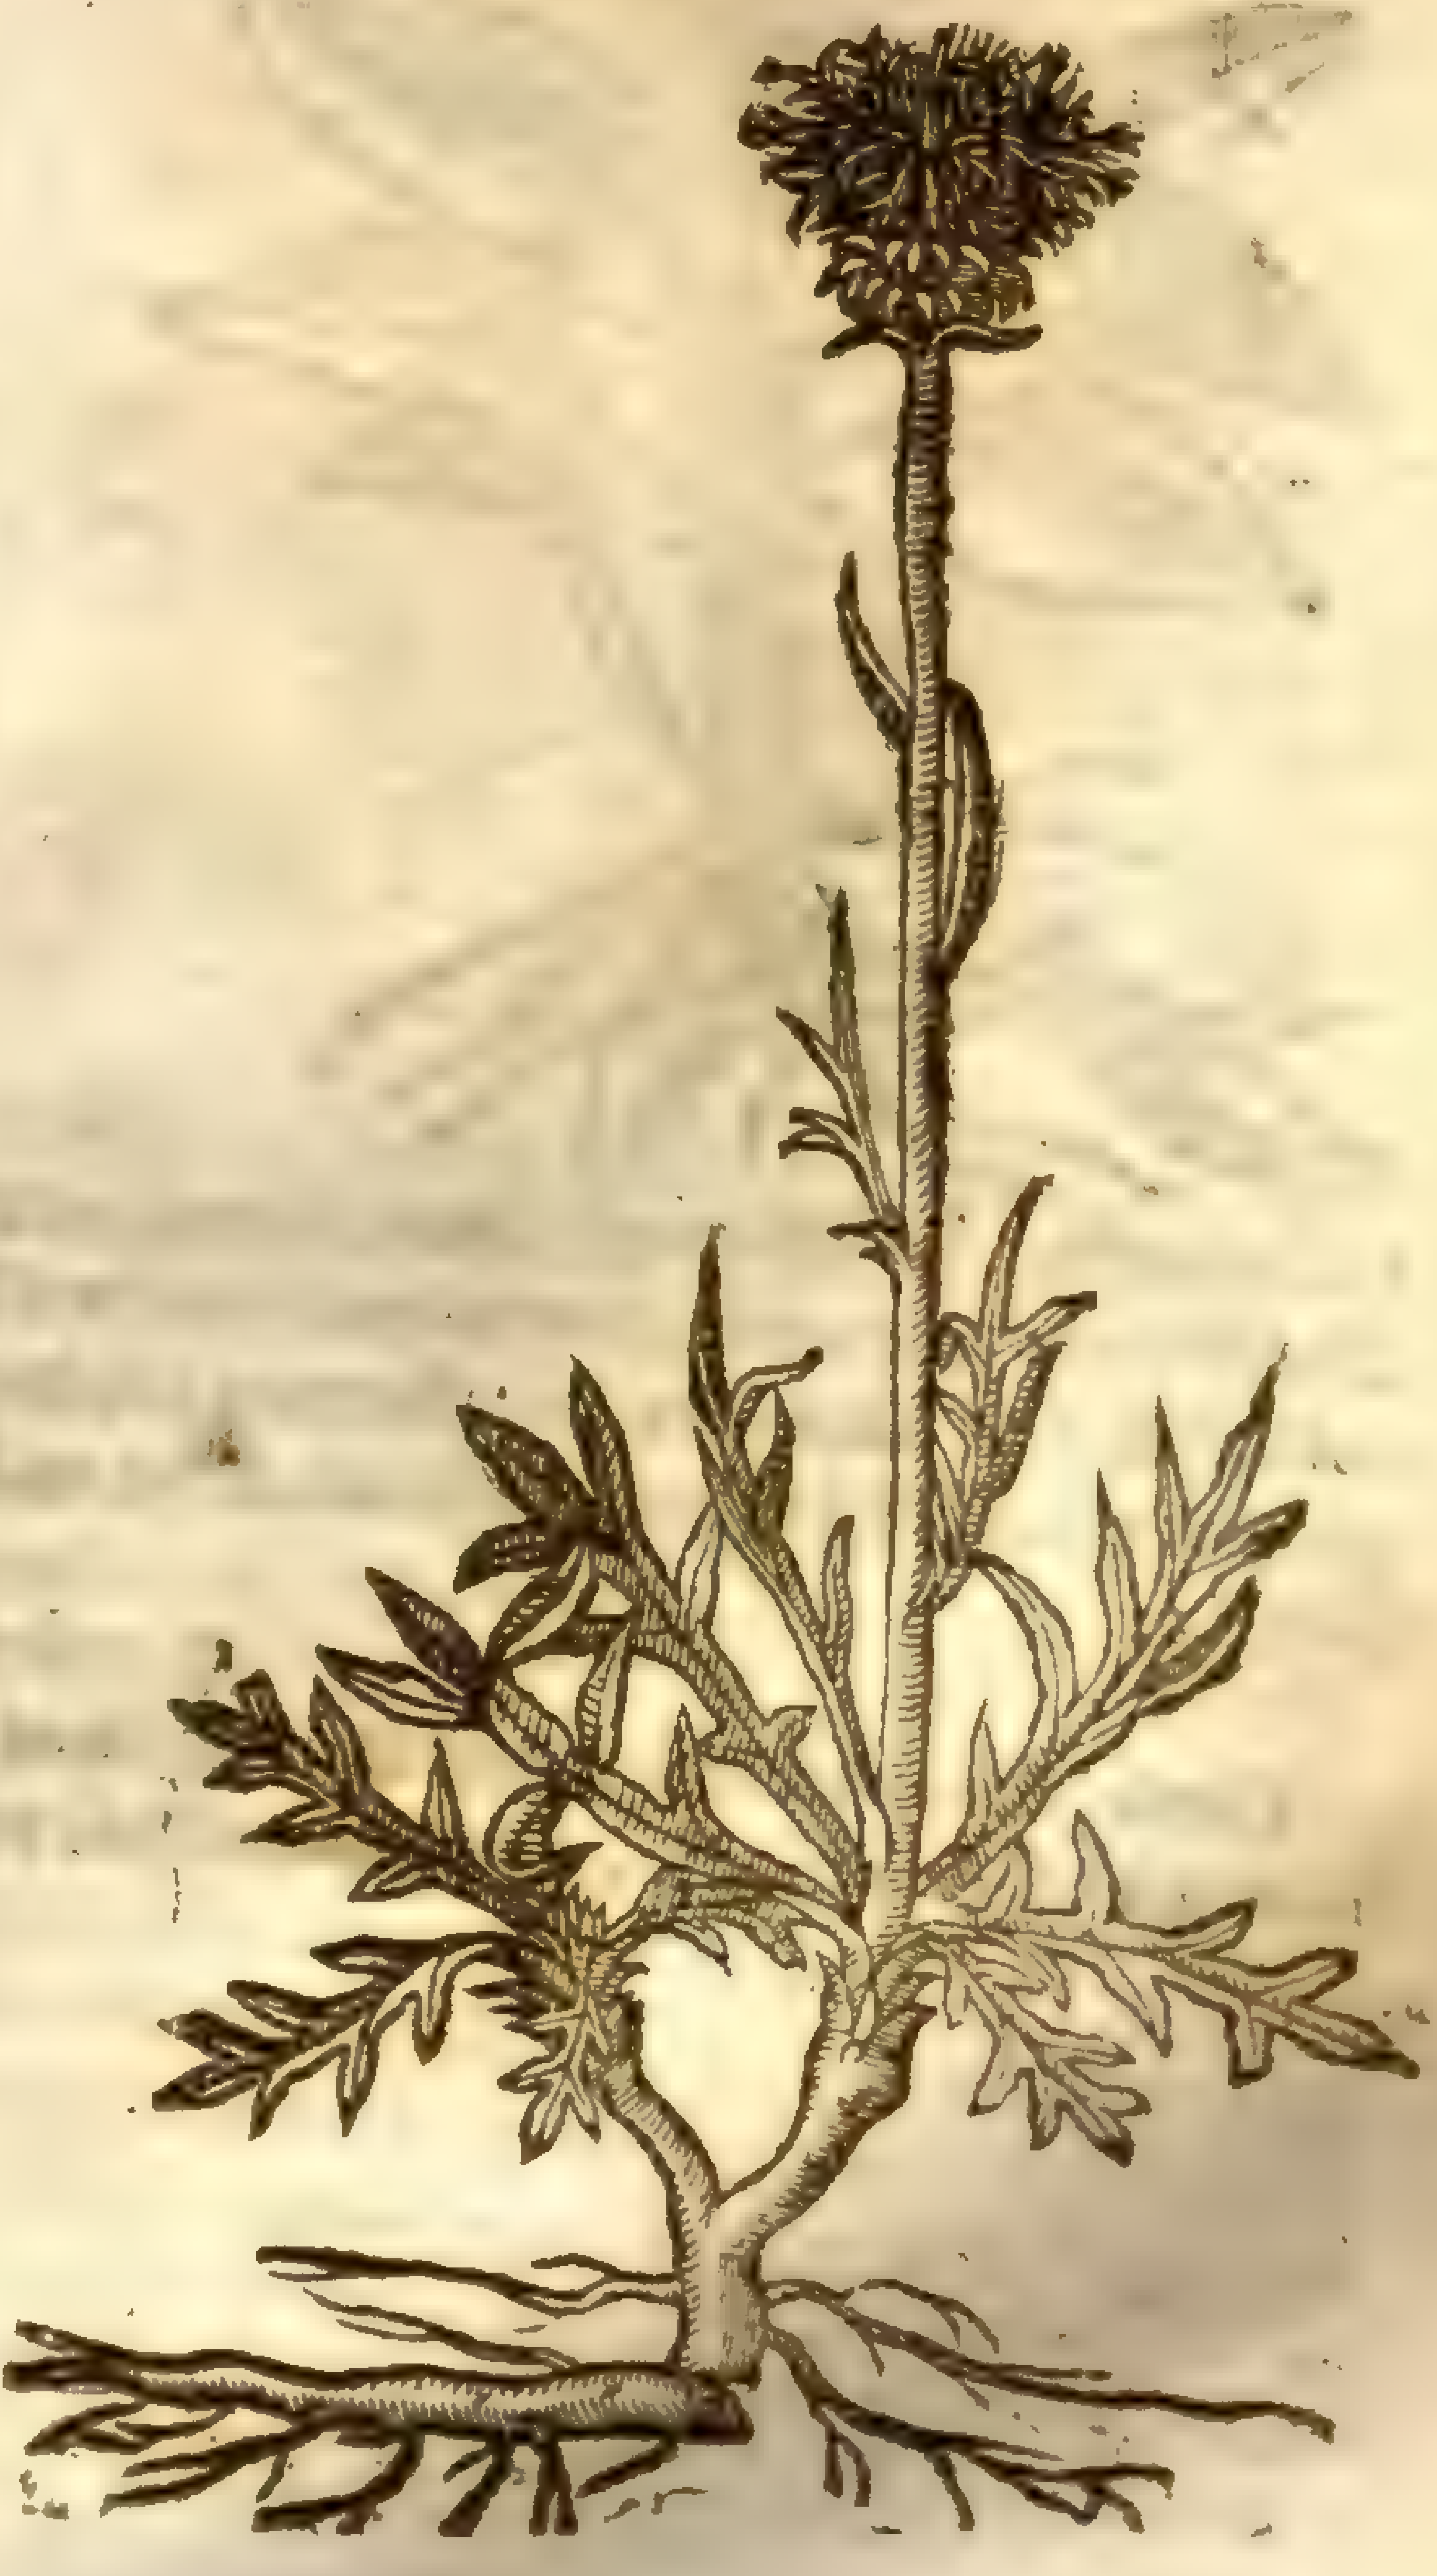
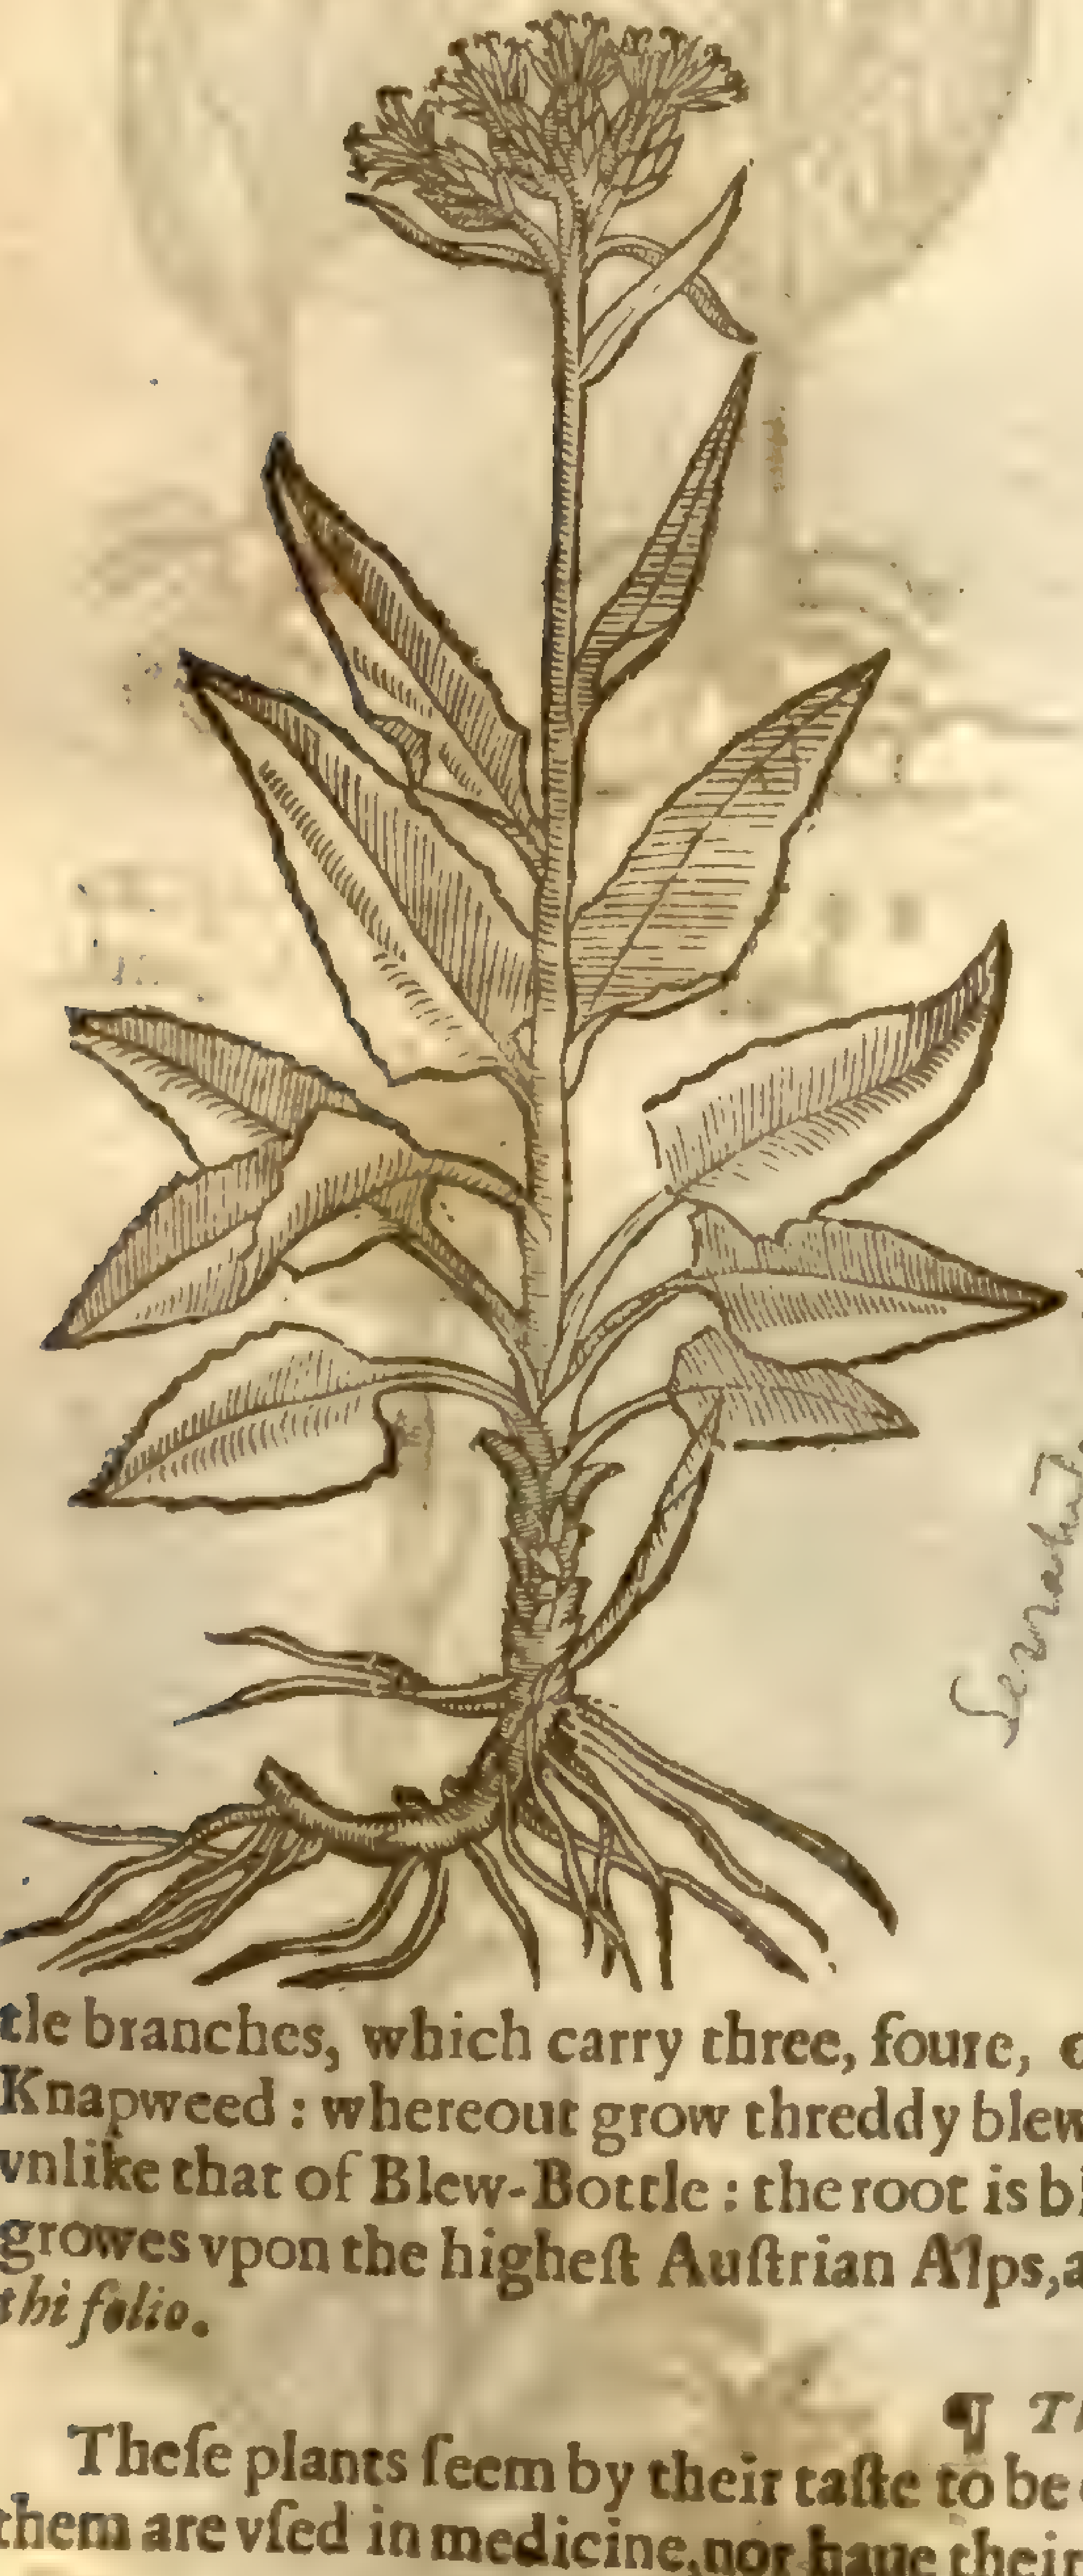
‡ 6 *Carduus mollis folijs diſſectis.*
Iagged leaued Thiſtle gentle.



which at length turne into down: among which lies hid a ſmall ſhining ſeed like the other plants of this kinde. The root is made of diuers thicke fibres, which run in the ground, and here and there put vp new heads. This plant wants no ſetting forth; for *Cluſius* giues vs the figure and hiſtorie of it, firſt by the name of *Cirſium Pannonicum* 1. *pratenſe*; then he giues another hiſtorie thereof, with a worſer figure (which he receiued of Dr *Thomas Penny* of London) by the name of *Cirſium Anglicum* 2. *Lobel* alſo deſcribed it, and ſet it forth with a figure expreſſing the floure already faded, by the name of *Cirſium Anglicum*. *Bauhine* in his *Pinax*, deceiued by theſe ſeuerall expreſſions, hath made three ſeuerall plants of this one; a fault frequent in many writers of plants. *Cluſius* found it growing in the mountainous medowes alongſt the ſide of the Danow in Auſtria. *Penny*, in the medowes at the foot of Ingleborow hil in Yorkſhire: *Lobel*, in the medowes at a place called Acton in Glocester-ſhire. I found this only once, and that was in a medow on this ſide High-gate, hauing been abroad with the Company of Apothecaries, and returning homeward that way in the company of Mr *Iames Walſall*, *William Broad*, and ſome others. I haue giuen you both the figures of *Cluſius*, his owne in the firſt place, and that of Dr *Penny* in the ſecond, but the former is the better. I haue alſo giuen you that of *Lobel*.

‡ 7 *Carduus mollis folijs Lapathi.*
Docke leaued Thiſtle gentle.



Serratula alpina
Lin.

6 Theſe alſo *Cluſius* (whom I herein follow) addeth to the kindes of This jagged leafed one, which hee calleth *Carduus mollior primus*, hath many leaues at the root, both ſpreading vpon the ground, and alſo ſtanding vpright; and they are couered with a white ſoft downineſſe, yet greene on the vpper ſide: they are alſo much diuided or cut in euen to the middle rib, like to the ſofter or tenderer leaues of the Star Thiſtle: they haue no prickles at all vpon them: out of the middeſt of theſe leaues grow vp one or two ſtalkes, round, creſted, purpliſh, hoary, and ſome cubit or better high. The leaues that grow vpon the lower part of the ſtalke are diuided, thoſe aboue not ſo: the tops of the ſtalks ſomtimes, yet very ſeldome, are parted into branches, which carry ſcaly heads containing elegant floures made of many purple ſtrings. The floure decaying, there ſucceedeth a cornered ſeed. The root ſometimes equalls the the thickneſſe of ones finger, browniſh, long and ſomewhat fibrous. It floures in May, and growes vpon the hilly places of Hungary.

7 The ſtalke of this is ſome foot or better high, thick, creſted, and ſomwhat hairy: the leaues about the root are ſomewhat large, and in ſhape like thoſe of *Bonus Henricus* (abuſiuely called in Engliſh, Mercury) ſomewhat ſinuated about the edges, and ſet with harmleſſe prickles, greene aboue, and very hoary vnderneath, like the leaues of the white Poplar: thoſe that grow vpon the ſtalke are leſſer and narrower, out of whoſe boſomes toward the tops of the ſtalke grow out little branches, which carry three, foure, or more little ſcaly heads like thoſe of the blew Bottle or Knapweed: whereout grow threddy blewiſh purple floures: the ſeed is wrapped in downe, and not vnlike that of Blew-Bottle: the root is blacke, hard, and liuing, ſending forth ſhoots on the ſides. It growes vpon the higheſt Auſtrian Alps, and floures in Iuly. *Cluſius* calls this *Carduus mollior Lapathi folio*.

¶ *The Temperature and Vertues.*

Theſe plants ſeem by their taſte to be of a moderately heating and drying facultie, but none of them are vſed in medicine, nor haue their vertues ſet down by any Author. ‡

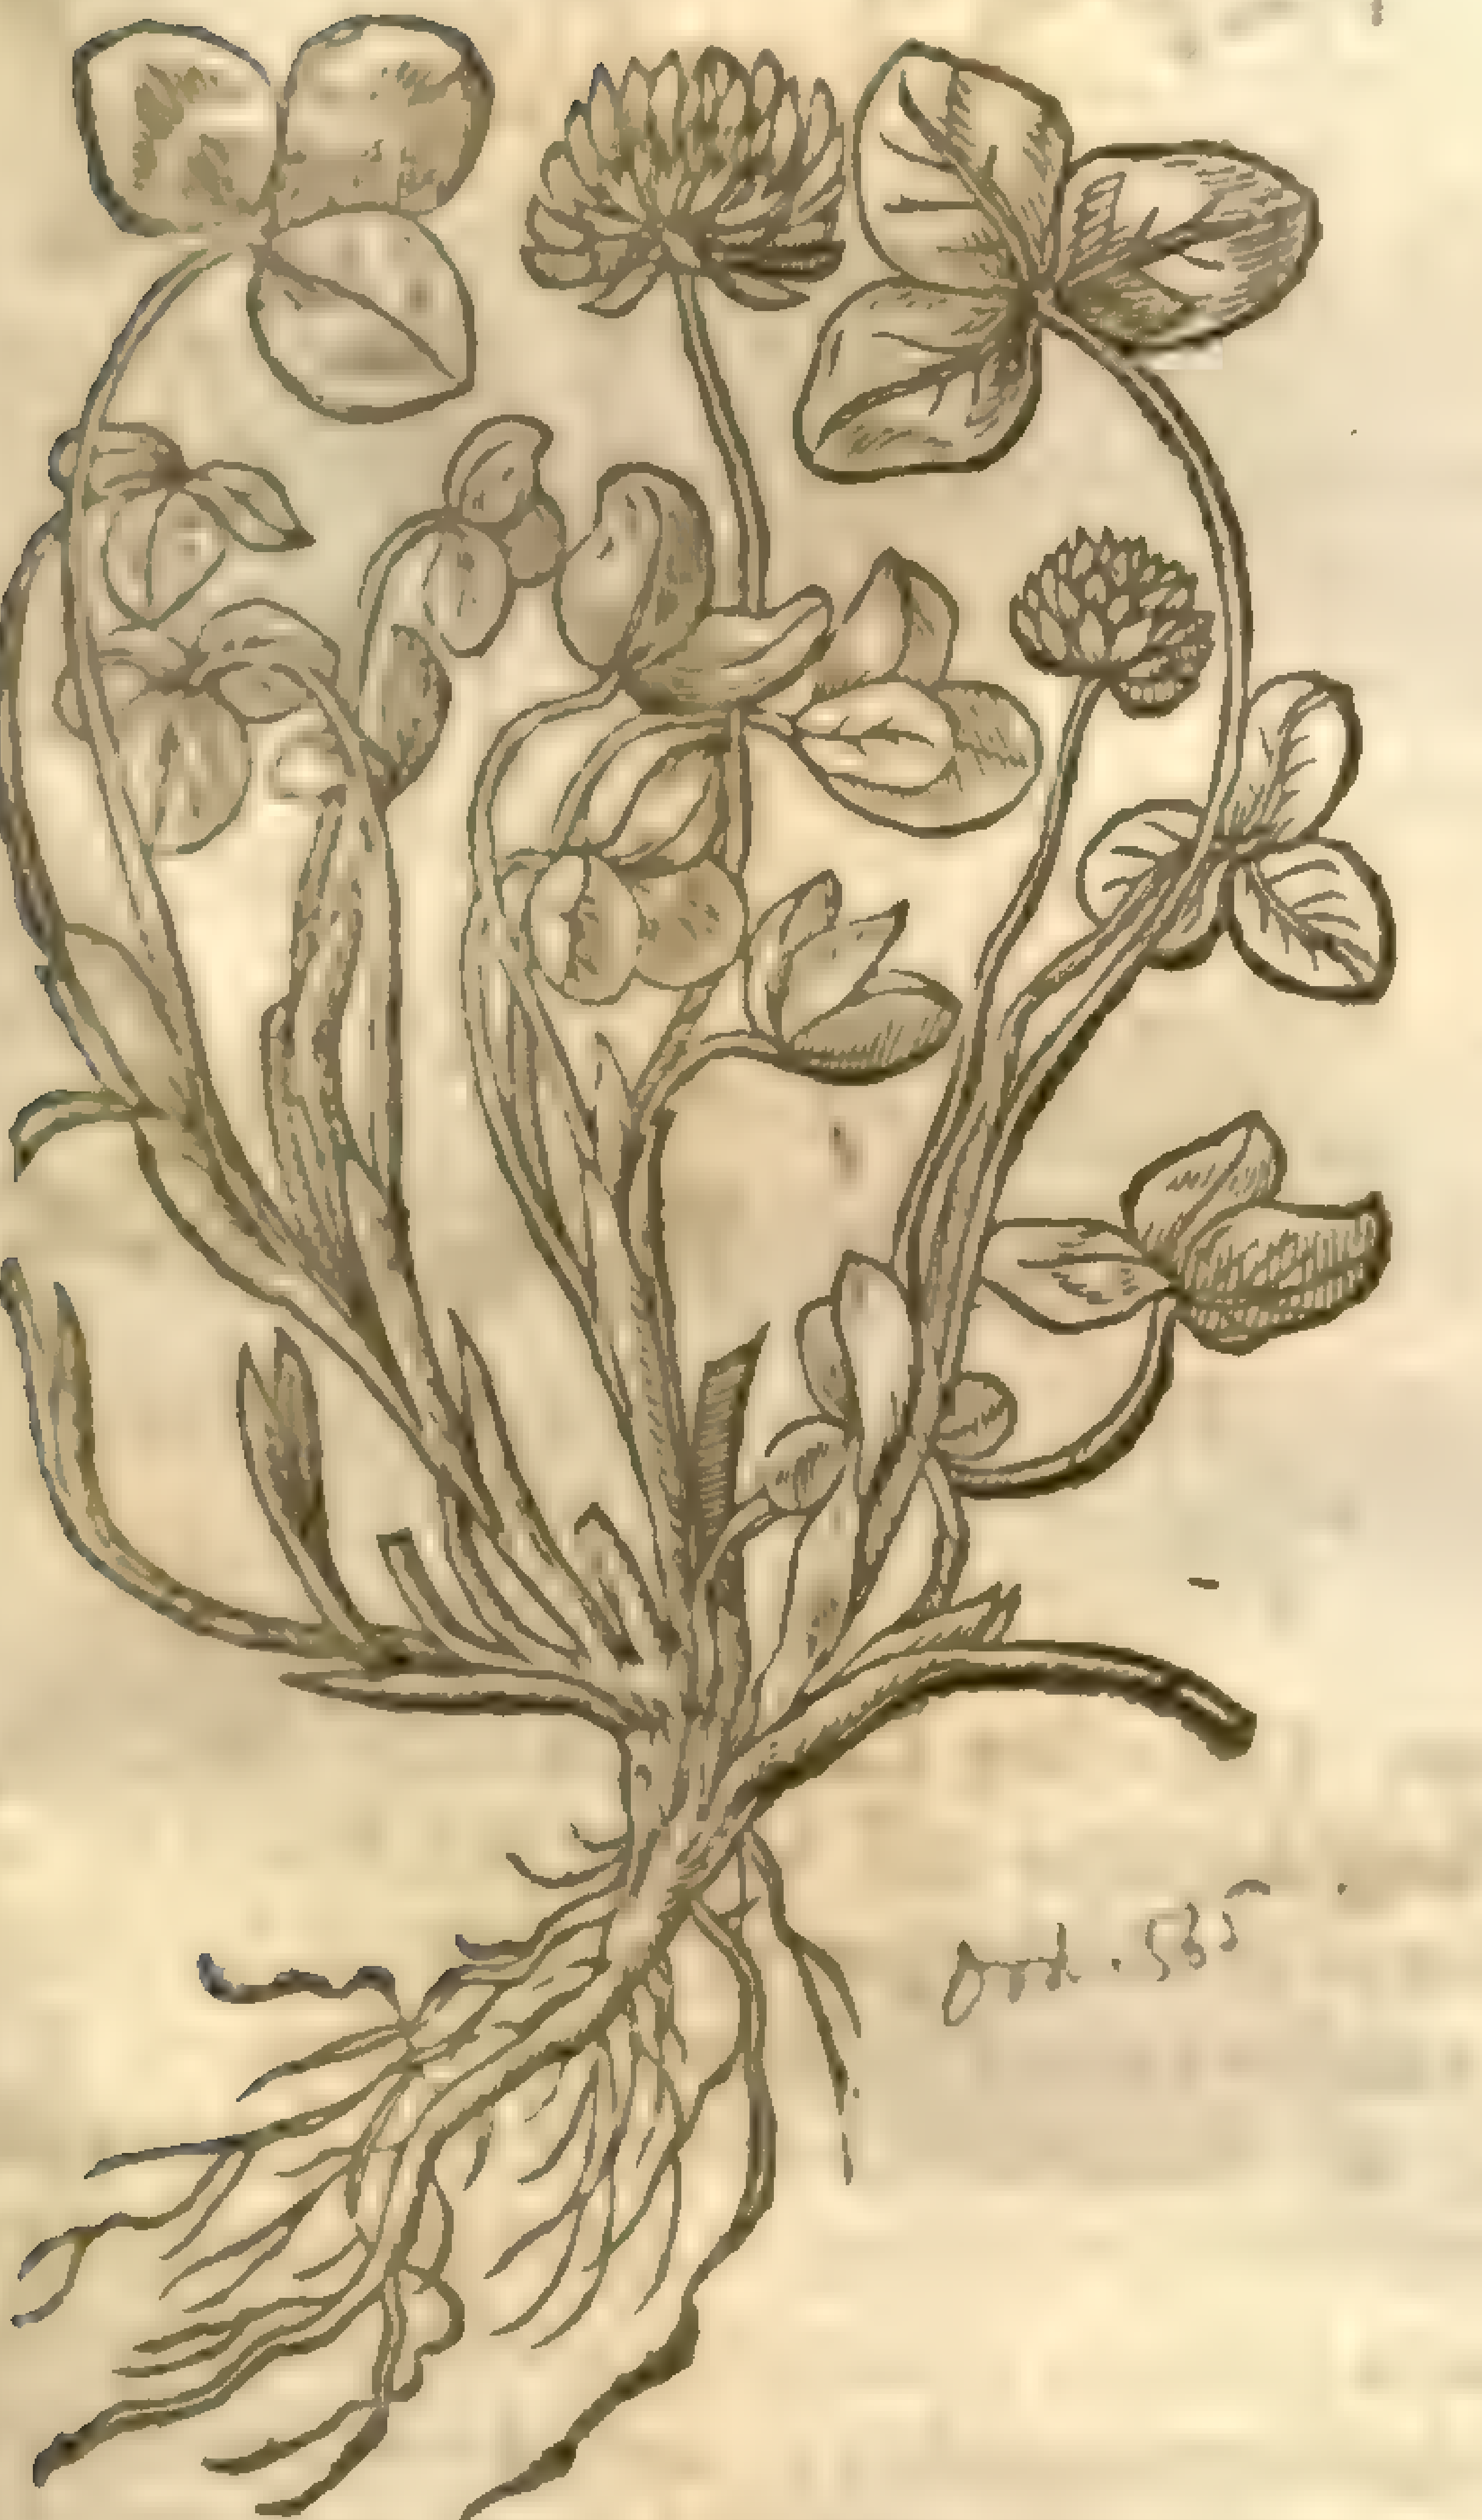
Chap. 494. *Of three leafed Graſſe or Medow Trefoile.*

¶ *The Kindes.*

THere be diuers ſorts of three leafed Graſſes, ſome greater, others leſſer; ſome beare floures of one colour, ſome of another: ſome of the water, and others of the land: ſome of a ſweet ſmel, others ſtinking: and firſt of the common medow Trefoiles, called in Iriſh *Shamrocks*.

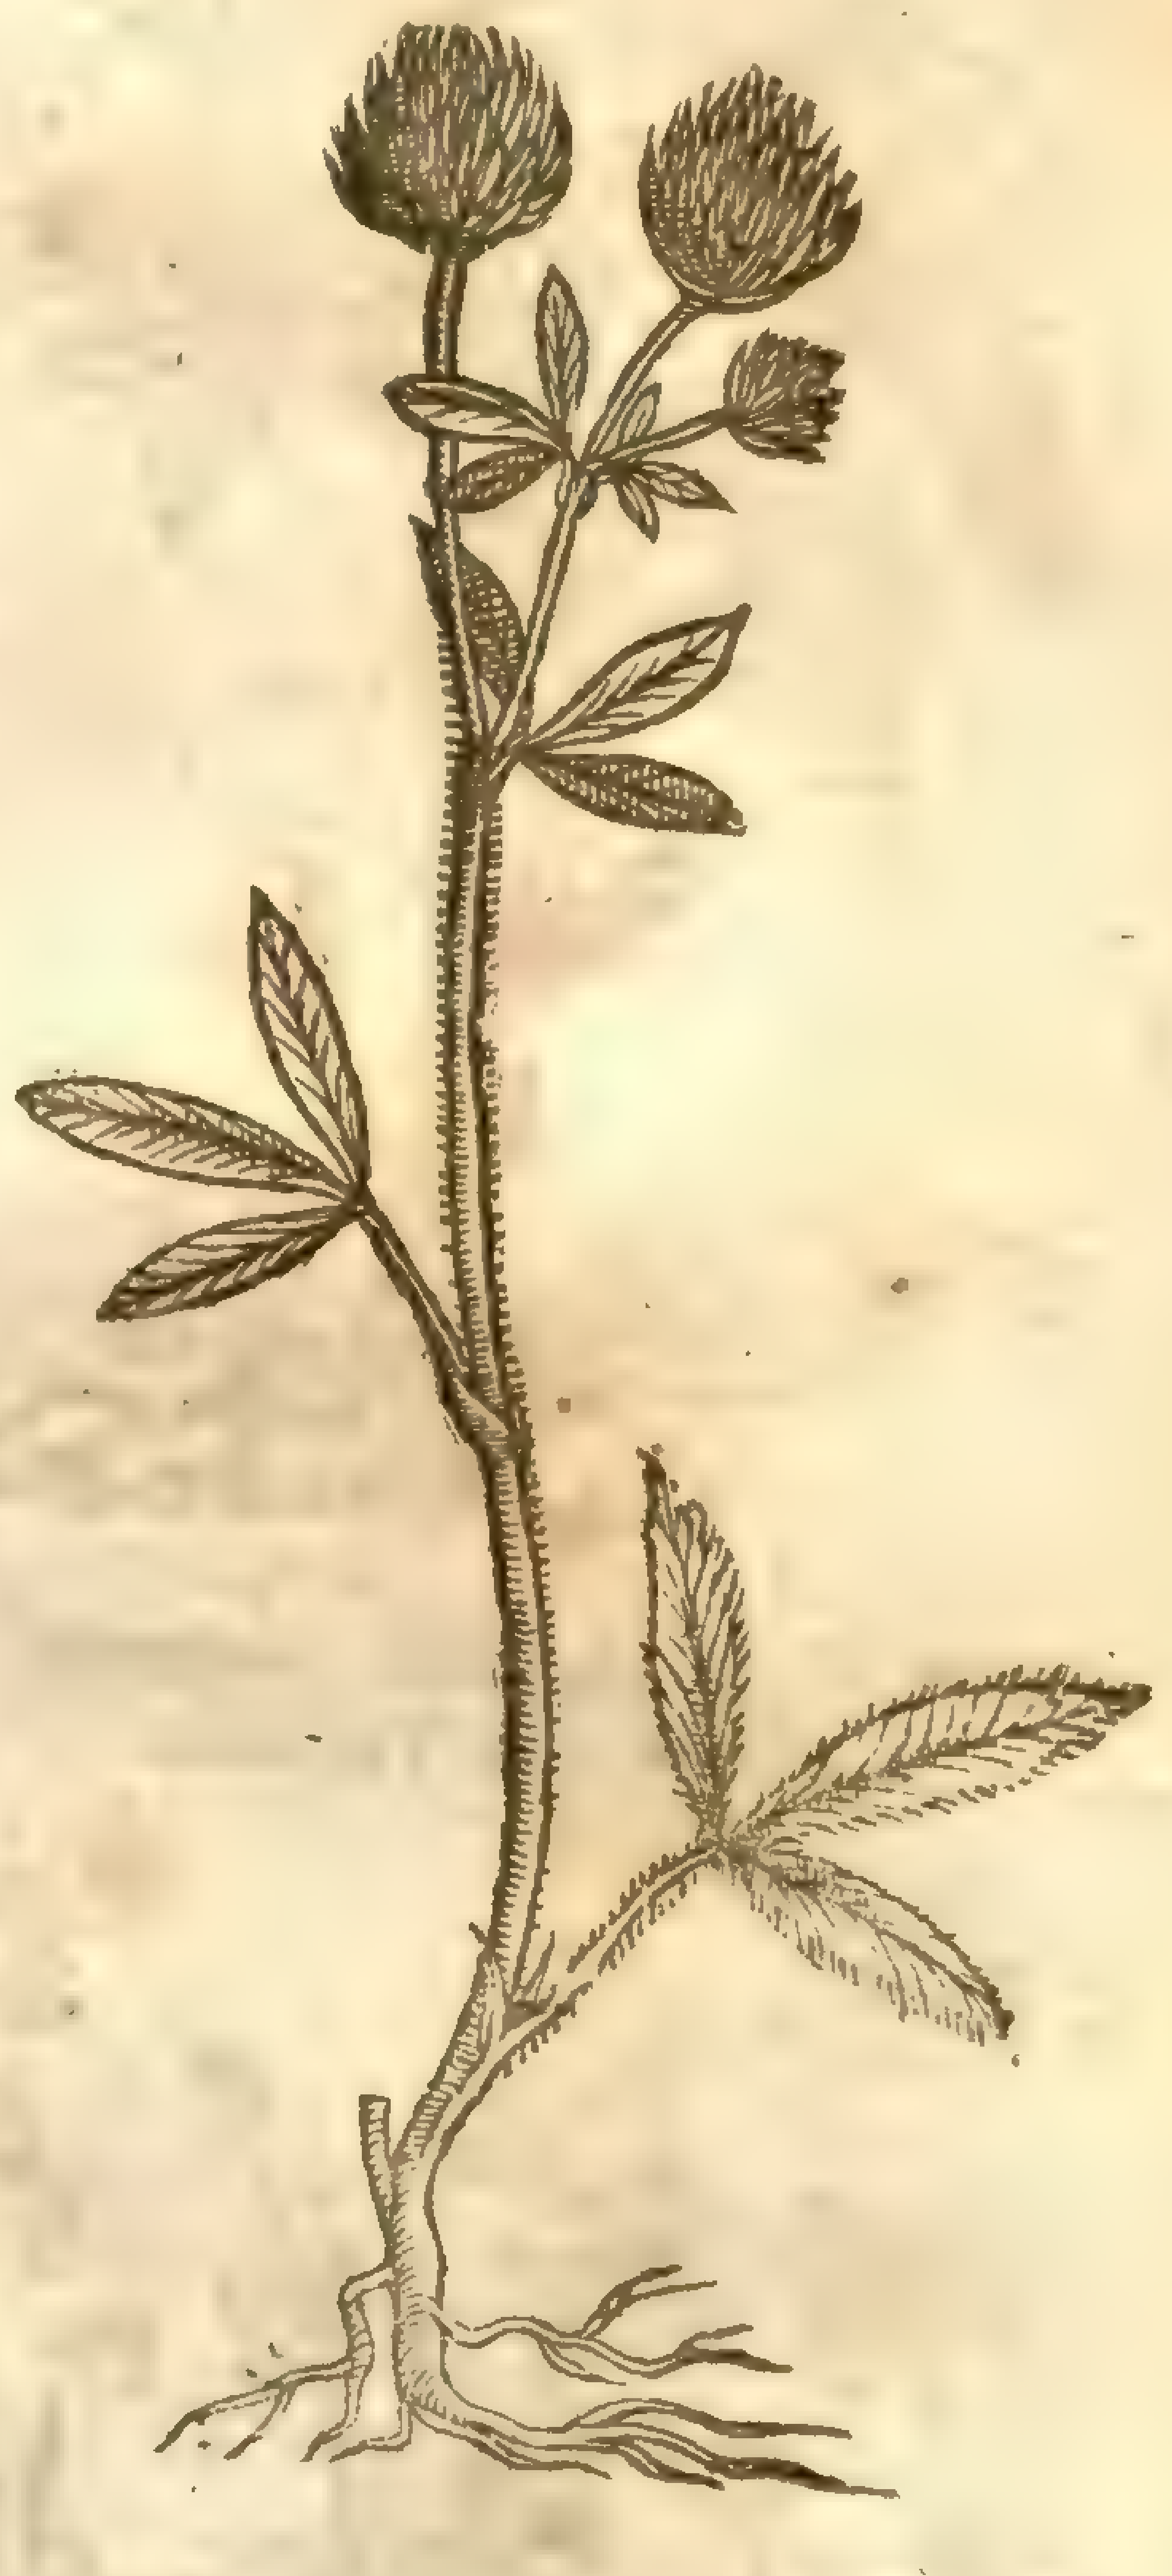
1 *Trifolium pratenſe.*
Medow Trefoile.

T. repens. L.
[illegible] dict.
[illegible] pl. 3.299



Dod. 585

‡ 3 *Trifolium majus flore albo.*
Great white Trefoile.



¶ *The Deſcription.*

1 MEdow Trefoile bringeth forth ſtalkes a cubit long, round and ſomething hairy, the greater part of which creepeth vpon the ground: whereon grow leaues conſiſting of three ioined together, one ſtanding a little from another, of which thoſe that are next the ground and roots are rounder, and they that grow on the vpper part longer, hauing for the moſt part in the midſt a white ſpot like a halfe moone. The floures grow at the tops of the ſtalks in a tuft or ſmall Fox-taile eare, of a purple colour, and ſweet of taſte. The ſeed growes in little husks, round and blackiſh: the root is long, wooddy, and groweth deep.

2 There is another of the field Trefoiles, differing from the precedent eſpecially in the color of the floures; for as thoſe are of a bright purple, contrariwiſe theſe are very white, which maketh the difference. The leaues, floures, and all the whole plant is leſſe than the former.

3. 4. There is alſo a Trefoile of this kinde which is ſowne in fields of the low-Countries, in Italy and diuers other places beyond the ſeas, that comes vp ranker and higher than that which groweth in medowes, and is an excellent food for Cattell, both to fatten them and cauſe them to giue good ſtore of milke.

‡ Of this there is one more with white floures which hath ſtalkes ſome foot high, and narrow hairy leaues, with a root of the thickneſſe of ones little finger. This is *Cluſius* his *Trifolium majus primum*,

which at length turne into down: among which lies hid a ſmall ſhining ſeed like the other plants of this kinde. The root is made of diuers thicke fibres, which run in the ground, and here and there put vp new heads. This plant wants no ſetting forth; for *Cluſius* giues vs the figure and hiſtorie of it, firſt by the name of *Cirſium Pannonicum* 1. *pratenſe*; then he giues another hiſtorie thereof, with a worſer figure (which he receiued of Dr *Thomas Penny* of London) by the name of *Cirſium Anglicum* 2. *Lobel* alſo deſcribed it, and ſet it forth with a figure expreſſing the floure already faded, by the name of *Cirſium Anglicum*. *Bauhine* in his *Pinax*, deceiued by theſe ſeuerall expreſſions, hath made three ſeuerall plants of this one; a fault frequent in many writers of plants. *Cluſius* found it growing in the mountainous medowes alongſt the ſide of the Danow in Auſtria. *Penny*, in the medowes at the foot of Ingleborow hil in Yorkſhire: *Lobel*, in the medowes at a place called Acton in Gloceſter-ſhire. ‡ 6 *Trifolium luteum minimum.*
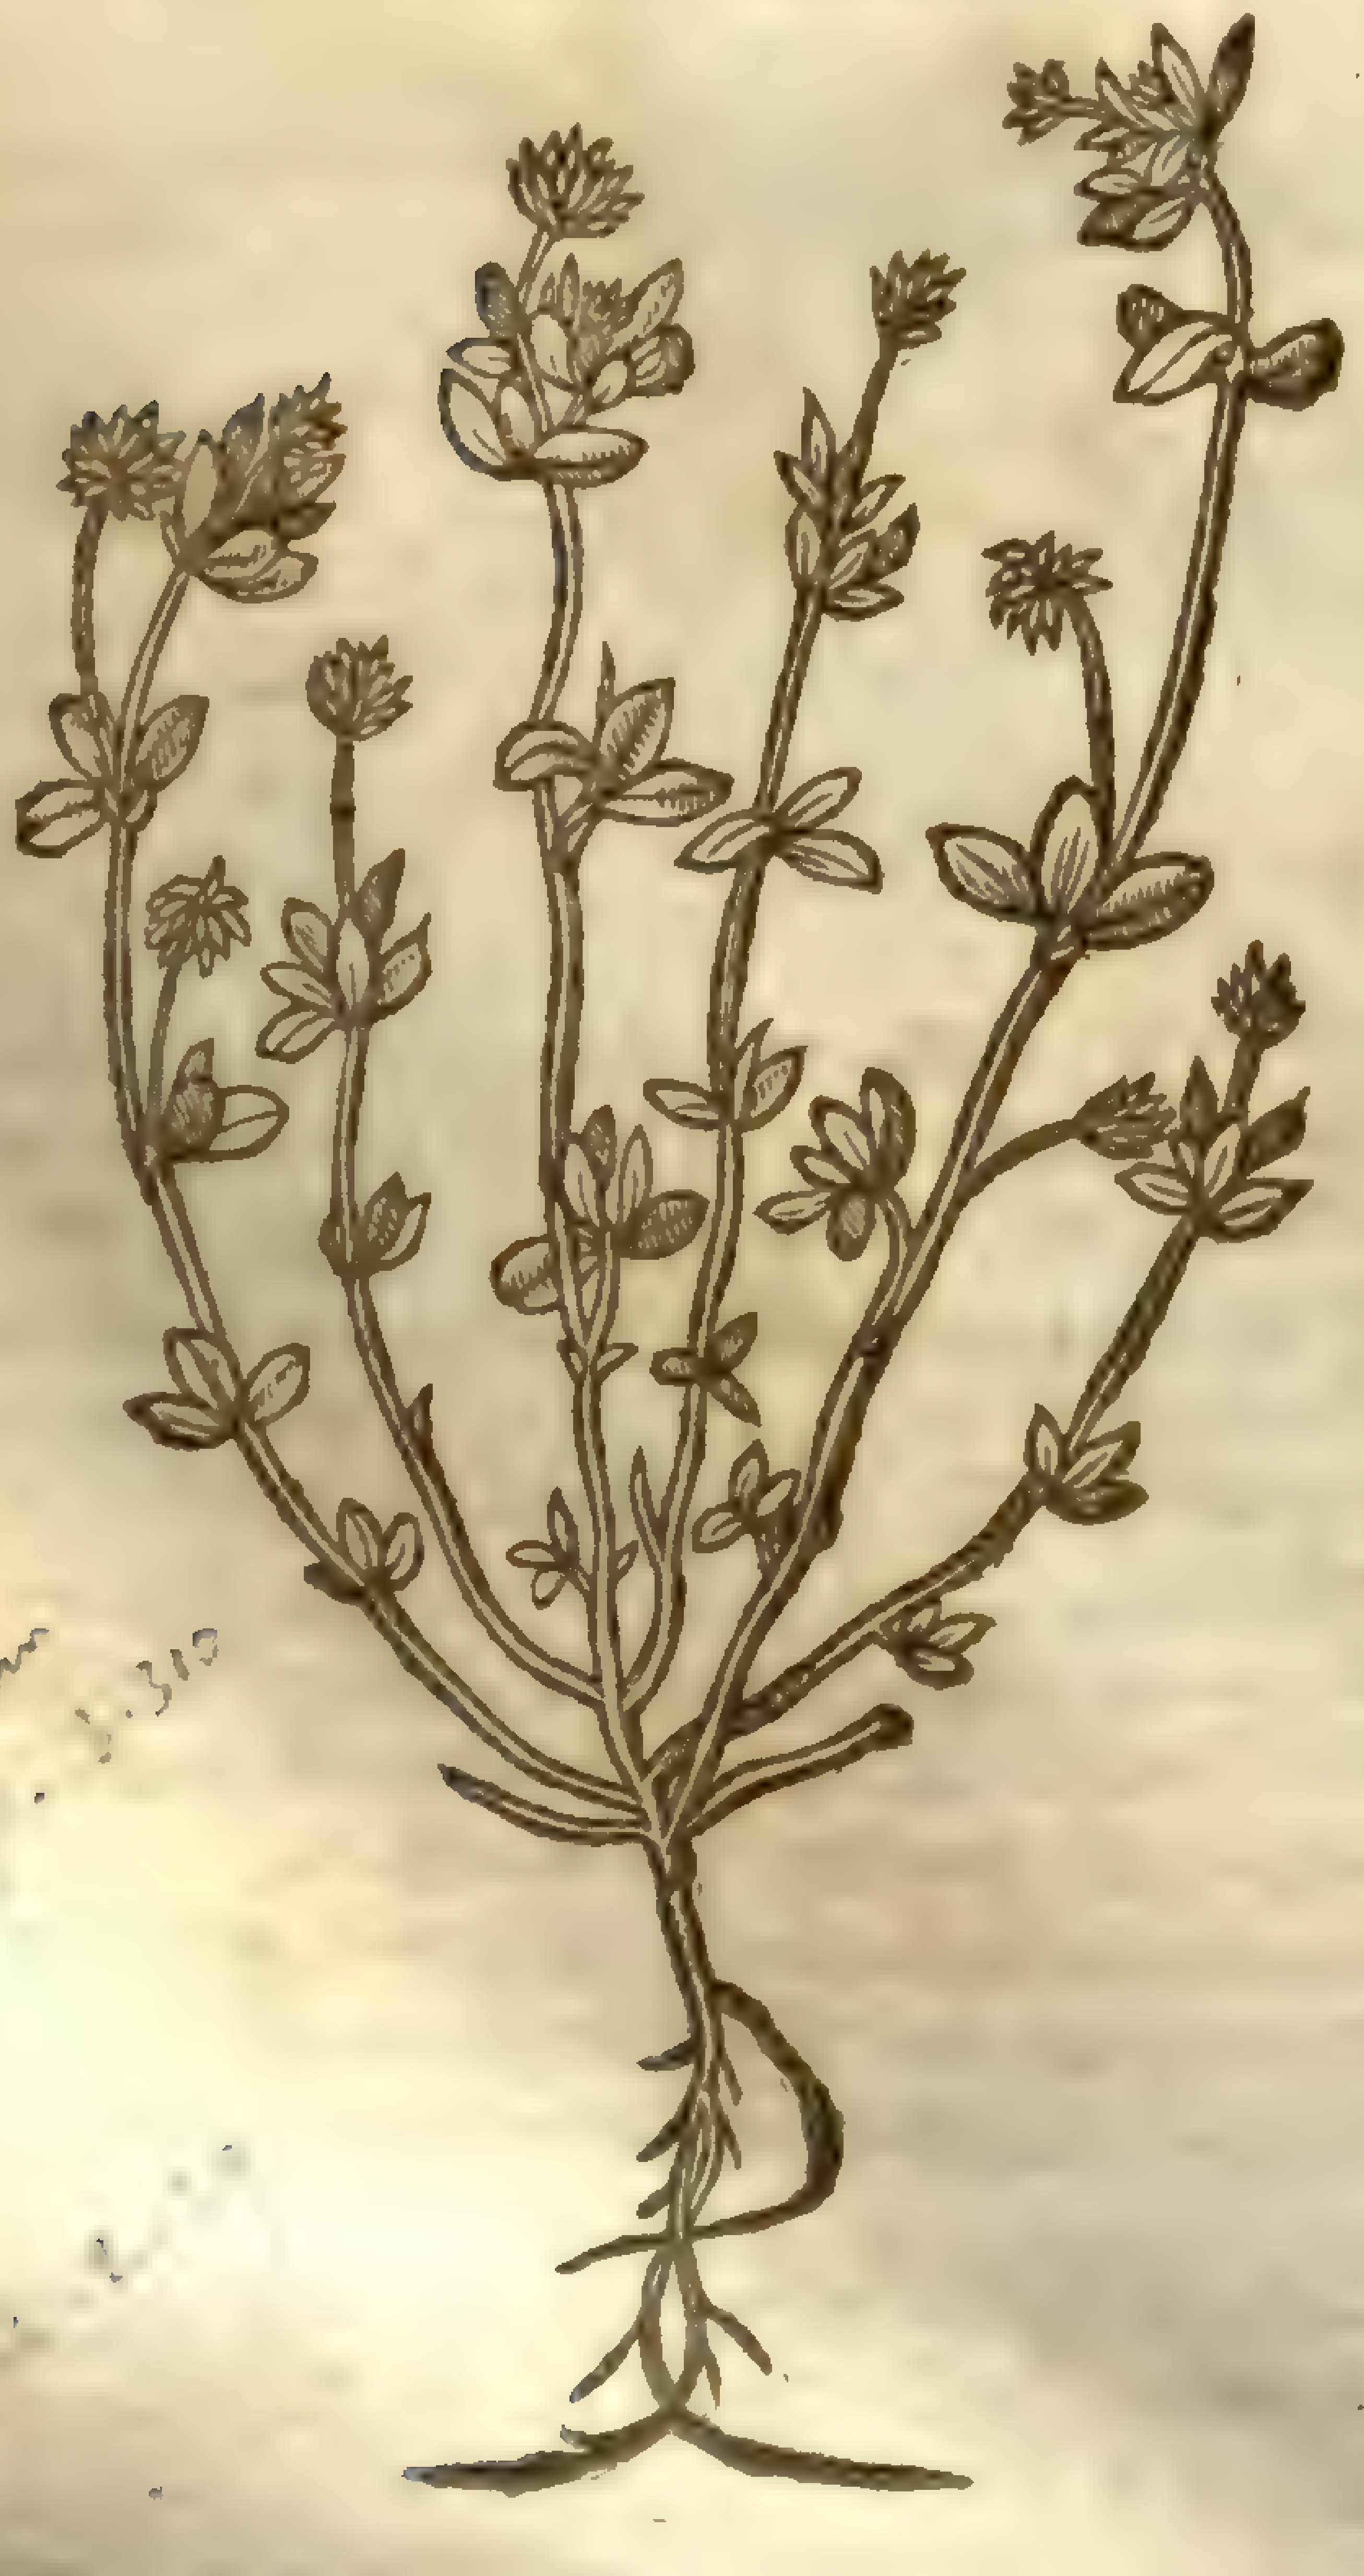
Little yellow Trefoile.



T. minus, i. e. [illegible]
Sm. Fl. 3.310

primum. The other hath ſtalks ſome cubit high, with larger joints and leaues: the floure or head of floures is alſo larger, of an elegant red colour. This *Cluſius* calls *Trifolium majus tertium.* ‡

5. 6 Likewiſe we haue in our fields a ſmaller Trefoile that brings forth yellow flours, a greater and a leſſer, & diuers others alſo, differing from theſe in diuers notable points, the which to diſtinguiſh apart would greatly inlarge our volume, and yet to ſmall purpoſe: therefore we leaue them to be diſtinguiſhed by the Curious, who may at the firſt view eaſily perceiue the difference, and alſo that they be of one ſtocke or kindred.

‡ The greater of theſe yellow Trefoiles hath prety large yellow heads, which afterward become of a browniſh colour, and ſomewhat reſemble an hop; whence *Thalius* called it *Lupulus ſylvaticus,* or *Trifolium luteum alterum lupulinum*: *Dodonæus* cals it *Trifolium agrarium.* The leaues are ſmal, and lightly nickt about the edges: the leſſer hath ſmaller and far leſſer yellow heads, which are ſucceeded by many little crooked cluſtring ſeeds. The leaues of this are ſmall, and alſo ſnipt about the edges. Both this and the other hath two little leaues cloſe by the faſtning of the foot-ſtalkes of the leaues to the main ſtalks: wherefore I referre them to the Medickes, and vſually call this latter, *Medica ſem. racemoſo.* It is the *Trifol. luteum minim.* of *Pena* and *Lobel*; and *Trifol. arvenſe* of *Taber.* ‡

¶ *The Place.*

Common medow Trefoile grows in medowes, fertile paſtures, and wateriſh grounds: the others loue the like ſoile.

¶ *The Time.*

They floure from May to the end of Summer.

¶ *The Names.*

Medow Trefoile is called in Latine *Trifolium pratenſe*: in high-Dutch, **Weiſenklee**: in low-Dutch, **Claueren**: in French, *Treffle*, and *Trainiere*, and *Viſumarus*, as *Marcellus* an old writer teſtifies: in Engliſh, Common Trefoile, Three leafed graſſe: of ſome, Suckles, Hony-ſuckles, and Cocks-heads: in Iriſh, *Shamrocks*.

¶ *The Temperature.*

The leaues and floures of medow Trefoiles are cold and dry.

¶ *The Vertues.*

The decoction of three leafed graſſe made with hony and vſed as a cliſter, is good againſt frettings and paines of the guts, and driueth forth tough and ſlimy humors that cleaue vnto the guts. A

The leaues boiled with a little barrows greaſe, and vſed as a pultis, take away hot ſwellings and inflammations. B

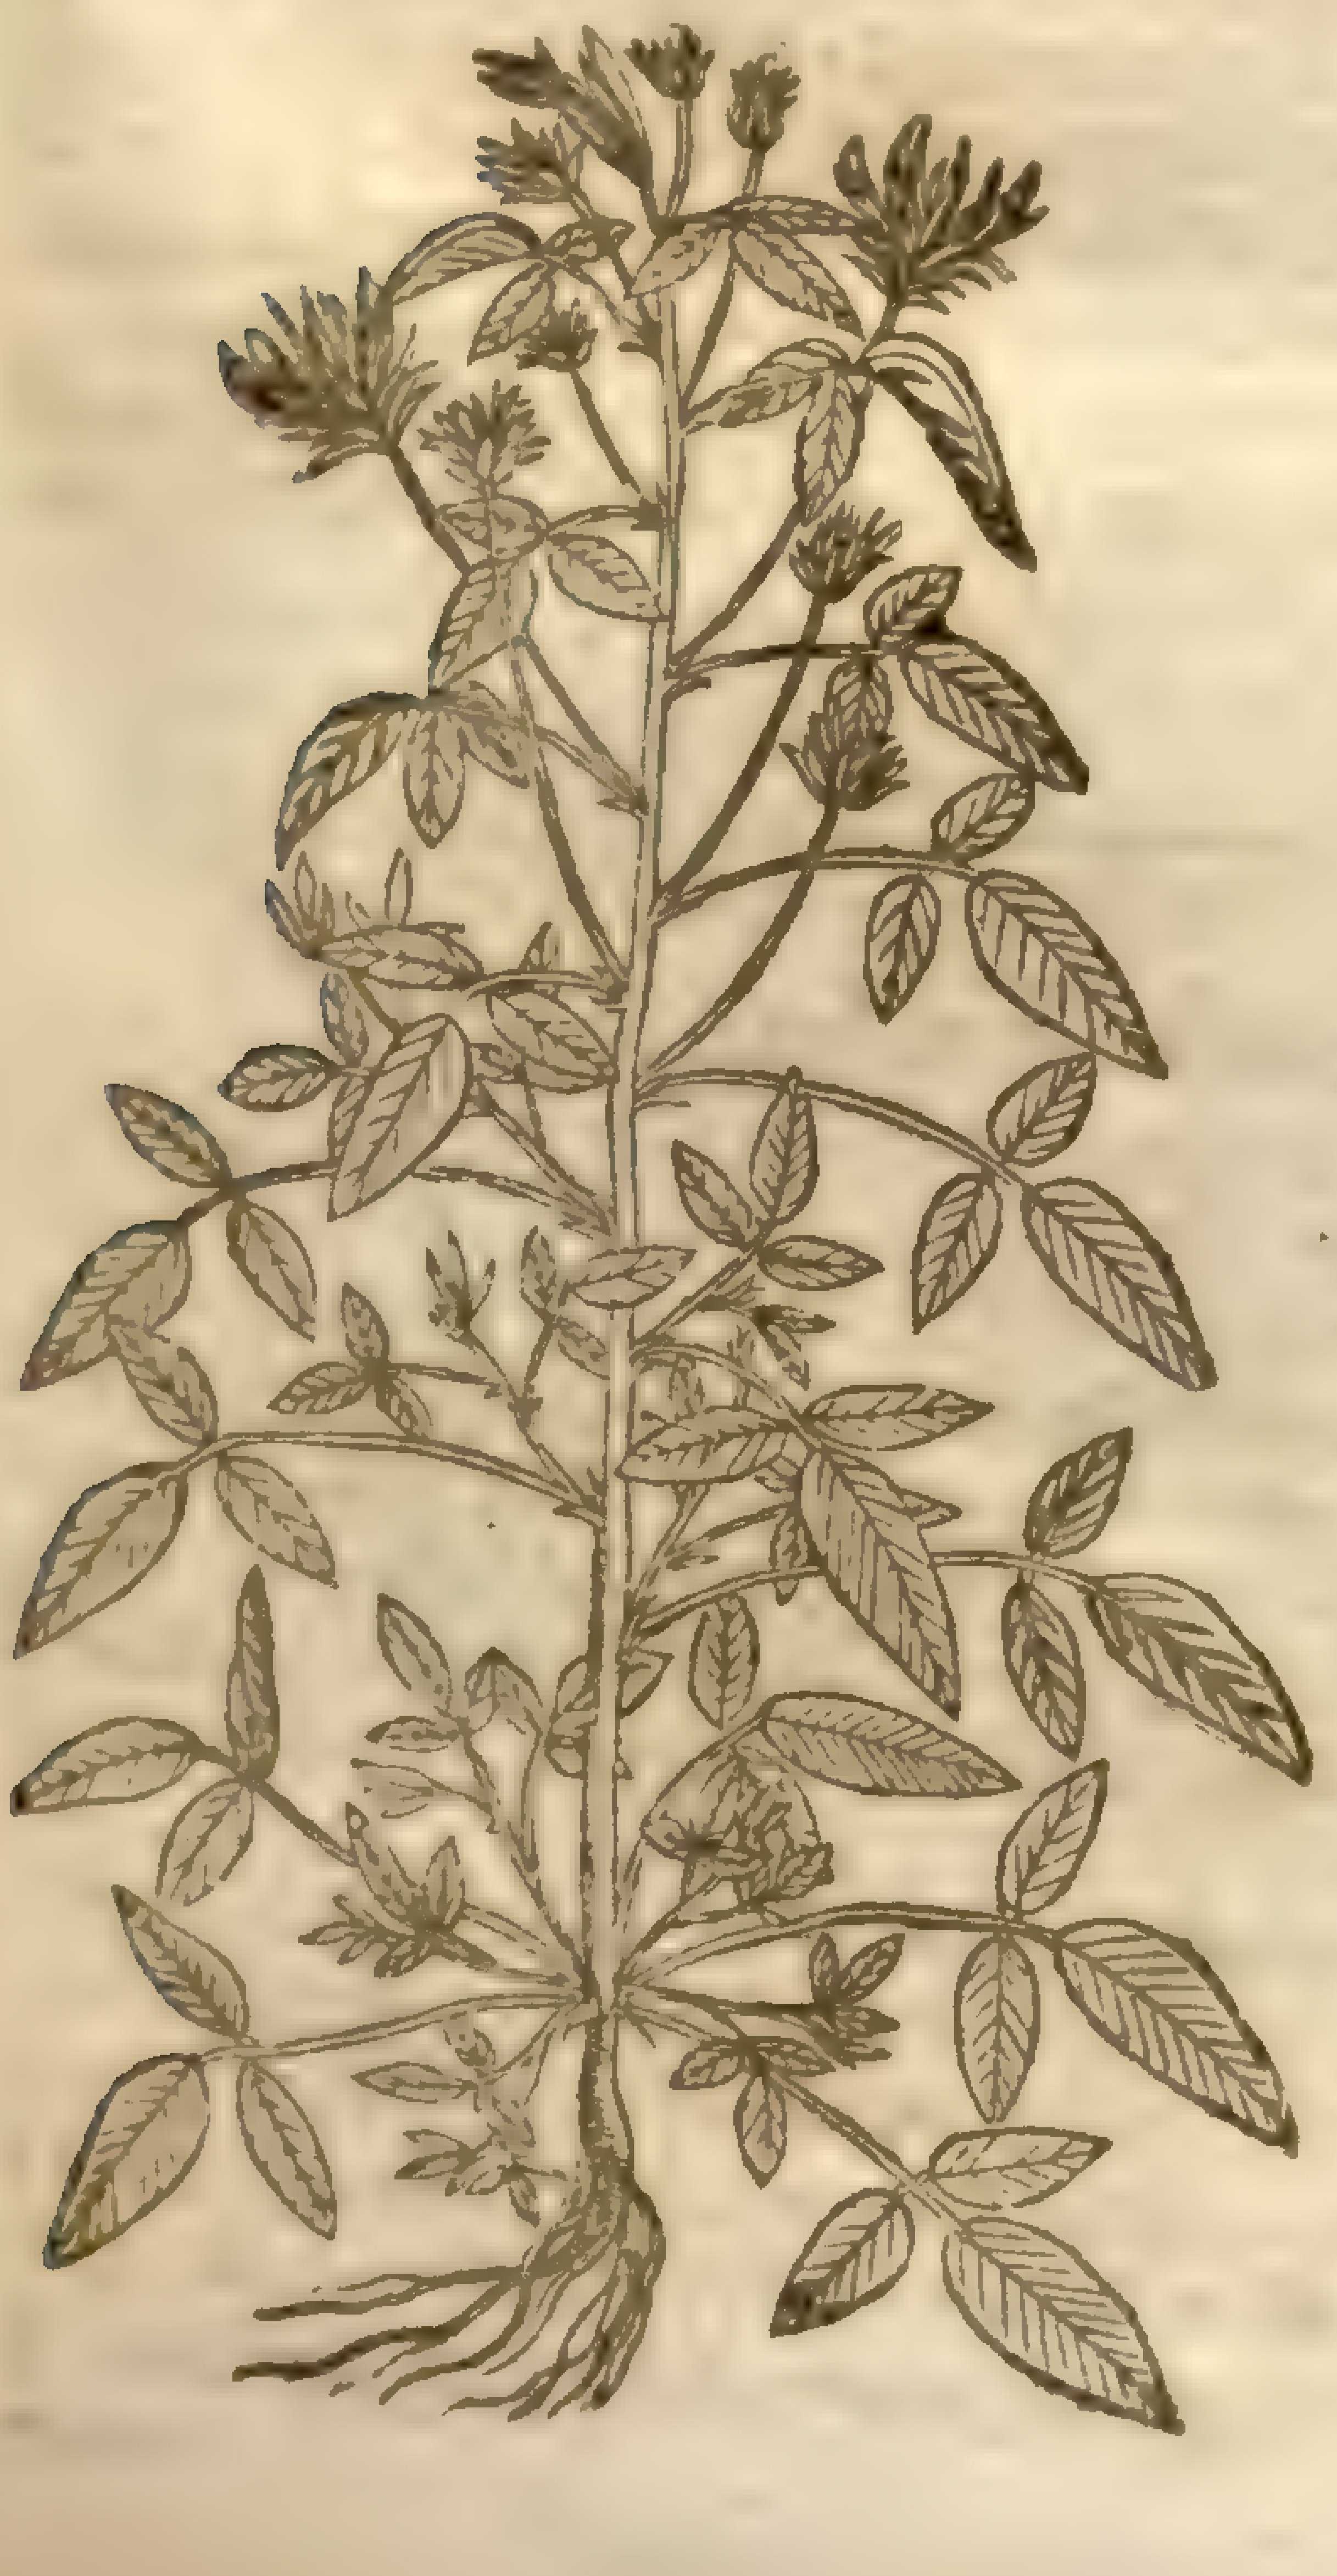
Oxen and other cattell do feed on the herb, as alſo calves and yong lambs. The flours are acceptable to Bees. C

Pliny writeth and ſetteth it downe for certaine, that the leaues hereof do tremble and ſtand right vp againſt the comming of a ſtorme or tempeſt. D

The medow Trefoile (eſpecially that with the blacke halfe-moon vpon the leafe) ſtamped with a little hony, takes away the pin and web in the eies, ceaſing the pain and inflammation thereof, if it be ſtrained and dropped therein. E

CHAP. 495. *Of ſtinking Trefoile or Treacle Claver.*

Trifolium bituminoſum.
Treacle Claver.



¶ *The Deſcription.*

Treacle Claver growes vpright like a ſhrubbie plant, with ſtalkes of a cubit and a halfe high; whereupon grow next the ground broad leaues three joined together: thoſe vpon the ſtalks are longer and narrower. The ſtalks are couered ouer with a rough euill coloured hairineſſe: the leaues are of a darke blacke green colour, and of a loathſome ſmell, like the pitch called *Bitumen Iudaicum*, whereof it took the name. The flours grow at the top of the ſtalks, of a dark purpliſh colour tending to blewneſſe, in ſhape like thoſe of Scabious. The ſeed is broad, rough, long, and ſharp pointed: the root is ſmal & tender, and canot endure the coldneſſe of our Winter, but periſheth at the firſt approch thereof.

¶ *The Place.*

It groweth naturally, ſaith *Hippocrates, Hippiatros*, not *Cous*, in rough places, as *Ruellius* tranſlateth it: in Germany, France, and England it neuer commeth vp of it ſelfe, but muſt be ſown in gardens, as my ſelfe haue proued diuers times, and was conſtrained to ſow it yerely, or elſe it would not come vp, either of his owne ſowing or otherwiſe

¶ *The Time.*

It floured not in my garden vntill the end of Auguſt.

¶ *The*

¶ *The Names.*

Nicander calls this Trefoile τρίφυλλον: in Latine, *Trifolium acutum*, or ſharpe pointed Trefoile: of *Pliny*, *Trifolium odoratum*, but not properly: of others, *Trifolium Aſphaltæum, ſive Bituminoſum*, or ſtone Pitch Trefoile.

Avicen calleth it *Tarſilon*, and not *Handacocha*: *Avicen* doth comprehend *Dioſcorides* his *Loti*, that is to ſay, *Lotus vrbana ſylveſtris*, and *Ægyptia*; which *Dioſcorides* confoundeth one with another in one Chapter. In Engliſh it is called Clauer gentle, Pitch Trefoile, ſtinking Trefoile, and Treacle Clauer.

¶ *The Temperature.*

This Trefoile, called *Aſphaltæum*, as *Galen* ſaith, is hot and dry in the third degree, as *Bitumen* is.

¶ *The Vertues.*

A Being drunke, it taketh away the pain of the ſides which commeth by obſtruction or ſtoppings, prouoketh vrine, and bringeth downe the deſired ſickneſſe.

B *Hippocrates* writeth, that it doth not only bring them downe, but likewiſe the birth, not onely inwardly taken, but alſo outwardly applied: if a woman, ſaith he, be not well clenſed after her childbearing, giue her this Trefoile to drinke in white wine.

C *Dioſcorides* ſaith, that the ſeeds and leaues being drunke in water are a remedie for the pleuriſie, difficultie of making water, the falling ſickeneſſe, the dropſie when it firſt beginneth, and for thoſe that be troubled with the Mother: the quantity to be taken at once is three drams of the ſeeds, and foure of the leaues.

D The leaues drunke in Oxymel or a ſyrrup of vineger made with hony, is good for thoſe that are bitten with ſerpents.

E Some affirm, that the decoction of the whole plant, root and leaues, taketh away pain comming of the ſting of ſerpents, if the part be waſhed therewith: but if any other man hauing an vlcer, bee waſhed with that water wherewith he was bathed that was bitten of the ſerpent, they ſay that hee ſhall be troubled in the ſame manner that the ſtinged party was.

F Some alſo giue with wine three leaues, or a ſmall quantitie of the ſeeds in tertian agues, and in Quartane foure, as a ſure remedie againſt the fits.

G The root alſo is put into antidotes or counterpoiſons, ſaith *Dioſcorides*: but other antient Phyſitions do not only mix the root with them, but alſo the ſeed, as we may ſee in *Galen, lib.* 2. of his antidots, in many compoſitions; that is to ſay, in the Treacles of *Ælius Gallus*, *Zeno Laudocens*, *Claudius Apollonius*, *Eudemus*, *Heraclides*, *Dorothæus*, and *Heras*.

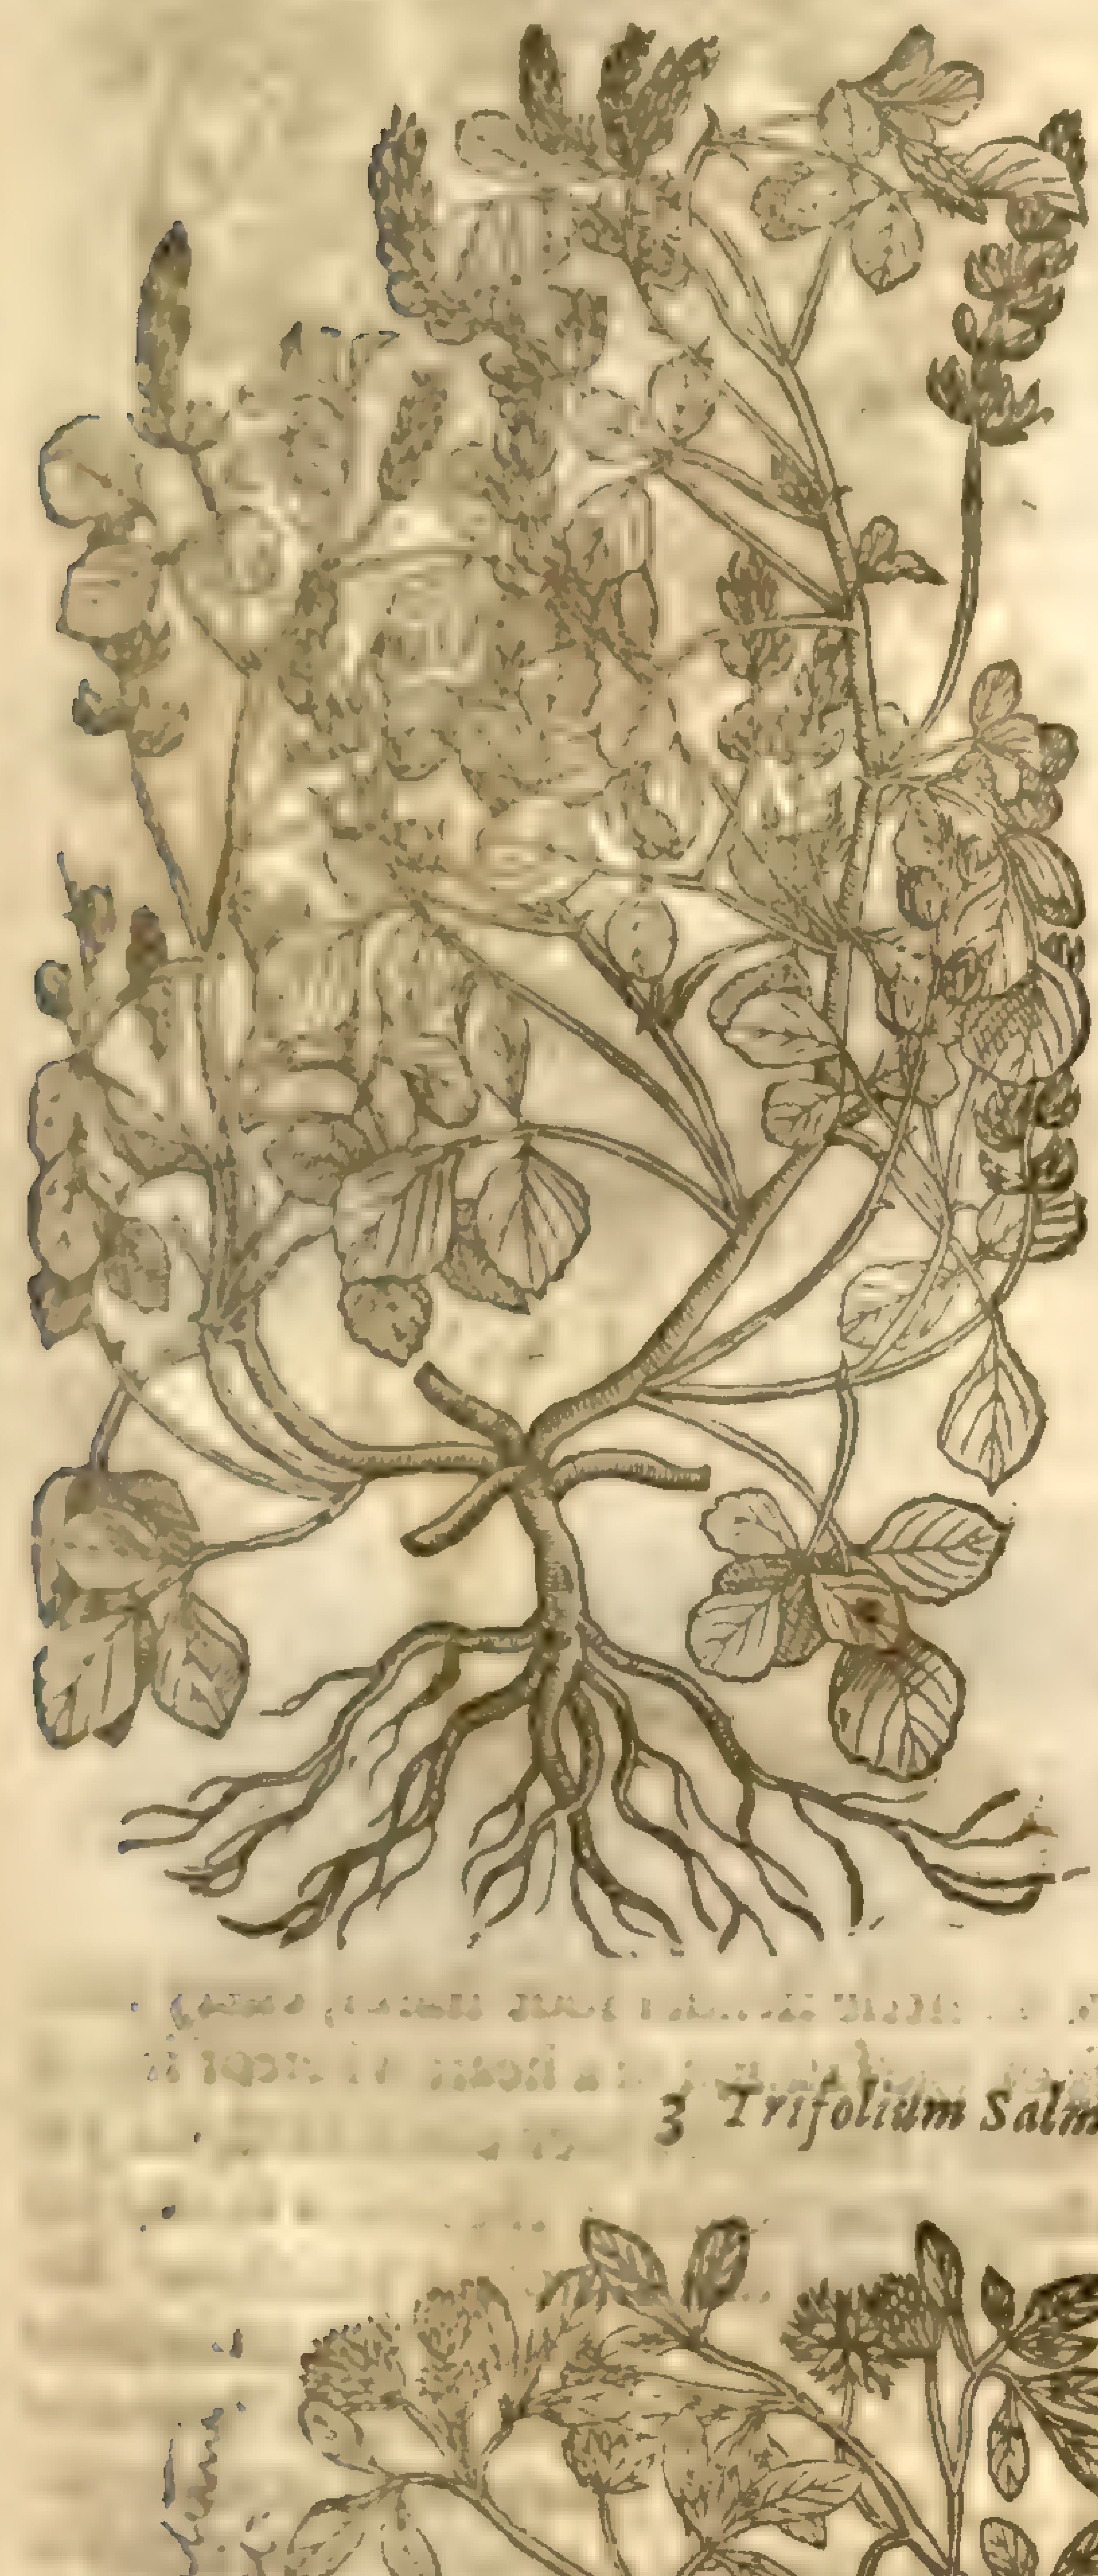
H The herbe ſtamped and applied vpon any invenomed wound or made with poiſoned weapon, drawes the poiſon from the depth moſt apparantly: but if it be applied vpon a wound where there is no venomous matter to work vpon, it doth no leſſe infect that part, than if it had bin bitten with ſome ſerpent or venomous beaſt: which wonderful effect it doth not performe in reſpect of any vitious qualitie that it hath in it ſelfe, but becauſe it doth not finde that venomous matter to worke vpon, which it naturally draweth (as the Load-ſtone doth iron) wherupon it is conſtrained through his attractiue qualitie, to draw and gather together humors from farre vnto the place, whereby the paine is greatly increaſed.

Chap. 496. *Of diuers other Trefoiles.*

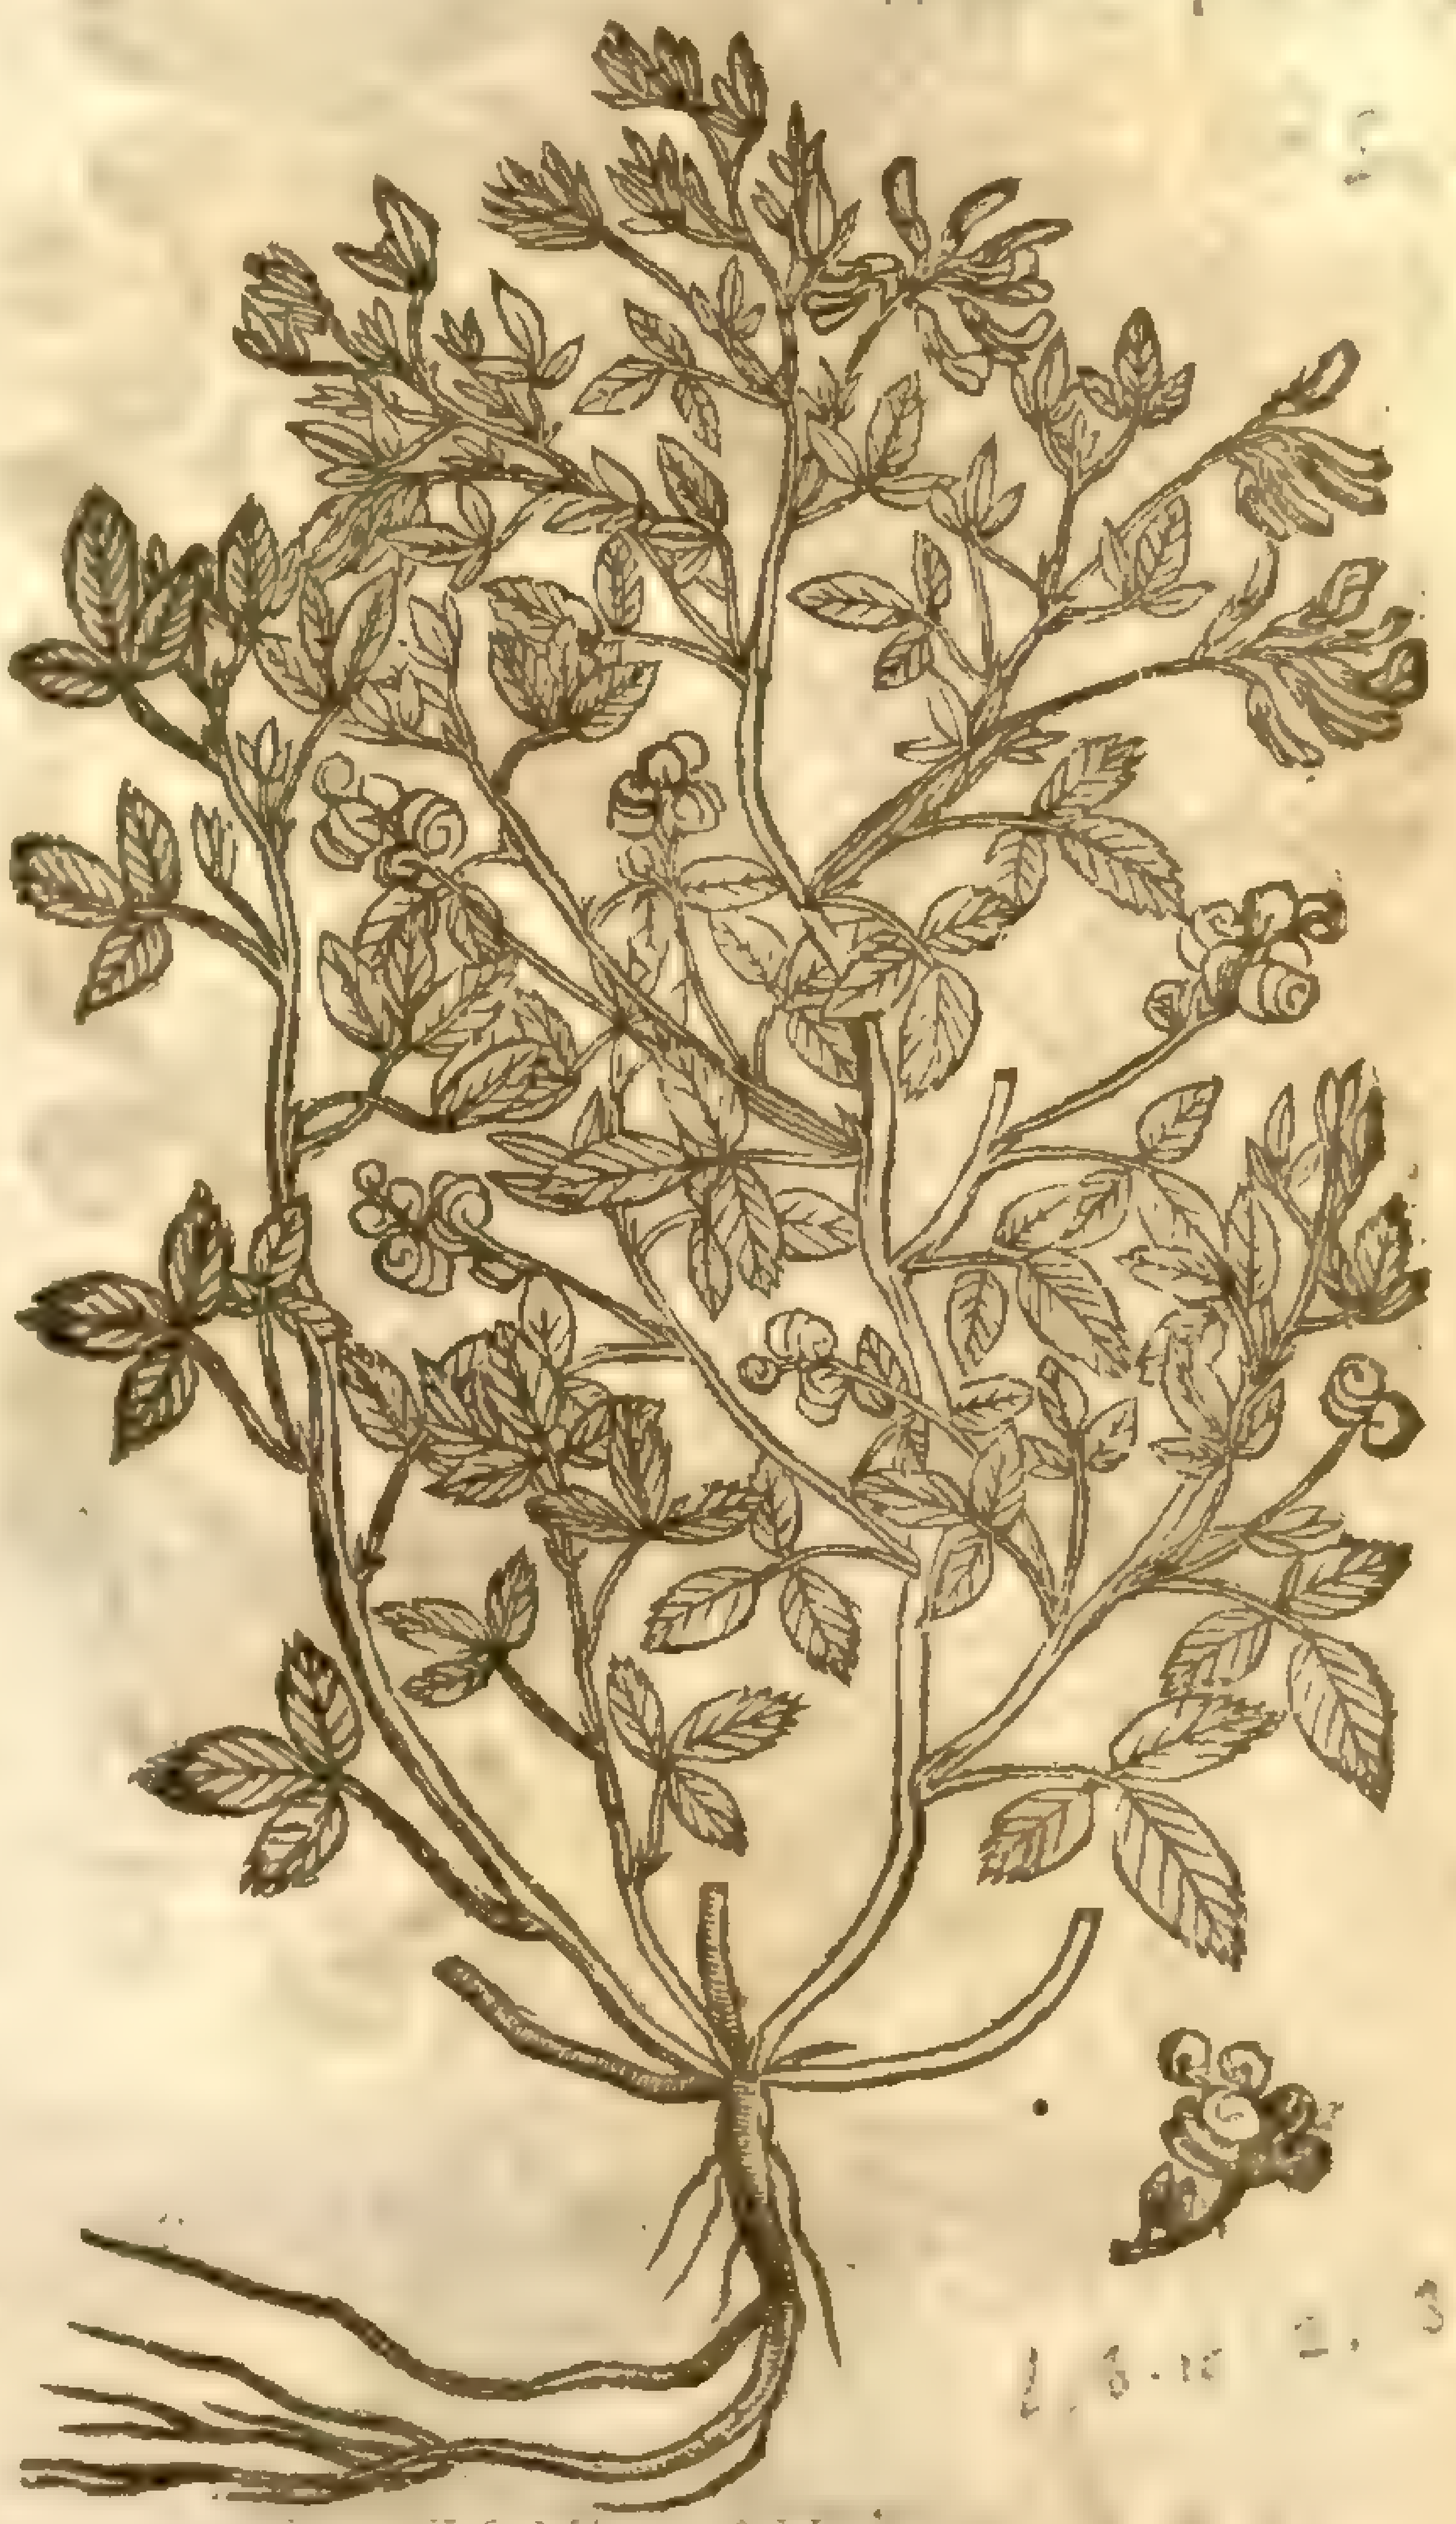
¶ *The Deſcription.*

1 Three leaued Graſſe of America hath diuers crooked round ſtalks leaning this way and that way, and diuided into diuers branches, whereon grow leaues like thoſe of the medow Trefoile, of a blacke greene colour, and of the ſmell of pitch Trefoile or Treacle Claver: the floures grow at the top of the branches, made vp in a long ſpiked chaffie eare, white of colour: after which comes the ſeed, ſomwhat flat, almoſt like to thoſe of Tares: the roots are long ſtrings of a wooddy ſubſtance.

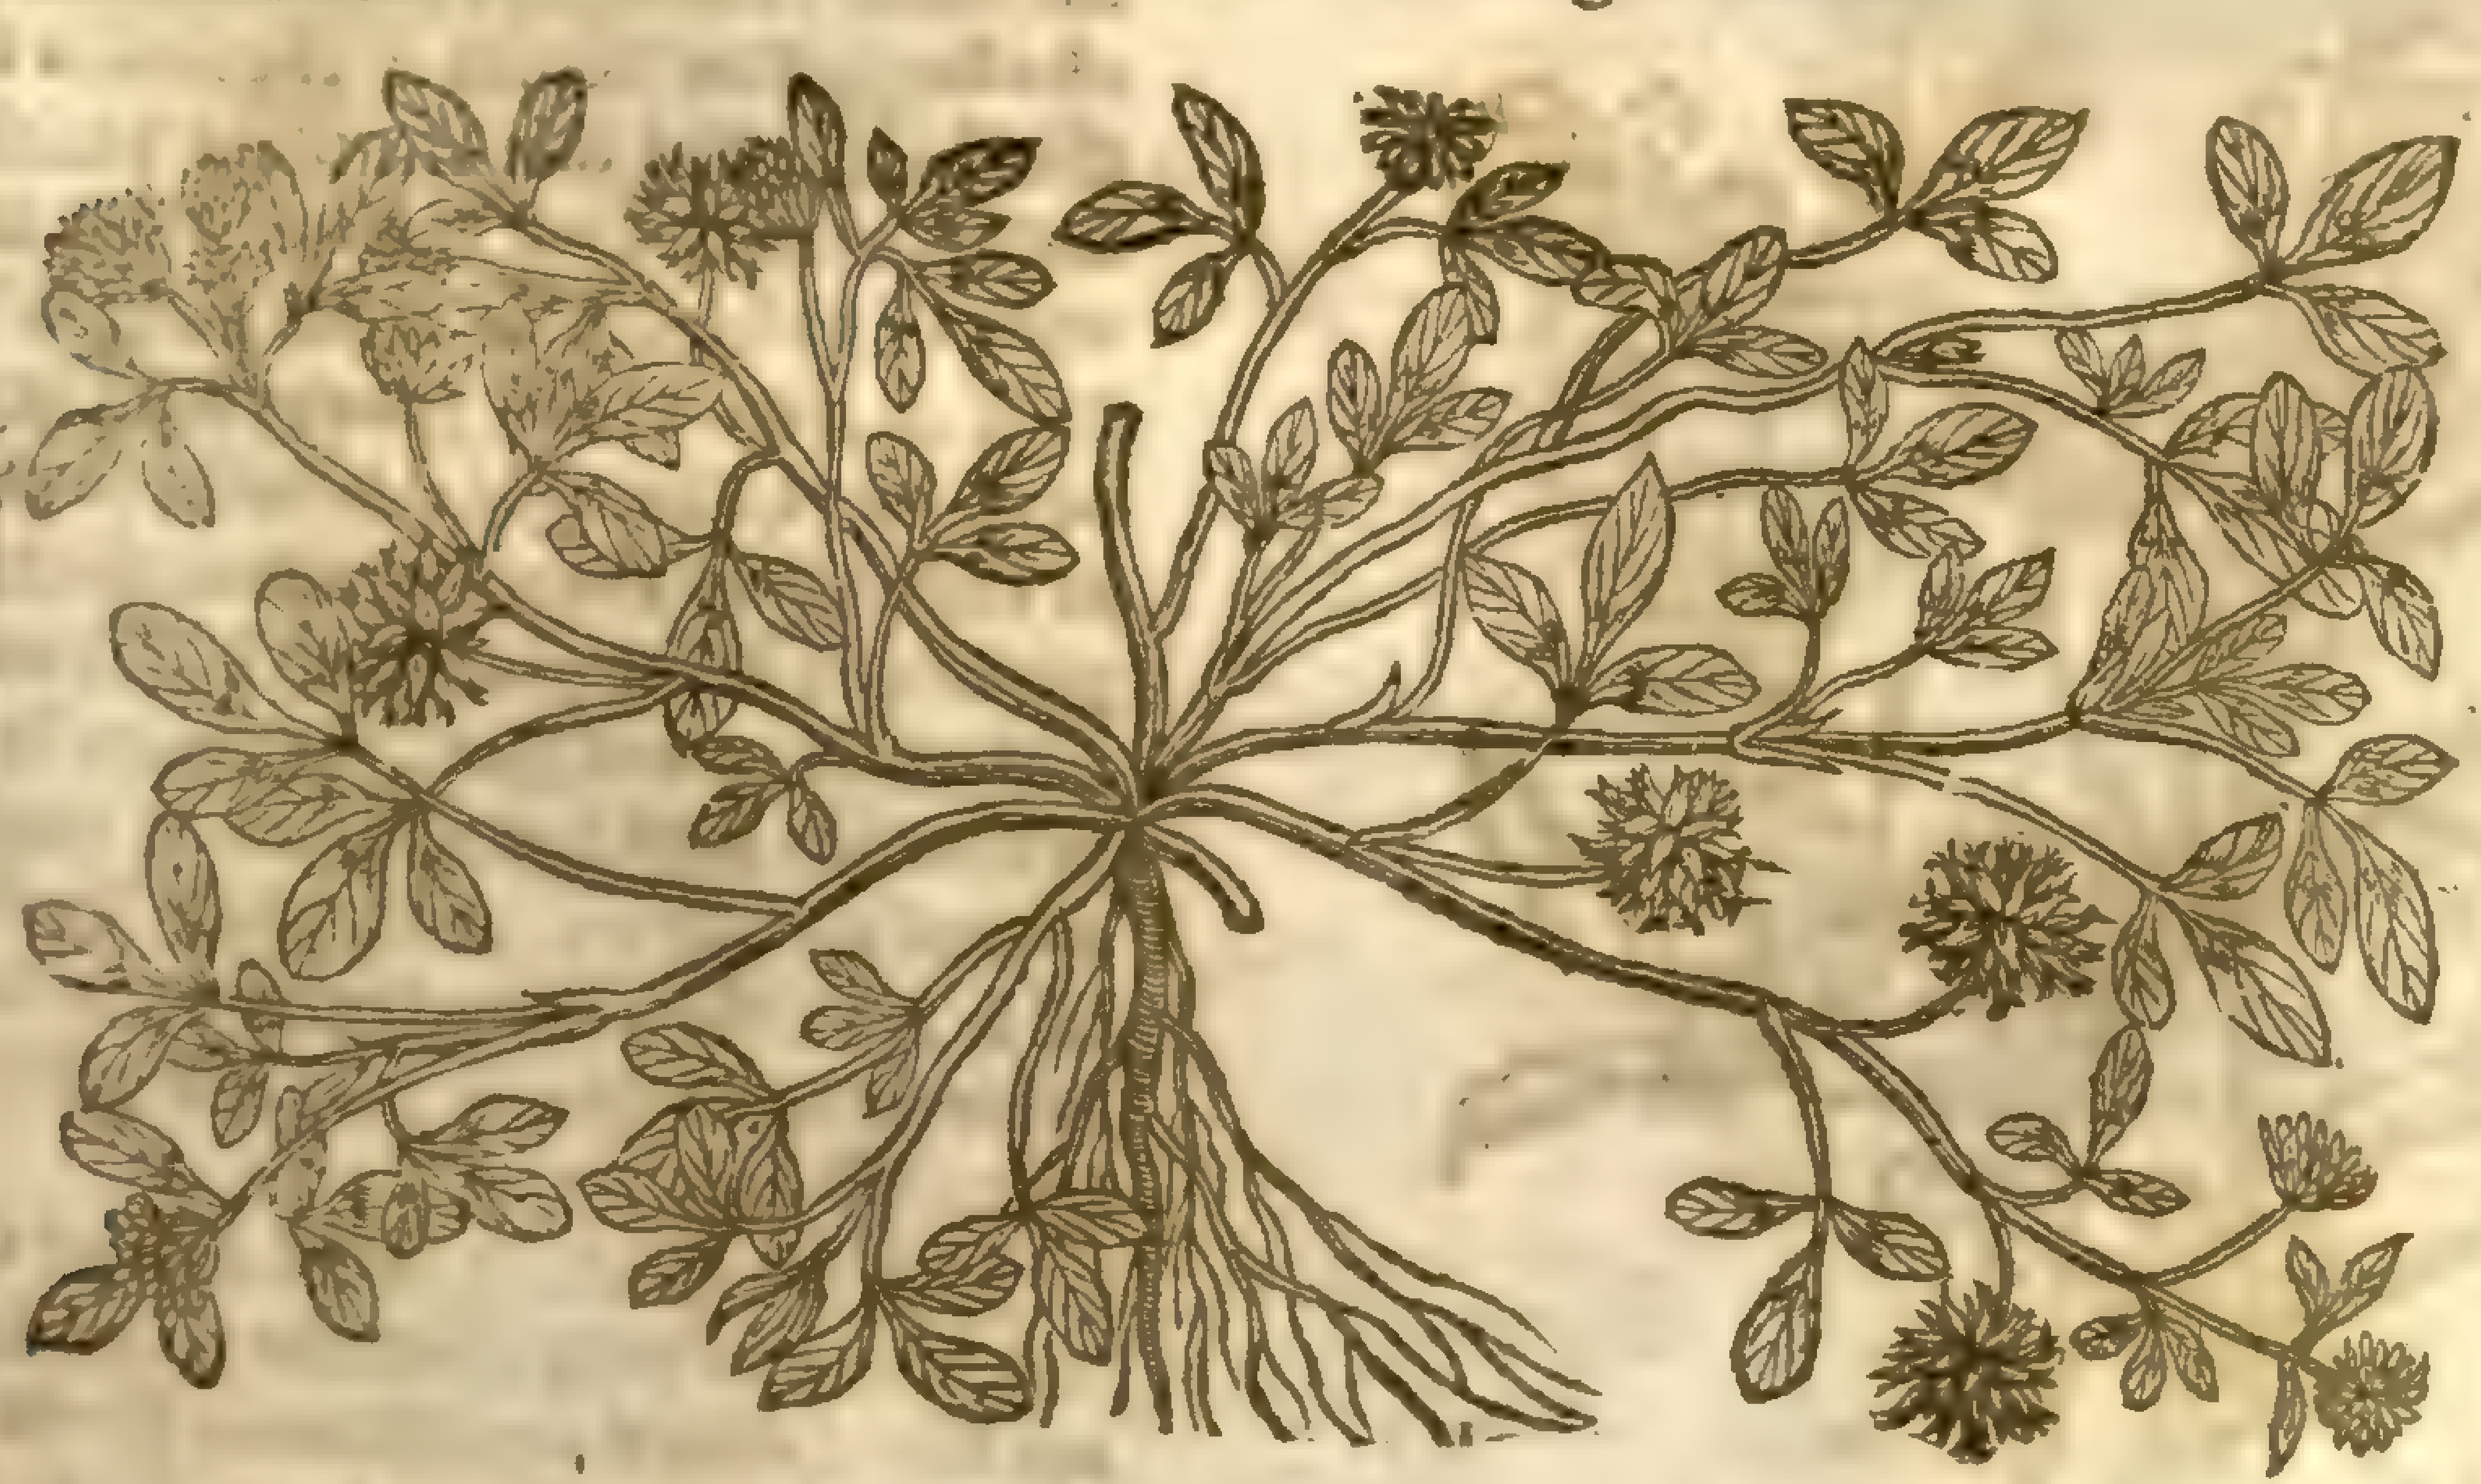
2 This three leafed Graſſe (which *Dodonæus* in his laſt edition calleth *Trifolium cochleatum primum*; and *Lobel*, *Fœnum Burgundiacum*) hath diuers round vpright ſtalkes of a wooddy rough ſubſtance, yet not able of it ſelfe to ſtand without a prop or ſtay: which ſtalkes are diuided into diuers ſmall branches, whereupon doe grow leaues joined three together like the other Trefoiles, but of a darke ſwart greene colour: the floures grow at the tops of the ſtalks, in ſhape like thoſe of the codded Trefoile, but of a darke purple colour: the ſeed followeth, contained in ſmall wrinckled huskes



1 *Trifolium Americum.*
Trefoile of America.



† 2 *Trifolium Burgundiacum.*
Burgondy Trefoile.



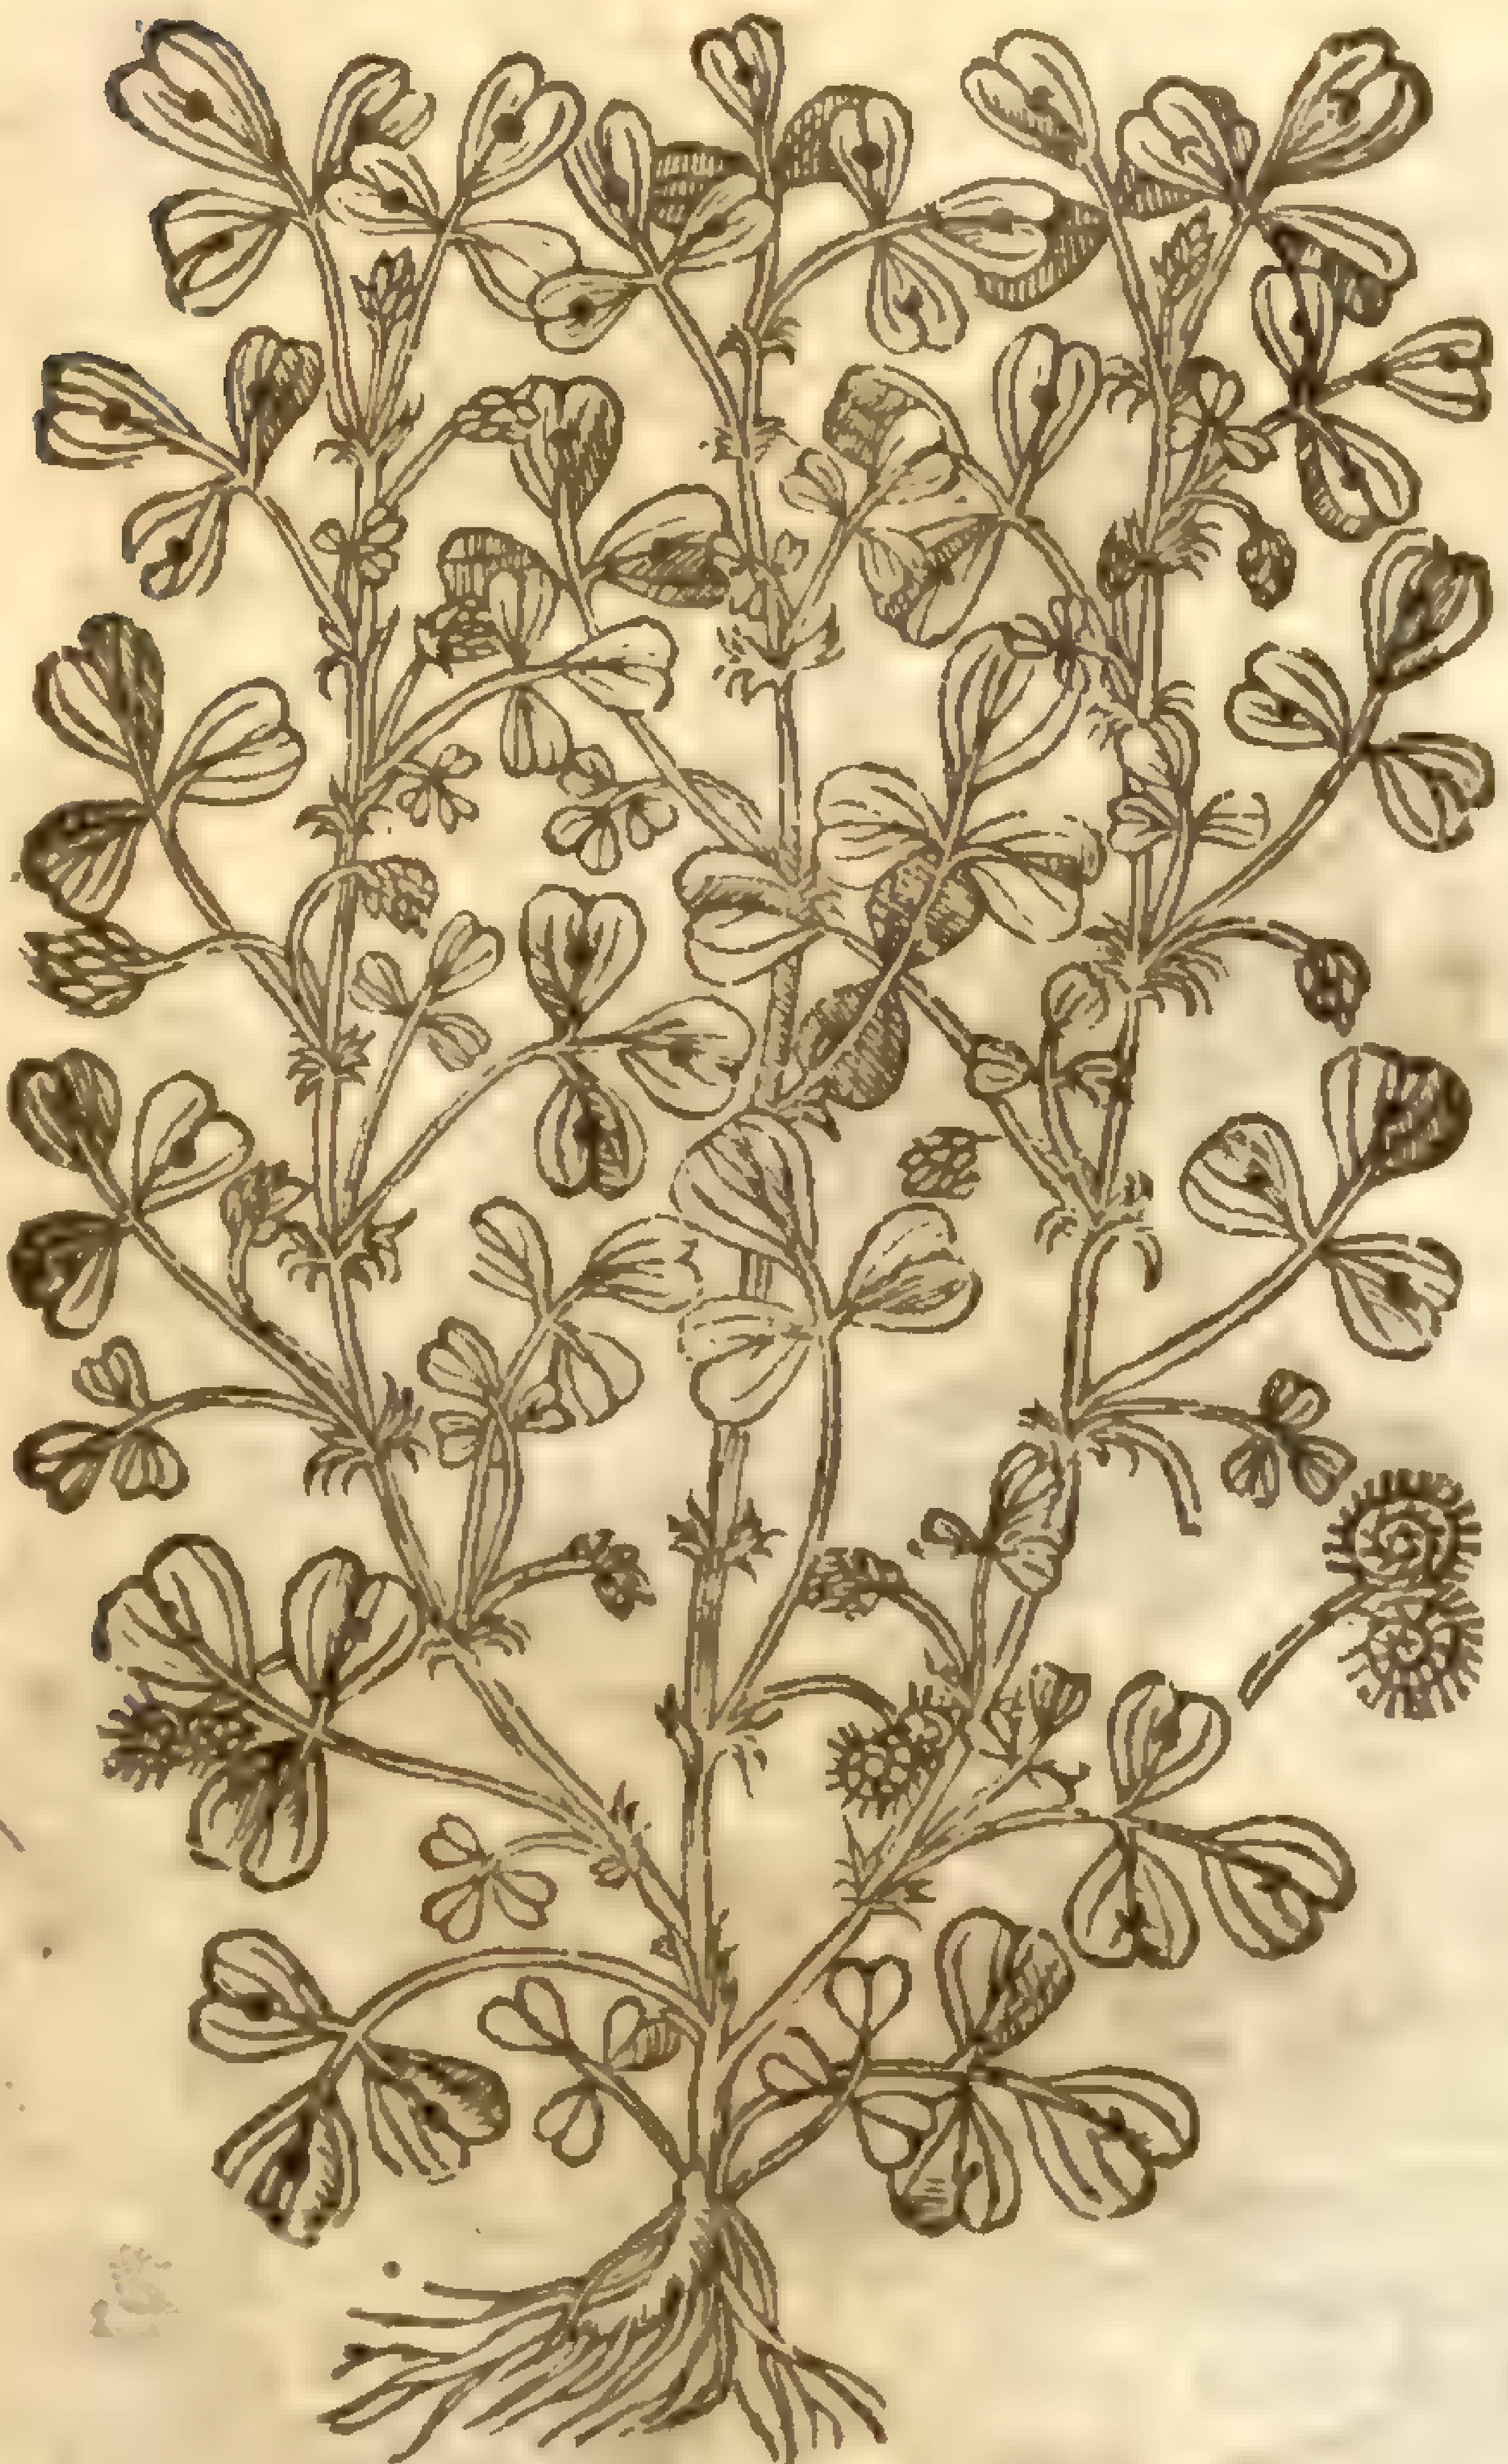
3 *Trifolium Salmanticum.* Portugal Trefoile.

husks turned round, after the maner of a water ſnaile. The root is thick, compoſed of diuers tough threddy ſtrings, and laſteth long in my garden with great increaſe.

3 This three leaued Graſſe of Salmanca, a city as I take it in Portugal, differs not much from our field Trefoile: it hath many branches weak and tender, trailing vpon the ground, of two cubits and a halfe high: whereupon grow leaues ſet together by three vpon a ſtemme; from the boſome whereof thruſt forth tender foot-ſtalkes, whereon ſtand moſt fine floures of a bright red tending to purple: after which come the ſeeds wrapped in ſmall skins, of a red colour

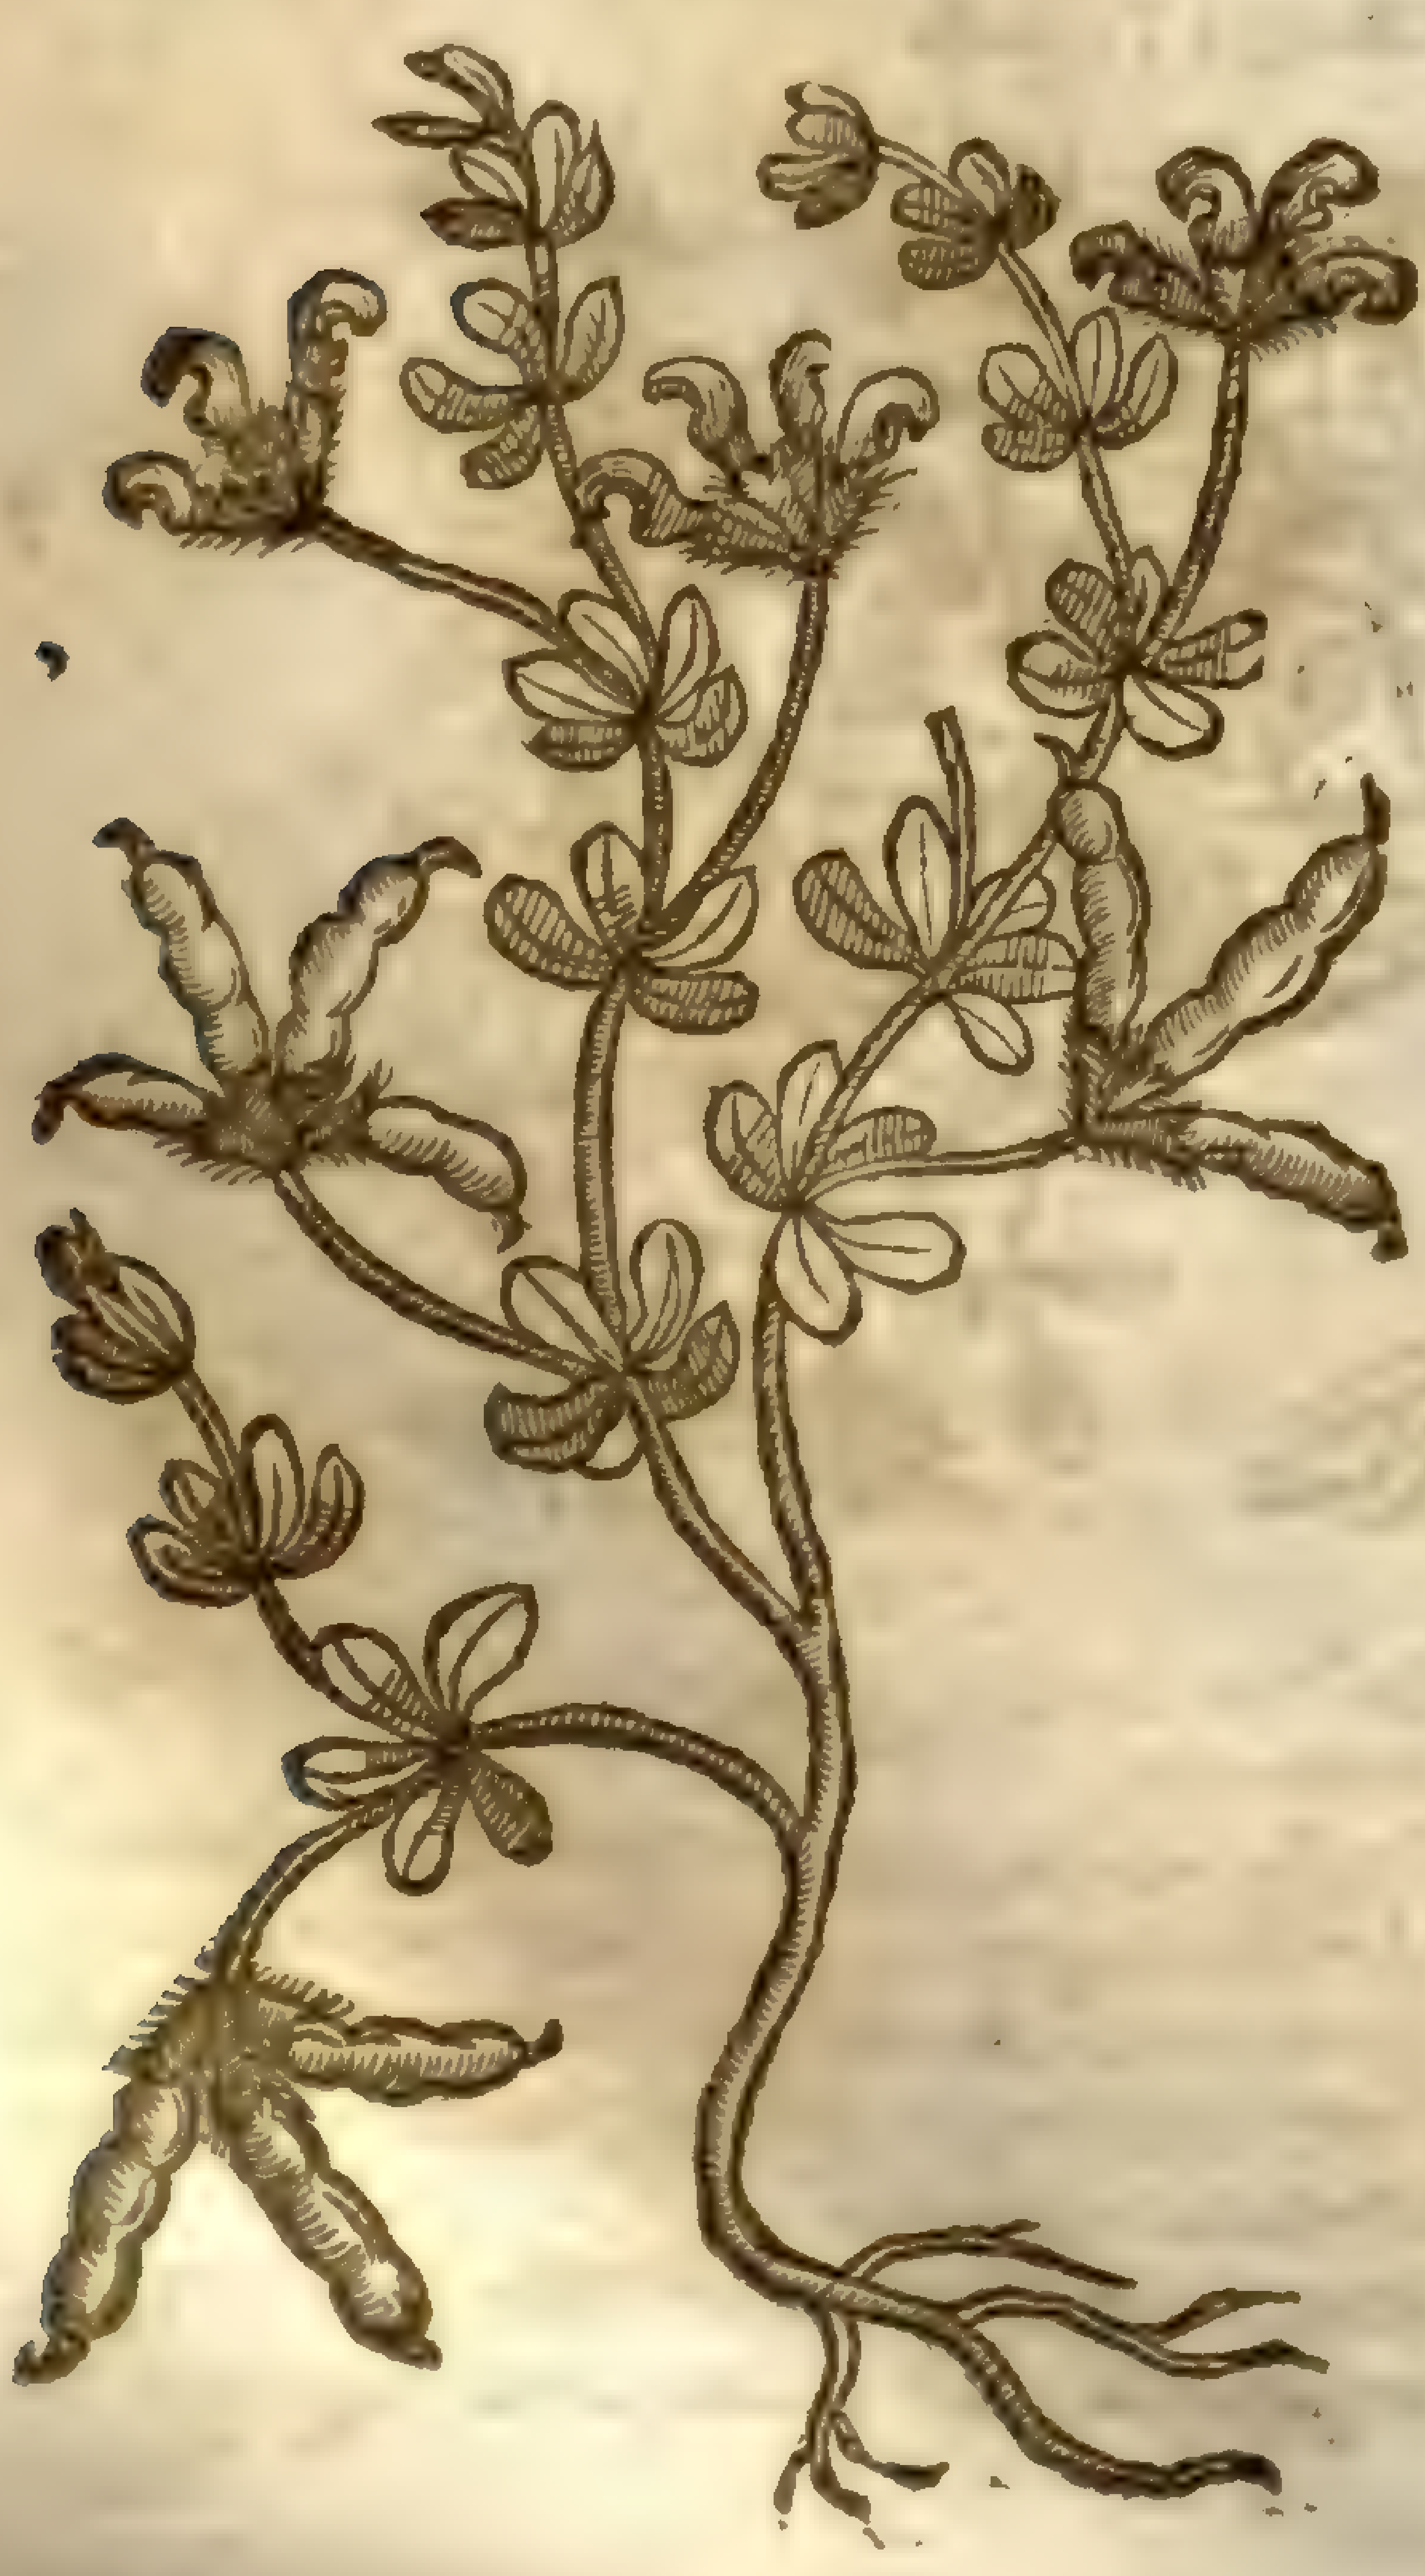
4 The Hart Trefoile hath very many flexible branches, ſet vpon a ſlender ſtalke, of the length of two or three foot, trailing hither and thither: whereupon doe grow leaues joined together by three

4 *Trifolium Cordatum.*
Heart Trefoile.

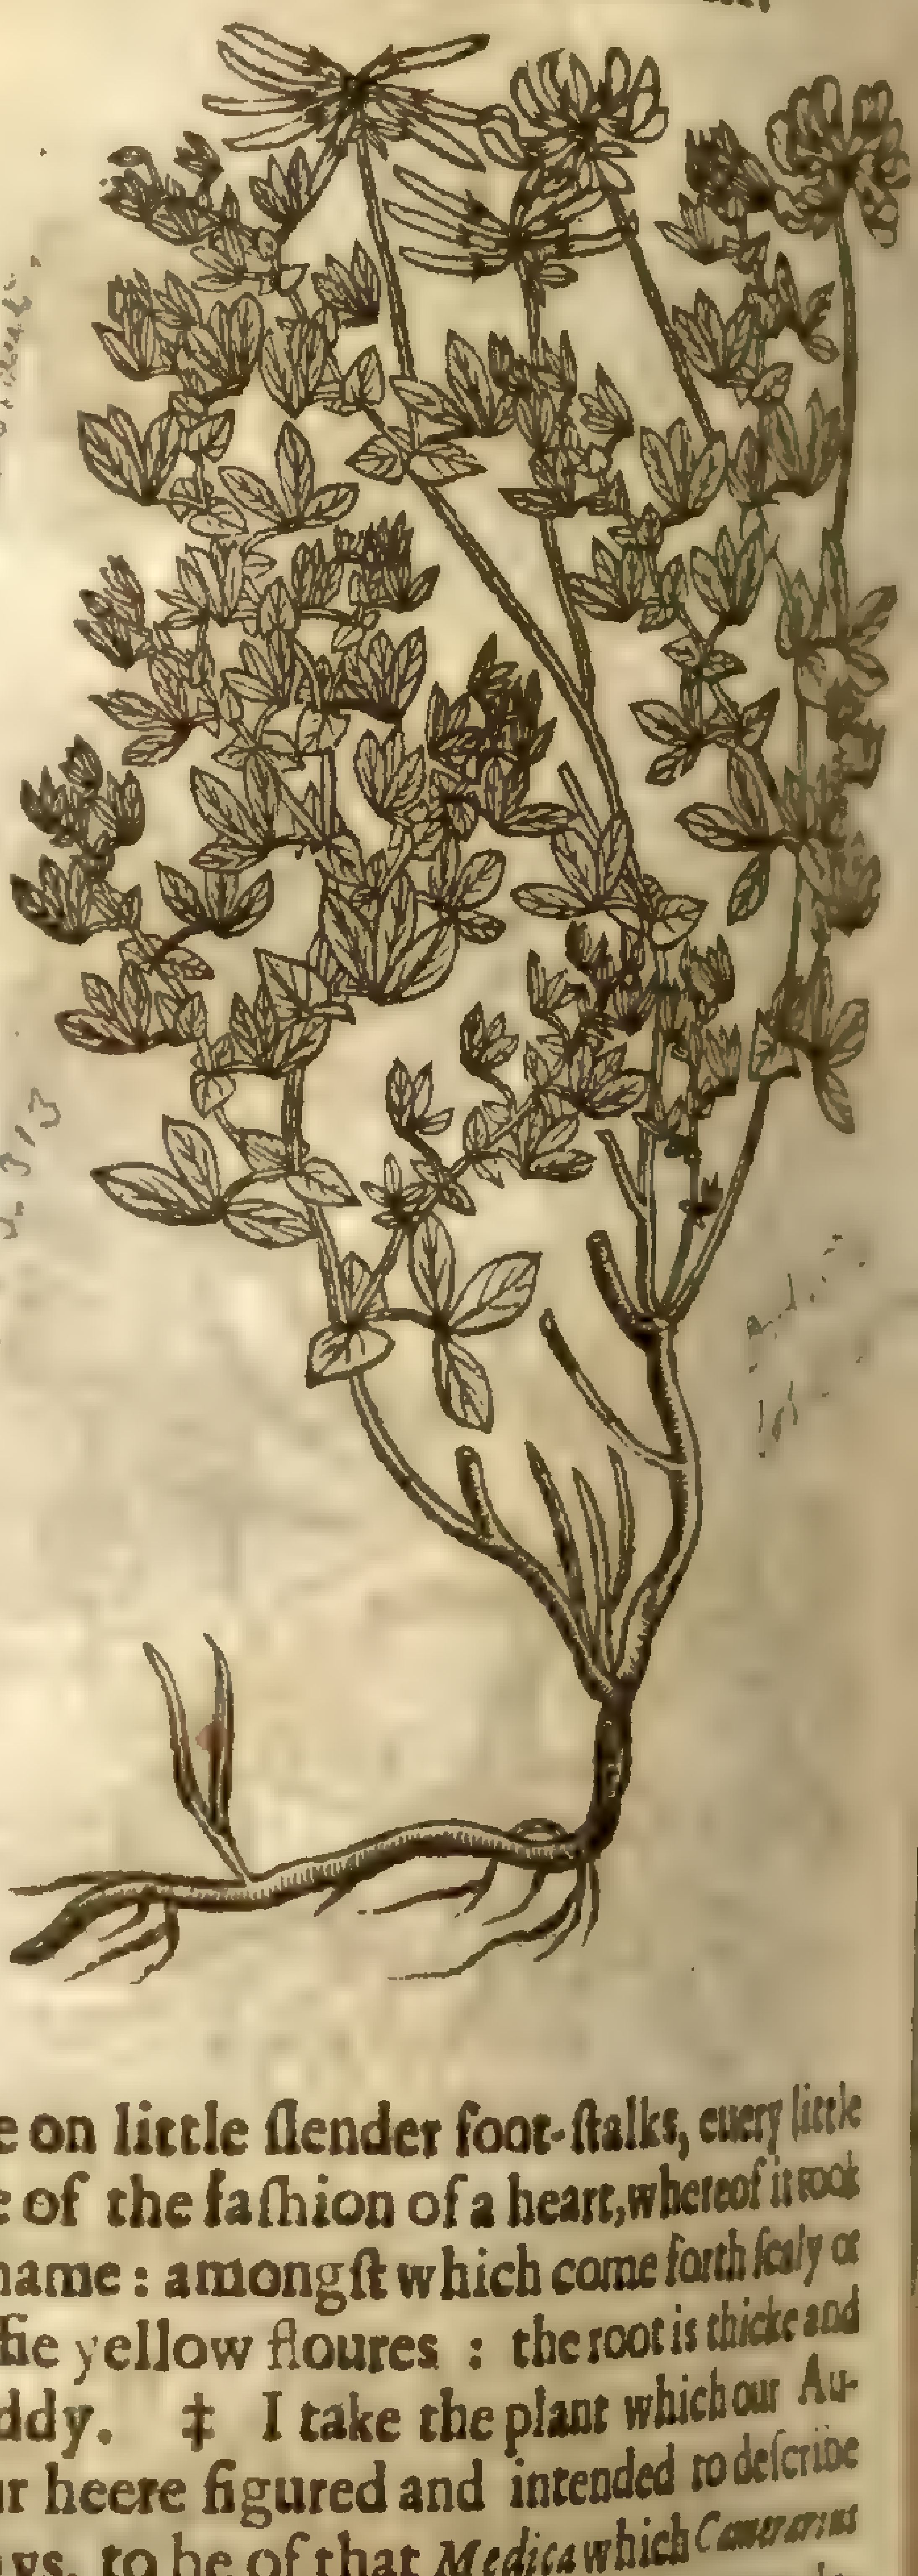


M[illegible] [illegible] M. maculata Sibth. Sm. fl. 3. 319

‡ 6 *Coronopus ex codice Cæſareo.*
Crow-foot Trefoile.



5 *Trifolium ſiliquoſum minus.*
Small codded Trefoile.



Lotus corniculatus, [illegible] Sm. fl. 3. 313

three on little ſlender foot-ſtalks, euery little leafe of the faſhion of a heart, whereof it tooke his name: amongſt which come forth ſcaly or chaffie yellow floures: the root is thicke and threddy. ‡ I take the plant which our Author heere figured and intended to deſcribe vnto vs, to be of that *Medica* which *Camerarius* calls *Arabica*, which growes wild in many places with vs, hauing the leaues a little dented in at the ends, ſo that they reſemble the vulgar figure of an heart; and each leaf is marked with a blackiſh or red ſpot: the flours be ſmall and yellow; the ſeed is contained in rough buttons wound vp like the other ſnaile Trefoils, whereof it is a kinde. I haue giuen you the figure a little more exquiſite, by the addition of the ſpots and cods. ‡

5 This kinde of three leaued Graſſe is a low herb creeping vpon the ground: the leaues are like thoſe of the common Trefoile, but leſſer, and of a grayiſh greene colour: the floures are faire and yellow, faſhioned like thoſe of Broome, but leſſer: after come three or foure cods, wherein is contained round ſeed: the root is long and reddiſh. ‡ This is the *Trifolium Corniculatum*, or *Melilotus coronata* of *Lobel*: *Lotus pentaphyllos* of *Geſner*. ‡

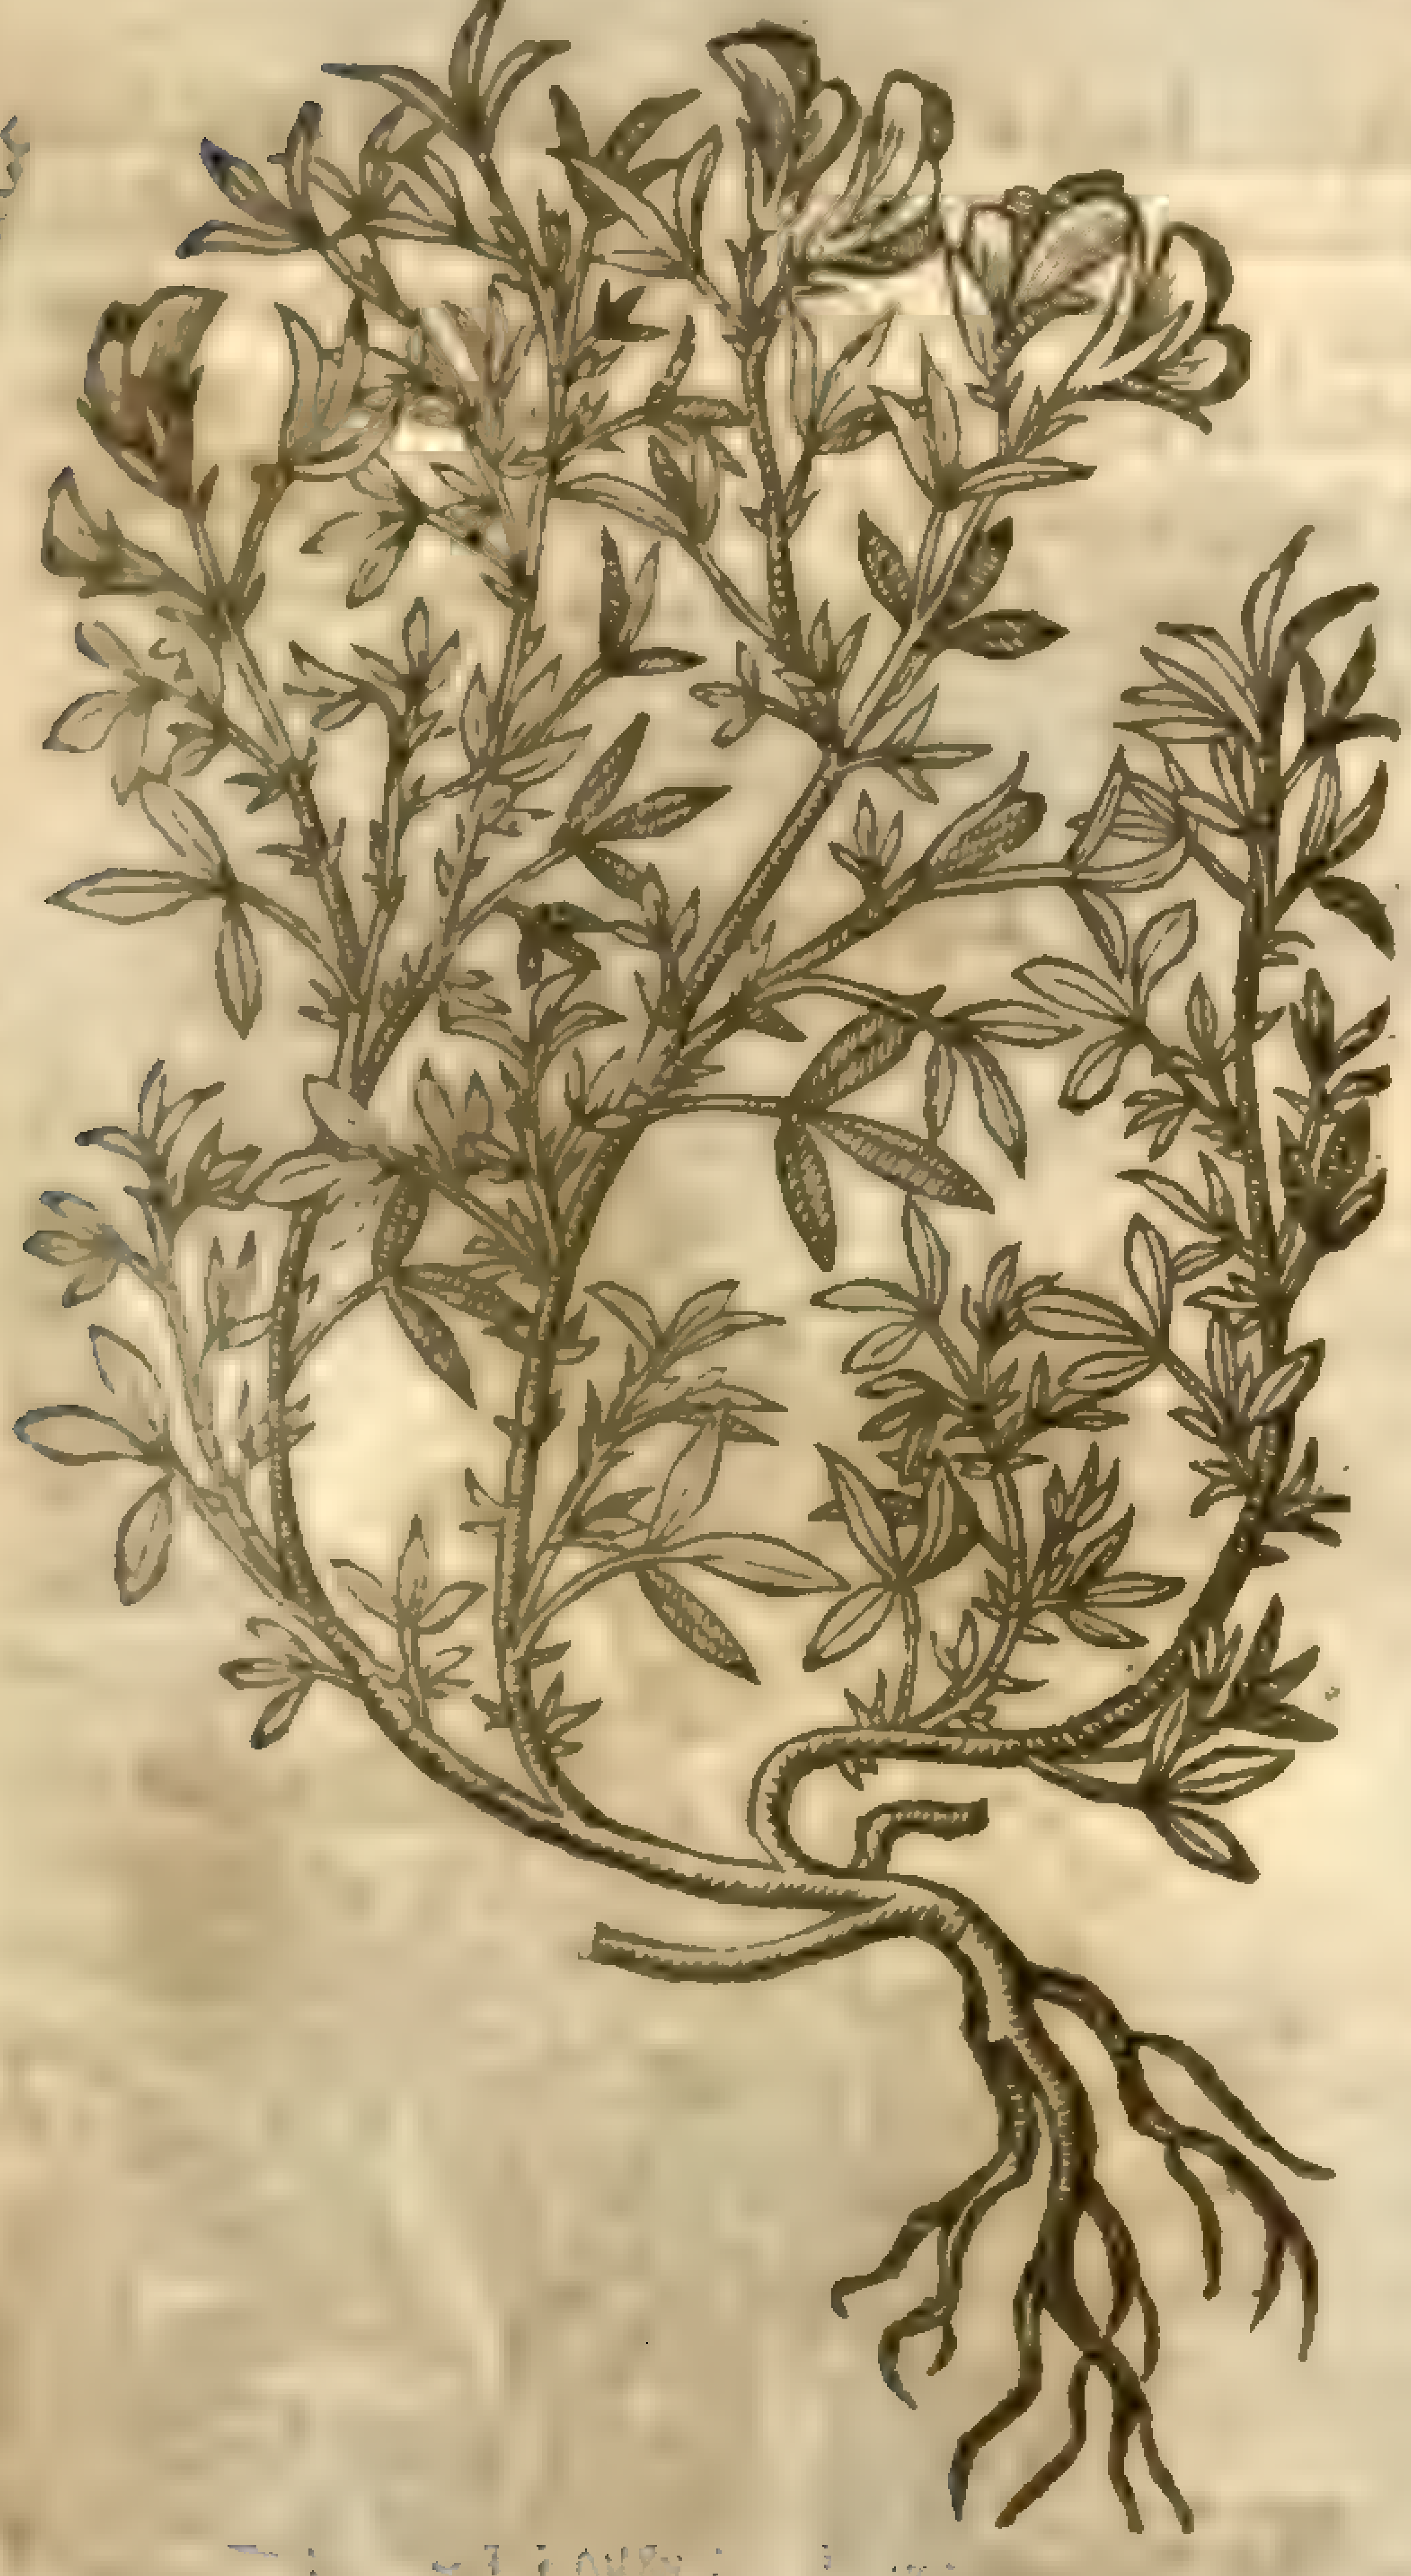
This codded Trefoile is like vnto the laſt deſcribed in euery reſpect, ſauing that this plant is altogether ‡ larger, hauing ſtalks a cubit

bit and a halfe high: the leaues are alſo foure times as large, two roundiſh leaues growing by the ſtalke, and three longiſh ones growing vpon a ſhort foot-ſtalk comming forth betweene the two roundiſh leaues: both the ſtalke and leaues haue a little ſoft downineſſe or hairineſſe on them: the floures grow cluſtering together on the tops of the ſtalks, in ſhape, bigneſſe, and colour like that of the laſt deſcribed, but commonly more in number: they are alſo ſucceeded by ſuch cods as thoſe of the former.

6 The figure which *Dodonæus* hath ſet forth out of an old Manuſcript in the Emperors Library, being there figured for *Coronopus*, ſeems to be of the laſt deſcribed, or ſome plant very like thereto; though the fiue leaues at each joint be not put in ſuch order as they ſhould be, yet all the parts are well expreſt, according to the drawing of thoſe times: for you ſhall finde few antient expreſſions come ſo neere as this doth. ‡

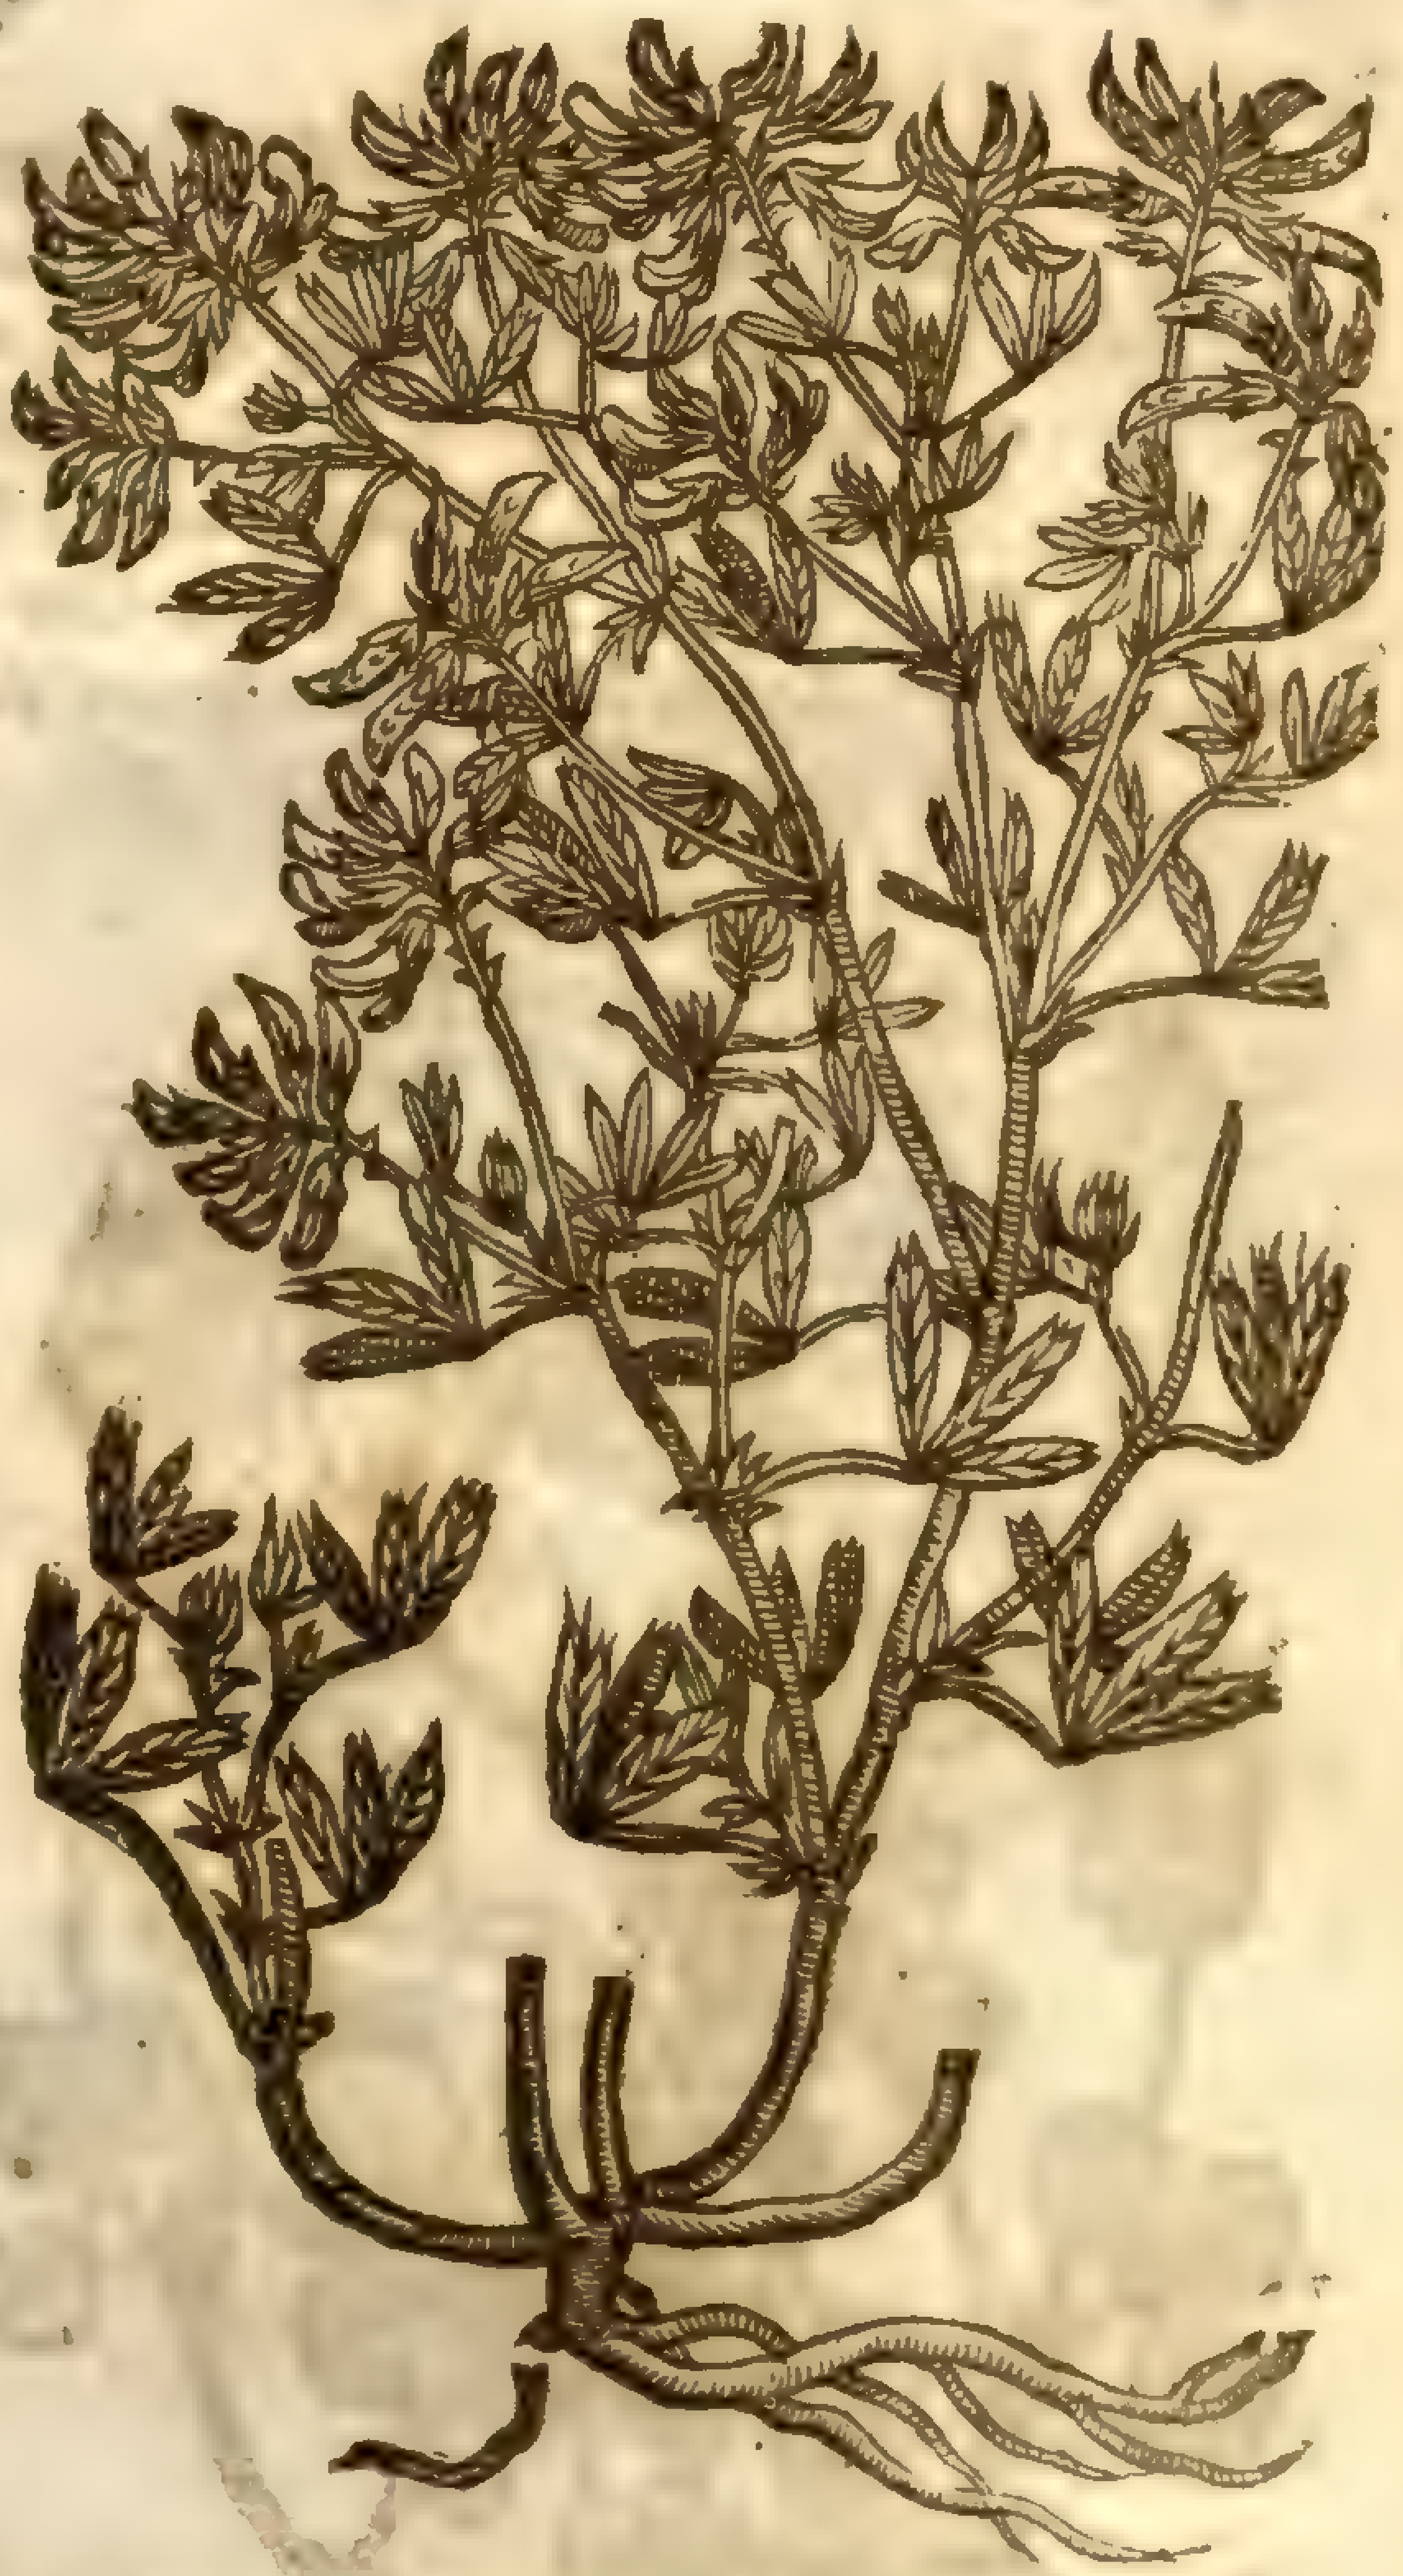
7 There is a kind of Clauer growing about Narbon in France, that hath many twiggy tough branches comming from a wooddy root; whereon are ſet leaues three together, after the maner of the other Trefoiles, ſomewhat long, hairy, and of an hoary or ouerworn green colour: the floures are yellow, and grow at the tops of the branches like thoſe of Broome.

7 *Lotus incana, ſive Oxytriphyllon Scribonij largi.*
Hoary Claver.



‡ 8 *Trifolium luteum ſiliqua cornuta.*
Yellow horned Trefoile.

Medicago [illegible]
[illegible]
Sm [illegible]



‡ This ſends vp many branches from one root, ſome cubit or more long, commonly lying along vpon the ground, round, flexible, and diuided into ſundry branches: the leaues ſtand together by threes, and are like thoſe of the true *Medica* or Burgondy Trefoile, but much leſſe: the floures grow cluſtering together at the tops of the branches, like in ſhape to thoſe of the former, of a yellow colour, and not without ſmell: they are ſucceeded by ſuch, yet narrower crooked coddes, as the Burgondy Trefoile hath (but the Painter hath not well expreſſed them:) in theſe cods are contained ſeeds like thoſe alſo of that Trefoile, and ſuch alſo is the root, which liues long, and much increaſes. It growes in Hungary, Auſtria, and Moravia. It floures in Iune and Iuly. *Cluſius* calls it *Medica flore flavo.* *Tabernamontanus, Lens maior repens*: and *Tragus, Meliloti majoris ſpecies tertia.* *Bauhine* ſaith, That about Nimes in Narbone it is found with floures either yellow, white, green, blew, purple, blacke, or mixt of blew and green; and he calleth it *Trifolium ſylveſtre luteum ſiliqua cornuta*; or *Medica fruteſcens.* ‡

¶ *The*

¶ *The Place.*

The ſeuerall titles of moſt of theſe plants ſet forth their naturall place of growing: the reſt grow in moſt fertile fields of England.

¶ *The Time.*

They floure and flouriſh moſt of the ſummer moneths.

¶ *The Names.*

There is not much to be ſaid as touching their Names, more than hath bin ſet downe.

¶ *The Temperature and Vertues.*

The temperature and faculties of theſe Trefoiles are referred to the common medow Trefoils.

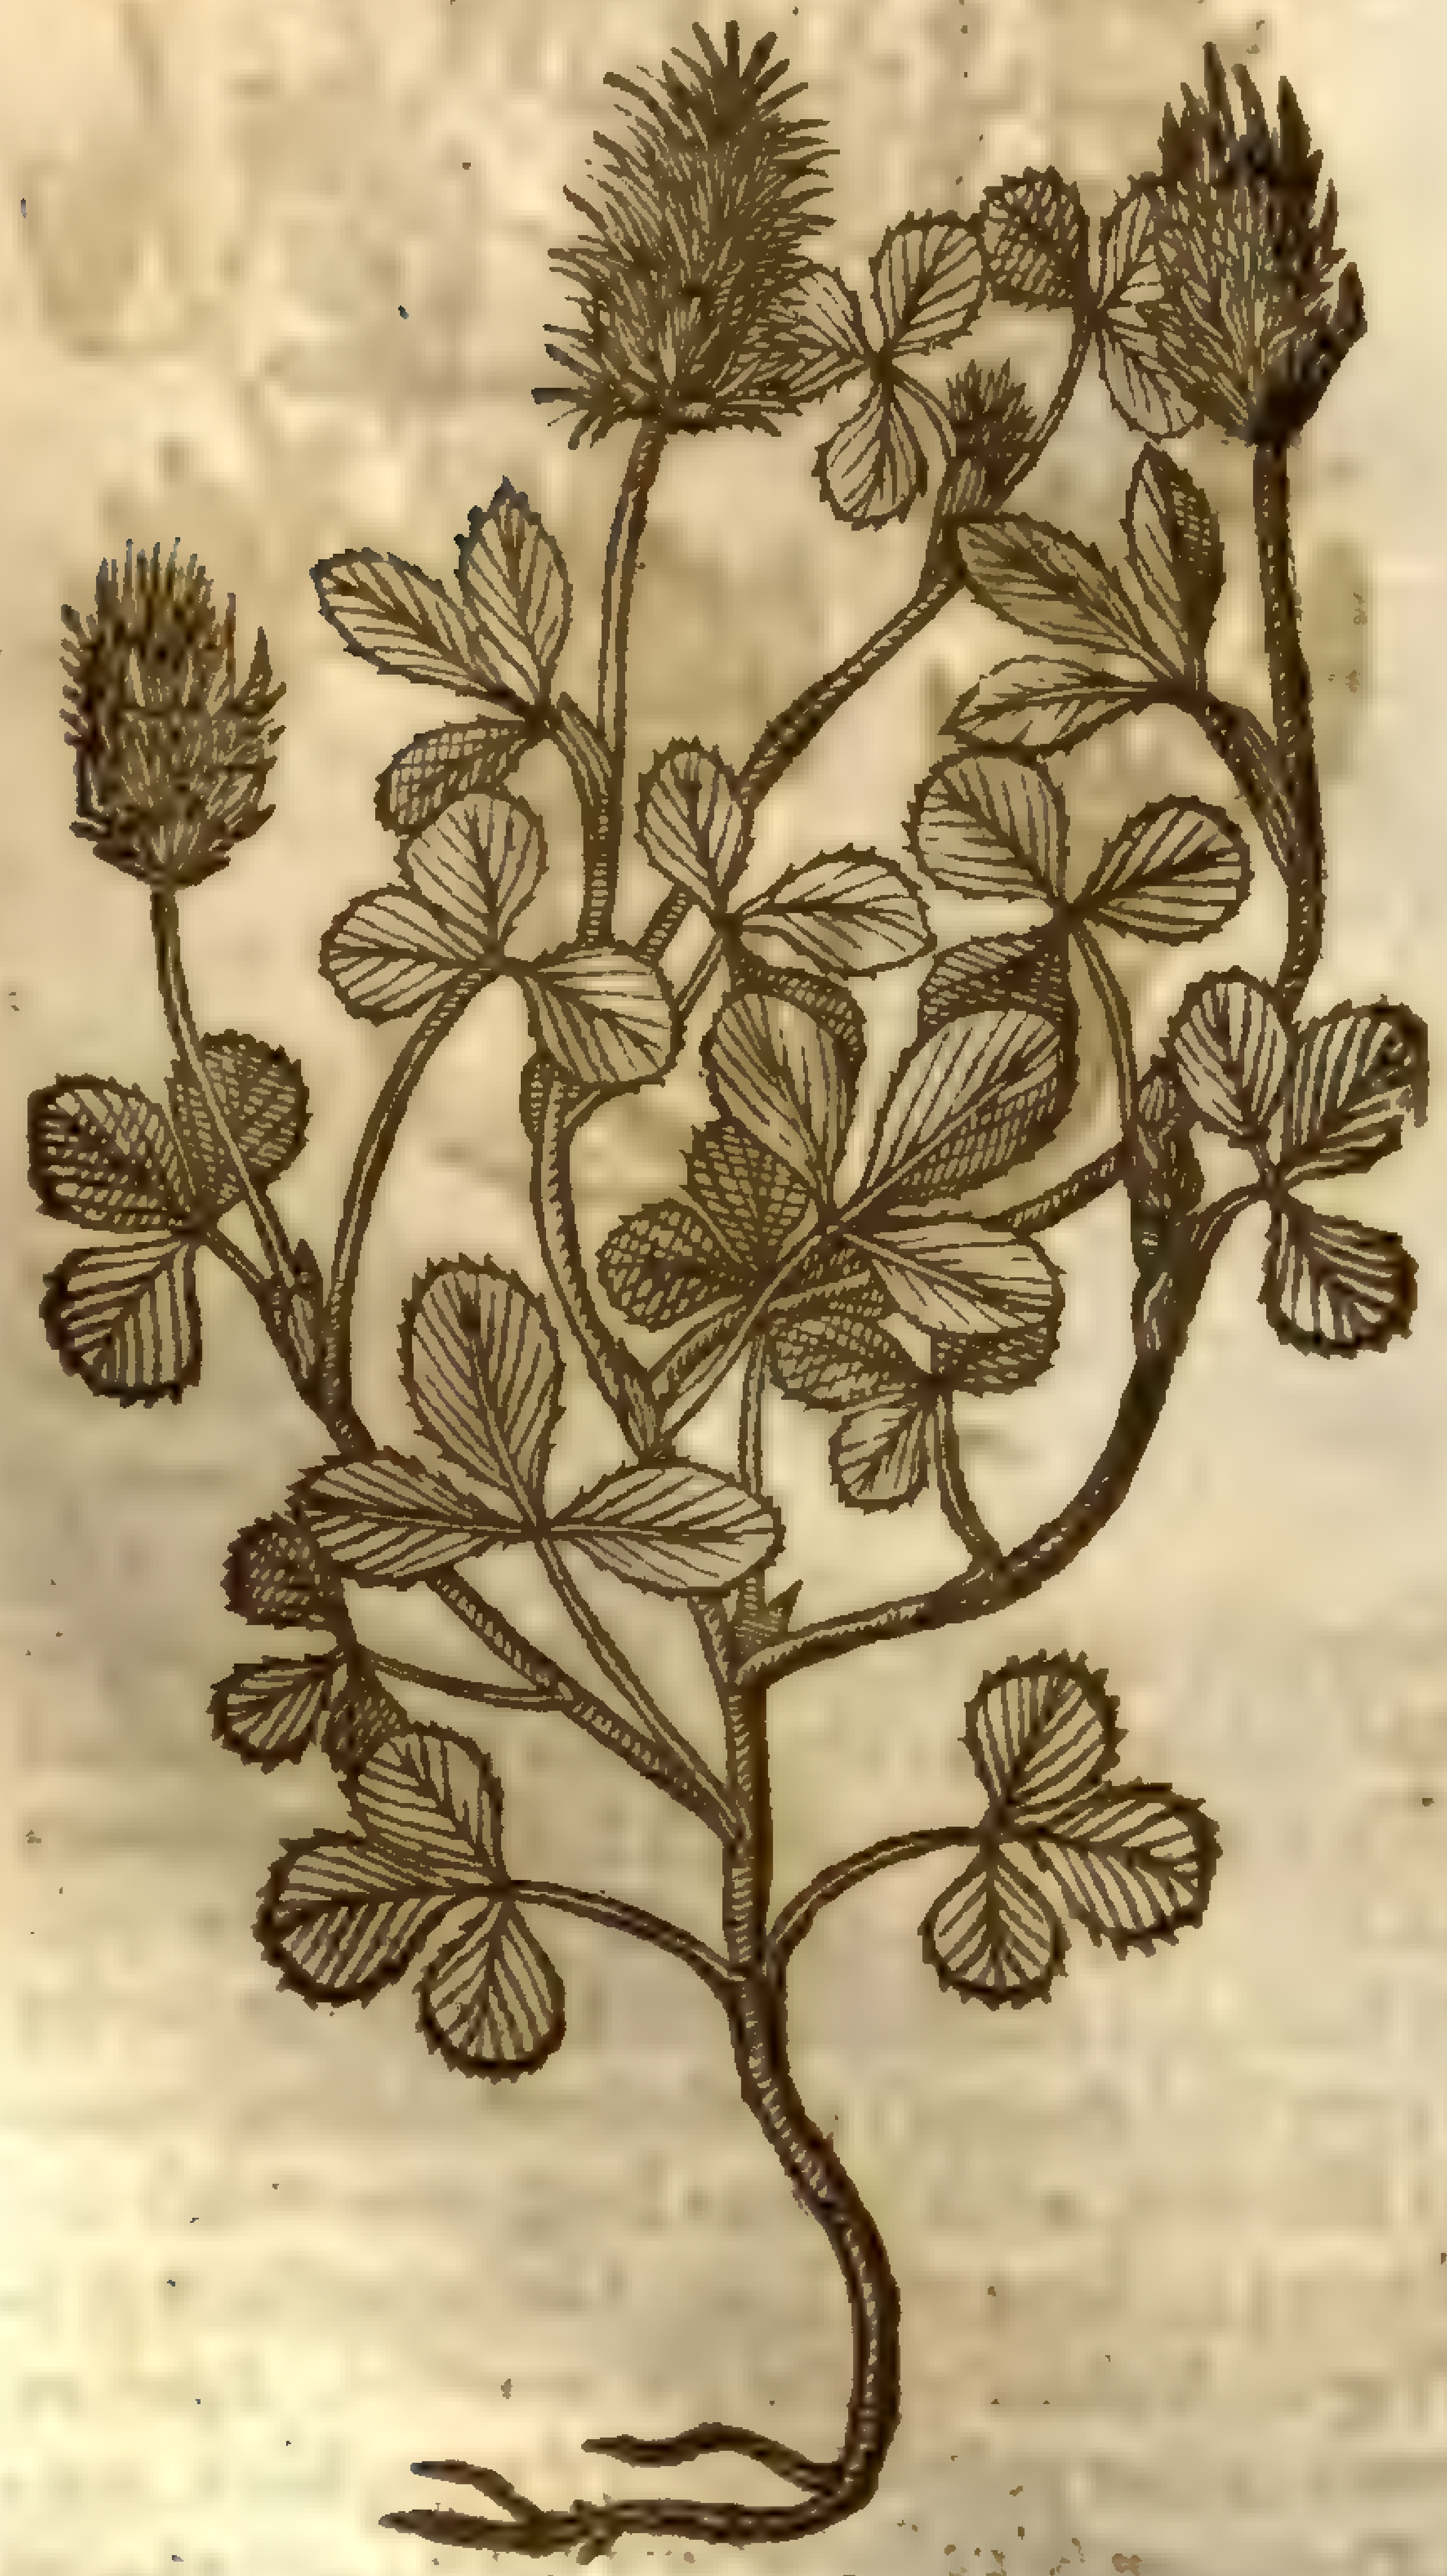
† The figure formerly put in the ſecond place was of the leſſer *Trefoile* deſcribed in the laſt chapter ſave one.

Chap. 497.

Of the great Trefoiles or winged Clavers.

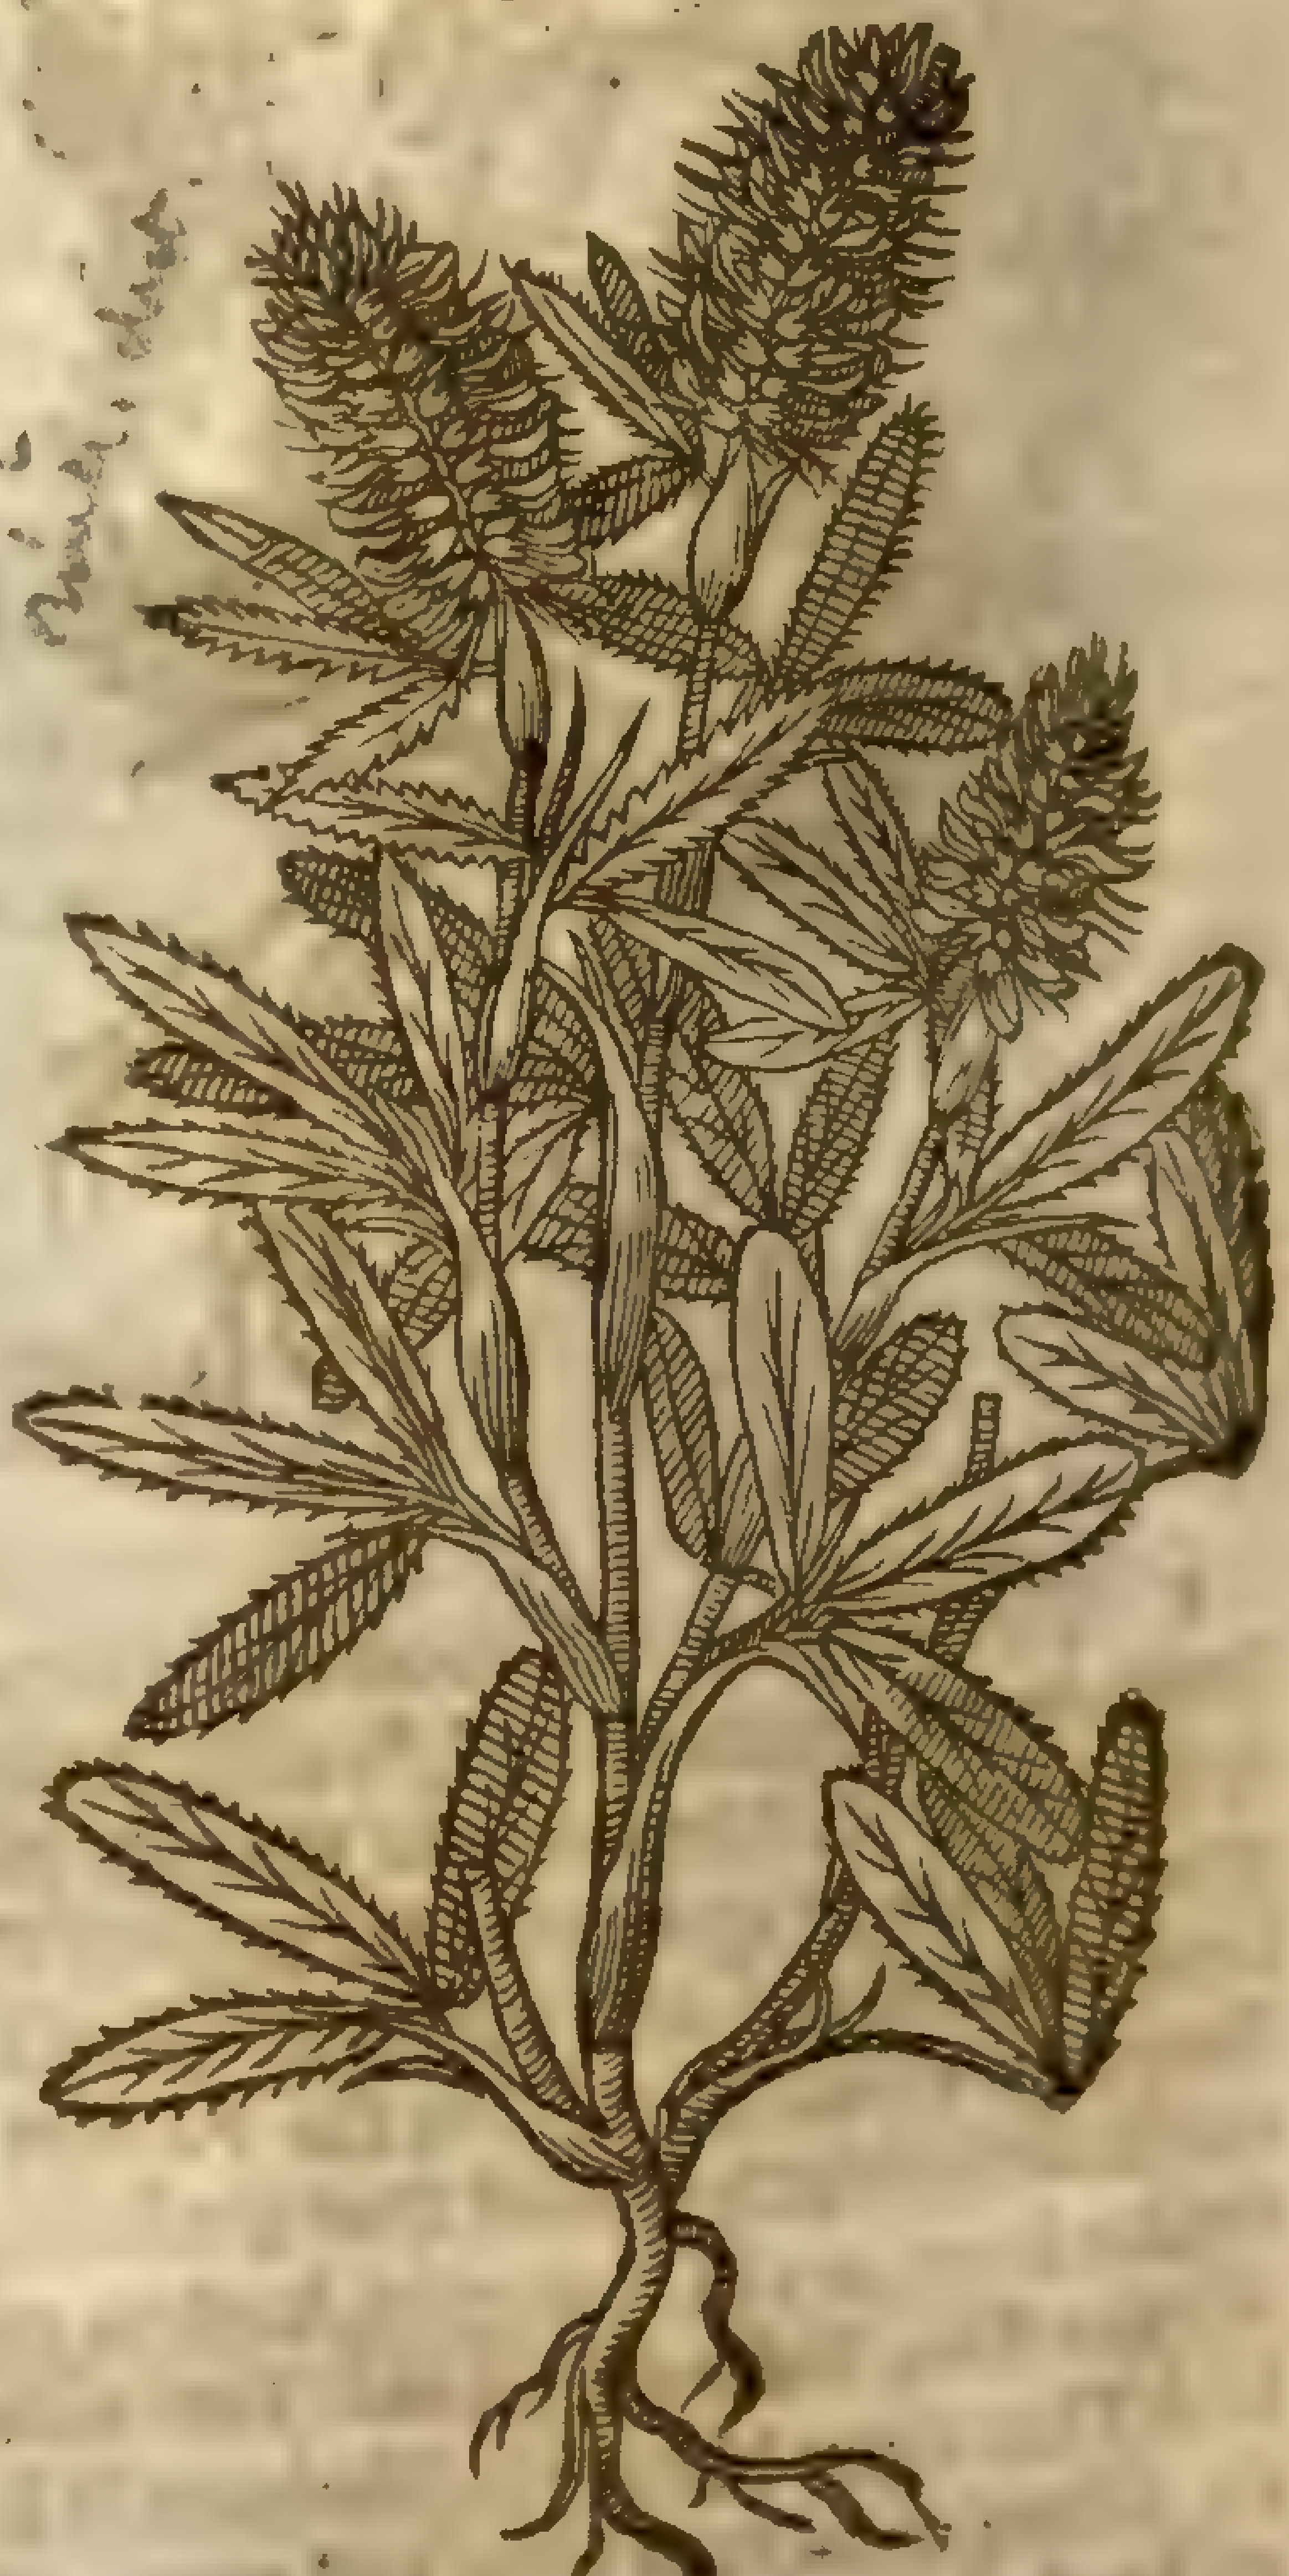
¶ *The Deſcription.*

† 1 The great Hares-foot being a kinde of Trefoile, hath a hard and wooddy root, full of black threddy ſtrings: from whence ariſe diuers tough and feeble branches, whereupon grow leaues ſet together by threes, making the whole plant to reſemble thoſe of the Medow Trefoile: the floures grow at the top of the ſtalks, compoſed of a bunch of gray haires: among the which ſoft matter commeth forth ſmall floures of a moſt bright purple colour, ſomewhat reſembling the floures of the common medow Trefoile, but far greater. *Lobel* calls this *Lagopus minimus folio, & facie Trifolij pratenſis*: *Dodonæus, Lagopus maior folio Trifolij.*



‡ 1 *Lagopus maximus.*
The great Hares-foot Trefoile.

Trifolium incarnatum, L.
[illegible]



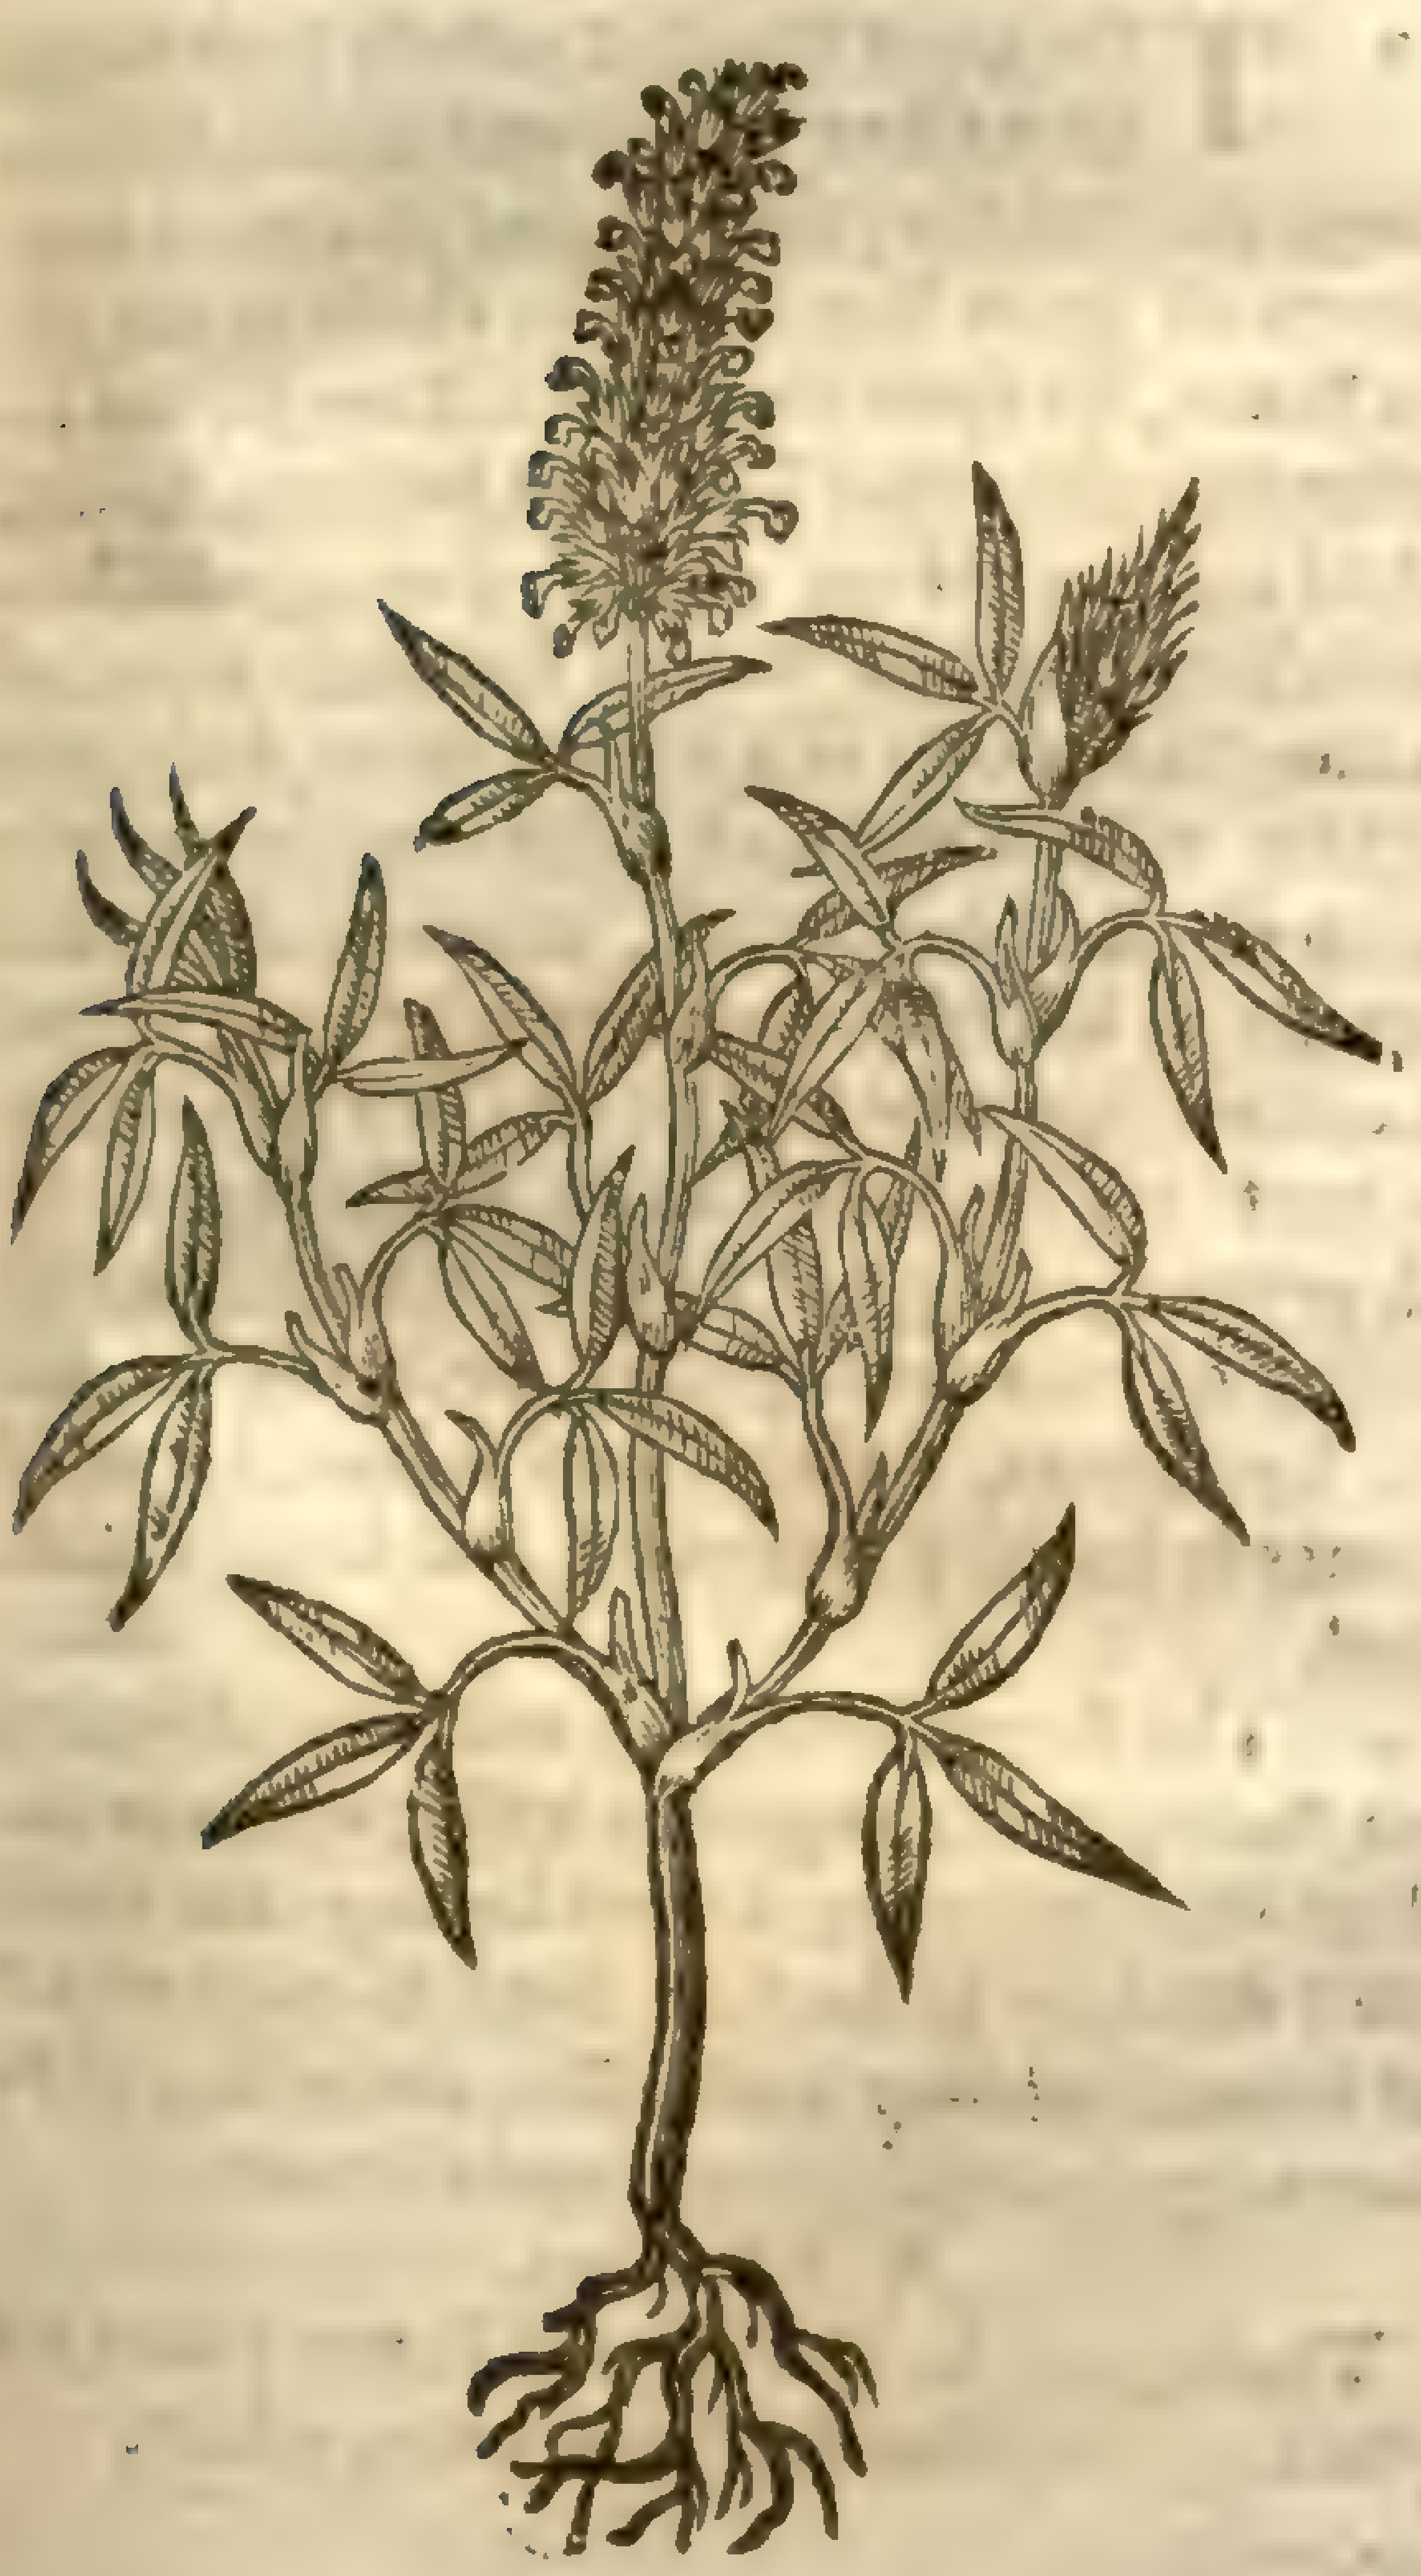
‡ 2 *Lagopus major ſpica longiore.*
Great large headed Hares-foot.

Trifolium rubens,
[illegible]

‡ 2 This elegant plant (which *Tragus* hath ſet forth for *Cytiſus*, *Lobel* by the name of *Lagopus altera folio pinnato*, and *Cluſius* for his *Trifolij majoris 3. altera ſpecies*) hath ſtalkes ſome foot and better high, whereon grow leaues ſet together by threes, long, hoary, and lightly ſnipt about the edges, with elegant nerues or veines, running from the middle ribbe to the ſides of the leaues, which are moſt conſpicuous in hot Countries, and chiefly then when the leafe begins to decay. At the tops of the branches, in long and large heads grow the floures, of an elegant ſanguine colour. This floures in May and Iune, and growes wilde vpon ſome mountaines of Hungary and Auſtria; I haue ſeene them, both this and the former, growing in the gardens of ſome of our Floriſts.

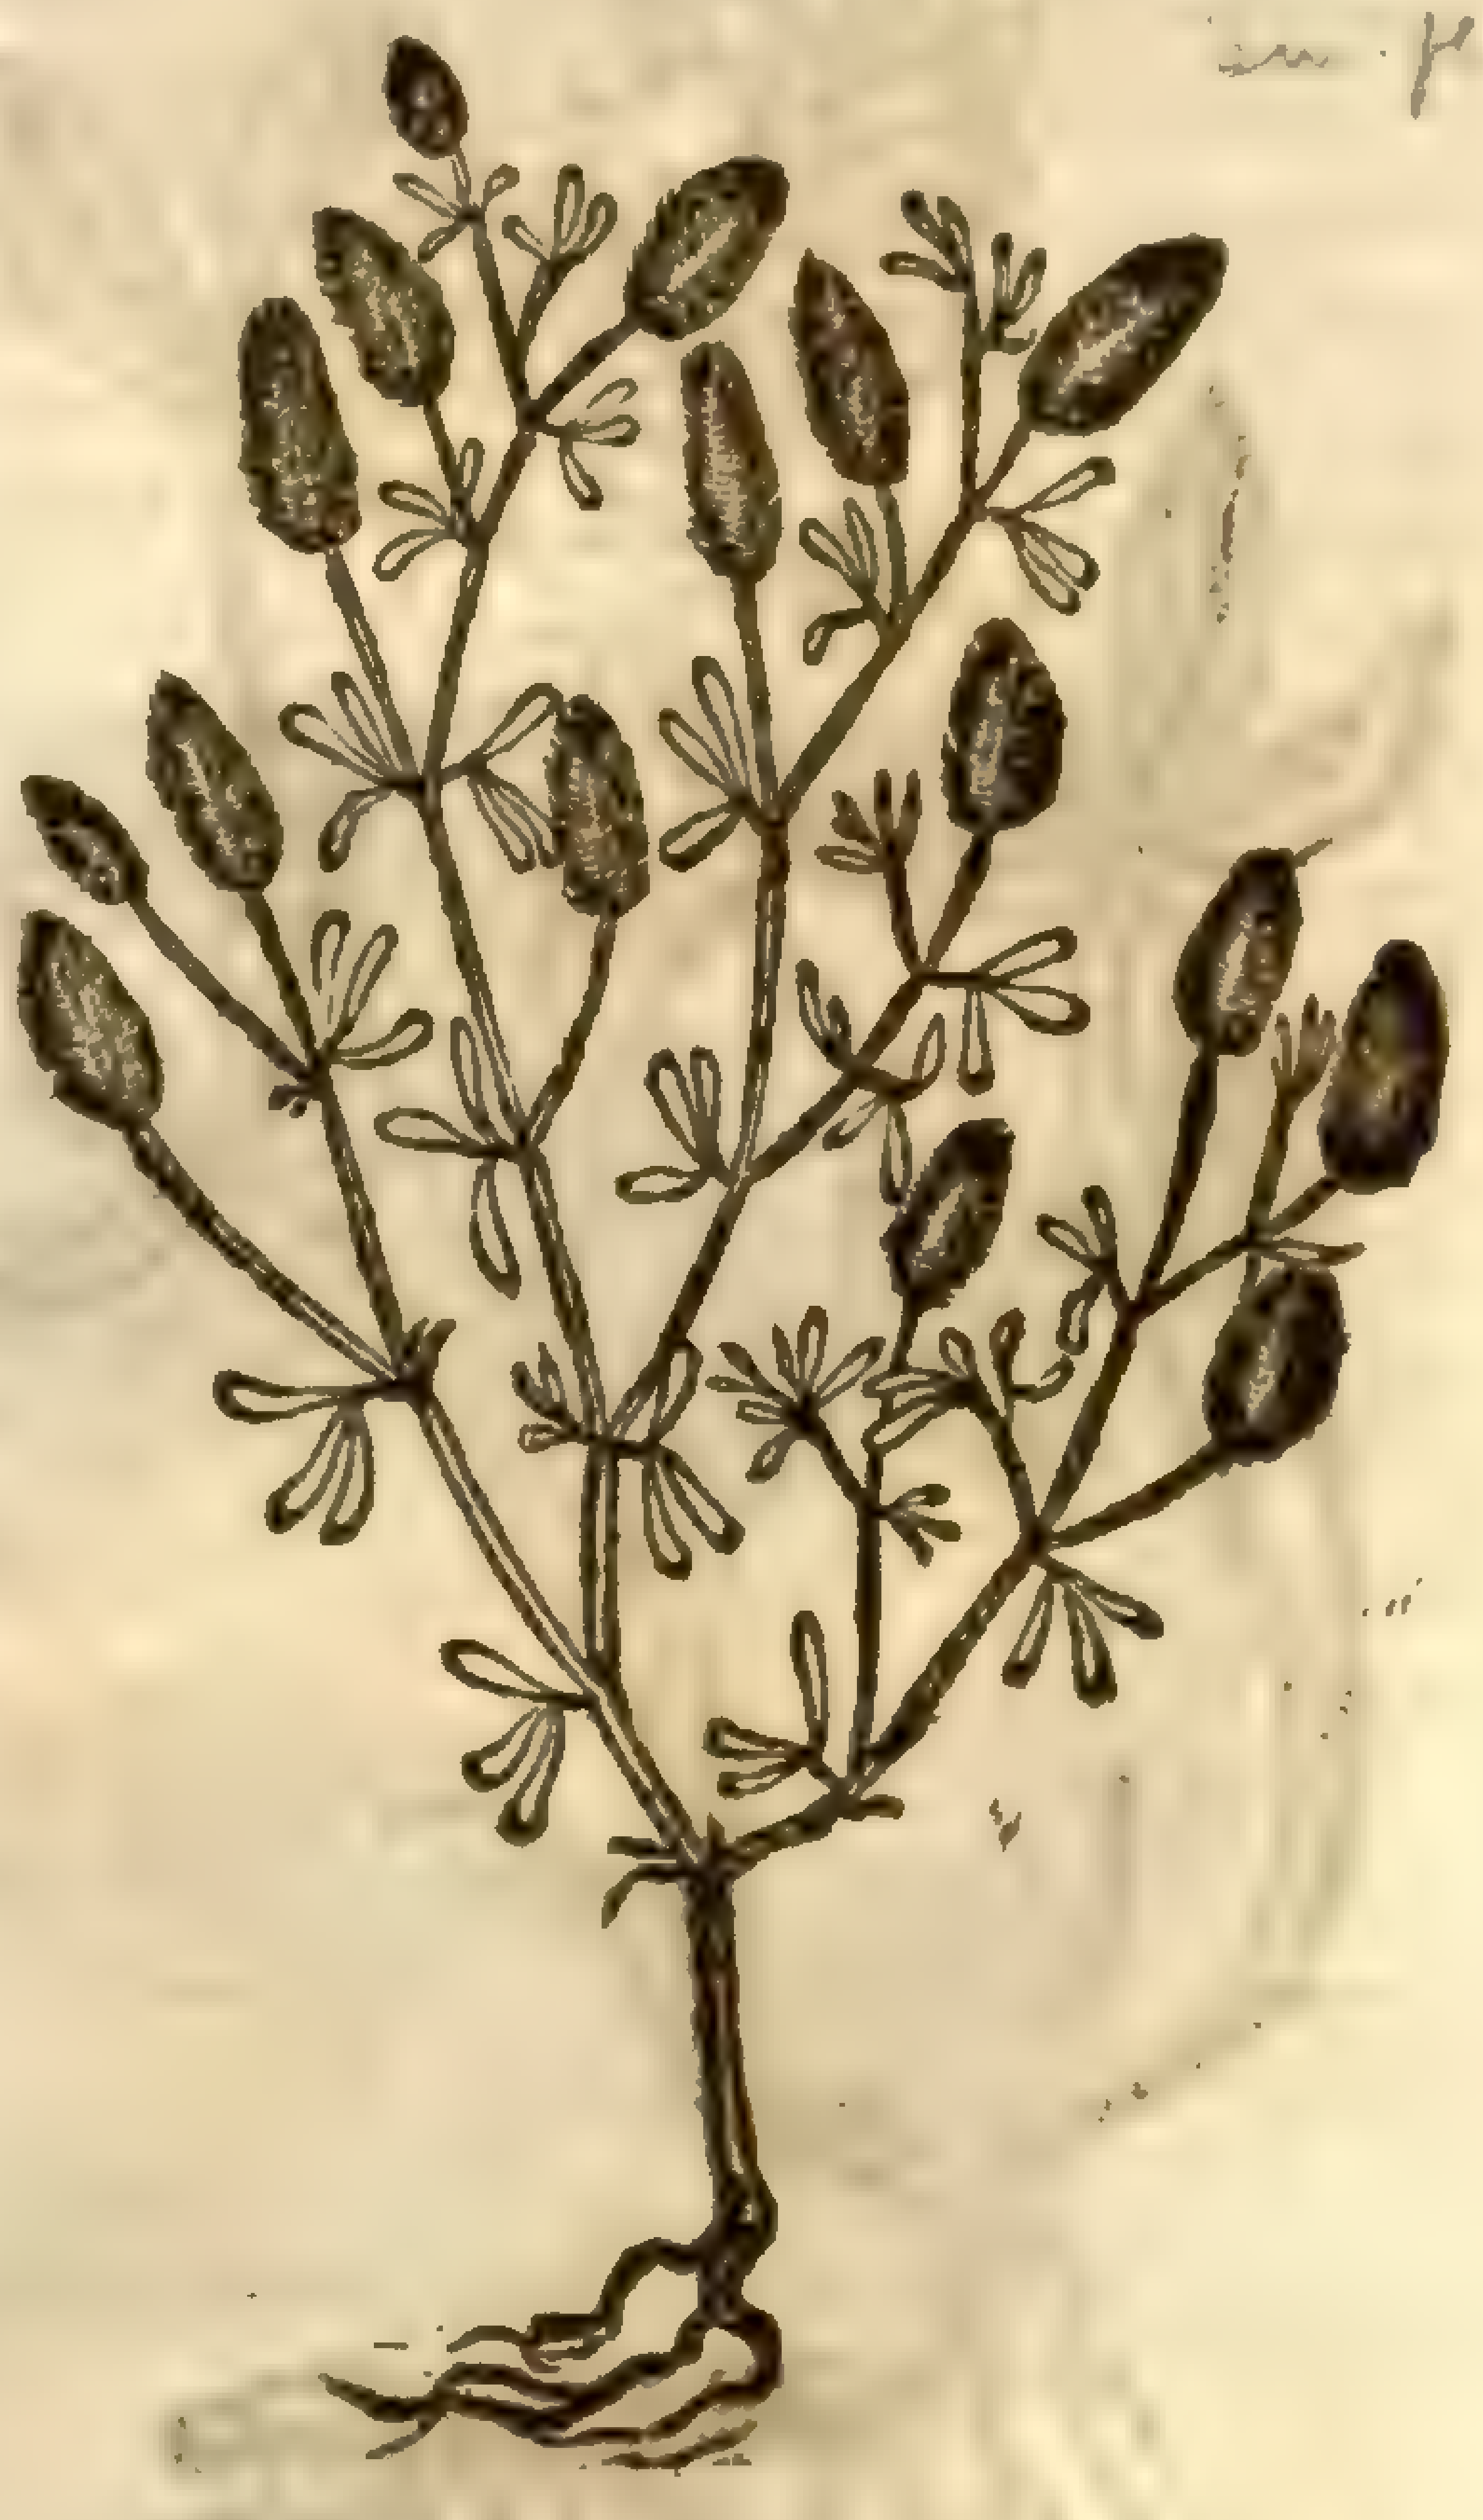
3 This other great kinde of Hares-foot ſends forth one ſlender, yet ſtiffe ſtalke, whereon grow leaues whoſe foot-ſtalkes are large at the ſetting on, encompaſſing the ſtalkes: the leaues themſelues grow by threes, long, narrow, and ſharpe pointed, of a grayiſh colour like thoſe of the common Hares-foot; the ſpike at the tuft is ſoft ond downy, with little reddiſh floures amongſt the whitiſh hairineſſe. This growes wild in Spaine: *Cluſius* cals it *Lagopus anguſtifolius Hiſpanicus major*. There is another ſort of this deſcribed by *Lobel* and *Pena* in the *Aduerſ.* whoſe leaues are longer and narrower than this, the whole plant alſo is oft times leſſer: they call it *Lagopus altera anguſtifolia*. ‡

‡ 3 *Lagopus anguſtifolius Hiſpanicus.*
Narrow leafed Spaniſh Hare-foot.



3 *Lagopodium, Pes leporis.*
Little Hares-foot Treſoile.

Trifolium arvense hu-
mili [illegible]
in p. 3. 305



4 The ſmall Hares-foot hath a round rough and hairy ſtalke, diuiding it ſelfe into diuers other branches; whereupon do grow ſmall leaues, three ioyned together, like thoſe of the ſmall yellow Trefoile: the floures grow at the very point of the ſtalkes, conſiſting of a rough knap or buſh of haires or downe, like that of *Alopecuros*, or Fox-taile, of a whitiſh colour tending to a light bluſh, with little white floures amongſt the downineſſe: the root is ſmall and hard.

¶ *The Place.*

The firſt groweth in the fields of France and Spaine, and is a ſtranger in England; yet it groweth in my garden.

The ſmall Hare-foot groweth among corne, eſpecially among Barly, and likewiſe in barren paſtures almoſt euery where.

¶ *The Time.*

They floure and flouriſh in Iune, Iuly, and Auguſt.

¶ *The Names.*

The great Hare-foot Trefoile is called of *Tragus*, *Cytiſus*: of *Cordus*, *Trifolium magnum*: of *Lobelius*, *Lagopum maximum*, and *Lagopodium*: in Greeke, λαγώπους: in Engliſh, the great Hares-foot.

The laſt, being the ſmalleſt of theſe kinds of Trefoiles, is called *Lagopus*, and *Pes Leporis*: in Dutch, **Haſen Pootkens**: in high Dutch, **Haſen fuſz**: in French, *Pied de lieure*: in Engliſh Hare-foot.

¶ *The Temperature and Vertues.*

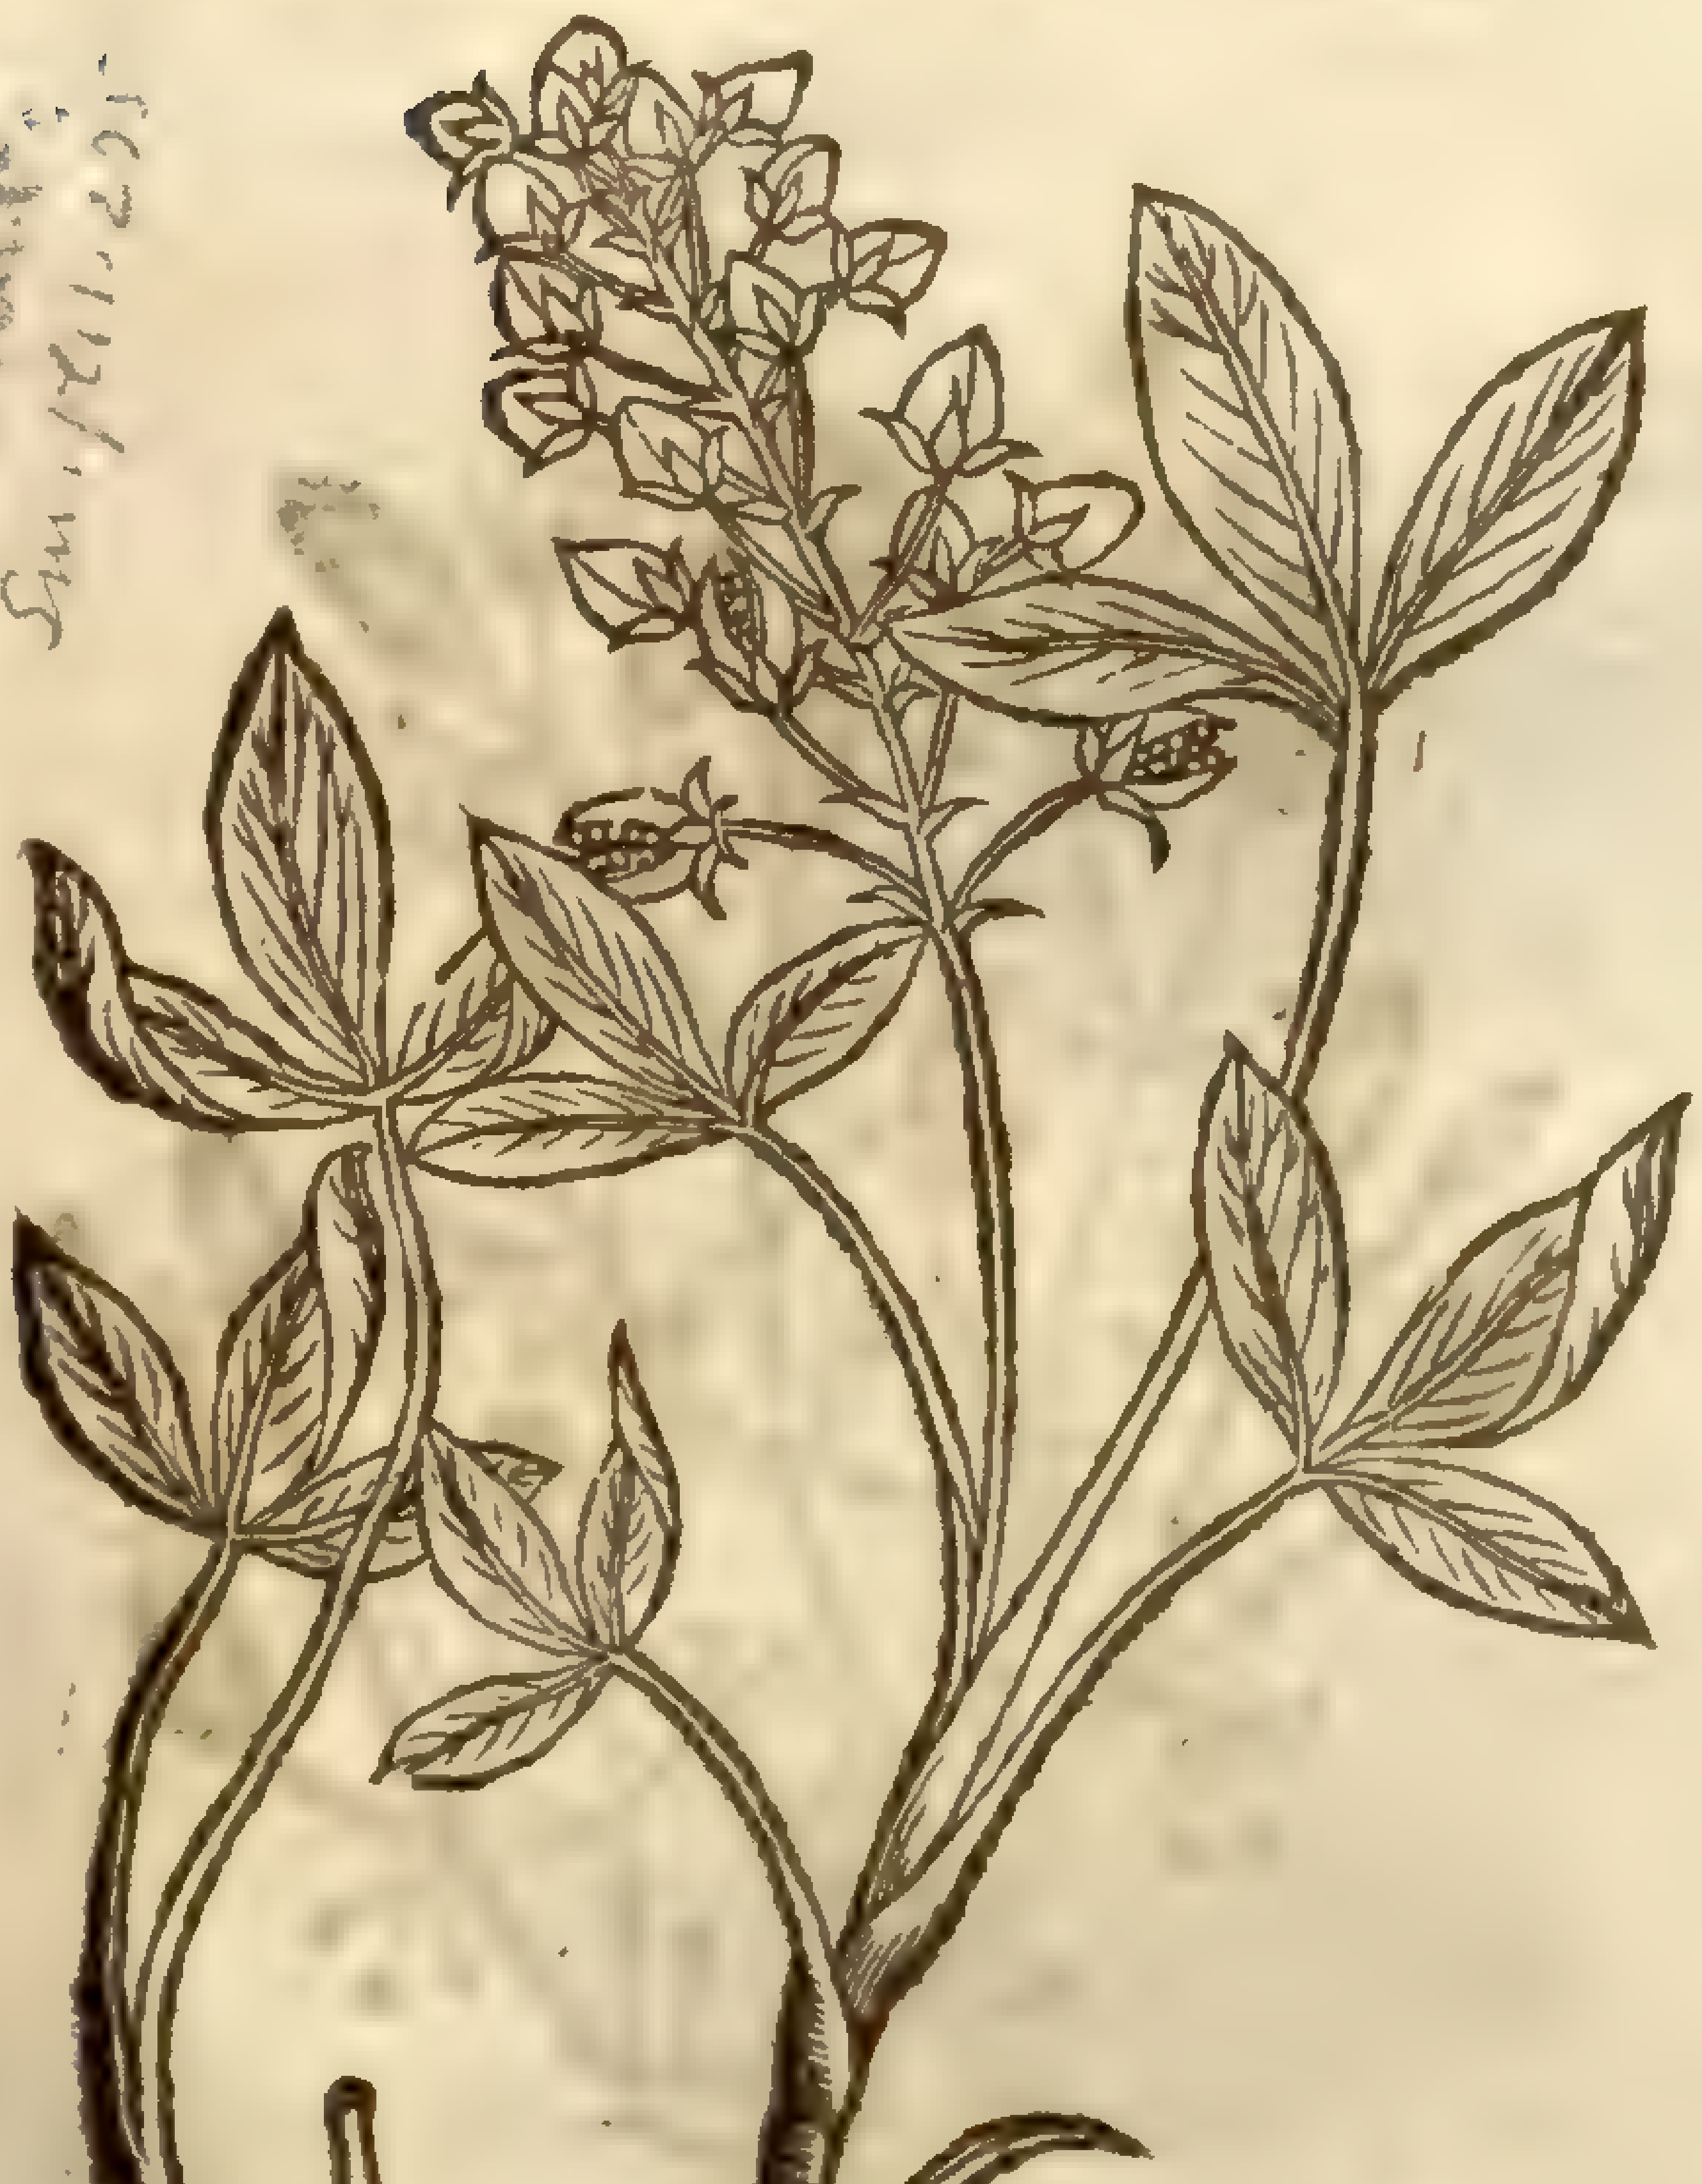
A The temperature and faculties are referred vnto the other Trefoiles, whereof theſe are kindes: notwithſtanding *Dioſcorides* ſaith, that the ſmall Hares-foot doth binde and dry. It ſtoppeth, ſaith he, the laske, if it be drunke with red wine. But it muſt be giuen to ſuch as are feueriſh with water.

† Our Author in the firſt place formerly gaue the figure of *Tabern* his *Lagopodium flore albo*, being only a variety of that plant you ſhall hereafter finde deſcribed by the name of *Anthyllis leguminoſa*; now he made the deſcription ſomewhat in the leaues to agree with the figure, though nothing almoſt with the truth of that he intended to deſcribe, for (as it is euident by the names) he intended to deſcribe both the firſt and ſecond (which are here now deſcribed) in the firſt place, for he hath confounded them both together in the names.

CHAP. 498. *Of Water Trefoile, or Bucks Beanes.*

Trifolium paludoſum.
Marſh Trefoile.

Menyanthes trifoliata, L. [illegible] Sm. [illegible]



¶ *The Deſcription.*

1 THe great Marſh Trefoile hath thicke fat ſtalkes, weake and tender, full of a ſpungious pith, very ſmooth, and of a cubit long: wheron do grow leaues like to thoſe of the garden Beane, ſet vpon the ſtalkes three joyned together like the other Trefoiles, ſmooth, ſhining, and of a deepe greene colour: among which toward the top of the ſtalkes ſtandeth a buſh of feather-like floures of a white colour, daſht ouer ſlightly with a waſh of light carnation: after which the ſeed followeth, contained in ſmall buttons, or knobby husks, of a browne yellowiſh colour like vnto Millet, and of a bitter taſte: the roots creepe diuers waies in the mirie mariſh ground, being full of joynts, white within, and full of pores, and ſpungy, bringing forth diuers by-ſhoots, ſtalkes, and leaues, by which meanes it is eaſily increaſed, and largely multiplied.

2 The ſecond differeth not from the precedent, ſauing it is altogether leſſer, wherein conſiſteth the difference, if there be any: for doubtleſſe I think it is the ſelfe ſame in each reſpect, and is made greater and leſſer, according to his place of growing, clymate and countrey.

¶ *The Place.*

Theſe grow in Mariſh and Fenny places, and vpon boggie grounds almoſt euery where.

¶ *The Time.*

They floure and flouriſh from Iune to the end of Auguſt.

¶ *The Names.*

Mariſh Trefoile is called in high Dutch, **Biberklee**, that is to ſay *Caſtoris Trifolium*, or *Trifolium fibrinum*: in low Dutch, of the likeneſſe that the leaues haue with the garden Beanes, **Bocxboonen**, that is to ſay, *Faſelus Hircinus*, or *Boona Hircina*: the later Herbariſts call it *Trifolium paluſtre*, and *Paludoſum*: of ſome, *Iſopyrum*: in Engliſh, marſh-Clauer, marſh-Trefoile, and Buckes-Beanes.

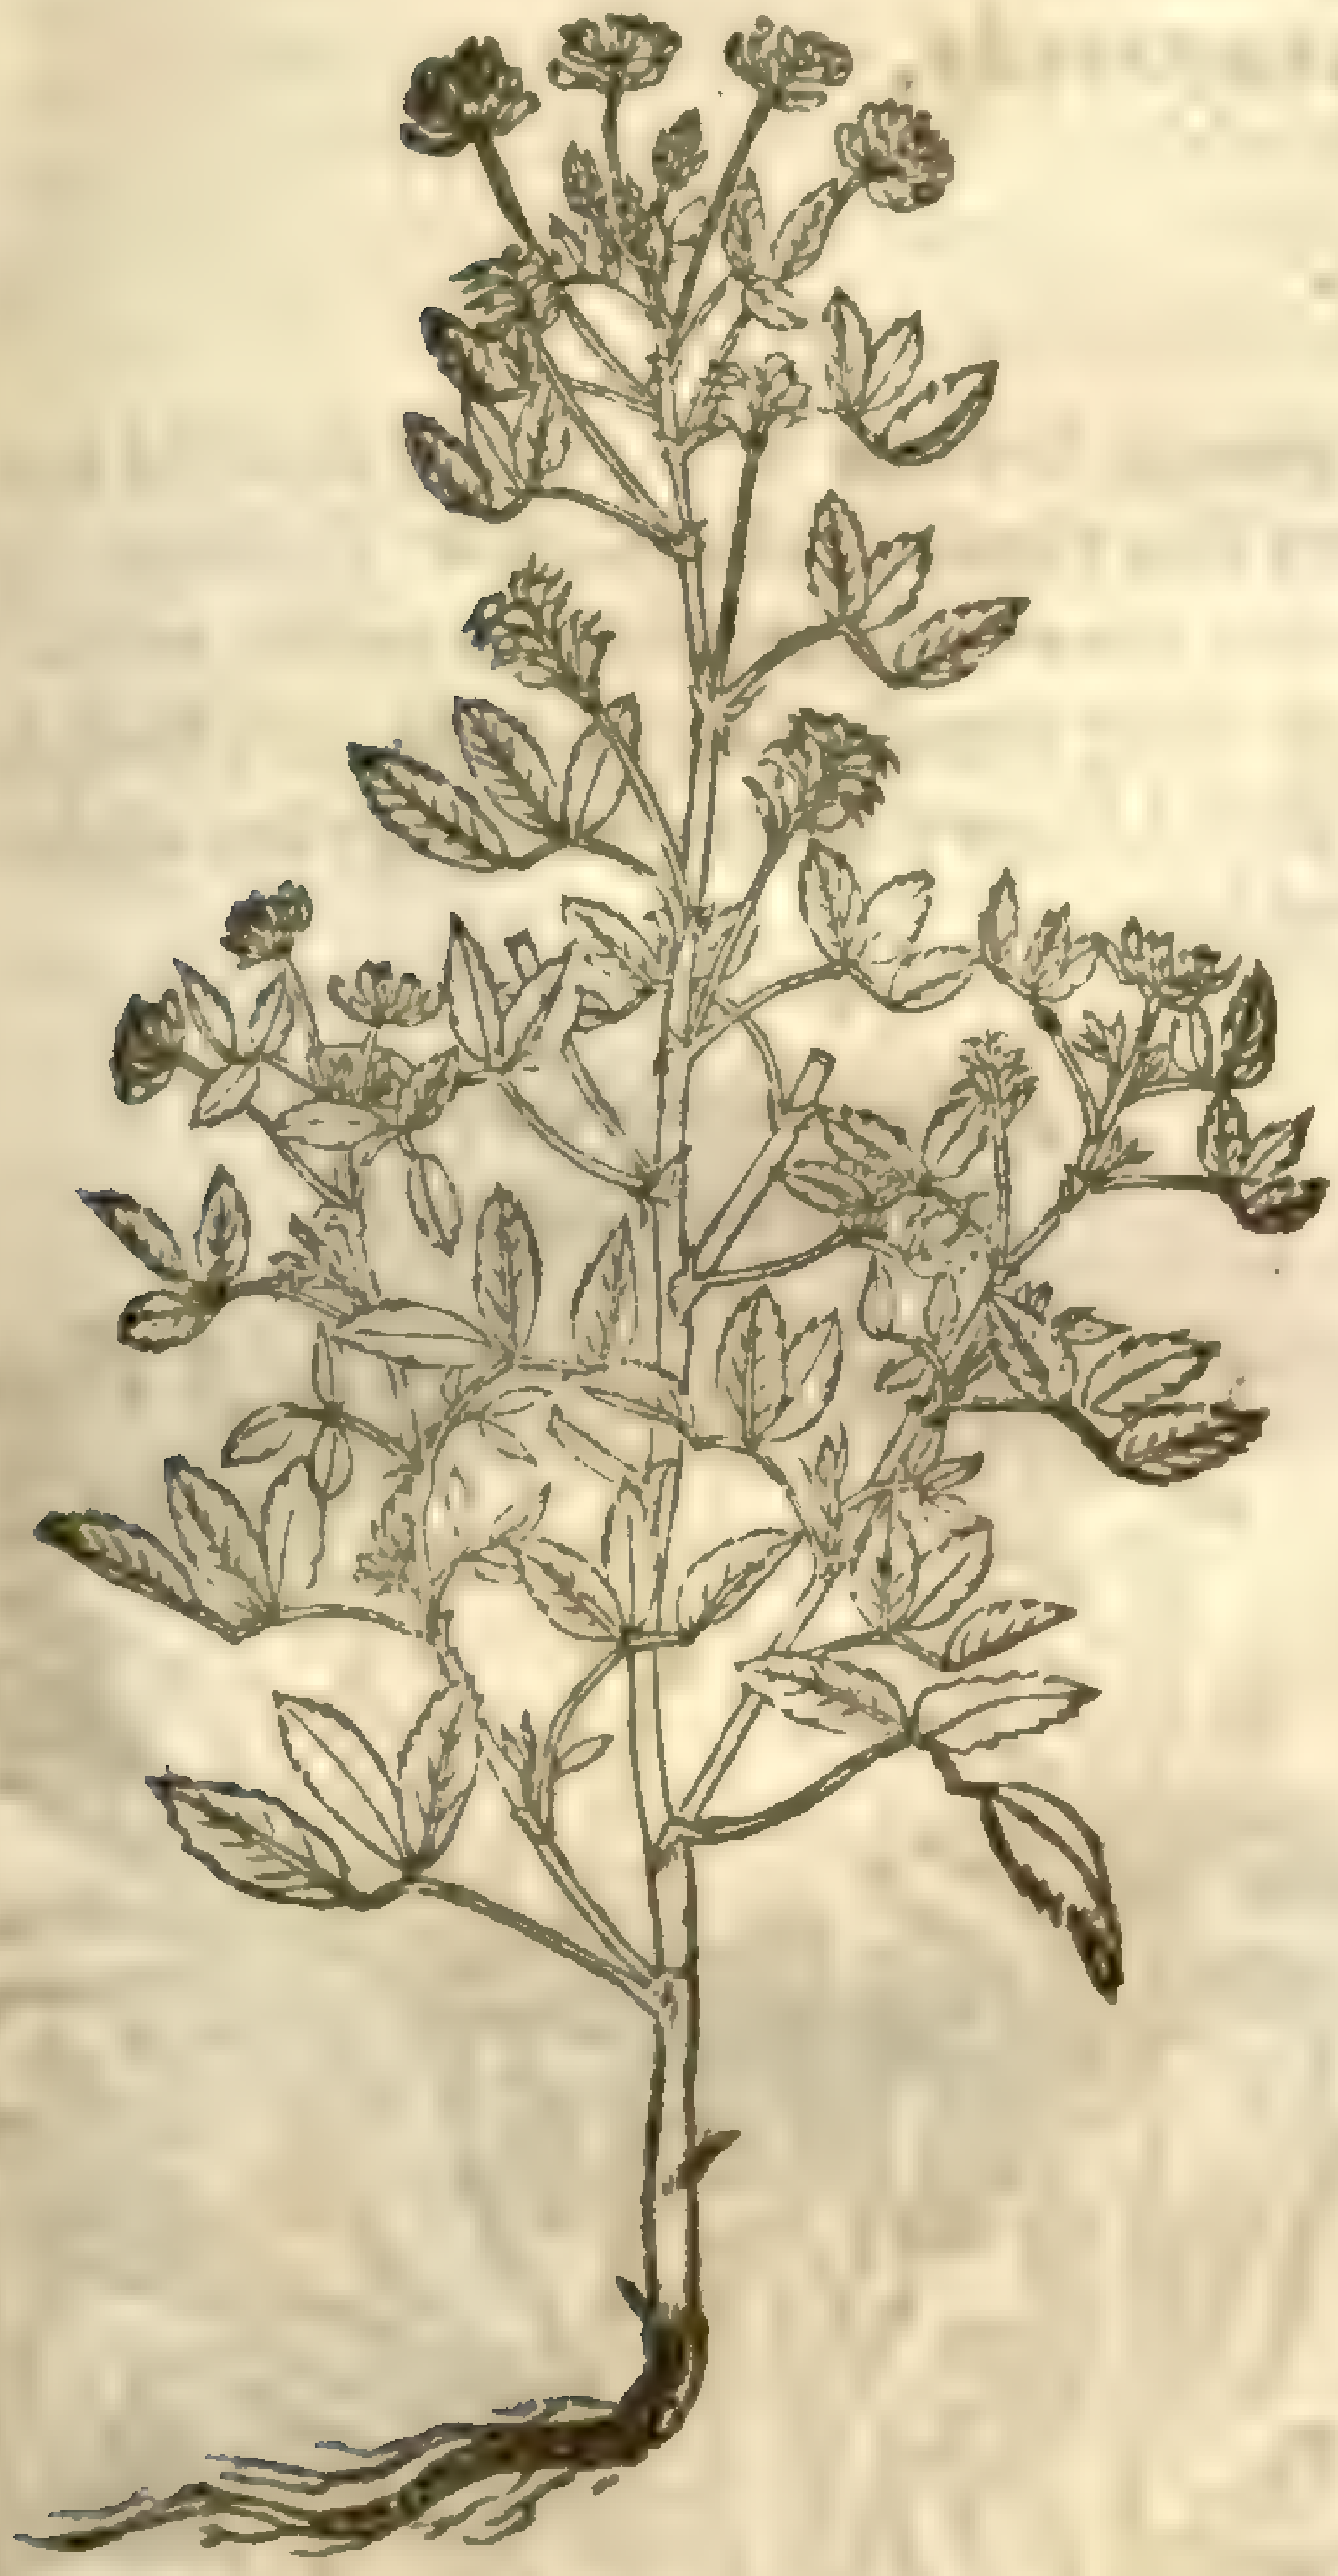
¶ *The Temperature and Vertues.*

A The ſeed of *Iſopyrum*, ſaith *Dioſcorides*, if it be taken with meade or honied water, is good againſt the cough and paine in the cheſt.

B It is alſo a remedy for thoſe that haue weake liuers and ſpet bloud, for as *Galen* ſaith it clenſeth and cutteth tough humors, hauing alſo adjoined with it an aſtringent or binding qualitie.

CHAP. 499. *Of ſweet Trefoile, or garden Clauer.*

Trifolium odoratum.
Sweet Trefoile.



¶ *The Deſcription.*

SWeet Trefoile hath an vpright ſtalk, hollow, and of the height of two cubits, diuiding it ſelfe into diuers branches: whereon do grow leaues by three and three like to the other Trefoiles, ſteightly and ſuperficiouſly nicked in the edges: from the boſom whereof come the floures, euery one ſtanding on his owne ſingle foot-ſtalk; conſiſting of little chaffie husks, of a light or pale blewiſh colour: after which come vp little heads or knops, in which lieth the ſeed, of a whitiſh yellow colour, and leſſer than that of Fenugreeke: the root hath diuers ſtrings: the whole plant is not onely of a whitiſh greene colour, but alſo of a ſweet ſmell, and of a ſtrong aromaticall or ſpicie ſent, and more ſweet when it is dried: which ſmel in the gathered and dried plant doth likewiſe continue long: and in moiſt and rainy weather, it ſmelleth more than in hot and dry weather: and alſo when it is yet freſh and greene it loſeth and recouereth again his ſmell ſeuen times a day; whereupon the old wiues in Germany do call it **Sieuen gezeiten kraut**, that is, the herbe that changeth ſeuen times a day.

¶ *The Place.*

It is ſowne in Gardens not onely beyond the ſeas, but in diuers gardens in England.

¶ *The Time.*

It is ſowne in May, it floureth in Iune and Iuly, and perfecteth his ſeed in the end of Auguſt, the ſame yeare it is ſowne.

¶ *The Names.*

It is called commonly in Latine *Trifolium odoratum*: in high Dutch as we haue ſaid **Sieuen gezeiten**: in low Dutch, **Seuenghetijtcruijt**, that is to ſay, an herbe of ſeuen times: it is called in Spaniſh, *Trebol real*: in French, *Treffle oderiferant*: in Engliſh, Sweet Trefoile, and garden Clauer: it ſeemeth to be *Lotus Vrbana*, or *ſatiua*, of which *Dioſcorides* writeth in his fourth book: neuertheleſſe diuers Authors ſet downe Melilot, for *Lotus vrbana*, and *Trifolium odoratum*, but not properly. ‡ The Gardiners and herbewomen in Cheapſide commonly call it, and know it by the name of Balſam, or garden Balſam. ‡

¶ *The Temperature.*

Galen ſaith, that ſweet Trefoile doth in a meane concoct and dry, and is in a meane temperate facultie betweene hot and cold: the which faculties vndoubtedly are plainely perceiued in this ſweet Trefoile.

¶ *The Vertues.*

A The juyce preſſed forth, ſaith *Dioſcorides*, with hony added thereto, clenſeth the vlcers of the eies, called in Latine *Argema*, and taketh away ſpots in the ſame, called *Albugines*; and remoueth ſuch things as do hinder the ſight.

B The oile wherein the floures are infuſed or ſteeped, doth perfectly cure greene wounds in very ſhort ſpace; it appeaſeth the paine of the gout, and all other aches, and is highly commended againſt ruptures, and burſtings in young children.

C The juyce giuen in white Wine cureth thoſe that haue fallen from ſome high place, auoideth congealed and clotted bloud, and alſo helpeth thoſe that do piſſe bloud, by meanes of ſome great bruiſe, as was prooued lately vpon a boy in Fanchurch ſtreet, whom a cart went ouer, whereupon

upon he did not onely piſſe bloud, but alſo it moſt wonderfully guſhed forth, both at his noſe and mouth.

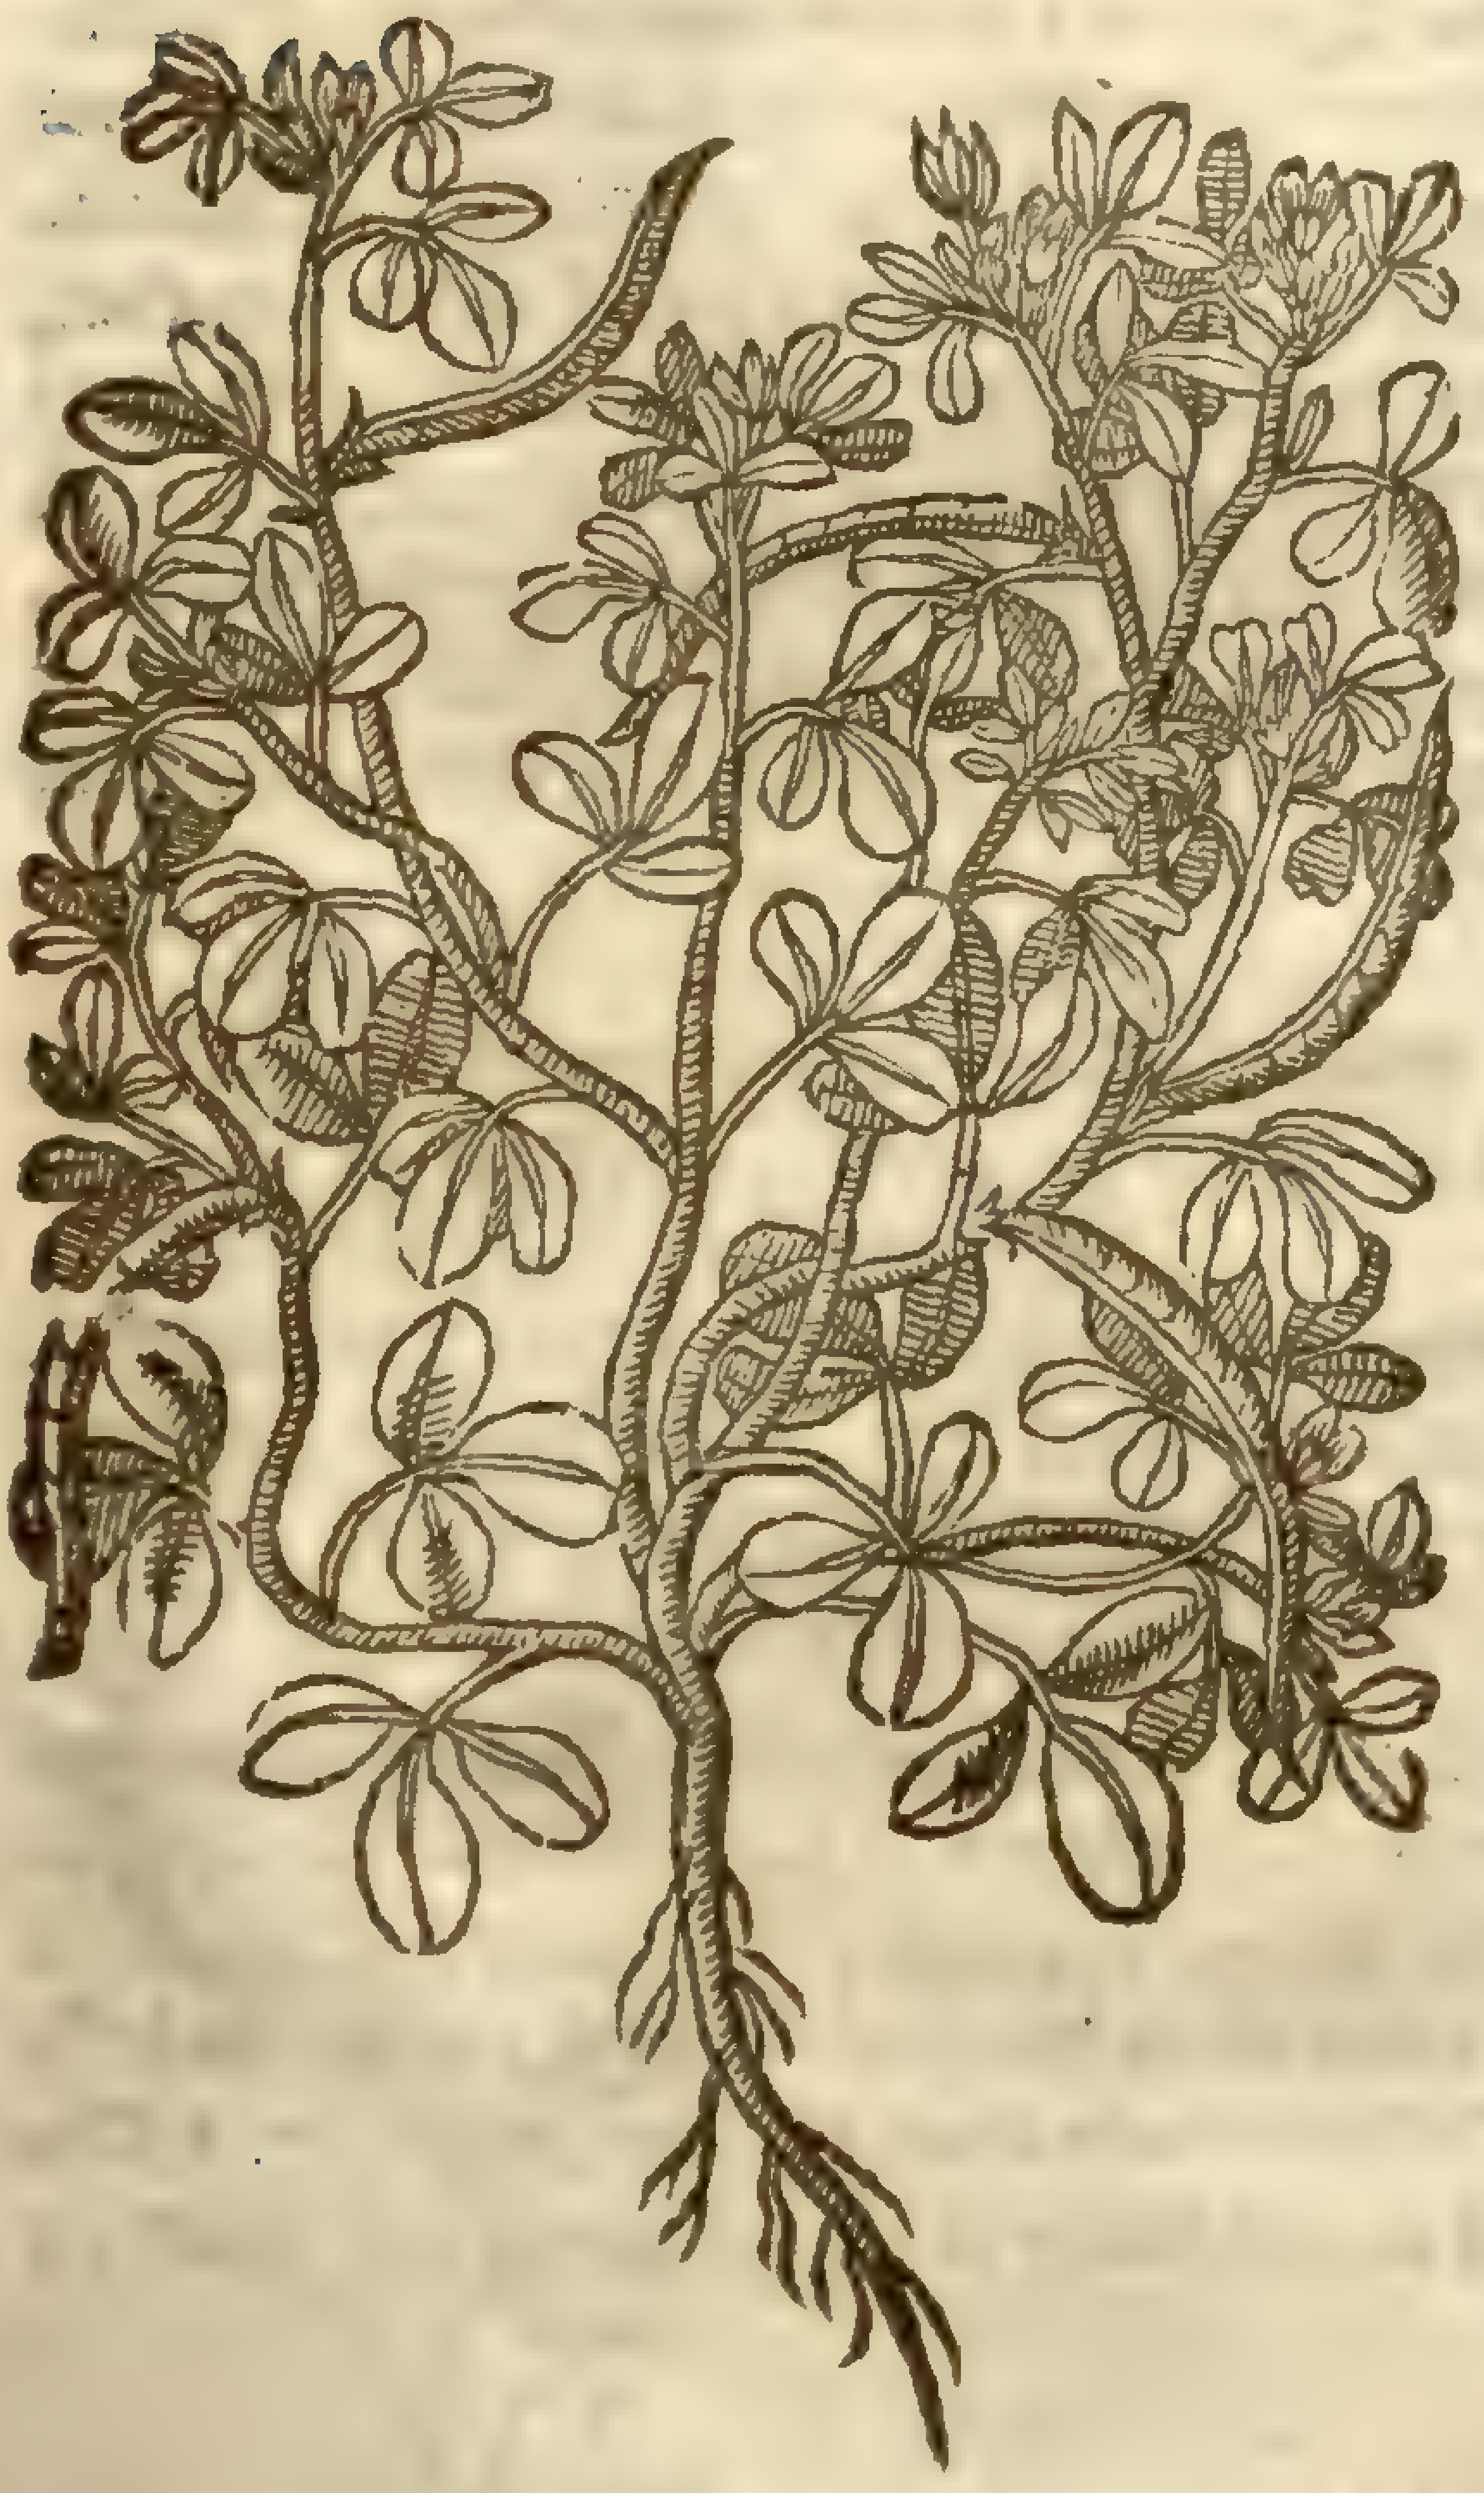
D The dried herbe laid among garments keepeth them from Mothes and other vermine.

Chap. 500. *Of Fenugreeke.*

¶ *The Deſcription.*

1 Fenugreeke hath a long ſlender trailing ſtalke, greene, hollow within, and diuided into diuers ſmall branches: whereon doe grow leaues like thoſe of the medow Trefoile, but rounder and leſſer, greene on the vpper ſide, on the lower ſide tending to an aſh colour: among which come ſmall white floures, after them likewiſe long ſlender narrow cods, in which do lie ſmall vneuen ſeeds, of a yellowiſh colour: which being dryed, haue a ſtrong ſmell, yet not vnpleaſant: the root is ſmall, and periſheth when it hath perfected his ſeed.

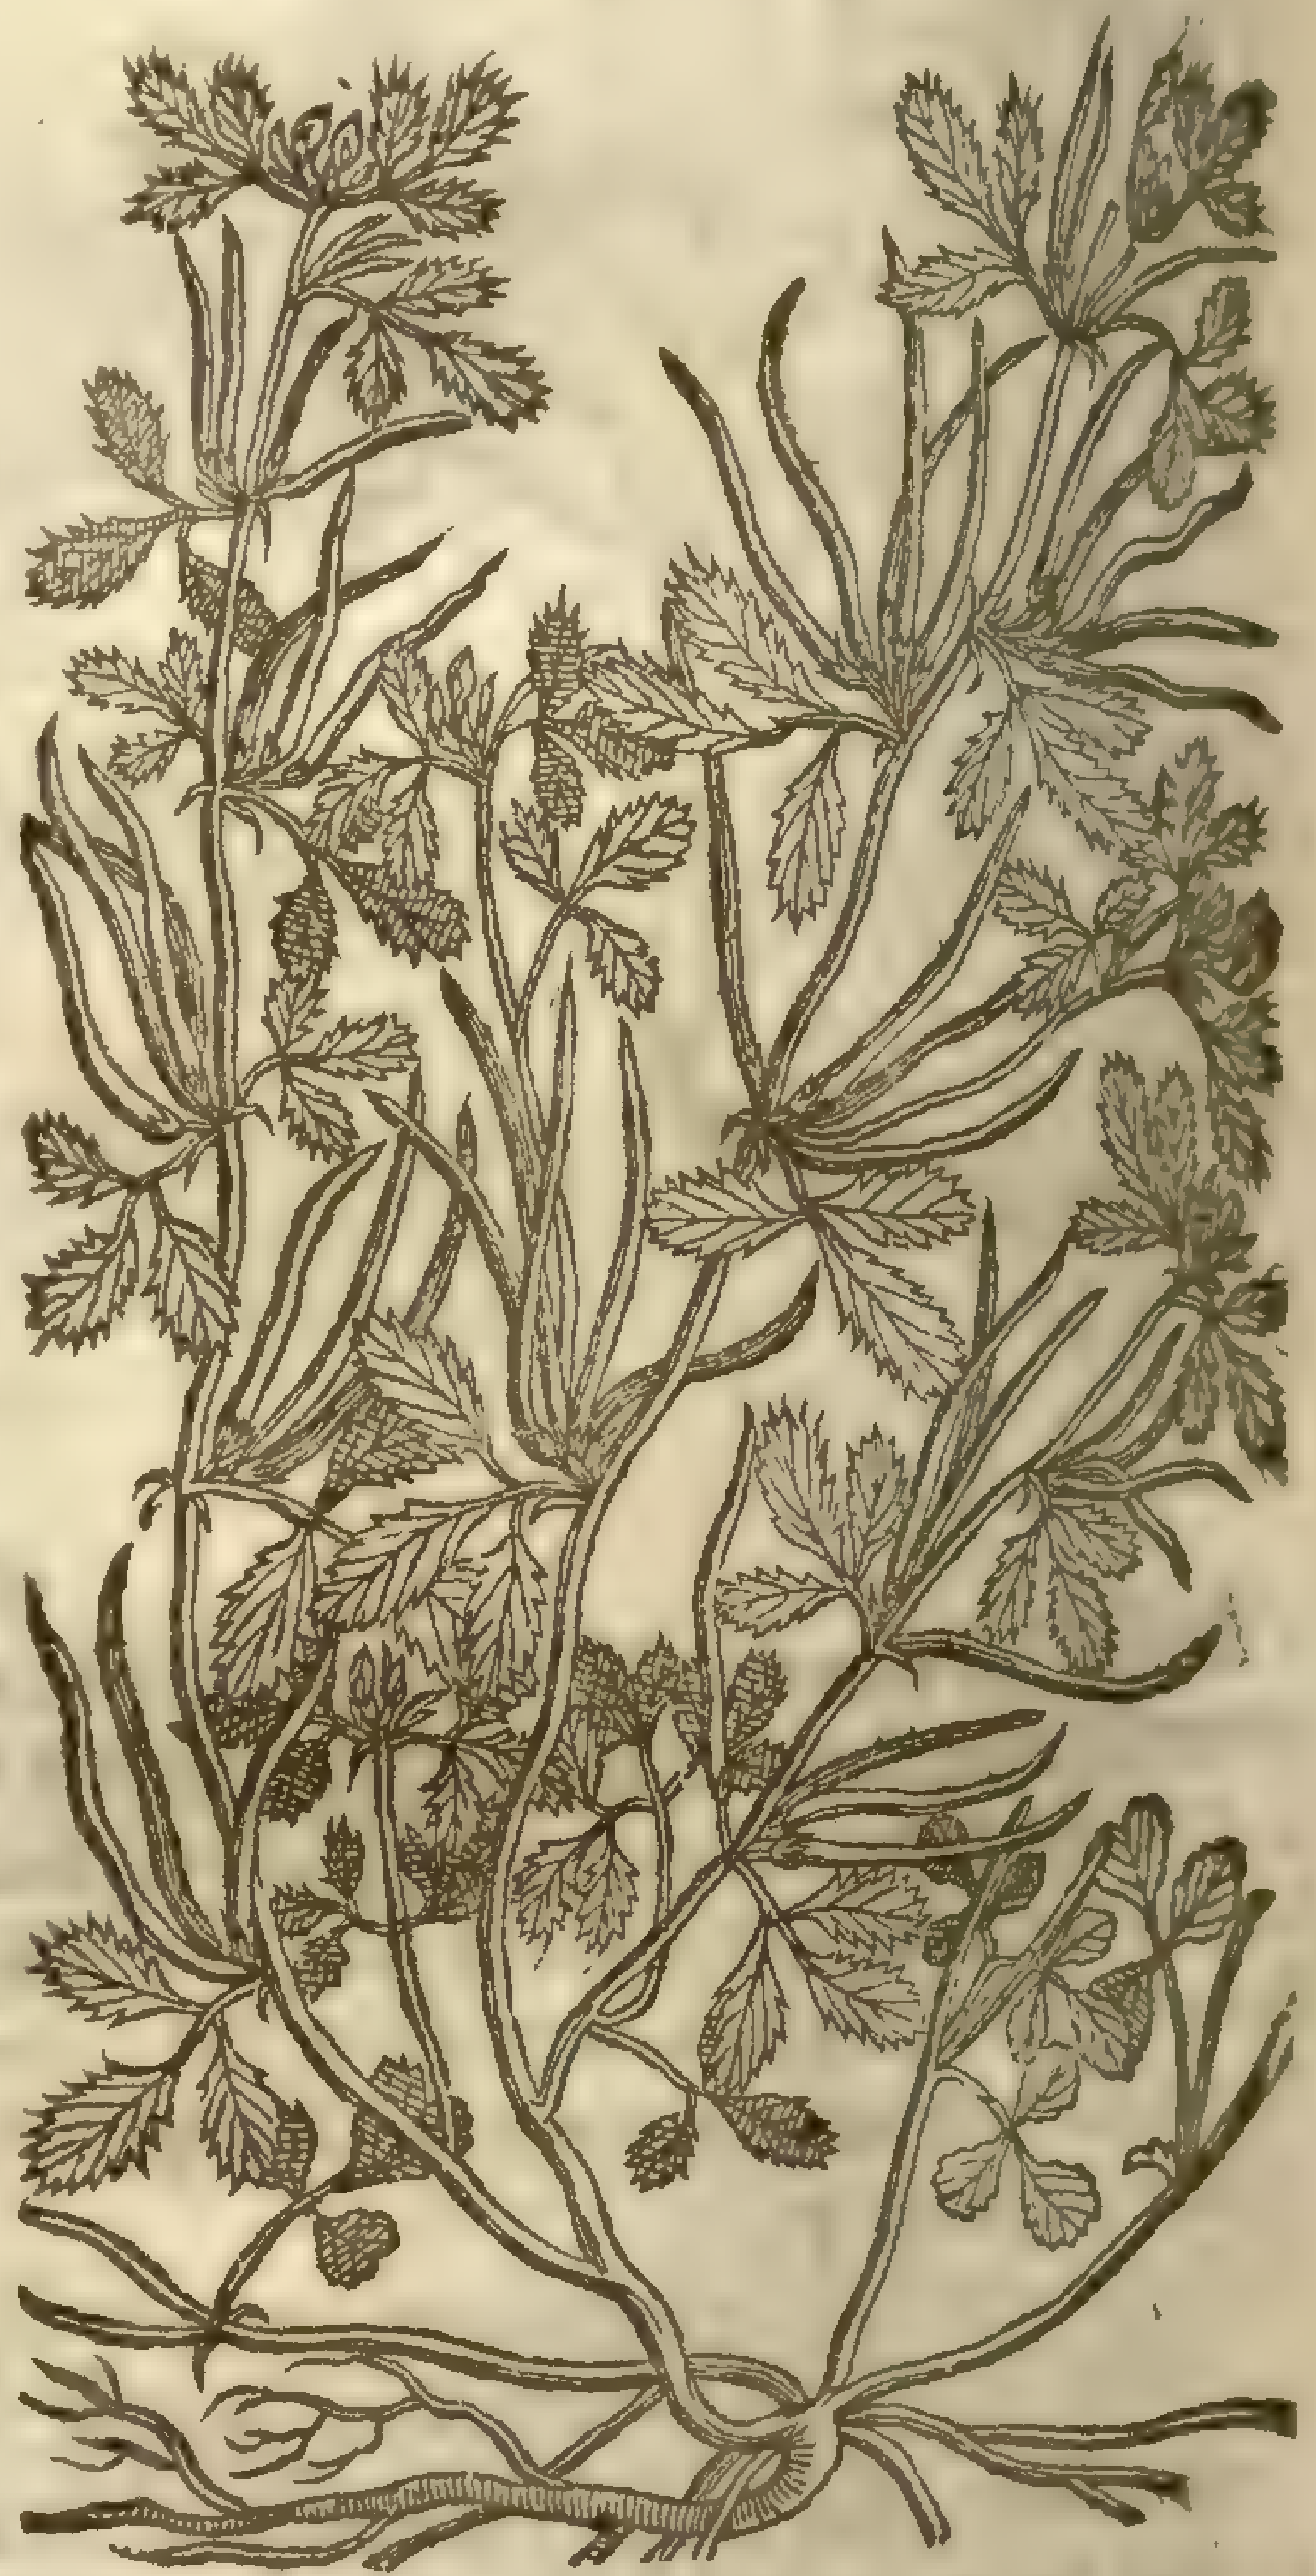
1 *Fœnumgræcum.*
Fenugreeke.



[illegible]

[illegible]

‡ 2 *Fœnumgræcum ſylueſtre.*
Wilde Fenugreeke.



2 There is a wilde kinde hereof ſeruing for little vſe, that hath ſmall round branches, full of knees or joynts: from each joynt proceedeth a ſmall tender foot-ſtalk, wheron do grow three leaues and no more, ſomewhat ſnipt about the edges, like vnto thoſe of Burgundie Haie: from the boſoms whereof come forth ſmall yellow floures, which turne into little cods: the root is thicke, tough, and pliant.

¶ *The Place.*

Fenugreeke is ſowne in fields beyond the ſeas: in England we ſow a ſmall quantity thereof in our gardens.

¶ *The Time.*

It hath two ſeaſons of ſowing, according to *Columella*, of which one is in September, at what time it is ſowne that it may ſerue for fodder againſt Winter; the other is in the end of Ianuary, or the beginning of February, notwithſtanding we may not ſow it vntill Aprill in England.

¶ *The Names.*

It is called in Greeke, τῆλις, or as it is found in *Pliny* his copies *Carphos*: in Latine, *Fœnum Græcum*: *Columella* ſaith that it is called *Siliqua*: in *Pliny* we reade *Silicia*: in *Varro*, *Silicula*: in high Dutch, **Bockſhorne**: in Italian, *Fiengreco*: in Spaniſh, *Alfornas*: in French, *Fenegrec*: and in Engliſh, Fenegreeke.

¶ *The Temperature and Vertues.*

It is thought according to *Galen* in his booke of the Faculties of nouriſhments, that it is one of thoſe ſimples which do manifeſtly heat, and that men do vſe it for food, as they do Lupines; for it is taken with pickle to keep the body ſoluble; and for this purpoſe it is more agreeable than Lupines, ſeeing it hath nothing in his owne proper ſubſtance, that may hinder the working. A

The juyce of boyled Fenegreeke taken with hony is good to purge by the ſtoole all manner of corrupt humors that remaine in the guts, making ſoluble through his ſlimineſſe, and mitigating paine through his warmeneſſe. B

And becauſe it hath in it a clenſing or ſcouring faculty, it raiſeth humors out of the cheſt: but there muſt be added vnto it no great quantity of honie, leaſt the biting quality ſhould abound. C

In old diſeaſes of the cheſt without a feuer, fat dates are to be boyled with it, but when you haue mixed the ſame juyce preſſed out with a great quantity of hony, and haue againe boiled it on a ſoft fire to a meane thickeneſſe, then muſt you vſe it long before meat. D

In his booke of the Faculties of ſimple medicines, he ſaith, that Fenegreeke is hot in the ſecond degree and dry in the firſt: therefore it doth kindle and make worſe hot inflammations, but ſuch as are leſſe hot and more hard are thereby cured by being waſted and conſumed away. E

The meale of Fenegreeke, as *Dioſcorides* ſaith, is of force to mollifie and waſte away: being boiled with mead and applied it taketh away inflammations, as well inward as outward. F

The ſame being tempered or kneaded with niter and vineger, doth ſoften and waſte away the hardneſſe of the milt. G

It is good for women that haue either impoſthume, vlcer, or ſtopping of the matrix, to bathe and ſit in the decoction thereof. H

The juyce of the decoction preſſed forth doth clenſe the haire, taketh away dandraffe, ſcoureth running ſores of the head, called of the Græcians ἄχωρες: being mingled with gooſe greaſe, and put vp in manner of a peſſary, or mother ſuppoſitory, it doth open and mollifie all the parts about the mother. I

Greene Fenegreeke bruiſed and pounded with vineger, is a remedy for weake and feeble parts, and that are without skin, vlcerated and raw. K

The decoction thereof is good againſt vlcers in the low gut, and foule ſtinking excrements of thoſe that haue the bloudy flix. L

The oile which is preſſed out thereof ſcoureth haires and ſcars in the priuie parts. M

The decoction of Fenegreeke ſeed, made in wine, and drunke with a little vineger, expelleth all euill humors in the ſtomacke and guts. N

The ſeed boiled in wine with dates and hony, vnto the form of a ſyrrup, doth mundifie and clenſe the breſt, and eaſeth the paines thereof. O

The meale of Fenegreeke boiled in meade or honied water, conſumeth and diſſolueth all cold hard impoſthumes and ſwellings, and being mixed with the roots of Marſh Mallowes and Linſeed effecteth the ſame. P

It is very good for women that haue any griefe or ſwelling in the matrix, or other lower parts, if they bathe thoſe parts with the decoction thereof made in wine, or ſit ouer it and ſweat. Q

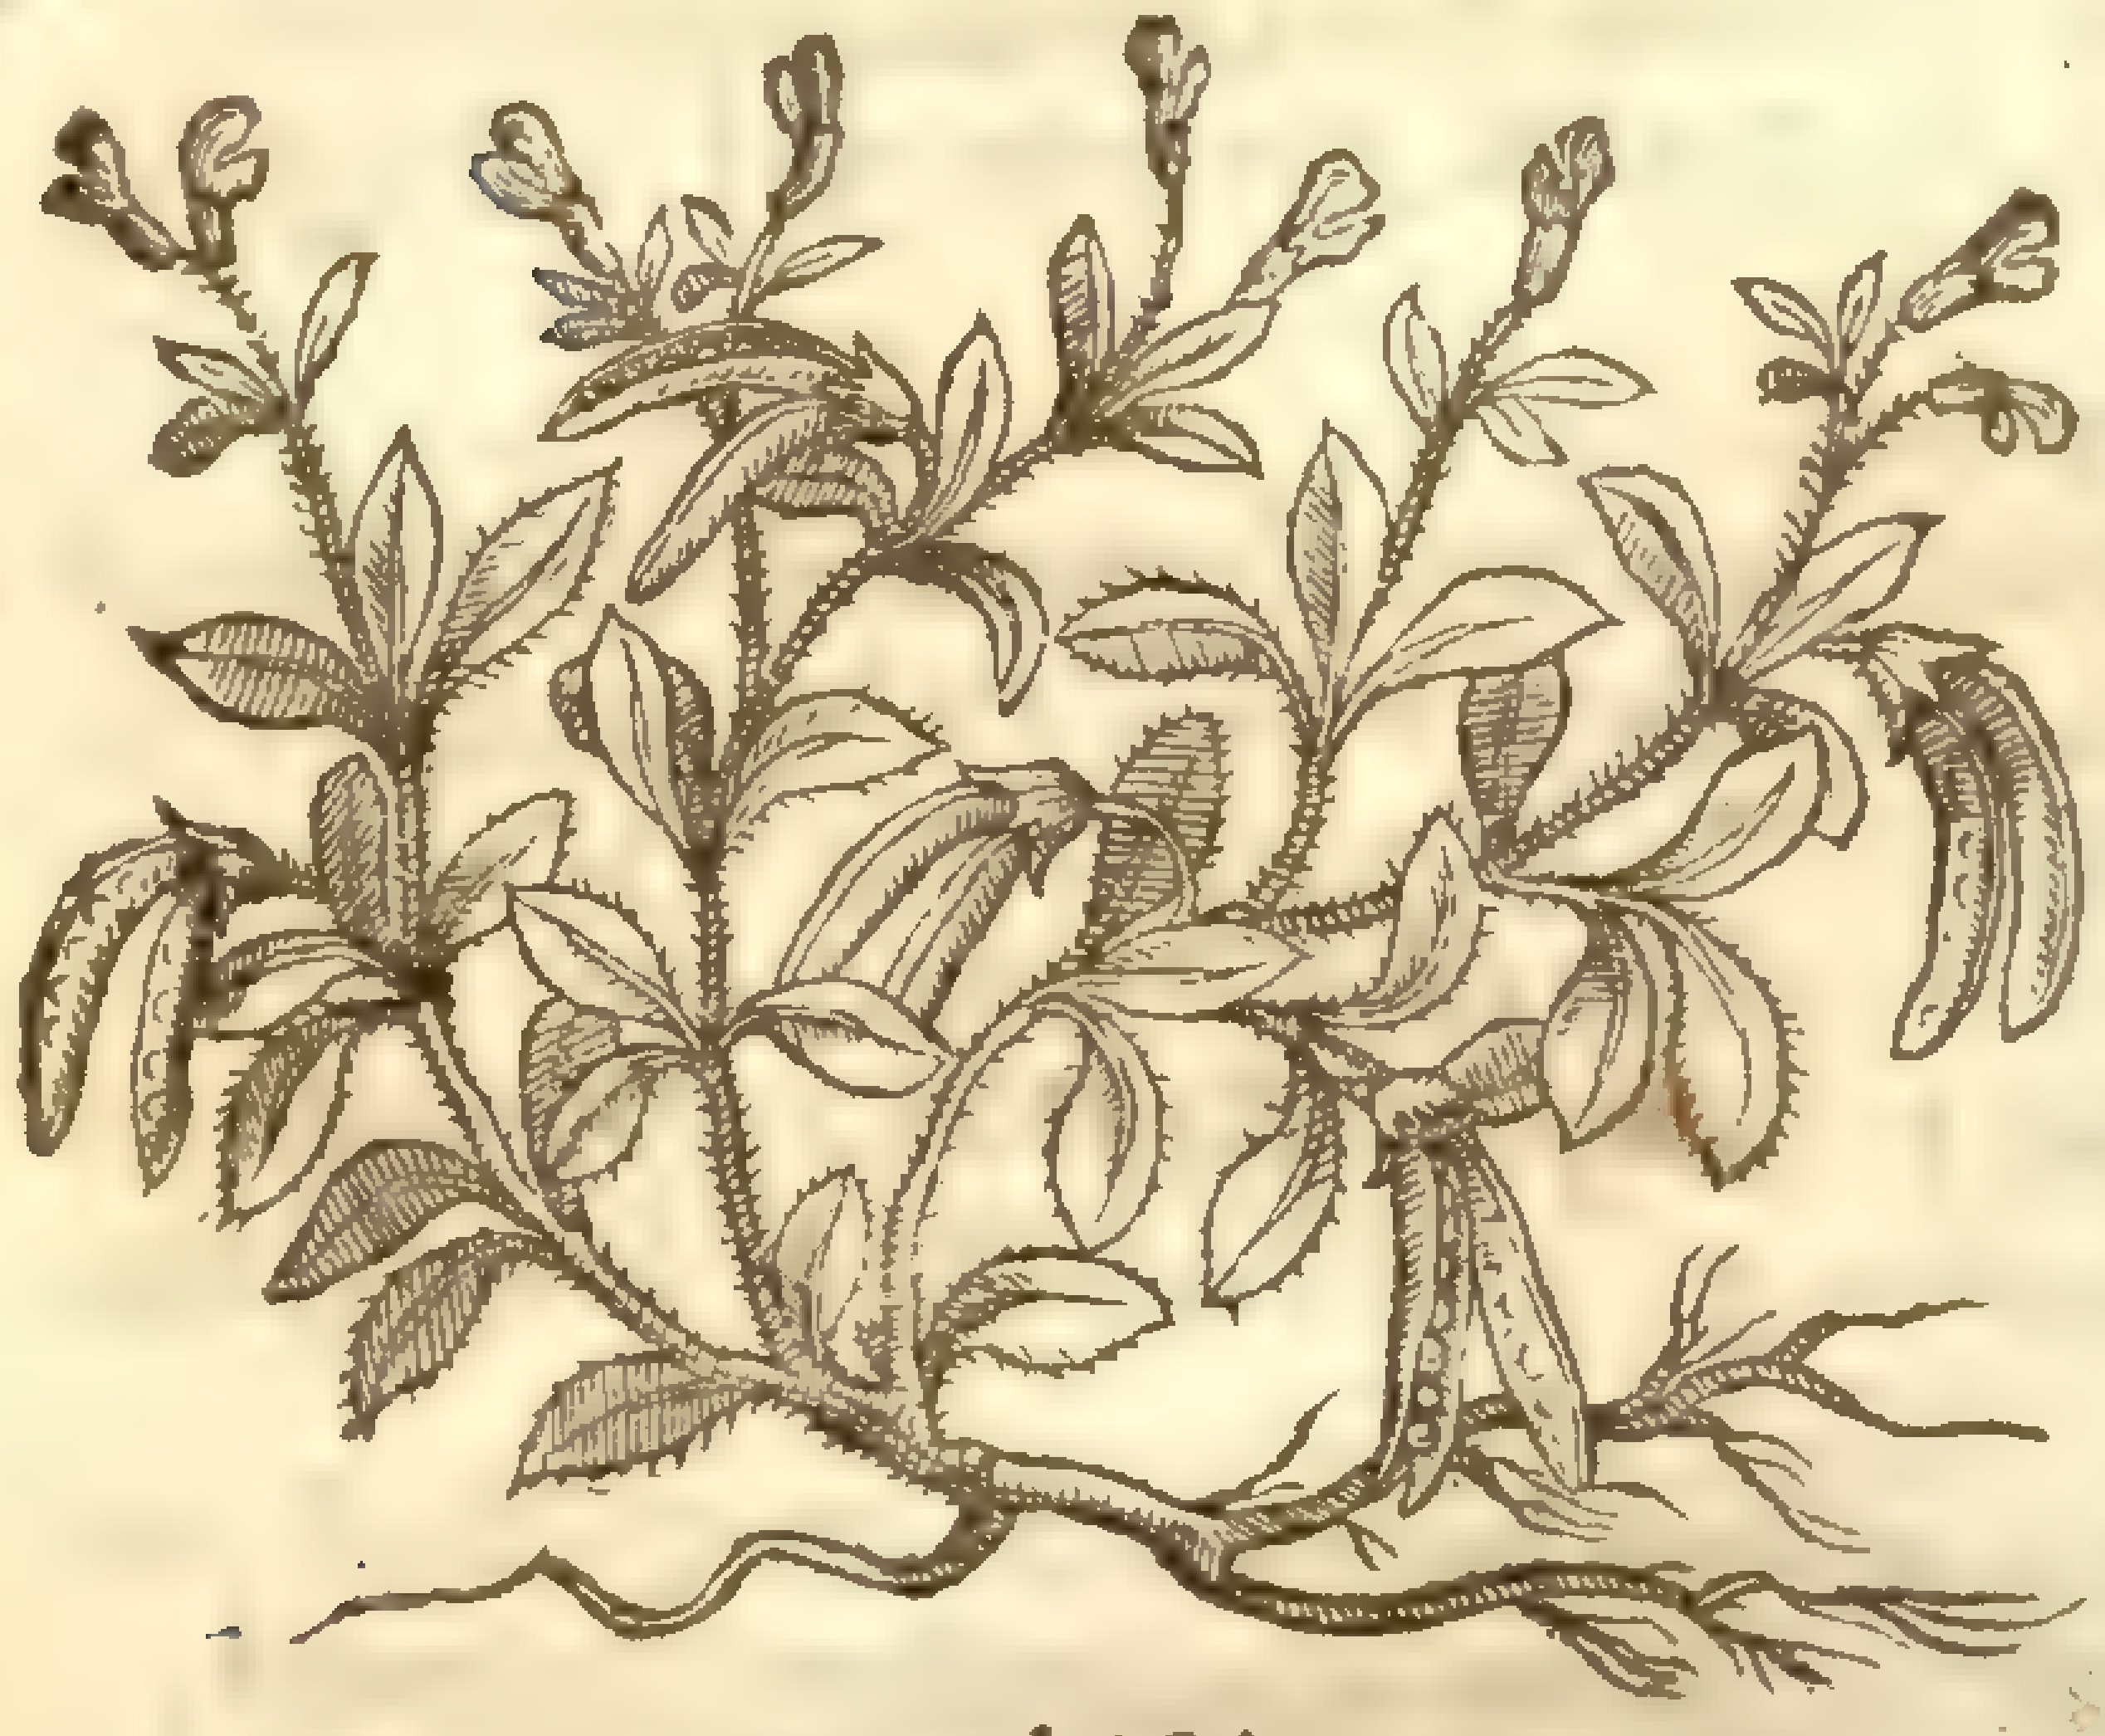
It is good to waſh the head with the decoction of the ſeed, for it taketh away the ſcurfe, ſcales, nits, and all other ſuch like imperfections. R

Chap. 501. *Of Horned Clauer, and blacke Clauer.*

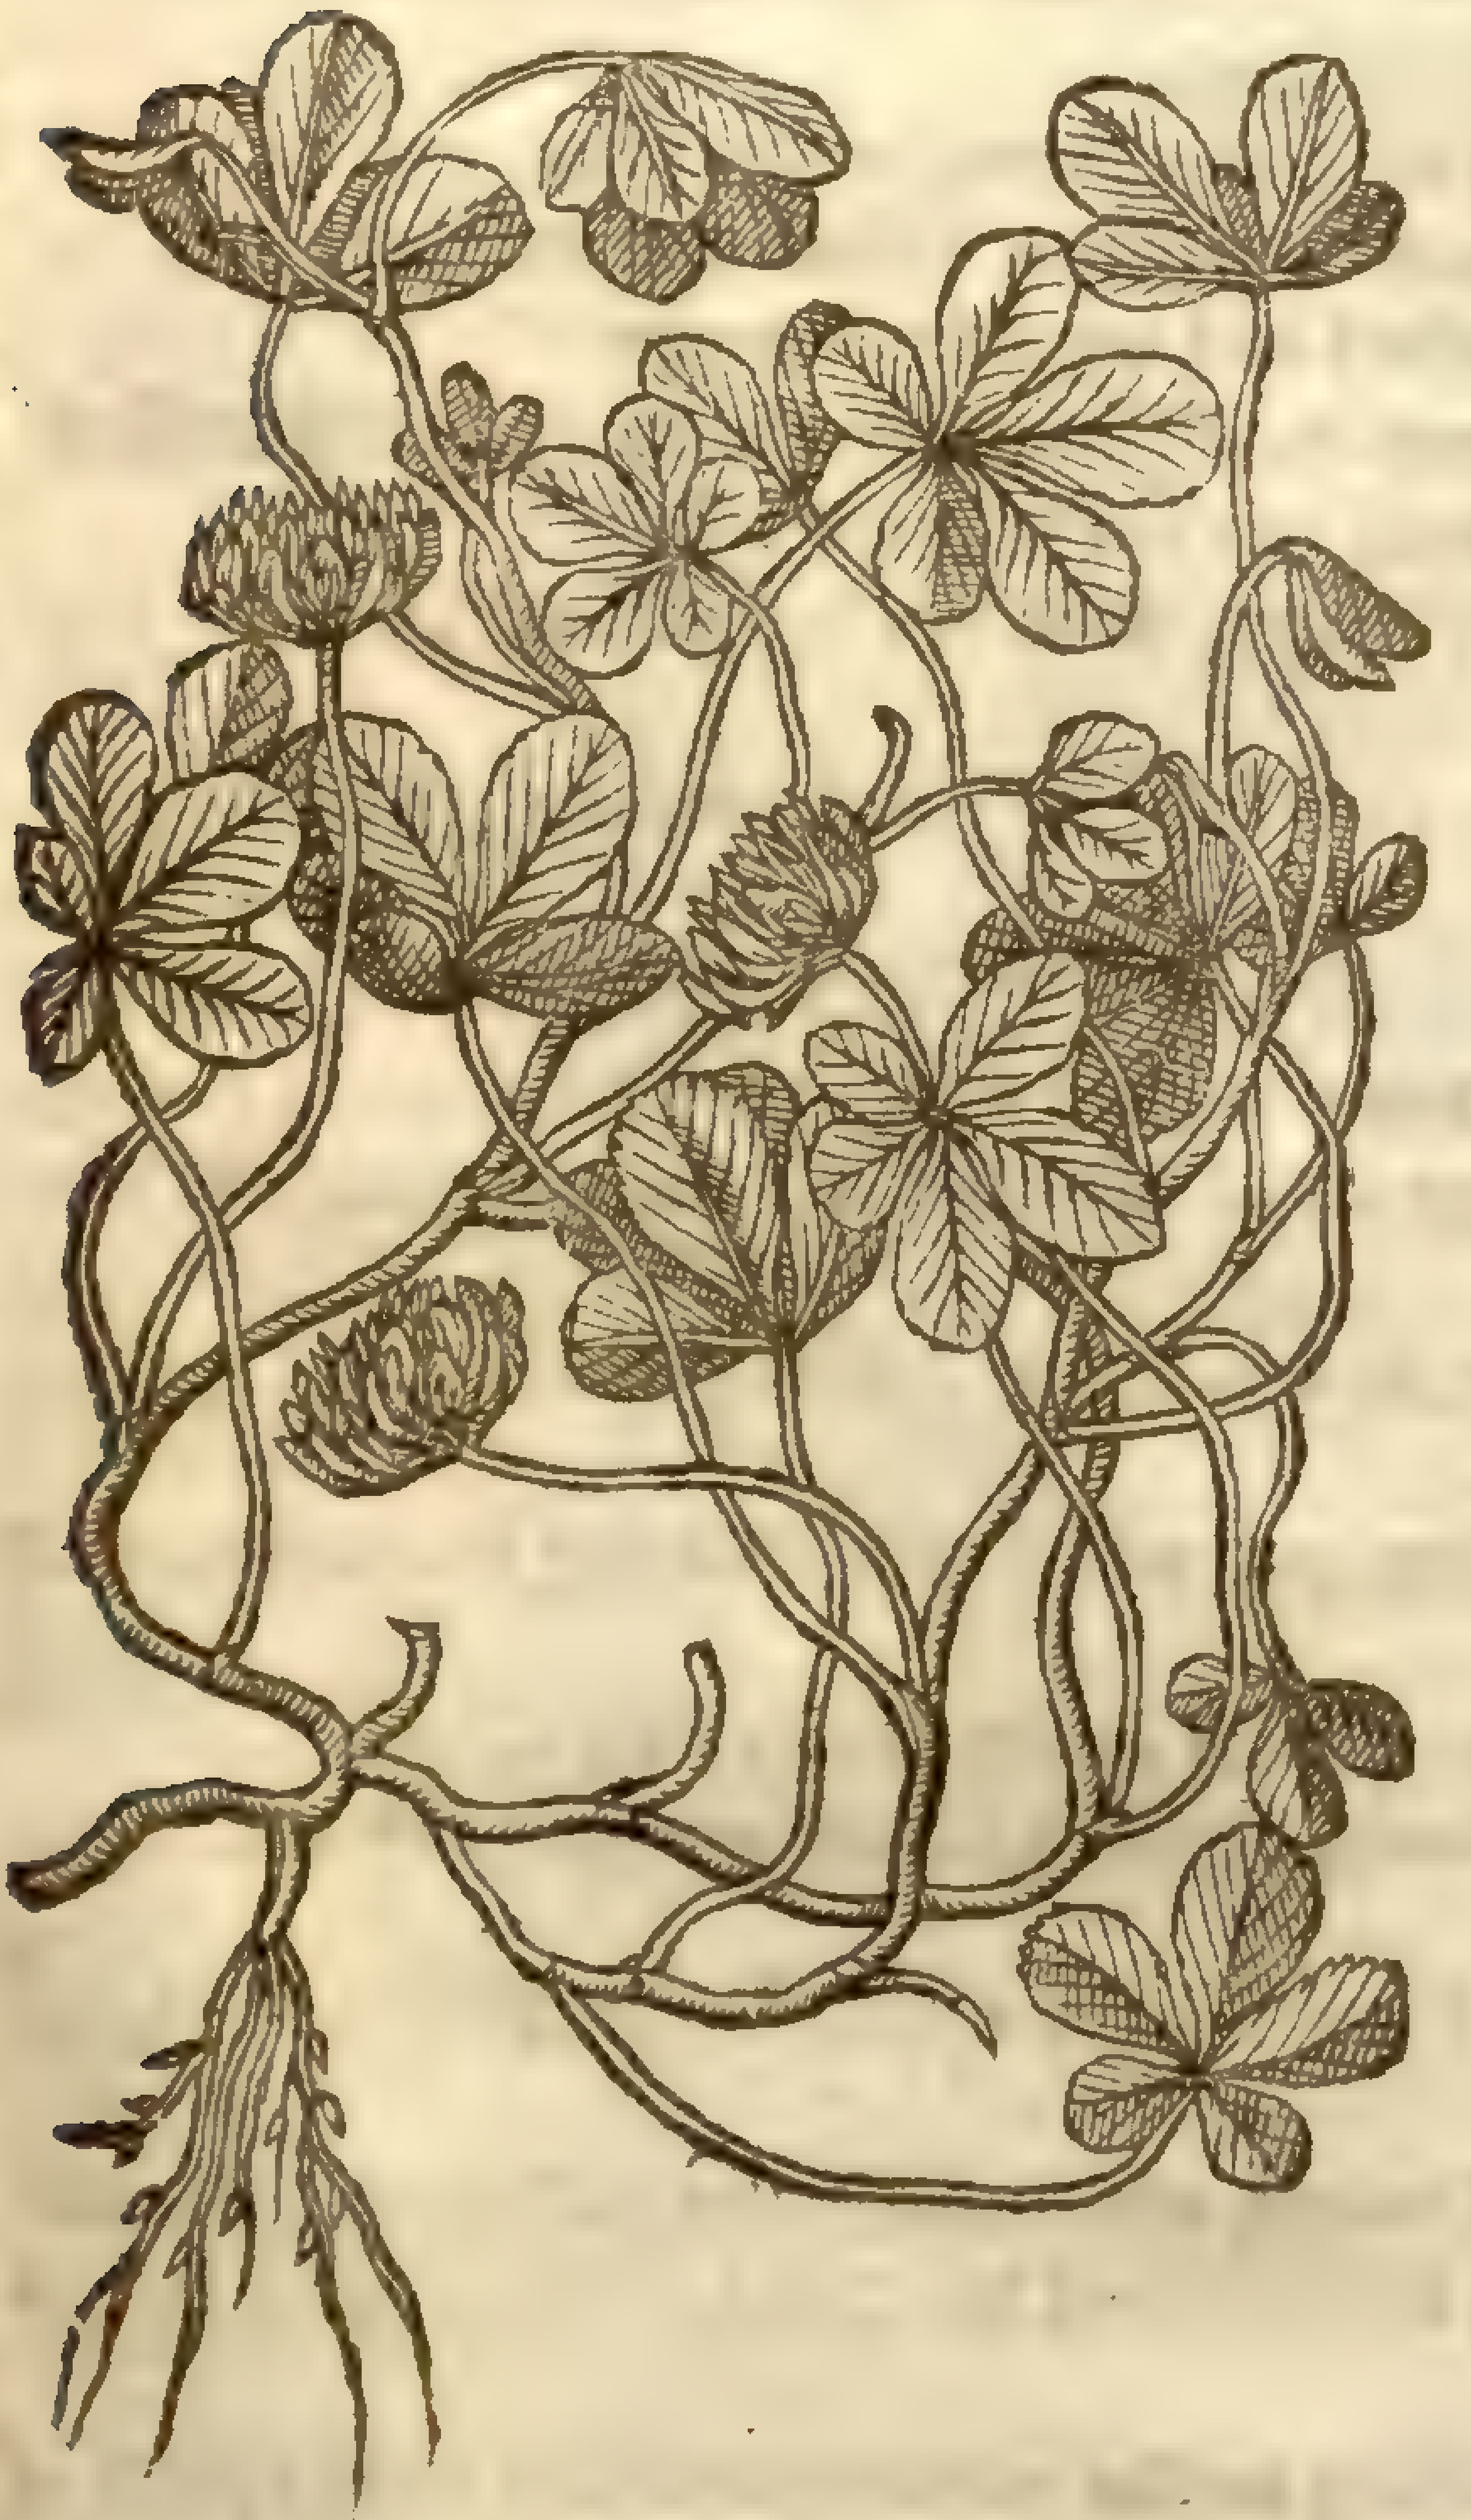
¶ *The Deſcription.*

1 The horned Clauer, or codded Trefoile, groweth vp with many weake and ſlender ſtalkes lying vpon the ground: about which are ſet white leaues, ſomewhat long, leſſer and narrower than any of the other Trefoiles: the floures grow at the tops, of the faſhion of thoſe of Peaſon, of a ſhining yellow colour: after which come certaine ſtraight cods, bigger than thoſe of Fenegreeke, but blunter at their ends, in which are contained little round ſeed; the root is hard and wooddy and ſendeth forth young ſprings euery yeare.

1 *Lotus trifolia corniculata.*
Horned or codden Caler.



2 *Lotus quadrifolia.*
Foure leaſed graſſe.



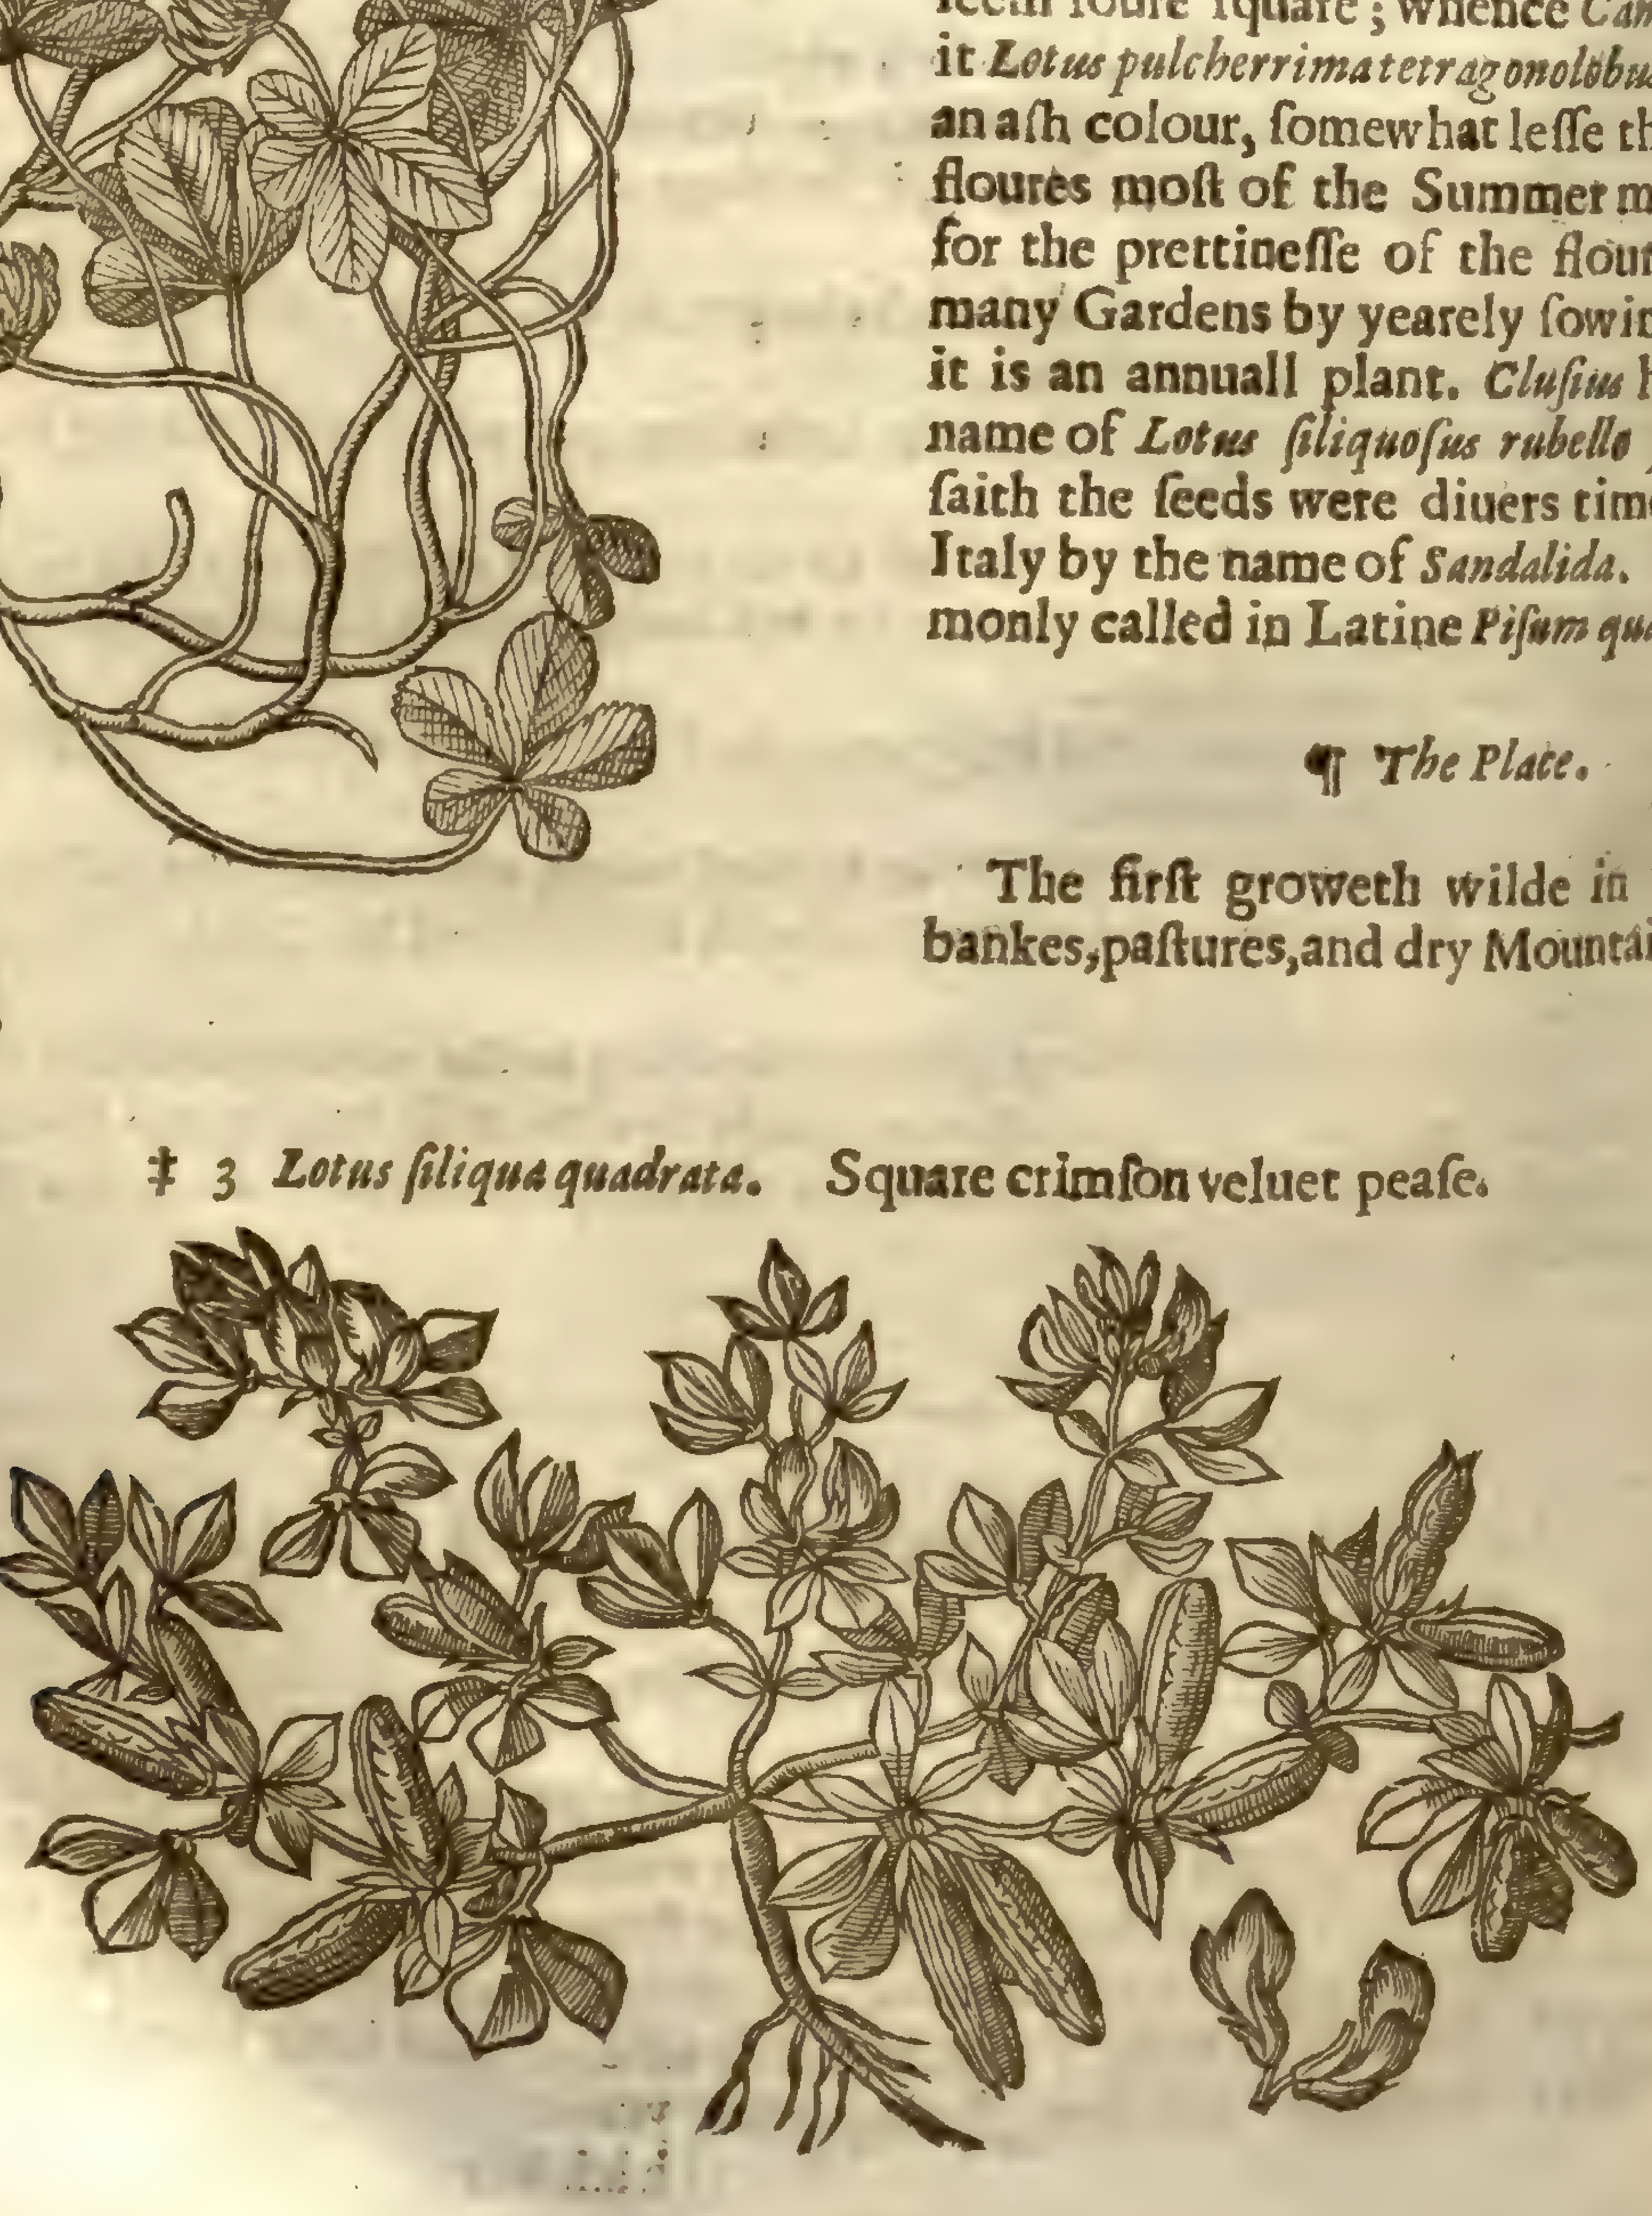
2 This kinde of three leafed graſſe, or rather foure leafed Trefoile, hath leaues like vnto the common Trefoile, ſauing that they bee leſſer, and of a browne purpliſh colour, known by the name of Purple-wort, or Purple-graſſe; whoſe floures are in ſhape like the medow Trefoile, but of a duſty ouerworne colour tending to whitenesſe; the which doth oftentimes degenerate, ſometime into three leaues, ſometimes in fiue, and alſo into ſeuen, and yet the plant of his nature hath but foure leaues & no more. ‡ I do not thinke this to be the purple leaued Trefoile with the white floure, which is commonly called Purple-graſſe, for I could neuer obſerue it to haue more leaues than three vpon a ſtalke. ‡

‡ 3 The root of this is ſmall and white, from which ariſe many weake hairy branches ſome cubit long: wheron grow ſoft hairy leaues three on one foot-ſtalke, with two little leaues at the root therof, & out of the boſoms of theſe vpon like foot-ſtalkes grow three leſſer leaues, as alſo floures of the bignes and ſhape of thoſe of a Vetch, but of a braue deep crimſon veluet colour: after theſe are paſt come cods ſet with foure thinne welts or skins which make them ſeem foure ſquare; whence *Camerarius* called it *Lotus pulcherrima tetragonolobus*: the ſeed is of an aſh colour, ſomewhat leſſe then a peaſe. It floures moſt of the Summer moneths, and is for the prettineſſe of the floure preſerued in many Gardens by yearely ſowing the ſeed, for it is an annuall plant. *Cluſius* hath it by the name of *Lotus ſiliquoſus rubello flore*: and hee ſaith the ſeeds were diuers times ſent out of Italy by the name of *Sandalida*. It is alſo commonly called in Latine *Piſum quadratum*. ‡

¶ *The Place.*

The firſt groweth wilde in barren ditch bankes, paſtures, and dry Mountaines.

‡ 3 *Lotus ſiliqua quadrata.* Square crimſon veluet peaſe.



The ſecond groweth likewiſe in paſtures and fields, but not ſo common as the other; and it is planted in gardens.

¶ *The Time.*

They floure in Iuly and Auguſt.

¶ *The Names.*

The ſecond is called *Lotus Trifolia*: in Engliſh, horned Clauer, or codded Trefoile.

The other is called *Lotus quadrifolia*, or foure leafed Graſſe, or Purple-wort: of *Pena* and *Lobel*, *Quadrifolium phæum fuſcum hortorum.*

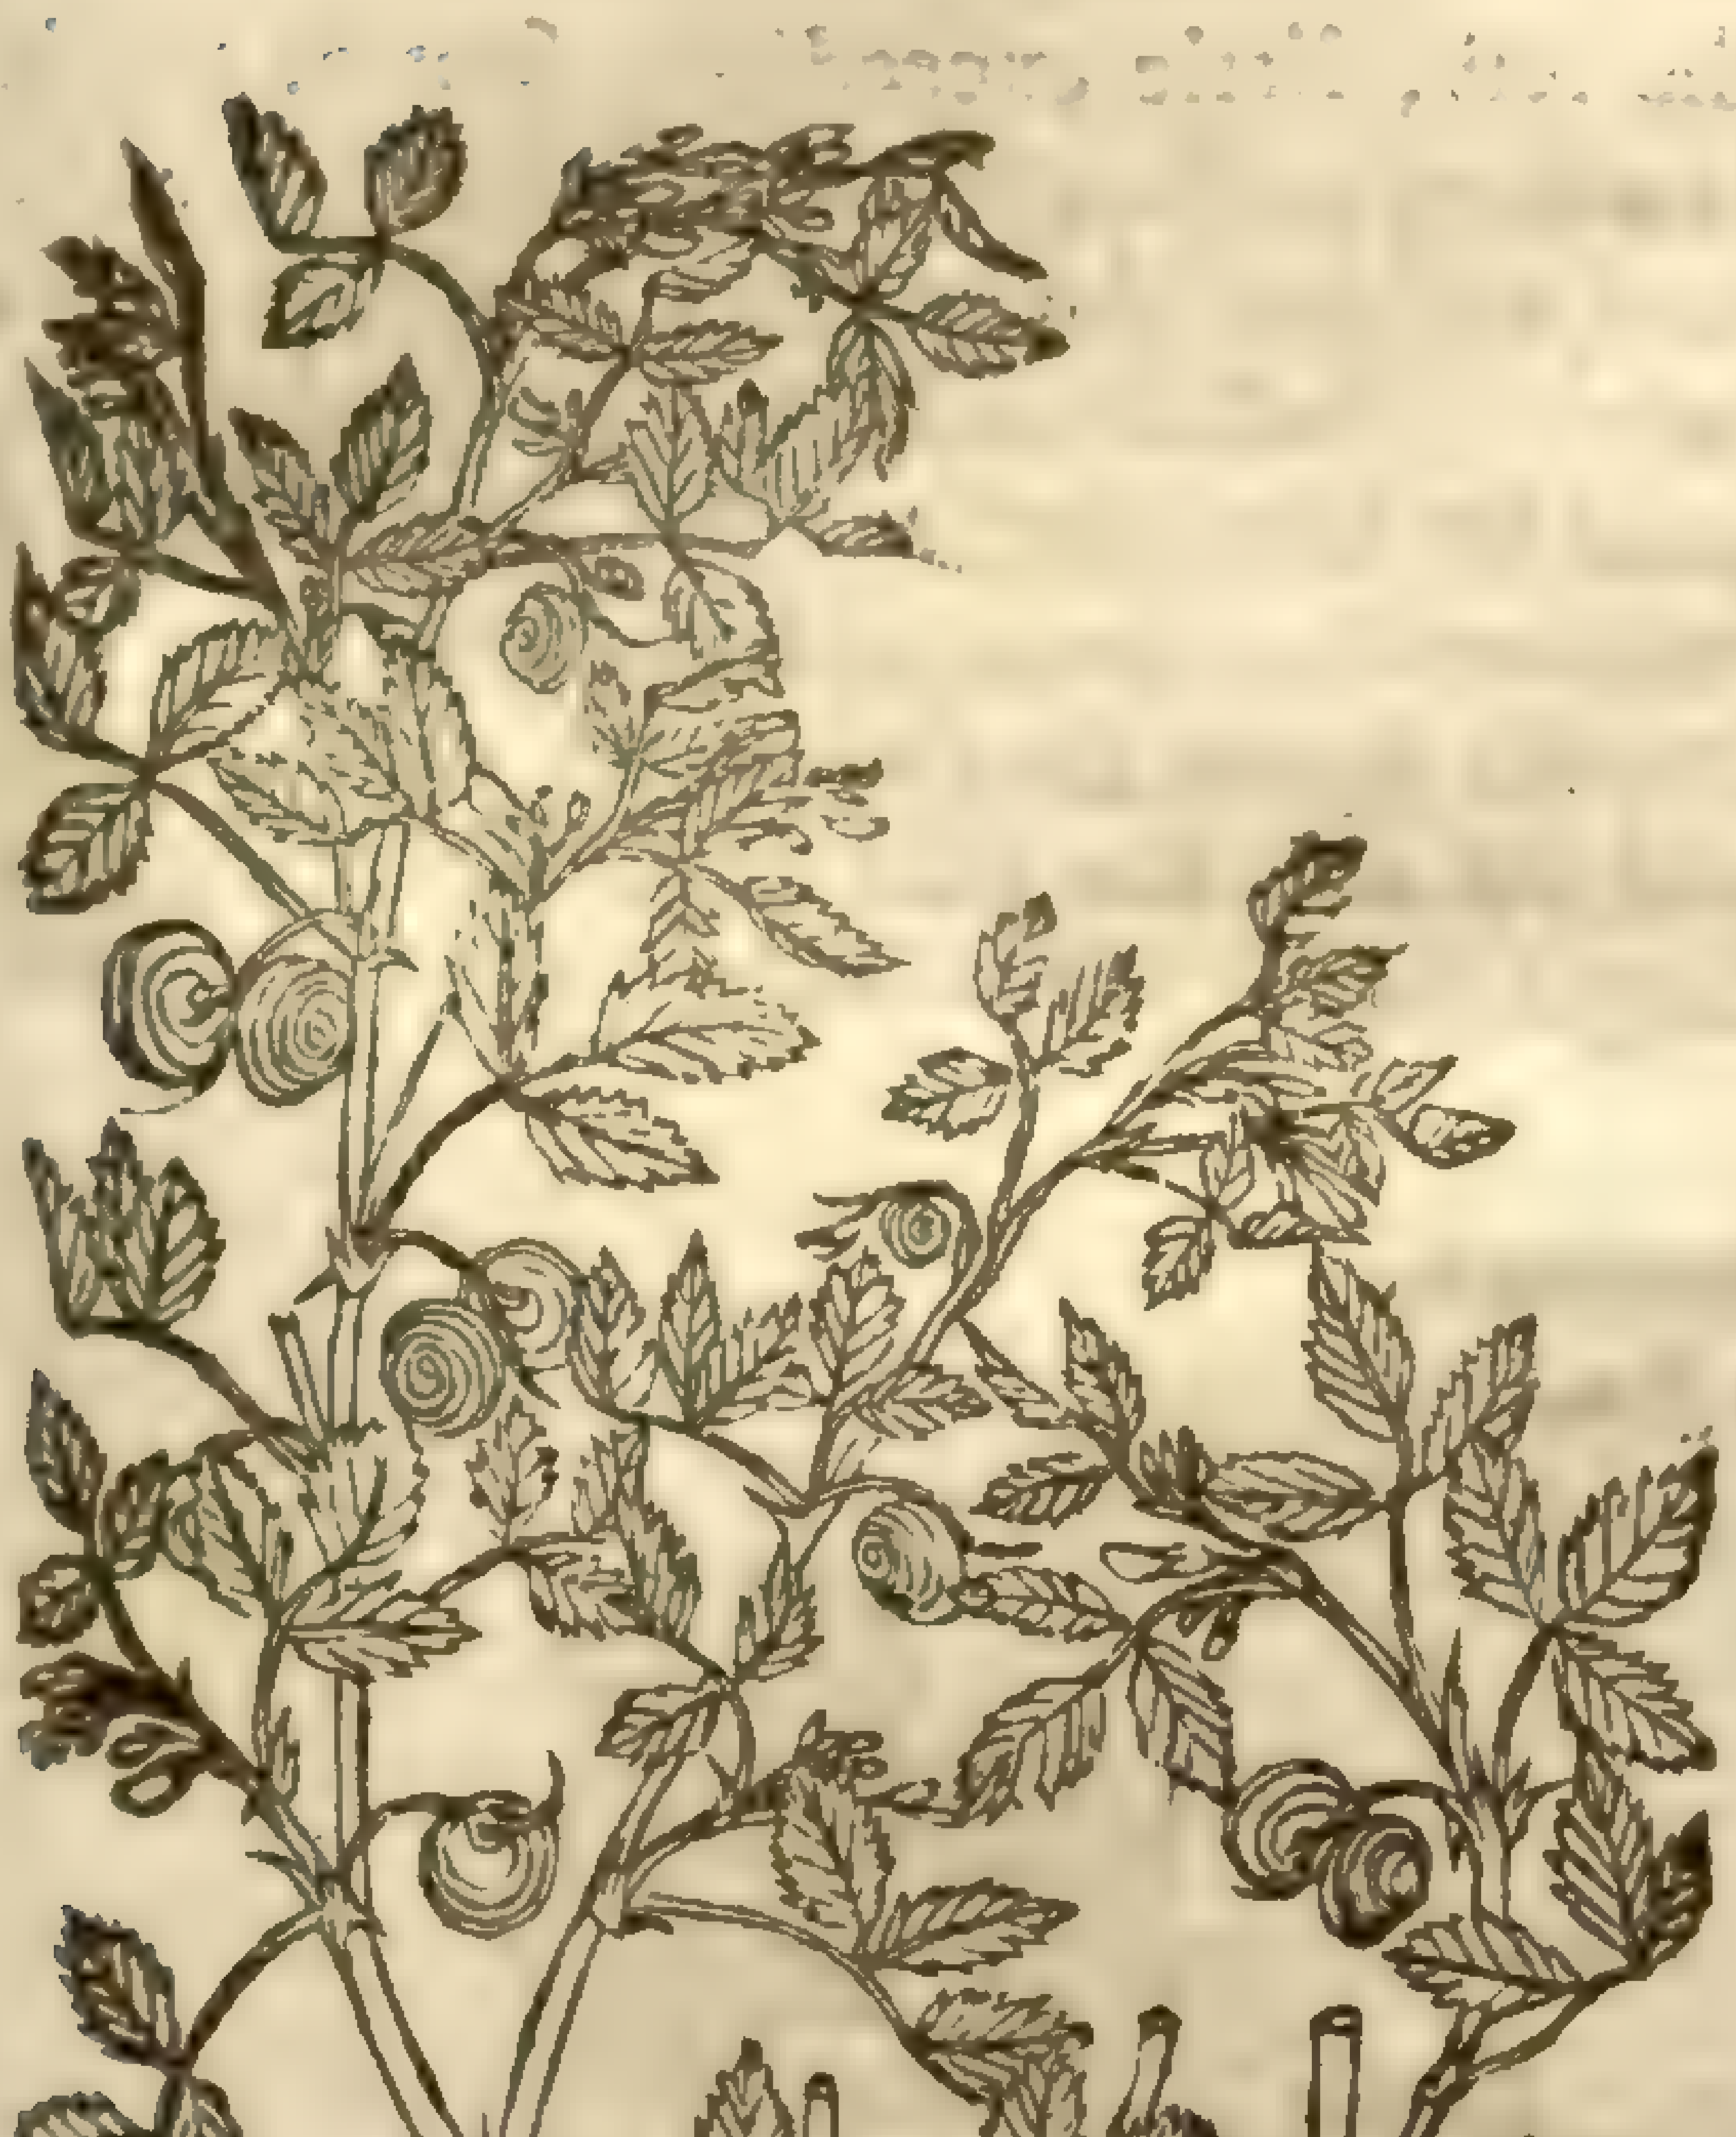
¶ *The Temperature and Vertues.*

Their faculties in working are referred vnto the medow Trefoiles: notwithſtanding it is reported, that the leaues of Purple-wort ſtamped, and the juyce giuen to drinke, cureth young children of the diſeaſe called in Engliſh the Purples. A

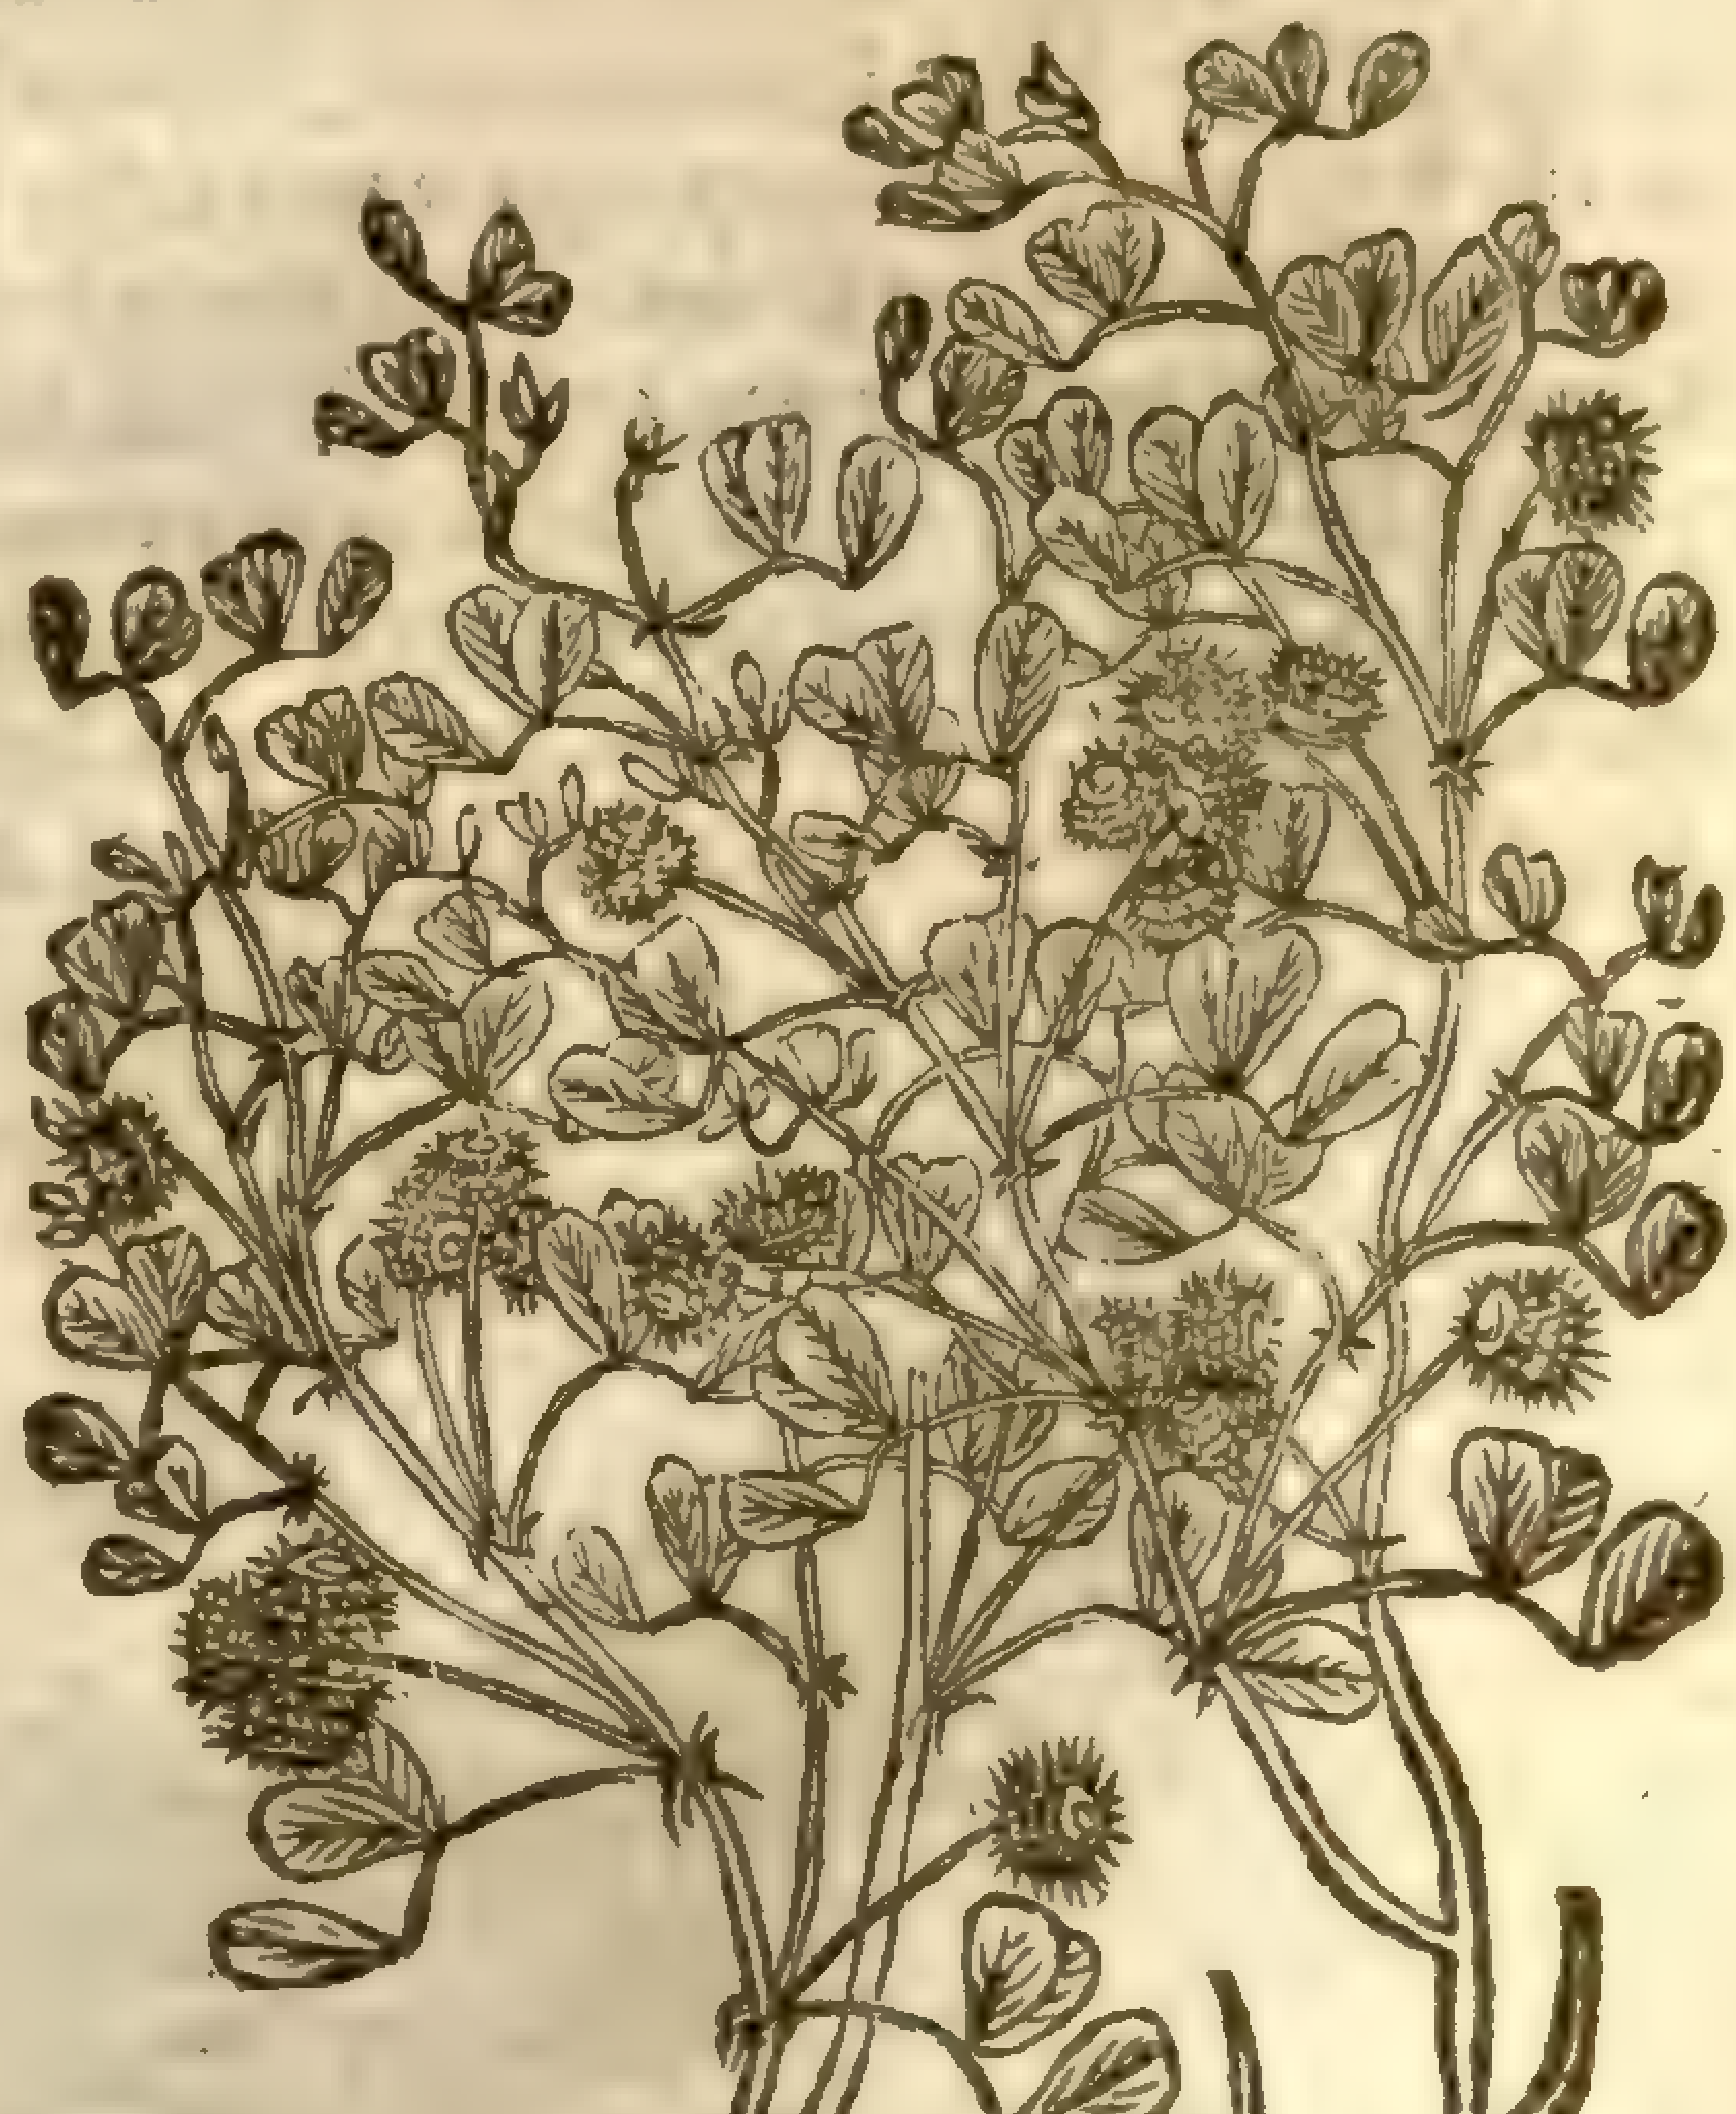
CHAP. 502. *Of Medicke Fodder, or ſnaile Clauer.*

¶ *The Deſcription.*

1 THis kinde of Trefoile, called *Medica*, hath many ſmall and ſlender ramping branches, crawling and creeping along vpon the ground, ſet full of broad leaues ſlightly indented about the edges: the flours are very ſmall, and of a pale yellow colour, which turne into round wrinkled knobs, like the water Snaile, or the fiſh called Periwinckle: wherein is contained flat ſeed faſhioned like a little kidney, in colour yellow, in taſte like a Vetch or peaſe: the root is ſmall, and dieth when the ſeed is ripe: it growes in my garden, and is good to feed cattell fat.



1 *Trefolium Cochleatum.*
Medicke Fodder.



‡ 2 *Medica fructu cochleato ſpinoſo.*
Prickly Snaile Trefoile.

‡ There are many varieties of theſe plants, and they chiefely conſiſt in the fruit; for ſome are ſmooth and flat, as this firſt deſcribed: other ſome are rough and prickly, ſome with leſſer, and

otherſome with bigger prickles; as alſo with them ſtanding diuers waies, ſome are onely rough, and of thoſe, ſome are as big as a ſmall nut, otherſome no bigger then a peaſe. I giue you here the deſcriptions of three rough ones (as I receiued them from Mr. *Goodyer*) whereof the laſt is of the ſea, which, as you may ſee, our Author did but ſuperficially deſcribe.

2 *Medicæ majoris Baticæ ſpecies prima, ſpinulis intortis.*

Medicago [illegible]

This hath foure ſquare reddiſh ſtreaked hairy trailing branches, like the ſmall Engliſh *Medica*, greater and longer, foure or fiue foot long: the leaues are alſo ſmooth, growing three together, neither ſharpe pointed, nor yet ſo broad at the top as the ſaid Engliſh Medica, but blunt topped, with a ſmall blacke ſpot in the midſt, not crooked: the floures are alſo yellow, three, foure, or fiue on a foot-ſtalke: after commeth a round writhed fruit fully as big as a haſell nut, with ſmall prickles not ſtanding fore-right, but lying flat on the fruit, finely wrapped, plaited, folded, or interlaced together, wherein lieth wrapped the ſeed in faſhion of a kidney, very like a kidney beane, but foure times ſmaller, and flatter, of a ſhining blacke colour without, like poliſhed Ieat; containing a white kernell within: the root is like the former, and periſheth alſo at Winter.

Medicæ majoris Baticæ ſpinoſæ ſpecies altera.

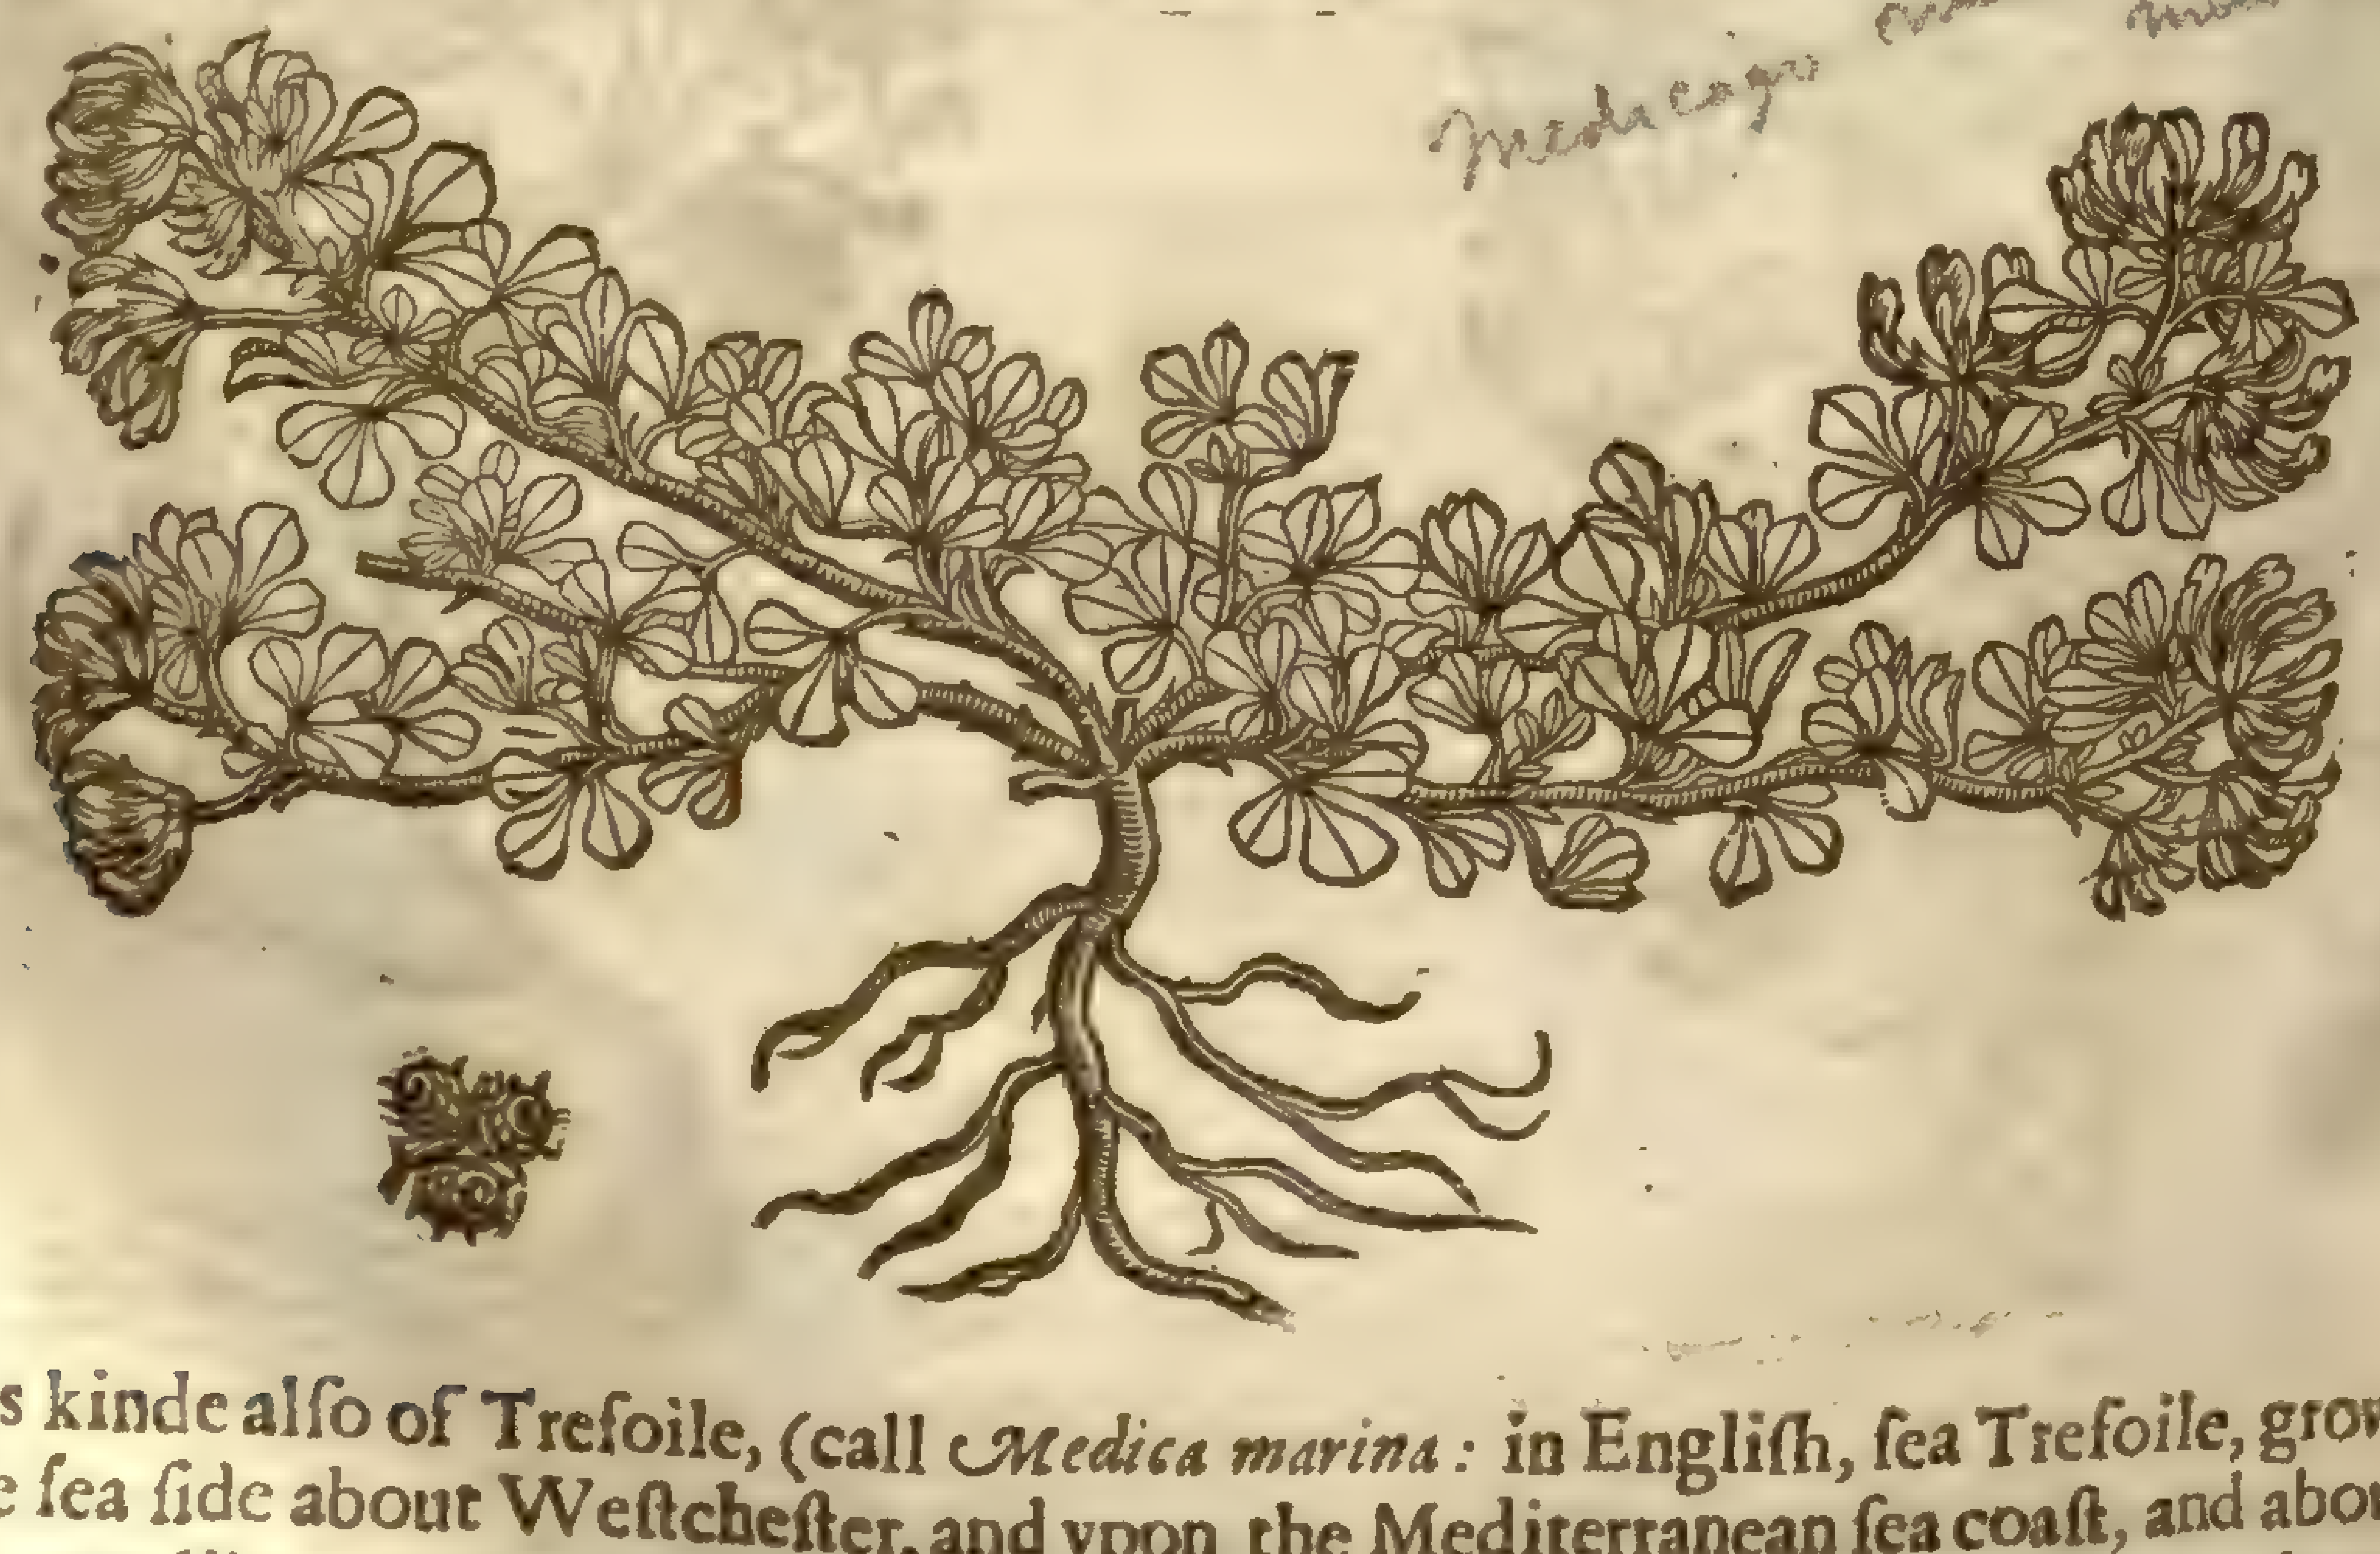
The branches alſo creepe on the ground, and are ſtraked, ſmooth, foure-ſquare, reddiſh here and there, three or foure foot long: the leaues are ſmooth, finely notched about the edges, ſharpe pointed, without blacke ſpots, very like *Medica pericarpio plana*: the floures are ſmall and yellow like the other: the fruit is round, writhed or twined in alſo, fully as big as a haſell nut, ſomewhat cottonie or woolly, with ſhort ſharpe prickles: wherein lyeth alſo wrapped a ſhining blacke kidney-like ſeed, ſo like the laſt deſcribed, that they are not to be diſcerned apart: the root is alſo alike, and periſheth at Winter.

Medicæ marinæ ſpinoſæ ſpecies.

The branches of this are the leaſt and ſhorteſt of all the reſt, little exceeding a foot or two in length, and are foure ſquare, greene, ſomewhat hairy, and trailing on the ground: the leaues are like to thoſe of *Medica pericarpio plano*, not fully ſo ſharpe pointed, without blacke ſpots, ſoft, hairy, three on a foot-ſtalke: the floures grow alongſt the branches, on very ſmall foot-ſtalkes, forth of the boſomes of the leaues, (not altogether on or neere the tops of the branches) and are very ſmall and yellow, but one on a foot-ſtalke: after commeth ſmall round writhed fruit, no bigger than a peaſe, with very ſhort ſharpe prickles, wherein is contained yellowiſh ſeed of the faſhion of a kidney like the former, and is the hardeſt to be plucked forth of any of the reſt: the root is alſo whitiſh like the roots of the other, and alſo periſheth at Winter. Aug. 2. 1621. *Iohn Goodyer.* ‡

3 *Trifolium Cochleatum marinum.*
Medick Fodder of the ſea.

Medicago marina L. [illegible]



3 This kinde alſo of Trefoile, (call *Medica marina*: in Engliſh, ſea Trefoile, growing naturally by the ſea ſide about Weſtcheſter, and vpon the Mediterranean ſea coaſt, and about Venice) hath leaues very like vnto the common medow Trefoile, but thicker, and couered ouer with a

flockie hoarineſſe like *Gnaphalium*, after the manner of moſt of the ſea herbes: the floures are yellow: the ſeeds wrinkled like the former, but in quantitie they be leſſer.

¶ *The Place.*

The firſt is ſowne in the fields of Germany, Italy, and other countries, to feed their cattell, as we in England doe Bucke-wheat: wee haue a ſmall quantity thereof in our Gardens, for pleaſures ſake.

The third groweth neere vnto the ſea ſide in diuers places.

¶ *The Time.*

Medica muſt be ſowne in Aprill; it floureth in Iune and Iuly: the fruit is ripe in the end of Auguſt.

¶ *The Names.*

Medick fodder is called of ſome *Trifolium Cochleatum*, and *Medica*: in French, *L'herbe à Limaſſon*: in Greeke, Μηδική: in Spaniſh, *Mielguas*: of the Valentians and Catalons, *Alfafa*, by a word either barbarous or Arabicke: for the chiefe of the Arabian writers, *Avicen*, doth call *Medica*, *Cot*, *Alaſeleti*, and *Alfasfaſa*.

The other is called Sea Clauer, and Medick fodder of the ſea.

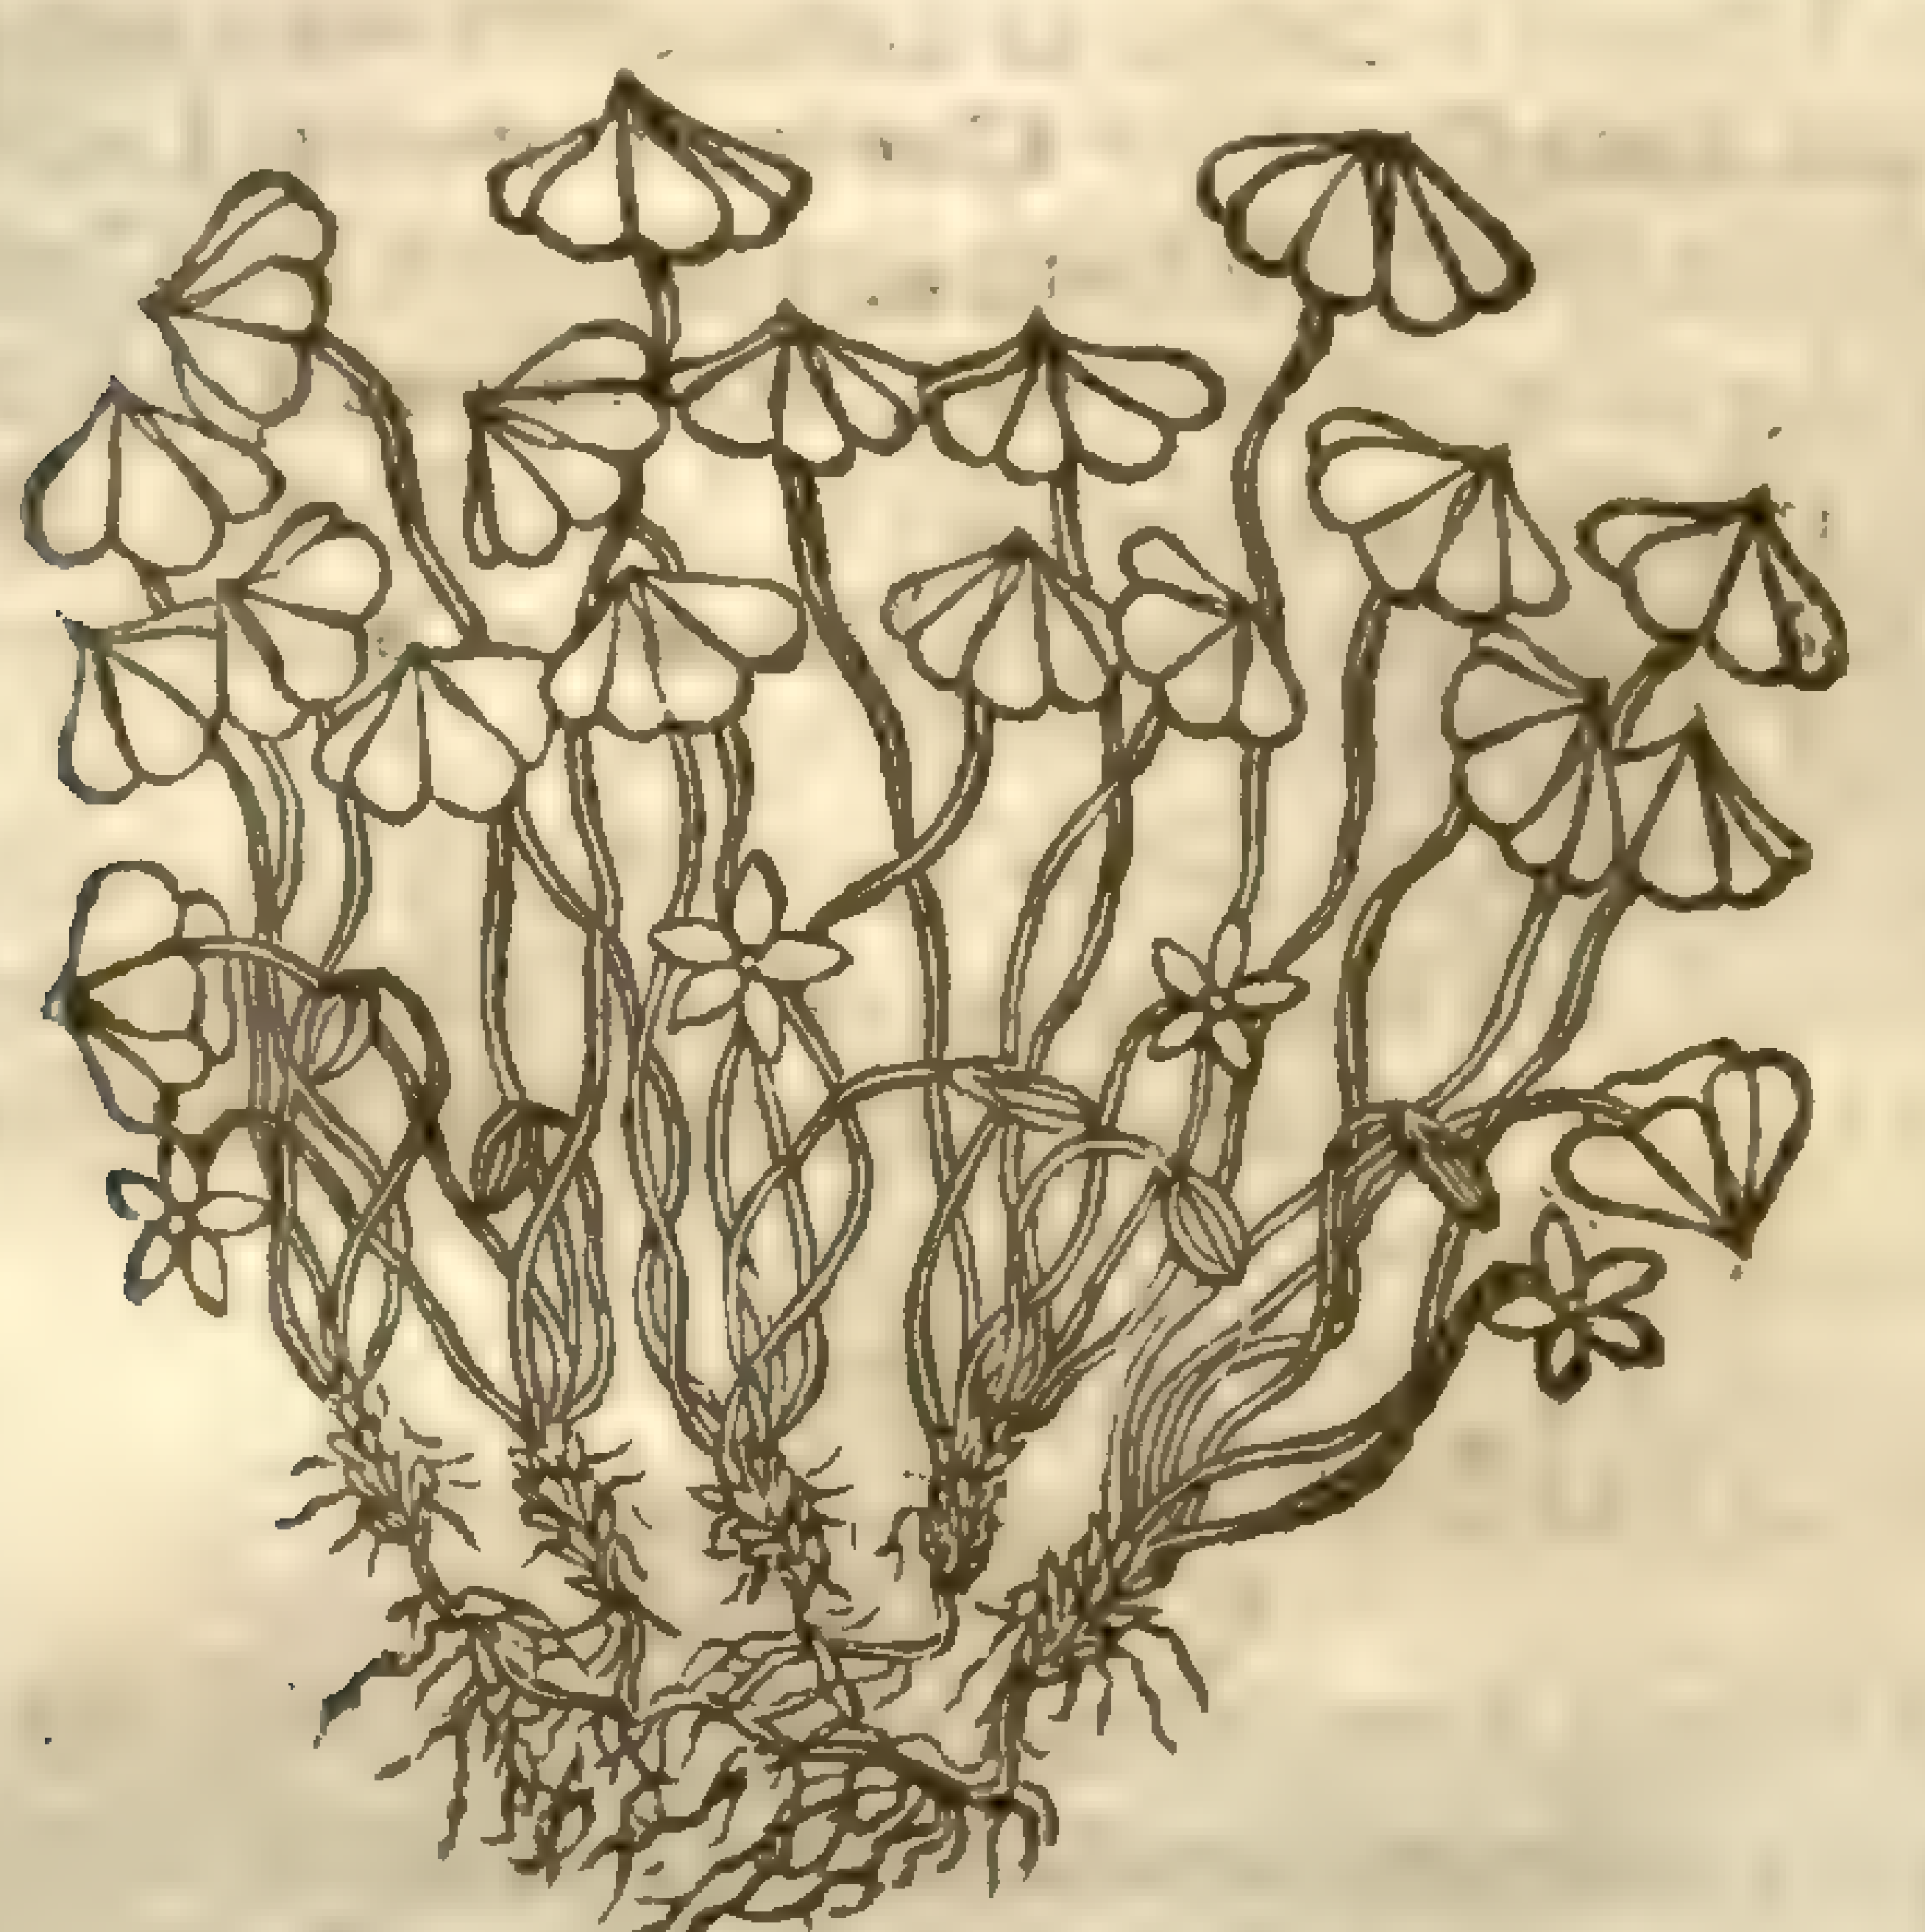
¶ *The Temperature and Vertues.*

A Medick Fodder is of temperature cold, for which cauſe it is applied greene to ſuch inflammations and infirmities as haue need of cooling.

Chap. 503. *Of Wood Sorrell, or Stubwort.*

1 *Oxys alba.*
White Wood Sorrell.

Oxalis acetosella, L.
[illegible]
Sm. fl. 2. 322



¶ *The Deſcription.*

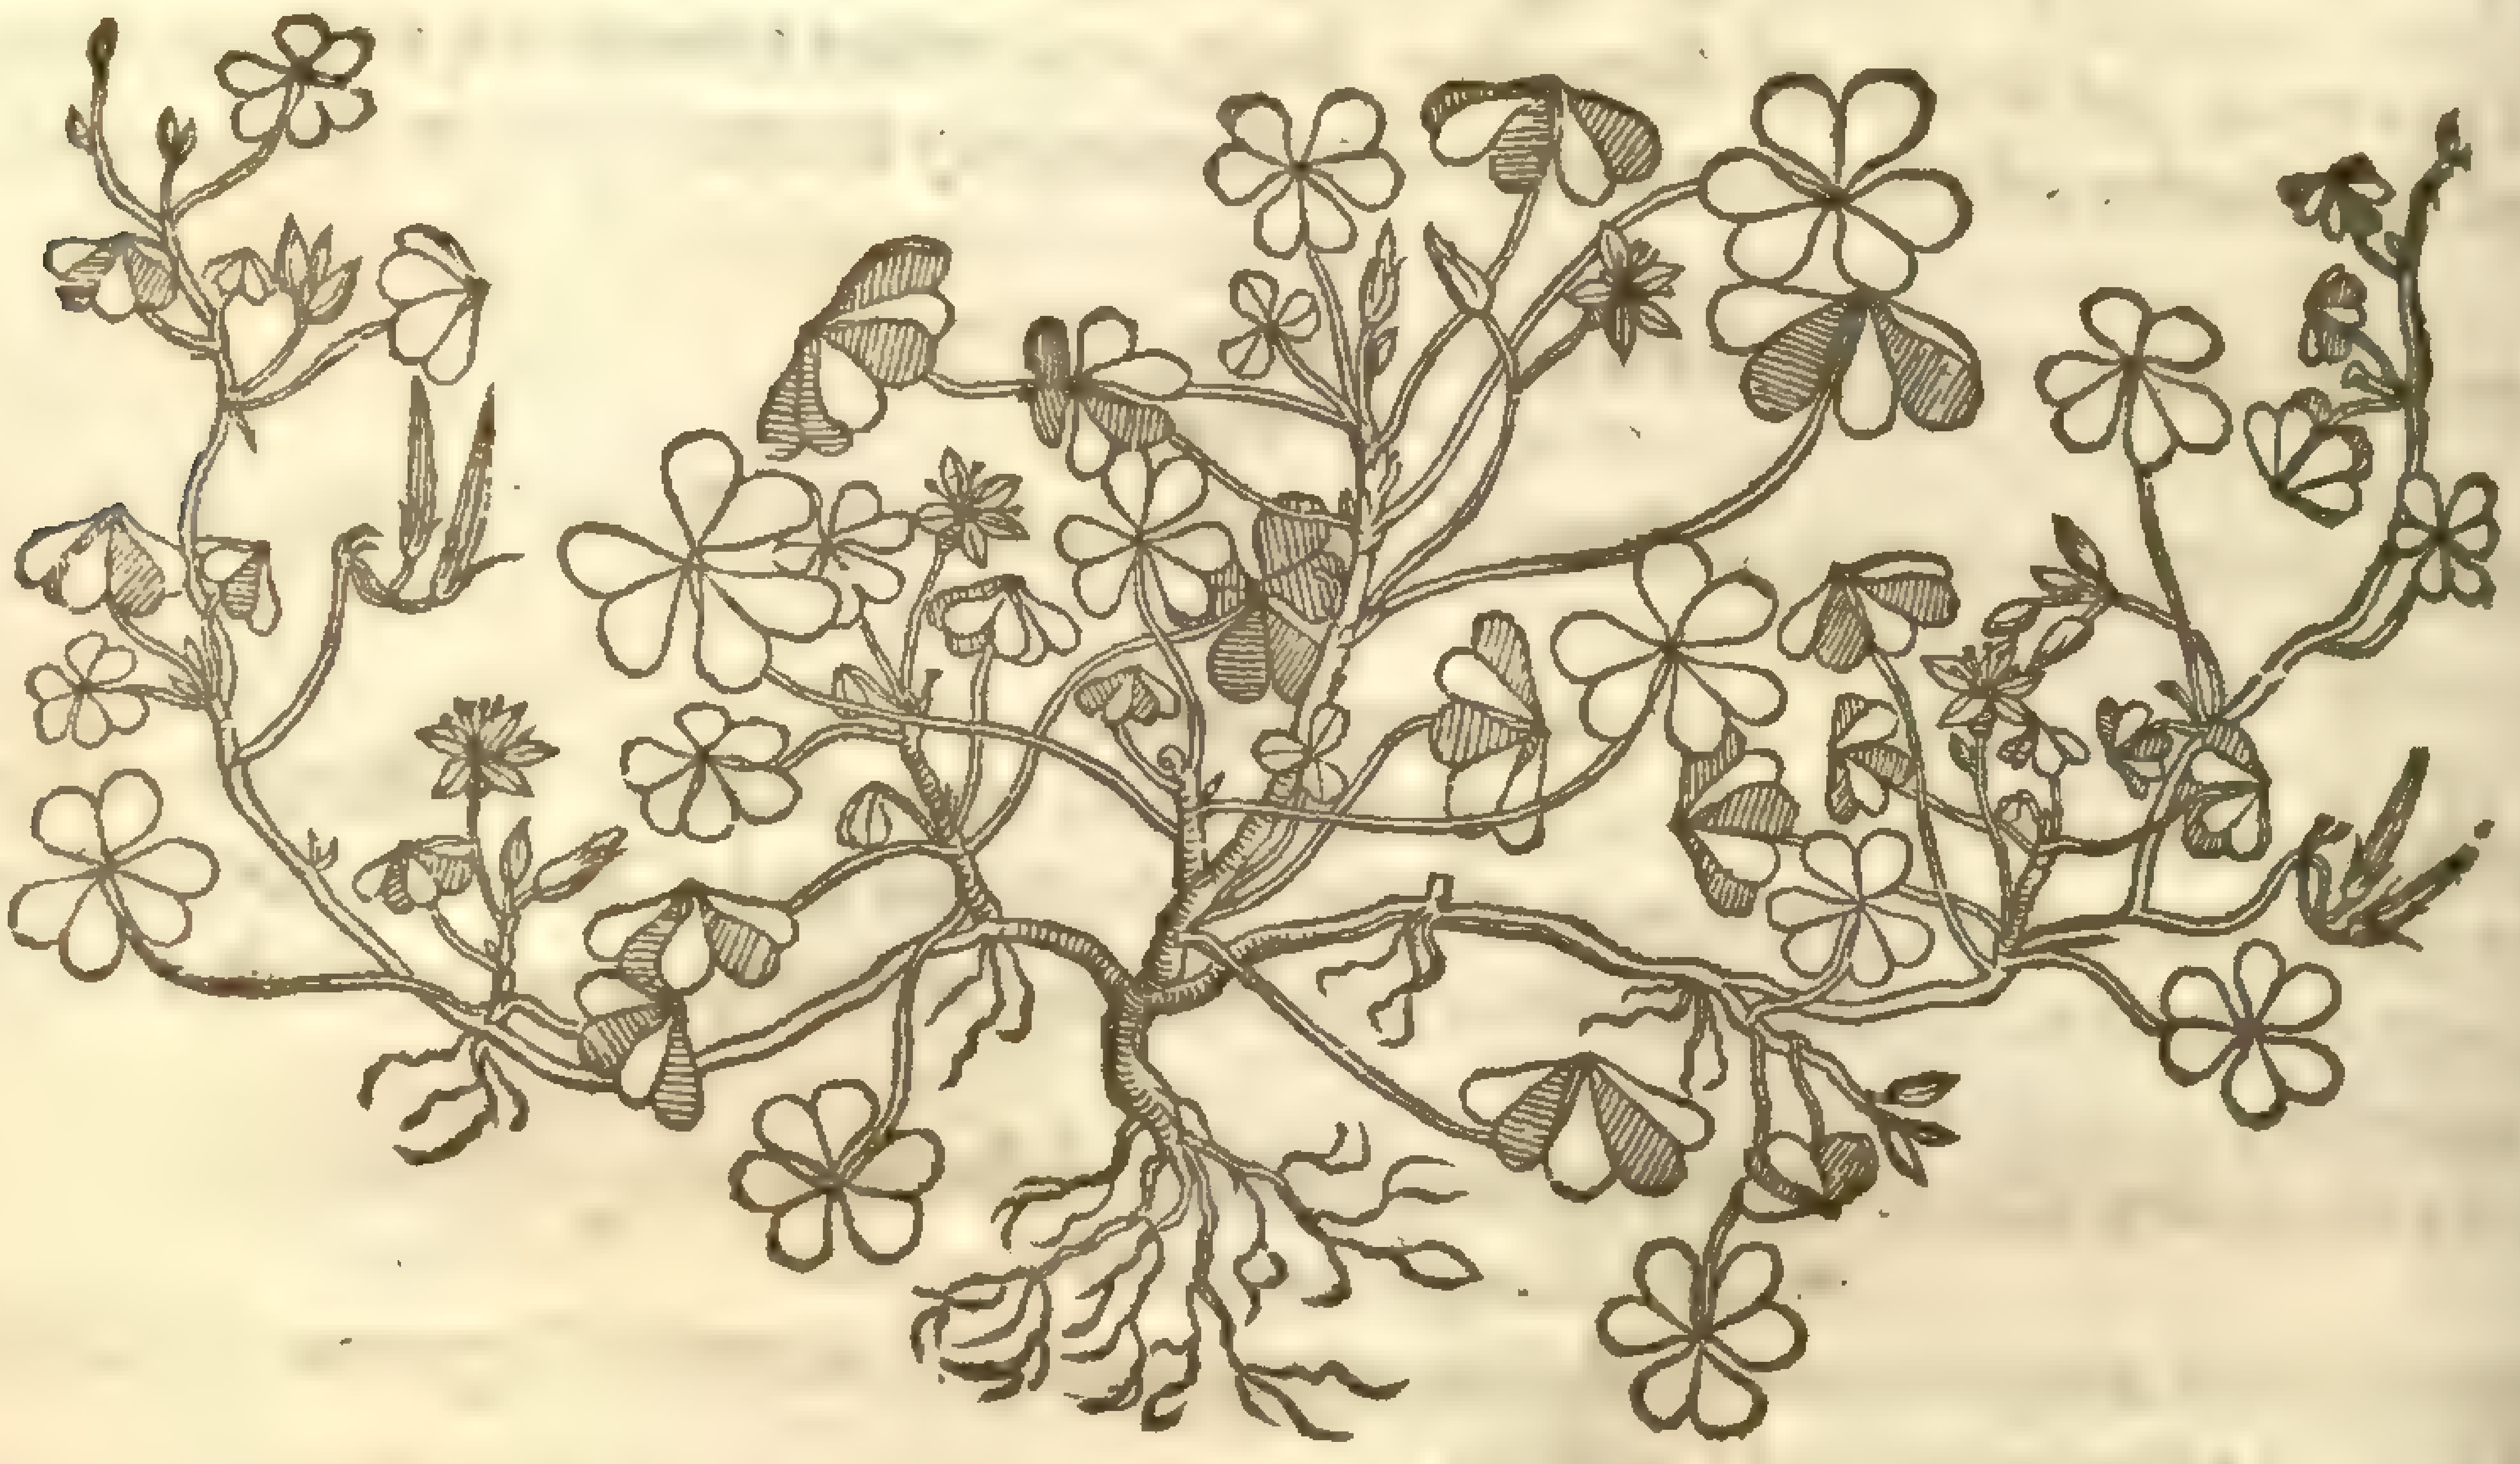
1 Oxys *Pliniana*, or *Trifolium acetoſum*, being a kinde of three leafed graſſe, is a low and baſe herbe without ſtalke; the leaues immediately riſing from the root vpon ſhort ſtemmes at their firſt comming forth folded together, but afterward they do ſpred abroad, and are of a faire light greene colour, in number three, like the reſt of the Trefoiles; but that each leafe, hath a deep cleft or rift in the middle: among theſe leaues come vp ſmall and weake tender ſtems, ſuch as the leaues do grow vpon, which beare ſmall ſtarre-like floures of a white colour, with ſome brightnes of carnation daſht ouer the ſame: the floure conſiſteth of fiue ſmall leaues; after which come little round knaps or huskes full of yellowiſh ſeed: the root is very threddy, and of a reddiſh colour: the whole herbe is in taſte like Sorrell, but much ſharper and quicker, and maketh better greene ſauce than any other herbe or Sorrell whatſoeuer.

‡ My oftmentioned friend M^{r}. *George Bowles* ſent me ſome plants of this with very faire redde floures, which hee gathered in Aprill laſt, in a wood of Sir *Thomas Walſinghams* at Chiſſelhurſt in Kent, called Stockwell wood, and in a little round wood thereto adjoyning. ‡

The ſecond kinde of *Oxys* or Wood Sorrell is very like the former, ſauing that the floures are

of

2 *Oxys lutea.*
Yellow Wood Sollell.



Oxalis corniculata
Sm. Fl. 2. 324

of a yellow colour, and yeeld for their ſeed veſſels ſmall and long horned cods; in other reſpects alike.

¶ *The Place.*

Theſe plants grow in woods and vnder buſhes, in ſandie and ſhadowie places in euery countrey. ‡ I haue not as yet found any of the yellow growing with vs. ‡

¶ *The Time.*

They floure from the beginning of Aprill vnto the end of May and midſt of Iune.

¶ *The Names.*

Wood Sorrell or Cuckow Sorrell is called in Latine *Trifolium acetoſum*: the Apothecaries and Herbariſts call it *Alleluya*, and *Panis Cuculi*, or Cuckowes meate, becauſe either the Cuckow feedeth thereon or by reaſon when it ſpringeth forth and floureth the Cuckow ſingeth moſt, at which time alſo *Alleluya* was wont to be ſung in Churches. *Hieronymus Fracaſtorius* nameth it *Lujula*. *Alexander Benedictus* ſaith that it is called *Alimonia*: in high Dutch, **Saurelklee**: in low Dutch, **Coeckcoecxbroot**: in French, *Pain de Cocu*: in Engliſh, wood Sorrell, wood Sower, Sower Trefoile, Stubwort, Alleluia, and Sorrell du Bois.

It is thought to be that which *Pliny*, *lib.* 27. *cap.* 12. calleth *Oxys*; writing thus: *Oxys* is three leafed, it is good for a feeble ſtomack, and is alſo eaten of thoſe that are burſten. But *Galen* in his fourth booke of Simples ſaith, that *Oxys* is the ſame which *Oxalis* or Sorrell is: and *Oxys* is found in *Pliny* to be alſo *Iunci ſpecies*, or a kinde of Ruſh.

¶ *The Temperature.*

Theſe herbes are cold and dry like Sorrell.

¶ *The Vertues.*

A Sorrell du Bois or Wood Sorrell ſtamped and vſed for greene ſauce, is good for them that haue ſicke and feeble ſtomackes; for it ſtrengthneth the ſtomacke, procureth appetite, and of all Sorrell ſauces is the beſt, not onely in vertue, but alſo in the pleaſantneſſe of his taſte.

B It is a remedy againſt putrified and ſtinking vlcers of the mouth, it quencheth thirſt, and cooleth mightily any hot peſtilentiall feuer, eſpecially being made with a ſyrrup of ſugar.

Chap. 504. *Of noble Liuer-wort, or golden Trefoile.*

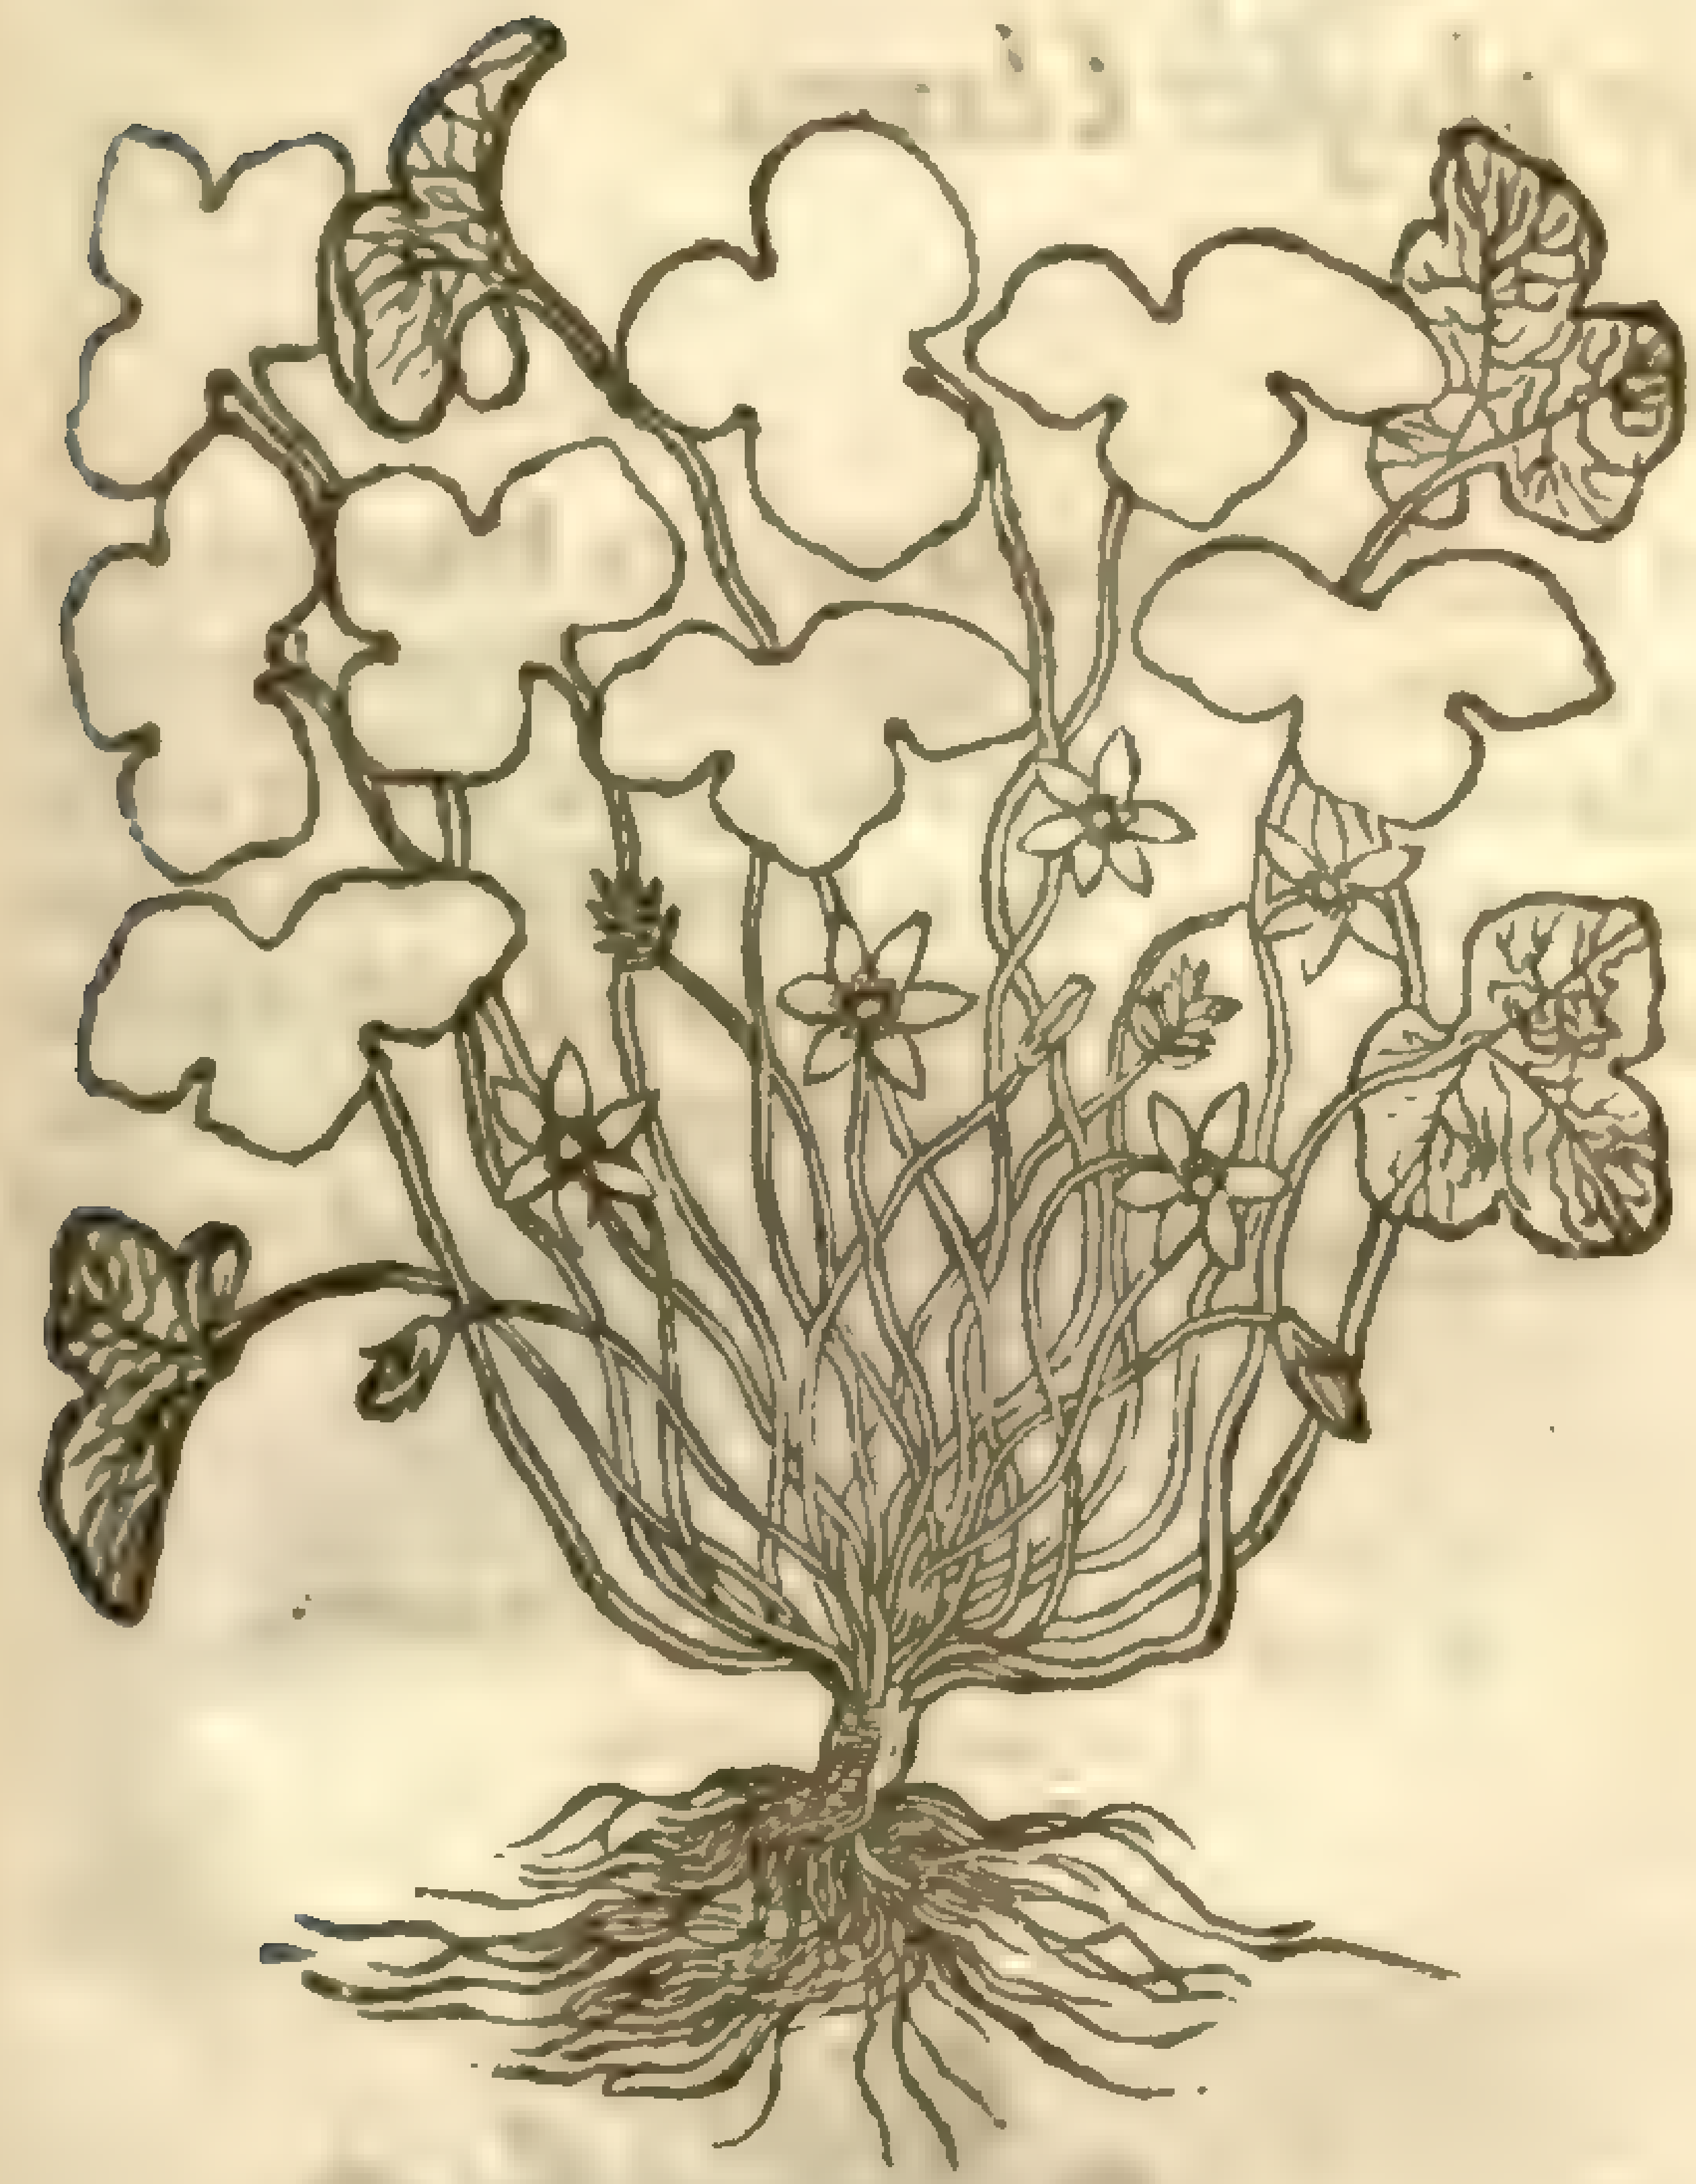
¶ *The Deſcription.*

1 Noble Liuerwort hath many leaues ſpred vpon the ground, three cornered, reſembling the three leafed graſſe, of a perfect graſſe greene colour on the vpper ſide, but grayiſh vnderneath: among which riſe vp diuers ſmall tender foot-ſtalks of three inches long, on the ends whereof ſtands one ſmall ſingle blew floure, conſiſting of ſix little leaues, hauing in the middle a few white chiues: the ſeed is incloſed in little round knaps, of a whitiſh colour; which being ripe do ſtart forth of themſelues: the root is ſlender, compoſed of an infinite number of blacke ſtrings.

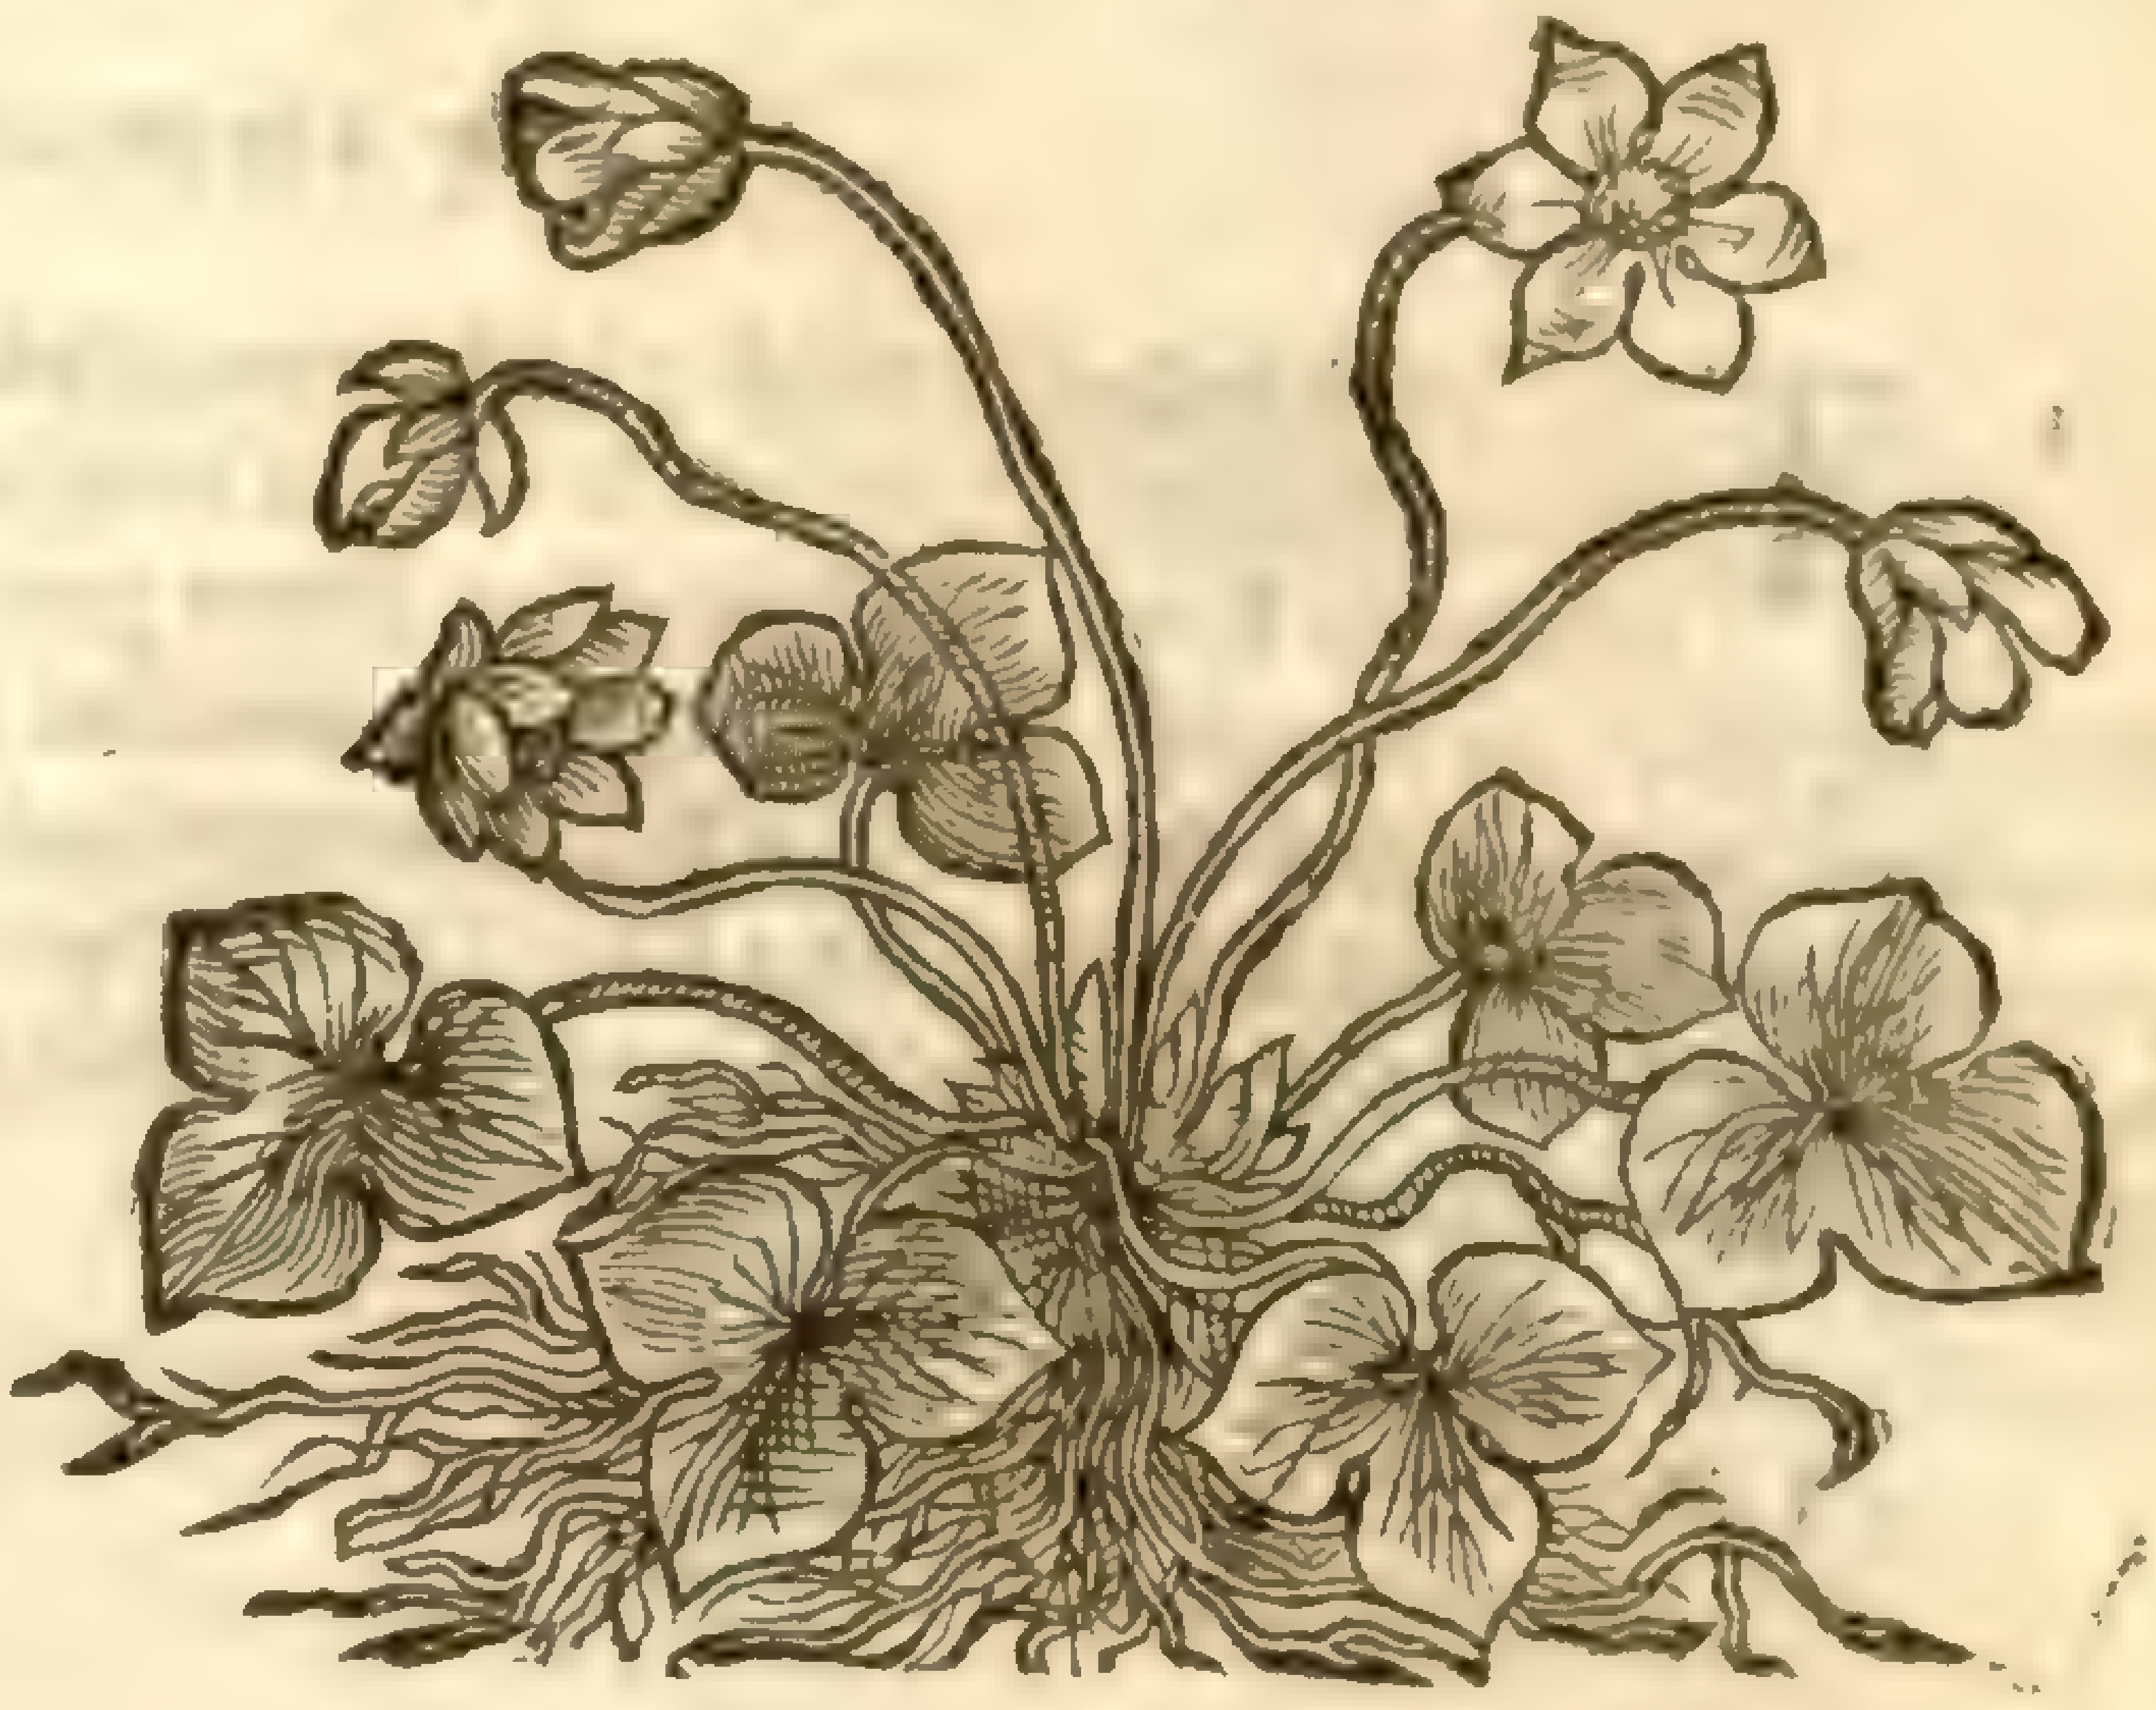
2 The ſecond is like vnto the precedent in leaues, roots, and ſeeds: the floures hereof are of a ſhining red colour, wherein conſiſteth the difference.

This ſtrange three leaued Liuerwort differeth not from the former, ſauing that this brings forth double blew floures tending to purple, and the other not ſo.

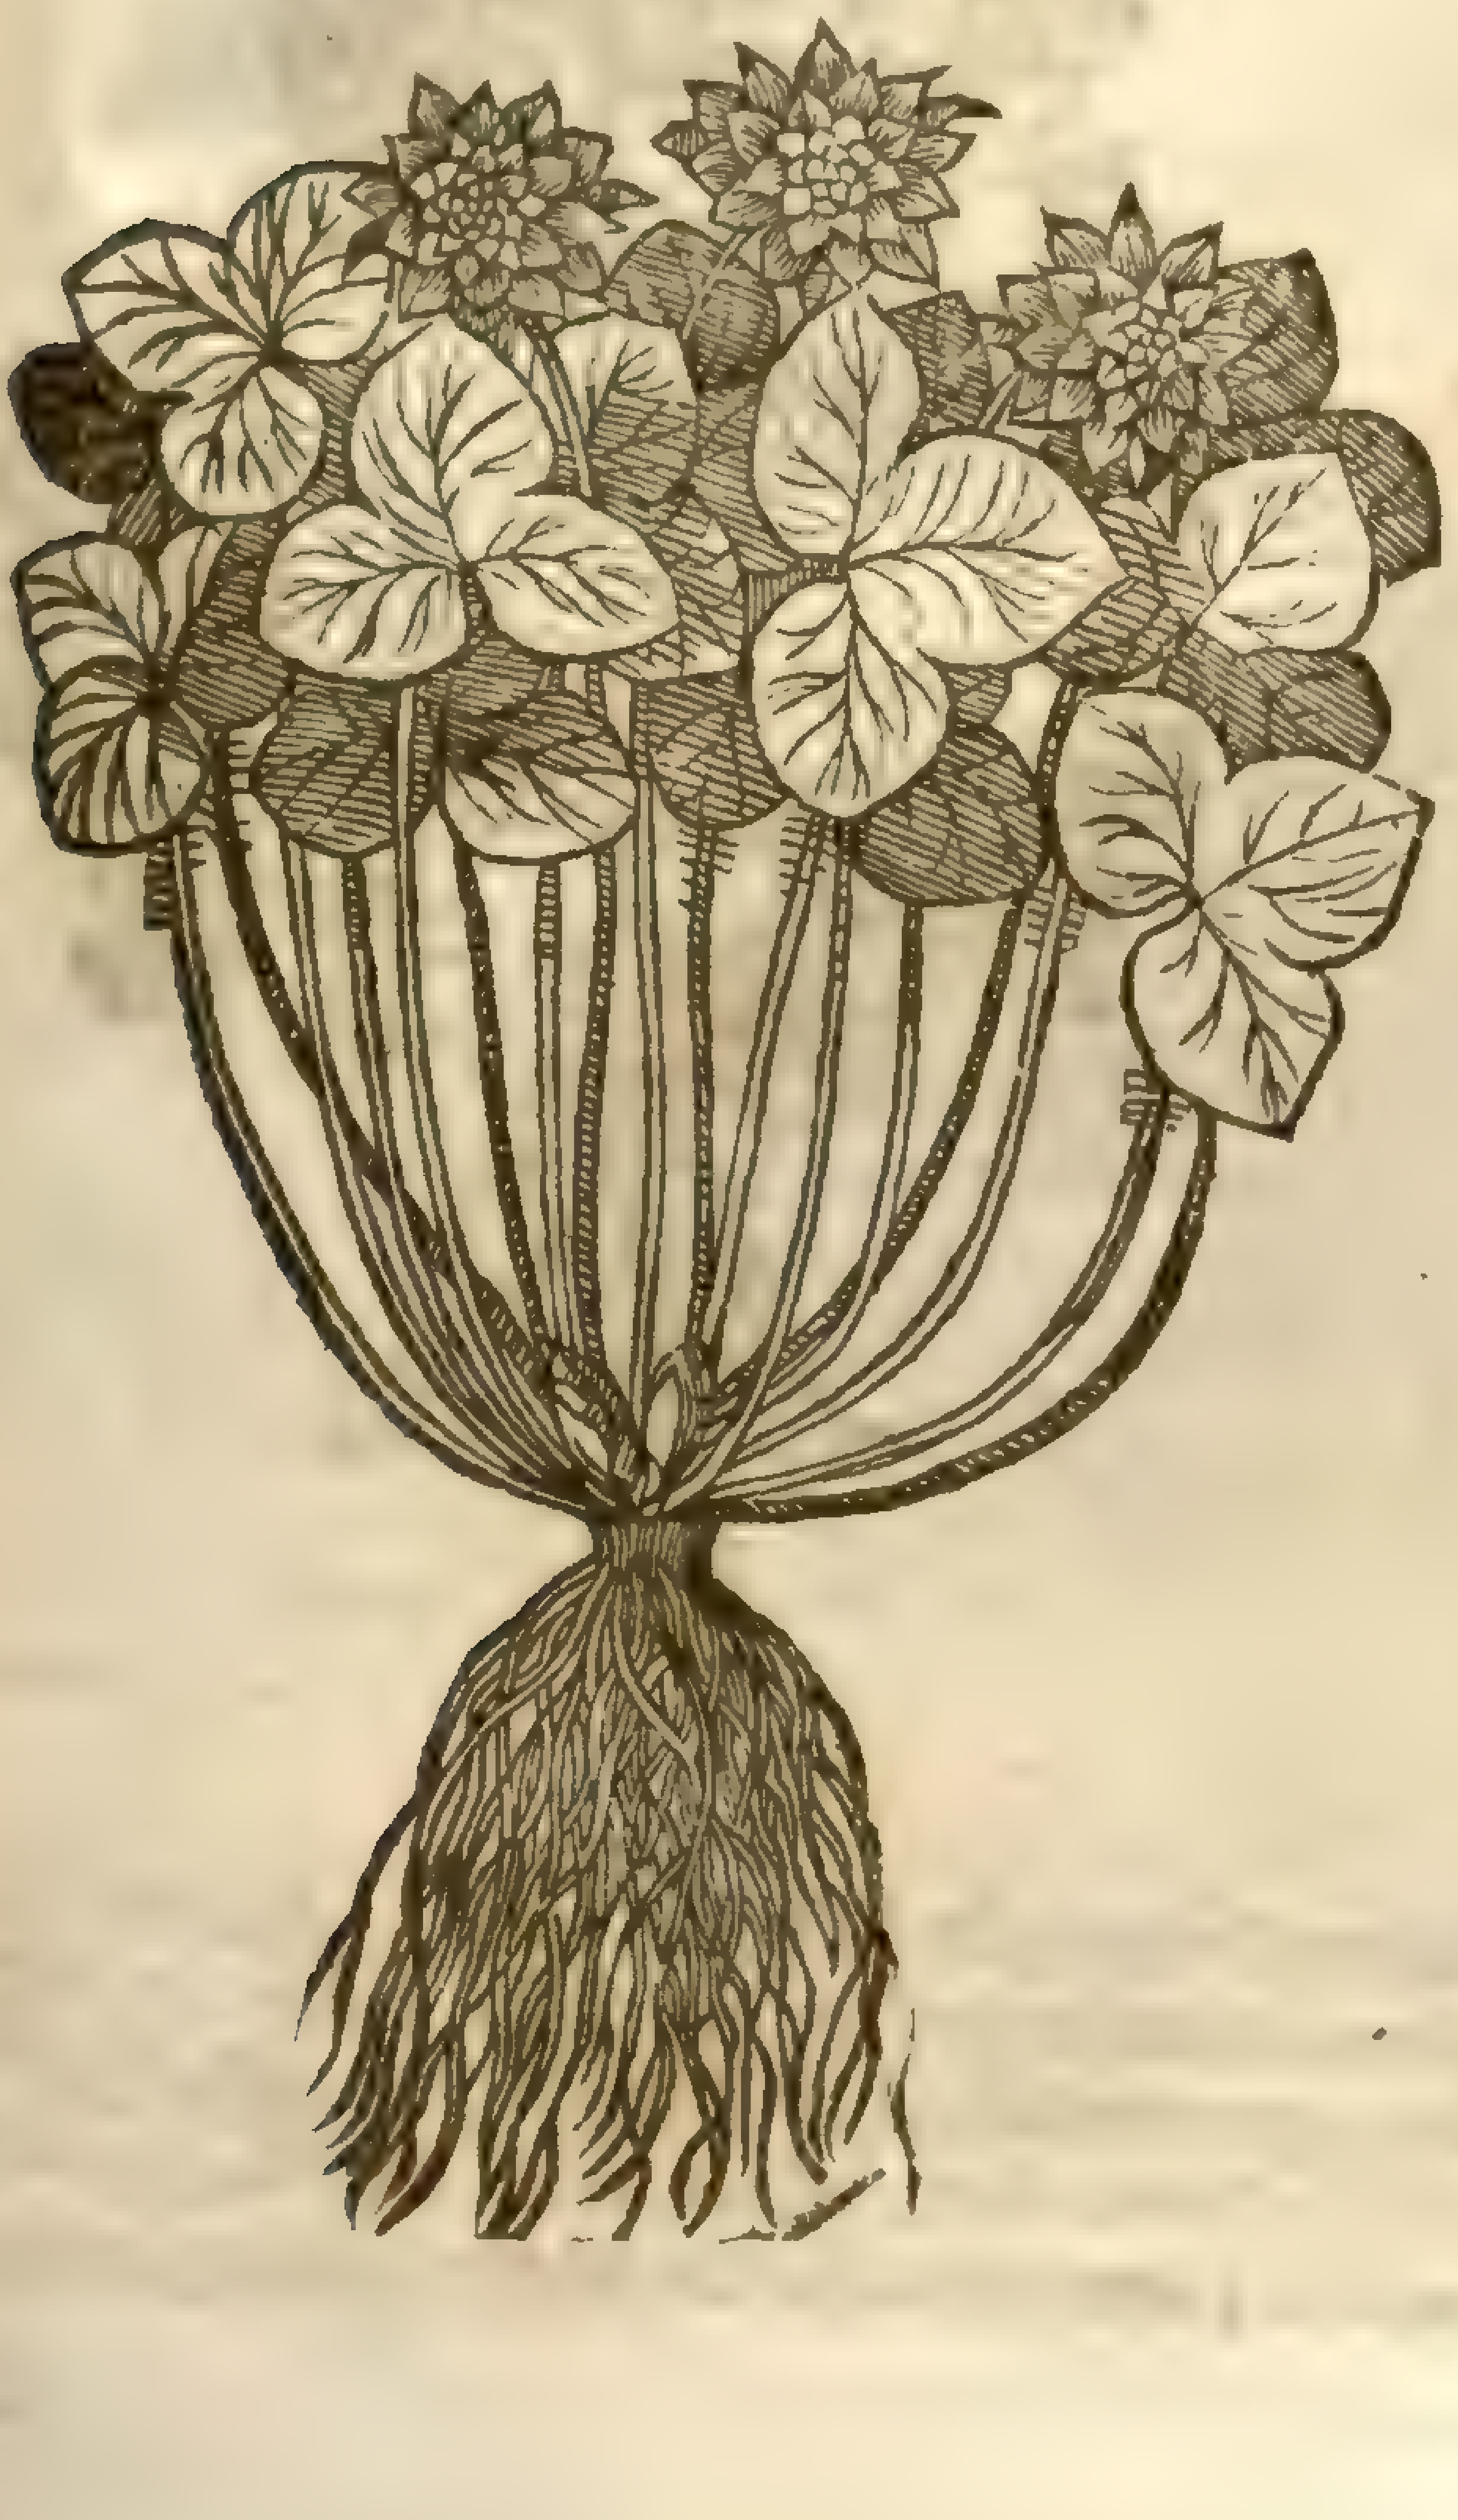
There is another in my garden with white floures, which in ſtalkes and euery other reſpect is like the others.



1 *Hepaticum trifolium.*
Noble Liuerwort.



2 *Hepatica trifolia rubra.*
Noble red Liuerwort.



3 *Hepatica multiflora Lobelij.*
Noble Liuerwort with double floures.

¶ *The Place.*

Theſe pretty floures are found in moſt places of Germanie in ſhadowie woods among ſhrubs, and alſo by highwaies ſides: in Italy likewiſe, and that not only with the blew floures, but the ſame with double floures alſo, by the report of *Alfonſus Pancius* D^{r}. of Phyſick in the Vniuerſity of Ferrara, a man excellently well ſeen in the knowledge of Simples. They do all grow likewiſe in my garden, except that with double floures, which is as yet a ſtranger in England: ‡ It is now plentifull in many gardens. ‡

¶ *The Time.*

They floure in March and April, and perfect their ſeed in May.

¶ *The Names.*

Noble Liuerwort is called *Hepatica trifolia, Hepatica aurea, Trifolium aureum:* of *Baptiſta Sardus, Herba Trinitatis:* in high Dutch, **Edel Leber kraut:** in low Dutch, **Edel leuer cruijt:** in French, *Hepatique:* in Engliſh, Golden Trefoile, three leaued Liuerwort, noble Liuerwort, and herbe Trinitie.

¶ *The Temperature.*

Theſe herbes are cold and dry, with an aſtringent or binding quality.

¶ *The*

¶ *The Time.*

Theſe herbes do floure in Iuly and Auguſt.

¶ *The Names.*

Plaiſter Clauer is called by the generall name, *Melilotus*, of ſome, *Trifolium odoratum*; yet there is another ſweet Trefoile, as hath beene declared. Some call it *Trifolium Equinum*, and *Caballinum*, or Horſe-Trefoile, by reaſon it is good fodder for horſes, who do greedily feed thereon: likewiſe *Trifolium Vrſinum*, or Beares Trefoile: of *Fuchſius*, *Saxifraga lutea*, and *Sertula Campana*: of *Cato*, *Serta Campana*, which moſt doe name *Corona Regia*: in high Durch, **Groote Steenclaueren**: of the Romanes and Hetrurians, *Tribolo*, as *Matthiolus* wtiteth: in Engliſh, Melilot, and Plaiſter-Clauer: in Yorkeſhire, Harts-Clauer.

¶ *The Temperature.*

Melilote, ſaith *Galen*, hath more plenty of hot ſubſtance then cold (that is to ſay, hot and dry in the firſt degree) it hath alſo a certaine binding quality, beſides a waſting and ripening faculty. *Dioſcorides* ſheweth, that Melilot is of a binding and mollifying quality, but the mollifying quality is not proper vnto it, but in as much as it waſteth away, and digeſteth humors gathered in hot ſwellings, or otherwiſe: for ſo far doth it mollifie or ſupple that thing which is hard, which is not properly called mollifying, but digeſting and waſting away by vapors: which kind of quality the Grecians call διαφορητική.

¶ *The Vertues.*

A Melilote boiled in ſweet wine vntill it be ſoft, if you adde thereto the yolke of a roſted egge, the meale of Fenugreeke and Lineſeed, the roots of Marſh Mallows and hogs greaſe ſtamped together, and vſed as a pultis or cataplaſme, plaiſterwiſe, doth aſſwage and ſoften all manner of ſwellings, eſpecially about the matrix, fundament and genetoires, being applied vnto thoſe places hot.

B With the juyce hereof, oile, wax, roſin and turpentine, is made a moſt ſoueraigne healing and drawing emplaiſter, called Melilote plaiſter, retaining both the colour and ſauour of the herbe, being artificially made by a ſkilfull Surgion.

C The herbe boyled in wine and drunke pronoketh vrine, breaketh the ſtone, and aſſwageth the paine of the kidnies, bladder and belly, and ripeneth flegme, and cauſeth it to be eaſily caſt forth.

D The juyce thereof dropped into the eies cleereth the ſight, conſumeth, diſſolueth, and cleane taketh away the web, pearle, and ſpot in the eies.

E Melilote alone with water healeth *Recentes melicerides*, a kinde of wens or rather apoſtems contayning matter like hony; and alſo the running vlcers of the head, if it be laied to with chalke, wine and galls.

F It likewiſe mitigateth the paine of the eares, if the juyce be dropped therein mixed with a little wine, and taketh away the paine of the head, which the Greekes call κεφαλαλγίαν, eſpecially if the head be bathed therewith, and a little vineger and oyle of Roſes mixed amongſt it.

‡ Chap. 506. *Of certaine other Trefoiles.*

‡ Thoſe Trefoiles being omitted by our Author, I haue thought good to put into a chapter by themſelues, though they haue little affinity one with another, the two laſt excepted.

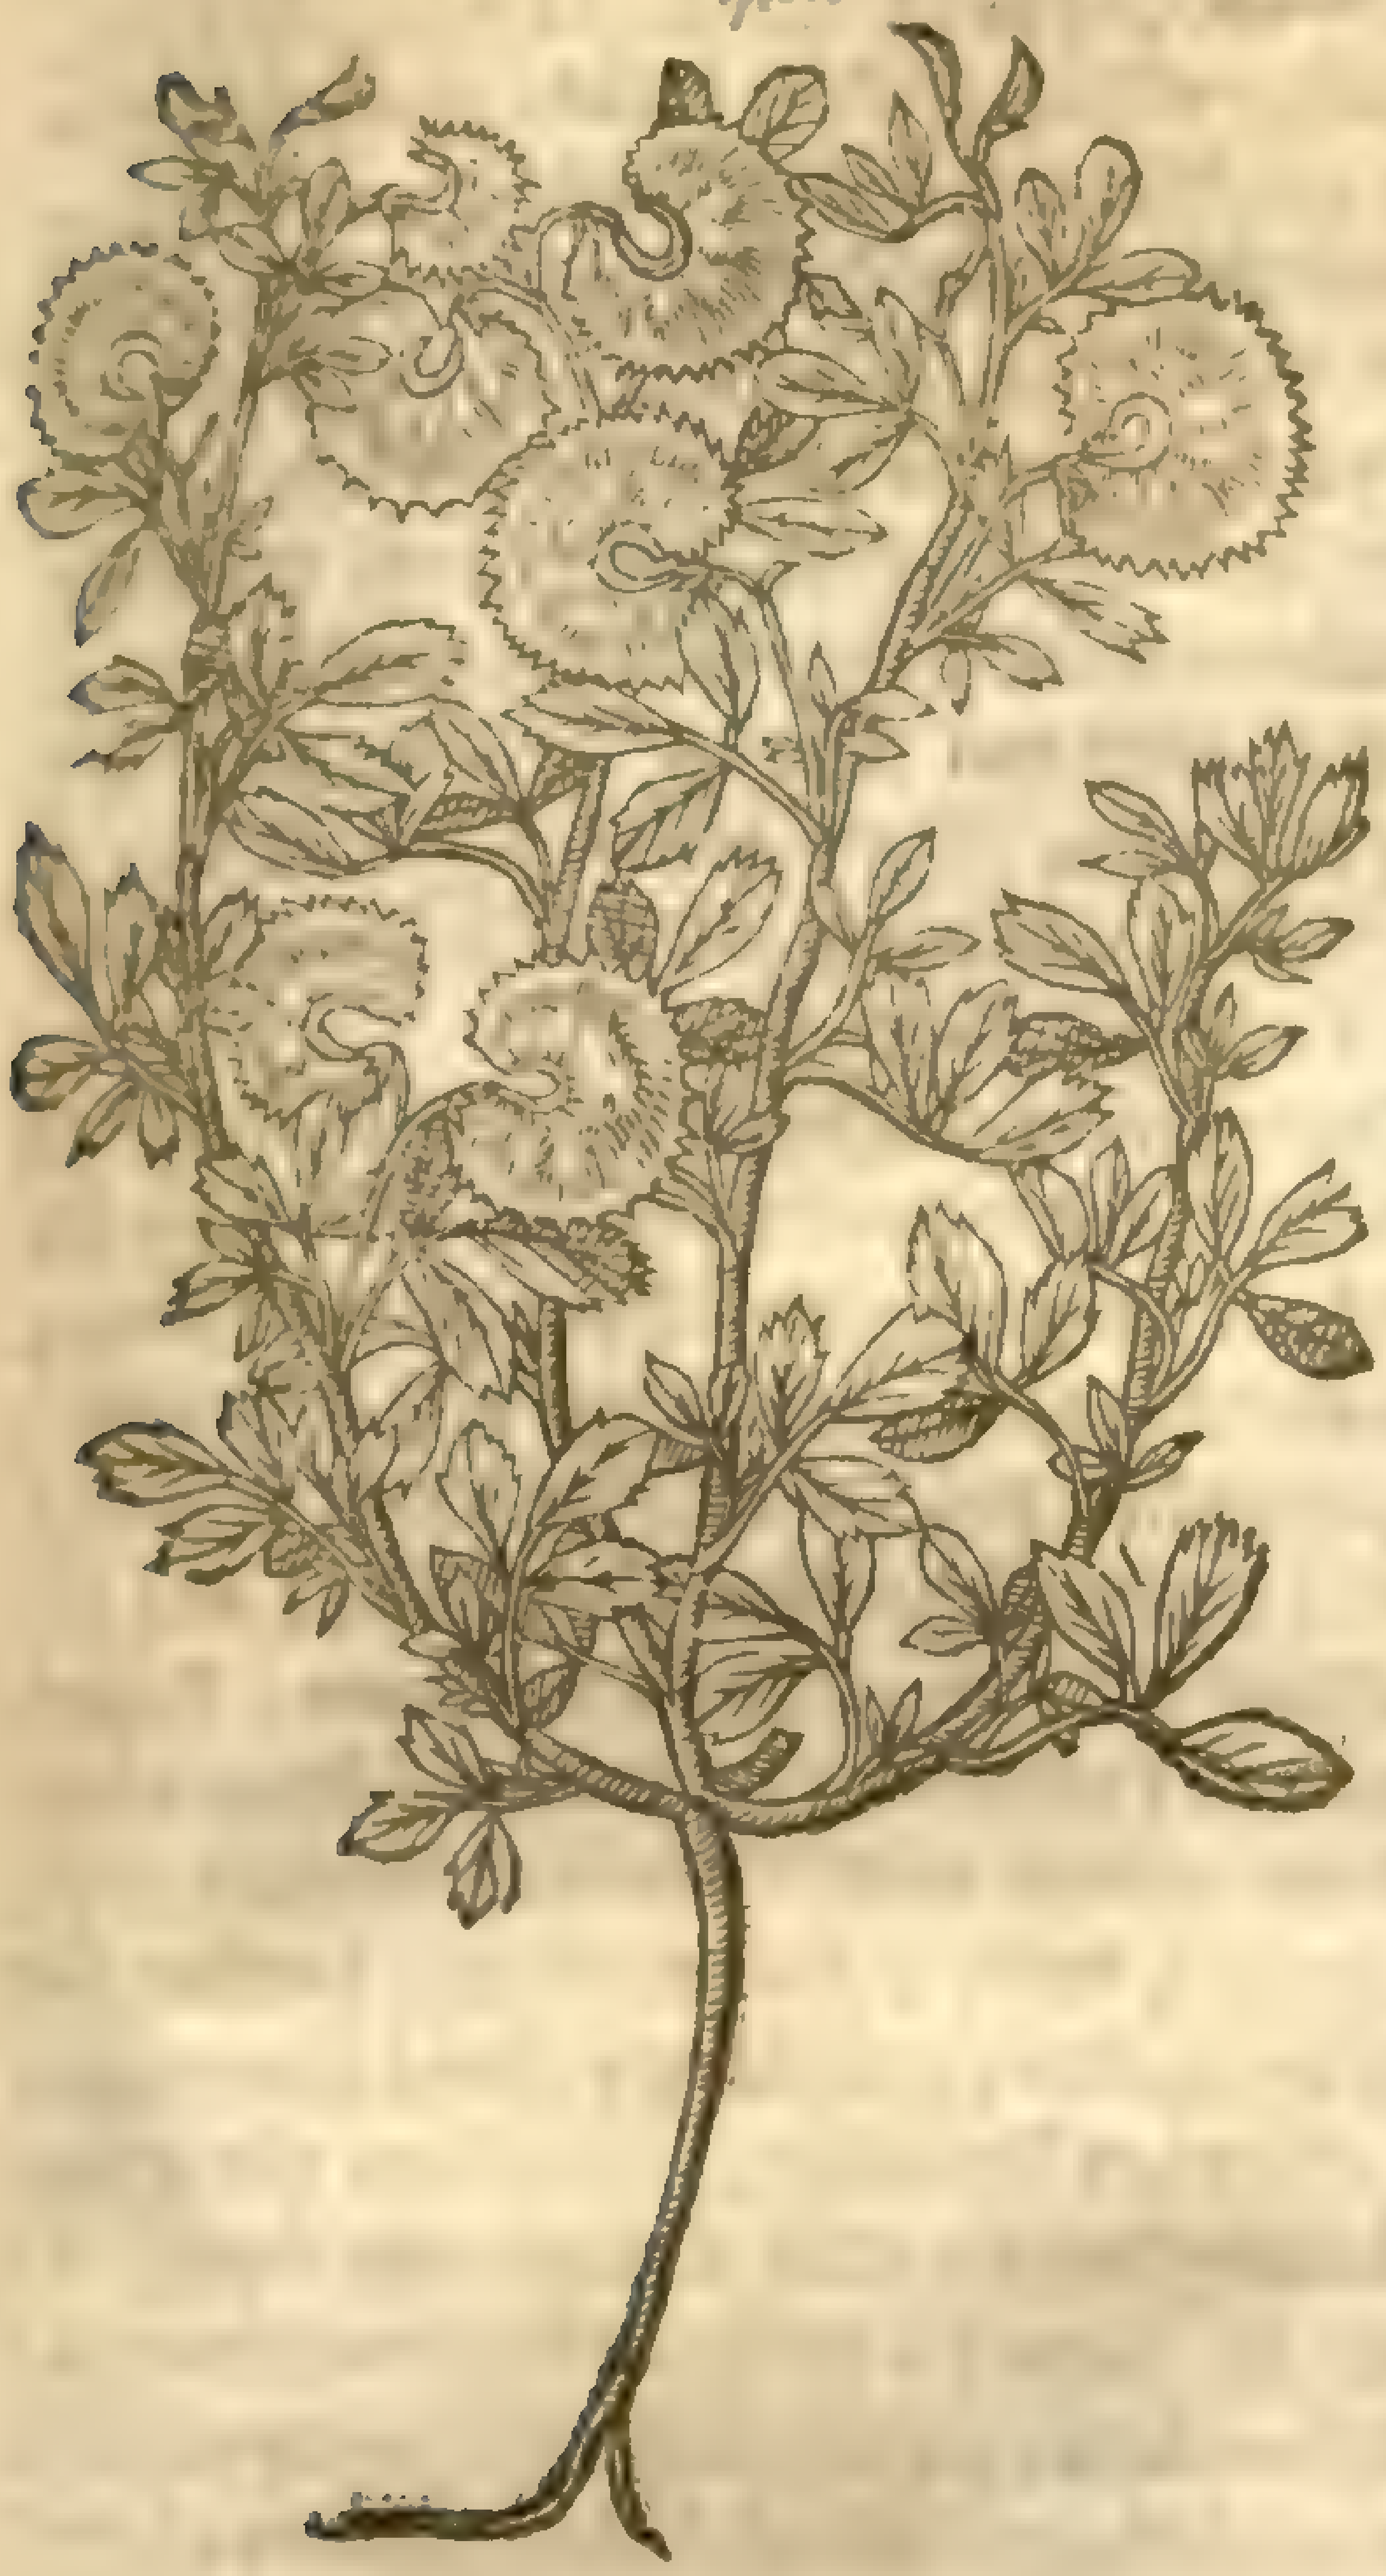
¶ *The Deſcription.*

1 The firſt of thoſe in roots, ſtalkes, and manner of growing is like the Medicke or ſnaile Trefoiles formerly deſcribed: the leaues are hairy: the floures yellow and ſmall: after which follow crooked flat cods, of an indifferent bredth, wherein is contained ſeeds made after the faſhion of little Kidneyes; this the Italians, according to *Lobel*, call *Lunaria radiata*; in the *Hiſt. Lugd.* it is called *Medica ſyl. altera lunata.*

2 The root of this is long and thicke, couered with a yellowiſh rinde, and hauing a white ſweet pith in the inſide, couered with a hairineſſe on the top, and ſending forth ſundry fibres: from this riſe vp many weake long foot-ſtalkes, whereon grow leaues ſet together by threes, long, narrow, ſmooth, lightly nickt on the edges: amongſt theſe riſeth vp commonly one ſtalke (yet ſometimes two) ſmooth and naked, three or foure inches long; on the top thereof grow ſpike faſhion, eight or ten pretty large light purple floures, each of them being ſet in a cup diuided into fiue parts. This growes vpon diuers parts of the Alps: and *Pona* in his *Mons Baldus* ſet it forth by the name of *Trifolium anguſtifolium Alpinum*. *Bauhinus* ſaith, the root hereof taſts like liquorice, wherefore it may be called *Glycyrrhiza Aſtragaloides*, or *Aſtragalus dulcis*: and he receiued it out of Spaine by the name of *Glycyrrhiza*. He calls it in his *Prodromus*, *Trifolium Alpinum flore magno radice dulci.*

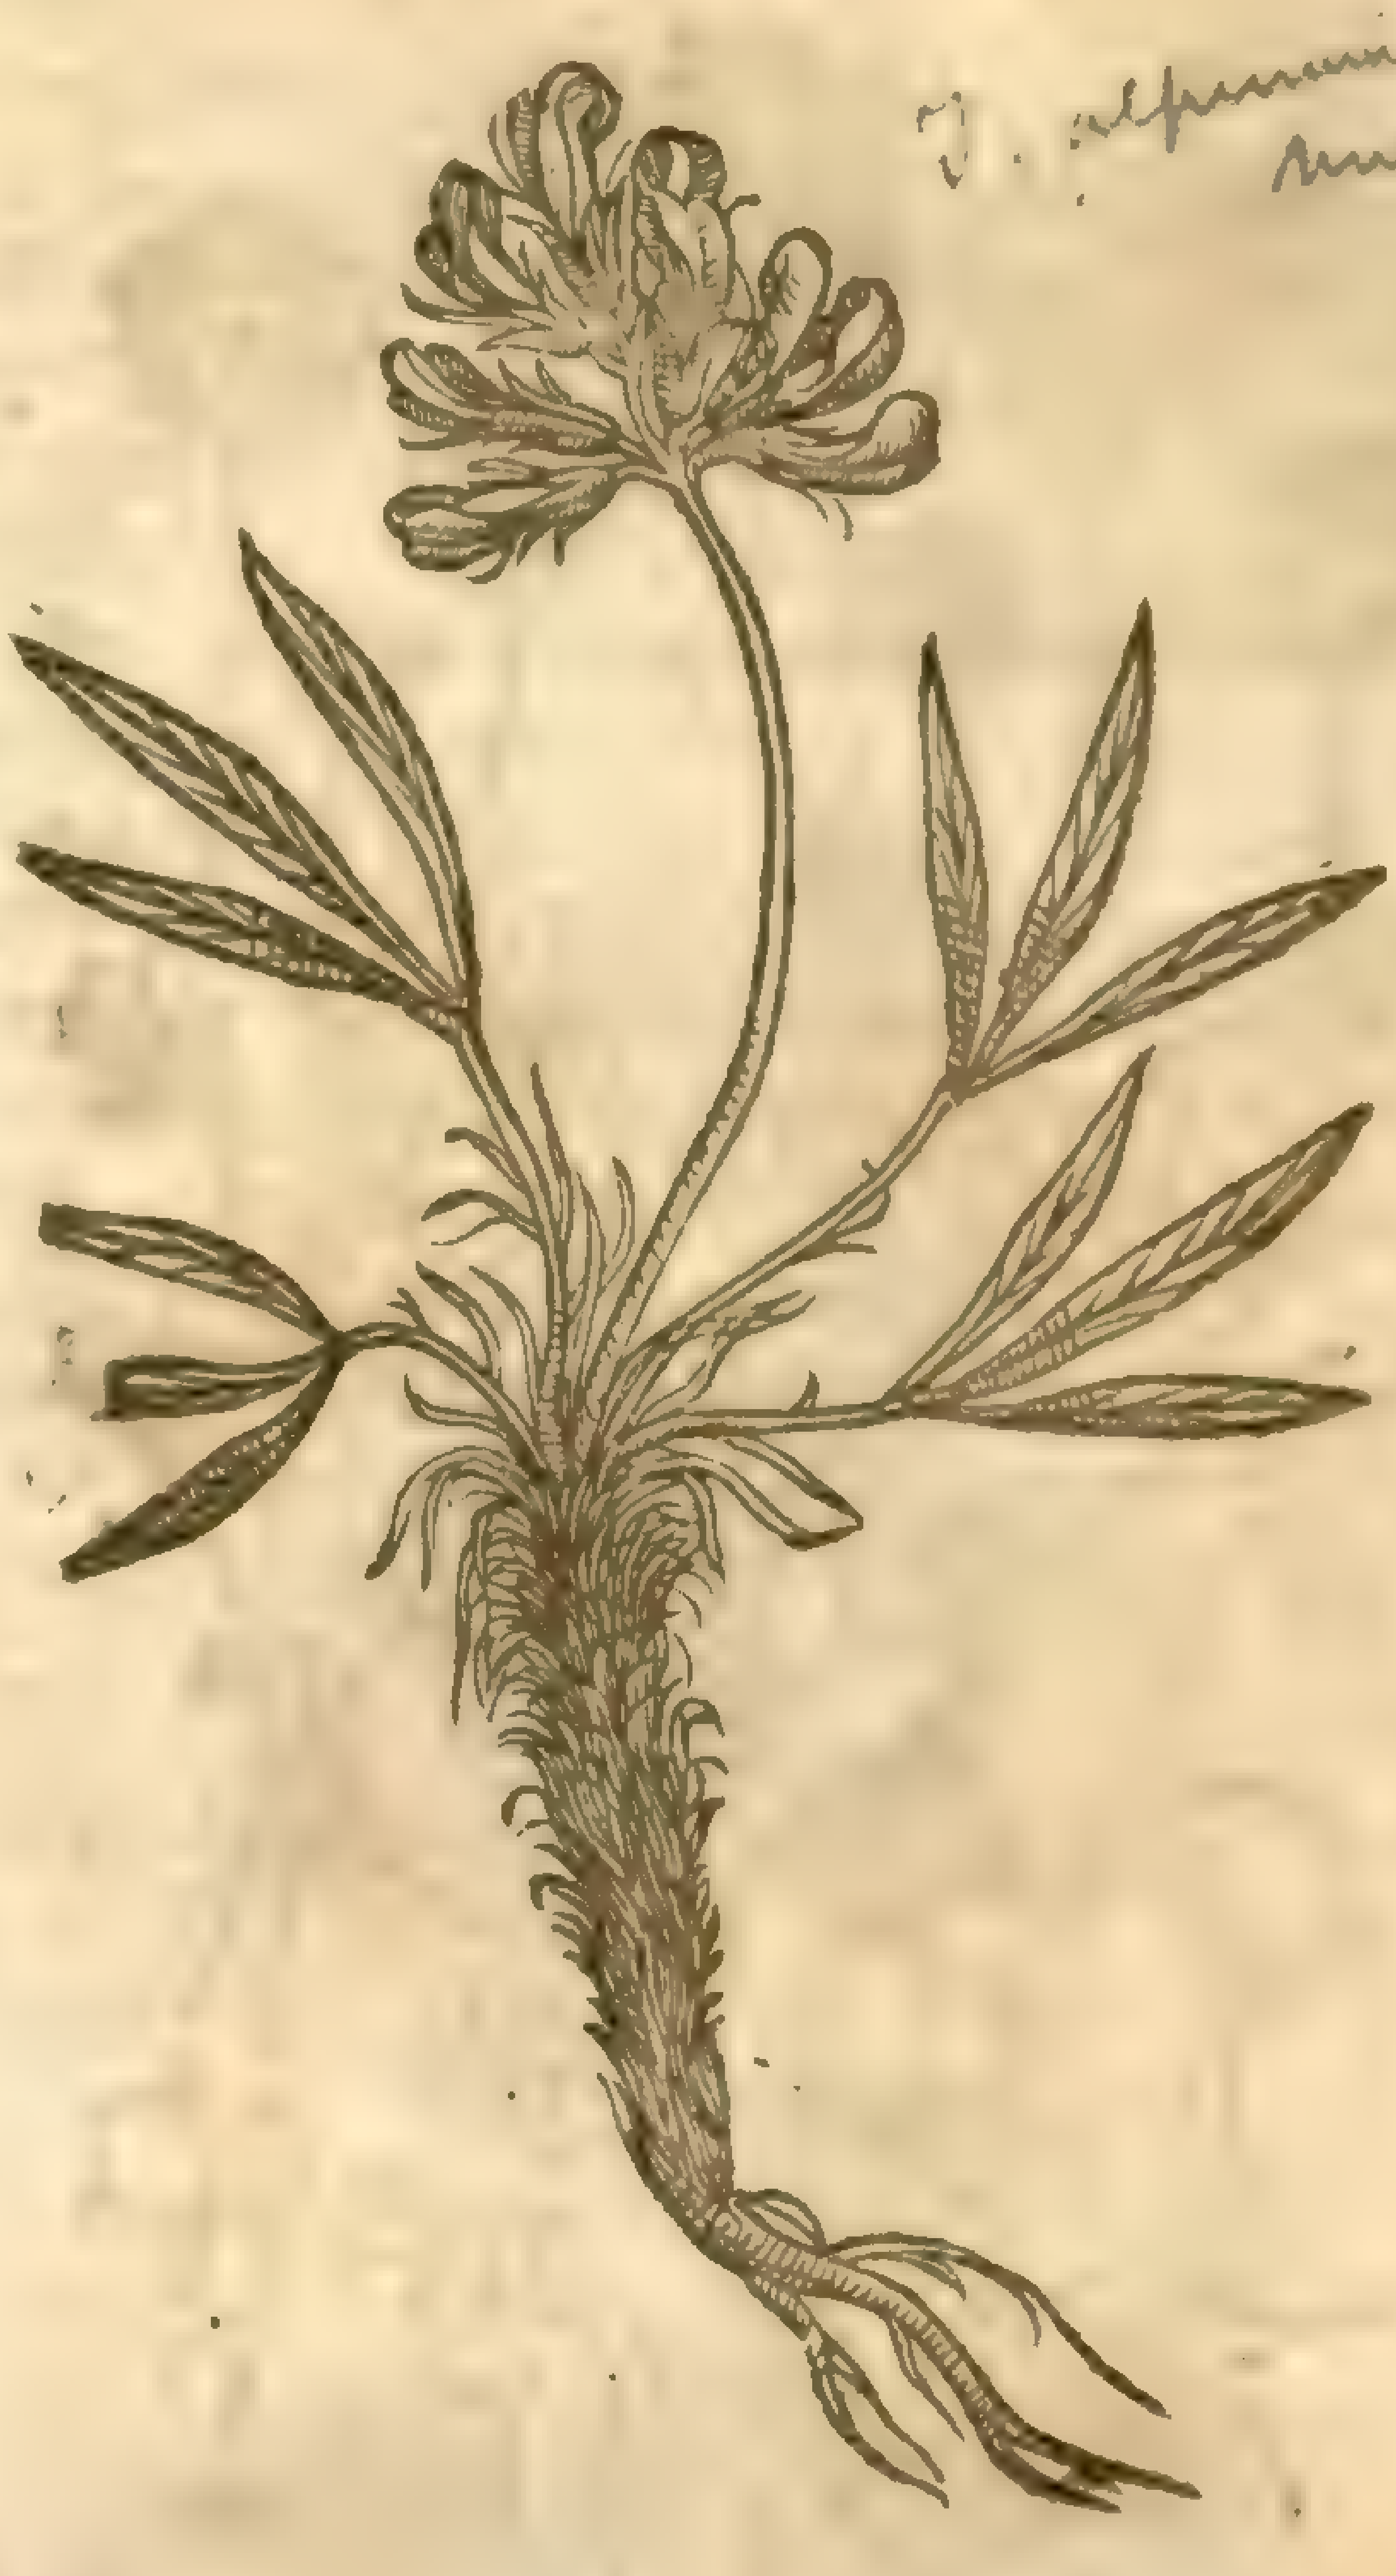
‡ 1 *Trifolium ſiliqua lunata.*
Moone Trefoile.

Medica [illegible], [illegible] dict

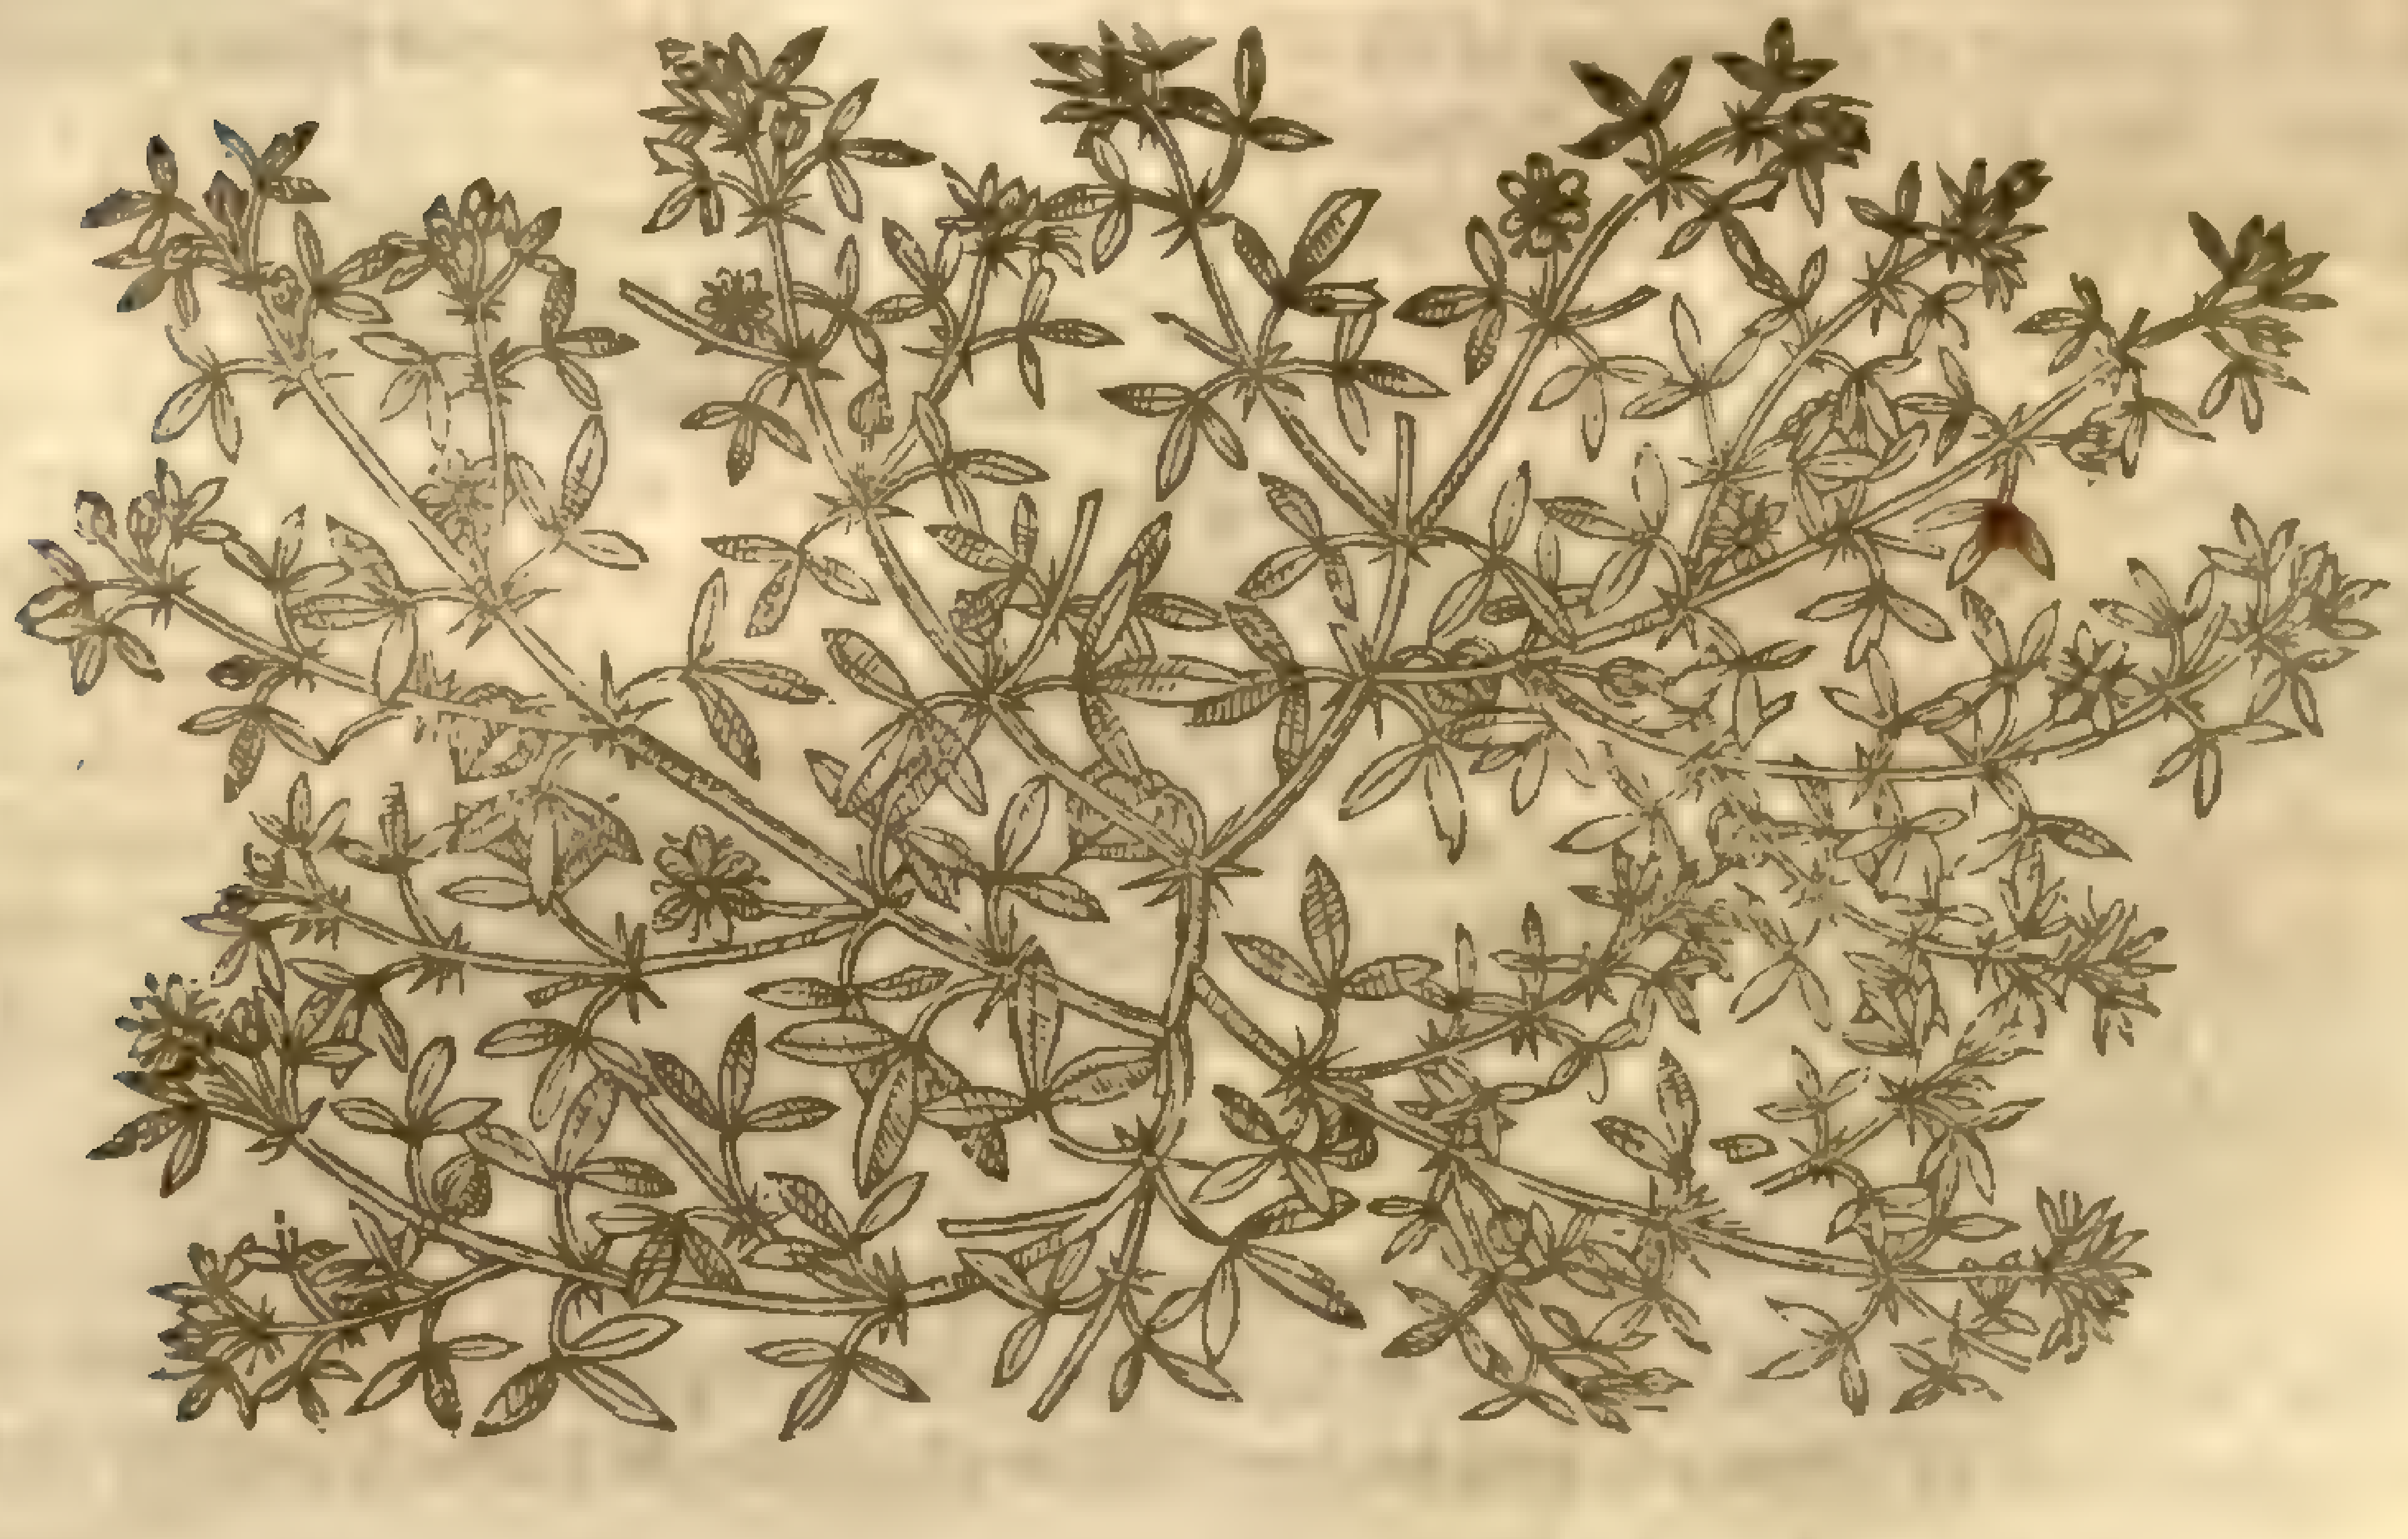


‡ 2 *Trifol. anguſtifol. Alpinum.*
Liquorice Trefoile.

T. alpinum – Mill. dict.



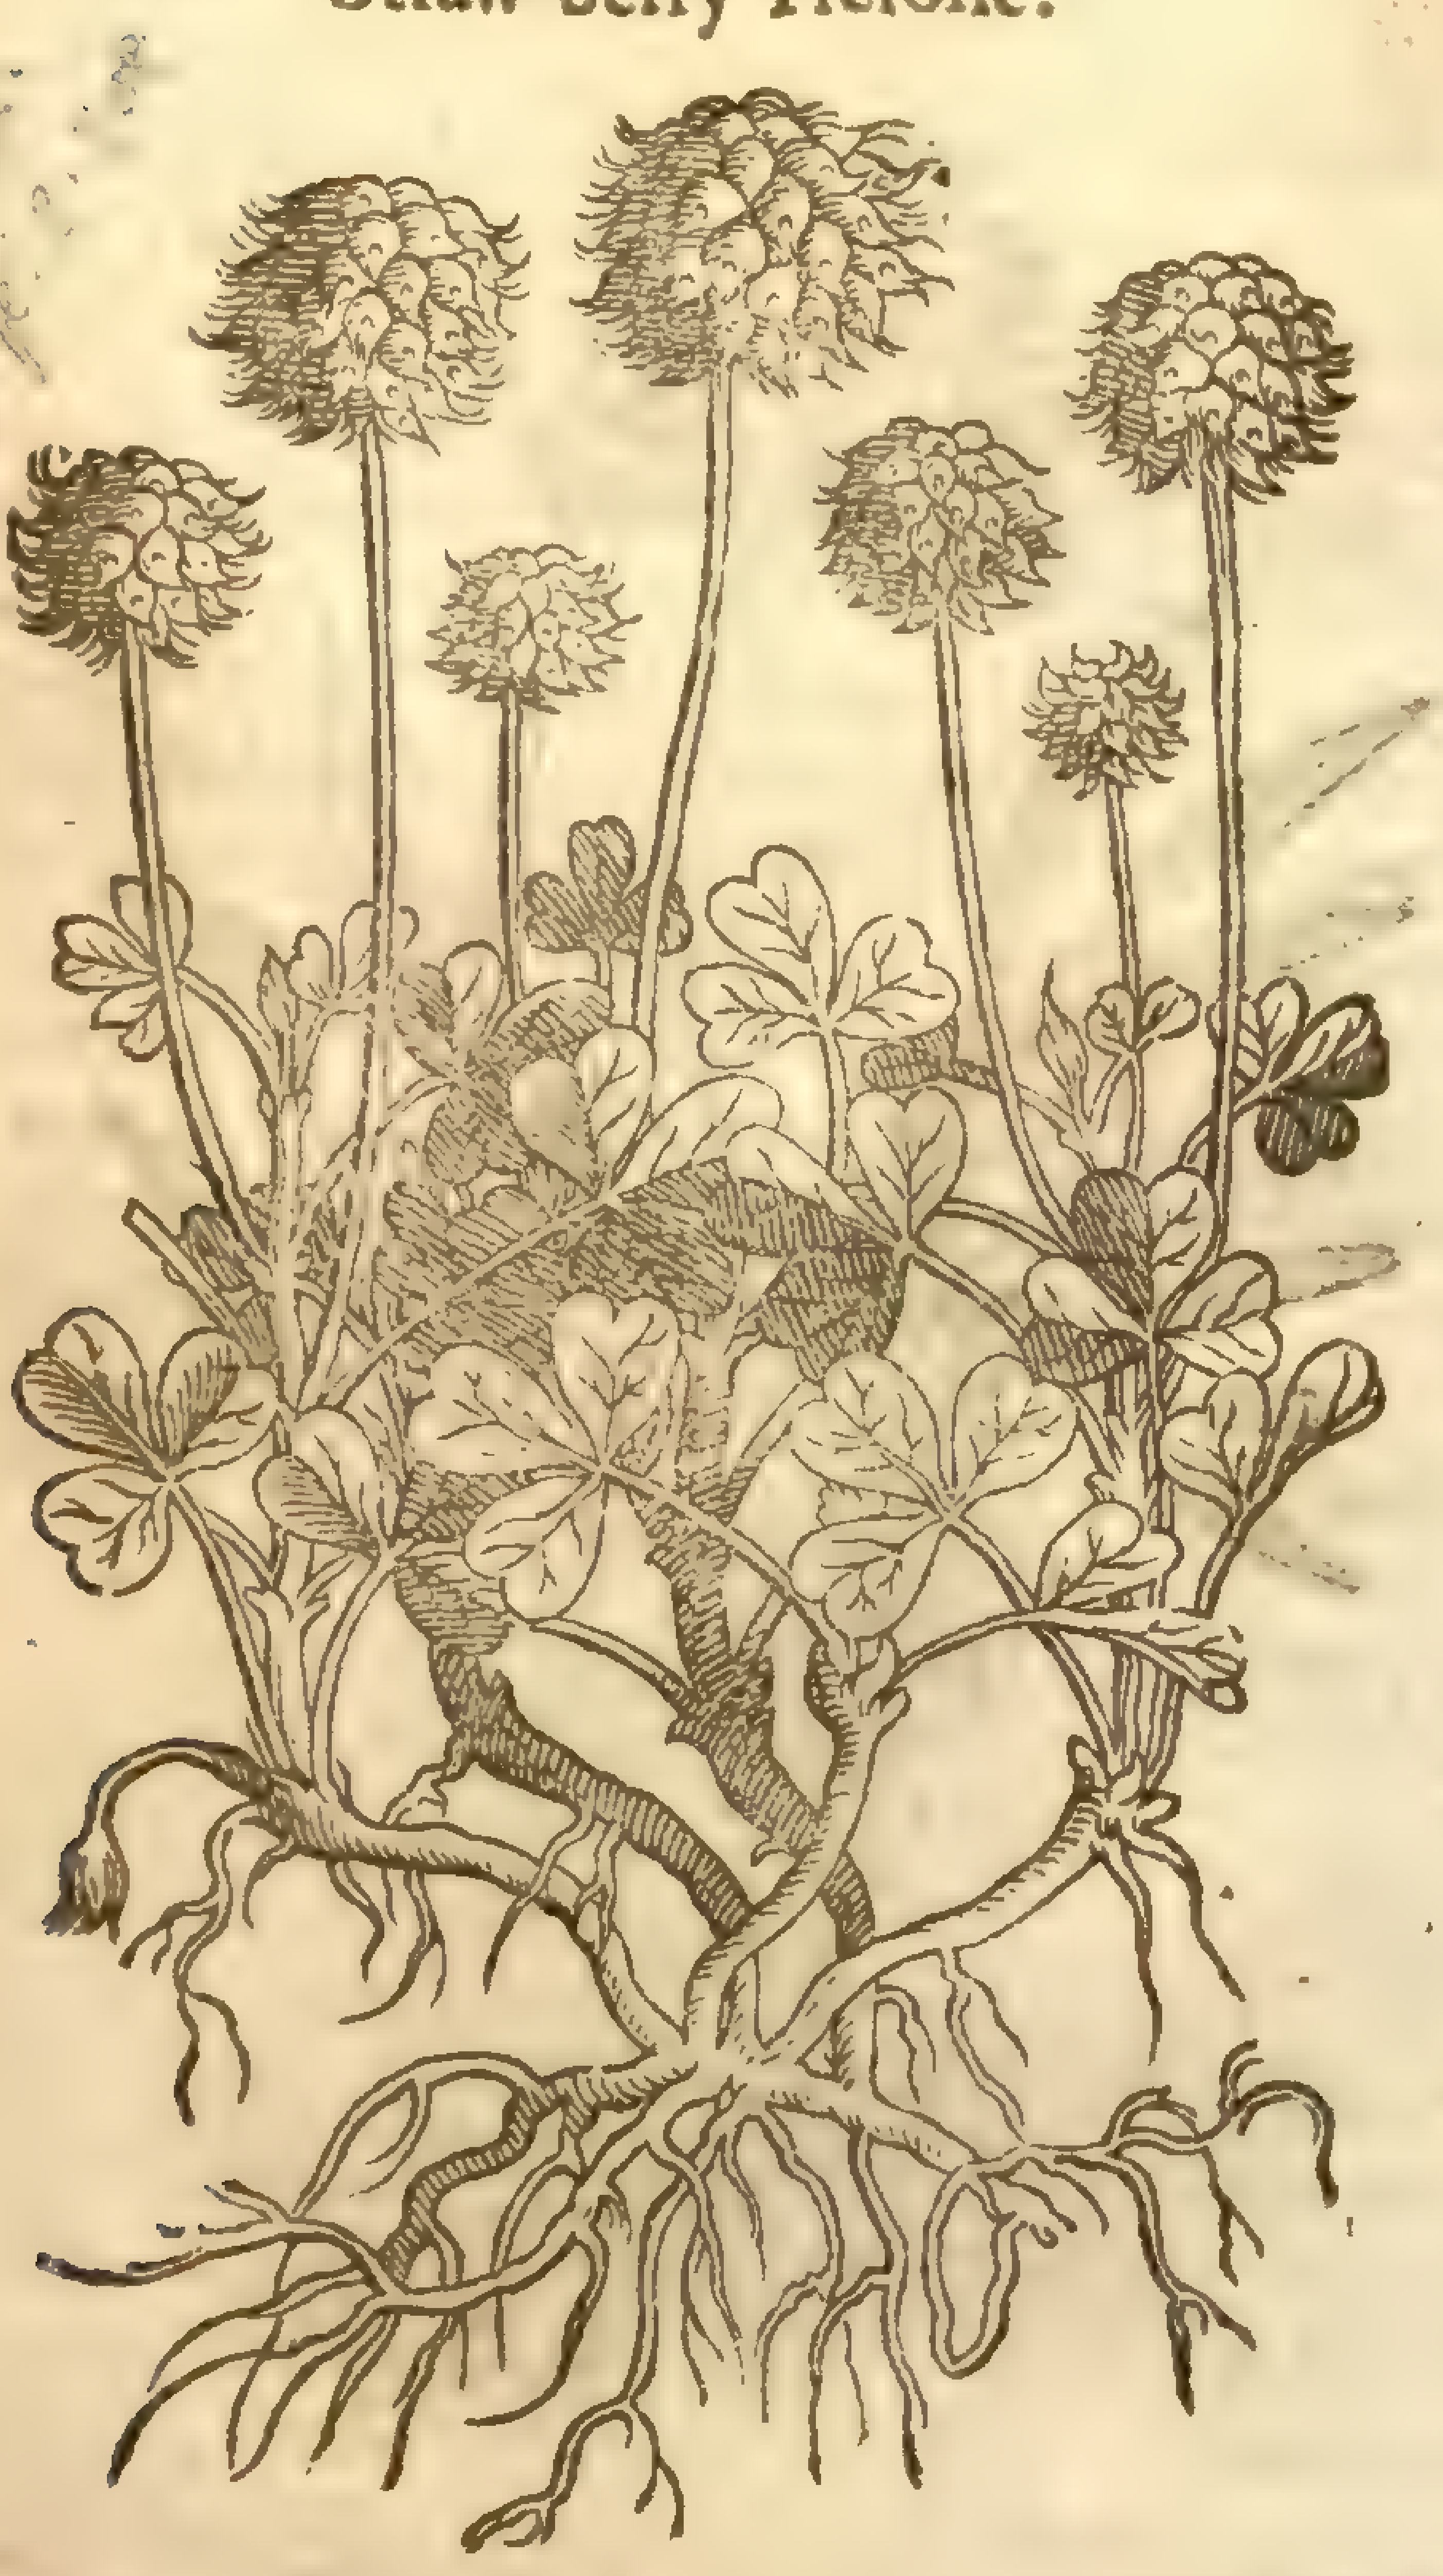
‡ 3 *Trifolium ſpinoſum Creticum.*
Prickly Trefoile.



3 This thorny Trefoile hath a long threddy root, from which ariſe many ſhort branched ſtalks ſome two handfuls high, cornered, and ſpred vpon the ground: the joints which are many, are commonly red, & armed with foure ſharp prickles, and out of each of them vpon ſhort foot-ſtalks grow two trifoile leaues, green, longiſh, and ending in a little prickle: out of theſe joints alſo grow little foot-ſtalks which carry ſingle floures made of fiue little leaues of the ſhape and colour of the little Blew-bell floure, with ten chiues in the middle tipt with yellow: after theſe follow fiue cornered ſharp pointed heads, containing a ſingle flat red ſeed in each corner. *Cluſius* ſet forth this by the name of *Trifolium ſpinoſum Creticum*: the ſeed was ſent out of Candy by the name of ὀρθινοχόρτον: He queſtions whether it may not be the true *Tribulus terreſtris* of *Dioſcorides*.

4 The roots, ſtalkes, and leaues of this pretty Trefoile doe not much differ from the common white

‡ 4 *Trifolium fragiferum.*
Straw-berry Trefoile.



T. fragiferum, [illegible] Sm. [illegible]

white Trefoil,but there is ſome difference in the floures and ſeed; for the floures of this are ſmal, grow thicke together,and are of a whitiſh bluſh colour: after which follow heads made of little bladders or thin skins,after ſuch a maner as they reſemble a Straw-berry or Raſpas,and they are of a grayiſh colour here and there marked with red: the ſtalks ſeldom grow aboue three inches high. It growes in moſt ſalt mariſhes, as in Dartford ſalt mariſh: in thoſe below Purfleet,and the like. It floures in Iuly and Auguſt. *Cluſius* hath ſet it forth by the name of *Trifolium fragiferum Friſicum*: ſome had rather cal it *Trifolium veſicarium*, Bladder Trefoile.

5 There are two other Trefoiles with which I thinke good to acquaint you, and thoſe by the ſimilitude of the cups which contain the flours, and become the ſeed-veſſels, may be fitly called *Stellata*; and thus *Bauhine* calls the firſt *Trifolium ſtellatum*: whereto for diſtinctions ſake I add *hirſutum*,calling it *Trifol.ſtellatum hirſutum*, Rough ſtarry headed Trefoile: it hath a ſmal long white root, from which ariſe ſtalkes ſome foot high, round, ſlender, hairy, and reddiſh, hauing few leaues or branches: the leaues ſtand three on a ſtalke,as in other Trefoiles, ſmooth on the vpper ſide,and hairy below: the floures are ſmall and red, like in ſhape to thoſe of the common red Trefoile,but leſſer; and they ſtand each of them in a cup,reddiſh,and rough below,and on the vpper part cut into fiue long ſharp leaues ſtanding open as they commonly figure a ſtar: the floures fallen, theſe cups dilate themſelues, and haue in the middle a longiſh tranſverſe whitiſh ſpot. I ſaw this flouring in May in the garden of Mr *Tradeſcant*, who firſt brought plants hereof from Fermentera a ſmall Iſland in the Mediterranean ſea.

6 This other (which for any thing that I know is not figured nor deſcribed by any) hath ſtalks ſometimes a foot,otherwhiles little aboue an inch high,hairy,and diuided but into few branches: the leaues,which ſtand by threes,are faſtned to long foot-ſtalks,and they themſelues are ſomewhat longiſh,hauing no little ſharpe pointed leaues growing at the ſetting on of the foot-ſtalks to the ſtalks: they are green of colour,and not ſnipt about the edges: the heads that grow on the tops of the ſtalks are round,ſhort,and green,with ſmall purple or elſe whitiſh flours like thoſe of the common Trefoile,but leſſer,ſtanding in cups diuided into fiue parts, which when the flours are fallen, become ſomewhat bigger,harſher,and more prickly,but open not themſelues ſo much as thoſe of the former: the ſeed is like that of Millet,but ſomewhat rounder: this flours in Iune,and the ſeed is ripe in Iuly. I firſt obſerued it in Dartford ſalt mariſh, the tenth of Iune, 1633. I haue named this *Trifolium ſtellatum glabrum*, Smooth ſtarry headed Trefoile.

T. maritimum. spe. nat. Sm. Fl. 3. 303

¶ *The Temperature and Vertues.*

Theſe, eſpecially the three laſt, ſeeme to be of the ſame temper and vertue as the common Medow Trefoiles,but none of them are at this day vſed in phyſicke,or known, vnleſſe to ſome few. ‡

Chap. 507. *Of Pulſe.*

¶ *The Kindes.*

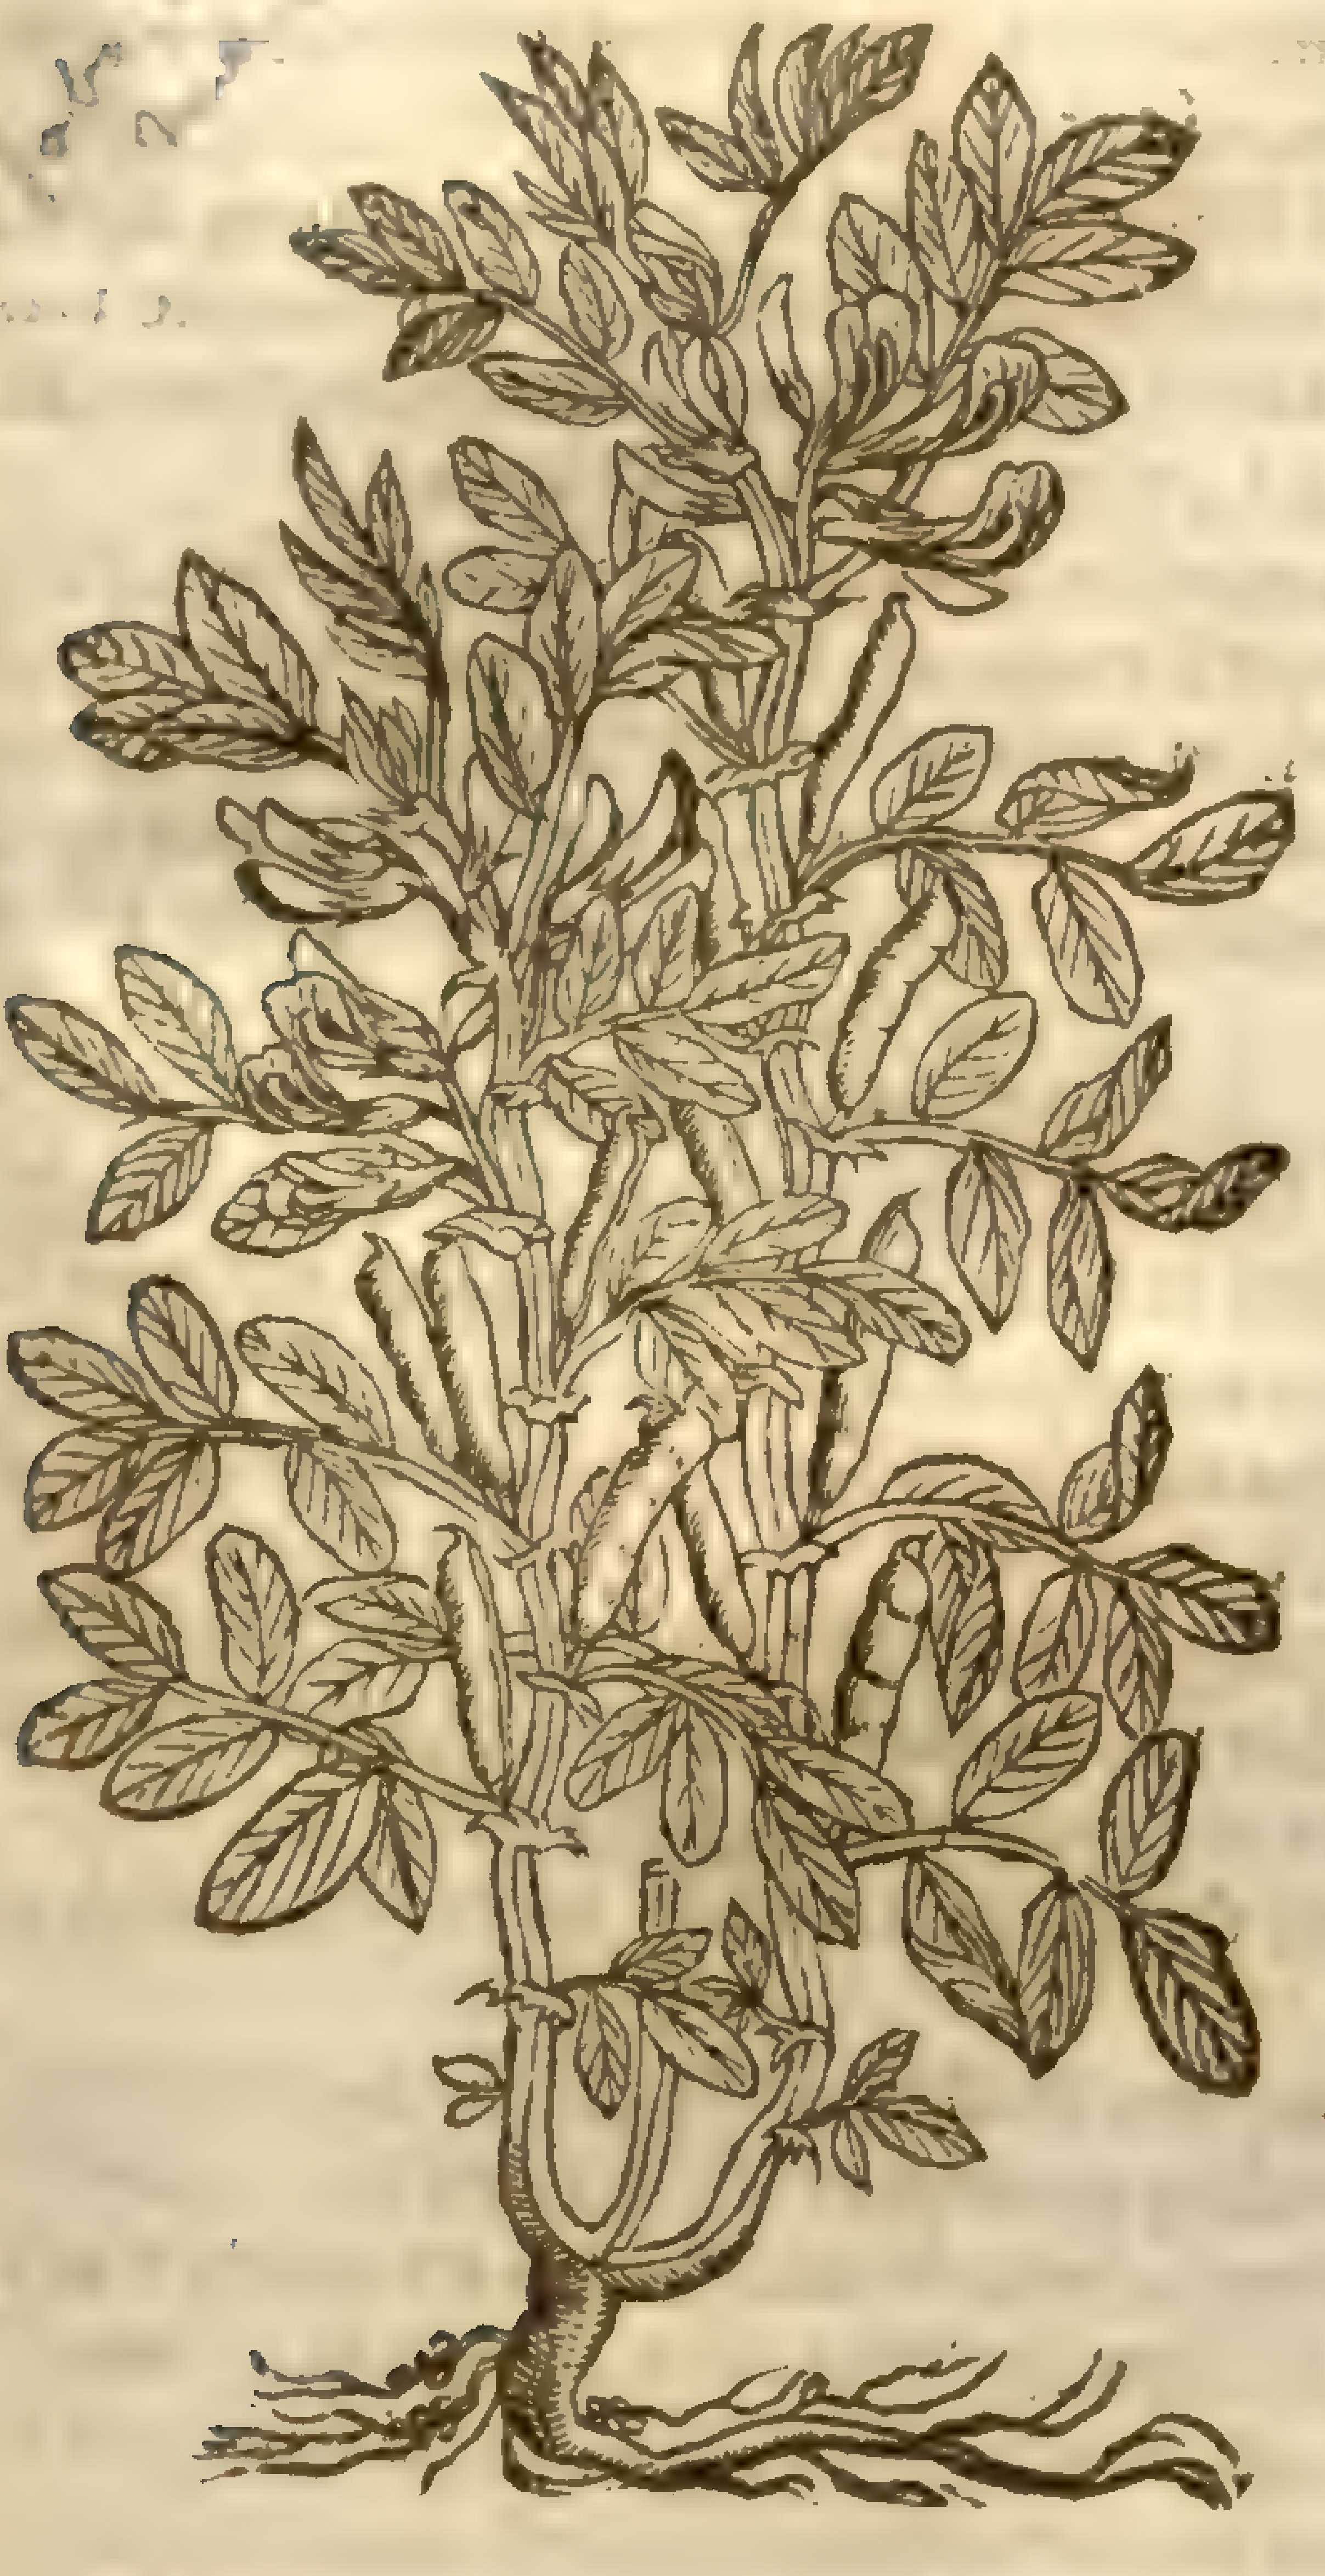
There be diuers ſorts of Pulſe,as Beans,Peaſon,Tares, Chiches, and ſuch like, comprehended vnder this title Pulſe: and firſt of the great Bean or garden Bean.

¶ *The*

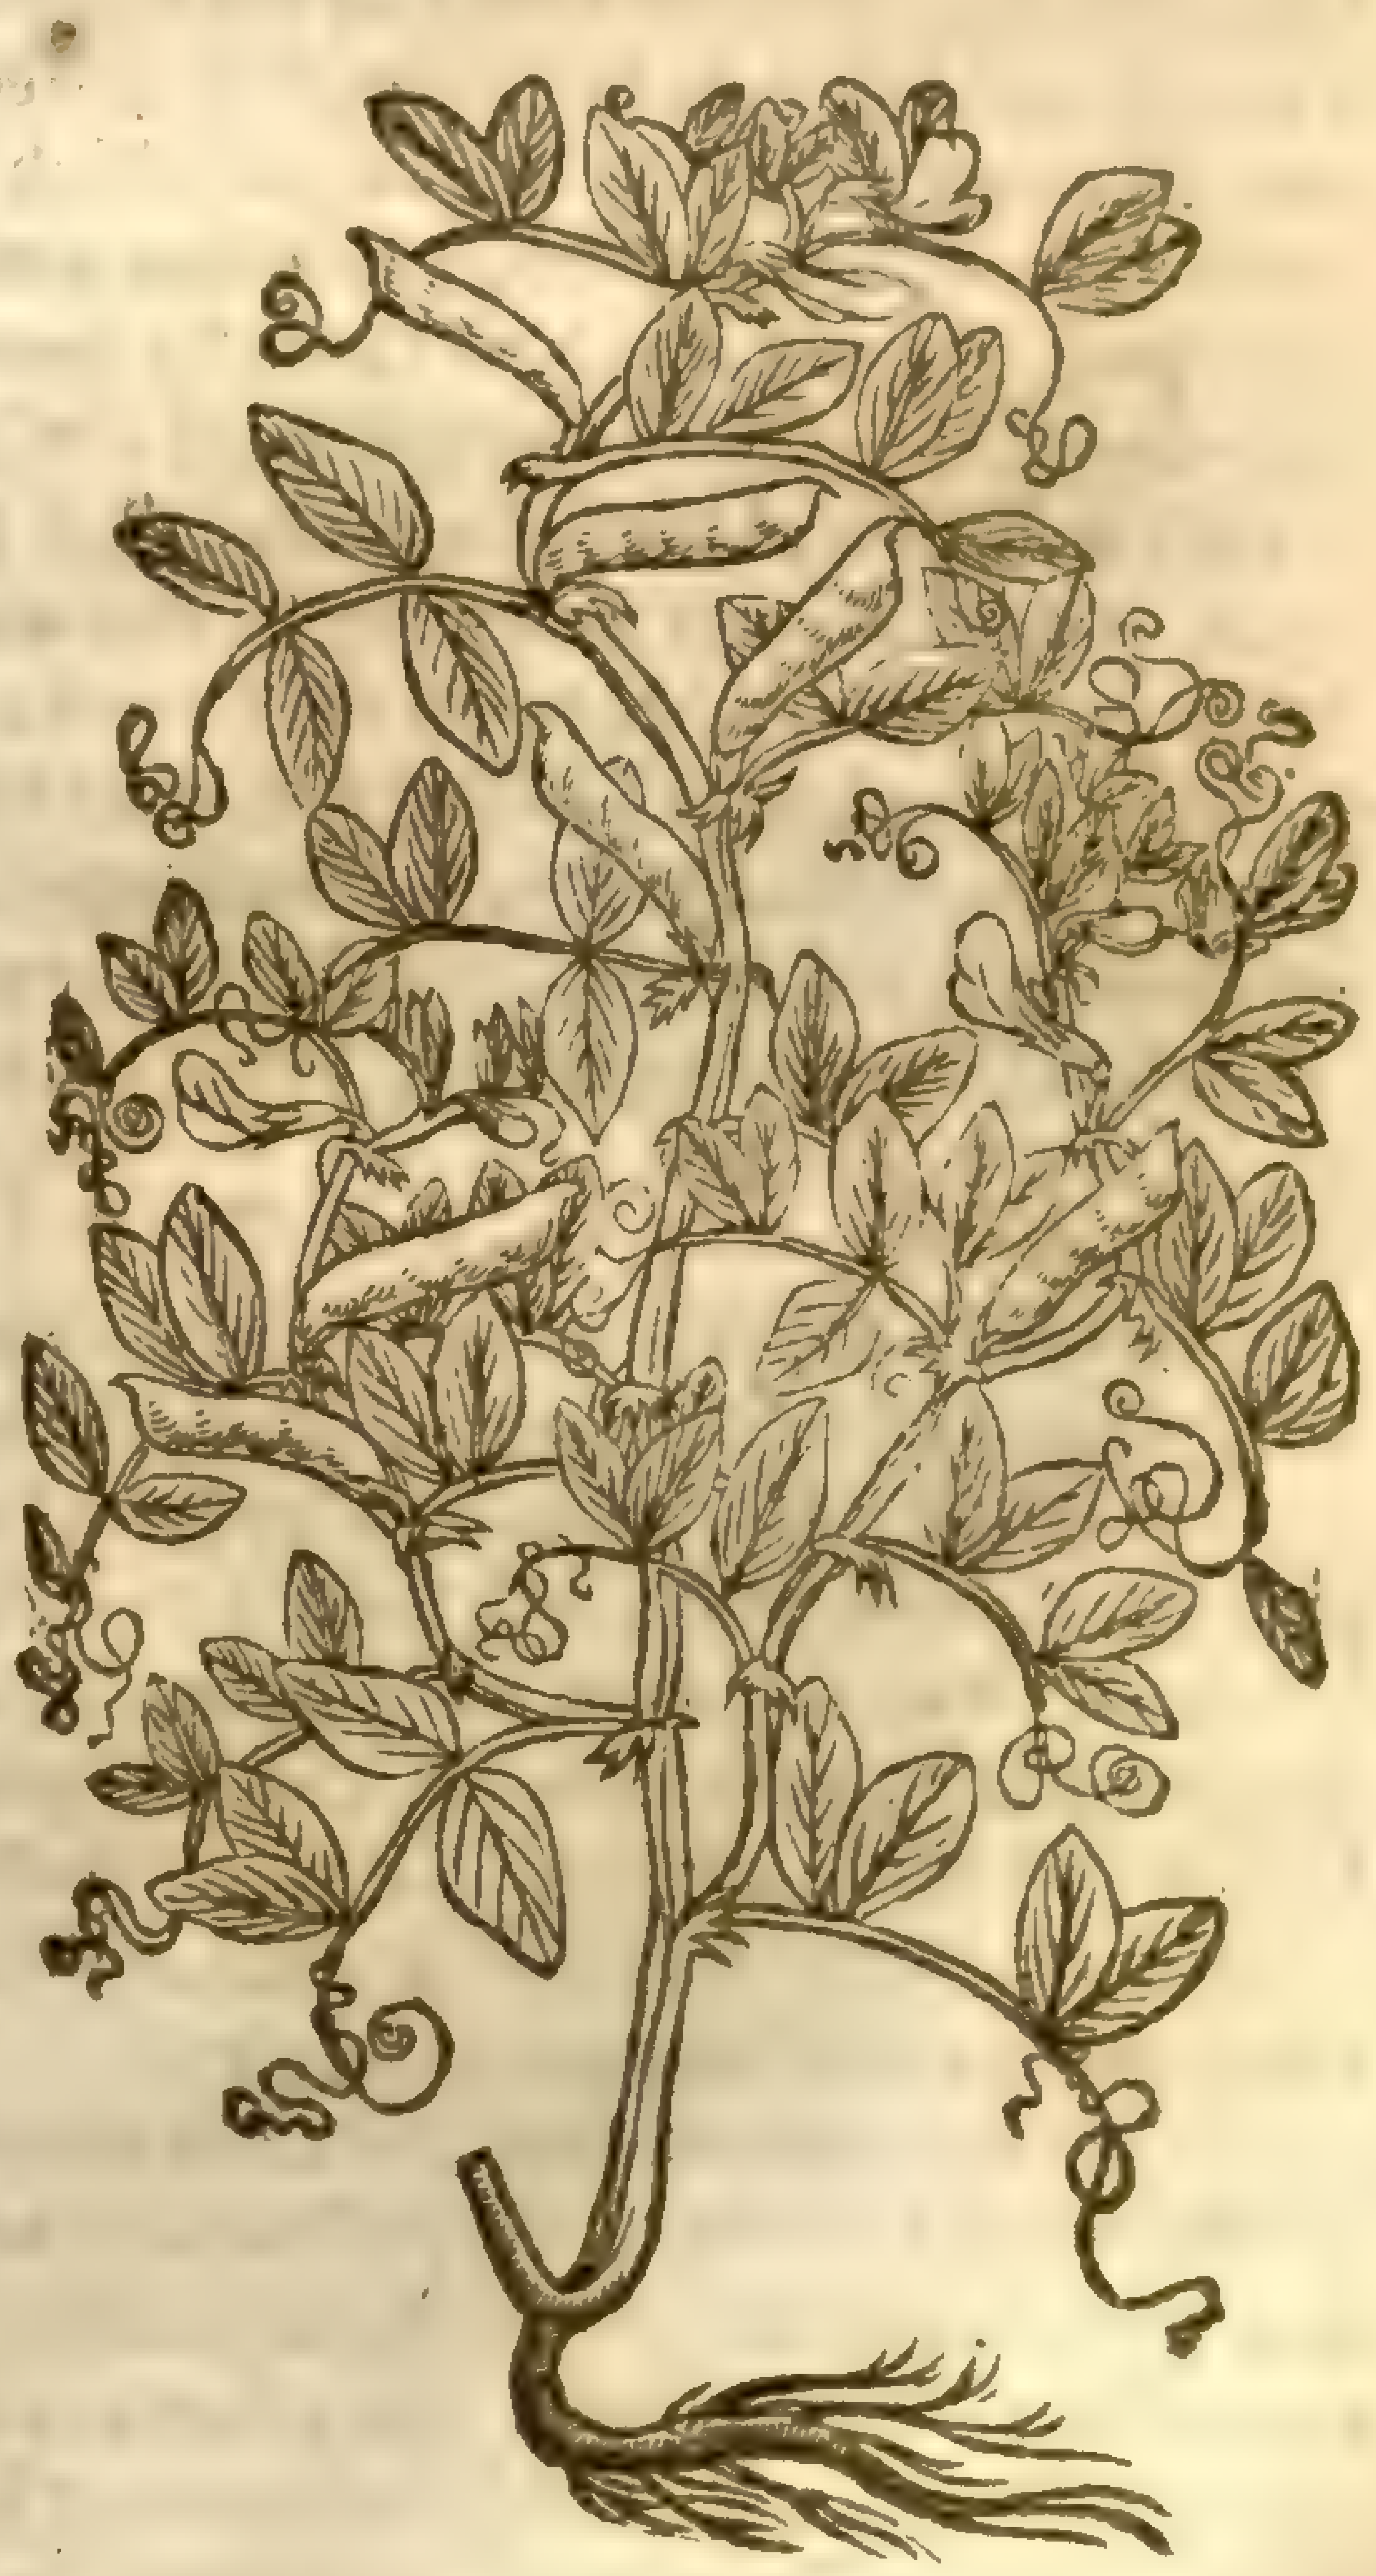
¶ *The Deſcription.*

1 THe great Beane riſeth vp with a foure ſquare ſtalke, ſmooth, hollow, without ioynts, long and vpright, which when it is thicke ſowne hath no need of propping, but when it is ſowne alone by it ſelfe it ſoone falleth down to the ground: it bringeth forth long leaues one ſtanding from another, conſiſting of many growing vpon one rib or ſtem, euery one whereof is ſomewhat fat, ſet with veines, ſlippery more long than round. The floures are eared, in forme long, in colour either white with blacke ſpots, or of a blackiſh purple: after them come vp long cods, thicke, full of ſubſtance, ſlenderer below, frized on the inſide with a certaine white wooll as it were, or ſoft flockes; which before they be ripe are green, and afterwards being dry they are black and ſomewhat hard, as be alſo the cods of broome, yet they be longer than thoſe, and greater: in which are contained three, foure, or fiue Beans, ſeldome more, long, broad, flat, like almoſt to a mans naile, great, and oftentimes to the weight of halfe a dram; for the moſt part white, now and then of a red purpliſh colour; which in their vpper part haue a long blacke nauell as it were, which is couered with a naile, the colour whereof is a light greene: the skin of the fruit or beane is cloſely compacted, the inner part being dry is hard and ſound, and eaſily cleft in ſunder; and it hath on the one ſide an euident beginning of ſprouting, as haue alſo the little peaſe, great Peaſe, Ciches, and many other Pulſes. The roots hereof are long, and faſtned with many ſtrings.

1 *Faba major hortenſis.*
The great garden Beane.



2 *Faba ſylueſtris.*
The wilde Beane.



2 The ſecond kinde of Beane (which *Pena* ſetteth forth vnder the title of *Sylueſtris Græcorum Faba*, and *Dodonæus*, *Bona ſylueſtris*; which may be called in Engliſh, Greeke Beanes) hath ſquare hollow ſtalkes like the garden Beanes, but ſmaller. The leaues be alſo like the common Beane, ſauing that the ends of the rib whereon thoſe leaues doe grow haue at the very end ſmall tendrels or claſpers, ſuch as the Peaſe leaues haue. The floures are in faſhion like the former, but of a darke red colour: which being vaded, there ſucceed long cods which are blacke when they be ripe, within which is incloſed blacke ſeed as big as a Peaſe, of an vnpleaſant taſte and ſauour.

‡ 3 The common Beane in ſtalkes, leaues, floures, and cods is like the former great garden Beane, but leſſer in them all; yet the leaues are more, and grow thicker, and out of the boſomes of the leaues vpon little foot-ſtalks grow the floures, commonly ſix in number, vpon one ſtalke, which are ſucceeded by ſo many cods, leſſer and rounder than thoſe of the former: the Beanes themſelues are alſo leſſe, and not ſo flat, but rounder, and ſomewhat longiſh: their colour are either whitiſh, yellowiſh or elſe blacke. This is ſowne in moſt places of this kingdome, in corne fields, and knowne both to man and beaſt. I much wonder our Author forgot to mention ſo common and vulgarly knowne a Pulſe. It is the *Bona* or *Faſelus minor* of *Dodonæus*; and the *Faba minor* of *Pena* and *Lobel*. ‡

¶ *The Place.*

The firſt Beane is ſowne in fields and gardens euery where about London.

This blacke Beane is ſowne in a few mens Gardens who bee delighted in variety and ſtudy of herbes, whereof I haue great plenty in my garden.

¶ *The Time.*

They floure in Aprill and May, and that by parcels, and they be long in flouring: the fruit is ripe in Iuly and Auguſt.

¶ *The Names.*

The garden Beane is called in Latine *Faba*: in Engliſh, the garden Beane: the field Beane is of the ſame kinde and name, although the fertilitie of the ſoile hath amended and altered the fruit into a greater forme. ‡ The difference between the garden and the field Beane is a ſpecificke difference, and not an accidental one cauſed by the ſoile, as euery one that knoweth them may well perceiue. ‡

The blacke Beane, whoſe figure we haue ſet forth in the ſecond place, is called *Faba ſylueſtris*: of ſome thought to be the true Phyſicke Beane of the Antients; whereupon they haue named it *Faba Veterum*, and alſo *Faba Græcorum*, or the Greeke Beane. Some would haue the garden Beane to be the true *Phaſeolus*, or Kidney Beane; of which number *Dodonæus* is chiefe, who hath ſo wrangled and ruffled among his relatiues, that all his antecedents muſt be caſt out of dores: for his long and tedious tale of a tub wee haue thought meet to commit to obliuion. It is called in Greeke πύανον, whereupon the Athenians feaſt daies dedicated to *Apollo* were named Πυανέψια, in which Beanes and Pulſes were ſodden: in Latine it is called *Faba freſa* or *fracta*, broken or bruiſed Beanes.

‡ *Dodonæus* knew well what he did, as any that are either iudicious or learned may ſee, if they looke into the firſt chapter of the ſecond booke of his fourth *Pemptas*. But our Authors words are too iniurious, eſpecially being without cauſe, and againſt him, from whom he borrowed all that was good in this his booke, except the figures of *Tabernamontanus*. It may be Dr. *Prieſt* did not fit his tranſlation in this place to our Authors capacitie; for *Dodonæus* did not affirme it to be the *Phaſeolus*, but *Phaſelus*, diſtinguiſhing betweene them. ‡

¶ *The Temperature and Vertues.*

A The Beane before it be ripe is cold and moiſt: being dry it hath power to bind and reſtraine, according to ſome Authors: further of the temperature and vertues of *Galen*.

B The Beane (as *Galen* ſaith in his booke of the Faculties of Nouriſhments) is windie meate, although it be neuer ſo much ſodden and dreſſed any way.

C Beanes haue not a cloſe and heauy ſubſtance, but a ſpongie and light, and this ſubſtance hath a ſcouring and clenſing faculty; for it is plainely ſeene, that the meale of Beanes clenſeth away the filth of the skin; by reaſon of which qualitie it paſſeth not ſlowly through the belly.

D And ſeeing the meale of Beanes is windie, the Beanes themſelues if they be boyled whole and eaten are yet much more windie.

E If they be parched they loſe their windineſſe, but they are harder of digeſtion, and doe ſlowly deſcend, and yeeld vnto the body thicke or groſſe nouriſhing juyce; but if they be eaten greene before they be ripe and dried, the ſame thing hapneth to them which is incident to all fruits that are eaten before they be fully ripe; that is to ſay, they giue vnto the body a moiſt kinde of nouriſhment, and therefore a nouriſhment more full of excrements, not onely in the inward parts, but alſo in the outward, and whole body through: therefore thoſe kindes of Beans do leſſe nouriſh, but they do more ſpeedily paſſe thorow the belly, as the ſaid Author in his booke of the Faculties of ſimple medicines ſaith, that the Beane is moderately cold and dry.

F The pulpe or meate thereof doth ſomewhat clenſe, the skin doth a little binde.

G Therefore diuers Phyſitians hath giuen the whole Beane boyled with vineger and ſalt to thoſe that were troubled with the bloudy flix, with laskes and vometings.

H It raiſeth flegme out of the cheſt and lungs: being outwardly applied it dryeth without hurt the watery humors of the gout. We haue oftentimes vſed the ſame being boiled in water, and ſo mixed with ſwines greaſe.

We haue laid the meale thereof with Oxymel, or ſyrrup of vineger, both vpon bruiſed and wounded ſinewes, and vpon the wounded parts of ſuch as haue been bitten or ſtung, to take away the fiery heat. I

It alſo maketh a great plaiſter and pultis for mens ſtones and womens paps: for theſe parts when they are inflamed, haue need of moderate cooling, eſpecially when the paps are inflamed through the cluttered and congealed milke contained in them. K

Alſo milke is dried vp with that pultis. L

The meale thereof (as *Dioſcorides* further addeth) being tempered with the meale of Fenugreeke and hony, doth take away blacke and blew ſpots, which come by dry beatings, and waſteth away kernels vnder the eares. M

With Roſe leaues, Frankincenſe, and the white of an egge, it keepeth backe the watering of the eies; the pin and the web, and hard ſwellings. N

Being tempered with wine it healeth ſuffuſions, and ſtripes of the eies. O

The Beane being chewed without the skin, is applied to the forehead againſt rheumes and falling downe of humours. P

Being boyled in wine it taketh away the inflammation of the ſtones. Q

The skins of Beans applied to the place where the hairs were firſt plucked vp, wil not ſuffer them to grow big, but rather conſumeth their nouriſhment. R

Being applied with Barly meale parched, and old oyle, they waſte away the Kings euill. S

The decoction of them ſerueth to die woollen cloth withall. T

This Beane being diuided into two parts (the skin taken off) by which it was naturally joyned together, and applied, ſtancheth the bloud which doth too much iſſue forth after the biting of the horſeleach, if the one halfe be laied vpon the place. V

The blacke Beane is not vſed with vs at all, ſeeing, as we haue ſaid, it is rare, and ſowne onely in a few mens gardens, who be delighted in variety and ſtudy of herbes. X

Chap. 508. *Of Kidney Beane.*

¶ *The Kindes.*

THe ſtocke or kindred of the Kidney Bean are wonderfully many; the difference eſpecially conſiſteth in the colour of the fruit: there be other differences, wherof to write perticularly would greatly ſtuffe our Volune with ſuperfluous matter, conſidering that the ſimpleſt is able to diſtinguiſh apart the white Kidney Beane from the blacke, the red from the purple, and likewiſe thoſe of mixt colours from thoſe that are only of one colour: as alſo great ones from the little ones. Wherefore it may pleaſe you to be content with the deſcription of ſome few, and the figures of the reſt, with their ſeuerall titles in Latine and Engliſh, referring their deſcriptions vnto a further conſideration, which otherwiſe would be an endleſſe labour, or at the leaſt needleſſe.

¶ *The Deſcription.*

1 THe firſt kinde of *Phaſeolus* or garden Smilax hath long and ſmall branches growing very high, taking hold with his claſping tendrels vpon poles and ſtickes, and whatſoeuer ſtandeth neere vnto him, as doth the Hop or Vine, which are ſo weake and tender that without ſuch props or ſupporters they are not able to ſuſtaine themſelues, but will run ramping on the ground fruitleſſe: vpon the branches do grow broad leaues almoſt like Iuie, growing together by three, as in the common Trefoile or three leaued Graſſe: among which come the floures, that do vary and differ in their colours, according to the ſoile where they grow, ſometimes white, ſomtimes red, and oftentimes of a pale color: afterwards there come out long cods, whereof ſome are crooked, and ſome are ſtraight, and in thoſe the fruit is contained, ſmaller than the common Beane, ſomwhat flat, and faſhioned like a Kidney, which are of diuers colours, like vnto the floures: whereto for the moſt part theſe are like.

2 There is alſo another *Dolichus* or Kidney Beane, leſſer, ſhorter, and with ſmall cods, whoſe floures and fruit are like in forme to the former Kidney Beanes, but much leſſer, and of a blacke colour.

3 There is likewiſe another ſtrange Kidney Beane, which doth alſo winde it ſelfe about poles and props neere adjoyning, that hath likewiſe three leaues hanging vpon one ſtem, as haue the other Kidney Beans, but euery one is much narrower and alſo blacker: the cods be ſhorter, plainer, and flatter, and containe fewer ſeeds.

4 This

P. lunatus L.

Clus. hist. 2. 225

4 This Kidney bean differeth not from the others but only in the colour of the fruit, which are of a pale yellow colour, wherein conſiſteth the difference.

‡ Beſides the varieties of theſe Kidny beans mentioned by our Author, there are diuers other reckoned vp by *Cluſius*, which haue bin brought from the Eaſt and Weſt Indies, and from ſome parts of Africa. I will only giue you the figures of two or three of them out of *Cluſius*, with the colour of their floures and fruit.

5 The ſtalk of this is low and ſtif: the flours of a whitiſh yellow on the out ſide, and of a Violet colour within: the fruit is ſnow white, with a blacke ſpot in the eye. This is *Phaſeolus peregrinus* 4 of *Cluſius*.

6 This hath leaues like the marſh Trefoile, floures growing many together, in ſhape & magnitude like thoſe of common Peaſe: the coddes were narrow, and contained three or foure ſeeds which were ſmal, no bigger than the ſeeds of *Laburnum*; the painter expreſſed two of them in the leafe next vnder the vppermoſt tuft of flours: this is *Cluſius* his *Phaſeolus peregrinus* 5,

7 This groweth high, winding about poles or other ſupporters: the leaues are narrower than the former: the fruit leſſer and flatter, of a reddiſh colour. This is the *Phaſeolus peregrinus* 6 of *Cluſius*.

8 This windes about poles, and growes to a great

great height, with ſoft hairy leaues and large cods, wherein are contained ſeeds of diuers colours; ſometimes they are red, otherwhiles of a whitiſh aſh colour, ſometimes wholly blacke, and otherwhiles ſpotted.

9 The Egyptian Beane is ſomewhat like the other Kidney beanes in his growing: his fruit is of the bigneſſe of a ſmall Haſell nut, blacke on one ſide, and of a golden yellow or Orenge colour on the other.

Beſides theſe you finde here figured, and diuers others deſcribed by *Cluſius*, I think it not amiſſe to mention two more. The firſt of theſe, which was procured by Mr. *Tradeſcant*, and growes in our Gardens, is a large plant, not differing in maner of growth from the former Indian Kidney Beanes, but his floures are large, many, and of an elegant Scarlet colour: whence it is vulgarly termed by our Floriſts, the Scarlet Beane. The other I haue ſeene grow to a little height, but it would not indure; but the cods of it which were brought to vs were ſome three inches long, and couered with a hairy downe of a reddiſh colour, which put vpon the hands or skin in any part of the body would ſting like a Nettle, and this was called the Stinging Beane: I thinke it came from ſome part of the Eaſt-Indies.

¶ The

¶ *The Place.*

Kidney Beanes doe eaſily and ſoone ſpring vp, and grow into a very great length, being ſowne neere to long poles faſtned hard by them, or hard by arbors or banqueting places, otherwiſe they lie flat on the ground, ſlowly come vp, hardly bring forth fruit, and become faulty and ſmitted, as *Theophraſtus* writeth.

¶ *The Time.*

It is ſowne in the Spring, eſpecially in the midſt of April, but not before: the fruit is ripe about tbe end of Summer.

¶ *The Names.*

Hippocrates, *Diocles*, *Theophraſtus*, and moſt of the other old Writers do call it δόλιχον: diuers of the bigneſſe of the ſeed do name it λόβον and λόβιον: in Latine, *Siliqua*: *Dioſcorides* calleth it *Smilax*, becauſe it climeth vp as *Smilax* doth, and taketh hold of props, ſtaies, and ſhrubbes ſtanding neere vnto it: others name it φασίολον, a Diminitiue deriued from φάσηλος: for φάσηλος and φασίολος are not one and the ſelfe ſame pulſe called by diuers names, as ſome ſuppoſe, but ſundry fruits one differing from the other, as *Galen* in his firſt booke of the Faculties of Nouriſhments doth ſufficiently declare, where he intreateth of them both. For firſt he diſputeth of *Phaſeli* and *Ochri*, Beanes and Peaſe; then afterward others comming betweene, he writeth of *Dolichus*, which alſo is named *Phaſeolus*: and though hee may be thought to doubt what manner of pulſe that is which *Theophraſtus* calleth *Dolichus*: notwithſtanding he gathereth and concludeth that it is a fruit of a garden plant in Italy, and in Caria, growing in the fields, which is in forme longer than the Cichlings, and was commonly called in his time *Faſeolus*. Of his opinion is *Paulus Ægineta*, writing of *Phaſeolus*, which he nameth *Dolychus*, in the 79. chap. of his firſt booke. Moreouer, *Faſelus* was in times paſt a common pulſe in Italy and Rome, and *Dolichus* a ſtrange pulſe; for *Columella* and *Palladius*, writers of husbandry, haue made mention of the ſowing of *Phaſelus*: and *Virgil* calleth it *Vilis* in the firſt of his Georgicks: but concerning the ſowing of *Dolichus* or Kidney Beane, none of the Latines haue written, by reaſon that the ſame was rare in Italy, and ſowne onely in gardens, as *Galen* hath affirmed, naming it oftentimes a garden plant, and ſhewing that the ſame, as we haue ſaid, is ſowne in Caria; and likewiſe *Dioſcorides* nameth it σμίλαξ κηπαία, that is to ſay, *Smilax hortenſis*, or garden Smilax, becauſe it groweth in gardens: who alſo writing of this in another ſeuerall chapter, ſheweth plainely, that *Smilax hortenſis*, or *Dolichus*, which he nameth *Phaſeoluschus*, is another plant differing from *Faſelus*.

Forwhich cauſes it is not to be doubted, but that *Phaſelus* with three ſyllables, differeth from *Faſeolus* with foure ſyllables, no otherwiſe than *Cicer*, *Cicercula*, and *Cicera* differ, which notwithſtanding be neere one to another in names: and it is not to be doubted but that they are deceiued, who thinke it to be one and the ſelfe ſame Pulſe called by ſundry names.

This plant is named in Engliſh, Kidney Beane, Sperage Beanes: of ſome, Faſelles, or long Peaſon, French Beanes, Garden Smilax, and Romane Beanes: in French, *Feues de Romme*: in Dutch, **Turcksbooneu.**

¶ *The Temperature.*

Kidney Beans, as *Dioſcorides* teacheth, do more looſe the belly than Peaſon; they are leſſe windy, and nouriſh well, and no leſſe than Peaſon, as *Diocles* ſaith: they be alſo without ingendring windineſſe at all: the Arabian Phyſitions ſay that they are hot and moiſt of nature.

¶ *The Vertues.*

A The fruit and cods of Kidney Beanes boyled together before they be ripe, and buttered, and ſo eaten with their cods, are exceeding delicate meat, and doe not ingender winde as the other Pulſes doe.

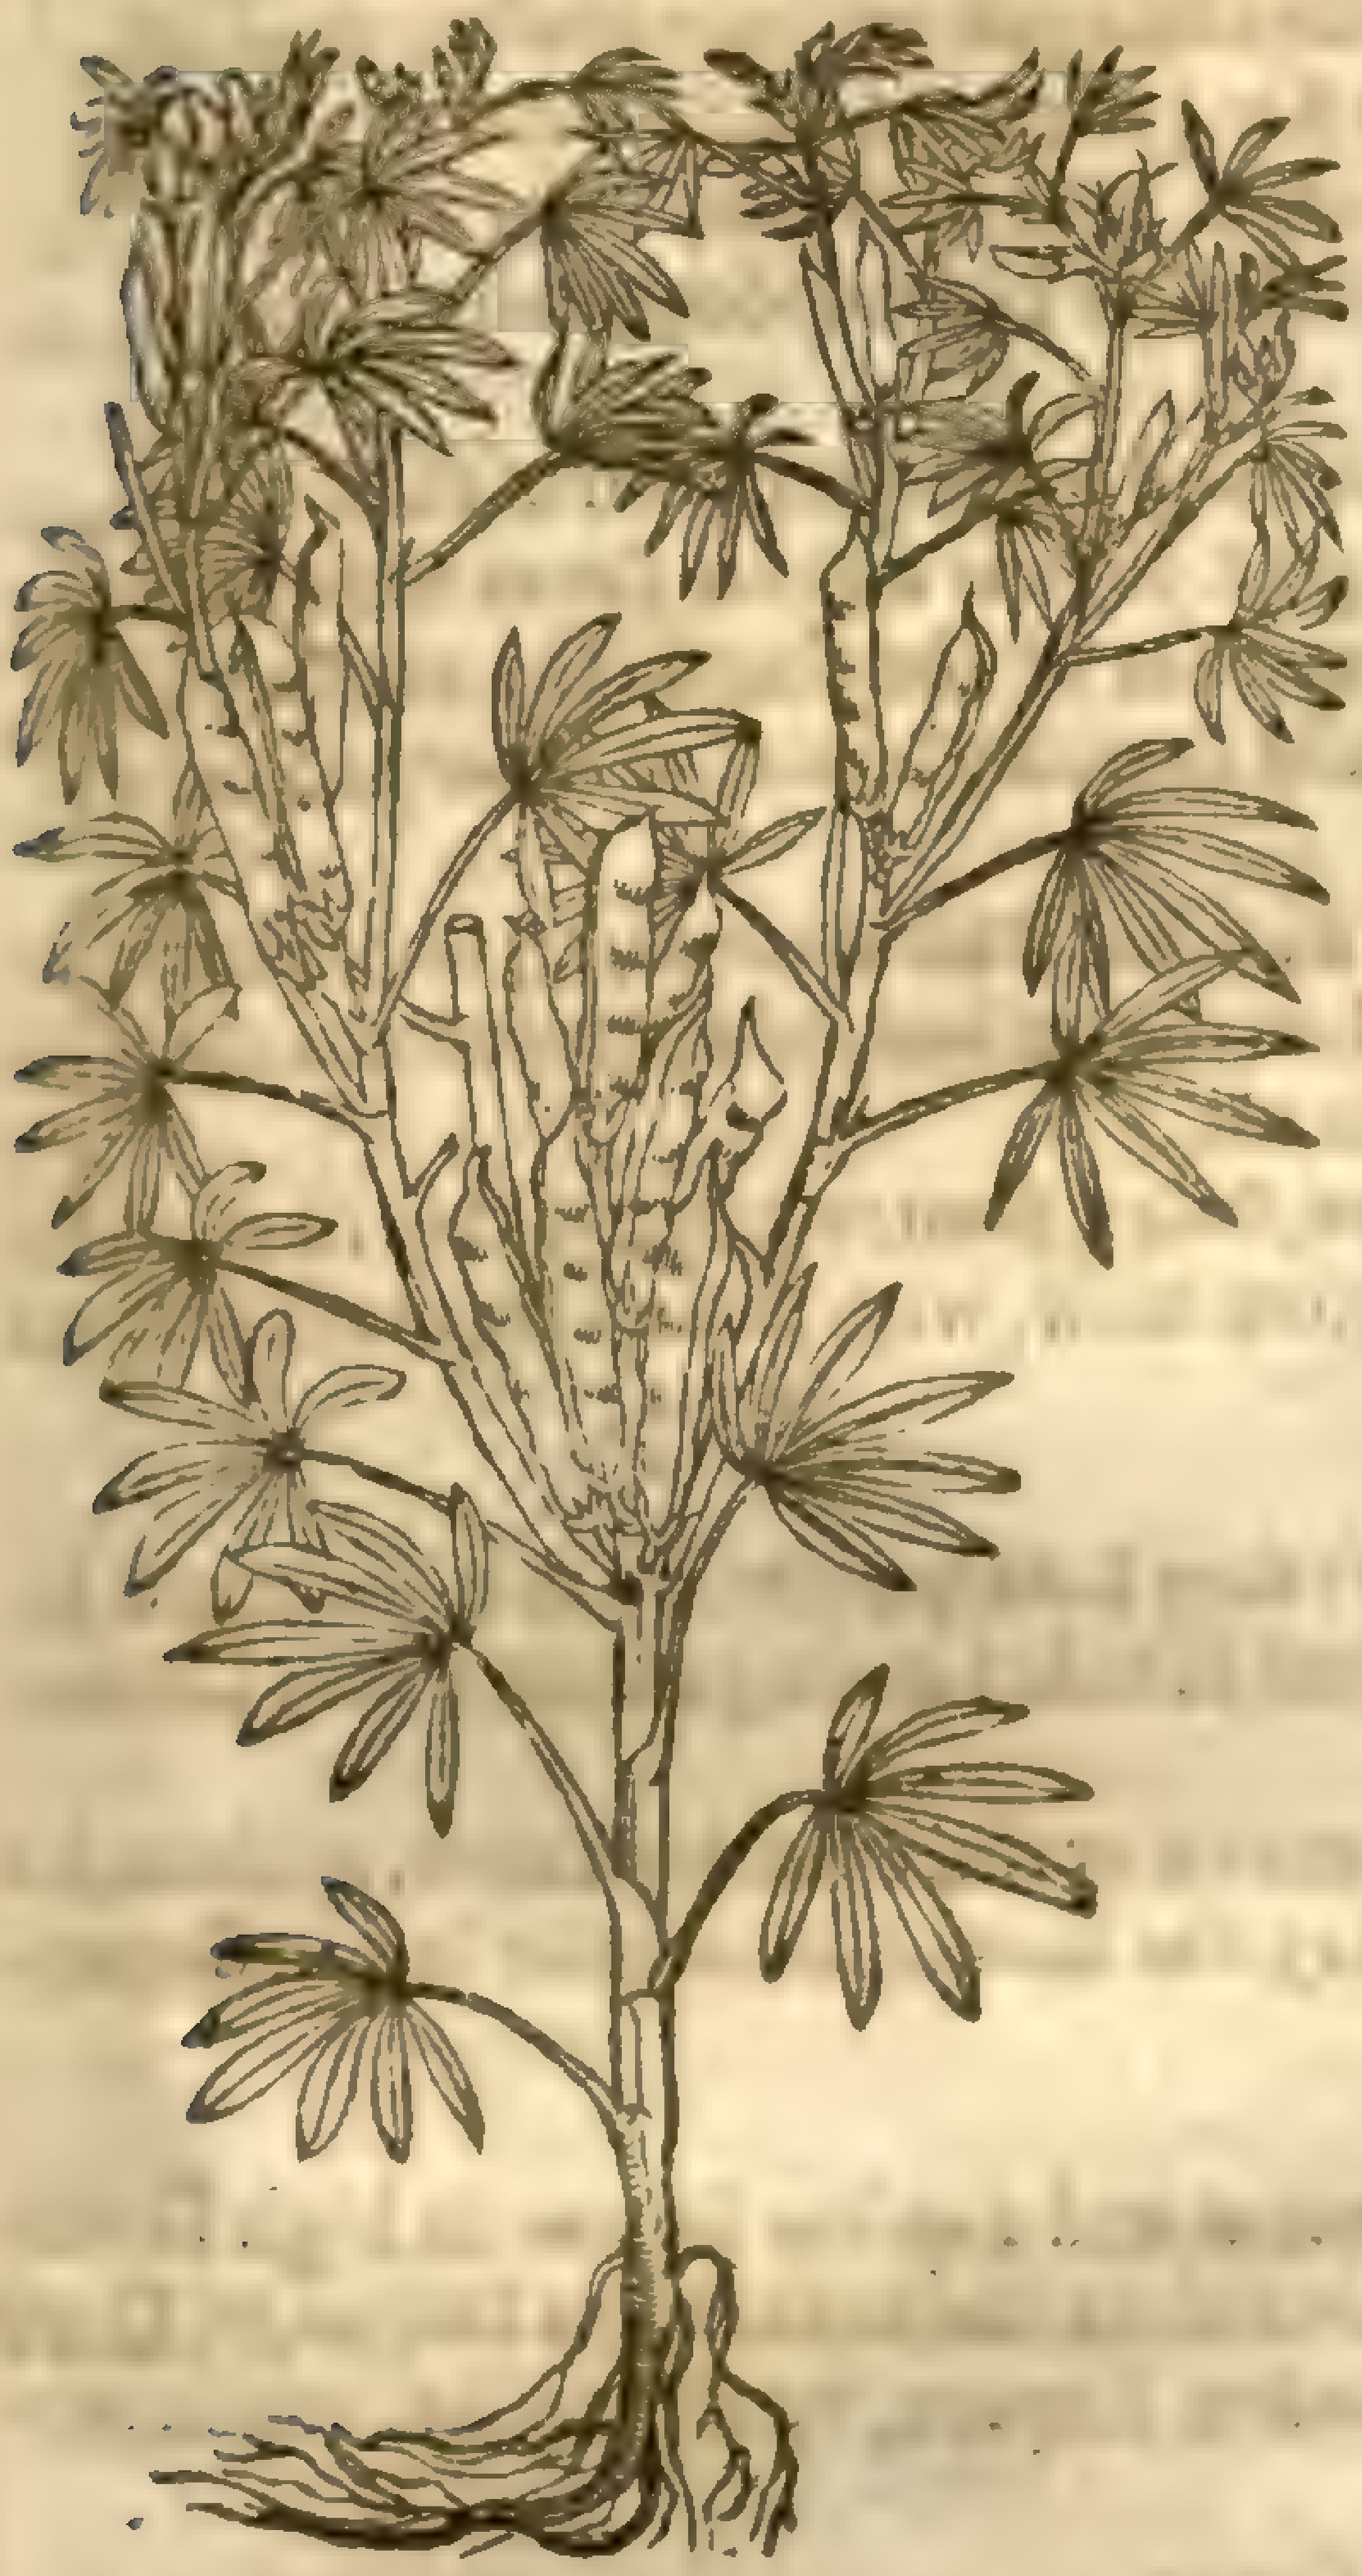
B They doe alſo gently looſe the belly, prouoke vrine, and ingender good bloud reaſonable well, but if you eat them when they be ripe, they are neither toothſome nor wholeſome. Therefore they are to be taken whileſt they are yet greene and tender, which are firſt boyled vntill they be tender; then is the rib or ſinew that doth run alongſt the cod to be taken away; then muſt they be put into a ſtone pipkin, or ſome other veſſell with butter, and ſet to the fire againe to ſtew, or boyle gently: which meat is very wholeſome, nouriſhing, and of a pleaſant taſte.

Chap. 509. *Of the flat Beane called Lupine.*

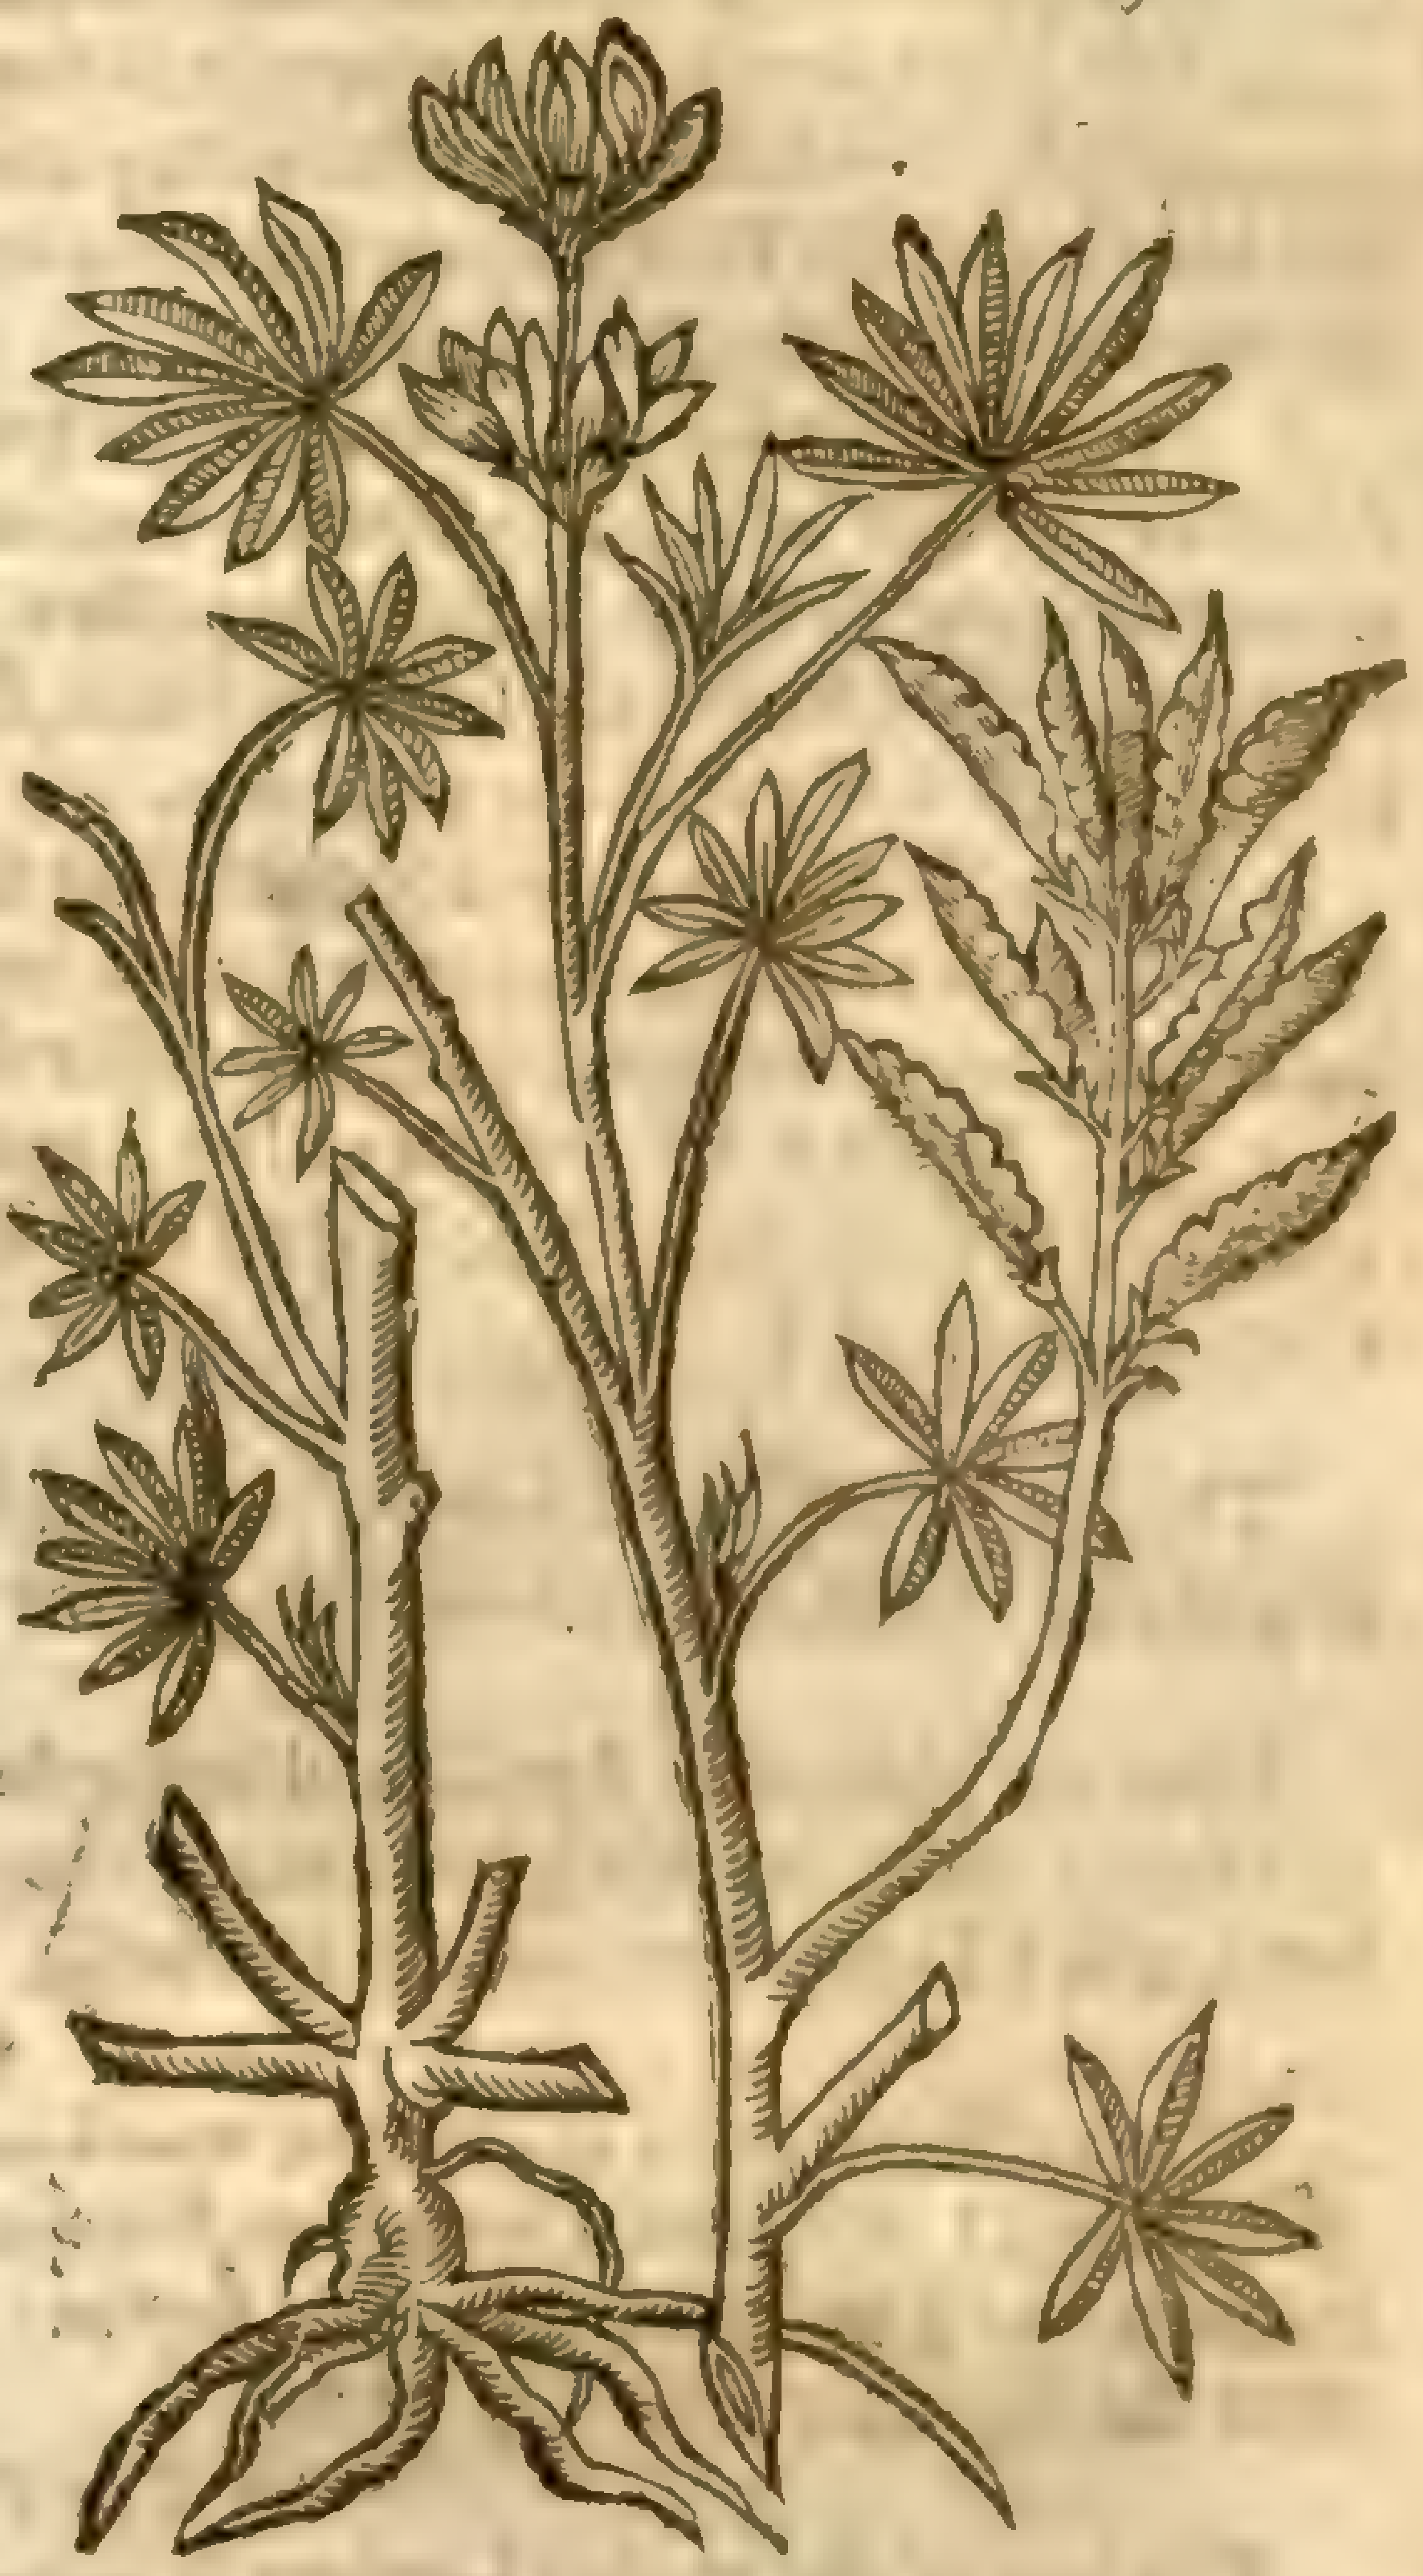
¶ *The Deſcription.*

1 THe tame or Garden Lupine hath round hard ſtems, which of themſelues doe ſtand vpright without any ſuccour, help or ſtay: the leaues conſiſt of fiue, ſix, or ſeuen joyned together,

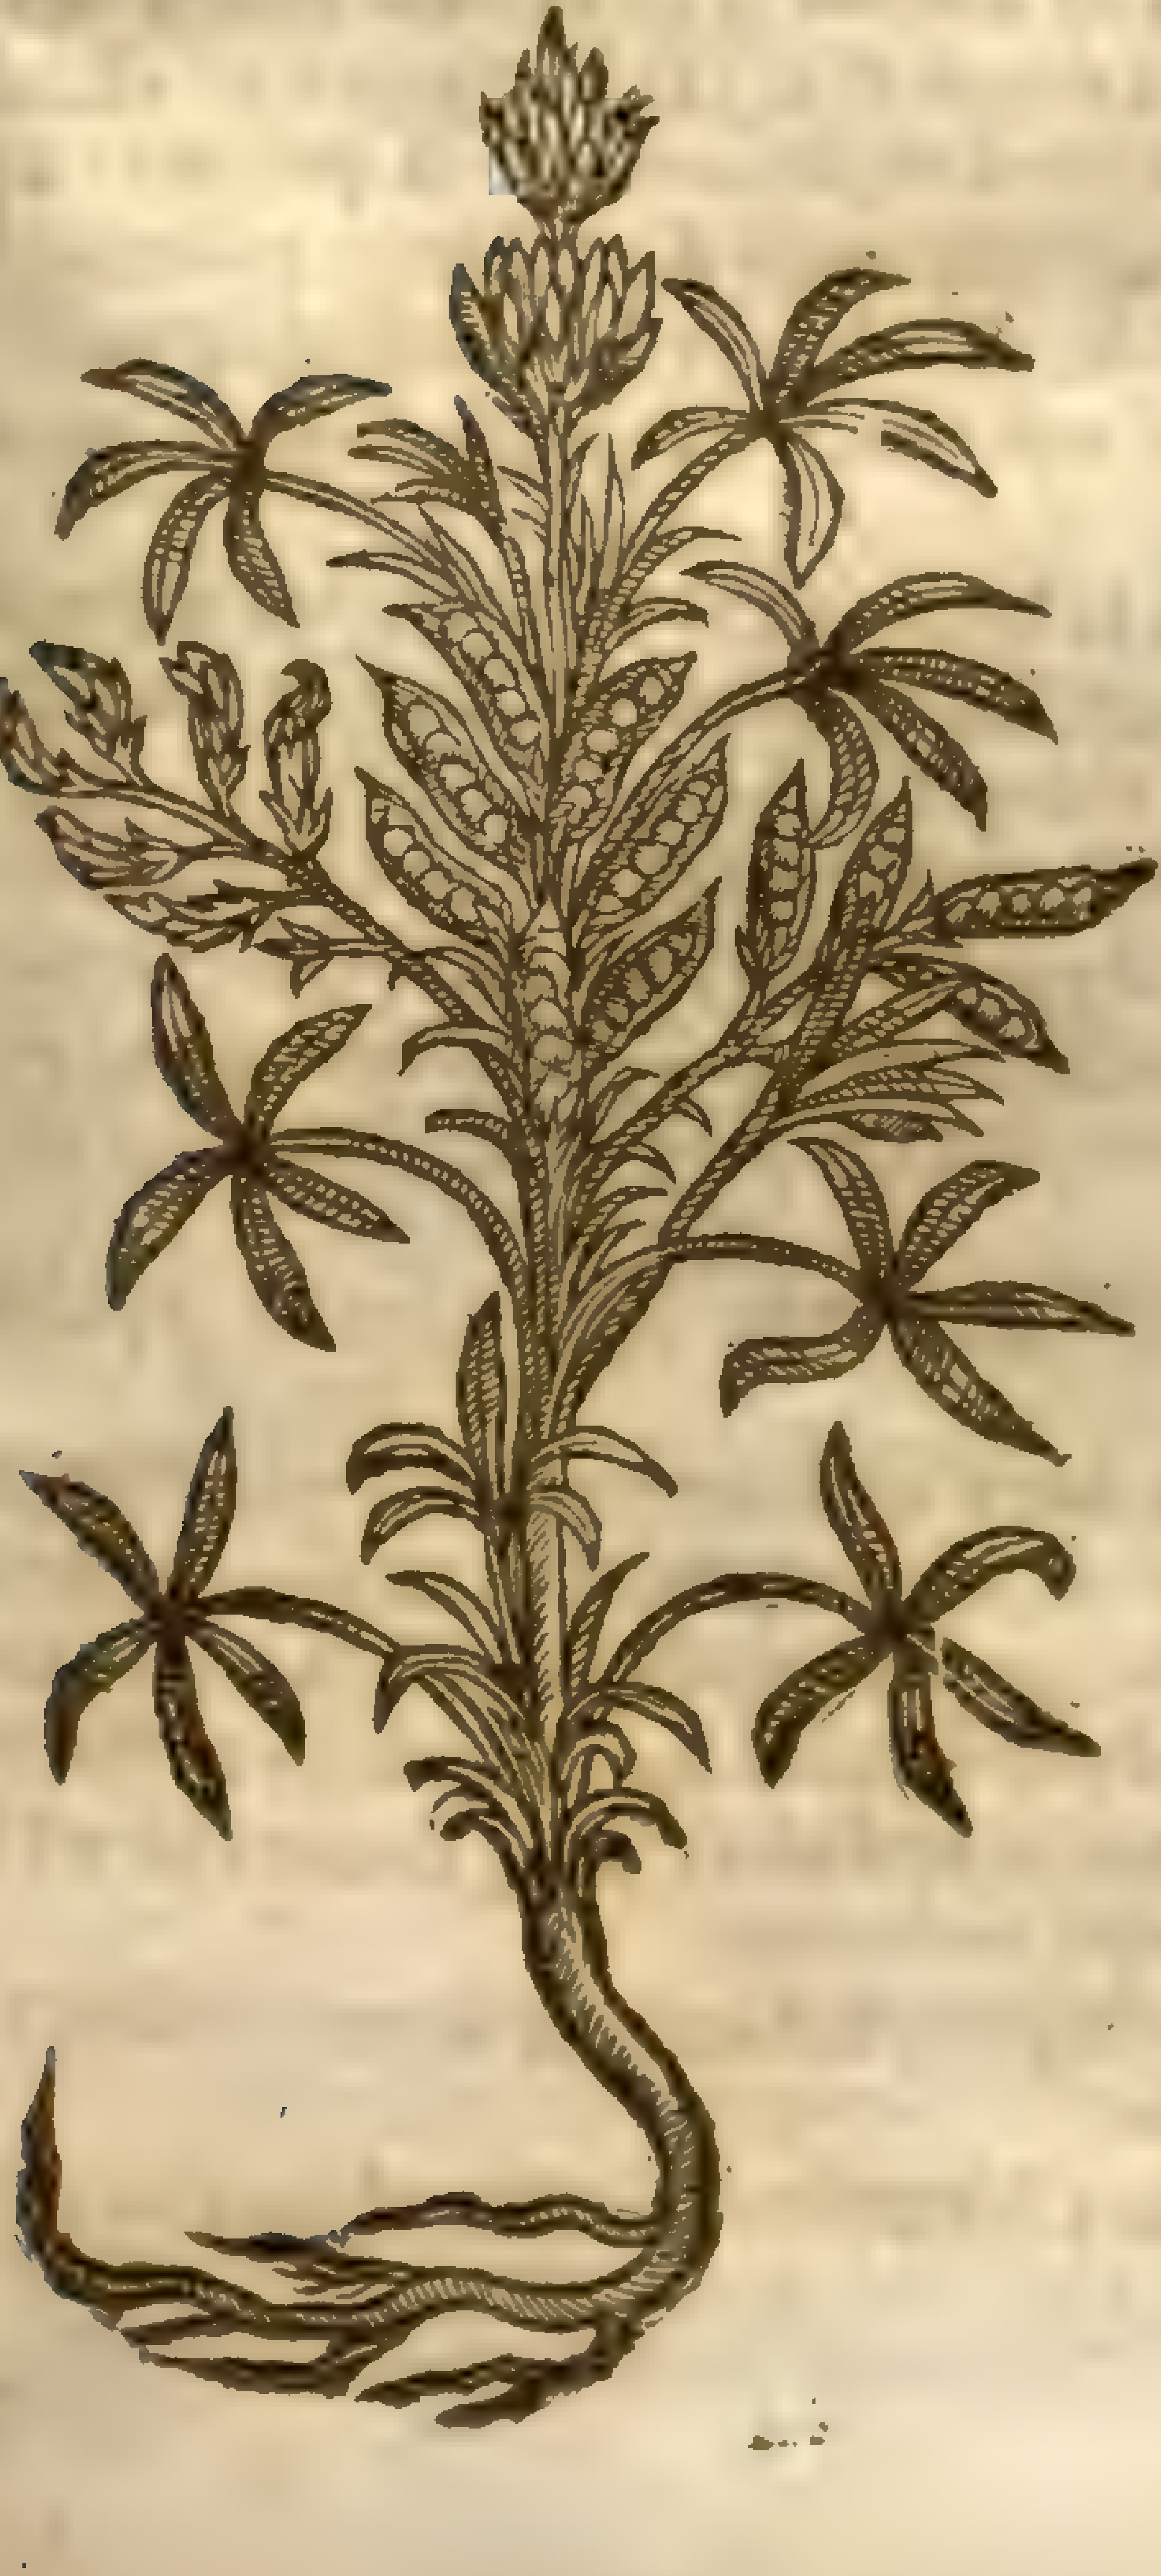
1 *Lupinus ſativus.*
Garden Lupines.



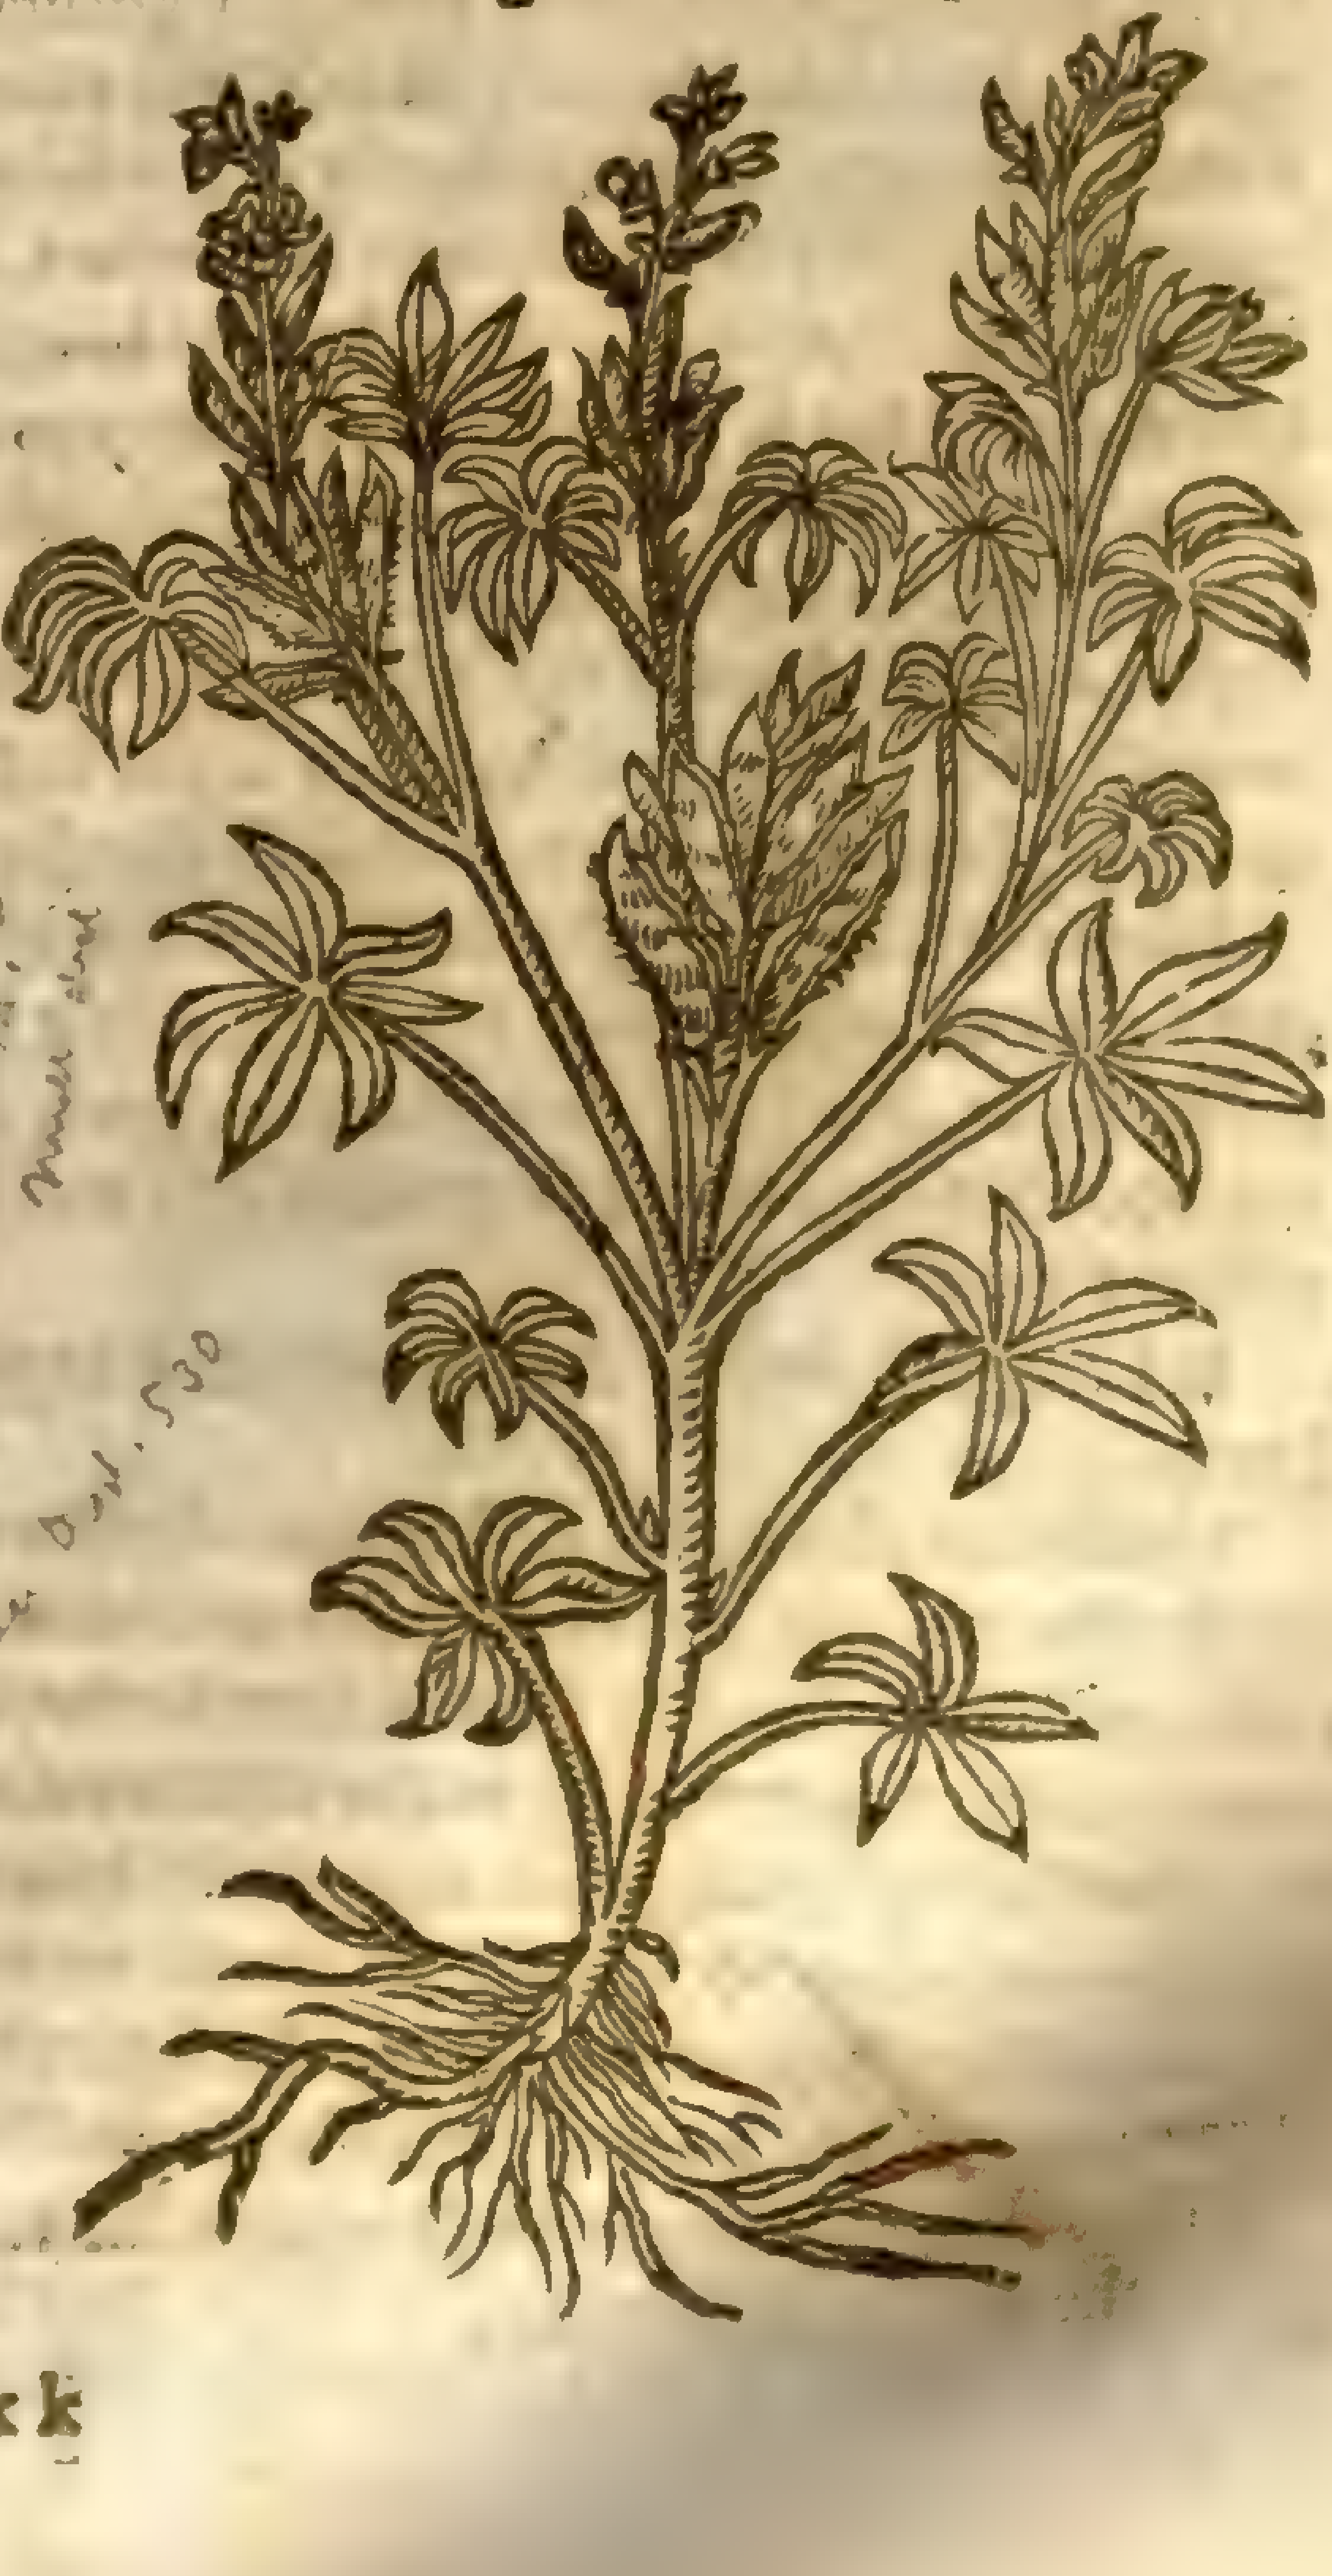
2 *Lupinus flore luteo.*
Yellow Lupines.



3 *Lupinus flore cæruleo.*
Blew Lupine.



‡ 4 *Lupinus major flo. cæruleo.*
The great blew Lupine.



L. [illegible] much alike
2. See Dod. 530

gether, like thoſe of the Chaſt tree, greene on the vpper ſide, and on the nether ſide white and downy; and in the euening about the ſetting of the Sun they hang flagging downwards as though they were withered: among theſe there commeth vp a tuft of flours of a pale or light bluſh colour, which turne into great rough cods, wherein is the fruit, which is flat and round like a cake, of a white colour, and bitter in taſte: and where they cleaue vnto the cod, in that part they haue a certaine dent like a little nauell. This Lupine hath but one root, which is ſlender and wooddy, hauing hanging on it a few ſmall threds like haires.

2 The yellow Lupine is like to the garden one in ſtalke and leaues, yet both of theſe leſſer and ſhorter. It hath beautifull floures of an exceeding faire gold yellow colour, ſweet of ſmell, made vp into an eare, of the colour of the yellow Violet, and ſomewhat of the ſmell: the cods are ſmall, hard, ſomewhat hairy: the ſeeds be little, flat, round, in taſte extreme bitter, of ſundry colours, ill-fauoured, far leſſer than the tame one.

3 The blew Lupines are longer than the yellow, and diuided into more wings or branches: the leaues be leſſer and thinner: the floures ſmall: and leſſer than the yellow, of a blew colour: the ſeeds be alſo of diuers colours, bitter, and leſſer than any of them all.

‡ 4 There is alſo another blew Lupine, whoſe leaues, ſtalks, floures, and cods are like: but larger then thoſe of the firſt deſcribed: the floures are of colour blew, with ſome whiteneſſe here and there intermixt. ‡

¶ *The Place.*

They require (ſaith *Theophraſtus*) a ſandy and bad ſoile: they hardly come vp in tilled places, being of their owne nature wilde: they grow in my garden, and in other mens gardens about London.

¶ *The Time.*

They are planted in Aprill, and bring forth their fruit at two or three ſundry times, as though it did floure often, and bring forth many crops: the firſt in May, the ſecond in Iuly, the laſt in September, but it ſeldome commeth to ripeneſſe.

¶ *The Names.*

This pulſe is named in Greeke, θέρμος ἥμερος: in Latine: *Lupinus*, and *Lupinus ſatiuus*: in high Dutch, **Feigbonen**: in Italian, *Lupino domeſtico*: in Spaniſh, *Entramocos*: in the Brabanders language, **Wijch boonen**, and **Lupinen**: in French, *Lupins*: in Engliſh, Garden Lupine, tame Lupine, and of ſome after the German name Fig-beane.

¶ *The Temperature and Vertues.*

A The ſeed of the garden Lupines is πολύχρηστον, that is to ſay, much and often vſed, as *Galen* ſaith in his books of the Faculties of Nouriſhments: for the ſame being boyled and afterwards ſteeped in faire water, vntill ſuch time as it doth altogether loſe his naturall bitterneſſe, and laſtly being ſeaſoned with a reaſonable quantity of ſalt, it is eaten with pickle. The Lupine is of an hard and earthy ſubſtance, wherfore it is neceſſarily of hard digeſtion, and containeth in it a thicke juyce; of which being not perfectly concocted in the veines, is engendred a bloud or juyce which is properly called crude, or raw: but when it hath loſt all his bitterneſſe by preparing or dreſſing of it (as aforeſaid) it is like τοῖς ἀποίοις, that is to ſay, to ſuch things as are without reliſh, which is perceiued by the taſte; and being ſo prepared, it is, as *Galen* writeth in his books of the Faculties of ſimple medicines, one of the emplaiſtickes or clammers.

B But whileſt the naturall bitterneſſe doth as yet remaine, it hath power to clenſe and to conſume or waſte away; it killeth wormes in the belly, being both applied in manner of an ointment and giuen with hony to licke on, and alſo drunke with water and vineger.

C Moreouer, the decoction thereof inwardly taken, voideth the wormes; and likewiſe if it be ſundry times outwardly vſed as a bath, it is a remedy againſt the morphew, ſore heads, the ſmall Pox, wilde ſcabs, gangrenes, venomous vlcers, partly by clenſing, aud partly by conſuming and drying without biting; being taken with Rue and Pepper, that it may be the pleaſanter, it ſcoureth the liuer and milt.

D It bringeth downe the menſes, and expelleth the dead childe if it be laied to with myrrhe and hony.

E Moreouer, the meale of Lupines doth waſte or conſume away without any biting quality, for it doth not onely take away blacke and blew ſpots that come of dry beatings, but alſo it cureth *Choradas*, and *Phymata*: but then it is to be boyled either in vineger or oxymell, or elſe in water and vineger, and that according to the temperature of the grieued parties, and the diuerſities of the diſeaſes, *Quod ex vſu eſt eligendo*: and it alſo taketh away blew marks, and what thing ſoeuer elſe we haue ſaid the decoction could do, all the ſame doth meale likewiſe performe.

F Theſe Lupines, as *Dioſcorides* doth furthermore write, being boyled in raine water till they yeeld a certaine creame, are good to clenſe and beautifie the face.

G They cure the ſcabs in ſheepe with the root of blacke Chameleon Thiſtle, if they be waſhed with the warme decoction.

The root boyled with water and drunke, prouoketh vrine. H

The Lupines being made ſweet and pleaſant, mixed with vineger and drunke, take away the lothſomneſſe of the ſtomacke, and cauſe a good appetite to meat. I

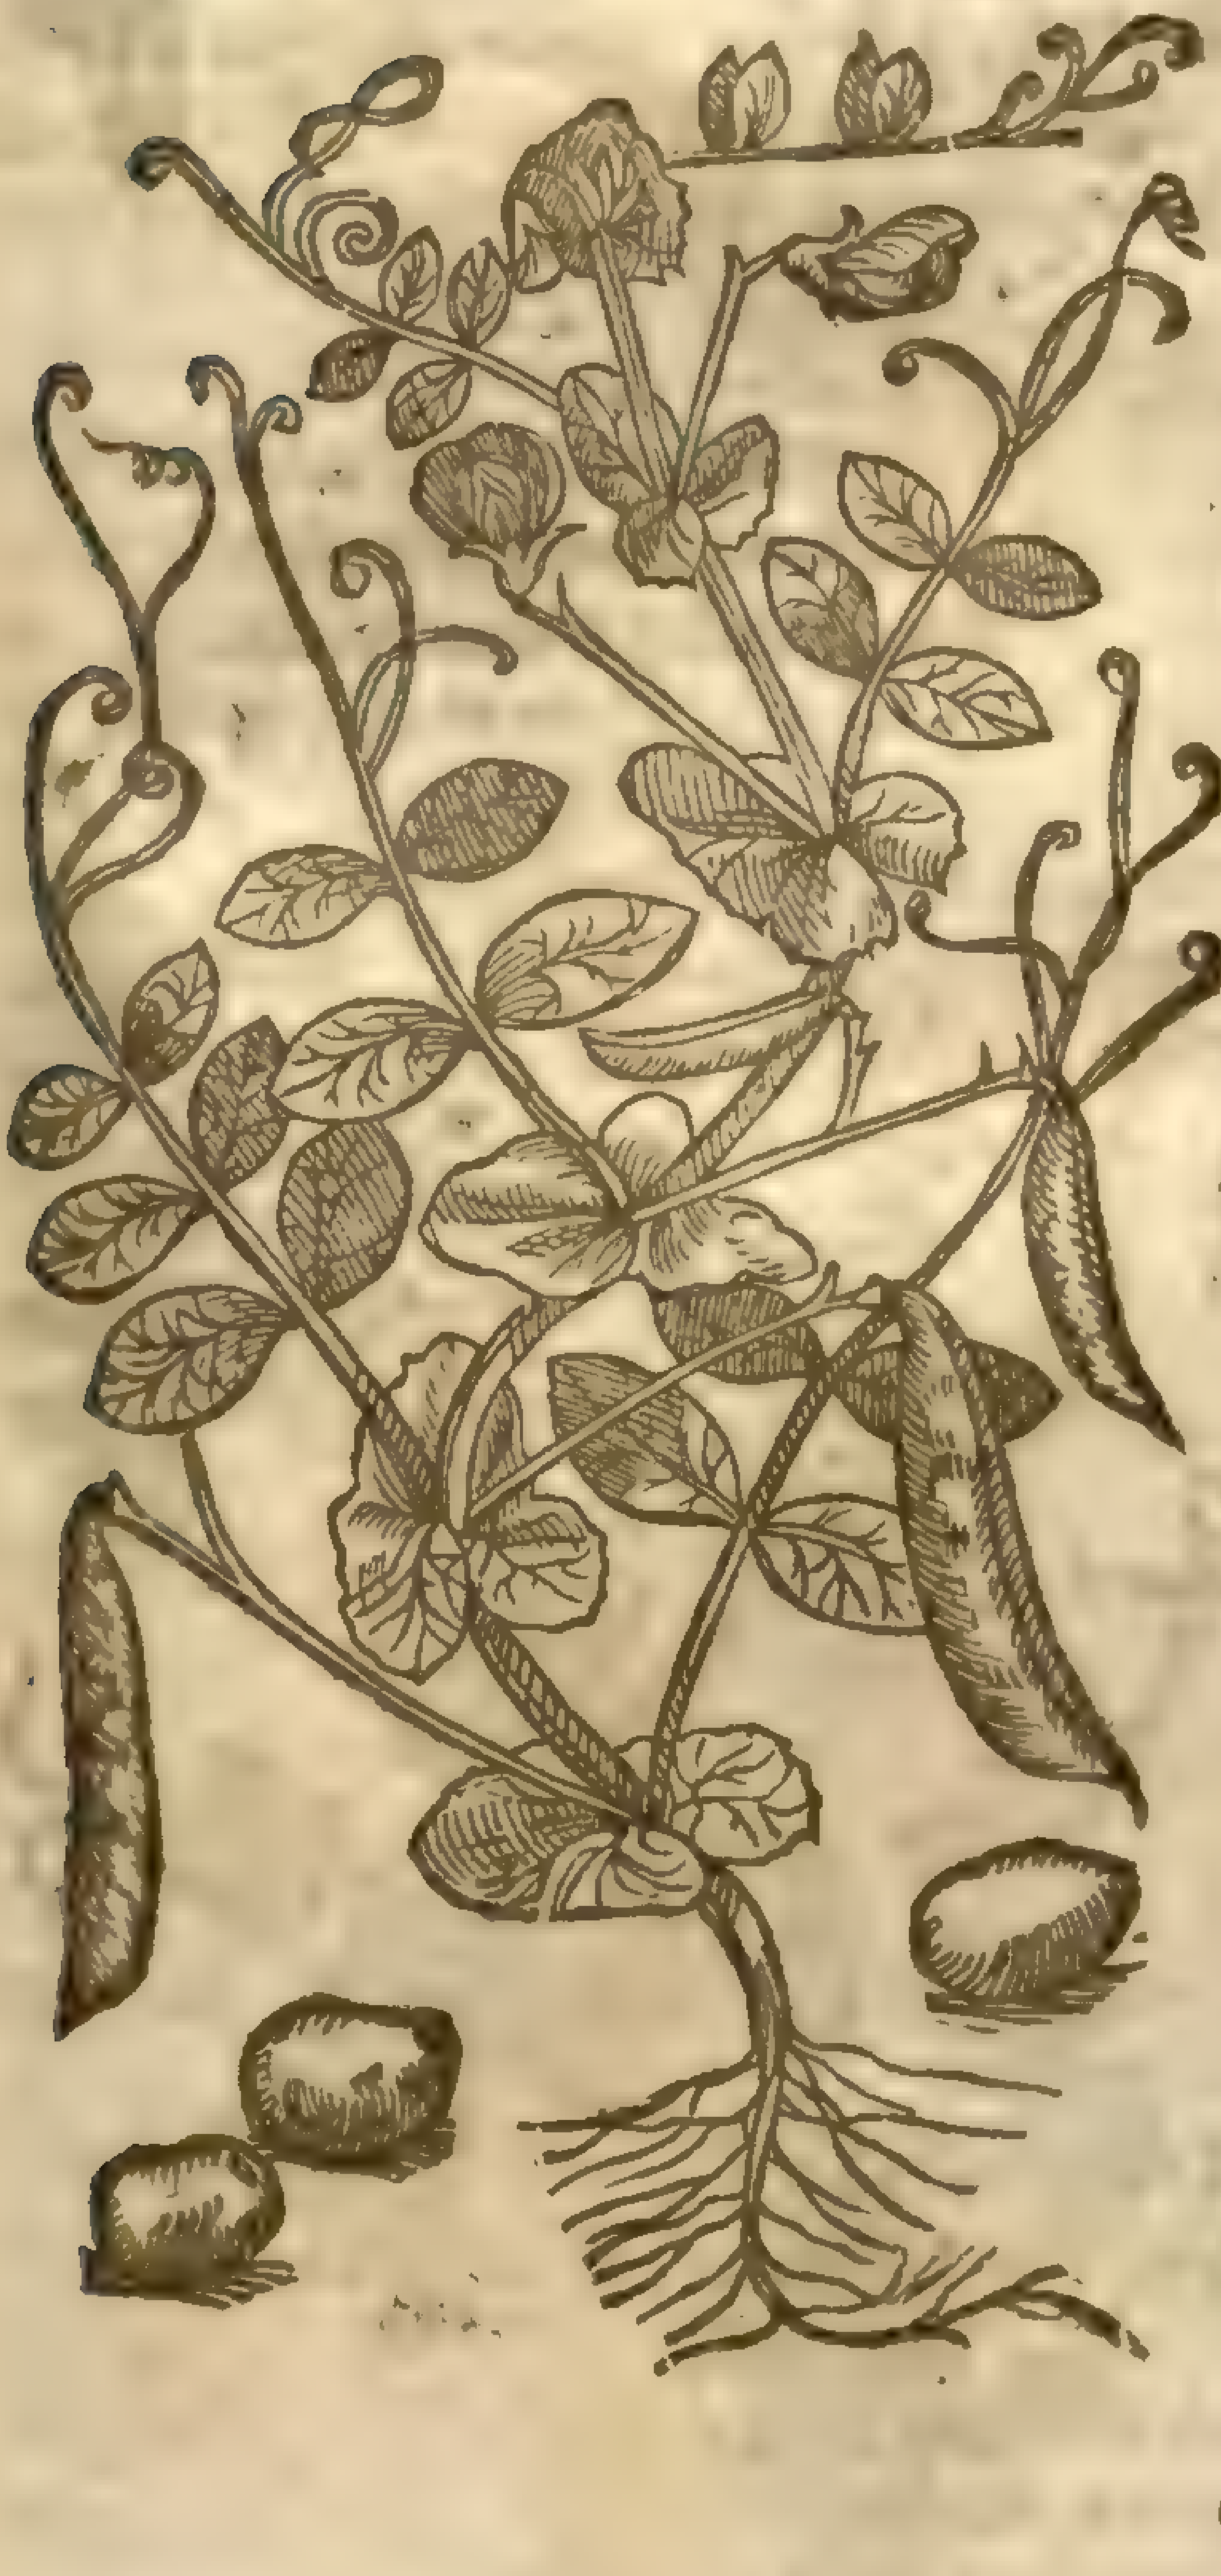
Lupines boyled in that ſtrong leigh which Barbards do vſe, and ſome Wormwood, Centorie and bay ſalt added thereto, ſtay the running and ſpreading of a *Gangræna*, and thoſe parts that are depriued of their nouriſhment and begin to mortifie, and ſtaieth the ambulatiue nature of running and ſpreading vlcers, being applied thereto very hot, with ſtuphes of cloth or tow. K

Chap. 510. *Of Peaſon.*

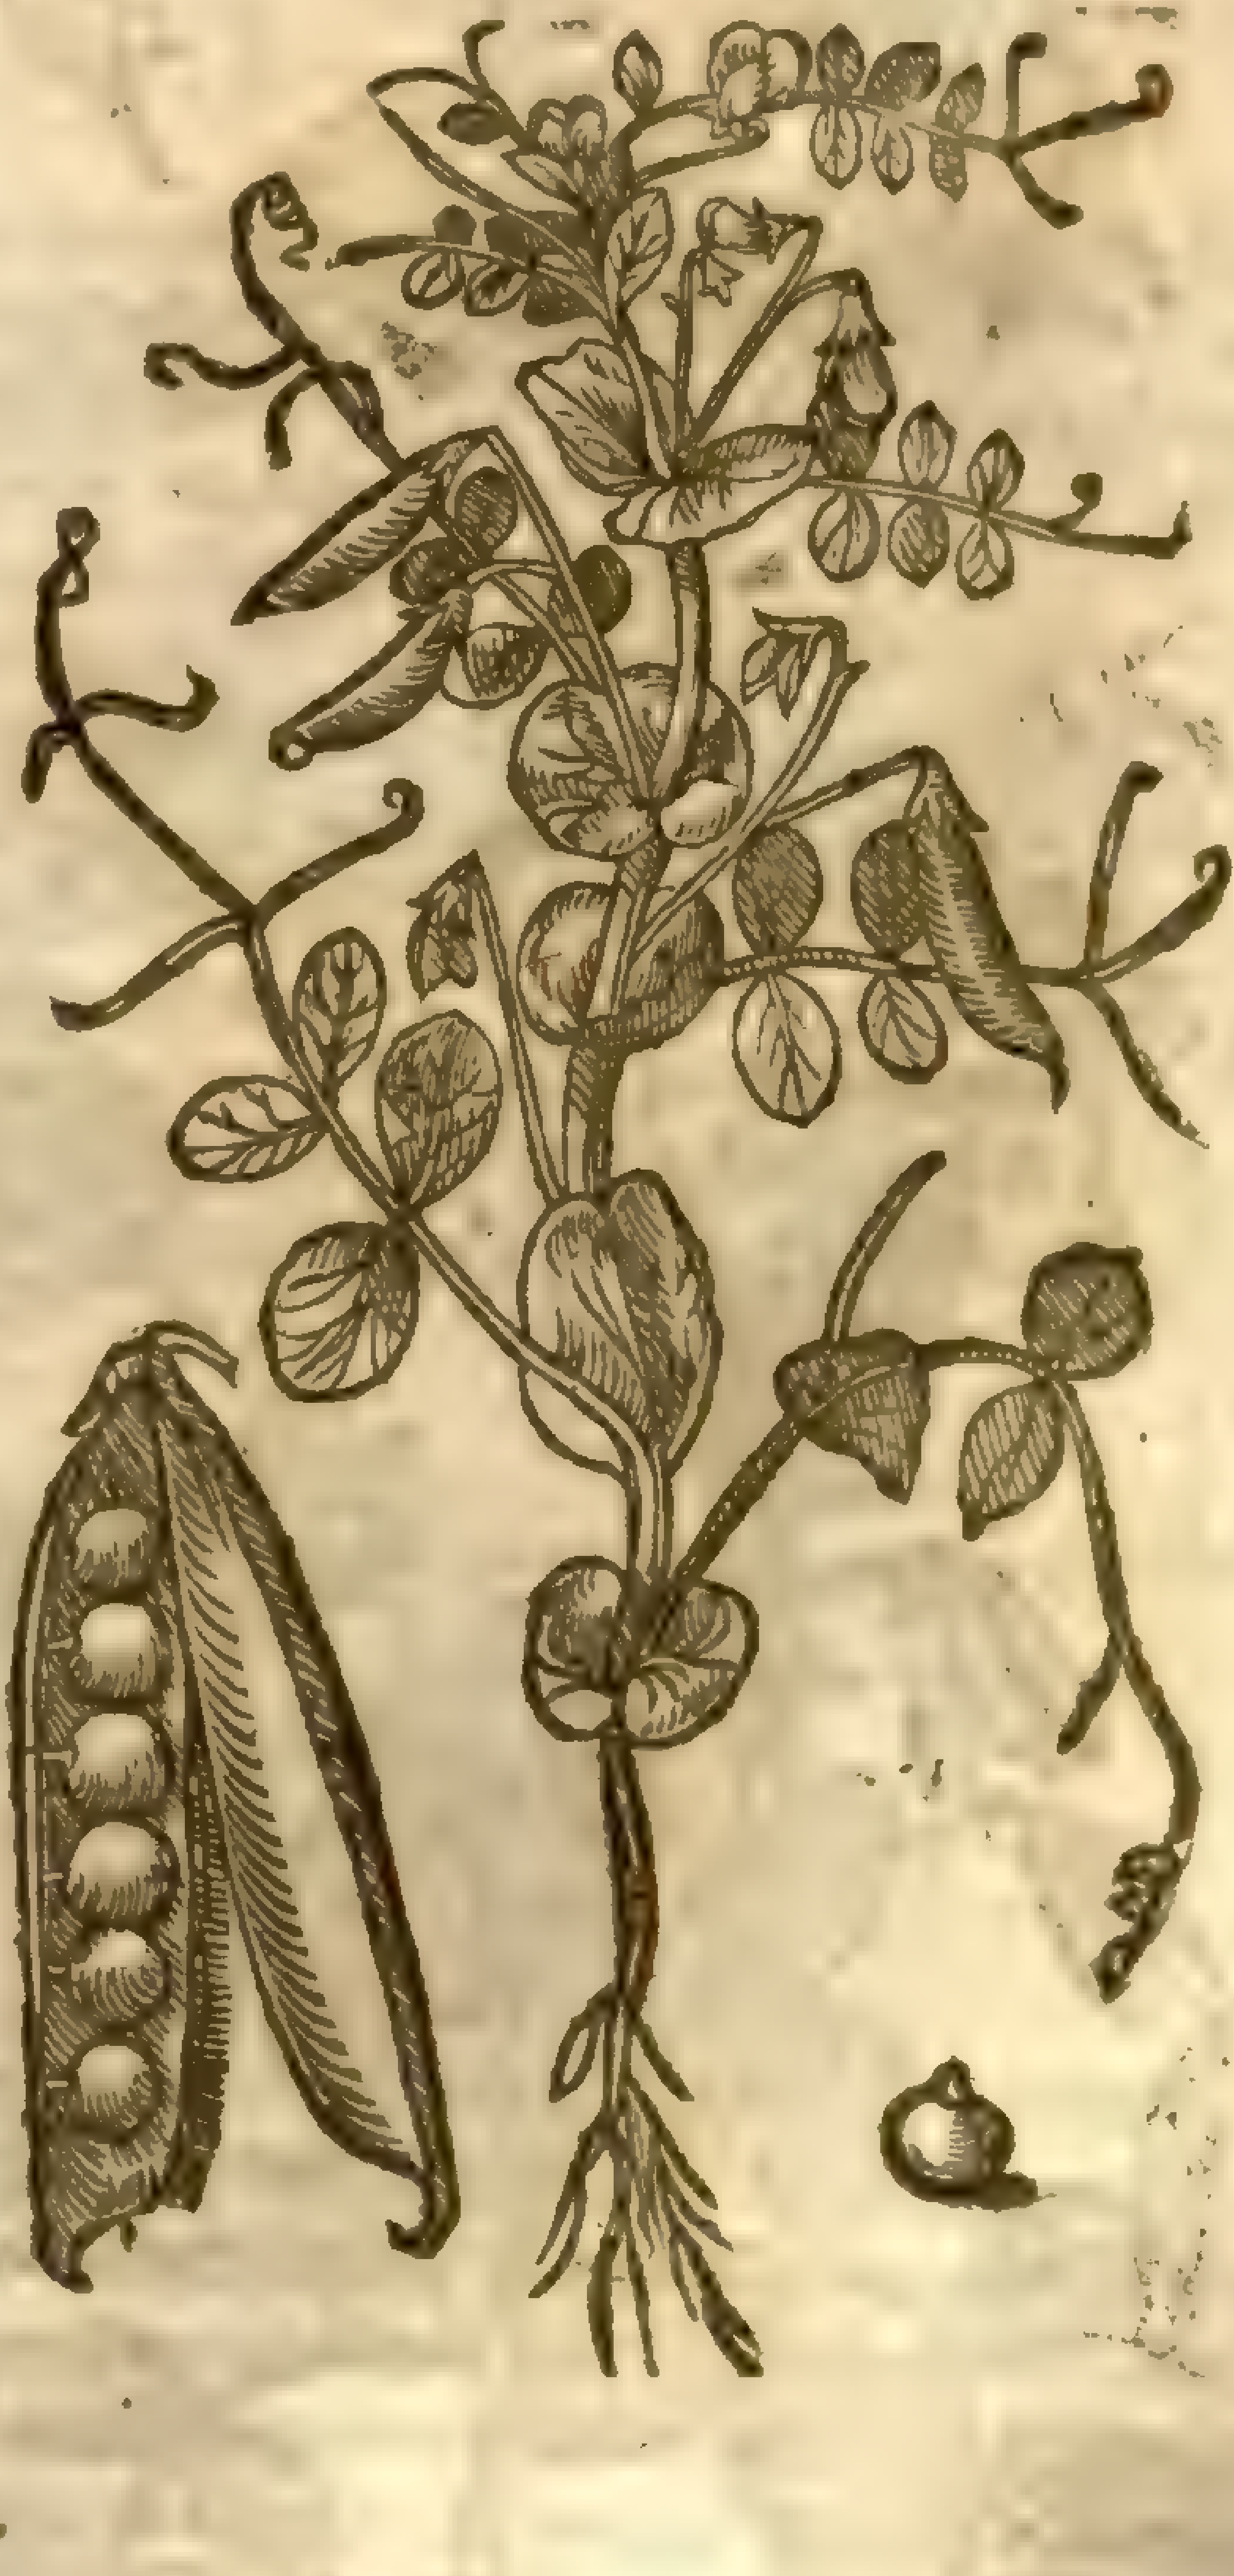
¶ *The Kindes.*

THere be diuers ſorts of Peaſon, differing very notably in many reſpects; ſome of the garden, and others of the field, and yet both counted tame: ſome with tough ſkinnes or membranes in the cods, and others haue none at all, whoſe cods are to be eaten with the Peaſe when they be young, as thoſe of the young Kidney Beane: others carrying their fruit in the tops of the branches, are eſteemed and taken for Scottiſh Peaſon, which is not very common, There be diuers ſorts growing wild, as ſhall be declared.

P. sativum & ood. 521



1 *Piſum majus.*
Rowncivall Peaſe.

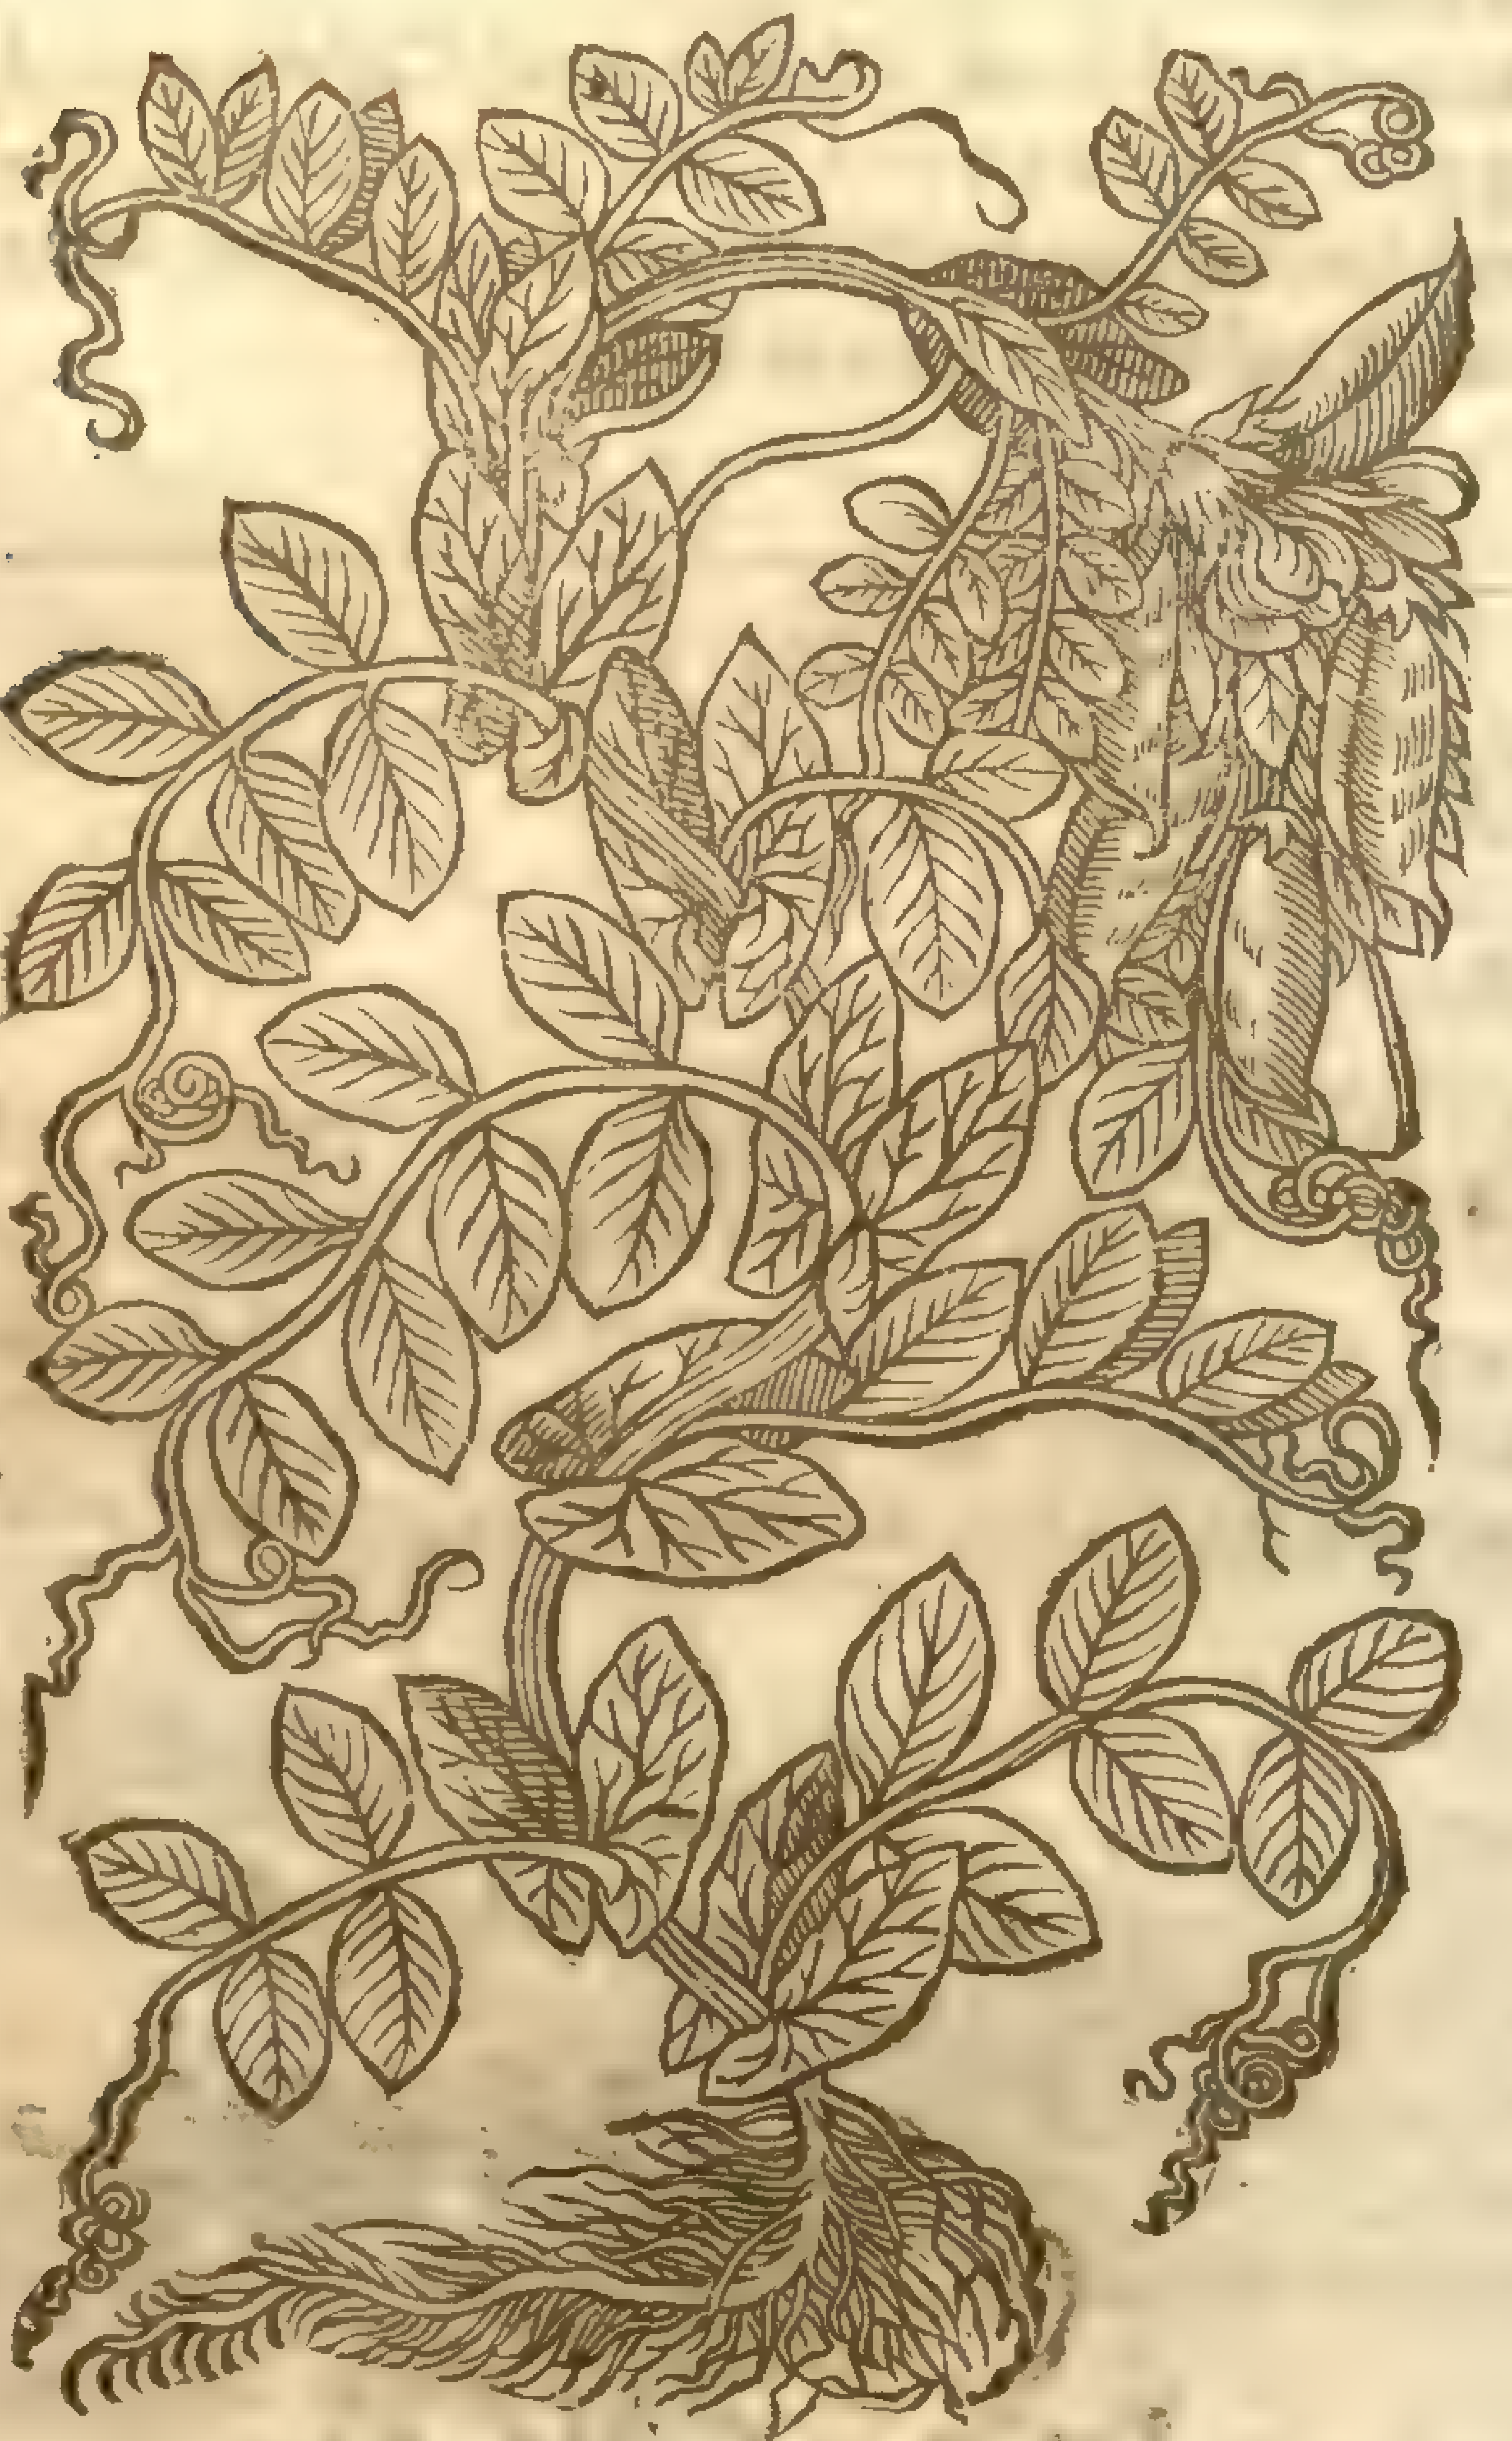


2 *Piſum minus.*
Garden and field Peaſe.

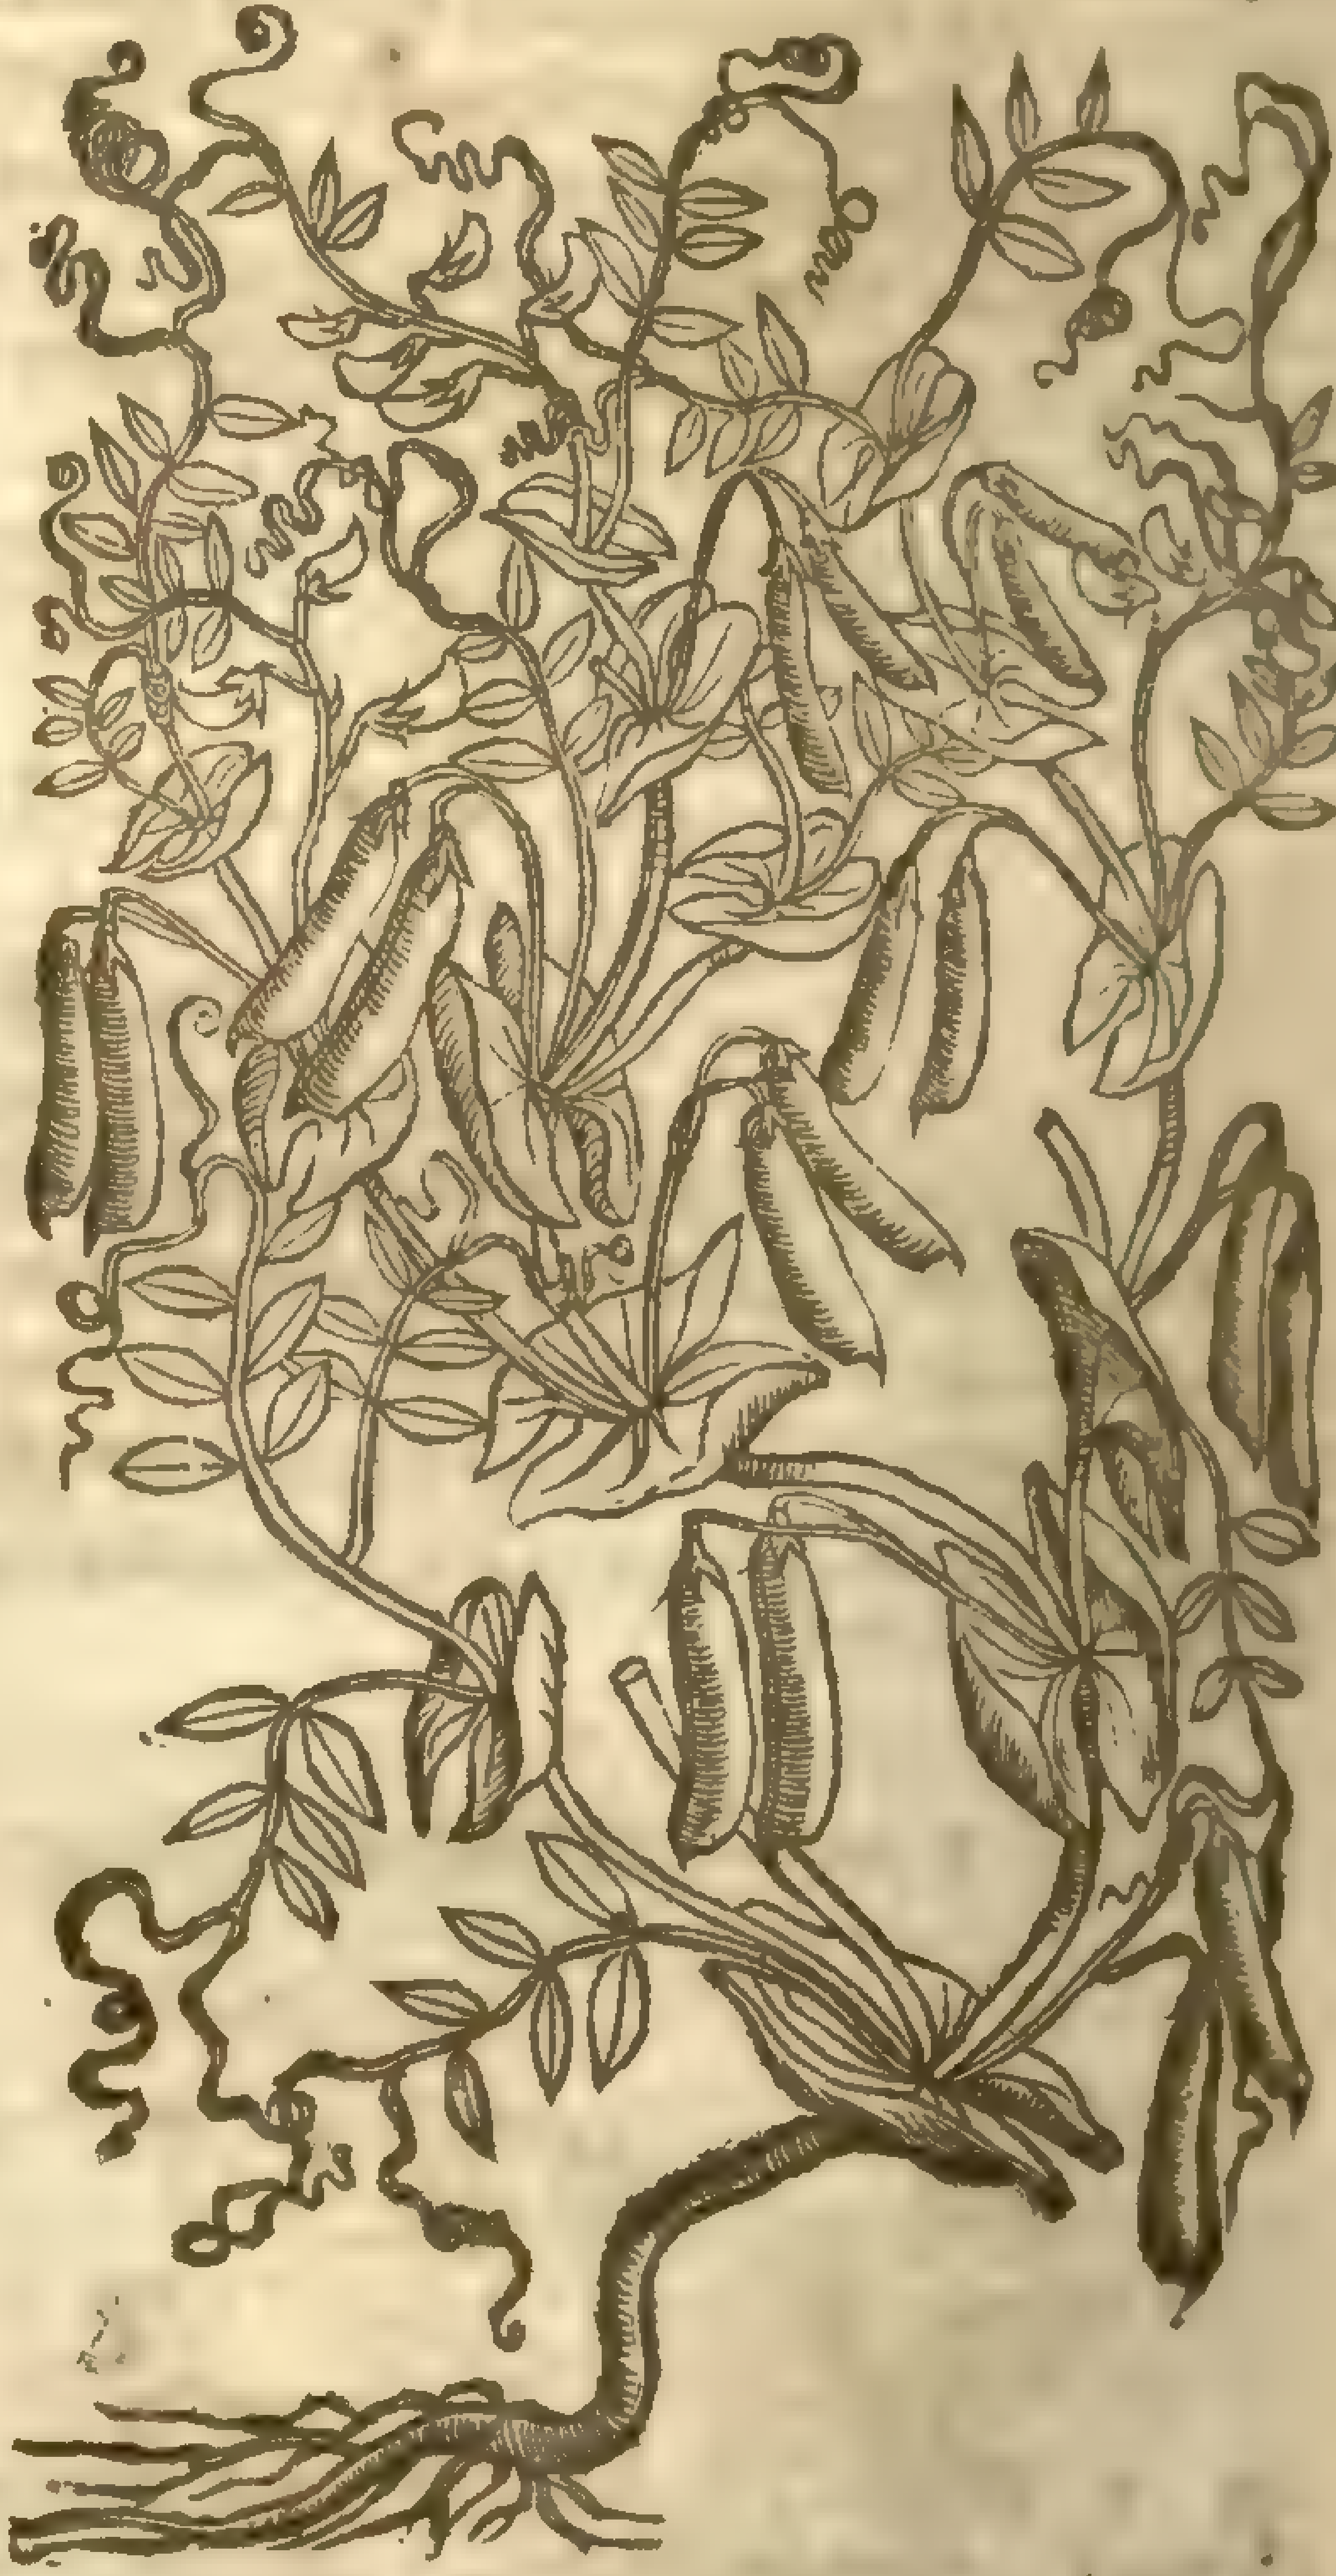
¶ *The Deſcription.*

1 THe great Peaſe hath long ſtalks, hollow, brickle, of a whitiſh green colour, branched, and ſpred vpon the ground, vnleſſe they be held vp with proppes ſet neere vnto them: the leafe thereof is wide and long, made vp of many little leaues which be ſmooth, white, growing vpon one little ſtalke or ſtem, and ſet one right againſt another: it hath alſo in the vpper part long claſping tendrels, wherewith it foldeth it ſelfe vpon props and ſtaies ſtanding next vnto

3 *Piſum vmbellatum.*
Tufted or Scottiſh Peaſe.

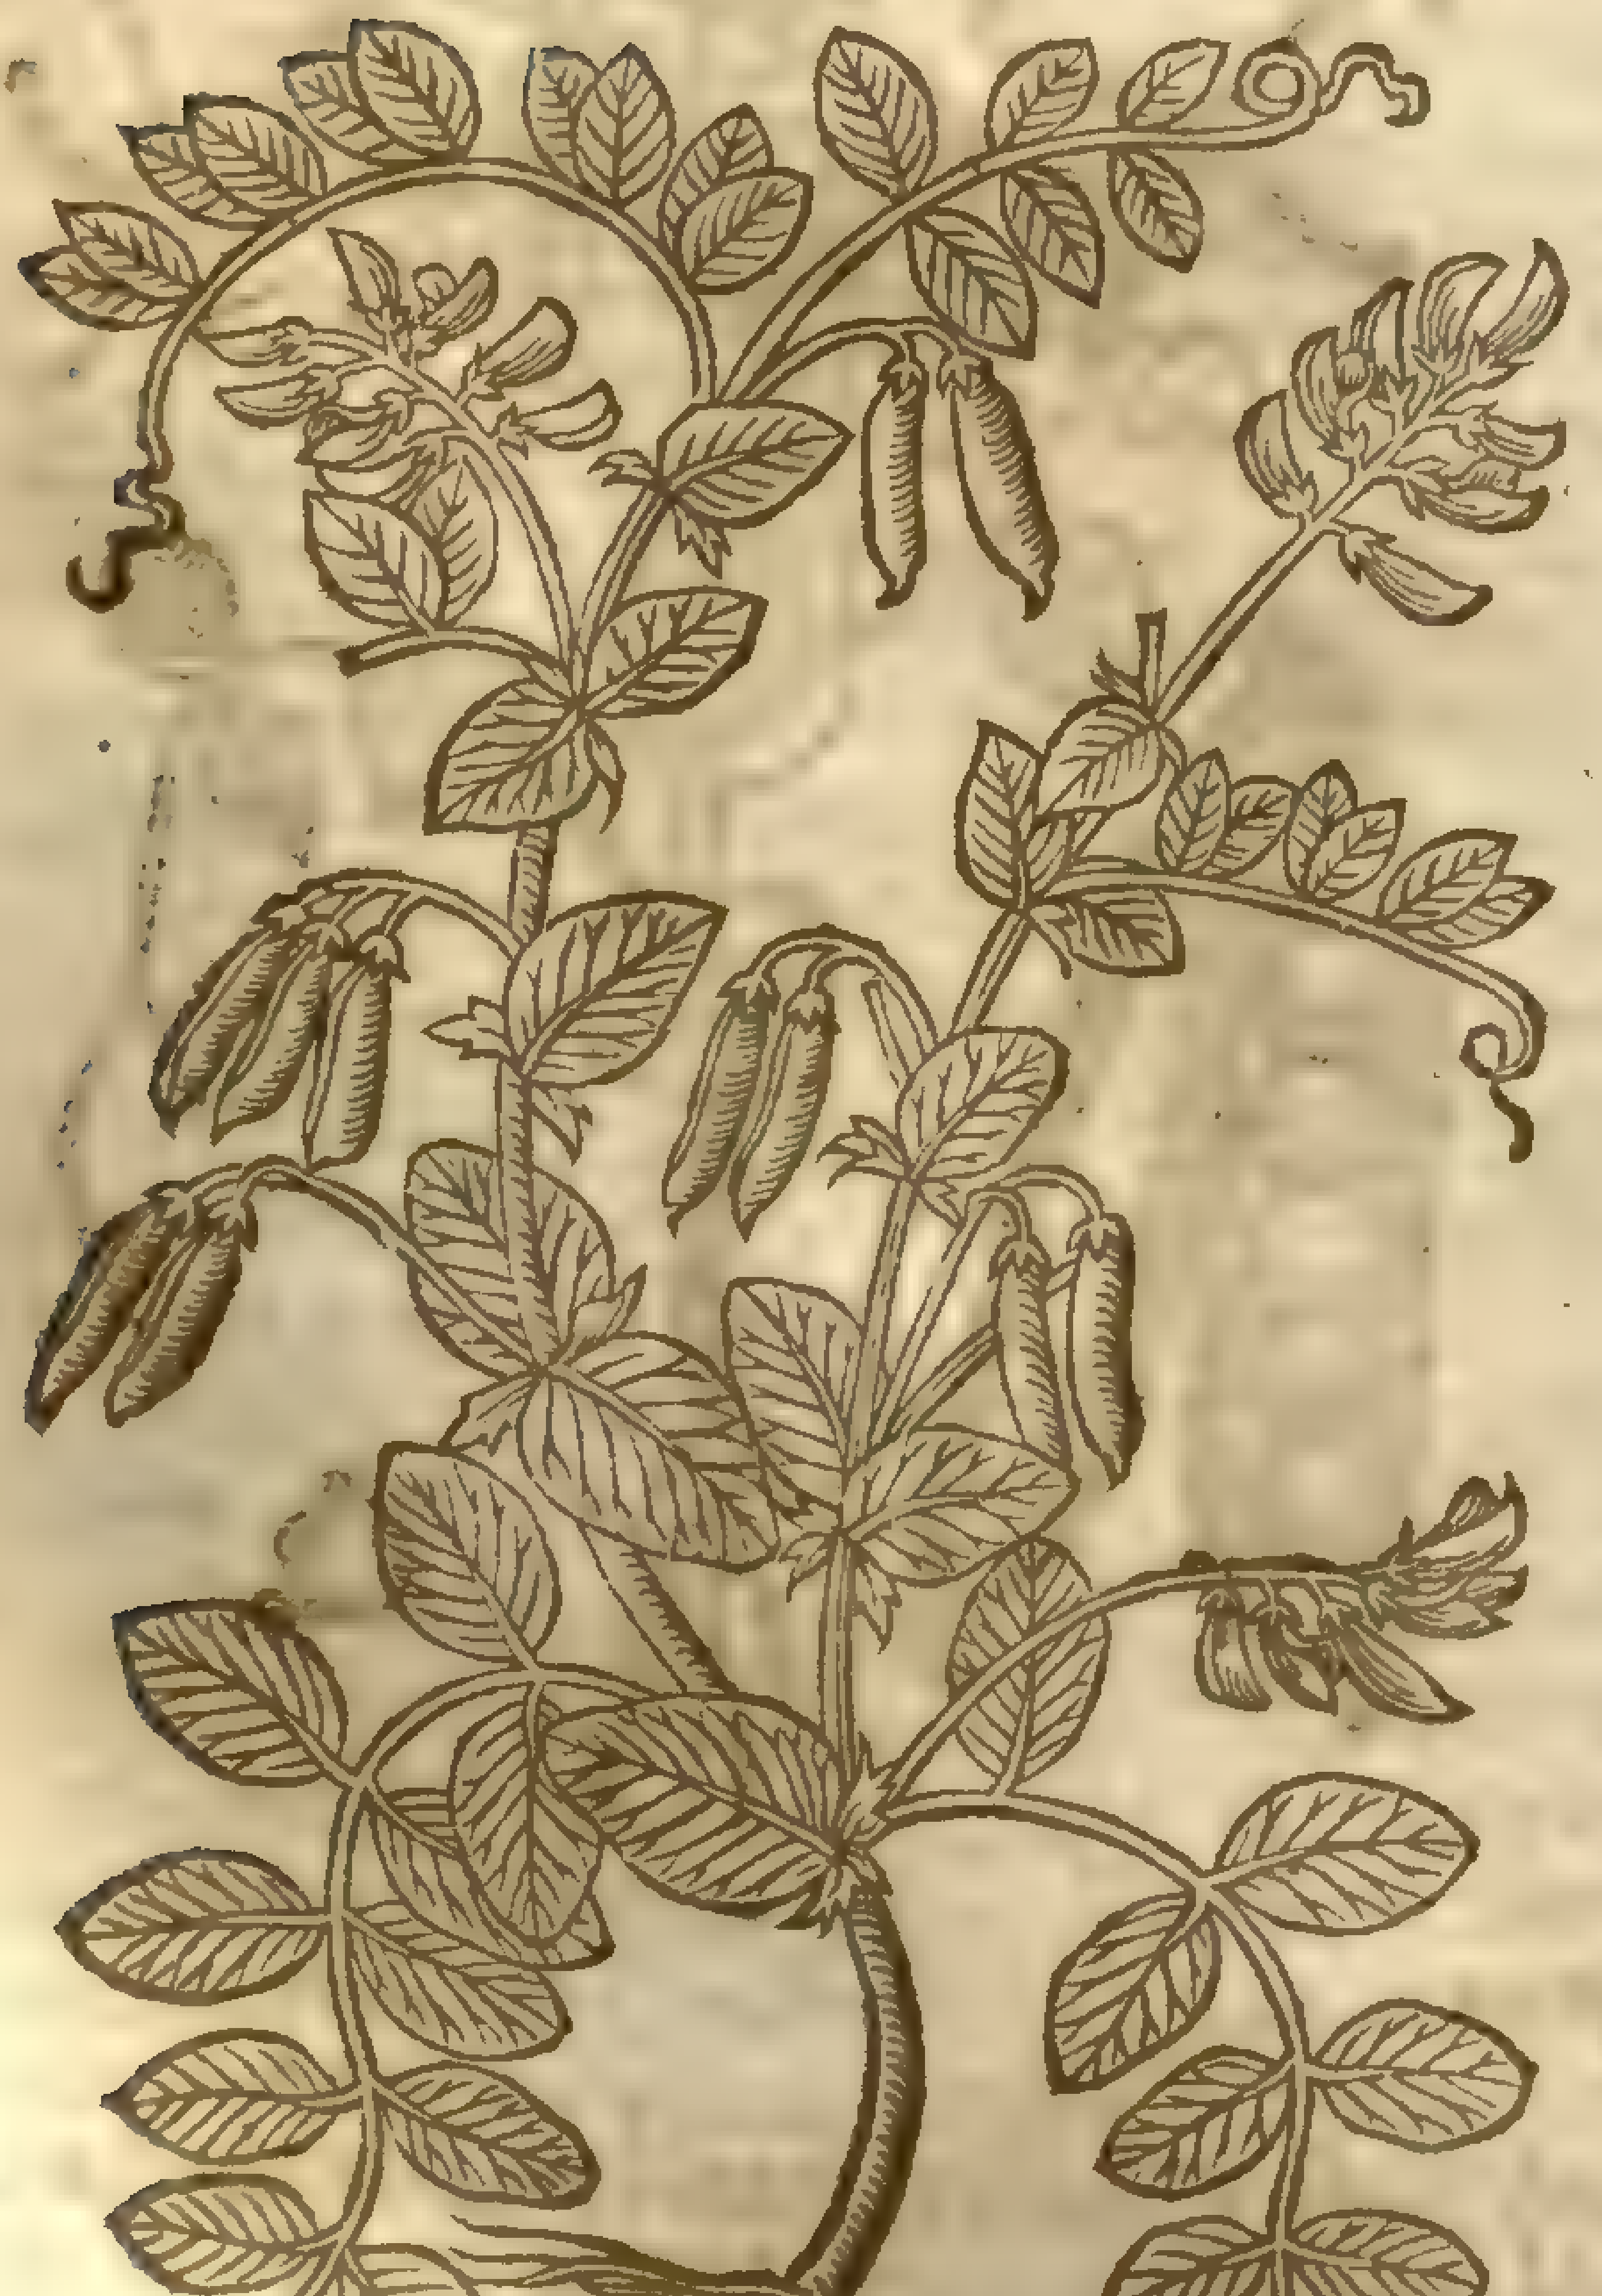


4 *Piſum excorticatum.*
Peaſe without skins in the cod.

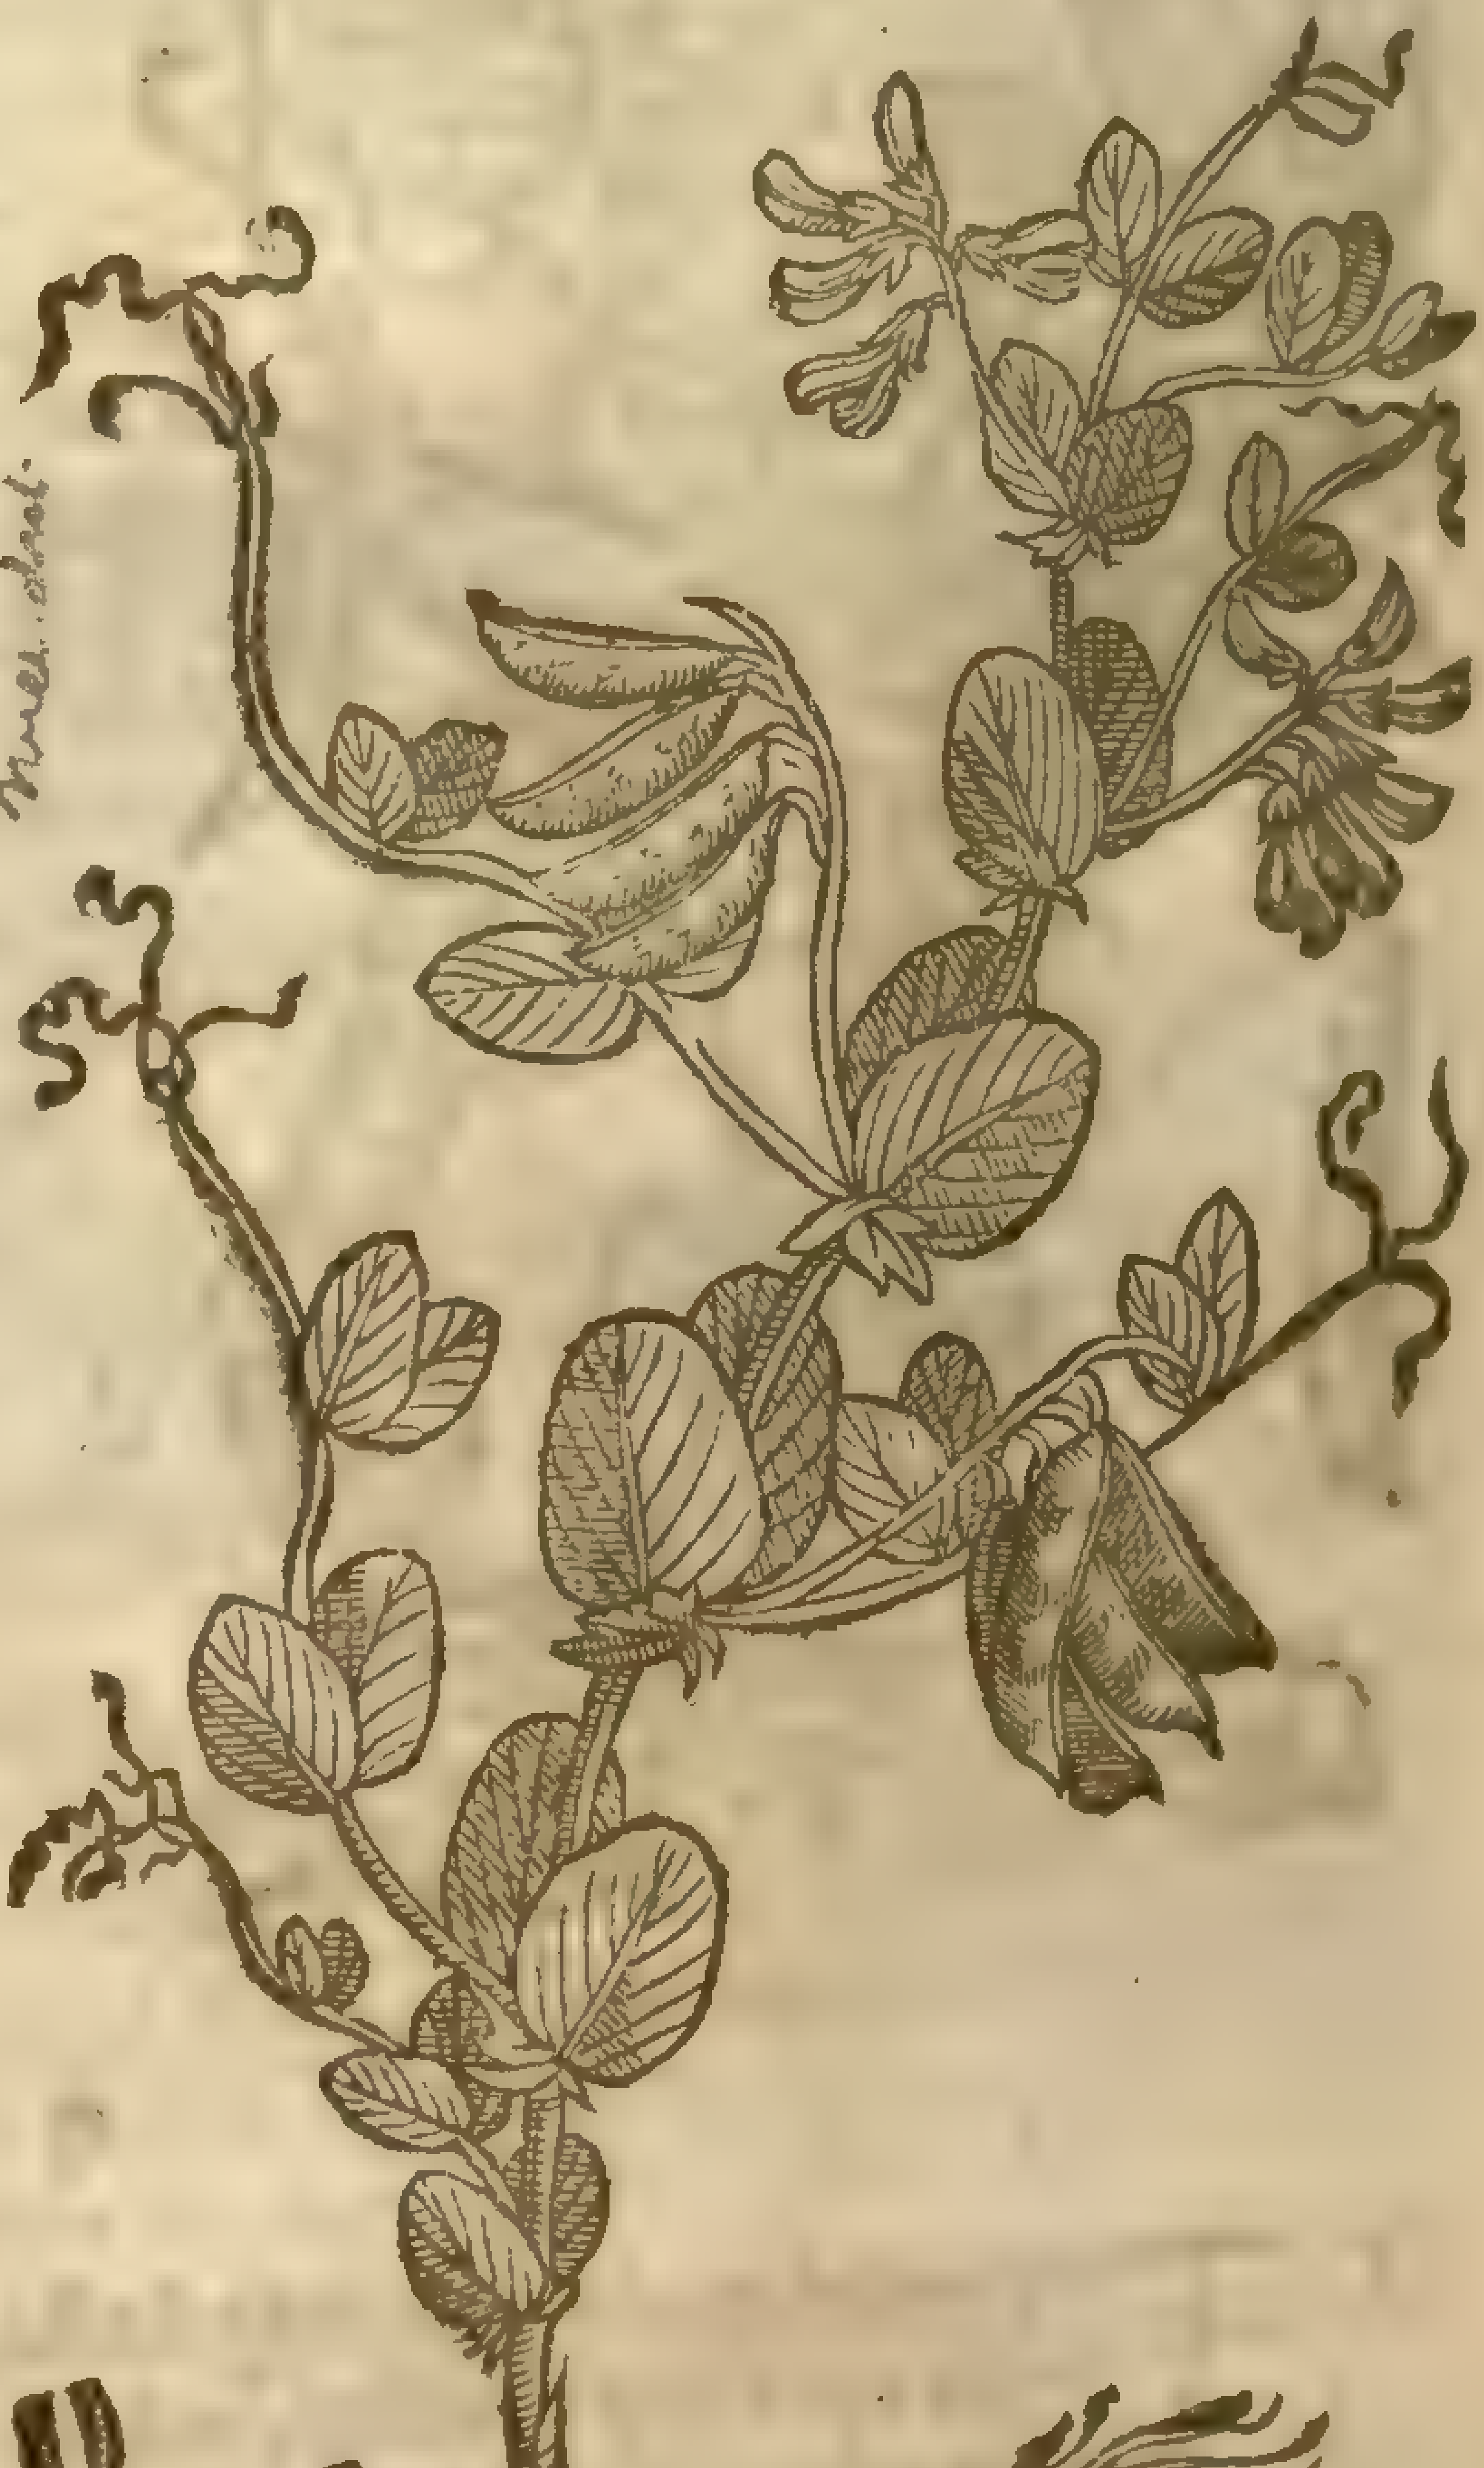


= P. [illegible] [illegible]
= V. [illegible], [illegible]
[illegible] 5. 45

5 *Piſum ſylueſtre.*
Wilde Peaſe.



6 *Piſum perenne ſylueſtre.*
Euerlaſting wilde Peaſe.



Vicia pisiformis L.
[illegible]

it: the floure is white and hath about the middle of it a purple ſpot: the cods be long, round *Cilindriforma*: in which are contained ſeeds greater than *Ochri*, or little Peaſon; which being dry are cornered, and that vnequall, of colour ſometimes white and ſometimes gray: the roots are ſmall.

2 The field Peaſe is ſo very well knowne to all, that it were a needleſſe labour to ſpend time about the deſcription.

3 Tufted Peaſe are like vnto thoſe of the field, or of the garden in each reſpect; the difference conſiſteth onely in that, that this plant carreth his floures and fruit in the tops of the branches in a round tuft or vmbel, contrary to all other of his kinde, which bring forth their fruit in the midſt, and alongſt the ſtalkes: the root is thicke and fibrous.

4 Peaſe without skins, in the cods differ not from the precedent, ſauing that the cods hereof want that tough skinnie membrane in the ſame, which the hogs cannot eat by reaſon of the roughneſſe; whereas the other may be eaten cods and all the reſt, euen as Kidney beanes are: which being ſo dreſſed are exceeding delicate meat.

5 The wild Peaſe differeth not from the common field Peaſe in ſtalke and leaues, ſauing that this wilde kinde is ſomewhat leſſer: the floures are of a yellow colour, and the fruit is much leſſer.

6 The Peaſe whoſe root neuer dies differeth not from the wilde Peaſe, onely his continuing without ſowing, being once ſowne or planted, ſetteth forth the difference.

¶ *The Place.*

Peaſe are ſet and ſowne in gardens, as alſo in the fields in all places of England. The tufted Peaſe are in reaſonable plenty in the Weſt part of Kent, about Sennocke or Seuenock; in other places not ſo common.

The wilde Peaſe do grow in paſtures and earable fields in diuers places, ſpecially about the field belonging vnto Biſhops Hatfield in Hartfordſhire.

¶ *The Time.*

They be ſowne in the Spring time, like as be alſo other pulſes, which are ripe in Summer: they proſper beſt in warme weather, and eaſily take harme by cold, eſpecially when they floure.

¶ *The Names.*

The great Peaſe is called in Latine, *Piſum Romanum*, or *Piſum majus*: in Engliſh, Romane Peaſe, or the greater Peaſe, alſo garden Peaſe: of ſome, Branch Peaſe, French Peaſe, and Rounſiuals. *Theophraſtus* and other old Writers do call it in Greeke, *πίσον*: in Latine, alſo *Piſum*: in low Dutch, **Roomſche erwiten**: in French, *des Pois*. The little Peaſe is called of the Apothecaries euery where *Piſum*, and *Piſum minus*: it is called in Engliſh, little Peaſe, or the common Peaſe.

¶ *The Temperature and Vertues.*

The Peaſe, as *Hippocrates* ſaith, is leſſe windie than Beans, but it paſſeth ſooner through the belly. A
Galen writeth, that Peaſon are in their whole ſubſtance like vnto Beanes, and be eaten after the ſame manner that Beanes are, notwithſtanding they differ from them in theſe two things both becauſe they are not ſo windie as be the Beans, and alſo for that they haue not a clenſing faculty and therfore they do more ſlowly deſcend through the belly. They haue no effectuall quality manifeſt, and are in a meane between thoſe things which are of good and bad juyce, that nouriſh much and little, that be windy and without winde, as *Galen* in his booke of the Faculties of Nouriſhments hath written of theſe and of Beanes.

Chap. 511. *Of the tame or Garden Ciche.*

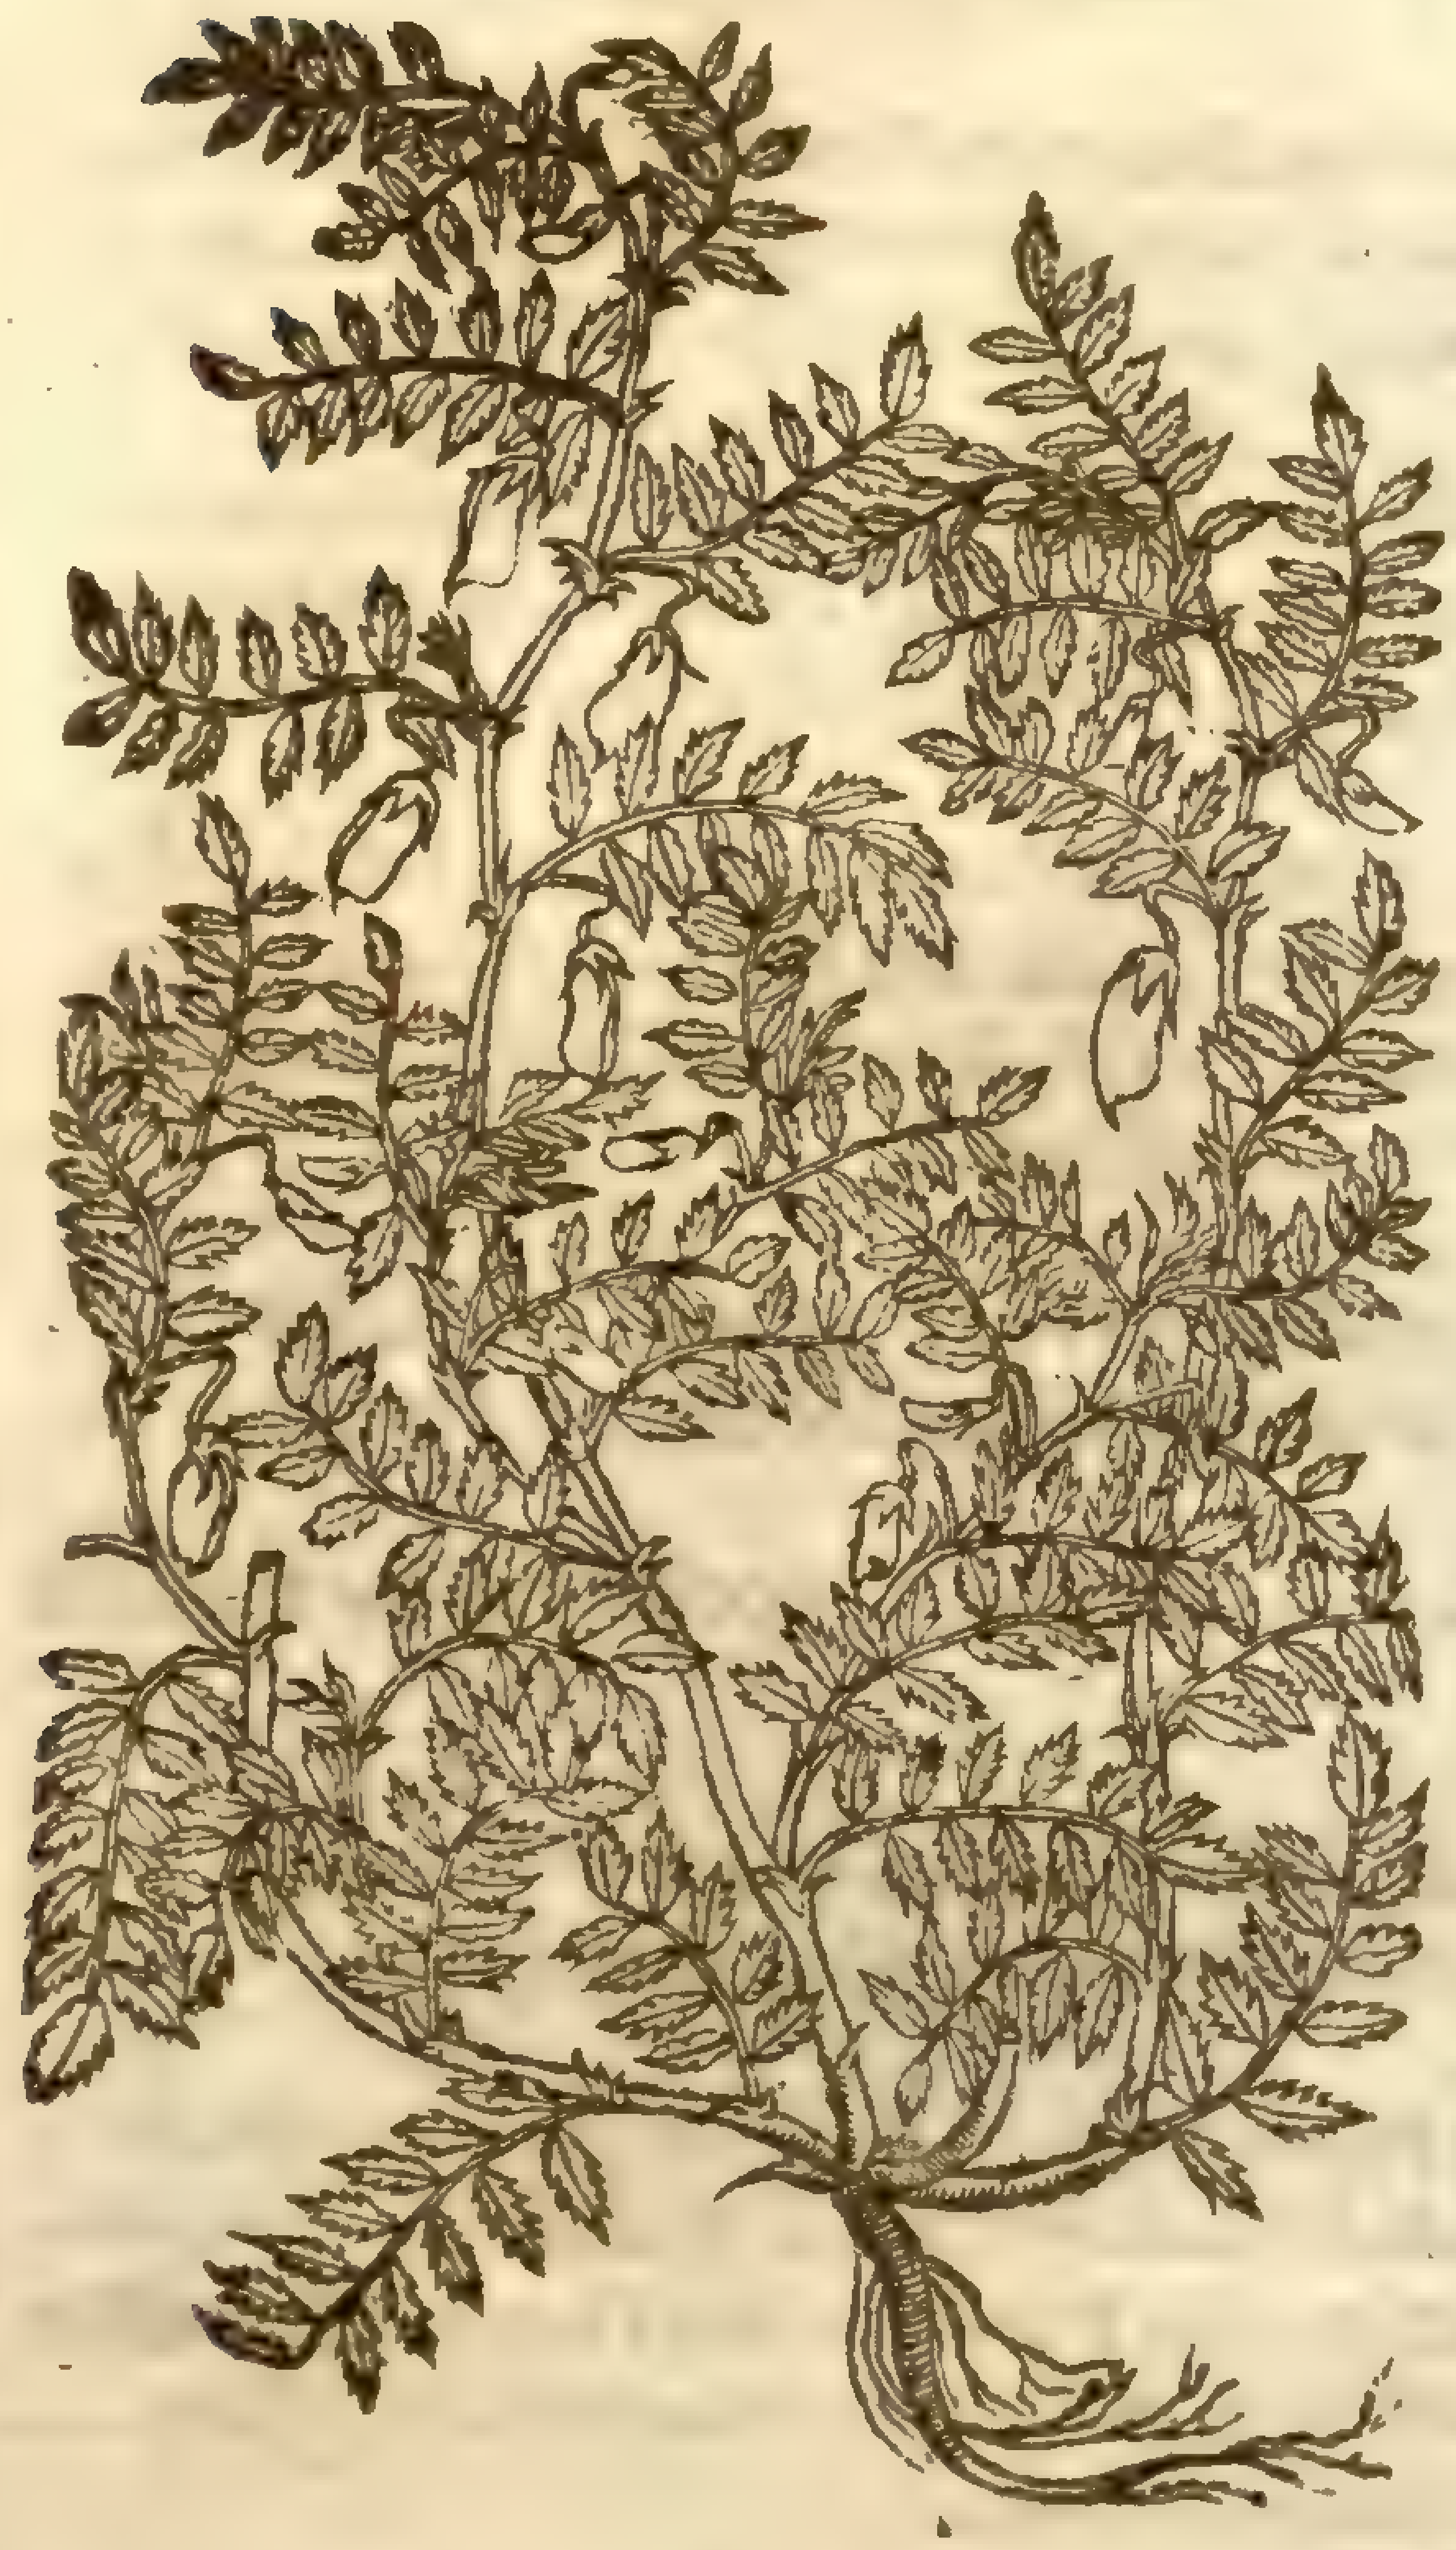
¶ *The Deſcription.*

Garden Ciche bringeth forth round ſtalkes, branched and ſomewhat hairy, leaning on the one ſide, the leaues are made of many little ones growing vpon one ſtem or rib, and ſet one right againſt another: of which euery one is ſmall, broad and nicked on the edges, leſſer than the leaues of wilde Germander: the floures be ſmall, of colour either white, or of a reddiſh purple: after which come vp little ſhort cods, puffed vp as it were with winde like little bladders, in which doe lie two or at the moſt three ſeeds cornered, ſmall towards the end, with one ſharpe corner, not much vnlike to a rams head, of colour either white, or of a reddiſh blacke purple; in which is plainly ſeene the place where they begin firſt to ſprout, The root ir ſlender, white and long: for as *Theophraſtus* ſaith, the Ciche taketh deepeſt root of all the Pulſes.

¶ *The Place.*

It is ſowne in Italy, Spaine, and France, euery where in the fields. It is ſowen in our London gardens, but not common.

Cicer ſativum.
Garden Ciche.



Cicer arietinum, [illegible]

¶ *The Time.*

It is ſowne in April, being firſt ſteeped in water a day before: the fruit is ripe in Auguſt.

¶ *The Names.*

It is called in Greeke, ἐρέβινθος κριὸς: in Latine, *Cicer arietinum*, or Rams Ciches, & of the blackiſh purple colour, *Cicer nigrum, vel rubrum*: blacke or red Ciche: and the other is named *Candidum vel album Cicer*: or white Ciche: in Engliſh, Common Cich, or Ciches, red Cich, of ſome, Sheepes Ciche Peaſe, or Sheepes Ciche Peaſon.

¶ *The Temperature and Vertues.*

A The Ciche, as *Galen* writeth in his booke of the Faculties of nouriſhments, is no leſſe windie than the true Beane, but it yeeldeth a ſtronger nouriſhment than that doth: it prouoketh luſt, and it is thought to engender ſeed.

B Some giue the ſame to ſtalion horſes. Moreouer, Ciches do ſcoure more than doe the true Beanes: inſomuch as certaine of them doe manifeſtly diminiſh or waſte away the ſtones in the Kidneyes: thoſe be the blacke and little Ciches called *Arietina*, or Rams Ciches, but it is better to drinke the broth of them ſodden in water.

C Both the Rams Ciches, as *Dioſcorides* ſaith, the white and the blacke prouoke vrine, if the decoction therof be made with Roſemary, and giuen vnto thoſe that haue either the Dropſie or yellow jaundiſe; but they are hurtfull vnto the Bladder and Kidneies that haue vlcers in them.

Chap. 512. *Of wilde Ciches.*

¶ *The Kindes.*

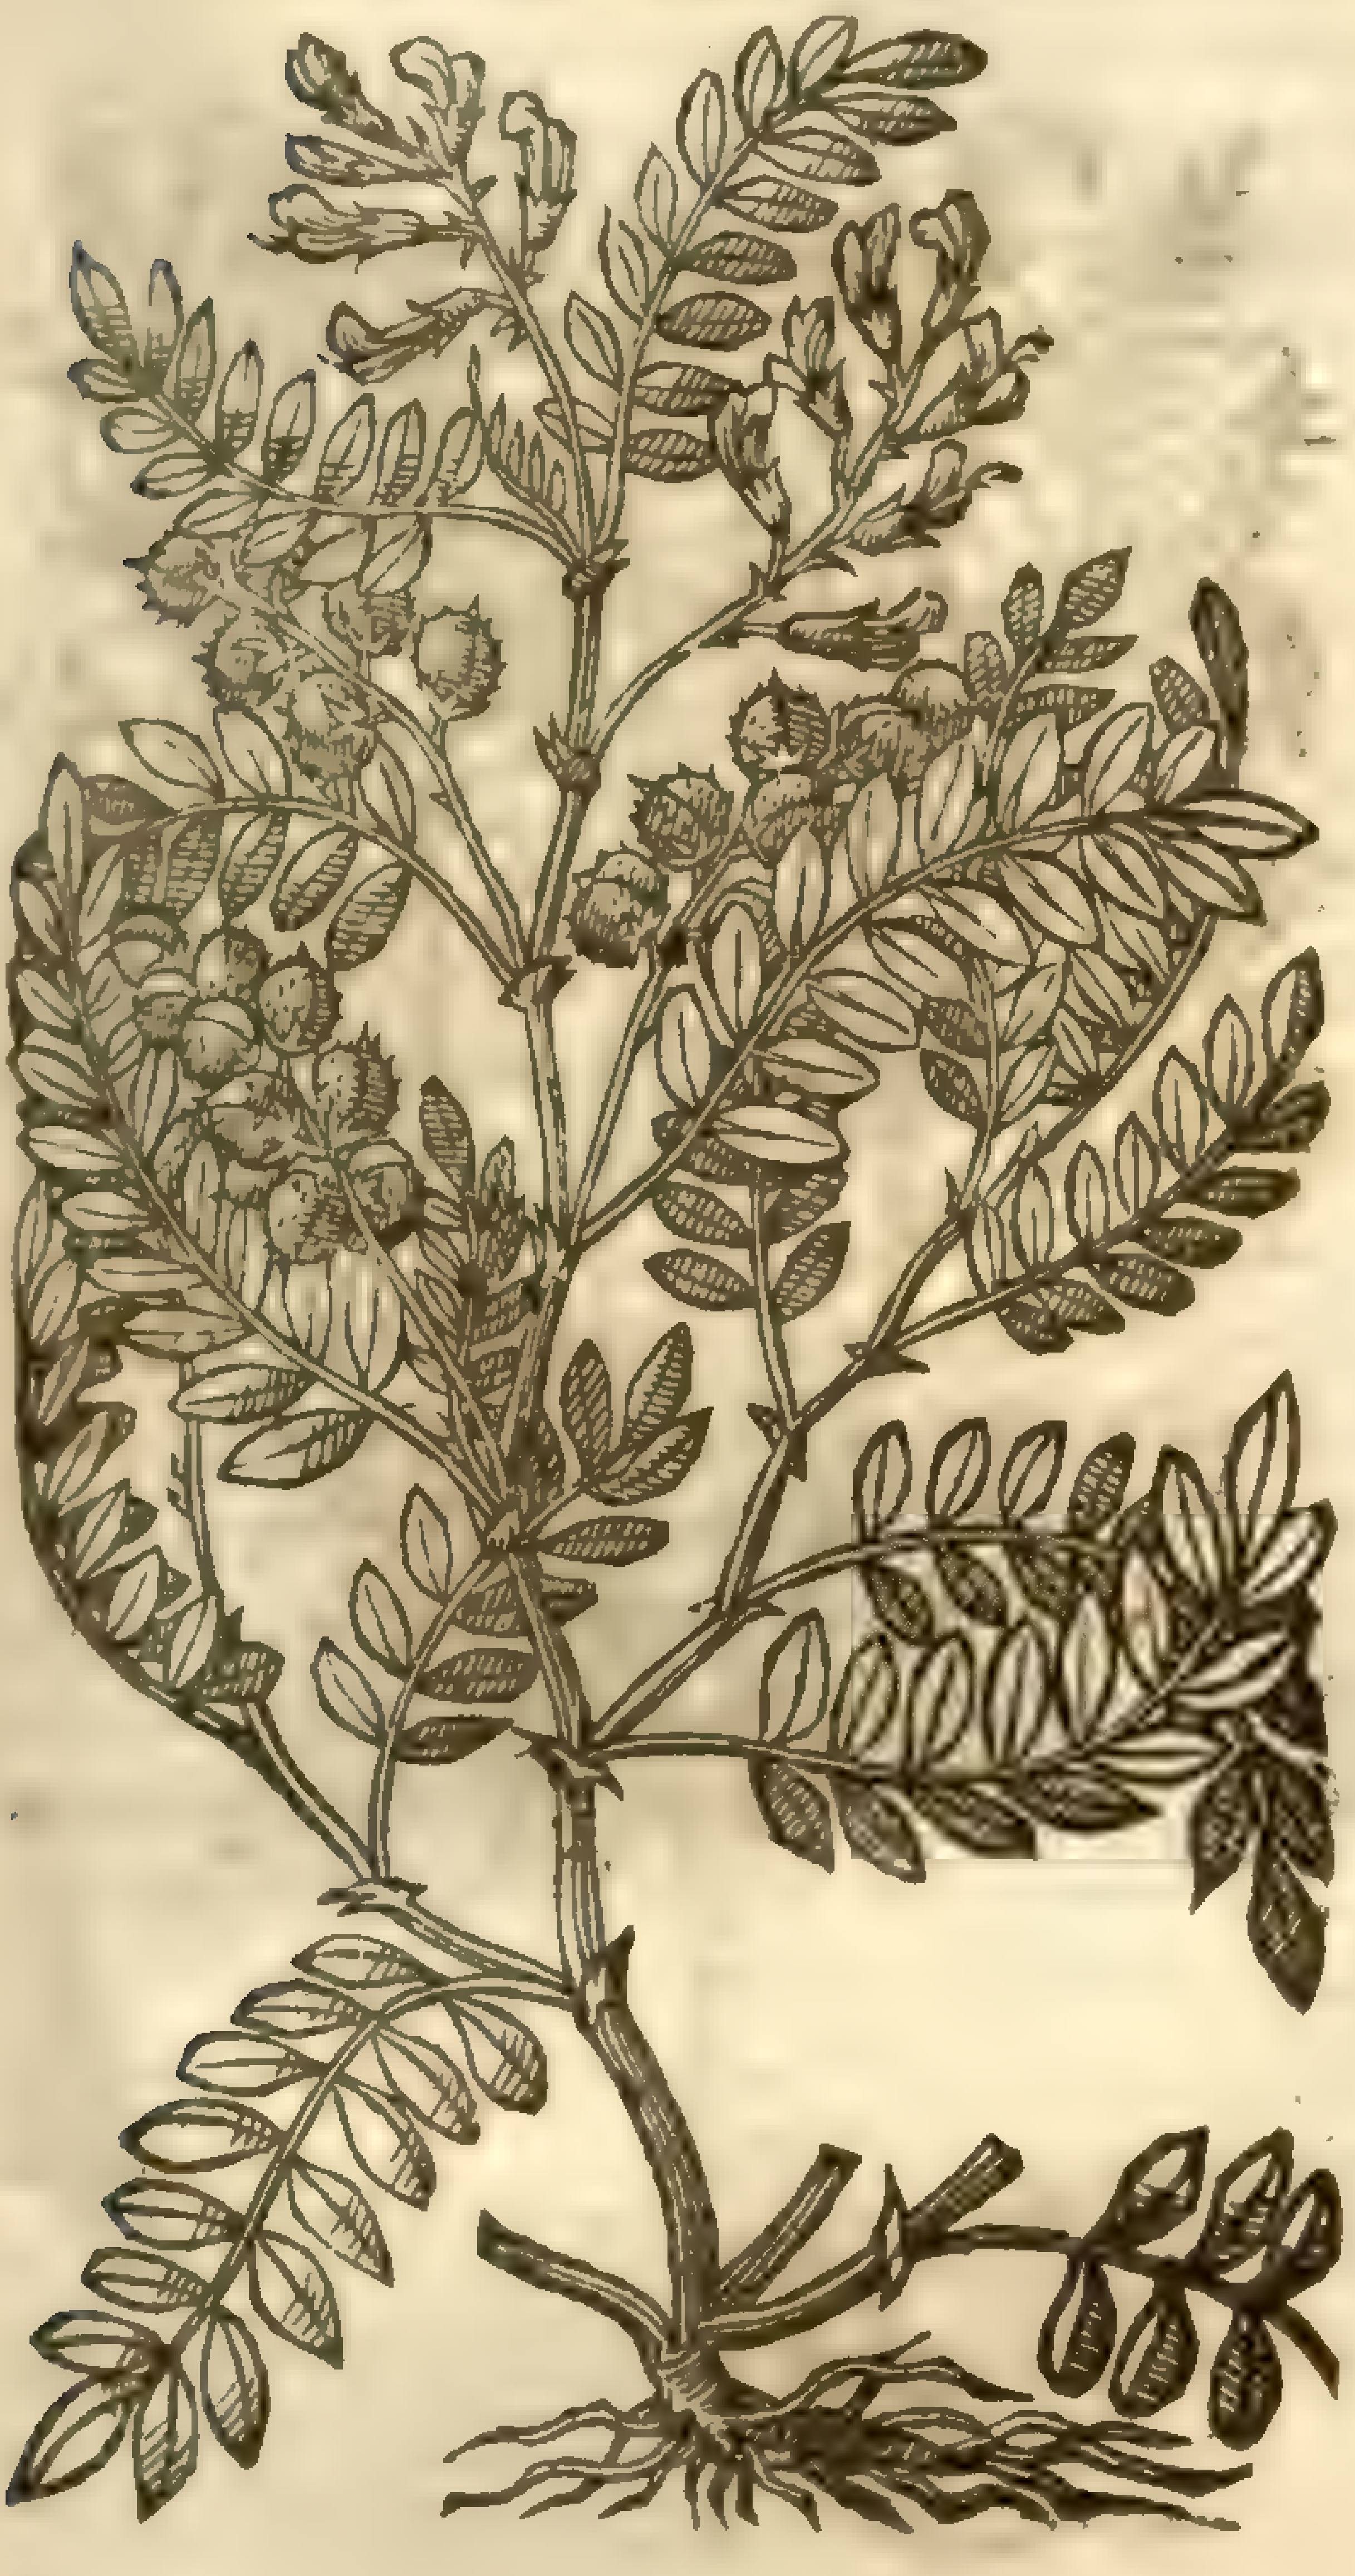
The wilde Ciche is like to the tame (ſaith *Dioſcorides*) but it differeth in ſeed: the later writers haue ſet downe two kindes thereof, as ſhall be declared.

¶ *The Deſcription.*

1 The firſt wilde Cich bringeth forth a great number of ſtalkes branched, lying flat on the ground: about which be the leaues, conſiſting of many vpon one rib as do thoſe of the garden Cich, but not nicked in the edges, more like to the leaues of Axcich: the flours come forth faſtned on ſmall ſtems, which grow cloſe to the ſtalkes, of a pale yellow colour, and like vnto eares: in their places come vp little cods, in forme and bigneſſe of the fruit of garden Ciches, blacke and ſomething hairy, in which lieth the ſeed, that is ſmall, hard, flat, and glittering, in taſte like that of Kidney Beane: the root groweth deepe, faſtened with many ſtrings.

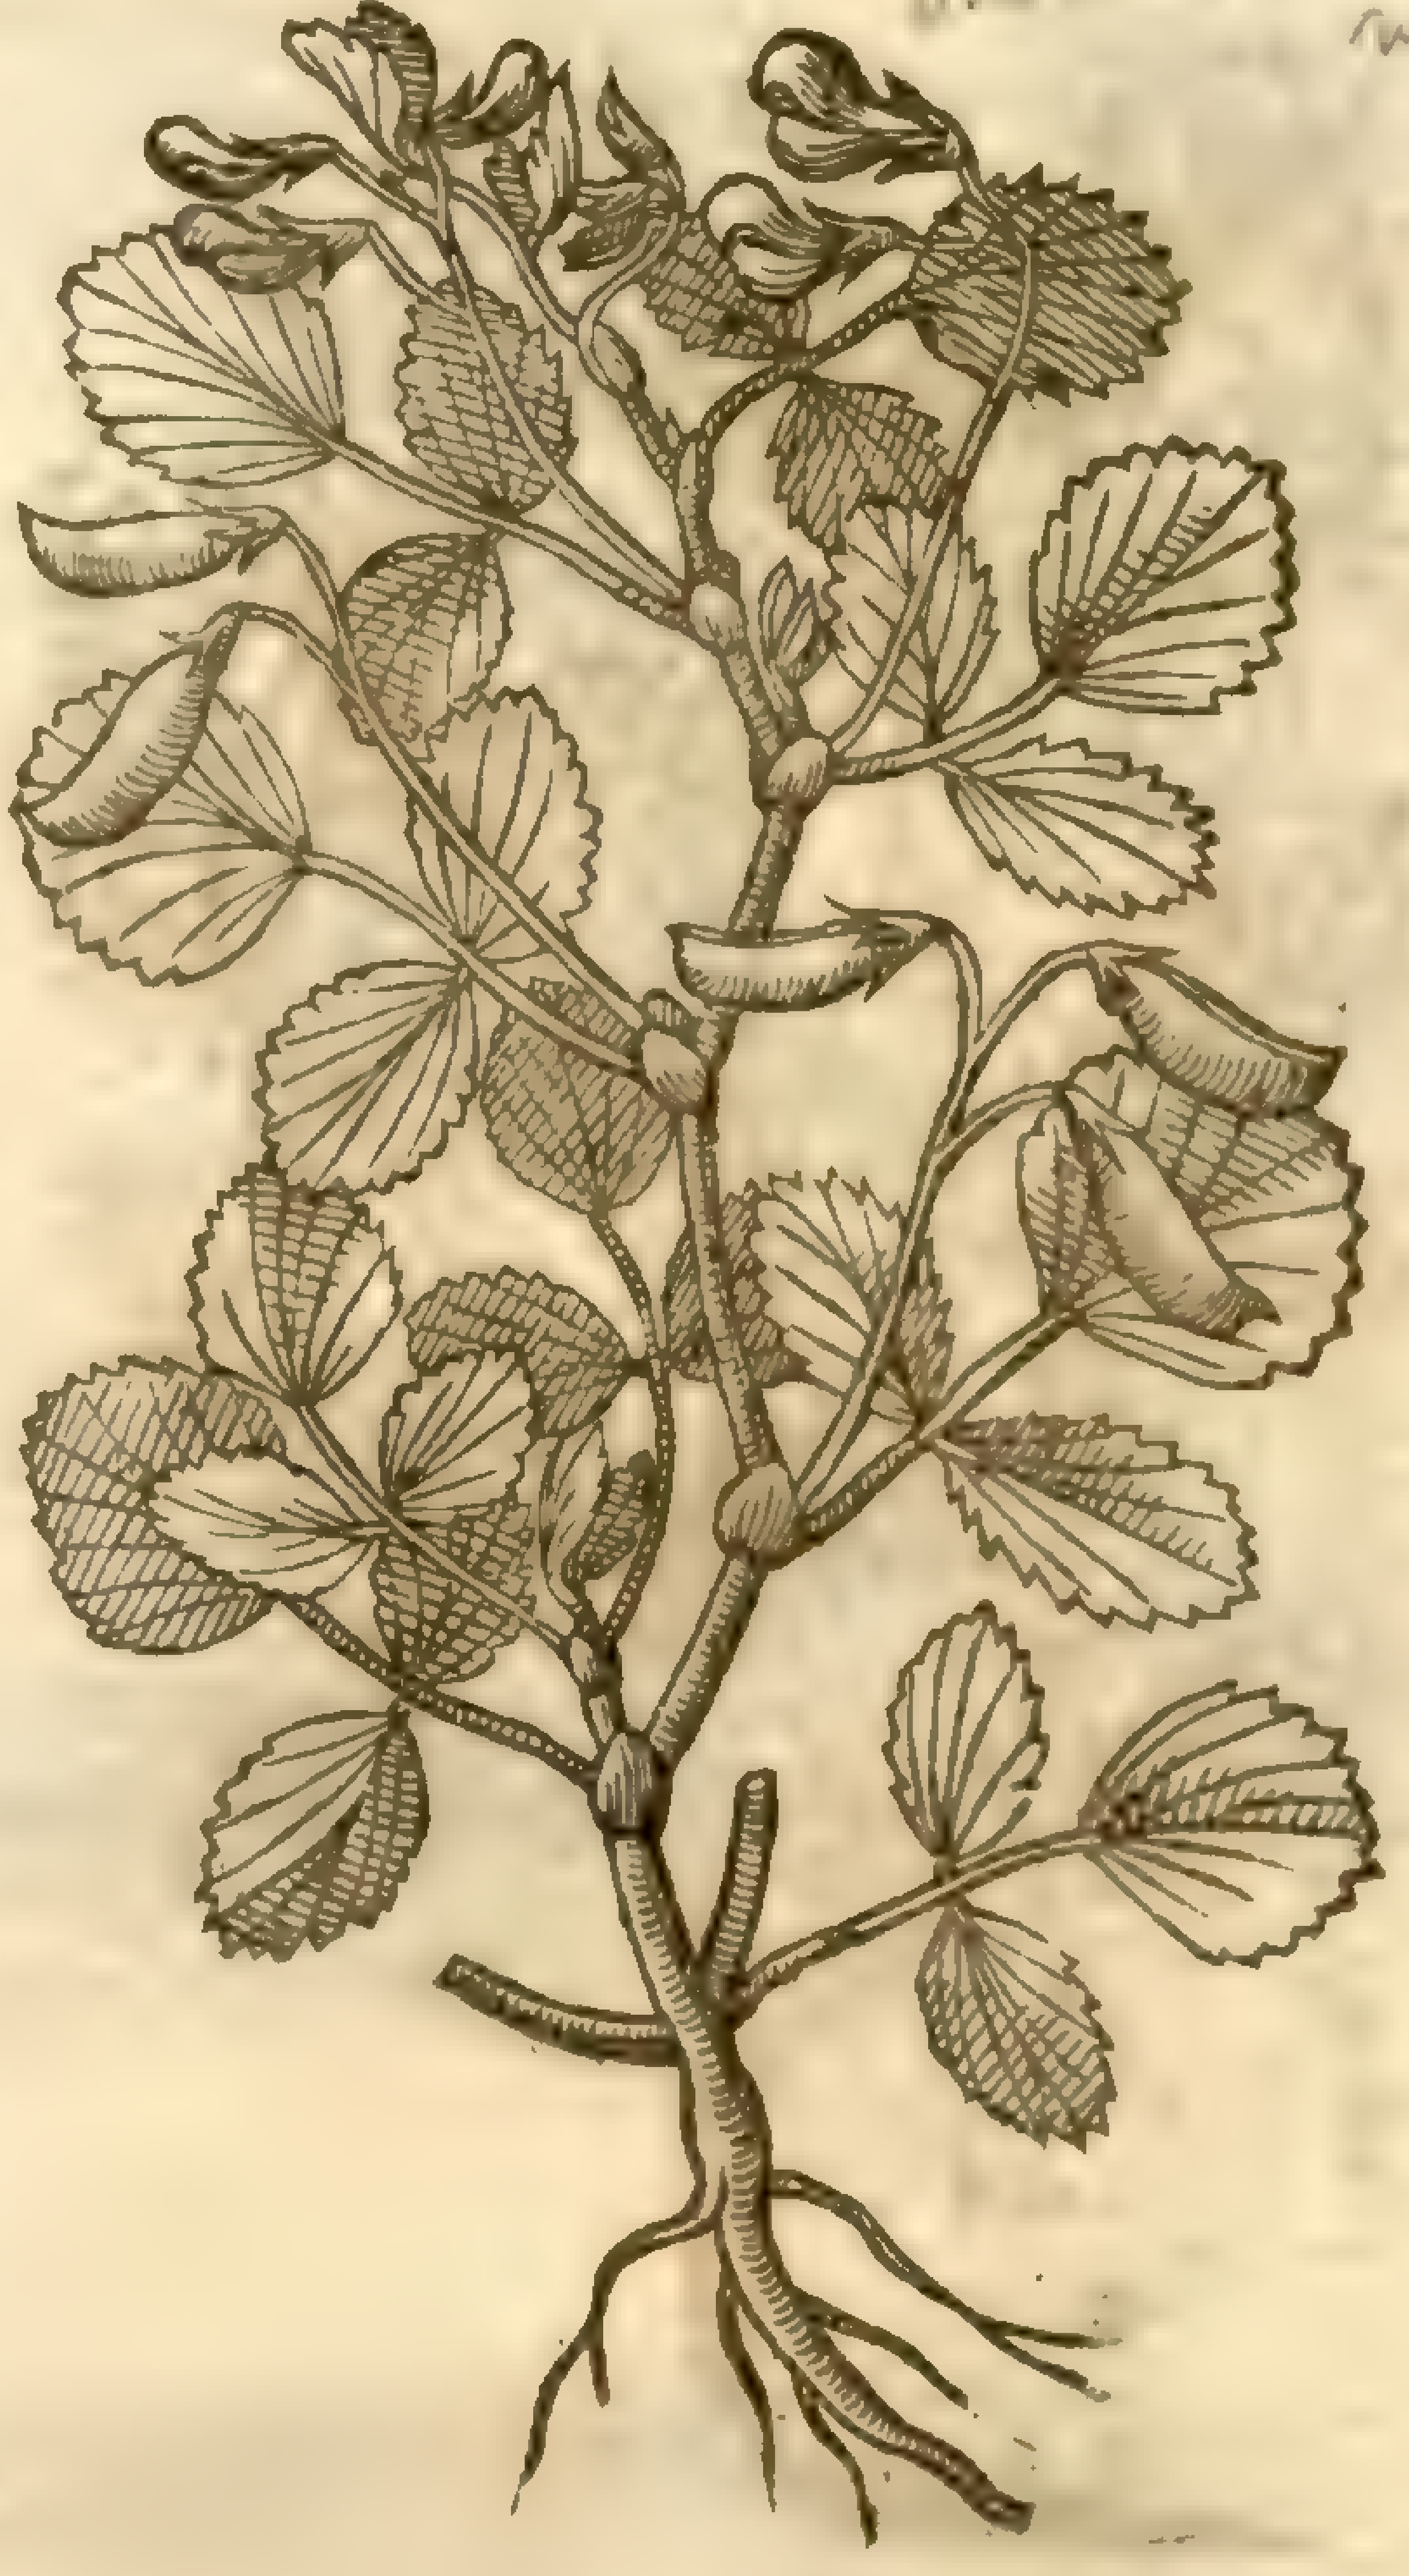
2 There is another kinde of wild Cich that hath alſo a great number of ſtalkes lying vpon the ground, about which ſtand ſoft leaues, ſomething hairy and white, conſiſting of three broad leaues ſtanding vpon a middle rib, the leaſt of which ſtand neereſt to the ſtem, and the greateſt at the very top: the floures come forth at the bottome of the leaues many together, of colour yellow: after which grow ſmall long huskes, ſoft and hairy, in euery one whereof is a little cod, in which lie two ſeeds like little Cichlings.

1 *Cicer ſylueſtre.*
The wilde Cich.



2 *Cicer ſylueſtre latifolium.*
Broad leafed wilde Cich.

[illegible]



[illegible]

¶ *The Place.*

Theſe plants are ſowne in the parts beyond the ſeas for to feed their cattell with in Winter, as we do Tares, Vetches, and ſuch other baſe pulſe.

¶ *The Time.*

The time anſwereth the Vetch or Tare.

¶ *The Names.*

The wild Cich hath no other name in Latine but *Cicer ſylueſtre*: the later writers haue not found any name at all.

¶ *The Temperature and Vertues.*

Their temperature and vertues are referred to the garden Cich, as *Theophraſtus* affirmes; and *Galen* ſaith that the wilde Cich is in all things like vnto that of the garden, but in Phyſicks vſe more effectually, by reaſon it is more hotter and drier, and alſo more biting and bitter.

CHAP. 513. *Of Lentils.*

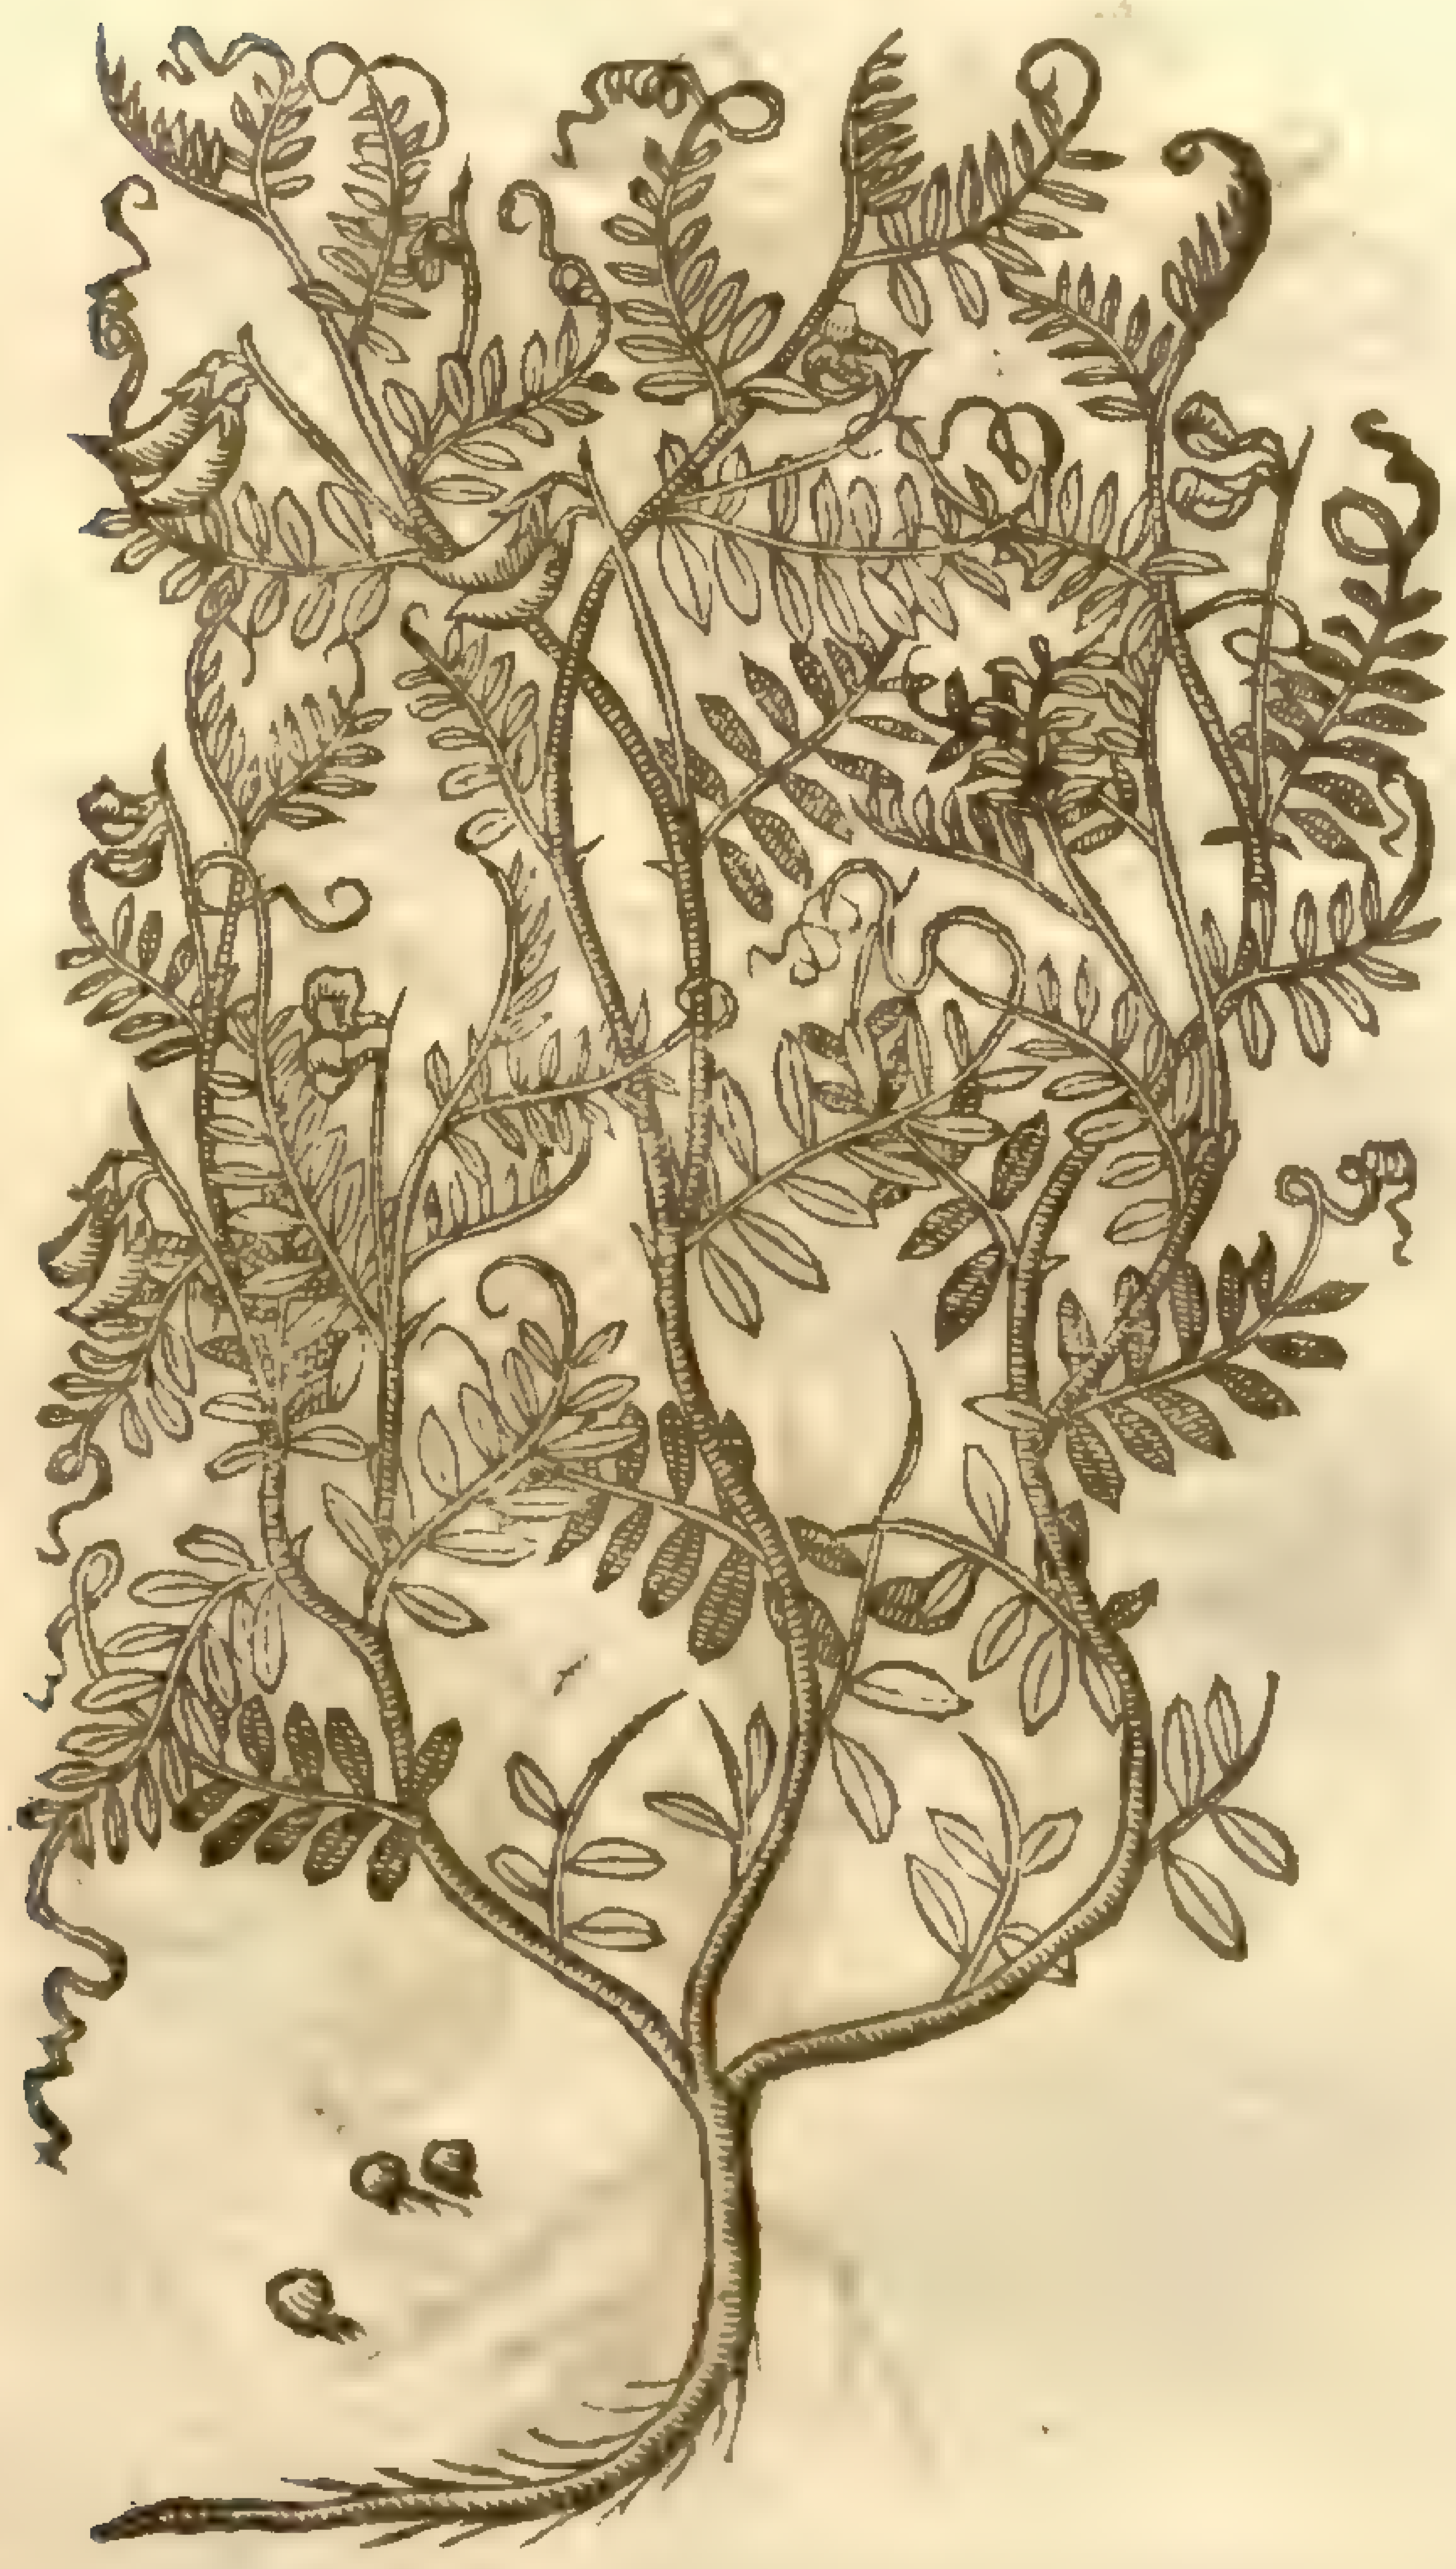
¶ *The Deſcription.*

1 THe firſt Lentil growes vp with ſlender ſtalks, and leaues which be ſomewhat hard, growing aſlope from both ſides of the rib or middle ſtalke, narrow and many in number like thoſe of Tares, but narrower and leſſer: the floures be ſmall, tending ſomewhat towards a purple: the cods are little and broad: the ſeeds in theſe are in number three or foure, little, round, plaine, and flat: the roots are ſmall and threddy.

2 The ſecond kinde of Lentill hath ſmall tender and pliant branches a cubit high; whereon do grow leaues diuided or conſiſting of ſundry other ſmall leaues, like the wilde Vetch, ending at the middle rib with ſome claſping tendrels, wherewith it taketh hold of ſuch things as are neere vnto it: among theſe come forth little browniſh floures mixed with white, which turne into ſmall flat cods, containing little browne flat ſeed, and ſometimes white.

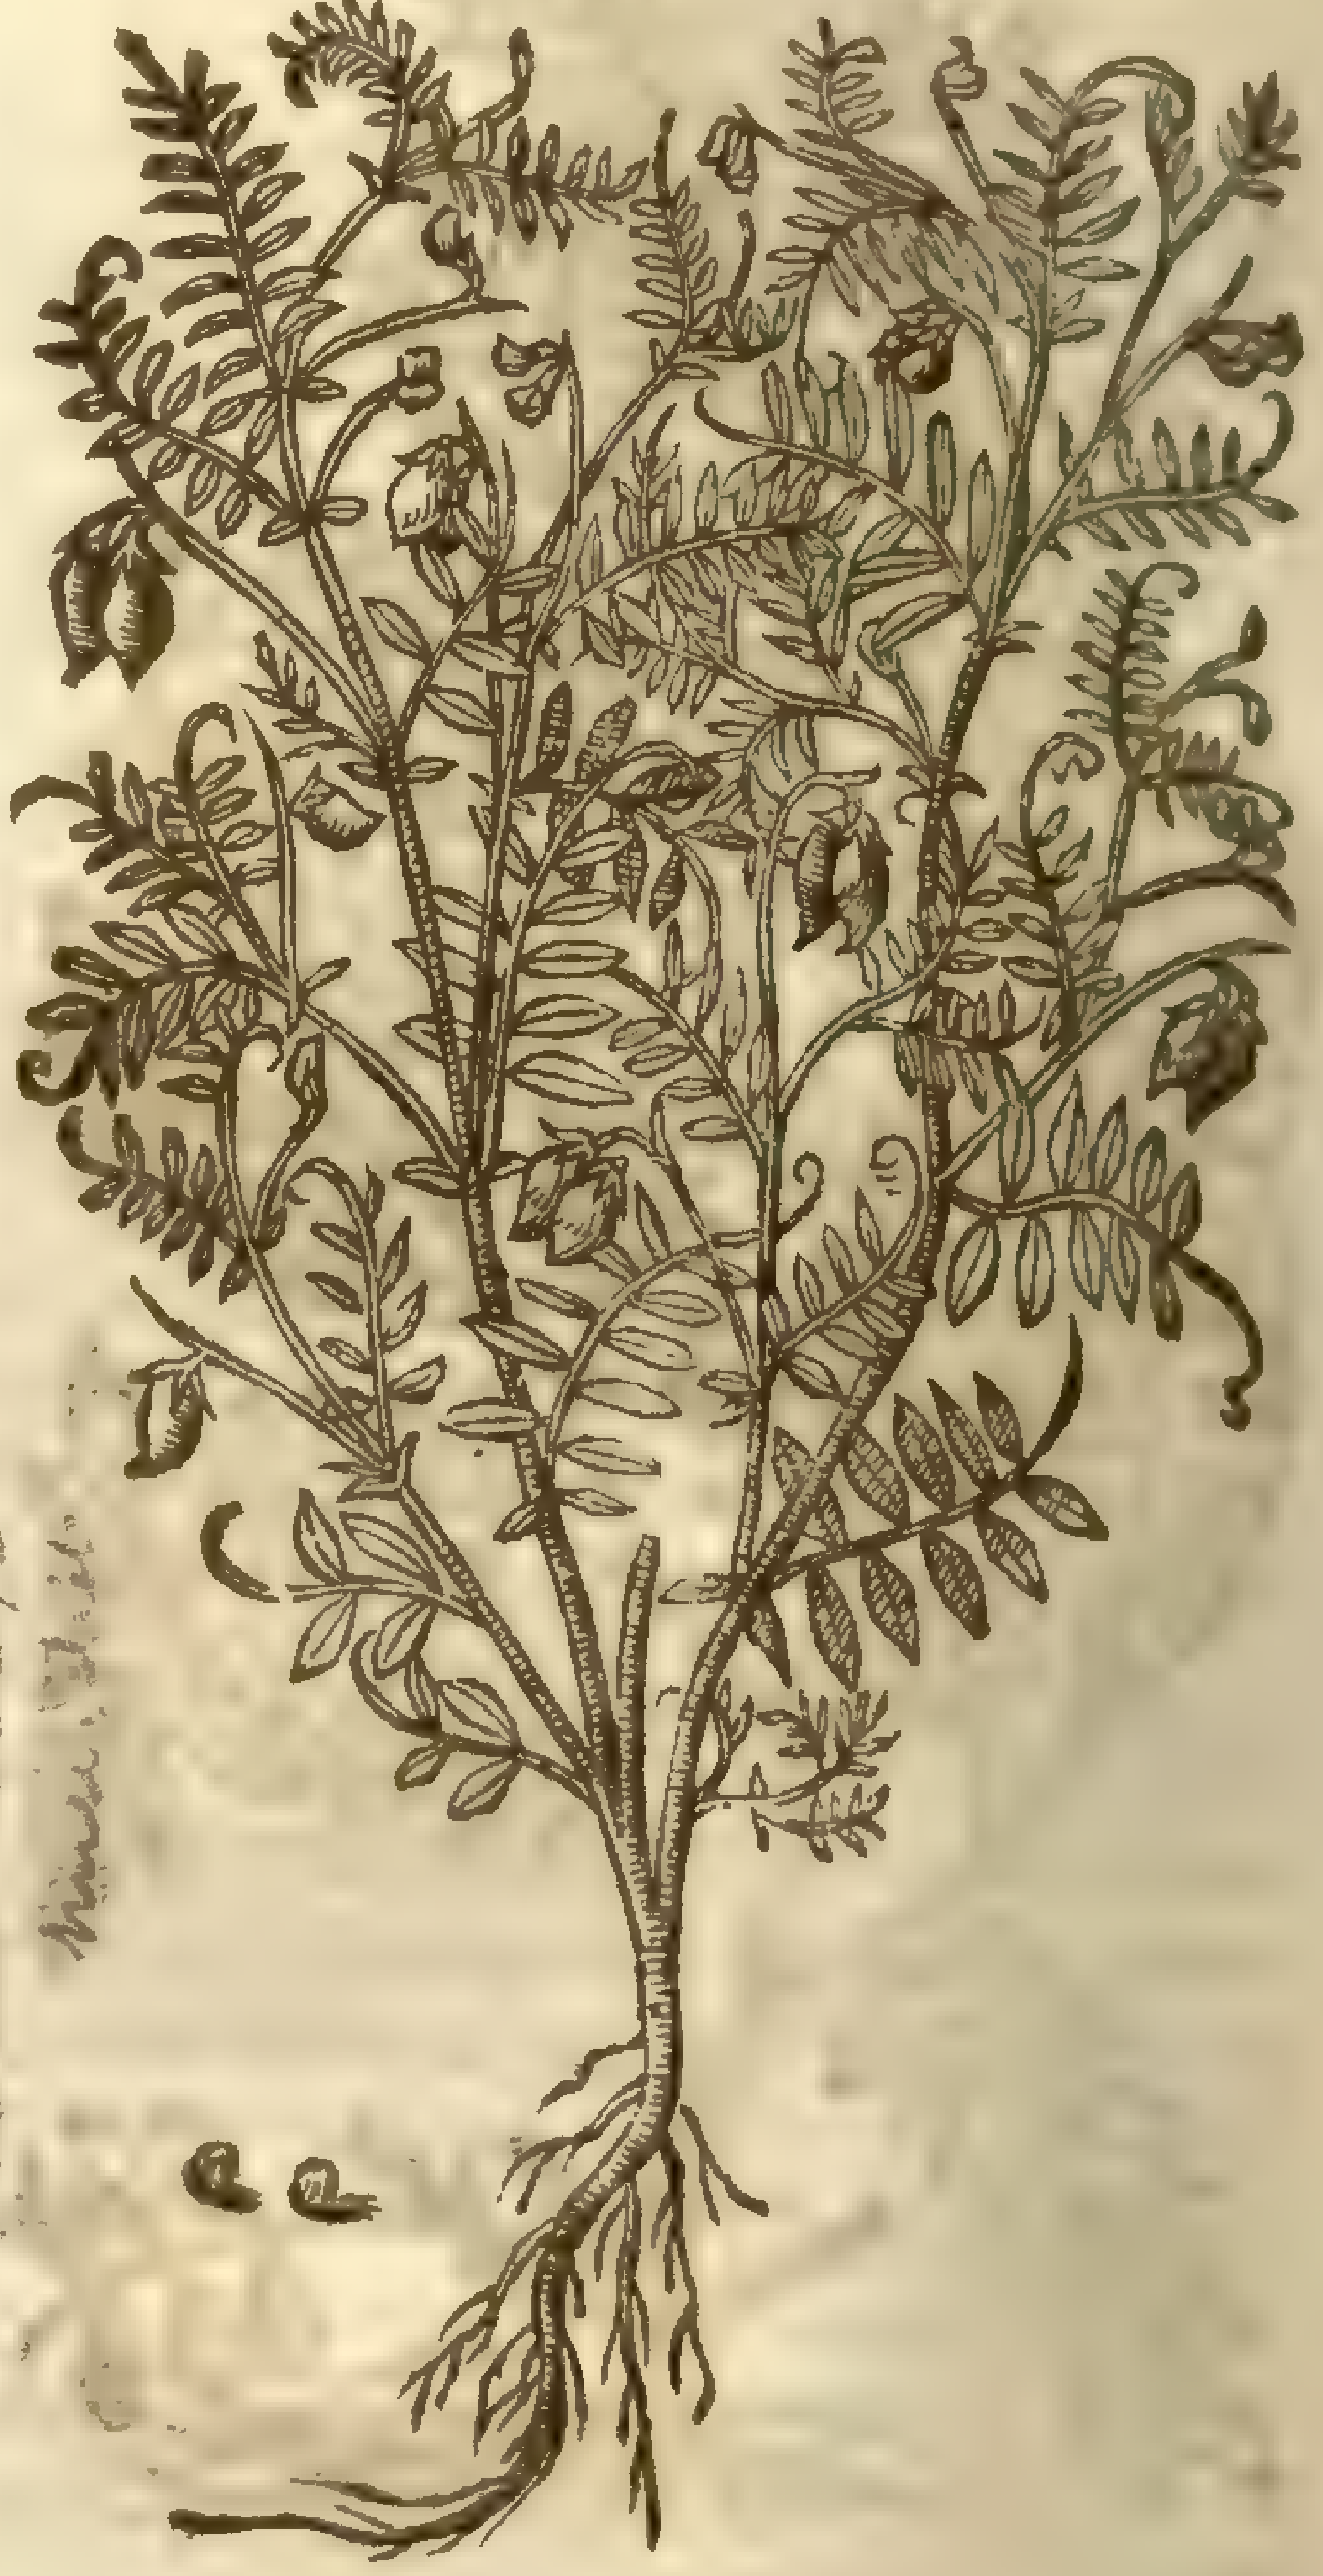
¶ The

1 *Lens major.*
Great Lentils.



Ervum Lens, b. β
maj. Lob.

2 *Lens minor.*
Little Lentils.



Ervum Lens, b.
minus Lob.

¶ *The Place.*

Theſe Pulſes do grow in my garden; and it is reported vnto me by thoſe of good credit, that about Watford in Middleſex and other places of England the husbandmen doe ſow them for their cattell, euen as others do Tares.

¶ *The Time.*

They both floure and wax ripe in Iuly and Auguſt.

¶ *The Names.*

They are called in Greeke, φακός, or φακῆ: in Latine, *Lens*, and *Lenticula*: in high Dutch, **Linſen**: in French, *Lentille*: in Italian, *Lentichia*: in Spaniſh, *Lenteia*: in Engliſh, Lentils.

¶ *The Temperature and Vertues.*

A Lentils as *Galen* ſaith, are in a meane betweene hot and cold, yet are they dry in the ſecond degree: their skin is aſtringent or binding, and the meate or ſubſtance within is of a thicke and earthy juyce, hauing a quality that is a little auſtere or ſomething harſh, much more the skin thereof: but the juyce of them is quite contrary to the binding quality; wherefore if a man ſhall boile them in faire water, and afterwards ſeaſon the water with ſalt and pickle, *aut cum ipſis oleo condiens*, and then take it, the ſame drunke doth looſe the belly.

B The firſt decoction of Lentils doth looſe the belly; but if they bee boyled againe, and the firſt decoction caſt away, then doe they binde, and are good againſt the bloudy flix or dangerous laskes.

C They do their operation more effectually in ſtopping or binding, if all or any of theſe following be boyled therewith, that is to ſay, red Beets, Myrtles, pils of Pomegranats, dried Roſes, Medlars, Seruice berries, vnripe Peares, Quinces, Plantaine leaues, Galls, or the berries of Sumach.

D The meale of Lentils mixed with hony doth mundifie and clenſe corrupt vlcers and rotten ſores, filling them with fleſh againe; and is moſt ſingular to be put into the common digeſtiues vſed among our London Surgeons for greene wounds.

E The Lentil hauing the skin or coat taken off, as it loſeth that ſtrong binding quality, and thoſe accidents that depend on the ſame, ſo doth it more nouriſh than if it had the skin on.

F It ingendreth thicke and naughty juyce, and ſlowly paſſeth through the belly, yet doth it not ſtay the looſeneſſe as that doth which hath his coat on; and therefore they that vſe to eat too much thereof doe neceſſarily become Lepers, and are much ſubject to cankers, for thicke and dry nouriſhments are apt to breed melancholy.

Therefore the Lentill is good food for them that through wateriſh humours be apt to fall into the dropſie, and it is a moſt dangerous food for dry and withered bodies; for which cauſe it bringeth dimneſſe of ſight, though the ſight be perfect, through his exceſſiue dryneſſe, whereby the ſpirits if the ſight be waſted; but it is good for them that are of a quite contrary conſtitution. G

It is not good for thoſe that want their termes; for it breedeth thicke bloud, and ſuch as ſlowly paſſeth through the veines. H

But it is ſingular good to ſtay the menſes, as *Galen* in his booke of the faculties of nouriſhments affirmeth. I

It cauſeth troubleſome dreams (as *Dioſcorides* doth moreouer write) it hurteth the head, ſinewes and lungs. K

It is good to ſwallow downe thirty graines of Lentils ſhelled or taken from their husks, againſt the ouercaſting of the ſtomacke. L

Being boyled with parched barly meale and laid to, it aſſwageth the paine and ach of the gout. M

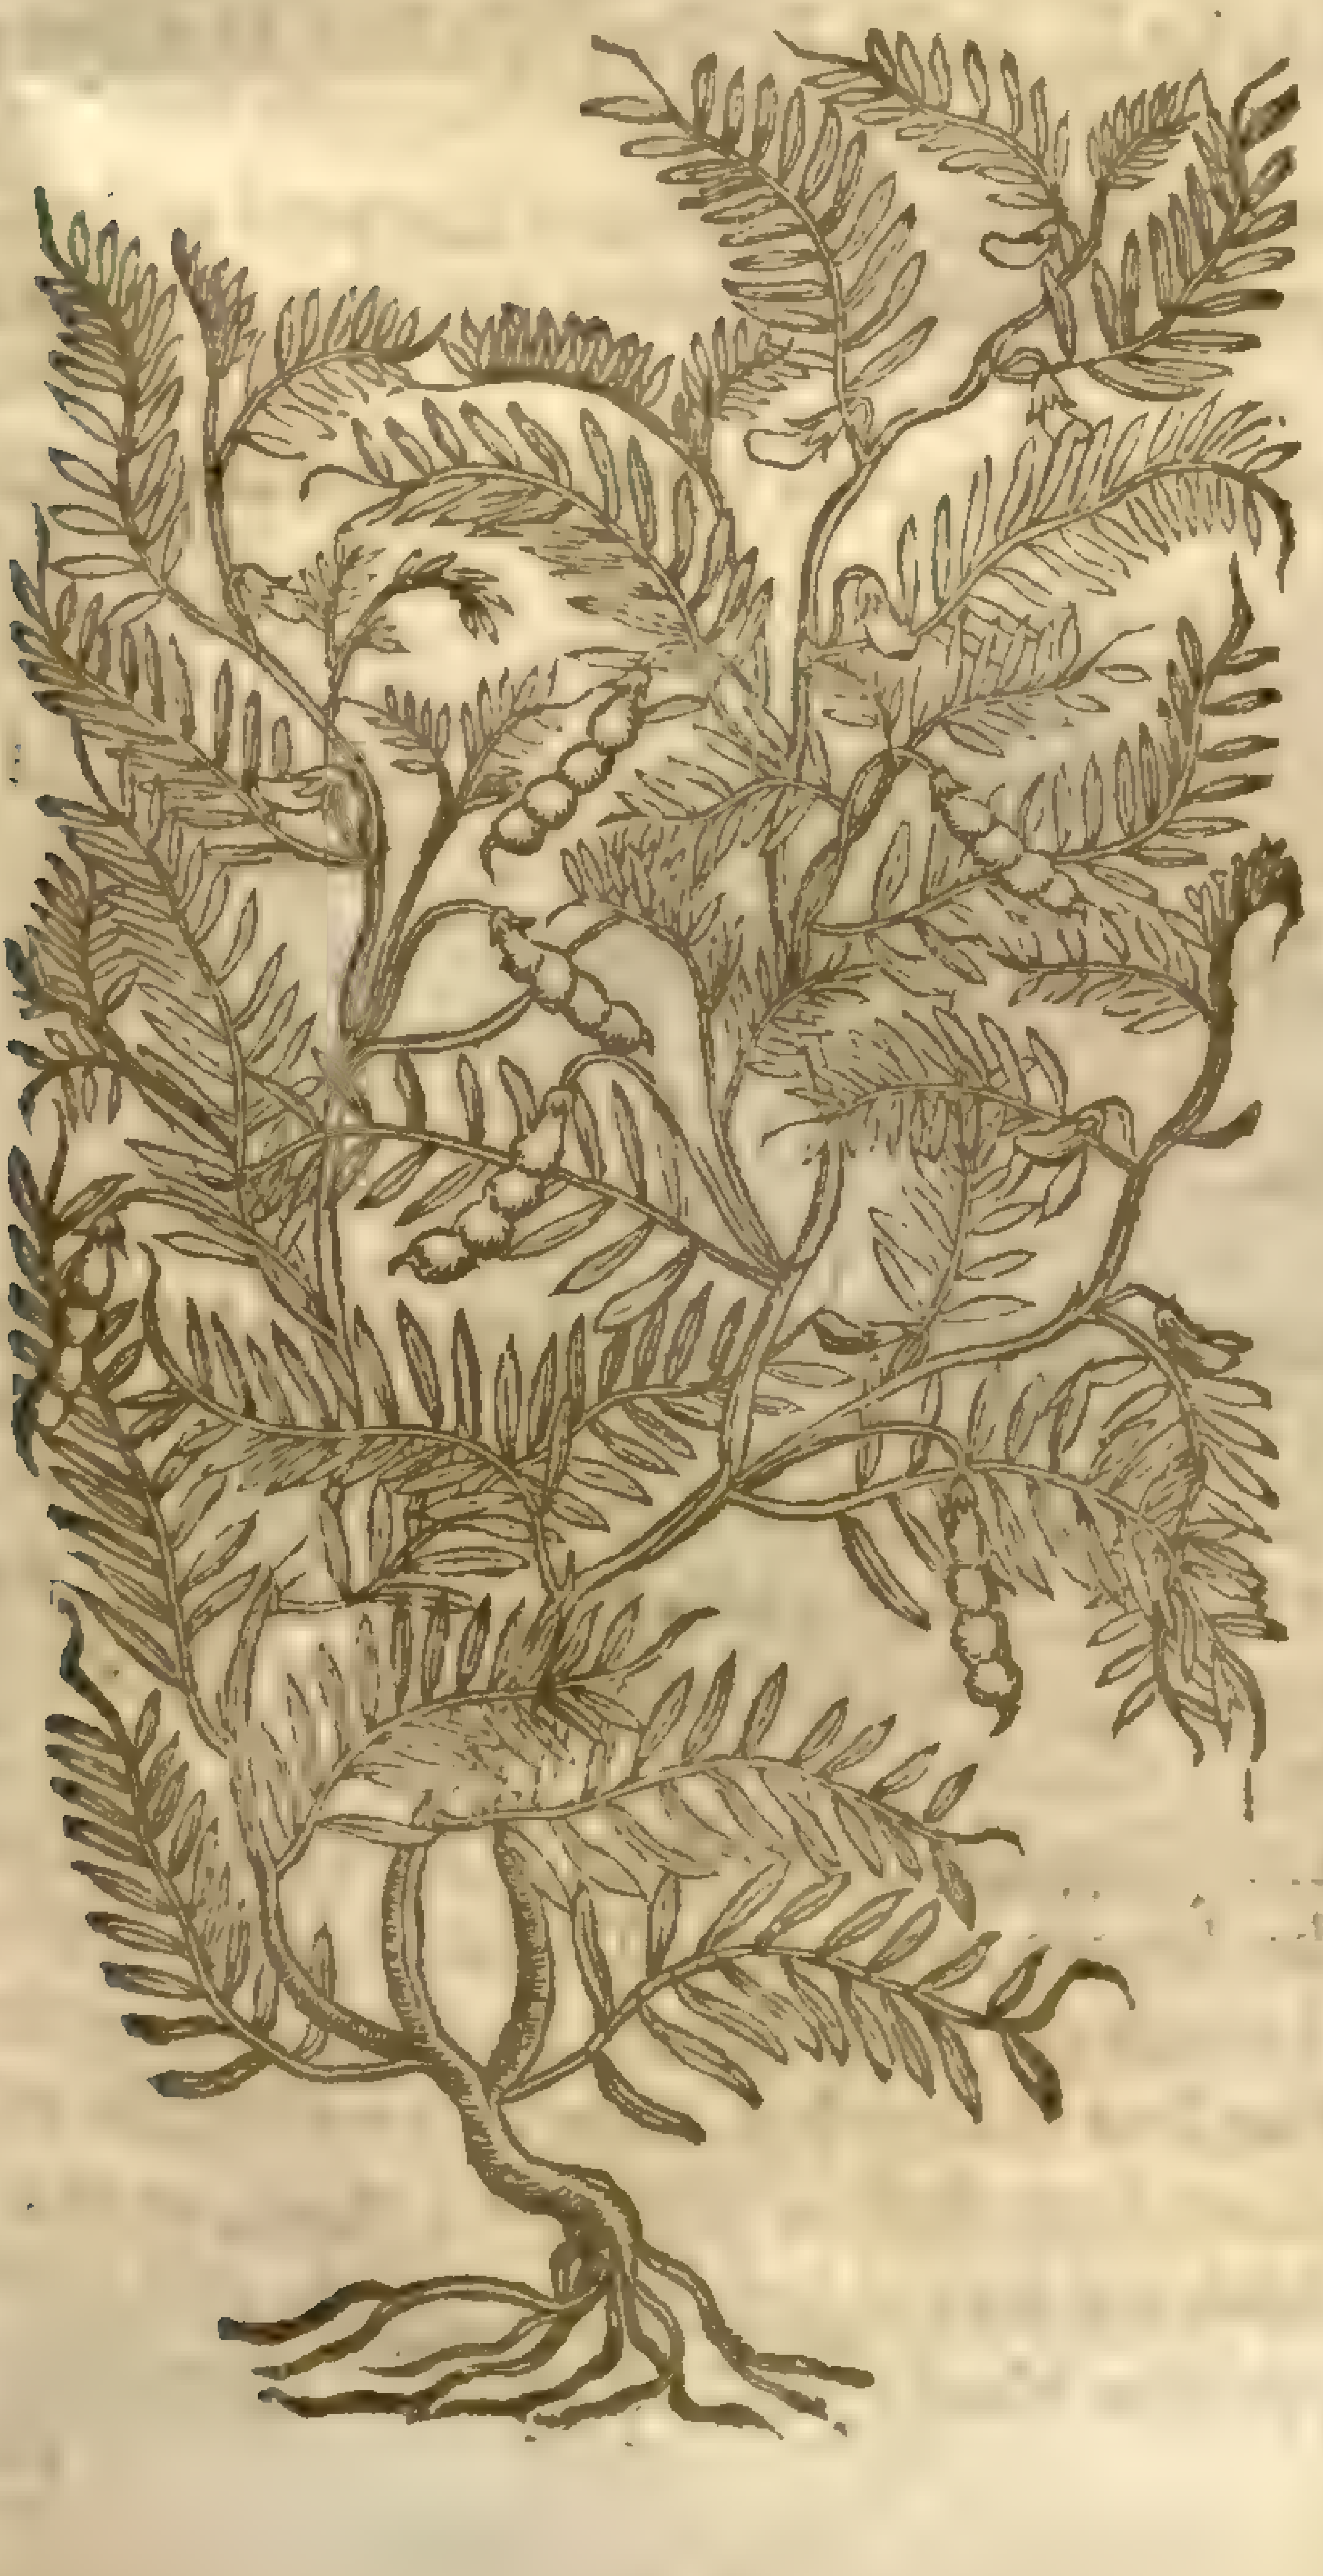
With hony it filleth vp hollow ſores, it breaketh aſchares, clenſeth vlcers: being boyled in wine it waſteth away wens and hard ſwellings of the throat. N

With a quince, and Melilot, and oyle of Roſes, it helpeth the inflammation of the eies and fundament; but in greater inflammations of the fundament, and great deep vlcers, it is boyled with the ride of a pomegranate, dry Roſe leaues, and hony. O

And after the ſame maner againſt eating ſores that are mortified, if ſea water be added; it is alſo a remedy againſt puſhes, the ſhingles, and the hot inflammation called S. Anthonies fire, and for kibes, in ſuch manner as we haue written; being boyled in ſea water and applied, it helps womens breſts in which the milke is cluttered, and cannot ſuffer too great abundance of milke. P

Chap. 514. *Of Cich or true Orobus.*

Orobus reptus Herbariorum.
The true Orobus.



¶ *The Deſcription.*

This Pulſe, which of moſt Herbariſts is taken for the true Orobus, and called of ſome, bitter Fitch, is one of the Pulſes whoſe tender branches traile vpon the ground, as *Theophraſtus* ſaith, and whoſe long tender branches ſpred far abroad, whereon doe grow leaues like thoſe of the field Vetch: among which grow white floures; after which come long cods, that appeare bunched on the outſide againſt the place where the ſeeds do lie, which are ſmall, round, ruſſet of colour, and of a bitter taſte: the root is ſmall and ſingle.

¶ *The Place.*

It proſpereth beſt in a leane ſoile, according to *Columella*: it groweth in woods and copſes in ſundry places of Spaine and Italy, but here only in gardens.

¶ *The Time.*

This is ſowne early and late, but if it be ſowne in the Spring it eaſily commeth vp, and is pleaſant; and vnpleaſant if it be ſowne in the fall of the leafe.

¶ *The Names.*

This is called in Greeke, Ὄροβος: the ſhops of Germany haue kept the name *Orobus*: the Italians cal it *Macho*: the Spaniards, *Yeruo*, and *Yeruos*: in Engliſh it is called bitter Vetch, or bitter Fitch, and Orobus, after the Latine name. Of ſome Ers; after the French name.

¶ *The*

¶ *The Temperature and Vertues.*

A *Galen* in his firſt booke of the Faculties of nouriſhments ſaith, That men do altogether abſtaine from the bitter Vetch, for it hath a very vnpleaſant taſte, and naughty juyce; but Kine in Aſia and in moſt other countries doe eat thereof, being made ſweet by ſteeping in water; notwithſtanding men being compelled through neceſſity of great famine, as *Hippocrates* alſo hath written, doe often-times feed thereof; and we alſo dreſſing them after the manner of Lupines, vſe the bitter Vetches with hony, as a medicine that purgeth thicke and groſſe humors out of the cheſt and lungs.

B Moreouer, among the bitter Vetches the white are not ſo medicinable, but thoſe which are neere to a yellow, or to the colour of Okar; and thoſe that haue been twice boyled, or ſundry times ſoked in water, loſe their bitter and vnpleaſant taſte, and withall their clenſing and cutting quality, ſo that there is onely left in them an earthy ſubſtance, which ſerues for nouriſhment, that dryeth without any manifeſt bitterneſſe.

C And in his booke of the Faculties of ſimple medicines he ſaith, That bitter Vetch is dry in the later end of the ſecond degree, and hot in the firſt: moreouer, by how much it is bitter, by ſo much it clenſeth, cutteth, and remooueth ſtoppings: but if it be ouermuch vſed it bringeth forth bloud by vrine.

D *Dioſcorides* writeth, that bitter Vetch cauſeth head-ache and heauy dulneſſe, that it troubles the belly, and driueth forth bloud by vrine; notwithſtanding being boyled it ſerues to fatten Kine.

E There is made of the ſeed a meale fit to be vſed in medicine, after this maner: the full and white graines are choſen out, and being mixed together they are ſteeped in water, and ſuffered to lie till they be plumpe, and afterwards are parched till the skinne be broken; then are they ground, and ſearſed or ſhaken through a meale ſieue, and the meale reſerued.

F This looſeth the belly, prouoketh vrine, maketh one well coloured: being ouermuch eaten or drunke it draweth bloud by the ſtoole, with gripings, and alſo by vrine.

G With hony it clenſeth vlcers, taketh away freckles, ſun-burnes, blacke ſpots in the skinne, and maketh the whole body faire and cleane.

H It ſtaieth running vlcers or hard ſwellings, and gangrens or mortified ſores; it ſofteneth the hardneſſe of womens breaſts, it taketh away and breaketh eating vlcers, carbuncles, and ſores of the head: being tempered with wine and applied it healeth the bitings of dogs, and alſo of venomous beaſts.

I With vineger it is good againſt the ſtrangury, and mitigateth paine that commeth thereof.

K It is good for them that are not nouriſhed after their meat, being parched and taken with honey in the quantitie of a nut.

L The decoction of the ſame helpeth the itch in the whole body, and taketh away kibes, if they be waſhed or bathed therewith.

M *Cicer* boyled in fountaine water with ſome *Orobus* doth aſſwage the ſwelling of the yard and priuie parts of man or woman, if they be waſhed or bathed in the decoction thereof; and the ſubſtance hereof may alſo be applied plaiſterwiſe.

N It is alſo vſed for bathing and waſhing of vlcers and running ſores, and is applied vnto the ſcurfe or the head with great profit.

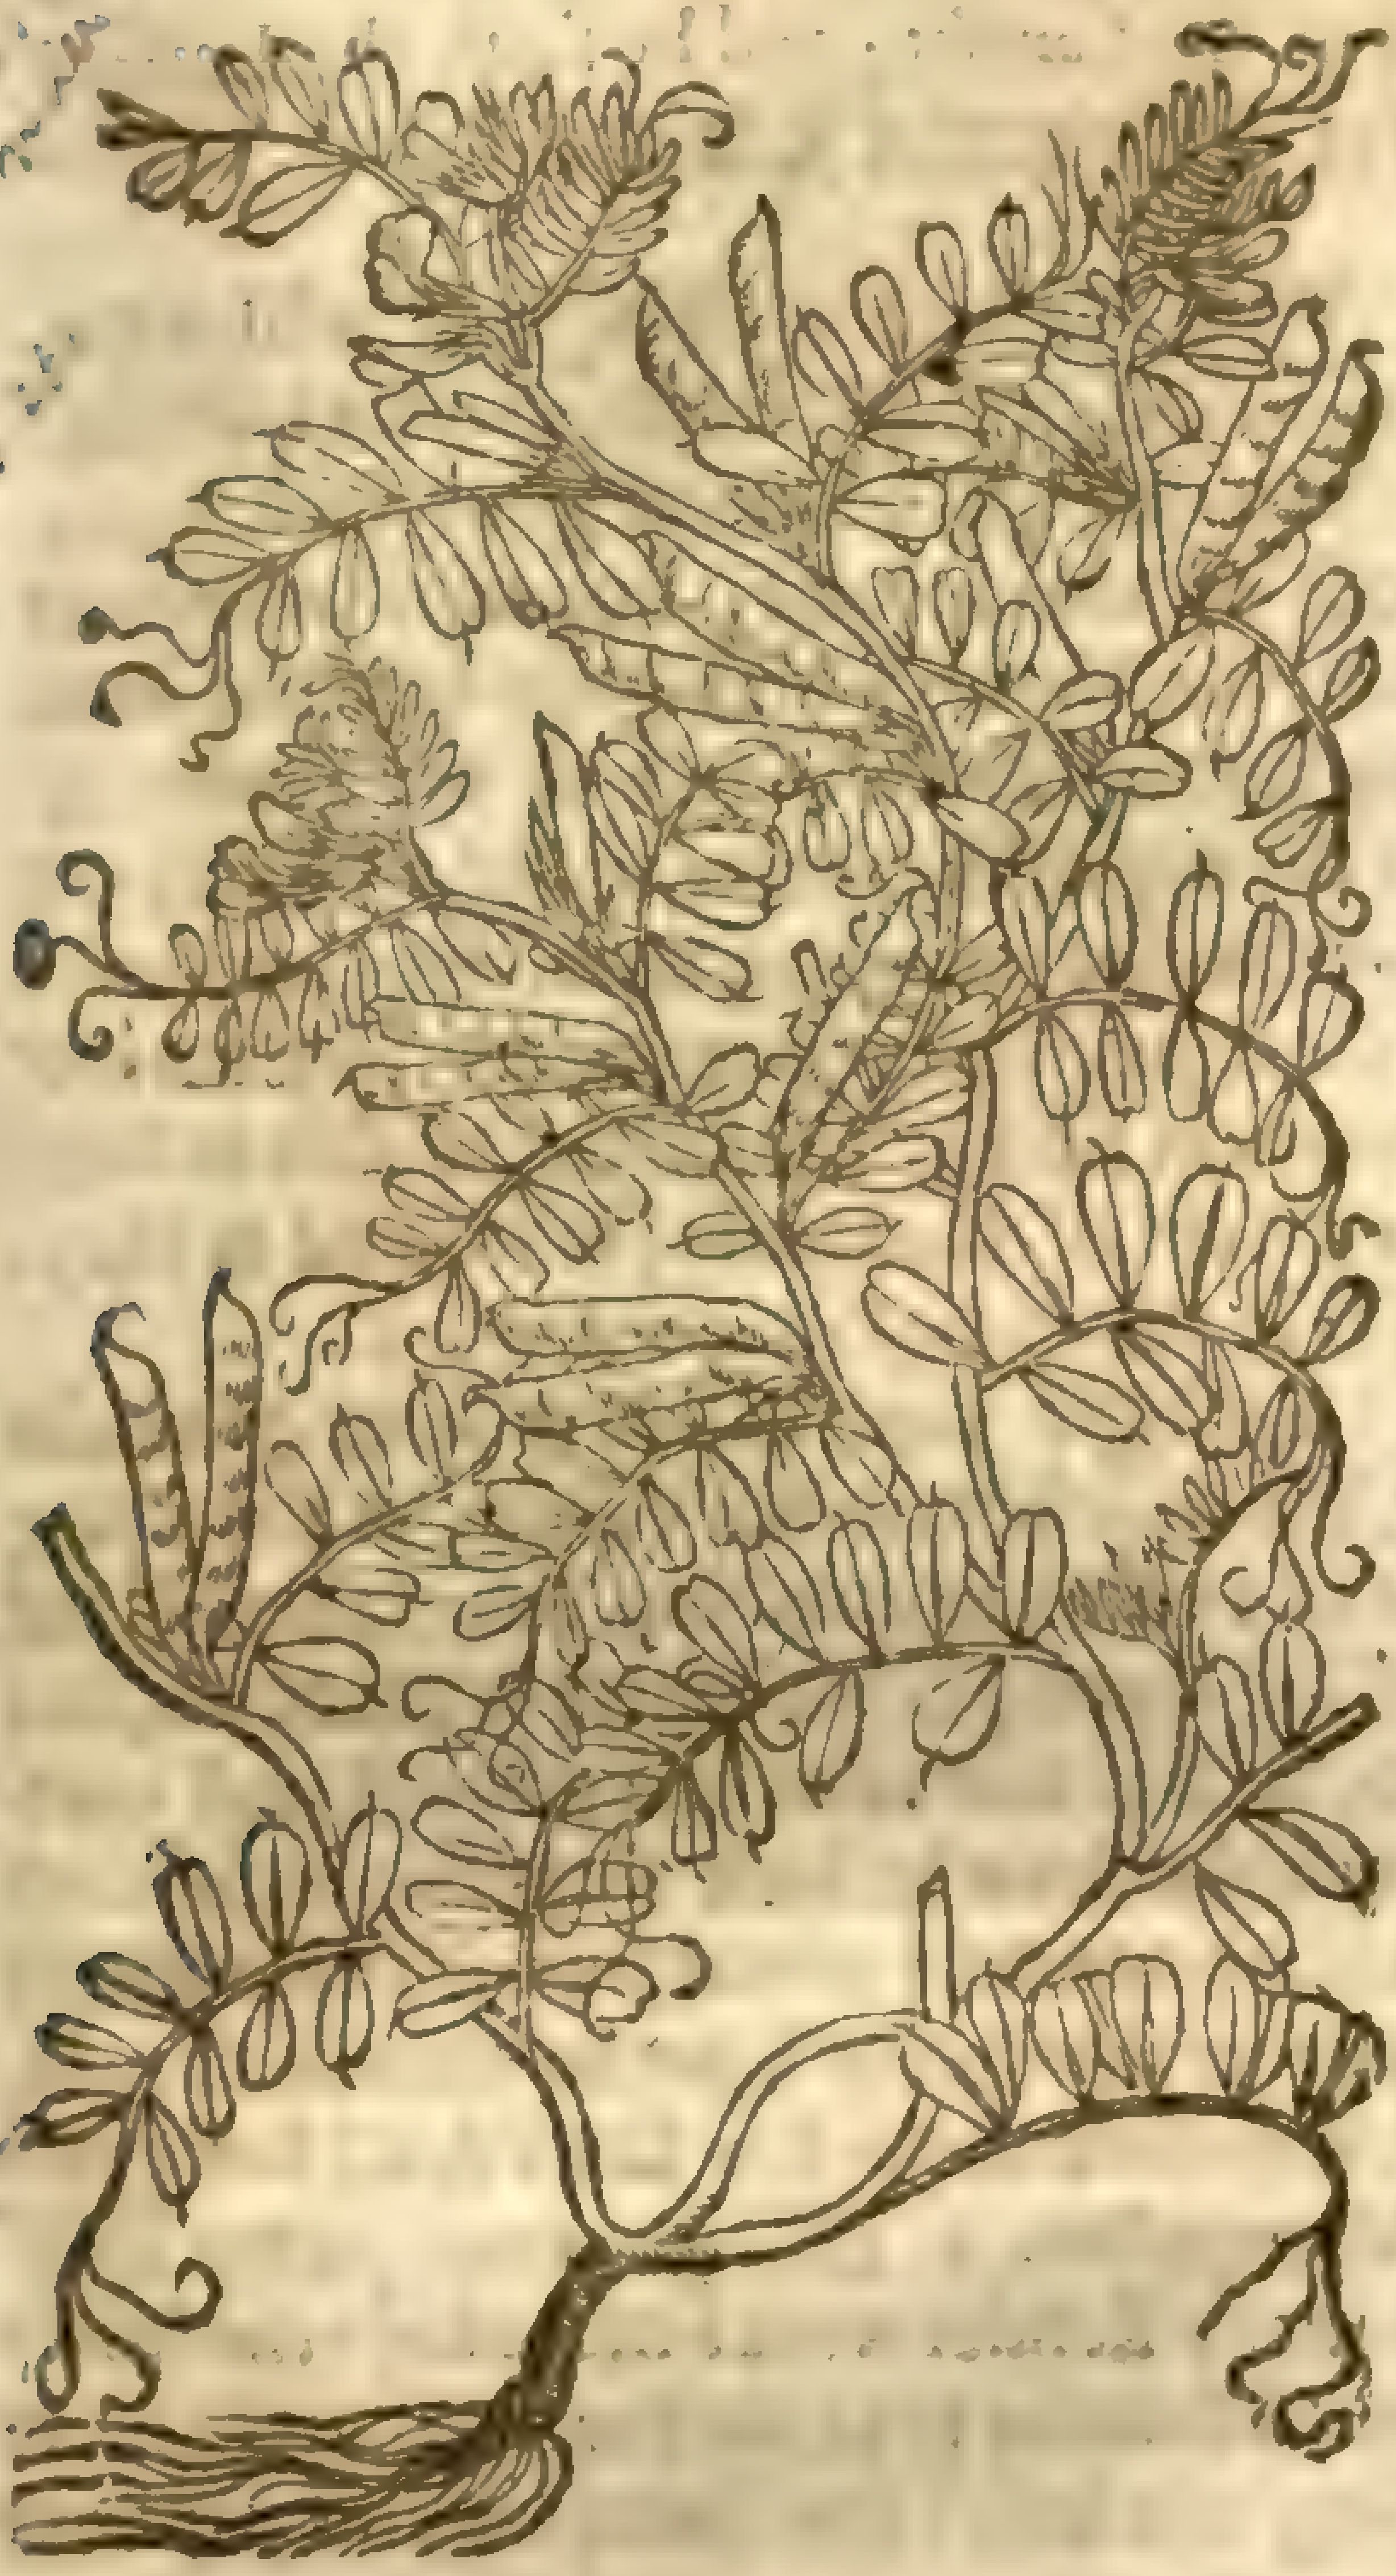
CHAP. 515. *Of the Vetch or Fetch.*

¶ *The Deſcription.*

1 THe Vetch hath ſlender and foure ſquared ſtalkes almoſt three foot long: the leaues be long, with claſping tendrels at the end made vp of many little leaues growing vpon one rib or middle ſtem; euery one whereof is greater, broader, and thicker than that of the Lentill: the floures are like to the floures of the garden Beane, but of a blacke purple colour: the cods be broad, ſmall, and in euery one are contained fiue or ſix graines, not round, but flat like thoſe of the Lentill, of colour blacke, and of an vnpleaſant taſte.

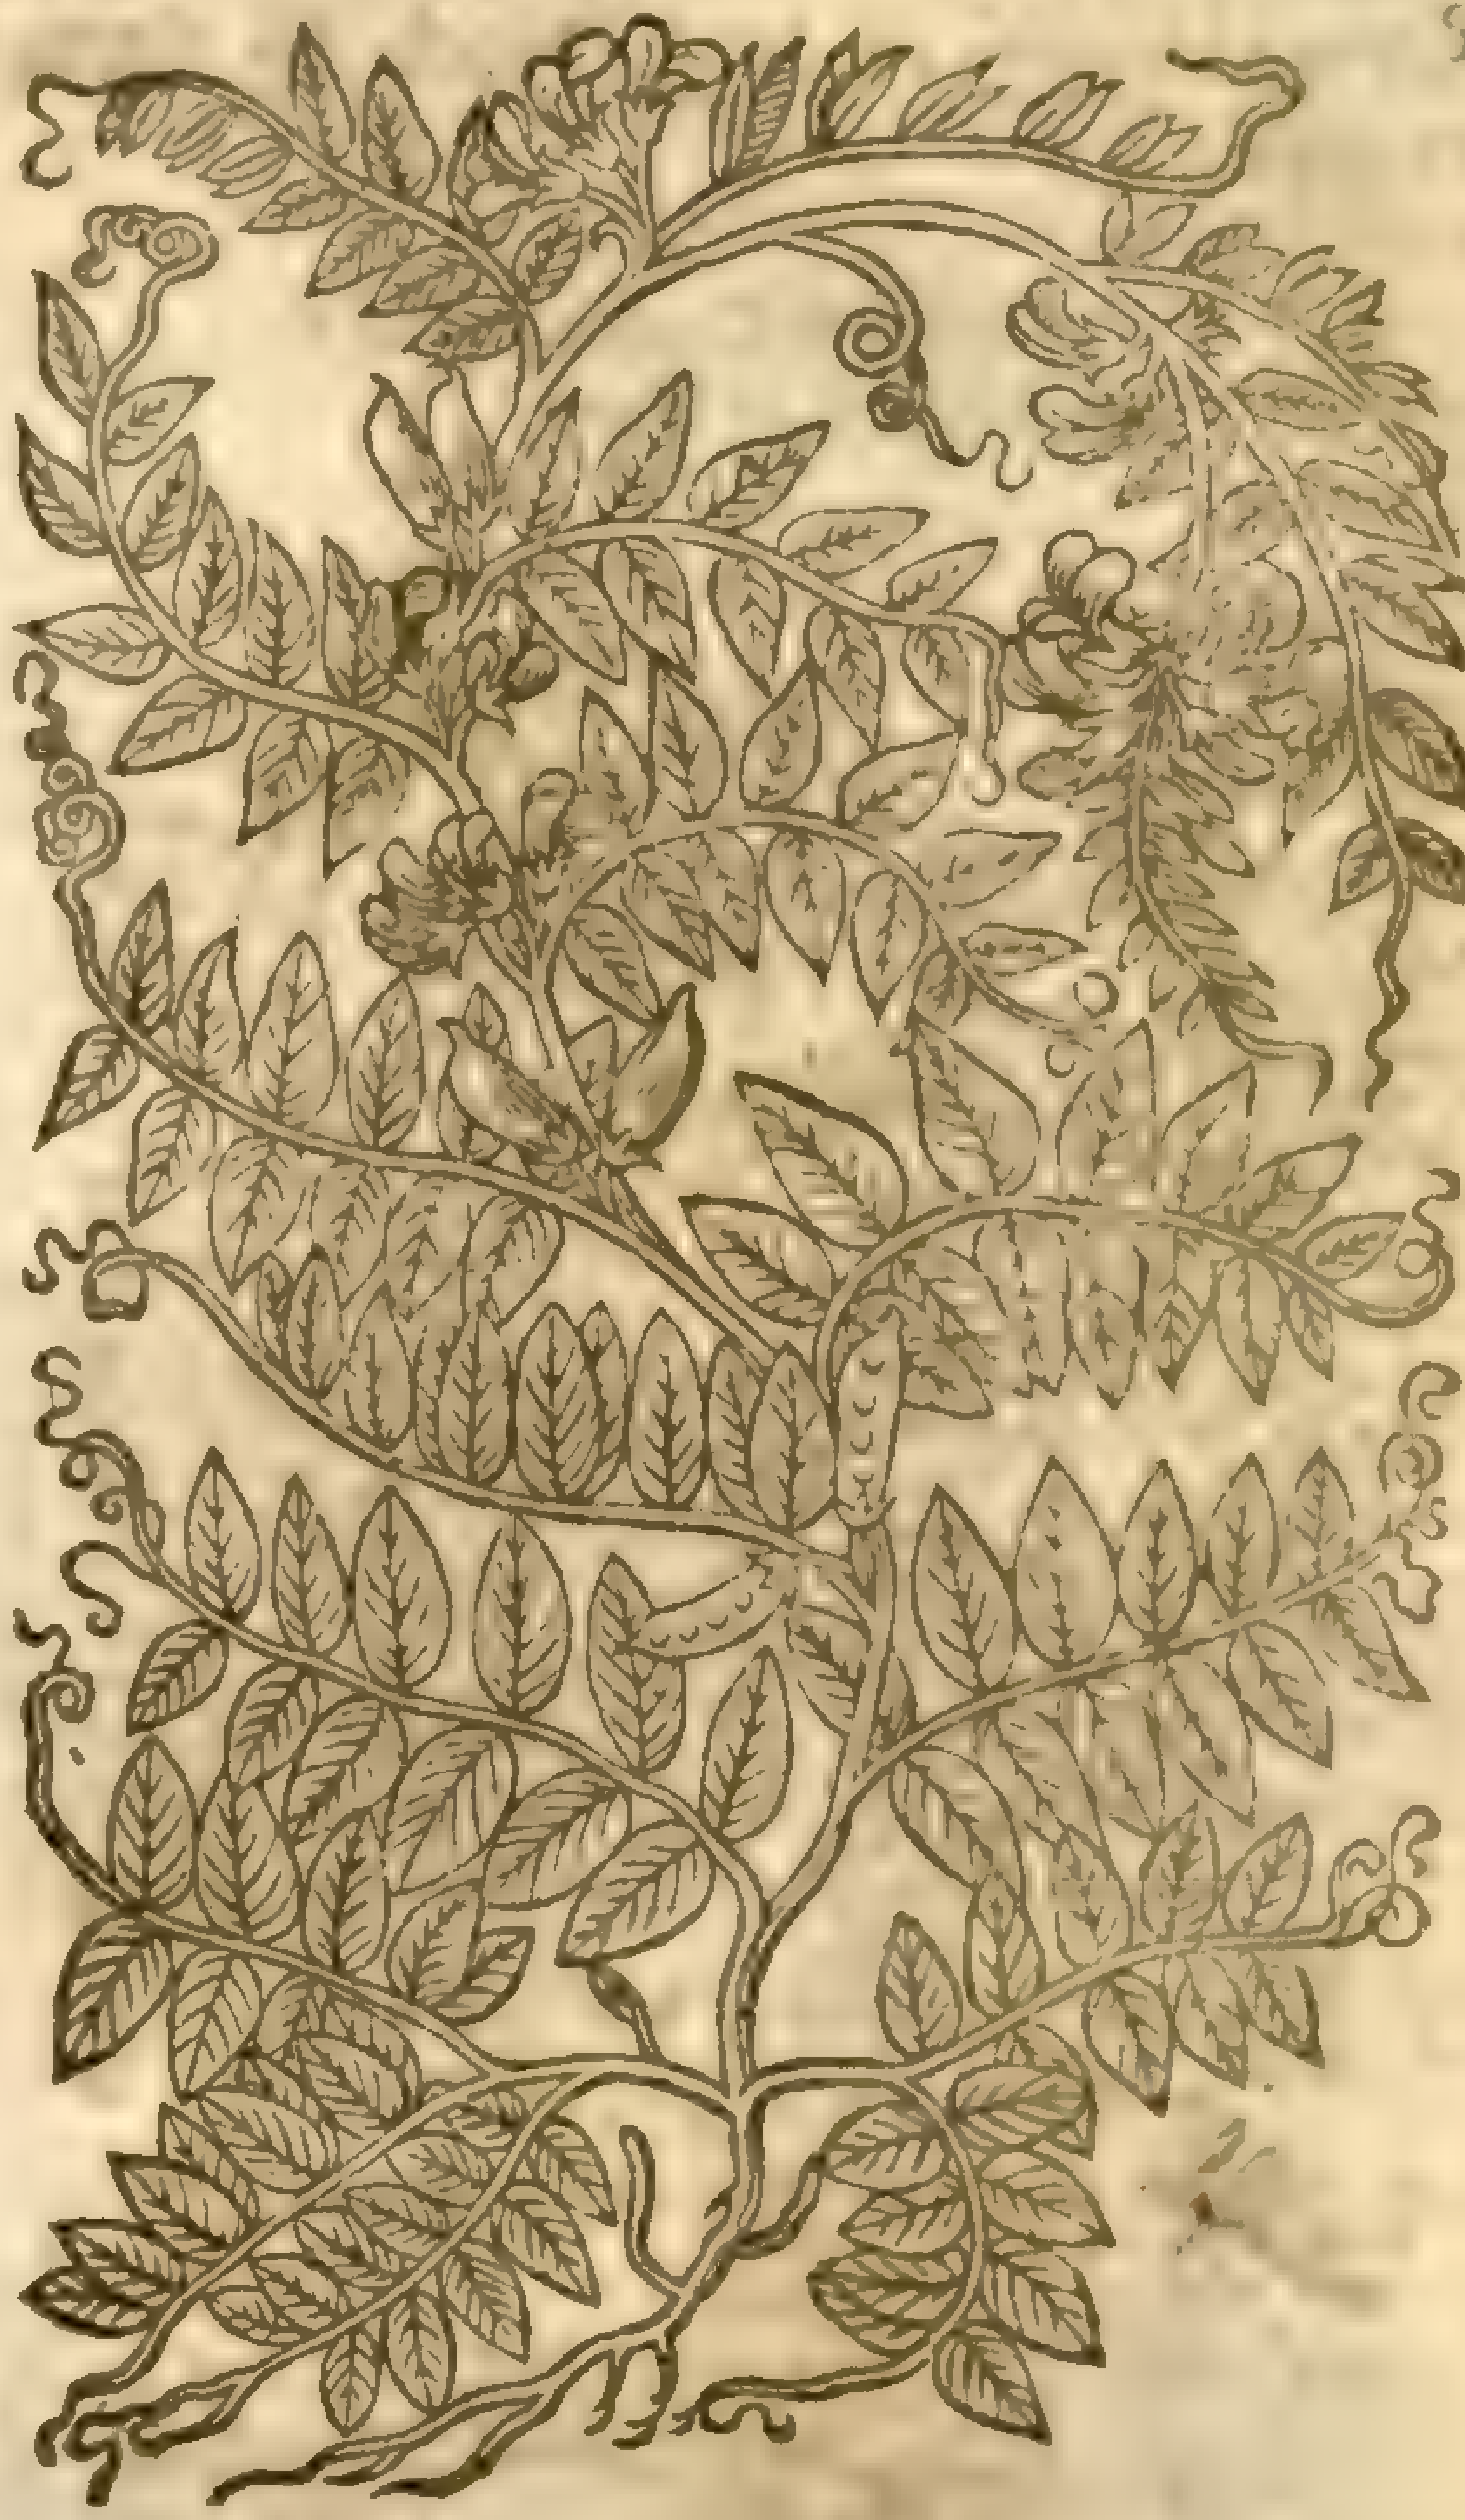
‡ 2 There is another of this kinde which hath a creeping and liuing root, from which it ſendeth forth creſted ſtalkes ſome cubit and halfe high: the leaues are winged, commonly a dozen growing vpon one rib, which ends in a winding tendrel: each peculiar leaues broader toward the bottome, and ſharper towards the top, which ends not flat, but ſomewhat round. Out of the boſomes of the leaues towards the tops of the ſtalkes, on ſhort foot-ſtalkes grow two, three, or more pretty large Peaſe-faſhioned blewiſh purple floures, which are ſucceeded by ſuch cods as the former, but ſomewhat leſſer; which when they grow ripe become blacke, and fly open of themſelues, and

‡ 1 *Vicia.*
Tare, Vetch, or Fetch.

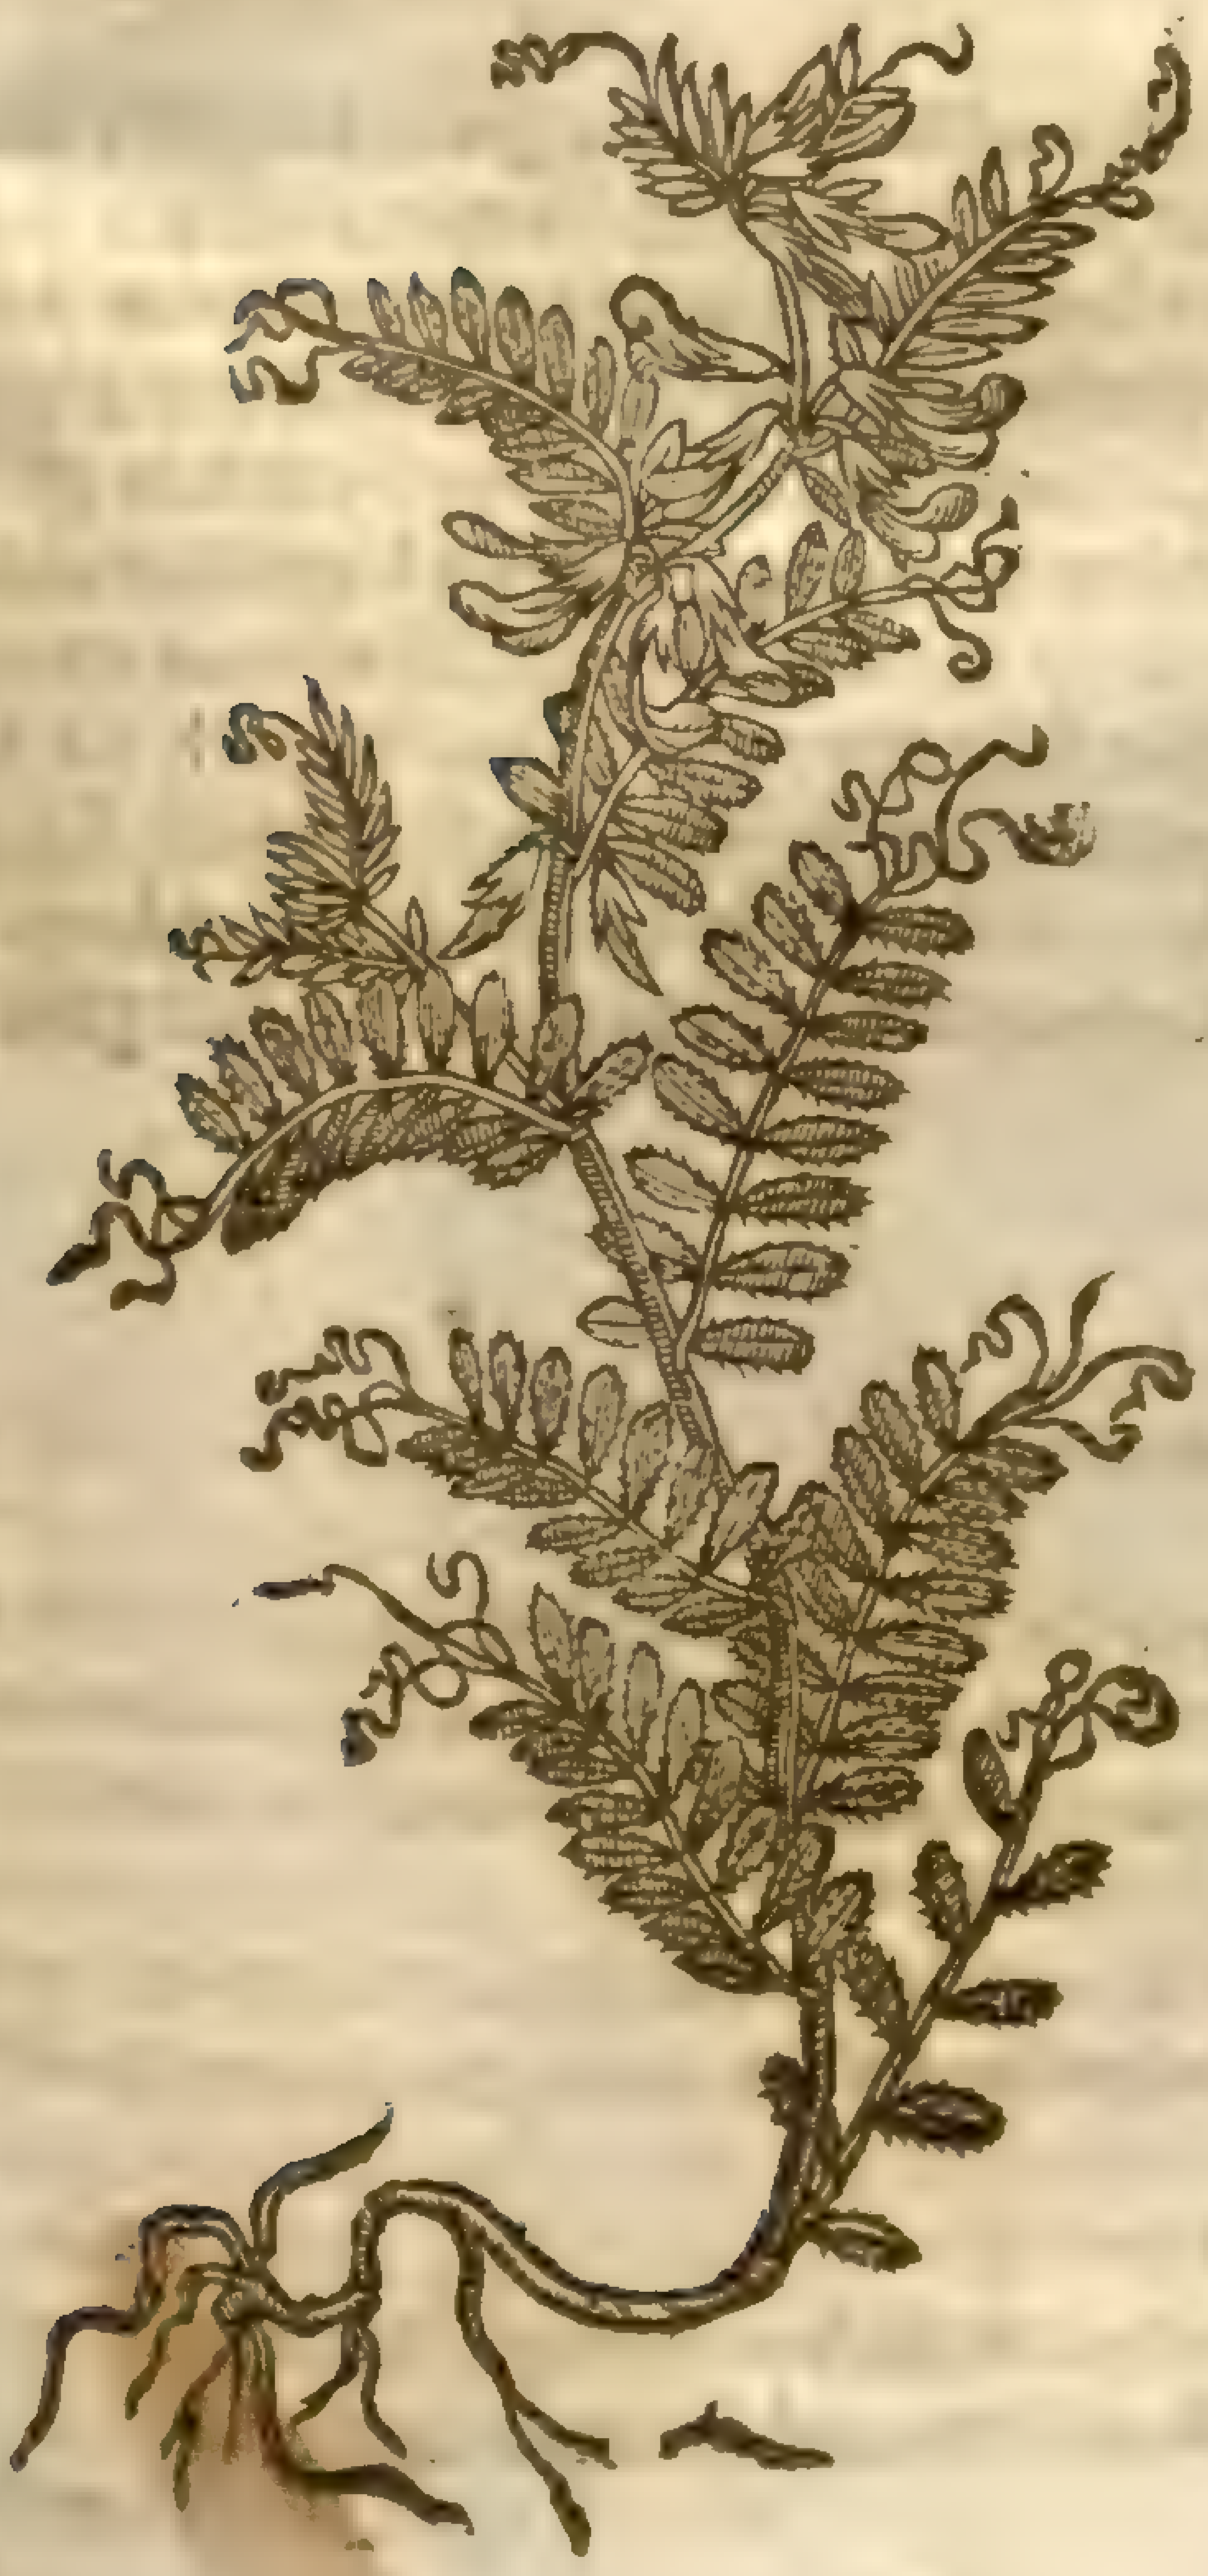


† 2 *Vicia maxima dumetorum.*
Buſh Vetch.

V. [illegible] [illegible] Linn. sp. pl. 3 [illegible]

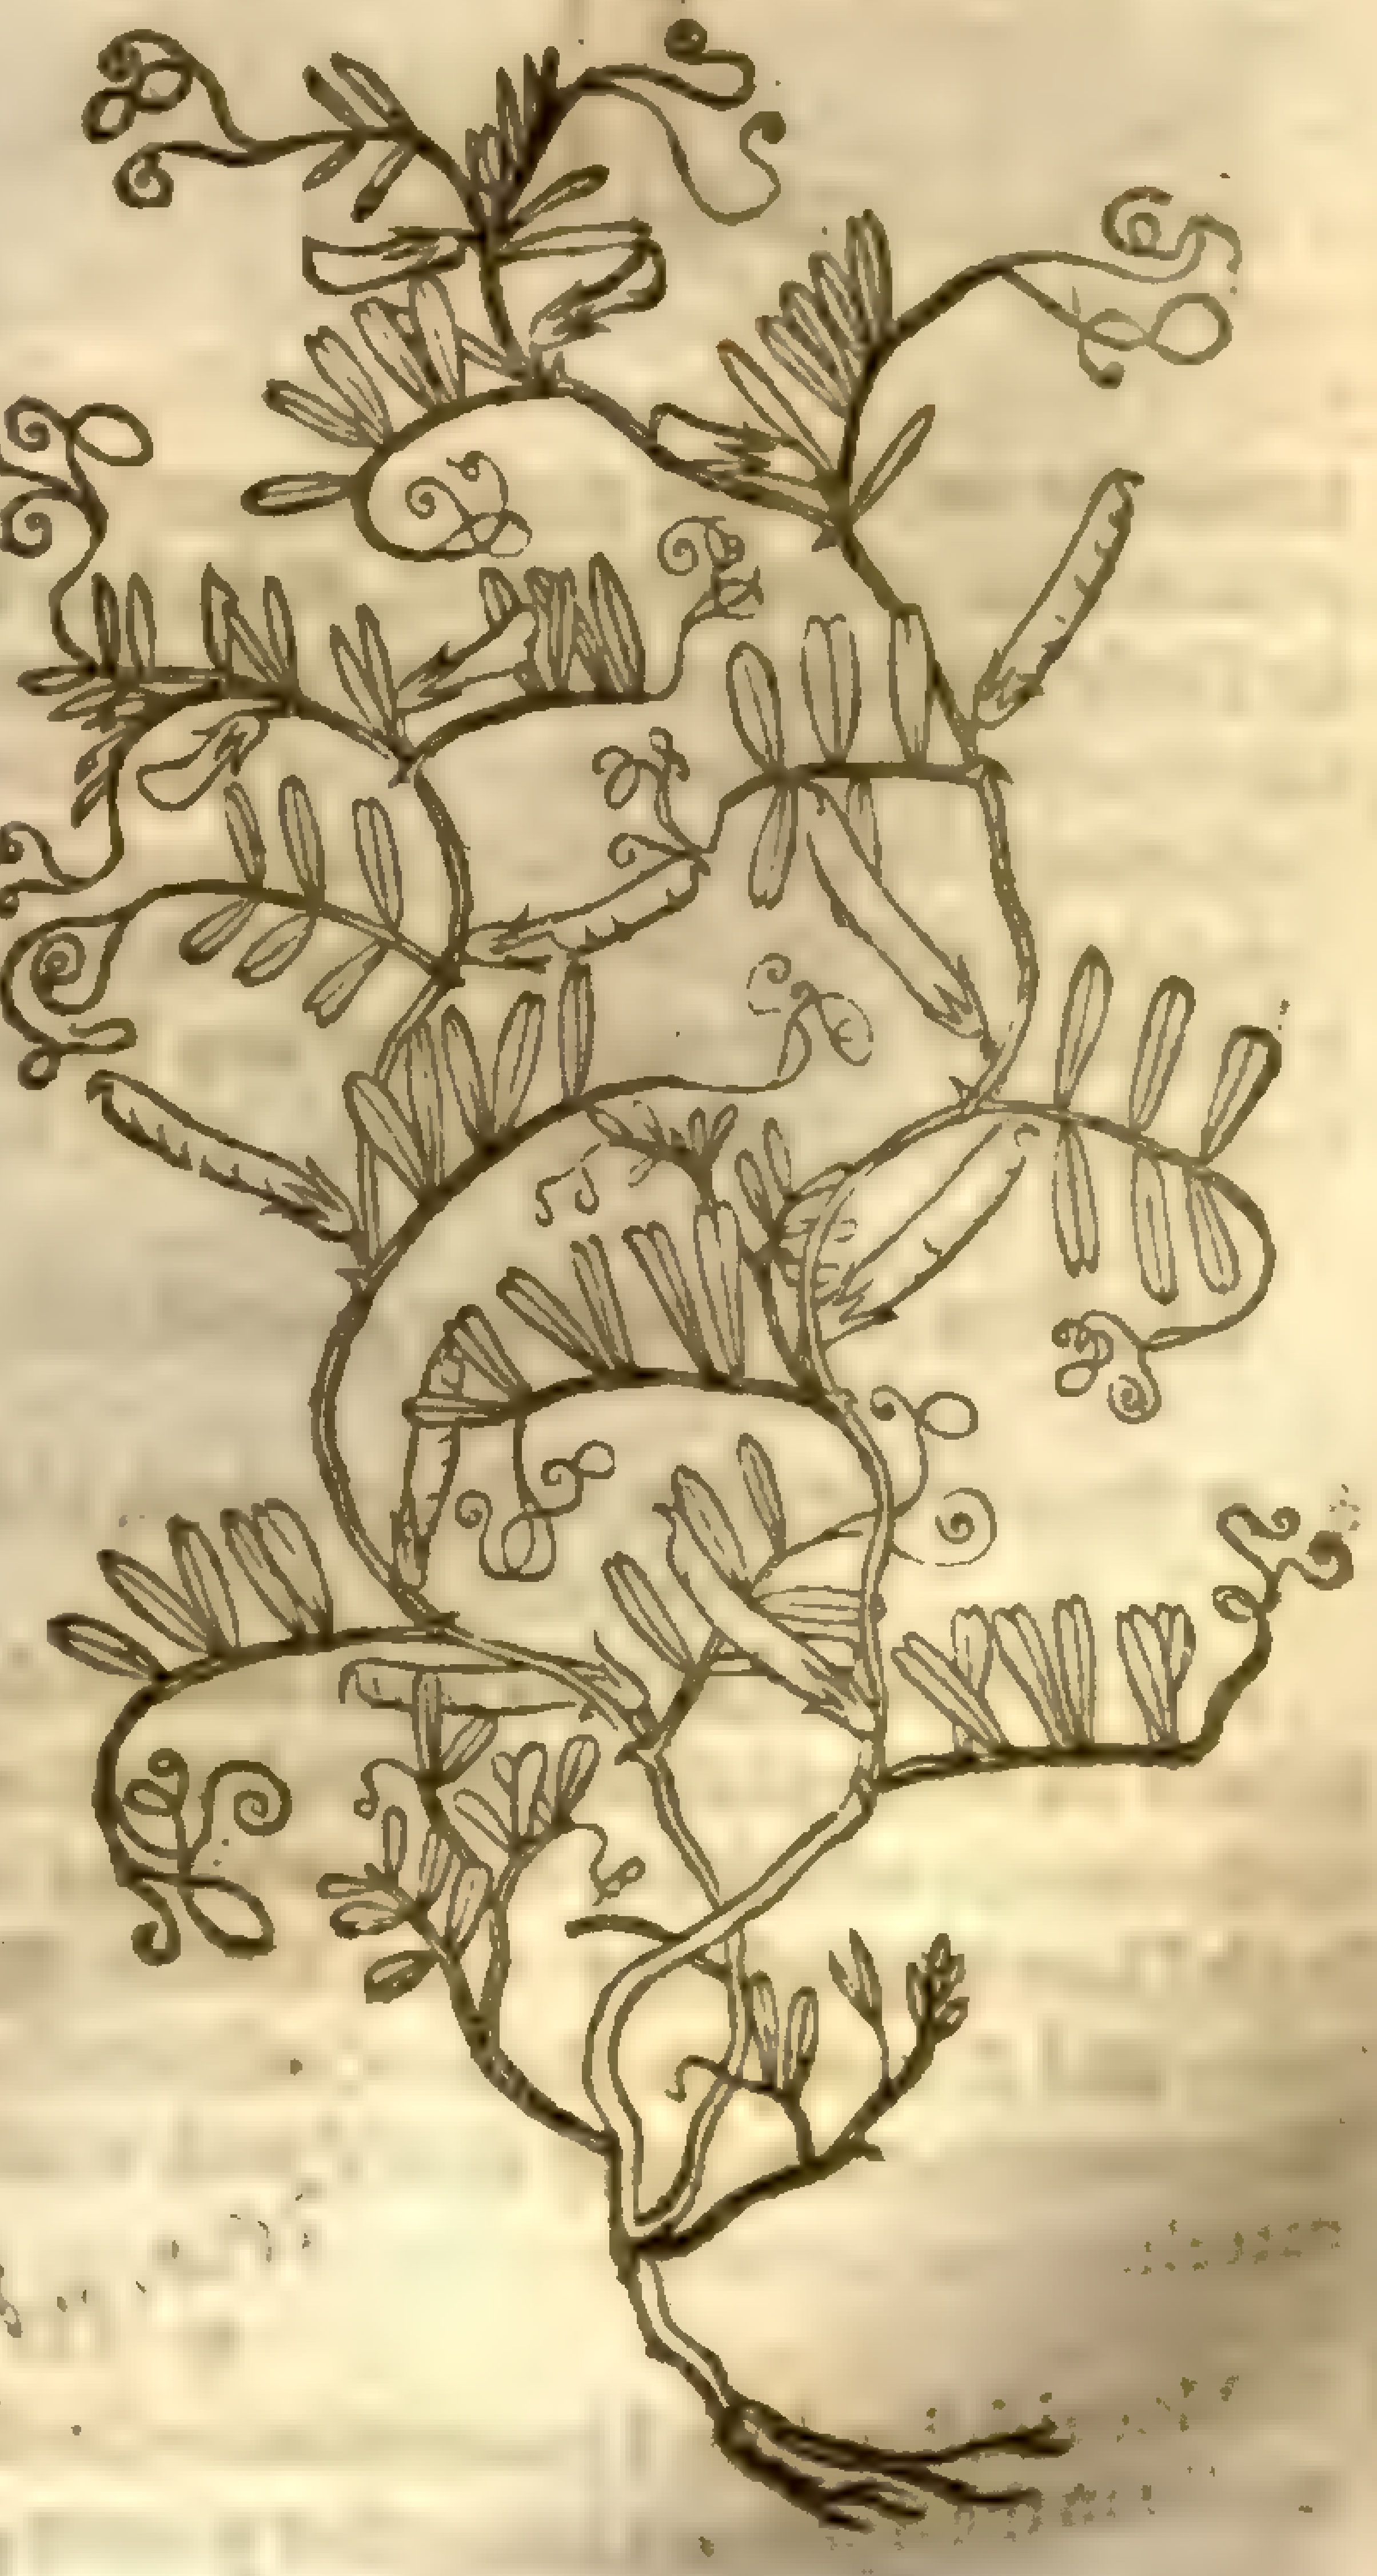


‡ 3 *Vicia ſyl. flo. albo.*
White floured Vetch.



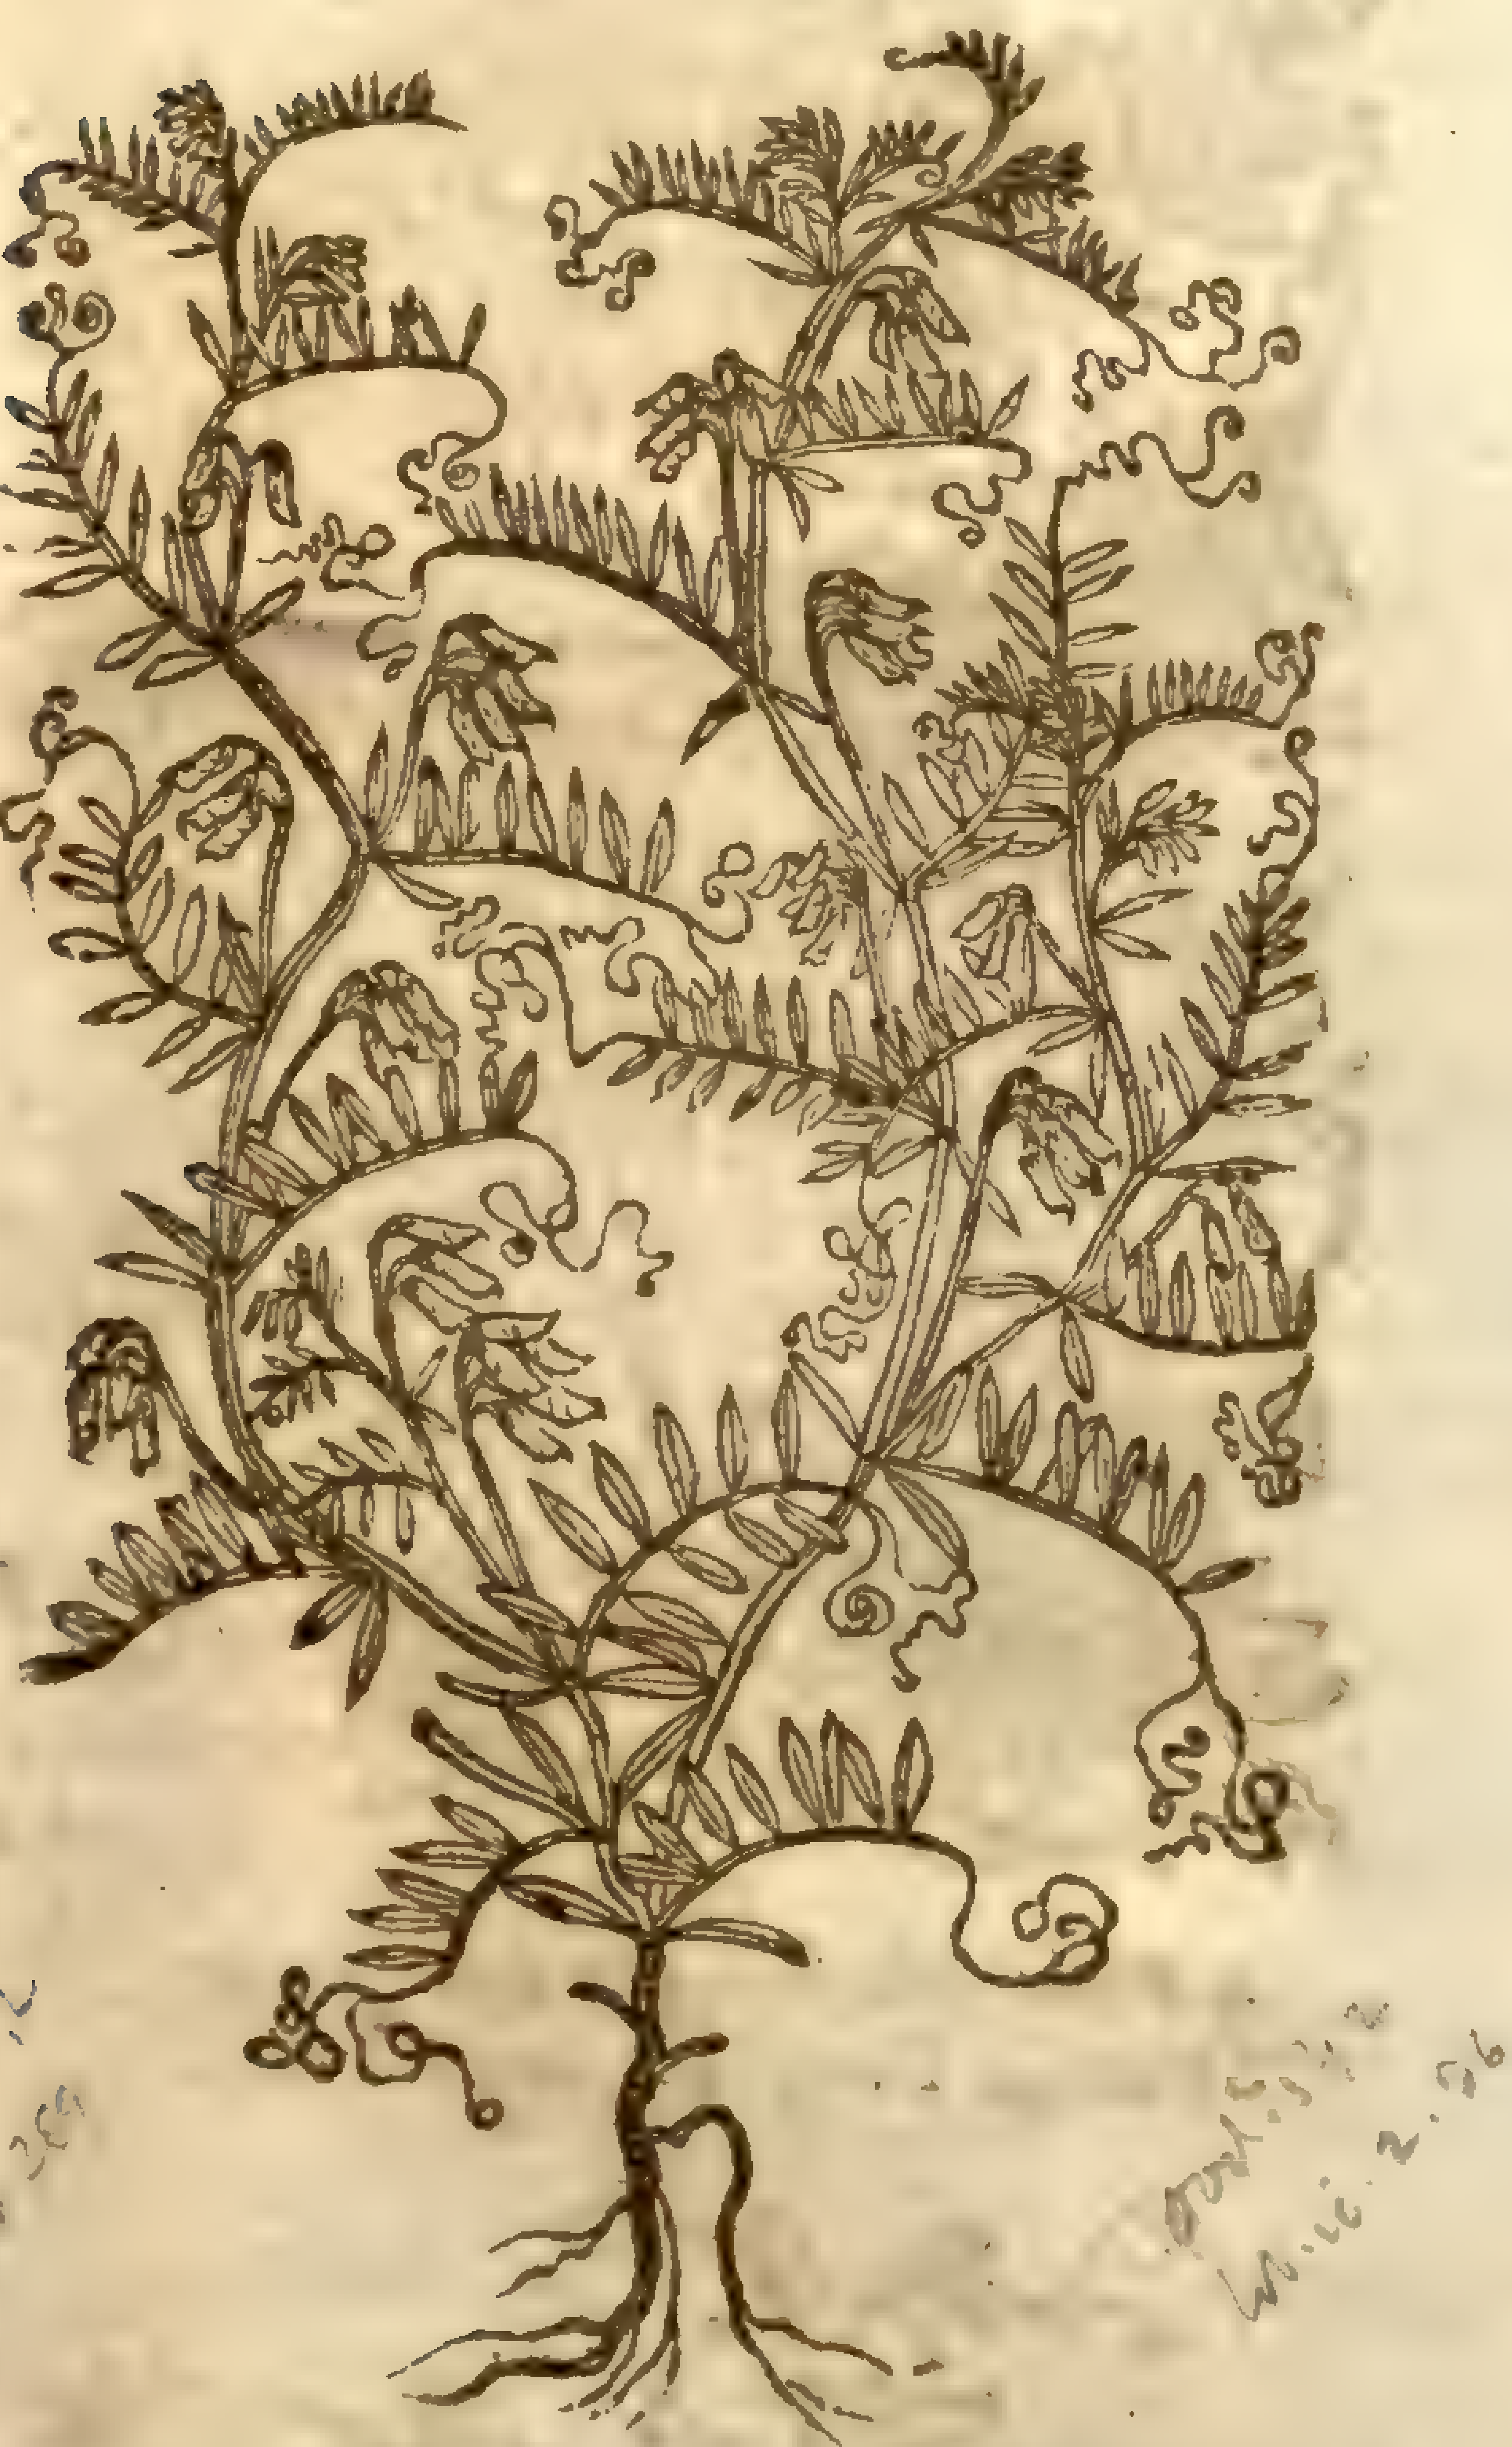
4 *Vicia ſylueſtris, ſive Cracca major.*
Strangle Tare, Tine, or wild Fetch.

Vicia sativa, L. β. [illegible] Linn. sp. pl. 3. 281.



and ſo ſcatter their ſeed. This growes in many places wilde among buſhes, both here and in Germany, as appeares by that name, *Bauhine* thence giues it, calling it *Vicia maxima dumetorum. Tragus* makes it his *Vicia ſyl. altera*; and iudges it to be the *Aphace* of *Dioſcorides*; and he ſaith the Latines call it *Os mundi*: the high Dutch, **S. Criſtoffels kraut**, and **Schwartz Linſen**. *Tabern.* calls it *Cracca maior*.

‡ 5 *Vicia ſyl. ſive Cracca minima.*
Small wilde Tare.



Ervum hirsutum L. Sm. fl. 3. 389

[illegible] With. ed. 2. 656

2 [illegible]

3 This alſo hath a laſting root, which ſendeth vp round creſted branches, a foot and ſomtimes a cubit high, whereon grow ſuch leaues as thoſe of the former, but more white and downie: the floures which grow on ſhort footſtalkes, out of the boſomes of the leaues, towards the top of the ſtalks, are of a whitiſh colour, with veines of a duskie colour, diuaricated ouer the vpper leafe: the cods are like thoſe of the common Fetch. *Cluſius* found this in ſome wilde places of Hungarie; it floured in May: he calls it *Vicia ſylueſtris albo flore.* ‡

4 Strangle Tare, called in ſome countries Tine, and of others wilde Vetch, is a ramping herbe like vnto the common Tare, ramping and clymbing among corne where it chanceth, that it plucketh it downe to the ground, and ouergroweth the ſame in ſuch ſort, that it ſpoileth and killeth not only wheat, but all other graine whatſoeuer: the herbe is better known than deſired, therefore theſe few lines ſhall ſuffice for the deſcription. ‡ This groweth pretty long, with many ſlender weake branches: the leaues are much ſmaller than the former, and end in claſping tendrels: the floures are of a purple colour, and commonly grow but one at a joynt, and they are ſucceeded by flat ſharpe pointed cods which containe ſome nine or ten ſeeds apiece.

5 This alſo growes a good height, with ſlenderer ſtalkes than the former, which is diuided into ſundry branches: the leaues grow foure or ſix vpon foot-ſtalkes, ending alſo in claſping tendrels: the floures grow vpon pretty long but very ſlender foot-ſtalkes, ſometimes two or three, otherwhiles more, very ſmall, and of a whitiſh colour inclining to blewneſſe: which are ſucceeded by little ſhort flat cods, containig commonly foure or fiue little ſeeds of a blackiſh colour: this is the *Arachus, ſive Cracca minima* of *Lobel*; but I queſtion whether it be that which *Bauhine* in his *Pinax* hath made the ſame with it, calling it *Vicia ſegetum cum ſiliquis plurimis hirſutis*: for that which I haue deſcribed, and which exactly agrees with this figure of *Lobel* and that deſcription in the *Aduerſaria* hath cods very ſmooth without any hairineſſe at all. This floures moſt part of Summer, and growes in moſt places both in corne fields and medowes. ‡

¶ *The Place.*

The Tare is ſowne in any ground or ſoile whatſoeuer.

¶ *The Time.*

It floureth in May, and perfecteth his ſeed toward September.

¶ *The Names.*

It is called in Latine *Vicia à vinciendo*, of binding or wrapping, as *Varro* noteth, becauſe, ſaith he, it hath likewiſe claſping tendrels ſuch as the Vine hath, by which it crawles vpward vpon the ſtalks of the weeds which are next vnto it: of ſome, *Cracca*, and *Arachus*, and alſo *Aphaca*: it is called in high Dutch, **Wicken**: in low Dutch, **Uitſen**: in French, *Veſce*: in moſt ſhops it is falſely termed Ὄροβος: and *Eruum*; for *Eruum* doth much differ from *Vicia*: it is called in Engliſh, Vetch, or Fetch. The country-men lay vp this Vetch with the ſeeds and whole plant, that it may be fodder for their cattell.

¶ *The Temperature and Vertues.*

A Notwithſtanding I haue knowne, ſaith *Galen*, ſome, who in time of famine haue fed hereof, eſpecially in the Spring, it being but greene; yet is it hard of digeſtion, and bindeth the belly.

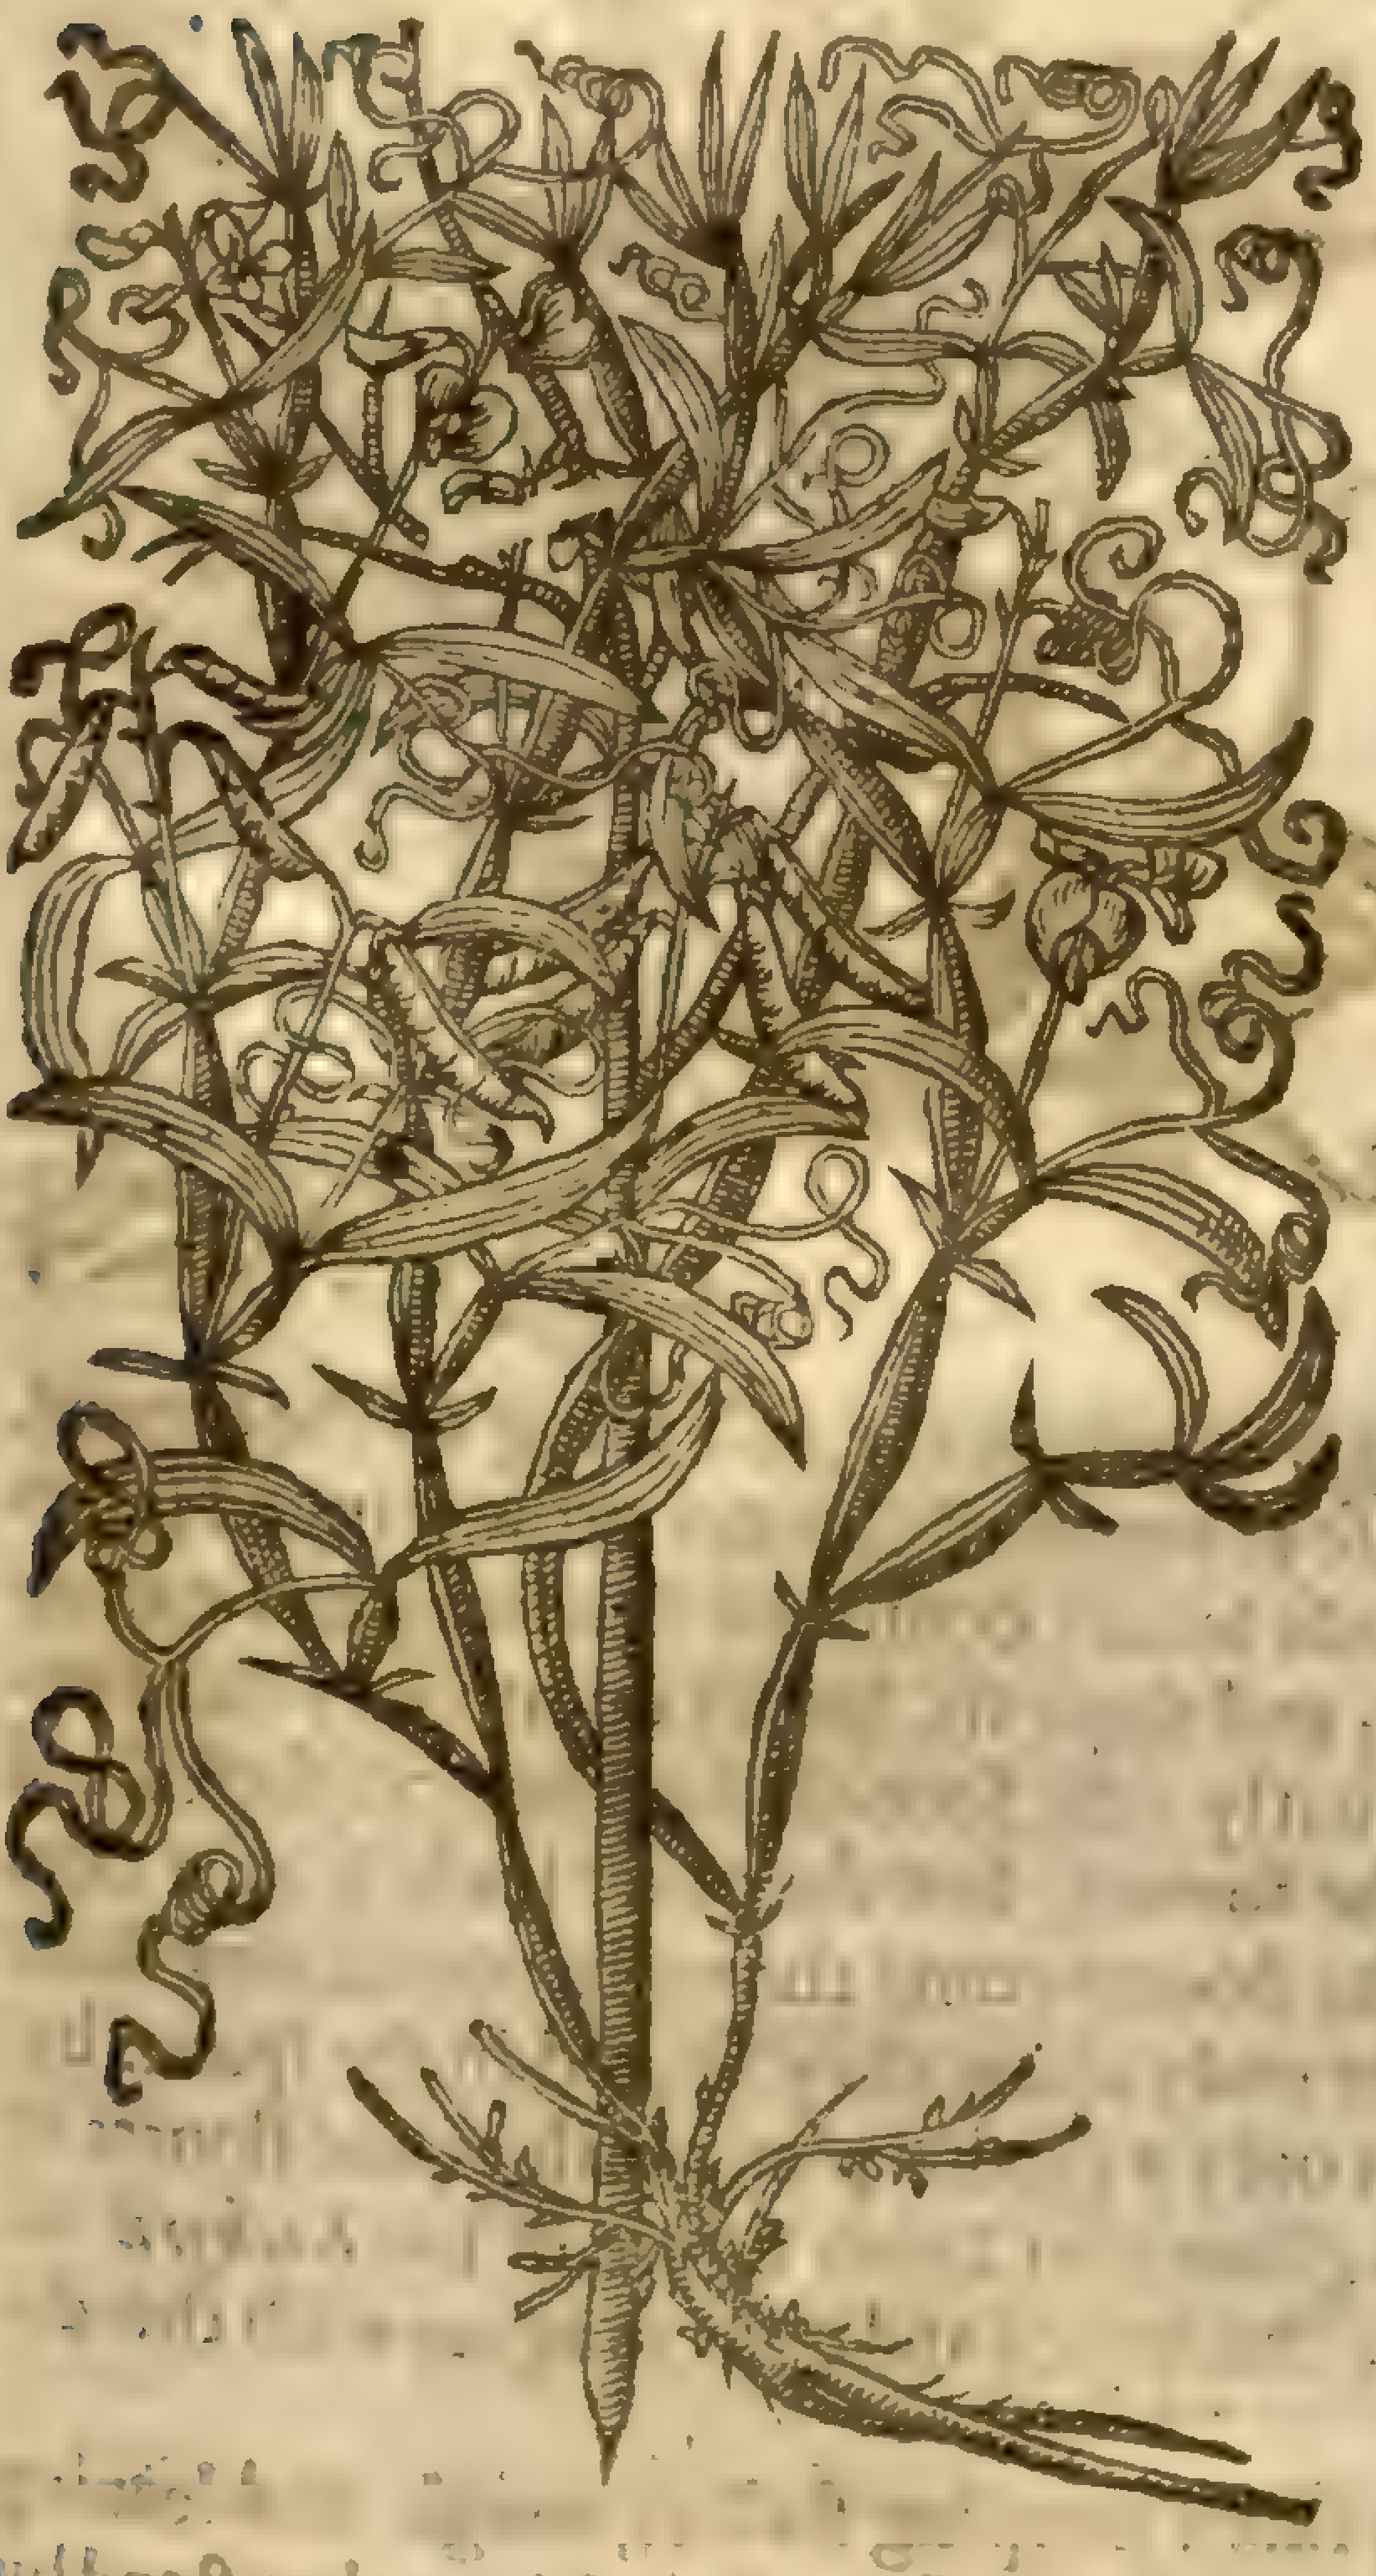
Therefore ſeeing it is of this kind of nature, it is manifeſt that the nouriſhment that commeth therof hath in it no good juice at all, but ingendreth a thick bloud, and apt to become melancholy.

† The figure of the common Fetch was formerly wanting, and in ſtead thereof was put that of the other deſcribed here in the ſecond place.

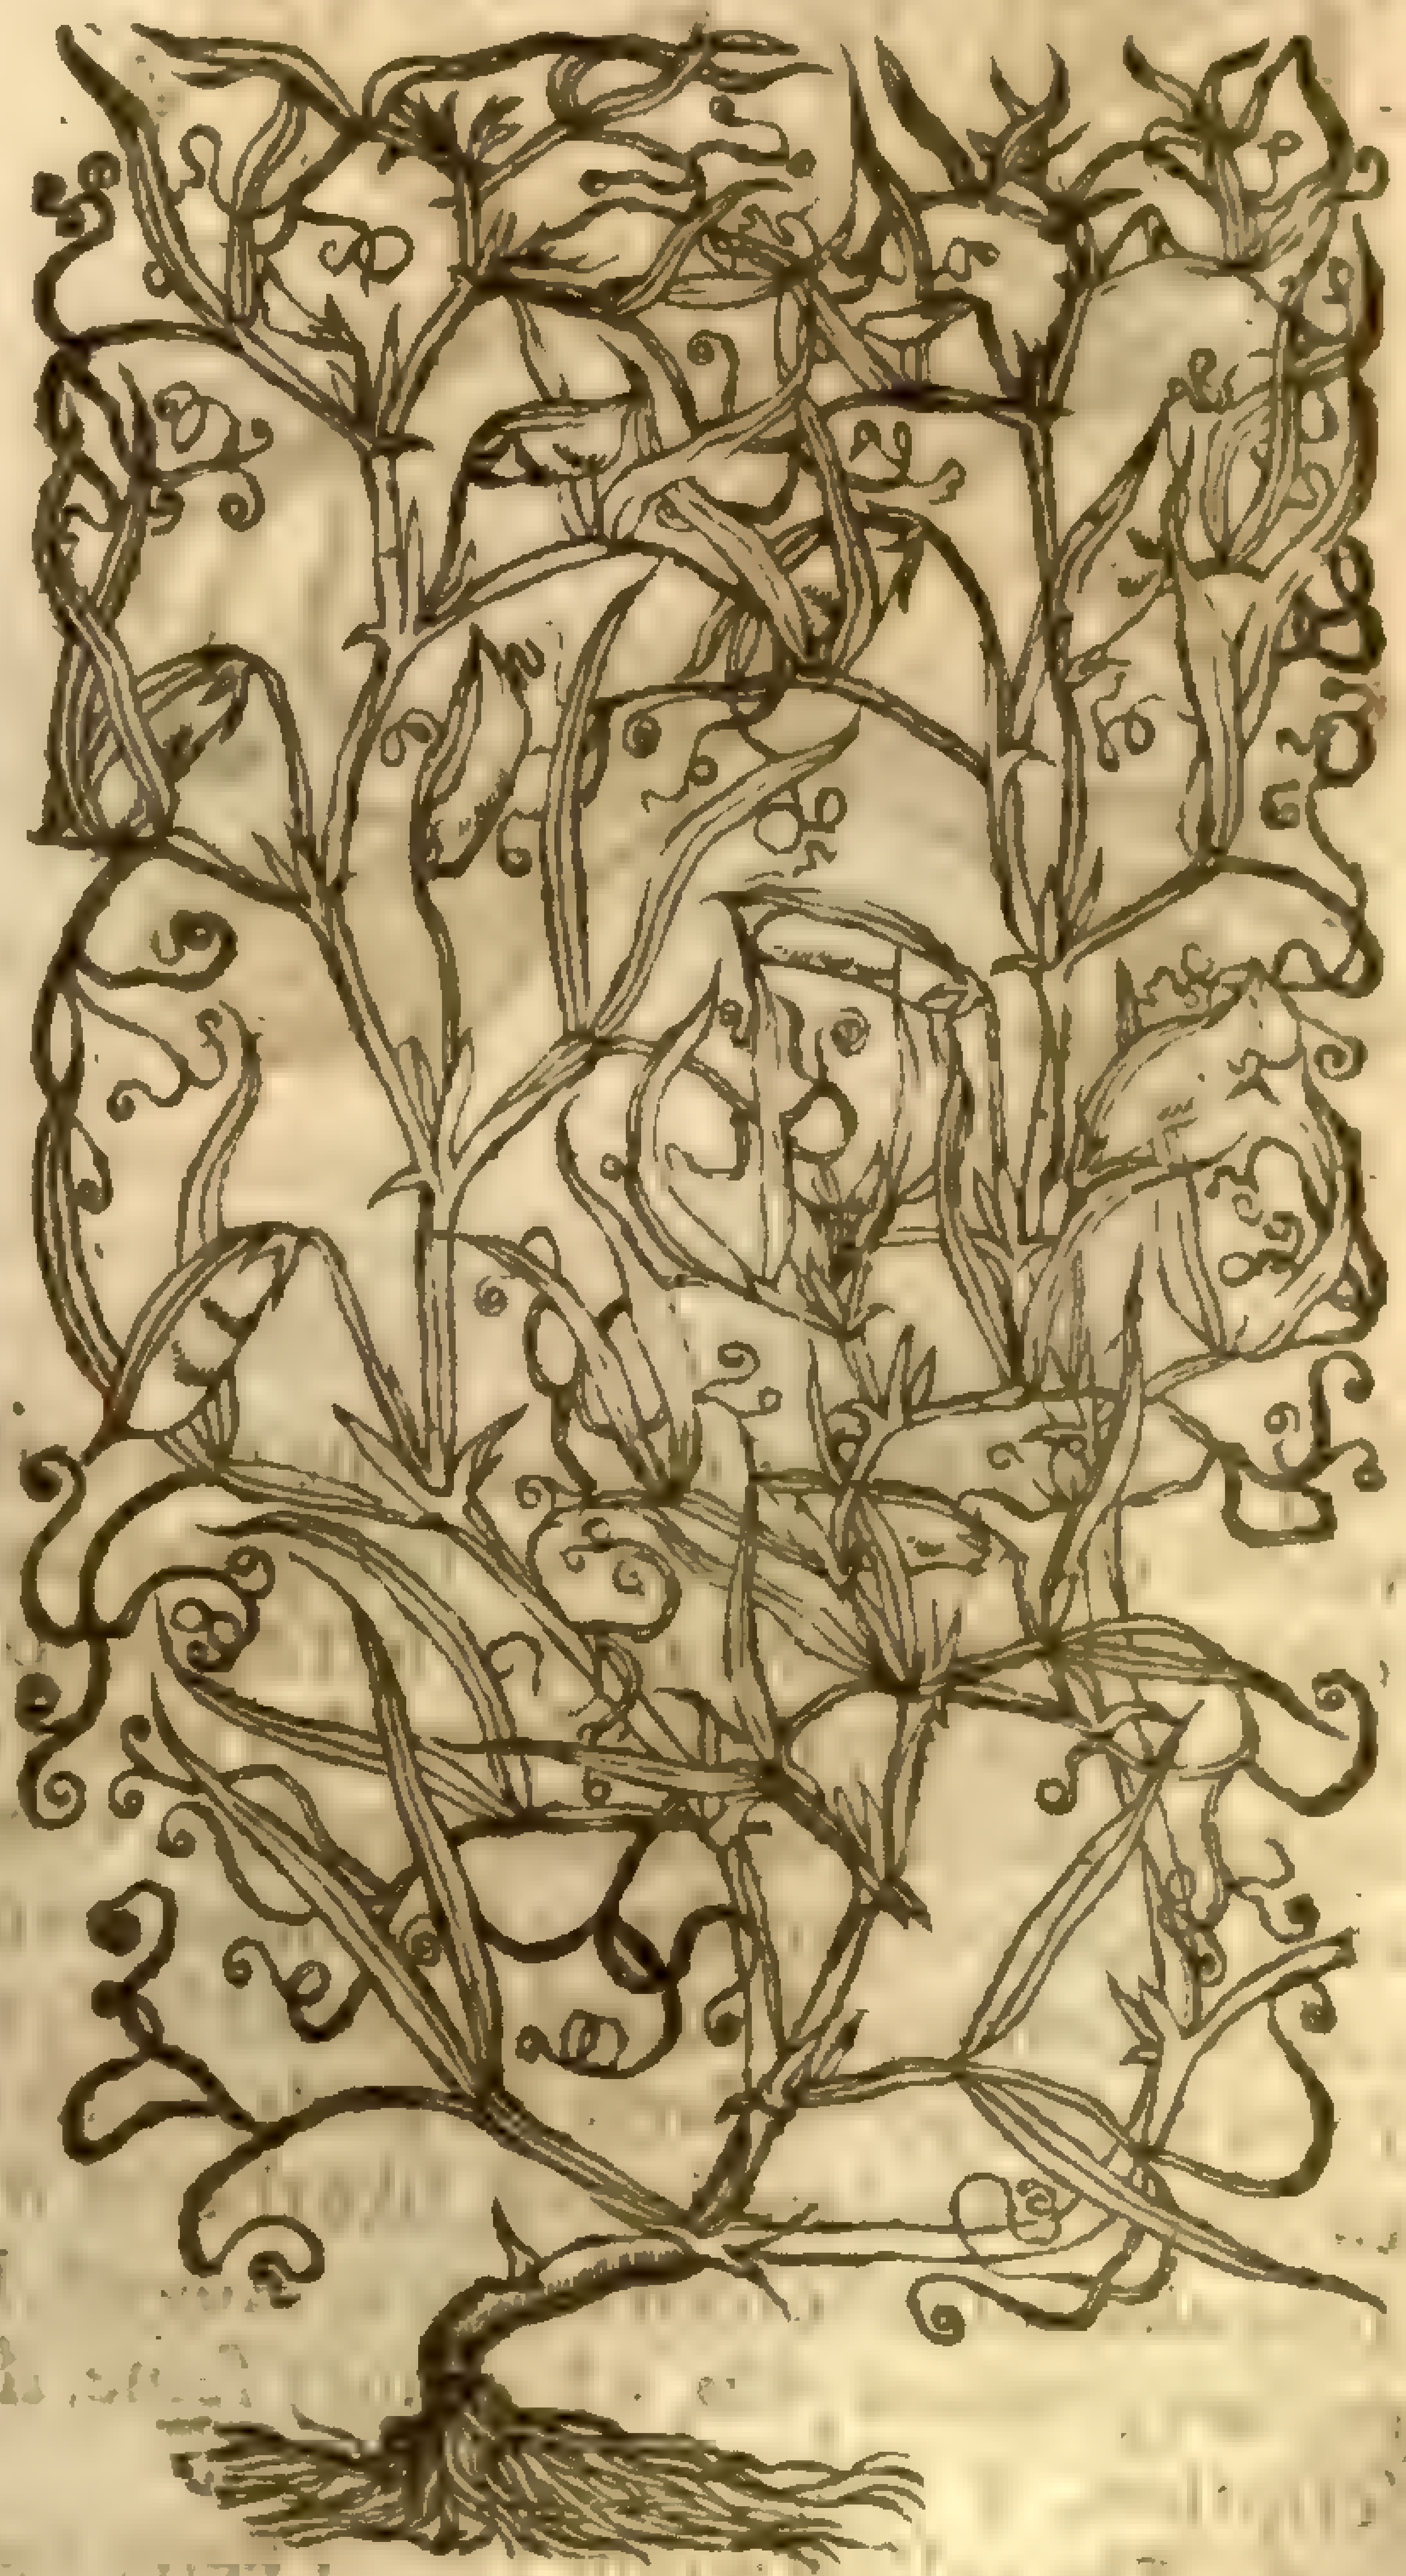
CHAP. 516. *Of Chichlings, Peaſe, and Tare euerlaſting.*

¶ *The Deſcription.*

1 THere is a Pulſe growing in our high and thicke woods, hauing a very thick tough and wooddy root, from which riſe vp diuers long weake and feeble branches, conſiſting of a rough middle rib edged on both ſides with a thin skinny membrane, ſmooth, and of a graſſe green colour; whereon grow at certaine diſtances ſmall flat ſtemmes, vpon which ſtand two broad leaues joining together at the bottome: from betwixt thoſe leaues come forth tough claſping tendrels which take hold of ſuch things as grow next vnto them: from the boſom of the ſtem whereon the leaues do grow, ſhooteth forth a naked ſmooth foot-ſtalke, on which grow moſt beautifull floures like thoſe of the Peaſe, the middle part whereof is of a light red tending to a red purple in grain: the outward leaues are ſomewhat lighter, inclining to a bluſh colour: which beeing paſt, there ſucceed long round cods, wherein is contained ſeed of the bigneſſe of a Tare, but rounder, blackiſh without, yellowiſh within, and of a bitter taſte.



‡ 1 *Lathyrus major latifolius.*
Peaſe euerlaſting.



‡ 2 *Lathyrus anguſtifolius flore albo.*
White floured Chichlings.

L. sativus, L.
[illegible]

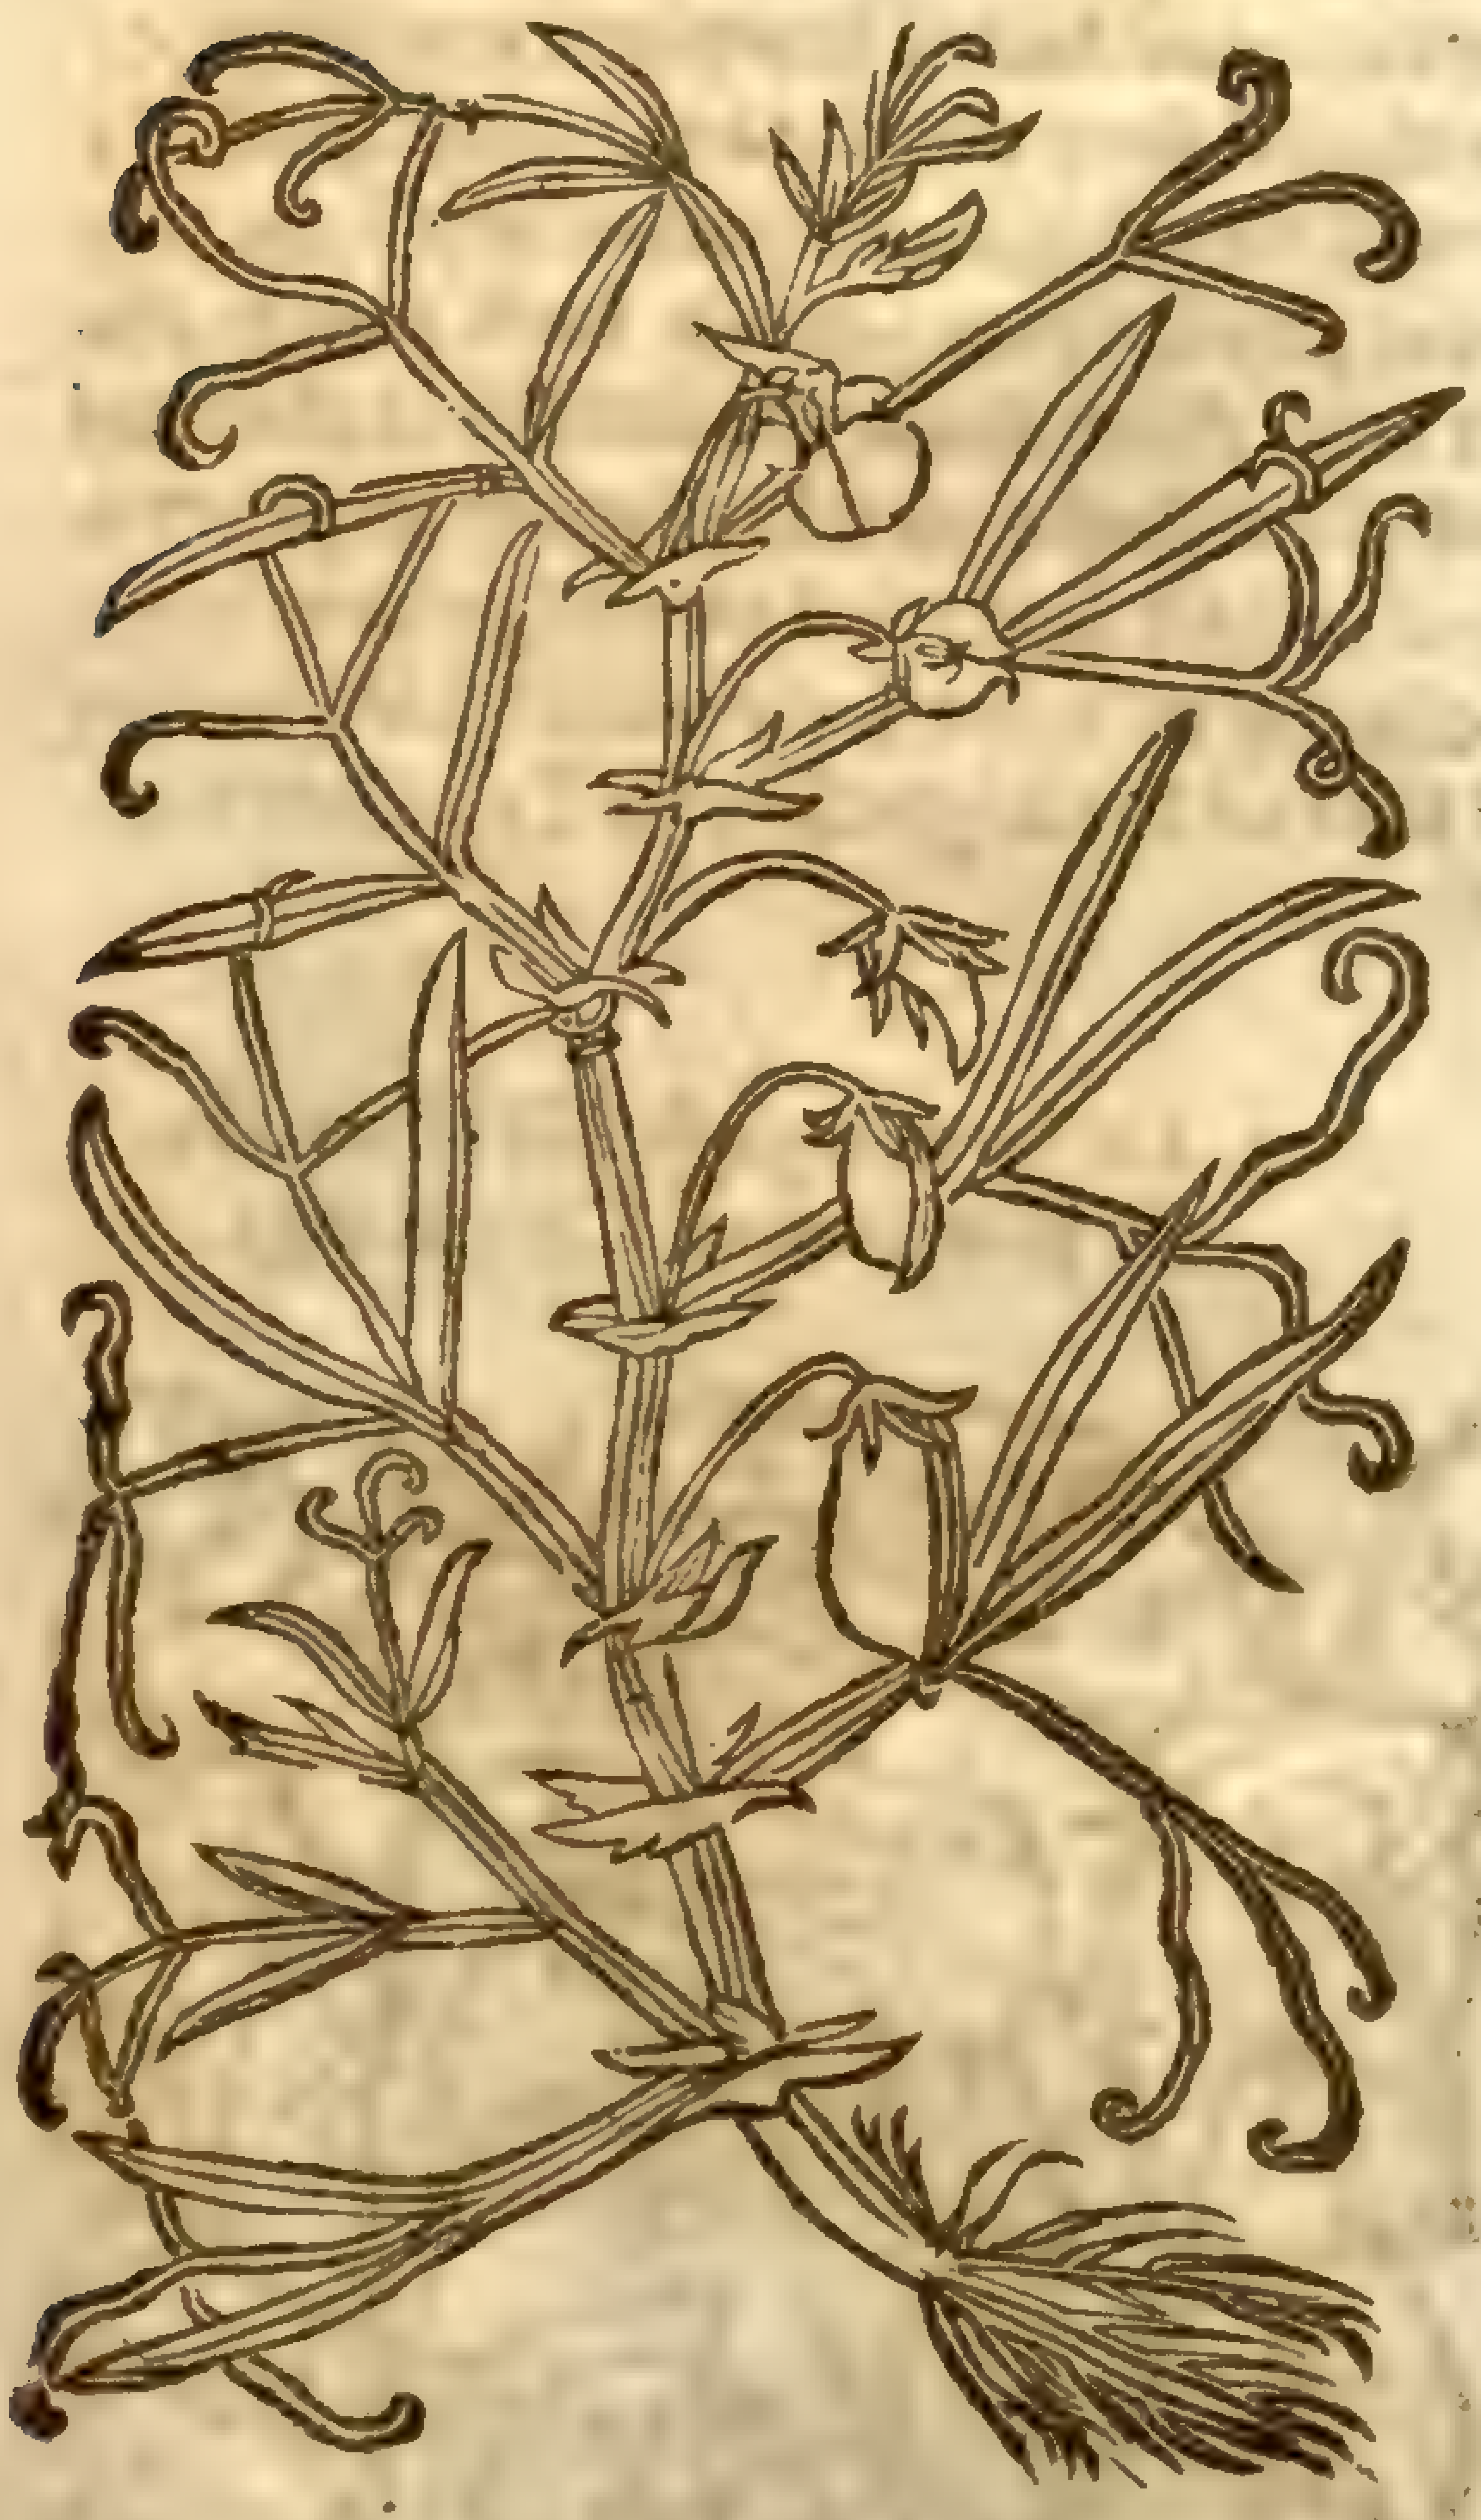
† 2 Of this kinde there is likewiſe another like vnto the precedent in each reſpect, ſaue that the leaues thereof are narrower and longer, and therfore called of moſt which ſet forth the deſcription, *Lathyrus anguſtifolia*: the floures of this are white, and ſuch alſo is the colour of the fruit: the root is ſmall, and not laſting like that of the former.

‡ 3 The ſtalks, leaues, and floures of this are like thoſe of the precedent, but the floures are of a reddiſh purple colour: the cods are leſſer than thoſe of the former, and in them are contained

leſſer, harder, and rounder ſeeds of a darke or blackiſh colour. This growes not wilde with vs, but is ſometimes ſowne in gardens, where it floures in Iune and Iuly.

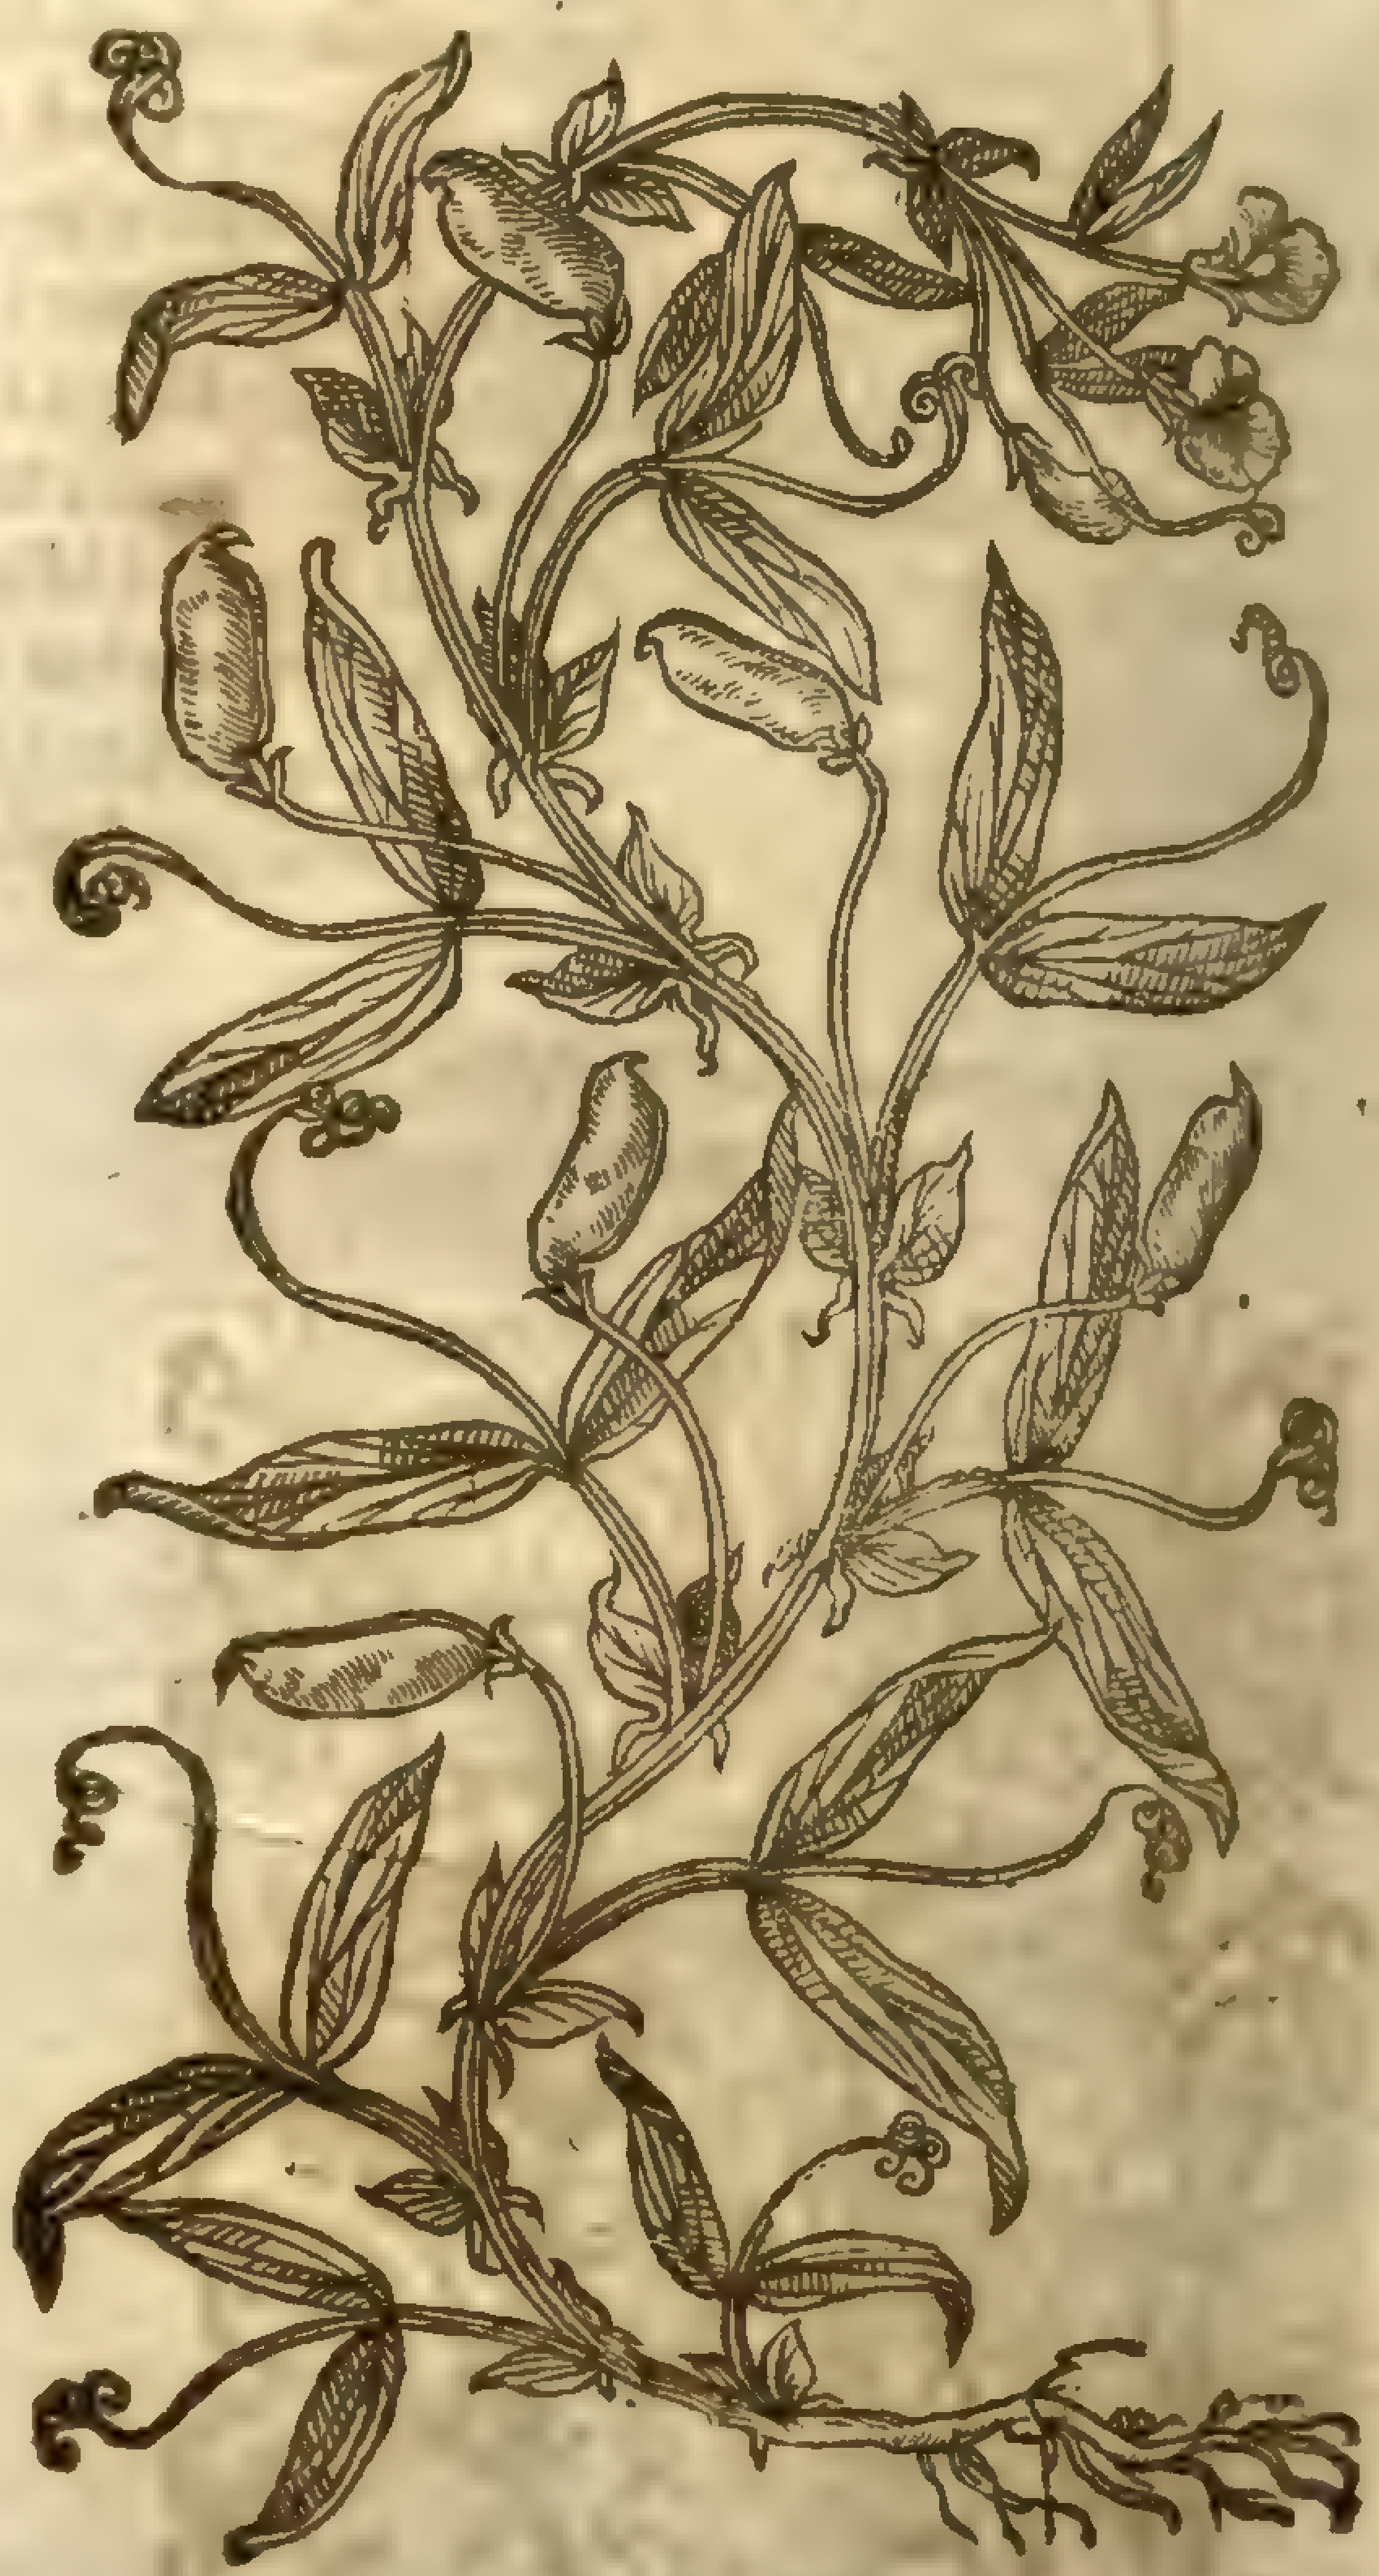
4 This Egyptian differs not in ſhape from the reſt of his kinde, but the floures are of an elegant blew on the in ſide, but of an aſh colour inclining to purple on the out ſide: the cods grow vpon long foot-ſtalks, and are a little welted or winged, and containe but two or three little cornered ſeeds ſpotted with blacke ſpots. This floures in Iune and Iuly, and the ſeed thereof was ſent to *Cluſius* from Conſtantinople, hauing been brought thither out of Egypt.

‡ 3 *Lathyrus anguſtifol. flo. purp.*
Purple floured Chichlings.



? Lathyrus Cicera, L [illegible]

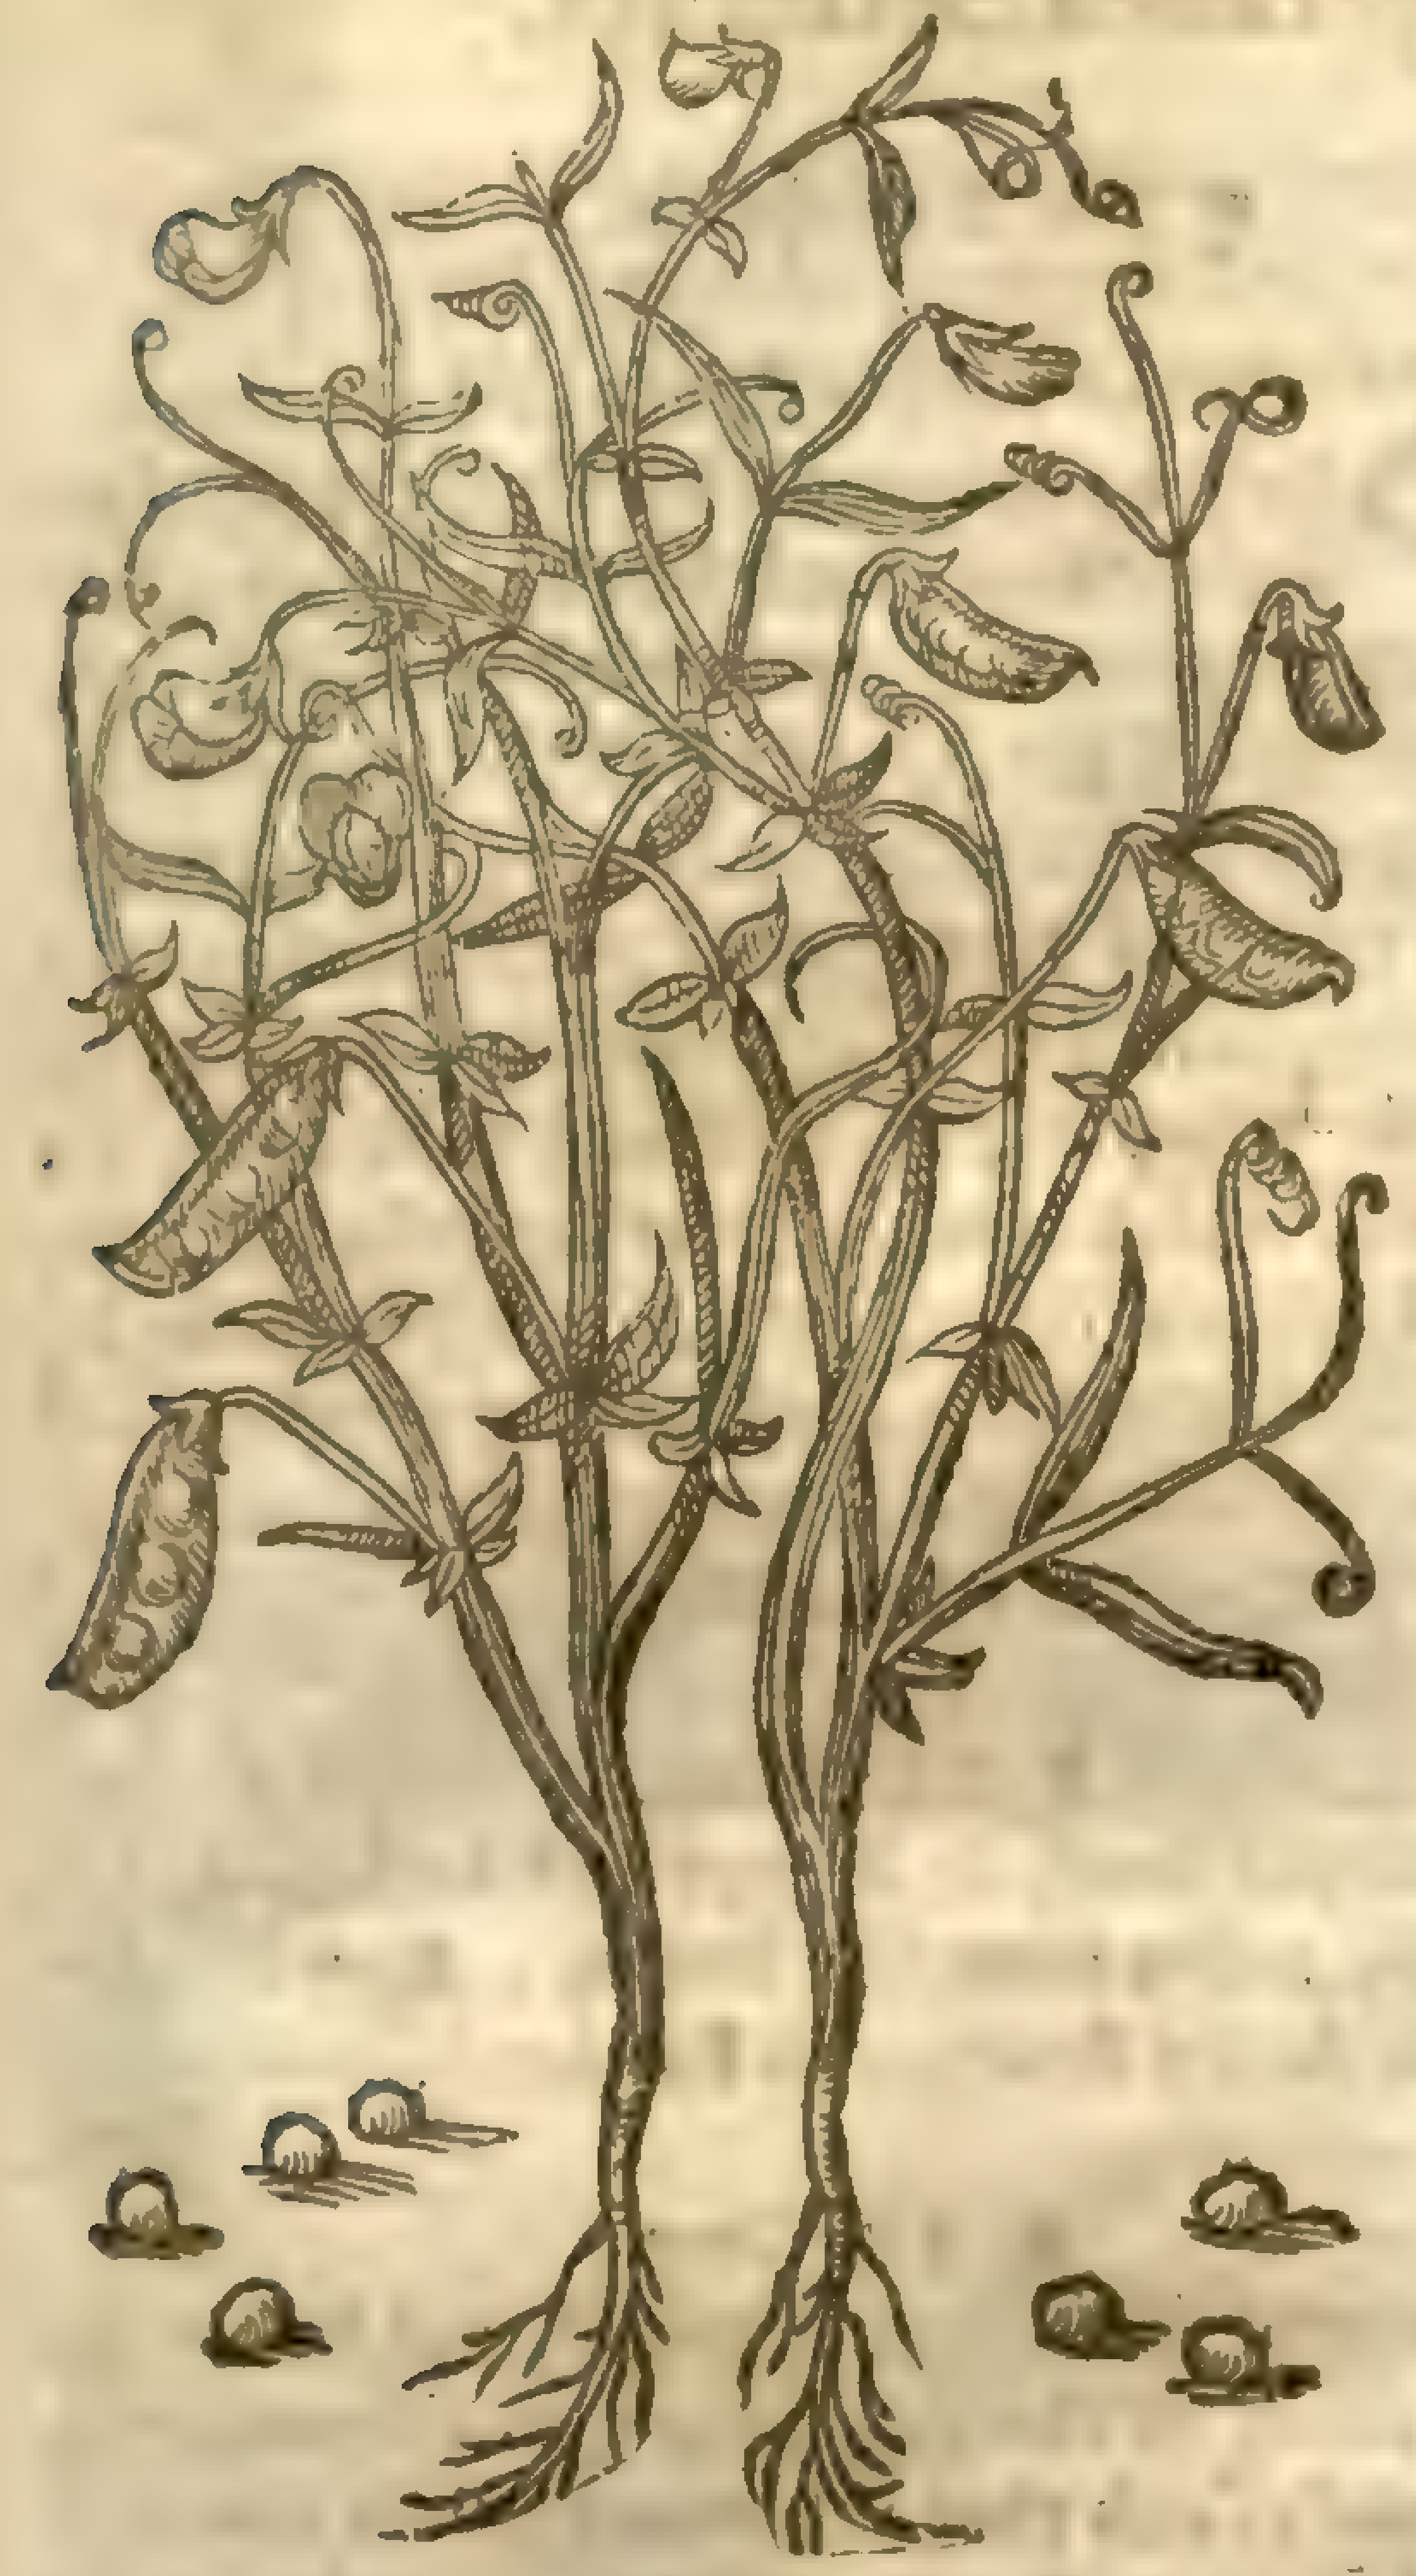
‡ 4 *Lathyrus Ægyptiacus.*
Egyptian Chichlings.



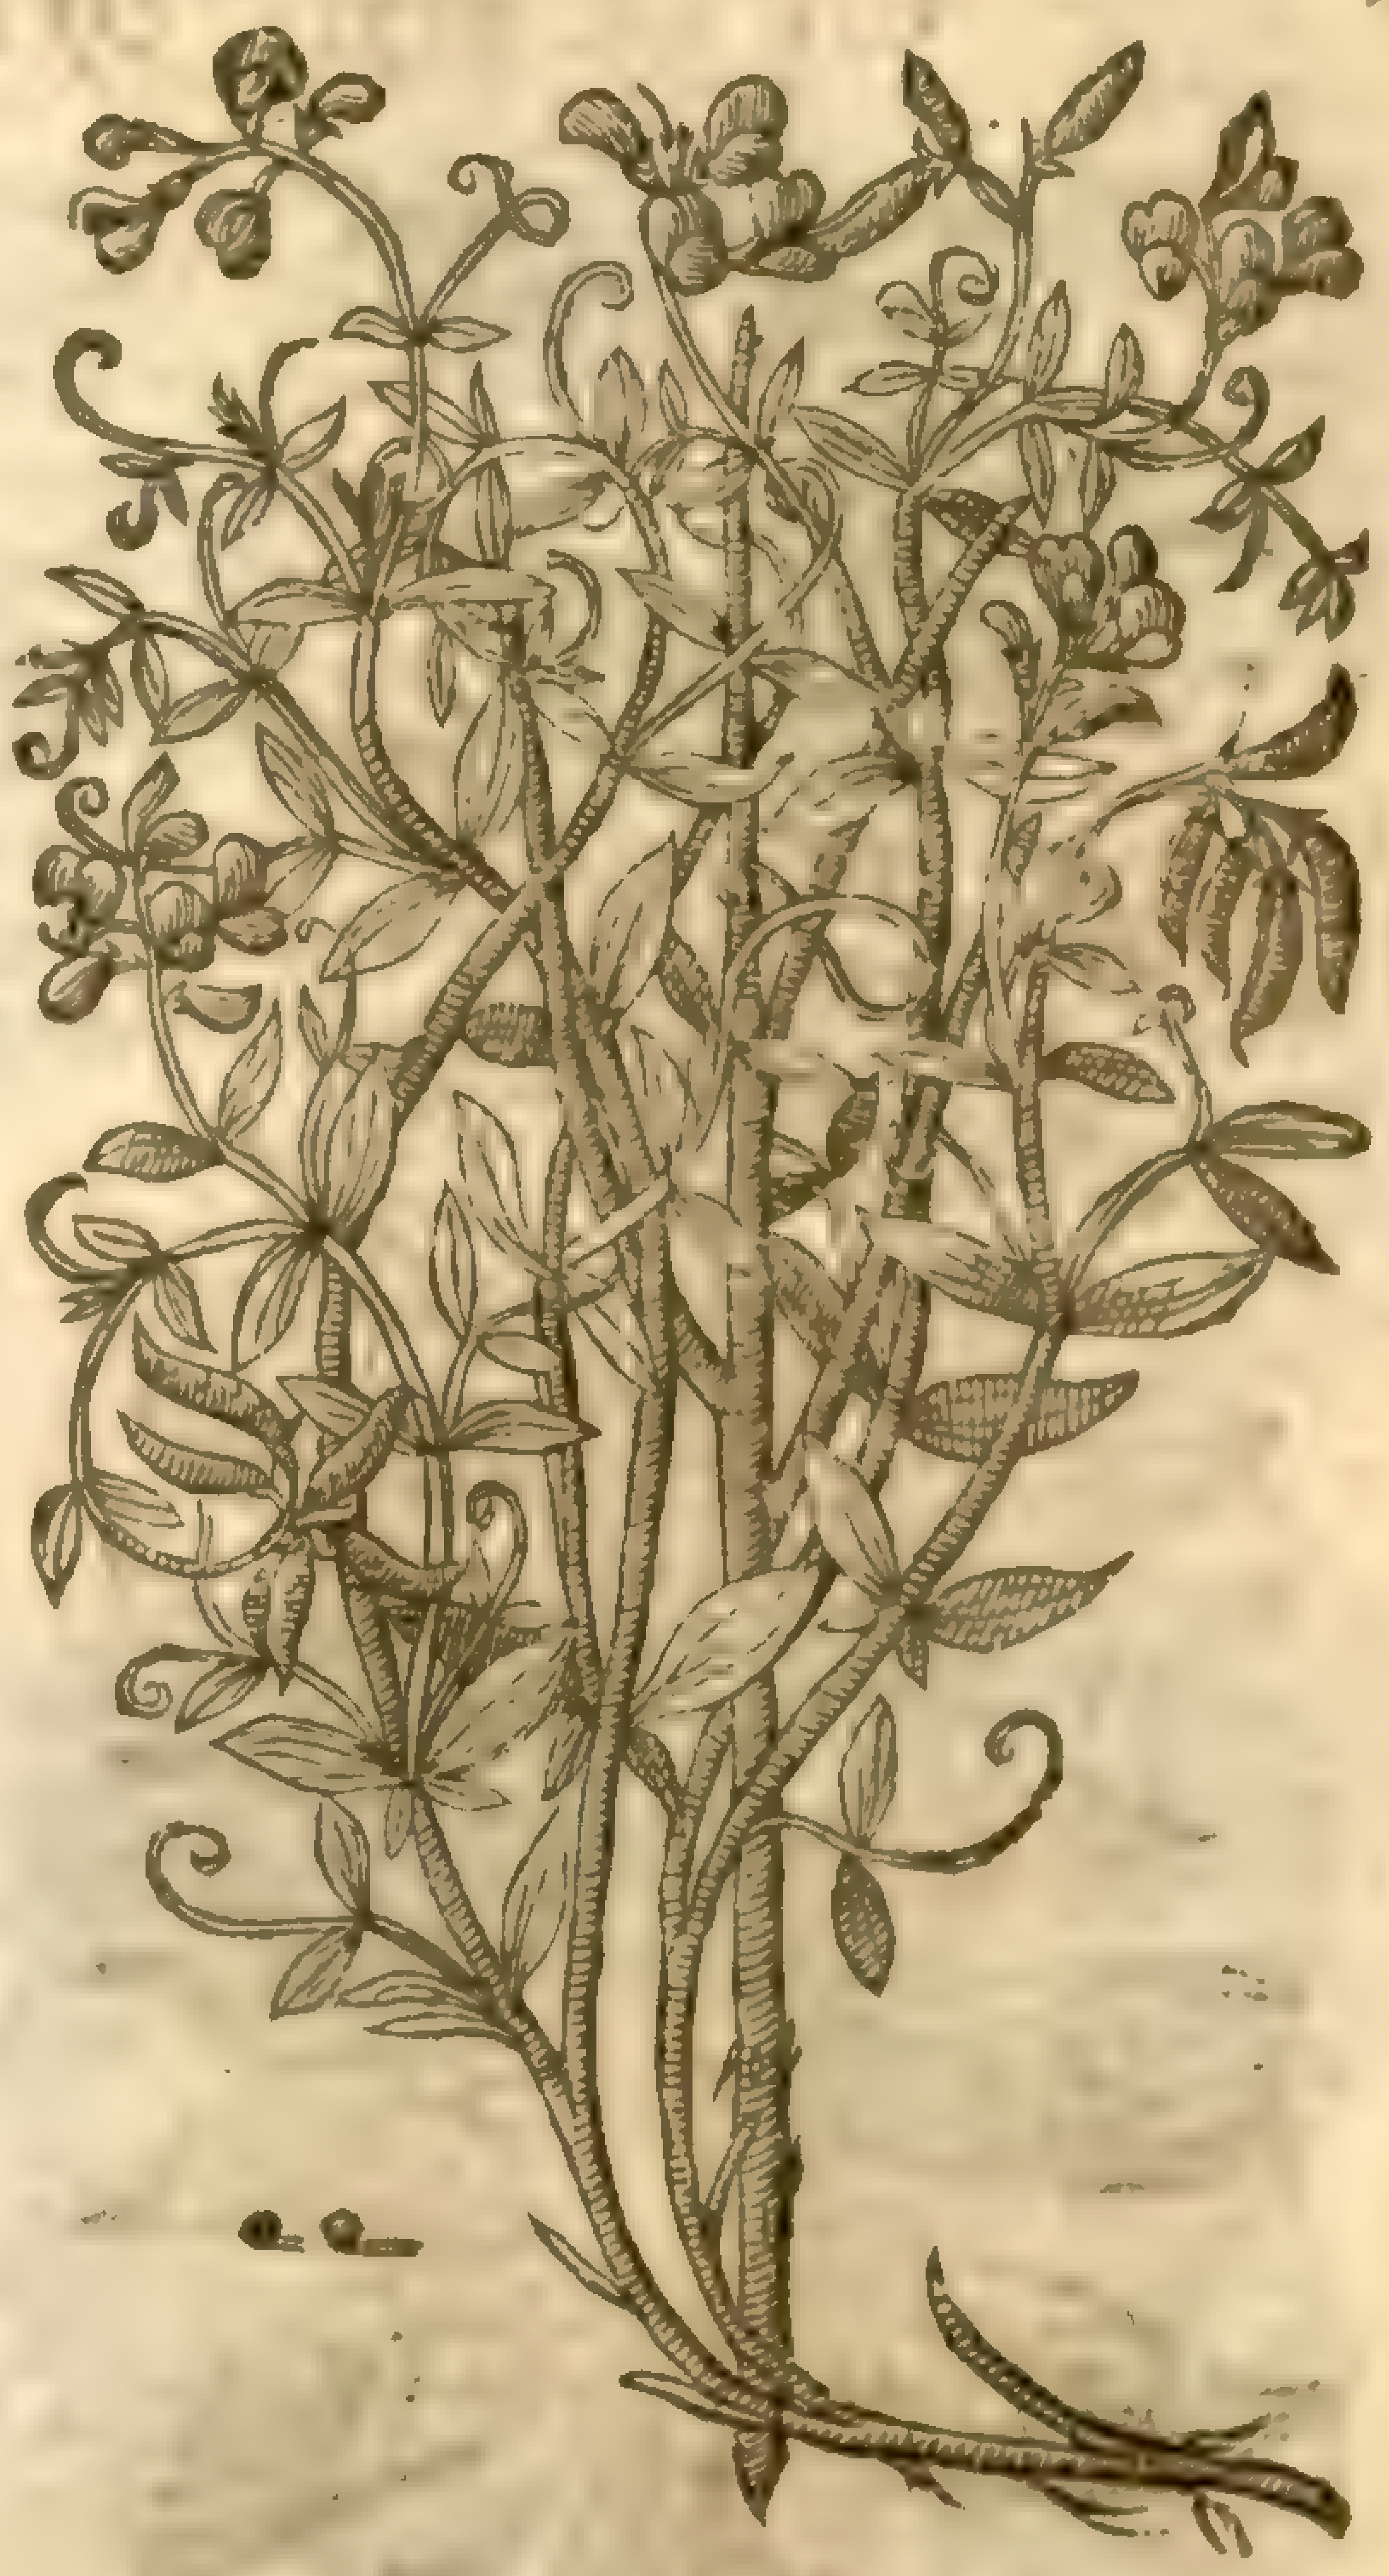
5 The ſtalks of this are ſome two or three foot long, winged, weake, and lying on the ground, vnleſſe they haue ſomewhat to ſupport them. Vpon theſe at certain diſtances grow winged leaues with two little eares at their ſetting on to the ſtalke: theſe leaues conſiſt of ſixe long and narrow green leaues like thoſe of the other plants of this kinde; and theſe ſix leaues commonly ſtand vpright by couples one againſt another; otherwhiles alternatly: the foot-ſtalke whereon theſe ſtand ends in claſping tendrels: the floures are in ſhape like the former, but the outer leafe is of a faire red or crimſon colour, and the inner leafe white: after the floures come the cods, containing ſome foure or fiue pretty large flat ſeeds, which ſwel out of the cods where they lie, and in the ſpaces between each ſeed are depreſt, like that of *Orobus*. This is only a garden plant with vs, and floures in Iune and Iuly, the ſeed is ripe in Auguſt. I haue for this giuen you *Lobels* figure of his *Lathyris anguſtiore gramineo folio*, which may ſerue, if you but make the leaues and cods to agree with this deſcription. ‡

6 The yellow wilde Tare or Fetch hath diuers very ſmall ramping ſtalkes, tough, and leaning this way and that way, not able to ſtand of it ſelfe without the help of props or things that ſtand by it: the leaues are very thin and ſharp pointed: the floures grow alongſt the leaues, in ſhape of the peaſe floures, of a bright yellow colour: the roots are very ſmall, long, tough, and in number infinit, inſomuch that it is impoſſible to root it forth, being once gotten into the ground, vnleſſe the earth be digged vp with the roots, and both caſt into the riuer or burned. Doubtleſſe it is the moſt pernitious and hurtfull weed of all others, vnto all maner of green wholſome herbs or any wood whatſoeuer.

‡ 5 *Lathyrus annuus ſiliquis Orobi.*
Party coloured Chichling.



‡ 6 *Lathyrus ſylveſtris flo. luteo.*
Tare euerlaſting. L. pratensis, L.
[illegible]



¶ *The Place.*

The firſt growes in ſhadowie woods and amongſt buſhes: there groweth great ſtore thereof in Swainſcombe wood, a mile and a halfe from Greenhithe in Kent, as you go to a village therby called Betſome, and in diuers other places.

The ſixt groweth in moſt graſſie paſtures, borders of fields, and among grain almoſt euery where

¶ *The Time.*

The time anſwereth the other pulſes.

¶ *The Names.*

The firſt is called *Lathyrus*, to make a difference betwixt it and *Lathyris* or Spurge: of *Matthiolus*, *Clymenum*: of *Cordus*, *Ervum ſativum*: of *Tragus*, *Piſum Græcorum*: in Engliſh, Peaſe euerlaſting, great wilde Tare, and Cichling.

‡ The ſecond is the *Ervum album ſativum* of *Fuchſius*: *Lathyrus* or *Cicercula* of *Dodonæus*: *Lathyrus anguſtiore gramineo folio* of *Lobel*.

The third is the *Aracus ſive Cicera* of *Dodonæus*: the *Lathyrus flore purpureo* of *Camerarius*.

The fourth by *Cluſius* is called *Cicercula Ægyptiaca*: by *Camerarius*, *Aracus Hiſpanicus*, *ſive Lathyrus Ægyptiacus*.

The fift is not mentioned by any that I remember, but Mr *Parkinſon*, in his Garden of flours, and that by the name I giue it you.

The ſixt is the *Lathyrus ſylveſtris flo. luteis* of *Thalius*: *Legumen terræ glandibus ſimile* of *Dodonæus*: *Vicia* of *Tabern.* and it may be the *Aracus flo. luteo* of the *Adverſ.* Howeuer, I haue put *Lobels* figure of the *Aracus* for it, which well enough agrees with it. I vſe for ſome reſemblance it hath to *Aphaca*, to call it *Aphacoides*. ‡

¶ *The Nature and Vertues.*

The temperature and vertues are referred to the manured Tare or Vetch, notwithſtanding they are not vſed for meat or medicine.

Chap. 517. *Of the oily Pulſe called* Seſamum.

Seſamum, ſiue Siſamum.
The oily Graine.

¶ *The Deſcription.*

† Seſamum hath a thicke and fat vpright ſtalk a cubit and a half high, garniſhed with leaues much like the Peach or almond, but rougher, and cut in with ſomwhat deep gaſhes on their ſides: amongſt theſe leaues come forth large white or elſe red floures, ſomwhat ſhaped like thoſe of Fox-gloues, which turne into round long creſted cods containing white flat oilous ſeed. *Theophraſtus* affirmeth that there is a kind therof which is white, bearing only one root. No beaſt will eat this plant while it is greene, becauſe of his bitterneſſe: but beeing withered and dried the ſeed thereof becommeth ſweet, and Cattell will feed on the whole plant.

¶ *The Place.*

It groweth both in Egypt and India. *Seſama*, ſaith *Pliny*, came from the Indies: they make an oile of it. It is a ſtranger in England.

¶ *The Time.*

It is one of the Summer grains, and is ſown before the riſing of the ſeuen ſtars, as *Pliny* writeth: yet *Columella* ſaith that *Seſamum* muſt be ſowne after the Autumne Æquinoctial, againſt the Ides of October: they require for the moſt part a rotten ſoile, which the husbandmen of Campania do cal a blacke mold.

¶ *The Names.*

The Grecians call this Grain Σήσαμον: the Latines alſo *Seſamum* and *Siſamum*, and often in the feminine gender *Seſama*: we are conſtrained for want of an Engliſh name to vſe the Latine: it is vnknowne to the Apothecaries, eſpecially the plant it ſelfe; but the ſeed and oile thereof is to bee found among them in other countries: we may call it Turky Millet.

¶ *The Nature and Vertues.*

A According to ſome it is hot and dry in the firſt degree: the ſeed thereof, as *Galen* ſaith, is fat, and therefore being laid vp it commeth to be oily very quickly: wherefore it ſpeedily fills and ſtuffeth vp thoſe that feed thereof, and ouerthroweth the ſtomack, being ſlow of digeſtion, and yeelding to the body a fat nouriſhment: therefore it is manifeſt that it cannot ſtrengthen the ſtomake or any part thereof, as alſo no other kind of fat thing; and the juice that comes thereof is thick, and therefore cannot eaſily paſſe thorow the veines. Men doe not greedily feed of it alone, but make cakes thereof with hony, which they call Σησαμίδας: it is alſo mixed with bread, and is of an hot temper, for which cauſe it procureth thirſt. And in his booke of the faculties of ſimple medicines he ſaith that *Seſamum* is not a little clammy and fat, and therefore it is an emplaſtick and a ſoftner, and is moderatly hot: the oile which comes thereof is of like temperature, and ſo is the decoction of the herb alſo.

B *Dioſcorides* writeth, That *Seſamum* is an enemy to the ſtomacke, cauſing a ſtinking breath if it remain ſticking betweene the teeth after it is chewed.

C It waſteth away groſneſſe of the ſinues: it is a remedie againſt bruiſes of the eares, inflammations, burnings, and ſcaldings, pains of the joints, and biting of the poiſonſom horned ſerpent called *Ceraſtes*. Being mixt with oile of roſes it takes away the head-ache comming of heate.

D Of the ſame force is the herb boiled in wine, but it is eſpecially good for the heat and paine of the eies.

E Of the herb is made an oile vſed of the Egyptians, which, as *Pliny* ſaith, is good for the eares.

F It is a remedie againſt the ſounding and ringing of the eares.

CHAP. 518. *Of Hatchet Vetch.*

¶ *The Deſcription.*

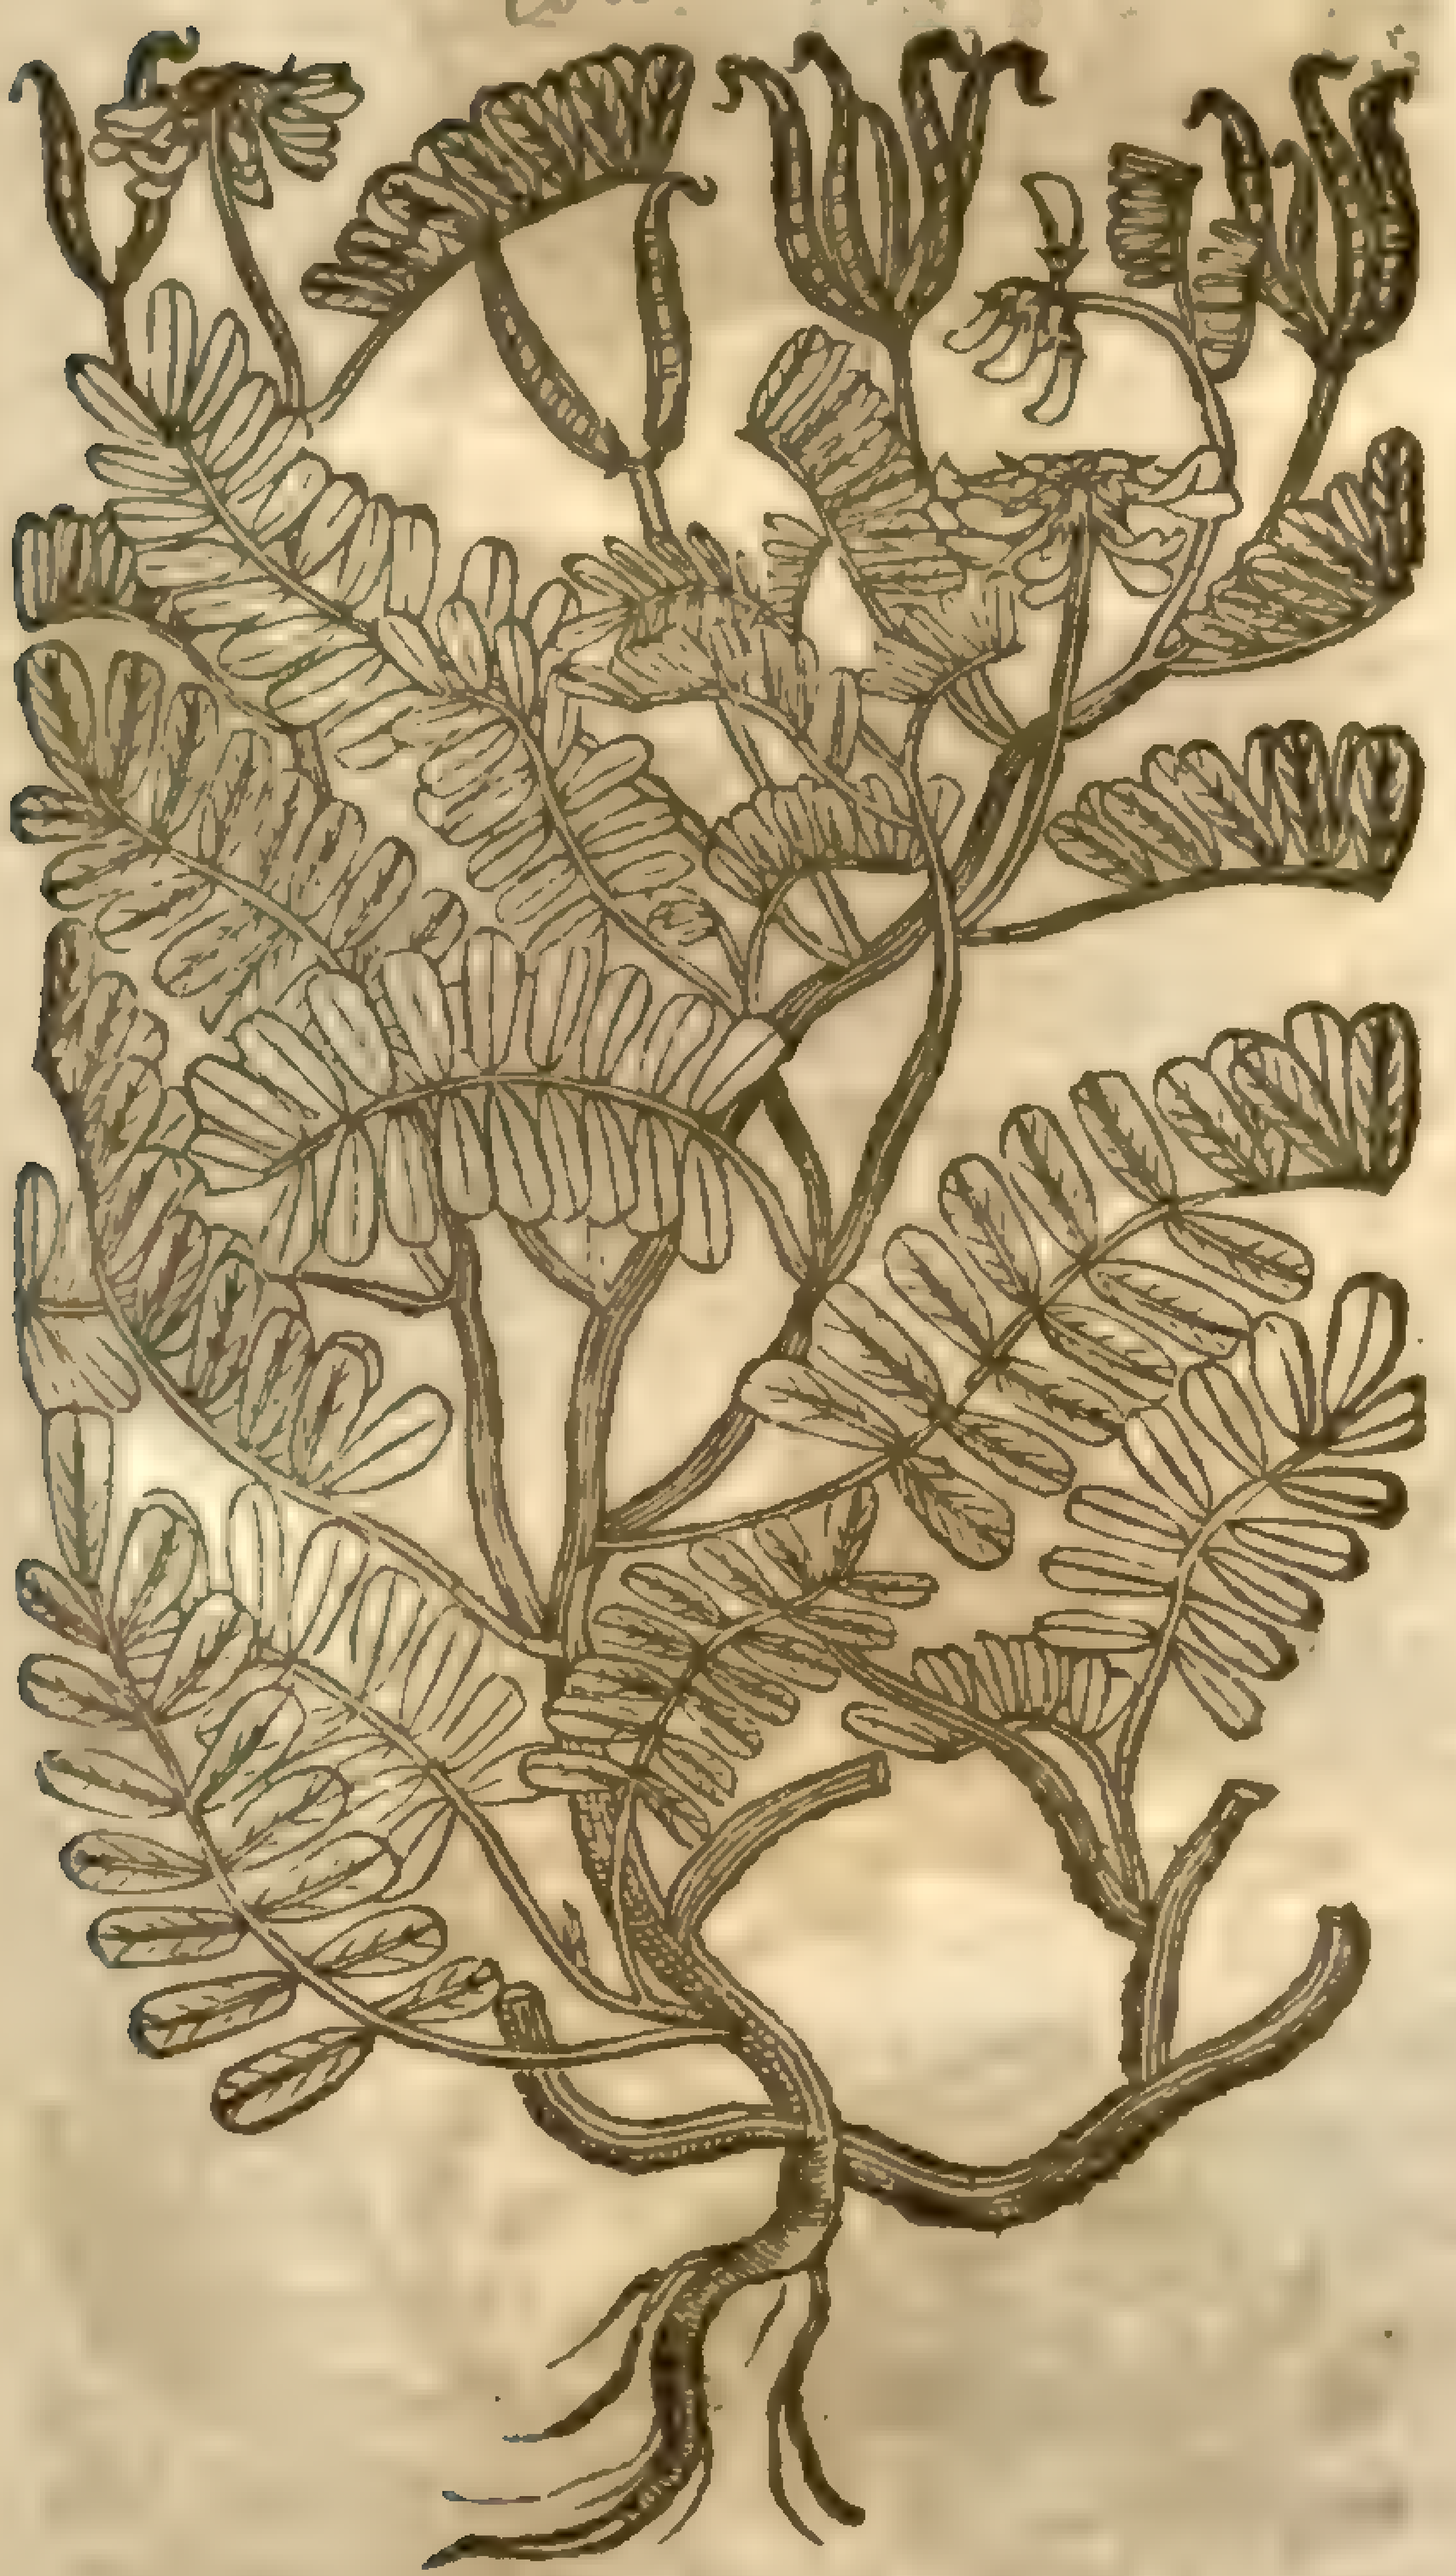
1 THe firſt kinde of Hatchet Fetch hath many ſmall branches trailing here and there vpon the ground: vpon which grow ſmall leaves ſpred abroad like the leaues of the wild Vetch: among which come forth cluſters of ſmal yellow floures, which fade away, and turne into little flat thin and brown cods, wherein is contained ſmall reddiſh ſeed of a bitter taſte.

2 The ſecond kinde of Hatchet Vetch hath many round tough and flexible branches, trailing vpon the ground: whereupon do grow leaves like the former, but more like the leaves of Liquorice, and hath the taſte of the Liquorice root; which cauſed ſome to deeme it a kinde of Liquorice: among theſe leaues come forth pale yellow floures: after which there ſucceed ſmal crooked cods turning their points inwardly, one anſwering another like little hornes, containing ſmall flat ſeeds foure cornered, and faſhioned like a little wedge: the root is tough, of a woody ſubſtance, and doth continue fruitfull a very long time.

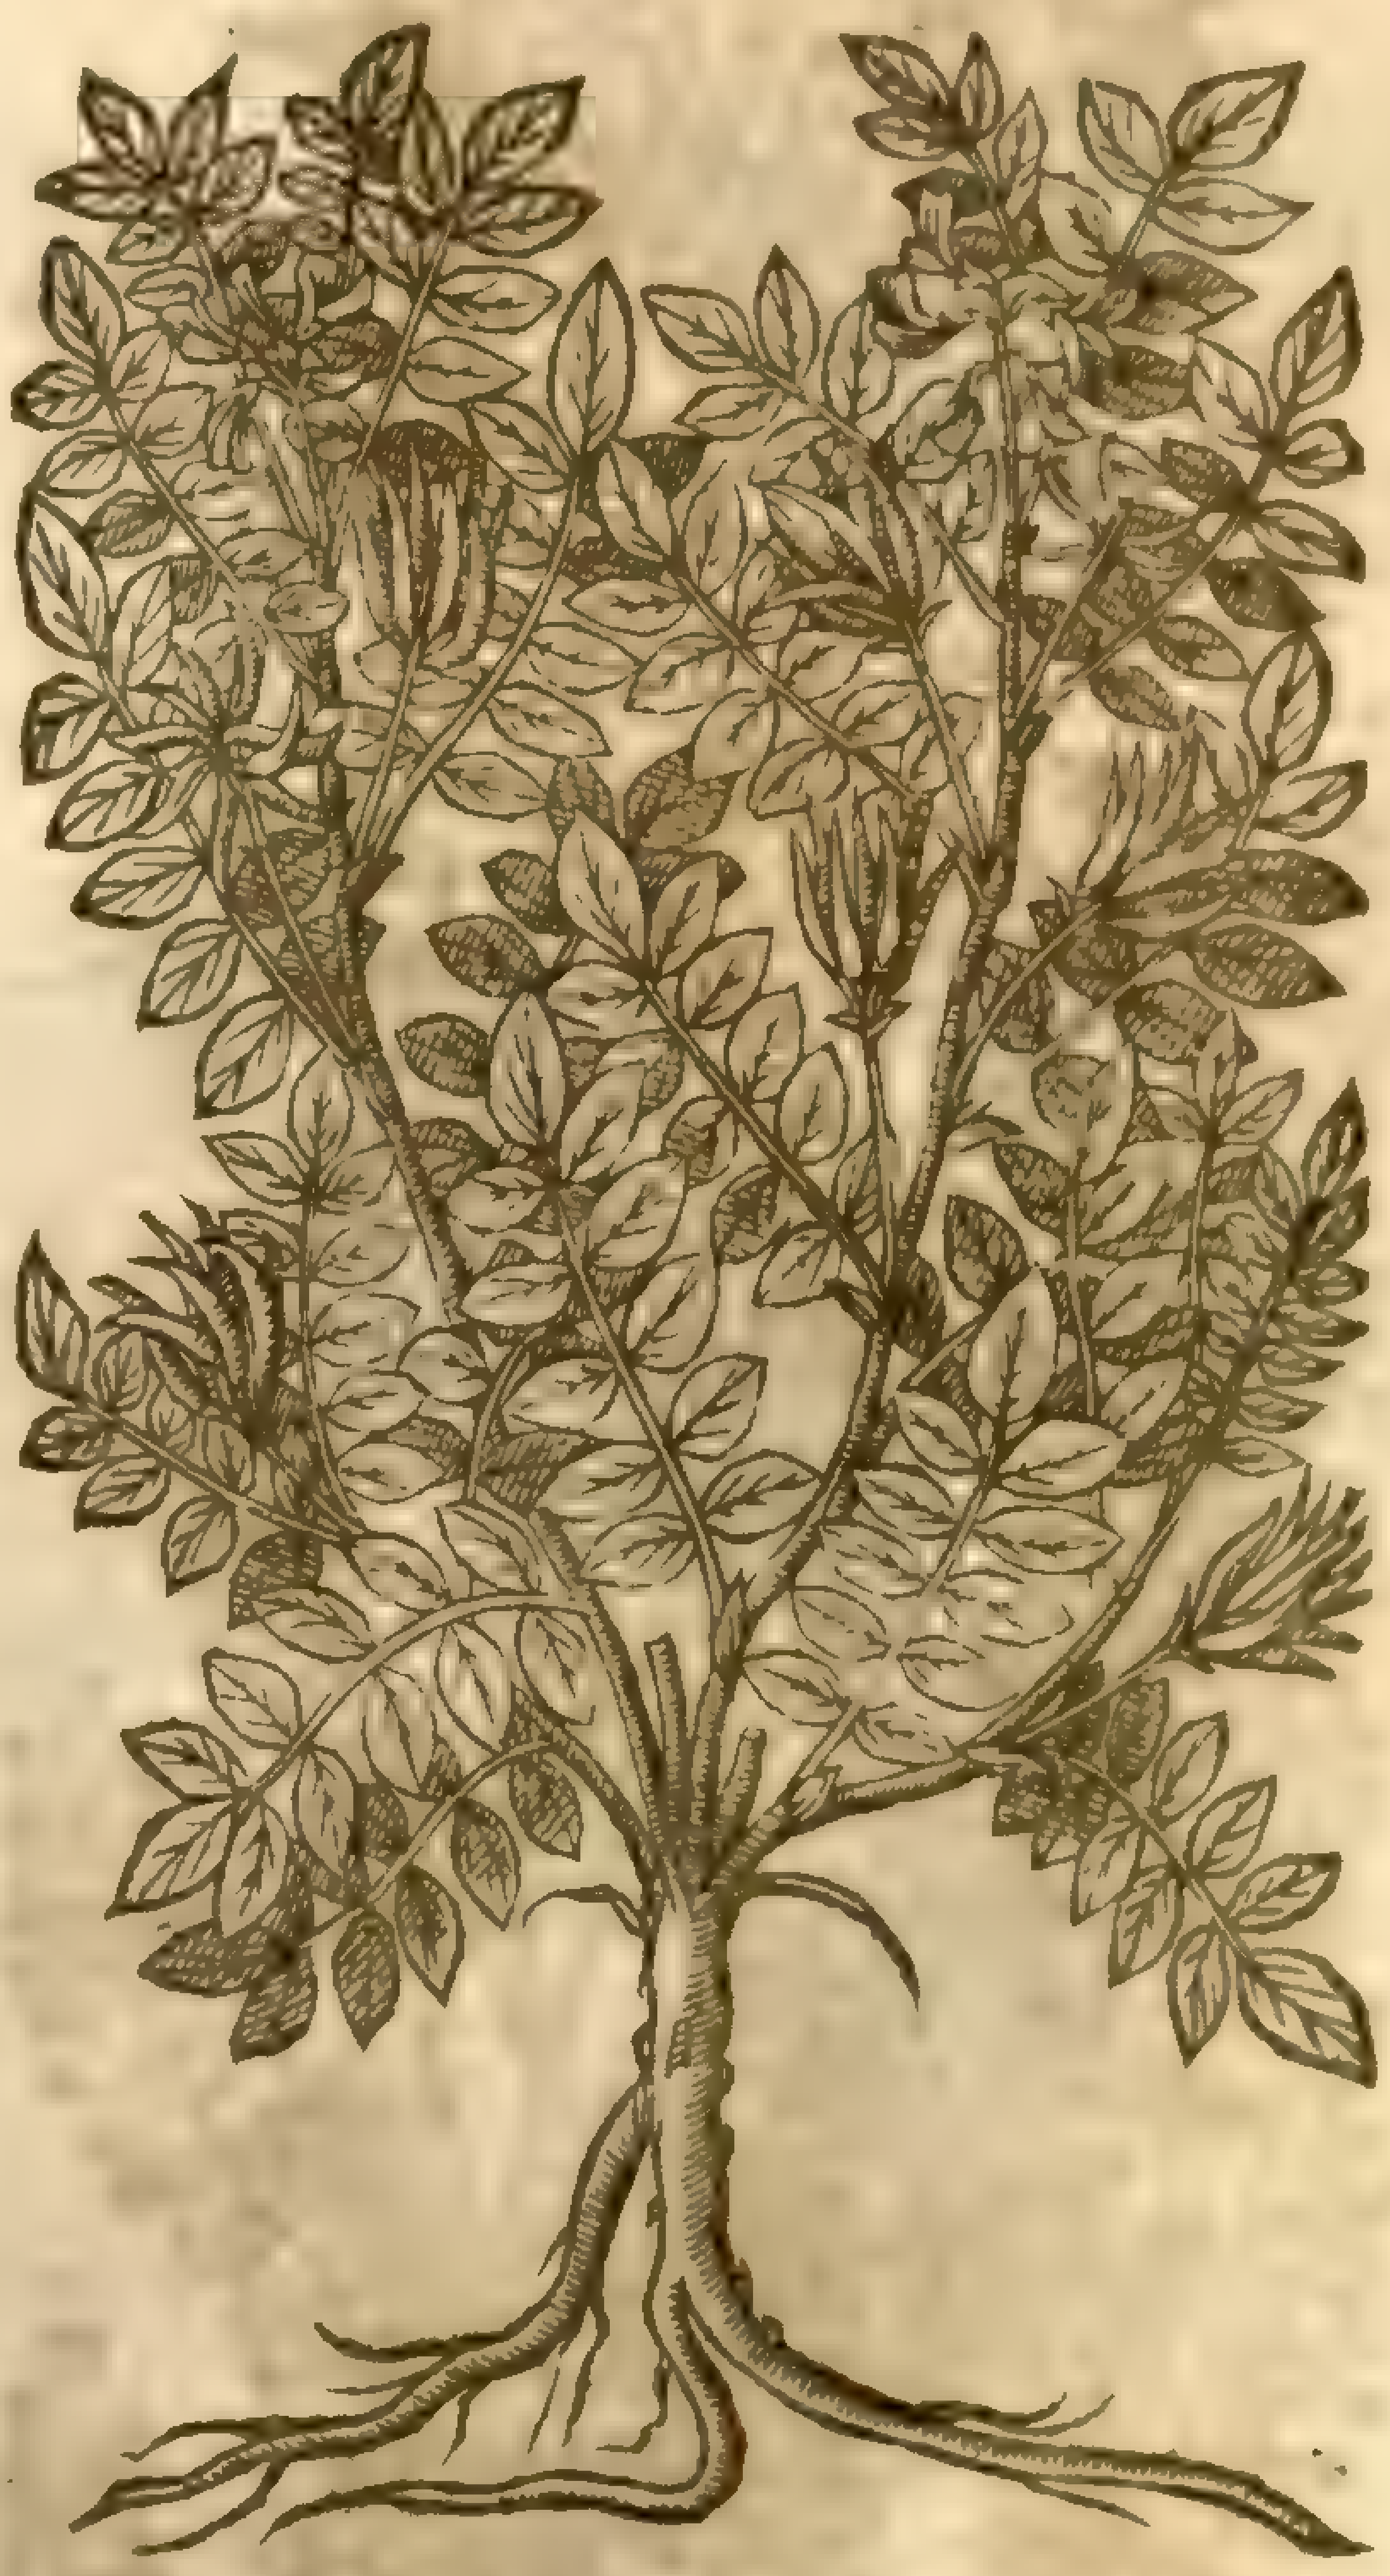
[illegible] galus glycyphyllos. [illegible] dict. Sm. fl. 3 294

† 1 *Hedyſarum majus.*
Hatchet Fetch.

Coronilla [illegible]



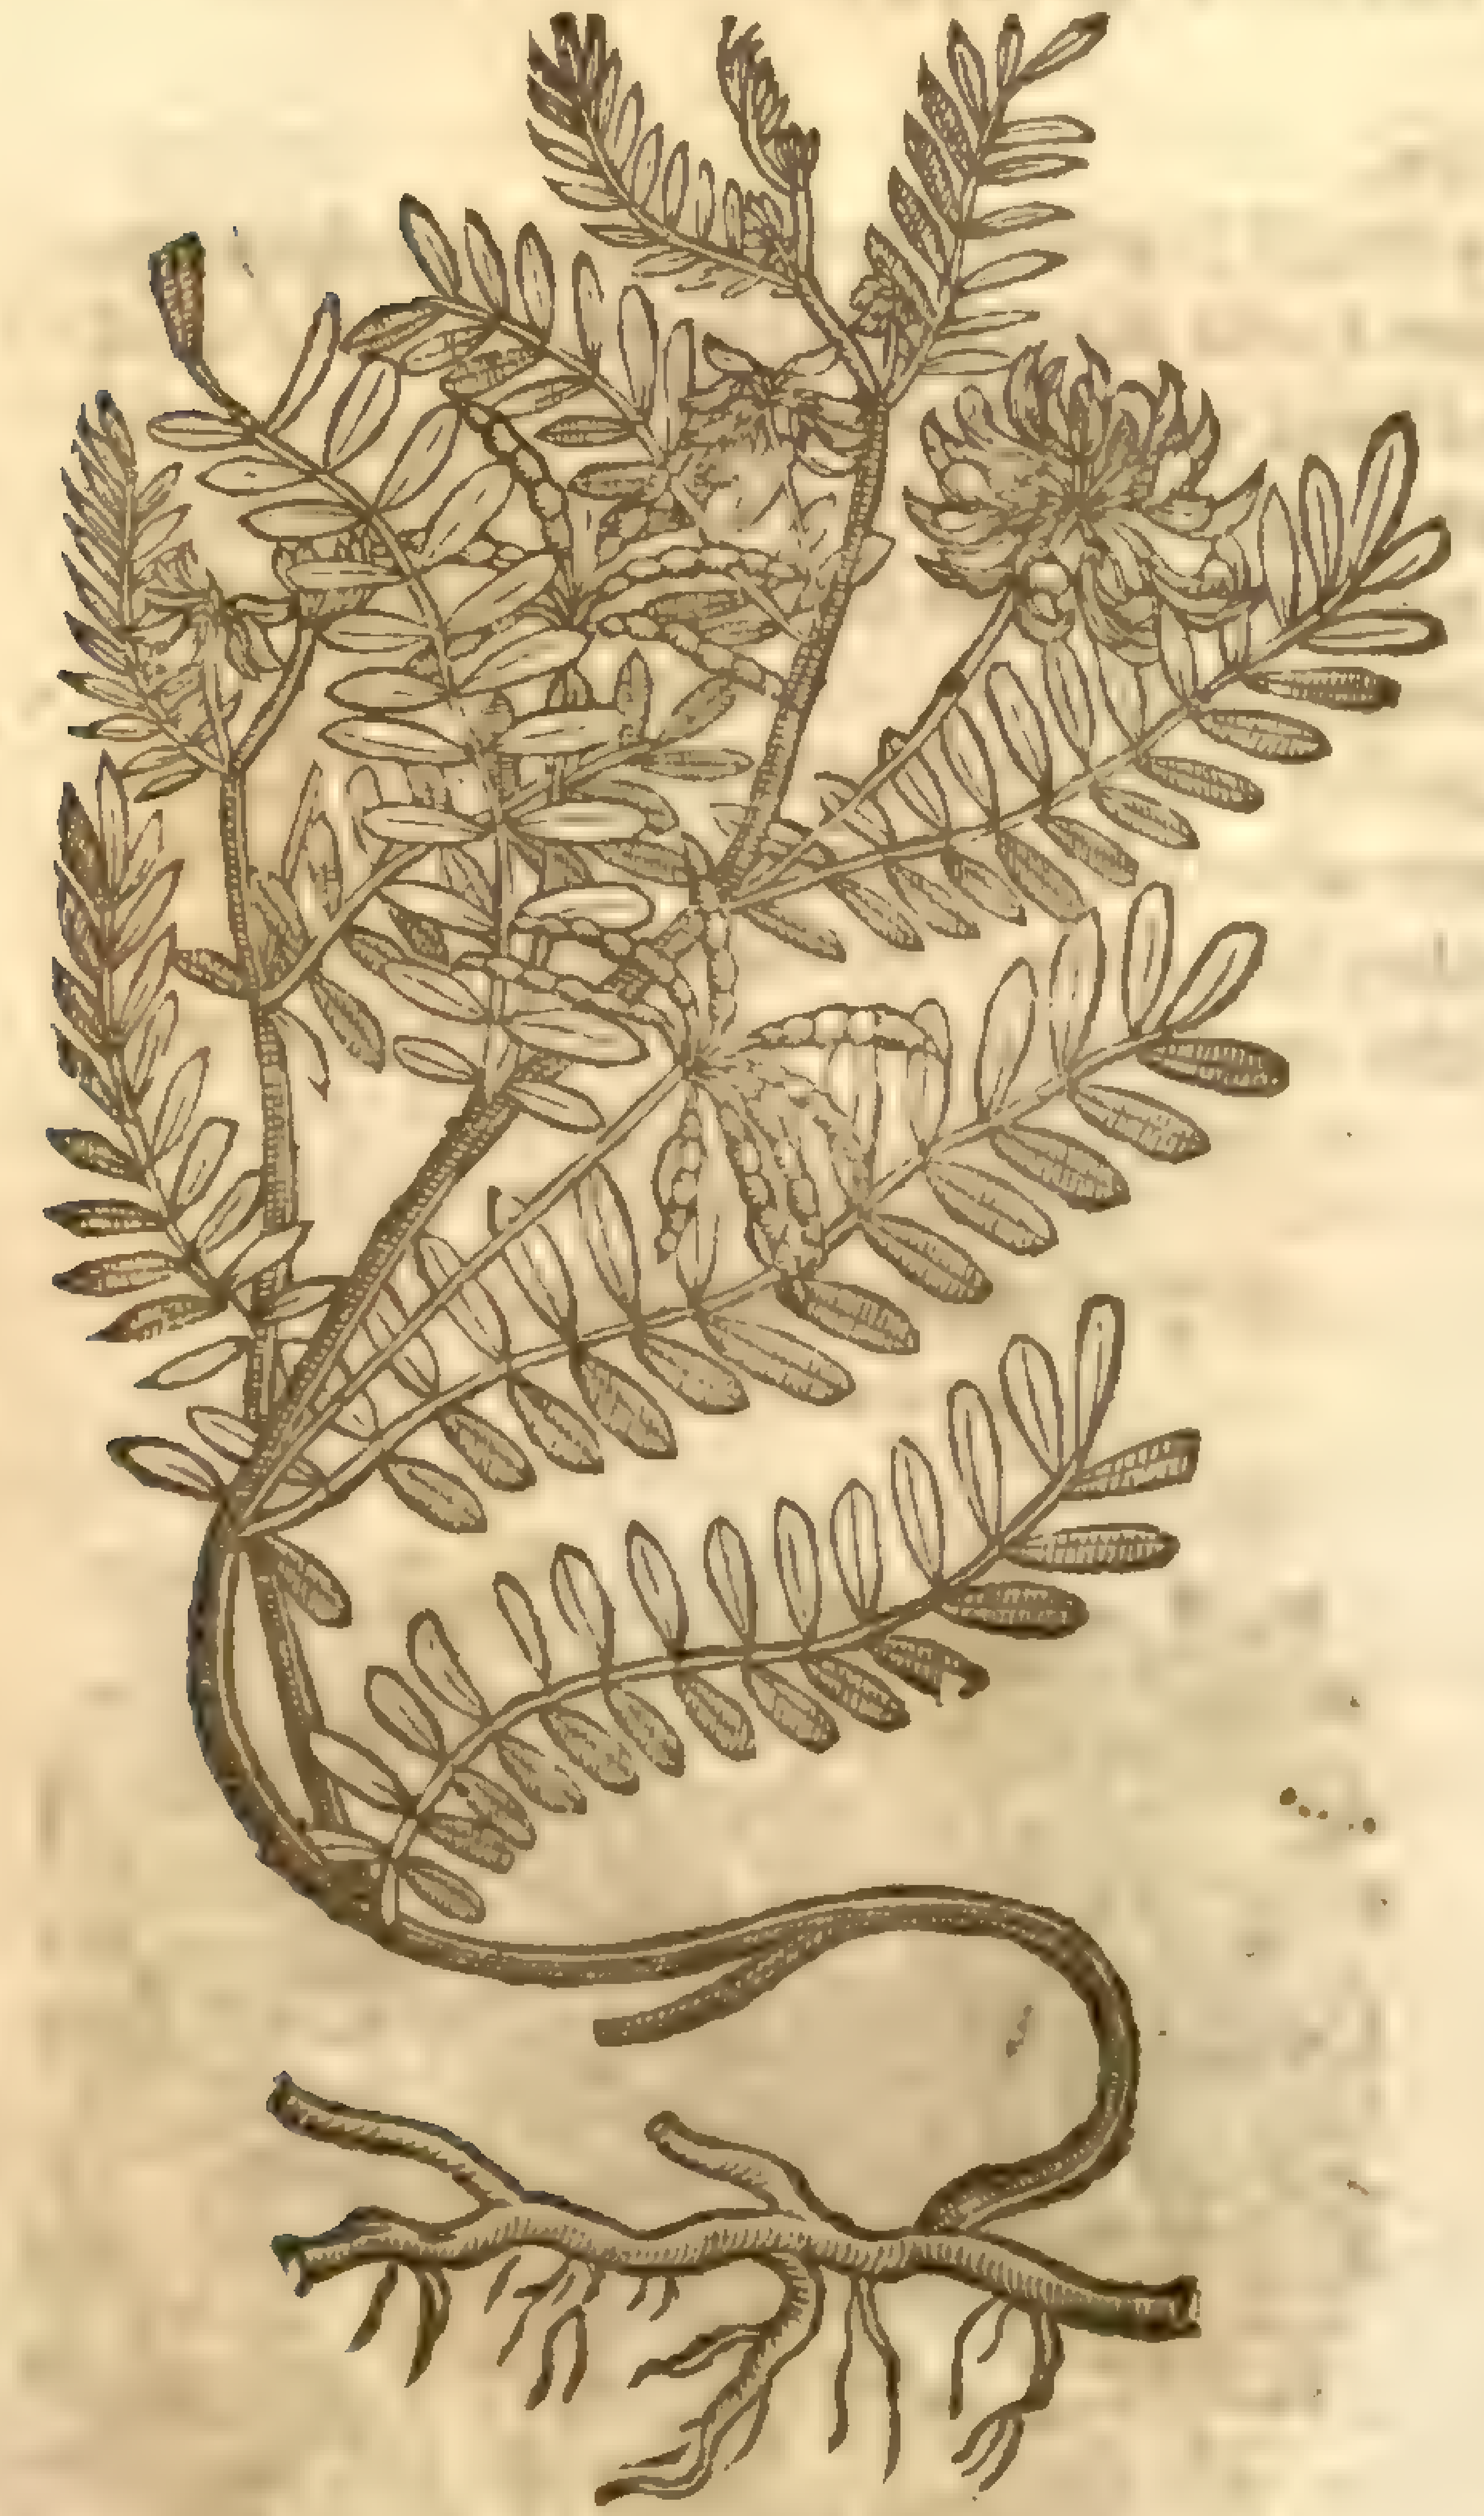
‡ 2 *Hedyſarum Glycyrrhizatum.*
Liquorice Hatchet Fetch.



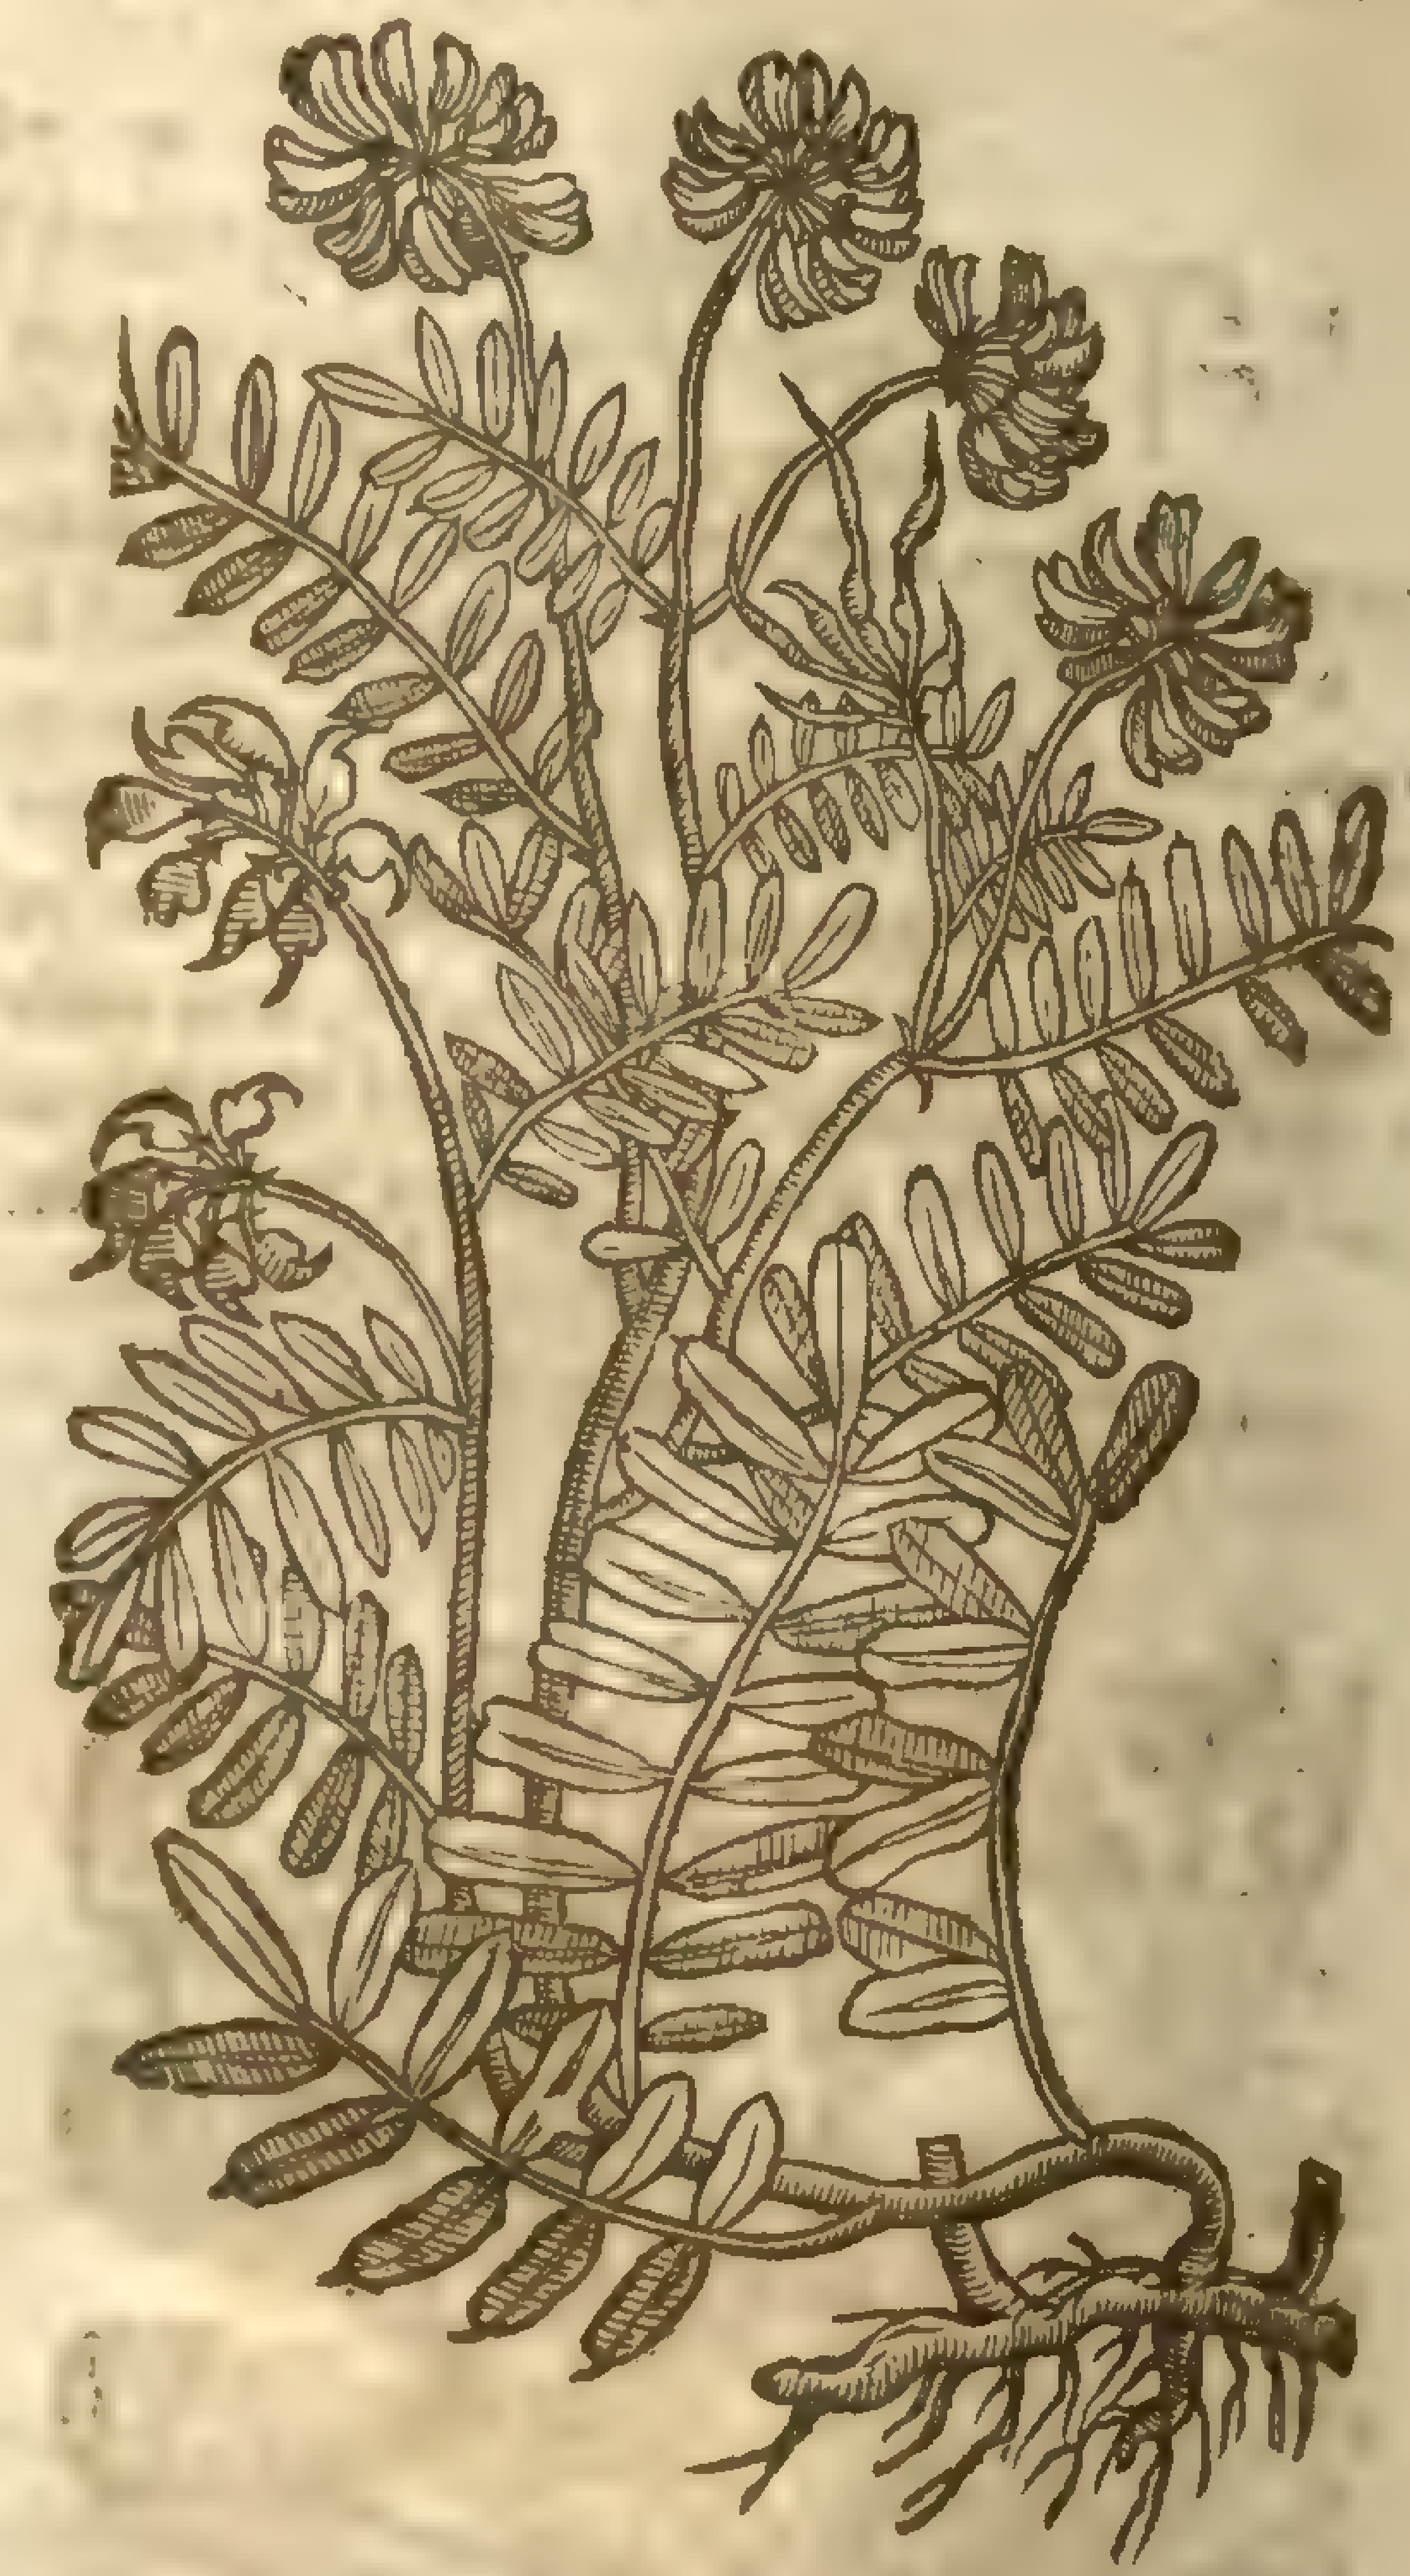
3 There is another kind of *Securidaca* or hatchet Fetch, which hath branches, leaues and roots like the laſt before remembred, and differeth in that, that the floures of this plant are mixed and do vary into ſundry colours, being on the vpper part of a fleſh colour, and on the lower of a white or ſnowy colour, with a purple ſtorks bill in the middle: the leaues are in taſte bitter: the cods are ſmall like thoſe of Birds foot, and not much vnlike the cods of *Orobus*.

4 There is likewiſe another kinde of *Securidaca* or hatchet Fetch, which is dedicated to *Cluſius* by the afore named Dr *Penny*, who found it in the North parts of England, hauing leaues, roots, and branches like vnto the former: but the floures of this are white, and mixed with ſome purple, and bitter alſo in taſte: the cods are like the claw of a Crab, or (as *Cluſius* ſaith) like the knife which ſhoo-makers do vſe in Flanders; in which cods are contained ſmal rediſh ſeed: this root is alſo of long continuance. ‡ *Cluſius* doth not ſay that Dr *Penny* found this in the North of England, but in the territorie of Geneva not far from Pontetremile, among the buſhes, and no where elſe.

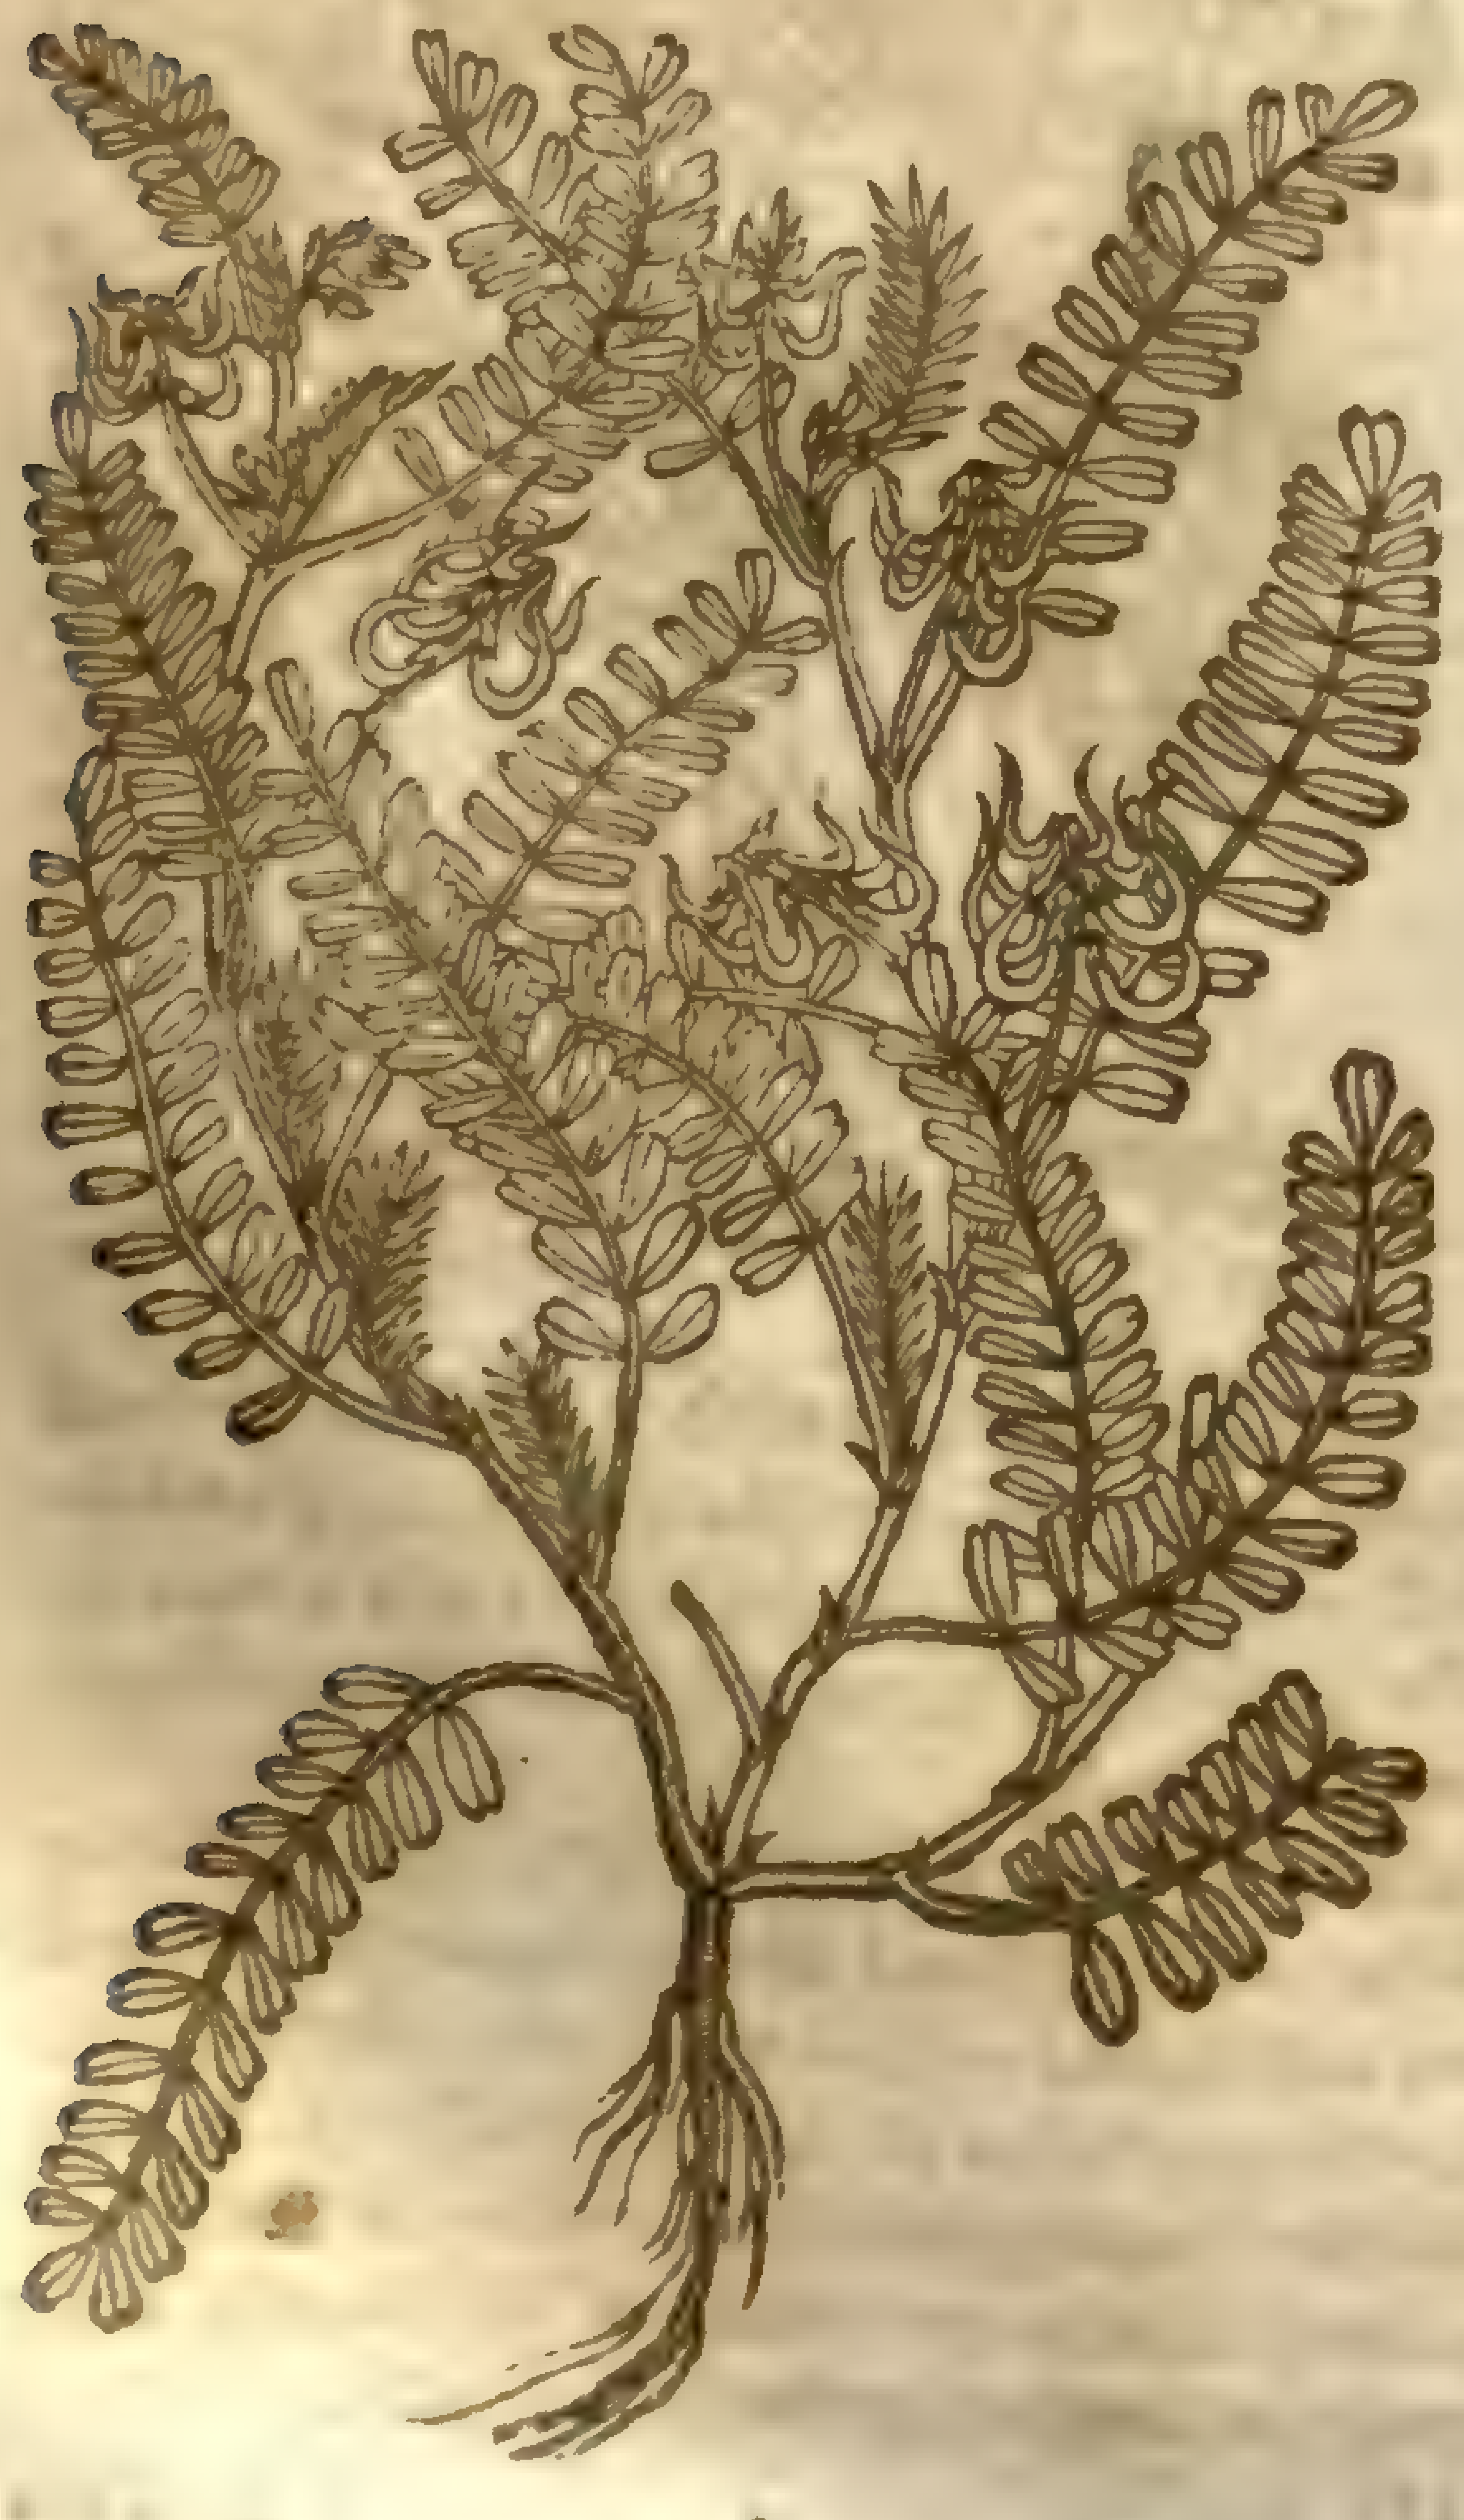
‡ 3 *Hedyſarum majus ſiliquis articulatis.*
Hatchet Fetch with jointed cods.



‡ 4 *Securidaca minor pallide cærulea.*
Small blew floured Hatchet Fetch.

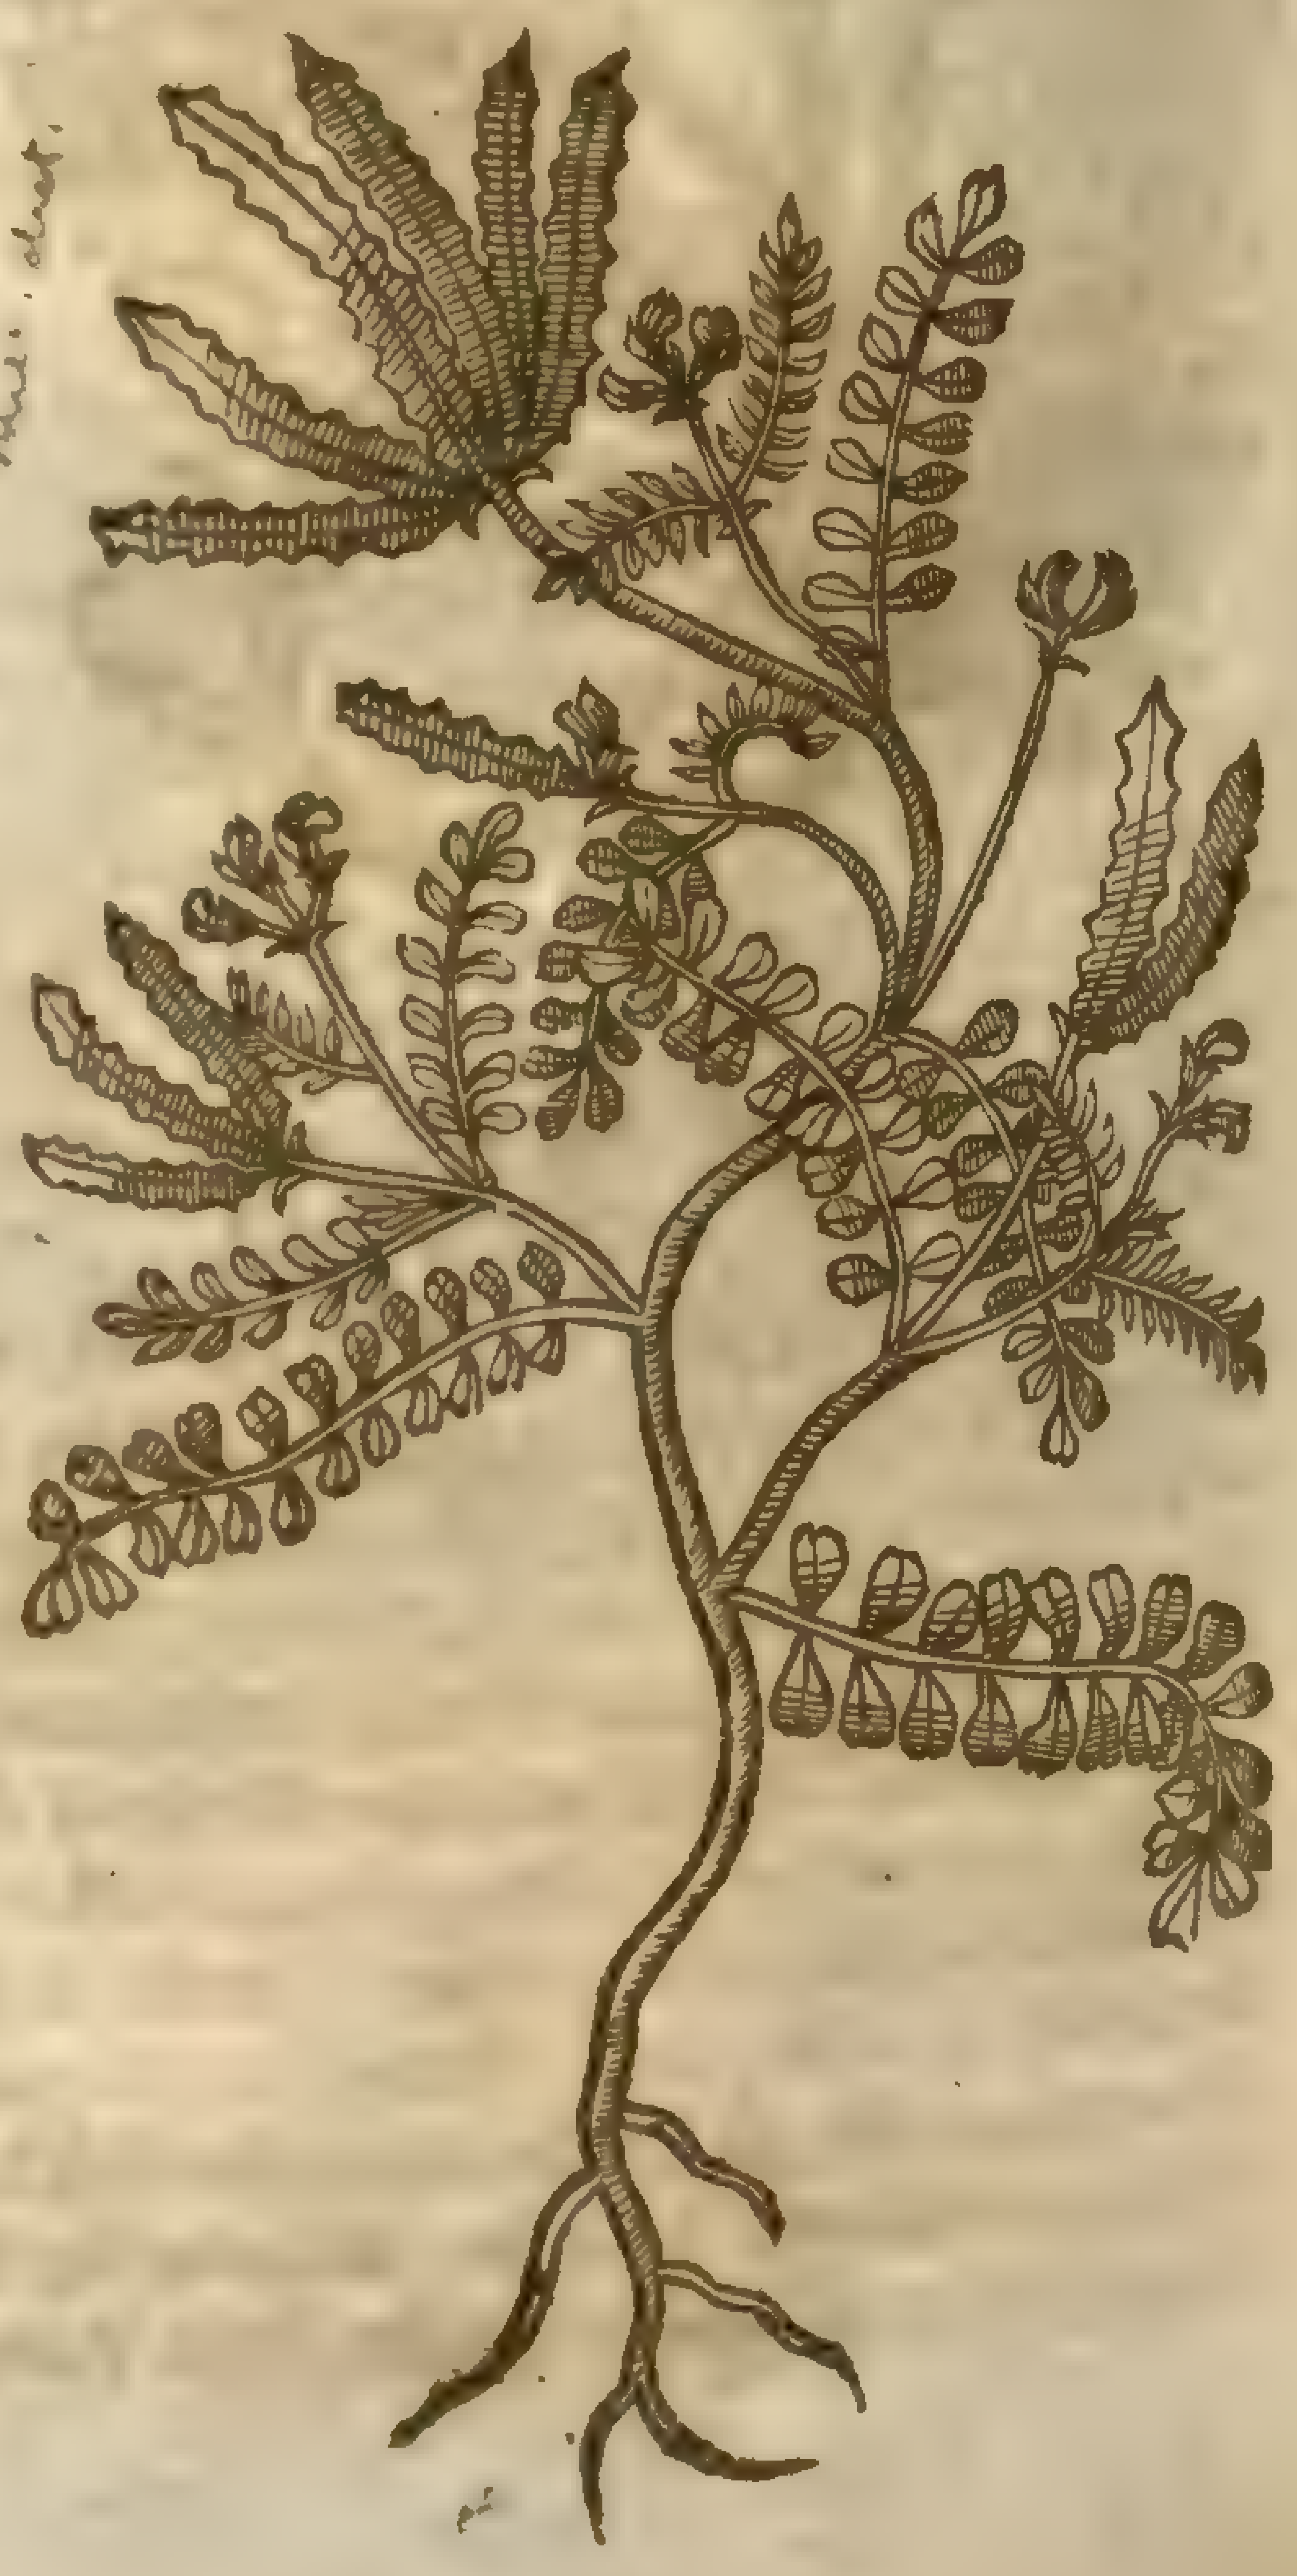


‡ 5 *Securidaca minor lutea.*
Small yellow Hatchet Vetch.



Biserrula pelecinus, L
mi. dist.

‡ 6 *Securidaca ſiliquis planis dentatis.*
Indented Hatchet Fetch.

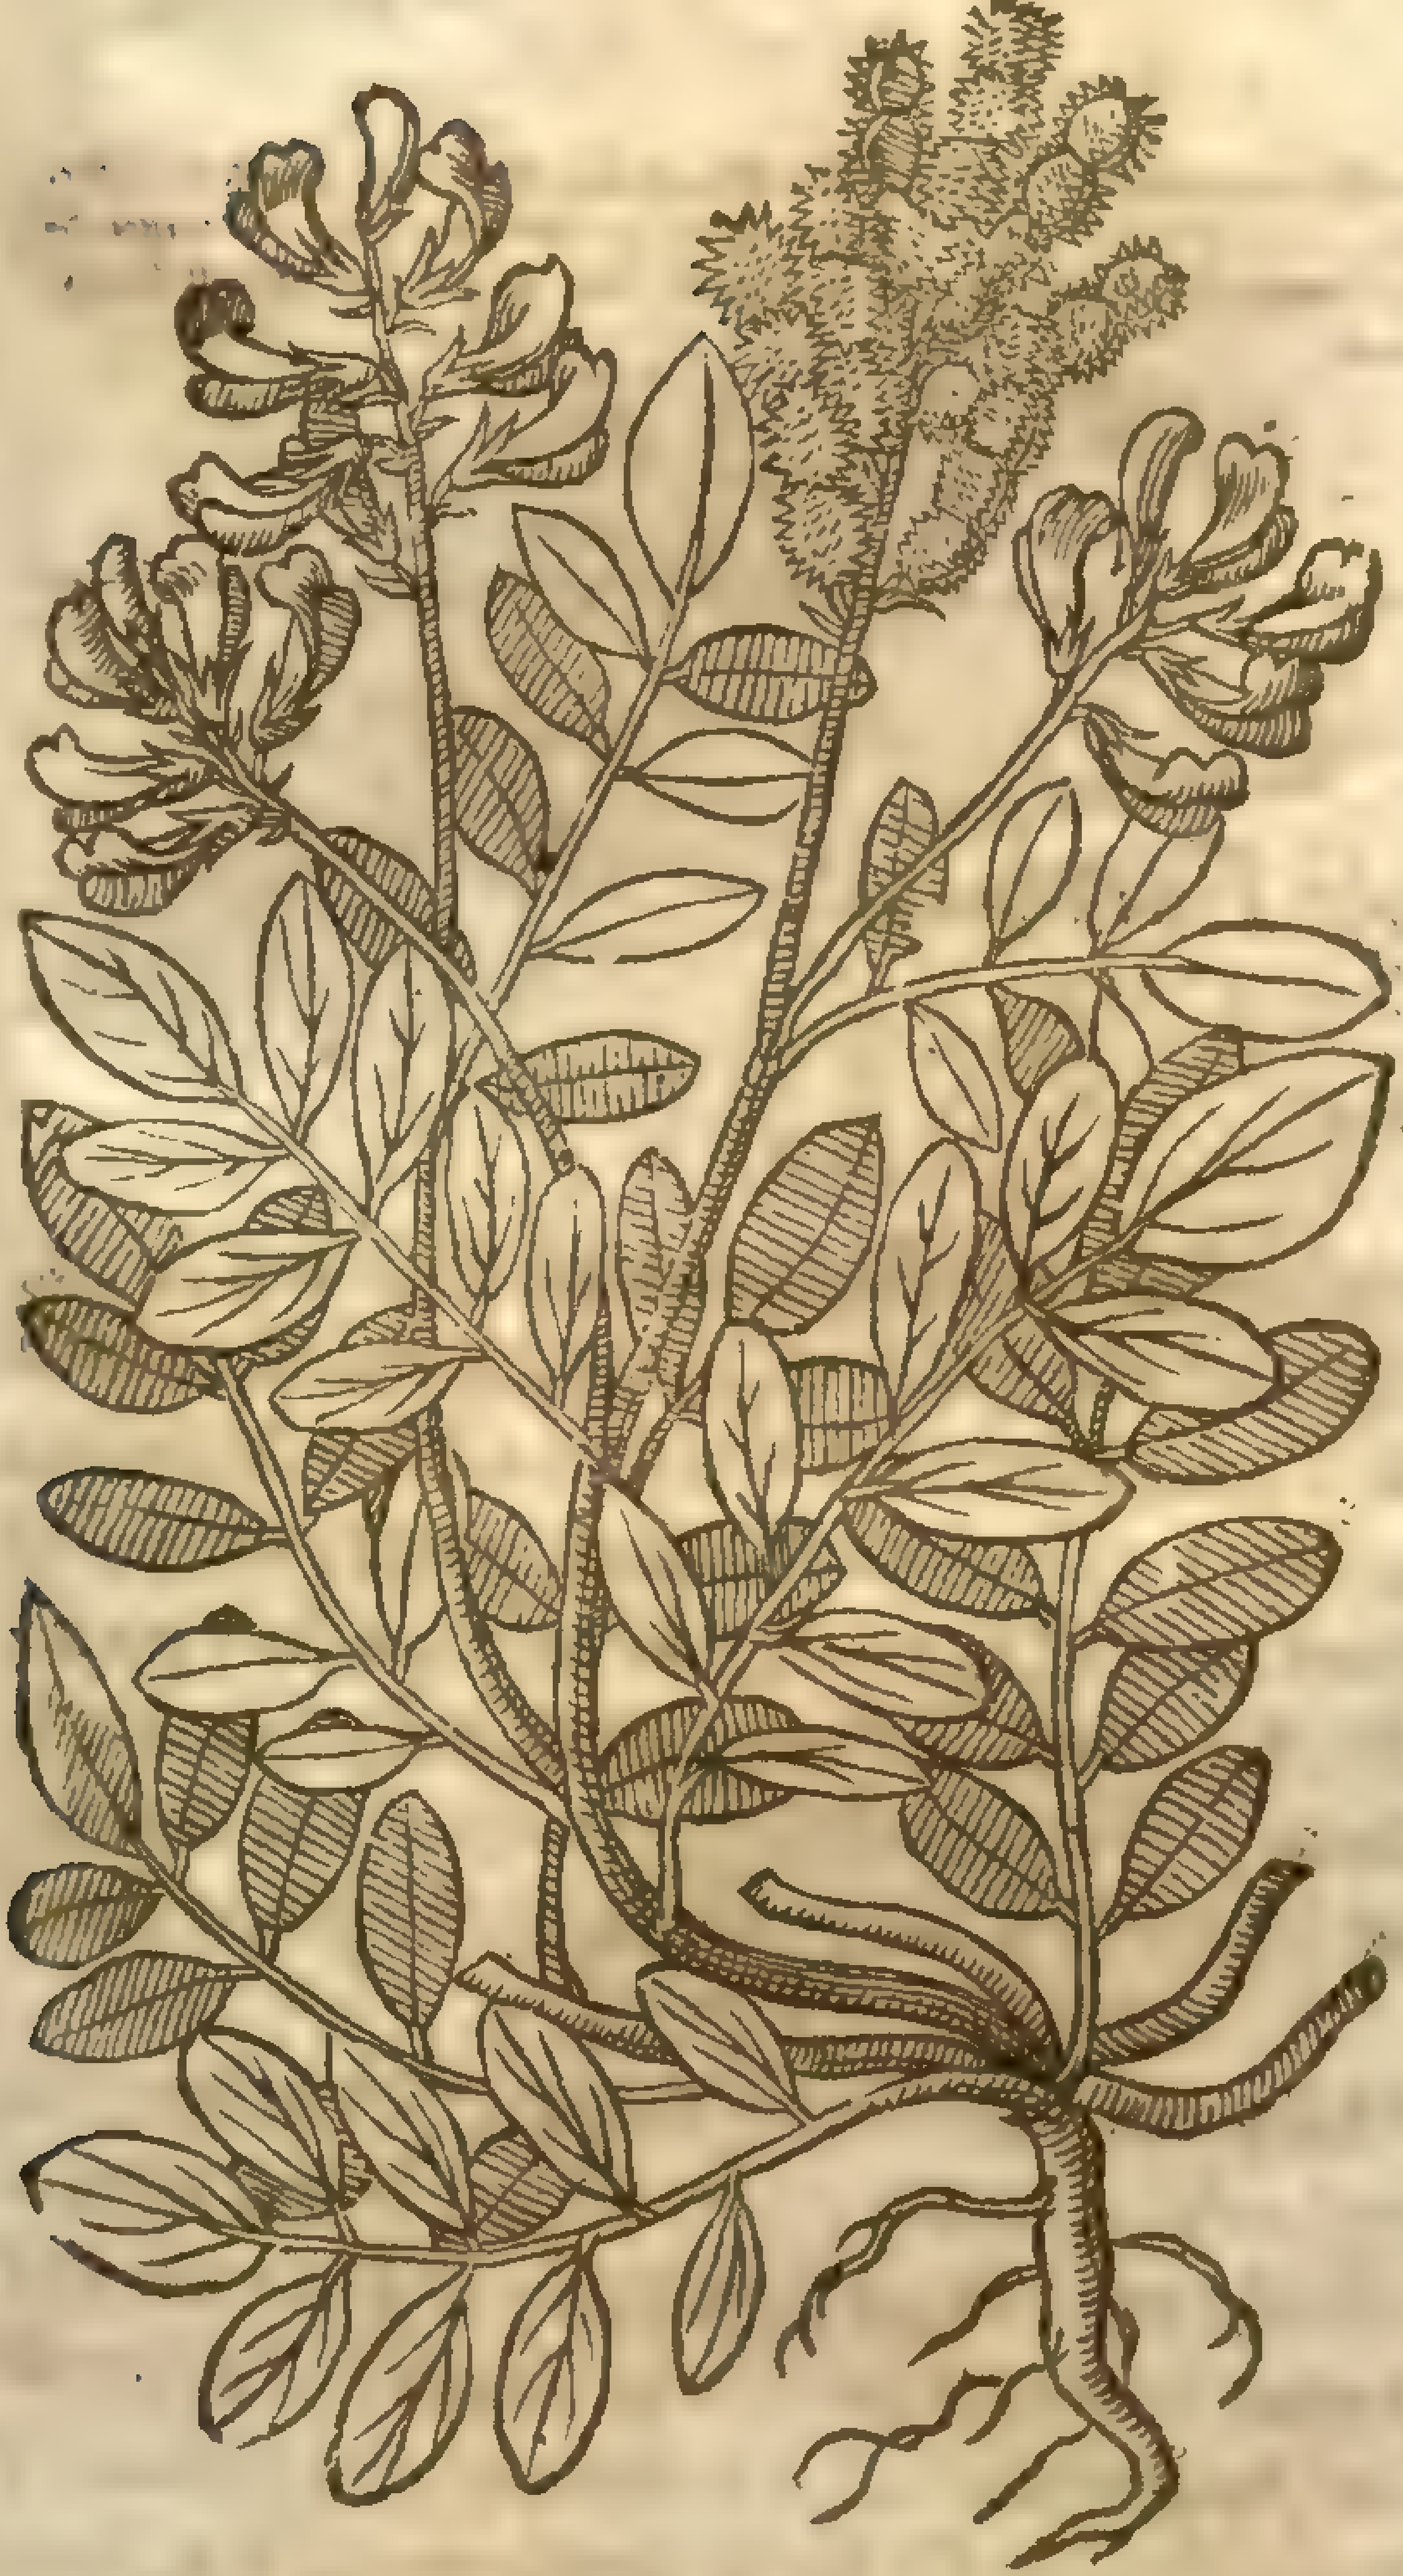


‡ 5 This in the ſtalkes, leaues, colour, and ſhape of the floures is like, yet leſſe than the firſt deſcribed; the cods are alſo ſmaller, leſſer, and more crooked, and herein onely conſiſts the chiefe difference: it is an annual plant, and growes only in ſome gardens. *Matthiolus*, *Lobel*, *Dodonæus*, and others make this their *Hedyſarum*, or *Securidaca minor*.

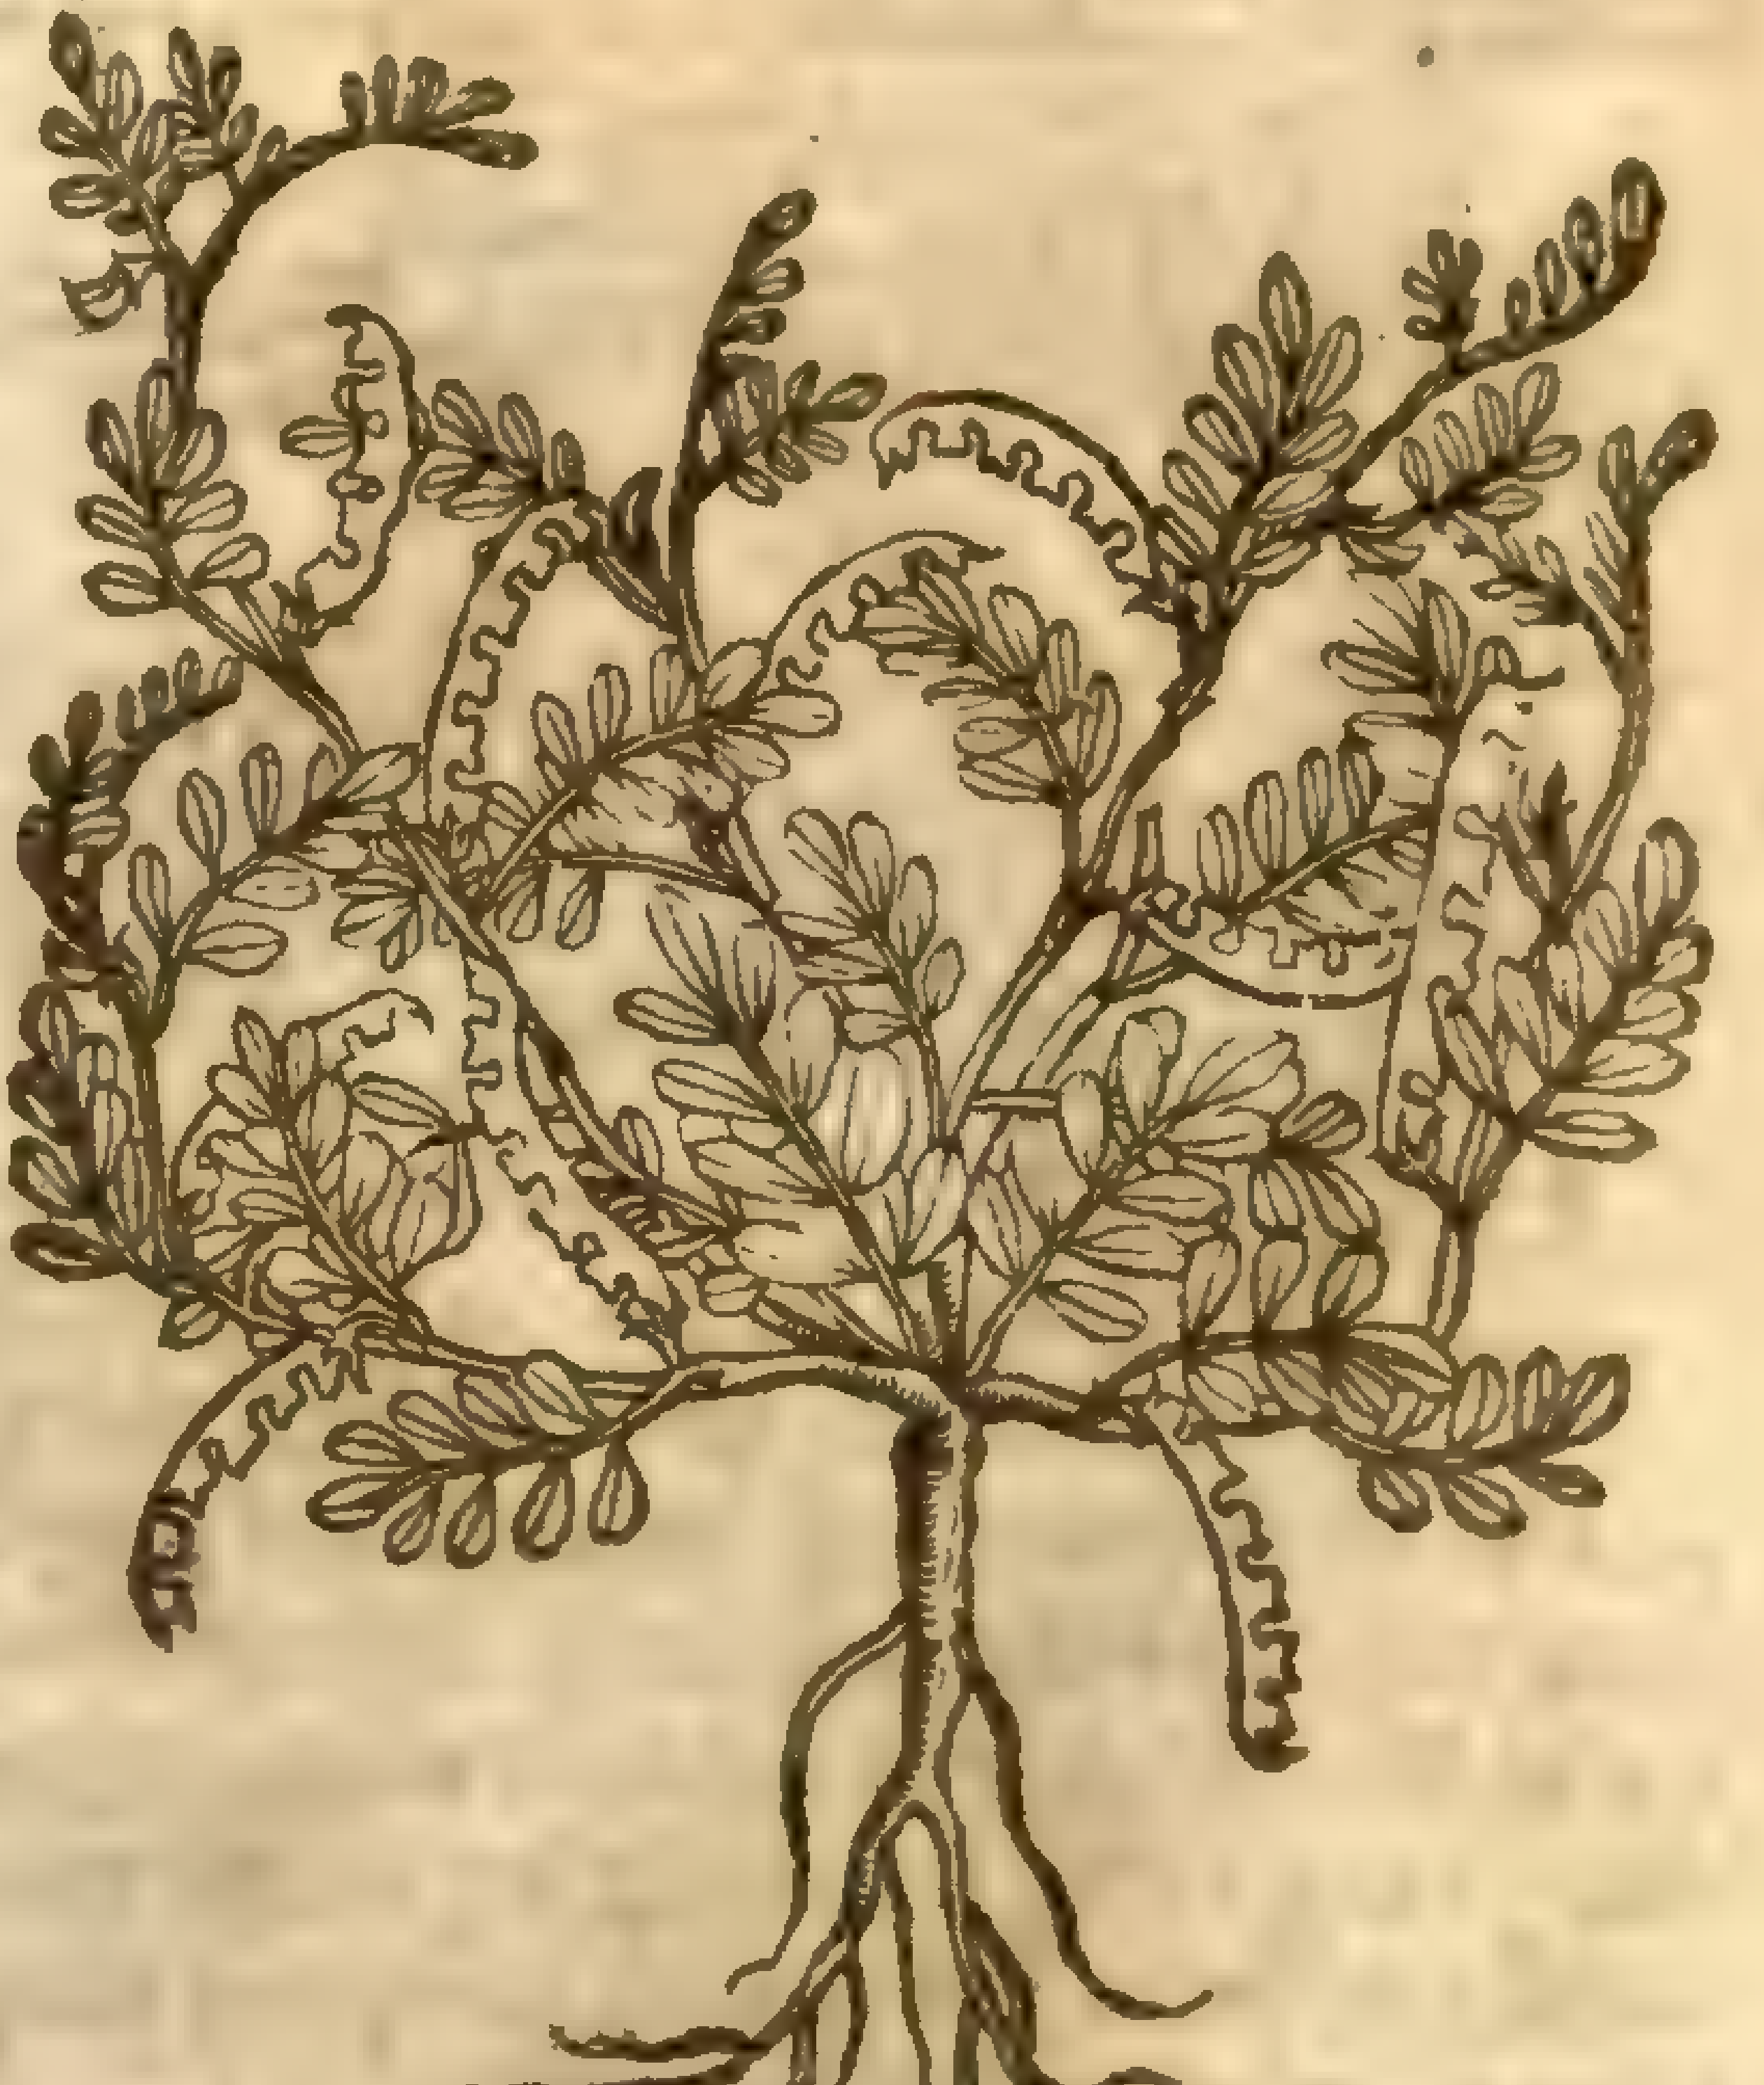
6 This hath many creſted branches, whereon great winged leaues, that is ſome twenty or more are faſtned to one rib: the floures are like thoſe of the other plants of this kind, but the cods are an inch long, flat, indented or toothed on the ſides: but of what colour the floures and ſeeds are it is not expreſt by *Cluſius*, who only ſet this forth by a picture, and ſome pieces of a dried plant thereof, which he receiued from *Cortuſus*, by the name of *Scolopendria leguminoſa*, or *Hedyſarum peregrinum*. *Cortuſus* had it from *Honorius Bellus*, who obſerued it growing vpon the rockes at Seberico a citie of Illyria. ‡

7 There is alſo another ſort of Hatchet Fetch, which hath very long and tough branches trailing vpon the ground, beſet with leaues like the former, but much greater: the floures grow at the top of the branches, of a pale colour, and turne into rough round and flat cods, faſhioned like little bucklers: the root of this (as of the firſt) dieth at the firſt approch of Winter, as ſoon as the ſeed is ripe. ‡ The ſtalks of this are ſtiffe and creſted, growing to the height of two cubits, with leaues as large as thoſe of Liquorice: the floures are of a faire bright red colour, the cods are made as it were of many rough buckler-like ſeeds, or rather ſeed-veſſels, wherein are contained ſmall browne ſeeds. ‡

‡ 7 *Hedyſarum clypeatum.*
French Honyſuckle.



8 *Ferrum Equinum.*
Horſe-ſhoo.



8 Horſe-ſhoo hath many ſtalks tender and lying vpon the ground: the leaues be thin, and leſſer than thoſe of Axſeed: the floures along the ſtalks are little, after which come vp long cods ſomthing broad, a little bowing, which haue vpon the one ſide deep round and indented cuts, like after a ſort to a horſe-ſhoo: the root is ſomewhat long.

¶ *The Place.*

Theſe plants grow in my garden. The ſecond kinde I found growing in Suffolke in *the highway* on the right hand as you go from Sudbury to Corner Church, about an hundred *paces from* the end of the towne, as alſo in ſundry other places of the ſame countrey; and in Eſſex *about* Dunmow,

mow, and in the townes called Clare and Henningham. ‡ Alſo it growes by Purfleet, about the foot of the hill whereon the winde-mill ſtands, and in diuers parts of Kent. ‡

Horſe-ſhoo commeth vp in certain vntilled and ſunny places of Italy and Languedoc: it groweth alſo in my garden.

¶ *The Time.*

Theſe plants floure in Iune, and their ſeed is ripe in Auguſt.

¶ *The Names.*

The Grecians name this, whether it be a Pulſe, or an infirmitie among corn, [illegible]: the Latines, of the forme of the ſeed, *Securidaca*, and *Hedyſarum*: in Engliſh, Axſeed, Axwort, Ax-fitch, and hatchet Fitch: it is vnknowne to the Apothecaries.

‡ The ſecond is the *Fænugræcum ſylveſtre* of *Tragus* and *Dodonæus*; the *Glycyrrhiza ſylveſtris* of *Geſner*; and the *Glaux vulgaris* of *Lobel* ‡

Horſe-ſhoo is commonly called in Italian, *Sferro de cavallo*: you may name it in Latine, *Ferrum equinum*: in Engliſh, Horſe ſhoo.

¶ *The Nature.*

The ſeeds of theſe plants are hot and dry of complexion.

¶ *The Vertues.*

A Being drunke it is acceptable to the ſtomacke, and remoueth ſtoppings out of the intrals; and of like vertue be the new leaues and tender crops of the whole plant.

B *Dioſcorides* ſheweth that it is alſo good for the ſtomack being taken in drinke, and is mixed with counterpoiſons.

C And it is thought to hinder conception, if it be applied with hony before the act.

D The ſeed of Ax-wort openeth the ſtoppings of the liuer, the obſtruction of the ſpleen and of all the inward parts.

E Horſe-ſhoo is bitter, and like in nature to Axſeed.

† The figure which formerly was in the firſt place agreed with the third deſcription: that which was in the ſecond place was of the *Hedyſarum minus* of *Tabern.* being a kinde of *Ferrum equinum*, which carries the cods many together on the tops of the branches, and growes in Germany: whence *Bauhine* calls it *Ferrum Equinum Germanicum ſiliquis in ſummitate*. This growes about Bath, and in diuers places of the Weſt countrey, bearing yellow floures like *Trifolium Corniculatum*, about the middle of Iune. The floures of the indented hatchet Fitch are of a whitiſh blew colour.

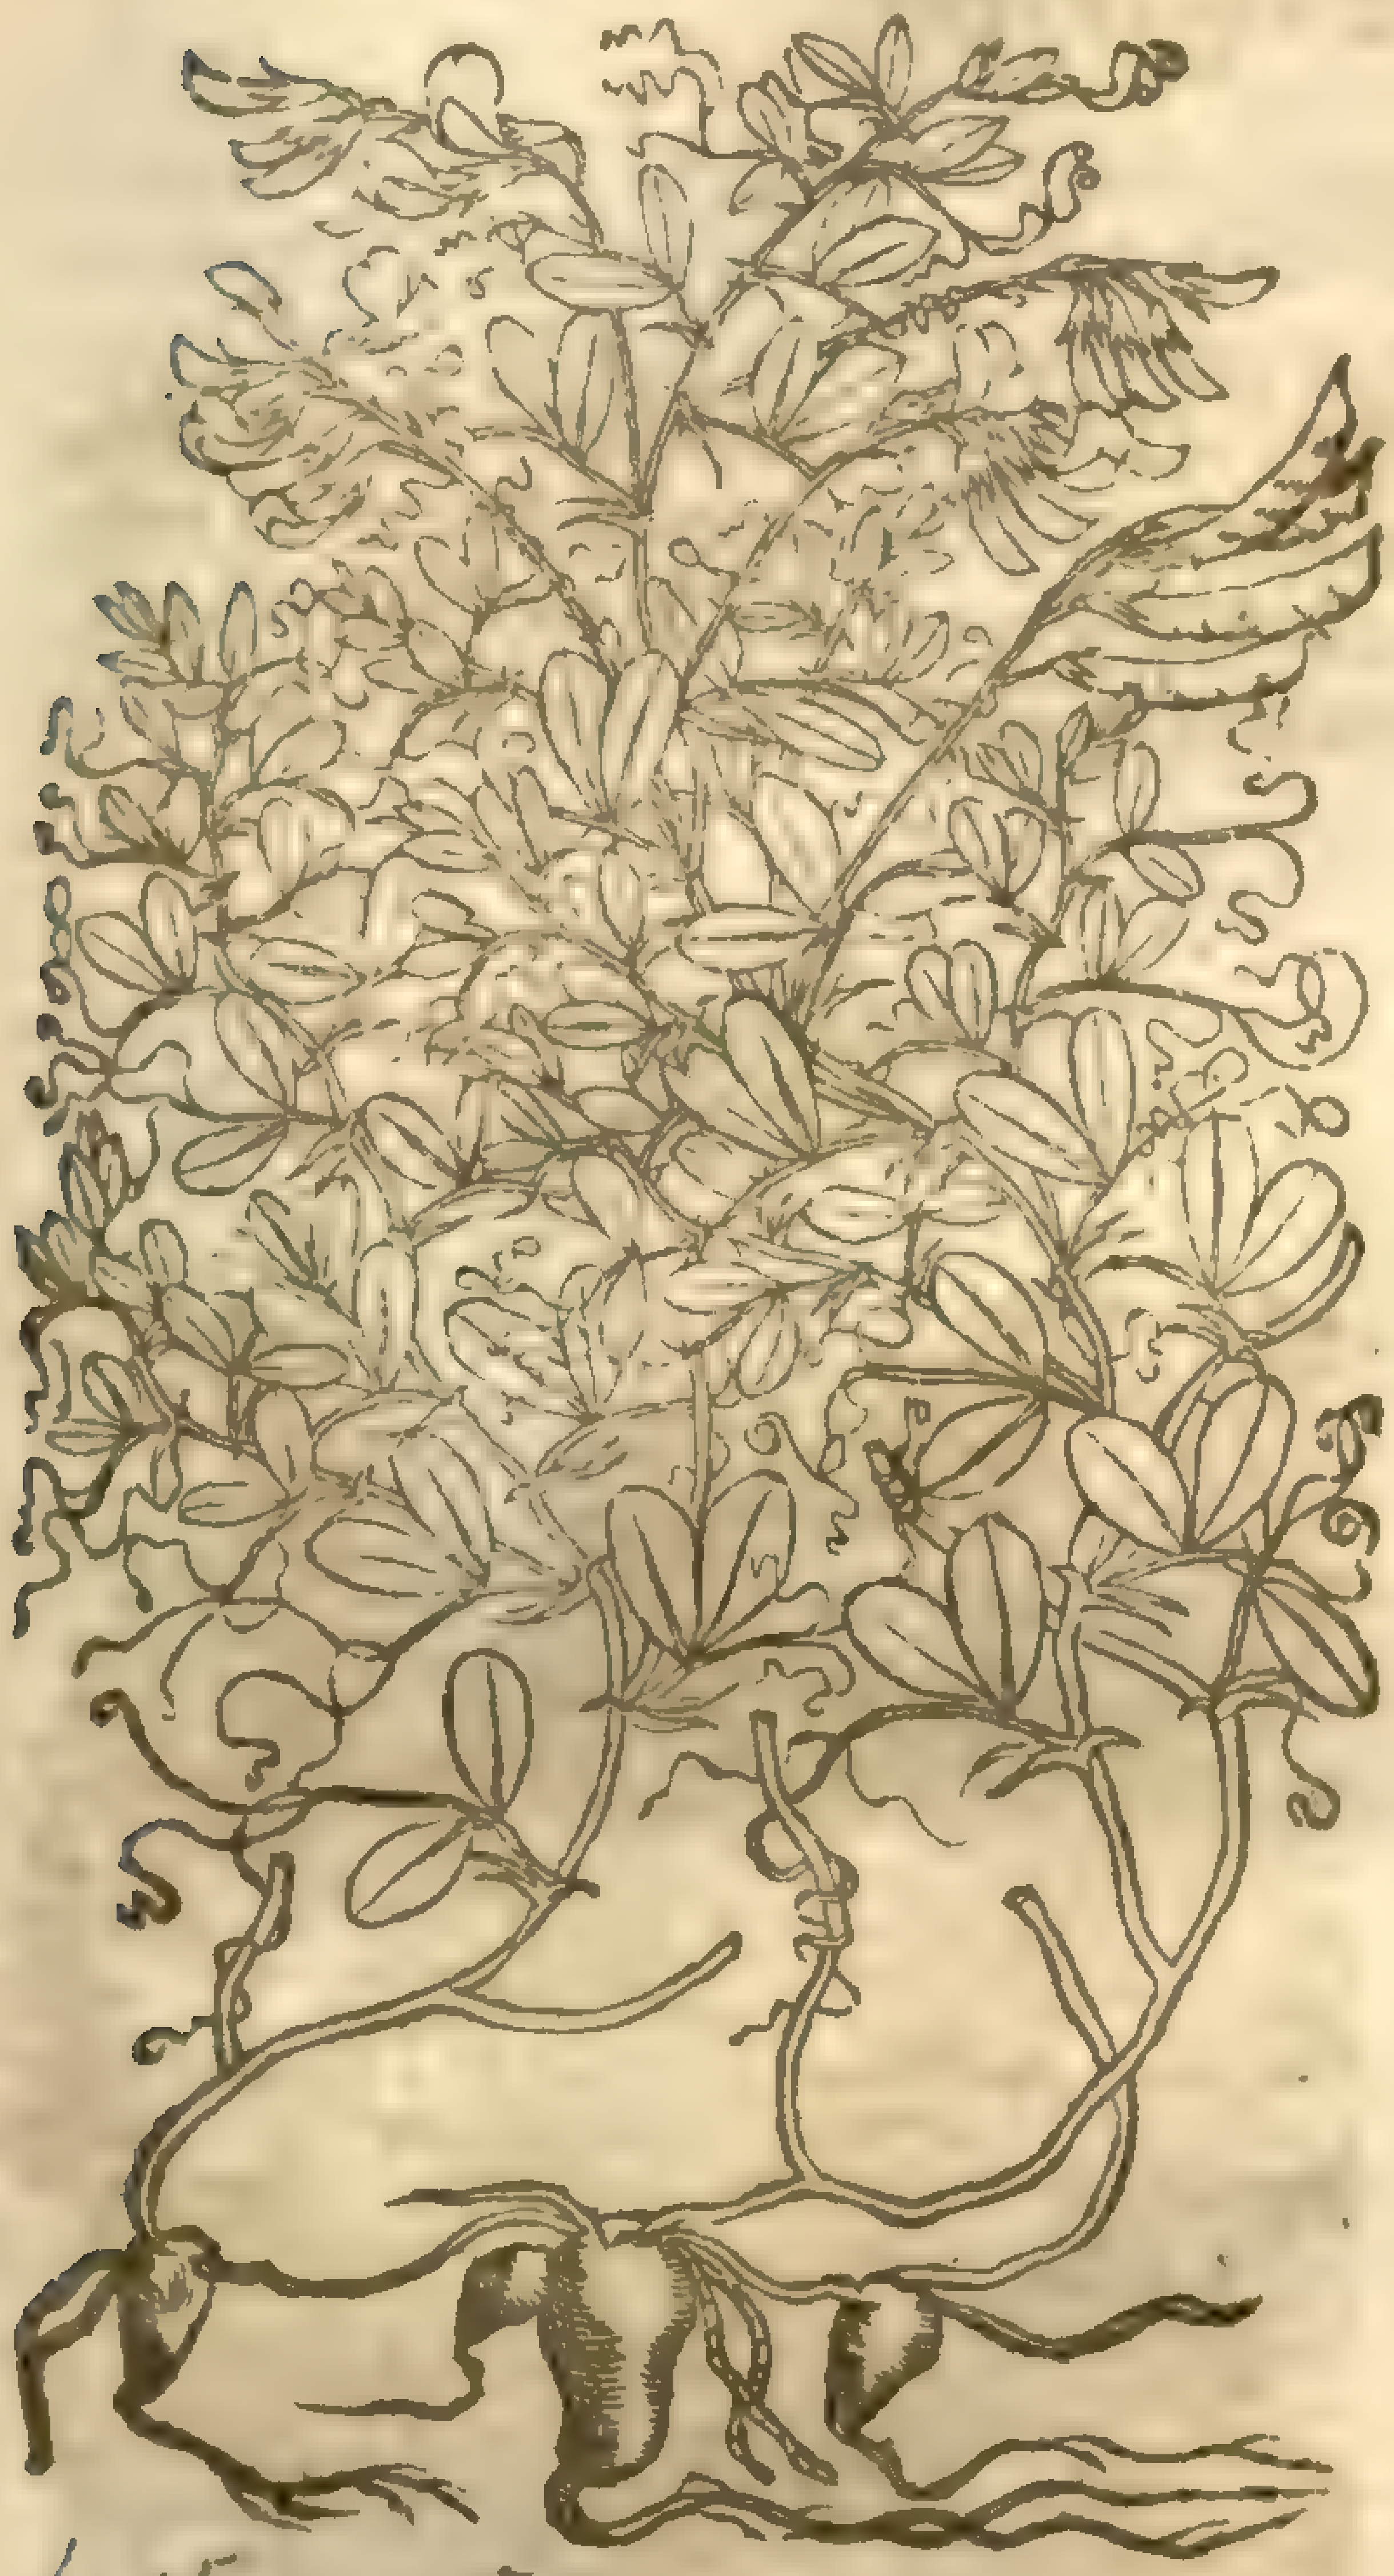
Chap. 519. *Of Peaſe Earth-nut.*

¶ *The Deſcription.*

1 The Peaſe Earth-nut comes vp with ſlender weake ſtalkes: the leaues be thin and little, growing on ſlender ſtems, with claſping tendrels at the ends, with which it imbraceth and taketh hold of ſuch things as ſtand neere it: the flours on the tops of the ſtalks are like thoſe of Peaſe, but leſſe, of a red purple colour, in ſmel not vnpleaſant: in their places come vp long cods in which are three or foure round ſeeds: the roots be thick, long, like after a ſort to Acorns, but much greater, black without, gray within, in taſte like the Cheſnut; out of which beneath doth hang a long ſlender ſtring: there grow out of the ſame alſo other ſtrings hard to the ſetting on of the ſtalke, vnto which creeping aſlope do grow other kernelled roots, whileſt the plant doth thus multiply it ſelfe.

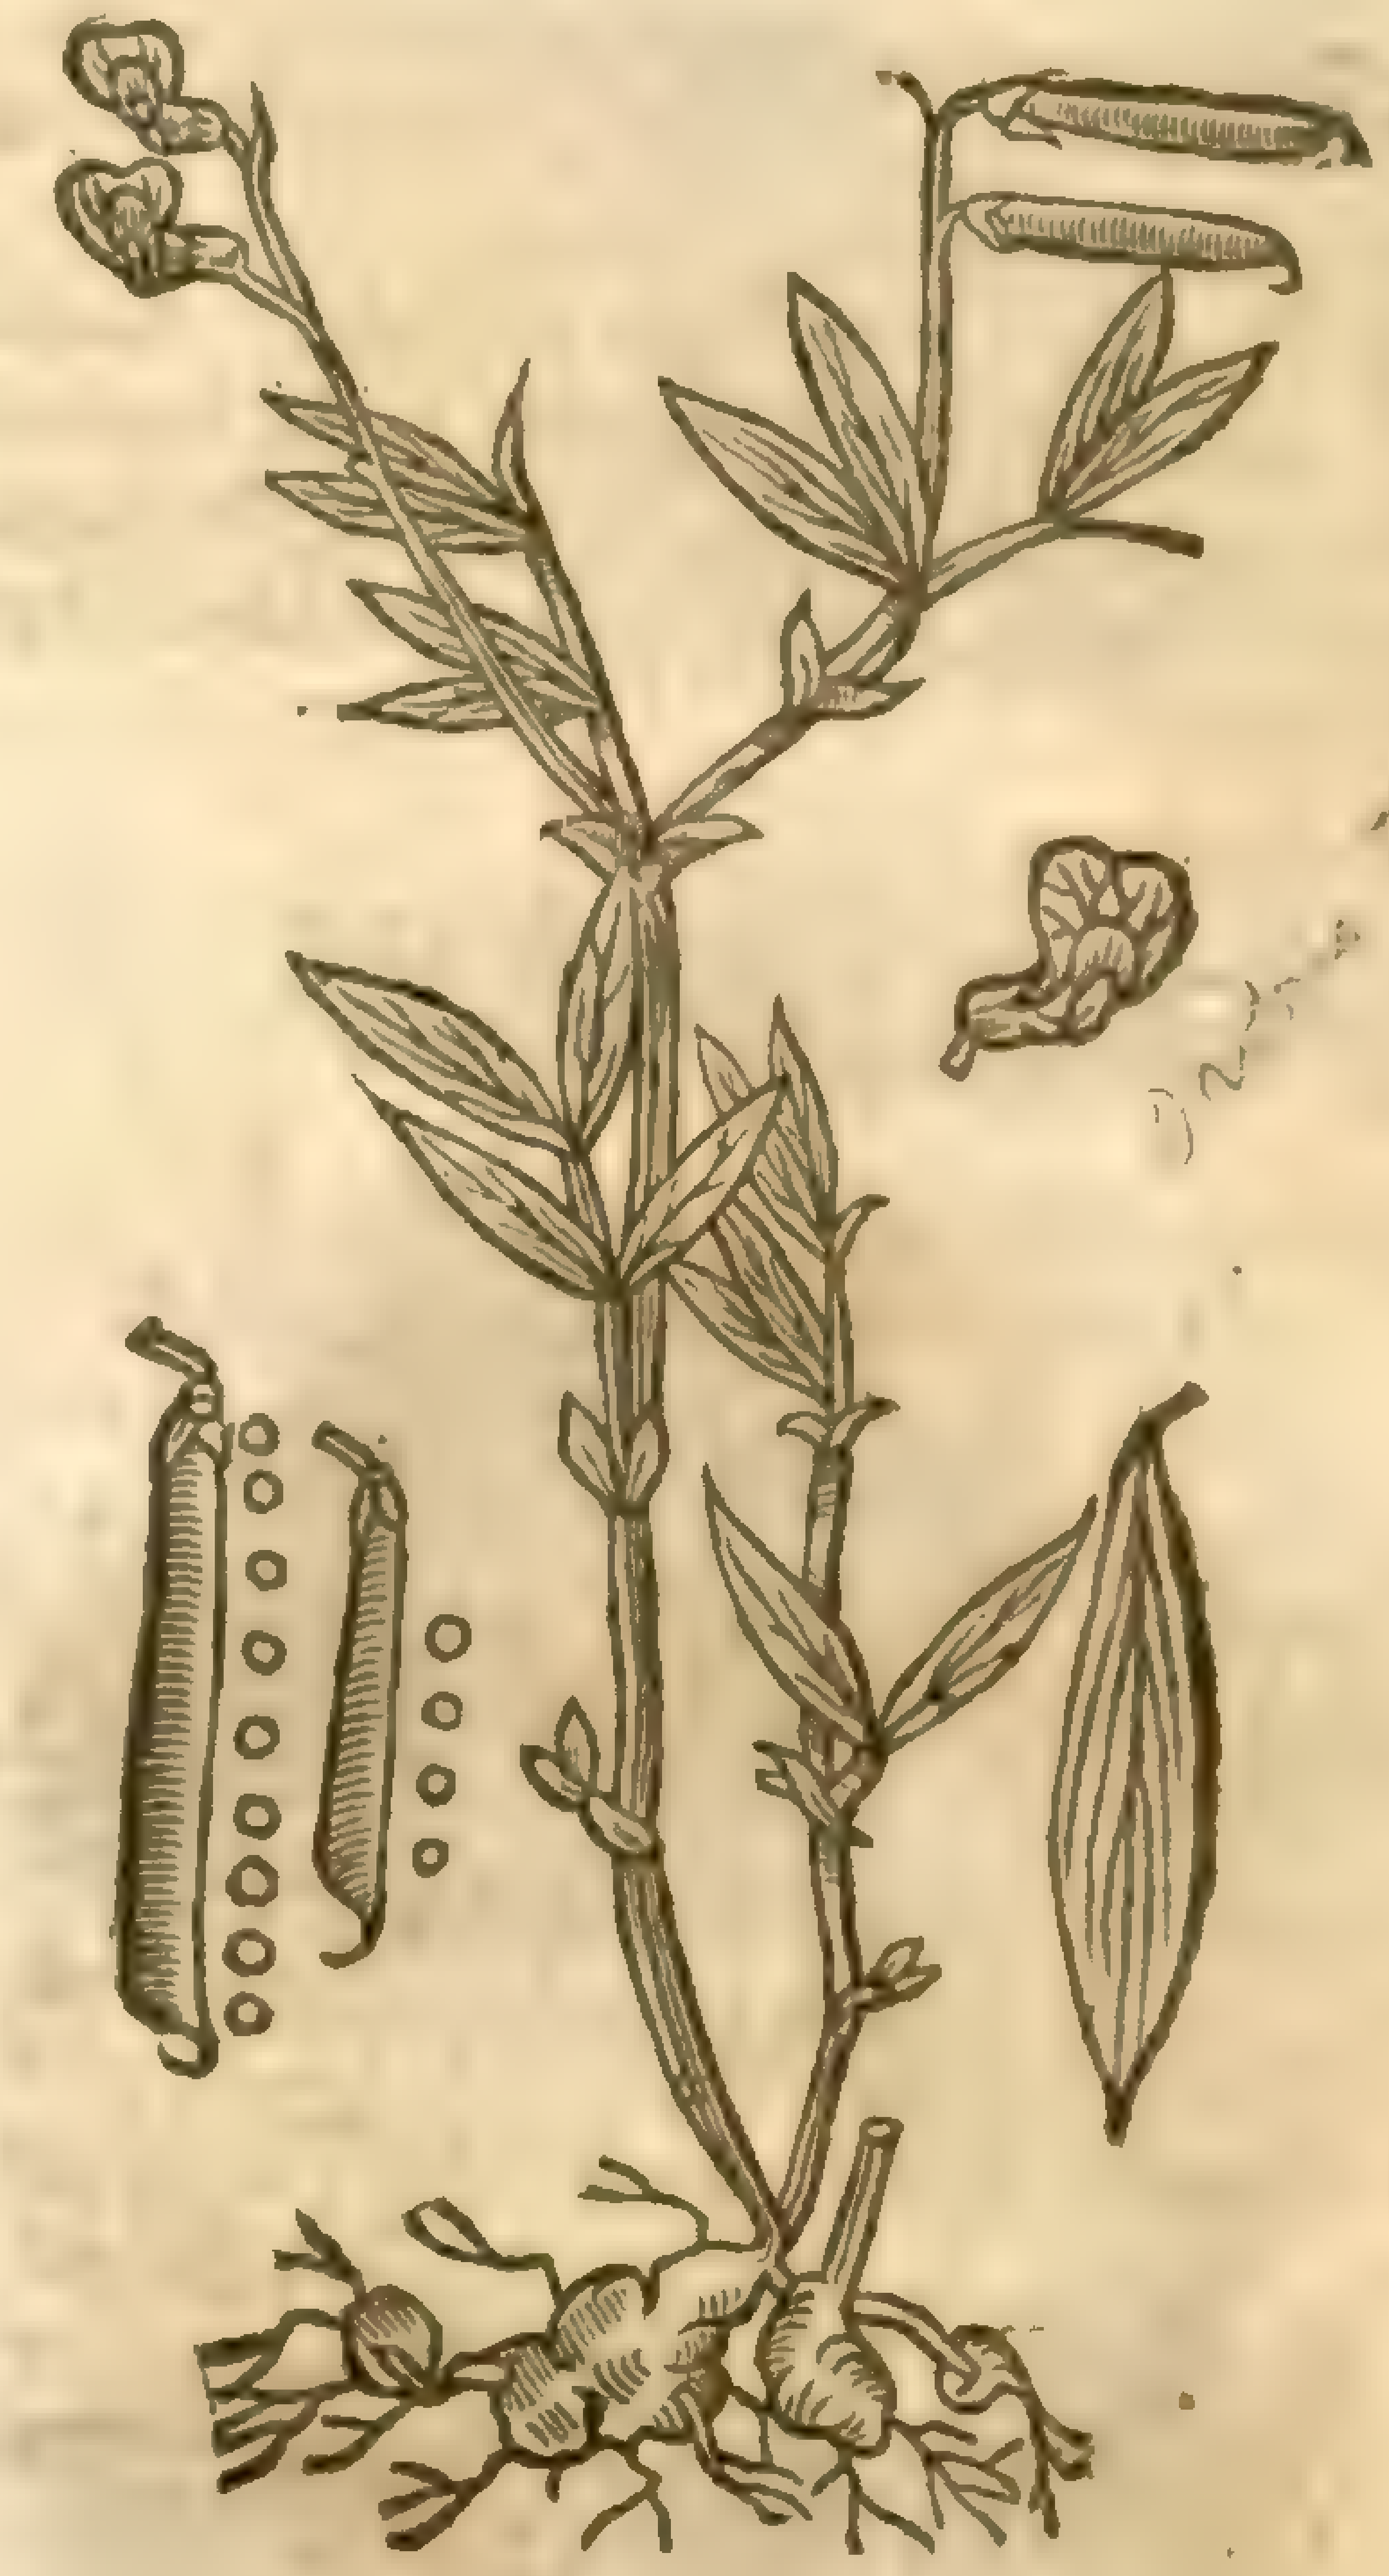
‡ 2 This, which *Thalius* in his *Sylva harcynia* ſets forth by the name of *Aſtragalus ſylvaticus*, was by our Author taken for and confounded with the *Terræ glandes*, and therefore I haue put it with it that the difference may the better appeare, which is not a little to ſuch as heedfully obſerue it. But our Author in this is to be pardoned, ſeeing Dr *Turner*, a man more exquiſite in the knowledge of plants, and who had ſeen the true *Terræ glandes* in Germany, miſtooke this for it, as may appeare by that little Tract of his of the names of plants in Latine and Engliſh, ſet forth *Anno* 1548. for there he ſaith, [I haue ſeen this herb of late in Come parke more aſtringent than it of Germany.] And indeed this growes there, and is much more aſtringent and woody than that of Germany, and in no wiſe fit to be eaten. The root conſiſts of many blacke tuberous particles, here and there ſending forth fibers: from hence ariſe cornered ſtalks ſome foot high, ſmall below, and ſomewhat larger aboue: the leaues grow forth of the ſtalks, conſiſting ſometimes of two, otherwhiles of 4 longiſh narrow leaues faſtned to one foot-ſtalke, which at the ſetting on hath two little leaues or eares: out of the boſoms of theſe leaues grow ſtalks ſome two inches long, each of which vſually carry a couple of peaſe-faſhioned flours of a purple colour, which fading, vſually become blew: after theſe follow cods ſtraight, round and blacke, and in each of them are commonly contained nine or tenne white round

1 *Terræ glandes.*
Peaſe Earth-nut.



Lathyrus tuberosus, L. Mill. dict.

‡ 2 *Aſtragalus ſylvaticus.*
Wood Peaſe or heath Peaſe.



Orobus tuberosus [illegible] Eng. fl. 3. 272

round ſeeds: it floures in ſummer, and perfects the ſeed in Iuly and Auguſt.

¶ *The Place.*

† 1 This groweth in corne fields, both with the corne it ſelfe, and alſo about the borders of fields among briers and brambles: it is found in diuers places of Germany, but not with vs, that I can yet learne.

2 This is found in the woods and paſtures of England, eſpecially in Hampſtead Wood neere London: it groweth in Richmond heath, and in Come parke likewiſe.

¶ *The Time.*

It floureth in Iune and Iuly; the nuts after harueſt be digged vp and gathered.

¶ *The Names.*

It is called in high-Dutch, **Erdnuſſen**: in low-Dutch, **Eerdnoten**, **Eerdeeckelen**, and **Muyſen metſteerten**, that is to ſay, tailed Mice, of the ſimilitude or likeneſſe of domeſtick Mice, which the black round and long nuts, with a piece of the ſlender ſtring hanging out behinde do repreſent. The later writers call it in Latine *Terræ glandes*, or *Terreſtres glandes*: in Greeke, χαμαιβάλανοι, *Chamabalani*. in Engliſh, Peaſe Earth-nut.

¶ *The Temperature and Vertues.*

The nuts of theſe Peaſe being boiled and eaten are hardlier digeſted than be either Turneps or Parſneps, yet do they nouriſh no leſſe than the Parſnep: they are not ſo windy as they, but do more ſlowly paſſe through the belly by reaſon of their binding qualitie; and beeing eaten raw they bee yet harder of digeſtion, and do ſlowlier deſcend. A

They be of temperature meanly hot and ſomwhat dry, being withal not a little binding: whereupon alſo they do not only ſtay the fluxes of the belly, but alſo all iſſues of bloud, eſpecially from the mother or bladder. B

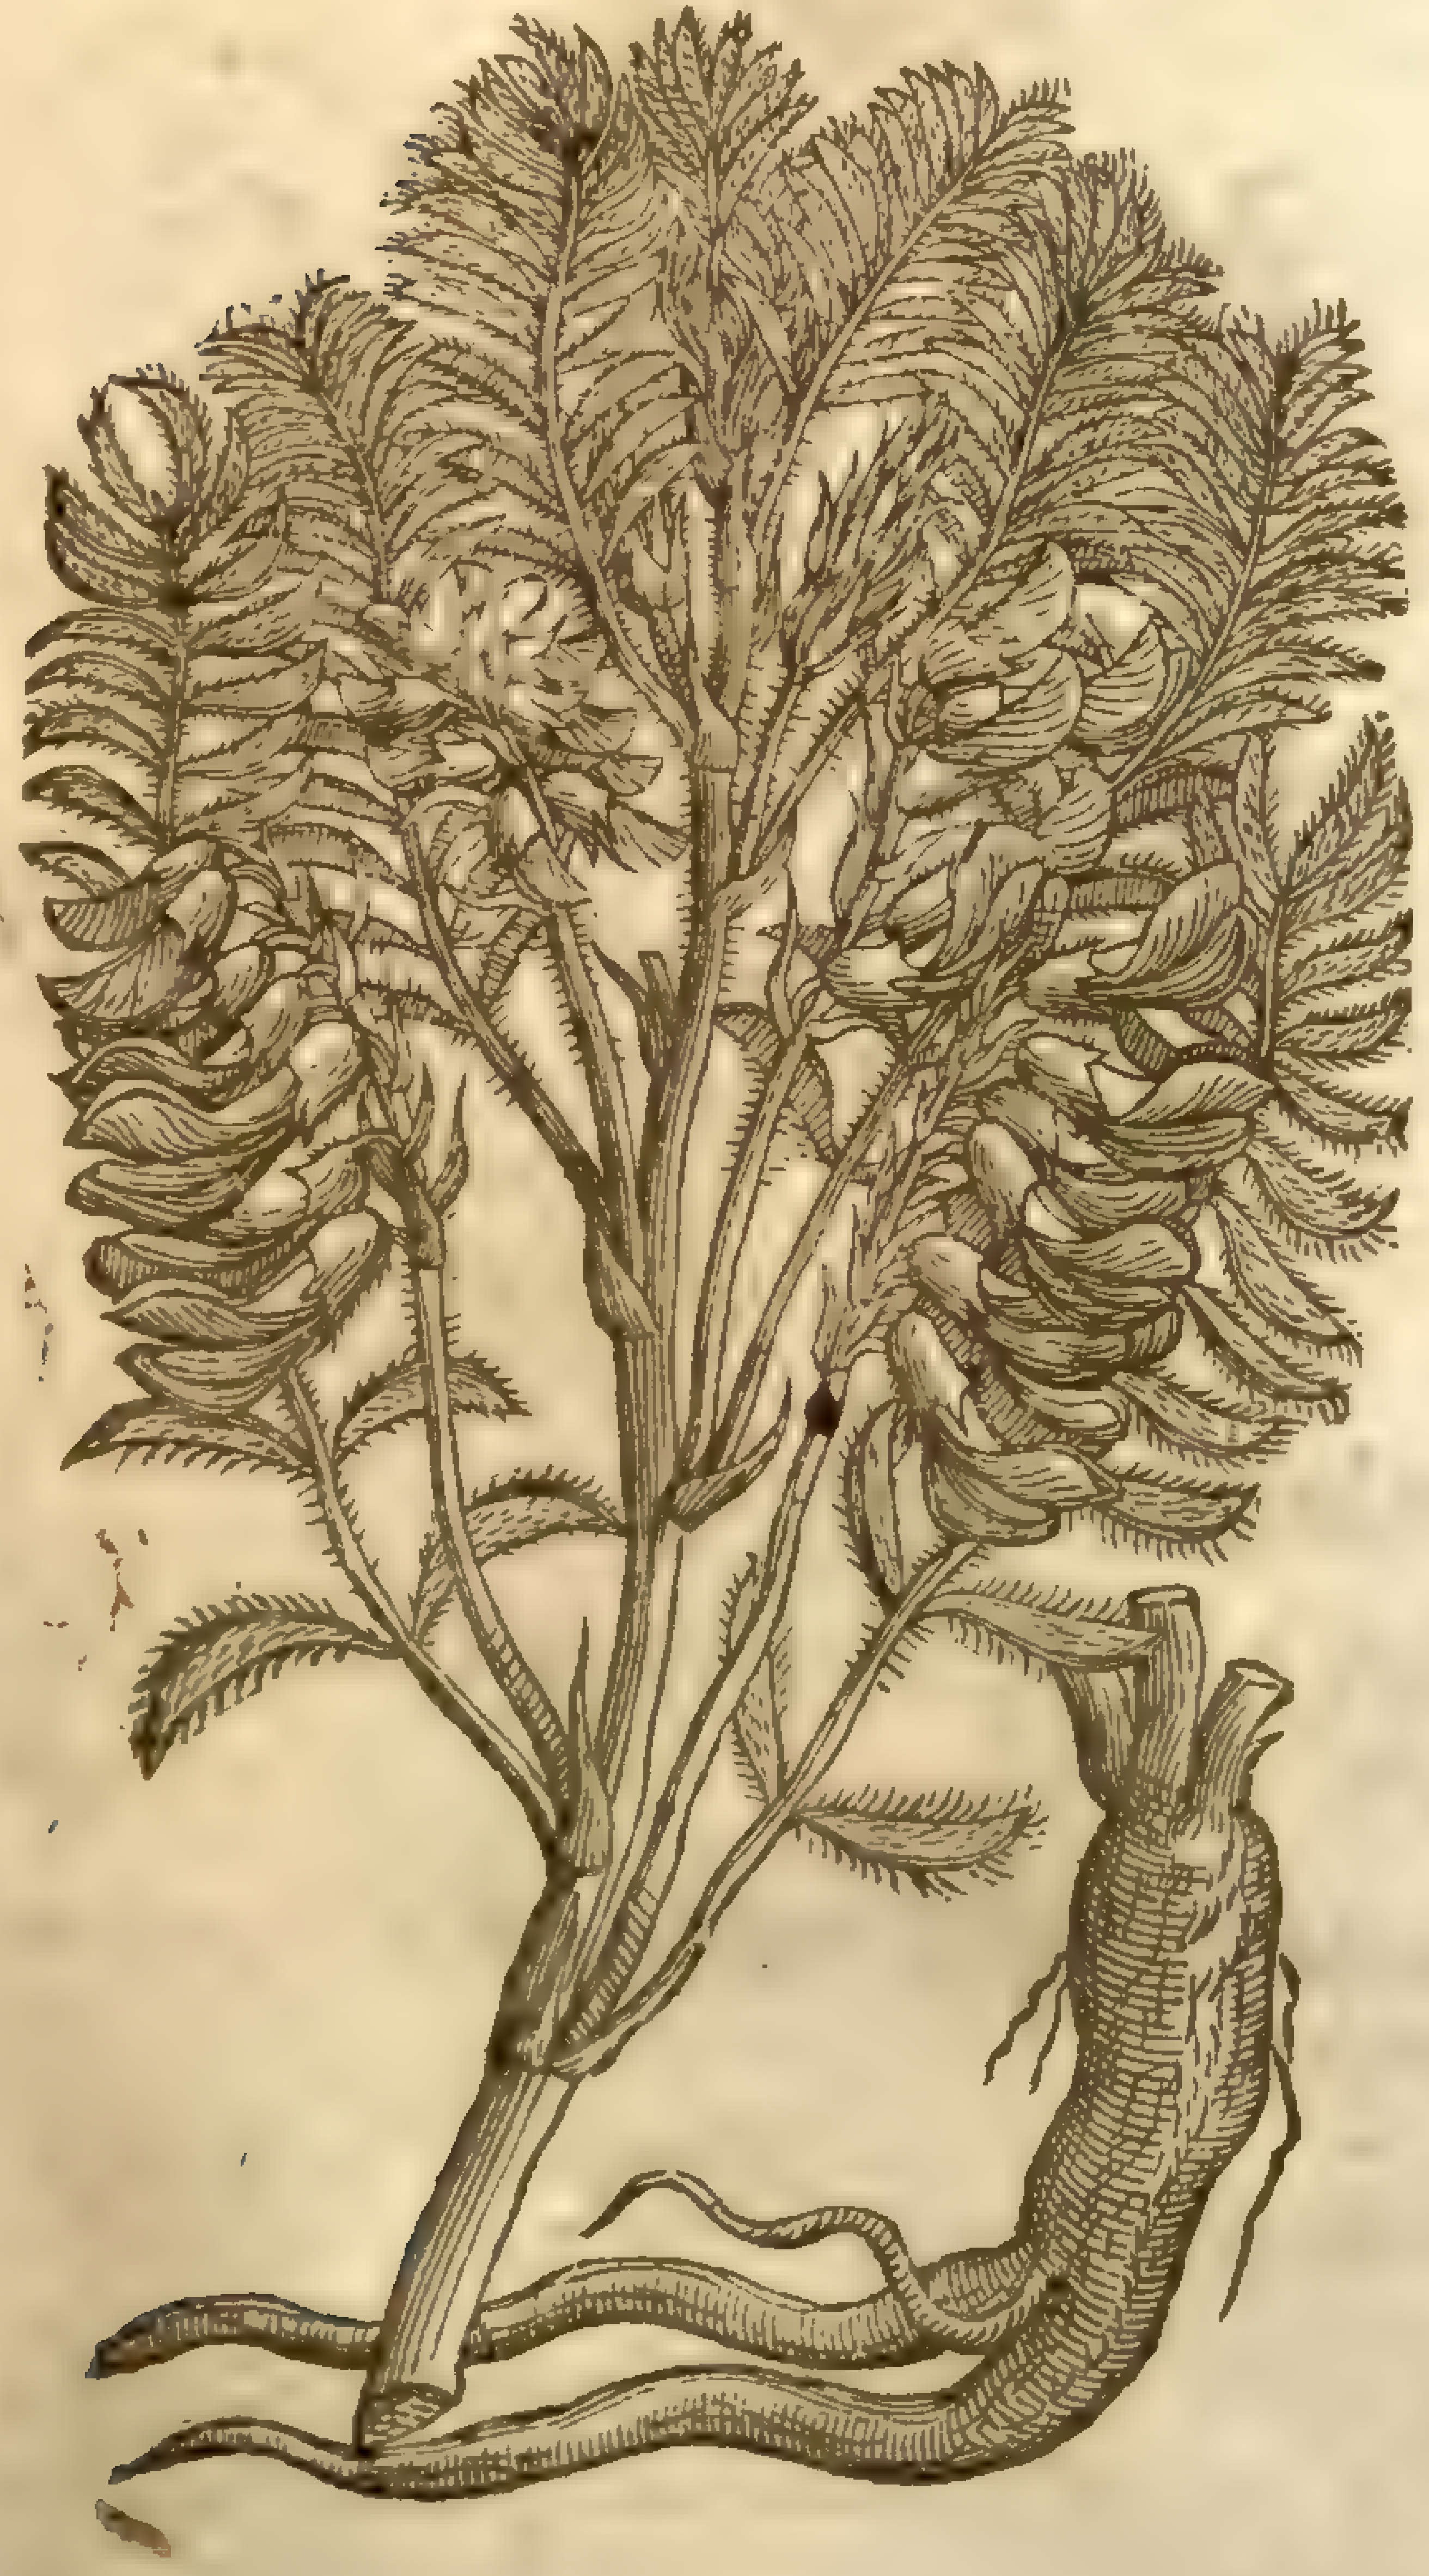
The root of Peaſe Earth-nut ſtoppeth the belly, and the inordinat courſe of womens ſickneſſe. C

Chap. 520. *Of Milke-Vetch.*

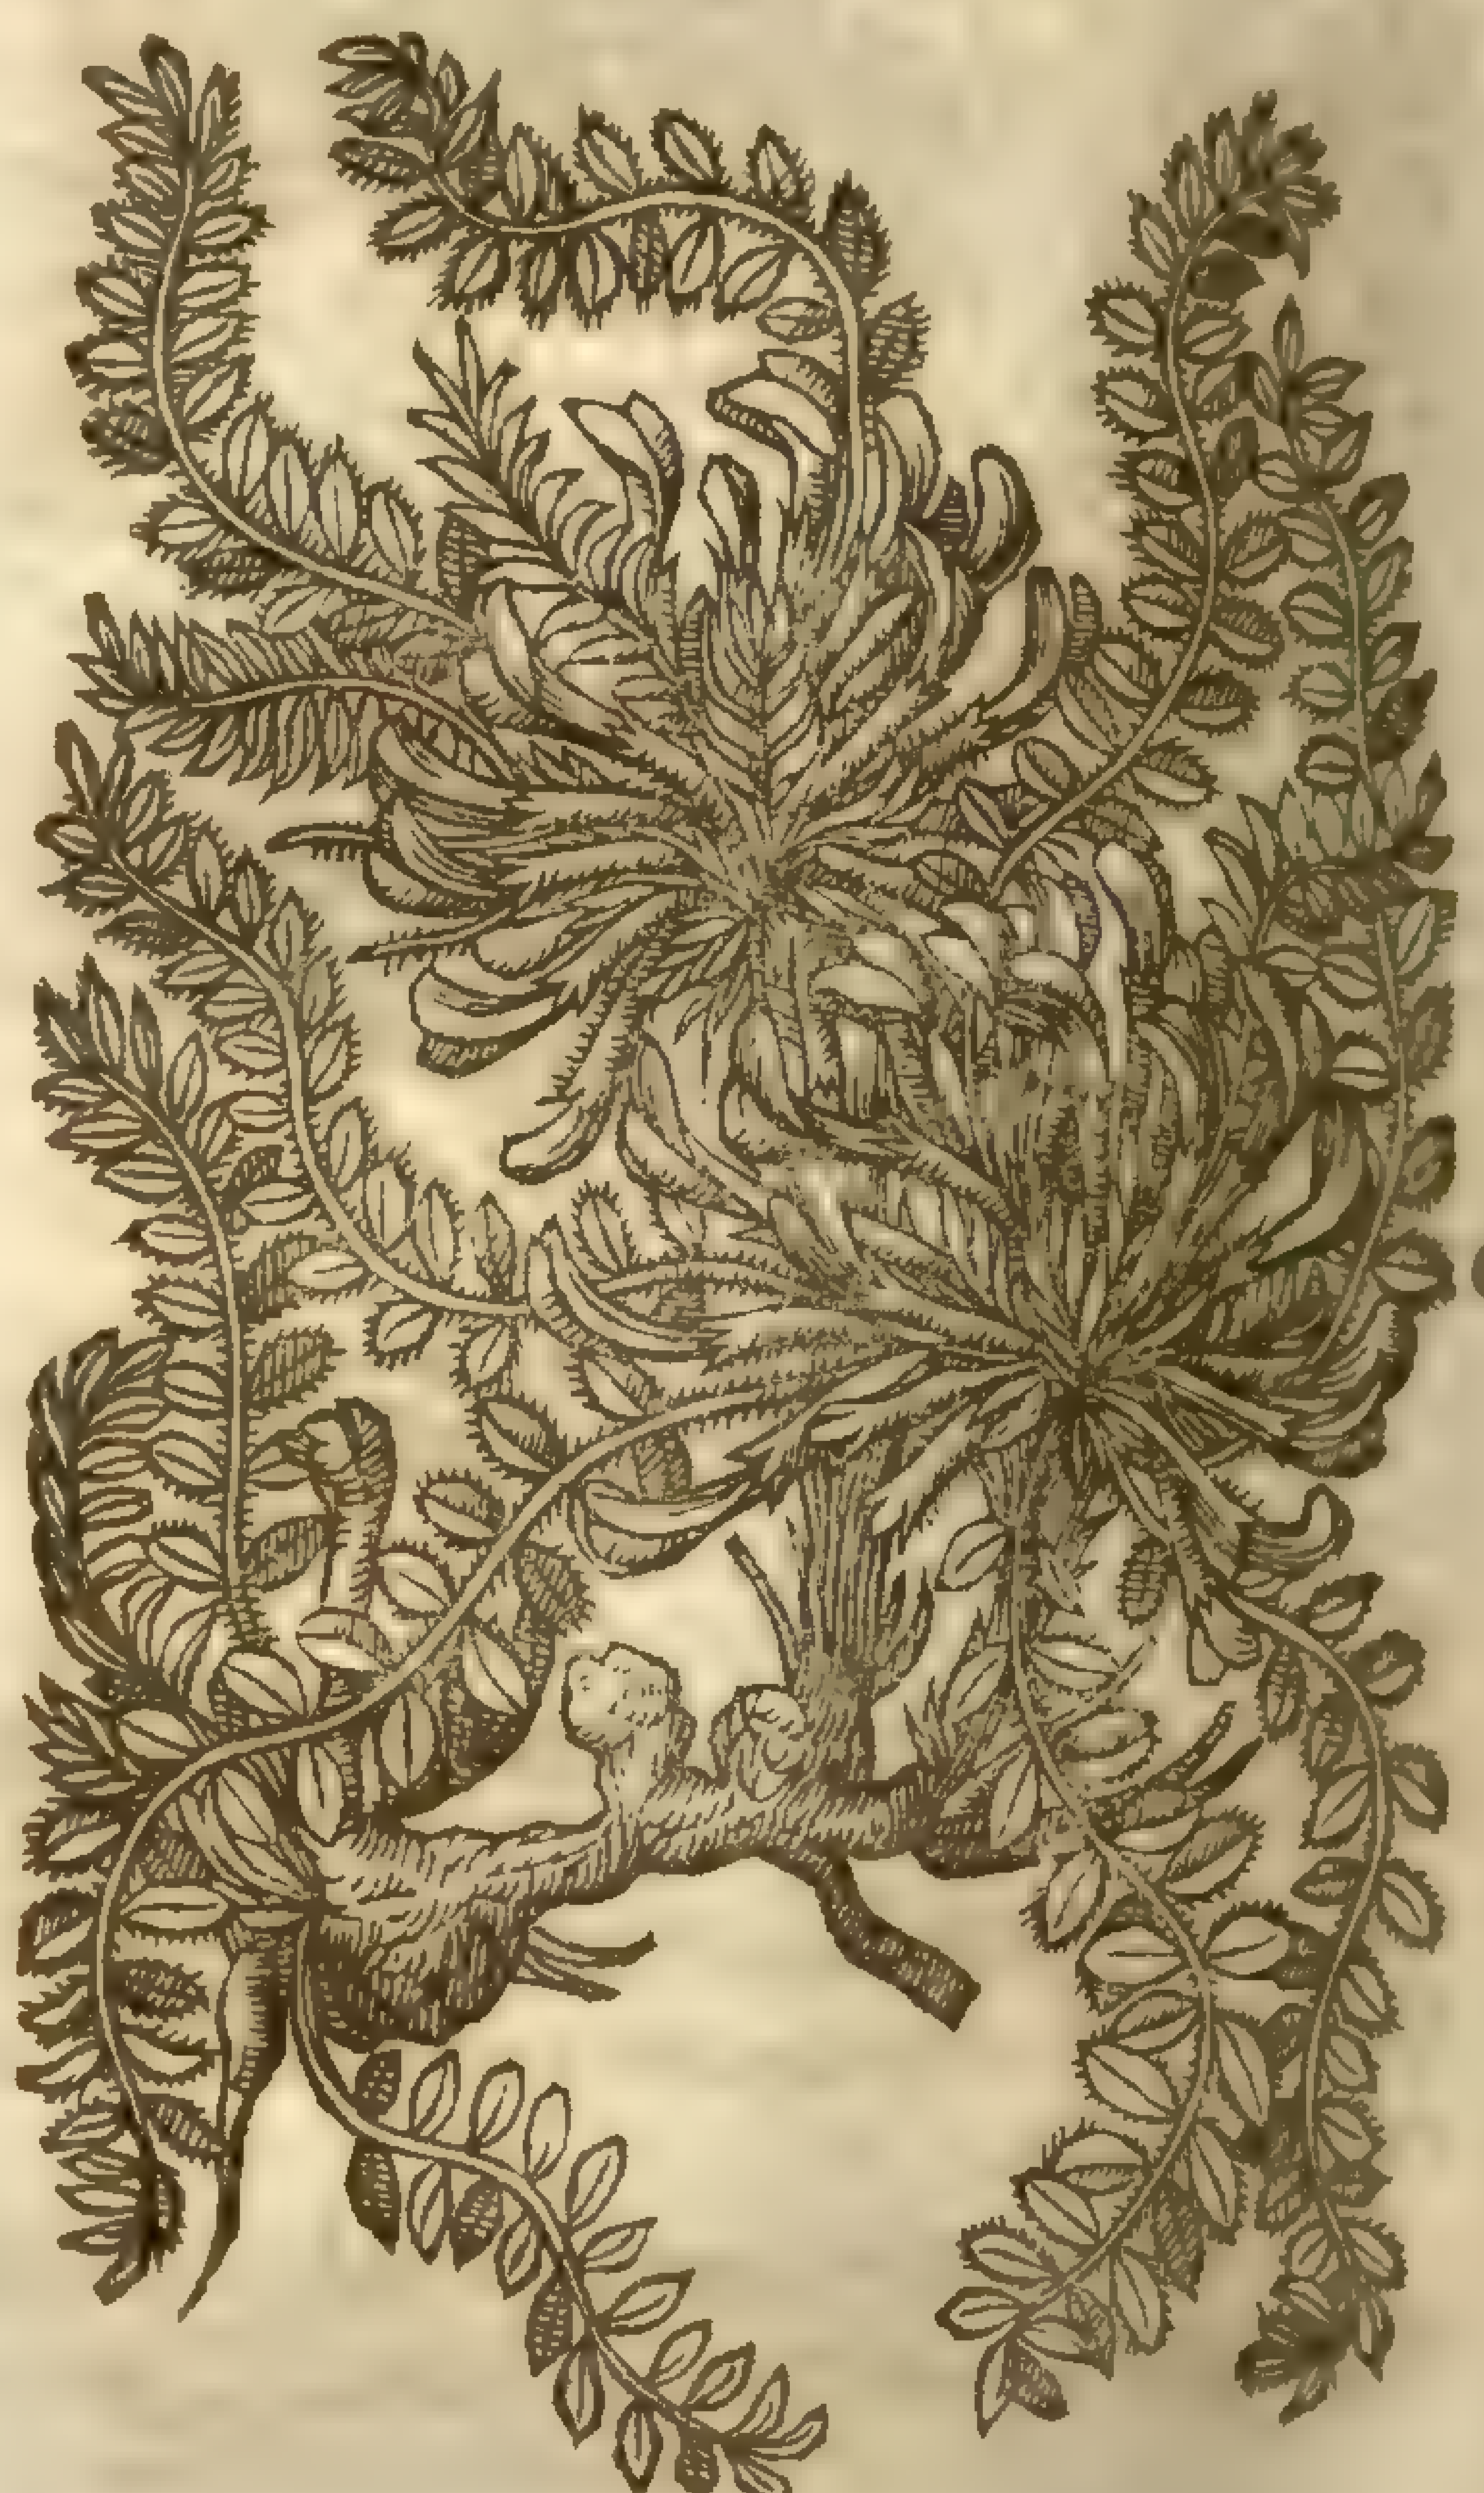
¶ *The Kindes.*

There be diuers ſorts of herbs contained vnder the title of *Aſtragalus*; whether I may without breach of promiſe made in the beginning, inſert them amongſt the *Legumina*, Pulſes, or herby plants, it is doubtfull: but ſeeing the matter is diſputable, I thinke it not amiſſe to ſuffer them to paſſe thus, vntill ſome other ſhall finde a place more conuenient and agreeing vnto them in neighborhood.

Phaca bœtica; [illegible]



1 *Aſtragalus Luſitanicus Cluſij.*
Portugal milke-Vetch.



2 *Aſtragalus Syriacus.*
Aſſyrian milke Vetch.

¶ *The Deſcription.*

1 The firſt kinde of *Aſtragalus* hath reddiſh ſtalks a cubit high, a finger thicke, ſomwhat creſted or furrowed, and couered ouer with an hairy moſſineſſe; which diuide themſelues into ſundry ſmall branches, beſet with leaues conſiſting of ſundry little leaues ſet vpon a middle rib like the wilde Vetch, placed on the ſmal pliant branches like feathers, which are likewiſe couered ouer with a woolly hoarineſſe; in taſte aſtringent at the firſt, but afterwards burning hot: among theſe leaues come forth many ſmall white floures in faſhion like the floures of Lupins, which before their opening ſeem to be ſomewhat yellow: the root is maruellous great and large, conſidering the ſmalneſſe of the plant; for ſometimes it groweth to the bigneſſe of a mans arme, keeping the ſame bigneſſe for the ſpace of a ſpan in length, and after diuideth it ſelfe into two or more forks or branches, blacke without, and wrinkled; white within, hard, and woody, and in taſte vnpleaſant: which being dried becommeth harder than an horne.

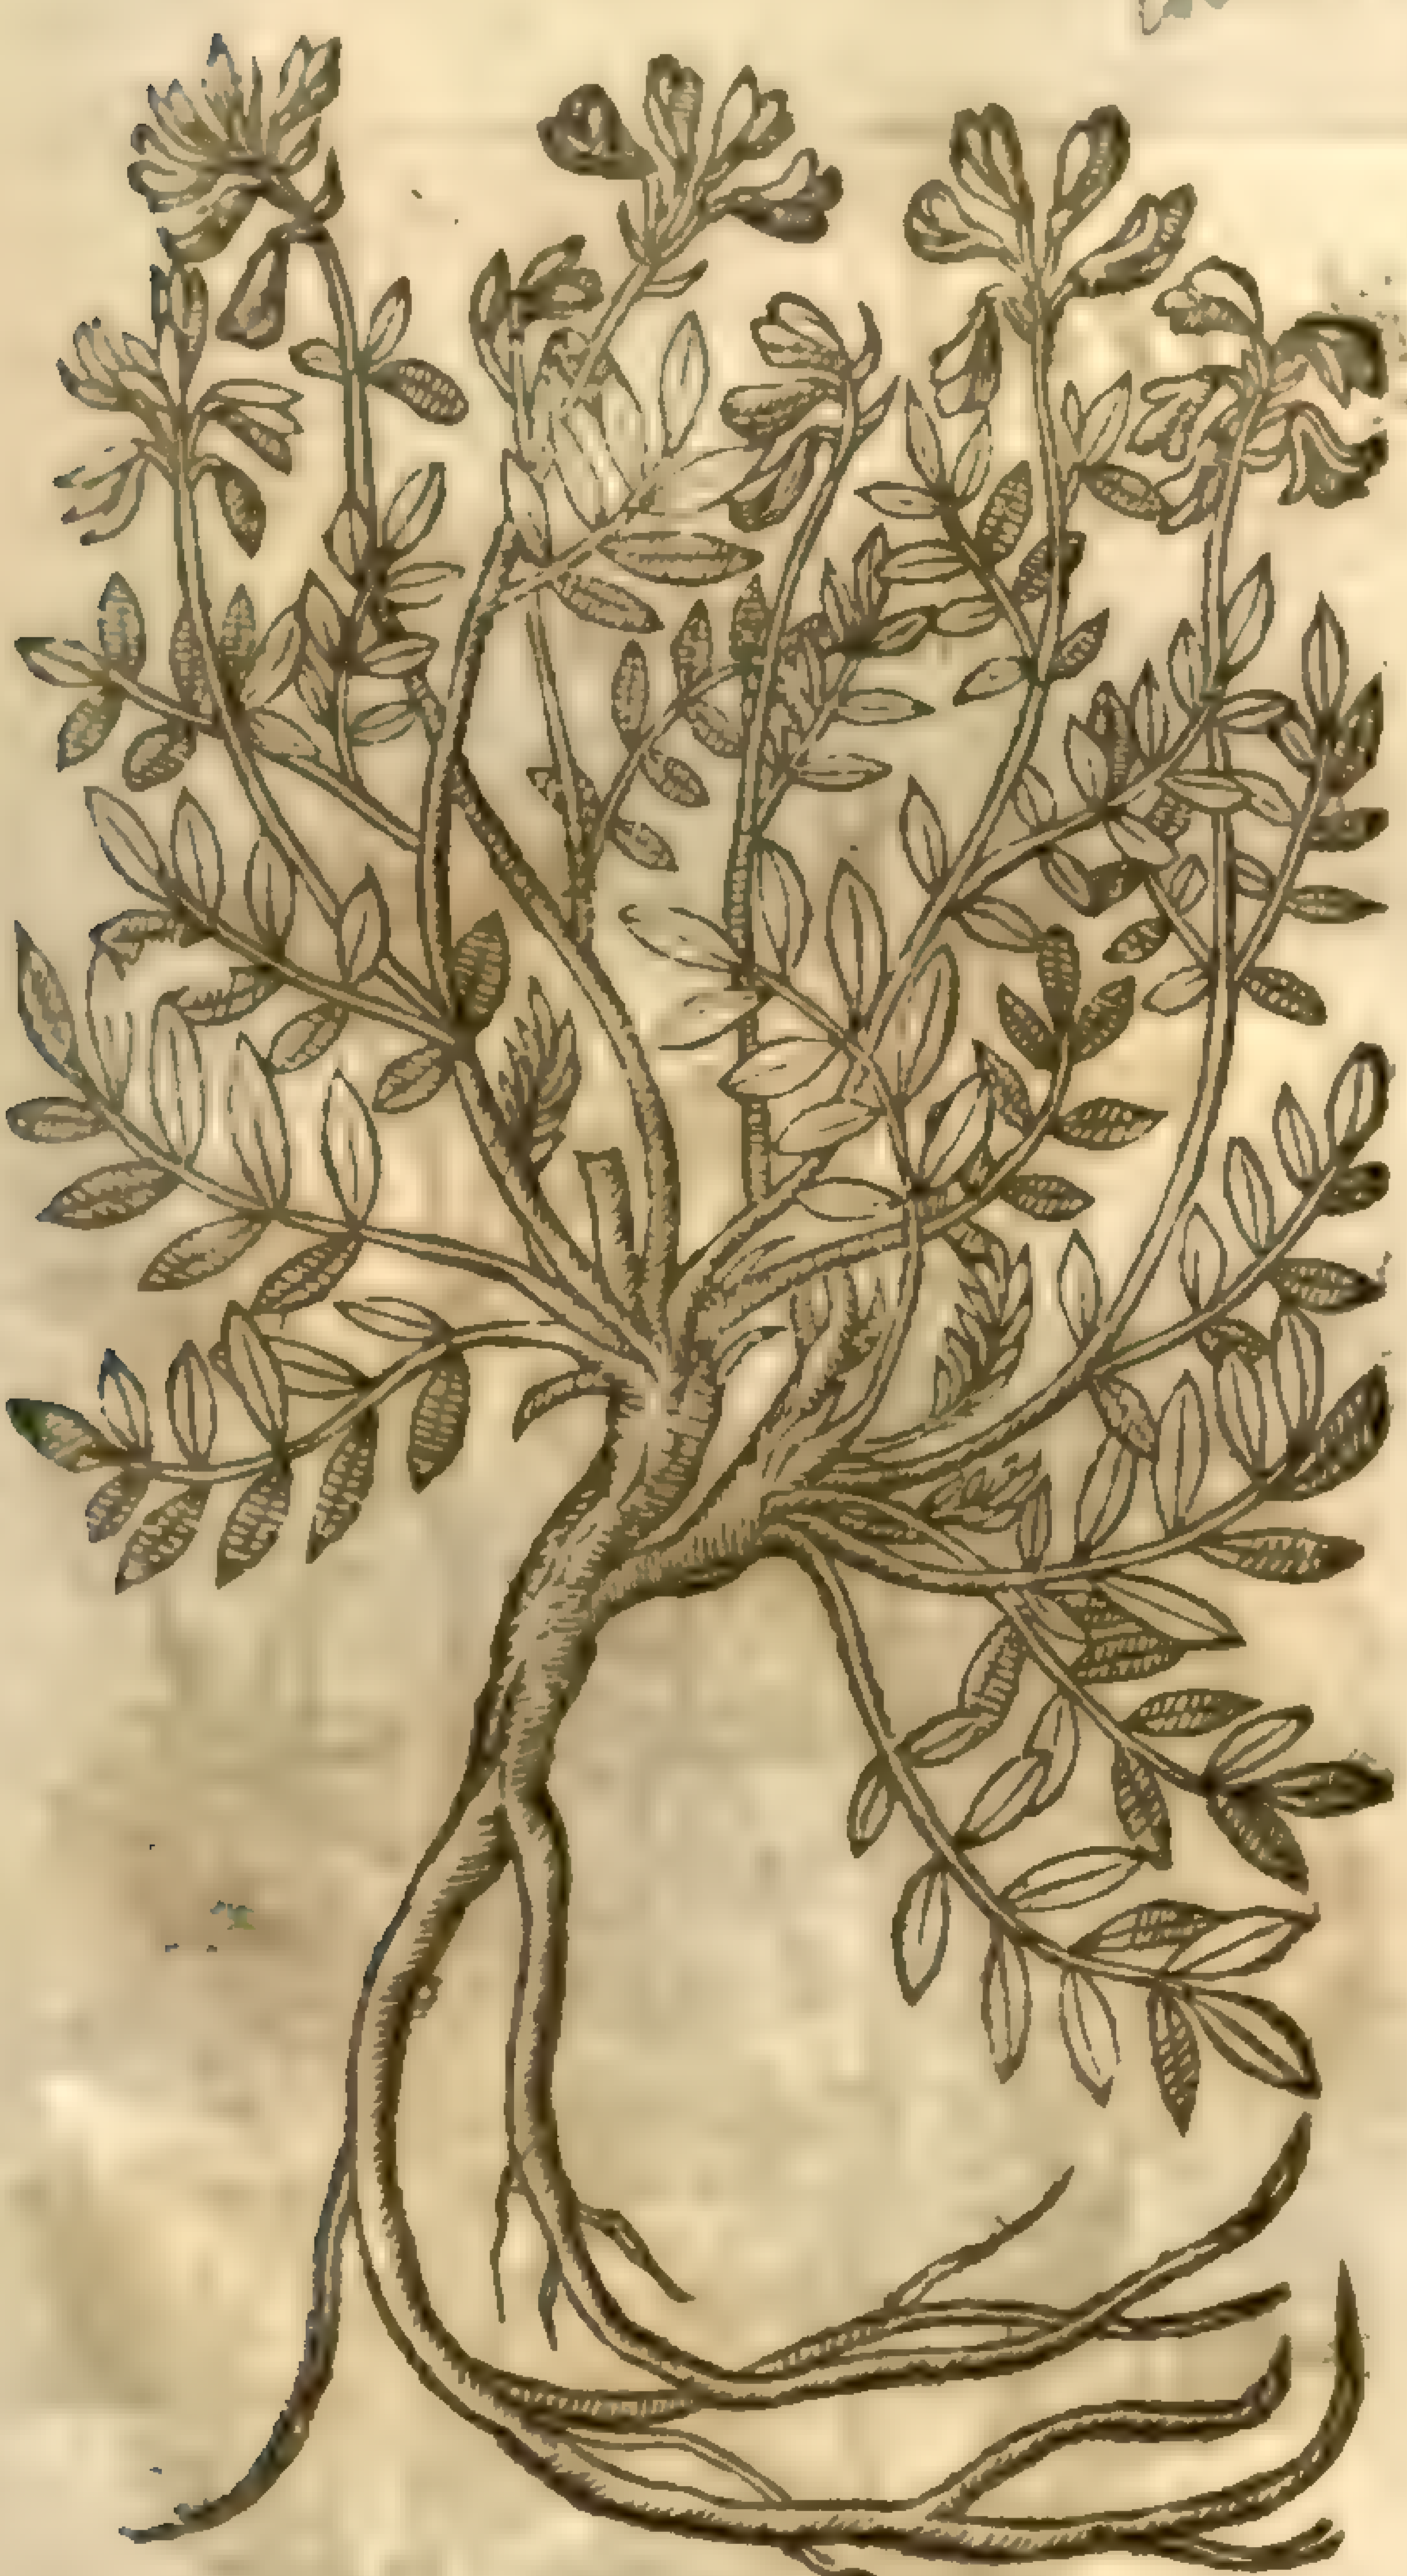
2 The ſecond kinde of *Aſtragalus* is a rare and gallant plant, and may well be termed *Planta leguminoſa*, by reaſon that it is counted for a kinde of *Aſtragalus*, reſembling the ſame in the ſimilitude of his ſtalks and leaues, as alſo in the thickeneſſe of his rootes, and the creeping and folding

thereof, and is garniſhed with a moſt thicke and pleaſant comelineſſe of his delectable red floures, growing vp together in great tufts, which are very ſeemly to behold.

3 There hath been ſome controuerſie about this third kinde, which I am not willing to proſecute or enter into: it may very well be *Aſtragalus* of *Matthiolus* his deſcription, or elſe his *Polygala*, which doth exceeding well reſemble the true *Aſtragalus*: his ſmall ſtalkes grow a foot high, beſet with leaues like *Cicer* or *Galega*, but that they are ſomewhat leſſer: among which come forth ſmall peaſe like flours, of an Orenge colour, very pleaſant in ſight: the root is tough and flexible, of a finger thicke.

‡ 3 *Aſtragalus* Matthioli.
Matthiolus his milke Vetch.

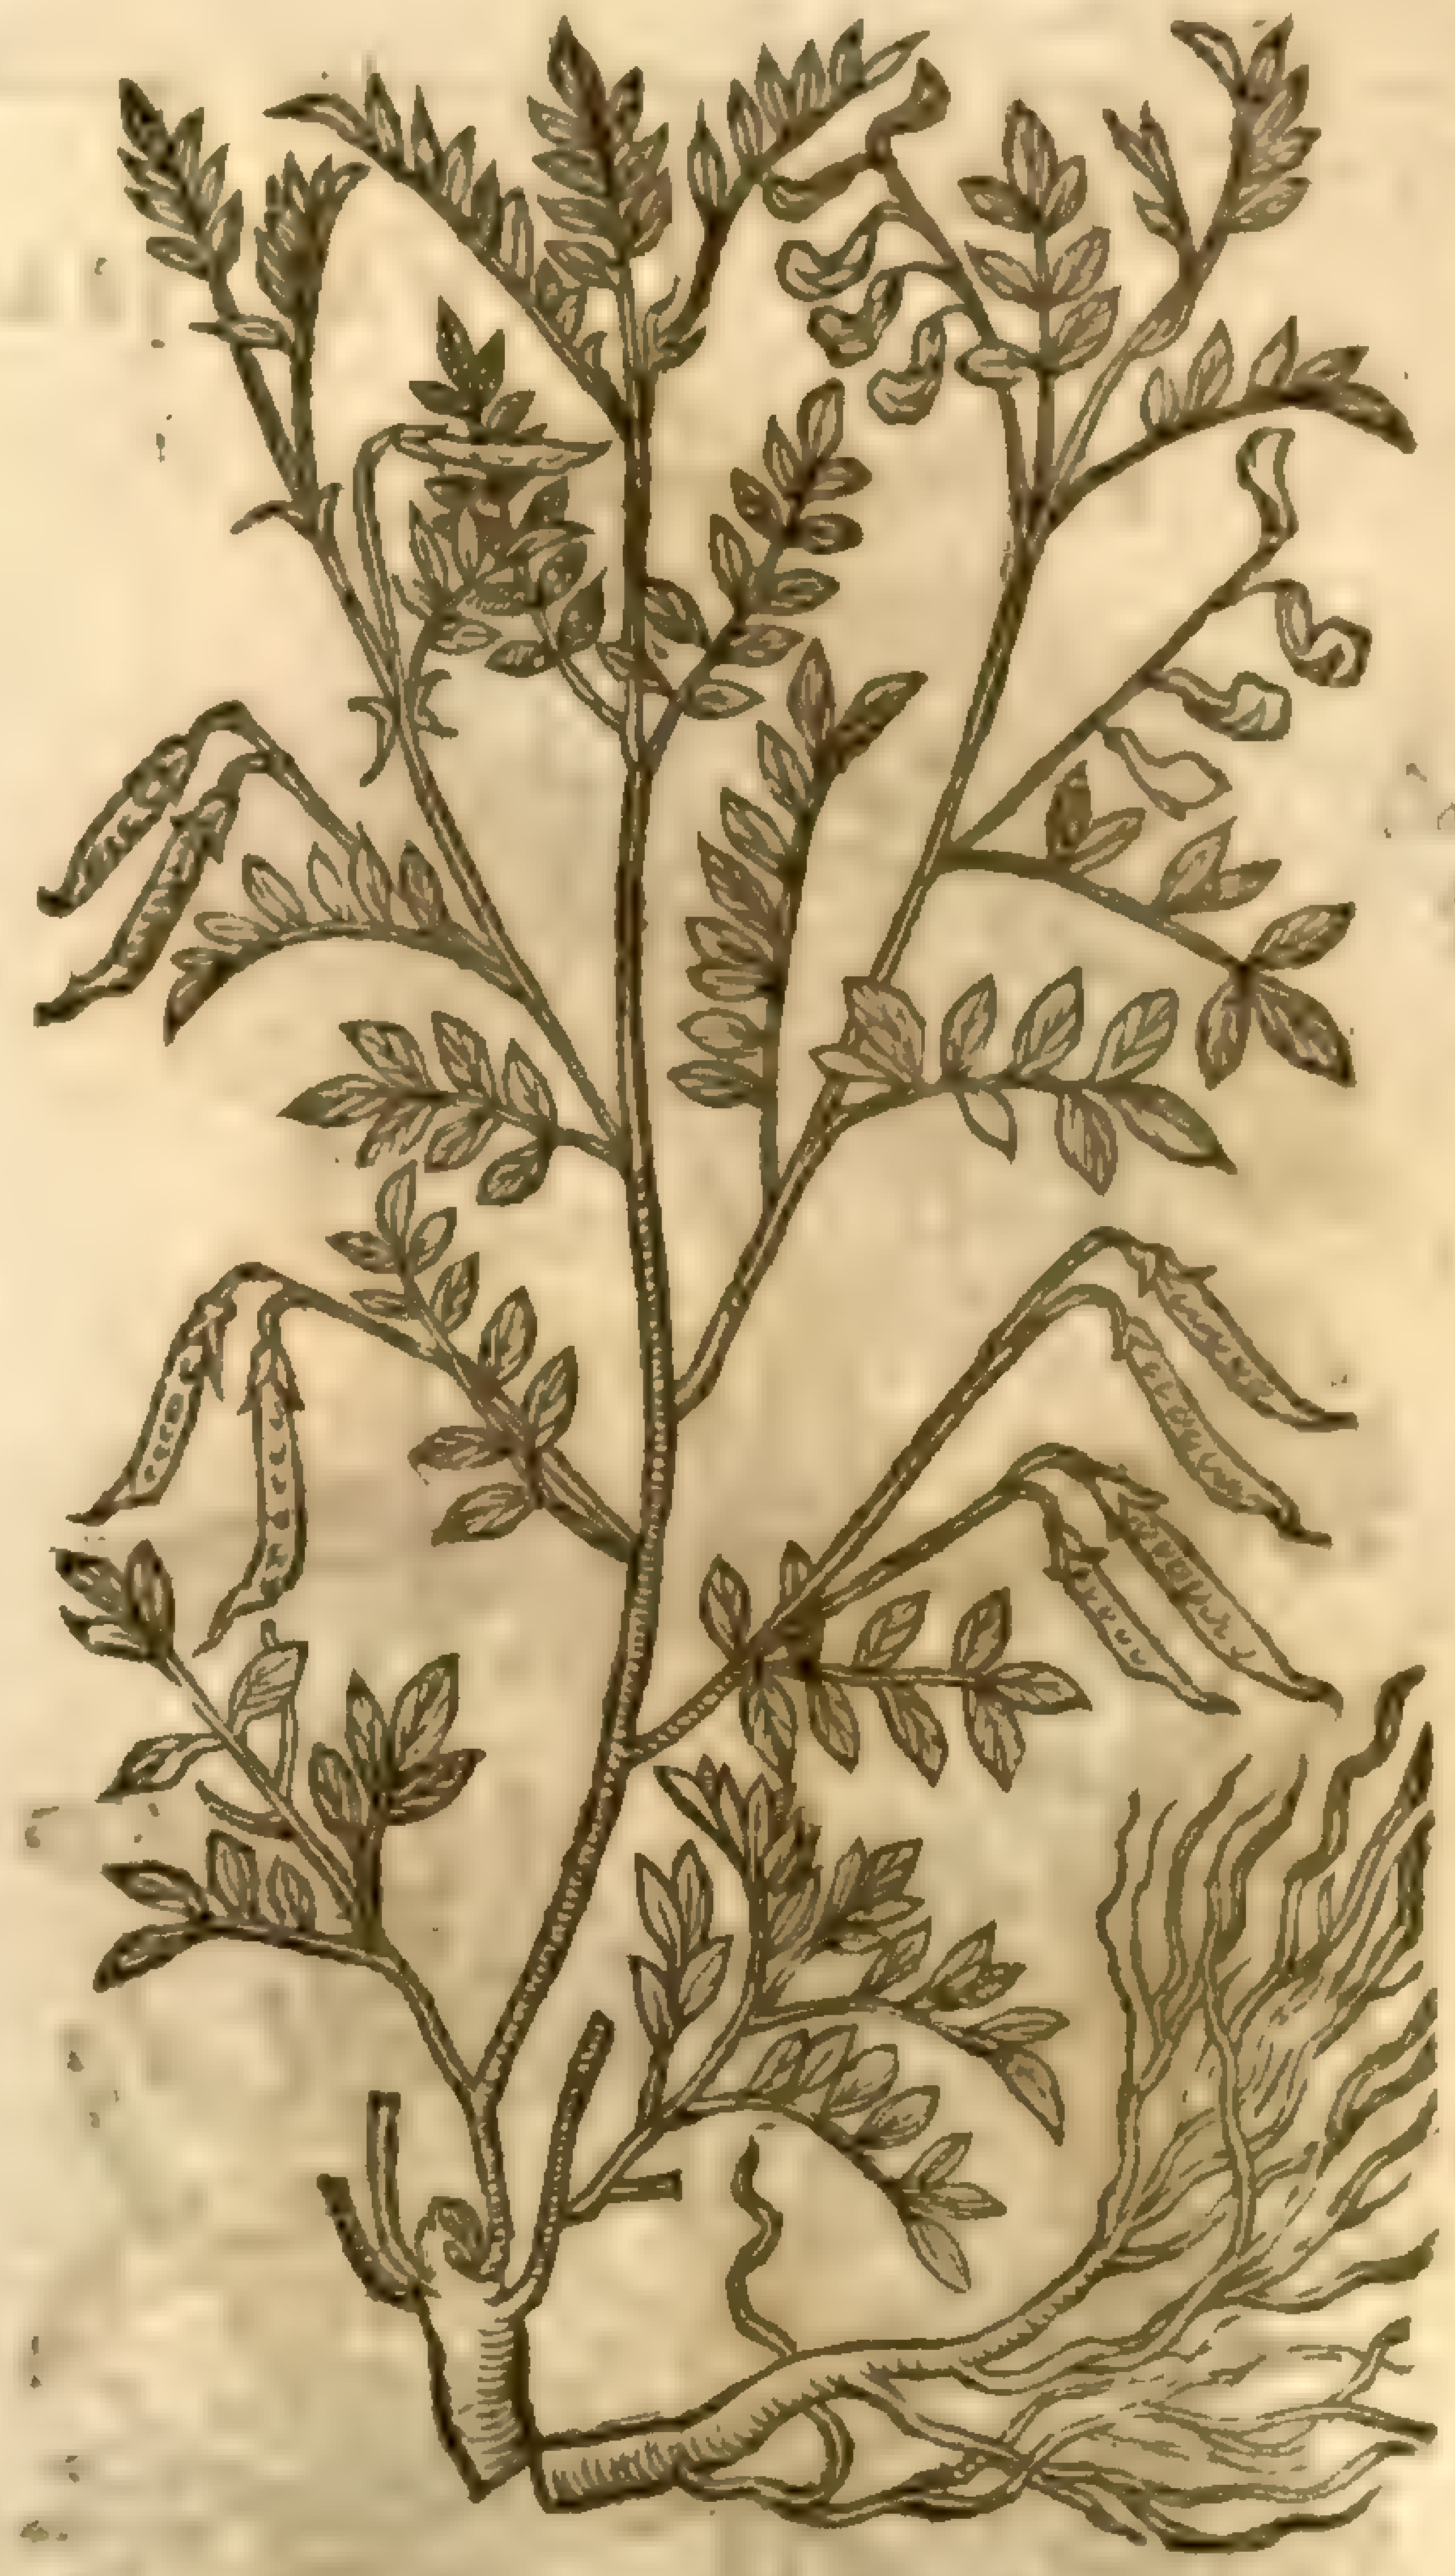
Lob.ic.2.79



‡ 4 *Aſtragaloides*.
Baſtard milke Vetch.

Ord.551
Lob.ic. 2.78

[illegible]
Simpl. 4.273



4 The fourth is called of *Mutonus* and other learned Herbariſts, *Aſtragaloides*, for that it reſembleth the true *Aſtragalus*, which groweth a cubit high, and in ſhew reſembleth liquorice: the flours grow at the top of the ſtalks, in ſhape like the peaſe bloome, of a faire purple colour, which turn into ſmall blacke cods when they be ripe: the root is tough and very long, creeping vpon the vpper part of the earth, and of a wooddy ſubſtance.

¶ *The Place.*

They grow amongſt ſtones in open places, as *Oribaſius* writeth, in places ſubiect to windes, and couered with ſnow: *Dioſcorides* copies do adde, in ſhadowie places: it groweth plentifully in Phenea a city in Arcadia, as *Galen* and *Pliny* report: in *Dioſcorides* his copies is read, in Memphis a city in Arcadia; but Memphis is a city in Egypt, and in Arcadia there is none of that name. Some of them grow in my garden, and in ſundry places of England wilde: they grow in the medowes neere Cambridge, where the Schollers vſe to ſport themſelues; and in ſundry places of Eſſex, as about Dunmow and Clare, and many other places of that country.

‡ I ſhould be glad to know which or how many of theſe our Author here affirms to grow wild in England; for as yet I haue not heard of nor ſeen any of them wilde, nor in gardens with vs, except the laſt deſcribed, which growes in ſome few gardens. ‡

¶ *The Time.*

They floure in Iune and Iuly, and their ſeed is ripe in September.

¶ *The Names.*

Milke Vetch is called of *Matthiolus*, *Polygala*, but not properly: of moſt it is called *Aſtragalus*: in Spaniſh, *Garavancillos*: in the Portugals tongue, *Alphabeca*: in Dutch, **Cleyne Ciceren.**

¶ *The Nature and Vertues.*

A *Aſtragalus*, as *Galen* ſaith, hath aſtringent or binding roots, and therefore it is of the number of thoſe Simples that are not a little drying; for it glueth and healeth vp old vlcers, and ſtayeth the flux of the belly, if they be boiled in wine and drunke. The ſame things alſo touching the vertues of *Aſtragalus*, *Dioſcorides* hath mentioned: The root, ſaith he, drunke in wine, ſtayeth the laske, and prouoketh vrine, being dried and caſt vpon old vlcers it cureth them: it likewiſe procureth great ſtore of milke in cattell that do eat thereof; whence it tooke his name.

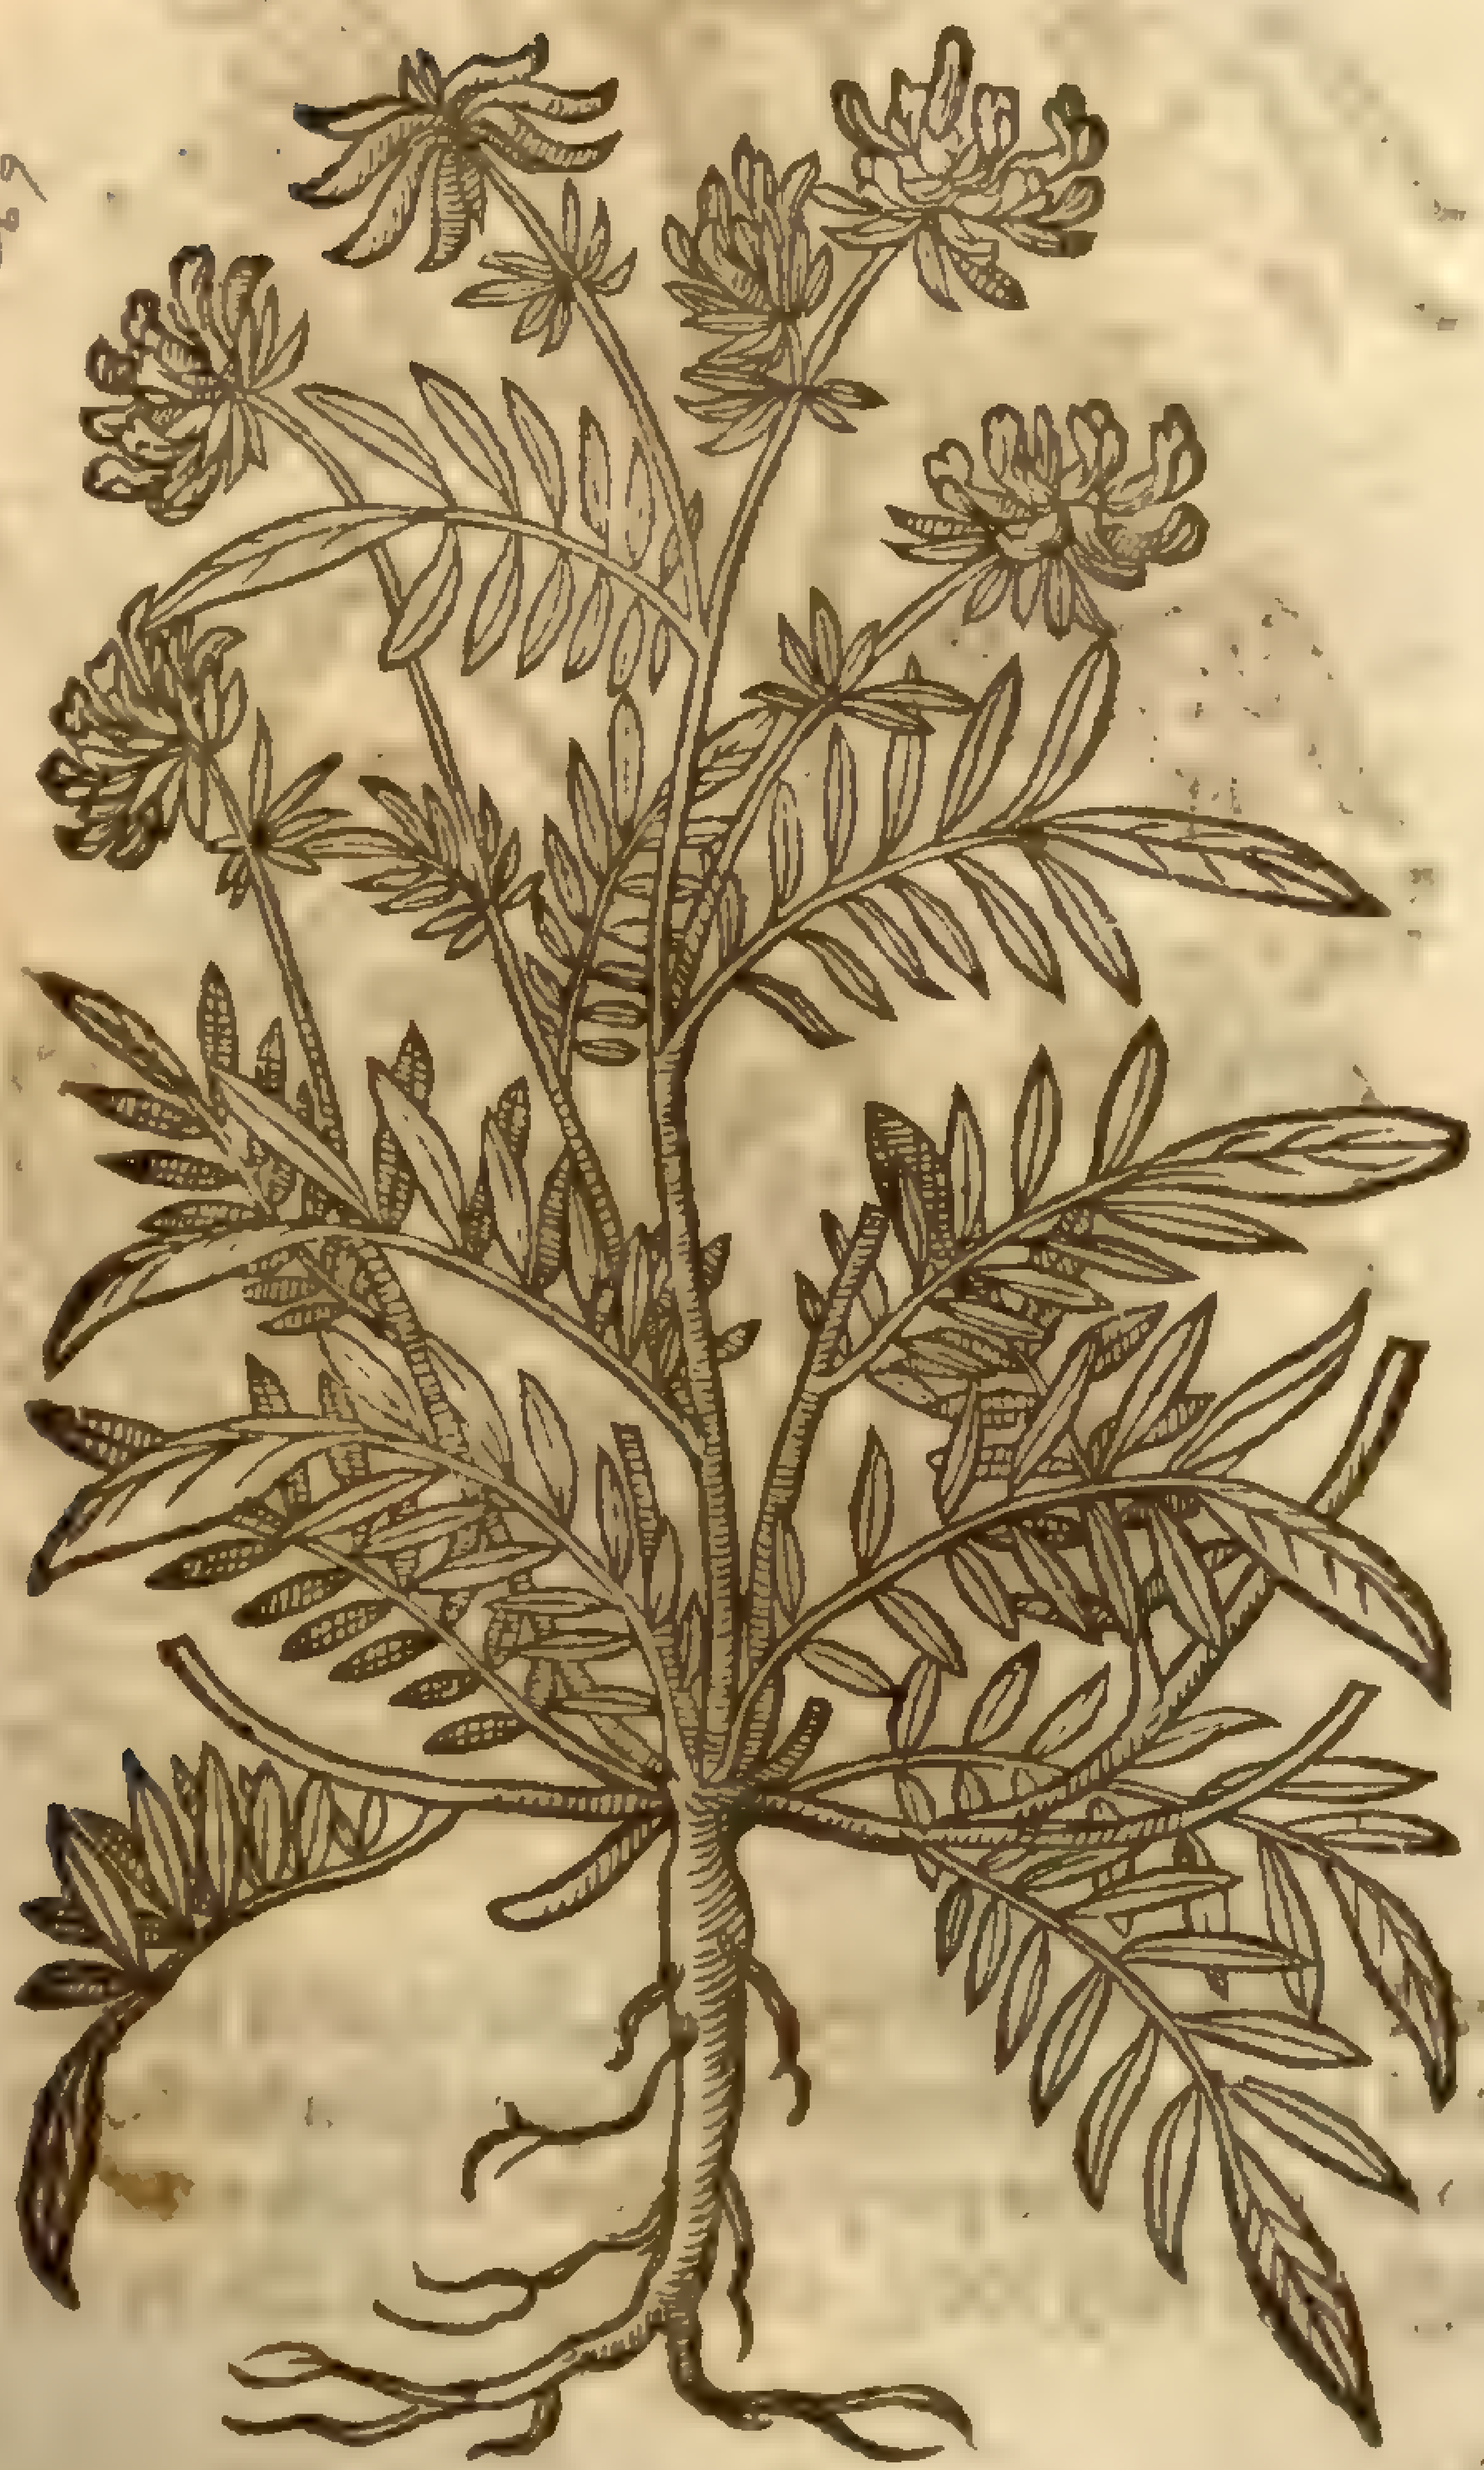
B It ſtoppeth bleeding, but it is with much ado beaten, by reaſon of his hardneſſe.

Chap. 521. *Of Kidney Vetch.*

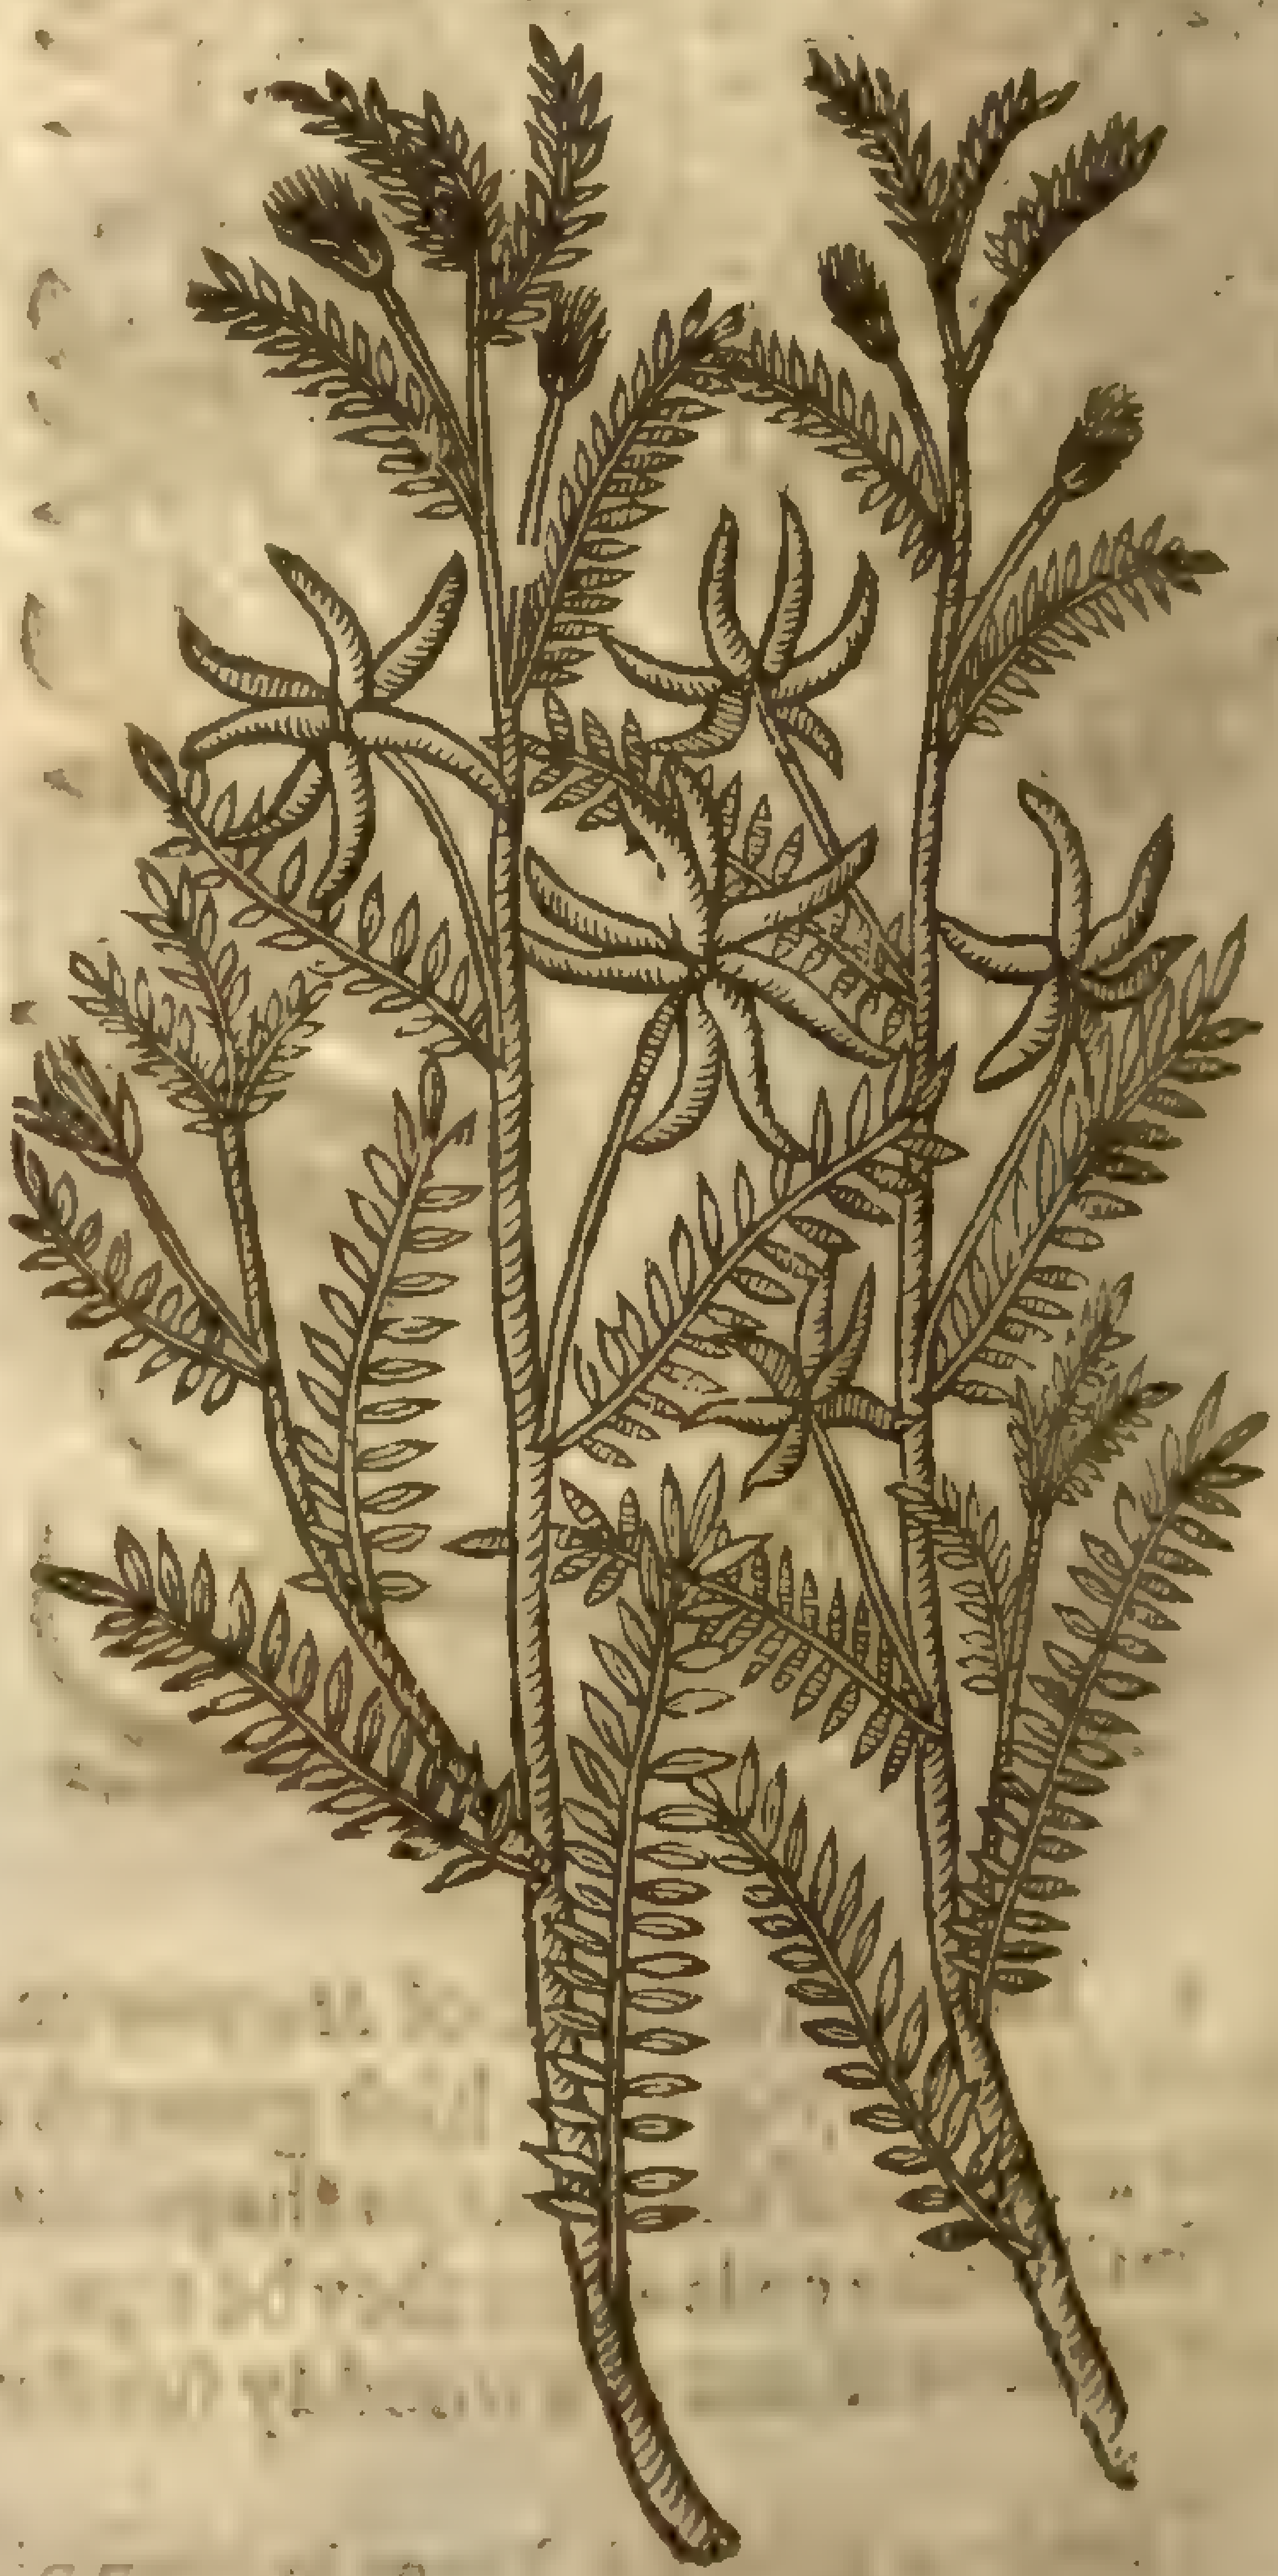
1 *Anthyllis leguminoſa.*
Kidney Vetch.

A. Vulneraria, Linn. Sm. fl. 3. 269

Eb. ii. 2. 5



2 *Stella leguminoſa.*
Starry Kidney Vetch.



¶ *The Deſcription.*

1 Kidney Vetch hath a ſtalke of the height of a cubit, diuiding it ſelfe into other branches, whereon grow long leaues made of diuers leaues like thoſe of the Lentil, couered as it were with a ſoft white downineſſe: the floures on the top of the ſtalks are of a yellow colour, very many joined together as it were in a ſpoky rundle: after which grow vp little cods in which is contained ſmall ſeed: the root is ſlender, and of a wooddy ſubſtance. ‡ This is ſomtimes found with white floures: whereupon *Tabern.* gaue two figures, calling the one *Lagopodium flore luteo*, and the other *Lagopodium flo. albo.* Our Author vnfitly gaue this later mentioned figure in the chapter of *Lagopus*, by the name of *Lagopum maximum*. ‡

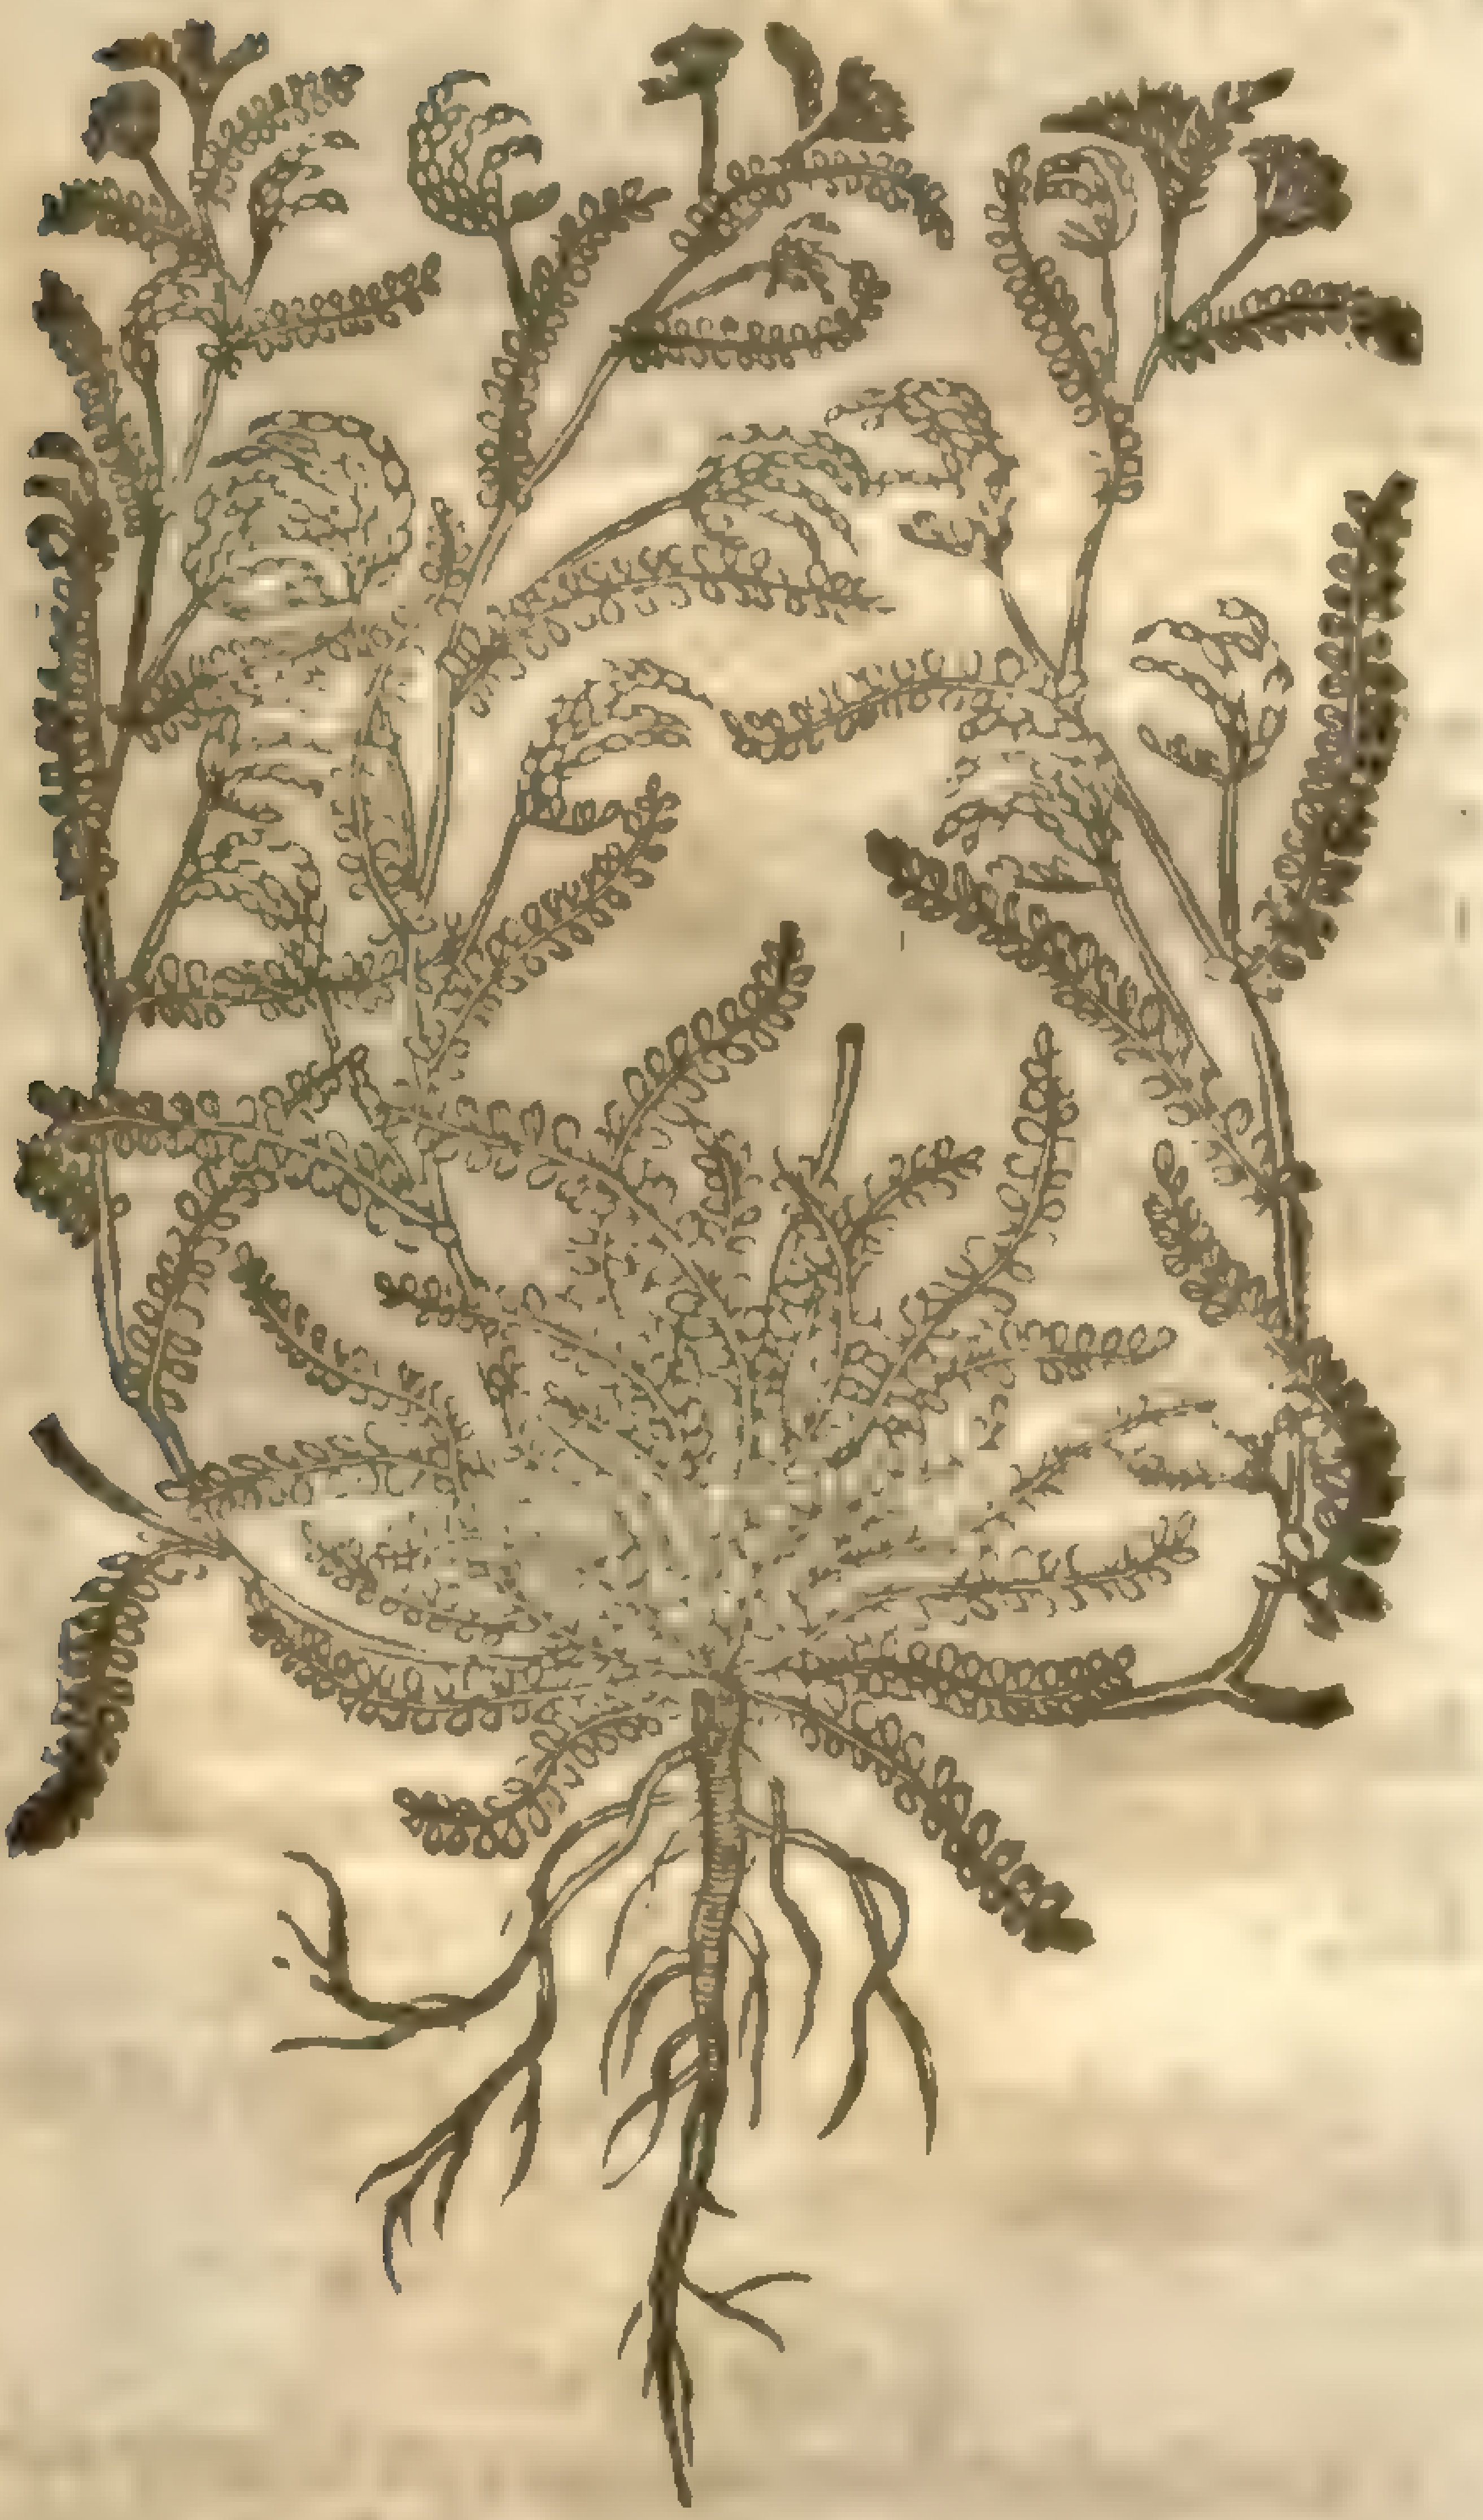
2 The ſtarry Kidney Vetch, called *Stella Leguminoſa*, or according to *Cortuſus*, *Arcturo*, hath

many ſmall flexible tough branches, full of ſmall knots or knees, from each of which ſpringeth forth one long ſmall winged leafe, like birds foot, but bigger: from the bottome of thoſe leaues come forth little tender ſtems, on the ends whereof doe grow ſmall whitiſh yellow floures, which are very ſlender, and ſoone vaded, like vnto them of Birds-foot: theſe floures turne into ſmall ſharp pointed cods, ſtanding one diſtant from another, like the diuiſions of a ſtar, or as though it conſiſted of little hornes; wherein is contained ſmall yellowiſh ſeeds: the root is tough, and deepely growing in the ground.

3 There is another ſort of Kidney Vetch called Birds-foot, or *Ornithopodium*, which hath very many ſmall and tender branches, trailing here and there cloſe vpon the ground, ſet full of ſmall and ſoft leaues, of a whitiſh greene, in ſhape like the leaues of the wilde Vetch, but a great deale leſſer, and finer, almoſt like ſmall feathers: amongſt which the floures do grow, that are very ſmall, yellowiſh, and ſometimes whitiſh; which being vaded there come in place thereof little crooked cods, fiue or ſix growing together, which in ſhew and ſhape are like vnto a ſmall Birds-foot, and each and euery cod reſembling a claw: in which are incloſed ſmall ſeed like that of Turneps.

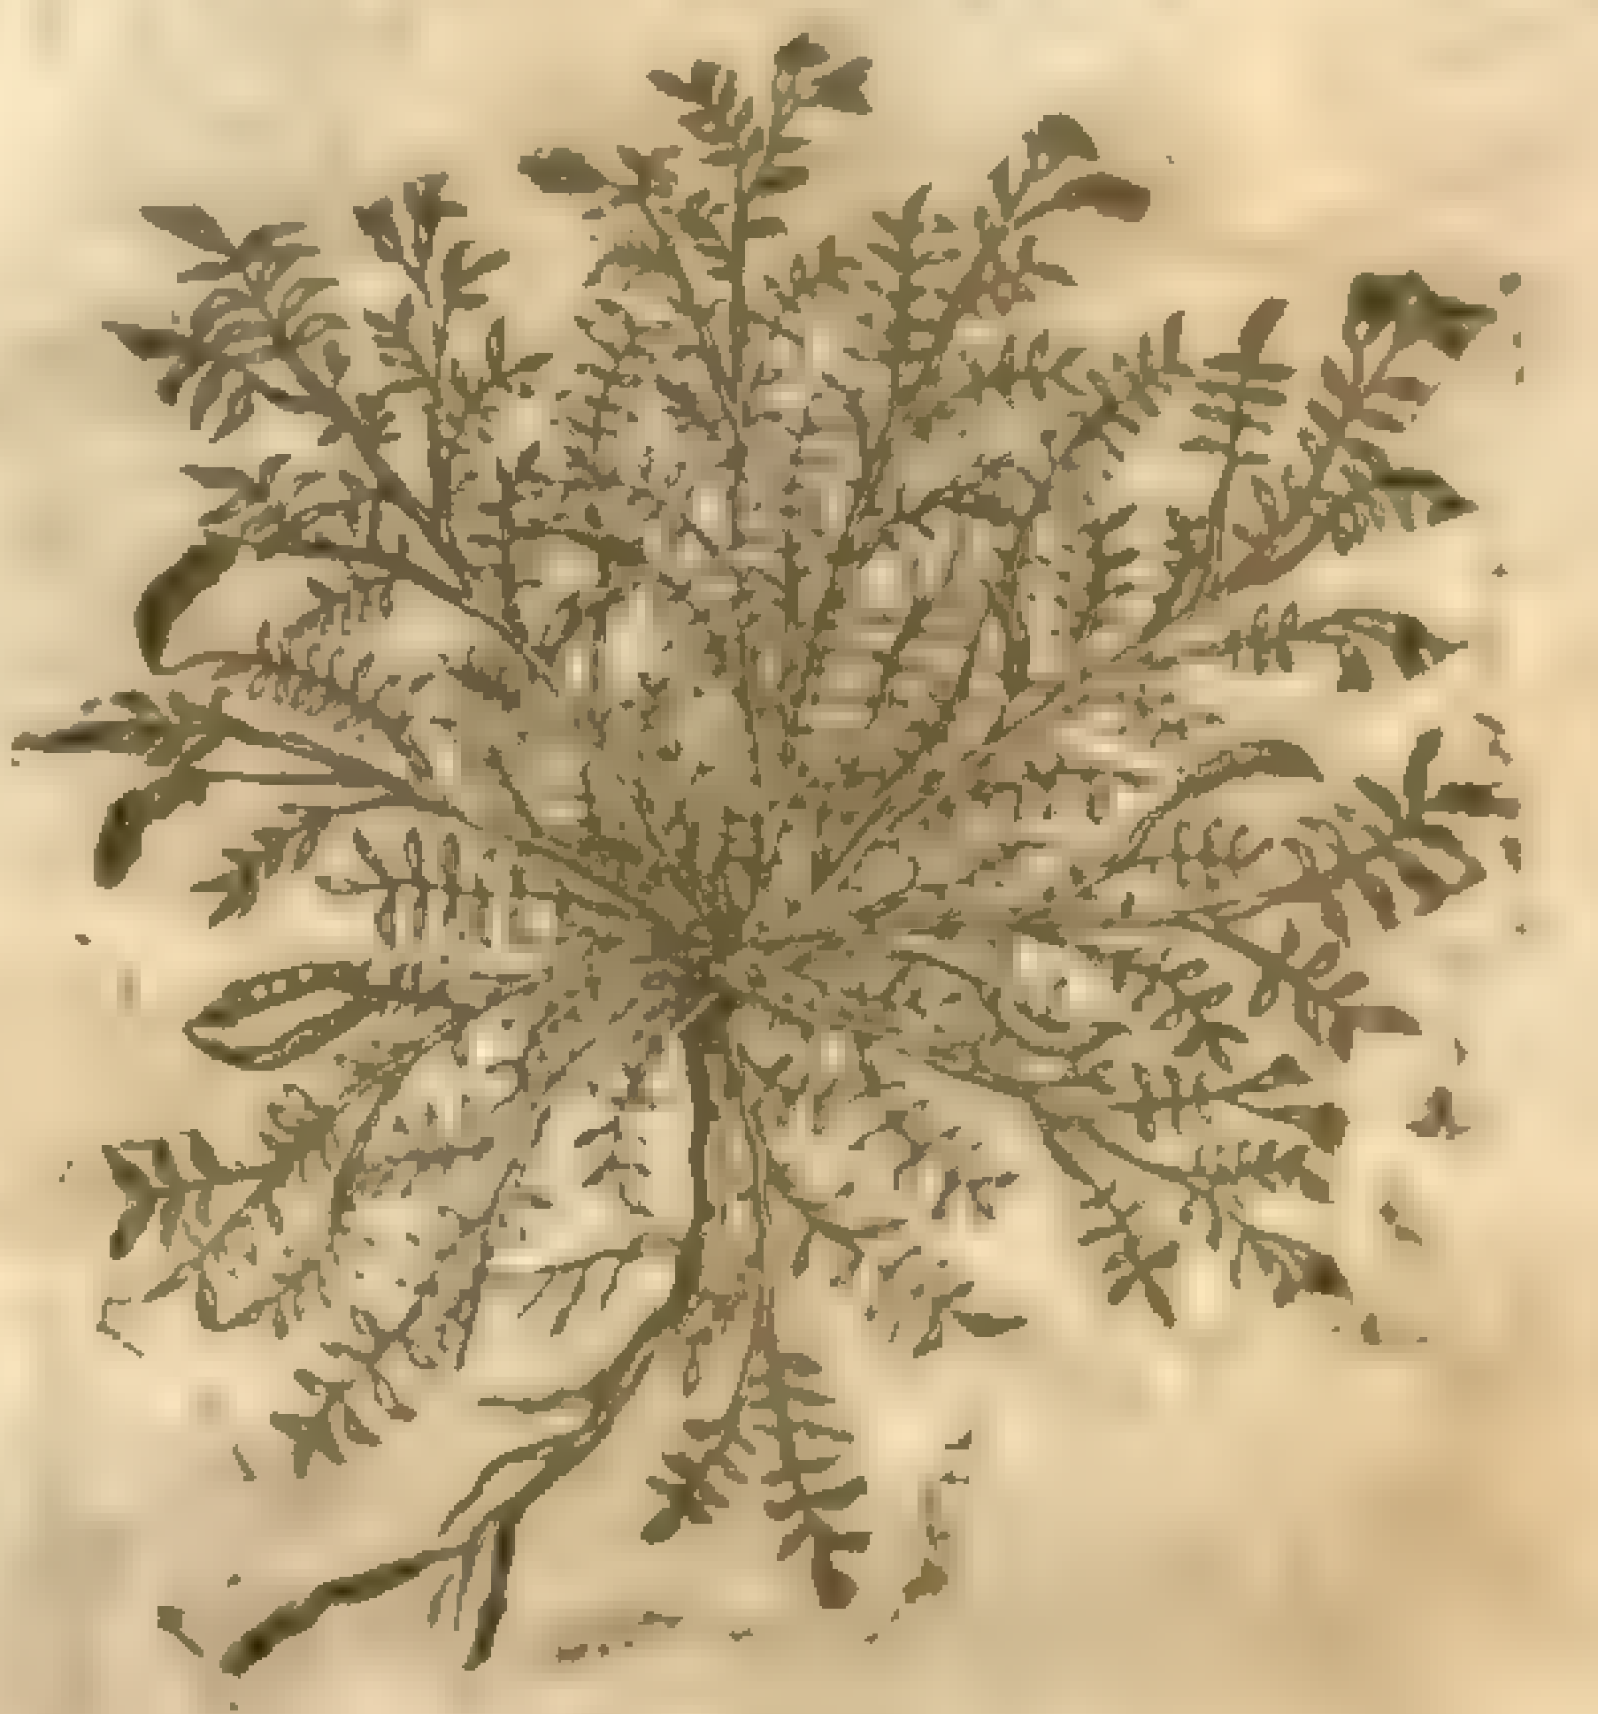
Ornithopus perpusillus. L. β
Mill. dict.

‡ 3 *Ornithopodium majus.*
The great Birds-foot.



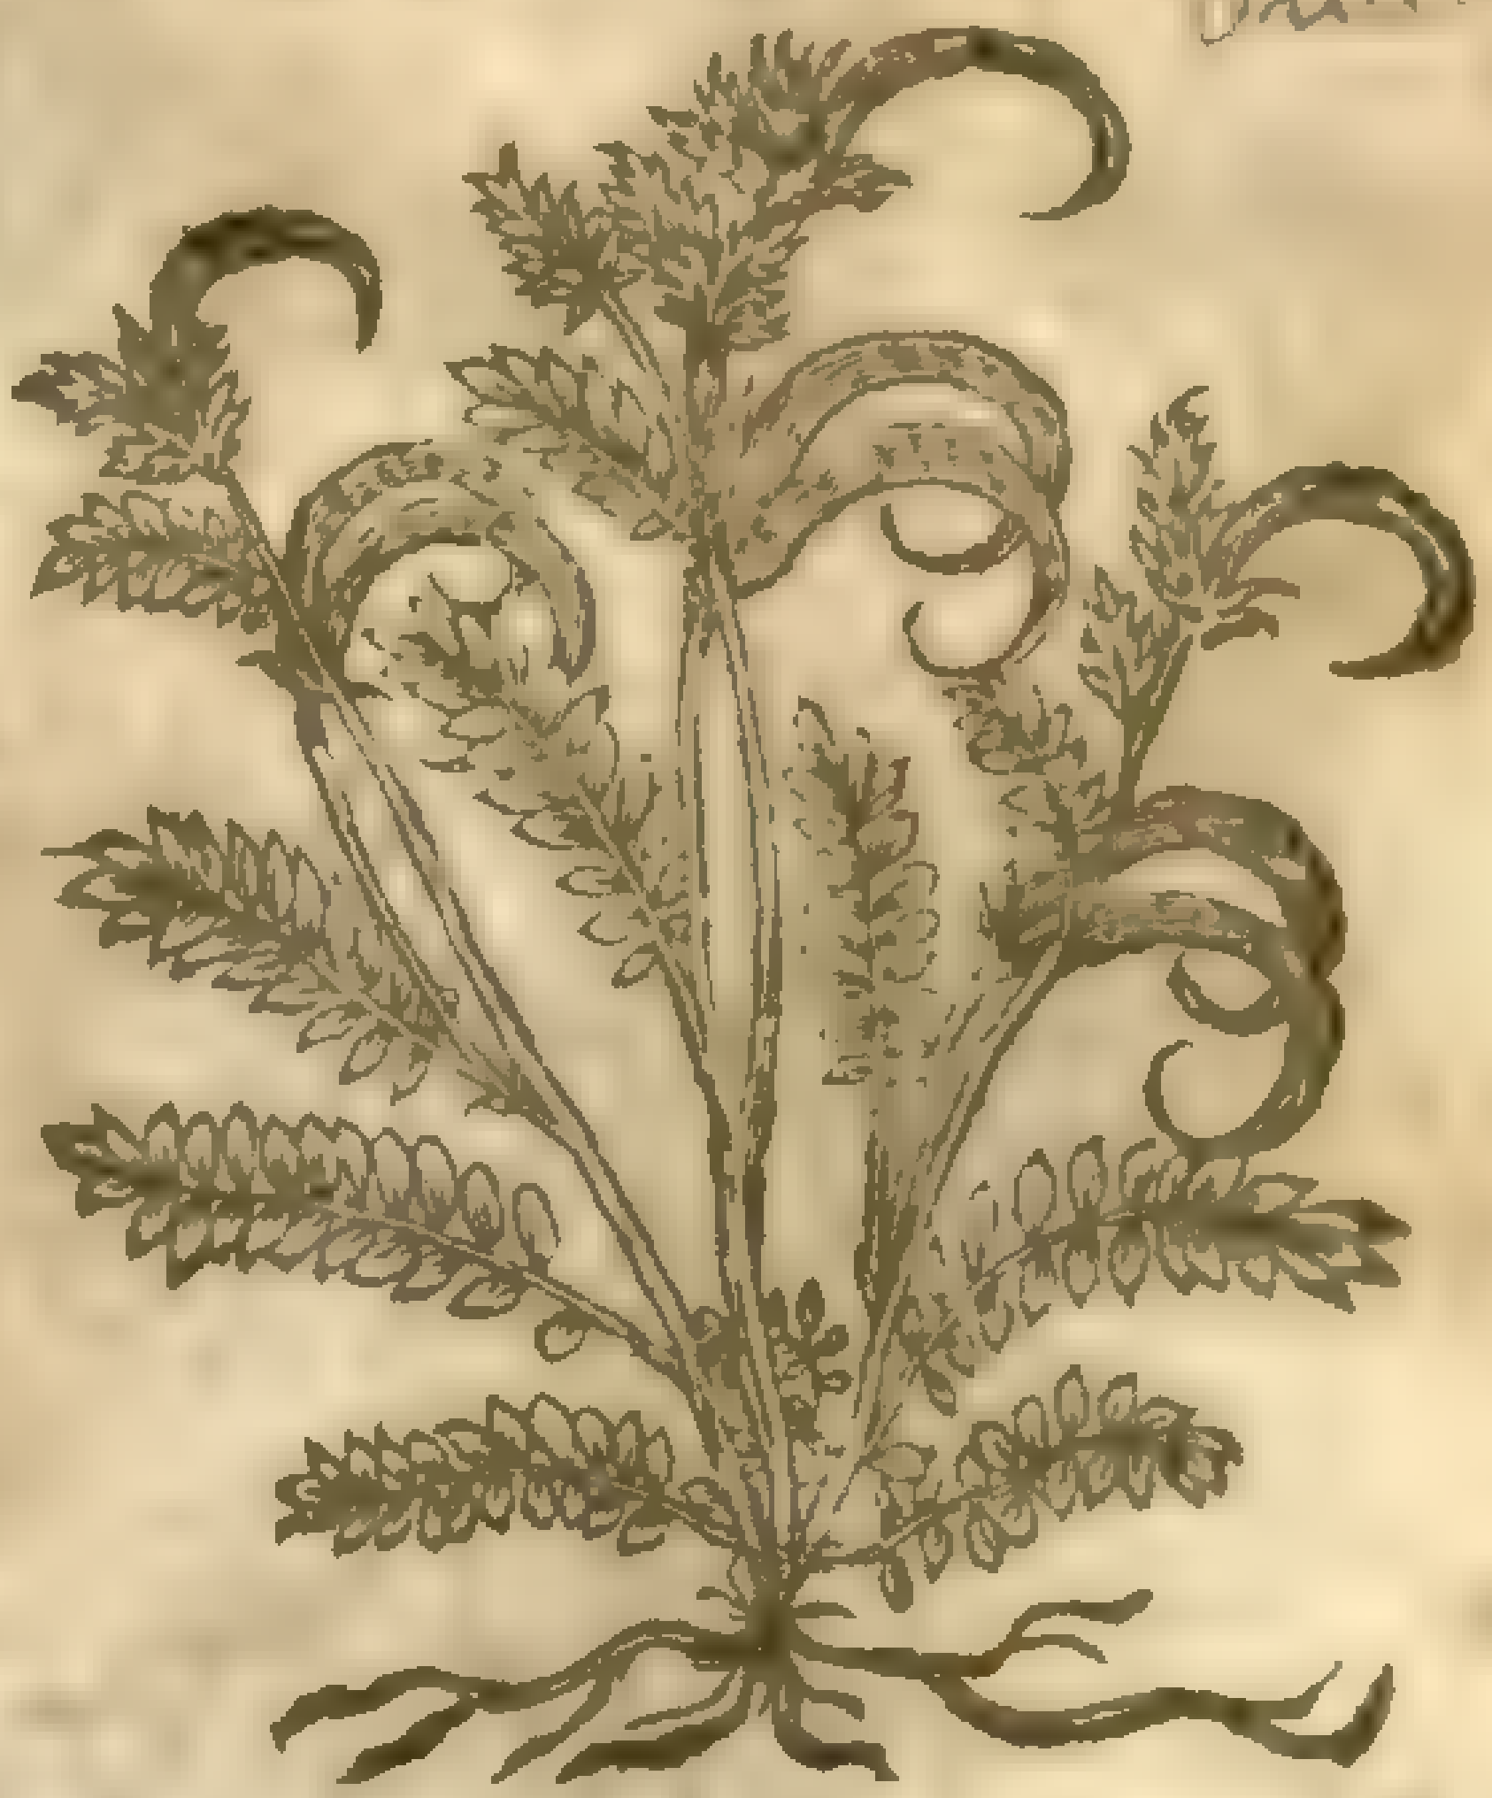
‡ 4 *Ornithopodium minus.*
Small Birds-foot.

Ornithopus perpusillus, L.
Mill. dict.
[illegible] 290



‡ 5 *Scorpoides Leguminoſa.*
Small horned pulſe.

Ornithopus compressus. L.
Mill. dict.



4 There is alſo another kinde of *Ornithopodium*, or Birds-foot, called ſmall Birds-foot, which is very like vnto the firſt, but that it is much ſmaller: the branches or ſprigs grow not aboue a hand or halfe an hand in length, ſpreading themſelues vpon the ground with his ſmall leaues and branches, in manner of the leſſer *Arachus*: the floures are like vnto thoſe of the former, but very ſmall, and of a red colour.

‡ 5 This ſmall horned pulſe may fitly here take place: The root thereof conſiſts of many little fibres, from which ariſe two or three little ſlender ſtraight ſtalkes ſome handfull and halfe or foot high: at the tops of theſe grow little ſharpe pointed crooked hornes, rounder and ſlenderer than thoſe of Fenugreeke, turning their ends inwards like the tailes of Scorpions and ſo joynted; the floures are ſmall and yellow; the leaues little, and winged like thoſe of Birds-foot. *Pena* and *Lobel* found this amongſt the corne in the fields in Narbon in France, and they ſet it forth by the name as I haue here giuen you it. ‡

¶ *The Place.*

1. 3. 4. Theſe plants I found growing vpon Hampſtead Heath neere London, right againſt

the Beacon, vpon the right hand as you goe from London, neere vnto a grauell pit: they grow alſo vpon blacke Heath, in the high way leading from Greenwich to Charleton, within halfe a mile of the towne.

¶ *The Time.*

They floure from Iune to the middle of September.

¶ *The Names.*

‡ 1 This *Geſner* calls *Vulneraria ruſtica: Dodonæus, Lobel*, and *Cluſius* call it *Anthyllis*, and *Anthyllis leguminoſa*. ‡

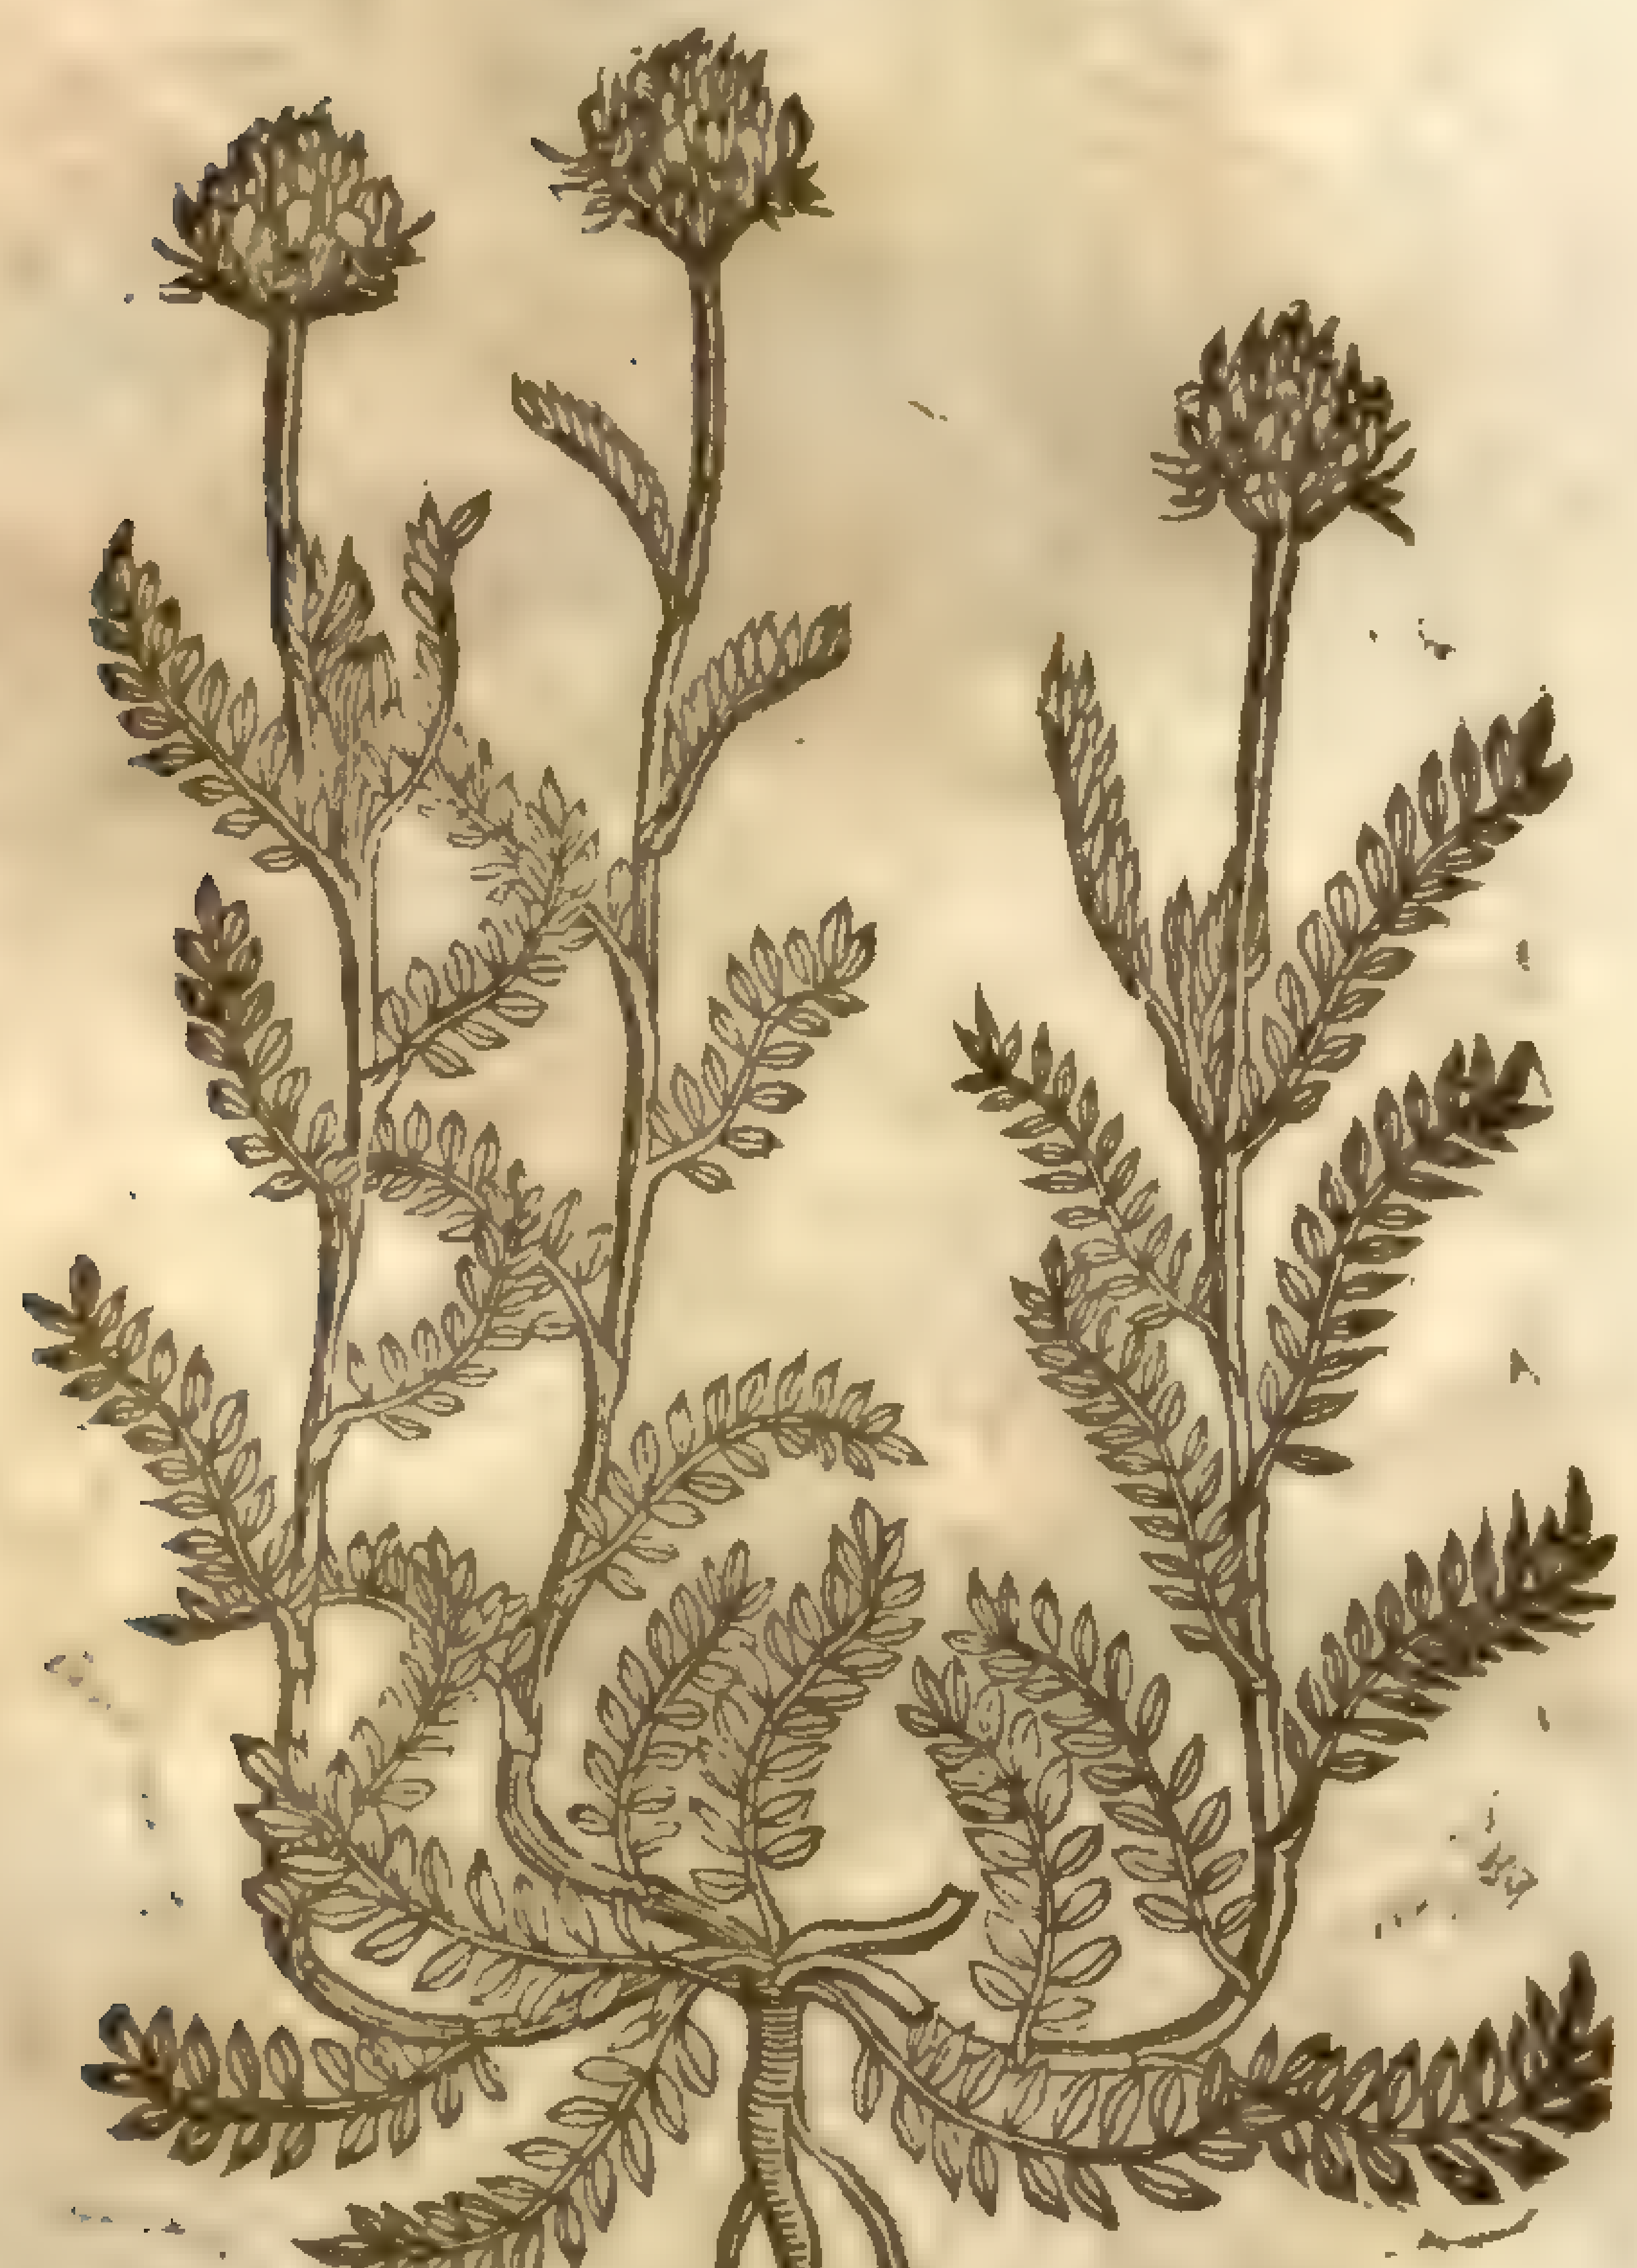
3. 4. I cannot finde any other name for theſe plants, but *Ornithopodium*: the firſt is called in Engliſh, great Birds-foot; the ſecond ſmall Birds-foot.

¶ *The Temperature and Vertues.*

Theſe herbes are not vſed either in meate or medicine, that I know of as yet; but they are very good food for cattell, and procure good ſtore of milke, whereupon ſome haue taken them for kinds of *Polygala*.

CHAP. 522. *Of Blacke milke Tare.*

Glaux Dioſcoridis.
Dioſcorides his milke Tare.



¶ *The Deſcription.*

The true *Glaux* of *Dioſcorides* hath very many tough and woody branches trailing vpon the ground, ſet full of ſmall winged leaues, in ſhape like the common *Glaux*, but a great deale ſmaller, reſembling the leaues of Tares, but rather like Birds-foot, of a very gray colour: amongſt which come forth knobby & ſcaly, or chaffie heads, very like the Medow Trefoile, of a fare pulple colour: the root is exceeding long and wooddy, which the figure doth not expreſſe and ſet forth.

¶ *The Place.*

The true *Glaux* groweth vpon Barton hill, foure miles from Lewton in Bedfordſhire, vpon both the ſides of the declination of the hill.

¶ *The Time.*

Theſe plants do floure and flouriſh about Midſummer.

¶ *The Names.*

Theſe plant haue in times paſt beene called *Glaux*, *i. folia habens glauca, ſiue pallentia*; that is, hauing skie coloured, or pale leaues. Sithens that in times paſt, ſome haue counted *Glaux* among the kindes of *Polygala*, or Milke-worts, we may therefore call this kinde of *Glaux*, blacke Milke-wort.

¶ *The Temperature.*

Theſe herbes are dry in the ſecond degree.

¶ *The Vertues.*

A The ſeeds of the common *Glaux* are in vertue like the Lentils, but not ſo much aſtringent: they ſtop the flux of the belly, dry vp the moiſture of the ſtomacke, and ingender ſtore of milke.

---

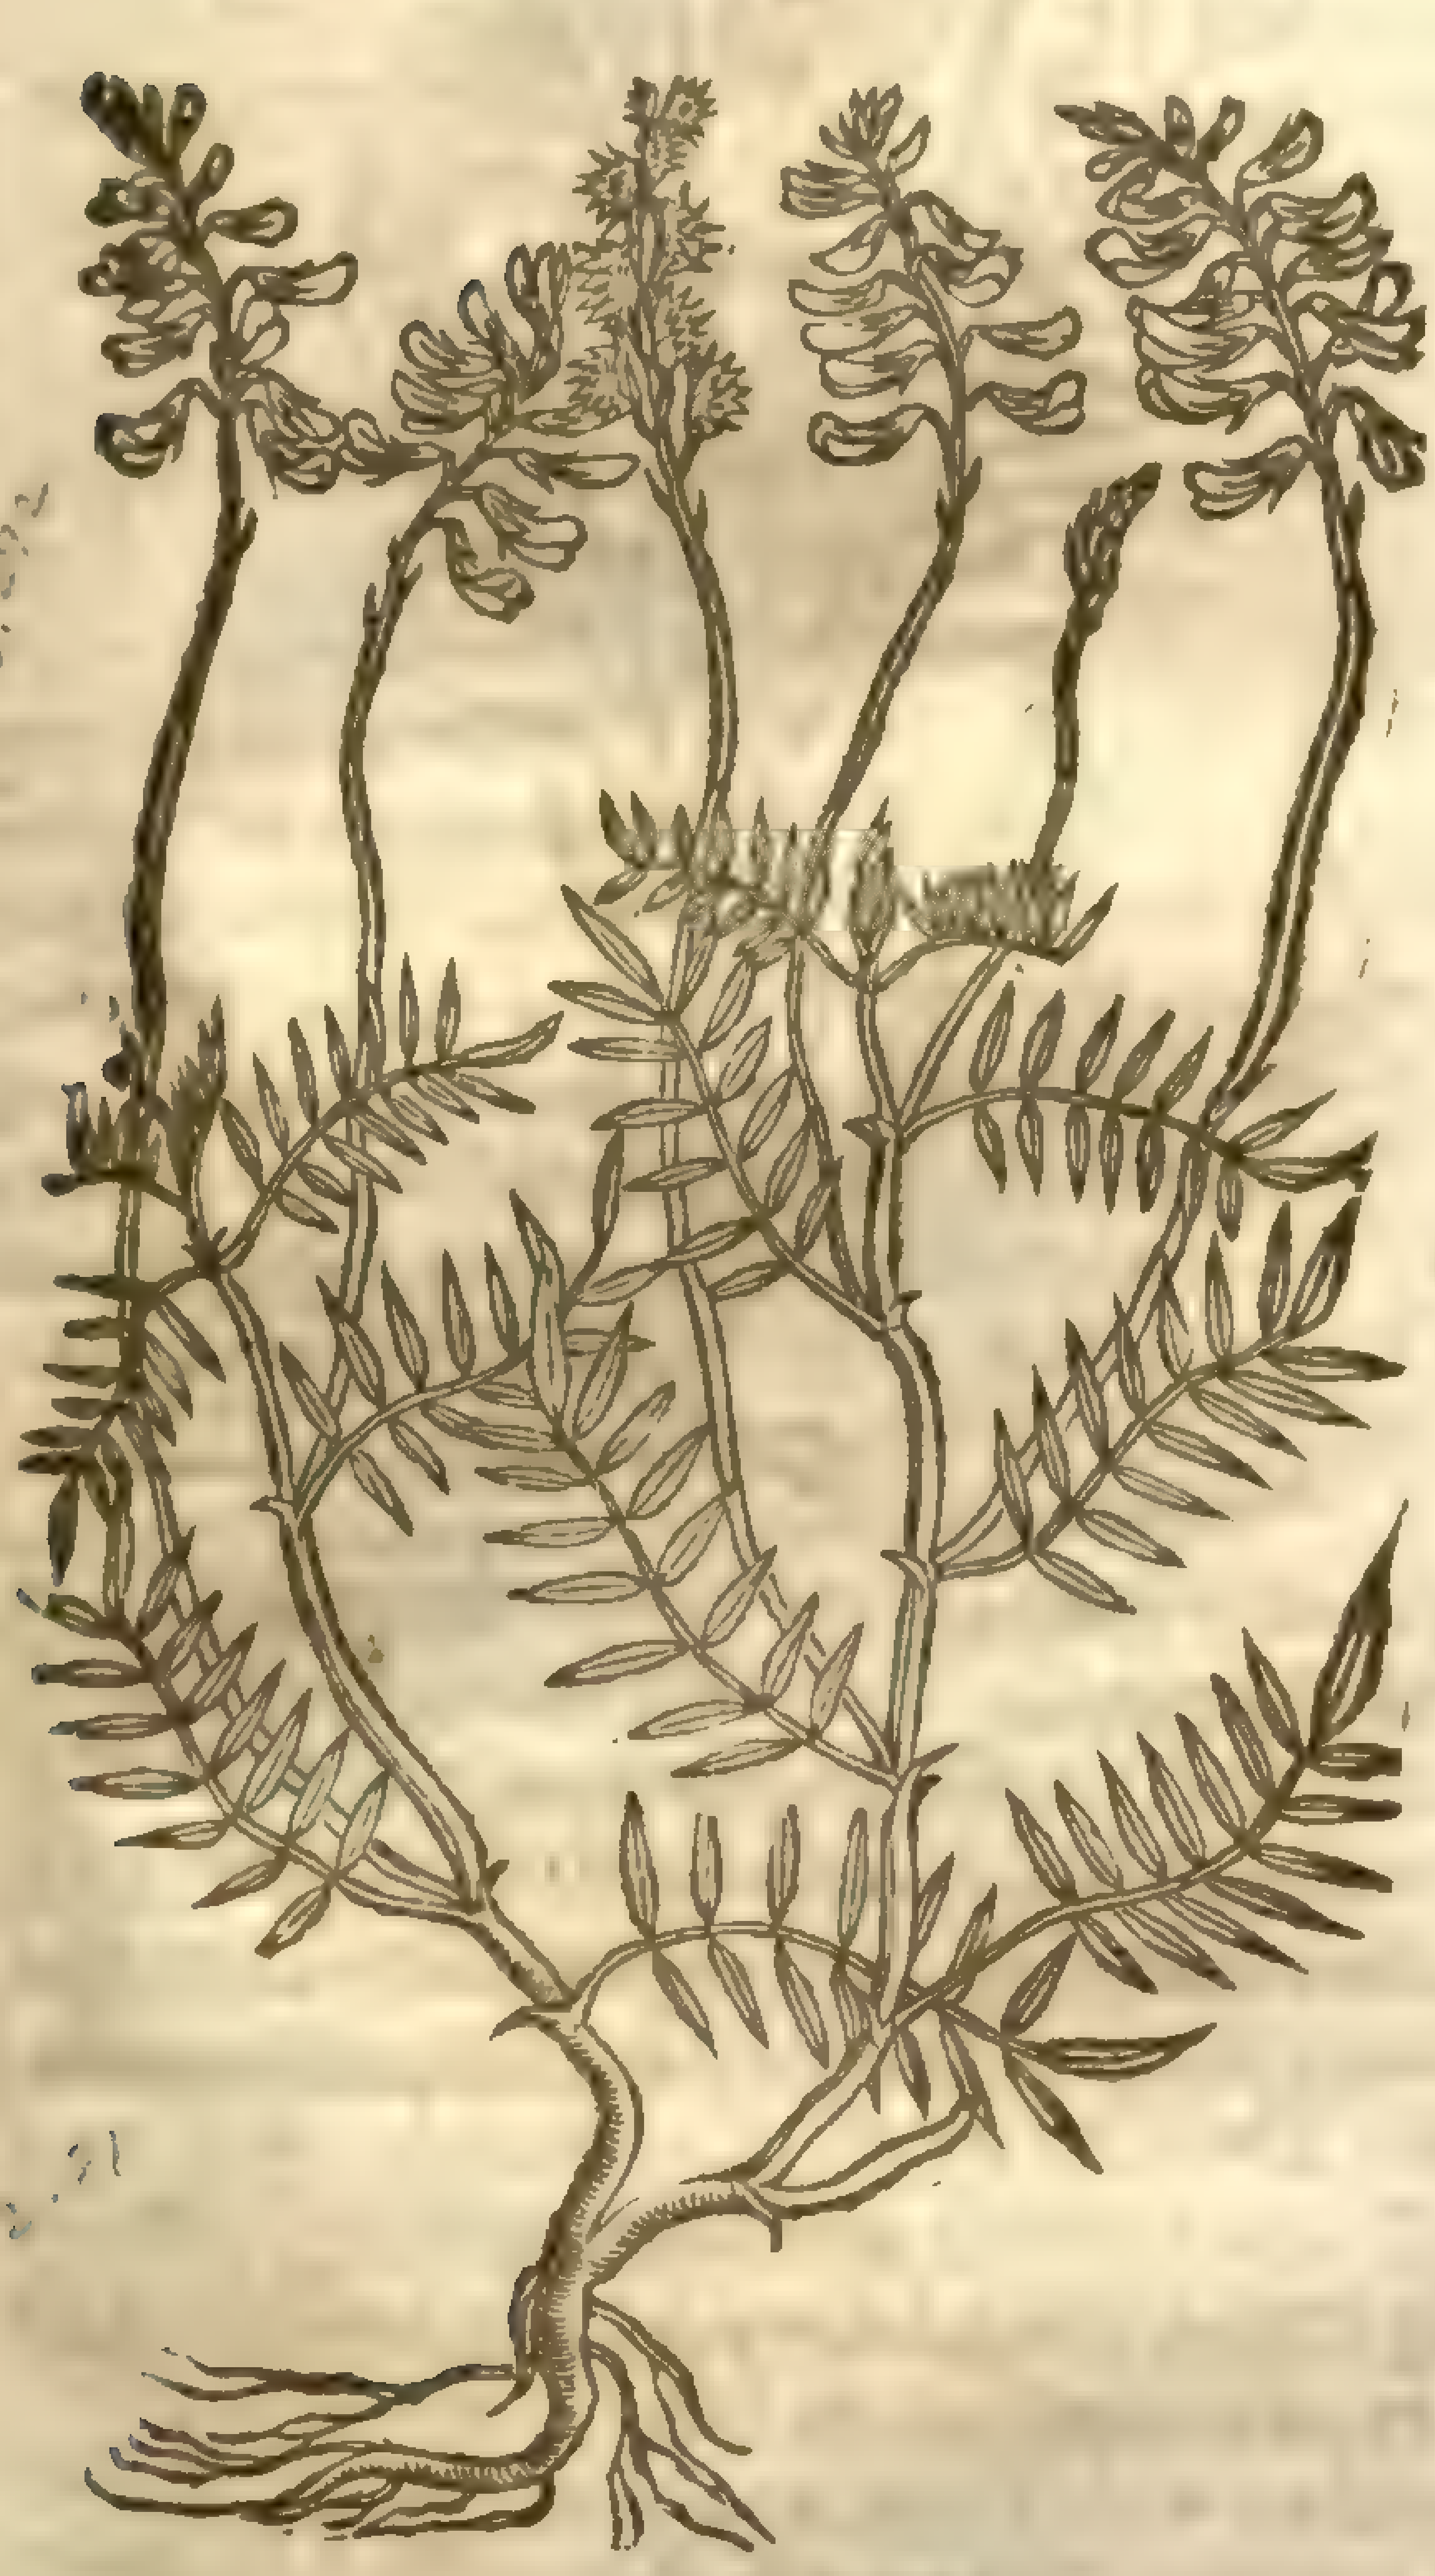
† Our Author either not knowing, or forgetting what he had done, againe in this chapter, deſcribed the *Glaux Vulgaris*, whoſe hiſtory he gaue vs but foure Chapters before, by the name of *Hedyſarum glycyrhizatum*; wherefore I haue omitted it here as not neceſſary.

CHAP. 523. *Of red Fitchling, Medick Fitch, or Cockes-head.*

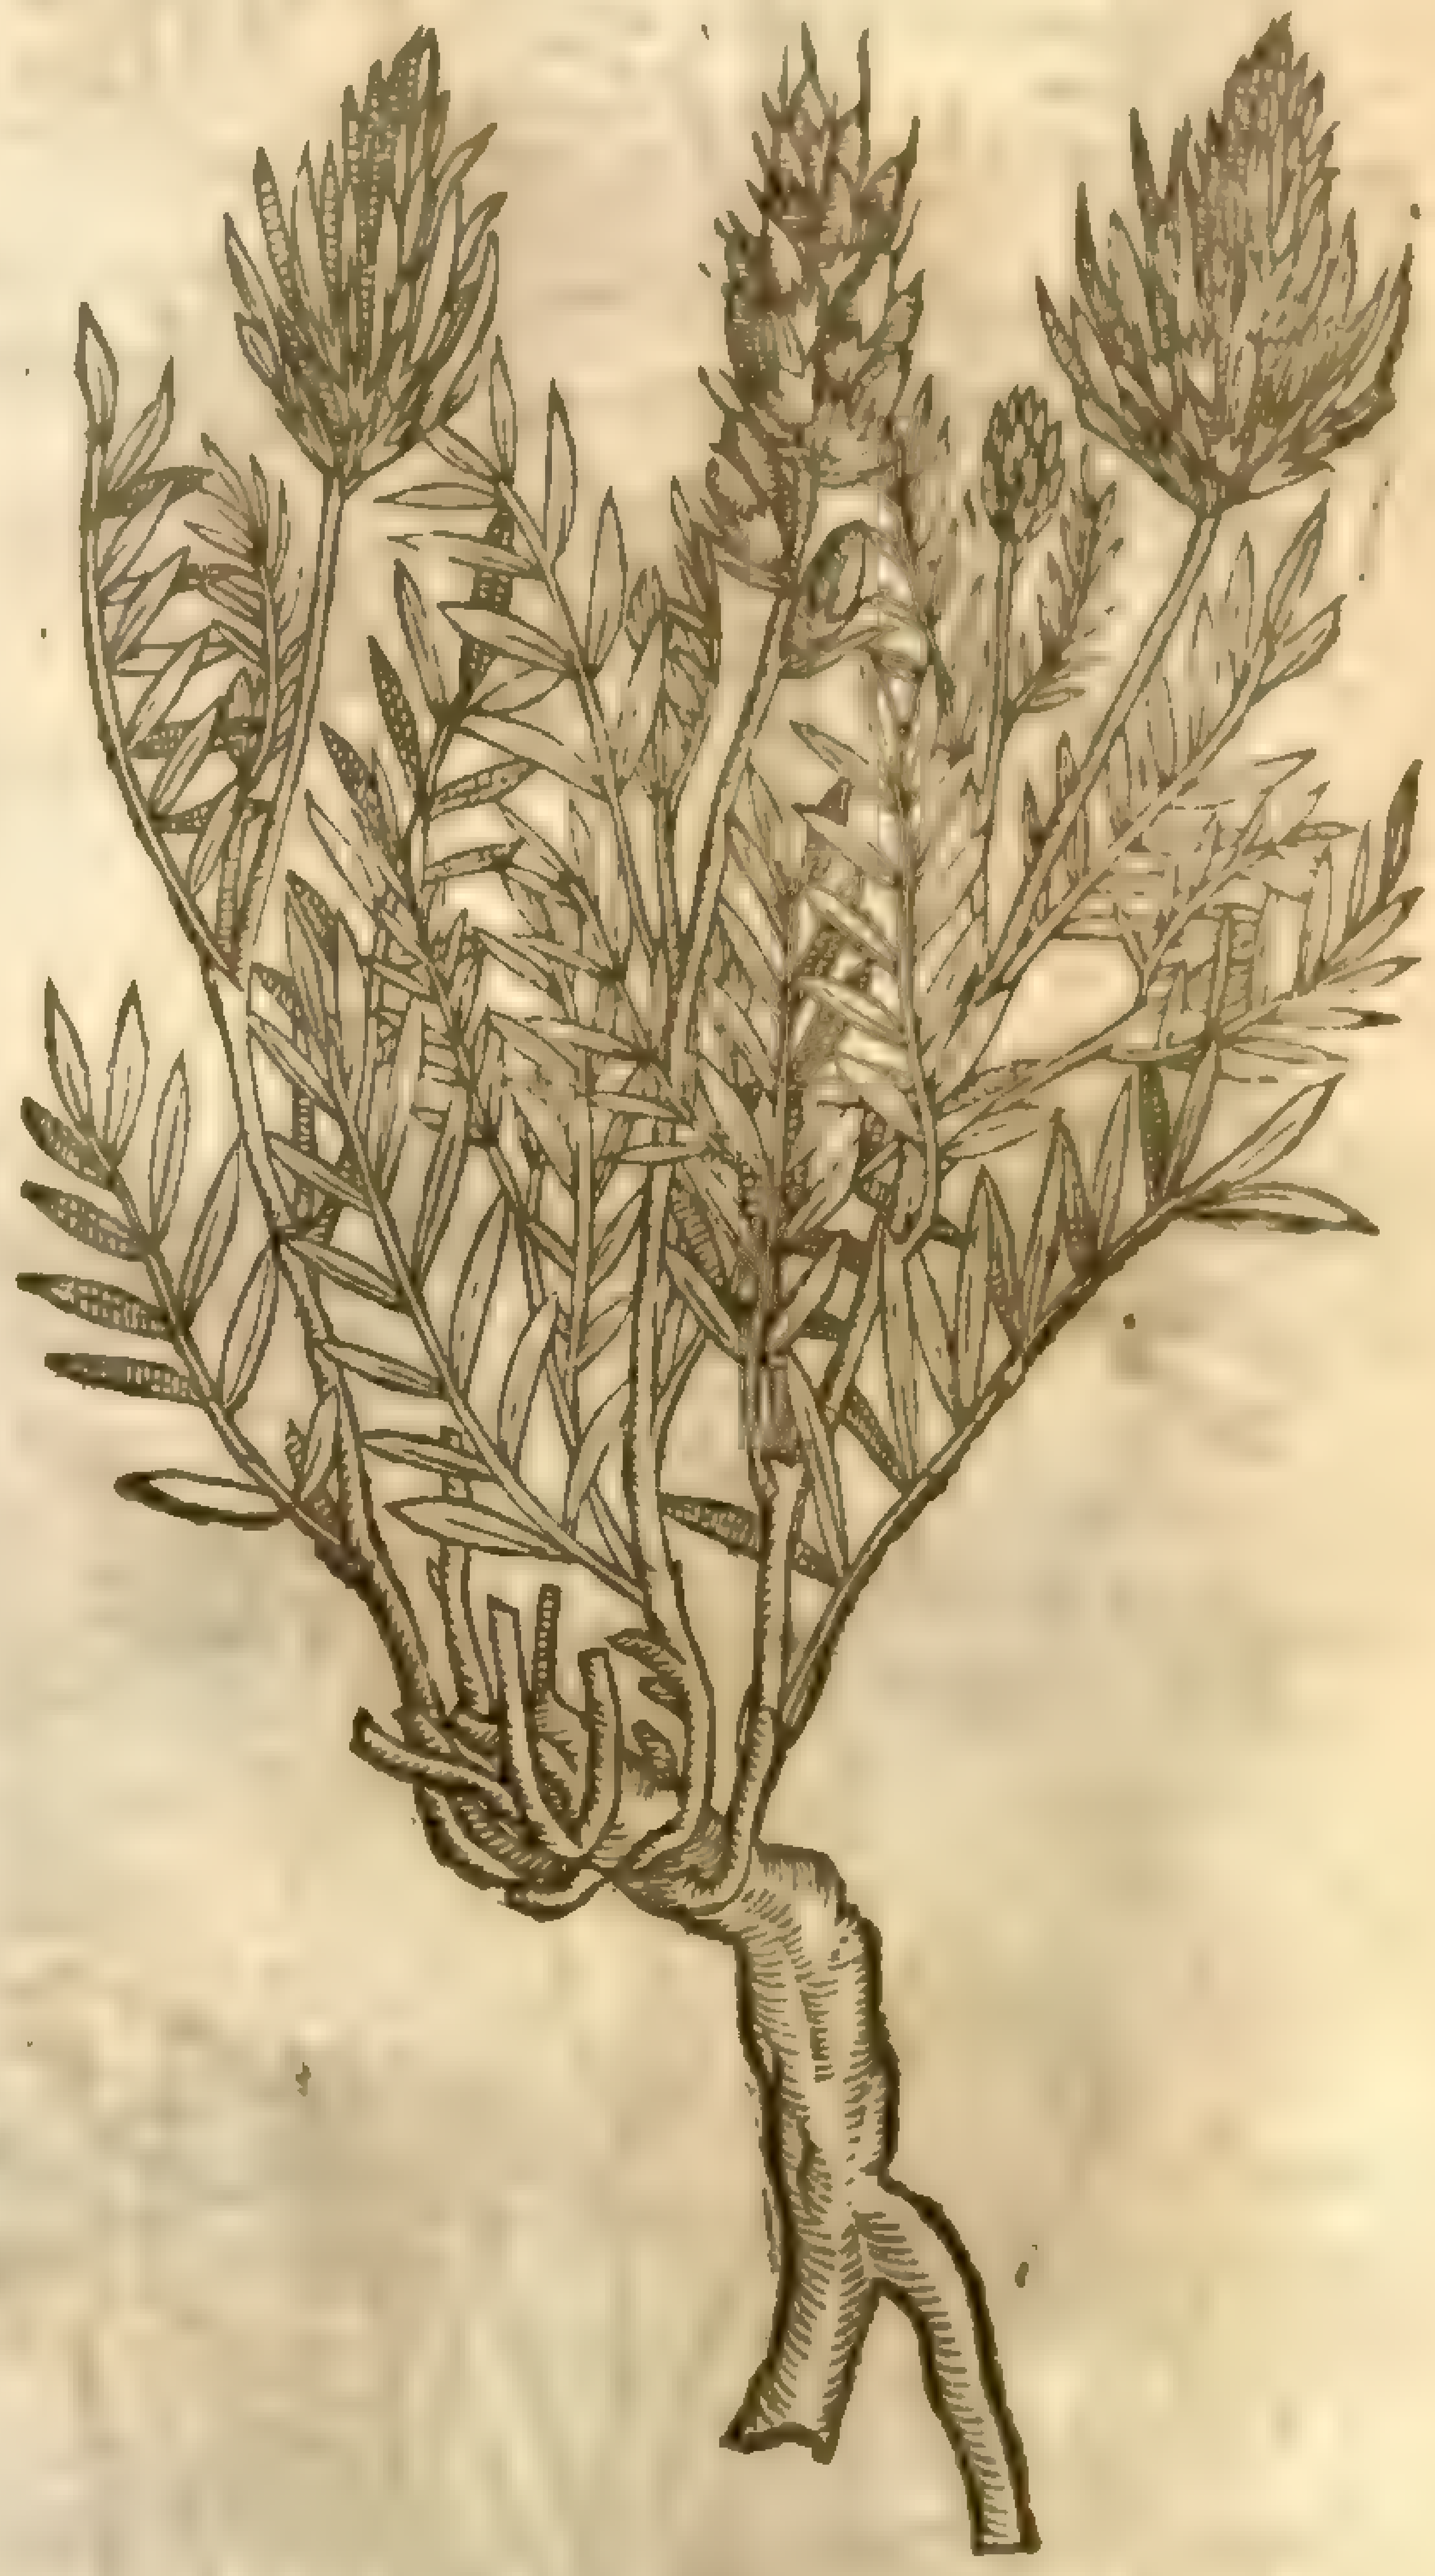
¶ *The Deſcription.*

1 THe firſt kinde of *Onobrychis* hath many ſmall and twiggie pliant branches, ramping and creeping through and about buſhes, or whatſoeuer it groweth neere vnto: the leaues and all the reſt of the pulſe or plant is very like to the wilde Vetch or Tare: the floures grow at the top of ſmall naked ſtalkes, in ſhape like the peaſe bloome, but of a purple colour laied ouer with blew, which turne into ſmall round prickly husks, that are nothing elſe but the ſeed.

1 *Onobrychis, ſiue Caput Gallinaceum.*
Medick Fitchling, or Cockes-head.



2 *Onobrychis flore purpureo.*
Purple Cockes-head.



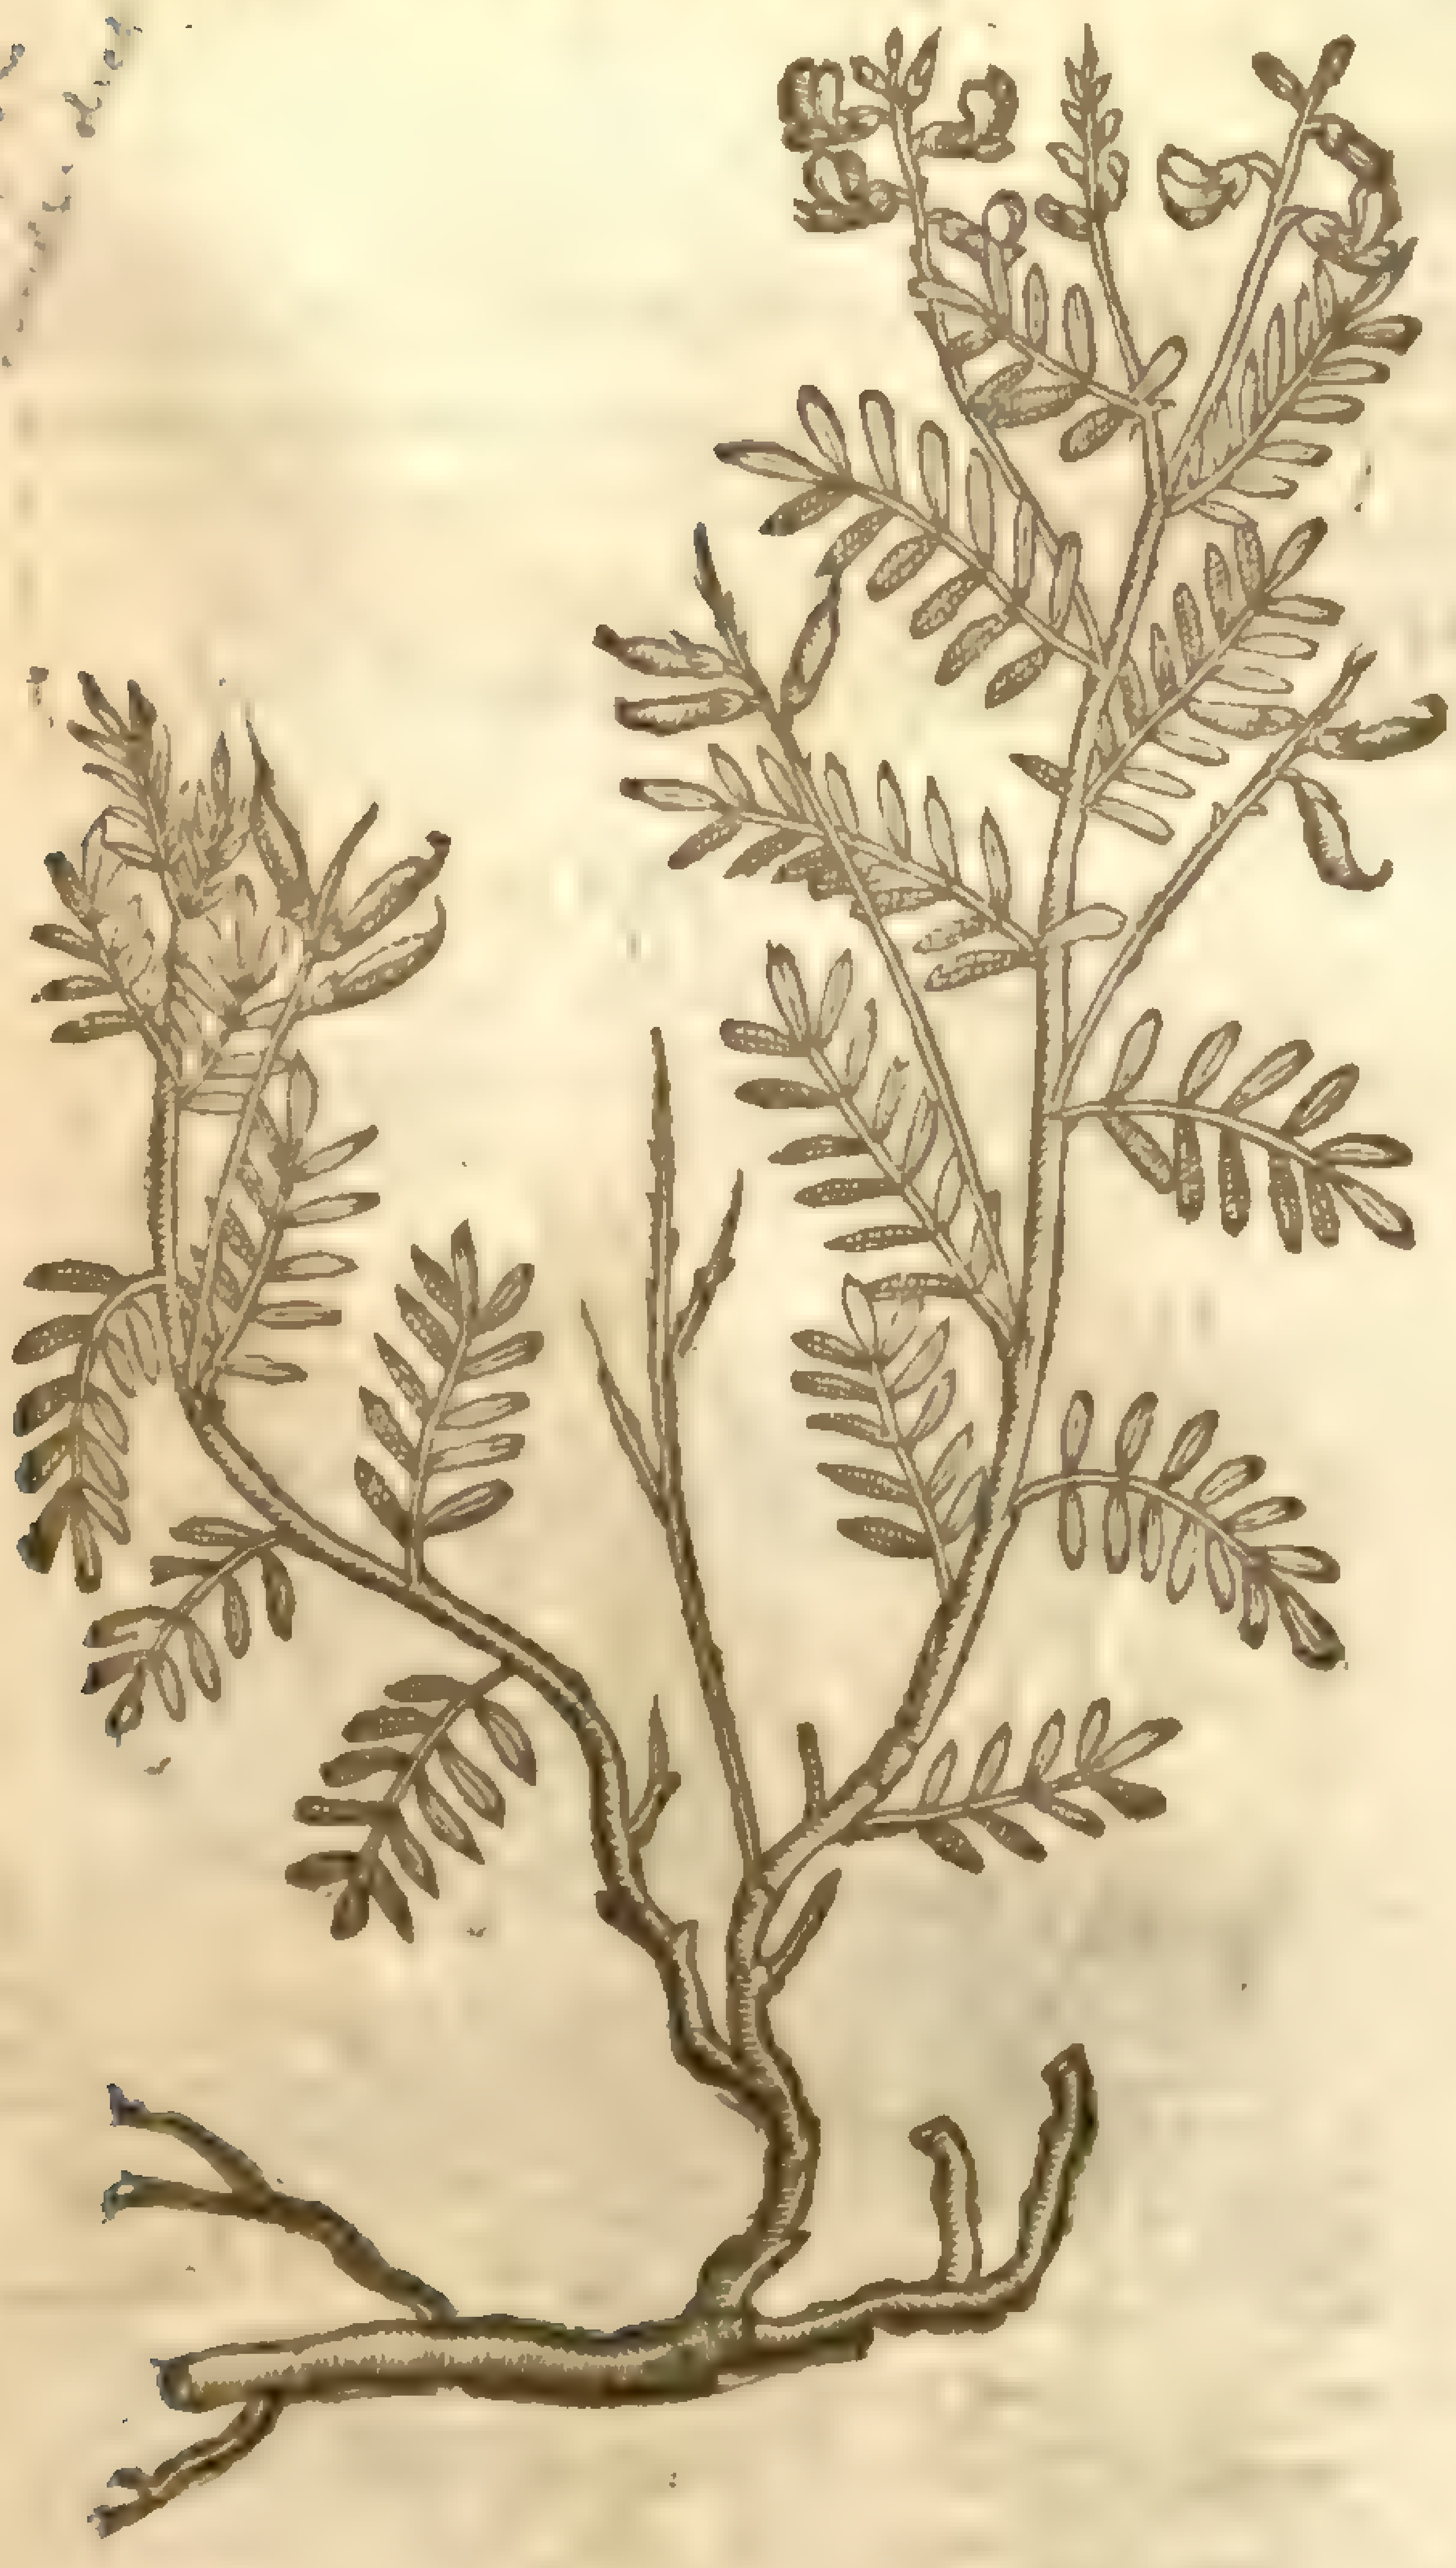
2 The ſecond kind of Fitchling or Coks-head, of *Cluſius* his deſcription, hath very many ſtalks, eſpecially when it is growne to an old plant, round, hard, and leaning to the ground like the other pulſes; and leaues very like *Galega*, or the wilde Vetch, of a biter taſte and lothſome ſauour: among which come forth ſmall ronnd ſtems, at the ends whereof do grow floures, ſpike faſhion, three inches long, in ſhape like thoſe of the great *Lagopus*, or medow Trefoile, but longer, of an excellent ſhining purple colour, but without ſmell: after which there follow ſmall cods, containing little hard and blacke ſeed, in taſte like the Vetch. The root is great and long, hard, and of a wooddy ſubſtance, ſpreading it ſelfe farre abroad, and growing very deepe into the ground.

3 The third kinde of Fitchling or Cocks-head hath from a tough ſmall and wooddy root, many twiggy branches growing a cubit high, full of knots, ramping and creeping on the ground. The leaues are like the former, but ſmaller and ſhorter: among which come forth ſmall tender ſtemmes, whereupon do grow little floures like thoſe of the Tare, but of a blew colour tending to purple: the floures being vaded, there come the ſmall cods, which containe little blacke ſeed like a Kidney, of a blacke colour.

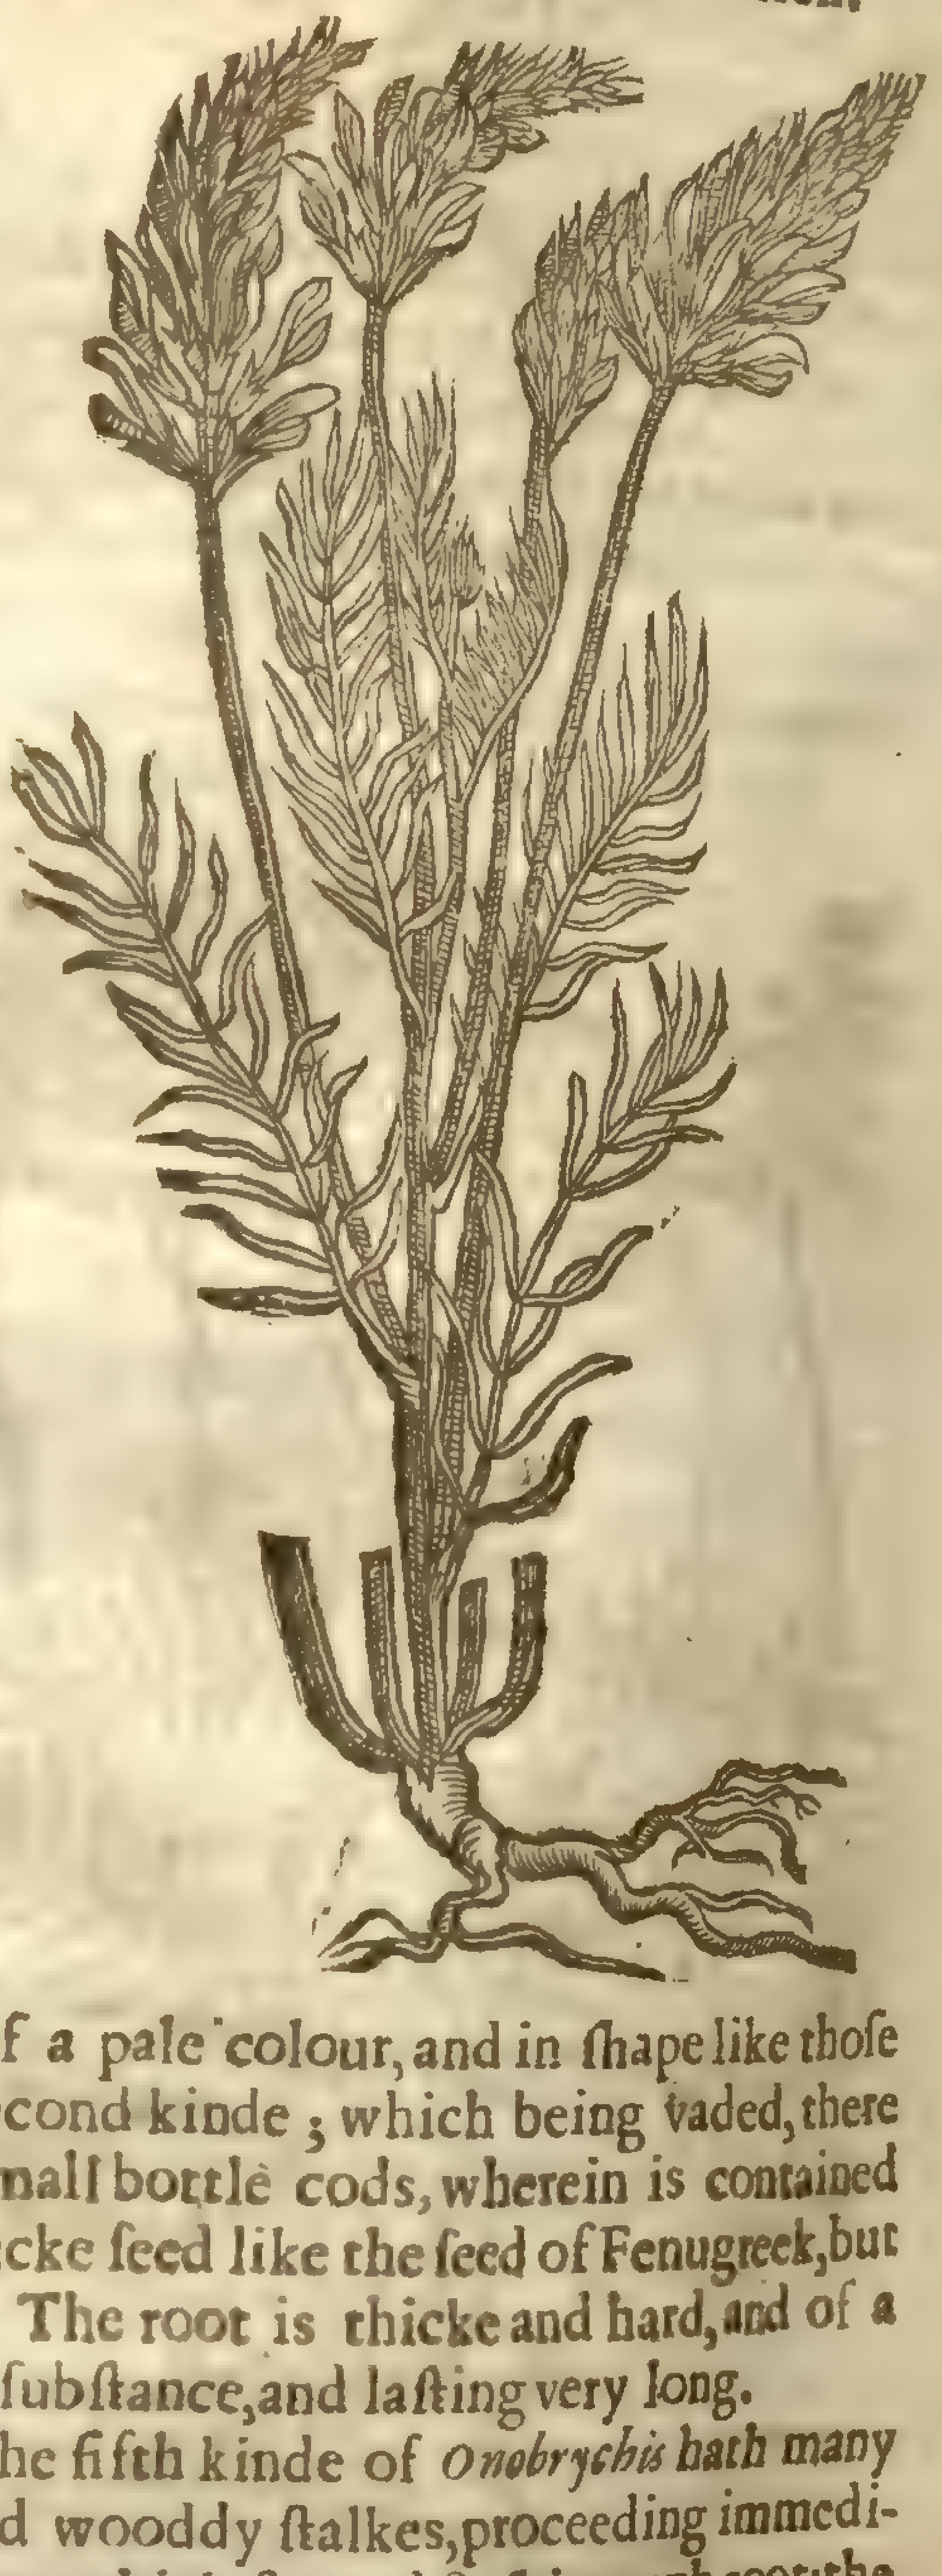
4 The fourth kinde of Fetchling hath firme greene hard ſtalks a cubit and a halfe high, whereupon grow leaues like to the wilde Tare or *Galega*, but ſmaller and ſomewhat hairy, bitter and vnpleaſant in taſte, and in the end ſomewhat ſharpe. At the top of the ſtalkes come forth long ſpiked

Astragalus onobrychis [illegible]

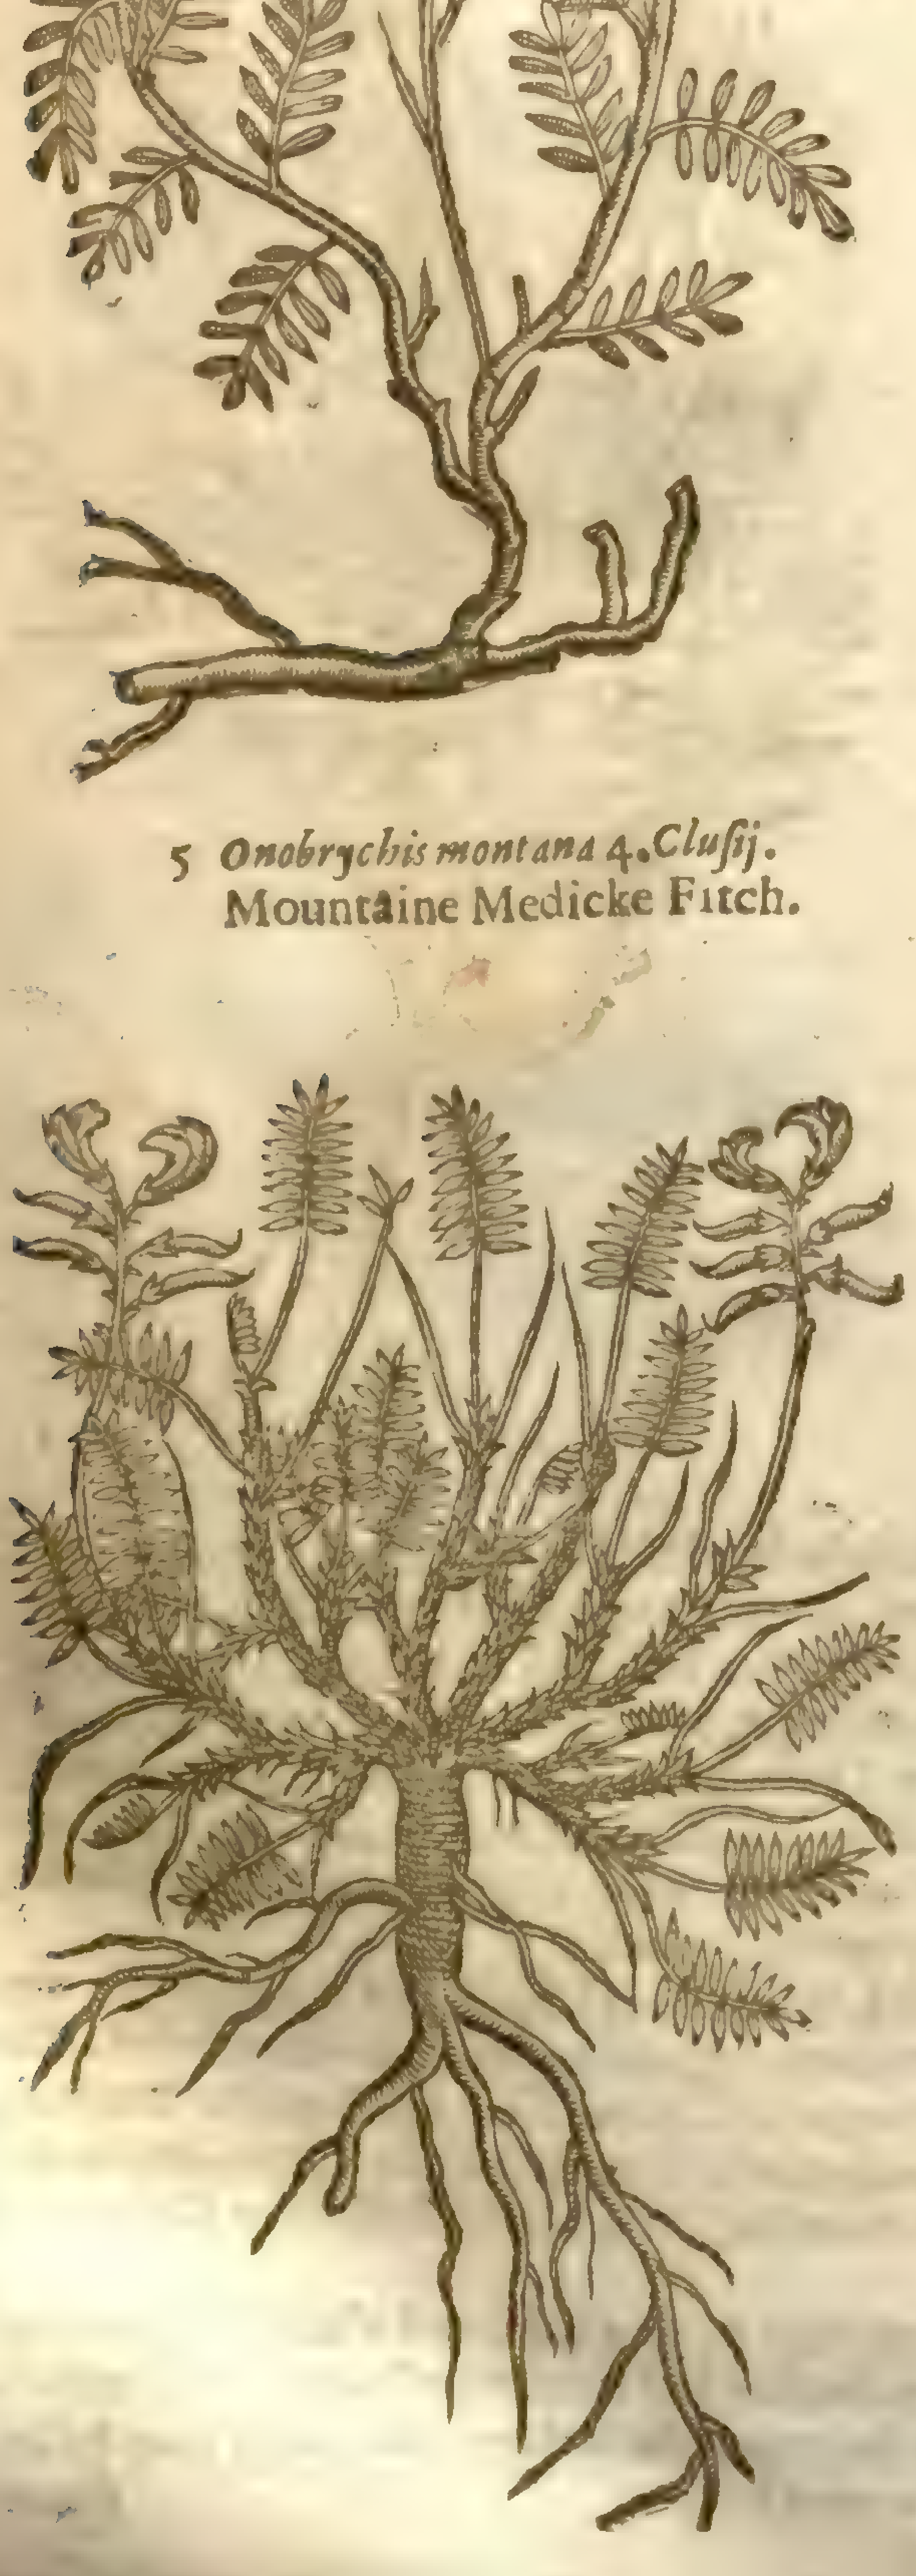
3 *Onobrychis 2. Cluſij.*
Blew Medicke Fitch.



4 *Onobrychis 3. Cluſij flore pallido.*
Pale coloured Medicke Fitch.



5 *Onobrychis montana 4. Cluſij.*
Mountaine Medicke Fitch.



floures of a pale colour, and in ſhape like thoſe of the ſecond kinde; which being vaded, there follow ſmall bottle cods, wherein is contained little blacke ſeed like the ſeed of Fenugreek, but ſmaller. The root is thicke and hard, and of a wooddy ſubſtance, and laſting very long.

5 The fifth kinde of *Onobrychis* hath many groſſe and wooddy ſtalkes, proceeding immediately from a thick, fat, and fleſhie tough root: the vpper part of which are ſmall, round, and pliant, garniſhed with little leaues like thoſe of Lentils, or rather *Tragacantha*, ſomewhat ſoft, and couered ouer with a woolly hairineſſe: amongſt which come forth little long and naked ſtems, eight or nine inches long, whereon do grow many ſmall floures of the faſhion of the Vetch or Lentill, but of a blew colour tending to purple; and after them come ſmall cods, wherin the ſeed is contained.

¶ *The Place.*

The firſt and ſecond grow vpon Barton hill, foure miles from Lewton in Bedfordſhire, vpon both the ſides of the hill: and likewiſe vpon the graſſie balks between the lands of corn two miles from Cambridge, neere to a water mill towards London; and diuers other places by the way from London to Cambridge: the reſt are ſtrangers in England.

¶ *The Time.*

Theſe plants do floure in Iuly, and their ſeed is ripe ſhortly after.

¶ *The Names.*

It is ἀνώνυμος, or without a name among the later writers: the old and antient Phyſitions doe call it ὀνοβρυχὶς: for all thoſe things that are found written in *Dioſcorides* or *Pliny* concerning *Onobrychis*, doe eſpecially agree hereunto. *Dioſcorides* writeth thus; *Onobrychis* hath leaues like a Lentill, but longer; a ſtalk a ſpan high; a crimſon floure; a little root: it groweth in moiſt and vntilled places: and *Pliny* in like manner; *Onobrychis* hath the leaues of a Lentill, ſomewhat longer, a red floure, a ſmall and ſlender root: it groweth about ſprings or fountaines of waters.

All which things and euery particular are in this ἀνώνυμος, or nameleſſe herbe, as it is manifeſt: and therefore it is not to be doubted at all, but that the ſame is the *Onobrychis* of the old Writers: it may be called in Engliſh, red Fetchling, or as ſome ſuppoſe, Medick Fetch, or Cockes-head.

¶ *The Temperature.*

Theſe herbes as *Galen* hath written in his books of the Faculties of ſimple Medicines, doe rarifie or make thinne and waſt away.

¶ *The Vertues.*

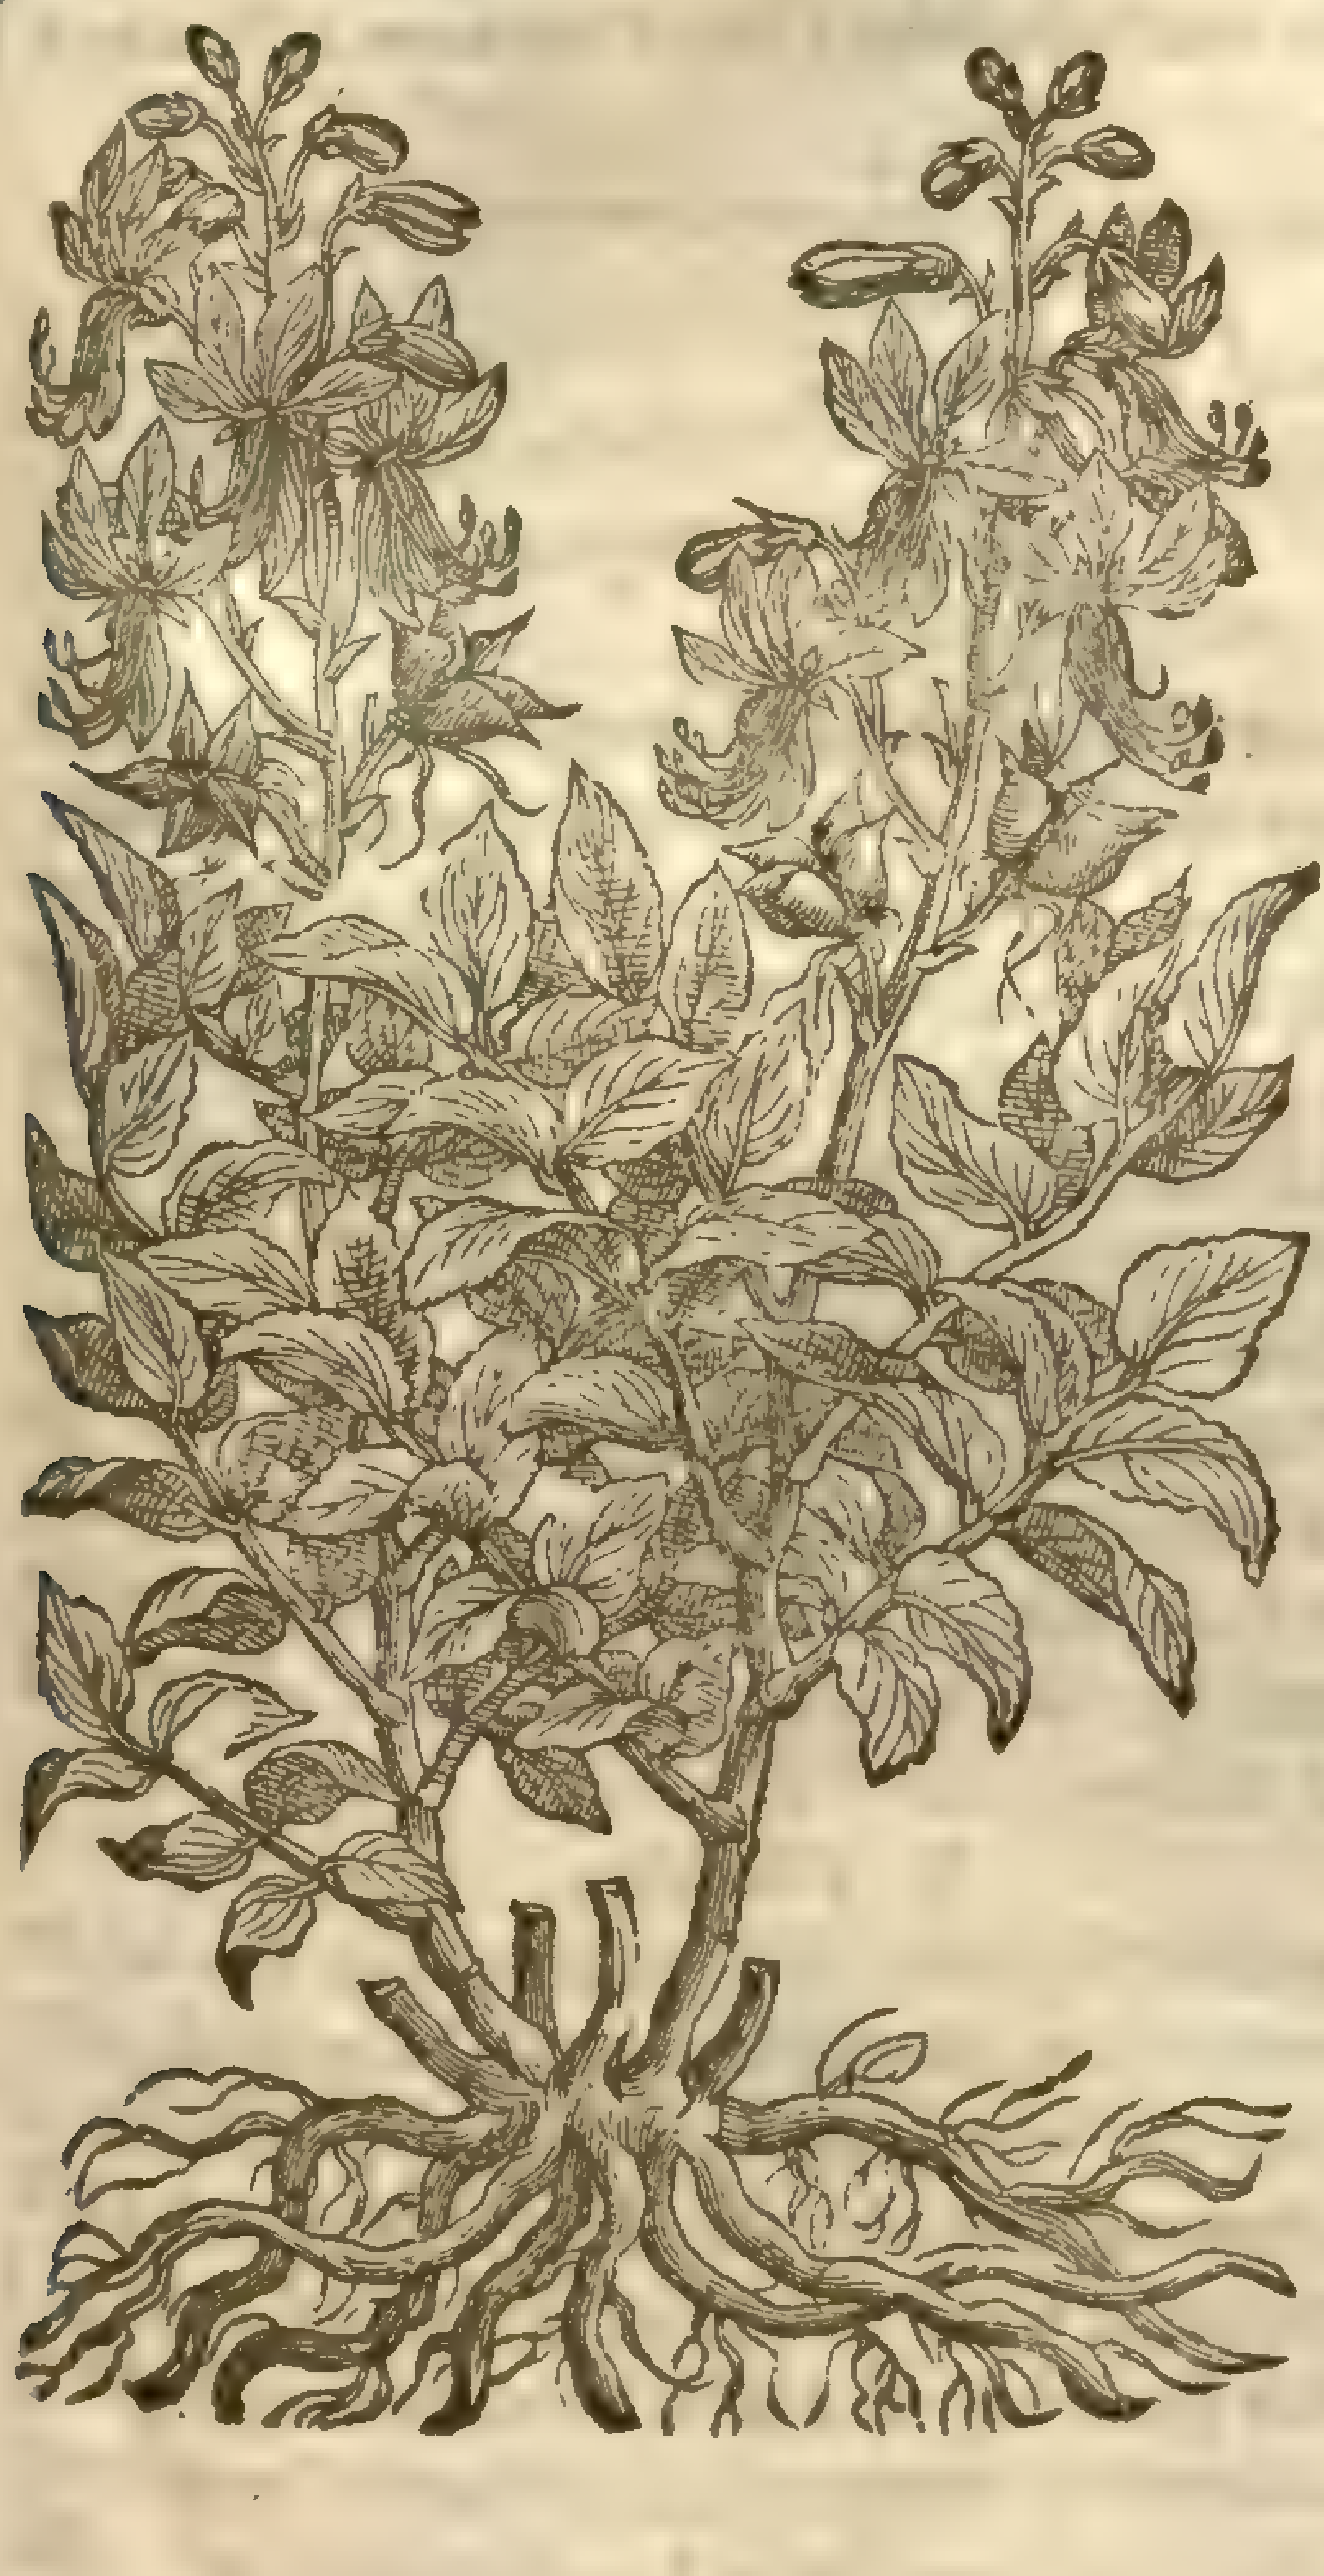
A Therefore the leaues thereof when it is greene, being yet laied vpon hard ſwellings, or waxen kernels, in manner of a ſalue, do waſt and conſume them away, but being dryed and drunke in wine they cure the ſtrangurie; and laied on with oile it procureth ſweat.

B Which things alſo concerning *Onobrychis*, *Dioſcorides* hath in theſe words ſet downe: the herbe ſtamped and applied waſteth away hard ſwellings of the kernels; but being drunke with wine it helpeth the ſtangury, and rubbed on with oile it cauſeth ſweatings.

CHAP. 524. *Of Baſtard Dittanie.*

[illegible]

Fraxinella.
Baſtard Dittanie.



¶ *The Deſcripton.*

Baſtard Dittanie is a very rare and gallant plant, hauing many browne ſtalks, ſomwhat rough, diuided into ſundry ſmall branches, garniſhed with leaues like Liquorice, or rather like the leaues of the Aſh tree, but blacker, thicker, and more ful of juice, of an vnpleaſant ſauor: among which grow floures, conſiſting of fiue whitiſh leaues ſtripped with redde, whereof one which groweth vndermoſt hangeth downe low; but the foure which grow vppermoſt grow more ſtiffe and vpright: out of the midſt of this floure commeth forth a taſſell, which is like a beard, hanging alſo downwards, and ſomewhat turning vp at the lower end: which beeing vaded, there come in place foure huskes joyned together, much like the husks or coddes of Columbines, ſomewhat rough without, ſlimie to handle, and of a lothſome ſauour, almoſt like the ſmell of a goat; whereupon ſome Herbariſts haue called it *Tragium*: in the cods are contained ſmall blacke ſhining ſeeds like Peonie ſeeds in colour: the roots are white, a finger thicke, one twiſting or knotting within another, in taſt ſomwhat bitter.

There is another kinde hereof growing in my garden, not very much differing: the leaues of the one are greater, greener, harder, and ſharper pointed: of the other blacker, not ſo hard, nor ſo ſharpe pointed: the floures alſo hereof be ſomthing more bright coloured, and of the other a little redder.

¶ *The Place.*

Baſtard Dittany groweth wilde in the mountaines of Italy and Germany, and I haue it growing in my garden.

¶ *The Time.*

It floureth in Iune and Iuly: the ſeed is ripe in the end of Auguſt.

¶ *The Names.*

The later Herbariſts name it *Fraxinella*: moſt, χαμαιμελιον, as though they ſhould ſay *Humilis Fraxinus* or a low aſh: in Engliſh, baſtard, or falſe Dittanie: the ſhops call it *Dictamnum*, and *Diptamum*, but not truly, and vſe oftentimes the roots hereof in ſtead of the right Dittany. That it is not the right Dittany it is better knowne than needfull at all to be confuted; and it is euident that the ſame is not *Dioſcorides* his *Pſeudodictamnum*, or baſtard Dittanie: but it is plaine to be a kinde of *Tragium* of the old Writers wherewith it ſeemeth to agree in ſhew, but not in ſubſtance.

‡ The root of this is onely vſed in ſhops, and there knowne by the name of *Radix Diptamni*, or *Dictamni*. ‡

¶ *The Temperature.*

The root of Baſtard Dittany is hot and dry in the ſecond degree, it is of a waſting, attenuating, and opening faculty.

¶ *The Vertues.*

A It bringeth downe the menſes, it alſo bringeth away the birth and after birth, it helpeth cold diſeaſes of the matrix: and it is reported to be good for thoſe that haue ill ſtomackes and are ſhort winded.

B They alſo ſay, that it is profitable againſt the ſtingings and bitings of venomous ſerpents; againſt deadly poiſons, againſt contagious and peſtilent diſeaſes, and that it is with good ſucceſſe mixed with counterpoiſons.

C The ſeed of Baſtard Dittanie taken in the quantity of a dram is good againſt the ſtrangury, prouoketh vrine, breaketh the ſtone in the bladder, and driueth it forth.

D The like vertue hath the leaues and juyce taken after the ſame ſort; and being applied outwardly, it draweth thornes and ſplinters out of the fleſh.

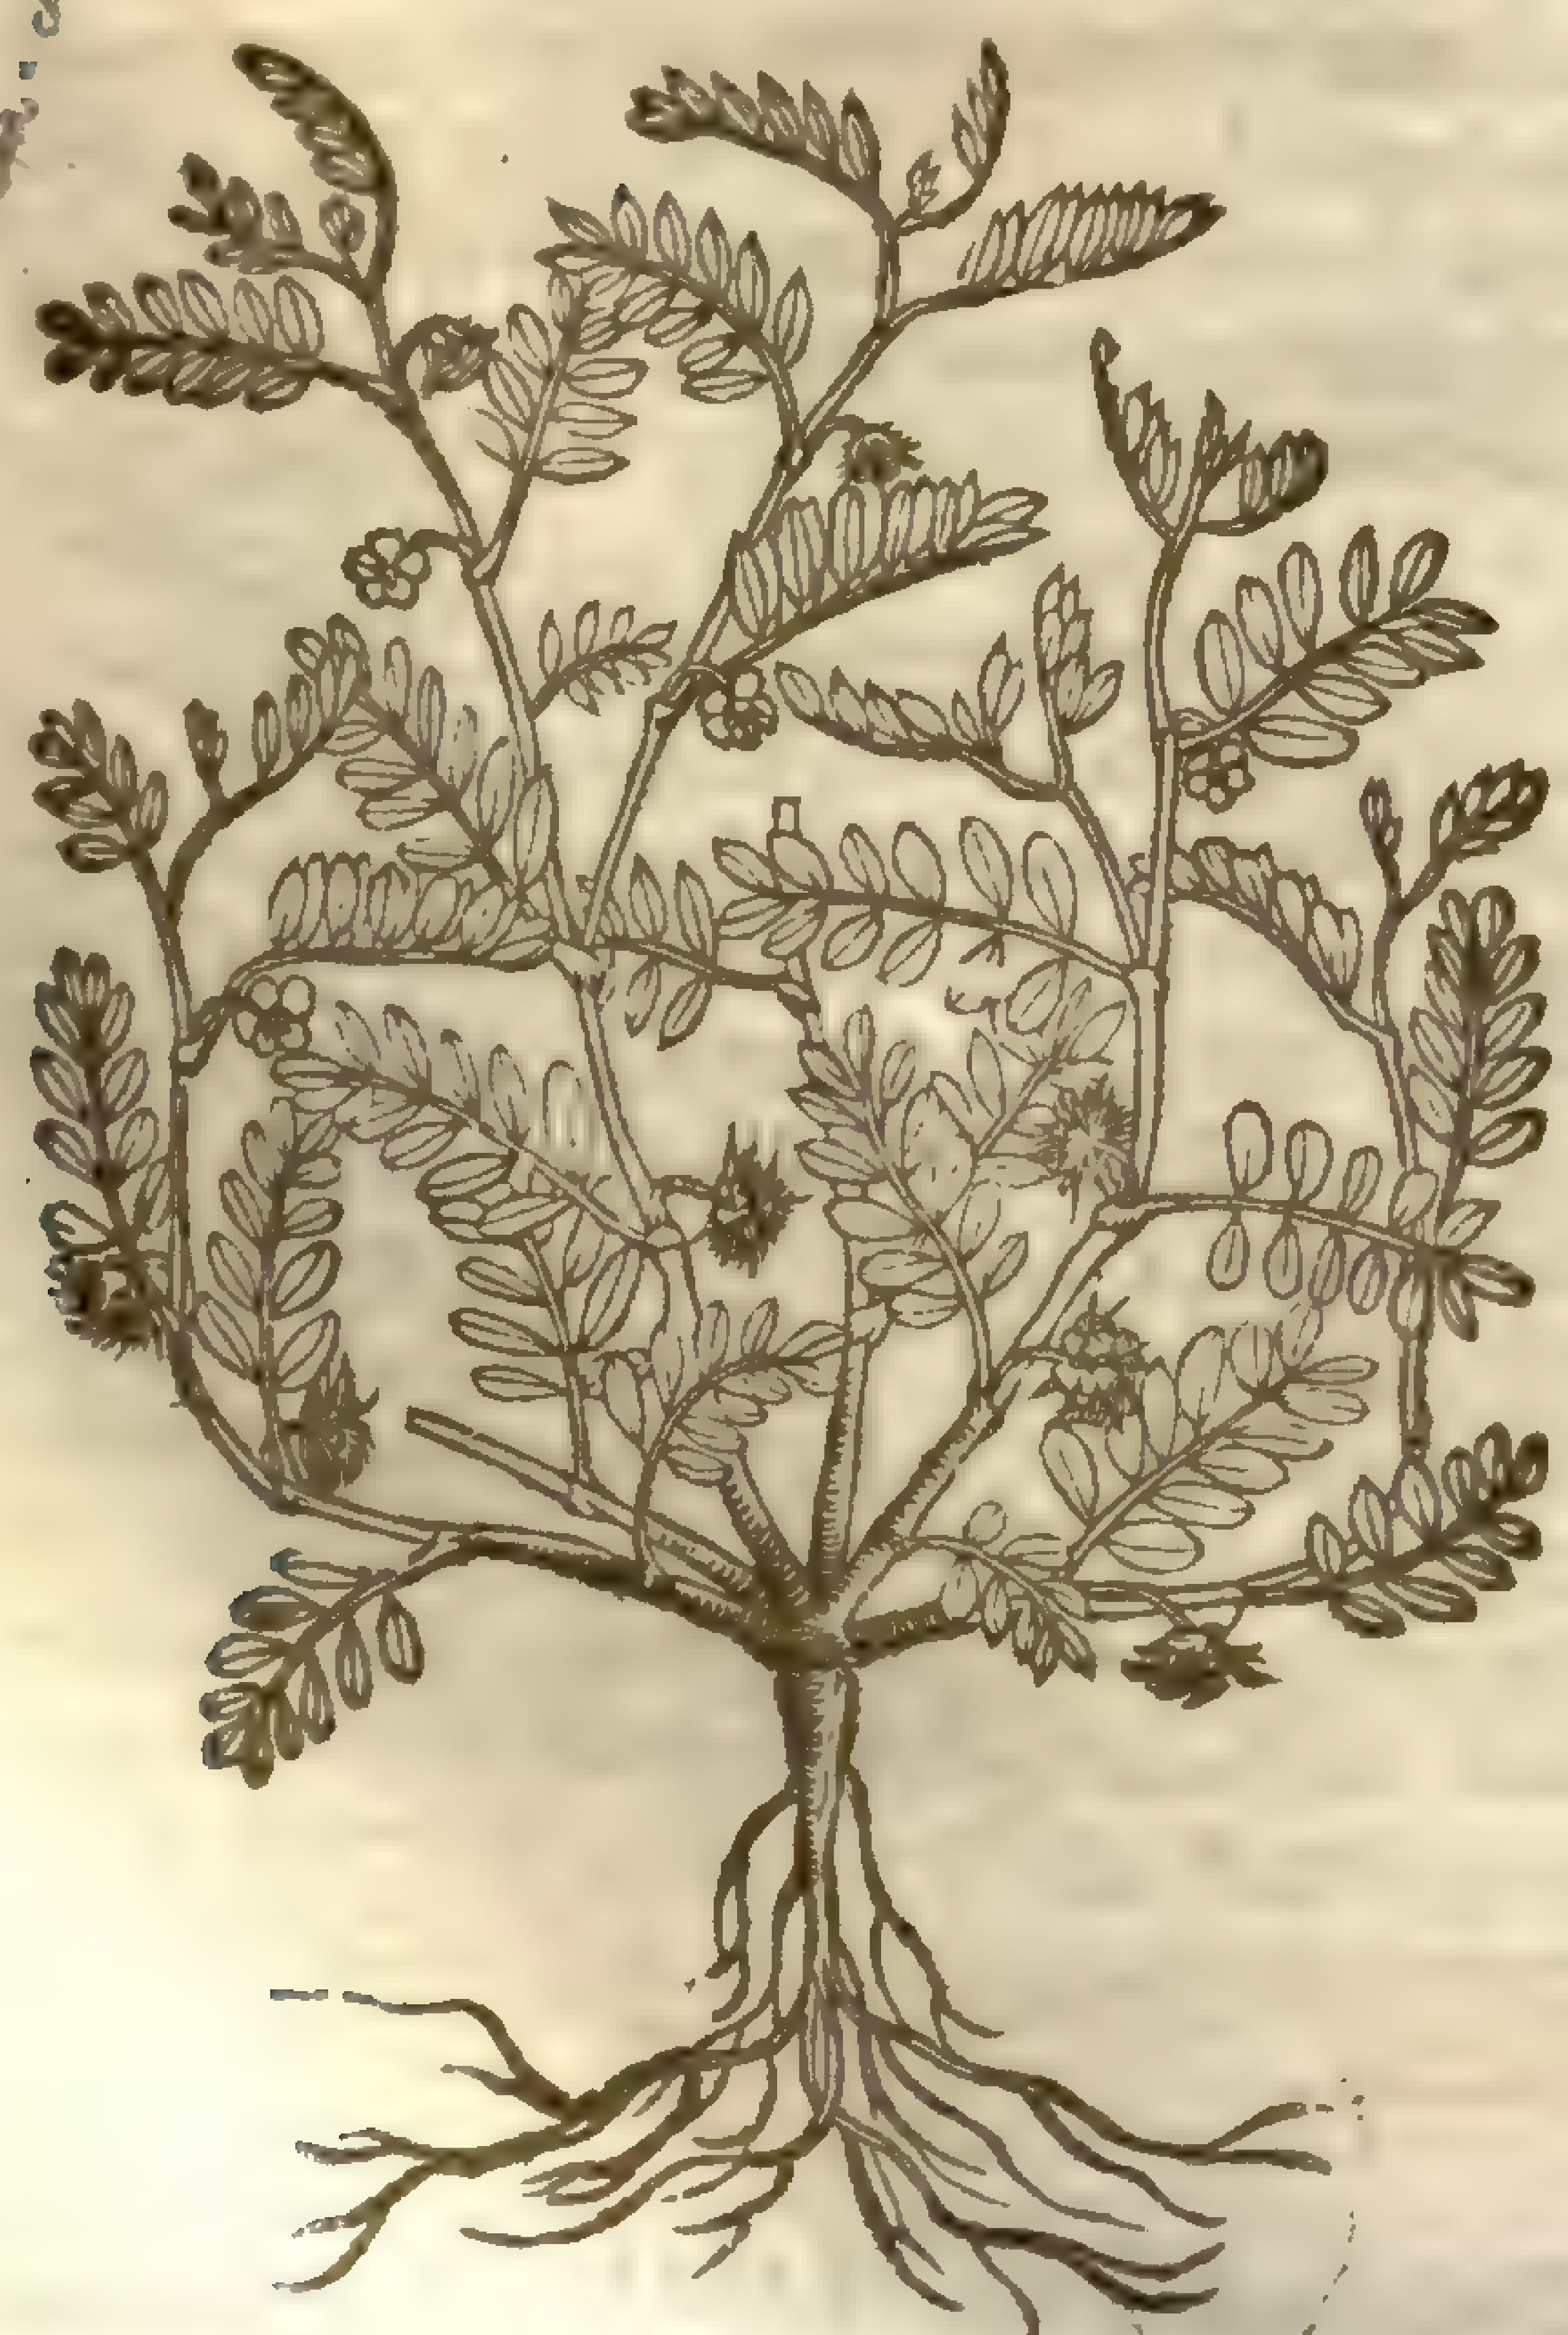
E The root taken with a little Rubarb killeth and driueth forth wormes.

F *Dioſcorides* reporteth, that the wilde Goats being ſtriken with darts or arrowes, will eat *Dictam*, and thereby cauſe them to fall out of their bodies; which is meant of the right *Dictam*, though *Dodonæus* reporteth that this plant will do the like (which I do not beleeue) ‡ nor *Dodonæus* affirme. ‡

CHAP. 525. *Of Land Caltrops.*

Tribulus Terreſtris.
Land Caltrops.

T. terrestris, & minus dict.



¶ *The Deſcription.*

Land Caltrops hath long branches full of joynts, ſpred abroad vpon the ground, garniſhed with many leaues ſet vpon a middle rib, after the manner of Fetches; amongſt which grow little yellow branches, conſiſting of fiue ſmall leaues, like vnto the floures of Tormentill: I neuer ſaw the plant beare yellow, but white floures, agreeing with the deſcription of *Dodonæus* in each reſpect, ſaue in the colour of the floures, which doe turne into ſmall ſquare fruit, rough, and full of prickles, wherein is a ſmall kernell or ſeed: the root is white, and full of ſtrings.

¶ *The Place.*

It groweth plentifully in Spain in the fields: it is hurtfull to corne, but yet as *Pliny* ſaith, it is rather to bee accounted among the diſeaſes of corne, than among the plagues of the earth: it is alſo found in moſt places of Italy and France; I found it growing in a moiſt medow adjoyning to the wood or Parke of Sir *Francis Carew*, neere Croidon, not farre from London, and not elſewhere; from whence I brought plants for my garden.

¶ *The Time.*

It floureth in Iune and Iuly: the fruit is ripe in Auguſt.

¶ *The Names.*

It is called in Greeke, τρίβολος: and in Latine, *Tribulus*: and that it may differ from the other which groweth in the water, it is named τρίβολος χερσαῖος, or *Tribulus terreſtris*: it may be called in Engliſh, land Caltrops, of the likeneſſe which the fruit hath with Caltrops, that are inſtruments of Warre caſt in the way to anoy the feet of the enemies horſes, as is before remembred in the Water Saligot.

¶ *The Temperature and Vertues.*

In this land Caltrop there is an earthy and cold quality abounding, which is alſo binding, as *Galen* ſaith. A

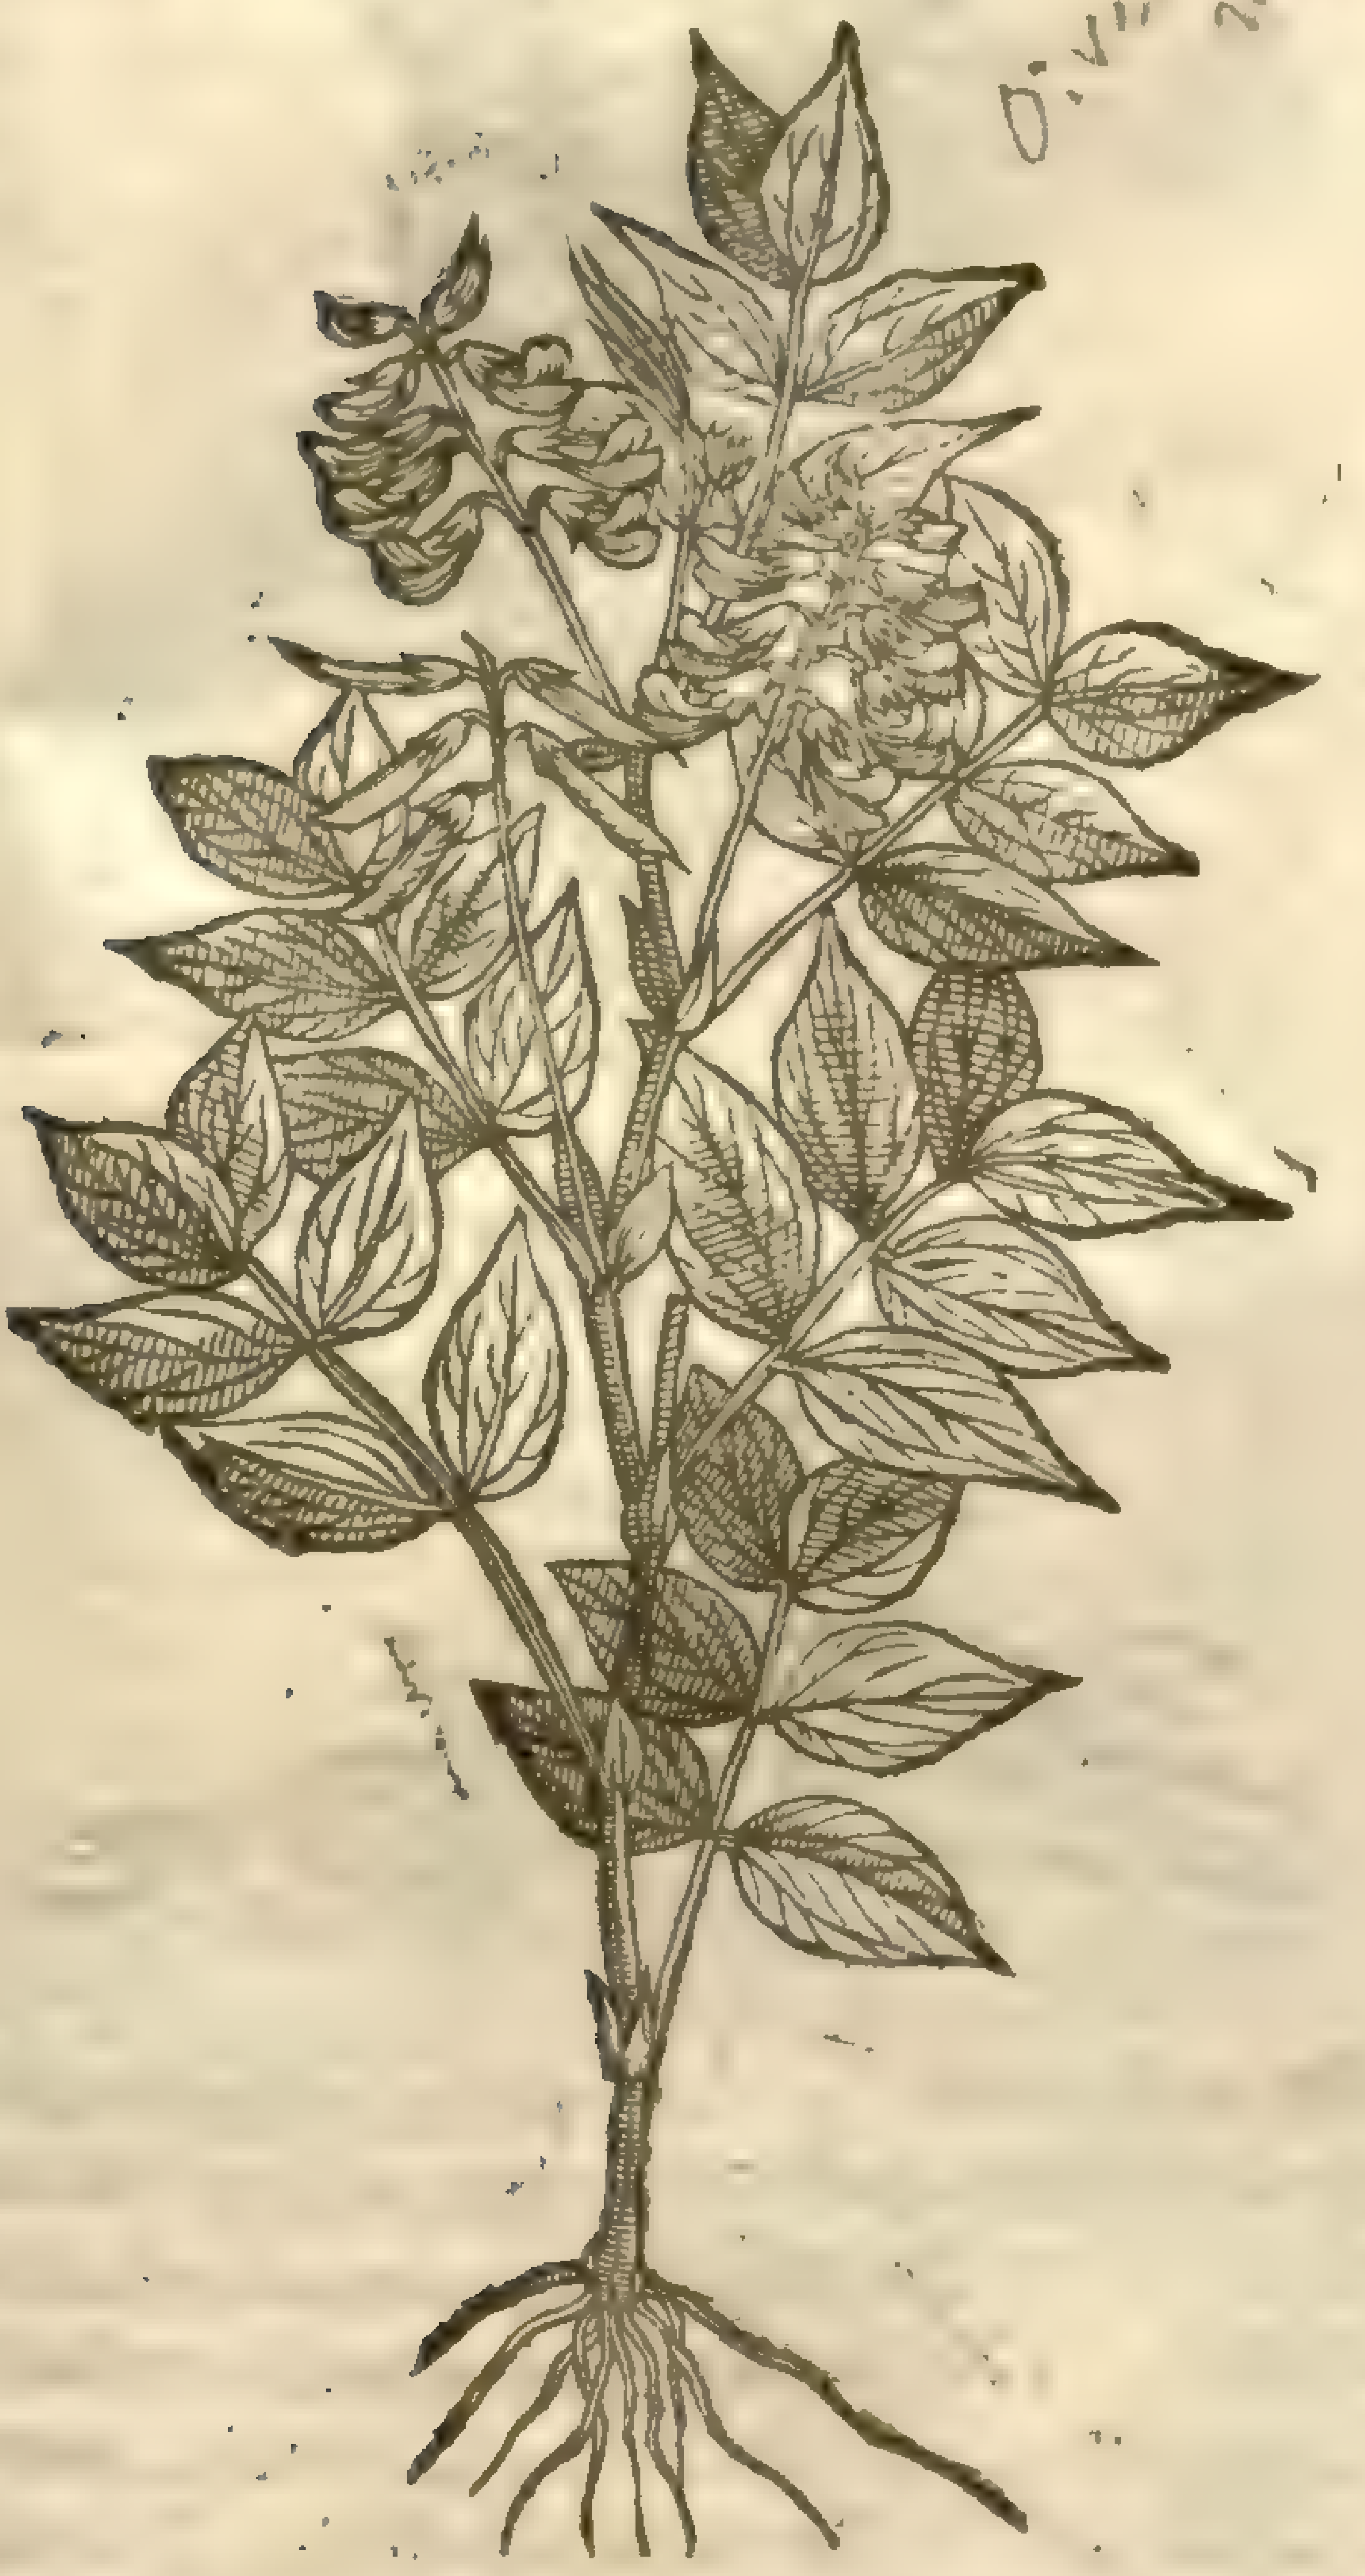
The fruit thereof being drunke waſteth away ſtones in the kidneyes, by reaſon that it is of thinne parts. B

Land Caltrops, ſaith *Dioſcorides*, being drunke to the quantity of a French crowne weight, and ſo applied, cureth the bitings of the Viper. C

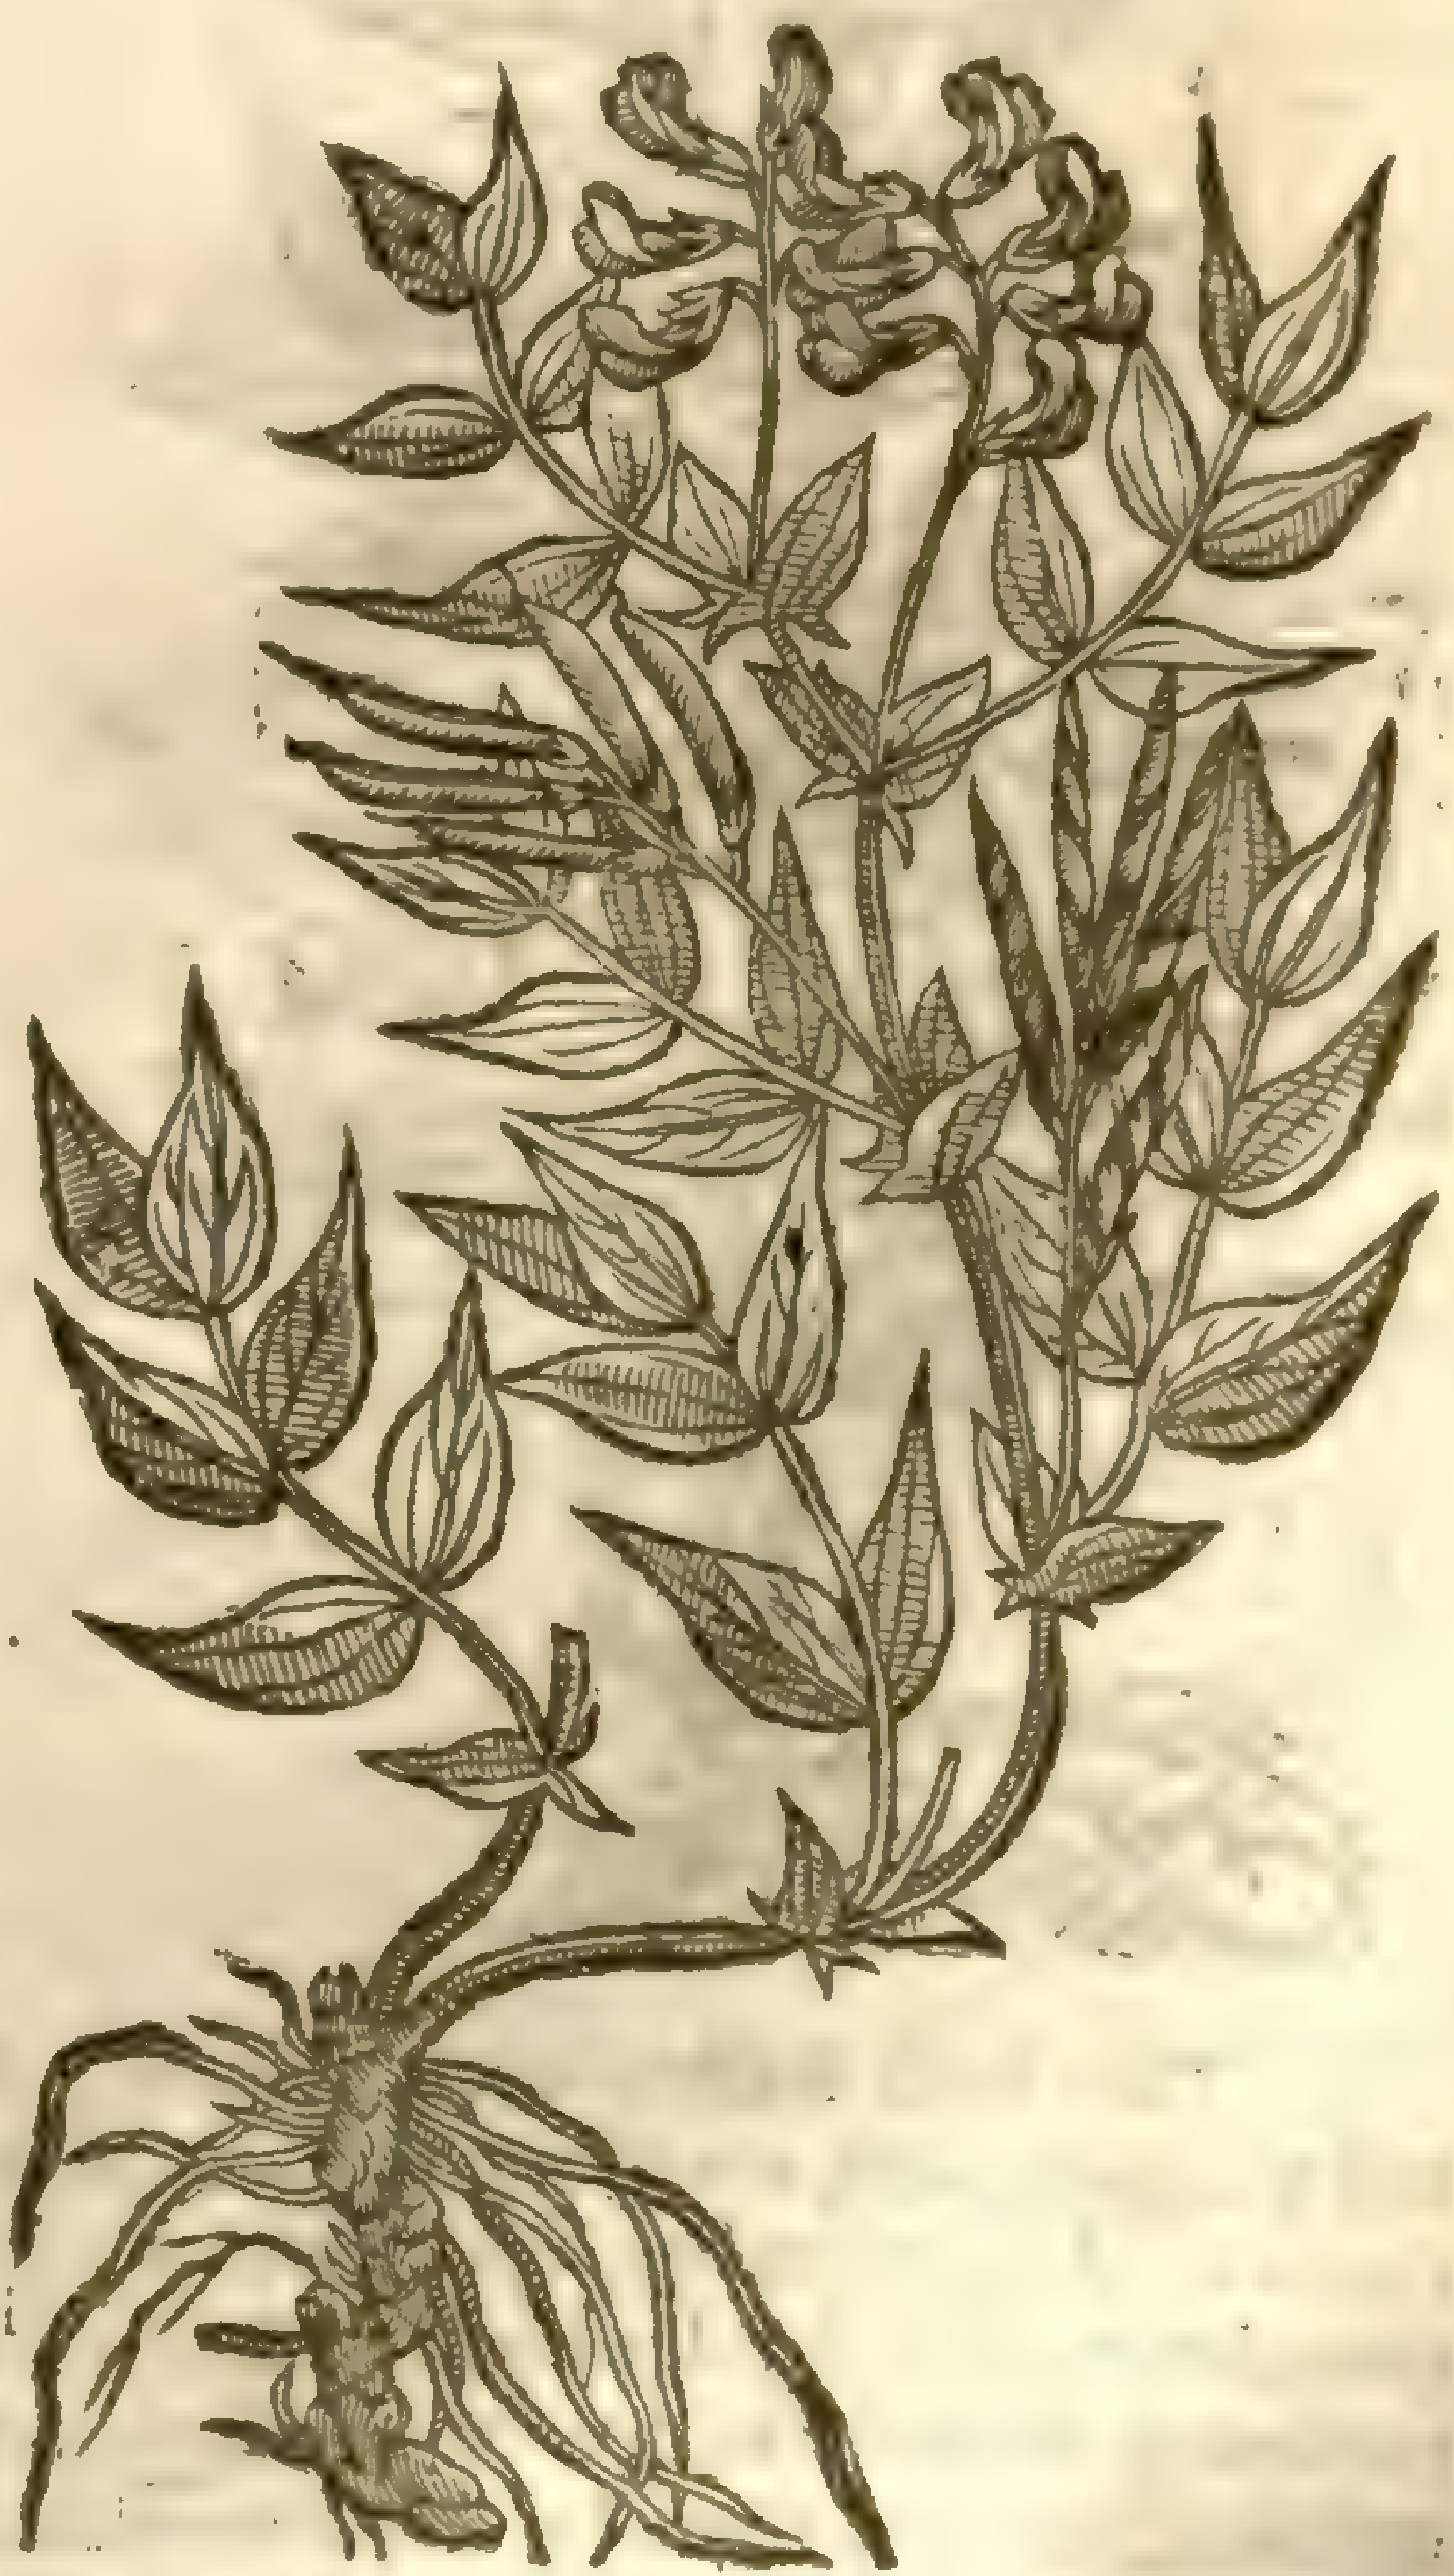
And if it be drunke in wine it is a remedy againſt poyſons: the decoction thereof ſprinckled about killeth fleas. D

‡ Chap. 526. *Of Spring or mountaine Peaſe or Vetches.*

‡ 1 *Orobus Venetus.*
Venice Peaſe.



‡ 2 *Orobus ſyluaticus vernus.*
Spring Peaſe.



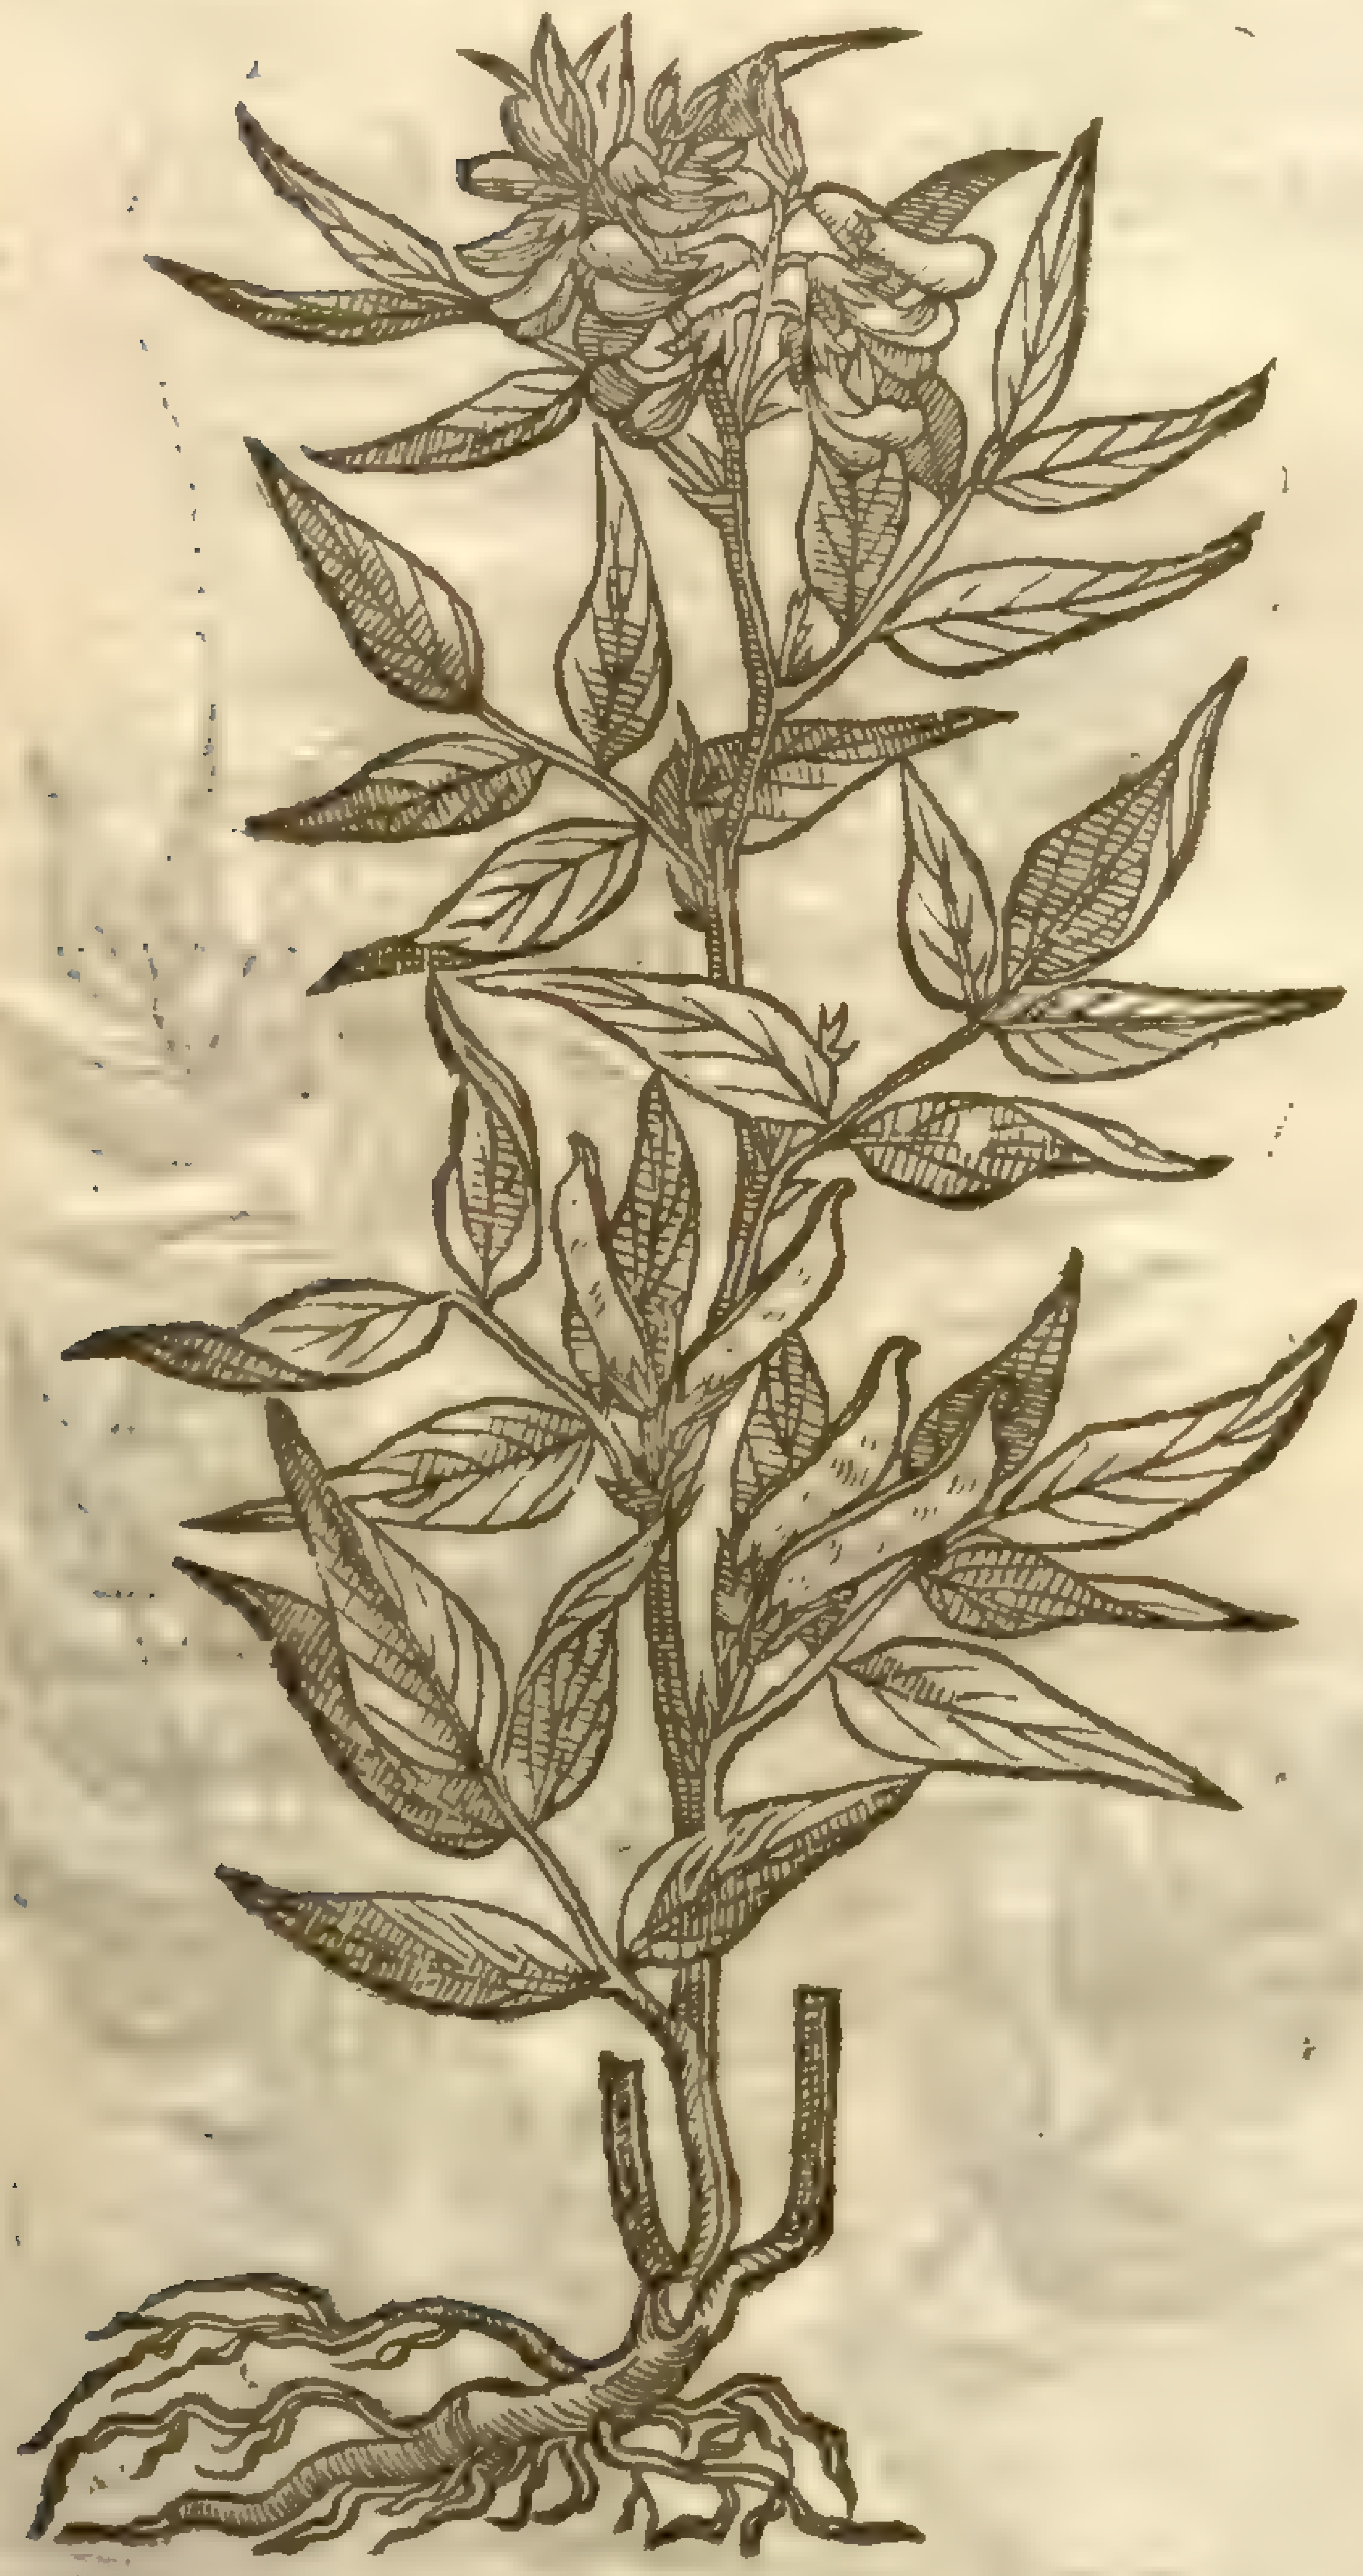
¶ *The Deſcription.*

‡ 1 This, which *Cluſius* calls *Orobus Venetus*, hath many cornered ſtalkes ſome foot long, whereon grow winged leaues, foure or ſix faſtned to one rib, ſtanding by couples one againſt another, without any odde leafe at the end: theſe leaues are of an indifferent largeneſſe,

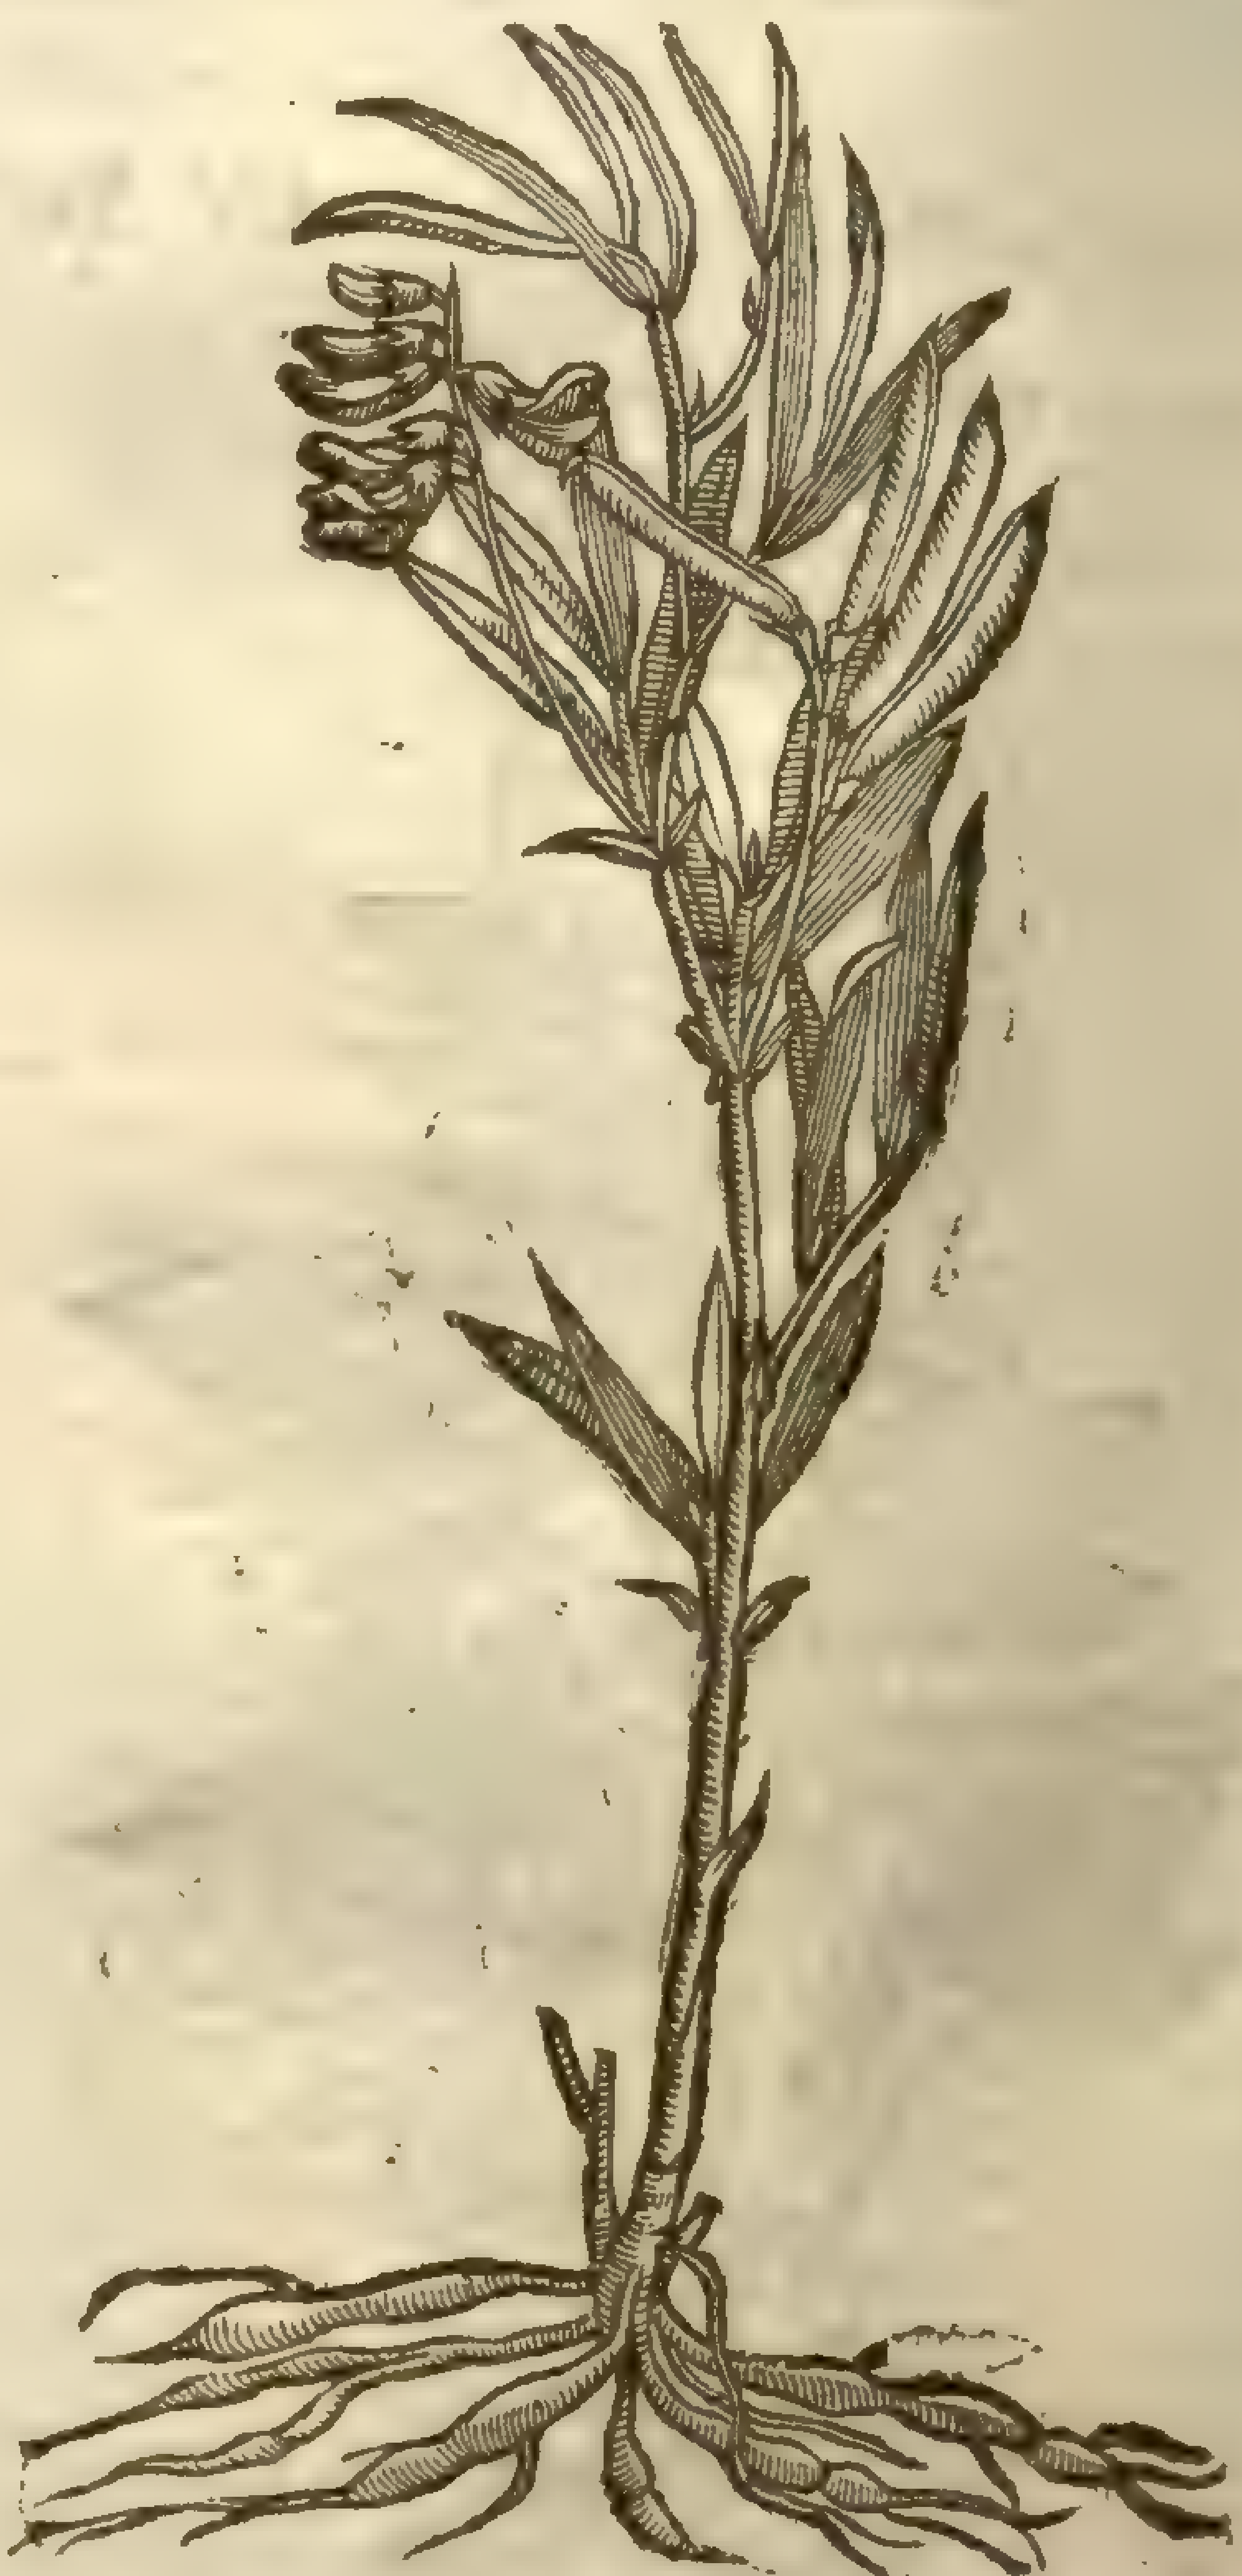
and of a light greene colour: the flours grow vpon long foot-ſtalks comming forth of the boſoms of the leaues, many together, hanging downe, ſmall, yet ſhaped like thoſe of other Pulſes, and of a purple colour: after theſe follow cods almoſt like thoſe of Fetches, but rounder, red when they be ripe, and containing in them a longiſh white ſeed: the root is hard and wooddy, running diuers waies with many fibres, and liuing ſundry yeares: this varies ſometimes with yellower green leaues and white floures. It floures in May, and growes only in ſome few gardens with vs.

2 The ſtalkes of this alſo are a foot or more high, ſtiffe, cornered, and greene; on theſe do grow winged leaues ſix or eight on a rib, after the manner of thoſe of the laſt deſcribed: each of theſe leaues hath three veines running alongſt it: the floures in ſhape and manner of growing are like thoſe of the former, but of a moſt elegant purple colour: which fading they become blew. The floures are ſucceeded by ſuch cods as the former, wherein are contained longiſh ſmall variegated ſeed, which ripe, the cods fly open, and twine themſelues round, as in moſt plants of this kinde: the root is blacke, hard, tuberous and wooddy, ſending forth each yeare new ſhoots. This floures in Aprill and May, and ripeneth the ſeed in Iune. This was found by *Cluſius* in diuers mountainous wooddie places of Hungary: he calls it *Orobus Pannonicus* 1.

‡ 3 *Orobus montanus flo. albo.*
White mountaine Peaſe.



‡ 4 *Orobus montanus anguſtifolius.*
Narrow leafed mountaine Peaſe.



3 This hath ſtalkes ſome cubit high, ſtiffe, ſtraight, and creſted; whereon by turnes are faſtned winged leaues, conſiſting of foure ſufficiently large and ſharpe pointed leaues, whereto ſometimes at the very end growes a fifth: the veines in theſe run from the middle rib towards their edges: their taſte is firſt ſomewhat ſouriſh, afterwards bitteriſh. The floures grow vpon ſhort ſtalkes comming forth of the boſomes of the leaues, fiue or ſix together, like thoſe of the Fetch, but of colour white, with ſome little yellowneſſe on the two little leaues that turne vpwards. The cods are like thoſe of the laſt deſcribed, and containe in them a browniſh ſeed, larger than any of the other kindes. This is an annuall plant, and periſheth as ſoone as it hath perfected the ſeed. *Cluſius* giues vs this by the name of *Orobus Pannonicus* 4. *Dodonæus* giues the ſame figure for his *Arachus latifolius*: and *Bauhine* affirmes this to be the *Galega montana*, in the *Hiſt. Lugd. pag.* 1139. But theſe ſeeme to be of two ſeuerall plants; for *Dodonæus* affirmes his to haue a liuing root, and ſuch ſeemes alſo that in the *Hiſt. Lugd.* to be: yet *Cluſius* ſaith expreſſely that his is an annuall, and floureth in

Aprill and May, and groweth in ſome wooddy mountainous places of the Kingdome of Hungarie.

4 This fourth hath ſtraight firme cornered ſtalkes ſome foot or more high, whereupon grow leaues vſually foure on a foot-ſtalke, ſtanding two againſt two, vpright, beeing commonly almoſt three inches long, at firſt of a ſowriſh taſte, but afterwards bitter: it hath no clauicles, becauſe the ſtalkes need no ſupporters: the floures grow vpon long foot-ſtalkes, ſpike-faſhion like thoſe of Peaſe, but leſſe, and white of colour: after theſe follow long blackiſh cods, full of a blacke or elſe ſpotted ſeed: the roots are about the length of ones little finger, faſhioned like thoſe of the Aſphodill or leſſer female Peionie, but leſſer, blacke without, and white within. *Cluſius* found this on the mountainous places nigh the baths of Baden, and in the like places in Hungary: he calls it *Orobus Pannonicus 3*.

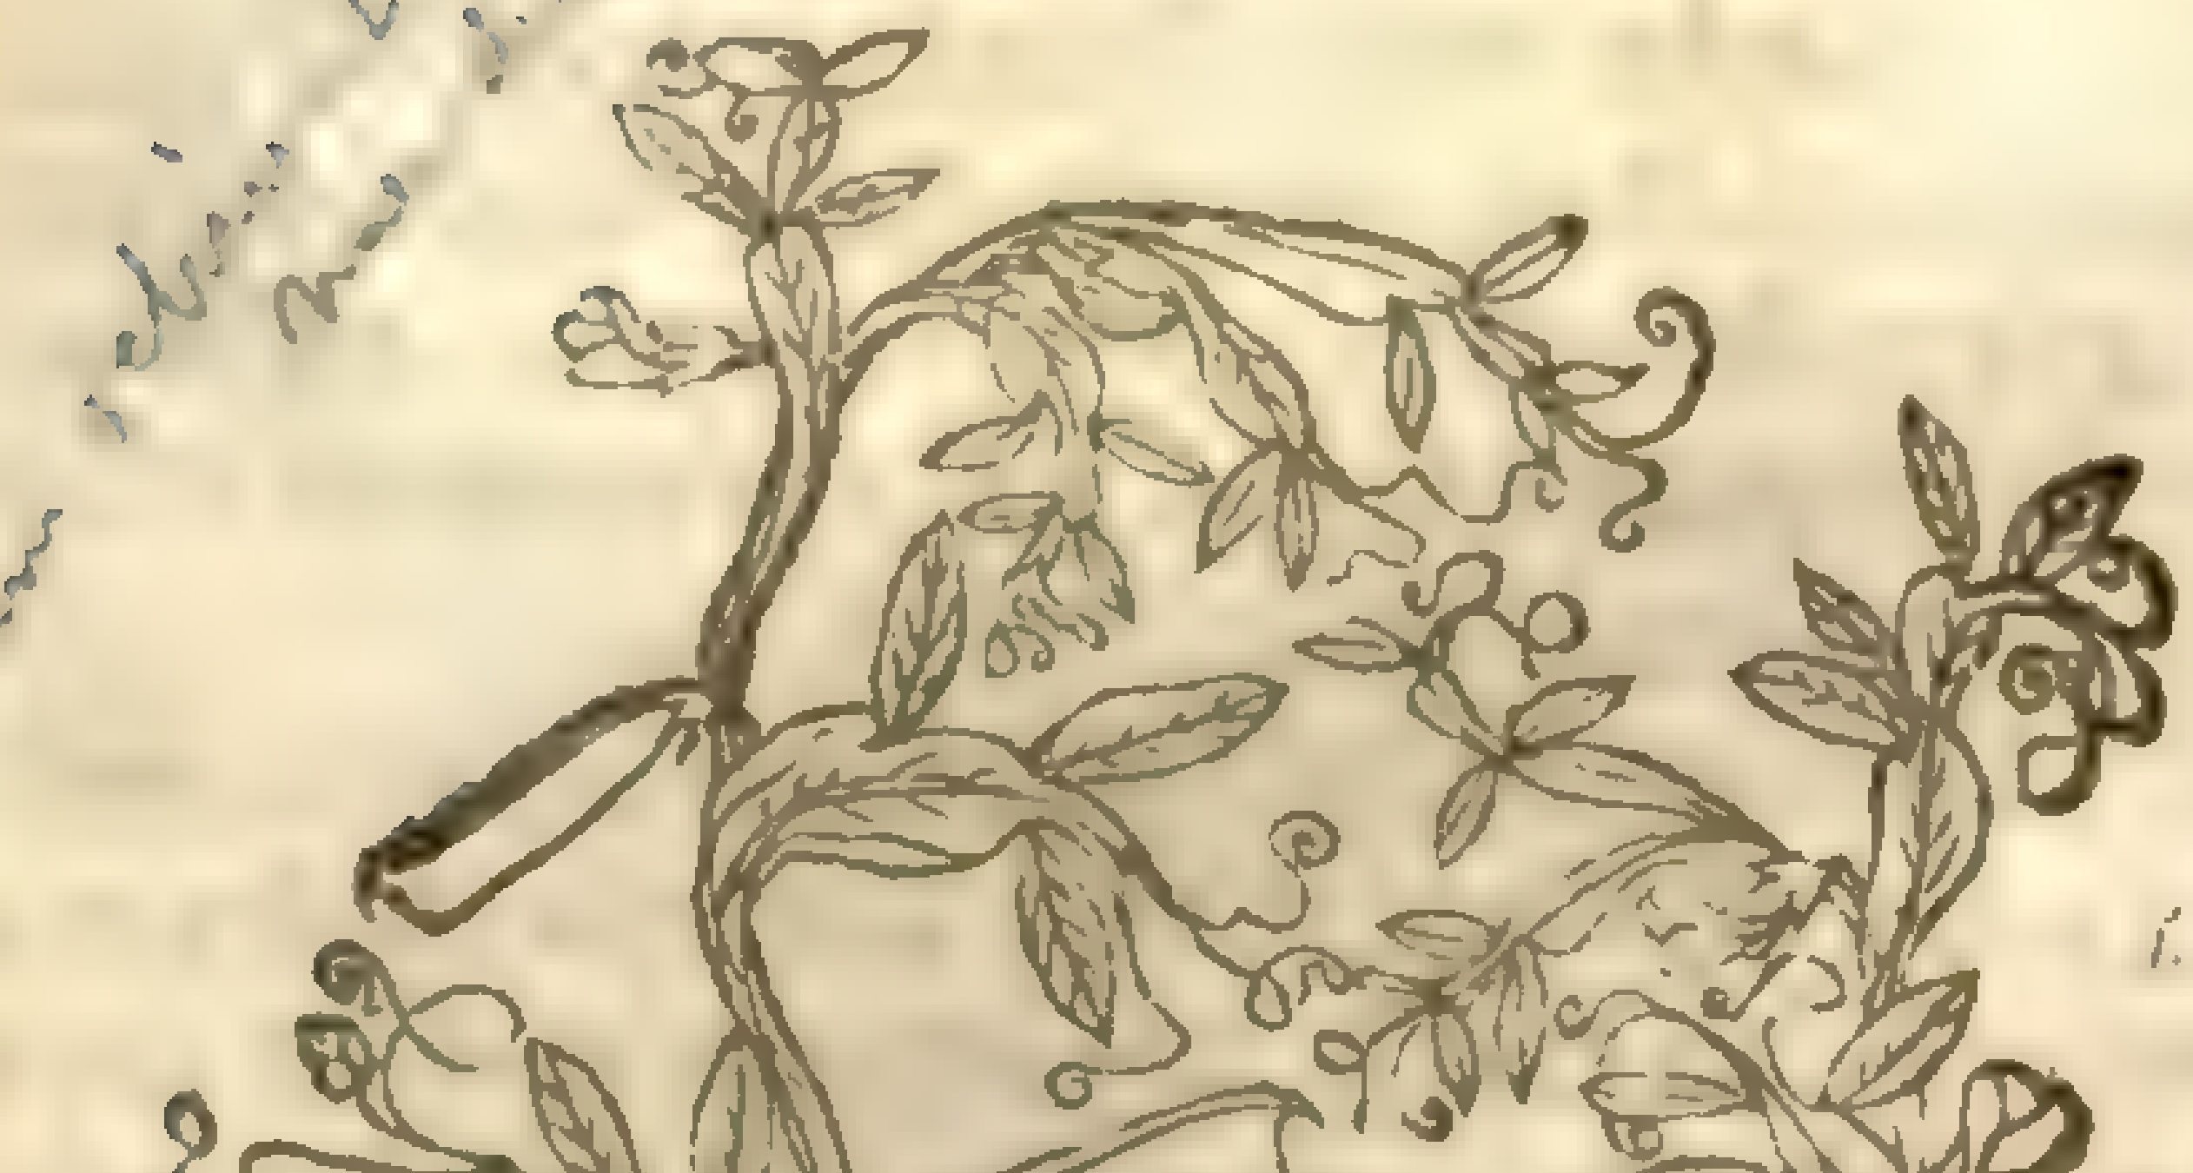
¶ *The Temperature and Vertues.*

Theſe are not knowne nor vſed in Phyſicke; yet if the third be the *Galega montana* of the *Hiſtoria Lugd.* then it is there ſaid to be effectuall againſt poyſon, the wormes, the falling ſickeneſſe, and the Plague. ‡

‡ CHAP. 527. *Of ſome other Pulſes.*

‡ 1 *Ochrus, ſiue Ervilia.*
Birds Peaſe.

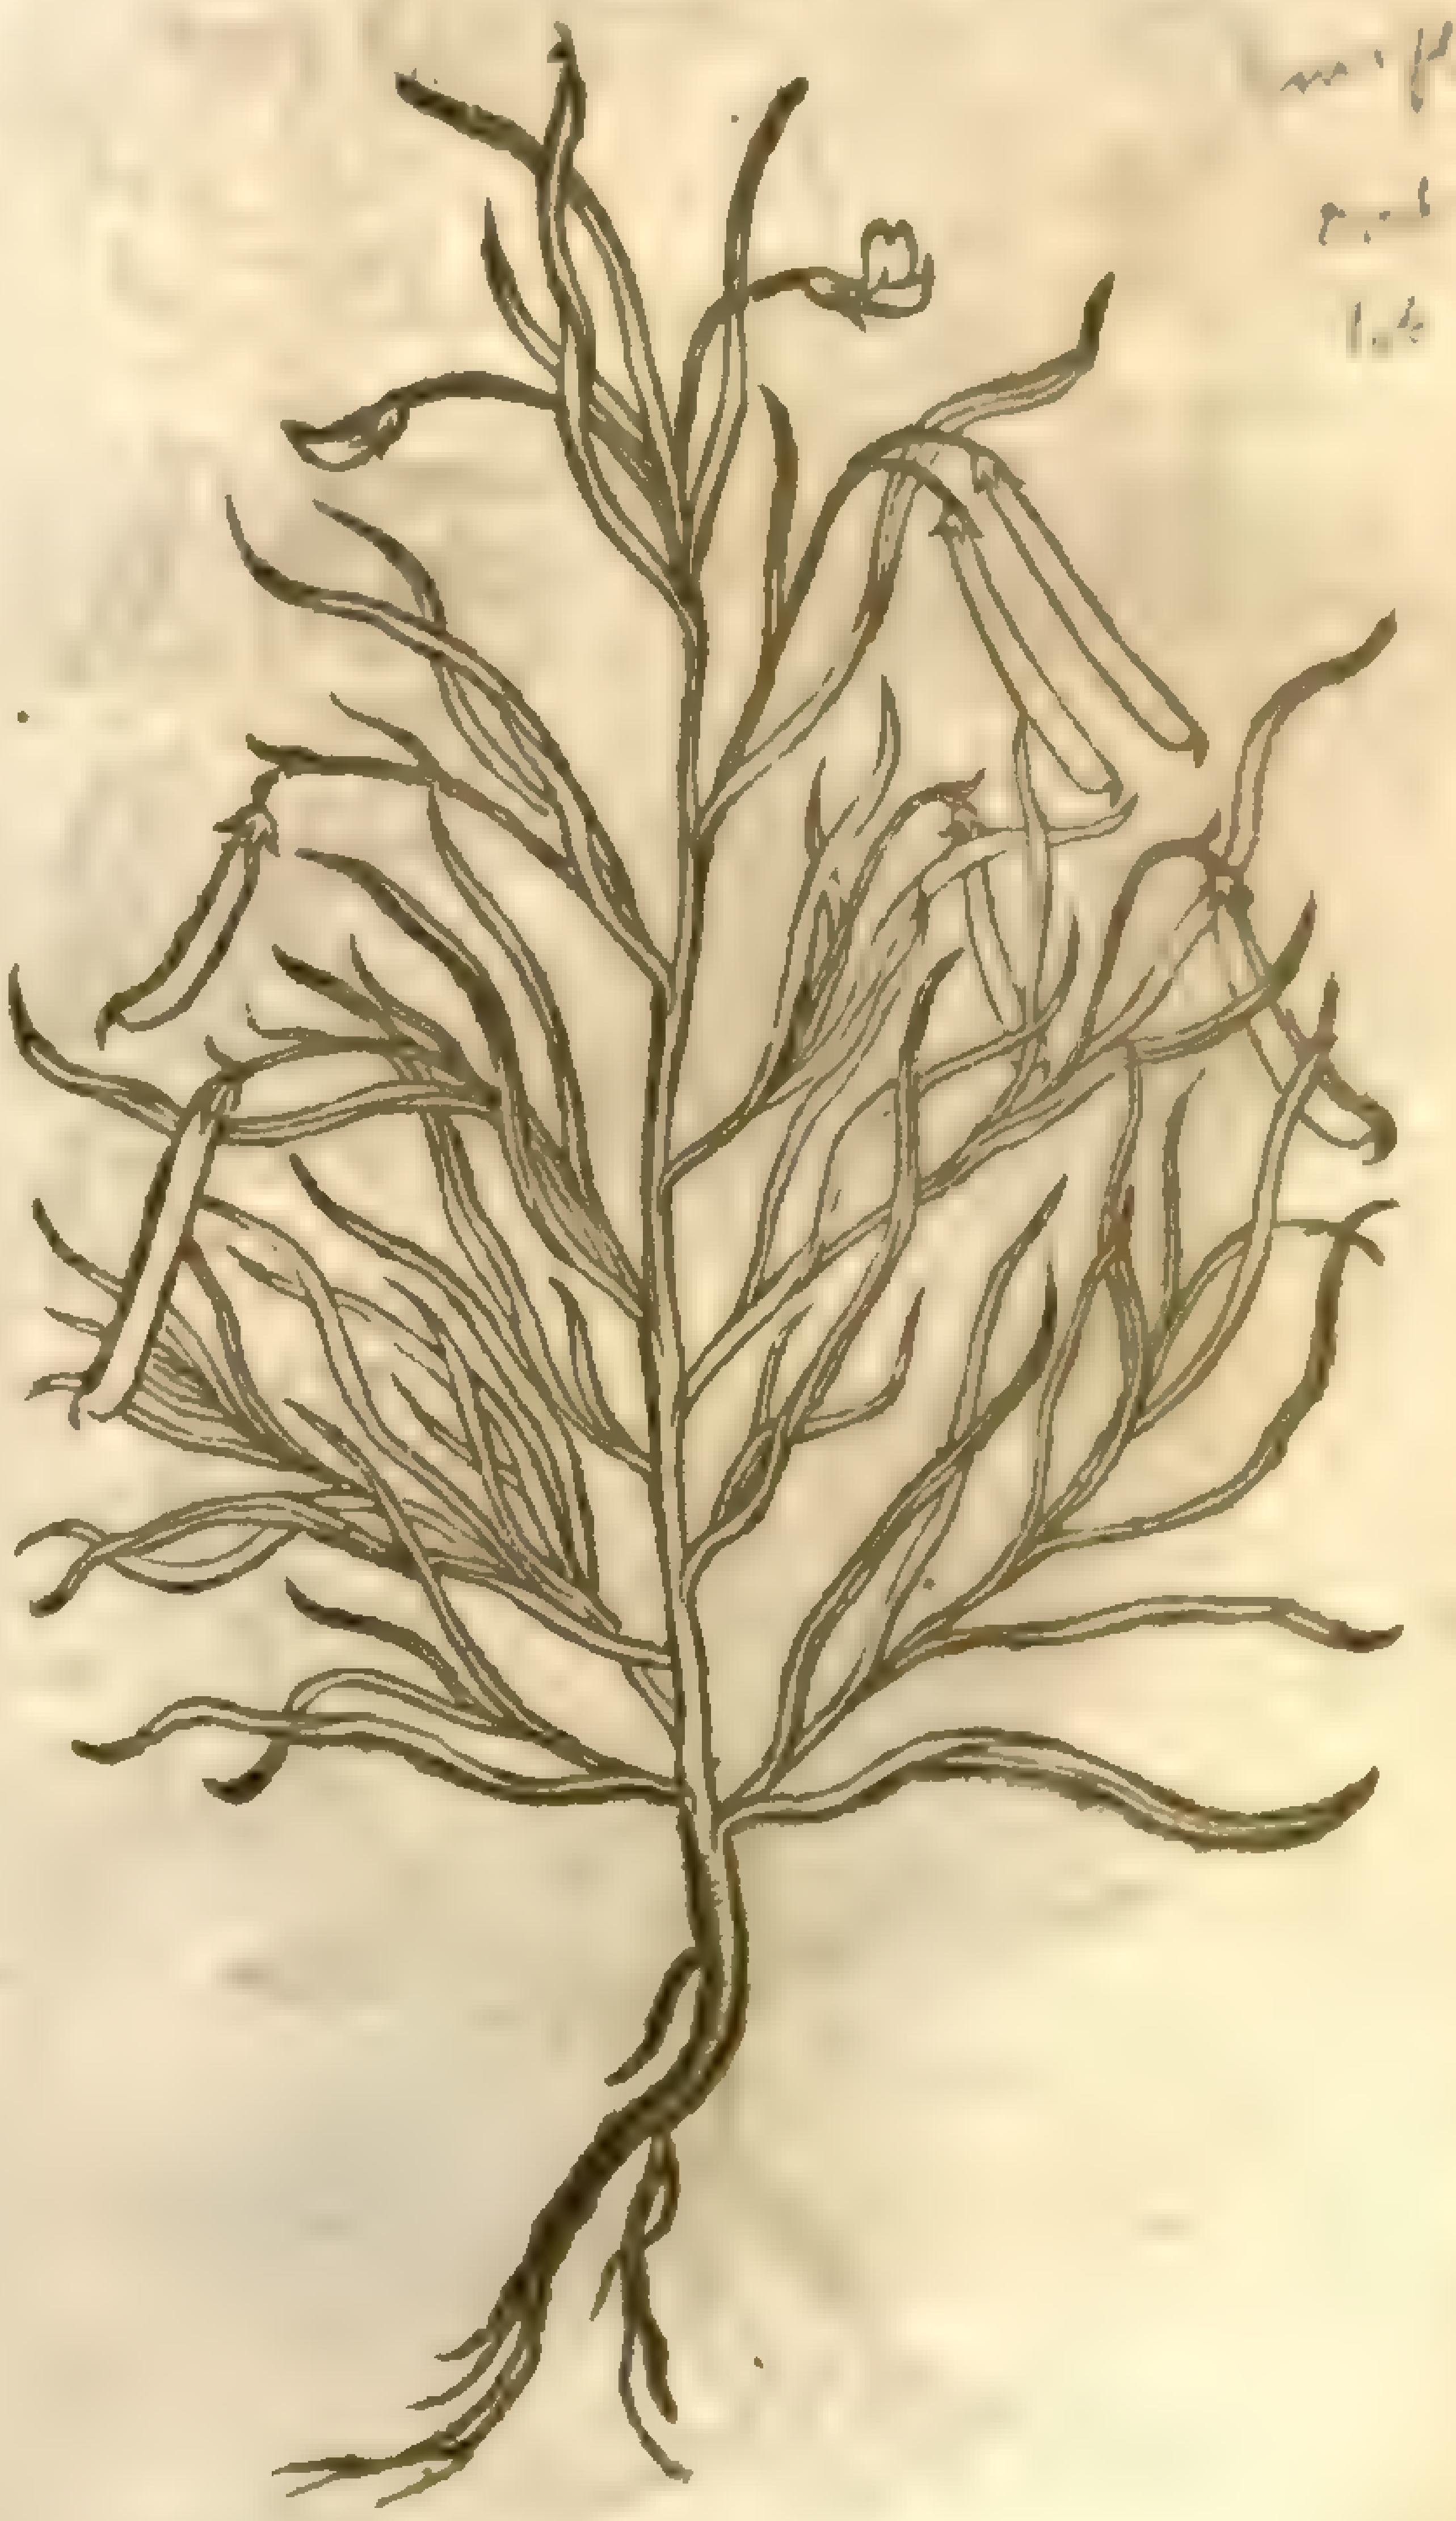
[illegible]



‡ 2 *Ervum ſylueſtre.*
Crimſon graſſe Fetch.

Lathyrus [illegible]

[illegible]



¶ *The Deſcription.*

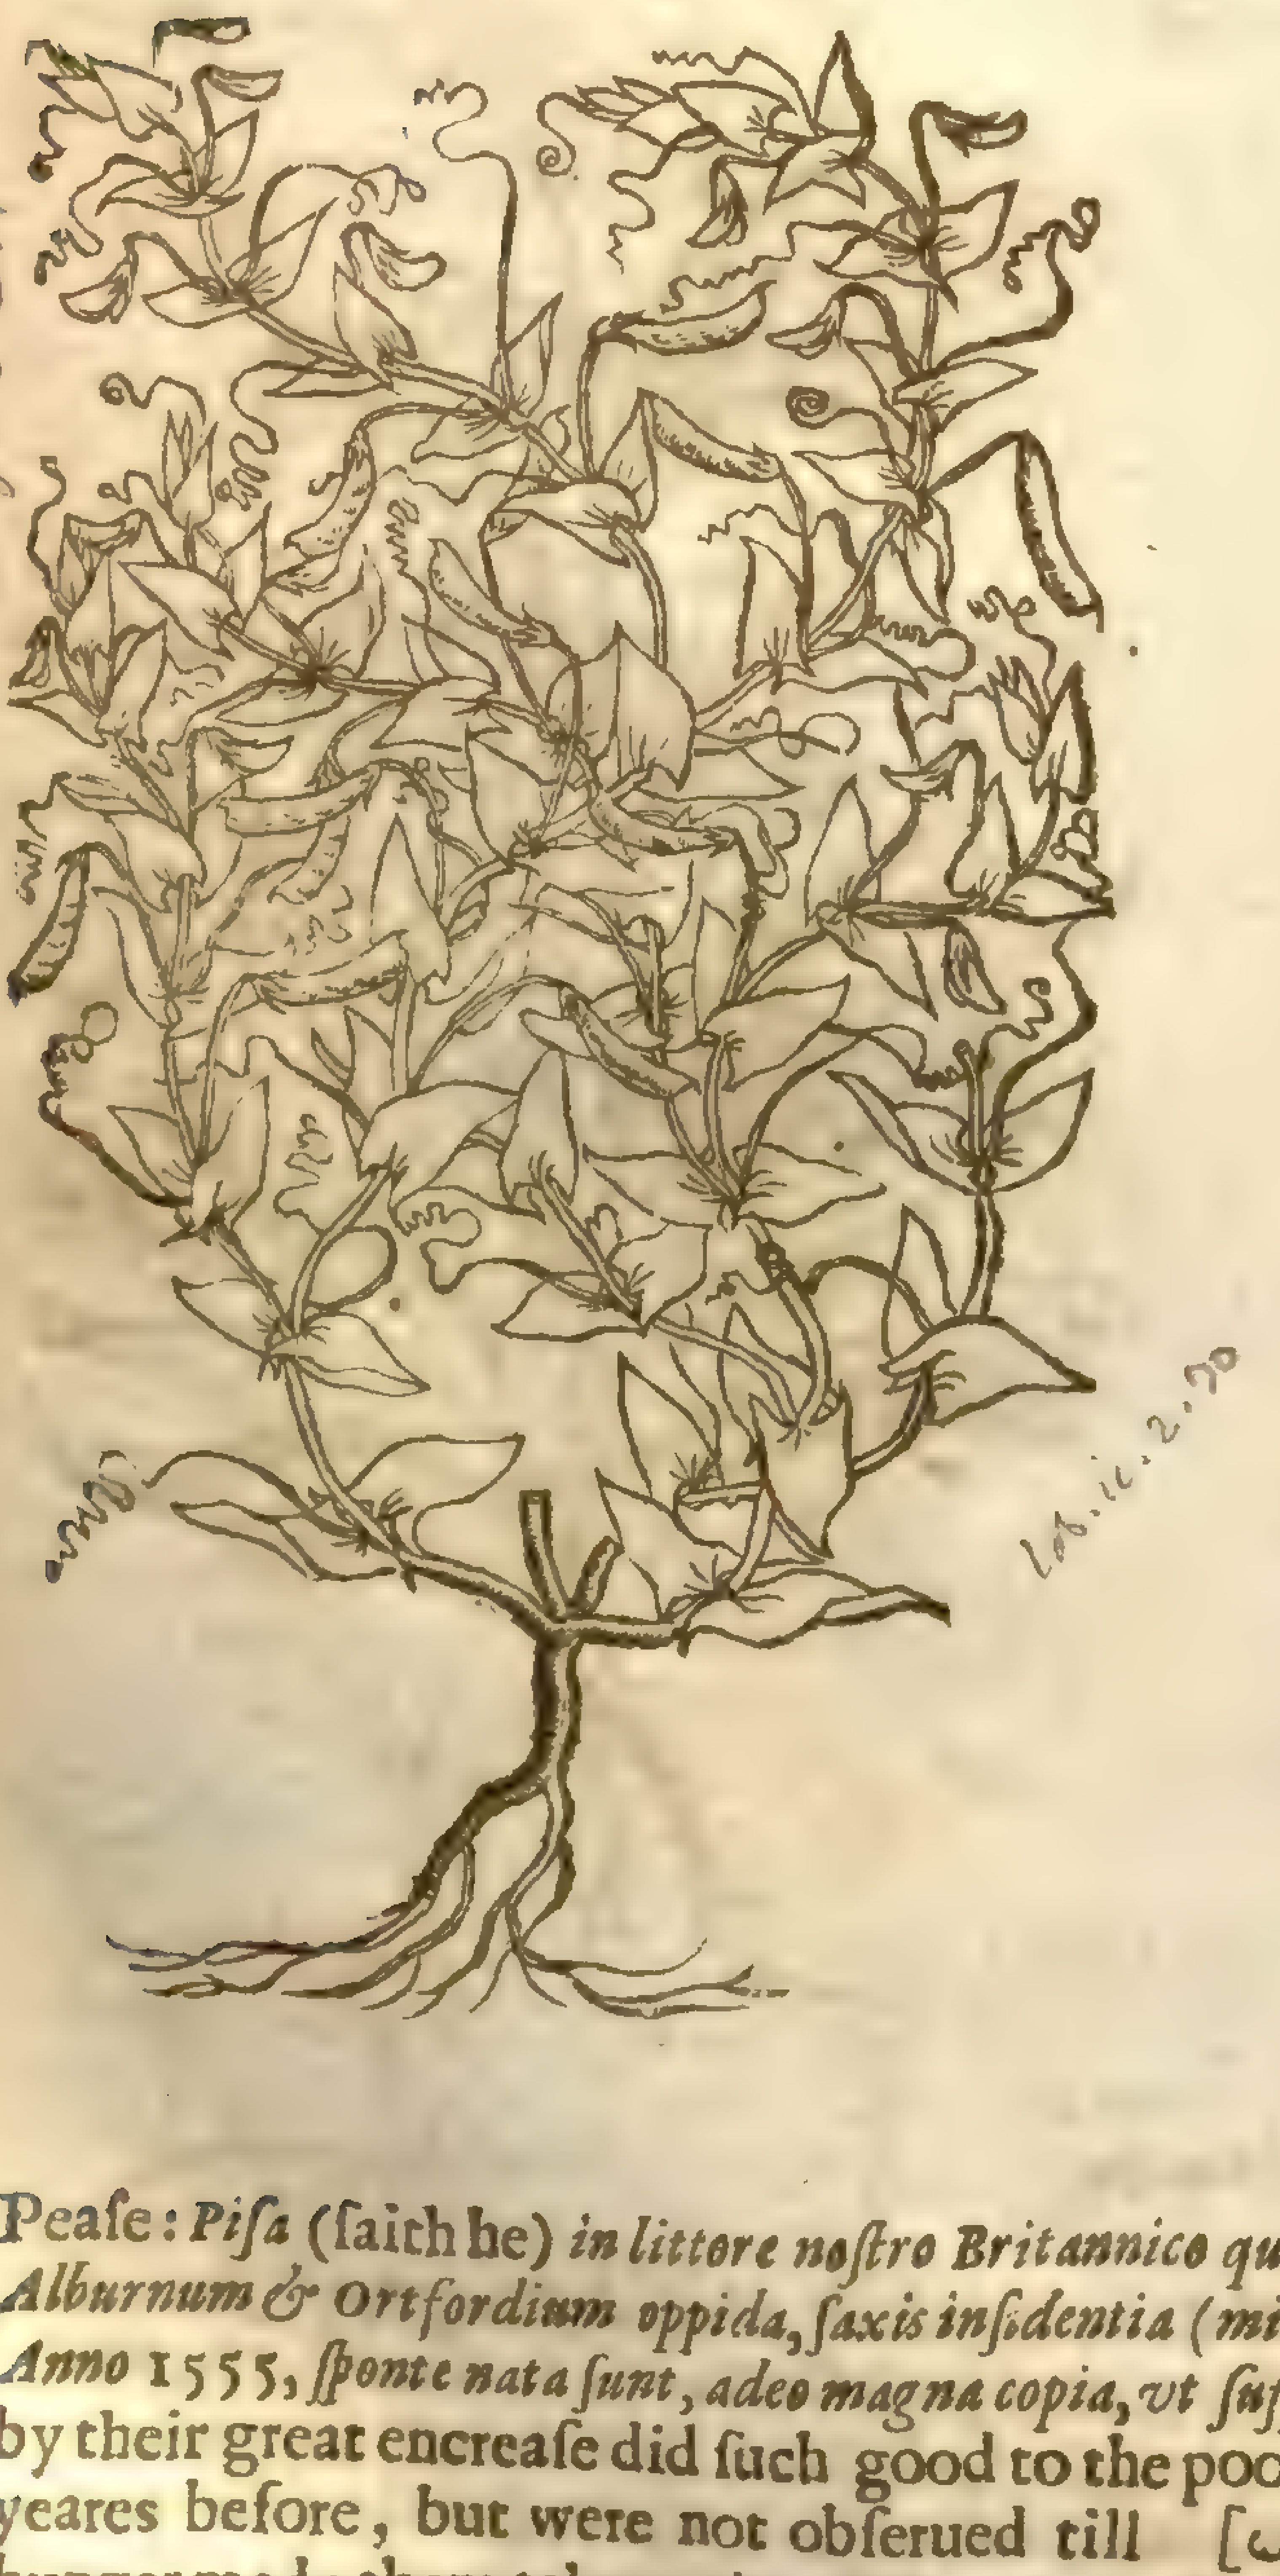
‡ 1 THe firſt of theſe hath cornered broad ſtalks like thoſe of euerlaſting Peaſe, and they are weake, and commonly lie vpon the ground, vnleſſe they haue ſomething to ſupport them: the lower leaues are broad, and commonly welt the ſtalke at their ſetting on, and at the end of the firſt leafe do vſually grow out after an vnuſuall manner, two, three, or more other pretty large leaues more long than broad, and the middle rib of the firſt leafe runnes out beyond the ſetting on of the higheſt of the out-growing leaues, and then it ends in two or three claſping tendrels. Thoſe leaues that grow the loweſt vpon the ſtalkes haue commonly the feweſt comming out of

them. The floures are like thoſe of other pulſes, of colour white: the cods are ſome inch and halfe long, containing ſome halfe dozen darke yellow or blackiſh ſmall Peaſe: theſe cods grow one at a joynt, on ſhort foot-ſtalkes comming forth of the boſomes of the leaues, and are welted on their broader ſide, which ſtands towards the maine ſtalke. This growes with vs only in gardens. *Dodonæus*, *Pena*, and *Lobel* call it *Ochrus ſylueſtris, ſiue Ervilia.*

2 The ſtalkes of this grow vp ſometimes a cubit high, being very ſlender, diuided into branches, and ſet vnorderly with many graſſe-like long narrow leaues: on the tops of the ſtalkes and branches, vpon pretty long foot-ſtalkes grow pretty peaſe-faſhioned floures of a faire and pleaſant crimſon colour: which fallen, there follow cods, long, ſmall, and round, wherein are nine, ten, or more round hard blacke ſhining graines: the root is ſmall, with diuers fibres, but whether it die when the ſeed is perfected, or no as yet I haue not obſerued. This growes wilde in many places with vs, as in the paſture and medow grounds about Pancridge Church. *Lobel* and *Dodon.* call this *Ervum ſylueſtre*; and they both partly iudge it to be the firſt *Catanance* of *Dioſcorides*, and by that name it is vſually called. It floures in Iune and Iuly, and the ſeed is ripe in Auguſt.

3 This alſo, though it be not frequently found, is no ſtranger with vs; for I haue found it in the corne fields about Dartford in Kent and ſome other places. It hath long ſlender joynted creeping ſtalkes, diuided into ſundry branches, whereon ſtand pretty greene three cornered leaues two at a joynt, in ſhape and bigneſſe like thoſe of the leſſer Binde-weed. Out of the boſomes of theſe leaues at each joynt comes a claſping tendrel, and commonly together with it a foot-ſtalke ſome inch or more long, bearing a pretty little peaſe-faſhioned yellow flour, which is ſucceeded by a ſhort flattiſh cod containing ſix or ſeuen little ſeeds. This floures in Iune, Iuly, and Auguſt, and ſo ripens the ſeed. It is by *Lobel* and others thought to be the *Aphace* of *Dioſcorides*, *Galen*, and *Pliny*: and the *Pitine* of *Theophraſtus*, by *Anguillara.*

‡ 3 *Aphaca.*
Small yellow Fetch.



Lathyrus aphaca, L.
[illegible] Sm. fl. 3. 294

Lob. ic. 2. 70

I finde mention in *Stowes* Chronicle, in *Anno* 1555, of a certaine Pulſe or Peaſe, as they term it, wherewith the poore people at that time there being a great dearth, were miraculouſly helped: he thus mentions it; In the moneth of Auguſt (ſaith he) in Suffolk at a place by the ſea ſide all of hard ſtone and pibble, called in thoſe parts a ſhelfe, lying betweene the townes of Orford and Aldborough, where nether grew graſſe, nor any earth was euer ſeene; it chanced in this barren place ſuddnely to ſpring vp without any tillage or ſowing, great abundance of Peaſon, whereof the poore gathered (as men iudged) aboue an hundred quarters, yet remained ſome ripe and ſome bloſſoming, as many as euer there were before: to the which place rode the Biſhop of Norwich and the Lord *Willoughby*, with others in great number, who found nothing but hard rockie ſtone the ſpace of three yards vnder the roots of theſe Peaſon: which roots were great and long, and very ſweet.

Geſner alſo, *de Aquatilibus, lib. 4. pag.* 256. making mention, out of D^r^ *Cajus* his letters, of the ſpotted Engliſh Whale, taken about that time at Lin in Northfolke, alſo thus mentions thoſe Peaſe: *Piſa* (ſaith he) *in littore noſtro Britannico quod Orientem ſpectat, certo quodam in loco Suffolciæ, inter Alburnum & Ortfordium oppida, ſaxis inſidentia (mirabile dictu) nulla terra circumfuſa, autumnali tempore Anno* 1555, *ſponte nata ſunt, adeo magna copia, vt ſufficerent vel millibus hominum.* Theſe Peaſe, which by their great encreaſe did ſuch good to the poore that yeare, without doubt grew there for many yeares before, but were not obſerued till [*Magiſter artis, ingenijque largitor Venter*] —— hunger made them take notice of them, aud quickned their inuention, which commonly in our people is very dnll, eſpecially in finding out food of this nature.

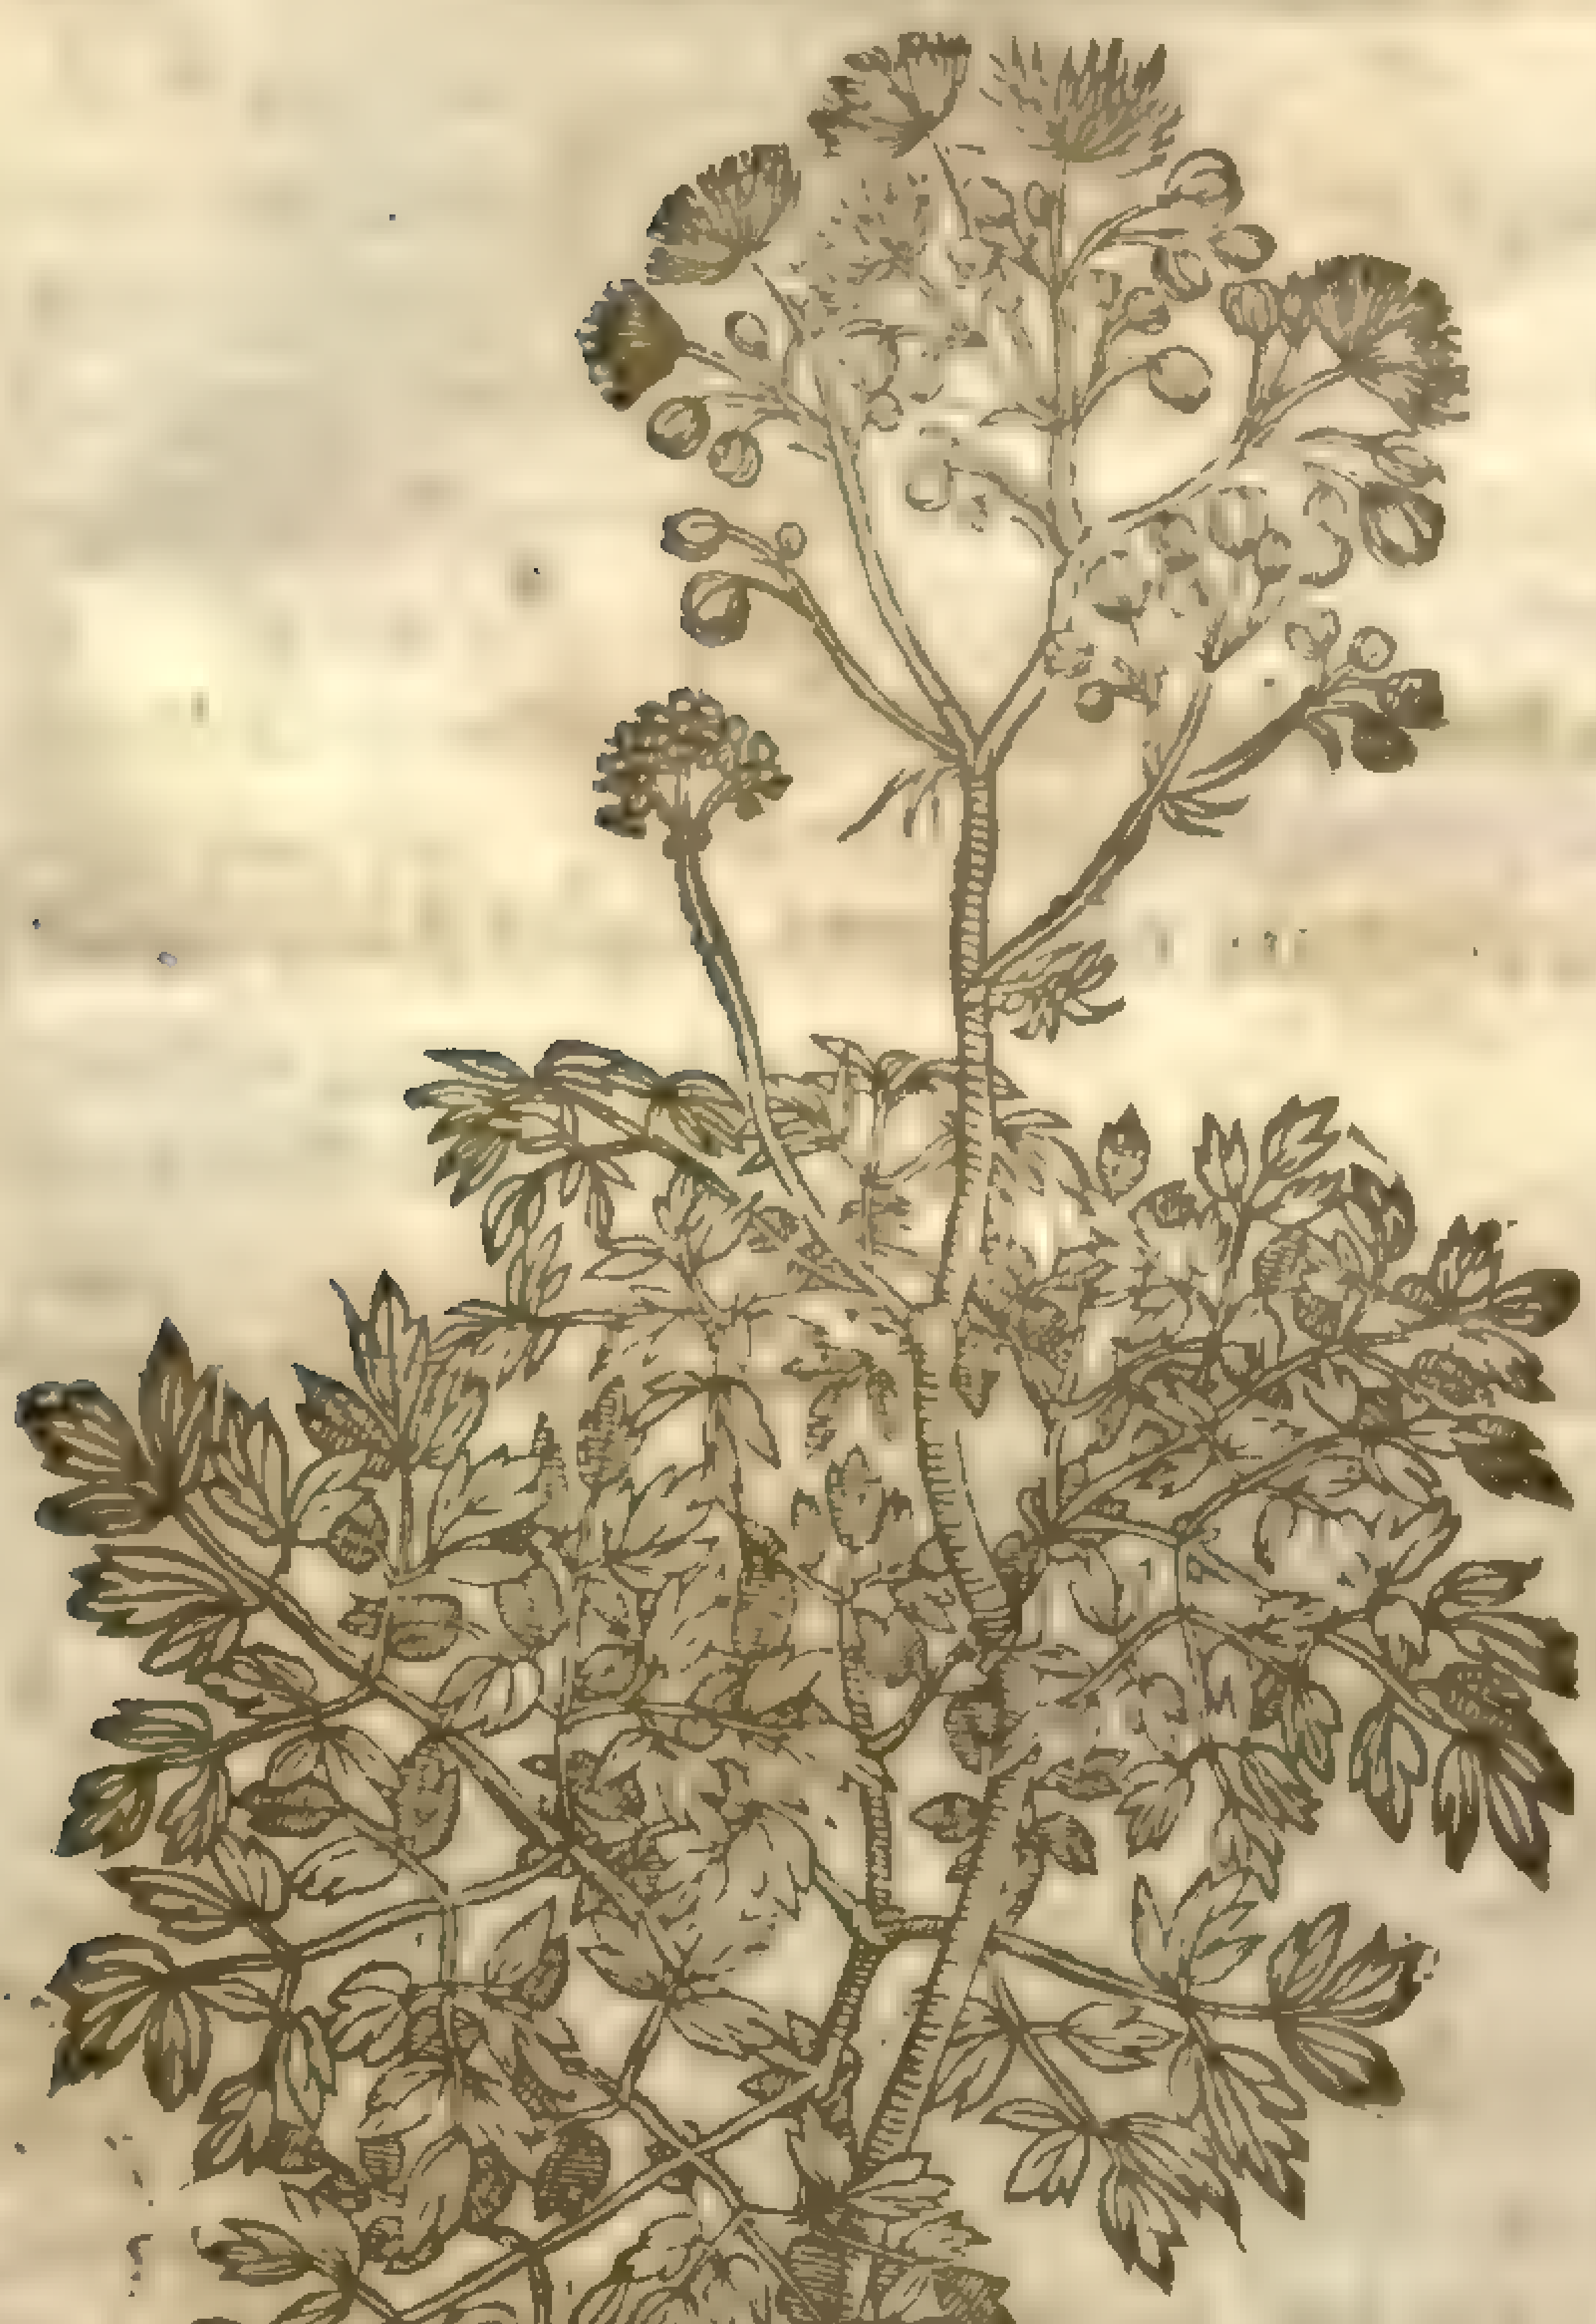
My Worſhipfull friend Dr. *Argent* hath told me, that many yeares agoe he was in this place, and cauſed his man to pull away the beach with his hands, and follow the roots ſo long, vntill he got ſome equall in length vnto his height, yet could come to no ends of them: he brought theſe vp with him to London, and gaue them to Dr. *Lobel*, who was then liuing; and he cauſed them to be drawne, purpoſing to ſet them forth in that Worke which he intended to haue publiſhed, if God had ſpared him longer life. Now whether theſe Peaſe be truly ſo called, and be the ſame with the *Piſum ſylueſtre Perenne*, or different; or whether they be rather of the ſtocke of the *Lathyrus major*, or of ſome other Pulſe here formerly deſcribed, I can affirme nothing of certainety, becauſe I haue ſeene no part of them, nor could gather by any that had, any certainty of their ſhape or figure: yet would I not paſſe them ouer in ſilence, for that I hope this may come to be read by ſome who liue thereabout, that may by ſending me the things themſelues, giue me certaine knowledge of them, that ſo I may be made able, as I am alwaies willing, to impart it to others.

¶ *The Temperature and Vertues.*

I haue not found any thing written of the faculties of the two firſt; but of *Aphace*, *Galen* ſaith it hath an aſtringent faculty like as the Lentill, and alſo is vſed to be eaten like as it, yet it is harder of concoction, but it dries more powerfully, and heates moderately. The ſeeds (ſaith he) haue an aſtringent faculty; wherefore parched, broken, and boyled, they ſtay fluxes of the belly. We know (ſaith *Dodonaeus*) by certaine experience, that the *Aphace* here deſcribed hath this aſtringent force and faculty. ‡ A

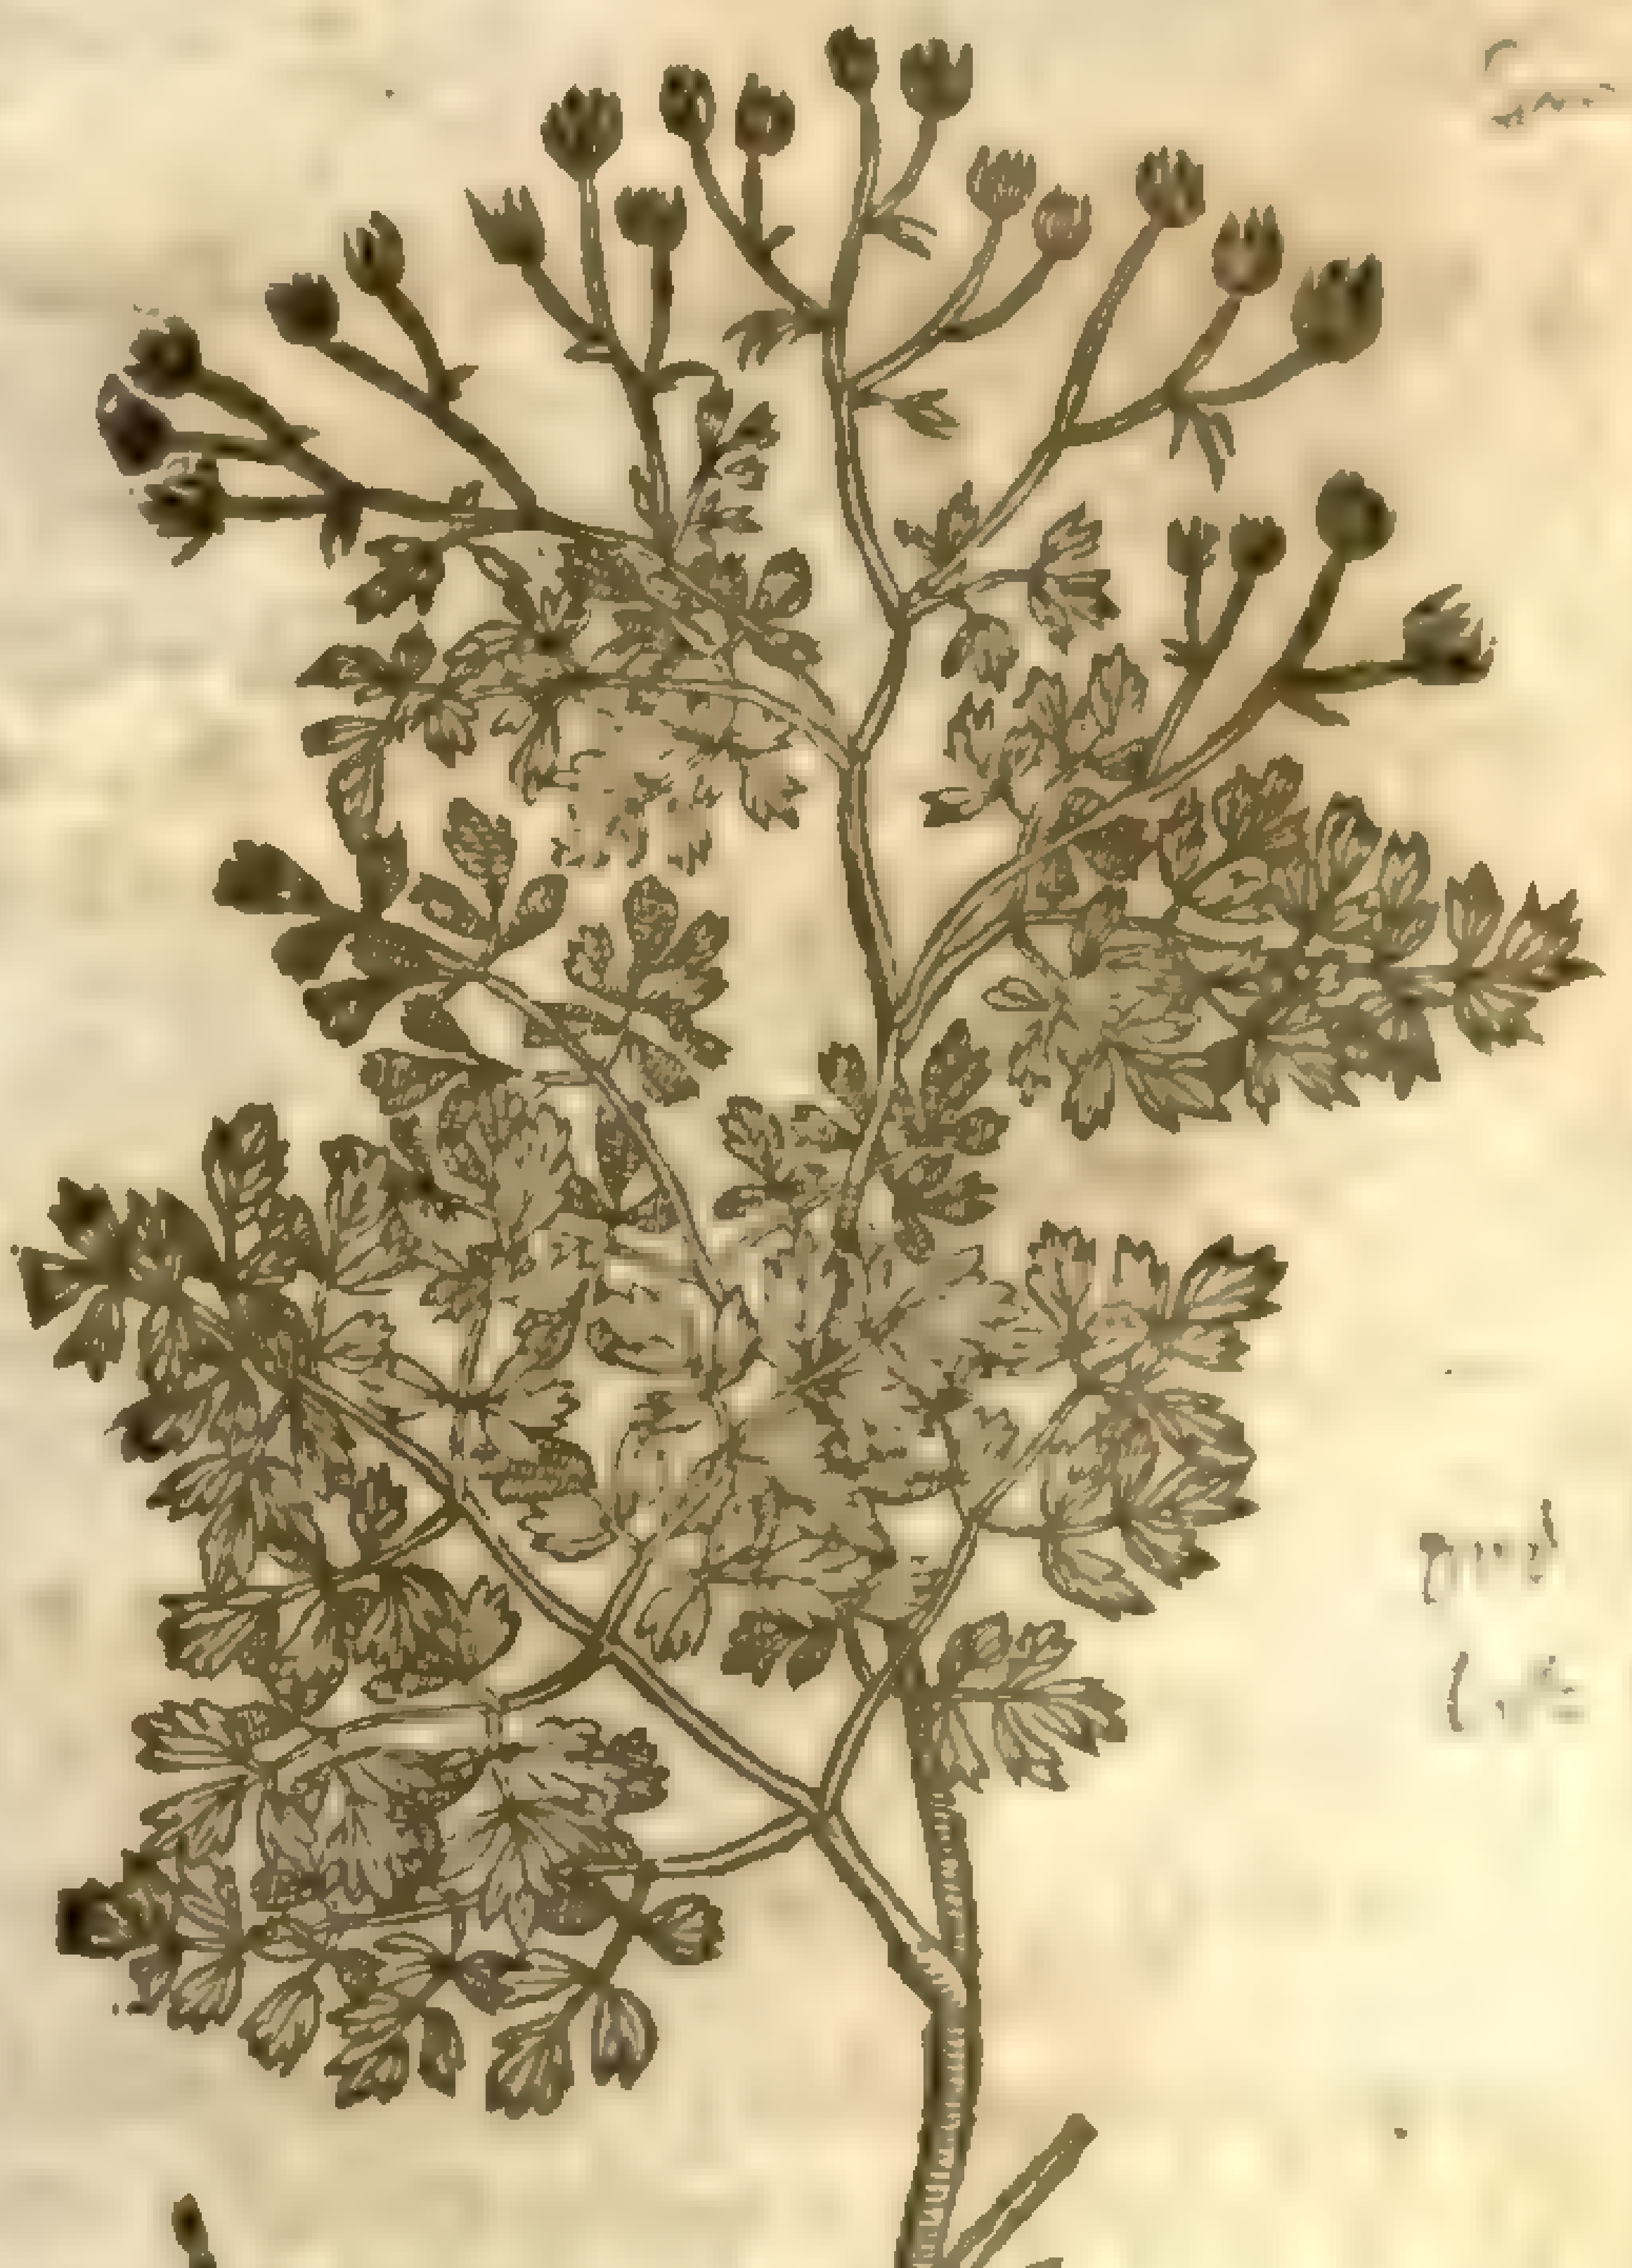
Chap. 528. *Of baſtard Rubarb.*

1 *Thalietrum, ſiue Thalictrum majus.*
Great baſtard Rubarb.



2 *Thalictrum minus.*
Small baſtard Rubarb.

T. minus, [illegible]



¶ *The Deſcription.*

1 THe great *Thalietrum* or baſtard Rubarb hath large leaues parted or diuided into diuers other ſmall leaues, ſomewhat ſnipt about the edges, of a blacke or darke greene colour:

the ſtalkes are creſted or ſtreaked, of a purple colour, growing to the height of two cubits: at the top whereof grow many ſmall and hairy white floures, and after them come ſmall narrow huskes like little cods, foure or fiue growing together: the root is yellow, long, round, and knotty, diſperſing it ſelfe far abroad on the vpper cruſt of the earth.

2 The ſmall baſtard Rubarb is very like vnto the precedent, but that it is altogether leſſer: his ſtalkes are a ſpan or a foot long: his leaues be thin and tender; the root fine and ſlender: the little floures grow together in ſmall bundles or tufts, of a light yellow colour, almoſt white, and are of a grieuous ſauour.

‡ 3 There is kept in ſome gardens a plant of this kinde growing vp with large ſtalkes to the height of three cubits: the leaues are very like thoſe of Columbines: the floures are made of many white threds: it floures in Iune, and is called *Thalictrum majus Hiſpanicum*, Great Spaniſh Baſtard Rubarb. ‡

¶ *The Place.*

Theſe plants doe grow alongſt the Ditch ſides leading from Kentiſh ſtreet vnto Saint Thomas a-Waterings (the place of Execution) on the right hand. They grow alſo vpon the bankes of the Thames, leading from Blacke-wall to Woolwich, neere London, and in ſundry other places alſo.

¶ *The Time.*

They floure for the moſt part in Iuly and Auguſt.

¶ *The Names.*

Diuers of the later Herbariſts do call it *Pigamum*, as though it were πήγανον, that is, Rue; whereupon moſt call it *Ruta paluſtris*, or Fen Rue: others, *Pſeudo-Rhabarbarum*, and *Rhabarbarum Monachorum*, by reaſon of the yellow colour of the root. But nether of their iudgements is greatly to be eſteemed of: they iudge better that would haue it to be *Thalietrum*, which *Dioſcorides* deſcribeth to haue leaues ſomething flatter than thoſe of Coriander; and the ſtalke like that of Rue: vpon which tho leaues do grow. *Pena* calleth it *Thalietrum*, *Thalictrum*, and *Ruta pratenſis*: in Engliſh, Baſtard Rubarb, or Engliſh Rubarb: which names are taken of the colour, and taſte of the roots.

¶ *The Temperature.*

Theſe herbes are hot and dry of complexion.

¶ *The Vertues.*

A The leaues of Baſtard Rubarb with other pot-herbes do ſomewhat moue the belly.

B The decoction of the root doth more effectually.

C *Dioſcorides* ſaith, That the leaues being ſtamped do perfectly cure old vlcers. *Galen* addeth, that they dry without biting.

Chap. 529. *Of Goats Rue.*

¶ *The Deſcription.*

Galega or Goats Rue hath round hard ſtalkes two cubits or more high, ſet full of leaues diſplayed or winged abroad; euery leafe conſiſting of ſundry ſmall leaues ſet vpon a ſlender rib, reſembling the leaues of the field Vetch or Tare, but greater and longer. The floures grow at the top of the ſtalke, cluſtering together after the manner of the wilde Vetch, of a light skie colour, which turne into long cods ſmall and round, wherein the ſeed is contained. The root is great, thicke, and of a white colour.

¶ *The Place.*

It groweth plentifully in Italy euery where in fat grounds and by riuers ſides: it groweth likewiſe in my garden.

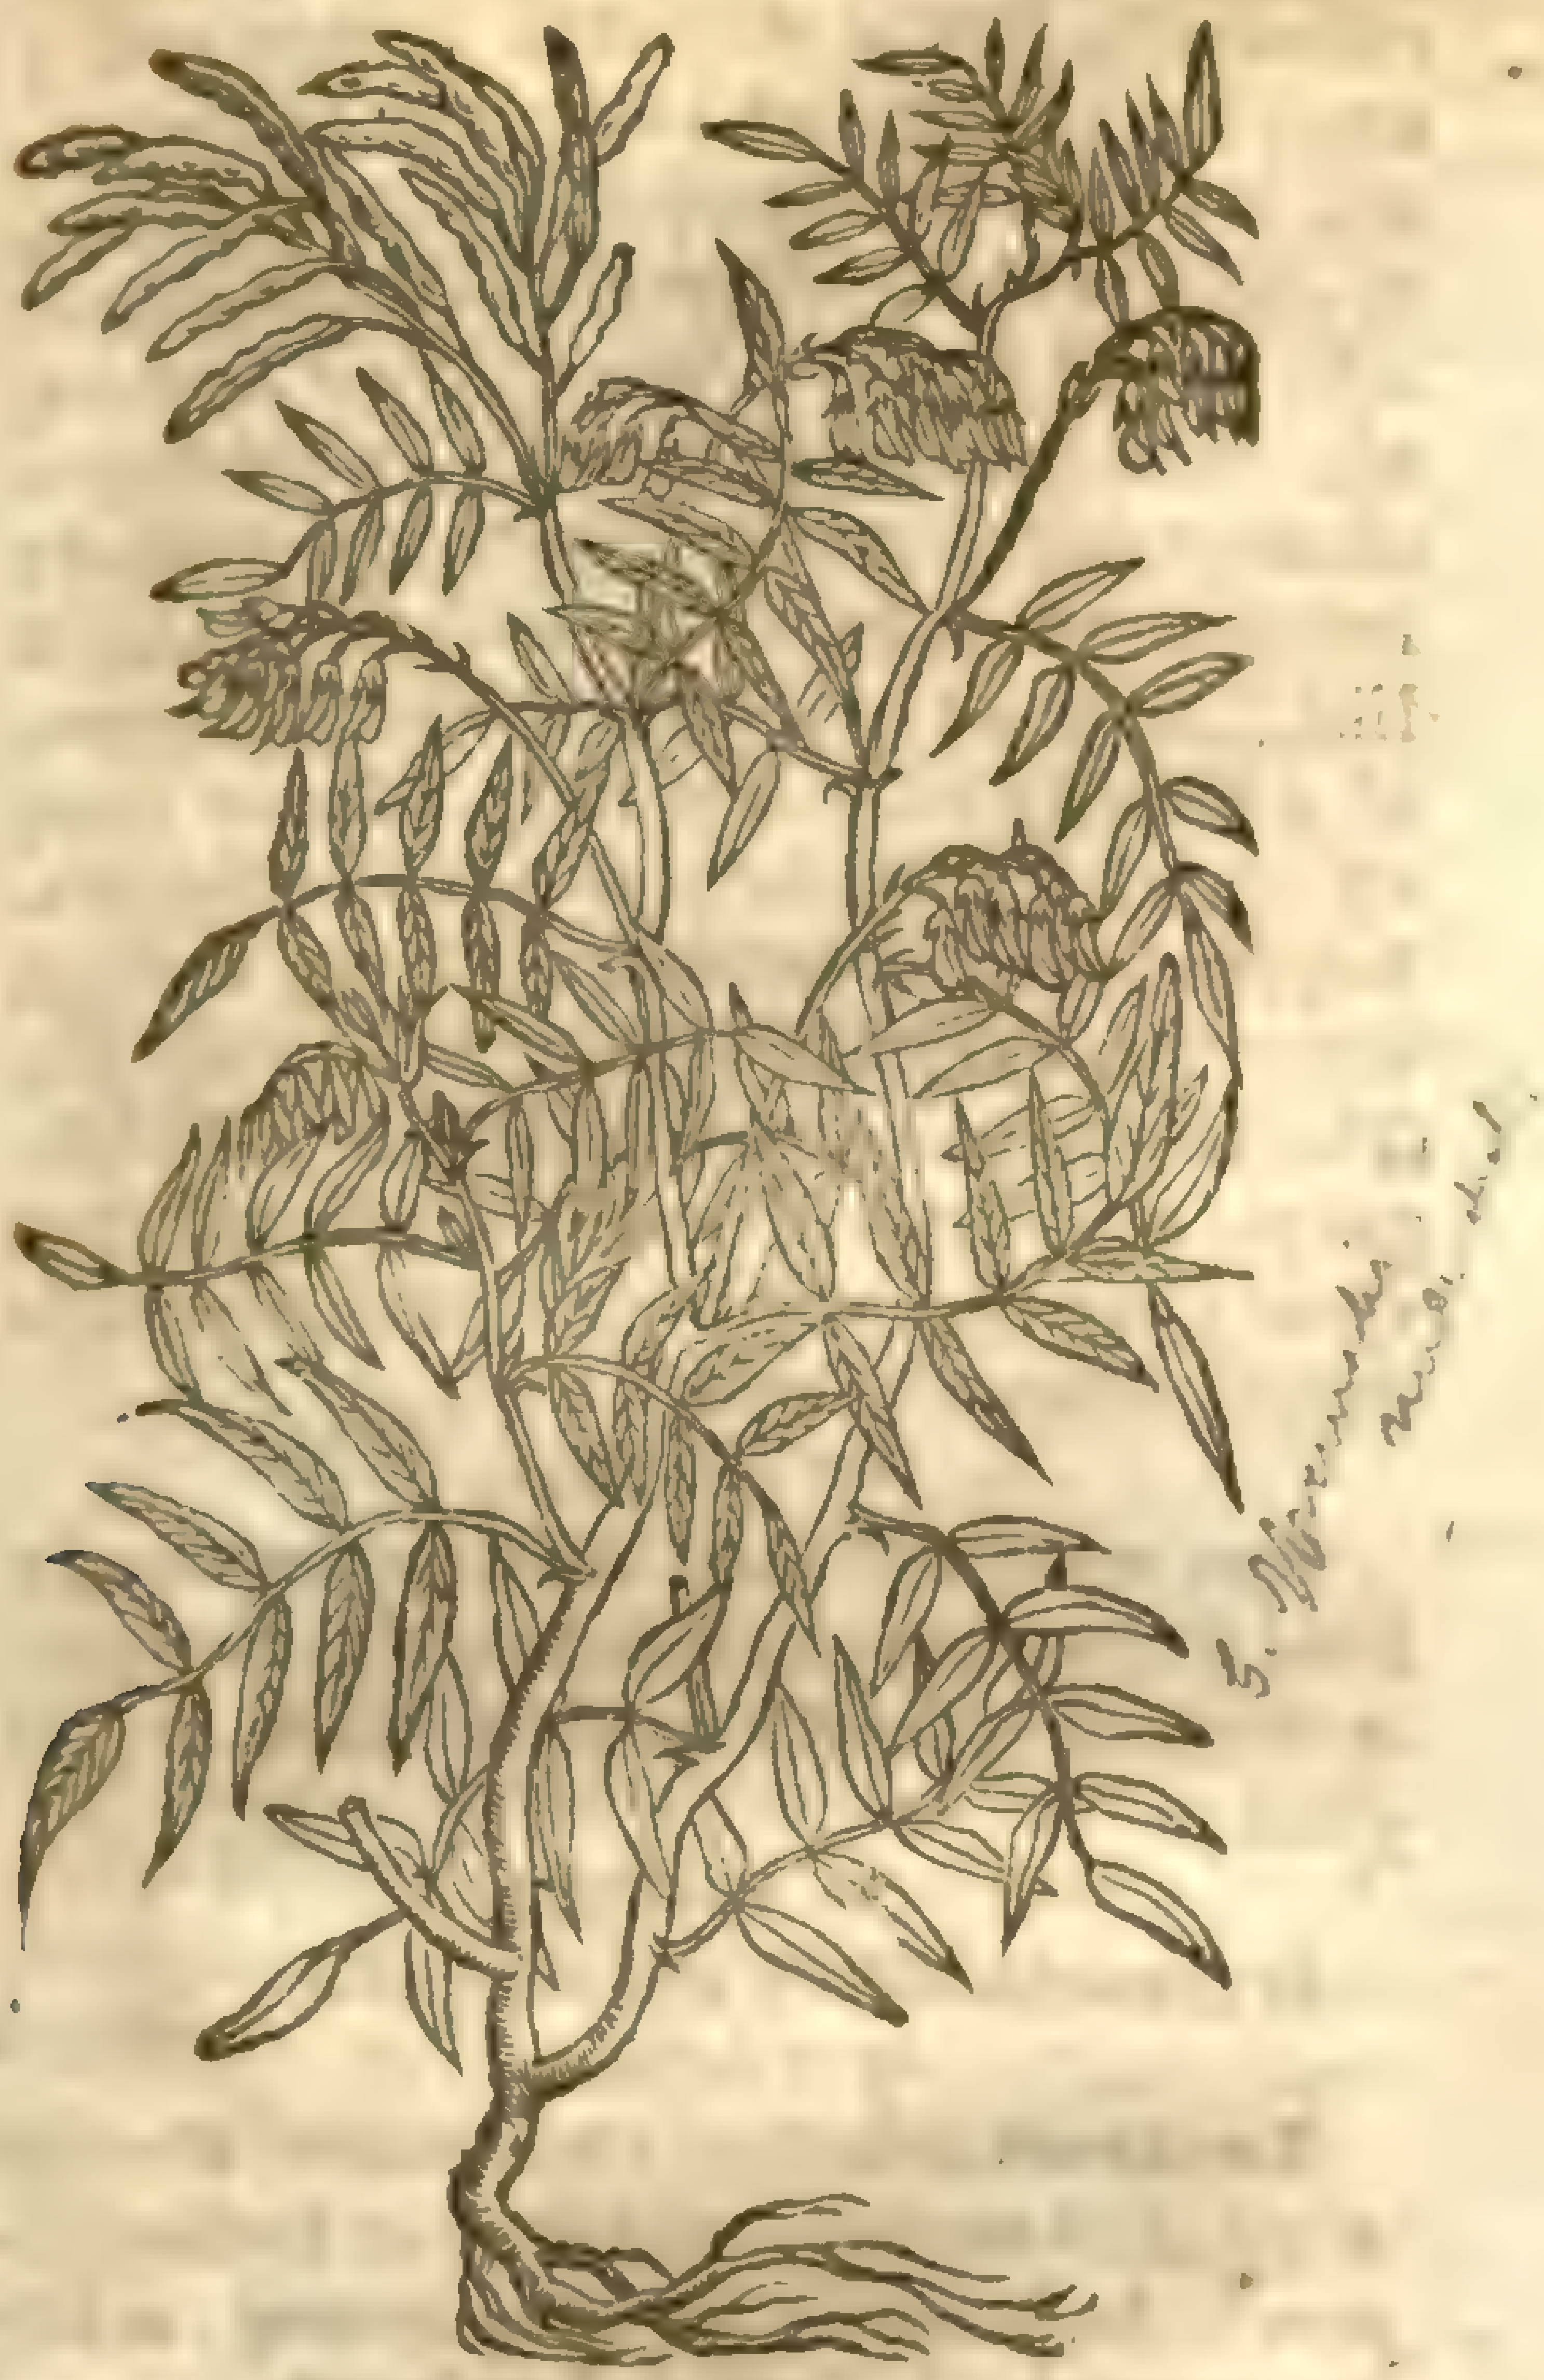
¶ *The Time.*

It floureth in Iuly and Auguſt.

¶ *The Names.*

The Italians call it *Galega*, and *Ruta Capraria*: diuers name it corruptly *Gralega*: *Hieronymus*

Fracaſtorius



Galega.
Goats Rue.

Fracaſtorius calleth it *Herba Galleca*: the Hetruſcians, *Lauaneſe*; and it is alſo called by diuers other names in ſundry places of Italy, as *Geſner* ſaith, as are *Caſtracane*, *Lauanna*, *Thorina*, or *Taurina*, *Martanica*, *Sarracena*, *Capragina*, *Herbaneſa*, *Fœnum græcum ſylueſtre*, and as *Braſauolus* witneſſeth, *Giarga*. It is named in Engliſh, Italian Fitch, and Goats Rue.

Some iudge that the old Phyſitions were wont to call it *Onobrychis*: others, *Glauce*: diuers would haue it to bee *Polemonium*, but not ſo much *Petr. And. Matthiolus* in his commentaries, as euery one of the deſcriptions mentioned by *Dioſcorides* doe gaineſay them; as alſo thoſe, who thinke that *Galega*, is *Polygalon*, and that the name of *Galega* came of *Polygalon*, the very deſcription alſo of *Polygalon* is againſt them: for *Galega* is higher and greater than that it may be called a little ſhrub onely of an hand breadth high.

¶ *The Temperature.*

This plant is in a meane temperature betweene hot and cold.

¶ *The Vertues.*

Goats Rue is a ſingular herbe againſt all venome and poiſon, and againſt wormes, to kill and driue them forth, if the juyce be giuen to little children to drinke. A

It is of like vertue if it bee fryed with Lineſeed oyle, and bound vpon the childes nauell. B

It is miniſtred vnto children which are poſſeſſed with a falling euill, a ſpoonfull euery morning in milke. C

Being boiled in vineger, and drunke with a little Treacle, it is very good againſt the infection of the plague, eſpecially if the medicine be taken within twelue houres. D

The herbe it ſelfe is eaten, being boyled with fleſh, as we vſe to eat Cabbage and other worts, and likewiſe in ſallades, with oyle, vineger and pepper, as we doe eat boyled Spinage, and ſuch like; Which is moſt excellent being ſo eaten, againſt all poiſon and peſtilence, or any venomous infirmitie whatſoeuer, and procureth ſweat. E

It alſo helpeth the bitings and ſtingings of venomous beaſts, if either the juyce or the herbe ſtamped be laid vpon the wound. F

Halfe an ounce of the juyce inwardly taken is reported to helpe thoſe that are troubled with convulſions, crampes, and all other the diſeaſes aforeſaid. G

The ſeeds do feed pullen exceedingly, and cauſe them to yeeld greater ſtore of egges than ordinary. H

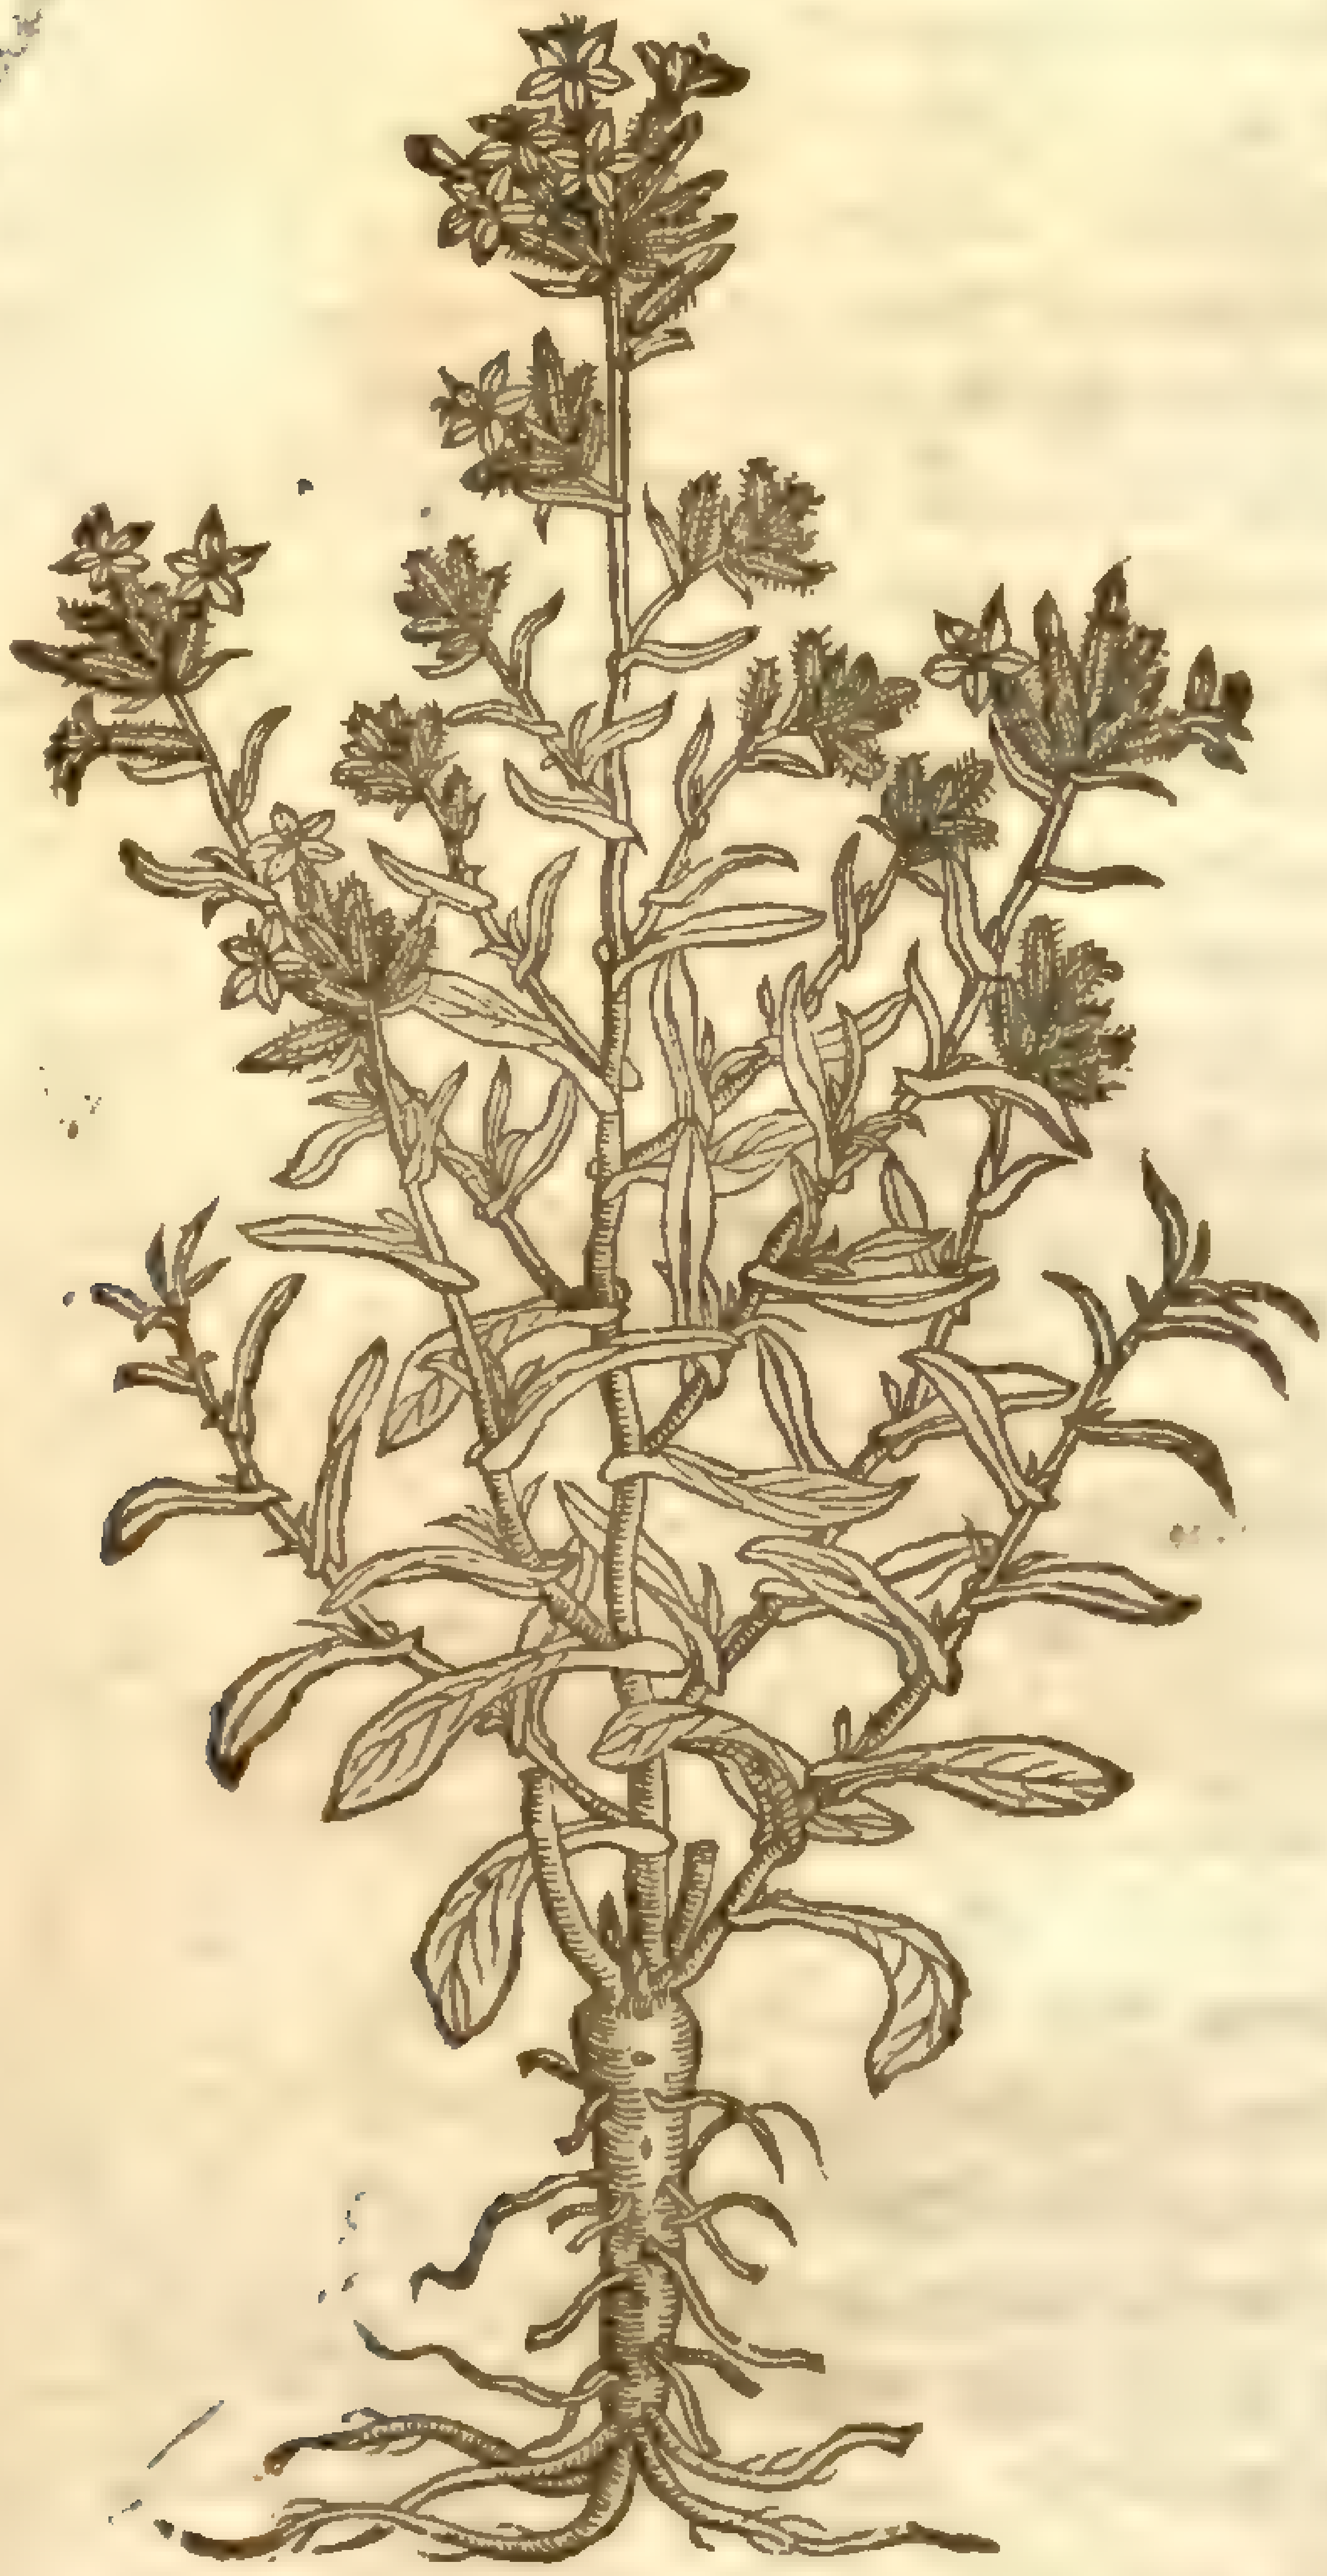
‡ The juyce of the leaues, or the leaues themſelues bruiſed and applied to any part ſwollen by the ſting of a Bee or waſpe, mitigate the paine, and are a preſent remedy, as Mr. *Cannon* a louer of Plants, and friend of mine, hath aſſured me he hath ſeene by frequent experience. ‡ I

Chap. 530. *Of* Pliny *his Leadwort.*

¶ *The Deſcription.*

Dentaria or *Dentillaria* hath offended in the ſuperlatiue degree, in that he hath hid himſelfe like a runnagate ſouldier, when the aſſault ſhould haue beene giuen to the plant *Lepidium*, whereof doubtleſſe it is a kinde. But if the fault be mine, as without queſtion it is, I craue pardon for the ouerſight, and doe intreate the gentle Reader to cenſure me with fauour, whereby I may be more bold to inſert it in this place, rather than to leaue it vntouched. The learned of Narbone (eſpecially *Rondeletius*) haue not without good cauſe accounted this goodly plant for a kinde thereof,

Plumbago Plinij.
Leadwort.



P. europaea L.
[illegible]

thereof, becauſe the whole plant is of a biting taſte, and a burning faculty, and that in ſuch extremity, that it will raiſe bliſters vpon a mans hand: for which cauſe ſome of the learned ſort haue accounted it *Plinies Molybdæna*, or *Ægineta* his *Lepidium*: but the new Herbariſts call it *Dentaria*, or *Dentillaria Rondeletij*, who made the like vſe hereof, as he did of *Pyrethrum*, and ſuch burning plants, to appeaſe the immoderate paine of the tooth-ache and ſuch like. This plant hath great thicke tough roots, of a wooddy ſubſtance, from whence ſpring vp long and tough ſtalks two cubits high, confuſedly garniſhed & beſet with long leaues, in color like Woad, of a ſharpe and biting taſte. The floures grow at the top of the ſtalkes of a purple colour; which being paſt there ſucceed cloſe glittering and hairy huskes, wherein is contained ſmall blackiſh ſeed.

¶ *The Place.*

Pena reporteth that *Dentillaria* groweth about Rome, nigh the hedges and corne fields: it likewiſe groweth in my Garden in great plenty.

¶ *The Time.*

It floureth in Iuly and Auguſt.

¶ *The Names.*

Leadwort is called *Molybdæna*, *Plumbago Plinij*, & *Dentillaria Rondeletij*: in Italian, *Crepanella*: the Romanes, *Herba S. Antonij*: in Illyria, *Cucurida*: in Engliſh Leadwort.

¶ *The Temperature.*

Dentillaria is of a cauſticke quality.

¶ *The Vertues.*

A It helpeth the tooth-ache, and that as ſome ſay if it be holden in the hand ſome ſmall while.

CHAP. 531. *Of Rue, or herbe Grace.*

¶ *The Deſcription.*

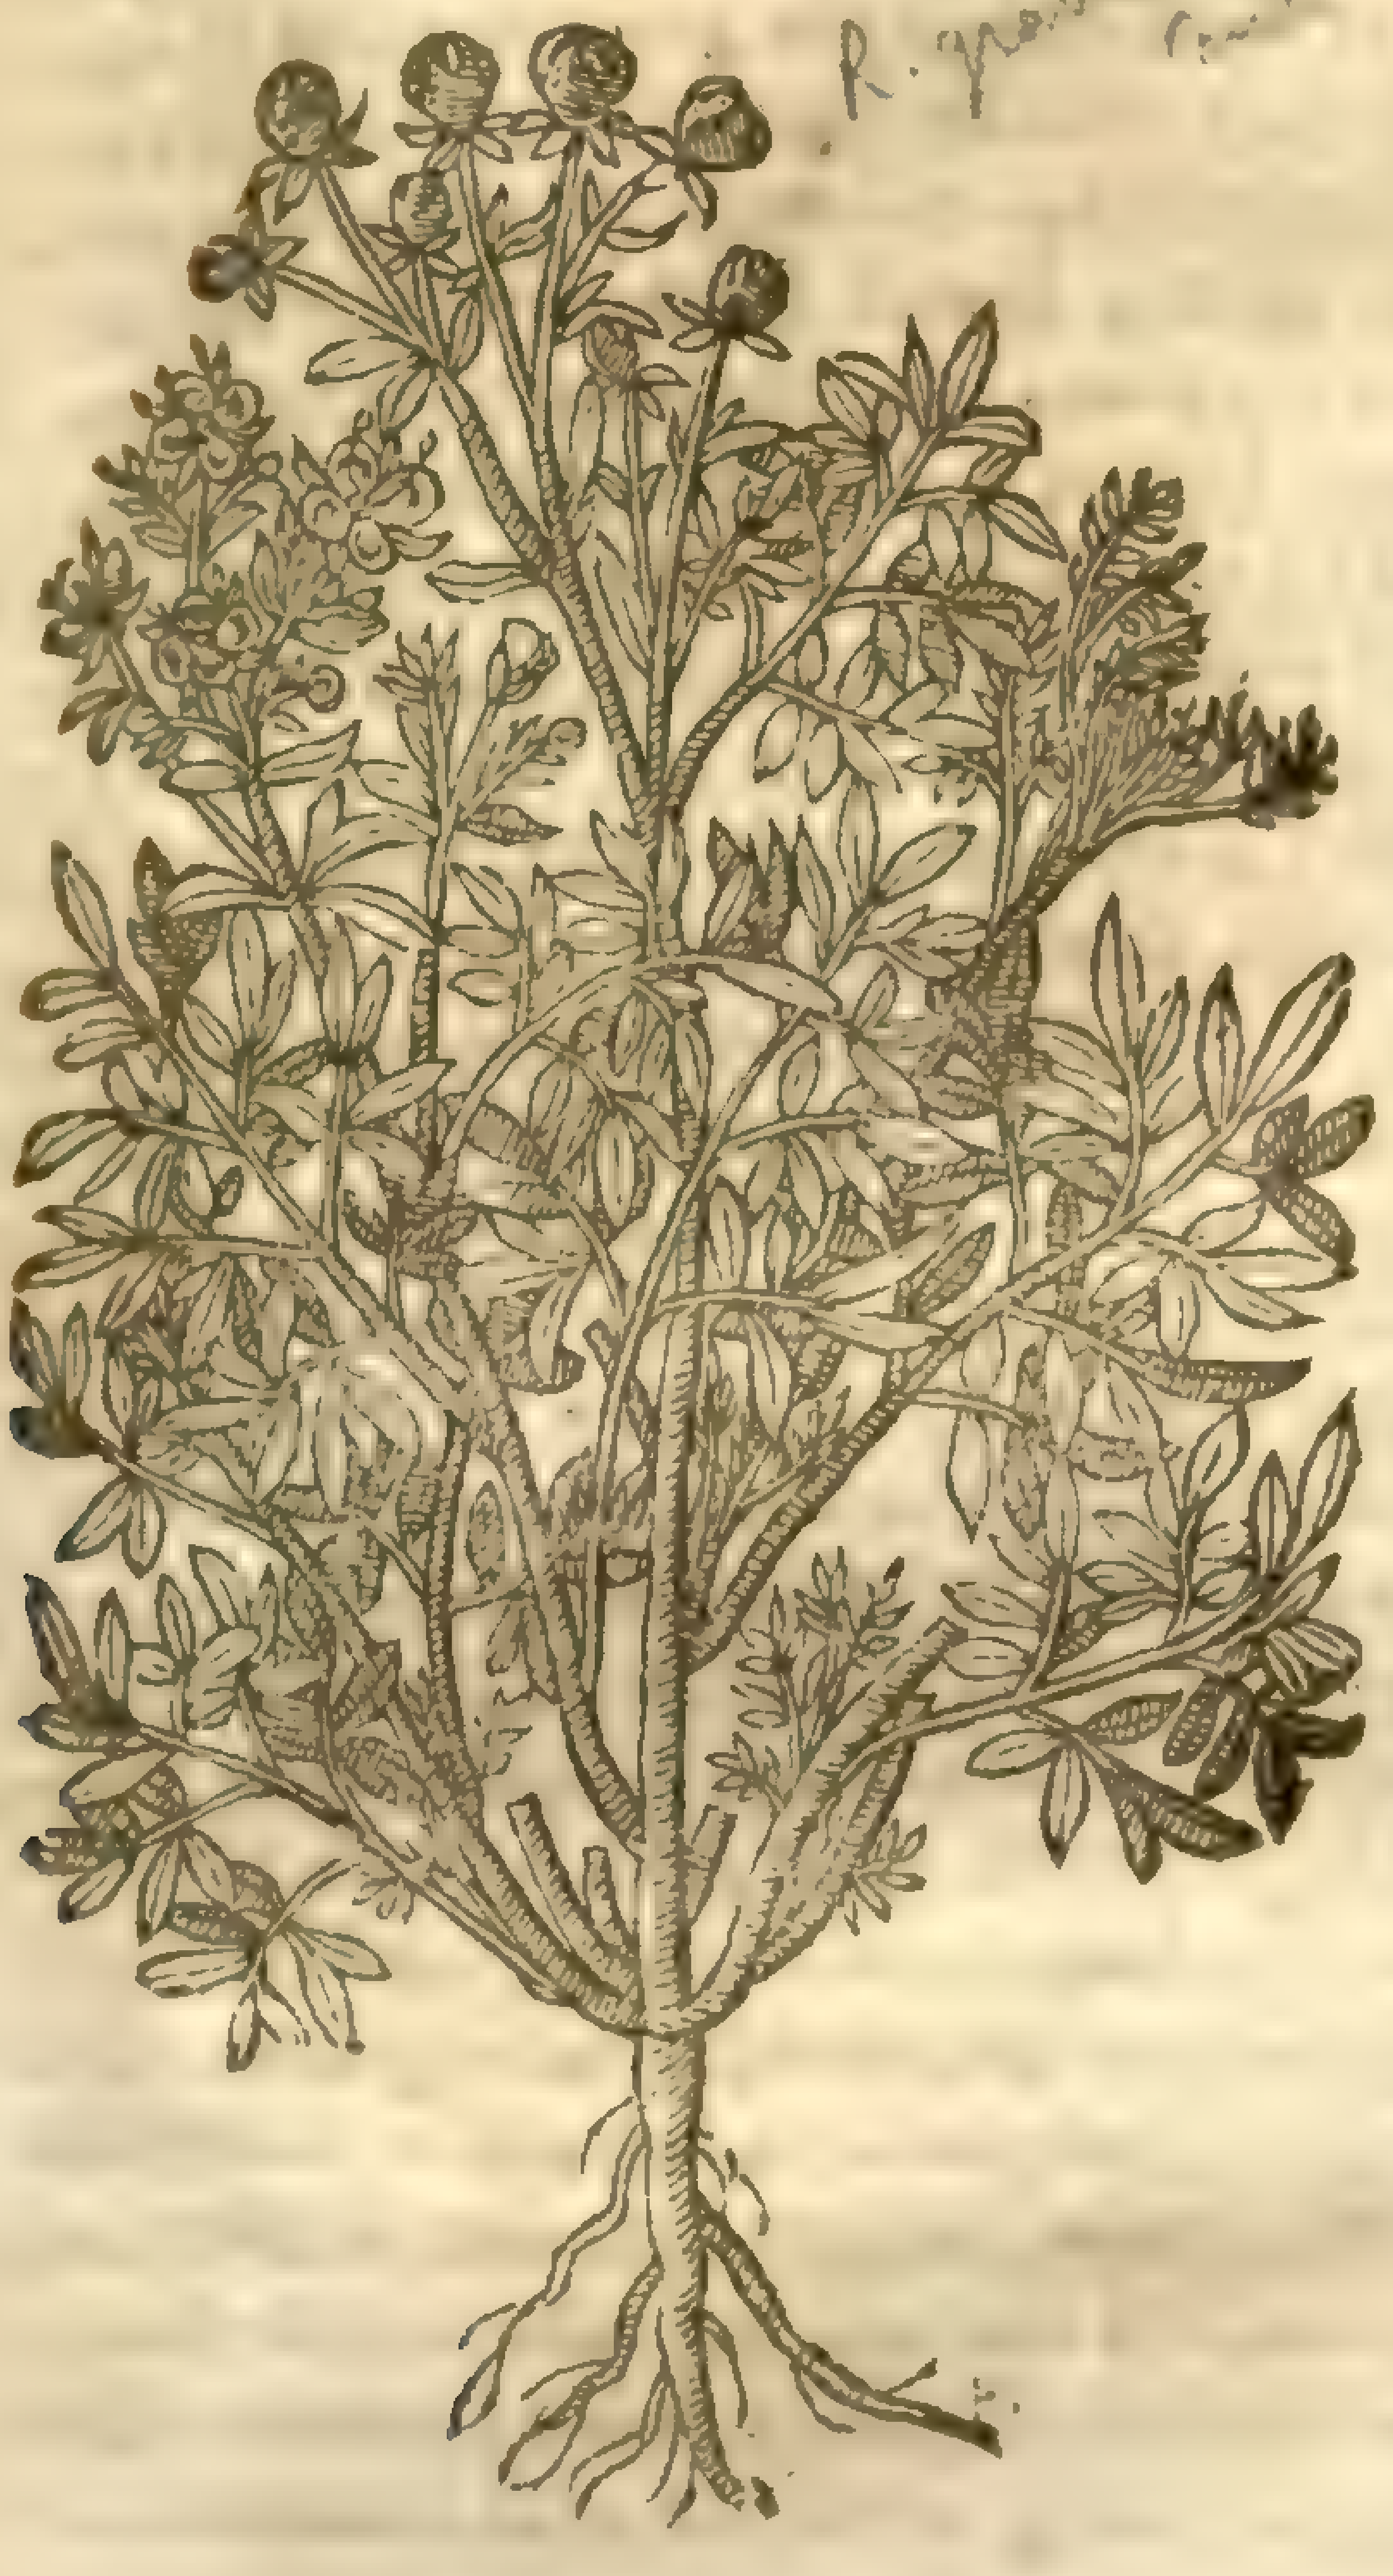
1 GArden Rue or planted Rue, is a ſhrub full of branches, now and then a yard high, or higher: the ſtalkes whereof are couered with a whitiſh barke, the branches are more green: the leaues hereof conſiſt of diuers parts, and be diuided into wings, about which are certaine little ones, of an odde number, ſomething broad, more long than round, ſmooth and ſomewhat fat, of a gray colour or greeniſh blew: the floures in the top of the branches are of a pale yellow conſiſting of foure little leaues, ſomething hollow: in the middle of which ſtandeth vp a little head or button foure ſquare, ſeldome fiue ſquare, containing as many little coffers as it hath corners, being compaſſed about with diuers little yellow threds: out of which hang pretty fine tips of one colour; the ſeed groweth in the little coffers: the root is wooddy, and faſtned with many ſtrings: this Rue hath a very ſtrong and ranke ſmell, and a biting taſte.

2 the ſecond being the wild or mountaine Rue, called *Ruta ſylueſtris*, is very like to garden Rue, in ſtalkes, leaues, floures, ſeed, colour, taſte, and ſauour, ſauing that euery little leafe hath ſmaller cuts, and is much narrower: the whole plant dieth at the approch of Winter, being an anuall plant, and muſt either ſtand till it doe ſow himſelfe, or elſe muſt be ſowne of others. ‡ This ſecond is a variety of the garden Rue differing from the former onely in ſmallneſſe. ‡

3 This plant is likewiſe a wilde kinde of Rue, and of all the reſt the ſmalleſt, and yet more virulent, biting, and ſtinking than any of the reſt: the whole plant is of a whitiſh pale greene, agreeing with the laſt before mentioned in each reſpect, ſaue in greatneſſe, and in that the venomous fumes or vapors that come from this ſmall wild Rue are more noiſome & hurtfull than the former. ‡ The leaues lie ſpred vpon the ground, and are very finely cut and diuided: the whole plant is of ſuch

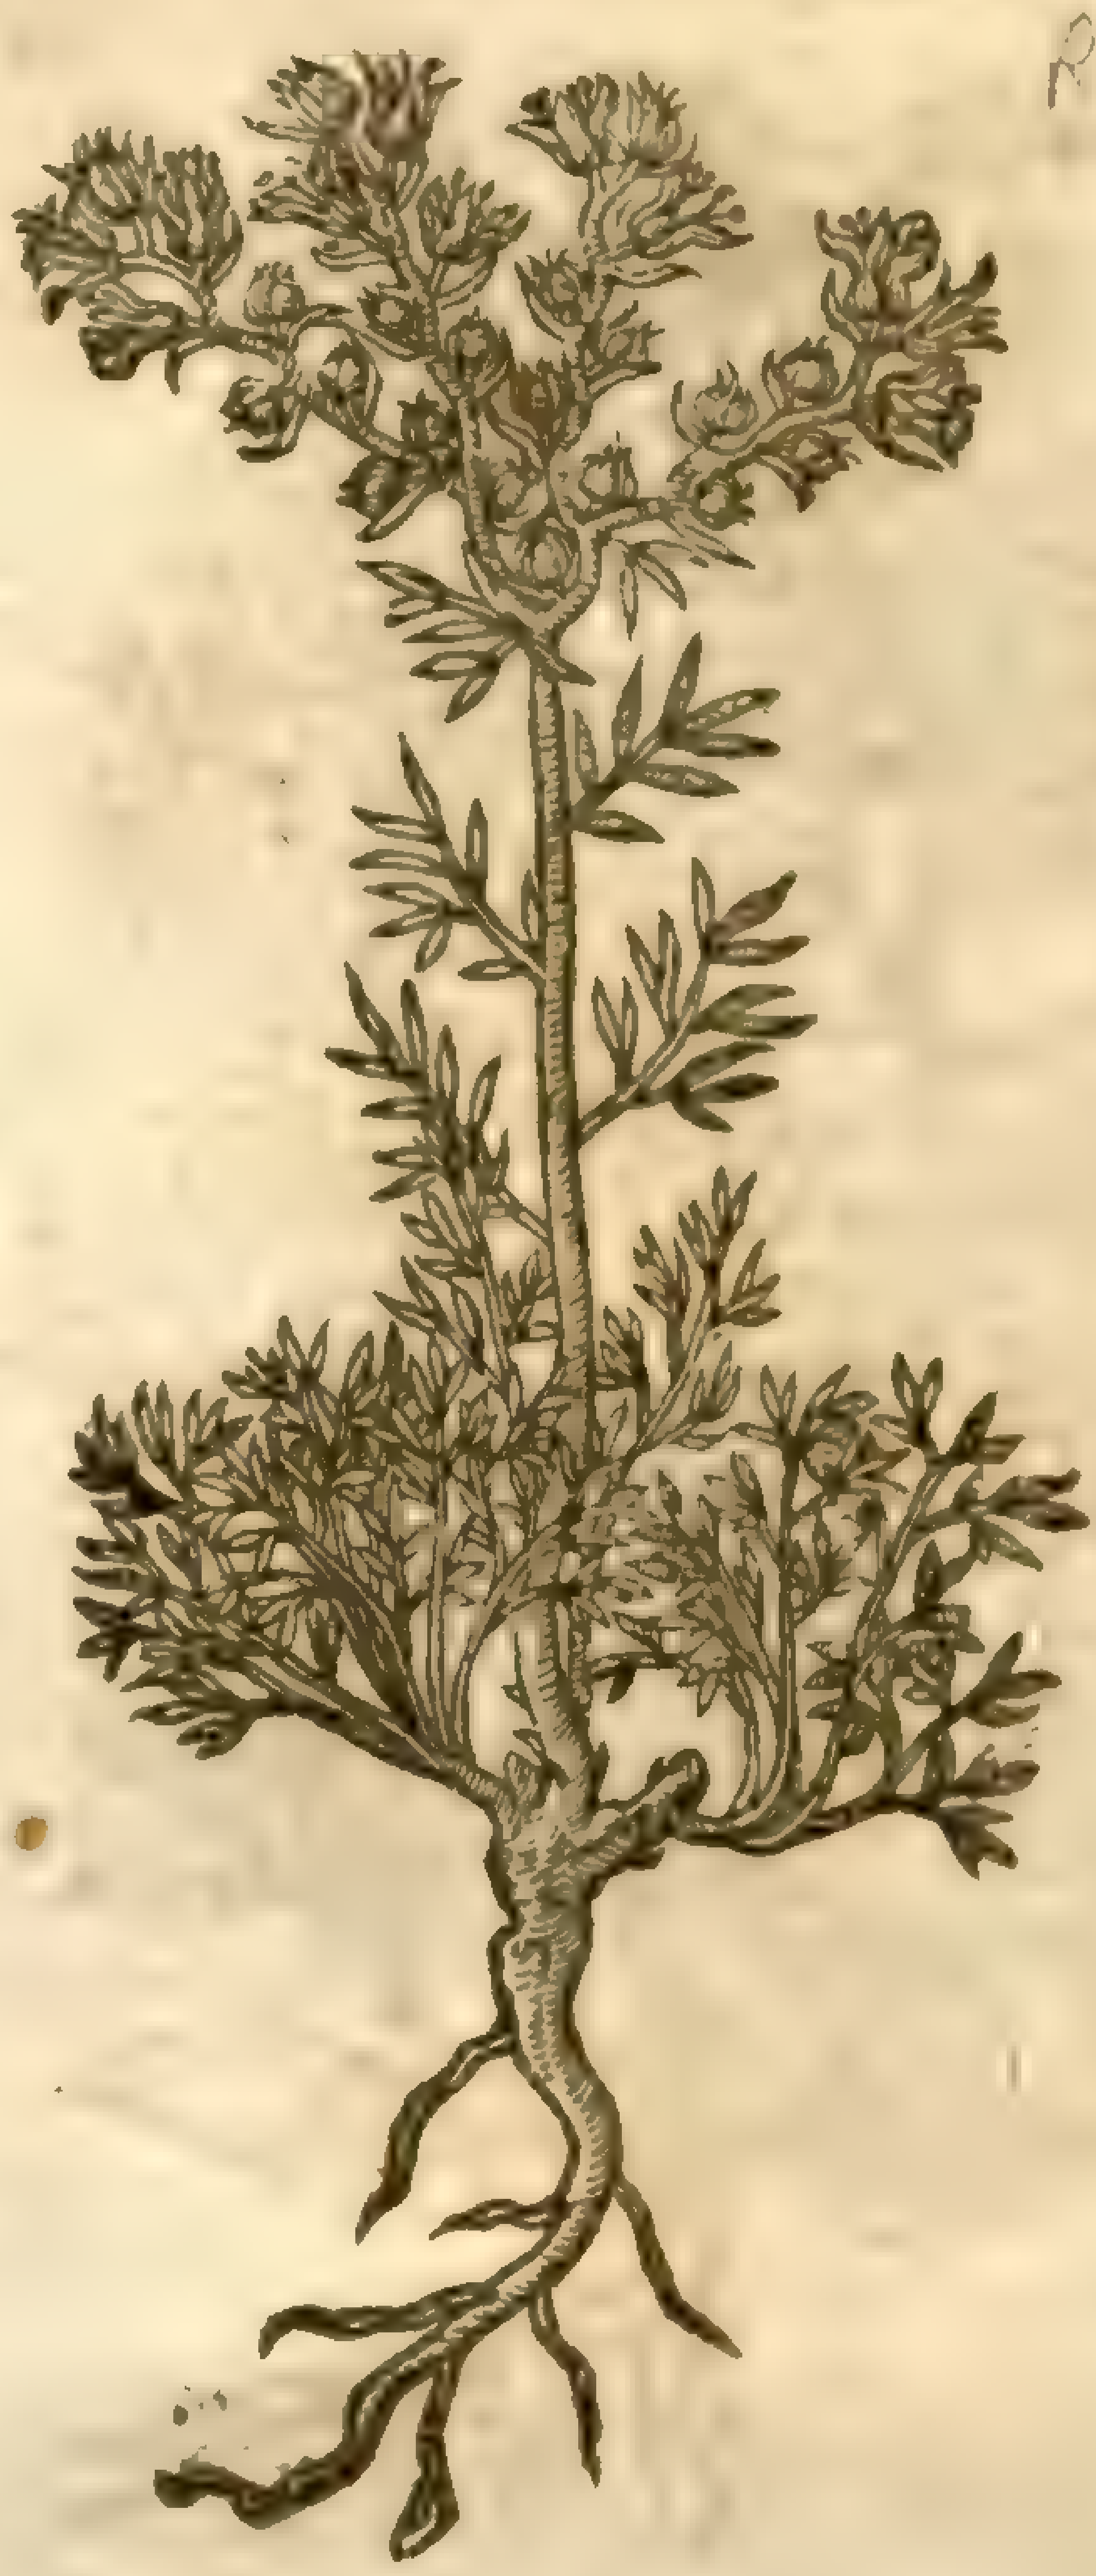
Ruta hortenſis.
Garden Rue.

R. graveolens L. β [illegible]



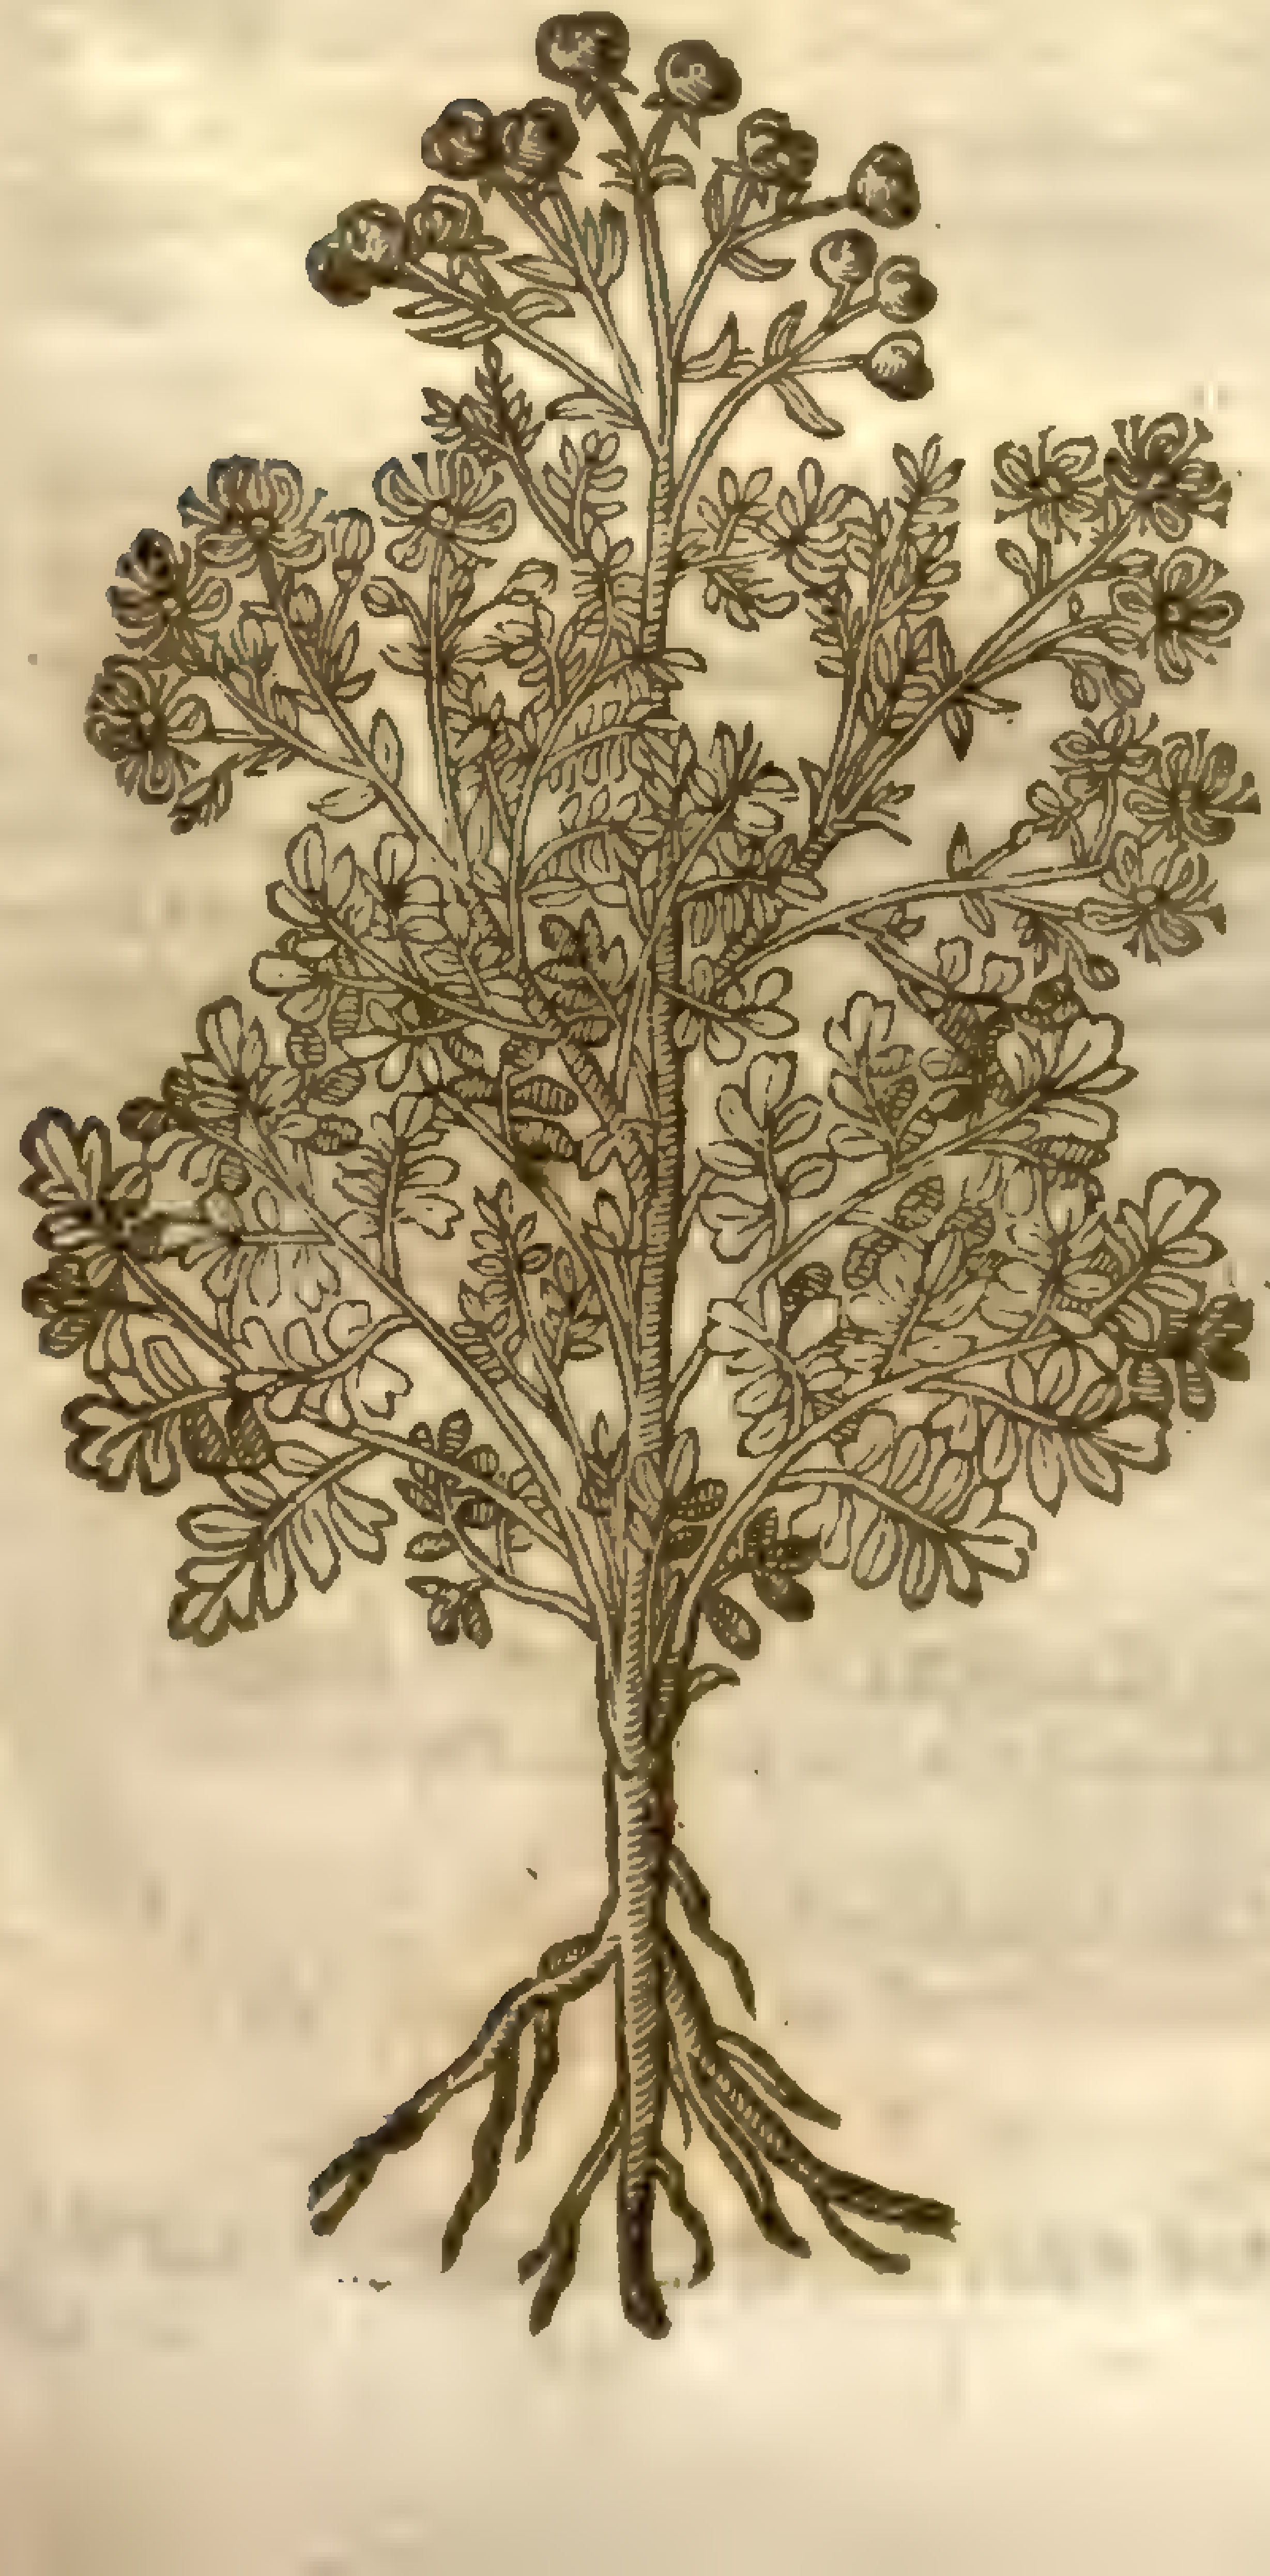
3 *Ruta ſylveſtris minima.*
The ſmalleſt wilde Rue.

R. [illegible]

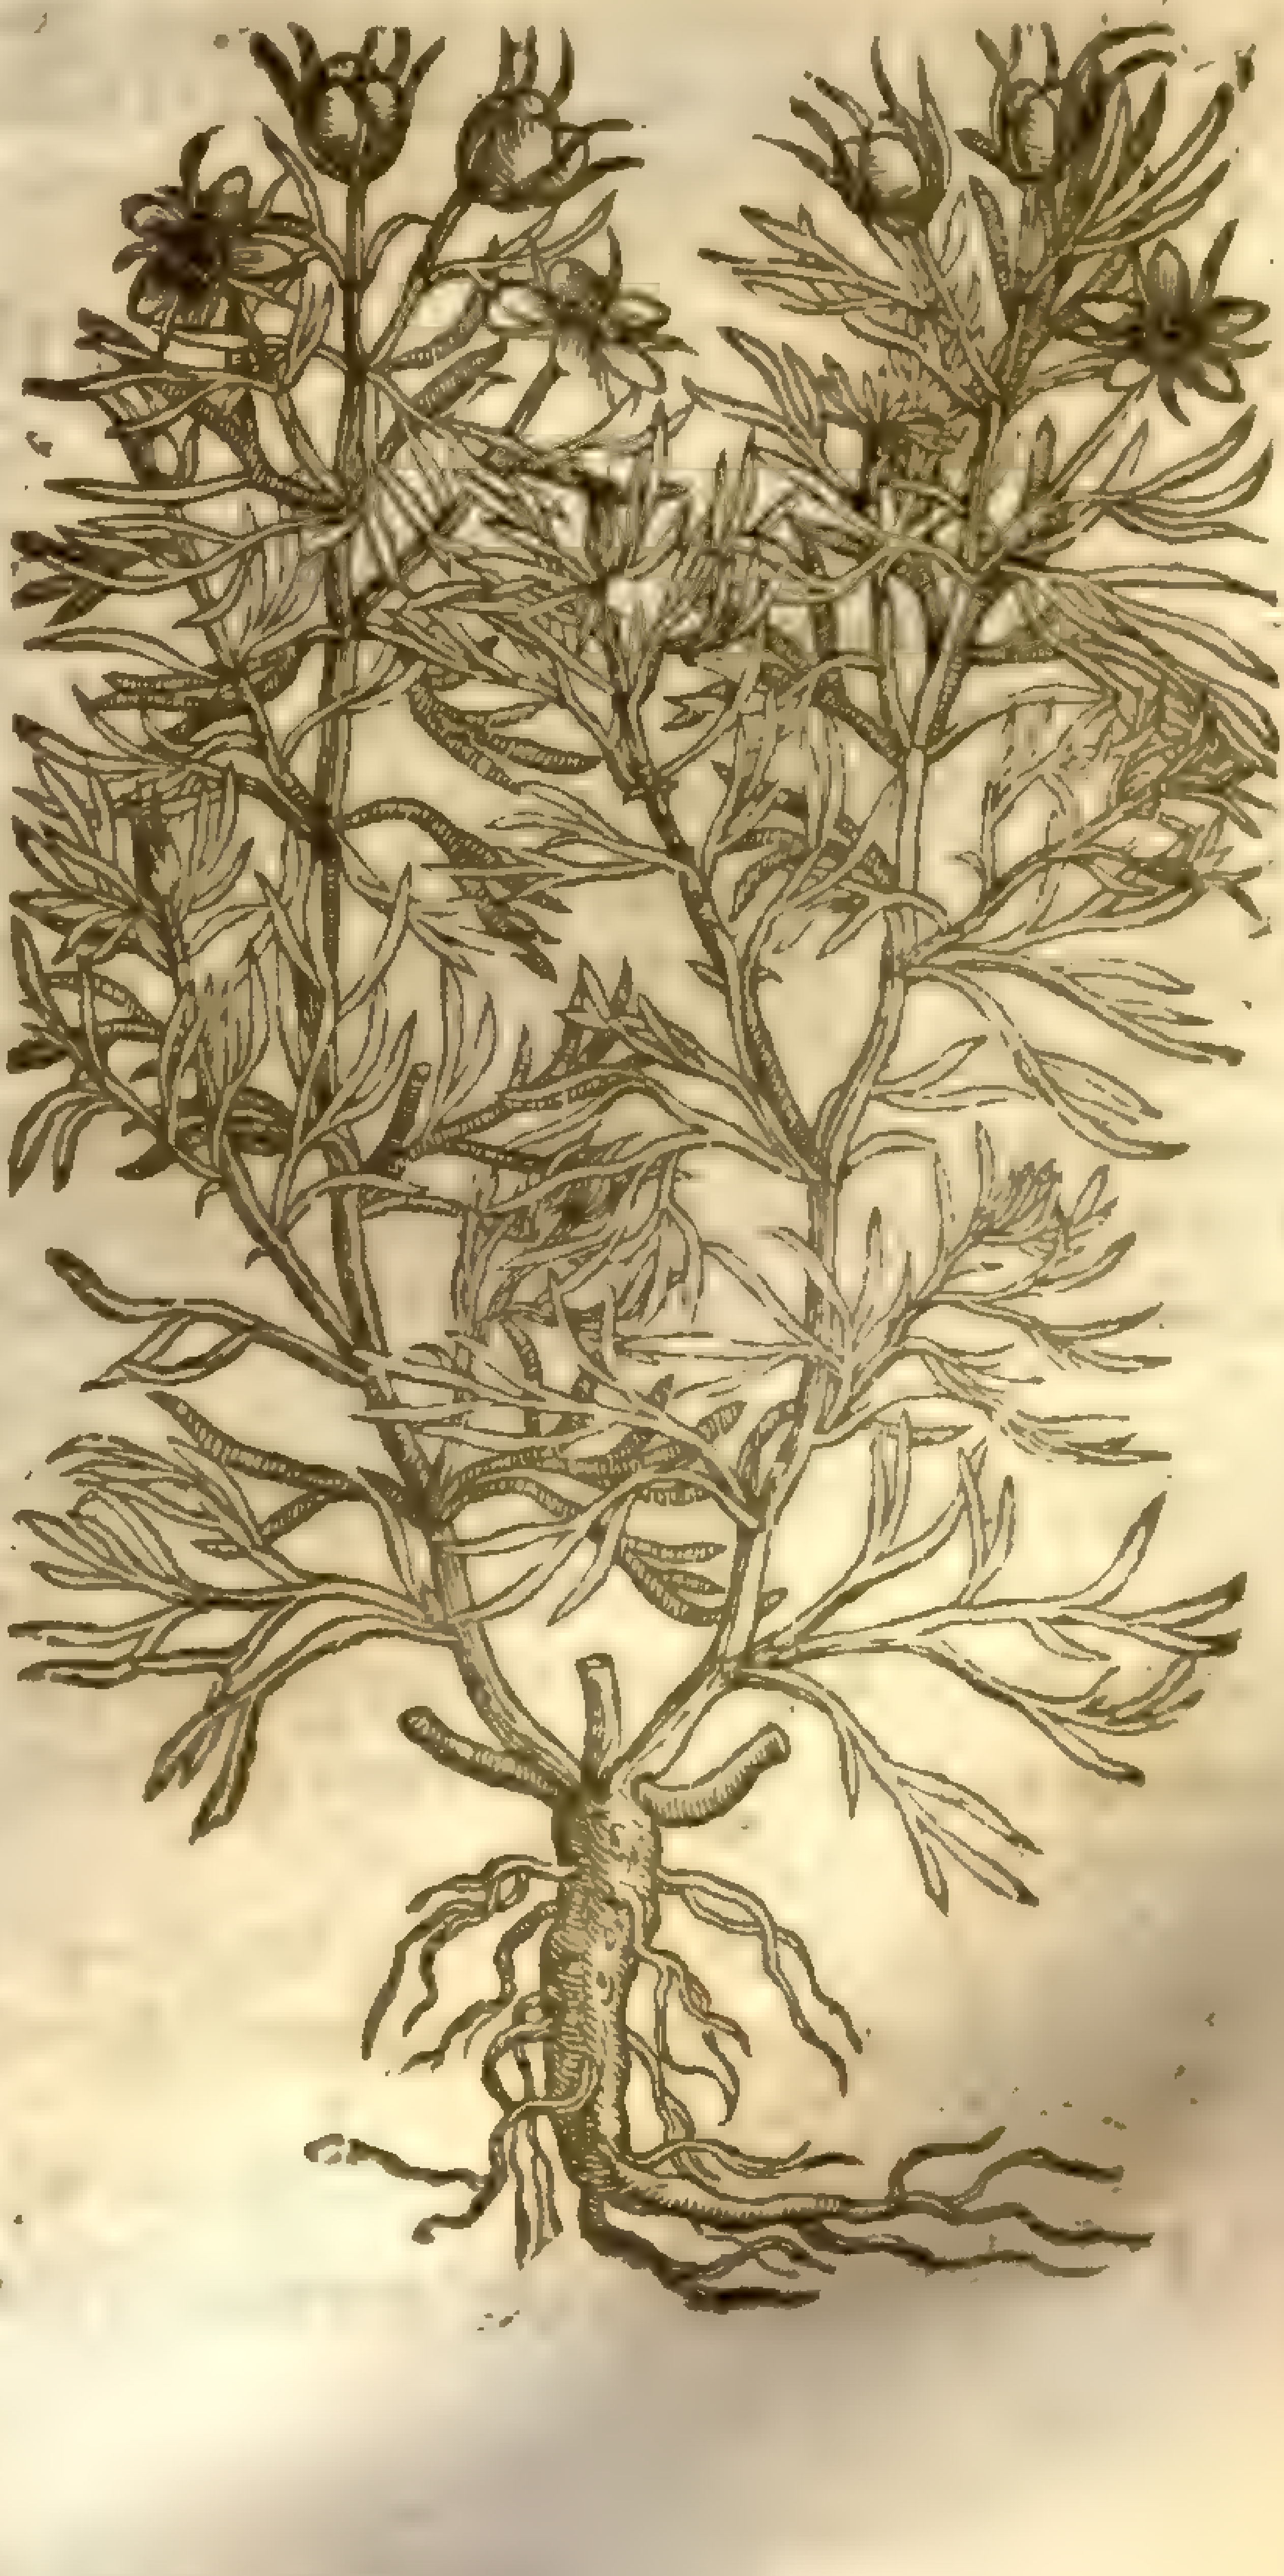


4 *Ruta montana.*
Mountaine Rue.

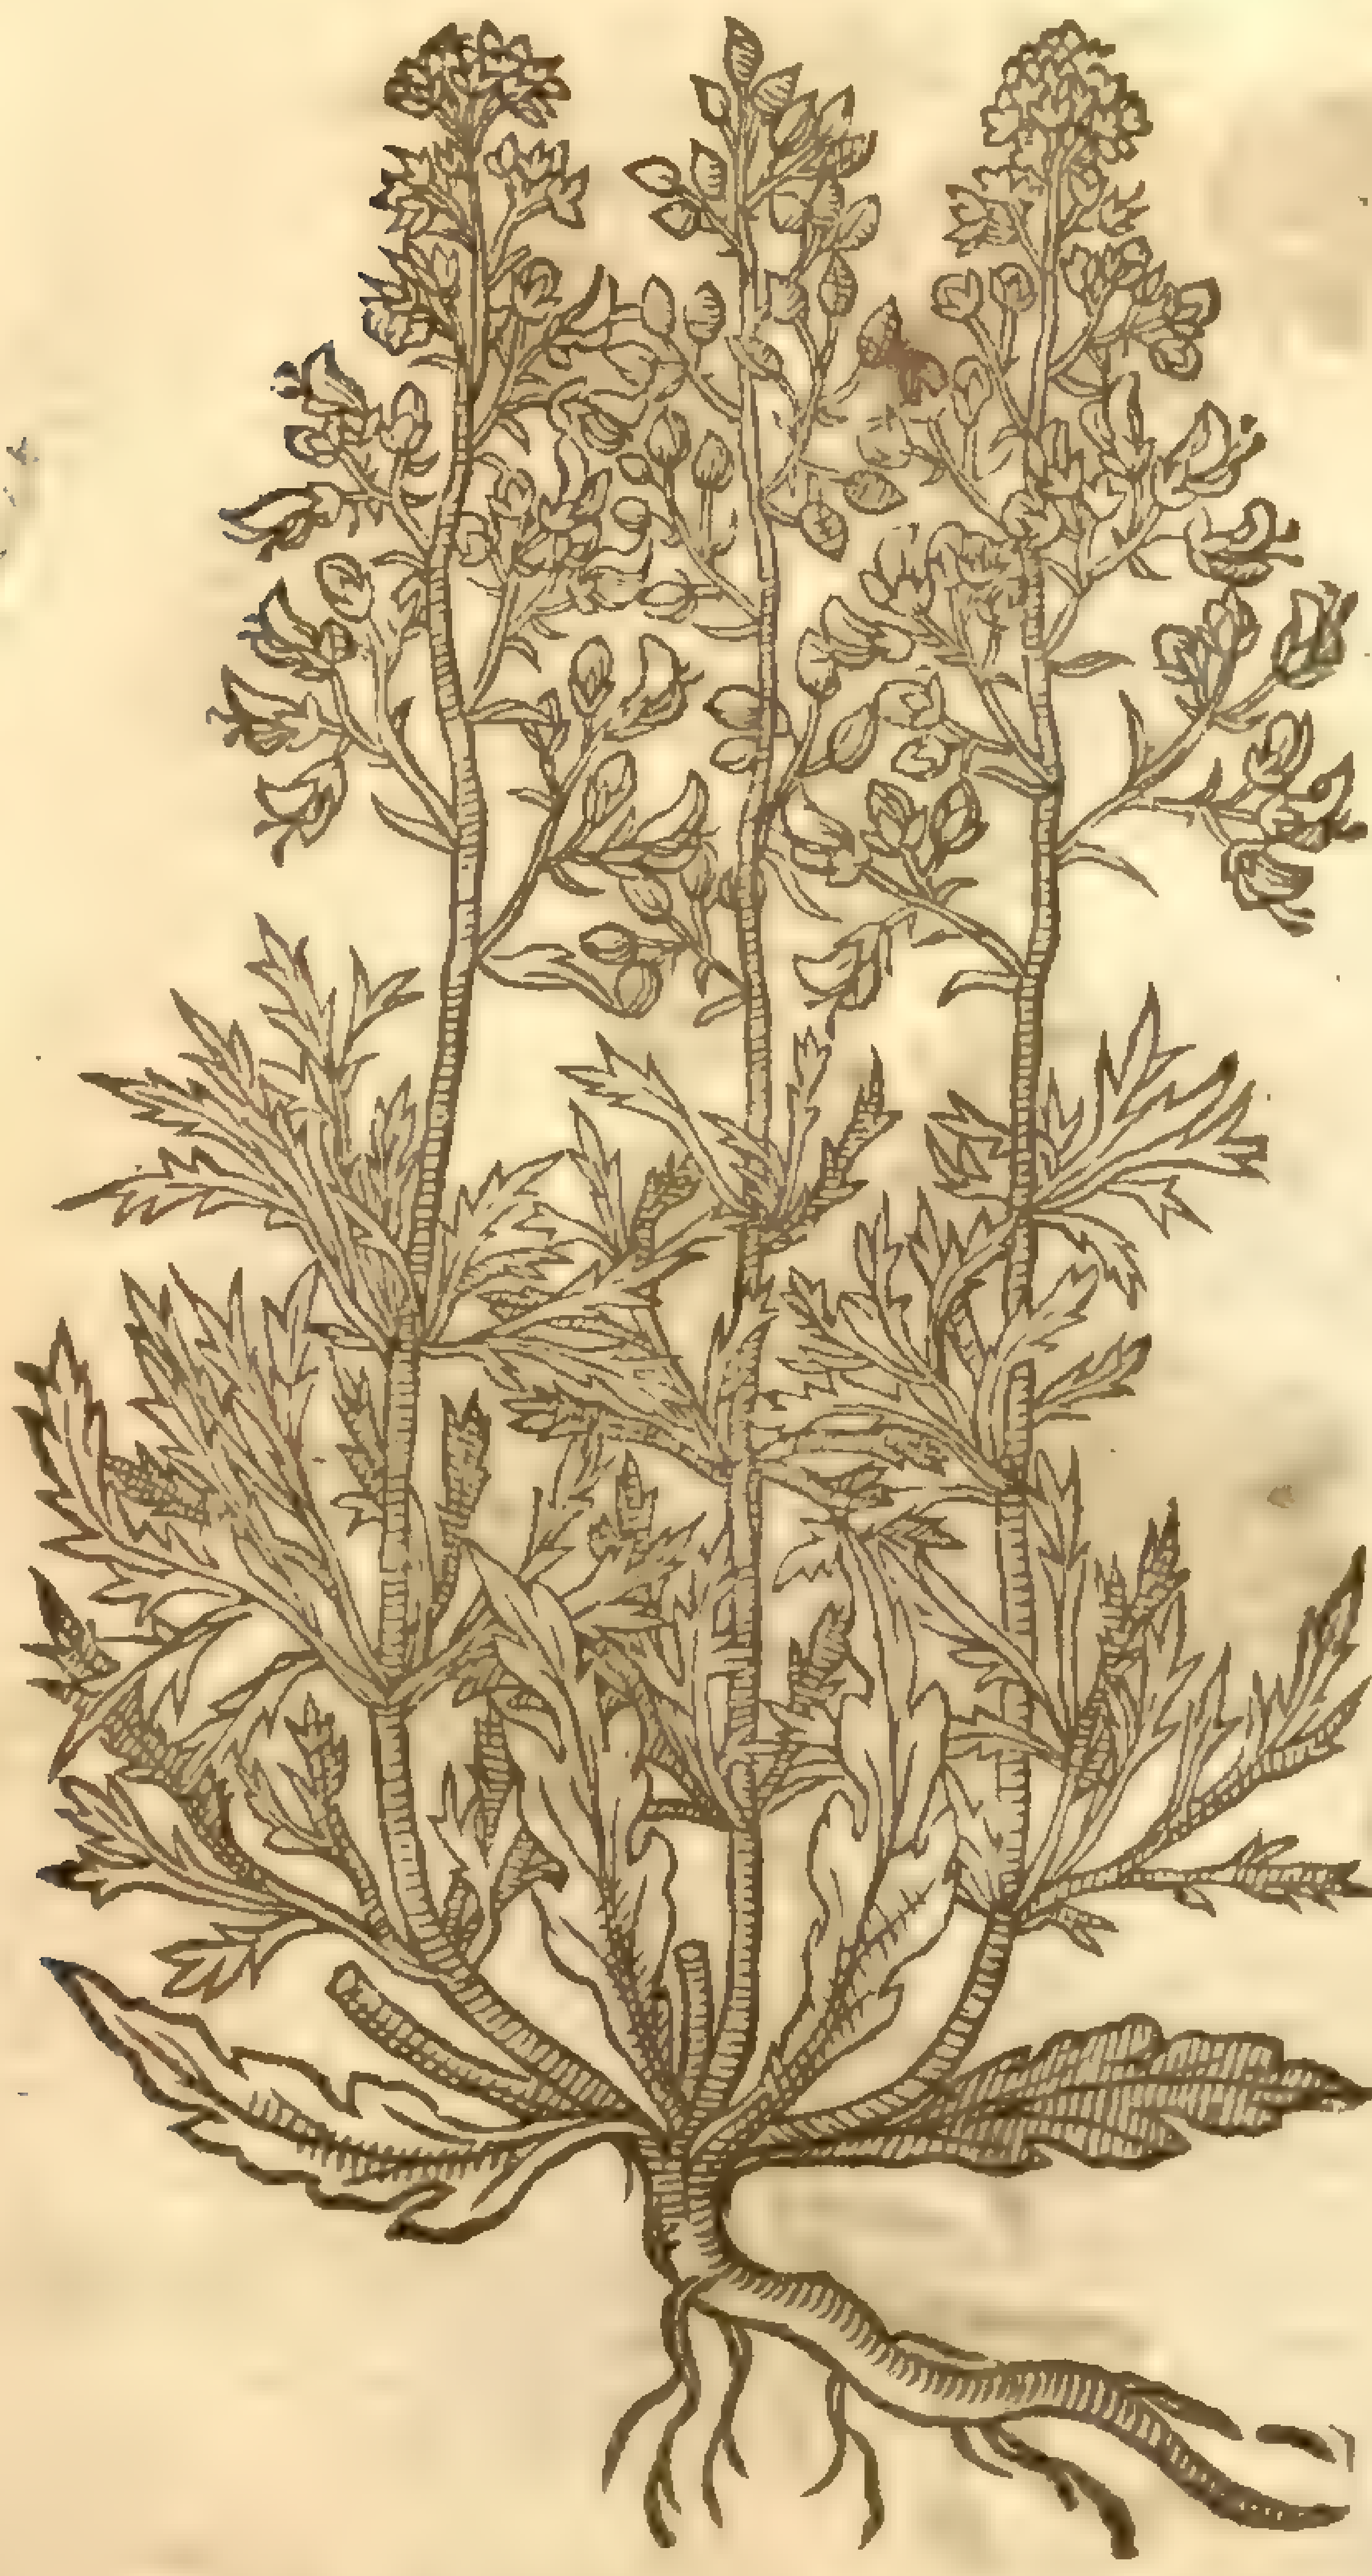
[illegible]



5 *Harmala.*
Wilde Rue with white floures.



‡ 6 *Ruta Canina.*
Dogs Rue.



Scrophularia canina [illegible]

ſuch acrimonie, that *Cluſius* ſaith he hath oftener than once obſerued it to pierce through three pair of gloues to the hand of the gatherer; and if any one rub his face with his hand that hath newly gathered it, forthwith it will mightily inflame it. He tells a hiſtorie of a Dutch Student of Montpelier that went with him a ſimpling, who putting ſome of it between his hat and his head to keep him the cooler, had by that means all his face preſently inflamed and bliſtered whereſoeuer the ſweat ranne downe. ‡

4 There is another wilde Rue growing on the mountaines of Savoy and other places adioyning, hauing a great thicke root, from which ariſe great ſhoots or ſtalkes, whereon grow leaues very thicke and fat, parted into diuers longiſh ſections, otherwiſe reſembling the leaues of the firſt deſcribed, of a ſtrong and ſtinking ſmell: the flours grow on the tops of the ſtalks, conſiſting of foure ſmall yellow leaues: the ſeeds are like the other.

5 *Harmel* is one of the wilde Rues, it bringeth forth immediatly from the root diuers little ſtalks of a cubit high; whereupon grow green leaues diuerſly cut into long pieces, longer and narrower than thoſe of the wilde ſtrong ſmelling Rue. The flours be white, compoſed of fiue white leaues: the fruit is three ſquare, bigger than that of the planted Rue, in which the ſeed lies: the root is thicke, long, and blackiſh. This Rue in hot countries hath a maruellous ſtrong ſmell: in cold countries not ſo.

‡ 6 This, which *Matthiolus* gaue for *Siditis* 3. and *Lobel, Cluſius*, and others, for *Ruta Canina*, hath many twiggy branches ſome cubit and half high, whereon grow leaues reſembling thoſe of the *Papaver Rhæas* or *Argemone*, leſſer, thicker, and of a blackiſh green: the floures are of a whitiſh purple colour, faſhioned ſomewhat like thoſe of *Antirrhinum*: the ſeed is ſmall, and contained in ſuch veſſels as thoſe of Rue, or rather thoſe of *Blattaria*: the whole plant is of a ſtrong and ingratefull ſmel: it grows in the hot and dry places about Narbon in France, Ravenna, and Rome in Italy. ‡

¶ *The Place.*

Garden Rue ioyeth in ſunny and open places: it proſpereth in rough and bricky ground and among aſhes: it can in nowiſe away with dung.

The wild are found on mountains in hot countries, as in Cappadocia, Galatia, and in diuers prouinces of Italy and Spain, and on the hills of Lancaſhire and Yorke.

Pliny ſaith that there is ſuch friendſhip between it and the fig-tree, that it proſpers no where ſo well as vnder the fig tree. The beſt for phyſicks vſe is that which groweth vnder the fig tree, as *Dioſcorides* ſaith: the cauſe is alledged by *Plutarch, lib.* 1. of his *Sympoſiacks* or Feaſts, for he ſaith it becomes more ſweet and milde in taſte, by reaſon it taketh as it were ſome part of the ſweetneſſe of the fig tree, whereby the ouer-ranke qualitie of the Rue is allayed; vnleſſe it be that the figge tree whileſt it drawes nouriſhment to it ſelfe, draweth alſo the rankneſſe away from the Rue.

¶ *The Time.*

They floure in theſe cold countries in Iuly and Auguſt: in other countries ſooner.

¶ *The Names.*

The firſt is *Hortenſis Ruta* or garden Rue: in high-Dutch, **Rauten**: in low-Dutch, **Ruijte**: The Italians and Apothecaries keep the Latine name: in Spaniſh, *Aruda*: in French, *Rue de Iarden*; in Engliſh, Rue, and Herb-Grace.

Wilde Rue is called in Greeke, Πήγανον. *Peganon*: in Latine, *Ruta ſylveſtris*, or wilde Rue: in Galatia and Cappadocia, μῶλυ: of diuers, *Harmala*: of the Arabians, *Harmel*: of the Syrians, *Beſara*:

¶ *The Temperature.*

Rue is hot and dry in the later end of the third degree, and wilde Rue in the fourth: it is of thin and ſubtill parts: it waſts and conſumes winde, it cutteth and digeſteth groſſe and tough humors.

¶ *The Vertues.*

Rue or Herb-grace prouokes vrine, brings downe the ſickneſſe, expels the dead childe and afterbirth, being inwardly taken, or the decoction drunk; and is good for the mother if but ſmelled to. *Pliny, lib.* 20. *cap.* 13. ſaith it opens the matrix and brings it into the right place, if the belly all ouer and the ſhare (the breſt ſay the old falſe copies) be anointed therewith: mixt with honey it is a remedie againſt the inflammation and ſwelling of the ſtones, proceeding of long abſtinence from venerie, called of our Engliſh Mountebanks the Colts euill, if it be boiled with Barrows greaſe, Bay leaues, and the pouders of Fenugreeke and Lineſeed be added thereto, and applied pultis-wiſe. A

It takes away crudity and rawneſſe of humors, and alſo windineſſe and old pains of the ſtomack. B

Boiled with vineger it eaſeth paines, is good againſt the ſtitch of the ſide and cheſt, and ſhortnes of breath vpon a cold cauſe, and alſo againſt the pain in the joints and huckle bones. C

The oile of it ſerues for the purpoſes laſt recited: it takes away the colick and pains of the guts, not only in a cliſter, but alſo anointed vpon the places affected. But if this oile be made of the oile preſſed out of Lineſeed it will bee ſo much the better, and of ſingular force to take away hard ſwellings of the ſpleen or milt. D

It is vſed with good ſucceſſe againſt the dropſie called in Greeke ἀνασάρκα, beeing applied to the belly in manner of a pultis. E

The herb a little boiled or skalded, and kept in pickle as Sampier, and eaten, quickens the ſight. F

The ſame applied with hony and the juice of Fennell, is a remedie againſt dim eies. G

The juice of Rue made hot in the rinde of a pomegranat and dropped into the eares, takes away the pain of thereof. H

S. Anthonies fire is quenched therewith: it killeth the ſhingles, and running vlcers and ſores in the heads of yong children, if it be tempered with Ceruſe, white lead, vineger, and oile of roſes, and made into the form of *Nutritum* or *Triapharmacon*. I

Dioſcorides ſaith, That Rue put vp in the noſthrils ſtayeth bleeding. K

So ſaith *Pliny* alſo: when notwithſtanding it is of power rather to procure bleeding, through its ſharpe and biting quality. L

The leaues of Rue beaten and drunke with wine are an antidote againſt poiſons, as *Pliny* ſaith. M

Dioſcorides writeth, That a twelue penny weight of the ſeed drunke in wine is a counterpoiſon agaiſt deadly medicines or the poiſon of Wolfes-bane, *Ixia*, Muſhroms or Toad-ſtooles, the biting of Serpents, the ſtinging of Scorpions, Bees, hornets, and waſps; and is reported, That if a man bee anointed with the juice of Rue, theſe will not hurt him; and that the ſerpent is driuen away at the ſmell thereof when it is burned: inſomuch that when the Weeſell is to fight with the ſerpent, ſhee armeth her ſelfe by eating Rue, againſt the might of the Serpent. N

The leaues of Rue eaten with the kernels of Walnuts or figs ſtamped together and made into a maſſe or paſte, is good againſt all euill aires, the peſtilence or plague, reſiſts poiſon and all venome. O

Rue boiled with Dil, Fennel ſeed, and ſome ſugar, in a ſufficient quantitie of wine, ſwageth the torments and griping pains in the belly, the pain in the ſides and breſt, the difficulty of breathing, the cough, and ſtopping of the lungs, and helpeth ſuch as are declining to a dropſie. P

The juice taken with Dill as aforeſaid, helpeth the cold fits of Agues, and alters their courſe: it helpeth the inflammation of the fundament, and paines of the gut called *Rectum inteſtinum*. Q

The juice of Rue drunk with wine purgeth women after their deliuerance, driuing forth the dead childe, the ſecondine, and the vnnatural birth. R

Rue vſed very often either in meat or drinke, quencheth and drieth vp the naturall ſeed of generation, and the milke of thoſe that giue ſucke. S

The oile wherein Rue hath bin boiled and infuſed many daies together in the Sun, warmeth and chafeth all cold members if they be anointed therewith: alſo it prouoketh vrine, if the region of the bladder be anointed with it. T

If it be miniſtred in cliſters it expels windineſſe, and the torſion or gnawing paines of the guts. V

The leaues of garden Rue boiled in water and drunke cauſeth one to make water, prouoketh the terms, and ſtoppeth the laske. X

Ruta ſylveſtris or wild Rue is more vehement both in ſmel and operation, and therefore the more virulent or pernitious; for ſometimes it fumeth out a vapor or aire ſo hurtfull that it ſcorches the face of him that looketh vpon it, raiſing vp bliſters, wheals, and other accidents: it venometh their hands that touch it, and will infect the face alſo if it be touched before they be clean waſhed: wherfore it is not to be admitted to meat or medicine. Y

The end of the ſecond Booke.

THE THIRD BOOKE OF THE HISTORY OF PLANTS.

Containing the Deſcription, Place, Time, Names, Nature, and Vertues, of Trees, Shrubs, Buſhes, Fruit-bearing Plants, Roſins, Gums, Roſes, Heath, Moſſes, ſome Indian Plants, and other rare Plants not remembred in the Proeme to the firſt Booke. Alſo Muſhroms, Corall, and their ſeuerall Kindes, &c.

The Proeme.

HAuing finiſhed the treatiſe of Herbs and Plants in general, vſed for meat, medicine, or ſweet ſmelling vſe, only ſome few omitted for want of perfect inſtruction; and alſo being hindered by the ſlackneſſe of the Cutters or grauers of the Figures: theſe wants we intend to ſupply in this third and laſt part. The Tables as well general as particular ſhall be ſet forth in the end of this preſent Volume.

Chap. 1. *Of Roſes.*

¶ *The Kindes.*

THe Plant of Roſes, though it be a ſhrub full of prickles, yet it had bin more fit and conuenient to haue placed it with the moſt glorious floures of the world, than to inſert the ſame here among baſe and thorny ſhrubs: for the Roſe doth deſerue the chief and prime place among all floures whatſoeuer; beeing not onely eſteemed for his beauty, vertues, and his fragrant and odoriferous ſmell; but alſo becauſe it is the honor and ornament of our Engliſh Scepter, as by the conjunction appeareth, in the vniting of thoſe two moſt Royall Houſes of Lancaſter and Yorke. Which pleaſant floures deſerue the chiefeſt place in crownes and garlands, as *Anacreon Thius* a moſt antient Greeke Poet (whom *Henricus Stephanus* hath tranſlated in a gallant Latine Verſe) affirmes in thoſe Verſes of a Roſe, beginning thus;

Τὸ ῥόδον τὸ τῶν ἐρώτων, &c.

Roſa honos, decuſq; florum,
Roſa, cura, amorq; Veris.
Roſa, cælitum voluptas,
Roſeis puer Cytheres.
Caput implicat Corollis,
Charitum Choros frequentans.

The Roſe is the honour and beauty of floures,
The Roſe in the care and loue of the Spring:
The Roſe is the pleaſure of th' heavenly Pow'rs.
The Boy of faire *Venus*, *Cythera's* Darling,
Doth wrap his head round with garlands of Roſe,
When to the dances of the Graces he goes.

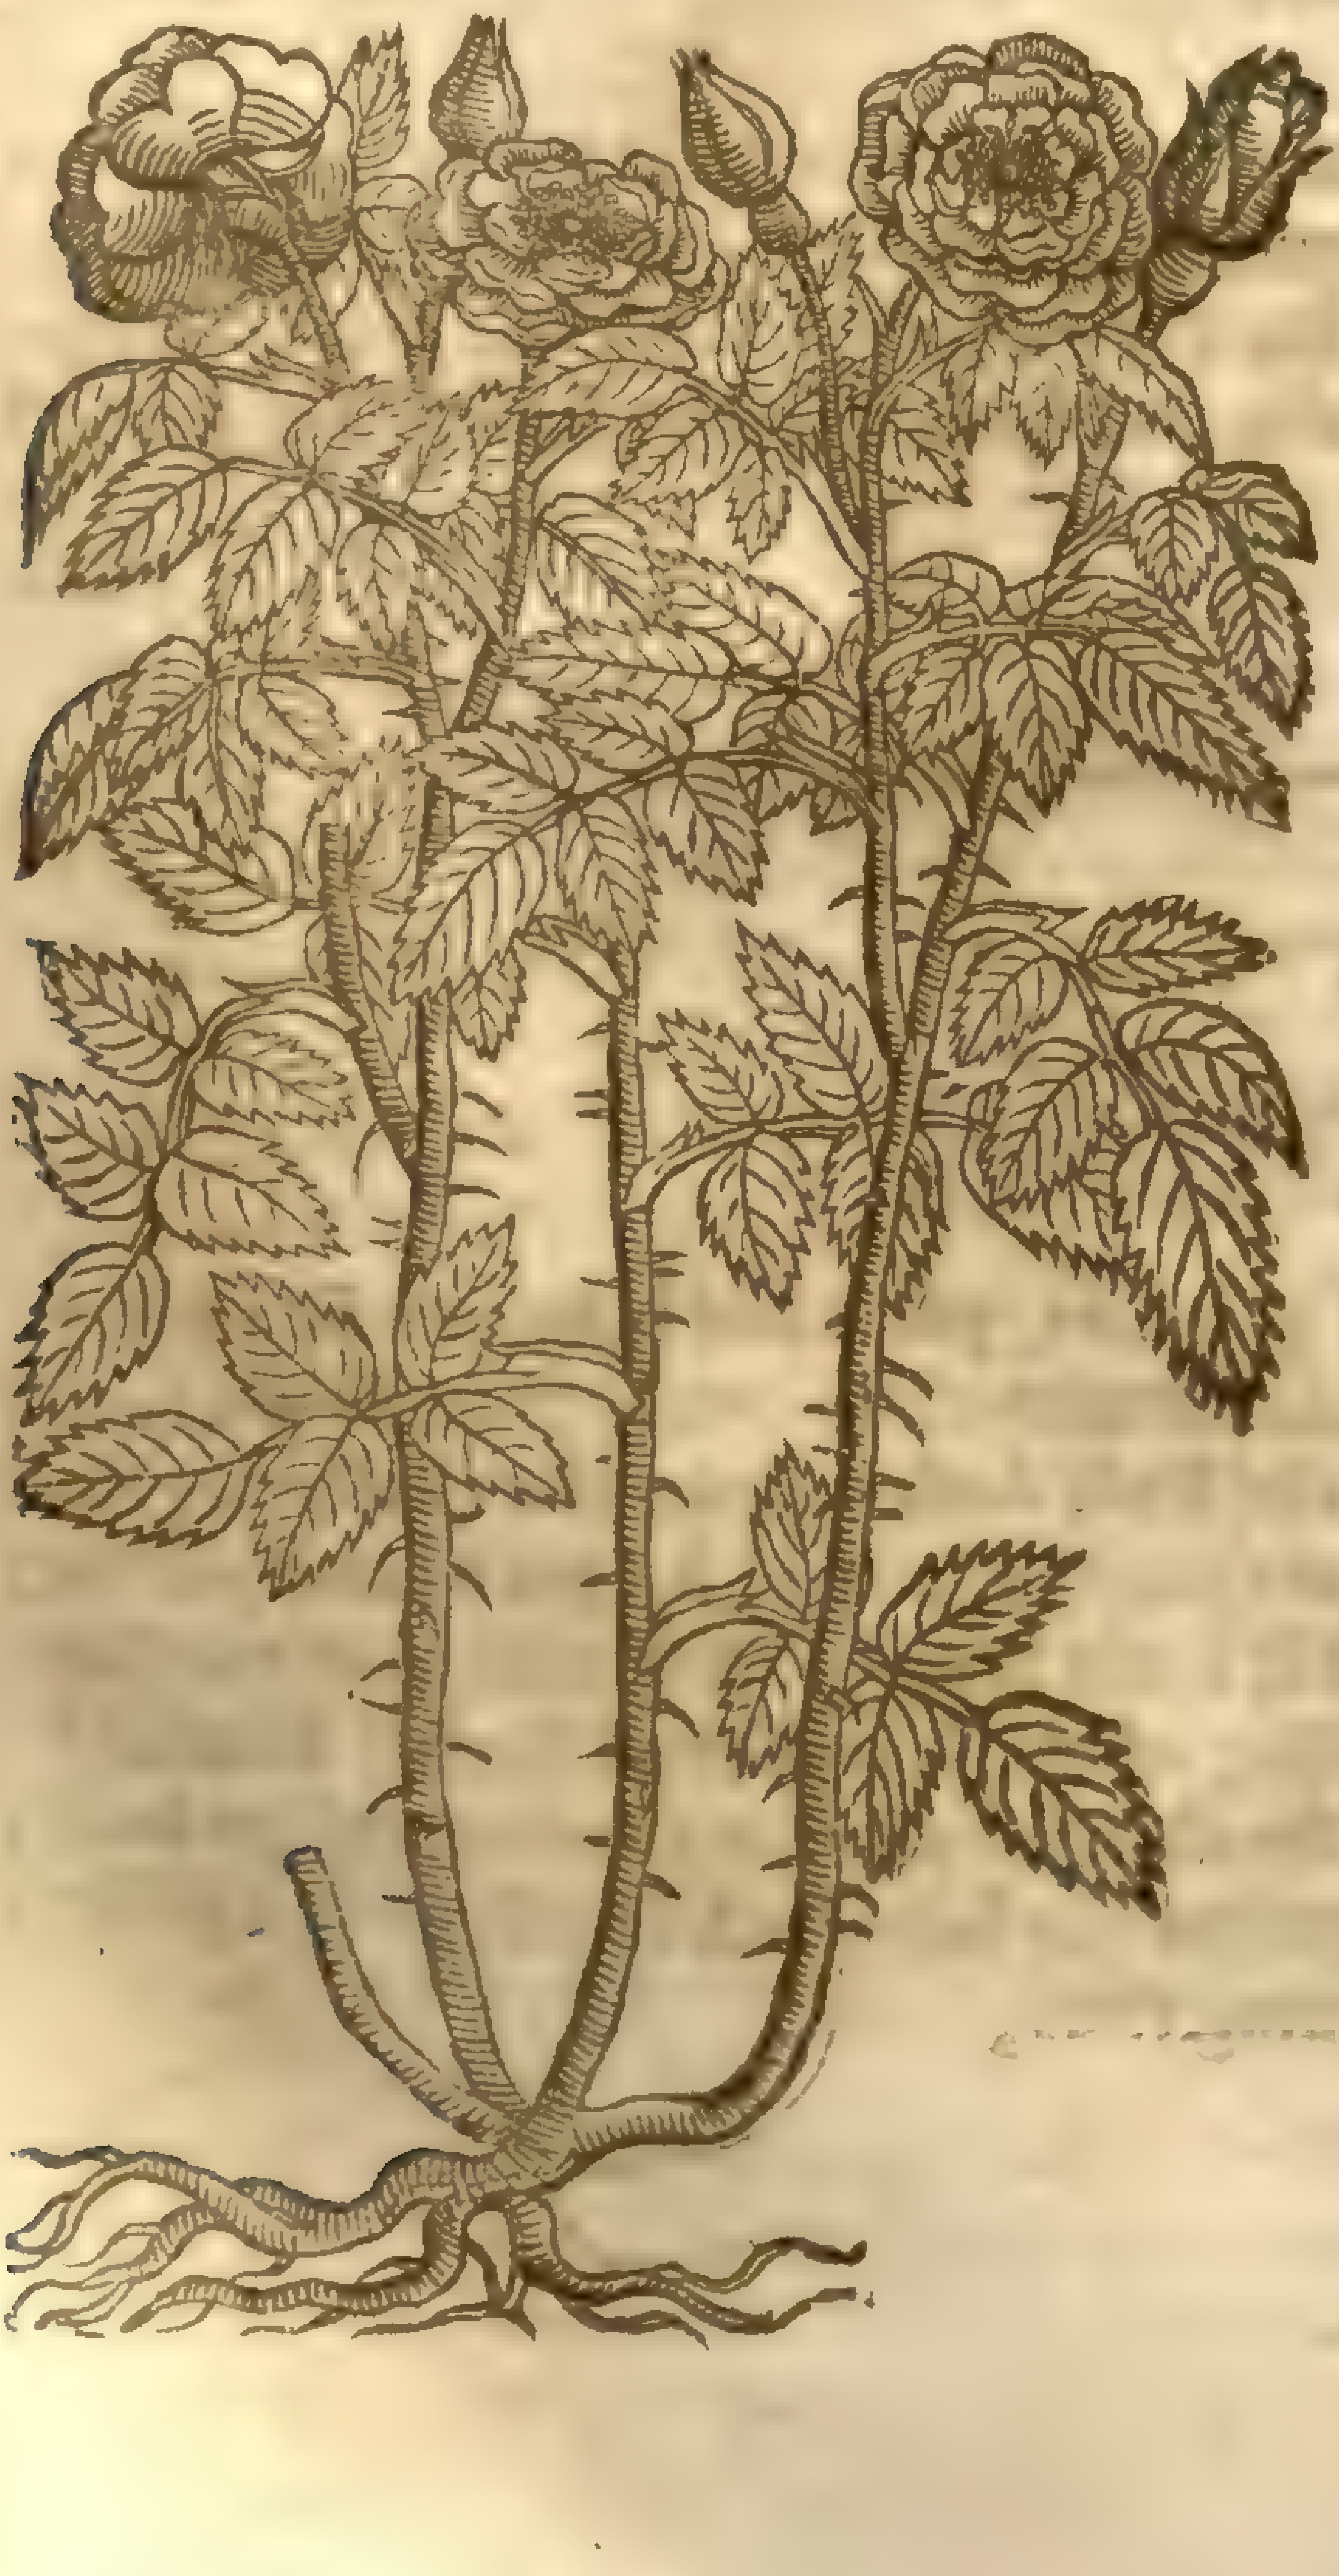
Augerius Busbequius ſpeaking of the eſtimation and honor of the Roſe, reporteth, That the Turks can by no means endure to ſee the leaues of Roſes fall to the ground, becauſe ſome of them haue dreamed, that the firſt or moſt antient Roſe did ſpring out of the bloud of *Venus*: and others of the Mahumetans ſay that it ſprang of the ſweat of *Mahumet*.

But there are many kindes of Roſes, differing either in the bigneſſe of the floures, or the plant it ſelfe, roughneſſe or ſmoothneſſe, or in the multitude or fewneſſe of the flours, or elſe in colour and ſmell; for diuers of them are high and tall, others ſhort and low, ſome haue fiue leaues, others very many. *Theophraſtus* tells of a certain Roſe growing about Philippi, with an hundred leaues, which the Inhabitants brought forth of Pangæum, and planted in Campania, as *Pliny* ſaith. Which wee hold to be the Holland Roſe, that diuers call the Prouince Roſe, but not properly.

Moreouer, ſome be red, others white, and moſt of them or all ſweetly ſmelling, eſpecially thoſe of the garden.

R. alba. C.B. [illegible]

1 *Roſa alba.*
The white Roſe.



¶ *The Deſcription.*

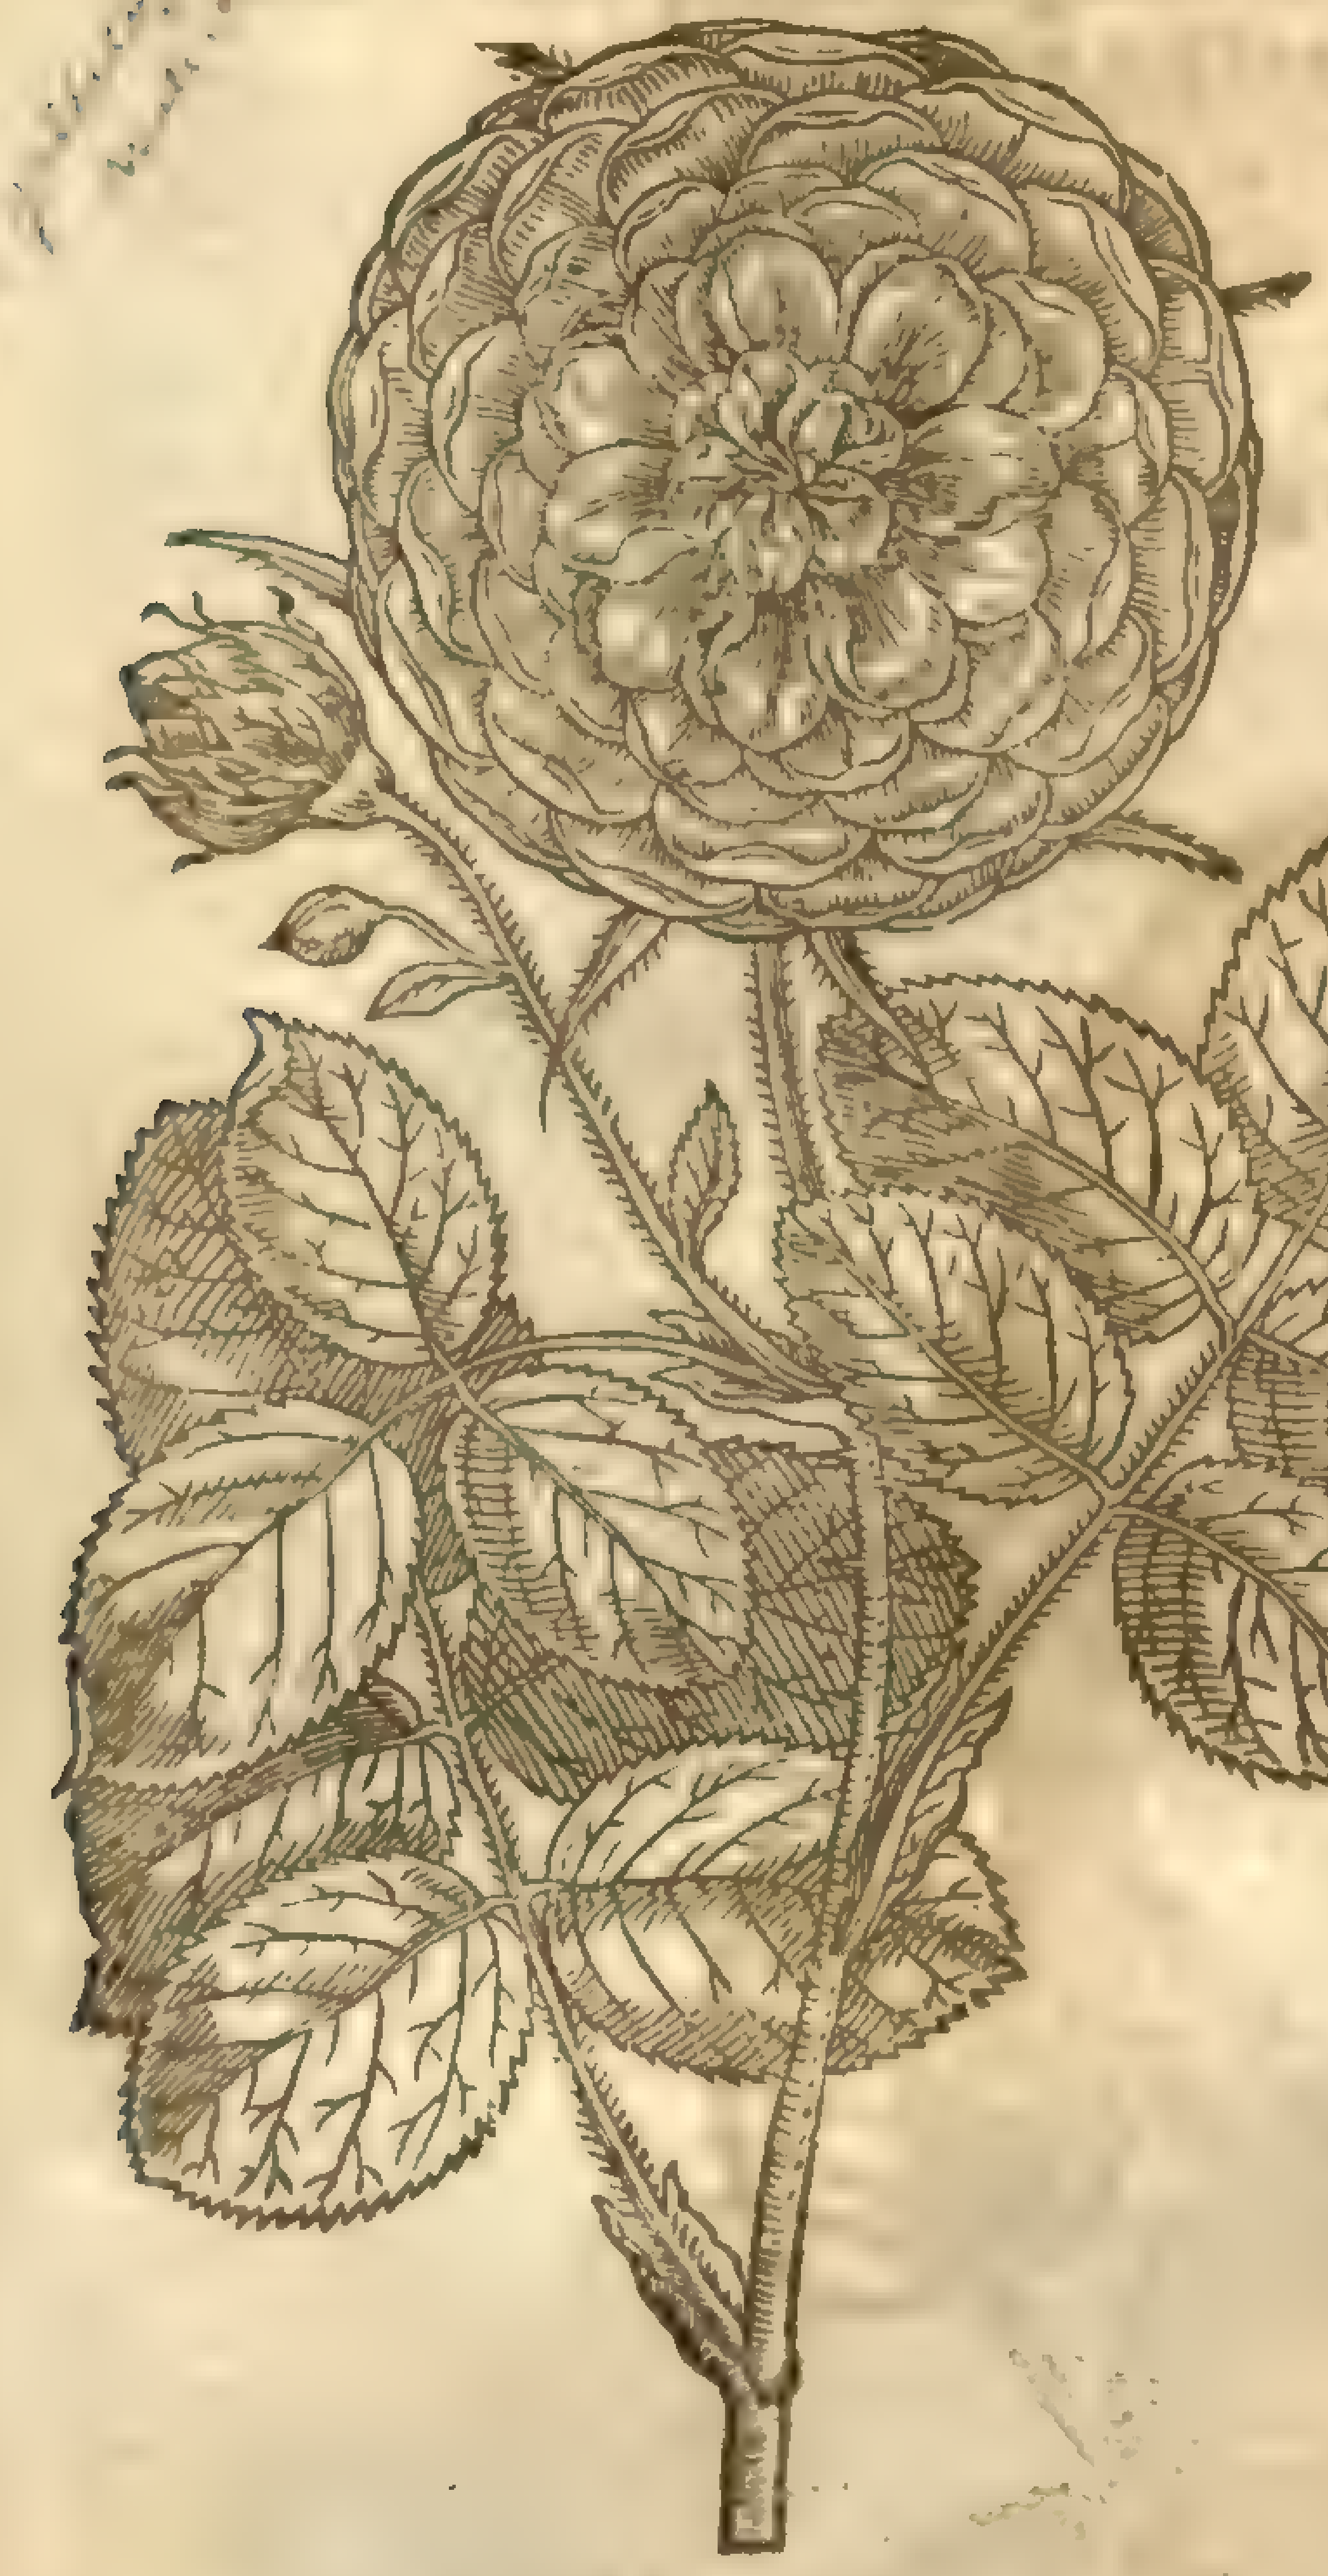
1 IF the Curious could ſo be content, one generall deſcription might ſerue to diſtinguiſh the whole ſtock or kindred of the Roſes, being things ſo wel knowne: notwithſtanding I thinke it not amiſſe to ſay ſomthing of them ſeuerally, in hope to ſatisfie all. The white Roſe hath very long ſtalkes of a wooddy ſubſtance, ſet or armed with diuers ſharpe prickles: the branches wherof are likewiſe full of prickles, whereon grow leaues conſiſting of fiue leaues for the moſt part, ſet vpon a middle rib by couples, the old leaf ſtanding at the point of the ſame, and euery one of thoſe ſmall leaues ſomwhat ſnipt about the edges, ſomewhat rough, and of an ouerworne greene colour: from the boſome whereof ſhoot forth long foot ſtalks, whereon grow very faire double flours of a white colour, and very ſweet ſmell, hauing in the middle a few yellow threds or chiues; which being paſt, there ſucceedeth a long fruit, greene at the firſt, but red when it is ripe, and ſtuffed with a downy choking matter, wherein is contained ſeed as hard as ſtones. The root is long, tough, and of a wooddy ſubſtance.

2 The red Roſe groweth very low in reſpect of the former: the ſtalks are ſhorter, ſmoother, and browner of colour: The leaues are like, yet of a worſe duſty colour: The floures grow on the tops of the branches, conſiſting of many leaues of a perfect red colour: the fruit is likewiſe red when it is ripe: the root is wooddy.

3 The common Damaske Roſe in ſtature, prickely branches, and in other reſpects is like the white

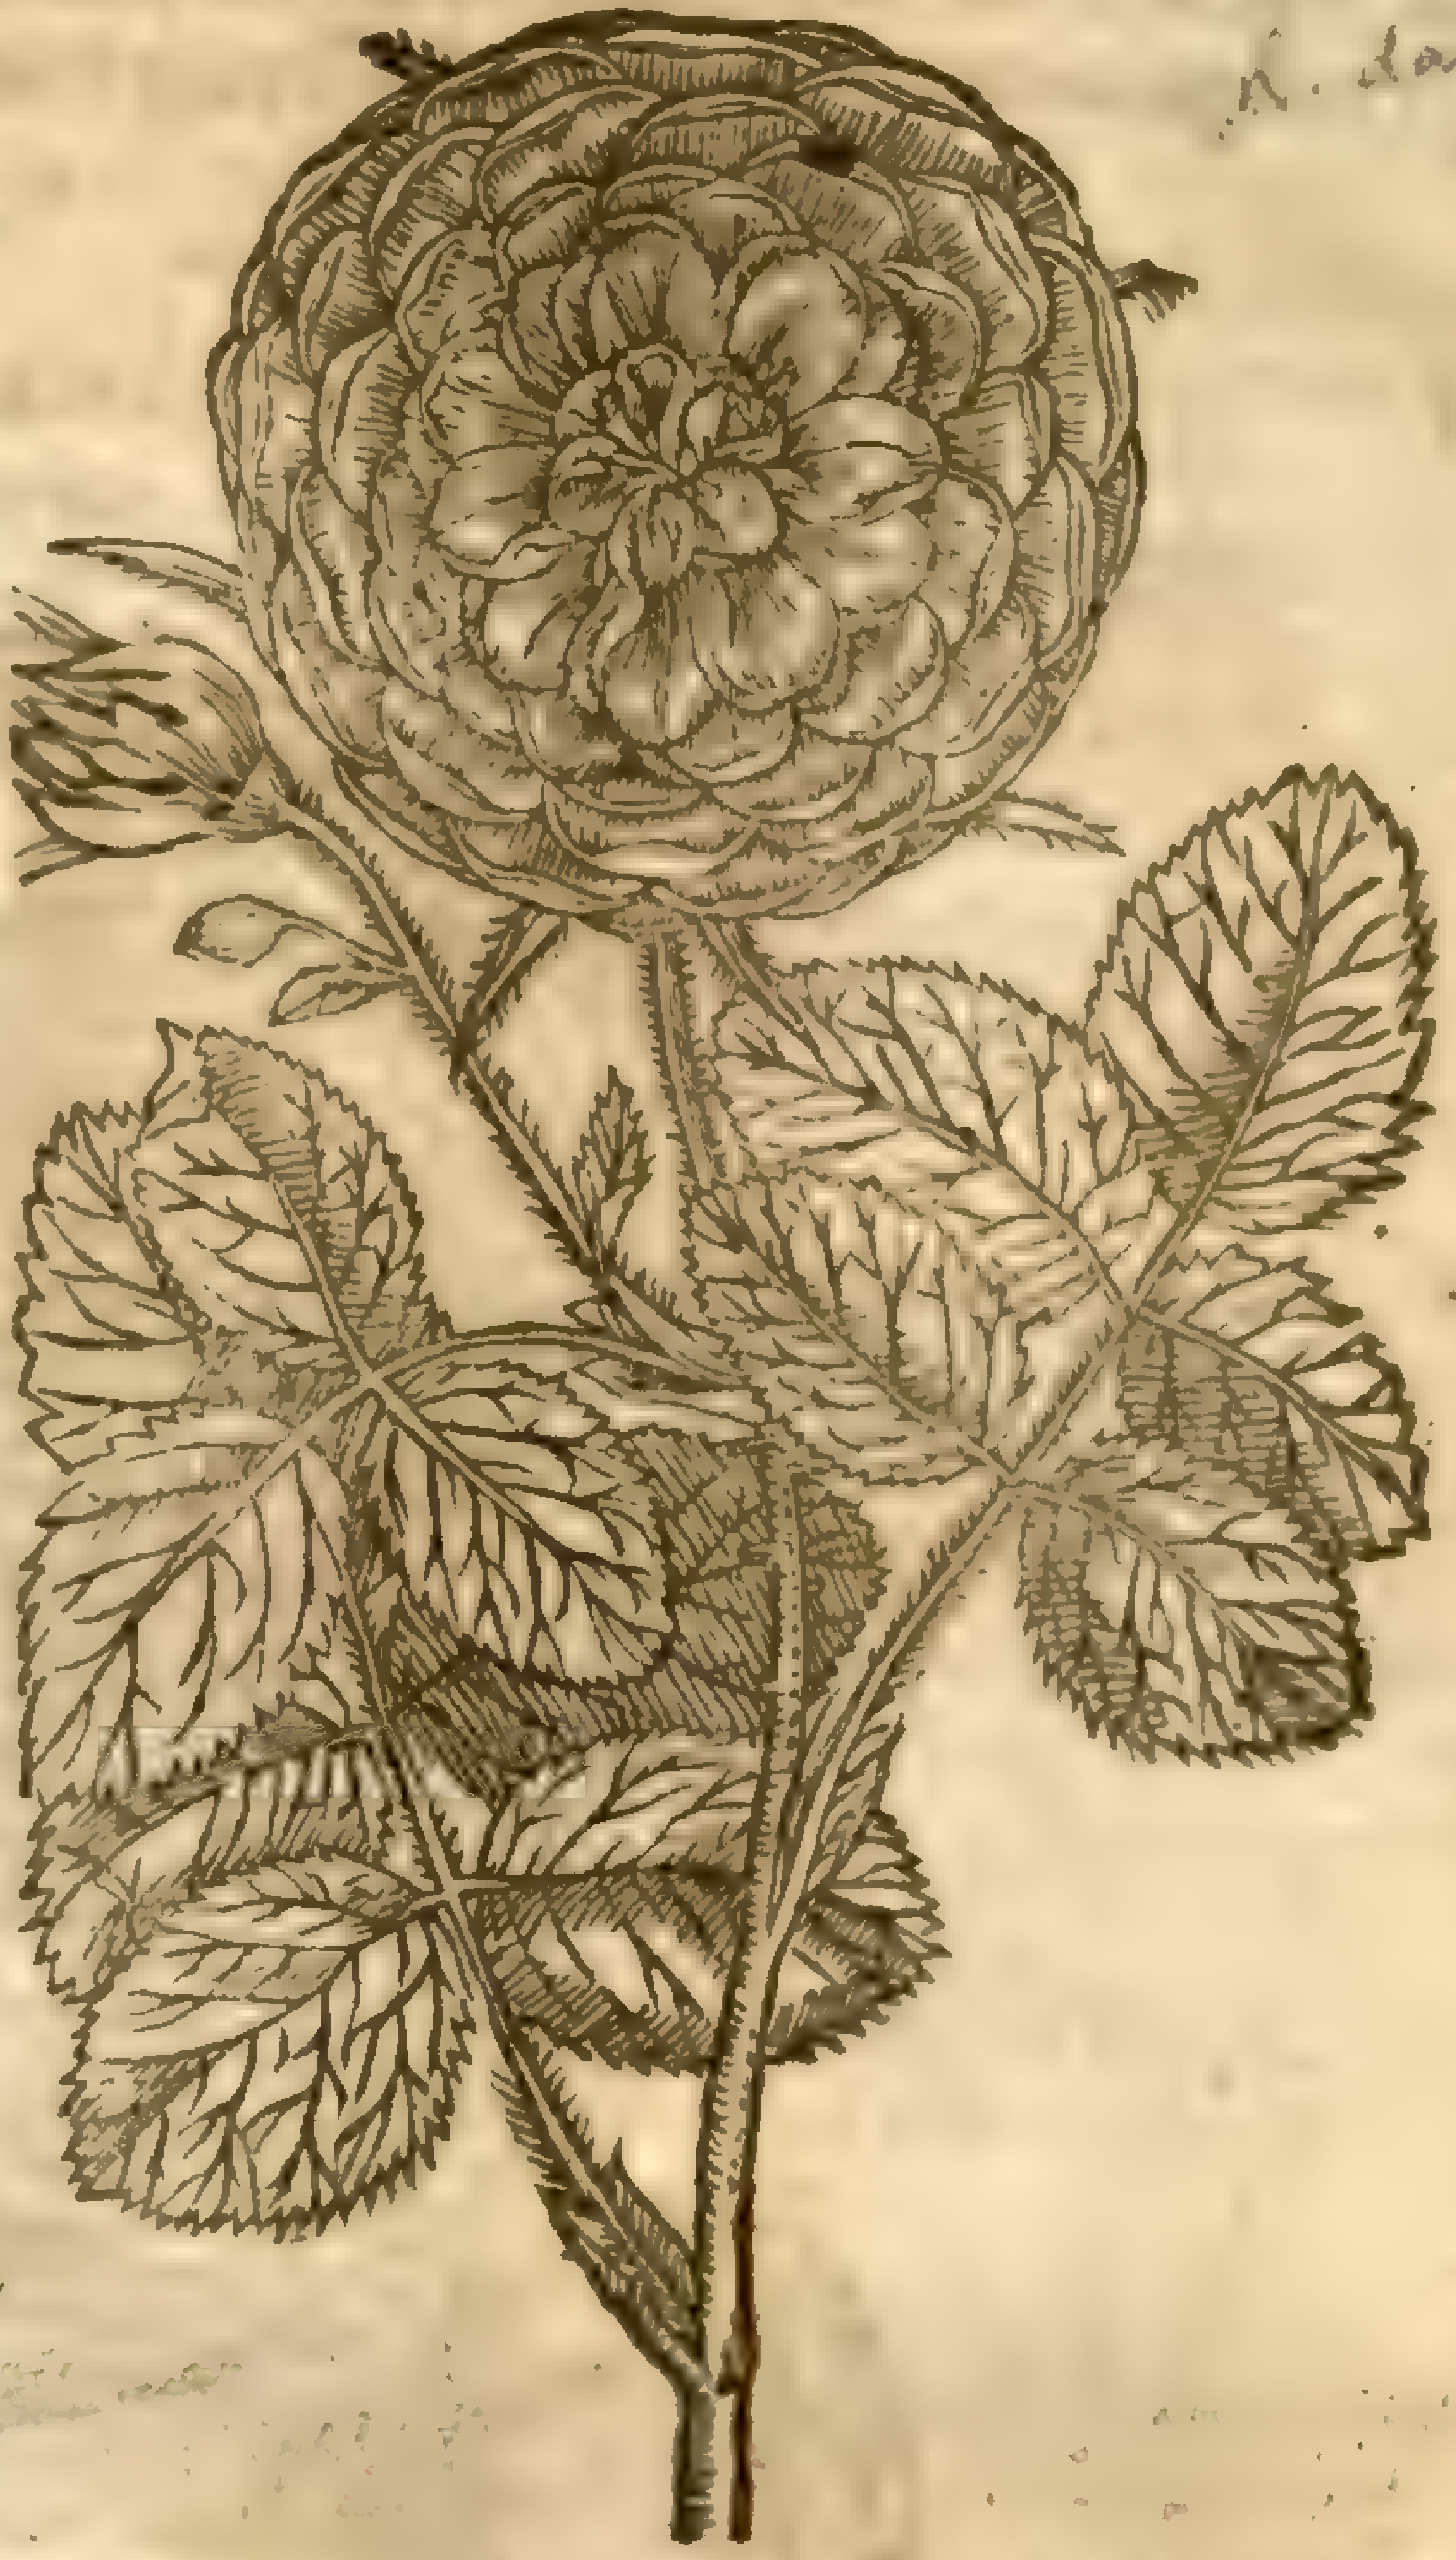
2 *Roſa rubra.*
The red Roſe.

R. gallica, L. mill. dict.

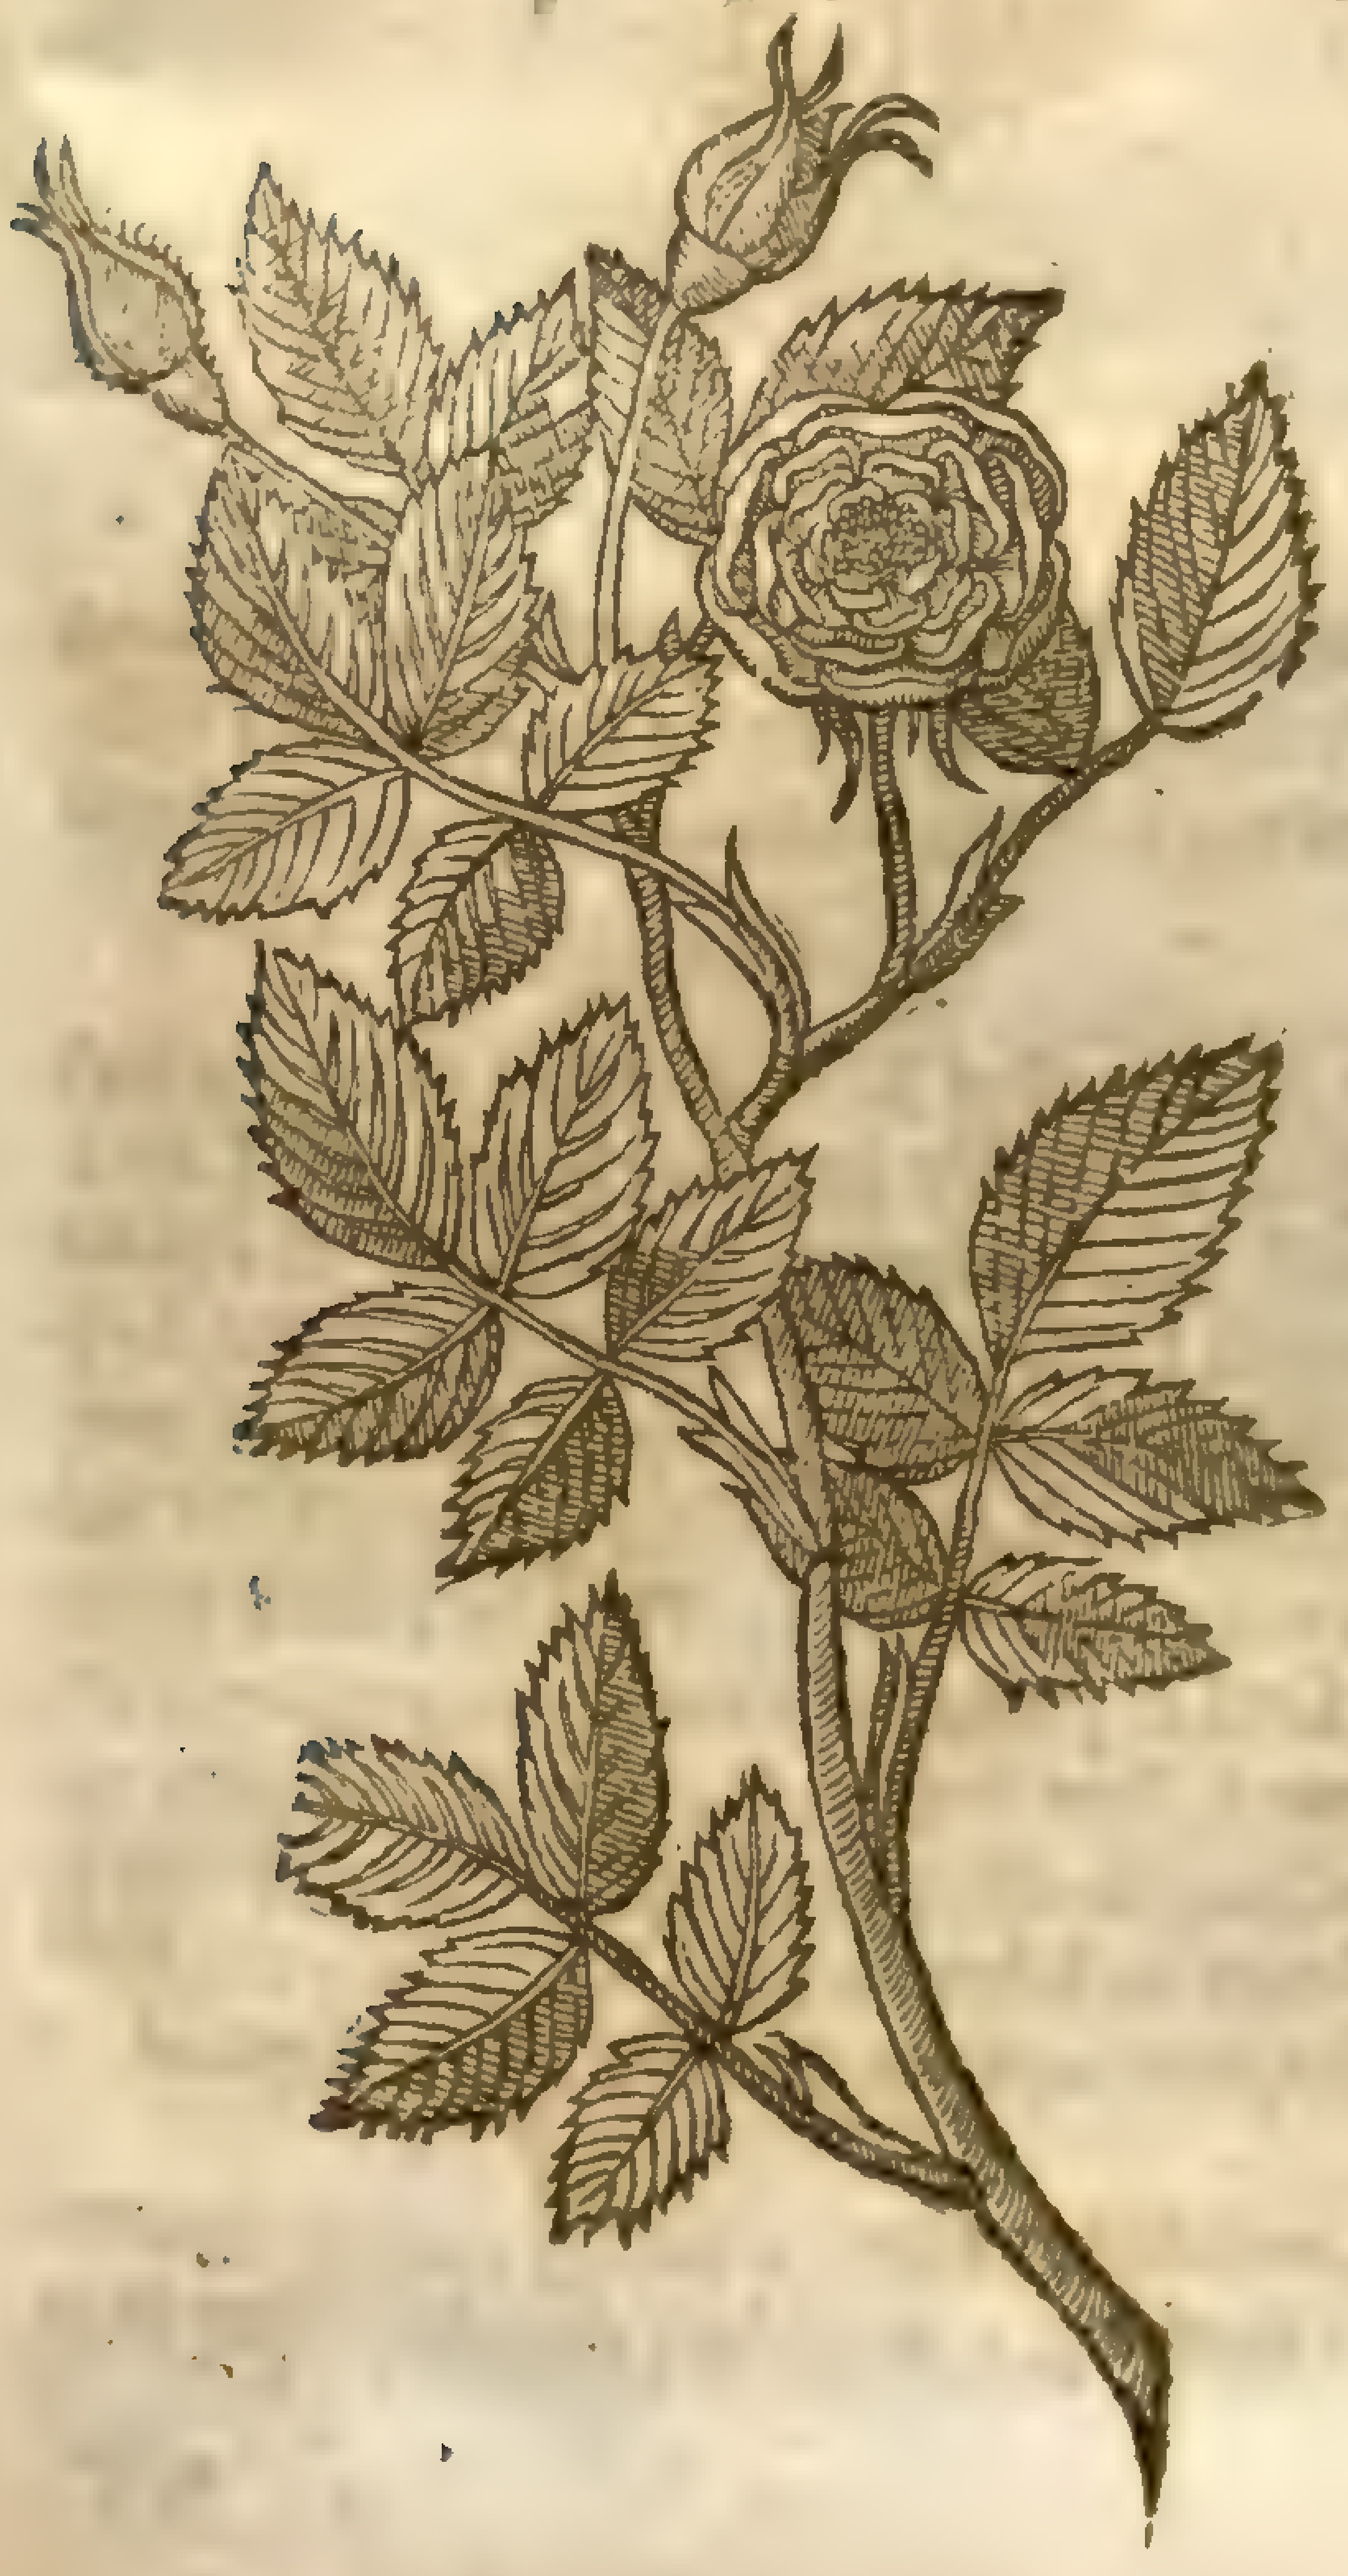


3 *Roſa Provincialis, ſive Damaſcena.*
The Province or Damaske Roſe.

R. damascena, L. mill. dict.



5 *Roſa ſine ſpinis.*
The Roſe without prickles.



white Roſe; the eſpeciall difference conſiſts in the colour and ſmell of the flours: for theſe are of a pale red colour, of a more pleaſant ſmel, and fitter for meat and medicine.

4 The *Roſa Provincialis minor* or leſſer Province Roſe differeth not from the former, but is altogether leſſer: the floures and fruit are like: the vſe in phyſicke alſo agreeth with the precedent.

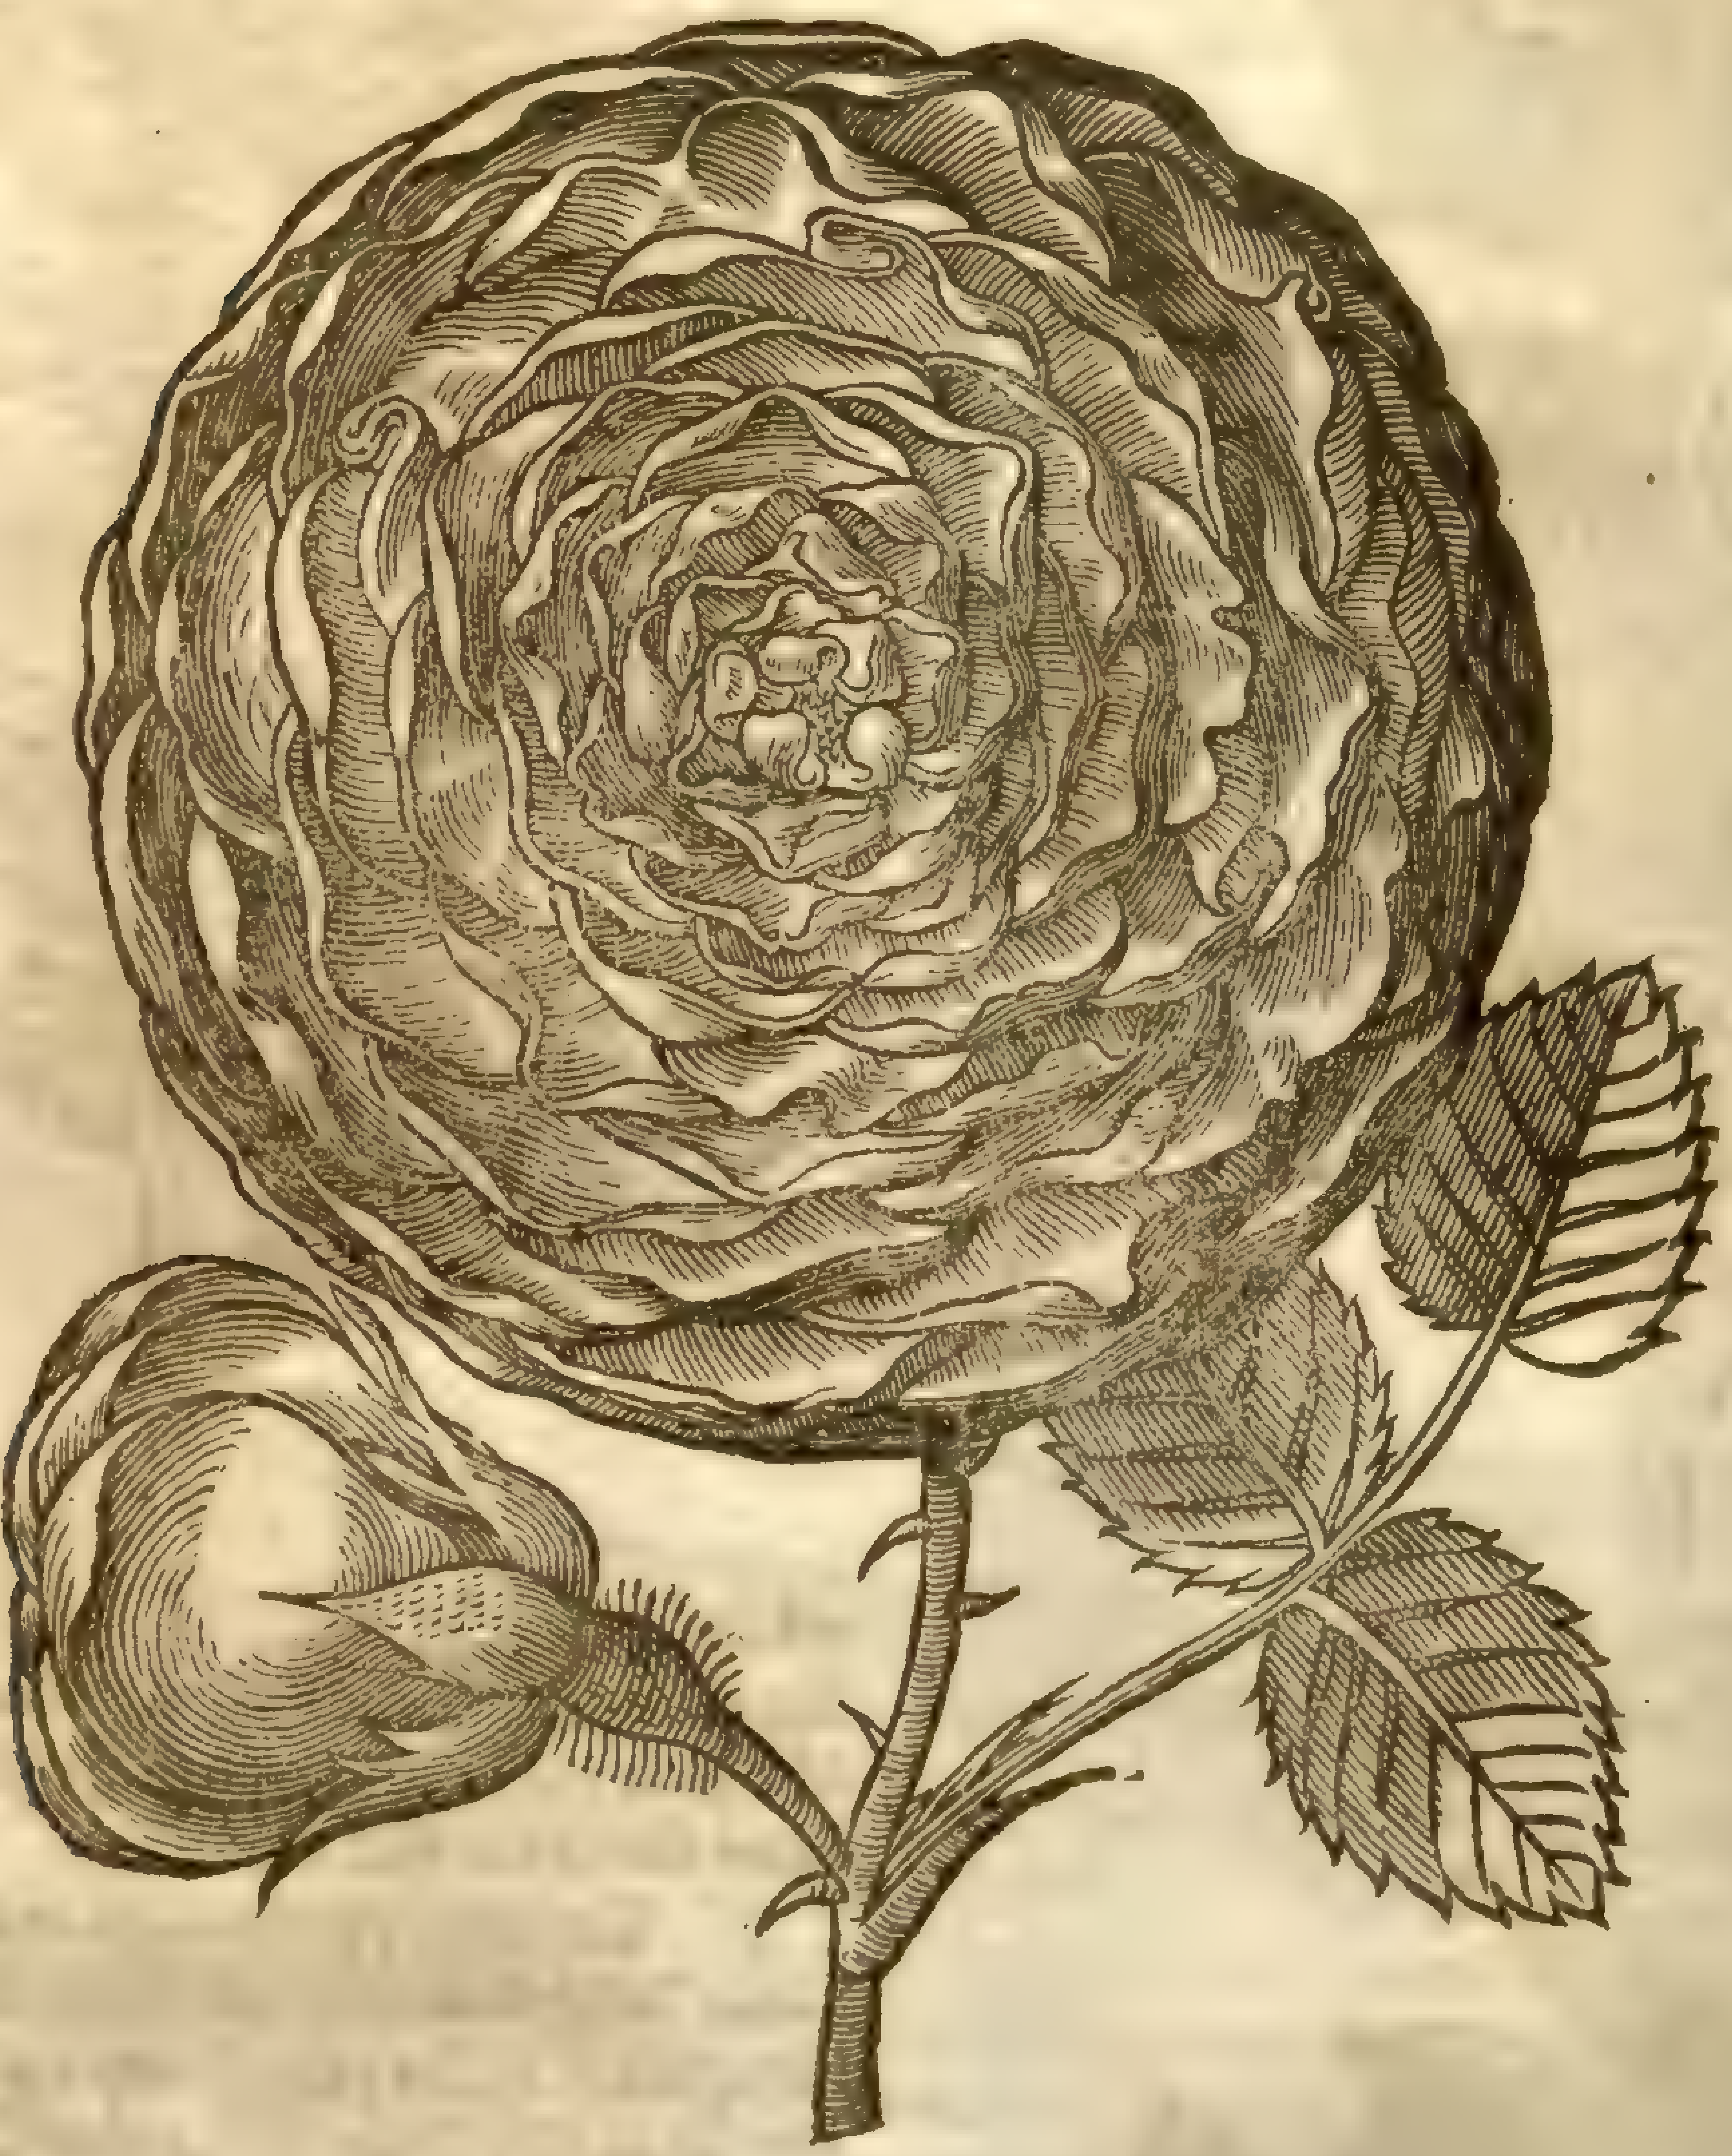
5 The Roſe without prickles hath many young ſhoots comming from the root, diuiding themſelues into diuers branches, tough, and of a woddy ſubſtance as are all the reſt of the Roſes, of the height of two or three cubits, ſmooth and plain without any roughneſſe or prickles at all: whereon grow leaues like thoſe of the Holland Roſe, of a ſhining deep green colour on the vpper ſide, vnderneath ſomewhat hoary and hairy. The flours grow at the tops of the branches, conſiſting of an infinite number of leaues, greater than thoſe of the Damaske Roſe, more double, and of a colour between the red and damask Roſes, of a moſt ſweet ſmell. The fruit is round, red when it is ripe, and ſtuffed with the like flocks and ſeeds of thoſe of the damaske Roſe. The root is great, wooddy, and far ſpreading.

6 The Holland or Province Roſe hath diuers ſhoots proceeding from a wooddy root ful of ſharpe prickles, diuiding it ſelfe into diuers branches, wheron grow leaues conſiſting of fiue

leaues ſet on a rough middle rib,& thoſe ſnipt about the edges: the flours grow on the tops of the branches,in ſhape and colour like the damaske Roſe, but greater and more double; inſomuch that the yellow chiues in the middle are hard to be ſeene; of a reaſonable good ſmell, but not fully ſo ſweet as the common damaske Roſe: the fruit is like the other of his kinde.

6 Roſa Hollandica ſiue Batava.
The great Holland Roſe,commonly called the great Prouince Roſe.

R. provincialis. Linn. mill. dict.



We haue in our London gardens one of the red Roſes, whoſe flours are in quantitie and beautie equall with the former,but of greater eſtimation,of a perfect red colour,wherin it eſpecially differeth from the Province Roſe; in ſtalks,ſtature,and manner of growing it agrees with our common red Roſe.

¶ *The Place.*

All theſe ſorts of Roſes we haue in our London gardens,except that Roſe without pricks,which as yet is a ſtranger in England. The double white Roſe groweth wilde in many hedges of Lancaſhire in great aboundance, euen as Briers do with vs in theſe Southerly parts, eſpecially in a place of the country called Leyland,and at Roughford not far from Latham. Moreouer,in the ſaid Leyland fields doth grow our garden Roſe wilde,in the plowed fields among the corne,in ſuch aboundance,that there may be gathered daily during the time,many buſhels of roſes,equal with the beſt garden Roſe in each reſpect: the thing that giueth great cauſe of wonder,is, That in a field in the place aforeſaid,called Glovers field,euery yeare that the field is plowed for corne,that yeare it wil be ſpred ouer with Roſes,and when it lieth ley,or not plowed,then is there but few Roſes to be gathered; by the relation of a curious gentleman there dwelling,ſo often remembred in our hiſtory.

‡ I haue heard that the Roſes which grow in ſuch plenty in Glovers field euery yere the field is plowed,are no other than Corn Roſe,that is,red Poppies,howeuer our Author was informed. ‡

¶ *The Time.*

Theſe floure from the end of May to the end of Auguſt,and diuers times after,by reaſon the tops and ſuperfluous branches are cut away in the end of their flouring: and then doe they ſomtimes floure euen vntill October and after.

¶ The

¶ *The Names.*

The Roſe is called in Latine *Roſa*: in Greeke ῥόδον: and the plant it ſelfe ῥοδωνία: (which in Latine keepeth the ſame name that the floure hath) and it is called *Rodon* (as *Plutarch* ſaith) becauſe it ſendeth forth plenty of ſmell.

The middle part of the Roſes, that is, the yellow chiues, or ſeeds and tips, is called *Anthos*, and *Flos Roſæ*, the floure of the Roſe: in ſhops, *Anthera*, or the blowing of the Roſe.

The white parts of the leaues of the floure it ſelfe, by which they are faſtened to the cups, be named *Vngues* or nails. That is called *Calix*, or the cup, which containeth and holdeth in together the yellow part and leaues of the floure.

Alabaſtri are thoſe parts of the cup which are deeply cut, and that compaſſe the floure cloſe about before it be opened, which be in number fiue, two haue beards and two haue none, and the fifth hath but halfe one: moſt do call them *Cortiſes Roſarum*, or the husks of the Roſes: the ſhoots of the plant of Roſes, *Strabo Gallus* in his little garden doth call *Viburna*.

The white Roſe is called *Roſa alba*: in Engliſh, the white Roſe: in high Dutch, **Weiſz Rooſen**: in low Dutch, **Witte Rooſen**: in French, *Roſe Blanche*: of *Pliny*, *Spineola Roſa*, or *Roſa Campana*.

The red Roſe is called in Latine, *Roſa rubro*: the French-men, *Roſe Franche*, *Roſe de Pronins*, a towne in Campaigne: of *Pliny*, *Trachinia*, or *Præneſtina*.

The Damaske Roſe is called of the Italians *Roſa incarnata*: in high Dutch, **Leibfarbige Rooſen**: in low Duth, **Prouincie Rooſe**: of ſome, *Roſa Prouincialis*, or Roſe of Prouince: in French of ſome, *Meleſia*: the Roſe of Melaxo, a city in Aſia, from whence ſome haue thought it was firſt brought into thoſe parts of Europe.

The great Roſe, which is generally called the great Prouince Roſe, which the Dutchmen cannot endure; for ſay they, it came firſt out of Holland, and therefore to be called the Holland Roſe: but by all likelihood it came from the Damaske Roſe, as a kind thereof, made better and fairer by art, which ſeemeth to agree with truth.

The Roſe without prickles is called in Latine, *Roſa ſine ſpinis*, and may be called in Engliſh, the Roſe without thornes, or the Roſe of Auſtrich, becauſe it was firſt brought from Vienna, the Metropolitan citie of Auſtrich, and giuen to that famous Herbariſt *Carolus Cluſius*.

¶ *The Temperature.*

The leaues of the floures of Roſes, becauſe they doe conſiſt of diuers parts haue alſo diuers and ſundry faculties: for there be in them certaine that are earthy and binding, others moiſt and watery, and ſundry that are ſpirituall and airie parts, which notwithſtanding are not all after one ſort, for in one kinde theſe excell, in another thoſe, all of them haue a predominant or ouer-ruling cold temperature, which is neereſt to a meane, that is to ſay, of ſuch as are cold in the firſt degree, moiſt, airie, and ſpirituall parts are predominant in the White roſes, Damaske and Muske,

¶ *The Vertues.*

The diſtilled water of Roſes is good for the ſtrengthning of the heart, and refreſhing of the ſpirits, and likewiſe for all things that require a gentle cooling. A

The ſame being put in junketting diſhes, cakes, ſauces, and many other pleaſant things, giueth a fine and delectable taſte. B

It mitigateth the paine of the eies proceeding of a hot cauſe, bringeth ſleep, which alſo the freſh roſes themſelues prouoke through their ſweet and pleaſant ſmell. C

The juyce of theſe Roſes, eſpecially of Damask, doth mooue to the ſtoole, and maketh the belly ſoluble: but moſt effectuall that of the Musk Roſes: next to them is the juyce of the Damask, which is more commonly vſed. D

The infuſion of them doth the ſame, and alſo the Syrrup made thereof, called in Latine *Droſatum*, or *Serapium*: the Apothecaries call it Syrrup of roſes ſolutiue, which muſt be made of the infuſion in which a great number of the leaues of theſe freſh Roſes are diuers and ſundry times ſteeped. E

It is profitable to make the belly looſe and ſoluble, when as either there is no need of other ſtronger purgation, or that it is not fit and expedient to vſe it: for beſides thoſe excrements which ſtick to the bowels, or that in the firſt and neereſt veines remaine raw, flegmaticke, and now and then cholericke, it purgeth no other excrements, vnleſſe it be mixed with certaine other ſtronger medicines. F

This Syrrup doth moiſten and coole, and therefore it allayeth the extremity of heat in hot burning feuers, mitigateth the inflammations of the intrails, and quencheth thirſt: it is ſcarce good for a weake and moiſt ſtomacke, for it leaueth it more ſlacke and weake. G

Of like vertue alſo are the leaues of theſe preſerued in Sugar, eſpecially if they be onely bruiſed with the hands, and diligently tempered with Sugar, and ſo heat at the fire rather than boyled. H

¶ *The Temperature of Red Roſes.*

There is in the red Roſes, which are common euery where, and in the other that be of a deep purple, called Prouince Roſes, a more earthy ſubſtance, alſo a drying and binding quality, yet not without I out certain moiſture joyned, being in them when they are as yet freſh, which they loſe when they be dried: for this cauſe their juyce and infuſion doth alſo make the body ſoluble, yet not ſo much as of the others aforeſaid. Theſe Roſes being dried, and their moiſture gone, do bind and dry; and likewiſe coole, but leſſer than when they are freſh.

¶ *The Vertues.*

I They ſtrengthen the heart, and helpe the trembling and beating thereof.

K They giue ſtrength to the liuer, kidnies, and other weake intrails; they dry and comfort a weake ſtomacke that is flaſhie and moiſt; ſtay the whites and reds, ſtanch bleeding in any part of the body, ſtay ſweatings, binde and looſe, and moiſten the body.

L And they are put into all manner of counterpoyſons and other like medicines, whether they be to be outwardly applied or to be inwardly taken, to which they giue an effectuall binding, and certaine ſtrengthning quality.

M Hony of Roſes, or *Mel Roſarum*, called in Greeke ῥοδόμελι, which is made of them, is moſt excellent good for wounds, vlcers, iſſues, and generally for ſuch things as haue need to be clenſed and dried.

N The oyle doth mitigate all kindes of heat, and will not ſuffer inflammations or hot ſwellings to riſe, and being riſen it doth at the firſt aſſwage them.

¶ *The Temperature and Vertues of the parts.*

O The flours or bloomings of Roſes, that is to ſay, the yellow haires and tips, do in like manner dry and binde, and that more effectually than of the leaues of the roſes themſelues: the ſame temperature the cups and beards be of; but ſeeing none of theſe haue any ſweet ſmell, they are not ſo profitable, nor ſo familiar or beneficiall to mans nature: notwithſtanding in fluxes at the ſea, it ſhall auaile the Surgion greatly, to carry ſtore thereof with him, which doth there preuaile much more than at the land.

P The ſame yellow called *Anthera*, ſtayeth not only thoſe lasks and bloudy fluxes which do happen at the Sea, but thoſe at the land alſo, and likewiſe the white flux and red in women, if they bee dried, beaten to pouder, and two ſcruples thereof giuen in red wine, with a little pouder of Ginger added thereto: and being at the Sea, for want of red Wine you may vſe ſuch liquor as you can get in ſuch extremity.

Q The little heads or buttons of the Roſes, as *Pliny* writeth, doe alſo ſtanch bleeding and ſtop the laske.

R The nailes or white ends of the leaues of the floures are good for watering eies.

S The juice, infuſion, or decoction of Roſes, are to be reckoned among thoſe medicines which are ſoft, gentle, looſing, opening and purging gently the belly, which may be taken at all times and in all places, of euery kinde or ſex of people, both old and young, without danger or perill.

T The Syrrup made of the infuſion of Roſes, is a moſt ſingular and gentle looſing medicine, carrying downewards cholericke humors, opening the ſtoppings of the liuer, helping greatly the yellow jaundiſe, the trembling of the heart, and taking away the extreme heat in agues and burning feuers; which is thus made:

V Take two pound of Roſes, the white ends cut away, put them to ſteepe or infuſe in ſix pintes of warme water in an open veſſell for the ſpace of twelue houres: then ſtraine them out, and put thereto the like quantitie of Roſes, and warme the water again, ſo let it ſtand the like time: do thus foure or fiue times; in the end adde vnto that liquor or infuſion, foure pound of fine Sugar in pouder; then boyle it vnto the forme of a ſyrrup, vpon a gentle fire, continually ſtirring it vntill it be cold; then ſtraine it, and keepe it for your vſe, whereof may be taken in white wine, or other liquor, from one ounce vnto two.

X Syrrup of the juyce of Roſes is very profitable for the griefes aforeſaid, made in this manner:

Y Take Roſes, the white nailes cut away, what quantitie you pleaſe, ſtampe them, and ſtraine out the juyce, the which you ſhall put to the fire, adding thereto Sugar, according to the quantity of the juyce: boyling them on a gentle fire vnto a good conſiſtence.

Z Vnto theſe ſyrrups you may adde a few drops of oyle of Vitriol, which giueth it a moſt beautifull colour, and alſo helpeth the force in cooling hot and burning feuers and agues: you likewiſe may adde thereto a ſmall quantity of the juyce of Limons, which doth the like.

A The conſerue of Roſes, as well that which is crude and raw, as that which is made by ebullition or boiling, taken in the morning faſting, and laſt at night, ſtrengthneth the heart, and taketh away the ſhaking and trembling thereof, ſtrengthneth the liuer, kidneies, and other weake intrals, comforteth a weake ſtomacke that is moiſt and raw; ſtaieth the whites and reds in women, and in a word is the moſt familiar thing to be vſed for the purpoſes aforeſaid, and is thus made:

B Take the leaues of Roſes, the nails cut off, one pound, put them into a cleane pan; then put thereto a pinte and a halfe of ſcalding water, ſtirring them together with a woodden ſlice, ſo let them ſtand to macerate, cloſe couered ſome two or three houres; then ſet them to the fire ſlowly to boyle, adding thereto three pounds of ſugar in powder, letting them to ſimper together according to diſcretion, ſome houre or more; then keepe it for your vſe.

C The ſame made another way, but better by many degrees: take Roſes at your pleaſure, put them to boyle in faire water, hauing regard to the quantity; for if you haue many Roſes you may take more water; if fewer, the leſſe water will ſerue: the which you ſhall boyle at the leaſt three or foure houres, euen as you would boile a piece of meate, vntill in the eating they be very tender, at which time the Roſes will loſe their colour, that you would thinke your labour loſt, and the thing ſpoiled. But proceed, for though the Roſes haue loſt their colour, the water hath gotten the tincture thereof; then ſhall you adde vnto one pound of Roſes, foure pound of fine ſugar in pure pouder, and ſo according to the reſt of the Roſes. Thus ſhall you let them boyle gently after the ſugar is put thereto, continually ſtirring it with a woodden Spatula vntill it be cold, whereof one pound weight is worth ſix pound of the crude or raw conſerue, as well for the vertues and goodneſſe in taſte, as alſo for the beautifull colour.

D The making of the crude or raw conſerue is very well knowne, as alſo Sugar roſet, and diuers other pretty things made of Roſes and Sugar, which are impertent vnto our hiſtory, becauſe I intend nether to make thereof an Apothecaries ſhop, nor a Sugar-Bakers ſtorehouſe, leauing the reſt for our cunning confectioners.

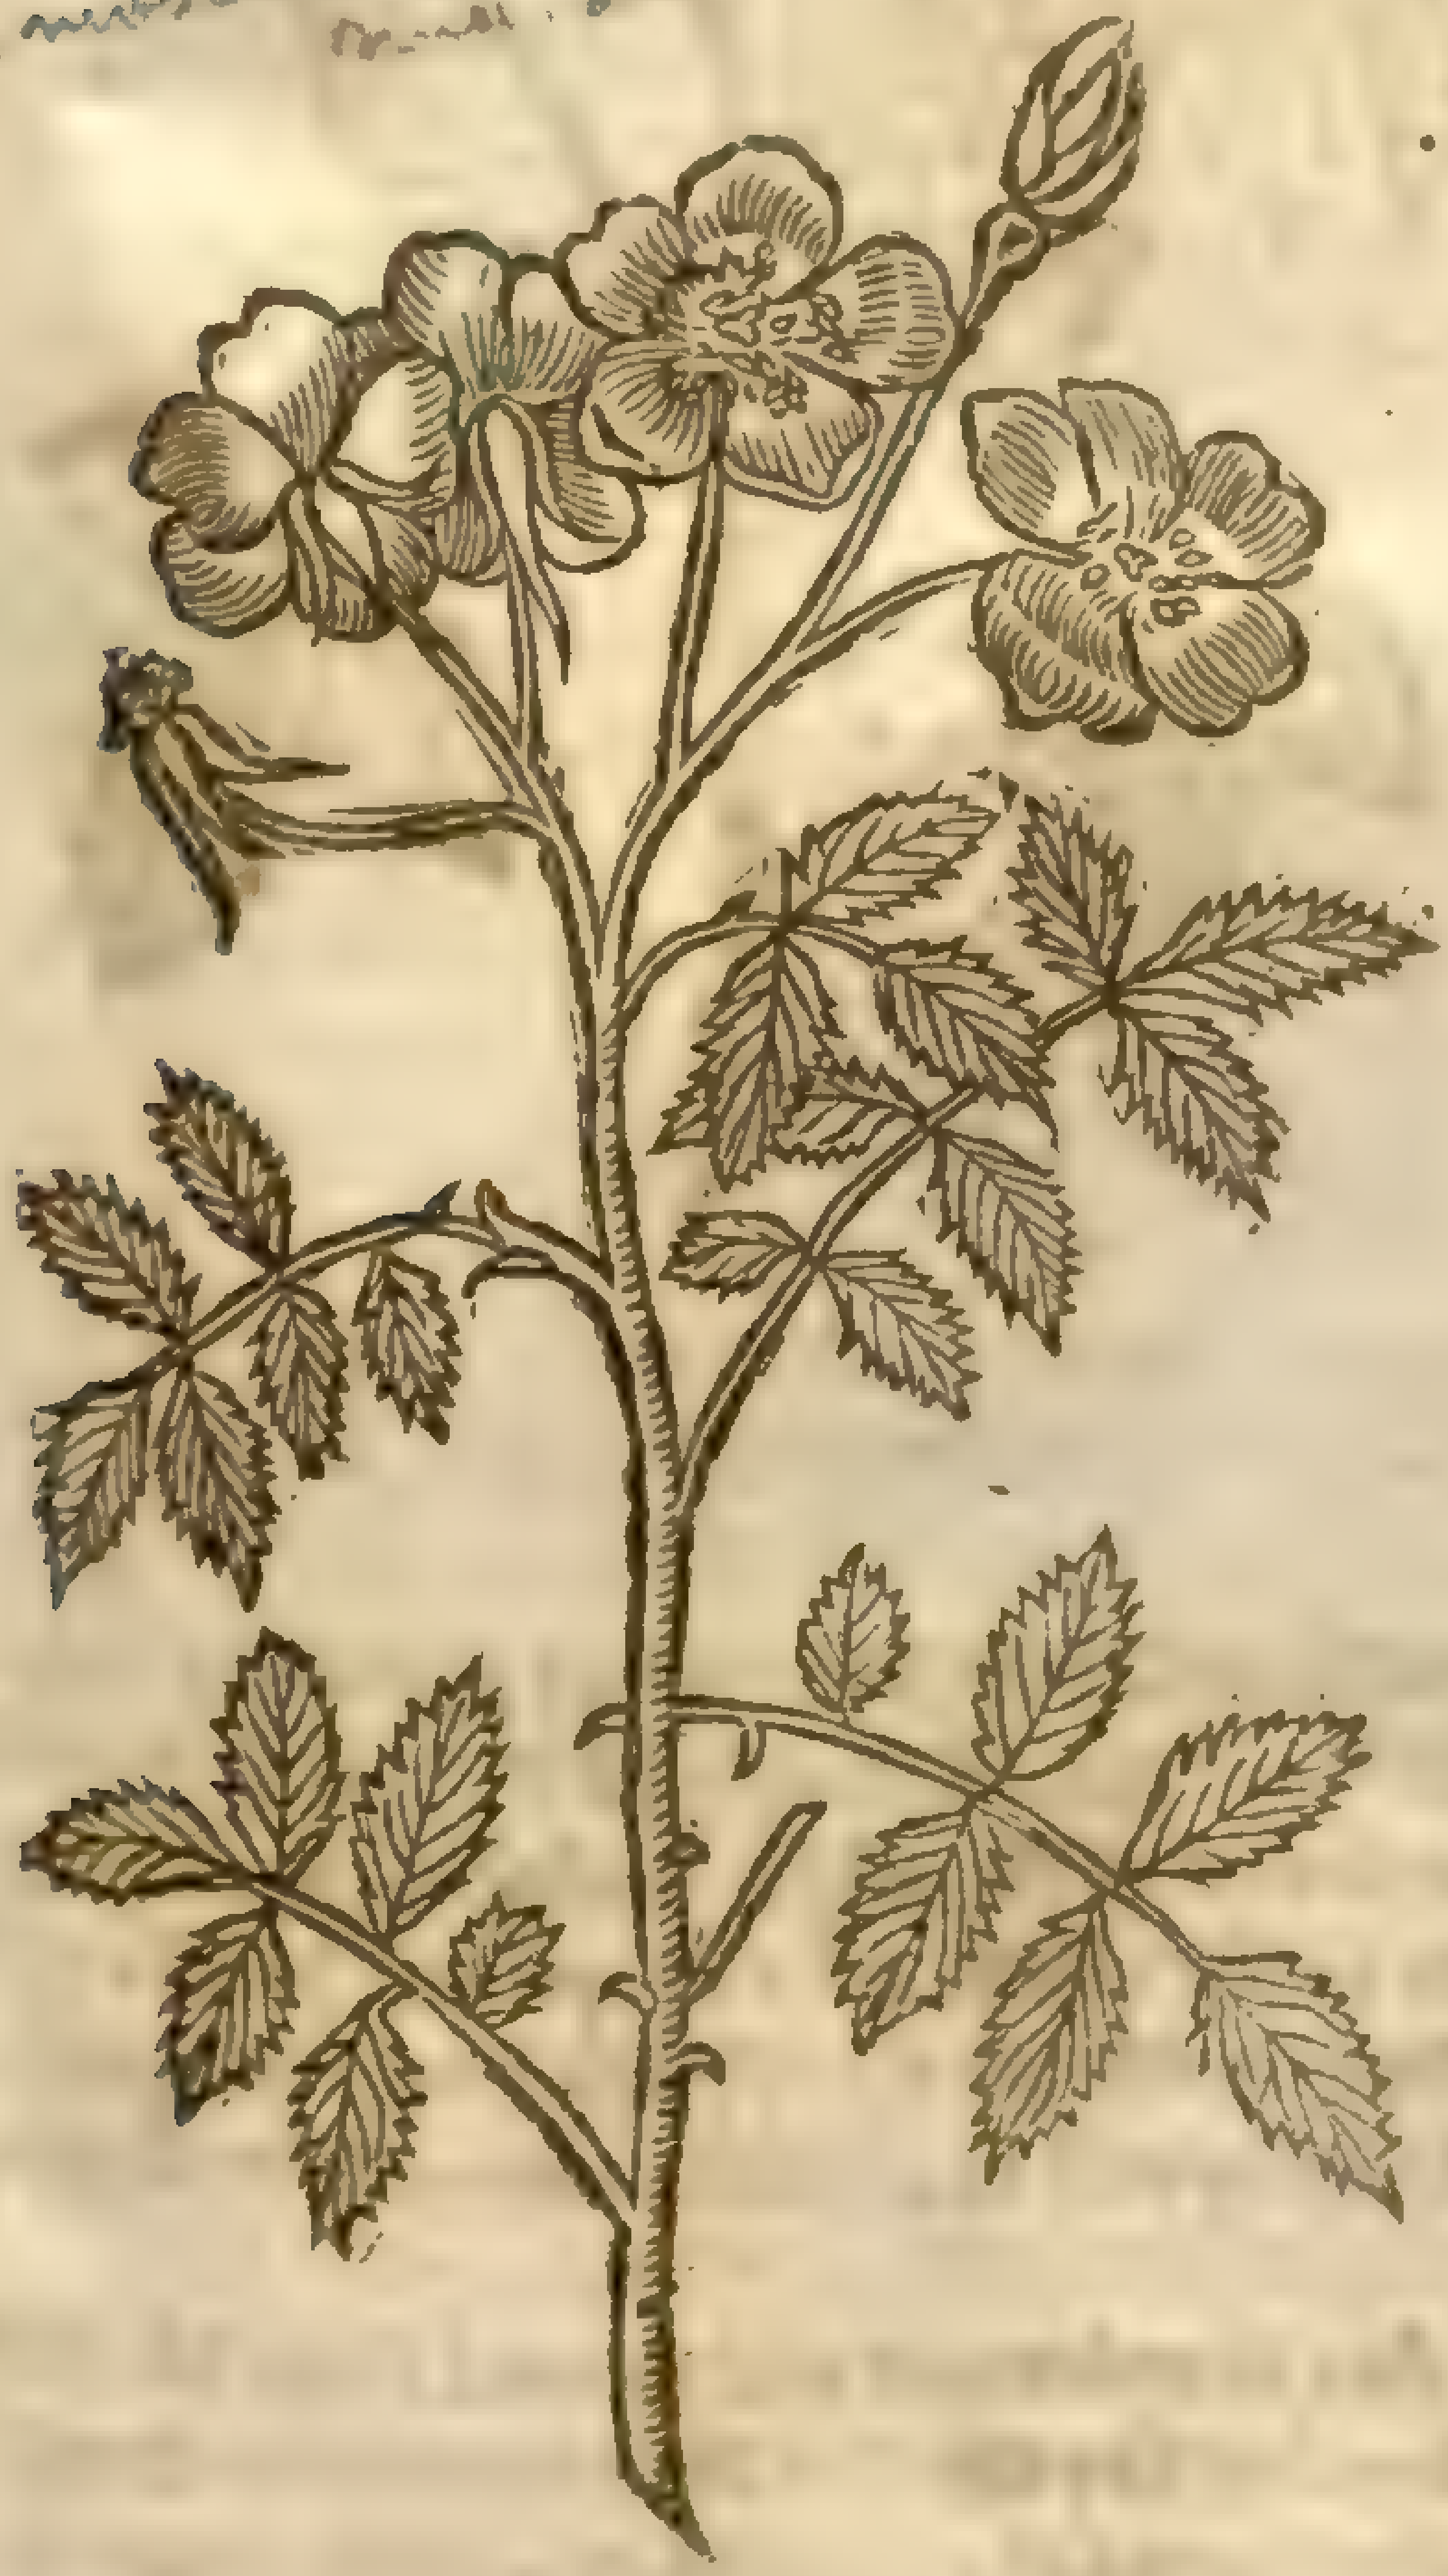
Chap. 2. *Of the Muske Roſes.*

¶ *The Kindes.*

There be diuers ſorts of Roſes planted in gardens, beſides thoſe written of in the former chapter, which are of moſt writers reckoned among the wilde Roſes, notwithſtanding we thinke it conuenient to put them into a chapter betweene thoſe of the garden and the brier Roſes, as indifferent whether to make them of the wilde Roſes, or of the tame, ſeeing we haue made them denizons in our gardens for diuers reſpects, and that worthily.

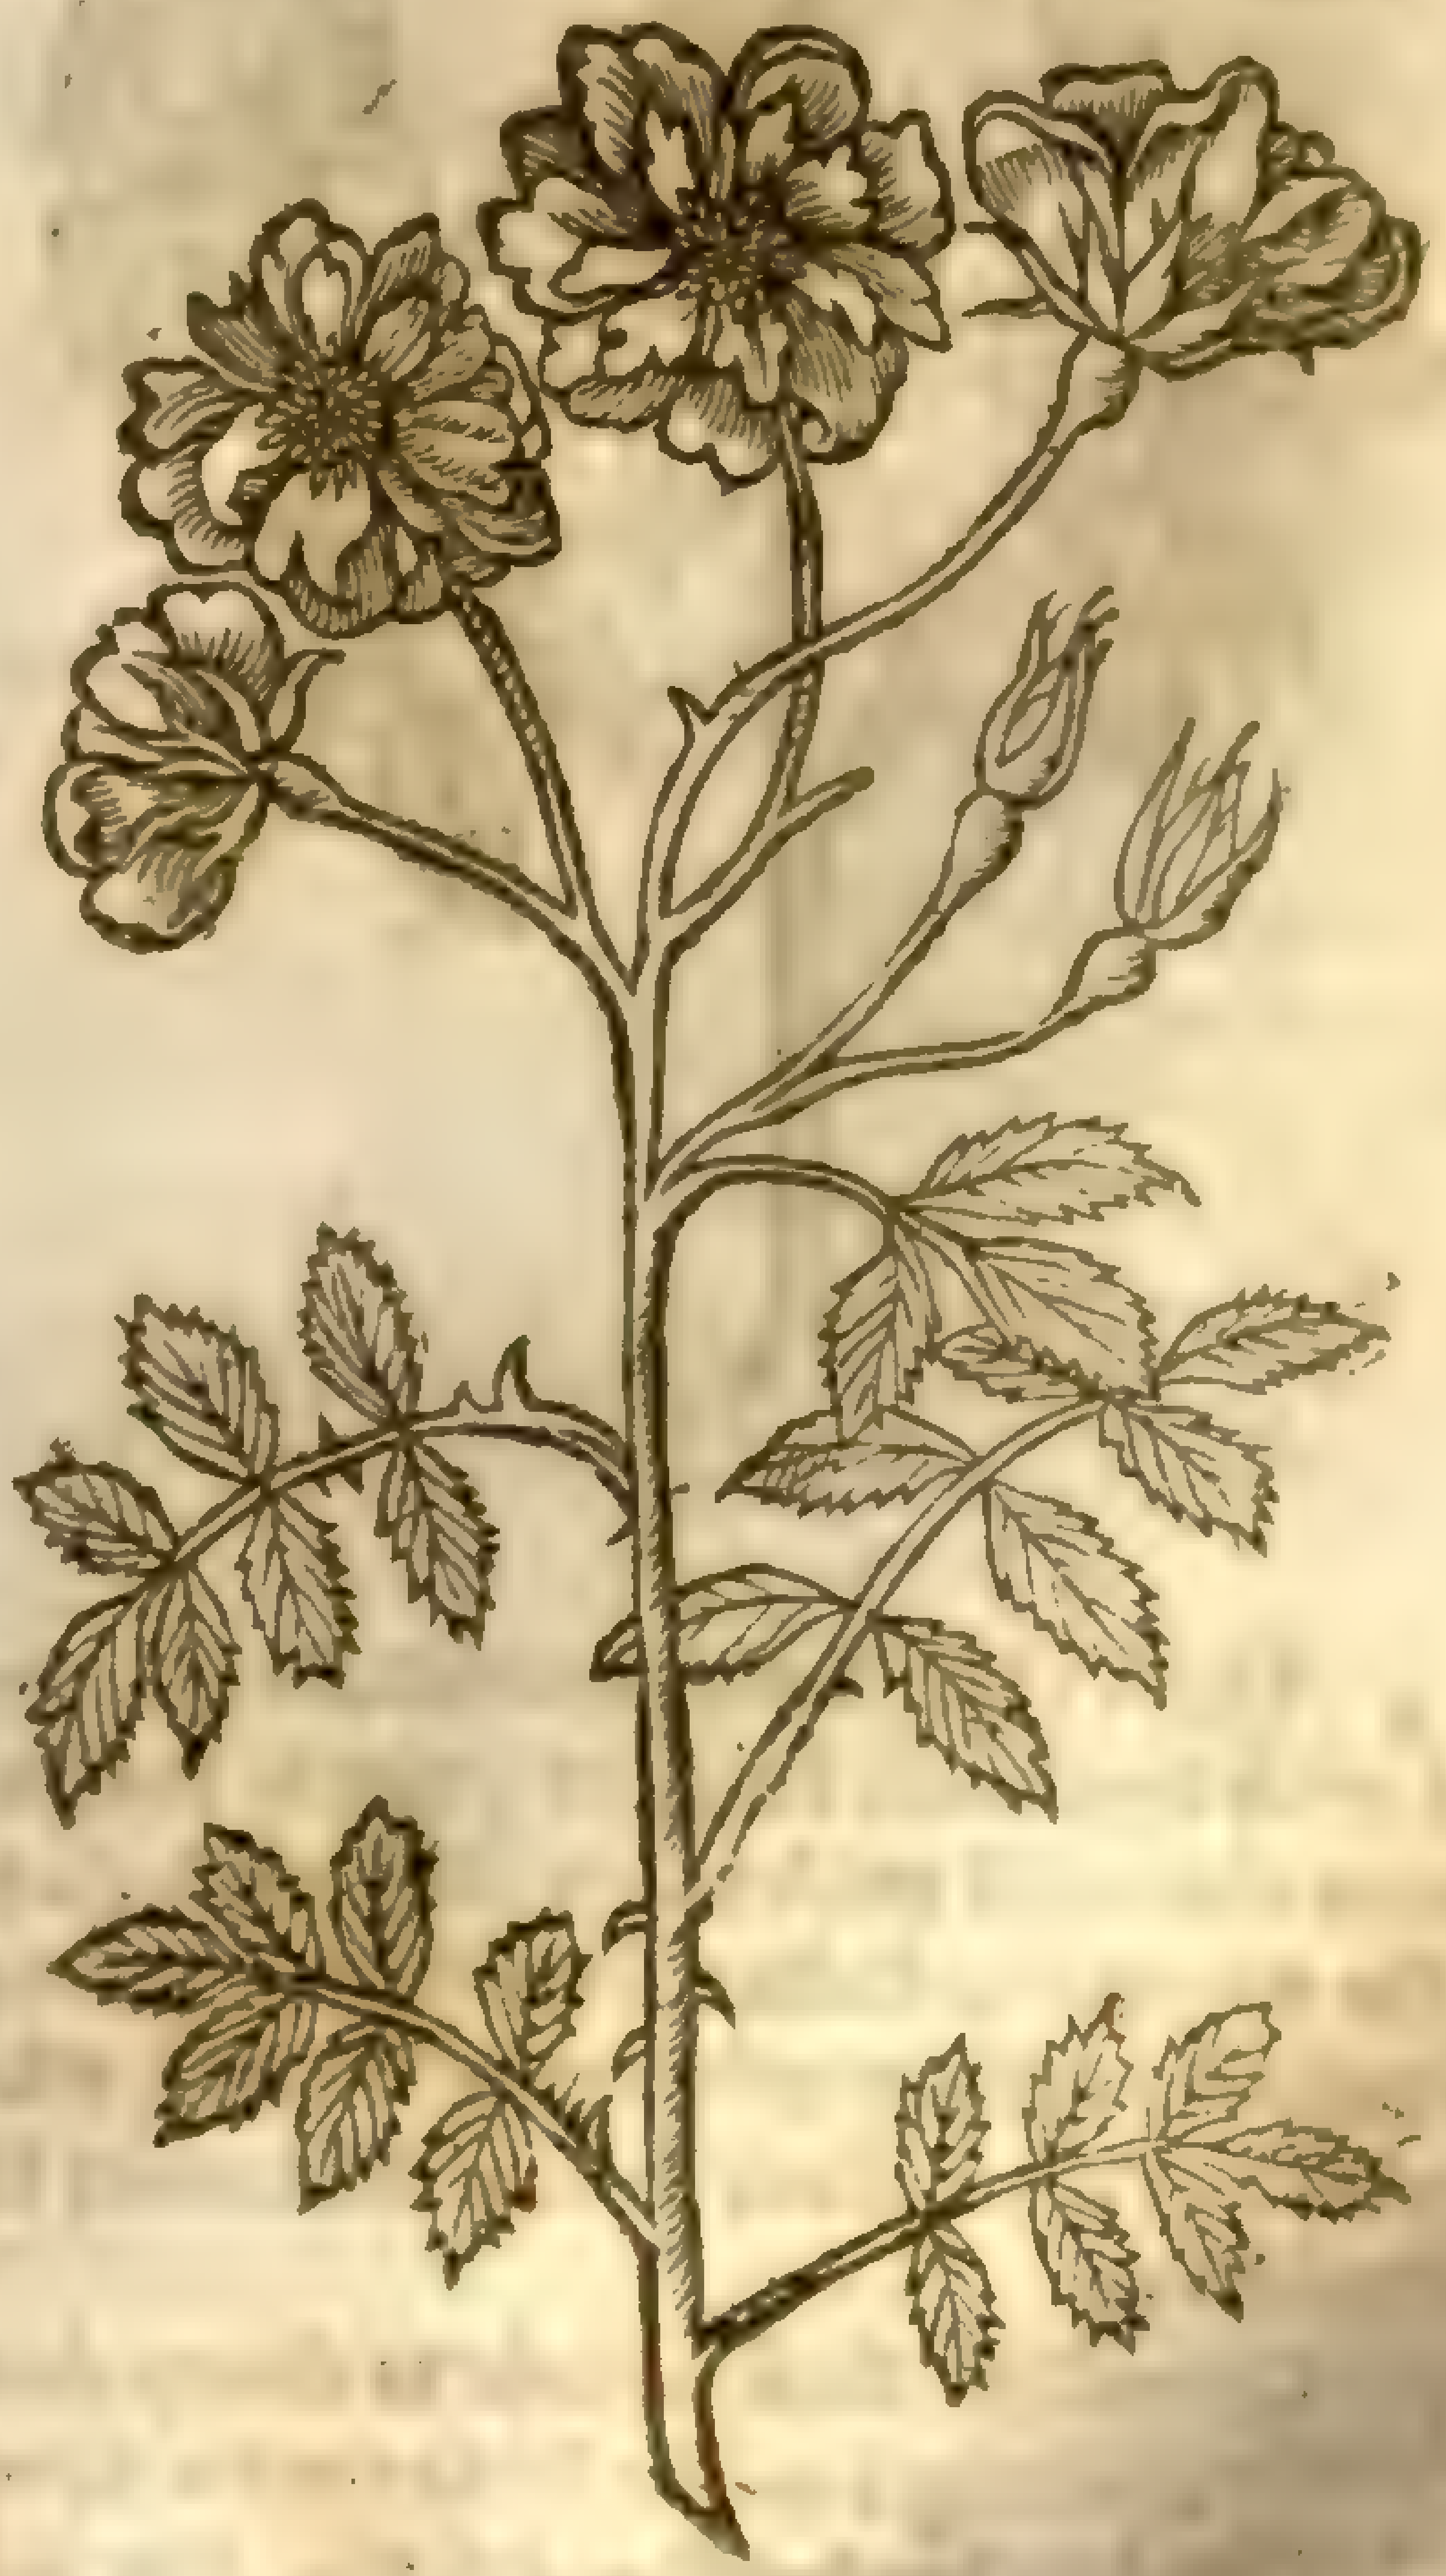
1 *Roſa Moſchata ſimplici flore.*
The ſingle Muske Roſe.

R. moschata [illegible]



2 *Roſa Moſcata multiplex.*
The double Muske Roſe.

R. [illegible]



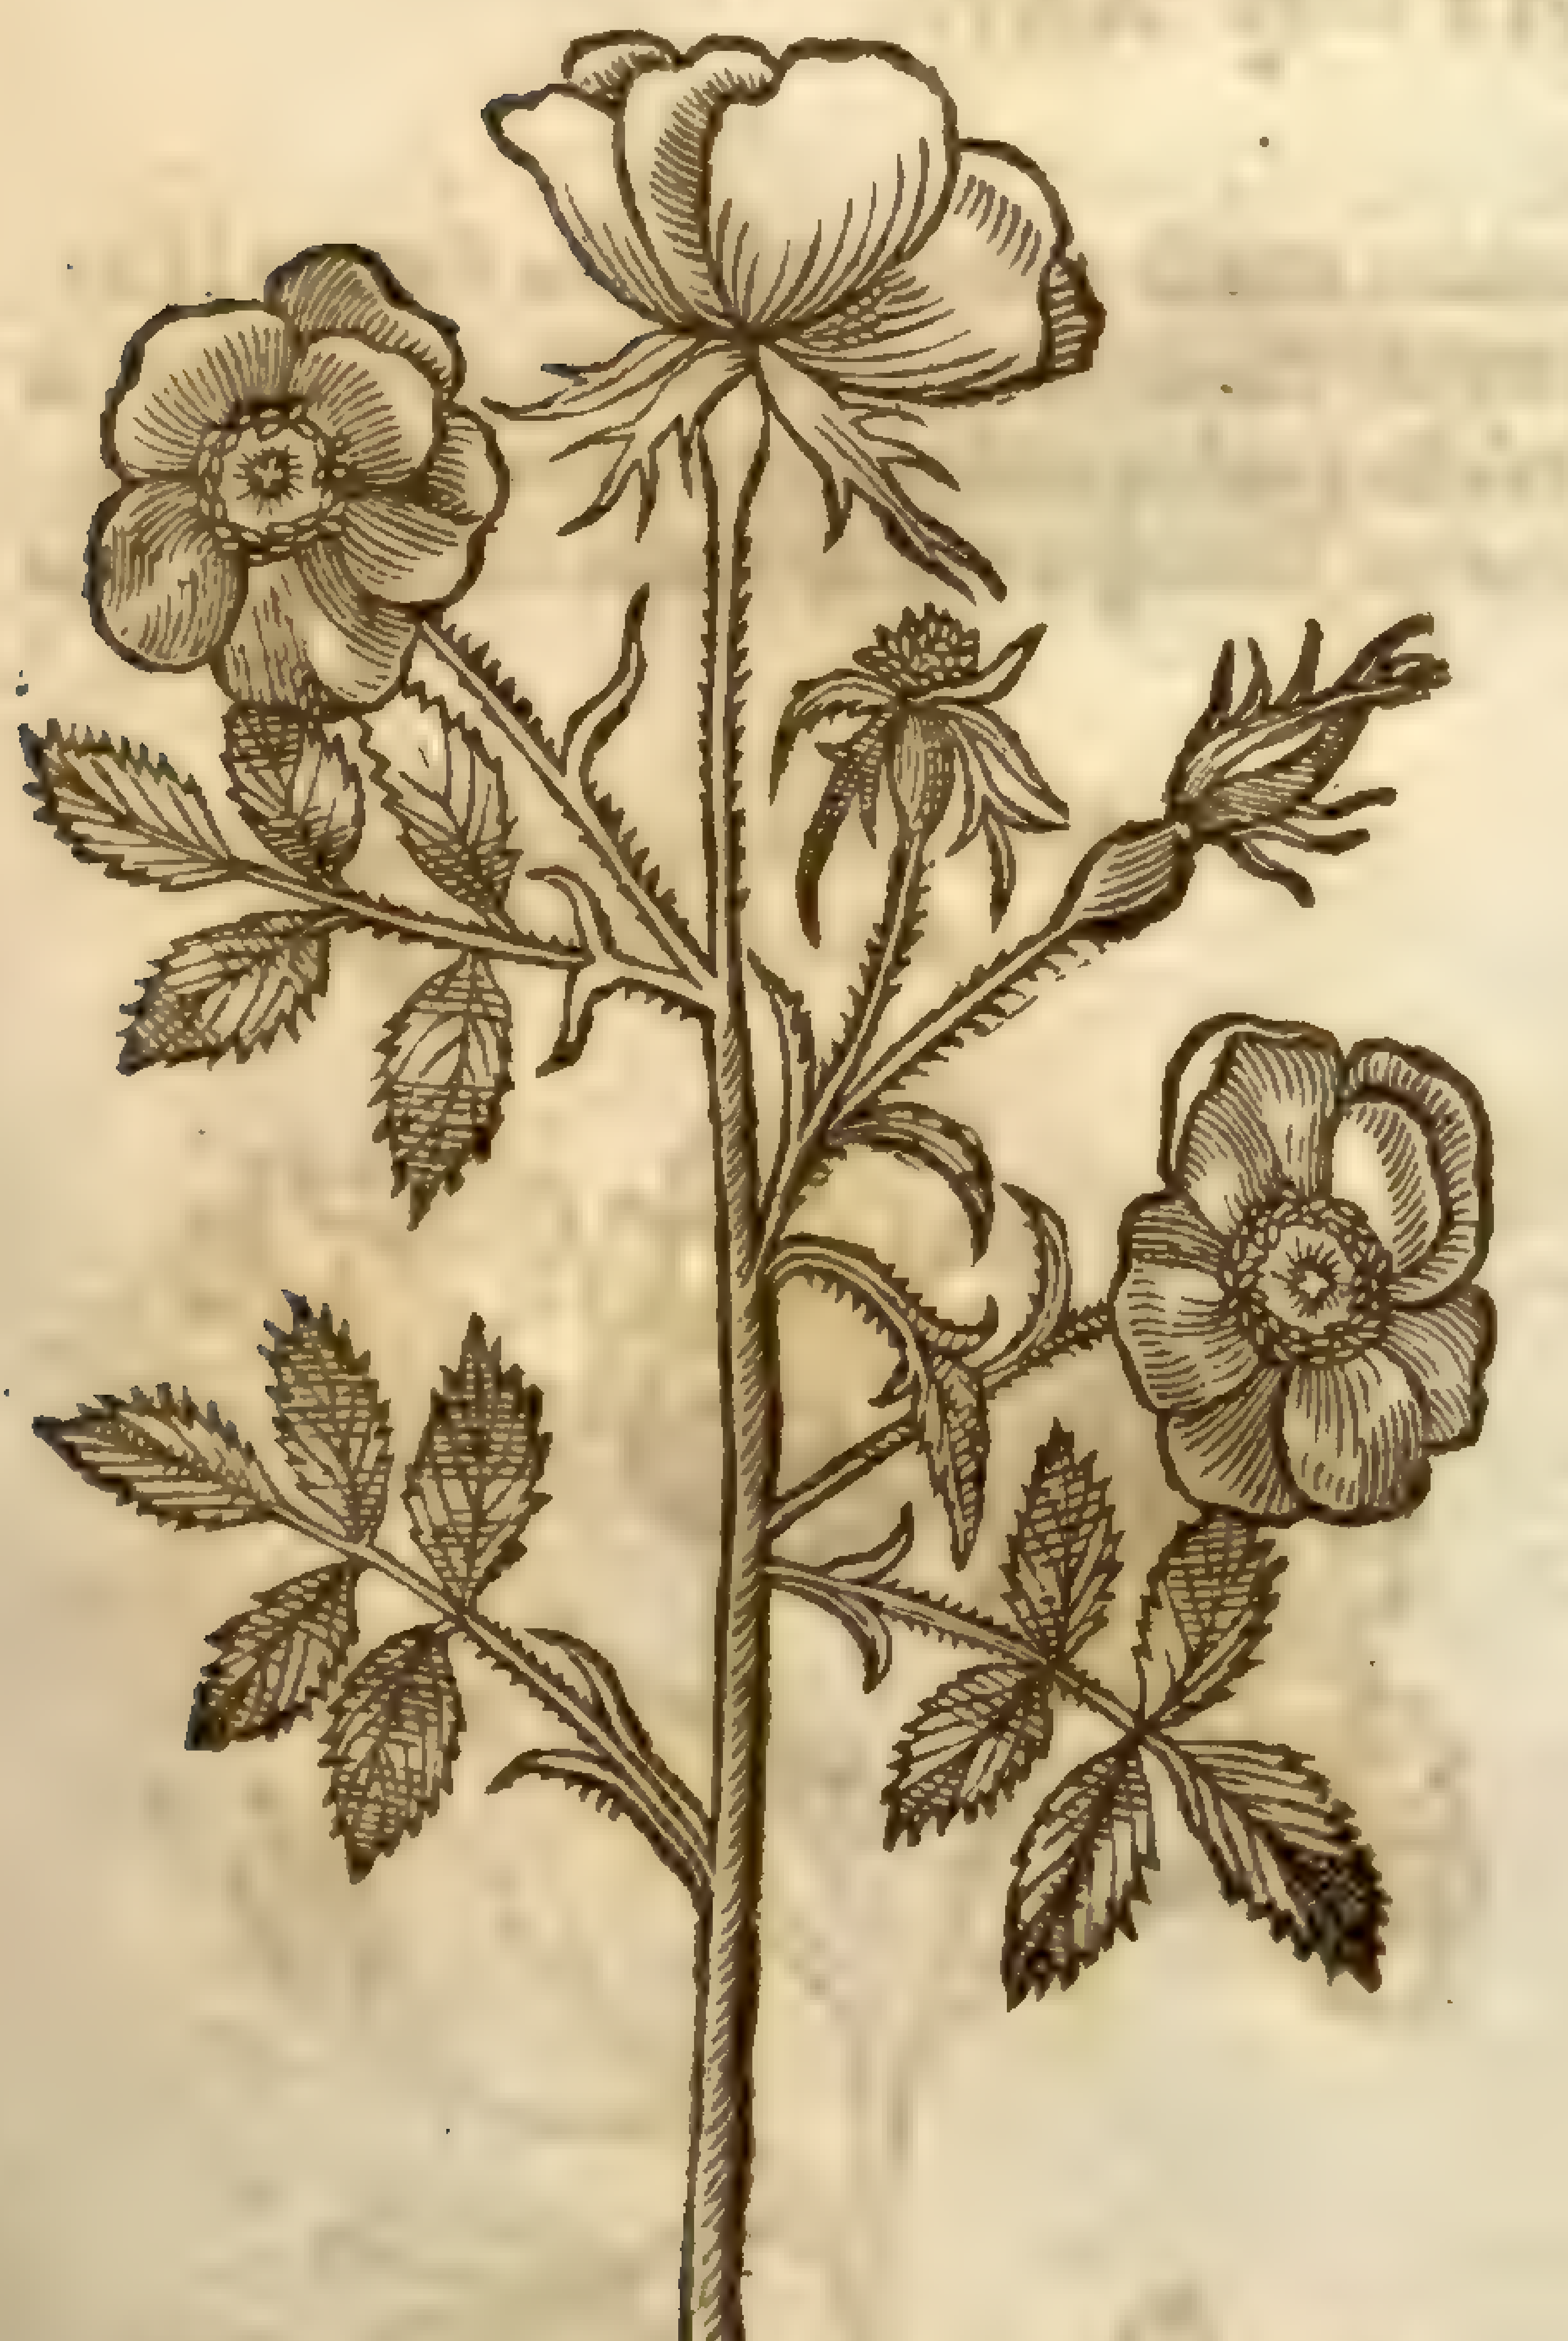
¶ *The Deſcription.*

1 THe ſingle Muske Roſe hath diuers long ſhoots of a greeniſh colour and wooddy ſubſtance, armed with very ſharpe prickles, diuiding it ſelfe into diuers branches: whereon doe grow long leaues, ſmooth and ſhining, made of diuers leaues ſet vpon a middle rib, like the other Roſes: the floures grow on the tops of the branches, of a white colour, and pleaſant ſweet ſmell, like that of Muske, wherof it tooke his name; hauing certaine yellow ſeeds in the middle, as the reſt of the Roſes haue: the fruit is red when it is ripe, and filled with ſuch chaffie flockes and ſeeds as thoſe of the other Roſes: the root is tough and wooddy.

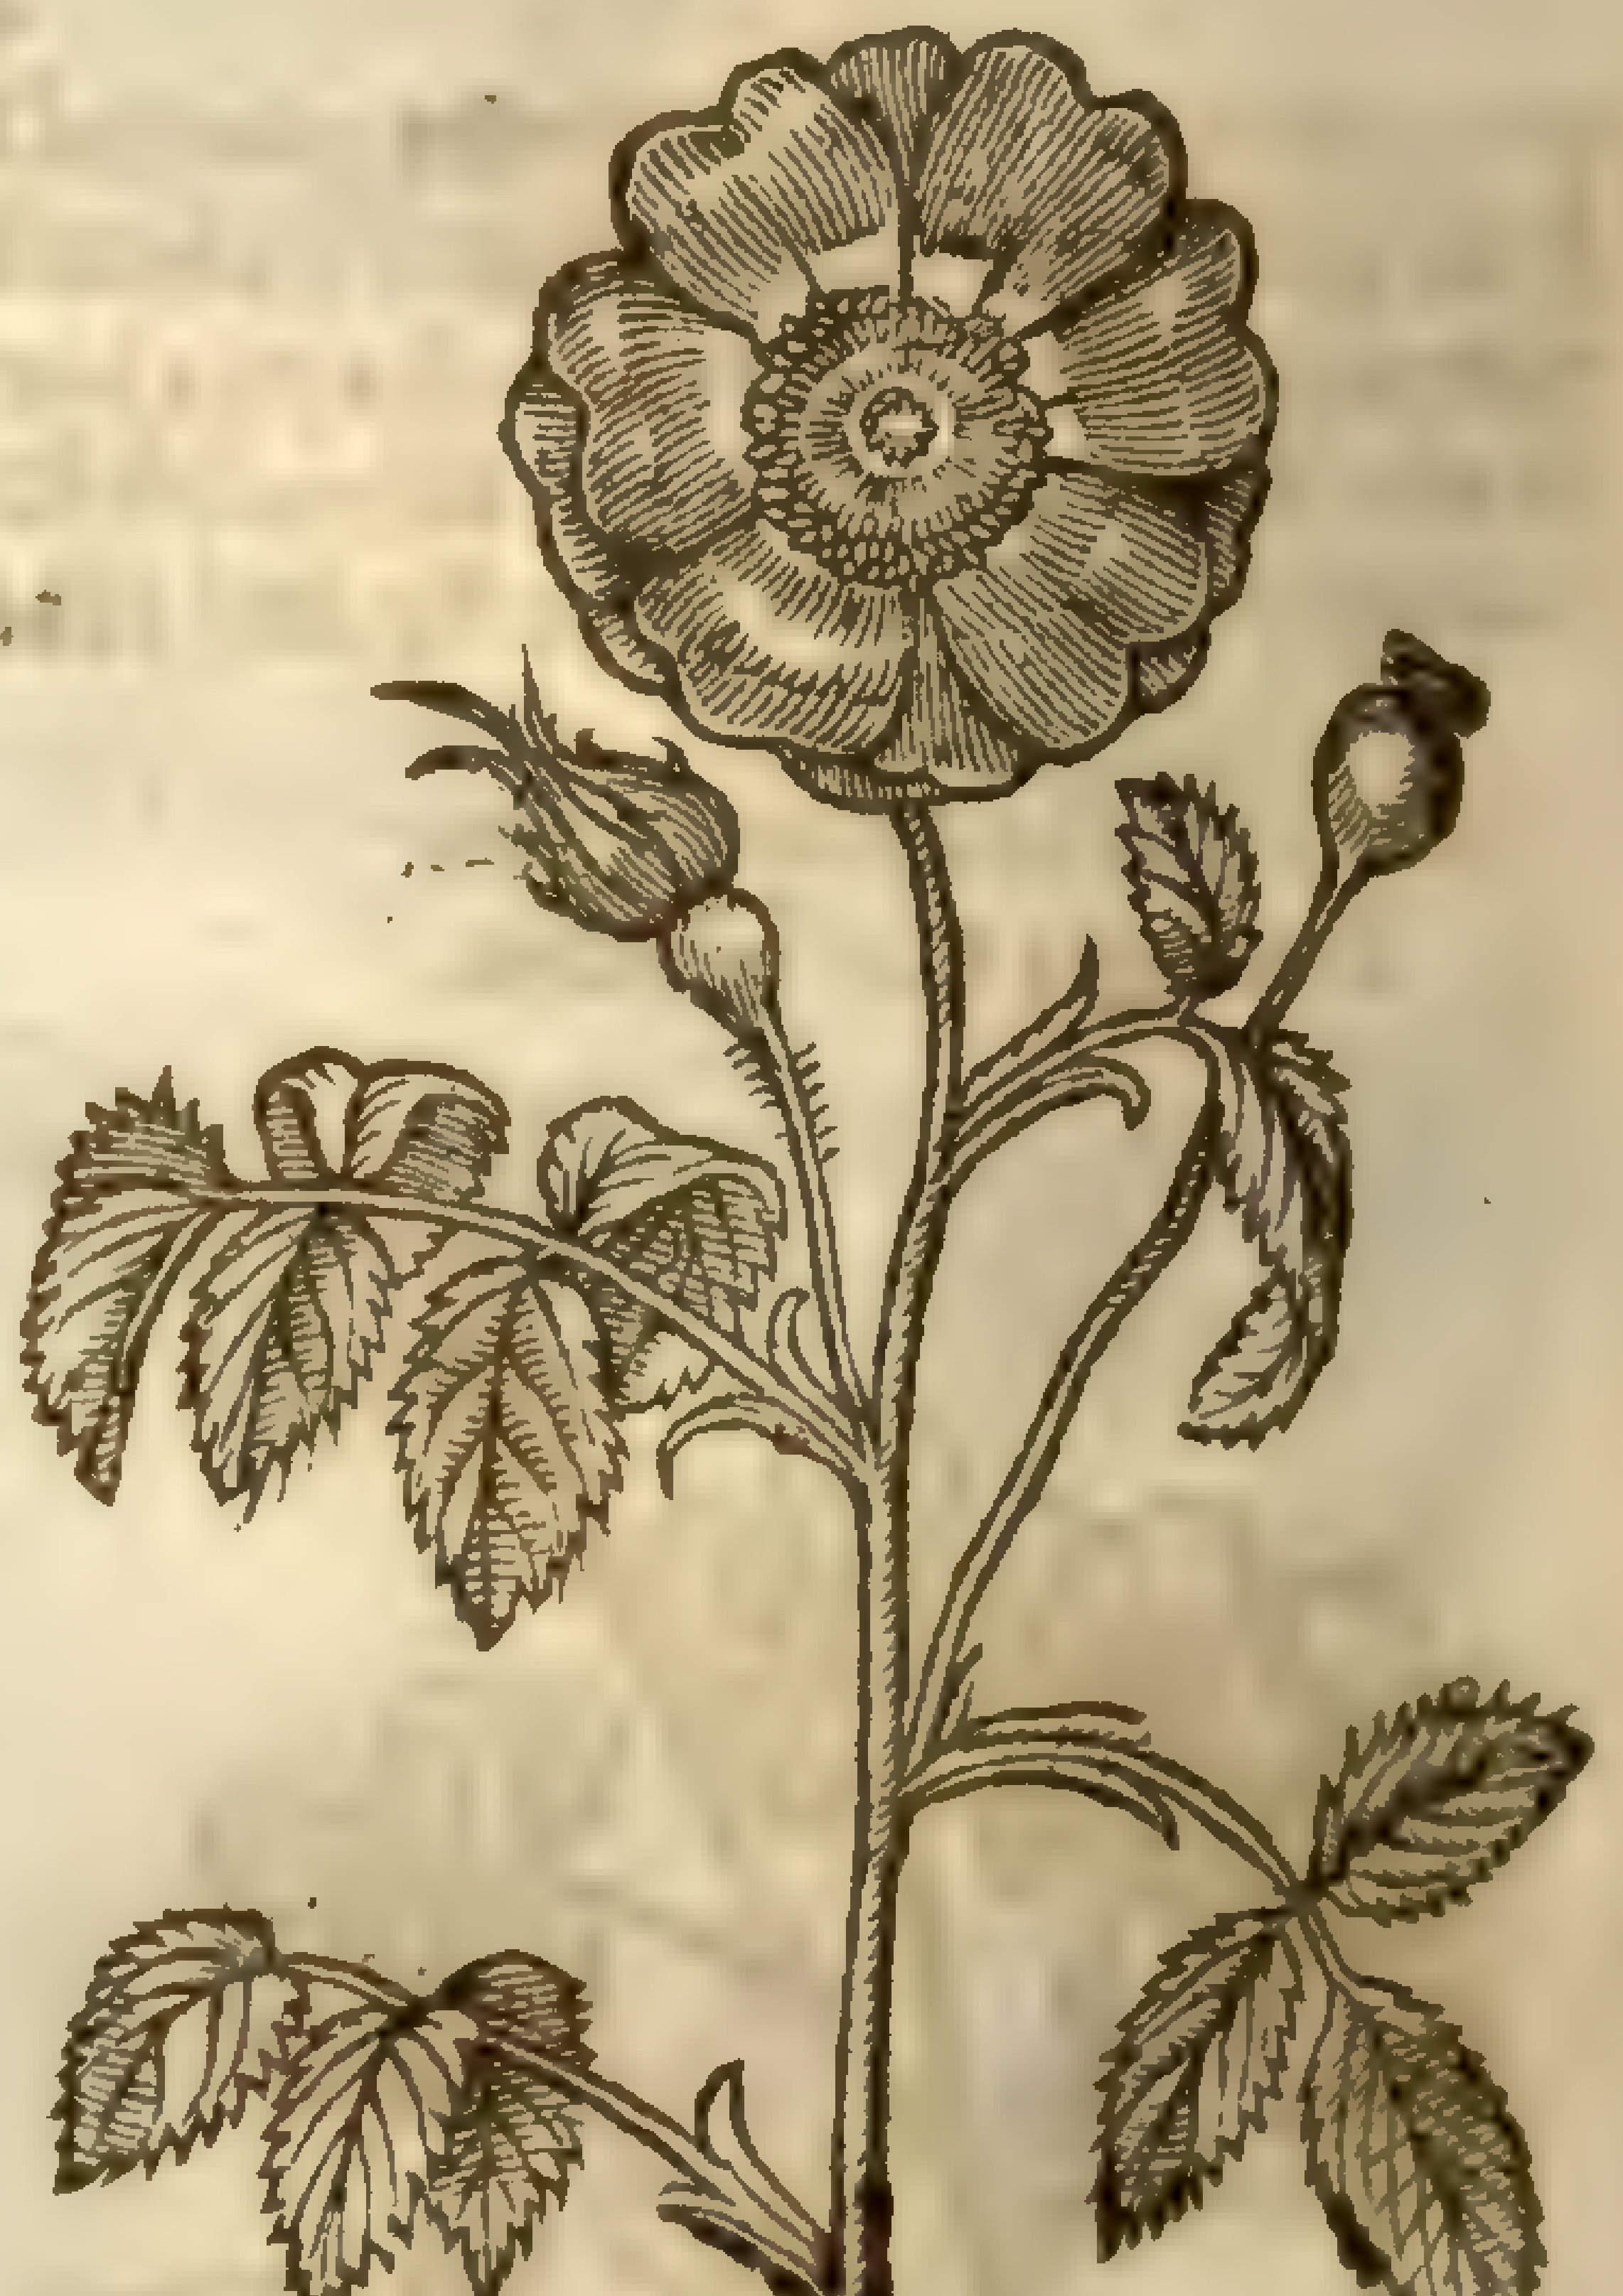
2 The double Muske Roſe differeth not from the precedent in leaues, ſtalkes, and roots, nor in the colour of the floures, or ſweetneſſe thereof, but onely in the doubleneſſe of the floures, wherein conſiſteth the difference.

3 Of theſe roſes we haue another in our London gardens, which of moſt is called the bluſh roſe, it floureth when the Damaske Roſe doth: the floures hereof are very ſingle, greater than the other Muske Roſes, and of a white colour, daſht ouer with a light waſh of carnation, which maketh that colour which wee call a bluſh colour: the proportion of the whole plant, as alſo the ſmell of the floures, are like the precedent.

3 *Roſæ Moſchatæ ſpeciis major.*
The great Muske Roſe.



4 *Roſa Holoſericea.*
The Veluet Roſe.



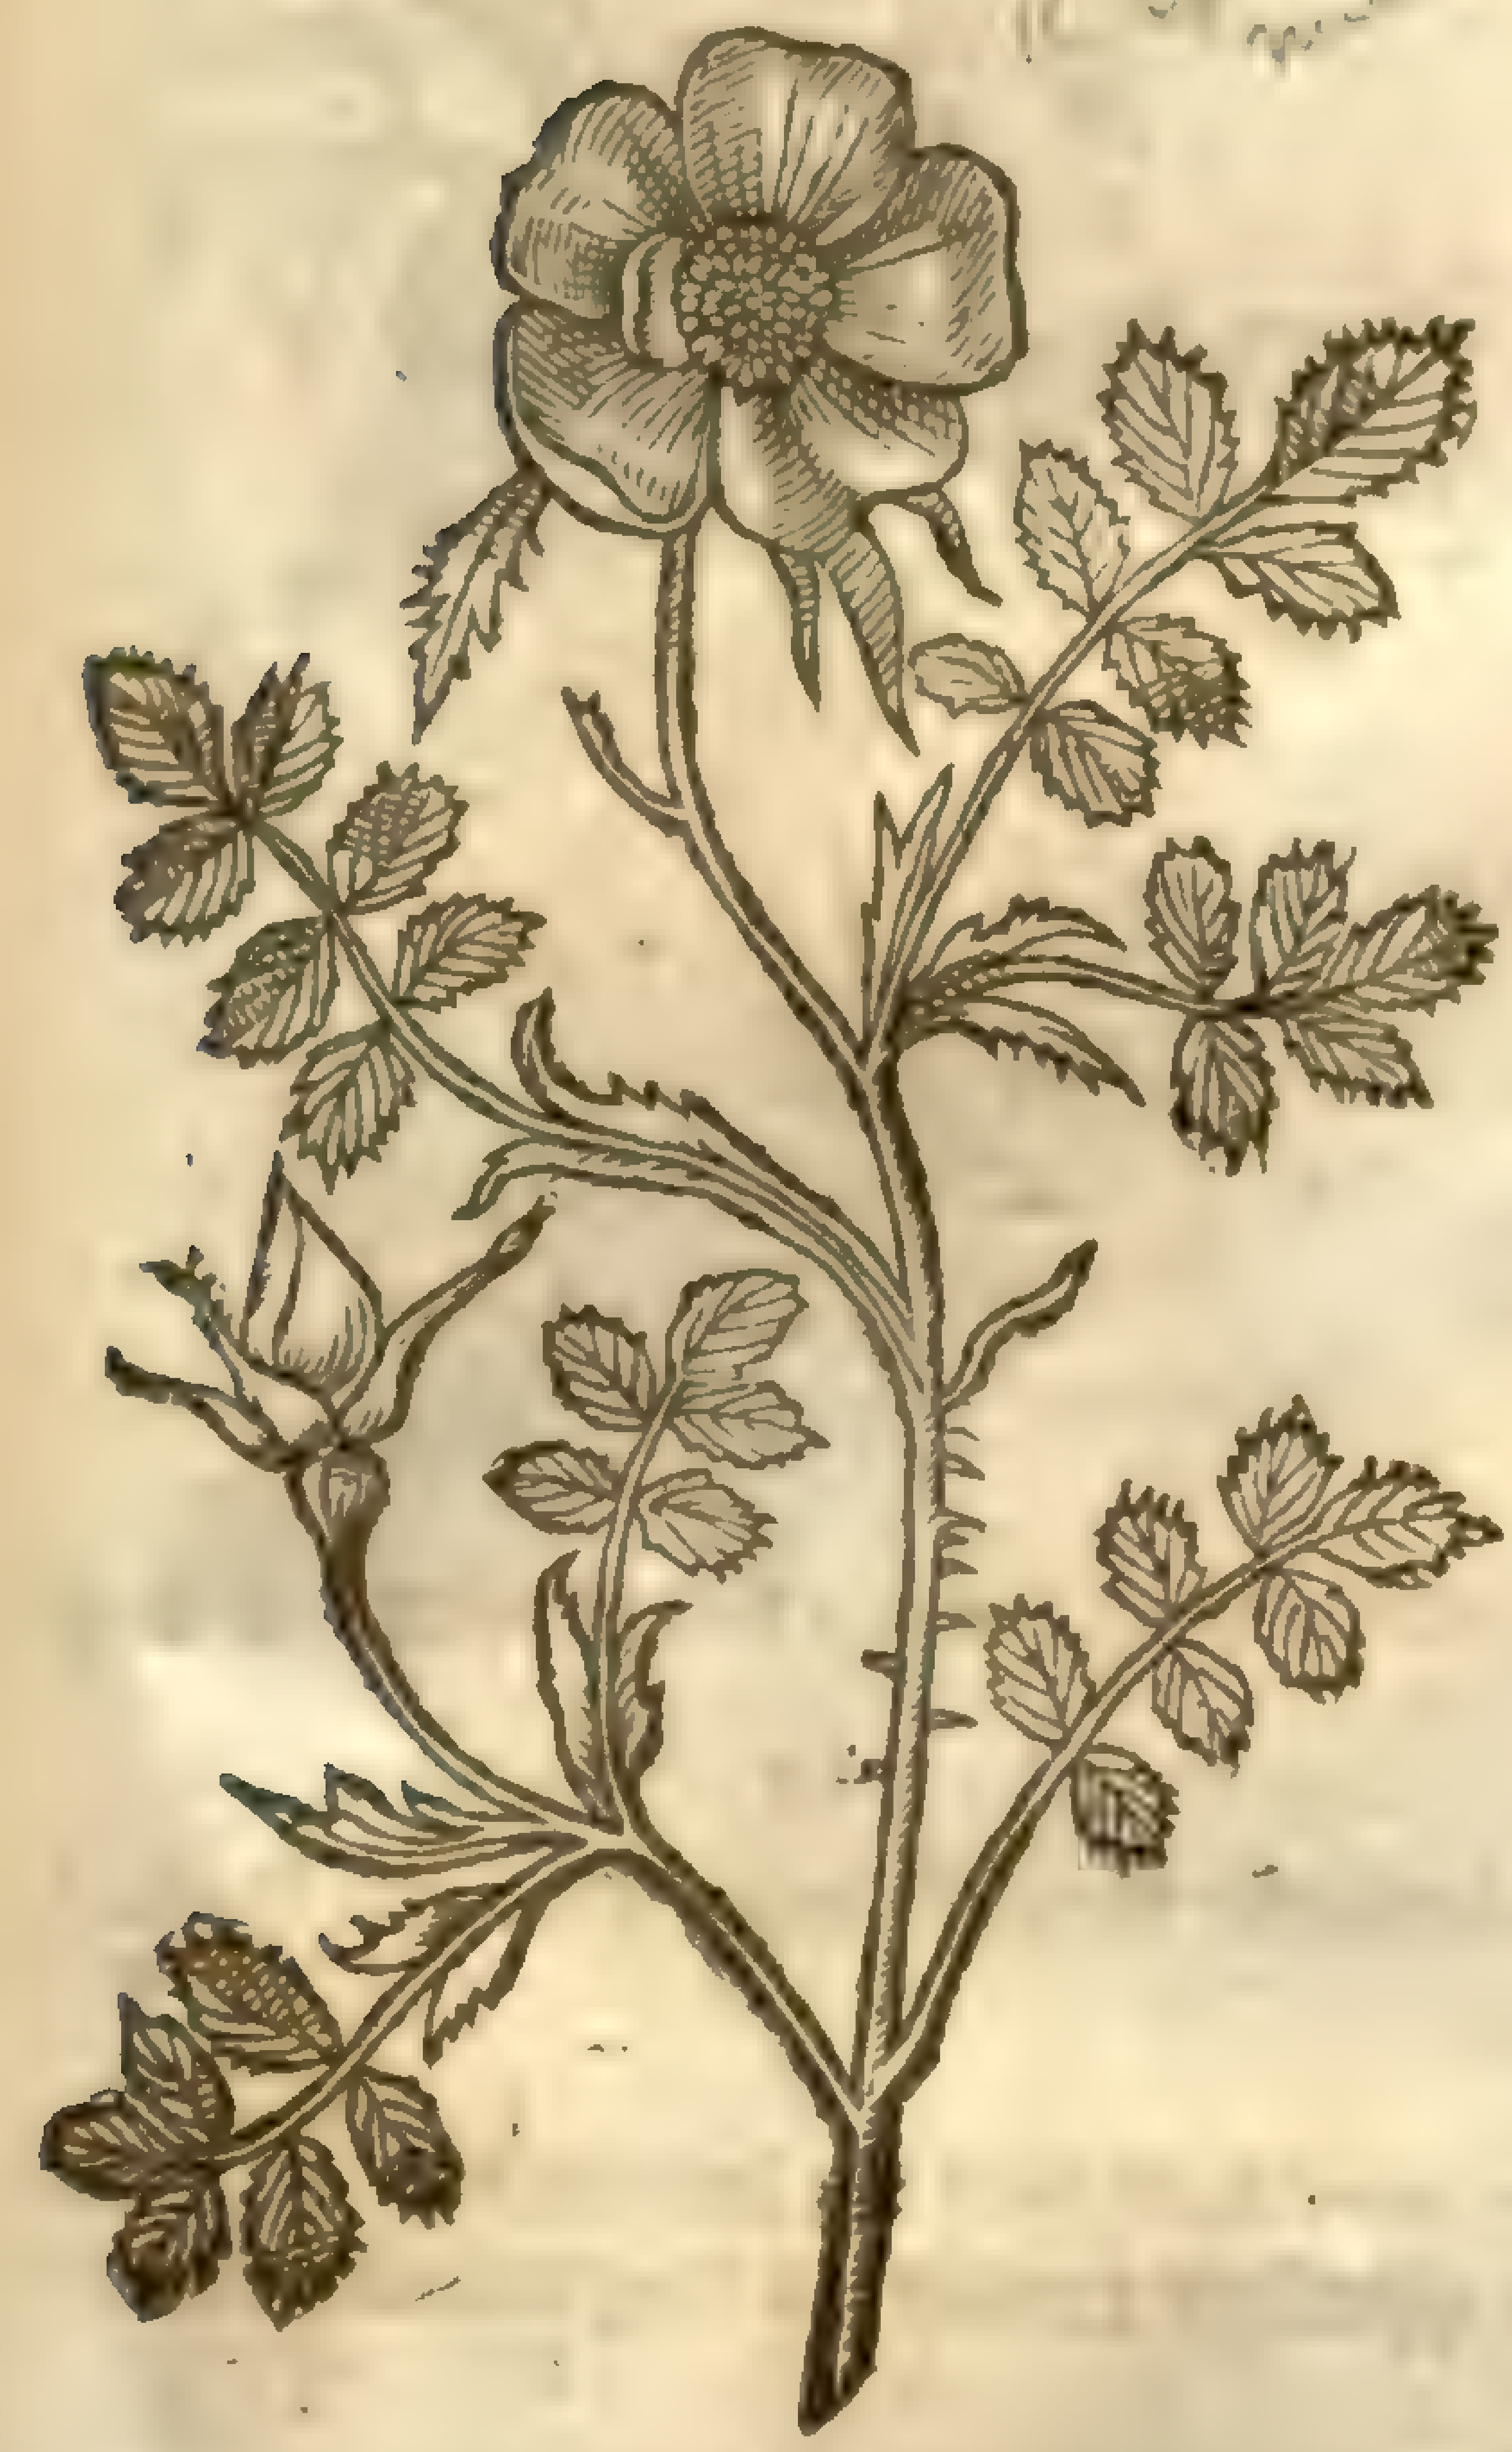
4 The Veluet Roſe groweth alwaies very low, like vnto the red Roſe, hauing his branches couered with a certaine hairy or prickly matter, as fine as haires, yet not ſo ſharpe or ſtiffe that it will harme the moſt tender skin that is: the leaues are like the leaues of the white Roſe: the flours grow at the top of the ſtalkes, doubled with ſome yellow thrums in the midſt, of a deepe and blacke red colour, reſembling red crimſon Veluet, whereupon ſome haue called it the Veluet Roſe: when the floures be vaded, there follow red berries full of hard ſeeds, wrapped in a downe or woollineſſe like the others.

5 The yellow Roſe which (as diuers do report) was by Art ſo coloured, and altered from his firſt eſtate, by grafting a wilde Roſe vpon a Broome-ſtalke; whereby (ſay they) it doth not onely change his colour, but his ſmell and force. But for my part I hauing found the contrary by mine owne experience, cannot be induced to beleeue the report: for the roots and off-ſprings of this Roſe haue

brought forth yellow roſes, ſuch as the maine ſtocke or mother bringeth out, which euent is not to be ſeen in all other plants that haue been graffed. Moreouer, the ſeeds of yellow roſes haue brought forth yellow Roſes, ſuch as the floure was from whence they were taken; which they ſhould not do by any conjecturall reaſon, if that of themſelues they were not a naturall kinde of Roſe. Laſtly it were contrary to that true principle,

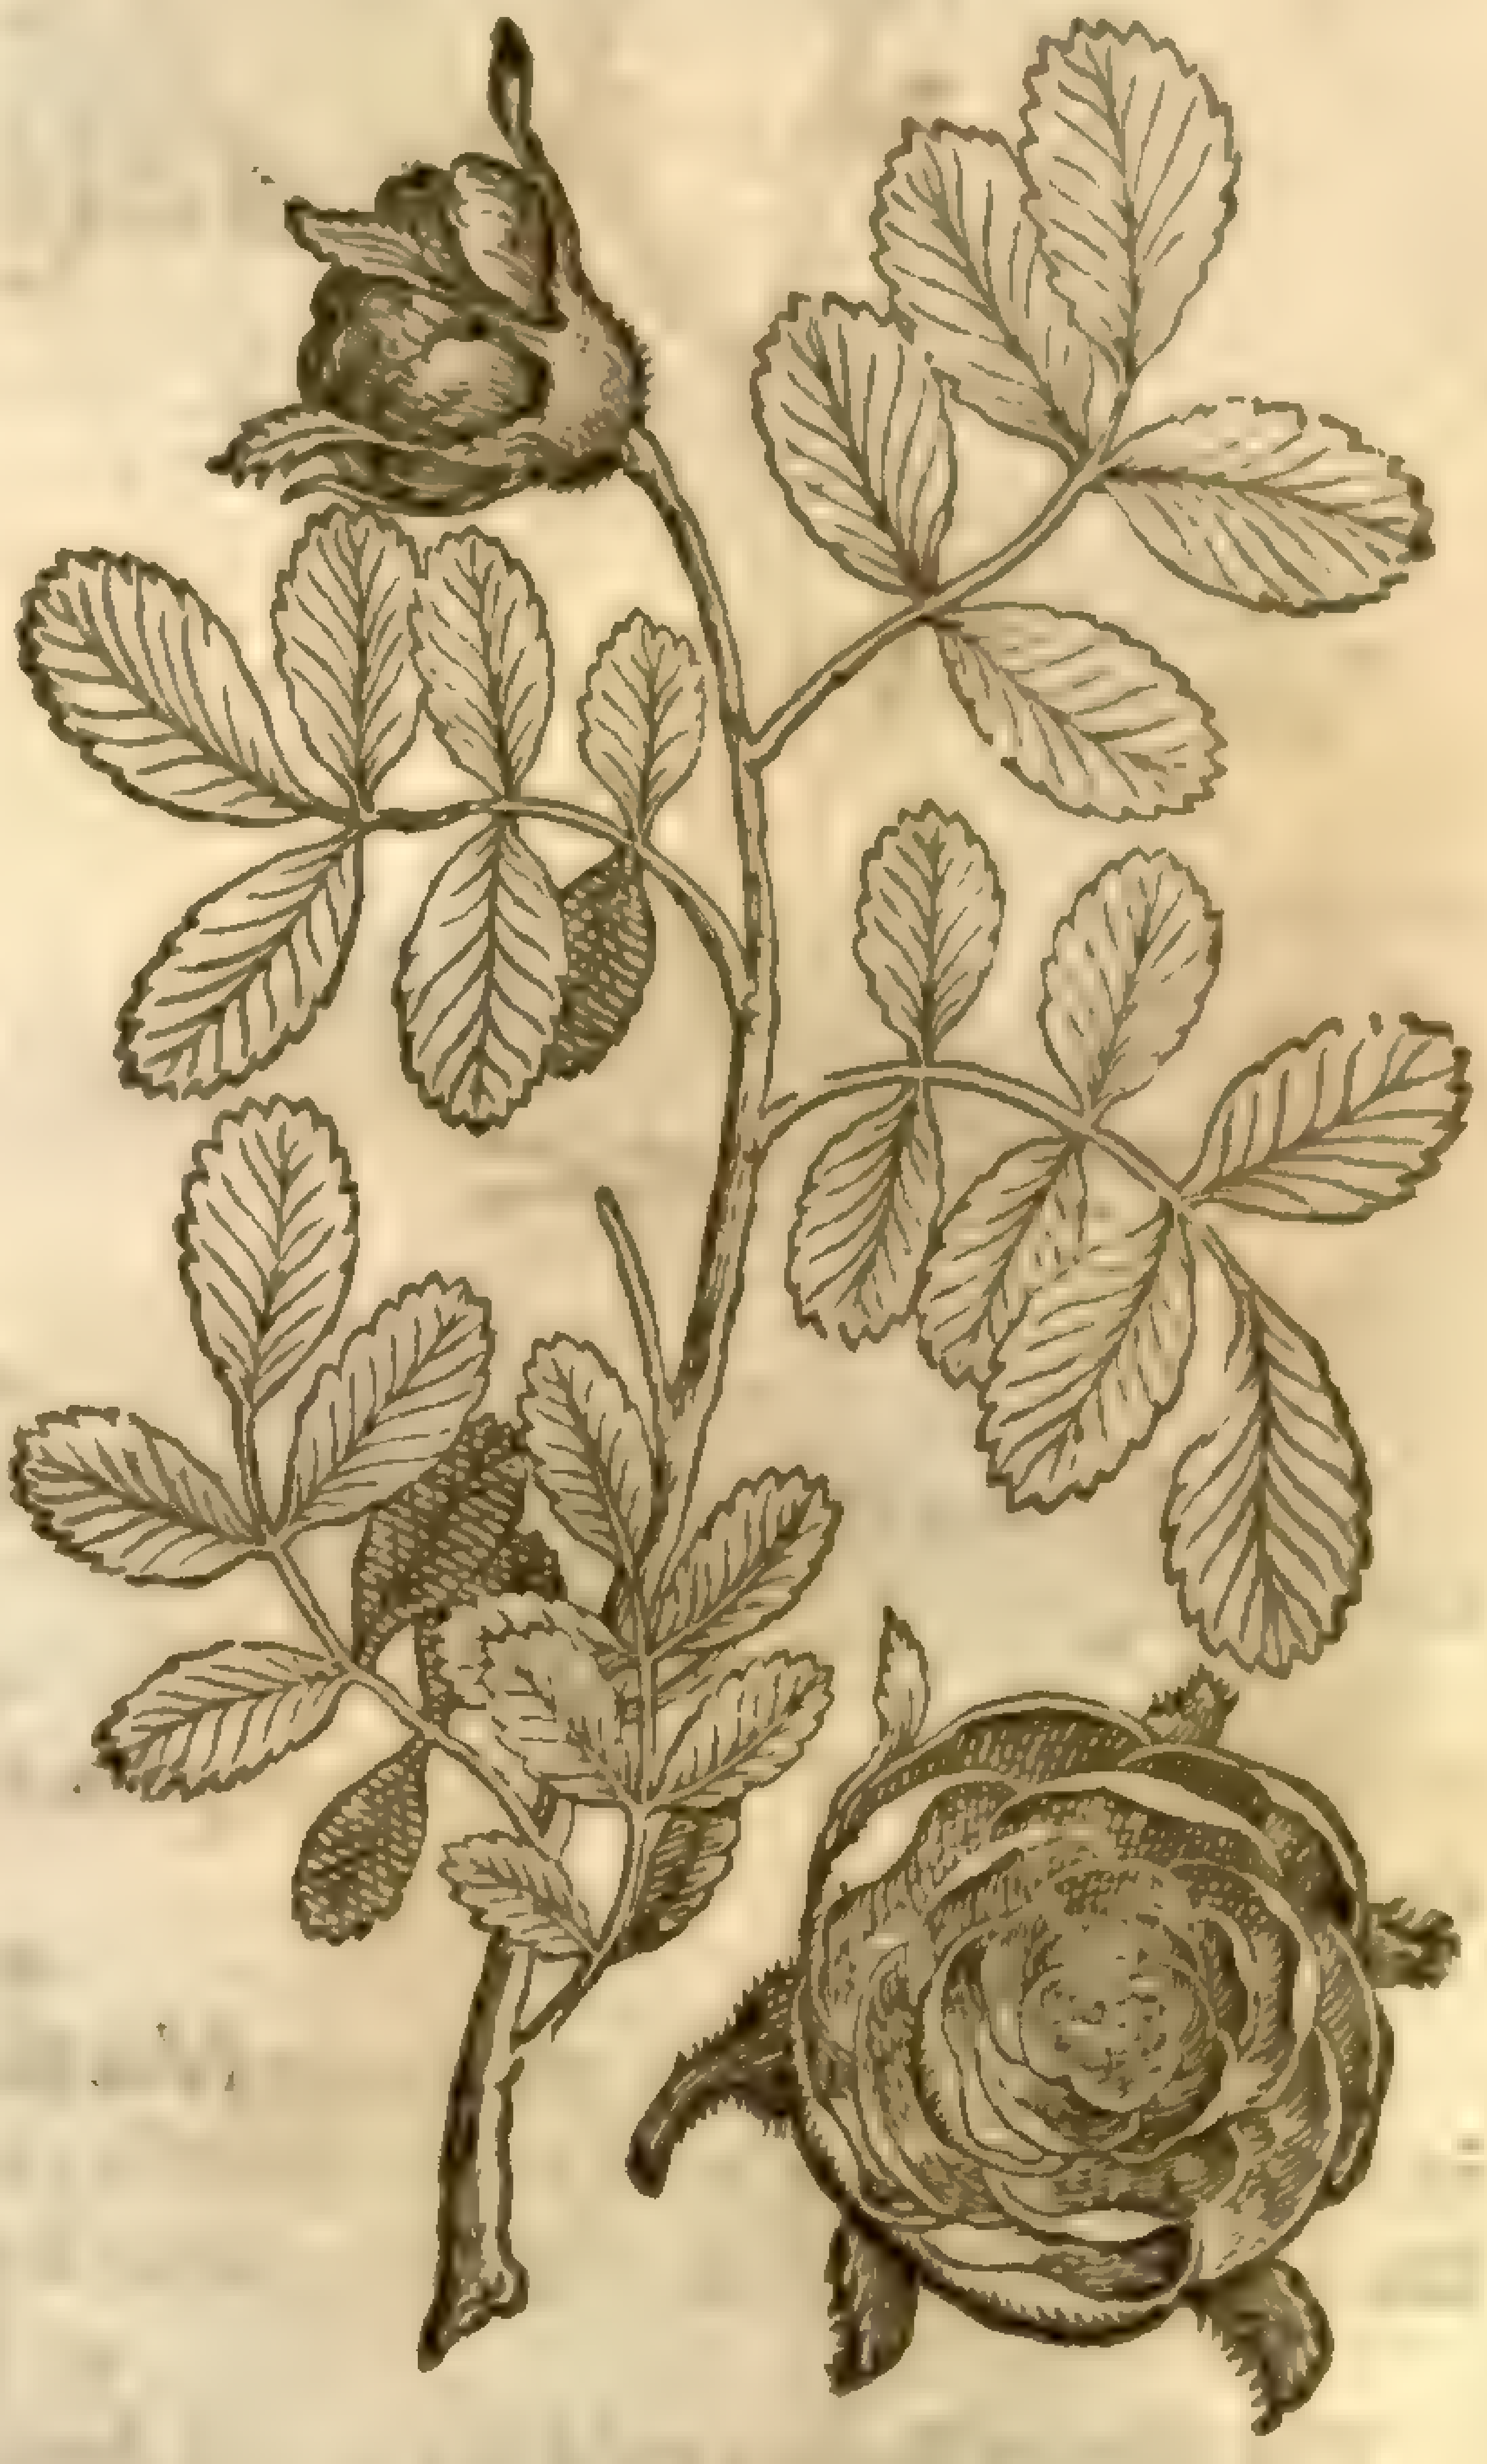
Naturæ ſequitur ſemina quodque ſuæ : that is to ſay.

Euery ſeed and plant bringeth forth fruit like vnto it ſelfe, both in ſhape and nature: but leauing that errour, I will proceed to the deſcription: the yellow roſe hath browne and prickly ſtalks or ſhoots, fiue or ſix cubits high, garniſhed with many leaues, like vnto the Muske roſe, of an excellent ſweet ſmell, and more pleaſant than the leaues of the Eglantine: the floures come forth among the leaues, and at the top of the branches of a faire gold yellow colour: the thrums in the middle, are alſo yellow: which being gone, there follow ſuch knops or heads as the other Roſes do beare.



5 *Roſa lutea.*
The yellow Roſe.

R. [illegible]



‡ 6 *Roſa lutea multiplex.*
The double yellow Roſe.

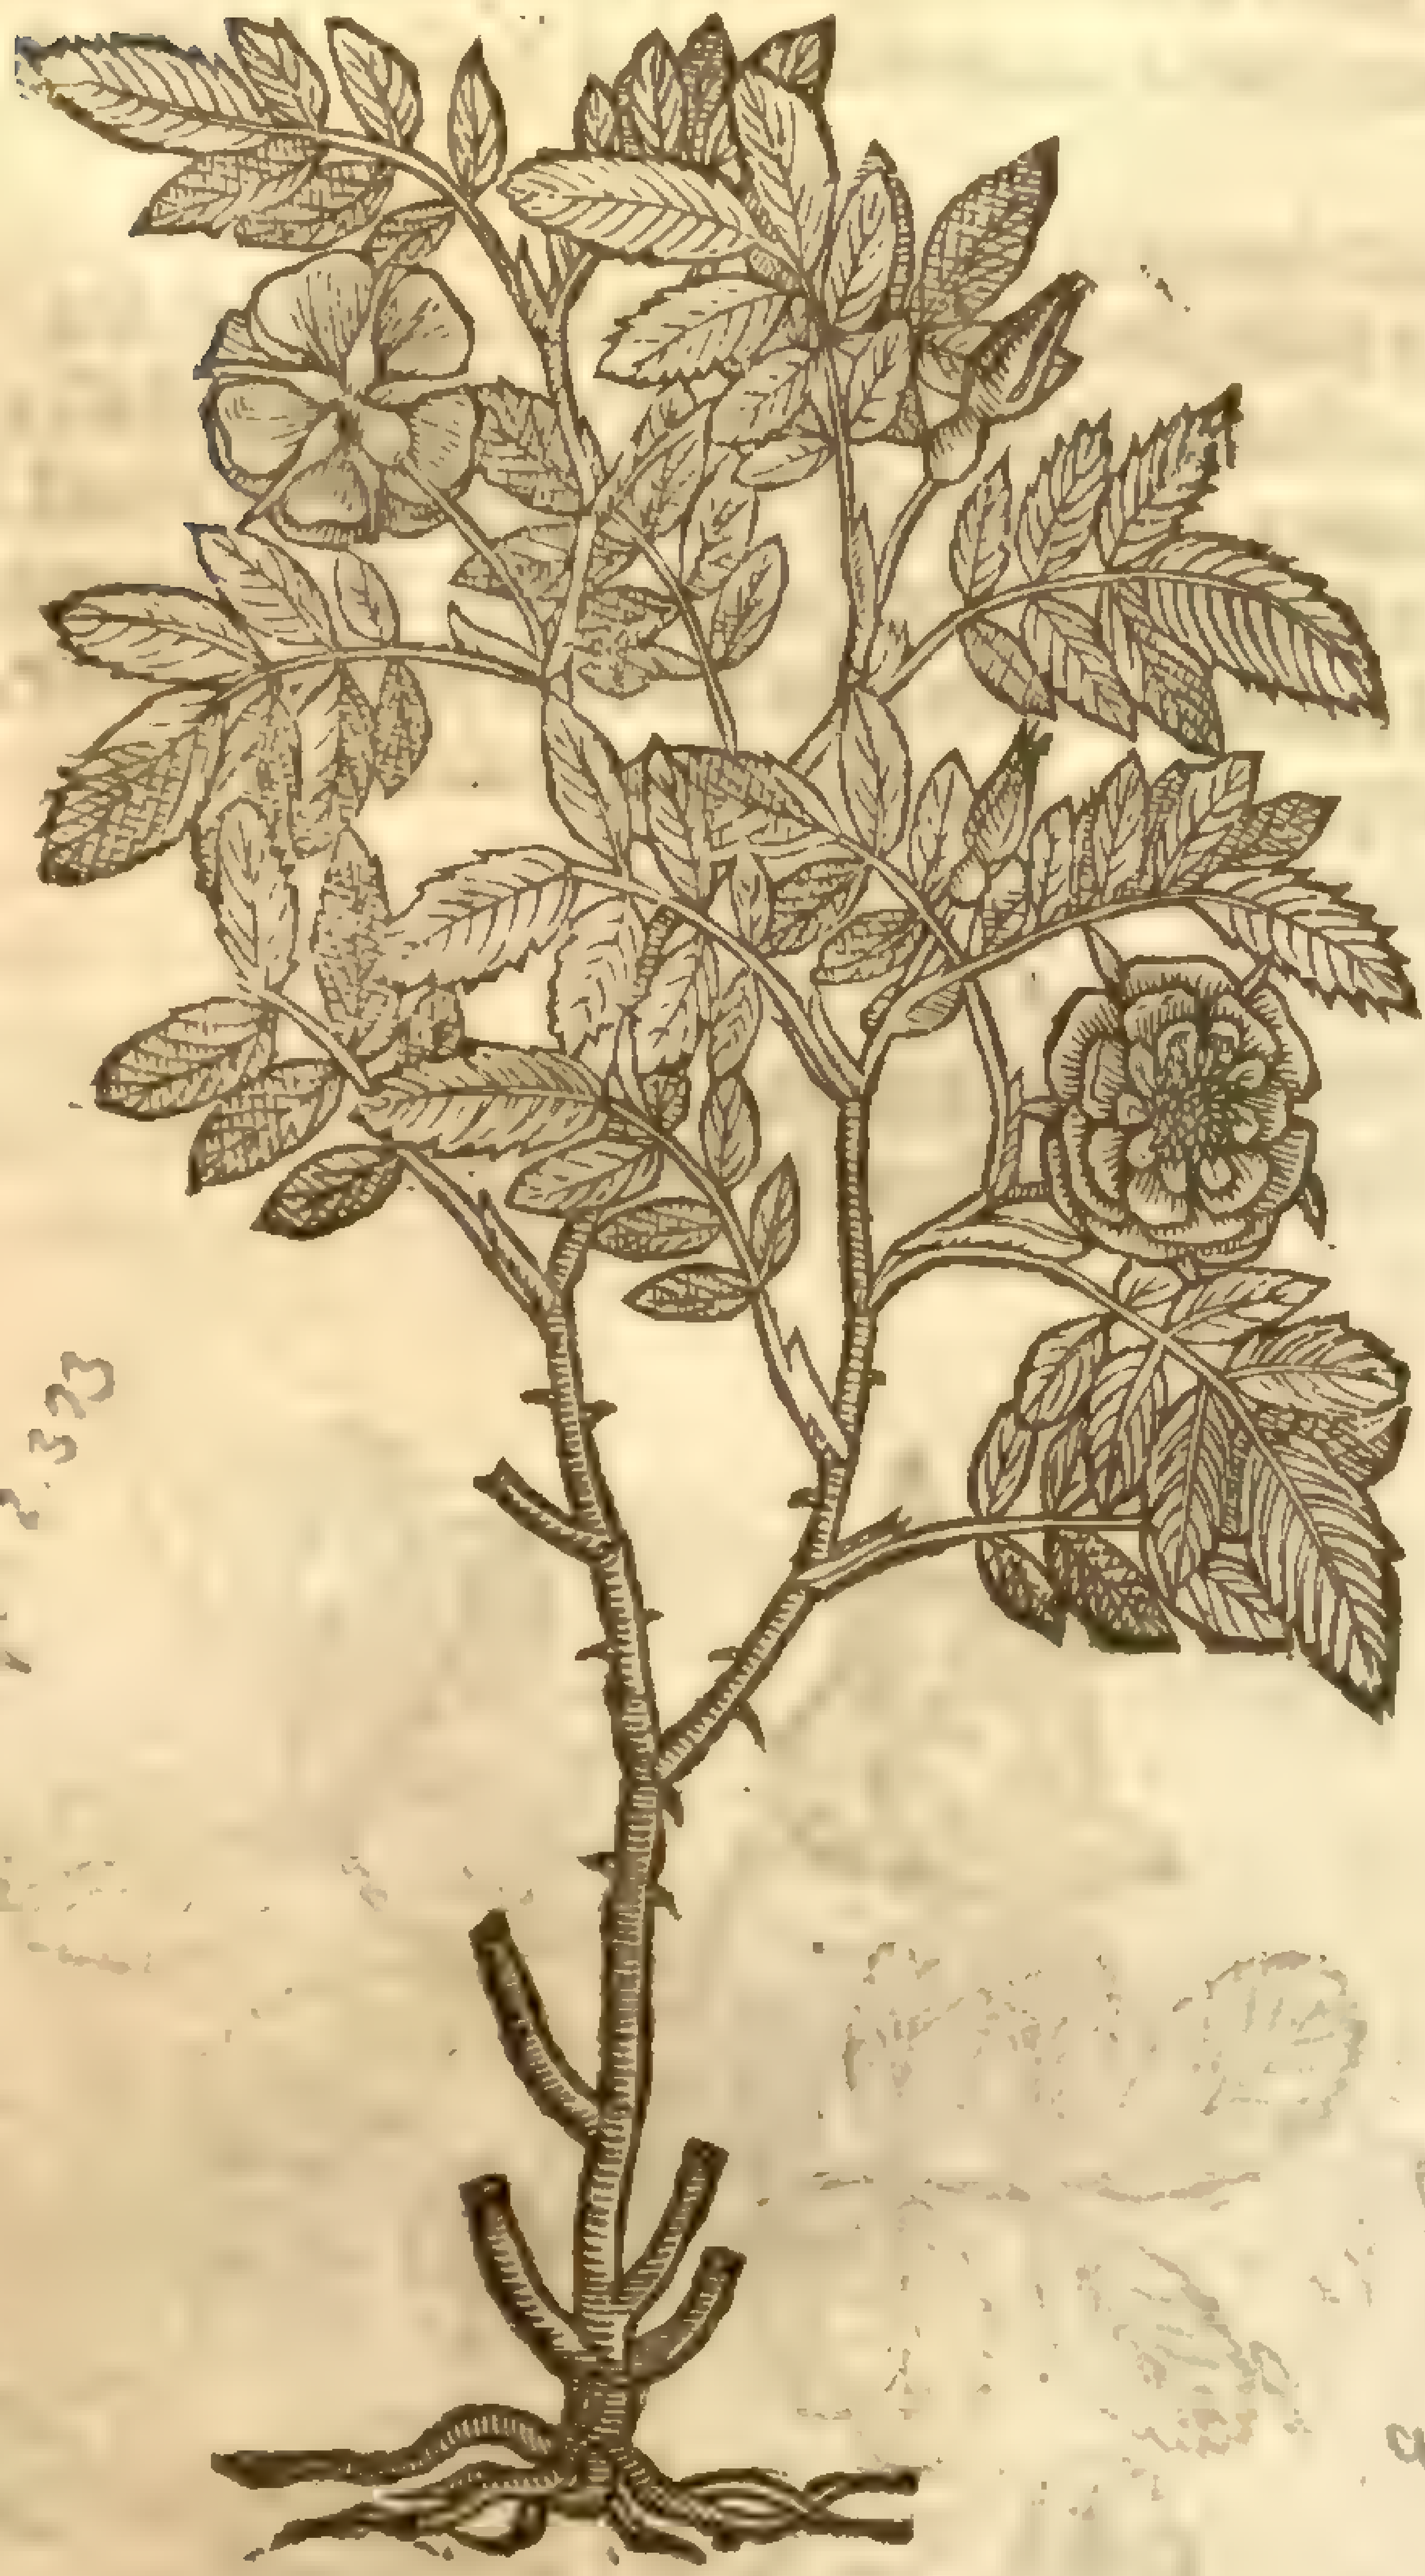
R. [illegible]

‡ 6 Of this kinde there is another more rare and ſet by, which in ſtalks, leaues, and other parts is not much different from the laſt deſcribed, onely the floure is very double, and it ſeldome fairely ſhewes it ſelfe about London, where it is kept in our chiefe gardens as a prime rariety. ‡

7 The Canell or Cinnamon Roſe, or the Roſe ſmelling like Cinnamon, hath ſhots of a brown colour, foure cubits high, beſet with thorny prickles, and leaues like vnto thoſe of Eglantine, but ſmaller and greener, of the ſauour or ſmell of Cinnamon, whereof it tooke his name, and not of the ſmell of his floures (as ſome haue deemed) which haue little or no ſauour at all: the floures be exceeding double, and yellow in the middle, of a pale red colour, and ſometimes of a carnation: the root is of a wooddy ſubſtance.

8 We haue in our London gardens another Cinnamon or Canell Roſe, not differing from the laſt deſcribed in any reſpect, but onely in the floures; for as the other hath very double floures, contrariwiſe theſe of this plant are very ſingle, wherein is the difference.

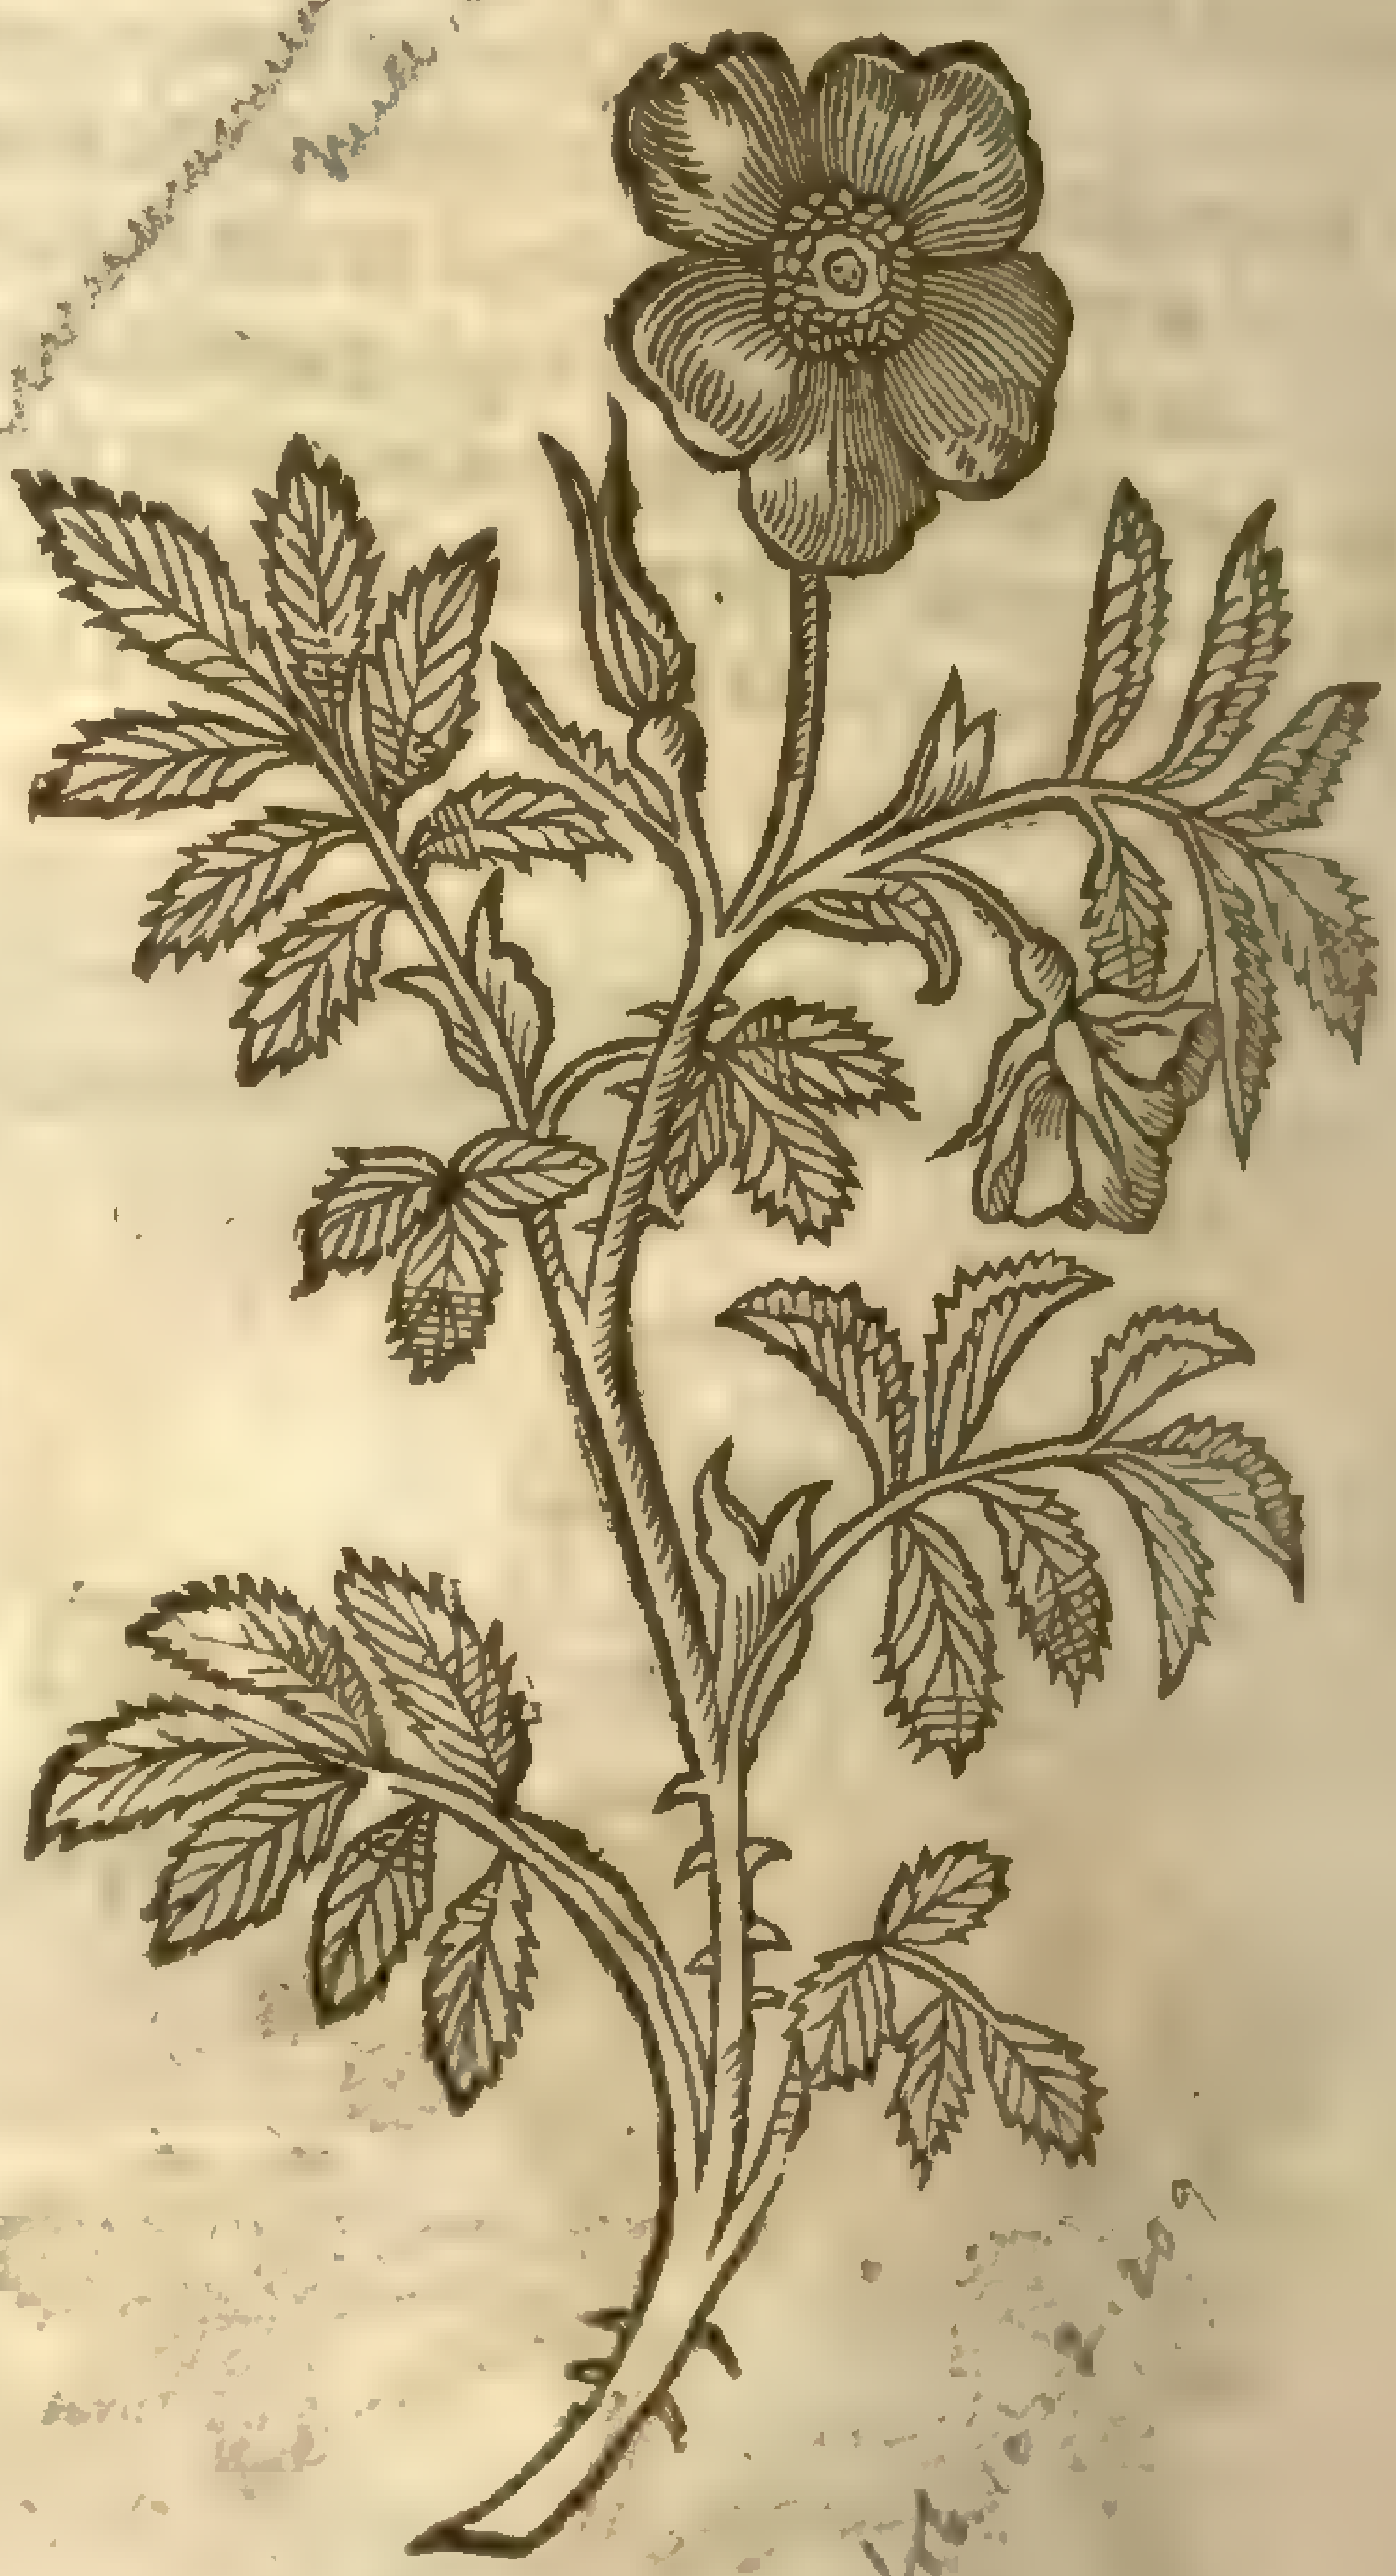
7 *Roſa Cinnamomea pleno flore.*
The double Cinnamon Roſe.



R. cinnamomea, L. β Mill. dict.

R. cinnamomea, β Sm. Fl. 2. 323

‡ 8 *Roſa Cinnamomea flore ſimplici.*
The ſingle Cinnamon Roſe.



R. cinnamomea, L. α Mill. dict.

8. = R. cinnamomea, L. Sm. Fl. B. 323

¶ *The Place.*

Theſe Roſes are planted in our London Gardens, and elſe-where, but not found wilde in England.

¶ *The Time.*

The Muske Roſe floureth in Autumne, or the fall of the leafe: the reſt floure when the Damask and red Roſe do.

¶ *The Names.*

The firſt is called *Roſa Moſchata*, of the ſmell of Muske, as we haue ſaid: in Italian, *Roſe Moſchette*: in French, *Roſes Muſquees*, or *Muſcadelles*: in low Dutch, **Muſket rooſen**: in Engliſh Musk Roſe: the Latine and Engliſh titles may ſerue for the reſt.

¶ *The Temperature.*

The Muske Roſe is cold in the firſt degree, wherin airy and ſpirituall parts are prodominant: the reſt are referred to the Brier Roſe and Eglantine.

¶ *The Vertues.*

A Conſerue or ſyrrup made of the Muske Roſe, in manner as before told in the Damaske and Red Roſes, doth purge very mightily wateriſh humors, yet ſafely, and without all danger, taken in the quantity of an ounce in weight.

B The leaues of the floures eaten in the morning, in manner of a ſallad, with oyle, vineger and pepper, or any other way according to the appetite and pleaſure of them that ſhall eate it, purge very notably the belly of wateriſh and cholericke humors, and that mightily, yet without all perill or paine at all, inſomuch as the ſimpleſt may vſe the quantity, according to their owne fancie: for if they do deſire many ſtooles, or ſieges, they are to eat the greater quantity of the leaues; if fewer, the leſſe quantity; as for example: the leaues of twelue or fourteene floures giue ſix or eight ſtooles, and ſo increaſing or diminiſhing the quantity, more or fewer, as my ſelfe haue often proued.

C The white leaues ſtamped in a wooden diſh with a piece of Allum and the juyce ſtrained forth into ſome glaſed veſſell, dried in the ſhadow, and kept, is the moſt fine and pleaſant yellow colour that may be diuiſed, not onely to limne or waſh pictures and Imagerie in books, but alſo to colour meats and ſauces, which notwithſtanding the Allum is very wholeſome.

There is not any thing extant of the others, but are thought to be equall with the white Muske Roſe,whereof they are taken and holden to be kindes.

Chap. 3. *Of the wilde Roſes.*

¶ *The Deſcription.*

1 The ſweet Brier doth oftentimes grow higher than all the kindes of Roſes;the ſhoots of it are hard,thicke,and wooddy; the leaues are glittering,and of a beautifull greene colour,of ſmell moſt pleaſant: the Roſes are little, fiue leaued, moſt commonly whitiſh, ſeldom tending to purple,of little or no ſmell at all: the fruit is long,of colour ſomewhat red,like a little oliue ſtone,& like the little heads or berries of the others,but leſſer than thoſe of the garden: in which is contained rough cotton, or hairy downe and ſeed, folded and wrapped vp in the ſame; which is ſmall and hard: there be likewiſe found about the ſlender ſhoots hereof, round, ſoft, and hairy ſpunges,which we call Brier Balls,ſuch as grow about the prickles of the Dog-Roſe.

1 *Roſa ſylueſtris odora.* The Eglantine,or ſweet Brier.

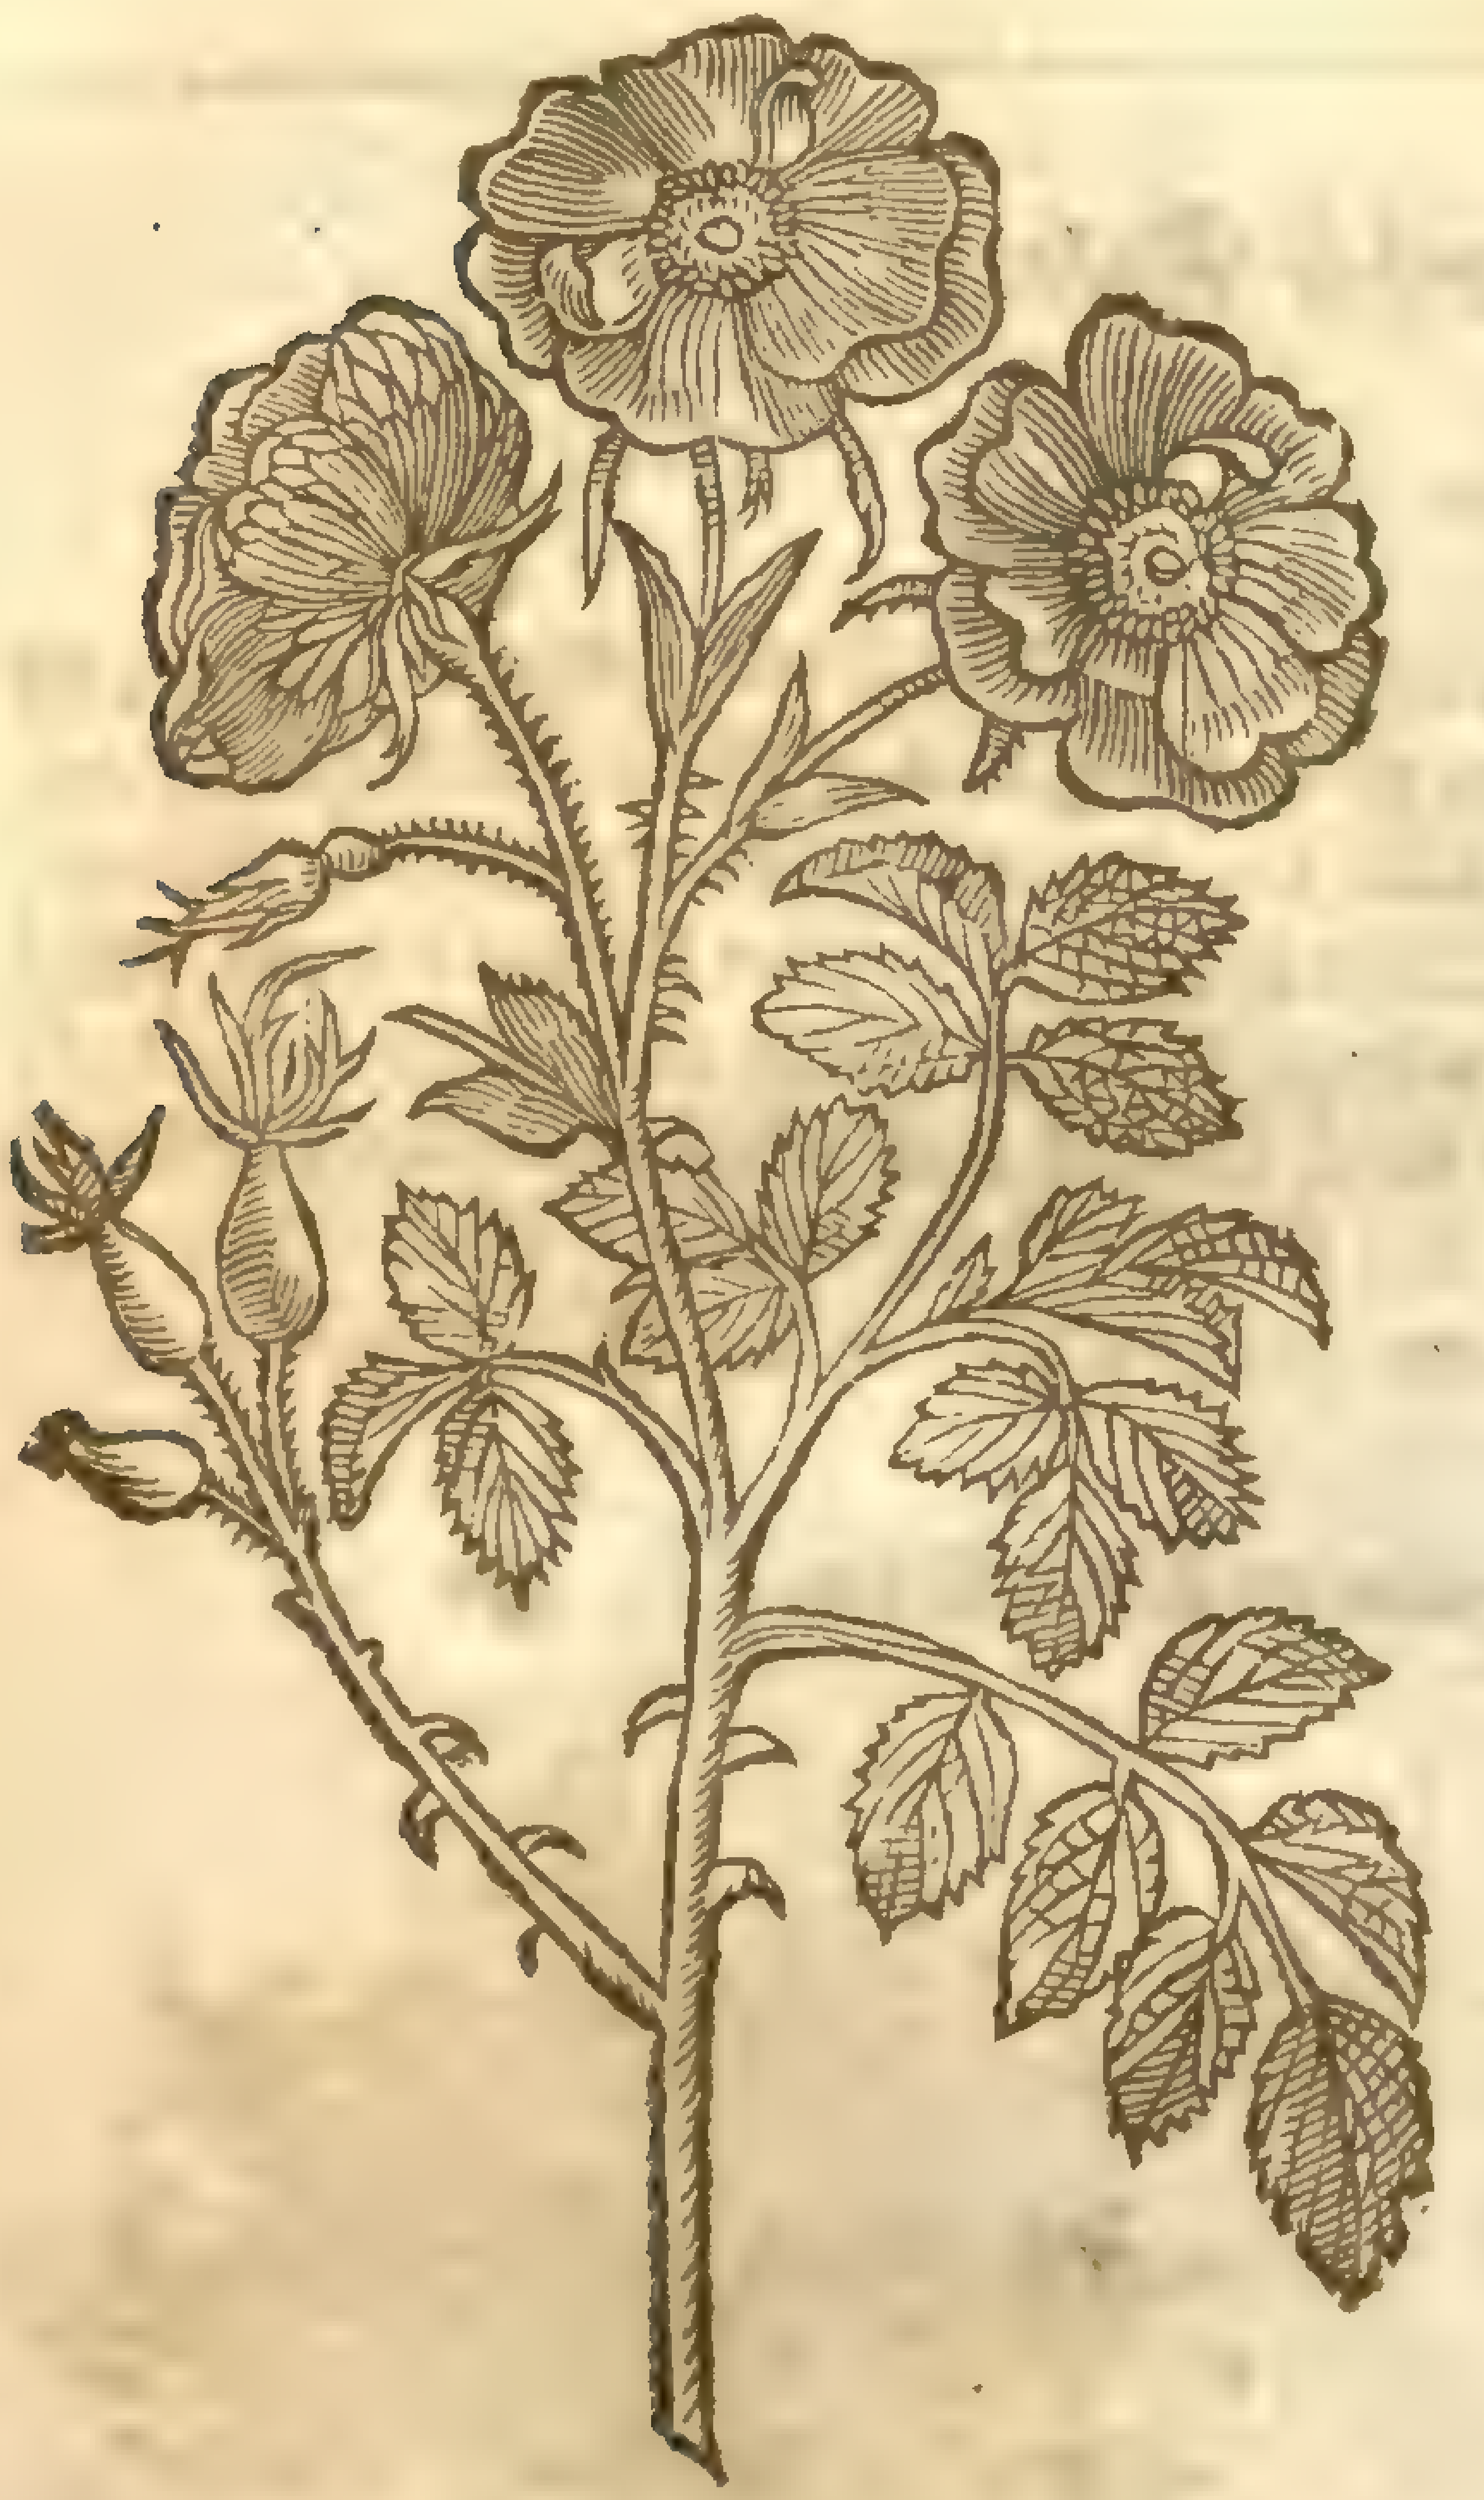
Rosa rubiginosa
Spec. hist.
[illegible]

2 We haue in our London gardens another ſweet Brier, hauing greater leaues,and much ſweeter: the floures likewiſe are greater, and ſomewhat doubled, exceeding ſweet of ſmell, wherein it differeth from the former.

3 The Brier Buſh or Hep tree, is alſo called *Roſa canina*, which is a plant ſo common and well knowne, that it were to ſmall purpoſe to vſe many words in the deſcription thereof: for euen children with great deligh eat the berries thereof when they be ripe, make chaines and other prettie gewgawes of the fruit:cookes and gentlewomen make Tarts and ſuch like diſhes for pleaſure thereof, and therefore this ſhall ſuffice for the deſcription.

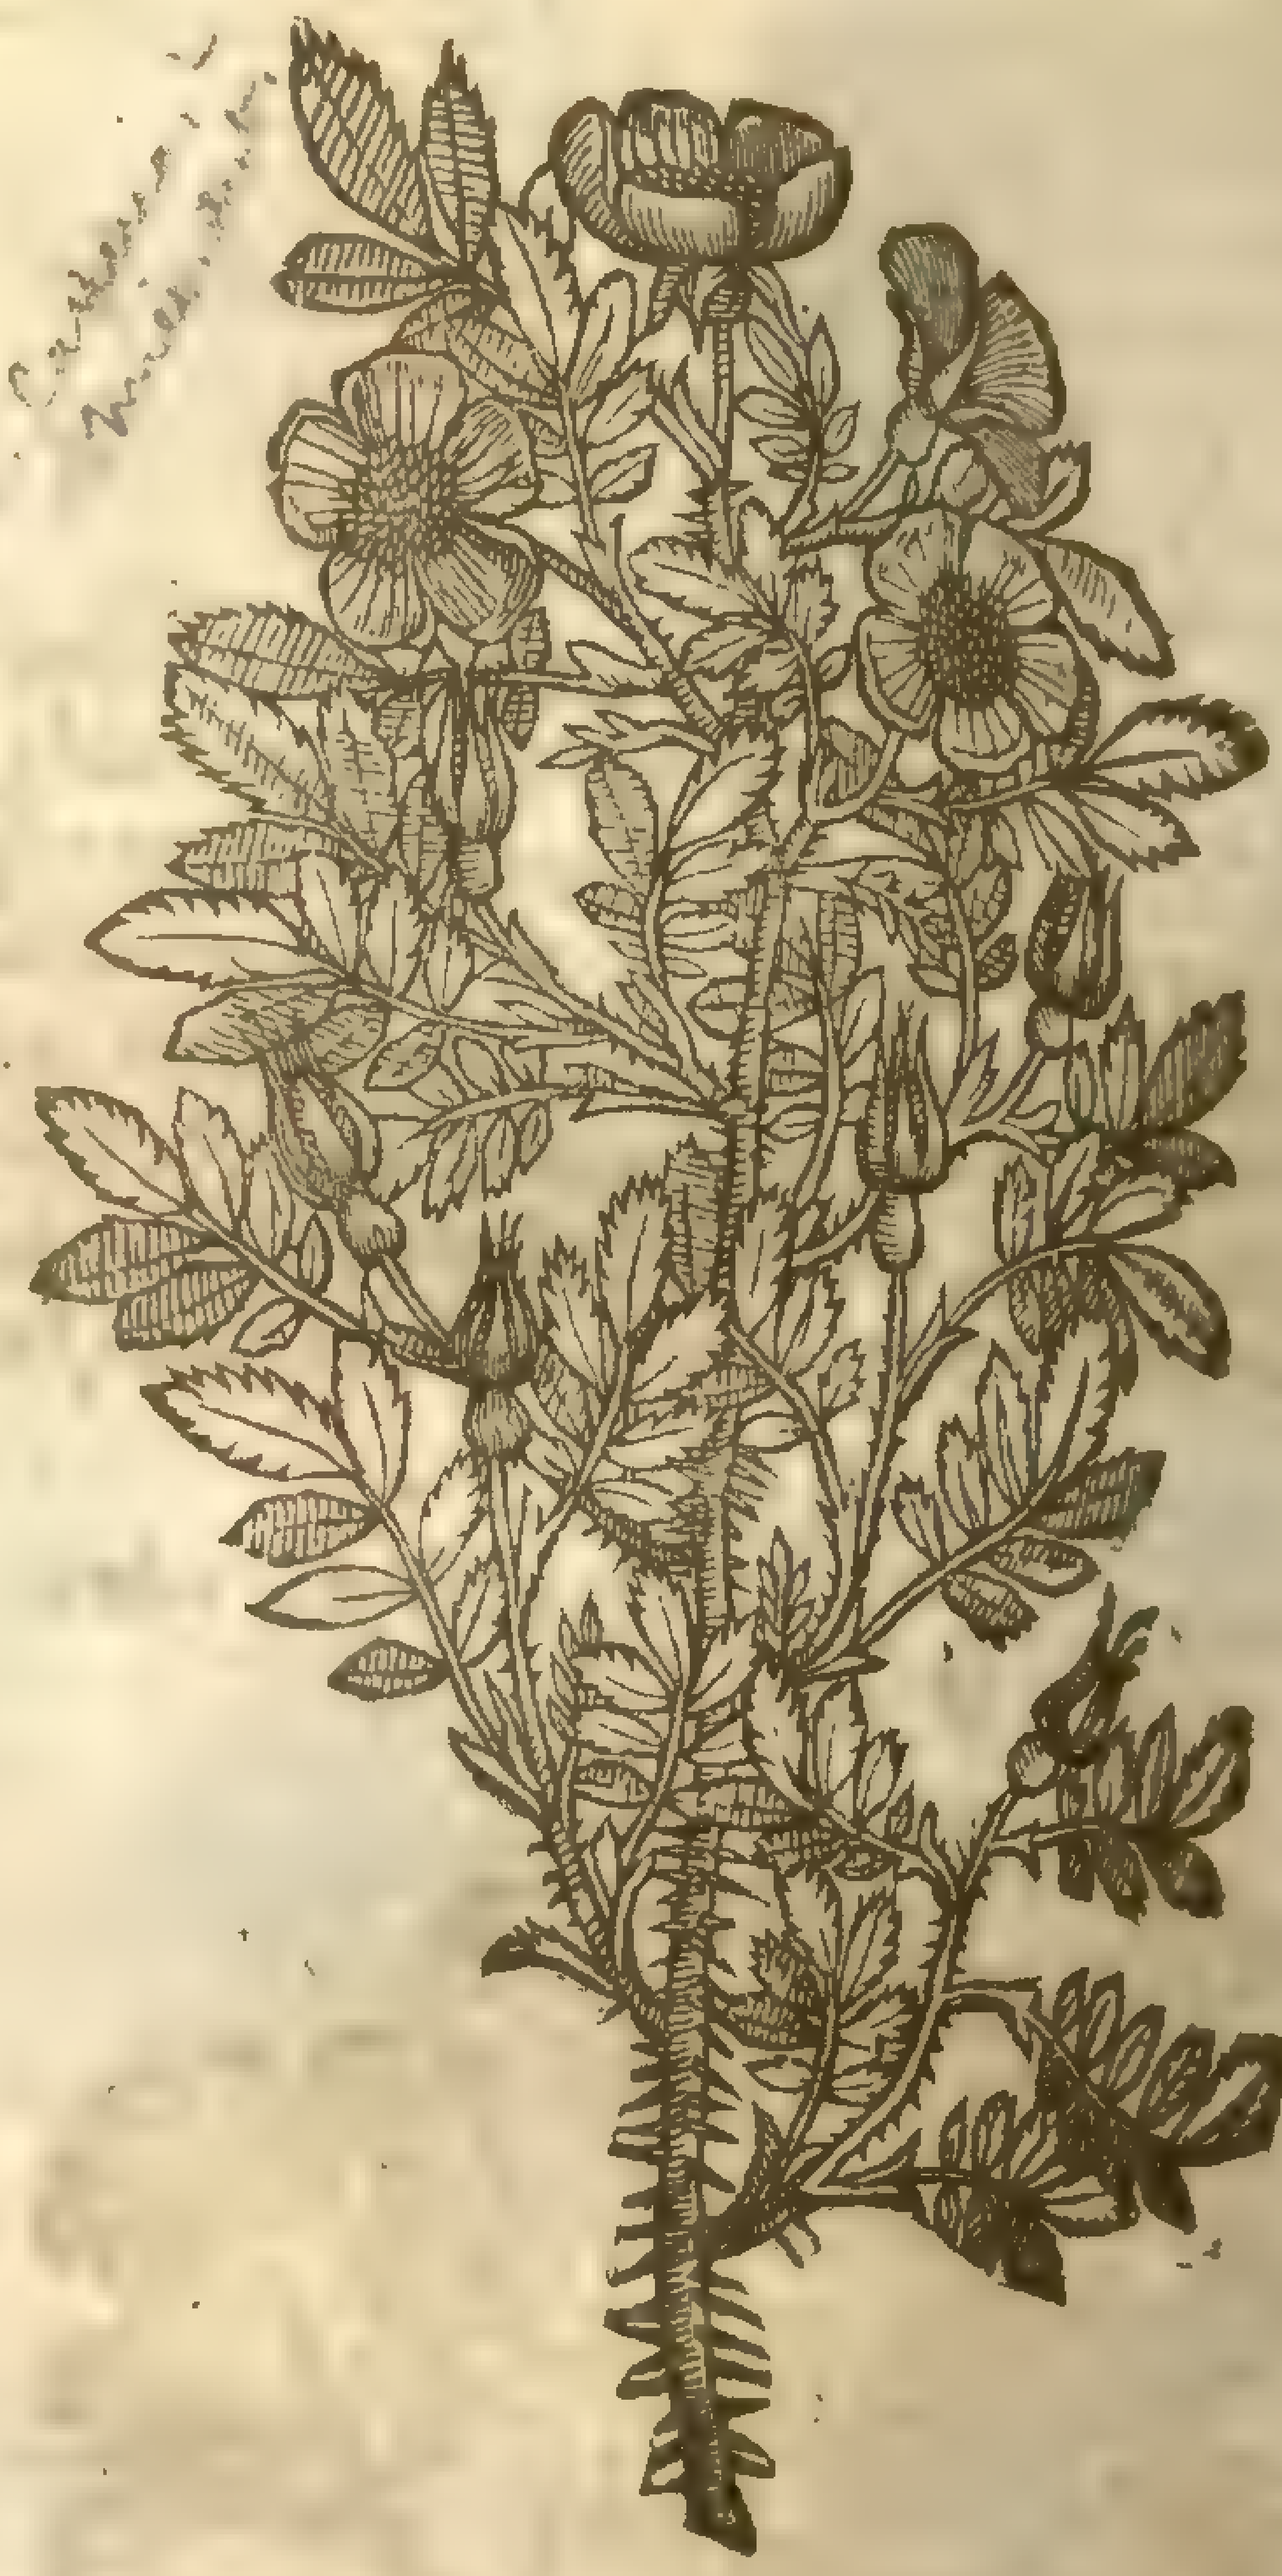
4 The Pimpinell Roſe is likewiſe one of the wilde ones,whoſe ſtalks ſhoot forth of the ground in many places,of the height of one or two cubits, of a browne colour, and armed with ſharpe prickles,

‡ 2 *Roſa ſyl. odora flore duplici.*
The double Eglantine.

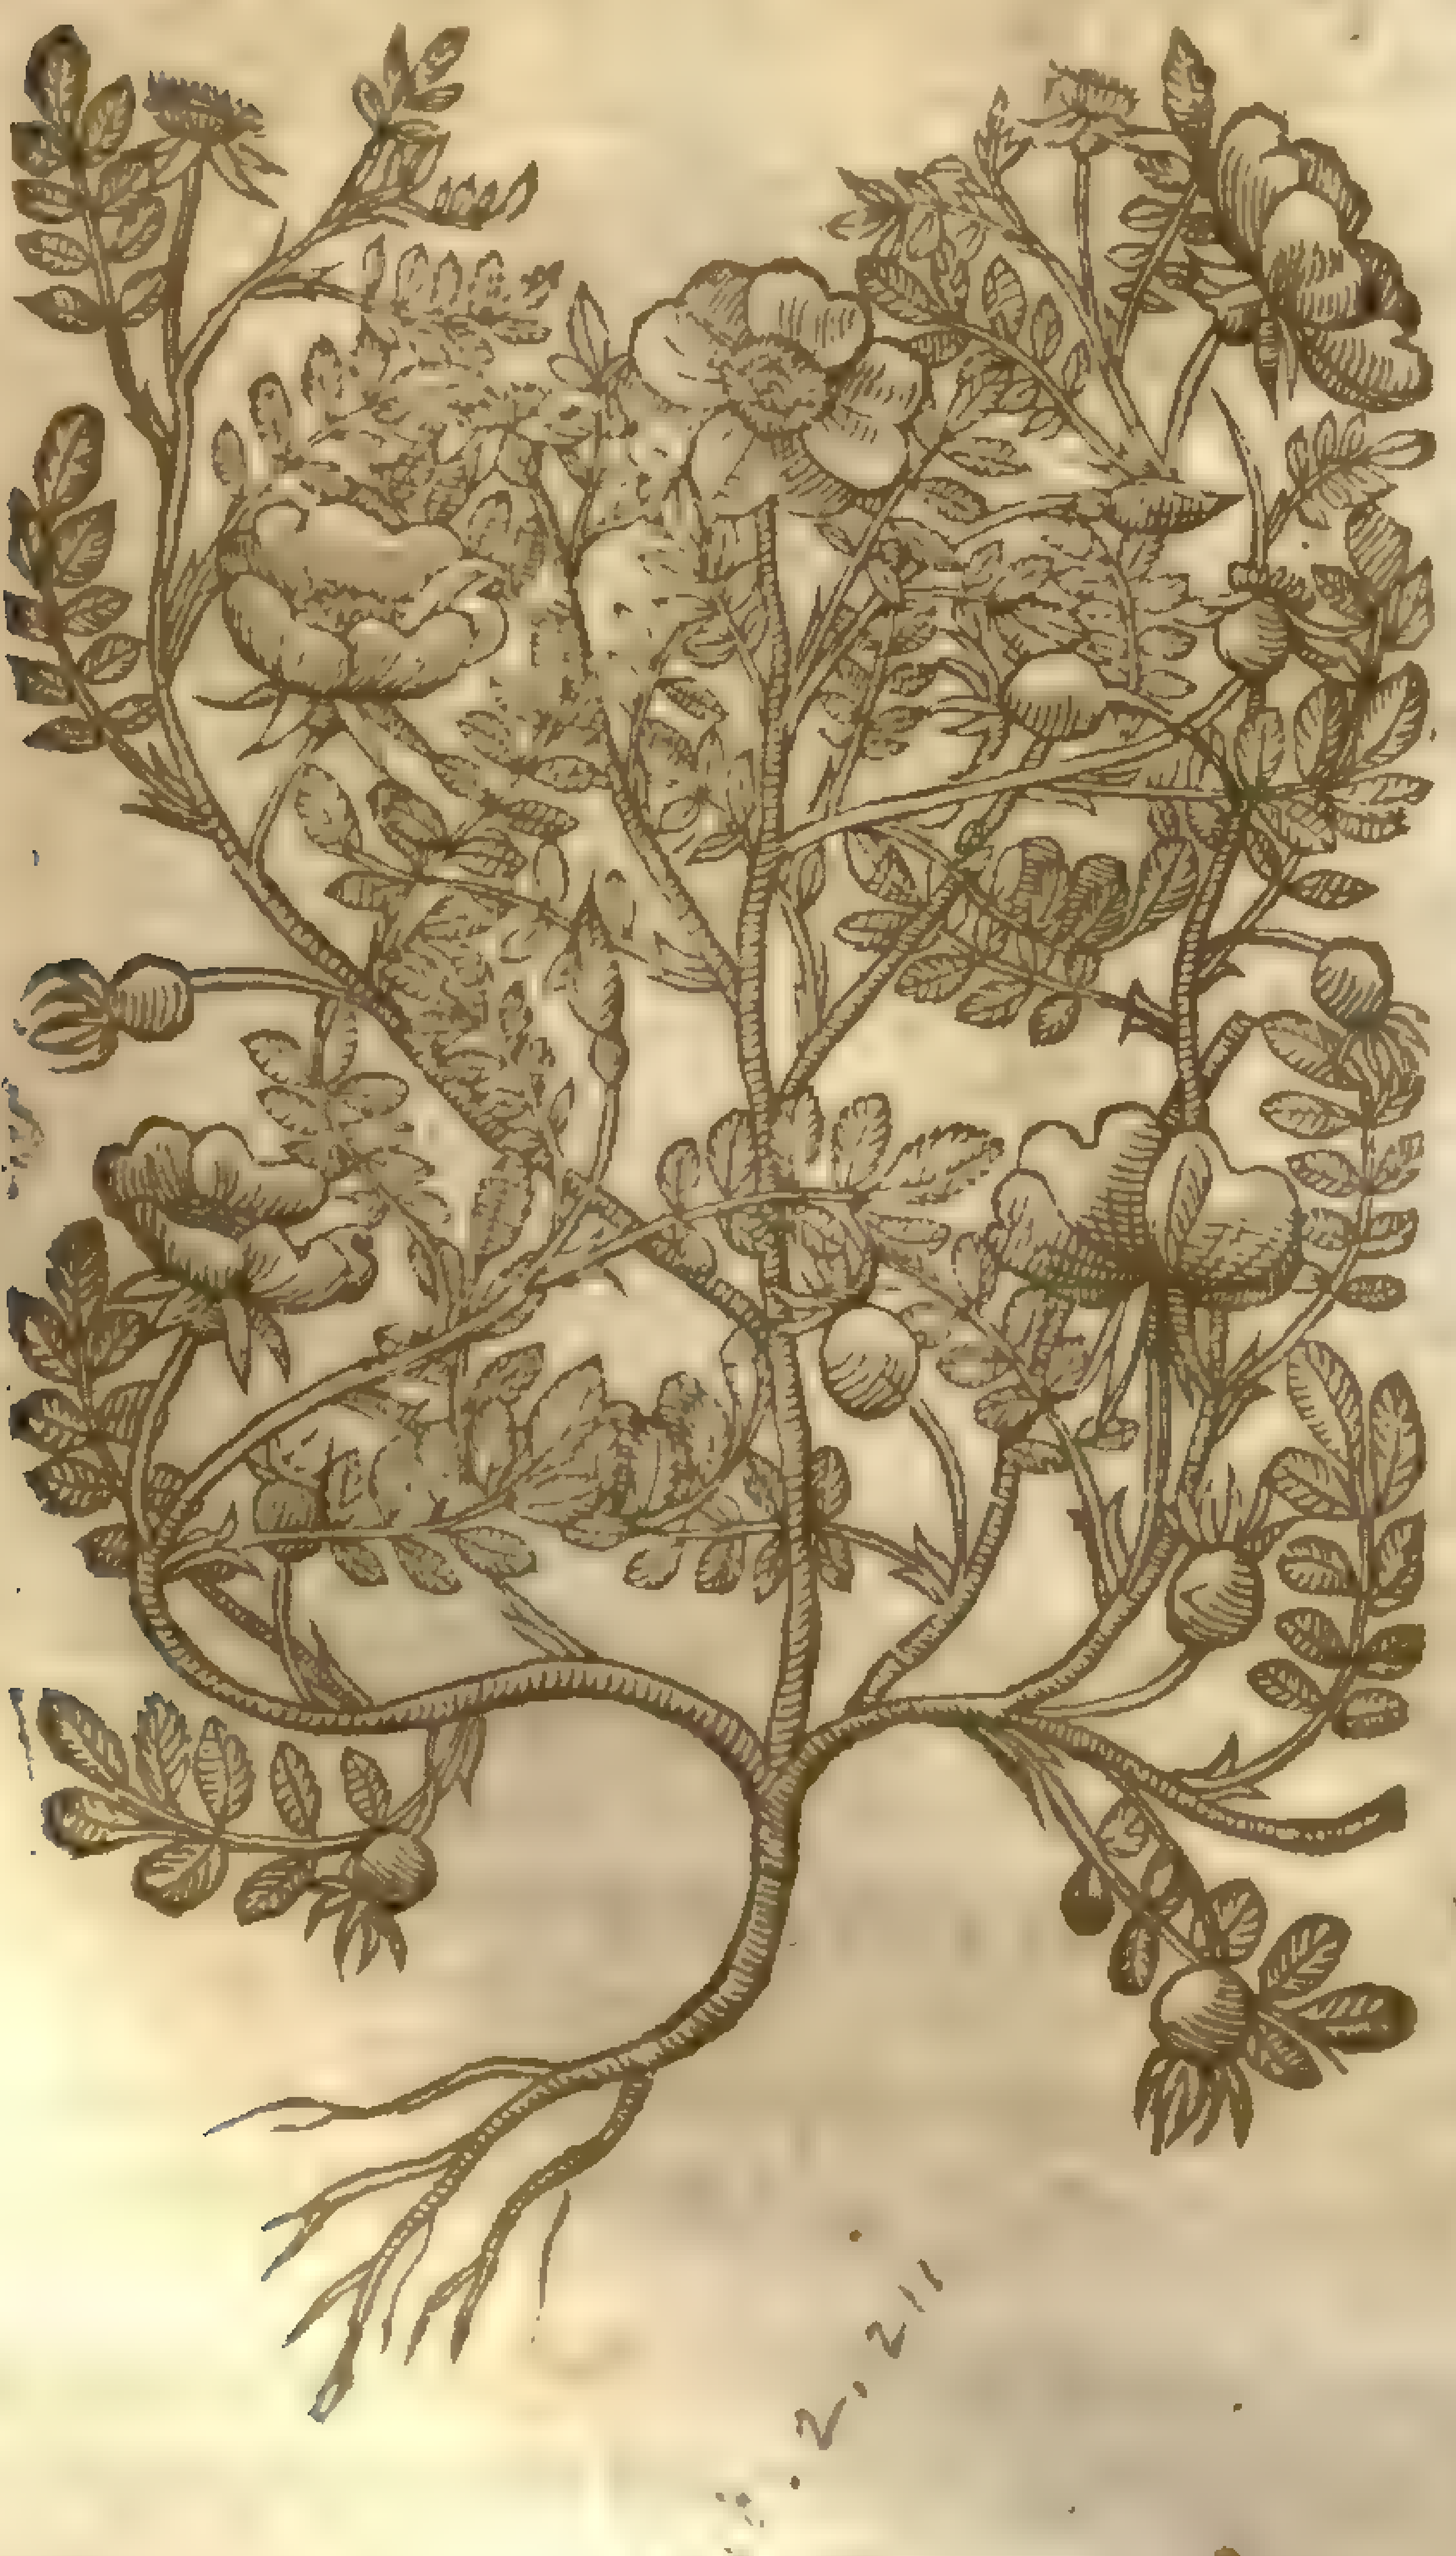


3 *Roſa Canina inodora.*
The Brier Roſe or Hep-tree.

R. Canina



4 *Roſa Pimpinellæ folio.*
The Pimpinell Roſe.



Lin. sp. 2. 372

2, 211

kles, which diuide themſelues toward the tops into diuers branches, whereon doe grow leaues conſiſting of diuers ſmall ones, ſet vpon a middle rib like thoſe of Burnet, which is called in Latine *Pimpinella*, whereupon it was called *Roſa Pimpinella*, the Burnet Roſe. The floures grow at the tops of the branches, of a white colour, very ſingle, and like vnto thoſe of the Brier or Hep tree: after which come the fruit, blacke, contrary to all the reſt of the roſes, round as an apple; whereupon ſome haue called it *Roſa Pomifera*, or the Roſe bearing apples: wherein is contained ſeed, wrapped in chaffie or flockie matter, like that of the Brier: the root is tough and wooody.

¶ *The Place.*

Theſe wilde Roſes do grow in the borders of fields and woods, in moſt parts of England. The laſt growes very plentifully in a field as you go from a village in Eſſex, called Graies (vpon the brinke of the riuer Thames) vnto Horndon on the hill, inſomuch that the field is full fraught therewith all ouer.

It groweth likewiſe in a paſture as you goe from a village hard by London called Knightsbrige vnto Fulham, a Village thereby, and in many other places.

We haue them all except the Brier Buſh in our London gardens, which we think vnworthy the place.

¶ The

¶ *The Time.*

They floure and flouriſh with the other Roſes.

¶ *The Names.*

The Eglantine Roſe, which is *Cynorrhodi*, or *Caninæ Roſæ ſpecies*, a kinde of Dogs Roſe: and *Roſa ſylueſtris*, the wilde Roſe: in low Dutch, **Eglantier**: in French, *Eſglentine*; and as *Ruellius* teſtifies, *Eglenterium*. who alſo ſuſpects it to be *Cynosbaton*, or *Canirubus*: of which *Dioſcorides* hath written in theſe words; *Cynosbatus*, or *Canirubus*, which ſome call *Oxycantha*, is a ſhrub growing like a tree, full of prickles, with a white floure, long fruit like an oliue ſtone, red when it is ripe, and downie within: in Engliſh we call it Eglantine or ſweet Brier.

The ſpongie balls which are found vpon the branches are moſt aptly and properly called *Spongiolæ ſylueſtris Roſæ*, the little ſponges of the wilde Roſe. The ſhops miſtake it by the name of *Bedeguar*; for *Bedeguar* among the Arabians is a kinde of Thiſtle, which is called in Greeke Ἄκανθα λευκή: that is to ſay, *Spina alba* the white Thiſtle, not the white Thorne, though the word doe import ſo much.

The Brier or Hep tree is called *Sylueſtris Roſa*, the wilde Roſe: in high Dutch, **Wilden Roſen**: in French, *Roſes ſauuages*: *Pliny, lib.8.cap.25.* ſaith that it is *Roſa Canina*, Dogs Roſe: of diuers *Caninaſentis*, or Dogs Thorne: in Engliſh, Brier Buſh, and Hep tree: the laſt hath beene touched in the deſcription.

¶ *The Temperature and Vertues.*

A The faculties of theſe wilde Roſes are referred to the manured Roſe, but not vſed in Phyſicke where the other may be had: notwithſtanding *Pliny* affirmeth, that the root of the Brier Buſh is a ſingular remedy found out by Oracle, againſt the biting of a mad dog, which hee ſets downe in his eight booke, Chap.41.

B The ſame Author *lib.25.cap.2.* affirmeth, that the little ſpongie Brier Ball ſtamped with honey and aſhes cauſeth haires to grow which are fallen through the diſeaſe called *Alopecia*, or the Foxes euill.

C *Fuchſius* affirmes that the ſpongie excreſcence or ball growing vpon the Brier are good againſt the ſtone and ſtrangurie, if they be beaten to pouder and inwardly taken.

D They are good not as they be diureticks or prouokers of vrine, or as they are wearers away of the ſtone, but as certaine other binding medicines that ſtrengthen the weake and feeble kidnies; which do no more good to thoſe that be ſubject to the ſtone, than many of the diuretickes, eſpecially of the ſtronger ſort; for by two much vſing of diuretickes or piſſing medicines, it hapneth that the kidnies are ouerweakened, and oftentimes too much heated, by which meanes not onely the ſtones are not diminiſhed, worne away, or driuen forth, but oftentimes are alſo increaſed and made more hard: for they ſeperate and take away that which in the bloud is thin, waterie, and as it were wheyiſh; and the thicker part, the ſtronger ſorts of diuretickes do draw together and make hard: and in like manner alſo others that are not ſo ſtrong, by the ouermuch vſing of them, as *Galen lib.5.* of the faculties of ſimple medicines reporteth.

E The fruit when it is ripe maketh moſt pleaſant meats and banqueting diſhes, as tarts and ſuch like; the making whereof I commit to the cunning cooke, and teeth to eate them in the rich mans mouth.

CHAP. 4. *Of the Bramble or blacke-berry buſh.*

¶ *The Deſcription.*

1 THe common Bramble bringeth forth ſlender branches, long, tough, eaſily bowed, ramping among hedges and whatſoeuer ſtands neere vnto it; armed with hard and ſharpe prickles, whereon doe grow leaues conſiſting of many ſet vpon a rough middle ribbe, greene on the vpper ſide, and vnderneath ſomewhat white: on the tops of the ſtalkes ſtand certaine floures, in ſhape like thoſe of the Brier Roſe, but leſſer, of colour white, and ſometimes waſht ouer with a little purple: the fruit or berry is like that of the Mulberry, firſt red, blacke when it is ripe, in taſte betweene ſweet and ſoure, very ſoft, and full of grains: the root creepeth, and ſendeth forth here and there young ſprings.

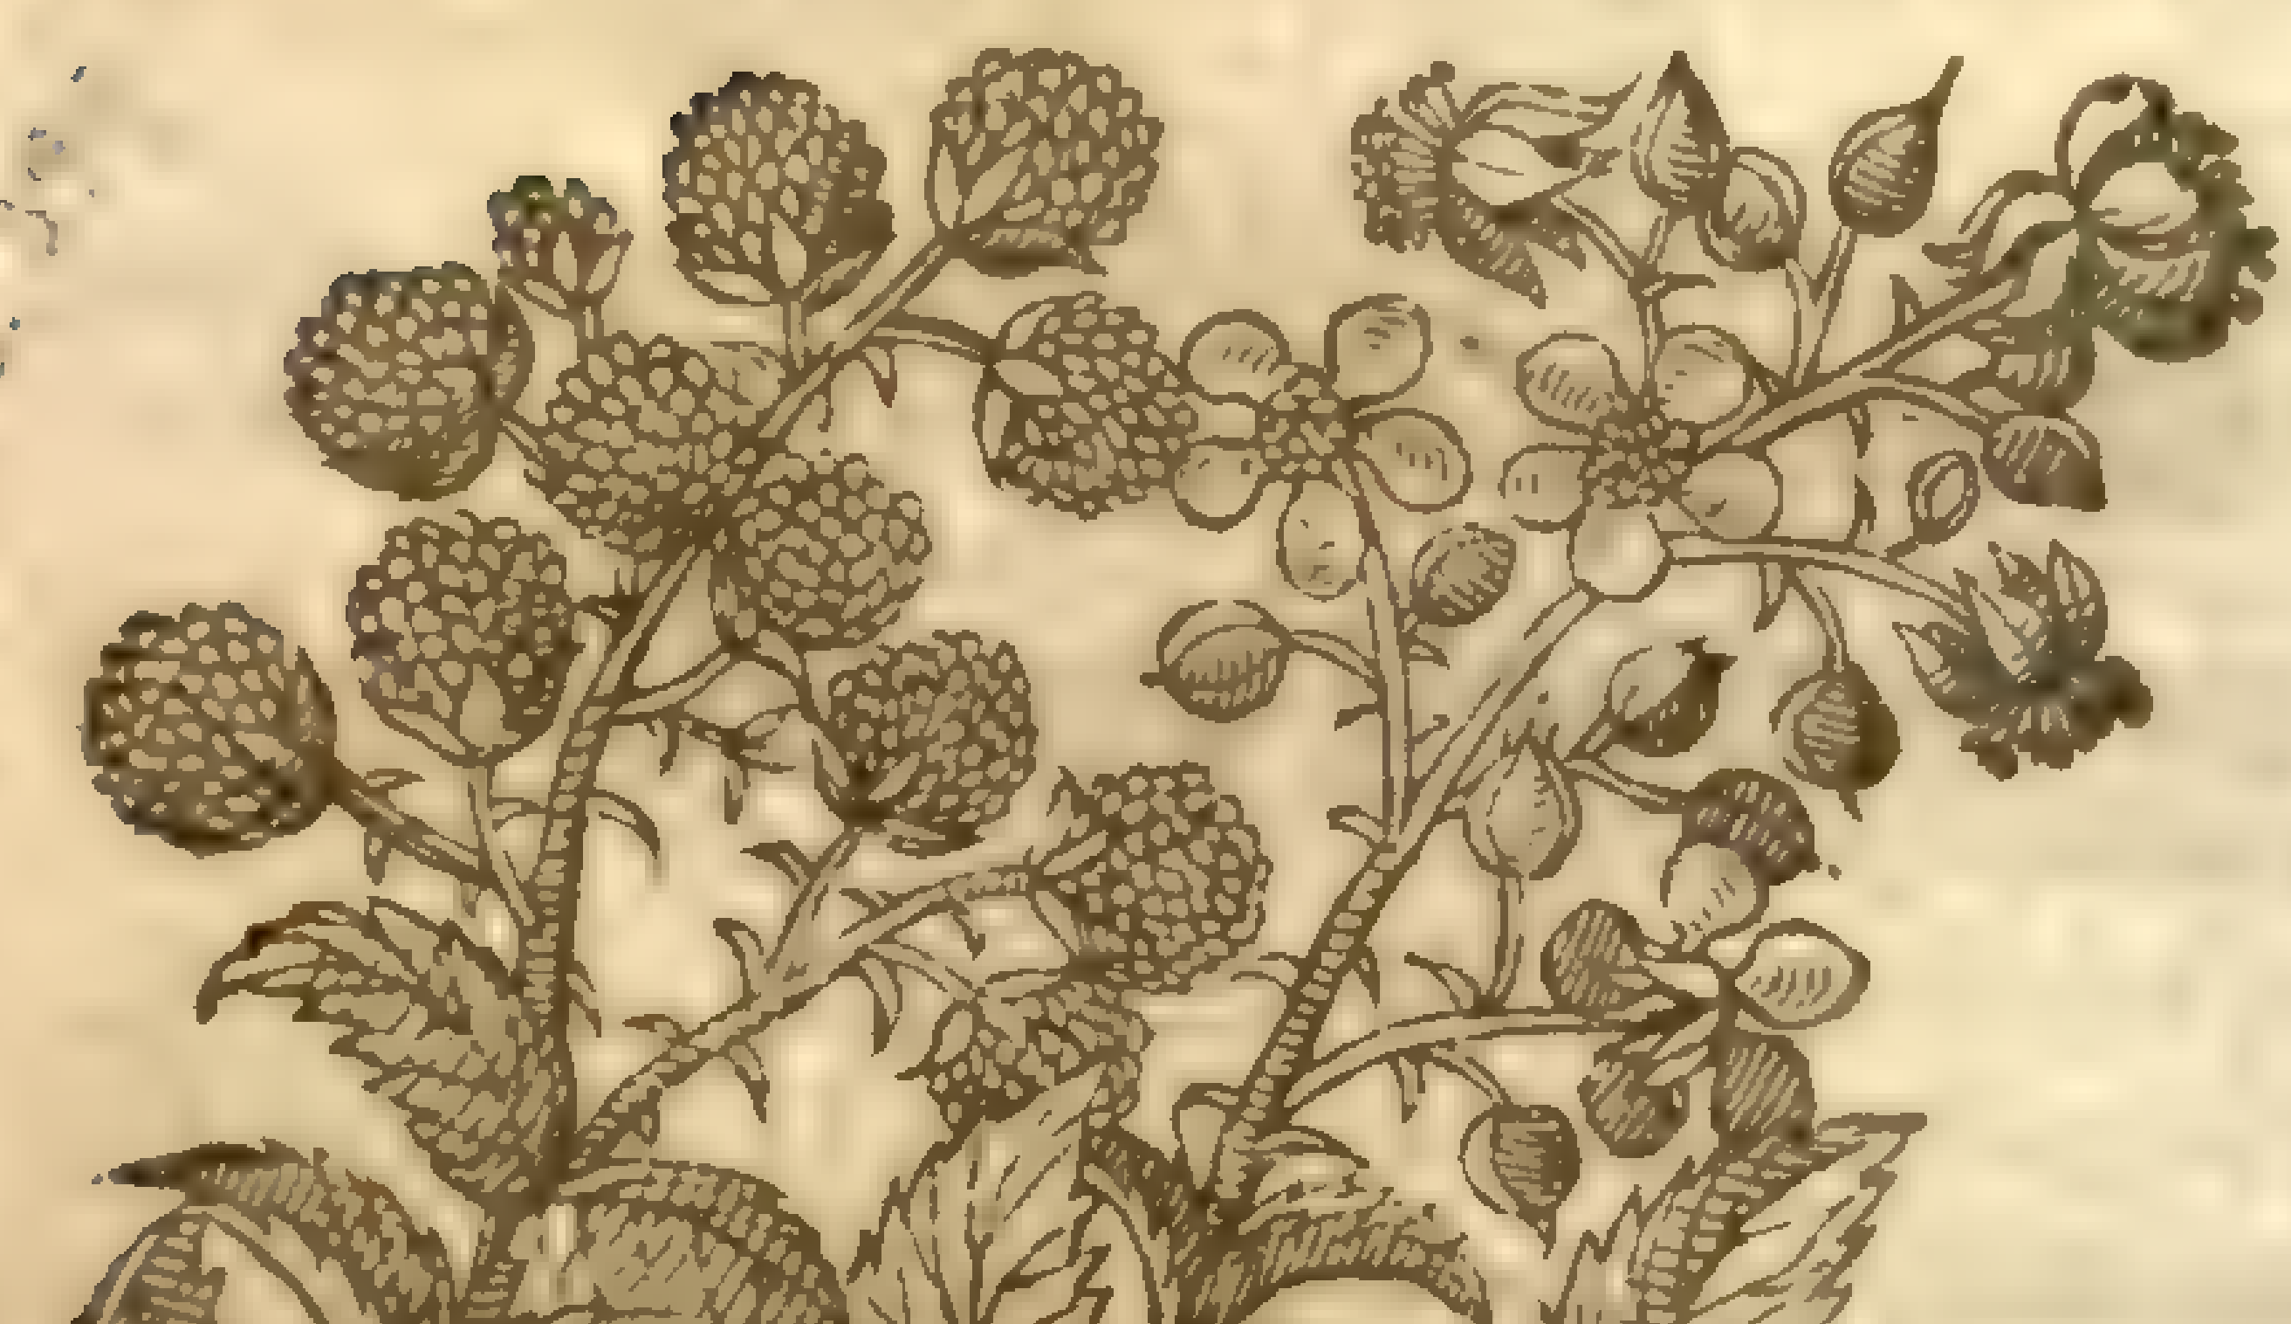
‡ *Rubus repens fructu cæſio.* R. [illegible]

‡ 2 This hath a round ſtalke ſet full of ſmall crooked and very ſharpe pricking thornes, and creepeth on hedges and low buſhes of a great length, on the vpper ſide of a light red colour, and vnderneath greene, and taketh root with the tops of the trailing branches, whereby it doth mightily

encreaſe: the leaues grow without order, compoſed of three leaues, and ſometimes of fiue, or elſe the two lower leaues are diuided into two parts, as hop leaues are now and then, of a light greene colour both aboue and vnderneath. The floures grow on the tops of the branches, *racematim*, many together, ſometimes white, ſometimes of a very light purple colour, euery floure containing fiue leaues, which are crompled or wrinkled, and do not grow plaine: the fruit followes, firſt greene, and afterwards blew, euery berry compoſed of one or two graines, ſeldome aboue foure or fiue growing together, about the bigneſſe of corans; wherein is contained a ſtony hard kernell or ſeed, and a juice of the colour of Claret wine, contrary to the common *Rubus* or Bramble, whoſe leaues are white vnderneath: the berries being ripe are of a ſhining blacke colour, and euery berry containes vſually aboue forty graines cloſely compacted and thruſt together. The root is woddy and laſting. This growes common enough in moſt places, and too common in ploughed fields. Sept. 6. 1619. *Iohn Goodyer*. ‡

3 The Raſpis or Framboiſe buſh hath leaues and branches not much vnlike the common Bramble, but not ſo rough nor prickly, and ſometimes without any prickles at all, hauing onely a rough hairineſſe about the ſtalkes: the fruit in ſhape and proportion is like thoſe of the Bramble, red when they be ripe, and couered ouer with a little downineſſe; in taſte not very pleaſant. The root creepeth far abroad, whereby it greatly encreaſeth. ‡ This growes either with prickles vpon the ſtalks, or elſe without them: the fruit is vſually red, but ſometimes white of colour. ‡

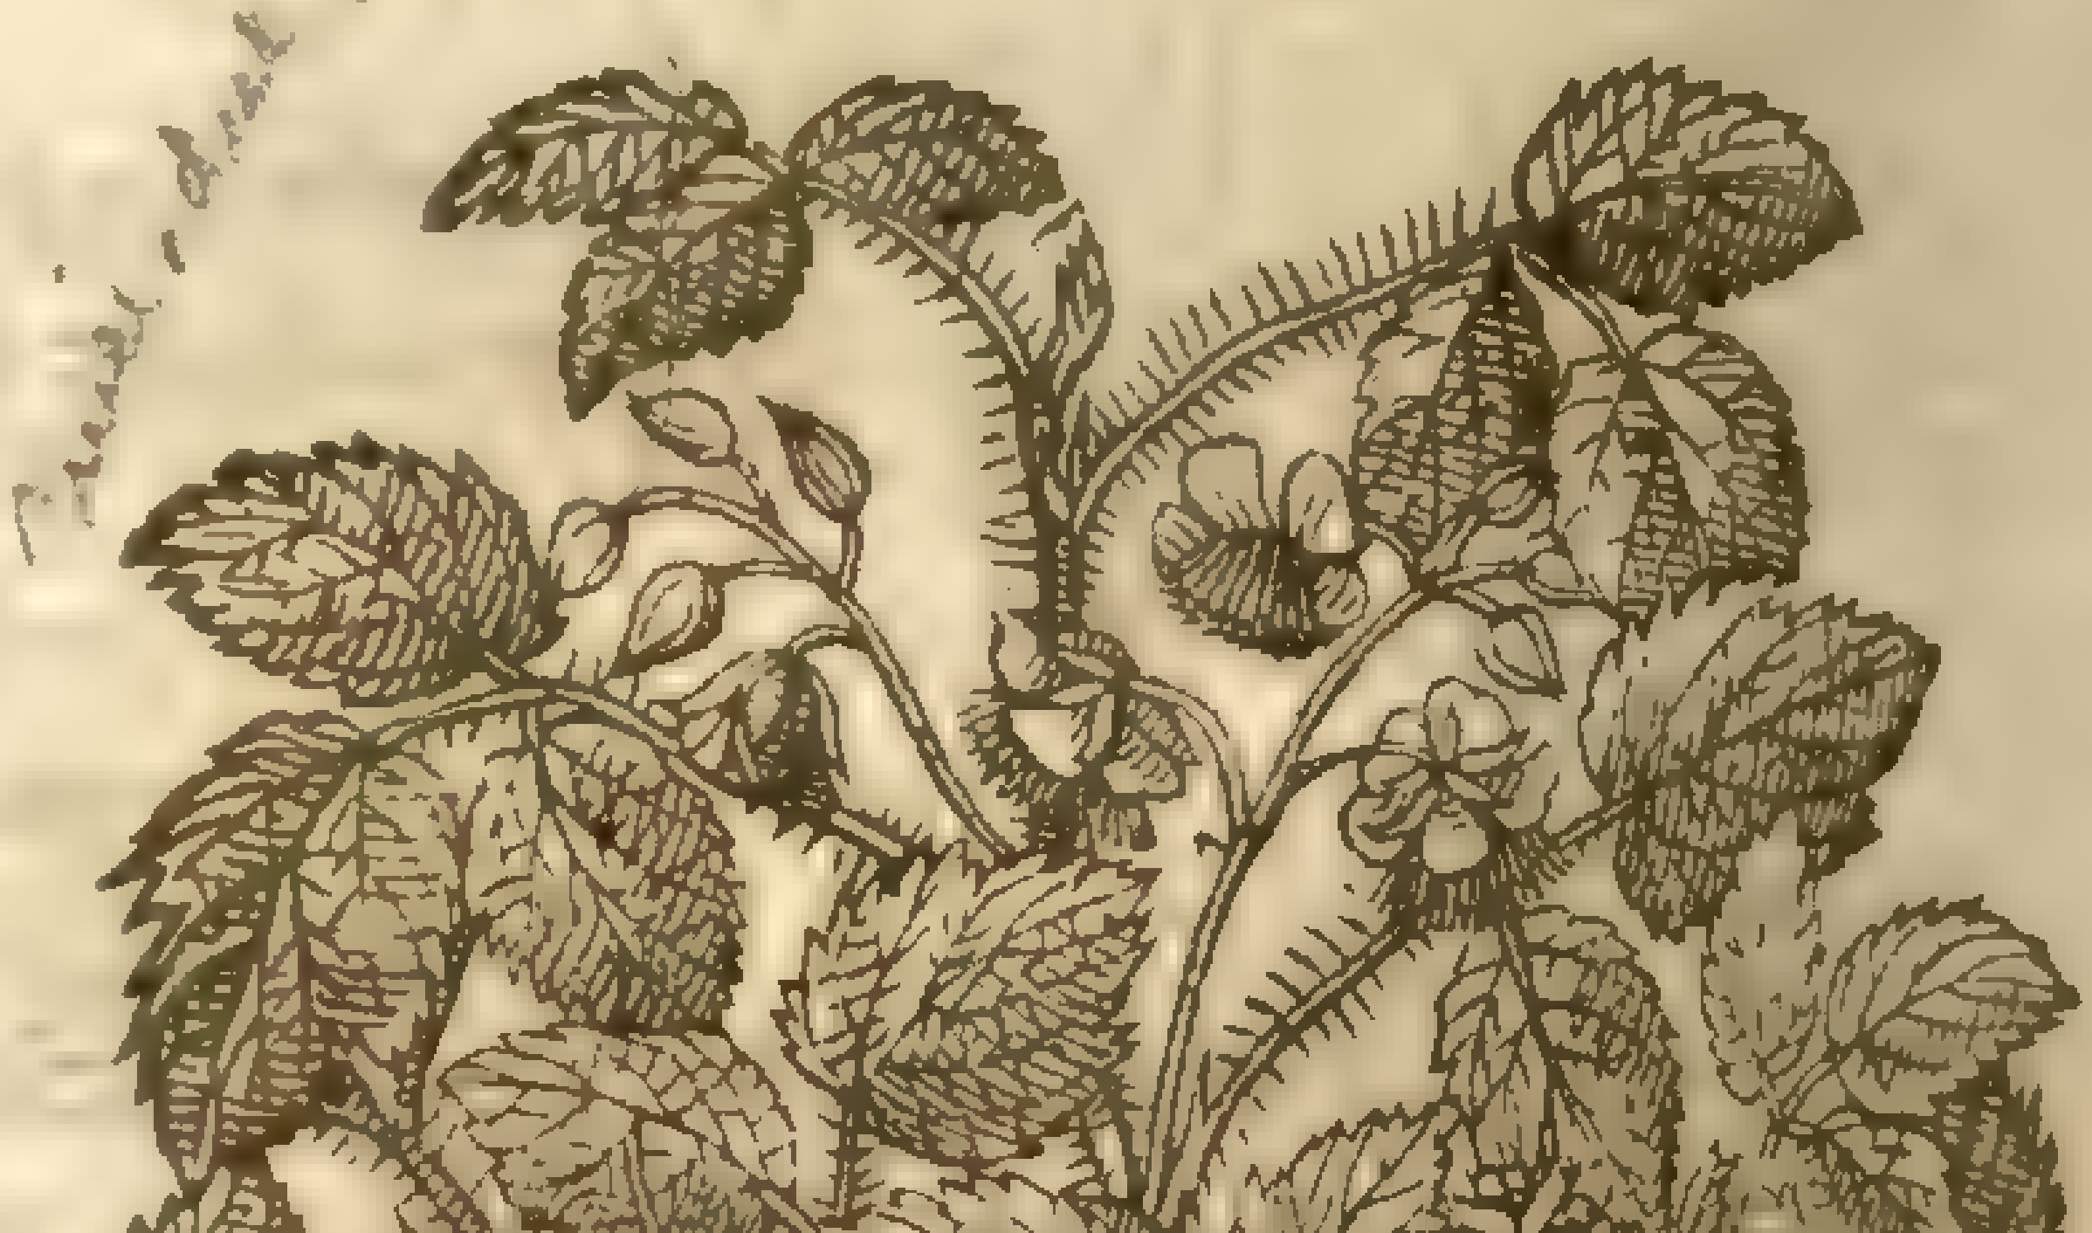
1 *Rubus*.
The Bramble Buſh.



R. fruticosus, L. a) Hudson, dark. Sm. F. 2. 3?

Lob. ic. 2. 211

2 *Rubus Idæus*.
The Raſpis Buſh or Hinde-berry.



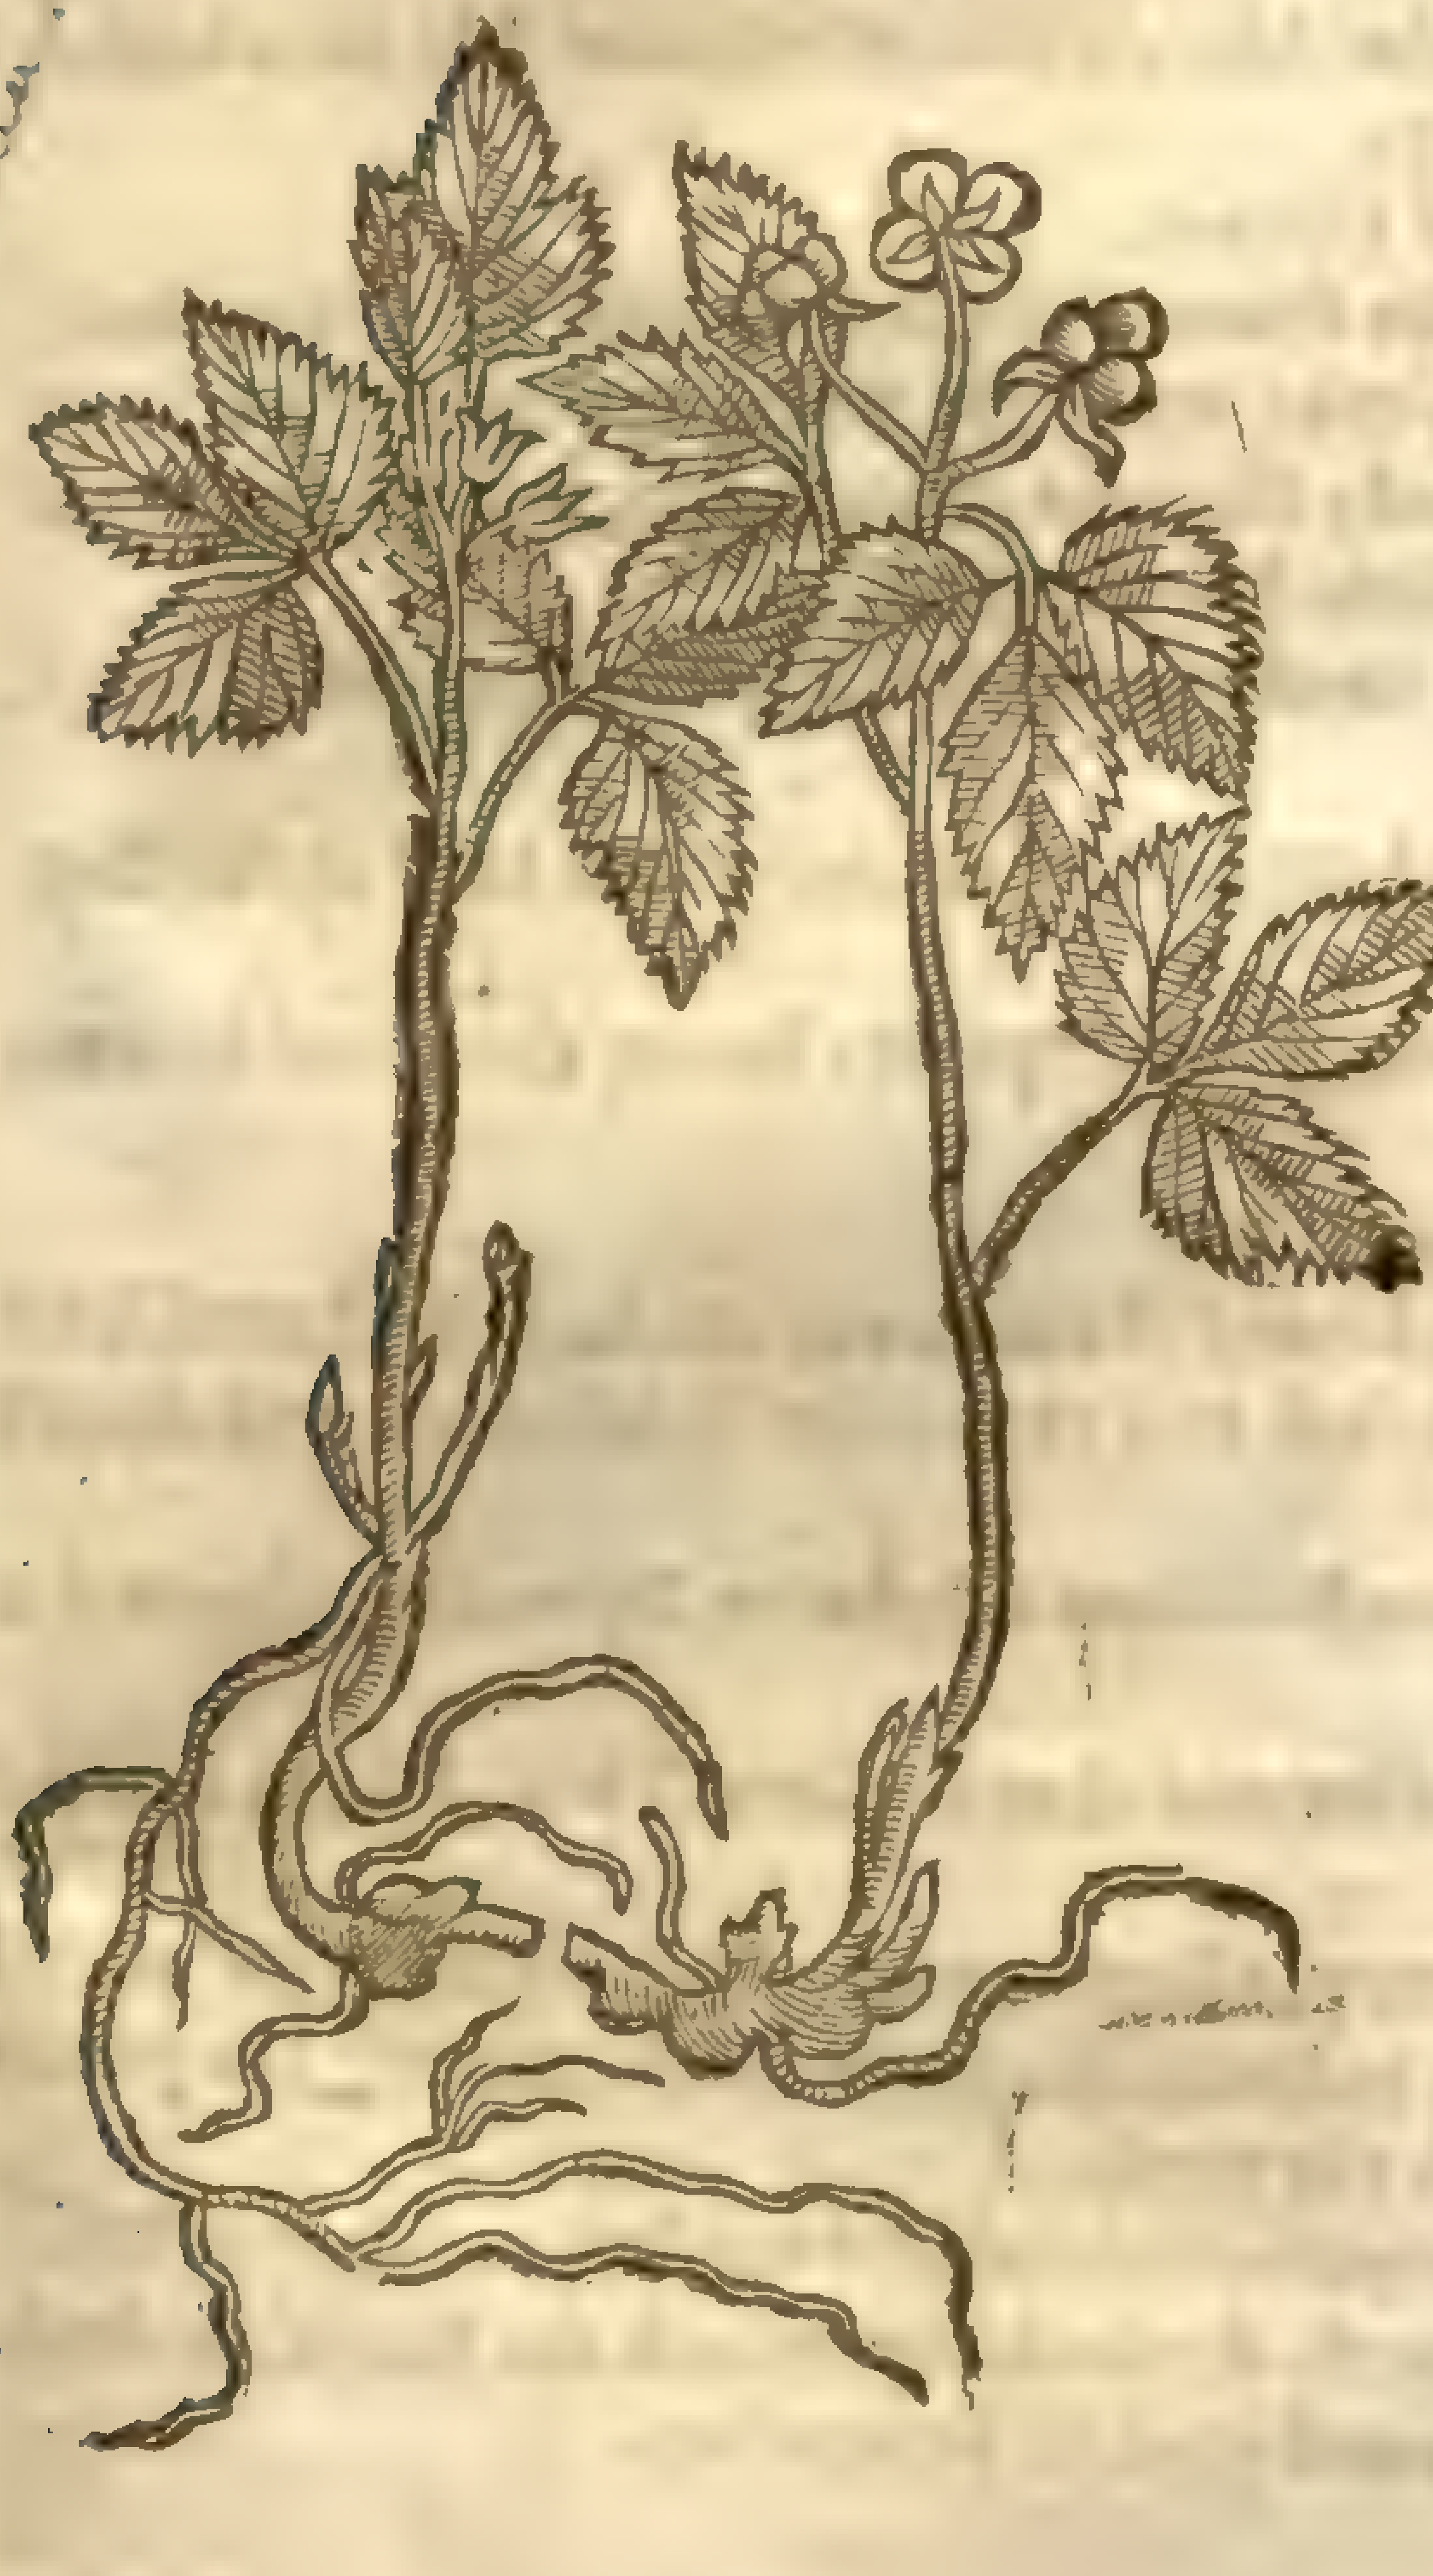
R. idaeus, L. a) [illegible]

4 Stone Bramble ſeldome groweth aboue a foot high, hauing many ſmall flexible branches without prickles, trailing vpon the ground, couered with a reddiſh barke, and ſomewhat hairy: the leaues grow three together, ſet vpon tender naked foot-ſtalkes ſomewhat ſnipt about the edges: the floures grow at the end of the branches, conſiſting of foure ſmall white leaues like thoſe of the Cherry-tree: after which come ſmall Grape-like fruit, conſiſting of one, two, or three large tranſparent berries, ſet together as thoſe of the common Bramble, of a red colour when they be ripe, and of a pleaſant taſte, but ſomwhat aſtringent. The roots creepe along in the ground very farre abroad, whereby it greatly increaſeth.

4 *Chamæmorus* (called in the North part of England, where they eſpecially doe grow, Knotberries, and Knought-berries) is likewiſe one of the Brambles, though without prickles: it brings

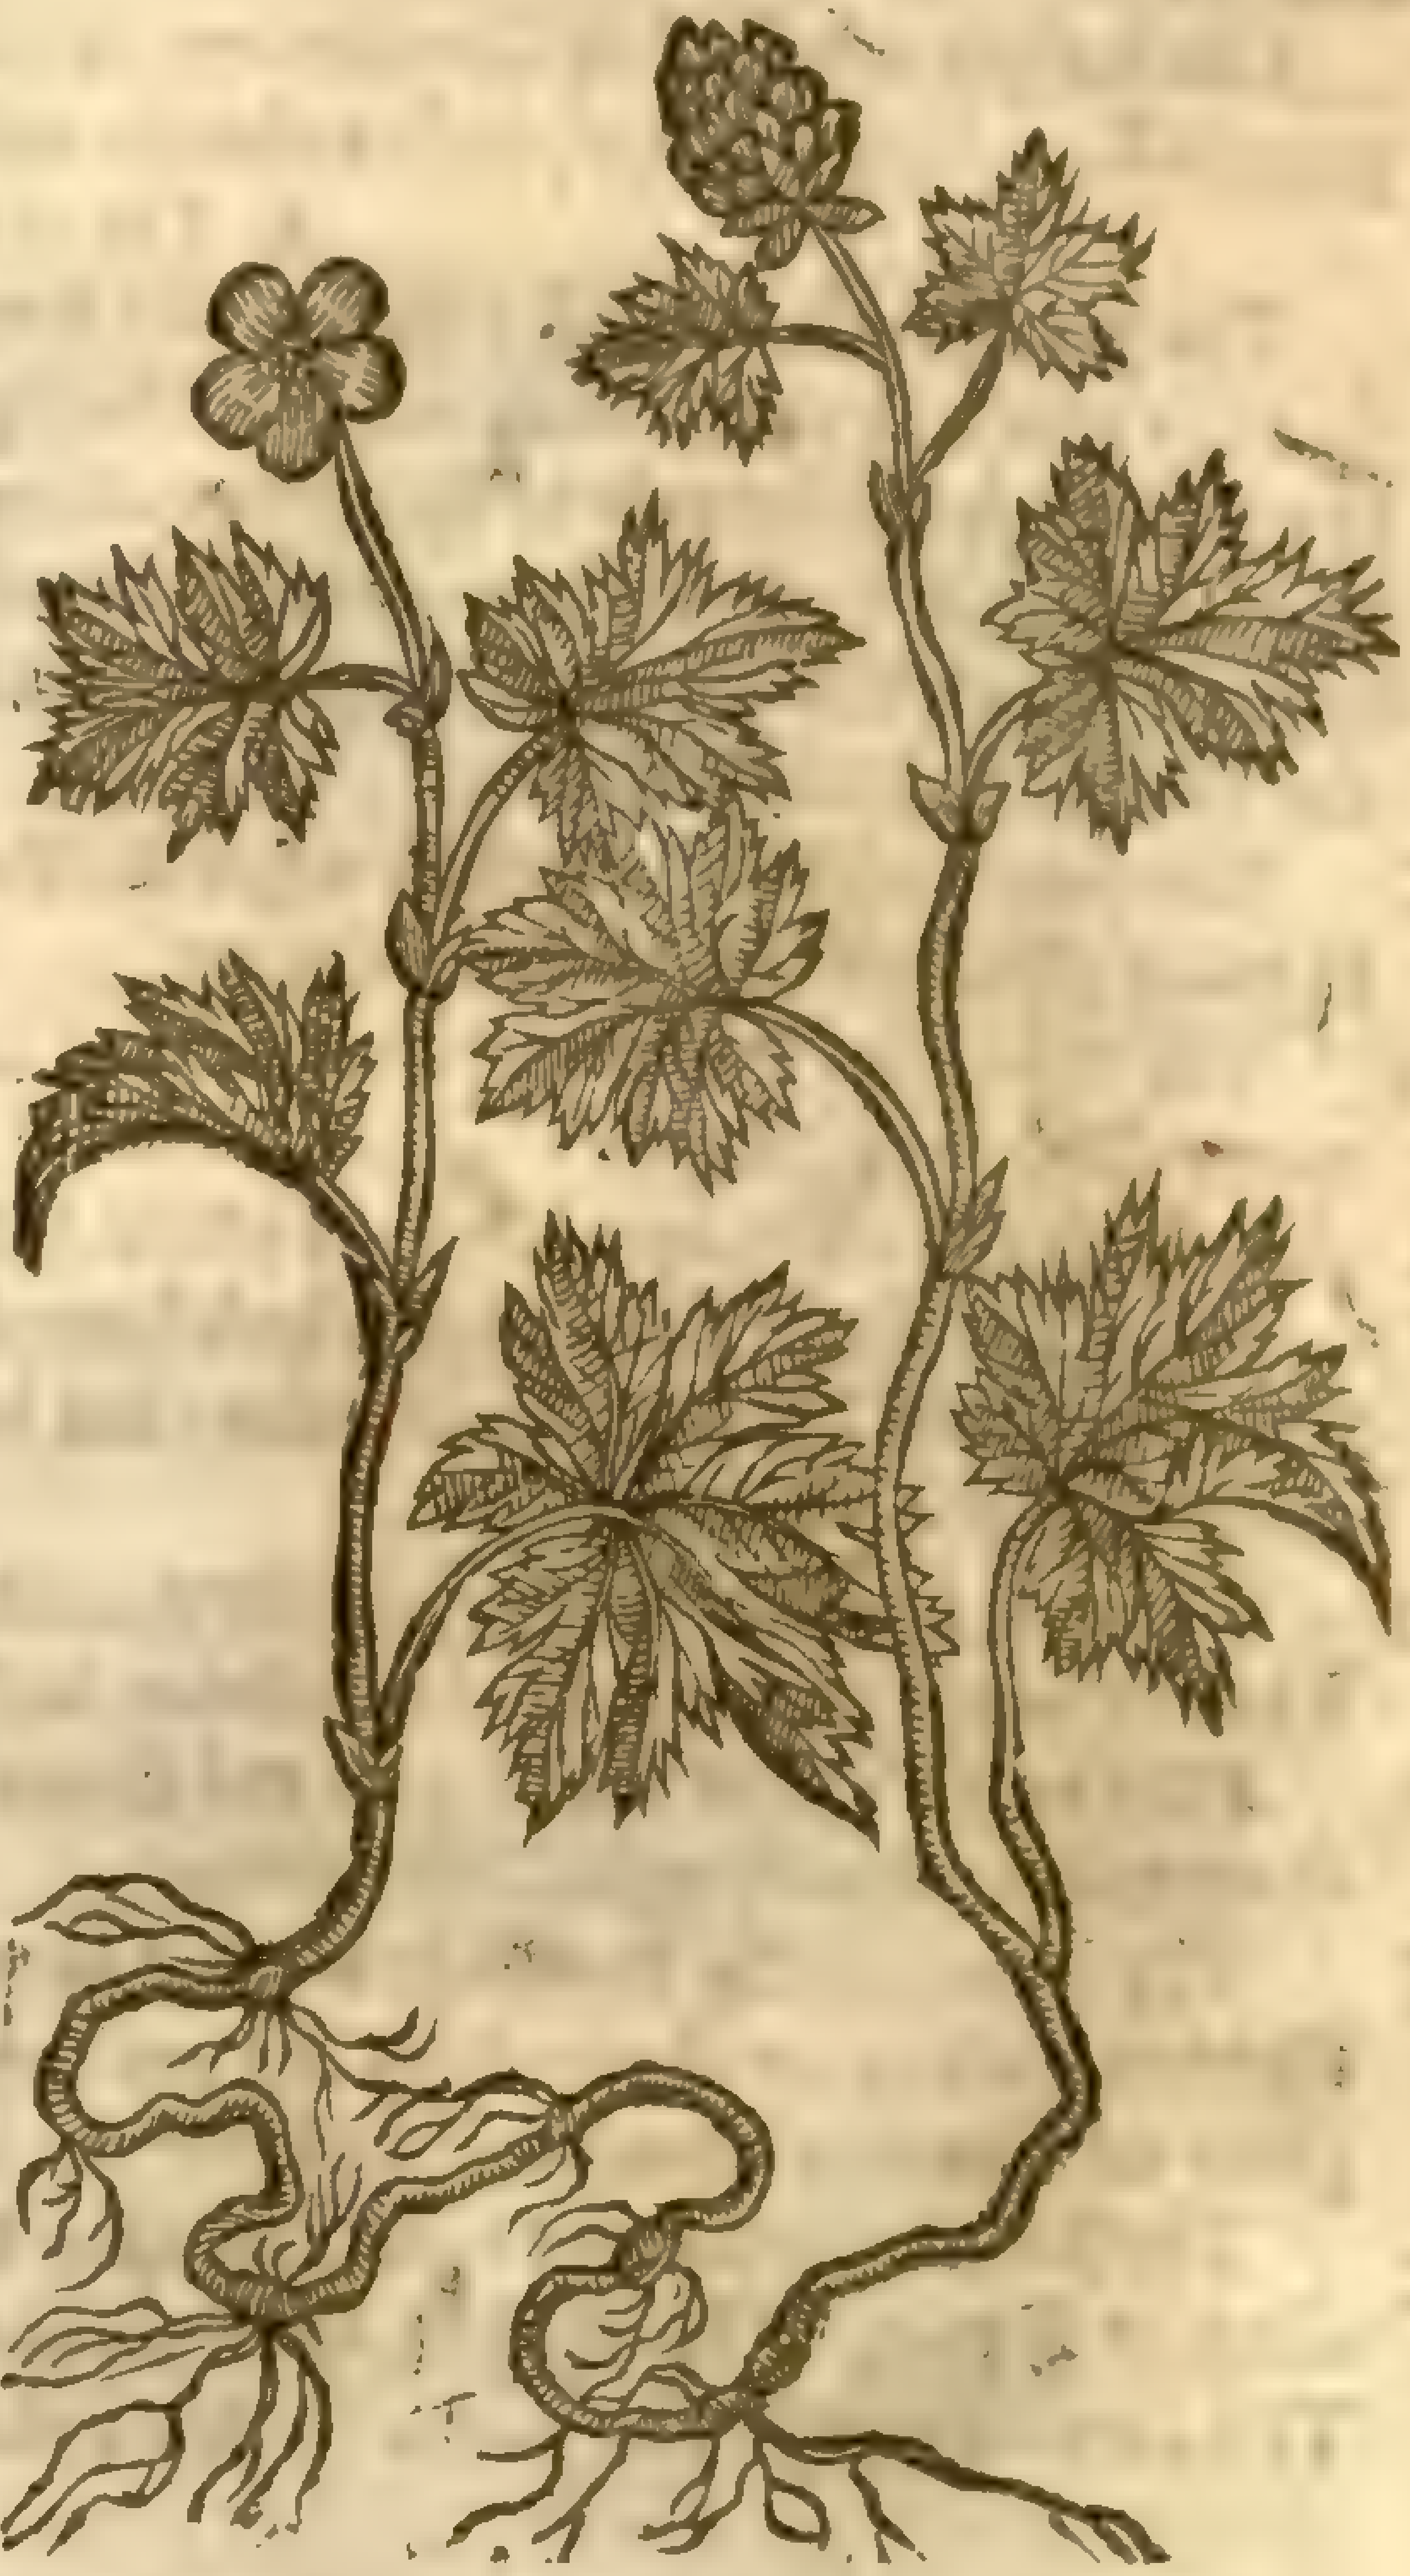
forth ſmall weake branches or tender ſtems of a foot high; whereon do grow at certaine diſtances rough leaues in ſhape like thoſe of the Mallow, not vnlike to the leaues of the Gooſeberry buſh: on the top of each branch ſtandeth one floure and no more, conſiſting of fiue ſmall leaues of a dark purple colour: which being fallen, the fruit ſucceedeth, like vnto that of the Mulberry, whereof it was called *Chamæmorus*, dwarfe Mulberry; at the firſt white and bitter, after red and ſomewhat pleaſant: the root is long, ſomething knotty; from which knots or joynts thruſt forth a few threddie ſtrings. ‡ I take that plant to which our Author hereafter hath allotted a whole chapter, and called *Vaccinia nubis*, or Cloud-berries, to be the ſame with this, as I ſhall ſhew you more largely in that place. ‡

4 *Rubus Saxatilis.*
Stone blacke-Berry buſh.



4 *Chamæmorus.*
Knot berry buſh.

Rubus chamaemorus [illegible]



¶ *The Place.*

The Bramble groweth for the moſt part in euery hedge and buſh.

The Raſpis is planted in gardens: it groweth not wilde that I know of, except in the field by a village in Lancaſhire called Harwood, not far from Blackeburne.

I found it among the buſhes of a cauſey, neere vnto a village called Wiſterſon, where I went to ſchoole, two miles from the Nantwich in Cheſhire.

The ſtone bramble I haue found in diuers fields in the Iſle of Thanet, hard by a village called Birchinton, neere Queakes houſe, ſomtimes Sir *Henry Criſpes* dwelling place. ‡ I feare our Author miſtooke that which was here added in the ſecond place, for that which he figured and deſcribed in the third (now the fourth) which I know not yet to grow wilde with vs. ‡

Knot-berries do loue open ſnowie hills and mountaines; they grow plentifully vpon Ingleborow hils among the heath and ling, twelue miles from Lancaſhire, being thought to be the higheſt hill in England.

They grow vpon Stane-more betweene Yorkeſhire and Weſtmerland, and vpon other wet *Fells* and mountaines.

¶ *The Time.*

Theſe floure in May and Iune with the Roſes: their fruit is ripe in the end of *Auguſt* and September.

¶ *The Names.*

The Bramble is called in Greeke, Βάτος: in French, *Rouges, Loi Duyts Brelmers*: in Latine, *Rubus*, and *Sentis*, and *Vepres*, as *Ouid* writeth in the firſt booke of Metamorphoſis:

Aut Lepori, qui vepre latens hoſtilia cernit
Ora canum. ——

Or to the Hare, that vnder Bramble cloſely lying, ſpies
The hoſtile mouth of Dogs. ——

Of diuers it is called *Cynosbatus*, but not properly; for *Cynosbatus* is the wilde Roſe, as we haue written: in high Dutch, **Bremen**: in low Dutch, **Breemen**: in French, *Rouce*: in Italian, *Garza*: in Engliſh, Bramble buſh, and Blacke-berry buſh.

The fruit is named in Latine *Morum rubi*; and as *Fuchſius* thinketh, *Vaccinium*, but not properly: in ſhops, *Mora Bati*: and in ſuch ſhops as are more barbarous, *Mora Baſſi*: in Engliſh, Blackeberries.

The Raſpis is called in Greeke, Βάτος ἰδαῖα: in Latine, *Rubus Idæa*, of the mountaine Ida on which it groweth: in Engliſh, Raſpis, Framboiſe, and Hinde-berry.

¶ *The Temperature and Vertues.*

A The yong buds or tender tops of the Bramble buſh, the floures, the leaues, and the vnripe fruit, do very much dry and binde withall: being chewed they take away the heate and inflammation of the mouth, and almonds of the throat: they ſtay the bloudy flix, and other fluxes, and all manner of bleedings: of the ſame force is their decoction, with a little hony added.

B They heale the eies that hang out, hard knots in the fundament, and ſtay the hemorrhoides, if the leaues be laid thereunto.

C The juyce which is preſſed out of the ſtalks, leaues, and vnripe berries, and made hard in the Sun, is more effectuall for all thoſe things.

D The ripe fruit is ſweet, and containeth in it much juyce of a temperate heate, therefore it is not vnpleaſant to be eaten.

E It hath alſo a certaine kinde of aſtriction or binding quality.

F It is likewiſe for that cauſe wholeſome for the ſtomacke, and if a man eat too largely therof, ſaith *Galen*, hee ſhall haue the head-ache: but being dried whileſt it is yet vnripe it bindeth and drieth more than the ripe fruit.

G The root beſides that it is binding containeth in it much thinne ſubſtance, by reaſon whereof it waſteth away the ſtone in the kidnies, ſaith *Galen*.

H *Pliny* writeth, that the berries and flours do prouoke vrine, and that the decoction of them in wine is a preſent remedy againſt the ſtone.

I The leaues of the Bramble boyled in water, with honey, allum, and a little white wine added thereto, make a moſt excellent lotion or waſhing water to heale the ſores in the mouth, the priuie parts of man or woman, and the ſame decoction faſtneth the teeth.

K The Raſpis is thought to be like the Bramble in temperature and vertues, but not ſo much binding or drying. The Raſpis, ſaith *Dioſcorides*, performeth thoſe things which the Bramble doth. The fruit is good to be giuen to thoſe that haue weake and queaſie ſtomackes.

Chap. 5. *Of Holly Roſes, or* Ciſtus.

¶ *The Deſcription.*

Ciſtus hath beene taken of diuers to be a kinde of Roſe: the old Writers haue made two ſorts thereof, male and female; and likewiſe a third ſort, which is called *Ledum*: the later Herbariſts haue diſcouered diuers more, as ſhall be declared.

¶ *A generall Deſcription, wherein all the ſorts of Ciſtus are compriſed.*

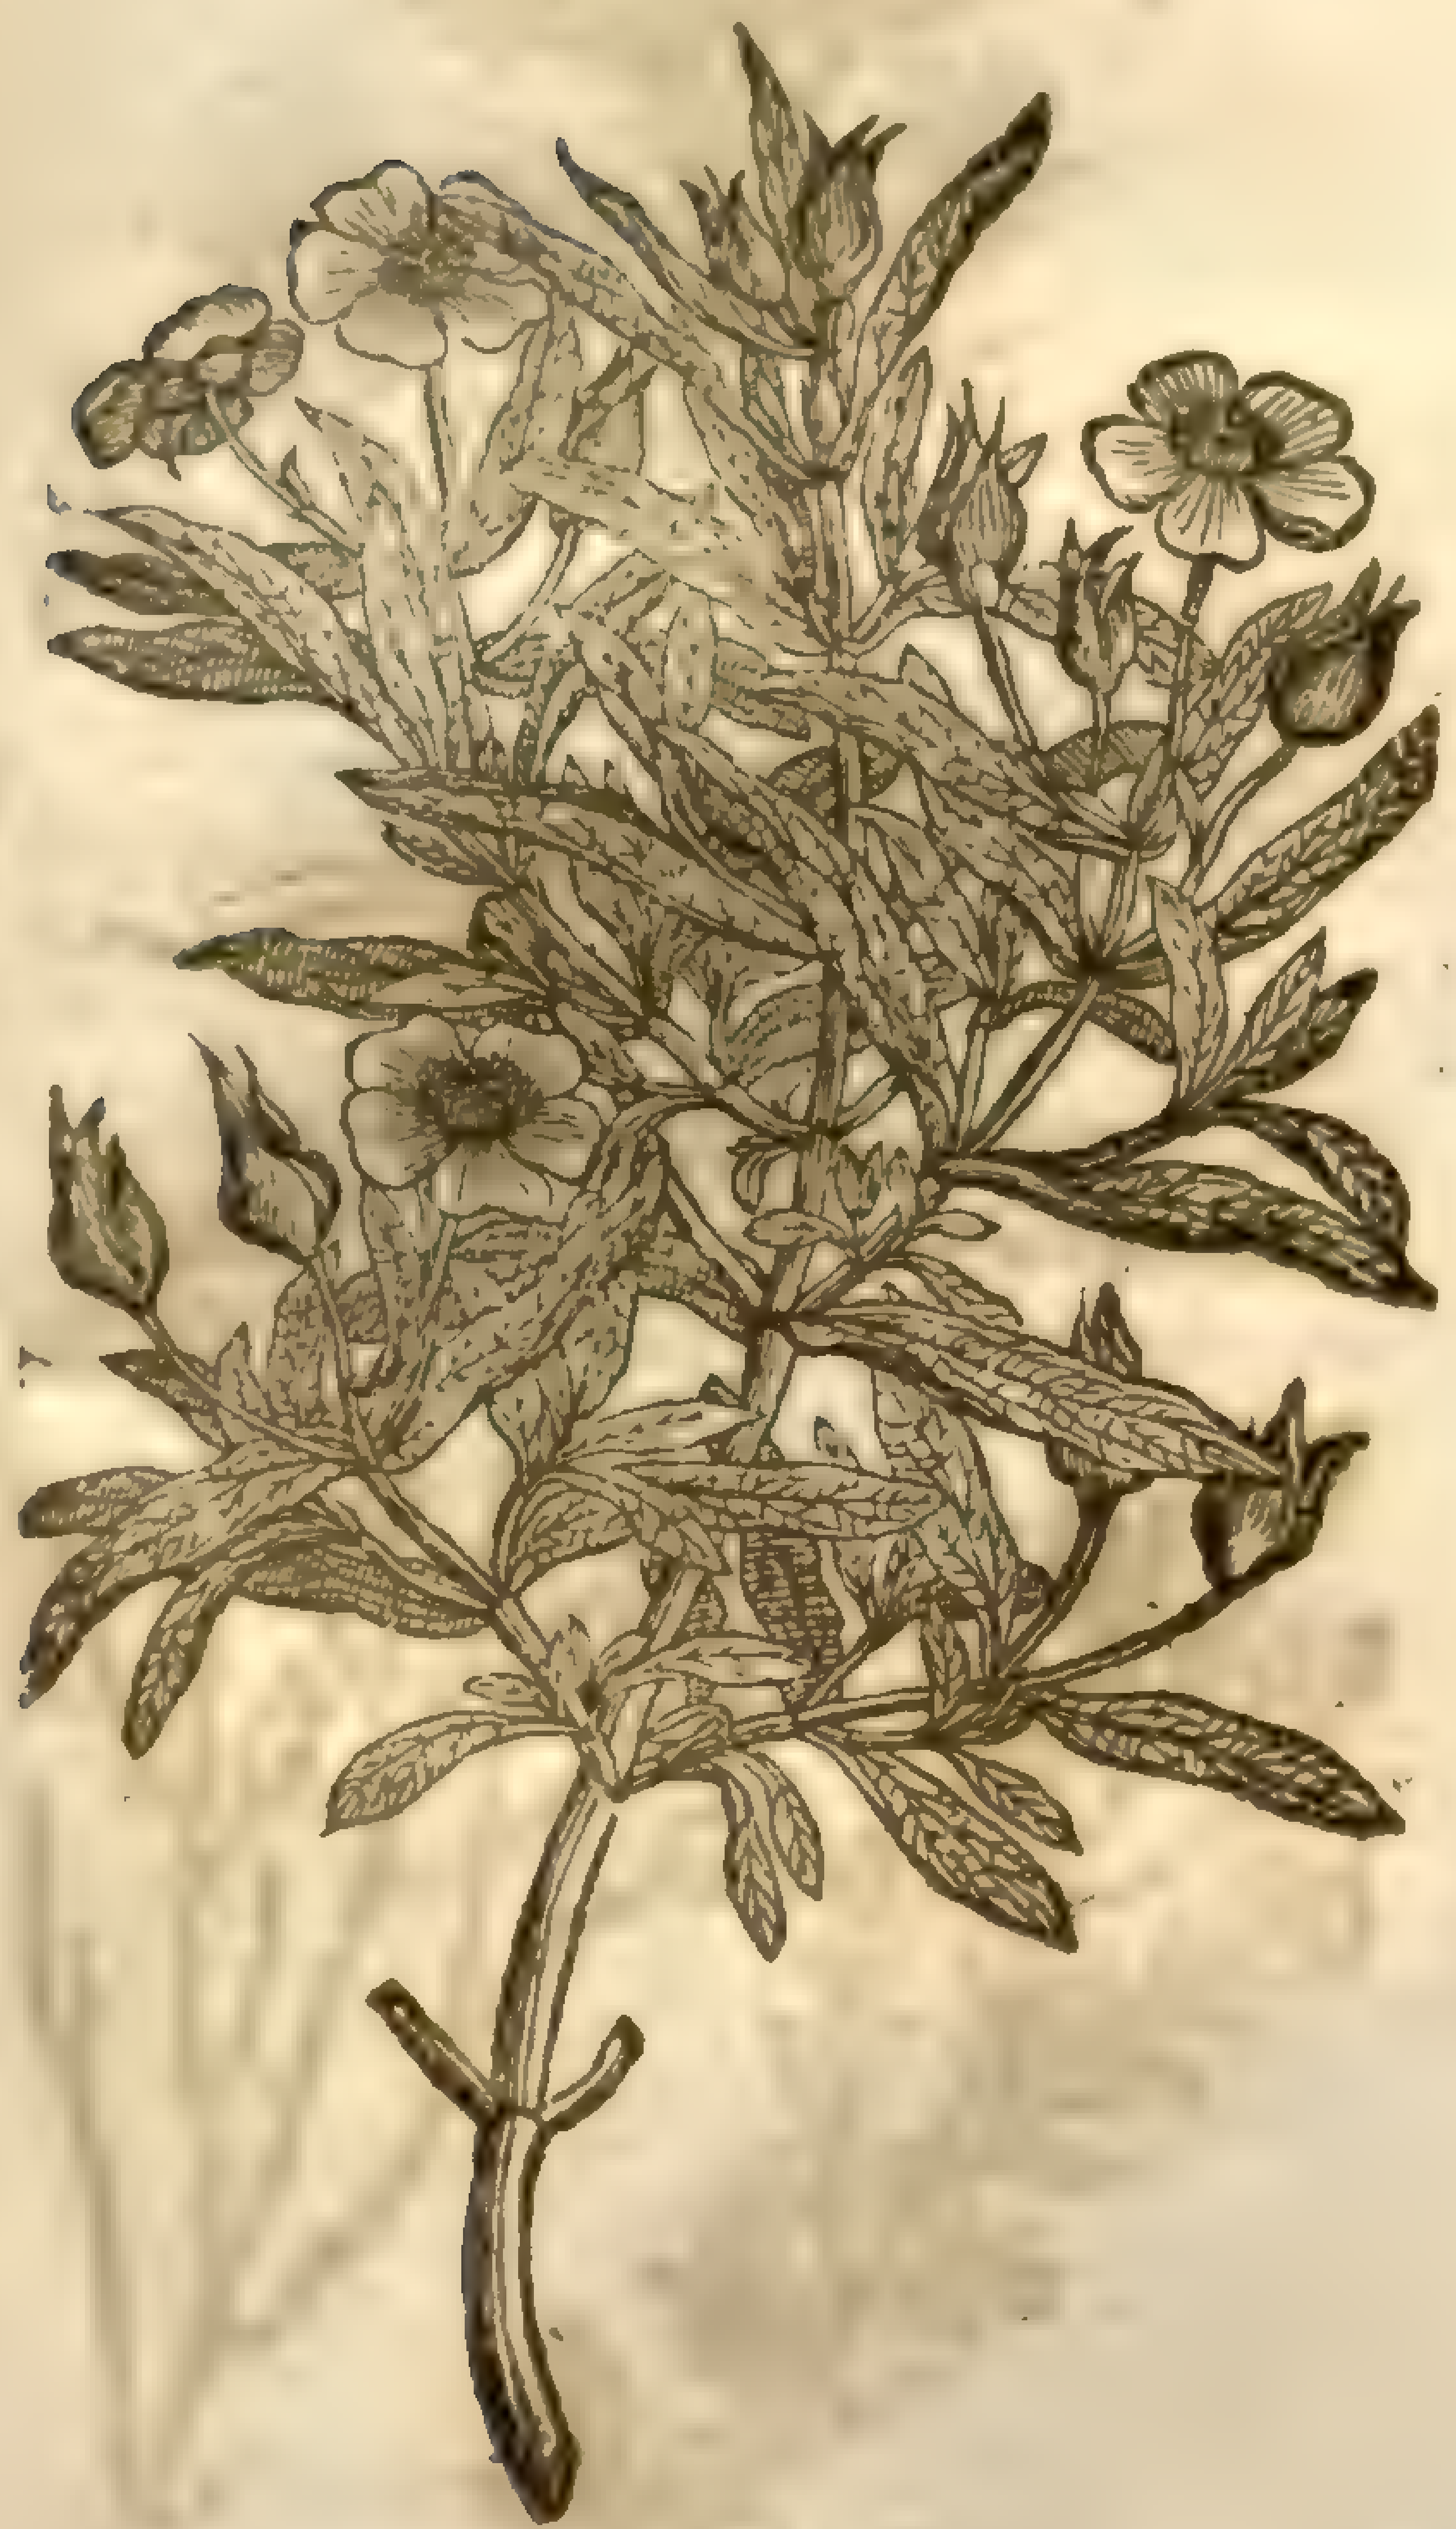
Ciſtus and his kindes are wooddy ſhrubs full of branches, of the height of two or three cubits: ſome haue broad leaues, others rough, vneuen, wrinkled, ſomewhat downy, and moſt like the leaues of Sage; although ſome haue the leaues of Roſemary, others the forme of thoſe of the Poplar tree: the floures grow on the tops of the branches, like vnto the wild Roſe, yet ſuch as very quickely vade, periſh, and fall away: thoſe of the male are moſt of a reddiſh blew or purple colour; and of the female white: in their places come vp little heads or knops ſomewhat round, in which is contained ſmall ſeed: the roots of them all are wooddy.

There groweth vp ſometimes vnder the ſhrub hard to the roots, a certaine excreſcence or hypociſt, which is thicke, fat, groſſe, full of juyce, without leaues, wholly conſiſting of many little caſes or boxes, as do thoſe of Henbane or of the Pomegranate tree; of a yellowiſh red colour in one kind, and in another white, and in certaine other greene or graſſie, as *Dioſcorides* ſaith.

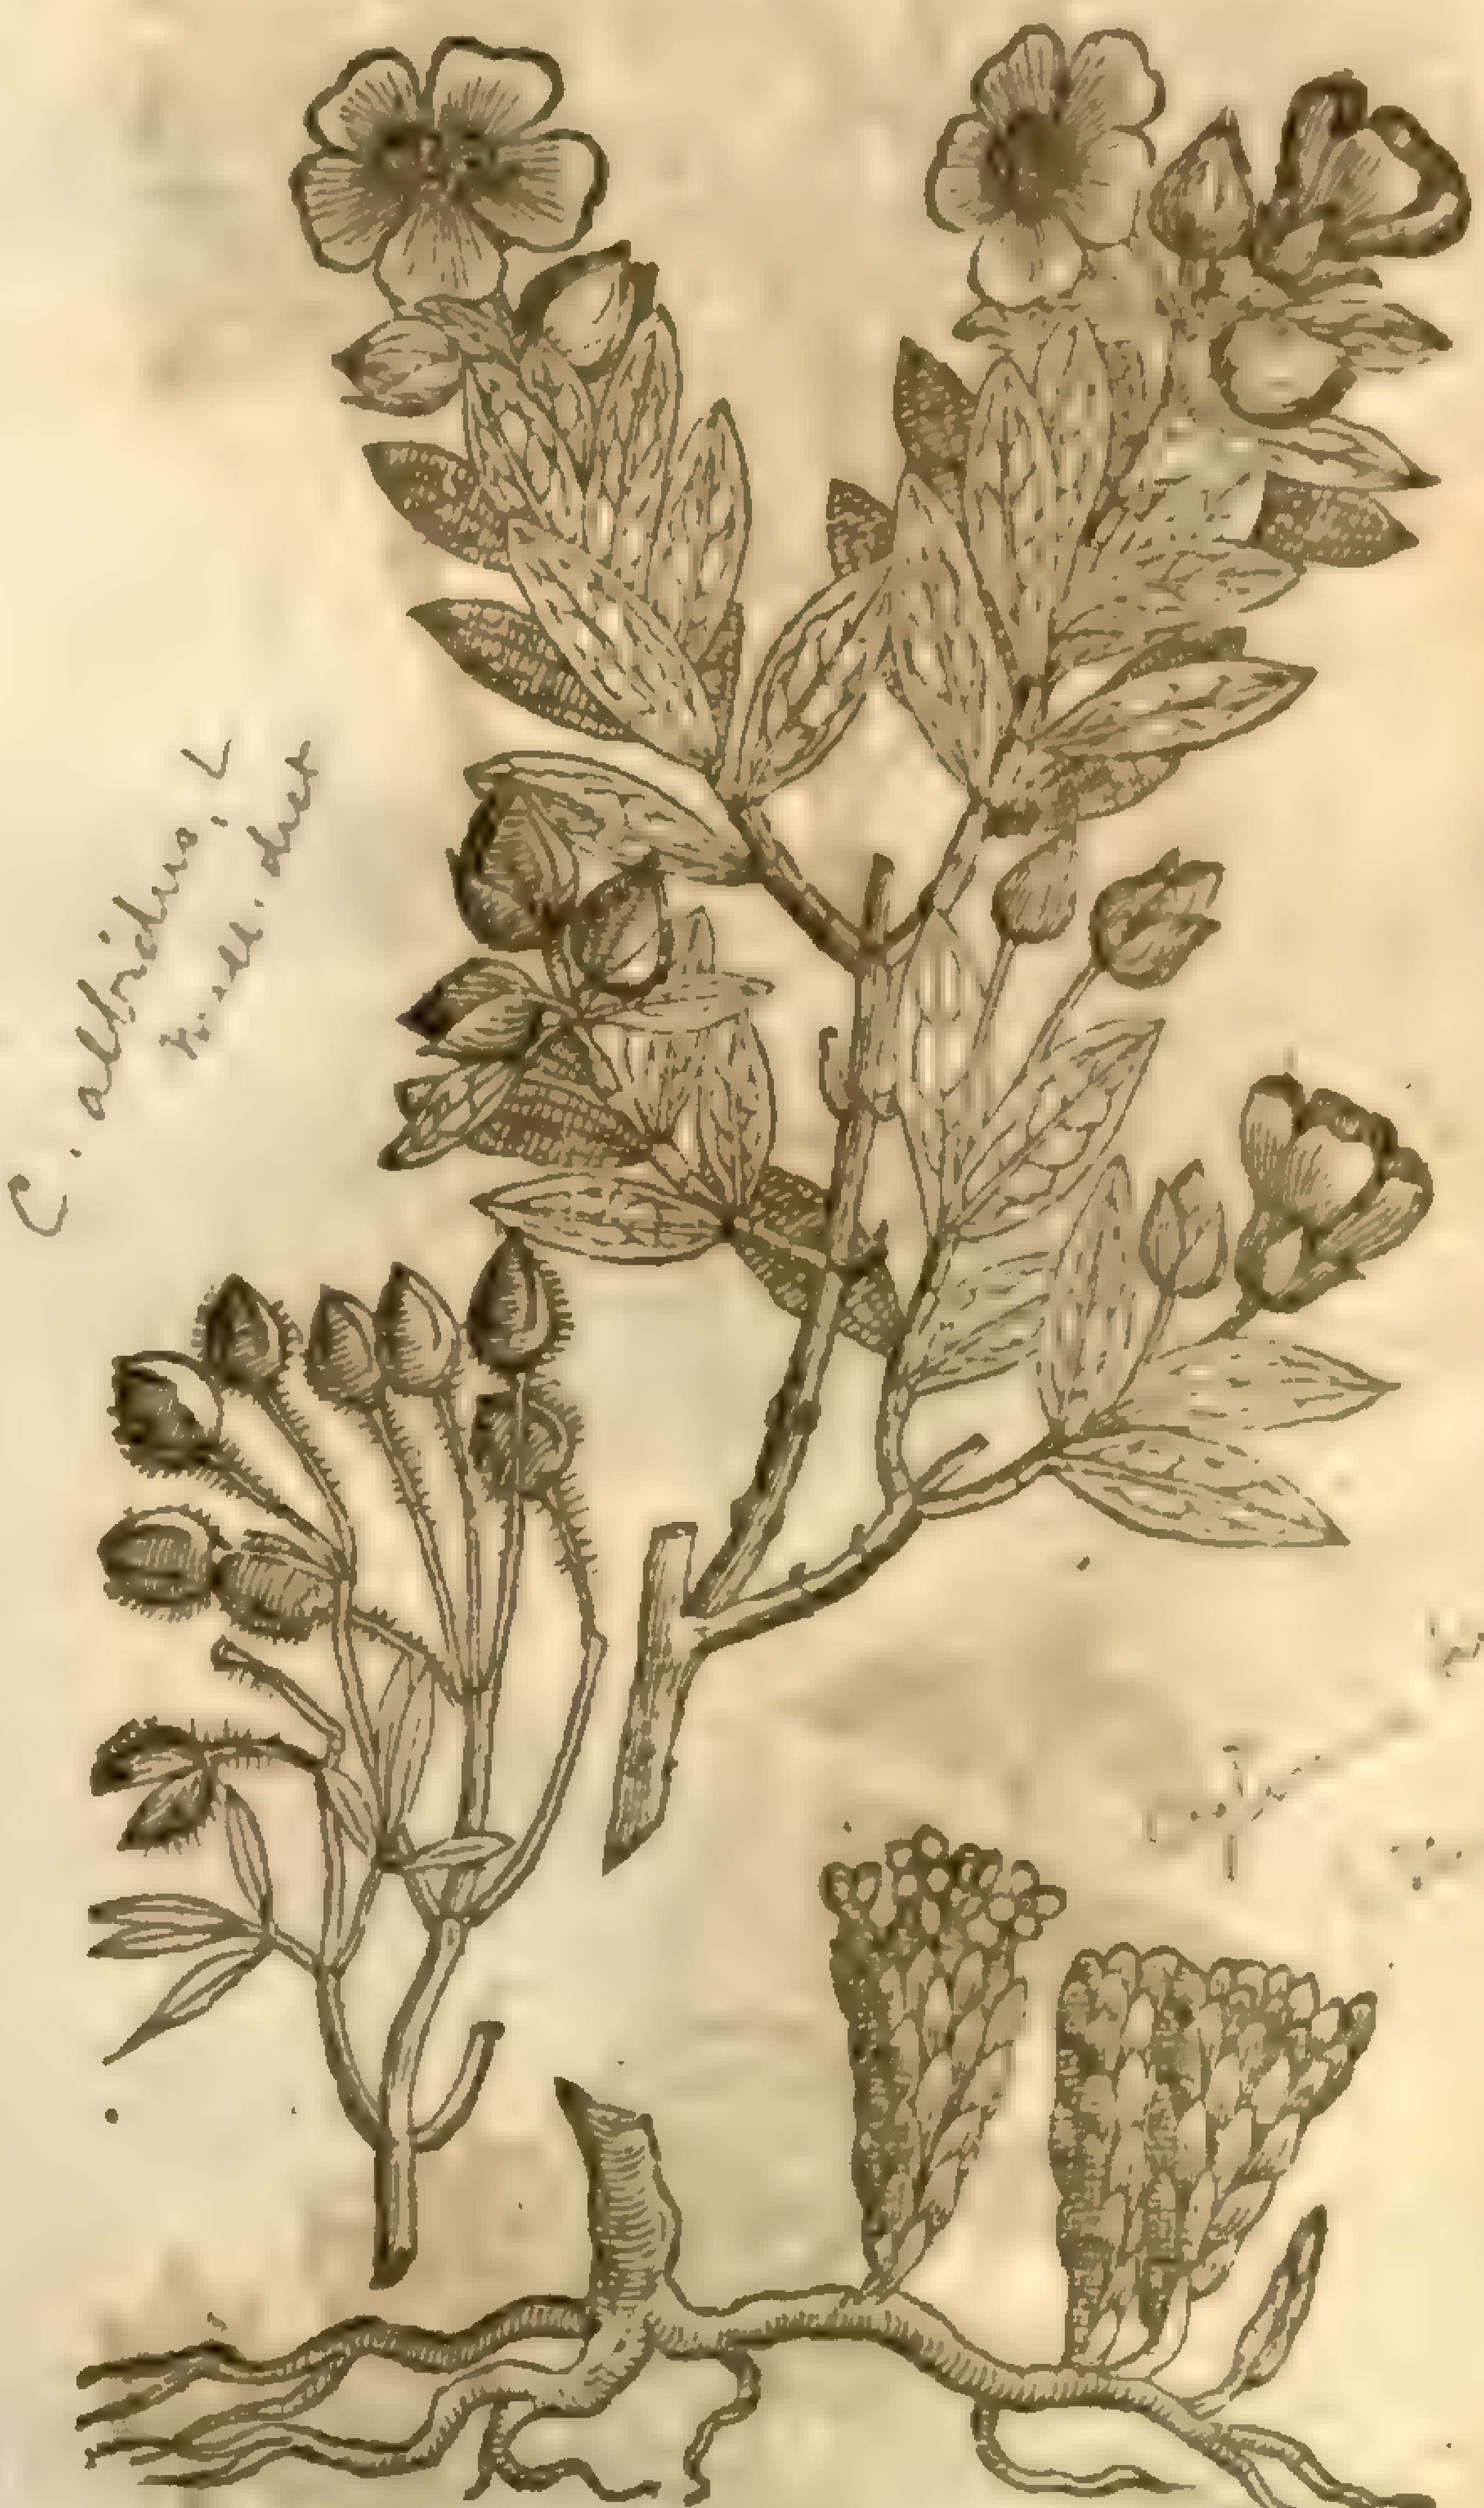
❡ *The Deſcription.*

1 The firſt kinde of *Ciſtus* groweth vp like a ſmall buſh or ſhrub, of a wooddy ſubſtance, three or foure cubits high, garniſhed with many ſmall and brittle branches, ſet full of crumpled or rugged leaues very like vnto Sage leaues: at the top of the branches come floures of a purple colour, in ſhape like vnto a ſingle Brier Roſe, hauing leaues ſomewhat wrinkled like a cloth new dried before it be ſmoothed, and in the midſt a few yellow chiues or thrums: the floures for the moſt part do periſh and fall away before noone, and neuer ceaſe flouring in ſuch maner from the moneth of May vnto the beginning of September, at which time the ſeed is ripe, being of a reddiſh colour, and is contained in an hard hairy huske not much vnlike the huske of Henbane.

1 *Ciſtus mas anguſtifolius.*
The male Holly Roſe.



2 *Ciſtus mas cum Hypociſtide.*
The male Holly Roſe with his excreſcence.



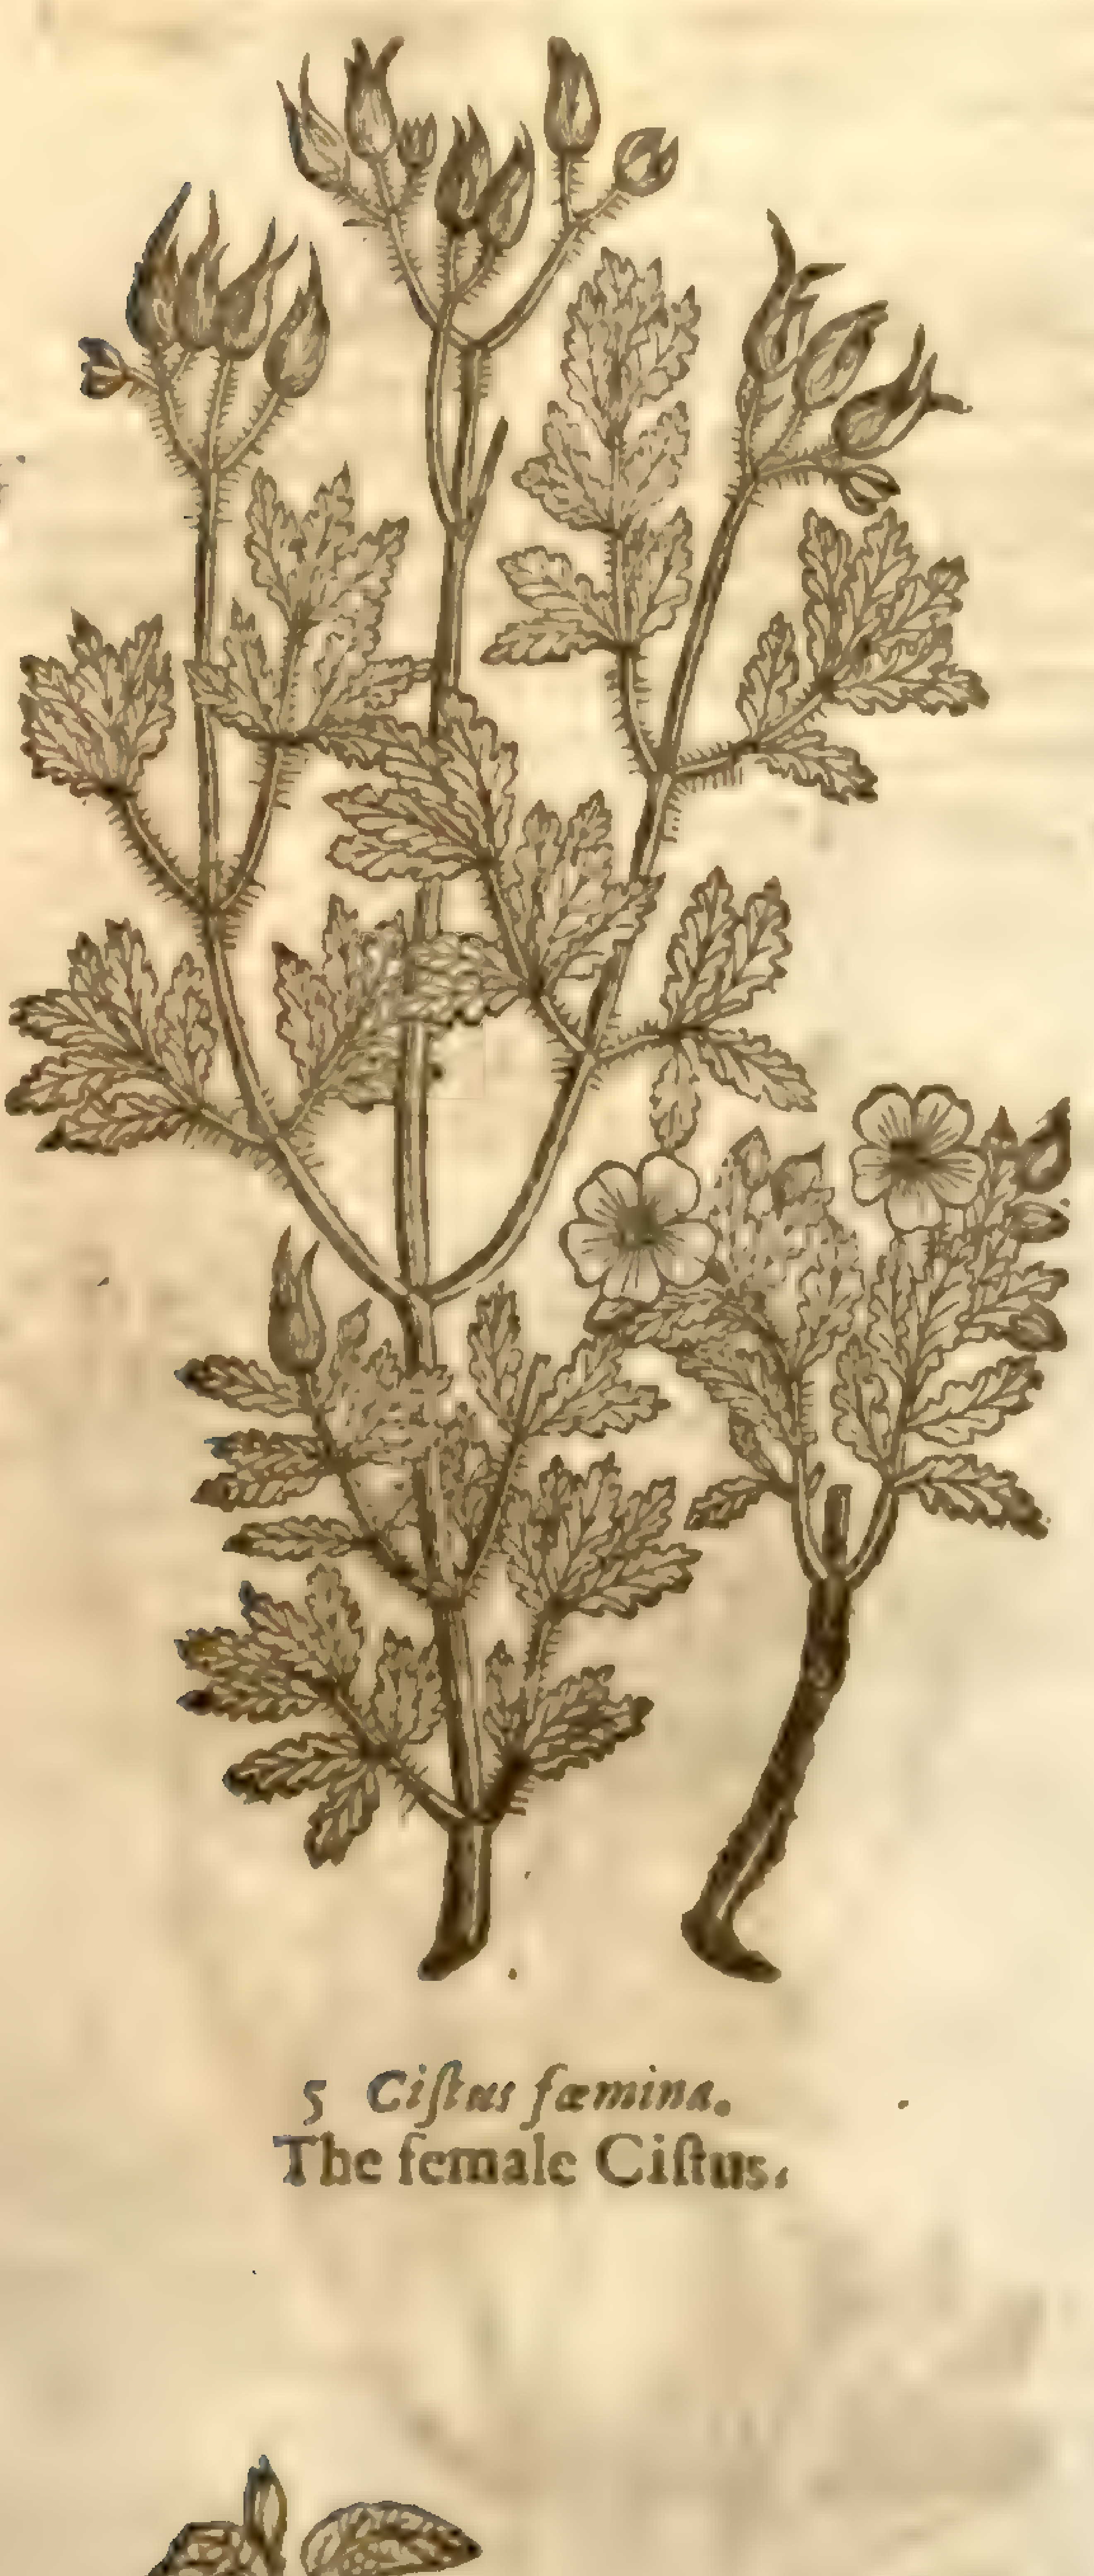
C. albidus L.
[illegible]

2 The ſecond ſort of *Ciſtus*, being another kinde of the male *Ciſtus*, which *Pena* calls *Ciſtus mas cum Hypociſtide*, is like vnto the former, but that from the root of this kinde there commeth a certaine excreſcence or out-growing, which is ſometimes yellow, ſometimes greene, and ſometimes white; from which is drawne by an artificiall extraction a certaine juyce called in ſhops *Hypociſtis*.

3 This kinde of *Ciſtus* hath many wooddy ſtalkes diuided into diuers brittle branches of a ruſſet colour: whereon doe grow rough leaues ſomewhat cut or toothed on the edges, and of an ouerworne colour: the floures grow on the tops of the branches, in forme of a Muske Roſe, but of an excellent bright purple colour: after which come round knops, wherein is contained ſmall reddiſh ſeed: the root is tough and wooddy.

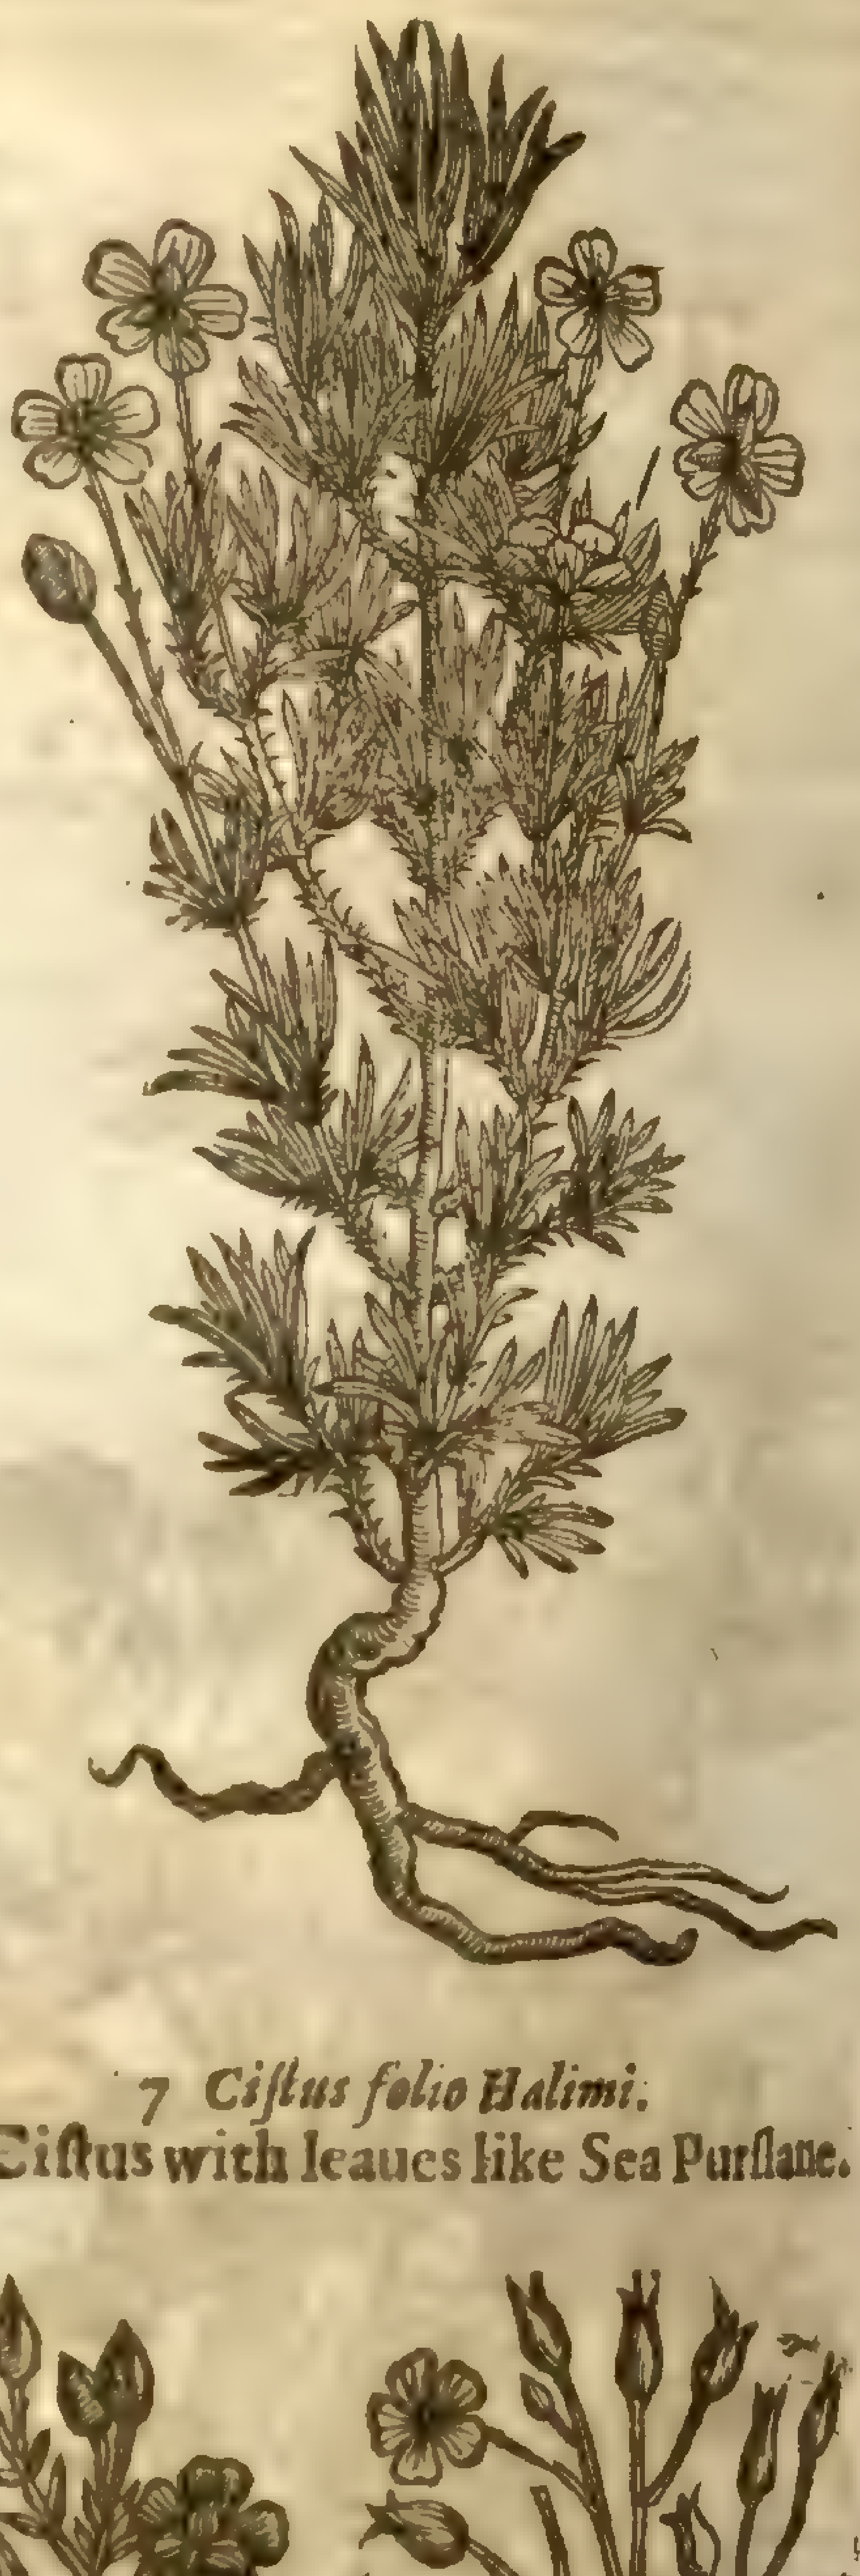
4 This fourth ſort of *Ciſtus* hath diuers wooddy branches, whereon are ſet, thicke thruſt together, diuers ſmall leaues narrow like thoſe of Winter Sauorie, but of an ouerworne ruſſet colour: the root and floures are like the precedent.

3 *Ciſtus mas dentatus.*
Toothed or ſnipt male Ciſtus.

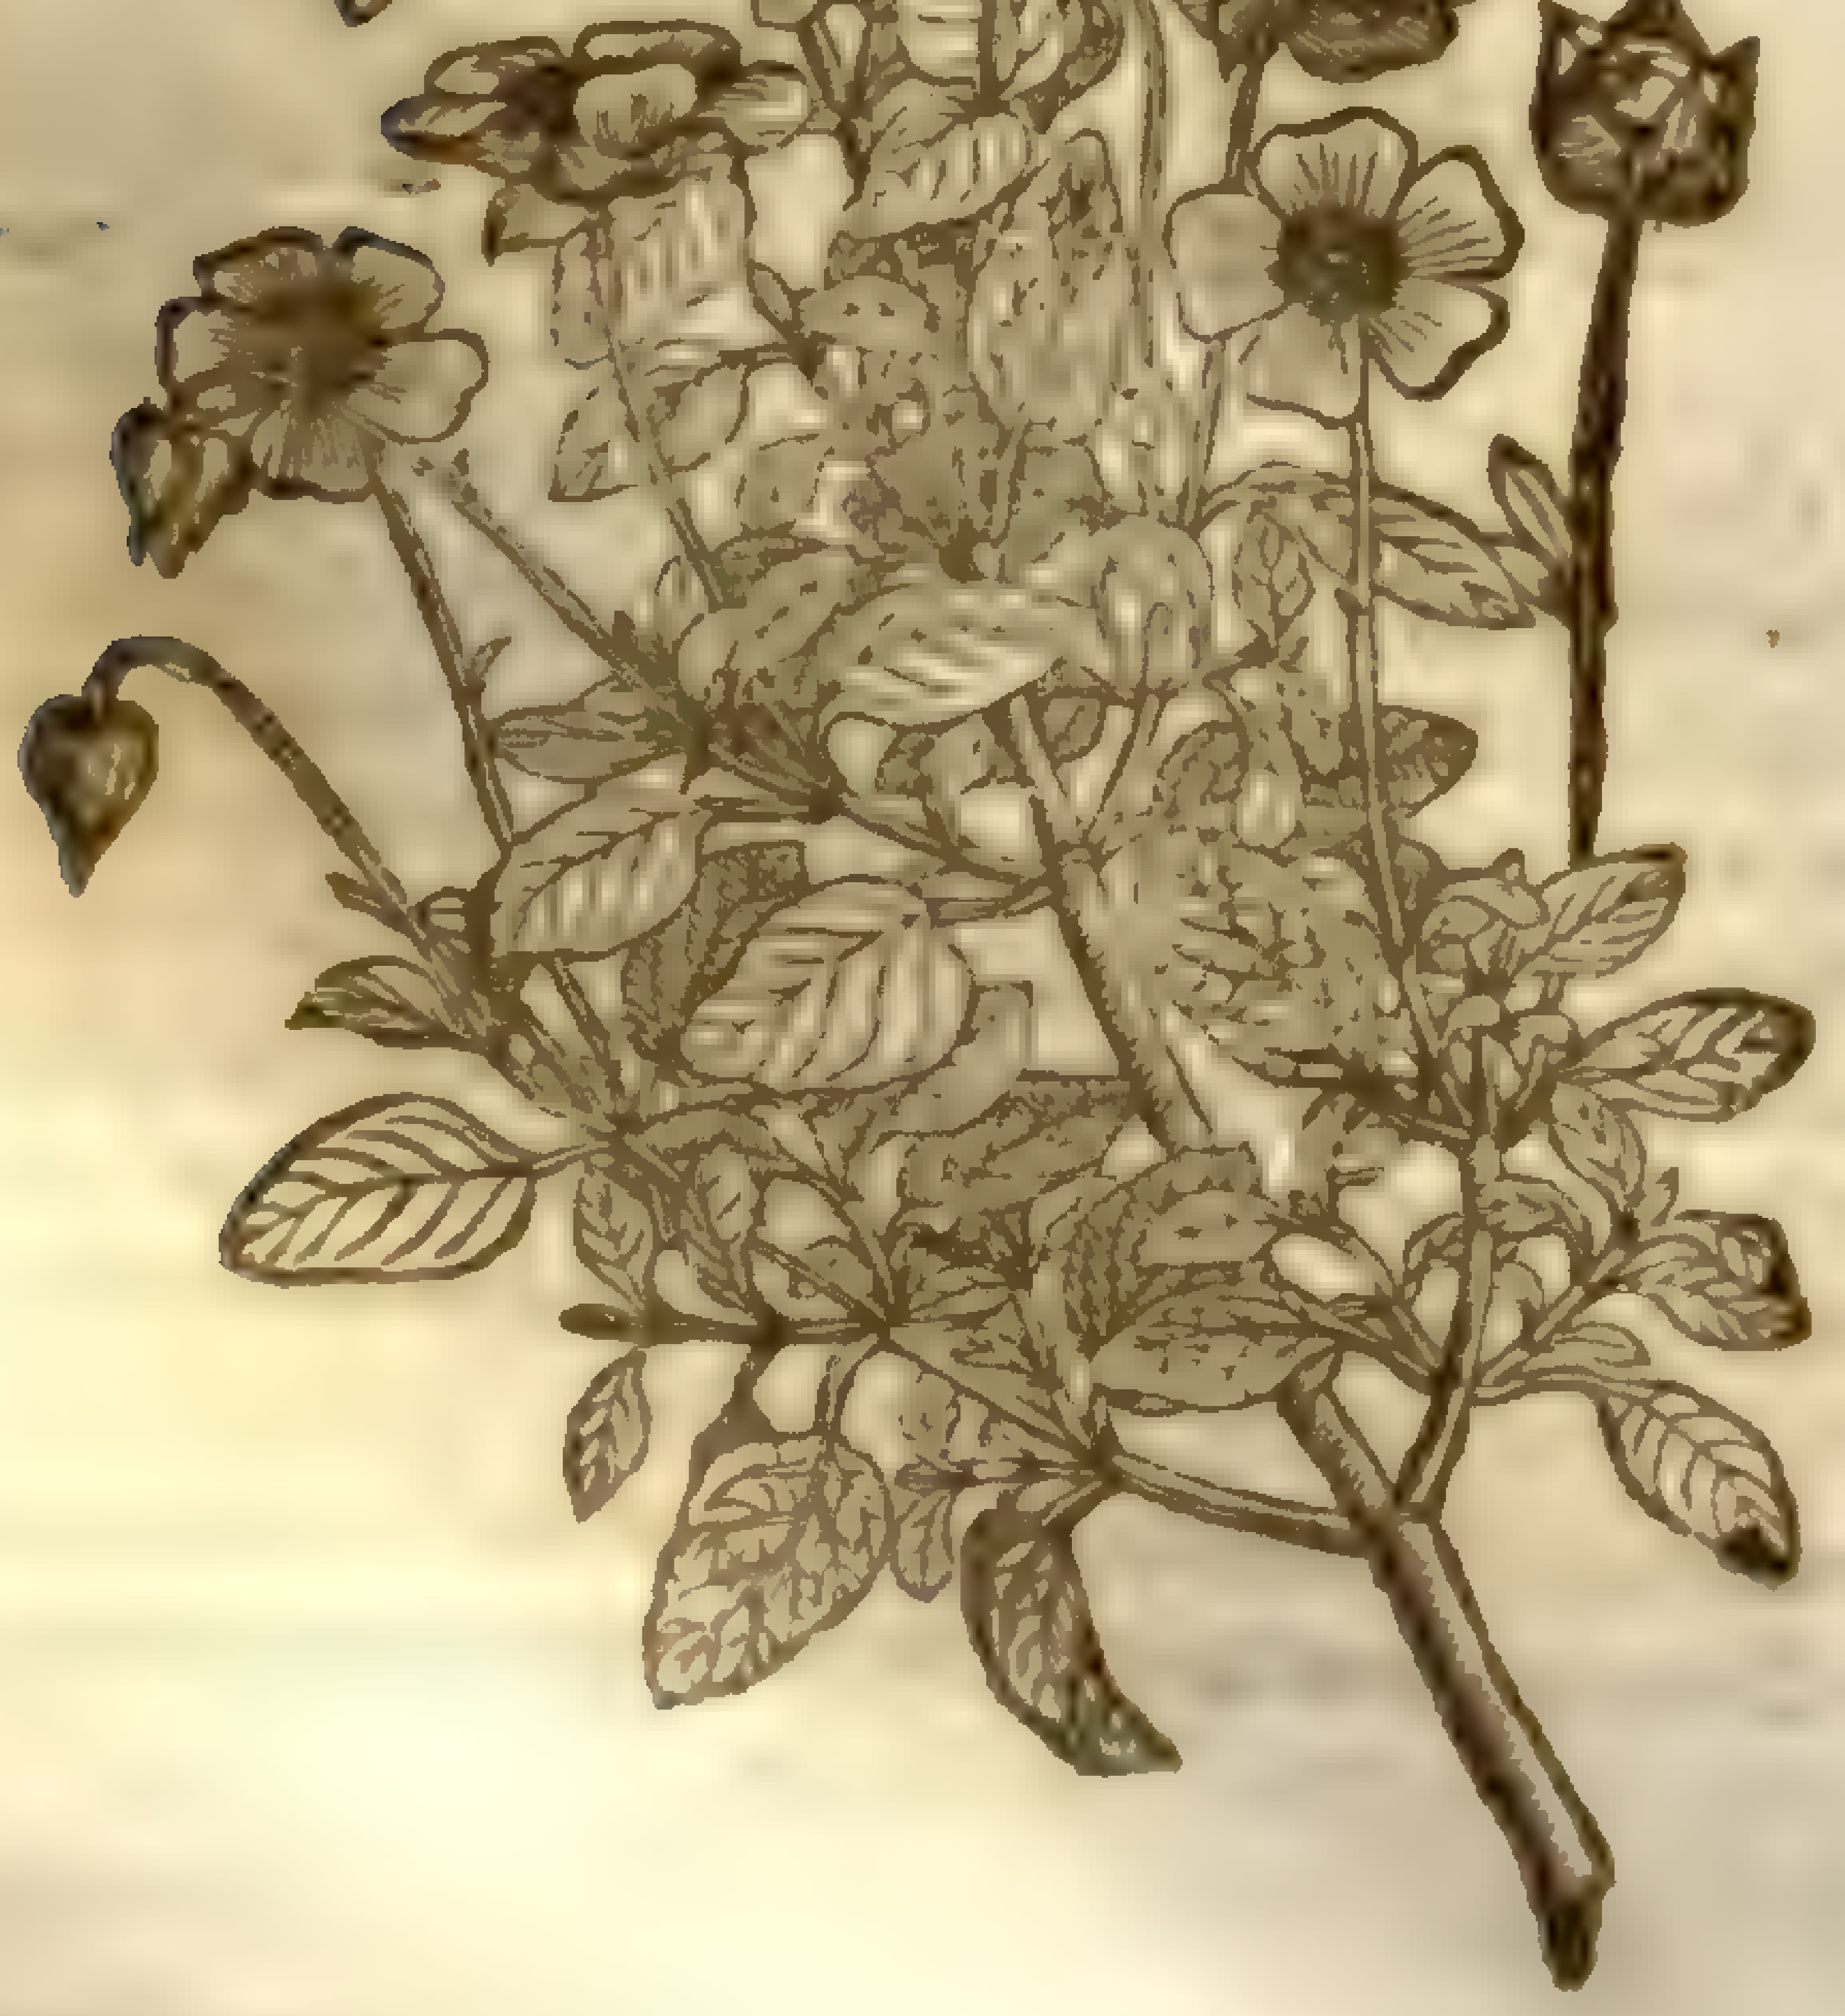


C. brevifolius, mas.
Mill. dict.

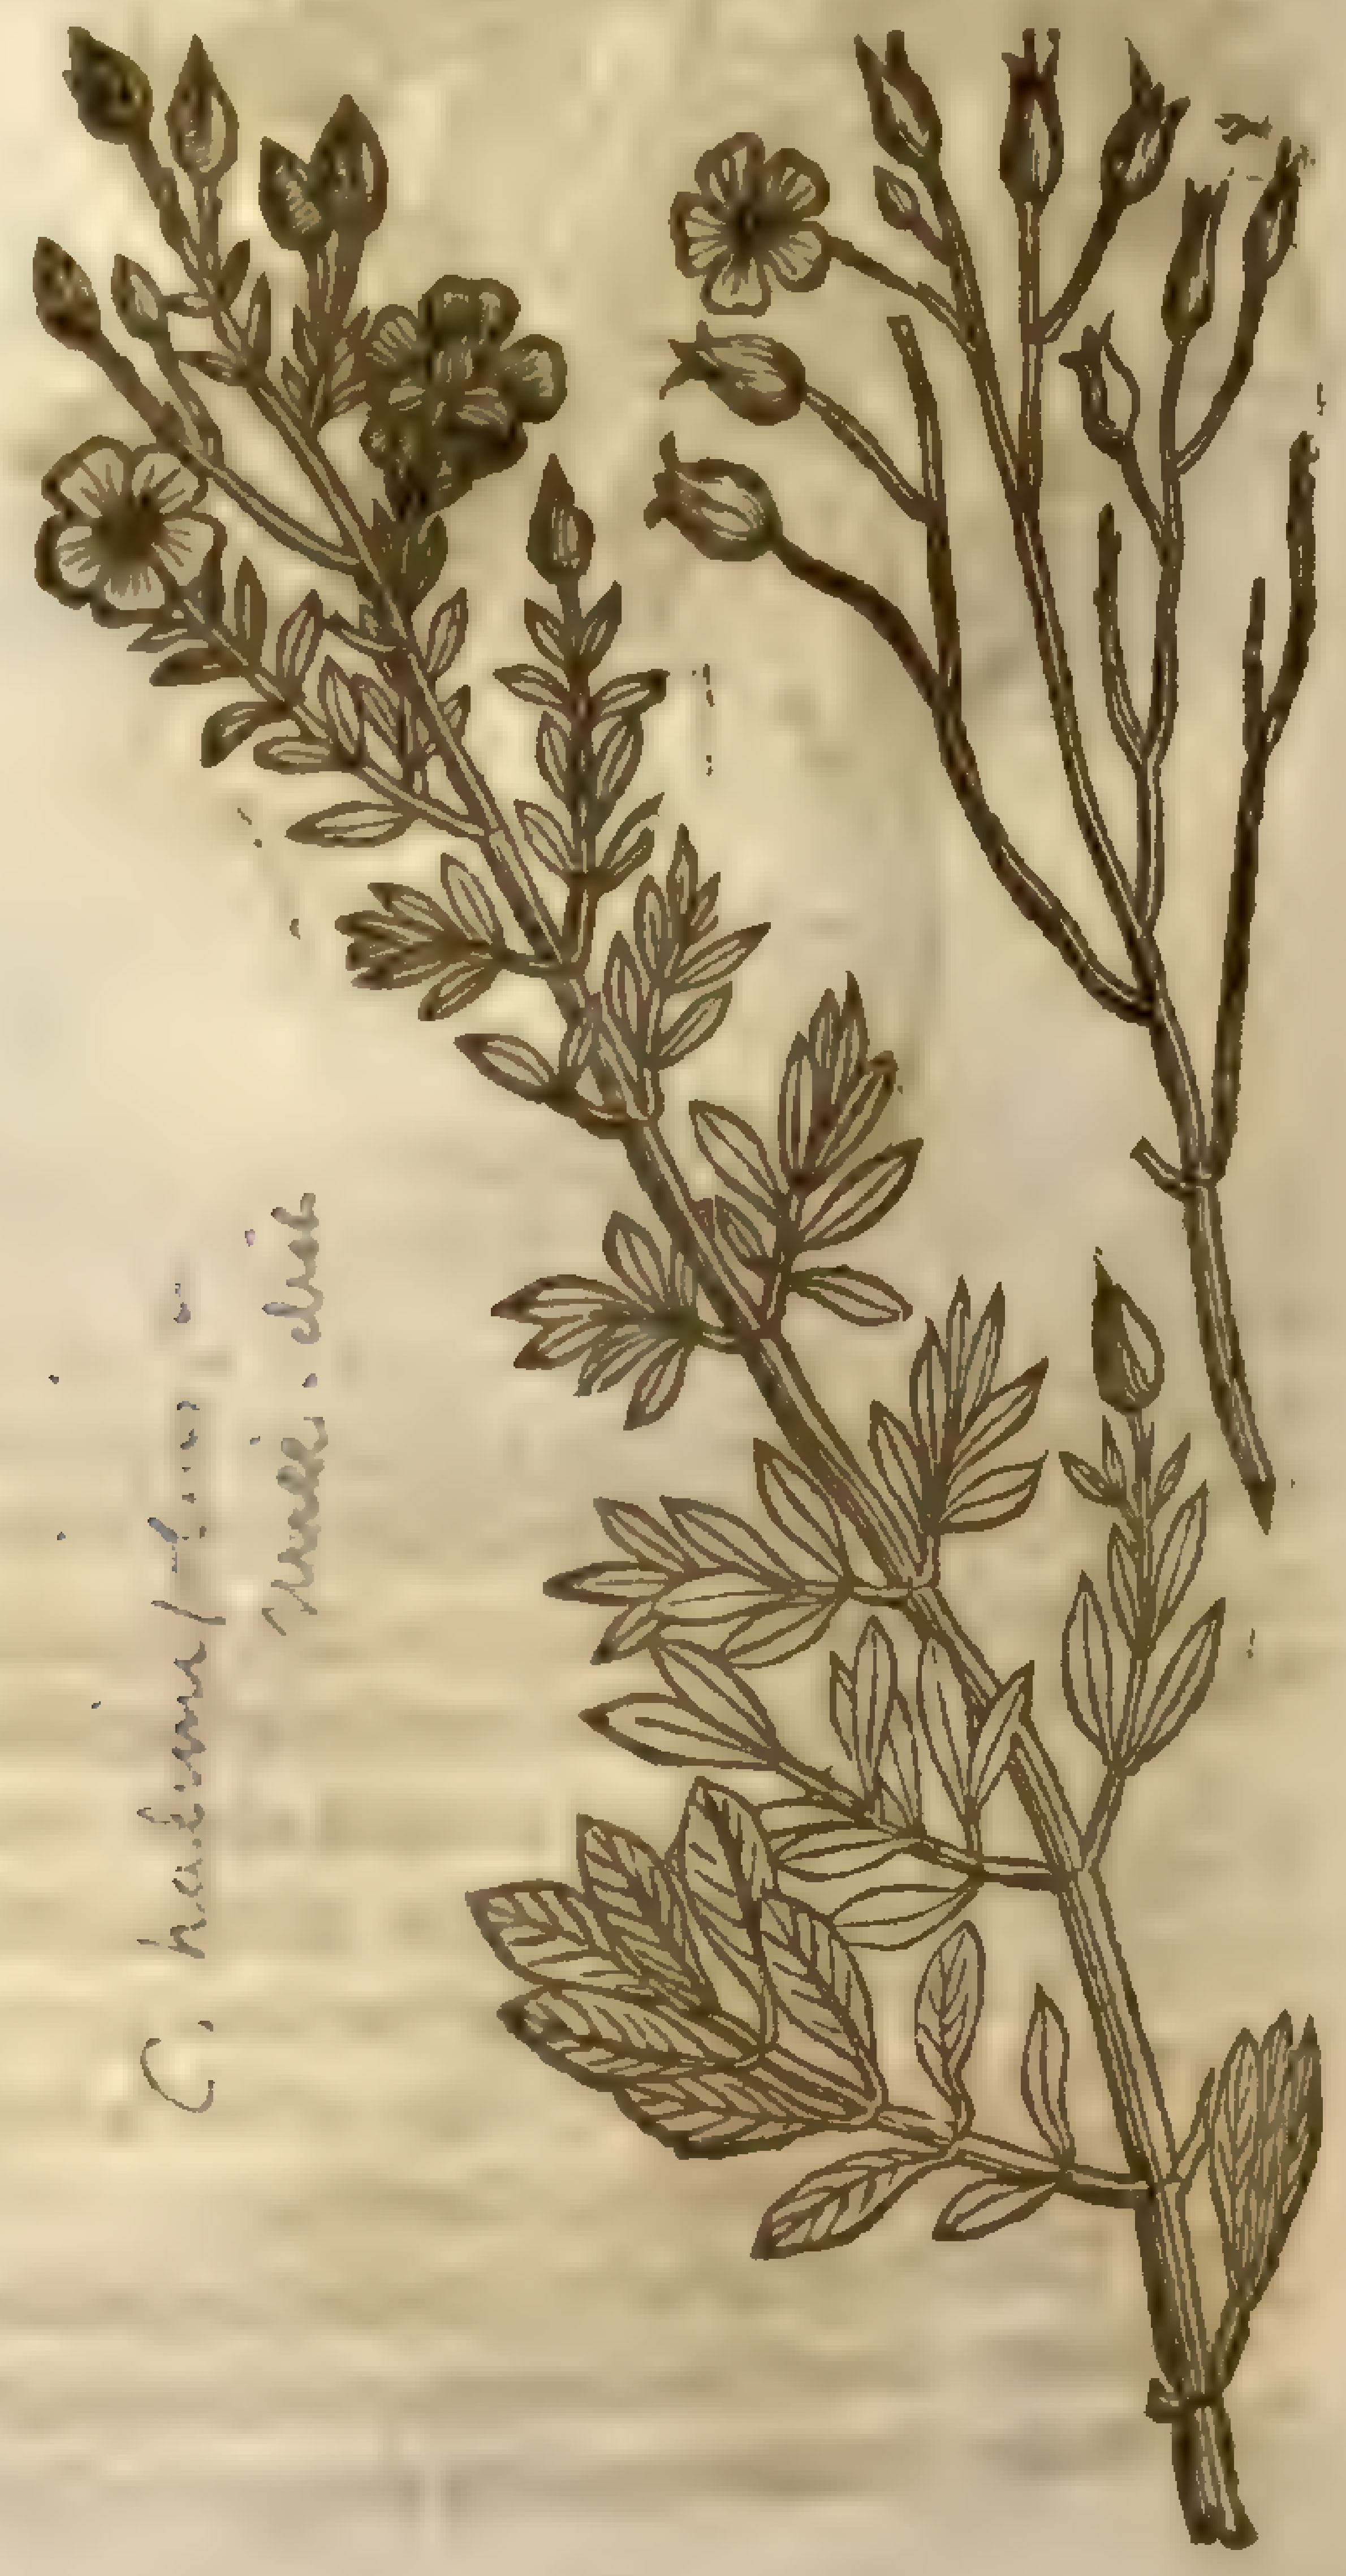
4 *Ciſtus mas tenuifolius.*
Thin leafed Ciſtus.



5 *Ciſtus fœmina.*
The female Ciſtus.



7 *Ciſtus folio Halimi.*
Ciſtus with leaues like Sea Purſlane.



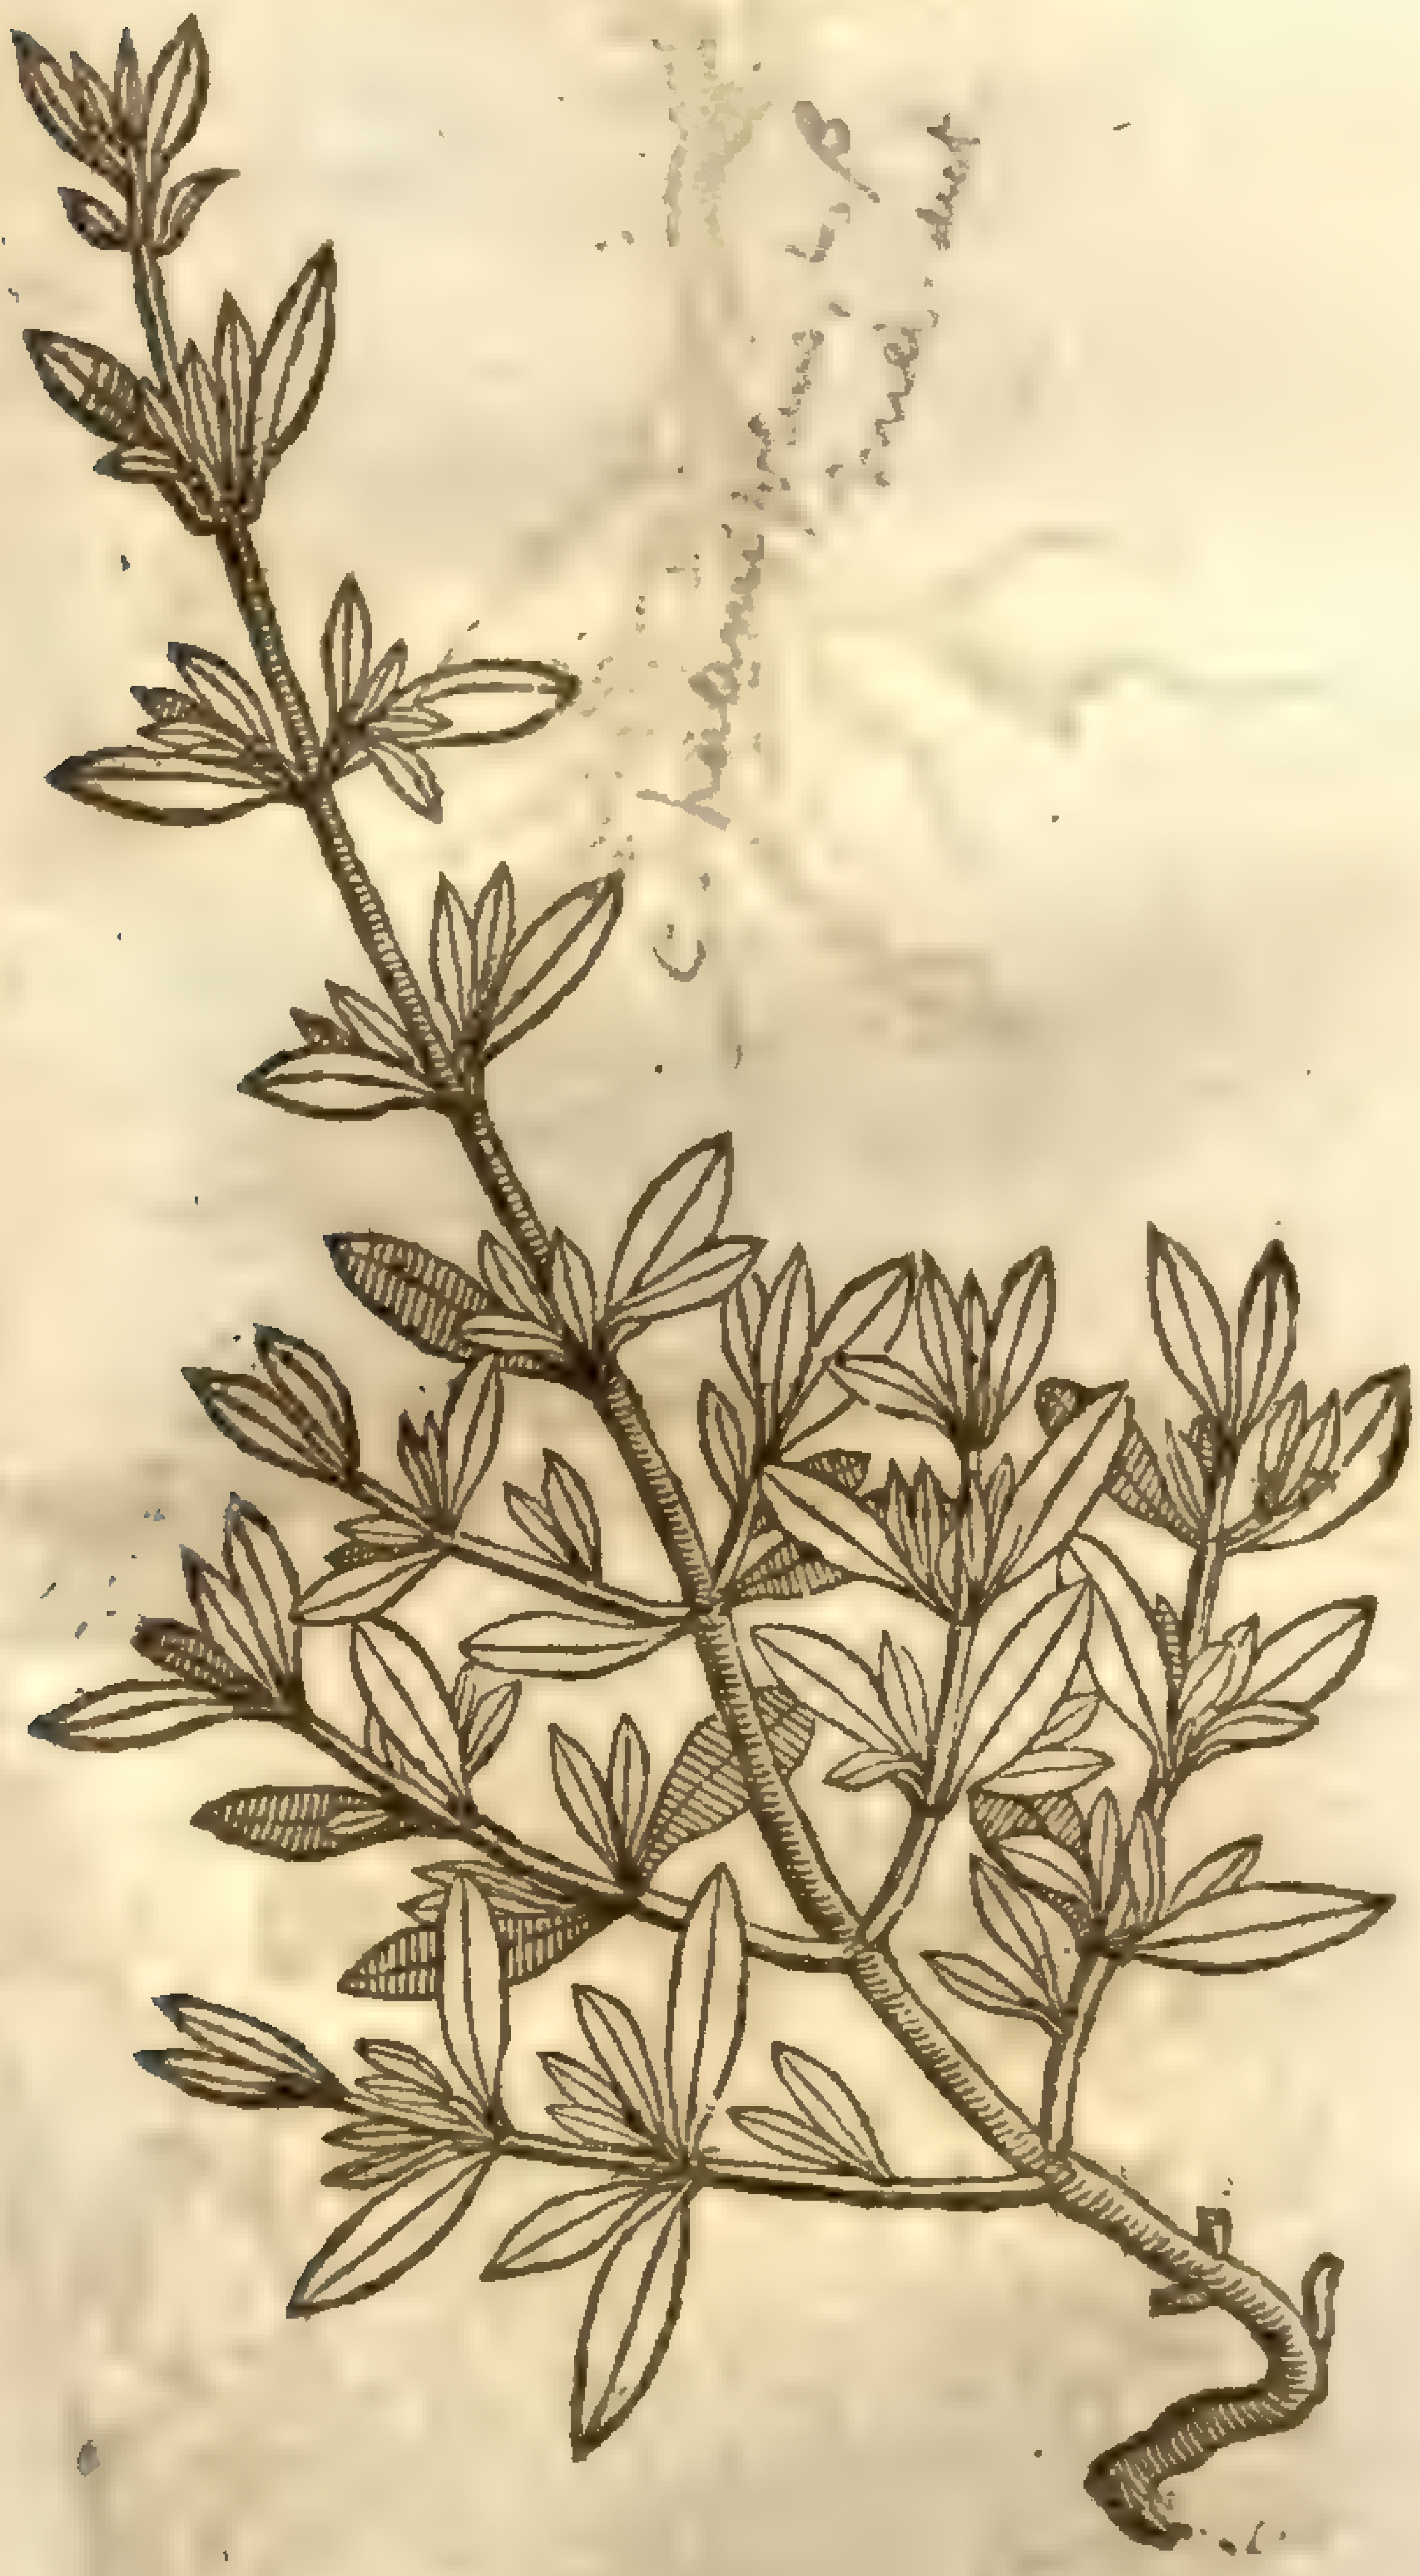
C. halimifolius
Mill. dict.

5 The firſt of the females is like vnto the male Ciſtus in each reſpect, ſauing that the floures hereof are of a white colour, with diuers yellow thrums in the middle, and the others purple, wherin conſiſteth the difference.

6 The ſecond female of *Matthiolus* deſcription hath many hard and wooddy ſtalks branched with diuers armes or wings; whereon are ſet by couples rough hoary and hairy leaues of a dark ruſſet colour, among which come forth ſmall white floures like vnto thoſe of the Iaſmin: the root is rough and wooddy. ‡ This I iudge all one with the former, and therefore haue omitted the figure as impertinent, although our Authour followed it, making the floure ſo little in his Deſcription. ‡

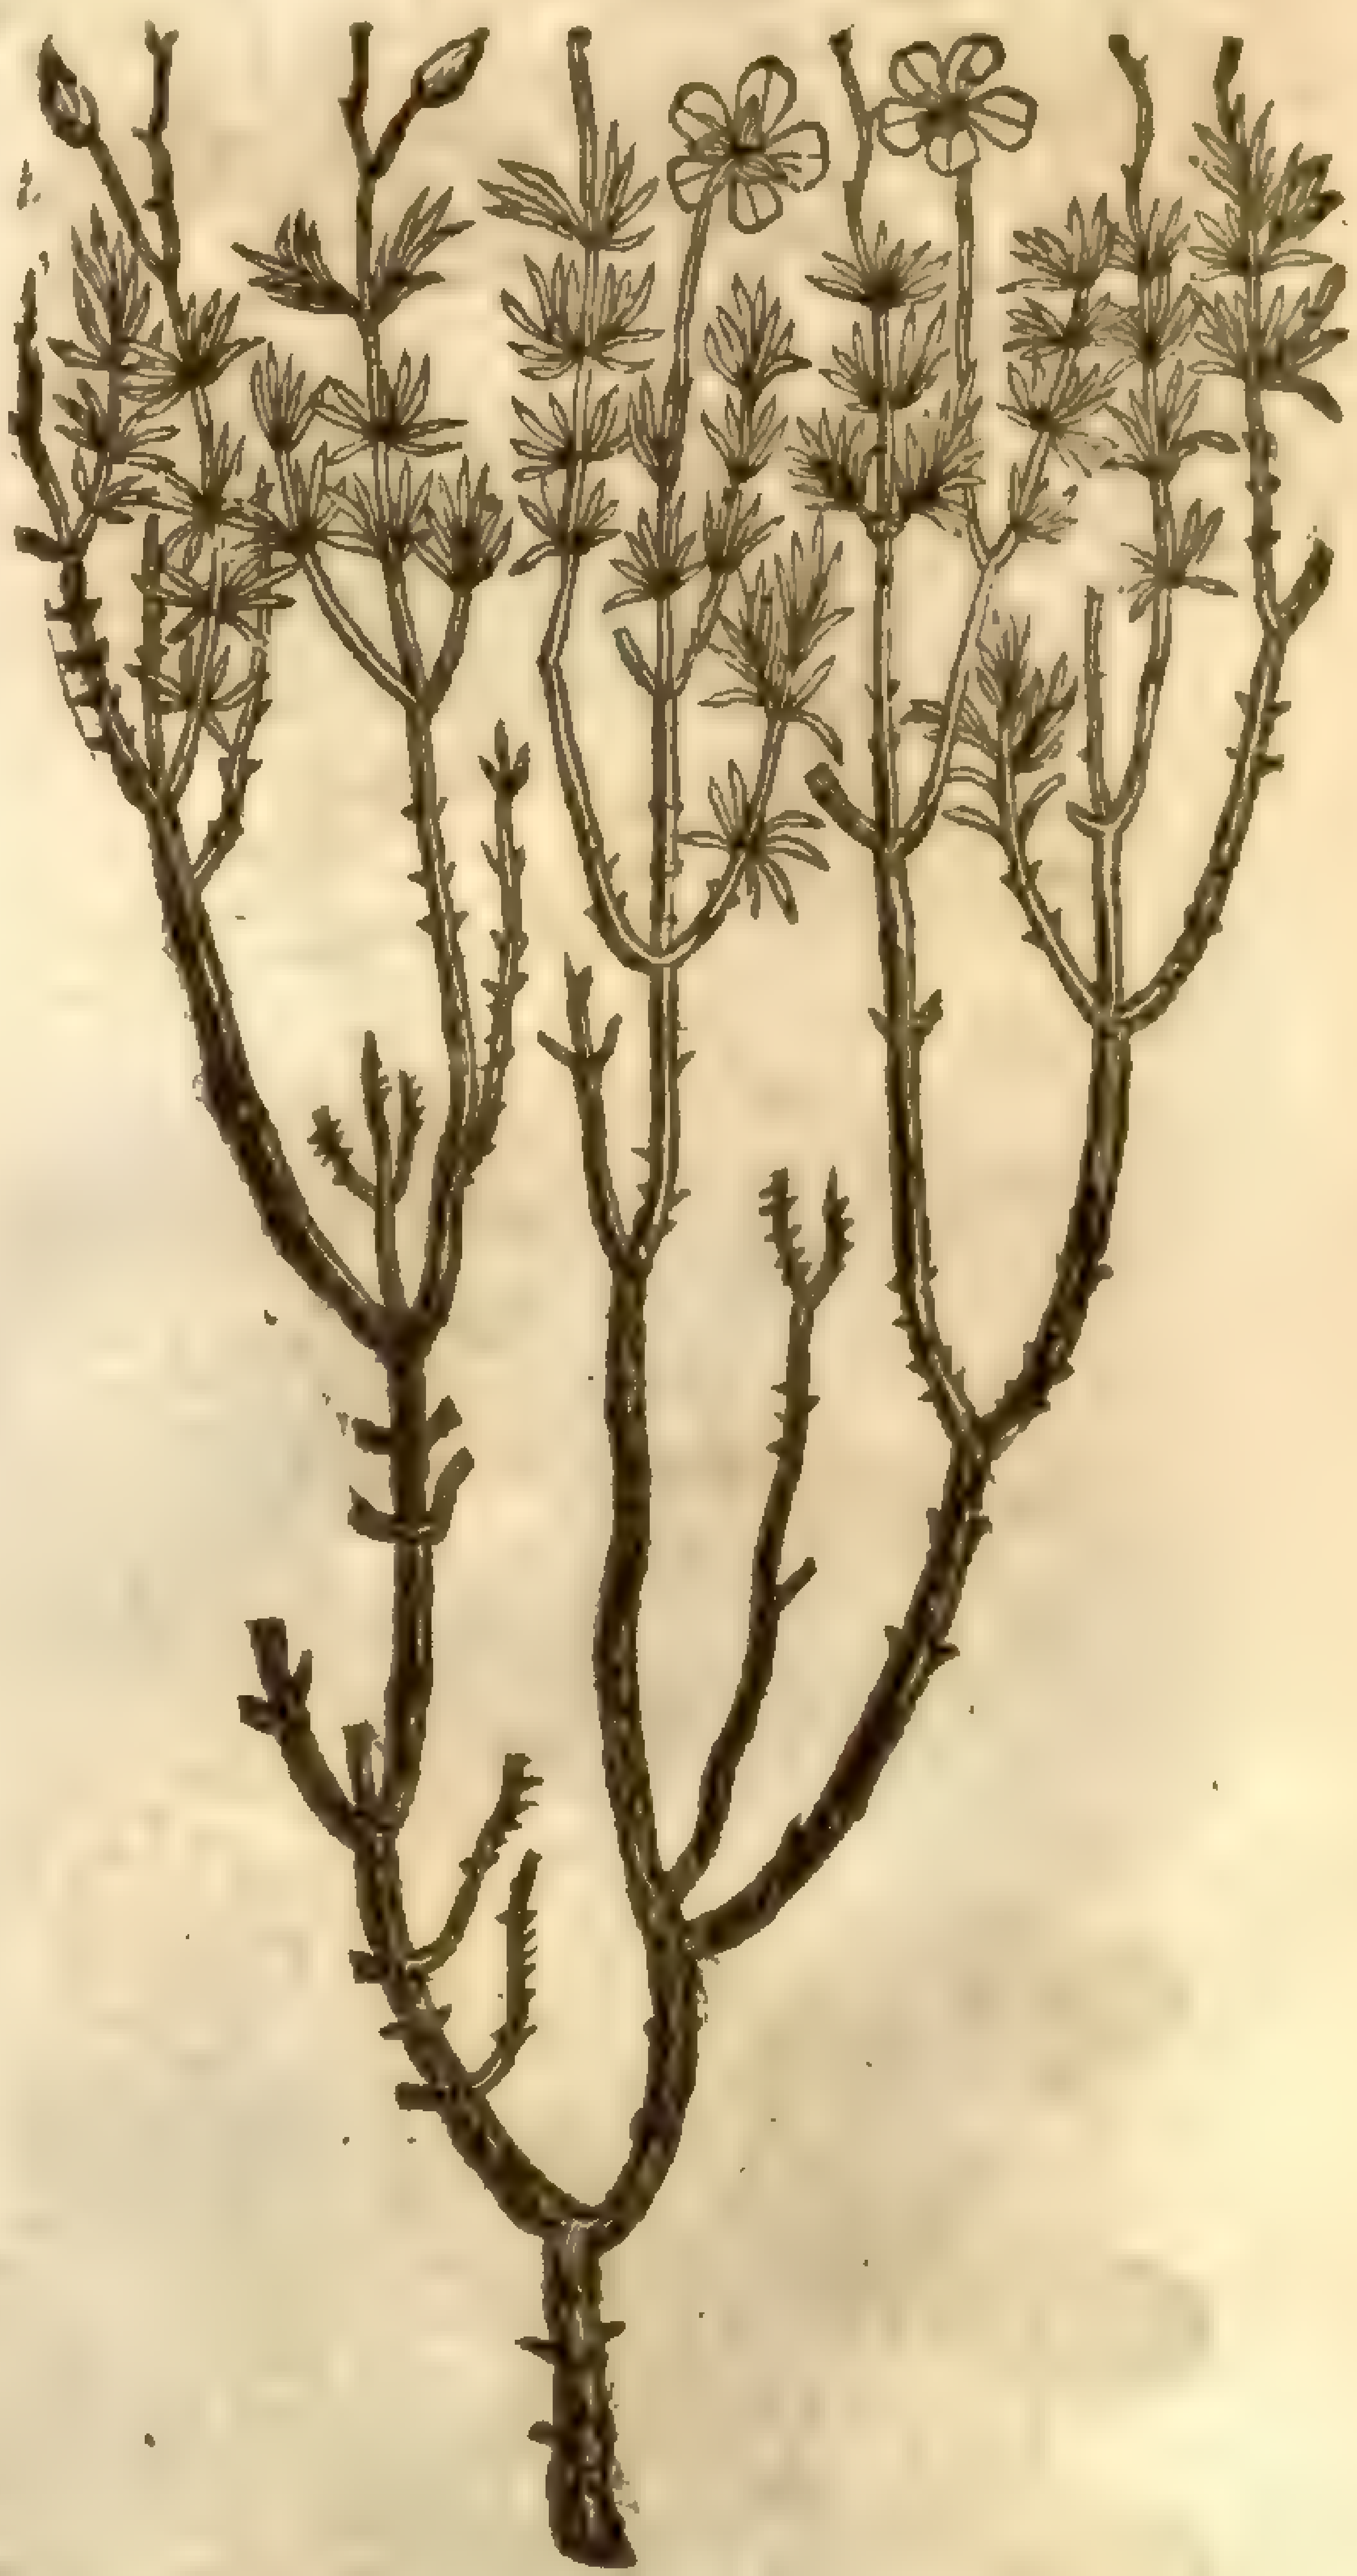
† 7 The ſeuenth ſort of Ciſtus growes vp to the height of a ſmall hedge buſh, hauing diuers brittle branches full of pith: whereon are ſet leaues by couples like thoſe of ſea Purſlane, that is to ſay, ſoft, hoary, and as it were couered ouer with a kinde of mealineſſe: the floures are yellow, and leſſe than thoſe of the former.

8 *Ciſtus folio Lavandulæ.*
Lavander leaued Ciſtus.



C. hispanicus, [illegible]

9 *Ciſtus folio Thymi.*
Ciſtus with the leaues of Tyme.



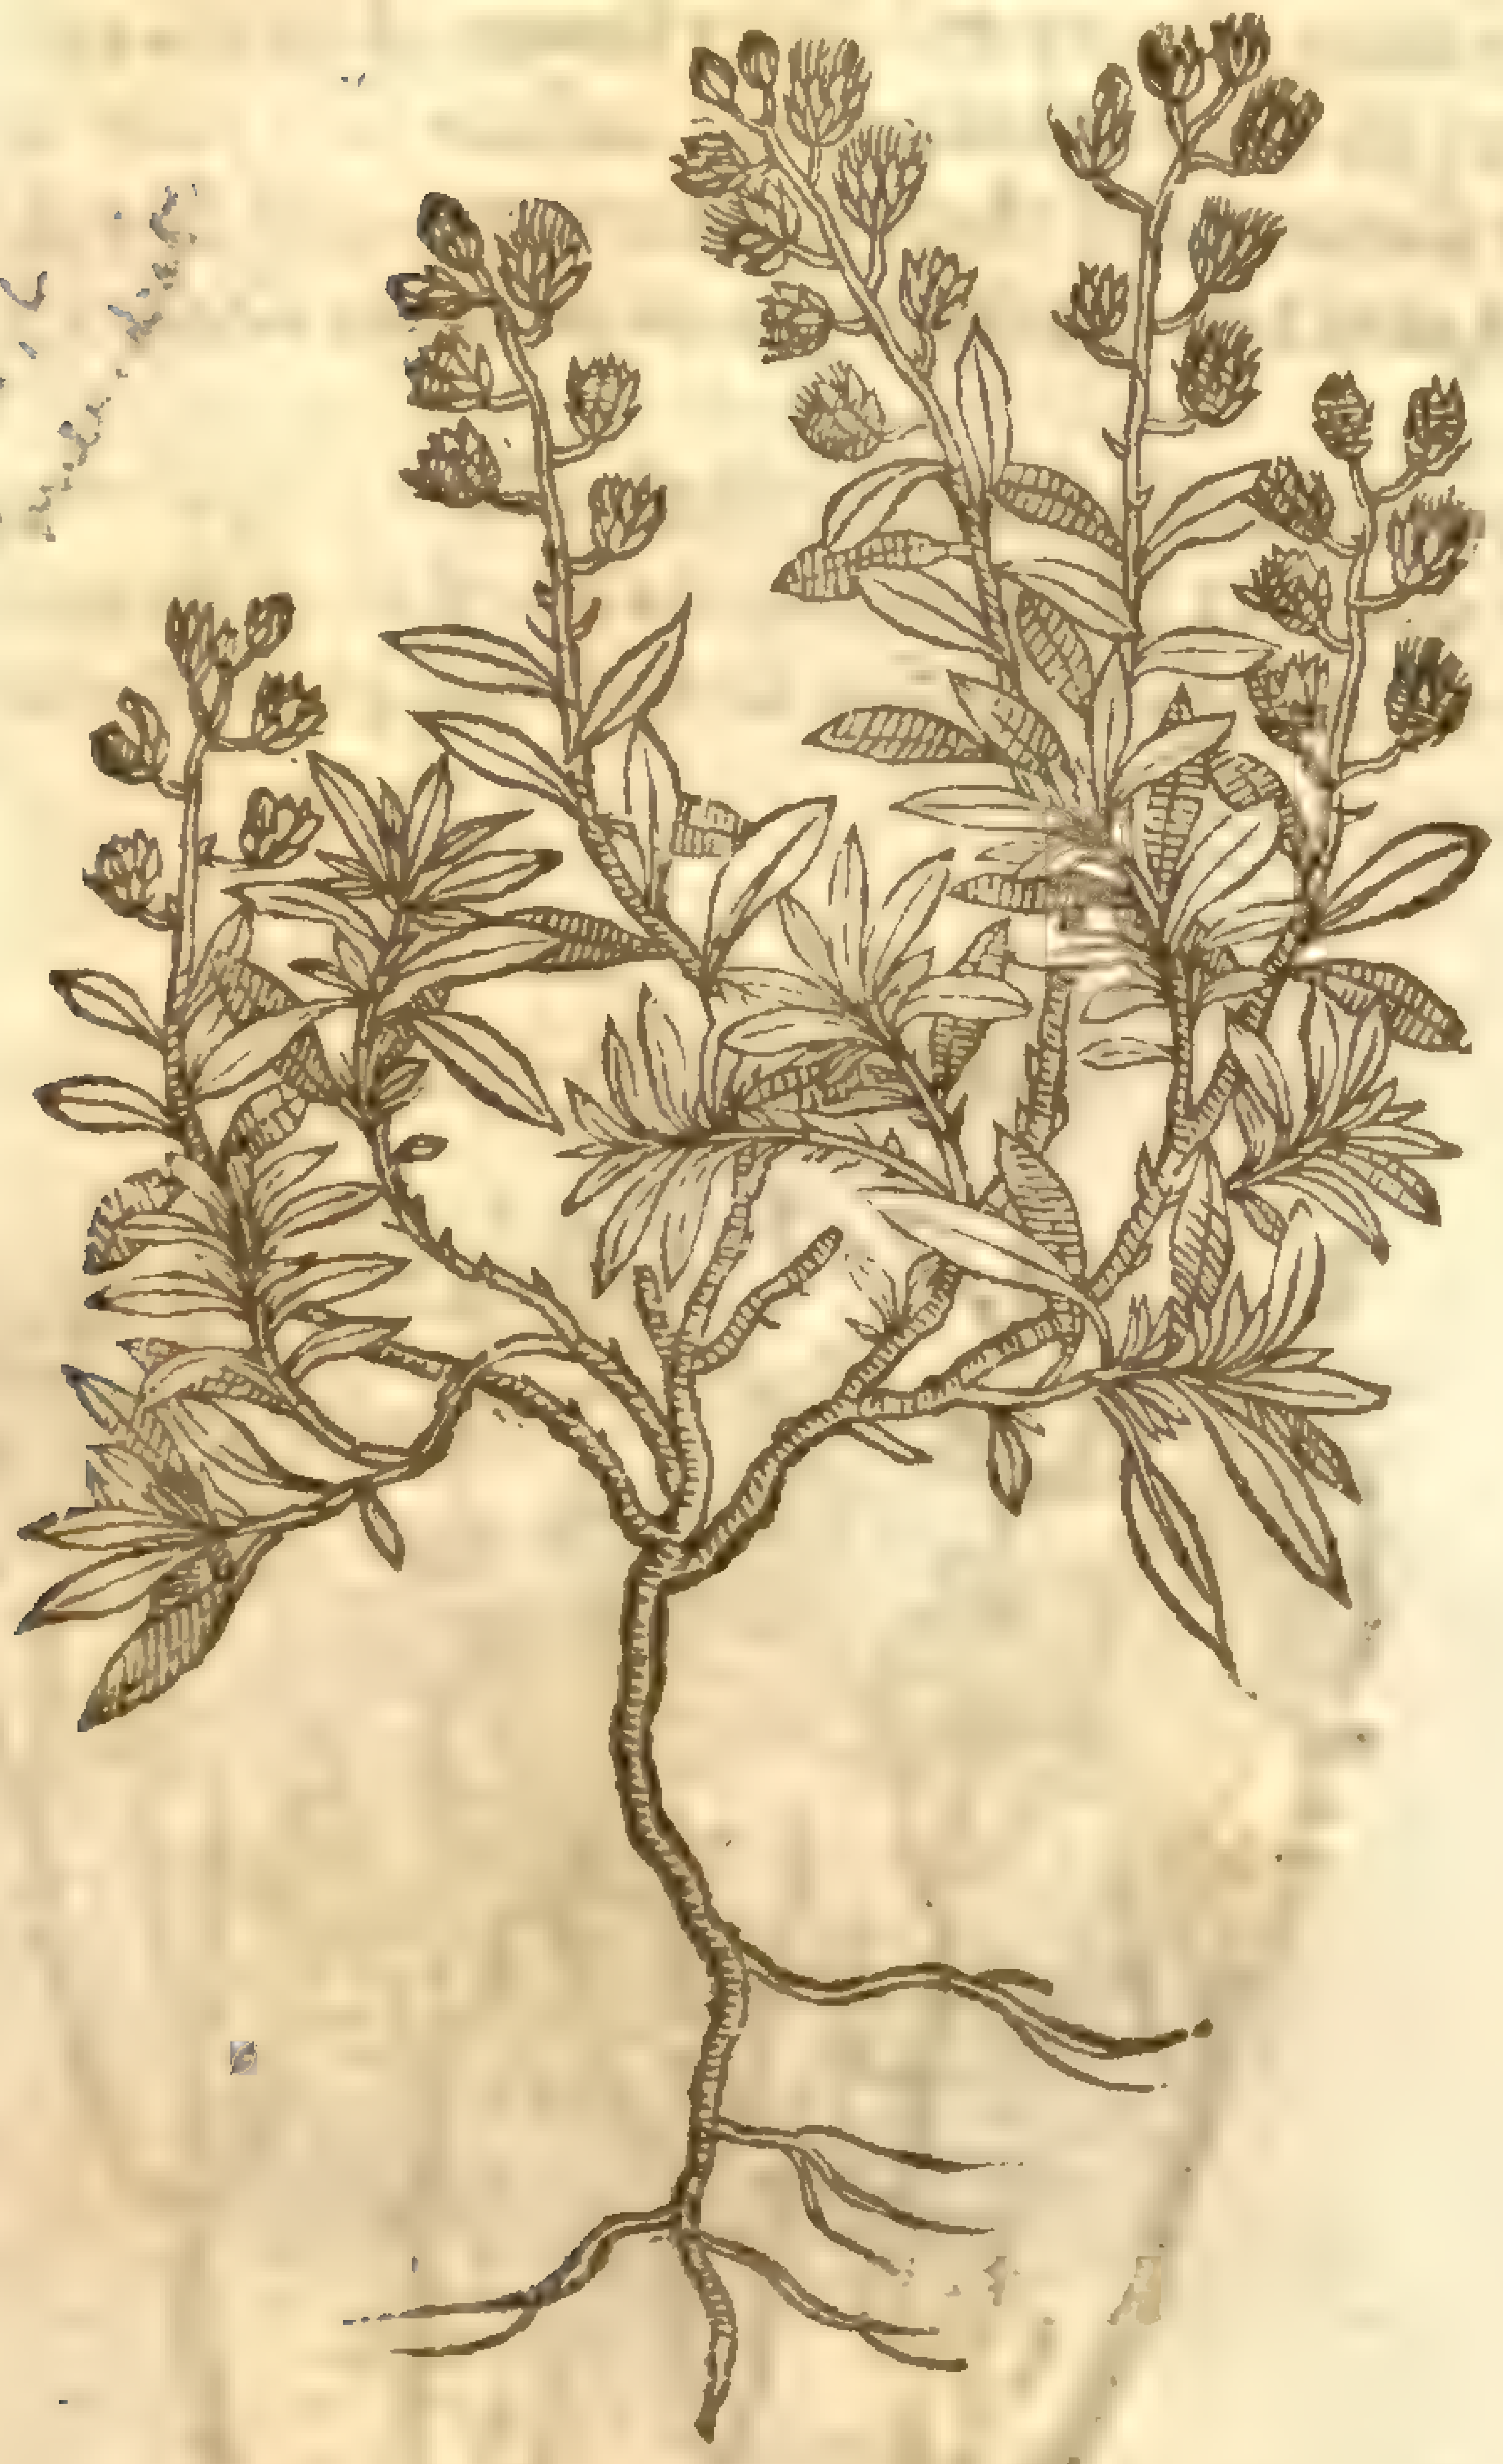
8 The eighth Ciſtus hath likewiſe ſhrubby ſtalks in manner of a hedge tree, whereon grow at certain diſtances diuers leaues cloſe joined together at the ſtalke like thoſe of the former, but ſomwhat lower and narrower: the floures we haue not expreſt in the figure, for that we haue no certain knowledge of them.

9 This ninth Ciſtus is likewiſe a wooddy ſhrub ſome foot high: the ſtalks are very brittle, as are all the reſt of his kinde, whereon grow very ſmall leaues like thoſe of Tyme: the floures are white, which maketh it one of the females.

10 The low or baſe Ciſtus with broad leaues growes like a ſmal ſhrub, of a woody ſubſtance; the leaues are many, of a darke green colour: the floures are in forme like the other, but of a yellow colour: the roots are likewiſe wooddy.

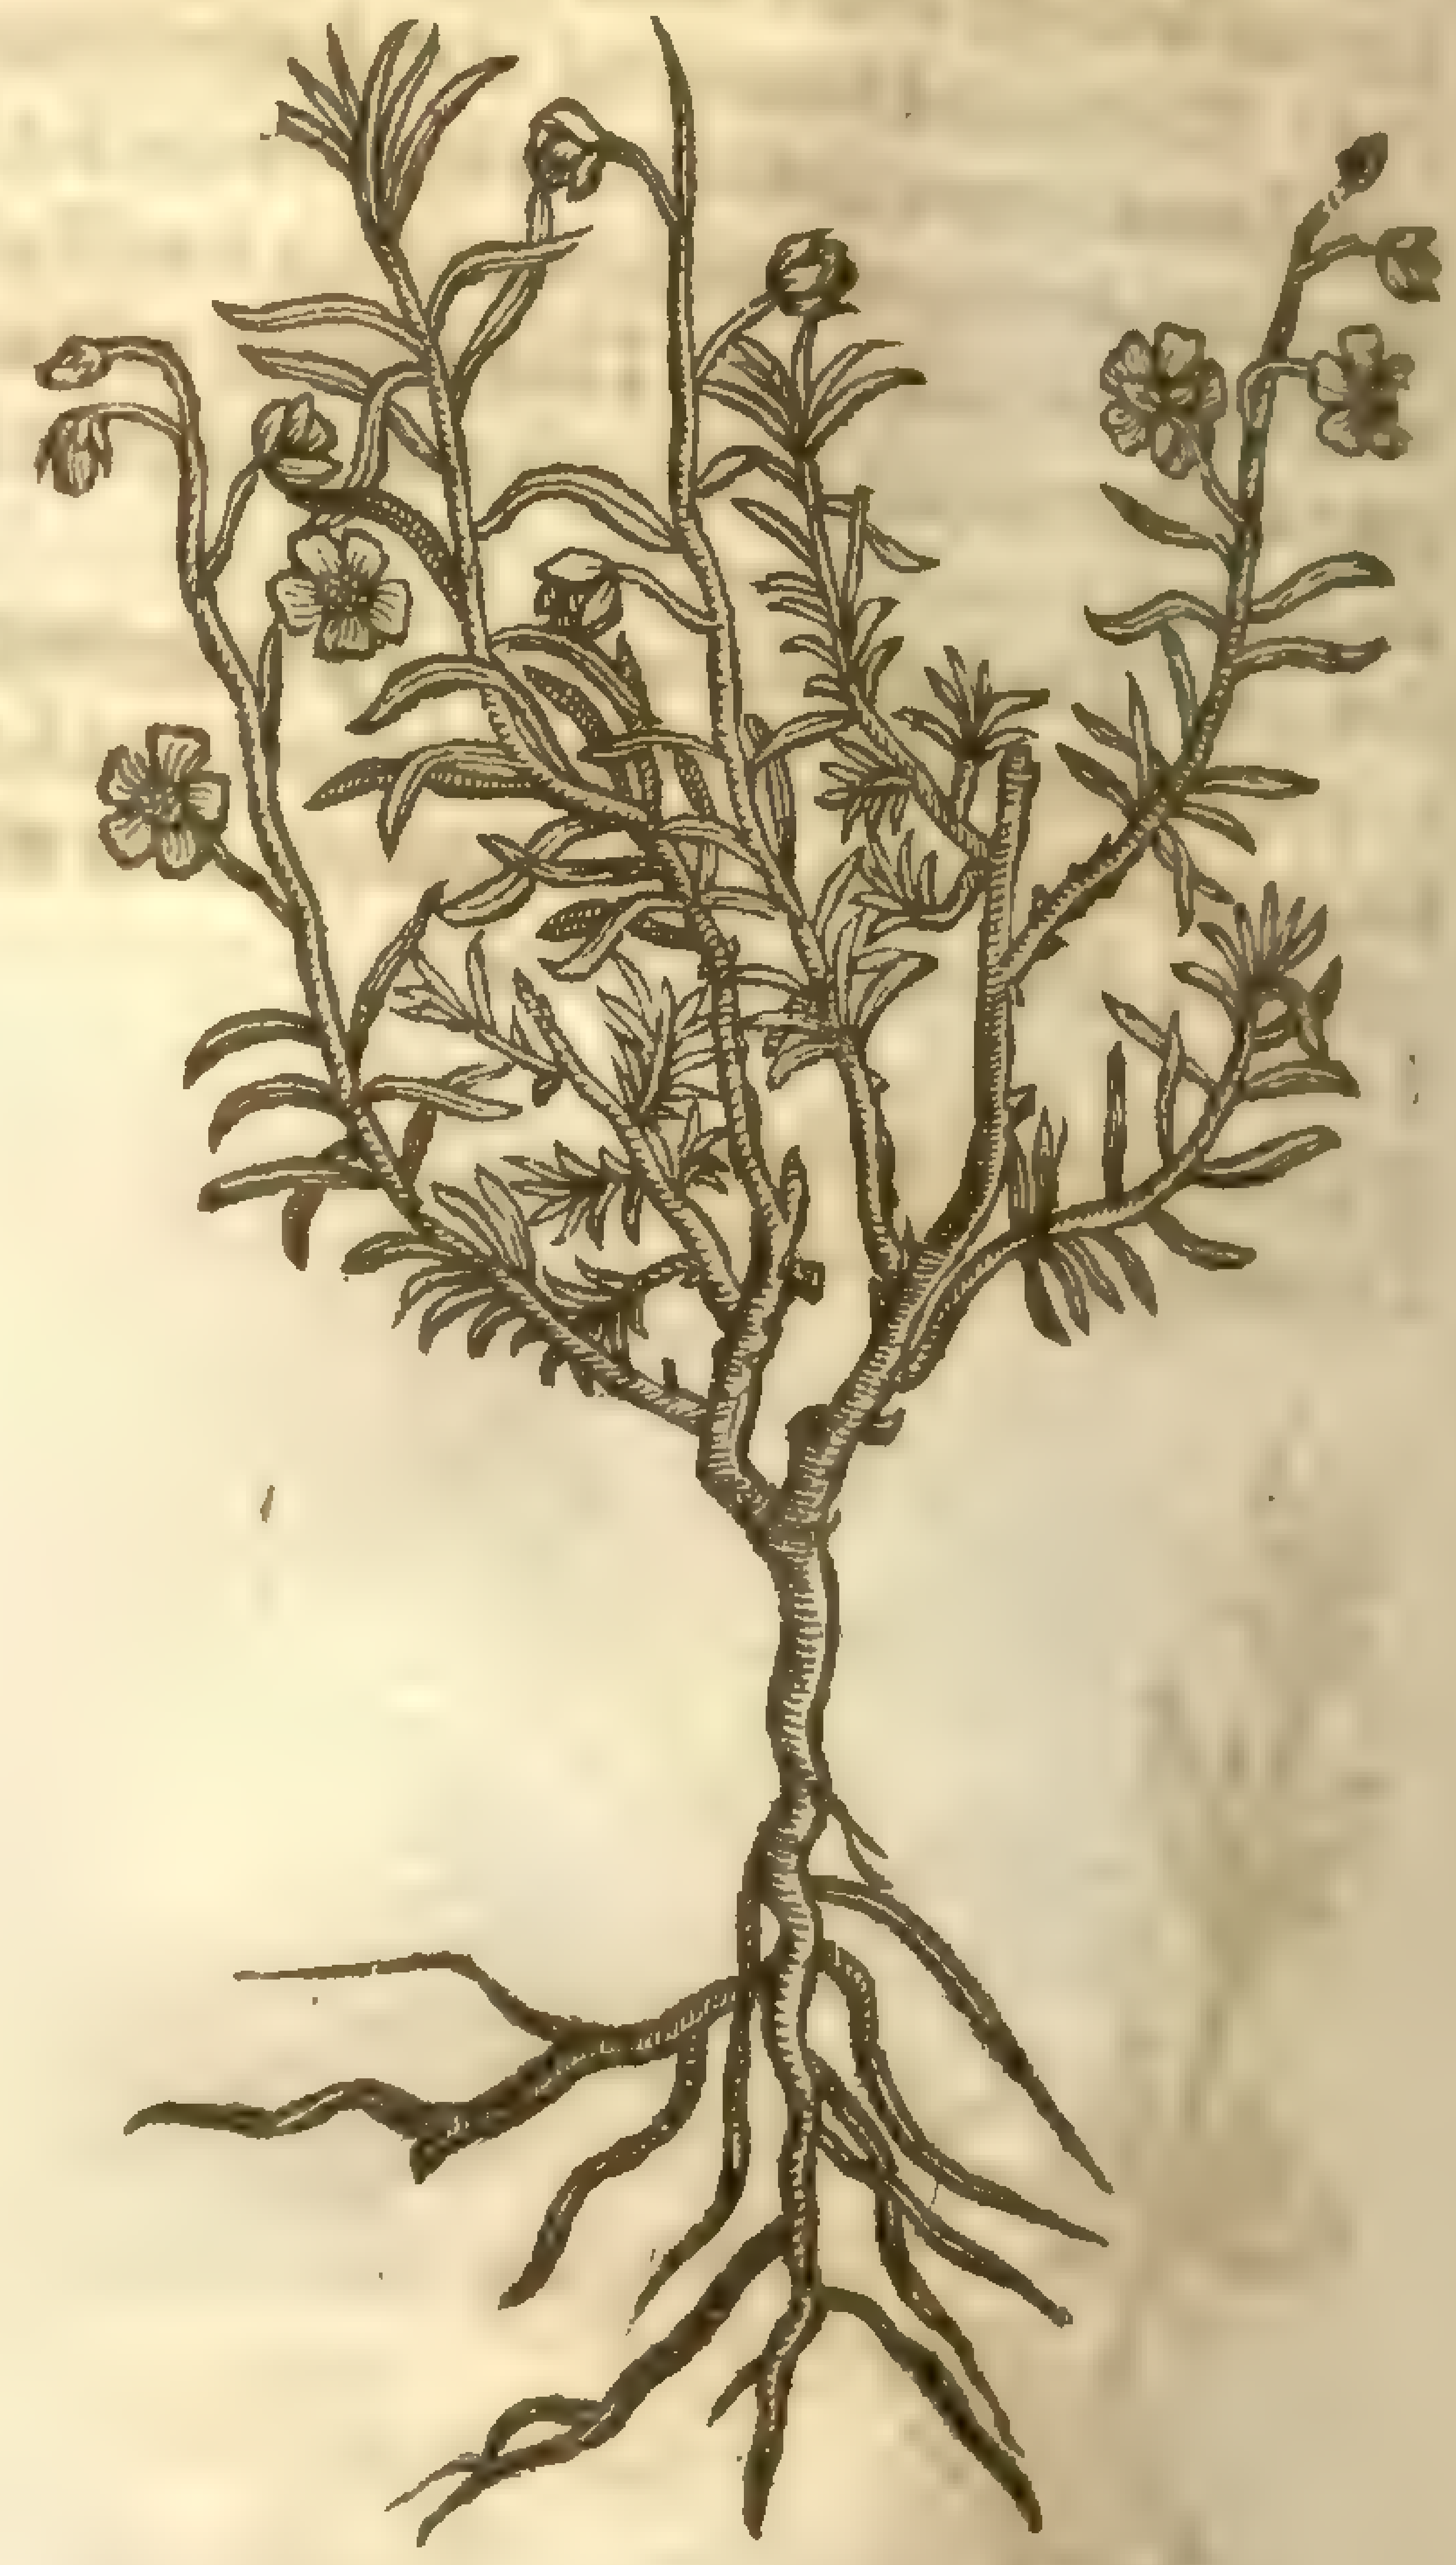
11 This narrow leafed low Ciſtus hath diuers tough branches leaning to the ground, whereon do grow without order many ſmall narrow leaues ſomwhat long, of a gummy taſte at the firſt, afterwards bitter: the floures grow on the tops of the branches, of a yellow colour, conſiſting of fiue leaues, with certaine chiues in the middle: after which follow three ſquare cods or ſeed-veſſels: the root is tough and wooddy.

10 *Ciſtus humilis latifolius.*
Low Ciſtus with broad leaues.

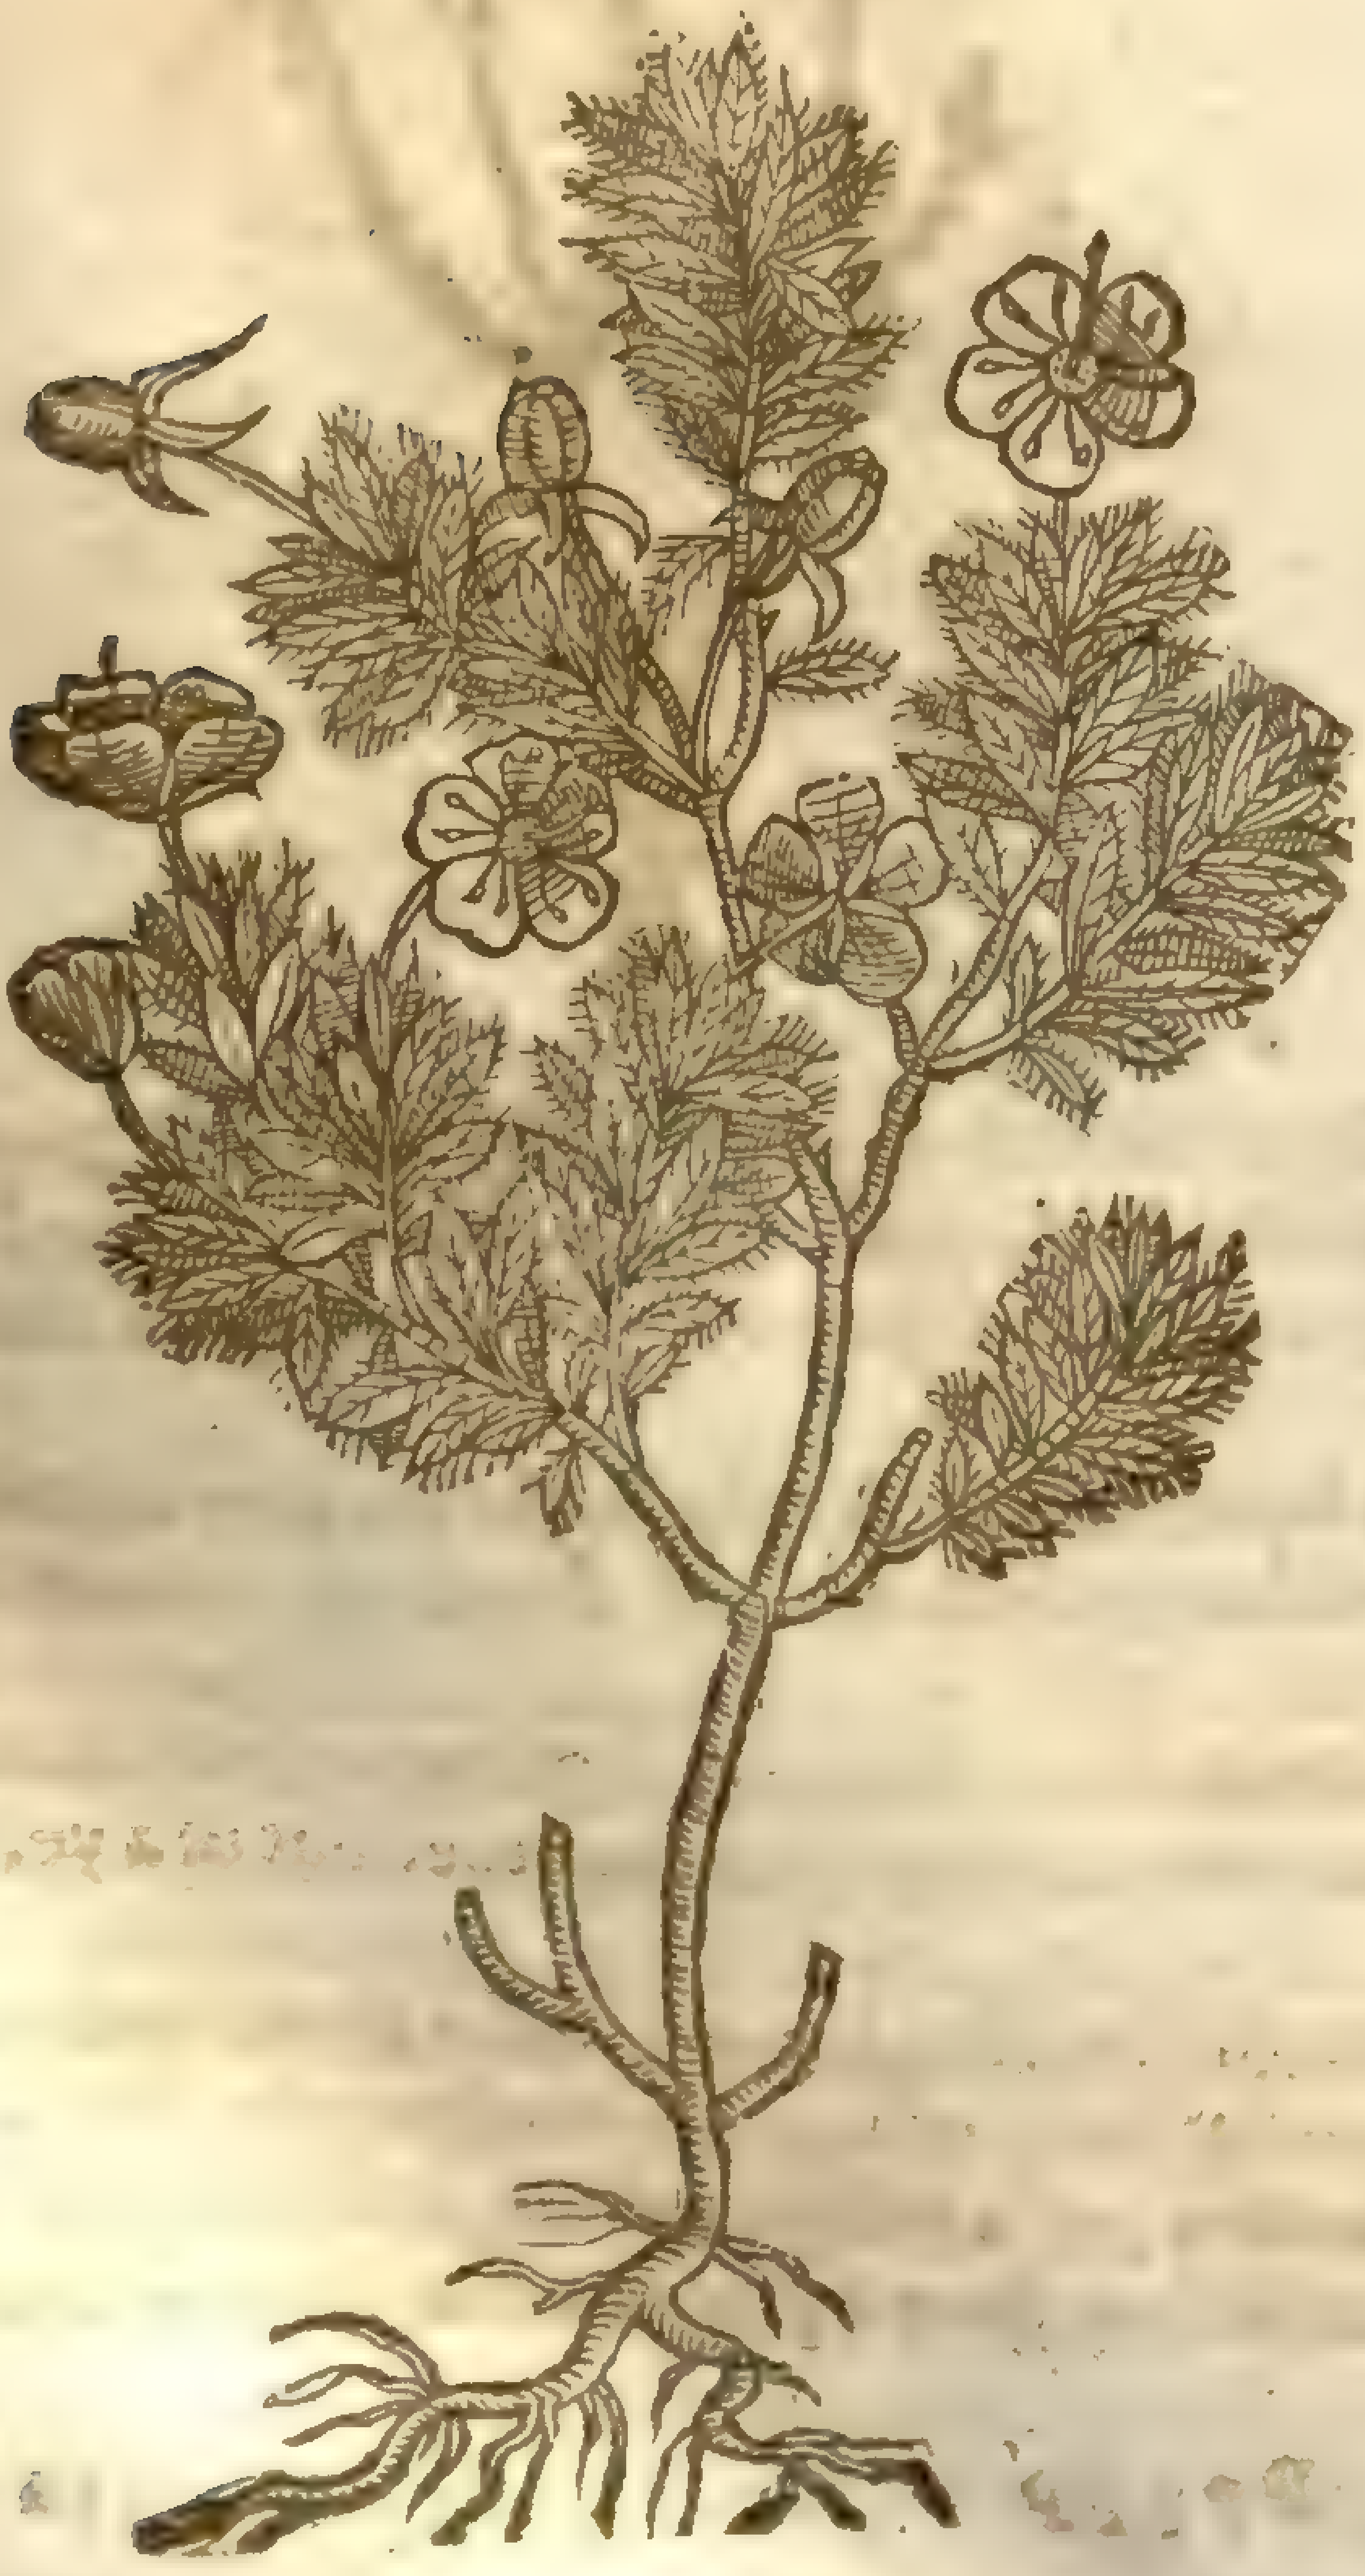


C. Canus, c. uni. dict.

11 *Ciſtus humilis anguſtifolius.*
Low Ciſtus with narrow leaues.

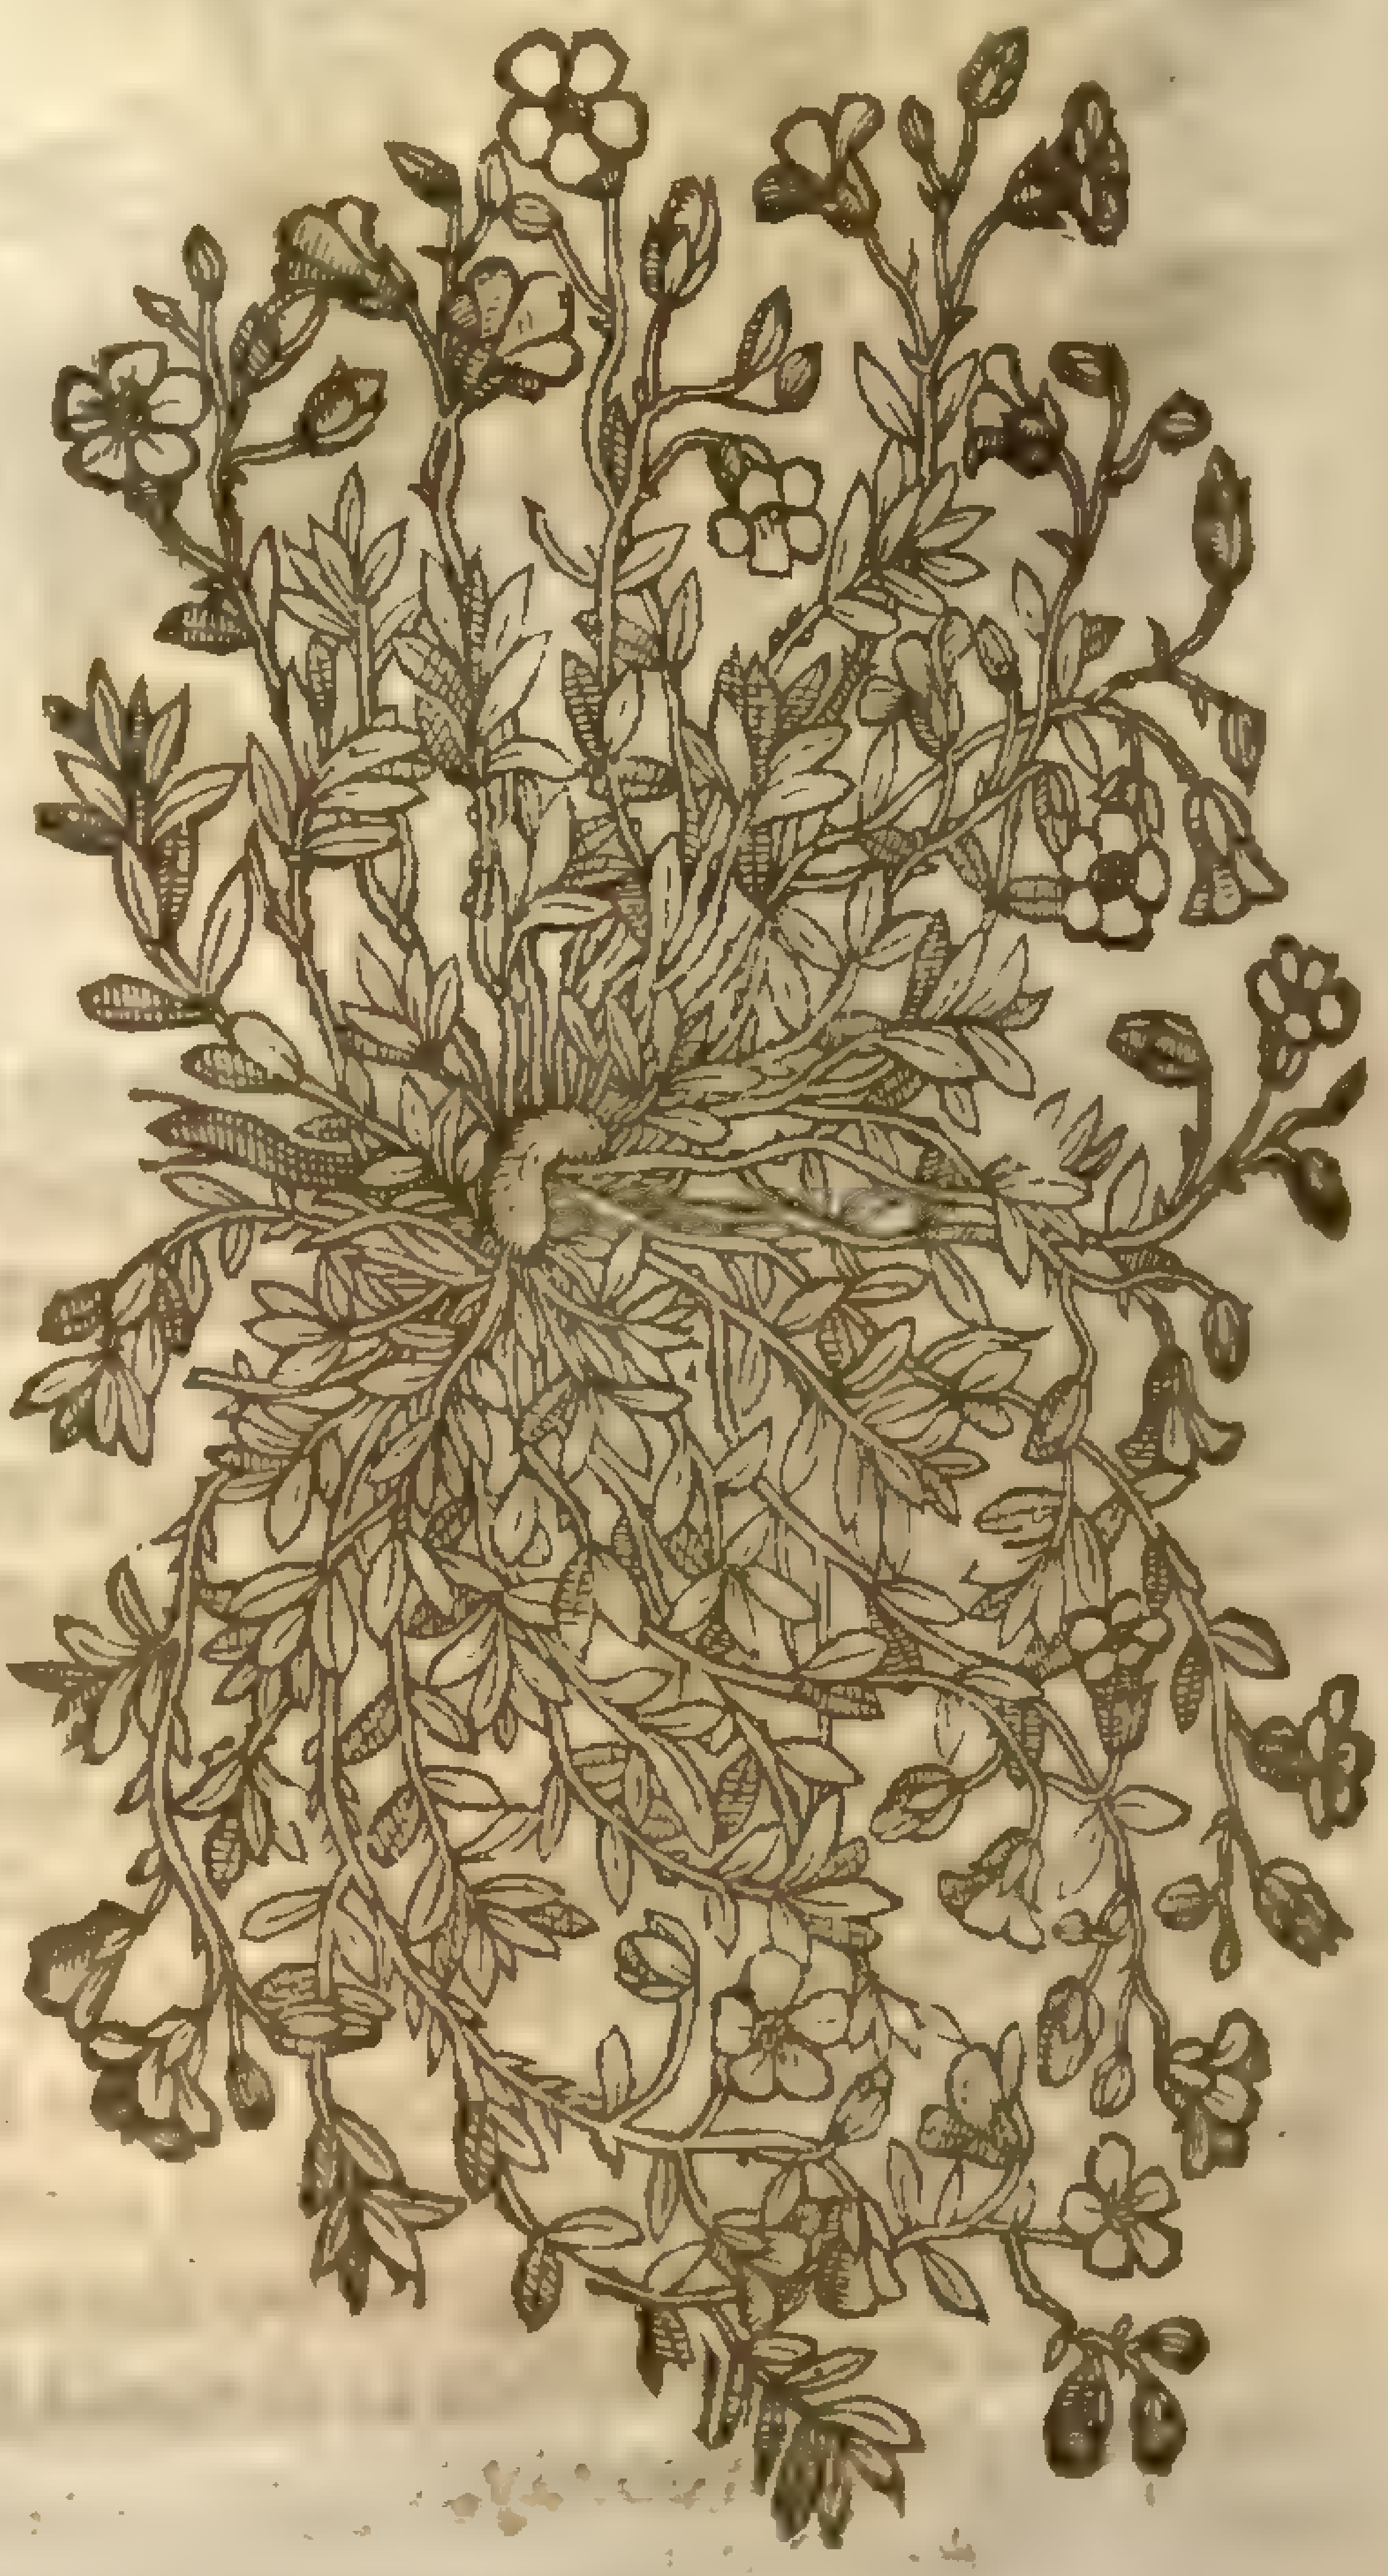


12 *Ciſtus humilis Auſtriaca Cluſij.*
Low Ciſtus of Auſtria.



Rhododendron Chamæcistus, c. uni. dict.

13 *Ciſtus humilis Serpilli folio.*
Low Ciſtus with leaues like wilde Tyme.

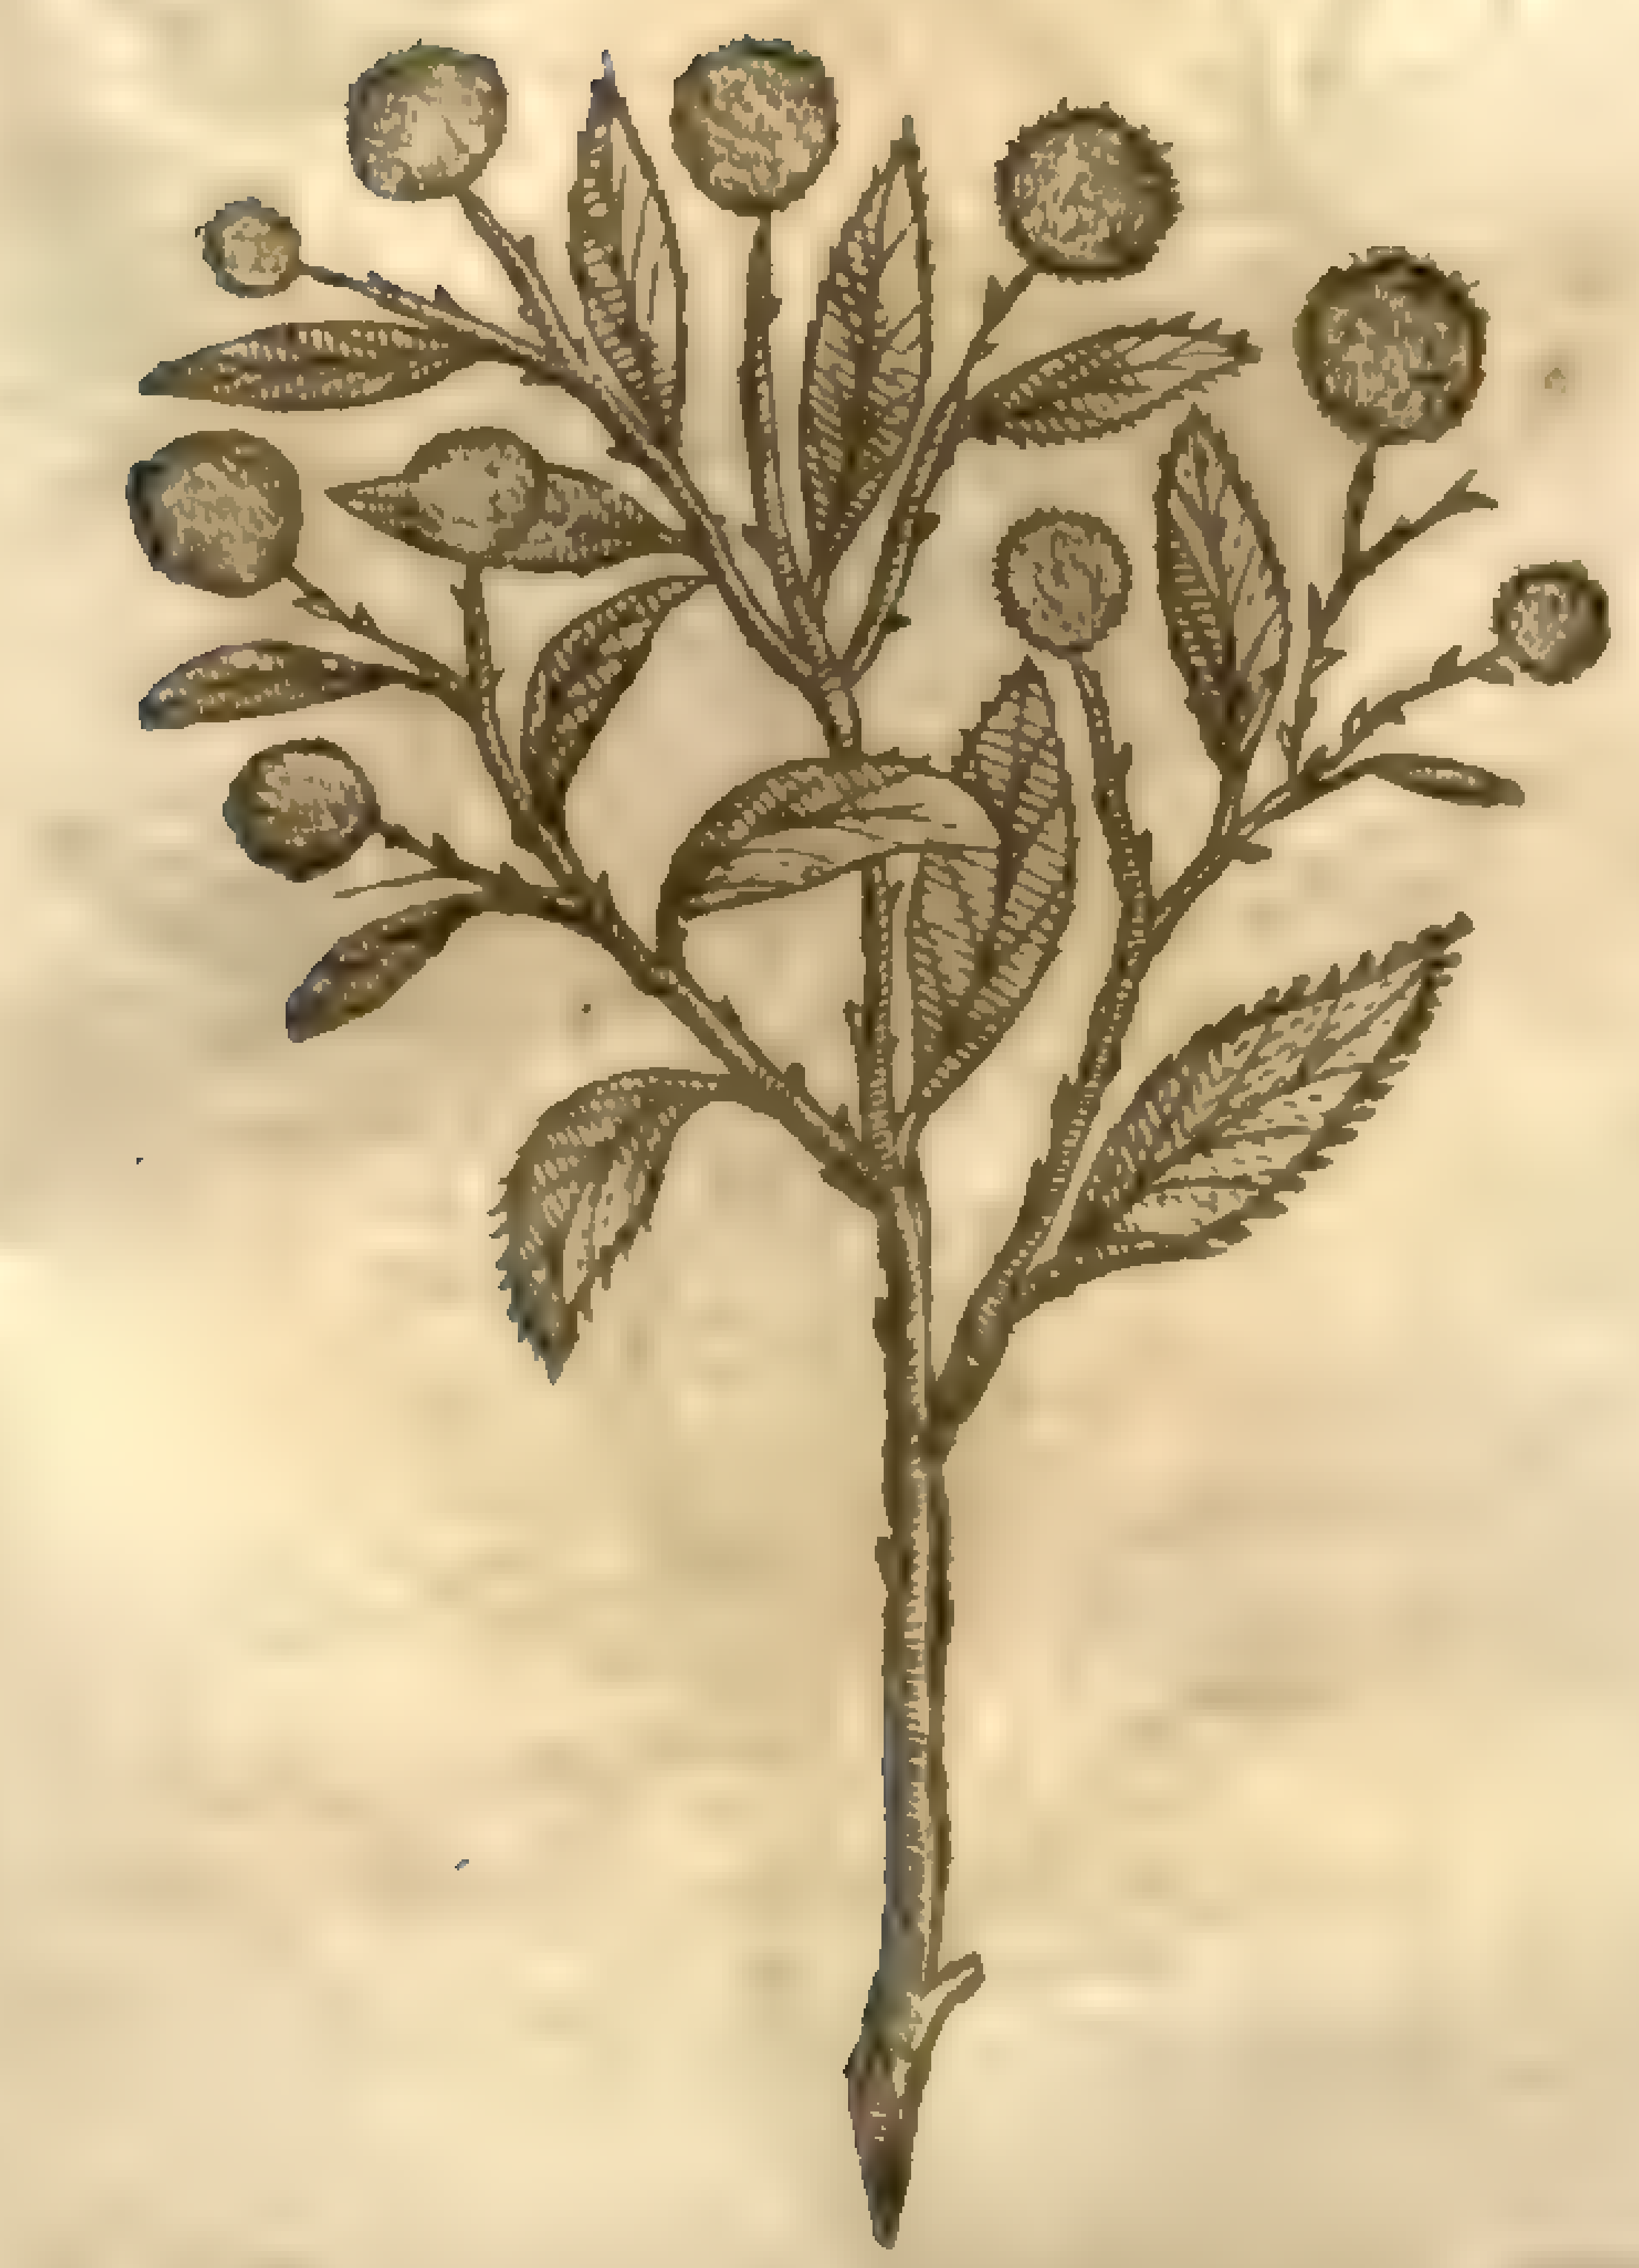


12 The low or baſe Ciſtus of Auſtria groweth likewiſe leaning to the ground, hauing many wooddy branches very firme and tough, couered with a blackiſh barke; whereon grow very many rough and hairy leaues in ſhape like thoſe of the ſmall Myrtle, of a ſhining green on the vpper ſide and of an aſtringent taſte: on euery branch ſtandeth one floure, ſeldom two, in form like the other, but conſiſting of one leafe deeply diuided into fiue parts, of a fleſhy white colour.

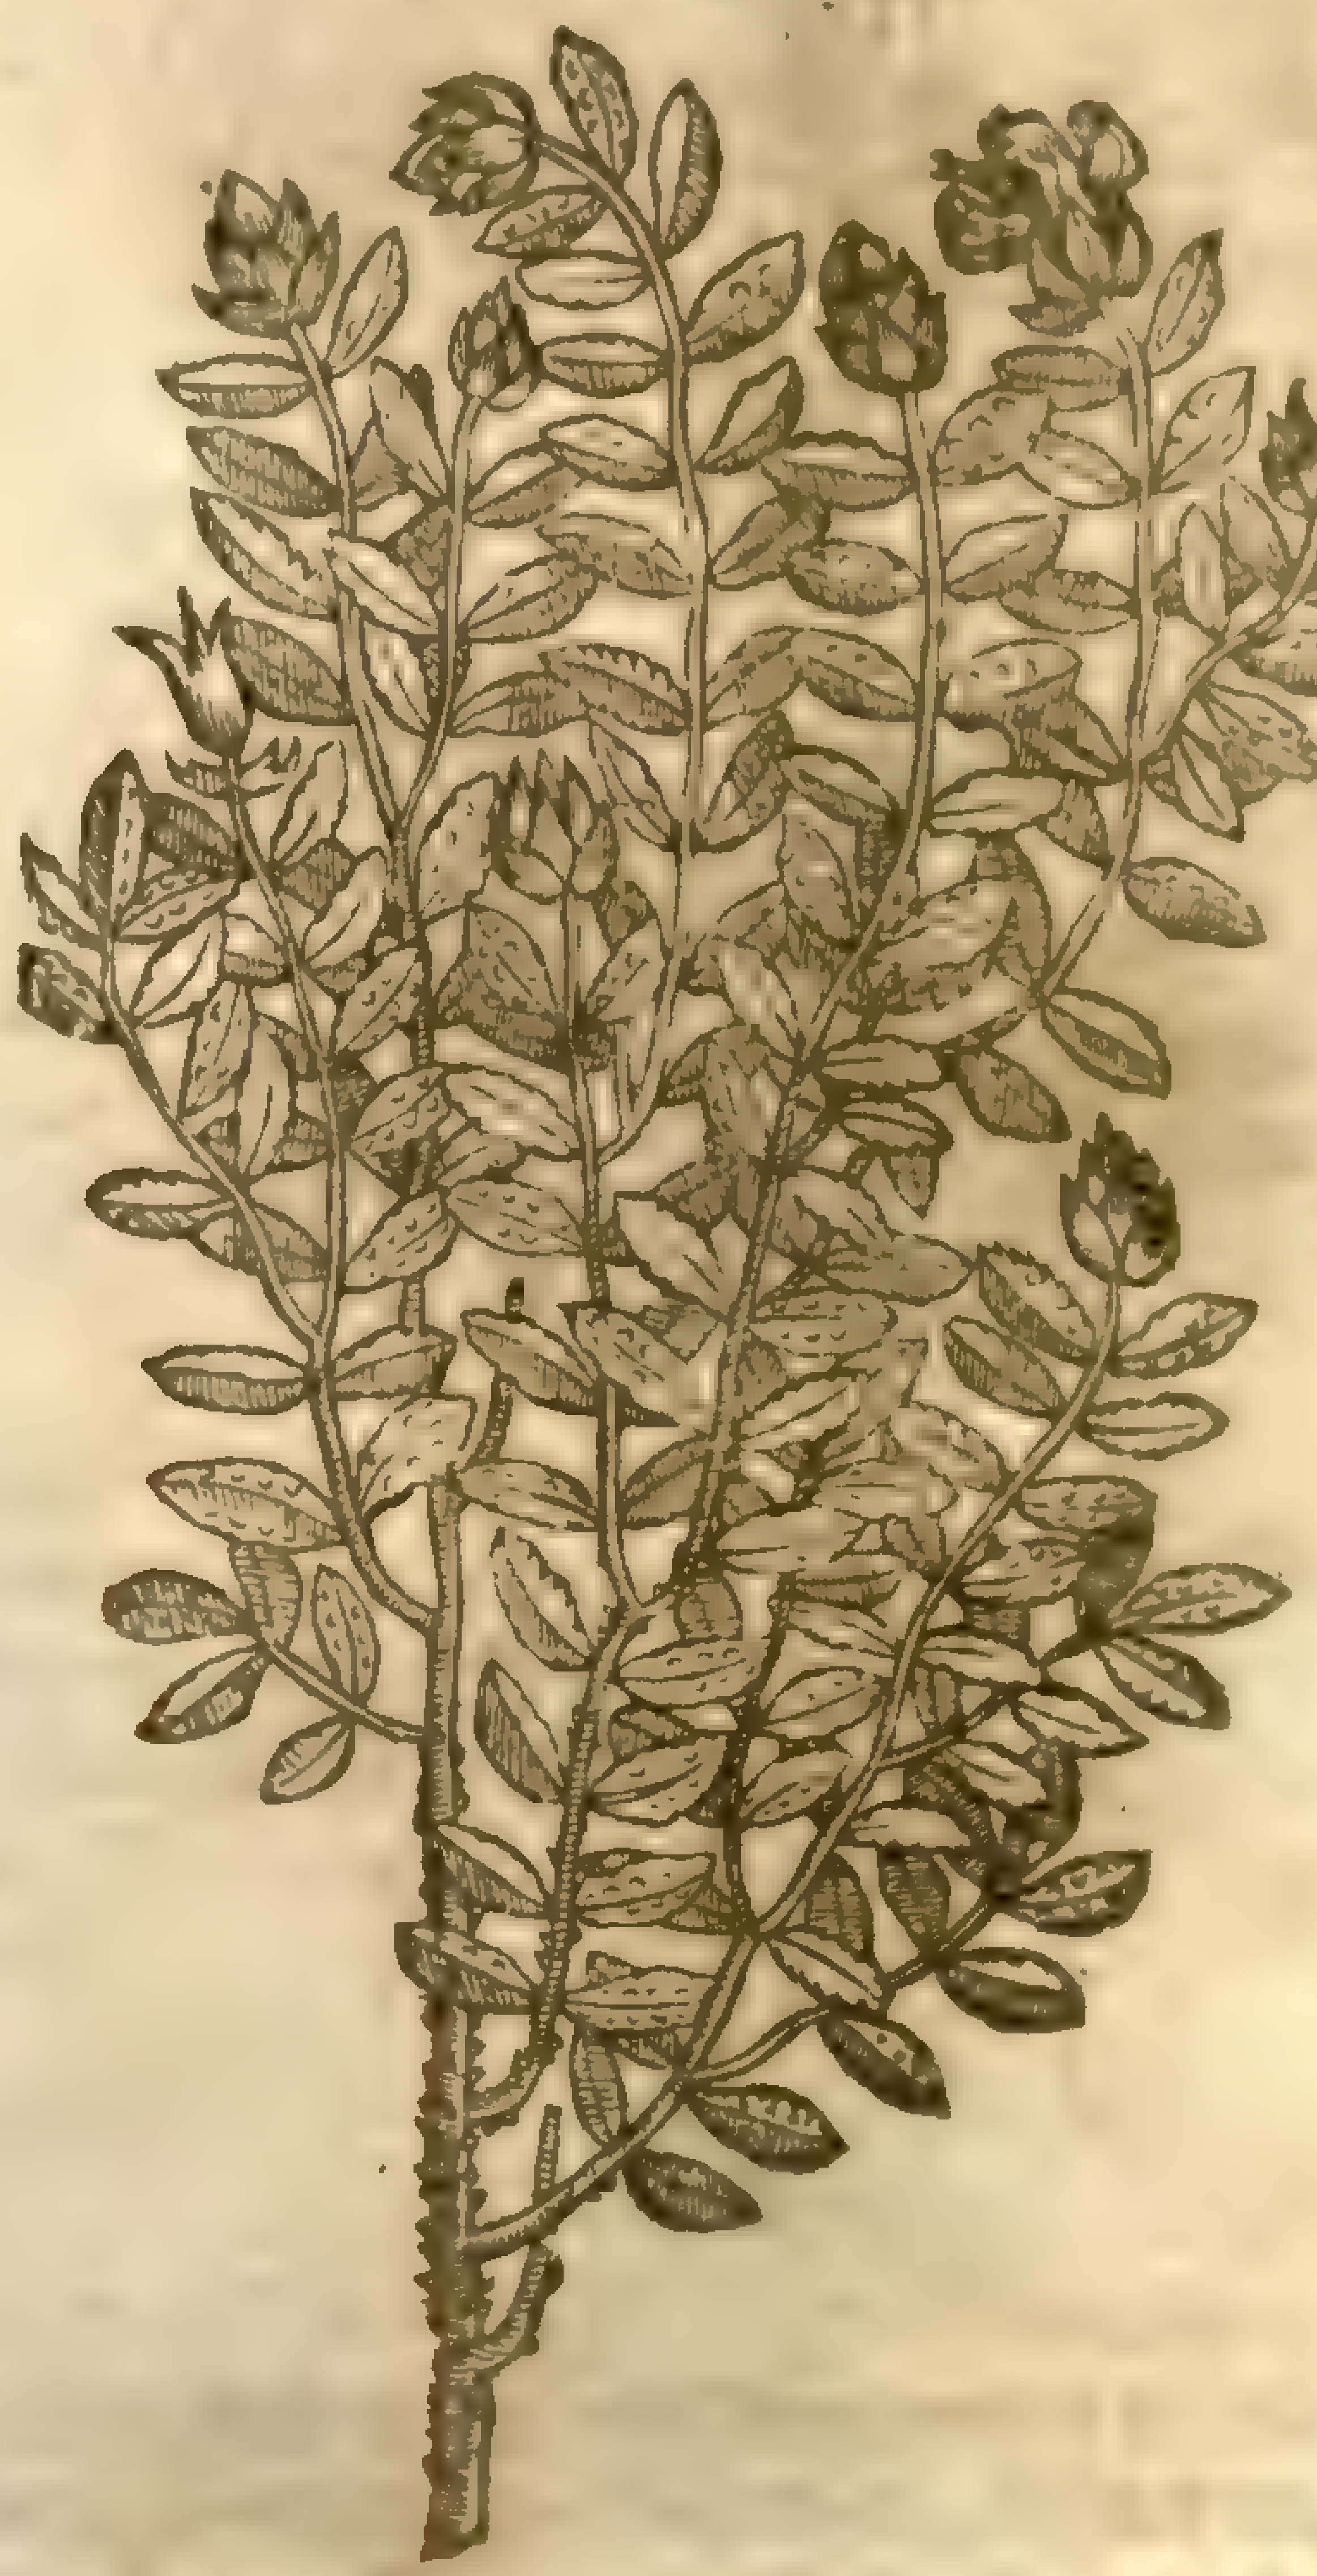
13 This low ſort of Ciſtus hath many tough branches trailing vpon the ground, of a reddiſh colour, whereon grow ſmall leaues like thoſe of wilde Tyme, of a dark green colour, very thick and fat, and ſomewhat hairy: the floures grow at the top of the branches, of a gold yellow colour, conſiſting of fiue ſmall leaues of a very ſweet ſmell: the root is thicke, hard, and wooddy.

14 This ſtrange and rare plant of *Lobels* obſeruation I haue thought meet to inſert among the kindes of Ciſtus, as a friend of theirs, if not one of the kinde: it hath leaues like the male Ciſtus, (the firſt in this chapter deſcribed) but more hairy, bearing at the top of his branches a ſmall knop in ſhape like a rotten Strawbery, but not of the ſame ſubſtance, for it is compact of a ſcaly or chaffie matter, ſuch as is in the midſt of the Camomill floures, and of a ruſſet colour.

14 *Ciſtus exoticus Lobelij.*
Lobels ſtrange Ciſtus.



16 *Myrtociſtus Th. Pennei Angli.*
Dr *Penny* his Ciſtus.



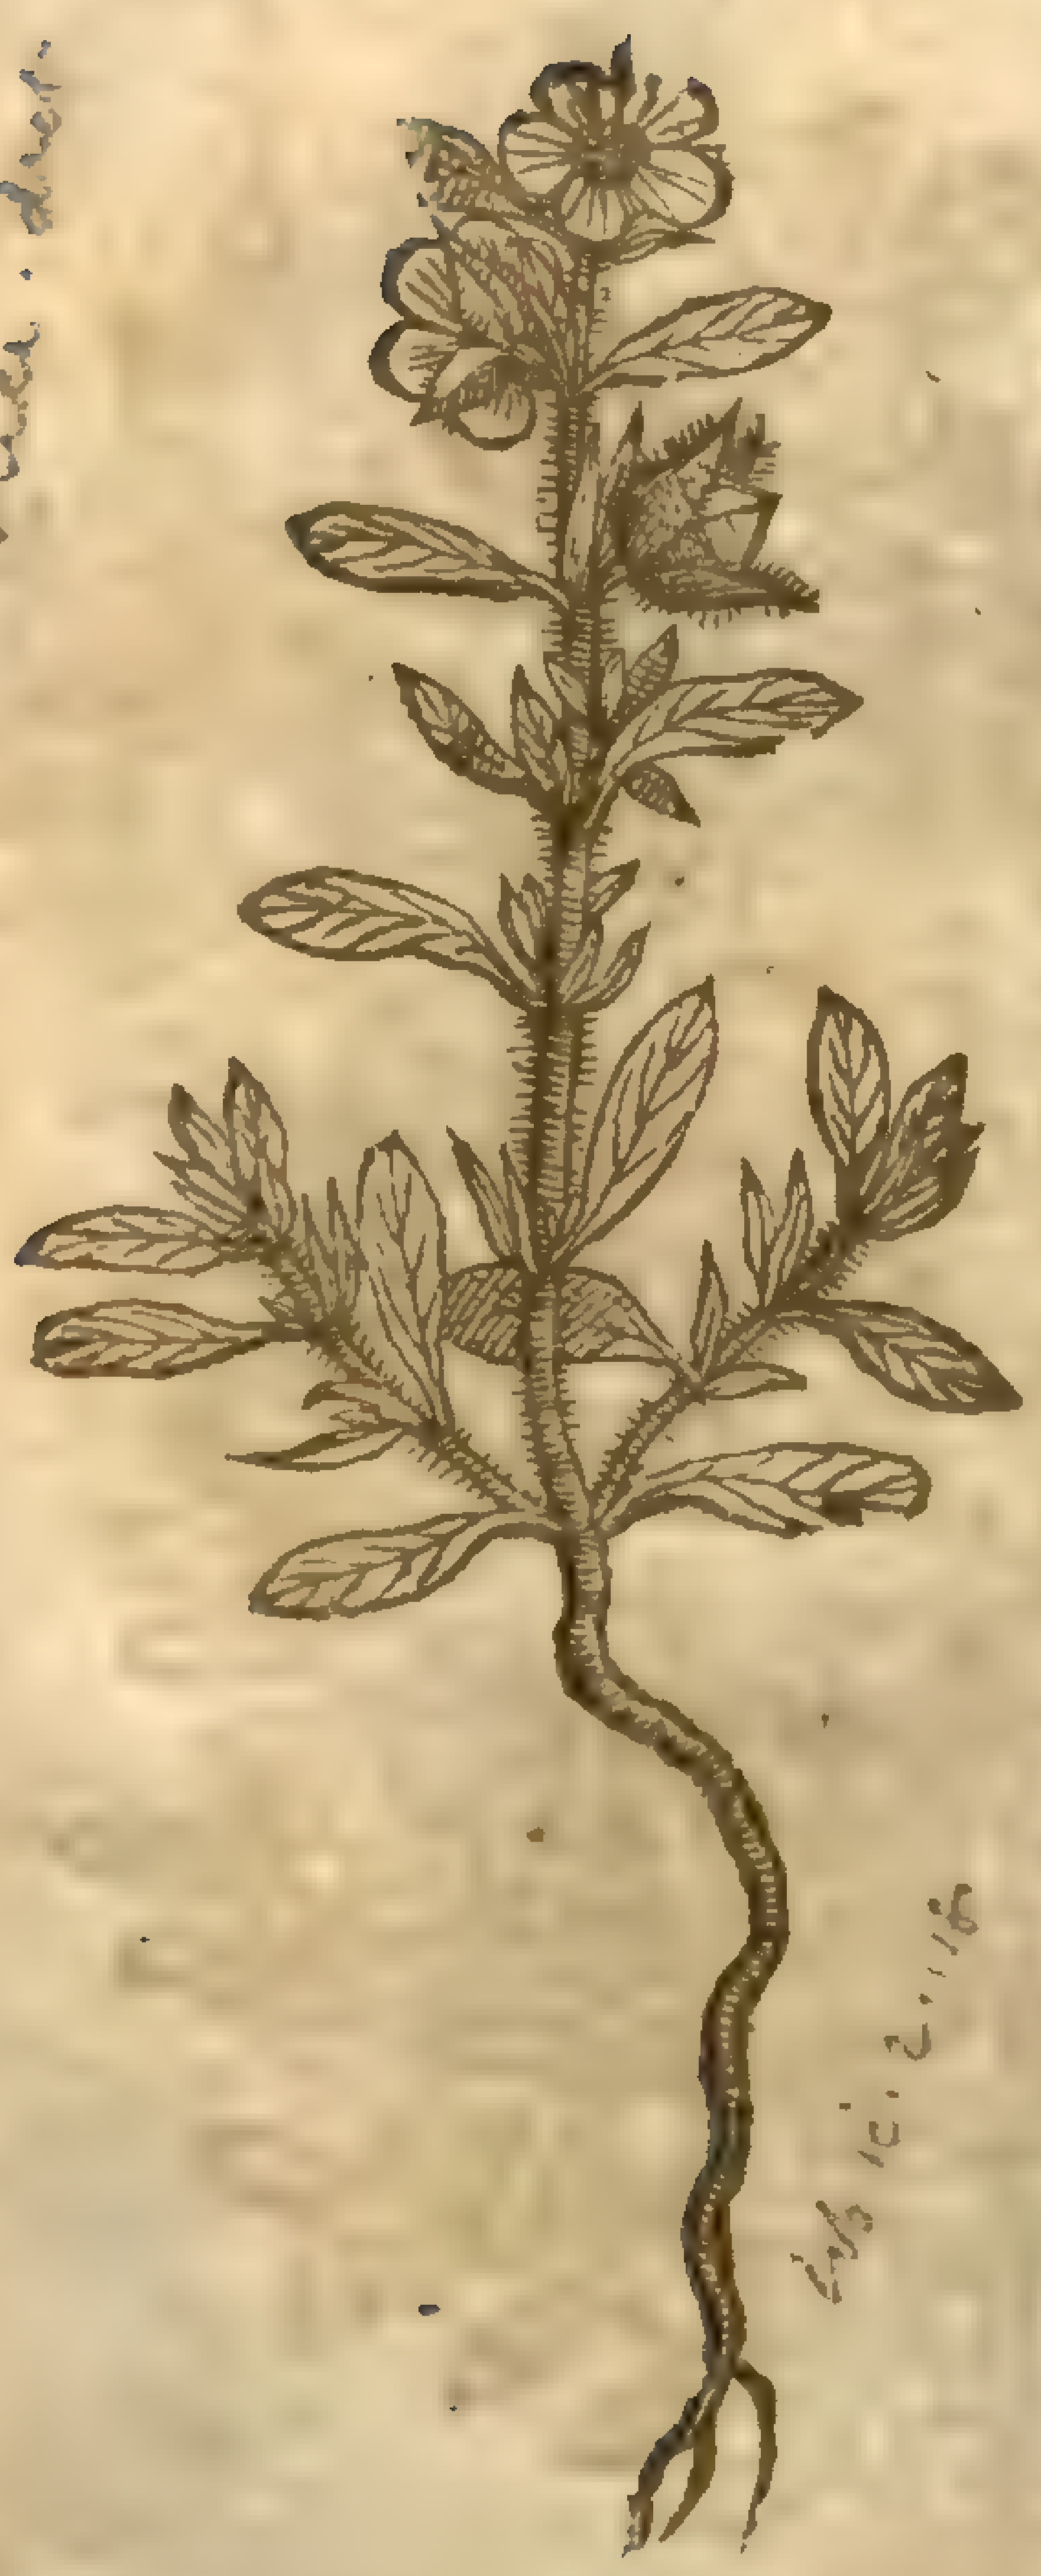
15 The adulterine or counterfeit Ciſtus growes to the height of a hedge buſh: the branches are long and brittle, whereon grow leaues like thoſe of the willow, of an ouerworn ruſſet colour: the floures are ſmall, conſiſting of fiue little yellow leaues: the whole plant being well viewed ſeemes to be a willow, but at the firſt ſight one of the Ciſtus, ſo that it is a plant participating of both: the root is wooddy. ‡ *Bauhine* iudges this (which our Author out of *Tabern.* figured and named *Ciſtus adulterinus*) to be the Ciſtus ſet forth in the eight place of the next chapter ſaue one: but I rather iudge it to be the *Ledum Sileſiacum* ſet forth in the eleuenth place of that chapter, and again in the twelfth, where you may finde more thereof. ‡

16 This kinde of Ciſtus, which Dr *Penny* a famous Phyſition of London deceaſed did gather vpon the Iſland of Majorca, and called by the name [illegible]. in Latin, *Myrtociſtus Balearica*, is a ſhrub growing to the height of three cubits, hauing a very rough bark, beſet round about with rough and ſcabbed warts, which barke wil of it ſelfe eaſily fall away from the old branches or boughes of the

tree. The leaues of this tree are almoſt like them of *Myrtus*, very rough vnderneath like the branches aforeſaid; but the leaues that grow higher, and towards the top of the branches, are ſmooth, growing about the branches very thicke together, as in the other kinds of Ciſtus. The floures are yellow, growing on the top of the twigs, conſiſting of fiue long leaues ful of many very long chiues within. When the floures be vaded, there followeth a very long and fiue ſquare head or husk ful of ſeed. The whole tree is very ſweet, out of which iſſueth a gum or roſin, or rather a thicke clammie and fat juice, ſuch as commeth forth of the kindes of *Ledum*.

17 This annuall Ciſtus groweth vp from ſeed with one vpright ſtalk to the height of a cubit, oft times diuided into other ſmal branches: whereon grow rough leaues ſomewhat long, of a dark green colour: the floures grow at the top of the ſtalks, conſiſting of fiue ſmall yellow leaues: which being paſt, there followes a three ſquare ſeed veſſel full of ſmall reddiſh ſeed. The root is ſmal and wooddy, and periſheth when the ſeed is perfected.

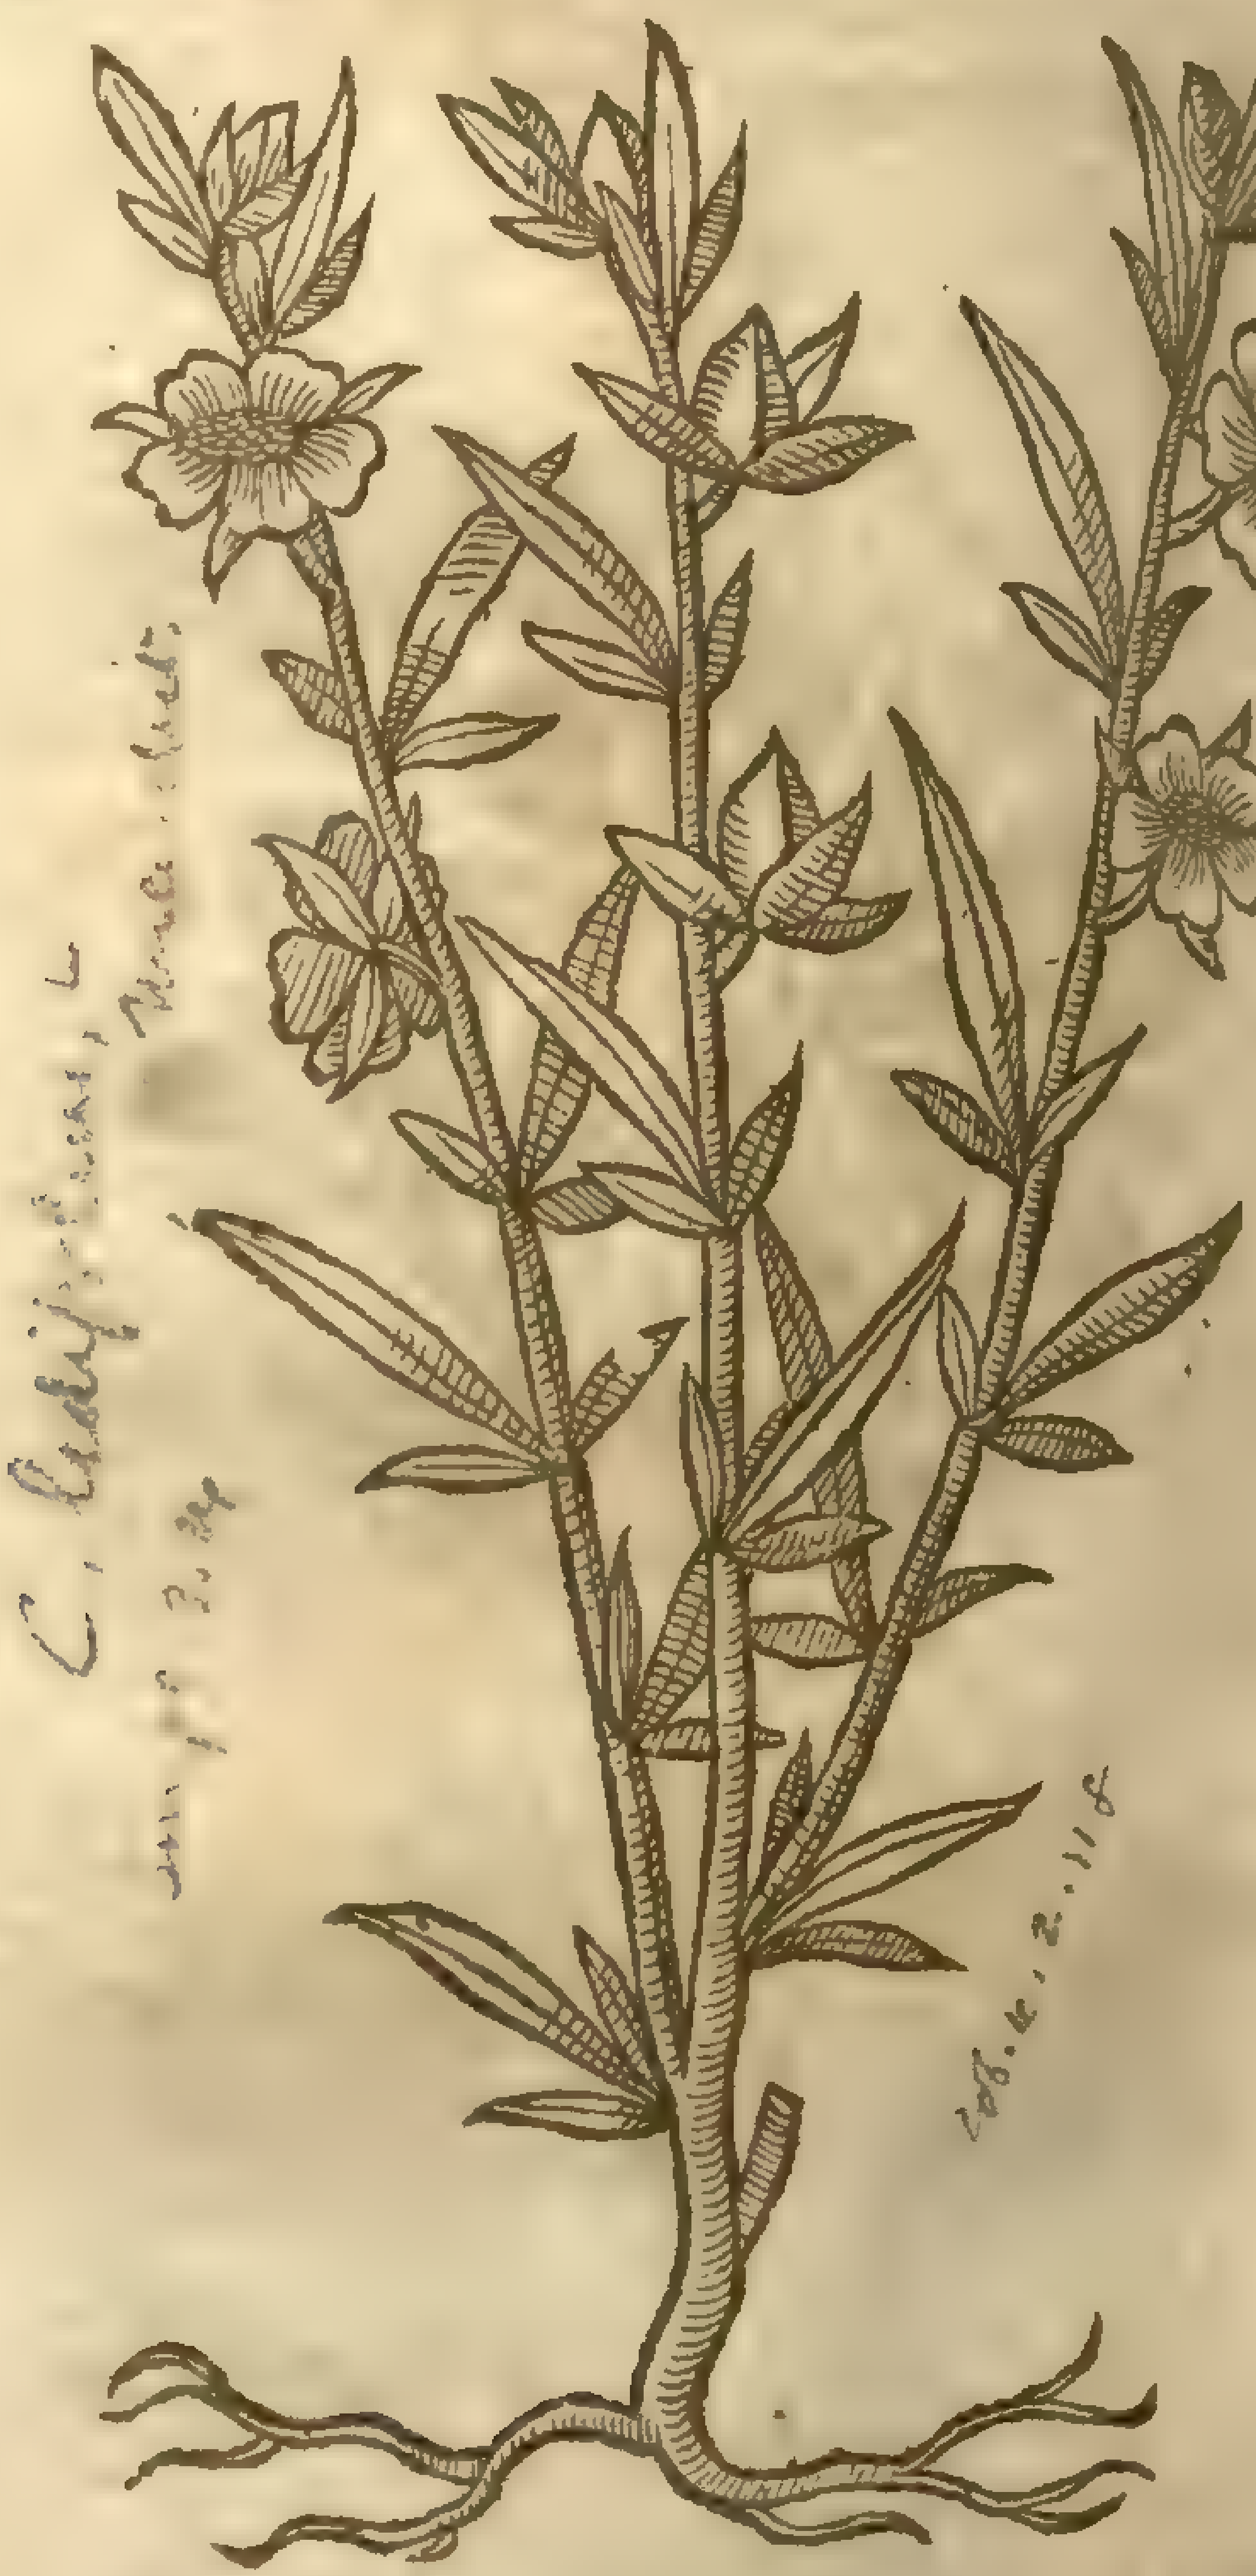
17 *Ciſtus annuus.*
Ciſtus laſting one yeare.



C. salviæfolius, L. Mill. dict.

Lob. ic. 2. 116

18 *Ciſtus annuus longifolius Lobelij.*
Long leafed yearely Ciſtus.



C. ledifolius, L. Mill. dict.

[illegible] p. 2, 34

Lob. ic. 2. 118

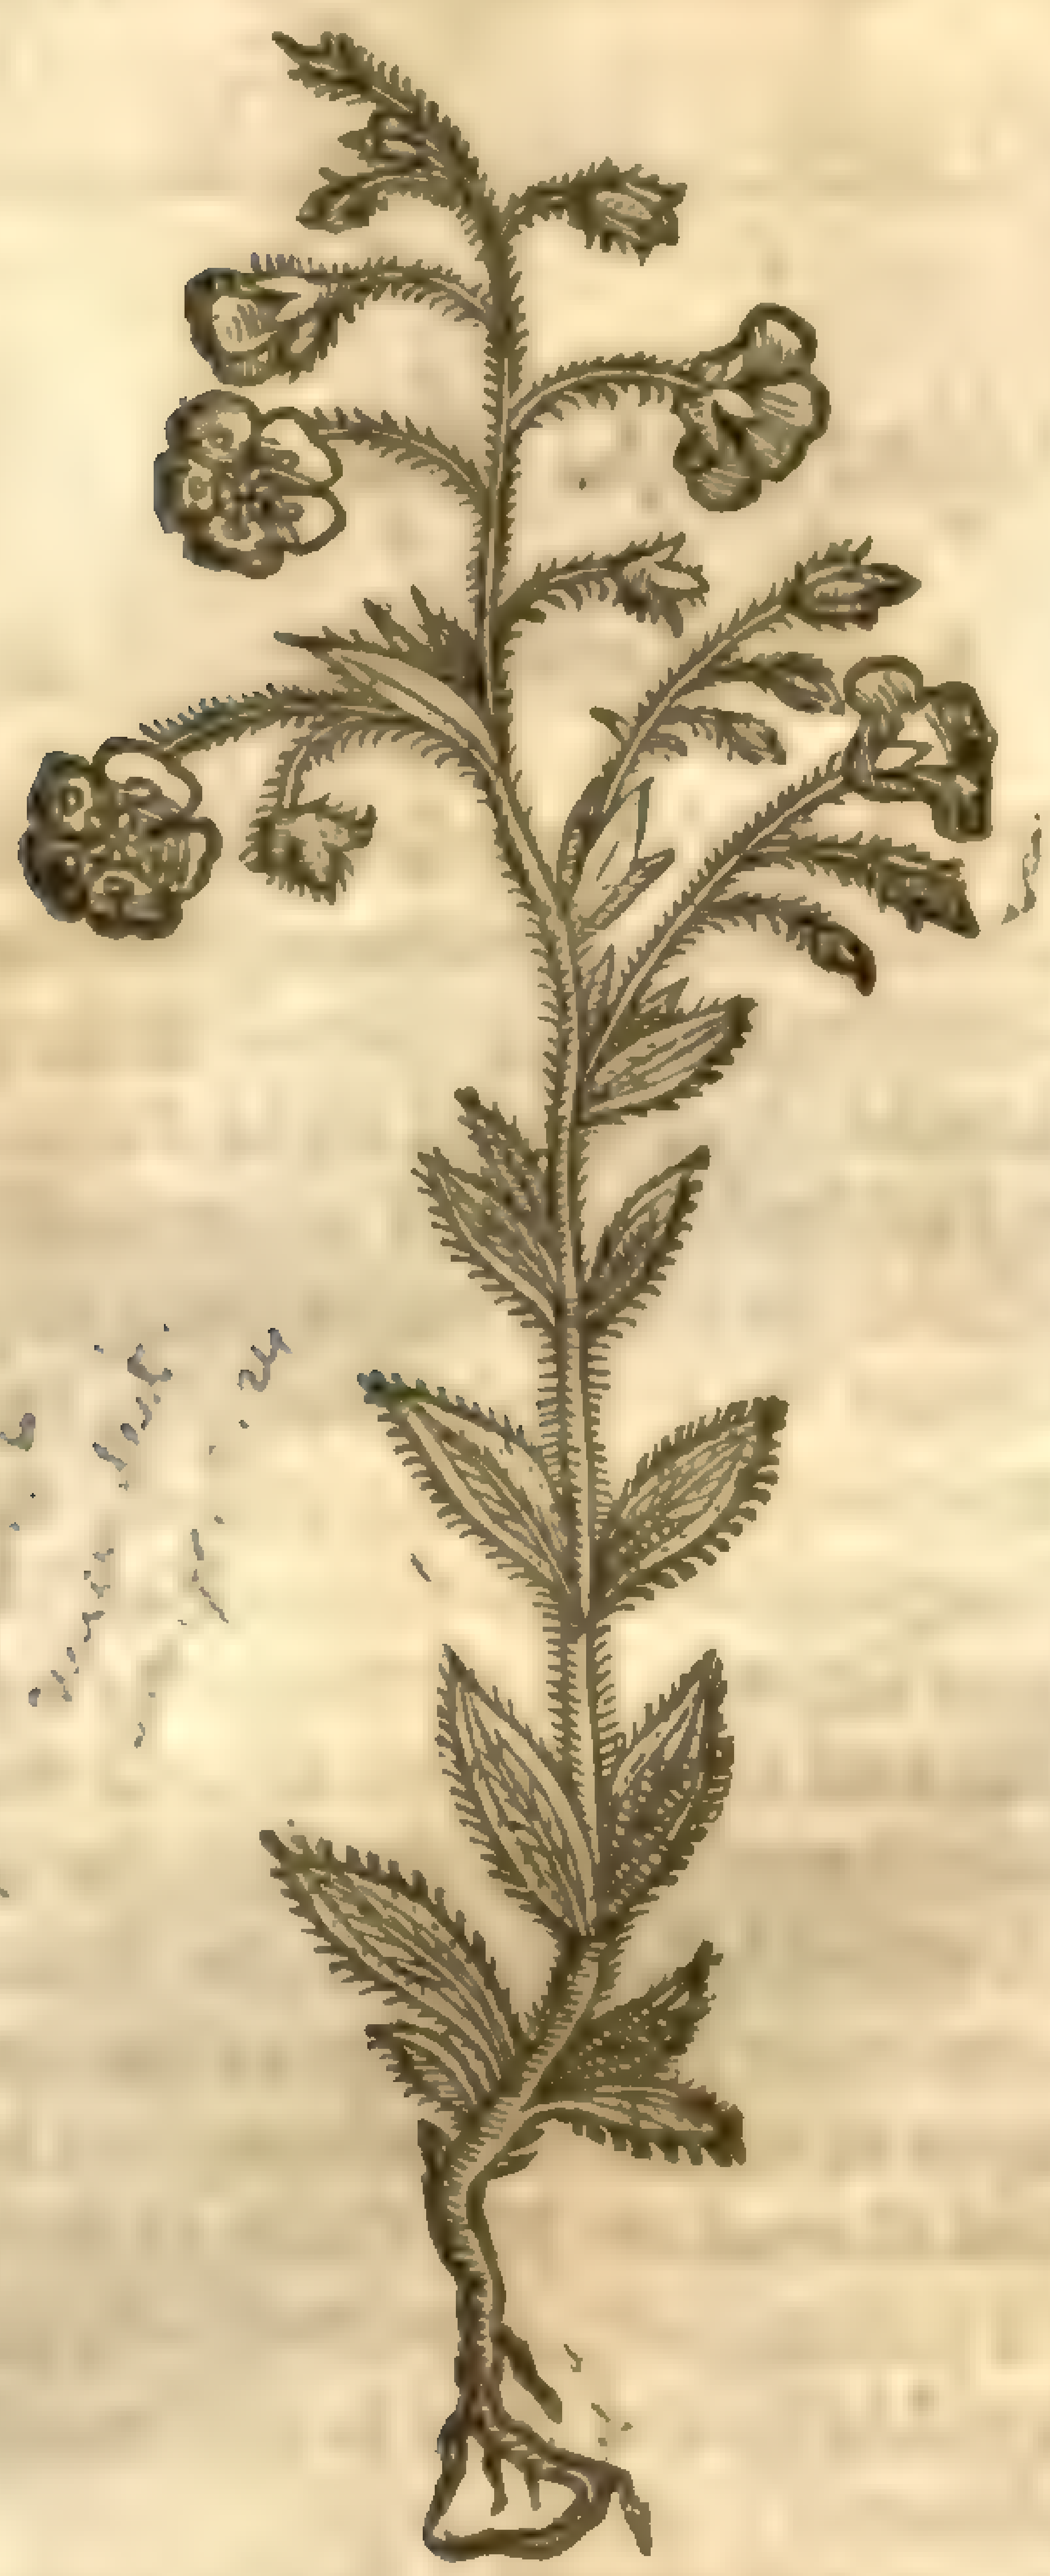
18 This other Ciſtus which laſteth but a yeare, hath long ſtalks diuided into other branches of the height of two cubits; whereon grow long rough leaues ſet three together at certain diſtances, the middlemoſt whereof is longer than the other two: the flours grow on the ſides of the branches like the female Ciſtus, of a white colour: the root is of a wooddy ſubſtance, as are all the reſt of his kinde.

‡ 19 This growes ſome foot high, with a ſquare rough greeniſh ſtalke, whereon by couples at certain ſpaces ſtand little longiſh rough leaues, yet toward the top of the ſtalke they ſtand ſomtimes three together: vpon the top of the little branches grow floures like thoſe of the other Ciſtus, of colour yellow, with a fine ſanguine ſpot vpon each leafe of the floure. It groweth in ſome parts of France, as alſo on the Alps in Italy. *Cluſius* deſcribes it by the name of *Ciſtus annuus* 2. *Pona* in his *Mons Baldus* calls it *Ciſtus annuus flore guttato.*

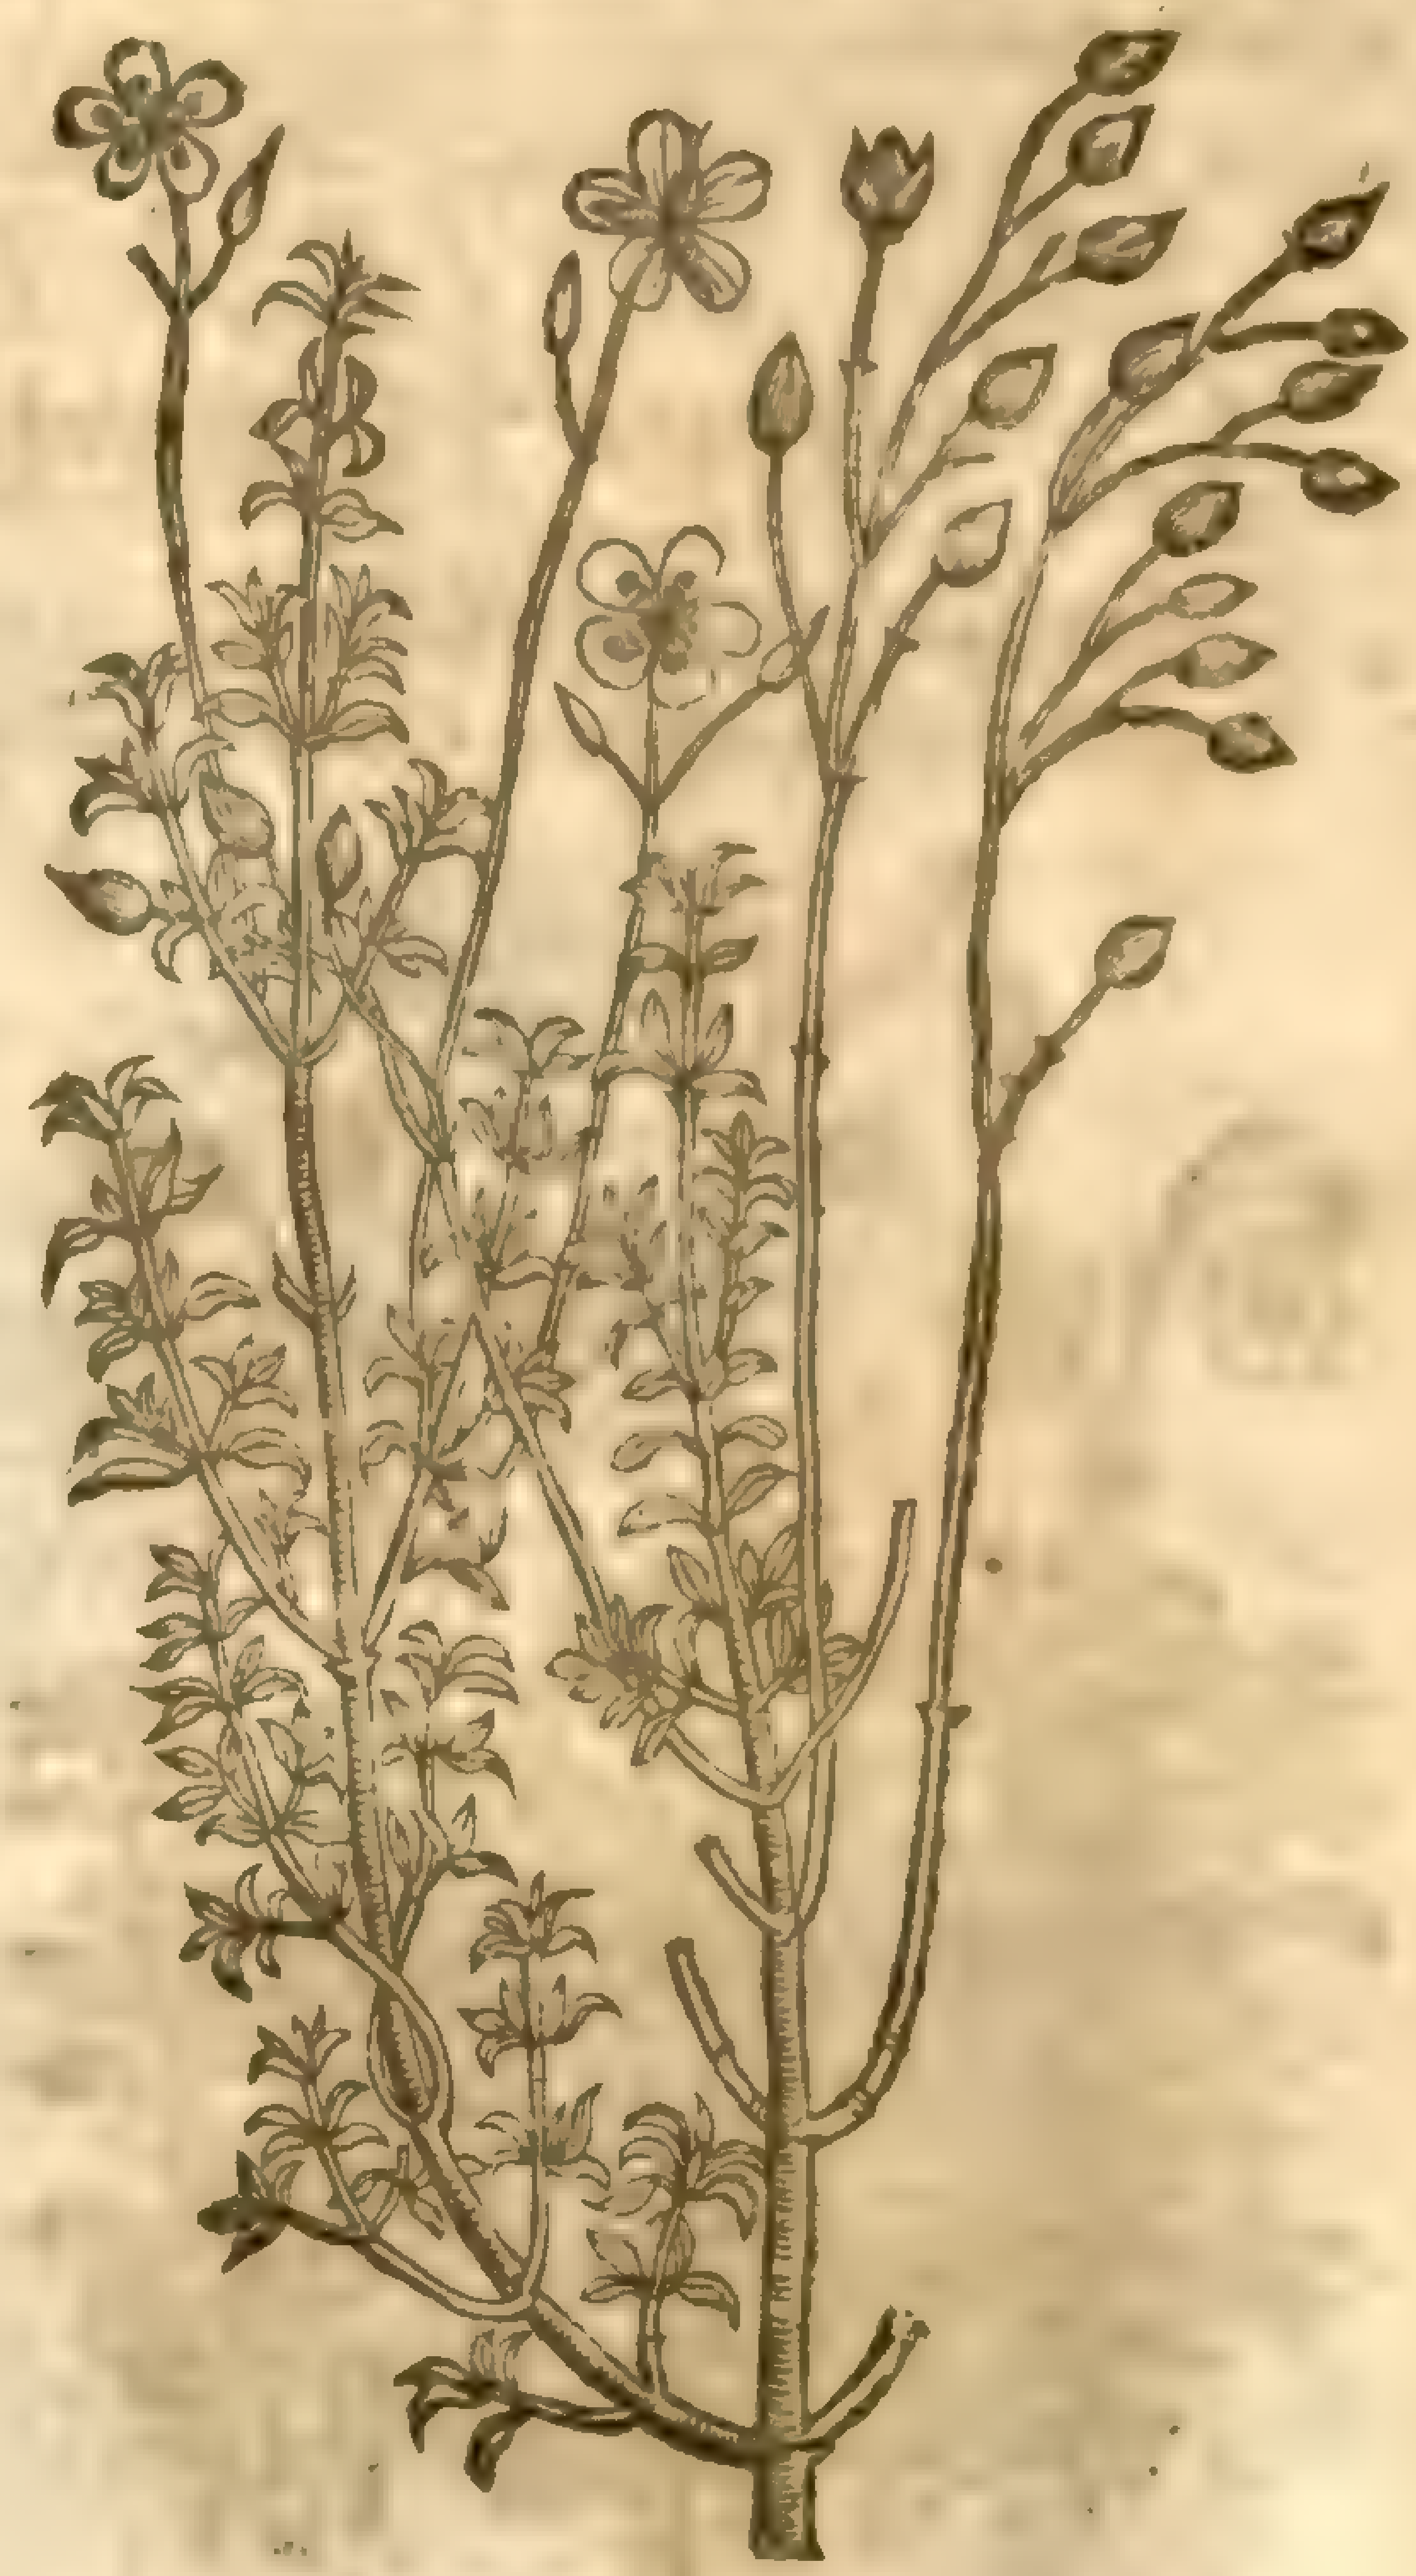
20 This hath many ſlender branches whereon grow ſmall roundiſh leaues, hoary, and ſomewhat like thoſe of Marjerome, ſomewhat leſſe, with the middle rib ſtanding out. The floures grow vpon the tops of the branches, and conſiſt of fiue white leaues, with a darke purple ſpot in the middle of each leafe: the threads in the middle of the floure are of a yellow colour: the ſeed-veſſels

are of the bigneſſe of thoſe of flax, but three ſquare, containing a ſeed of the bigneſſe of that of Henbane. *Cluſius* found this in diuers parts of Spaine, and ſets it forth by the name of *Ciſtus folio Sampſuchi*. ‡

‡ 19 *Ciſtus annuus flore maculato.*
Spotted annuall Ciſtus.



‡ 20 *Ciſtus folio Sampſuchi.*
Marjerome leafed Ciſtus.



¶ *The Place.*

Holly Roſes grow in Italy, Spain, and Languedoc, and in the countries bordering vpon the riuer Padus, in all Hetruria and Maſſiles, and in many other of the hotter prouinces of Europe, in dry and ſtony places, varying infinitely according to the diuerſitie of the regions where they grow. Of which I haue two ſorts in my garden, the firſt, and the *Ciſtus annuus*.

¶ *The Time.*

They floure from May to September.

¶ *The Names.*

The Holly Roſe is called in Greeke, κίϛος, and κίσθος: in Latine alſo *Ciſtus*, and *Roſa ſylvatica*: of diuers, *Roſa Canina*, as *Scribonius Largus* writes, but not properly: in Spaniſh, *Eſtepa*: of the Portugals *Roſella*: in Engliſh, Holly Roſe, and Ciſtus after the Greek name. The fungous excreſcence growing at the root of Ciſtus, is called in Greeke ὑποκιϛὶς, becauſe it growes vnder the ſhrub Ciſtus: it is alſo called *Limodoron*: ſome call it κύτινος, among which is *Paulus Ægineta*, who alſo doth not call that *Hypociſtis* which groweth vnder the ſhrub Ciſtus, but the juice hereof: wherupon might grow the word *Hypociſtis*, by which name the Apothecaries call this juice when it is hardned: of ſome it is called *Erithanon*, *Citinus*, and *Hypoquiſtidos*.

¶ *The Nature.*

Ciſtus, as *Galen* ſaith, doth greatly dry, almoſt in the ſecond degree, and it is of that coldnes, that it hath withall a temperat heate: the leaues and the firſt buds being beaten do only dry and bind, in ſuch ſort as they may cloſe vp vlcers, and joine together green wounds.

¶ *The Vertues.*

The floures are of moſt force, which being drunke with wine are good againſt the bloudy flixe, weakneſſe of the ſtomacke, fluxes, and ouerflowing of moiſt humors. A

They cure putrified vlcers, being applied in manner of a pultis. *Dioſcorides* teacheth, That they are a remedie for eating vlcers, called in Greeke Νομαὶ, being anointed therewith; and that they cure burnings, ſcaldings, and old vlcers. B

C *Hypociſtis* is much more binding: it is a ſure remedie for all infirmities that come of fluxes, as voiding of bloud, the whites, the laske, and the bloudy flix: but if it be requiſit to ſtrengthen that part which is ouerweakned with a ſuperfluous moiſture, it doth notably comfort and ſtrengthen the ſame.

D It is excellent to be mixed with fomentations that ſerue for the ſtomack and liuer.

E It is put into the Treacle of Vipers, to the end it ſhould comfort and ſtrengthen weake bodies, as *Galen* writeth.

Chap. 6.

Of other Plants reckoned for dwarfe kindes of Ciſtus.

1. 2. *Helianthemum Anglicum luteum vel album.*
English yellow or white dwarfe Ciſtus.

Lob. ic. 2. 116

Cistus helianthemum, &c
Ins. 96. 3. 26

¶ *The Deſcription.*

1 THe Engliſh dwarfe Ciſtus, called of *Lobel, Panax Chironium* (but there is another *Panax* of *Chirons* deſcription which I hold to be the true and right *Panax*, notwithſtanding hee hath inſerted it amongſt the kindes of Ciſtus, as being indifferent to joyne with vs and others for the inſertion) is a low and baſe plant creeping vpon the ground, hauing many ſmall tough branches of a browne colour; wherupon grow little leaues ſet together by couples, thicke, fat, and ful of ſubſtance, and couered ouer with a ſoft downe; from the boſome whereof come forth other leſſer leaues: the floures before they be open are ſmall knops or buttons, of a browne colour mixed with yellow, and beeing open and ſpred abroad are like thoſe of the wilde Tanſie, & of a yellow colour, with ſome yellower chiues in the middle: the root is thicke, and of a wooddy ſubſtance.

2 The ſecond is very like to the precedent, ſauing that the leaues are long, and do not grow ſo thicke thruſt together, and are more woolly. the flours are greater, and of a white color, wherin the eſpeciall difference conſiſteth. The root is like the former.

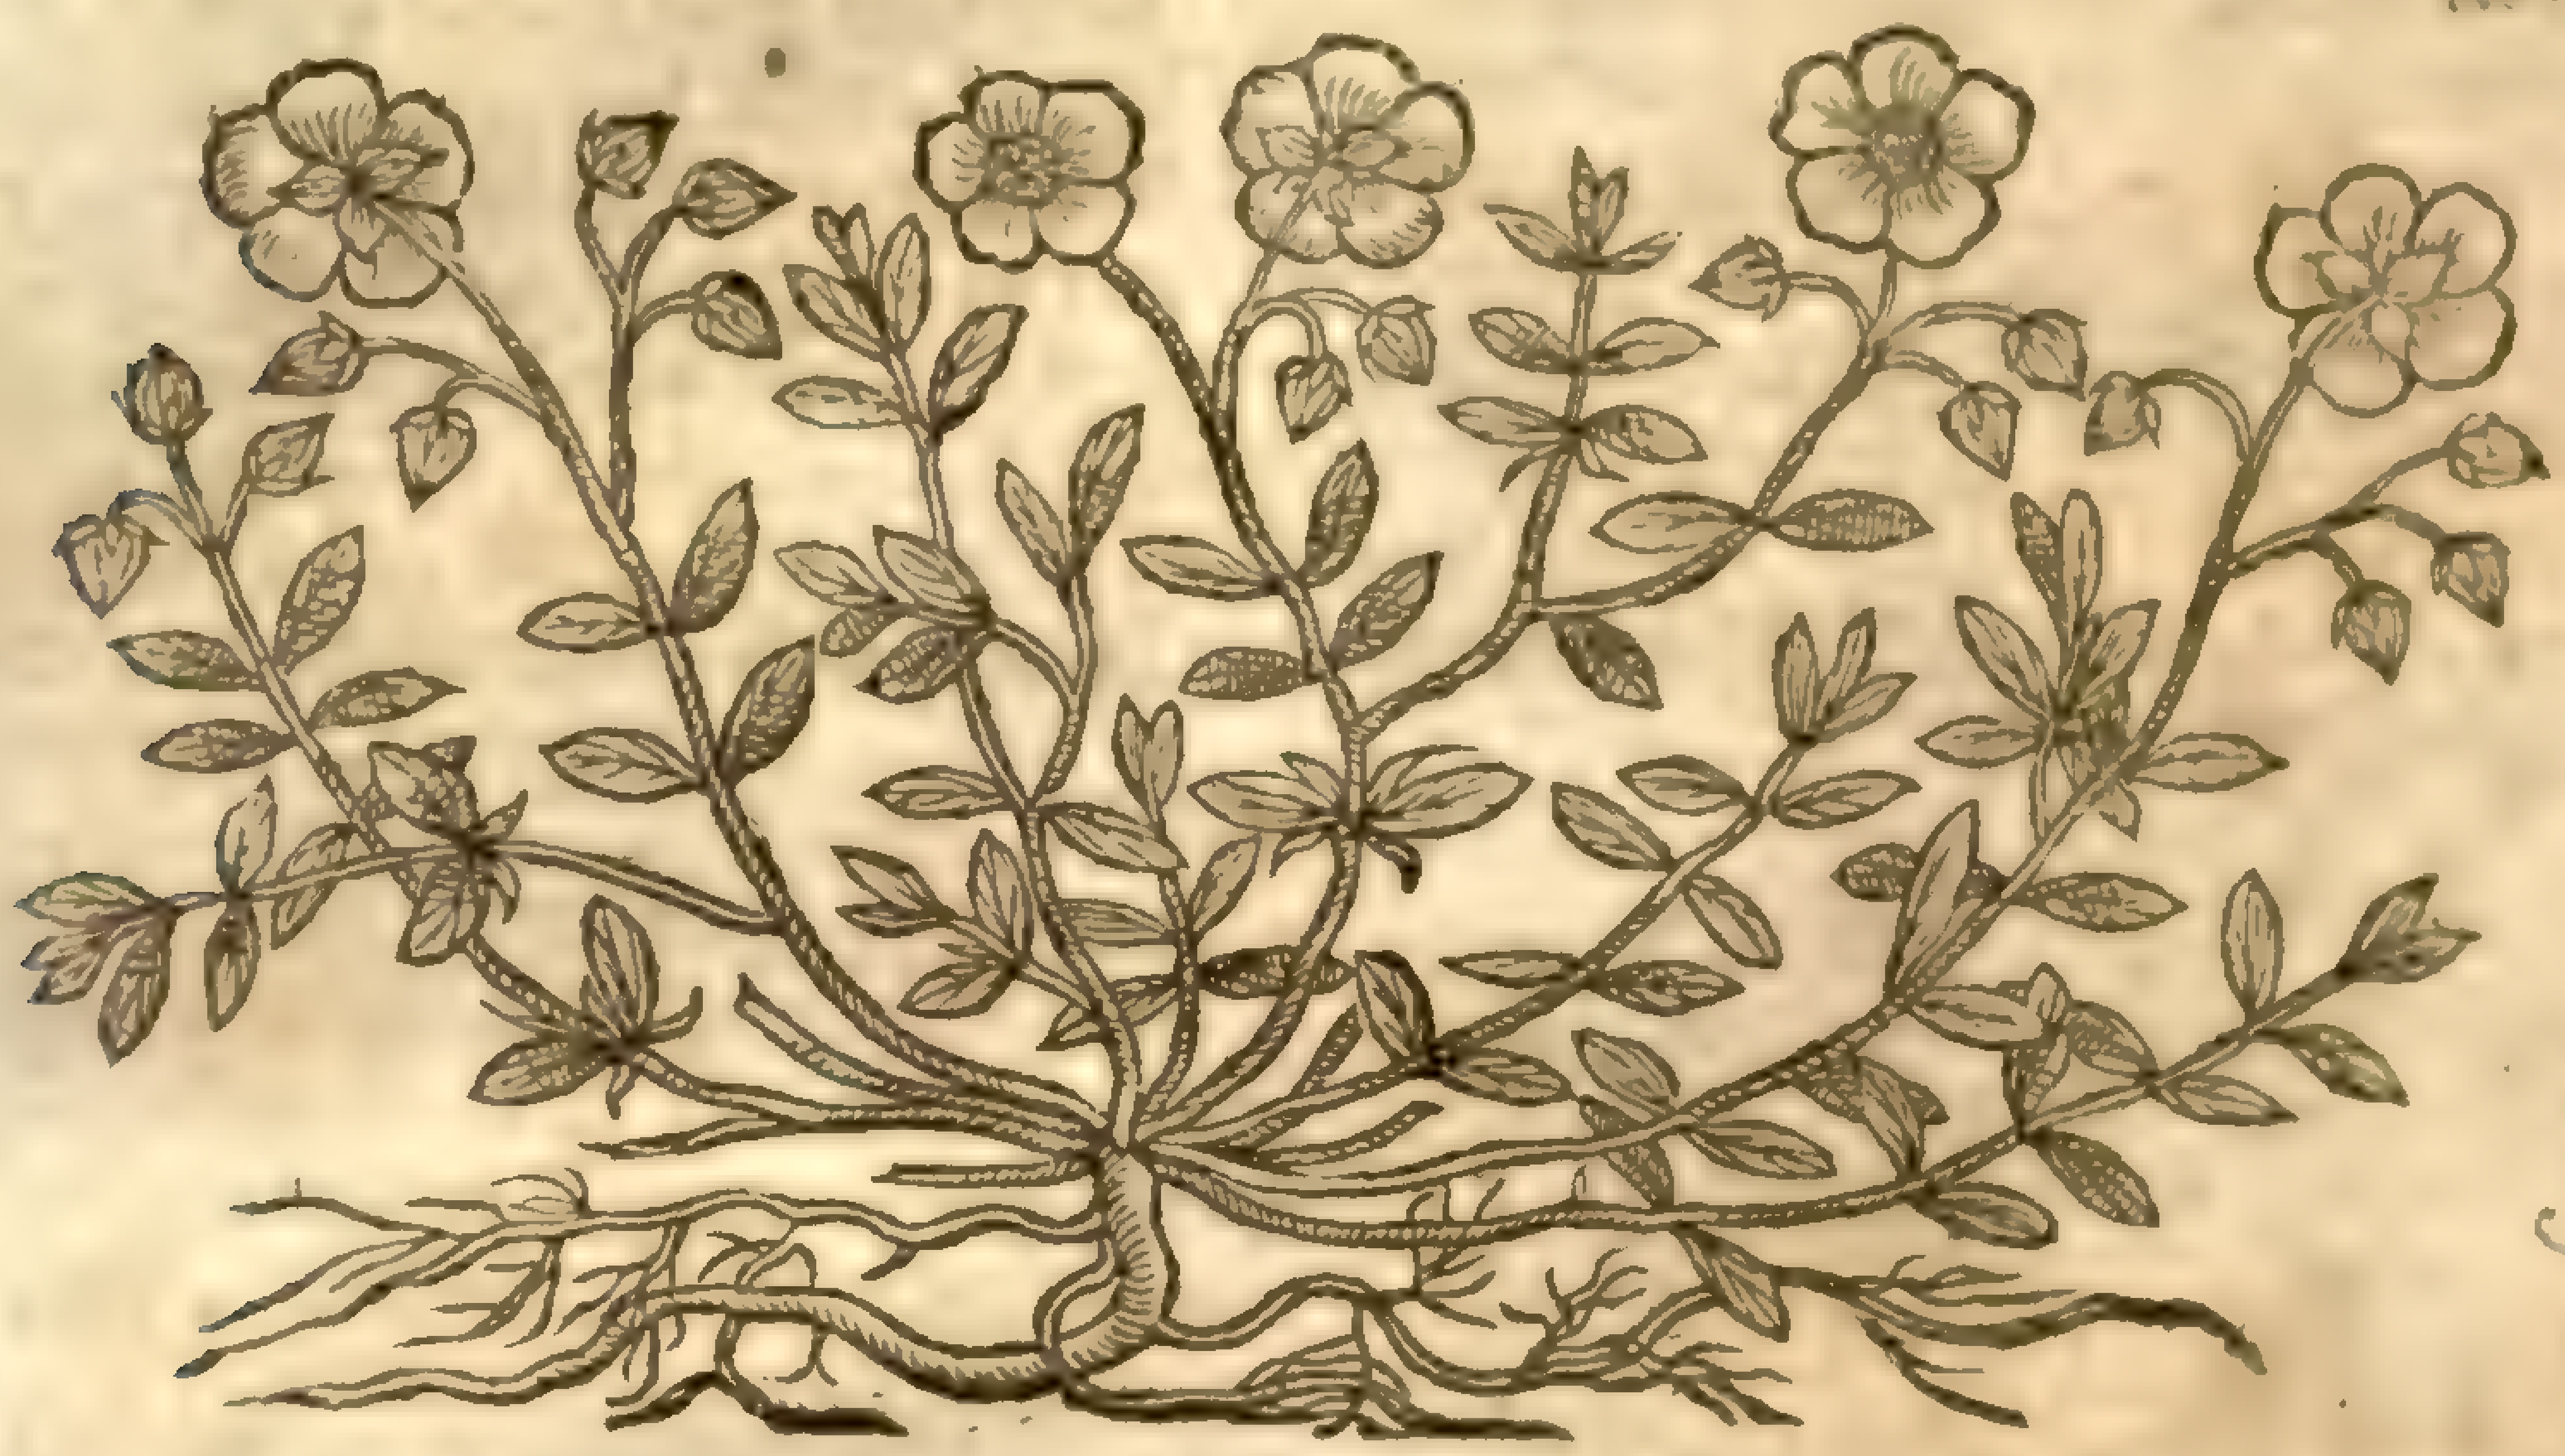
3 *Helianthemum luteum Germanicum.* The yellow dwarfe Ciſtus of Germany.

Lob. ic. 2. 117

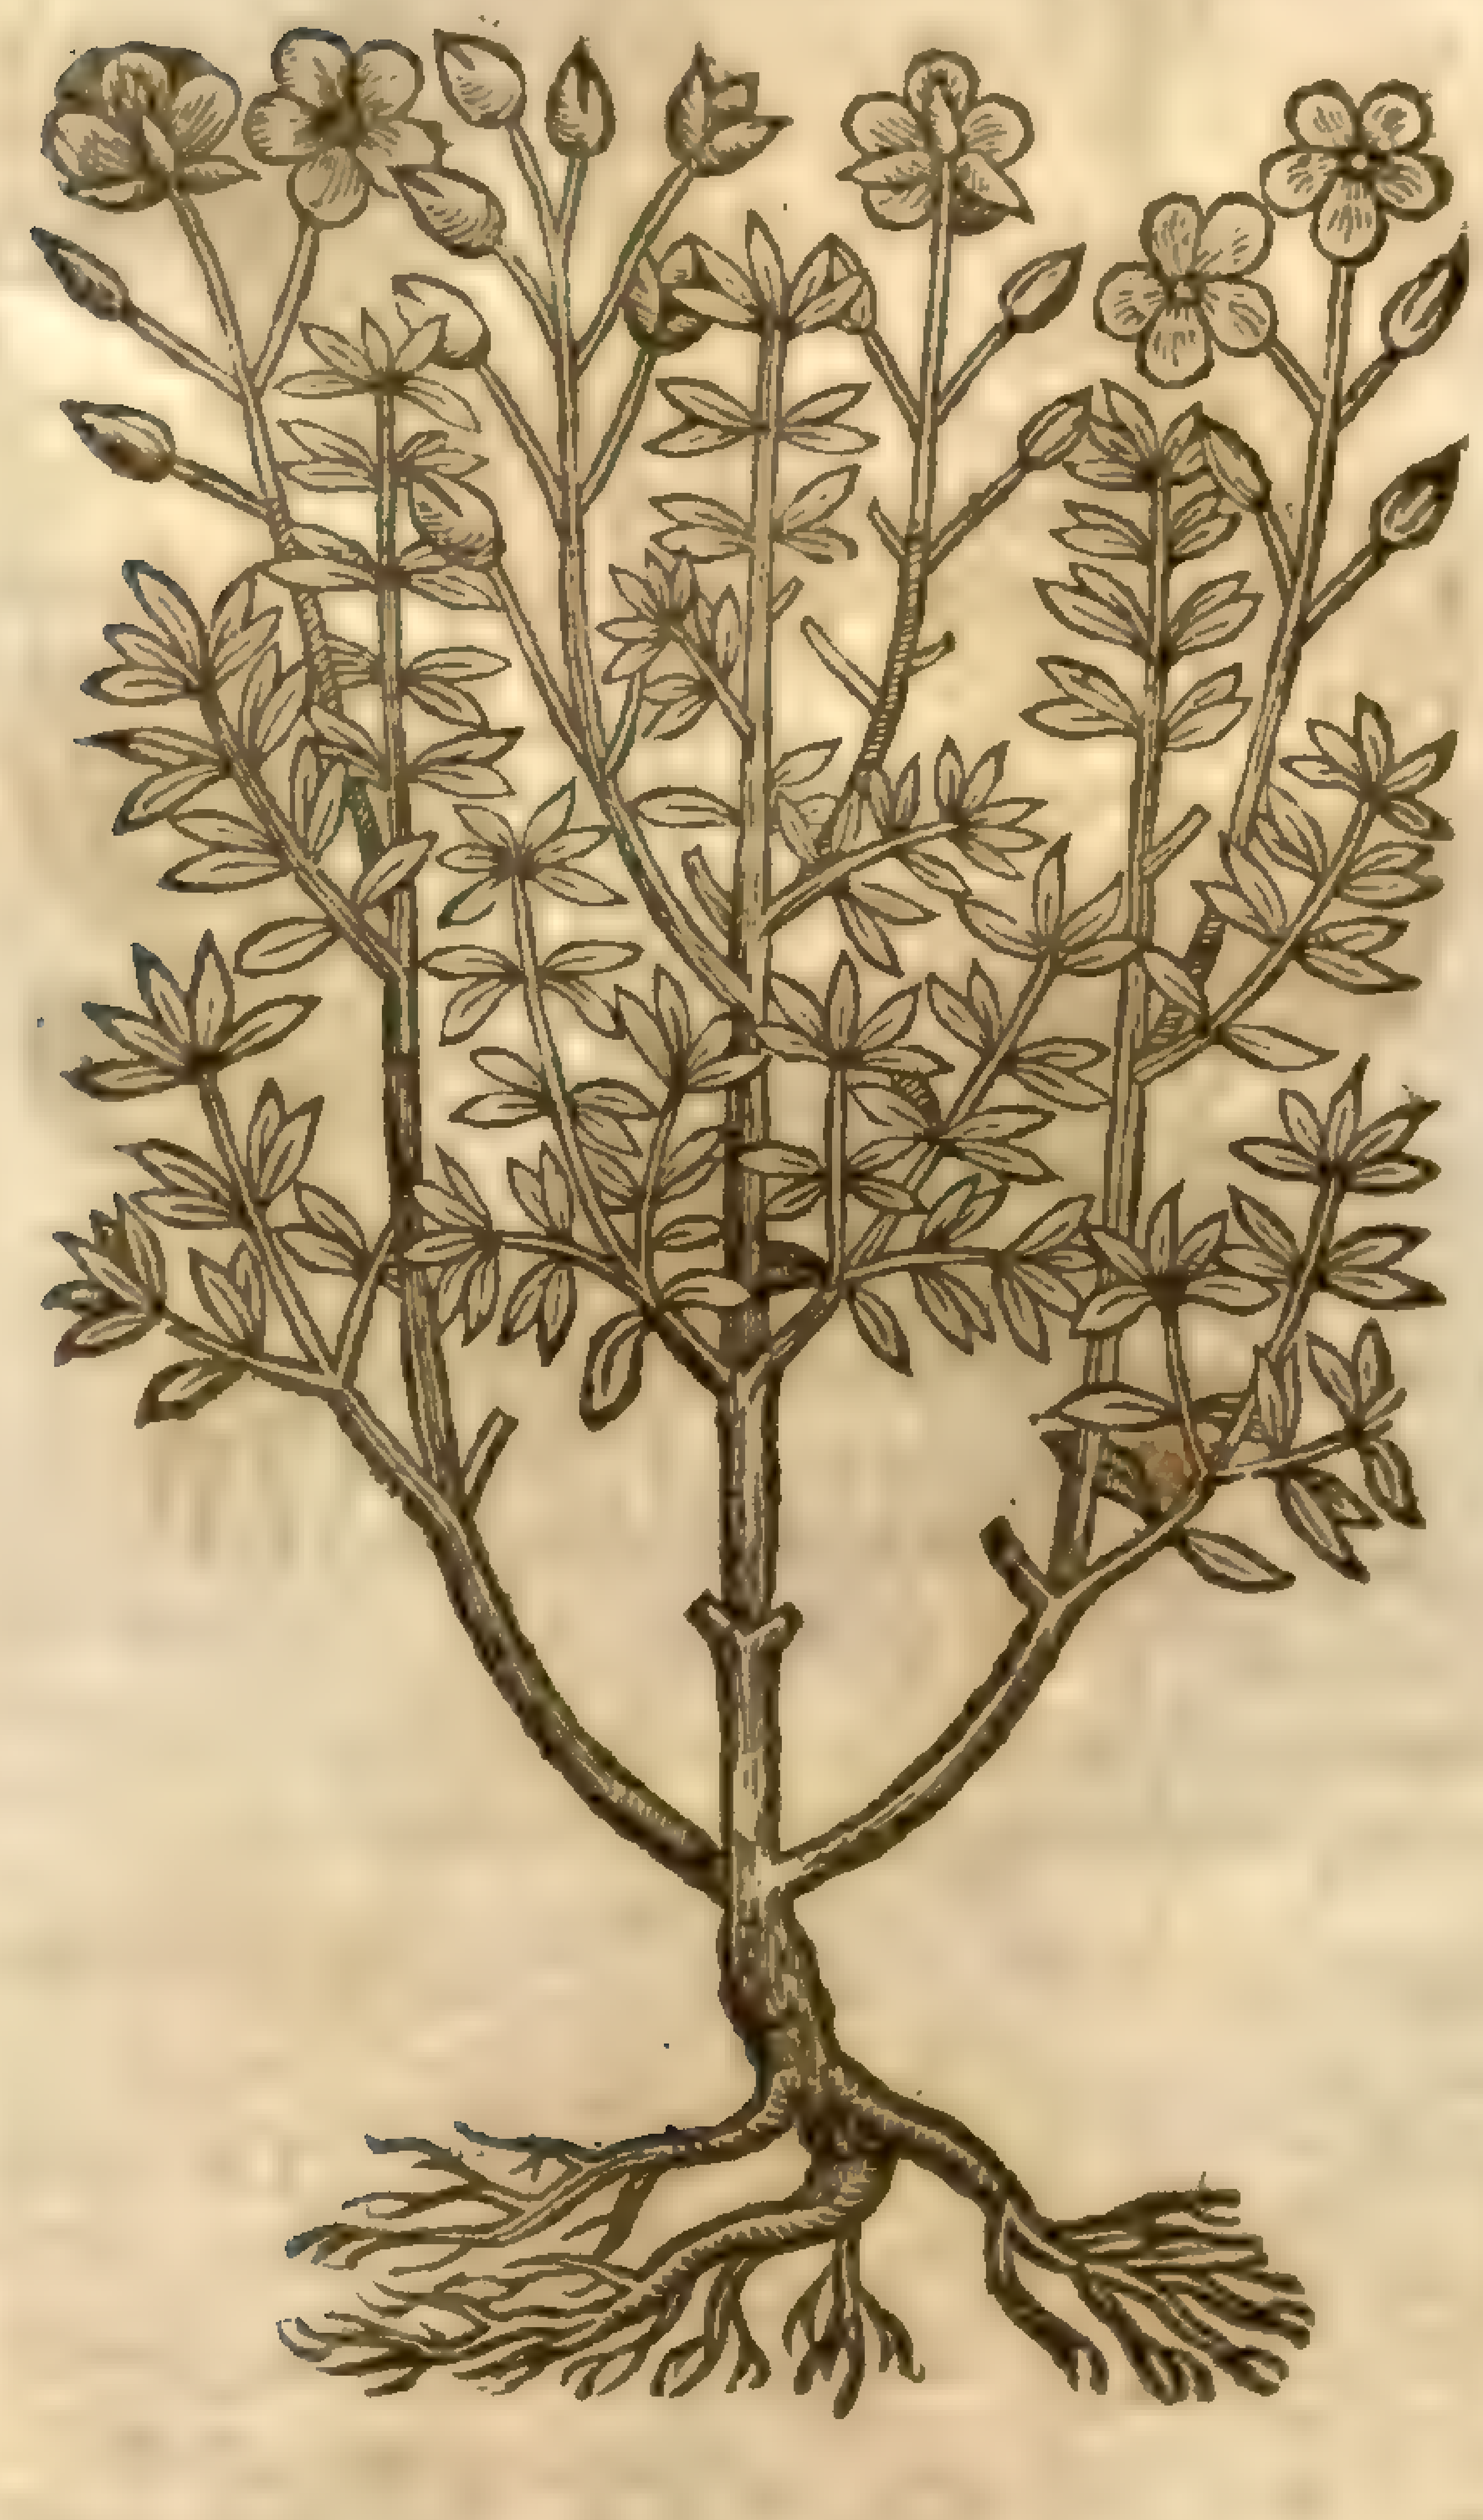
Cistus helianthemum, &
vulg. dict.

3 There is found in Germanie a certaine plant like to Ciſtus and *Ledon*, but much leſſer, creeping vpon the ground vnleſſe it be propped vp, hauing a multitude of twiggy branches ſlender and fine, whereupon grow leaues leſſer than thoſe of Ledon or Ciſtus, very like to that of our Engliſh white dwarfe Ciſtus, of a full ſubſtance, ſlightly haired, wherein is contained a tough juice. The floures are ſmall like little Roſes or the wilde Tanſie, of a yellow colour: the roots be ſlender, woody, and ſomething red.

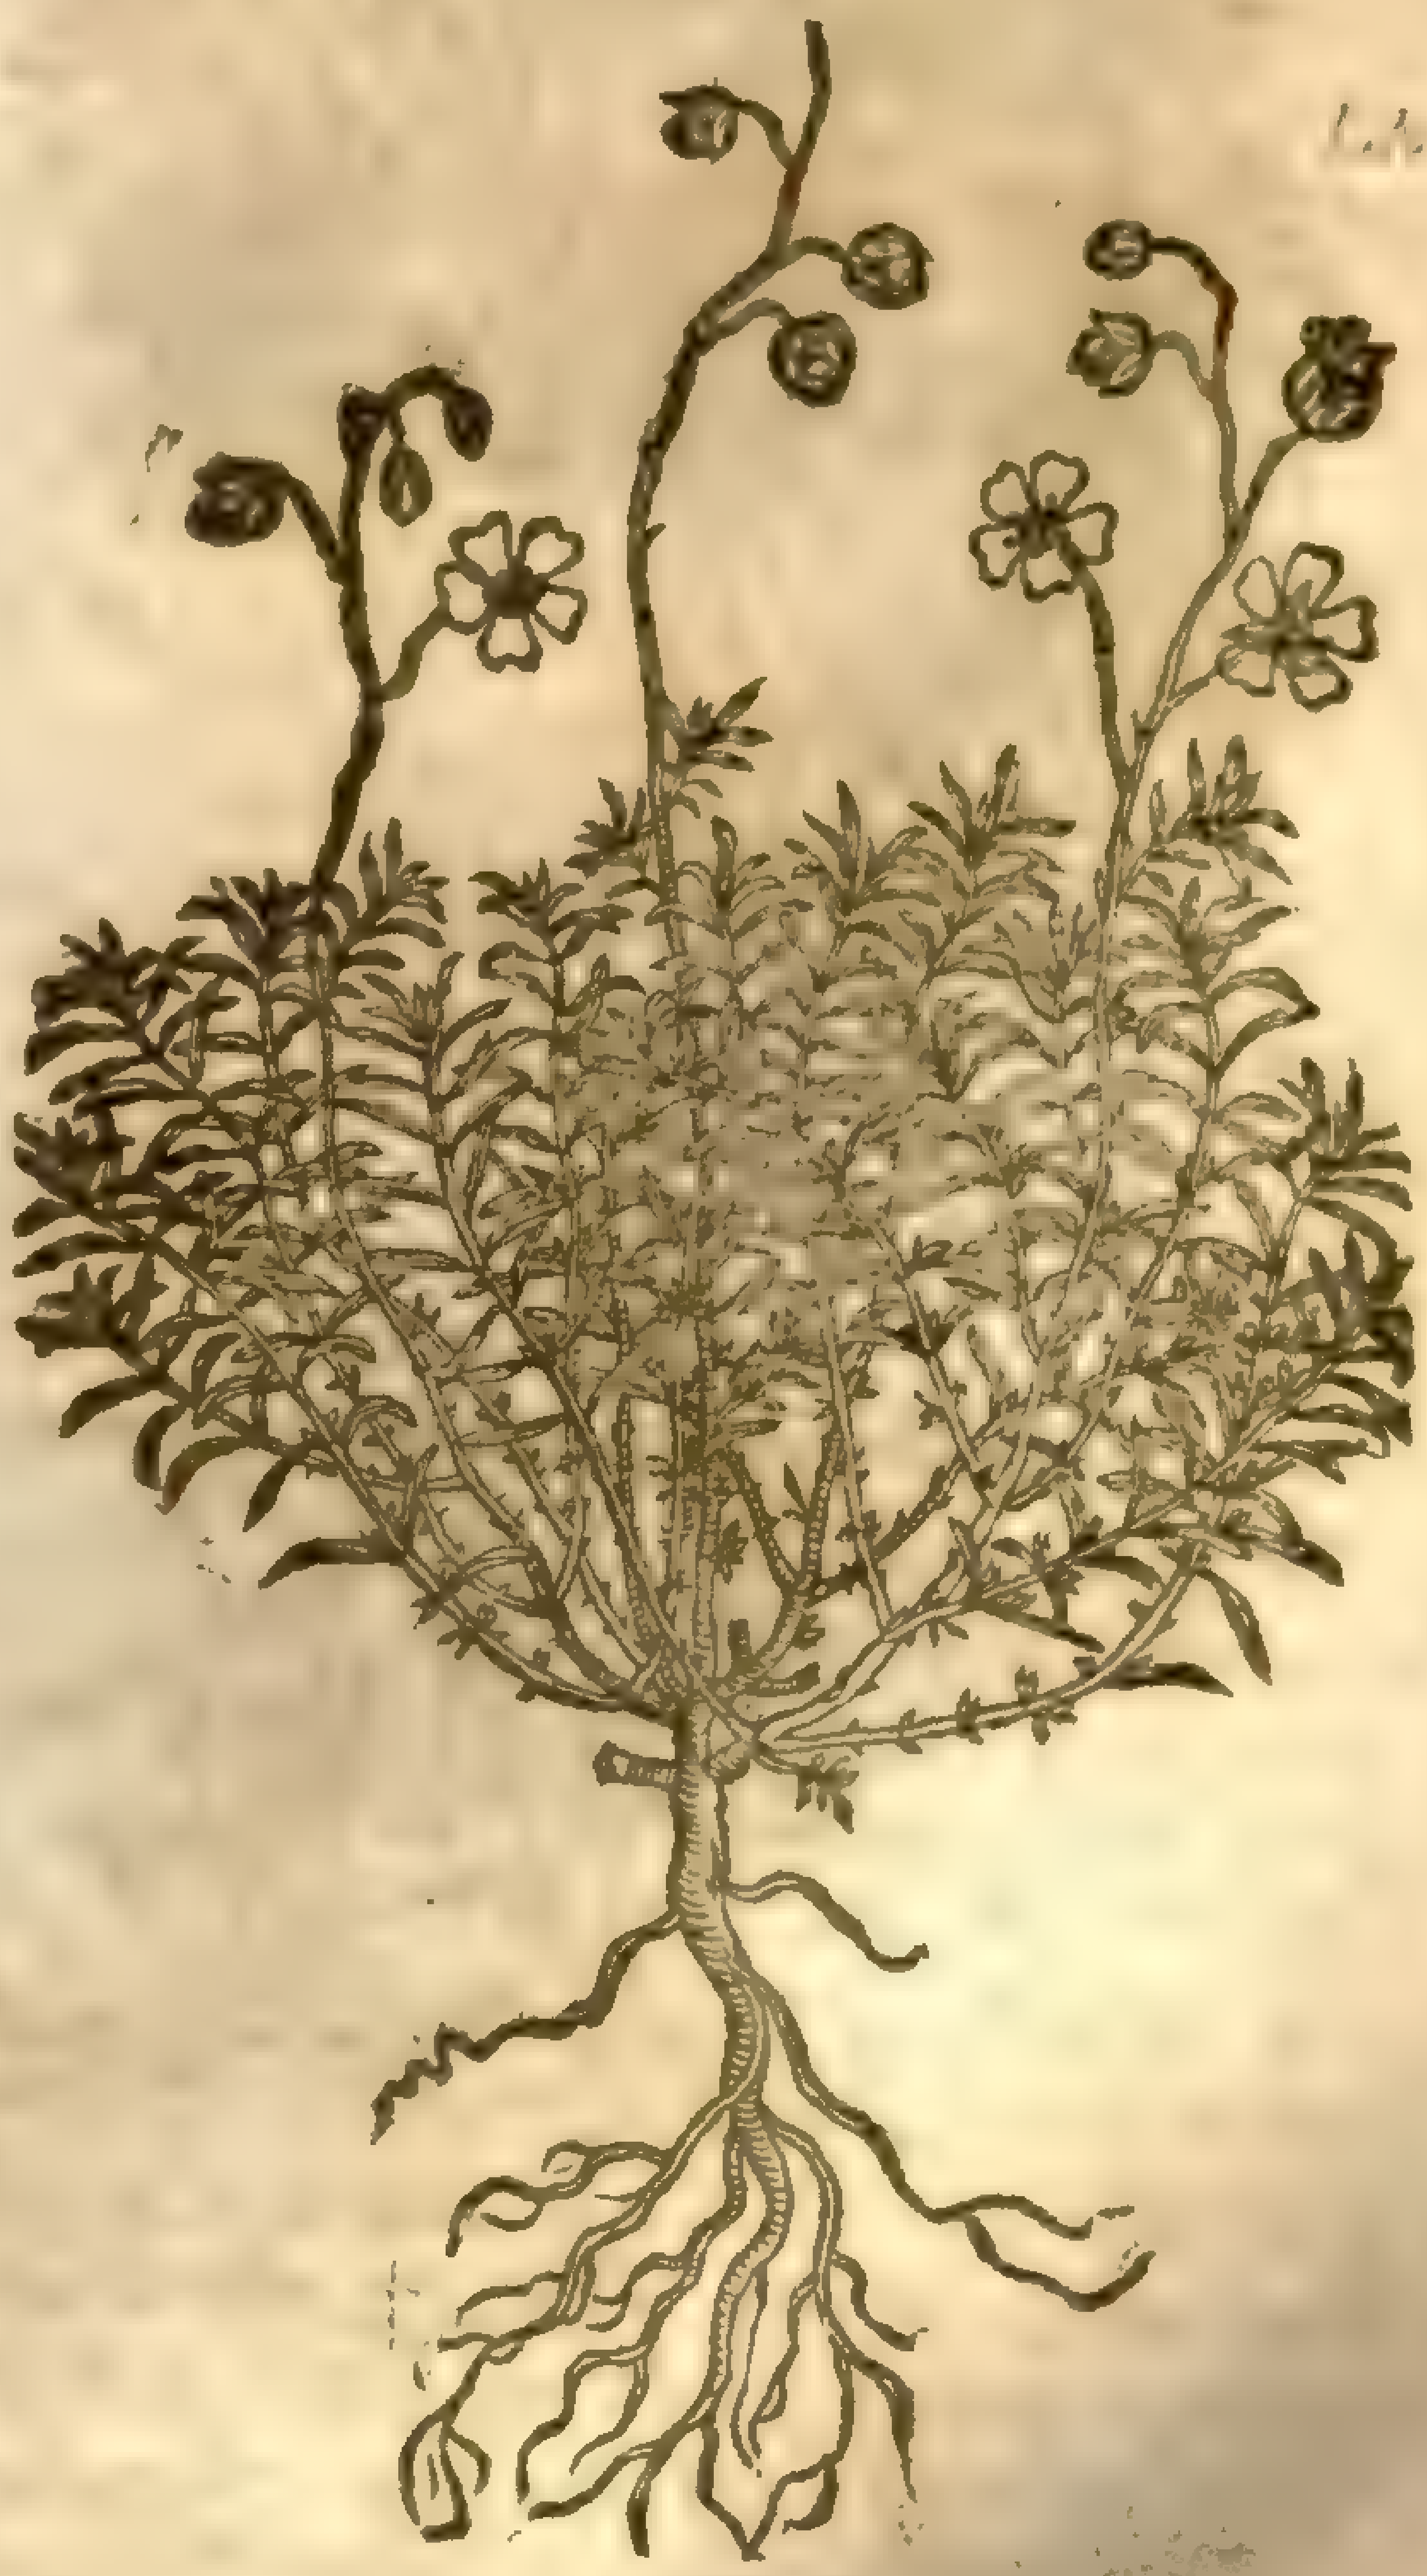
4 *Helianthemum album Germanicum.* The white dwarfe Ciſtus of Germanie.



5 *Helianthemum Sabaudicum.*
The dwarfe Ciſtus of Savoy.



6 *Helianthemum anguſtifolium.*
Narrow leafed dwarfe Ciſtus.



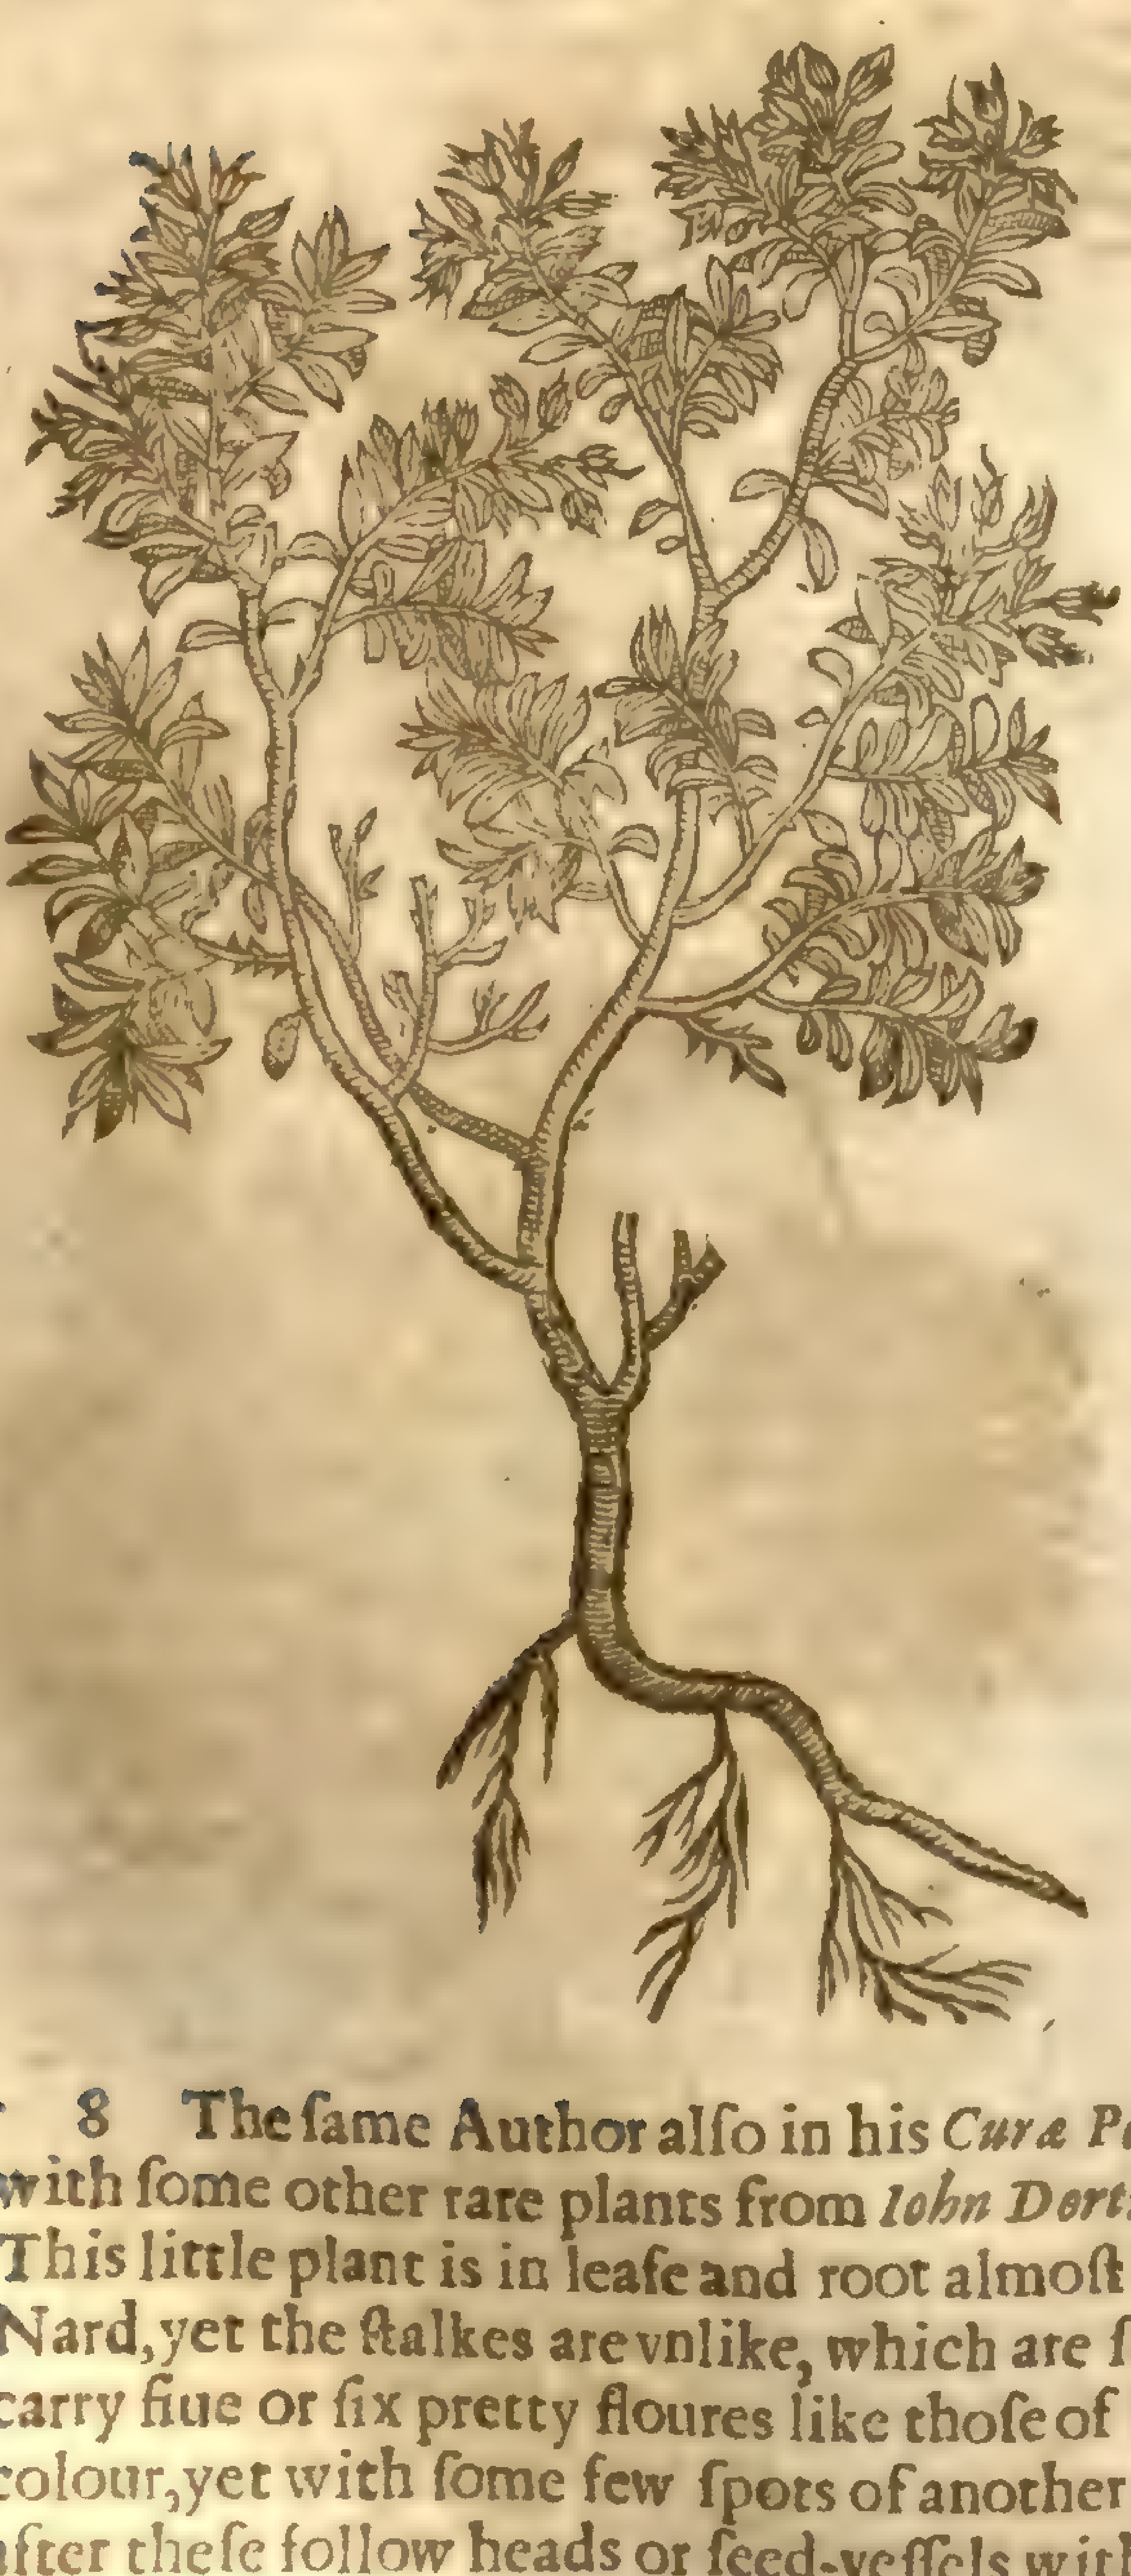
4 This differeth not from the laſt deſcribed, ſauing that the floures hereof are very white, and the others yellow, wherein they eſpecially differ.

5 The dwarf Ciſtus of Savoy hath diuers tough branches of a reddiſh colour, very tough and woody, diuided into diuers other branches; whereon are ſet ſmal leaues foure together, by certain ſpaces: the floures grow at the top of the branches like thoſe of our yellow dwarſe Ciſtus, of a yellow colour: the root is very wooddy.

6 This dwarſe Ciſtus with narrow leaues hath very many ſmall flexible branches, of a brown colour, very ſmooth, and ramping vpon the ground; whereon grow ſmall long narrow leaues like like thoſe of Tyme of Candy; from the boſome whereof come forth diuers other ſmaller leaues: the floures grow on the tops of the branches, of a bleake yellow colour: the root is likewiſe woody.

‡ 7 To theſe I may fitly adde two more: the firſt hath creeping ſtalks ſome foot or two long, blackiſh, and diuided into ſundry ſmaller branches: the leaues grow thicke and many together, ſet by couples, though the figure do not well expreſſe ſo much: theſe leaues are ſmall, of the bigneſſe of thoſe of Tyme, thicke, green aboue, whitiſh vnderneath, and of a bitter taſte: at the ends of the branches grow two or foure floures neere together, very ſmall, compoſed of fiue little leaues of a kinde of fleſh colour: to theſe ſucceed heads opening themſelues when they come to ripeneſſe into fiue parts, and containing a very ſmal ſeed: the root is hard and wooddy, ſending out certaine fibres; alſo the branches here and there put forth ſome fibres. This plant dried hath a pretty pleaſant ſmell. It growes vpon the higheſt Auſtrian and Styrian Alps, and is ſet forth by *Cluſius* by the name of *Chamæciſtus ſeptimus*.

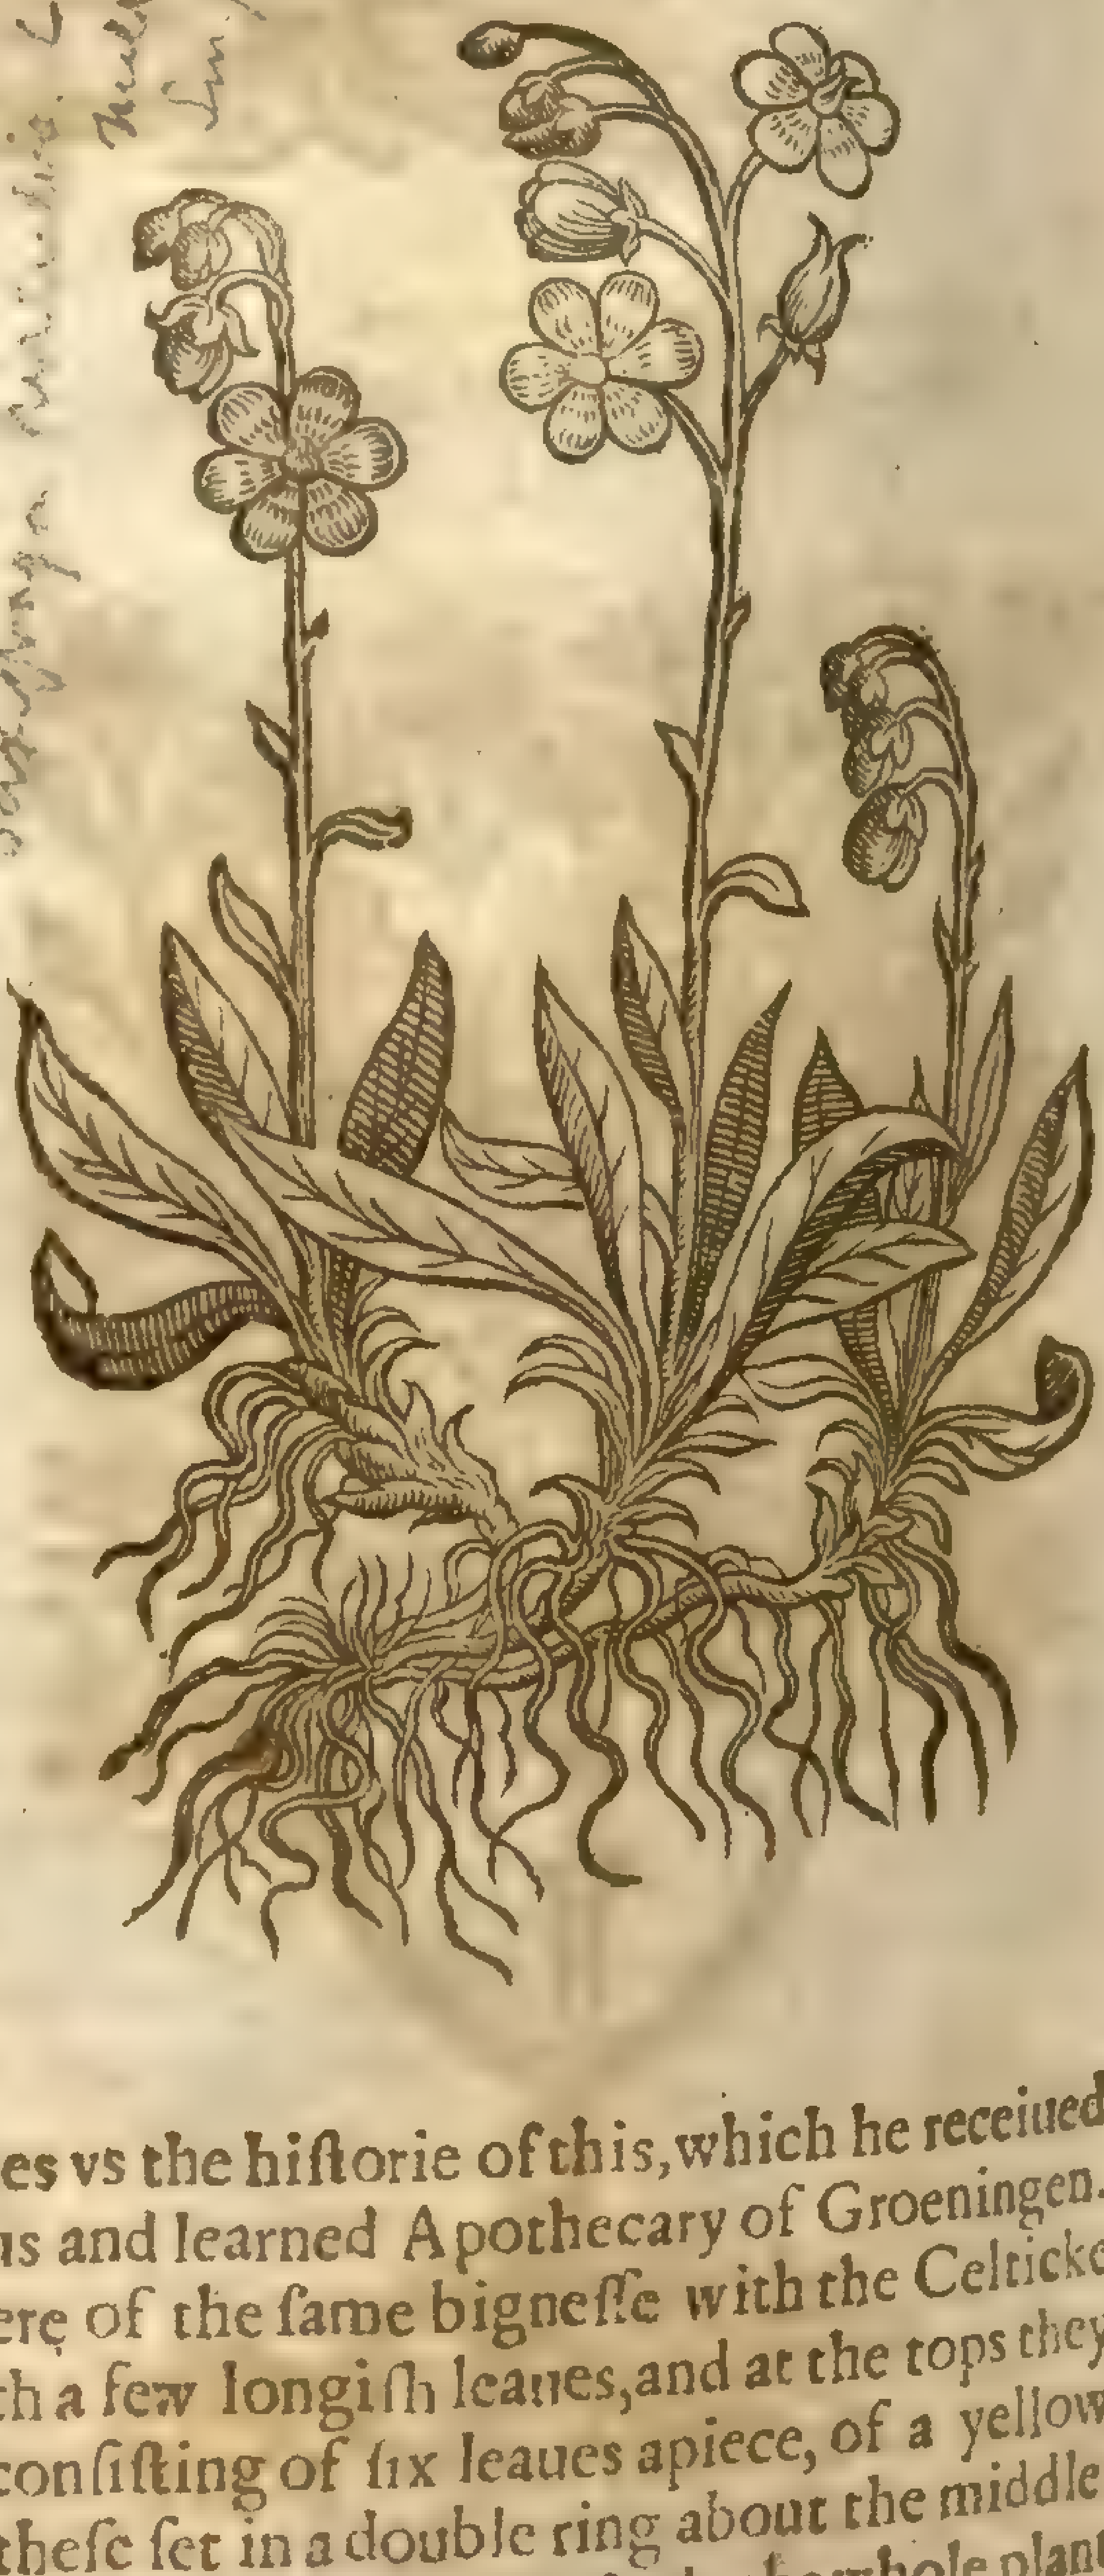
‡ 7 *Chamæciſtus ſerpillifolius.*
Tyme leafed dwarfe Ciſtus.



Azalea procumbens. Mill. dict. Lin. pl. 1283

‡ 8 *Chamæciſtus Friſicus.*
Friſian dwarfe Ciſtus.

Clus. cur. post.



Saxifraga Hirculus. Mill. dict. Lin. pl. 2.

8 The ſame Author alſo in his *Curæ Poſteriores* giues vs the hiſtorie of this, which he receiued with ſome other rare plants from *Iohn Dertman* a famous and learned Apothecary of Groeningen. This little plant is in leafe and root almoſt like and neere of the ſame bigneſſe with the Celticke Nard, yet the ſtalkes are vnlike, which are ſmall, ſet with a few longiſh leaues, and at the tops they carry fiue or ſix pretty floures like thoſe of Crow-feet, conſiſting of ſix leaues apiece, of a yellow colour, yet with ſome few ſpots of another colour, and theſe ſet in a double ring about the middle: after theſe follow heads or ſeed-veſſels with forked tops, filled with a chaffie ſeed: the whole plant ſmels ſomewhat ſtrong. It growes together with *Gramen Parnaſſi* in rotten mooriſh places about a village in the country of Drent. *Dertman* called this, *Hirculus Friſicus*: *Cluſius* addes, *qui Chamæciſti genus*. ‡

¶ *The Place.*

Their ſeuerall titles haue touched their natiue countries; they grow in rough dry and ſunny places in plain fields and vpon mountains.

Thoſe of our Engliſh growing I haue found in very many places, eſpecially in Kent vpon the chalky banks about Graueſend, Southfleet, and for the moſt part all the way from thence to Canturbury and Douer.

¶ *The Time.*

They floure from Iuly to the end of Auguſt.

¶ *The Names.*

Tragus calls dwarfe Ciſtus in the high-Dutch tongue **Heyden Yſop**: in Latine, *Gratia Dei*: but there is another herb called alſo of the later herbariſts *Gratia Dei*, which is *Gratiola*: *Valerius Cordus* nameth it *Helianthemum*, and *Solis flos* or Sun floure: of *Cluſius*, *Chamæciſtus*, or dwarfe Ciſtus.

Pliny writeth, that *Helianthemum* growes in the champian country Temiſcyra in Pontus, and in the mountains of Cilicia neere the ſea: ſaying further, that the wiſe men of thoſe countries & the Kings of Perſia do anoint their bodies herewith, boiled with Lions fat, a little Saffron, and Wine of Dates, that they may ſeem faire and beautifull; and therefore haue they called it *Heliocaliden*, or the beauty of the Sun. *Matthiolus* ſaith, that *Helianthemum* is taken of ſome to be *Panaces Chironium* or *Chirons* All-heale: but it is nothing likely, as we haue ſaid.

¶ *The Nature and Vertues.*

A The faculties and temperature are referred to the kindes of Ciſtus, for it healeth wounds, ſtancheth bloud, and ſtoppeth the ſpitting of bloud, the bloudy flix, and all other iſſues of bloud.

B The ſame boiled in wine healeth vlcers in the mouth and privy parts, if they be waſhed therewith: to be briefe, it joineth and ſtrengthneth: which things do plainly and euidently ſhew, That it is not only like to Ciſtus and Ledon in forme, but in vertues and faculties alſo, and therefore it is manifeſt that it is a certain wilde kinde of Ciſtus and Ledon.

Chap. 7. *Of Ciſtus* Ledon and Ladanum.

¶ *The Kindes.*

There be diuers ſorts of Ciſtus, whereof that gummy matter is gathered called in ſhops *Ladanum*, and *Labdanum*, but vnproperly.

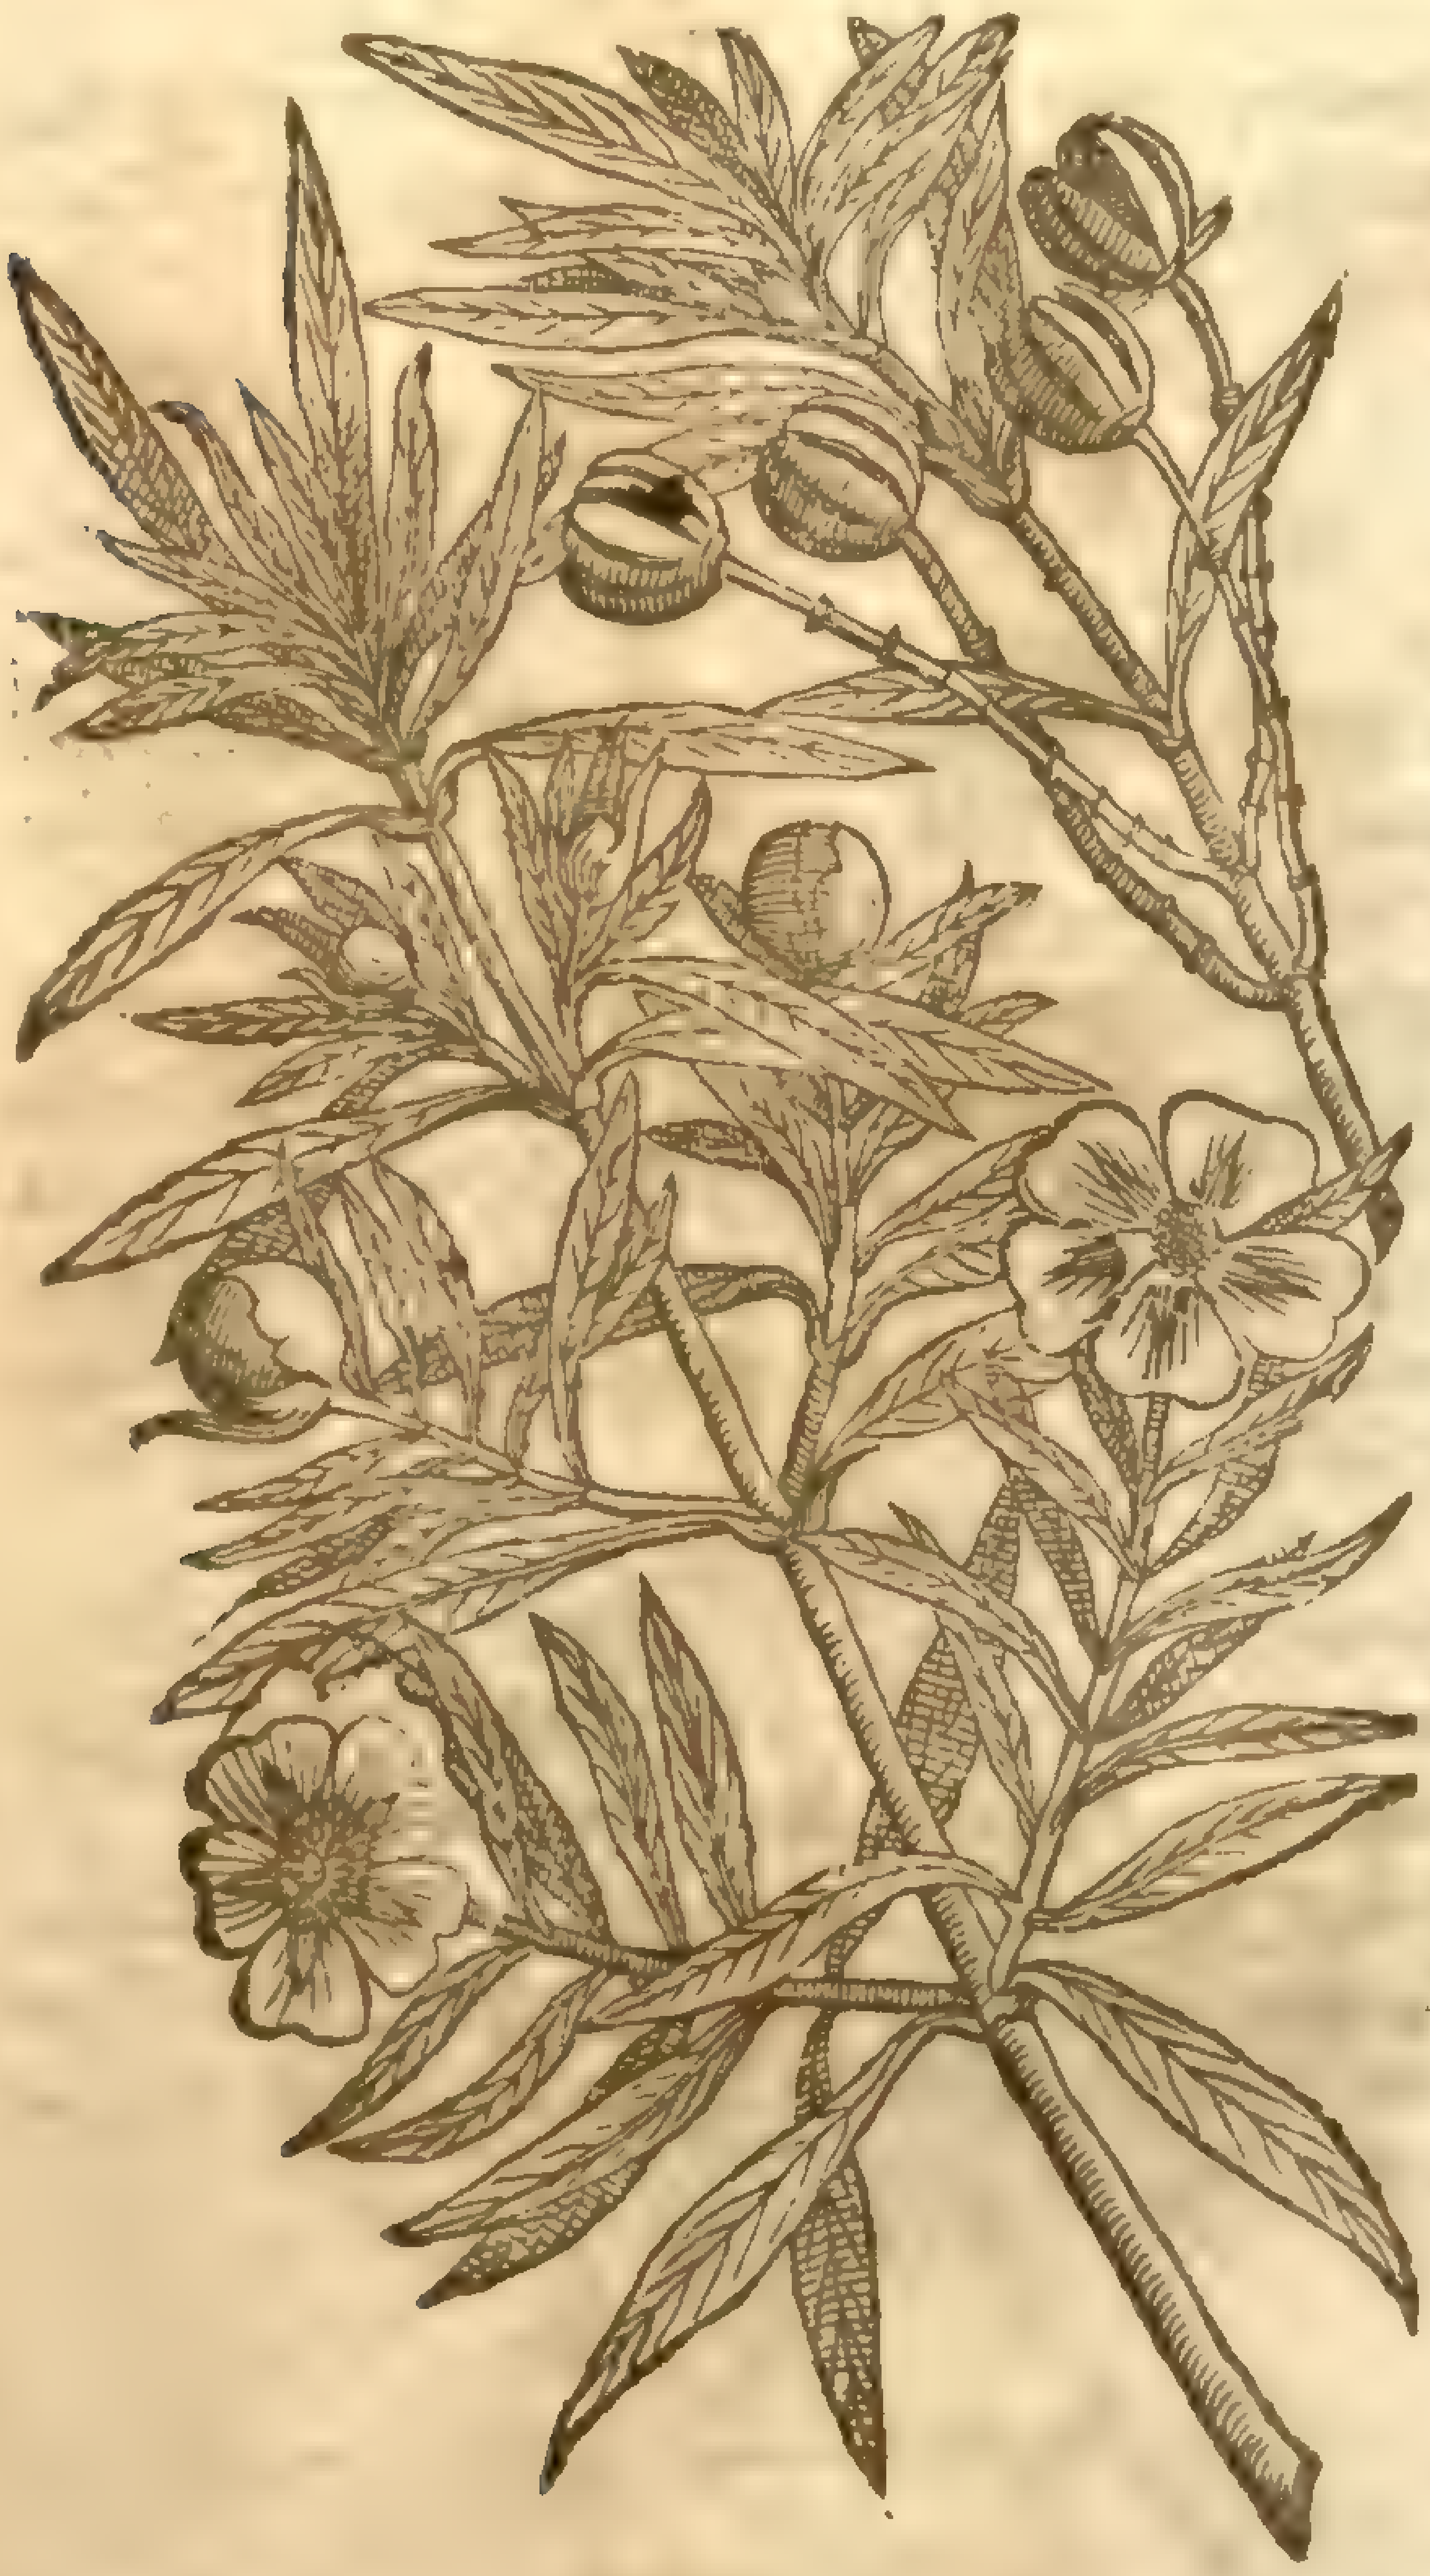
¶ *The Deſcription.*

1 Ciſtus Ledon is a ſhrub growing to the height of a man, and ſometimes higher, hauing many hard wooddy branches, couered with a blackiſh barke; whereupon grow leaues ſet together by couples, one right againſt another like vnto wings, of an inch broad, of a black ſwart green on the vpper ſides, and whitiſh vnderneath: whereon is gathered a certain clammie tranſparent or through-ſhining liquor, of a very hot ſweet ſmel, which being gathered & hardned is that which in ſhops is called *Labdanum*: the floures grow at the ends of the branches like little roſes, conſiſting of fiue white leaues, euery one decked or beautified toward the bottome with pretty darke purpliſh ſpots tending to blackeneſſe, hauing in the middle very many yellow chiues ſuch as are in the middle of the Roſe; after come the knaps or ſeed-veſſels full of moſt ſmall reddiſh ſeed: the whole plant being dried groweth ſomewhat whitiſh, and of a pleaſant ſmell, which it retaineth many yeares.

2 The ſecond groweth likewiſe to the height of an hedge buſh, the branches are long, and very fragil or eaſie to breake, whereon grow leaues greener than any other of his kind, yet vnderneath of a hoary colour, growing toward winter to be ſomewhat reddiſh, of a ſoure and binding taſte. The flours are like the precedent, the forme whereof the Grauer hath omitted, in other reſpects like the former.

3 The third ſort of Ciſtus Ledon groweth vp to the height of a ſmall hedge buſh, hauing many twiggy branches, whereon grow leaues like thoſe of the Poplar tree, ſharp at the point, couered ouer with that clammy dew that the others are: the floures grow at the tops of the branches, of a white colour like the precedent.

1 *Ciſtus Ledon 1 Cluſij.*
The firſt Ciſtus bringing *Ladanum.*



C. Ladanifera, mas. dict.

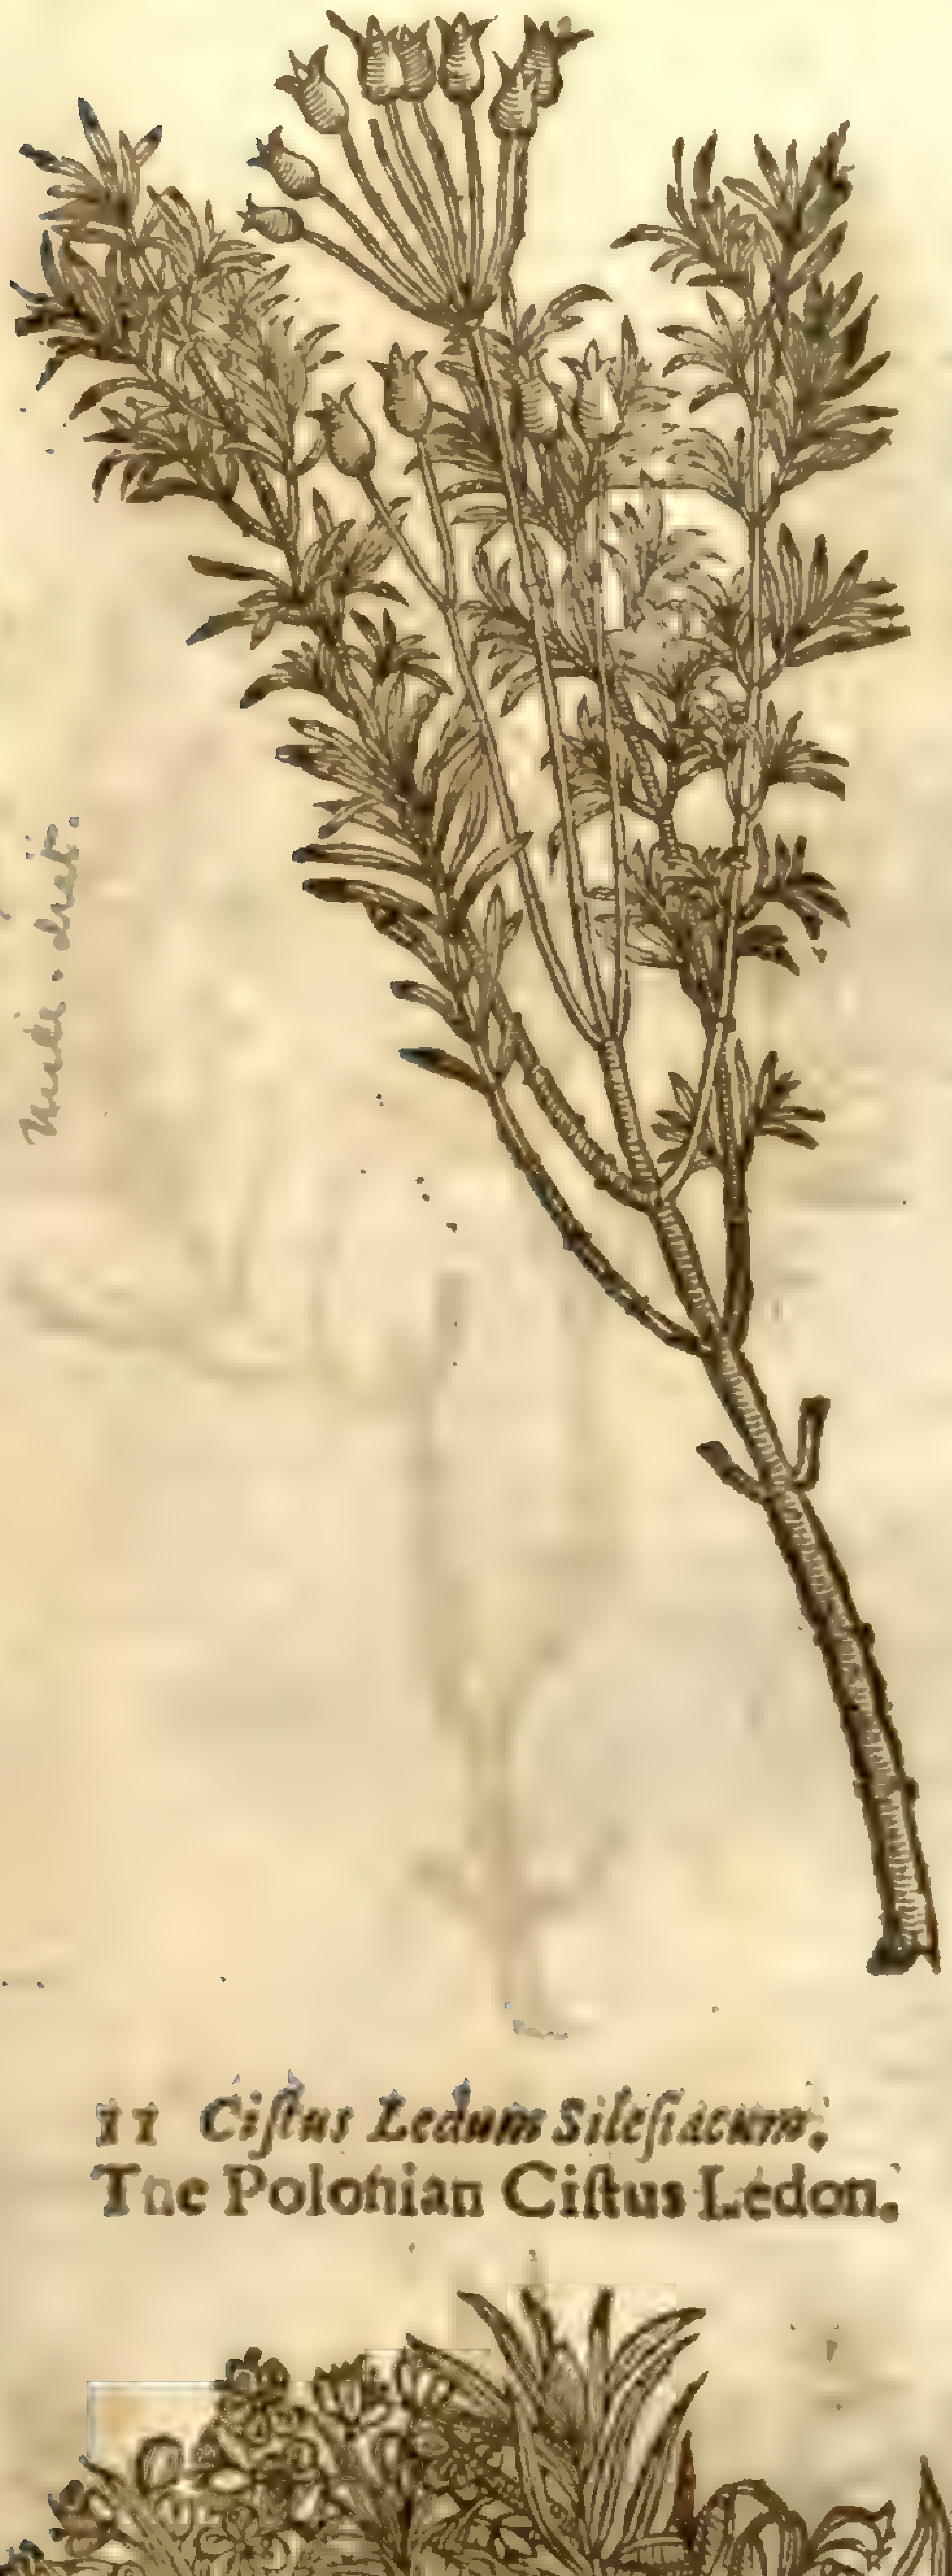
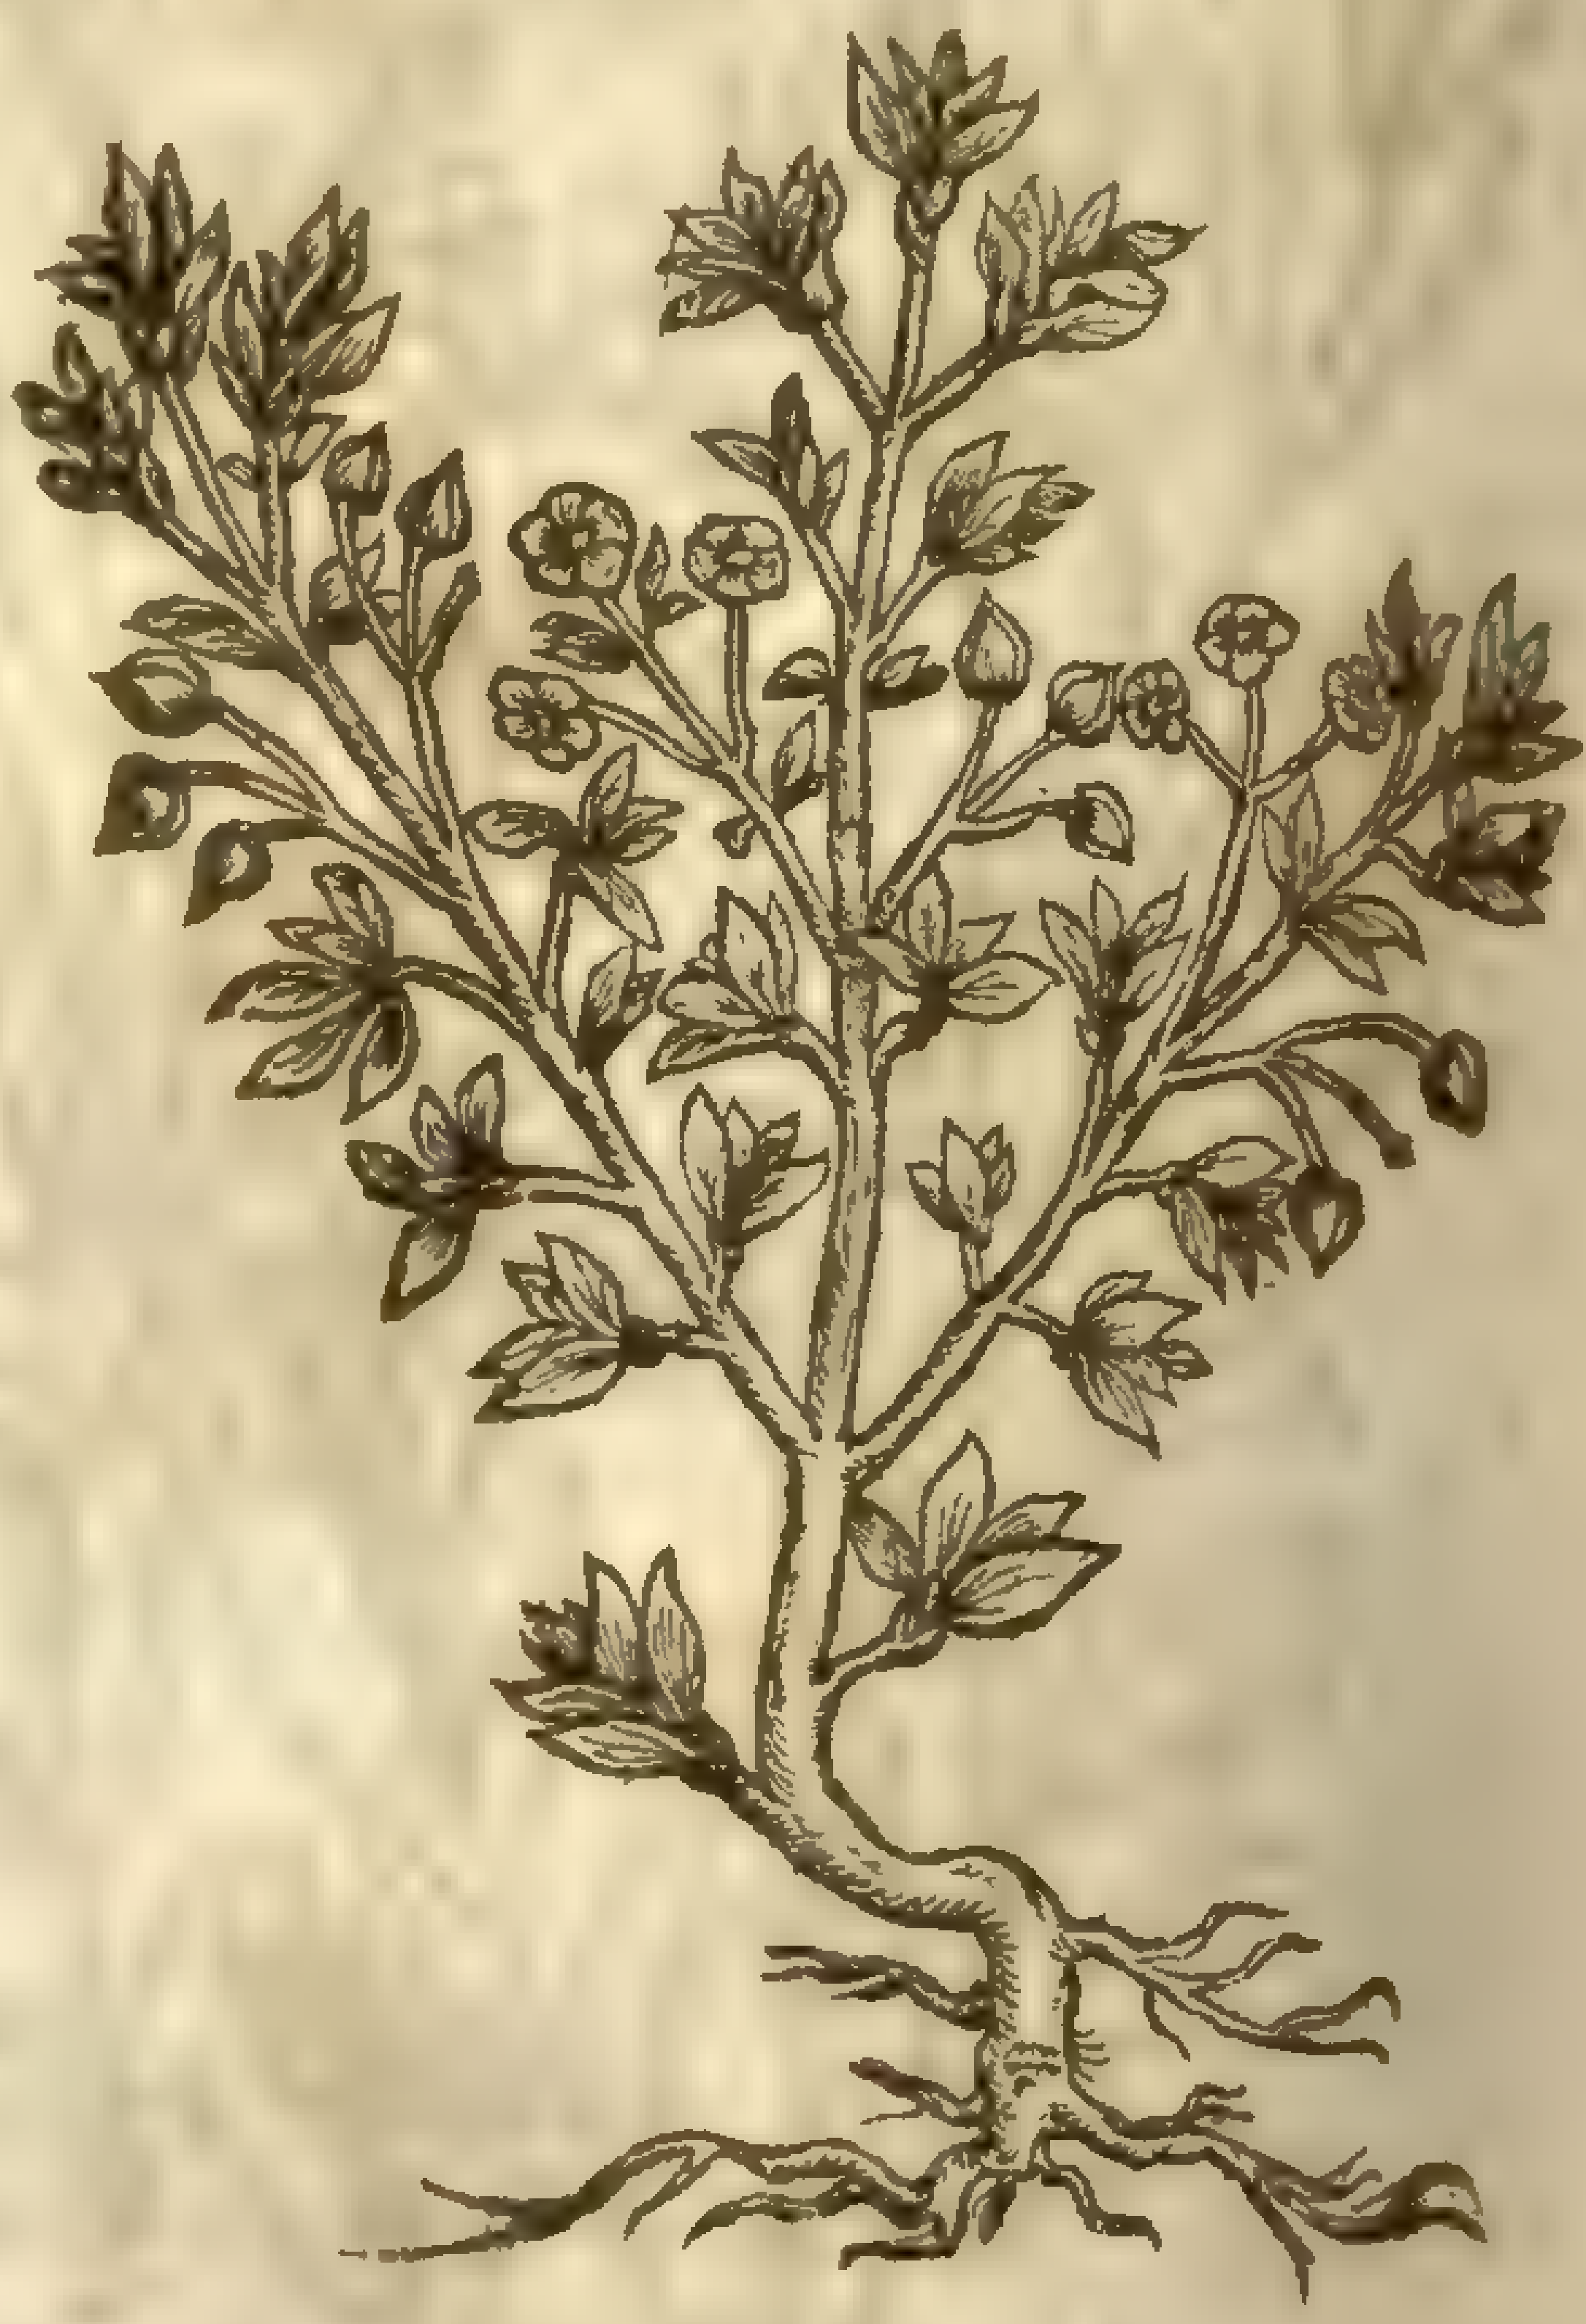
The tenth Ciſtus Ledon.

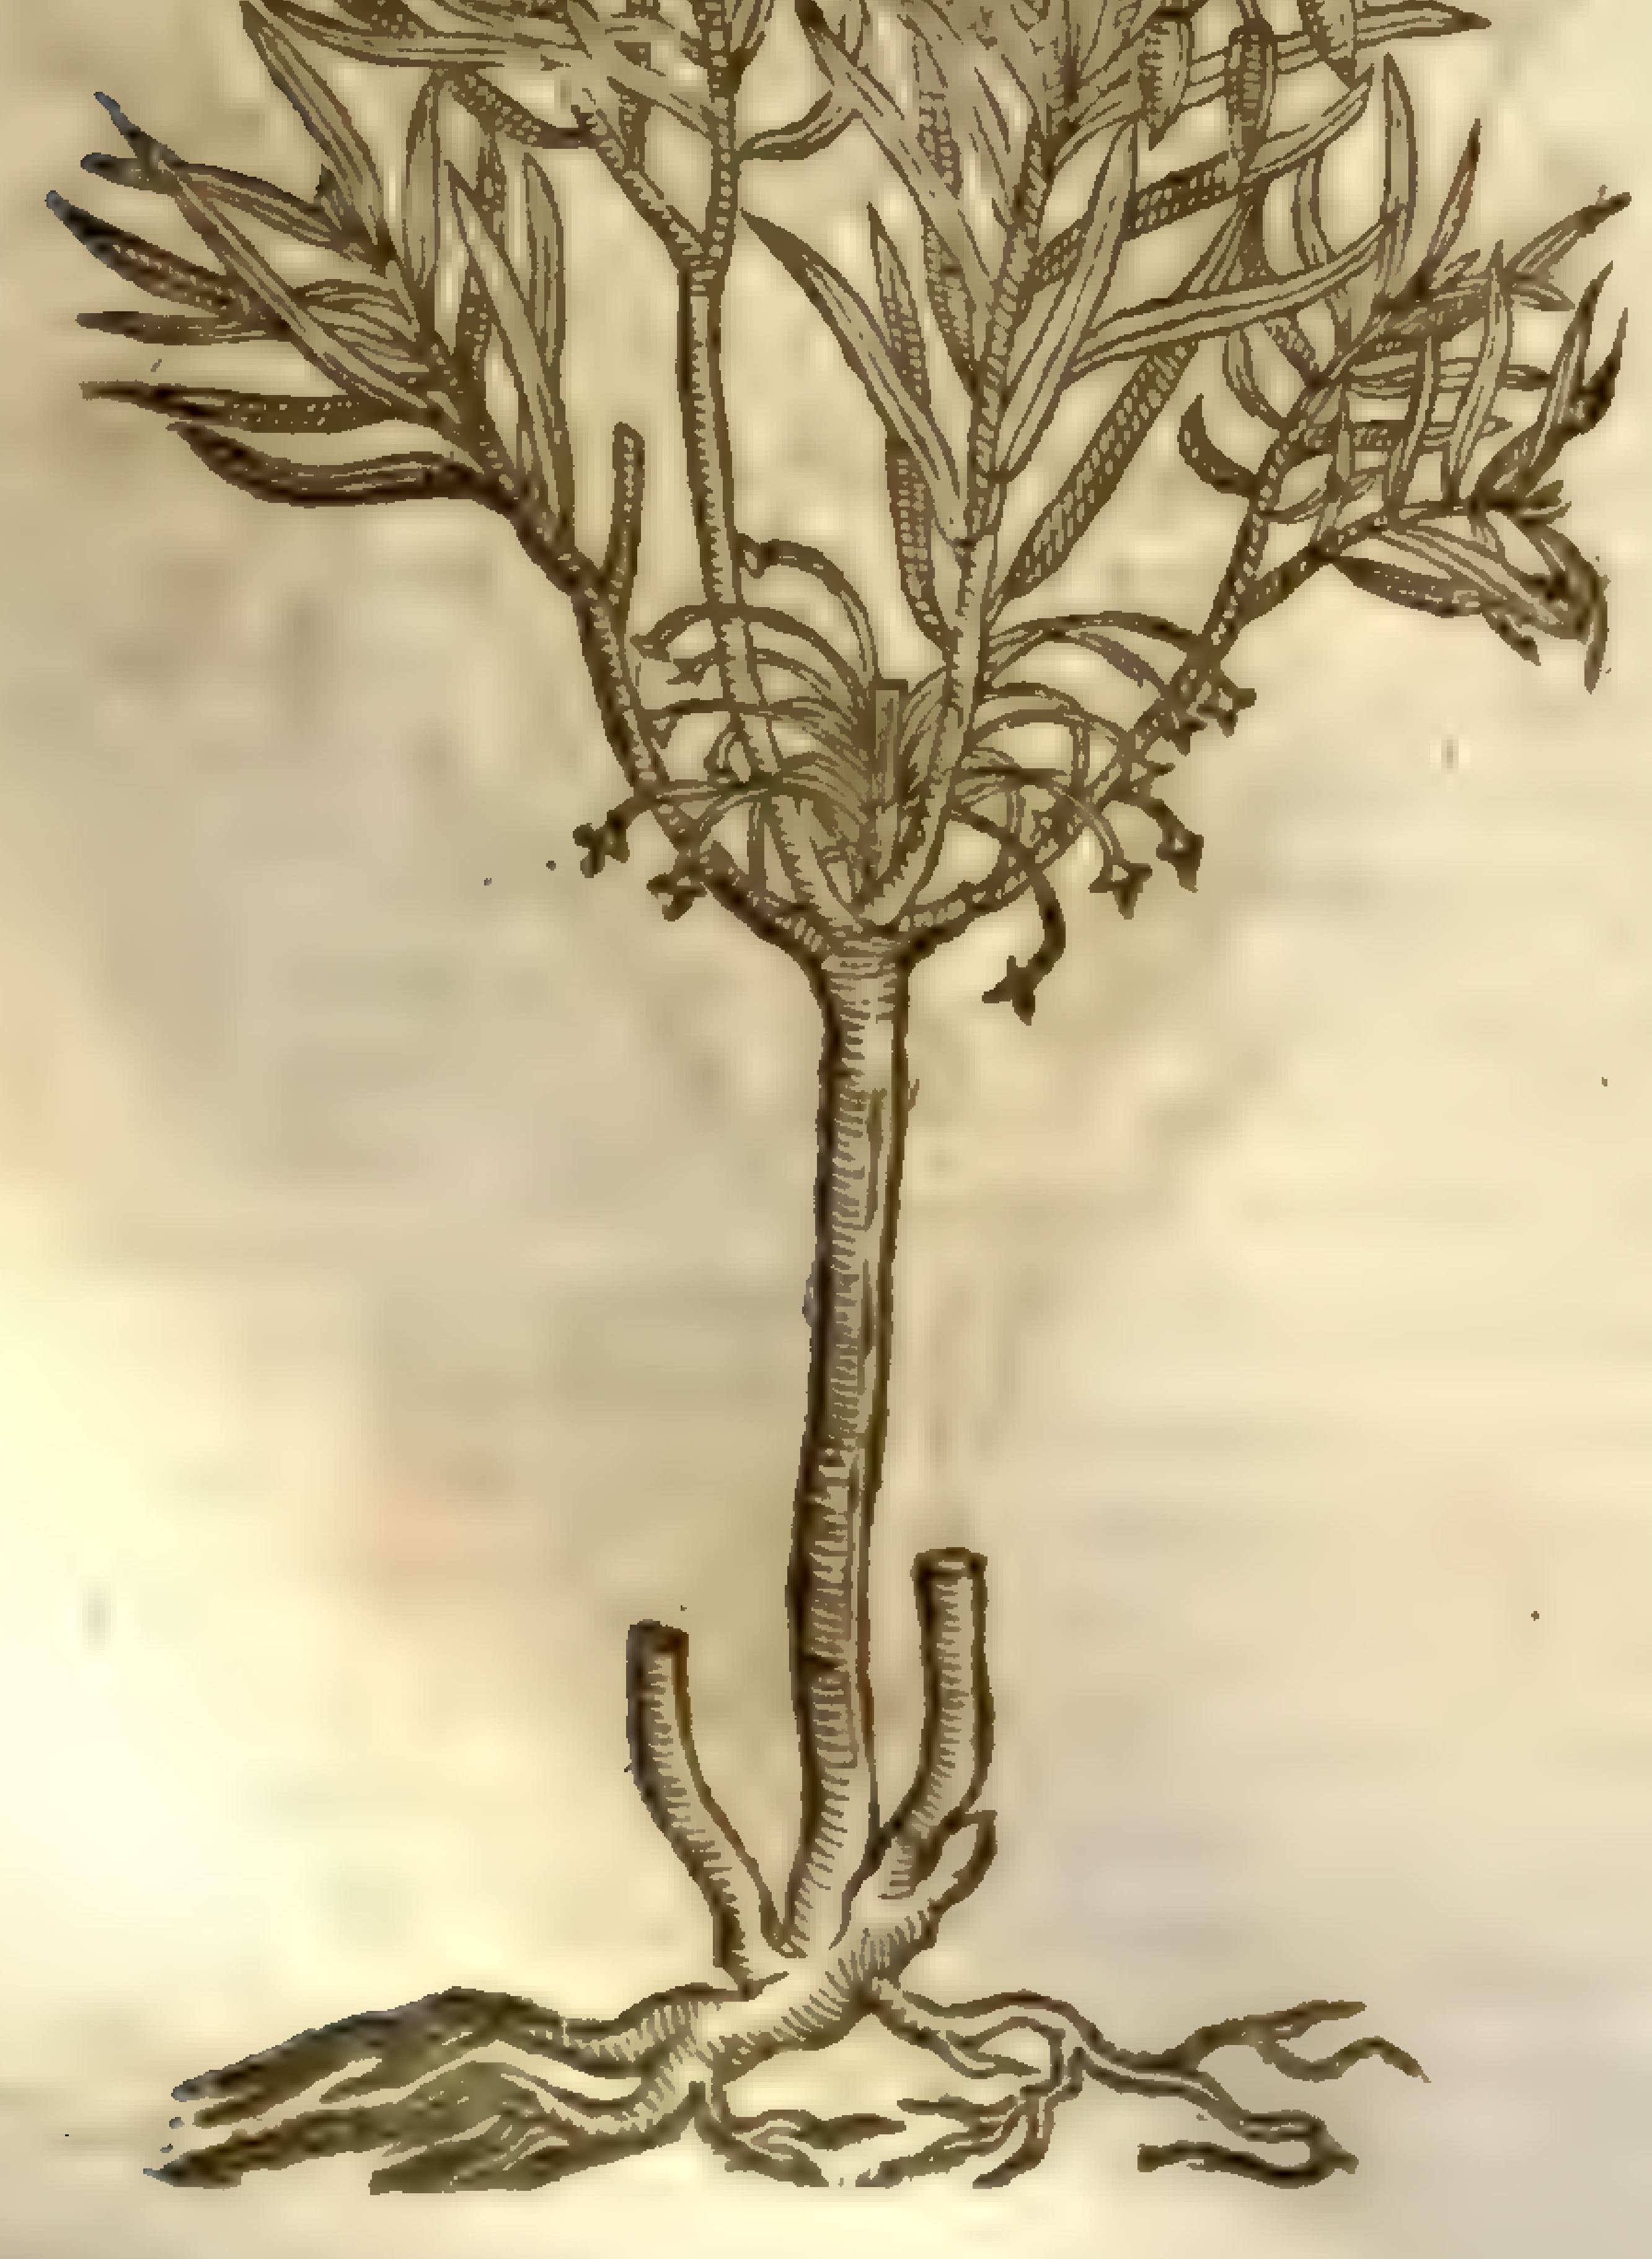


C. umbellatus, r mihi. dict.

10 *Ciſtus Ledon Myrtifolium.*
Ciſtus Ledon with leaues like Myrtle.



11 *Ciſtus Ledum Sileſiacum.*
The Polonian Ciſtus Ledon.



Ledum palustre, r mihi. dict

4 This fourth of *Cluſius* deſcripition groweth likewiſe to the height of a ſhrubby buſh, hauing many branches flexible, hoary, and hairy: the leaues are like the reſt of his kind, but ſofter, more hairy, of a ſwart green colour, daſht ouer with that dewy fatneſſe not onely in the Spring time, but in the heate of Summer alſo: the floures are white with yellow thrums in the middle: the reſt anſwereth the laſt deſcribed.

5 The fifth growes vp like a hedge buſh with many tough branches, whereon are ſet long rough leaues hoary vnderneath, ſomewhat daſhed ouer with that fatty dew or humor that the reſt are poſſeſſed of: the floures are likewiſe of a white colour, with certaine yellow chiues in the middle. The root is wooddy.

† 6 The ſixt hath diuers ſmal branches couered with a blackiſh barke: the floures are ſet together at the toppes of the branches by certaine ſpaces: they are yellow, and like the former in each reſpect.

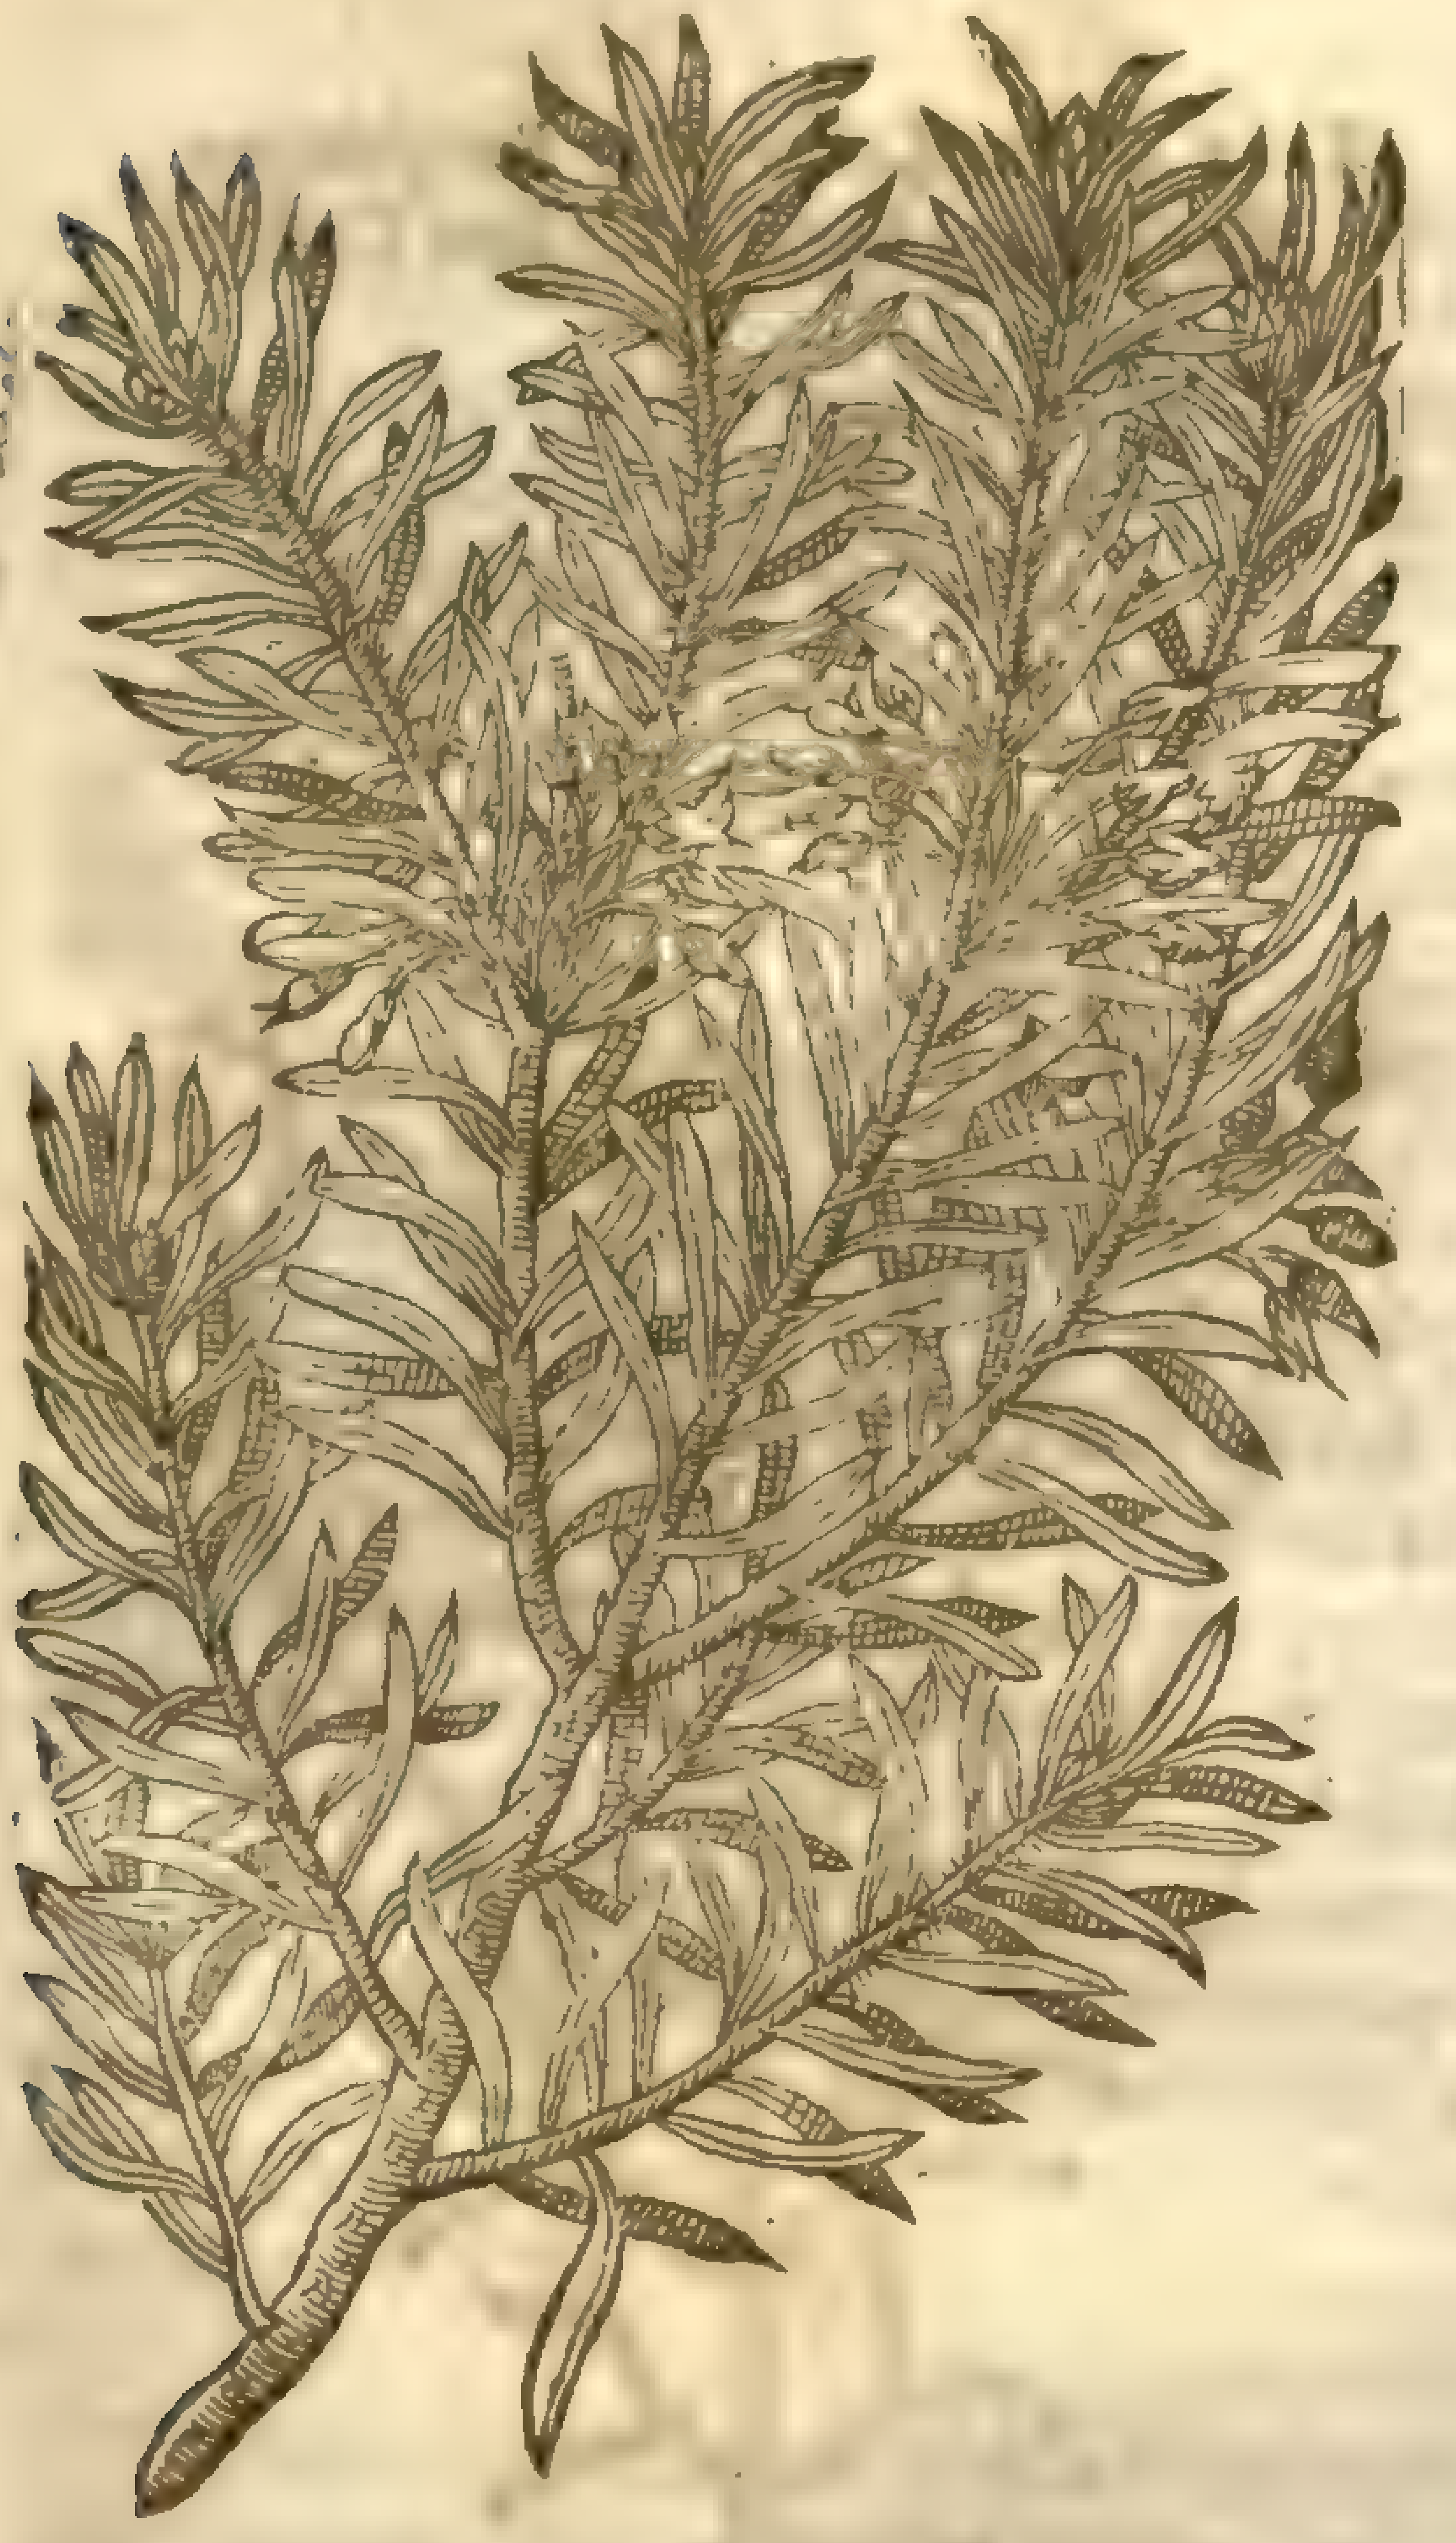
7 This is a low ſhrub growing to the height of two cubits, hauing many branches couered with a bark of the colour of aſhes, whereon are confuſedly ſet diuers leaues at certain diſtances, ſmall, narrow, like thoſe of Winter Sauorie, of an ouerworne ruſſet colour, verie thicke, fat, and glutinous: the flours are white, and differ not, nor the ſeed from the reſt.

8 The eighth groweth vp like a little hedge buſh, hauing leaues like the common female Ciſtus, ſauing that thoſe of this plant are ſprinkled ouer with that clammy moiſture, and the other not ſo: the floures and ſeed are alſo like. From the root of this plant commeth ſuch like excreſcence called *Limodoron, Orobanche*, or *Hypociſtis*, as there doth from the firſt male Ciſtus, wherein it differeth from all the reſt vnder the name Ledon.

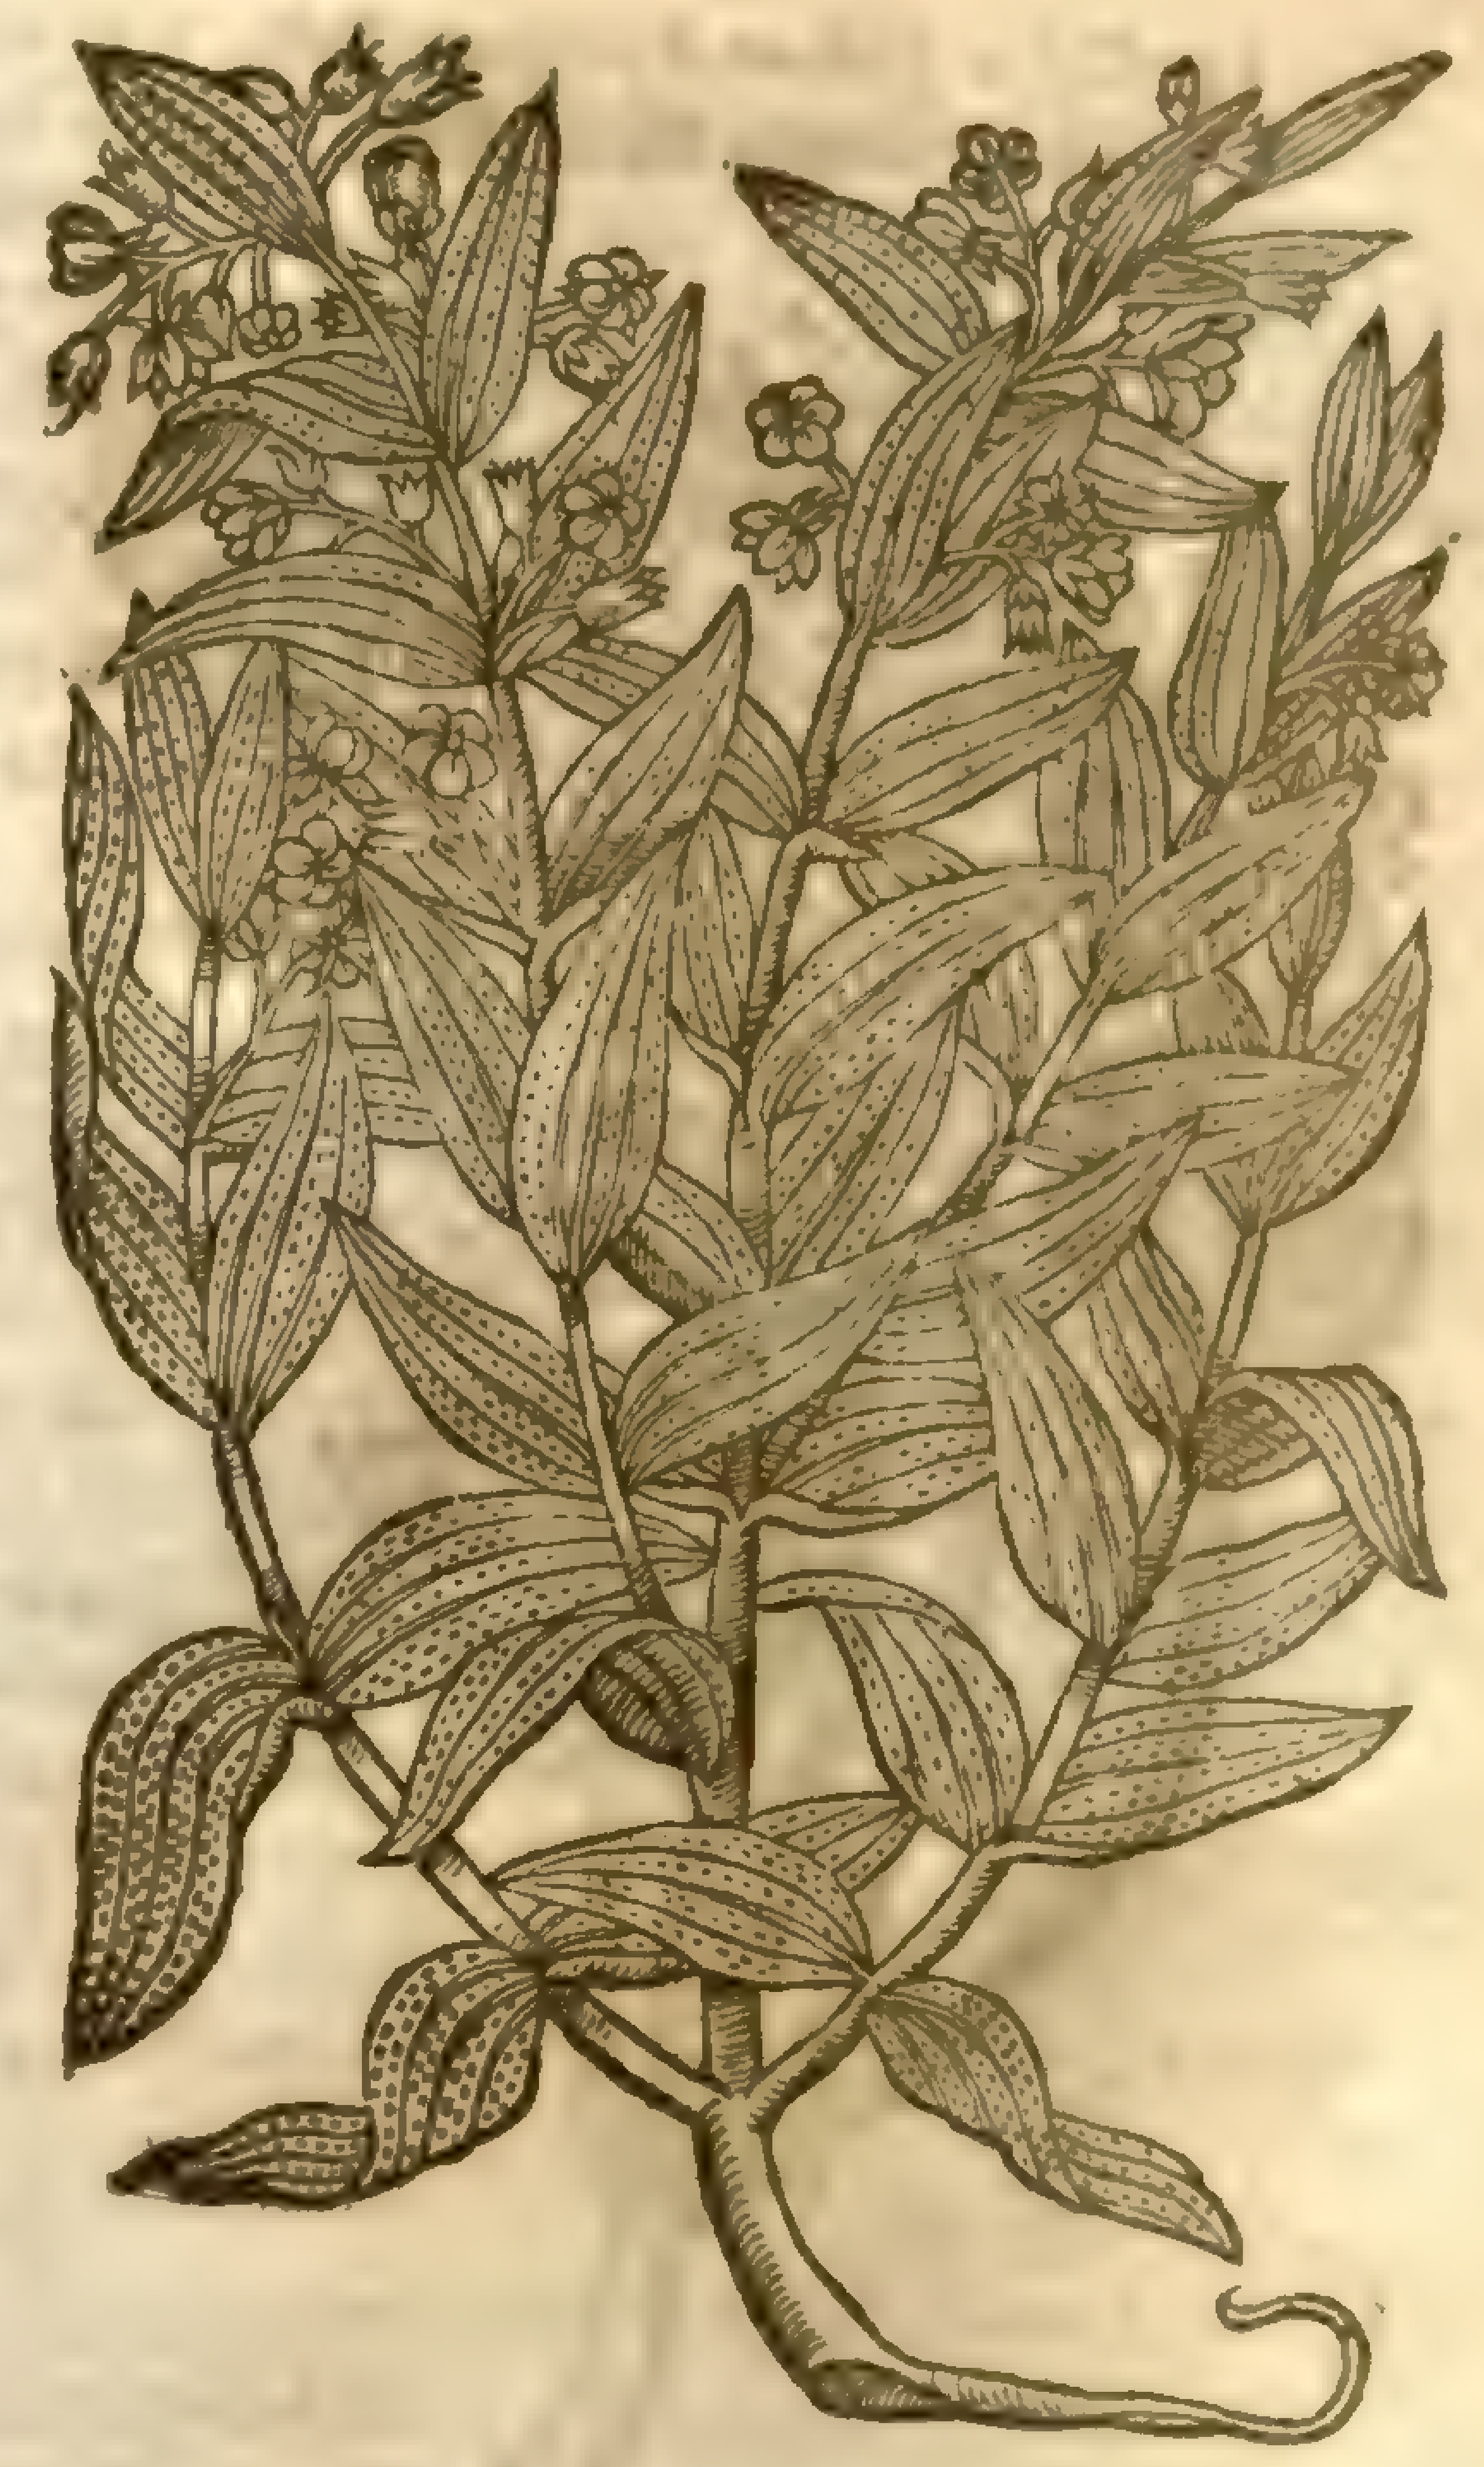
9 The ninth hath diuers brittle ſtalkes of an aſh colour tending to a ruſſet; whereon are ſet very may leaues like thoſe of Thyme, of an ouerworne colour: the floures are white, with certaine yellow chiues in the middle, which the grauer hath omitted in the figure.

10 The tenth groweth vp like a ſmall ſhrub, hauing brittle ſtalkes, couered with a blackiſh barke, and diuided into diuers branches; whereon are ſet vpon ſhort truncheons or fat foot-ſtalkes, foure or fiue like thoſe of the Myrtle tree, of a ſtrong ſmell: the floures are likewiſe of a white colour.

12 *Ciſtus Ledum Roriſmarini folio.*
Ciſtus Ledon with leaues like Roſemarie.



13 *Ciſtus Ledum Matthioli.*
Ciſtus Ledon of *Matthiolus* deſcription.

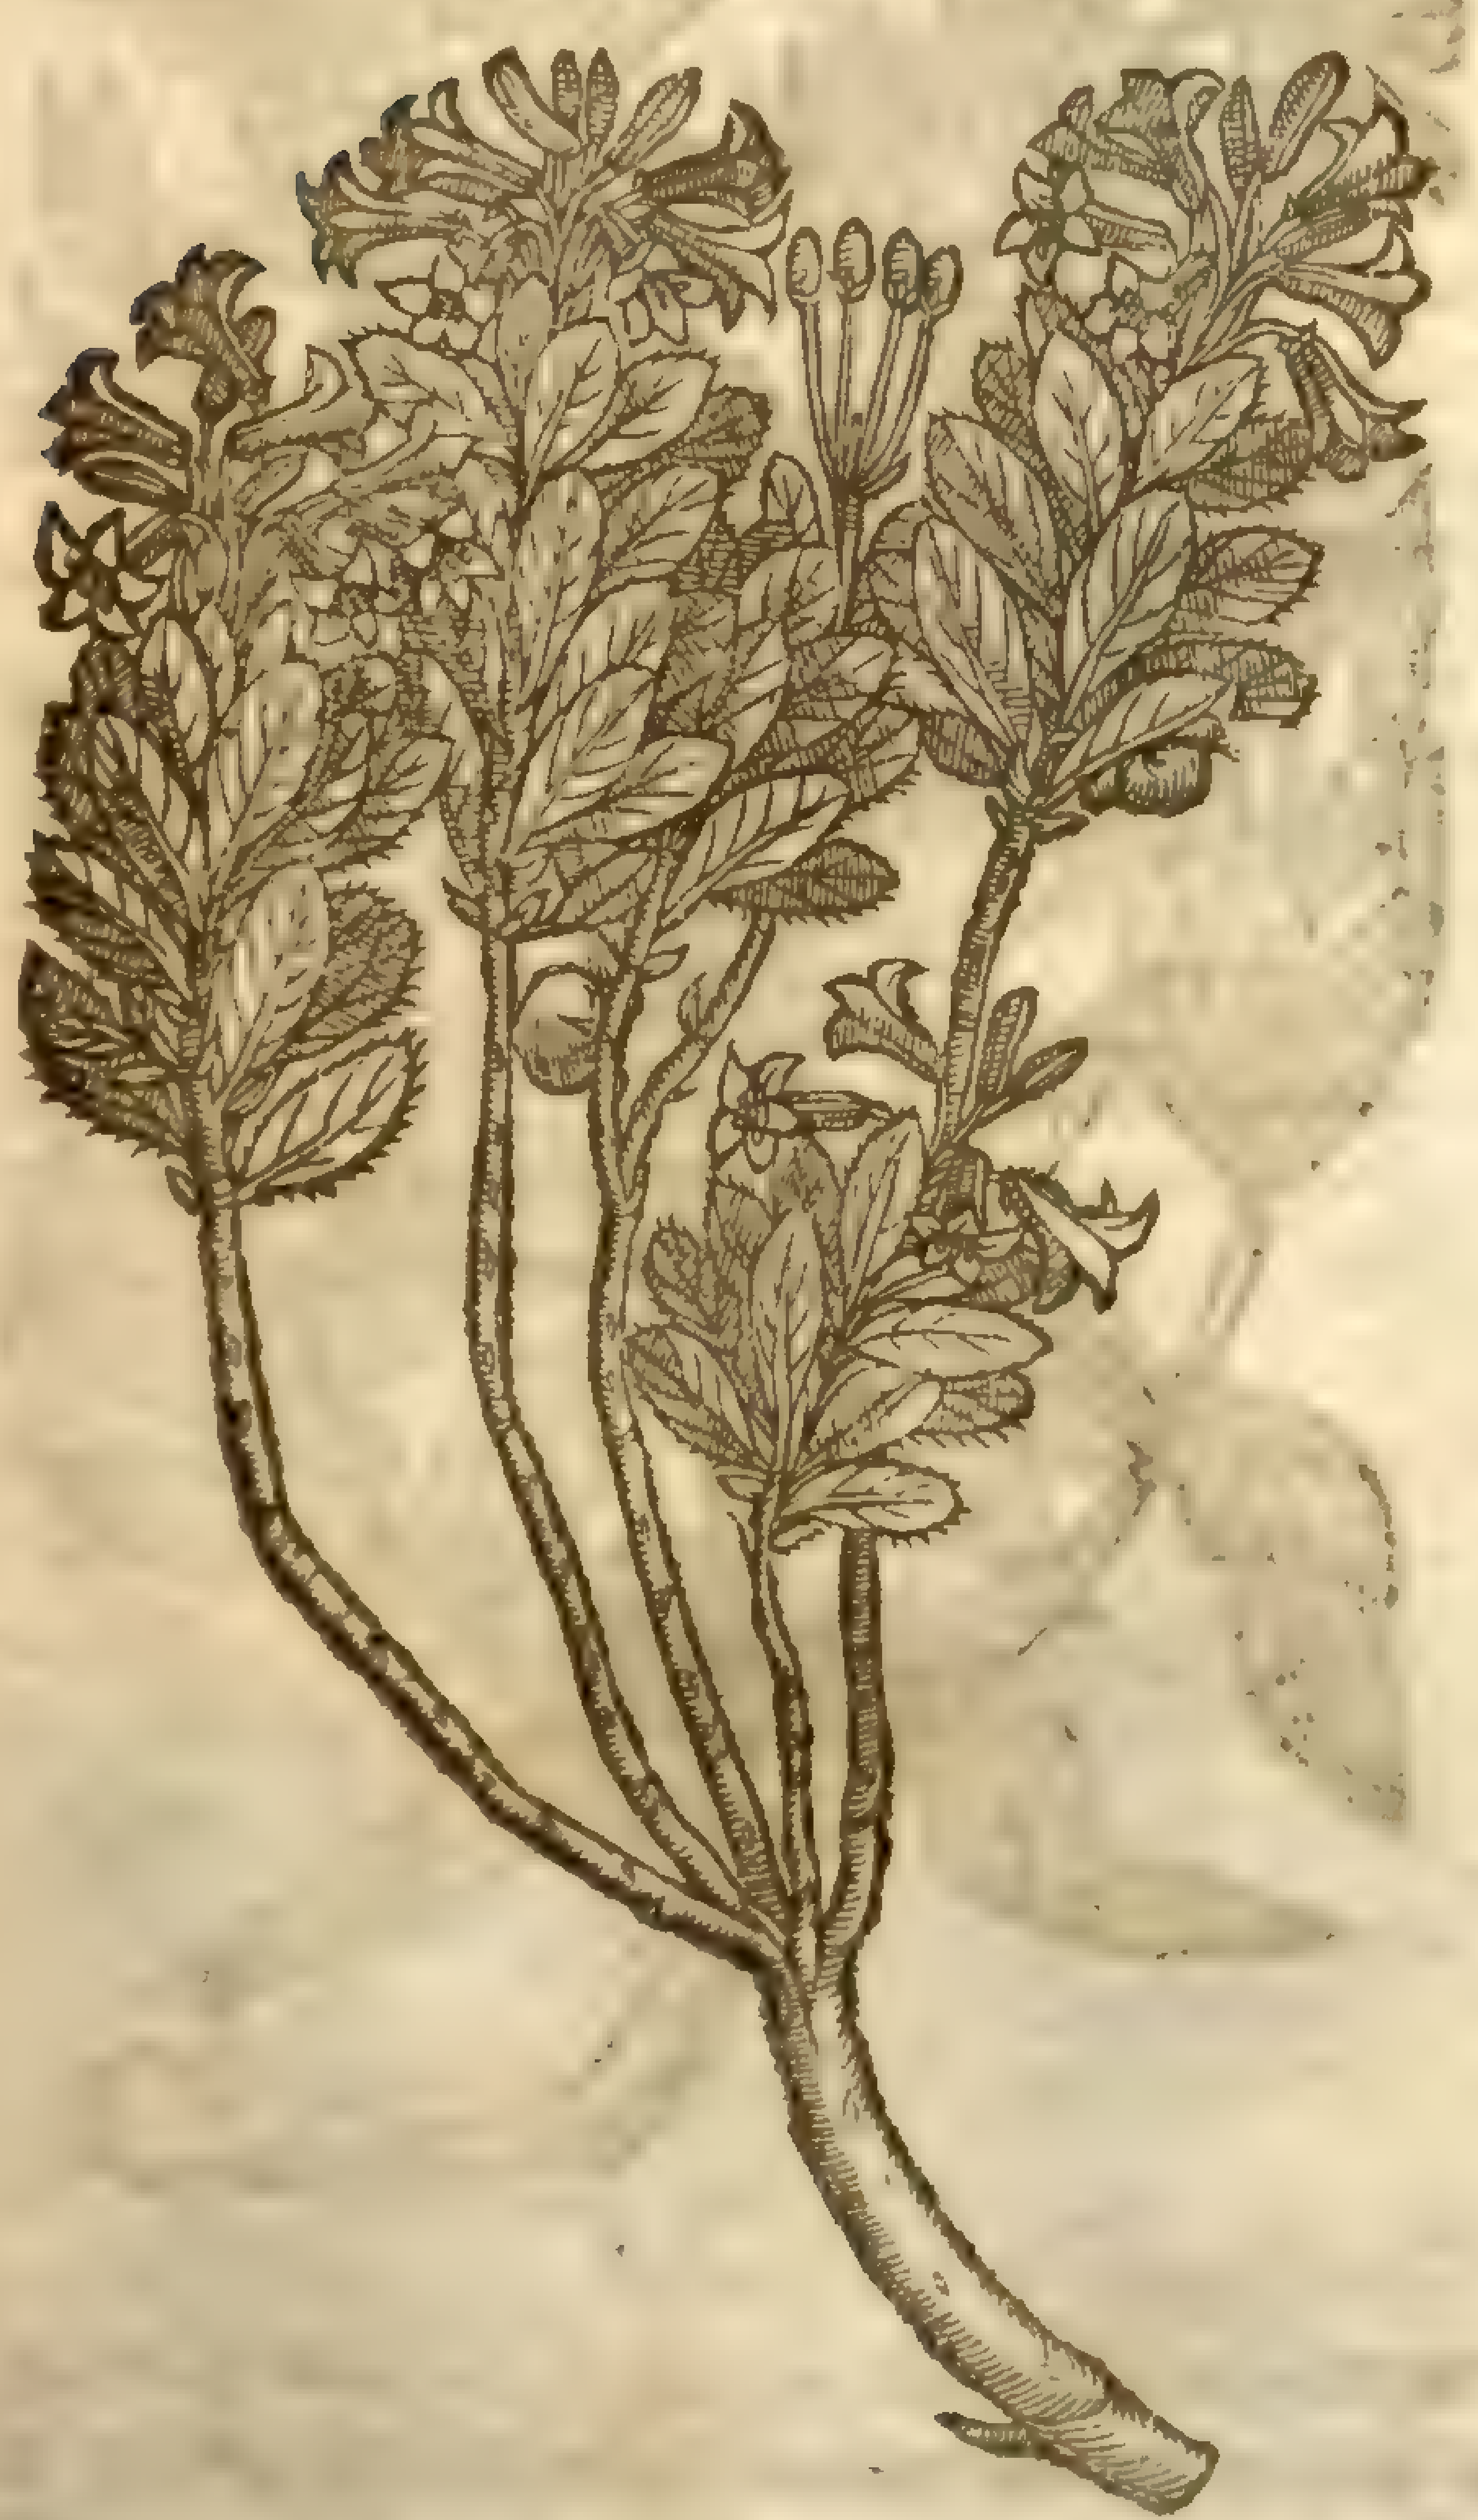


11. 12. The twelfth kinde of Ciſtus Ledon groweth vpright with a ſtraight body or ſtocke, bringeth at the top many ſmall twigs or rods of a cubit long, couered with a barke of the colour of aſhes, which diuide themſelues into other branches, of a purpliſh colour, beſet with long and narrow leaues, not much vnlike to Roſemary, but longer; of a greene colour aboue, but vnderneath hauing as it were a long rib, made or compact of wooll or downe; of a ſweet and pleaſant ſmell, and ſomewhat ſharpe in taſte: on the tops of the branches grow knops or heads compact as it were of many ſcales, of an iron or ruſſet colour: out of which commeth and proceedeth a certaine round and long mane, or hairy panickled tuft of floures, with many long, tender, greene, and ſomewhat woolly ſtalkes or twigs growing vnto them, of a ſweet ſent and ſmell: the floures conſiſt of fiue little white leaues, within which are contained ten white chiues with a long ſtile or pointal in the midſt of the floure: when the floures be vaded, there ſucceed long knops or heads which are fiue cornered, in ſhape and bigneſſe like vnto the fruite and berries of *Cornus*; which being greene, are beſpeckled with many ſiluer ſpots, but being ripe, are of a red colour; containing within them a long yellow ſeed, which is ſo ſmall and ſlender, that it is like to the duſt or pouder that falleth out of worme holes. ‡ This is the *Ledum Sileſiacum* of *Cluſius*; and the *Ledum Roriſmarini folio* of *Tabernamontanus*: it is alſo the *Roſmarinum ſylueſtre* of *Matthiolus*; and *Chamæpeuce* of *Cordus*: and I am

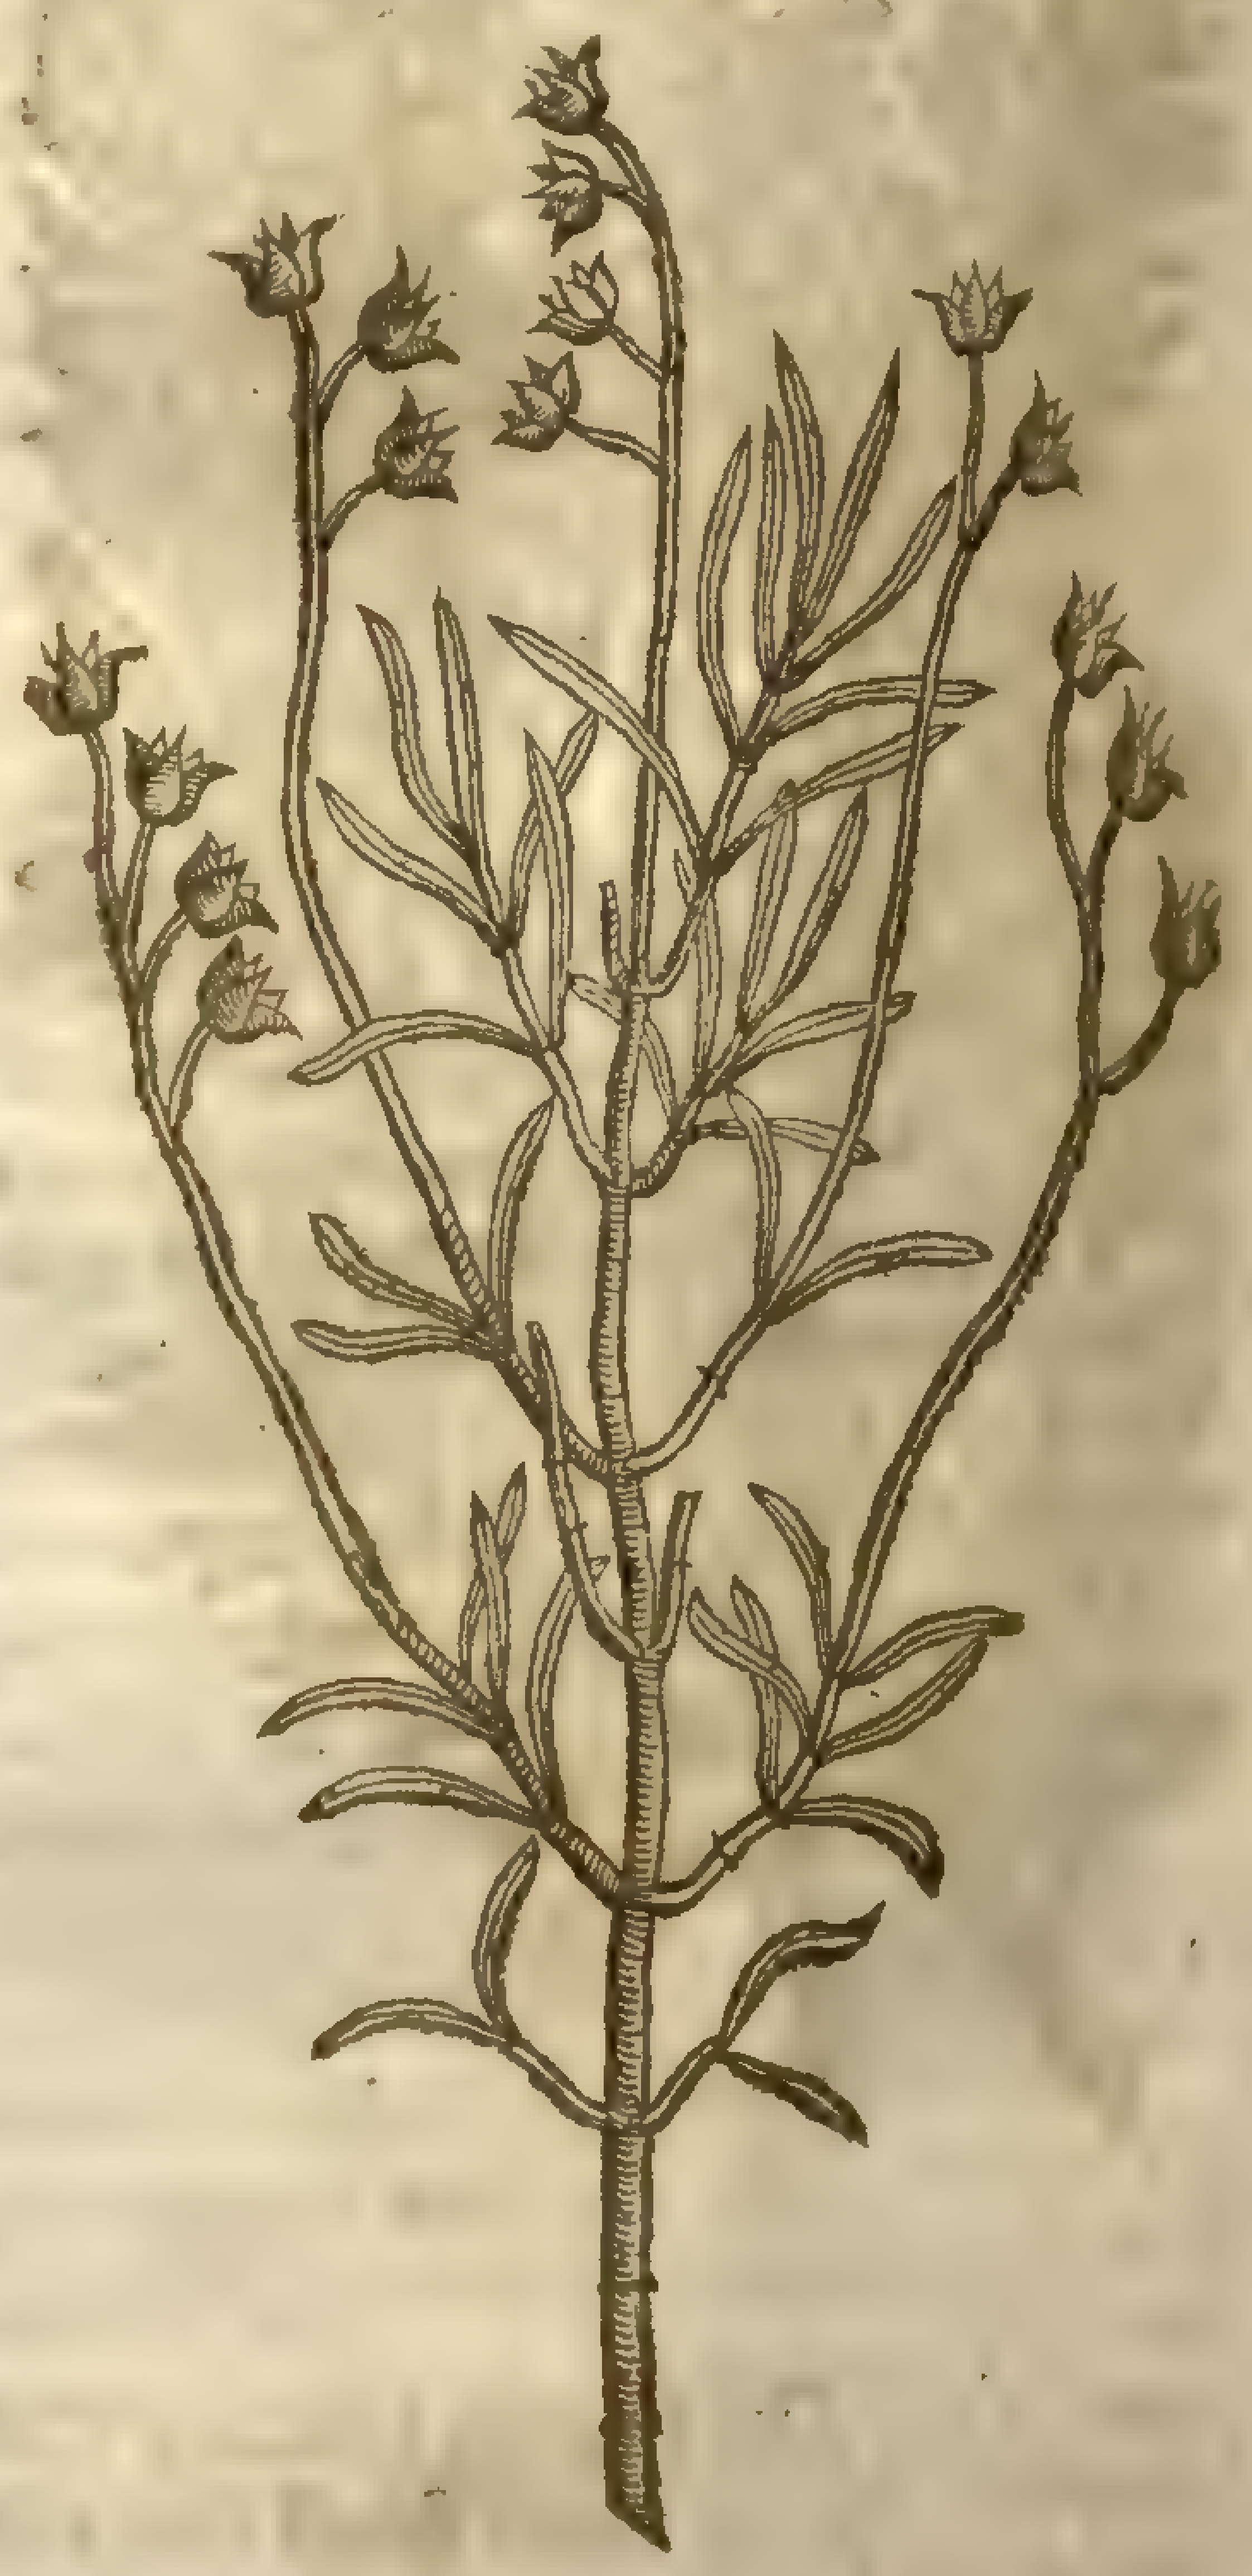
deceiued if the figure which *Tabernamontanus* and our Author out of him gaue by the name of *Ciſtus adulterinus*, were not of this. ‡

13 Among the ſhrubby buſhes comprehended vnder the title of *Ciſtus Ledum*, *Matthiolus* hath ſet forth one, whereof to write at large were impoſſible, conſidering the Author is ſo briefe, and of our ſelues we haue not any acquaintance with the plant it ſelfe: *Dioſcorides* to helpe what may be, ſaith, that it is a ſhrub growing like vnto the ſtocke or kindred of the *Ciſti*: from whoſe leaues is gathered a clammy dew which maketh that gummie matter that is in ſhops called *Lapdanum*: it groweth, ſaith he, in hot regions (but not with vs:) the Mauritanians call the juyce or clammy matter, *Leden*, and *Laden*: of ſome, *Ladano*, and *Odano*: in Spaniſh, *Xara*: and further ſaith, it groweth in Arabia, where the buſh is called *Chaſus*: thus much for the deſcription. ‡ Our Author here ſeems to make *Dioſcorides* to comment vpon *Matthiolus*, which ſhewes his learning, and how well he was exerciſed in reading or vnderſtanding any thing written of Plants. But of this enough; The Plant here figured which *Matthiolus* iudges to be the true *Ledon*, or *Ciſtus Ladanifera* of *Dioſcorides*, hath large ſtalkes and branches, whereon grow very thicke leaues, broad alſo and long, with the nerues running alongſt the leaues: the floures of this conſiſt of fiue white leaues, and the ſeed is contained in a three cornered ſeed veſſell. ‡

14 *Ciſtus Ledum Alpinum Cluſij.*
The Mountaine Ciſtus.



‡ 15 *Ciſtus Ledon folijs Roriſmarini.*
Roſemary leaued Ciſtus Ledon.



Rhododendron hirsutum, [illegible]

4 The foureteenth Ciſtus, being one of thoſe that doe grow vpon the Alpiſh mountaines, which *Lobel* ſetteth downe to be *Balſamum alpinum* of *Geſner*: notwithſtanding I thinke it not amiſſe to inſert it in this place, hauing for my warrant that famous Herbariſt *Carolus Cluſius*: this plant is one of the beautifulleſt, differing in very notable points, yet reſembling them in the wooddy branches and leaues: it riſeth vp hauing many weake branches leaning to the ground, yet of a wooddie ſubſtance, couered ouer with an aſh-coloured barke: the leaues are broad, and very tough, of a ſhining greene colour, and a binding taſte: the floures grow at the tops of the branches like little bels, hanging downe their heads, diuided at the lips or brims into fiue diuiſions, of a deep red colour on the out ſide, and daſht ouer here and there with ſome ſiluer ſpots; on the inſide of a bright ſhining red colour, with certaine chiues in the middle, and of a very ſweet ſmell, as is all the reſt of the plant; after which come ſmall heads or knaps, full of ſeed like duſt, of a very ſtrong ſmell, making the head of them to ake that ſmel therto: the root is long, hard, and very wooddy: oftentimes there is

found vpon the trunke or naked part of the ſtalkes certain excreſcences, or out-growings in manner of galls, of a fungous ſubſtance, like thoſe of Touchwood, white within, and red without, of an aſtringent or biting taſte.

‡ 15 This growes ſome cubit or better high, and hath long narrow glutinous leaues like in ſhape to thoſe of Roſemarie, ſet by couples but not very thicke: the branches whereon the floures doe grow are ſlender, and the ſeed veſſels are diuided into fiue parts as in other plants of this kinde. This *Cluſius* found in Spaine, and ſets forth for his *Ledum nonum.* ‡

¶ *The Place.*

Ciſtus Ledon groweth in the Iſland of Candie, as *Bellonius* doth teſtifie, in vntilled places euery where: it is alſo found in Cyprus, as *Pliny* ſheweth, and likewiſe in many places of Spaine that lie open to the Sun: moreouer, both the forme and bigneſſe of the leaues, and alſo of the plants themſelues, as well of thoſe that bring forth *Ladanum*, as the other Ciſtus, do vary in this wonderful maner, according to the diuerſitie of the places and countries where they grow: they are ſtrangers in theſe Northernly parts, being very impatient of our cold clymate.

¶ *The Time.*

They floure for the moſt part from May to the end of Auguſt: the clammy matter which falleth vpon the leaues, which is a liquid kinde of Roſen of a ſweet ſmell, is gathered in the Spring time, as *Dioſcorides* ſaith: but as *Petrus Bellonius* affirmeth (being an eye witnes of the gathering) in the midſt of ſummer, and in the extreme heat of the Dog-daies, the which in our time not without great care and diligence, and as great labour, is gathered from the whole plant (with certain inſtruments made in manner of tooth-pickes, or eare-pickes, which in their tongue they call *Ergaſtiri*) and not gathered from the beards of Goats, as it is reported in the old fables of the lying Monks themſelues, called *Calobieros*, that is to ſay Greekiſh Monkes, who of very mockery haue foiſted that fable among others extant in their workes.

‡ I thinke it not amiſſe for the better explanation of the matter here treated of, as alſo to ſhew you after what manner our Authour in diuers places gaue the teſtimony of ſundry Writers, and how well hee vnderſtood them, here to ſet downe in Engliſh the words of *Bellonius* concerning the gathering of *Ladanum*, which are theſe. [The Greekes (ſaith he) for the gathering of *Ladanum*, prouide a peculiar inſtrument which in their vulgar tongue they terme *Ergaſtiri*: This is an inſtrument like to a Rake without teeth, to this are faſtened ſundry thongs cut out of a raw and vntanned hide, they gently rub theſe vpon the *Ladanum* bearing ſhrubs, that ſo the liquid moiſture concrete about the leaues may ſticke to them, which afterwards with kniues they ſhaue off theſe thongs in the heat of the day. Wherefore the labour of gathering *Ladanum* is exceeding great, yea intollerable, ſeeing they muſt of neceſſitie ſtay in the mountaines all the day long in the greateſt heat of the Dog-daies: neither vſually ſhall you finde any other who will take the paines to gather it; beſides, the *Calobieroi*, that is, the Greeke Monkes. It is gathered no where in the whole Iſland of Candy in greater plenty, than at the foot of the mountaine Ida at a village called Cogualino, and at Milopotamo. ‡]

¶ *The Names.*

The ſhrub it ſelfe is called in Greeke, λῆδον, or λάδον: the Latines keepe the name *Ledon* or *Ladon*, and is a kinde of *Ciſtus* or Holly Roſes: the fat or clammie matter which is gathered from the leaues, is named *Ladanon* and *Ledanon*, according to the Greeke: the Apothecaries corruptly call it *Lapdanum*: *Dioſcorides* counteth that to be the beſt which is ſweet of ſmell, and ſomewhat greene, that eaſily waxeth ſoft, is fat, without ſand, and is not eaſily broken, but very full of Roſin or gumme.

¶ *The Temperature.*

Ladanum, ſaith *Galen*, is hot in the later end of the firſt degree, hauing alſo a little aſtrictiue or binding quality; it is likewiſe of a thin ſubſtance, and therefore it ſofteneth, and withall doth moderately digeſt, and alſo concoct.

¶ *The Vertues.*

Ladanum hath a peculiar property againſt the infirmities of the mother, it keepeth haires from falling; for it waſteth away any ſetled or putrified humor that is at their roots. A

Dioſcorides ſaith, That *Ladanum* doth binde, heate, ſouple, and open, being tempered with wine, Myrrhe, and oyle of Myrtles; it keepeth haires from falling, being annointed therewith; or laied on mixed with wine, it maketh the markes or ſcars of wounds faire and well coloured. B

It taketh away the paine of the eares if it be poured or dropped therein, mixed with honied water, or with oyle of Roſes. C

A fume made thereof draweth forth the after-birth, and taketh away the hardneſſe of the matrix. D

E It is with good ſucceſſe mixed with mollifying plaiſters that mitigate paine.

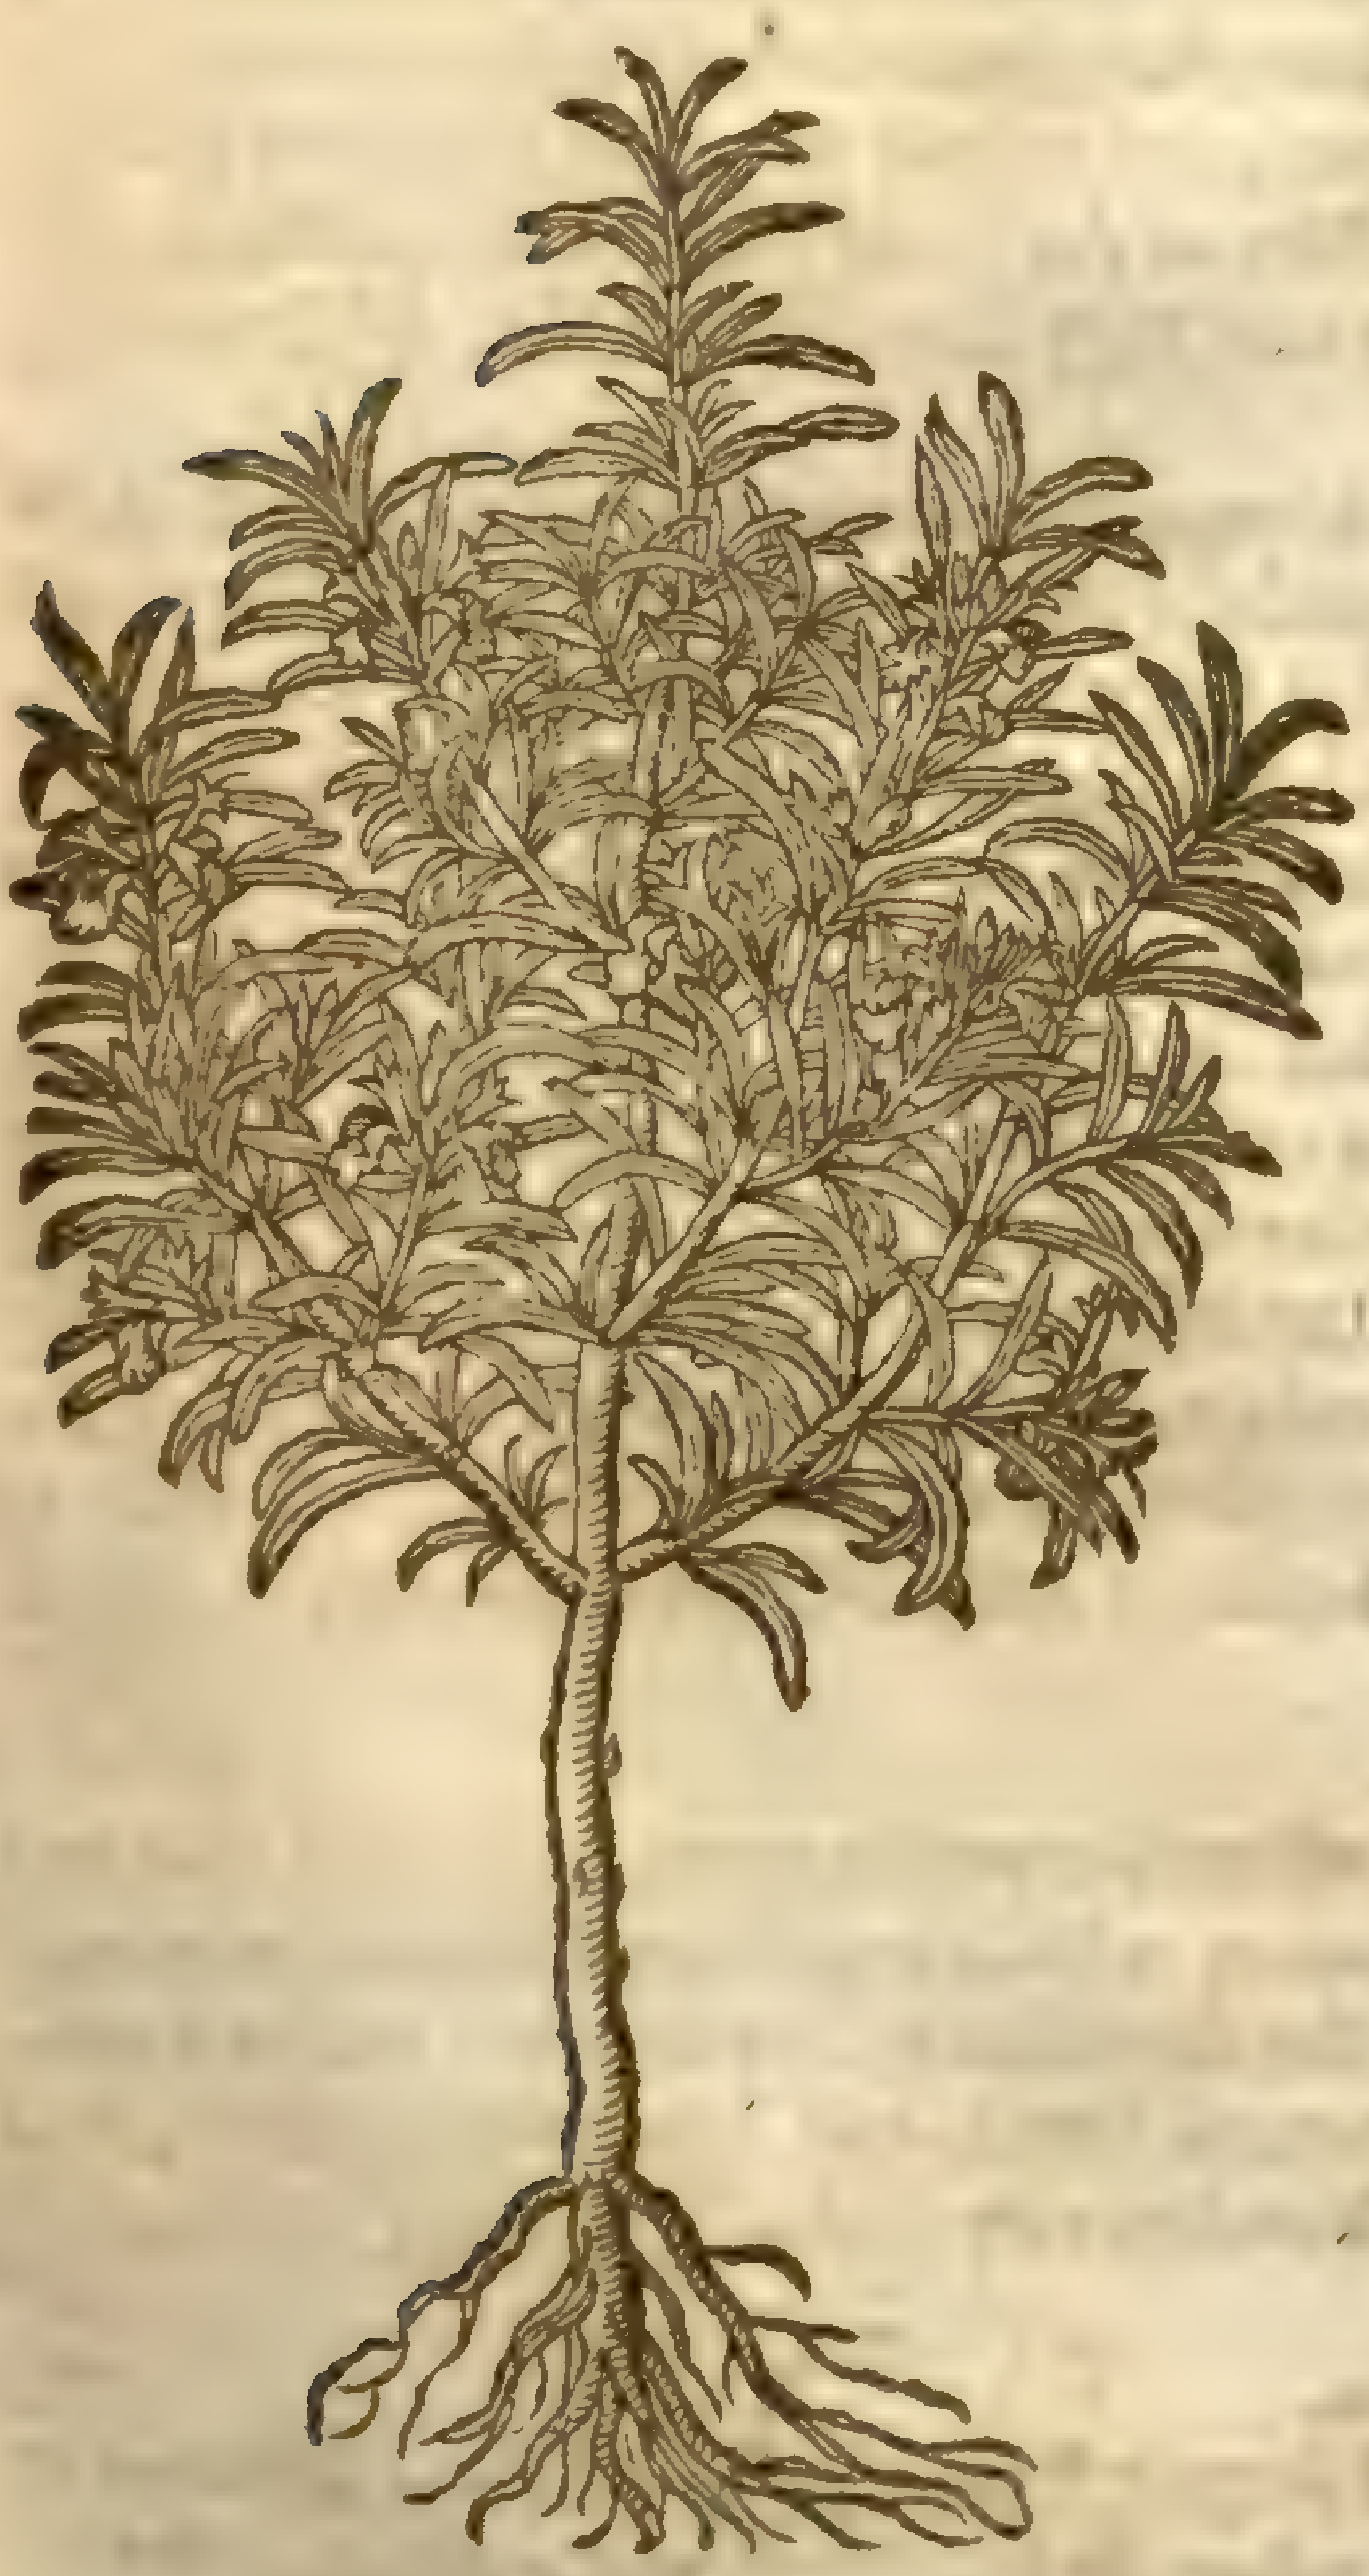
F Being drunke with wine, it ſtoppeth the laske and prouoketh vrine.

G There is made hereof diuers ſorts of Pomanders, chaines, and bracelets, with other ſweets mixed therewith.

Chap. 8. *Of Roſemary.*

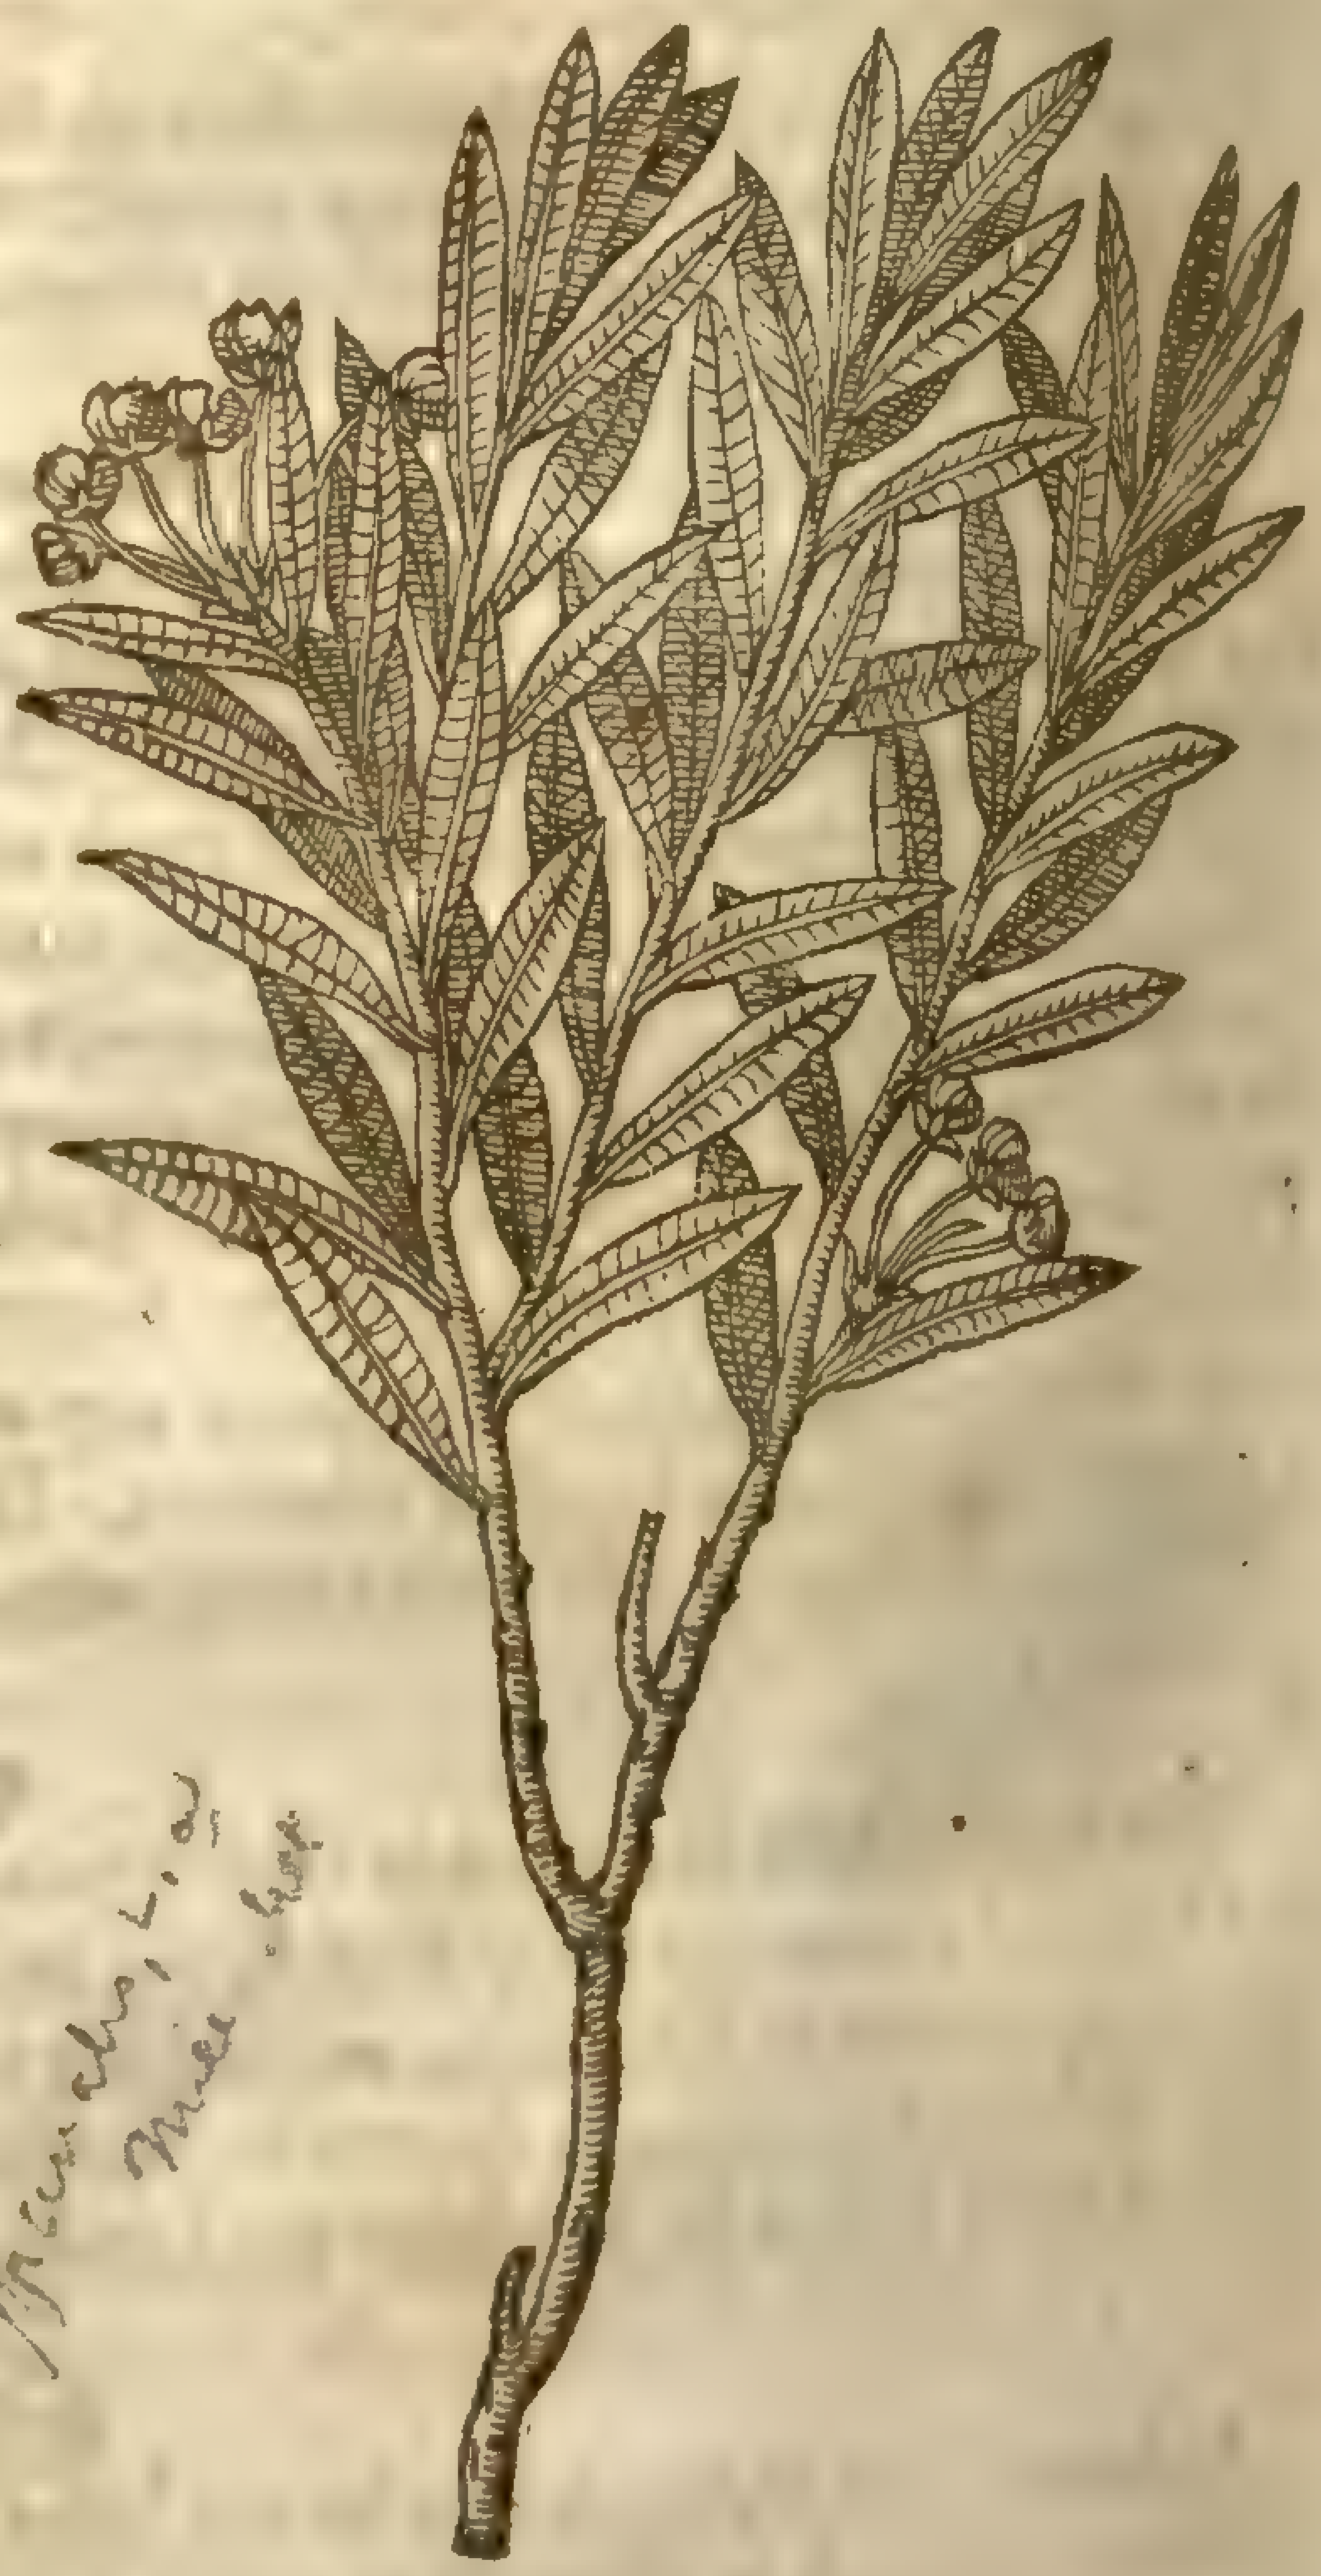
¶ *The Deſcription.*

1 Roſemarie is a wooddy ſhrub, growing oftentimes to the height of three or foure cubits, eſpecially when it is ſet by a wall: it conſiſteth of ſlender brittle branches, whereon do grow very many long leaues, narrow, ſomewhat hard, of a quicke ſpicy taſte, whitiſh vnderneath, and of a full greene colour aboue, or in the vpper ſide, with a pleaſant ſweet ſtrong ſmell; among which come forth little floures of a whitiſh blew colour: the ſeed is blackiſh: the roots are tough and wooddy.



1 *Roſmarinum Coronarium.*
Garden Roſemarie.

R. officinalis, L.
Mill. Dict.



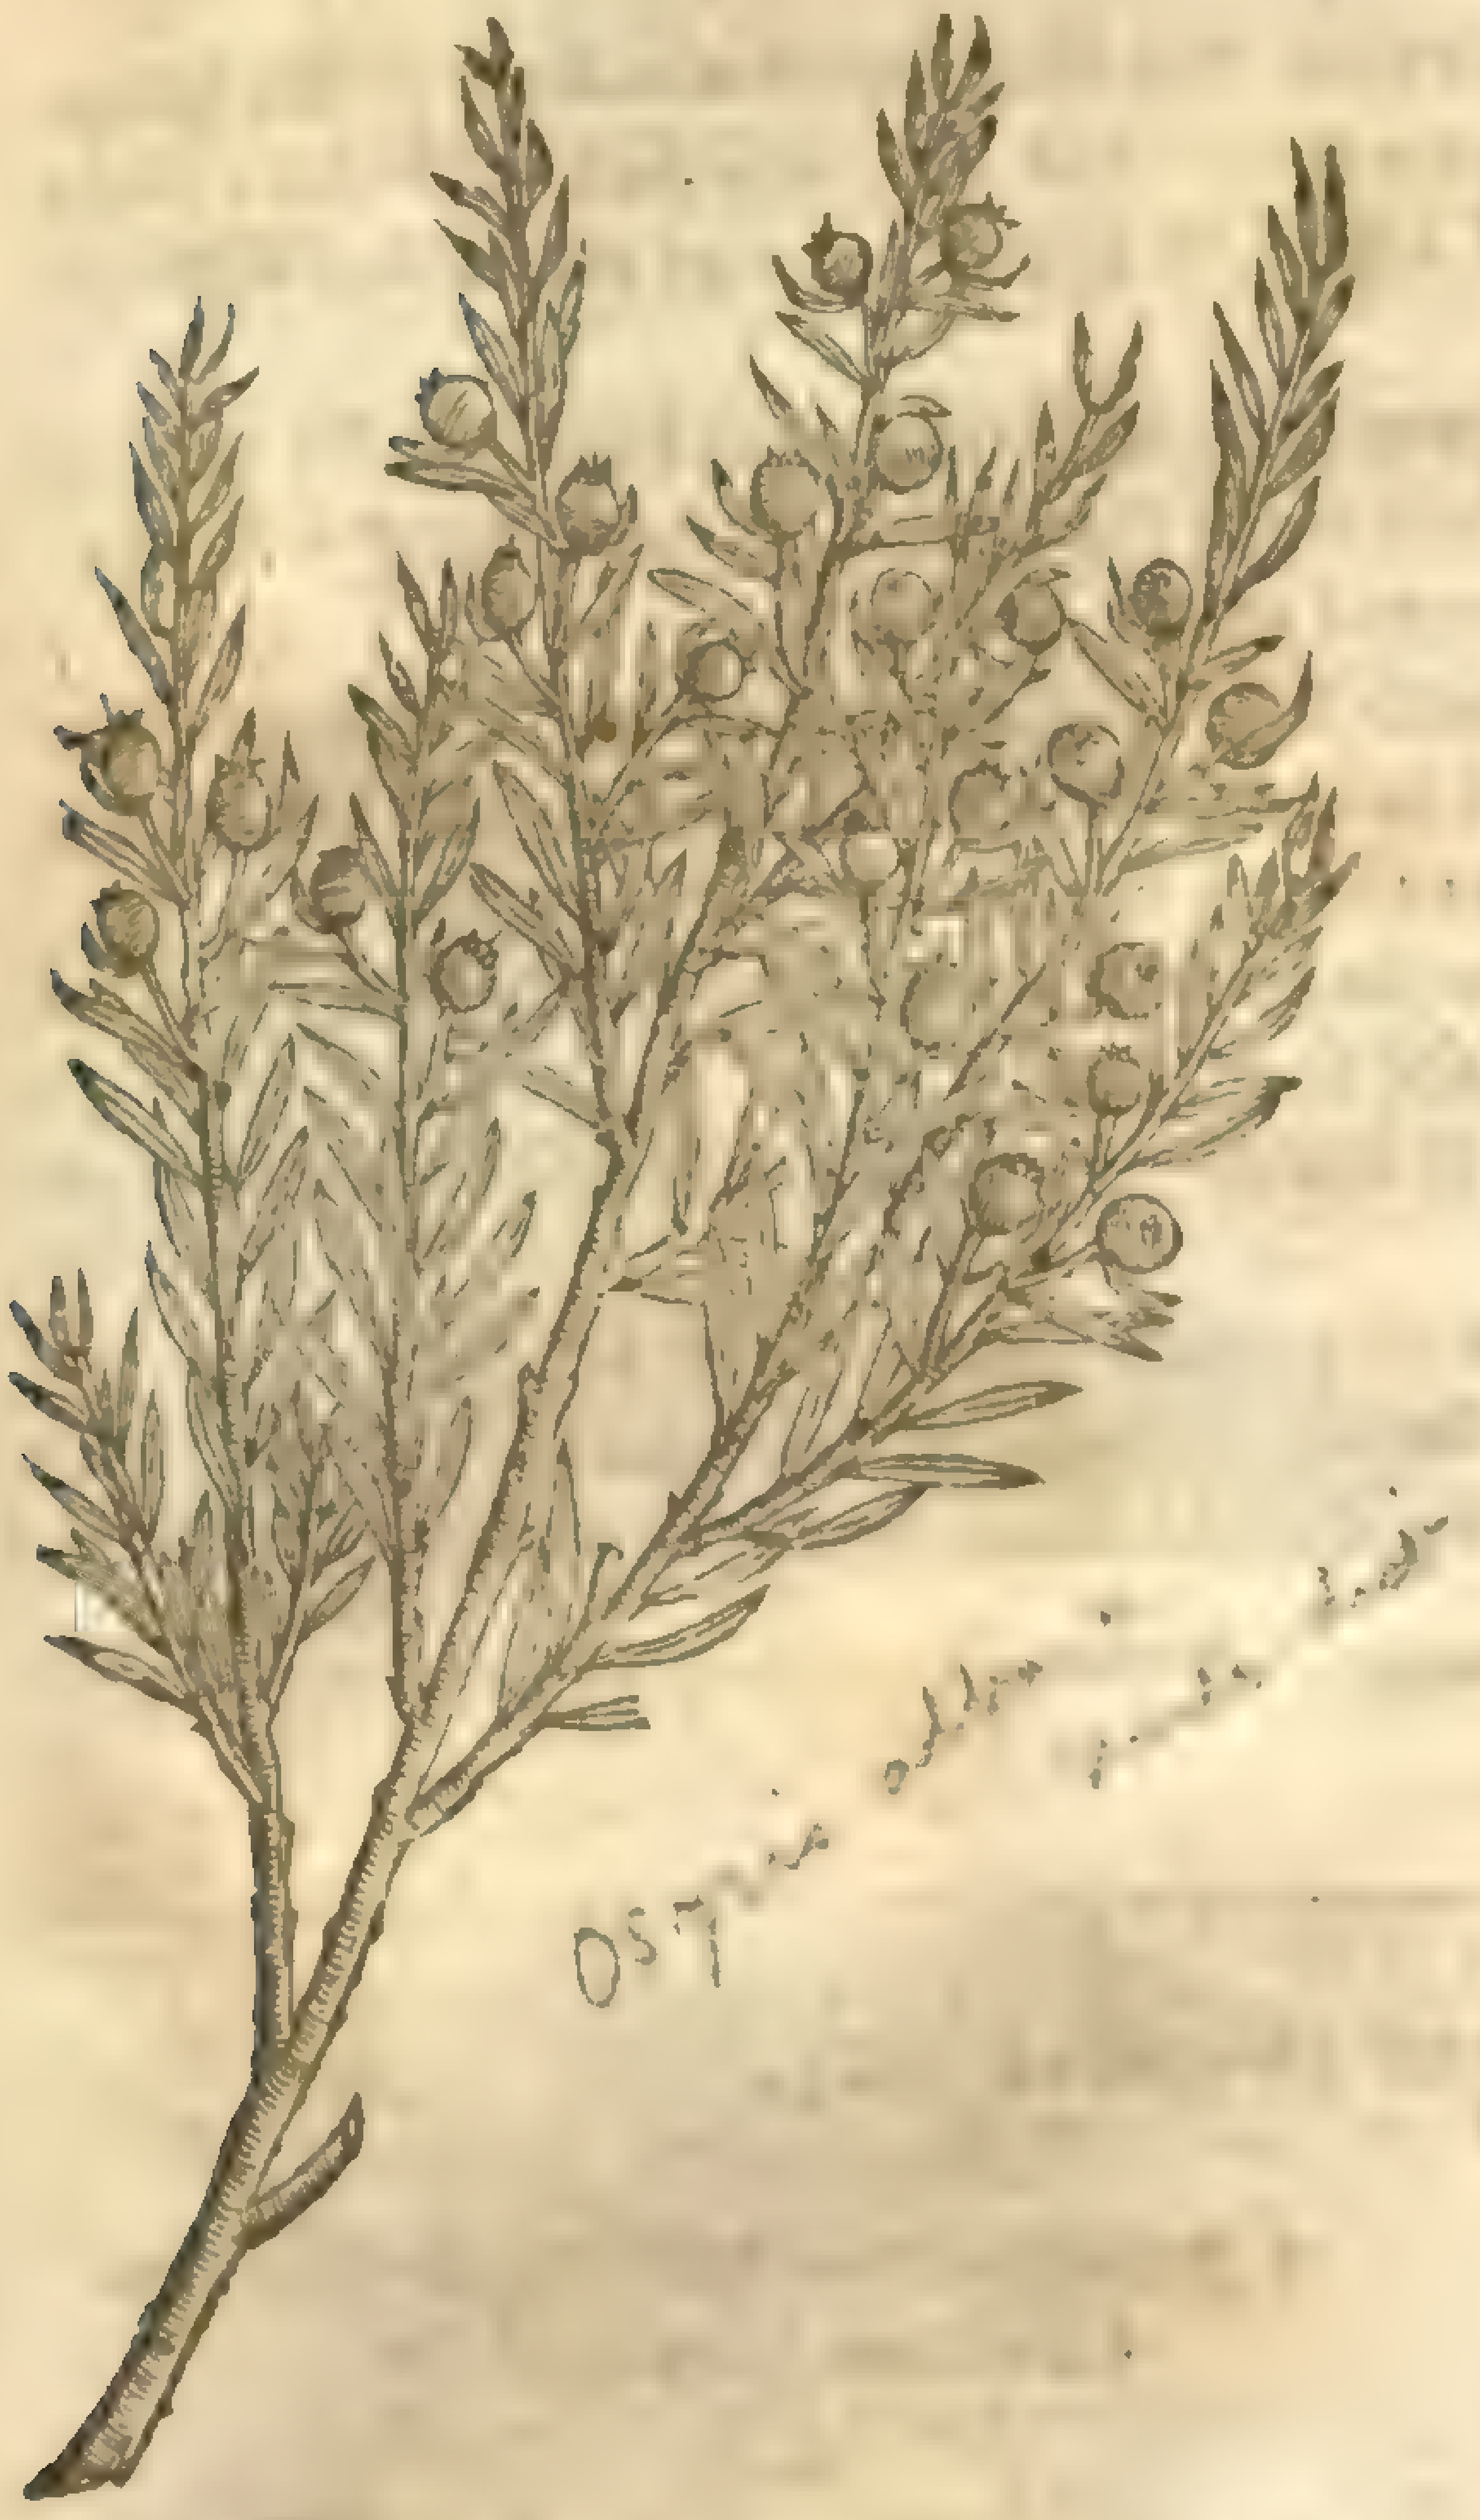
2 *Roſmarinum ſylueſtre.*
Wilde Roſemarie.

R. officinalis, L. β
Mill. Dict.

2 The wilde Roſemary *Cluſius* hath referred vnto the kindes of Ciſtus Ledon; we haue as a poore kinſman thereof inſerted it in the next place, in kindred or neighbourhood at the leaſt. This wilde Roſemary is a ſmall wooddy ſhrub, growing ſeldome aboue a foot high, hauing hard branches of a reddiſh colour, diuiding themſelues into other ſmaller branches of a whitiſh color: whereon are placed without order diuers long leaues greene aboue, and hoarie vnderneath, not vnlike to thoſe of the dwarfe Willow, or the common Roſemary, of a dry and aſtringent taſte, of little ſmell or none at all: the floures ſtand on the tops of the branches, ſet vpon bare and naked foot-ſtalkes, conſiſting of fiue ſmall leaues of a reddiſh colour, ſomewhat ſhining; after which appeare little knaps full of ſmall ſeed: the root is tough and wooddy.

3 This plant grows vp like an hedge ſhrub of a wooddy ſubſtance, to the height of two or three cubits;

3 *Caſia Poetica, Lobelij.*
The Poëts Roſemary or Gardrobe.



Osy[illegible]

cubits; hauing many twiggie brnnches of a green colour: wherupon do grow narrow leaues like vnto *Linaria* or Toad-flax, of a bitter taſte; among which come forth ſmall moſſie floures, of a greeniſh yellow colour like thoſe of the Cornell tree, and of the ſmell of Roſemarie: which hath moued me to place it with the Roſemaries as a kind thereof, not finding any other plant ſo neere vnto it in kinde and neighbourhood: after the floures be paſt, there ſucceed fruit like thoſe of the Myrtle tree, greene at the firſt, and of a ſhining red colour when they bee ripe, like Corall, or the berries of *Aſparagus*, ſoft and ſweet in taſte, leauing a certaine acrimony or ſharpe taſte in the end: the ſtone within is hard as is the nut, wherein is contained a ſmall white kernel, ſweet in taſt: the root is of a wooddie ſubſtance: it floureth in the Summer; the fruit is ripe in the end of October: the people of Granade, Montpelier, and of the kingdom of Valentia, doe vſe it in their preſſes and Wardrobes, whereupon they cal it *Guardalobo.* ‡ This in *Cluſius* his time when he liued about Montpelier was called *Oſyris*; but afterwards they called it *Caſia*, thinking it that mentioned by the Poët *Virgil*, the which it cannot be, for it hath no ſweet ſmell. *Pena* and *Lobel* iudge it to be the *Caſia* of *Theophraſtus*, wherewith alſo it doth not well agree. ‡

¶ *The Place.*

Roſemary groweth in France, Spaine, and in other hot countries; in woods, and in vntilled places: there is ſuch plenty thereof in Languedocke, that the inhabitants burne ſcarce any other fuell: they make hedges of it in the gardens of Italy and England, being a great ornament vnto the ſame: it groweth neither in the fields nor gardens of the Eaſterne cold countries; but is carefully and curiouſly kept in pots, ſet into the ſtoves and cellers, againſt the injuries of their cold Winters.

Wild Roſemary groweth in Lancaſhire in diuers places, eſpecially in a field called Little Reed, amongſt the Hurtle berries, neere vnto a ſmall village called Maudſley; there found by a learned Gentleman often remembred in our Hiſtory (and that worthily) Mr. *Thomas Hesketh.*

¶ *The Time.*

Roſemary floureth twice a yeare, in the Spring, and after in Auguſt.

The wilde Roſemary floureth in Iune and Iuly.

¶ *The Names.*

Roſemary is called in Greeke, λιβανωτὶς στεφανωματική: in Latine, *Roſmarinus Coronaria*: it is ſurnamed *Coronaria*, for difference ſake betweene it and the other *Libanotides*, which are reckoned for kindes of Roſemary, and alſo becauſe women haue beene accuſtomed to make crownes and garlands thereof: in Italian, *Roſemarino coronario*: in Spaniſh, *Romero*: in French and Dutch, *Roſemarin.*

Wilde Roſemary is called *Roſemarinus ſylueſtris*: of *Cordus*, *Chamæpeuce.*

¶ *The Temperature.*

Roſemary in hot and dry in the ſecond degree, and alſo of an aſtringent or binding quality, as being compounded of diuers parts, and taking more of the mixture of the earthy ſubſtance.

¶ *The Vertues.*

Roſemary is giuen againſt all fluxes of bloud; it is alſo good, eſpecially the floures thereof, for all infirmities of the head and braine, proceeding of a cold and moiſt cauſe; for they dry the braine, quicken the ſences and memory, and ſtrengthen the ſinewie parts. A

Serapio witneſſeth, That Roſemary is a remedy againſt the ſtuffing of the head, that commeth through coldneſſe of the braine, if a garland thereof be put about the head, whereof *Abin Meſuai* giueth teſtimony. B

Dioſcorides teacheth that it cureth him that hath the yellow jaundice, if it be boyled in water and drunke before exerciſe, and that after the taking thereof the patient muſt bathe himſelfe and drinke wine. C

D The diſtilled water of the floures of Roſemary being drunke at morning and euening firſt and laſt, taketh away the ſtench of the mouth and breath, and maketh it very ſweet, if there be added thereto, to ſteep or infuſe for certaine daies, a few Cloues, Mace, Cinnamon, and a little Anniſe ſeed.

E The Arabians and other Phyſitions ſucceeding, do write, that Roſemary comforteth the braine the memorie, the inward ſenſes, and reſtoreth ſpeech vnto them that are poſſeſſed with the dumbe palſie, eſpecially the conſerue made of the floures and ſugar, or any other way confected with ſugar, being taken euery day faſting.

F The Arabians, as *Serapio* witneſſeth, giue theſe properties to Roſemarie: it heateth, ſay they, is of ſubtill parts, is good for the cold rheume which falleth from the braine, driueth away windines, prouoketh vrine, and openeth the ſtoppings of the liuer and milt.

G *Tragus* writeth, that Roſemarie is ſpice in the Germane Kitchins, and other cold countries. Further, he ſaith, That the wine boyled with Roſemarie, and taken of women troubled with the mother, or the whites, helpeth them, the rather if they faſt three or foure houres after.

H The floures made vp into plates with Sugar after the manner of Sugar Roſet and eaten, comfort the heart, and make it merry, quicken the ſpirits, and make them more liuely.

I The oile of Roſemary chimically drawne, comforteth the cold, weake and feeble braine in moſt wonderfull manner.

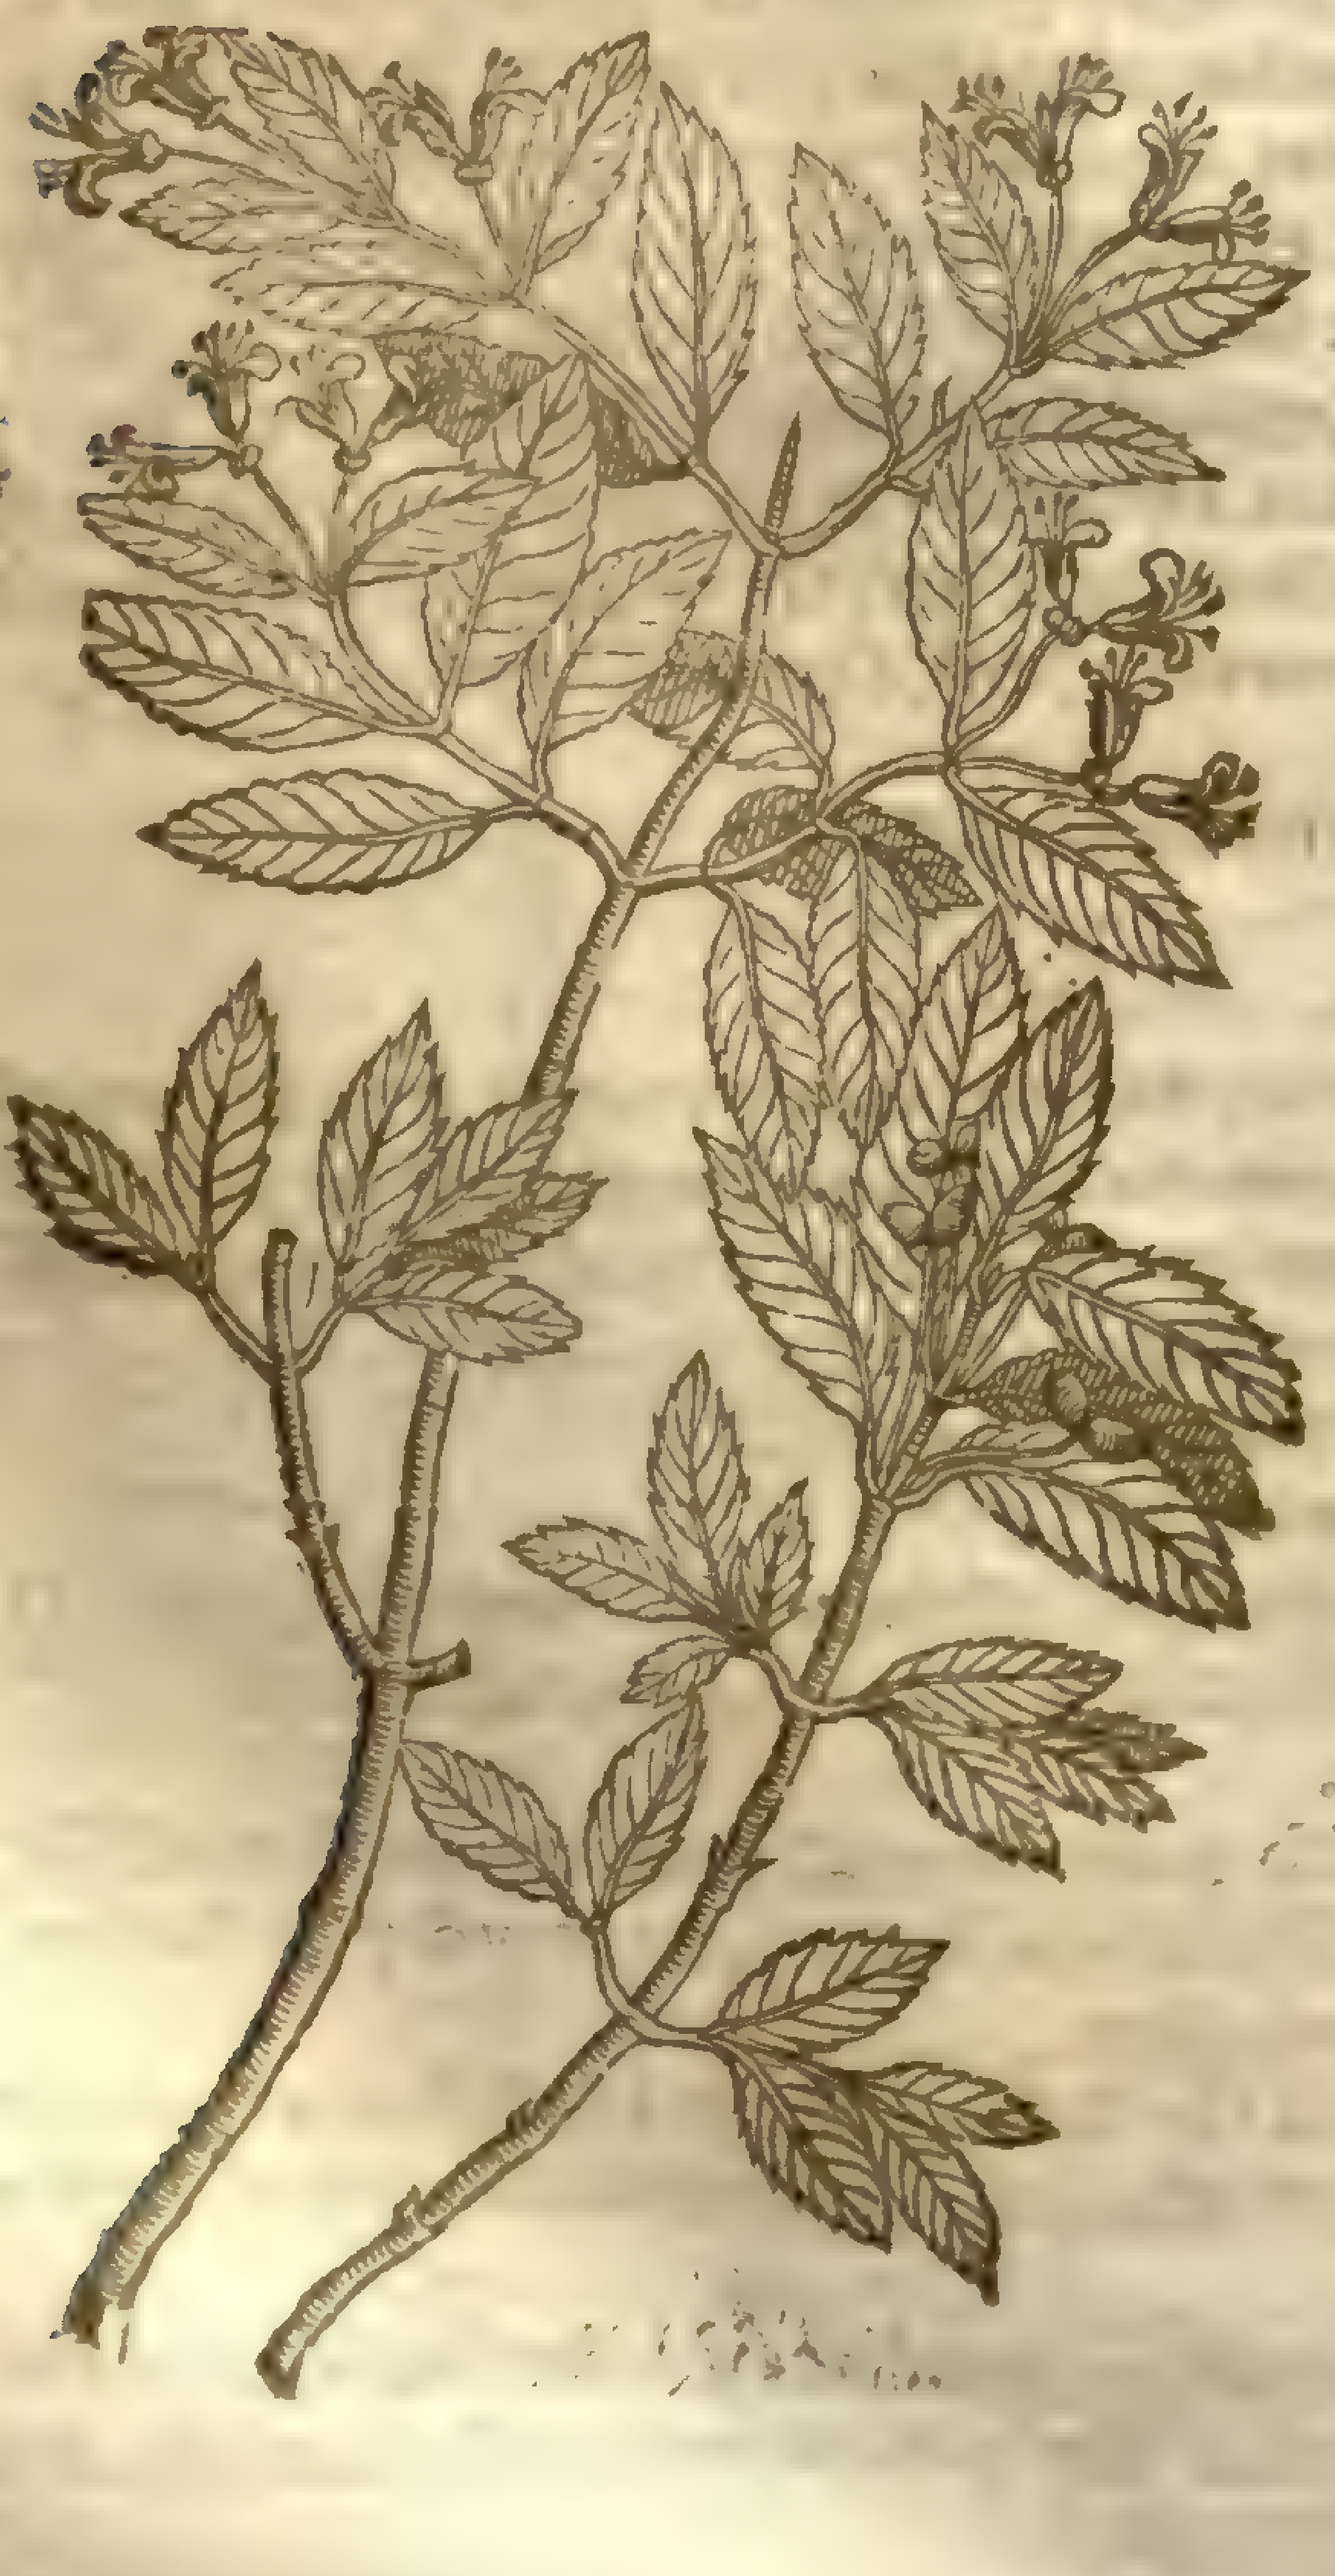
K The people of Thuringia do vſe the wilde Roſemarie to prouoke the deſired ſickneſſe.

L Thoſe of Marchia vſe to put it into their drinke the ſooner to make their clients drunke, and alſo do put it into cheſts and preſſes among clothes, to preſerue them from moths or other vermine.

† The vertues in the two laſt places properly belong to the *Roſemarinum ſylueſtre* of *Matthiolus*, which is the *Chamæpeuce* of *Cordus*, and is deſcribed in the 11 place of the foregoing chapter, by the name of *Ciſtus Ledum Sileſiacum*.

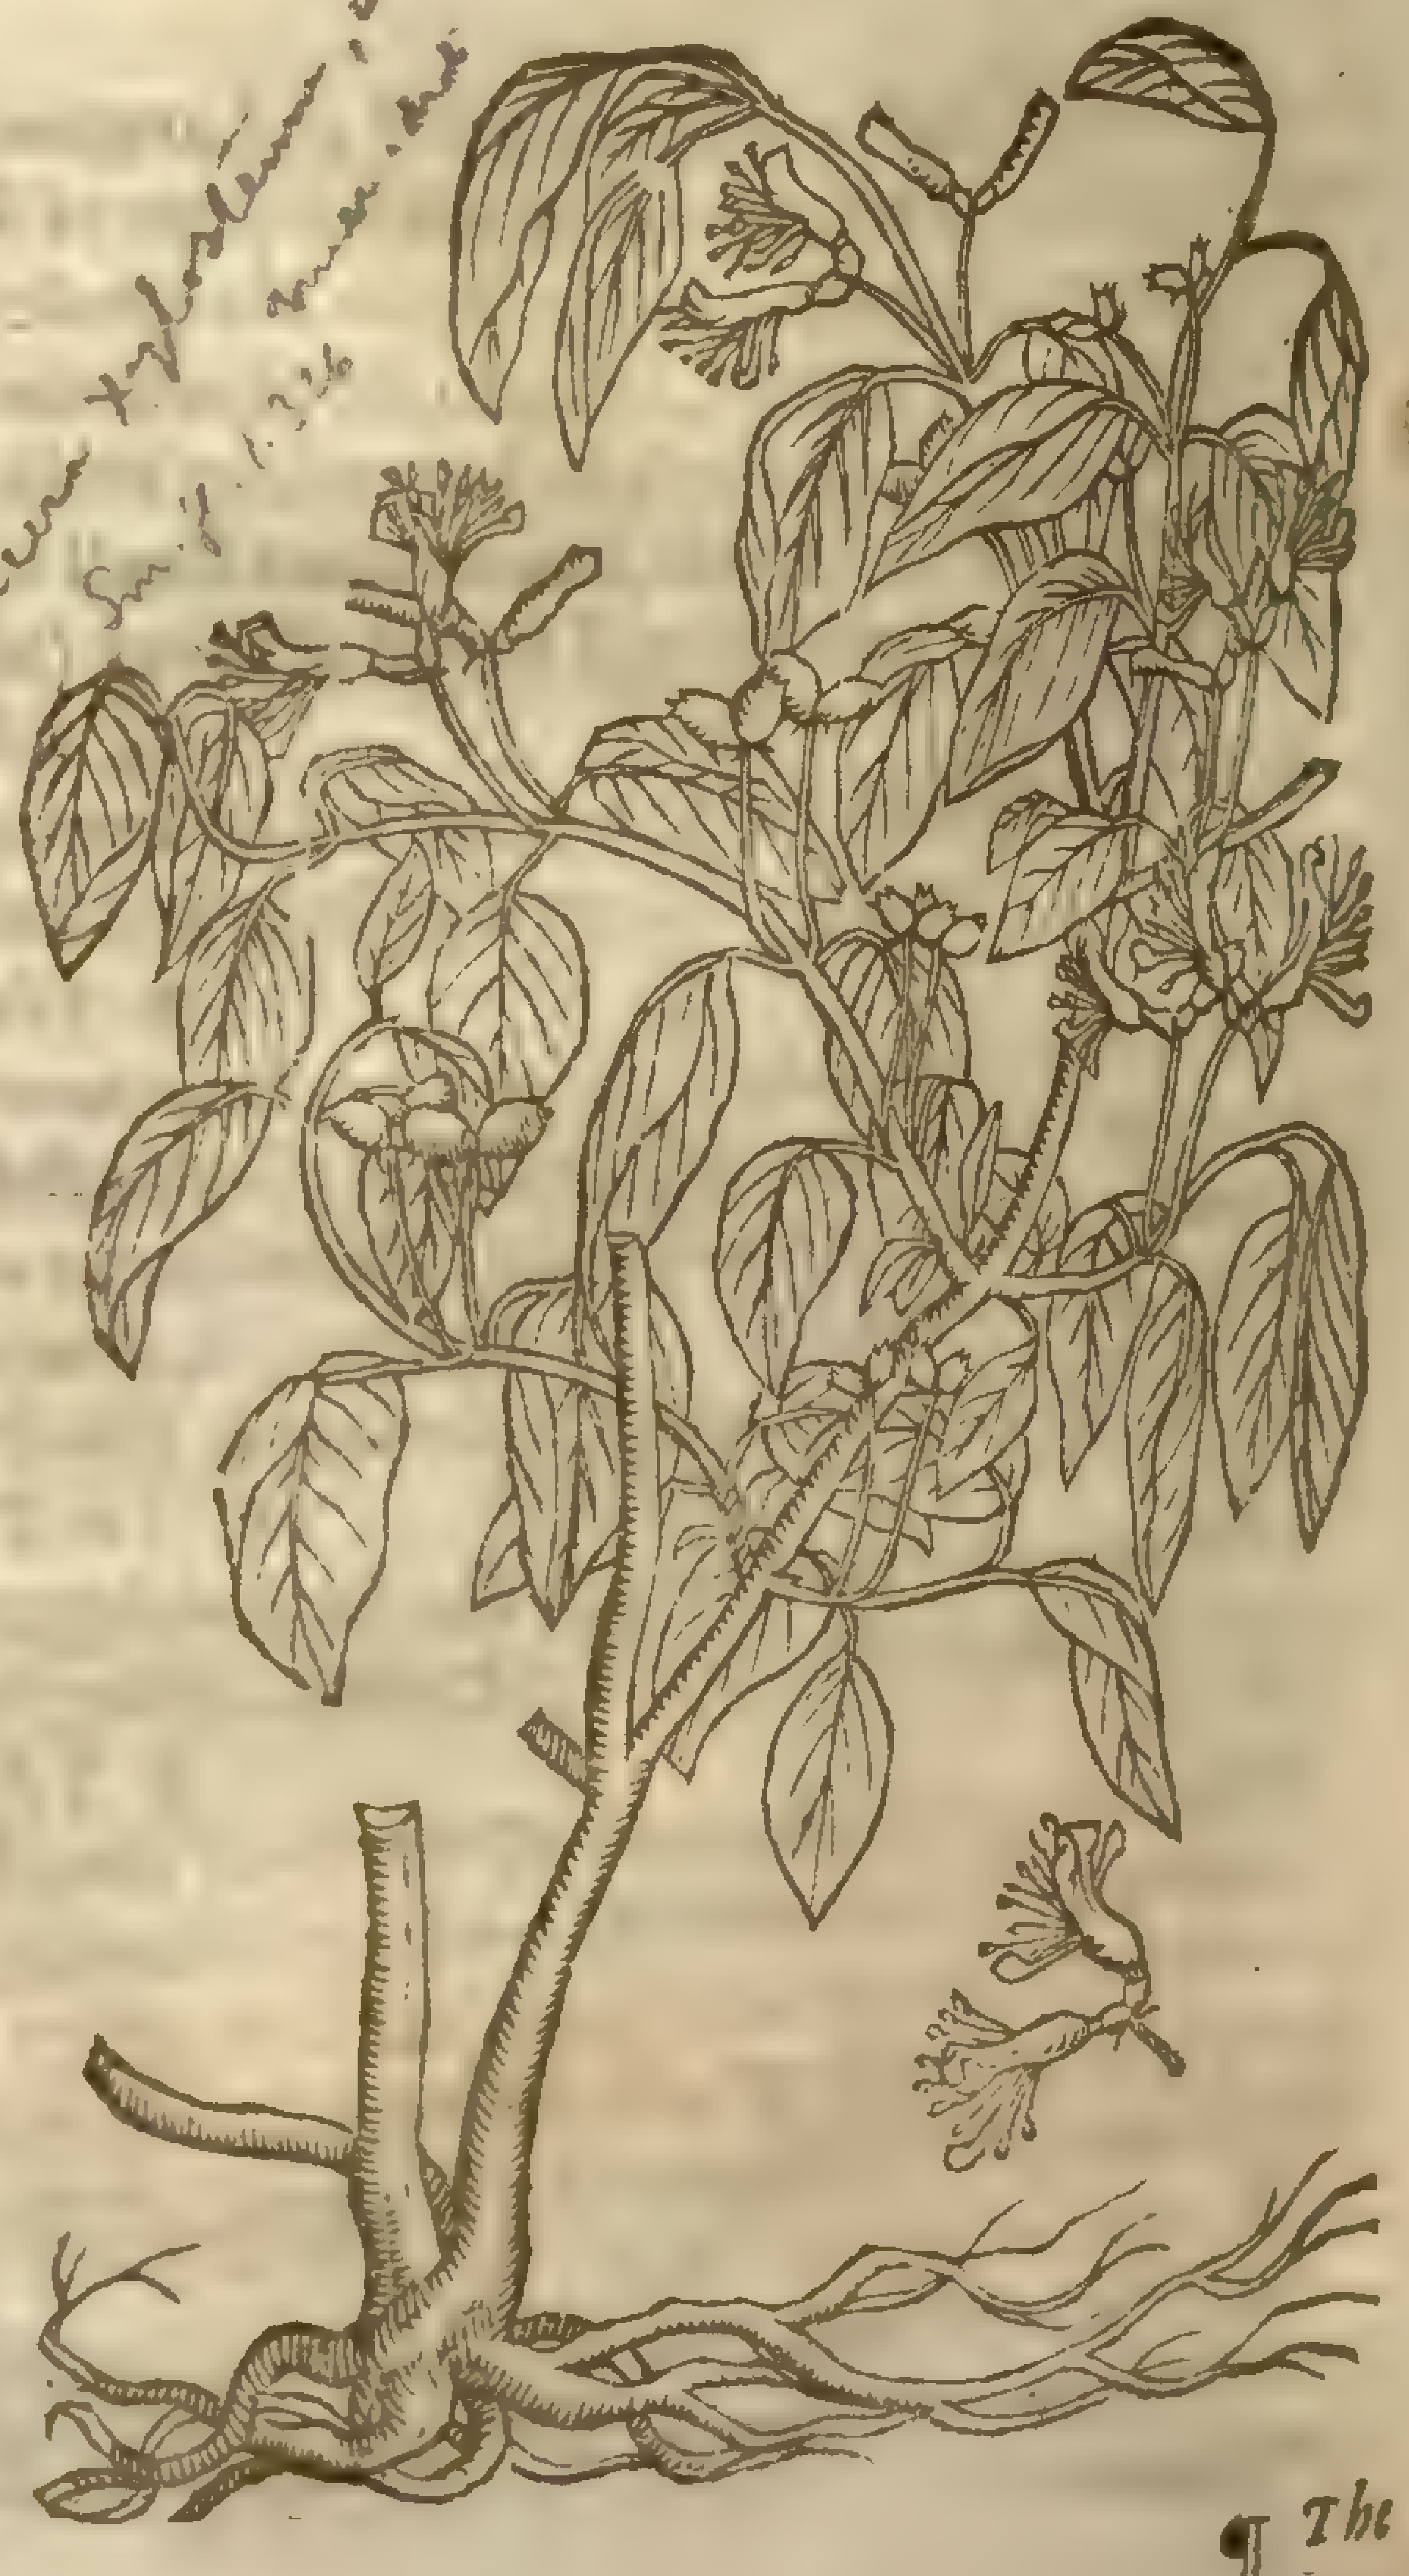
Chap. 9. *Of Vpright Wood-binde.*

1 *Periclymenum rectum Sabaudicum.*
Sauoy Honiſuckles.



Lonicera nigra, L

2 *Periclymenum rectum Germanicum.*
Germane Honiſuckles.



Lonicera xylosteum L ✓

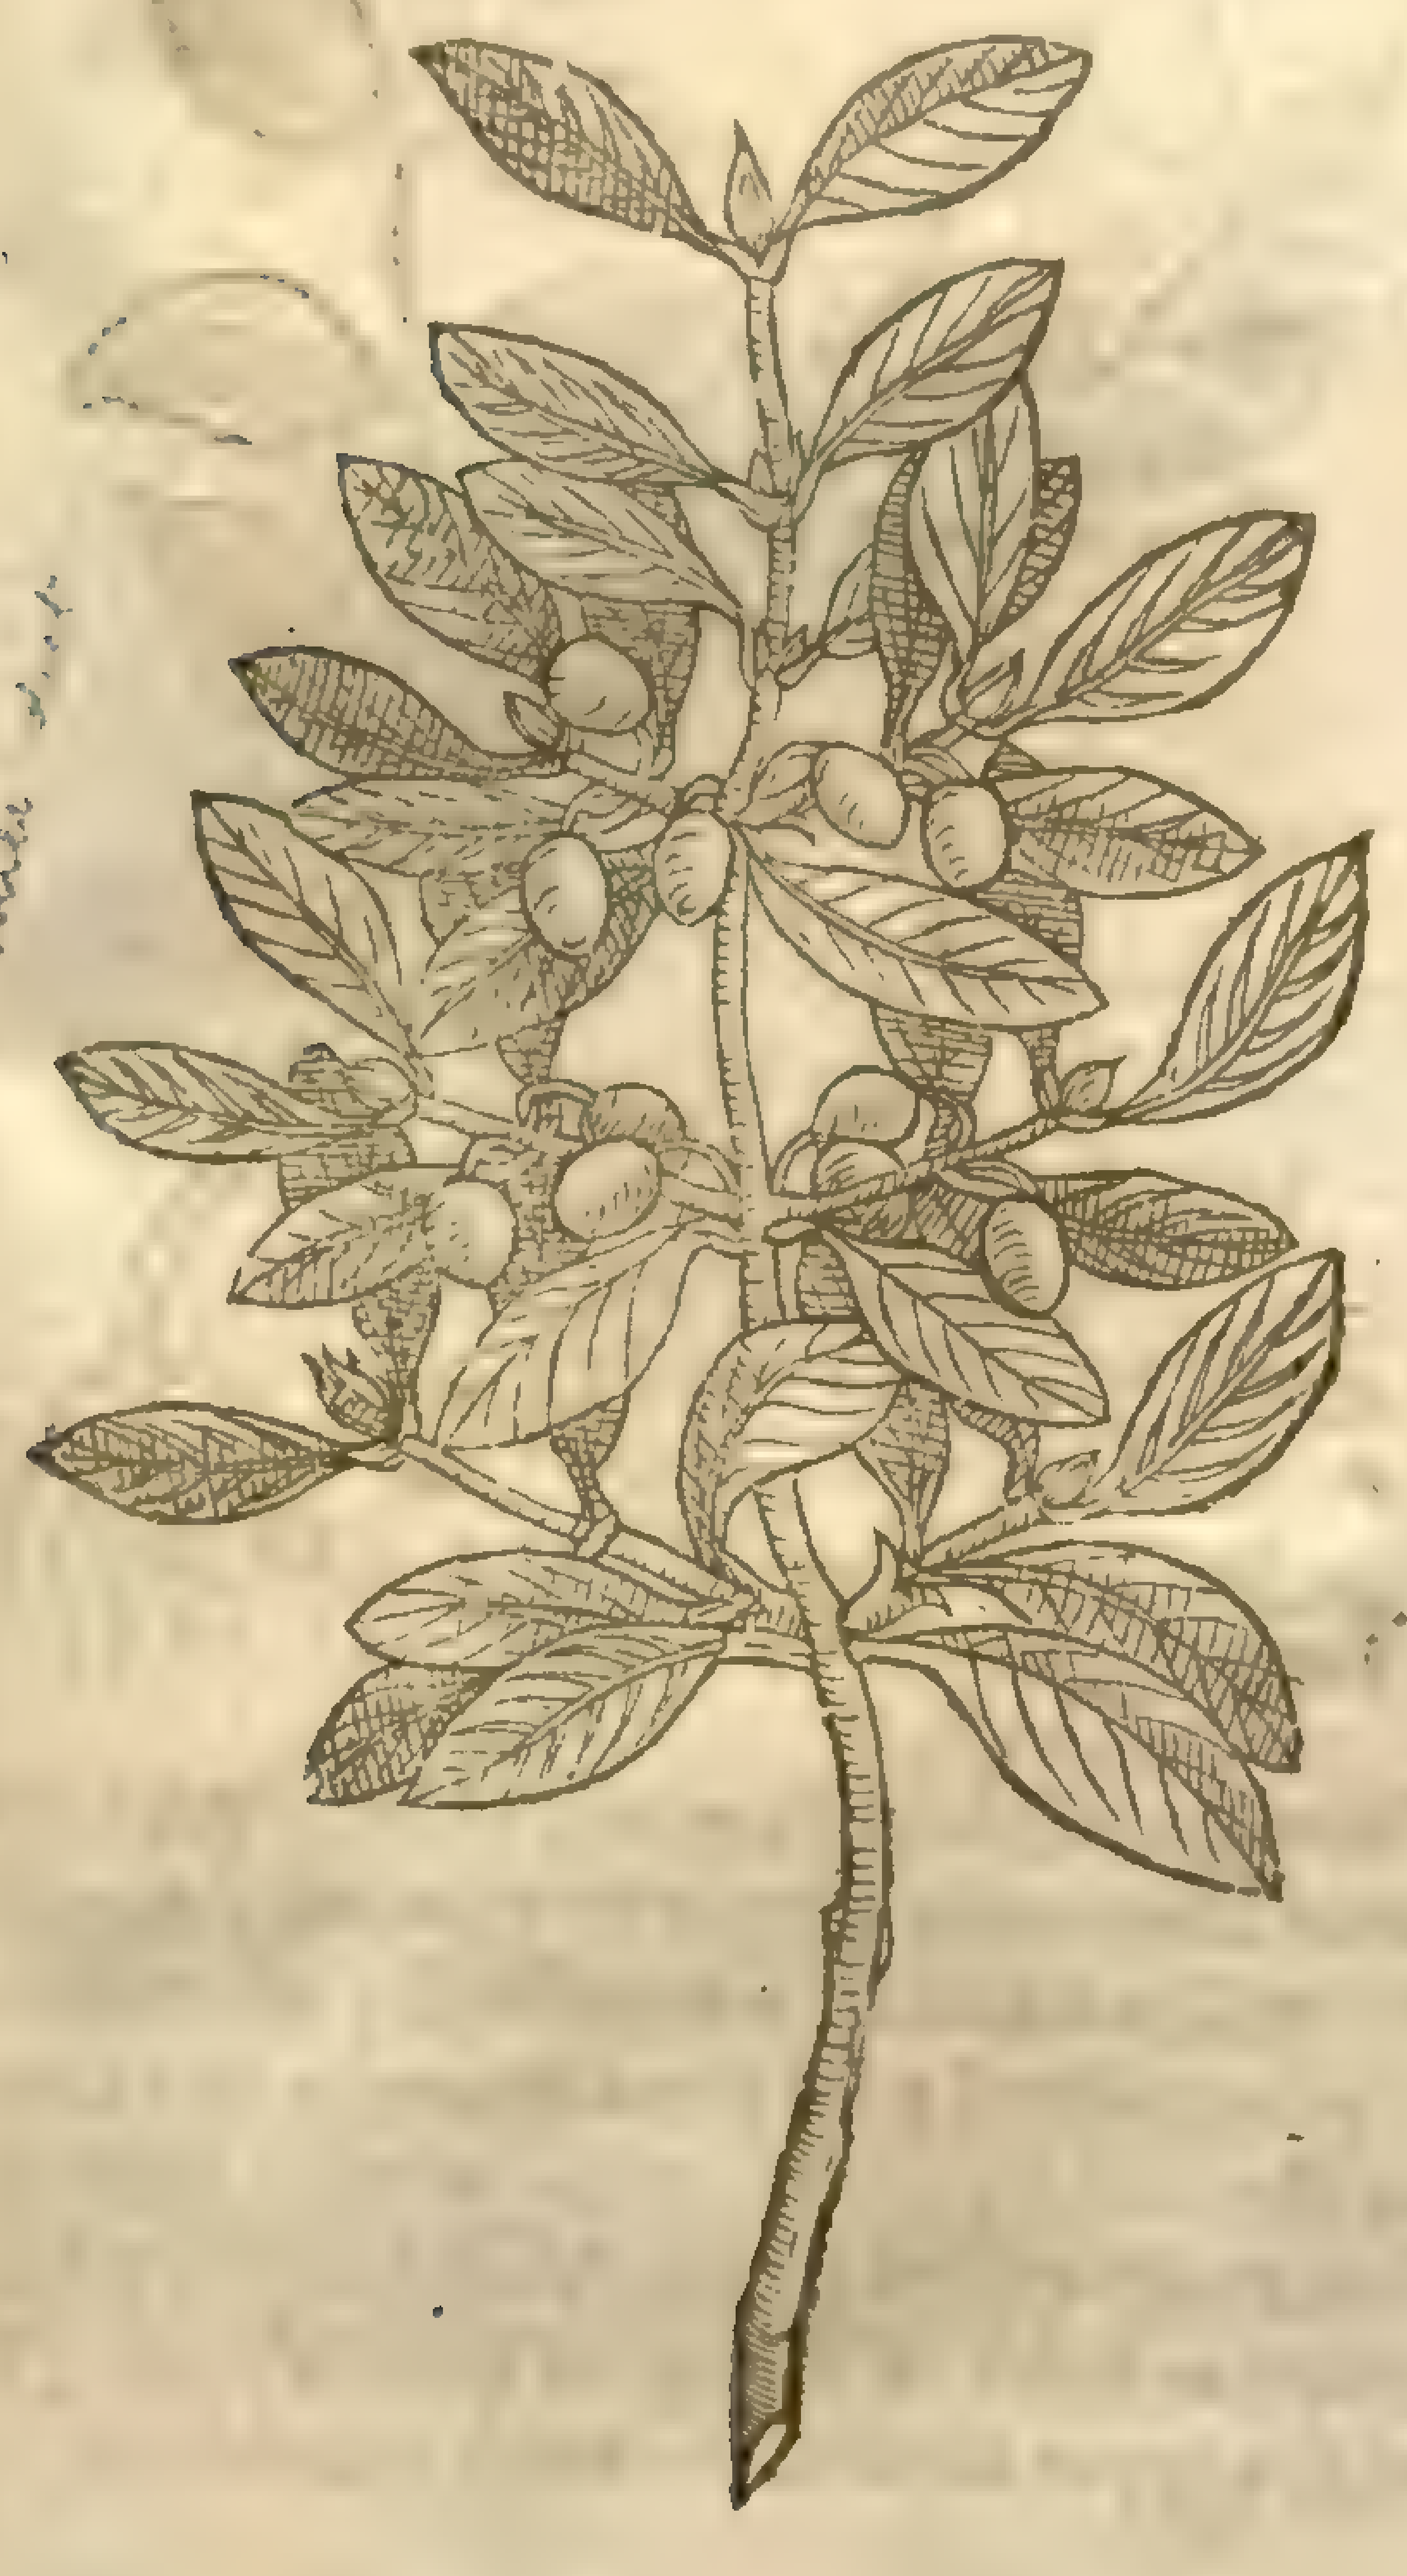
Sm. fl. 1.326

¶ *The Deſcription.*

1 This ſtrange kinde of Hony-ſuckle, found in the woods of Sauoy, repreſents vnto vs that ſhrub or hedge-buſh called *Cornus fœmina*, the Dog-berry tree, or Pricke-timber tree, hauing leaues and branches like the common Wood-binde, ſauing that this doth not clamber or clymbe as the others do, but contrariwiſe groweth vpright, without leaning to one ſide or other, like a ſmall tree or hedge-buſh: the flours grow vpon the tender ſprayes or twiggie branches, by couples, not vnlike in ſhape and colour to the common Wood-bind, but altogether leſſer, and of a white colour, hauing within the ſame many hairy chiues like the other of his kinde: after which come red berries ioyned together by couples: the root is tough and wooddy.

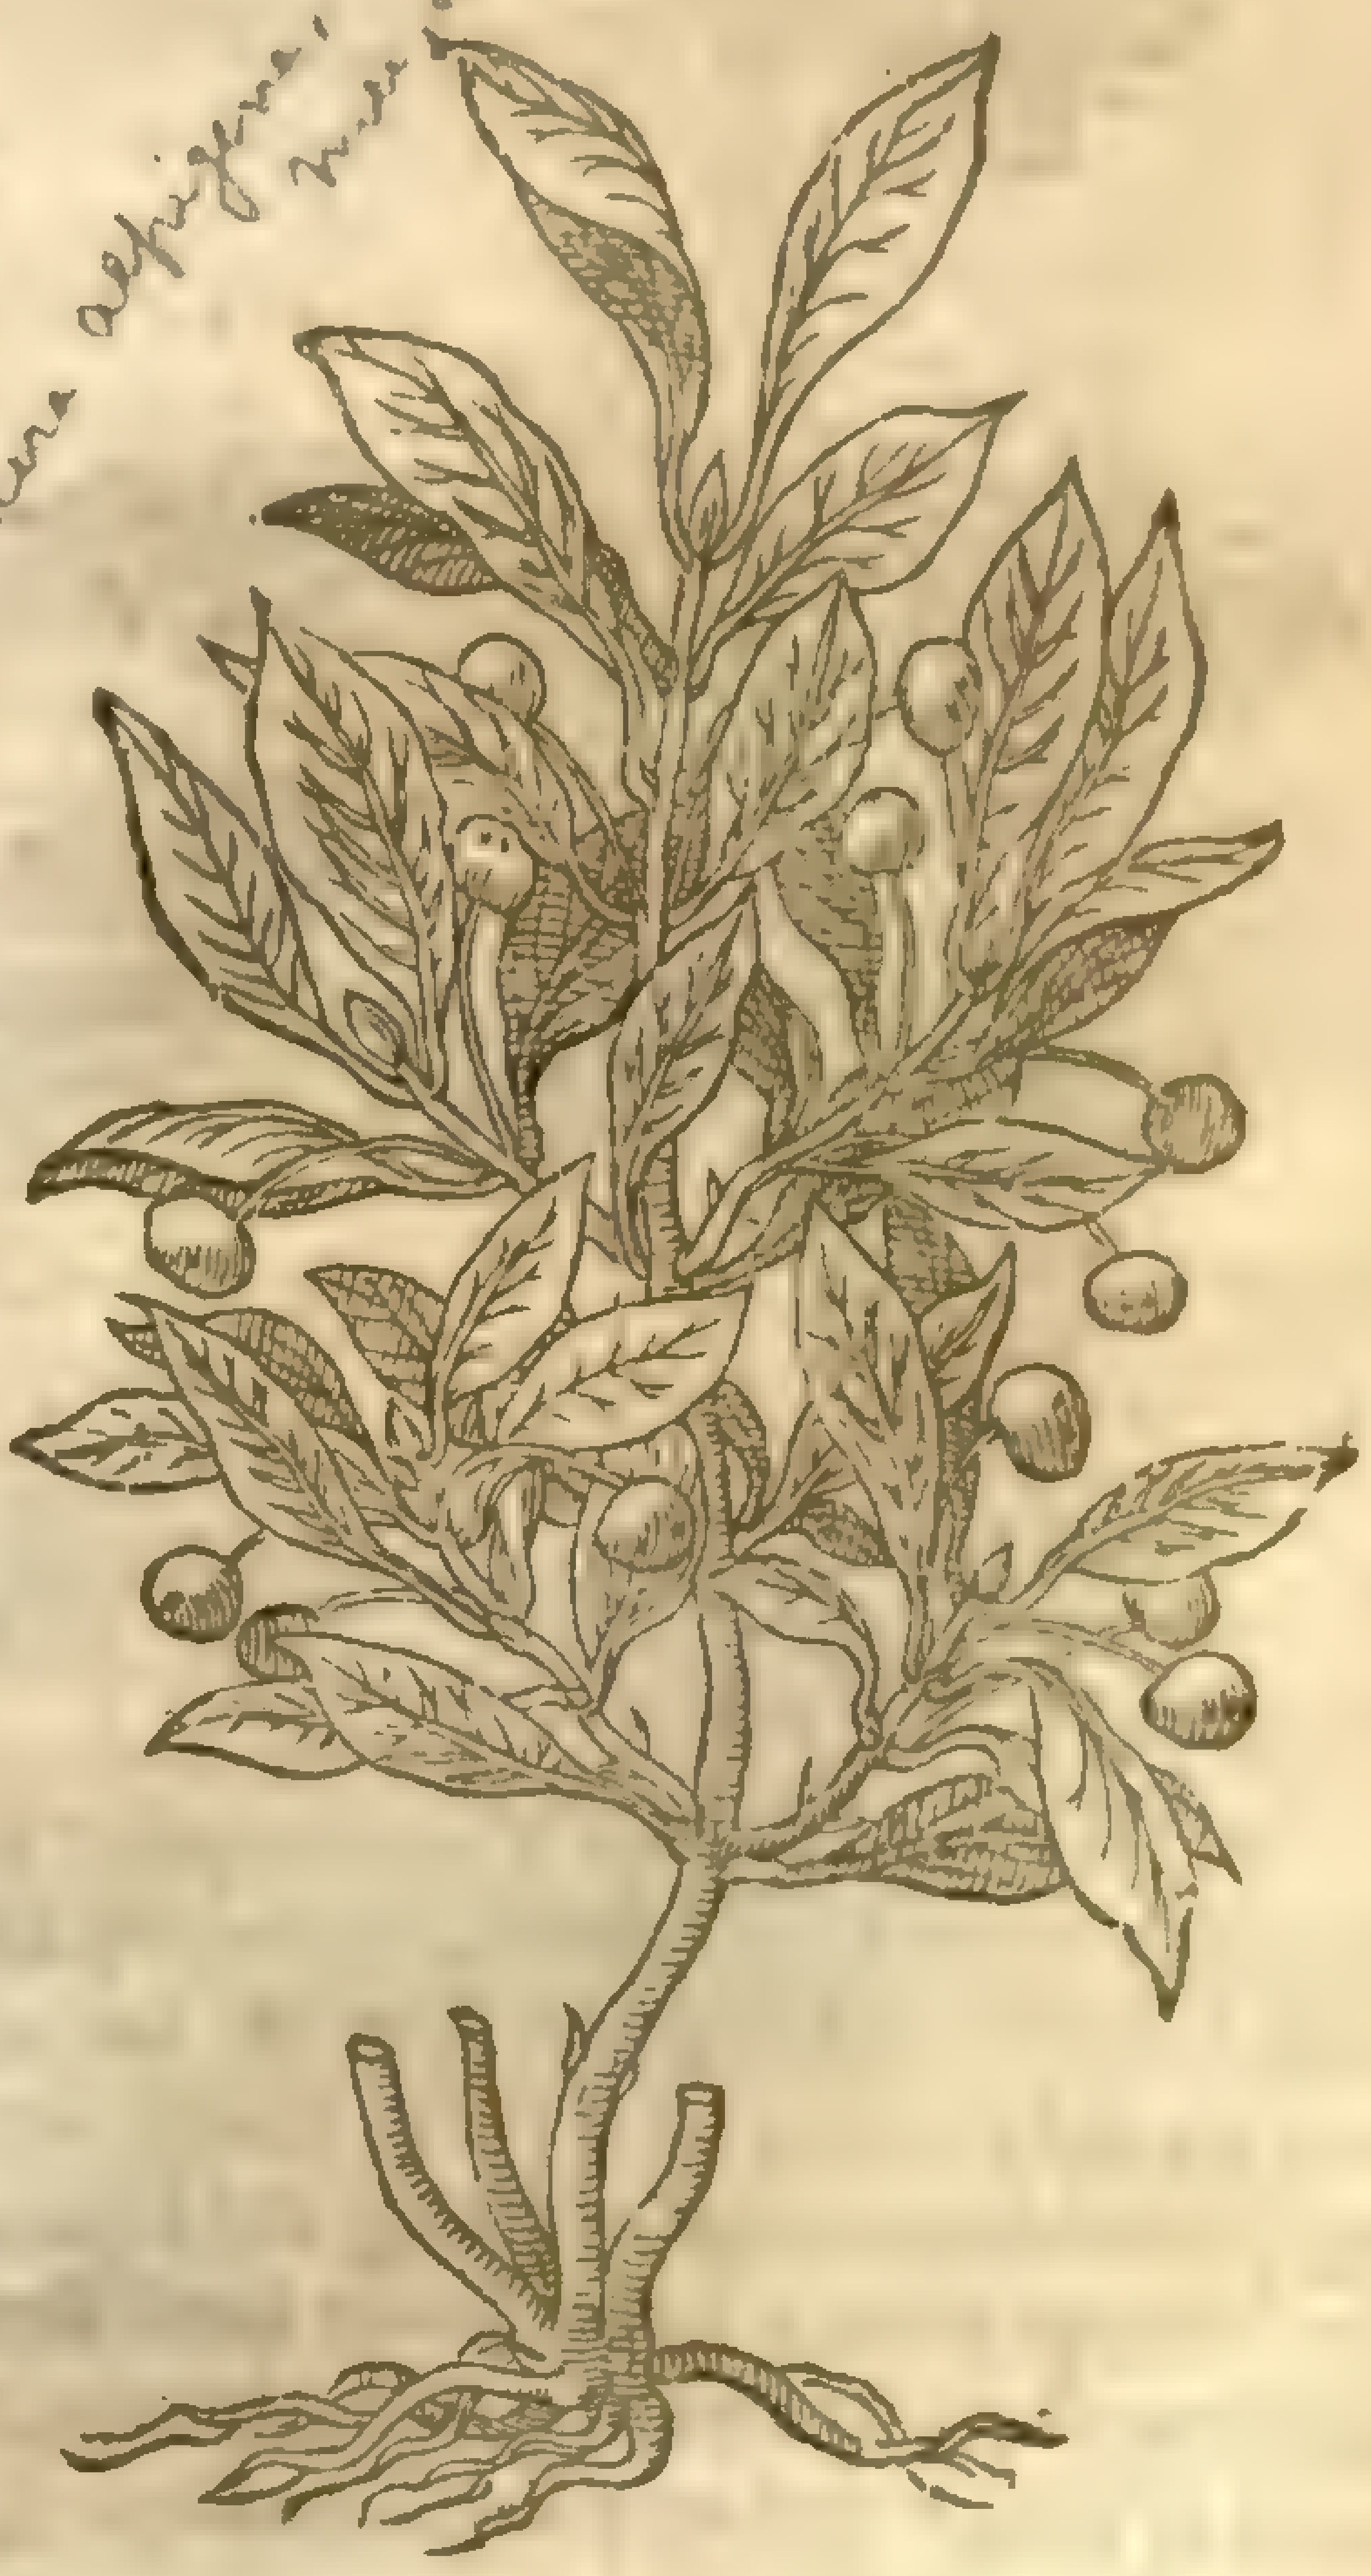
2 The ſtalkes of the ſecond be oftentimes of a meane thickneſſe, the wooddy ſubſtance ſomewhat whitiſh and ſoft: the branches be round, and couered with a whitiſh barke, notwithſtanding in the beginning when the ſprayes be young they are ſomewhat reddiſh. The leaues be long, like thoſe of the common Hony-ſuckle, ſoft, and of a white greene: on the lower ſide they be whiter, and a little hairy: the floures be leſſer than any of the Wood-bindes, but yet of the ſame faſhion, and of a whitiſh colour, ioyned together by couples vpon ſeuerall ſlender foot-ſtalkes, like little wilde Cherries, of a red colour, the one leſſer oftentimes than the other.

3 *Periclymenum rectum fructu cæruleo.*
Vpright Wood-binde with blew berries.



Lonicera caerulea [illegible]

4 *Periclymenum rectum fructu rubro.*
Cherry Wood-binde.

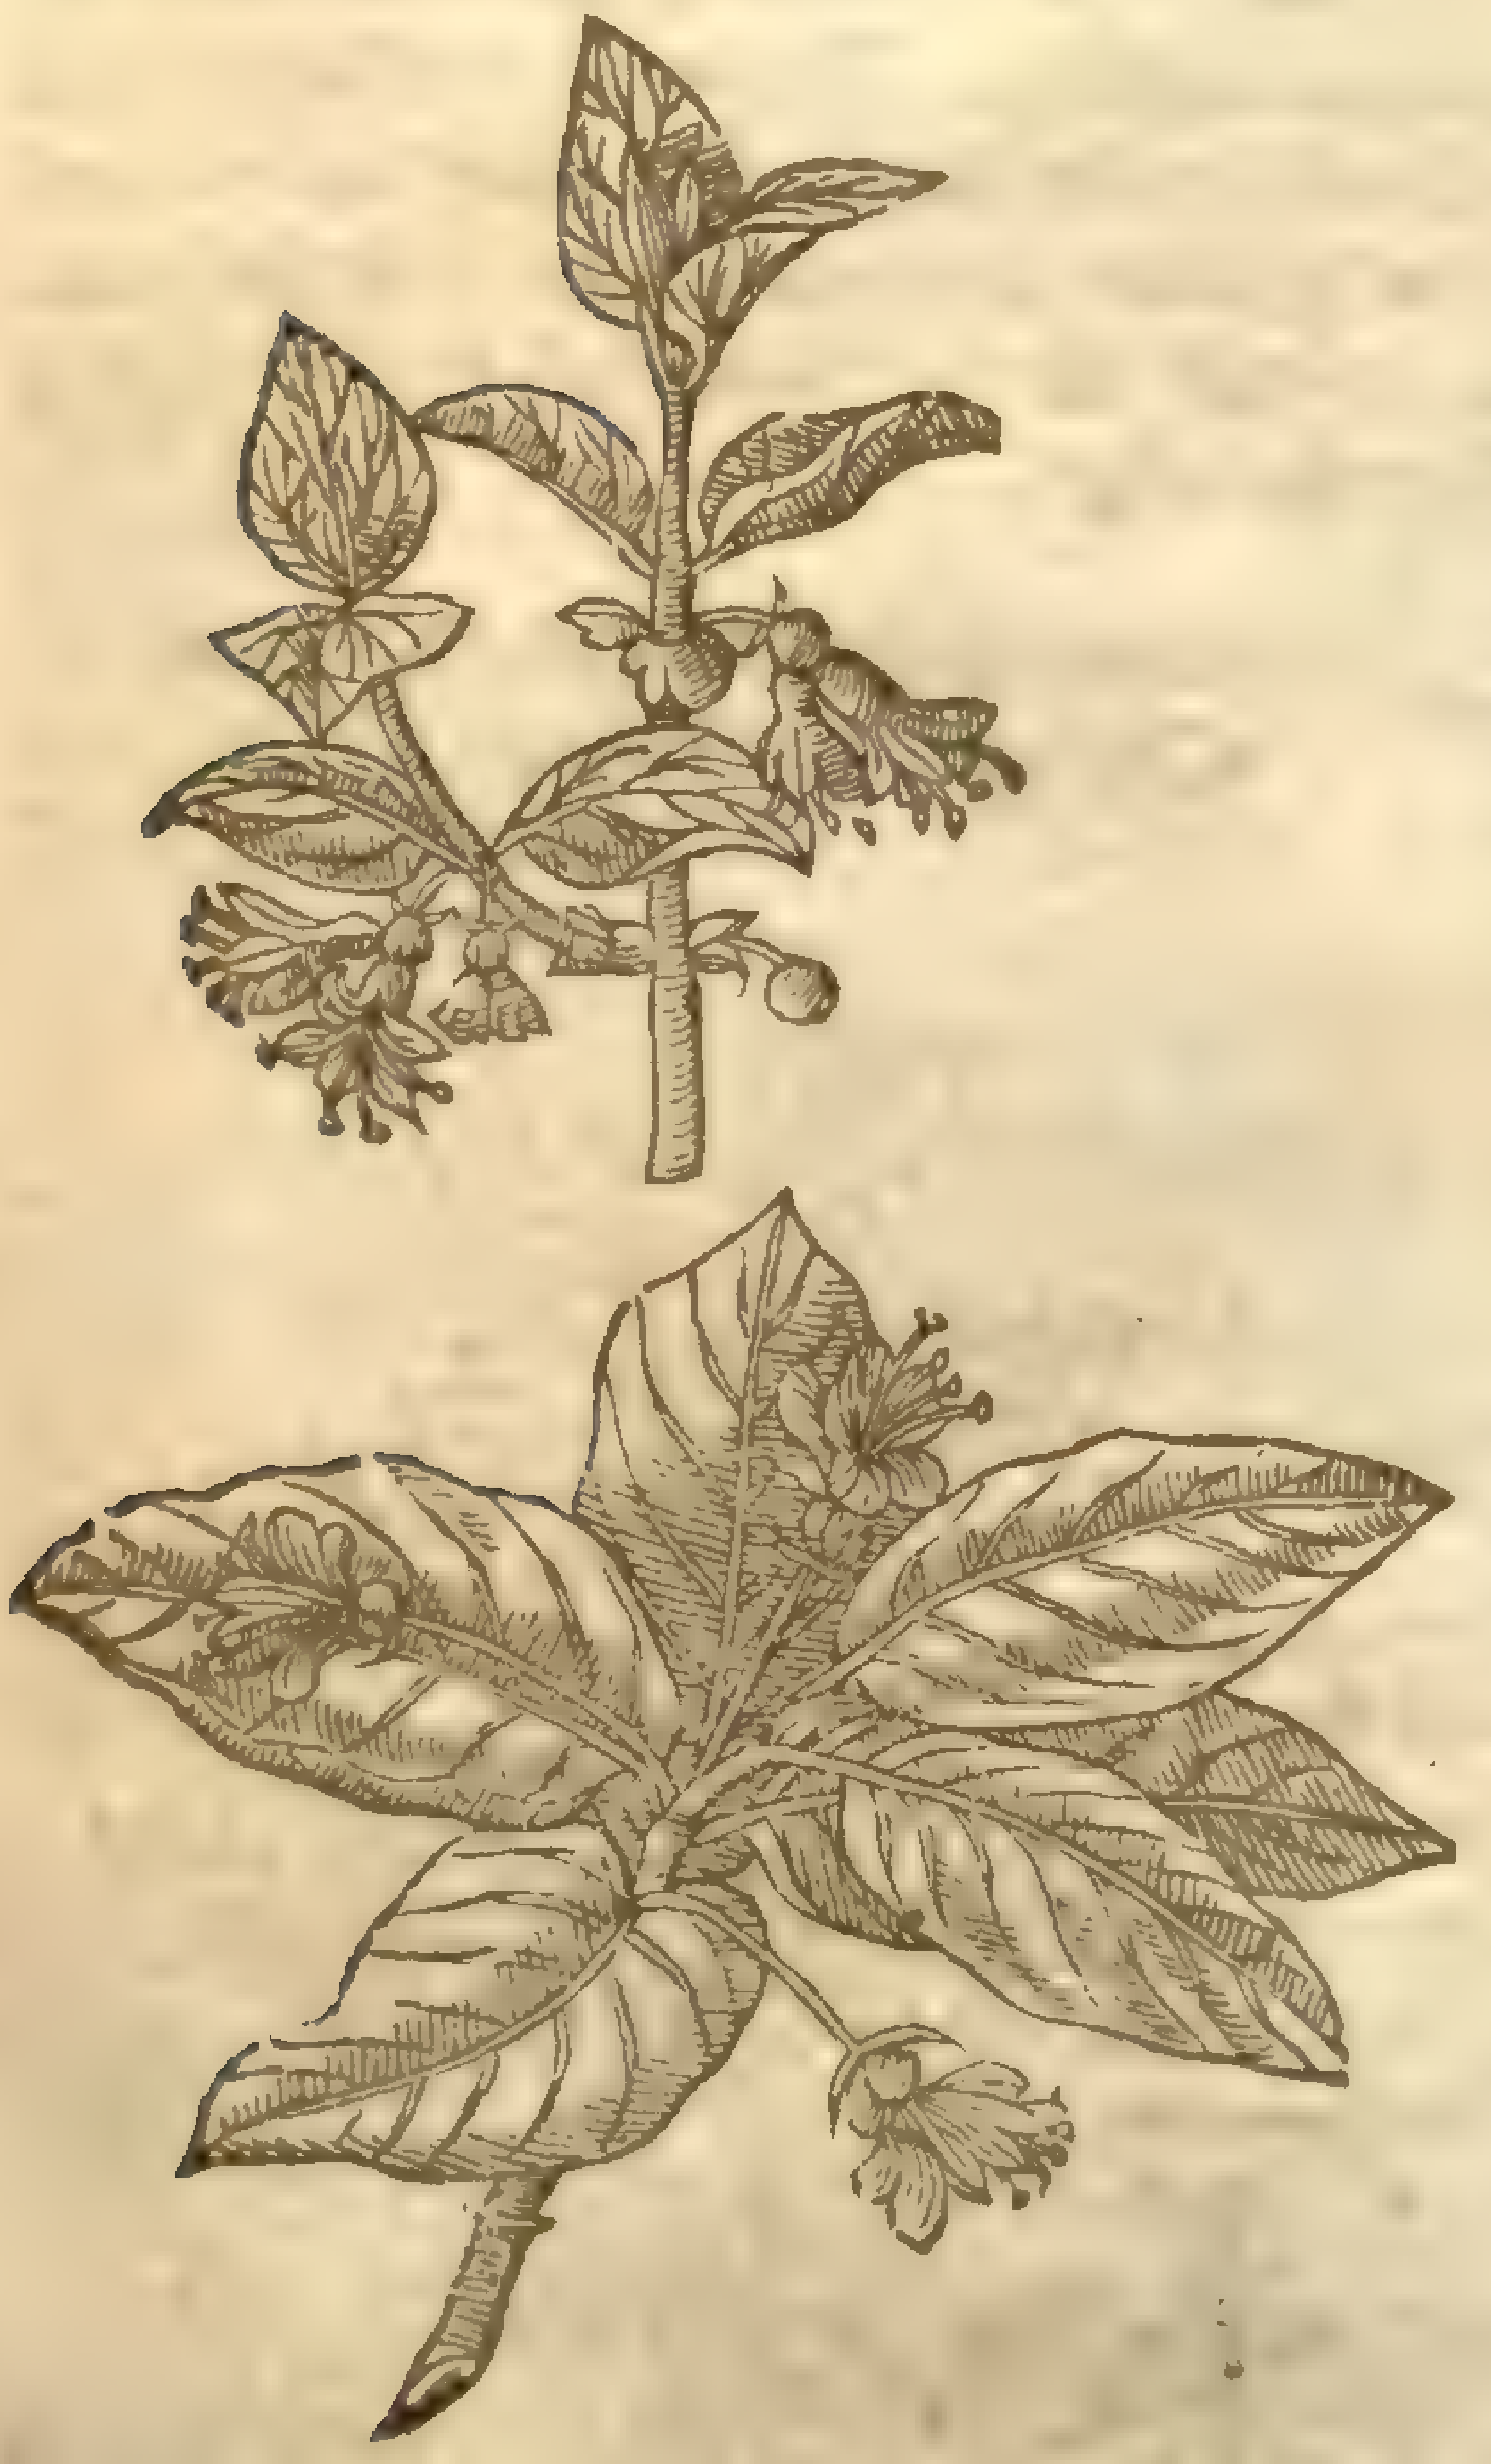


Lonicera alpigena [illegible]

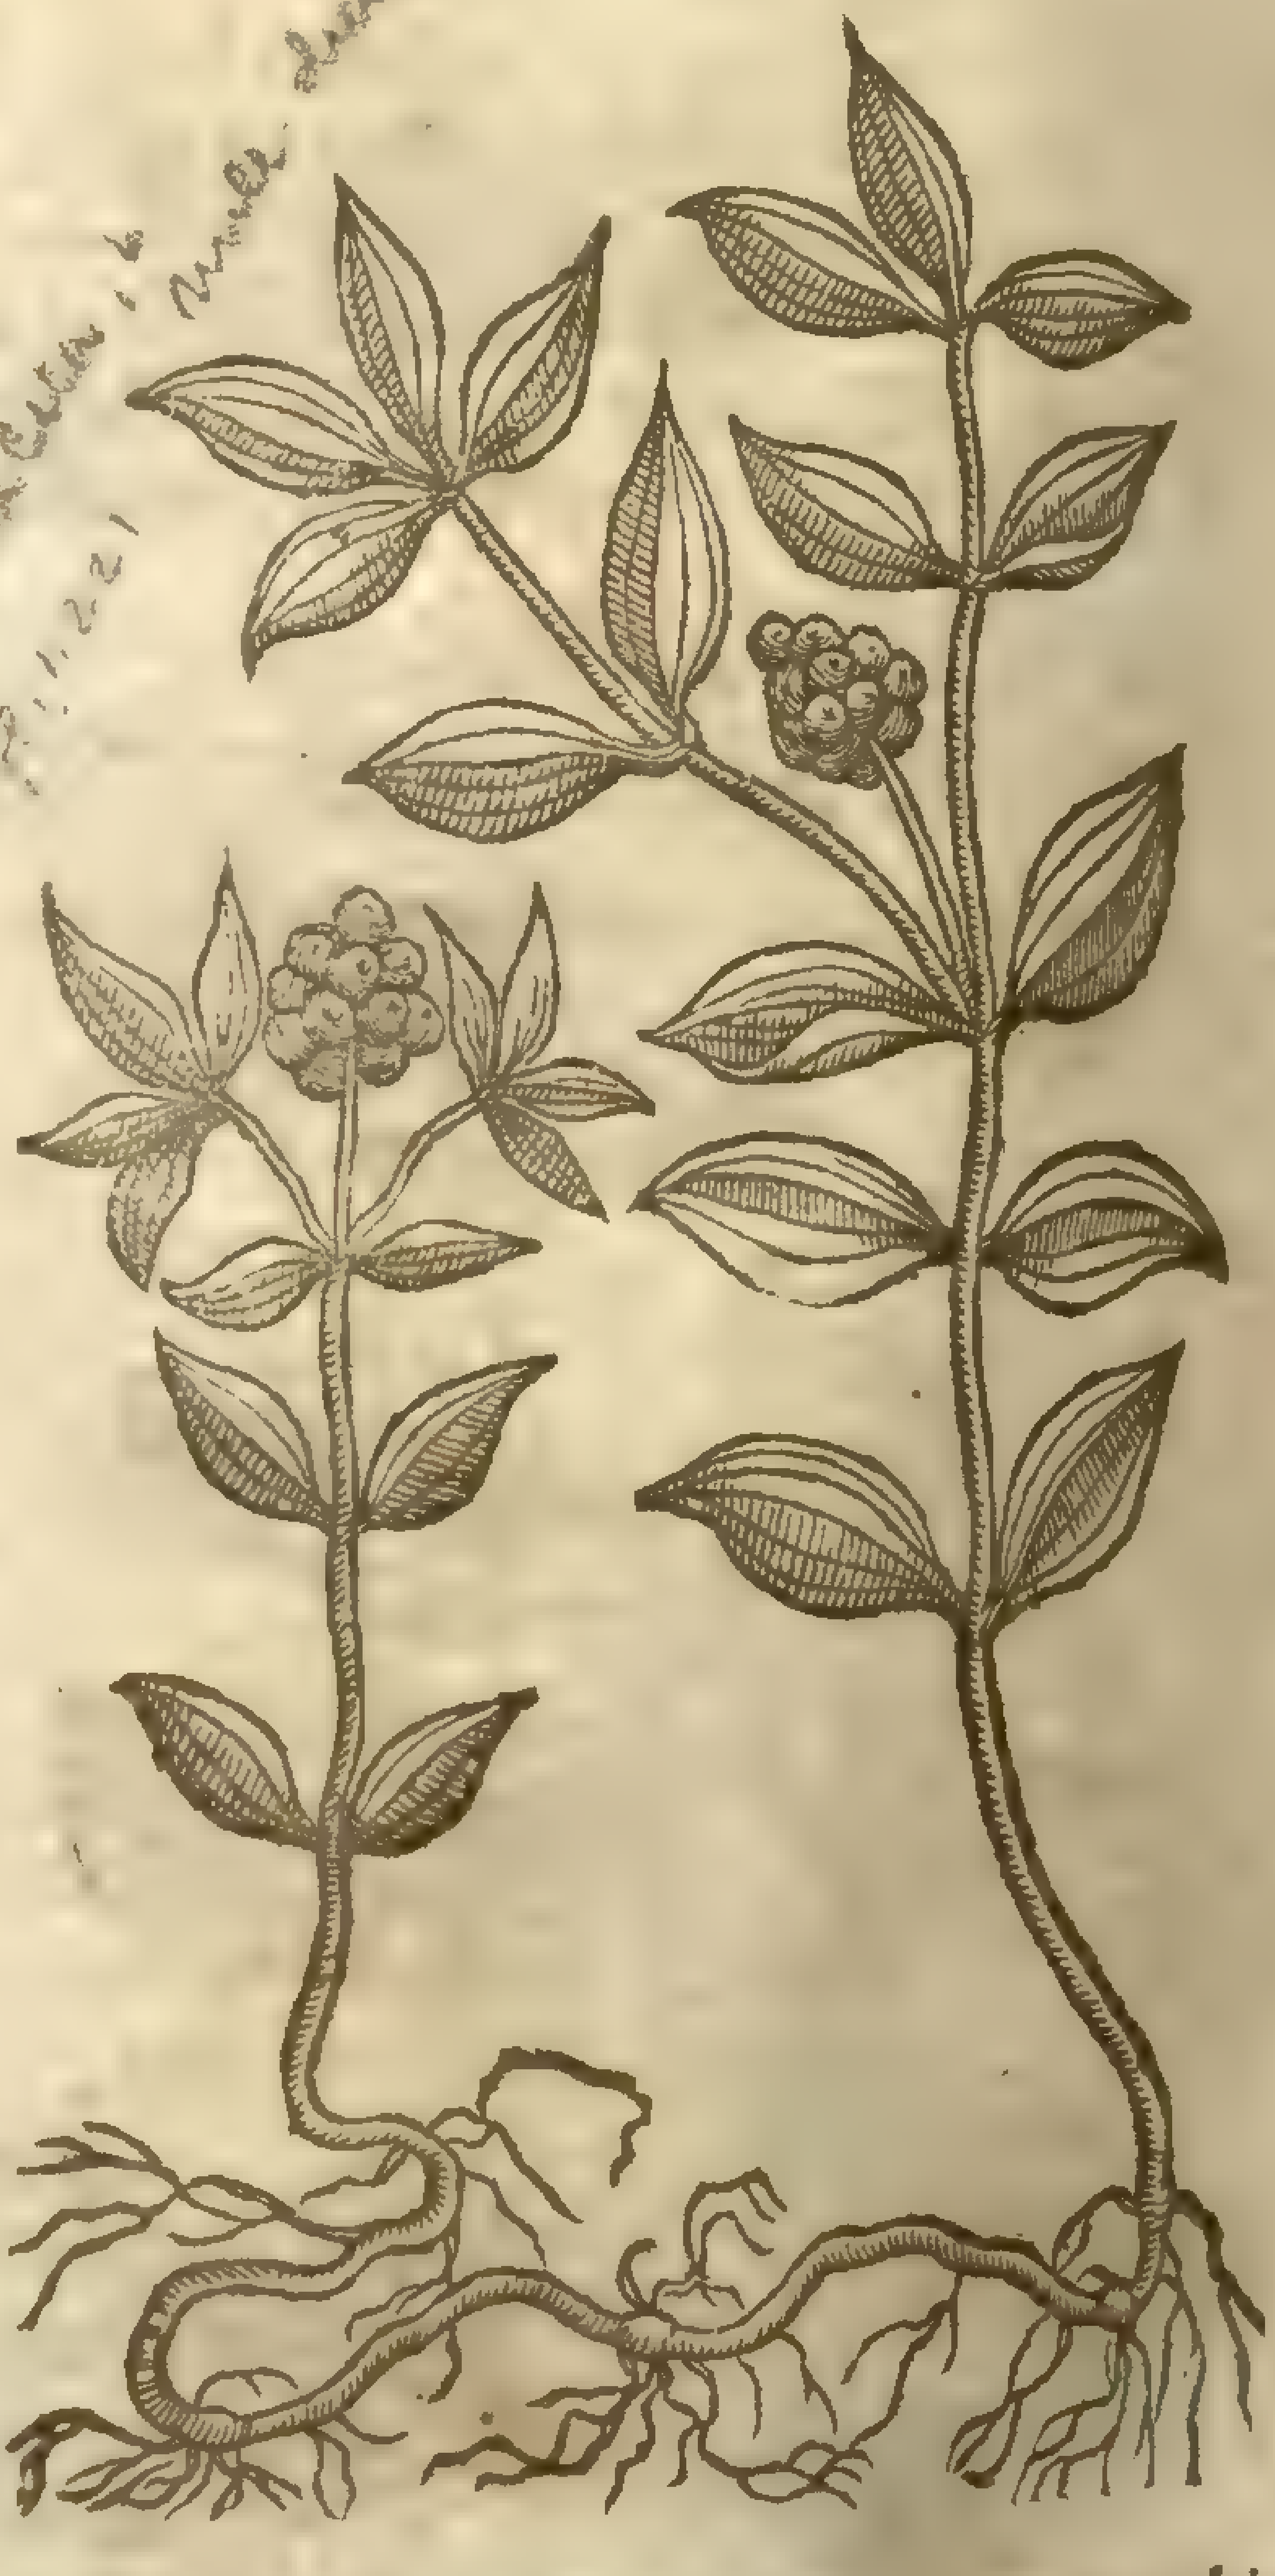
3 This ſtrange kind of Wood-binde, which *Carolus Cluſius* hath ſet forth in his Pannonicke Obſeruations, riſeth vp oftentimes to the height of a man, euen as the former doth; which diuides it ſelfe into many branches, couered with a rough blacke barke, that choppeth and gapeth in ſundry clefts as the barke of the Oke. The tender branches are of a whitiſh greene colour, couered with a woolly hairineſſe, or an ouerworne colour whereupon doe grow leaues ſet by couples one againſt the other, like vnto the common Woodbinde, of a drying bitter taſte: the floures grow by couples likewiſe, of a whitiſh colour. The fruit ſucceedeth, growing like little Cherries each one in his owne foot-ſtalke, of a bright and ſhining blew colour; which being bruiſed, doe die the hands of a reddiſh colour, and they are of a ſharpe winie taſte, and containe in them many ſmall flat ſeeds. The root is wooddy, diſperſing it ſelfe far abroad.

4 This kind of vpright Wood-bind groweth vp likewiſe to the height of a man, and oftentimes more high, like to the laſt deſcribed but altogether greater. The berries hereof are very blacke, wherein eſpecially is the difference. ‡ The leaues of this are as large as Bay leaues, ſharpe pointed, greene aboue, and whitiſh vnderneath, but not hairy, nor ſnipt about the edges: the floures grow by couples, of a whitiſh purple, or wholly purple: to theſe paires of floures there commonly ſucceeds but one berry, larger than any of the former, of the bigneſſe of a little cherry, and of the ſame colour, hauing two markes vpon the top thereof, where the floures ſtood. ‡

Periclymeni 3. & 4. flores.
The floures of the third and fourth.



5 *Chamæpericlymenum.*
Dwarfe Hony-ſuckle.



Cornus [illegible] [illegible]
Sm. Fl. i. 221

5 To the kinds of Wood-bindes this plant may likewiſe be referred, whoſe picture with this deſcription was ſent vnto *Cluſius* long ſince by that learned Doctor in Phyſicke *Thomas Penny* (of our London colledge of famous memory:) it riſeth vp with a ſtalke of a foot high; whereupon are ſet by couples faire broad leaues one right againſt another, ribbed with certain nerues like thoſe of Plantaine, ſharpe pointed, and ſomewhat hollowed in the middle like Spoone-woort: from the boſome of which leaues come forth ſmall floures, not ſeen or deſcribed by the Author: after which commeth forth a cluſter of red berries, thruſt hard together as thoſe of Aaron or Prieſts pint. The root is tough and very ſlender, creeping far abroad vnder the vpper cruſt of the earth, whereby it occupieth much ground.

¶ *The Place.*

Theſe plants are ſtrangers in England: they grow in the woods and mountaines of Switzerland, Germany, Sauoy, and other thoſe parts tending to the Eaſt, Eaſt North-Eaſt, and Eaſt and by South.

I haue a plant of the firſt kinde in my garden: the reſt as yet I haue not ſeene, and therefore cannot write ſo liberally thereof as I could wiſh.

‡ The dwarfe Hony-ſuckle growes in the maritime parts of Norway and Sweden, and the countries thereabout. ‡

¶ *The Time.*

They floure for the moſt part when the others doe, that is to ſay, in May and Iune, and their fruit is ripe in September.

¶ *The Names.*

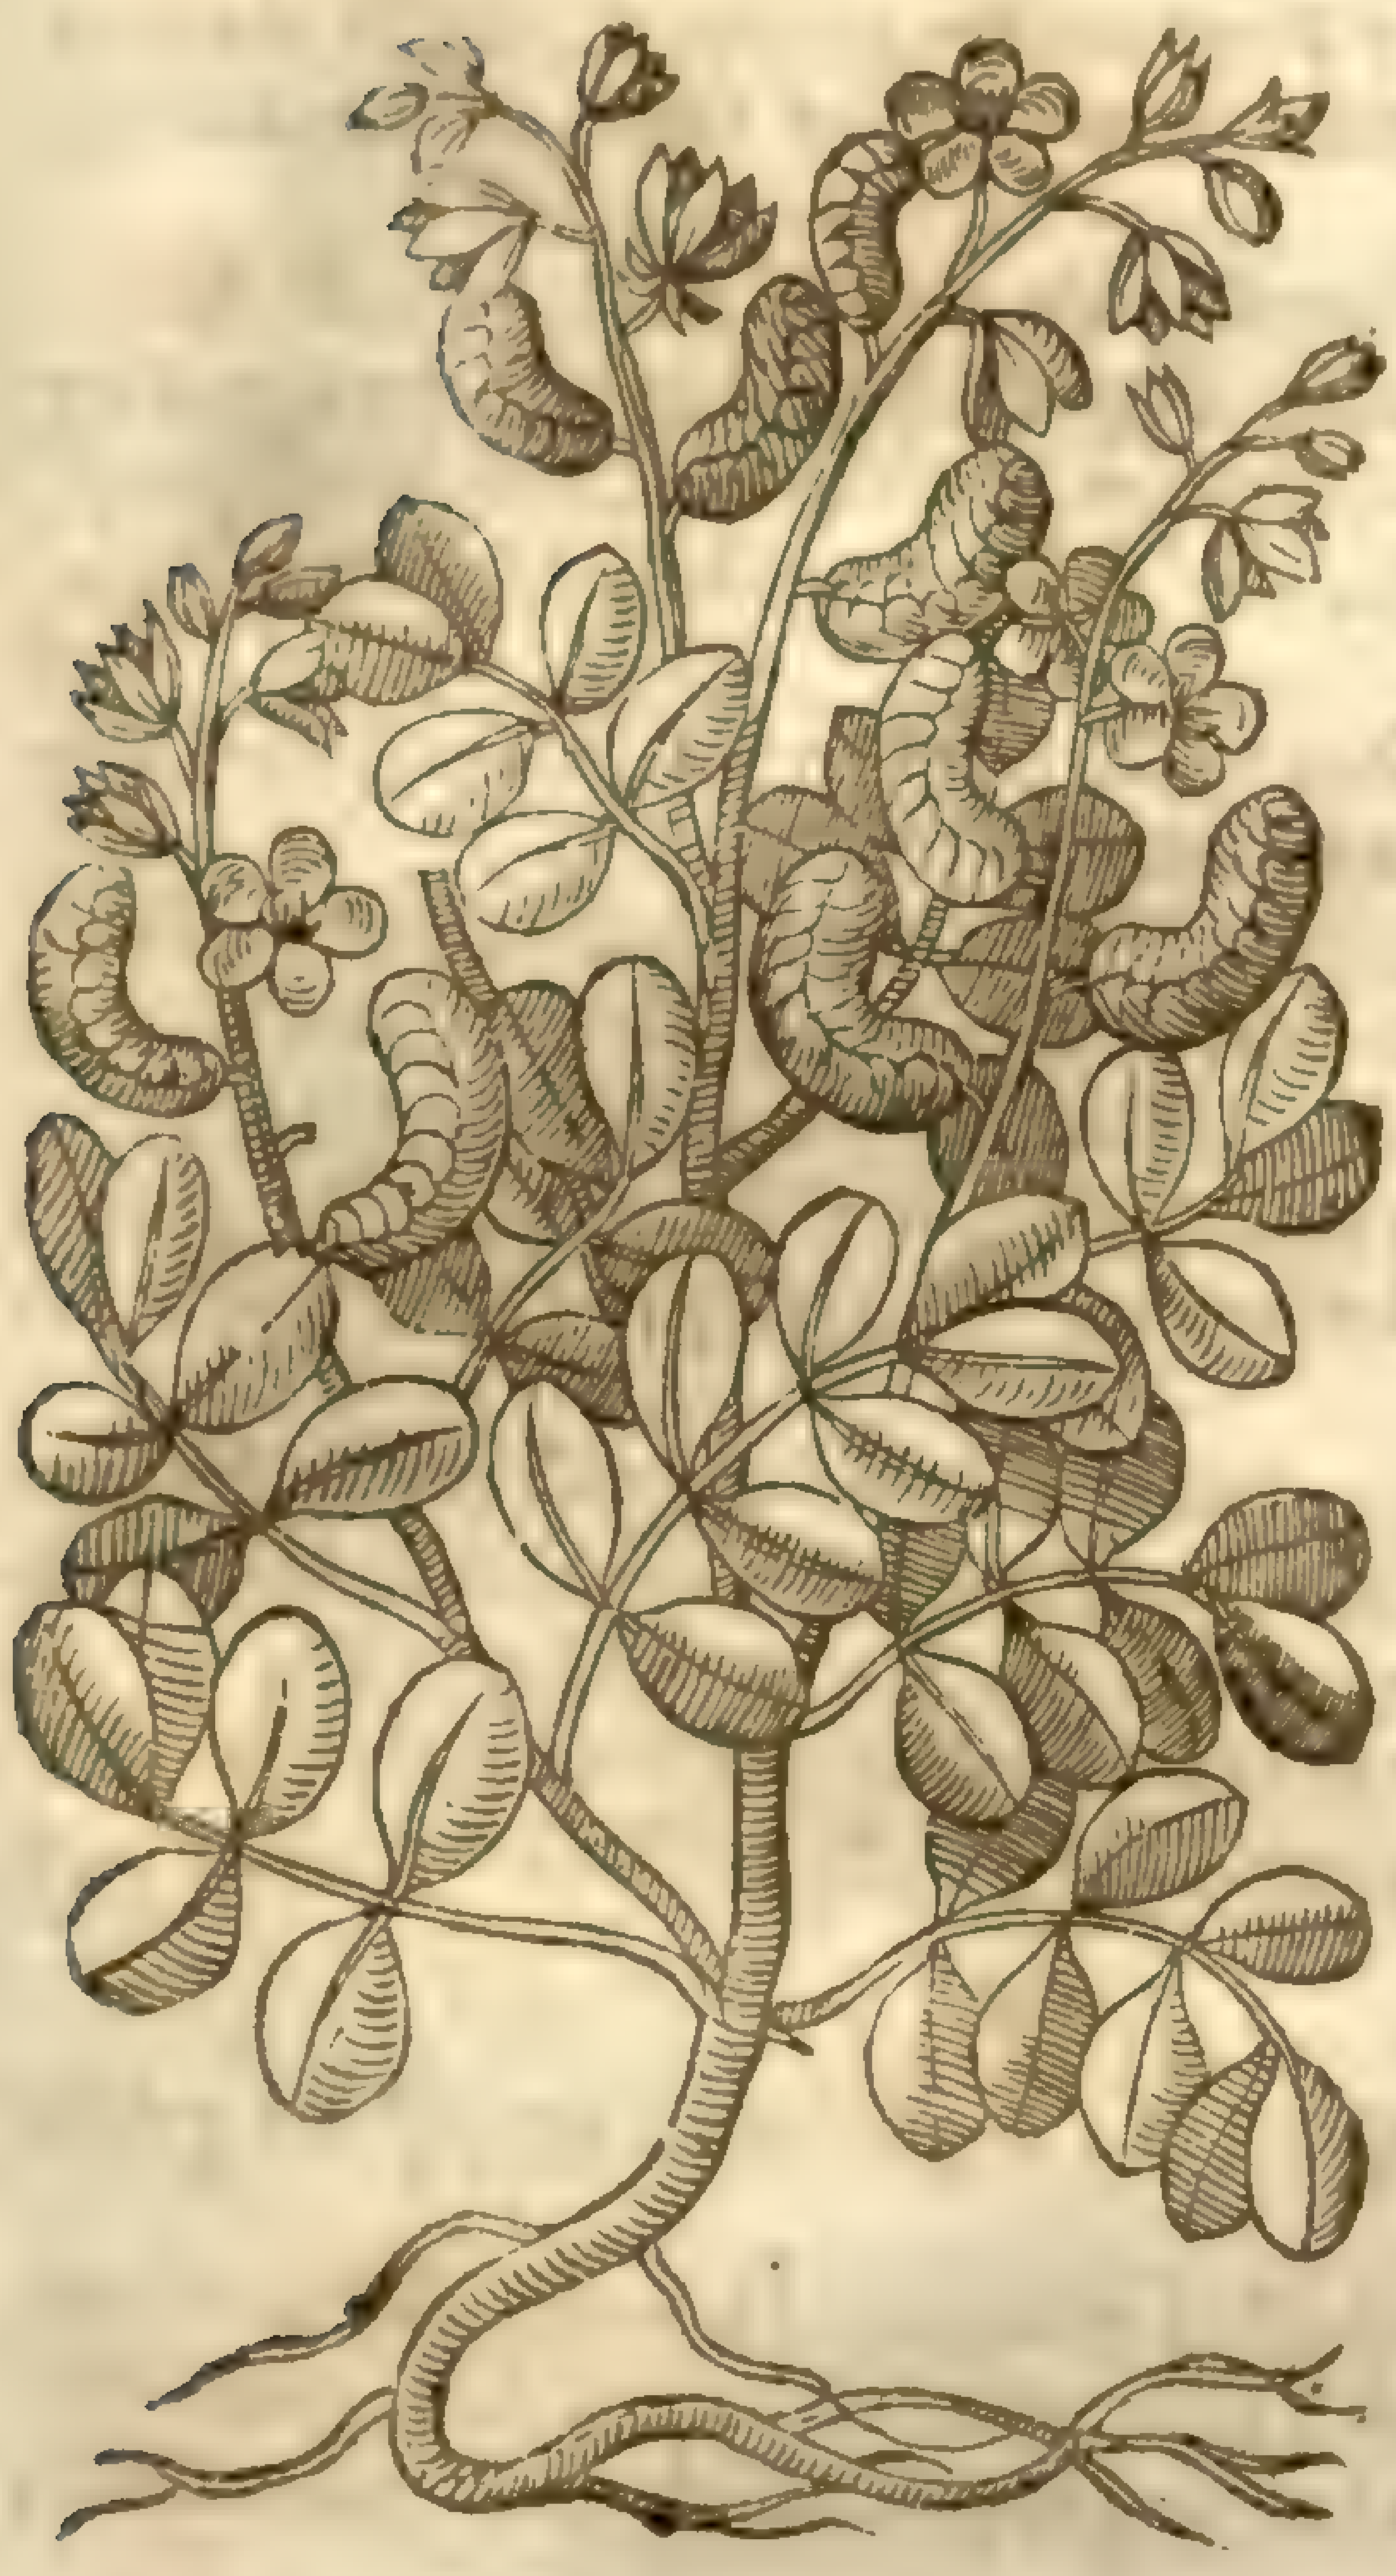
Vpright Wood-binde or Hony-ſuckle is called *Periclymenum ſtans*, and *Periclymenum rectum*, or vpright Wood-binde: of *Dodonæus*, *Xyloſteum*: in high Dutch, **Honds kirſen**, that is to ſay, *Canum Ceraſa*, or Dog Cherries. The Engliſh names are expreſſed in their ſeuerall titles. It hath beene called *Chamæceraſus*, but not truly.

¶ *The Temperature and Vertues.*

Touching the temperature and vertues of theſe vpright Wood-bindes we haue no experience at all our ſelues, neither haue we learned any thing of others.

Chap. 10. *Of Sene.*

Sena folijs obtuſis.
Italian Sene.



¶ *The Deſcription.*

Sene bringeth forth ſtalkes a cubit high, ſet with diuers branches: the leaues are long, winged, conſiſting of many ſmall leaues like thoſe of Liquorice, or of baſtard Sene: the floures come forth of the bottom of the wings, of colour yellow, ſtanding vpon ſlender footſtalkes; from which after the floures be gone hang forked cods, the ſame bowing inward like a halfe-Moone, plain and flat, in which are contained ſeeds like to the ſeeds or kernels of grapes, of a blackiſh colour. The root is ſlender, long, and vnprofitable, which periſheth when the leaues are gathered for medicine, and the ſeeds be ripe and muſt be ſowne againe the next yeare, euen as we do corne.

There is another kinde of Sene growing in Italy, like the other in each reſpect ſauing that it is greater, and hath not that force in purging that the other hath.

¶ *The Place and Time.*

This is planted in Syria and Ægypt, alſo in Italy, in Prouince, in France, in Languedoc. It hardly groweth in high and low Germany, neither in England: it proſpereth in hot Regions, and cannot away with cold; for that cauſe it is in Italy ſowne in May, and continueth no longer than Autumne: the beſt is brought from Alexandria and Egypt. The Arabians were the firſt that found it out.

¶ *The Names.*

The Perſians call it *Abalzemer*, as *Meſue* his copy teacheth: the Apothecaries *Sena*, by which name it was knowne to *Actuarius* the Grecian, and to the later Latines: it is called in Engliſh, Sene.

¶ *The Temperature.*

Sene is of a meane temperature, neither hot nor cold, yet inclining to heate, and dry almoſt in the third degree: it is of a purging faculty, and that by the ſtoole, in ſuch ſort as it is not much troubleſome to mans nature, hauing withall a certaine binding quality, which it leaueth after the purging.

¶ *The Vertues.*

It voideth forth flegmaticke and cholericke humors, alſo groſſe and melancholike, if it be helped with ſomething tending to that end. A

It is a ſingular purging medicine in many diſeaſes, fit for all ages and kindes. B

It purgeth without violence or hurt, eſpecially if it be tempered with Aniſe ſeed or other like ſweet ſmelling things added or with gentle purgers or lenitiue medicines. It may be giuen in pouder, but commonly the infuſion thereof is vſed. C

D The quantitie of the pouder is a dram weight, and in the infuſion, foure, fiue, or more. It may be mixed with any liquor.

E It is in the decoction or in the infuſion tempered with cold things in burning agues and other hot diſeaſes: in cold and long infirmities it is boyled with hot opening ſimples and ſuch like; or elſe it is ſteeped in wine, in which manner as familiar to mans nature, it draweth forth gently by the ſtoole, almoſt without any kinde of paine, crude and raw humors.

F Moſt of the Arabians commend the cods, but our Phyſitions the leaues rather; for vnleſſe the cods be full ripe they ingender winde, and cauſe gripings in the belly. For they are oftentimes gathered before they be ripe, and otherwiſe eaſily fall away being ſhaken downe by the winde, by reaſon of their weake and ſlender ſtalkes.

G Some alſo thinke that Sene is hurtfull to the ſtomacke, and weakneth the ſame, for which cauſe they ſay that Ginger or ſome ſweet kinde of ſpice is to be added, whereby the ſtomacke may be ſtrengthned. Likewiſe *Meſue* noteth that it is ſlow in operation, and therefore Salgem is to bee mixed with it. Moreouer, Sene purgeth not ſo ſpeedily as ſtronger medicines do.

H Notwithſtanding it may be helped not only by Salgem, but alſo by other purging things mixed therewith, that is to ſay, with ſimple medicines, as Rubarb, Agaricke, and others; and with compounds, as that which is called *Catholicon*, or the Electuary *Diaphœnicon*, or that which is made of the juyce of Roſes, or ſome other, according as the condition or quality of the diſeaſe and of the ſicke man requireth.

I The leaues of Sene are a familiar purger to all people, but they are windie, and do kinde the bodie afterwards, very much diſquieting the ſtomacke with rumbling and belching: for the auoiding of which inconuenience there muſt bee added Cinnamon, Ginger, Anniſe ſeed, and fennell ſeed, Raiſins of the Sun, and ſuch like that do breake winde, which will the better help his purging qualitie.

K Sene doth better purge when it is infuſed or ſteeped, than when it is boyled: for doubtleſſe the more it is boyled the leſſe it purgeth, and the more windie it becommeth.

L Take Borage, Bugloſſe, Balme, Fumitory, of each three drams, Sene of Alexandria very well prepared and pouned, two ounces, ſtrow the pouder vpon the herbes and diſtill them: the water that commeth thereof reſerue to your vſe to purge thoſe that liue delicately, being miniſtred in white wine with Sugar, in condited confections, and ſuch dainty waies, wherein delicate and fine people do greatly delight: you may alſo (as was ſaid before) adde hereunto according to the maladie, diuers purgers, as Agaricke, Mirobalans, &c.

M The pouder of Sene after it is well prepared two ounces, of the poudet of the root of Mechoacan foure drams, pouder of Ginger, Anniſe ſeeds, of each a little, a ſpoonfull of Anniſe ſeeds, but a very little Ginger, and a modicum or ſmall quantity of *Sal gemmæ*: this hath beene proued a very fit and familiar medicine for all ages and ſexes. The patient may take one ſpoonefull or two thereof faſting, either in pottage, ſome ſupping in drinke, or white wine. This is right profitable to draw both flegme and melancholy from the breſt and other parts.

N The leaues of Sene and Cammomill are put in baths to waſh the head.

O Sene opens the inward parts of the body which are ſtopped, and is profitable againſt all griefes of the principall members of the body.

P Take Sene prepared according to art one ounce, Ginger halfe a quarter of an ounce, twelue cloues, Fennell ſeed two drams, or in ſtead thereof Cinnamon and Tartar, of each halfe a dram, pouder all theſe; which done, take thereof in white wine one dram before ſupper, which doth maruellouſly purge the head.

Q Handle Sene in manner aboue ſpecified, then take halfe an ounce thereof, which done adde thereto ſixty Raiſins of the Sunne with the ſtones pickt out, one ſpoonefull of Anniſe ſeed braied; boile theſe in a quart of ale till one halfe be waſted, and while it is boiling put in your Sene: let it ſtand ſo till the morning, then ſtraine it and put in a little Ginger: then take the one halfe of this potion and put thereunto two ſpoonfulls of ſyrrup of Roſes: drinke this together, I meane the one halfe of the medicine at one time, and if the patient cannot abide the next day to receiue the other halfe, then let it be deferred vntill the third day after.

R Sene and Fumitory (as *Raſis* affirmeth, doe purge aduſt humors, and are excellent good againſt ſcabs, itch, and the ill affection of the body.

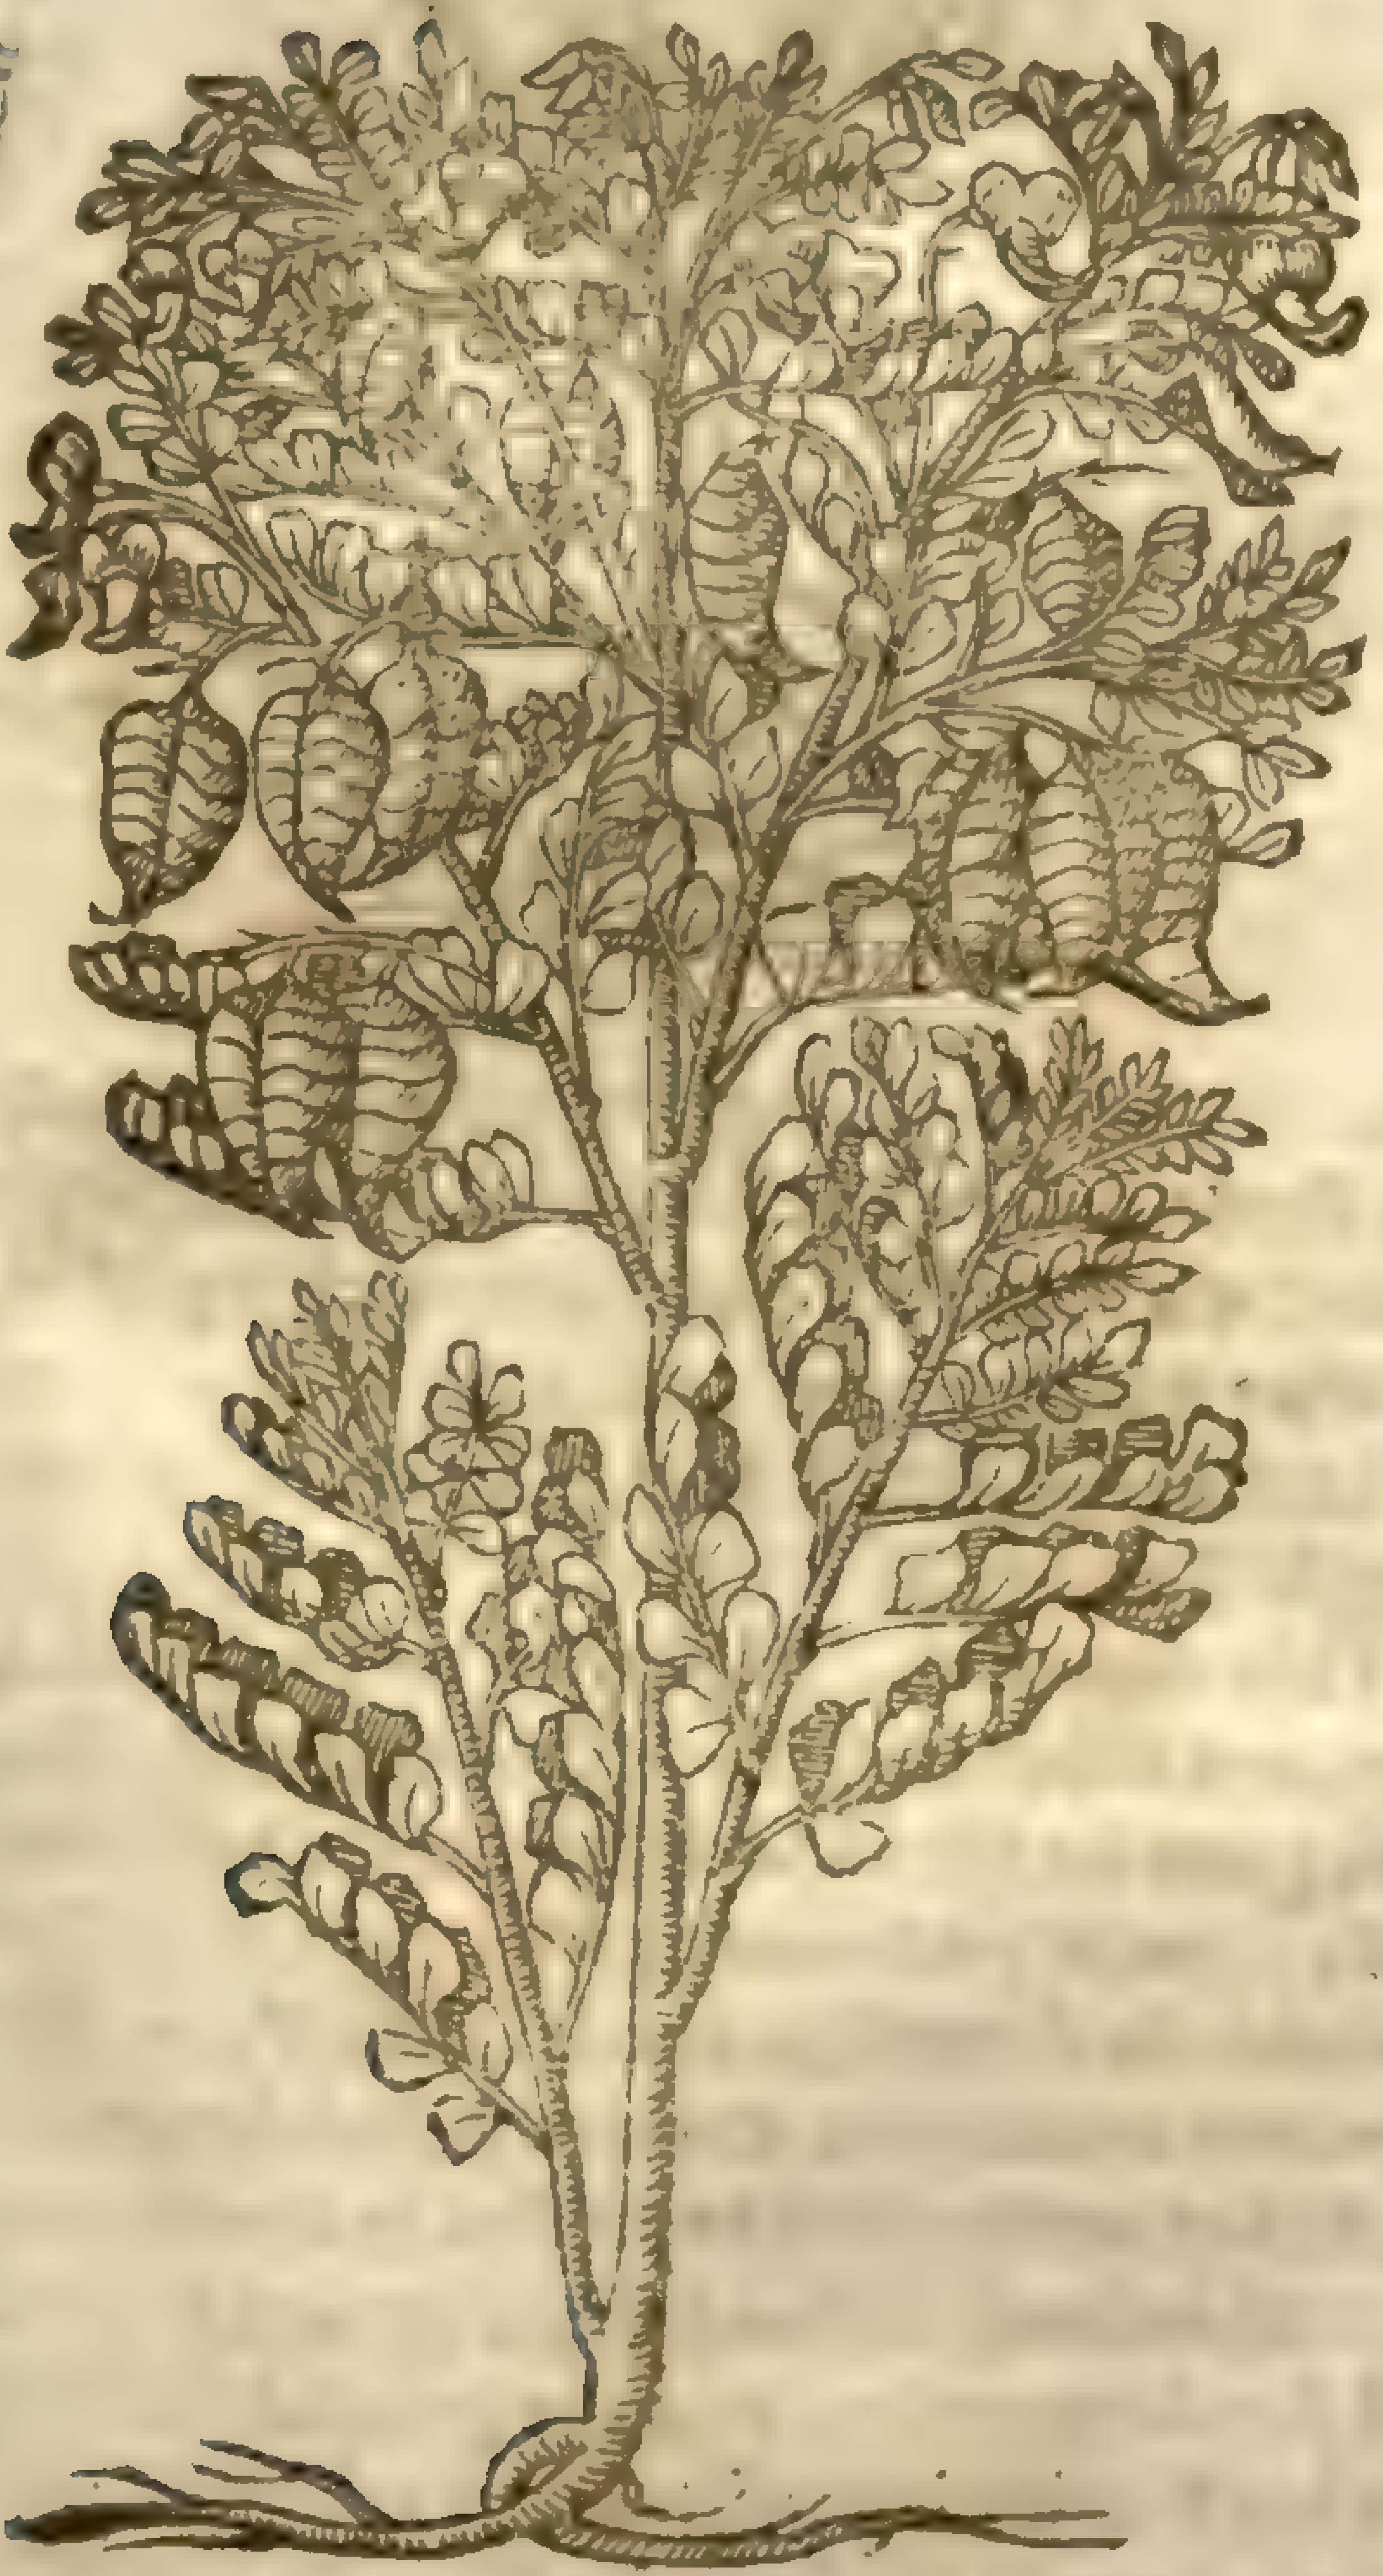
S If Sene be infuſed in whey, and then boyled a little, it becommeth good Phyſicke againſt melancholy, clenſeth the braine and purgeth it, as alſo the heart, liuer, milt, and lungs, cauſeth a man to looke young, engendreth mirth, and taketh away ſorrow: it cleereth the ſight, ſtrengthneth hearing, and is very good againſt old feuers and diſeaſes ariſing of melancholy.

† There were formerly two figures in this chapter, which differed onely in that the firſt, which was the *Sena Orientalis*, had leſſer, narrower, and ſharper pointed leaues than the *Sena Italica*, which was the ſecond.

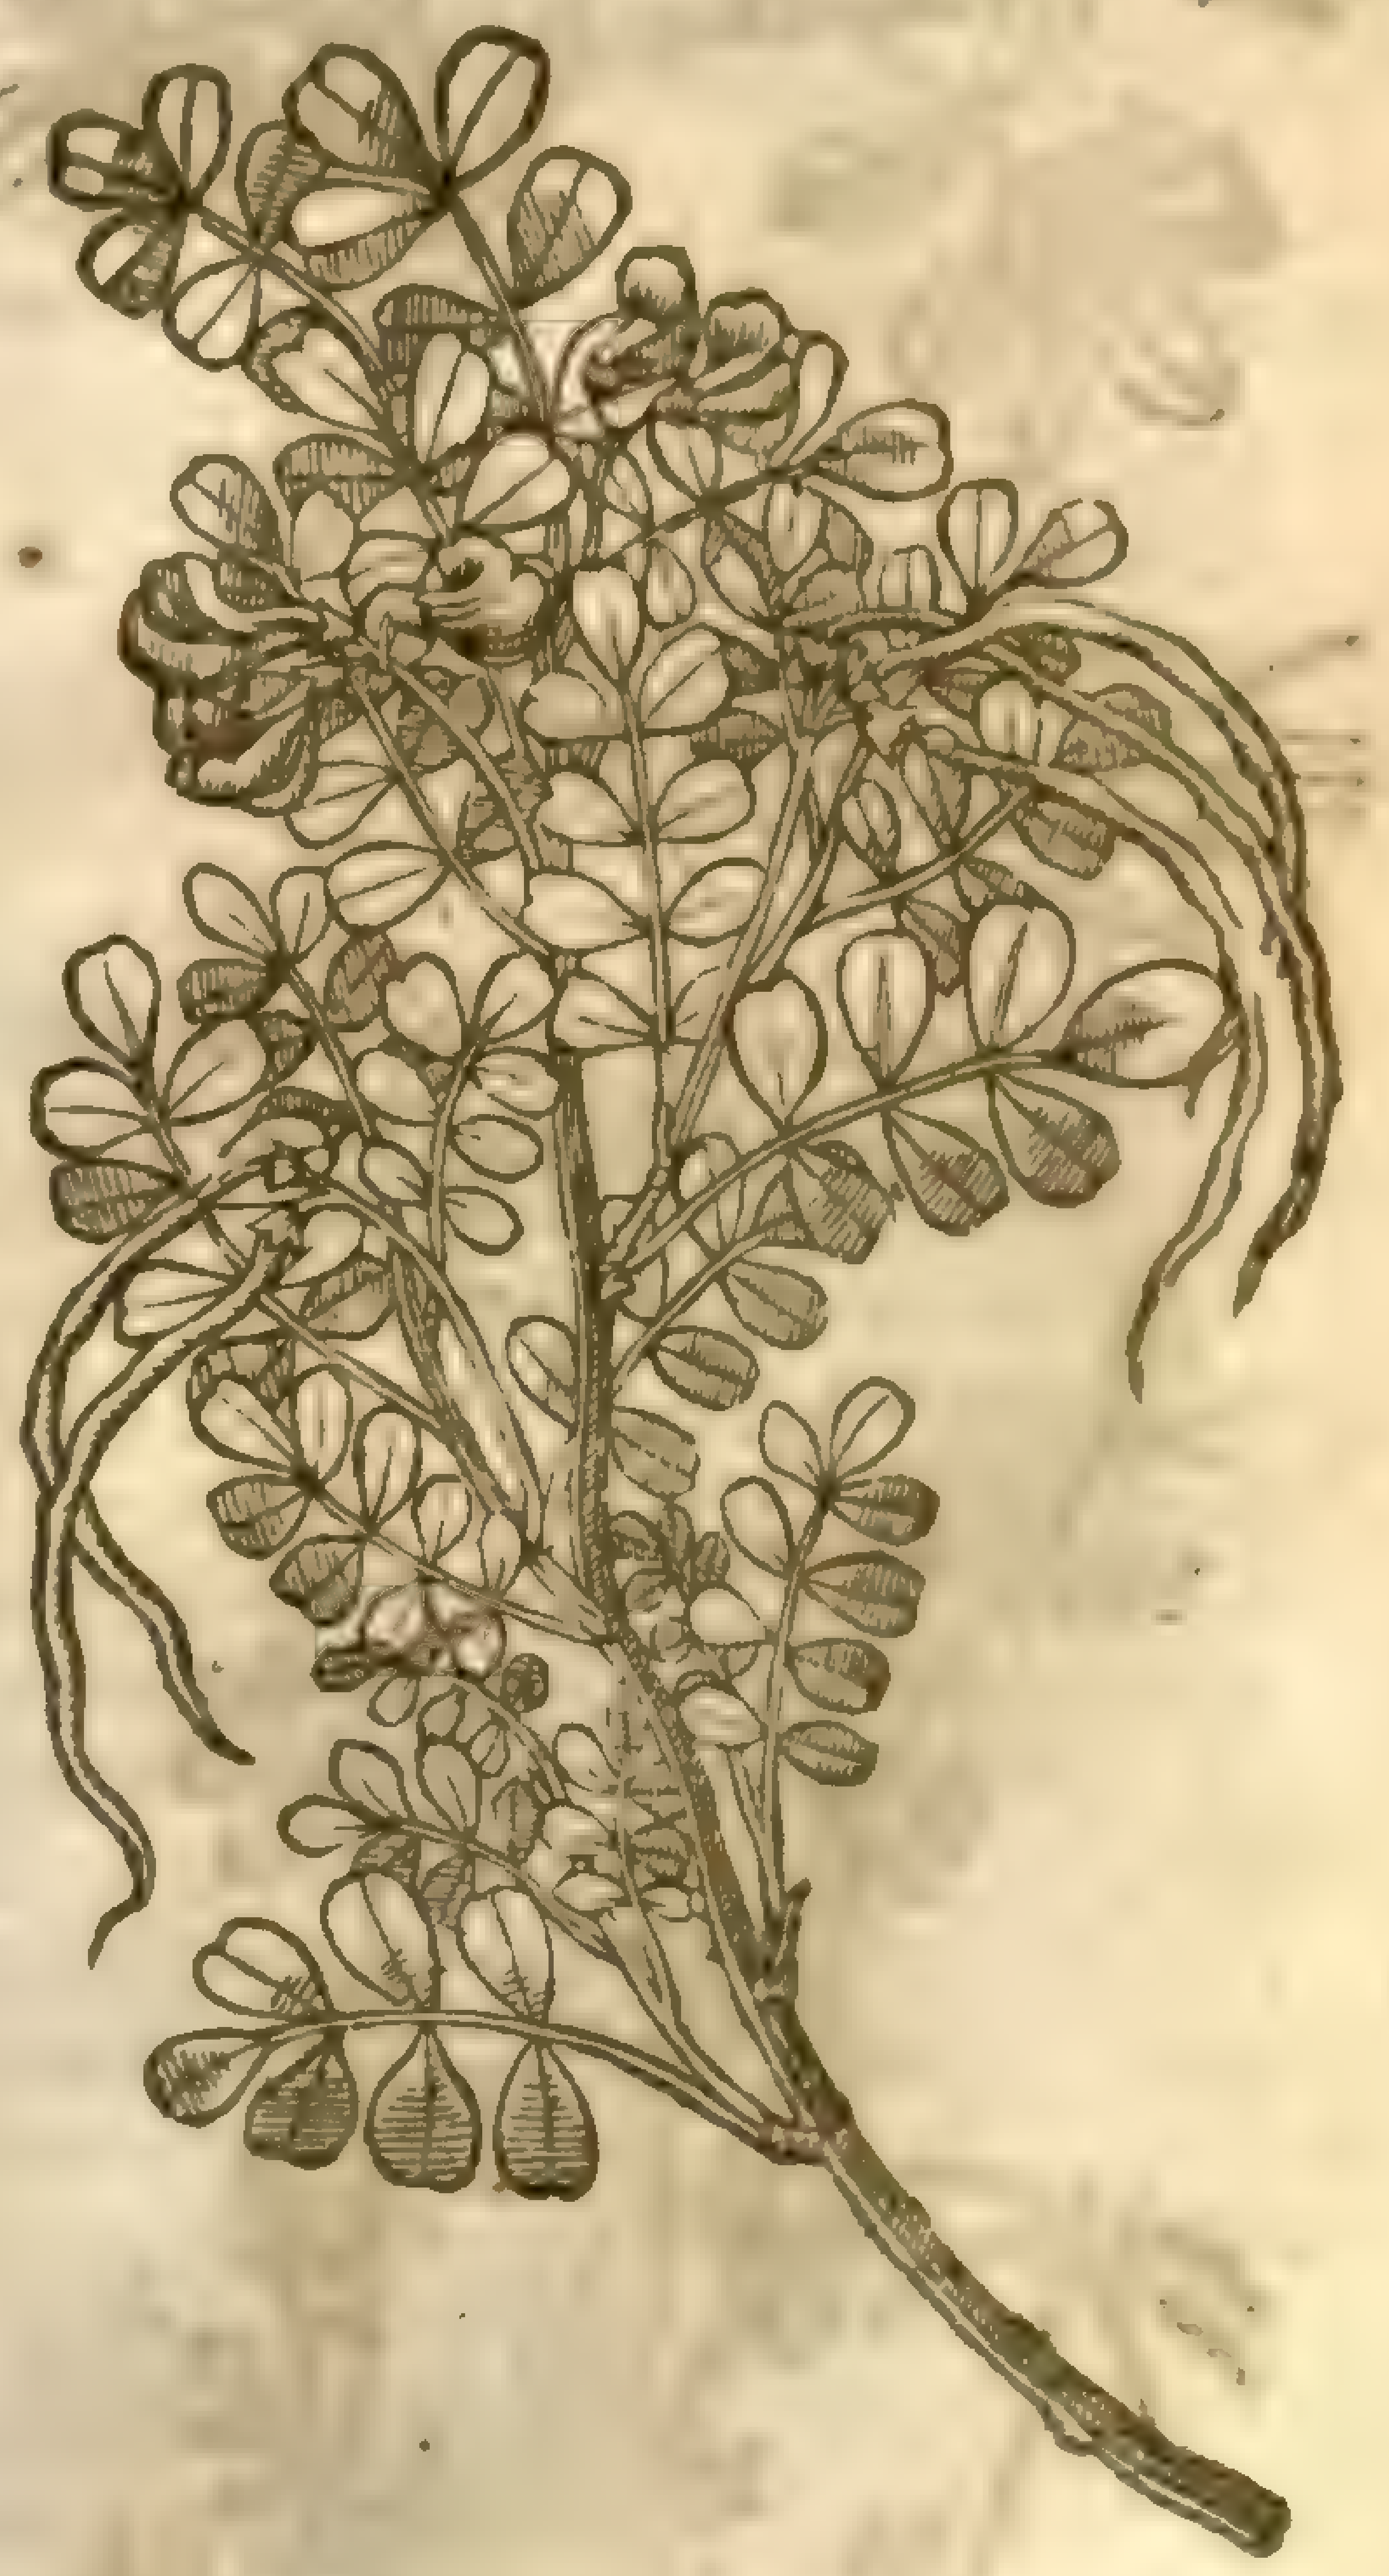
Chap. 11. *Of Baſtard Sene.*

¶ *The Deſcription.*

1 *Colutea* and Sene be ſo neere the one vnto the other in ſhape and ſhew, that the vnskilful Herbariſts haue deemed *Colutea* to be the right Sene. This Baſtard Sene is a ſhrubby plant growing to the forme of a hedge buſh or ſhrubby tree: his branches are ſtraight, brittle, and wooddy; which being careleſly broken off, and as negligently prickt or ſtucke in the ground, will take root and proſper at what time of the yeare ſoeuer it be done; but ſlipt or cut, or planted in any curious ſort whatſoeuer, among an hundred one will ſcarcely grow: theſe boughes or branches are beſet with leaues like *Sena* or *Securidaca*, not much vnlike liquorice: among which come forth faire broom-like yellow floures, which turn into ſmall cods like the ſownd of a fiſh or a little bladder, which will make a cracke being broken betweene the fingers: wherein are contained many blacke flat ſeeds of the bigneſſe of Tares, growing vpon a ſmall rib or ſinew within the cod: the root is hard, and of a wooddy ſubſtance.



1 *Colutea.*
Baſtard Sene.



2 *Colutea Scorpioides.*
Baſtard Sene with Scorpion cods.

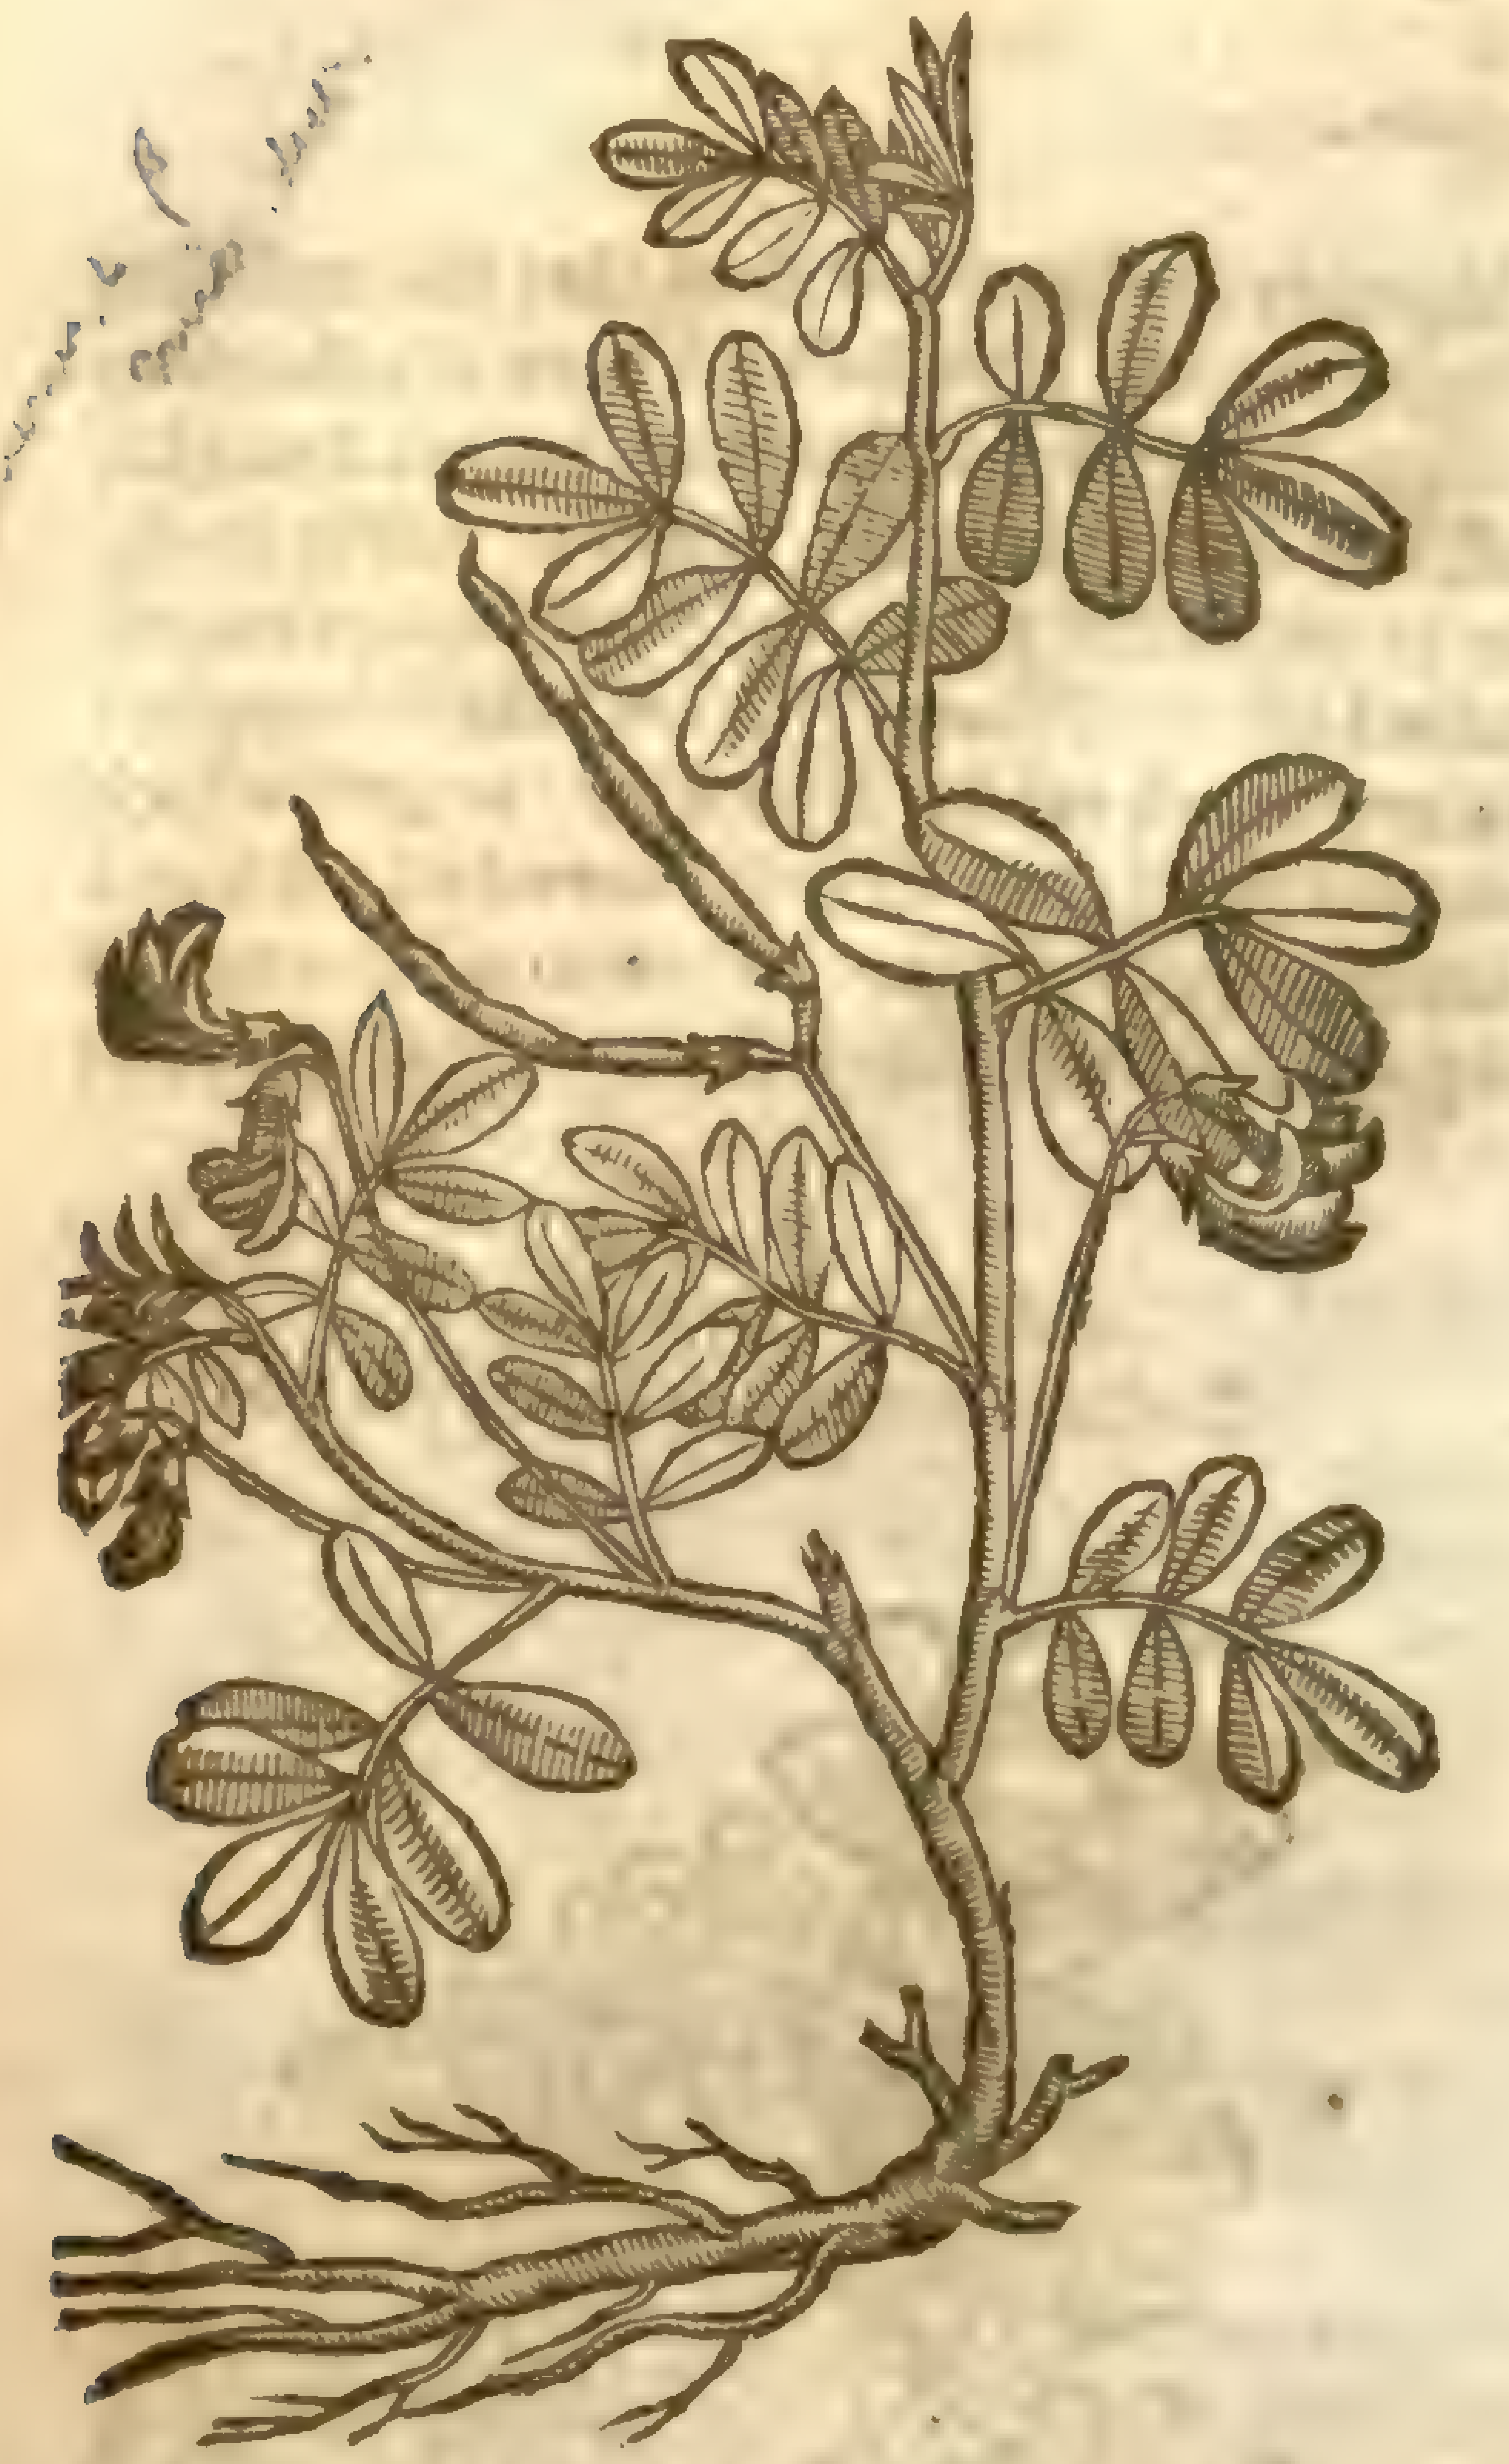
2 Baſtard Sene with Scorpion cods is a ſmall wooddy ſhrub or buſh, hauing leaues, branches and flours like vnto the former baſtard Sene, but leſſe in each reſpect: when his ſmall yellow floures are fallen there ſucceed little long crooked cods like the long cods or husks of *Matthiolus* his *Scorpioides*, whereof it took his name: the root is like the root of the Box tree, or rather reſembling the roots of *Dulcamara* or Bitter-ſweet, growing naturally in the ſhadowie woods of Valena in Narbone; whereof I haue a ſmall plant in my garden, which may be called Scorpion Sene.

3 The low or dwarfe *Colutea* of *Cluſius* deſcription, hath a thicke wooddy root couered with a yellowiſh barke, with many fibres annexed thereto, which bringeth forth yearely new ſhoots; whereby it greatly increaſeth, of a cubit and a halfe high, ſmooth, and of a greene colour; whereon doe grow leaues compoſed of ſix or ſeuen leaues, and ſometimes nine, ſet vpon a middle rib like thoſe of the common kinde, of a ſtipticke taſte, with ſome ſharpeneſſe or biting: the floures grow vpon

ſlender

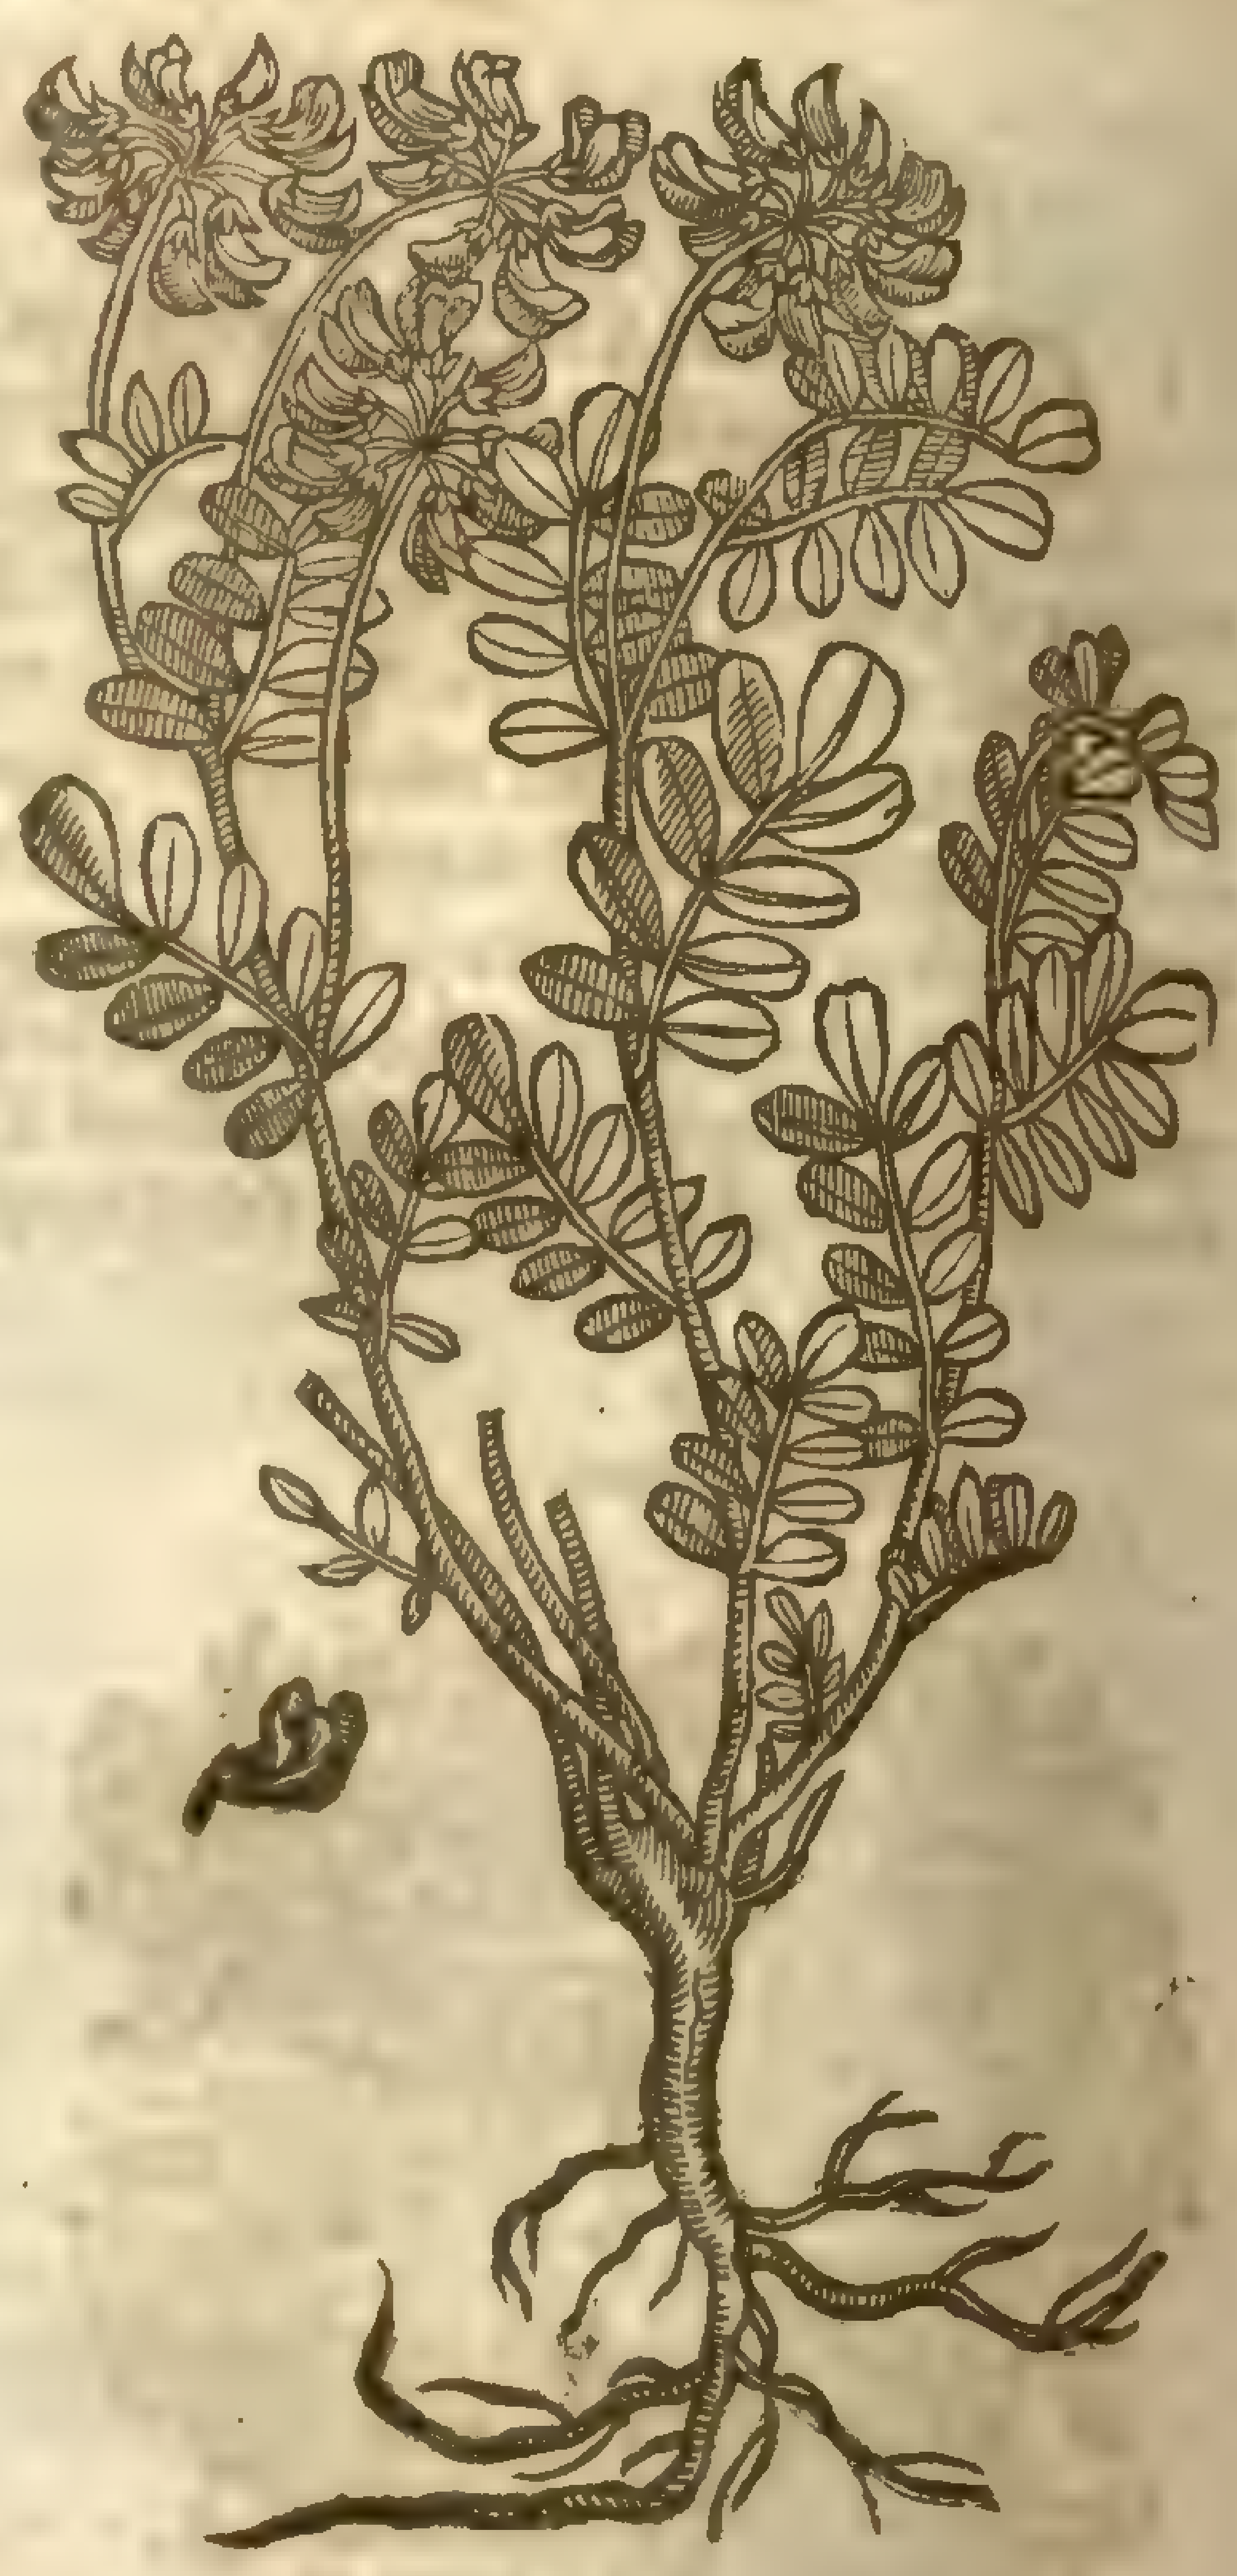
3 *Colutea ſcorpioides humilis.*
Dwarfe Baſtard Sene.

Coronilla [illegible] β [illegible] Linn.



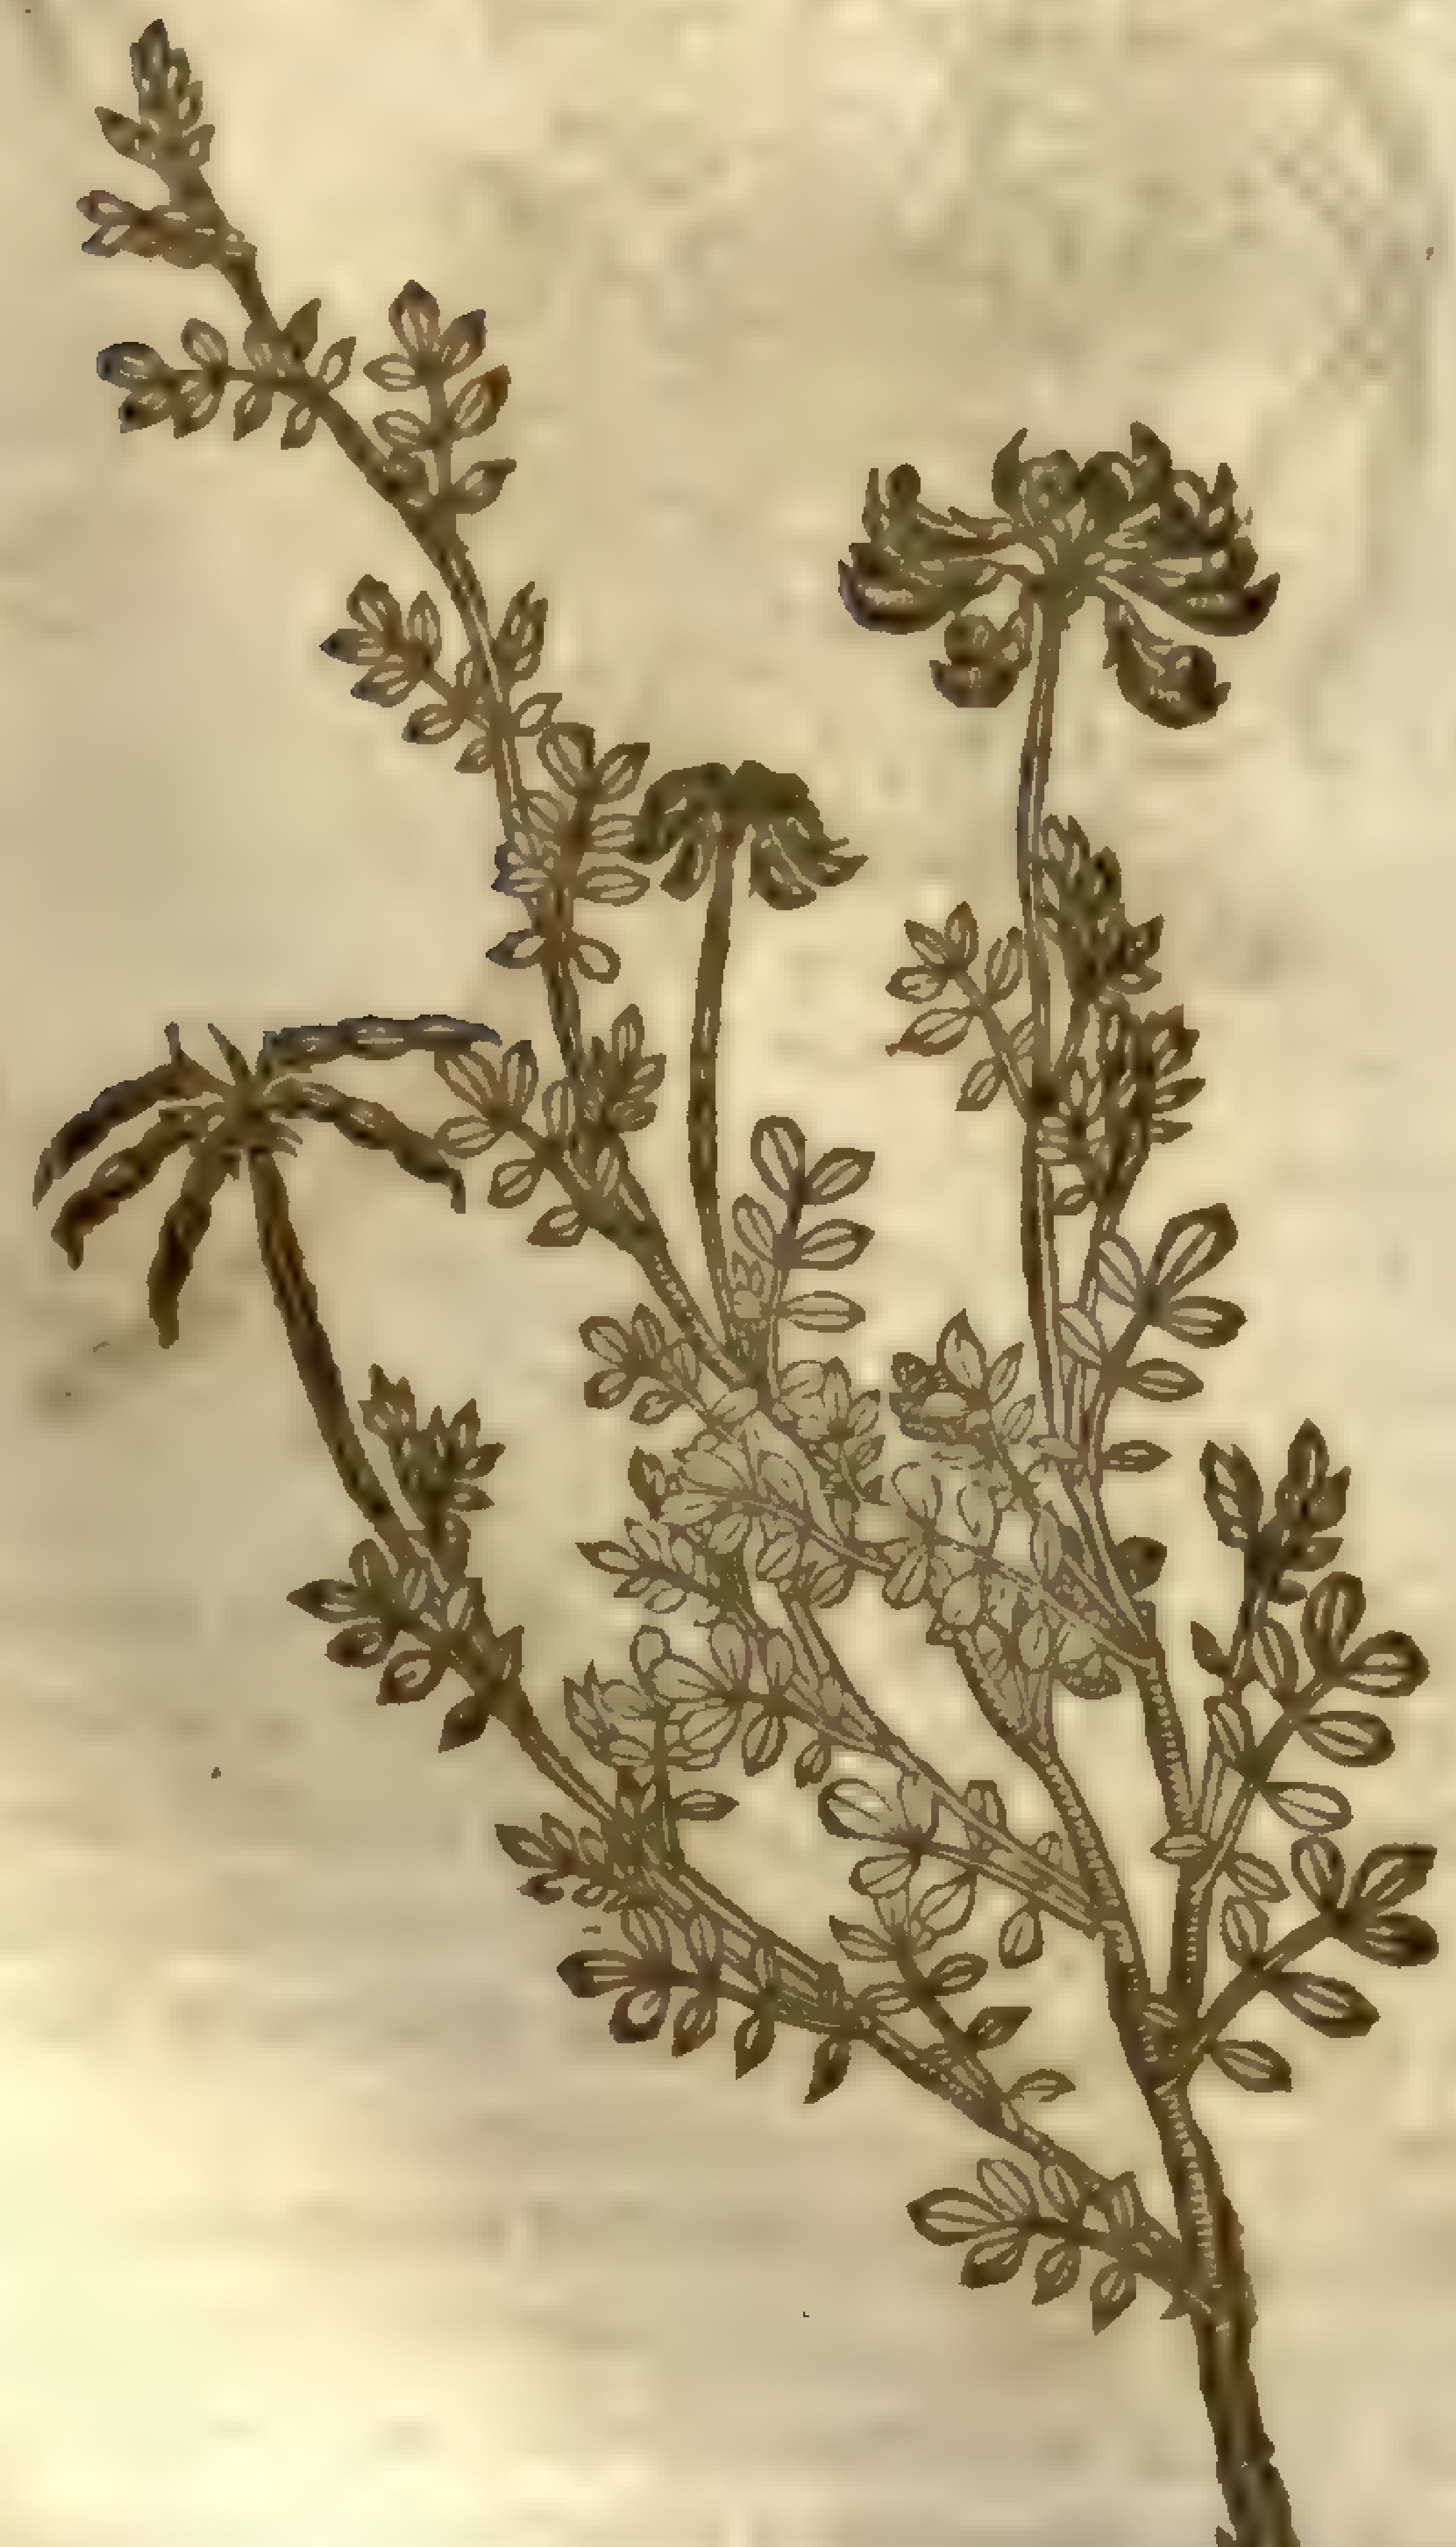
4 *Colutea ſcorpioides montana Cluſij.*
Mountaine Baſtard Sene.

Coronilla coronata Linn.



5 *Colutea minima, ſiue Coronilla.*
The ſmalleſt Baſtard Sene.

Coronilla valentina Linn.



ſlender foot-ſtalkes, long and naked like thoſe of the Peaſe, and of a yellow colour, of little or no ſmell at all, and yet that little nothing pleaſant: after which come forth long cods, wherein is contained ſmall ſeed like thoſe of the Strangle Tare.

4 This mountaine baſtard Sene hath ſtalks, leaues, and roots like the laſt deſcribed. The floures grow on the tops of the branches in maner of a crowne; whereupon ſome haue called it *Coronilla:* in ſhape like thoſe of the Peaſe, and of a yellow colour: the cods as yet we haue not ſeen, and therefore not expreſſed in the figure.

5 This ſmall Baſtard Sene groweth like a ſmall ſhrub creeping vpon the ground, halfe a cubit high, bringing forth many twiggy branches, in maner of thoſe of the Spaniſh broome; wherupon do grow leaues like thoſe of Lentils or the Strangle Tare, with many ſmal leaues ſet vpon a middle rib, ſomwhat fat or full of juice, of the colour of the leaues of Rue or Herbegrace, of an aſtringent and vnpleaſant taſte: the floures grow at the tops of the branches, of a yellow color, in ſhape like thoſe of the ſmalleſt broome: after which come little crooked cods like the clawes or toes of a bird, wherin is contained ſeed ſomewhat long, blacke, and of an vnſauorie taſte: the root is long, hard, tough, and of a wooddy ſubſtance.

6 There is alſo found another ſort hereof not much differing from the former, ſauing that this plant is greater in each reſpect, wherein eſpecially conſiſteth the difference.

¶ *The Place.*

Colutea or baſtard Sene groweth in diuers gardens, and commeth vp of ſeed; it quickly comes to perfection, inſomuch that if a ſticke thereof be broken off and thruſt into the ground, it quickly taketh root, yea although it be done in the middle of ſummer, or at any other time, euen as the ſticks of willow or Elder, as I my ſelfe haue often proued: the which bring forth flours and fruit the next yeare after.

The ſecond with ſcorpion cods groweth likewiſe in my garden: the laſt growes in diuers barren chalky grounds of Kent toward Sittinburne, Canturbury, and about Southfleet; I haue not ſeene them elſewhere: the reſt are ſtrangers in England.

¶ *The Time.*

They floure from May til ſummer be well ſpent, in the meane ſeaſon the cods bring forth ripe ſeed.

¶ *The Names.*

This ſhrub is called of *Theophraſtus* in Greeke κολουτέα, with the dipthong ου in the ſecond ſyllable: in Latine, as *Gaza* expounds it, *Coloutea*, or *Colutea*: in high-Dutch, **Welſch linſen**: in French, *Baguenaudier*: they are deceiued that thinke it to be *Sena* or any kinde thereof, although wee haue followed others in giuing it to name baſtard Sene, which name is very vnproper to it: in low Dutch it is called **Sene boom**: and we may vſe the ſame name Sene tree in Engliſh.

This *Colutea* or baſtard Sene differs from that plant κολύτεα with υ in the ſecond ſyllable, of which *Colutea Theophraſtus* writeth, *lib.* 3. ‡ The fift is the *Polygala Valentina* of *Cluſius*. ‡

¶ *The Temperature and Vertues.*

Theophraſtus nor any other hath made mention of the temperature or faculties of theſe plants, A more, than that they are good to fatten cattell, eſpecially ſheep.

† There were formerly in the fifth and ſixth places here two figures no way different, but that which was in the ſixth place was a little larger, and *Lobels* title which he puts in his *Icons* ouer this, was diuided between them: For as you ſee, *Colutea minima, ſiue Coronilla*, was ouer in the fift; and *Colutea, ſiue Polygala Valentina Cluſij* was ouer the ſixt.

CHAP. 12. *Of Liquorice.*

¶ *The Deſcription.*

1 THe firſt kind of Liquorice hath many wooddy branches riſing vp to the height of two or three cubits, beſet with leaues of an ouerworn green color, conſiſting of many ſmal leaues ſet vpon a middle ribbe like the leaues of *Colutea* or the Maſtick tree, ſomewhat glutinous in handling: among which come ſmall knops growing vpon ſhort ſtemmes between the leaues and the branches, cluſtering together, and making a round form or ſhape: out of which grow ſmall blew flours of the colour of an Engliſh Hyacinth: after which ſucceed round rough prickly heads, conſiſting of diuers rough and ſcaly husks cloſely and thicke compact together, in which is contained a flat ſeed: the root is ſtraight, yellow within, and browne without, of a ſweet and pleaſant taſte.

2 The common and vſuall Liquorice hath ſtalkes and leaues very like the former, ſauing that his leaues are greener and greater, and the floures of a light ſhining blew colour: but the floures of this are ſucceeded by longiſh cods that grow not ſo thicke cluſtering together in round heads as the former, but ſpike faſhion, or rather like the wilde Vetch called *Onobrychis*, or *Galega*: the cods are ſmall and flat like vnto the Tare: the roots are of a browniſh colour without, and yellow within like Box, and ſweeter in taſte than the former.

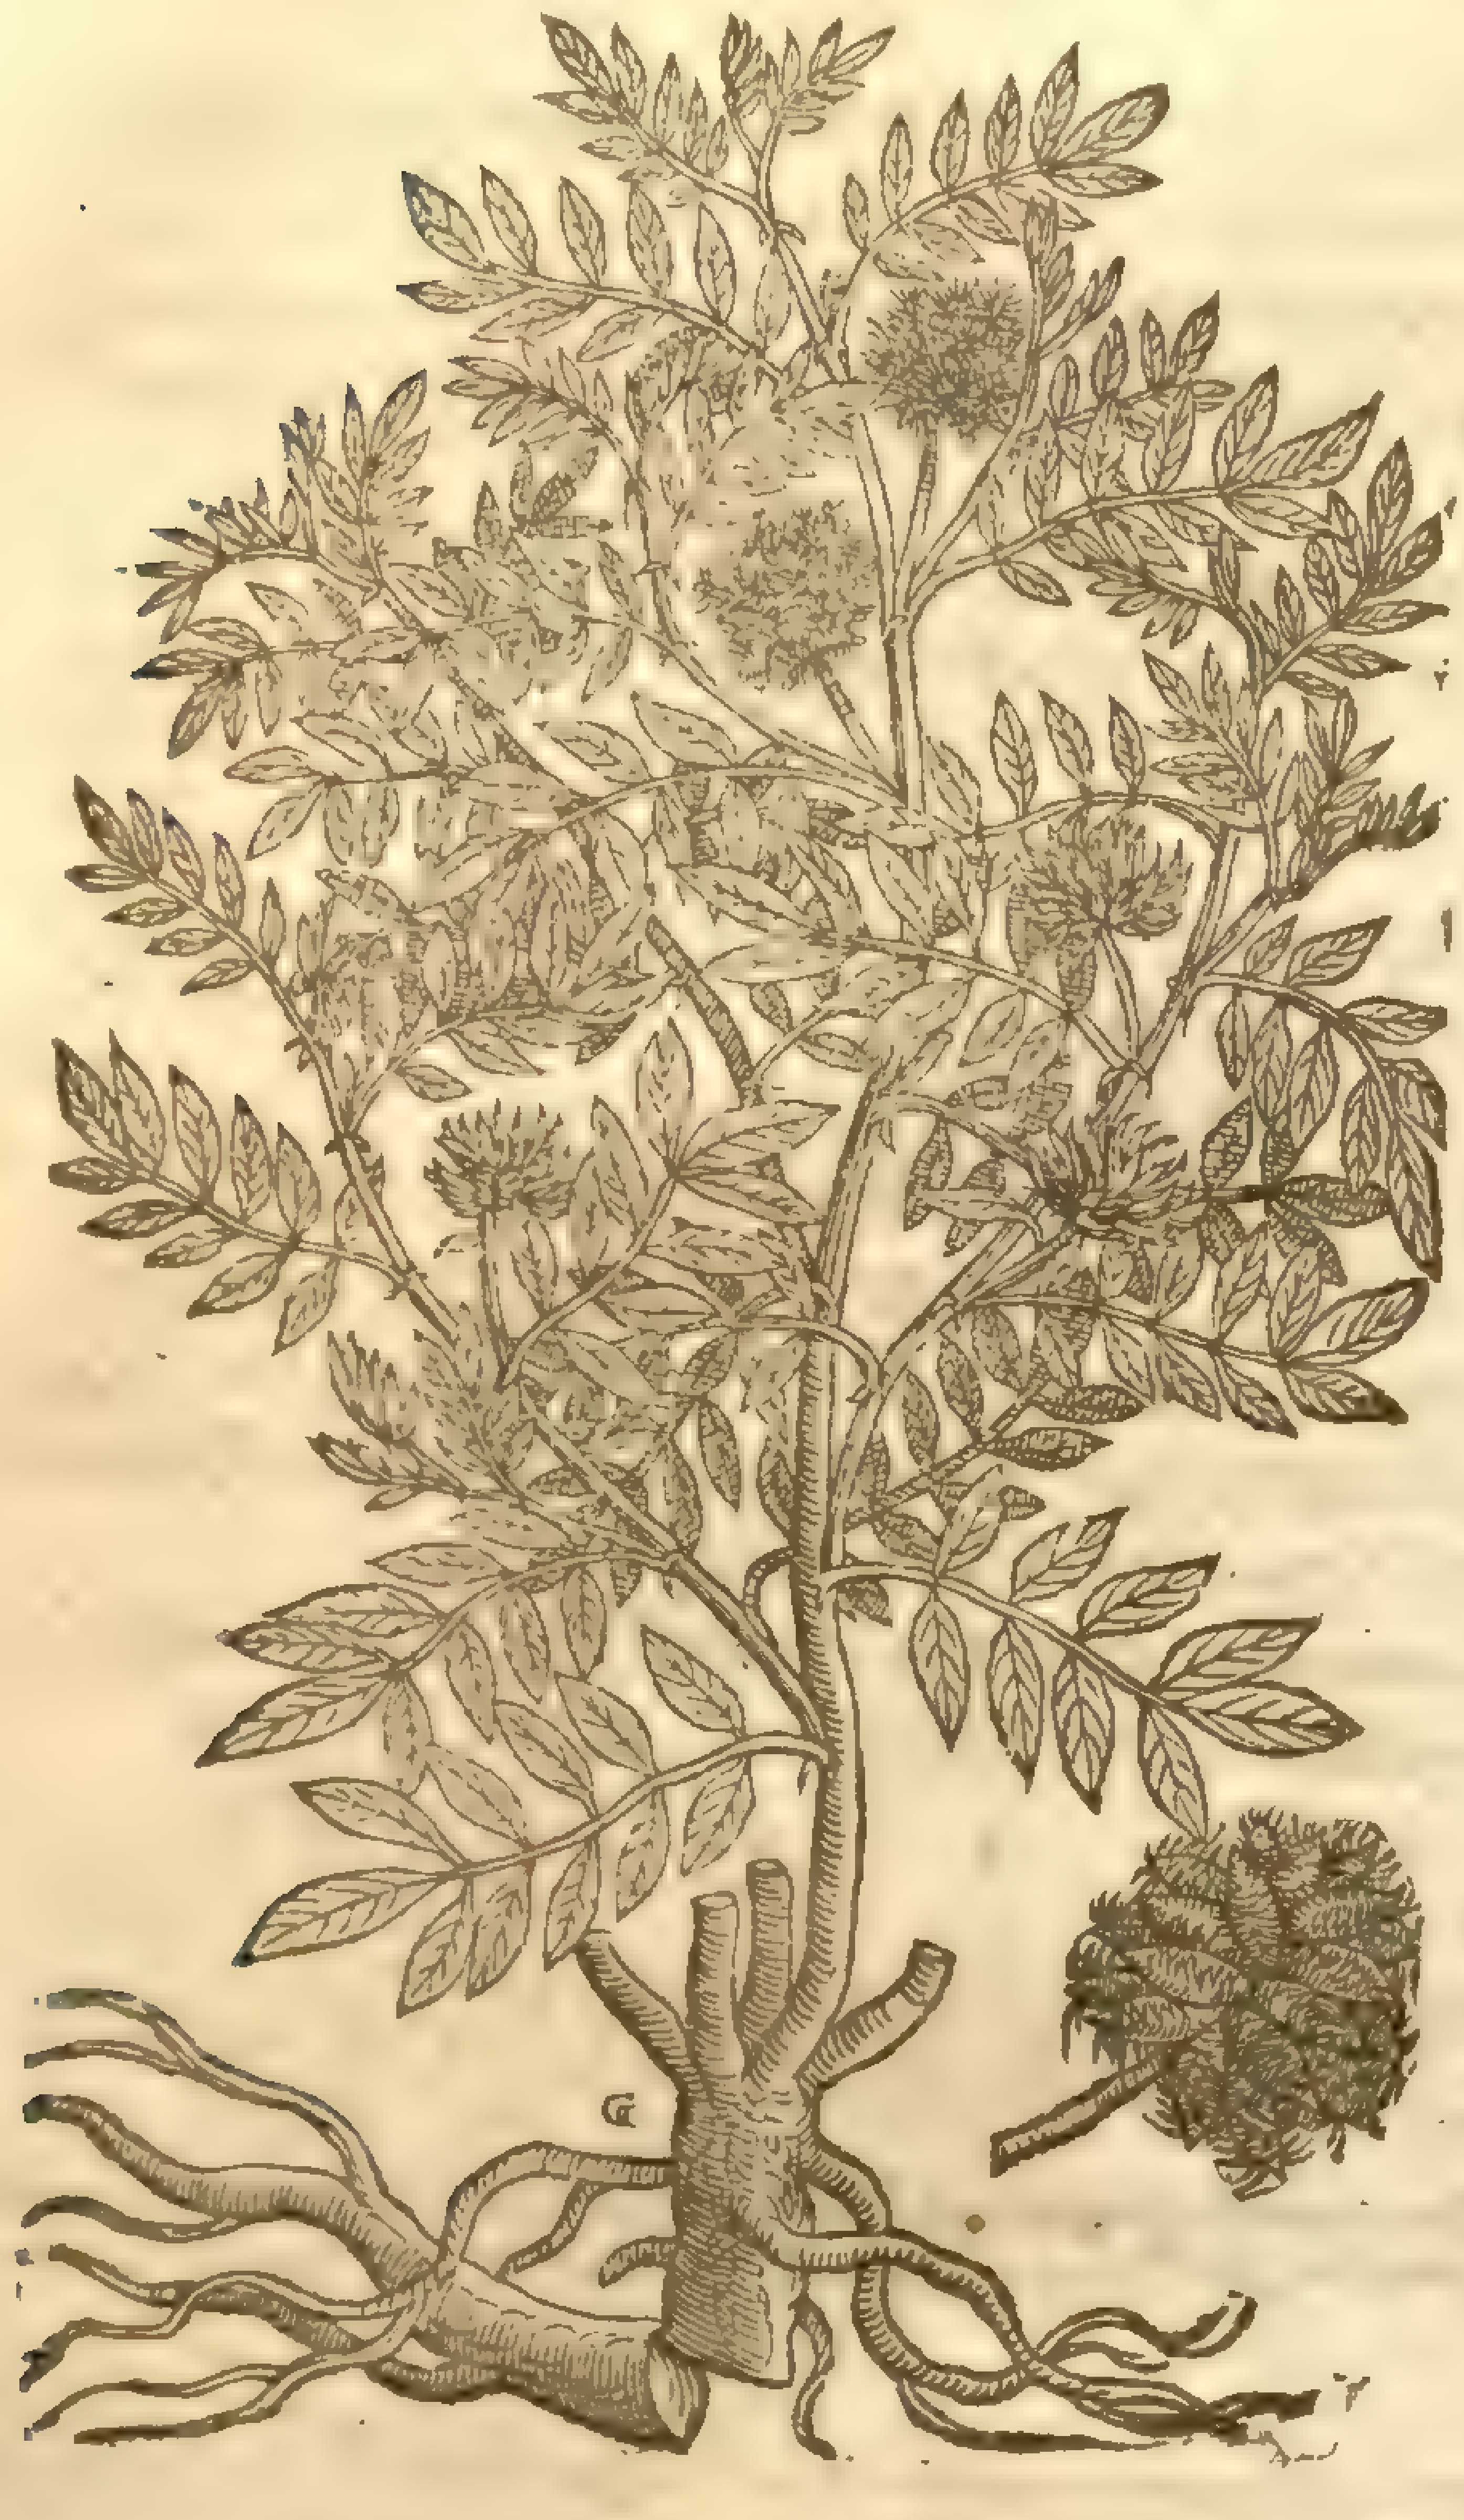
¶ *The Place.*

Theſe plants grow wilde in ſundry places of Germany, France and Spaine, but they are planted in gardens in England, whereof my garden hath plenty: the poore people of the North parts of England do manure it with great diligence, whereby they obtaine great plenty thereof, replanting the ſame once in three or foure yeares.

¶ *The Time.*

Liquorice floureth in Iuly, and the ſeed is ripe in September.

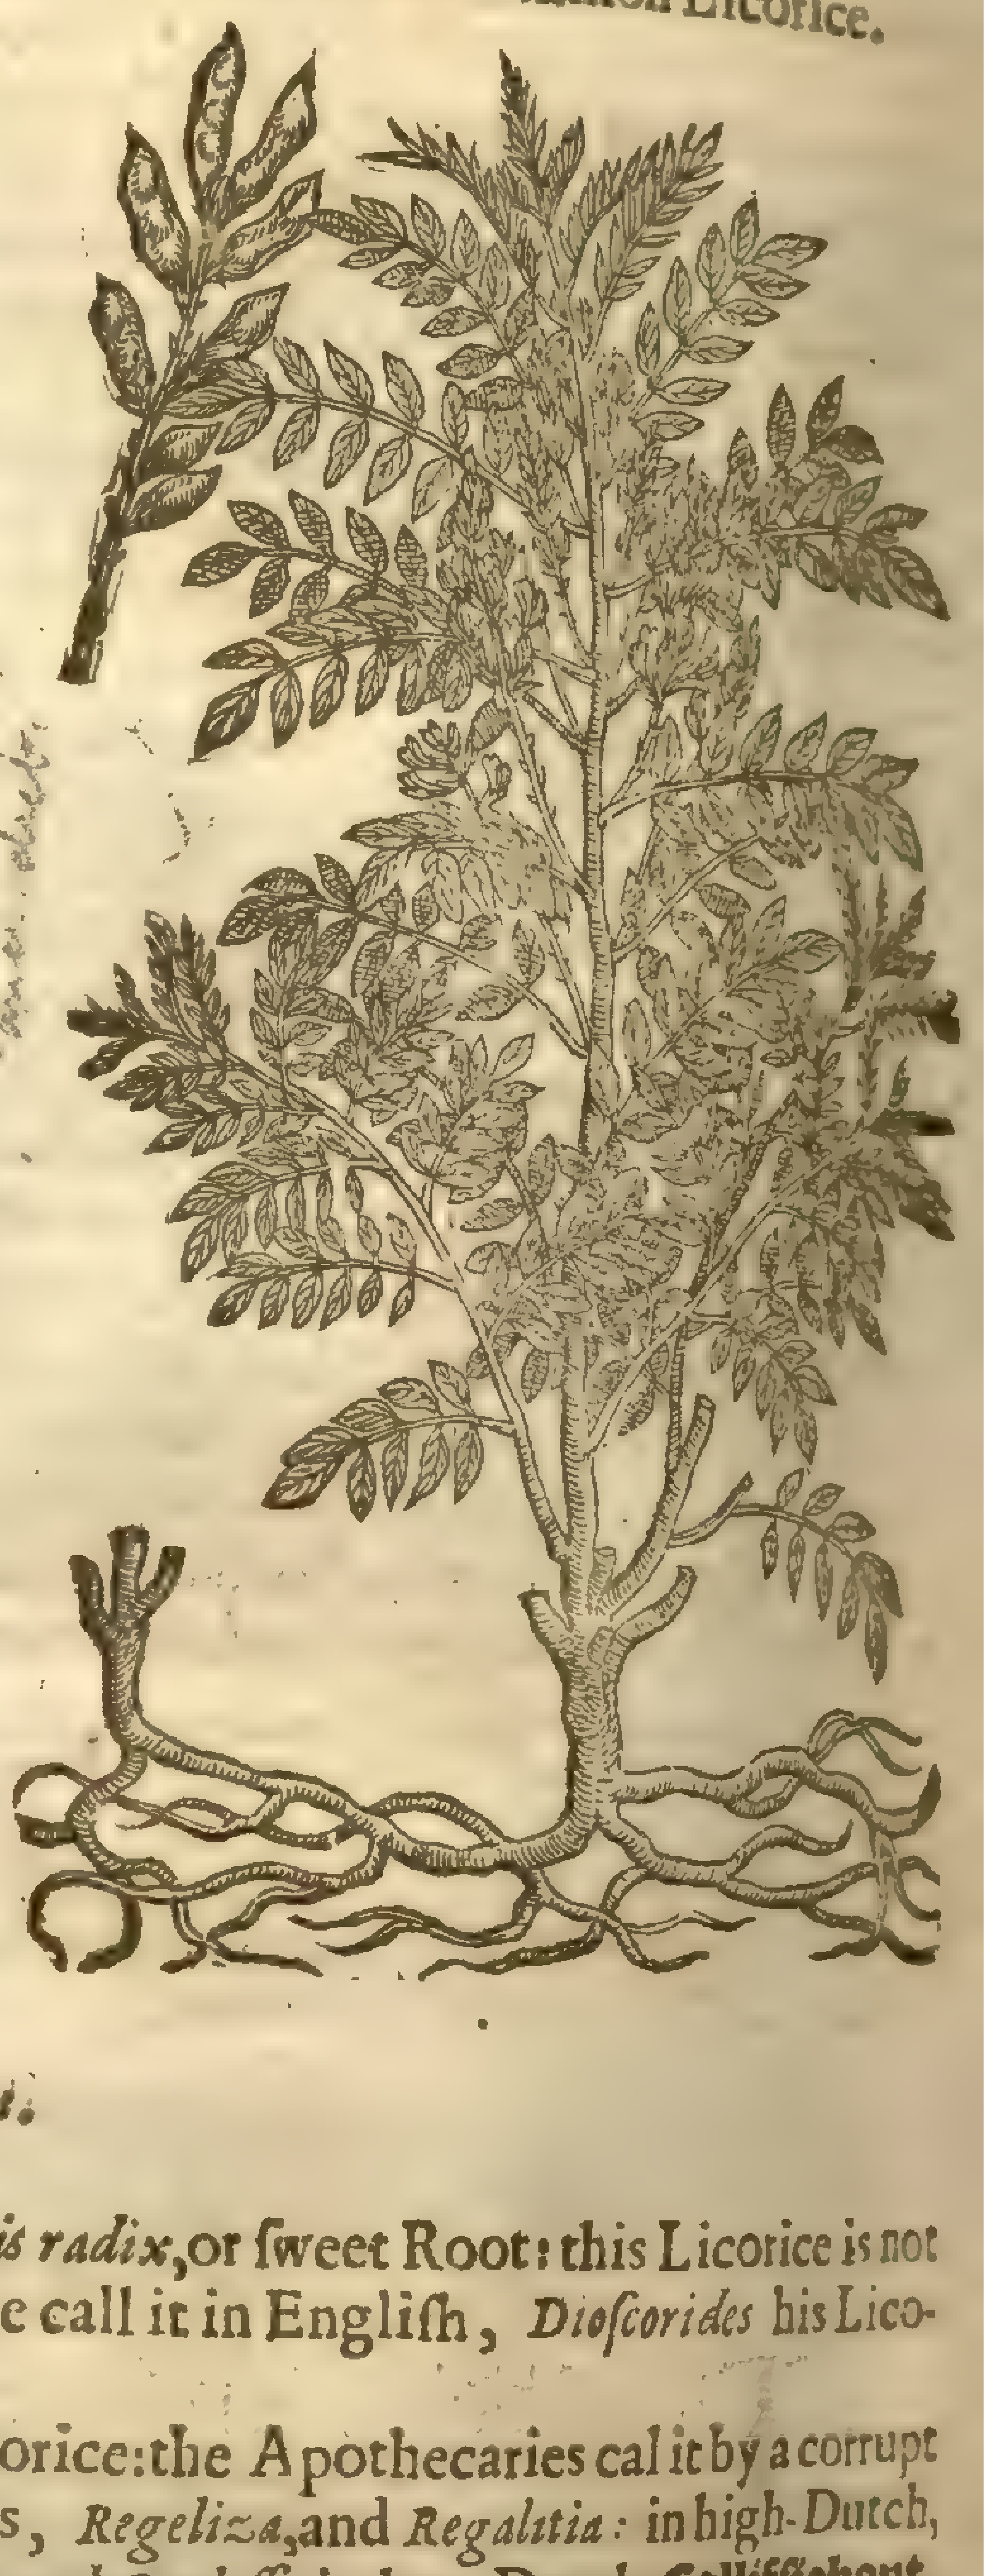
1 *Glycyrrhiza echinata Dioſcoridis.*
Hedge hog Licorice.



G. echinata, L. [illegible]

‡ 2 *Glycyrrhiza vulgaris.*
Common Licorice.

G. glabra, L. [illegible]



¶ *The Names.*

The firſt is called in Greeke, γλυκύρριζα : in Latine, *Dulcis radix*, or ſweet Root: this Licorice is not knowne either to the Apothecaries or vulgar people : we call it in Engliſh, *Dioſcorides* his Licorice.

It is moſt euident, that the other is *Glycyrrhiza* or Licorice: the Apothecaries cal it by a corrupt word, *Liquiritia* : the Italians, *Regalitia* : the Spaniards, *Regeliza*, and *Regalitia* : in high-Dutch, **Suſzholtz, Suſzwurtzel** : in French, *Rigoliſſe, Raigaliſſe*, and *Regliſſe*: in low-Dutch, **Calliſſiehout, ſuethout** : in Engliſh, common Licorice : *Pliny* calls it *Scythica herba* : it is named *Scythice*, of the country Scythia where it groweth.

¶ *The Temperature.*

The nature of *Dioſcorides* his Licorice, as *Galen* teſtifith, is familiar to the temperature of our bodies, and ſeeing it hath a certain binding qualitie adjoined, the temperature thereof, ſo much as is hot and binding, is ſpecially of a warm qualitie, comming neereſt of all to a meane temper : beſides, for that it is alſo ſweet, it is likewiſe meanly moiſt.

Foraſmuch as the root of the common Licorice is ſweet, it is alſo temperately hot and moiſt; notwithſtanding the barke hereof is ſomthing bitter and hot, but this muſt be ſcraped away : The freſh root when it is full of juice doth moiſten more than the dry.

¶ *The Vertues.*

A The root of Licorice is good againſt the rough harſhneſſe of the throat and breſt ; it opens the pipes of the lungs when they be ſtuffed or ſtopt, ripeneth the cough, and bringeth forth flegme.

B The juice of Licorice made according to art, and hardned into a lump, which is called *Succus Liquiritiæ*, ſerueth well for the purpoſes aforeſaid, being holden vnder the tongue, and there ſuffered to melt.

C Moreouer, with the juice of Licorice, Ginger, and other ſpices, there is made a certaine bread or cakes called Ginger-bread, which is very good againſt the cough and all infirmities of the lungs and breſt ; which is caſt into moulds, ſome of one faſhion, and ſome of another.

D The juice of Licorice is profitable againſt the heate of the ſtomacke and of the mouth.

E The ſame is drunk with wine and Raiſins againſt the infirmities of the liuer and cheſt, ſcabs or ſores of the bladder,and diſeaſes of the kidnies.

F Being melted vnder the tongue it quencheth thirſt:it is good for green wounds being laid therupon,and for the ſtomacke if it be chewed.

G The decoction of the freſh roots ſerueth for the ſame purpoſes.

H But the dried root moſt finely poudered is a ſingulat remedie for a pin and a web in the eie,if it be ſtrewed thereupon.

I *Dioſcorides* and *Pliny* alſo report,that Licorice is good for the ſtomacke and vlcers of the mouth, being caſt vpon them.

K It is good againſt hoarſneſſe, difficultie of breathing, inflammation of the lungs, the pleuriſie, ſpitting of bloud or matter,conſumption and rottenneſſe of the lungs, all infirmities and ruggedneſſe of the cheſt.

L It takes away inflammation, mitigateth and tempereth the ſharpneſſe and ſaltneſſe of humors, concocteth raw humors,and procureth eaſie ſpitting.

M The decoction is good for the kidnies and bladder that are exulcerated.

N It cureth the ſtranguric,and generally all infirmities that proceed of ſharpe ſalt and biting humors.

O Theſe things concerning Licorice hath alſo *Theophraſtus : viz.* That with this and cheeſe made of mares milke the Scythians were reported to be able to liue eleuen or twelue dayes.

P The Scythian root is good for ſhortneſſe of breath, for a dry cough, and generally for all infirmities of the cheſt.

Q Moreouer, with hony it healeth vlcers, it alſo quencheth thirſt if it be held in the mouth : for which cauſe they ſay that the Scythians do liue eleuen or twelue daies with it and *Hippace*,which is cheeſe made of mares milke,as *Hippocrates* witneſſeth.

R *Pliny,lib.*25.*cap.*8. hath thought otherwiſe than truth,That *Hippace* is an herb ſo called.

† Both the figures formerly were of the firſt deſcribed.

CHAP. 13. *Of Milke Trefoile or Shrub-Trefoile.*

¶ *The Kindes.*

THete be diuers kindes or ſorts of the ſhrubby Trefoile,the which might very well haue paſſed among the three leaued Graſſes,had it not been for our promiſe in the proem of our firſt part, That in the laſt booke of our hiſtorie the ſhrubby or wooddy plants ſhould be ſet forth,euery one as neere as might be in kindred and neighborhood.

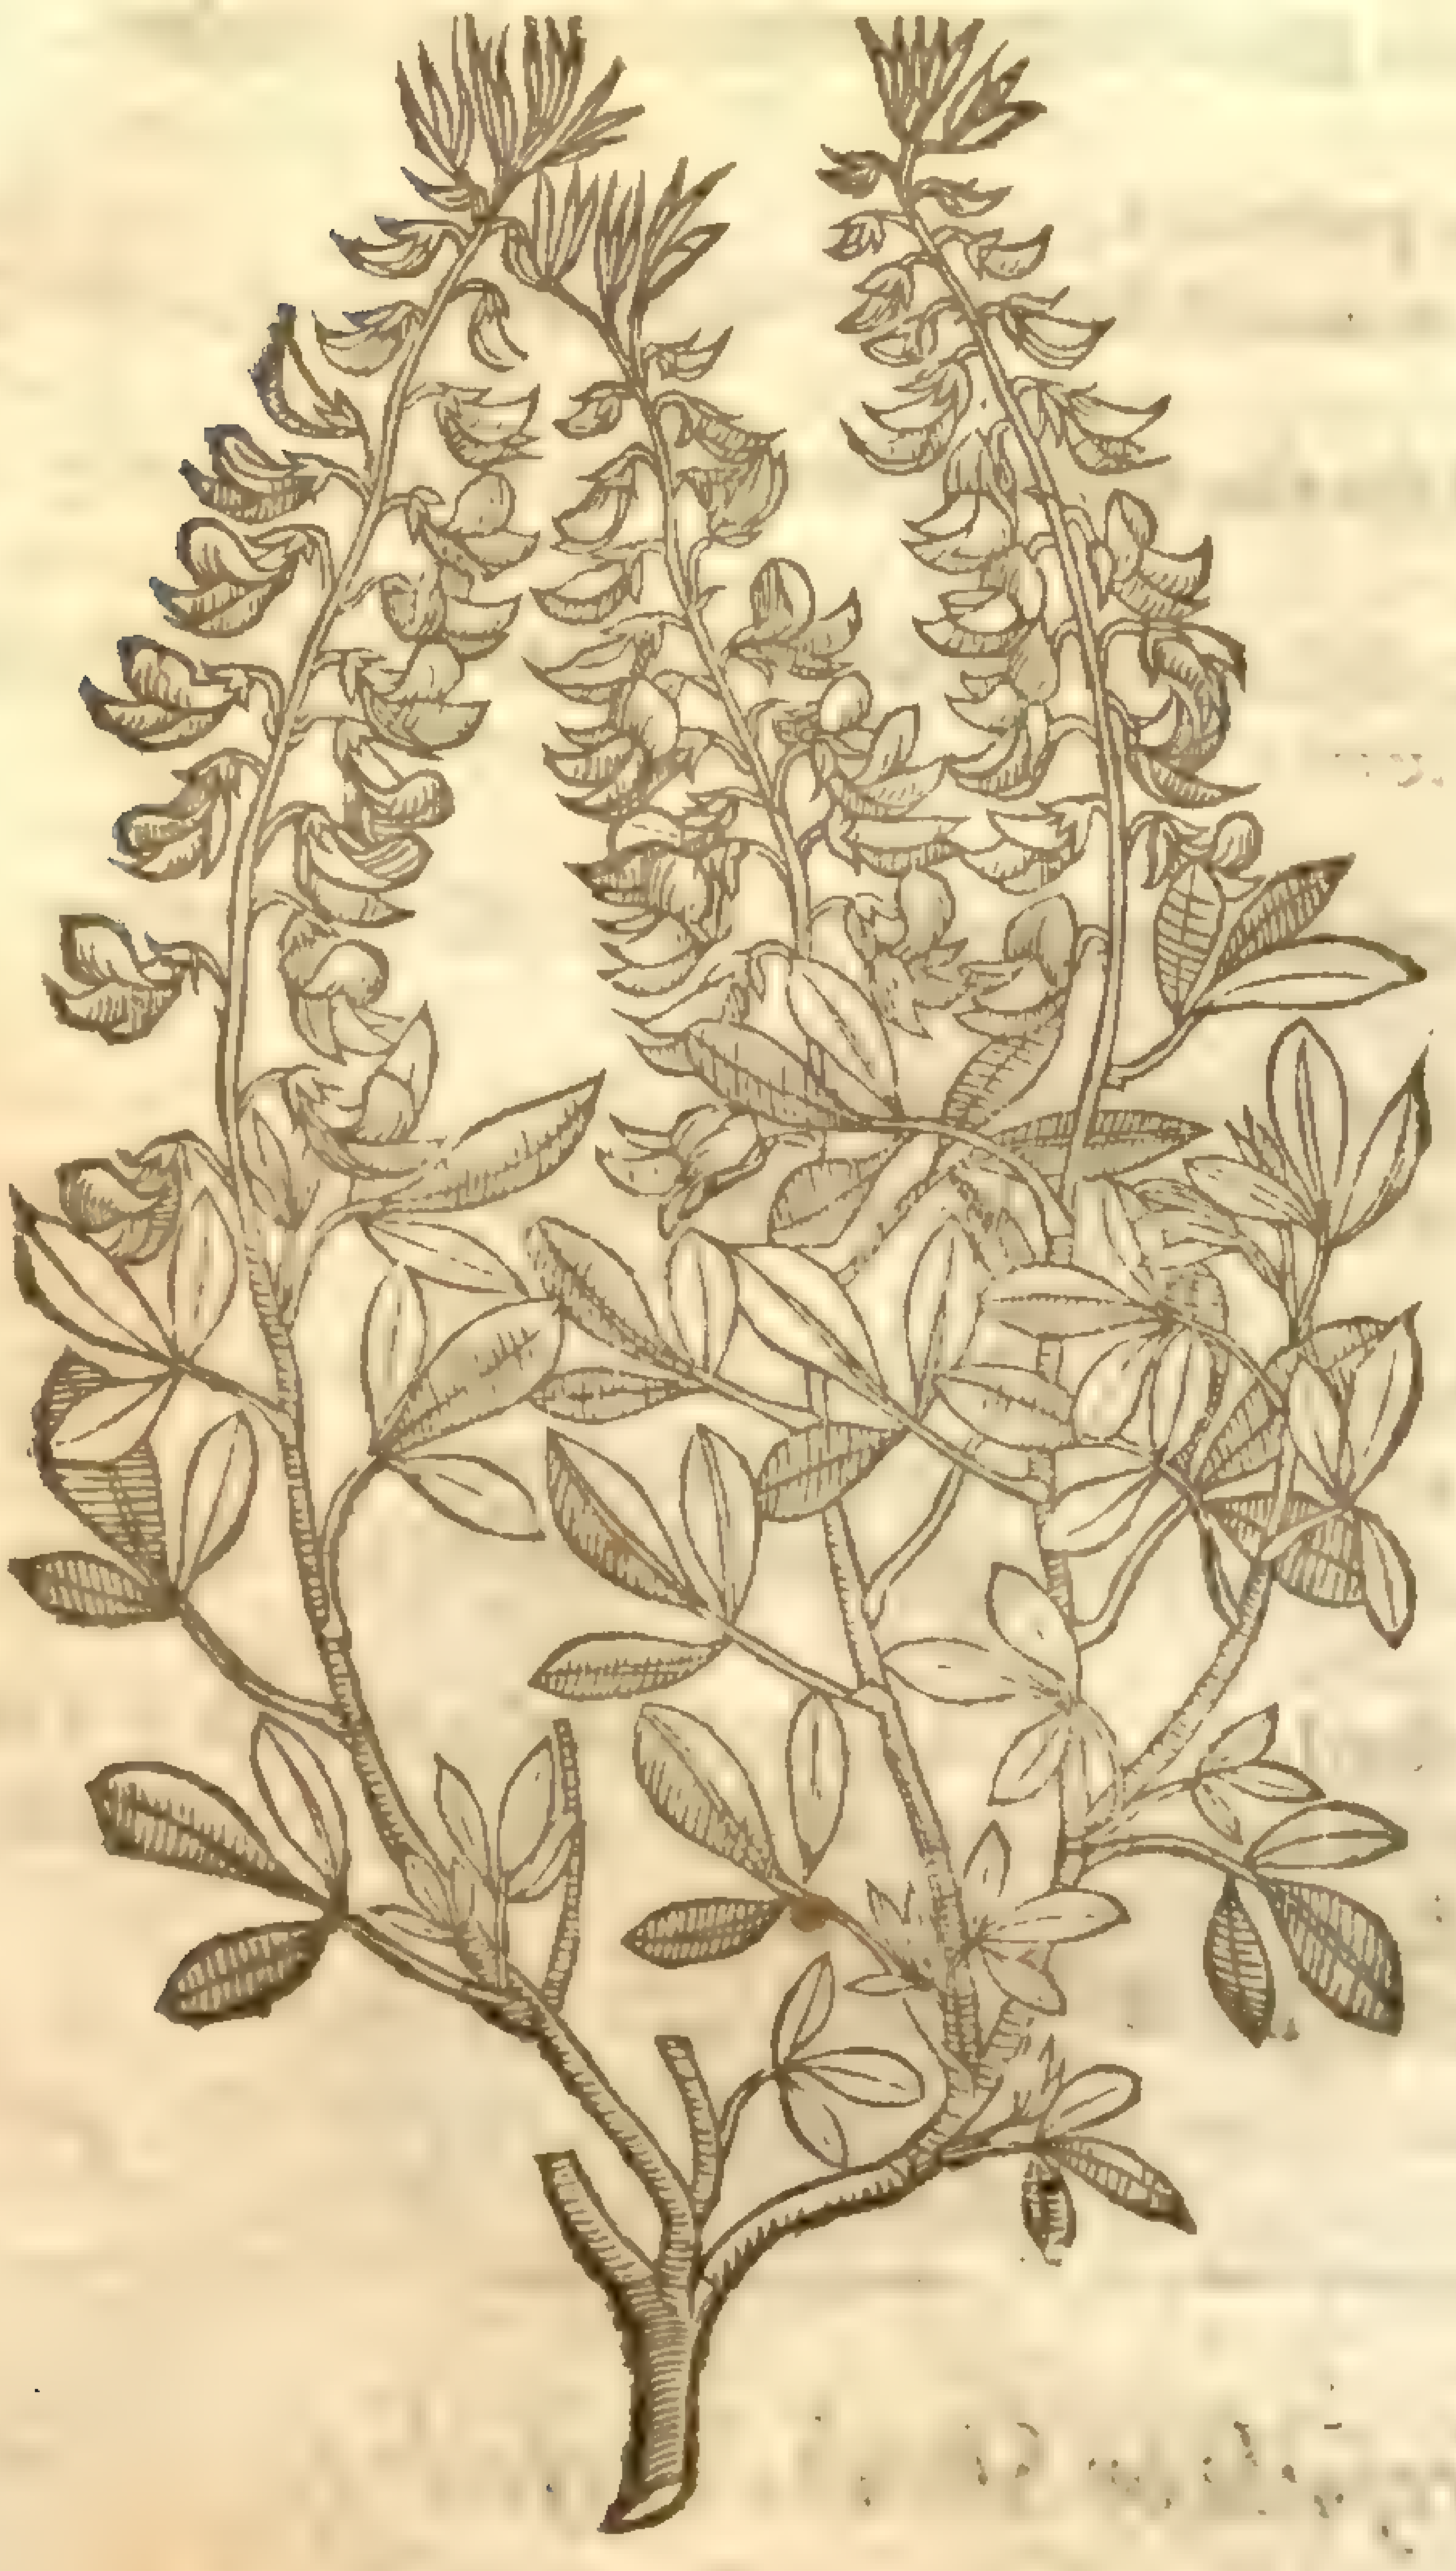
¶ *The Deſcription.*

† 1 THe firſt kinde of *Cytiſus* or ſhrubby Trefoile growes to the forme of a ſmall ſhrub or wooddy buſh two or three cubits high,branching into ſundry ſmall boughes or armes,ſet full of leaues like the ſmall Trefoile, darke greene, and not hairy, three growing alwaies together:among theſe come forth ſmal yellow flours like them of French broom, which do turn into long and flat cods,containing ſmall ſeed of a blackiſh colour.

2 The ſecond kinde of *Cytiſus* is likewiſe a ſmall ſhrub, in ſhape after the manner of the former,but that the whole plant is altogether ſmaller,and the leaues rounder,ſet together by couples, and the ſmall cods hairy at the ends,which ſets forth the difference. ‡ The leaues of this are almoſt round,and grow three together cloſe to the ſtalke : they are ſmooth,of a freſh greene, and the middlemoſt leafe of the three is the largeſt,and ends in a ſharp point : the flours are of the bignes and colour of the *Trifolium Corniculatum* : it flours in May. ‡

3 The root of this third kinde is ſingle,from whence ſpring vp many ſmooth brittle ſtalks diuided into many wings and branches,wheron grow green leaues ſmaller than thoſe of medow Trefoile : the flours are yellow,leſſer than Broom floures,otherwiſe very like,growing about the tops of the twiggy branches,diuided into ſpoky tufts ; which being vaded, there follow thin long narrow cods leſſer than thoſe of the Broome,wherin is contained ſmall blacke ſeed. The root is long, deeply growing into the ground, and ſometimes waxeth crooked in the earth. ‡ This alſo hath ſmooth green leaues,and differs little (if any thing at all) from the firſt deſcribed, wherefore I thought it needleſſe to giue a figure. Our Author called it *Cytiſus ſiliquoſus*, Codded ſhrub Trefoile,becauſe one of the branches was fairely in the figure expreſt with cods ; I know no other reaſon,for all the *Cytiſi* are codded as well as this. ‡

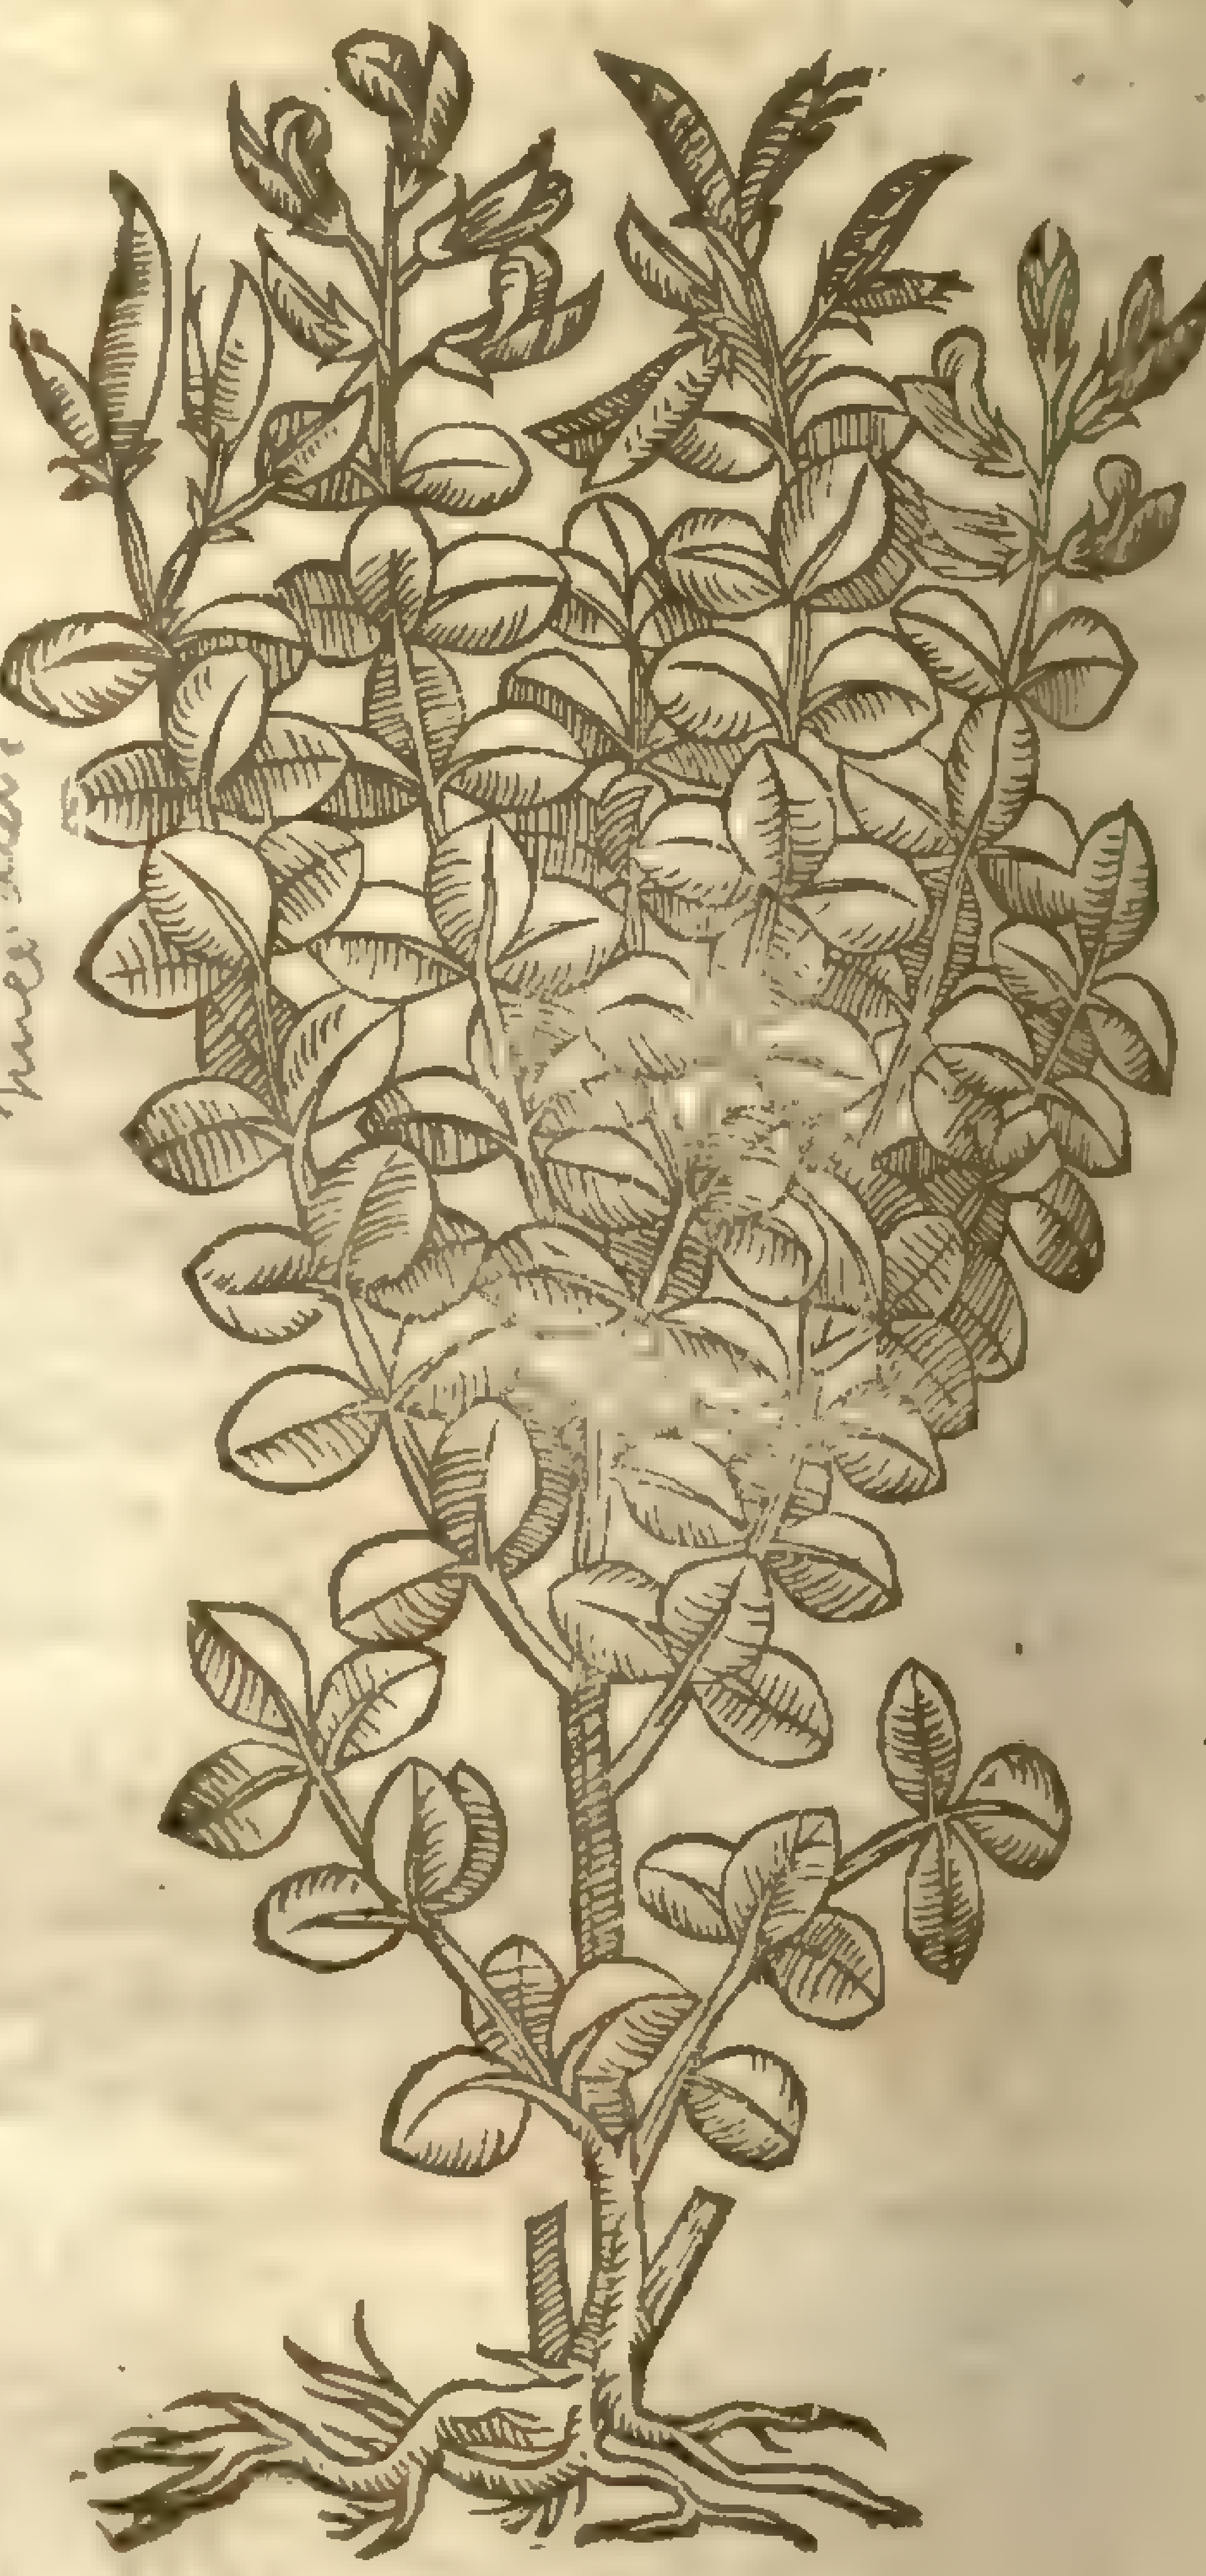
1 *Cytiſus.*
The firſt ſhrub Trefoile.



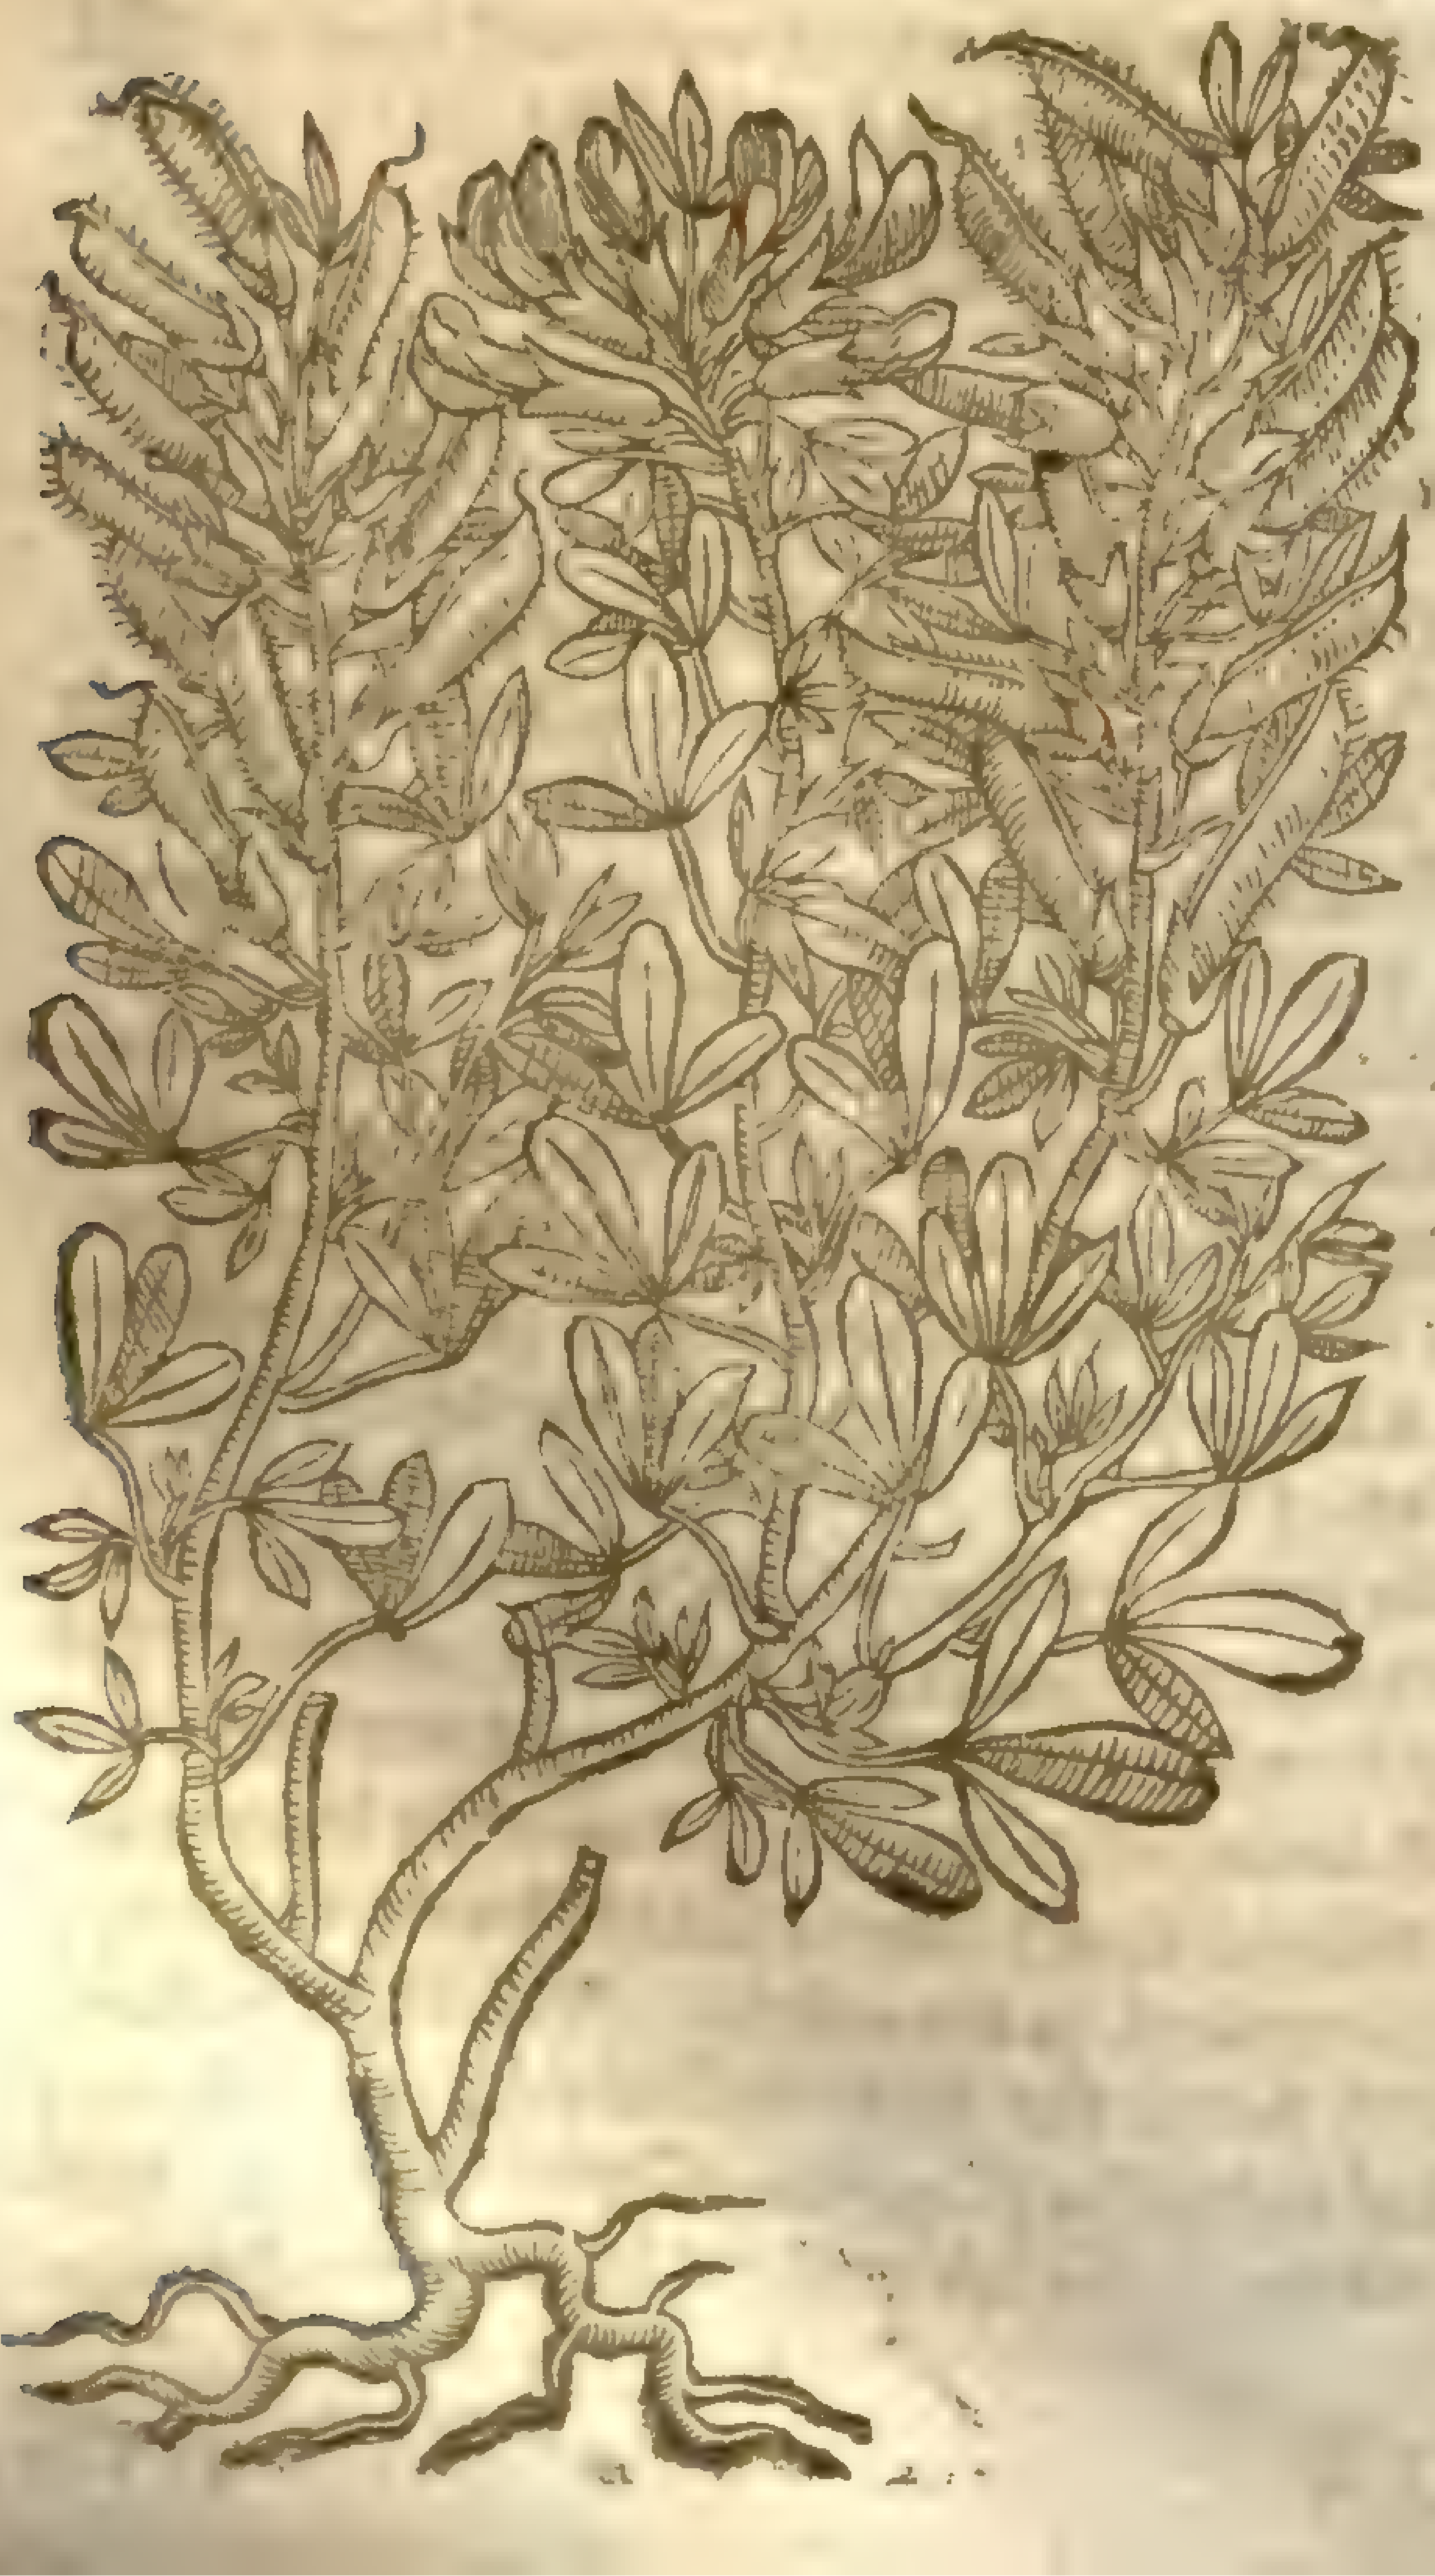
C. [illegible] L
Lob. ic. 550

2 *Cytiſus.*
The ſecond ſhrub Trefoile.

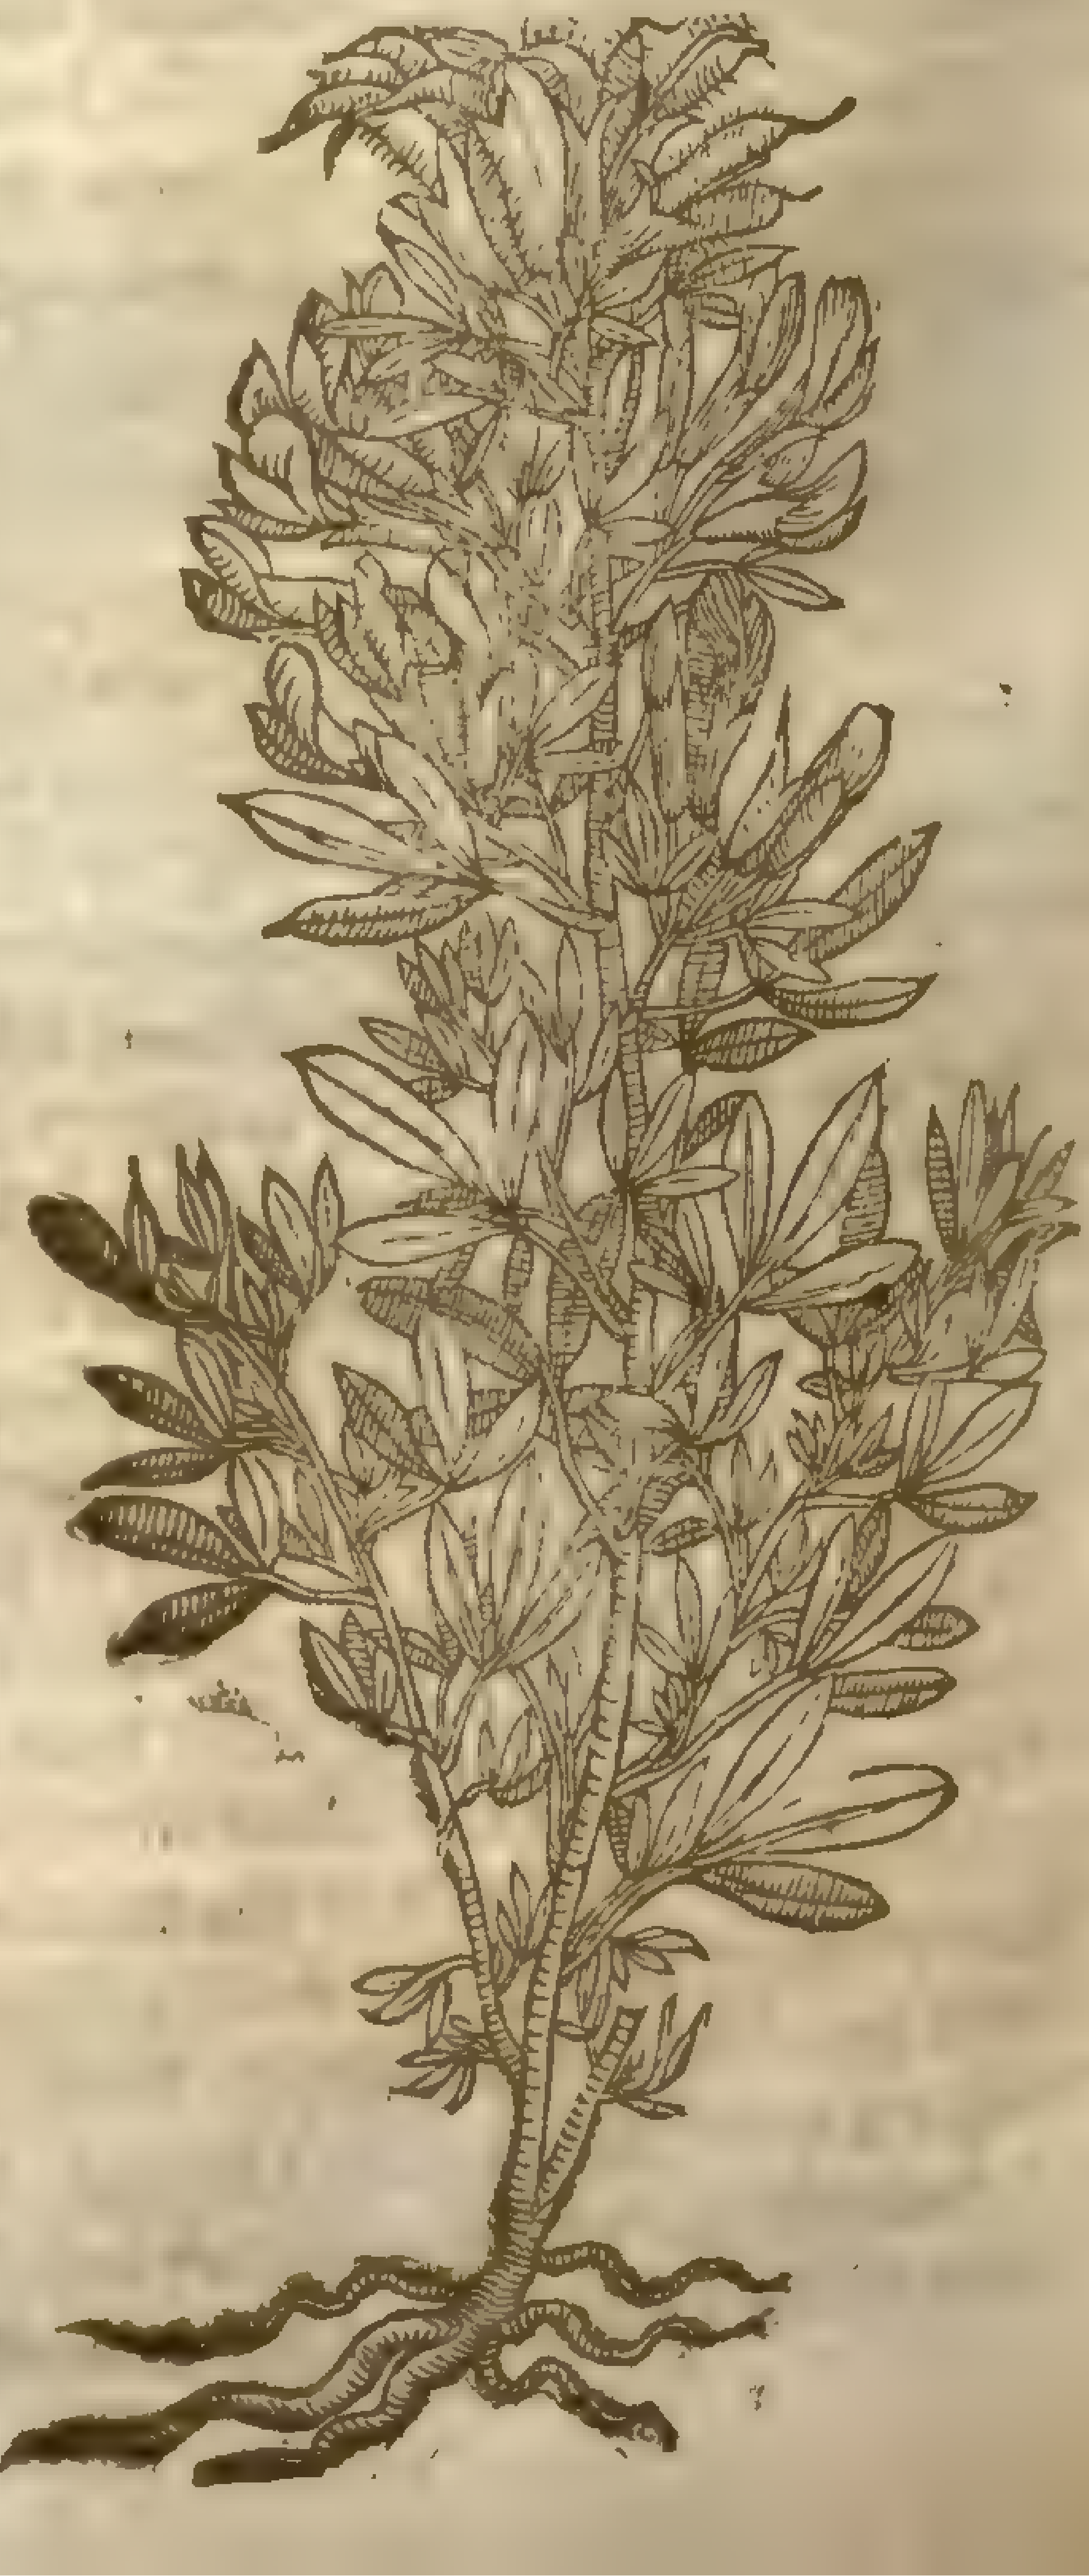
C. sessilifolius L
nec Lob.



4 *Cytiſus hirſutus.*
Hairy ſhrub Trefoile.



5 *Cytiſus incanus.*
Hoary ſhrub Trefoile.

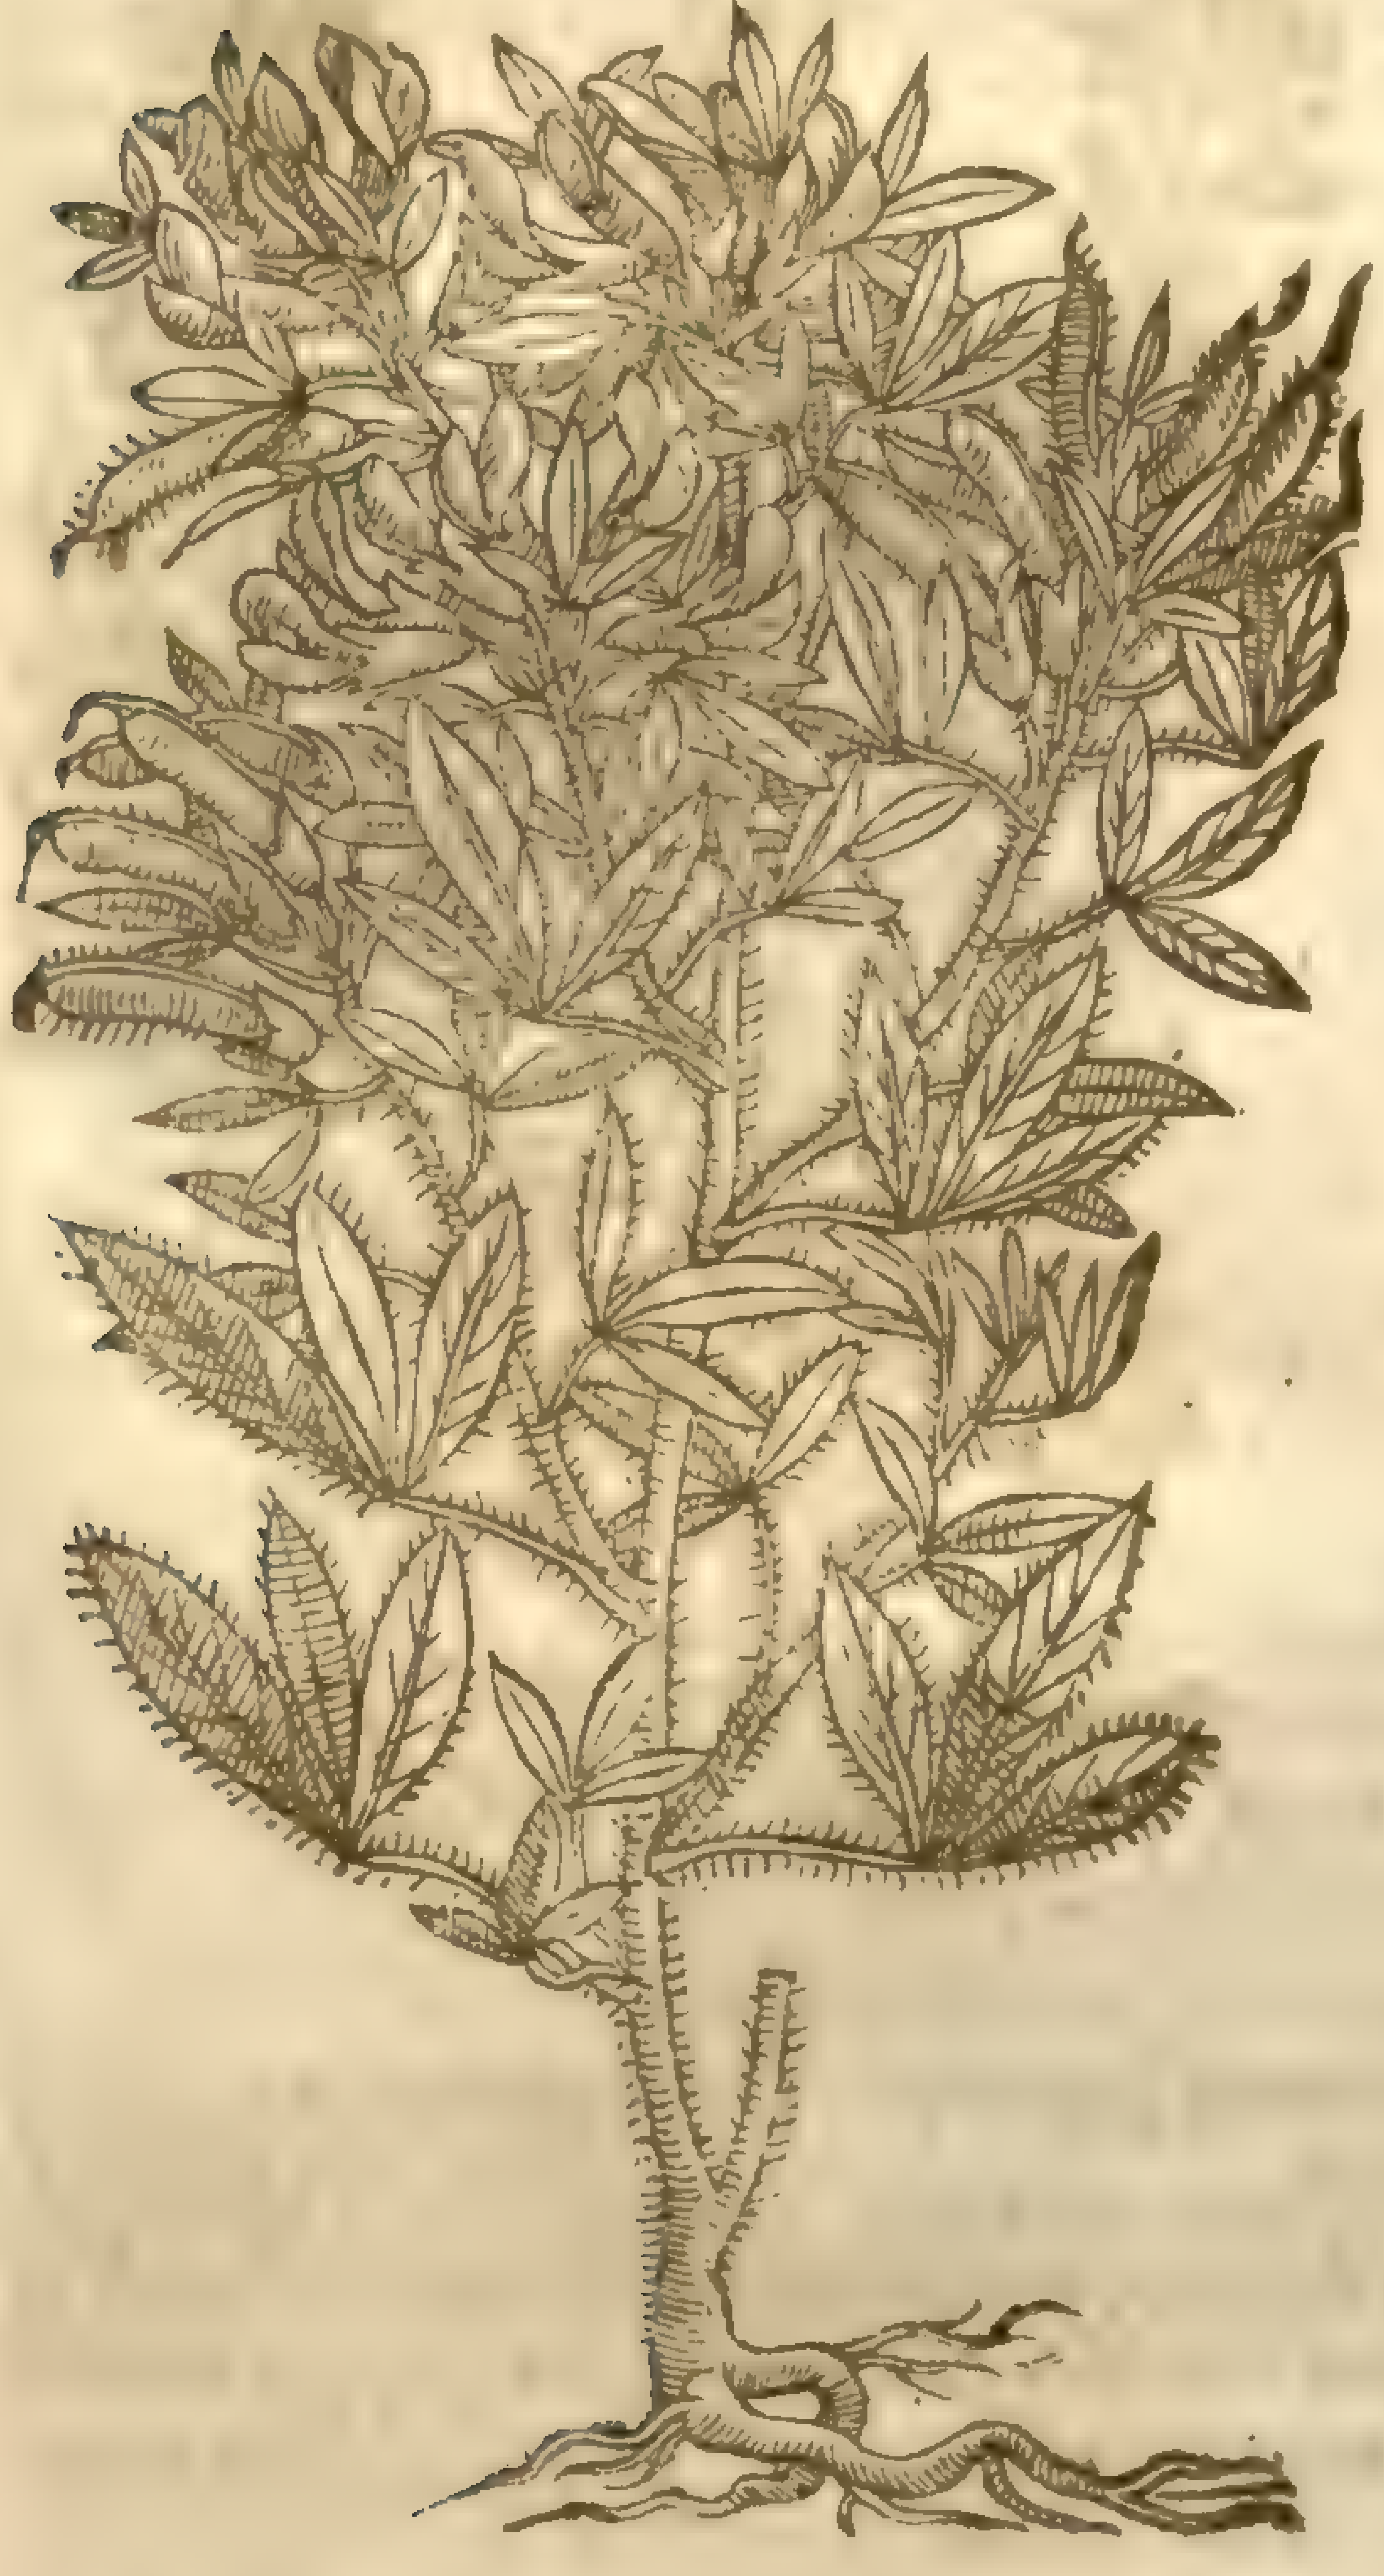


4 The fourth kinde of *Cytiſus* hath a great number of ſmall branches and ſtalkes like the former, but it is a low plant and more woolly; whoſe ſtalks and branches grow not very high, but yet very plentifully ſpred about the ſides of the plant: the leaues are greater than the former, but leſſer than thoſe of medow Trefoile: the floures grow cloſe together, as though they were bound vp or compact into one head or ſpoky tuft ſomewhat greater than the former: the cods are alſo greater, and more hairy: the root groweth very deep into the ground, whereunto are adjoined a few fibres: it falls out to be more hairy or woolly in one place than in another, and the more hairy and woolly that it is, the whiter it waxeth; for the roughneſſe bringeth it a certaine whitiſh colour. ‡ The branches of this oft times lie along vpon the ground: the leaues are ſmooth, green aboue, and hoary vnderneath: the floures yellow, which fading, ſomtimes become orange coloured. The cods are round, and ſeeds browniſh. ‡

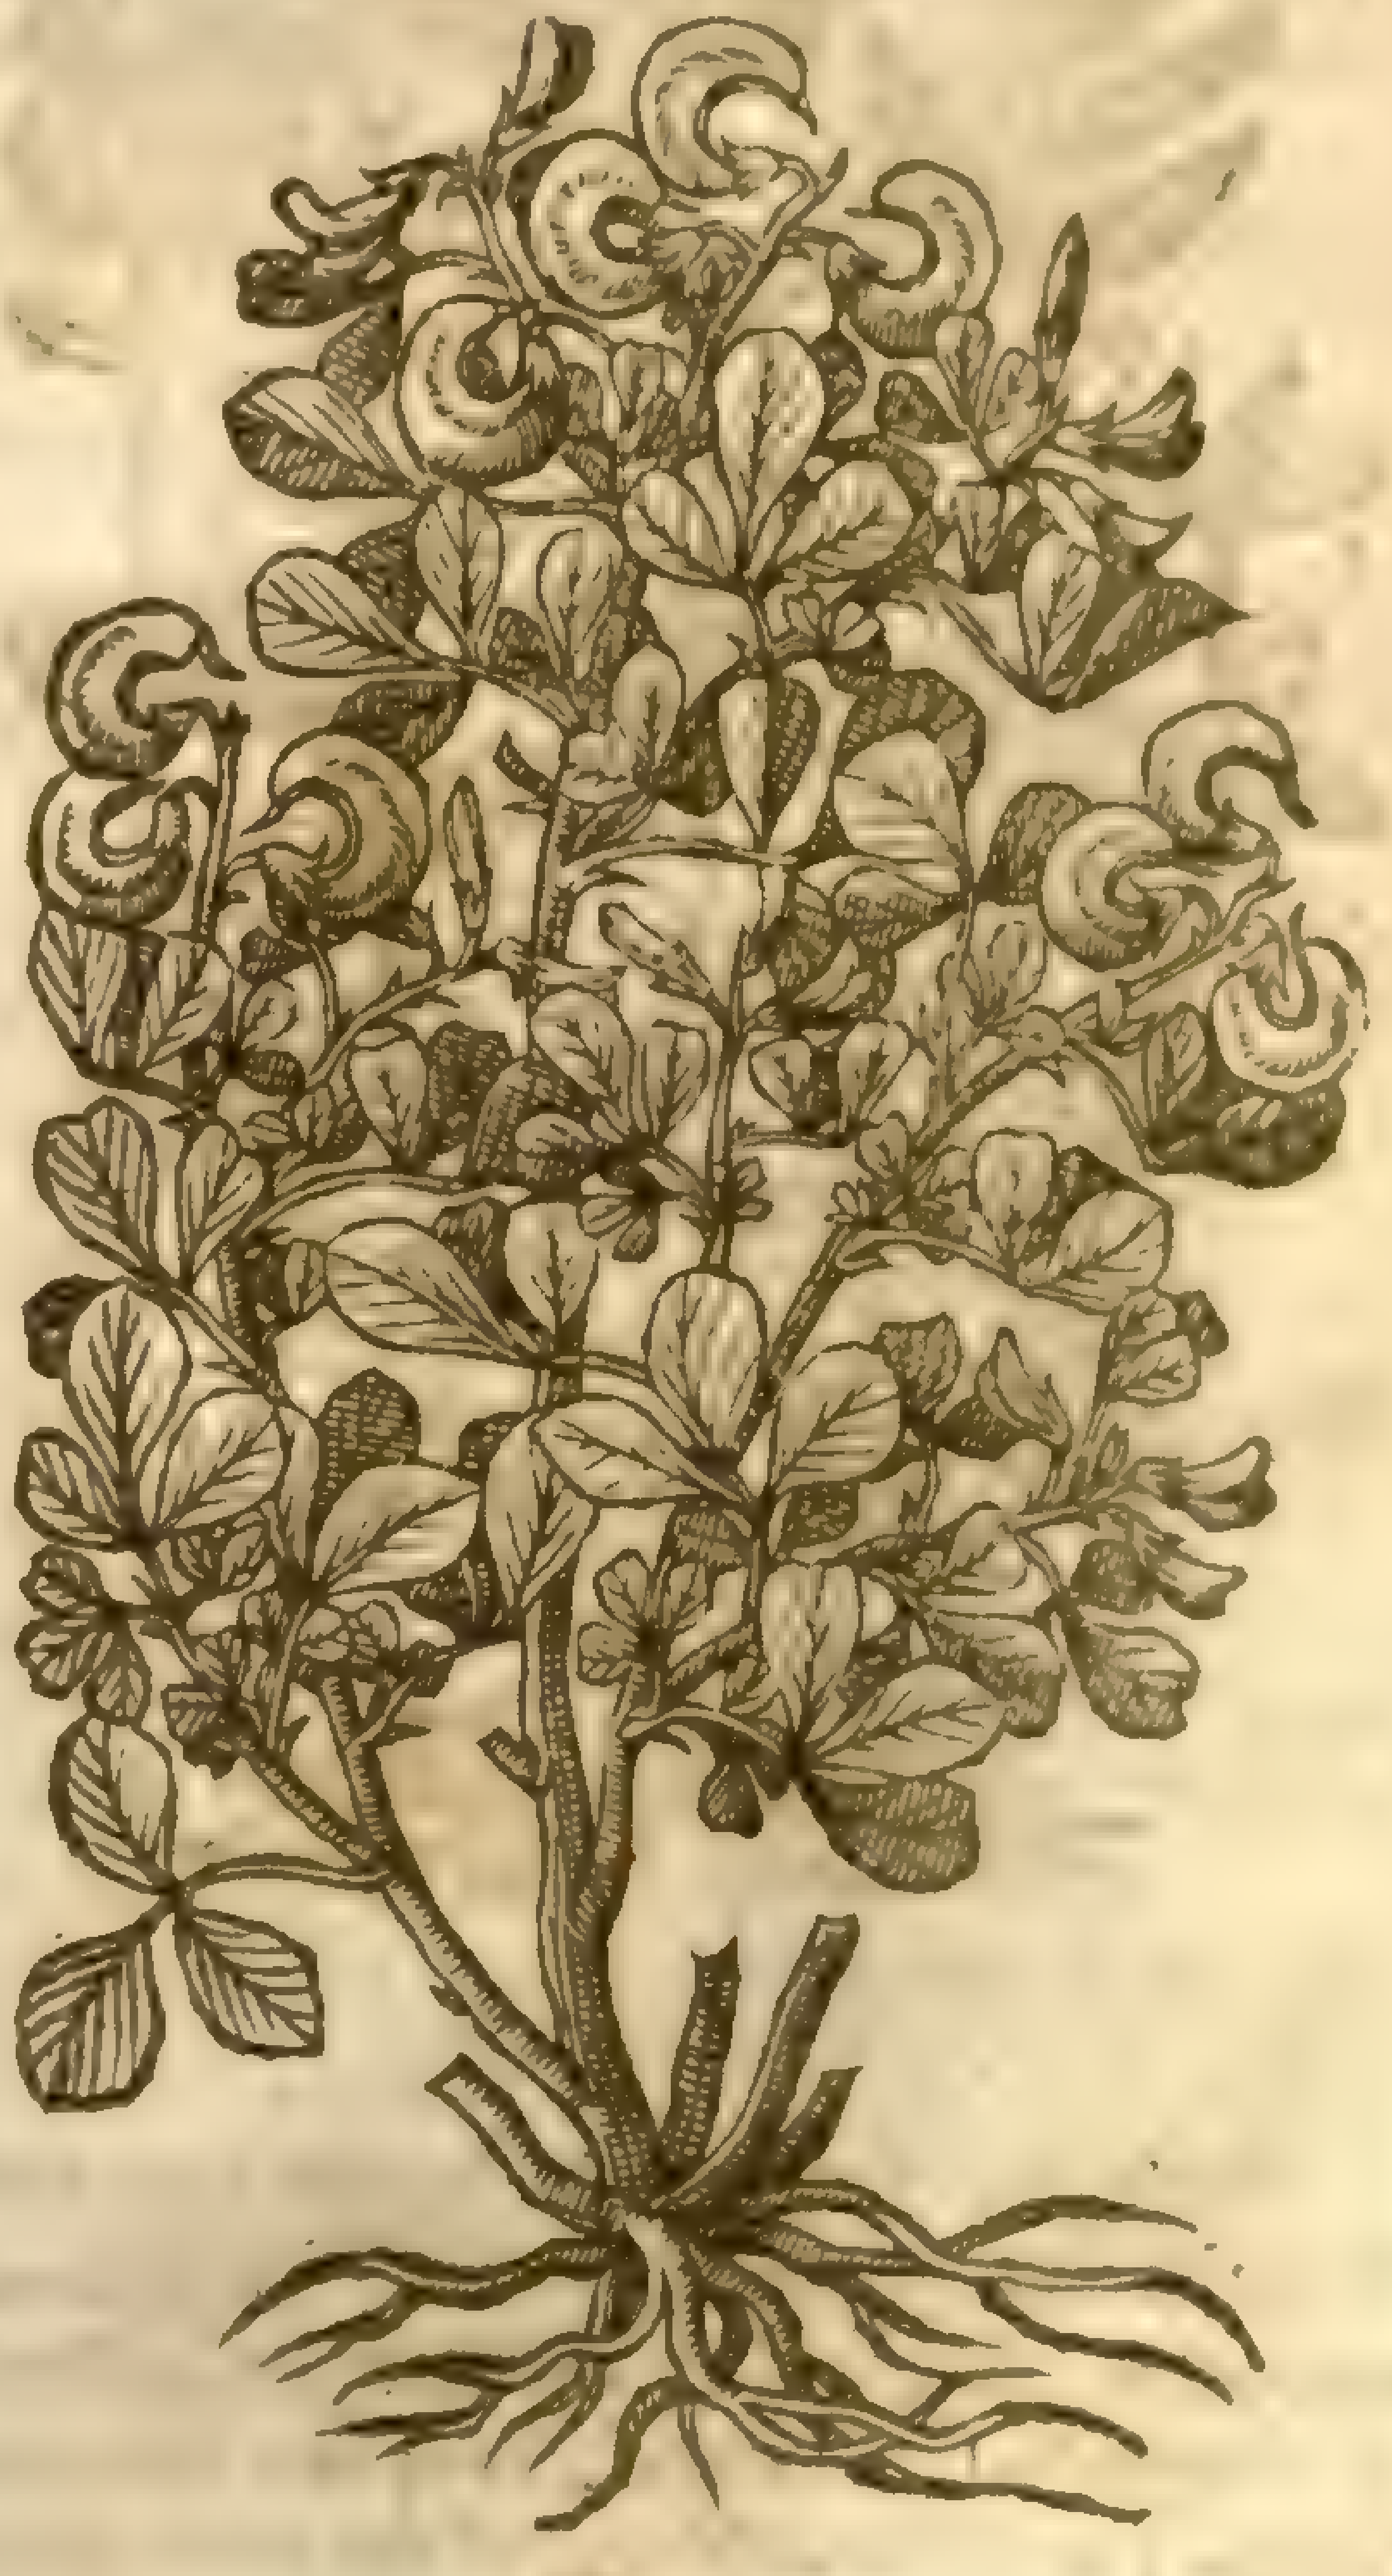
5 The fifth kinde of *Cytiſus* groweth to the height of a cubit or more, hauing many ſlender twiggy branches like Broom, ſtreaked, and very hard, whereupon grow leaues very like Fenugreek, yet all hoary, three together; from the boſom of which, or between the leaues and the ſtalks come forth yellow floures very like Broom, *Spartum*, or Peaſe, but ſmaller: the cods be like vnto Broome cods, of an aſh colour, but ſlenderer, rougher and flatter; in the ſeuerall cels or diuiſions whereof are contained bright ſhining ſeeds like the blacke ſeeds of Broome: all the whole plant is hoary like *Rhamnus* or *Halymus*.

medicago arborea [illegible]

6 *Cytiſus pinnatus.*
Winged ſhrub Trefoile.



7 *Cytiſus 7. cornutus.*
The horned ſhrub Trefoile.



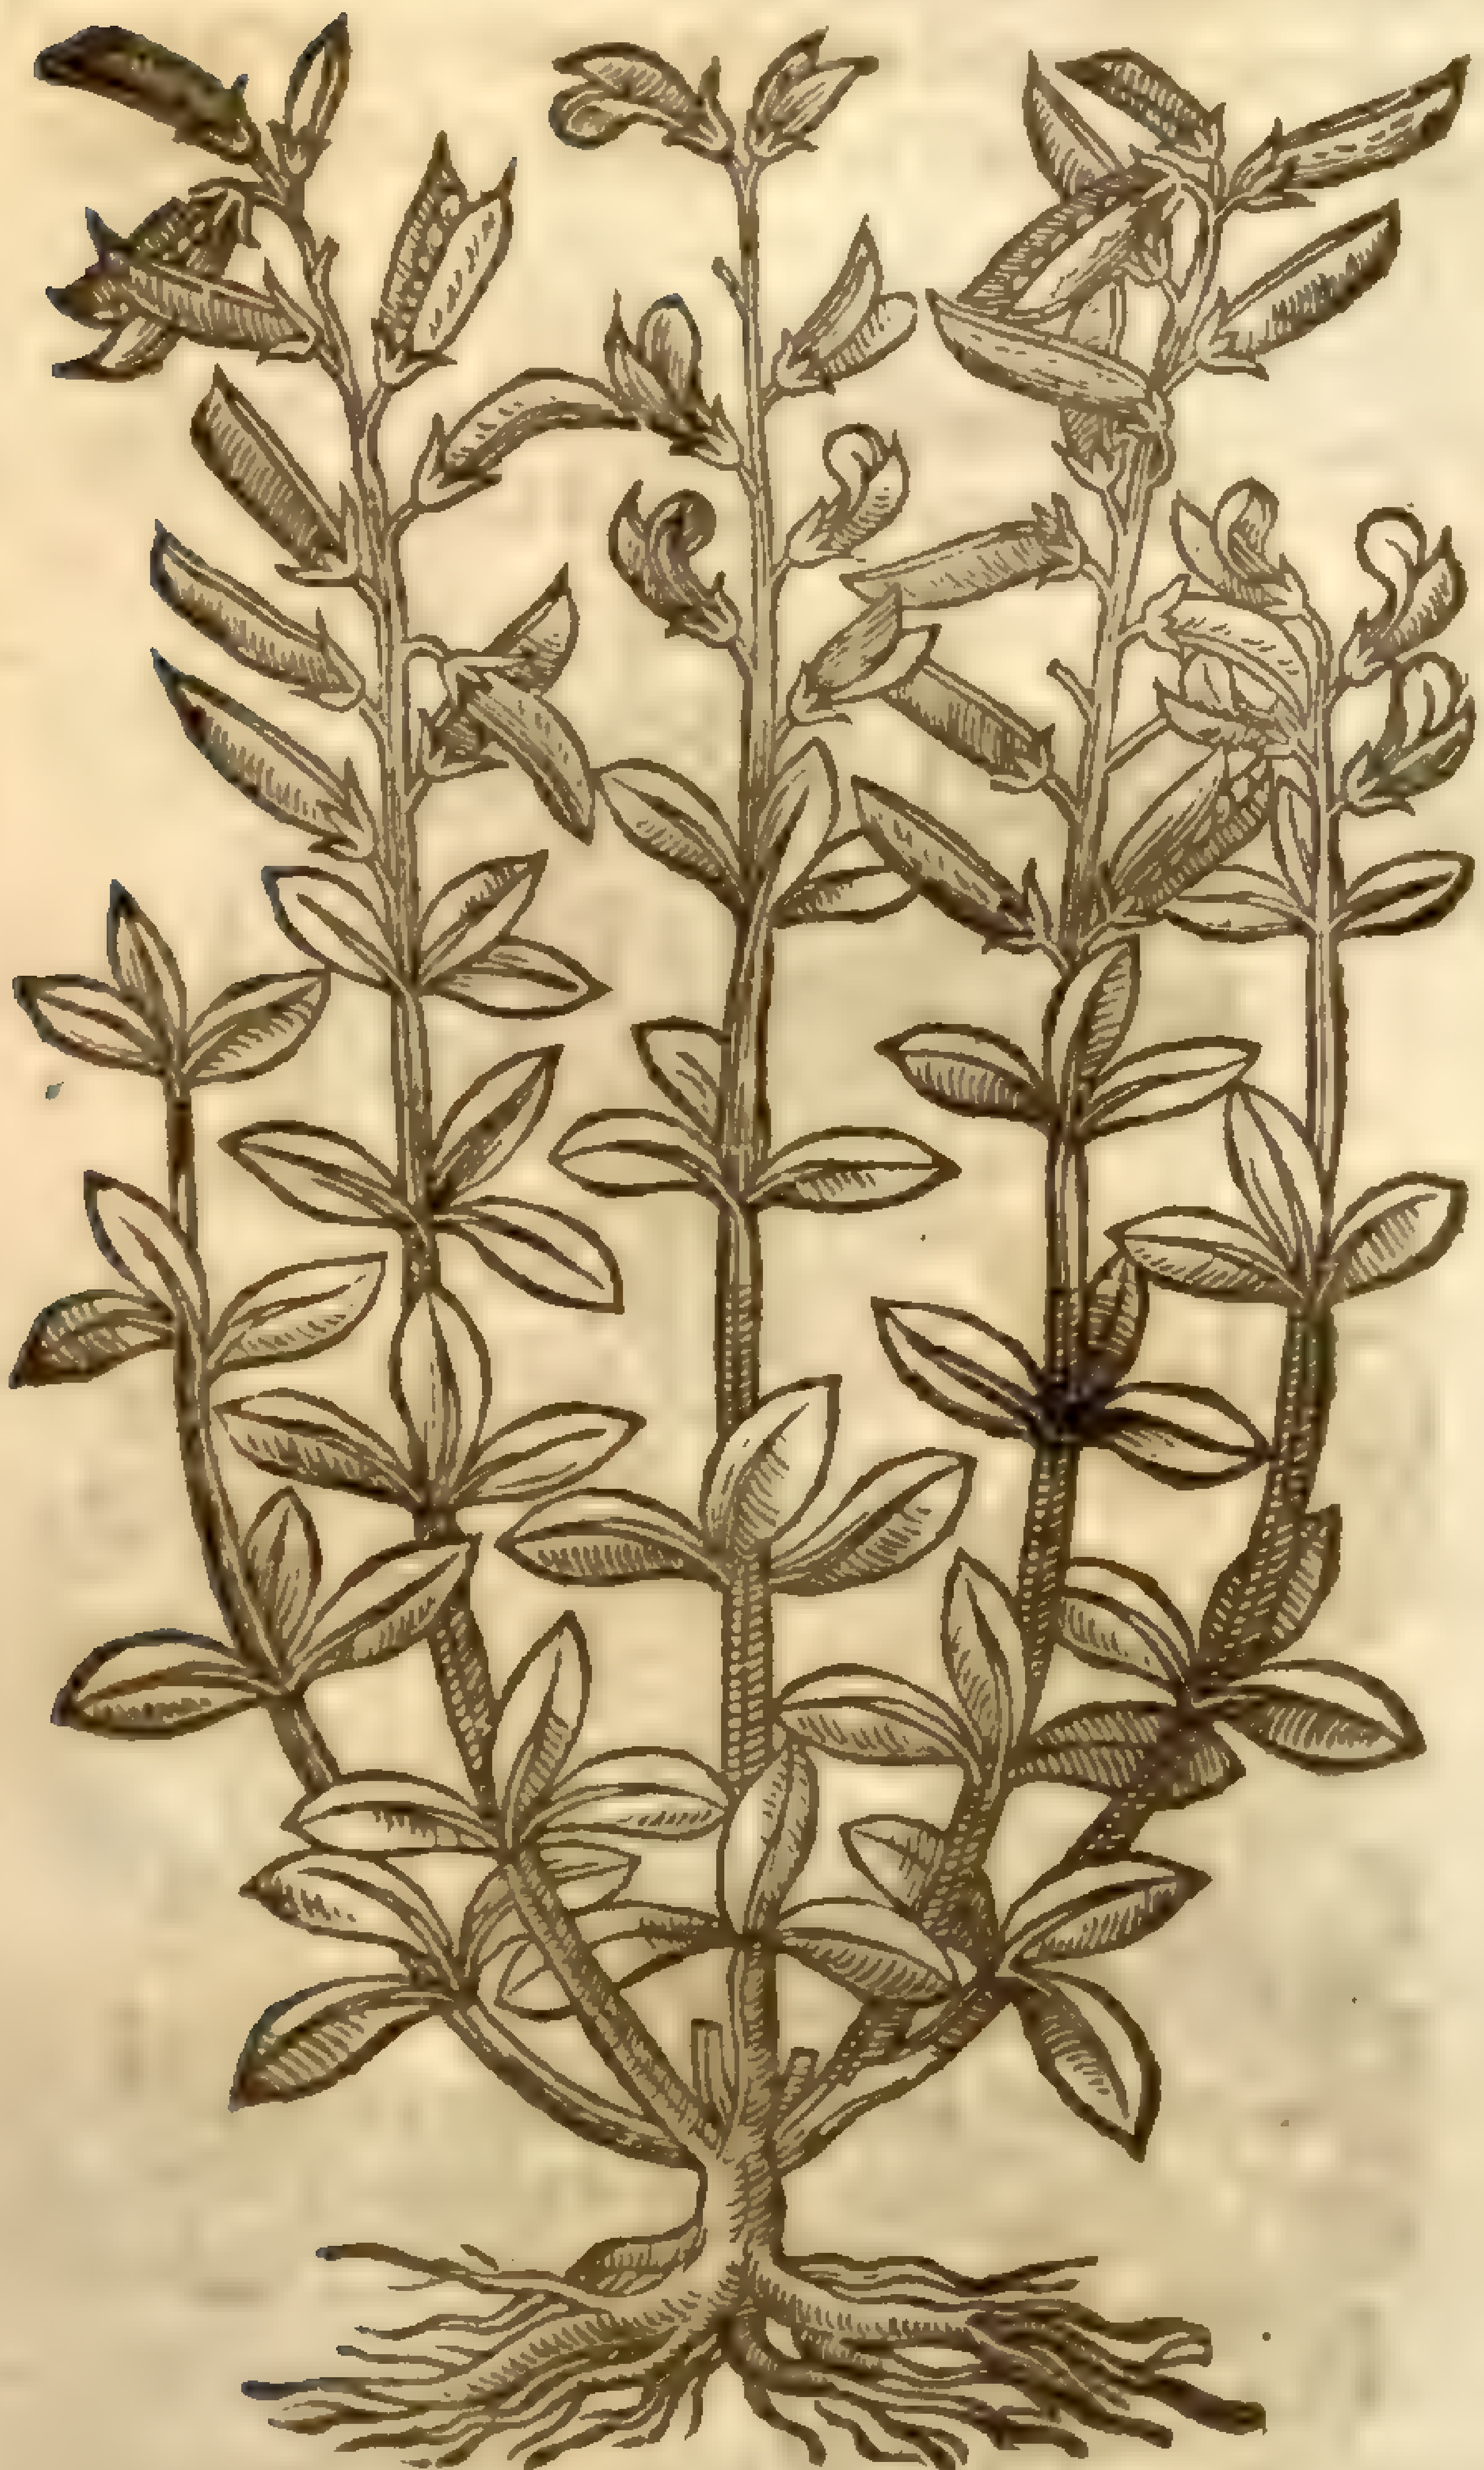
6 The ſixt kind of *Cytiſus* or buſh Trefoile growes to the height of a tall man, with long ſtalks couered ouer with a blackiſh barke, and a few boughes or branches beſet or garniſhed with leaues like the common Trefoile, but ſmaller, growing alſo three together, wherof the middlemoſt of the three leaues is twice as long as the two ſide leaues; the vpper ſide whereof is greene, and the lower ſide ſomwhat reddiſh and hairy: the floures grow along the ſtalks almoſt from the bottom to the top, of a golden yellow colour, faſhioned like the Broom floure, but greater than any of the reſt of his kinde, and of a reaſonable good ſauor: the ſeed hath the pulſie taſte of *Cicer*.

7 The ſeuenth kinde of *Cytiſus* hath many tough and hairy branches riſing from a wooddie root foure or fiue cubits high; which are diuided into ſundry ſmaller branches, beſet with leaues like the medow Trefoiles; amongſt which come forth yellow floures like Broome, that turne into

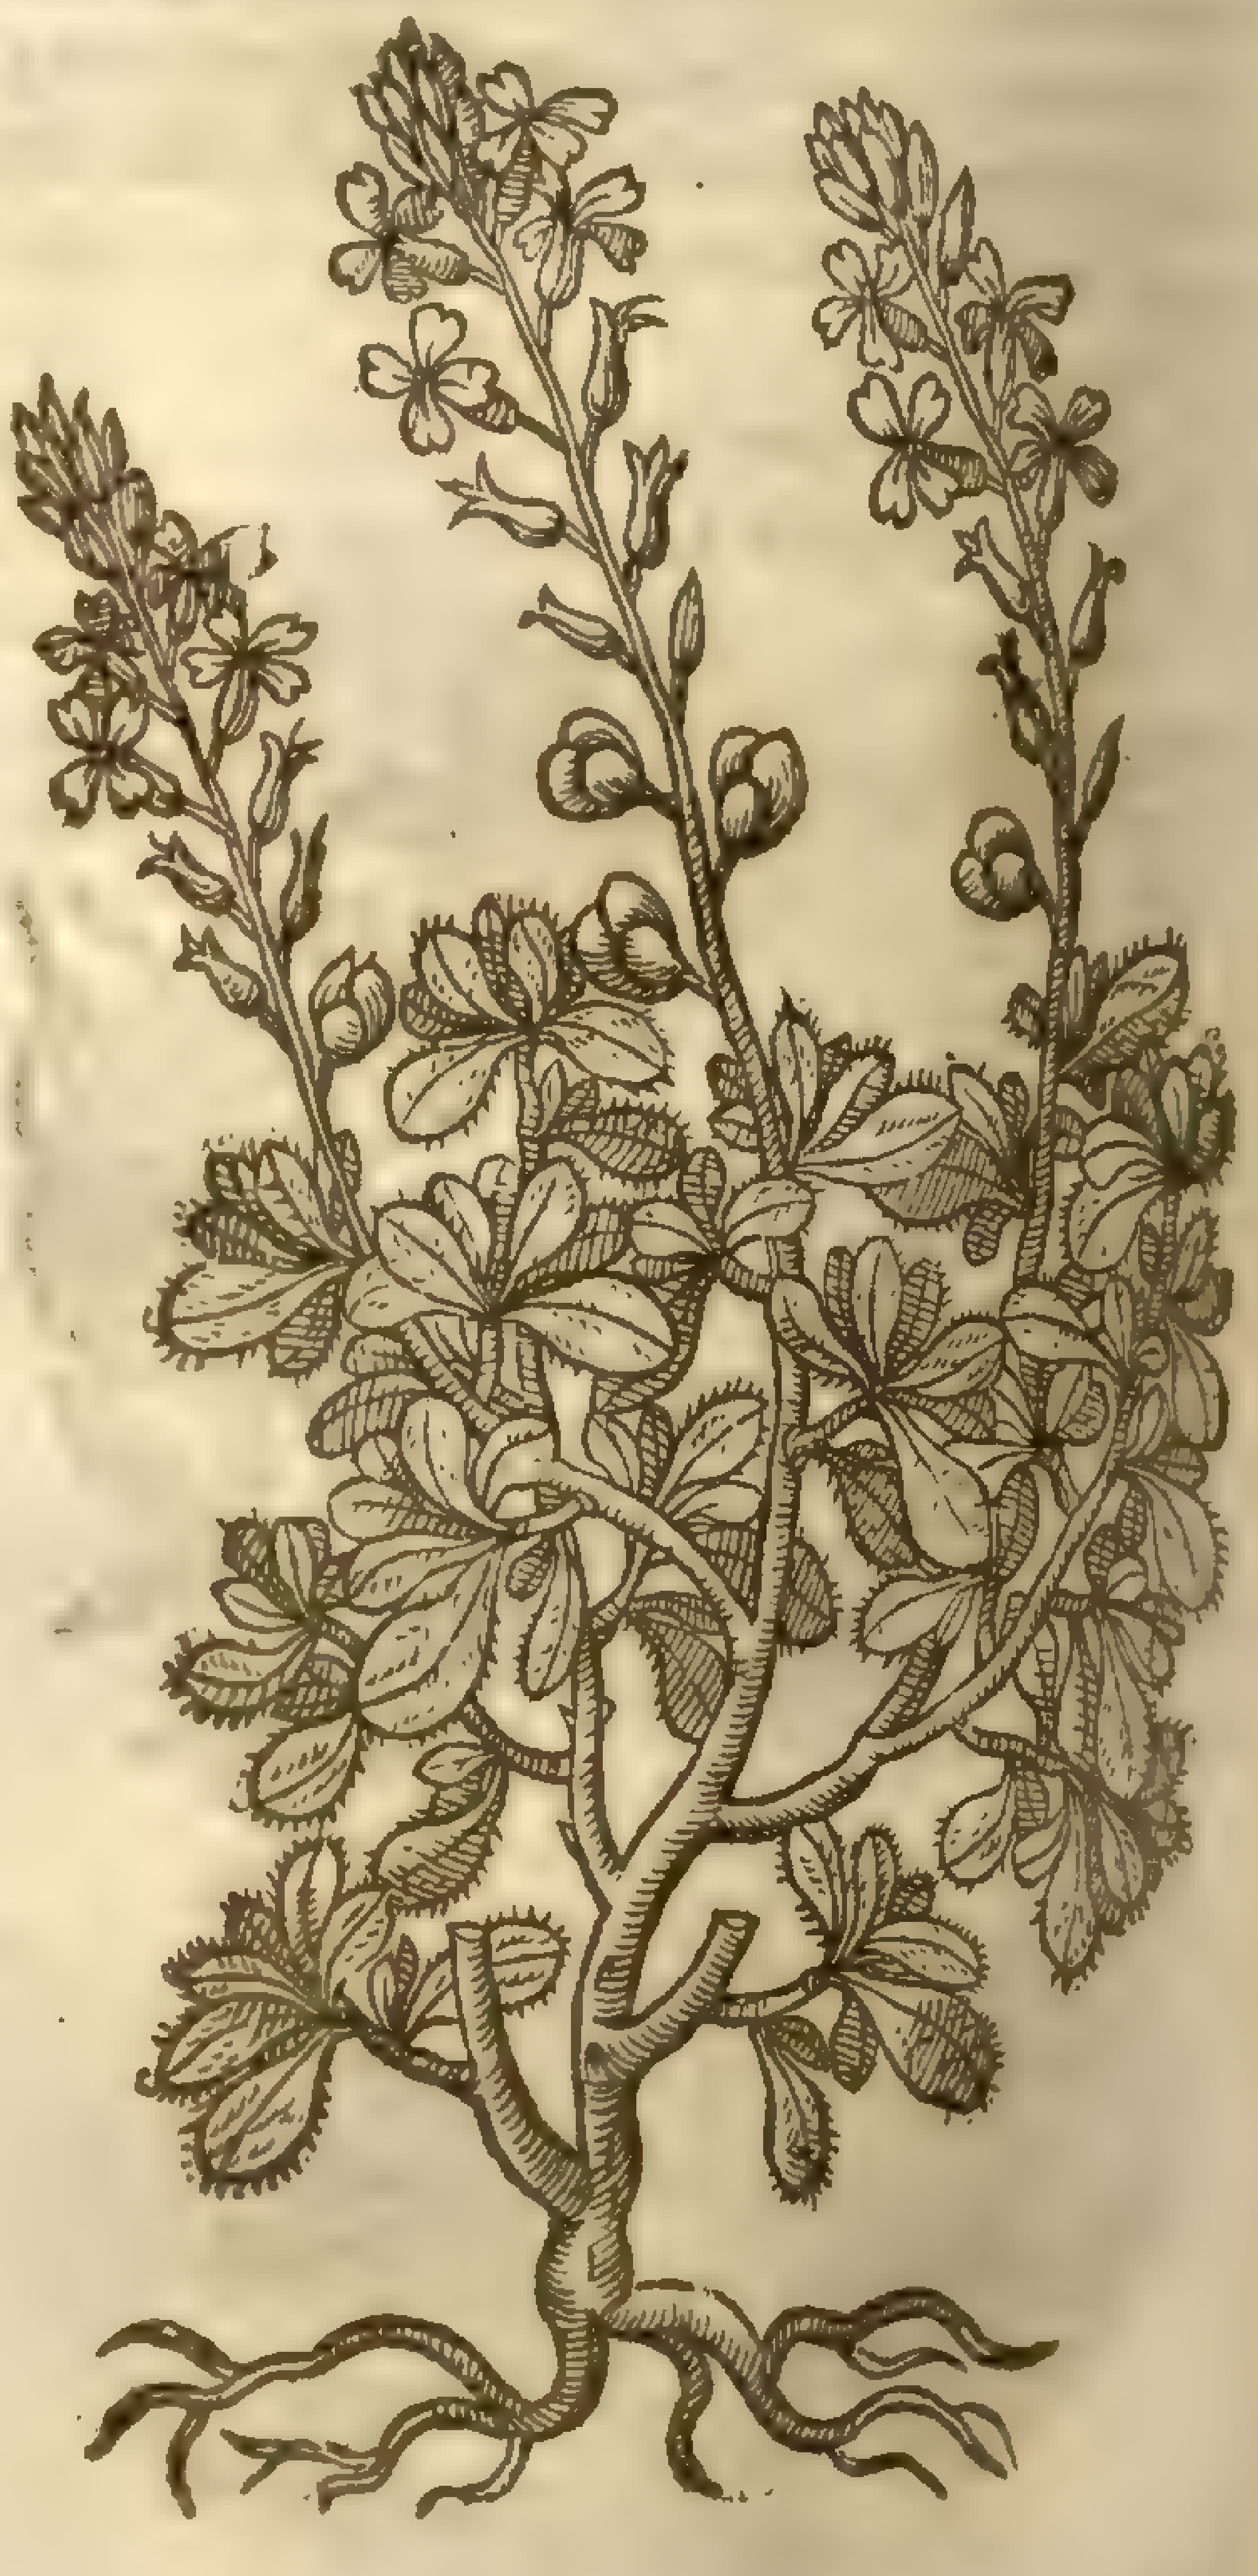
crooked flat cods like a ſickle, wherein is contained the ſeed taſting like *Cicer* or *Legumen*. The whole plant is hoary like *Rhamnus*, and being broken or bruiſed ſmelleth like Rocket.

8 This eighth kinde of *Cytiſus* which *Pena* ſetteth forth is doubtleſſe another kinde of *Cytiſus*, reſembling the former in leaues, floures, and cods, ſauing that the ſmall leaues (which are alwayes three together) are a little ſnipt about the edges: the whole plant is ſlenderer, ſofter, and greener, rather reſembling an herb than a ſhrub: the root is ſmall and ſingle.

9 This baſtard or miſ-begotten ſhrub Trefoile, or baſtard *Cytiſus* groweth vp like a ſhrub, but not of a wooddy ſubſtance, hauing tender ſtalks ſmooth and plain, whereon grow hairy leaues like the other, diuers ſet vpon one foot-ſtalke, contrarie to all the reſt: the floures grow along the ſtems like thoſe of the ſtock Gillofloures, of a yellow colour: the root is tough and wooddy.



8 *Cytiſus* 8.
The eighth ſhrub Trefoile.



9 *Cytiſus adulterinus, ſiue Alyſſon fruticans.*
Baſtard ſhrub Trefoile.

¶ *The Place.*

Theſe plants were firſt brought into Italy and Greece from one of the Iſles of Cyclades, called Cyntho or Cynthuſa, and ſince found in many places of France, as about Montpelier, Veganium, and other places: they are ſtrangers in England, though they grow very plentifully in Scotland, as it is reported; whereof I haue two ſorts in my garden, that is to ſay, *Cytiſus marantha*, or the horned *Cytiſus*; and likewiſe one of the ſmalleſt, that is to ſay, the third in number. ‡ The ſecond groweth in the garden of Mr *Iohn Tradeſcant*. ‡

¶ *The Time.*

Theſe plants floure for the moſt part in May, Iune, and Iuly, and ſome after: the ſeed is ripe in September.

¶ *The Names.*

The Grecians and Latines do call this ſhrub κύτισος, of Cynthuſa an Iſland before mentioned, in which place they are in great eſtimation, for that they do ſo wonderfully feed cattell, and encreaſe milke in their dugs, nouriſh ſheep and goats which bring young ones good for ſtore and increaſe. Our Author doth call theſe plants in Greeke κύθηλον, that is to ſay in Latine, *Fœcundum fœnum*, fertil or fruitfull Hay, for that the kindes hereof cauſe milke to encreaſe, maketh good bloud and juice, augmenteth ſtrength, and multiplieth the naturall ſeed of generation: they may be called in Engliſh, milke Trefoile, of the ſtore of milke which they increaſe.

¶ *Th*

¶ *The Temperature.*

The leaues of milke Trefoile do coole, as *Dioſcorides* writeth: they aſſwage ſwellings in the beginning, if they be ſtamped and laid vnto them with bread: the decoction thereof drunke prouoketh vrine. *Galen* teacheth, That the leaues of milke Trefoile haue a digeſting or waſting quality, mixed with a waterie and temperat facultie, as haue thoſe of the Mallow.

¶ *The Vertues.*

Women, ſaith *Columella*, if they want milke, muſt ſteepe dry milke Trefoile in faire water, and when it is throughly ſoked, they muſt the next day mix a quart or thereabouts of the ſame preſſed or ſtrained forth with a little Wine, and ſo let it be giuen vnto them to drinke, and by that meanes they themſelues ſhall receiue ſtrength, and their children comfort by aboundance of milke. A

Hippocrates reckons vp milke Trefoile among thoſe things that encreaſe milke, in his book of the nature of women and womens diſeaſes. B

Alſo *Ariſtomachus* of Athens in *Pliny* commandeth to giue with wine the dry plant, and the ſame likewiſe boiled in water, to nurſes to drinke when their milke is gon. C

Democritus and *Ariſtomachus* do promiſe that you ſhall want no Bees, if you haue milke Trefoile for them to feed on: for all writers with one conſent do conclude (as *Galen* ſaith) that Bees gather of the floures of Milke Trefoile very great ſtore of hony. D

Columella teacheth, That milk Trefoile is notable good for Hens, Bees, Goats, Kine, and all kind of cattel, which quickly grow fat by eating thereof; and that it yeeldeth very great ſtore of milk. E

The people of Betica and Valentia, where there is great ſtore of *Cytiſus*, doe vſe it very much for the Silke-wormes to hang their web vpon after they haue been well fed with the leaues of Mulberries. F

Milke Trefoile is likewiſe a maruellous remedie againſt the Sciatica and all other kindes of Gouts. G

† The deſcription that formerly was in the firſt place belonged to that deſcribed and figured in the ſeuenth.

Chap. 14. *Of Baſtard milke Trefoiles.*

¶ *The Deſcription.*

1 This riſeth vp with little ſtalks from the root, brittle, very many in number, parted into wings & branches, about which grow many leaues leſſer than thoſe of the medow Trefoile, of colour green: the floures about the tops of the twigs be orderly placed in manner like eares, of colour yellow, leſſer than thoſe of Broom, otherwiſe all alike: in their places grow vp ſlender cods, long, narrow, and leſſer than the cods of Broom, rough alſo and hairy; in which do lie little blackiſh ſeeds: the root is long, and groweth deepe, and oftentimes creepeth aſlope.

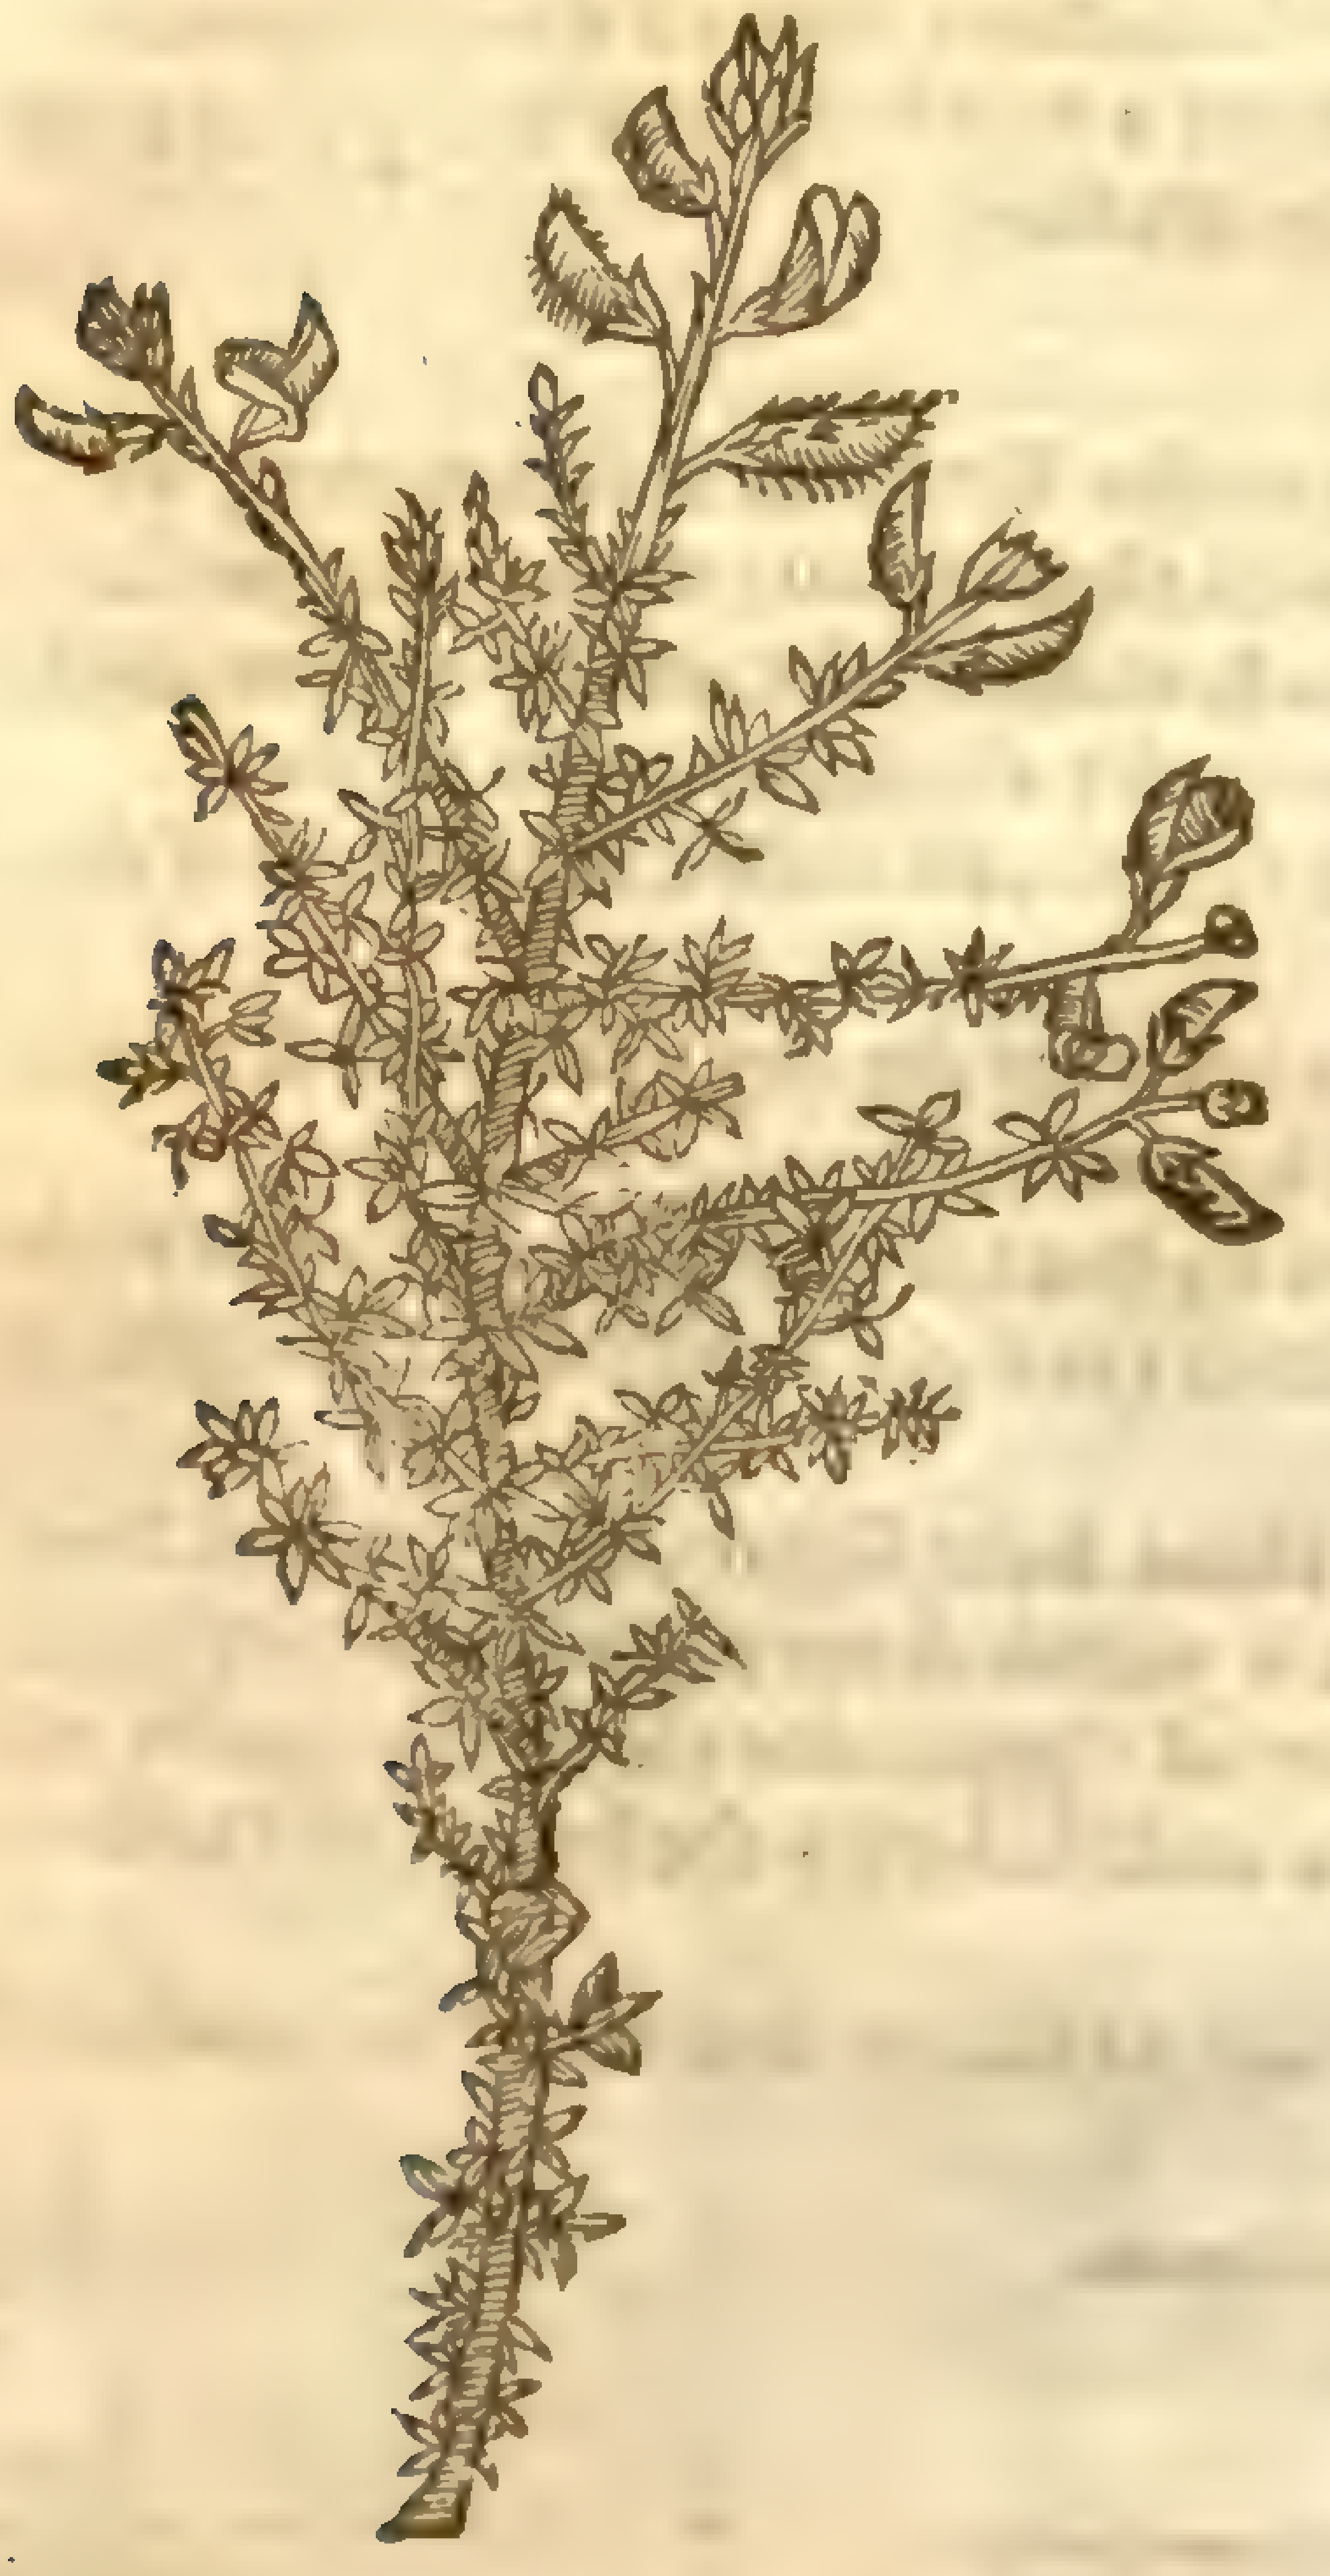
2 The ſecond kinde of baſtard milke Trefoile is like vnto the former in plentifull ſtalks and twigs, but that it is lower and more downy, neither doe the ſtalks thereof ſtand vpright, but rather incline to the one ſide: the leaues alſo are ſomwhat greater, but yet leſſer than thoſe of the medow Trefoile, wholly white, and they neuer open themſelues out, but keep alwaies folded, with the middle rib ſtanding out: the flours likewiſe be cloſelier joined together, and compacted as it were into a little head, and be alſo ſomething greater: the cods in like manner are a little bigger and hairy, and of a blackiſh purple or murrey: the root groweth deep in the ground, being diuided into a few ſprigs: it oftentimes hapneth to grow in one place more hairy or downy than in another; the more hairy and downy it is, the more white and hoary it is, for the hairineſſe doth alſo bring with it a certain whitiſh colour.

3 The third kinde of baſtard milke Trefoile brings forth a company of yong ſhoots that are ſomwhat writhed and crooked, long leaues of a faire green colour: the floures are cloſed together, long, white, or elſe galbineous, ſweetly ſmelling, that is to ſay, hauing the ſmell of hony: the ſhrub it ſelfe is alwaies green both Summer and Winter. ‡ This growes ſome foot or better high, *with* ſlender hoary branches, ſet with leaues three ſtanding together vpon a very ſhort ſtalk, and *the middle* leafe is as long again as the other two; they are very white and hoary, and the flours *grow out* of the boſoms of the leaues all alongſt the ſtalks. This is that mentioned in the vertues *of the former* chapter at *F*, for the ſilke wormes to worke vpon. ‡

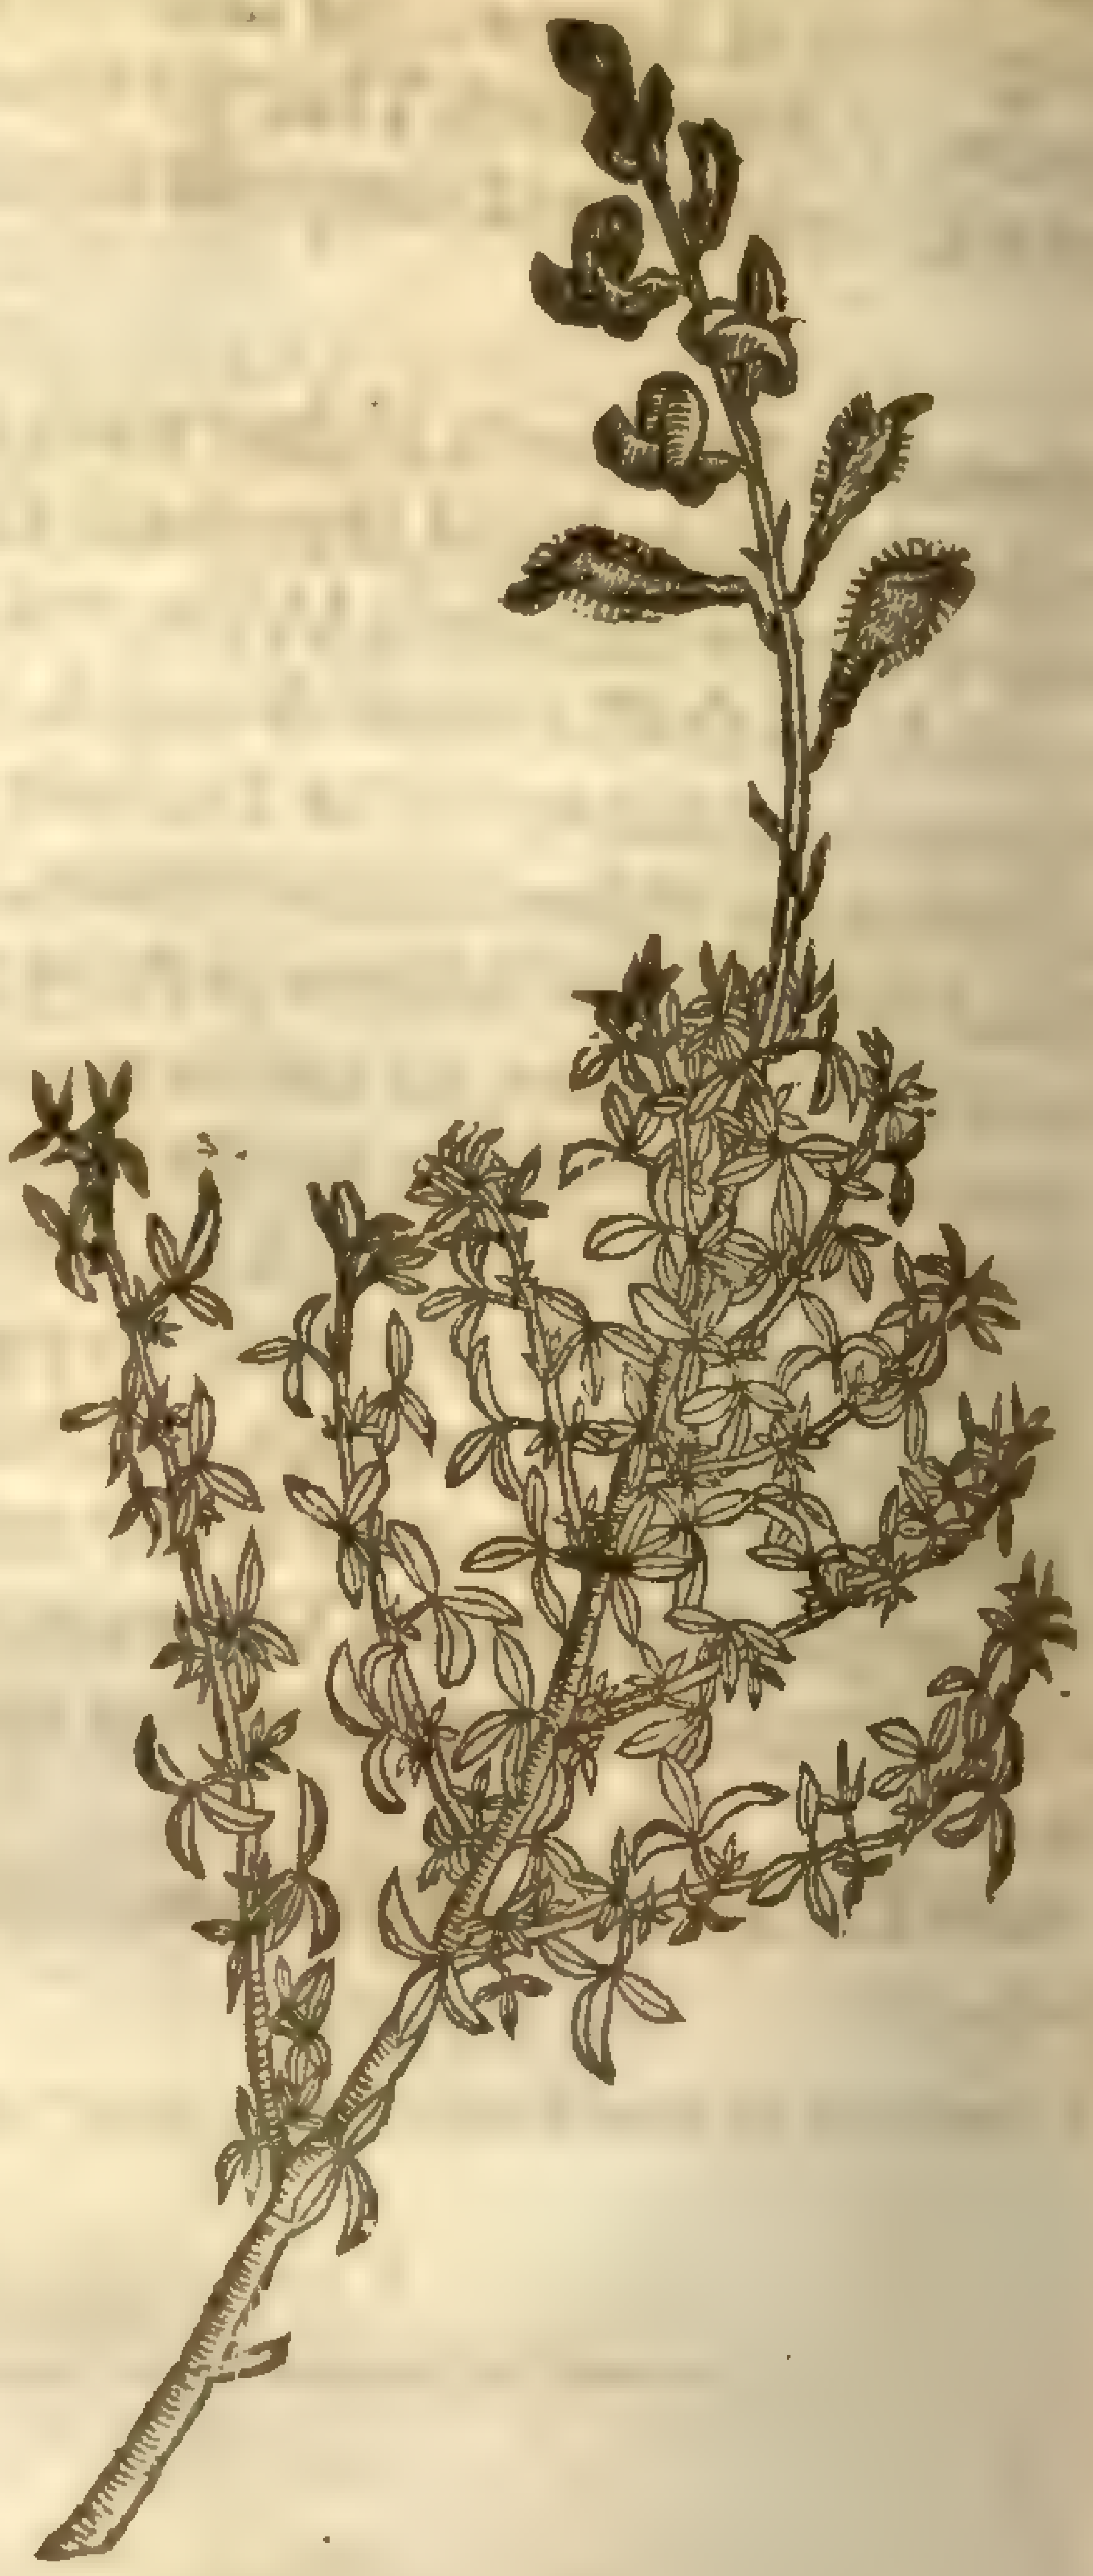
4 The fourth ſhrub is likewiſe one of the wilde kinde, though in face and ſtature like the ma-

nured

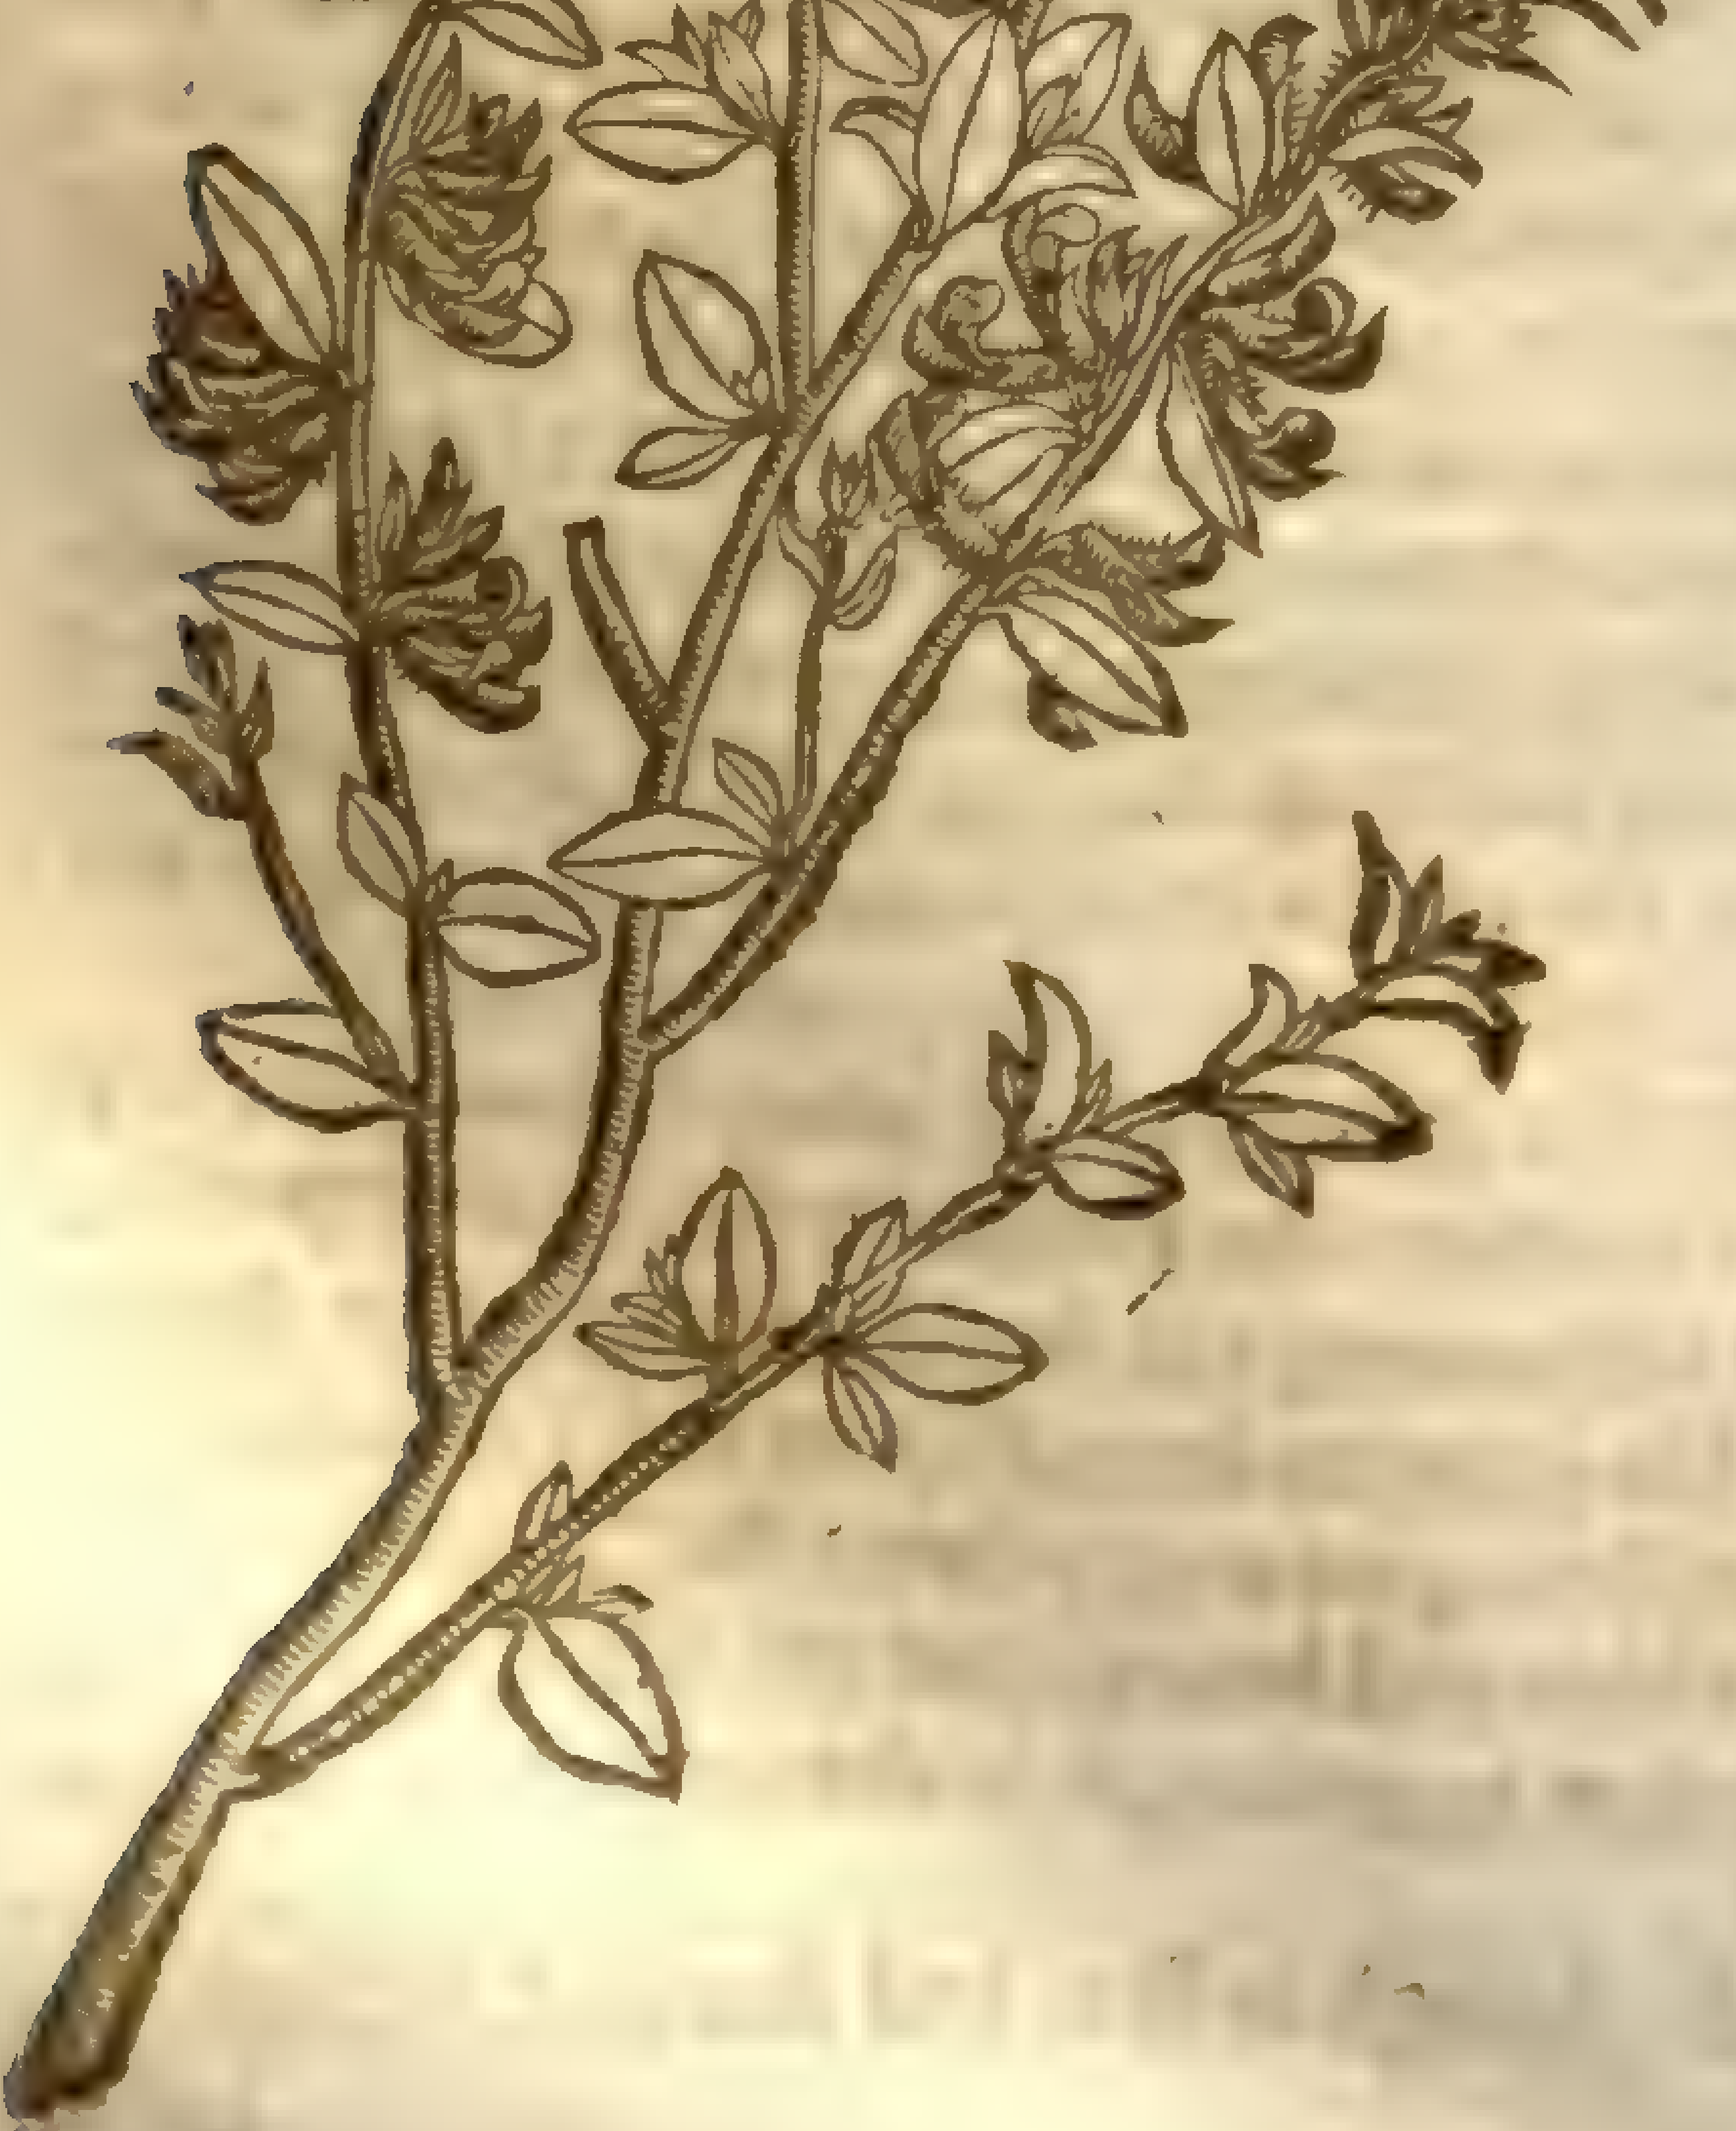
1 *Pſeudocytiſus* 1.
The firſt baſtard ſhrub Trefoile.



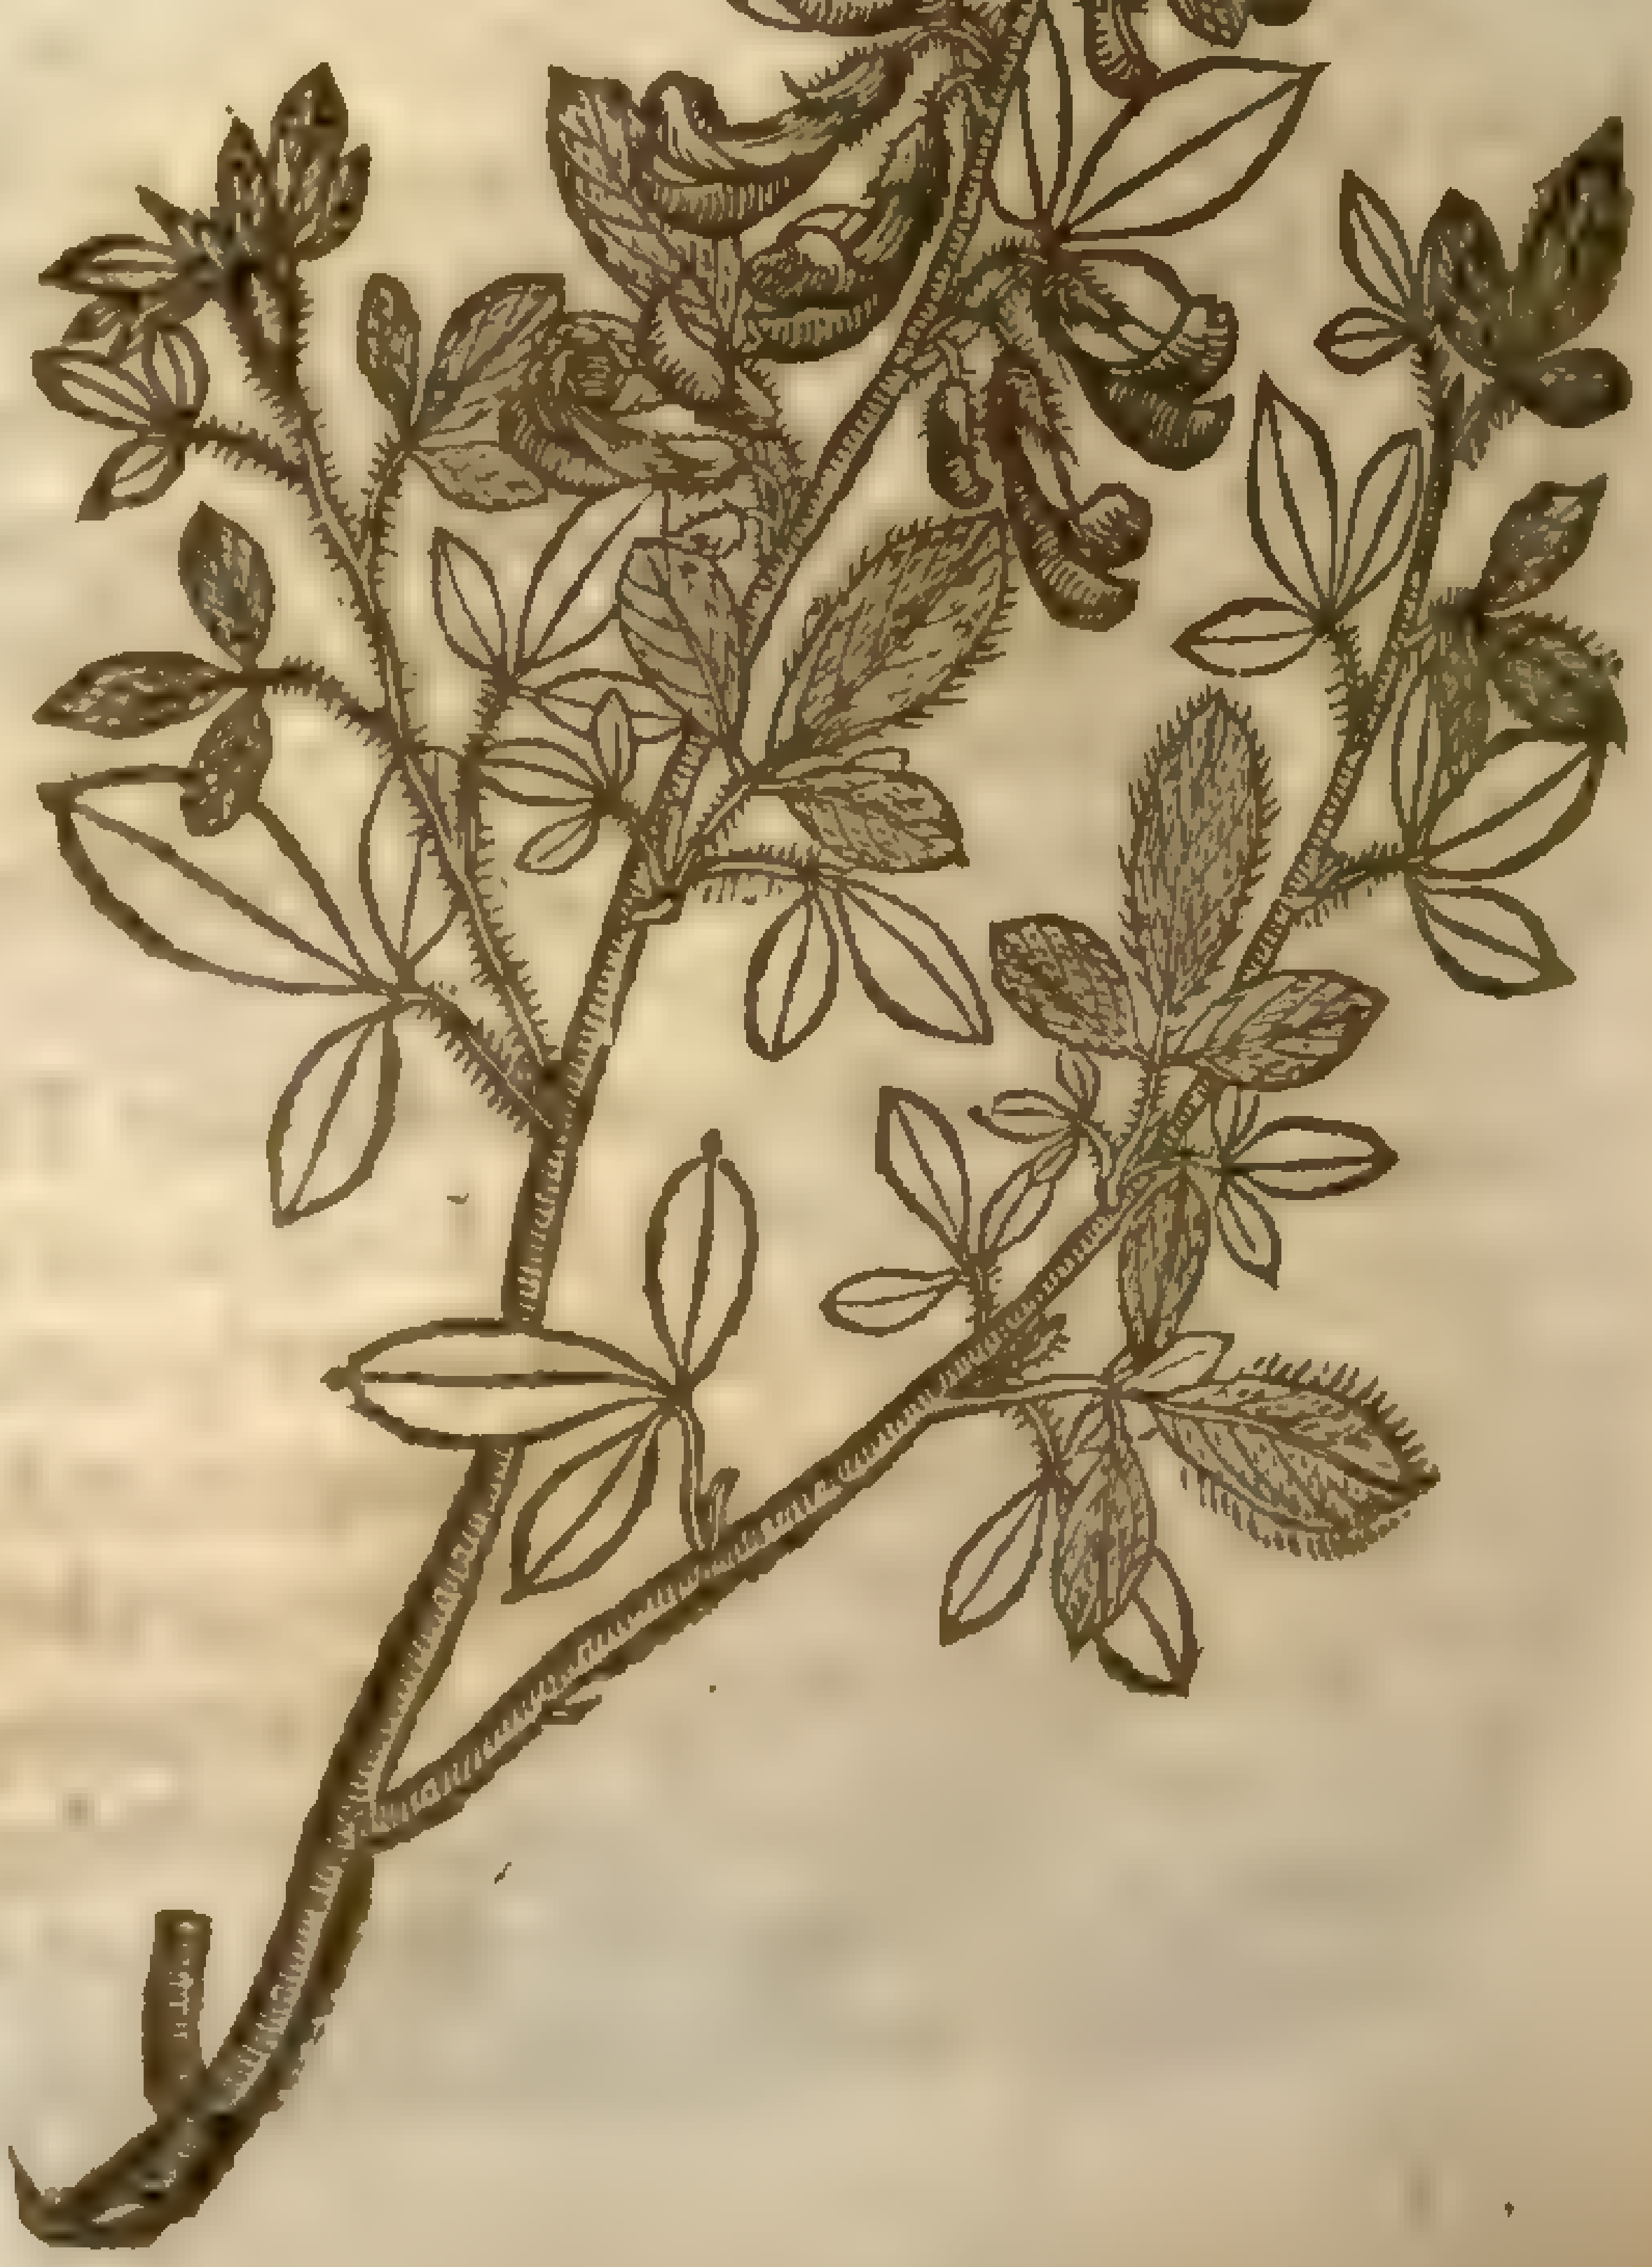
2 *Pſeudocytiſus* 2.
The ſecond baſtard ſhrub Trefoile.



3 *Cytiſus ſemper-virens.*
The euer-green ſhrub Trefoile.



4 *Pſeudocytiſus hirſutus.*
The hairy baſtard tree Trefoile.



nured *Cytiſus*. It groweth vp like a ſmall ſhrub or hedge buſh, to the height of two or three yards; on whoſe branches do grow three rough or hairy leaues ſet vpon a ſlender foot-ſtalke, of a graſſe-green colour aboue, with a reddiſh hairineſſe below: the floures grow alongſt the ſtalks, from the middle to the top, of a bright ſhining yellow colour: the root is likewiſe wooddy.

¶ *The Place.*

Theſe kindes of milke Trefoile are found in Moravia, ſo called in our age, which in times paſt was named *Marcomannorum provincia*, and in the vpper Pannonia, otherwiſe called Auſtria, neere to highwaies and in the borders of fields, for they ſeem after a ſort to ioy in the ſhade. ‡ Theſe grow (according to *Cluſius*) in ſundry parts of Spain. ‡

¶ *The Time.*

They floure eſpecially in Iune and Iuly.

¶ *The Names.*

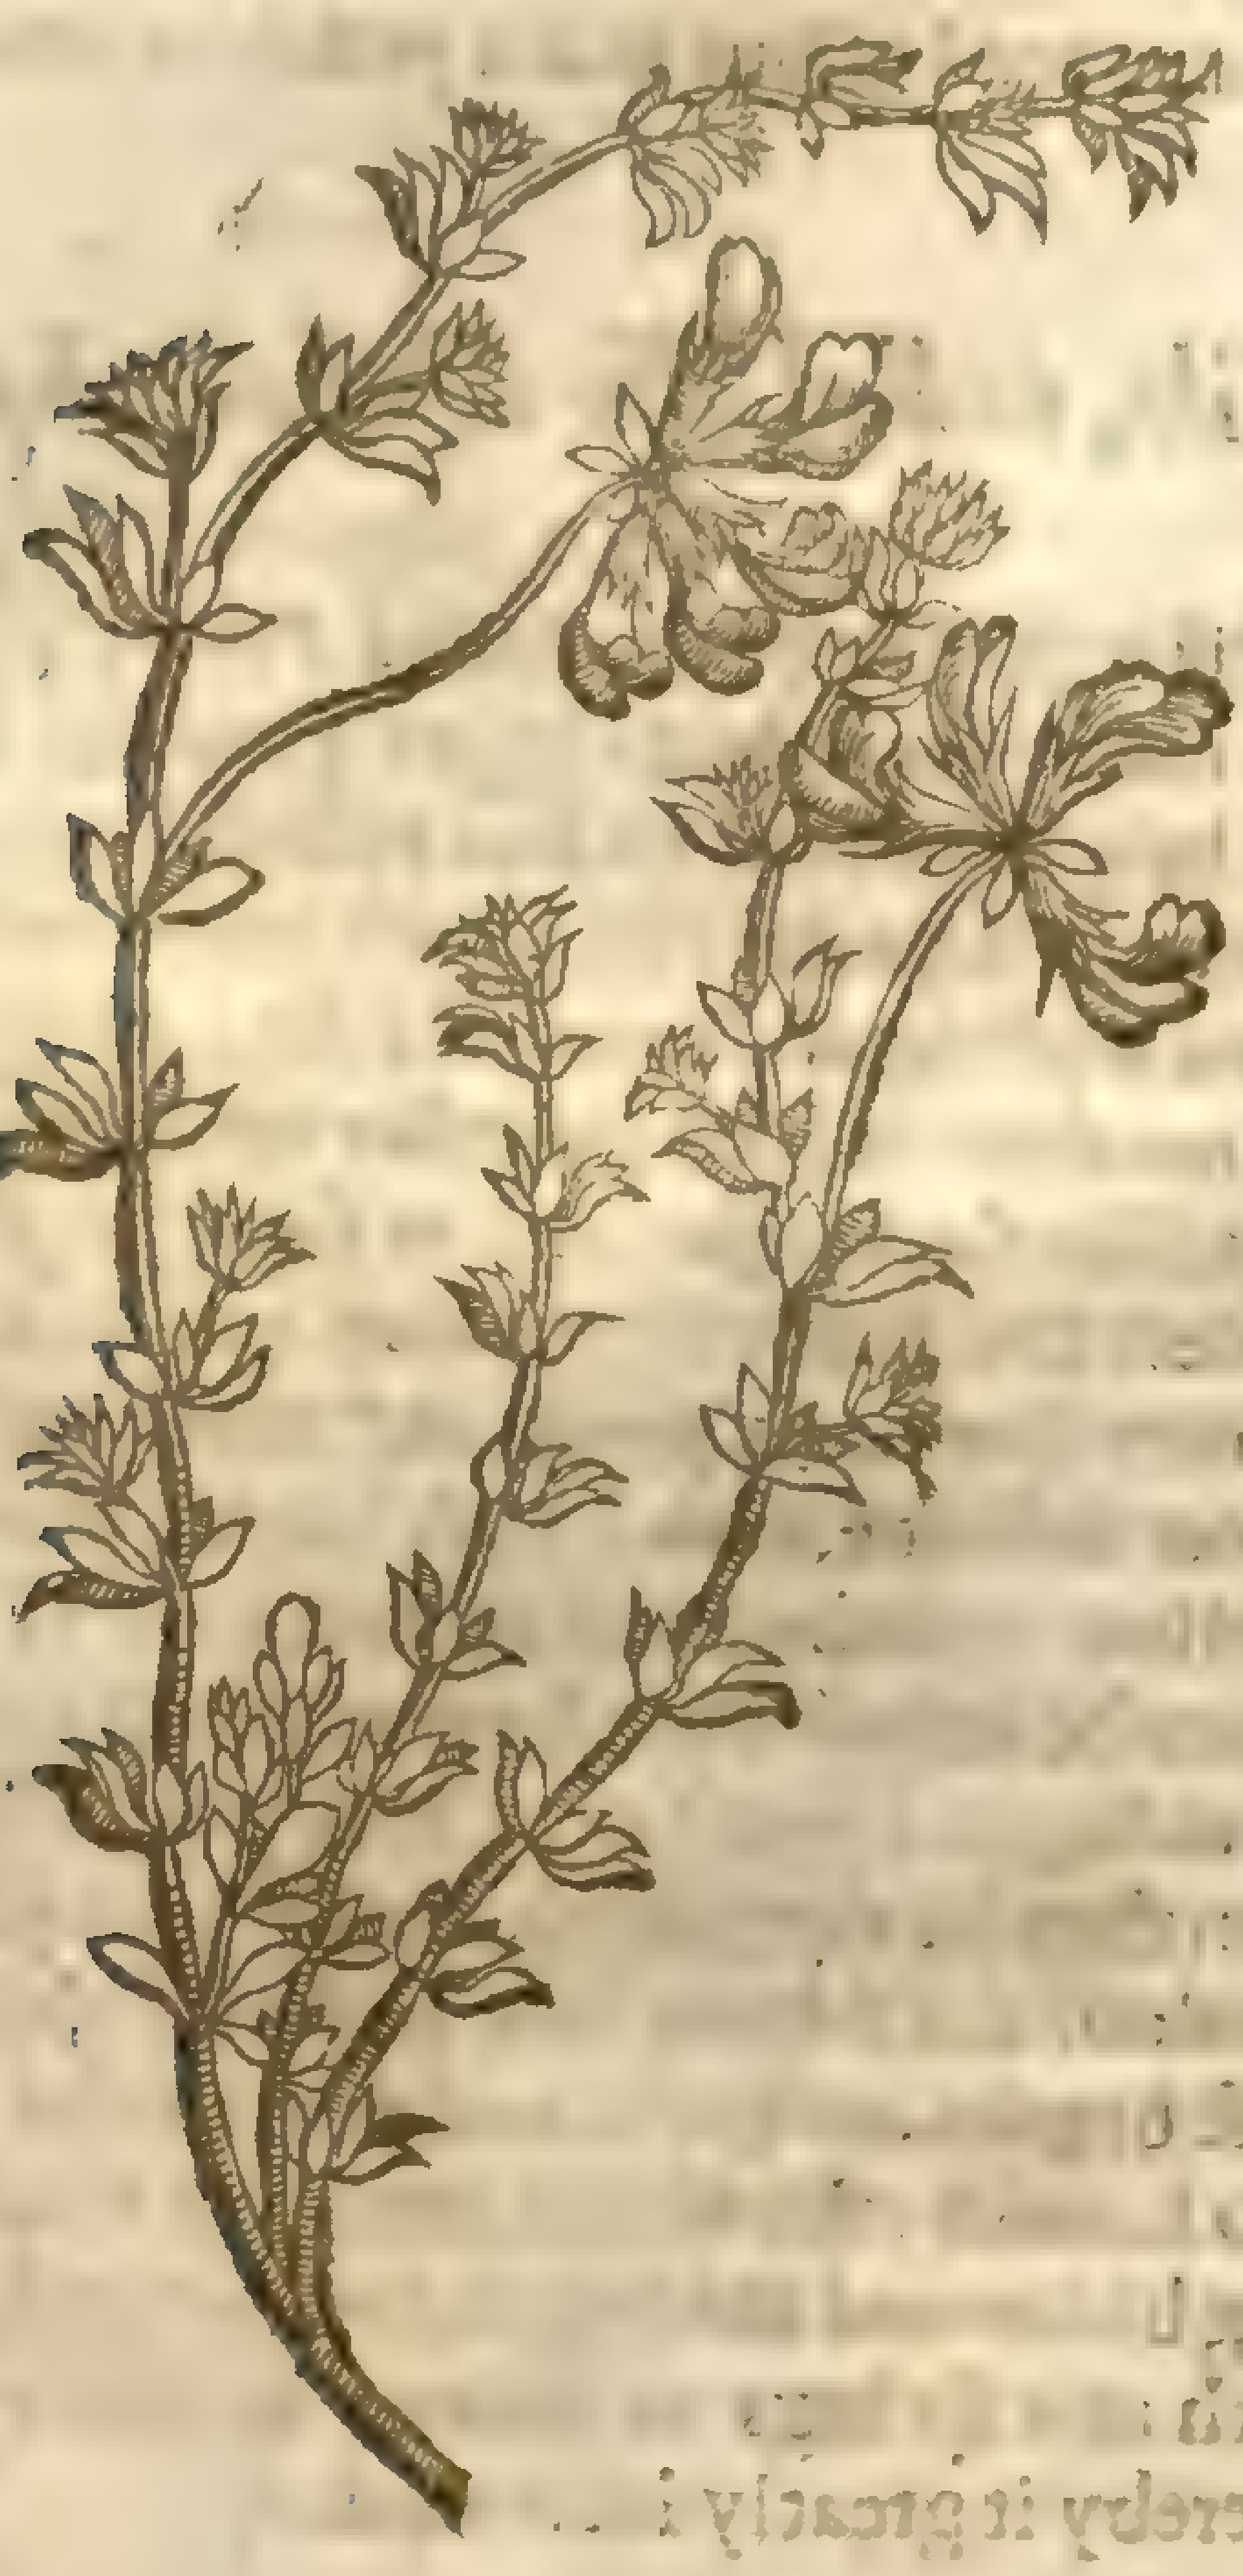
It is euident enough that they are baſtard kindes of milke Trefoiles, and therefore they may be called and plainly termed *Pſeudocytiſi* or baſtard milke Trefoiles, or *Cytiſi ſylveſtres*, that is to ſay, wilde milke Trefoiles.

¶ *The Nature and Vertues.*

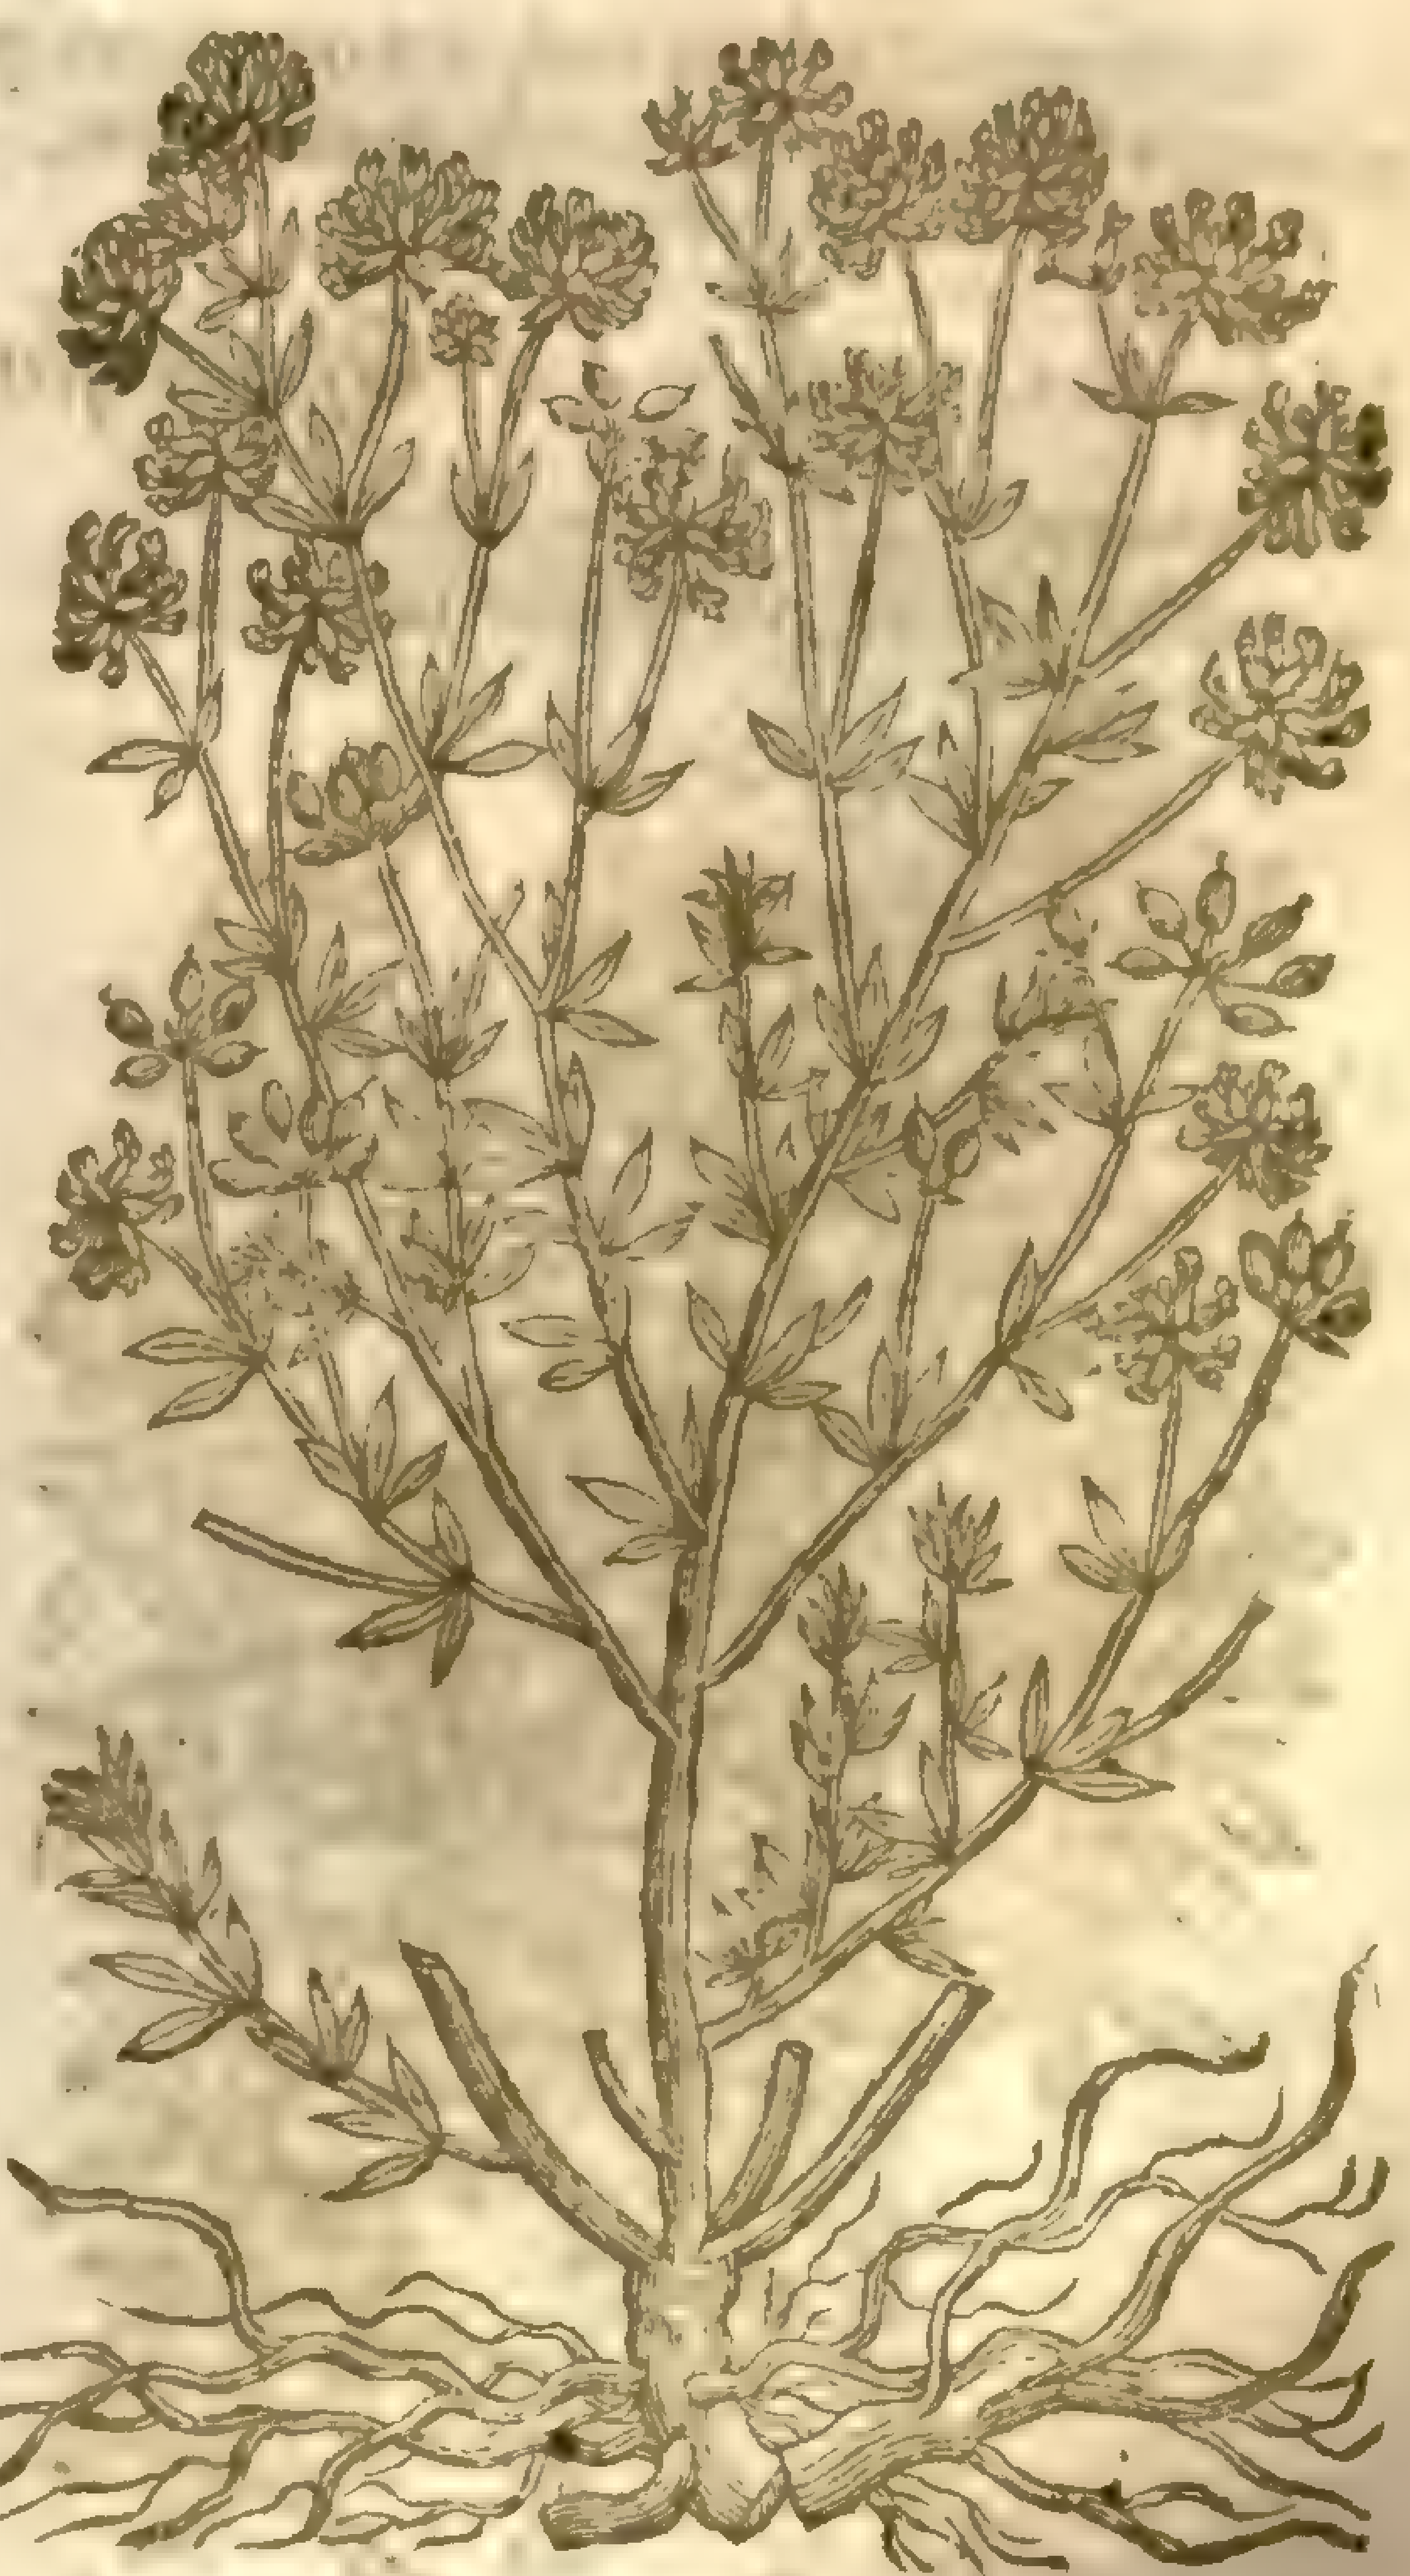
What temperature theſe ſhrubs are of, or what vertues they haue we know not, neither haue wee as yet found out any thing by our owne experience, wherefore they may be referred vnto the other milke-Trefoiles.

CHAP. 15. *Of the venomous tree Trefoile.*

† 1 *Dorycnium Monſpelienſium.*
The venomous Trefoile of Montpelier.



2 *Dorycnium Hiſpanicum.*
The venomous Trefoile of Spain.



Lotus dorycnium L
mill. dict.

¶ *The Deſcription.*

1 THe venomous Tree Trefoile of Montpellier hath many tough and pliant ſtalkes two or three cubits high, diuided into ſundry ſmall twiggy braunches, beſet with leaues three

together,placed from joint to joint by ſpaces,ſomewhat hoary,very like vnto the leaues of *Cytiſus* or Rue: among which come forth many ſmall moſſie white floures, tuft faſhion, in ſmall bundles like Noſegaies,and very like the floures of the Oliue or Oke tree,which turne into ſmall roundiſh bladders,as it were made of parchment; wherein is contained blacke ſeed like wilde *Lotus*, but in taſte like the wilde Tare: the whole plant is of an vnſauory ſmel; the root is thick,and of a wooddie ſubſtance.

2 The Spaniſh venomous Trefoile hath a wooddy ſtalke,rough and hoary, diuided into other ſmall branches,whereon grow leaues like the precedent: the floures grow on the tops of the branches,whereon grow leaues like thoſe of the Peaſe,and of a yellow or rather greeniſh color,wherein it differeth from the precedent.

¶ *The Place.*

Theſe venomous Trefoiles grow in Narbon,on the barren and ſtony craggy mountains,at Frontignana,and about the ſea coaſts,and are ſtrangers in England.

¶ *The Time.*

They flouriſh from May to the end of Iune.

¶ *The Names.*

Dorycnium,or Δορύκνιον, is that poiſonous or venomous plant wherewith in times paſt they vſed to poiſon their arrow heads,or weapons, thereby to do the greater hurt vnto thoſe whom they did aſſaile or purſue, whereupon it tooke his name. Great controuerſie hath been amongſt Herbariſts, what manner of plant *Dorycnium* ſhould be; ſome ſaying one thing,and ſome another: which controuerſies and ſundry opinions are very well confuted by the true cenſure of *Rondeletius*, who hath for a definitiue ſentence ſet down the plant deſcribed for the true *Dorycnium*, & none other,which may be called in Engliſh,Venomous tree Trefoile. ‡ Theſe plants do not ſufficiently anſwer to the deſcription of *Dioſcorides*,neither can any one ſay certainly that they are poiſonous. ‡

¶ *The Temperature.*

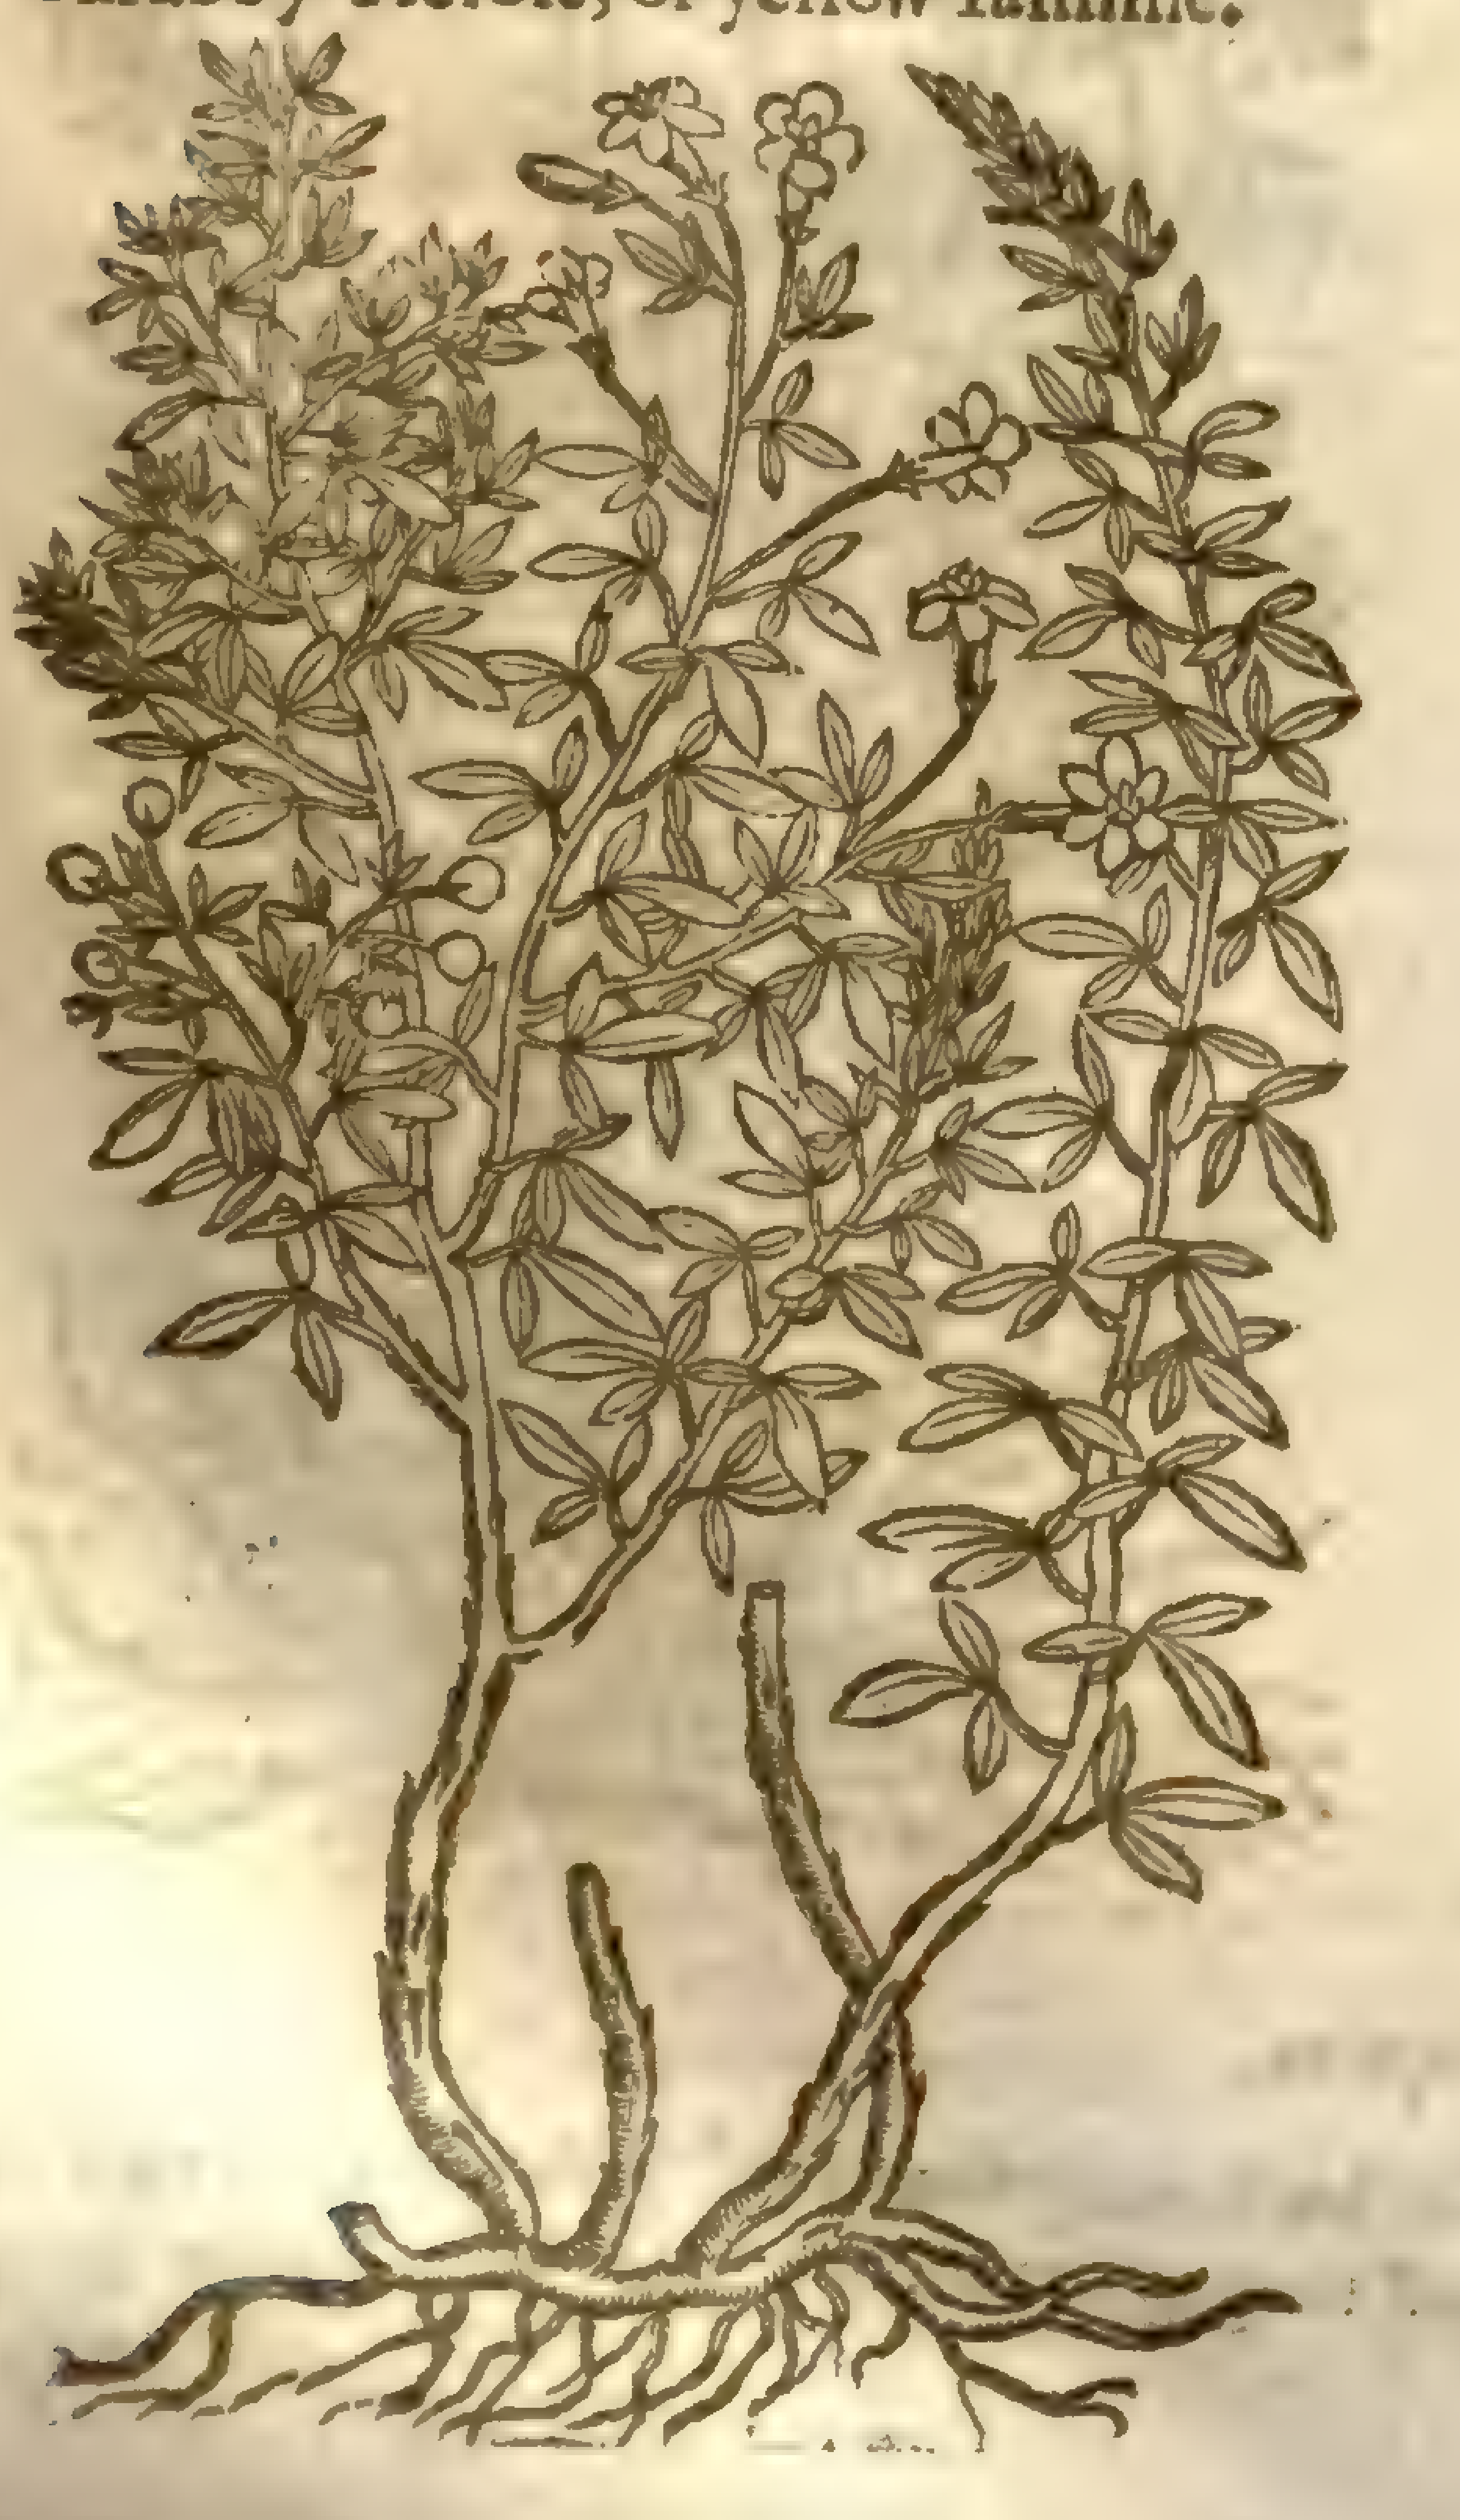
Dorycnium is very cold without moiſtning.

¶ *The Vertues.*

Venomous Trefoile hath not one good qualitie that I can read of,but it is a peſtilent venomous plant,as hath been ſaid in the deſcription.

† The figures were formerly tranſpoſed.

Chap. 16. *Of Of the ſhrub Trefoile, called alſo Make-bait.*



Polemonium, ſive Trifolium fruticans.
Shrubby Trefole, or yellow Iaſmine.

Jasminum simplicifolium; [illegible]

¶ *The Deſcription.*

This ſhruby plant called *Polemonium* hath many wooddy twigges growing into the height of four or fiue cubits,hauing ſmal ny twiggy branches of a dark green color,garniſhed with ſmall leaues of a deep green color, alwaies three ioined together vpon little footſtalks,like the *Cytiſus* buſh or field Trefoile,but ſmaller: the floures be yellow and round,diuided into fiue or ſix parts, not much vnlike the yellow Iaſmine,which hath cauſed many to cal it yellow Iaſmine,euen to this day. When the floures be vaded there ſucceed ſmall round berries as big as a peaſe,of a black purpliſh colour when they be ripe,which being broken wil die or colour the fingers like Elder berries:within theſe berries are contained a ſmall flat ſeed like vnto Lentils: the root is long and ſmall, creeping hither and thither vnder the earth,putting forth new ſprings or ſhoots in ſundry places, whereby it greatly increaſeth.

¶ *The Place.*

It grows plentifully in the country of Montpelier,at New-caſtle,vpon the dry hils,and hot banks of the oliue fields,and in the ſtony fields and Wood of Gramuntium: it groweth in my garden,and in other herbariſts gardens of England.

¶ *The*

¶ *The Time.*

It floureth in Summer: the ſeed is ripe in Autumne: the ſhrub it ſelfe is alwaies green, & hath a laſting root.

¶ *The Names.*

Moſt do call it *Cytiſus*, but we had rather name it *Trifolium fruticans*: for it doth not agree with *Cytiſus* or Milk Trefoile, as in the chapter before it is plain enough by his deſcription, vnleſſe it be *Cytiſus Marcelli*, or *Marcellus* his Milke Trefoile, with which peraduenture it might be thought to haue ſome likeneſſe, if the floures which are yellow were white, or *galbineous*, that is to ſay, blew.

There be diuers alſo that take this Trefoile to be *Polemonium*, foraſmuch as the leaues of it ſeem to be ſomewhat like thoſe of common Rue; but *Polemonium* hath not the leafe of common Rue, otherwiſe called Herb-grace, but of the other, that is to ſay, of S. *Iohns* Rue: it is called in Engliſh, ſhrubby Trefoile, or Make-bait.

¶ *The Temperature.*

Polemonium is dry in the ſecond degree, with ſome acrimonie or ſharpneſſe.

¶ *The Vertues.*

This ſhrubby plant hath ſo many ſingular and excellent vertues contained in it, that ſome haue called it by the name *Chiliodunamis*, that is, hauing a thouſand properties. A

It is very effectual againſt the ſtinging of Scorpions; and (as ſome ſay) if a man hold it in his hand, he cannot be hurt with the biting of any venomous beaſt. B

Being taken with vineger it is very good for thoſe that are ſpleneticke, and whoſe ſpleen or milt is affected with oppilations or ſtoppings. C

If the root be taken in wine it helpeth againſt the bloudy flix, it prouoketh vrine being drunke with water, ſcoureth away grauell, and eaſeth the pain and ache called the Sciatica. D

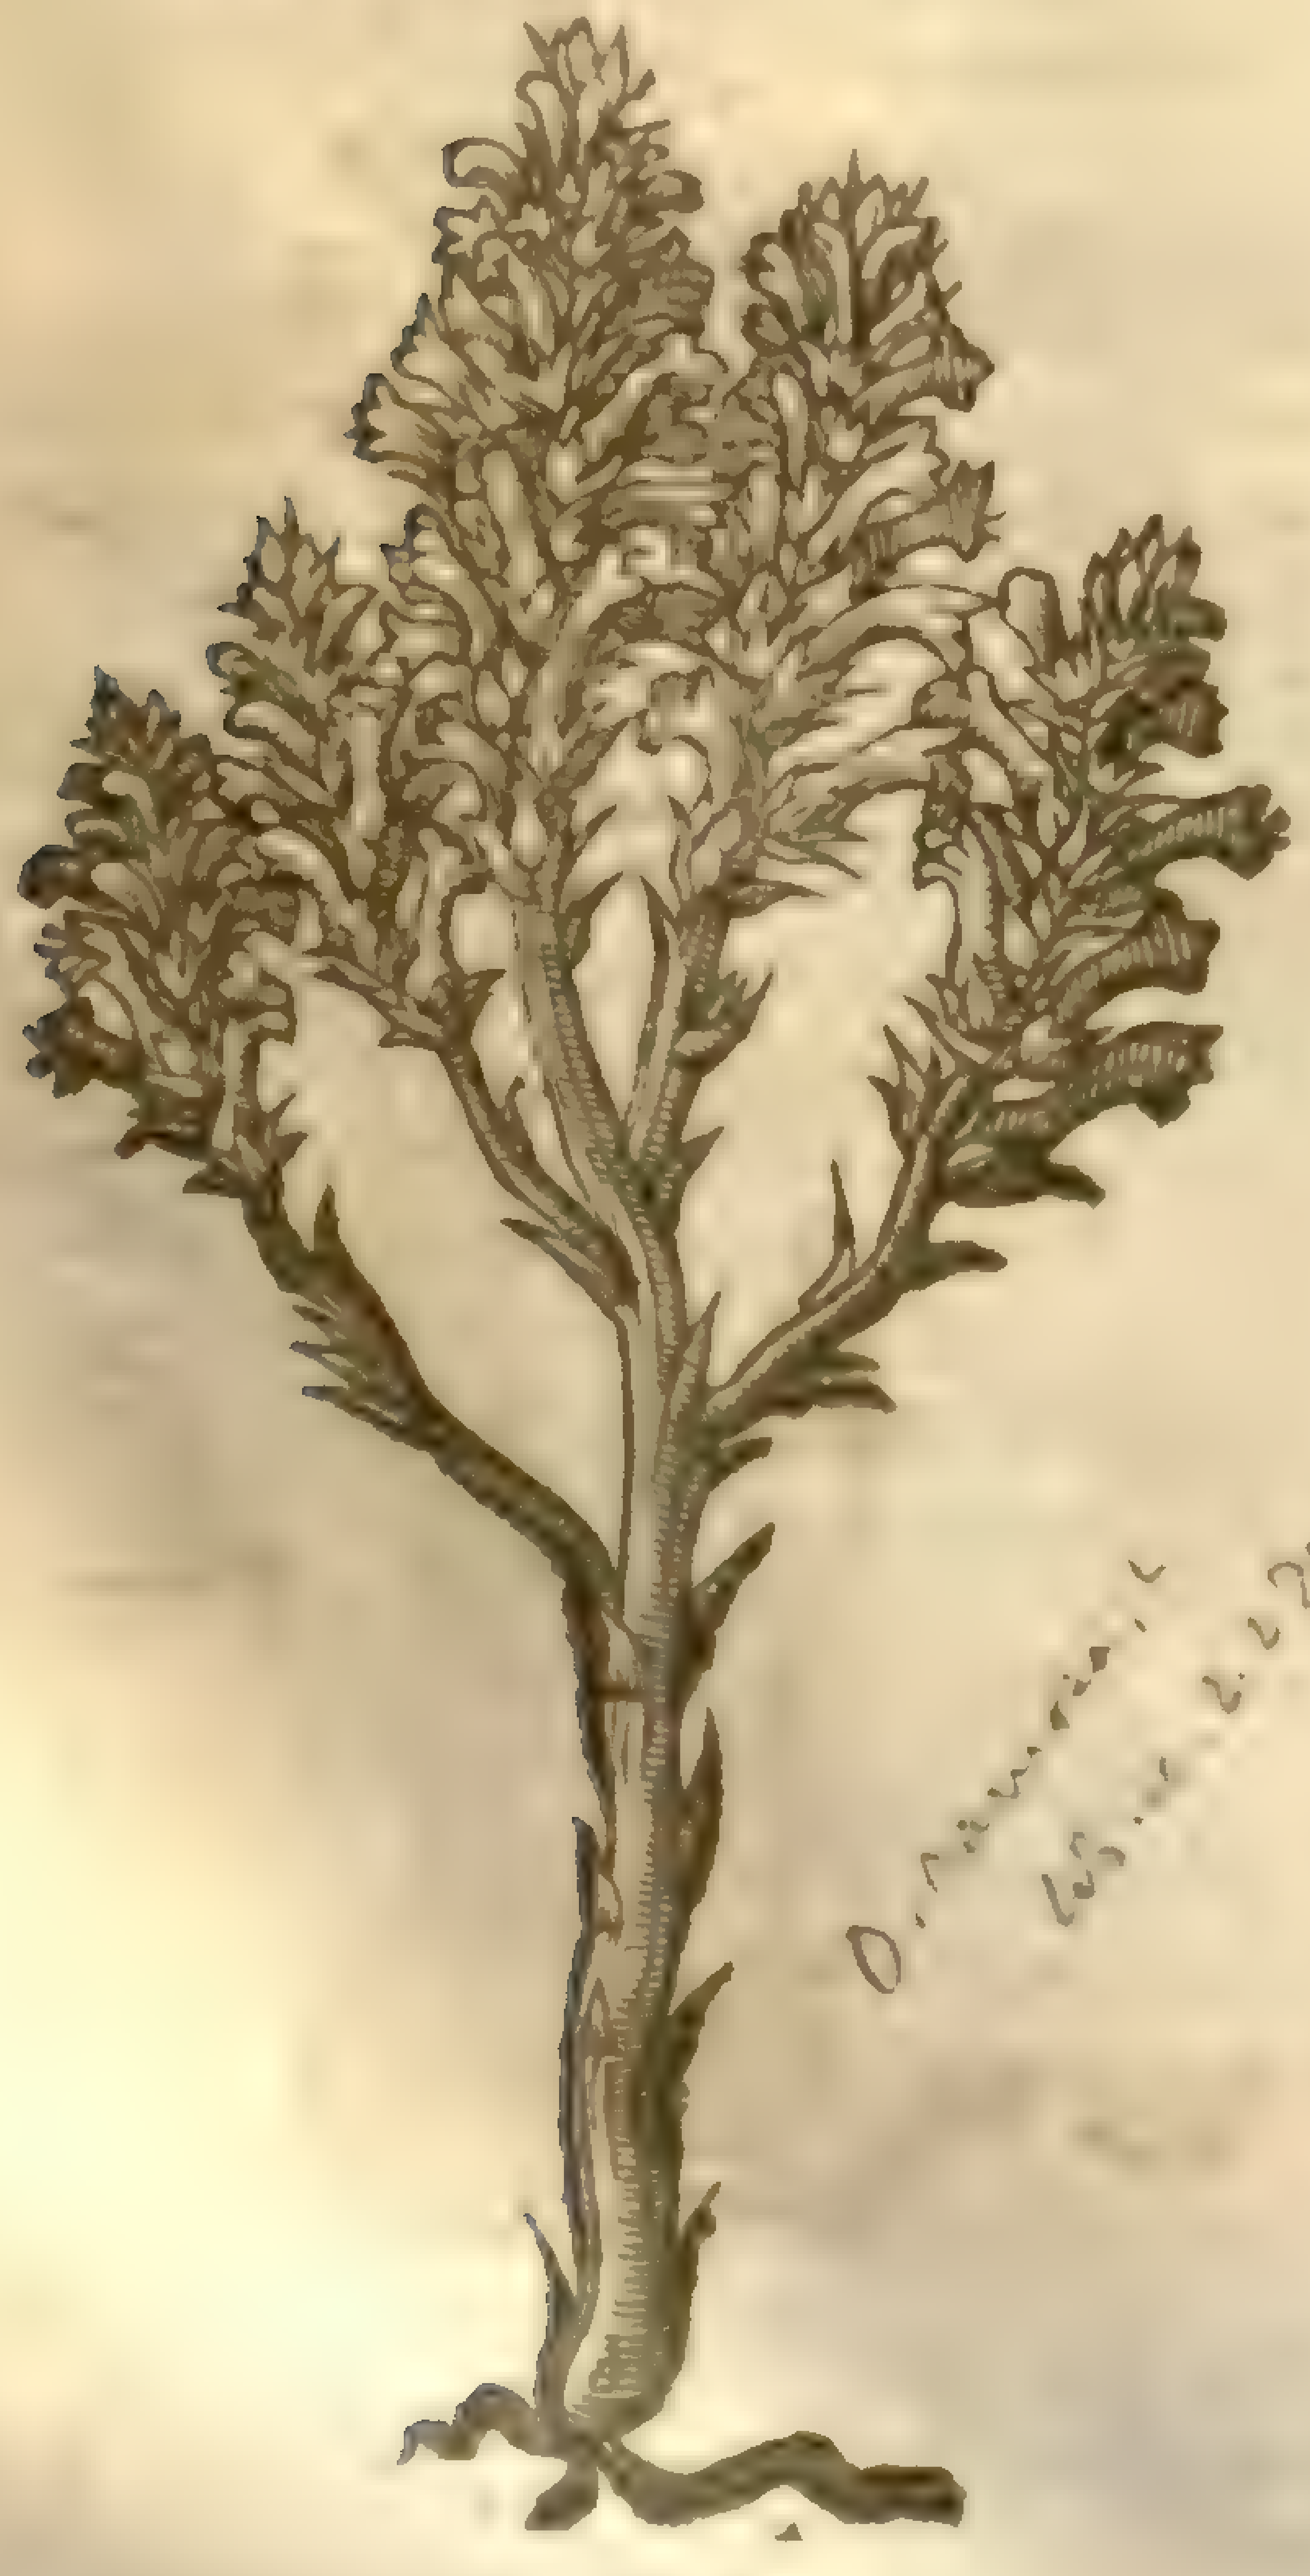
‡ *Orobanche Ramoſa.*
Branched Broom-Rape.



O. ramosa, L
Wo. ic. 2. 272

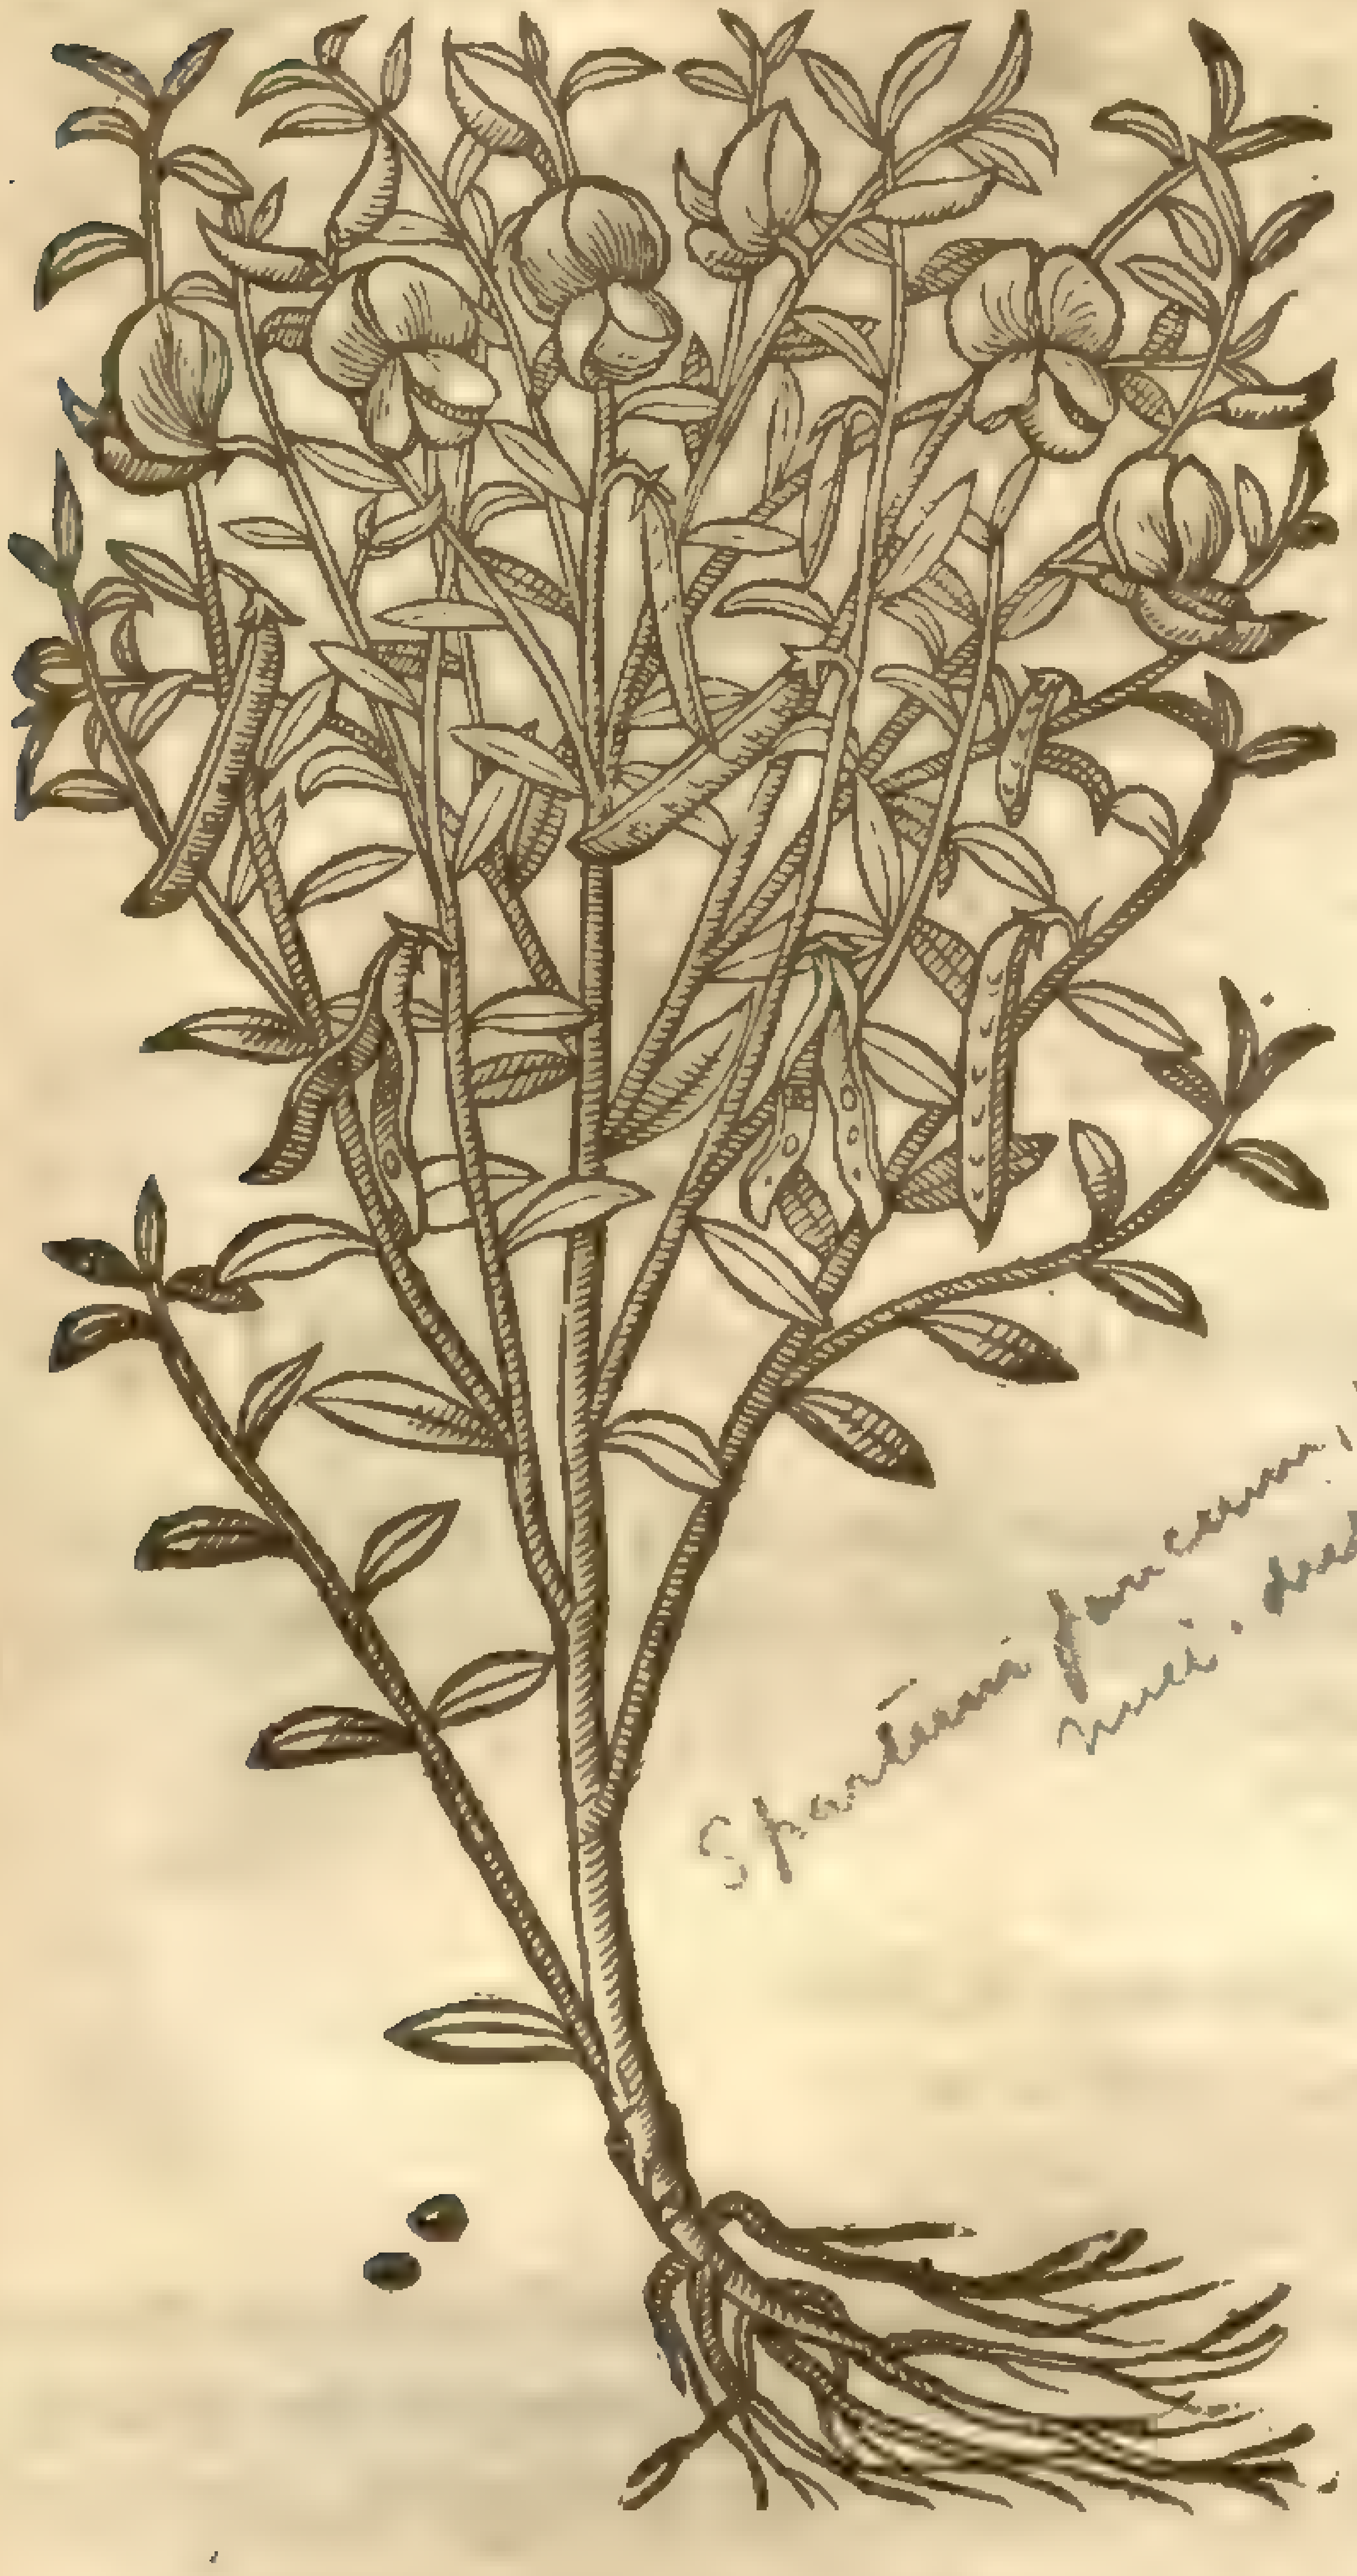
¶ *The Deſcription.*

1 Broom is a buſh or ſhrubby plant, it hath ſtalks or rather wooddy branches, from which do ſpring ſlender twigs, cornered, green, tough, and that be eaſily bowed, many times diuided into ſmal branches; about which do grow little leaues of an obſcure green colour, & braue yellow floures, and at the length flat cods, which beeing ripe are black, as are thoſe of the common Vetch, in which doe lie flat ſeeds, hard, ſomething browniſh, and leſſer than Lentils: the root is hard and wooddy, ſending forth diuers times another plant of the colour of an Oken leafe, in ſhape like vnto the baſtard Orchis, called Birds neſt, hauing a root like a Turnep or Rape, whereupon it is called *Rapum Geniſtæ*, or Broom-Rape.

2 This is a certain bulbed plant growing vnto the roots of Broom, big below, and ſmaller aboue, couered with blackiſh ſcales, and of a yellowiſh pulp within: from which doth riſe a ſtalke a ſpan long, hauing whitiſh flours about the top, like almoſt to thoſe of dead Nettle. After which grow forth long thicke and round husks, in which are contained verie many ſeeds, and good for nothing: the whole plant is of the colour of the Oken leafe.

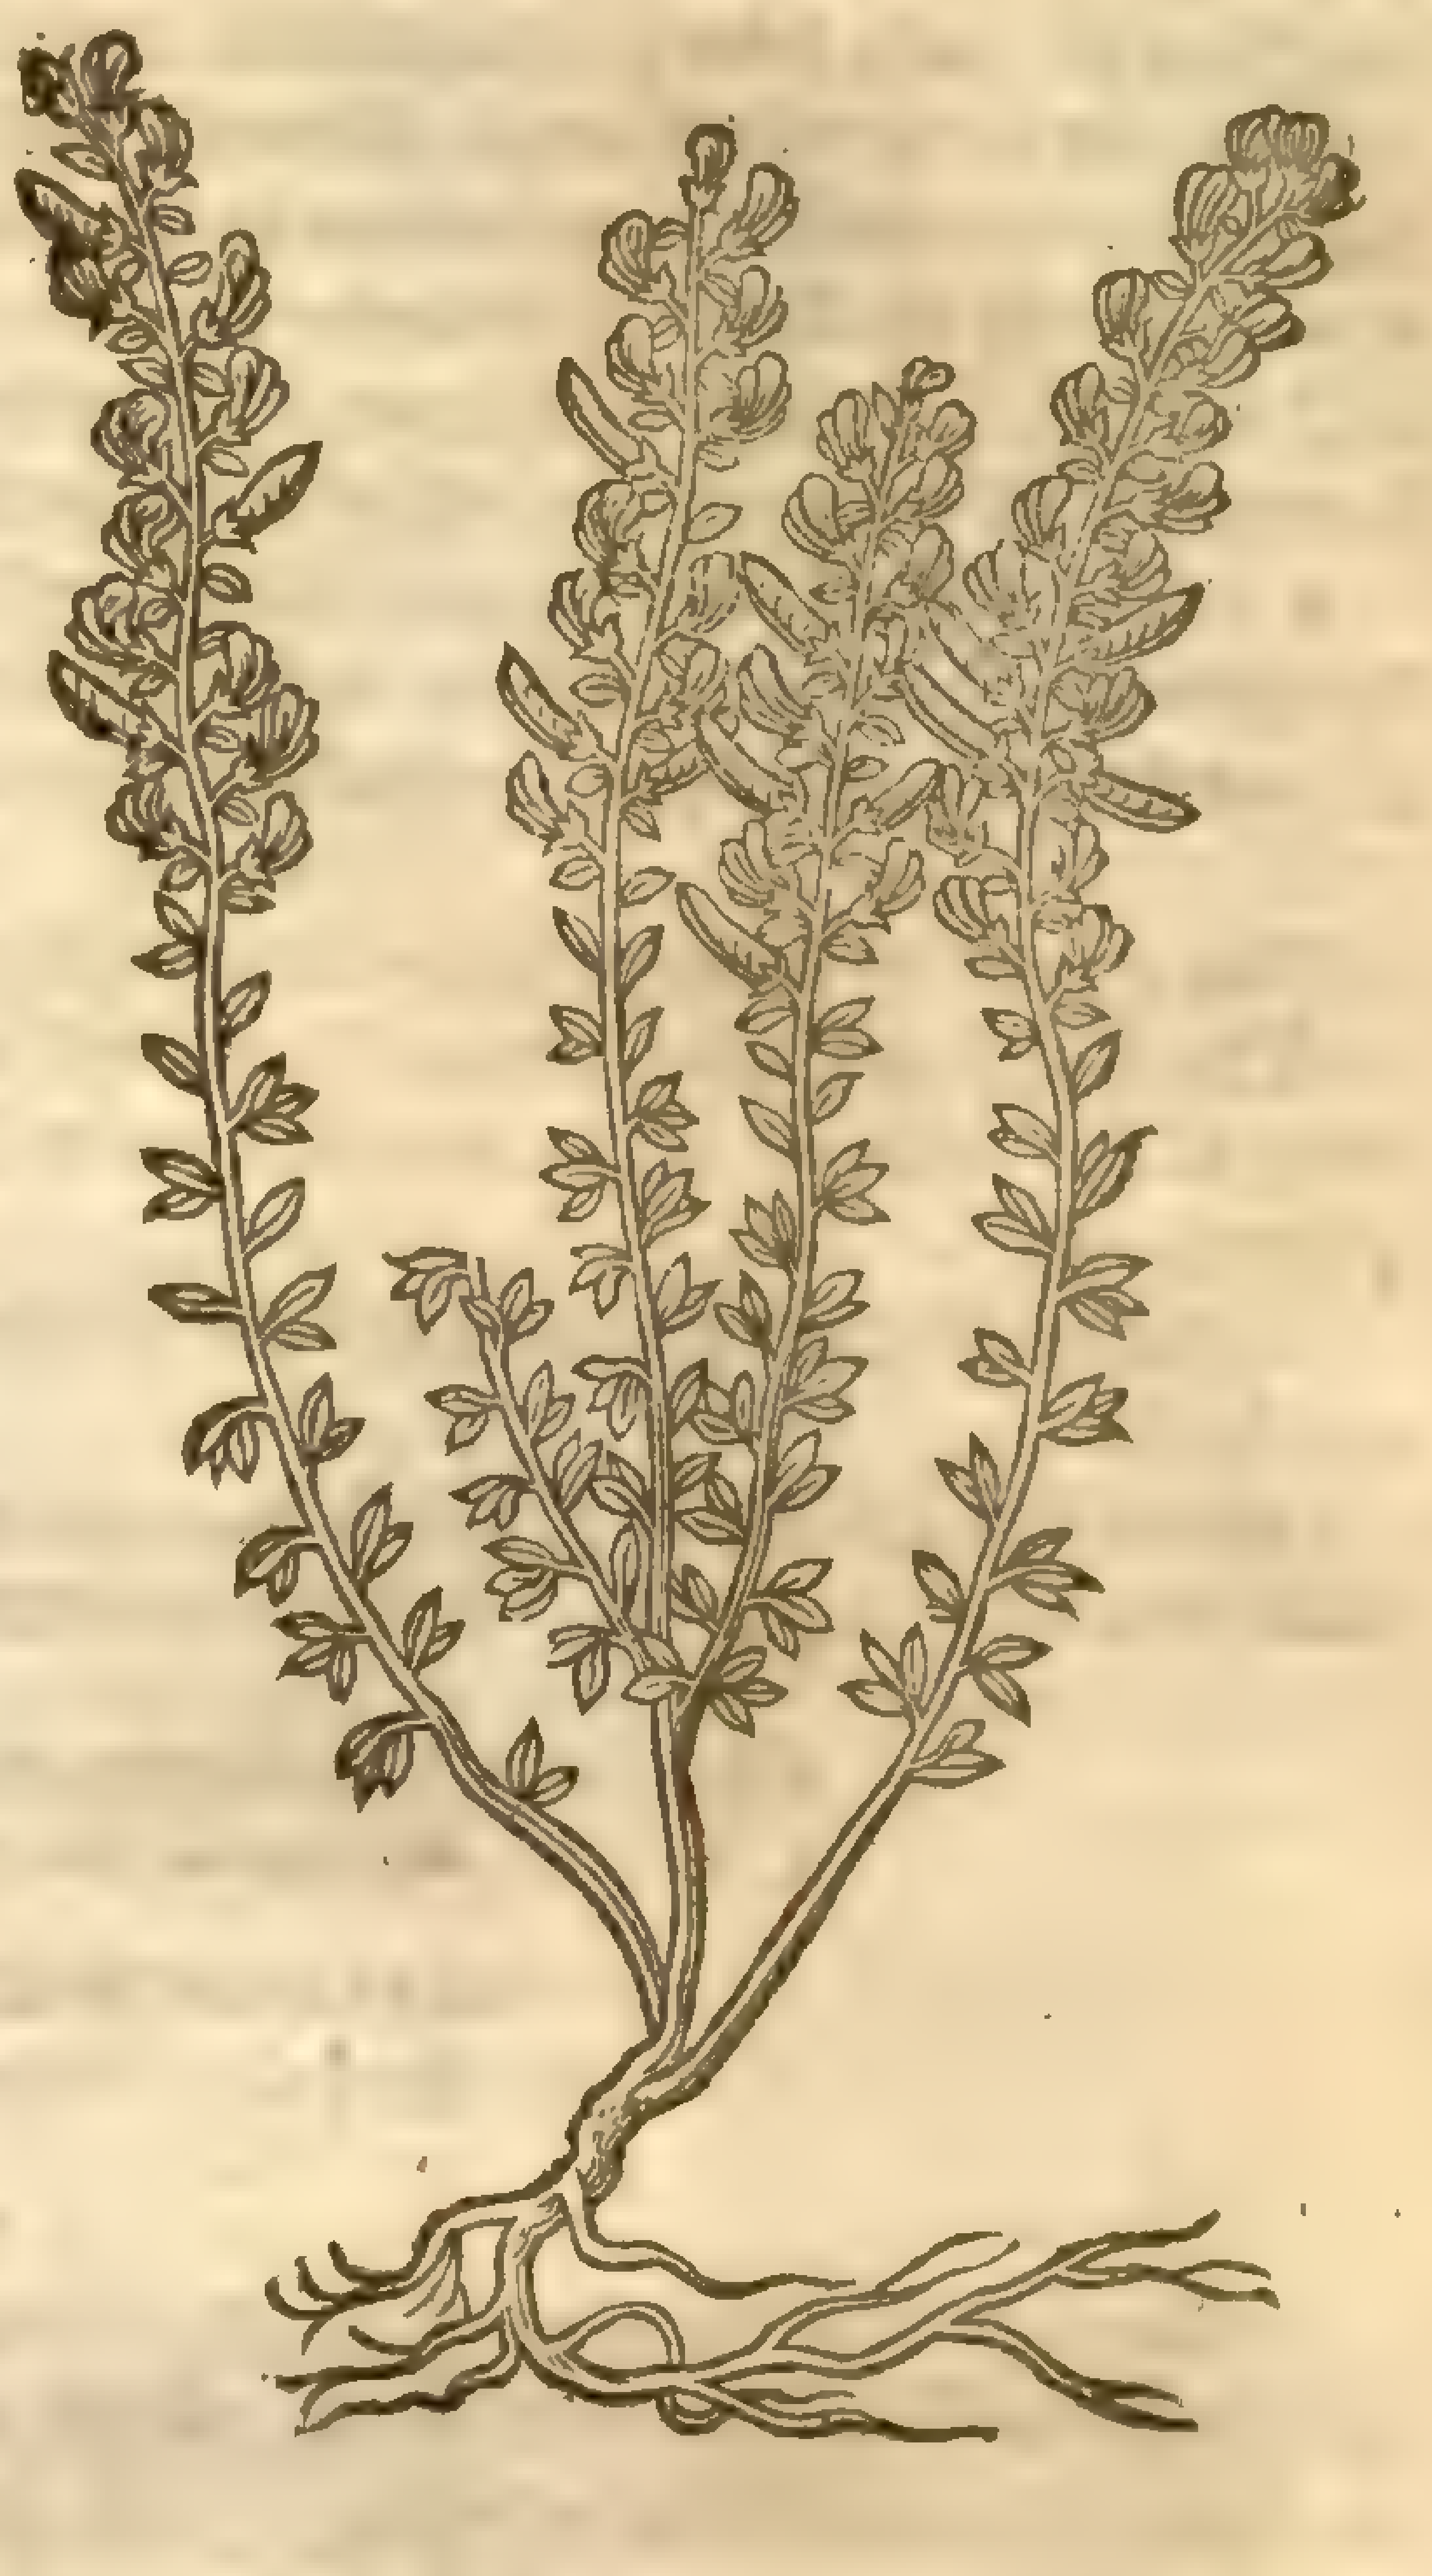
‡ Of

3 *Geniſta Hiſpanica.*
Spaniſh Broome.

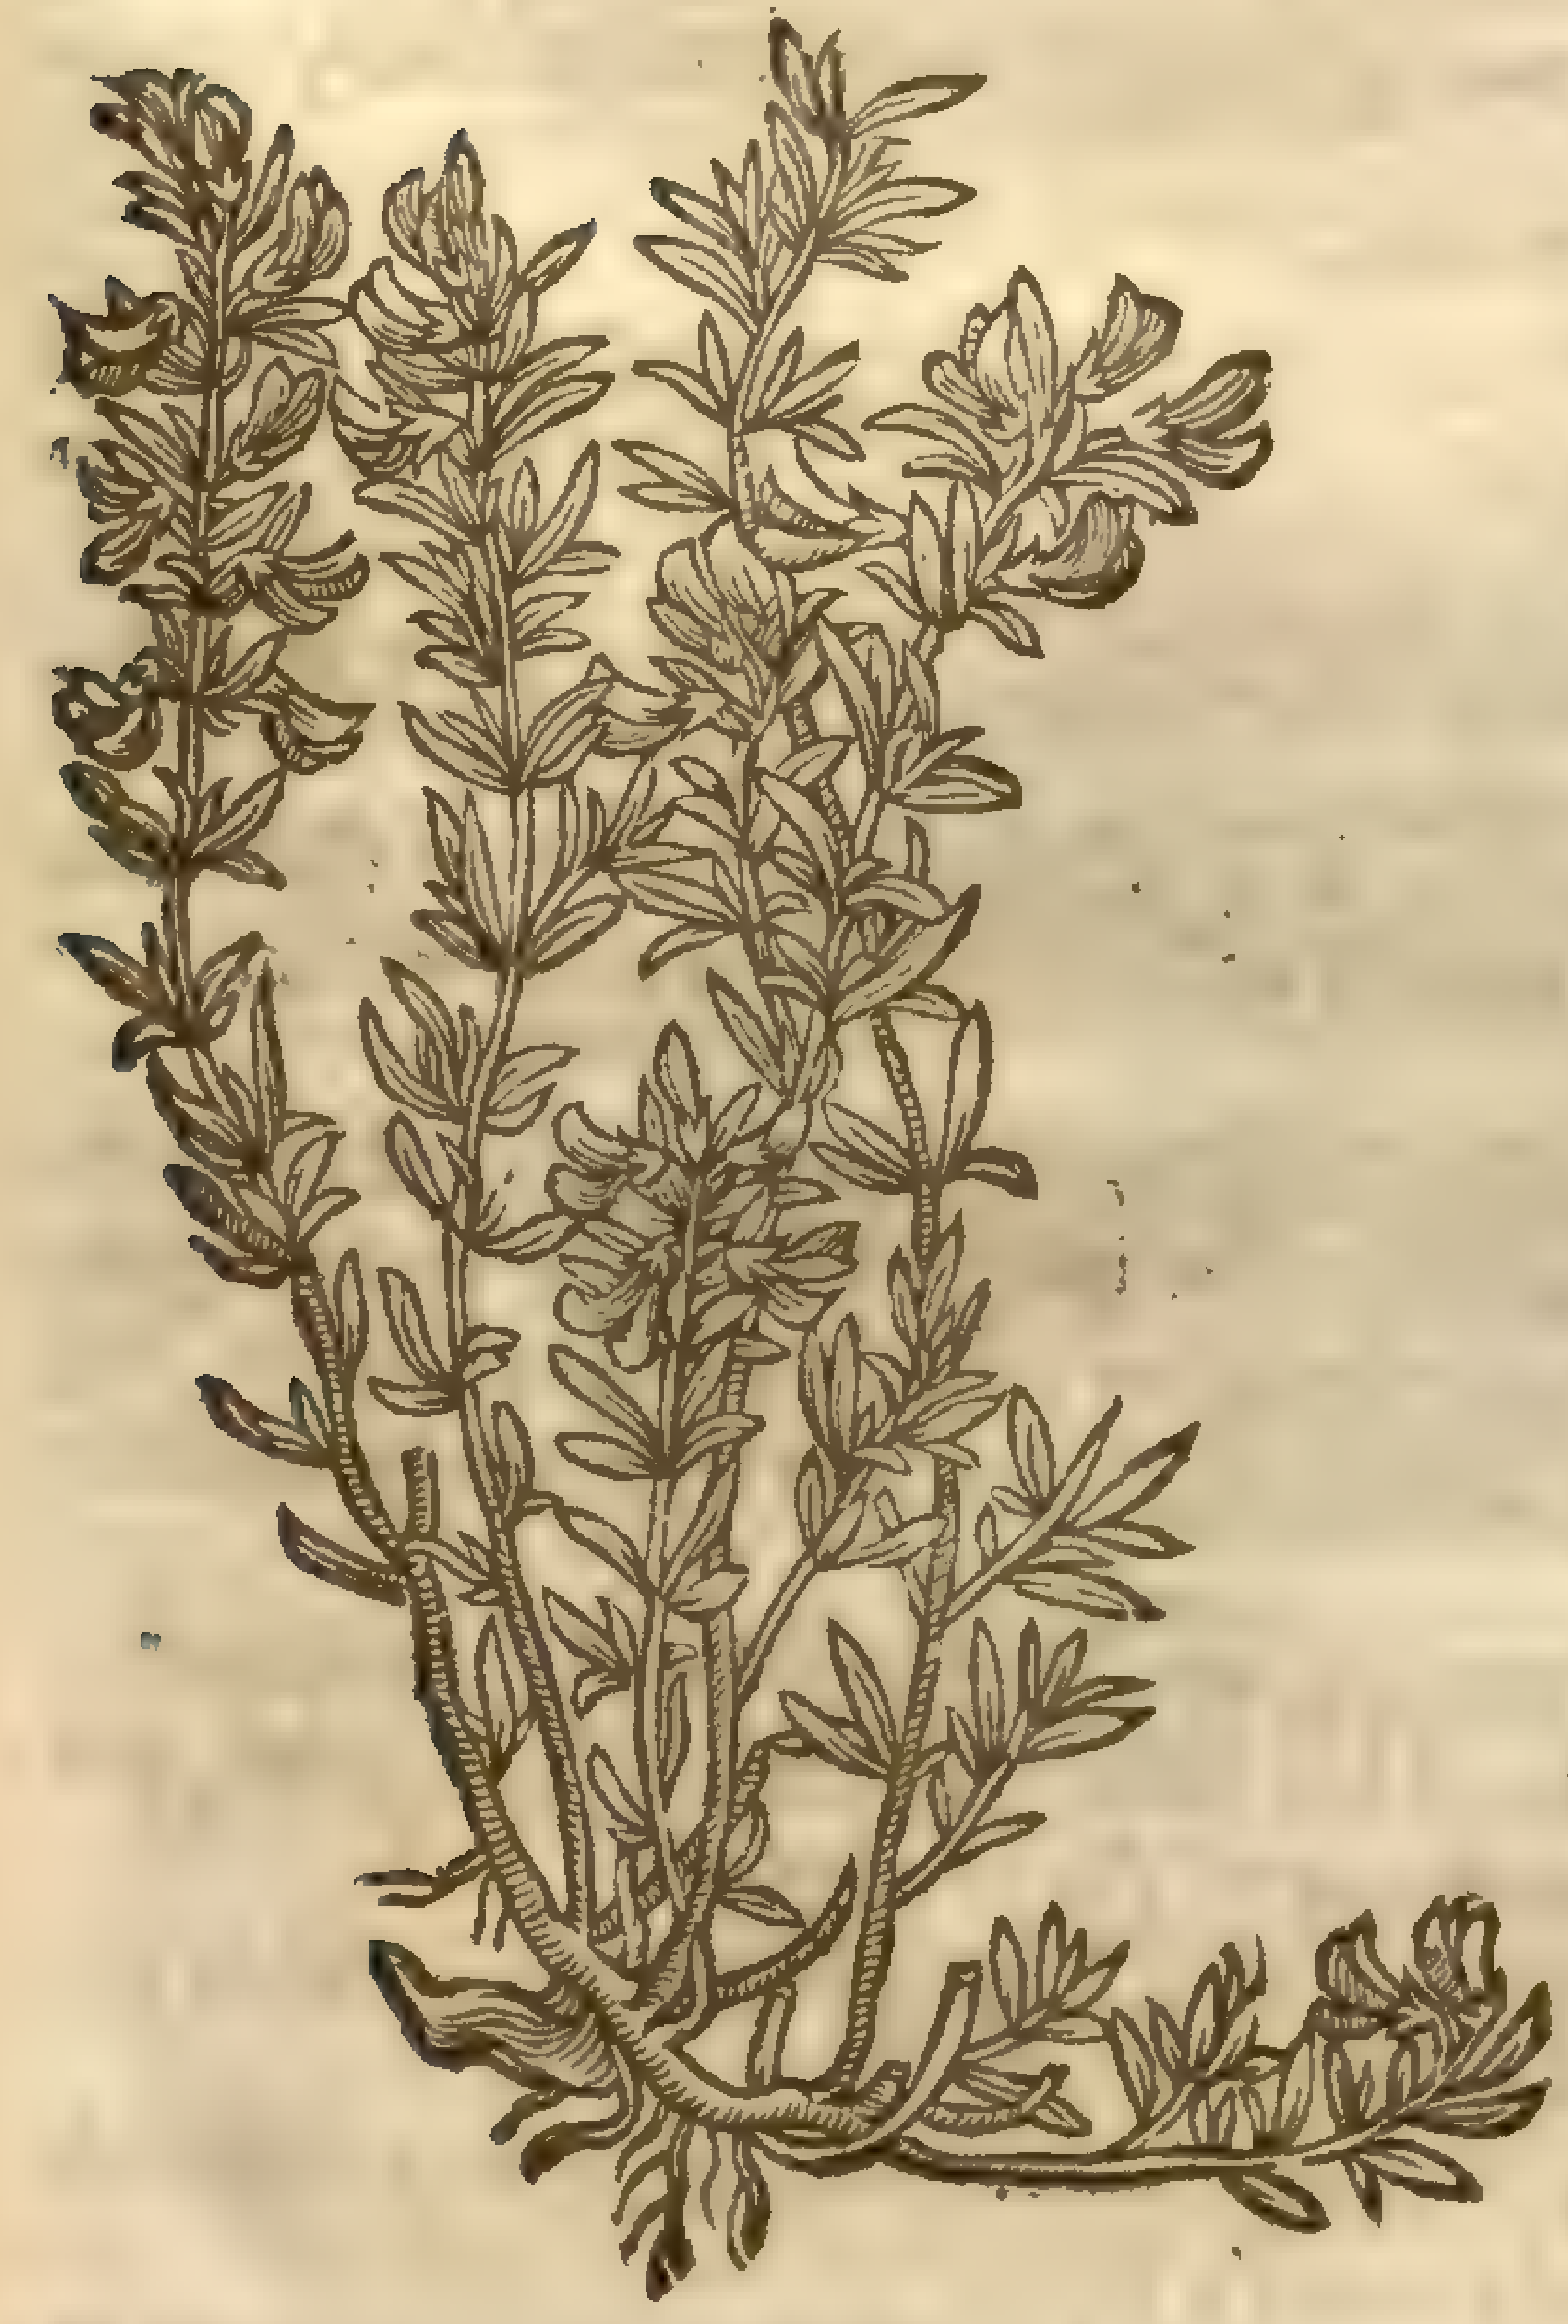


Spartium junceum L
nucl. dent.

5 *Chamægeniſta Anglica.*
Engliſh Dwarfe Broome.



6 *Chamægeniſta Pannonica.*
Dwarfe Broome of Hungary.



Genista pilosa L
[illegible]

‡ Of this *Orobanche* or Broome Rape there are ſome varieties obſerued and ſet forth by *Lobel* and *Cluſius*; the firſt of theſe varieties hath longer and ſmaller floures than the ordinarie. The ſecond hath larger floures, and thoſe of a blewiſh colour, and is ſometimes found among corne. The third is parted towards the top into ſundry branches; the floures of this are either blew, purpliſh or elſe white, and it willingly growes among Hempe. ‡

3 The Spaniſh Broome hath likewiſe wooddy ſtems, from whence grow vp ſlender pliant twigs, which be bare and naked without leaues, or at the leaſt hauing but few ſmall leaues, ſet here and there far diſtant one from another, with yellow floures not much vnlike the floures of common Broome, but greater, which turne into ſmall long cods, wherein is contained browne and flat ſeed: the root is tough and wooddy.

4 Small leafed or thin leafed Broome hath many tough pliant ſhoots riſing out of the ground, which grow into hard and tough ſtalks, which are diuided into diuers twiggy branches whereon doe grow very ſmall thin leaues, of a whitiſh colour; whereupon ſome haue called it *Geniſta alba*, white Broome: the floures grow at the top of the ſtalkes, in ſhape like thoſe of the common Broom, but of a white colour, wherein it ſpecially differeth from the other Broomes.

5 Engliſh Dwarfe Broome hath many twiggy branches, very greene, tough, ſomewhat ſtraked or cornered, leaning toward the ground: whereon doe grow leaues ſet without order, ſometimes two together, and often three or foure growing faſt together, like vnto the common Broome, greene on the vpper ſide, hoary vnderneath, and of a bitter taſte: among which leaues come forth yellow floures like thoſe of common Broome, but leſſer, of little or no ſmell at all: after which appeare ſmall cods ſomewhat hairy, wherein is contained ſmall ſeed: the root is tough and wooddy. ‡ *Bauhine* iudges theſe two laſt deſcribed to be onely varieties of the common Broome; to whoſe opinion I do much incline, yet I haue let our Authors deſcription ſtand, together with the figure of this later, which ſeemingly expreſſes the greateſt difference. ‡

6 The Dwarfe Broome of Hungary hath ſtalkes and yellow floures like thoſe of the laſt deſcribed: the leaues hereof are different, they are longer and more in number: the whole plant is altogether greater, wherein eſpecially conſiſteth the difference.

¶ *The Place.*

The common Broome groweth almoſt euery where in dry paſtures and low woods.

The Broome Rape is not to be found but where Broome doth grow; it groweth in a Broome field at the foot of Shooters hill next to London; vpon Hampſtead Heath, and in diuers other places.

Spaniſh Broome groweth in diuers kingdomes of Spaine and Italy; we haue it in our London gardens.

The White Broome groweth likewiſe in Spaine and other hot regions; it is a ſtranger in England; of this *Titus Calphurnius* makes mention in his ſecond Eclog of his Bucolicks, writing thus:

Cernis vt, ecce pater, quas tradidit Ornite vaccæ
Molle ſub hirſuta latus explicuere geniſta.

See Father, how the Kine ſtretch out their tender ſide
Vnder the hairy Broome, that growes in field ſo wide.

¶ *The Time.*

Broome floureth in the end of Aprill or May, and then the young buds of the floures are to bee gathered and laid in pickle or ſalt, which afterwards being waſhed or boyled, are vſed for ſallads, as Capers be, and be eaten with no leſſe delight: the cods and ſeeds be ripe in Auguſt; the Rape appeareth and is ſeene eſpecially in the moneth of Iune.

The Spaniſh Broome doth floure ſooner, and is longer in flouring.

¶ *The Names.*

This ſhrub is called in Latine, *Geniſta*, or as ſome would haue it *Geneſta*: in Italian *Geneſtra*: in Spaniſh likewiſe, *Geneſtra*, or *Gieſtra*: in high Dutch, **Pfrimmen**: in low Dutch, **Brem**: in French, *Geneſt*: in Engliſh Broome. ‡ The Spaniſh Broome by moſt Writers is iudged to be the *Spartium* of *Dioſcorides*. ‡

¶ *The Temperature and Vertues.*

A The twigs, floures and ſeeds of Broome are hot and dry in the ſecond degree: they are alſo of a thin eſſence, and are of force to clenſe and open, and eſpecially the ſeed, which is dryer and not ſo full of ſuperfluous moiſture.

B The decoction of the twigs and tops of Broome doth clenſe and open the liuer, milt, and kidnies.

C It driueth away by the ſtoole watery humors, and therefore it is wholeſome for them that haue the dropſie, eſpecially being made with wine; but better for the other infirmities with water.

D The ſeed alſo is commended for the ſame purpoſes.

E There is alſo made of the aſhes of the ſtalkes and branches dryed and burnt, a lie with thin white wine, as Rheniſh wine, which is highly commended of diuers for the greene ſickeneſſe and dropſie, and this doth mightily expell and driue forth thin and watery humors together with the vrine, and that by the bladder; but withall it doth by reaſon of his ſharpe quality many times hurt and fret the intrailes.

F *Meſue* ſaith, That there is in the floures and branches a cutting moiſture, but full of excrements, and therefore it cauſeth vomit: and that the plant doth in all his parts trouble, cut, attenuate, and violently purge by vomit and ſtoole, flegme and raw humors out of the joynts.

G But theſe things are not written of Broome, but of *Spartium*, which purgeth by vomit, after the manner of Hellebor, as both *Dioſcorides* and *Pliny* do teſtifie.

H *Meſue* alſo addeth, That Broome doth breake the ſtone of the kidnies and bladder, and ſuffereth not the matter whereof the ſtone is made to lie long, or to become a ſtone.

I The young buds or little floures preſerued in pickle, and eaten as a ſallad, ſtirre vp an appetite to meate and open the ſtoppings of the liuer and milt.

L The ſame being fully blowne, ſtamped and mixed with ſwines greaſe, doe eaſe the paine of the gout.

M And *Meſue* writeth, That this tempered with hony of Roſes, or with an egge, doth conſume away the Kings euill.

N The Rape of the Broome or Broome Rape, being boyled in wine, is commended againſt the pains of the kidneyes and bladder, prouoketh vrine, breaketh the ſtone, and expelleth it.

O The juyce preſſed forth of Broome rape healeth greene wounds, and clenſeth old and filthy vlcers: the later Phyſitions do affirme that it is alſo good for old venomous, and malicious vlcers.

P That worthy Prince of famous memory *Henry* 8. King of England, was wont to drinke the diſtilled water of Broome floures, againſt ſurfets and diſeaſes thereof ariſing.

Q Sir *Thomas Fitzherbert* Knight, was wont to cure the blacke jaundice with this drinke onely.

R Take as many handfulls (as you thinke good) of the dried leaues of Broome gathered and brayed to pouder in the moneth of May, then take vnto each handfull of the dried leaues, one ſpoonful and a halfe of the ſeed of Broome brayed into pouder: mingle theſe together, and let the ſicke drinke thereof each day a quantity, firſt and laſt, vntill he finde ſome eaſe. The medicine muſt be continued and ſo long vſed, vntill it be quite extinguiſhed: for it is a diſeaſe not very ſuddenly cured, but muſt by little and little be dealt withall.

S Orobanch or Broome rape ſliced and put into oyle Oliue, to infuſe or macerate in the ſame as ye do Roſes for oyle of Roſes, ſcoureth and putteth away all ſpots, lentils, freckles, pimples, wheals and puſhes from the face, or any part of the body, being annointed therewith.

T *Dioſcorides* writeth, That Orobanch may be eaten either raw or boiled, in manner as we vſe to eat the ſprigs or young ſhoots of *Aſparagus*.

V The floures and ſeeds of Spaniſh Broome are good to be drunke with meade or honied water in the quantity of a dram, to cauſe one to vomit with great force and violence, euen as white Hellebo or neeſing pouder.

X If it be taken alone, it looſeneth the belly, driueth forth great quantitie of waterie and filthy humours.

CHAP. 18. *Of baſe Broome or greening weed.*

¶ *The Deſcription.*

1 THis baſe kinde of Broom called Green weed or Diers weed, hath many tough branches proceeding from a wooddy root: whereon do grow great ſtore of leaues, of a deep green colour, ſomwhat long like thoſe of Flax: the flours grow at the top of the branches not much vnlike the leaues of Broome, but ſmaller; of an exceeding faire yellow colour, which turne into ſmall flat cods, wherein is contained a little flat ſeed.

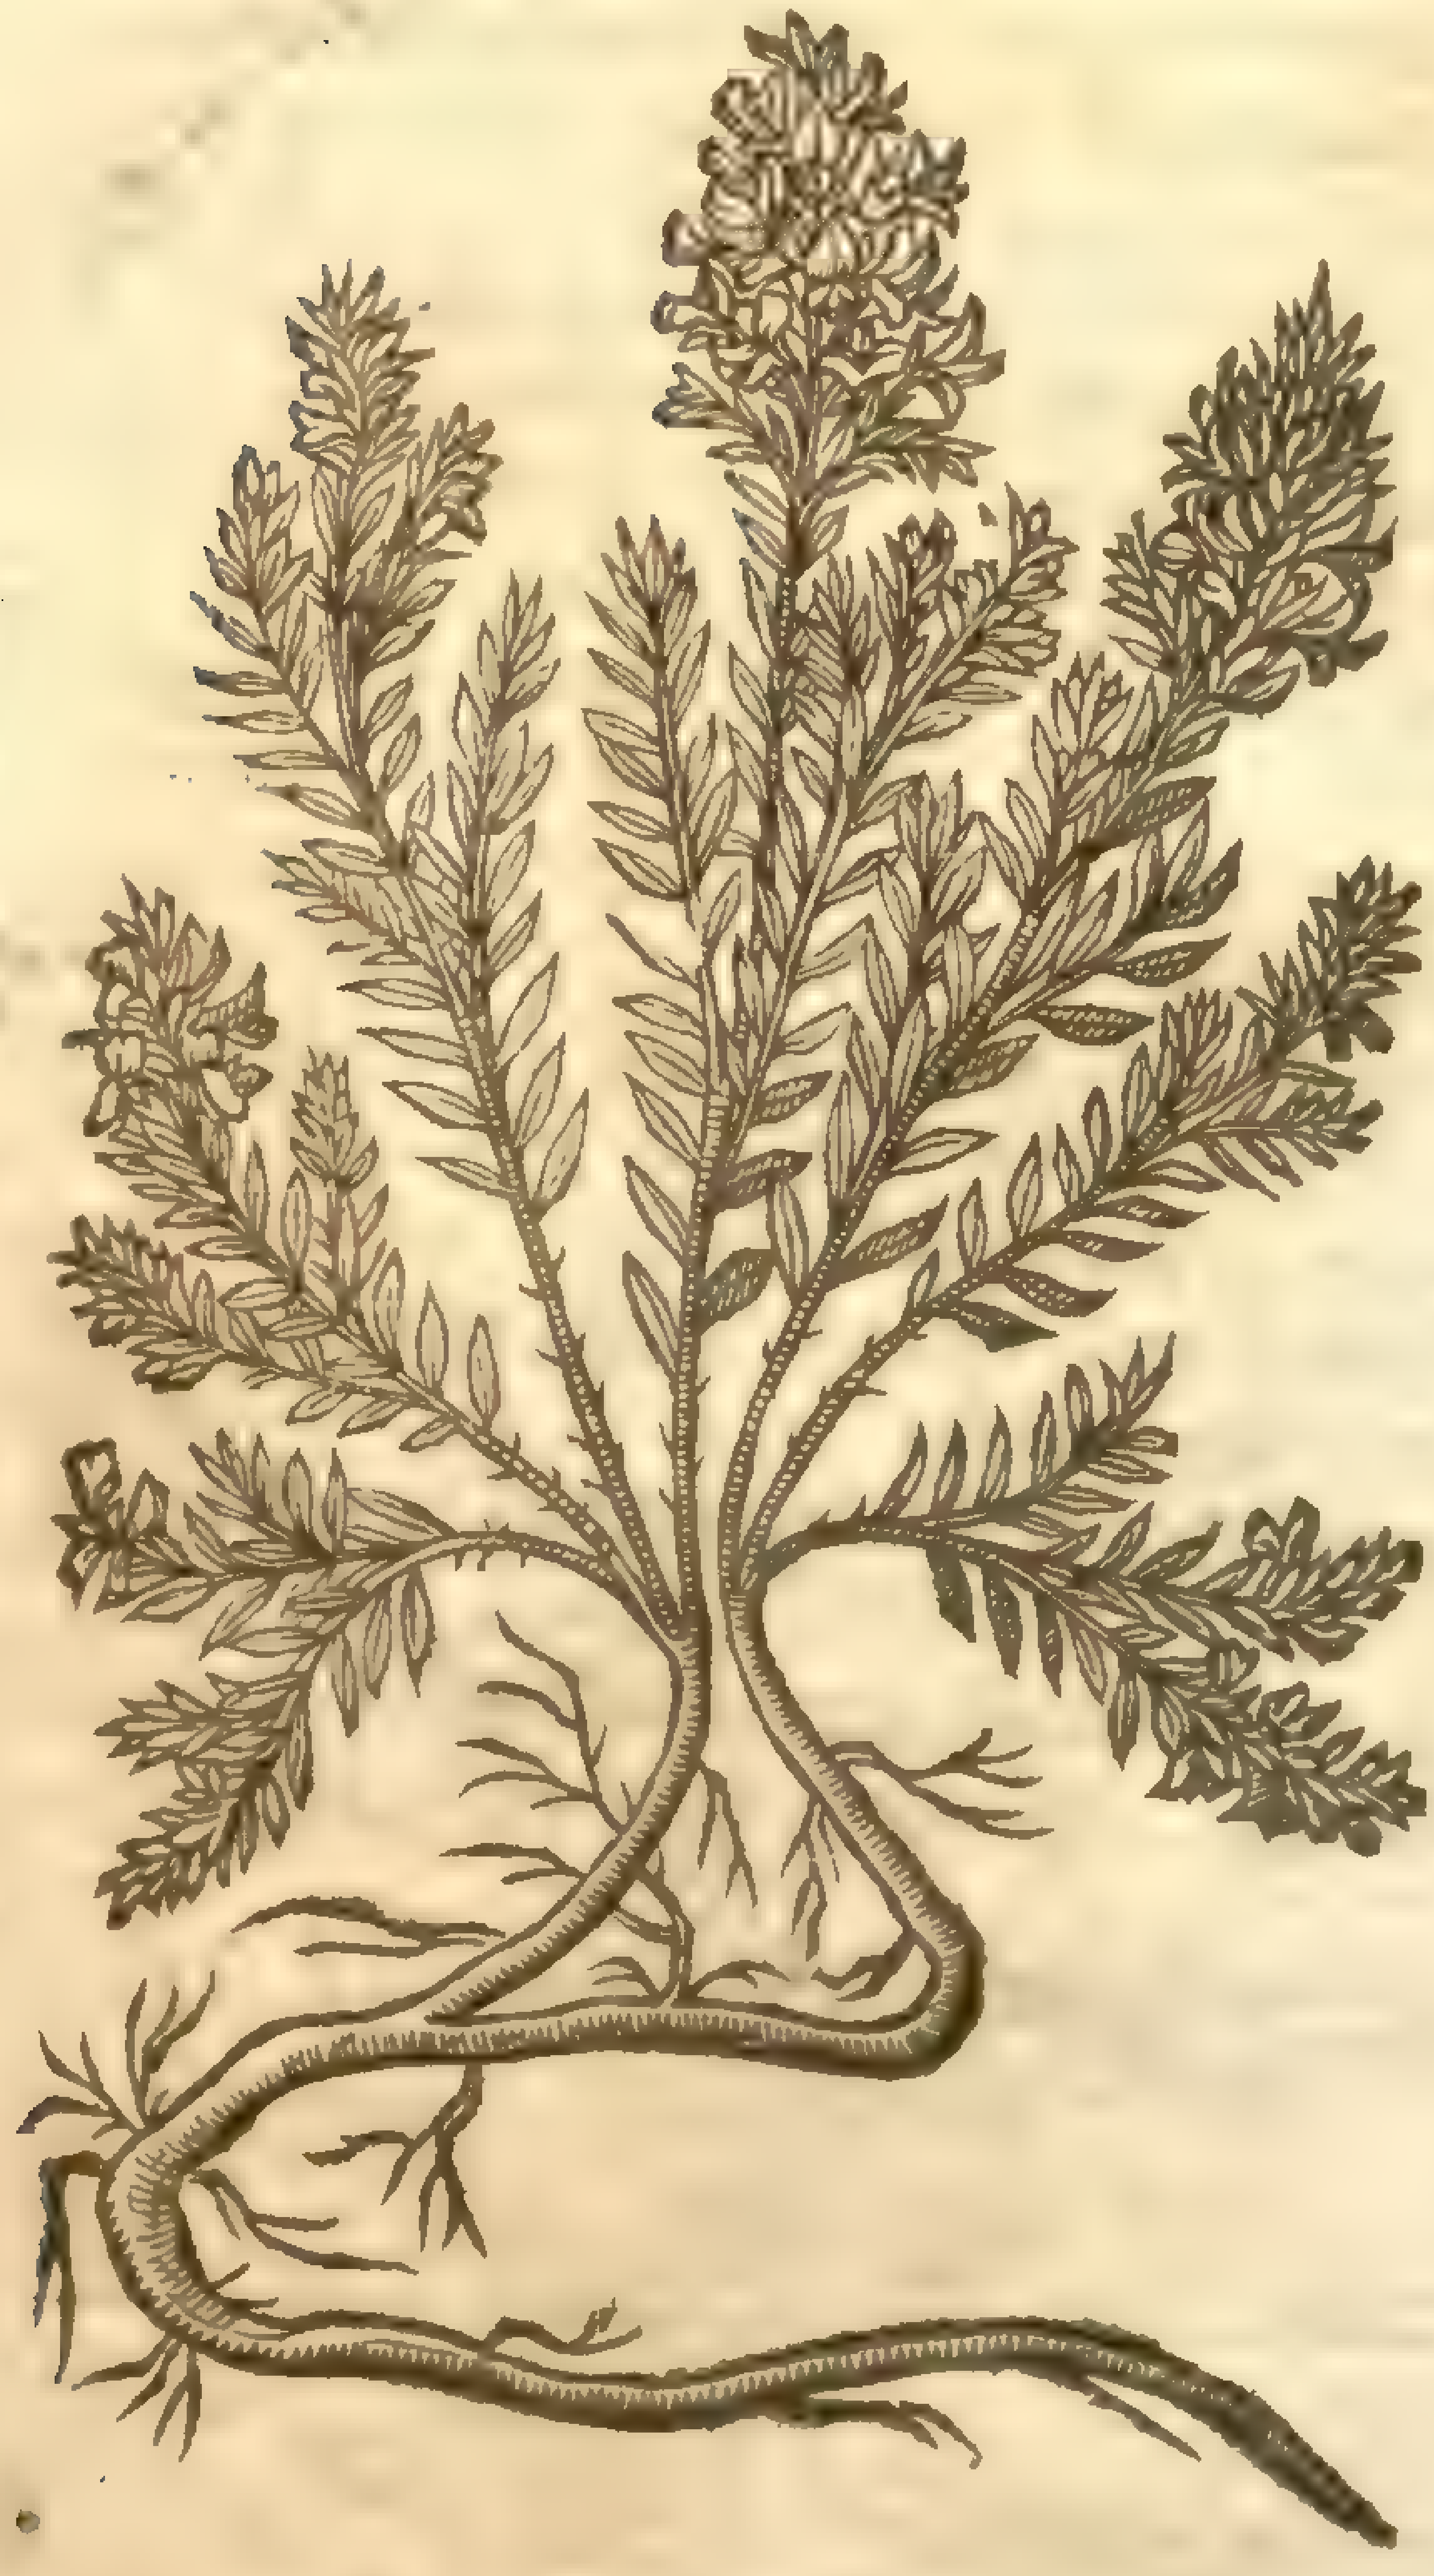
2 *Carolus Cluſius* ſetteth forth another kinde of Broome, which *Dodonæus* calleth *Geniſta tinctoria*, being another ſort of Diers weed: it groweth like the Spaniſh Broome: vpon whoſe branches do grow long and ſmall leaues like Flax, greene on the vpper ſide, and of an hoary ſhining colour on the other. The floures grow at the top of the ſtalkes, ſpike faſhion, in forme and colour like the former: the roots are thicke and wooddy.

3 *Carolus Cluſius* ſetteth forth two kindes of Broome. The firſt is a low and baſe plant, creeping and lying flat vpon the ground, whoſe long branches are nothing elſe, but as it were ſtalkes conſiſting of leaues thicke in the middeſt, and thinne about the edges, and as it were diuided with ſmall nicks; at which place it beginneth to continue the ſame leafe to the end, and ſo from leafe to leafe, vntill it haue increaſed a great ſort, all which doe as it were make one ſtalke; and hath none other leaues, ſauing that in ſome of the nicks or diuiſions there commeth forth a ſmall leafe like a little eare. At the end of thoſe flat and leafed ſtalks come forth the floures, much like the floures of the common Greening weed, but leſſer, and of a yellow colour, which turne into ſmall cods. The roots are very long, tough, and wooddy, full of fibres, cloſing at the top of the root, from whence they proceed as from one body.

4 This kinde of Greeneweed called of ſome *Chamæſpartium*, hath a thicke wooddy root: from which riſe vp diuers long leaues, conſiſting as it were of many pieces ſet together like a paire of Beads (as may better be perceiued by the figure, than expreſſed by words) greene on the vpper ſide, and whitiſh vnderneath, very tough, and as it were of a ruſhie ſubſtance: among which riſe vp very ſmall naked ruſhy ſtalkes; on the top whereof groweth an eare or ſpike of a chaffie matter, hauing here and there in the ſaid eares diuers yellow floures like Broome, but very ſmall or little.

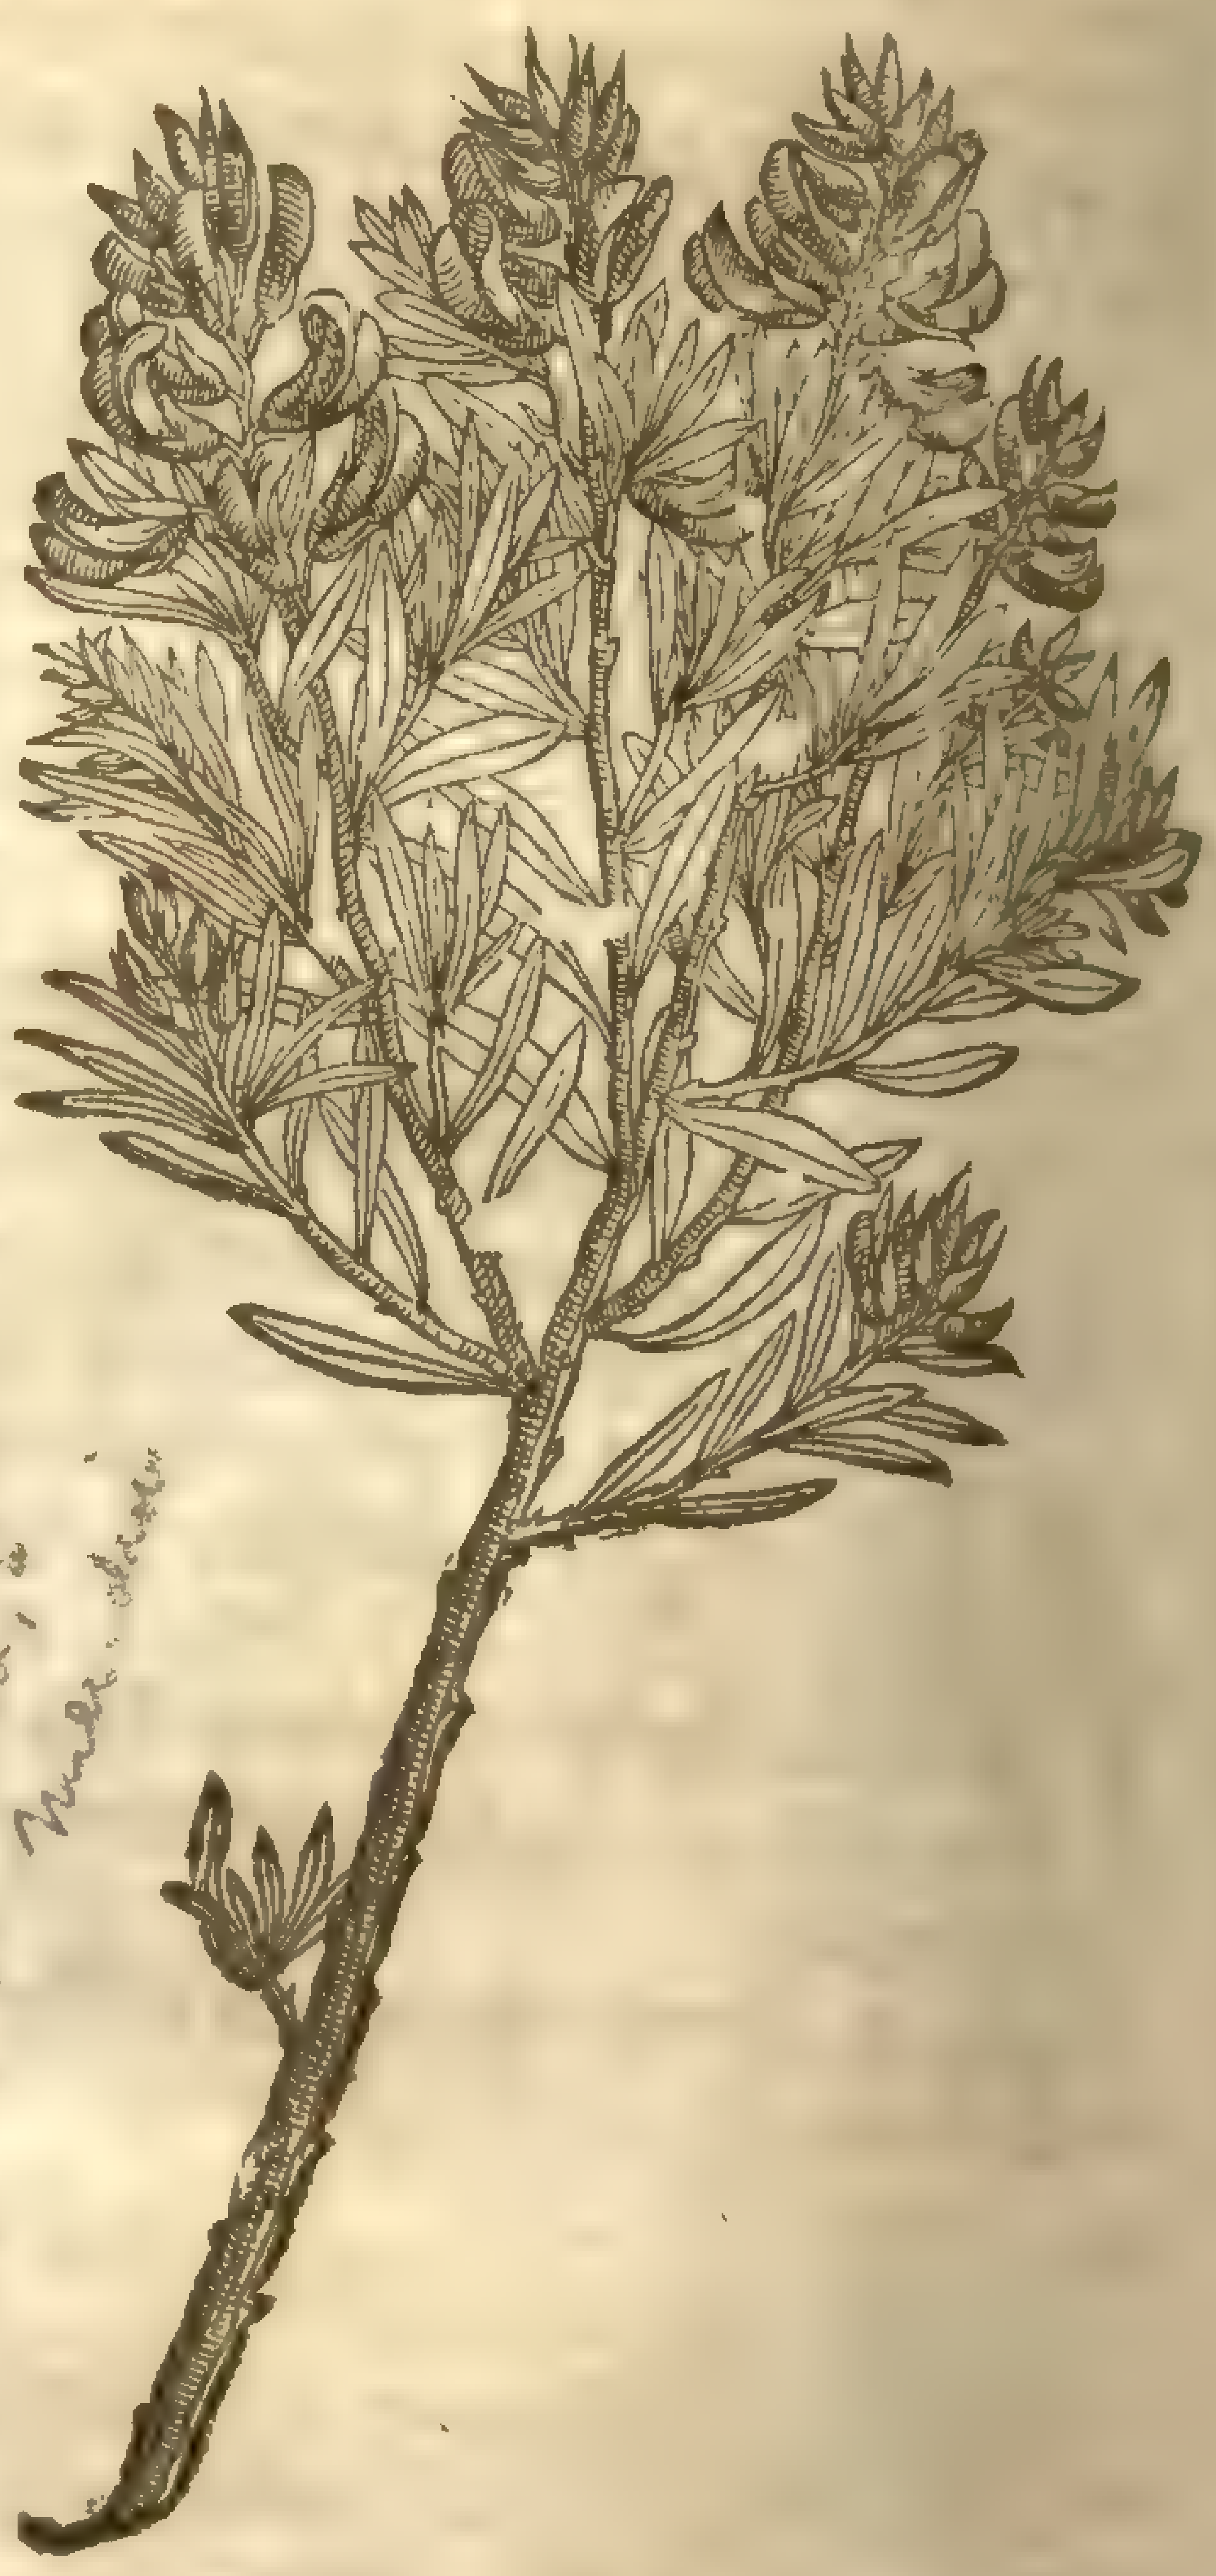
1 *Geniſtella tinctoria.*
Greeneweed or Diers weed.

Genista tinctoria, [illegible]



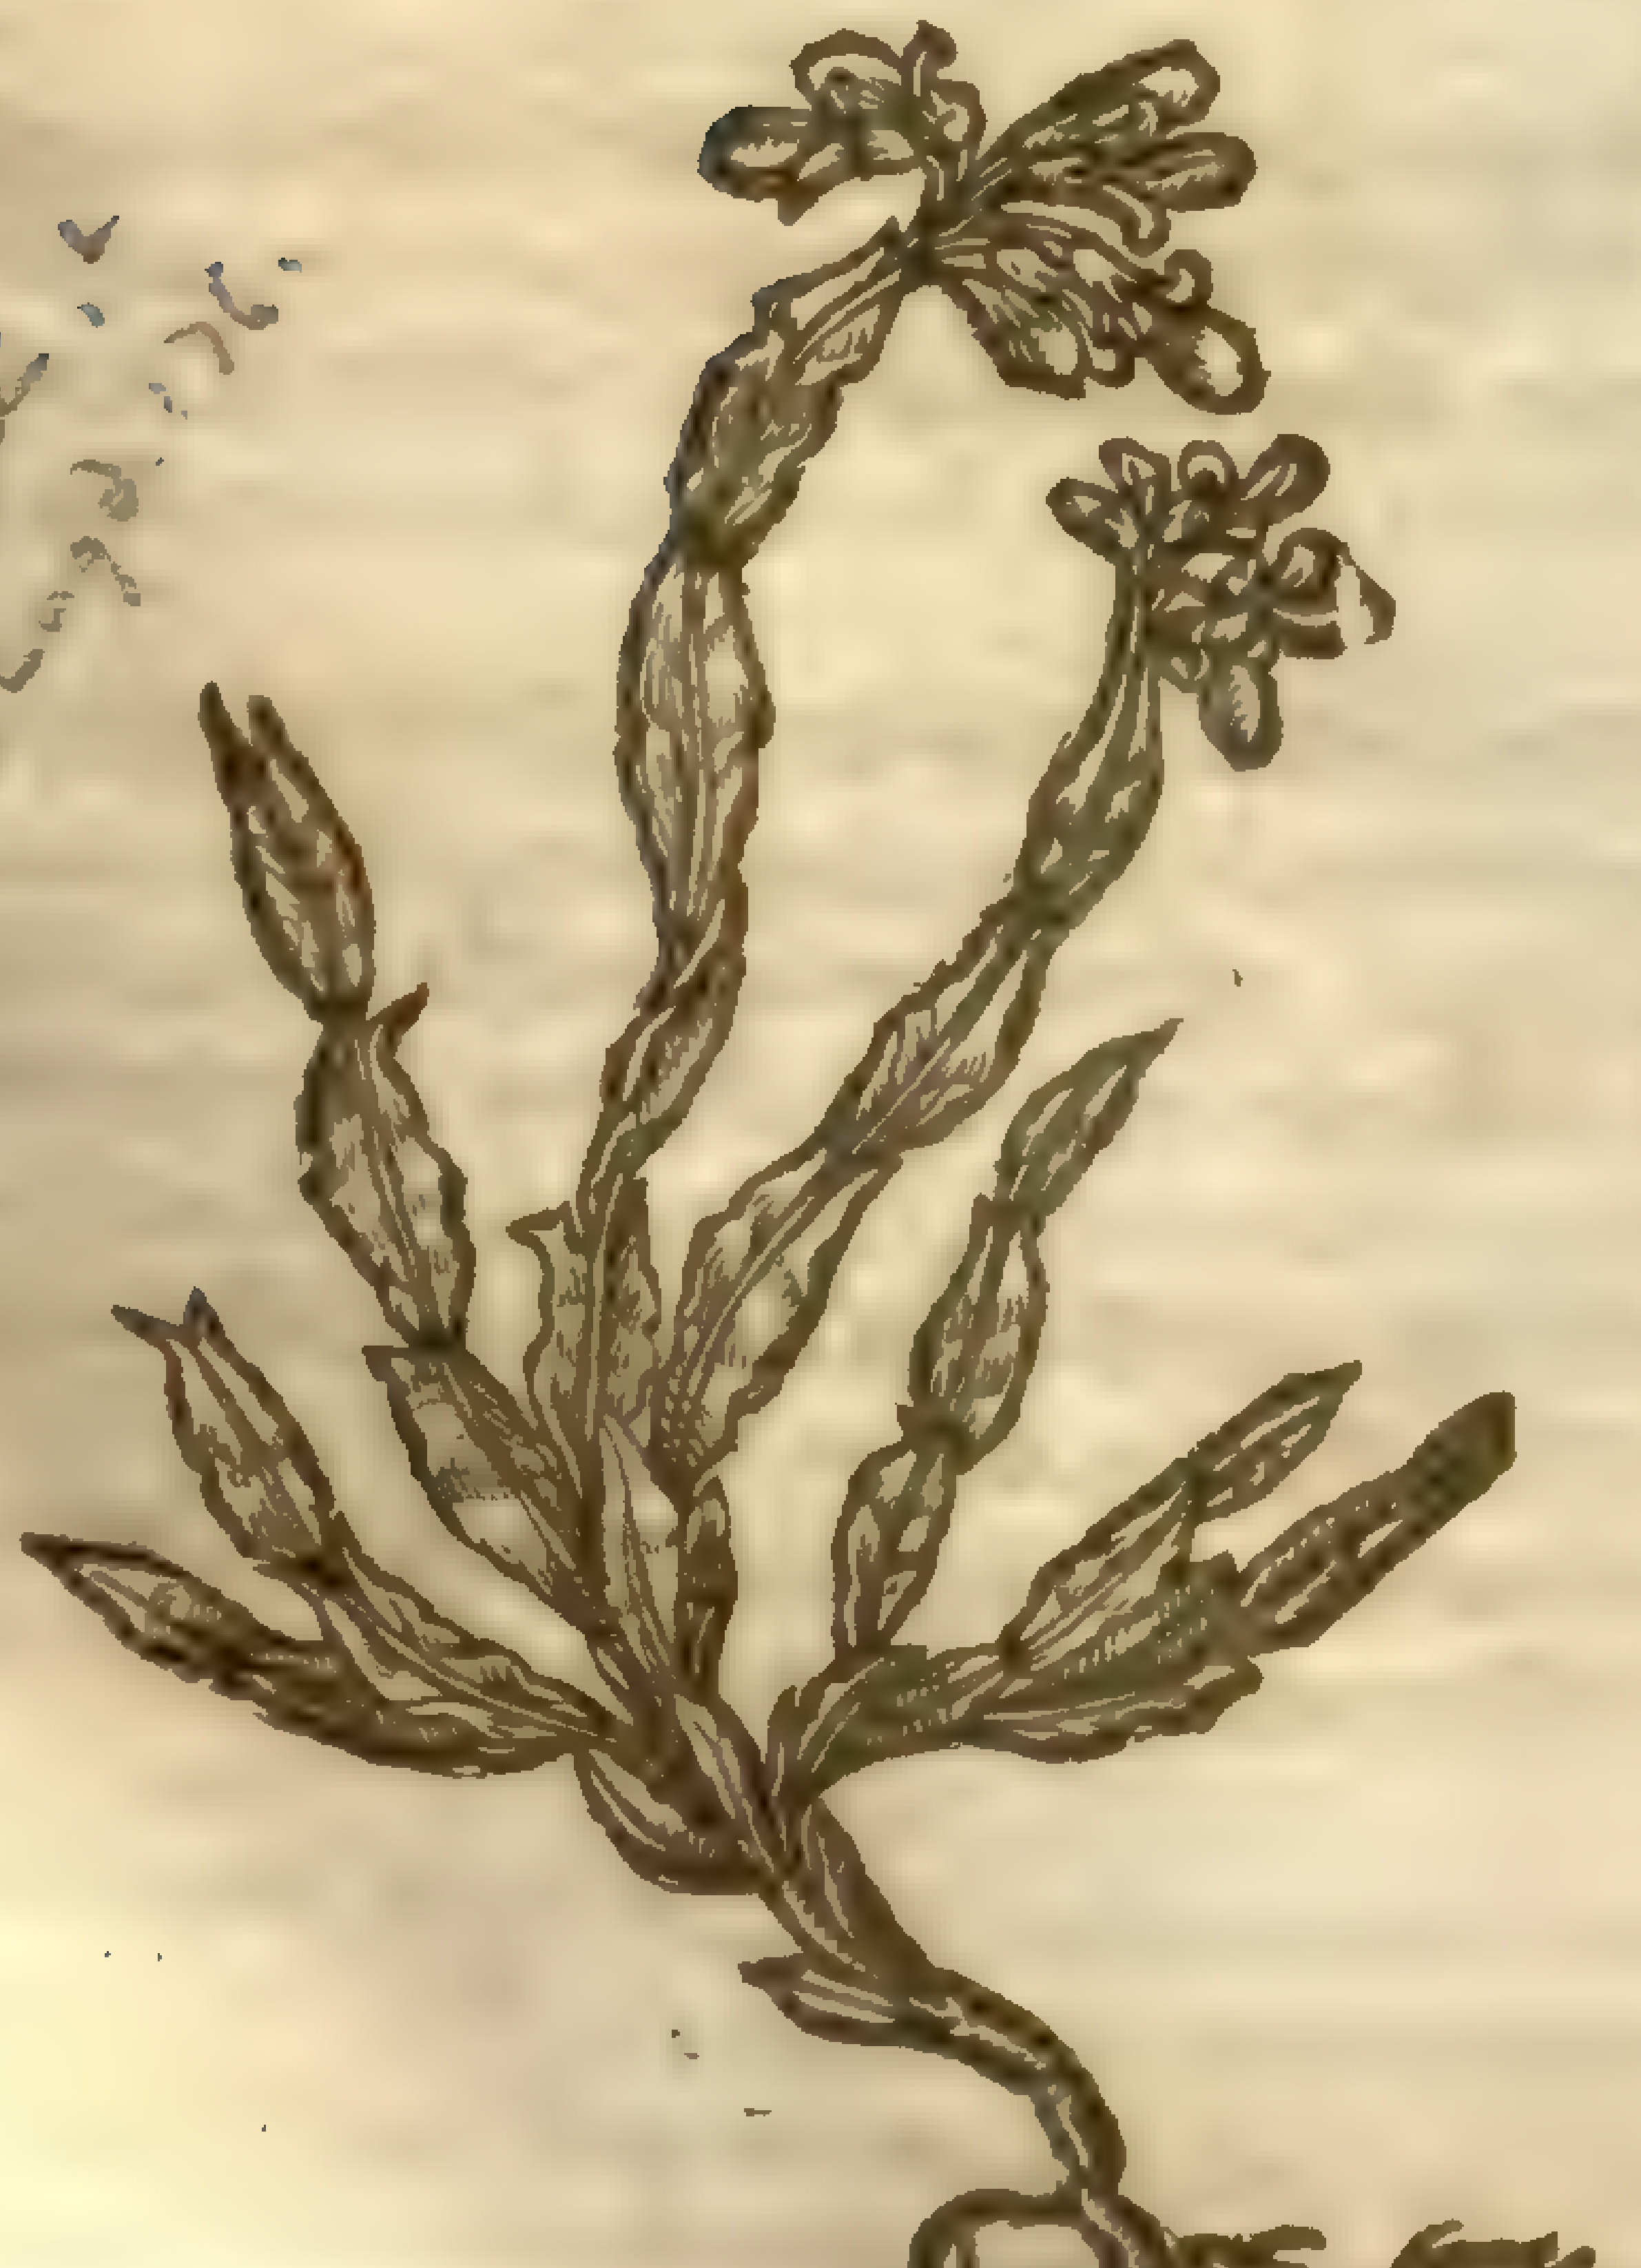
2 *Geniſtella infectoria.*
Wooddy Diers-weed.

Genista florida, [illegible]

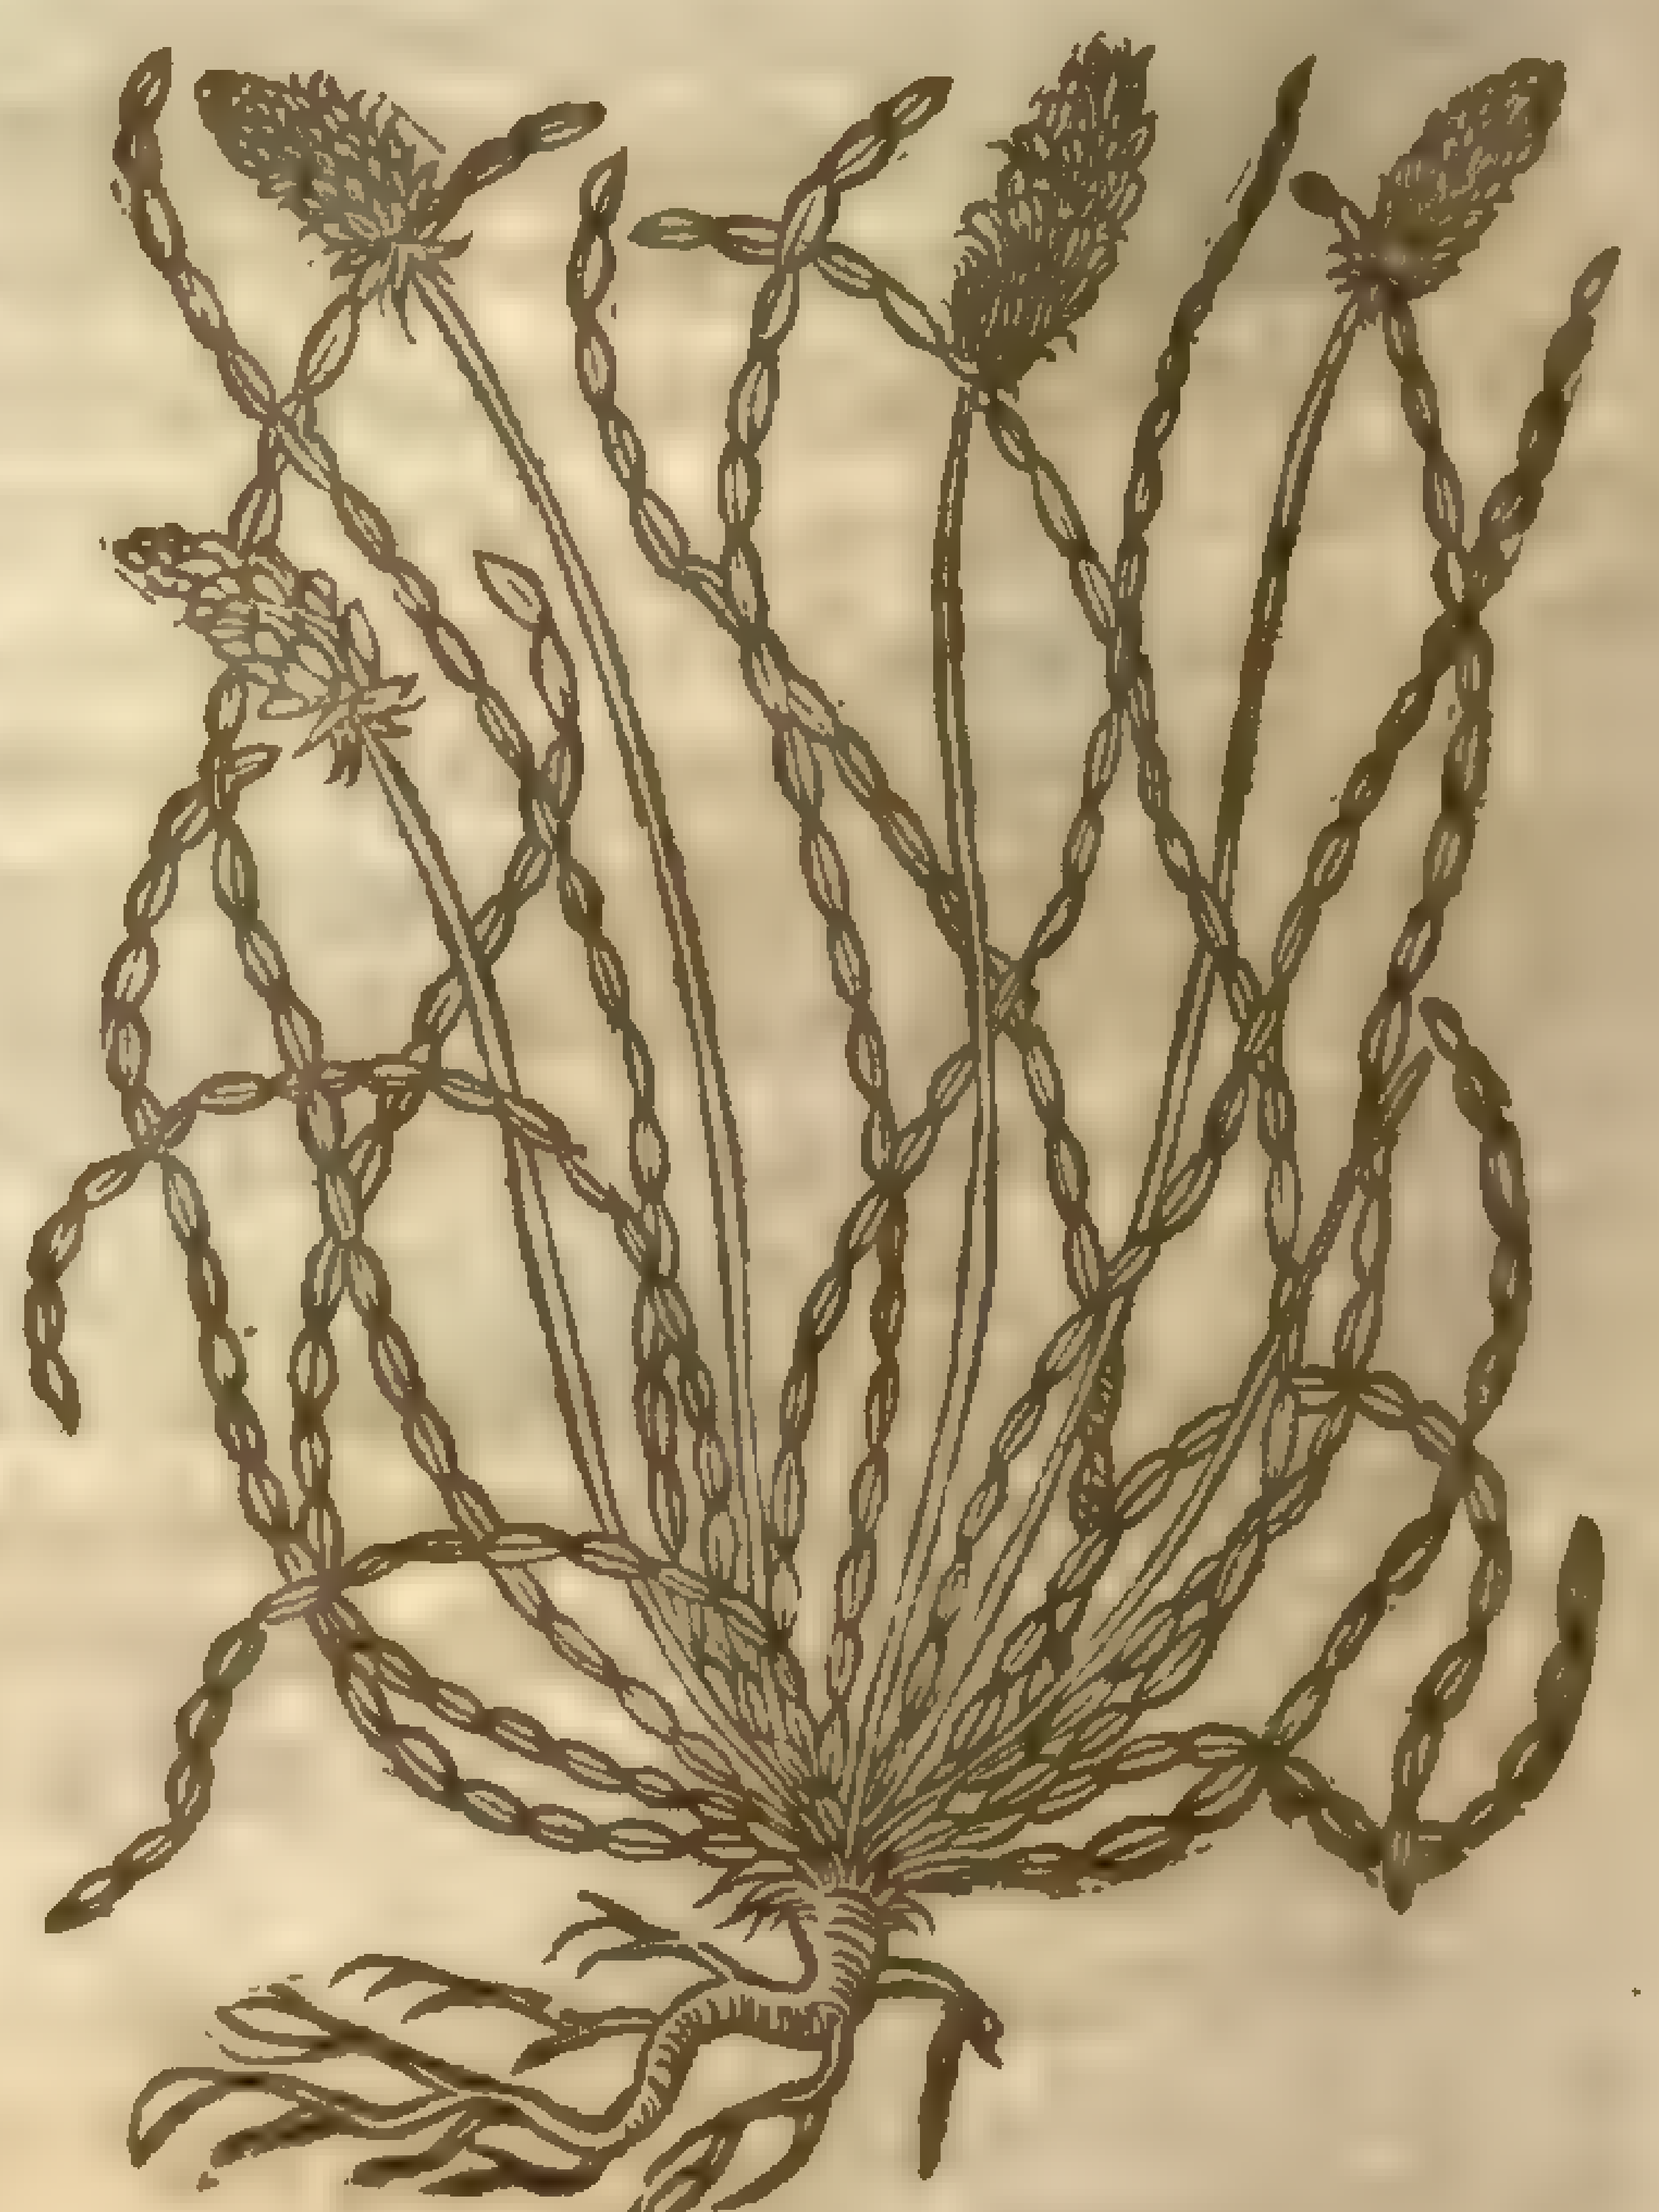


3 *Geniſtella pinnata.*
Winged Greeneweed.

Genista sagittalis, [illegible] 176.

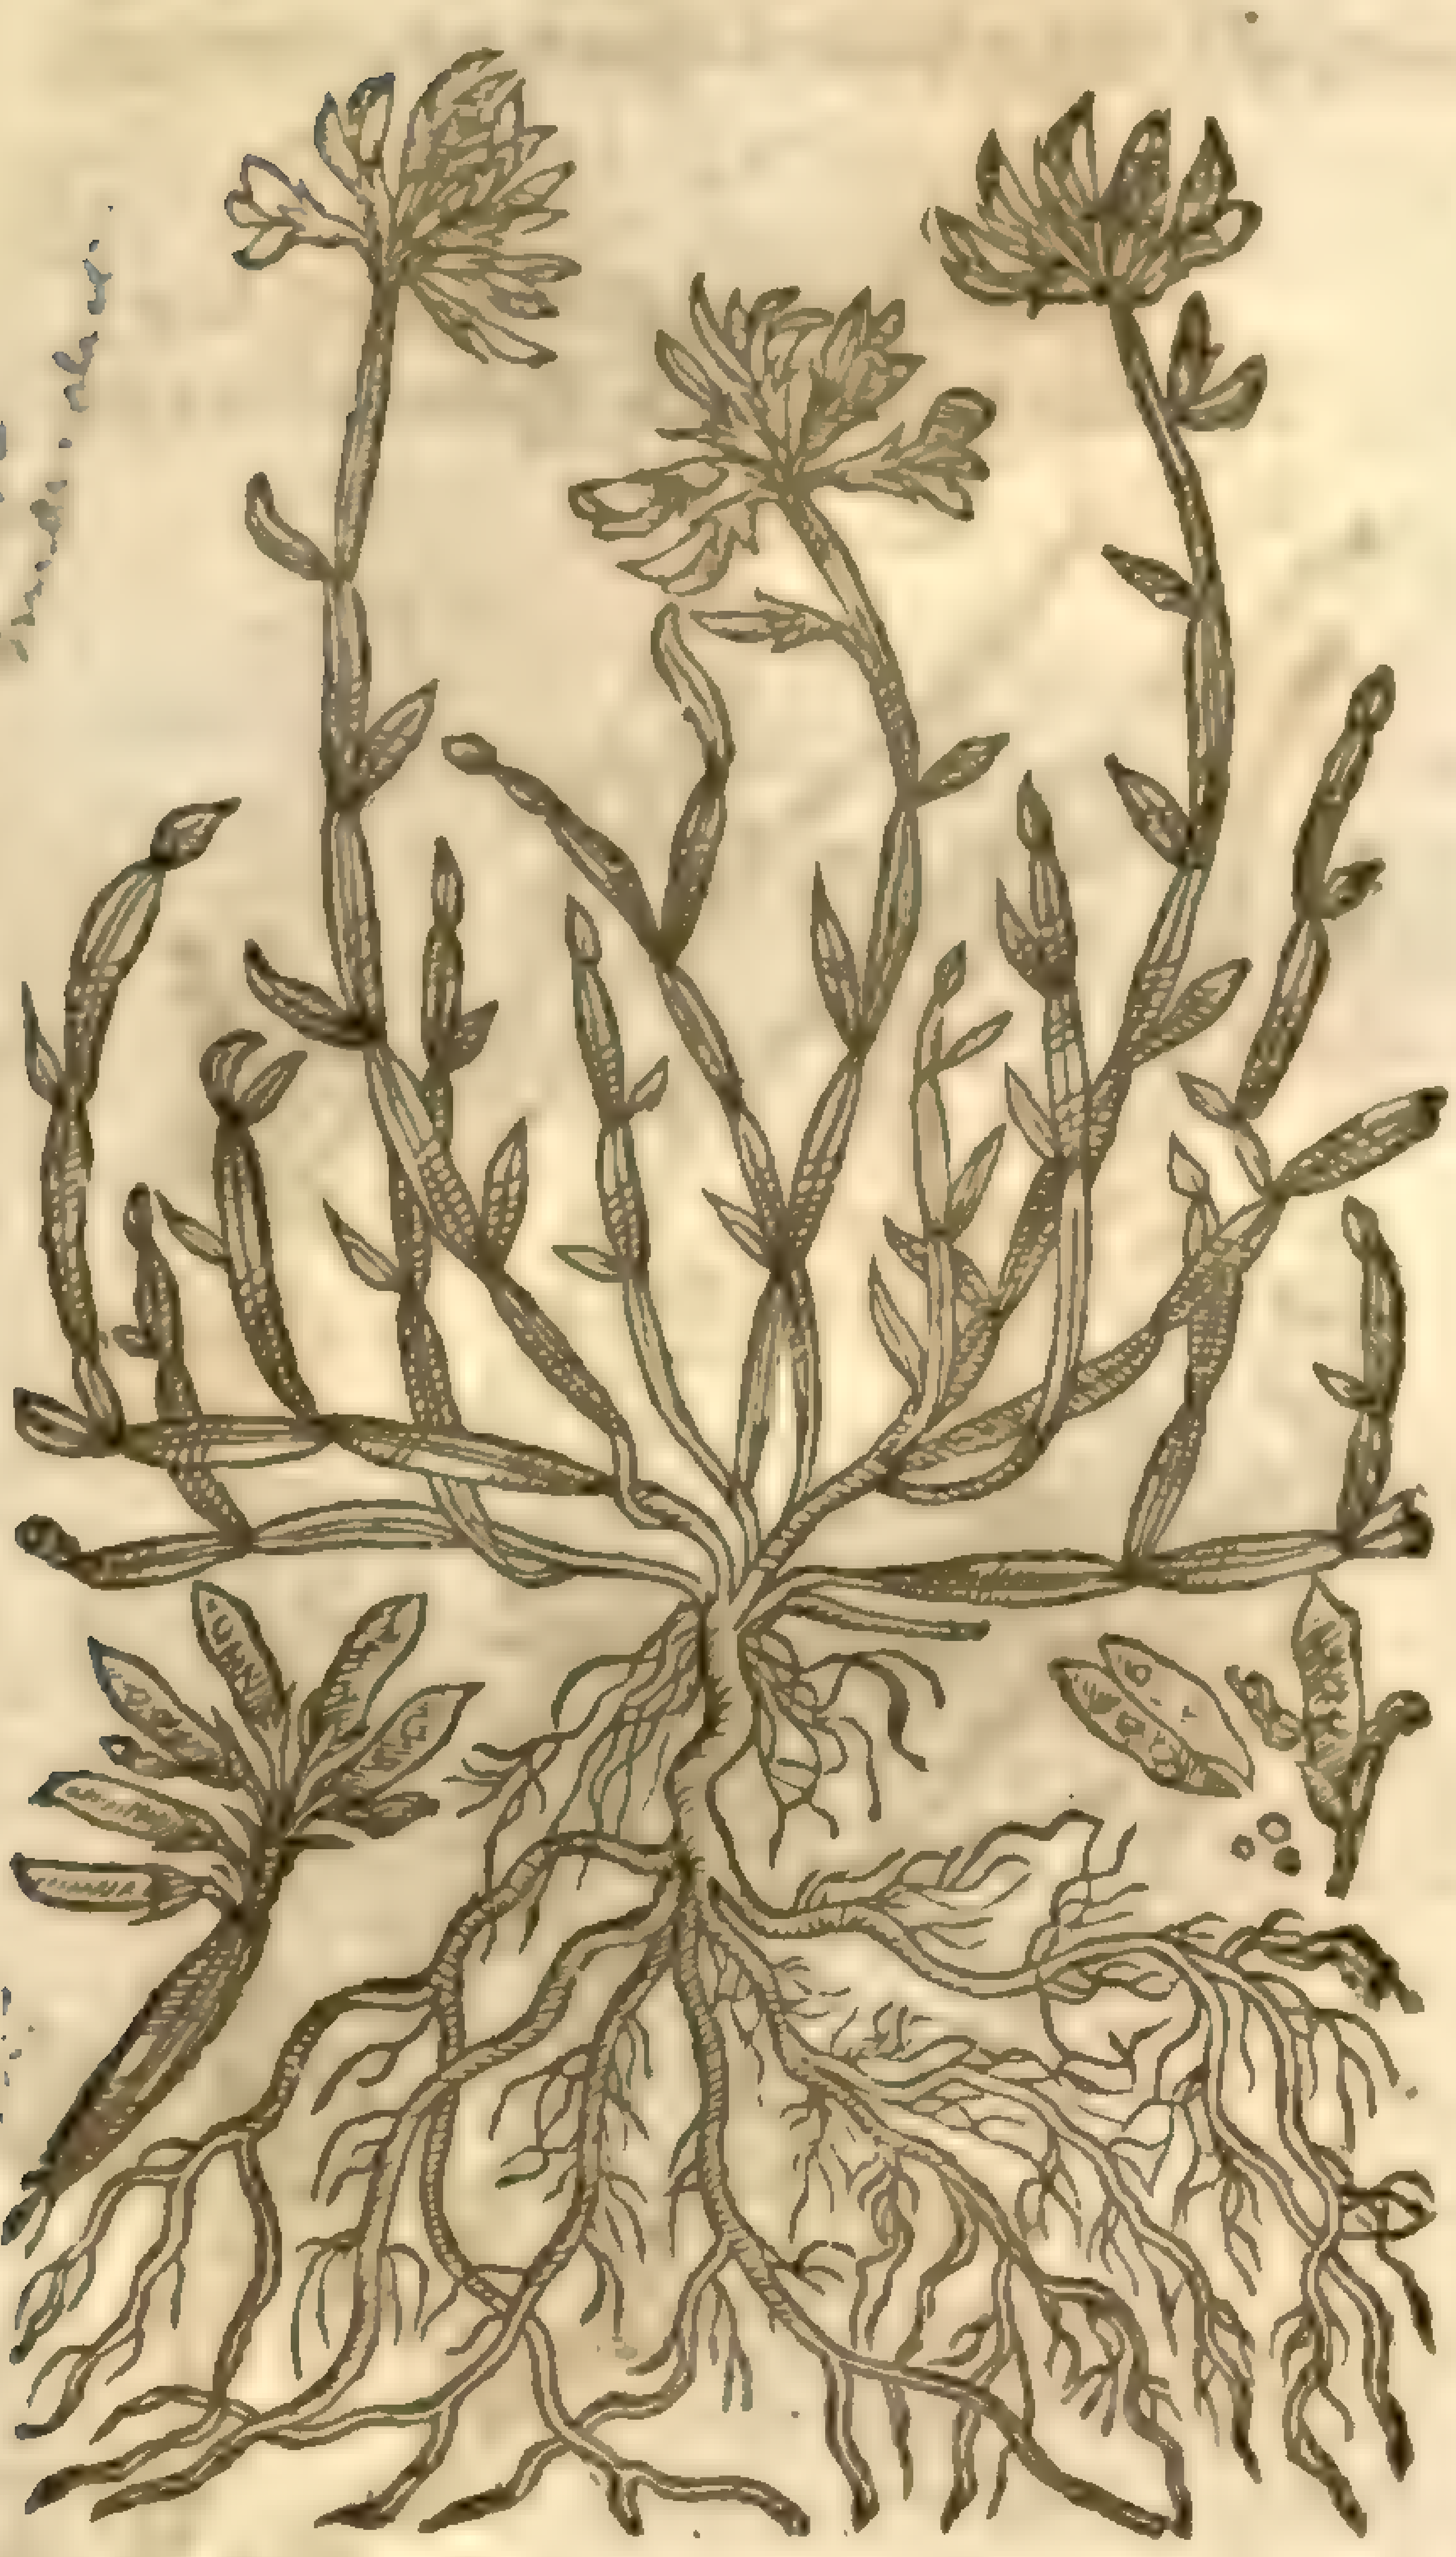


4 *Geniſtella globulata.*
Globe Greeneweed.



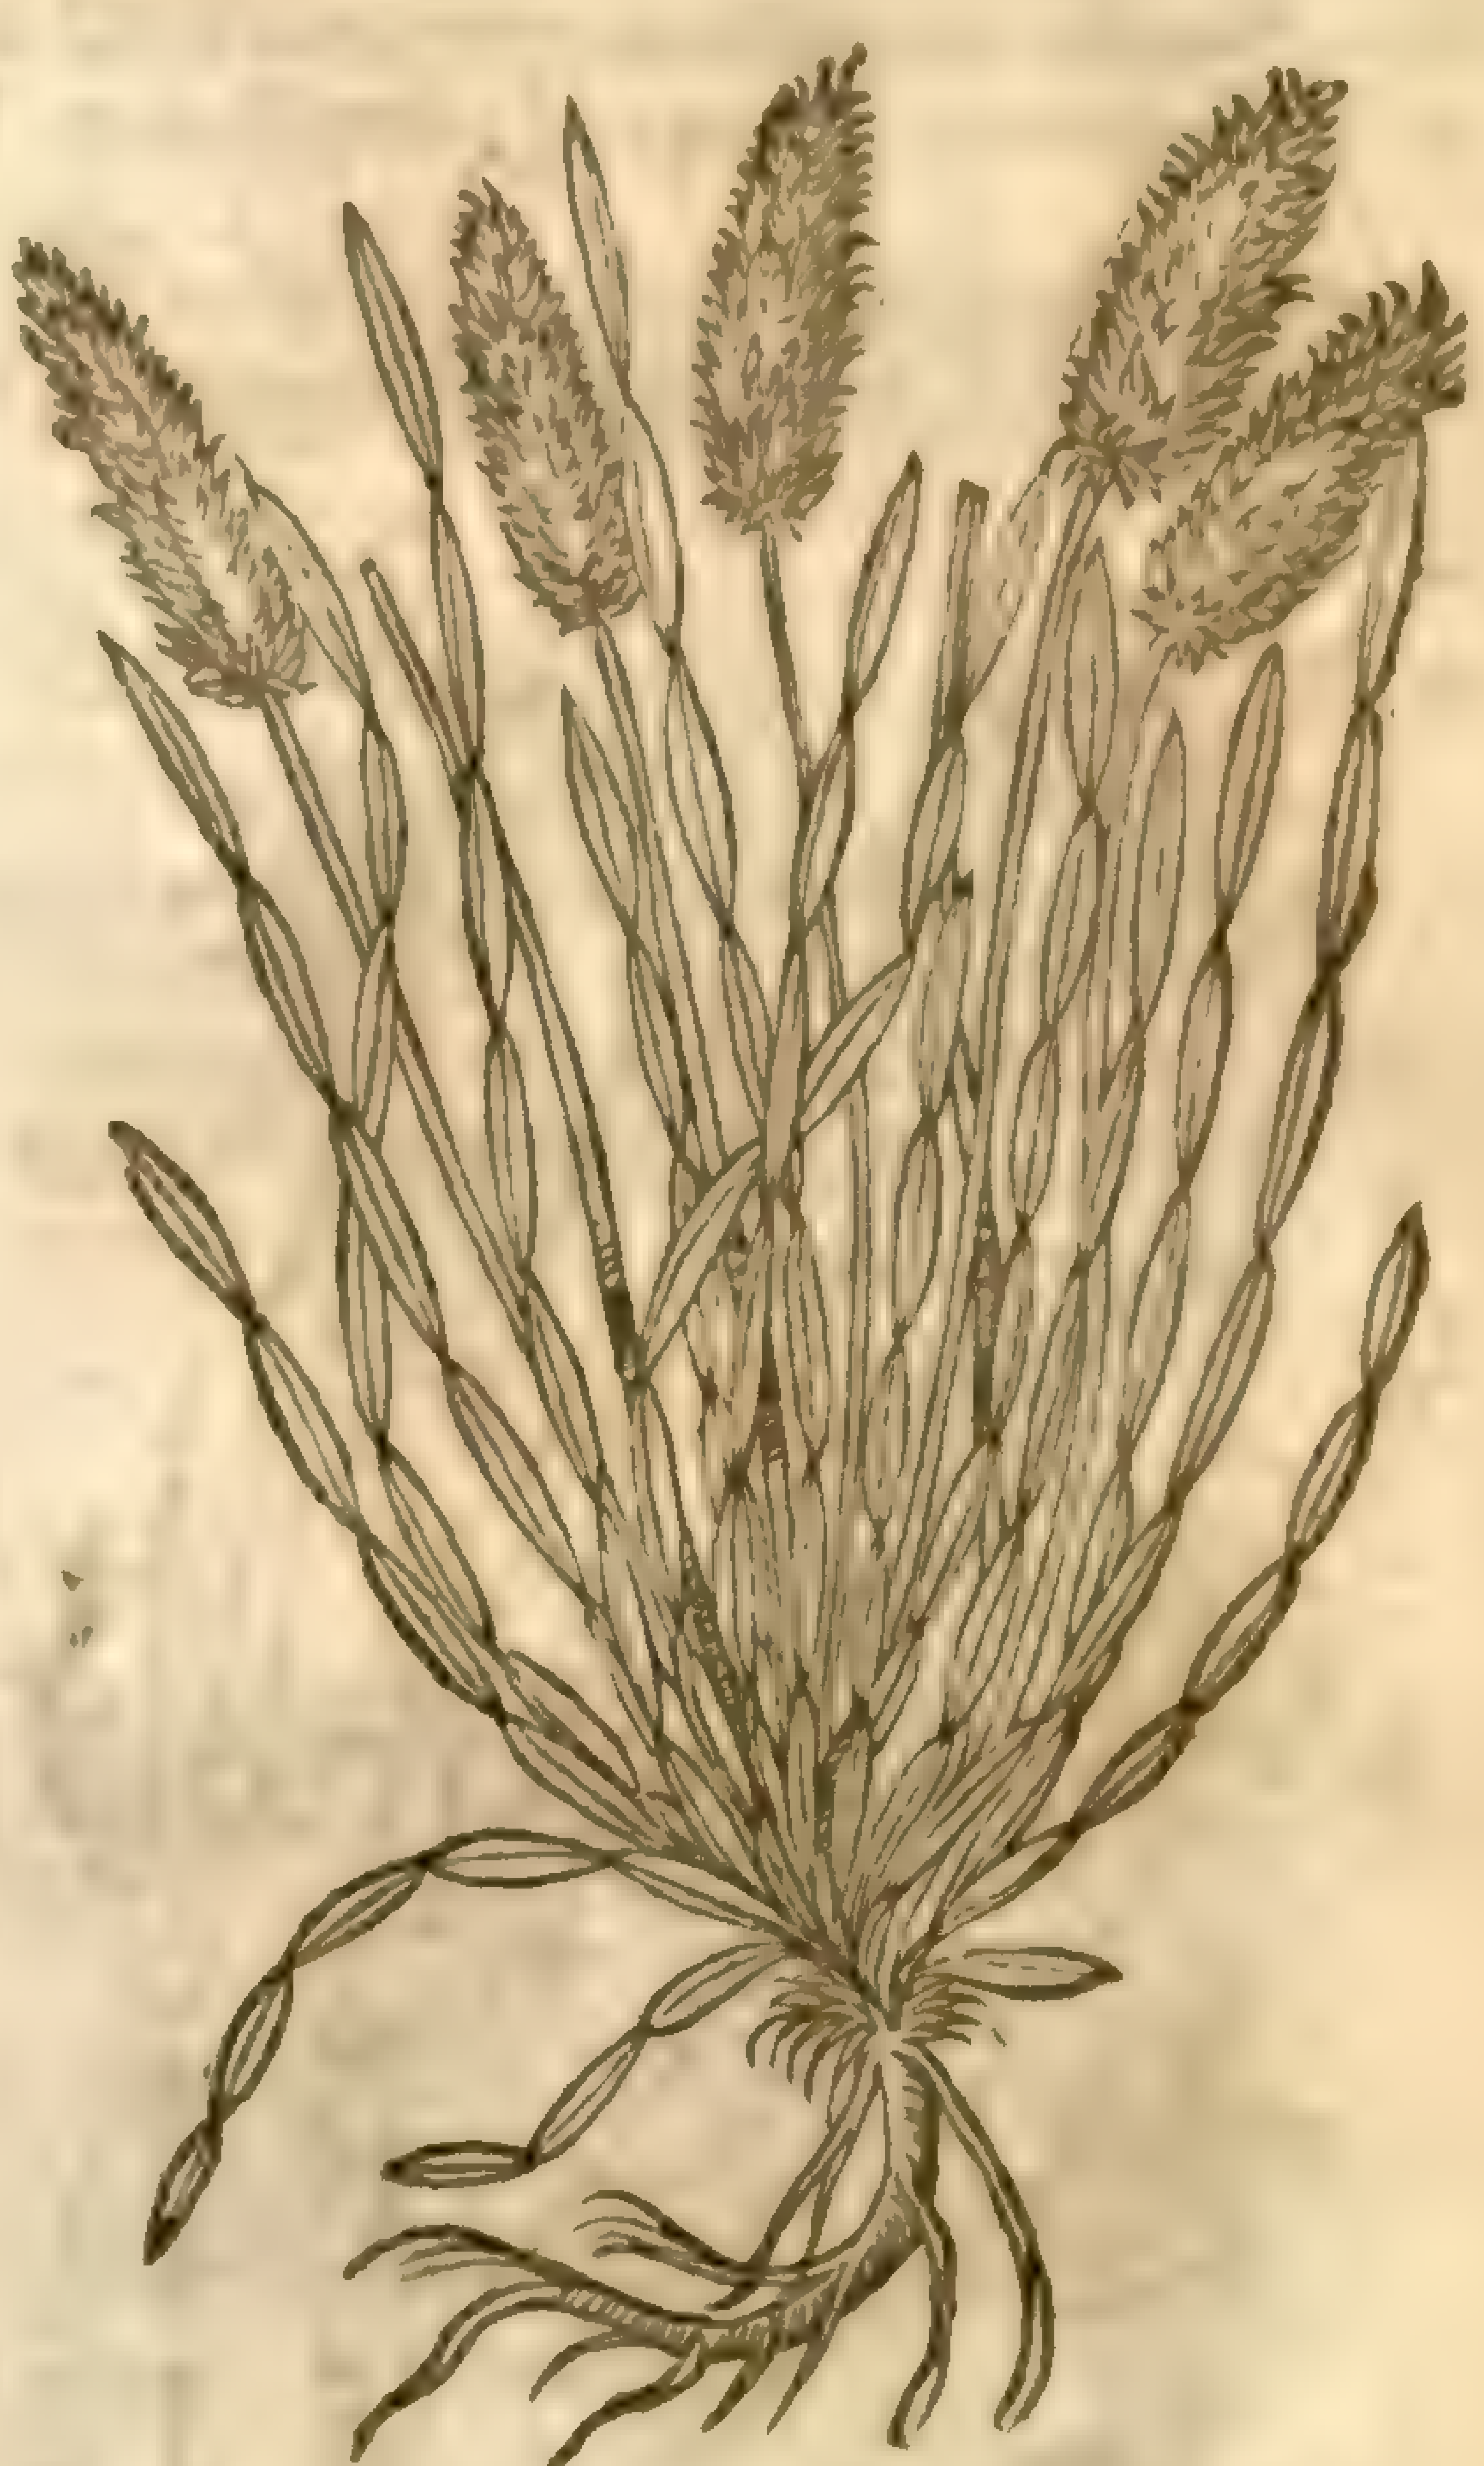
5 The fifth Greenweed hath a wooddy tough root,with certaine ſtrings annexed thereto:from which riſe vp diuers long,flat leaues,tough,and very hard,conſiſting as it were of many little leaues, ſet one at the end of another, making of many one entire leaſe, of a greene colour : amongſt which come forth diuers naked hard ſtalkes,very ſmall and ſtiffe, on the tops whereof ſtand ſpikie eares of yellow floures, like thoſe of Broome, in ſhape like that great three leafed graſſe, called *Lagopus*, or like the Fox-taile graſſe : after which come flat cods, wherein is incloſed ſmall ſeed like to Tares both in taſte and forme.

5 *Geniſtella Lagopoides major.*
Hares foot Greeneweed.



[illegible]

5 *Geniſtella Lagopoides minor.*
Small Greeneweed with Hares foot floure.



6 This differeth not from the precedent in ſtalks,roots and leaues:the floures conſiſt of a flockie ſoft matter,not vnlike to the graſſie tuft of Foxtaile,reſembling the floure of *Lagopus*,or Hares-foot,but hauing ſmall yellow floures leſſer than the former, wherein it chiefely differeth from the other of his kinde.

¶ *The Place.*

The firſt being our common Diers-weed,groweth in moſt fertile paſtures and fields almoſt euery where. The reſt are ſtrangers in England.

¶ *The Time.*

They floure from the beginning of Iuly to the end of Auguſt.

¶ *The Names.*

The firſt of theſe Greenweeds is named of moſt Herbariſts *Flos Tinctorius*,but more rightly,*Geniſta Tinctoria*,of this *Pliny* hath made mention [The Greeneweeds,ſaith he,do grow to dye clothes with] in his 18.booke,16.chapter. It is called in high Dutch, **Ferblumen**, and **Ackerbrem**: in Italian,*Cerretta*, and *Coſaria*, as *Matthiolus* writeth in his chapter of *Lyſimachia*,or Looſe-ſtrife: in Engliſh,Diers Greeneweed,baſe Broome,and Woodwaxen.

The reſt we refer to their ſeuerall titles.

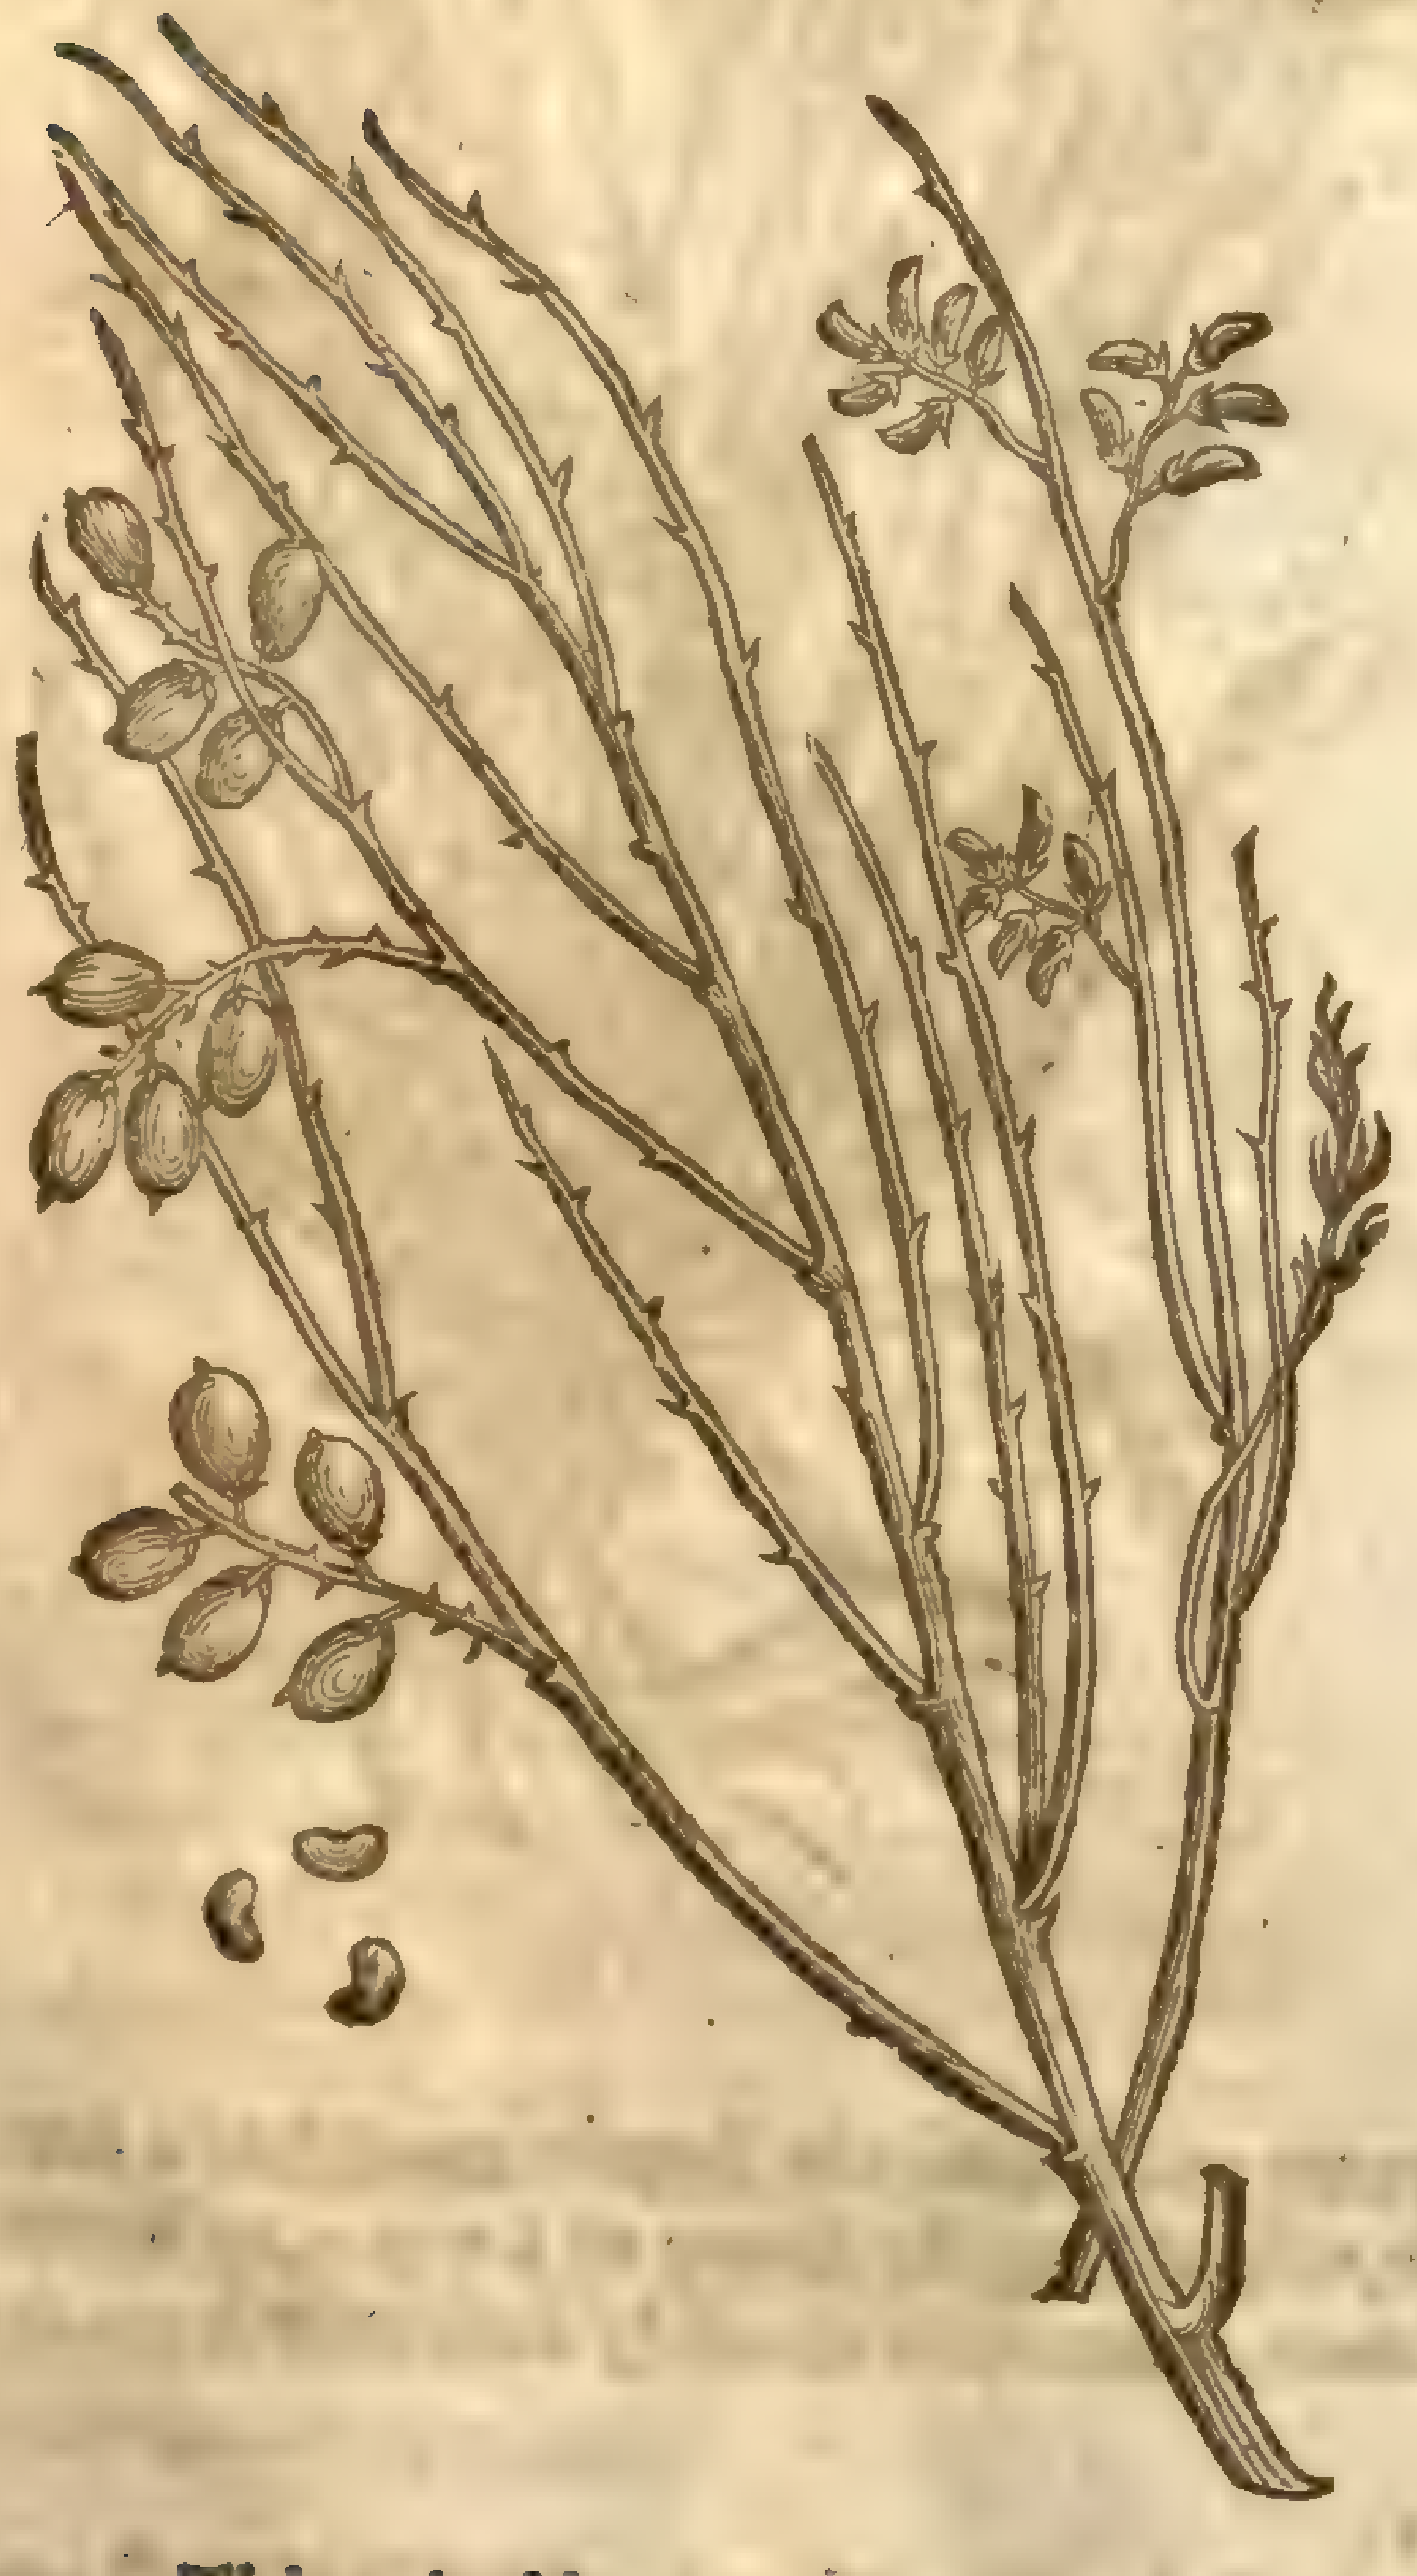
¶ *The Temperature and Vertues.*

These plants are like vnto common Broome in bitterneſſe, and therefore are hot and dry in the A ſecond degree:they are likewiſe thought to be in vertues equall;notwithſtanding their vſe is not ſo well knowne, and therefore not vſed at all where the other may be had : we ſhall not need to ſpeake of that vſe that Diers make thereof,being a matter impertinent to our Hiſtory.

Chap. 19. *Of Spaniſh baſe Broomes.*

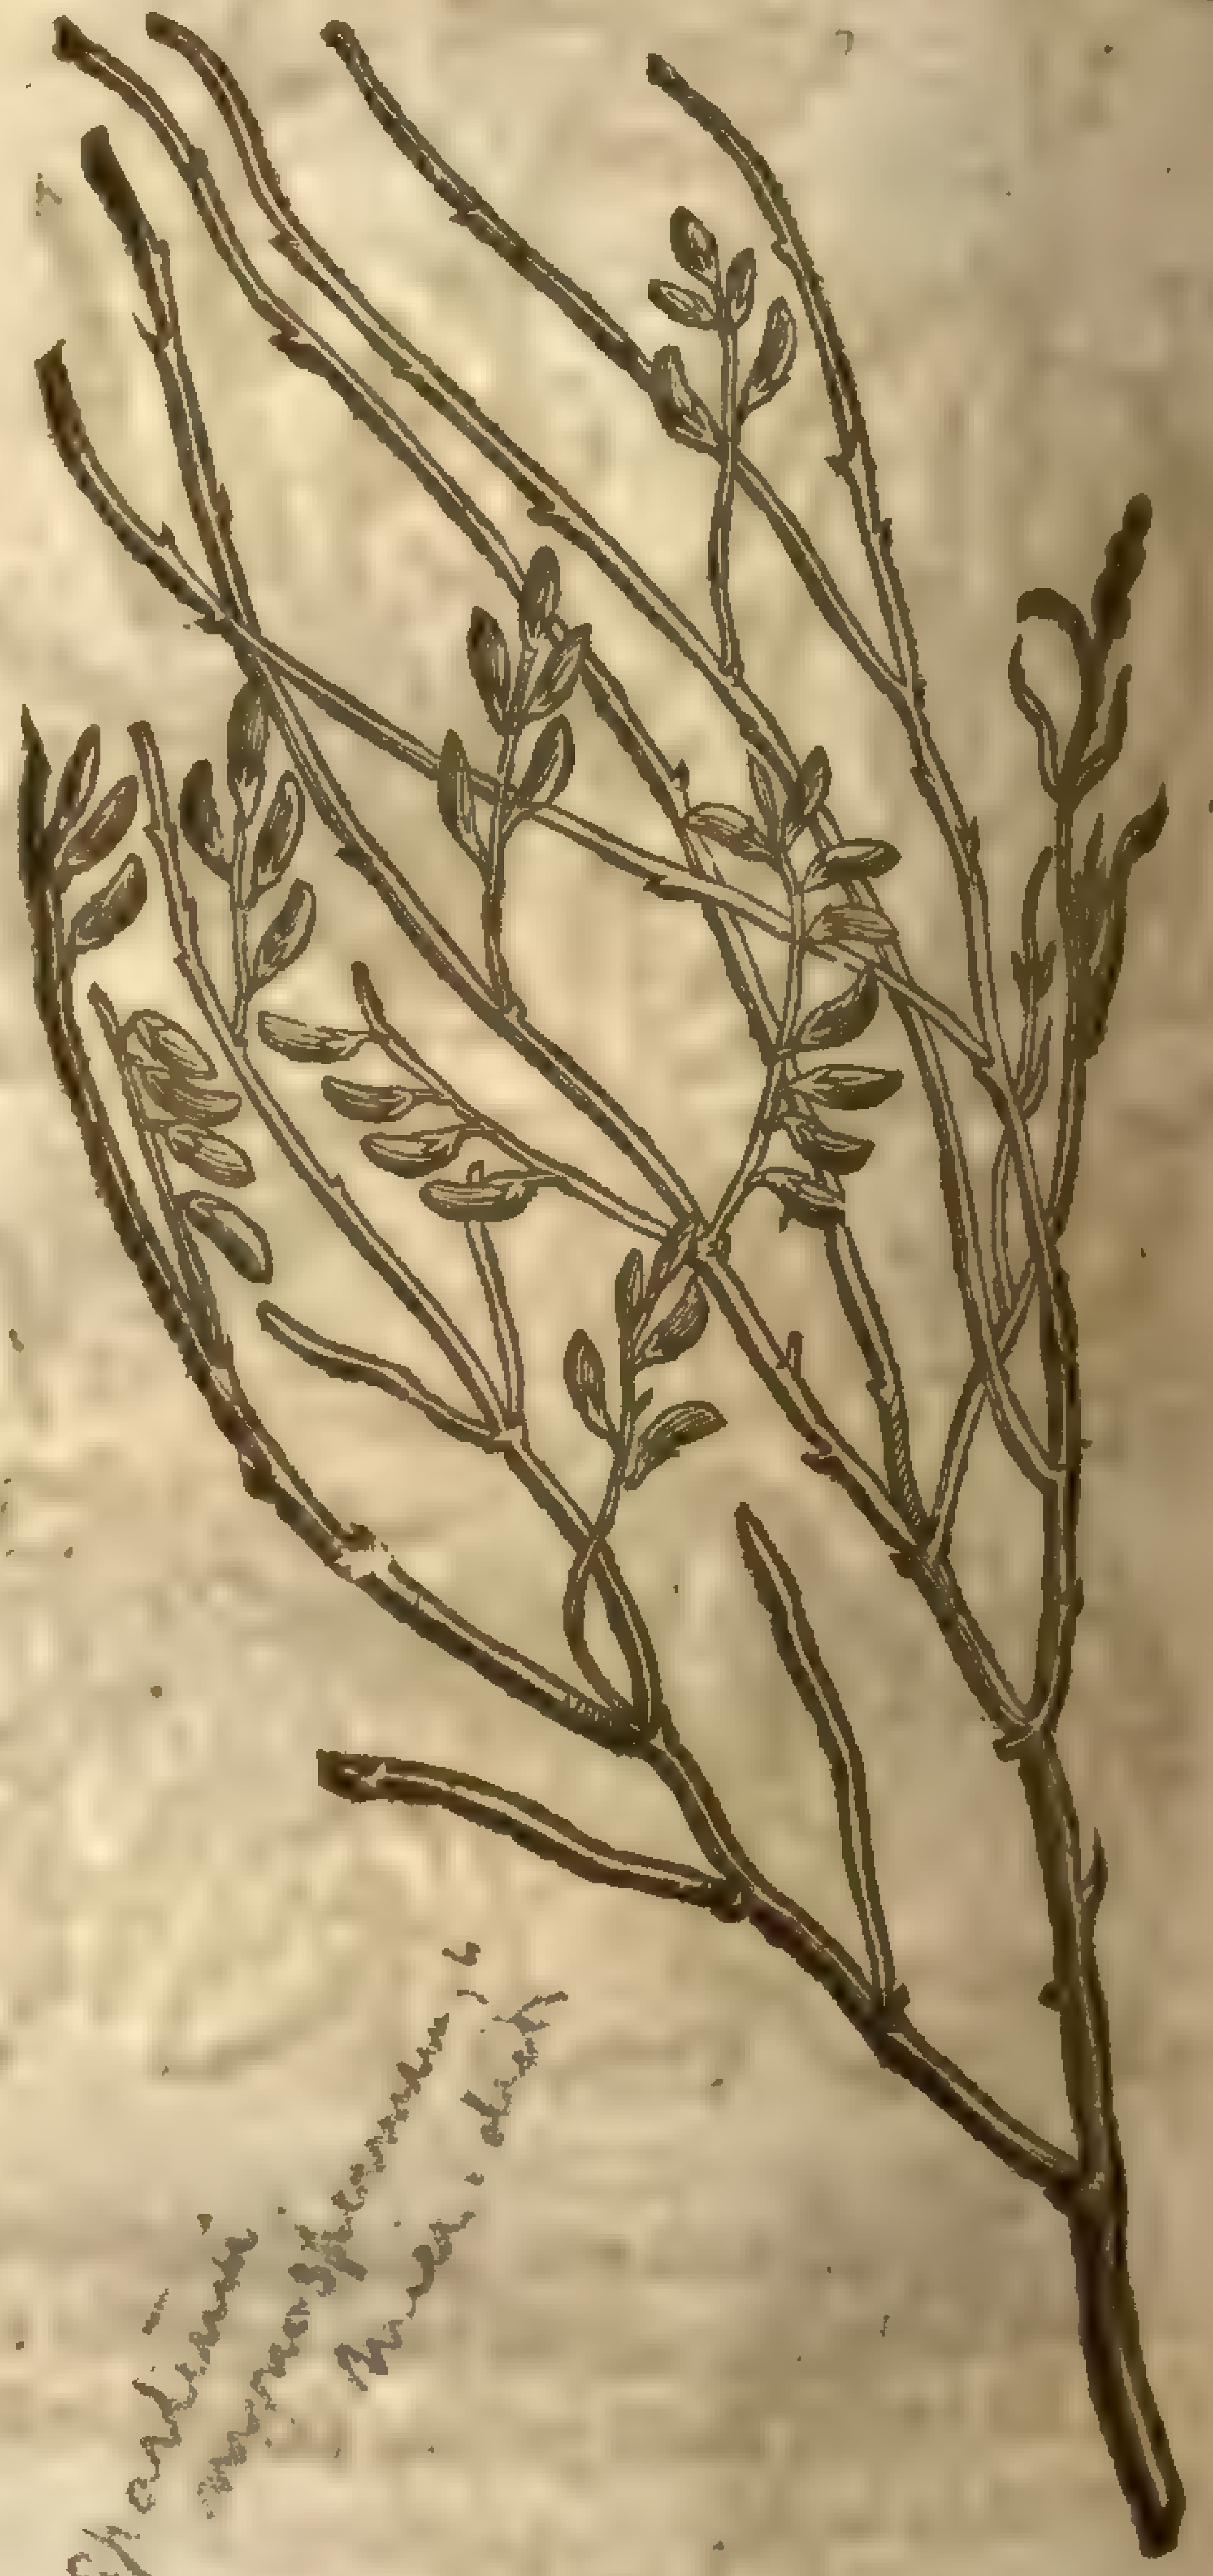
¶ *The Deſcription.*

‡ 1 This growes to the height of a cubit, and is couered with a creſted and rough barke, and diuided into many longiſh branches creſted and greene, which at their firſt ſpringing vp haue ſome leaues vpon them, which fall away as ſoone as the plant comes to floure: from the ſides of the branches come forth long foot-ſtalkes whereon hang ſome ſmall yellow flours, which are ſucceeded by ſhort round yellowiſh red cods which commonly containe but one ſeed, ſeldome two, and theſe hard and blacke, and like a little Kidney, which when it is ripe will rattle in the cod being ſhaken. ‡



1 *Pſeudoſpartum Hiſpanicum Aphyllum.*
Spaniſh Broome without leaues.

Spartium sphaerocarpum,
Linn. Syst.



2 *Pſeudoſpartum album Aphyllum.*
The white leafe-leſſe Spaniſh Broome.

Spartium
monospermum,
Linn. Syst.

2 This naked broome groweth vp to the height of a man: the ſtalk is rough, and void of leaues, very greene and pliant, which diuideth it ſelfe into diuers twiggie branches, greene and tough, like ruſhes: the floures grow all along the ſtalkes like thoſe of Broome, but of a white colour, wherein it differeth from all the reſt of his kinde.

¶ *The Place.*

Theſe grow in the Prouinces of Spaine, and are in one place higher and more buſhie, and in another lower.

¶ *The Time.*

‡ The firſt floures in May, and the ſecond in February. ‡

¶ *The Names.*

Theſe baſe Spaniſh broomes may be referred to the true, which is called in Greeke σπάρτιον: the Latines vſe the ſame name, calling it ſometimes *Spartum*, and *Spartium*: in Spaniſh, *Retama*: in Engliſh, Spaniſh Broome, and baſtard Spaniſh Broome.

¶ *The Temperature and Vertues.*

A Both the ſeeds and juyce of the branches of theſe baſe Broomes, wherewith they in Spaine and other hot regions do tie their vines, do mightily draw, as *Galen* writeth.

Dioſcorides ſaith, That the ſeeds and floures being drunke in the quantity of a dram, with Mede or honied water, doth cauſe one to vomit ſtrongly, as the Hellebor or neeſing pouder doth, but yet without jeopardy or danger of life: the ſeed purgeth by ſtoole. B

The juyce which is drawne from out of the branches ſteeped in water, being firſt bruiſed, is a remedy for thoſe that are tormented with the Sciatica, and for thoſe that be troubled with the Squincie, if a draught thereof be drunke in the morning; ſome vſe to ſteepe the branches in Sea water, and to giue the ſame in a cliſter, which purgeth forth bloudy and ſlimy excrements. C

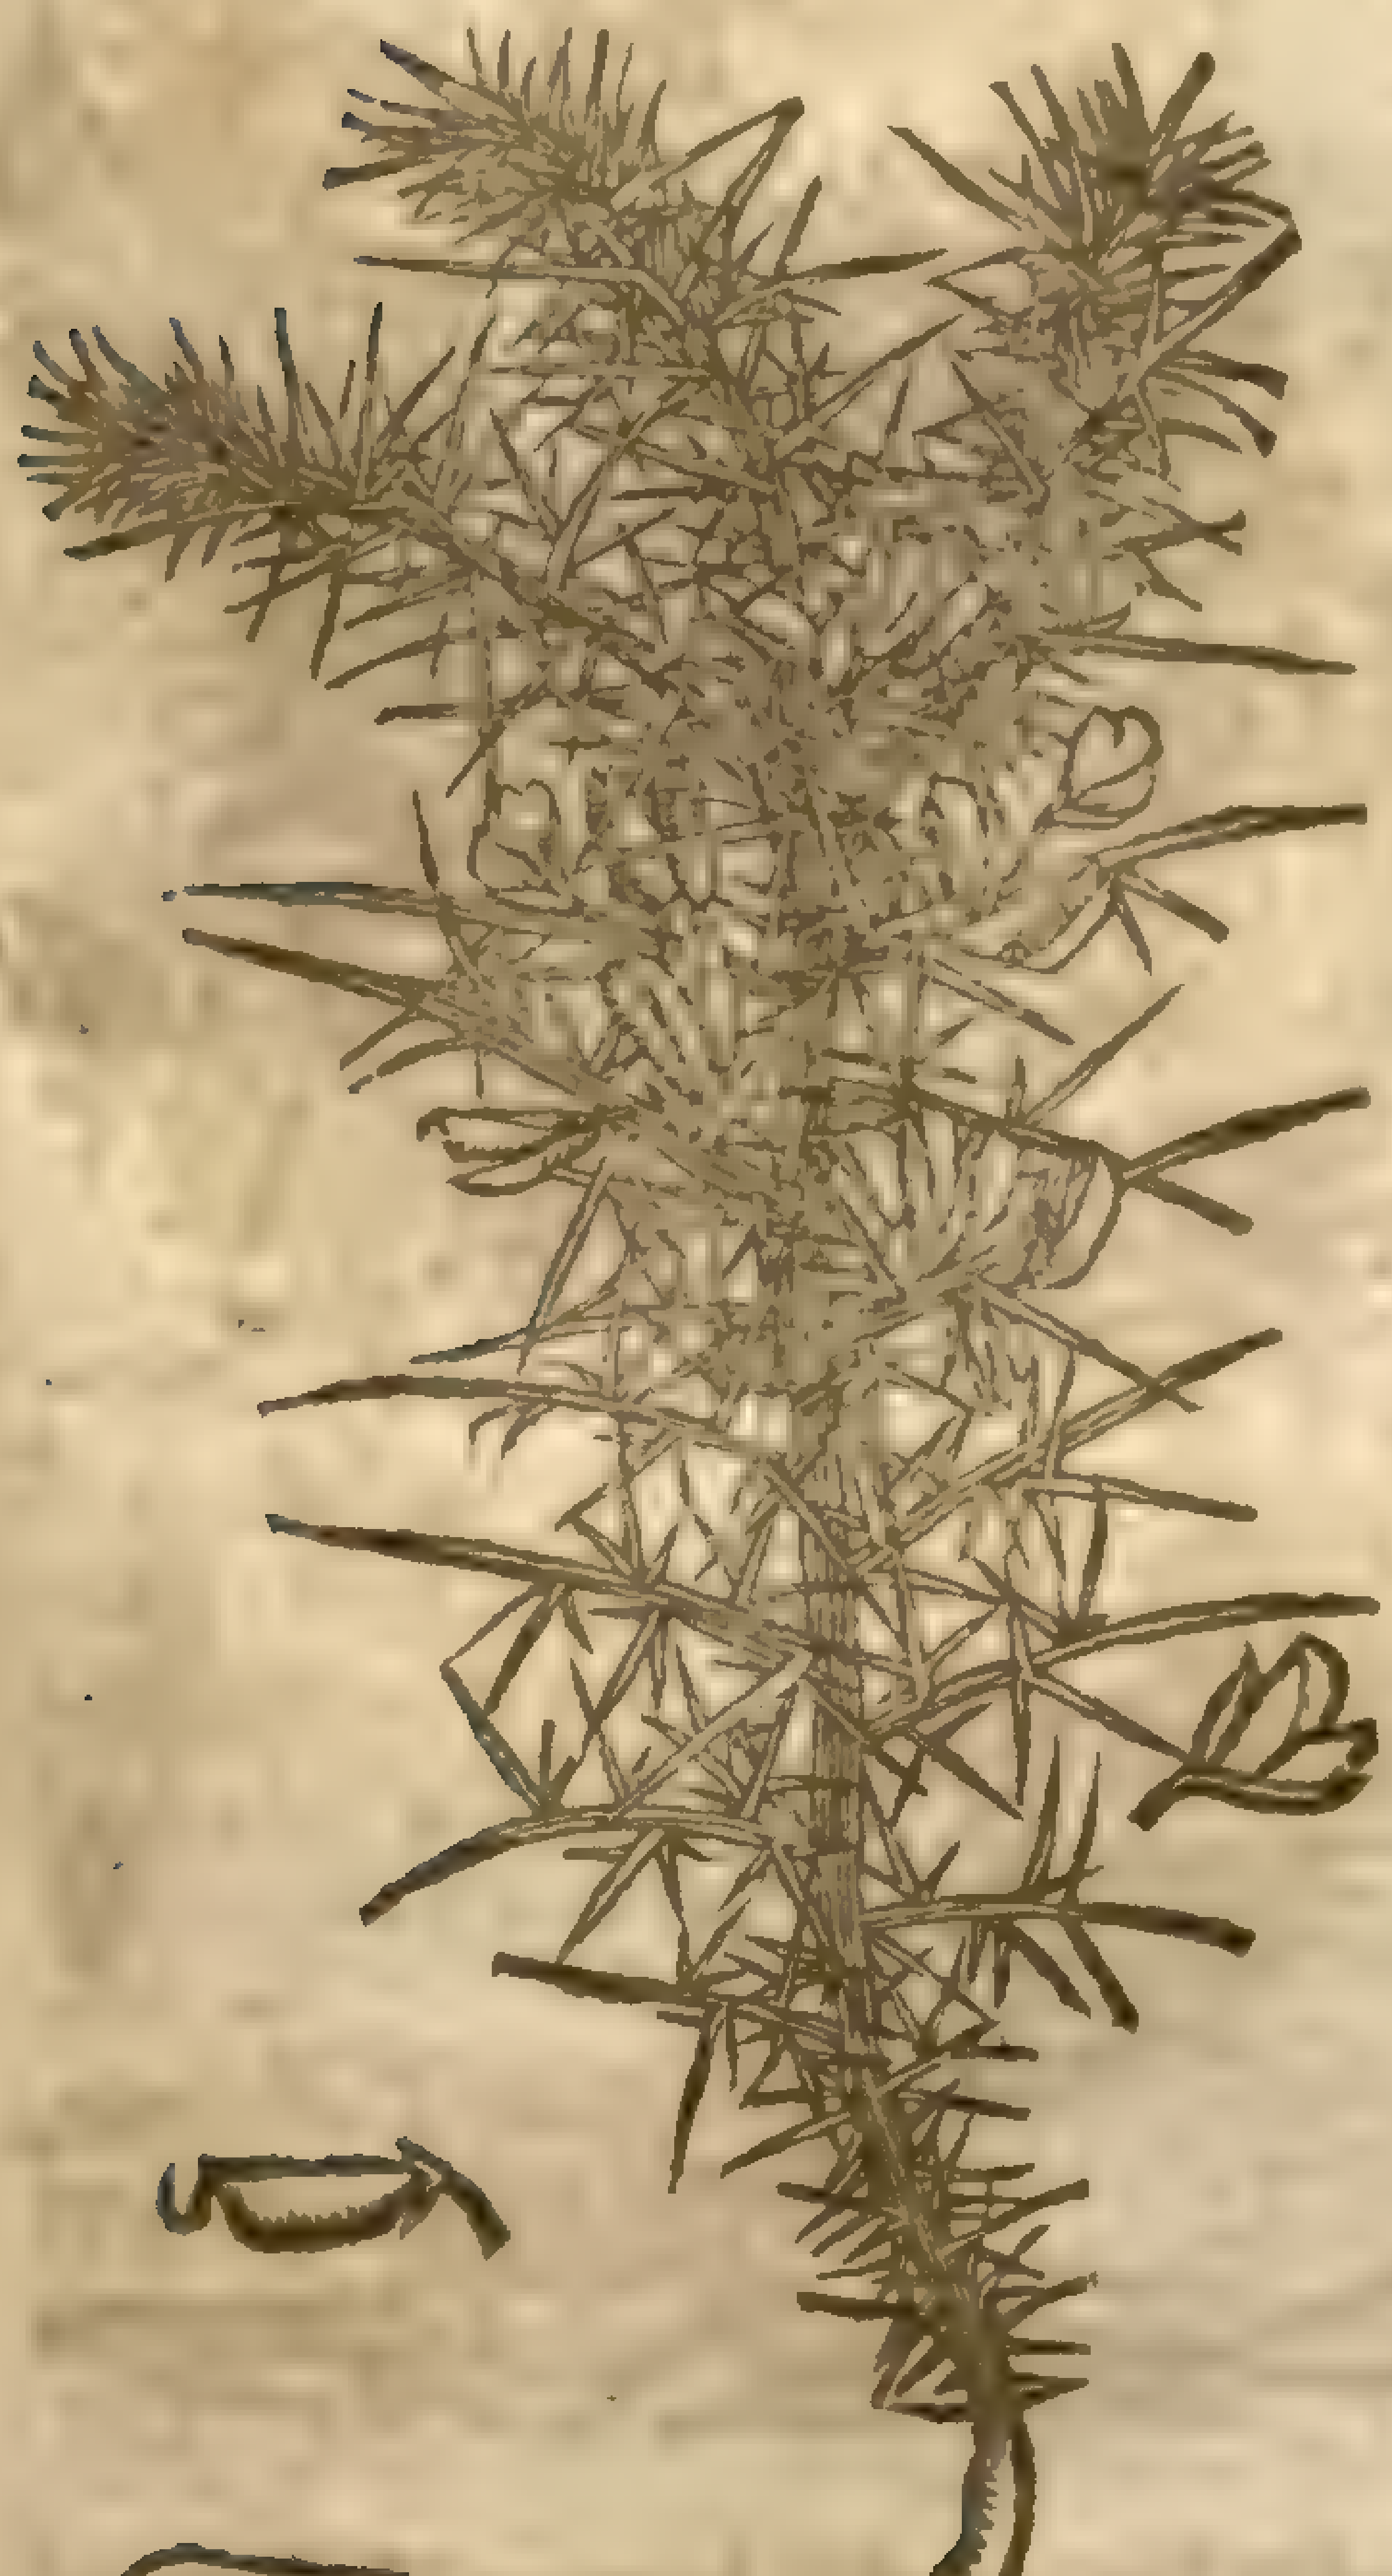
† In this chapter formerly in the firſt place was againe figured and deſcribed the true *Spartum* or Spaniſh Broome; which I haue now omitted, becauſe it was figured and deſcribed in the laſt chapter ſaue one before. In the ſecond place was deſcribed that figured in the third: and in the third place was a deſcription to no purpoſe, which I therefore omitted, and as you ſee deſcribed anew and put in the firſt place that which formerly held the ſecond.

CHAP. 20.

Of Furze, Gorſſe, Whin, or prickley Broome.

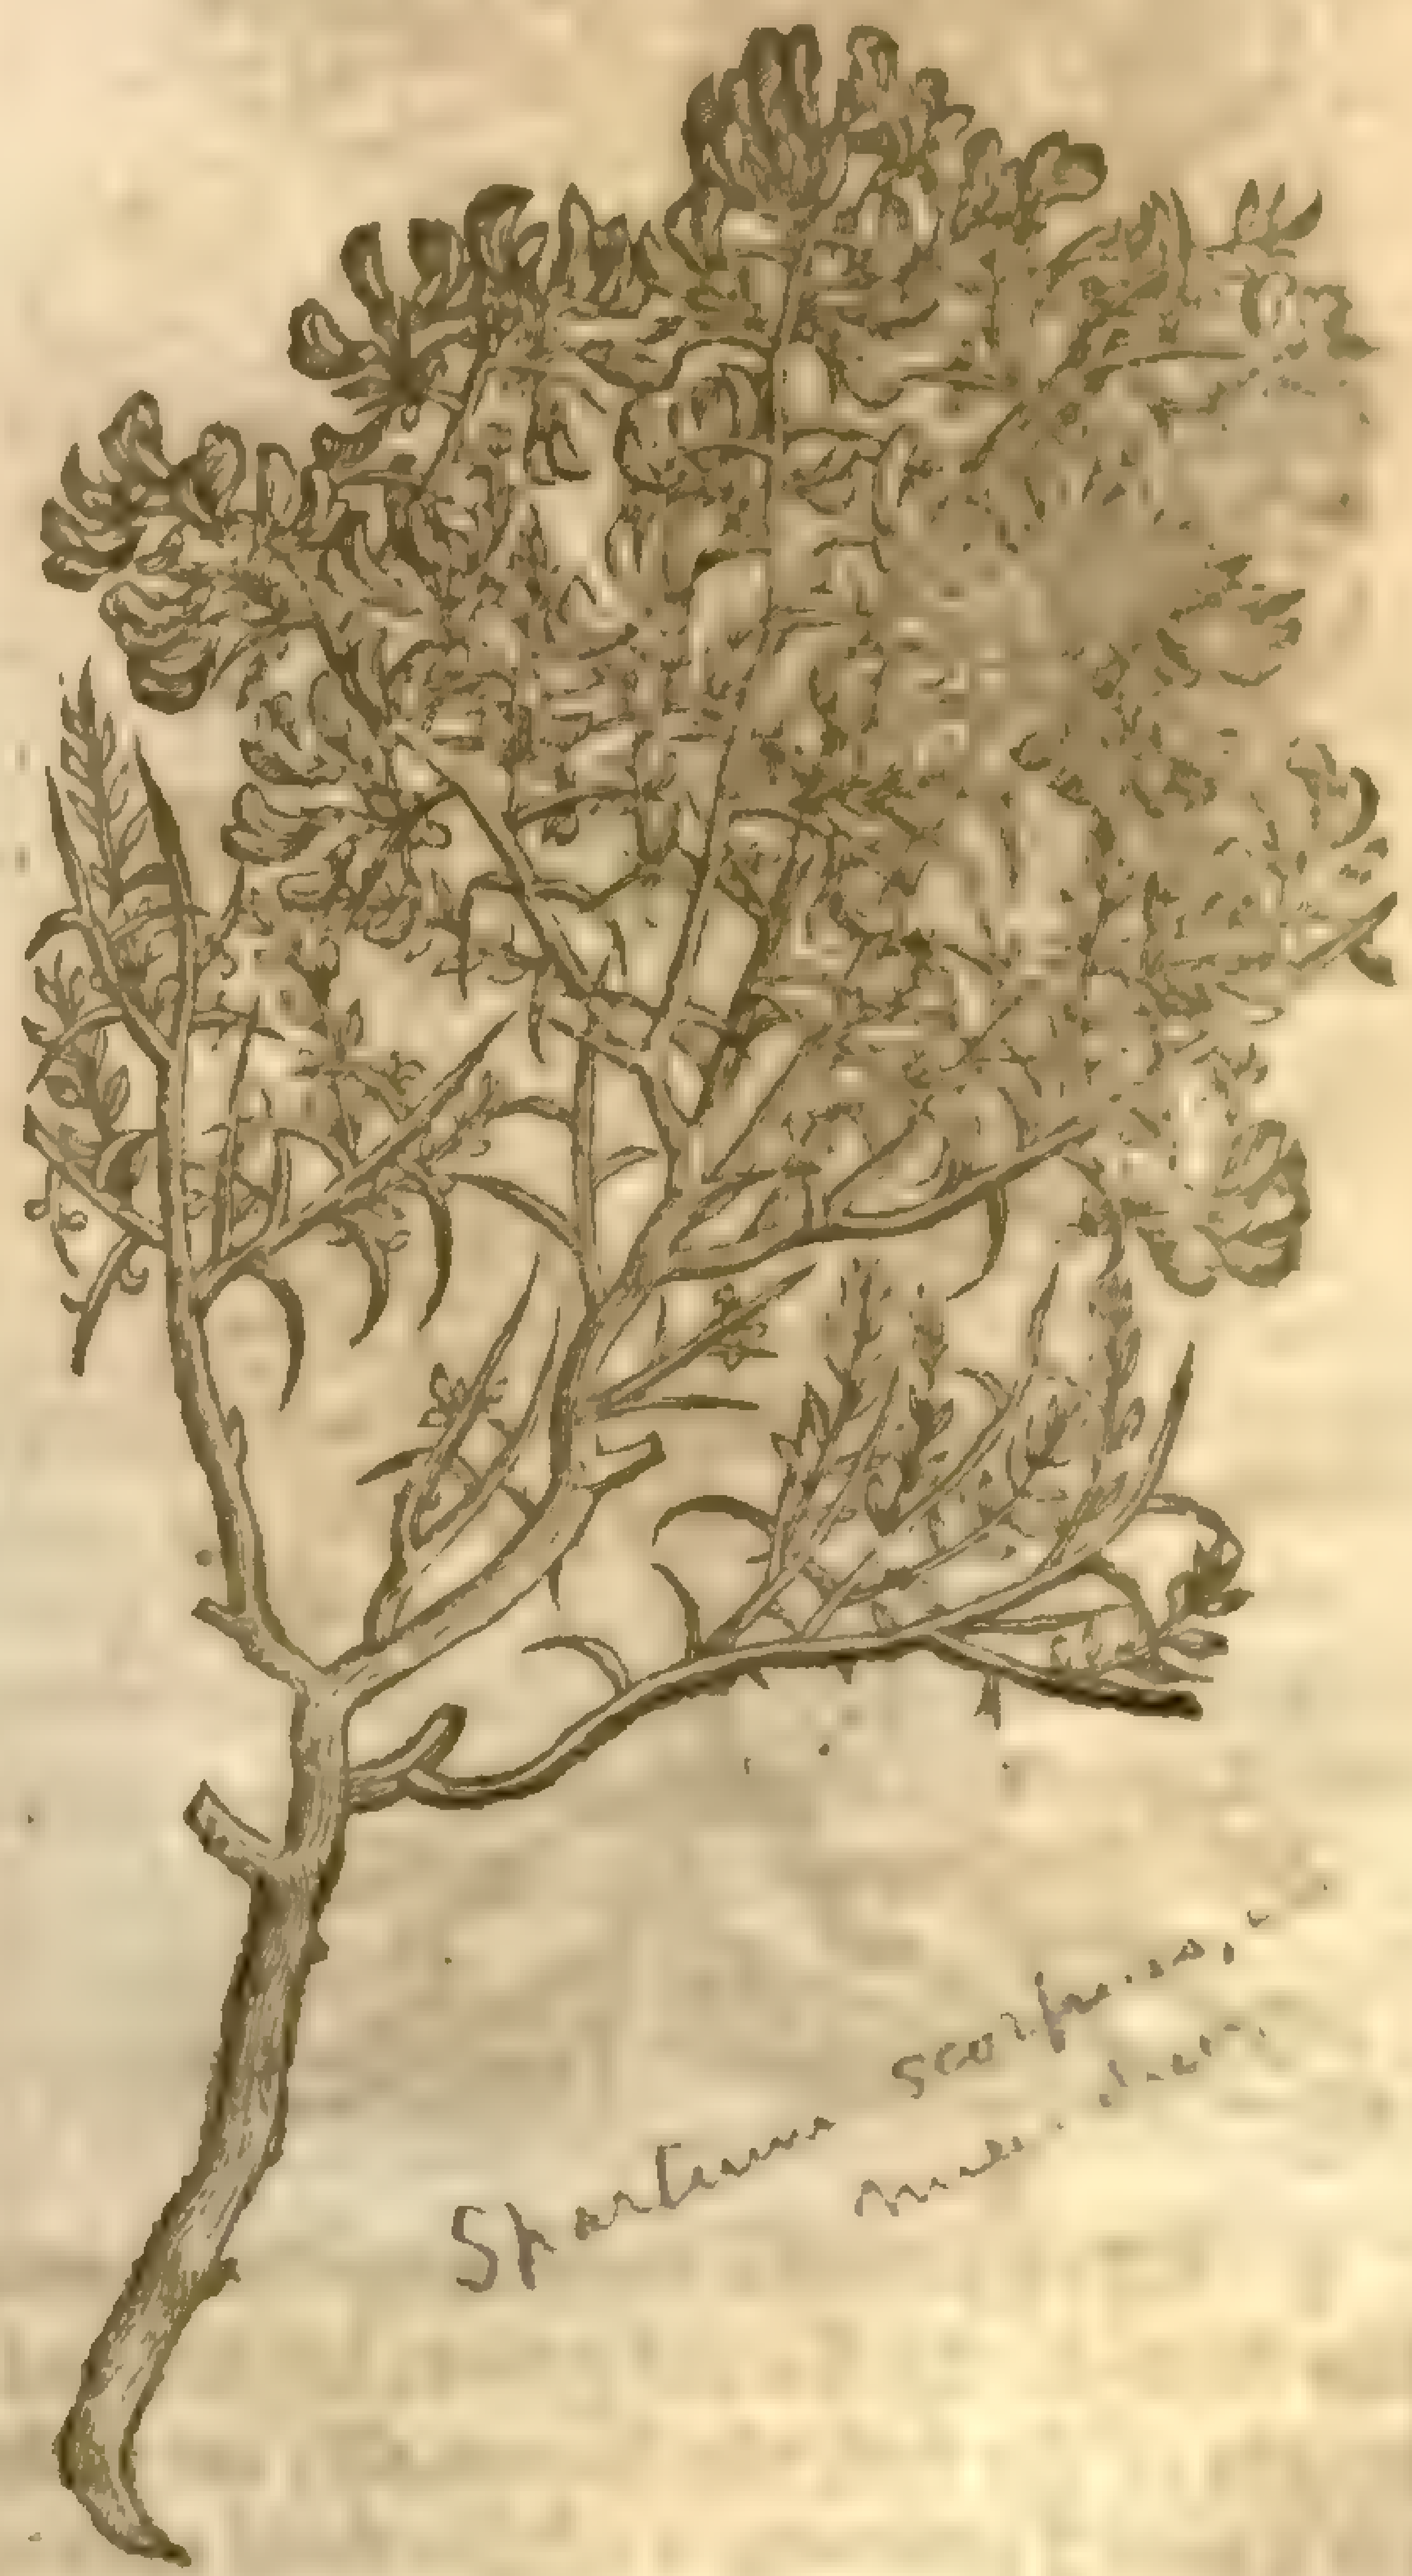
¶ *The Kindes.*

THere be diuers ſorts of prickely Broome, called in our Engliſh tongue by ſundry names, according to the ſpeech of the countrey people where they doe grow: in ſome places, Furzes; in others, Whins, Gorſſe, and of ſome, prickly Broome.



† 1 *Geniſta ſpinoſa vulgaris.*
Great Furze buſh.

Whin [illegible]



2 *Geniſta ſpinoſa minor.*
The ſmall Furze buſh.

Spartium scorpius, [illegible]

¶ *The Deſcription.*

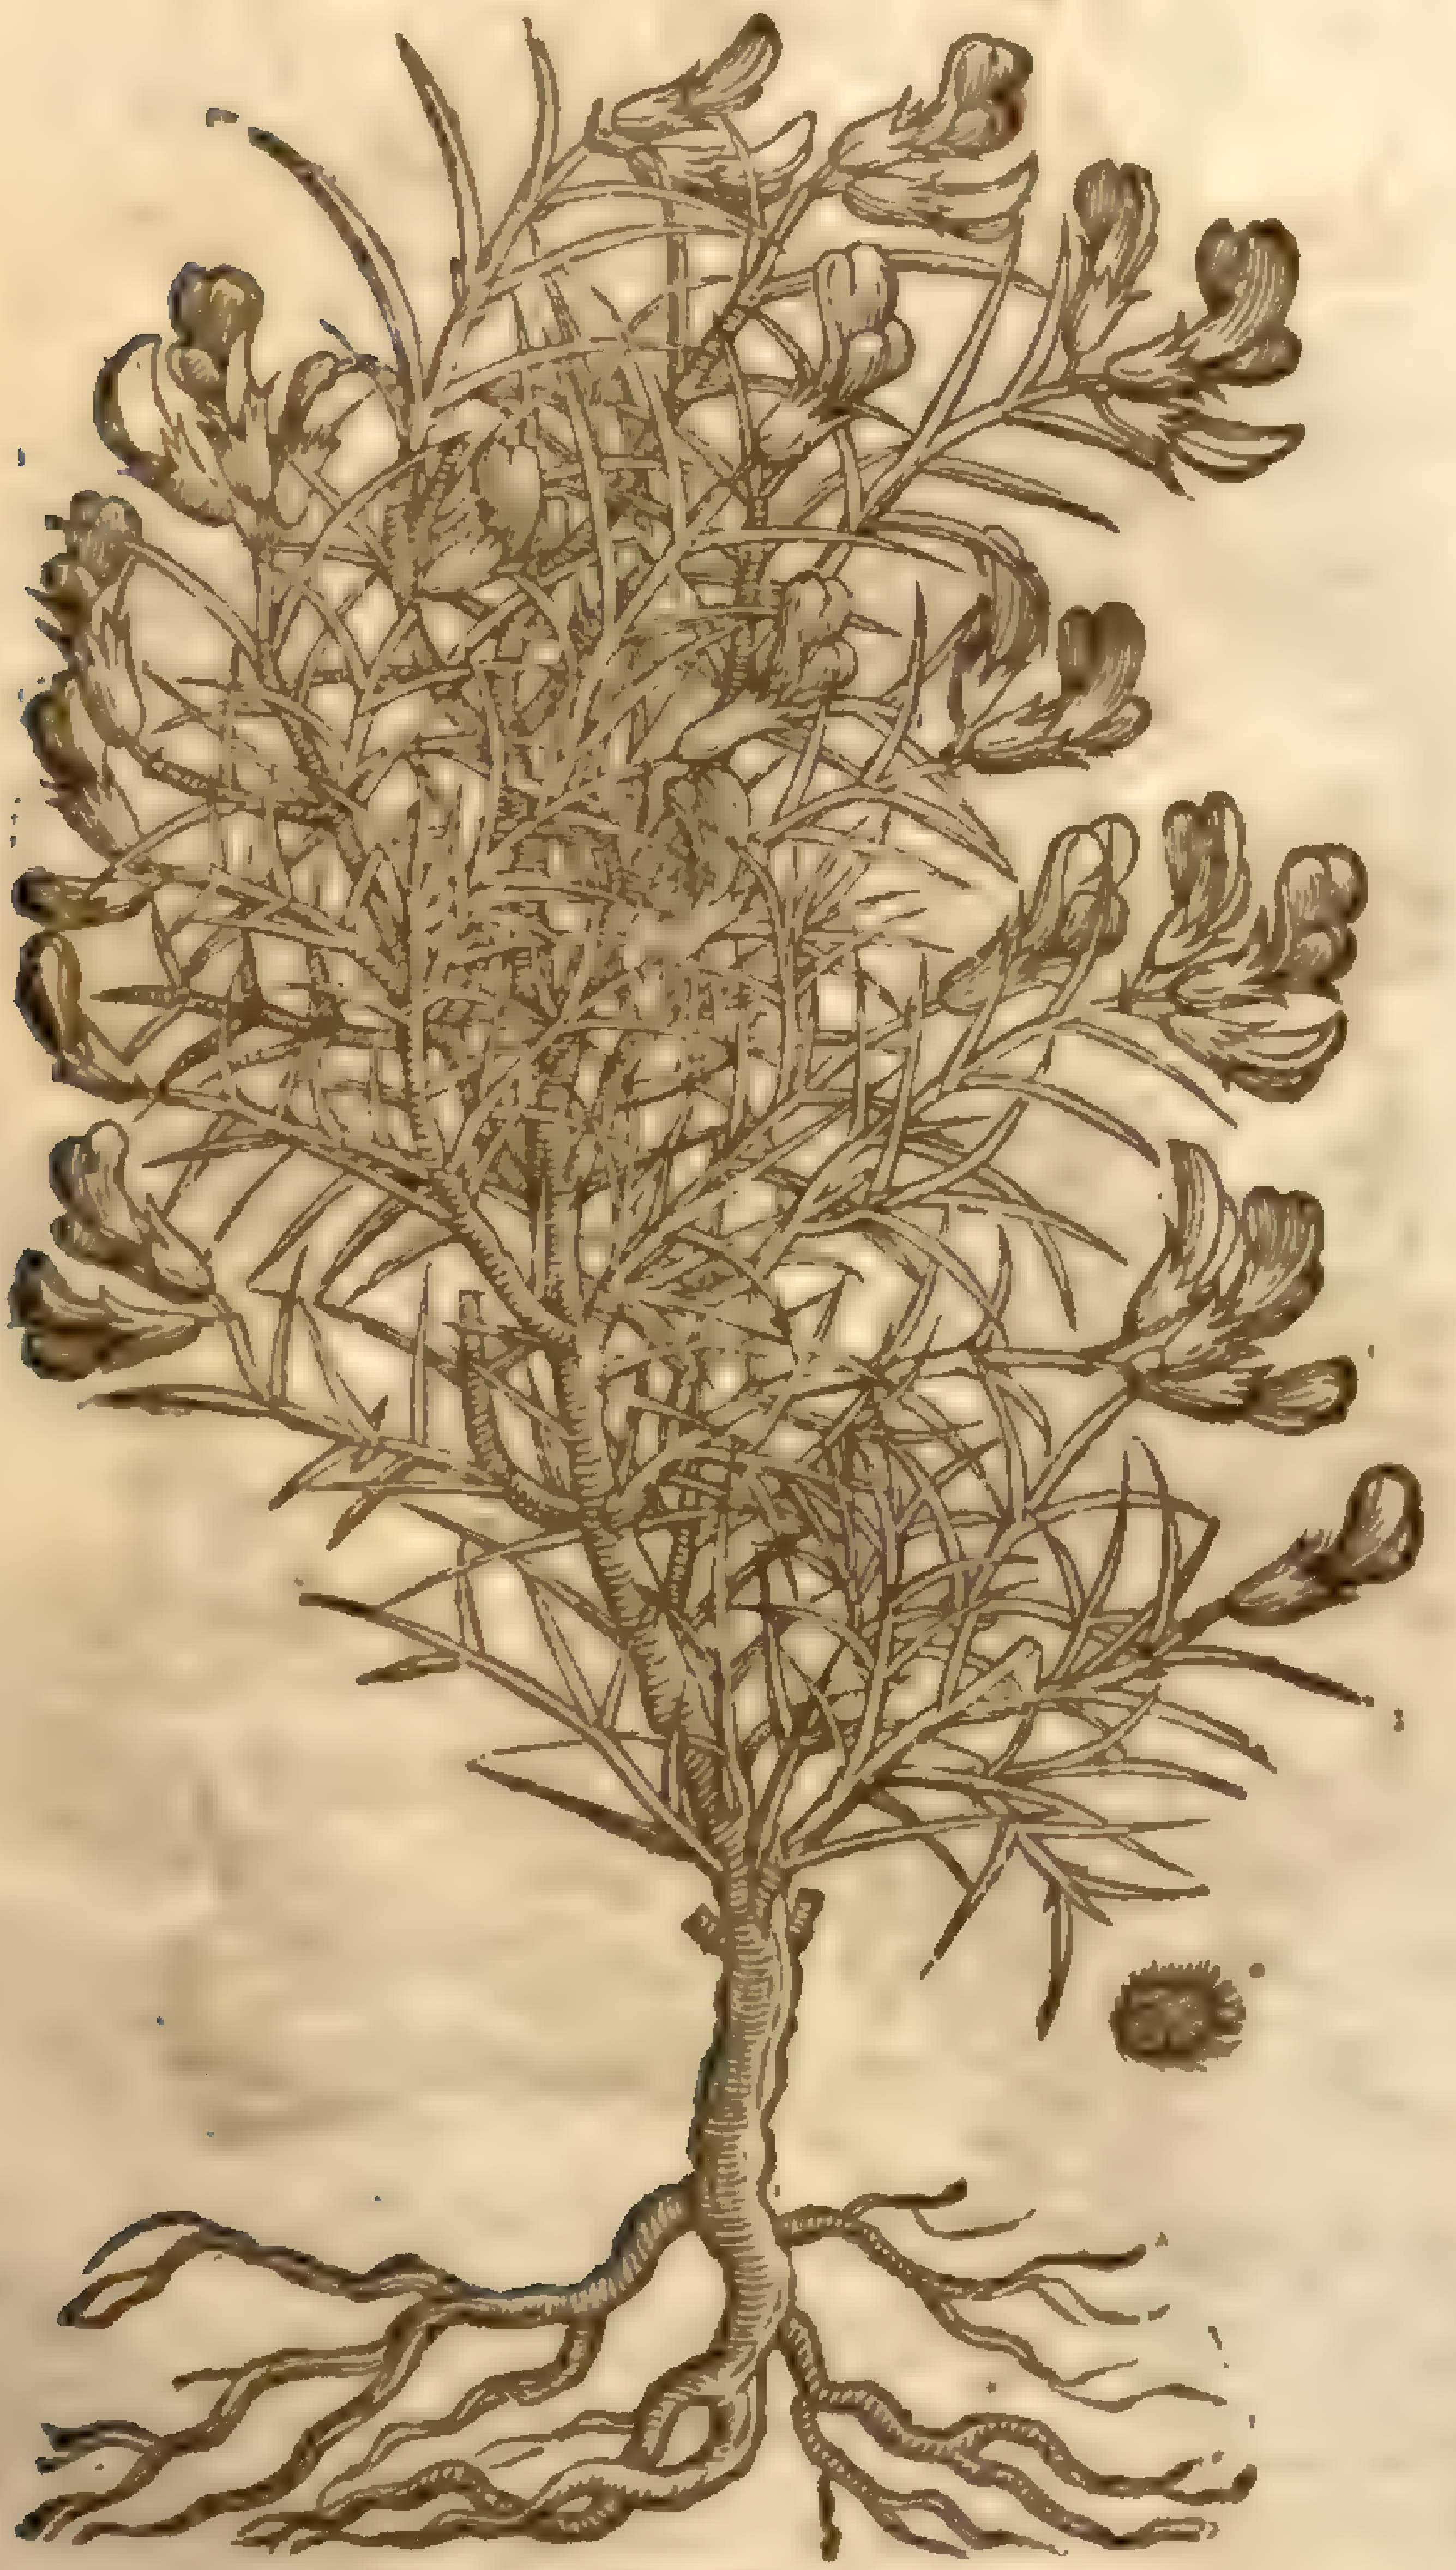
1 THe Furze buſh is a plant altogether a Thorne, fully armed with moſt ſharpe prickles, without any leaues at all except in the Spring, and thoſe very few and little, and quickly falling away: it is a buſhy ſhrub, often riſing vp with many wooddy branches to the height of foure or fiue cubits or higher, according to the nature and ſoile where they grow: the greateſt and higheſt that I did euer ſee do grow about Exceſter in the Weſt parts of England,

where the great ſtalks are dearely bought for the better ſort of people, and the ſmall thorny ſpraies for the poorer ſort. From theſe thorny branches grow little floures like thoſe of Broome, and of a yellow colour, which in hot regions vnder the extreme heate of the Sunne are of a very perfect red colour: in the colder countries of the Eaſt, as Danzicke, Brunſwicke, and Poland, there is not any branch hereof growing, except ſome few plants and ſeeds which my ſelfe haue ſent to Elbing otherwiſe called Meluin, where they are moſt curiouſly kept in their faireſt gardens, as alſo our common Broome, the which I haue ſent thither likewiſe, being firſt deſired by diuers earneſt letters: the cods follow the floures, which the grauer hath omitted, as a German who had neuer ſeene the plant it ſelfe, but framed the figure by heare-ſay: the root is ſtrong, tough, and wooddy.

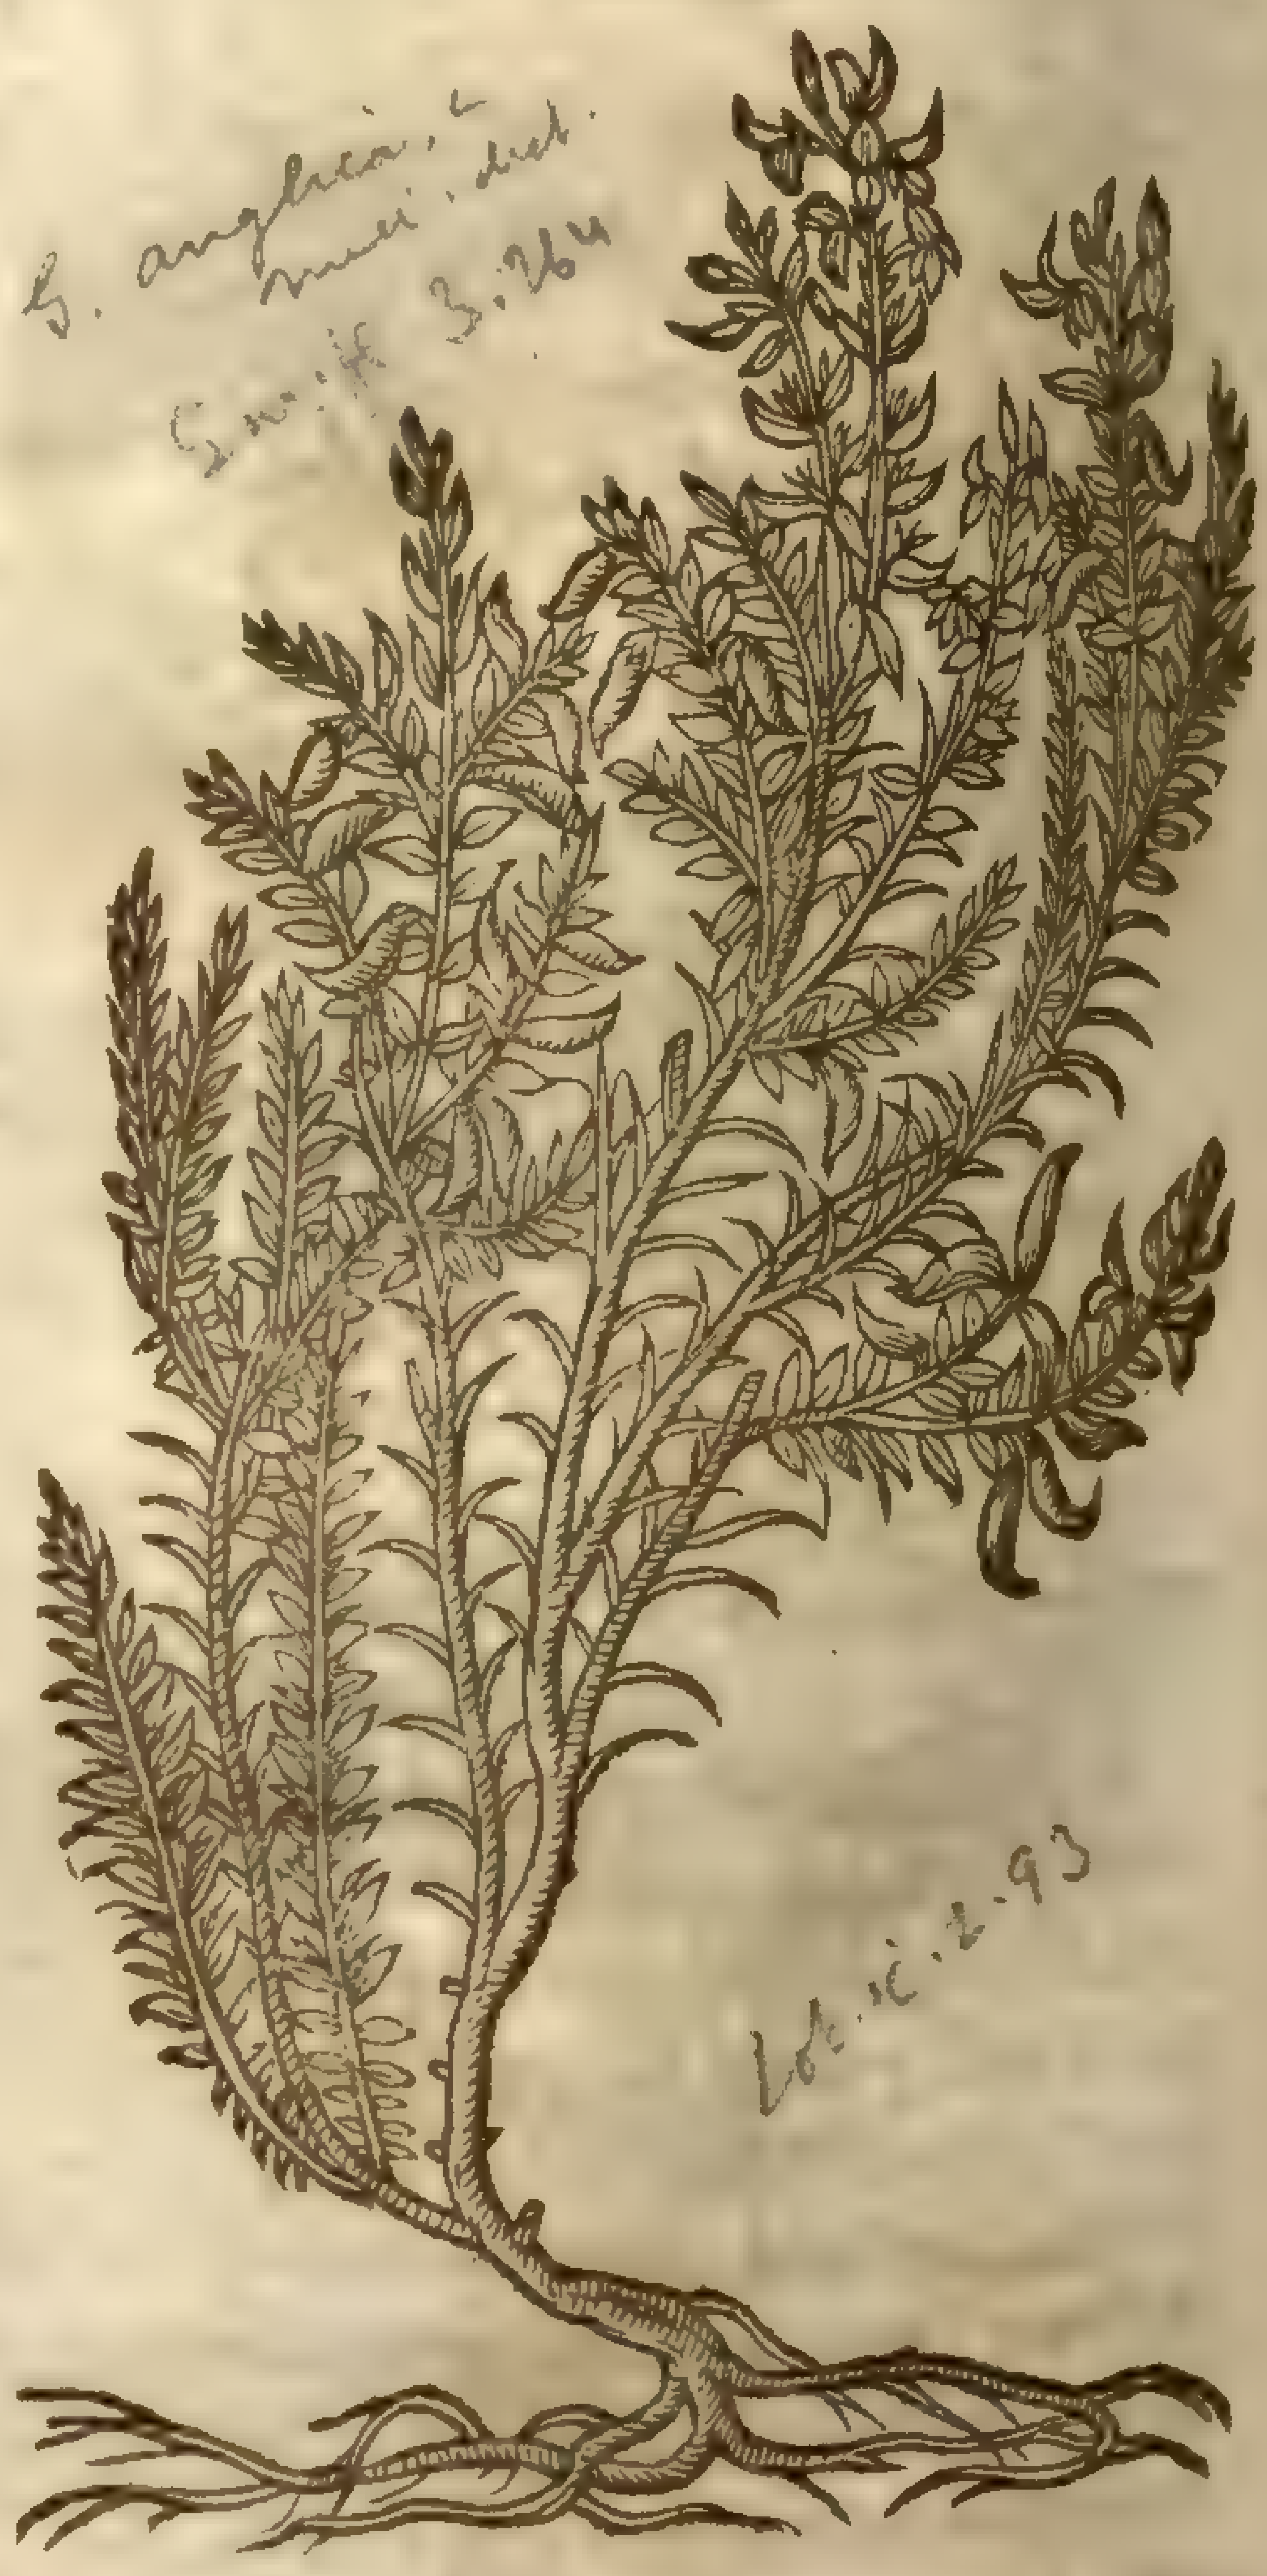
We haue in our barren grounds of the North part of England another ſort of Furze, bringing forth the like prickly thornes that the other haue: the onely difference conſiſteth in the colour of the floures; for the others bring forth yellow floures, and thoſe of this plant are as white as ſnow.

† 2 To this may be joyned another kinde of Furze which bringeth forth certaine branches that be ſome cubit high, ſtiffe, and ſet round about at the firſt with ſmall winged Lentil-like leaues and little harmeleſſe prickles, which after they haue been a yeare old, and the leaues gone, be armed onely with moſt hard ſharpe prickles, crooking or bending their points downewards. The floures hereof are of a pale yellow colour, leſſer than thoſe of Broome, yet of the ſame forme: the cods are ſmall, in which do lie little round reddiſh ſeeds: the root is tough and wooddy.

† 3 *Geniſta Spinoſa minor ſiliqua rotunda.*
Small round codded Furze.



4 *Geniſta aculeata.*
Needle Furze or petty Whin.



G. anglica L.
muri. dict.
Swift 3:264

Lob. ic. 2.93

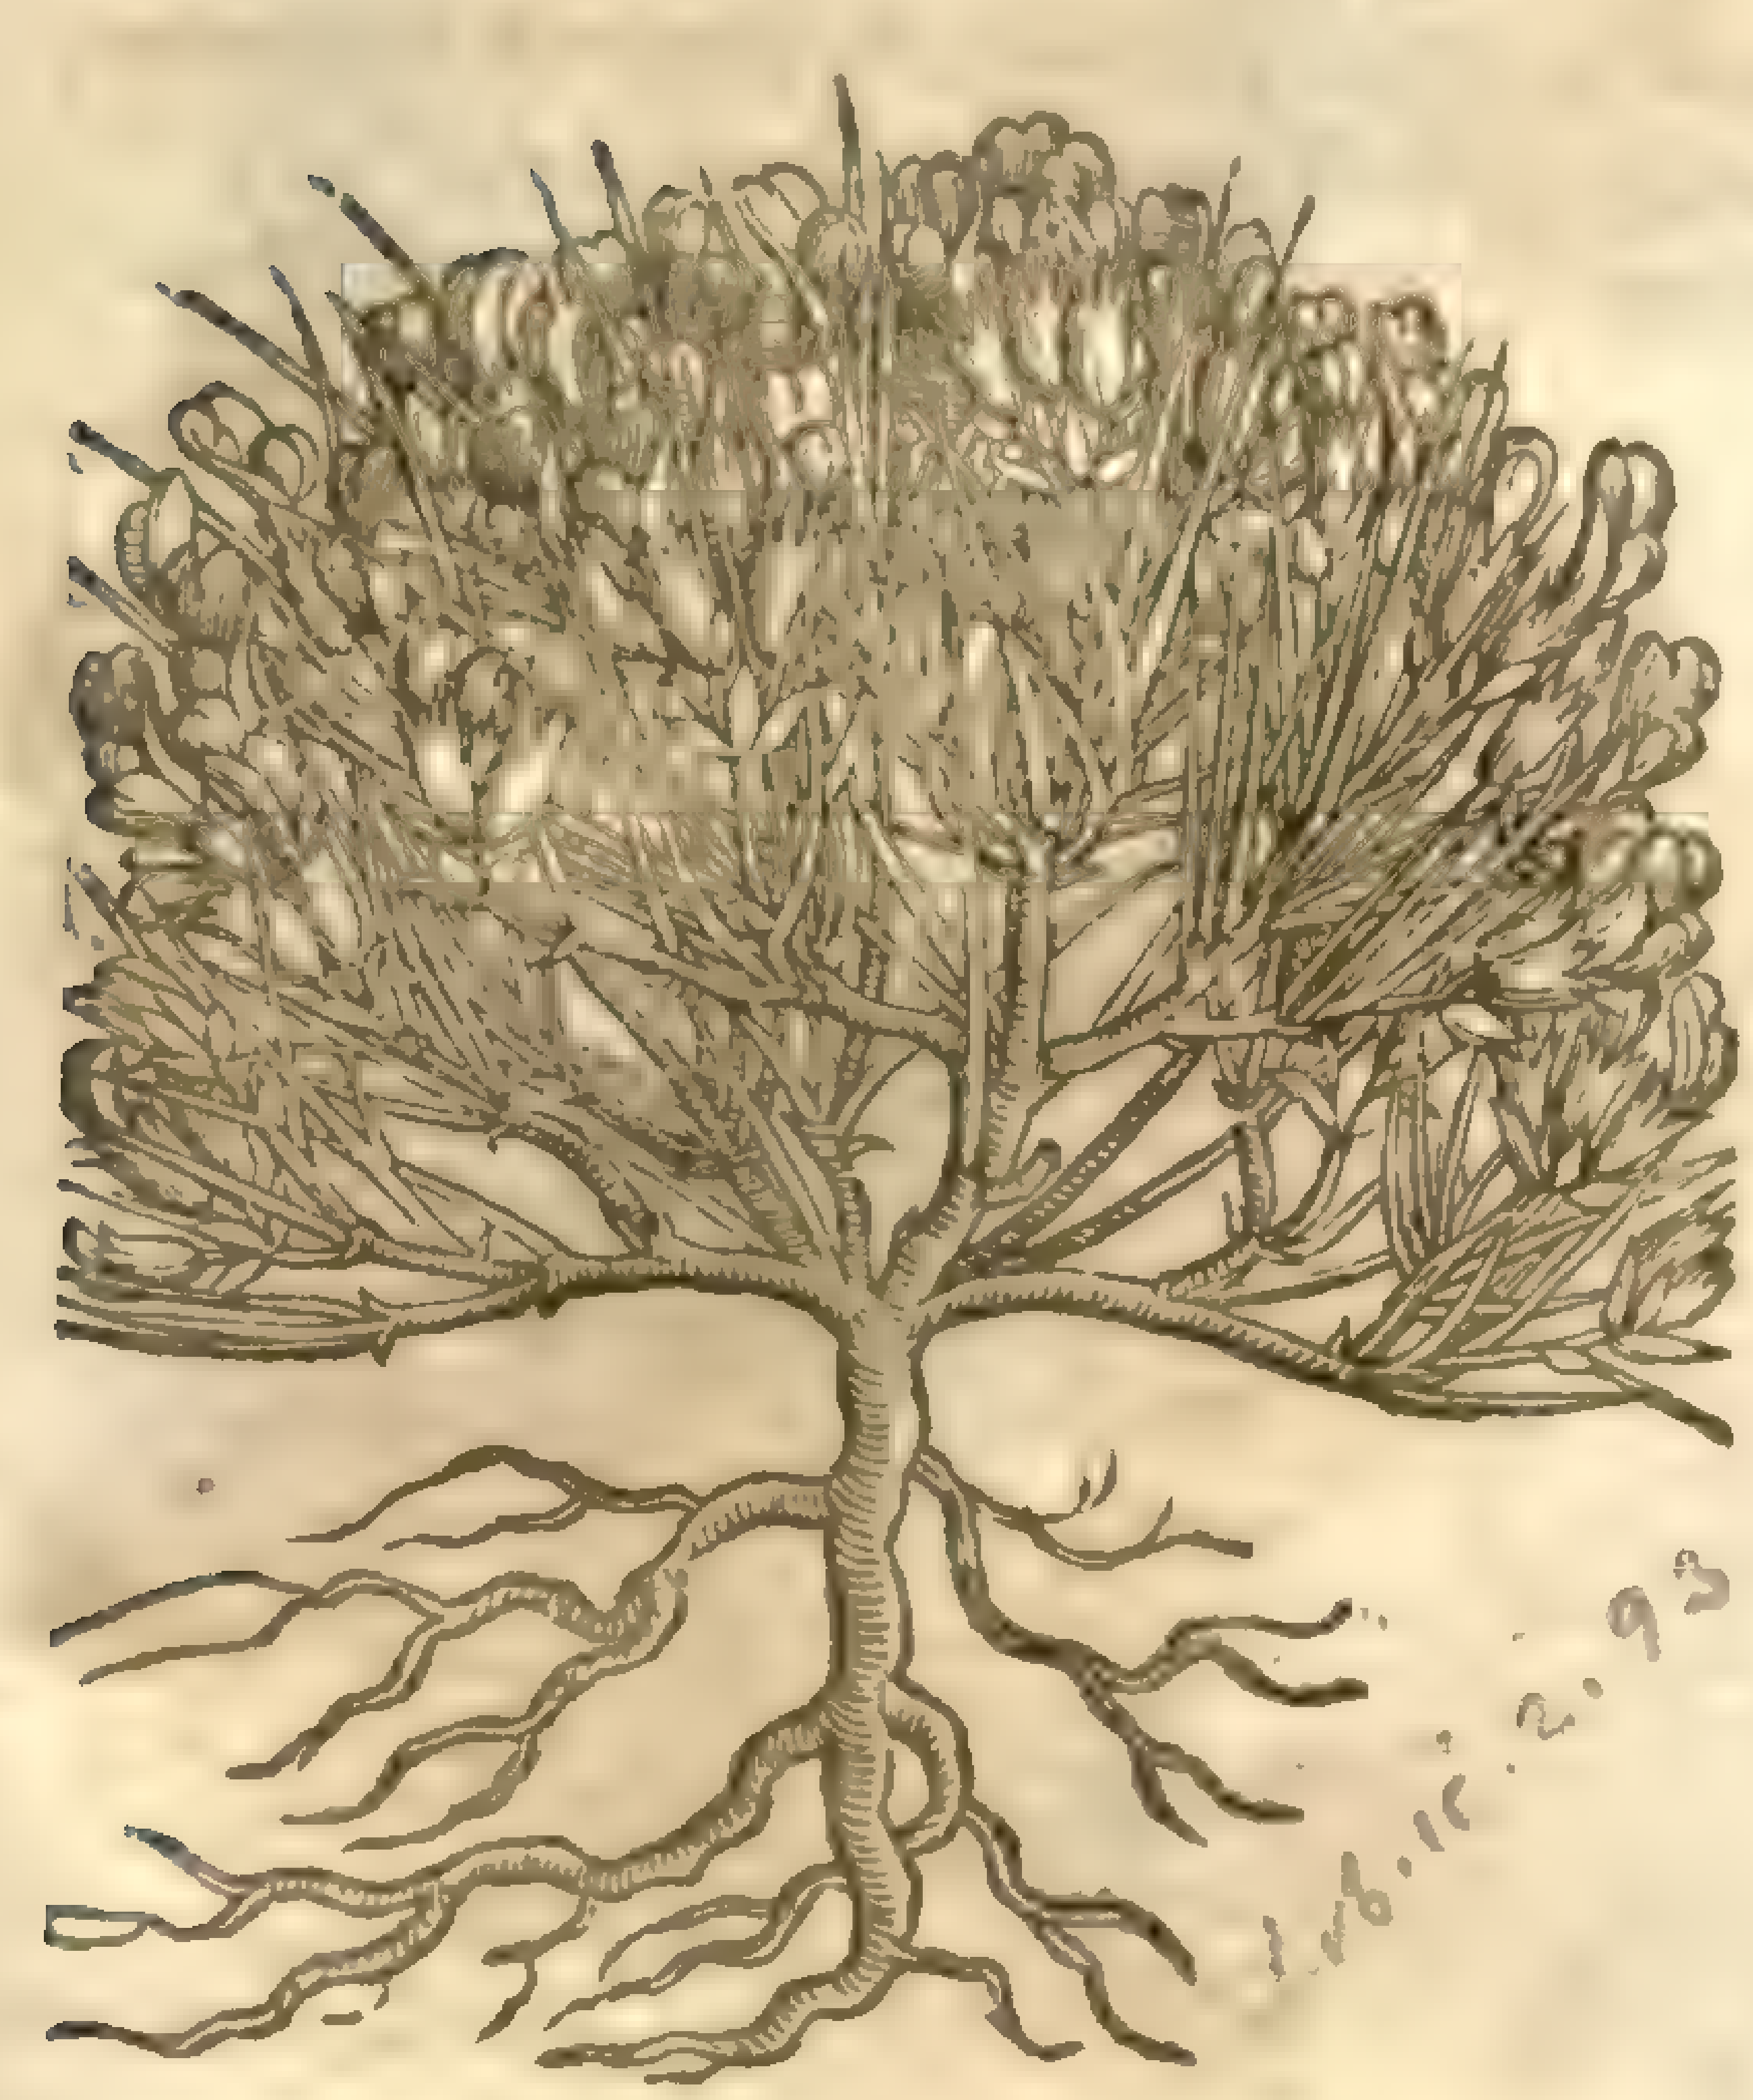
‡ Of this *Cluſius* reckons vp three varieties: the firſt growing ſome cubit high, with deep yellow floures: the ſecond growes higher, and hath paler coloured floures: the third groweth to the height of the firſt, the floures alſo are yellow, the branches more prickly, and the leaues hairy; and the figure I giue you is of this third variety.

3 This ſeldome exceeds a foot in height, and it is on euery ſide armed with ſharpe prickles, which grow not confuſedly, as in the common ſort, but keepe a certaine order, and ſtill grow forth by couples: they are of a lighter greene than thoſe of the common Furze: on the tops of each of the branches grow two or three yellow floures like thoſe of the former; which are ſucceeded by little round rough hairy cods of the bigneſſe of Tares. This floures in March, and groweth in the way betweene Burdeaux and Bayone in France, and vpon the Pyrenean mountaines. *Cluſius* makes it his *Scorpius* 2. or ſecond ſort of Furze: *Lobel* calls it *Geniſta ſpartium ſpinoſum alterum.* ‡

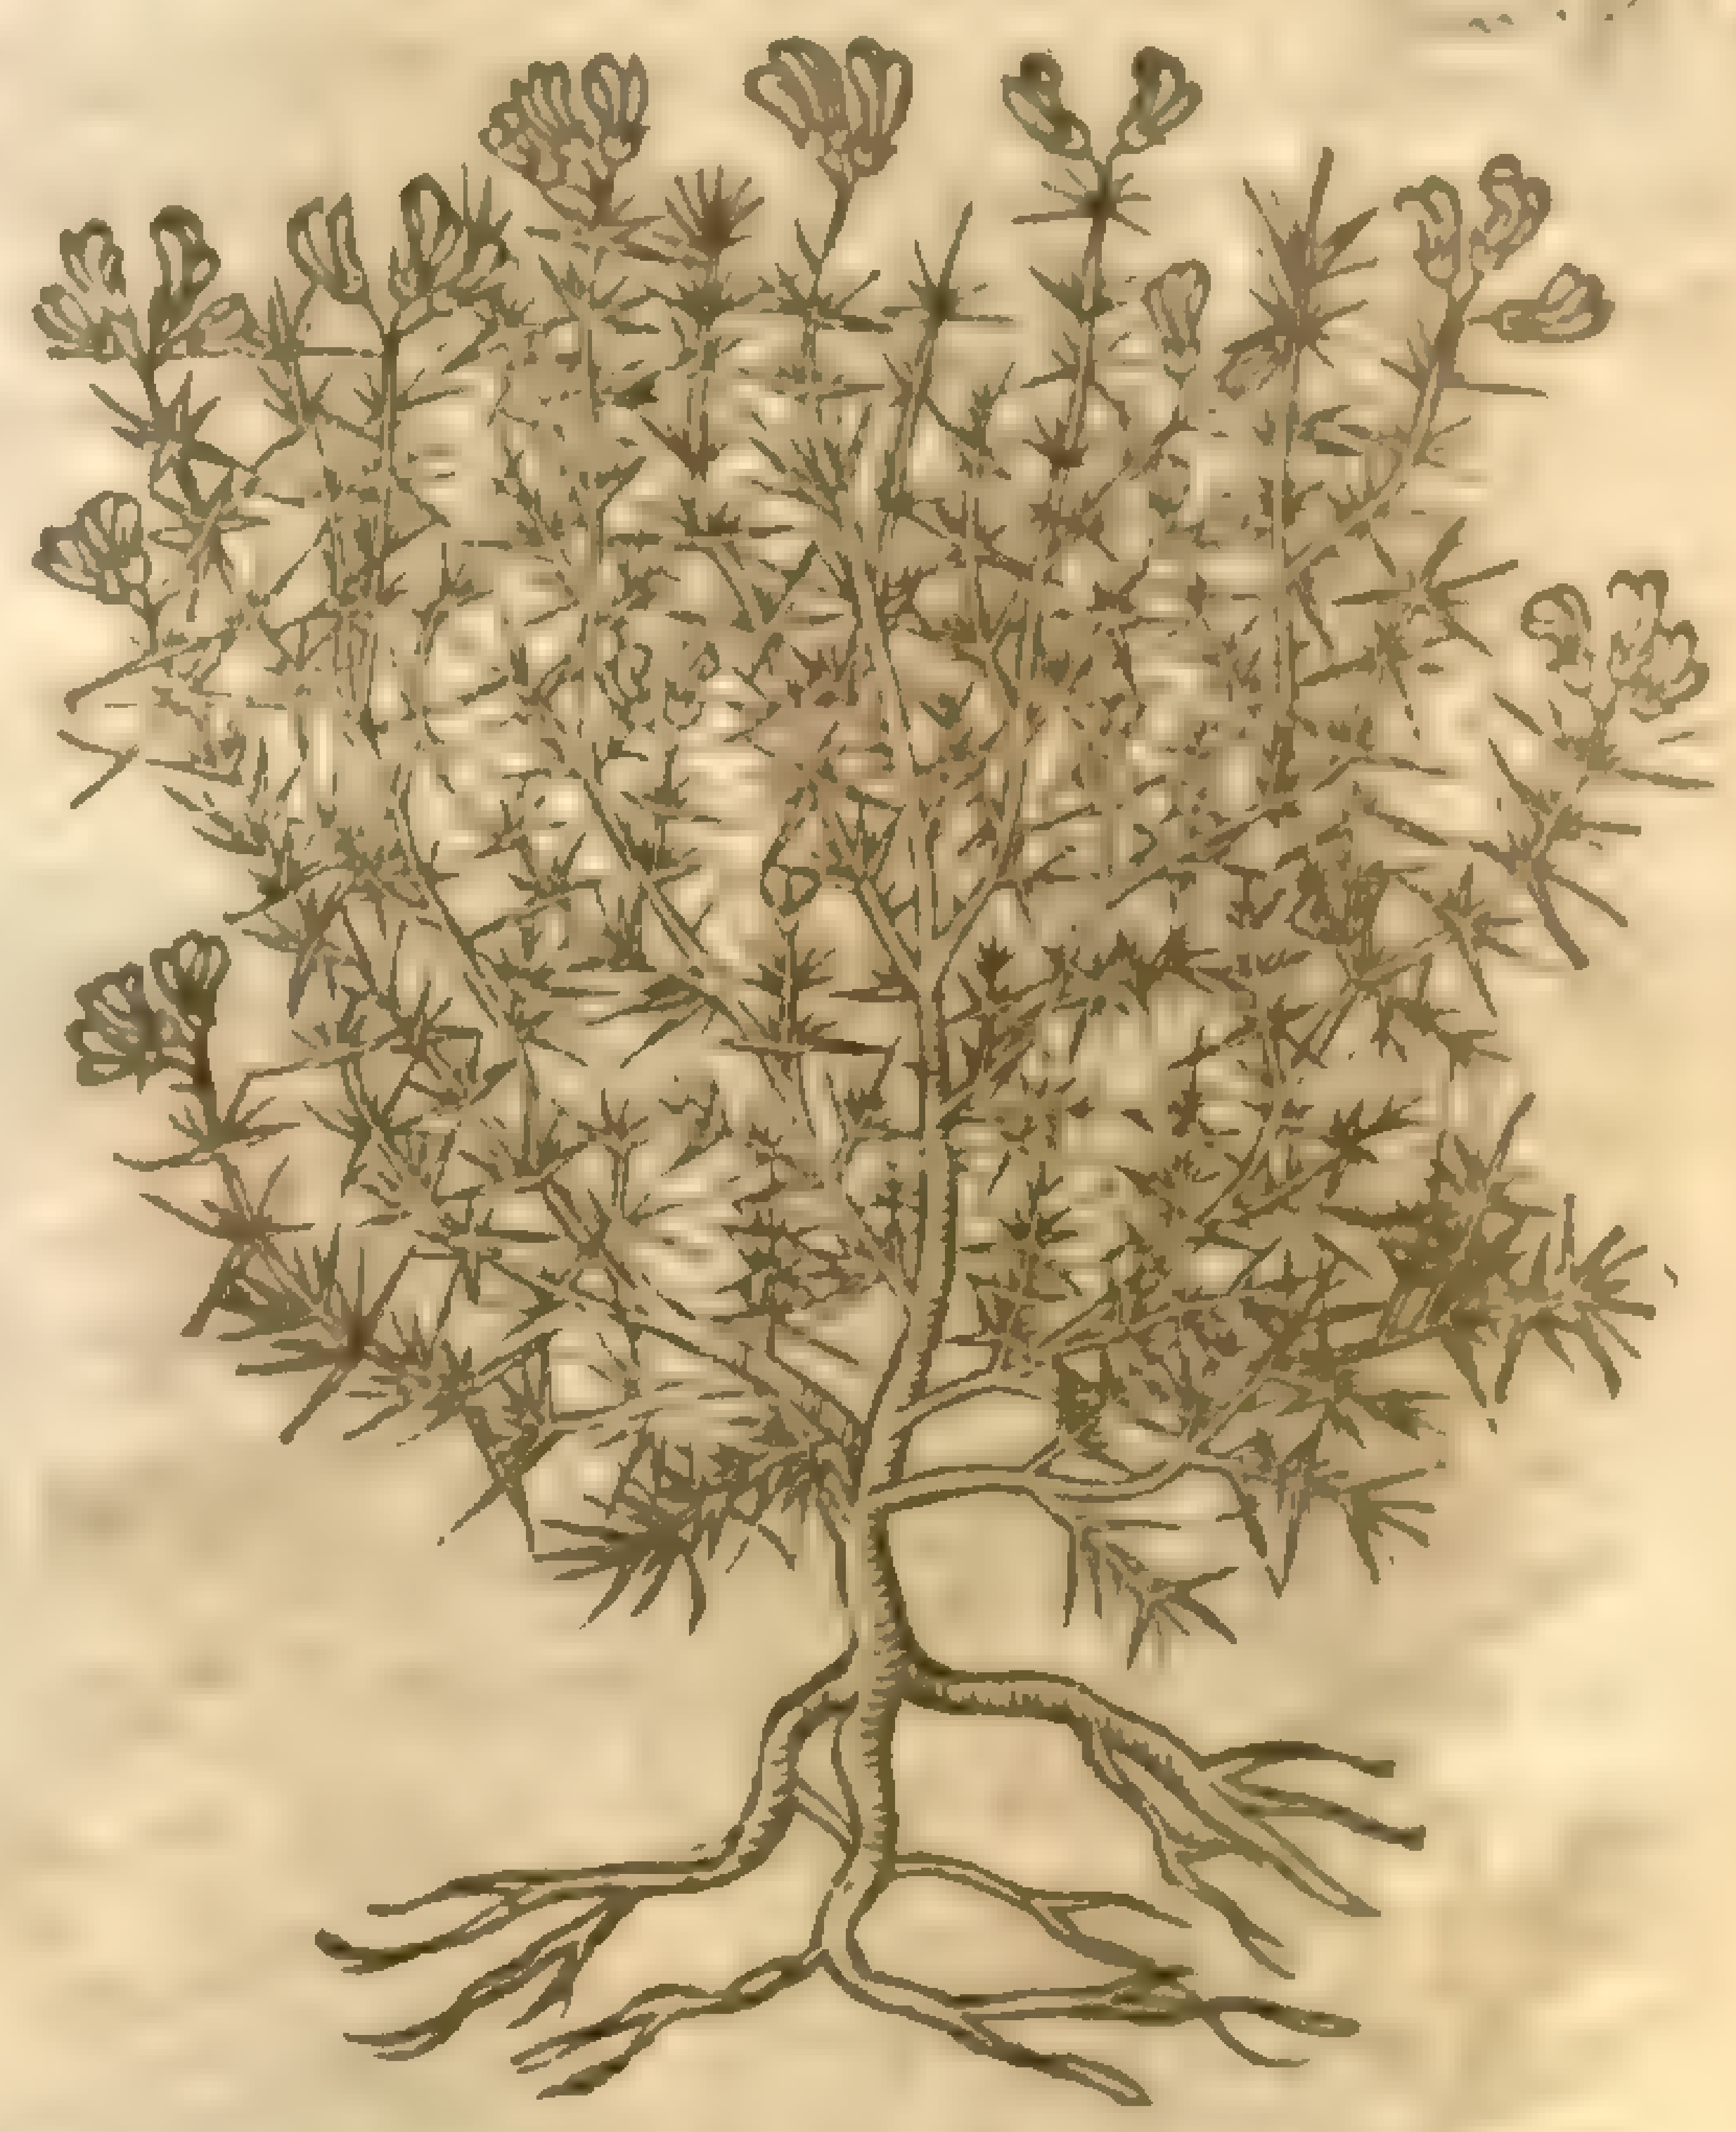
4 This ſmall kinde of Furze (growing vpon Hampſtead heath neere London, and in diuers other barren grounds, where, in manner nothing elſe will grow) hath many weake and flexible branches of a wooddy ſubſtance: whereon doe grow little leaues like thoſe of Tyme: among which are ſet in number infinite moſt ſharpe prickles, hurting like needles, whereof it tooke his name. The floures grow on the tops of the branches like thoſe of Broome, and of a pale yellow colour. The root is tough and wooddy.

‡ 5 This plant (ſaith *Cluſius*) is wholly new and elegant, ſome ſpan high, diuided into many branches, ſome ſpred vpon the ground, others ſtanding vpright, hauing plentifull ſtore of greene prickles: the floures in ſhape are like thoſe of Broome, bnt leſſe, and of a blewiſh purple colour, ſtanding in rough hairy whitiſh cups, two or three floures commonly growing neere together: ſometimes whileſt it floures it ſendeth forth little leaues, but not very often, and they are few, and like thoſe of the ſecond deſcribed, and quickely fall away, ſo that the whole plant ſeemes nothing but prickles or like a hedge-hog when ſhee folds vp her ſelfe: the root is wooddy, and large for the proportion of the plant. It growes in the kingdome of Valentia in Spaine, where the Spaniards call it *Erizo*, that is, the Hedge-hog; and thence *Cluſius* alſo termed it *Erinacea*. It floureth in Aprill. ‡

5 *Geniſta ſpinoſa humilis.*
Dwarfe or low Furze.



6 *Geniſta aculeata minor, ſiue Nepa Theophr.*
Scorpion Furze.



6 The ſmalleſt of all the Furze is that of the Antients called *Nepa*, or Scorpion Furze, as the word *Nepa* ſeemeth to import: it is a ſtranger in England: it hath beene touched of the Antients in name onely: which fault they haue beene all and euery of them to be complained of, being ſo briefe that nothing can be gathered from their deſcription: and therefore I refer what might hereof be ſaid to a further conſideration. ‡ This hath a thicke wooddy blacke root ſome halfe foot long, from whence ariſe many ſlender branches ſome foot high, which are ſet with many ſtiffe and ſharpe prickles, growing ſomewhat after the manner of the wilde prickly Sperage: the yong plants haue little leaues like thoſe of Tragacanth; the old ones none: the flours are ſmall, and come forth at the bottome of the prickles, and they are ſucceeded by broad cods wherein the ſeed is contained. It growes iu diuers places of France and Spaine, and is thought to be the *Scorpius* of *Theophraſtus*, which *Gaza* tranſlates *Nepa*. ‡

¶ *The Place.*

The common ſort hereof are very well knowne to grow in paſtures and fields in moſt places of England. The reſt are likewiſe well knowne to thoſe that curiouſly obſerue the difference.

¶ *The Time.*

They floure from the beginning of May to the end of September.

¶ *The Names.*

Furze is commonly called *Geniſta ſpinoſa*: in high Dutch, **Gaſpeldozen**: in Engliſh, Furze, Furzen buſhes, Whinne, Gorſſe, and Thorne-Broome.

☞ This thorny Broome is taken for *Theophraſtus* his *Scorpius*, which *Gaza* nameth *Nepa*: the name *Scorpius* in *Pliny* his πολώνυμον, that is to ſay, ſignifying many things, and common to certaine Plants:

for beſides this *Scorpius* of which he hath made mention, *lib.25.cap.5.* ſetting downe *Theophraſtus* his words, where he maketh *Aconitum Thelyphonon* to be *Scorpius, lib.23.cap.10.* and likewiſe other plants vnder the ſame title, but vnproperly.

¶ *The Temperature and Vertues.*

A There is nothing written in *Theophraſtus* concerning the faculties of *Scorpius ſpinoſus*, or Furze: *Pliny* ſeemeth to attribute vnto it the ſame vertues that *Scorpioides* hath: notwithſtanding the later Writers do agree that it is hot and dry of complexion: the ſeeds are vſed in medicines againſt the ſtone, and ſtaying of the laske.

† This chapter hath vndergone a great alteration: as thus; the firſt, third, and fourth deſcriptions belonged to the third figure: the ſecond and fifth deſcription to the fifth figure: and the firſt, ſecond, and fourth figures had no deſcriptions belonging to them. The figure that was in the firſt place is now in the third: the ſecond ſtill holds his place: the third is in the firſt, belonging thereto of right: and for handſomneſſe ſake I haue made the fourth and fifth change place. This Nepe alſo in the ſixth place was formerly mentioned by our Author (but now omitted) in the chapter of Aſparagus.

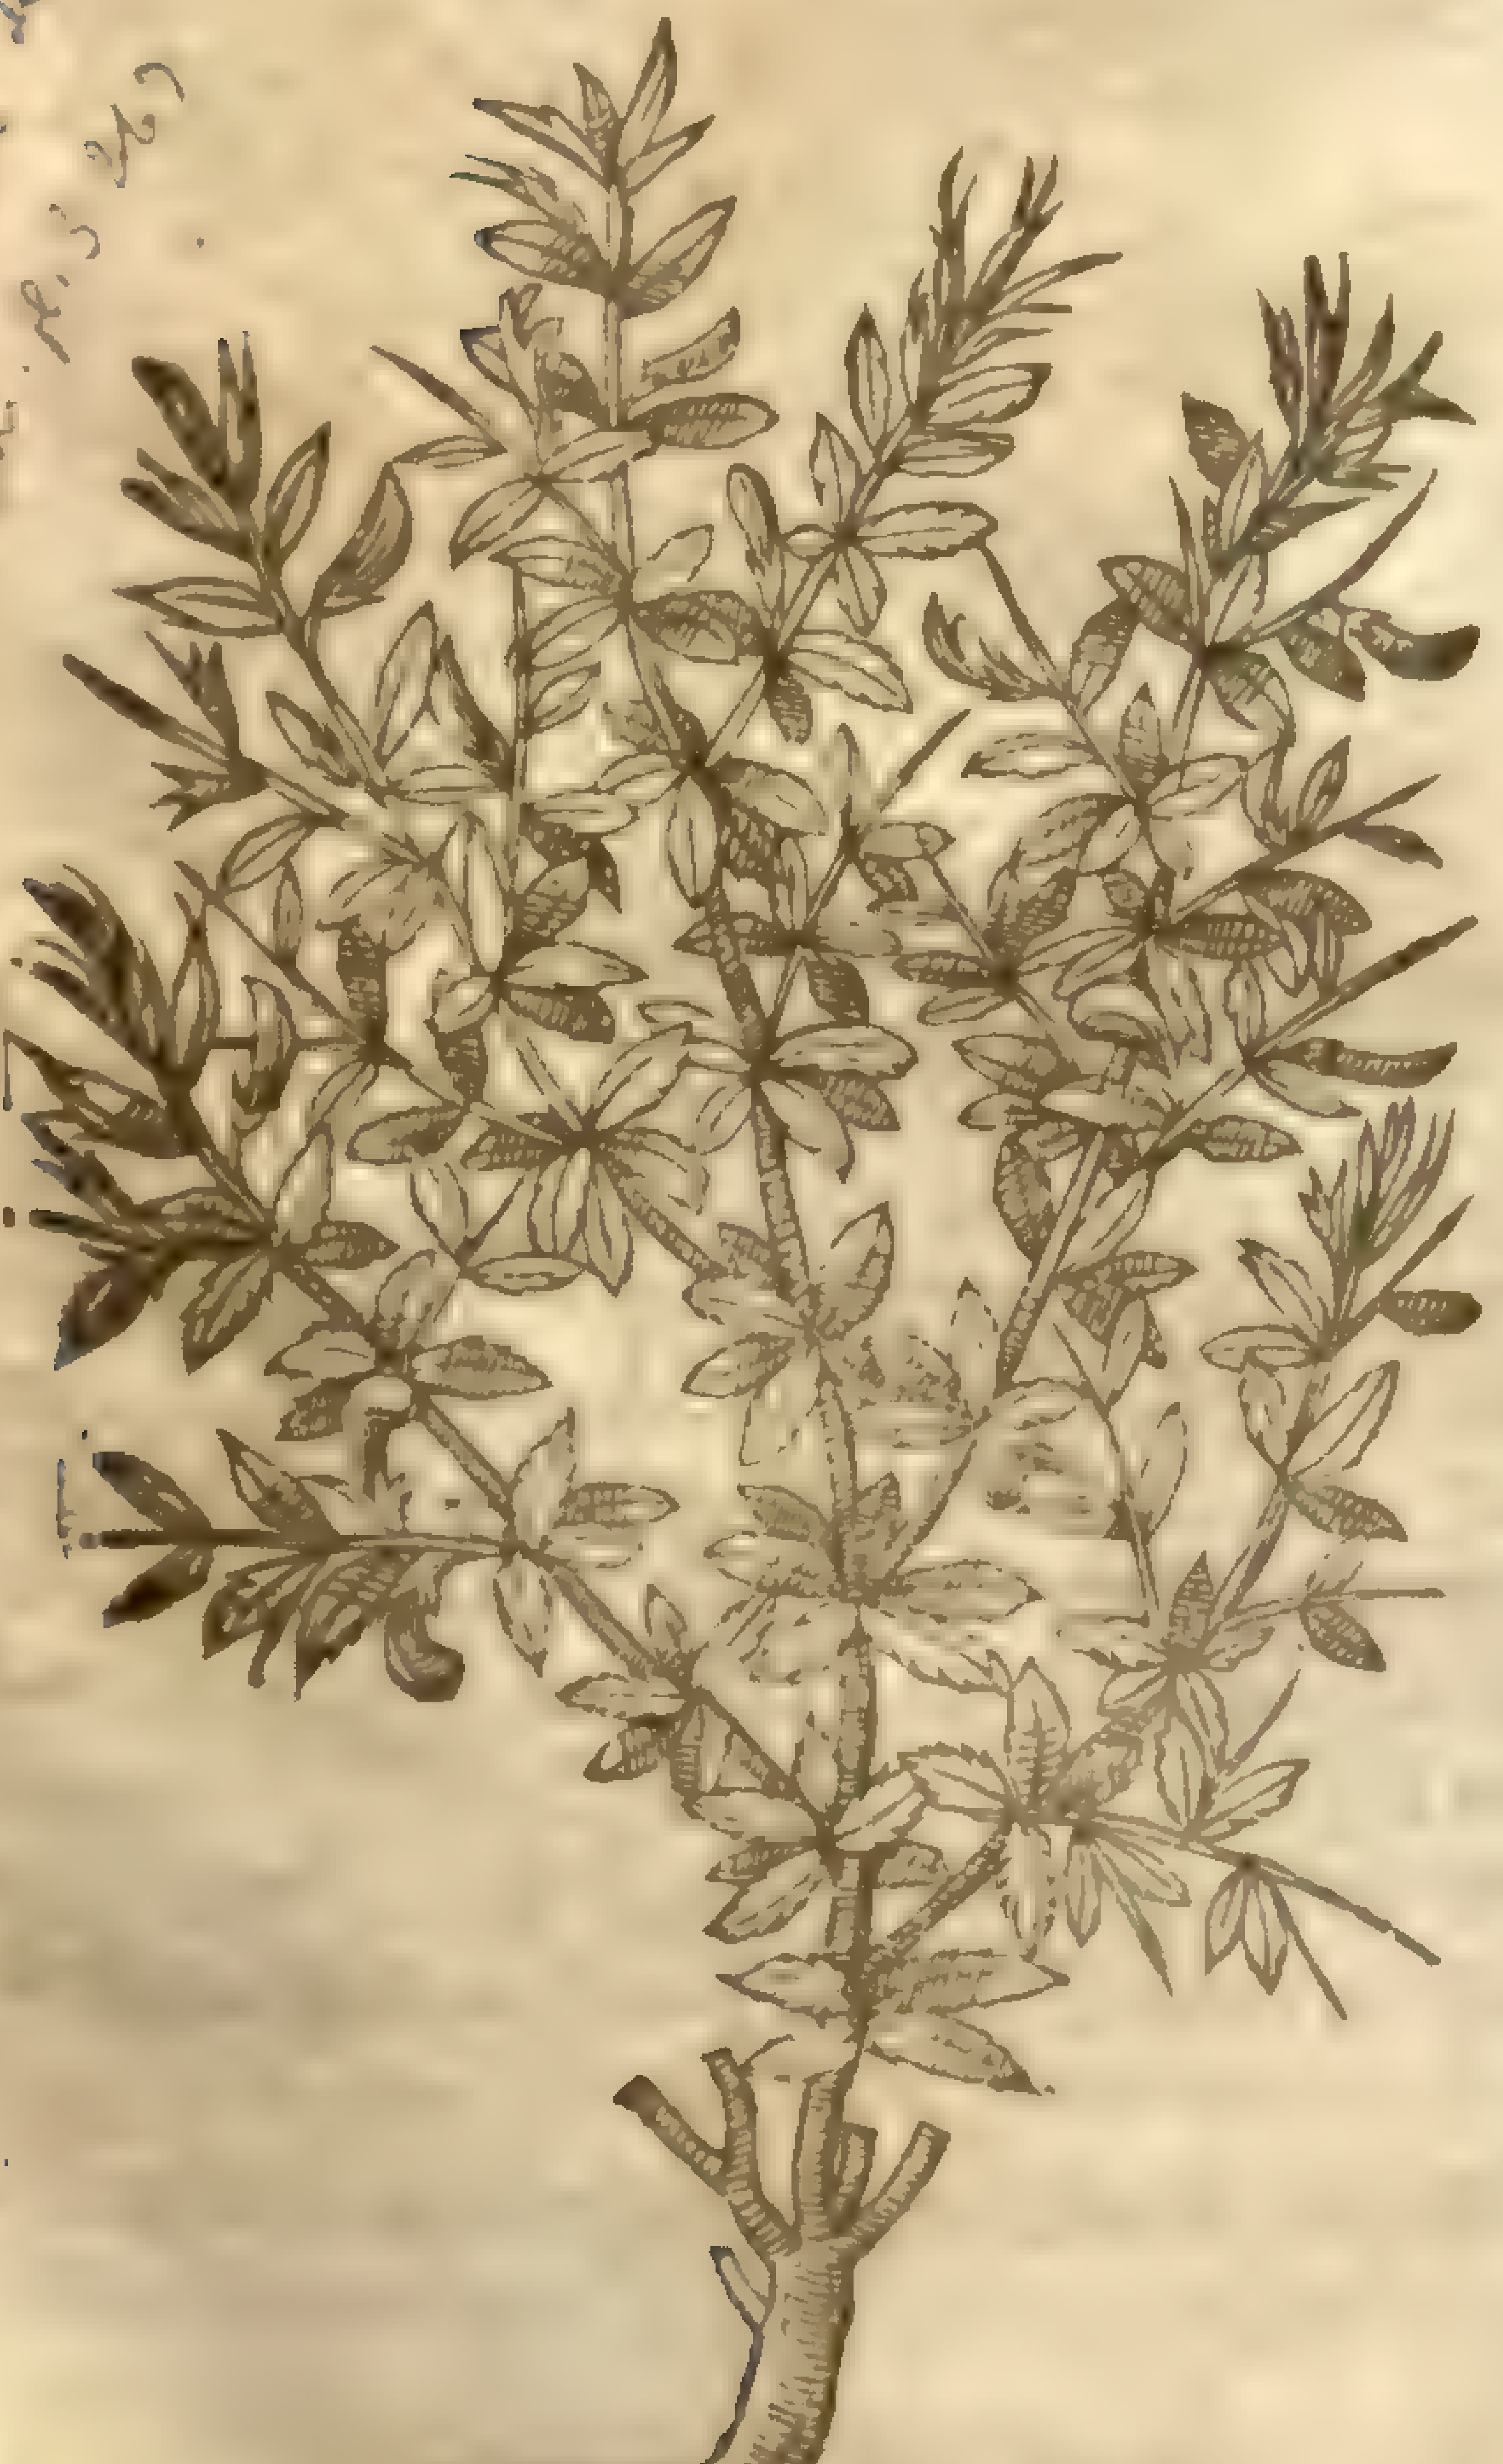
CHAP. 21.

Of Cammocke, Furze, Reſt-Harrow, or Petty Whinne.

¶ *The Kindes.*

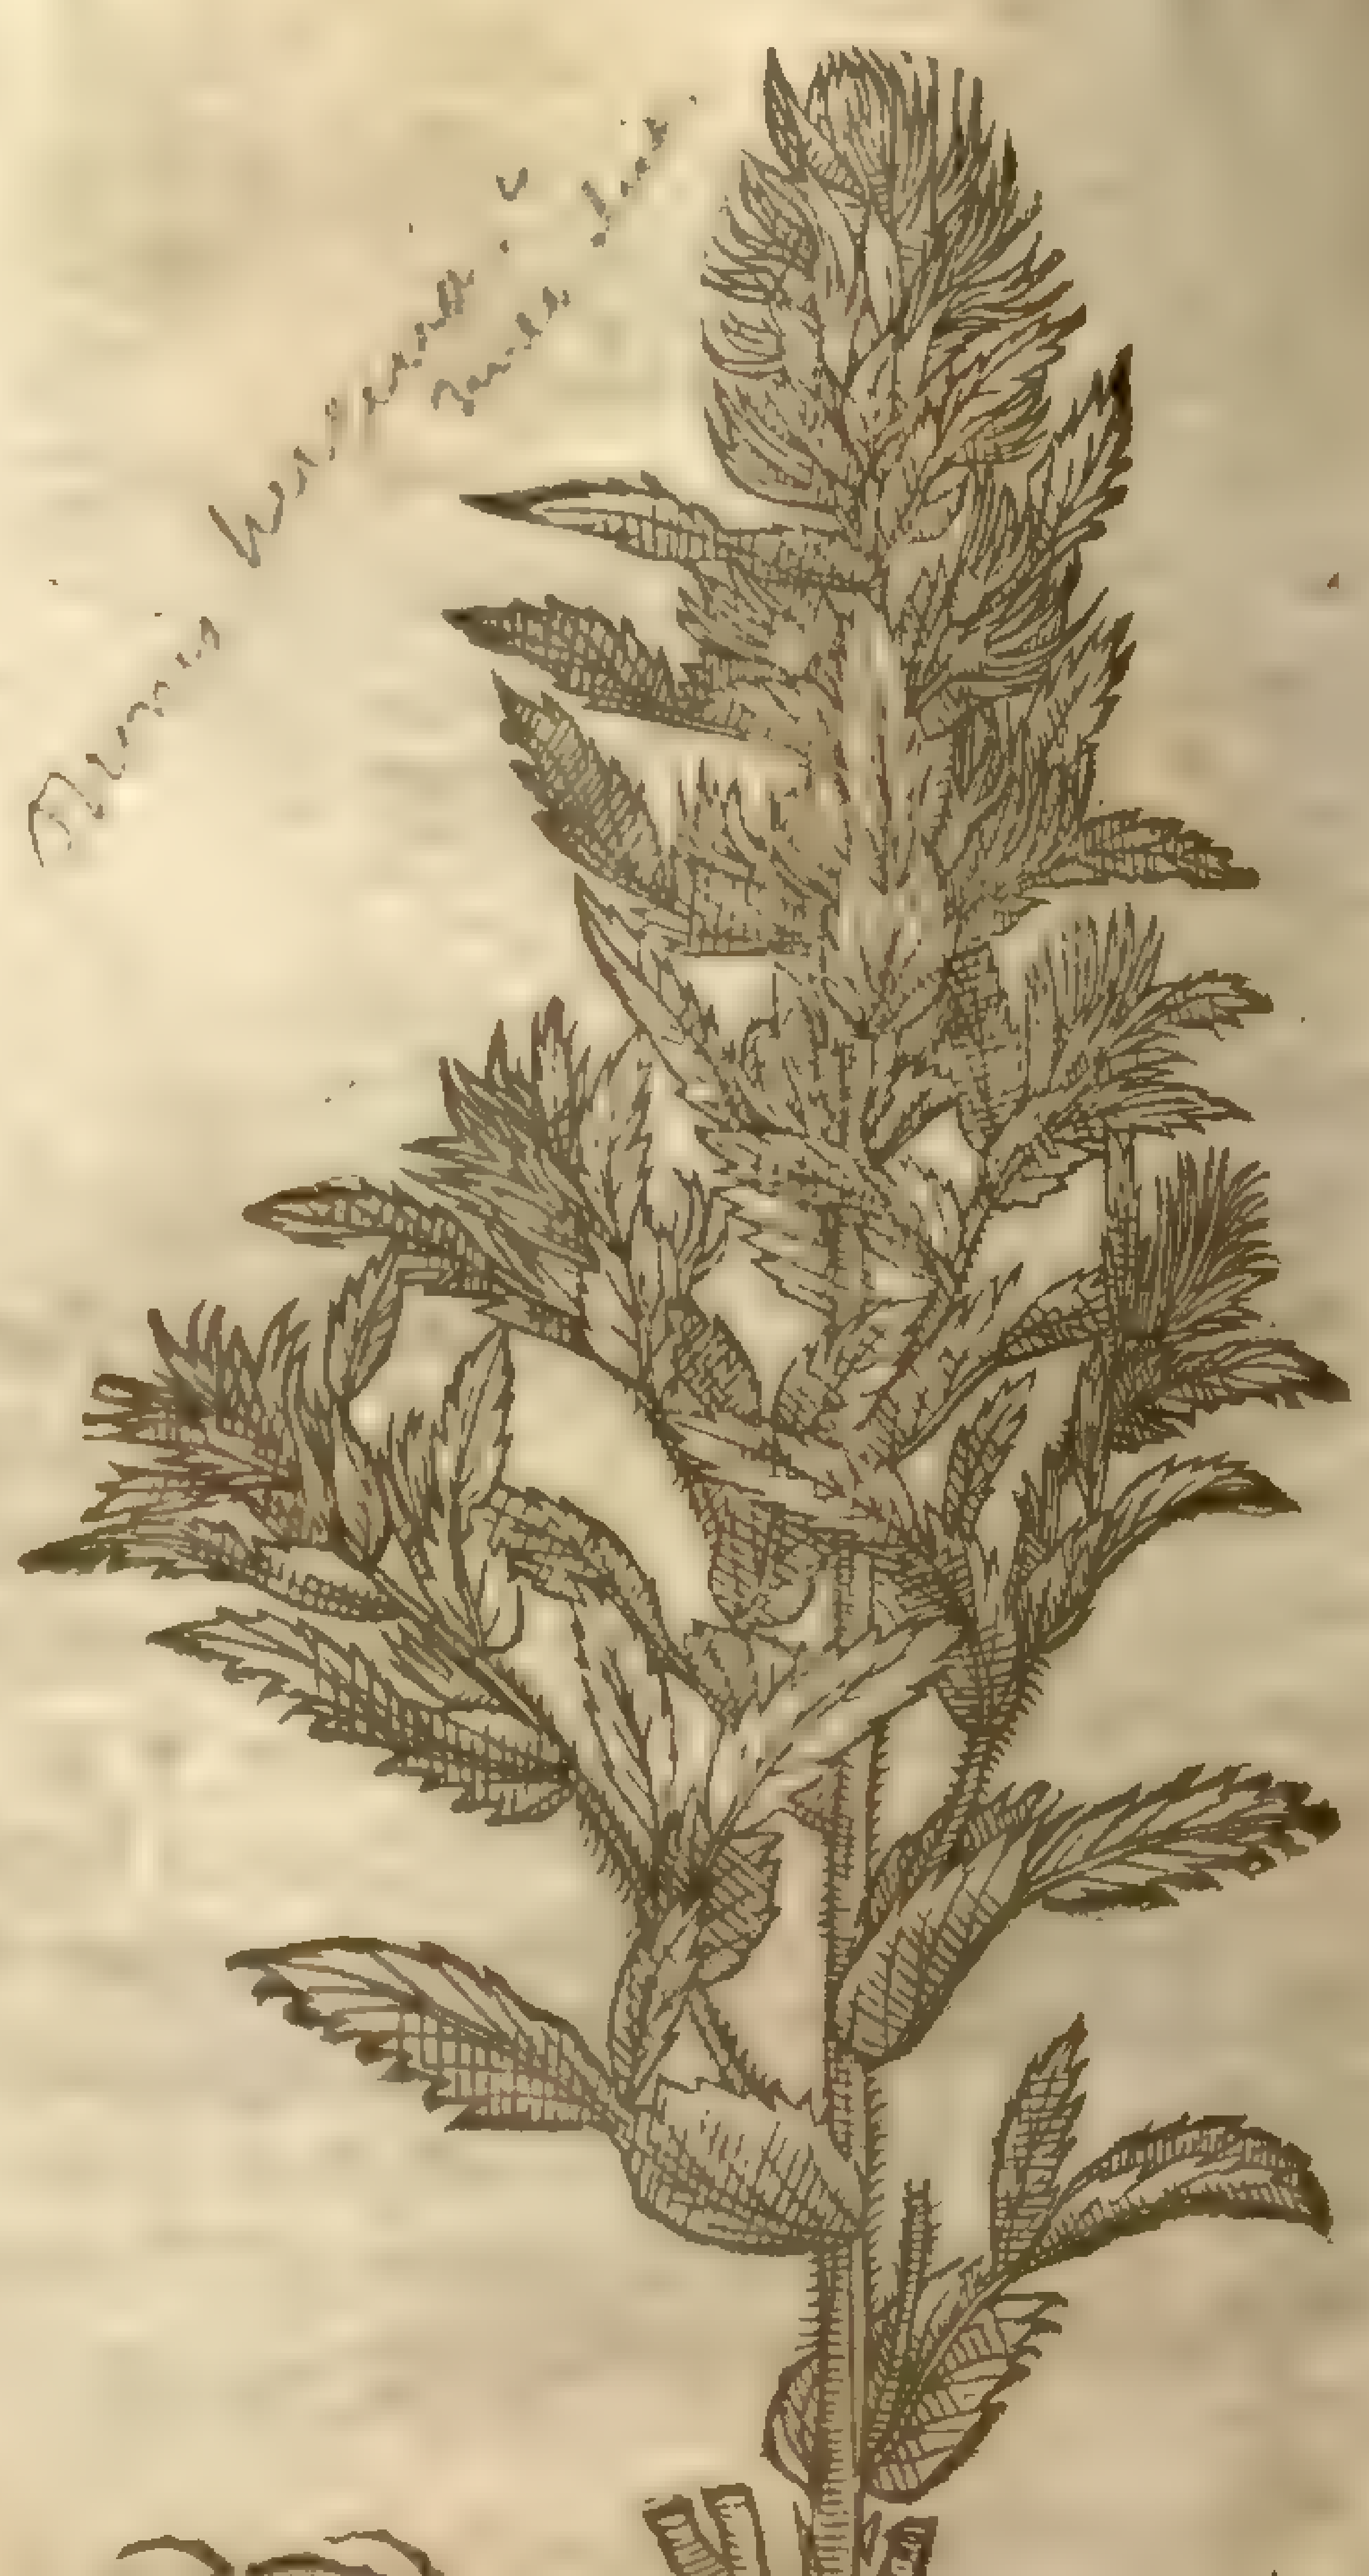
THere be diuers ſorts of Reſt-Harrow, which ſome haue inſerted among the ſmooth Broomes, others, among thoſe with prickles, whereof ſome haue purple floures and likewiſe full of prickles; others white floures, and ſharpe thornes: ſome alſo purple floures, others white, and alſo yellow, and euery of them void of prickles.

Anonis [illegible]



1 *Anonis, ſiue Reſta Bouis.*
Cammocke, or Reſt-Harrow.

Anonis [illegible]



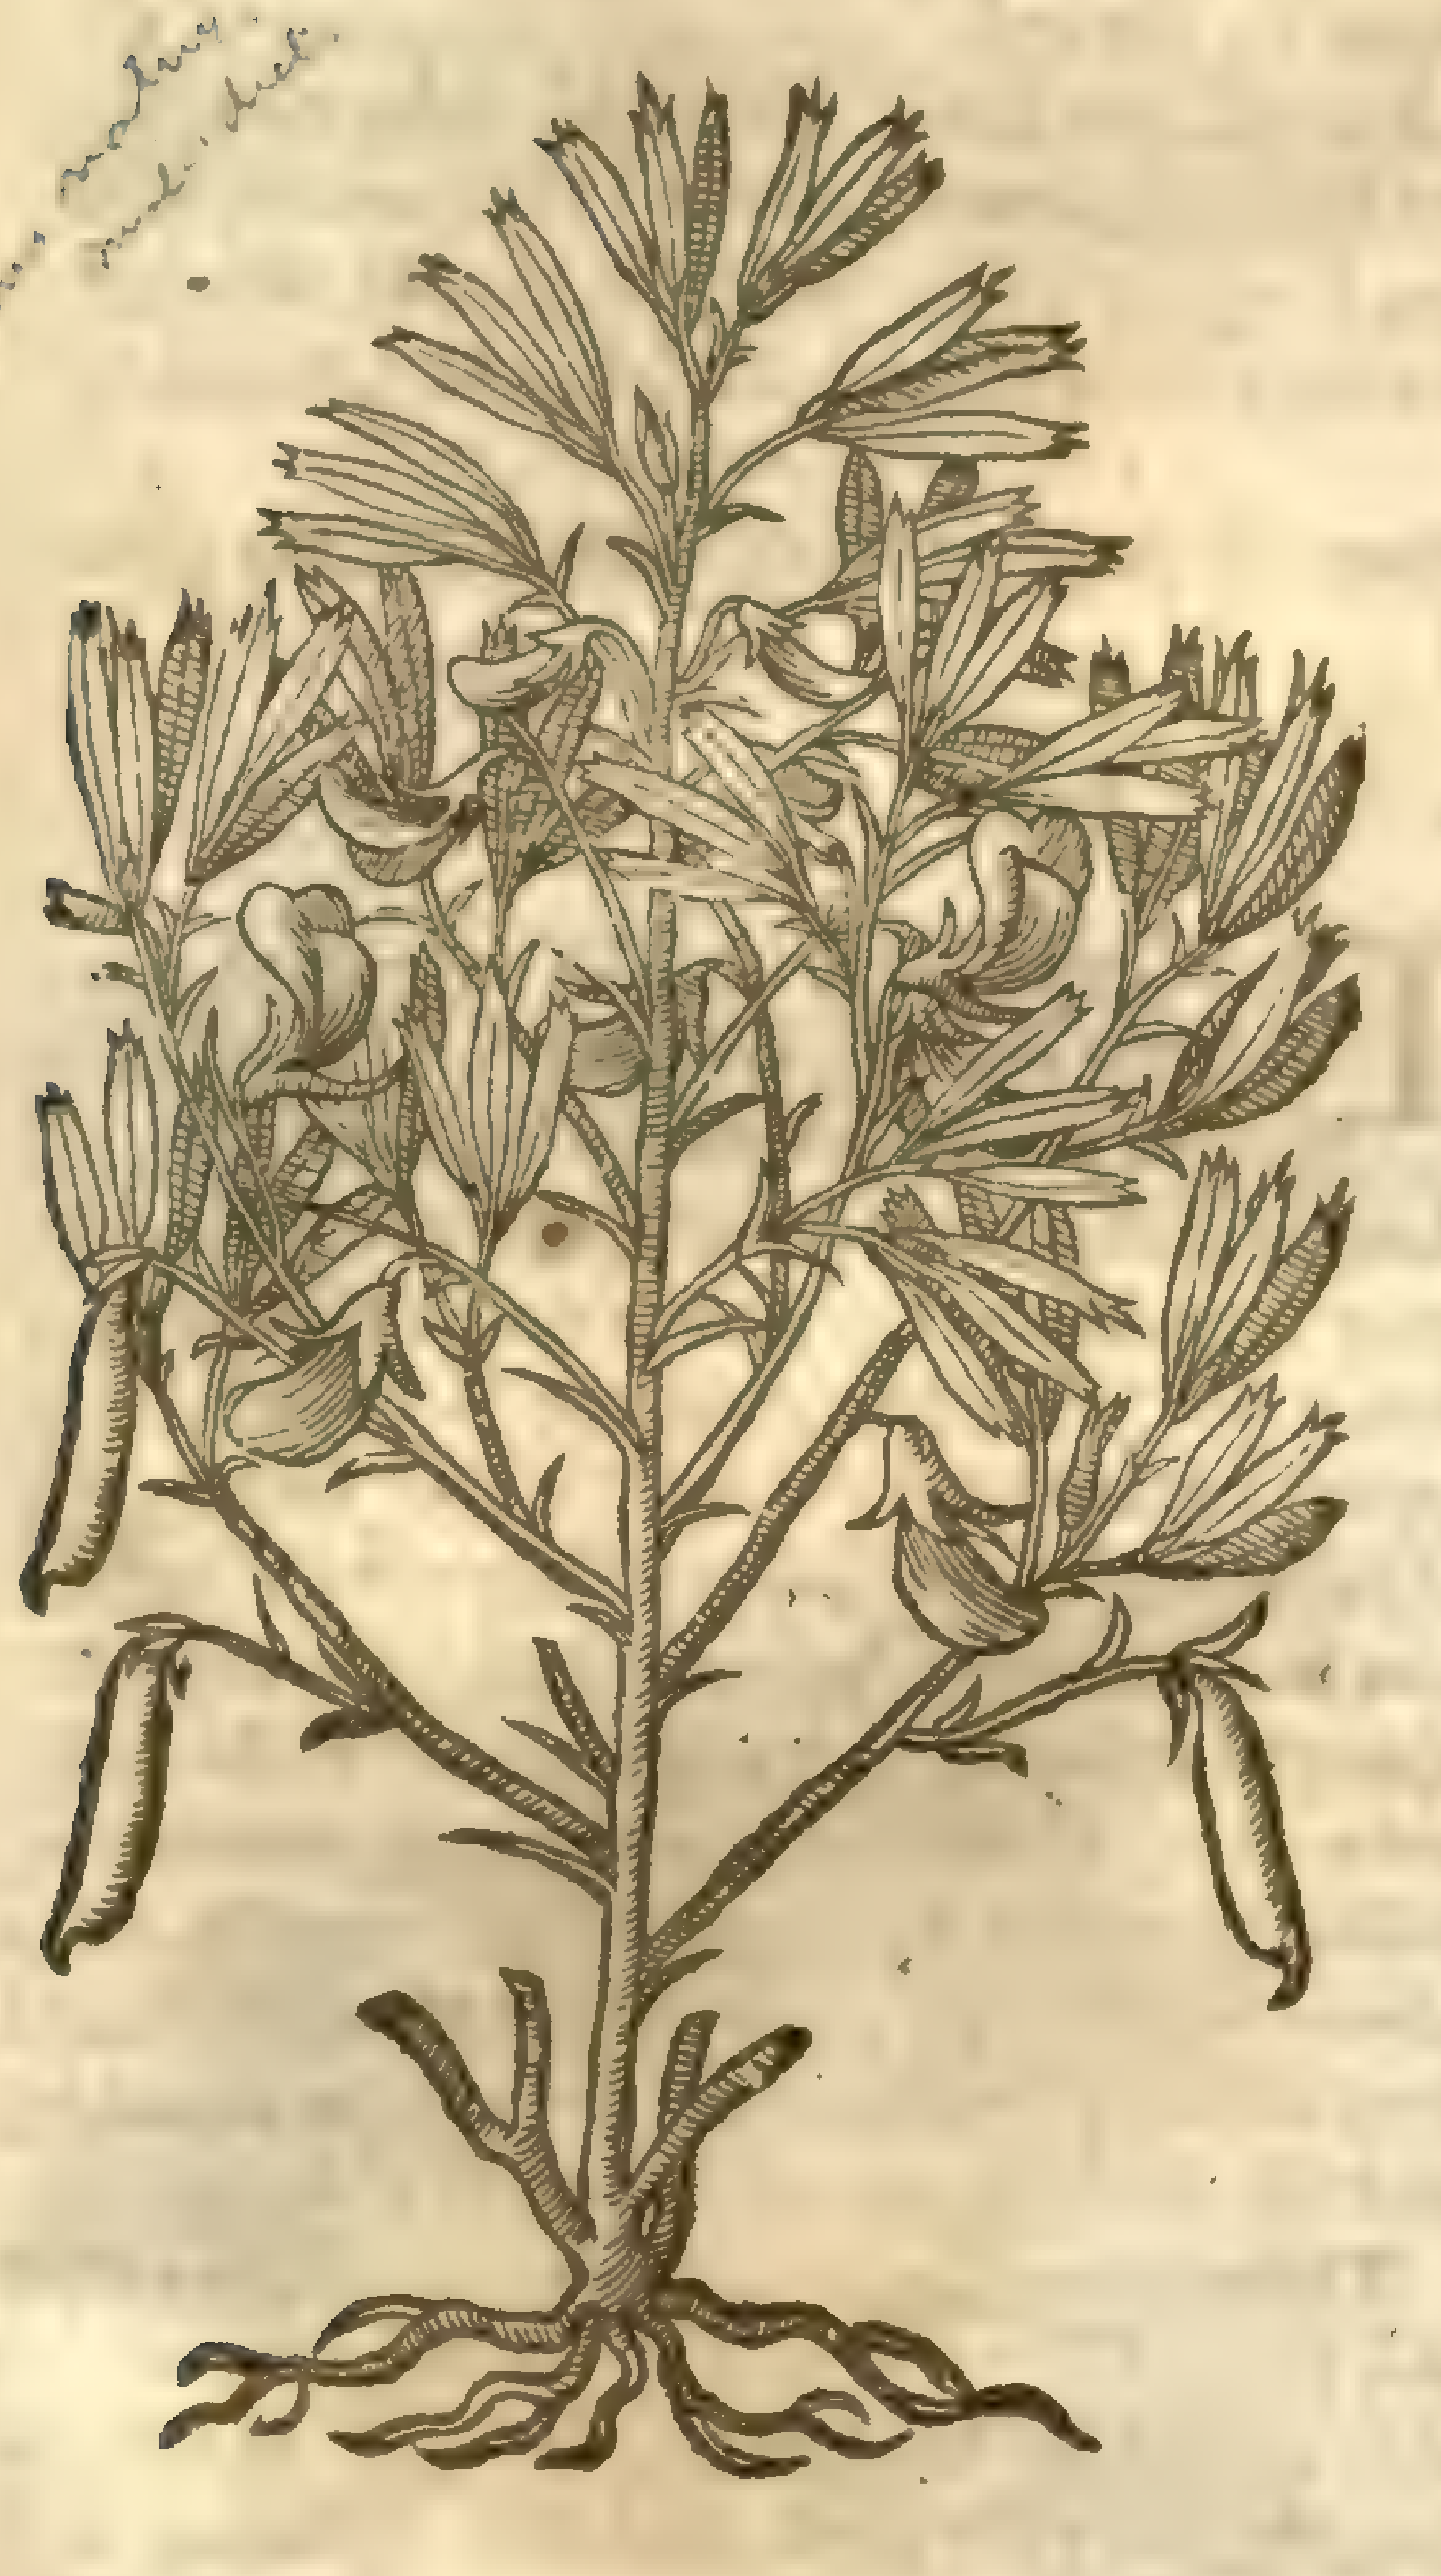
3 *Anonis non ſpinoſa purpurea.*
Purple Reſt-Harrow without prickles.

¶ *The Deſcription.*

1 CAmmock or ground Furze riſeth vp with ſtalkes a cubit high, and often higher, ſet with diuers joynted branches, tough, pliable, and full of hard ſharpe thornes: among which do grow leaues in forme like thoſe of S. Iohns-wort, or rather of the Lentill, of a

deepe green colour: from the boſome of which thorns and leaues come forth the floures, like thoſe of Peaſon, of a purple colour: after which doe come the cods, in which do lie flat ſeed: the root is long, and runneth far abroad, very tough, and hard to be torne in pieces with the plough, inſomuch that the oxen can hardly paſſe forward, but are conſtrained to ſtand ſtill; whereupon it was called Reſt-Plough, or Reſt-harrow.

4 *Anonis, ſiue Spina lutea.*
Yellow Reſt-Harrow.



2 We haue in our London paſtures, and likewiſe in other places, one of the Reſt-Harrowes, not differing from the precedent in ſtalkes, leaues, or prickles: the onely differnce is, that this plant bringeth forth white flours, and the others not ſo: whence we may call it *Anonis flore albo*, Cammocke with white floures.

3 Reſt-harrow without thornes hath a tough hoary rough ſtalke, diuided into other rough branches, whereon are ſet without order, long leaues ſharpe pointed, ſleightly cut about the edges, of an hoary colour, and ſomewhat hairie: from the boſome whereof commeth forth purple Peaſe like floures of a reaſonable good ſmell: the root is very tough, long, and wooddy.

4 The yellow floured Cammock is a ſtranger in theſe parts, it is only found in the cold Eaſterne countries, for ought that I can learne; it differs not from the laſt deſcribed, ſauing that the floures hereof are of a darke yellow colour, wherein it differeth from all the other of his kinde.

¶ *The Place.*

Theſe grow in earable grounds in fertile paſtures, and in the borders of fields, in a fat, fruitfull, and long laſting ſoile: it is ſooner found than deſired of husbandmen, becauſe the tough and wooddie roots are comberſome vnto them, for that they ſtay the plough, and make the oxen ſtand.

¶ *The Time.*

They ſend forth new ſhoots in May: they be ful growne in Autumne, and then thoſe that of nature are prickly be fulleſt of ſharpe thornes: they floure in Iuly and Auguſt.

¶ *The Names.*

Cammocke is called in Greeke, Ἄνωνις, or Ὄνωνις: and likewiſe in Latine *Anonis*, and *Ononis*: Of Herbariſts commonly *Areſta Bouis*, and *Remora aratri*, becauſe it maketh the Oxen whileſt they be in plowing to reſt or ſtand ſtill: it is alſo called *Acutella*, of the ſtiffe and ſharpe thorns which pricke thoſe that paſſe by: in French, *Areſte beuf*, and *Boucrande*.

Crateuas nameth it *Ægipyrus*: in high Dutch, **Stalkraut**: in low Dutch, **Prangwortele**: in Italian, *Bonaga*: in Spaniſh, *Gattilhos*: in French, *Arreſte beuf*, *Beuf & Bouerande*: in Engliſh, Cammocke, Reſt-harrow, Petty Whinne, and ground Furze.

¶ *The Temperature.*

The root of Cammocke is hot in the third degree, as *Galen* ſaith: it cutteth alſo and maketh thinne.

¶ *The Vertues.*

The barke of the root drunke with Wine prouoketh vrine, breaketh the ſtone, and driueth it forth. A

The root boyled in water and vineger allayeth the paine of the teeth, if the mouth be often waſhed therewith hot. B

Pliny reporteth, That being boyled in Oxymel (or the ſyrrup made with hony and vineger) till the one halfe be waſted, it is giuen to thoſe that haue the falling ſickeneſſe. *Matthiolus* reporteth, that he knew a man cured of a rupture, by taking of the pouder of this root for many moneths together. C

The tender ſprigs or crops of this ſhrub before the thornes come forth, are preſerued in pickle, and be very pleaſant ſauce to be eaten with meat as a ſallad, as *Dioſcorides* teacheth. D

Chap. 22.

Of Gooſe-berrie, or Fea-berry Buſh.

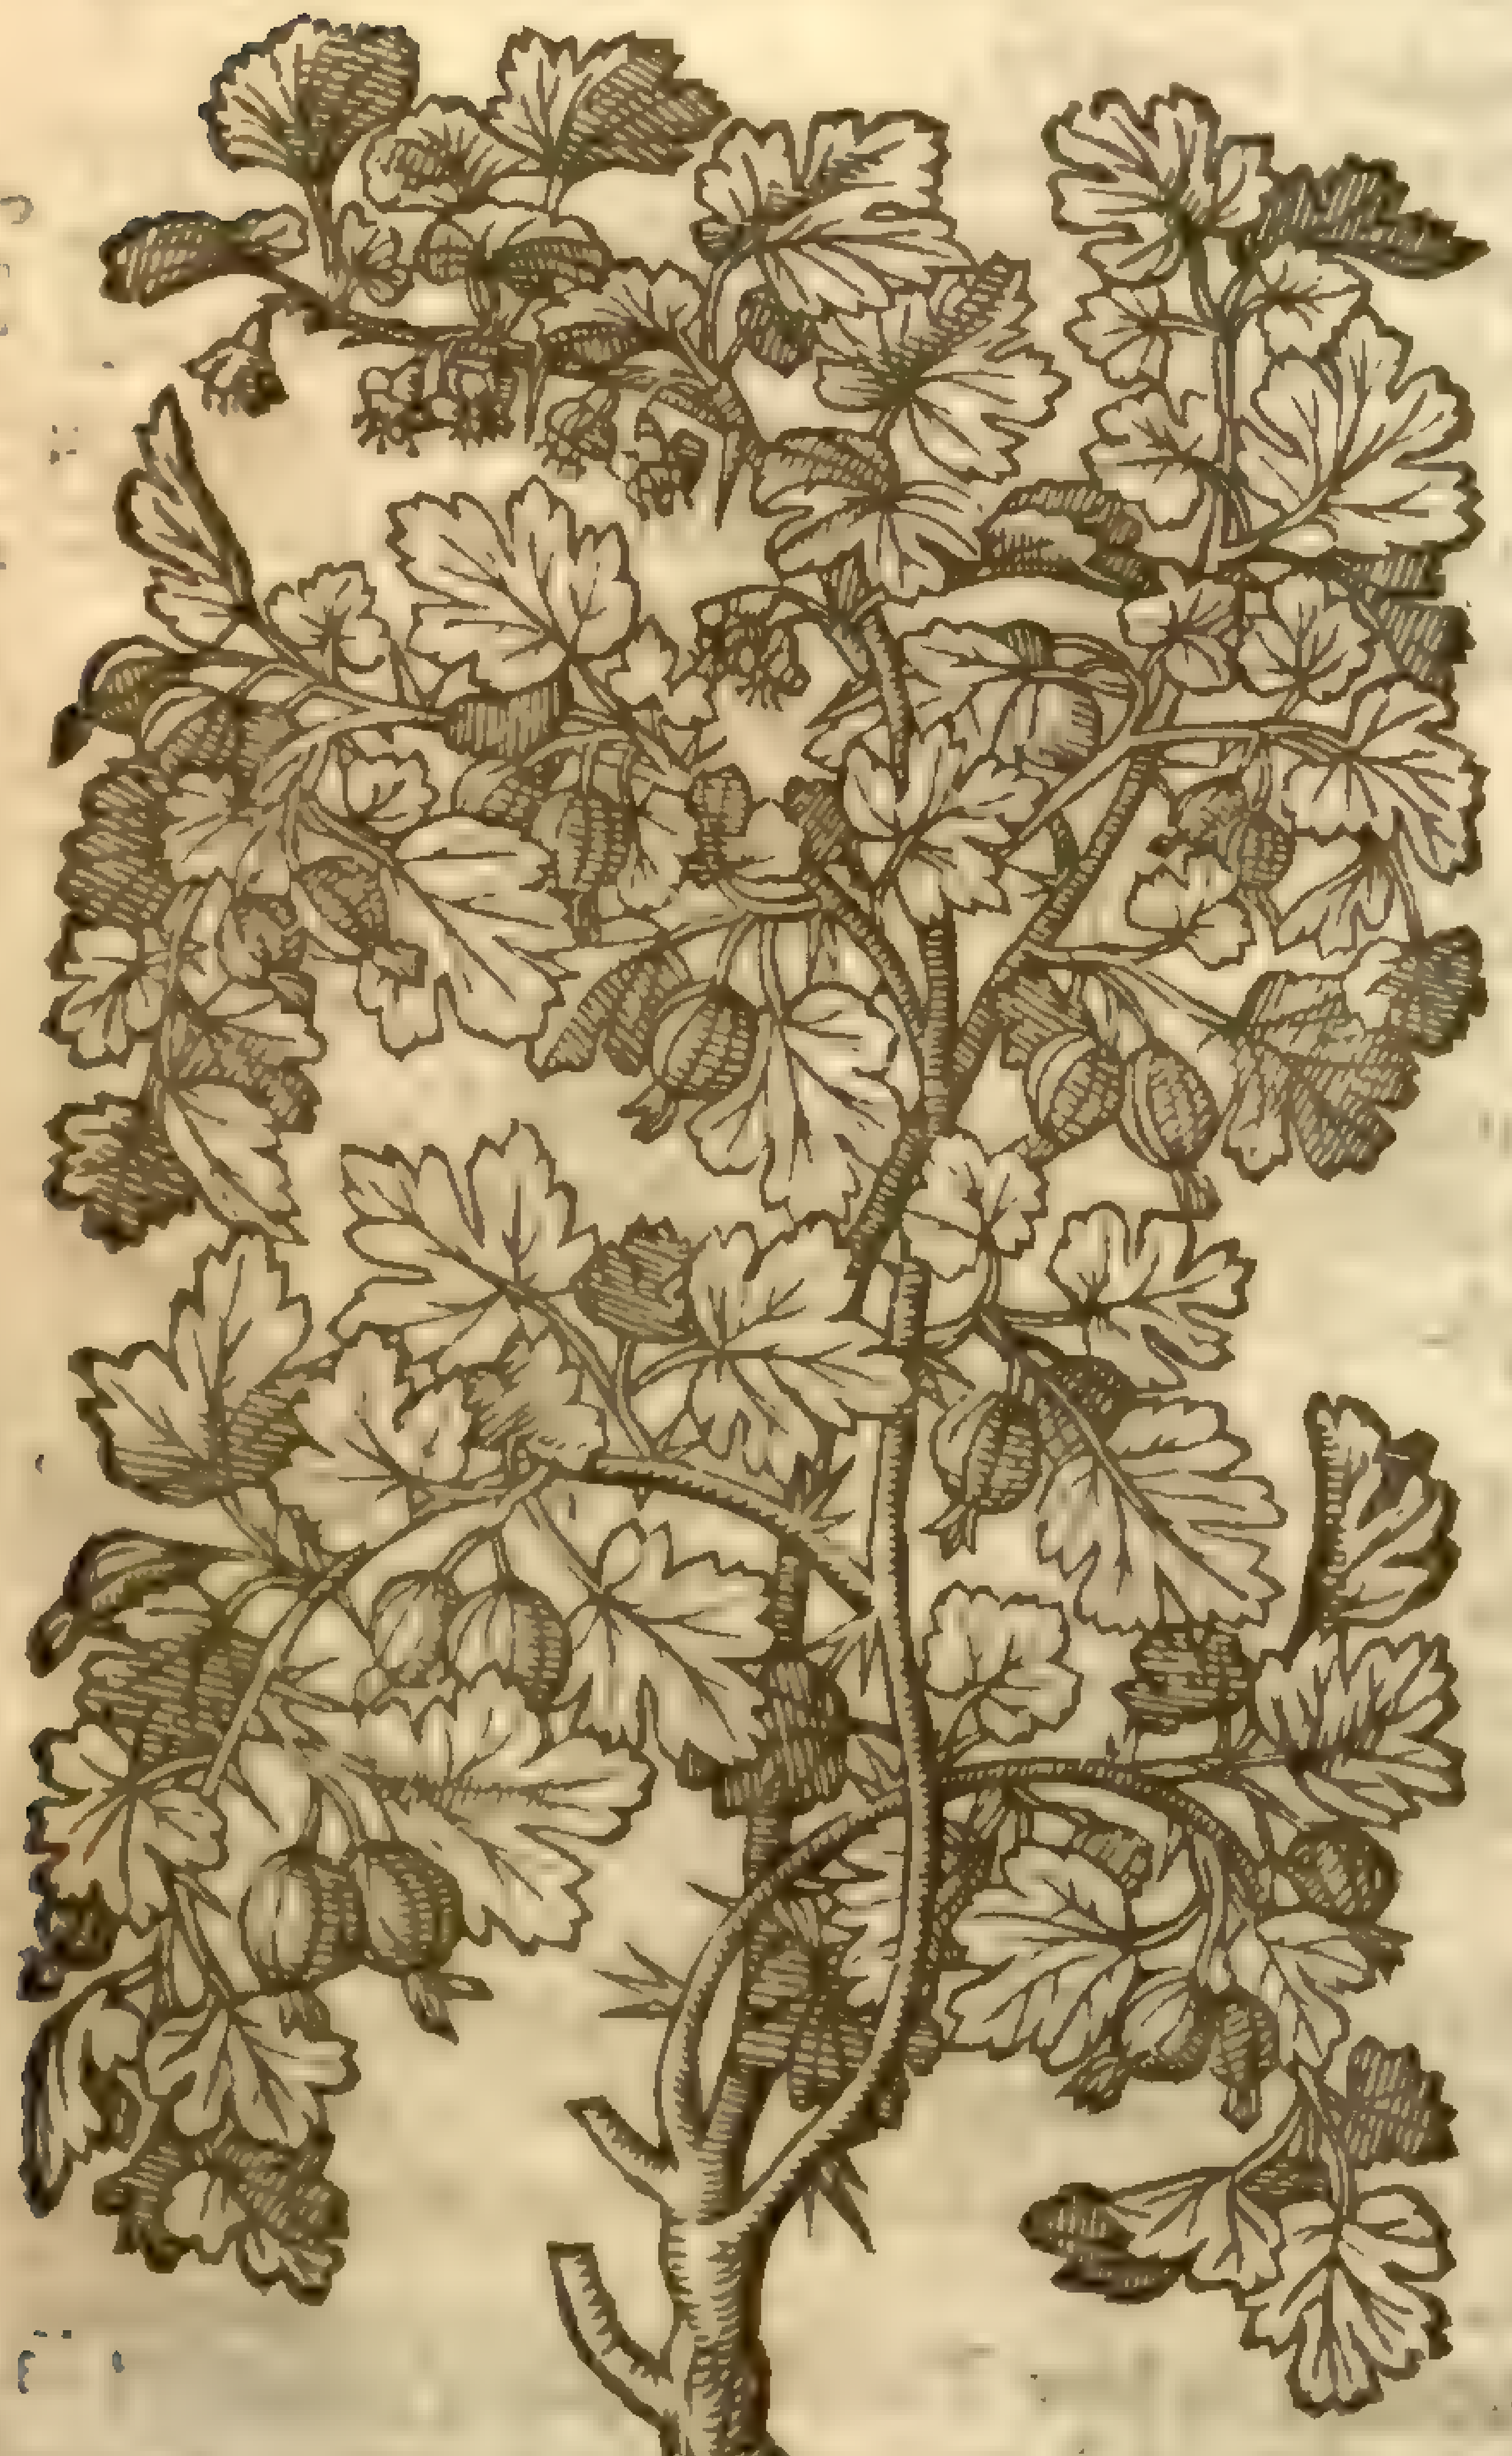
¶ *The Kindes.*

There be diuers ſorts of the Gooſe-berries; ſome greater, others leſſe: ſome round, others long; and ſome of a red colour: the figure of one ſhall ſerue for the reſt.

‡ I will not much inſiſt vpon diuerſities of fruits, becauſe my kinde friend Mr. *Iohn Parkinſon* hath ſufficiently in his late Worke diſcourſed vpon that ſubject; onely becauſe I iudge many will be deſirous to know their names, and where to get them, I will briefely name the chiefe varieties our Kingdome affords; and ſuch as are deſirous of them may finde them with Mr. *Iohn Millen* liuing in Old-ſtreet.

The ſorts of Gooſe-berries are theſe: the long greene, the great yellowiſh, the blew, the great round red, the long red, and the prickly Gooſe-berry. ‡

Vua Criſpa.
Gooſe-berries.



Ribes uva crispa, [illegible] Sm. fl. b. 313

E.B. 1244

¶ *The Deſcription.*

The Gooſe-berry buſh is a ſhrub of three or foure cubits high, ſet thicke with moſt ſharpe prickles: it is likewiſe full of branches, ſlender, woody, and prickly: whereon do grow round leaues cut with deepe gaſhes into diuers parts like thoſe of the Vine, of a very greene colour: the floures be very ſmall, of a whitiſh greene, with ſome little purple daſhed here and there: the fruit is round, growing ſcatteringly vpon the branches, greene at the firſt, but waxing a little yellow through maturitie; full of a winie iuyce ſomewhat ſweet in taſte when they be ripe; in which is contained hard ſeed of a whitiſh colour: the root is woody, and not without ſtrings annexed thereto.

There is another whoſe fruit is almoſt as big as a ſmall Cherry, and very round in forme: as alſo another of the like bigneſſe, of an inch in length, in taſte and ſubſtance agreeing with the common ſort.

We haue alſo in our London gardens another ſort altogether without prickles: whoſe fruit is very ſmal, leſſer by much than the common kinde, but of a perfect red colour, wherein it differeth from the reſt of his kinde.

¶ *The Place.*

Theſe plants doe grow in our London Gardens and elſe-where in great abundace.

¶ *The Time.*

The leaues come forth in the beginning of Aprill or ſooner: the fruit is ripe in Iune and Iuly.

¶ *The Names.*

This ſhrub hath no name among the old Writers, who as we deeme knew it not, or elſe eſteemed it not: the later Writers call it in Latine, *Croſſularia*: and oftentimes of the berries, *Vua Criſpa, Vua ſpina, Vua ſpinella*, and *Vua Criſpina*: in high Dutch, **Kruſelbeer**: in low Dutch, **Stekelbeſien**: in Spaniſh, *Vua Criſpa*, or *Eſpina*: in Italian, *Vua ſpina*: in French, *Groiſelles*: in Engliſh, Gooſe-berry, Gooſe-berry buſh, and Fea-berry buſh in Cheſhire, my natiue country.

¶ *The Temperature.*

The berries of this buſh before they be ripe are cold and dry, and that in the later end of the ſecond degree, and alſo binding.

¶ *The Vertues.*

A The fruit is vſed in diuers ſauces for meat, as thoſe that are skilfull in cookerie can better tell than my ſelfe.

They are vſed in broths in ſtead of Verjuice, which maketh the broth not onely pleaſant to the taſte, but is greatly profitable to ſuch as are troubled with an hot burning ague. B

They are diuerſly eaten, but they euery way ingender raw and cold bloud: they nouriſh nothing or very little: they alſo ſtay the belly and ſtench bleedings. C

They ſtop the menſes or monethly ſicknes, except they happen to be taken into a cold ſtomack, then do they not help, but rather clog or trouble the ſame by ſome manner of flix. D

The ripe berries, as they are ſweeter, ſo doe they alſo little or nothing binde, and are ſomething hot, and yeeld a little more nouriſhment than thoſe that be not ripe, and the ſame not crude or raw: but theſe are ſeldome eaten or vſed as ſauce. E

The juice of the green Gooſeberries cureth all inflammations, *Eryſipelas*, and S. *Anthonies* fire. F

They prouoke appetite, and cure the vehement heate of the ſtomacke and liuer. G

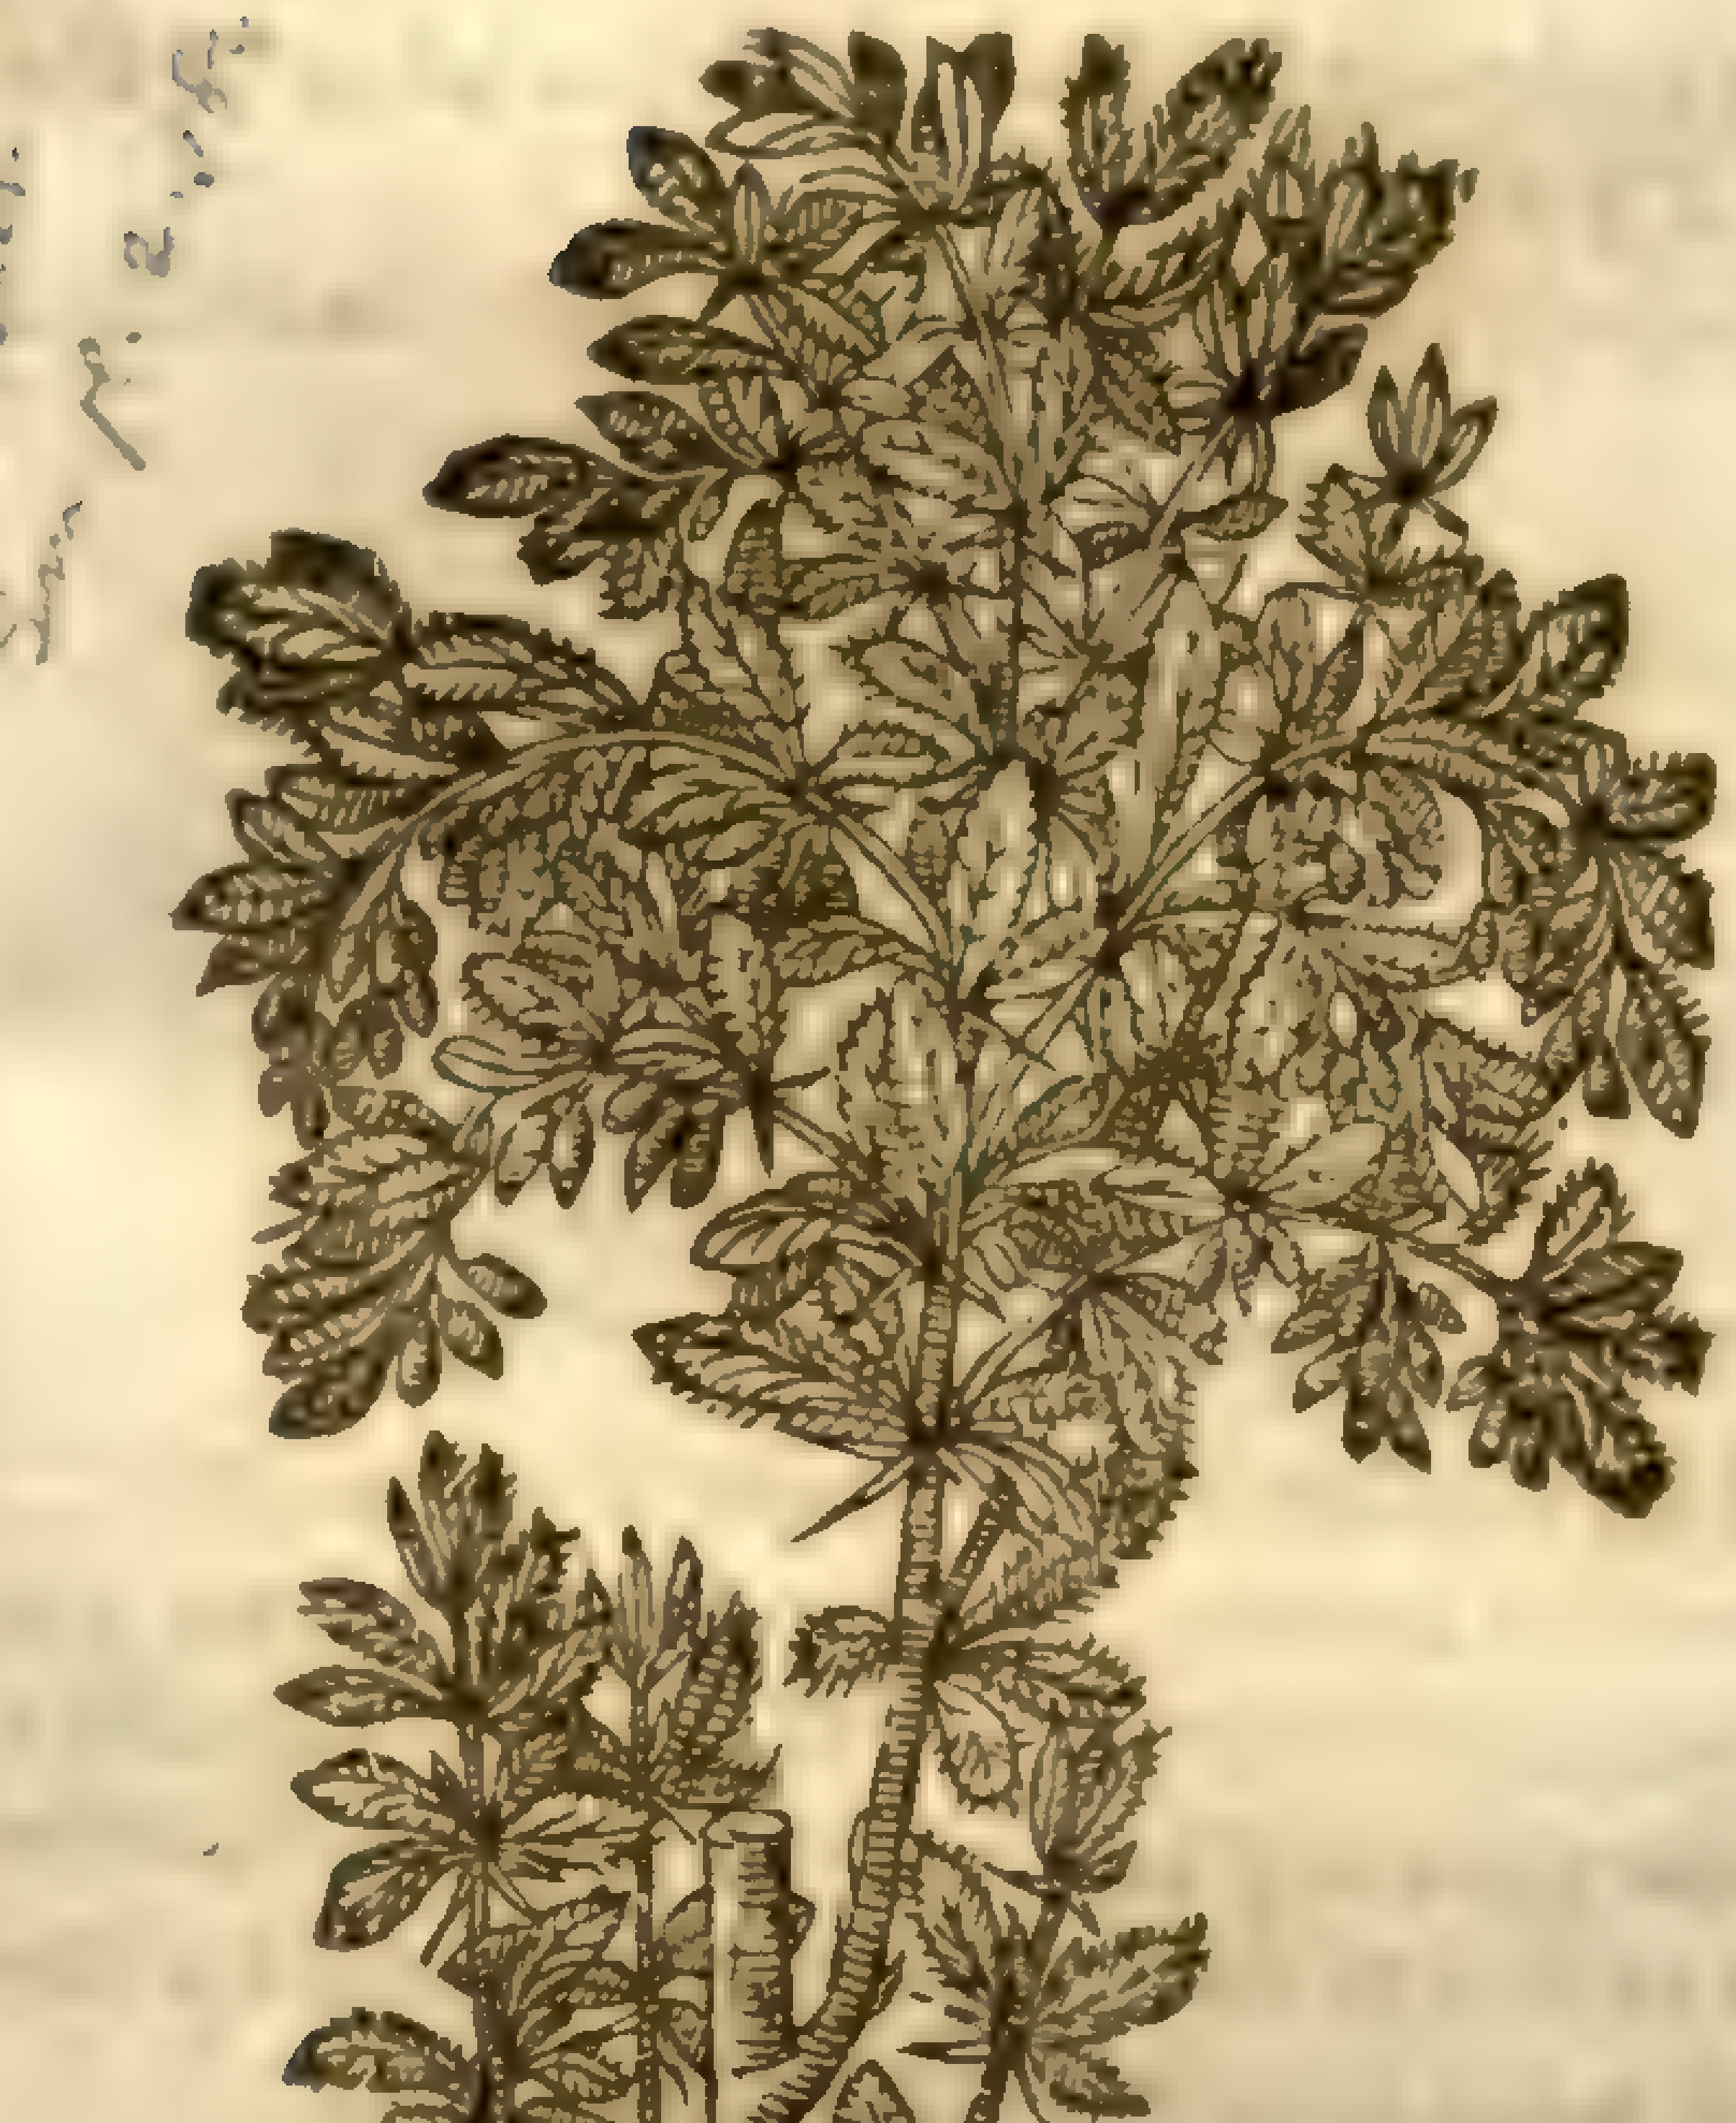
The young and tender leaues eaten raw in a ſallad prouoke vrine, and driue forth the ſtone and grauell. H

CHAP. 23. *Of Barberries.*

¶ *The Kindes.*

There be diuers ſorts of Barberries, ſome greater, others leſſer, and ſome without ſtones.

Spina acida, ſiue Oxyacantha.
The Barberry buſh.



Berberis vulgaris. [illegible]

ord. 22

¶ *The Deſcription.*

THe Barberry plant is an high ſhrub or buſh, hauing many yong ſtraight ſhoots & branches very full of white prickly thorns, the rinde whereof is ſmooth and thin, the wood it ſelf yellow: the leaues are long, very greene, ſleightly nicked about the edges, and of a ſoure taſte: the flours be yellow, ſtanding in cluſters vpon long ſtems: in their places come vp long berries, ſlender, red when they be ripe, with a little hard kernell or ſtone within; of a ſoure and ſharp taſte: the root is yellow, diſperſeth it ſelf far abroad, and is of a wooddy ſubſtance.

Wee haue in our London gardens another ſort, whoſe fruit is like in forme and ſubſtance, but one berry is as big as three of the common kinde, wherein conſiſteth the difference.

We haue likewiſe another without any ſtone, the fruit is like the reſt of the Barberries both in ſubſtance and taſte.

¶ *The Place.*

The Barberry buſh growes of it ſelfe in vntoiled places and deſart grounds, in woods and the borders of fields, eſpecially about a gentlemans houſe called Mr *Monke*, at a village called Iver two miles from Colebrooke, where moſt of the hedges are nothing elſe but Barberry buſhes.

They are planted in moſt of our Engliſh gardens.

¶ *The Time.*

The leaues ſpring forth in Aprill, the floures and fruit in September.

¶ *The Names.*

Galen calleth this Thorne in Greeke, ὀξυάκανθα, who maketh it to differ from ὀξυακάνθη, in his booke of the Faculties of ſimple Medicines; but more plainly in his booke of the Faculties of *Nouriſhments*; where he reckoneth vp the tender ſprings of Barberries amongſt the tender ſhoots that are to be eaten, ſuch as *Oxyacanthus* or the Hawthorne bringeth not forth, wherein he plainely made a difference, *Oxyacantha* the Barberry buſh, and *Oxyacanthus* the Hawthorne tree.

Dioſcorides hath not made mention of this Thorne; for that which he calleth *Oxyacantha*, in the fœminine gender, is *Galens Oxyacanthus* in the maſculine gender.

Avicen ſeemes to containe both theſe herbes vnder the name of *Amyrberis*, but we know they are neither of affinitie nor neighborhood, although they are both prickly.

The ſhrub it ſelfe is called in ſhops Barberries, of the corrupted name *Amyrberis*: of the later writers *Creſpinus*: in Italian, *Creſpino*: in Spaniſh, *Eſpino de maivelas*: in high-Dutch, **Paiſſelbeer**: in low-Dutch, **Sauſeboom**: in French, *Eſpine vinette*: and thereupon by a Latine name, *Spinineta, Spina acida*, and *Oxyacantha Galeni*: ‡ in Engliſh, a Barberry buſh, or Piprige tree, according to Dr *Turner*. ‡

¶ *The Temperature.*

The leaues and berries of this Thorne are cold and dry in the ſecond degree, and as *Galen* alſo affirmeth, they are of thin parts, and haue a certain cutting facultie.

¶ *The Vertues.*

A The leaues are vſed of diuers to ſeaſon meat with, and in ſtead of a ſallad, as be thoſe of Sorrell.

B The decoction thereof is good againſt hot burnings and cholericke agues: it allayeth the heat of the bloud, and tempereth the ouermuch heate of the liuer.

C The fruit or berries are good for the ſame things, and be alſo profitable for hot Laskes, and for the bloudy flix, and they ſtay all manner of ſuperfluous bleedings.

D The green leaues of the Barberry buſh ſtamped and made into ſauce as that made of Sorel, called Green-ſauce, doth coole hot ſtomacks, and thoſe that are vexed with hot burning agues, & procureth appetite.

E A conſerue made of the fruit and ſugar performeth all thoſe things before remembred, & with better force and ſucceſſe.

F The roots of the tree ſteeped for certain daies together in ſtrong lie made with the aſhes of the Aſh tree, and the haire often moiſtned therewith, maketh it yellow.

G ‡ The bark of the roots is alſo vſed in medicins for the jaundice, and that with good ſucceſſe. ‡

Chap. 24. *Of the white Thorne or Hawthorne tree.*

¶ *The Kindes.*

There be two ſorts of the white Thorn trees deſcribed by the later writers, one very common in moſt parts of England, another very rare, and not found in Europ, except in ſome few rare gardens of Germay; which differs not from our common Hawthorne, ſauing that the fruit thereof is as yellow as Saffron. We haue in the Weſt of England one growing at a place called Glaſtenbury which brings forth his floures about Chriſtmaſſe, by the report of diuers of good credit, who haue ſeen the ſame: but my ſelfe haue not ſeen it, and therefore leaue it to be better examined.

¶ *The Deſcription.*

1 The white Thorn is a great ſhrub growing often to the height of a peare tree, the trunk or body is great, the boughes and branches hard and woody, ſet with long ſharp thorns: the leaues be broad, cut with deep gaſhes into diuers ſections, ſmooth, and of a gliſtering green colour: the floures grow vpon ſpoky rundles, of a pleaſant ſweet ſmell, ſomtimes white, and often daſht ouer with a light waſh of purple, which hath moued ſome to thinke a difference in the plants: after which come the fruit, being round berries, green at the firſt, and red when they be ripe; wherein is found a ſoft ſweet pulpe and certaine whitiſh ſeed: the root growes deepe in the ground, of a hard wooddy ſubſtance.

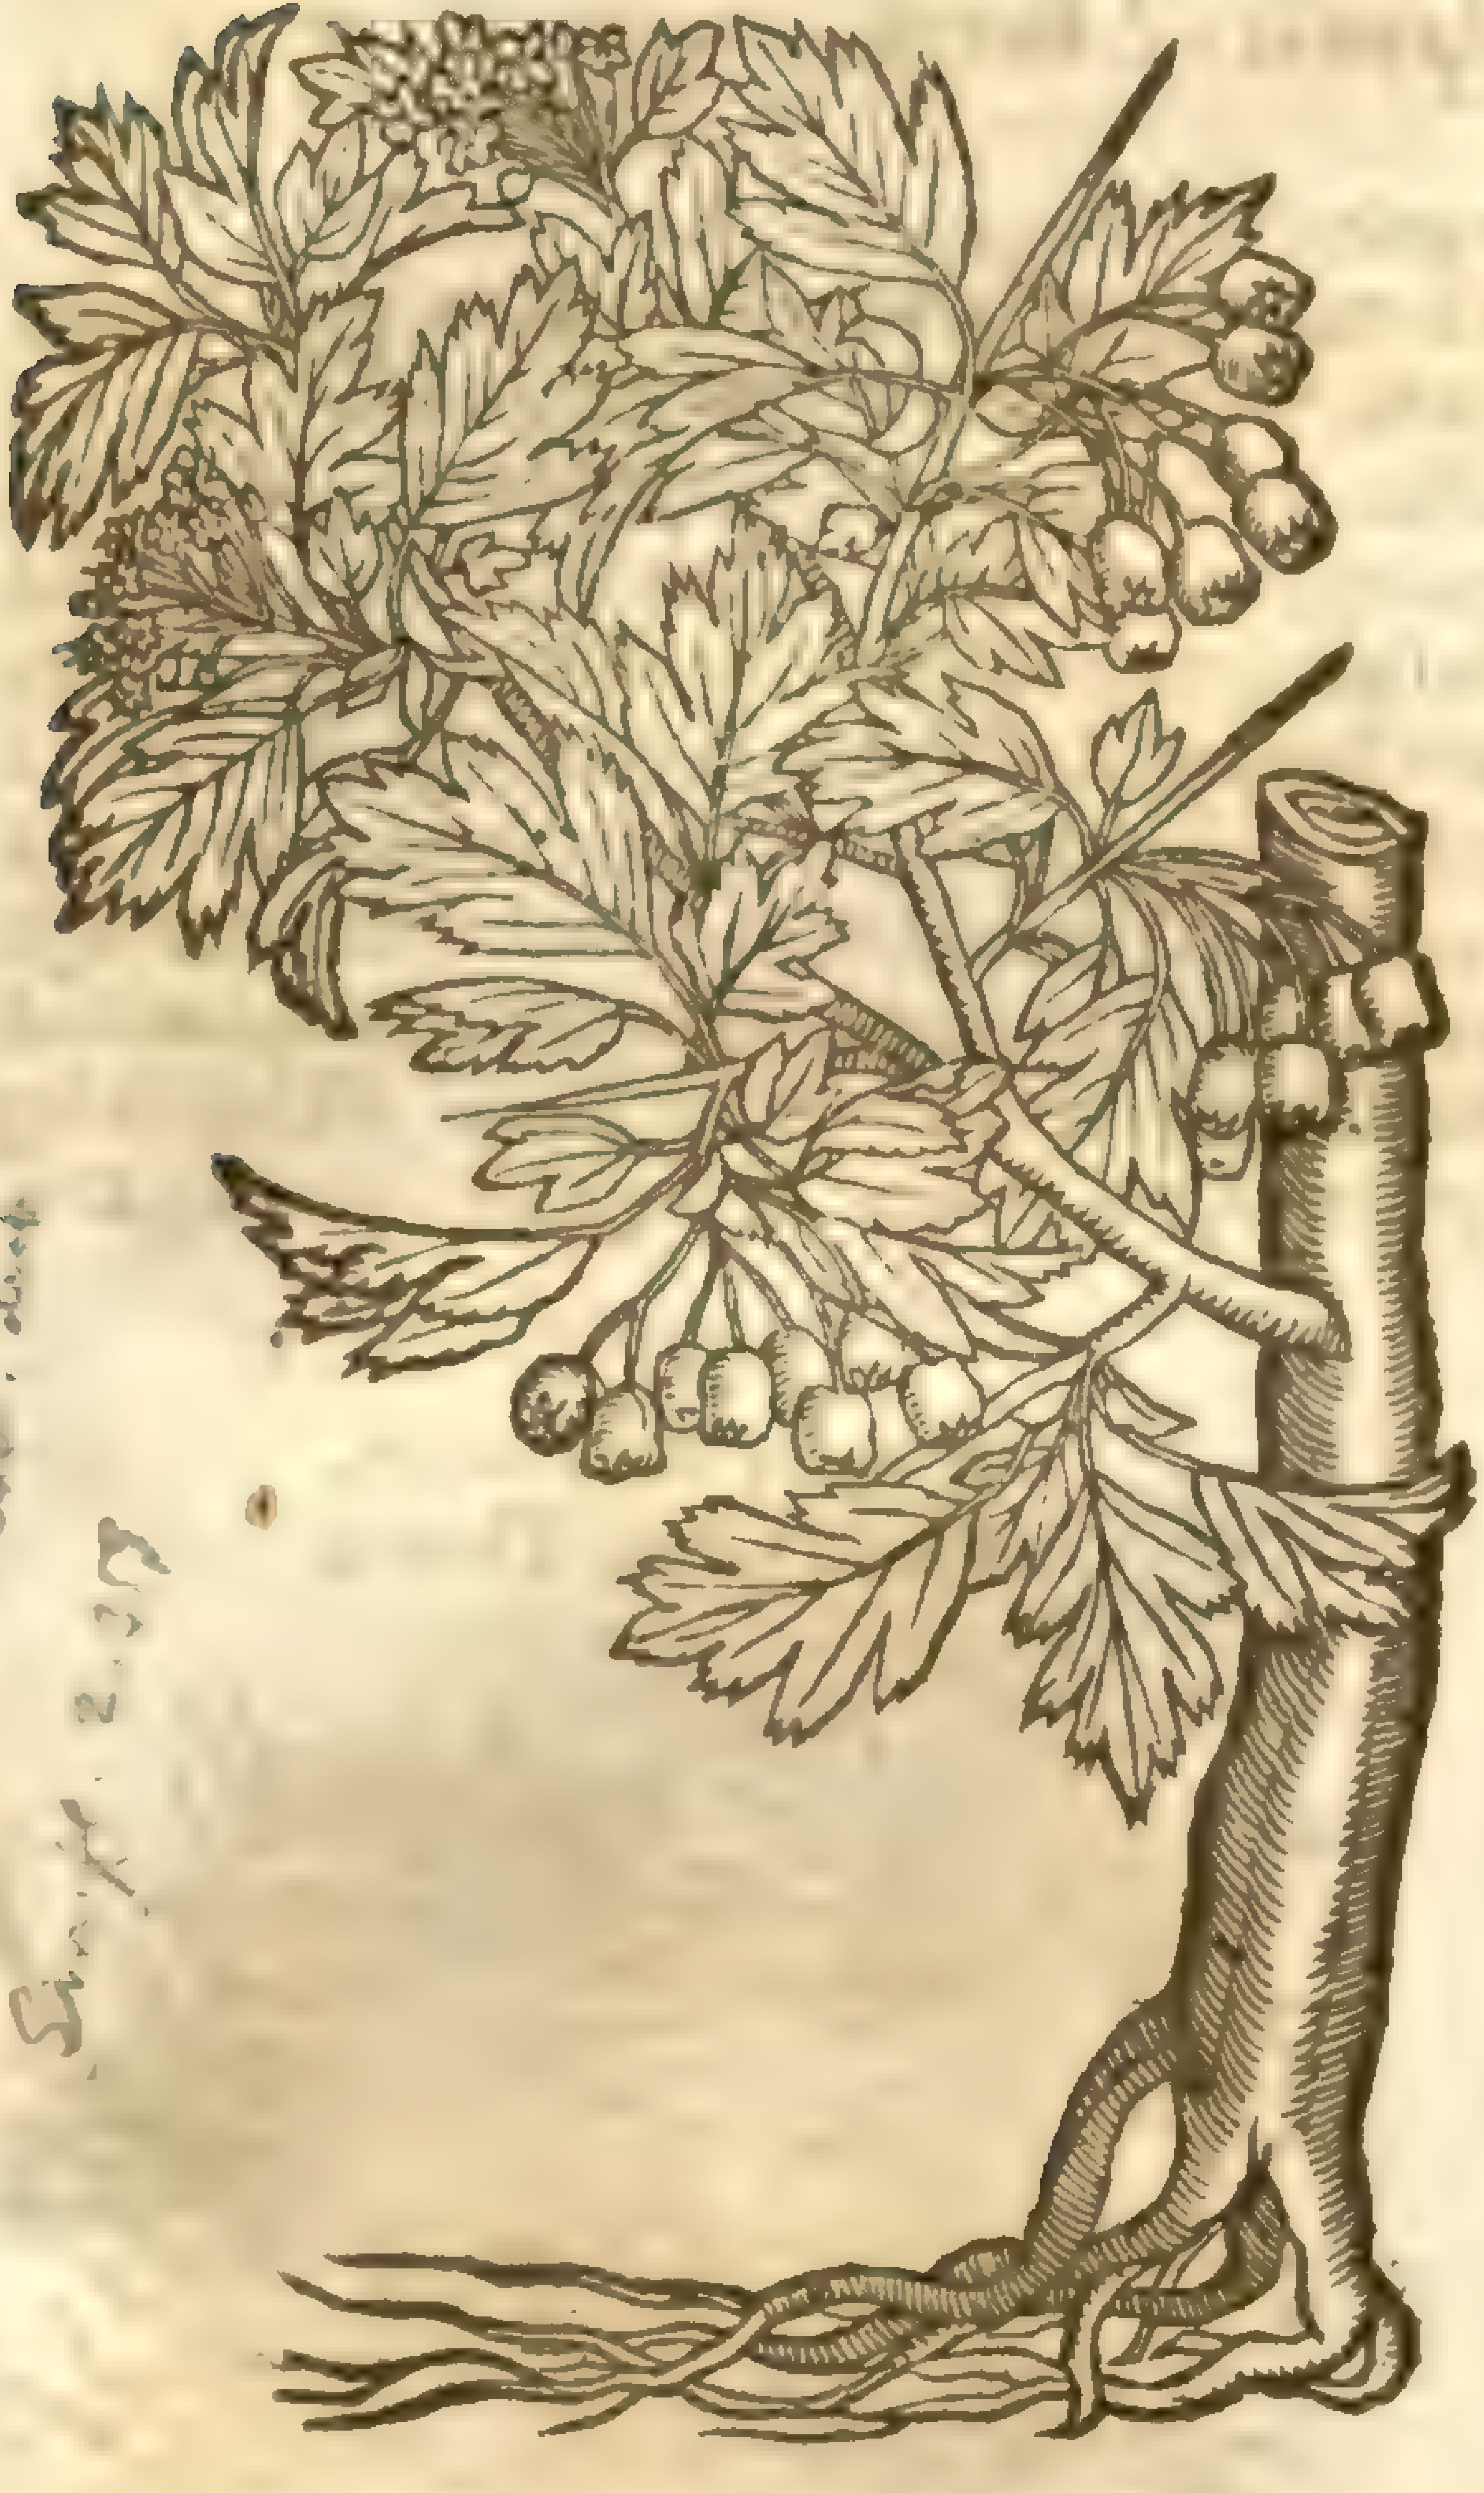
2 The ſecond and third haue bin touched in the firſt title, notwithſtanding I haue thought it not vnfit to inſert in this place a plant participating with the Hawthorne in floures and fruit, and with the Servis tree in tree in leaues, and not vnlike in fruit alſo.

Theophraſtus hath ſet forth this Tree vnder the name of *Aria*, which groweth vnto the forme of a ſmall tree, delighting to grow in the ſhadowie woods of Cumberland and Weſtmerland, and many other places of the North country, where it is to be found in great quantity: but ſeldome in

Spain, Italy, or any hot region. This tree is garniſhed with many large branches beſet with leaues like the Peare tree, or rather like the Aller leaf, of a dark green colour aboue, and white vnderneath: among theſe leaues come forth tufts of white floures very like vnto Hawthorn floures, but bigger: after which ſucceed ſmall red berries like the berries of the Hawthorn, in taſte like the Neapolitan Medlar; the temperature and faculties whereof are not yet knowne.

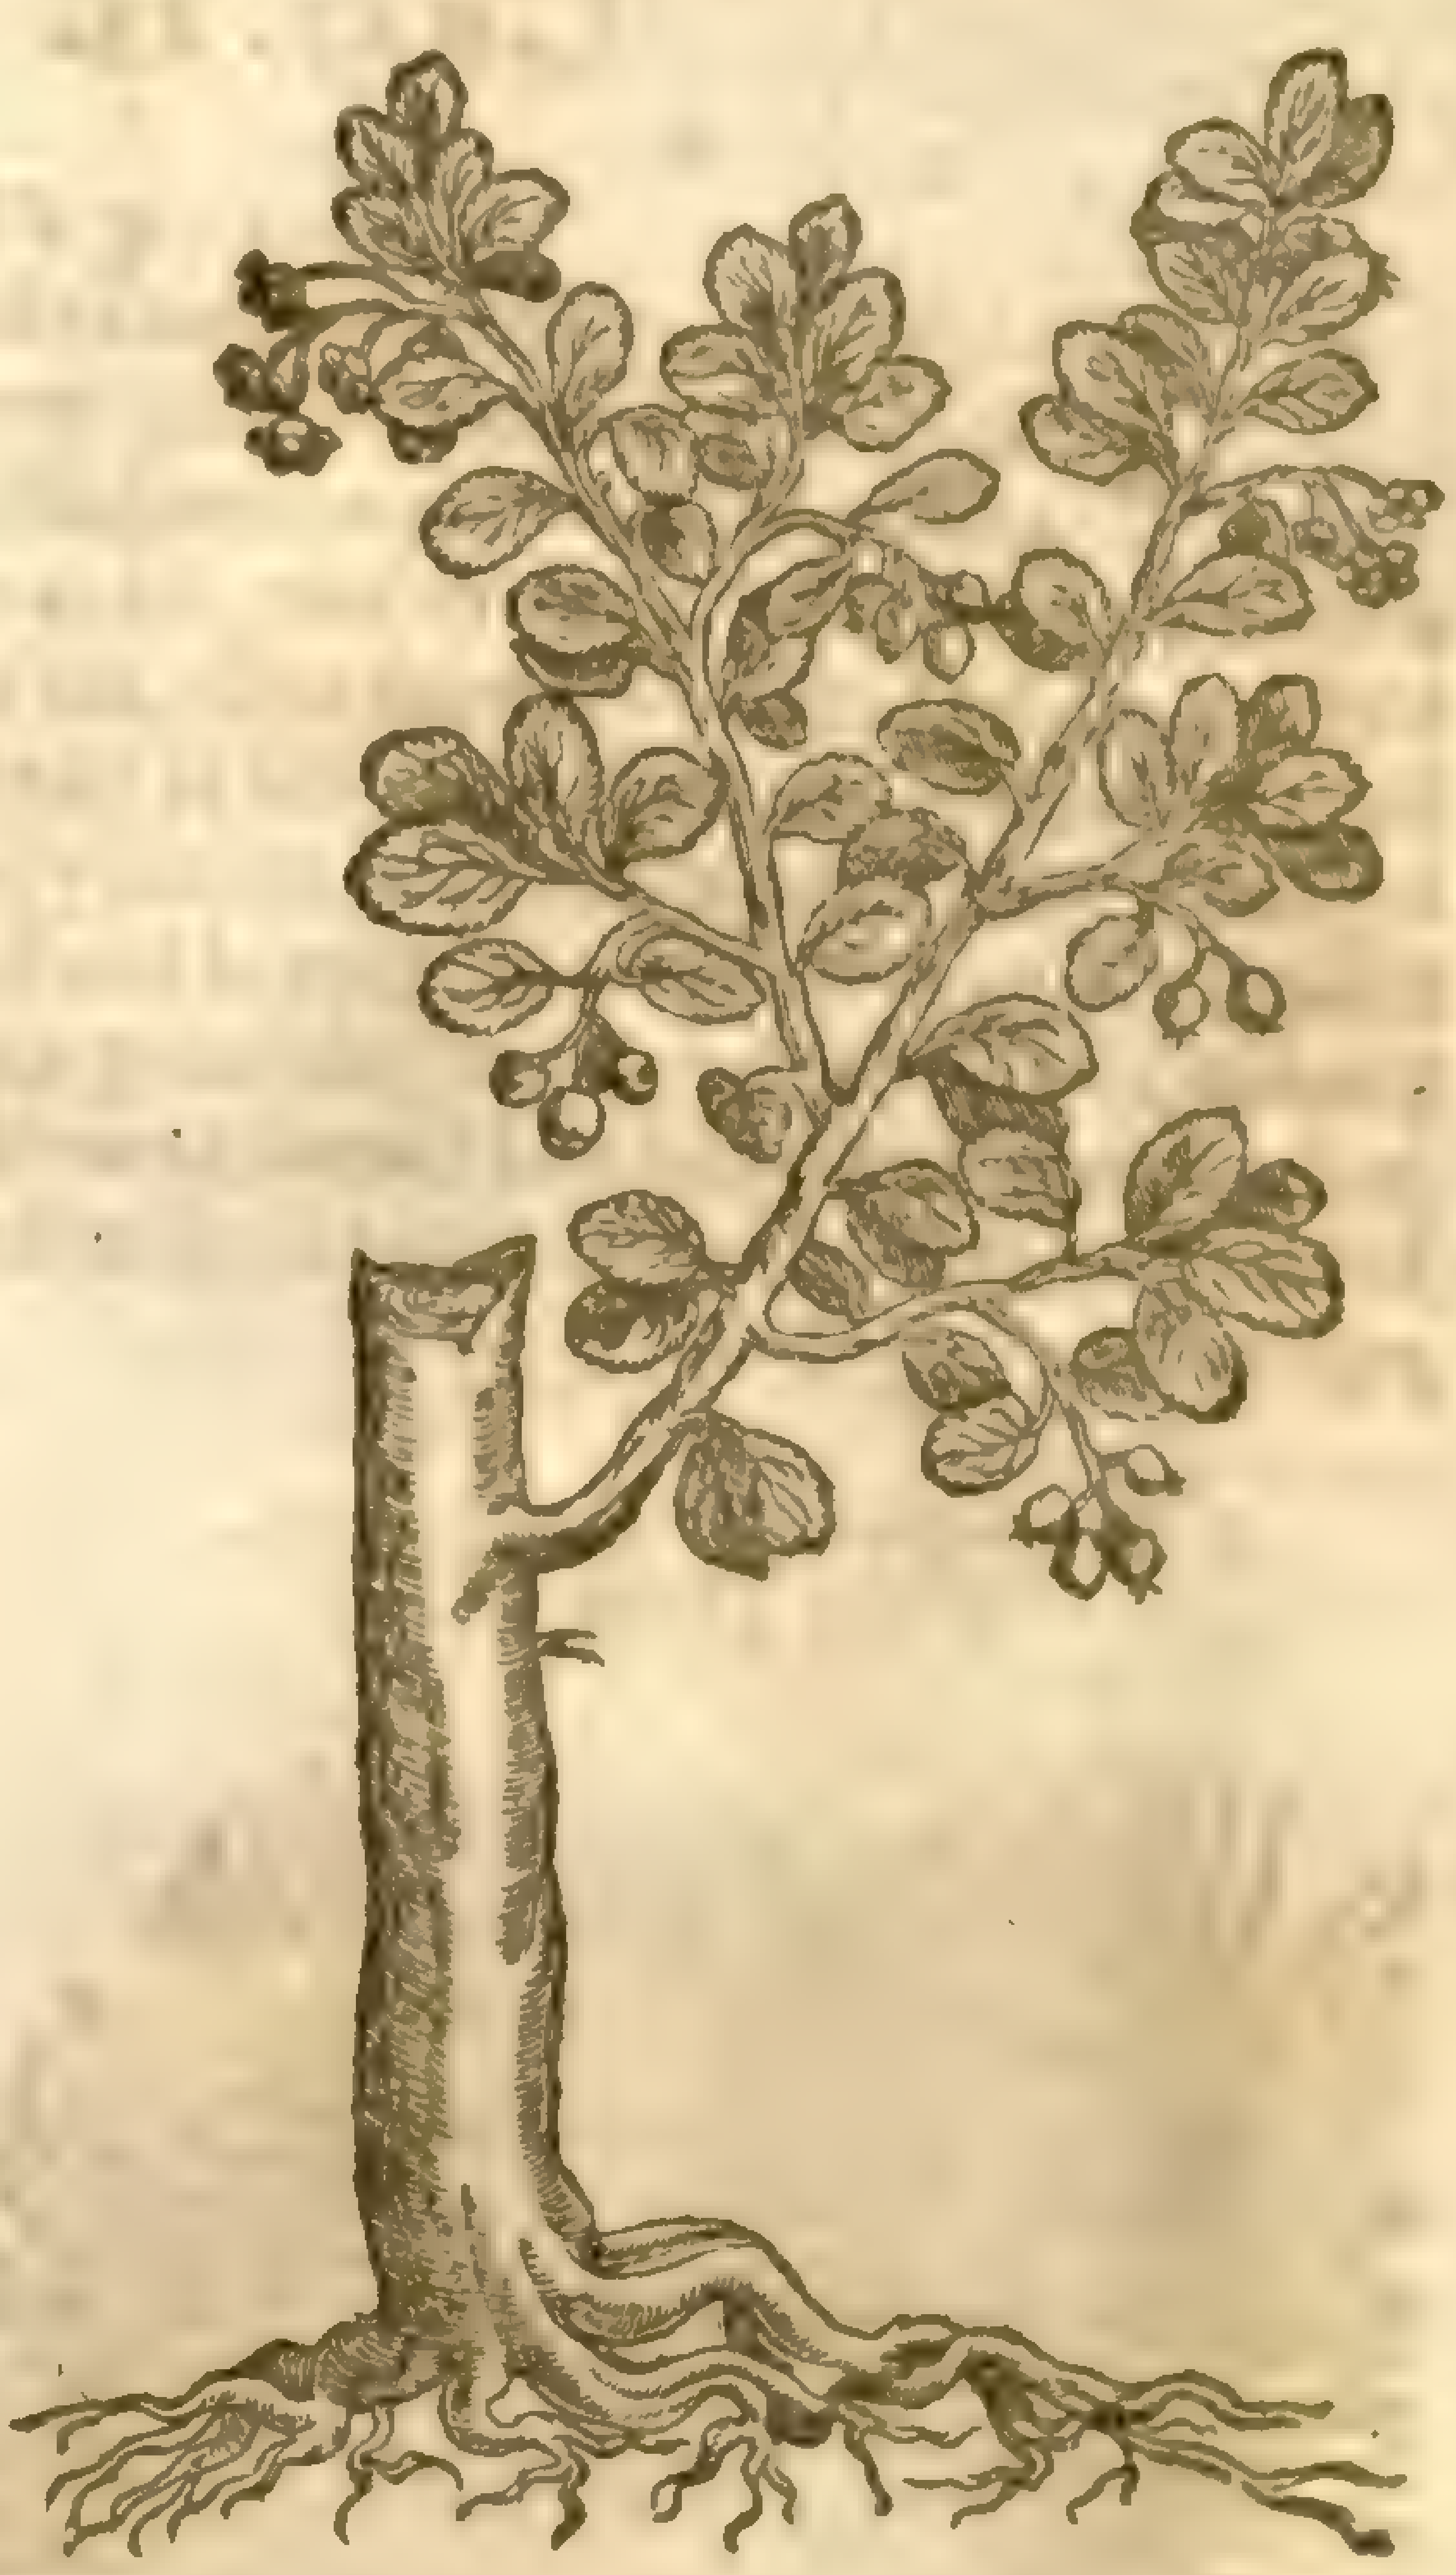
Crataegus aria [illegible] Sm [illegible]

1 *Oxyacanthus.*
The Hawthorne tree.



Crataegus oxyacantha [illegible] Sm [illegible]

2 *Aria Theophraſti.*
Cumberland Hawthorne.



¶ *The Place.*

The Hawthorn groweth in woods and in hedges neere vnto highwaies almoſt euery where. The ſecond is a ſtranger in England. The laſt groweth at Glaſtenbury abbey, as it is credibly reported to me. ‡ The *Aria* groweth vpon Hampſted heath, and in many places of the Weſt of England. ‡

¶ *The Time.*

The firſt and ſecond floure in May, whereupon many do call the tree it ſelfe the May-buſh, as a chiefe token of the comming in of May: the leaues come forth a little ſooner: the fruit is ripe in the beginning of September, and is a food for birds in Winter.

¶ *The Names.*

Dioſcorides deſcribeth this ſhrub, and nameth it ὀξυάκανθα, in the feminine gender; and *Galen* in his booke of the Faculties of ſimple medicines, ὀξυάκανθος, in the maſculine gender: *Oxyacanthus*, ſaith he, is a tree, and is like to the wilde Peare tree in forme, and the vertues not vnlike, &c. Of *Oxyacantha*, *Dioſcorides* writeth thus: It is a tree like to the wilde Peare tree, very full of thornes, &c. *Serapio* calleth it *Amyrberis*: and ſome, ſaith *Dioſcorides*, would haue it called πυρίνη, but the name *Pyrina* ſeemeth to belong to the yellow Hawthorn: it is called in high-Dutch, **Haagdoꝛen**: in low-Dutch, **Hagedoꝛen**: in Italian, *Bagaia*: in Spaniſh, *Pirlitero*: in French, *Aube-eſpine*: in Engliſh, White-thorn, Hawthorn tree; and of ſome Londoners, May-buſh. ‡ This is not the *Oxyacantha* of the Greeks, but that which is called *Pyracantha*, as ſhall be ſhewed hereafter.

The ſecond is thought to be the *Aria* of *Theophraſtus*, and ſo *Lobel* and *Tabern.* call it. Some, as *Bellonius*, *Geſner*, and *Cluſius*, referre it to the *Sorbus*, and that not vnfitly: in ſome places of this Kingdome they call it a white Beam tree. ‡

¶ *The Temperature.*

The fruit of the Hawthorne tree is very aſtringent.

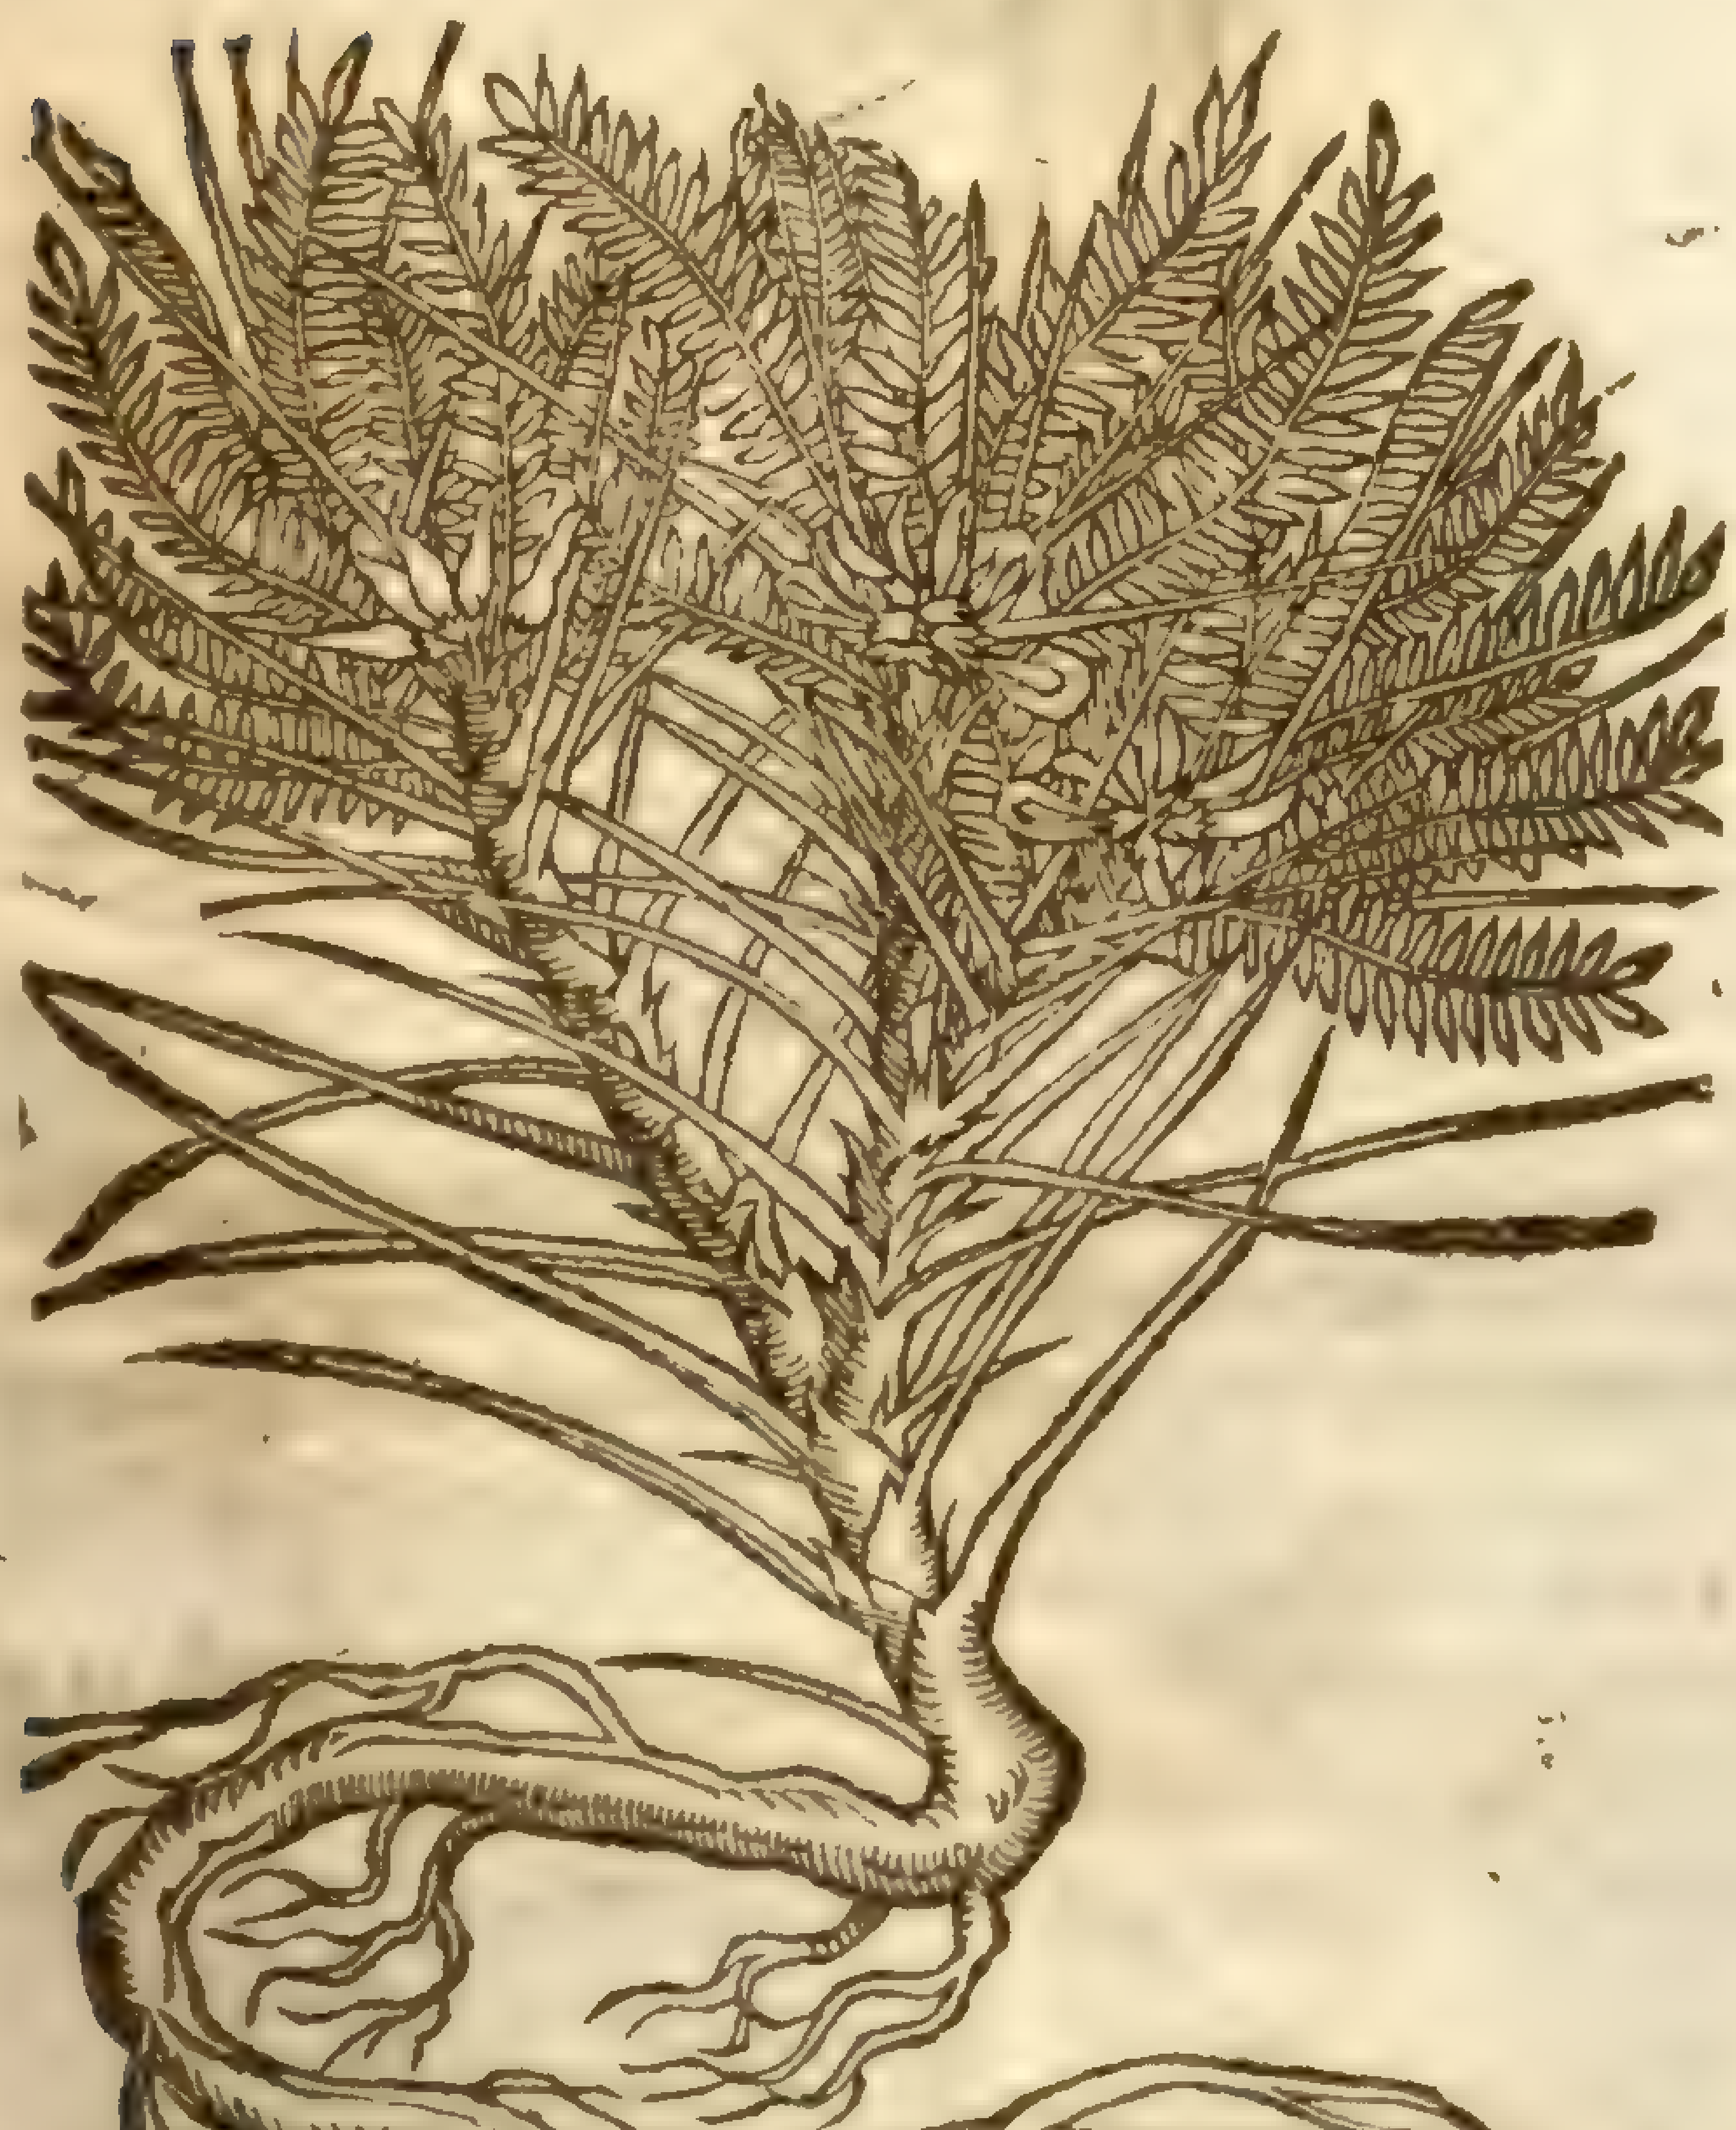
¶ *The Vertues.*

The Hawes or berries of the Hawthorne tree, as *Dioſcorides* writeth, doe both ſtay the Laske the menſes, and all other fluxes of bloud. Some Authors write, That the ſtones beaten to pouder and giuen to drinke are good againſt the ſtone.

Chap. 25. *Of Goats-Thorne.*

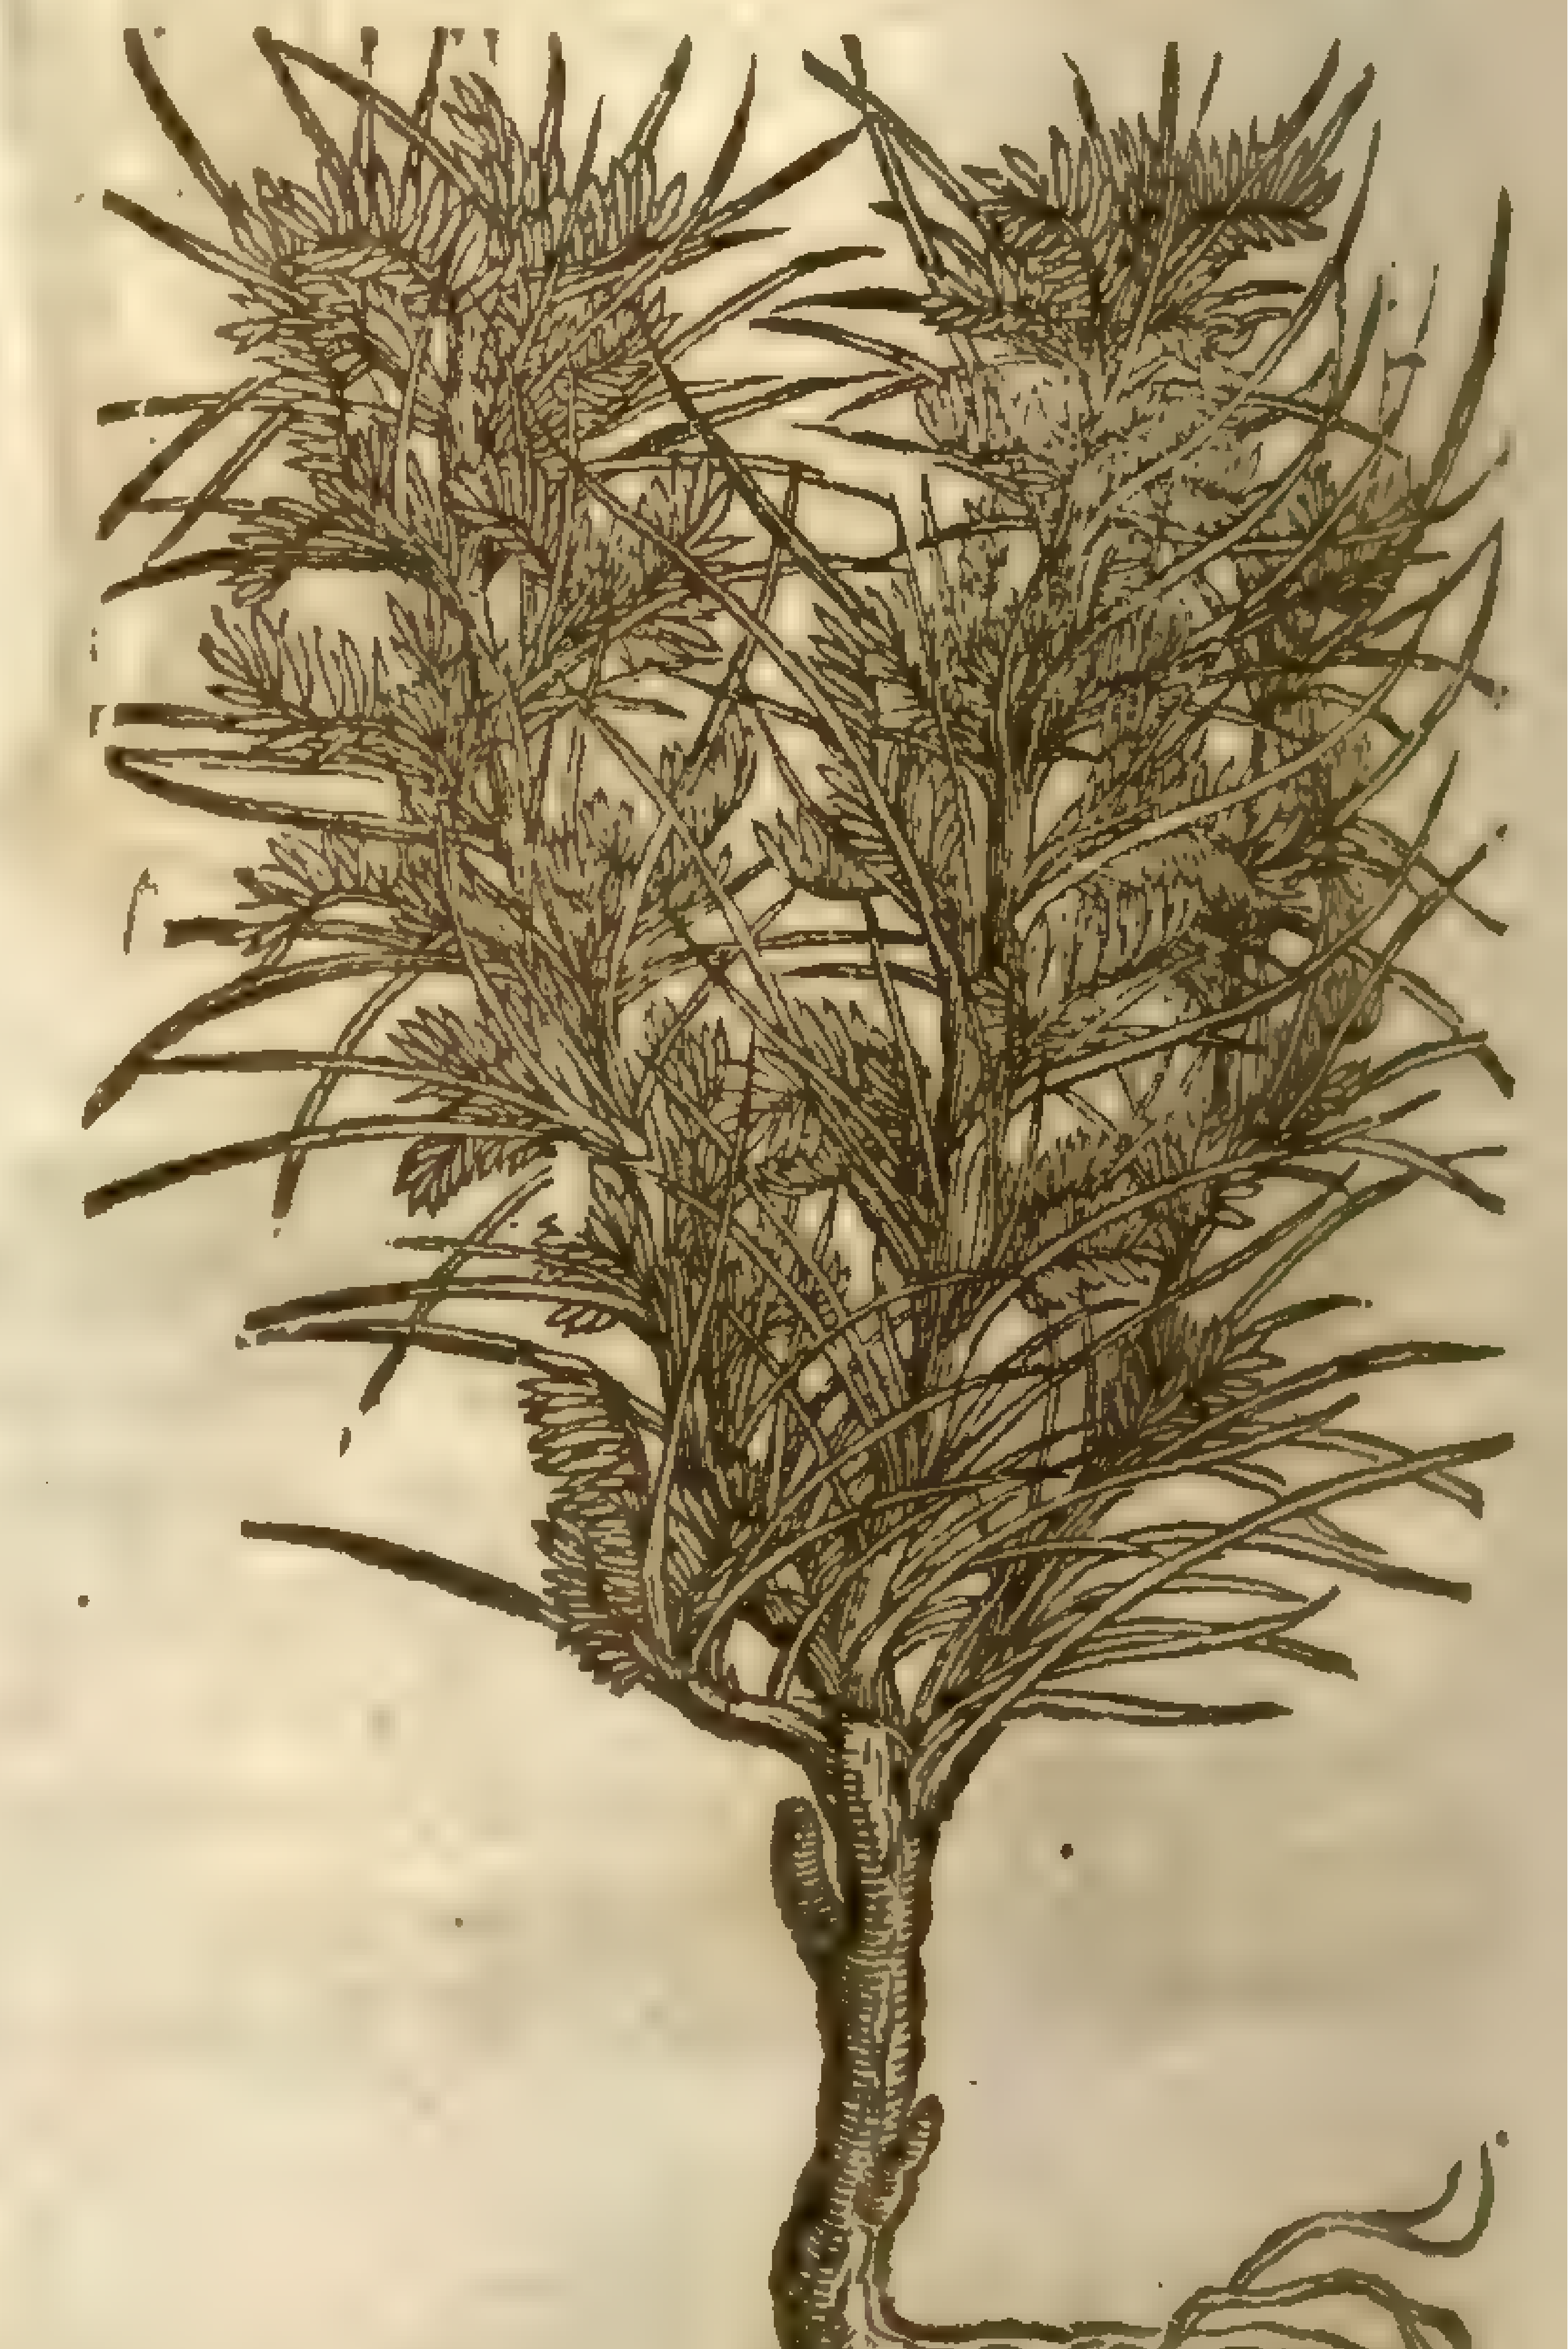
¶ *The Deſcription.*

1 The firſt *Tragacantha* or Goats-thorne hath many branchy boughes and twiggs, ſlender and pliant, ſo ſpread abroad vpon euery ſide, that one plant doth ſometimes occupie a great ſpace or room in compaſſe: the leaues are ſmall, and in ſhape like Lentil leaues, whitiſh, and ſomwhat moſſie or hairy, ſet in rowes one oppoſit againſt another: the flour is like the bloſſom of the Lentill, but much leſſer, and of a whitiſh colour, and ſomtimes marked with purple lines or ſtreakes: the ſeed is incloſed in ſmall cods and huskes, almoſt like vnto the wilde *Lotus* or horned Treſoile: the whole plant on euery ſide is ſet full of ſharp prickly thornes, hard, white, and ſtrong: the roots run vnder the ground like Licorice roots, yellow within, and black without, tough limmer, and hard to breake; which being wounded in ſundry places with ſome iron toole, and laid in the Sun at the higheſt and hotteſt time of Summer, iſſueth forth a certaine liquor, which being hardned by the Sun, is that gum called in ſhops *Tragacantha*, and of ſome, though barbarouſly, *Dragagant*.



1 *Tragacantha, ſiue Spina Hirci.*
Goats Thorne.

Astragalus Tragacantha, + minor.



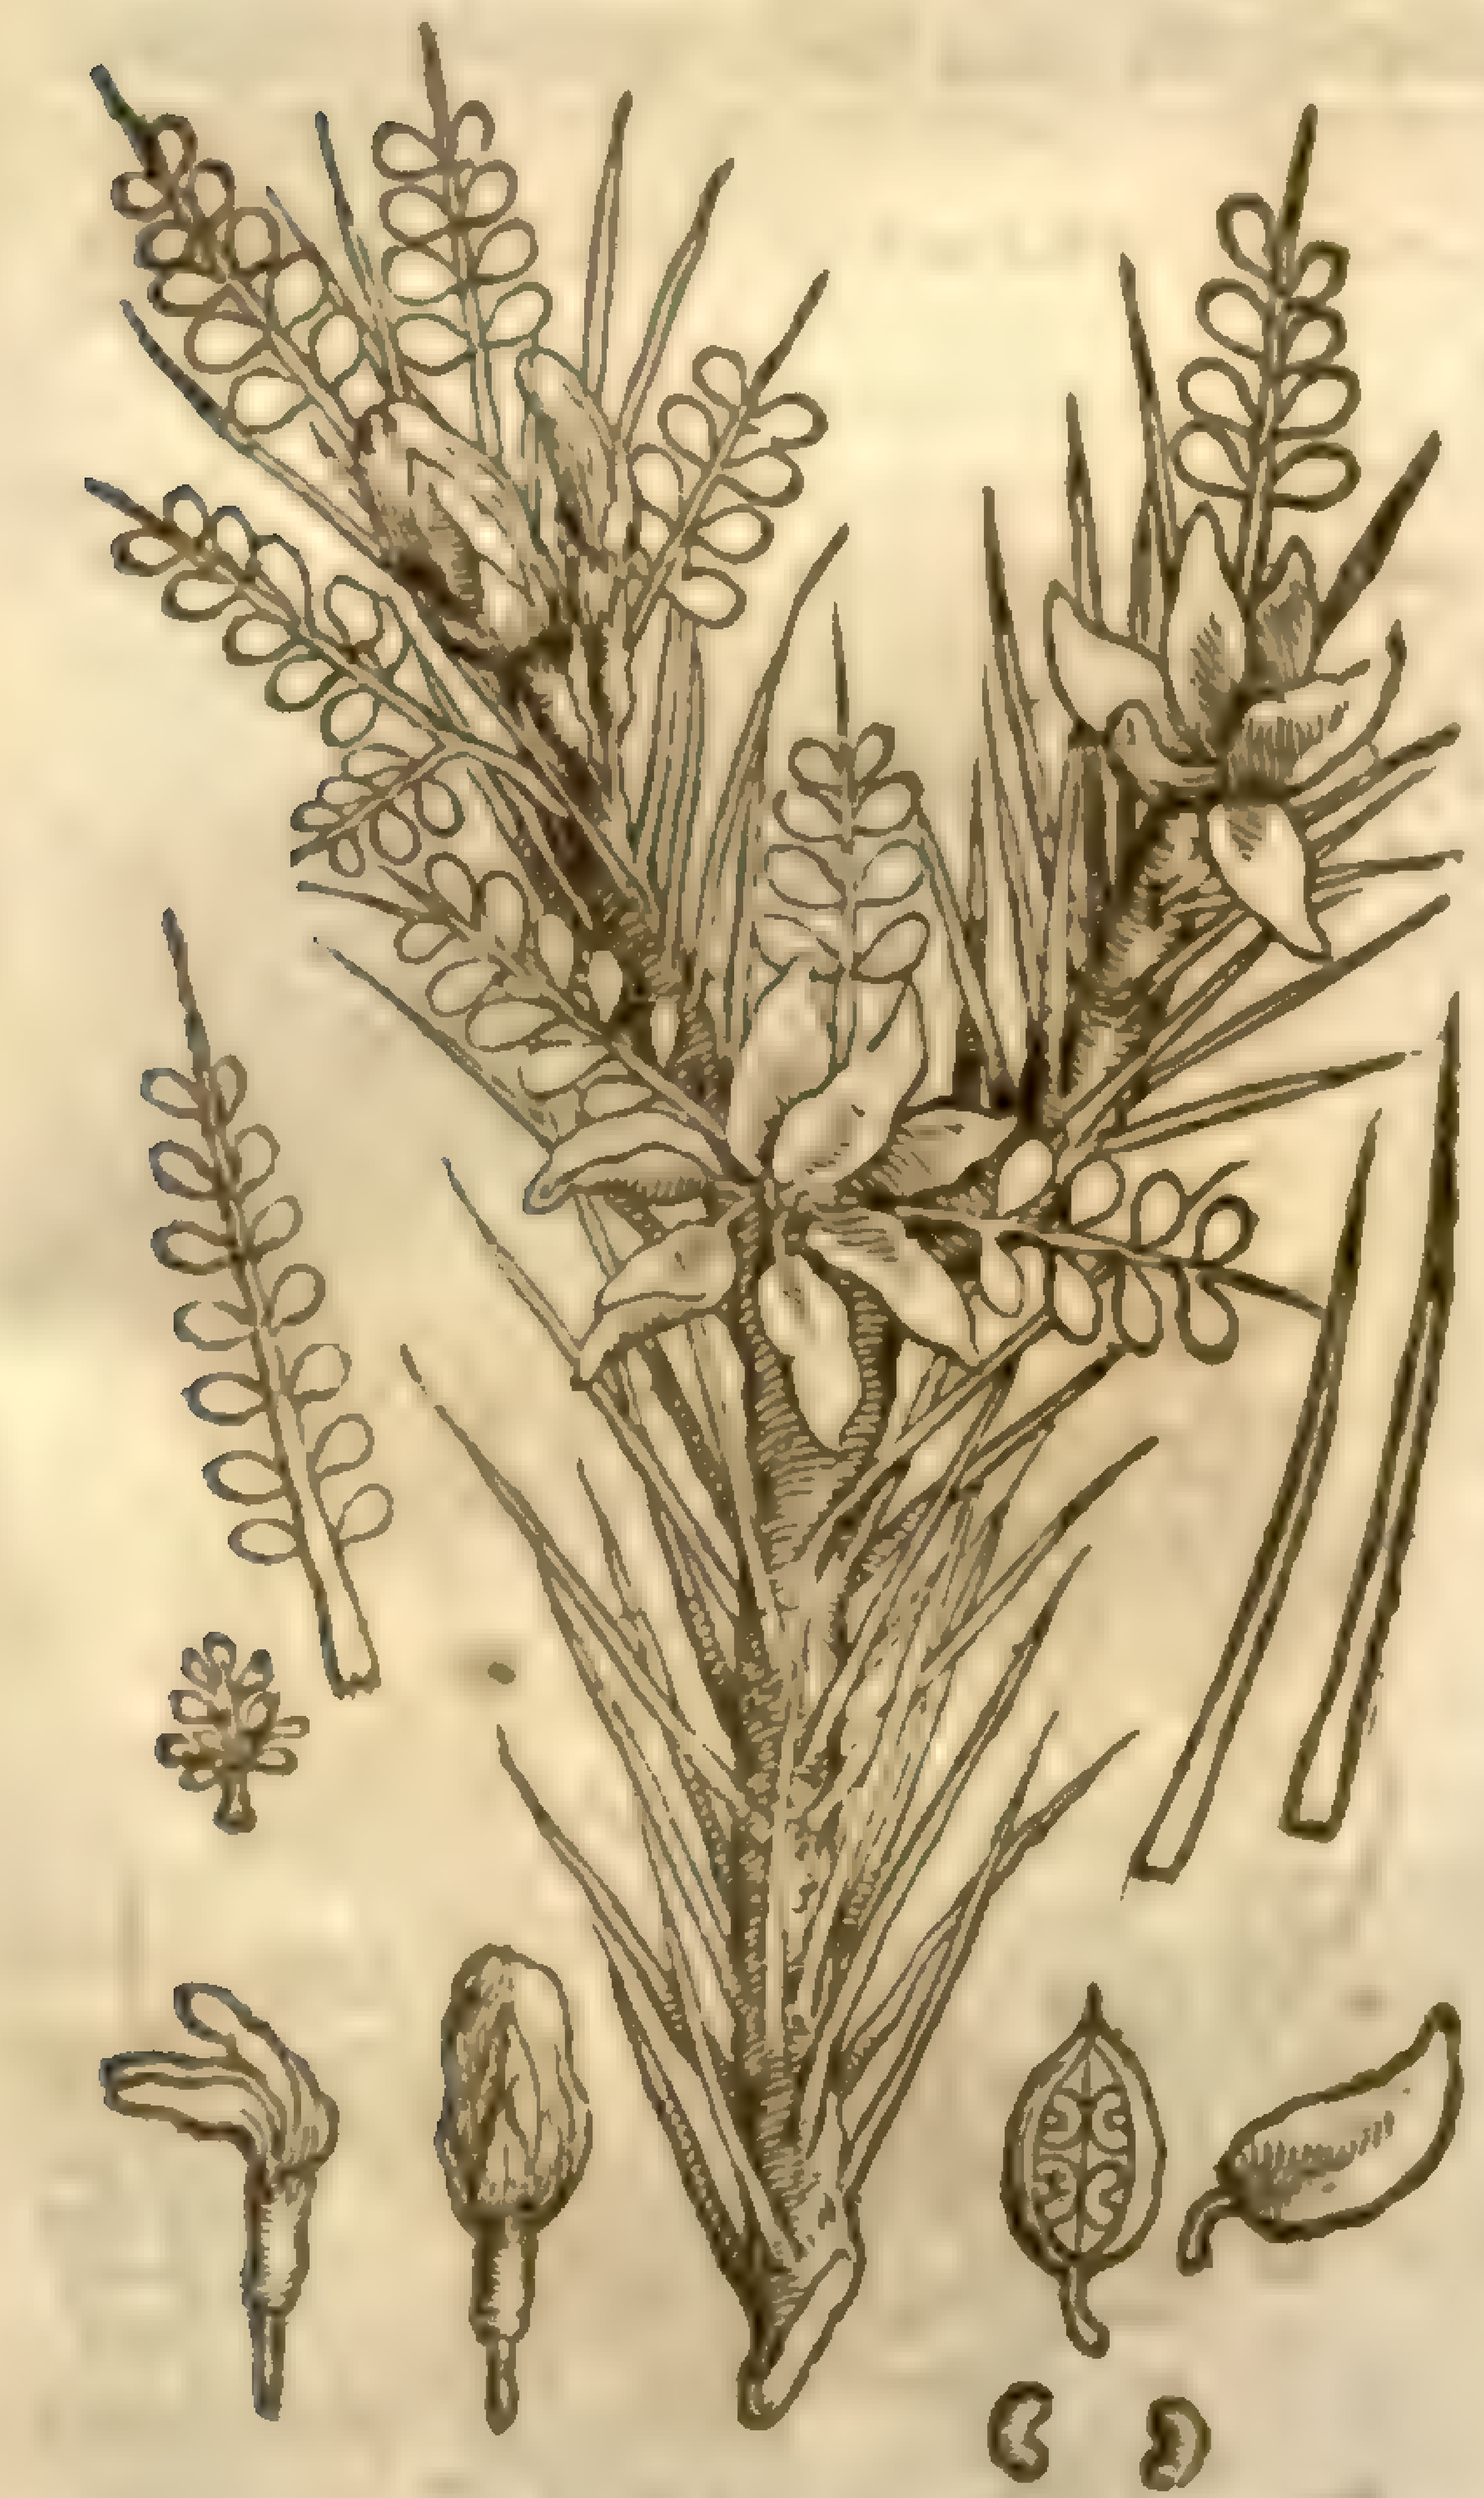
2 *Spina Hirci minor.*
Small Goats Thorne.

2 The ſecond kinde of *Tragacantha* is a low and thicke Shrub, hauing many ſhoots growing from one turfe, of a white or grayiſh colour, about a cubit high, ſtiffe and wooddy: the leaues are like the former, and garded with moſt ſtiffe pricks not very ſafely to be touched: among the thornie leaues come forth many floures in ſmall tufts like *Geniſtella*, but that they are white: the cods

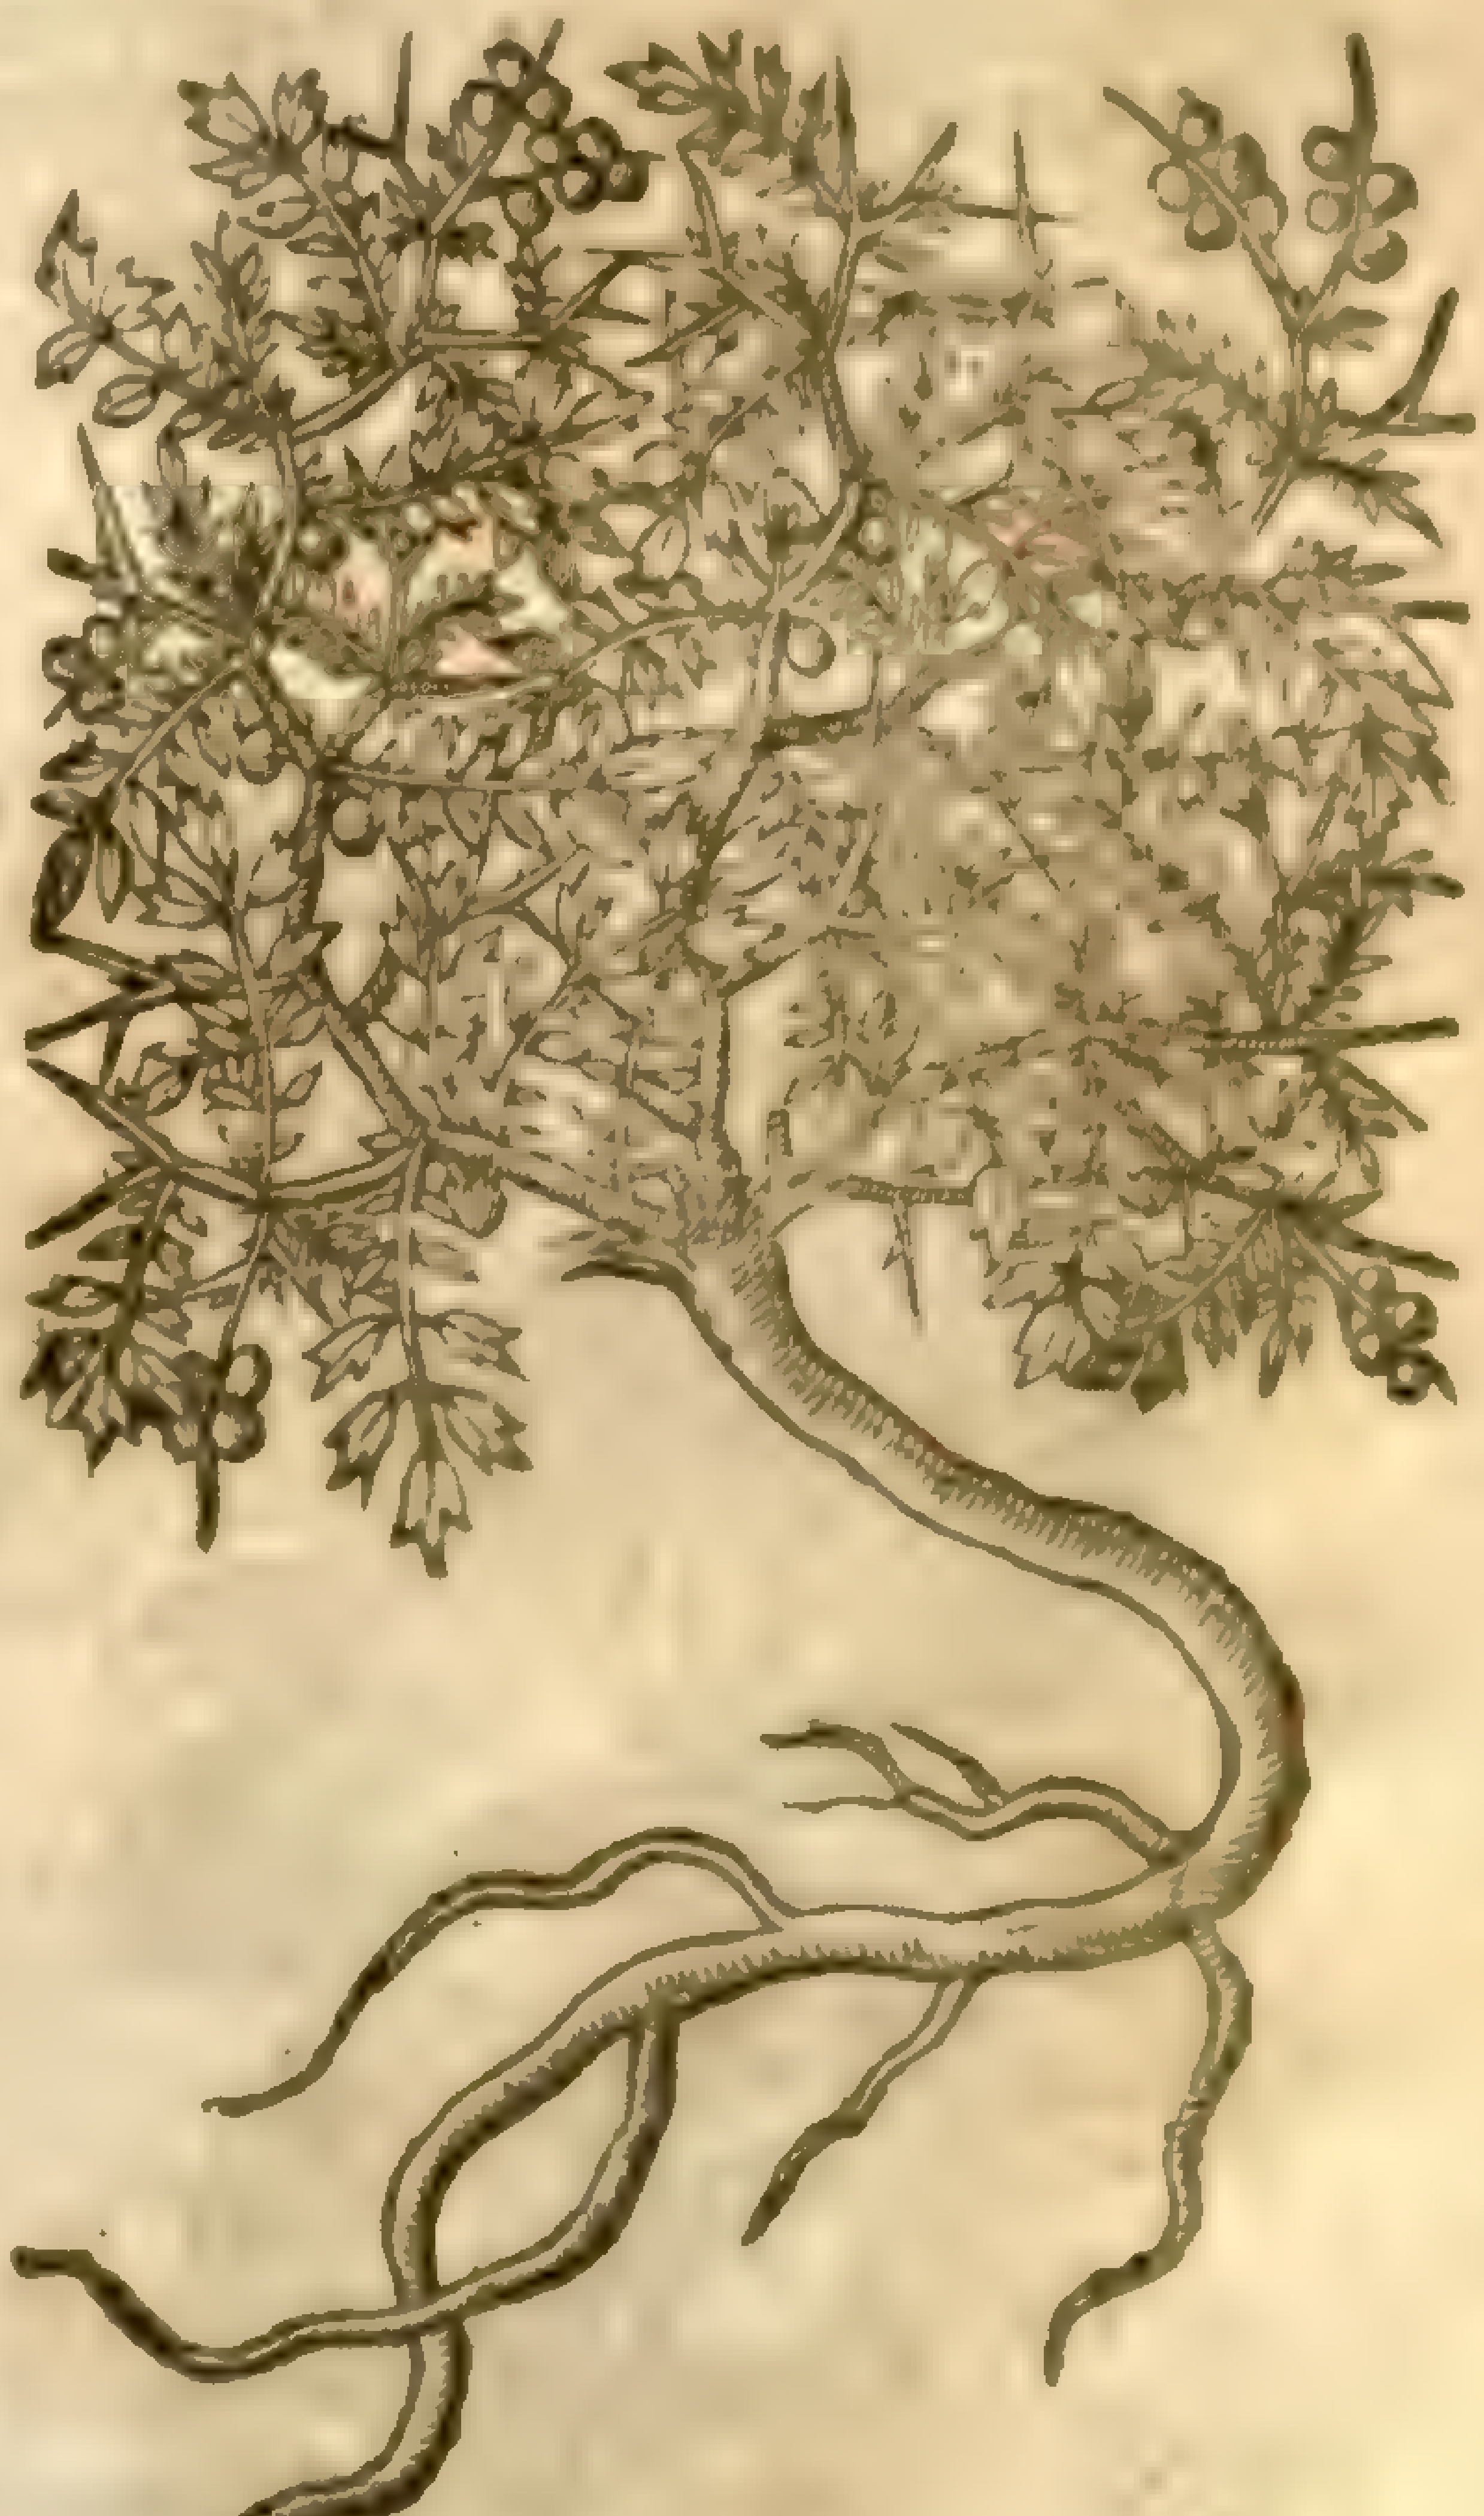
are many,ſtraight and thorny like *Geniſtella*, wherin are many ſmall white and three cornered ſeeds as big as muſtard ſeed. ‡ this differs from the former, in that it is ſmaller,and loſeth the leaues euery winter,when as the former keeps on the leaues vntill new ones come on in the Spring. The middle of the winged leaues ends in a pricke , which by the falling of the leaues becomes a long and nakedt horne. I haue giuen you a more accurat figure hereof out of *Cluſius* ,wherein the leaues, floures,cod s,and ſeeds are all expreſſed apart. ‡

3 The Grecians haue called this plant Νευράς. becauſe it is good for the ſinues:it ſhould ſeem it tooke the name *Poterion* of *Potrix*, becauſe it loueth a waterie or fenny ſoile : it hath ſmall branches,and leaues of *Tragacantha*,growing naturally in the tract of Piedmont in Italy : it ſpreadeth abroad like a ſhrub : the barke or rinde is blackiſh,and dry without great moiſture, very much writhed or wrinkled in and out as that of *Nepa* or *Corruda* : the ſharp prickes ſtand not in order as *Tragacantha*, but confuſedly, and are finer and three times leſſer than thoſe of *Tragacantha* , growing much after the manner of *Aſtragalus* ; but the particular leaues are green aboue, and white below, ſhaped ſomwhat like Burnet : the ſeed is ſmall and red, like vnto Sumach,but leſſer.

‡ *Tragacanthæ minoris icon accuratior.*
A better figure of the Goats-thorne.



† 3 *Poterion Lob. ſiue Pimpinella ſpinoſa Camer.*
Burnet Goats-thorne.



¶ *The Place.*

Petrus Bellonius,lib.1. of Singularities reports, that there is great plenty hereof growing in Candy vpon the tops of the mountains. *Theophraſtus* ſaith that it was thought to grow no where but in Candy ; but now it is certain that it is found in Achaia,Peloponeſus,and in Aſia : it growes alſo in Arcadia,which is thought to be inferior to that of Candy. It is thought by *Lobel* to grow in Languedoc in Frañce, whereof *Theophr.lib.9.* hath written,that the liquor or gum iſſues out of it ſelf,and that it is not needfull to haue the root broken or cut.The beſt is that,ſaith *Dioſcor.* which is through-ſhining,thin,ſmooth,vnmixt,and ſweet of ſmell and taſte.

¶ *The Time.*

They floure and flouriſh in the Summer moneths. I haue ſown the ſeed of *Poterion* in *April*,hauing receiued it from *Ioach.Camer.* of Noremberg : it grew in my garden two yeares together, and afterwards periſhed by ſome miſchance.

¶ *The Names.*

Goats-thorne is called in Greeke τραγάκανθα: of moſt writers likewiſe *Tragacantha*: we may call it in Latine *Spina hirci*: in French, *Barbe Renard*: and in Engliſh for want of a better name, Goats-thorne: the liquor or gum that iſſueth forth of the root beareth the name alſo of *Tragacantha*: it is called in ſhops *Gumma Tragacanthæ*, and in a barbarous manner, *Gumma Tragacanthi*: in Engliſh, Gum Dragagant.

¶ *The Temperature.*

Each part of this plant is of a drying facultie without biting: it doth conſolidate or glew together ſinues that be cut: but the roots boiled in wine haue that facultie ſpecially, being giuen to thoſe that haue any griefe or hurt in the ſinues.

Gum Dragagant hath an emplaſticke qualitie, by reaſon whereof it dulleth and allayeth the ſharpneſſe of humors, and doth alſo ſomthing dry.

¶ *The Vertues.*

The gum is ſingular good to be licked in with hony againſt the cough, roughneſſe of the throat, hoarſneſſe, and all ſharp and thin rheumes and diſtillations: being laid vnder the tongue it taketh away the roughneſſe thereof.

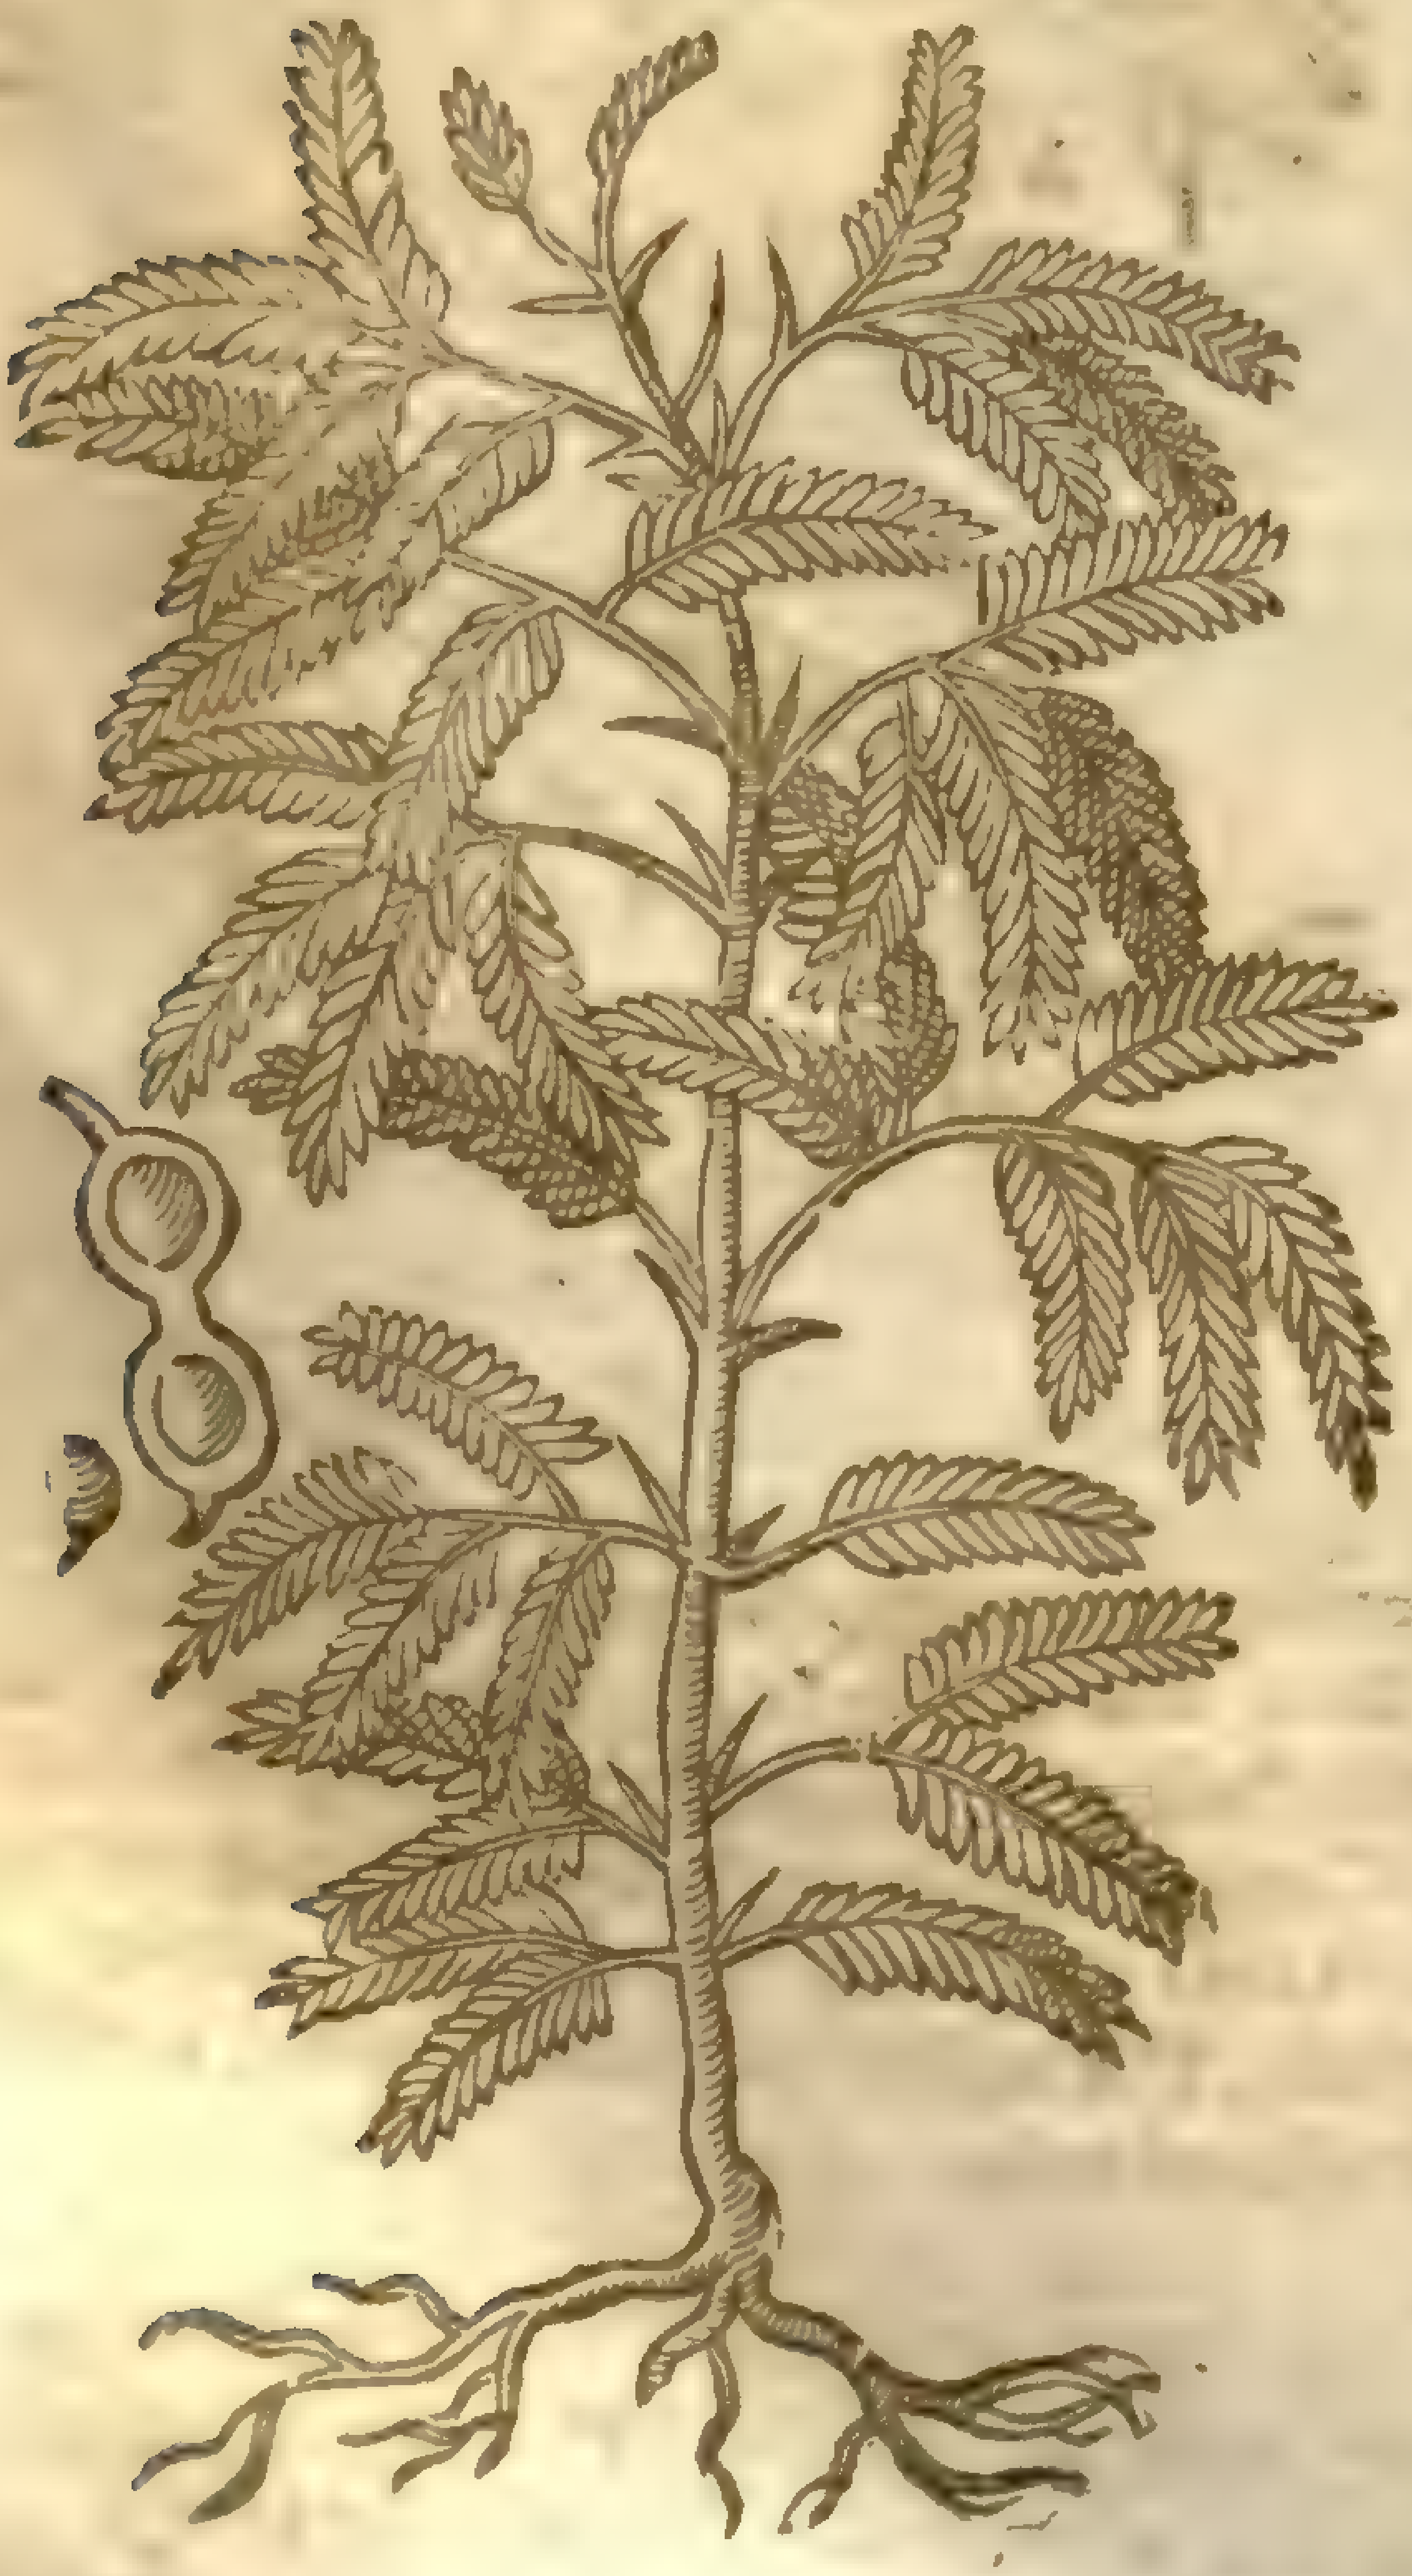
Being drunke with Cute or the decoction of Licorice it taketh away and allayeth the heate of the vrine: it is alſo vſed in medicines for the eies.

The greateſt part of thoſe artificiall beades, ſweet chaines, bracelets, and ſuch like pretty ſweet things of pleaſure are made hard and fit to be worne, by mixing the gum hereof with other ſweets, being firſt ſteeped in Roſe water vntill it be ſoft.

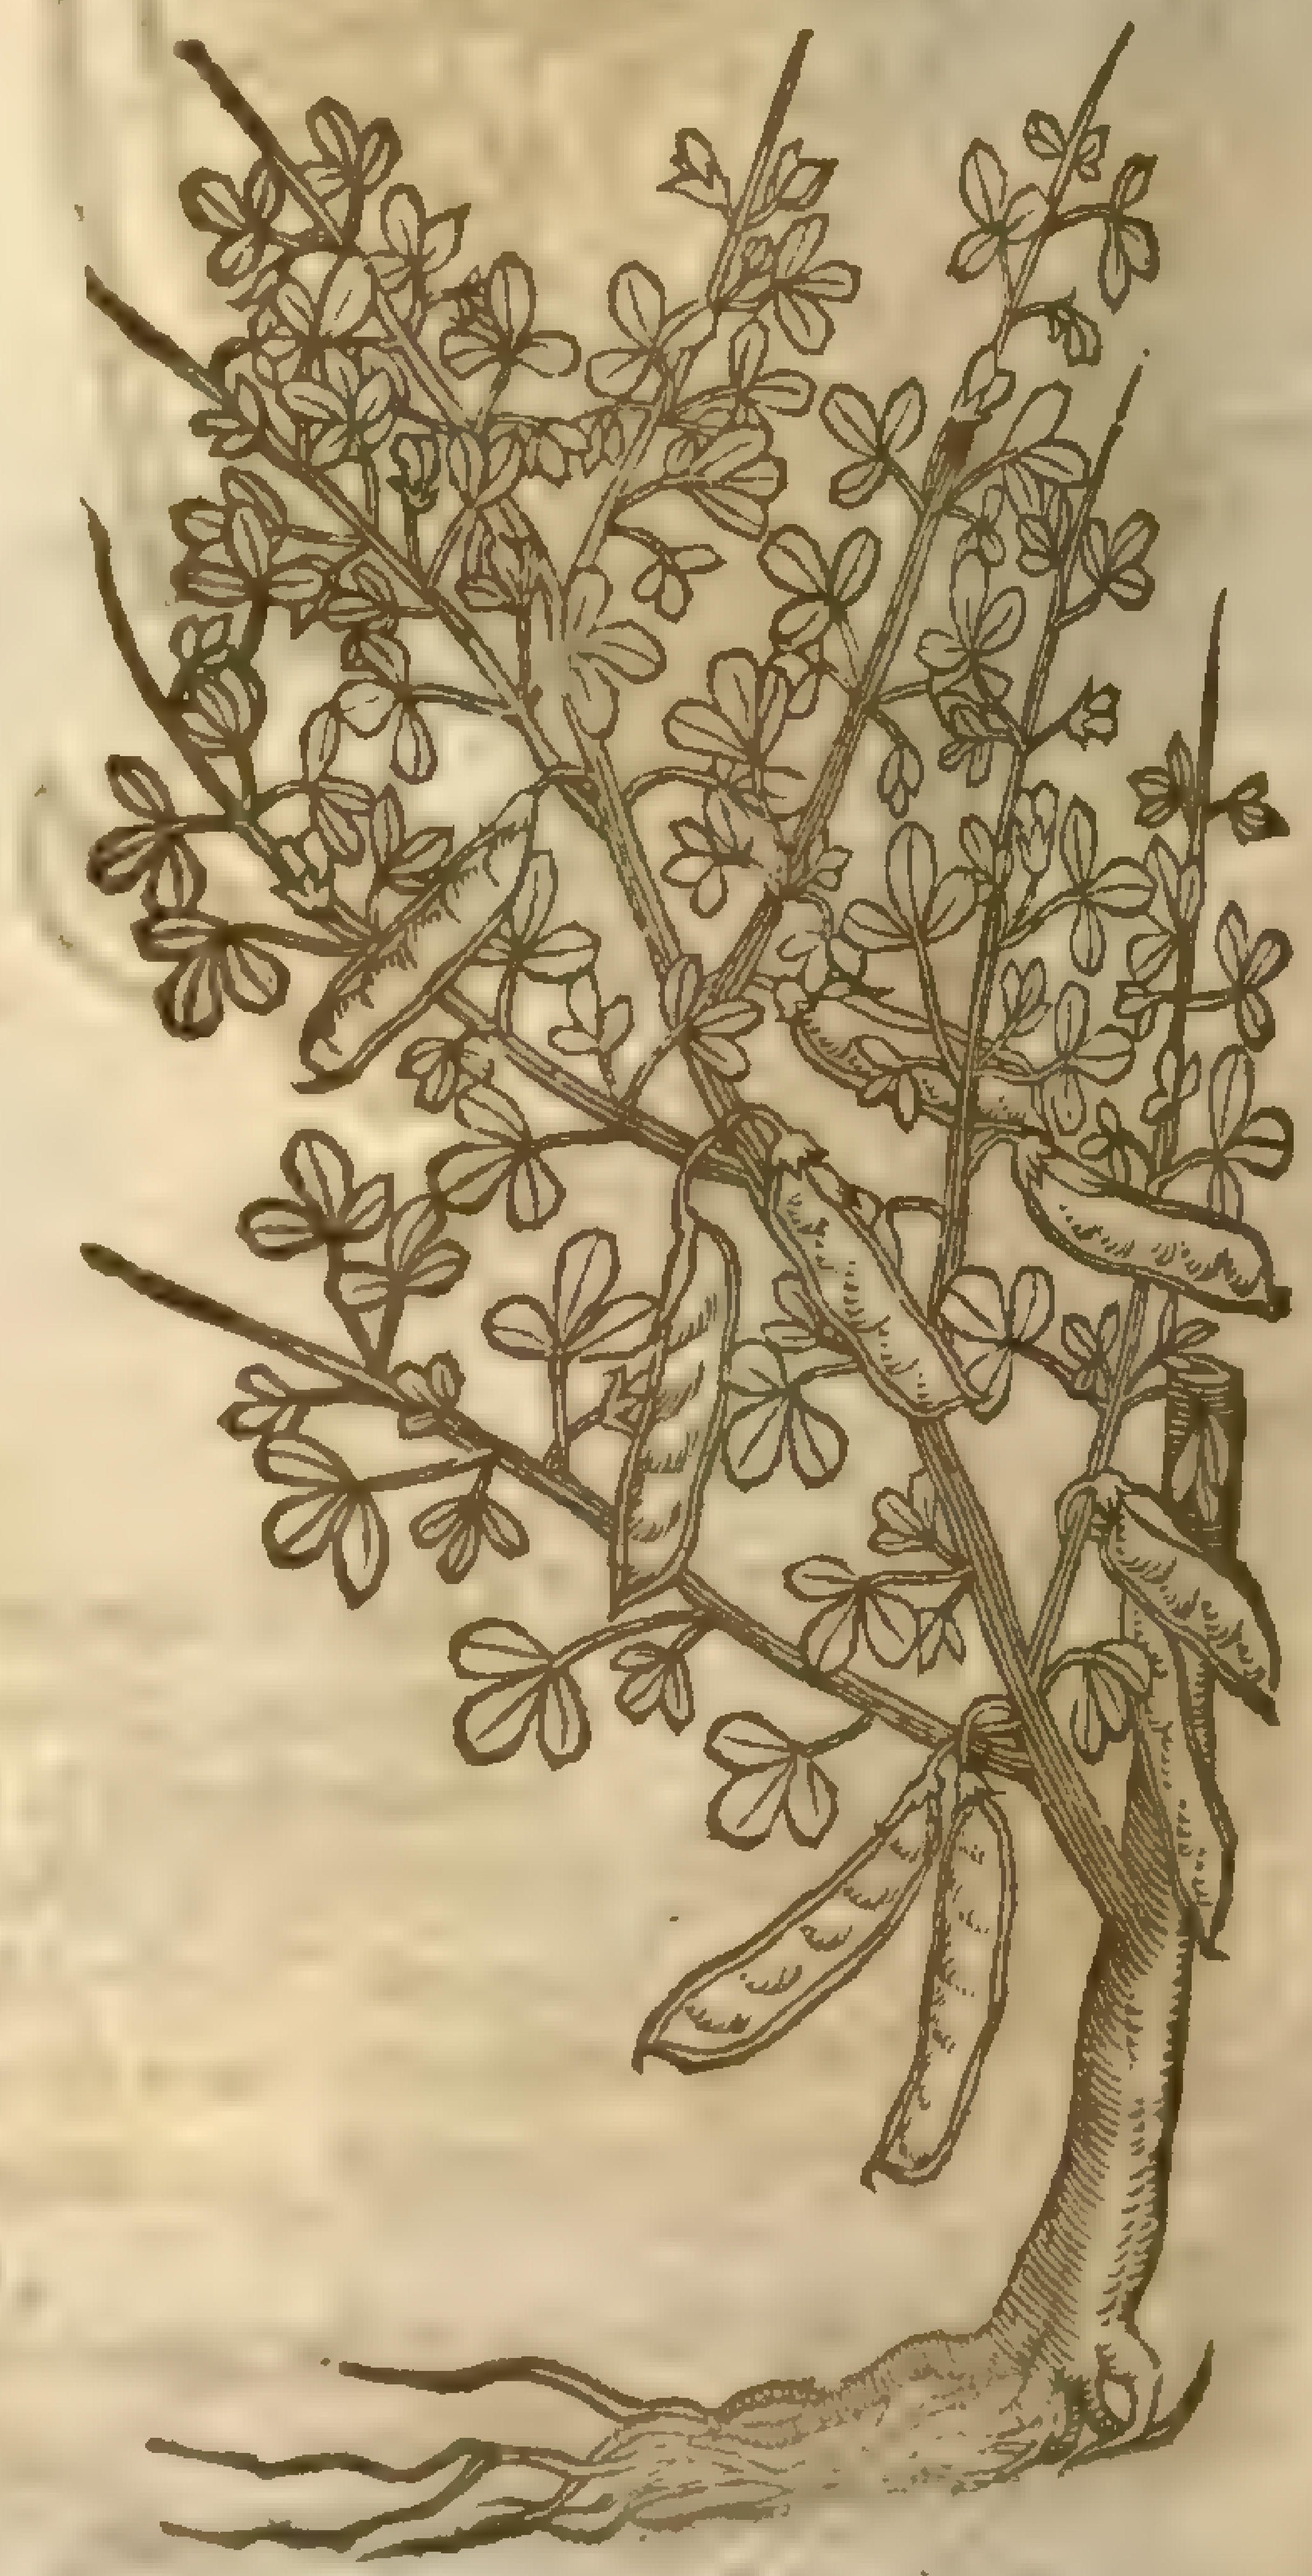
† The figure which was in the third place was of the plant deſcribed in the ſecond, which *Matthiolus* and *Tabern.* made their *Poterion*, but it agreed not with the deſcription, which was taken out of the *Adverſ.*

Chap. 26. *Of the Ægyptian Thorne.*

‡ 1 *Acacia Dioſcoridis.*
The Egyptian Thorne.



† 2 *Acacia altera trifolia.*
Thorny Trefoile.



Spartium spinosum, L
mili. dur.

¶ *The Deſcription.*

1 Dioſcorides makes mention of *Acacia*, whereof the firſt is the true and right *Acacia*, which is a ſhrub or hedge tree, but not growing right or ſtraight vp as other ſmall trees doe: his branches are wooddy, beſet with many hard and long thornes; about which grow the leaues, compact of many ſmall leaues cluſtering about one ſide, as in the Lentil: the flours are whitiſh, the huskes or cods be plaine and flat, yea very broad like Lupines, eſpecially on that ſide where the ſeed growes, which is contained ſomtimes in one part, and ſomtimes in two parts of the husk, growing together in a narrow neck: the ſeed is ſmooth and gliſtering. There is a black juyce taken out of theſe huskes, if they be dried in the ſhade when they be ripe; but if they are not ripe, then it is ſomwhat red: ſome do wring a juice out of the leaues and fruit: there flowes alſo a gum out of this tree, which is the gum of Arabia, called gum Arabick.

2 *Dioſcorides* hauing deſcribed *Spina Acacia*, ſets downe a ſecond kinde thereof, calling it *Acacia altera*, which hath the three leaues of Rue or *Cytiſus*, and coddes like thoſe of *Geniſtella*, but ſomewhat more blunt at the end, and thicke at the backe like a Raſor, and ſtill groweth forward narrower and narrower, vntill it come to haue a ſharpe edge: in theſe cods are contained three or foure flat ſeeds like *Geniſtella*, which before they wax ripe are yellow, but afterwards blacke: the whole plant growes to the height of *Geniſta ſpinoſa* or Gorſſe, both in ſhape, height, and reſemblance, and not to the height of a tree, as *Matthiolus* would perſuade vs, but full of ſharp thornes like the former.

¶ *The Place.*

The true Acacia groweth in Egypt, Paleſtina, Lombardy, and Syria, as *Dioſcorides* writes: among the ſhrubs and trees that remaine alwaies green, Acacia is noted for one, by *Petrus Bellonius, lib.* 1. *cap.* 44. of his Singularities.

The other Acacia growes in Cappadocia and Pontus, as *Dioſcorides* writeth: it is alſo found in Corſica, and in diuers mountaines of Italy, and likewiſe vpon all the coaſt of Liguria and Lombardie, and vpon the Narbon coaſt of the Mediterranean ſea.

¶ *The Time.*

Theſe floure in May, and their fruit is ripe in the end of Auguſt.

¶ *The Names.*

The tree Acacia is named of the Grecians ἀκακία, yea euen in our time, & likewiſe of the Latines *Acacia*: it is alſo called *Egyptia ſpina*: this ſtrange thorne hath no Engliſh name that I can learne, and therefore it may ſtill keep the Latine name Acacia; yet I haue named it the Egyptian thorne. The juice alſo is called Acacia. The Apothecaries of Germanie vſe in ſtead hereof the juice that is preſſed out of ſloes or ſnags, which they therefore call *Acacia Germanica*. *Matthiolus* pictureth for *Acacia* the tree which the later Herbariſts call *Arbor Iudæ*, to which he hath vntruly added thornes, that he might belie Acacia; and yet he hath not made it agree with *Dioſcorides* his deſcription.

They call this ἑτέρα ἀκακία: in Latine, *Acacia altera*, or the other Acacia, and *Pontica Acacia*, or Ponticke Acacia.

¶ *The Nature.*

The juice of Acacia, as *Galen* ſaith, conſiſts not of one onely ſubſtance, but is both cold and earthy, to which alſo is coupled a certain waterie eſſence, and it likewiſe hath thinne and hot parts diſperſed in it ſelfe; therefore it is dry in the third degree, and cold in the firſt, if it be not waſhed; and in the ſecond if it be waſhed; for by waſhing it loſeth his ſharp and biting quality, and the hot parts.

¶ *The Vertues.*

The juice of Acacia ſtoppeth the laske, the inordinat courſe of womens termes, and mans inuoluntarie iſſue called *Gonorrhæa*, if it be drunke in red wine. A

It healeth the blaſtings and inflammations of the eies, and maketh the skin and palmes of the hands ſmooth, after the healing of the *Serpigo*: it healeth the bliſters & extreme heat in the mouth, and maketh the haires blacke that are waſhed therewith. B

It is good, ſaith *Dioſcorides*, againſt S. Anthonies fire, the ſhingles, Chimetla, Pterygia, & whitlowes. C

The gum doth binde and ſomwhat coole: it hath alſo joined vnto it an emplaſticke qualitie, by which it dulleth or alayeth the ſharpneſſe of the medicines wherewith it is mixed. Being applied with the white and yolk of an egge it ſuffers not bliſters to riſe in burned or ſcalded parts. *Dioſc.* D

The juice of the other, ſaith *Dioſcorides*, doth alſo binde, but it is not ſo effectuall nor ſo good in eye medicines. E

† Our Author gaue but formerly one figure, which was that in the ſecond place, and he would haue perſuaded vs that it was of the right *Acacia*, yet in his deſcription he tells vs otherwiſe.

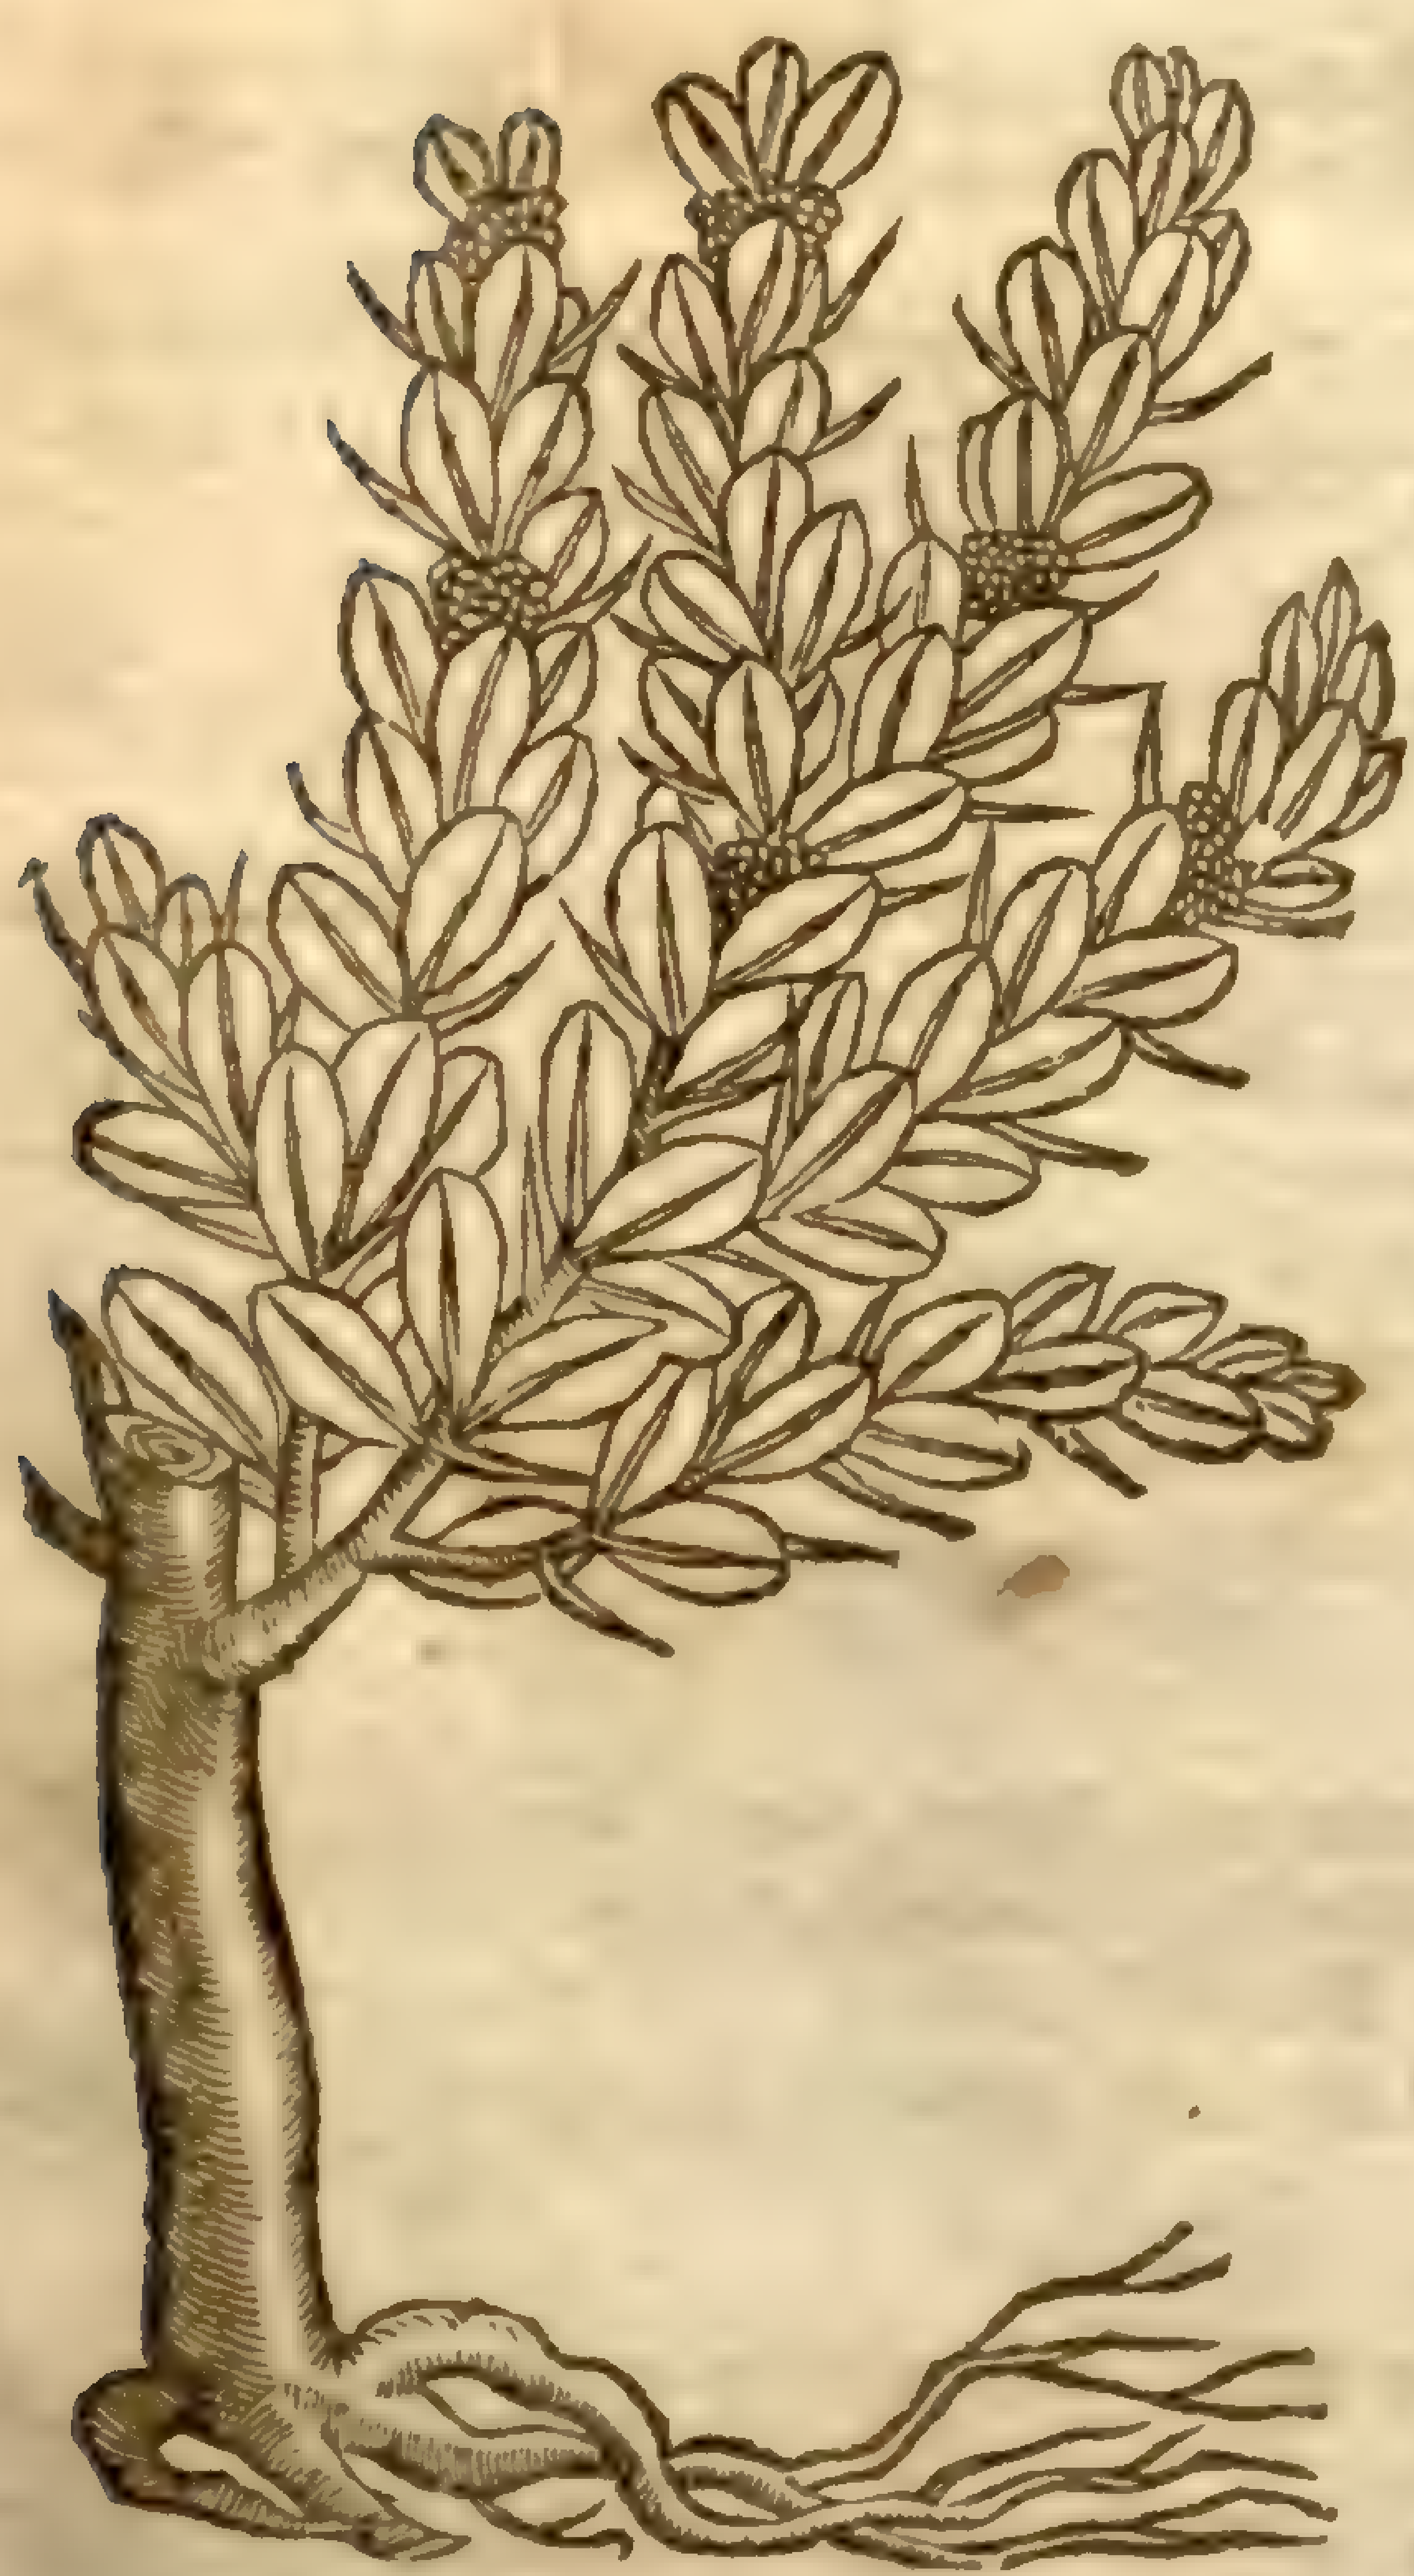
CHAP.

Chap. 27.

Of Box Thorne, and the juice thereof called Lycium.

¶ *The Deſcription.*

1 Box Thorne is a rare plant in ſhape not vnlike the Box tree, whereof it hath bin reckoned for a wilde kinde, hauing many great branches ſet full of round and thicke leaues very like that of the common Box tree: amongſt which grow forth moſt ſharpe pricking thornes: the floures grow among the leaues, which yeeld forth ſmall black berries of a bitter taſte, as big as a pepper corne: the juice whereof is ſomwhat oily, and of a reddiſh colour: which bitter juice being ſet on fire, doth burne with a maruellous cracking and ſparkling: the aſhes thereof are of a reddiſh colour: it hath many wooddy roots growing aſlope.



1 *Lycium, ſive Pyxacantha.*
Box Thorne.

‡ 2 *Lycium Hiſpanicum.*
Spaniſh Box Thorne.

2 The other kinde of *Pyxacantha* or *Lycium* groweth like vnto the common Privet, hauing ſuch like leaues, but ſomewhat narrower: the tops of the ſlender ſprigs are furniſhed with prickles: the root is tough, and of a wooddy ſubſtance.

¶ *The Place.*

They grow in Cappadocia and Lycia, and in many other countries: it proſpers in rough places; it hath likewiſe bin found at Languedoc and Province in France. *Bellonius* writeth that he found it in Paleſtina.

Matthiolus picturеth for Box Thorne a plant with Box leaues, with very many boughes and certaine thornes ſtanding among them: but the notable Herbariſt *Anguillara* and others hold opinion that it is not the right; with whom we alſo agree.

There is drawn out of the leaues and branches of Box Thorn, or as *Pliny* ſaith, out of the boughs and roots being throughly boiled, a juice named *Lycium*.

Dioſcorides ſaith that the leaues and branches muſt be brayed, and the infuſion made many daies in the decoction thereof,after which the feces or wooddy ſtuffe muſt be caſt away,and that which remaineth boiled againe till it become as thicke as hony. *Pliny* ſaith that the roots and branches are very bitter, and for three daies together they muſt be boiled in a copper veſſell, and the wood and ſticks often taken out till the decoction be boiled to the thickneſſe of hony.

¶ *The Time.*

They floure in Februarie and March,and their fruit is ripe in September.

¶ *The Names.*

It is named in Greeke πυξάκανθα, which a man may call in Latine *Buxea ſpina*; and in Engliſh,box Thorne: of ſome, Aſſes Box tree,and prickly Box: it is alſo named *Lycium*, of the juice which is boiled out of it: the juice is properly called λύκιον, and retaineth in Latine the ſame name *Lycium*: it is termed in Engliſh,Thorne Box. But it ſeemeth to me that the originall name *Lycium* is fitter, being a ſtrange thing,and knowne to very few: the Apothecaries know it not,who in ſtead thereof do vſe amiſſe the juice of the fruit of Woodbinde,and that not without great error, as we haue already written. ‡ It is vnknown in our ſhops,neither is there any thing vſed for it, it being wholly out of vſe: wherefore our Author might here very well haue ſpared *Dodonæus* his words. ‡

Dioſcorides teacheth to make a χύλισμα or Sumach which is good for thoſe things that *Lycium* is, and is vſed when *Lycium* is not to be had,and it is fit to be put into all medicines in ſtead thereof.

¶ *The Temperature.*

Lycium,or the juice of Box Thorne is,as *Galen* teacheth, of a drying qualitie, and compounded of diuers kinds of ſubſtances,one of thin parts digeſting and hot,another earthy and cold, wherby it enioyeth his binding facultie: it is hot in a mean,and therefore it is vſed for ſeuerall purpoſes.

¶ *The Vertues.*

Lycium cleareth the ſight,ſaith *Dioſcorides*,it healeth the ſcuruy feſtred ſores of the eye lids, the itch,and old fluxes or diſtillations of humors: it is a remedie for the running of the eares, for Vlcers in the gums,and almonds of the throat,and againſt the chaps or gallings of the lips and fundament. A

† The figure which was in the ſecond place was of the *Lycium Italicum* of *Matthiolus* and others; but the deſcription and title better fitted this *Lycium Hiſpanicum* of *Lobel*,which therefore I put thereto. The figure alſo of the *Lycium Italicum* of *Matthiolus* our Author gaue againe in the next chapter ſaue two.

Chap. 28. *Of Ram or Harts Thorne.*

¶ *The Kindes.*

AFter the opinion of *Dioſcorides* there bee three ſorts of *Rhamnus*; one with long flat and ſoft leaues,the other with white leaues,and the third with round leaues,which are ſomewhat blackiſh. *Theophraſtus* and *Pliny* affirme that there are but two,the one white,and the other black,both which do beare Thornes.But by the labor and induſtrie of the new and late writers there are found ſundry ſorts moe,all which and euery one of them are plants of a woody ſubſtance,hauing alſo many ſtraight twiggy and pliant branches ſet with moſt ſharp pricking thornes.

¶ *The Deſcription.*

1 THis is a ſhrub growing in the hedges, and bringing forth ſtraight branches and hard thornes like thoſe of the Hawthorn, with little long leaues ſomething fat and ſoft:and this hath that notable learned man *Cluſius* more diligently deſcribed in theſe words; The Ram is a ſhrub fit to make hedges of,with ſtraight branches parting it ſelfe into many twigs, white,and ſet with ſtiffe and ſtrong thornes,hauing leaues which for the moſt part grow by foures or fiues at the root of euery Thorne, long, ſomething fat, like to thoſe of the Oliue tree, ſomewhat white,but tender and full of juice; which in Autumne do ſometimes fall off,leauing new growing in their places: the floures in Autumne are ſomthing long,whitiſh,diuided at the brims into fiue parts: in their places is left a ſeed in ſhew as in *Gelſemine*, notwithſtanding it was neuer my chance to ſee the fruit: the root is thicke,and diuerſly parted.

‡ I obſerued another,ſaith the ſame Author,almoſt like to the former,but lower,and diuided into more branches,with leſſer leaues,more thick and ſalt of taſte,and whiter alſo than the former: the floures are like thoſe of the former in all things but their colour,which in this are purple.

2 This hath more flexible ſtalks and branches,and theſe alſo ſet with thornes: The leaues are narrow,and not ſo thicke and fleſhy as thoſe of the former,yet remaine alwayes greene like as they do: The floures are ſmall and moſſie,of a greeniſh colour,growing thicke about the branches, and they are ſucceeded by a round fruit,yellowiſh when it is ripe,and remaining on the ſhrubbe all the

Winter. The whole ſhrub looks as if it were ſprinkled ouer with duſt.

3 To theſe may be added another growing with many branches to the height of a Sloe Tree, or blacke Thorne, and theſe are couered with a blackiſh barke, and armed with long prickles. The leaues, as in the firſt, grow forth of certain knots many together, long, narrow, fleſhy, green, and continuing all the yeare: their taſt is aſtringent, ſomwhat like that of Rhabarb: the flours ſhew themſelues at the beginning of the Spring, of a greeniſh colour, growing thicke together, and neere the ſetting on of the leaues: in Summer it carries a blacke fruit almoſt like a Sloe, round, and harſh of taſte.

¶ *The Place.*

The firſt of theſe growes in ſundry places of Spaine, Portugal, and Prouince: the other varietie thereof *Cluſius* ſaith he found but only in one place, and that was neere the city Horivela, called by the Antients Orcellis, by the riuer Segura, vpon the borders of the kingdom of Valentia. The ſecond grows in many maritime places of Flanders and Holland, and in ſome vallies by riuers ſides. The third growes in the vntilled places of the kingdom of Granado and Murcia. ‡

¶ *The Time.*

This Ram is euer green together with his leaues: the fruit or berries remain on the ſhrub euen in Winter.

¶ *The Names.*

The Grecians call this Thorne Ῥάμνος: the Latines alſo *Rhamnus*: diuers name it Περσεφόνιον, λευκάκανθα, that is, *Spina alba*, or White Thorne; *Spina Cervalis*, or Harts Thorne, as wee finde written amongſt the baſtard words. *Marcellus* nameth it *Spina ſalutaris*, and *Herba ſalutaris*, which hath, ſaith hee, as it were a grape. It is called in Italian, *Marruco*, and *Rhamno*: in Spaniſh, *Scambrones*: in Engliſh, Ram or Harts Thorne.

¶ *The Temperature.*

The Ram, ſaith *Galen*, doth dry and digeſt in the ſecond degree, it cooleth in the later end of the firſt, and in the beginning of the ſecond degree.

¶ *The Vertues.*

A The leaues, ſaith *Dioſcorides*, are laid pultiswiſe vpon hot cholericke inflammations and S. *Anthonies* fire, but we muſt vſe them whileſt they be yet but tender, as *Galen* addeth.

B ‡ The leaues and buds or young ſhoots of the firſt are eaten as ſallads, with oile, vineger, and ſalt, at Salamanca and other places of Caſtile, for they haue a certain acrimonie and acidity which are gratefull to the taſte. A decoction of the fruit of the third is good to foment relaxed and weak or paralyticke members, and to eaſe the paine of the gout, as the inhabitants of Granado told *Cluſius*. ‡

† Our Author in this Chapter gaue only the figure of the third, and the deſcription of the firſt, and the place of the ſecond, with the names and faculties in generall.

CHAP. 29. *Of Chriſts Thorne.*

¶ *The Deſcription.*

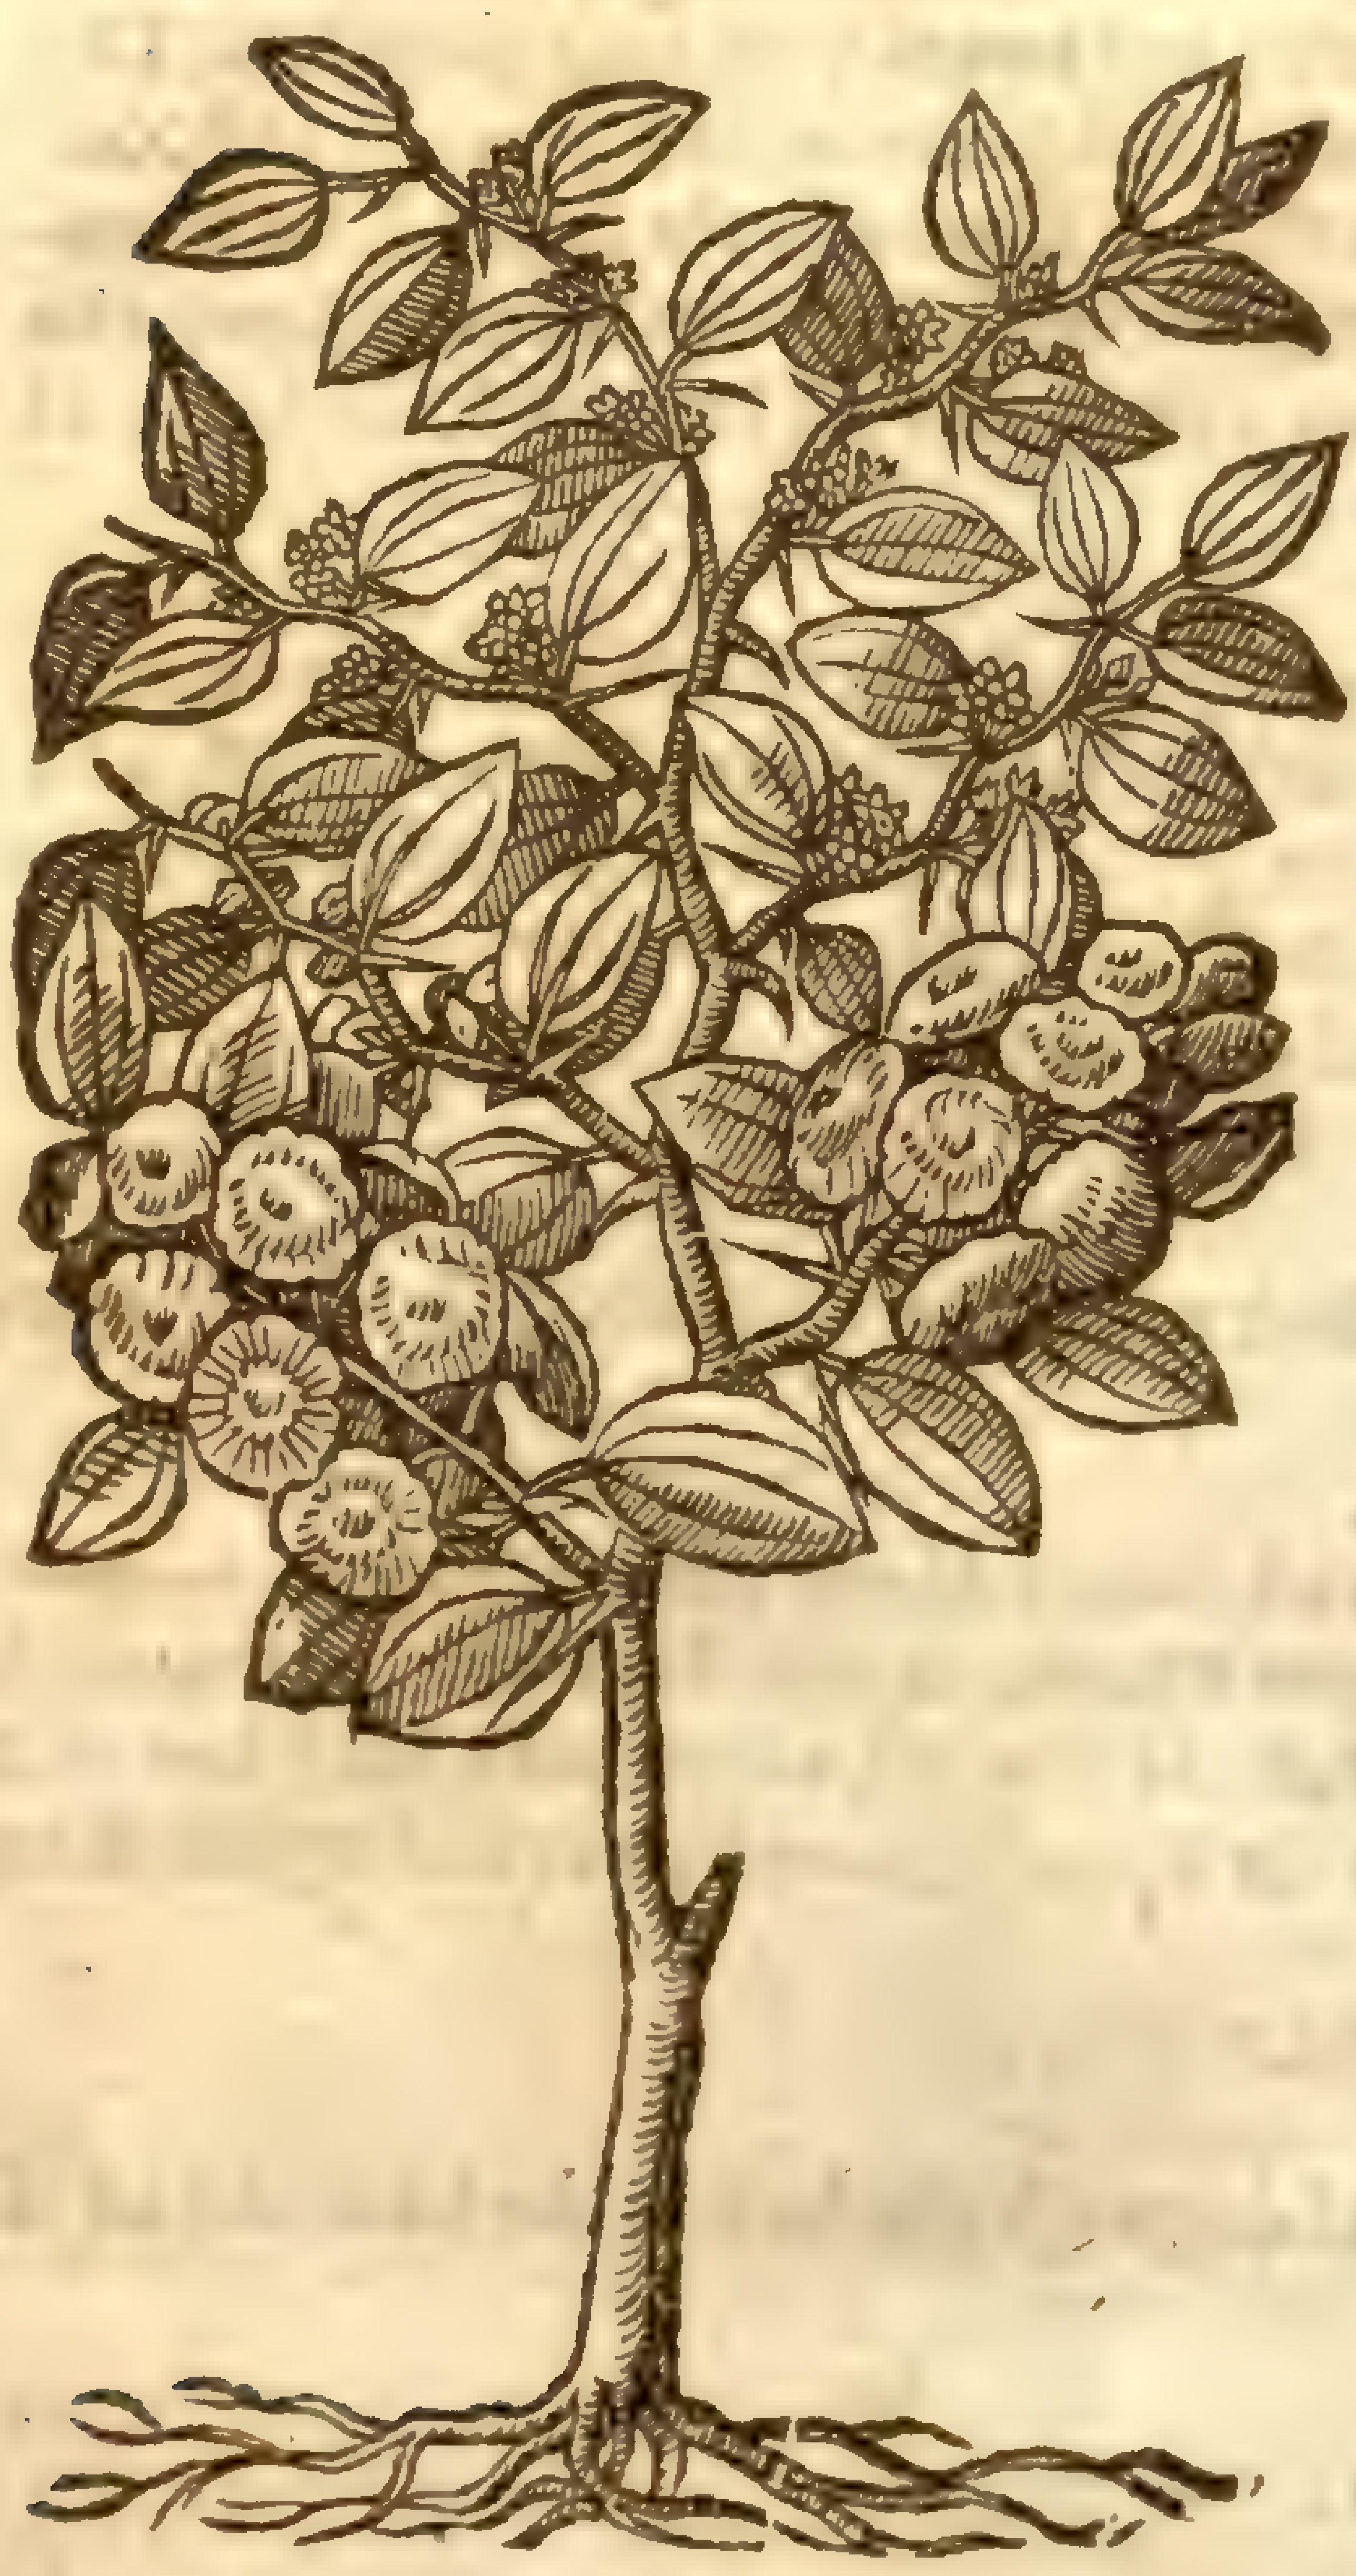
CHriſts Thorne or Ram of Lybia is a very tough and hard ſhrubby buſh, growing vp ſomtimes to the height of a little tree, hauing very long and ſharpe prickely branches; but the Thornes that grow about the leaues are leſſer, and not ſo prickly as the former. The leaues are ſmall, broad, and almoſt round, ſomewhat ſharp pointed, firſt of a darke green colour, and then ſomewhat reddiſh. The floures grow in cluſters at the tops of the ſtalks, of a yellow colour: the husks wherin the ſeeds be contained are flat and broad, very like vnto ſmall bucklers, as hard as wood, wherin are contained three or foure thin and flat ſeeds like the ſeed of Line or Flax.

¶ *The Place.*

This Thorne groweth in Lybia; it is better eſteemed of in the countrey of Cyrene than is their Lote tree, as *Pliny* affirmeth. Of this herb *Diphilus Siphnius* in *Athenæus* his 14 booke makes mention, ſaying, That he did very often eat of the ſame in Alexandria, that beautifull city.

Petrus Bellonius, who trauelled ouer the Holy land, ſaith, That this ſhrubby Thorne *Paliurus* was the Thorne wherewith they crowned our Sauiour Chriſt: his reaſon for the proofe hereof is this, That in Iudæa there was not any Thorne ſo common, ſo pliant, or ſo fit for to make a crown or garland of, nor any ſo full of cruell ſharpe prickles. It groweth throughout the whole countrey in ſuch abundance, that it is their common fuell to burn; yea, ſo common with them there, as our Gorſſe, Brakes, and Broome is here with vs. *Ioſephus, lib.* 1. *cap.* 11. of his Antiquities ſaith, That this thorne hath the moſt ſharp prickles of any other; wherefore that Chriſt might bee the more tormented, the Iewes rather tooke this than any other. Of which I haue a ſmall tree growing in my garden, that I haue brought forth by ſowing of the ſeed.

Paliurus.
Chriſts Thorne.



Rhamnus paliurus, L. [illegible]

¶ *The Time.*

The leaues fall away and continue not alwayes greene, as doe thoſe of the Rams: it buds forth in the Spring, as *Pliny* teſtifieth.

¶ *The Names.*

This thorny ſhrub is called in Greek, Παλίουρος: the Latines and Italians retaine the ſame name *Paliurus*: for want of an Engliſh name it may bee termed Ram of Lybia, or Chriſts thorn. *Pliny* ſaith the ſeed is called *Zura*.

¶ *The Temperature.*

The leaues and root of Chriſts thorne doe euidently binde and cut.

¶ *The Vertues.*

A By vertue of this cutting qualitie the ſeed doth weare away the ſtone, and cauſe tough and ſlimy humors to remoue out of the cheſt and lungs, as *Galen* ſaith.

B The decoction of the leaues and root of Chriſts Thiſtle, as *Dioſcorides* writes, ſtoppeth the belly, prouokes vrine, and is a remedie againſt poiſons and the bitings of ſerpents.

C The root doth waſte and conſume away *Phymata* and *Oedemata*, if it be ſtamped and applied.

D The ſeed is good for the cough, and weares away the ſtone in the bladder.

Chap. 30. *Of Buck-Thorne, or laxatiue Ram.*

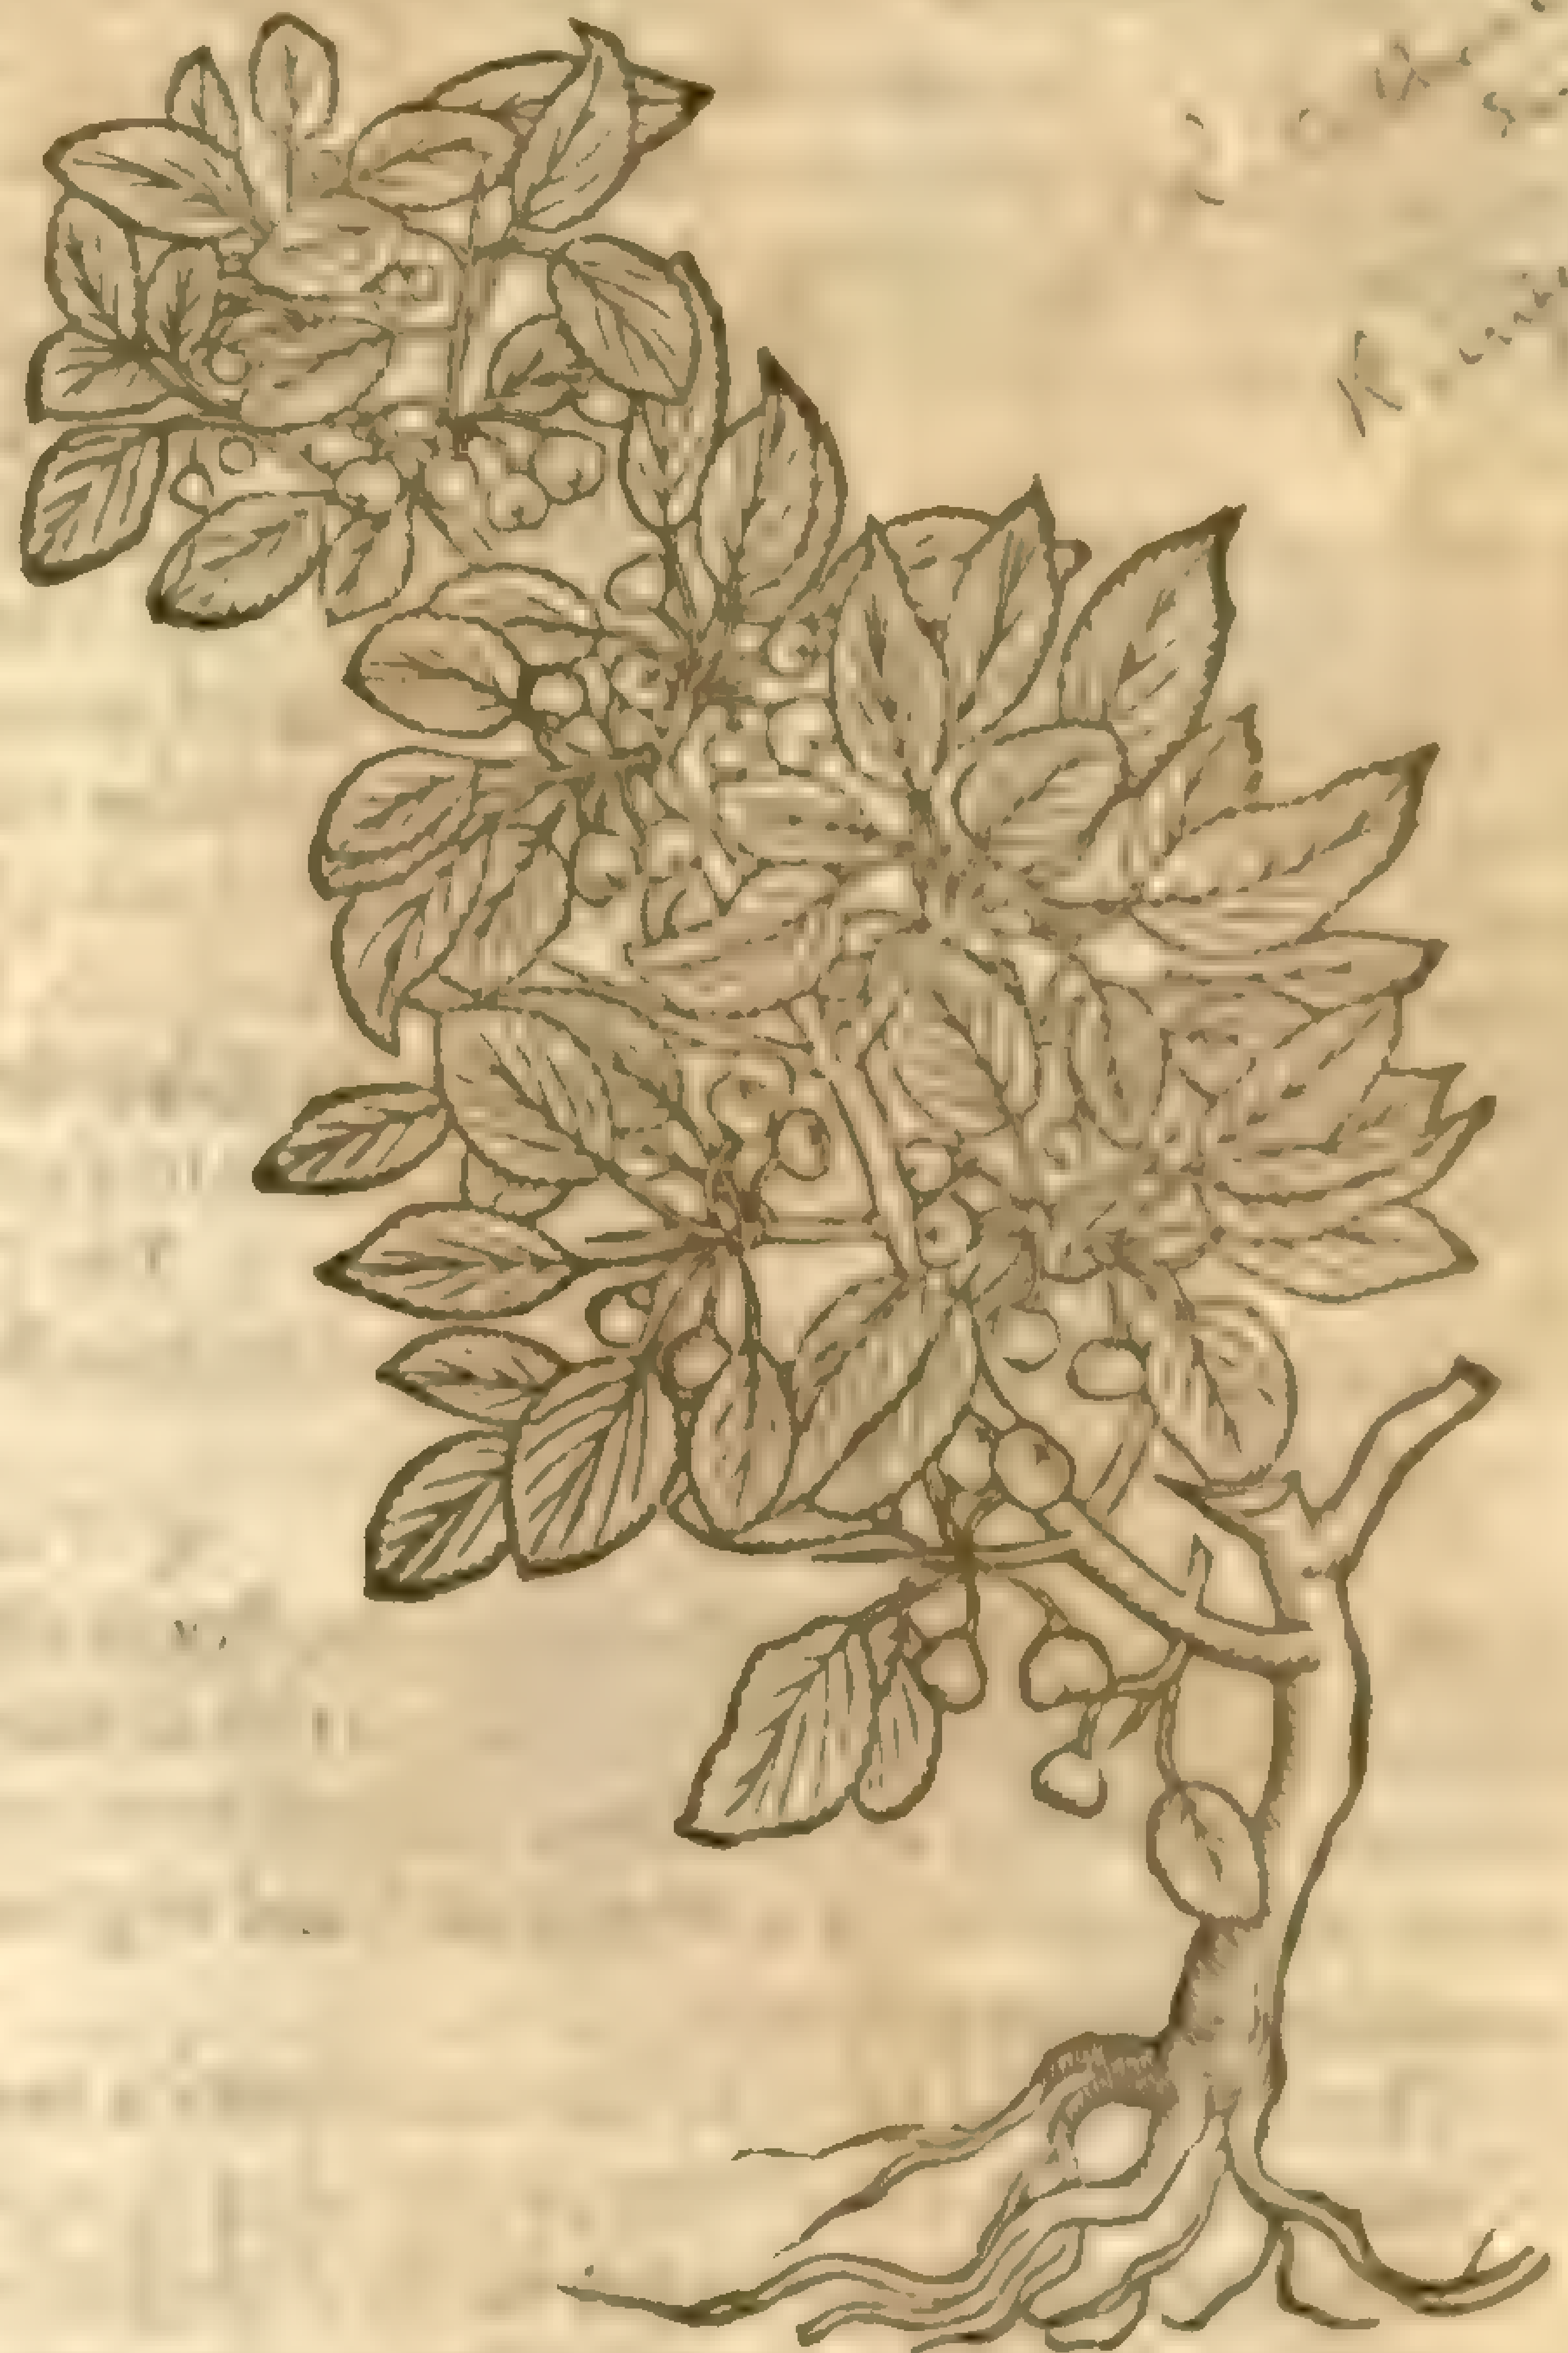
¶ *The Deſcription.*

1 Bvck-Thorne growes in manner of a ſhrub or hedge tree; his trunke or body is often as big as a mans thigh; his wood or timber is yellow within, and the barke is of the colour of a Cheſnut, almoſt like the barke of a Cherry tree. The branches are beſet with leaues that are ſomewhat round, and finely ſnipt about the edges like the leaues of the Crab or Wilding tree: among which come forth thorns which are hard and prickly: the flowres are white and ſmall, which being vaded, there ſucceed little round berries, green at the firſt, but afterwards black, whereof that excellent green colour is made which the Painters and limners do call Sap-green: but theſe berries before they be ripe do make a faire yellow colour, being ſteeped in vineger.

‡ 2 Beſides the common kinde *Cluſius* mentions two other: the firſt of which hath branches ſome two cubits long, ſubdiuided into diuers others, couered with a ſmooth barke like that of the former, which, the vpper rinde being taken off, is of a yellowiſh greene colour, and bitteriſh taſte: the branches haue ſome few prickles vpon them, and commonly end in them: the leaues are almoſt like vnto thoſe of the common kinde, but ſmaller, narrower, and ſomwhat reſembling thoſe of the blacke Thorne, hauing ſomewhat a drying taſte: the floures conſiſt of foure leaues of a yellowiſh greene

‡ 1 *Rhamnus ſolutiuus.*
Buck-thorne.

‡ 2 *Rhamnus ſolutiuus minor.*
Middle Buck-thorne.



† 3 *Rhamnus ſolutiuus pumilus.*
Dwarfe Buck-thorne.

greene colour: the root is wooddy as in other ſhrubs: *Cluſius* found this growing in the mountanous places of Auſtria, and calls it *Spina infectoria pumila.*

3 This other hath branches ſome cubit long, and of the thickeneſſe of ones little finger, or leſſer, couered with a blacke and ſhriuelled barke: and towards the top diuided into little boughs, which are couered with a thin & ſmoother barke, and commonly end in a ſharp thorn: the leaues much reſemble thoſe of the Slo-tree yet are they ſhorter and leſſer, greene alſo, and ſnipt about the edges; firſt of an aſtringent, and afterwards of ſomewhat a bitteriſh taſte; the floures which grow amongſt the leaues are of an herby colour, and conſiſt of foure leaues: the fruit is not much vnlike that of the former; but diſtinguiſhed with two, & ſomtimes with three creſts or dents, firſt green, and then blacke when it is ripe: the root is thicke, wooddy and hard. *Cluſius* found this on the hill aboue the Bathes of Baden, hee calls it *Spina infectoria pumila* 2. This *Matthiolus* and others call *Lycium Italicum:* and our Author formerly gaue the figure of *Matthiolus* and *Tabernamontanus* by the name of *Lycium Hiſpanicum*, and here againe another for his *Rhamnus ſolutiuus*, which made me to keepe it in this chapter, and omit it in the former, it being deſcribed in neither. ‡

¶ *The Place.*

Buck-thorne groweth neere the borders of fields, in hedges, woods, and in other vntoiled places: it delighteth to grow in riuers and in water ditches: it groweth in Kent in ſundry places, as at Farningham vpon the cony burrowes belonging ſometime to Mr *Sibil*, as alſo vpon cony burrowes in South-fleet, eſpecially in a ſmall and narrow lane leading from the houſe of Mr *William Swan* vnto Longfield-downes, alſo in the hedge vpon the right hand at Dartford townes end towards London, and in many places more vpon the chalkie bankes and hedges.

¶ *The Time.*

It floureth in May the berries be ripe in the fall of the leafe.

¶ *The Names.*

The later Herbariſts call it in Latine *Rhamnus ſolutivus*, becauſe it is ſet with thornes, like as the Ram, and beareth purging berries. *Matthiolus* nameth it *Spina infectoria*; *Valerius Cordus*, *Spina Cerui*, and diuers call it *Burgiſpina*. It is termed in high Dutch, **Creutzbeer Weghdorn**: in Italian, *Spino Merlo*, *Spino Zertino*, *Spino Ceruino*: in Engliſh, Laxatiue Ram, Way-thorne, and Buck-thorne: in low Dutch they call the fruit or berries **Rhijnbeſſen**, that is, as though you ſhould ſay in Latine, *Baccæ Rhenanæ*: in Engliſh, Rheinberries: in French, *Nerprun*.

¶ *The Temperature.*

The berries of this Thorne, as they be in taſte bitter and binding, ſo be they alſo hot and dry in the ſecond degree.

¶ *The Vertues.*

A The ſame do purge and void by the ſtoole thicke flegme, and alſo cholericke humors: they are giuen being beaten into pouder from one dram to a dram and a halfe: diuers do number the berries, who giue to ſtrong bodies from fifteene to twenty or more; but it is better to breake them and boile them in fat fleſh broth without ſalt, and to giue the broth to drinke: for ſo they purge with leſſer trouble and fewer gripings.

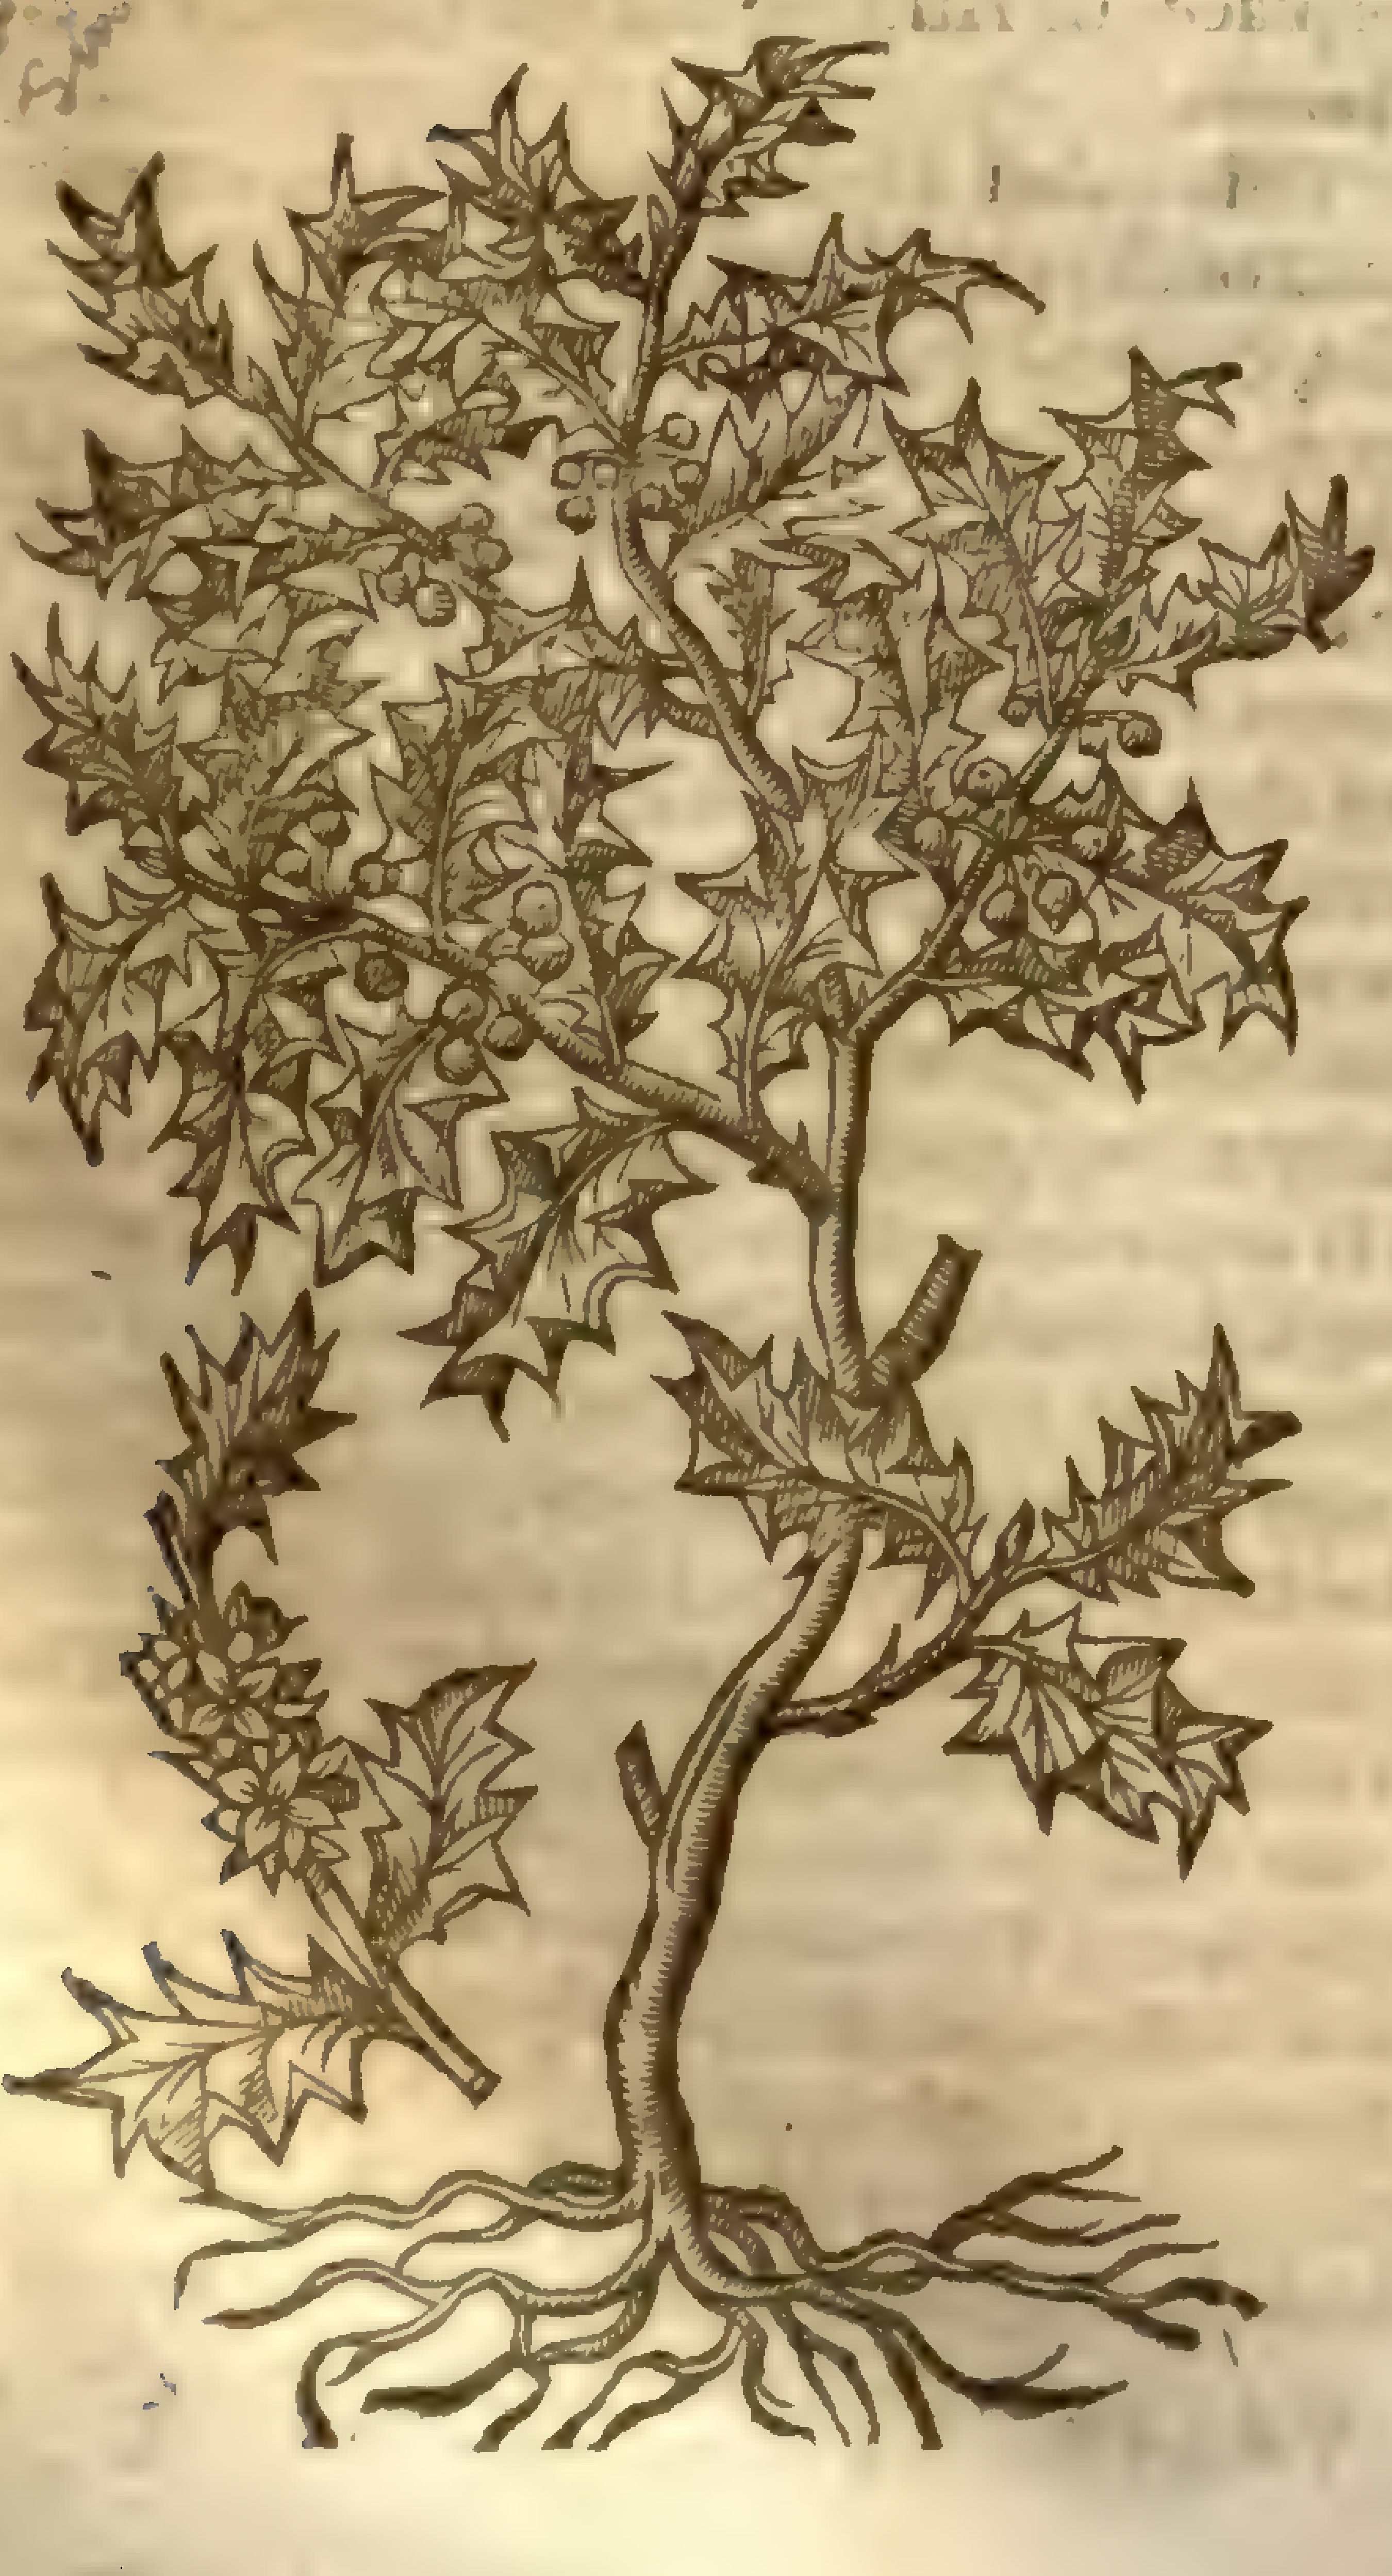
B There is preſſed forth of the ripe berries a juyce, which being boyled with a little Allum is vſed of painters for a deepe greene, which they do call Sap-greene.

C The berries which be as yet vnripe, being dried or infuſed or ſteped in water, do make a faire yellew colour: but if they be ripe they make a greene.

Chap. 31. *Of the Holme, Holly, or Huluer tree.*

Ilex aquifolium [illegible]

Agrifolium.
The Holly tree.



¶ *The Deſcription.*

THe Holly is a ſhrubbie plant, notwithſtanding it oftentimes growes to a tree of a reaſonable bigneſſe: the boughes whereof are tough and flexible, couered with a ſmooth and green barke. The ſubſtance of the wood is hard and ſound, and blackiſh or yellowiſh within, which doth alſo ſinke in the water, as doth the Indian wood which is called *Guaiacum*: the leaues are of a beautifnll green colour, ſmooth and glib, like almoſt the bay leaues, but leſſer, and cornered in the edges with ſharp prickles, which notwithſtanding they want or haue few when the tree is old: the floures be white, and ſweet of ſmell: the berries are round, of the bigneſſe of a little Peaſe, or not much greater, of colour red, of taſt vnpleaſant, with a white ſtone in the midſt, which do not eaſily fall away, but hang on the boughes a long time: the root is wooddy.

There is made of the ſmooth barke of this tree or ſhrub, Birdlime, which the birders and country men do vſe to take birds with: they pul off the barke, and make a ditch in the ground, ſpecially in moiſt, boggy, or foggy earth, wherinto they put this bark, couering the ditch with boughes of trees, letting it remaine there til it be rooted and putrified, which will be done in the ſpace of twelue daies or thereabout: which done, they take it forth, and beat in morters vntill it be come to the thickeneſſe and clammineſſe of Lime: laſtly, that they may cleare it from pieces of barke and other filthineſſe, they do waſh it very often: after which they adde vnto it a little oyle of nuts, and after that do put it vp in earthen veſſels.

¶ *The Place and Time.*

The Holly tree groweth plentifully in all countries. It groweth green both winter and ſummer; the berries are ripe in September, and they do hang vpon the tree a long time after.

¶ *The Names.*

This tree or ſhrub is called in Latine *Agrifolium*: in Italian, *Agrifoglio*: and *Aguifoglio*: in Spaniſh, *Azebo*: in high Dutch, **Walddiſtell**, and of diuers **Stecpalmen**: in low Dutch, **Hulſt**: in French, *Hous* and *Houſſon*: in Engliſh, Holly, Huluer, and Holme.

¶ *The Temperature.*

The berries of Holly are hot and dry, and of thin parts, and waſte away winde.

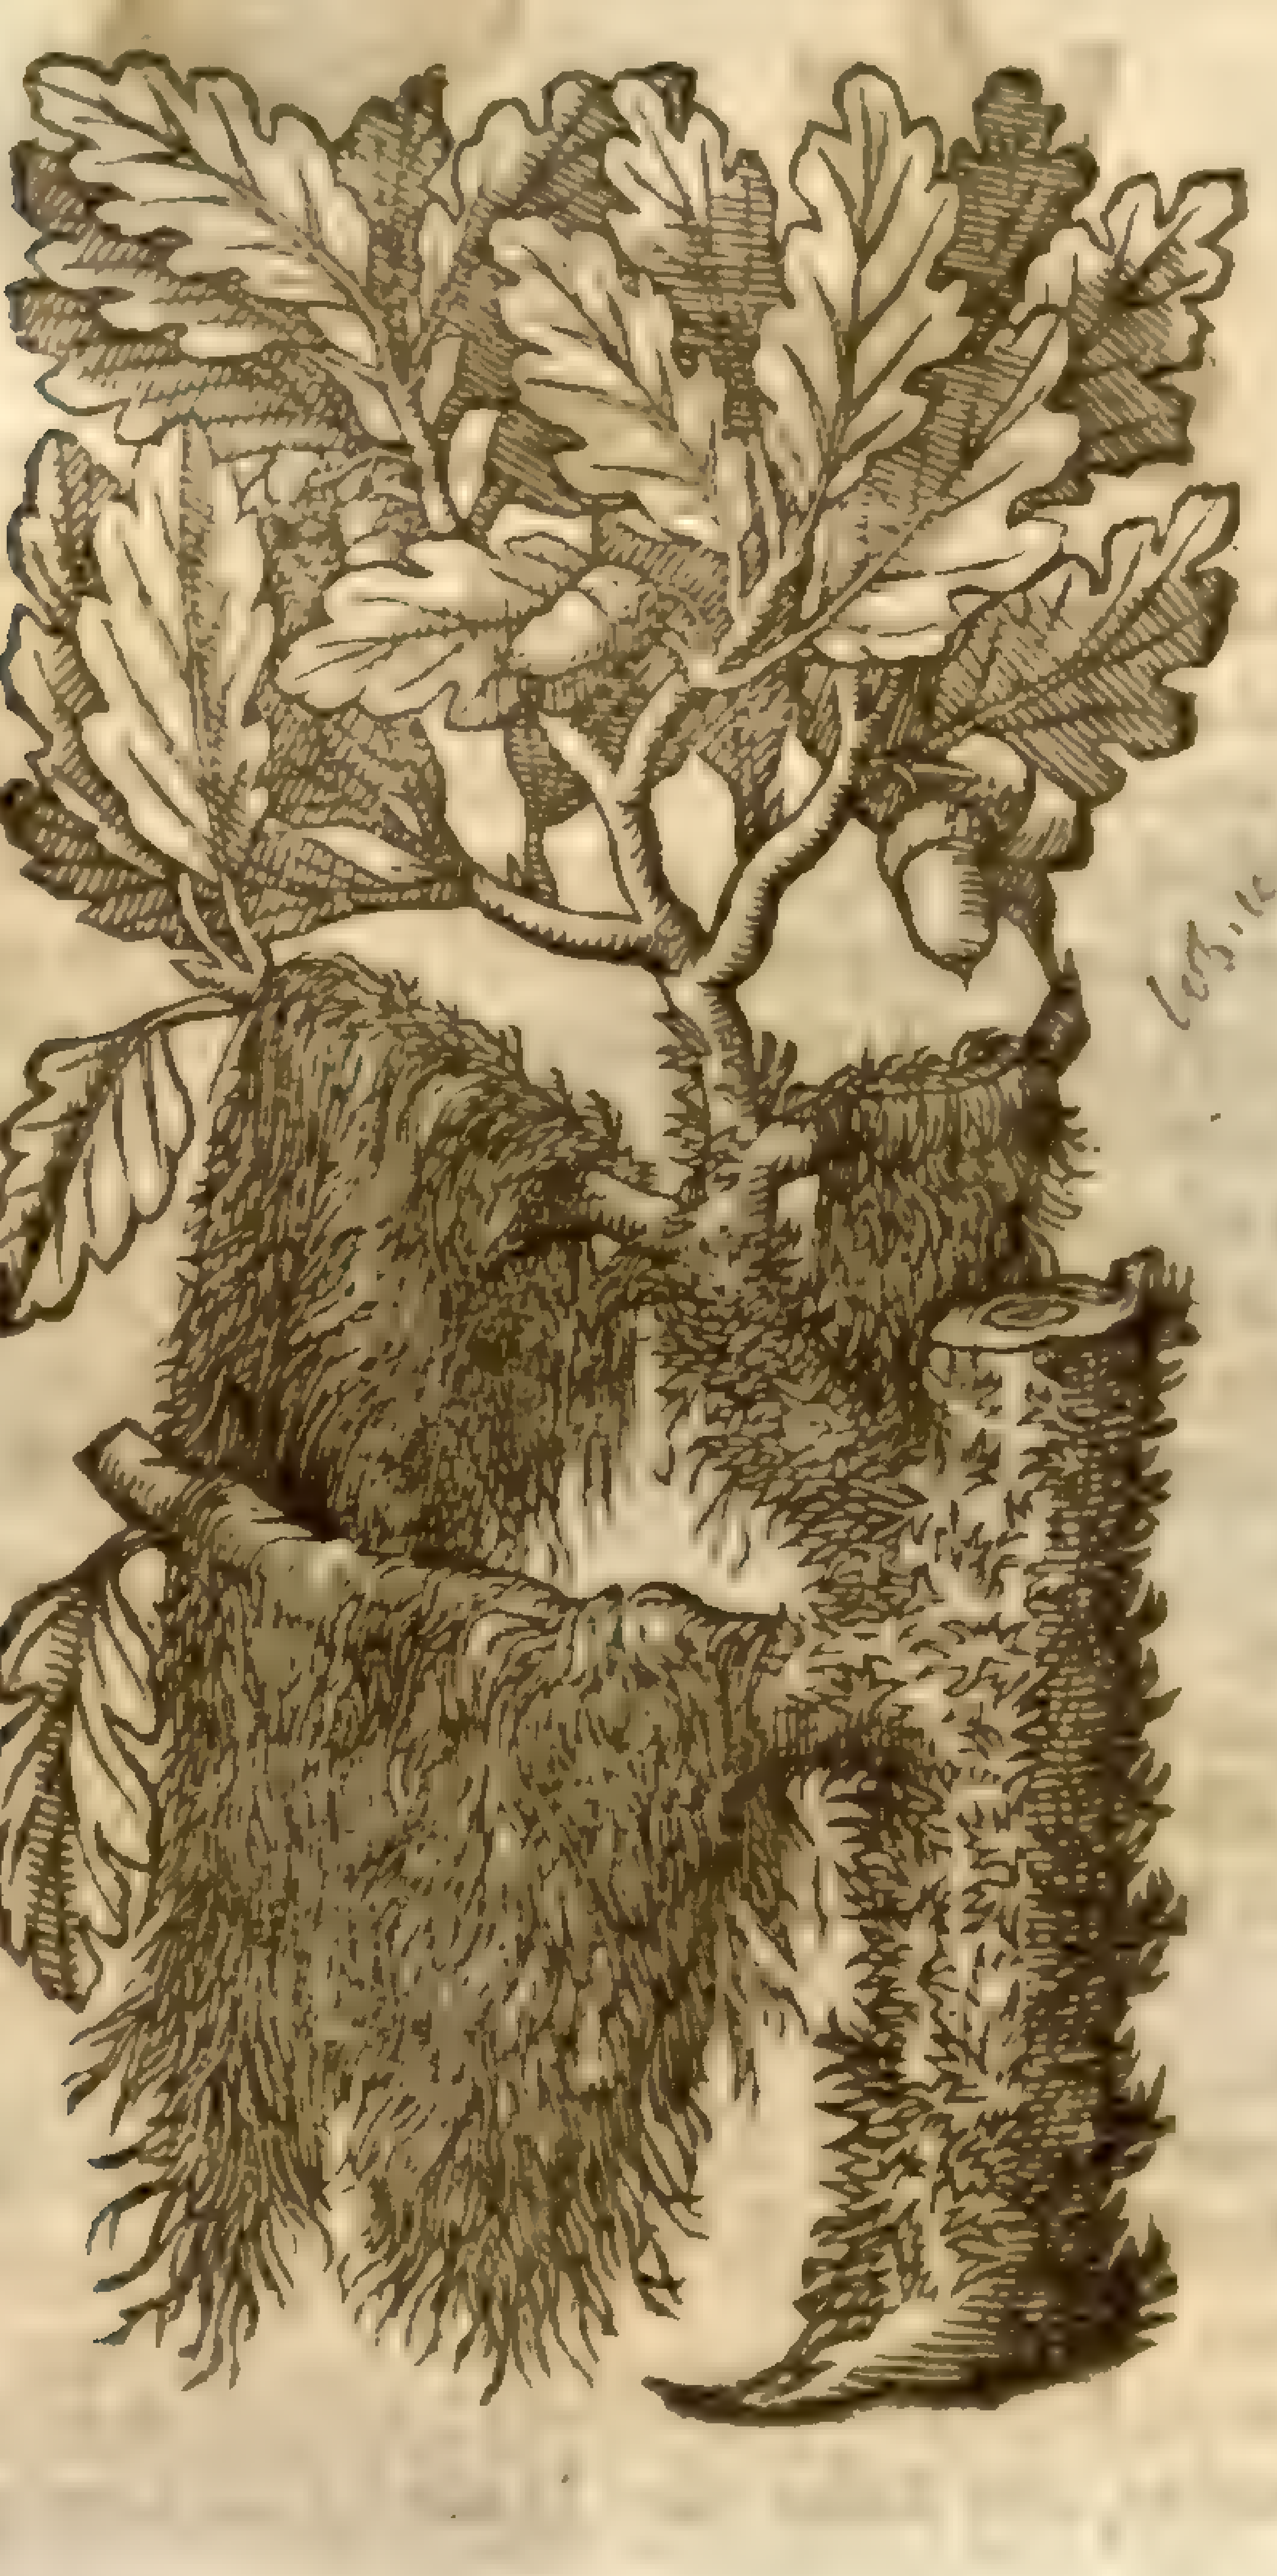
¶ *The Vertues.*

A They are good againſt the collicke: for ten or twelue being inwardly taken bring away by the ſtoole thicke flagmaticke humors, as we haue learned of them who oftentimes made triall thereof.

B The Birdlime which is made of the barke hereof is no leſſe hurtfull than that of Miſſeltoe, for it is maruellous clammy, it glueth vp all the intrails, it ſhutteth and draweth together the guts and paſſages of the excrements, and by this meanes it bringeth deſtruction to man, not by any quality, but by his gluing ſubſtance.

C Holly beaten to pouder and drunke, is an experimented medicine againſt all the fluxes of the belly, as the dyſentery and ſuch like.

CHAP. 32. *Of the Oke.*



1 *Quercus vulgaris tum glande & muſco ſuo.*
The Oke tree with his Acornes and Moſſe.

Sm. pl. 4 149

lob. ic. 2. 15

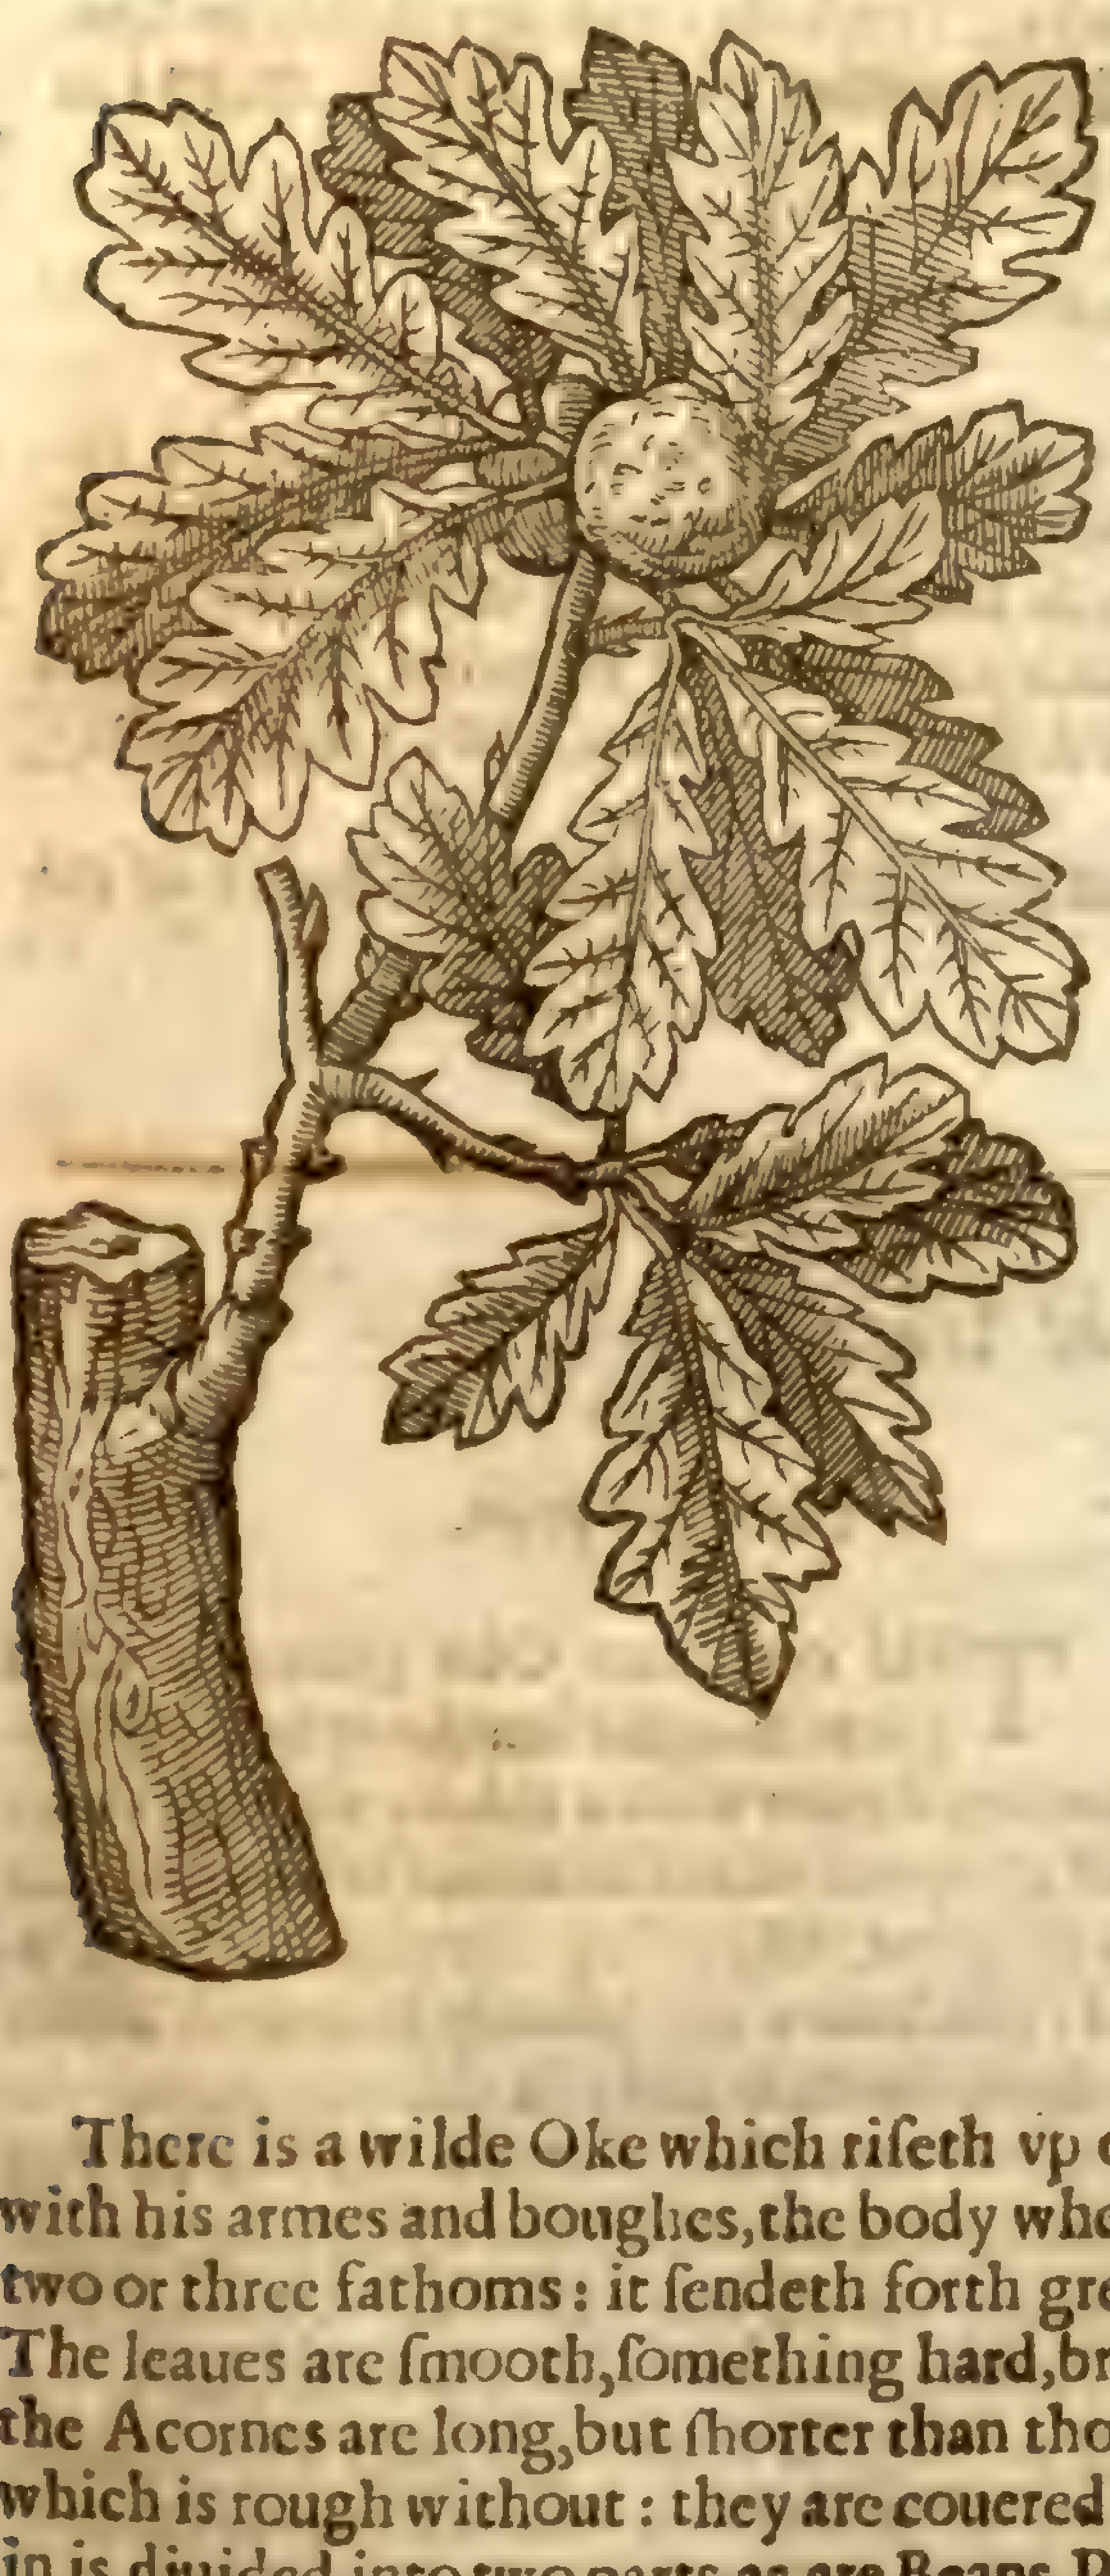
¶ *The Deſcription.*

1 THe common Oke groweth to a great tree; the trunke or body whereof is couered ouer with a thicke rough barke full of chops or rifts: the armes or boughes are likewiſe great, diſperſing themſelues farre abroad: the leaues are bluntly indented about the edges, ſmooth, and of a ſhining greene colour, whereon is often found a moſt ſweet dew and ſomewhat clammie, and alſo a fungous excreſcence, which wee call Oke Apples. The fruit is long, couered with a browne, hard, and tough pilling, ſet in a rough ſcaly cup or husk: there is often found vpon the body of the tree, and alſo vpon the branches, a certaine kind of long white moſſe hanging downe from the ſame: and ſometimes another wooddie plant, which we call Miſſeltoe, being either an excreſcence or outgrowing from the tree it ſelfe, or of the doung (as it is reported) of a bird that hath eaten a certaine berry. ‡ Beſides theſe there are about the roots of old Okes within the earth certaine other excreſcences, which *Bauhine* and others haue called *Vua quercina*, becauſe they commonly grow in cluſters together, after the manner of Grapes and about their bignes, being ſomtimes round, and otherwhiles cornered, of a wooddy ſubſtance, hollow within; and ſometimes of a purple, otherwhiles of a whitiſh colour on the outſide: their taſte is aſtringent, and vſe ſingular in all Dyſente-

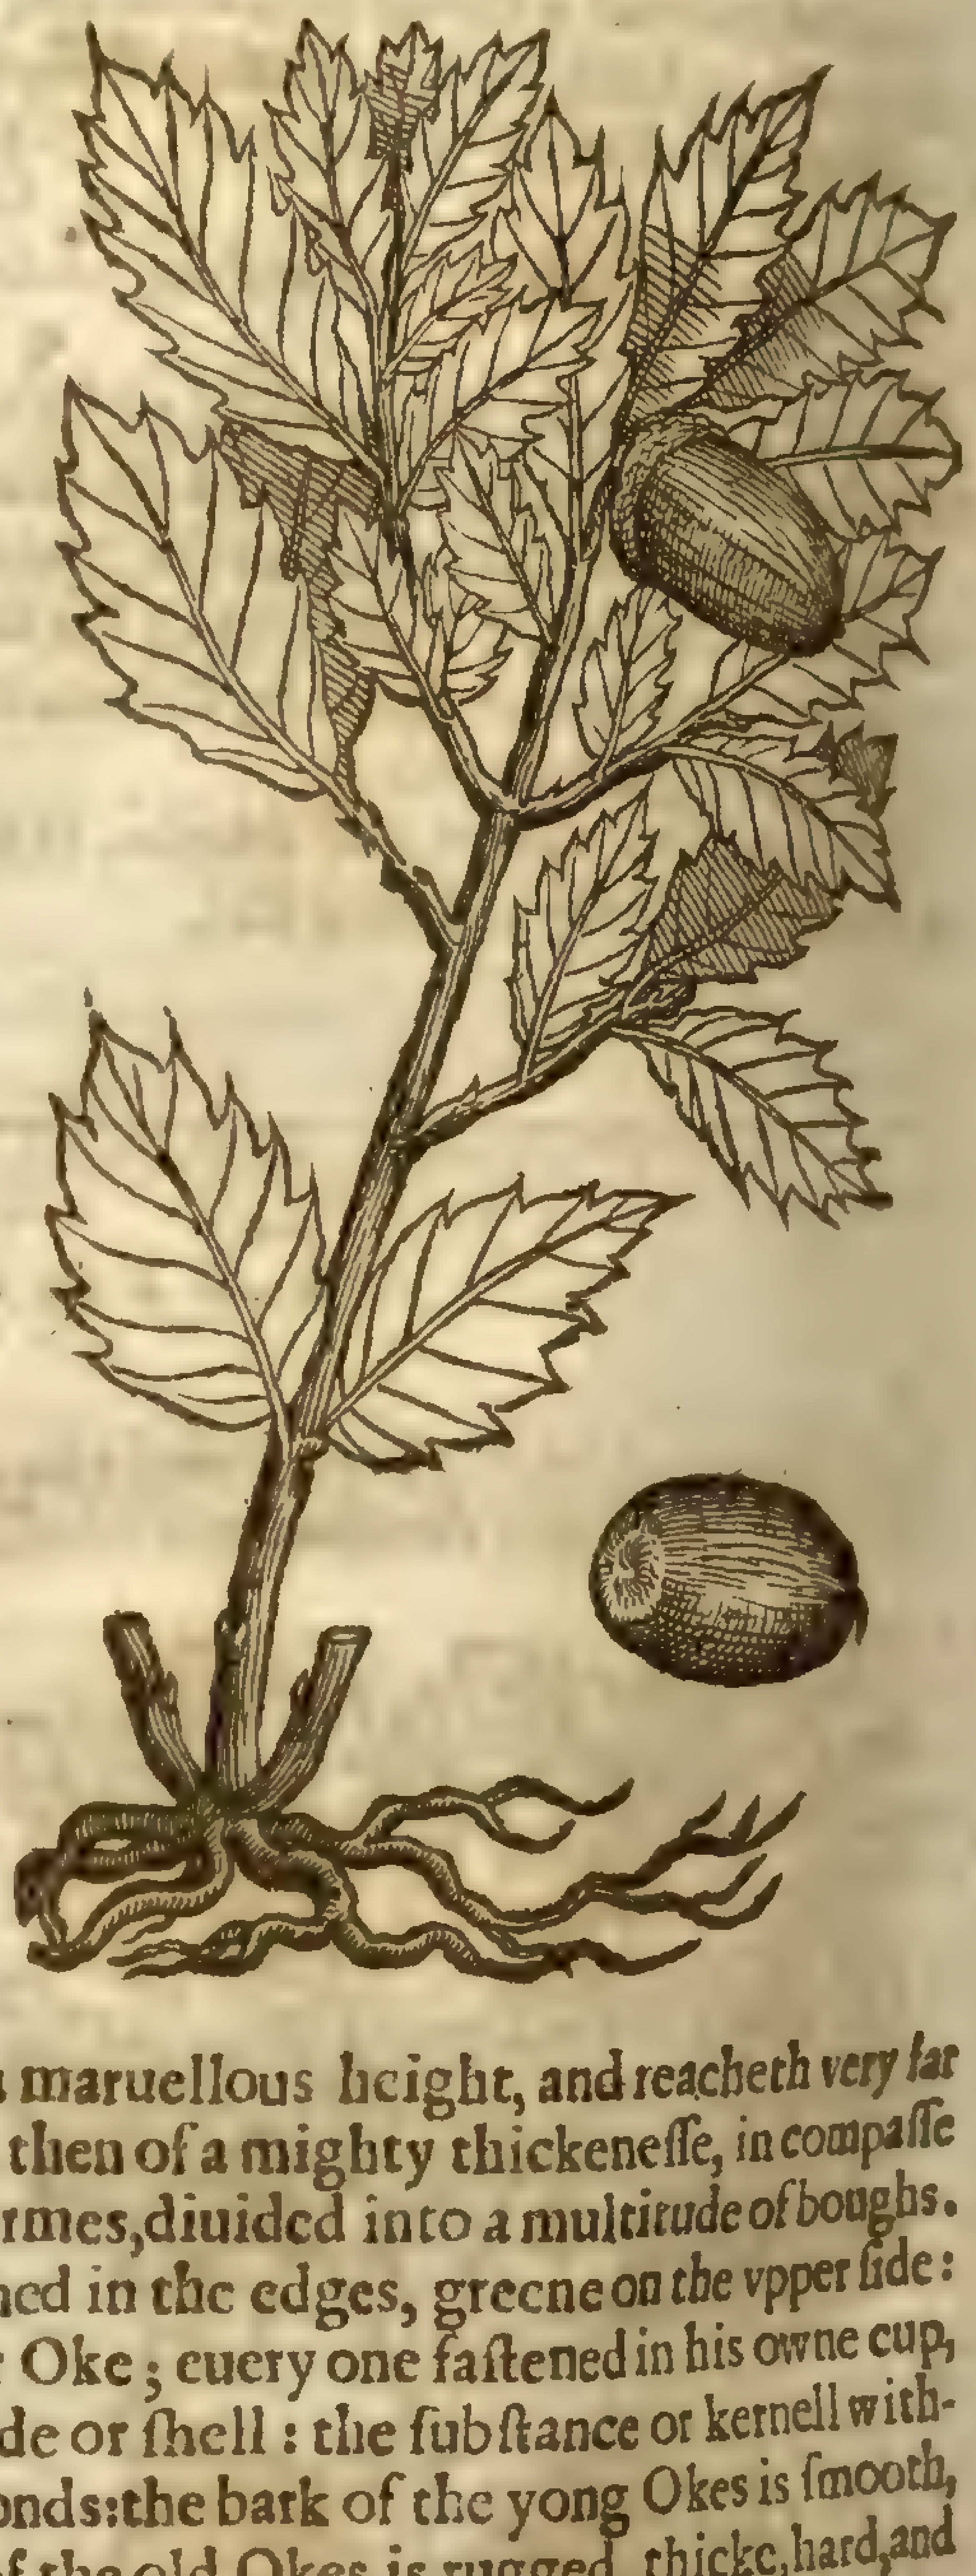
ries and fluxes of bloud, as *Encelius* affirmes, *cap.* 51. *de lapid. & gem.* ‡

3 *Carolus Cluſius* reporteth that hee found this baſe or low Oke not farre from Lisbone, of the height of a cubit, which notwithſtanding did alſo beare an Acorne like that of our Oke-tree, ſauing that the cup is ſmoother, and the Acorne much bitterer, wherein it differeth from the reſt of his kinde.

2 *Quercus vulgaris cum excrementis fungoſis.*
The common Oke with his apple or greene Gall.



3 *Quercus humilis.*
The dwarfe Oke.



There is a wilde Oke which riſeth vp oftentimes to a maruellous height, and reacheth very far with his armes and boughes, the body wherof is now and then of a mighty thickeneſſe, in compaſſe two or three fathoms: it ſendeth forth great ſpreading armes, diuided into a multitude of boughs. The leaues are ſmooth, ſomething hard, broad, long, gaſhed in the edges, greene on the vpper ſide: the Acornes are long, but ſhorter than thoſe of the tamer Oke; euery one faſtened in his owne cup, which is rough without: they are couered with a thin rinde or ſhell: the ſubſtance or kernell within is diuided into two parts, as are Beans, Peaſe, and Almonds: the bark of the yong Okes is ſmooth, glib, and good to thicken skins and hides with, but that of the old Okes is rugged, thicke, hard, and full of chops: the inner ſubſtance or heart of the wood is ſomething yellow, hard and ſound, and the older the harder: the white and outward part next to the barke doth eaſily rot, being ſubject to the worme, eſpecially if the tree be not felled in due time: ſome of the roots grow deepe into the earth, and otherſome far abroad, by which it ſtiffely ſtandeth.

¶ *The Place.*

The Oke doth ſcarcely refuſe any ground; for it groweth in a dry and barren ſoile, yet doth it proſper better in a fruitfull ground: it groweth vpon hills and mountaines, and likewiſe in vallies: it commeth vp euery where in all parts of England, but it is not ſo common in other of the South and hot regions.

¶ *The Time.*

The Oke doth caſt his leaues for the moſt part about the end of Autumne: ſome keepe their leaues on, but dry all Winter long, vntill they be thruſt off by the new Spring.

¶ *The Names.*

The Oke is called in Greeke δρῦς: in Latine, *Quercus*: of ſome, *Placida*, as *Gaza* tranſlats it. It may be called *Satiua, Vrbana*, or *Culta*; ſome alſo *Emeros mudion*, and *Robur*: the Macedonians [illegible] as though you ſhould ſay *Viriquercus*, as *Gaza* expoundeth it, or *Vere Quercus*, the true Oke. We may name it in Engliſh, the tamer Oke-tree: in French, *Cheſne*: in Dutch, **Eycken boom**.

The fruit is named in Greeke βάλανος: in Latine, *Glans*: in high Dutch, **Eichel**: in low Dutch, **Eekel**: in Spaniſh, *Bellotas*: in Italian, *Chiande*: in Engliſh, Acorne, and Maſt.

The cup wherein the Acorne ſtandeth is named in Greeke ὀμφακὶς, as *Paulus Ægineta*, in his third booke, 42 chapter teſtifieth, ſaying, *Omphacis* is the hollow thing out of which the Acorne groweth: in Latine, *Calix glandis*: in ſhops, *Capula glandis*: in Engliſh, the Acorne cup.

¶ *The Temperature and Vertues.*

A The leaues, barke, Acorne cups, and the Acornes themſelues, do mightily binde and dry in the the third degree, being ſomewhat cold withall.

B The beſt of them, ſaith *Galen*, is the thin skin which is vnder the barke of the tree, and that next, which lieth neereſt to the pulpe, or inner ſubſtance of the Acorne; all theſe ſtay the whites, the reds, ſpitting of bloud and laskes: the decoction of theſe is giuen, or the pouder of them dried, for the purpoſes aforeſaid.

C Acornes if they be eaten are hardly concocted, they yeeld no nouriſhment to mans body, but that which is groſſe, raw, and cold.

D Swine are fatted herewith, and by feeding thereon haue their fleſh hard and ſound.

E The Acorns prouoke vrine, and are good againſt all venome and poyſon, but they are not of ſuch a ſtopping and binding faculty as the leaues and barke.

F The Oke apples are good againſt all fluxes of bloud and lasks, in what manner ſoeuer they be taken, but the beſt way is to boile them in red wine, and being ſo prepared, they are good alſo againſt the exceſſiue moiſture and ſwelling of the jawes and almonds or kernels of the throat.

G The decoction of Oke Apples ſtaieth womens diſeaſes, and cauſeth the mother that is falne downe to returne againe to the naturall place, if they do ſit ouer the ſaid decoction being very hot.

H The ſame ſteeped in ſtrong white wine vineger, with a little pouder of Brimſtone, and the root of *Ireos* mingled together, and ſet in the Sun by the ſpace of a moneth, maketh the haire blacke, conſumeth proud and ſuperfluous fleſh, taketh away ſun-burning, freckles, ſpots, the morphew, with all deformities of the face, being waſhed therewith.

I The Oke Apples being broken in ſunder about the time of their withering, doe foreſhew the ſequell of the yeare, as the expert Kentiſh husbandmen haue obſerued by the liuing things found in them: as if they finde an Ant, they foretell plenty of graine to enſue: if a white worme like a Gentill or Magot, then they prognoſticate murren of beaſts and cattell; if a ſpider, then (ſay they) we ſhall haue a peſtilence or ſome ſuch like ſickeneſſe to follow amongſt men: theſe things the learned alſo haue obſerued and noted; for *Matthiolus* writing vpon *Dioſcorides* ſaith, that before they haue an hole through them, they containe in them either a flie, a ſpider, or a worme; if a flie then warre inſueth, if a creeping worme, then ſcarcitie of victuals; if a running ſpider, then followeth great ſickneſſe or mortalitie.

CHAP. 33. *Of the Scarlet Oke.*

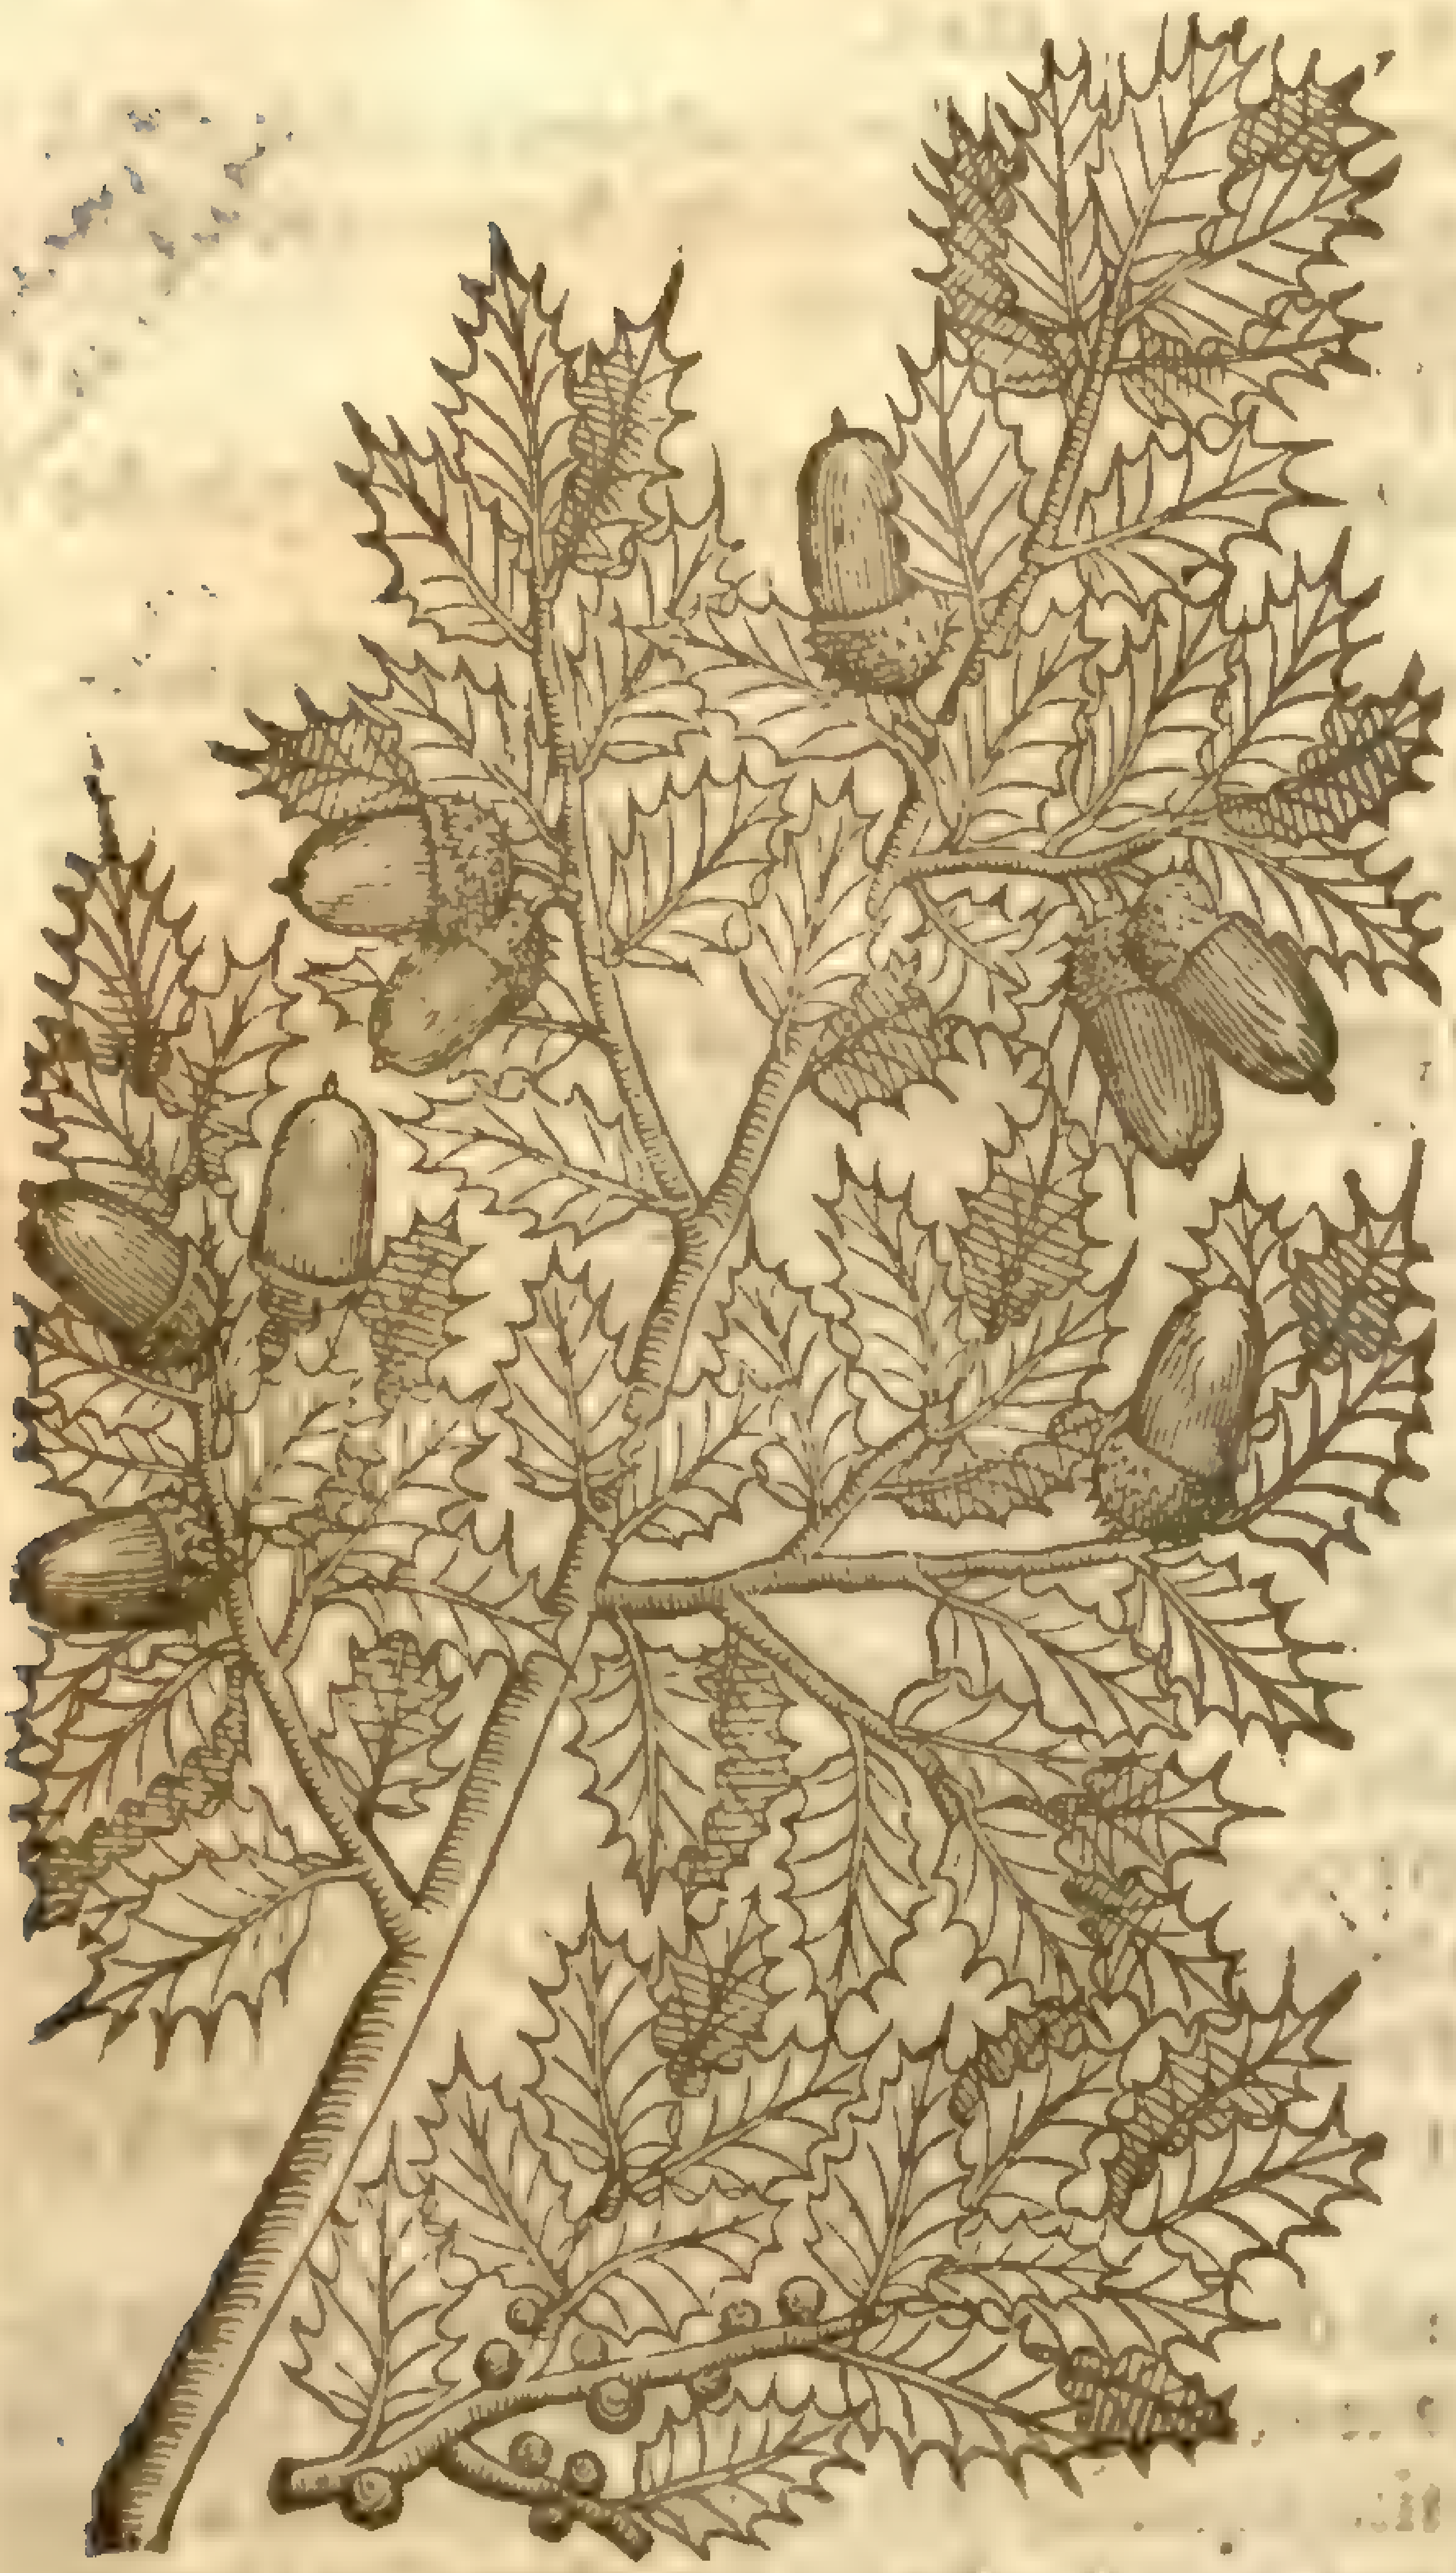
¶ *The Kindes.*

ALthough *Theophraſtus* hath made mention but of one of theſe Holme or Holly Okes onely, yet hath the later age ſet downe two kinds thereof; one bearing the ſcarlet grain, and the other only the Acorn: which thing is not contrarie to *Dioſcorides* his opinion, for he intreateth of that which beareth the Acorne, in his firſt booke, among δρύες or the Okes: and the other hee deſcribeth in his fourth booke, vnder the title κόκκος βαφική, or *Coccus Baphice*.

¶ *The Deſcription.*

THe Oke which beareth the Scarlet graine is a ſmall tree, in manner of a hedge tree, of a meane bigneſſe, hauing many faire branches or boughes ſpread abroad: whereon are ſet leaues, green aboue, white vnderneath, ſnipt about the edges, and at euery corner one ſharpe prickle, in manner of the ſmoother Holly: among which commeth ſometimes, but not often, ſmall Acornes, ſtanding in little cups or husks, armed with prickles as ſharpe as thornes, and of a bitter taſte. Beſides the Acornes, there is found cleauing vnto the wooddy branches, a certaine kind of berries, or rather an excreſcence, of the ſubſtance of the Oke Apple, and of the bigneſſe of a Peaſe, at the firſt white, and of the colour of aſhes when they be ripe, in which are ingendred little Maggots, which ſeeme

Ilex Coccigera.
The Scarlet Oke.



to be without life vntill they feele the heate of the ſun, and then they creep, and ſeeke to flie away. But the people of the countrey (which make a gaine of them) doe watch the time of their flying, euen as wee doe Bees, which they then take and put into a linnen bag, wherein they ſhake and boult them vp and downe vntil they bee dead, which they make vp into great lumpes oftentimes, and likewiſe ſell them to diers apart, euen as they were taken forth of the bag, whereof is made the moſt perfect Scarlet.

¶ *The Place.*

This Oke groweth in Languedocke, and in the countries thereabout, and alſo in Spain: but it beareth not the ſcarlet grain in all places, but in thoſe eſpecially which lie toward the Midland ſea, and which be ſubject to the ſcorching heat of the Sun, as *Carolus Cluſius* witneſſeth; & not there alwaies, for when the tree waxeth old it growes to be barren. Then do the people cut and lop it downe, that after the young ſhoots haue attained to two or three yeares growth, it may become fruitfull againe.

Petrus Bellonius in his books of Singularities ſheweth, That *Coccus Baphicus* or the Scarlet graine doth grow in the Holy land, and neere to the lake which is called the Sea of *Tiberias*, and that vpon little trees, whereby the inhabitants get great ſtore of wealth, who ſeparat the husks from the pulpe or Magots, and ſell this being made vp into balls or lumpes, much dearer than the empty ſhels or husks.

Of this graine alſo *Pauſanias* hath made mention in his tenth booke, and ſheweth, that the tree which bringeth forth this graine is not great, and alſo groweth in Phocis, which is a countrey in Macedonia neere to the Boetians, not far from the mountaine Parnaſſus.

Theophraſtus writeth, that πρῖνος, or the Scarlet Oke, is a great tree, and riſeth vp to the height of the common Oke: amongſt which writers there are ſome contrarietie. *Petrus Bellonius* reporteth it is a little tree, and *Theophraſtus* a great one, which may chance accordiug to the ſoile and clymate; for that vpon the ſtonie mountains they cannot grow to that greatneſſe as thoſe in the fertill grounds.

¶ *The Time.*

The little graines or berries which grow about the boughes begin to appeare eſpecially in the Spring, when the Southweſt windes do blow: the floures fall and are ripe in Iune, together with the Maggots growing in them, which receiuing life by the heat of the Sun, doe forthwith flie away (in manner of a Moth or Butterflie) vnleſſe by the care and diligence of the keepers, they be killed by much and often ſhaking them together, as aforeſaid.

The tree or ſhrub hath his leaues alwaies greene: the Acornes be very late before they be ripe, ſeldome before new come vp in their place.

¶ *The Names.*

The Scarlet Oke is called in Greeke πρῖνος: in Latine, *Ilex*: the later writers, *Ilex Coccigera*, or *Coccifera*; in Spaniſh, *Coſcoia*: for want of a fit Engliſh name, wee haue thought good to call it by the name of Scarlet Oke, or Scarlet Holme Oke: for *Ilex* is named of ſome in Engliſh, Holme, which ſignifyeth Holly or Huluer. But this *Ilex*, as well as thoſe that follow, might be called Holme Oke, Huluer Oke, or Holly Oke, for difference from the ſhrub or hedge tree *Agrifolium*, which is ſimply called Holme, Holly, and Huluer.

The graine or berry that ſerueth to die with is properly called in Greeke κόκκος βαφική: in Latine; *Coccus infectoria*, or *Coccum infectorium*: *Pliny* alſo nameth it *Cuſculium*: or as moſt men doe reade it, *Quiſquilium*: the ſame Author ſaith, that it is likewiſe named *Scarlecion*, or Maggot berry.

The Arabians and the Apothecaries doe know it by the name of *Cheſmes*, *Chermes*, and *Kermes*: They are deceiued who thinke that *Cheſmes* doth differ from *Infectorium Coccum*: it is called in Italian, *Grano de tinctori*: in Spaniſh, *Grana de tinctoreros*: in high Dutch, **Scharlachbeer**: in French, *Vermillon*,

Vermillon, and *Graine d'eſcarlate*: in Engliſh, after the Dutch, Scarlet Berry, or Scarlet graine, and after the Apothecaries word, *Coccus Baphicus*: the Maggot within is that which is named Cutchonele, as moſt do deeme.

Theophraſtus ſaith, the Acorne or fruit hereof is called of diuers, ἄκυλον, *Acylum*.

¶ *The Temperature and Vertues.*

A This graine is aſtringent and ſomwhat bitter, and alſo dry withour ſharpeneſſe and biting, therefore, ſaith *Galen*, it is good for great wounds and ſinewes that bee hurt, if it be layd thereon: ſome temper it with Vineger; others with Oxymel or ſyrrup of Vineger.

B It is commended and giuen by the later Phyſitians to ſtay the Menſes: it is alſo counted among thoſe Simples which be cordials, and good to ſtrengthen the heart. Of this graine that noble and famous confection *Alkermes*, made by the Arabians, hath taken his name, which many doe highly commend againſt the infirmities of the heart: notwithſtanding it was chiefly deuiſed in the beginning for purging of melancholy; which thing is plainly perceiued by the great quantitie of *Lapis Lazulus* added thereto: and therefore ſeeing that this ſtone hath in it a venomous quality, and likewiſe a property to purge melancholy, it cannot of it ſelfe be good for the heart, but the other things be good, which be therefore added, that they might defend the heart from the hurts of this ſtone, and correct the malice thereof.

C This compoſition is commended againſt the trembling and ſhaking of the heart, and for ſwounings and melancholy paſſions, and ſorrow proceeding of no euident cauſe: it is reported to recreate the minde, and to make a man merry and joyfull.

D It is therefore good againſt melancholy diſeaſes, vaine imaginations, ſighings, griefe and ſorrow without manifeſt cauſe, for that it purgeth away melancholy humors: after this manner it may be comfortable for the heart, and delightfull to the minde, in taking away the materiall cauſe of ſorrow: neither can it otherwiſe ſtrengthen a weake and feeble heart, vnleſſe this ſtone called *Lapis Cyaneus* be quite left out.

E Therefore he that is purpoſed to vſe this compoſition againſt beatings and throbbings of the heart, and ſwounings, and that not as a purging medicine, ſhall do wel and wiſely by leauing out the ſtone *Cyaneus*; for this being taken in a little weight or ſmall quantity, cannot purge at all, but may in the meane ſeaſon trouble and torment the ſtomacke, and withall thorow his ſharpe and venomous quality (if it be oftentimes taken) be very offenſiue to the guts and intrails, and by this means bring more harme than good.

F Moreouer, it is not neceſſary, no nor expedient, that the briſtle died with Cochenele, called *Cheſmes*, as the Apothecaries terme it, ſhould be added to this compoſition; for this briſtle is not died without *Auripigmentum*, called alſo Orpiment, and other pernitious things joyned therewith, whoſe poiſonſome qualities are added to the juyces together with the colour, if either the briſtle or died ſilke be boyled in them.

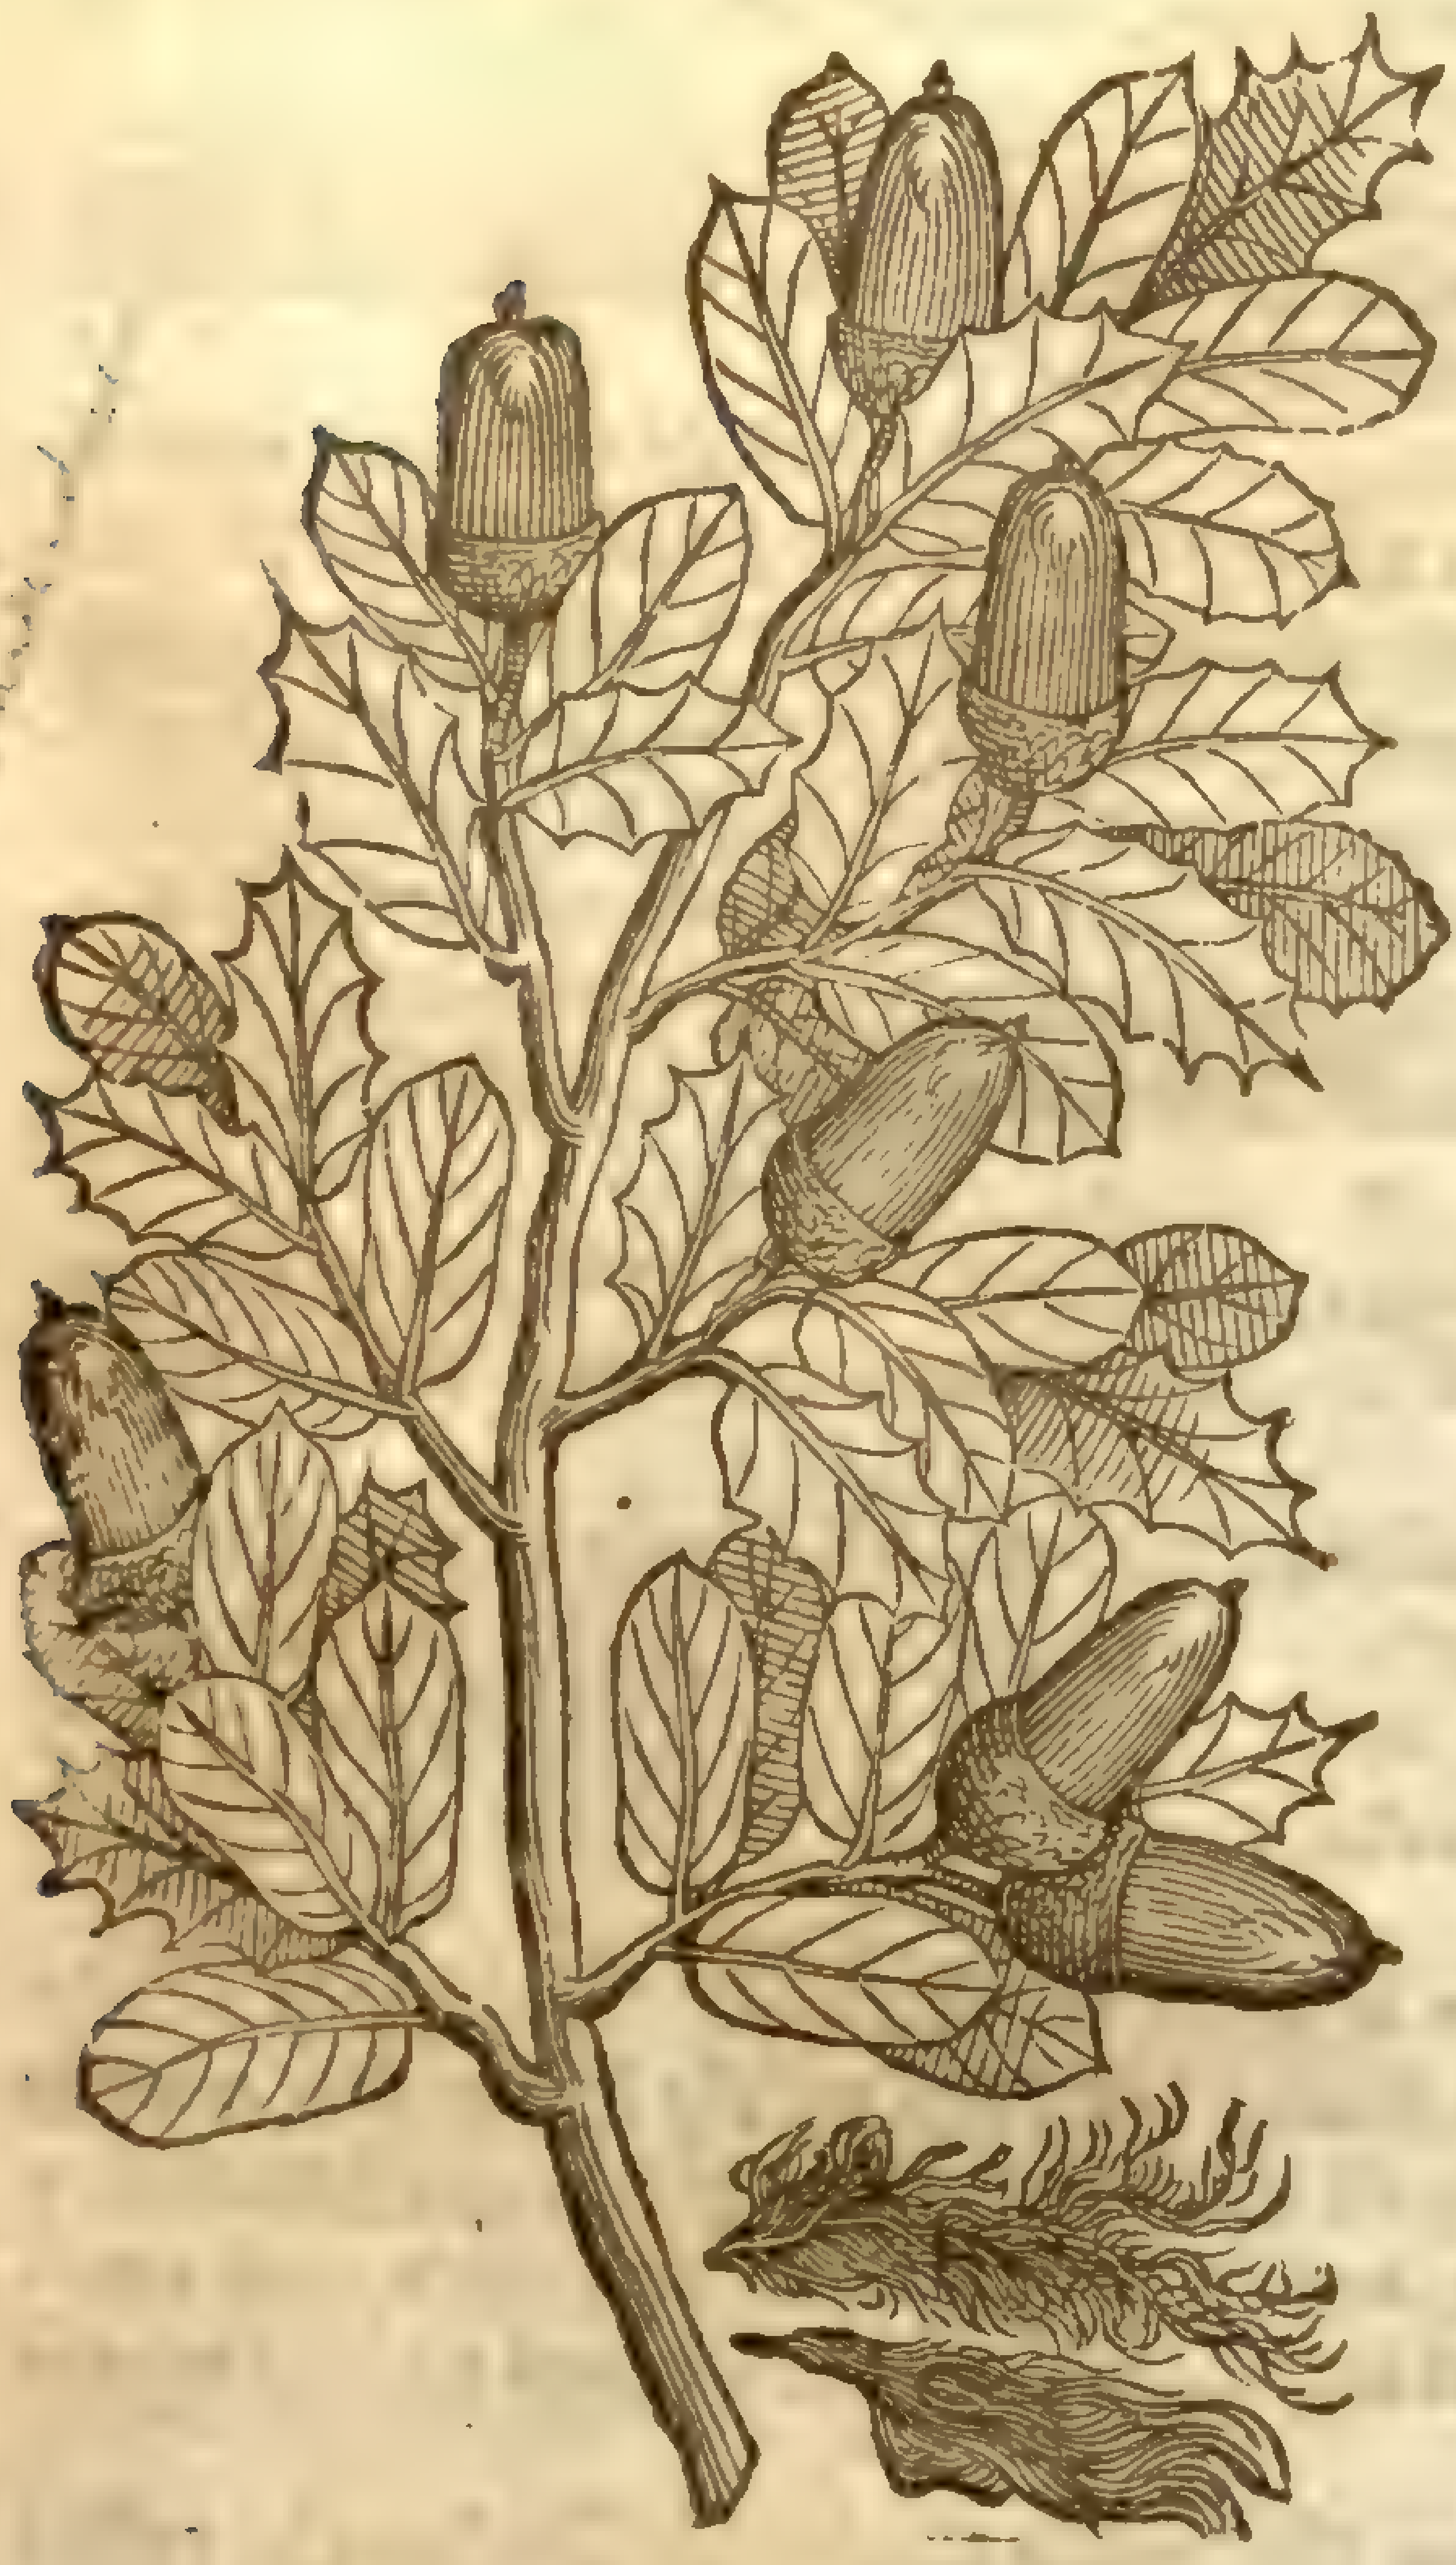
G The berries of the Cochenele muſt be taken by themſelues, which alone are ſufficient to die the juyces, and to impart vnto them their vertue: neither is it likewiſe needfull to boile the raw ſilke together with the graines, as moſt Phyſitians thinke: this may be left out, for it maketh nothing at all for the ſtrengthning of the heart.

Chap. 34. *Of the great Skarlet Oke.*

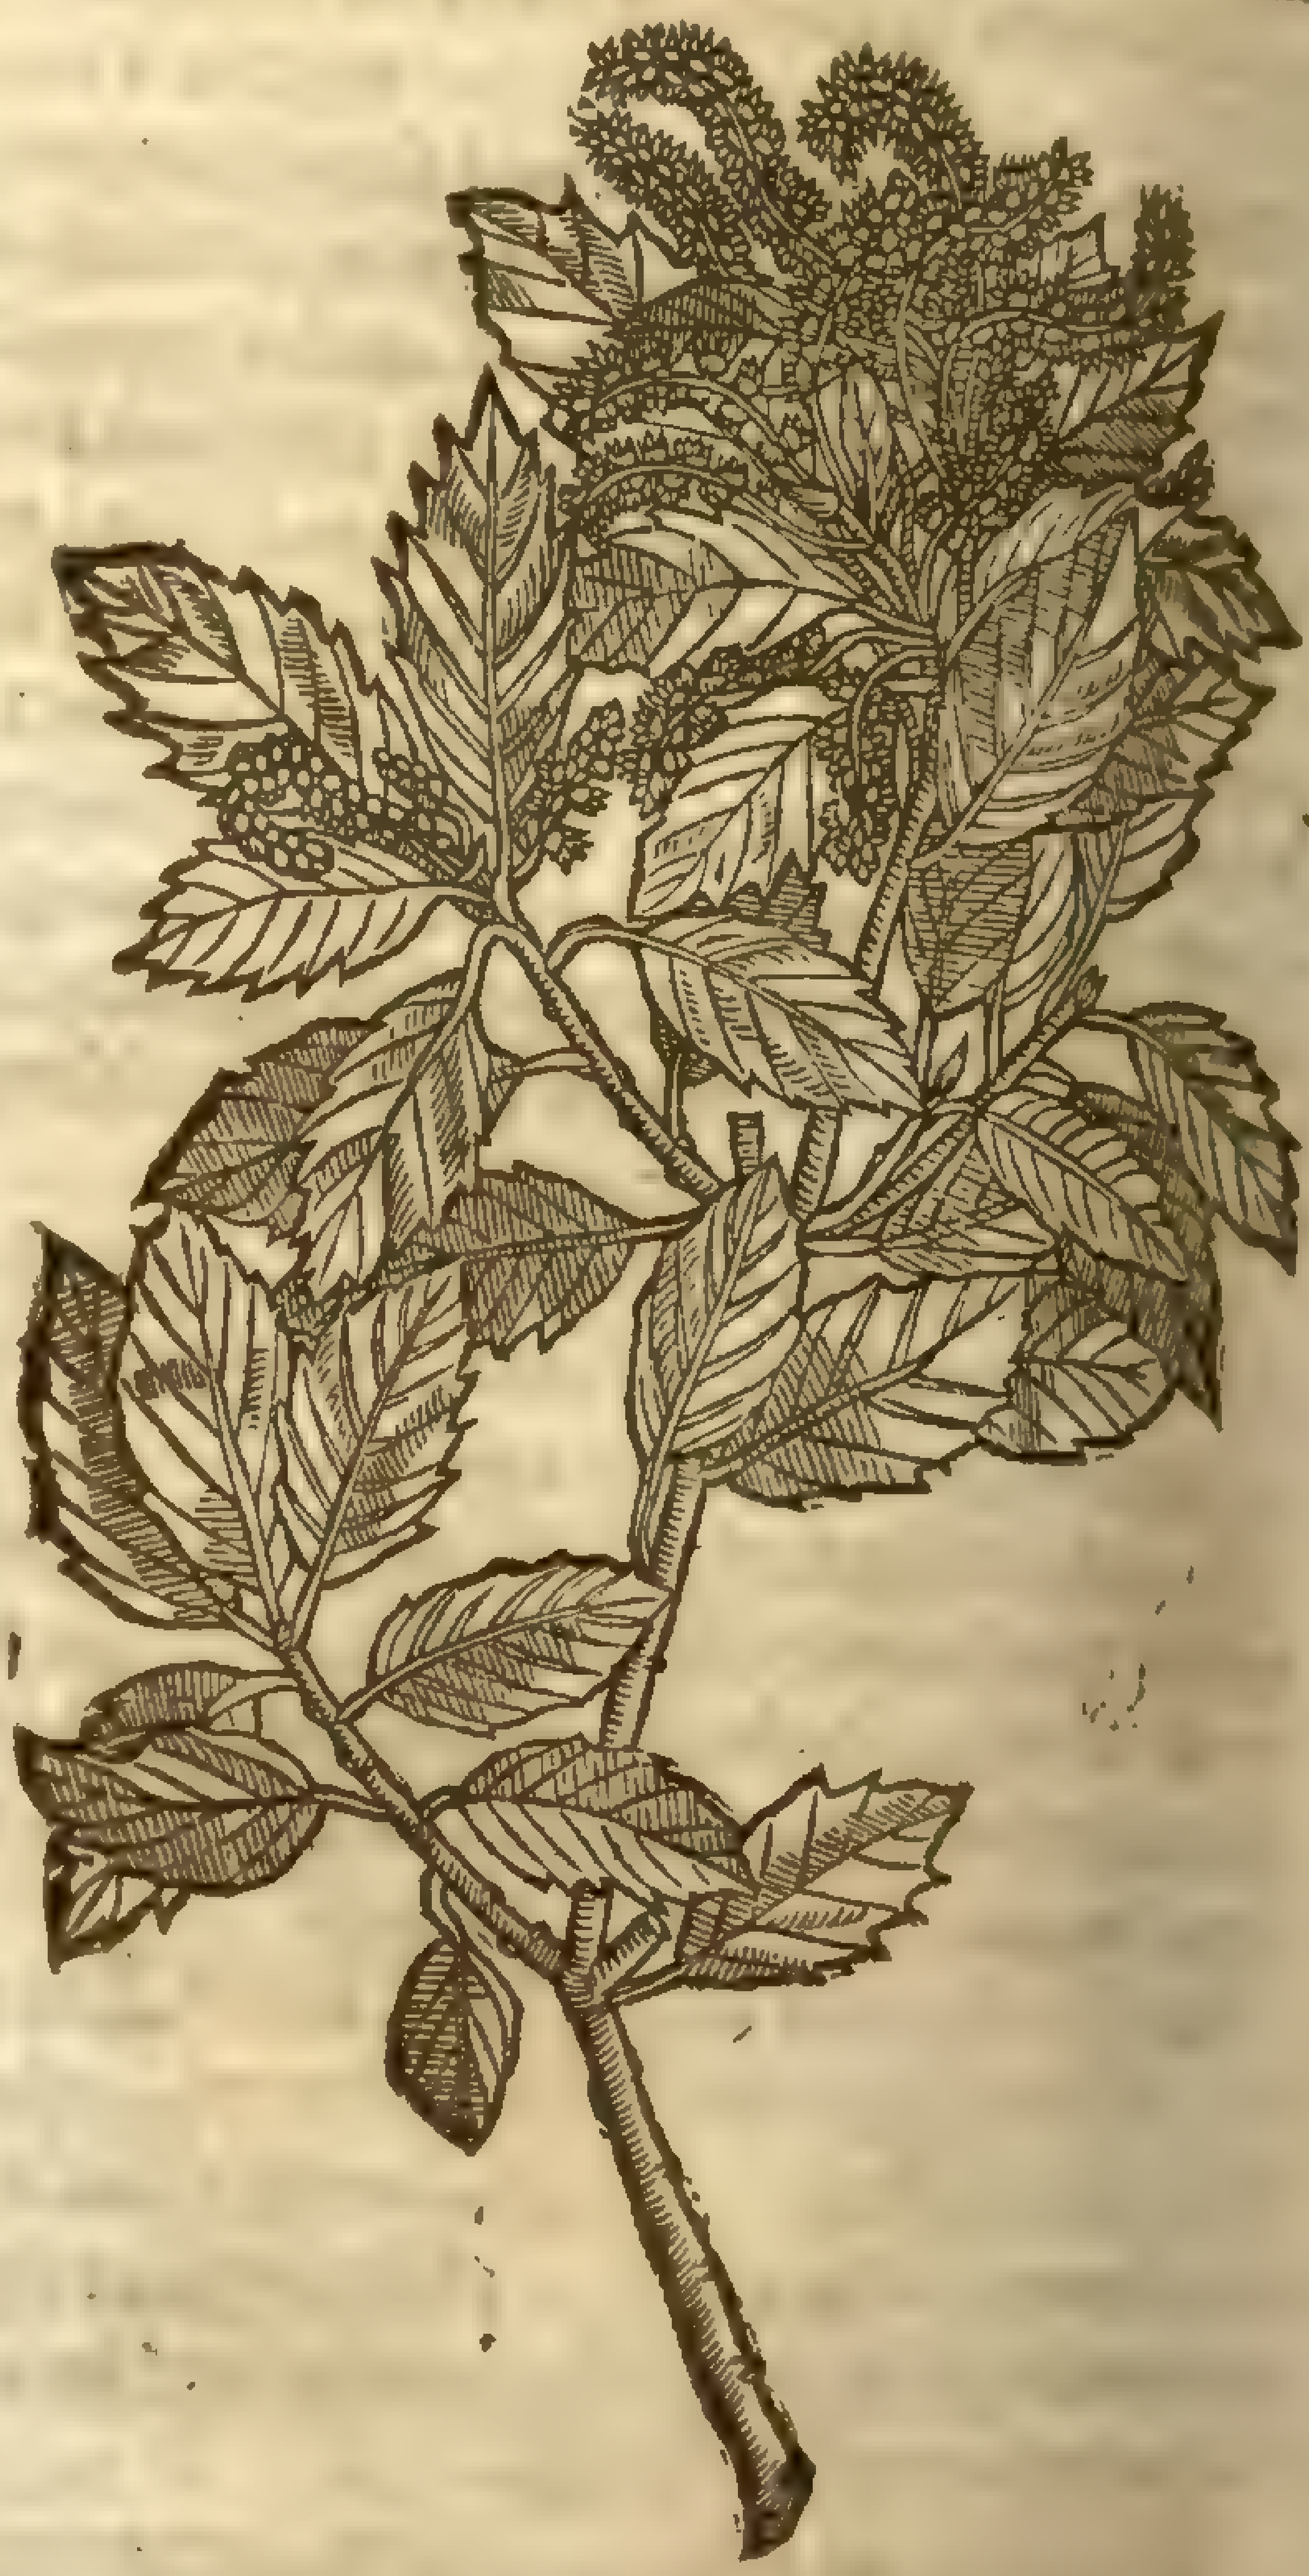
¶ *The Deſcription.*

The great Skarlet Oke, or the great Holme Oke, groweth many times to the full height of a tree, ſometimes as big as the Peare-tree, with boughes far ſpreading like the Acorne or common Maſt trees: the timber is firme and ſound: the leaues are ſet with prickles round about the edges, like thoſe of the former Skarlet Oke: the leaues when the tree waxeth old haue on them no prickles at all, but are ſomewhat bluntly cut or indented about the edges, greene on the vpper ſide, and gray vnderneath: the Acorne ſtandeth in a prickely cup like our common Oke Acorne, which when it is ripe becommeth of a browne colour, with a white kernell within of taſte not vnpleaſant. There is found vpon the branches of this tree a certaine kinde of long hairy moſſe of the colour of aſhes, not vnlike to that of our Engliſh Oke. ‡ This tree is euer greene, and at the tops of the branches about the end of May, here in England, carrieth diuers long catkins of moſſie yellow floures, which fall away and are not ſucceeded by the Acornes, for they grow out vpon other ſtalks. *Cluſius* in the yeare 1581 obſerued two trees; the one in a garden about the Bridge, and the other in the priuat garden at White-Hall, hauing leſſer leaues than the former. The later of theſe is yet ſtanding, and euery yeare beares ſmall Acornes, which I could neuer obſerue to come to any maturity. ‡

¶ The



Ilex major Glandifera.
The great Skarlet Oke.



‡ *Ilicis ramus floridus.*
The floures of the great Skarlet Oke.

¶ *The Place.*

In diuers places there are great woods of theſe trees, hills alſo and vallies are beautified therewith: they grow plentifully in many countries of Spaine, and in Languedocke and Prouince in great plenty. It is likewiſe found in Italy. It beareth an Acorne greater, and of a larger ſize than doth the tame Oke: in ſome countries leſſer and ſhorter: they are ſtrangers in England, notwithſtanding there is here and there a tree thereof, that hath been procured from beyond the ſeas: one groweth in her Majeſties priuie Garden at White-Hall, neere to the gate that leadeth into the ſtreet, and in ſome other places here and there one.

¶ *The Time.*

It is greene at all times of the yeare: it is late before the Acornes be ripe. *Cluſius* reporteth, that he ſaw the floures growing in cluſters of a yellow colour in May.

¶ *The Names.*

This Oke is named in Greeke πρινος: in Latine, *Ilex*: in Spaniſh, *Enzina*: in Italian, *Elize*: in French, *Cheſneuerd*: in Engliſh, Barren Skarlet Oke, or Holme Oke, and alſo of ſome, French or Spaniſh Oke.

The Spaniards call the fruit or Acorne *Bellota*, or *Abillota*. *Theophraſtus* ſeemeth to call this tree not *Prinos*, but *Smilax*; for he maketh mention but of one *Ilex* onely, and that is of Scarlet Oke; and he ſheweth that the Arcadians do not call the other *Ilex*, but *Smilax*: for the name *Smilax* is of many ſignifications: there is *Smilax* among the Pulſes, which is alſo called *Dolichus*, and *Phaſeolus*; and *Smilax aſpera*, and *Lœuis*, amongſt the Binde-weeds: likewiſe *Smilax* is taken of *Dioſcorides* to be *Taxus*, the Yew tree. Of *Smilax*, *Theophraſtus* writeth thus in his third booke: the Inhabitants of Arcadia do call a certaine tree *Smilax*, being like vnto the Skarlet Oke: the leaues thereof be not ſet with ſuch ſharpe prickles, but tenderer and ſofter.

Of this *Smilax Pliny* alſo writeth, in his ſixteenth booke, chap. 6. There be of *Ilex*, ſaith he, two kindes, *Ex ijs in Italia folio non multum ab oleis diſtant*, called of certaine Græcians *Smilaces*, in the prouinces *Aquifolia*: in which words, in ſtead of Oliue trees may perchance bee more truely placed *Suberis*, or the Corke-tree; for this kinde of *Ilex* or *Smilax* is not reported of any of the old Writers to haue the leafe of the Oliue tree: but *Suber* in Greeke, called *Phellos*, or the Corke tree, hath a little leafe.

¶ *The Temperature and Vertues.*

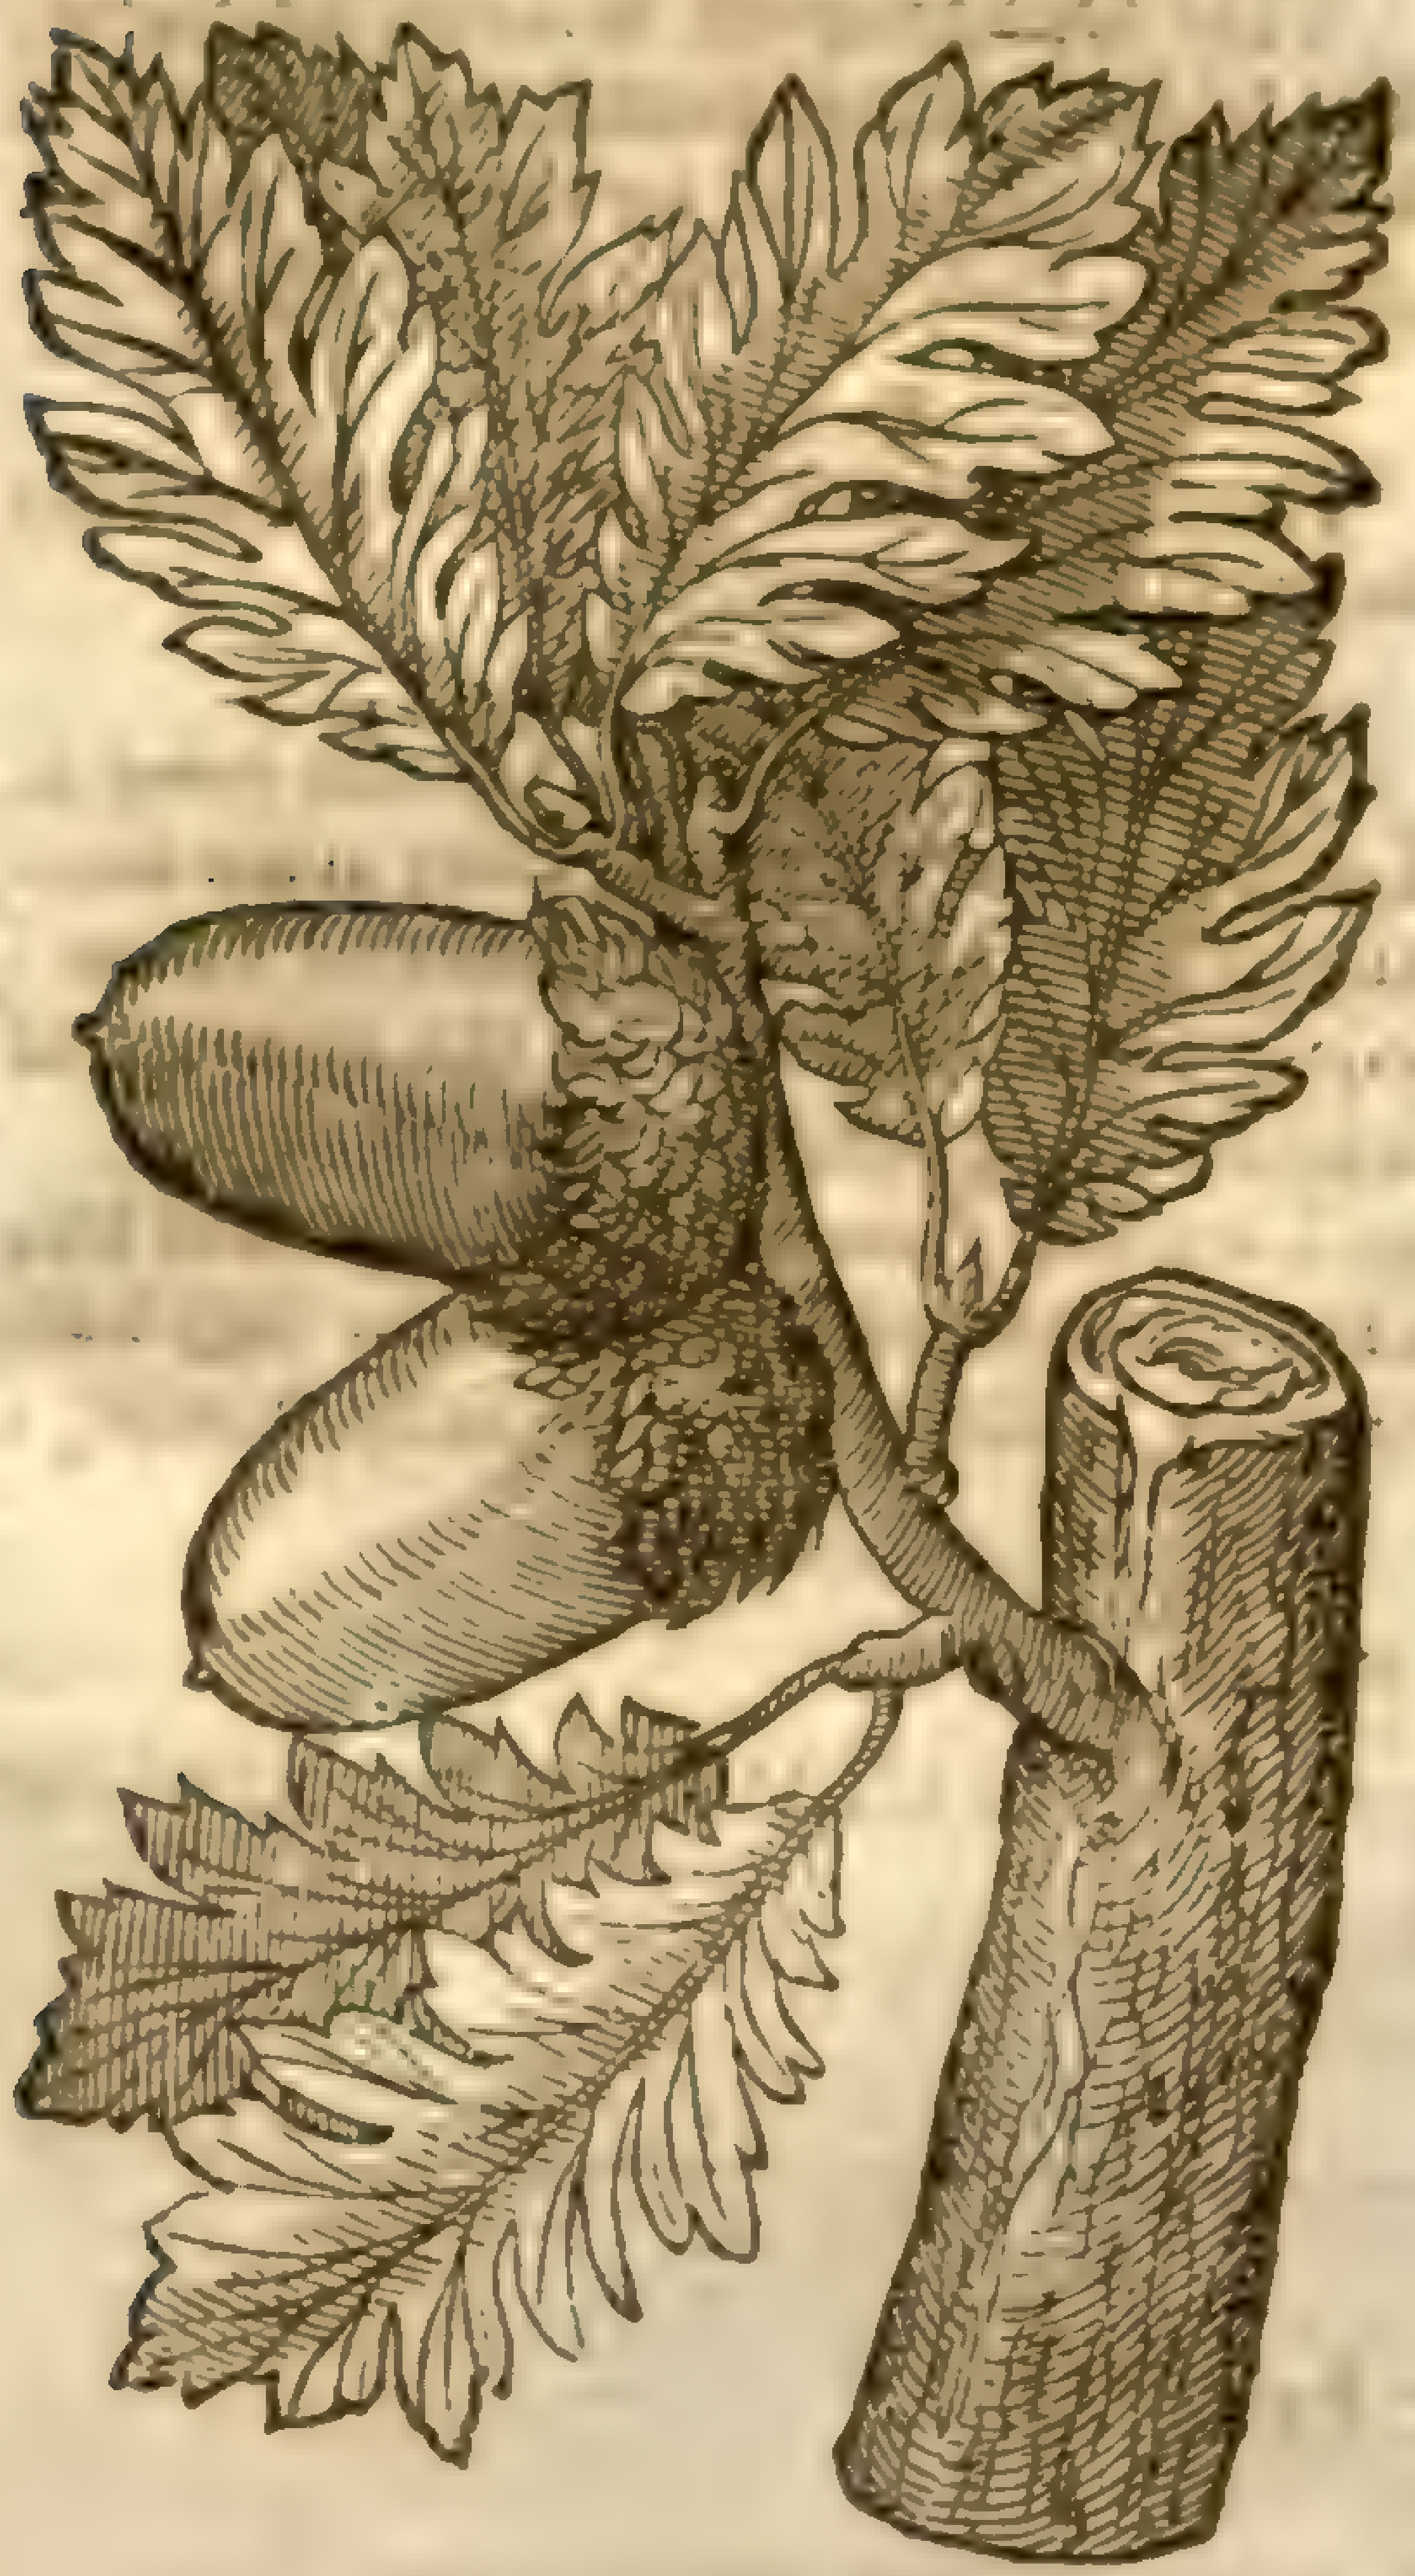
The leaues of this Oke hath force to coole and repell and keepe backe, as haue the leaues of the Acornes or Maſt trees: being ſtamped or beaten, and applied, they are good for ſoft ſwllings, and ſtrengthen weake members. A

The barke of the root boyled in water vntill it be diſſolued, and layd on all night, maketh the haire blacke, being firſt ſcoured with *Cimolia*, as *Dioſcorides* ſaith. B

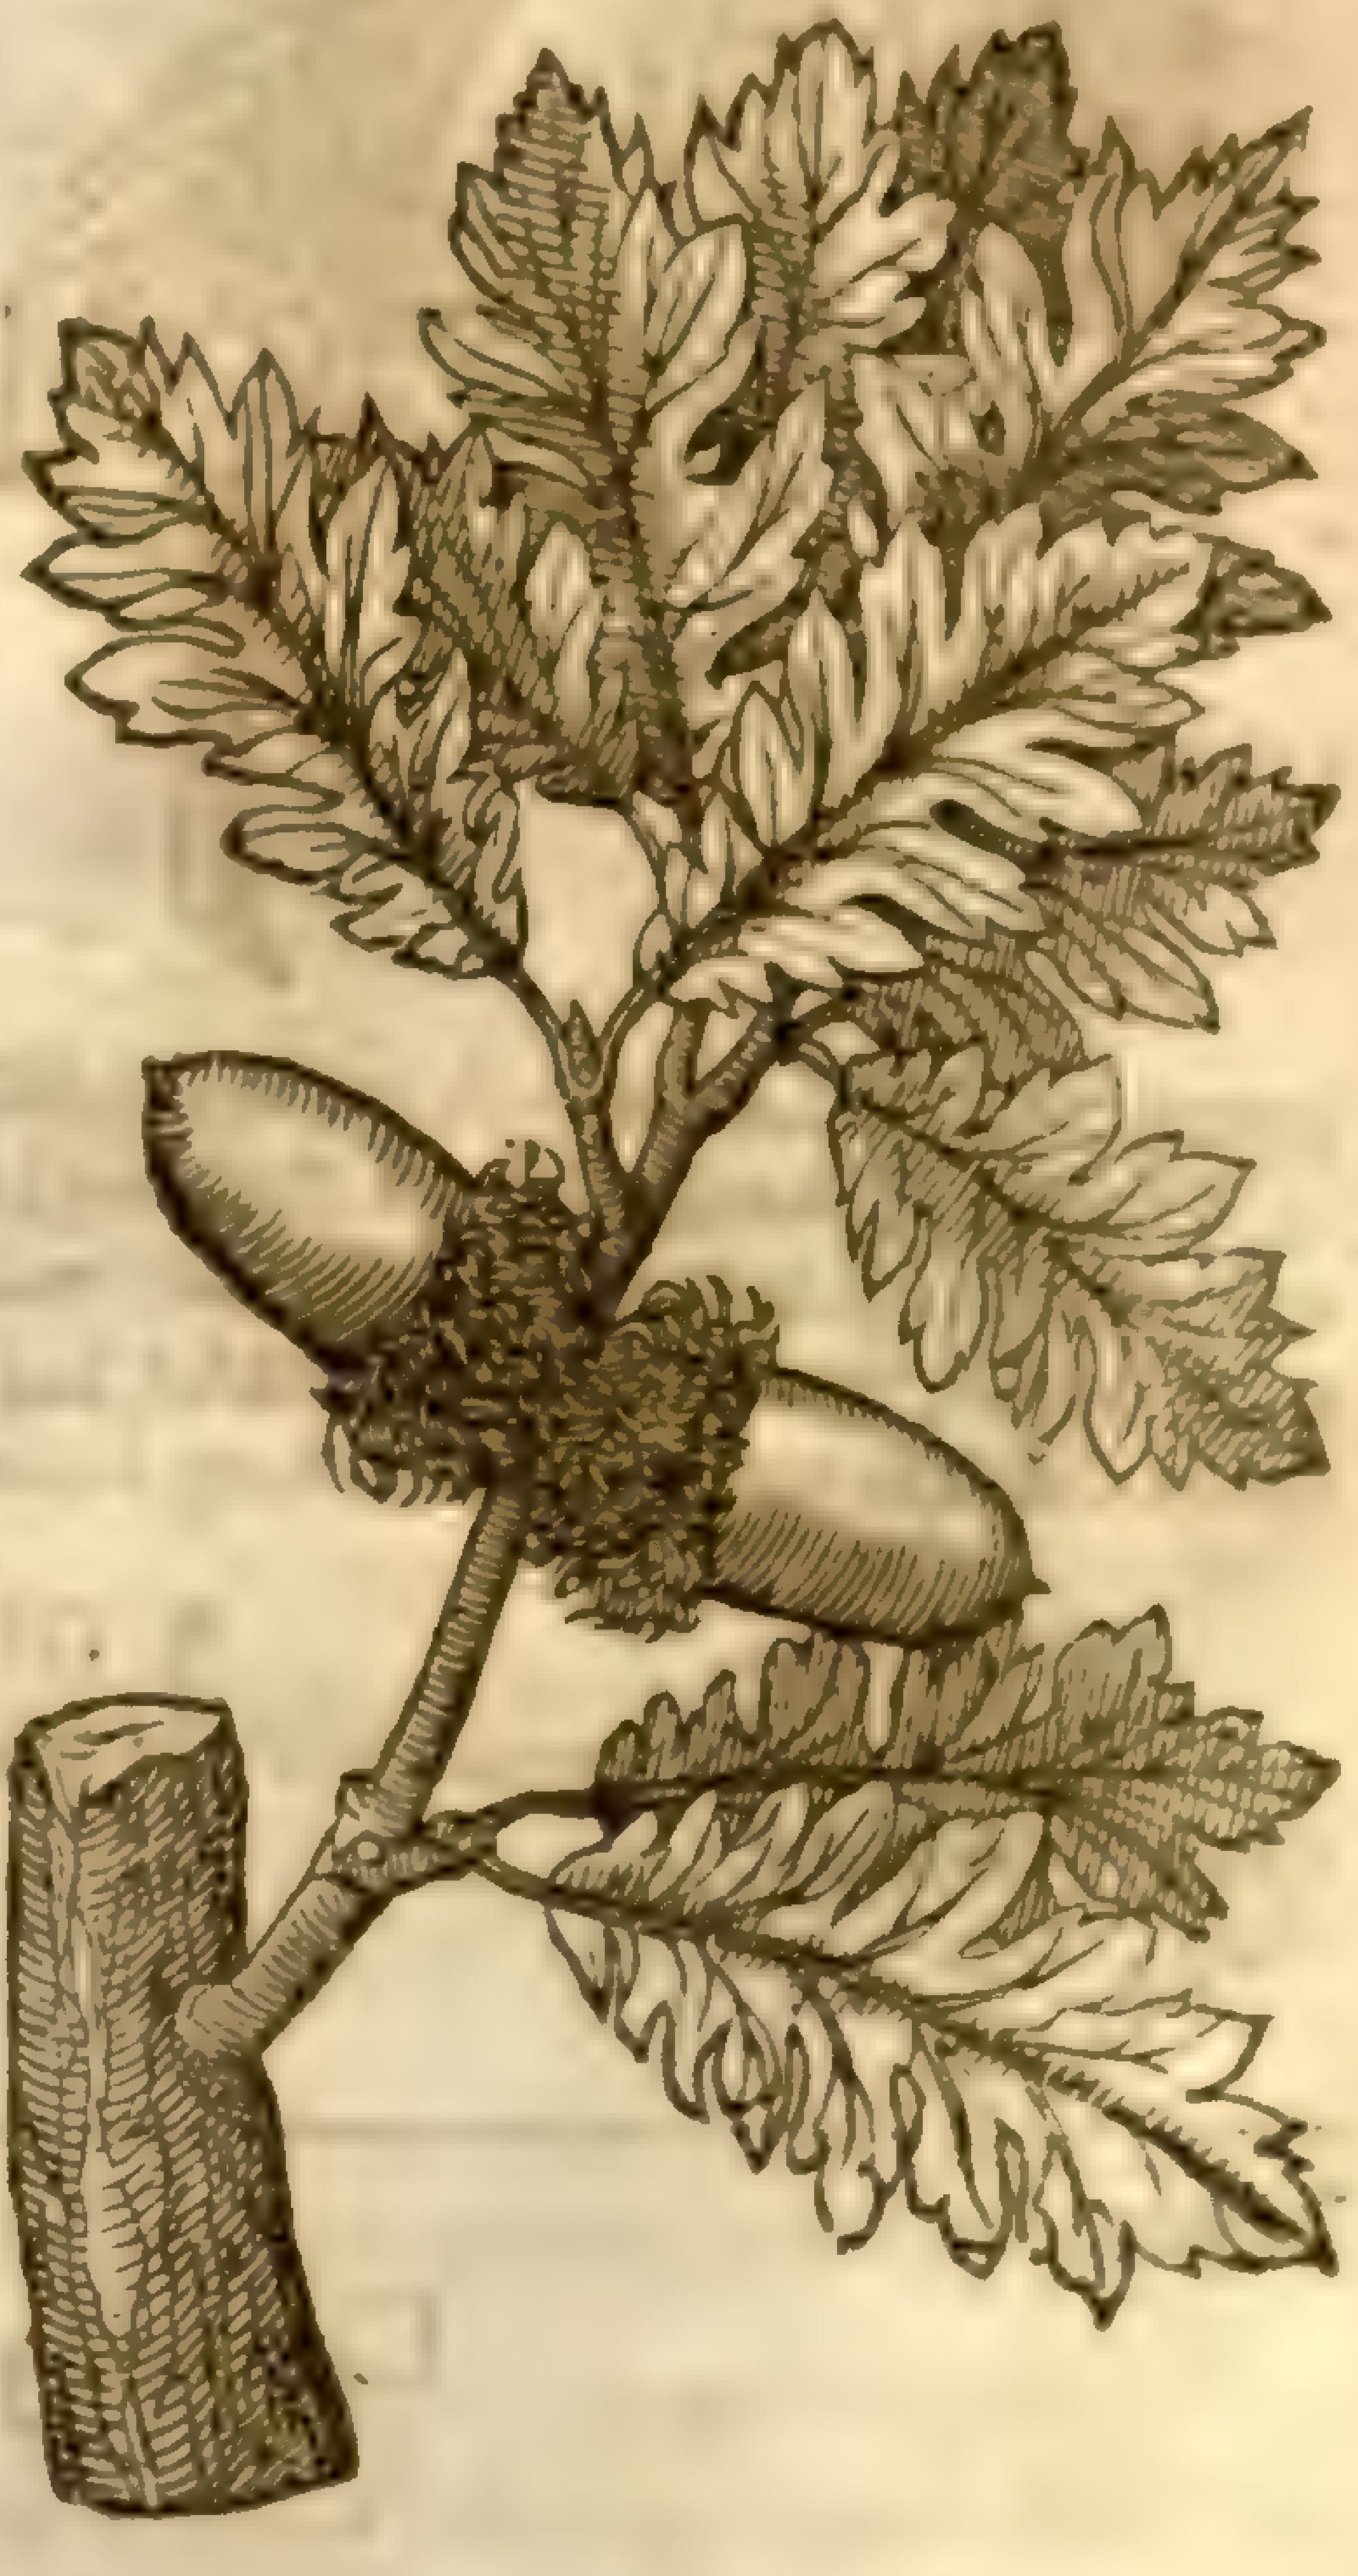
Cluſius reporteth, that the Acorne is eſteemed of, eaten, and brought into the market to be ſold, in the city of Salamanca in Spaine, and in many other places of that country; and of this Acorne *Pliny* alſo hath peraduenture written, *lib.16.cap.5.* in theſe words: Moreouer, at this day in Spaine the Acorne is ſerued for a ſecond courſe. C

Chap. 35. *Of the great Holme-Oke.*

1 *Cerris majore Glande.*
The Holme-Oke with great Acornes.



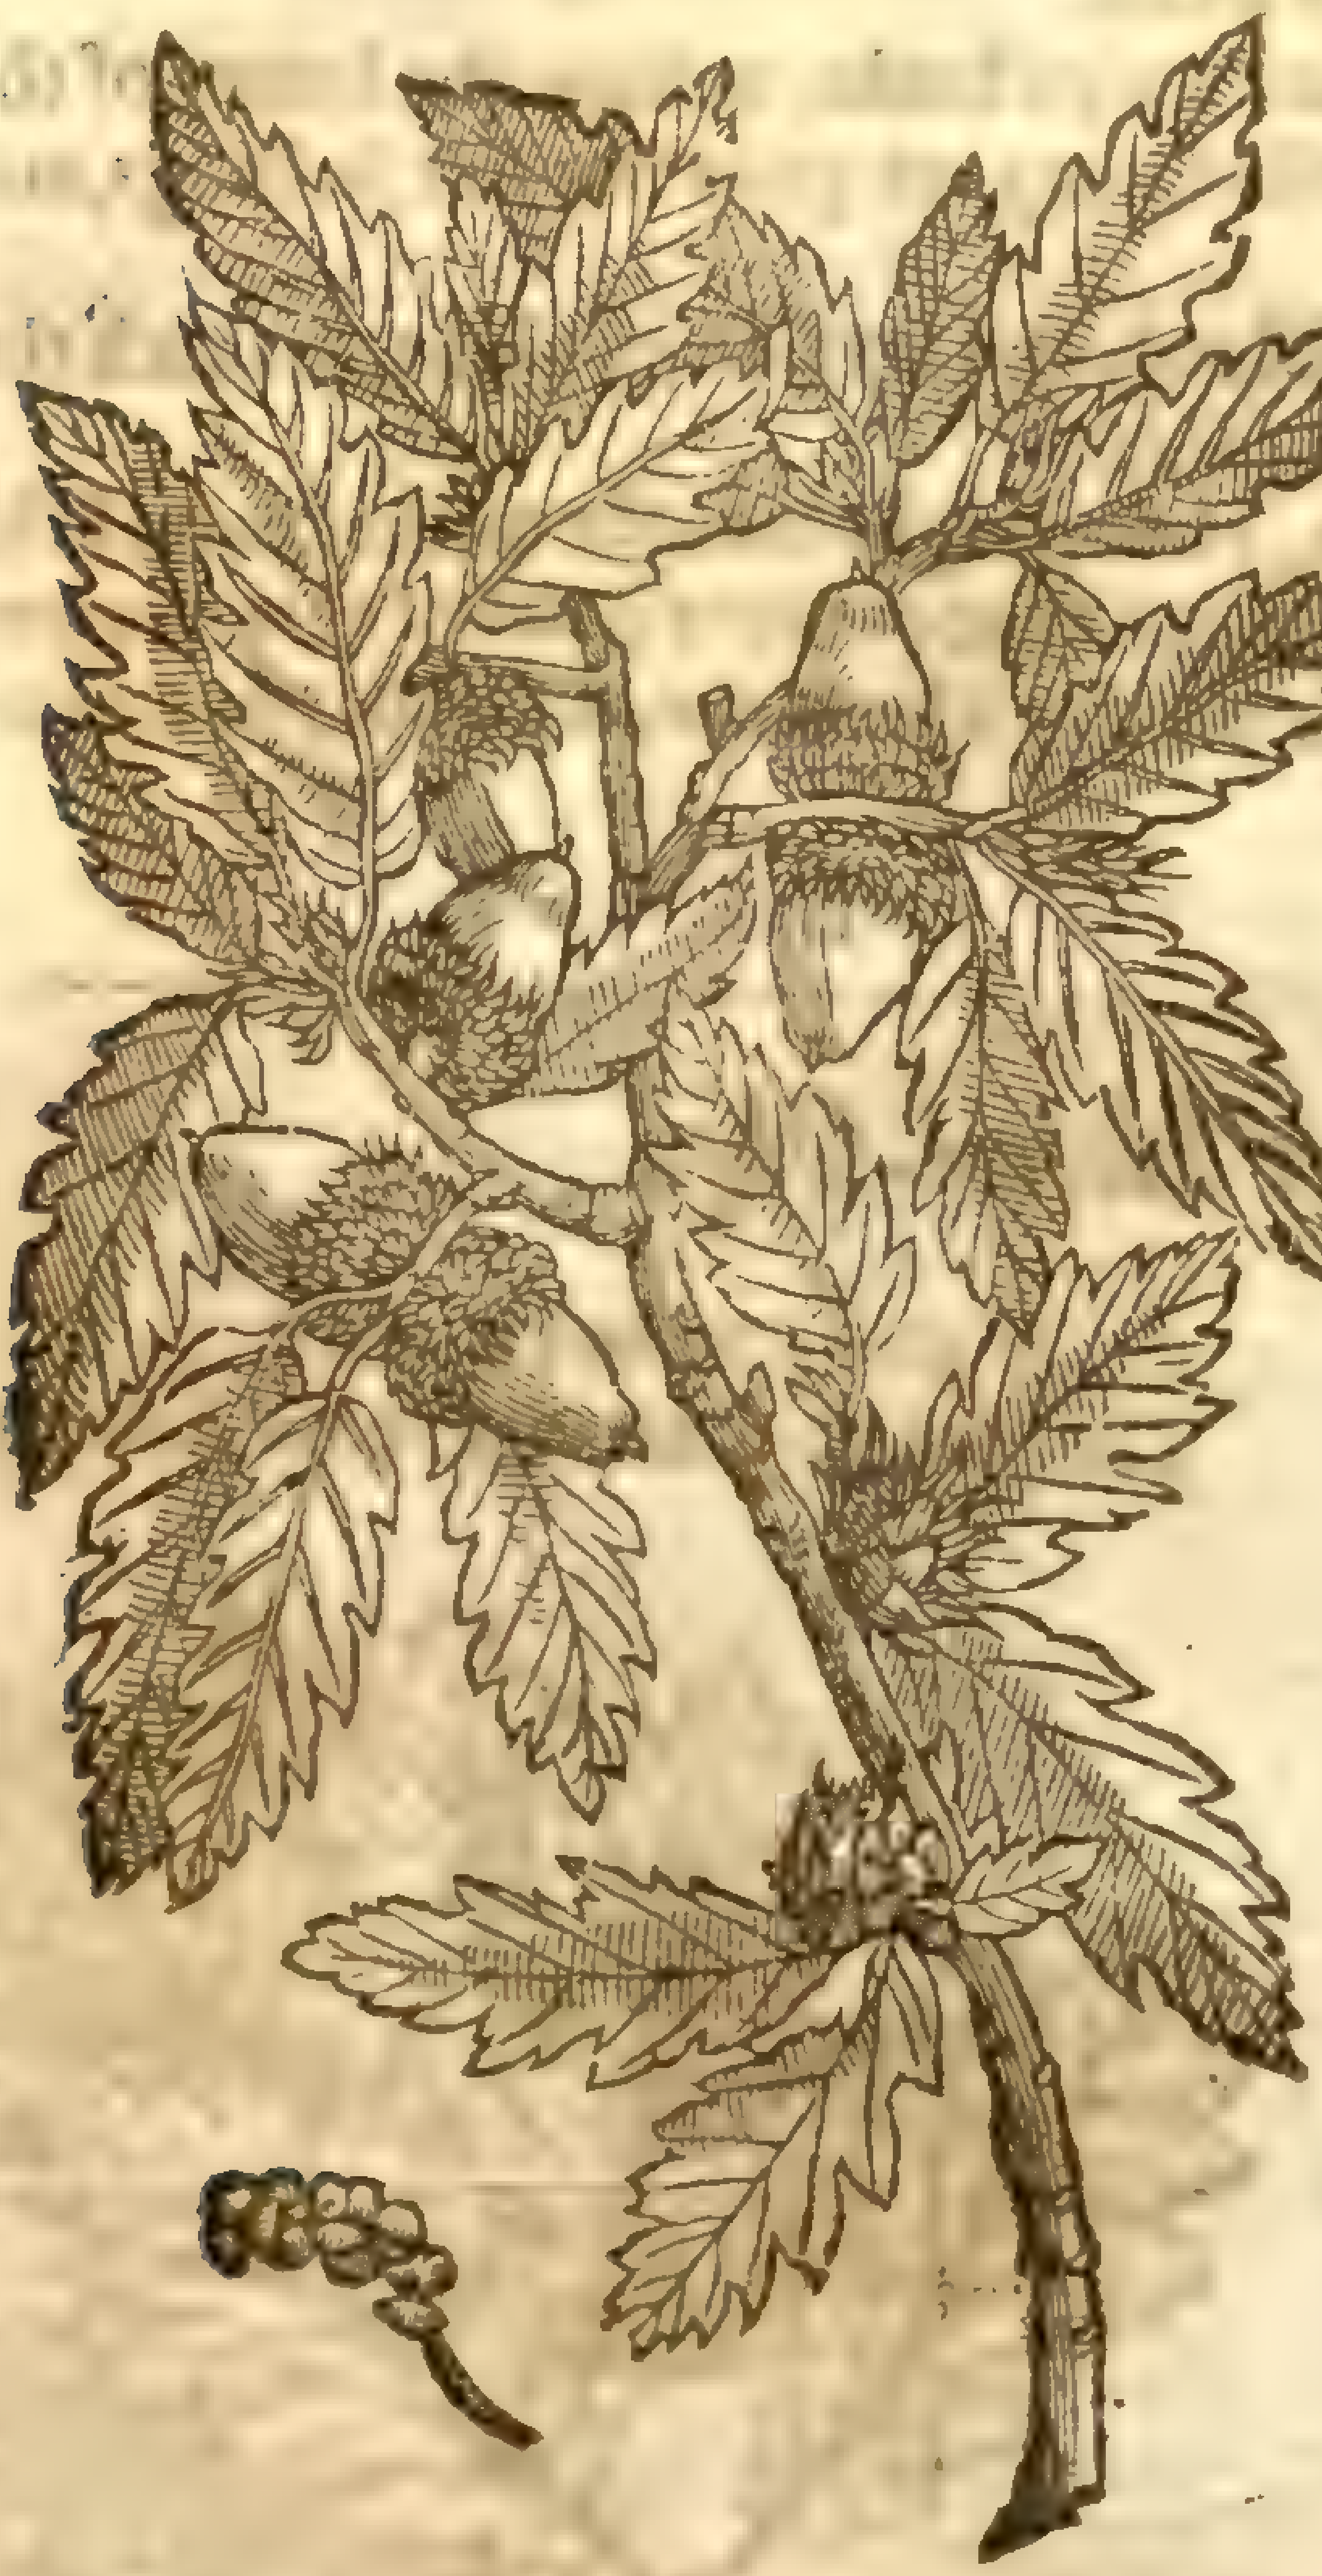
2 *Cerris minore Glande.*
The Holme-Oke with leſſer Acornes.



¶ *The Deſcription.*

1 Among the wilder Okes this is not the leaſt, for his comely proportion, although vnprofitable for timber, to make coles, carts, Wainſcot, houſes, or ſhips of: the fruit is not fit for any man or beaſt to eate, neither any property knowne for the vſe of Phyſicke or Surgerie: it groweth vp to the height of a faire tree, the trunke or body is great, and very faire to looke vpon: the wood or timber ſoft and ſpongie, ſcarce good to be burned: from which ſhooteth forth very comely branches diſperſing themſelues farre abroad; whereon are ſet for the moſt part by couples very faire leaues, greene aboue, and of an ouerworne ruſſet colour underneath, cut or ſnipt about the edges very deepe: the Acorne groweth faſt vnto the boughes, without any foot-ſtalke at all, being very like vnto our common Acorne, ſet in a rough and prickly cup like an Hedge-hog or the Cheſnut huske, of a harſh taſte, and hollow within: this tree beareth or bringeth

‡ *Cerri minoris ramulus cum flore.*
A branch of the ſmaller Holme Oke with floures.



bringeth forth oft times a certain ſmooth kind of Gall not altogether vnprofitable. This Oke likewiſe bringeth forth another kind of excreſence, which the Grauer hath omitted in the figure, which is called in Greeke φάσκον: *Gaza* nameth it *Penis*. This *Penis* or pricke is hollow, moſſie, hanging downe halfe a yard long, like a long rag of linnen cloath.

2 The ſecond is altogether like the firſt, ſauing that this beareth ſmaller Acornes, and the whole tree is altogether leſſe, wherein conſiſteth the difference.

‡ Both this & the former cary floures cluſtering vpon long ſtalkes, like as in the common Oke; but the fruit doth not ſucceed them, but grow forth in other places. ‡

¶ *The Place.*

This Oke groweth in vntoiled places, it is ſeldome times found, and that but in Woods onely: it is for the moſt part vnknowne in Italy, as *Pliny* reporteth.

¶ *The Time.*

They bring forth their fruit or Acornes in the fall of the leafe.

¶ *The Names.*

This Oke is called in Greeke Κέῤῥος: in Latine, *Cerrus*: yet doth *Pliny* make mention both of *Ægilops*, and alſo of *Cerrus*: Αἰγίλωψ is likewiſe one of the diſeaſes of corne, called in Latine *Feſtuca*: in Engliſh, wilde Otes, and far differing from the tree *Ægilops*.

That which hangeth from the boughes, *Pliny, lib.* 16. *cap.* 8. calleth *Panus* onely: that acorne tree named *Ægilops* bringeth forth *Panos arentes*, withered prickes, couered with white moſſie jags hanging downe, not onely in the barke, but alſo from the boughes, halfe a yard in bigneſſe, bearing a ſweet ſmell, as we haue ſaid among ointments.

¶ *The Temperature and Vertues.*

We finde nothing written of the faculties of this tree among the old Writers, neither of our owne experience.

Chap. 36. *Of the Corke Oke.*

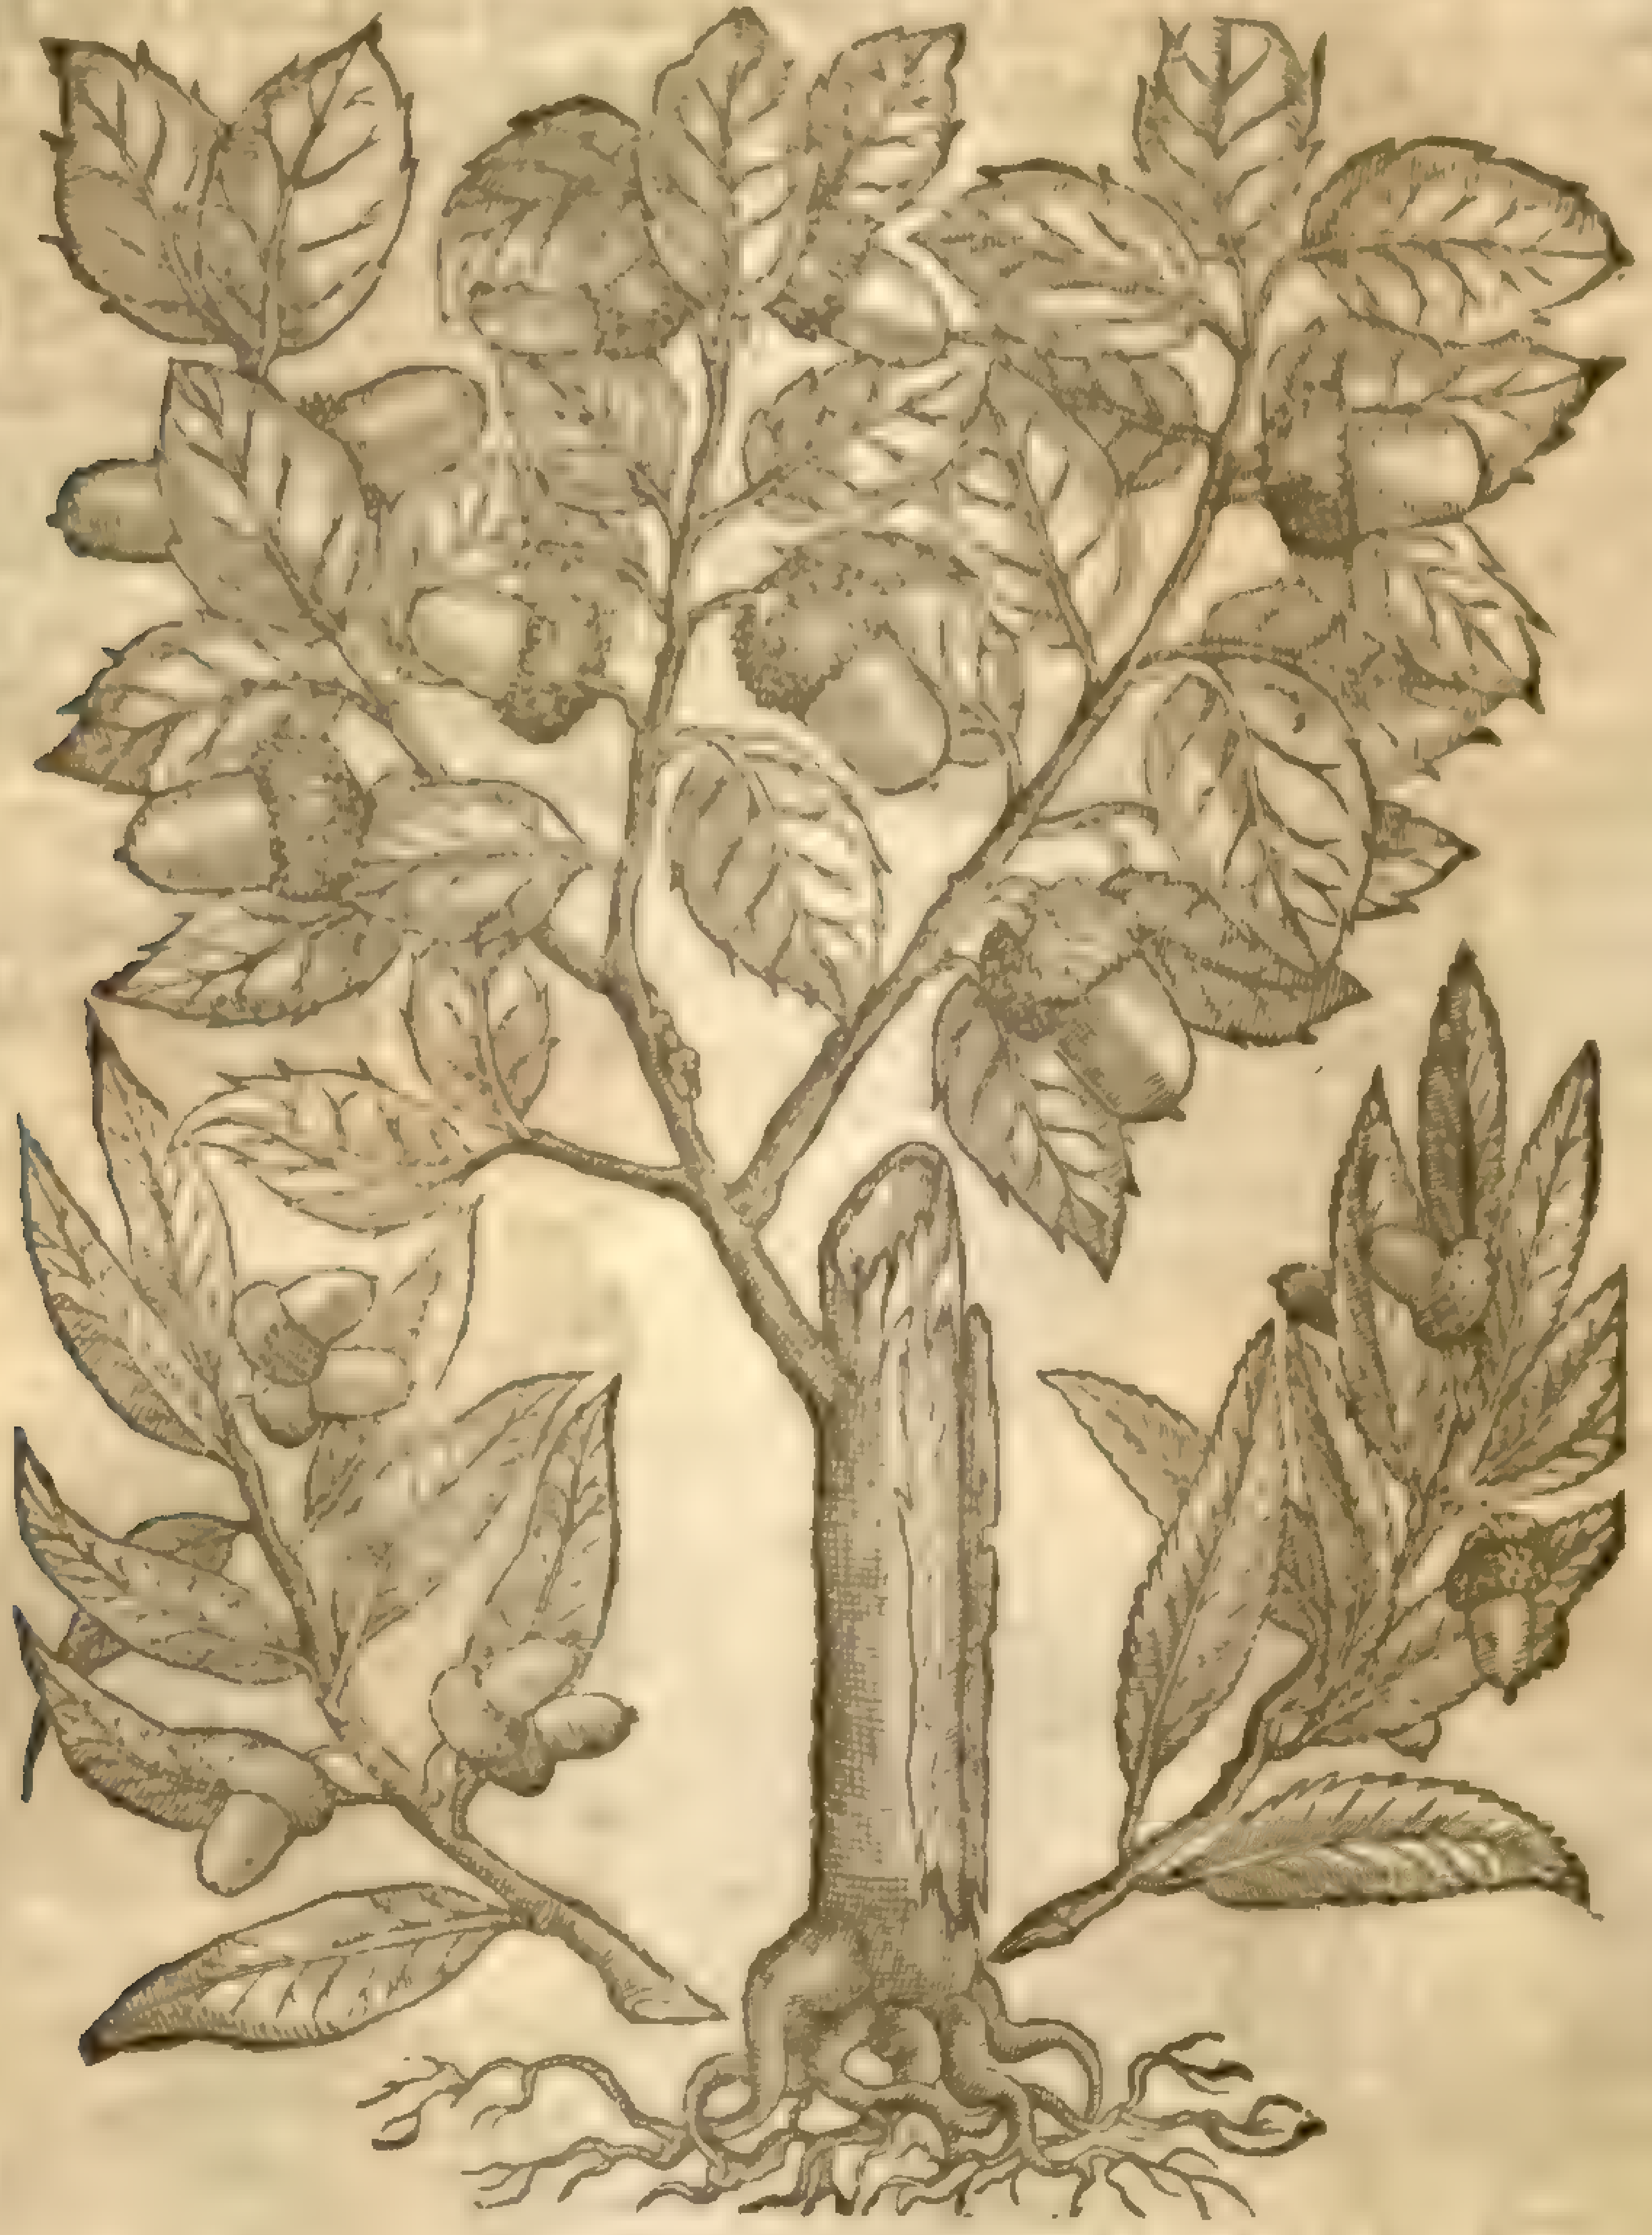
¶ *The Deſcription.*

1 THe Corke tree is of a middle bigneſſe like vnto *Ilex*, or the barren skarlet Oke, but with a thicker body, and fewer boughes: the leaues be for the moſt part greater, broader, rounder, and more nicked in the edges: the barke of the tree is thicke, very rugged, and full of chinkes or crannies that cleaueth and diuideth it ſelfe into pieces, which vnleſſe they be taken away in due time do giue place to another barke growing vnderneath, which when the old is remoued is maruellous red, as though it were painted with ſome colour: the Acorne ſtandeth in a cup, which is great, briſtled, rough, and full of prickles: this Acorne is alſo aſtringent or binding, more vnpleaſant than the Holme Acorne, greater in one place, and leſſe in another.

2 The Corke tree hath narrow leaues groweth likewiſe to the height and bigneſſe of a great tree; the trunke or body whereof is couered with a rough and ſcabbed barke of an ouerworne blackiſh colour, which likewiſe cleaueth and caſteth his coat when the inner barke groweth ſomewhat thicke: the branches are long, tough, and flexible, eaſie to be blowed any way, like thoſe of the

Oziar; whereupon do grow leaues like thoſe of the precedent, but longer, and little or nothing indented about the edges: the fruit groweth in ſmall cups as the Acornes doe: they are leſſer than thoſe of the other kinde, as is the reſt of the tree, wherein is the chiefeſt difference. ‡ This varies in the leafe, (as you may ſee in the figure) which in ſome is ſnipt about the edge, in other ſome not at all. ‡

1. 2. *Suber latifolium & anguſtifolium.*
The Corke tree with broad and narrow leaues.



¶ *The Place.*

It groweth in the country of Aquitania, neere to the mountaines called Pyrenæi: it alſo groweth plentifully in the kingdomes of Spaine, differing ſomewhat from that of Aquitania, as *Cluſius* declareth: it is likewiſe found in Italy, and that in the territory of Piſa, with a longer leafe, and ſharper pointed; and about Rome with a broader, and cut in the edges like a ſaw, and rougher, as *Matthiolus* teſtifieth.

¶ *The Time.*

The leaues of the firſt are alwaies greene in Spaine and Italy, about the Pyrenæan mountaines they fall away in Winter.

¶ *The Names.*

This tree is called in Greeke φελλός: in Latine, *Suber*: in French, *Liege*: in Italian, *Sugaro*: the ſame names do alſo belong to the barke; the Spaniards call the tree *Alcornoque*: the Engliſhmen, Corke tree; and the barke, *Corcha de Alcornoque*; whereupon the Low-country-men and Engliſh-men alſo do call it Corke; and yet it is called in low Dutch alſo **Vlothout**.

¶ *The Temperature and Vertues.*

A This barke doth moſt manifeſtly dry, with a binding faculty.

B Being beaten to pouder and taken in water it ſtancheth bleeding in any part of the body. The Corke which is taken out of wine veſſels, ſaith *Paulus* being burnt, maketh aſhes which doe mightily dry, and are mixed in compoſitions diuiſed againſt the bloudy flix.

C Corke is alſo profitable for many things: it is vſed (ſaith *Pliny*) about the anchors of ſhips, Fiſhers nets, and to ſtop veſſels with; and in Winter for womens ſhoos, which vſe remaines with vs euen to this day: fiſhermen hang this barke vpon the wings of their nets for feare of ſinking: and ſhoo-makers put it in ſhooes and pantofles for warmneſſe ſake.

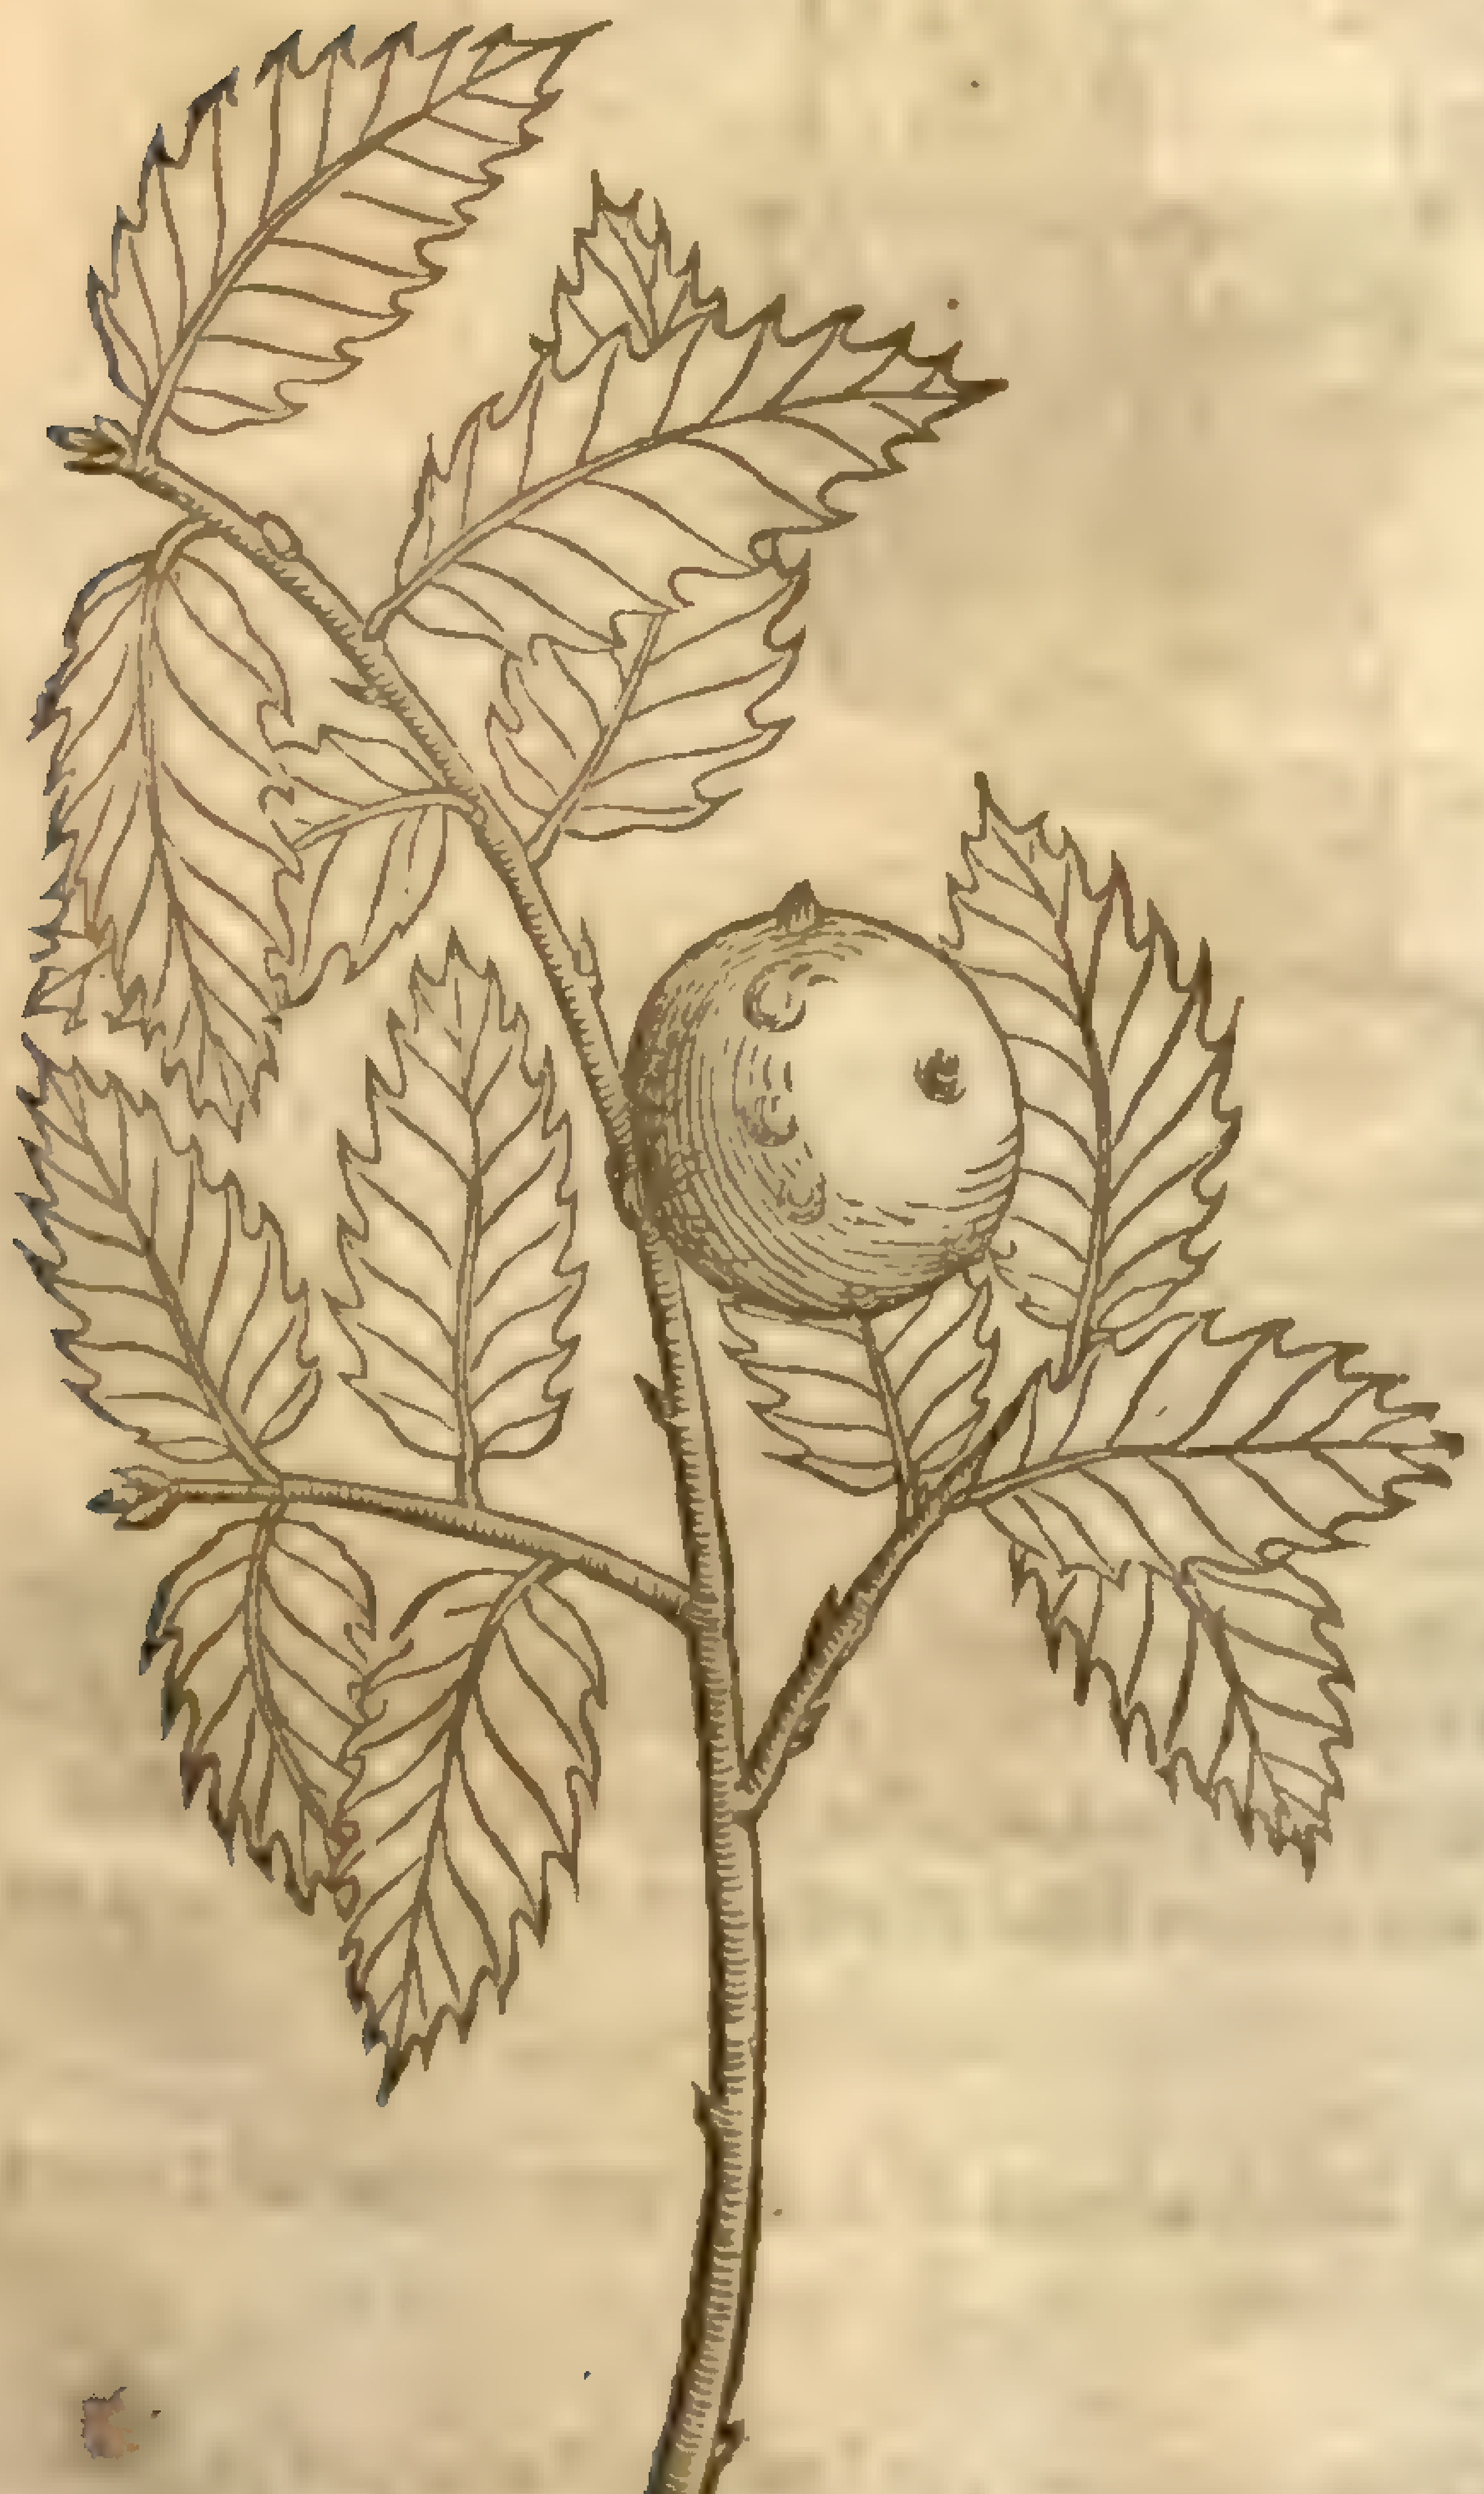
Chap. 37. *Of the Gall tree.*

¶ *The Kindes.*

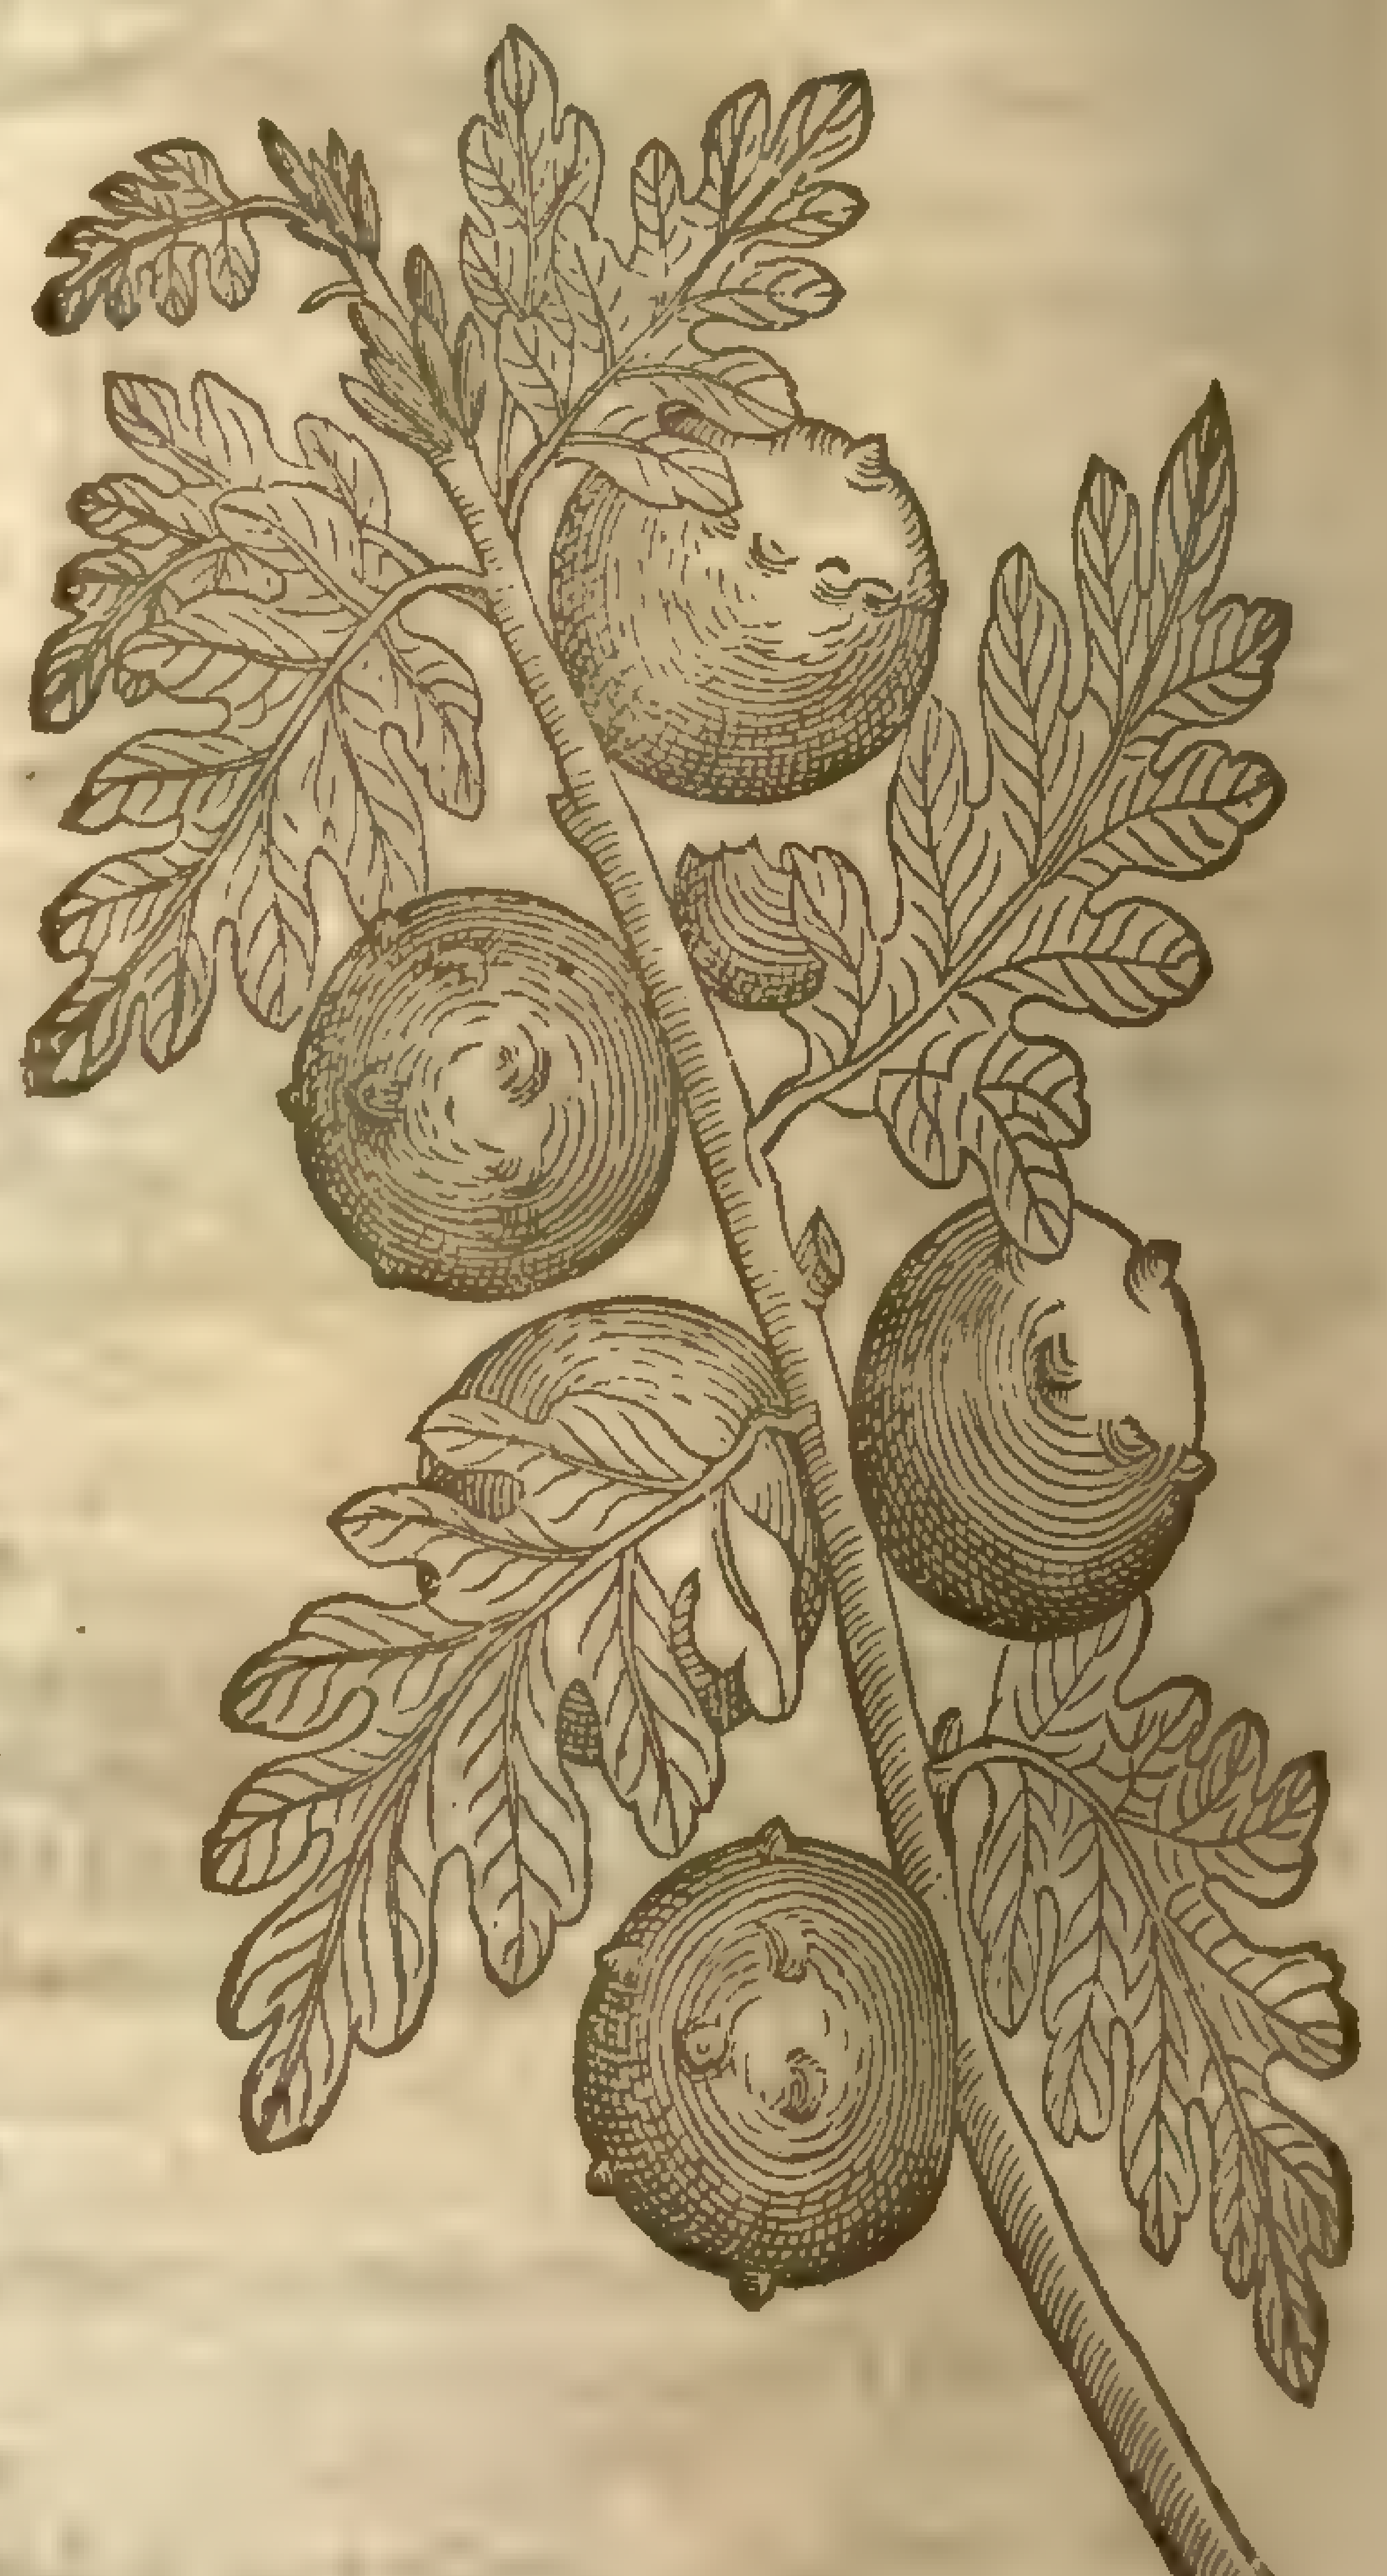
OF trees that bring forth Galls there be diuers ſorts, as may appeare by the diuers formes and ſorts of Galls ſet forth in this preſent chapter, which may ſerue for their ſeuerall diſtinctions, whereof ſome bring forth Acornes likewiſe, and ſome nothing but Galls: the figures of ſome few of the trees ſhall giue you ſufficient knowledge of the reſt: for all the Acorne or Maſt trees bring forth Galls, but thoſe trees whoſe figures we haue ſet forth doe beare thoſe galls fit for medicine, and to thicken skins with.

Dioſcorides and *Galen* make but two ſorts of Galls; the one little, yellow, full of holes, and more ſpongie in the inner part, both of them round, hauing the forme of a little ball, and the other ſmooth and euen on the out ſide: ſince the later writers haue found moe, ſome hauing certaine little knobs ſticking forth, like in forme to the Gall, which doth alſo cleaue and grow without ſtalke to the leafe. There is alſo found a certaine excreſcence of a light greene colour, ſpongie and watery, in the middle whereof now and then is found a little flie or worme: which ſoft ball in hot countries doth oftentimes become hard, like the little ſmooth Gall, as *Theophraſtus* ſaith.

1 *Galla, ſiue Robur majus.*
The great Gall tree.



‡ 2 *Robur, ſiue Galla major altera.*
Another great Gall tree.

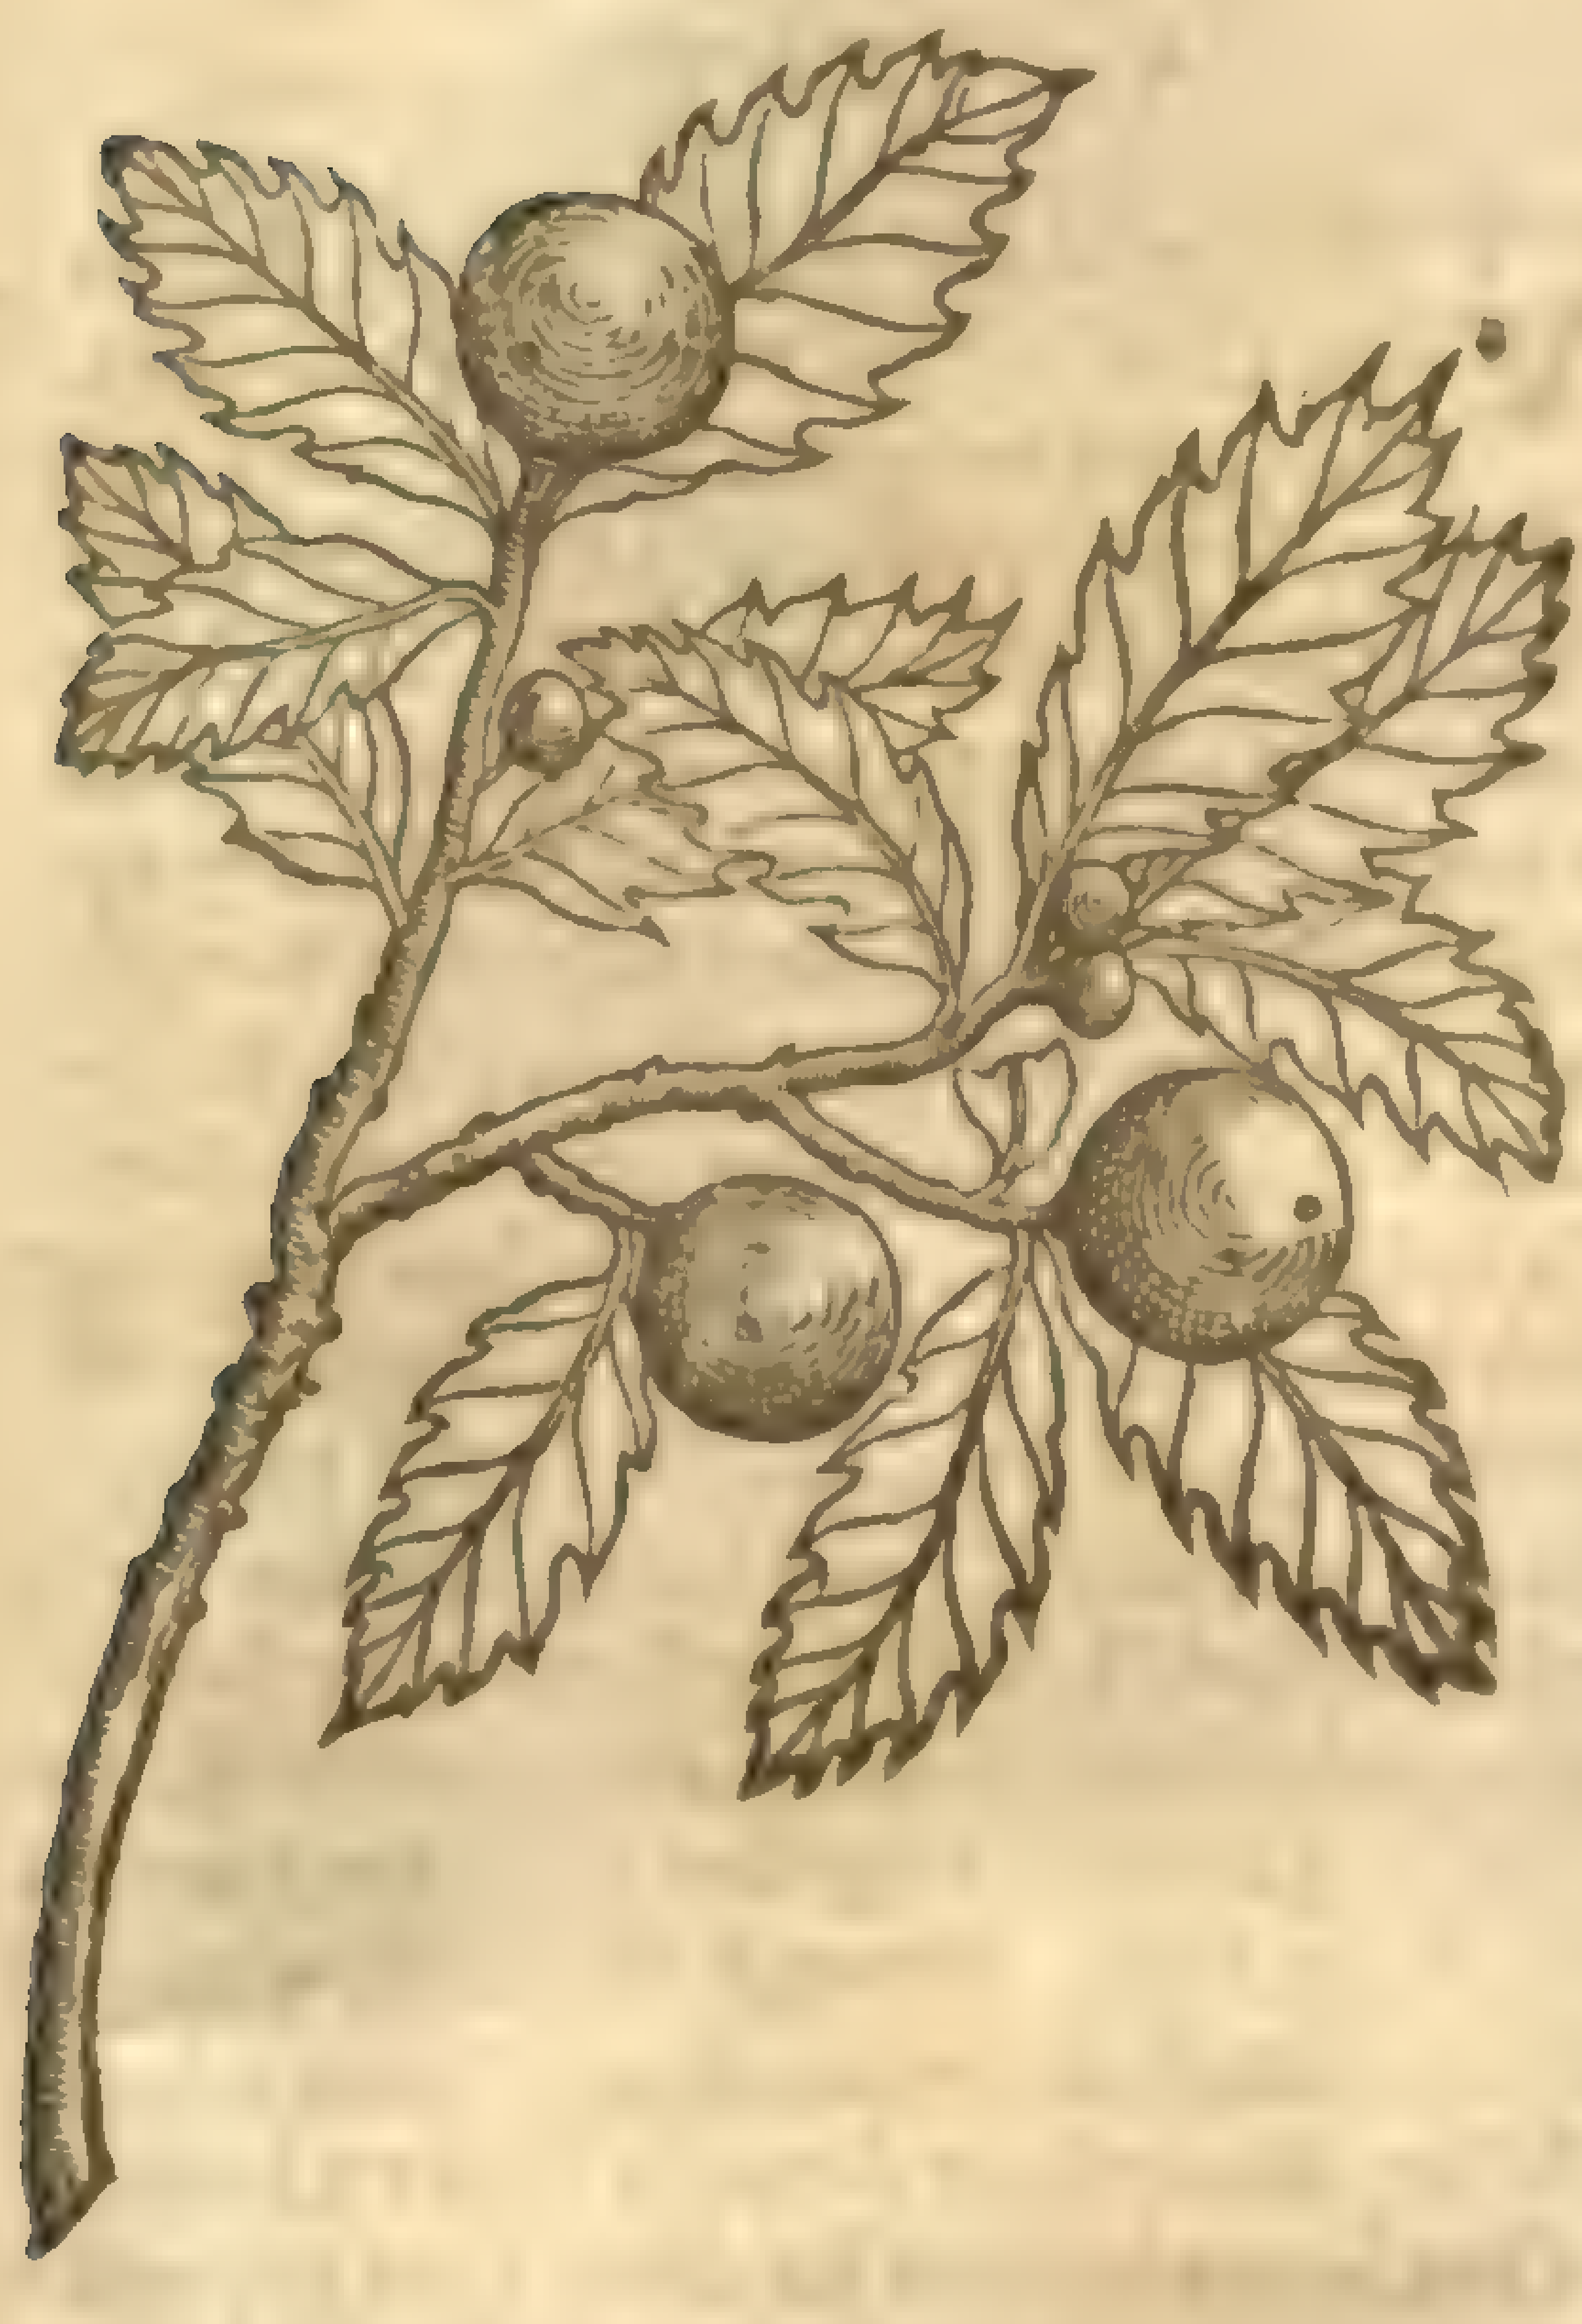


¶ *The Deſcription.*

1 THe Gall tree growes vp to a ſufficient height, hauing a very faire trunke or body, whereon are placed long twiggie branches bringing forth very faire leaues, broad, and nicked in the edges like the teeth of a ſaw: among which come forth acornes, although the figure expreſſe not the ſame, like thoſe of the Oke, and likewiſe a wooddy excreſcence, which we name the Gall, hauing certaine ſmall eminences or bunches on the out ſide, growing for the moſt part vpon the ſlender branches without ſtalks, and ſometimes they grow at the ends thereof; which by the heate of the Sun are harder, greater, and more ſollid in one country than another, according to the ſoile and clymat.

‡ 2 This

3 *Galla minor.*
The little Gall tree.



‡ 2 This growes to the height of a tal man, hauing leaues deepely diuided on the edges like the Oke, green aboue, but hairy and hoary below: it carries a great gall of the bigneſſe of a little apple, and that in great plenty, and without any order. This growes in diuers parts of old Caſtile in Spain, and in all the mountainous Woods about Vienna in Auſtria. ‡

3 The leſſer Gal tree differs not from the former, ſauing that it is altogether leſſer: the fruit or gall is likewiſe leſſer, wherin eſpecially conſiſteth the difference.

¶ *The Place.*

The Galls are found in Italy, Spain, and Bohemia, and moſt of the hot regions.

¶ *The Time.*

The Gall, ſaith *Pliny*, appeareth or commeth forth when the Sunne comes out of the ſigne *Gemini*, and that generally in one night.

¶ *The Names.*

The Gall tree is called *Quercus*, *Robur*, and *Galla arbor*: in Greek, [illegible]: the Apothecaries and Italians keepe the name *Galla* for the fruit: in high-Dutch, **Galopffell**: in low-Dutch, **Galnoten**: in Spaniſh, *Agatha*, *Galha*, and *Bugalha*: in French, *Noix de Galle*: in Engliſh, Gaules, and Galls.

¶ *The Temperature and Vertues.*

The Gall called *Omphacitis*, as *Galen* writeth, is dry in the third degree, and cold in the ſecond: it A
is a very harſh medicine; it faſteneth and draweth together faint and ſlacke parts, as the ouergrowings in the fleſh: it repelleth and keepeth backe rheumes and ſuch like fluxes and doth effectually dry vp the ſame, eſpecially when they haue a deſcent into the gums, almonds of the throat, & other places of the mouth.

The other Gall doth dry and alſo binde, but ſo much leſſer, by how much the harſh or choking B
qualitie is diminiſhed: being boiled, beaten, and alſo applied in manner of a plaiſter it is laid with good ſucceſſe vpon the inflammations of the fundament, and falling down thereof. It is boiled in water if there be need of a little aſtriction; and in wine, eſpecially in auſtere wine, if more need require.

Galls are very profitable againſt the Dyſenterie and the Cœliack paſſion, being drunk in wine, C
or the pouder thereof ſtrewed vpon meats.

Galls are vſed in dying and colouring of ſundry things, and in making of inke.

Laſtly, burnt Galls do receiue a further faculty, namely to ſtanch bloud, and are of thinne parts, D
and of a greater vertue to dry than be thoſe that are not burnt. They muſt be laid vpon hot burning E
coles vntill they come to be thorow white, and then they are to be quenched in vineger and wine.

Moreouer, Galls are good for thoſe that be troubled with the bloudy flixe and common laskes, F
being taken in wine or water, and alſo applied or vſed in meats: finally, theſe are to be vſed as oft as need requireth to dry and binde.

Oke apples are much of the nature of Galls, yet are they far inferior to them, and of leſſer force. G

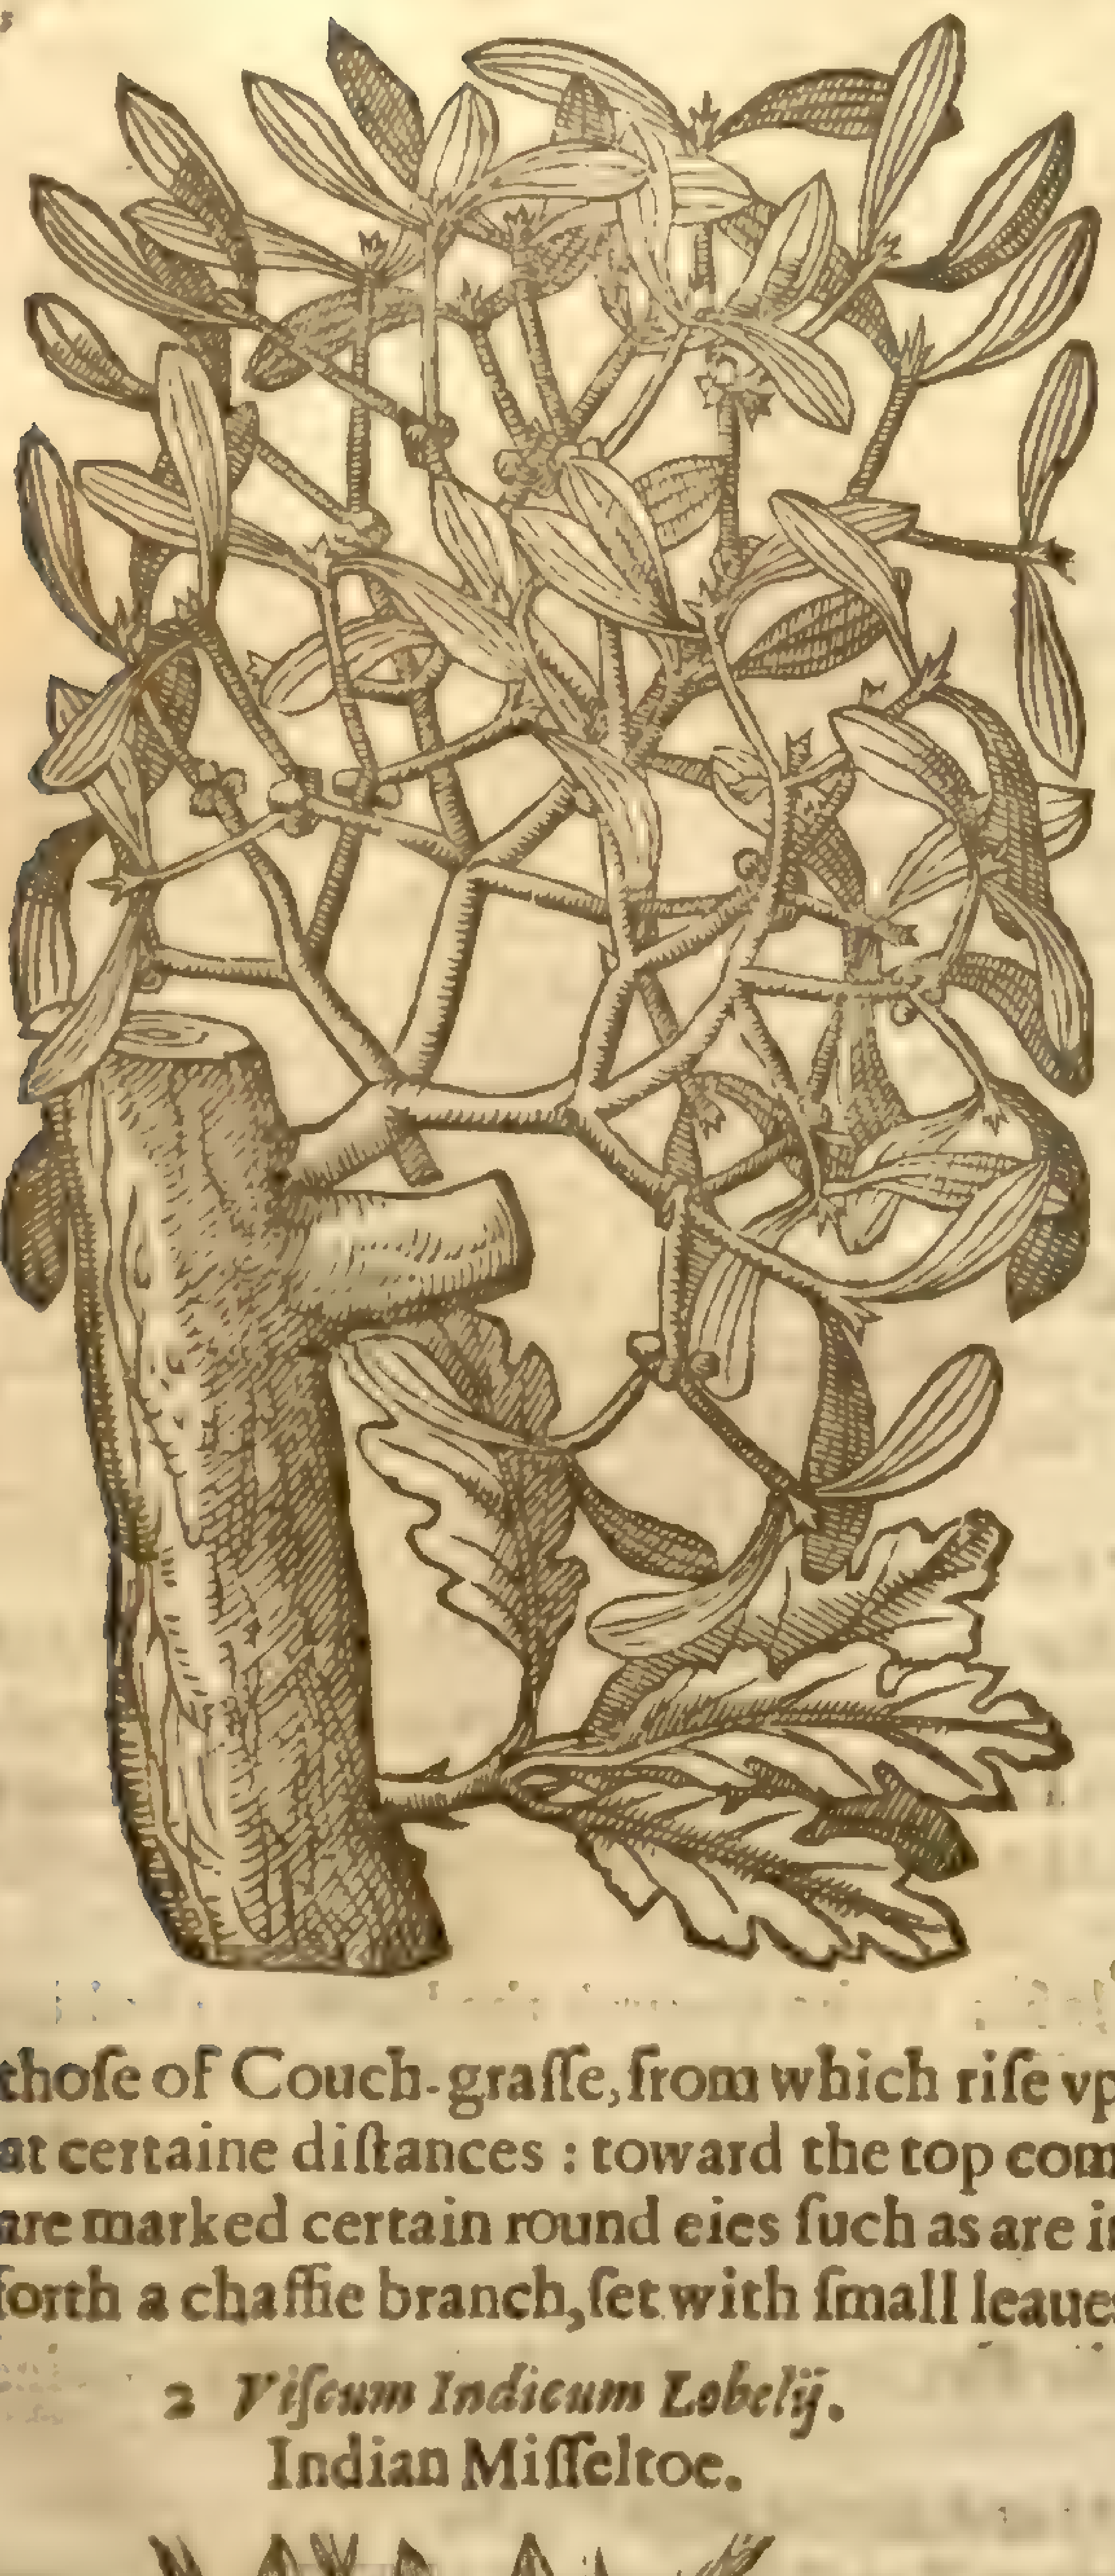
---

† Our Author out of *Tabern.* gaue the figures of fourteen varieties of Galls; ſome being large, others ſmall; ſome round, others longiſh, and other ſorts diuerſly cornered.

Chap. 38. *Of Miſſeltoe or Miſteltoe.*

[illegible]

1 *Viſcum.*
Miſſeltoe.

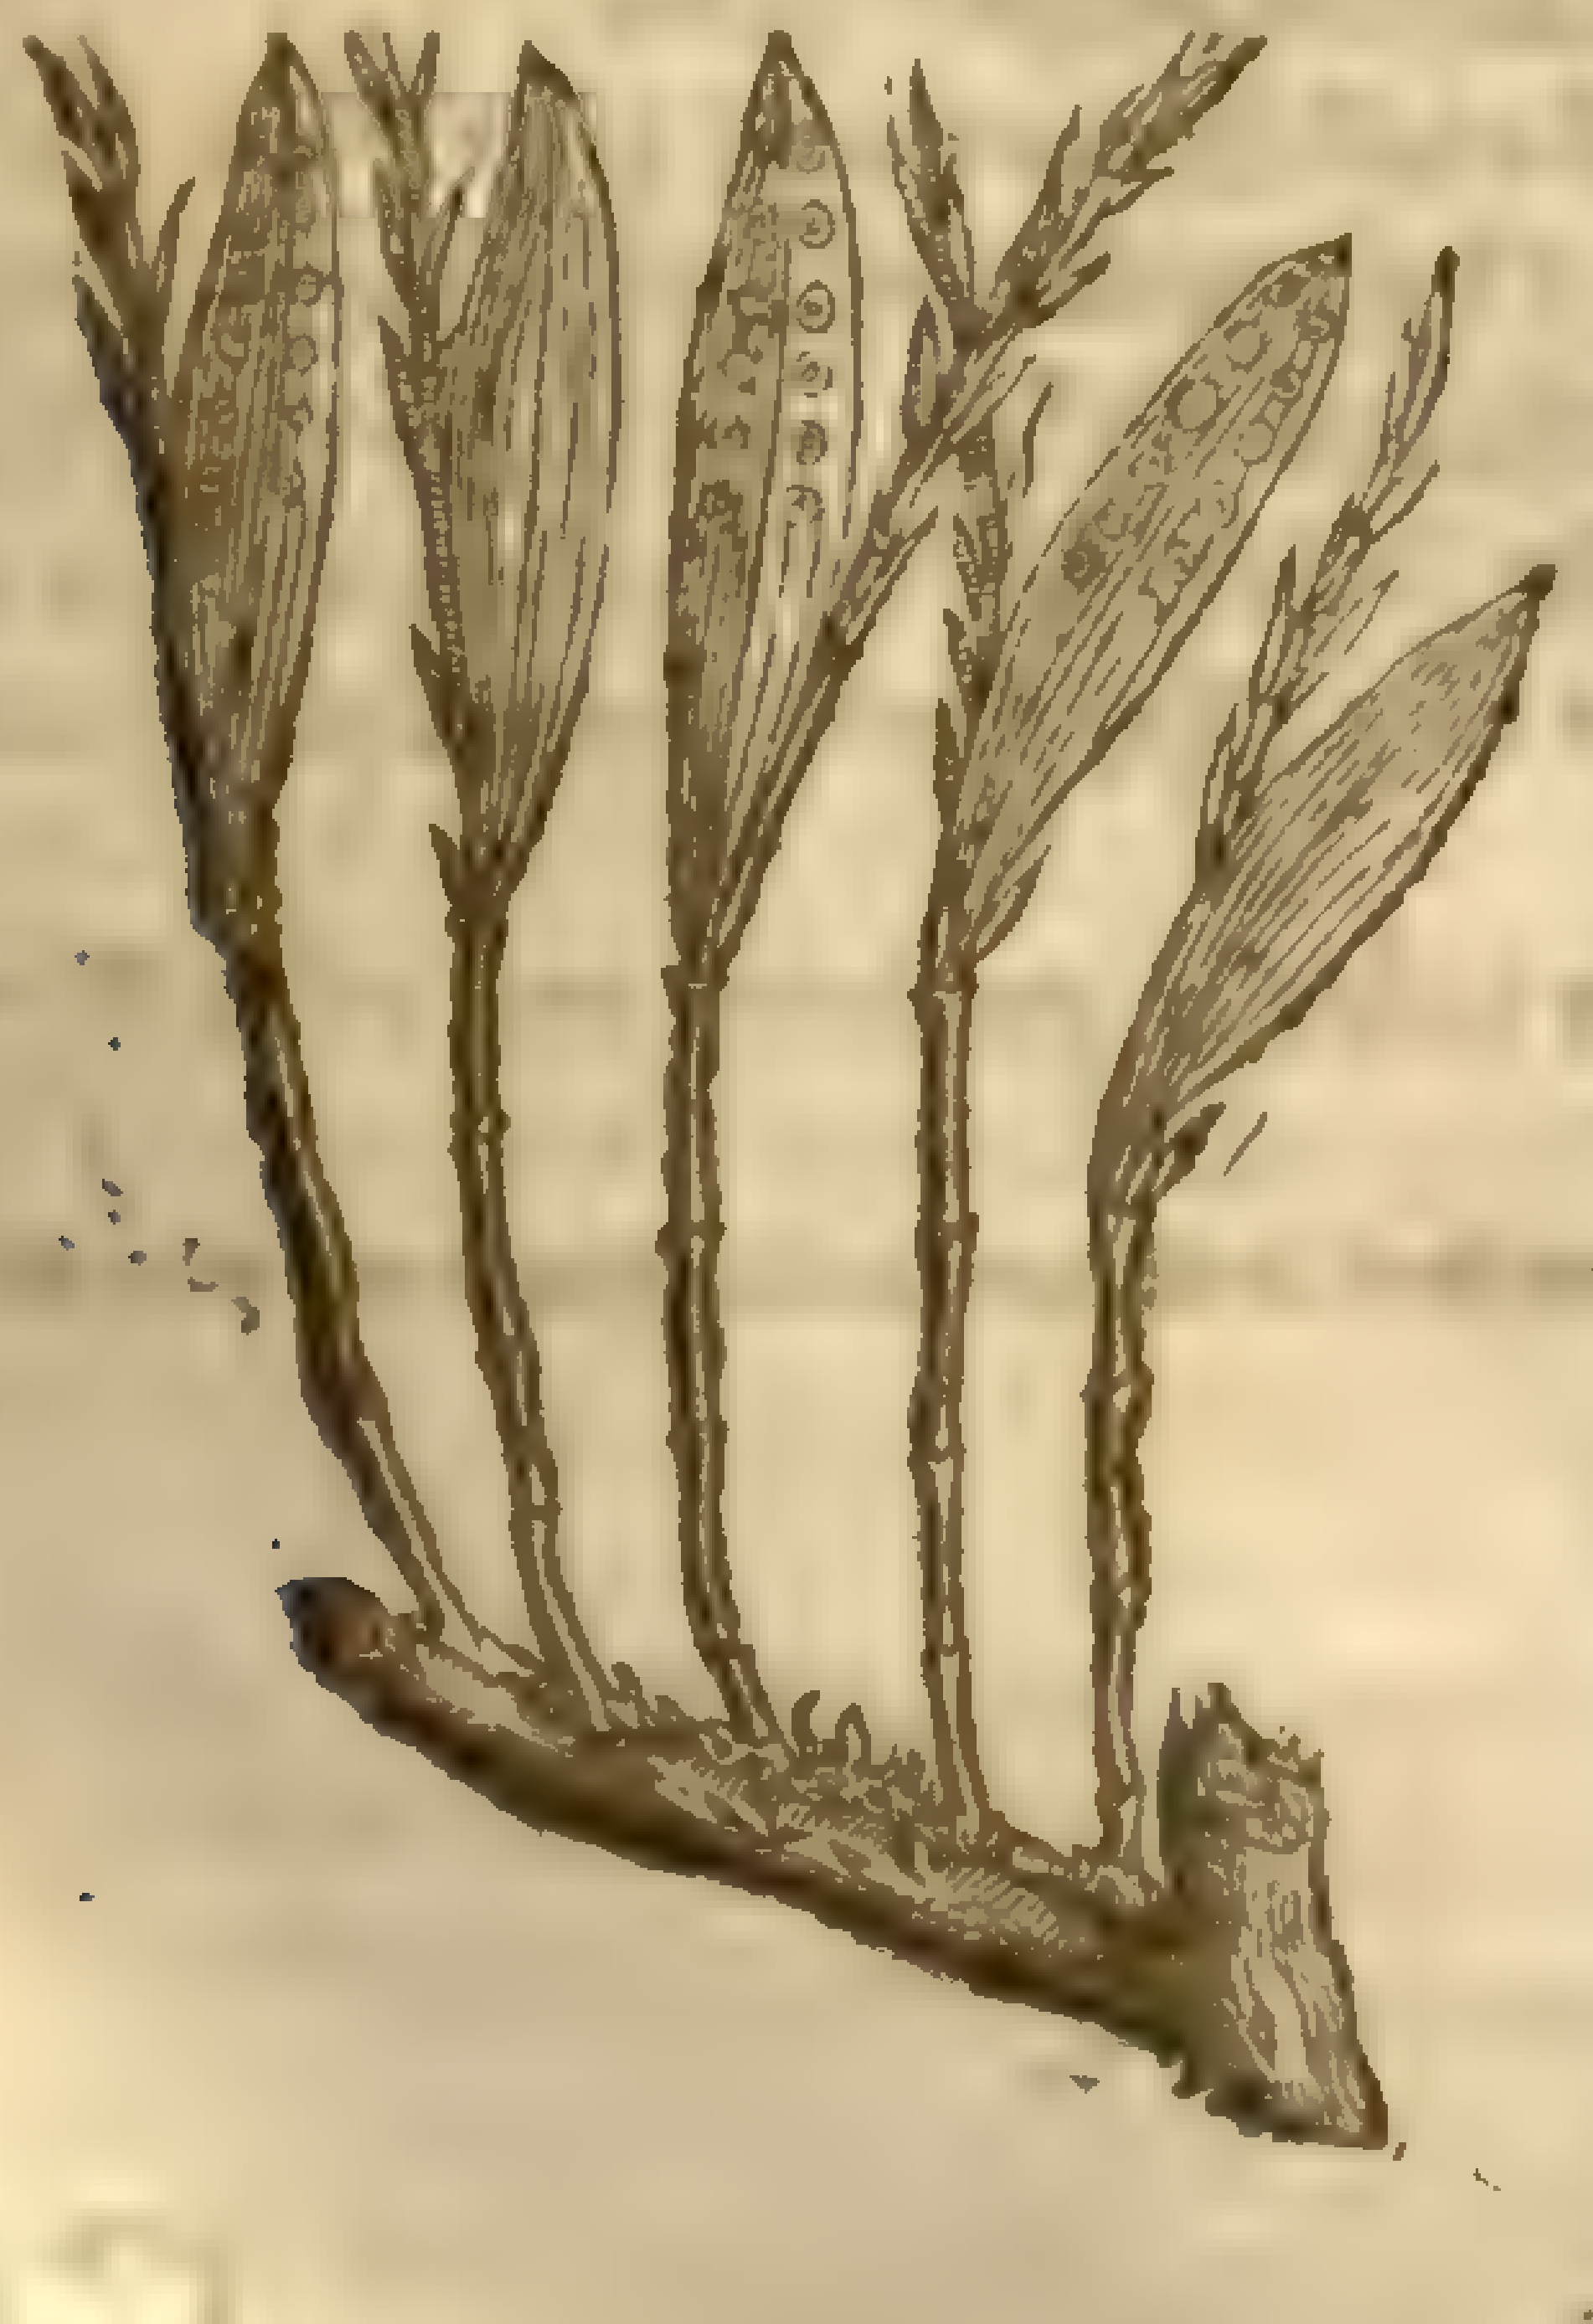


¶ *The Deſcription.*

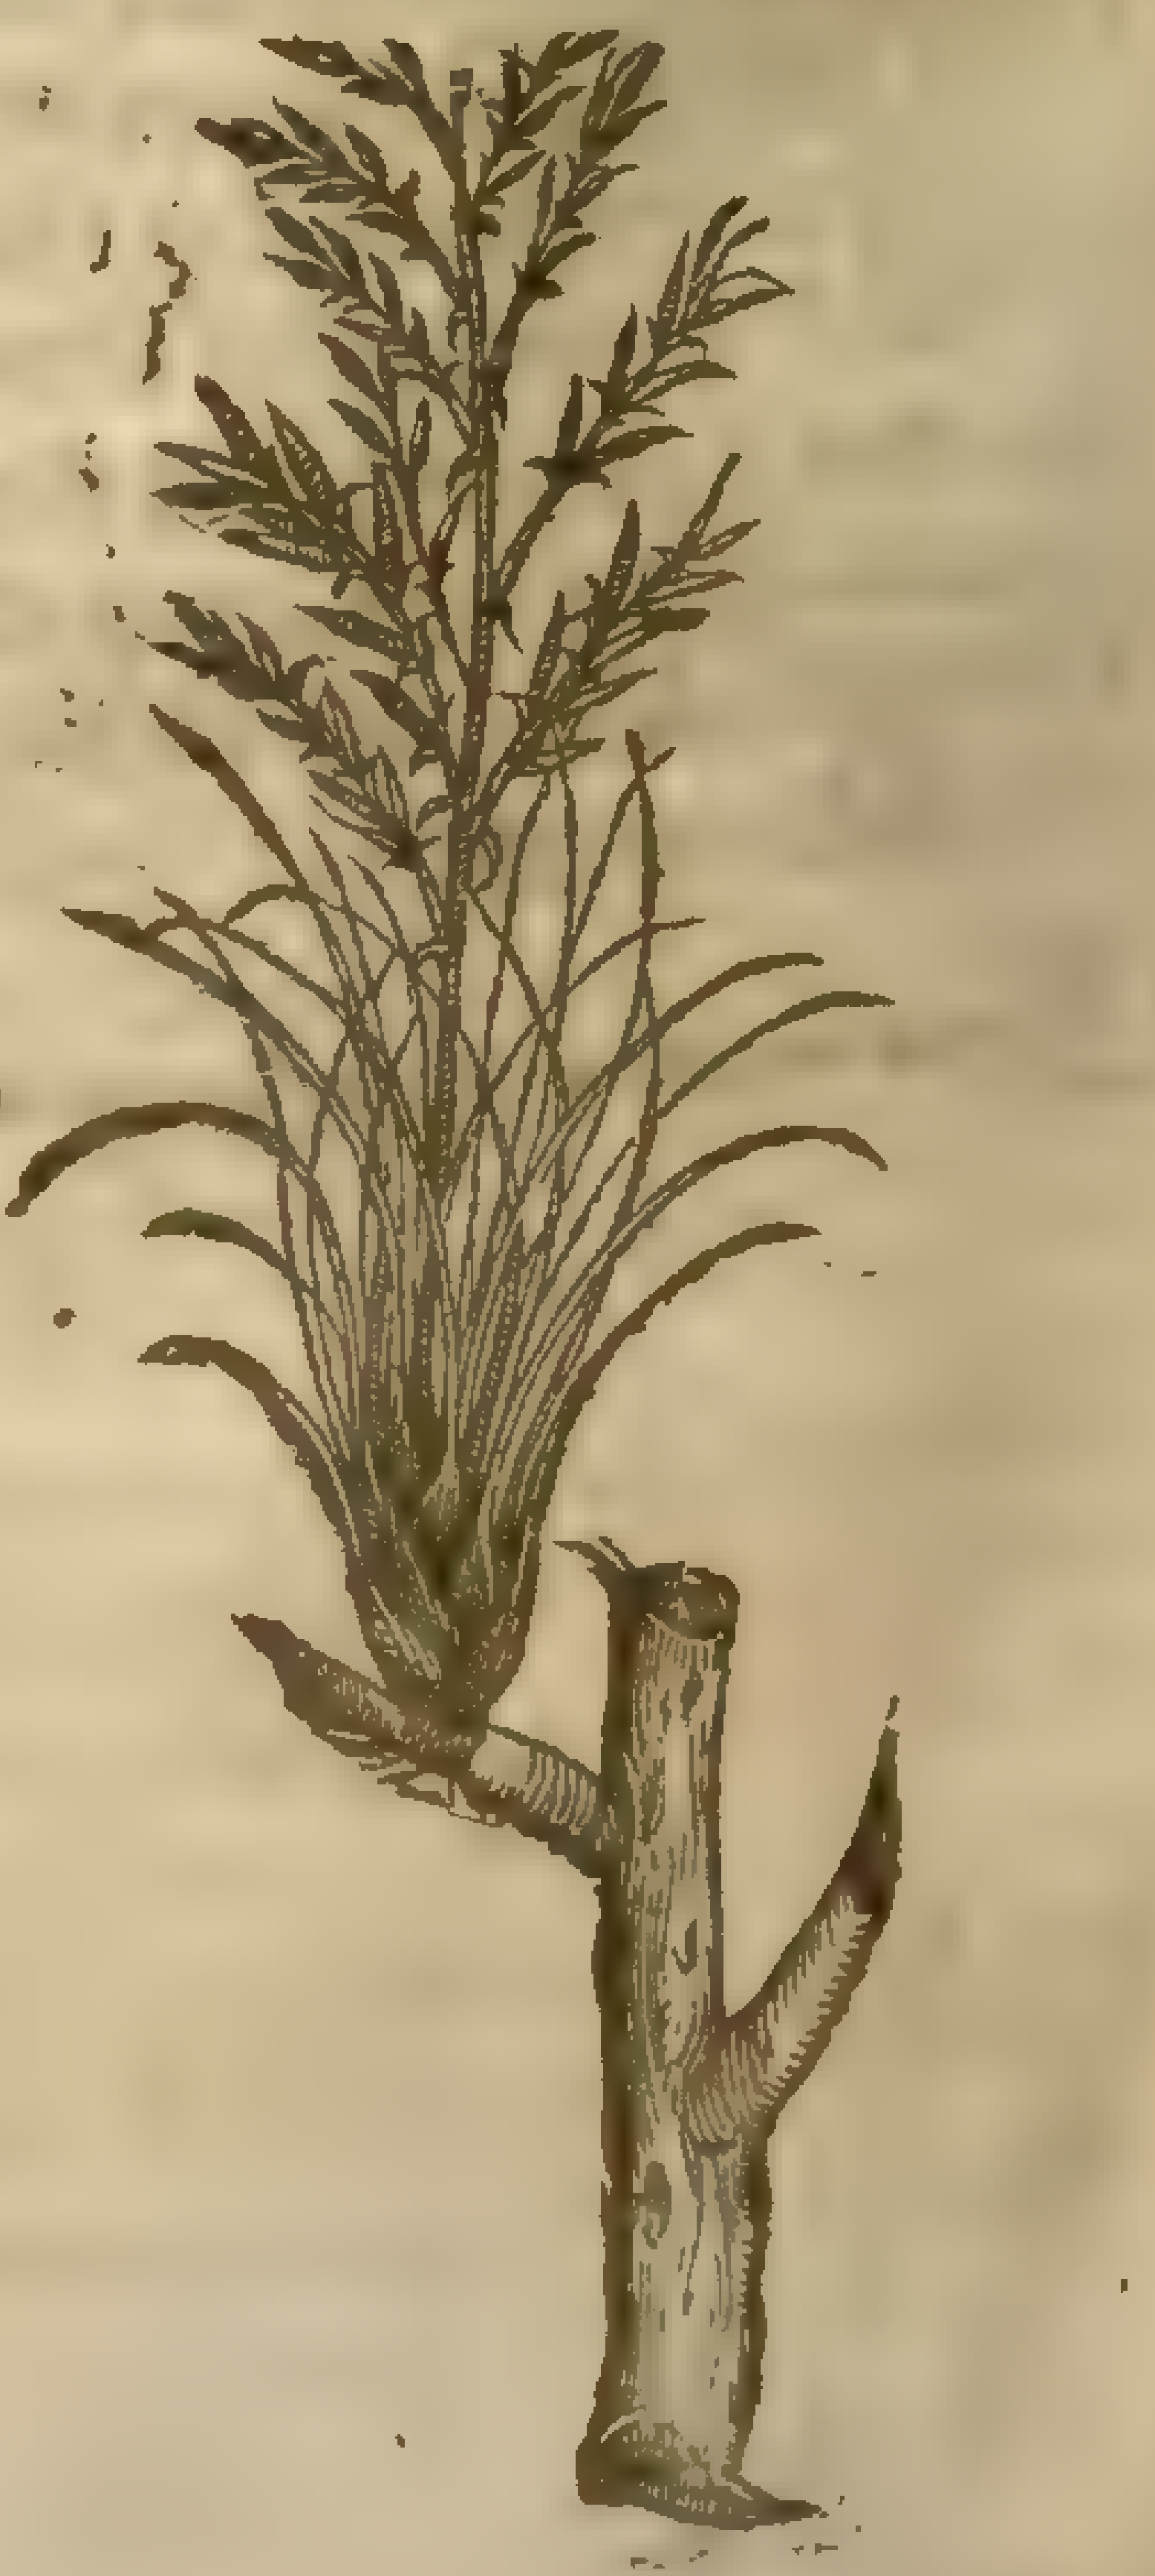
1 *Viſcum* or Miſſeltoe hath many ſlender branches ſpread ouerthwart one another, and wrapped or interlaced one within another, the bark wherof is of a light green or Popinjay colour: the leaues of this branching excreſcence be of a brown green colour: the floures be ſmall and yellow: which beeing paſt, there appeare ſmall cluſters of white tranſlucent berries, which are ſo cleare that a man may ſee thorow them, and are of a clammy or viſcous moiſture, whereof the beſt Bird-lime is made, far exceeding that which is made of the Holm or Holly bark: and within this berry is a ſmall blacke kernel or ſeed: this excreſcence hath not any root, neither doth increaſe himſelfe of his ſeed, as ſome haue ſuppoſed; but it rather commeth of a certaine moiſture and ſubſtance gathered together vpon the boughs and joints of the trees, through the barke whereof this vaporous moiſture proceeding, brings forth the Miſſeltoe. Many haue diuerſly ſpoken hereof: Some of the Learned haue ſet down, that it comes of the dung of the bird called a Thruſh, who hauing fed of the ſeeds thereof, as eating his owne bane, hath voided and left his dung vpon the tree, whereof was ingendred this bery, a moſt fit matter to make lime of to intrap and catch birds withall.

2 Indian Miſſelto groweth likewiſe vpon the branches of trees, running alongſt the ſame in maner of Polypodie: the ſtrings of the roots are like thoſe of Couch-graſſe, from which riſe vp diuers ſtalks ſmooth and euen, ſet with joints and knees at certaine diſtances: toward the top comes forth one leafe ribbed like the Plantain leafe, wheron are marked certain round eies ſuch as are in the haft of a knife; from the boſome wherof commeth forth a chaffie branch, ſet with ſmall leaues which continue green Winter and Summer.

2 *Viſcum Indicum Lobelij.*
Indian Miſſeltoe.



3 *Viſcum Peruvianum Lobelij.*
Miſſeltoe of Peru.



3 There is ſound alſo another plant growing vpon the boughes or branches of trees, in maner as our Miſſeltoe doth, and may very well be reckoned as a kind thereof: the plant cleaues vnto the branches, being ſet thereto as it were with the pillings of the ſea Onion, of the bredth of a mans hand toward the bottom, and ſomewhat hollow: the tops whereof are very ſmall and ruſhy, hollow likewiſe, and of a purple colour: among which comes forth a branch like that of *Haſtula Regia*, or Kings ſpeare, reſembling the buſh of Otes, couered with a white ſilk ſuch as is to be found in *Aſclepias*, of a ſalt and nitrous taſte, and very vnpleaſant.

¶ *The Place.*

The firſt kinde of Miſſeltoe groweth vpon Okes and diuers other trees almoſt euery where; as for the other two they are ſtrangers in England.

¶ *The Time.*

Miſſeltoe is alwaies greene as well in winter as ſummer: the berries are ripe in Autumne, they remain all winter thorow, and are a food for diuers birds, as Thruſhes, Black-birds, & Ring-doues.

¶ *The Names.*

Miſſeltoe is called in Greeke ἰξὸς, and ἰξία: in Latine, *Viſcum*: in high-Dutch, **Miſtell**: in Low-Dutch, **Marentacken**: in Italian, *Viſchio*: in Spaniſh, *Liga*: in the Portugal tongue, *Viſgo*: in Engliſh, Miſſel, and Miſſeltoe.

The glue which is made of the berries of Miſſel is likewiſe called *Viſcum*, and *Ixia*: in Engliſh, Bird-lime. *Ixia* is alſo called *Chamæleon albus*, by reaſon of the glue which is oft times found about the root thereof. This word is alſo aſcribed to *Chamæleon niger*, as wee reade amongſt the baſtard names. *Ixia* is likewiſe reckoned vp by *Dioſcorides, lib. 6.* and by *Paulus Ægineta, lib. 5* amongſt the poiſons: but what this poiſonſome and venomous *Ixia* is it is hard and doubtfull to declare: many would haue it to be *Chamæleon niger*: others, the glue or clammy ſubſtance which is made of the berries of Miſſeltoe; who do truly thinke that *Ixia* differeth from *Chamæleon niger*: for *Paulus Ægineta, lib. 5. cap. 30.* in reckoning vp of ſimple poiſons hath firſt made mention of *Chamæleon niger*; then a little after of *Ixia*: and whileſt he doth particularly diſcourſe of euery one, he treateth of *Chamæleon niger, cap. 32.* and of *Ixia* which he alſo nameth *Vlophonon, cap. 47.* and telleth of the dangerous and far differing accidents of them both. And *Dioſcorides* himſelfe, *lib. 6.* where he ſetteth down his iudgment of ſimple poiſons, intreateth firſt of *Chamæleon niger*, and then a little after of *Ixia*. Theſe things declare that *Chamæleon niger* differs from *Ixia*, which is reckoned among the poiſons. Moreouer, it can no where be read, that *Chamæleon niger* beareth Bird-lime, or hath ſo glutinous or clammy a ſubſtance as that it ought to be called *Ixia*: therfore *Ixia*, as it is one of the poiſons, is the glue that is made of the berries of Miſſeltoe, which becauſe it is ſharp and biting, inflameth and ſetteth the tongue on fire, and with his ſlimy and clammy ſubſtance doth ſo draw together, ſhut, and glue vp the guts, as that there is no paſſage for the excrements, which things are mentioned among the miſchiefes that *Ixia* bringeth.

‡ I can by no means approue of, or yeeld to this opinion here deliuered out of *Dodonæus* by our Author; which is, That the Bird-lime made of the berries of Miſſeltoe is poiſon; or that *Ixia* ſet forth by *Dioſcorides* and *Nicander* for a poiſon is meant of this: for this is manifeſtly treated of in *Dioſcorides, lib. 3. ca. 103.* by the name of ἰξὸς when as the other is mentioned, *lib. 6. cap. 21.* by the name of ἰξία. Alſo daily experience ſhewes this plant to haue no maligne or poiſonous, but rather a contrarie facultie, being frequently vſed in medicines againſt the Epilepſie. Such as would ſee more concerning *Ixia* or *Ixias*, let them haue recourſe to the firſt chapter of the firſt part of *Fabius Columna, de Stirpib. min. cognitis & rarioribus*, where they ſhall finde it largely treated of. ‡

¶ *The Nature and Vertues.*

A The leaues and berries of Miſſelto are hot and dry, and of ſubtill parts: the Bird-lime is hot and biting, and conſiſts of an airy and watery ſubſtance, with ſome earthy quality; for according to the iudgement of *Galen*, his acrimony ouercommeth his bitterneſſe; for if it be vſed in outward applications, it draweth humors from the deepeſt or moſt ſecret parts of the body, ſpreading and diſperſing them abroad, and digeſting them.

B It ripeneth ſwellings in the groin, hard ſwellings behinde the eares, and other impoſtumes, being tempered with roſin and a little quantitie of wax.

C With Frankincenſe it mollifieth old vlcers and malitious impoſtumes, being boiled with vnſlaked lime, or with *Gagate lapide* or *Aſio*, and applied, it waſteth away the hardneſſe of the ſpleen.

D With Orpment or *Sandaracha* it taketh away foule ilſauored nailes, being mixed with vnſlaked lime and wine lees it receiueth greater force.

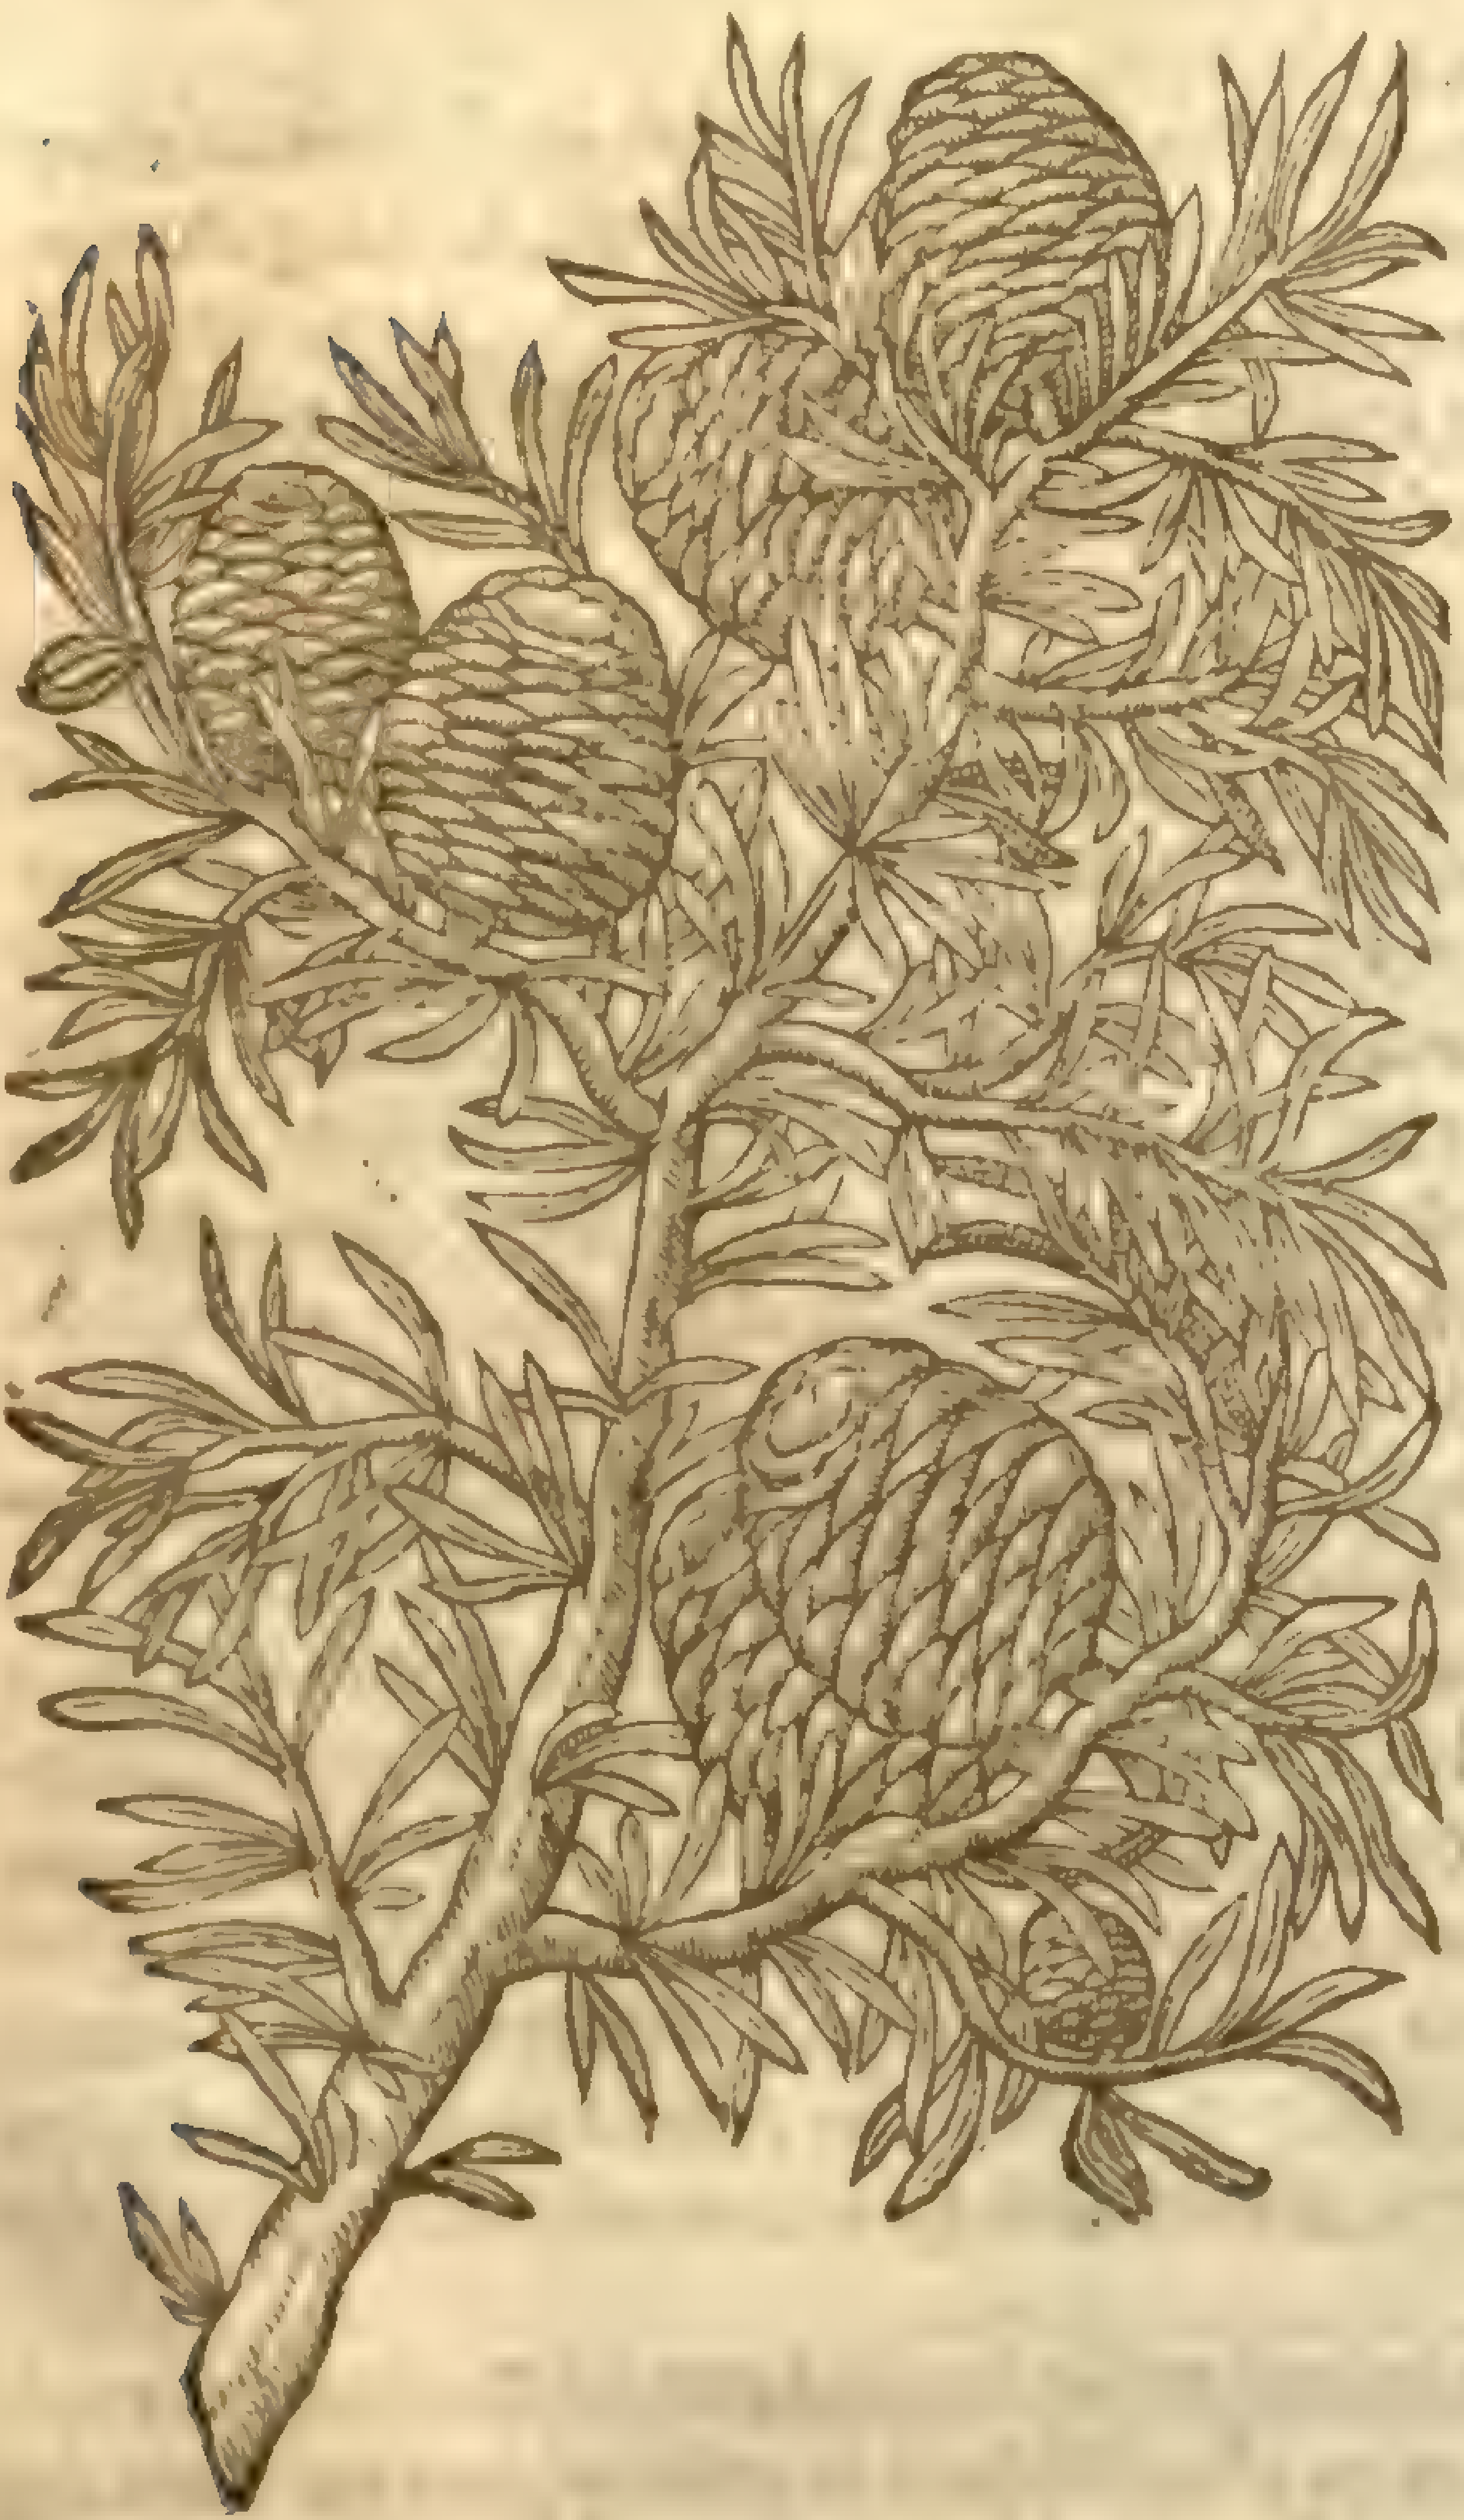
E It hath been moſt credibly reported vnto me, That a few of the berries of Miſſeltoe bruiſed and ſtrained into oile and drunken, hath preſently and forthwith rid a grieuous and ſore ſtitch.

Chap. 39. *Of the Cedar Tree,*

¶ *The Kindes.*

There be two Cedars, one great bearing cones, the other ſmall bearing berries like thoſe of Iuniper.

Cedrus Libani.
The great Cedar tree of Libanus.



Pinus Cedrus, L.
[illegible]

¶ *The Deſcription.*

The great cedar is a very big & high tree, not onely exceeding all other reſinous trees and thoſe which beare fruit like vnto it, but in his talneſſe and largeneſſe farre ſurmounting all other trees: the body or trunk thereof is commonly of a mighty bigneſſe, inſomuch as four men are not able to fathom it, as *Theophraſtus* writeth. The bark of the lower part which proceedeth out of the earth, to the firſt young branches or ſhoots, is rough and harſh; the reſt which is among the boughes is ſmooth and glib: the boughes grow forth almoſt from the bottom, and not farre from the ground, euen to the very top, waxing by degrees leſſer & ſhorter ſtil as they grow higher, the tree bearing the forme and ſhape of a Pyramide or ſharpe pointed ſteeple: theſe compaſſe the body round about in maner of a circle, and are ſo orderly placed by degrees, that a man may clymbe vp by them to the very top as by a ladder: the leaues be ſmall and round like thoſe of the Pine tree, but ſhorter, and not ſo ſharp pointed: all the cones or clogs are far ſhorter and thicker than thoſe of the Fir tree, compact of ſoft, not hard ſcales, which hang not downewards, but ſtand vpright vpon the boughes, whereunto alſo they are ſo ſtrongly faſtned, as they can hardly be pluckt off without breaking ſome part of the branches, as *Bellonius* writeth. The timber is extreame hard, and rotteth not, nor waxeth old; there is no wormes nor rottenneſſe can hurt or take the hard matter or heart of this wood, which is very odoriferous, and ſomwhat red. *Solomon* King of the Iewes did therefore build Gods Temple in Ieruſalem of Cedar wood. The Gentiles were wont to make their Diuels or Images of this kinde of wood, that they might laſt the longer.

¶ *The Place.*

The Cedar trees grow vpon the ſnowy mountaines, as in Syria vpon mount Libanus, on which there remaine ſome euen to this day, ſaith *Bellonius*, planted as is thought by *Solomon* himſelf: they are likewiſe found on the mountains Taurus and Amanus, in cold and ſtony places. The merchants of the Factorie of Tripolis told me, That the Cedar tree groweth vpon the declining of the mount Libanus, neere to the hermitage by the city Tripolis in Syria: The inhabitants of Syria vſe it to make boats of, for want of the Pine tree.

¶ *The Time.*

The Cedar tree remaines alwaies green, as other trees which beare ſuch maner of fruit: the timber of the Cedar tree, and the images and other works made thereof, ſeem to ſweat and ſend forth moiſture in moiſt and rainy weather, as do likewiſe all that haue an oily juice, as *Theophraſtus* witneſſeth.

¶ *The Names.*

The huge and mighty tree is called in Greeke κέδρος: in Latine likewiſe *Cedrus*: in Engliſh, Cedar, and Cedar tree. *Pliny, lib. 24. cap. 5.* nameth it *Cedrelate*, as though he ſhould ſay *Cedrus abies*, or *Cedrina abies*, Cedar Firre; both that it may differ from the little Cedar, and alſo becauſe it is very like the Firre tree.

The Roſin hath no proper name,but it may be named *Cedrina*,or Cedar Roſin.

The pitch which is drawne out of this is properly called κεδρία; yet *Pliny* writeth,that the liquor of the Torch tree is alſo named *Cedrium*. The beſt,ſaith *Dioſcorides*,is fat,thorow ſhining,and of a ſtrong ſmell; which being poured out in drops vniteth it ſelfe together, and doth not remain ſeuered.

¶ *The Nature and Vertues.*

Cedar is of temperature hot and dry,with ſuch an excellent tenuitie and ſubtiltie of parts, that it ſeemeth to be hot and dry in the fourth degree,eſpecially the Roſin thereof. A

There iſſueth out of this tree a roſin like to that which iſſueth out of the Fir tree, very ſweet in ſmell,of a clammy or cleauing ſubſtance,the which if you chew in your teeth it will hardly be gotten forth again,it cleaueth ſo faſt: at the firſt it is liquid and white,but being dried in the Sunne it waxeth hard: if it be boiled in the fire an excellent pitch is made thereof called Cedar pitch. B

The Egyptians were wont to coffin and embalme their Dead in Cedar and with Cedar pitch, although they vſed other means,as *Herodotus* recordeth. C

The condited or embalmed body they call in ſhops *Mumia*,but very vnfitly; for *Mumia* among the Arabians is that which the Grecians call *Piſſaſphalton*,as appeareth by *Avicen*,*cap*.474 and out of *Serapio*,*cap*.393. D

He that interpreted and tranſlated *Serapio* was the cauſe of this error, who rendred *Mumia* after his owne fancy,and not according to the ſence and meaning of his author *Serapio*,ſaying, That this *Mumia* is a compoſition of Myrrh and Aloes mingled together with the moiſture of mans body. B

The gum of Cedar is good to be put into medicines for the eies; for being anointed therewith it cleareth and clenſeth the ſight from the Haw and from ſtripes. F

Cedar infuſed in vineger and put into the eares,killeth the wormes therein; and being mingled with the decoction of Hyſſop,appeaſeth the ſounding,ringing,and hiſſing of the eares. G

If it be waſhed or infuſed in vineger,and applied to the teeth,it eaſeth the tooth-ache. H

If it be put into the hollowneſſe of the teeth,it breaketh them,and appeaſeth the extreme griefe thereof. I

It preuaileth againſt *Angina's*,and the inflammation of the tonſils,if a gargariſme be made of it. K

It is good to kill nits and lice and ſuch like vermin: it cureth the biting of the ſerpent Ceraſtes being layd on with ſalt. L

It is a remedie againſt the poiſon of the ſea Hare,if it be drunke with ſweet wine. M

It is good alſo for Lepers: being put vp underneath it killeth all manner of wormes,and draweth forth the birth,as *Dioſcorides* writeth. N

Chap. 40. *Of the Pitch tree.*

¶ *The Deſcription.*

† 1 Picea, the tree that droppeth pitch,called Pitch tree,groweth vp to be a tall faire and big tree,remaining alwaies green like the Pine tree: the timber of it is redder than that of the Pine or Fir: it is ſet full of boughes not onely about the top, but much lower,& alſo beneath the middle part of the body,which many times hang down,bending toward the ground: the leaues be narrow,not like thoſe of the Pine tree, but ſhorter and narrower, ſharpe pointed like them,yet are they blacker,and withall couer the yong and tender twigs in manner of a circle,like thoſe of the Fir tree; but being many,and thick ſet,grow forth on all ſides,and not onely one right againſt another,as in the Yew tree: the fruit is ſcaly,and like vnto the Pine apple, but ſmaller: the barke of the tree is ſomewhat blacke,tough,and flexible, not brittle as is the barke of the Fir tree; vnder which next to the wood is gathered a reſin,which many times iſſueth forth,and is like to that of the Larch tree.

‡ 2 Of this ſort(ſaith *Cluſius*)there is found another that neuer growes high, but remaineth dwarfiſh,and it caries certain little nugaments or catkins of the bigneſſe of a ſmall nut,compoſed of ſcales lying one vpon another,and ending in a prickly leaf, which in time opening ſhew certain empty cauities or cels: from the tops of theſe ſomtimes grow forth brauches ſet with many ſhort and pricking little leaues: all the ſhrub hath ſhorter and paler coloured leaues than the former. I obſerued neither fruit nor floure on this,neither know I whether it carry any. *Dalechampius* ſeems to haue known this,and to haue called it *Pinus Tubulus* or *Tibulus*. ‡

1 *Picea major.*
The Pitch tree.

‡ 2 *Picea pumila.*
The dwarfe Pitch tree.

¶ *The Place.*

The Pitch tree groweth in Greece, Italy, France, Germany, and all the cold Regions euen vnto Ruſſia.

¶ *The Time.*

The fruit of the Pitch tree is ripe in the end of September.

¶ *The Names.*

The Grecians call this Cone tree πίτυς: the Latines, *Picea,* and not *Pinus*; for *Pinus,* or the Pine tree, is the Grecians πεύκη, as ſhall be declared: that πίτυς is named in Latine *Picea, Scribonius Largus* teſtifieth in his 201 Compoſition, writing after this manner: *Reſinæ pituinæ, i. ex Picea arbore,* ſignifying in Engliſh, of the roſin of the tree *Pitys,* that is to ſay, of the Pitch tree. With him doth *Pliny* agree, *lib.* 16. *cap.* 10. where hee tranſlating *Theophraſtus* his words concerning *Peuce* and *Pitys,* doth tranſlate *Pitys, Picea,* although for *Peuce* he hath written *Larix,* as ſhall be declared. *Pliny* writeth thus, *Larix vſtis radicibus non repullulat:* and the Larch tree doth not ſpring vp againe when the roots are burnt: the Pitch tree ſpringeth vp again, as it hapned in Lesbos, when the wood Pyrthæus was ſet on fire. Moreouer, the wormes *Pityocampæ* are ſcarce found in any tree but onely in the Pitch tree, as *Bellonius* teſtifieth. So that they are not raſhly called *Pityocampæ,* or the wormes of the Pitch tree; although moſt of the Tranſlators name them *Pinorum erucæ,* or the Wormes of the Pine trees: and therefore *Pitys* is ſyrnamed by *Theophraſtus,* φθειροποιός, becauſe Wormes and magots are bred in it. But foraſmuch as the name *Pitys* is common both to the tame Pine, and alſo to the Pitch tree, diuers of the later writers do for this cauſe ſuppoſe that the Pitch tree is named by *Theophraſtus,* πιτυάγρια, or the wilde Pine tree. This *Picea* is named in high-Dutch, **Schwartz Tannebaum,** and **Rot Tannebaum,** and oftentimes alſo **Jozenholtz,** which name notwithſtanding agreeth alſo with other plants: in Engliſh, Pitch tree: in low-Dutch, **Peck boom,**

¶ *The Temperature and Vertues.*

The leaues, bark, and fruit of the Pitch tree are all of one nature, vertue, and operation, and of the ſame facultie with the Pines.

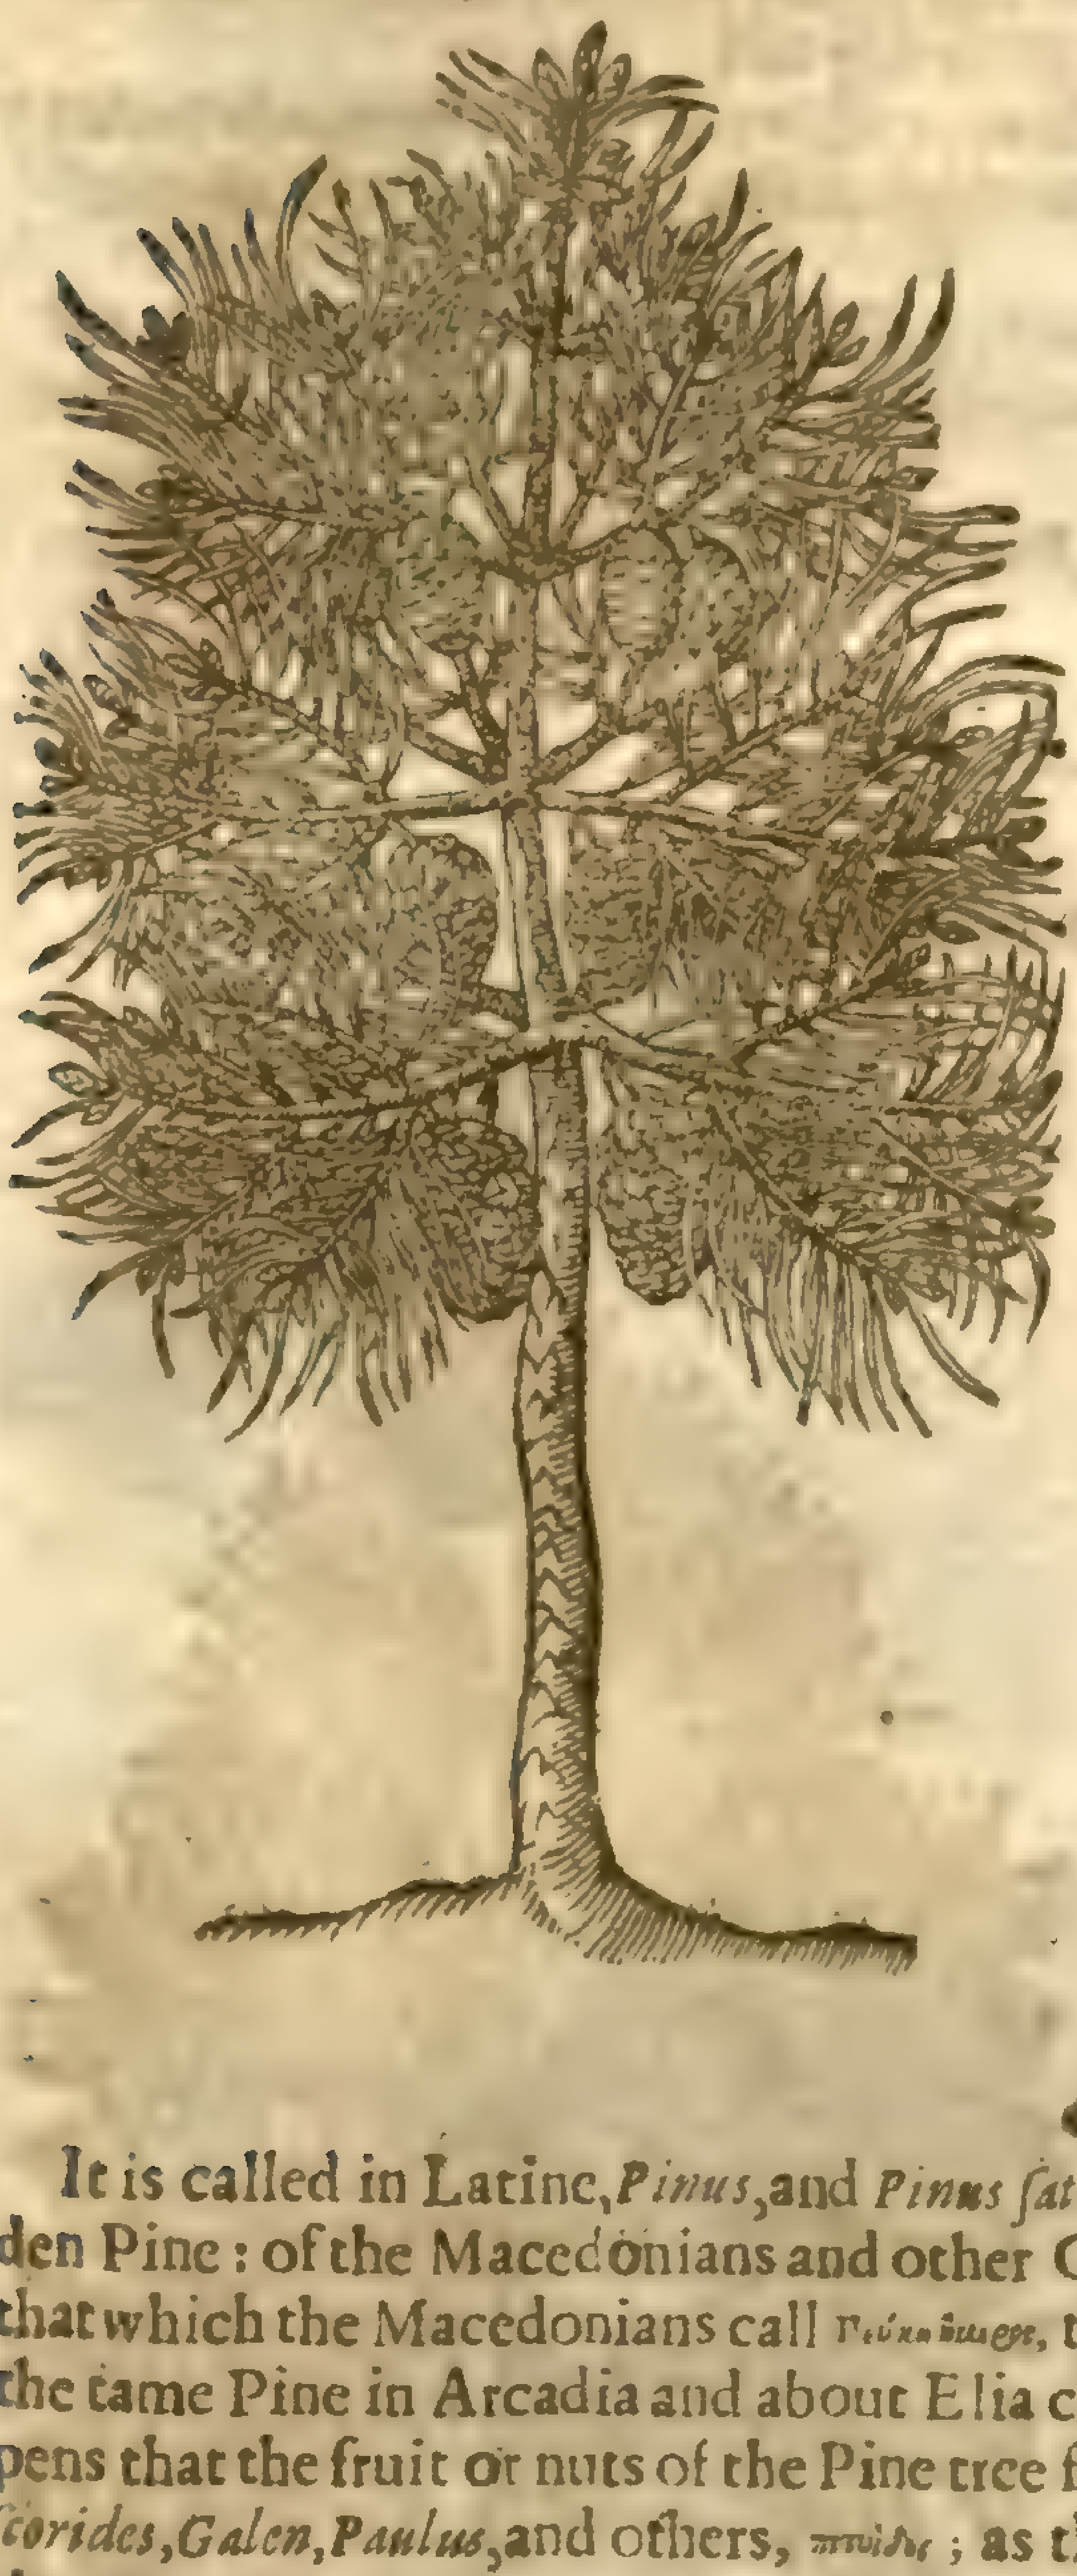
Chap.

CHAP. 41. *Of the Pine Tree.*

¶ *The Kindes.*

THe Pine tree is of two ſorts, according to *Theophraſtus*: the one ἥμερος, that is to ſay, tame, or of the garden; the other ἄγρια, or wild: hee ſaith that the Macedonians doe adde a third, which is ἄκαρπος, barren or without fruit, which is to vs vnknowne: the later writers haue found more, as ſhall be declared.

Pinus ſativa, ſive domeſtica.
The tame or manured Pine tree.



¶ *The Deſcription.*

THe Pine tree growes high and great in the trunke or body, which below is naked, but aboue is clad with a multitude of boughes which diuide themſelues into diuers branches, whereon are ſet ſmall leaues, very ſtraight, narrow, ſomwhat hard and ſharp pointed: the wood or timber is hard, heauy, about the heart or middle full of an oilous liquor, and of a reddiſh colour: the fruit or clogs are hard, great, and conſiſt of many ſound woody ſcales, vnder which are included certaine knobs without ſhape, couered with a woodden ſhell like ſmall nuts, wherin are white kernels, long, very ſweet, and couered with a thin skin or membrane, that eaſily is rubbed off with the fingers, which kernell is vſed in medicine.

¶ *The Place.*

This tree groweth of it ſelf in many places of Italy, and eſpecially in the territory of Rauenna, and in Languedoc, about Marſiles, in Spaine, and in other hot regions, as in the Eaſt countries. It is alſo cheriſhed in the gardens of pleaſure, both in the Low-countries and England.

¶ *The Time.*

The Pine tree groweth greene both Winter and Summer: the fruit is commonly two yeares before it be ripe: wherefore it is not to be found without ripe fruit, and alſo others as yet very ſmall and not come to ripeneſſe.

¶ *The Names.*

It is called in Latine, *Pinus*, and *Pinus ſativa, Vrbana*, or rather *Manſueta*: in Engliſh, tame or garden Pine: of the Macedonians and other Grecians, πεύκη ἥμερος; but the Arcadians name it πίτυς, for that which the Macedonians call Πεύκη ἥμερος, the Arcadians name Πίτυς, as *Theophraſtus* ſaith: & ſo doth the tame Pine in Arcadia and about Elia change her name: and by this alteration of them it happens that the fruit or nuts of the Pine tree found in the cones or apples, be named in Greek by *Dioſcorides, Galen, Paulus*, and others, πιτυΐδες; as though they ſhould terme it *Pityos fructus*, or the fruit of the Pine tree.

There is alſo another Πεύκη: in Latine, *Picea*, or the Pitch tree, which differeth much from the pine tree: but *Pytis* of Arcadia differeth nothing from the Pine tree, as we haue ſaid.

The fruit or apples of theſe be called in Greeke, κῶνοι, and in Latine *Coni*: notwithſtanding *Conos* is a common name to all the fruits of theſe kinde of trees: they be alſo named in Latine, *Nuces pineæ*: by *Mneſitheus* in Greek ςροβιλίδες, by *Diocles Cariſtius*, πιτυΐνα κάρυα, which be notwithſtanding the fruit or clogs of the tree that *Theophraſtus* nameth Πεύκη, or the wilde Pine tree, as *Athenæus* ſaith. It is thought that the whole fruit is called by *Galen* in his fourth commentary vpon *Hippocrates* books of diet in ſharp diſeaſes, *Strobilos*: yet in his ſecond book of the Faculties of nouriſhments he doth not call *Conos* or the apple by the name of *Strobilos*, but the nuts contained in it. And in like manner in his ſeuenth booke of the faculties of ſimple medicines; The Pine apple fruit, ſaith he, which they call *Coccalus* and *Strobilus*, as we haue ſaid before, that theſe are named in Greeke πιτυΐδες. This apple is called in high-Dutch, **Zyrbel**: in low-Dutch, **Pijn appel**: in Engliſh, Pine apple, Clog, and Cone.

¶ *The Temperature and Vertues.*

A The kernels of theſe nuts concoct and moderately heate, being in a mean between cold and hot: they make rough parts ſmooth, are a remedy againſt an old cough, and long infirmities of the cheſt, being taken by themſelues or with hony, or elſe with ſome other licking thing.

B It cureth the Ptyſicke, and thoſe that pine and conſume away through the rottenneſſe of their lungs: it recouereth ſtrength, nouriſheth, and is reſtoratiue to the body.

C It yeeldeth a thick and good juice, and nouriſheth much, yet is it not altogether of good digeſtion, and therefore it is mixed with preſerues, and boiled with ſugar.

D The ſame is good againſt the ſtone in the kidnies, and againſt frettings of the bladder, and ſcalding of vrine, for it allayeth the ſharpneſſe, mitigateth pain, and gently prouoketh vrine: moreouer it increaſeth milke and ſeed, and therefore it alſo prouoketh fleſhly luſt.

E The whole cone or apple being boiled with freſh Horehound, ſaith *Galen*, and afterwards boiled again with a little hony vntill the decoction be come to the thickneſſe of honey, maketh an excellent medicine for to clenſe the cheſt and lungs.

F The like ſaith *Dioſcor.* The whole cones (ſaith he) newly gathered from the trees, broken and boiled in ſweet wine are good for an old cough, and conſumption of the lungs, if a good draught of the liquor be drunke euery day.

G The ſcales of the Pine apple, with the barke of the tree, ſtop the laske and bloudy flixe, prouoke vrine, and the decoction alſo hath the like propertie.

Chap. 42. *Of the wilde Pine tree.*

1 *Pinus ſylveſtris.*
The wilde Pine tree.

[illegible]

2 *Pinus ſylveſtris mugo.*
The low wilde Pine tree.

[illegible]

¶ The

¶ *The Deſcription.*

1 THe firſt kinde of wilde Pine tree groweth very great, but not ſo high as the former, beeing the tame or mannured Pine tree: the barke thereof is glib; the branches are ſpred abroad, beſet with long ſharpe pointed leaues: the fruit is ſomewhat like the tame Pine tree, with ſome roſin therein, and ſweet of ſmell, which doth eaſily open it ſelfe, and quickly falleth from the tree.

2 The ſecond kinde of wilde Pine tree groweth not ſo high as the former, neither is the ſtem growing ſtraight vp, but yet it bringeth forth many branches, long, ſlender, and ſo eaſie to bee bent or bowed, that hereof they make hoops for wine hogſheads and tuns: the fruit of this Pine is greater than the fruit of any of the other wilde Pines.

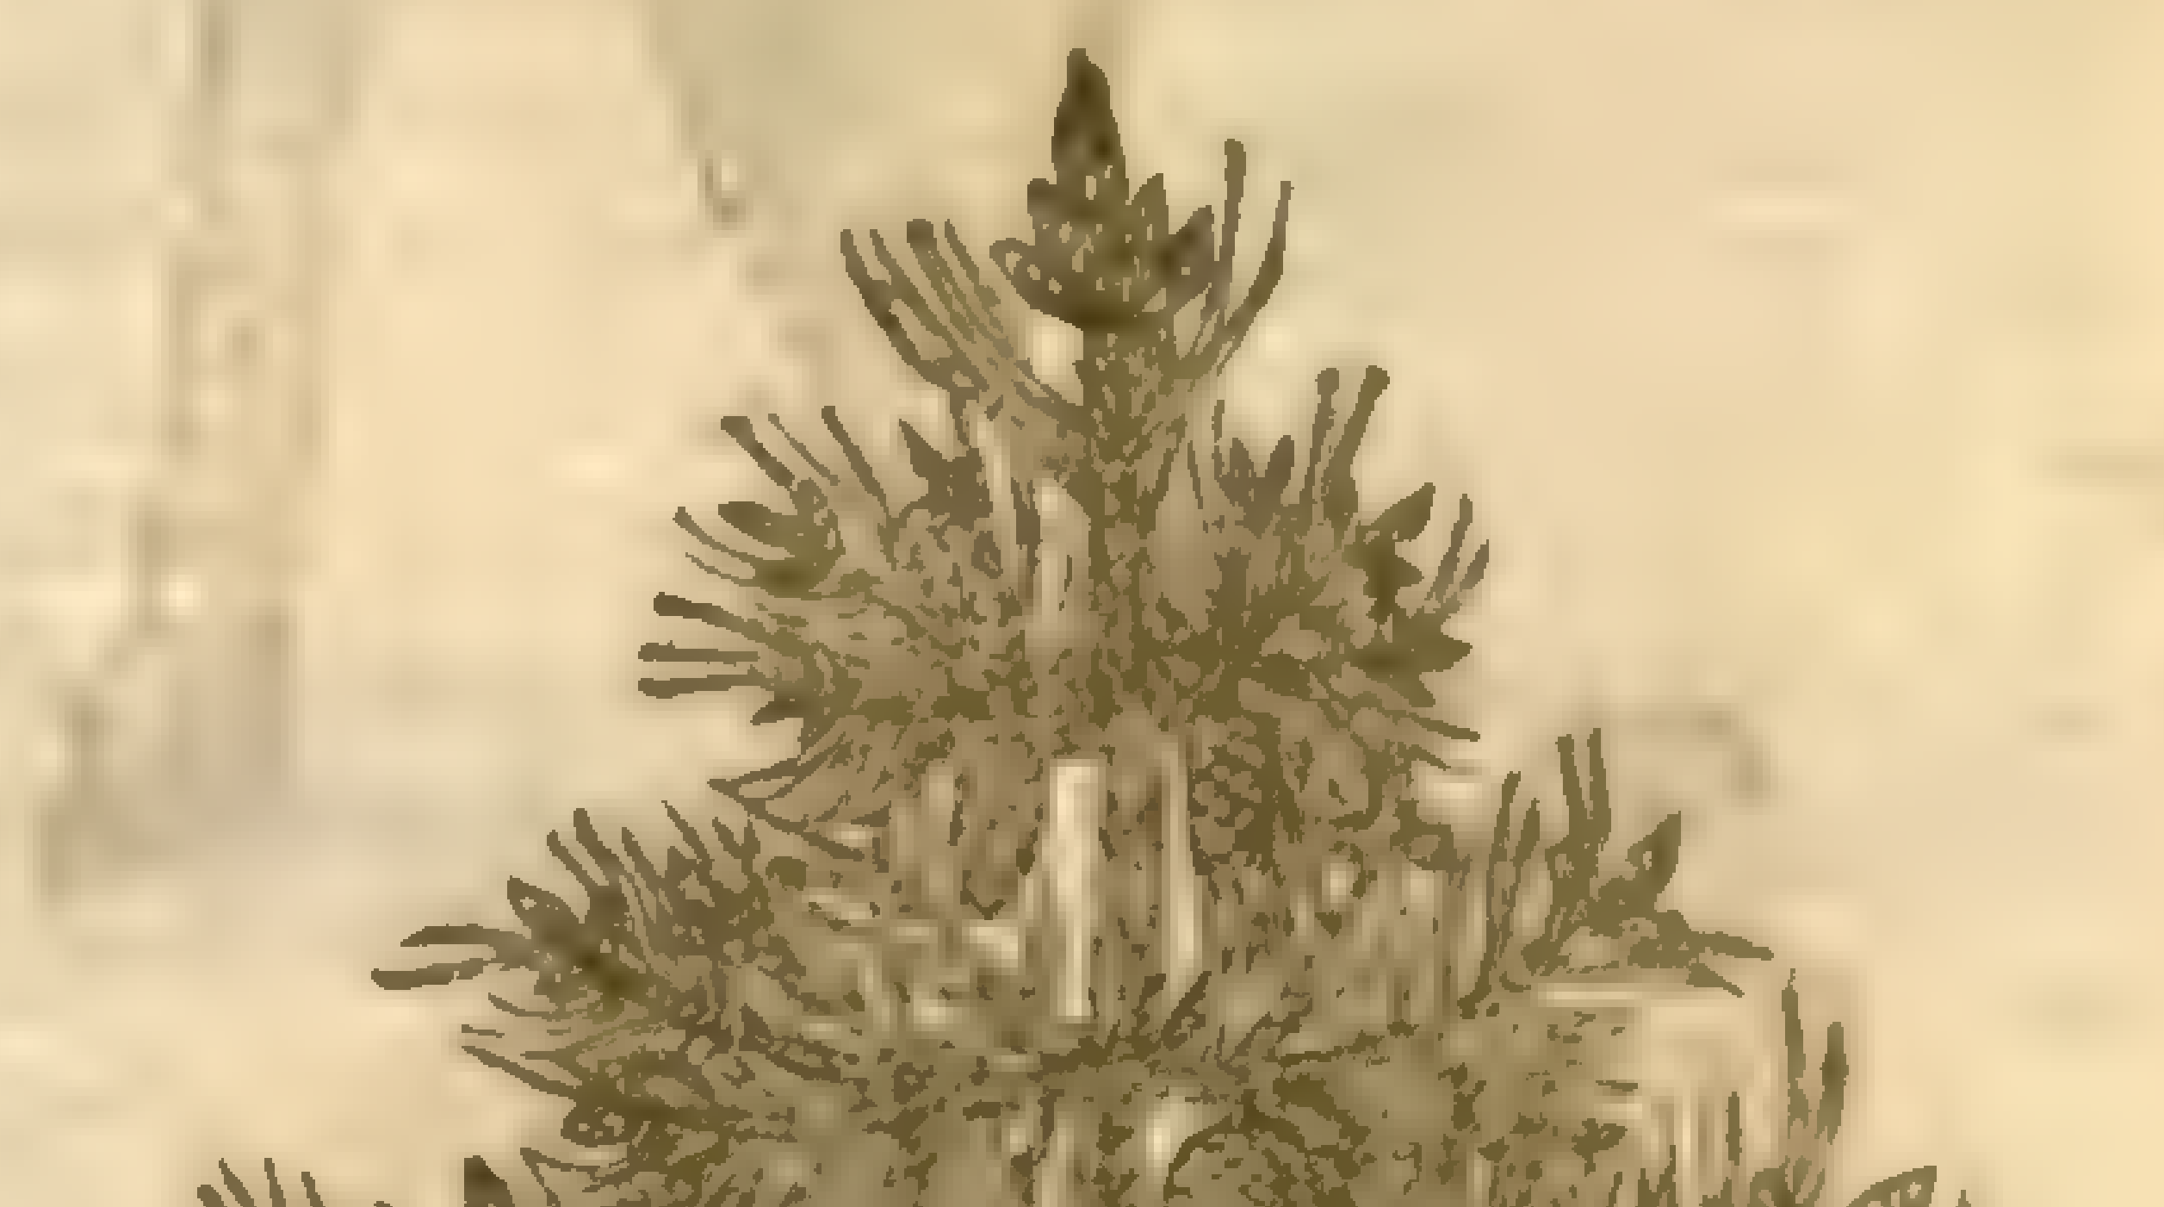
3 The third kinde of wild Pine tree groweth ſtraight vpright, and waxeth great and high, yet not ſo high as the other wilde kindes: the branches grow like the Pitch tree, the fruit is long and big, almoſt like the fruit of the ſaid Pitch tree; wherein are contained ſmal triangled nuts like the nuts of the Pine apple tree, but ſmaller, and more brittle: in which is contained a kernell of a good taſt, like the kernel of the tame Pine apple: the wood is beautiful, and ſweet of ſmell, good to make tables and other works of.

4 There is another wilde Pine of the mountaine, not differing from the precedent but in ſtature, growing for the moſt part like an hedge tree, wherein is the difference.

3 *Pinus ſylveſtris montana.*
The mountain wilde Pine tree.

P. maritima, Cam. Ic. Ord. 56,

4 *Pinus montana minor.*
The ſmaller wilde Pine tree.

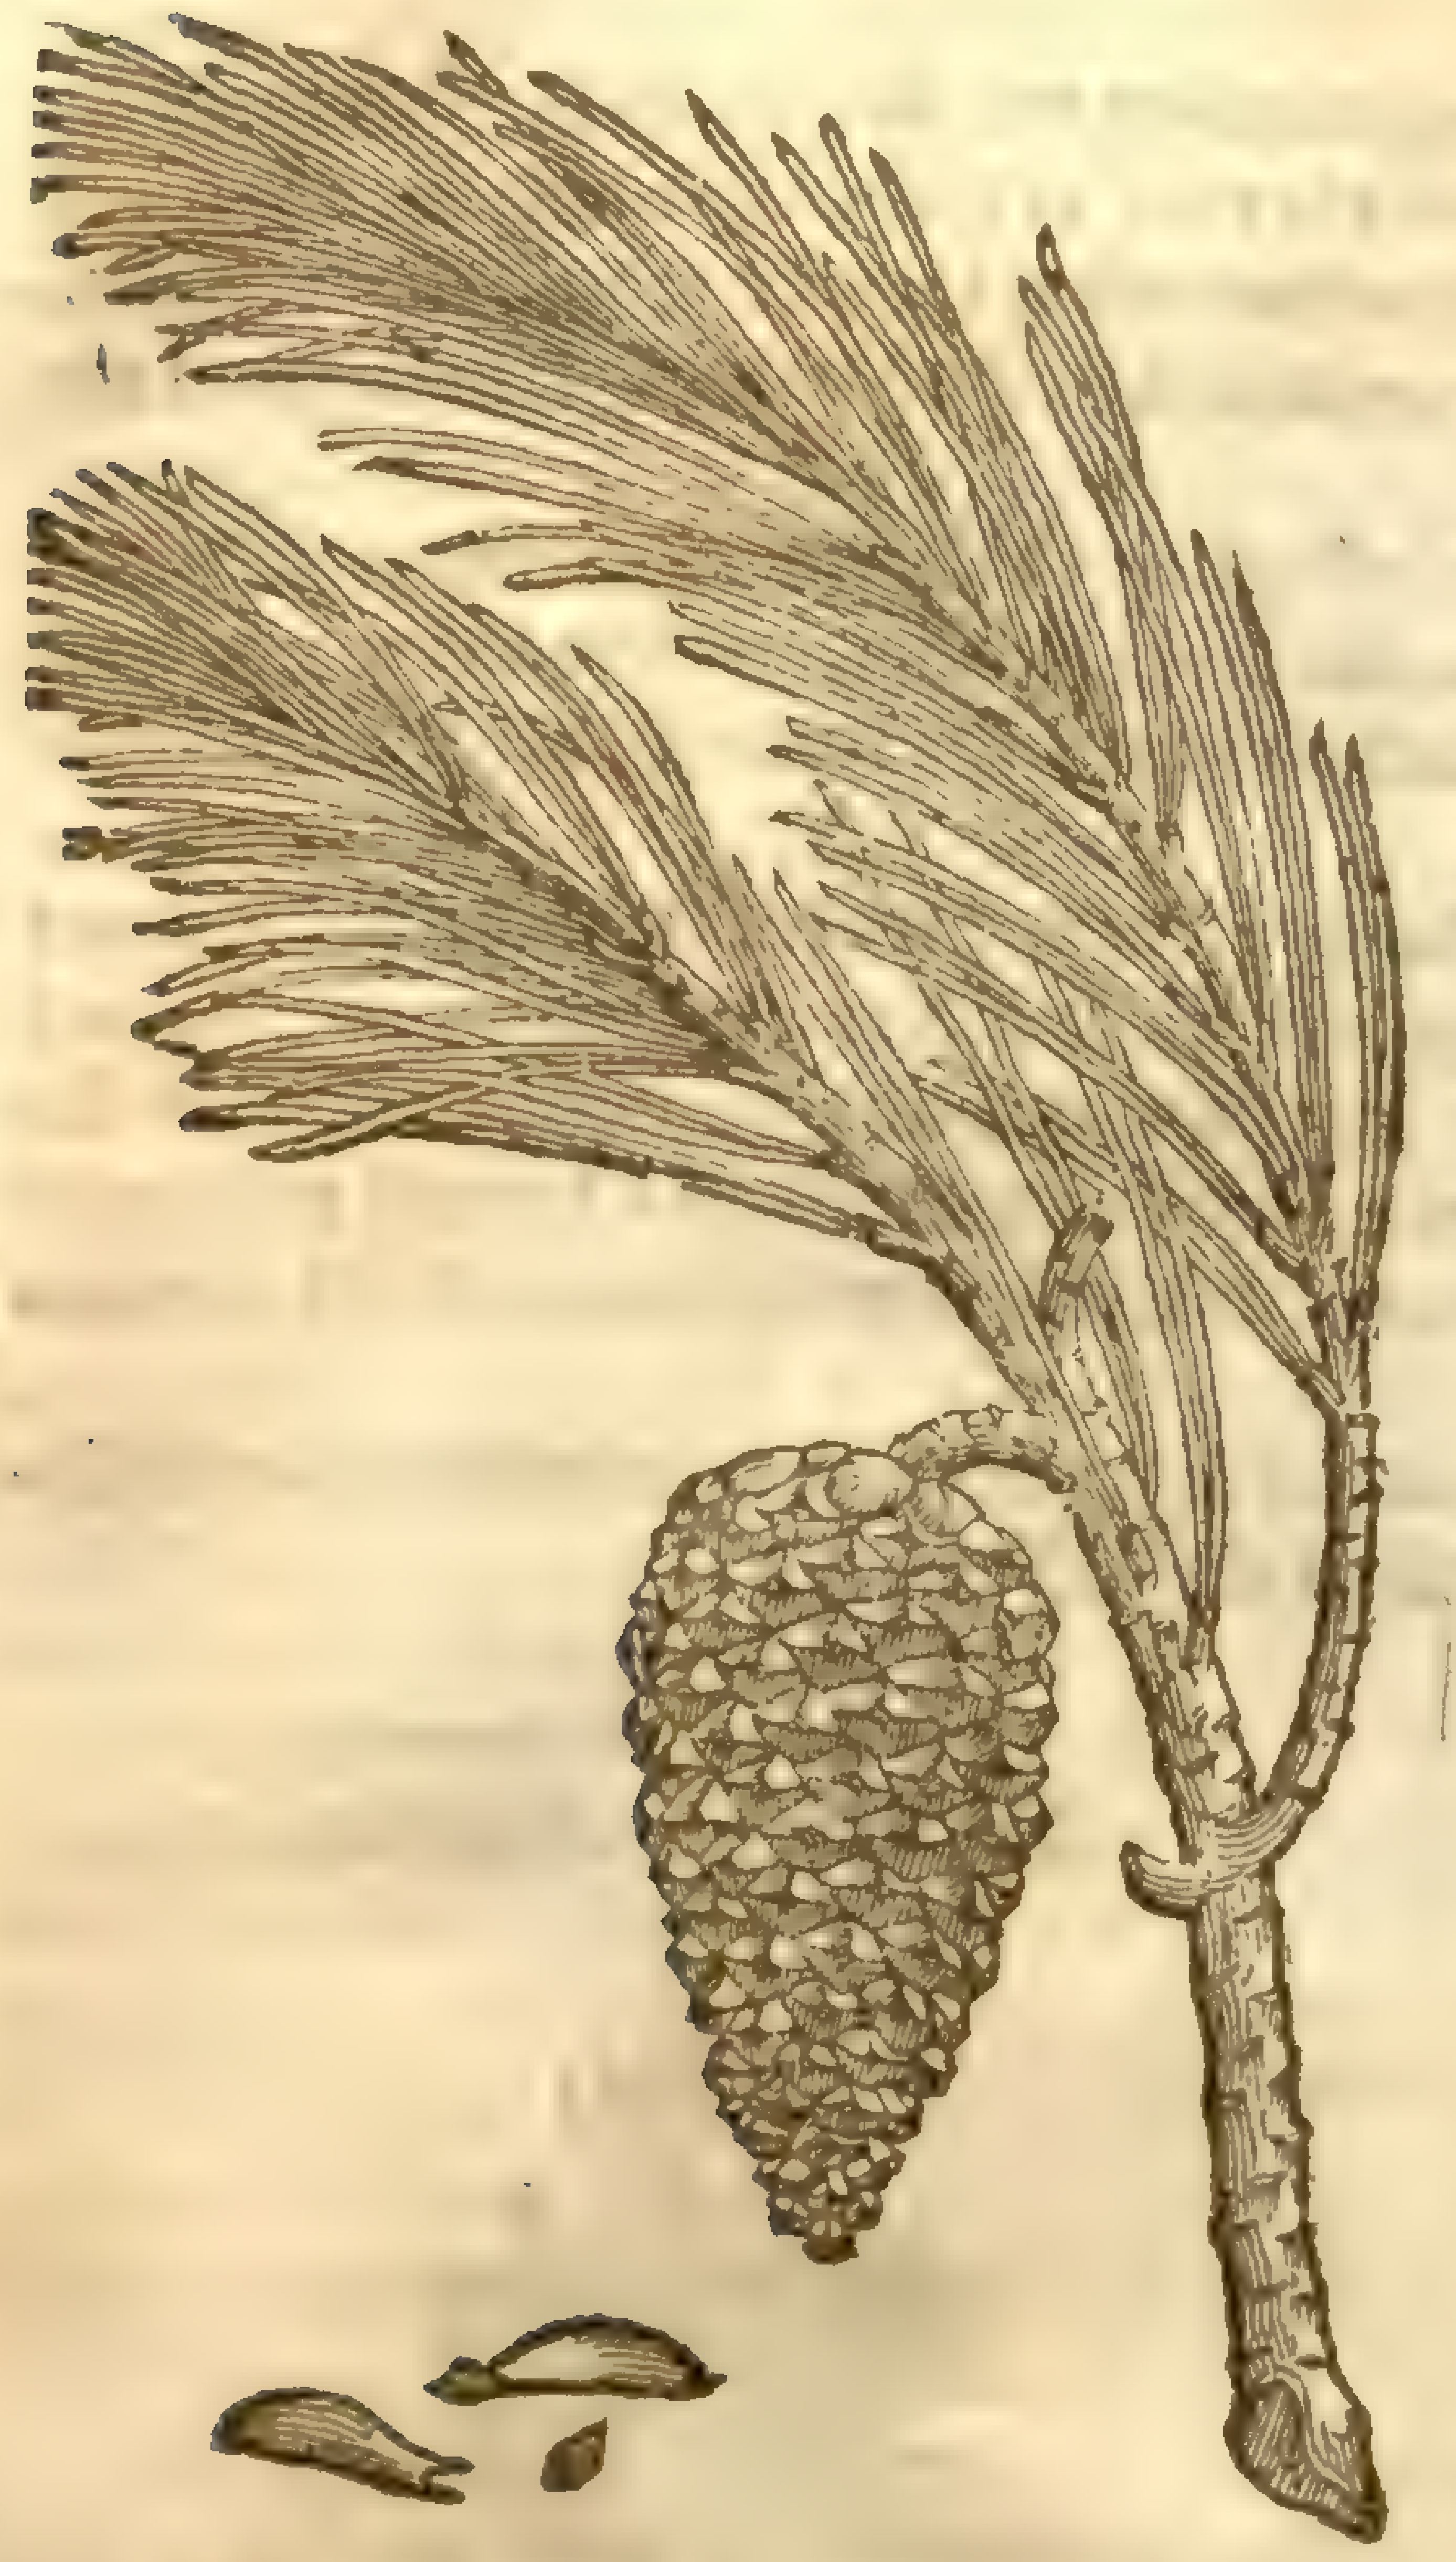


5 This kinde of Pine, called the ſea Pine tree, groweth not aboue the height of two men, hauing leaues like the tame Pine tree, but ſhorter: the fruit is of the ſame form, but longer, ſomwhat faſhioned like a Turnep. This tree yeeldeth very much roſin. ‡ *Bauhine* iudgeth this all one with the third. ‡

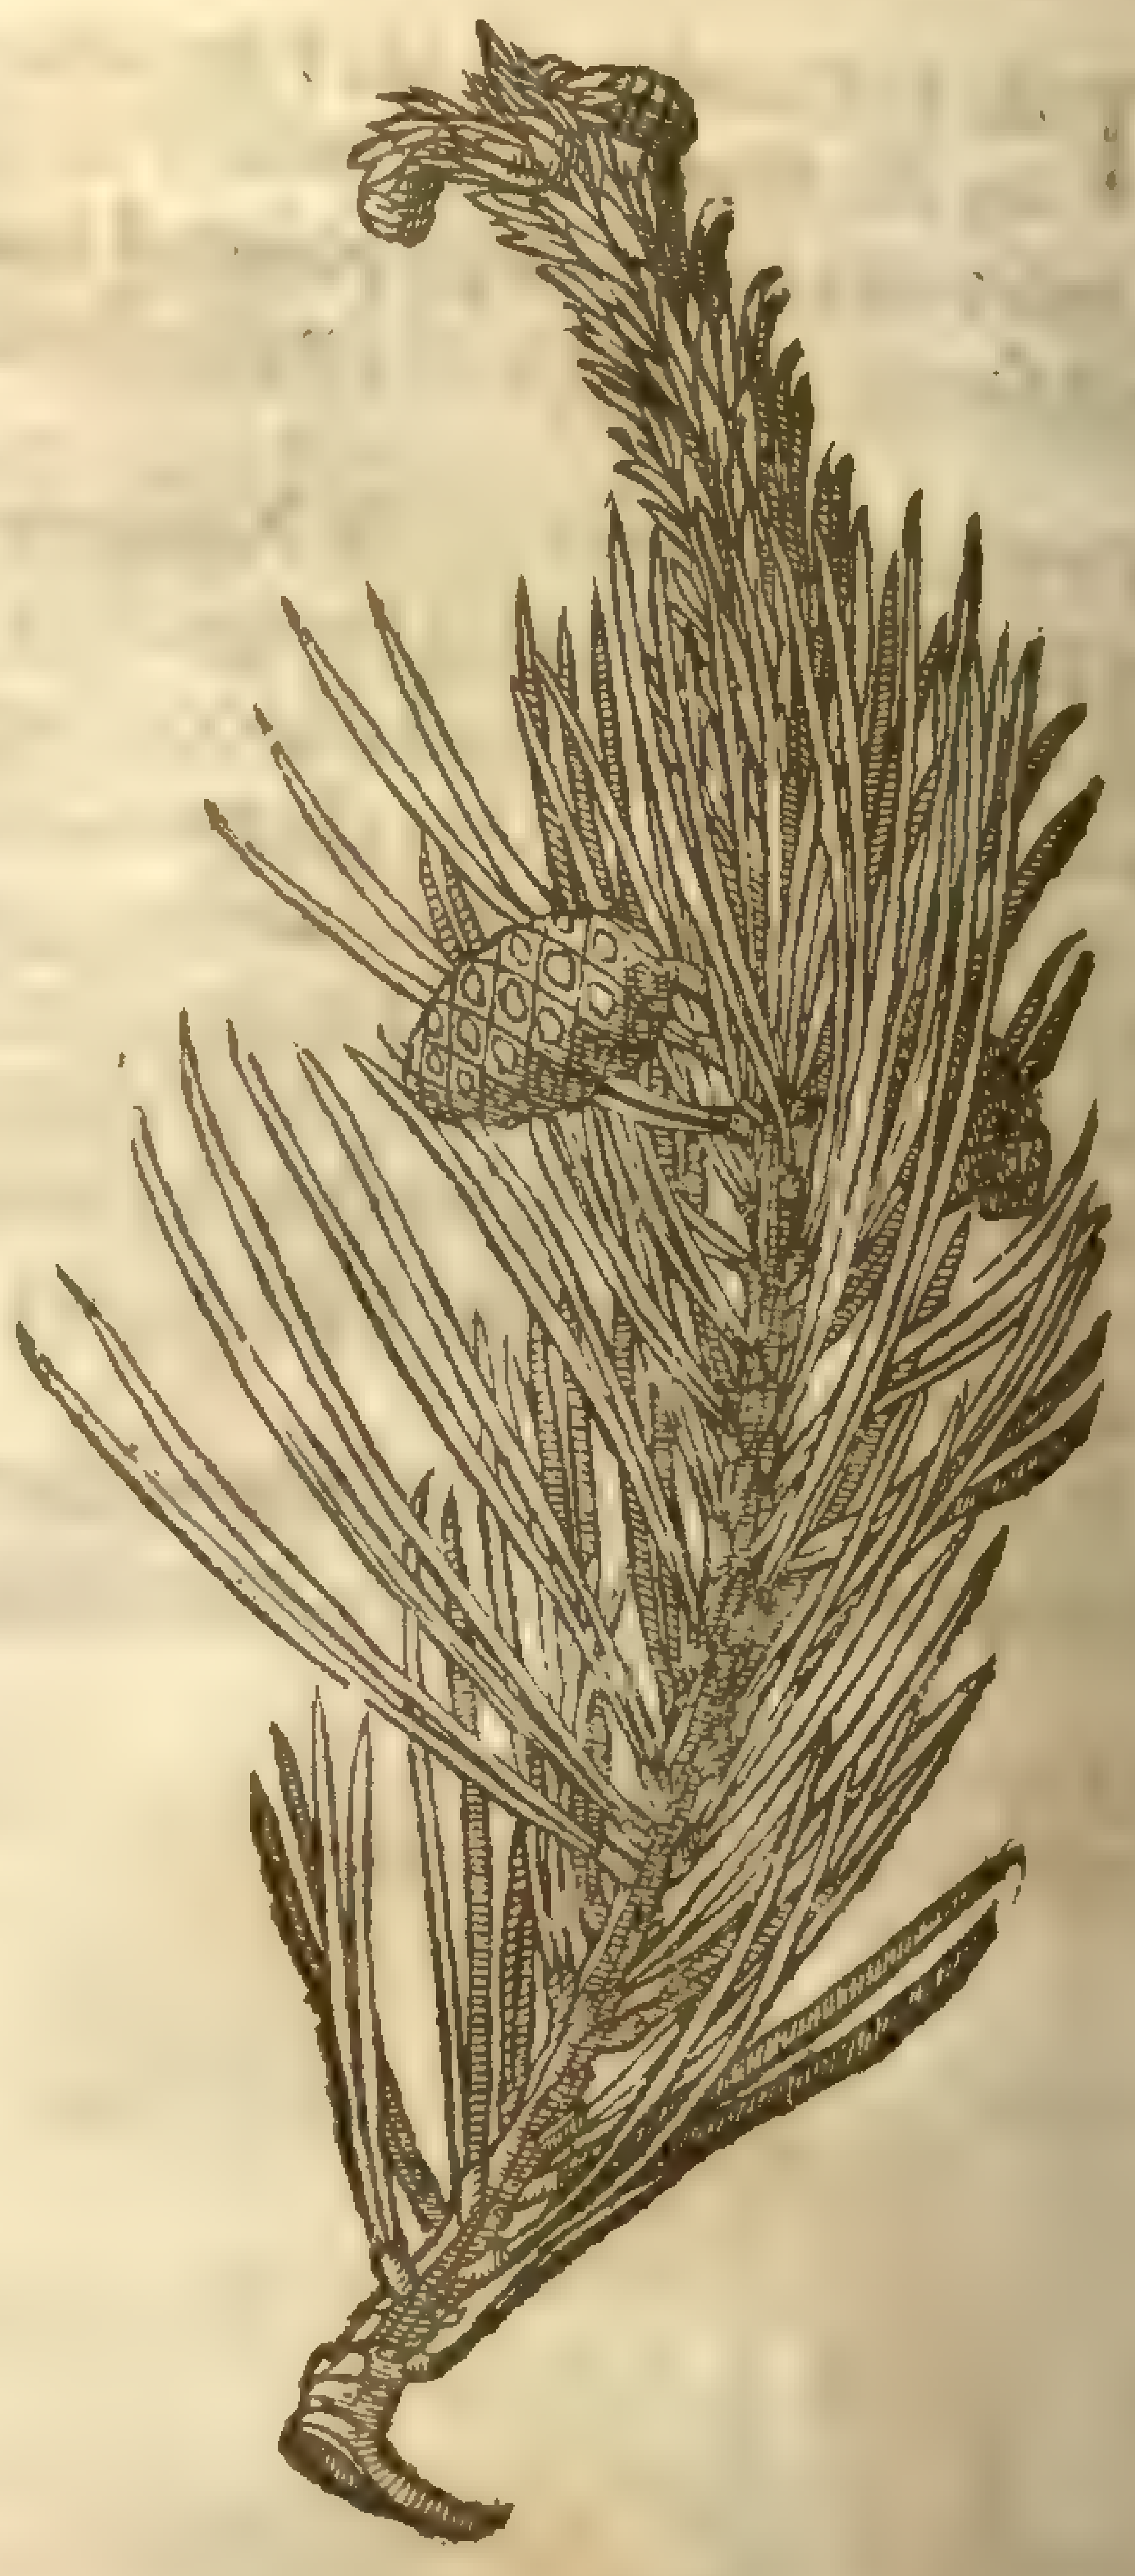
6 The ſixt kind of wilde Pine, being one of the ſea Pines, groweth like an hedge tree or ſhrub ſeldome exceeding the height of a man, with little leaues like thoſe of the Larch tree, but alwayes continuing with a very little cone and fine ſmall kernell.

7 The baſtard wilde Pine tree groweth vp to a meane height, the trunke or body, as alſo the branches

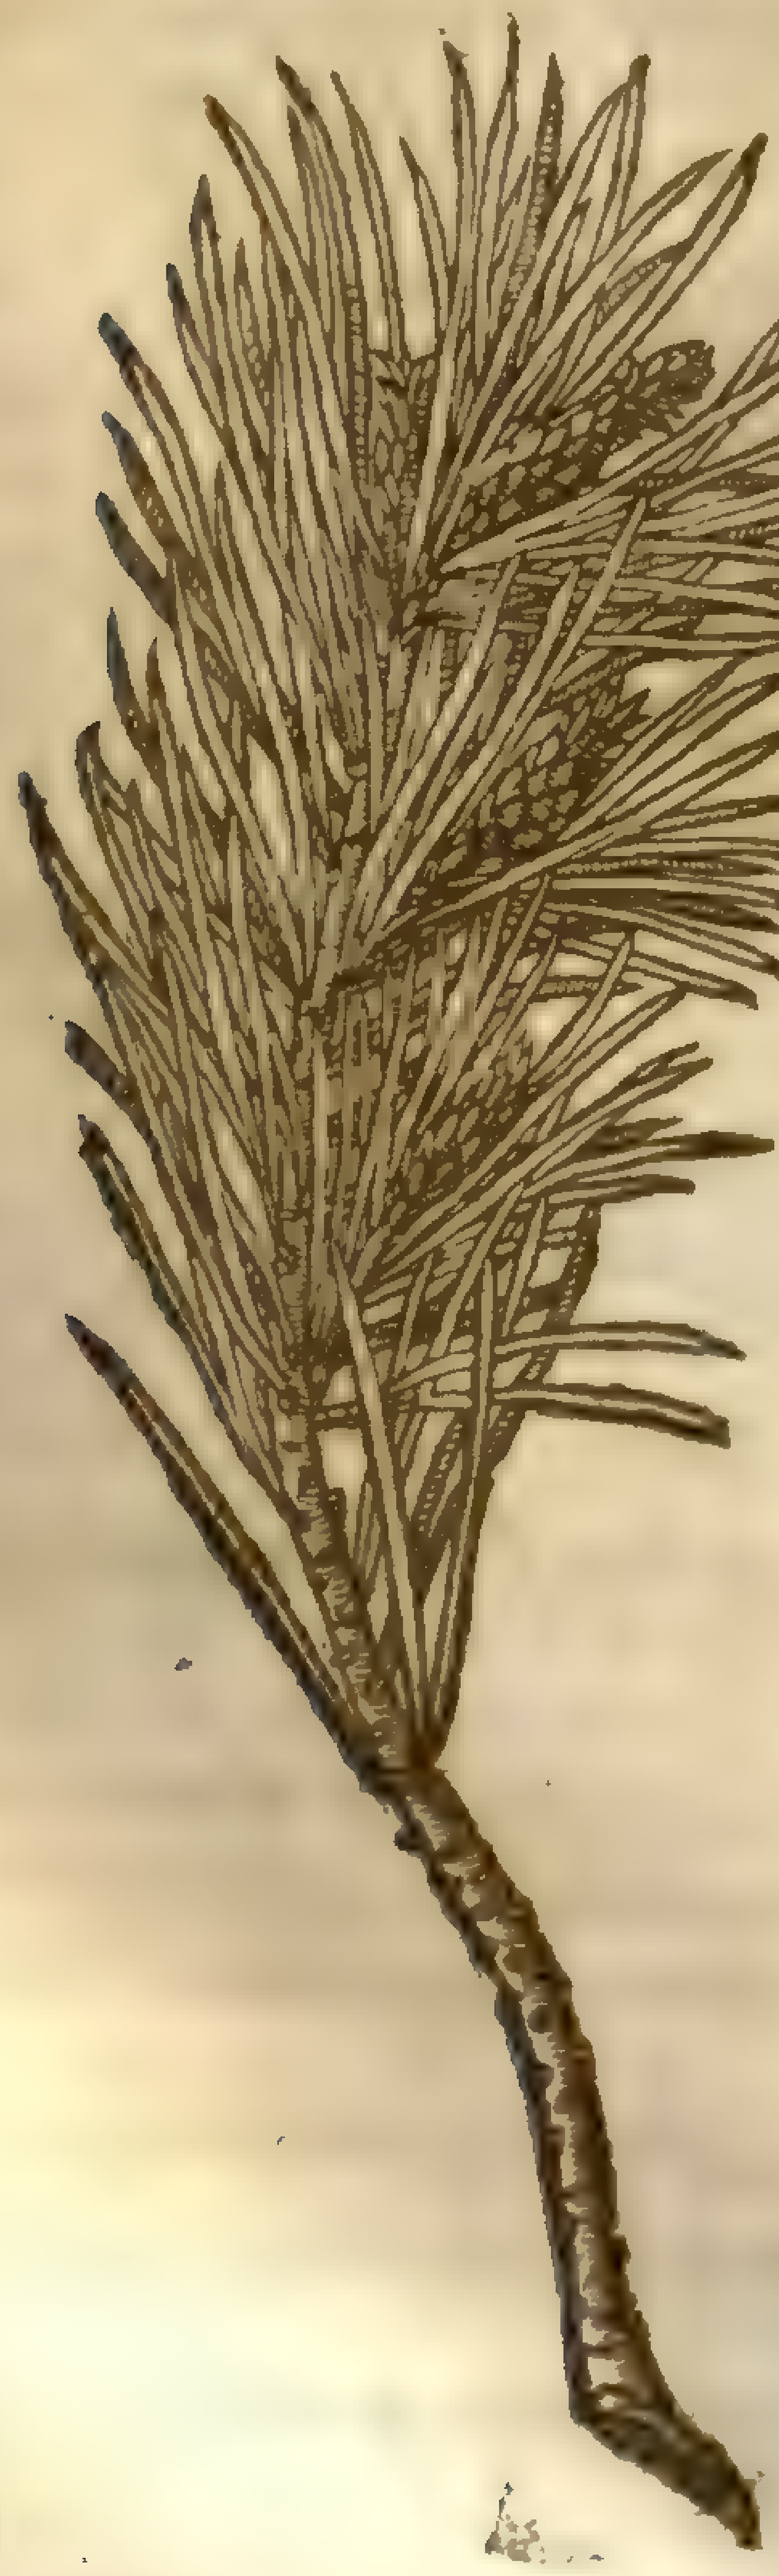
5 *Pinus maritima major.*
The great ſea Pine tree.



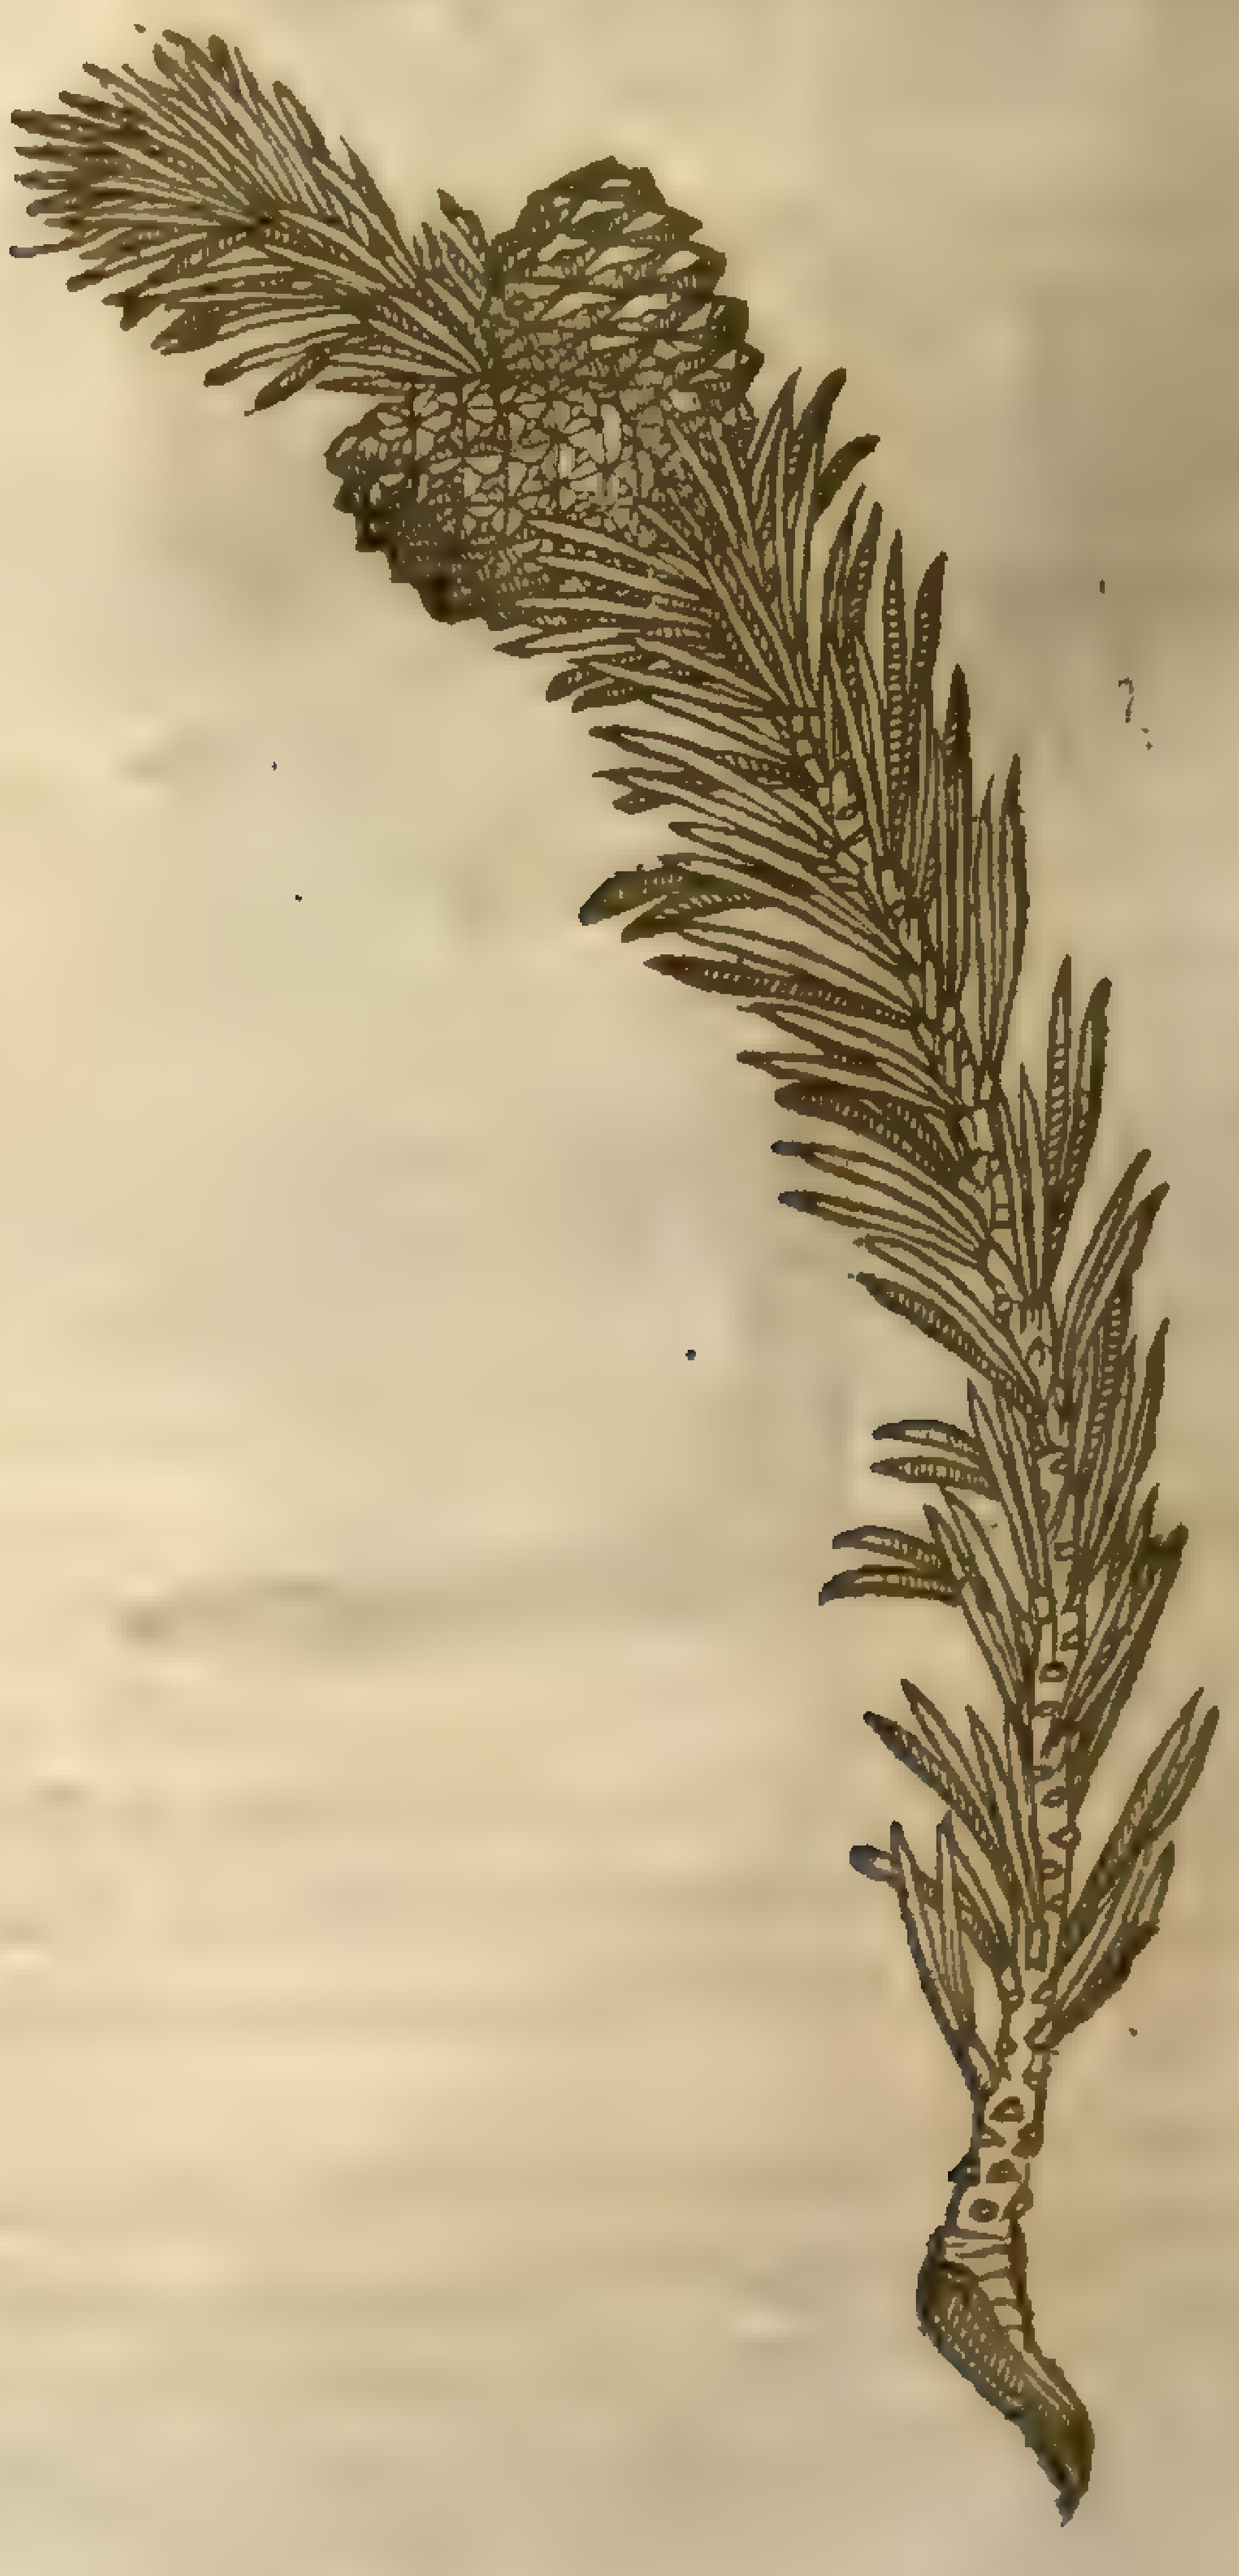
6 *Pinus ſylveſtris minor.*
The little ſea Pine tree.



7 *Teda, ſive Pſeudopinus.*
The baſtard wild Pine.

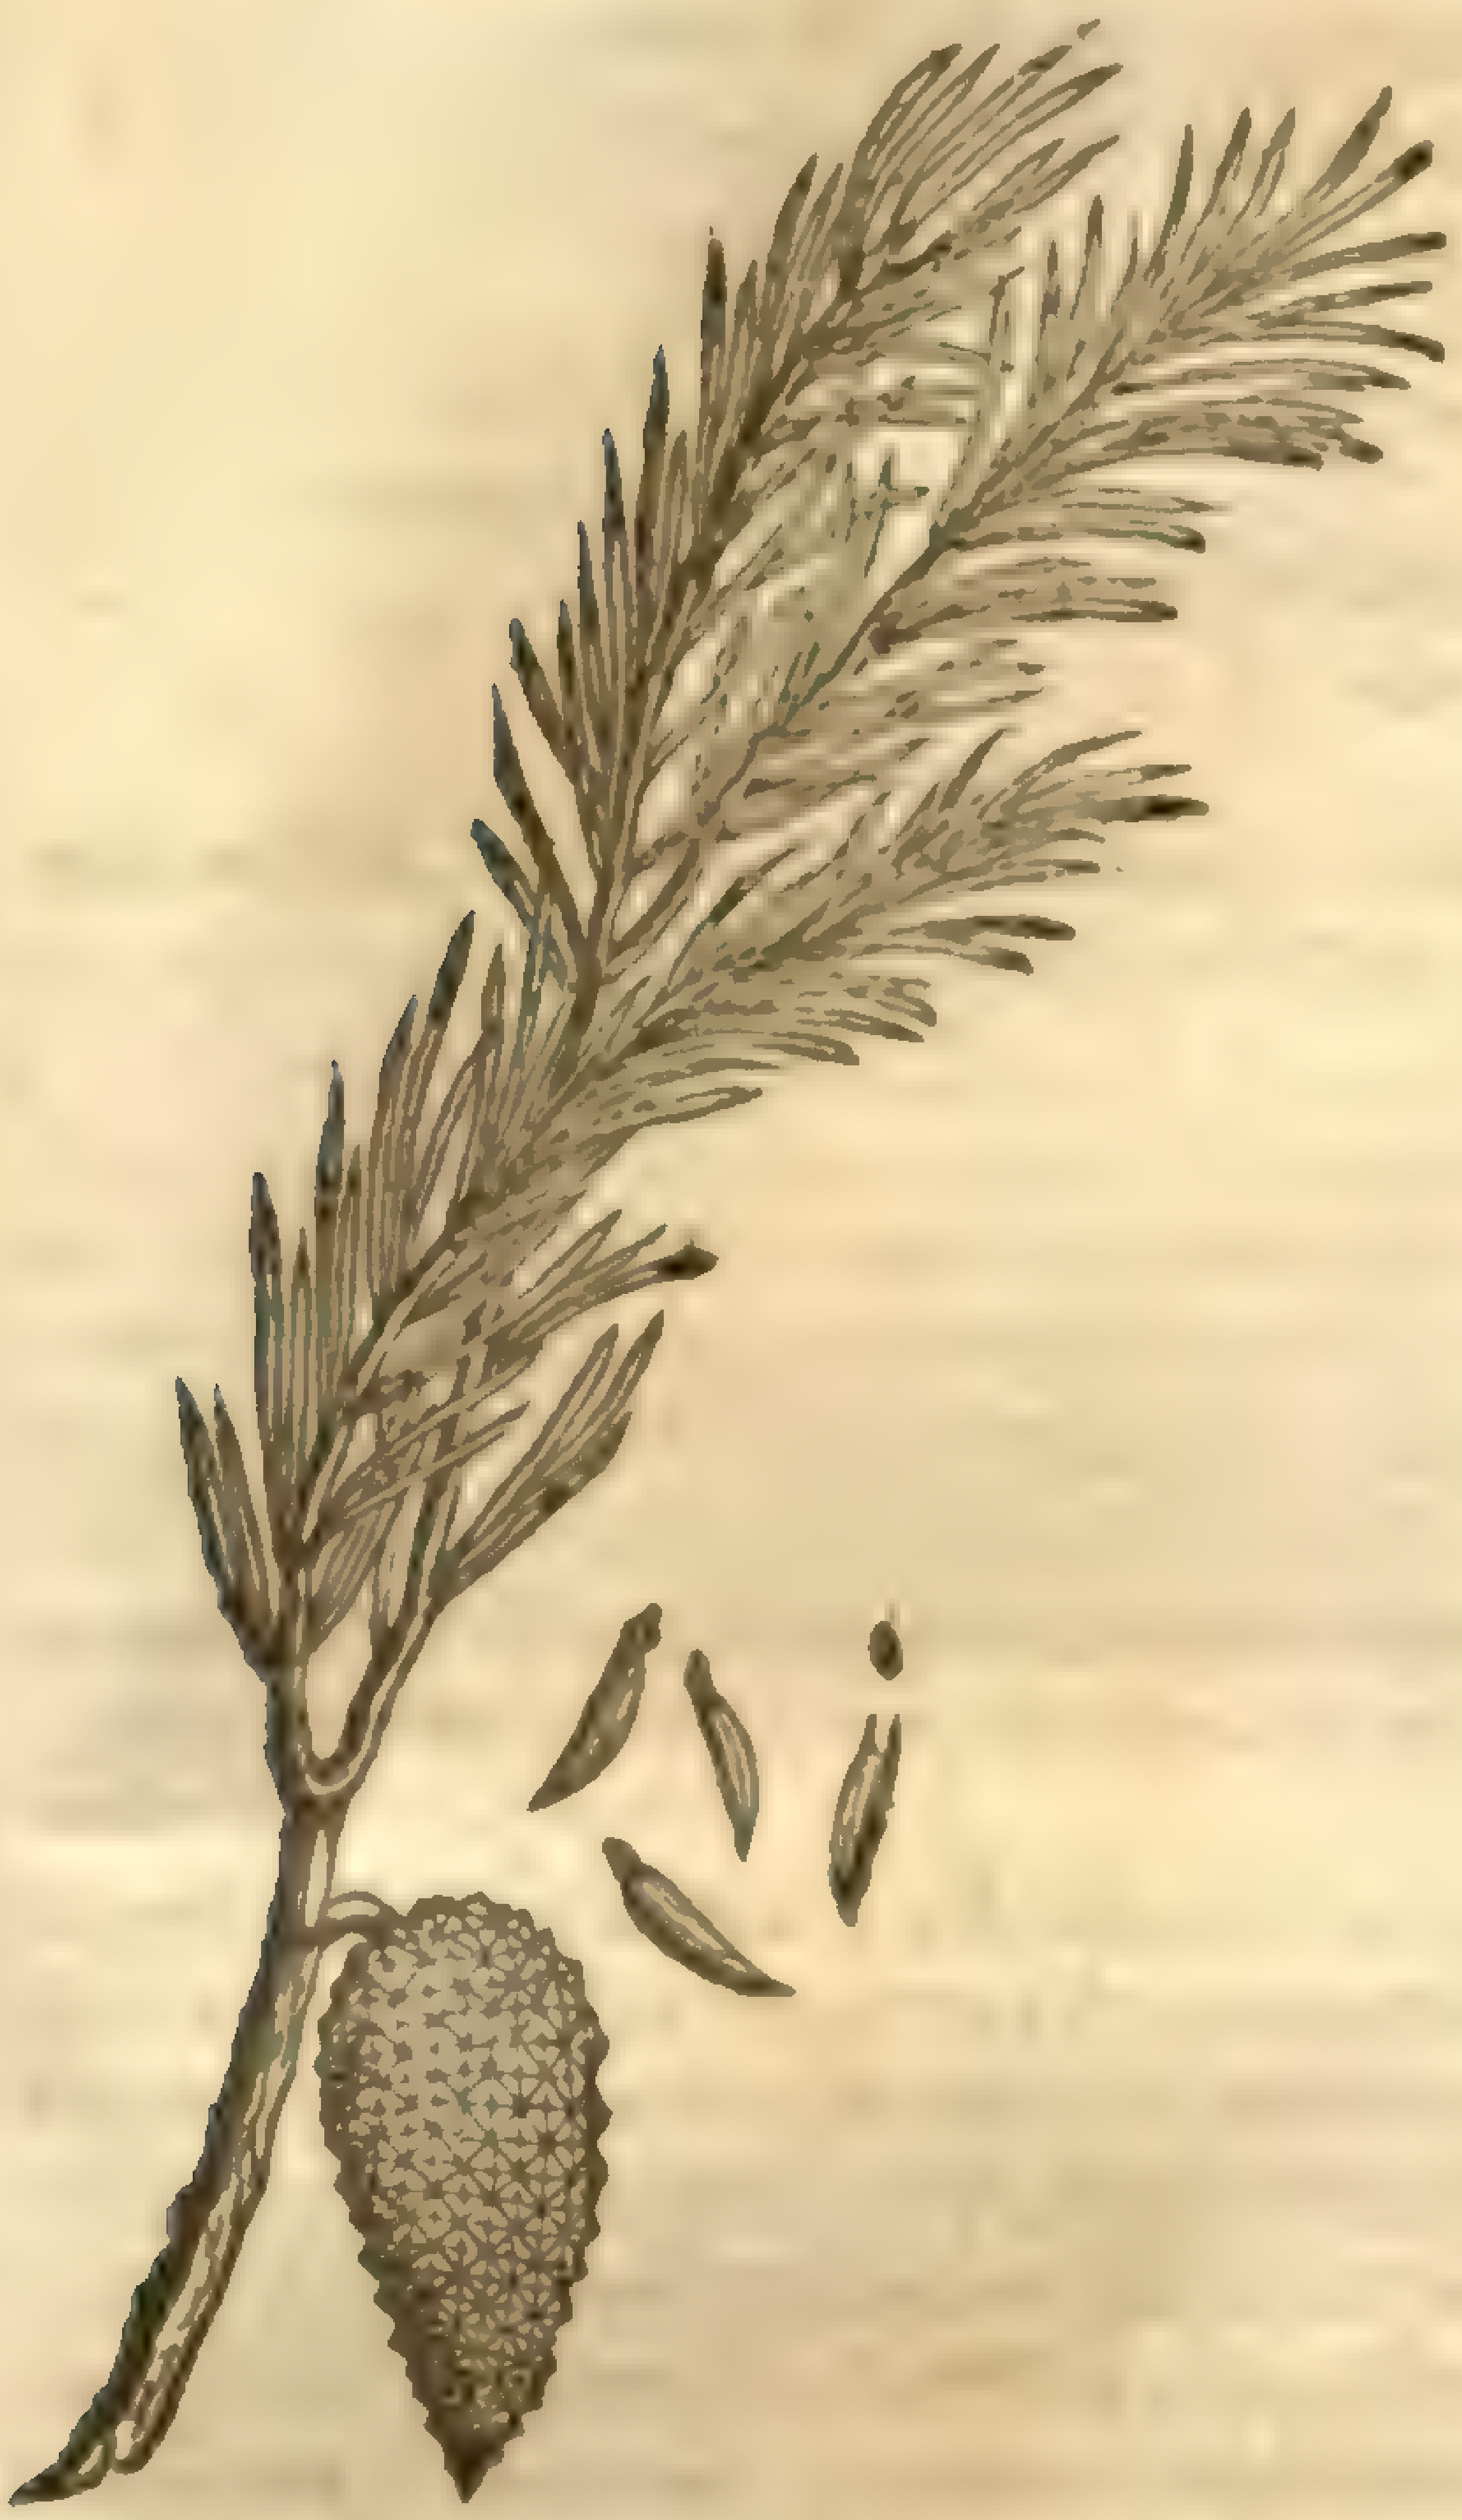


‡ 8 *Pinaſter Auſtriacus.*
Dwarfe Pine with vpright cones.



ches and leaues are like vnto thoſe of the manured Pine tree: the onely difference is, That ſome yeares it reſembles the Pine it ſelfe, and other yeares as a wilde hedge tree, varying often, as Nature liſteth to play and ſport her ſelf among her delights, with other plants of leſſe moment: the timber is ſoft, and not fit for building, but is of the ſubſtance of our Birch tree: the fruit is like thoſe of the other wild Pines, whereof this is a kinde.

‡ 9 *Pinaſter maritimus minor.*
Dwarfe ſea Pine.



‡ 8 This dwarfe Auſtrian Pine exceeds not the height of a man, but immediatly from the root is diuided and ſpread abroad into tough bending pretty thick branches, couered ouer with a rough barke: the leaues, as in the former, come two out of one hoſe, thicker, ſhorter, blunter pointed, and more greene than the former: the cones or clogs are but ſmall, yet round and compact, and hang not downewards, but ſtand vpright: the root is tough and woody like other plants of this kind. It growes on the Auſtrian and Styrian Alps. *Cluſius* ſets it forth by the name of *Pinaſter 4. Auſtriacus.*

9 The other Dwarfe is of the ſame height with the former: with ſuch tough and bending branches, which are neither ſo thicke, nor clad with ſo rough a barke, nor ſo much ſpred. The leaues alſo are ſmaller, and not vnlike thoſe of the Larix tree, but not ſo ſoft, nor falling euery yeare as they do. The cones are little and ſlender, the kernels ſmall, blackiſh, and winged as the reſt. *Cluſius* found this onely in ſome few places of the kingdome of Murcia in Spaine; wherefore he calls it *Pinaſter 3. Hiſpanicus. Dodonaus* calls it *Pinus maritima minor.* ‡

¶ *The Place.*

Theſe wilde Pines grow vpon the cold mountaines of Livonia, Polonia, Norvegia, and Ruſſia, eſpecially vpon the Iſland called Holland within the Sownd, beyond Denmarke, and in the Woods by Narua vpon the Liefeland ſhore, and all the tract of the way, being a thouſand werſts (each werſt containing three quarters of an Engliſh mile) from Narua vnto Muſcouia, where I haue ſeen them grow in infinite numbers.

¶ *The Time.*

The fruit of theſe Pine trees is ripe in the end of September: out of all theſe iſſueth forth a white and ſweet ſmelling roſin: they are alſo changed into *Teda*, and out of theſe is boiled through the force of the fire a blacke pitch: the Pitch tree and the Larch tree be alſo ſometimes changed into *Teda*, yet very ſeldome, for *Teda* is a proper and peculiar infirmitie of the wilde Pine tree. A tree is ſaid to be changed into *Teda*, when not only the heart of it, but alſo the reſt of the ſubſtance is turned into fatneſſe.

¶ *The Names.*

All theſe are called in Greeke Πεῦκαι ἄγριαι; and in Latine, *Sylveſtres Pini*: of *Pliny Pinaſtri*; *Pinaſter*, ſaith he, *lib. 16. cap. 10.* is nothing elſe but *Pinus ſylveſtris*, or the wilde Pine tree, of a leſſer height, and full of boughes from the middle, as the tame Pine tree in the top, (moſt of the couples haue falſly) of a maruellous height: they are farre deceiued who thinke that the Pine tree is called in Greeke Πίτυς, beſides the tame Pine, which notwithſtanding is not ſo called of all men, but onely of the Arcadians (as we haue ſaid before) Πίτυς: all men do name the wilde Πεύκη: and therefore *Teda* or the Torch Pine hereof is ſaid to be in Latine, not *Picea*, but *Pinea*, that is, not the Pitch tree, but the Pine tree, as *Ovid* doth plainly teſtifie in his Heroicall Epiſtles:

Th

Vt vidi, vt perij, nec notis ignibus arſi,
Ardet vt ad magnos Pinea Teda deos.

Alſo in *Faſt*. 4.

Illic accendit geminas pro lampade Pinus.
Hinc cereris ſacris nunc quoque Teda datur.

The ſame doth alſo *Virgil* ſignifie, *Æneid*. 7.

Ipſa inter medias, flagrantem fervida Pinum.
Suſtinet. ———————

Where in ſtead of *Flagrantem Pinum*, *Servius* admoniſheth vs to vnderſtand *Teda Pinea*. *Catulus* alſo conſenteth with them, in the mariage Song of *Iulia* and *Mallius*:

——— *Manu*
Pineam quate tedam.

And *Prudentius, in Hymno Cerei Paſchalis,*

Seu Pinus piceam fert alimoniam.

Moreouer, the herbe *Peucedanos*, or Horeſtrong, ſo named of the likeneſſe of πεύκη, is called alſo in Latine *Pinaſtellum*, of *Pinus*, the Pine tree: all which things do euidently declare, that πεύκη is called in Latine not *Picea*, but *Pinus*.

The firſt of theſe wilde kindes may be *Idæa Theophraſti*, or *Theophraſtus* his Pine tree, growing on mount Ida, if the apple which is ſhorter, were longer: for he nameth two kinds of wilde Pines, one of mount Ida, and the other the ſea Pine with the round fruit: but wee hold the contrary; for the fruit or apple of the wild mountain Pine is ſhorter, and that of the ſea Pine longer. This may more truly be *Macedonum mas*, or the Macedonians male Pine: for they make two ſorts of wilde Pines, the male and the female, and the male more wrythed and harder to bee wrought vpon, the female more eaſie; but the wood of this is more wrythed, & not ſo much in requeſt for works as the other, wherefore it ſeems to be the male. This wilde Pine tree is called in high-Dutch, **Hartzbaum**, and **Wilder Hartzbaum**: in Gallia Celtica, *Elvo Alevo*: and in Spaniſh, *Pino Carex*.

The ſecond wilde Pine tree is named commonly of the Italians about Trent and Anagnia, *Cembro*, and *Cirmolo*; it ſeems to differ nothing at all from the Macedonians wilde female Pine, for the wood is eaſie to be wrought on, and ſerueth for diuers and ſundry works.

The third they call *Mugo*: this may be named not without cauſe, χαμαιπεύκη, that is to ſay, *Humilis Pinus*, or dwarfe Pine: yet doth it differ from *Chamæpeuce*, the herb called in Engliſh, ground Pine.

The fourth wild Pine is named in Greeke, Παραλιάπευκη: in Latine, *Maritima*, and *Marina Pinus*: in Engliſh, ſea Pine.

That which the Latines call *Teda*, is named in Greeke δᾷς, and δᾳδίον: in high-Dutch, **Kynholtz**: it may be termed in Engliſh, Torch Pine.

Pliny is deceiued, in that he ſuppoſeth Torch Pine to be a tree by it ſelfe, making it the ſixt kind of Cone tree: as likewiſe he erreth in taking *Larix*, the Larch tree, for πεύκη the Pine tree. And as *Dioſcorides* maketh ſo little difference as ſcarce any, between πεύκη and πίτυς, and ſuppoſeth them to bee both of one kinde, ſo likewiſe he ſets downe faculties common to them both.

¶ *The Nature and Vertues.*

A The barke of them both, ſaith he, doth binde: being beaten and applied it cureth Merigals, and alſo ſhallow vlcers and burnings, if it be laid on with Litharge and fine Frankincenſe.

B With the Cerot of Myrtles it healeth vlcers in tender bodies: beeing beaten with Copperas it ſtayeth tettars and creeping vlcers: it drawes away the birth and after-birth, if it be taken vnder in a fume: being drunke it ſtoppeth the belly, and prouoketh vrine.

C *Galen* hath almoſt the ſame things; but he ſaith that the barke of the Pine tree is more temperat than that of the Pitch tree: the leaues ſtamped take away hot ſwellings and the ſores that do come thereof.

D Being ſtamped and boiled in vineger they aſſwage the pain of the teeth, if they be waſhed with this decoction hot: the ſame be alſo good for thoſe that haue bad liuers, being drunke with water or mede.

E Of the ſame operation is likewiſe the barke of the Pine nuts; but *Galen* affirmeth that the Cone or apple, although it ſeeme to be like theſe is notwithſtanding of leſſer force, inſomuch as it cannot effectually performe any of the aforeſaid vertues, but hath in it a certaine biting quality, which hurteth.

F The Torch Pine cut into ſmall pieces and boiled in vineger, is a remedy likewiſe againſt the tooth-ache if the teeth be waſhed with the decoction.

G Of this there is made a profitable ſpather or ſlice to be vſed in making of compound plaiſters and peſſaries that eaſe paine.

H Of the ſmoke of this is made a blacke which ſerueth to make inke of, and for eating ſores in the corners of eies, and againſt the falling away of the haire of the eie lids, and for watering and bleere eies, as *Dioſcorides* teacheth.

Of Roſins.

¶ *The Kindes.*

1 Out of the Pine tres, eſpecially of the wilde kinds, there iſſueth forth a liquid, whitiſh, and ſweet ſmelling Roſin, and that many times by it ſelfe; but more plentifully either out of the cut and broken boughes, or forth of the body when the tree commeth to be a Torch Pine.

2 There iſſueth alſo forth of the crackes and chinkes of the barke, or out of the cut boughes, a certaine dry Roſin, and that forth of the Pine tree or Firre Tree.

There is likewiſe found a certaine congealed Roſin vpon the cones or apples.

It is called in Latine, *Reſina*: in Greeke, ῥητίνη: in high Dutch, **Hartz**: in low Dutch, **Herſt**: in Italian, *Ragia*: in Spaniſh, *Reſina*: in Engliſh, Roſin.

The firſt is named in Latine, *Liquida Reſina*: in Greeke, ῥητίνη ὑγρὰ, and of diuers, αὐτόῤῥυτος, that is to ſay, iſſueth out of it ſelfe: of the Lacedemonians, πρωτόῤῥυτος, or *Primiflua*, the firſt flowing Roſin: and in Cicilia, Καππάλιον, as *Galen* writeth in his third booke of medicines according to the kindes: in ſhops, *Reſina Pini*, or Roſin of the Pine tree, and common Roſin. It hapneth oftentimes through the negligent and careleſſe gathering thereof, that certaine ſmall pieces of wood, and little ſtones be found mixed with it: this kinde of Roſin *Galen* ſurnameth συγκεχυμένη, as though he ſhould ſay, confuſed, which being melted and clenſed from the droſſe becommeth hard and brittle.

The like hapneth alſo to another liquid Roſin, which after it is milted, boyled, and cooled againe, is hard and brittle, and may likewiſe be beaten, ground, and ſearced; and this Roſin is named in Greeke φρυκτή: in Latine, *Fricta*, and many times *Colophonia*, in Greeke, κολοφωνία: which name is vſed among the Apothecaries, and may ſtand for an Engliſh name; for *Galen* in his third booke of Medicines according to their kindes ſaith, that it is called *Fricta*, and of ſome *Colophonia*: that, ſaith he, is the drieſt Roſin of all, which ſome call *Fricta*, others, *Colophonia*: becauſe in times paſt, as *Dioſcorides* writeth, it was fetched from *Colophon*, this being yellow or blacke in compariſon of the reſt, is white when it is beaten: *Pliny* in his 14 booke, 20. chapter.

The ſecond Roſin is named in Greeke ῥητίνη ξηρὰ, ſpecially that of the Pitch tree without fatneſſe, and that ſoone waxeth dry, which *Galen* in his 6. booke of Medicines according to their kindes, calleth properly φύσημα πιτυίνον: that which in Aſia is made of the Pitch tree being very white, is called *Spagus*, as *Pliny* teſtifieth.

The third is called in Greeke ῥητίνη στροβιλίνη: the ſame is alſo named φύσημα στροβίλινον: that is vnknowne in ſhops. Yet there is to be ſould a certaine dry Roſin, but the ſame is compounded of the Roſins of the Pine tree, of the cones or clogs, and of the Firre tree mixed altogether, which they call *Garipot*: this is vſed in perfumes in ſtead of Frankincenſe, from which notwithſtanding it farre differeth.

¶ *The Temperature and Vertues.*

A All the Roſins are hot and dry, but not all after one manner: for there is a difference among them: they which be ſharper and more biting, are hotter, as that which commeth of the cones, being of Roſins the hotteſt, becauſe it is alſo the ſharpeſt: the Roſin of the Pitch Tree is not ſo much biting, and therefore not ſo hot: the Roſin of the Firre tree is in a meane betweene them both; the liquid Roſin of the Pine is moiſter, comming neere to the quality and faculty of the Larch-Roſin.

B The Roſins which are burnt or dried, as *Dioſcorides* teſtifieth, are profitable in plaiſters, and compoſitions that eaſe weariſomeneſſe; for they do not onely ſupple or mollifie, but alſo by reaſon of the thinneſſe of their parts and dryneſſe, they digeſt: therefore they both mollifie and waſte away ſwellings, and through the ſame faculty they cure weariſomeneſſe: being vſed in compound medicines for that purpoſe.

C The liquid Roſins are very fitly mixed in ointments, commended for the healing vp of greene wounds, for they both bring to ſuppuration, and do alſo glue and vnite them together.

D Moreouer, there is gathered out from the Roſins as from Frankincenſe, a congealed ſmoke, called in Latine *Fuligo*; in Greeke, λιγνὺς: and in Engliſh, Blacke, which ſerueth for medicines that beautifie the eie lids, and cure the fretting ſores of the corners of the eies, and alſo watering eies, for it drieth without biting.

E There is made hereof, ſaith *Dioſcorides*, writing inke, but in our age not that which we write withall, but the ſame which ſerueth for Printers to print their bookes with, that is to ſay, of this blacke, or congealed ſmoke, and other things added.

Of Pitch and Tar.

The manner of drawing forth of Pitch.

Out of the fatteſt wood of the Pine tree changed into the Torch Pine, is drawne Pitch by force of fire. A place muſt be paued with ſtone, or ſome other hard matter, a little higher in the middle, about which there muſt alſo be made gutters, into which the liquor ſhall fall; then out from them other gutters are to be drawne, by which it may be receiued; being receiued, it is put into barrels. The place being thus prepared, the clouen wood of the Torch Pine muſt be ſet vpright; then muſt it be couered with a great number of Fir and Pitch boughes, and on euery part all about with much lome and earth: and great heed muſt be taken, leaſt there be any cleft or chinke remaining, onely a hole left in the top of the furnace, thorow which the fire may be put in, and the flame and ſmoke may paſſe ouer: when the fire burneth the Pitch runneth forth, firſt the thin, and then the thicker.

This liquor is called in Greeke πίσσα: in Latine, *Pix*: in Engliſh, Pitch, and the moiſture, euen the ſame that firſt runneth is named of *Pliny* in his 16. booke, 11. chapter, *Cedria*: There is boyled in Europe, ſaith he, from the Torch Pine a liquid Pitch vſed about ſhips, and ſeruing for many other purpoſes; the wood being clouen is burned with fire, and ſet round about the furnaces on euery ſide, after the manner of making Charcoles: the firſt liquor runneth through the gutter like water: (this in Syria is called *Cedria*, which is of ſo great vertue, as in Ægypt the bodies of dead men are preſerued being all couered ouer with it) the liquor following being now thicker, is made Pitch. But *Dioſcorides* writeth, That *Cedria* is gathered of the great Cedar tree, and nameth the liquor drawne out of the Torch tree by force of fire, πίσσα ὑγρὰ: that is, that which the Latines call *Pix liquida*: the Italians, *Pece liquida*: in high Dutch, **Weich bach**: in low Dutch, **Teer**: in French, *Poix foudire*: in Spaniſh, *Pex liquida*: certaine Apothecaries, *Kitran*: and we in Engliſh Tar.

And of this when it is boyled is made a harder Pitch: this is named in Greeke, ξηρὰ πίσσα: in Latine, *Arida*, or *ſicca Pix*: of diuers, παλίμπισσα as though they ſhould ſay, *Iterata Pix*, or Pitch iterated: becauſe it is boyled the ſecond time. A certaine kinde hereof being made clammie or glewing is named κωνὰς: in ſhops, *Pix naualis*, or Ship Pitch: in high Dutch, **Bach**: in low Dutch, **Steenpeck**: in Italian, *Pece ſecca*: in French, *Poix ſeche*: in Spaniſh, *Pez ſeca*: in Engliſh, Stone Pitch.

¶ *The Temperature and Vertues.*

A Pitch is hot and dry, Tarre is hotter, and ſtone Pitch more drying, as *Galen* writeth. Tar is good againſt inflammations of the Almonds of the throat, and the uvula, and likewiſe the Squincie, being outwardly applied.

B It is a remedie for mattering eares with oyle of Roſes: it healeth the bitings of Serpents, if it be beaten with ſalt and applied.

C With an equall portion of wax it taketh away foule ilfauoured nailes, it waſteth away ſwellings of the kernels, and hard ſwellings of the mother and fundament.

D With barly meale and a boies vrine it conſumeth χοιράδας, or the Kings euill: it ſtaieth eating vlcers, if it be laid vnto them with brimſtone, and the barke of the Pitch Tree, or with branne.

E If it be mixed with fine Frankincenſe, and a cerote made thereof, it healeth chops of the fundament and feet.

F Stone Pitch doth mollifie and ſoften hard ſwellings: it ripens and maketh matter, and waſteth away hard ſwellings and inflammations of kernels: it filleth vp hollow vlcers, and is fitly mixed with wound medicines.

G What vertue Tar hath when it is inwardly taken we may reade in *Dioſcorides* and *Galen*, but we ſet downe nothing thereof, for that no man in our age will eaſily vouchſafe the taking.

H There is alſo made of Pitch a congealed ſmoke or blacke, which ſerueth for the ſame purpoſes as that of the Roſins doth.

CHAP. 43. *Of the Firre or Deale Tree.*

¶ *The Deſcription.*

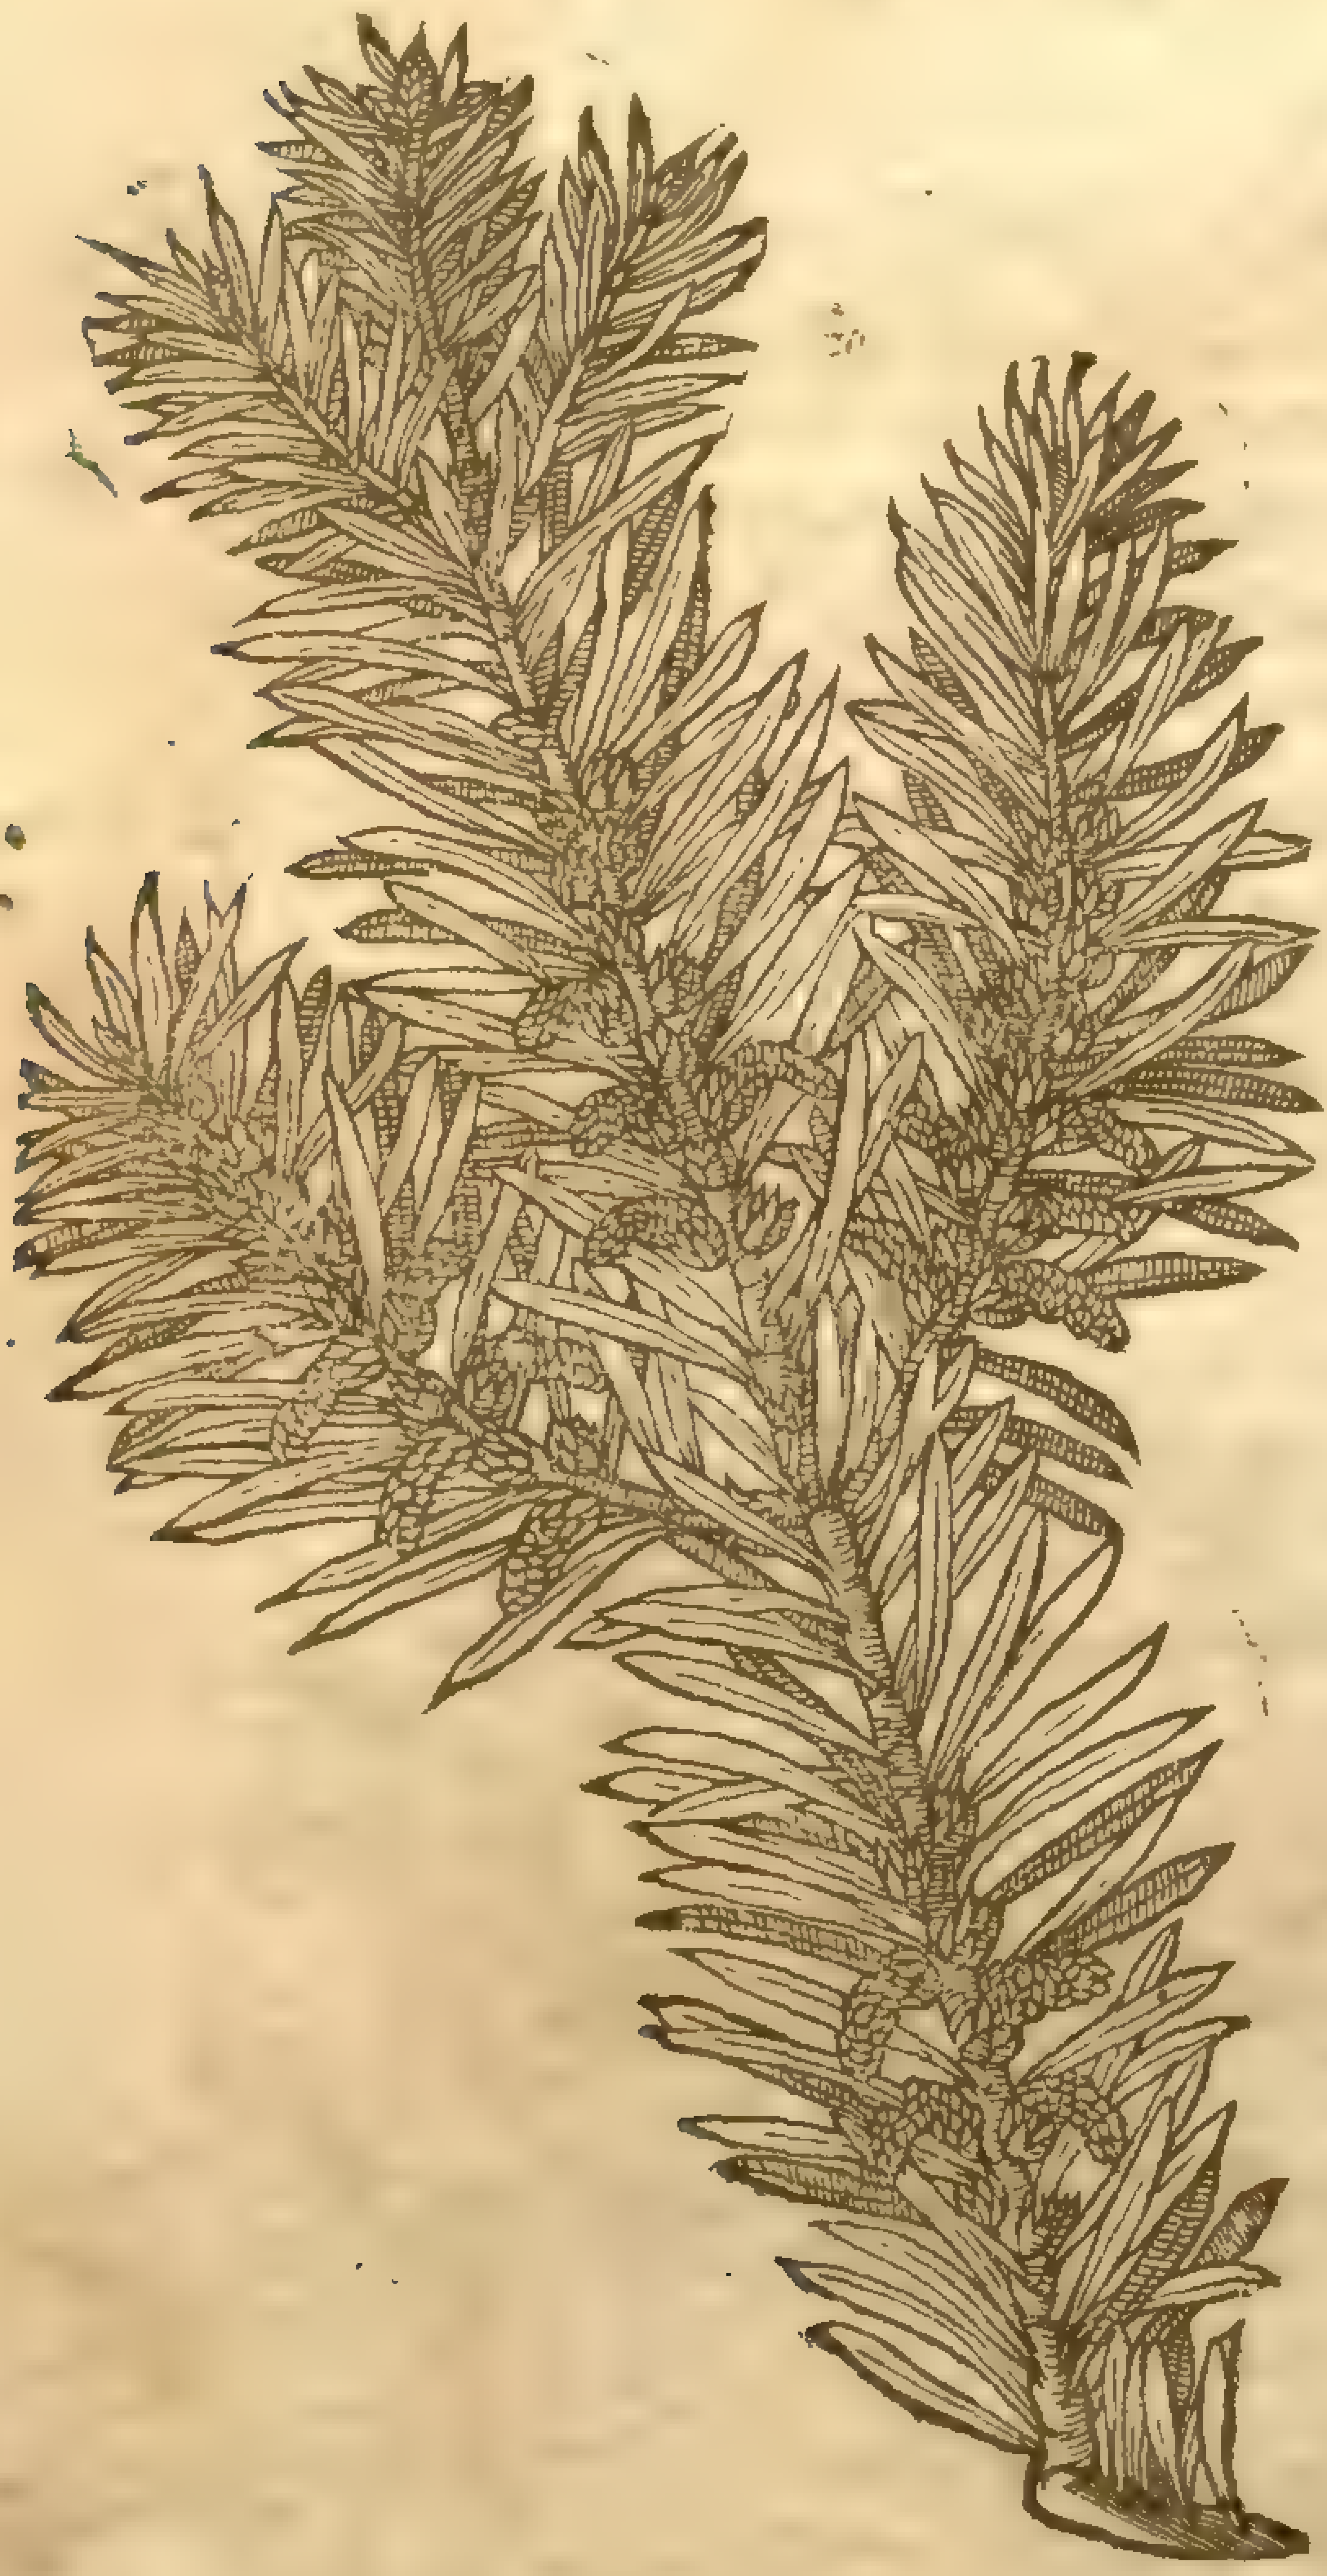
1 THe Firre tree groweth very high and great, hauing his leaues euer greene; his trunke or body ſmooth, euen, and ſtraight, without joynts or knots, vntill it hath gotten branches; which are many and very faire, beſet with leaues, not much vnlike the leaues of the Ewe tree, but ſmaller: among which come forth floures vpon the taller trees, growing at the bottomes of the leaues like little catkins, as you may ſee them expreſt in a branch apart by themſelues. the fruit is like vnto the Pine Apple, but ſmaller and narrower, hanging downe as the Pine Apple: the timber hereof excelleth all other timber for the maſting of ſhips, poſts, rails, deale boords, and ſundry other purpoſes.

1 *Abies.*
The Firre Tree.

‡ 2 *Abies mas.*
The male Firre Tree.

2 There is another kinde of Firre Tree, which is likewiſe a very high and tall tree, and higher than the Pine: the body of it is ſtraight without knots below, waxing ſmaller and ſmaller euen to the very top: about which it ſendeth forth boughes, foure together out of one and the ſelfe ſame part of the body, placed one againſt another, in manner of a croſſe, growing forth of the foure ſides of the body, and obſeruing the ſame order euen to the very top: out of theſe boughes grow others alſo, but by two and two, one placed right againſt another, out of the ſides which bend downewards when the other beare vpwards: the leaues compaſſe the boughs round about, and the branches thereof: they be long, round, and blunt pointed, narrower, and much whiter than thoſe of the Pitch Tree, that is to ſay, of a light greene, and in a manner of a white colour: the cones or clogs be long, and longer than any others of the cone trees: they conſiſt of a multitude of ſoft ſcales, they hang downe from the end of the twigs, and doe not eaſily fall downe, but remaine on the tree a very long time: the kernels in theſe are ſmall, not greater than the kernels of the Cherrie ſtone, with a thinne skin growing on the one ſide, very like almoſt to the wings of Bees, or great Flies: the timber or ſubſtance of the wood is white, and clad with many coats, like the head of an Onion.

‡ *Abietis ramus cum julis.*
A branch with Catkins or floures.



¶ *The Place.*

The Firre trees grow vpon high mountains, in many woods of Germany and Bohemia, in which it continueth alwaies greene; it is found alſo on hils in Italy, France, & other countries; it commeth downe oftentimes into the vallies: they are found likewiſe in Pruſe, Pomerania, Liefeland, Ruſſia, and eſpecially in Norway, where I haue ſeene the goodlieſt trees in the world of this kinde, growing vpon the rockie and craggie mountaines, almoſt without any earth about them, or any other thing, ſauing a little moſſe about the roots, which thruſt themſelues here and there into the chinkes and cranies of the rockes, and therefore are eaſily caſt downe with any extreme gale of winde. I haue ſeen theſe trees growing in Cheſhire, Staffordſhire, and Lancaſhire, where they grew in great plenty, as is reported, before *Noahs* floud: but then being ouerturned and ouerwhelmed haue lien ſince in the moſſes and waterie mooriſh grounds very freſh and ſound vntill this day, & ſo full of a reſinous ſubſtance, that they burne like a Torch or Linke, and the inhabitants of thoſe countries do call it Fir-wood, and Firewood vnto this day: out of this tree iſſueth the roſin called *Thus*, in Engliſh, Frankinſence: but from the young Fir trees proceedeth an excellent cleare and liquid Roſin, in taſte like to the peelings or outward rinde of the Pomecitron.

¶ *The Time.*

The time of the Fir tree agreeth with the Pine trees.

¶ *The Names.*

The tree is called in Latine *Abies*: in Greeke, ἐλάτη: amongſt the Græcians of our time the ſame name remaineth whole and vncorrupt: it is called in high Dutch, **Weiſz Thannen**, and **Weiſz Thannen baum**: in low Dutch, **Witte Dennen Boom**, or **Abel=boom**, and **Maſt=boom**: in Italian, *Abete*: in Spaniſh, *Abeto*: in Engliſh, Fir-tree, Maſt-tree, and Deale-tree. The firſt is called in French, *du Sap*, or *Sapin*; the other is *Suiſſe*.

The liquid roſin which is taken forth of the barke of the young Firre-trees, is called in Greeke δάκρυον τῆς ἐλάτης: in Latine, *Lachryma abietis*, and *Lachryma abiegna*: in the ſhops of Germany, as alſo of England, *Terebinthina Veneta*, or Venice Turpentine: in Italian, *Lagrimo*: diuers doe thinke that *Dioſcorides* calleth it ἐλαιώδης ῥητίνη, *Oleaſa Reſina*, or oile Roſin; but oile Roſin is the ſame that *Pix liquida*, or Tar is.

Arida Abietum Reſina, or dry Roſin of the Firre-trees, is rightly called in Greeke, ῥητίνη ἐλατίνη, and in Latine, *Abiegna Reſina*: it hath a ſweet ſmell, and is oftentimes vſed among other perfumes in ſtead of Frankinſcence.

¶ *The Temperature.*

The barke, fruit, and gums of the Fir-tree, are of the nature of the Pitch tree and his gums.

¶ *The Vertues.*

A The liquid Roſin of the Fir tree called Turpentine, looſeth the belly, driueth forth hot cholerick humours, clenſeth and mundifieth the kidnies, prouoketh vrine, and driueth forth the ſtone and grauell.

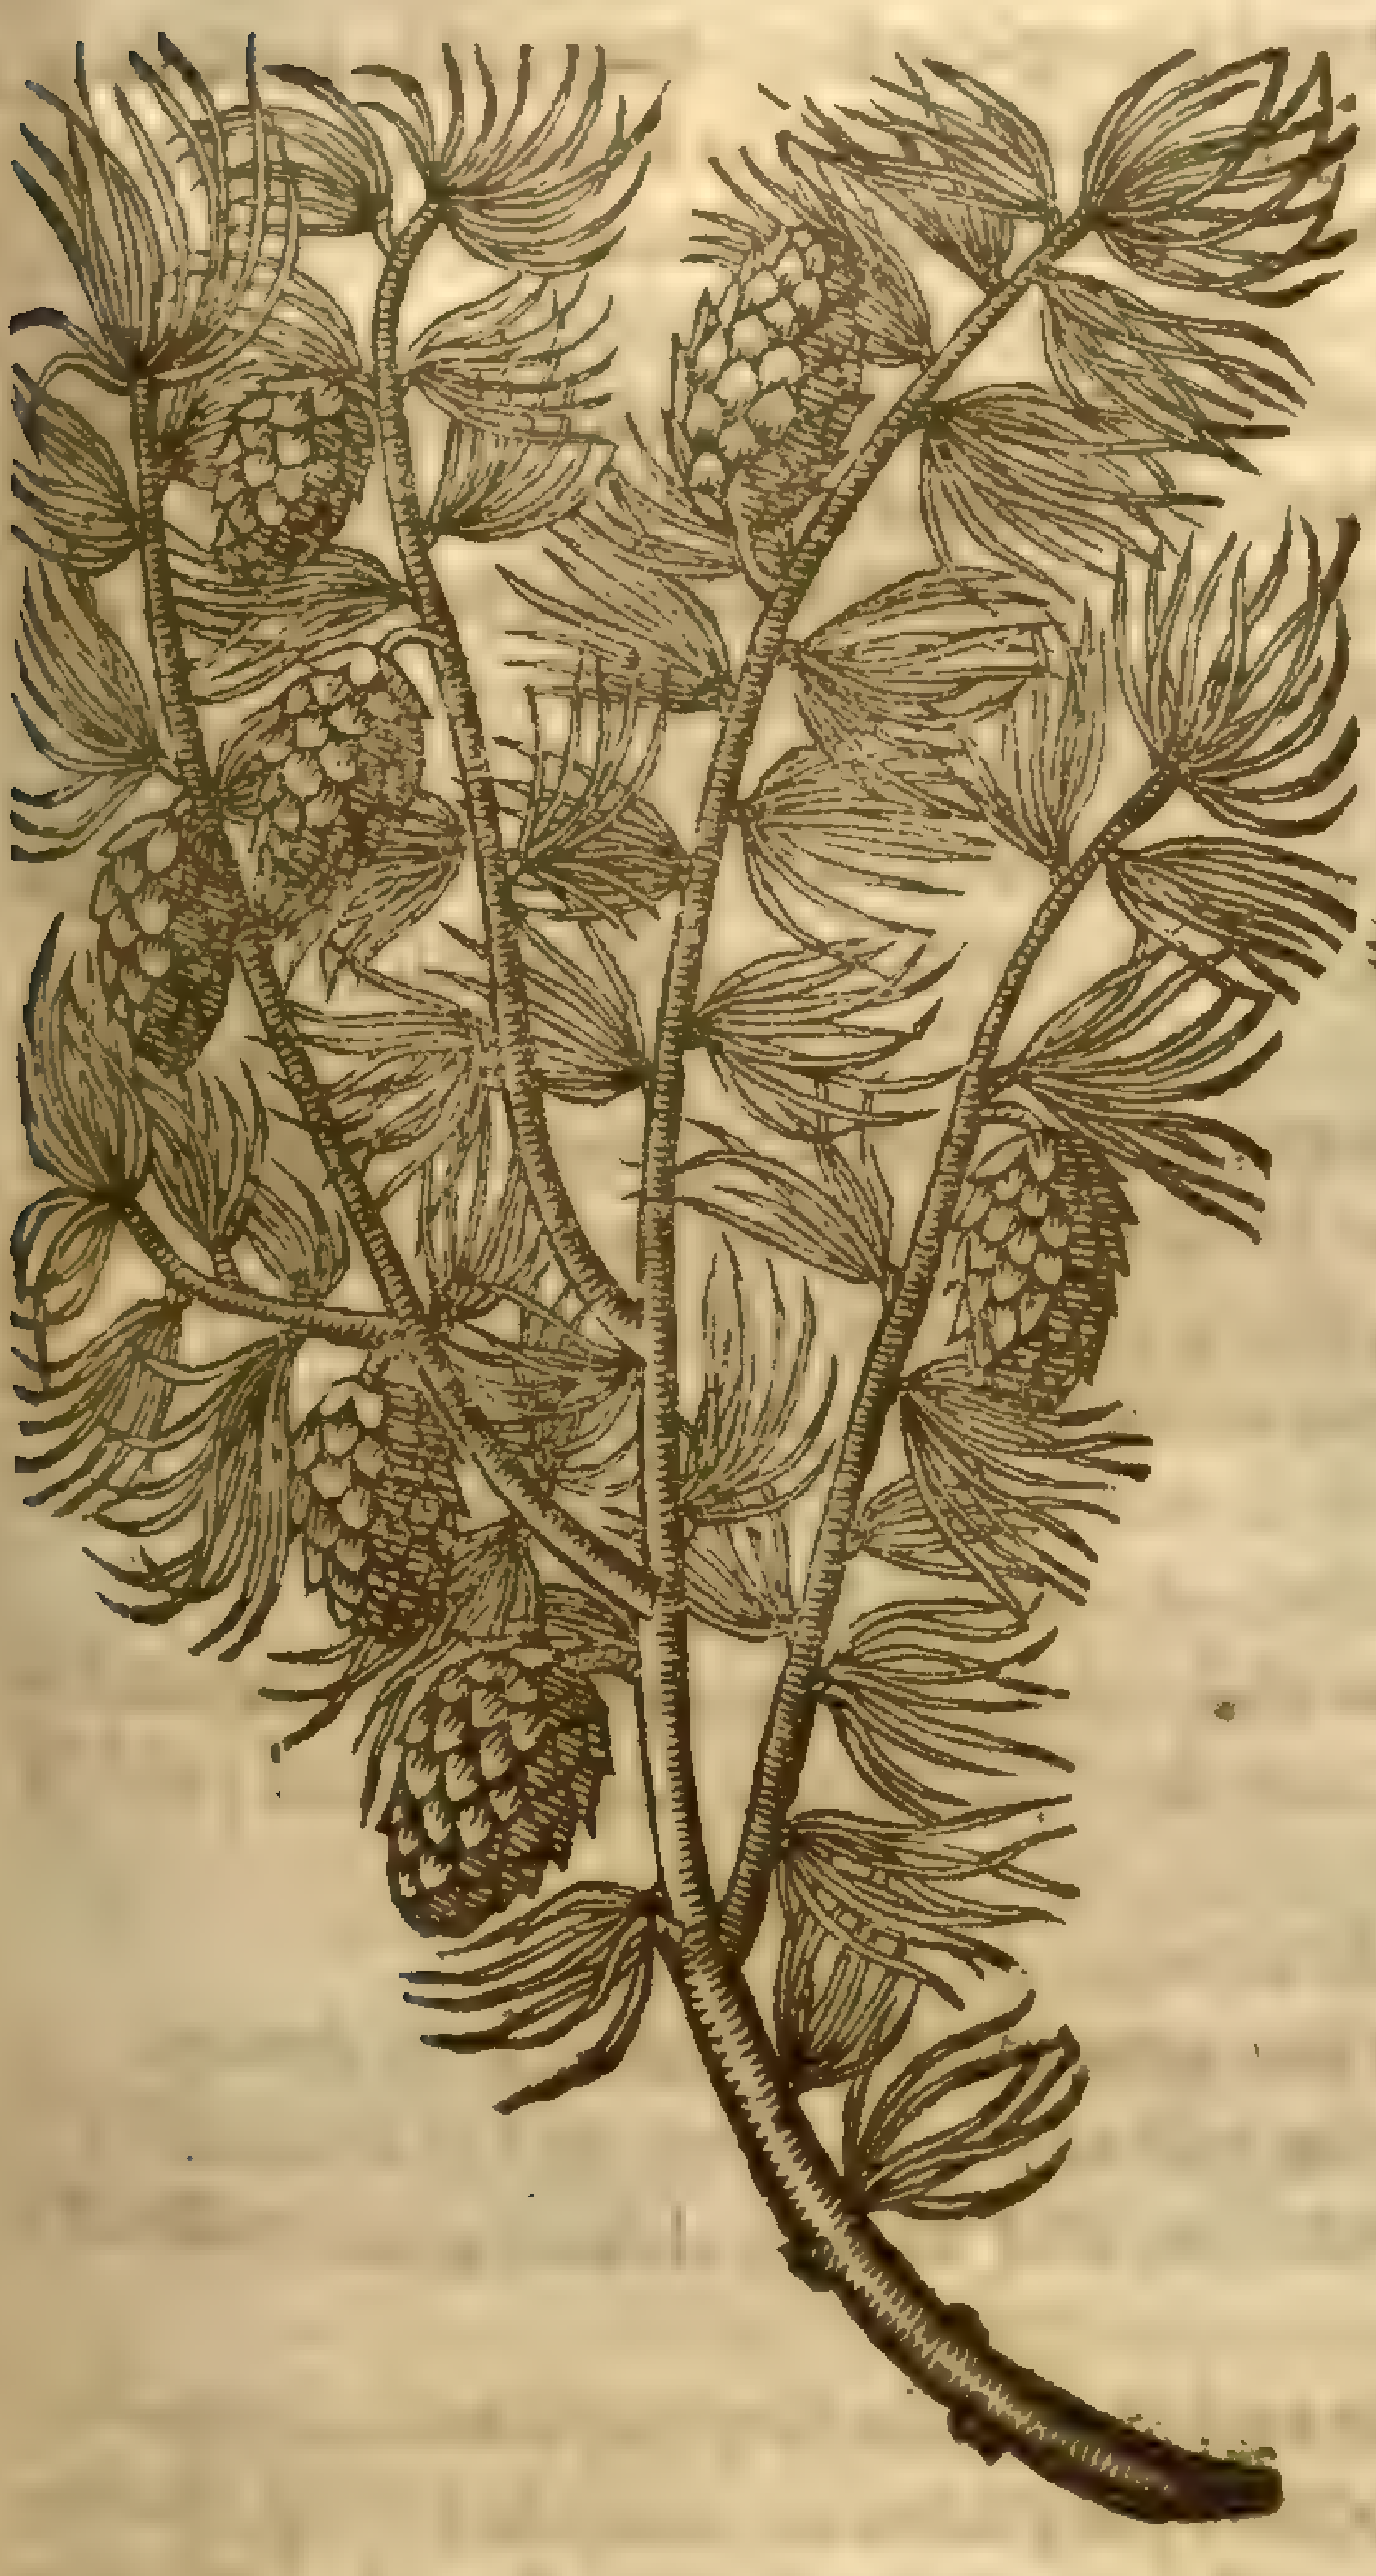
B The ſame taken with Sugar and the pouder of Nutmegs, cureth the ſtrangurie, ſtaieth the Gonorrhœa or the inuoluntary iſſue of mans nature, called the running of the rains, and the white flux in women.

C It is very profitable for all green and freſh wounds, eſpecially the wounds of the head: for it healeth and clenſeth mightily, eſpecially if it be waſhed in Plantaine water, and afterward in Roſe water, the yolke of an egge put thereto, with the pouders of *Olibanum* and Maſticke finely ſearced, adding thereto a little Saffron.

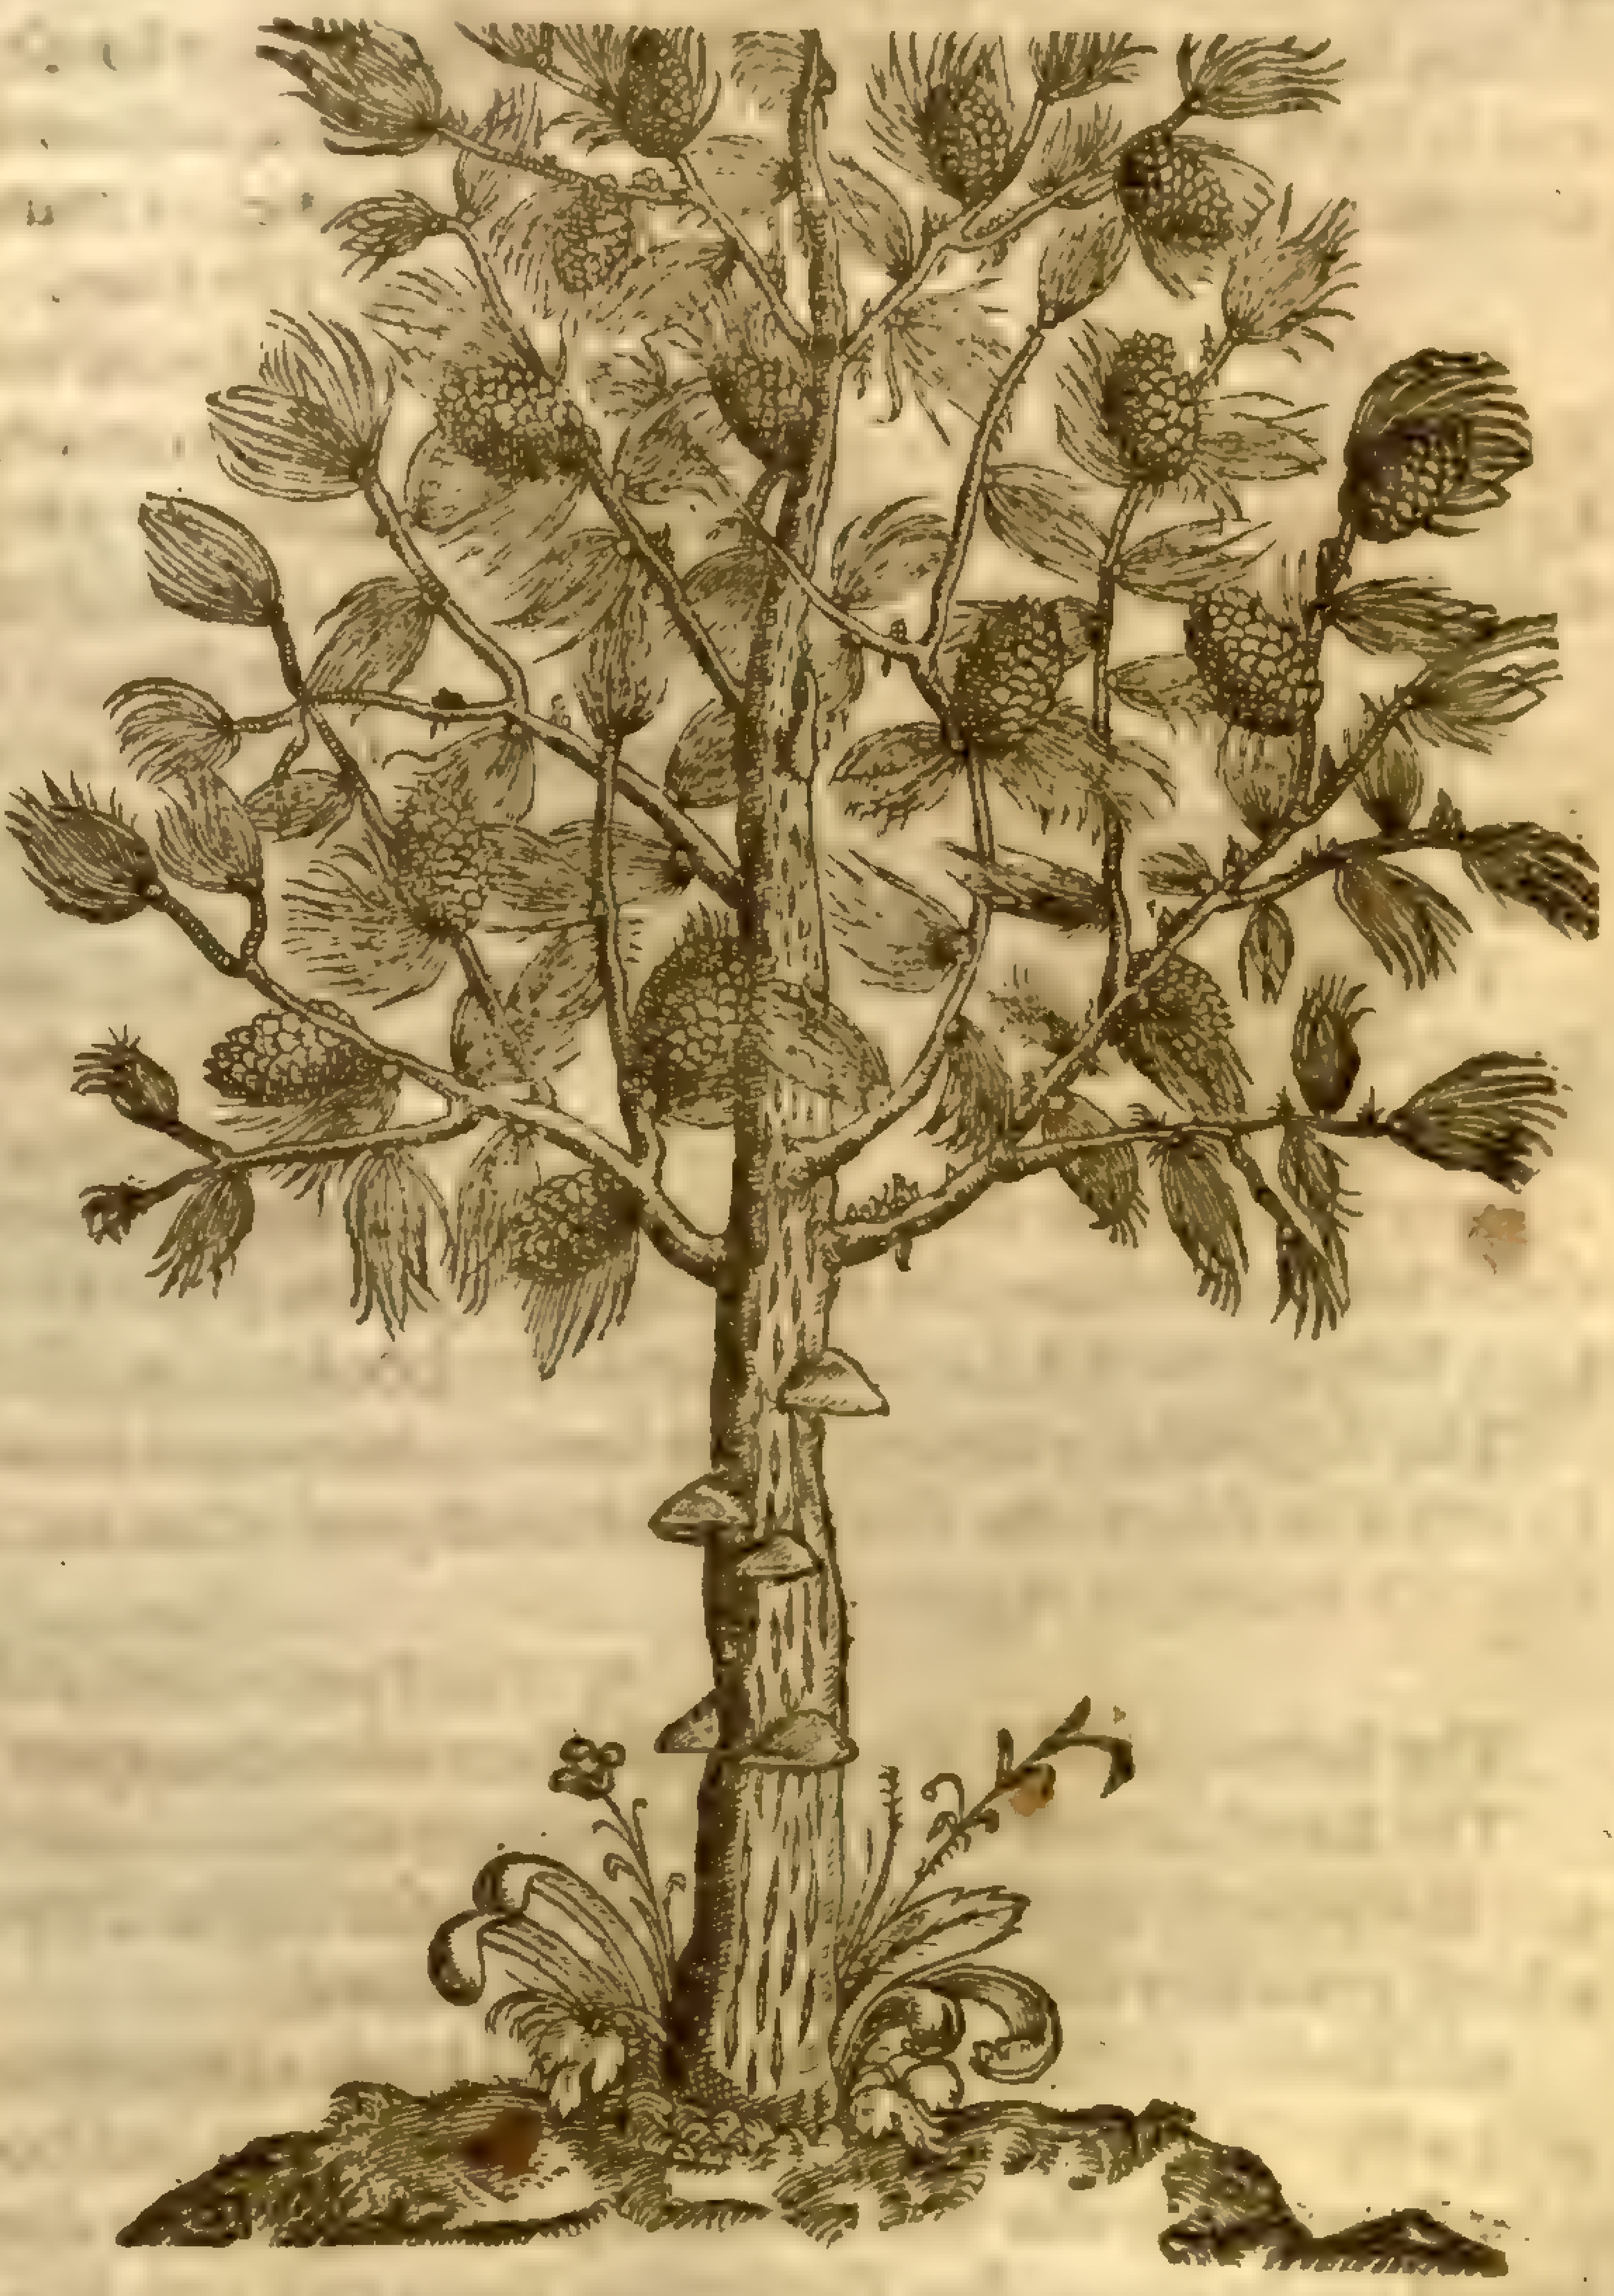
CHAP. 44. *Of the Larch Tree.*

¶ *The Deſcription.*

1 THe Larch is a tree of no ſmall height, with a body growing ſtraight vp: the barke wherof in the neither part beneath the boughes is thicke, rugged and full of chinkes; which being cut in ſunder is red within, and in the other part aboue ſmooth, ſlipperie, ſomething white without: it bringeth forth many boughes diuided into other leſſer branches, which be tough and pliable. The leaues are ſmall and cut into many jags, growing in cluſters thicke together like taſſels, which fall away at the approch of Winter: the floures, or rather the firſt ſhewes of the cones or fruit be round, and grow out of the tendereſt boughes, being at the length of a braue red purple colour: the cones be ſmall, and like almoſt in bigneſſe to thoſe of the Cypreſſe tree, but longer, and made vp of a multitude of thin ſcales like leaues: vnder which lie ſmall ſeeds, hauing a thin velme growing on them very like to the wings of Bees and waſps: the ſubſtance of the wood is very hard of colour, eſpecially that in the midſt ſomewhat red, and very profitable for workes of long continuance.



1 *Laricis ramulus.*
A branch of the Larch tree.



2 *Larix cum Agarico ſuo.*
The Larch tree with his Agarick.

It is not true that the wood of the Larch tree cannot be ſet on fire, as *Vitruvius* reporteth of the caſtle made of Larch wood, which *Cæſar* beſieged, for it burneth in chimneies, and is turned into coles, which are very profitable for Smithes, as *Matthiolus* writeth.

There is alſo gathered of the Larch tree a liquid Roſin, very like in colour and ſubſtance to the whiter hony, as that of Athens or of Spaine, which notwithſtanding iſſueth not forth of it ſelfe, but runneth out of the ſtocke of the tree, when it hath beene bored euen to the heart with a great and long auger and wimble.

Galen writeth, that there be after a ſort two kindes hereof, in his fourth book, of Medicines according to the kindes, one like vnto Turpentine, the other more ſharper than this, hotter, more liquid of a ſtronger ſmell, and in taſte bitterer and hotter: but the later is thought not to be the Roſine of the Larch, but of the Fir tree, which *Galen* becauſe it is after a ſort like in ſubſtance, might haue taken for that of the Larch tree.

There groweth alſo vpon the Larch tree a kinde of Muſhrum or excreſcence, not ſuch as is vpon other trees, but whiter, ſofter, more looſe and ſpungie than any other of the Muſhrums, and good for medicine, which beareth the name of *Agaricus*, or Agaricke: I finde that *Pliny* ſuppoſeth all the Maſticke trees, and thoſe that beare Galls, do bring forth this *Agaricum*: wherein he was ſomewhat deceiued, and eſpecially in that he tooke *Glandifera* for *Conifera*, that is, thoſe trees which beare maſt or Acornes, for the Pine apple trees: but among all the trees that beare *Agaricus*, the Larch is the chiefe, and bringeth moſt plenty of Agaricke.

¶ *The Place.*

The Larch tree groweth not in Greece, or in Macedon, but chiefely vpon the Alps of Italy, not far from Trent, hard by the riuers *Benacus* and *Padus*; and alſo in other places of the ſame mountains: it is likewiſe found on hils in Morauia, which in times paſt was called the country of the Marcomans: *Fuchſius* writeth, that it groweth alſo in Sileſia: others, in Luſatia, in the borders of Poland: it alſo groweth plentifully in the woods of Gallia Ceſalpina.

Pliny hath ſaid ſomewhat hereof, contradicting the writings of others, in his 16. booke, 8. chapter, where he ſaith, that ſpecially the Acorne trees of France do beare Agaricke, and not only the acorne trees, but the Cone trees alſo, among which, ſaith he, the Larch tree is the chiefe that bringeth forth Agaricke, and that not onely in Gallia, which now is called France, but rather in Lumbardy and Piemont in Italy, where there be whole woods of Larch trees, although they be found in ſome ſmal quantitie in other Countries.

The beſt Agaricke is that which is whiteſt, very looſe and ſpungie, which may eaſily be broken, and is light, and in the firſt taſte ſweet, hard and well compact: that which is heauie, blackiſh, and containing in it little threds as it were of ſinewes, is counted pernicious and deadly.

¶ *The Time.*

Of all the Cone trees onely the Larch tree is found to be without leaues in the Winter: in the Spring grow freſh leaues out of the ſame knobs, from which the former did fall. The cones are to be gathered before Winter, ſo ſoon as the leaues are gone: but after the ſcales are looſed and opened, the ſeeds drop away: the Roſine muſt be gathered in the Summer moneths.

¶ *The Names.*

This tree is called in Greeke, λάριξ: in Latine alſo *Larix*, in Italian and Spaniſh, *Larice*: in high Dutch, **Lerchenbaum**: in low Dutch, **Lorkenboom**: in French, *Meleſe*: in Engliſh, Larch tree, and of ſome Larix tree.

The liquid Roſin is named by *Galen* alſo λάριξ: the Latines call it *Reſina Larigna*, or *Reſina Laricea*, Larch Roſin: the Italians, *Larga*: the Apothecaries, *Terebinthina*, or Turpentine, and it is ſould and alſo mixed in medicines in ſtead thereof: neither is that a thing newly done; for *Galen* likewiſe in his time reporteth, that the Druggers ſold the Larch Roſine in ſtead of Turpentine: and this may bee done without errour; for *Galen* himſelfe in one place vſeth Larch Roſin for Turpentine; and in another, Turpentine for Larch Roſine, in his booke of medicines according to the kindes.

The Agaricke is alſo called in Greeke, ἀγάρικον and ἀγαρικός: in Latine, *Agaricum* and *Agaricus*, and ſo likewiſe in ſhops: the Italians, Spaniards, and other nations do imitate the Greeke word; and in Engliſh we call it Agaricke.

¶ *The Temperature and Vertues.*

A The leaues, barke, fruit, and kernell, are of temperature like vnto the Pine, but not ſo ſtrong.

B The Larch Roſin is of a moiſter temperature than all the reſt of the Roſines, and is withall without ſharpeneſſe or biting, much like to the right Turpentine, and is fitly mixed with medicines which perfectly cure vlcers and greene wounds.

C All Roſins, ſaith *Galen*, that haue this kinde of moiſture and clammineſſe joined with them, do as it were binde together and vnite dry medicines, and becauſe they haue no euident biting quality, they do moiſten the vlcers nothing at all: therefore diuers haue very well mixed with ſuch compound medicines either Turpentine Roſin, or Larch Roſin: thus far *Galen*. Moreouer, Larch Roſine performeth all ſuch things that the Turpentine Roſin doth, vnto which, as we haue ſaid, it is much like in temperature, which thing likewiſe *Galen* himſelfe affirmeth.

D Agaricke is hot in the firſt degree and dry in the ſecond, according to the old writers. It cutteth, maketh thin, clenſeth, taketh away obſtructions or ſtoppings of the intrailes, and purgeth alſo by ſtoole.

E Agaricke cureth the yellow jaundiſe proceeding of obſtructions, and is a ſure remedy for cold ſhakings, which are cauſed of thicke and cold humors.

F The ſame being inwardly taken and outwardly applied, is good for thoſe that are bit of venomous beaſts which hurt with their cold poiſon.

It prouoketh vrine, and bringeth downe the menſes: it maketh the body well coloured, driueth forth wormes, cureth agues, eſpecially quotidians and wandring feauers, and others that are of long continuance, if it be mixed with fit things that ſerue for the diſeaſe: and theſe things it performes by drawing forth and purging away groſſe, cold, and flegmaticke humours, which cauſe the diſeaſes. G

From a dram weight, or a dram and a halfe, to two, it is giuen at once in ſubſtance or in pouder: the weight of it in an infuſion or decoction is from two drams to fiue. H

But it purgeth ſlowly, and doth ſomewhat trouble the ſtomacke; and therefore it is appointed that Ginger ſhould be mixed with it, or wilde Carrot ſeed, or Louage ſeed, or Sal gem, in Latine, *Sal foßilis*. I

Galen, as *Meſue* reporteth, gaue it with wine wherein Ginger was infuſed: ſome vſe to giue it with Oxymel, otherwiſe called ſyrrup of vineger, which is the ſafeſt way of all. K

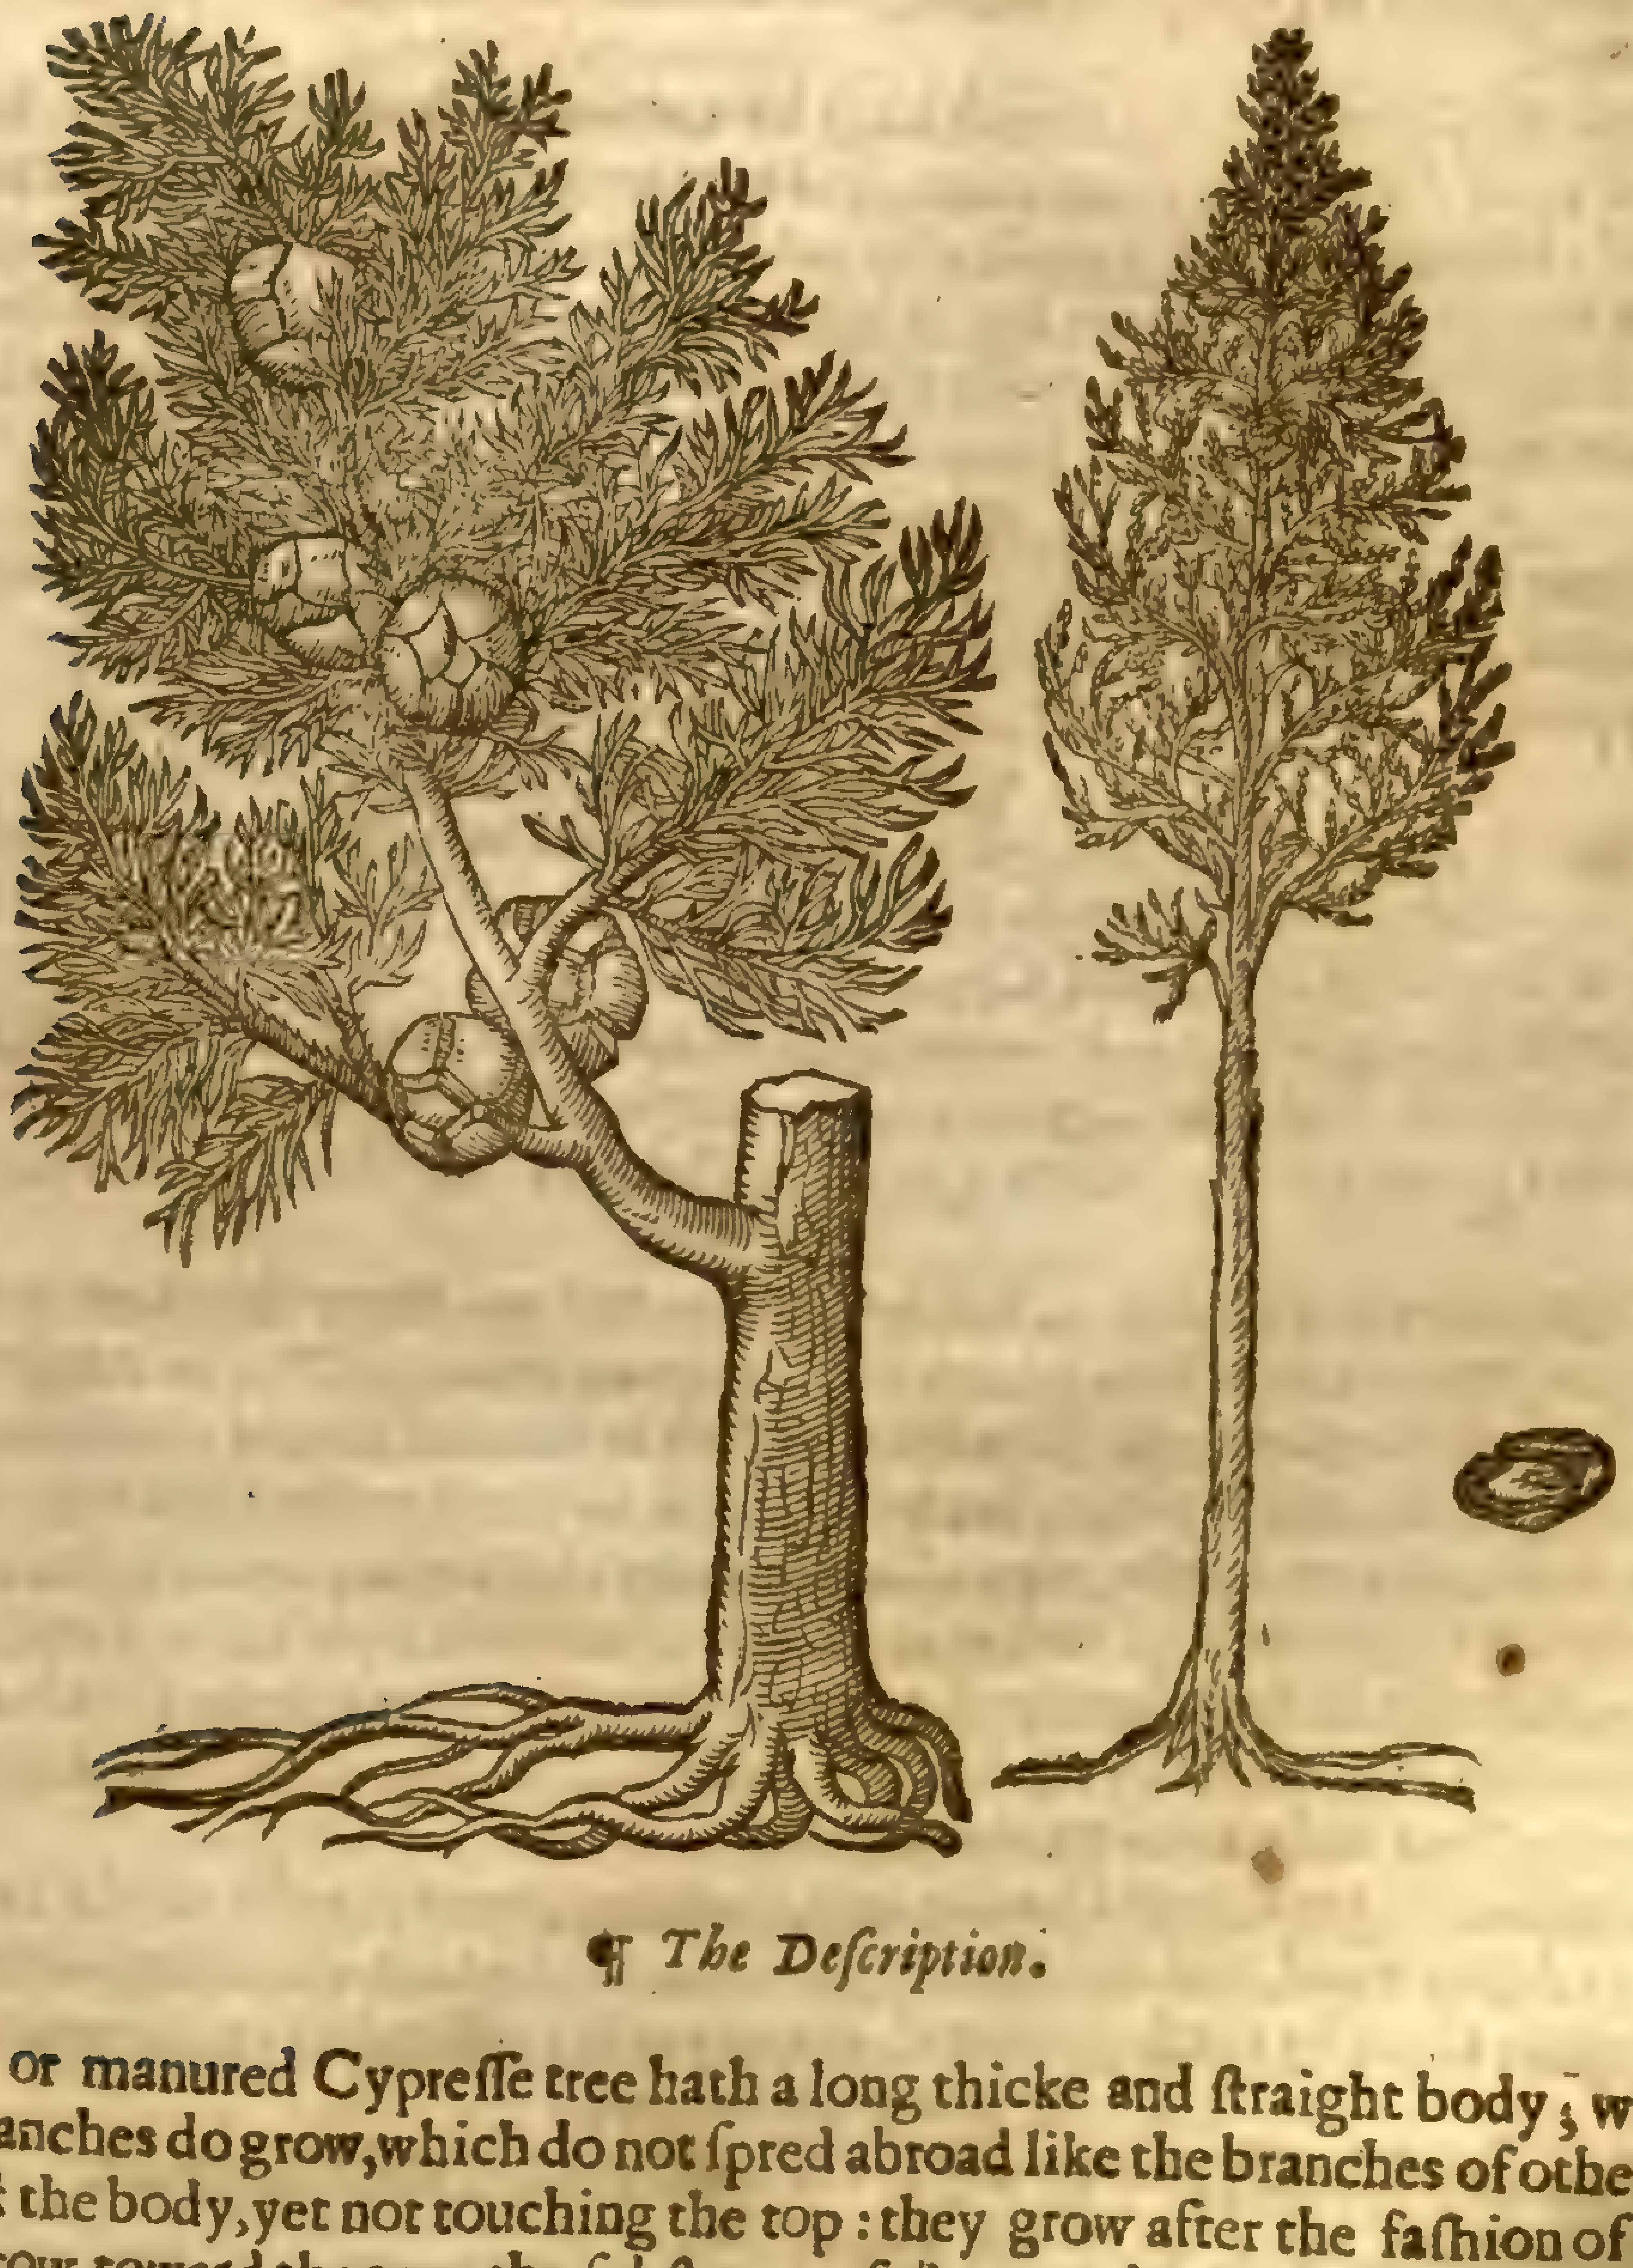
Agaricke is good againſt the paines and ſwimming in the head, or the falling Euill, being taken with ſyrrup of vineger. L

It is good againſt the ſhortneſſe of breath, called *Aſthma*, the inueterate cough of the lungs, the ptyſicke, conſumption, and thoſe that ſpet bloud: it comforteth the weake and feeble ſtomacke, cauſeth good digeſtion, and is good againſt wormes. M

Chap. 45. *Of the Cypreſſe Tree.*

Cupreſſus ſatiua & ſylueſtris.
The Garden and wild Cypreſſe tree.

Cupressus sempervirens, L.
[illegible]



The Deſcription.

THe tame or manured Cypreſſe tree hath a long thicke and ſtraight body; whereupon many ſlender branches do grow, which do not ſpred abroad like the branches of other trees, but grow vp alongſt the body, yet not touching the top: they grow after the faſhion of a ſteeple, broad below, and narrow toward the top: the ſubſtance of the wood is hard, ſound, well compact, ſweet of ſmell, and ſomewhat yellow, almoſt like the yellow Saunders, but not altogether ſo yellow, neither doth it rot nor wax old, nor cleaueth or choppeth it ſelfe. The leaues are long, round like thoſe of Tamariske, but fuller of ſubſtance. The fruit or nuts do hang vpon the boughes, being in manner like to thoſe of the Larch tree, but yet thicker and more cloſely compact: which being ripe do of themſelues part in ſunder, and then falleth the ſeed, which is ſhaken out with the winde: the ſame is ſmall, flat, very thin, of a ſwart ill fauoured colour, which is pleaſant to Ants or Piſmires, and ſerueth them for food.

Of this diuers make two kindes, the female and the male; the female barren, and the male fruitfull. *Theophraſtus* reporteth, that diuers affirme the male to come of the female. The Cypreſſe yeelds forth a certaine liquid Roſin, like in ſubſtance to that of the Larch tree, but in taſte maruellous ſharpe and biting.

The wilde Cypreſſe, as *Theophraſtus* writeth, is an high tree, and alwaies greene, ſo like to the other Cypreſſe, as it ſeemeth to be the ſame both in boughes, body, leaues, and fruit, rather than a certaine wilde Cypreſſe: the matter or ſubſtance of the wood is found, of a ſweet ſmell, like that of the Cedar tree, which rotteth not: there is nothing ſo criſped as the root, and therefore they vſe to make precious and coſtly workes thereof.

‡ I know no difference betweene the wilde and tame Cypreſſe of our Author, but in the handſomeneſſe of their growth, which is helped ſomewhat by art. ‡

¶ *The Place.*

The tame and manured Cypreſſe groweth in hot countries, as in Candy, Lycia, Rhodes, and alſo in the territory of Cyrene: it is reported to be likewiſe found on the hils belonging to mount Ida, and on the hills called *Leuci*, that is to ſay, white, the tops whereof be alwaies couered with ſnow. *Bellonius* denieth it to be found vpon the tops of theſe hills, but in the bottoms on the rough parts and ridges of the hills: it groweth likewiſe in diuers places of England where it hath been planted, as at Sion a place neere London, ſometimes a houſe of Nunnes: it groweth alſo at Greenewich, and at other places, and likewiſe at Hampſted in the garden of M^r^ *Wade*, one of the Clerkes of her Maieſties priuie Councell.

The wilde kinde of Cypreſſe tree groweth hard by *Ammons* Temple, and in other parts of the country of Cyrene vpon the tops of mountaines, and in extreme cold countries. *Bellonius* affirmeth, that there is found a certaine wilde Cypreſſe alſo in Candy, which is not ſo high as other Cypreſſe trees, nor groweth ſharpe toward the top, but is lower, and hath his boughes ſpred flat, round about in compaſſe: he ſaith the body thereof is alſo thicke: but whether this be *Thya*, of which *Theophraſtus* and *Pliny* make mention, we leaue it to conſideration.

¶ *The Time.*

The tame Cypres tree it alwaies greene; the fruit may be gathered thrice a yeare, in Ianuarie, May, and September, and therefore it is ſyrnamed *Trifera.*

The wilde Cypres tree is late, and very long before it buddeth.

¶ *The Names.*

The tame Cypres is called in Greek, Κυπάρισσος, or Κυπάριττος: in Latine, *Cupreſſus*: in ſhops, *Cypreſſus*: in Italian, *Cypreſſo*: in French and Spaniſh, *Cipres*: in high Dutch, **Cipreſſenbaum**; in low Dutch, **Cypreſſe boom**: in Engliſh, Cypres and Cypres tree.

The fruit is named in Greeke, Σφαίρια τῆς κυπαρίσσου: in Latine, *Pilulæ, Cupreſſi*, *Nuces Cupreſſi*, and *Galbuli*: in ſhops, *Nuces Cypreſſi*: in Engliſh, Cypres nuts or clogs. This tree in times paſt was dedicated to *Pluto*, and was ſaid to bee deadly; whereupon it is thought that the ſhadow thereof is vnfortunate.

The wilde Cypres tree is called in Greeke, θυῖα or θύον, and θύϊον: from this doth differ θυεία, being a name not of a plant, but of a mortar in which dry things are beaten: *Thya* as *Pliny* writeth, *lib.* 13. *cap.* 16. was well knowne to *Homer*: he ſheweth that this is burned among the ſweet ſmells, which *Circe* was much delighted withall, whom hee would haue to be taken for a goddeſſe, to their blame that call ſweet and odoriferous ſmells, euen all of them, by that name; becauſe hee doth eſpecially make mention withall in one verſe, of *Cedrus* and *Thya*: the copies haue falſly *Larix*, or Larch tree, in which it is manifeſt that he ſpake onely of trees: the verſe is extant in the fifth booke of *Odyſſes*, where he mentioneth, that *Mercurie* by *Iupiters* commandement went to *Calypſus* den, and that he did ſmell the burnt trees *Thya* and *Cedrus* a great way off.

Theophraſtus attributeth great honor to this tree, ſhewing that the roofs of old Temples became famous by reaſon of that wood, and that the timber thereof, of which the rafters are made is euerlaſting, and it is not hurt there by rotting, cobweb, nor any other infirmitie or corruption.

¶ *The Temperature.*

The fruit and leaues of the Cypres are dry in the third degree, and aſtringent.

¶ *The Vertues.*

A The Cypres nuts being ſtamped and drunken in wine, as *Dioſcorides* writeth, ſtop the laske and bloudy flix, and are good againſt the ſpitting of bloud and all other iſſues of bloud.

They glue and heale vp great vlcers in hard bodies: they ſafely and without harme ſoke vp and conſume the hid and ſecret moiſture lying deepe and in the bottome of weake and moiſt infirmities. B

The leaues and nuts are good to cure the rupture, to take away the *Polypus*, being an excreſcence growing in the noſe. C

Some do vſe the ſame againſt carbuncles and eating ſores, mixing them with parched Barley meale. D

The leaues of Cypres boyled in ſweet wine or Mede, help the ſtrangury and difficulty of making water. E

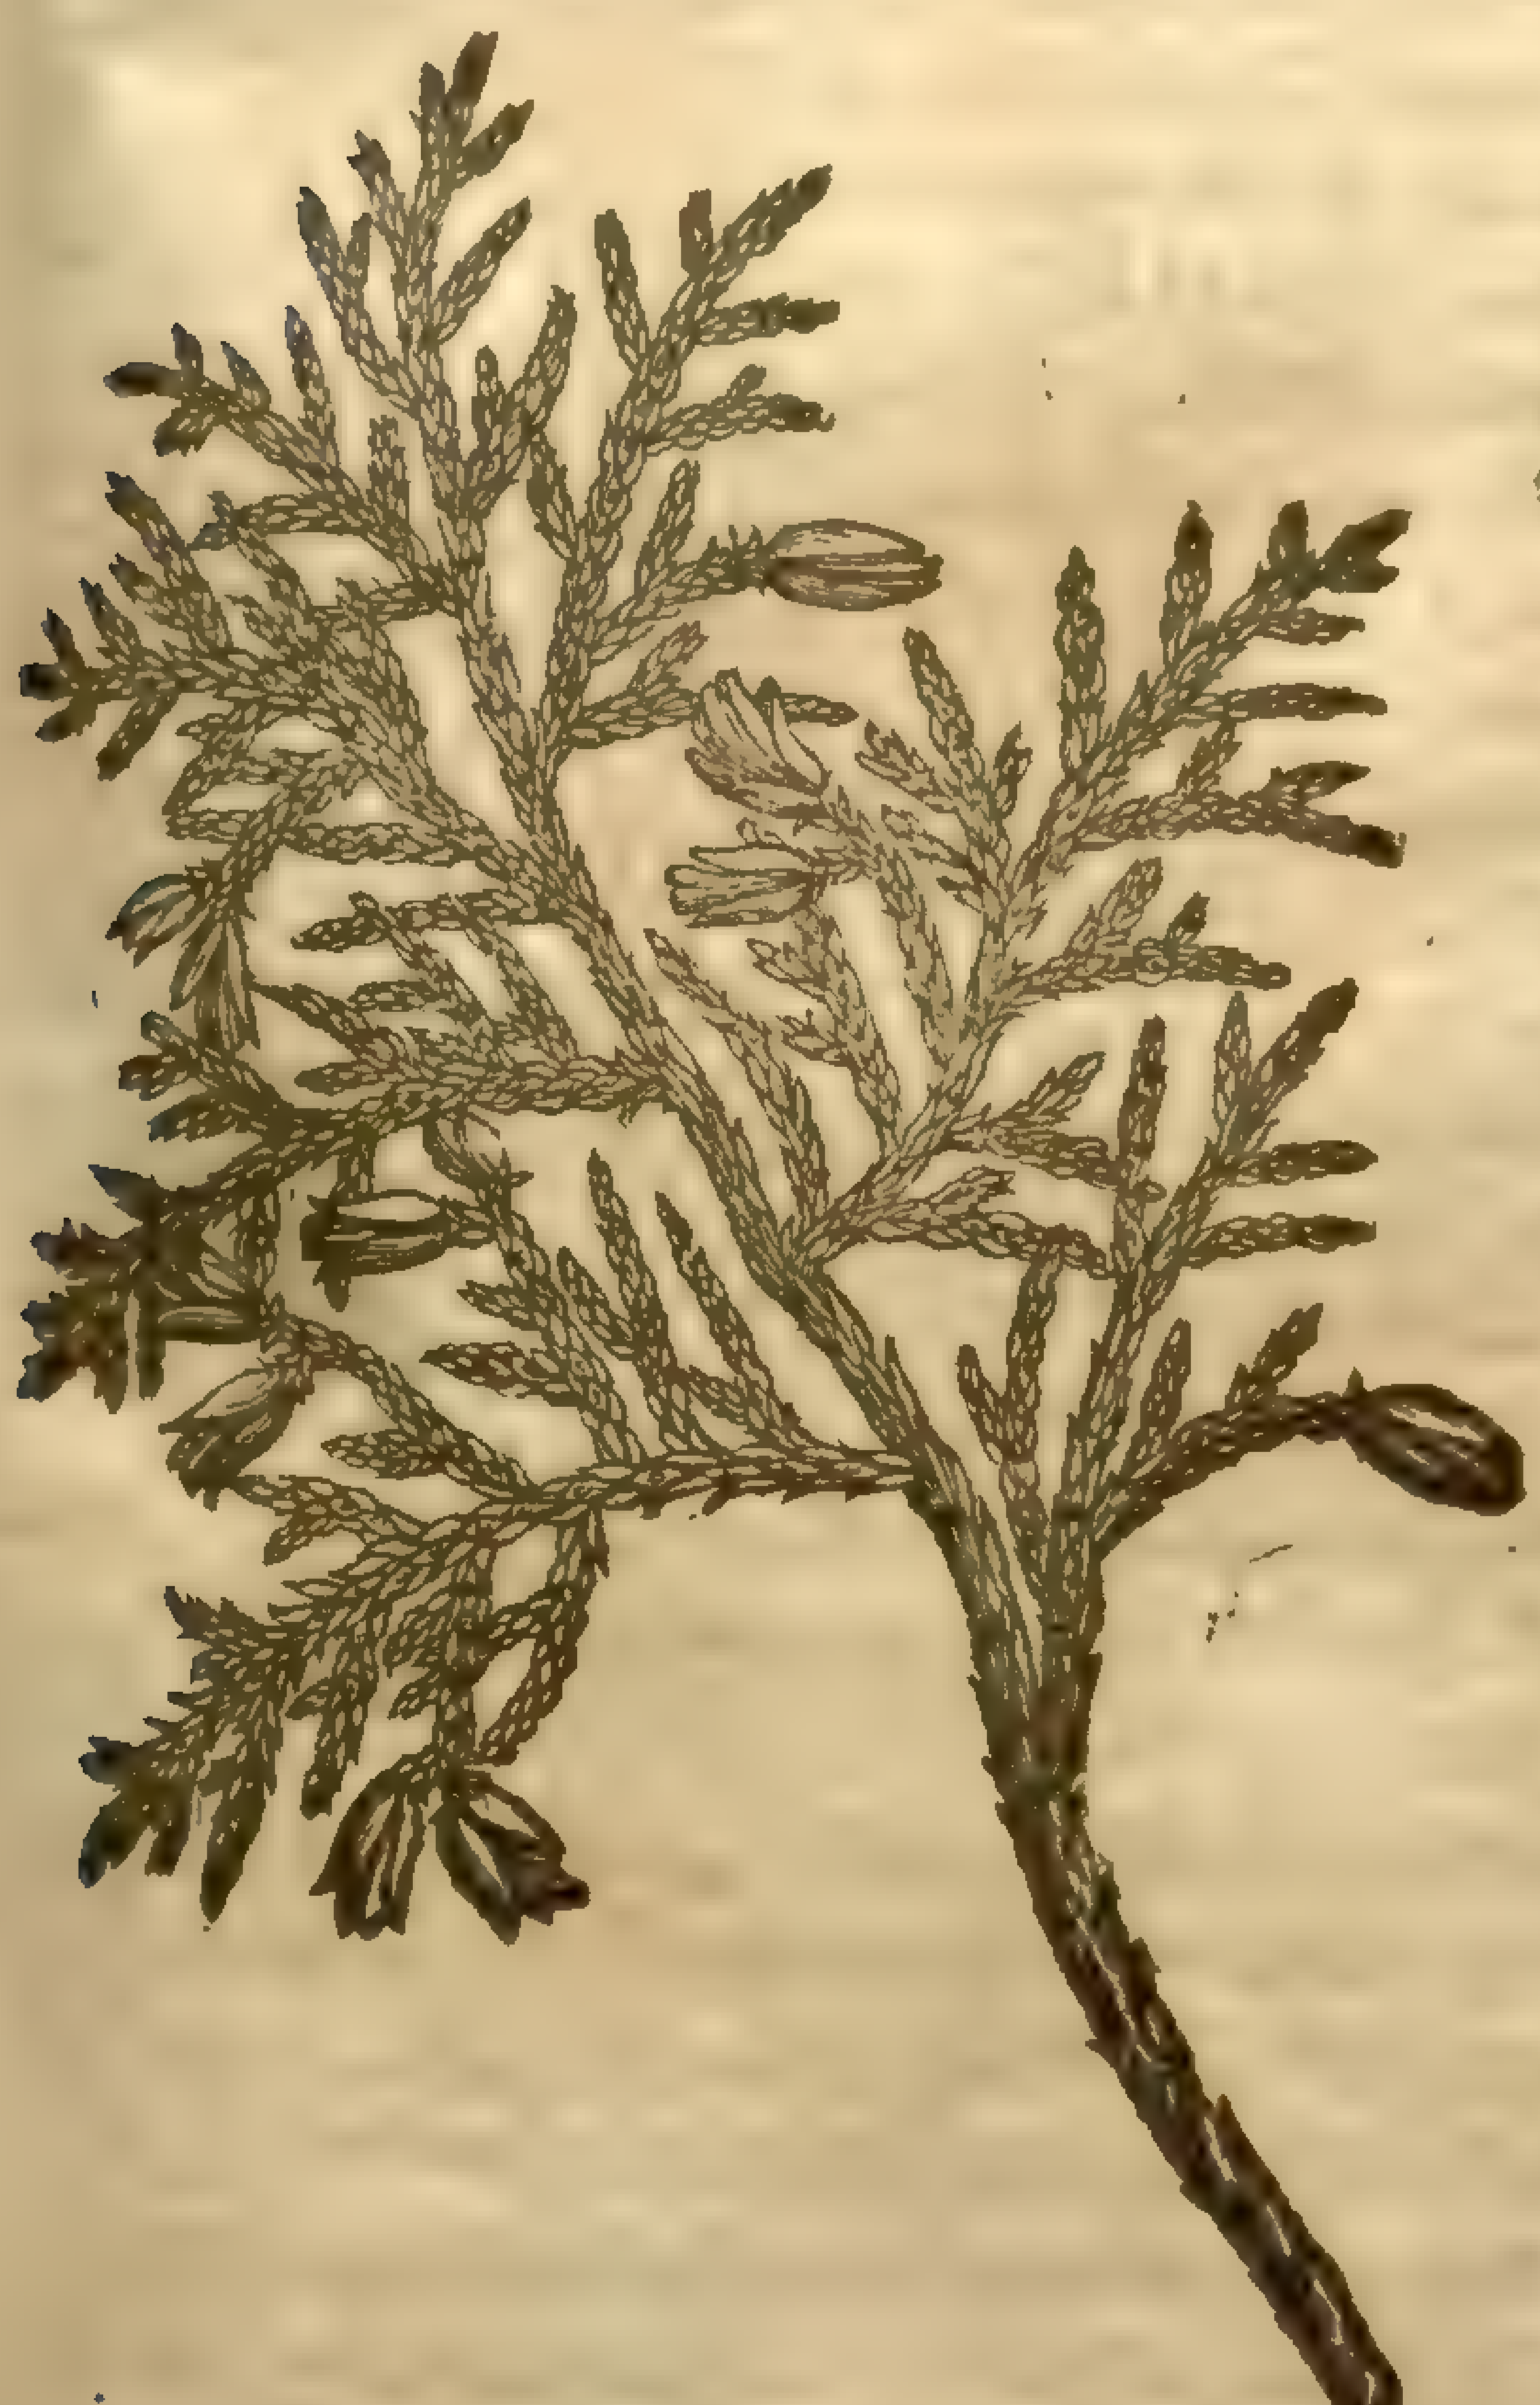
It is reported that the ſmoke of the leaues doth driue away gnats, and that the clogs doe ſo likewiſe. F

The ſhauings of the wood laid among garments preſerue them from the moths: the roſin killeth Moths, little wormes, and magots. G

† Our Author in this chapter hath put together two chapters of *Dodonæus*; the one of Cypreſſe, the other of *Thya*, out of *Theophraſtus* and others. *Vid. Pempt.6, lib.5.cap.7.& 8.*

Thuja occidentalis, Linn.

Chap. 46. *Of the tree of Life.*



Arbor Vitæ.
The Tree of Life.

¶ *The Deſcription.*

The tree of Life growes to the height of a ſmal tree, the barke being of a dark reddiſh colour: the timber very hard, the branches ſpreading themſelues abroad, hanging downe toward the ground by reaſon of the weakeneſſe of the twiggie branches ſurcharged with very oileous and ponderous leaues, caſting, and ſpreading themſelues like the feathers of a wing, reſembling thoſe of the Sauine tree, but thicker, broader, and more ful of gummie or oileous ſubſtance: which being rubbed in the hands do yeeld an aromatick, ſpicie, or gummy ſauor, very pleaſant and comfortable: amongſt the leaues come forth ſmall yellowiſh flours, which in my garden fall away without any fruit: but as it hath beene reported by thoſe that haue ſeene the ſame, there followeth a fruit in hot Regions, much like vnto the fruit of the Cypres tree, but ſmaller, compact of little and thinne ſcales cloſely pact one vpon another, which my ſelfe haue not yet ſeene. The branches of this tree laid downe in the earth will very eaſily take root, euen like the Woodbind or ſome ſuch plant; which I haue often proued, and thereby haue greatly multiplied theſe trees.

¶ *The Place.*

This tree groweth not wile in England, but it groweth in my garden very plentifully.

¶ *The Time.*

It endureth the cold of our Northerne clymat, yet doth it looſe his gallant greenes in the winter moneths: it floureth in my garden about May.

¶ *The Names.*

Theophraſtus and *Pliny*, as ſome thinke, haue called this ſweet and aromaticall tree *Thuia*, or *Thya*: ſome call it *Cedrus Lycia*: the new writers doe terme it *Arbor vitæ*: in Engliſh, the Tree of Life, I doe not meane that whereof mention is made, *Gen.3.22.*

¶ *The Temperature.*

Both the leaues and boughes be hot and dry.

¶ *The Vertues.*

Among the plants of the New-found Land, this Tree, which *Theophraſtus* calls *Thuia*, or *Thua*, is the moſt principall, and beſt agreeing vnto the nature of man, as an excellent cordial, and of a very pleaſant ſmell.

Chap. 47. *Of the Yew tree.*

[illegible]

Taxus.
The Yew tree.

¶ *The Deſcription.*

‡ In ſtead of the deſcription and place mentioned by our Author (which were not amiſſe) giue me leaue to preſent you with one much more accurate, ſent mee by Mr *Iohn Goodyer.*

Taxus glandifera bacciferáque.
The Yew bearing Acornes and Berries.

The Yew tree that beareth Acornes and berries is a great high tree remaining alwaies greene, and hath vſually an huge trunke or body as big as the Oke, couered ouer with a ſcabbed or ſcaly barke, often pilling or falling off, and a yong ſmooth barke appearing vnderneath; the timber hereof is ſomewhat red, neere as hard as Box, vniuerſally couered next the barke with a thicke white ſap like that of the Oke, and hath many big limmes diuided into many ſmall ſpreading branches: the leaues be about an inch long, narrow like the leaues of Roſemary, but ſmooth and of a darker greene colour, growing all alongſt the little twigs or branches cloſe together, ſeldome one oppoſite againſt another, often hauing at the ends of the twigs little branches compoſed of many leaues like the former, but ſhorter and broader, cloſely compact or joyned together: amongſt the leaues are to be ſeene at all times of the yeare, ſmall ſlender buds ſomewhat long, but neuer any floures; which at the very beginning of the Spring grow bigger and bigger, till they are of the faſhion of little Acornes, with a white kernell within: after they are of this forme, then groweth vp from the bottoms of the Acornes a reddiſh matter, making beautifull reddiſh berries more long than round, ſmooth on the out ſide, very clammie within, and of a ſweet taſte, couering all the Acorne, only leauing a little hole at the top, where the top of the Acorne is to be ſeene: theſe fallen, or deuoured by birds, leaue behinde them a little whitiſh huske made of a few ſcales: appearing like a little floure, which peraduenture may deceiue ſome, taking it to be ſo indeed: it ſeemes this tree, if it were not hindred by cold weather, would alwaies haue Acornes and berries on him, for hee hath alwaies little buds, which ſo ſoone as the Spring yeelds but a reaſonable heate, they grow into the forme of Acornes: about the beginning of Auguſt, ſeldome before, you ſhall finde them turned into ripe berries, and from that time till Chriſtmaſſe, or a little after, you may ſee on him both Acornes and red berries.

Taxus tantum florens.
The Yew which only floures.

The Yew which onely beareth floures and no berries, is like the other in trunke, timber, barke, and leaues; but at the beginning of Nouember, or before, this tree doth begin to be very thicke ſet or fraught on the lower ſide or part of the twigs or little branches, with ſmall round buds, very neere as big, and of the colour of Radiſh ſeed, and doe ſo continue all the Winter, till about the beginning or middle of February, when they open at the top, ſending forth one ſmall ſharpe pointall, little longer than the huske, diuided into many parts, or garniſhed towards the top with many ſmall duſty things like floures, of the colour of the huskes; and if you ſhall beate or throw ſtones into this tree about the end of February, or a good ſpace after, there will proceed and fly from theſe floures an abundance of duſty ſmoke. Theſe duſty floures continue on the trees till about harueſt, and then ſome and ſome fall away, and ſhortly after the round buds come vp as aforeſaid.

¶ *The Place.*

Theſe trees are both very common in England: in Hampſhire there is good plenty of them growing wilde on the chalkie hills, and in Church-yards where they haue been planted.

¶ *The Time.*

The time is expreſſed in their deſcriptions. Dec. 19. 1621. *Iohn Goodyer.* ‡

¶ *The Names.*

This tree is named by *Dioſcorides*, σμῖλαξ: by *Theophraſtus*, μίλος: but *Nicander* in his booke of Counterpoyſons, Σμίλος: *Galen* doth alſo call it κάκτος: it is named in Latine *Taxus*: in high Dutch, **Eybenbaum**: in low Dutch, **Ibenboom**: In Italian, *Taſſo*: in Spaniſh, *Toxo*, and *Taxo*: in French, *If*: in Engliſh, Ewe, or Eue tree: in the vnlearned ſhops of Germany, if any of them remaine, it is called *Tamariſcus*; where in times paſt they were wont not without great error, to mix the barke hereof in compound medicines, in ſtead of the Tamariske barke.

¶ *The Temperature.*

The Yew tree, as *Galen* reporteth, is of a venomous quality, and againſt mans nature. *Dioſcorides* writeth, and generally all that heretofore haue dealt in the facultie of Herbes, that the Yew tree is very venomous to be taken inwardly, and that if any doe ſleepe vnder the ſhadow thereof it cauſeth ſickneſſe and oftentimes death. Moreouer, they ſay that the fruit thereof being eaten is not onely dangerous and deadly vnto man, but if birds doe eat thereof it cauſeth them to caſt their feathers, and many times to die. All which I dare boldly affirme is altogether vntrue: for when I was yong and went to ſchoole, diuers of my ſchoole-fellowes and likewiſe my ſelfe did eat our fils of the berries of this tree, and haue not onely ſlept vnder the ſhadow thereof, but among the branches alſo, without any hurt at all, and that not one time, but many times. *Theophraſtus* ſaith, That λόφουρα; *animalia*, *Gaza* tranſlates them *Iumenta*, or labouring beaſts die, if they doe eate of the leaues; but ſuch cattell as chew their cud receiue no hurt at all thereby.

Nicander in his booke of counterpoiſons doth reckon the Yew tree among the venomous plants, ſetting downe alſo a remedy, and that in theſe words, as *Gorræus* hath tranſlated them.

Parce Venenatæ Taxo, quæ ſurgit in Oeta
Abietibus ſimilis, lethoque abſumit acerbo
Ni præter morem pleno cratere meraca
Fundere vina pares, cum primum ſentiet æger
Arctari obſtructas fauces animaque canalem.

‡ Shun th'poys'nous Yew, the which on Oeta growes,
Like to the Firre, it cauſes bitter death,
Vnleſſe beſides they vſe pure wine that flowes
From empty'd cups, thou drinke, when as thy breath
Begins to faile, and paſſage of thy life
Growes ſtraight.——

Pena and *Lobel* alſo obſerued that which our Author here affirmes, and dayly experience ſhewes it to be true, that the Yew tree in England is not poyſonous: yet diuers affirme, that in Prouince in France, and in moſt hot countries, it hath ſuch a maligne quality, that it is not ſafe to ſleepe or long to reſt vnder the ſhadow thereof. ‡

CHAP. 48. *Of the Iuniper tree.*

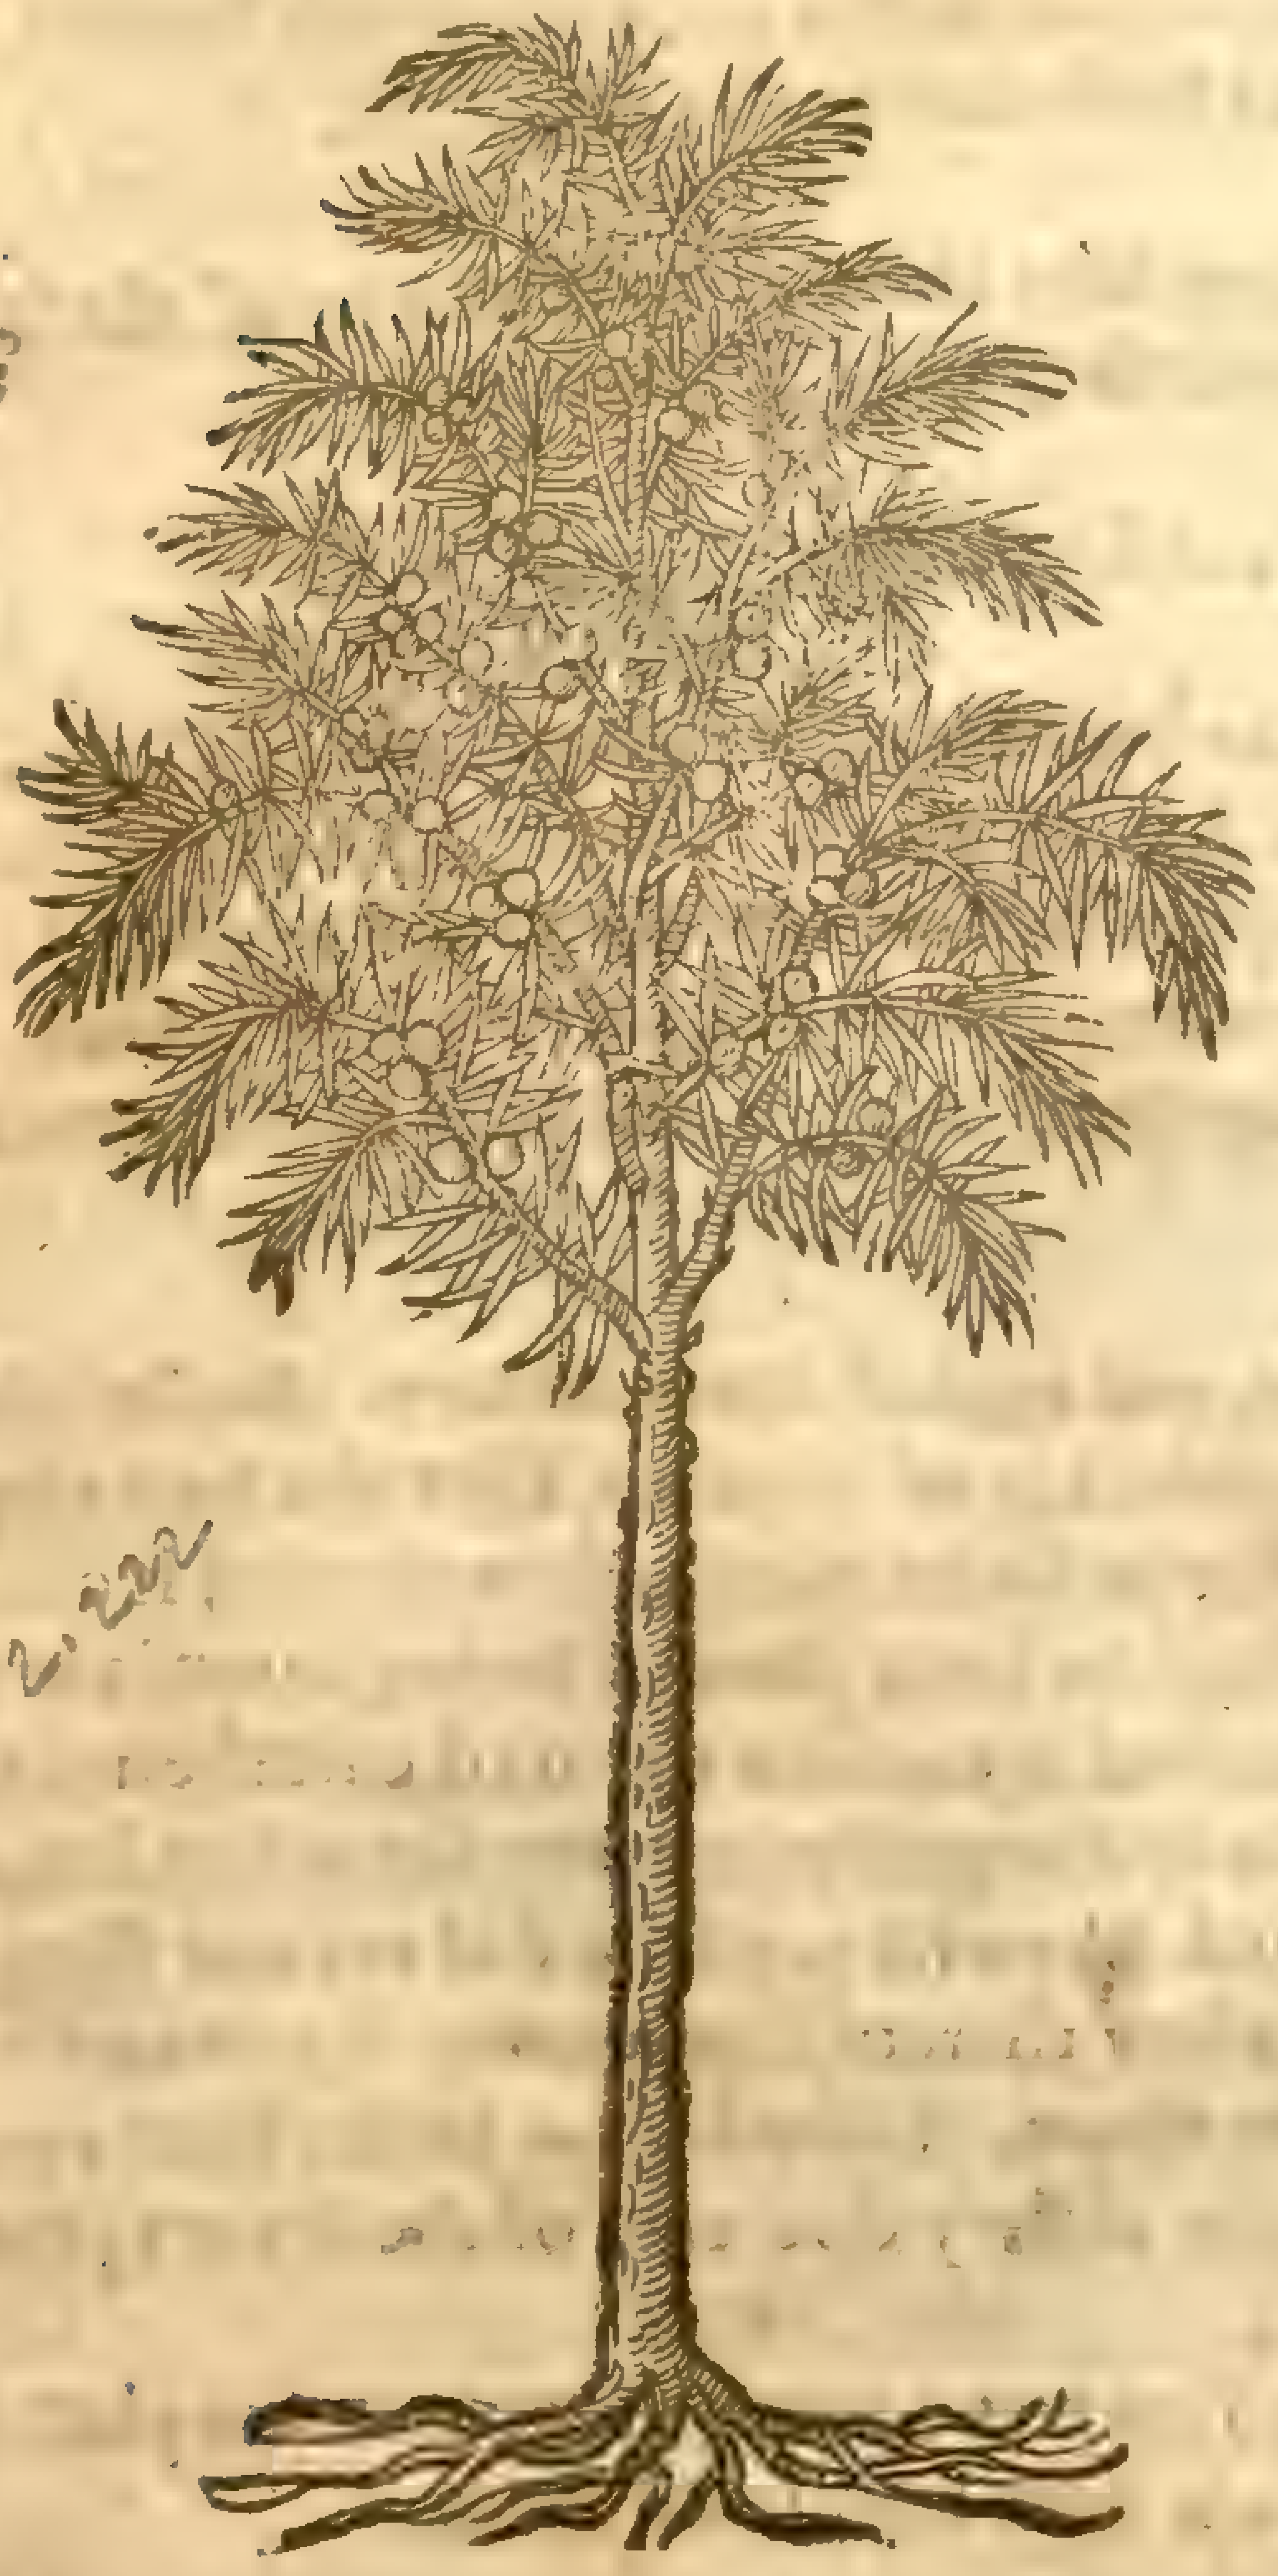
¶ *The Kindes.*

AMong the Iuniper trees one is leſſer, another greater, being a ſtrange and forreine tree: one of theſe bringeth forth a floure and no fruit; the other fruit and no floures.

¶ *The Deſcription.*

1 THe common Iuniper tree groweth in ſome parts of Kent vnto the ſtature and bignes of a faire great tree, but moſt commonly it growes very low like vnto ground Furres: this

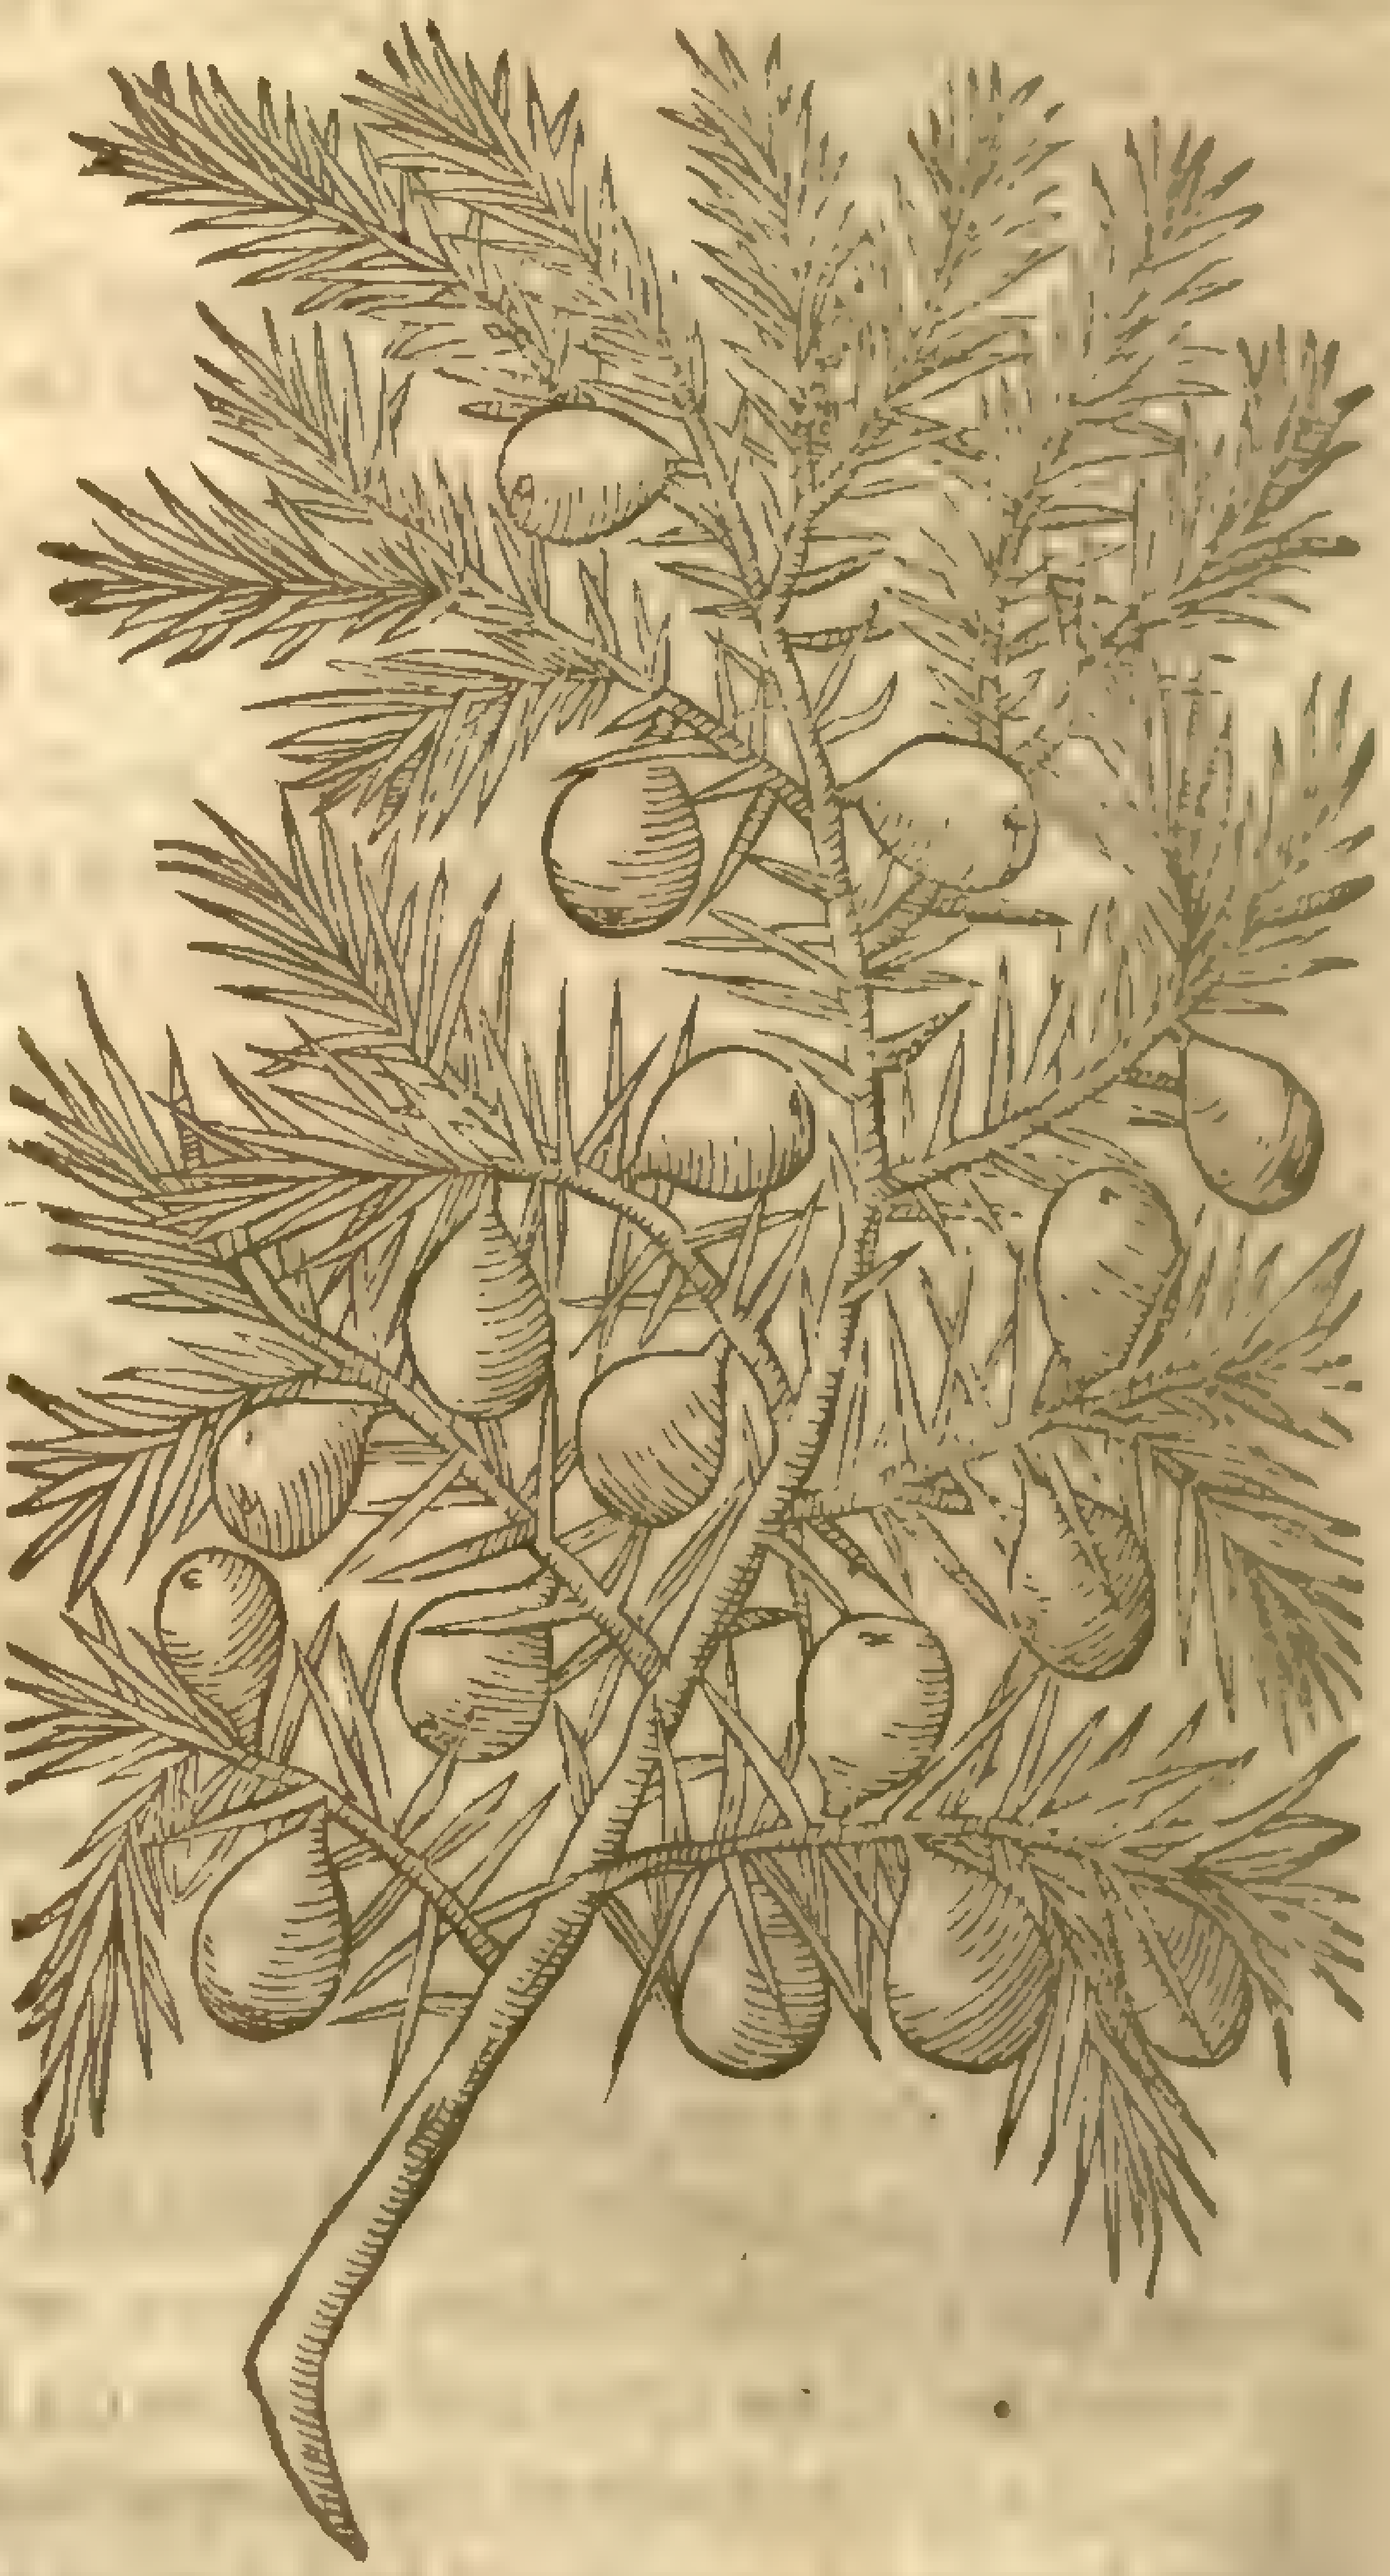
1 *Iuniperus.*
The Iuniper tree.



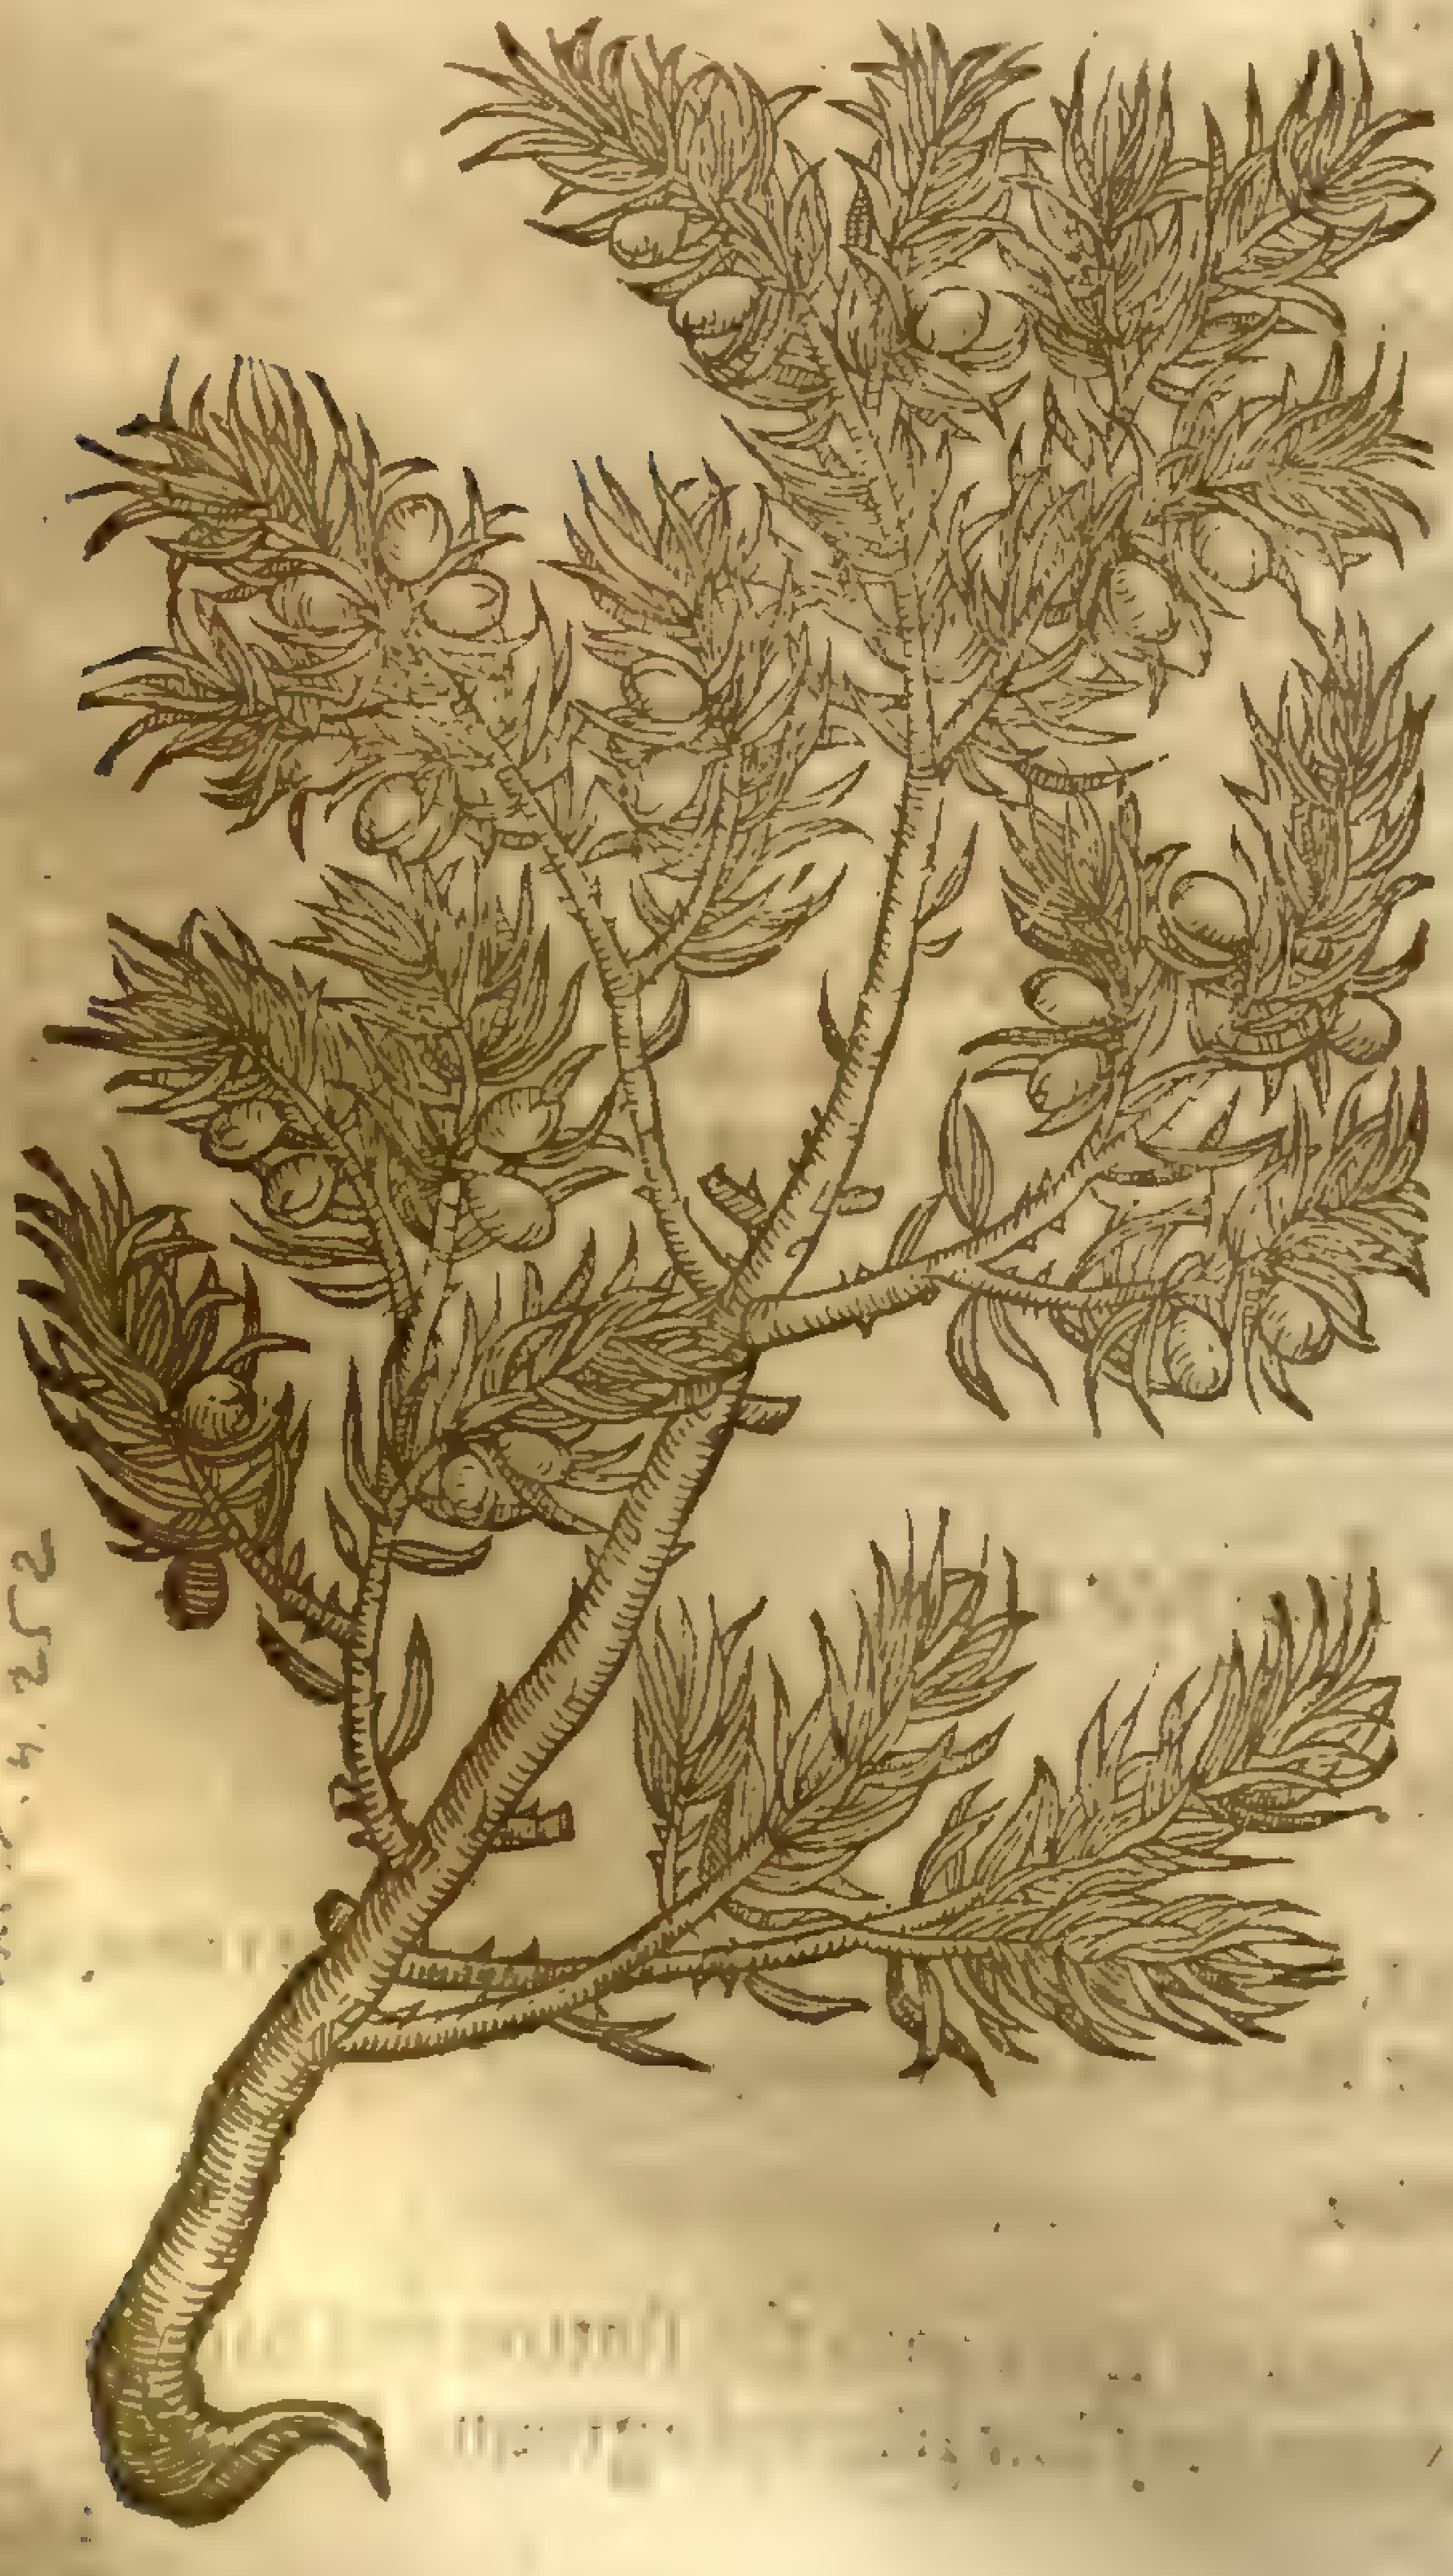
J. communis

Lob. ic. 2. 222

2 *Iuniperus maxima.*
The great Iuniper tree.



‡ 3. *Iuniperus Alpina minor.*
Small Iuniper of the Alps.



J. communis, L. β

tree hath a thin bark or rinde, which in hot regions will chop and rend it ſelf into many cranies or pieces: out of which rifts iſſueth a certaine gum or liquor much like vnto Frankincenſe: the leaues are very ſmall, narrow, and hard, and ſomwhat prickly, growing euer green along the branches, thicke together: amongſt which come forth round and ſmall berries, greene at the firſt, but afterward blacke, declining to blewneſſe, of a good ſauor, and ſweet in taſte, which do wax ſomwhat bitter after they be dry and withered.

2 The great Iuniper tree comes now and then to the height of the Cypres tree, with a greater and harder leafe, and alſo with a fruit as big as Oliue berries, as *Bellonius* writeth, of an exceeding faire blew colour, and of an excellent ſweet ſauour.

‡ 3 This exceeds not the height of a cubit, but growes low, and as it were creeps vpon the ground, and conſiſts of ſundry thicker and ſhorter branches than the common kind, tough alſo, writhen, and hard to breake; three leaues alwaies growing at equall diſtances, as in the common, but yet broader, ſhorter, and thicker, neither leſſe pricking than they, of a whitiſh greene colour on the inſide, and green without incompaſſe the tender branches. *Cluſius*, who giues vs this figure and hiſtory, obſerued not the floure, but the fruit is like that of the ordinarie,

nary,but yet ſomewhat longer: it growes vpon the Auſtrian Alps, and ripens the fruit in Auguſt and September. ‡

¶ *The Place.*

The common Iuniper is found in very many places,eſpecially in the South parts of England.

Bellonius reporteth,That the greater groweth vpon mount Taurus. *Aloyſius Anguillara* writes,that it is found on the ſhores of the Ligurian and Adriaticke ſea, and in Illyrium, bringing forth great berries: and others ſay it groweth in Provence of France: it comes vp for the moſt part in rough places and neere to the ſea,as *Dioſcorides* writeth.

¶ *The Time.*

The Iuniper tree floureth in May; the floure whereof is nothing elſe but as it were a little yellowiſh duſt or pouder ſtrewed vpon the boughes. The fruit is ripe in September, and is ſeldome found either winter or ſummer without ripe and vnripe berries,and all at one time.

¶ *The Names.*

The Iuniper tree is called in Greeke ἄρκευθος: the Apothecaries keepe the Latine name *Iuniperus*: the Arabians call it *Archonas*,and *Archencas*: the Italians, *Ginepro*: in high-Dutch, **Wechholter**: in Spaniſh, *Enebro*, *Ginebro*,and *Zimbro*: the French men and baſe Almanes, *Geneue*: in Engliſh,Iuniper tree.

The leſſer is named in Greeke, ἄρκευθος: in Latine *Iuniperus*: the great Iuniper tree is called as ſome thinke in Greeke, Κυπάρισσος ἀγρία: in Latine by *Lobel*, *Iuniperus maximus Illyricus cærulea bacca*, by reaſon of the colour of the berries; and may be called in Engliſh,blew Iuniper.

The berries are called *Grana Iuniperi*: in Greeke, ἀρκευθίδες, although the tree it ſelfe is oftentimes called alſo by the ſame name ἀρκευθίς: it is termed in high-Dutch, **Kranetbeer**. **Weckholterbeer**: in low-Dutch, **Geneverbeſſen**: in Spaniſh, *Neurinas*: in Engliſh,Iuniper berries.

The gum of the Iuniper tree is vſually called of the Apothecaries *Vernix*: in Latine, *Lachrima Iuniperi*. *Serapio* nameth it *Sandarax*, and *Sandaracha*: but there is another *Sandaracha* amongſt the Grecians,being a kinde of Orpment, which growes in the ſame minerals wherein Orpment doth; and this doth far differ from *Vernix* or the Iuniper gum. *Pliny*,*lib*.11.*cap*.7. makes mention alſo of another *Sandaracha*,which is called *Erithrace*,and *Cerinthus*; this is the meat of Bees whileſt they be about their worke.

¶ *The Temperature.*

Iuniper is hot and dry in the third degree,as *Galen* teacheth: the berries are alſo hot,but not altogether ſo dry: the gum is hot and dry in the firſt degree,as the Arabians write.

¶ *The Vertues.*

The fruit of the Iuniper tree doth clenſe the liuer and kidnies, as *Galen* teſtifieth: it alſo makes thin clammy and groſſe humors. It is vſed in countrepoiſons and other wholſome medicines. Being ouer largely taken it cauſeth gripings and gnawings in the ſtomack,and maketh the head hot; it neither bindeth nor looſeth the belly: it prouoketh vrine. A

Dioſcorides reporteth, That this being drunke is a remedie againſt the infirmities of the cheſt, coughs,windineſſe,gripings,and poiſons,and that the ſame is good for thoſe that be troubled with cramps,burſtings,and with the diſeaſe called the Mother. B

It is moſt certain,That the decoction of theſe berries is ſingular good againſt an old cough,and againſt that with which children are now and then extremely troubled,called the Chin-cough, in which they vſe to raiſe vp raw tough and clammy humors that haue many times bloud mixed with them. C

Diuers in Bohemia do take in ſtead of other drinke the water wherein thoſe berries haue beene ſteeped,who liue in wonderfull good health. D

This is alſo drunke againſt poiſons and peſtilent feuers,and it is not vnpleaſant in the drinking: when the firſt water is almoſt ſpent,the veſſell is again filled vp with freſh. E

The ſmoke of the leaues and wood driues away ſerpents and all infection and corruption of the aire,which bring the plague or ſuch like contagious diſeaſes:the juice of the leaues is laid on with wine,and alſo drunke againſt the bitings of the viper. F

The aſhes of the burned barke being applied with water take away ſcurfe and filth of the skin. G

The pouder of the wood being inwardly taken is pernitious and deadly,as *Dioſcorides* his vulgar copies do affirme; but the true copies do vtterly deny it,neither do any of the old writers affirm it. H

The fume and ſmoke of the gum doth ſtay flegmaticke humors that diſtill out of the head,and ſtoppeth the rheume: the gum doth ſtay raw and flegmaticke humors that ſtick in the ſtomacke and guts,if it be inwardly taken and alſo drunke. I

It killeth all manner of wormes in the belly,it ſtayeth the menſes and hemorrhoids: it is commended alſo againſt ſpitting of bloud,it drieth hollow vlcers and filleth them with fleſh, if it be caſt thereon: being mixed with oile of Roſes it healeth chops in the hands and feet. K

L There is made of this and oile of Lineſeed mixt together, a liquor called Verniſh, which is vſed to beautifie pictures and painted tables with, and to make iron gliſter, and to defend it from ruſt.

Chap. 49.

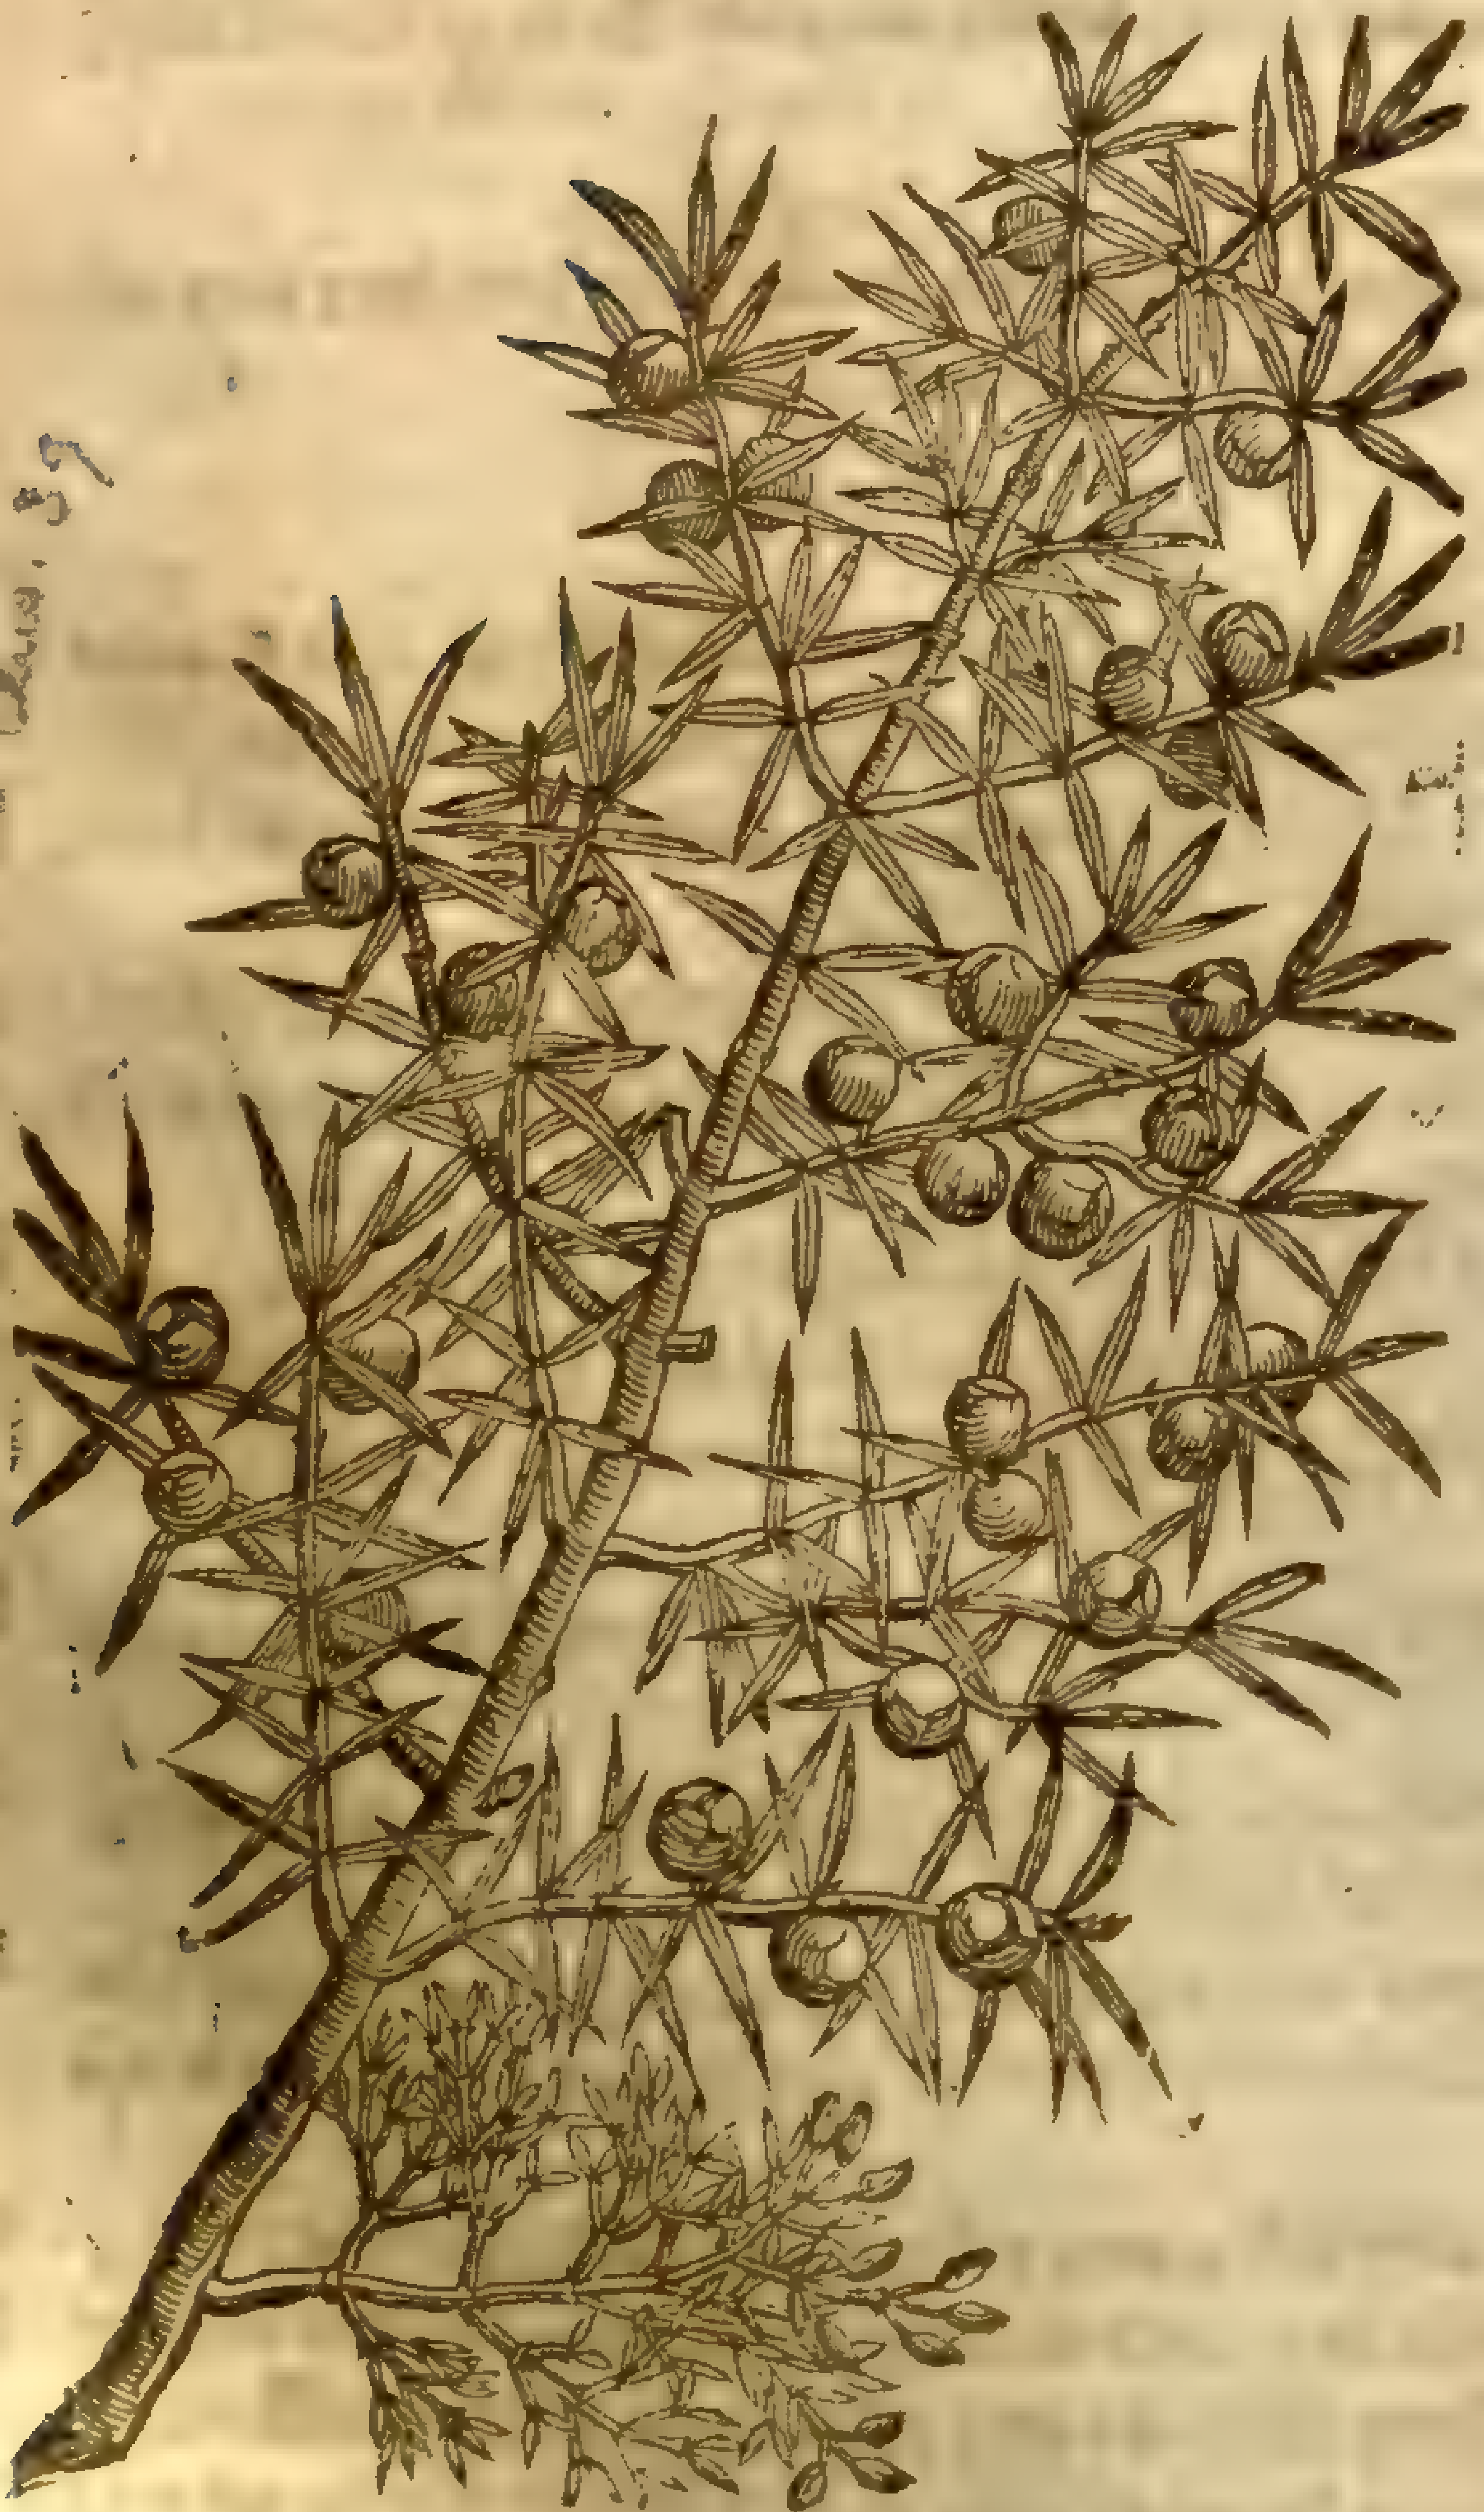
Of the prickly Cedar, or Cedar Iuniper.

¶ *The Kindes.*

The prickely Cedar tree is like to Iuniper, and is called the ſmall or little Cedar, for difference from the great and tall Cedar which bringeth Cones: and of this there are two kinds, as *Theophraſtus* and *Pliny* do teſtifie, that is to ſay, one of Lycia, and another crimſon.

¶ *The Deſcription.*

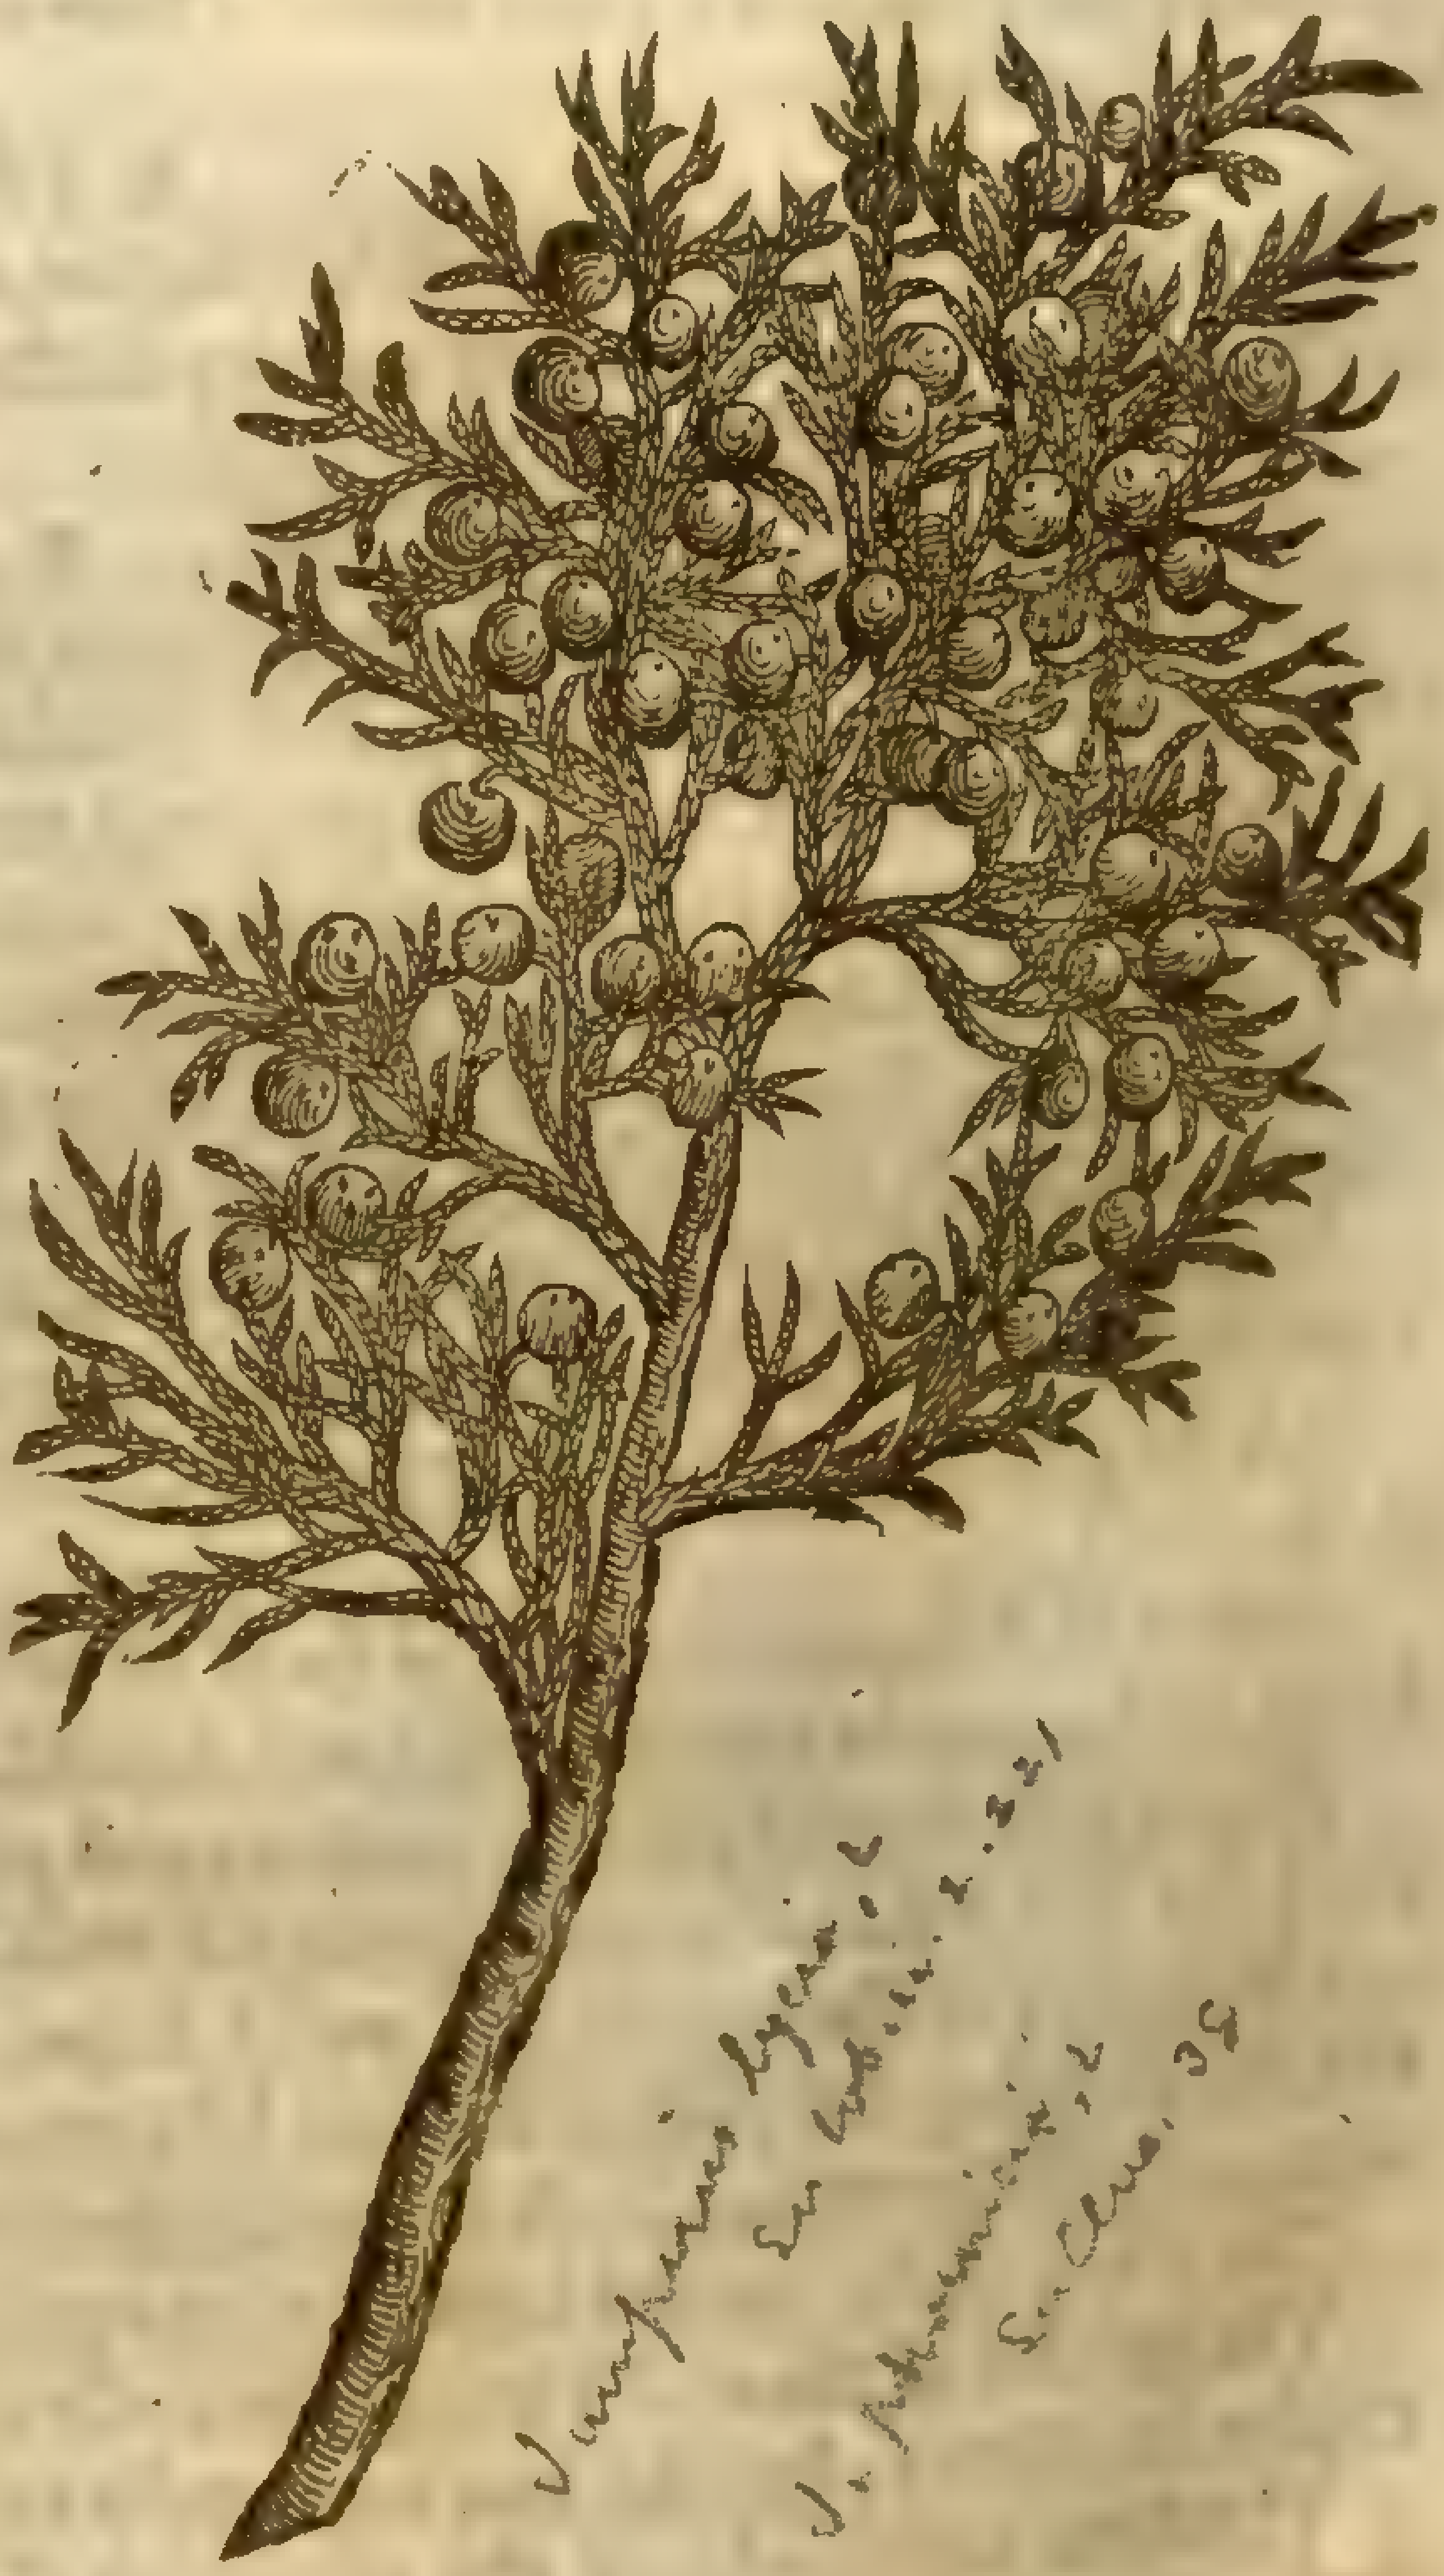
1 The crimſon or prickly cedar ſeems to be very like the Iuniper tree in body & boughs, which are writhed, knotty, and parted into very many wings: the ſubſtance of the wood is red, and ſweet of ſmel like that of the Cypreſſe: the tree is couered ouer with a rugged barke; the leaues be narrow and ſharp pointed, harder than thoſe of Iuniper, ſharper and more pricking, and ſtanding thinner vpon the branches: the fruit or berry is ſomtimes as big as a haſell nut, or as *Theophraſtus* ſaith, of the bigneſſe of Myrtle beries, and being ripe it is of a reddiſh yellow or crimſon colour, ſweet of ſmell, and ſo pleaſant in taſte, that the countreymen now and then doe eat of the ſame with bread.



1 *Oxycedrus Phœnicia.*
Crimſon prickly Cedar.

Juniperus oxycedrus
Sw Clus. 39

in Dispt. 758



2 *Oxycedrus Lycia.*
Rough Lycian Cedar.

Juniperus lycia L
Sw Lobel 2.221

J. phoenicea L
Sw Clus. 38

2 The other low Cedar which growes in Lycia is not ſo high as the former, hauing likewiſe a wrythed body as big as a mans arme, full of boughes: the barke is rough, yellowiſh without, and red within: the leaues ſtand thicker, like at the firſt to thoſe of Iuniper, but yet ſomewhat ſhorter, and in the third or fourth yeare thicker, long and round withall, comming neere to the leaues of

‡ 3 *Cedrus Lycia altera.*
The other Lycian Cedar.

of the Cypreſſe tree, or of the ſecond Sauine, that is, blunt and not pricking at all; which being bruiſed betwixt the fingers, doth yeeld a very pleaſant ſmell: ſo doth one and the ſelfe ſame plant bring forth below ſharp & prickly leaues, & aboue thick and blunt ones, as that notable learned Herbariſt *Cluſius* hath moſt diligently obſerued: the fruit or berry is round like that of Iuniper, of color yellow when it is ripe, inclining to a red, in taſt ſomewhat bitter, but ſweet of ſmell.

‡ 3 This alſo hath Cypreſſe-like leaues, not vnlike thoſe of the laſt deſcribed, yet ſomewhat thicker and broader: the fruit is alſo much larger, being as big as Haſell nuts, and of a red or ſcarlet colour; whence *Lobel* calleth it *Cedrus Phœnicia altera.* ‡

¶ *The Place.*

The prickely Cedar with the Crimſon colour comes vp higher and greater in certaine places of Italy, Spain, and Aſia, than in other countries. For that which grows on mount Gargarus in Apulia is much higher and broader than thoſe that grow elſwhere, and bringeth forth greater beries of the bignes of an haſell nut, and ſweeter, as that moſt diligent writer *Bellonius* reporteth. *Cluſius* ſhewes, that the prickely Cedar and the Iuniper tree be of ſo great a growth in diuers places of Spaine, that the body of them is as thicke as a man.

The Lycian Cedar is found in Prouince of France, not far from Maſſilia, and growes in a great part of Greece, in Illyricum and Epyrum.

¶ *The Time.*

Both of them are alwaies green, and in Winter alſo full of fruit, by reaſon that they continually bring forth berries, as when the old do fall new come in their places: in the ſpring grow vp new buds and beginnings of berries: in Autumne they wax ripe the ſecond yeare, as do the berries of Iuniper.

¶ *The Names.*

They are called in Latine *Minores*, and *Humiles Cedri*, Little and low Cedars, for difference from the tall and great Cedar which beareth Cones.

The former is named in Greeke, ὀξύκεδρος, and κέδρος φοινική: in Latine, *Oxycedrus*, and *Cedrus Punica*: in Engliſh, prickly Cedar, and Crimſon Cedar: *Pliny* ſyrnameth it *Phœnicea*, of the crimſon color of the fruit: the Spaniards cal this alſo *Enebro*, as *Cluſius* teſtifies, euen by the ſame name they giue the Iuniper; wherein likewiſe they are thought to imitate diuers of the old writers, who haue not by names diſtinguiſhed the Iuniper from the Cedar, but haue, as *Theophraſtus* noteth, called them *Cedros*, Cedar trees, yet with an addition ὀξύκεδροι, or prickly Cedars.

The other with the blunt leafe is named of *Theophraſtus*, λυκία κέδρος: of *Pliny* alſo *Lycia Cedrus*: in Prouince of France, *Moruein*: diuers name this *Sabina*, and vſe it in ſtead of Savin, which they want: as the apothecaries of Epidaurus, and in diuers cities of Greece, and alſo in Illyricum & Epyrum, as *Bellonius* teſtifieth. Some would haue it to be θυία, *Thya*: but *Thya*, according to *Theophraſtus*, is like not only in body, leaues, and boughes, but in fruit alſo, to the Cypreſſe tree: but the fruit of this is nothing like to the Cypreſſe cones.

The fruit of this Cedar is named by *Theophraſtus*, κεδρίς, *Cedris*: notwithſtanding *Cedrus*, as hee himſelfe doth alſo teſtifie (*Gaza* nameth it *Cedrula*) is a certain little ſhrub which neuer grows to a tree.

The gum or liquor which iſſues from the prickly Cedar is alſo called *Vernix*, and is ſold inſted thereof.

¶ *The Nature and Vertues.*

The little Cedar, as *Galen* writeth, is hot and dry in a manner in the third degree: the matter or A ſubſtance thereof is ſweet of ſmell like that of Iuniper, and is vſed for perfumes and odoriferous ſmels together with the leaues.

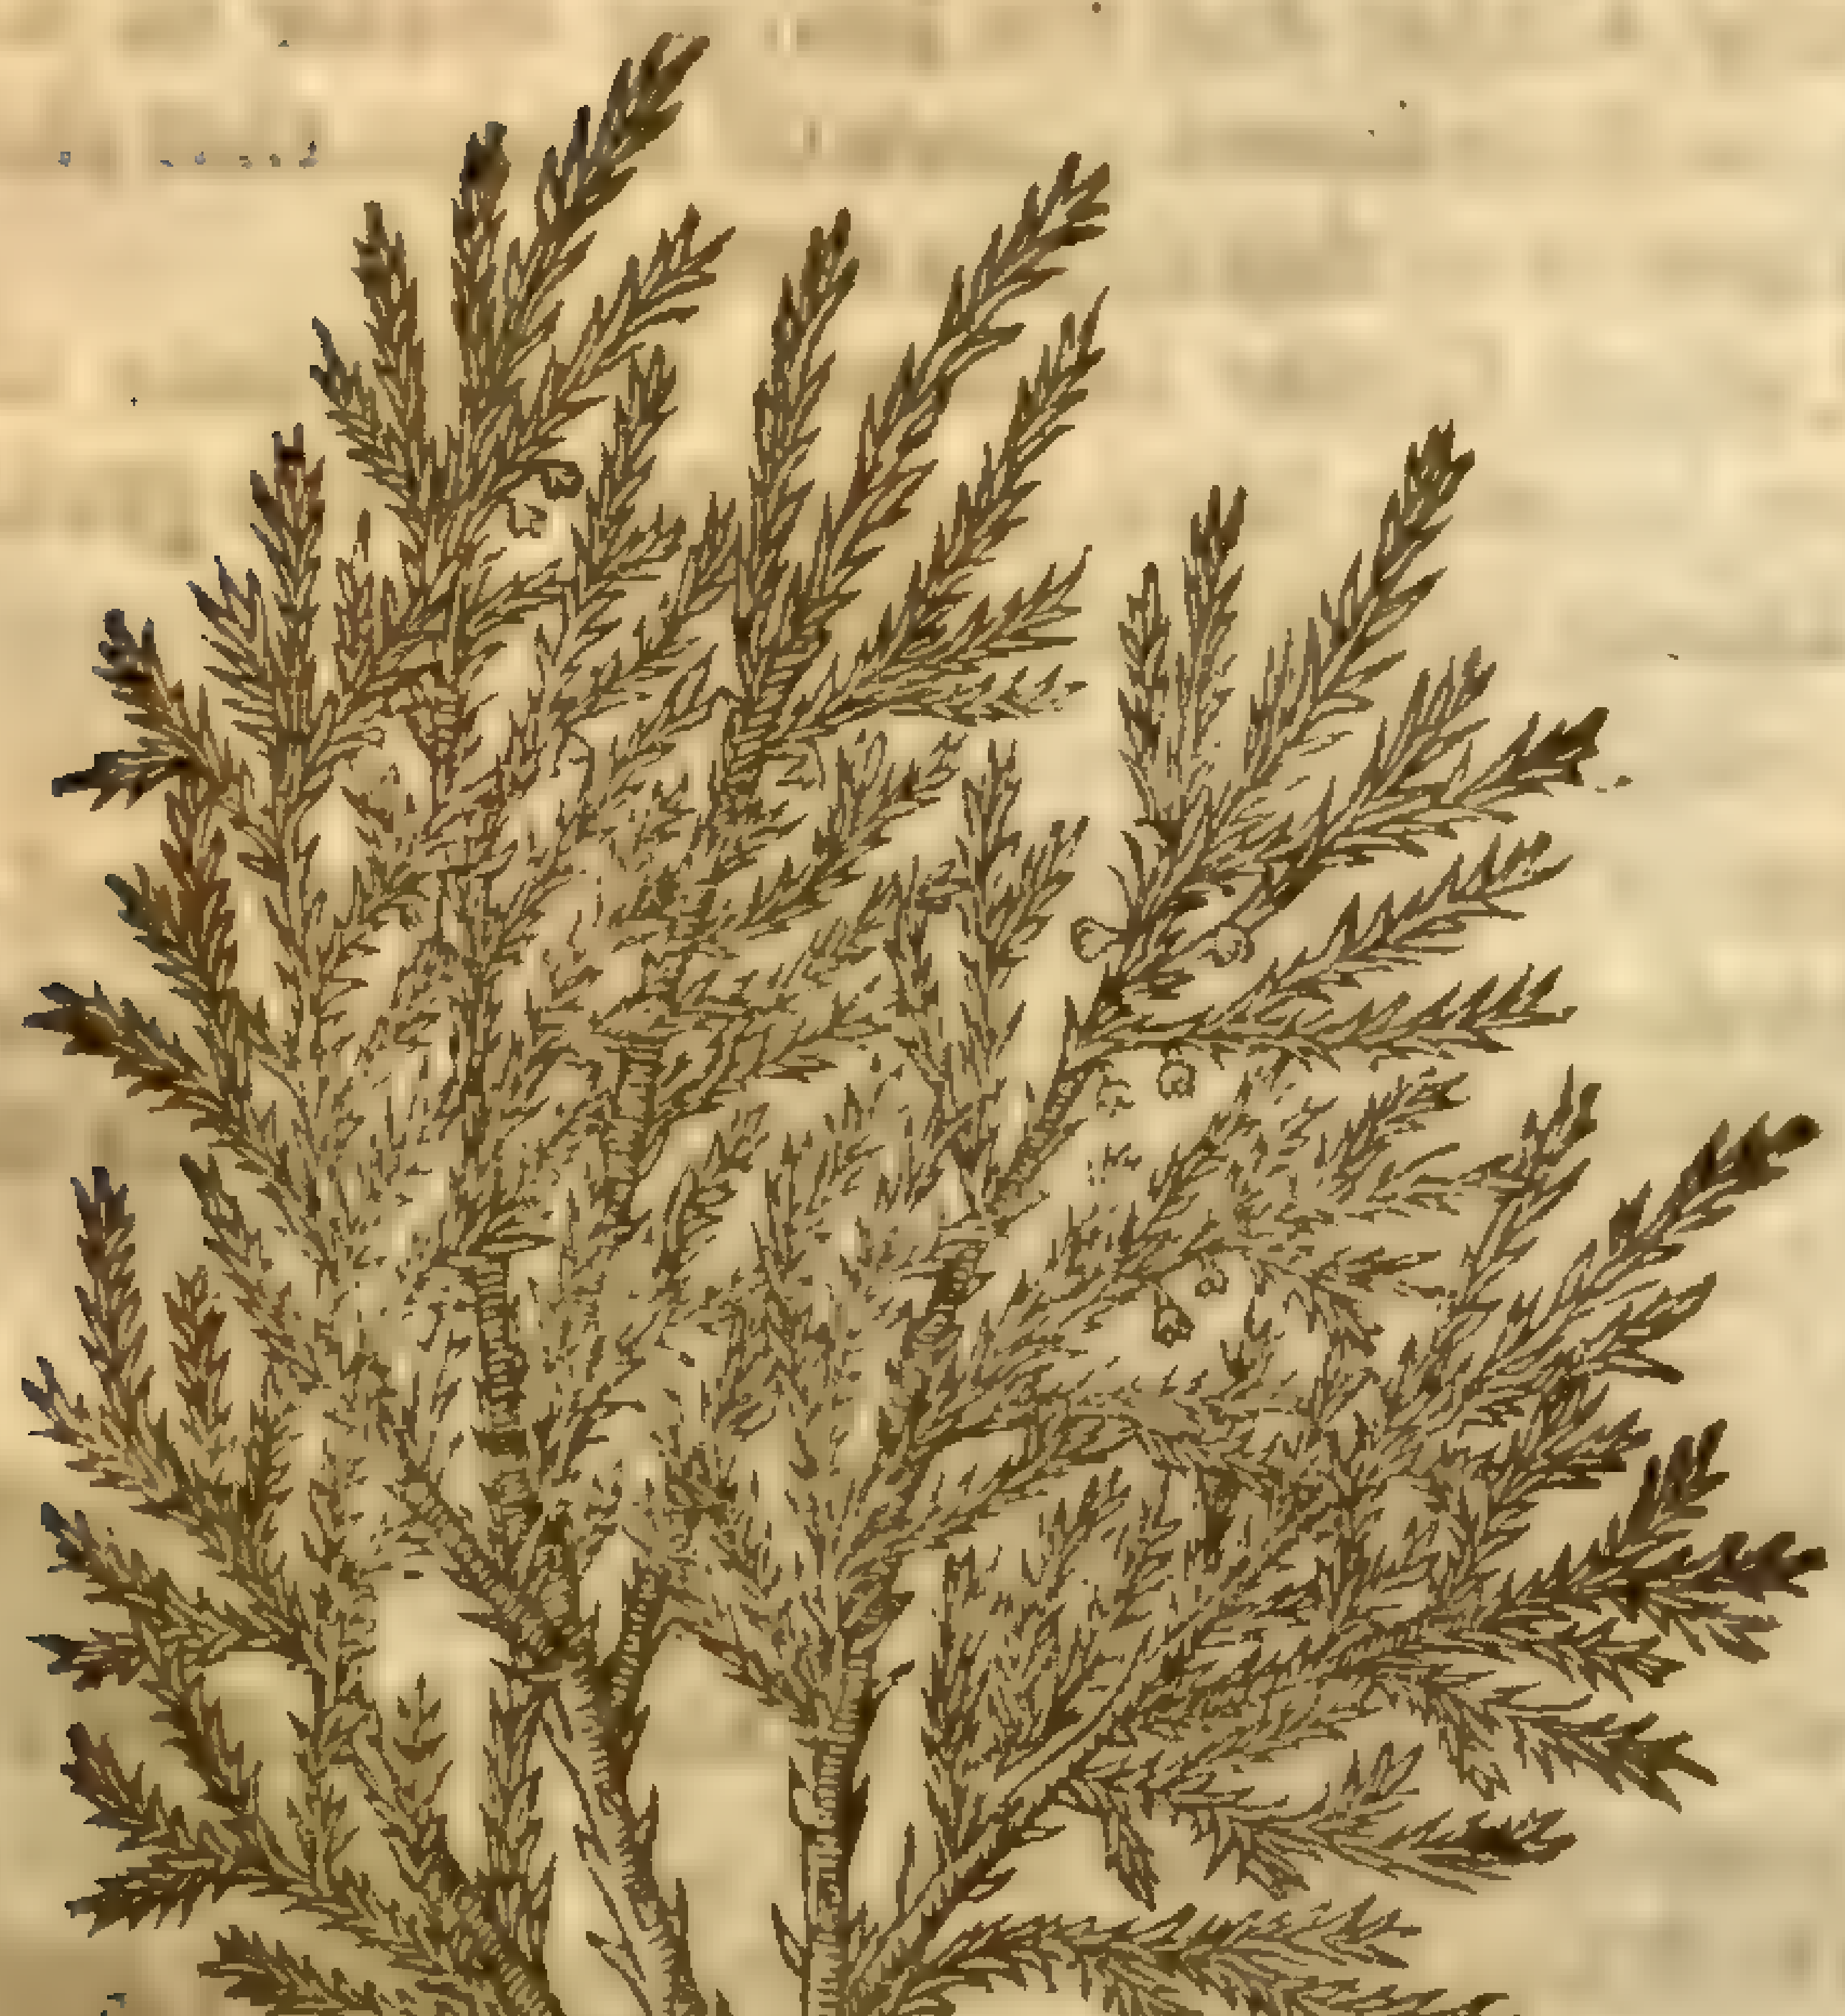
The berries or fruit of the low Cedar haue their faculties not ſo ſtrong, as the ſame Author teſtifieth, inſomuch as that they may alſo be eaten, yet if they bee taken too plentifully they cauſe head-ache, and breed heate and gnawings in the ſtomacke. Yet there is a difference betweene theſe two Cedar berries; for the crimſon ones are not ſo hot and dry, by reaſon they are ſweeter & pleaſanter to the taſte, and therefore they are better to be eaten, and do alſo yeeld vnto the body a kind of nouriſhment: but the berries of that of *Lycia* are biting, hotter and drier alſo than thoſe of Iuniper, from which they differ eſpecially in the biting quality, they bring no nouriſhment at all, and though a man eat neuer ſo few of them, hee ſhall feele gnawings in his ſtomacke, and paine in his head.

The Peaſants doe feed thereon rather to ſatisfie their hunger, than for any delight they haue in the taſte, or the phyſicall vertues thereof; albeit they be good againſt the ſtrangurie, and prouoke vrine.

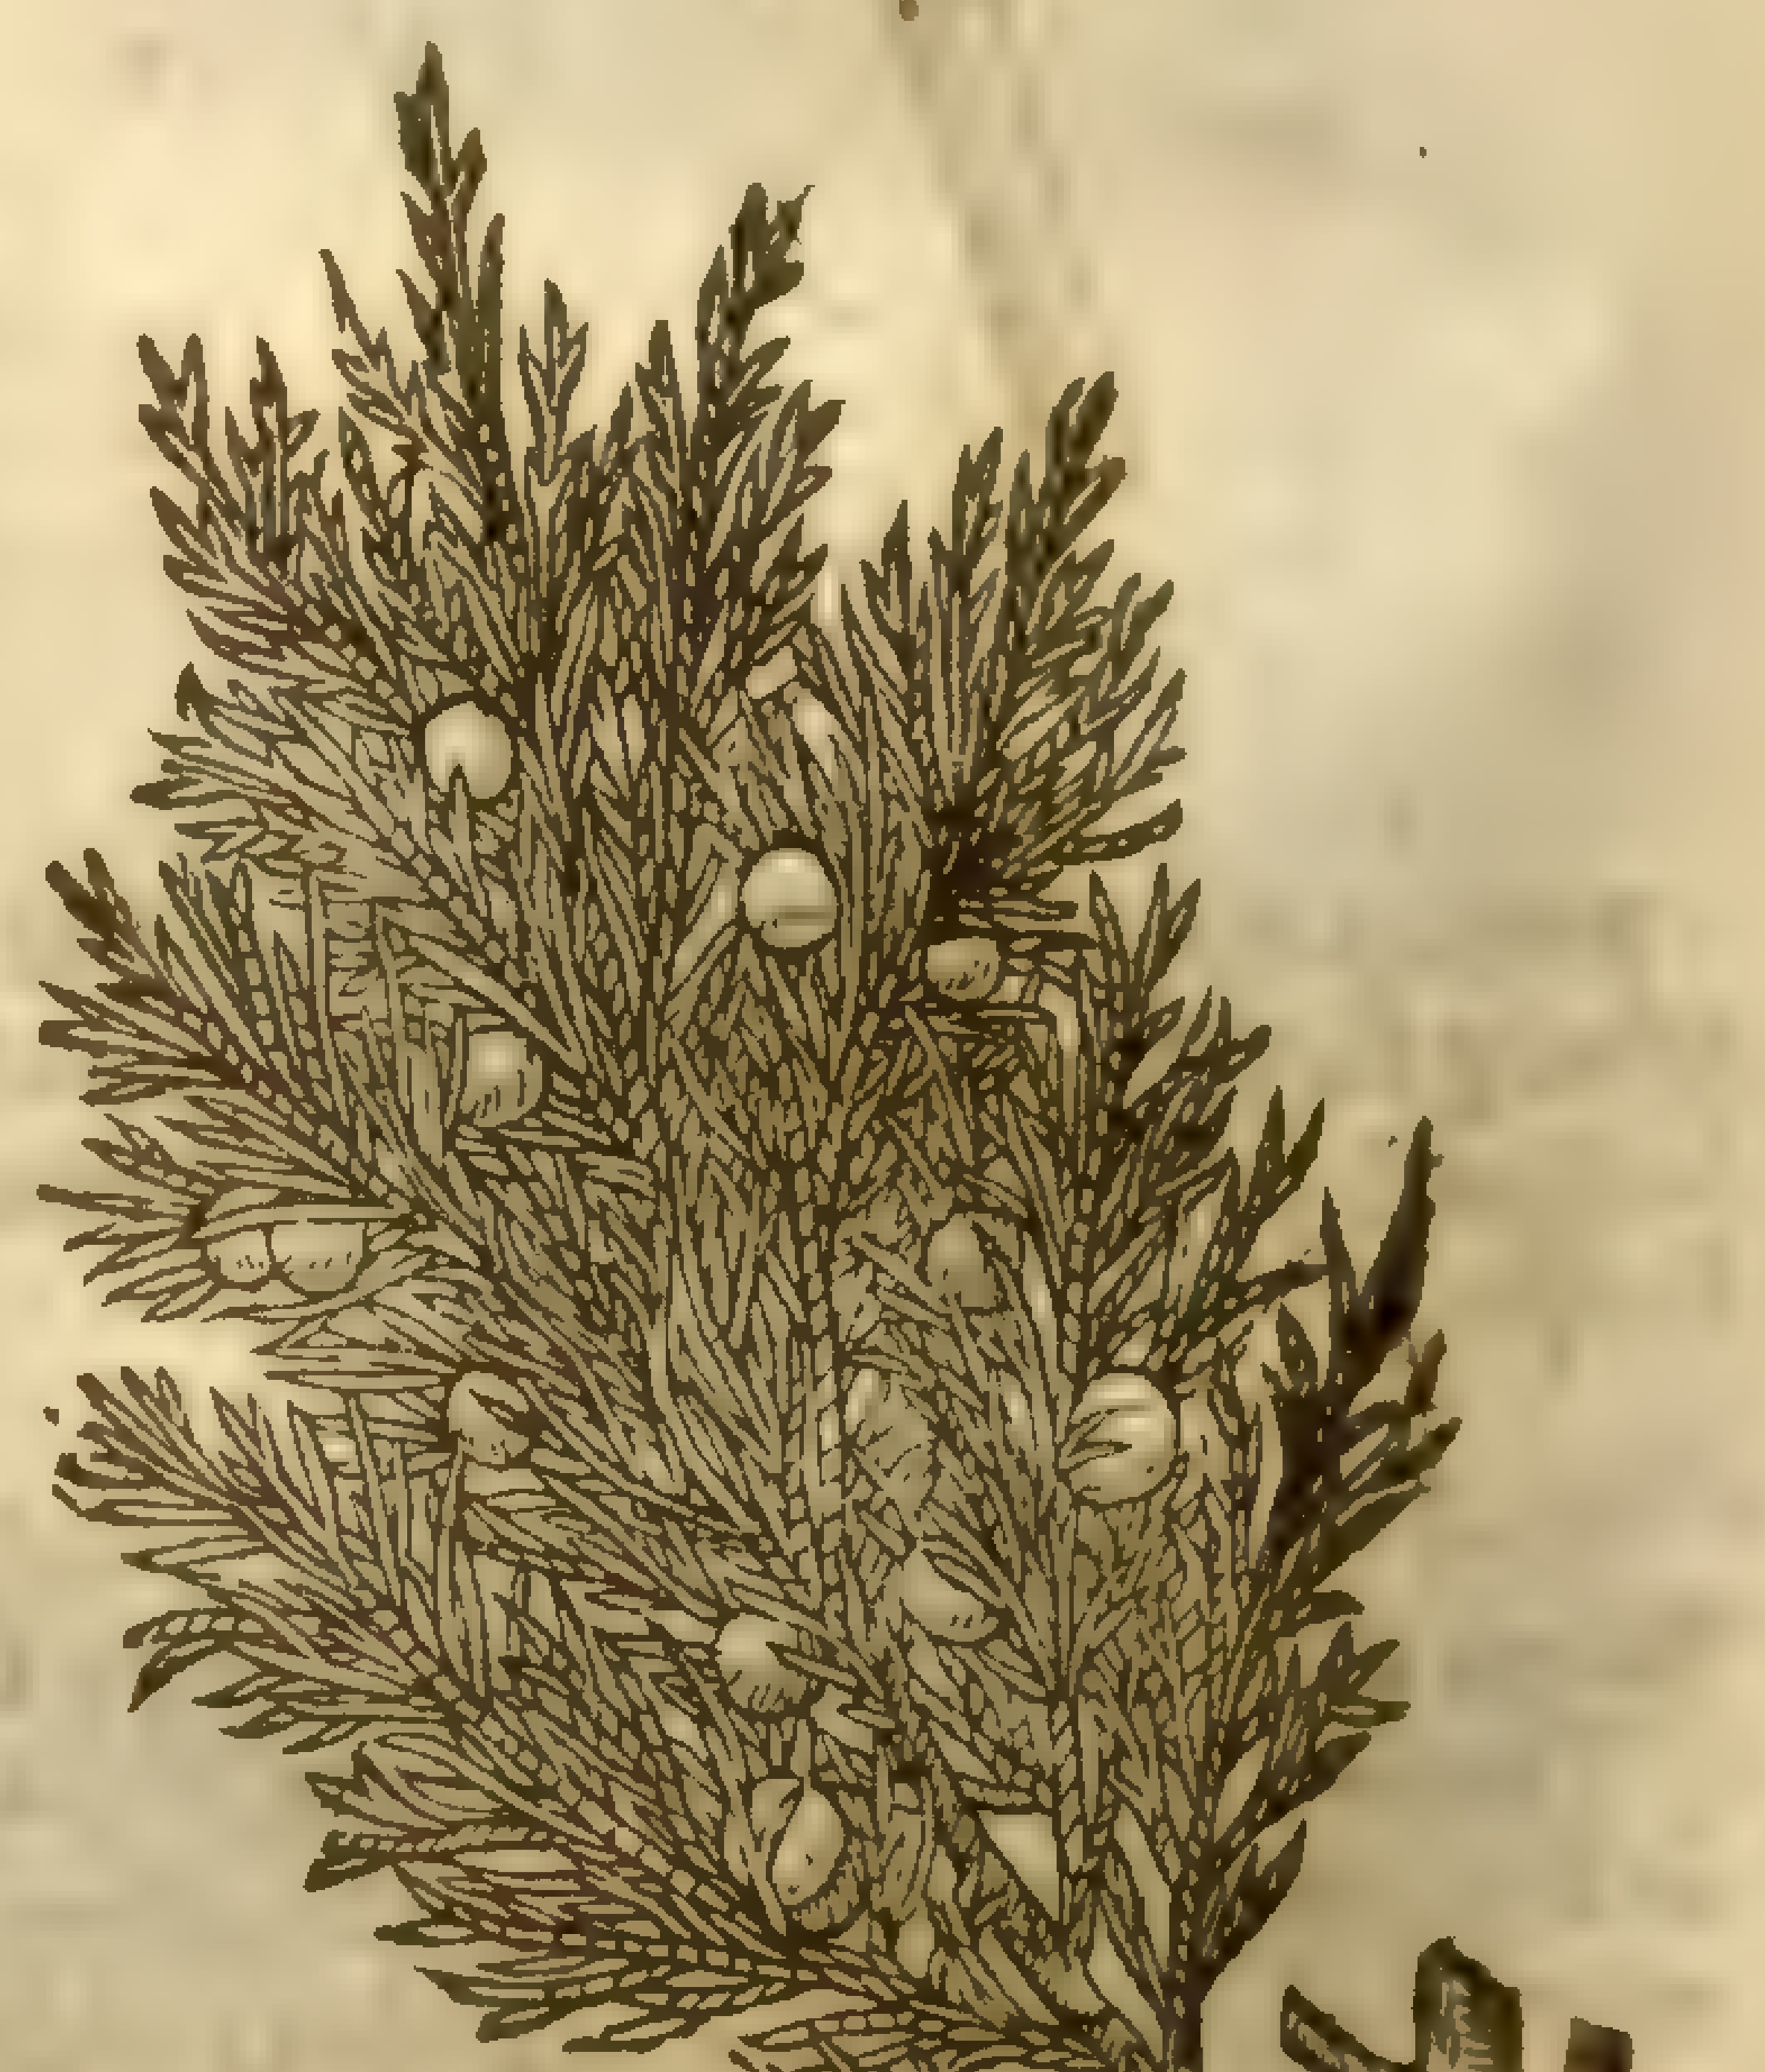
Chap. 5. *Of Savin.*

¶ *The Kindes.*

THere be two kinds of Savin, one like in leafe to Tamarisk, the other to the Cypres tree, whereof the one beareth berries, the other is barren.



1 *Sabina ſterilis.*
Barren Savin.

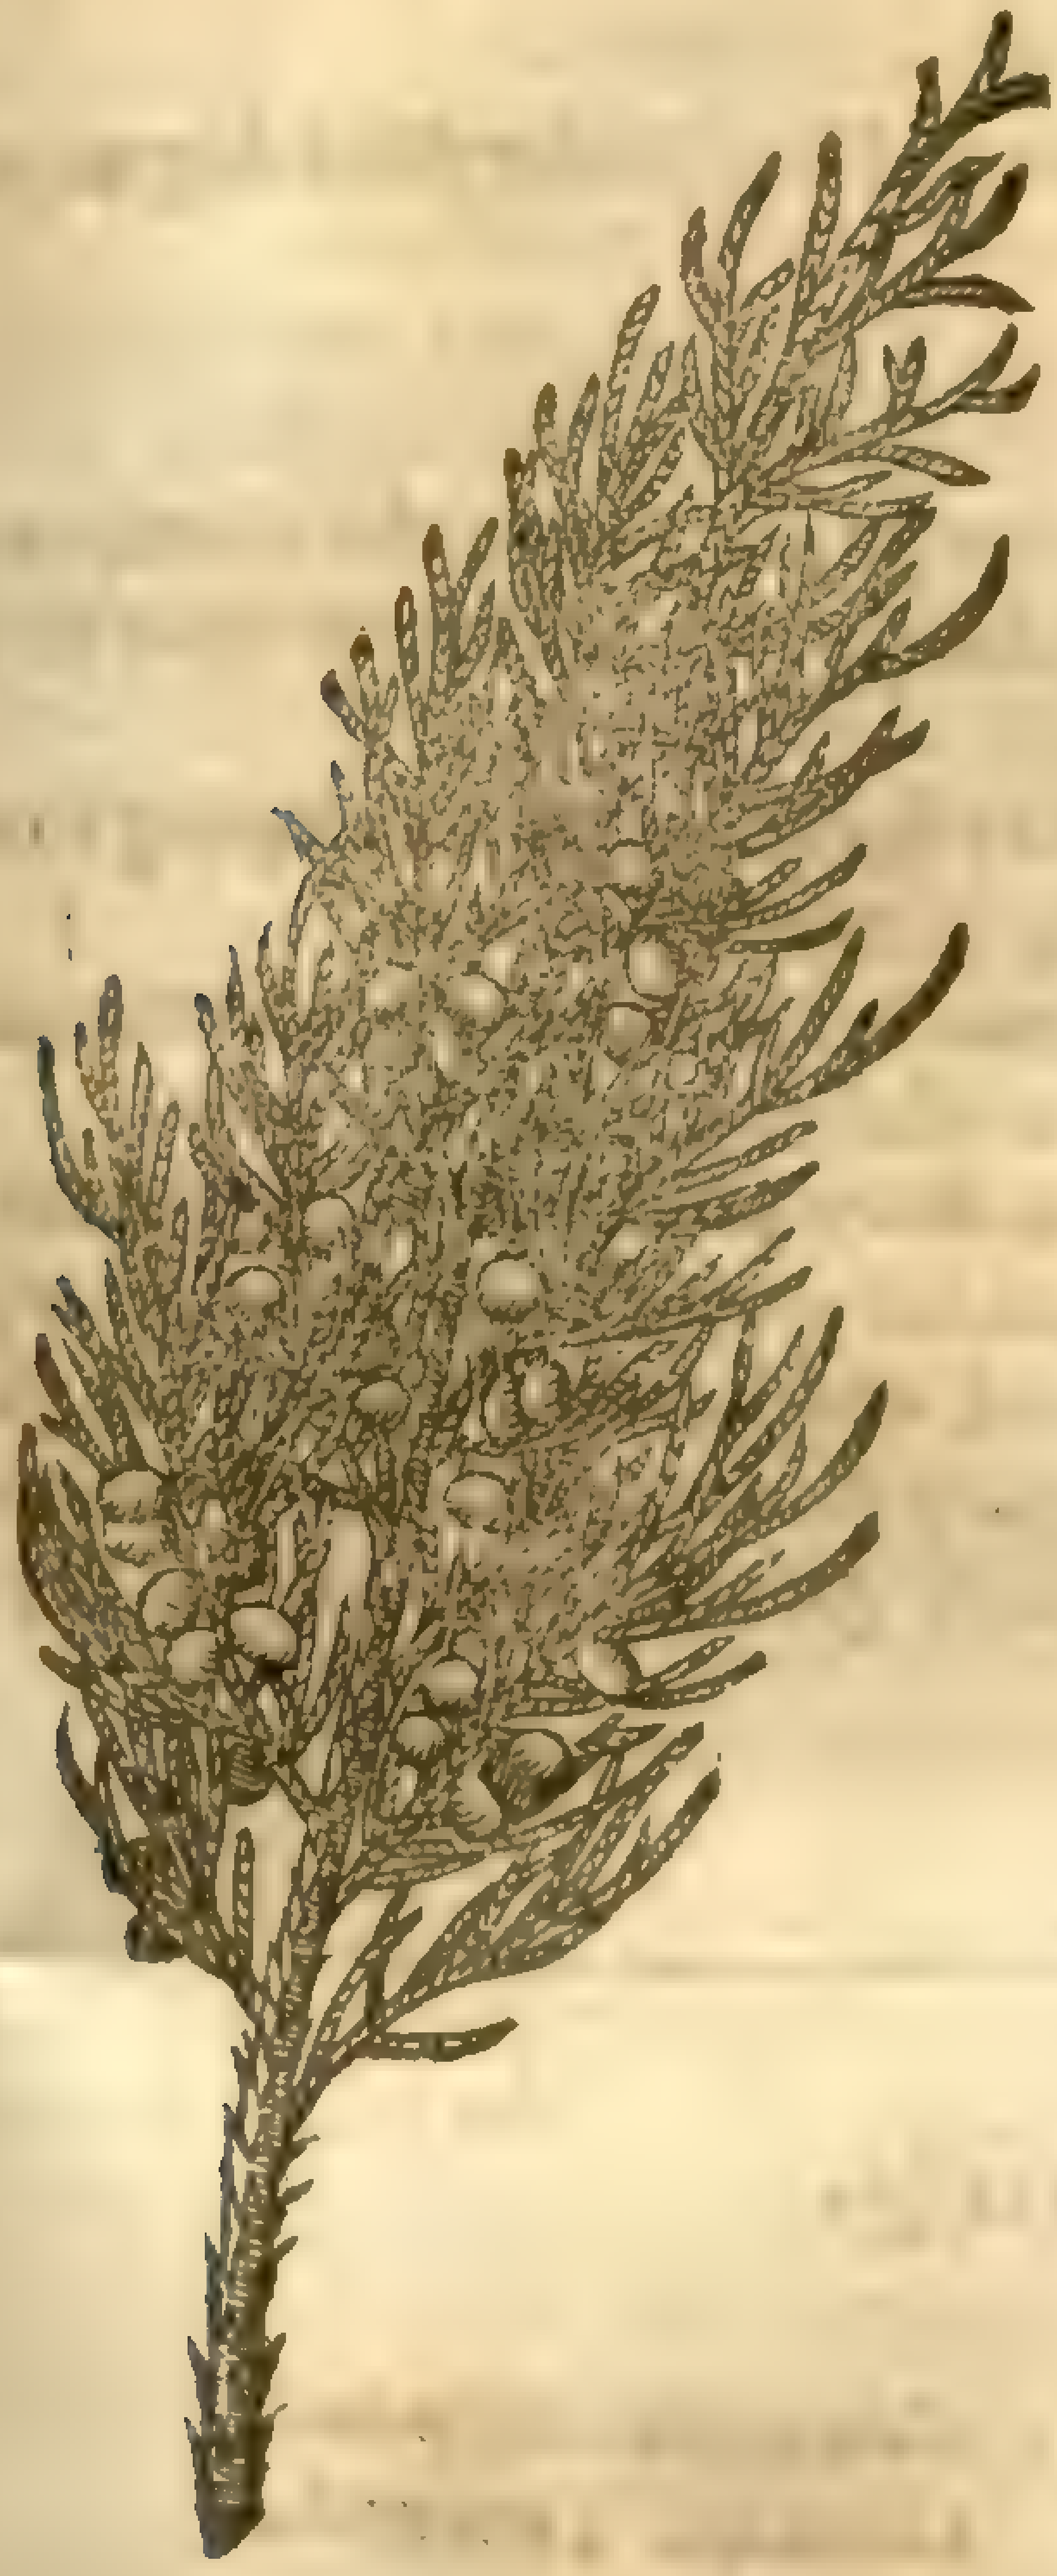


2 *Sabina baccifera.*
Savin bearing berries.

¶ *The Deſcription.*

1 THe firſt Savin, which is the common kind, and beſt of all known in this country, groweth in manner of a low ſhrub or tree, the ſtem or trunke whereof is ſomtimes as big as a mans arm, diuiding it ſelfe into many branches ſet full of ſmall leaues like Cypreſſe or Tamariske, but thicker, and more ſharp and prickly, remaining green winter and ſummer, in ſmell ranke or very ſtrong, barren both of floures and fruit.

‡ 3 *Sabina baccata altera.*
The leſſer berry-bearing Savin.



2 The other Savin is an high tree, as *Bellonius* ſaith, as tall as the Almond tree, and much like to the tame Cypreſſe tree: the body is wrythed, thick, and ſomtimes of ſo great a compaſſe as that it cannot be fathomed; the ſubſtance of the wood is red within, as is that of Iuniper and of the prickly Cedar: the barke is not very thicke, and it is of a yellowiſh red: the leaues are of a maruellous gallant greene colour, like to thoſe of the Cypres tree, yet thicker or more in number; in taſte bitter, of a ſpicie ſmell, and like Roſin: the boughes are broader, and thick ſet as it were with wings, like thoſe of the Pitch tree and of the Yew tree: on which grow a great number of beries very round like thoſe of the little Cedars, which at the firſt are green, but when they be ripe they are of a blackiſh blew. Out of the root hereof iſſueth oft times a Roſin, which being hard is like to that of the Iuniper tree, and doth alſo crumble in the chewing.

‡ 3 There is another which differs from the laſt deſcribed, onely in that the leaues are ſmaller and leſſe pricking than thoſe of the former, as alſo the branches leſſer. *Lobel* cals this *Savina baccata altera.* ‡

¶ *The Place.*

Both of them grow vpon hils, in woods & otherlike vntoiled places, as in Candy, Myſia, and elſewhere. *P. Bellonius* reporteth, that he found them both vpon the tops of the mountains Taurus, Amanus, and Olympus.

The firſt is planted in our Engliſh gardens almoſt euerie where. The ſecond is planted both by the ſeed and by the ſlip: the ſlips muſt be ſet in a ground that is meanly moiſt and ſhadowie, till they haue taken root: the ſhrubs which grow of theſe decline toward the one ſide, retaining ſtill the nature of the bough: but that Savin which is planted by the ſeed groweth more vpright: this in continuance of time bringeth forth ſeeds, and the other for the moſt part remaines barren. Both theſe grow in my garden.

¶ *The Time.*

They both continue alwaies greene: The one is found to be laden with ripe fruit commonly in Winter; but it hath fruit at all times, for before the old berries fall, new are come vp.

¶ *The Names.*

Savin is called in Greeke Βράθυς, or Βράθυ: in Latine, *Sabina.*

The firſt is commonly called in the Apothecaries ſhops by the name *Savina*: of diuers, *Savimera*: the Italians and Spaniards keepe the Latine name: it is called in high-Dutch, **Sebenbaum**: in low-Dutch, **Sauel boom**: in French, *Savenier*: in Engliſh, common Savin, or garden Savin.

Some name the other *Cupreſſus Cretica*, or Cypres of Candy, as *Pliny* ſaith, *lib.* 12. *cap.* 17. making mention of a tree called *Bruta.* Some there are that take this to be *altera Sabina*, or the ſecond Savin, and to be read *Bruta* for Βραθυ, *Brathu*, by altering the vowels: for *Pliny* deſcribes it, *lib.* 12. *cap.* 17. to be like the Cypres tree, in theſe words; They ſeeke in the mountain Elimæi the tree *Bruta*, beeing like to the broad Cypres tree, hauing white boughes, yeelding a ſweet ſmell when it is ſet on fire; whereof mention is made with a miracle, in the ſtories of *Claudius Cæſar.* It is reported, That the Parthians doe vſe the leaues in drinkes; that the ſmell is very like to that of Cypreſſe, and that the ſmoke thereof is a remedie againſt the ſmell of other woods. It growes beyond Piſitigris, neere to the towne Sittaca, on mount Zagrus. Thus far *Pliny.*

The mountaines Elimæi are deſcribed by *Strabo* in the country of the Aſſyrians, next after the mountain Sagrus aboue the Babylonians; by *Ptolomæus*, not far from the Perſian gulfe: therefore it is hard to ſay that *Bruta* is *Sabina altera* or the ſecond Savine, ſeeing that ſo great a diſtance of the place may vndoubtedly cauſe a difference, and that it is not largely, but briefely deſcribed. It ſeemeth that *Thya* mentioned by *Theophraſtus* is more like vnto Savin: but yet foraſmuch as *Thya* is like in fruit to the Cypres tree, and not to the fruit or berries of the little Cedars, it is alſo very manifeſt, that the ſecond Sauin is not *Thya*, neither *Vita arbor*, ſo called of the later Herbariſts: it is likewiſe named by *Lobel*, *Sabina genuina baccifera, atro cærulea*, that is, the true Sauine that bears berries of a blackiſh blew colour.

¶ *The Temperature.*

The leaues of Sauine, which are moſt vſed in medicine, are hot and dry in the third degree, and of ſubtill parts, as *Galen* ſaith.

¶ *The Vertues.*

A The leaues of Sauine boyled in Wine and drunke prouoke vrine, bring downe the menſes with force, draw away the after-birth, expell the dead childe, and kill the quicke: it hath the like vertue receiued vnder in a perfume.

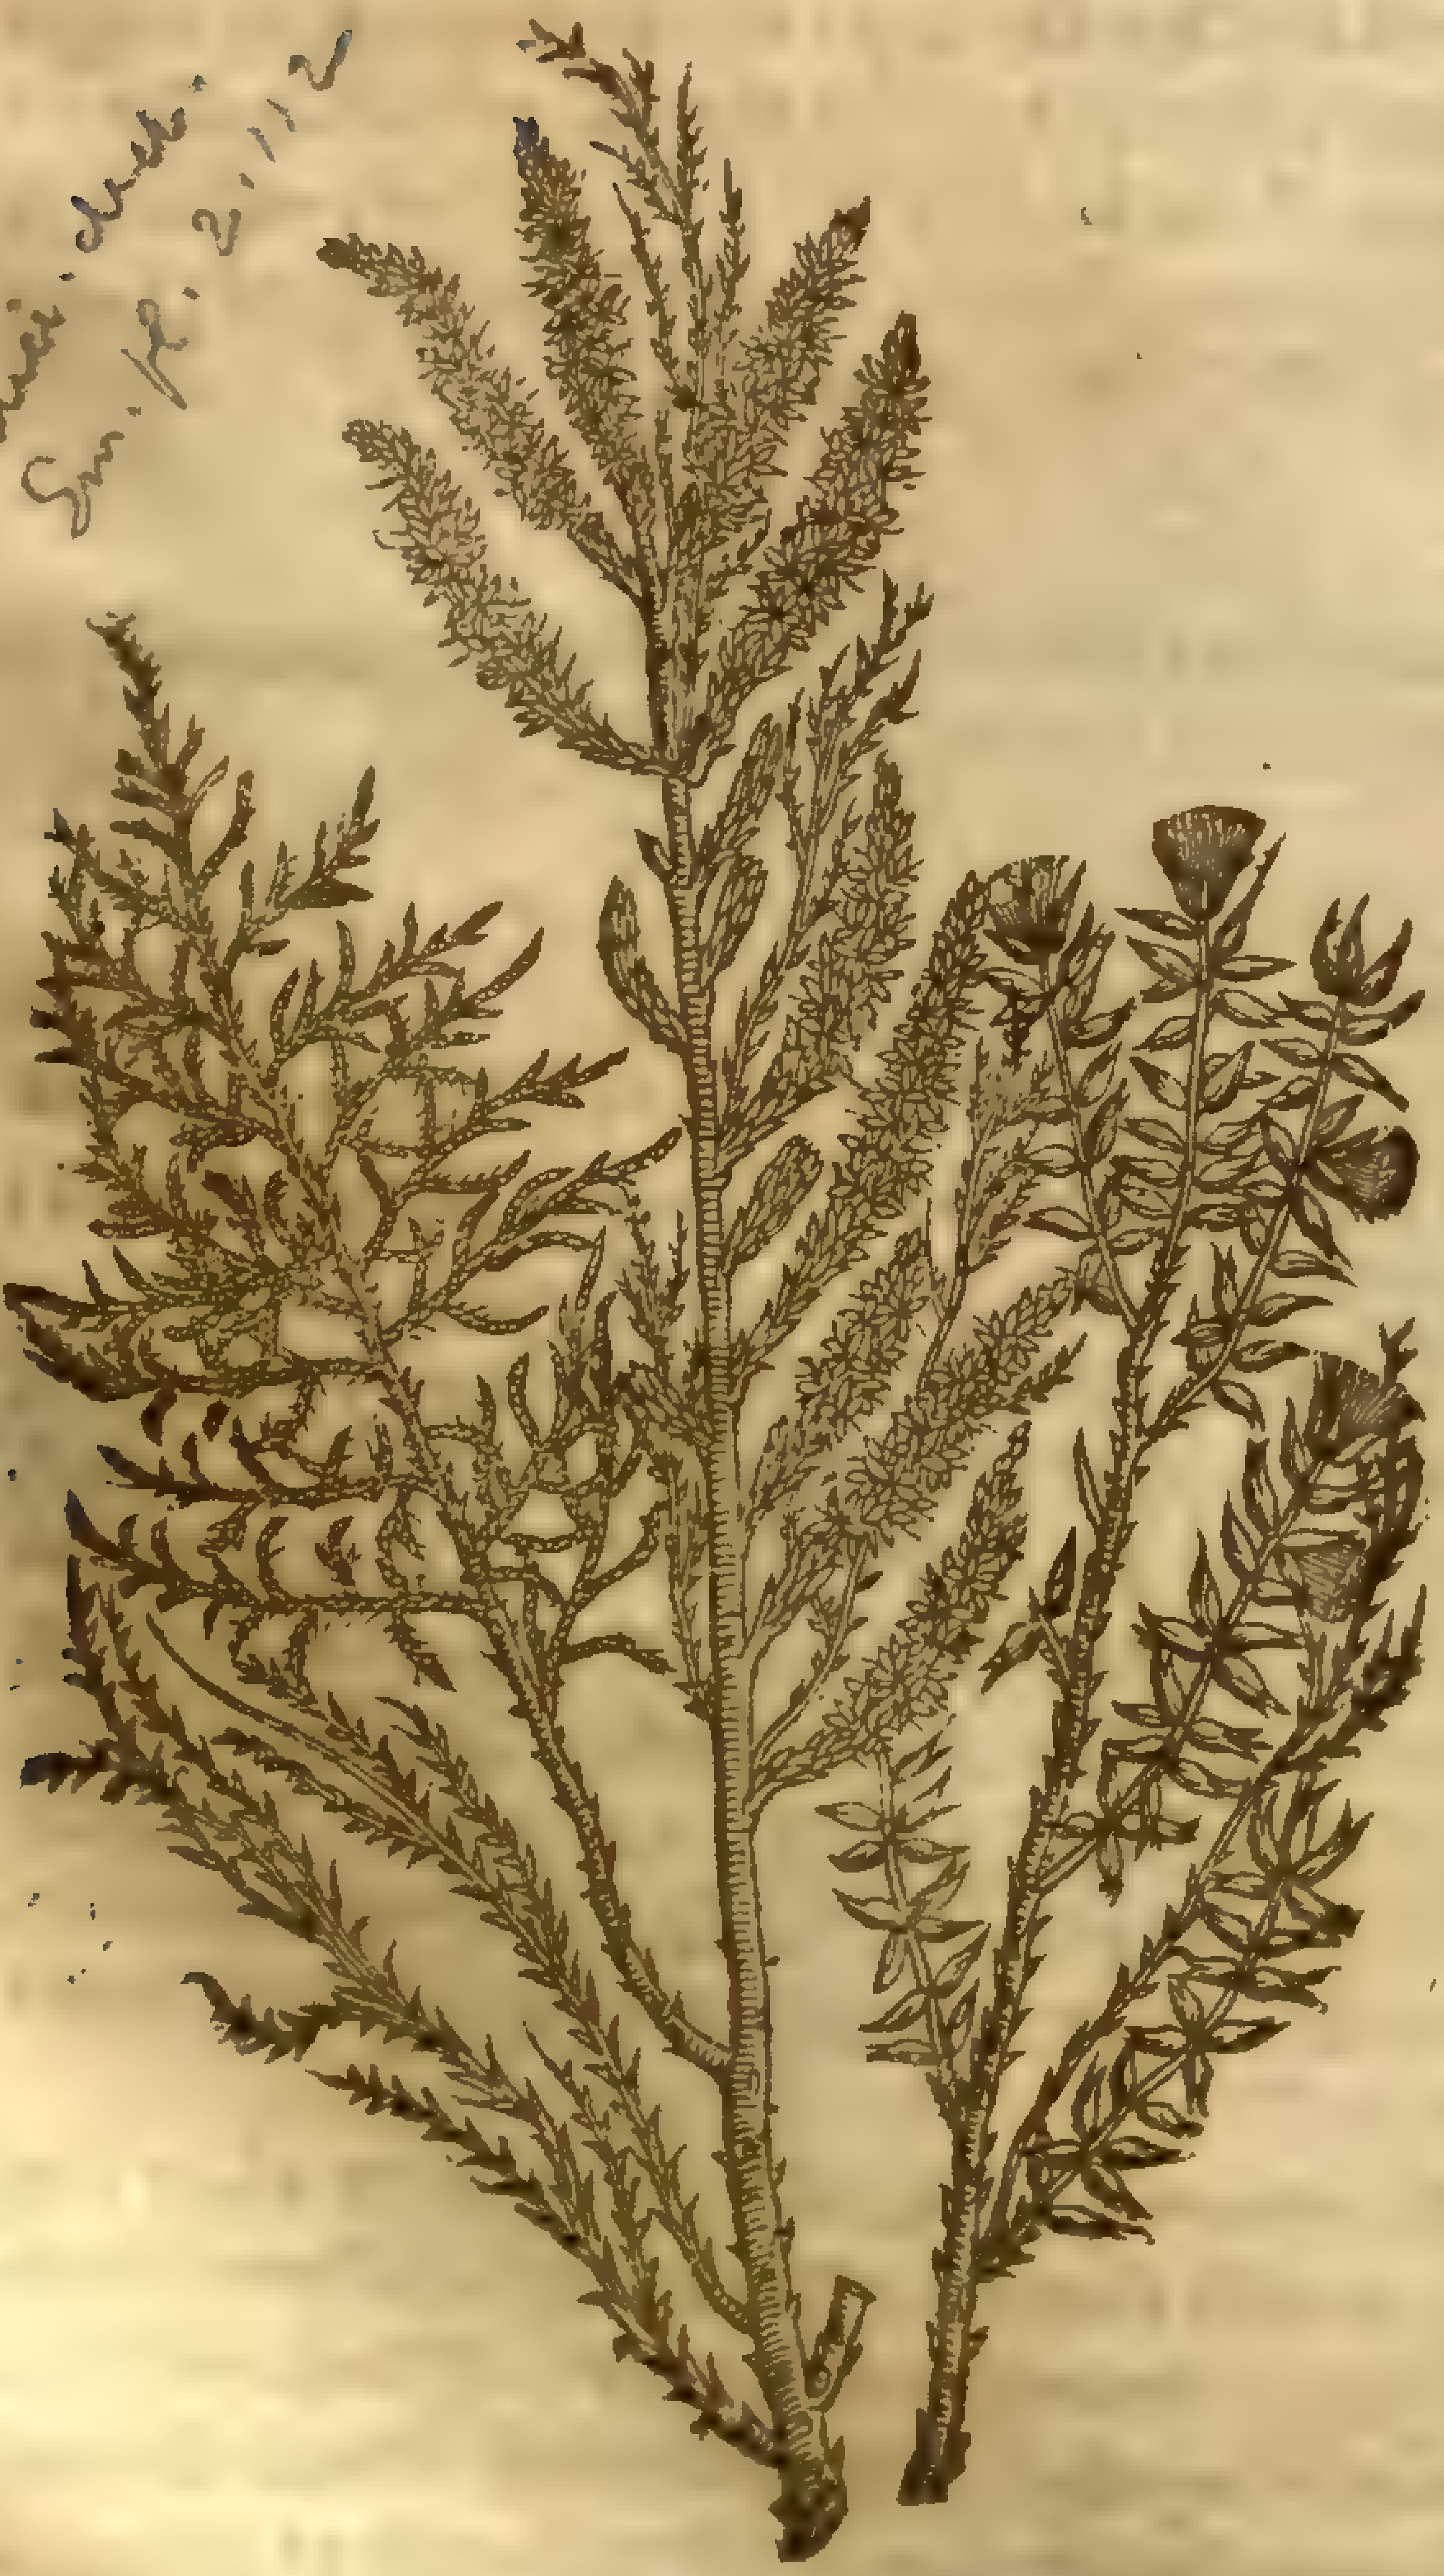
B The leaues ſtamped with honey and applied, cure vlcers, ſtay ſpreading and creeping vlcers, ſcoure and take away all ſpots and freckles from the face or body of man or woman.

C The leaues boiled in oile Oliue, and kept therein, kill the worms in children, if you anoint their bellies therewith: and the leaues poudered and giuen in milke or Muſcadell doe the ſame.

D The leaues dried and beat into fine pouder, and ſtrewed vpon thoſe kindes of excreſcences *ſub præputio*, called Caroles, and ſuch like, gotten by dealing with vnclean women, take them away perfectly, curing and healing them: but if they be inueterate and old, and haue been much tampered withall, it ſhall be neceſſarie to adde vnto the ſame a ſmall quantity of *Auripigmentum* in fine pouder, and vſe it with diſcretion, becauſe the force of the medicine is greatly increaſed thereby and made more corroſiue.

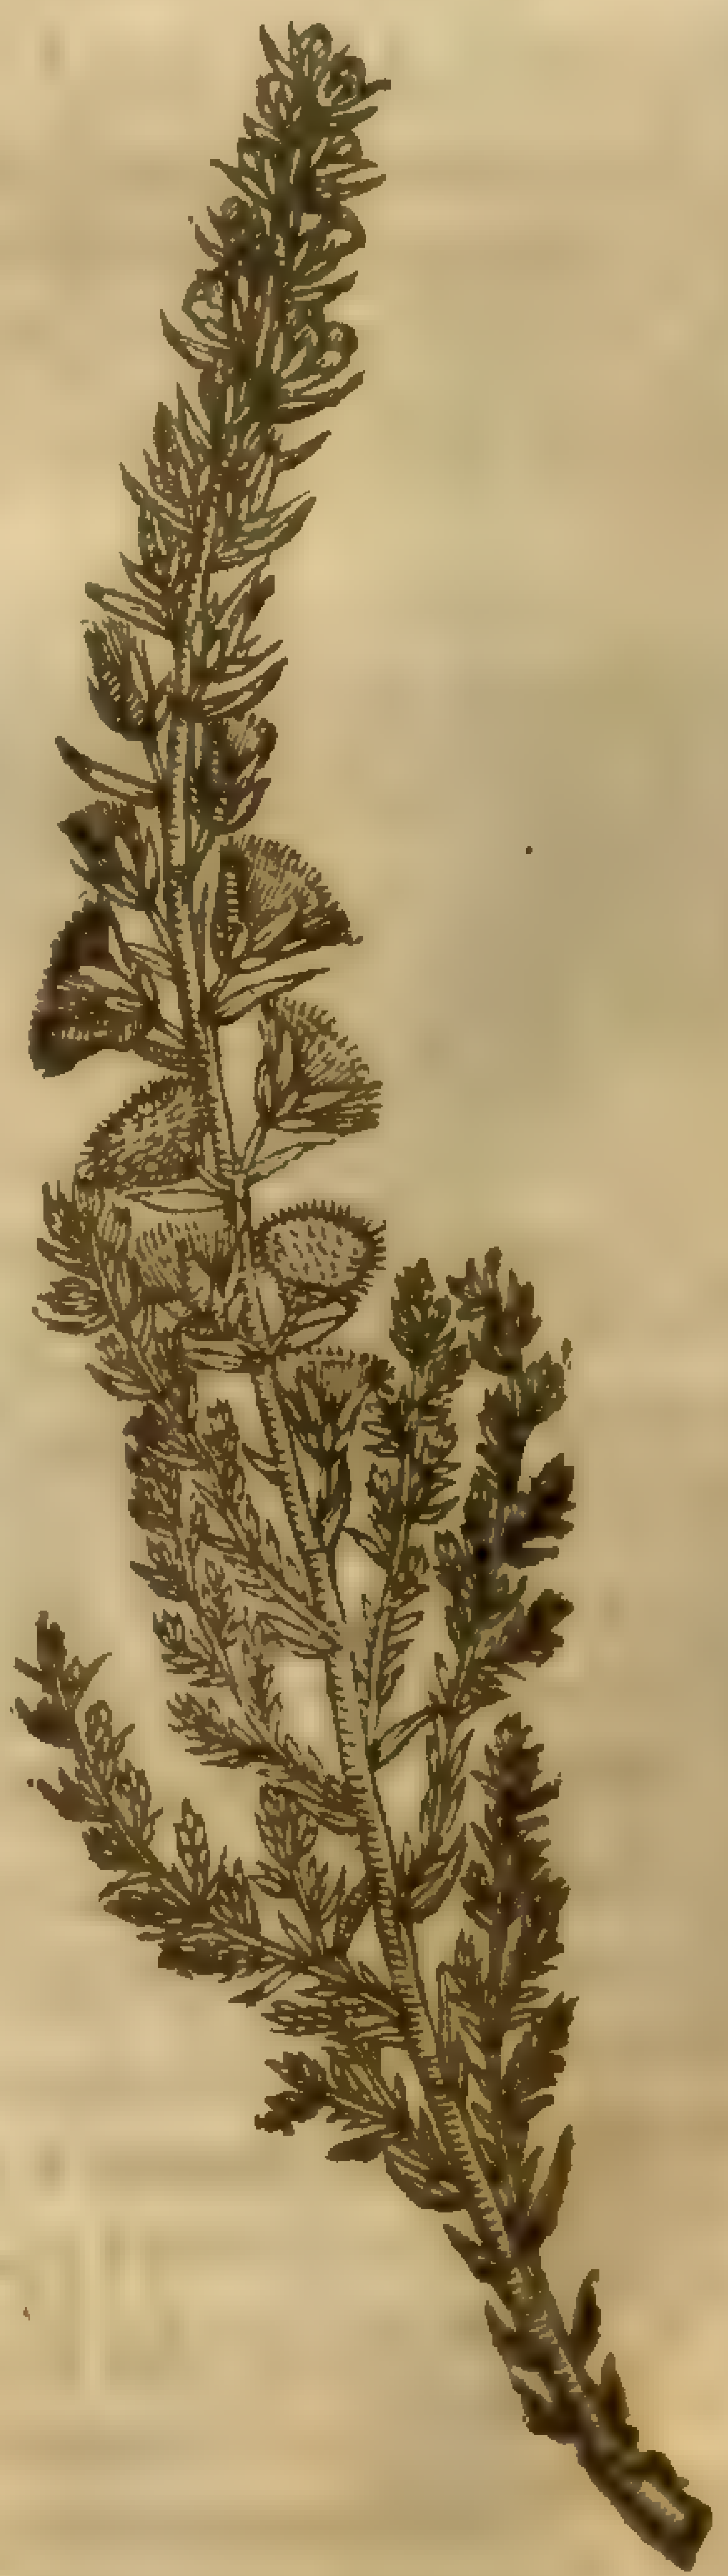
CHAP. 51. *Of Tamariske.*

1 *Tamariſcus Narbonenſis.*
French Tamariske.



Tamarix gallica Linn. dict. Sm. fl. 2. 112

2 *Tamariſcus Germanica.*
Germane Tamariske.



Tamarix germanica L. Linn. dict.

¶ The

¶ *The Deſcription.*

1 The firſt kinde of Tamariske groweth like a ſmall hedge,couered with a reddiſh barke, hauing many branches ſet and bedeckt with leaues much like to Heath:among which come forth ſmall moſſie white floures declining to purple, which turn into a pappous or downy ſeed that flieth away with the winde,as that of Willow doth: the root is woody,as the roots of other ſhrubs be,and groweth diuers waies.

2 The German Tamariske hath many wooddy branches and ſhoots riſing from the root,with a white barke, hauing his leaues thicker and groſſer than the former, and not ſo finely jagged or cut.The flours are reddiſh,and larger than the former,growing not vpon footſtalks many thick cluſtering together,as thoſe of the former,but each a pretty diſtance from another,on the tops of the branches ſpike-faſhion,and begin to flour below:which turn into ſeed,that is likewiſe caried away with the winde.

¶ *The Place.*

Tamariske groweth by running ſtreams,and many times by riuers that break forth, and not ſeldome about fenny grounds,commonly in a grauelly ſoile,for it beſt proſpereth in moiſt and ſtony places : it is found in Germany,Vindelicia,Italy,Spain,and alſo in Greece.

The Tamariſks do alſo grow in Egypt and Syria,as *Dioſcorides* writeth ; and likewiſe in Tylus an Iſle in Arabia,as *Theophr.* noteth,the wood whereof,ſaith he,is not weake,as with vs in Greece, but ſtrong,like πρῖνον or timber,or any other ſtrong thing :this Tamariske *Dioſcorides* cals ἥμερον, that is to ſay,tame or planted ; and ſaith that it bringeth forth fruit very like to Galls , in taſte rough and binding.

Petrus Bellonius in his ſecond booke of Singularities reporteth, That he ſaw in Egypt very high Tamariſks and great like other trees,and that ſometimes in moiſt places by riuers ſides, and many times alſo in dry & grauelly grounds where no other trees did grow,which now and then did beare hanging on the boughes ſuch a multitude of Galls, that the inhabitants call *Chermaſel*, as beeing ouerladen they are ready to breake. Both theſe grow and proſper well in gardens with vs heere in England.

¶ *The Time.*

Theſe trees or ſhrubs floure in May, and in the later end of Auguſt : their ſeed is carried away with the winde.

¶ *The Names.*

They are called in Greeke μυρίκη, and in Latine alſo *Myrica* and *Tamarix* : in ſhops, *Tamariſcus* : of *Octavius Horatianus*, *Murica* : *Dioſcorides* makes that which growes in Italy and Greece to be ἀγρίαν, or wild Tamarisk : it is named in high-Dutch, **Tamariſchenholtz**, & **Porſt**: in low-Dutch, **Ibenboom**, **Tamariſchboom** : in Italian, *Tamarigio* : in Spaniſh, *Tamarguira*, and *Tamariz* : in French, *Tamaris* : in Engliſh, Tamariske.

¶ *The Temperature and Vertues.*

Tamariske hath a clenſing and cutting facultie, with a manifeſt drying : it is alſo ſomewhat aſtringent or binding,and by reaſon of theſe qualities it is very good for an hard ſpleen,being boiled with vineger and wine,either the root,leaues,or tender branches,as *Galen* writeth. A

Moreouer, *Dioſcorides* teacheth,That the decoction of the leaues made with wine doth waſt the ſpleen,and that the ſame is good againſt the tooth-ache, if the mouth be waſhed therewith:that it bringeth down the menſes,if the patient ſit therein ; that it killeth lice and nits,if the parts be bathed therewith. B

The aſhes of burnt Tamariske haue a drying facultie, and greatly ſcouring withall, and a little binding. C

The floures and downy ſeed of the greater Tamariske do greatly binde,inſomuch as they come very neere to the Gall named *Galla Omphacitis*, but that the roughneſſe of taſte is more euident in the gall : the which floures are of an vnequal temper,for there is joined to the nature therof a great thinneſſe of parts,and clenſing facultie,which the Gall hath not,as *Galen* writeth. D

Theſe floures we fitly vſe (ſaith *Dioſcor.*) in ſtead of Gall,in medicines for the eies and mouth. E

It is good to ſtanch bloud,and to ſtay the laske and womens whites,it helpeth the yellow jaundice,and alſo cureth thoſe that are bit of the venomous ſpider called *Phalangium* : the bark ſerueth for the ſame purpoſes. F

The leaues and wood of Tamariske haue great power and vertue againſt the hardneſſe and ſtopping of the ſpleen,eſpecially the leaues being boiled in water,and the decoction drunke,or elſe infuſed in a ſmall veſſell of ale or beere,and continually drunke ; and if it be drunk forth of a cup or diſh made of the wood or timber of Tamariske,is of greater efficacie. G

Chap. 52. *Of Heath, Hather, or Linge.*

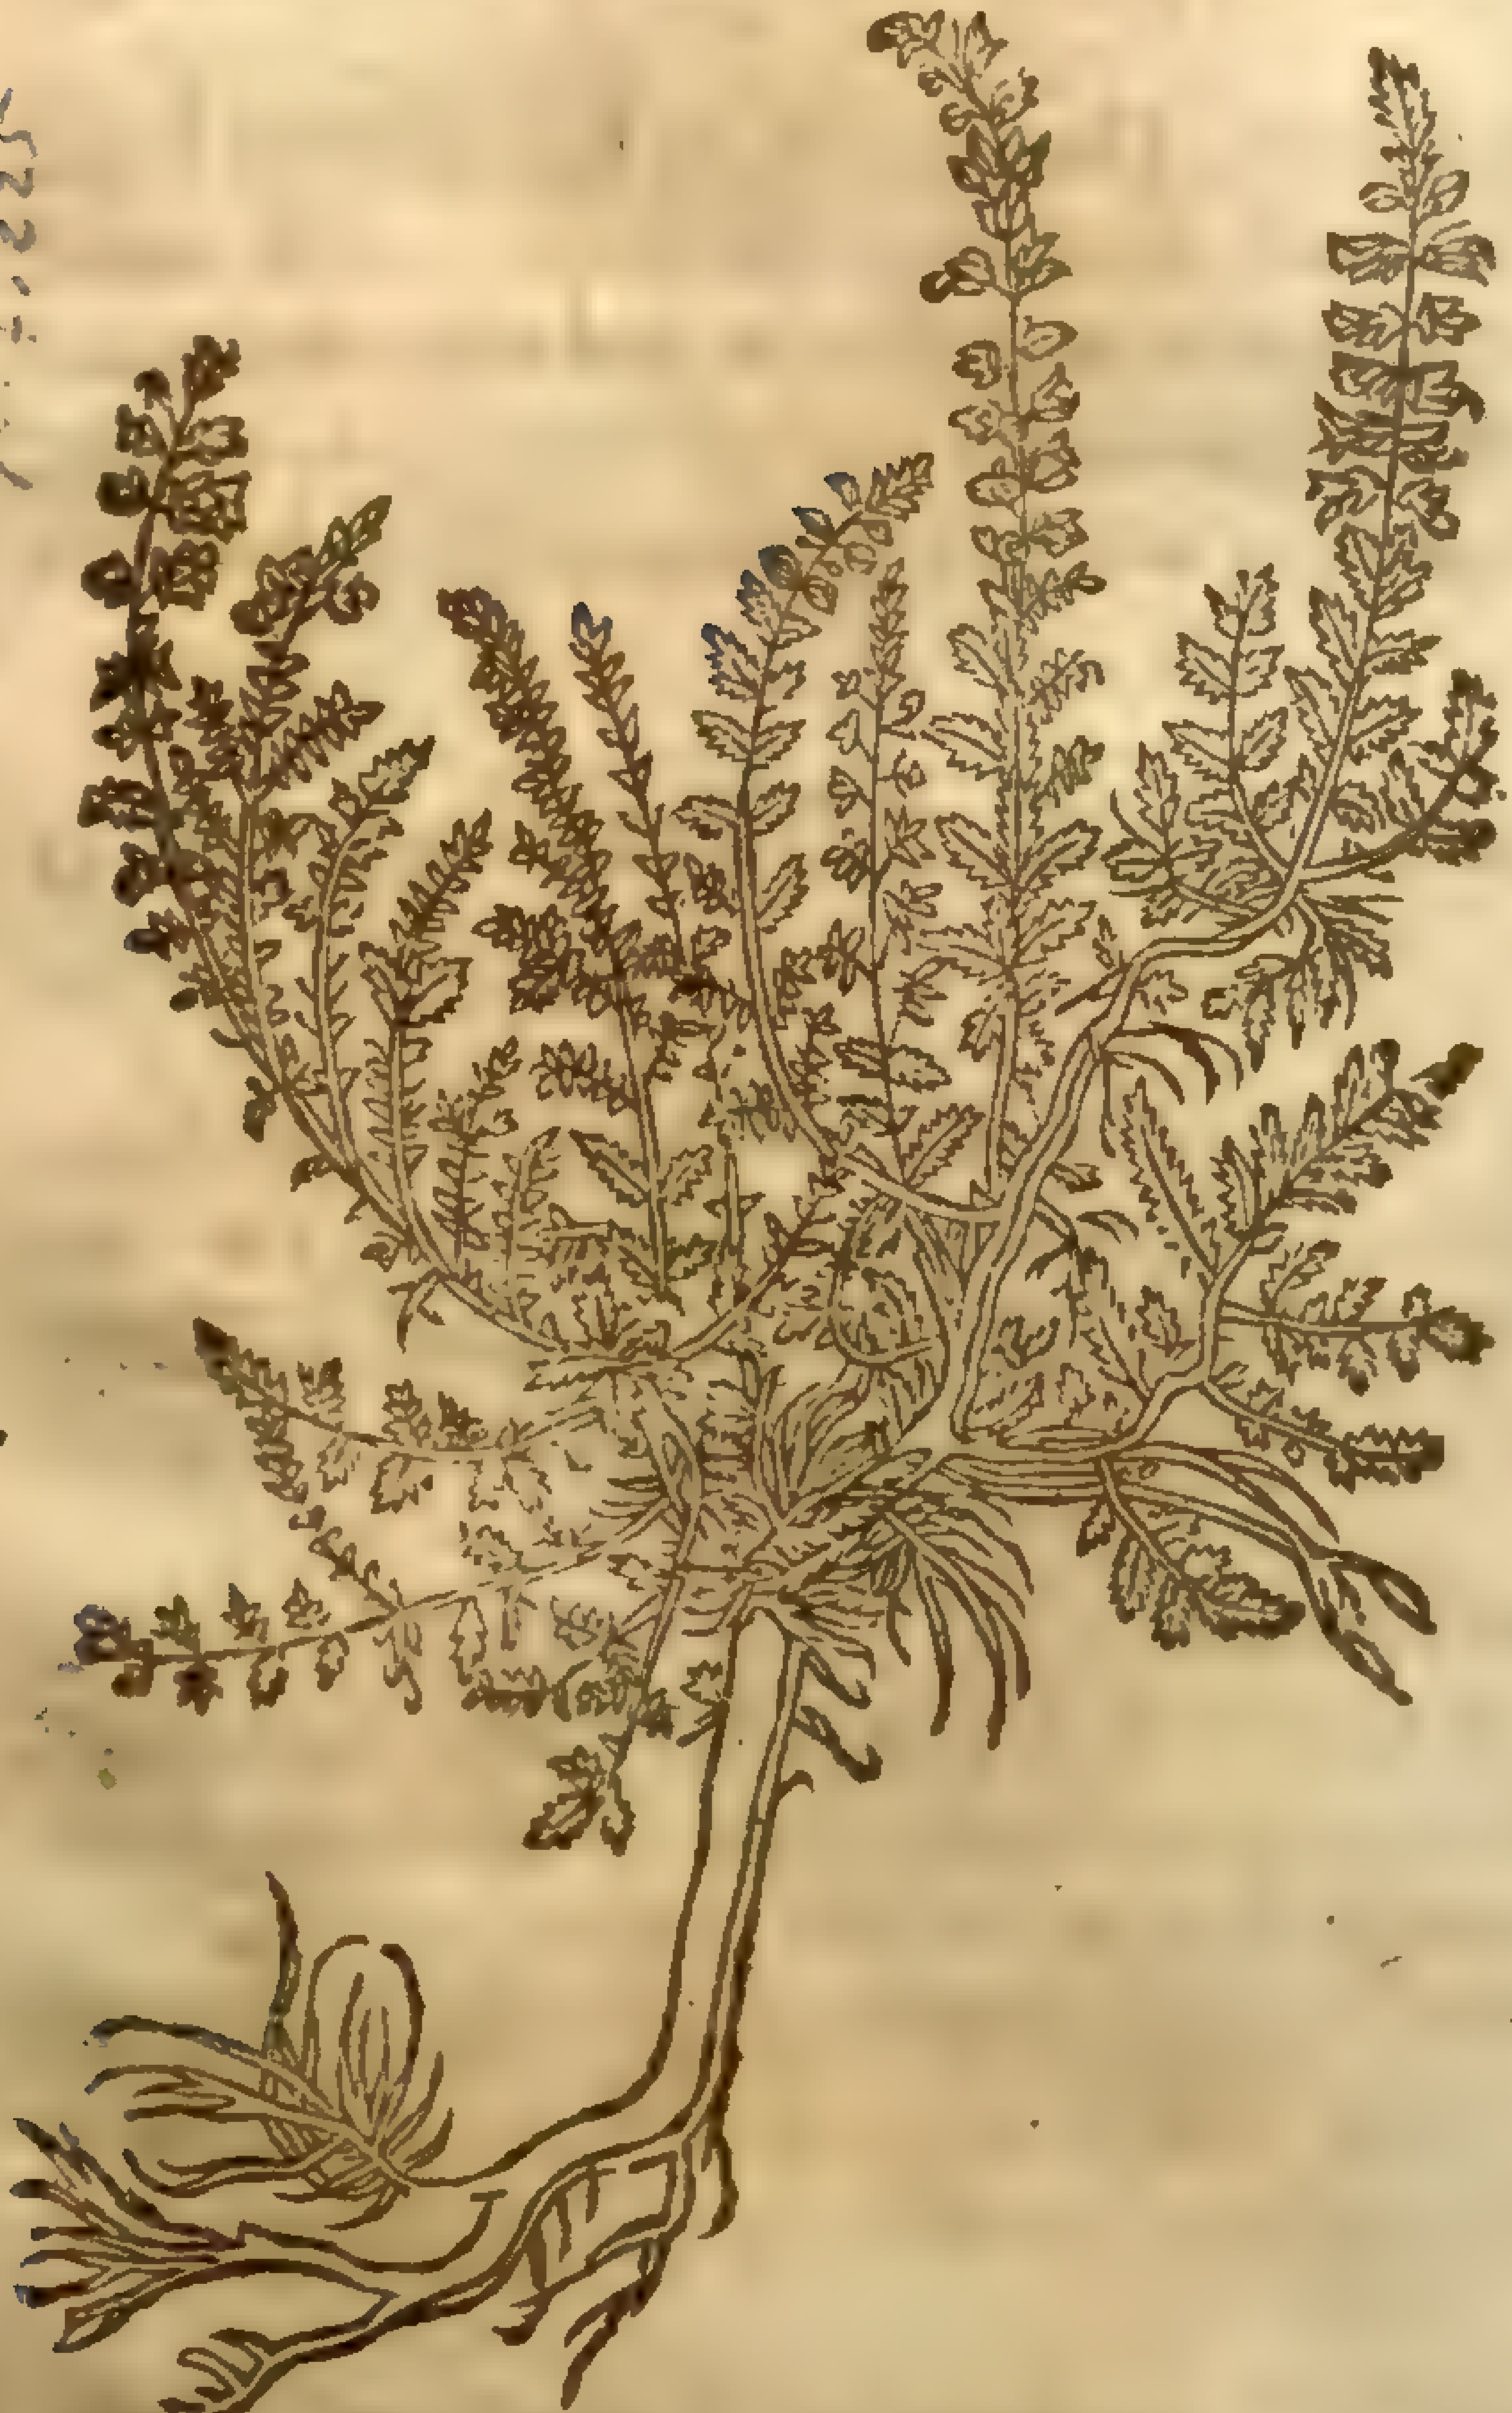
¶ *The Kindes.*

There be diuers ſorts of Heath, ſome greater, ſome leſſer, ſome with broad leaues, and ſome narrower; ſome bringing forth berries, and others nothing but floures.

¶ *The Deſcription.*

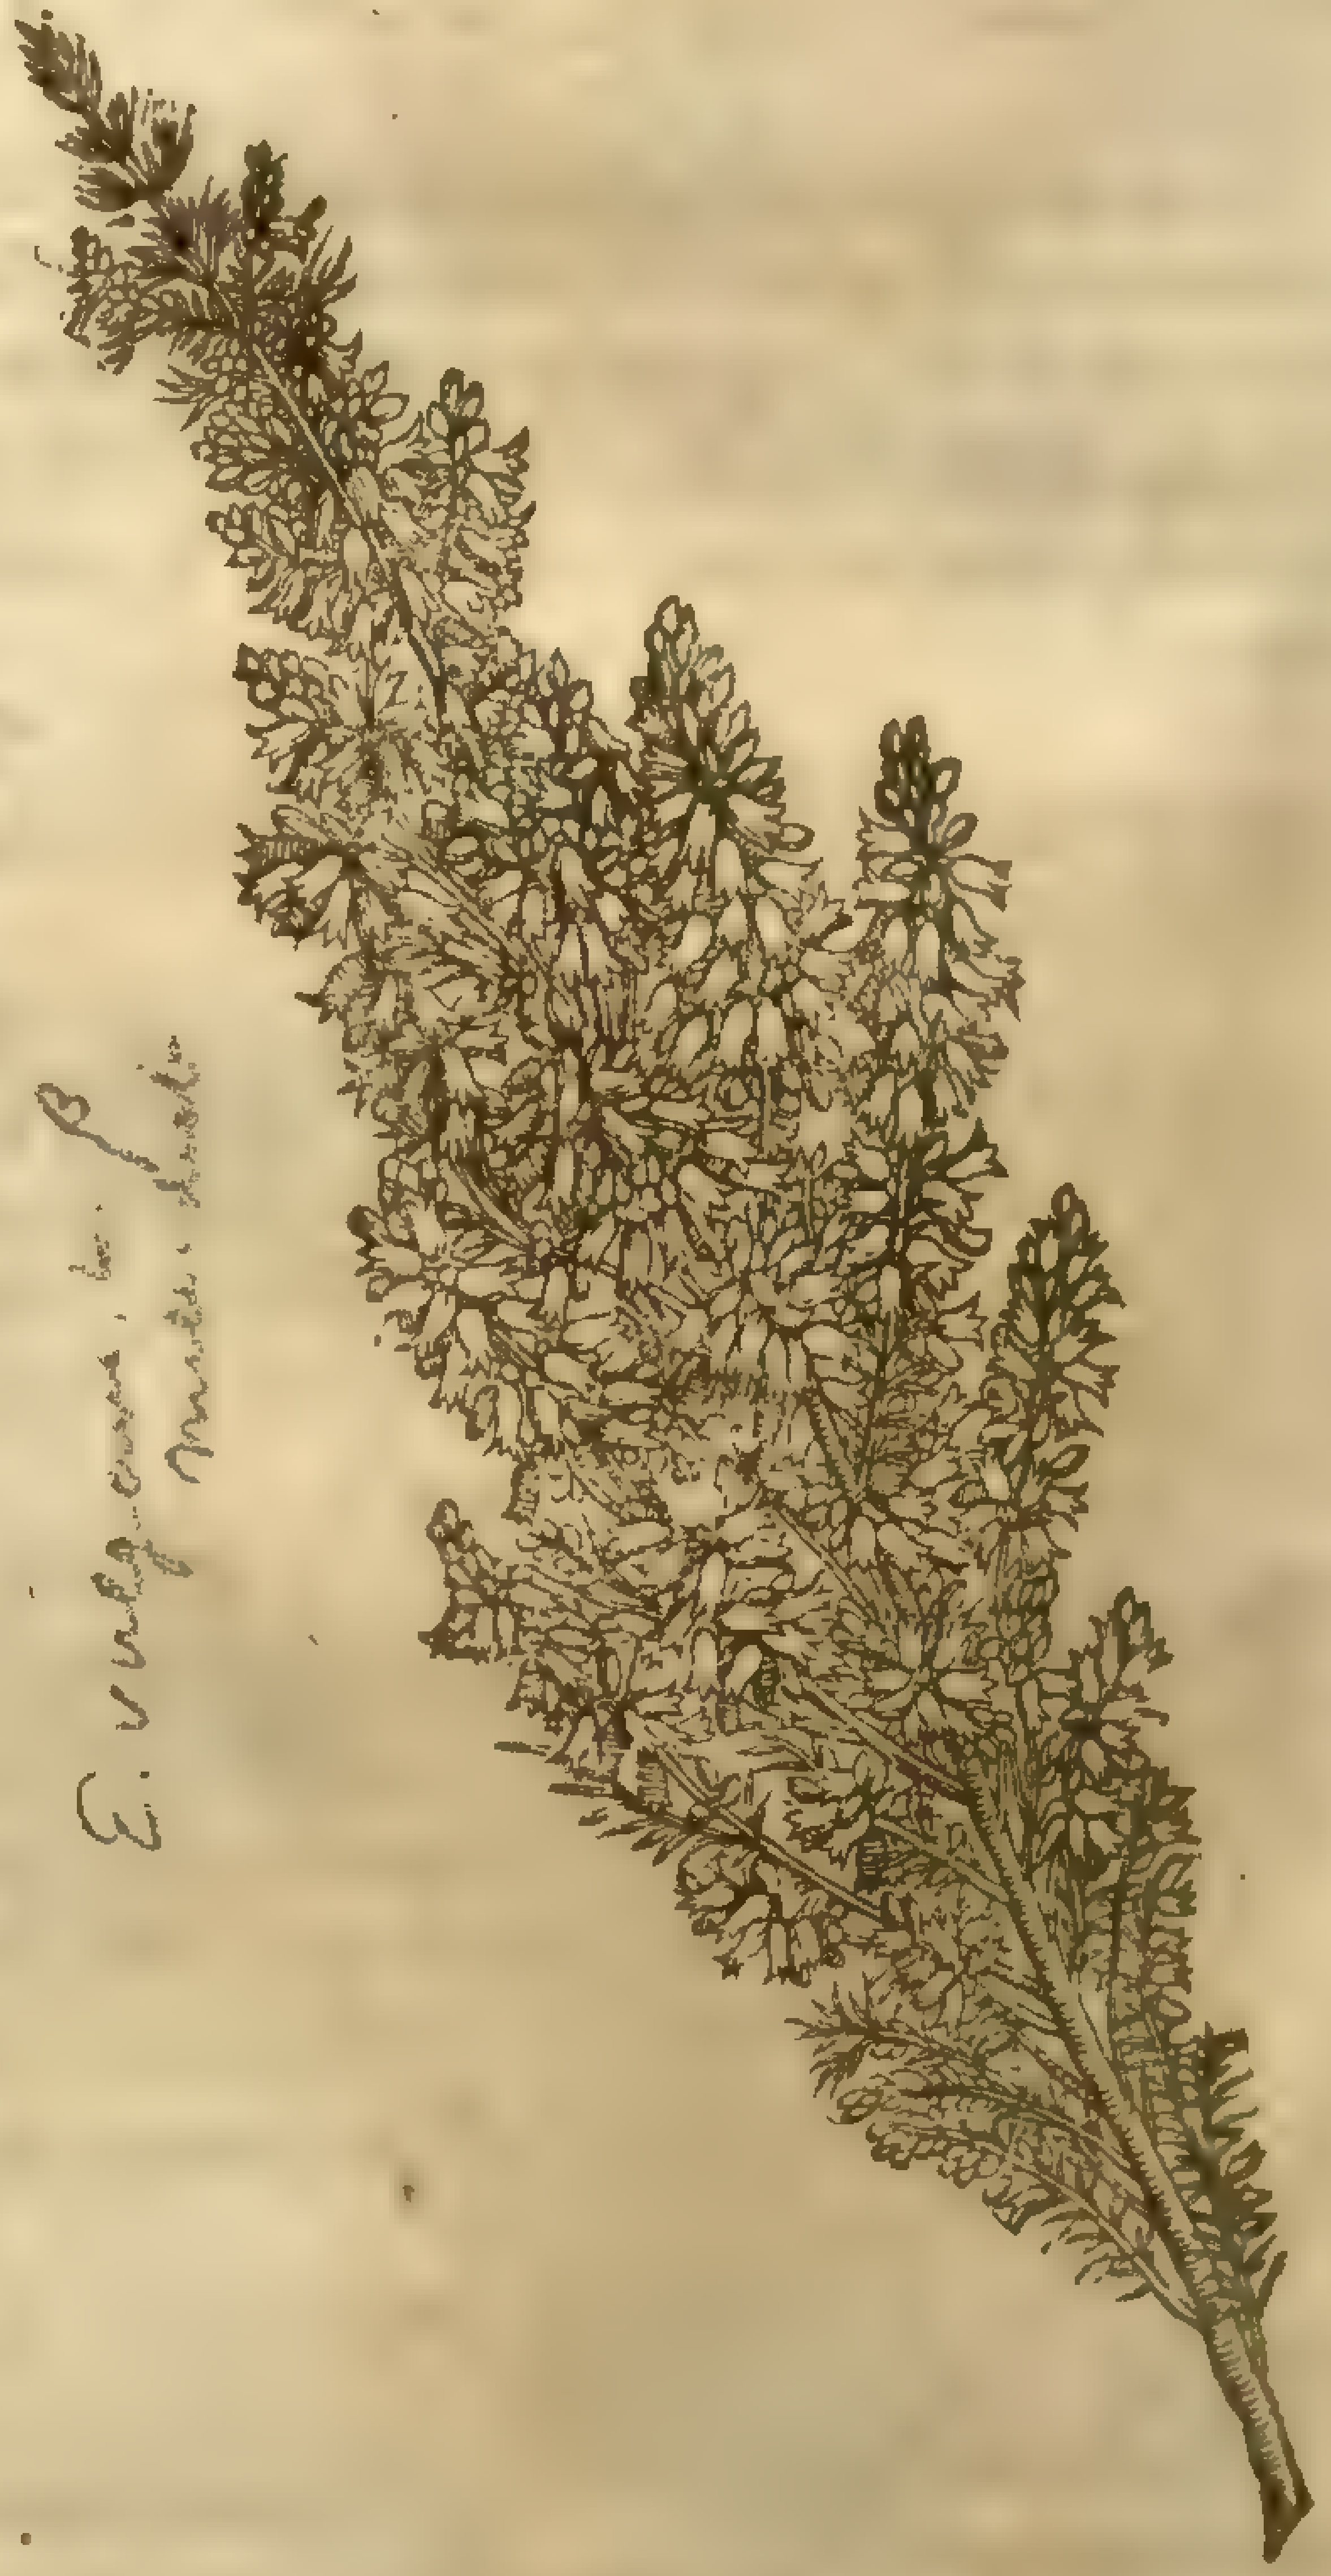
1 The common Heath is a low plant, but yet woddy and ſhrubby, ſcarce a cubit high: it brings forth many branches, whereupon doe grow ſundry little leaues ſomewhat hard and rough, very like to thoſe of Tamariske or the Cypres tree: the floures are orderly placed alongſt the branches, ſmall, ſoft, and of a light red colour tending to purple: the root is alſo wooddy, and creepeth vnder the vpper cruſt of the earth: and this is the Heath which the Antients tooke to be the right and true Heath.

‡ 1 *Erica vulgaris, ſive Pumila.*
Common or dwarfe Heath.



E. vulgaris, in Mill. dict. Sm. pl. 7. 225

‡ 2 *Erica vulgaris hirſuta.*
Rough leafed Heath.

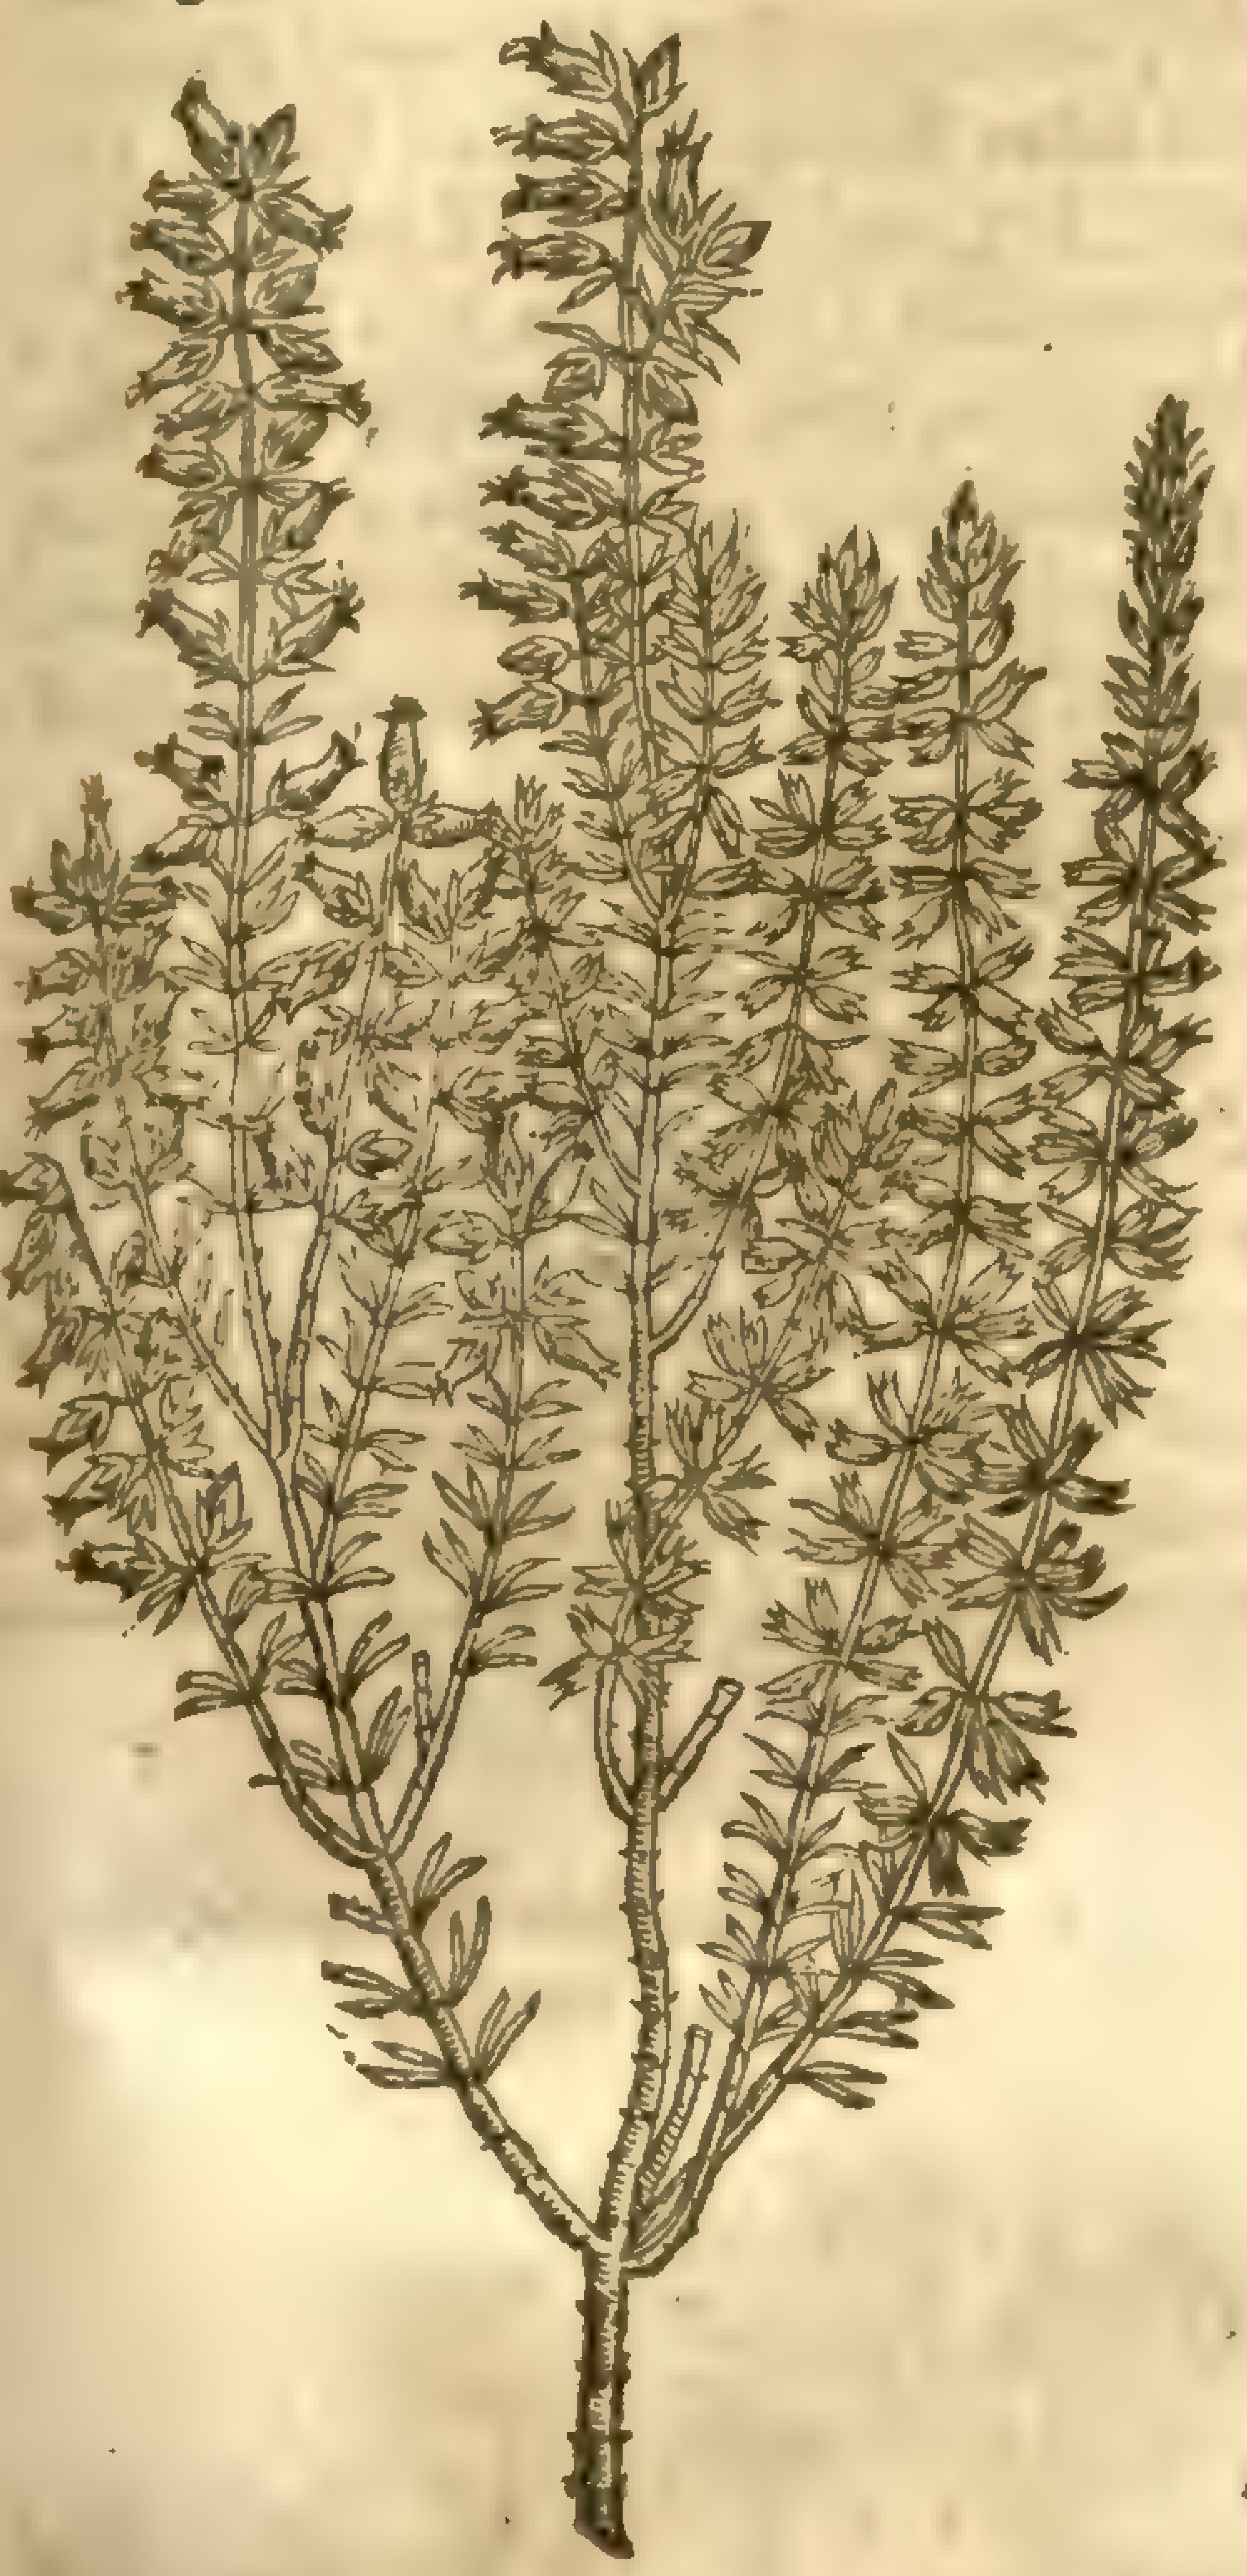


E. vulgaris β Mill. dict.

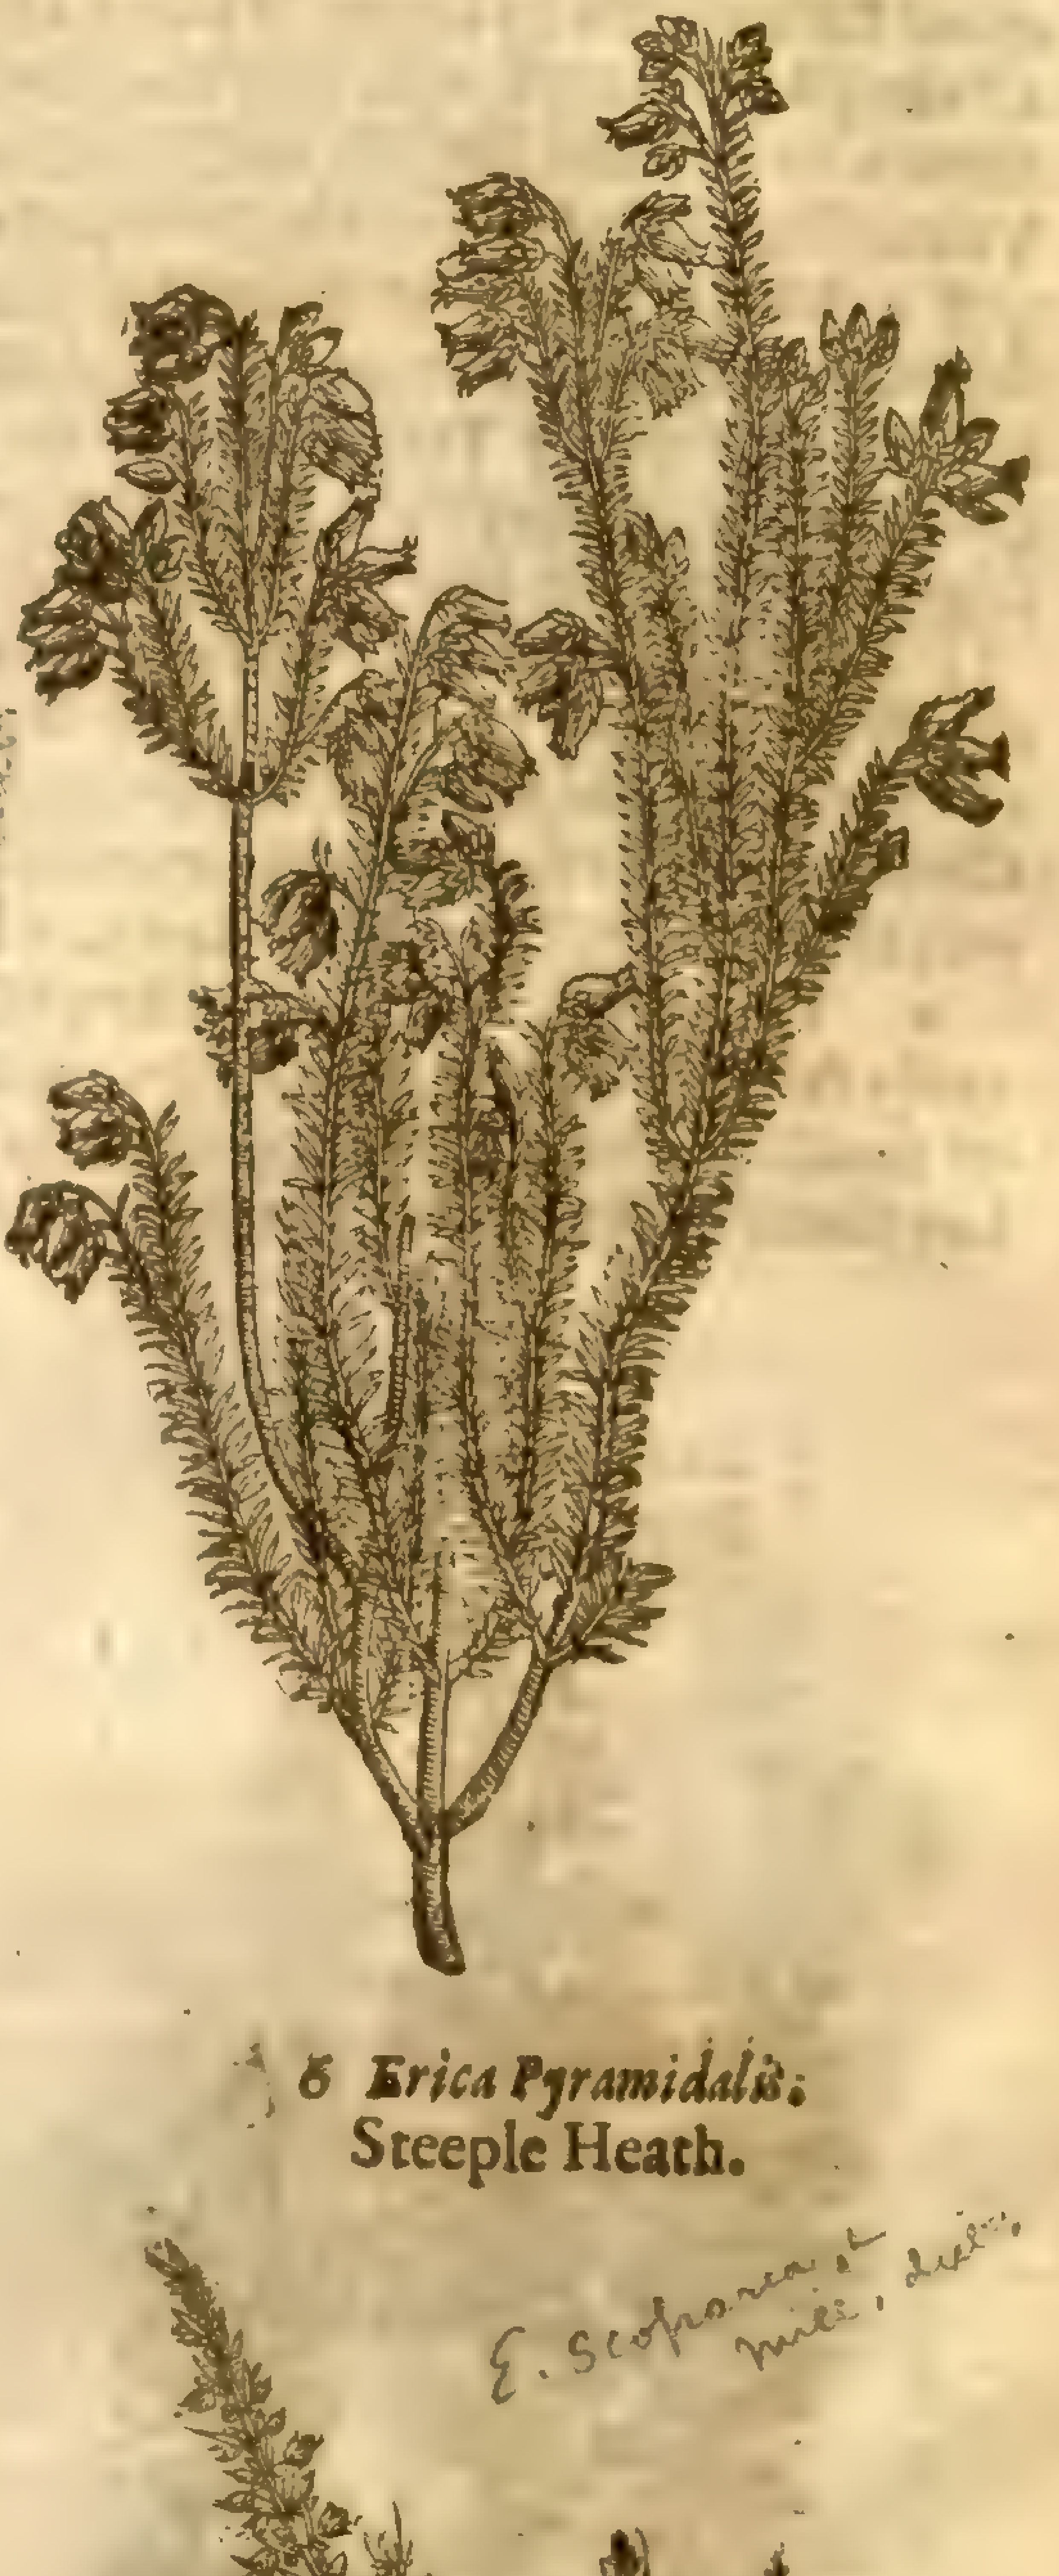
There is another Heath which differeth not from the precedent, ſauing that this plant bringeth forth floures as white as ſnow, wherein conſiſteth the difference: wherefore we may cal it *Erica pumila alba*, Dwarfe Heath with white floures.

2 The great Heath (which *Cluſius* at his being in England found in the barren grounds about Windſor, which in his Spaniſh trauels he maketh the firſt kinde) groweth to the height of two cubits, ſeldome higher, full of branches, couered with a blackiſh barke: whereon are ſet in very good order by couples ſmall rough ſquare leaues finer than thoſe of Tamarisk or Cypres. The floures incloſe the little twiggy branches round about at certaine diſtances, from the lower part to the top faſhioned like little bottles, conſiſting of foure parts, of a ſhining purple colour, very beautifull to behold, and the rather to be eſteemed becauſe it floureth twice in the yeare. The root is likewiſe wooddy.

† 3 *Erica maior flore albo Cluſij.*
The great Heath with white floures.

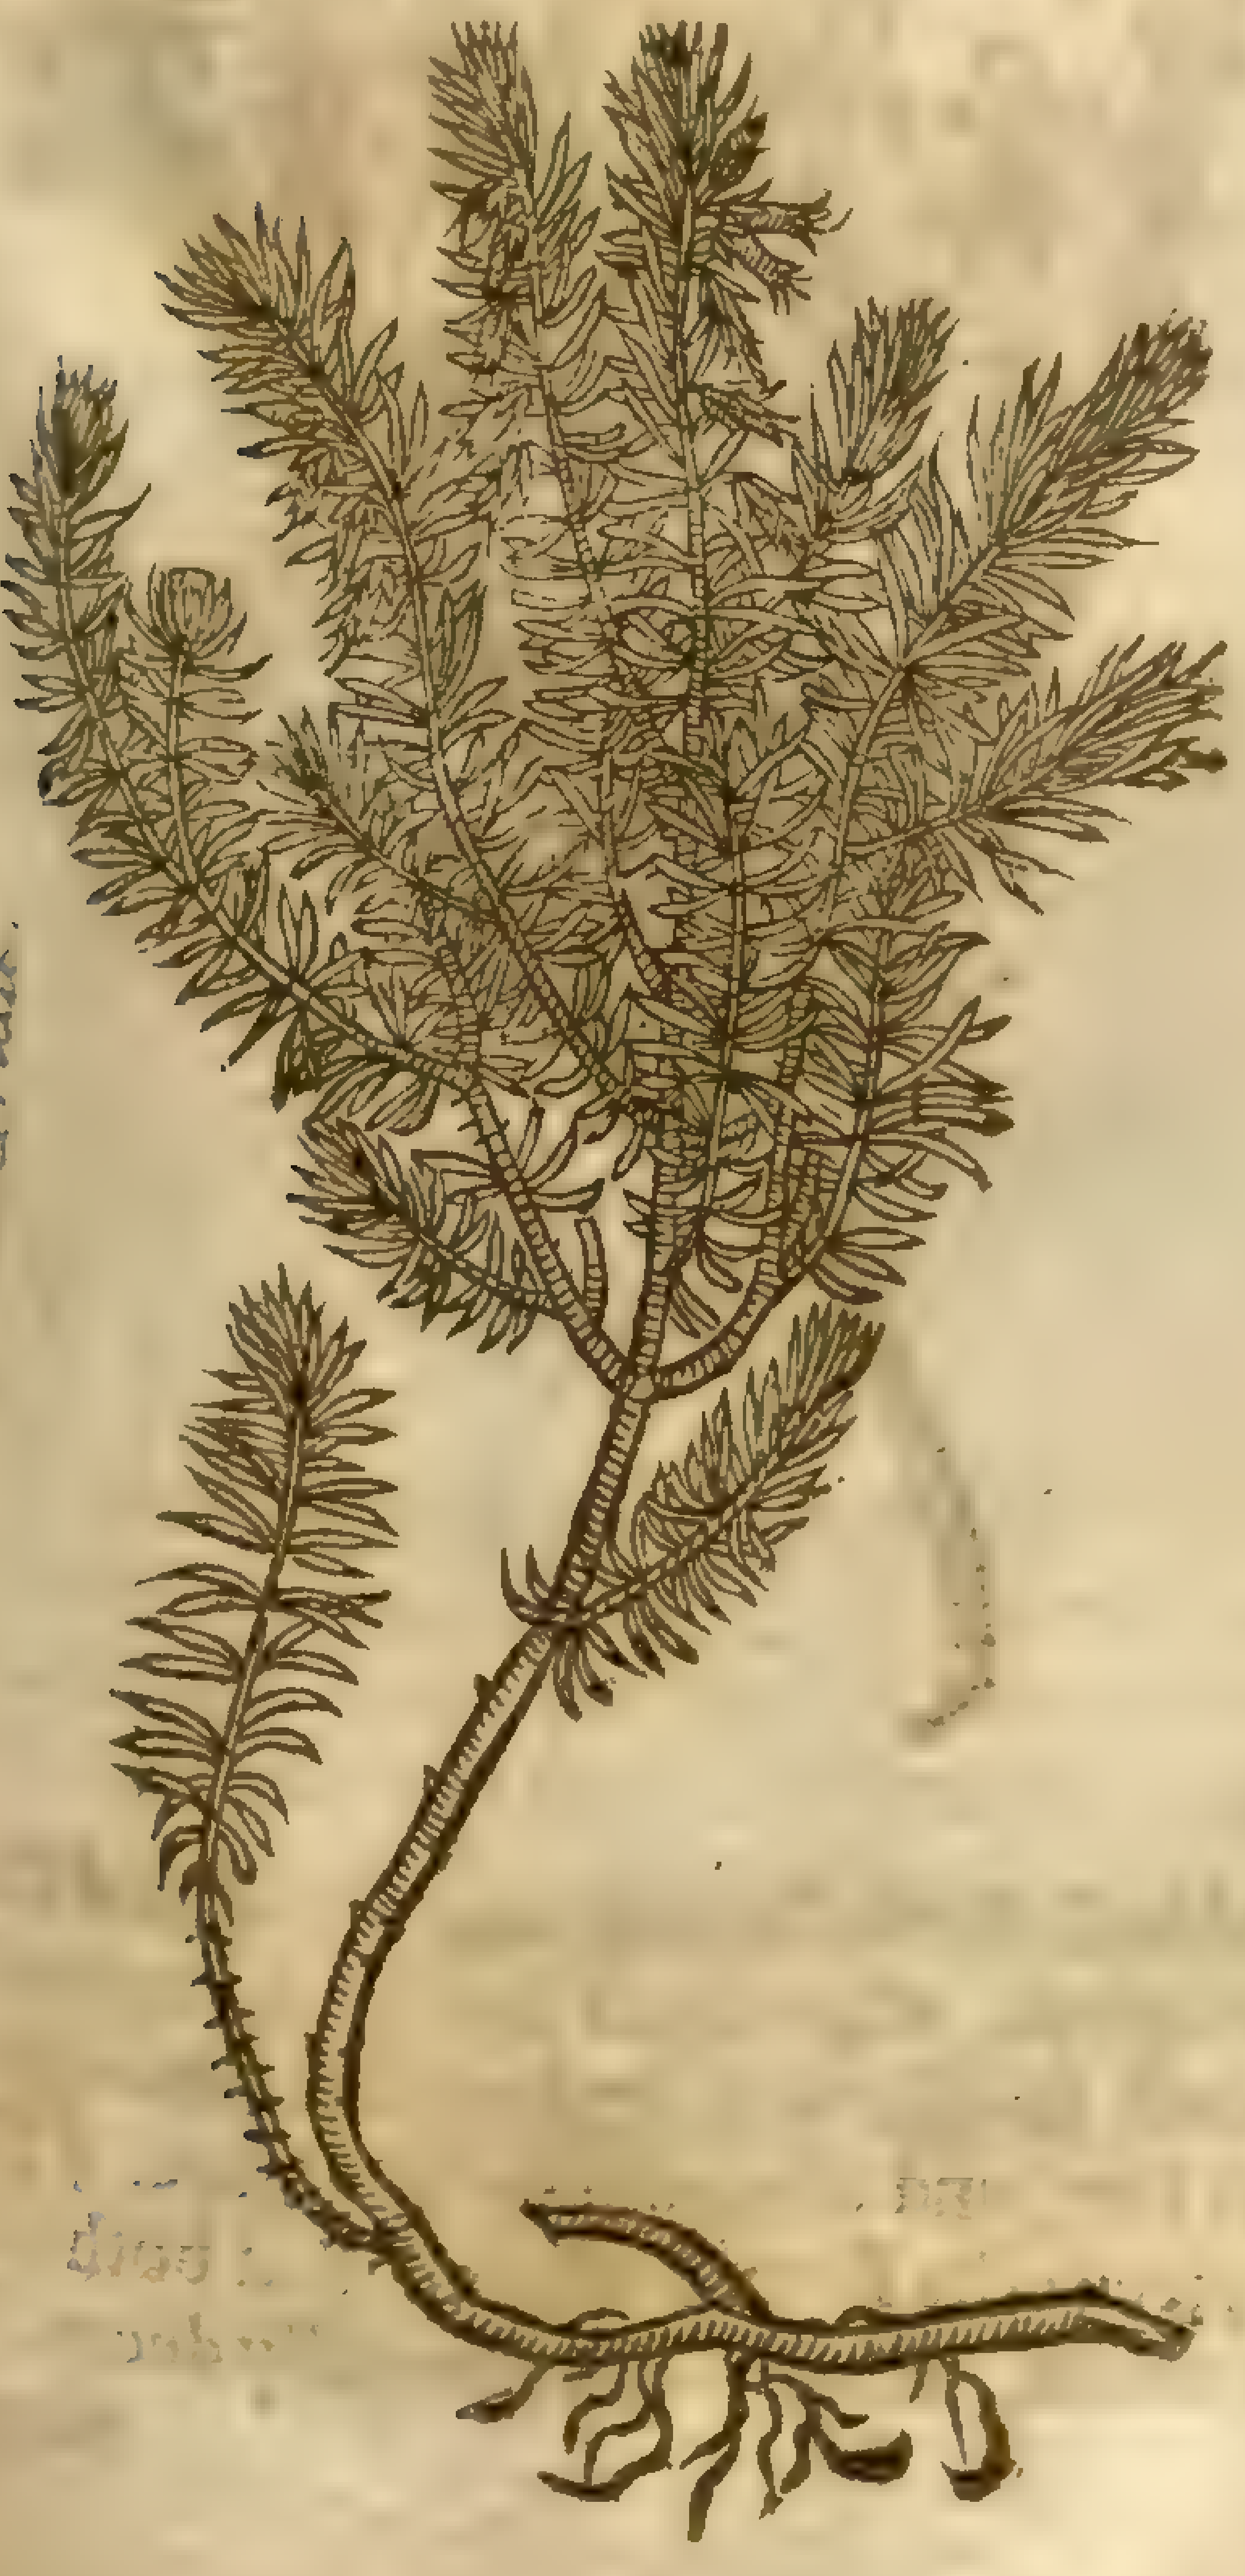


4 *Erica major flore purpureo.*
Great Heath with purple floures.



E. mediterranea, & mihi, dub.

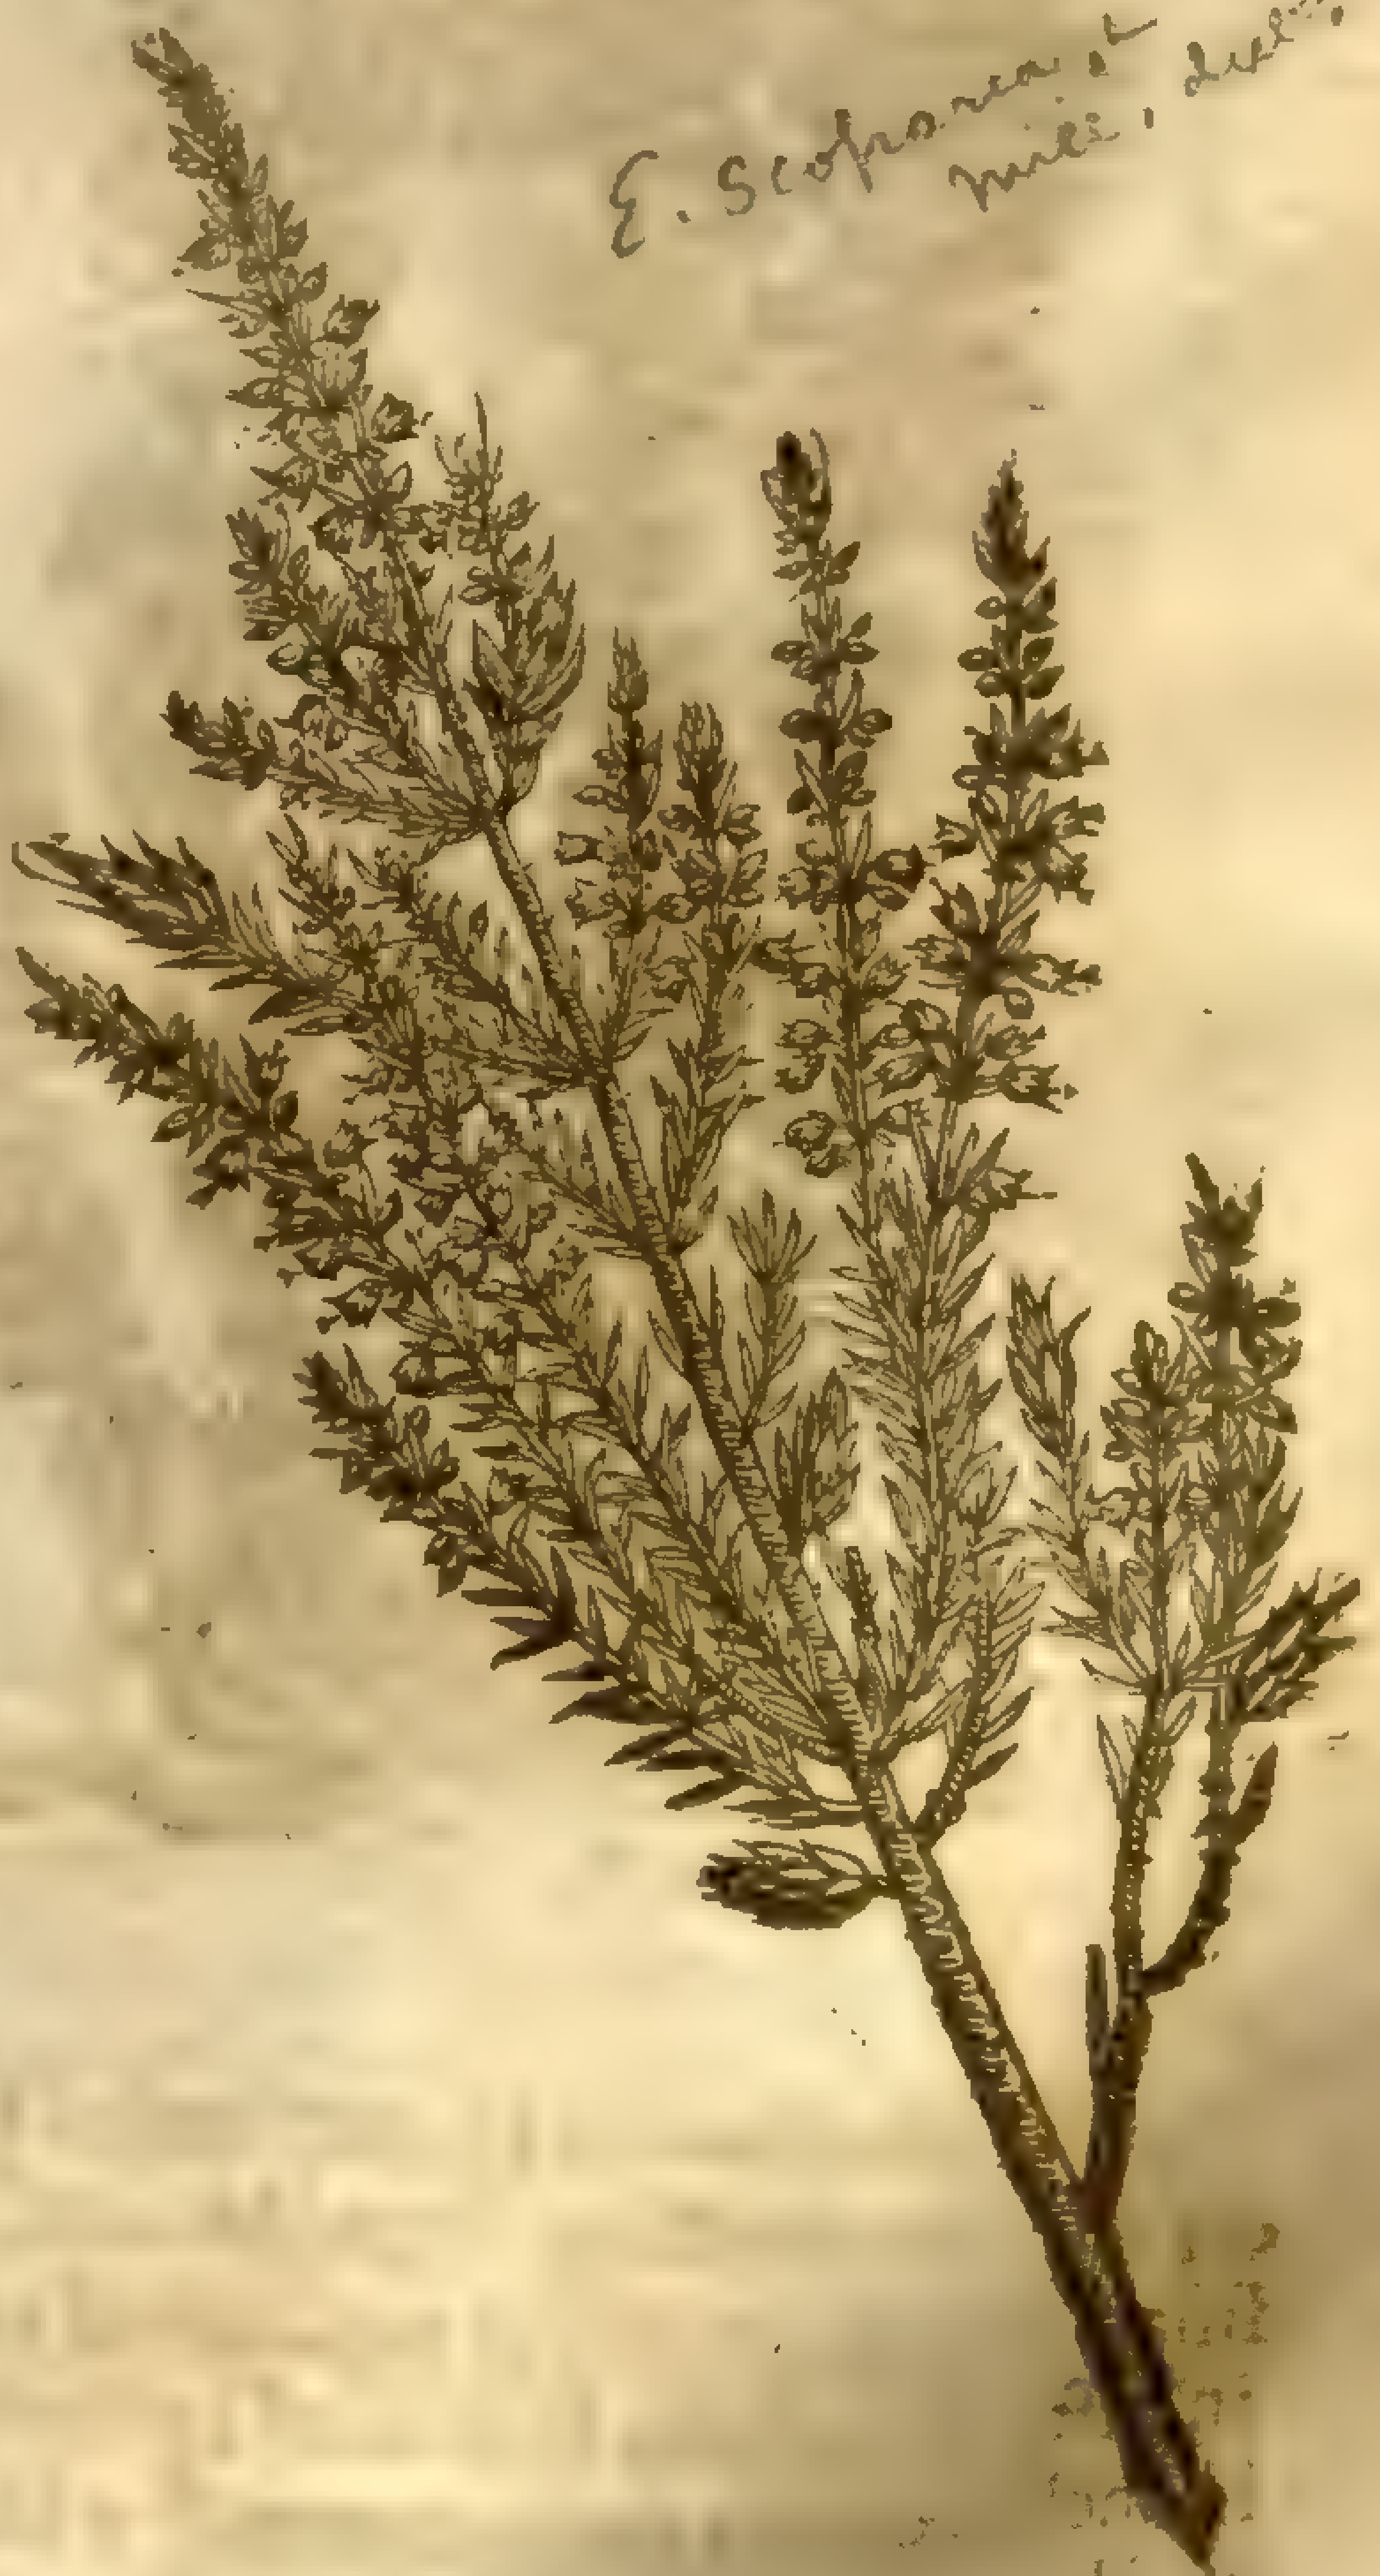
† 5 *Erica cruciata.*
Croſſed Heath.



E. herbacea, & mihi, dub.

6 *Erica Pyramidalis.*
Steeple Heath.

E. scoparia et mihi, dub.



‡ 3 This, ſaith *Cluſius*, which is the largeſt that I haue ſeen, ſomtimes exceeds the height of a man, very ſhrubby, hauing a hard and blackiſh red wood: the leaues are ſmall and ſhort, growing about the branches by foures, of a very aſtringent taſte: it hath plentifull ſtore of floures growing all alongſt the branches, ſo that ſometimes the larger branches haue floures for a foot long. This floure is hollow and longiſh, well ſmelling, white and beautifull. It growes betwixt Liſbon and the Vniuerſitie of Conimbrica in Portugal, where it floures in Nouember, December, and Ianuary. ‡

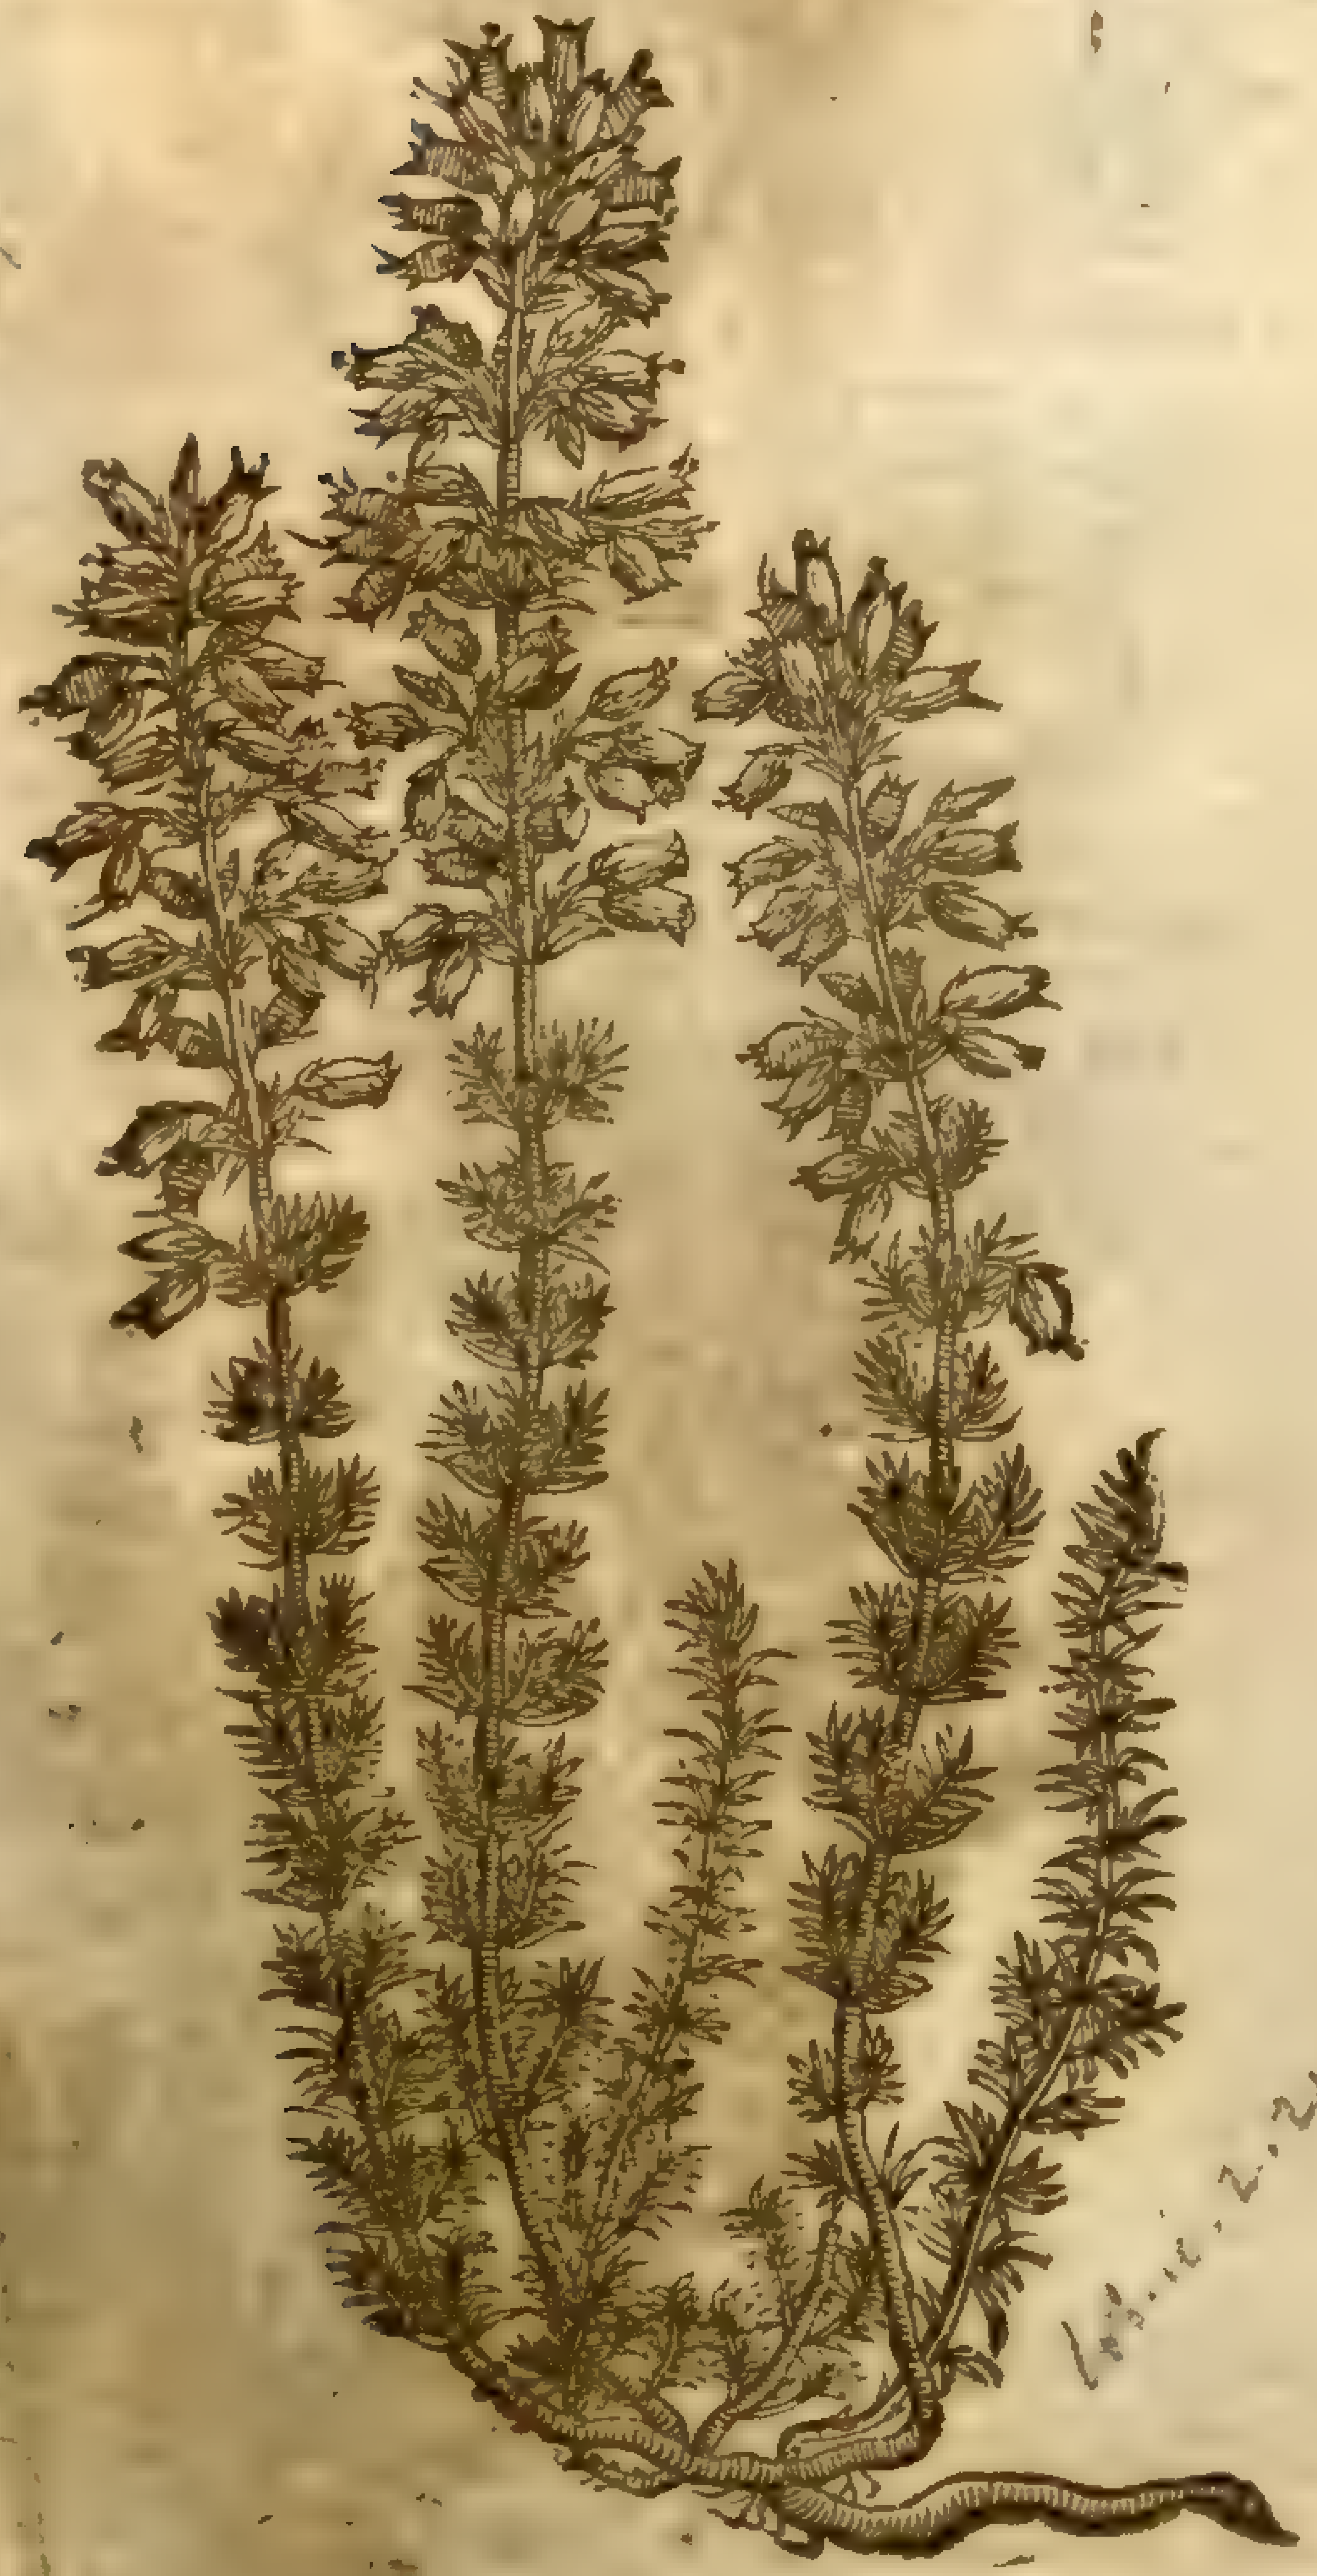
E. [illegible] L. mihi ded.

† 4 Of this kind there is another ſort with whitiſh purple floures, more frequently found than the other ſort; which floures are ſomewhat greater than the former, but in forme like, and flouring at the ſame time. ‡ The leaues alſo are hairy, and grow commonly by foures: the hollow floures grow cluſtering together at the very tops of the branches, and are to be found in Iuly and Auguſt. It growes on diuers heathy places of this kingdome. ‡

5 Croſſed Heath growes to the height of a cubit and a halfe, full of branches, commonly lying along vpon the ground, of a dark ſwart colour: whereon grow ſmall leaues ſet at certain ſpaces two vpon one ſide, and two on the other, oppoſite, one anſwering another, euen as do the leaues of Croſſewort. The floures in like manner ſtand along the branches croſſe-faſhion, of a dark ouerworn greeniſh colour. The root is likewiſe wooddy, as is all the reſt of the plant.

6 This ſteeple Heath hath likewiſe many wooddy branches garniſhed with ſmall leaues that eaſily fall off from the dried ſtalks; among which come forth diuers little moſſie greeniſh floures of ſmall moment. The whole buſh for the moſt part groweth round together like a little cock of hay, broad at the lower part and ſharp aboue like a pyramide or ſteeple, whereof it tooke his name.

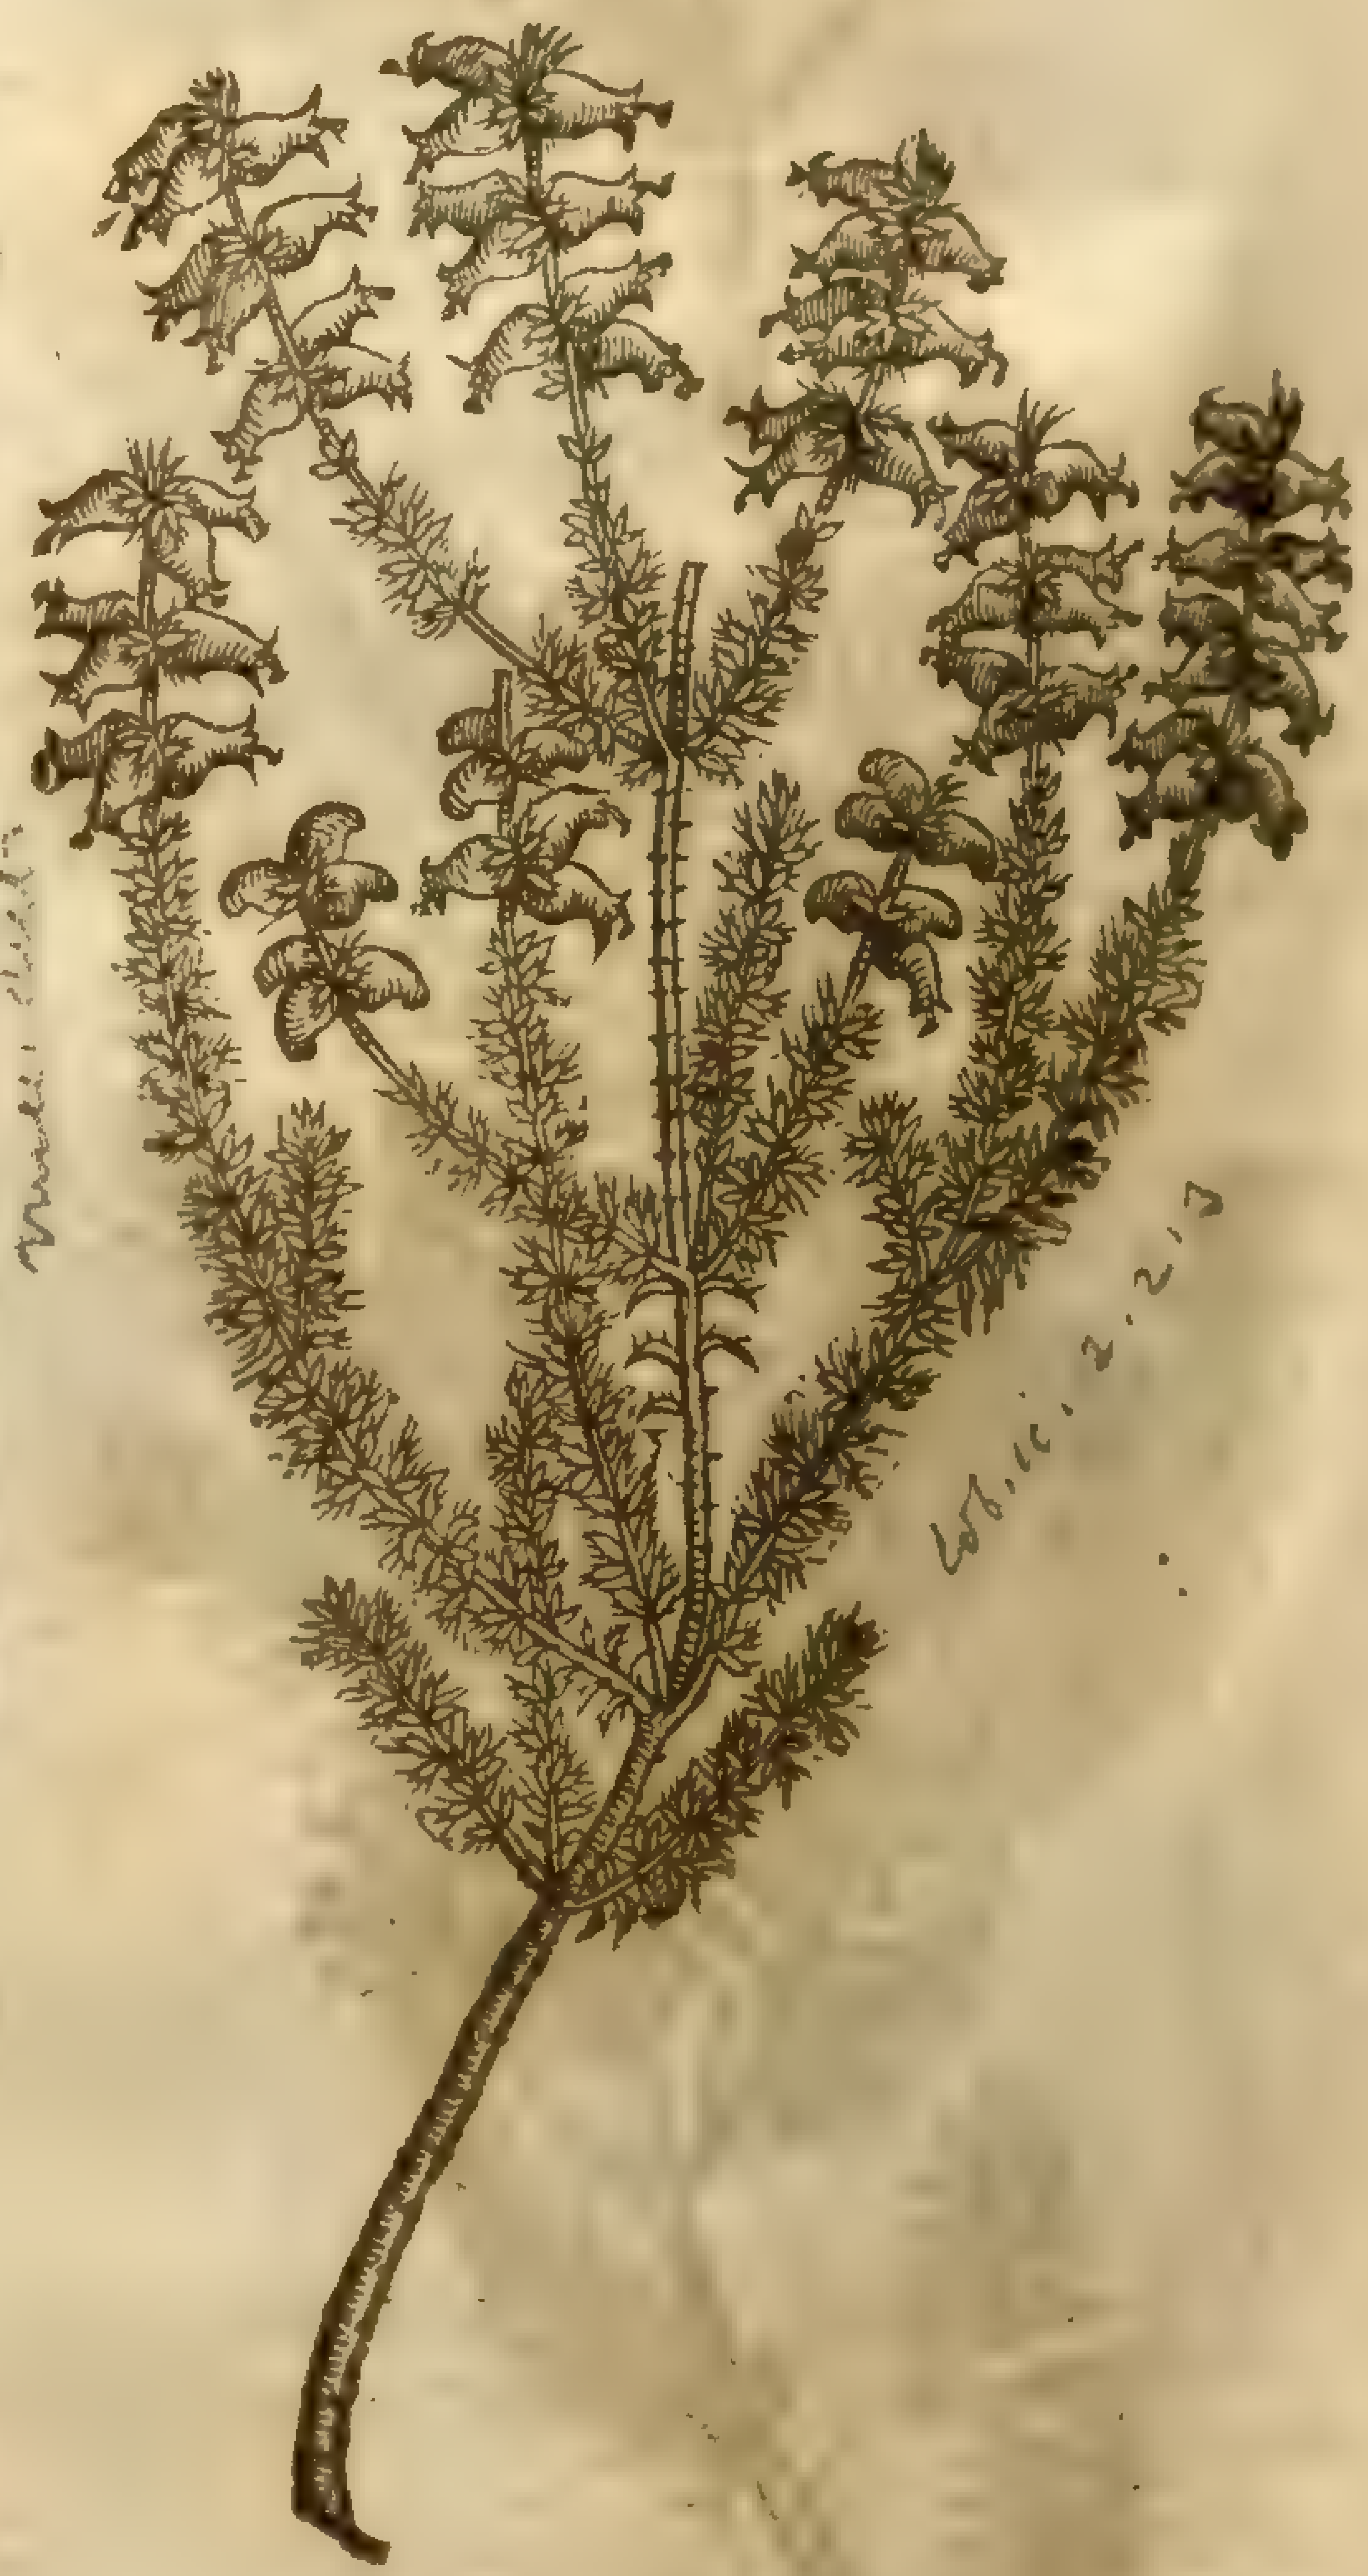
7 *Erica tenuifolia.*
Small leafed Heath.



E. cinerea L. mihi ded. Sm. Fl. 2. 227

Wh. ii. 2. 222

8 *Erica tenuifolia caliculata.*
Chalice Heath.



E. ciliaris L. mihi ded.

Wh. ii. 2. 217

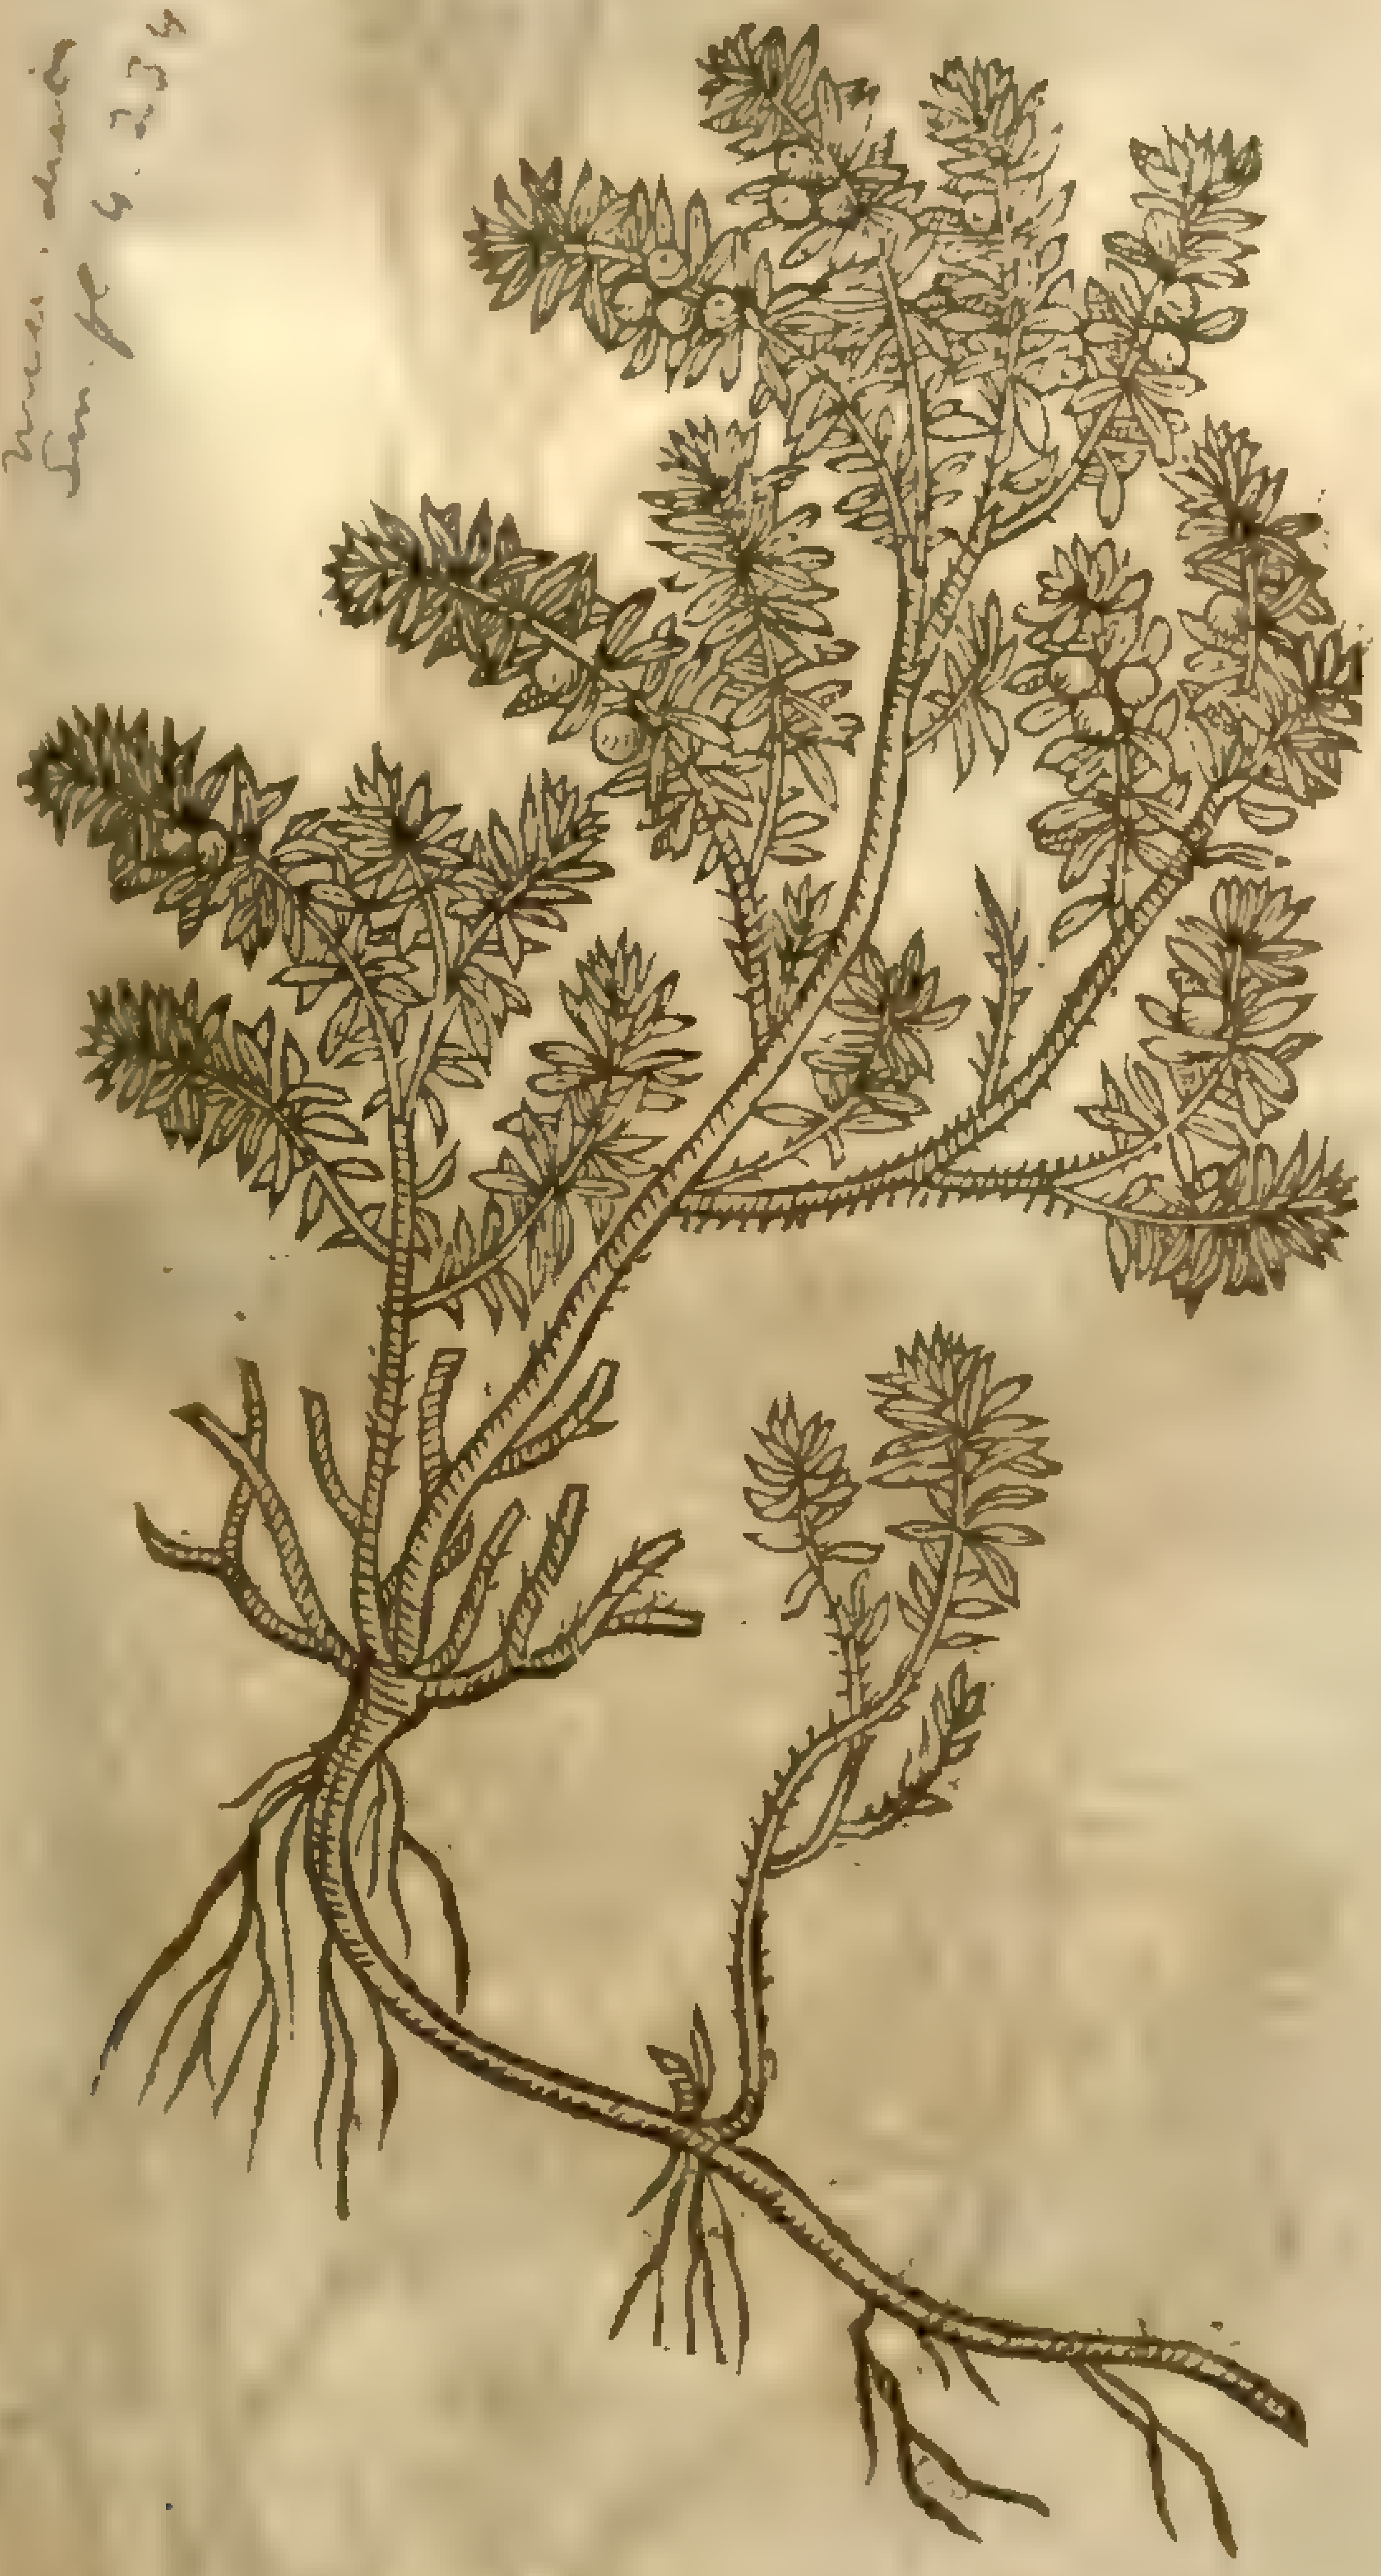
7 This ſmall or thinne leafed Heath is alſo a low and baſe ſhrub, hauing many ſmall and ſlender ſhoots comming from the root, of a reddiſh browne colour; whereupon doe grow very many ſmall leaues not vnlike to them of common Tyme, but much ſmaller and tenderer: the flours grow in tufts at certaine ſpaces, of a purple colour. The root is long, and of a woody ſubſtance. ‡ The branches of this are commonly whitiſh, the leaues very green: the flours are ſmalleſt at both ends and biggeſt in the middeſt, hollow, and of a faire purple colour, which doth not eaſily decay. It

floures moſt part of Summer, and growes in many heathy grounds. ‡

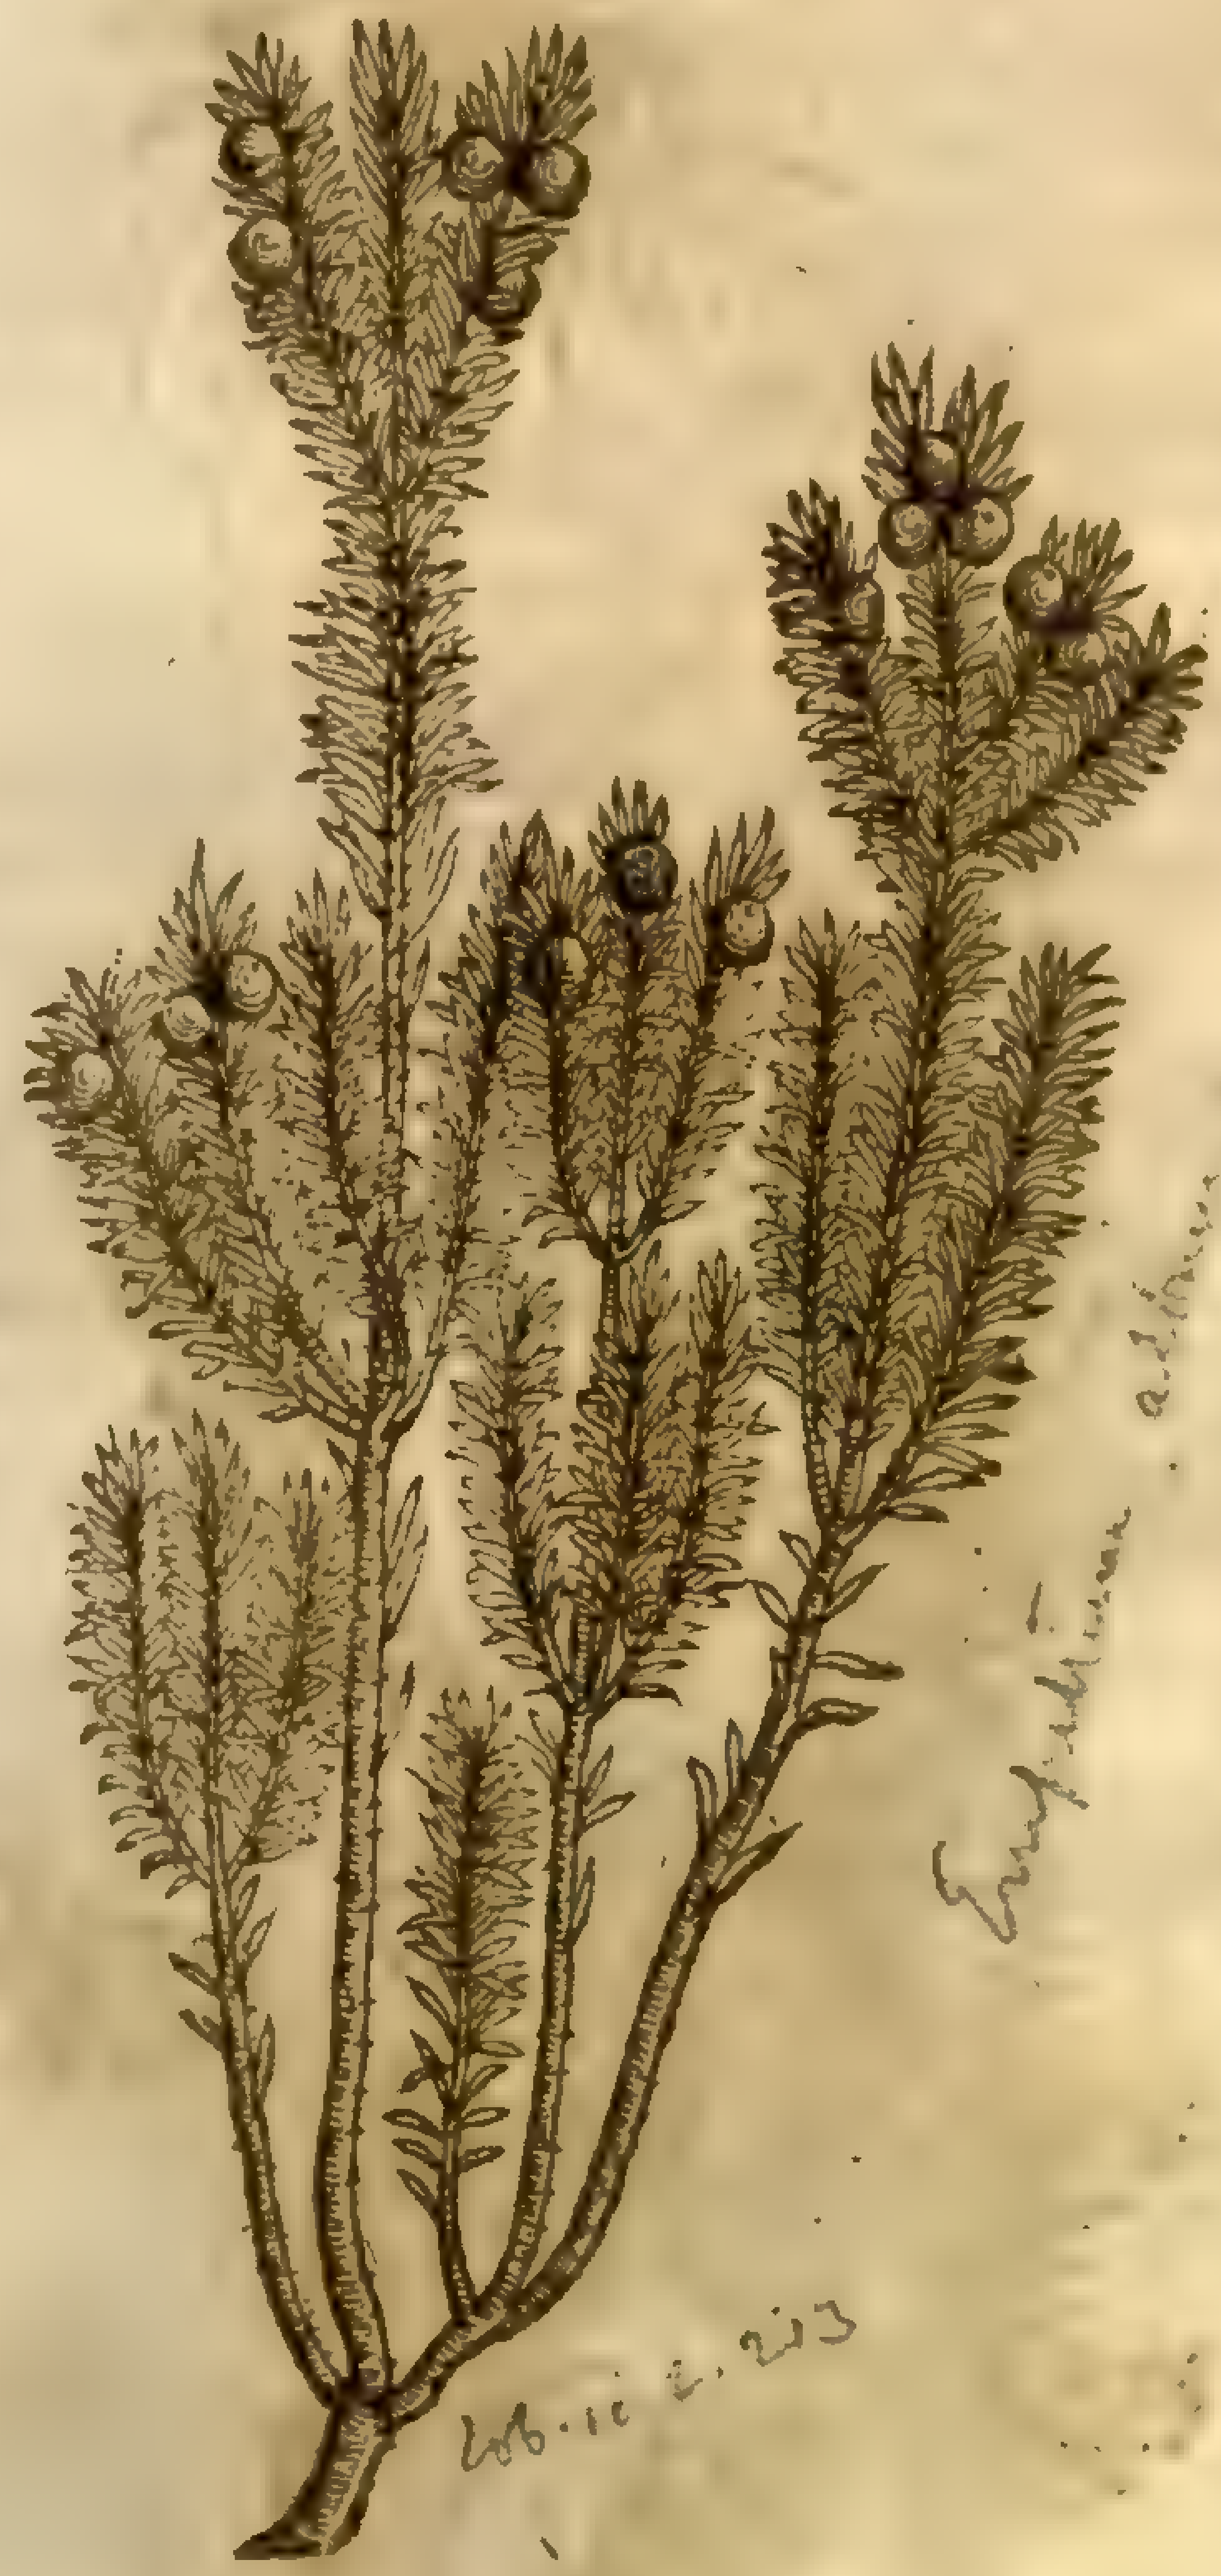
8 Chalice heath hath alſo many wooddy branches growing from the roots, ſlender, of a reddiſh brown colour, a foot and half high, garniſhed with very little leaues leſſer than thoſe of Time: the flours grow on the tops and vpper parts of the branches, and be in number fiue, ſix, or more, hanging downward, in faſhion long, hollow within like a little tunnel or open cup or chalice, of a light purpliſh colour: the root creepeth, and putteth forth in diuers places new ſprings or ſhoots.

9 The Heath that bringeth forth berries hath many weake and ſlender branches of a reddiſh colour, which trailing vpon the ground do take hold thereof in ſundry places, whereby it mightily increaſeth: the leaues are ſomewhat broad, of a thicke and fleſhy ſubſtance, in taſte ſomthing drying at the firſt, but afterwards ſomewhat ſharpe and biting the tongue: among which come forth ſmall floures of an herby colour: which being vaded there ſucceed ſmall round berries that at the firſt are green, and afterward blacke, being as big as thoſe of Iuniper, wherein is contained purple juice like that of the Mulbery: within thoſe berries are contained alſo ſmall three cornered grains: the root is hard, and of a woody ſubſtance. ‡ I found this growing in great plenty in Yorkſhire on the tops of the hills of Gisbrough, betwixt it and Roſemary-topin (a round hill ſo called) & ſome of the people thereabouts told me they called the fruit Crake-berries. This is the ſame that *Matthiolus* calls *Erica baccifera*; and it is the *Erica Coris folio* 11. of *Cluſius*. ‡

‡ 9 *Erica baccifera procumbens.*
Heath bearing berries.



10 *Erica baccifera tenuifolia.*
Small leafed Heath with berries.

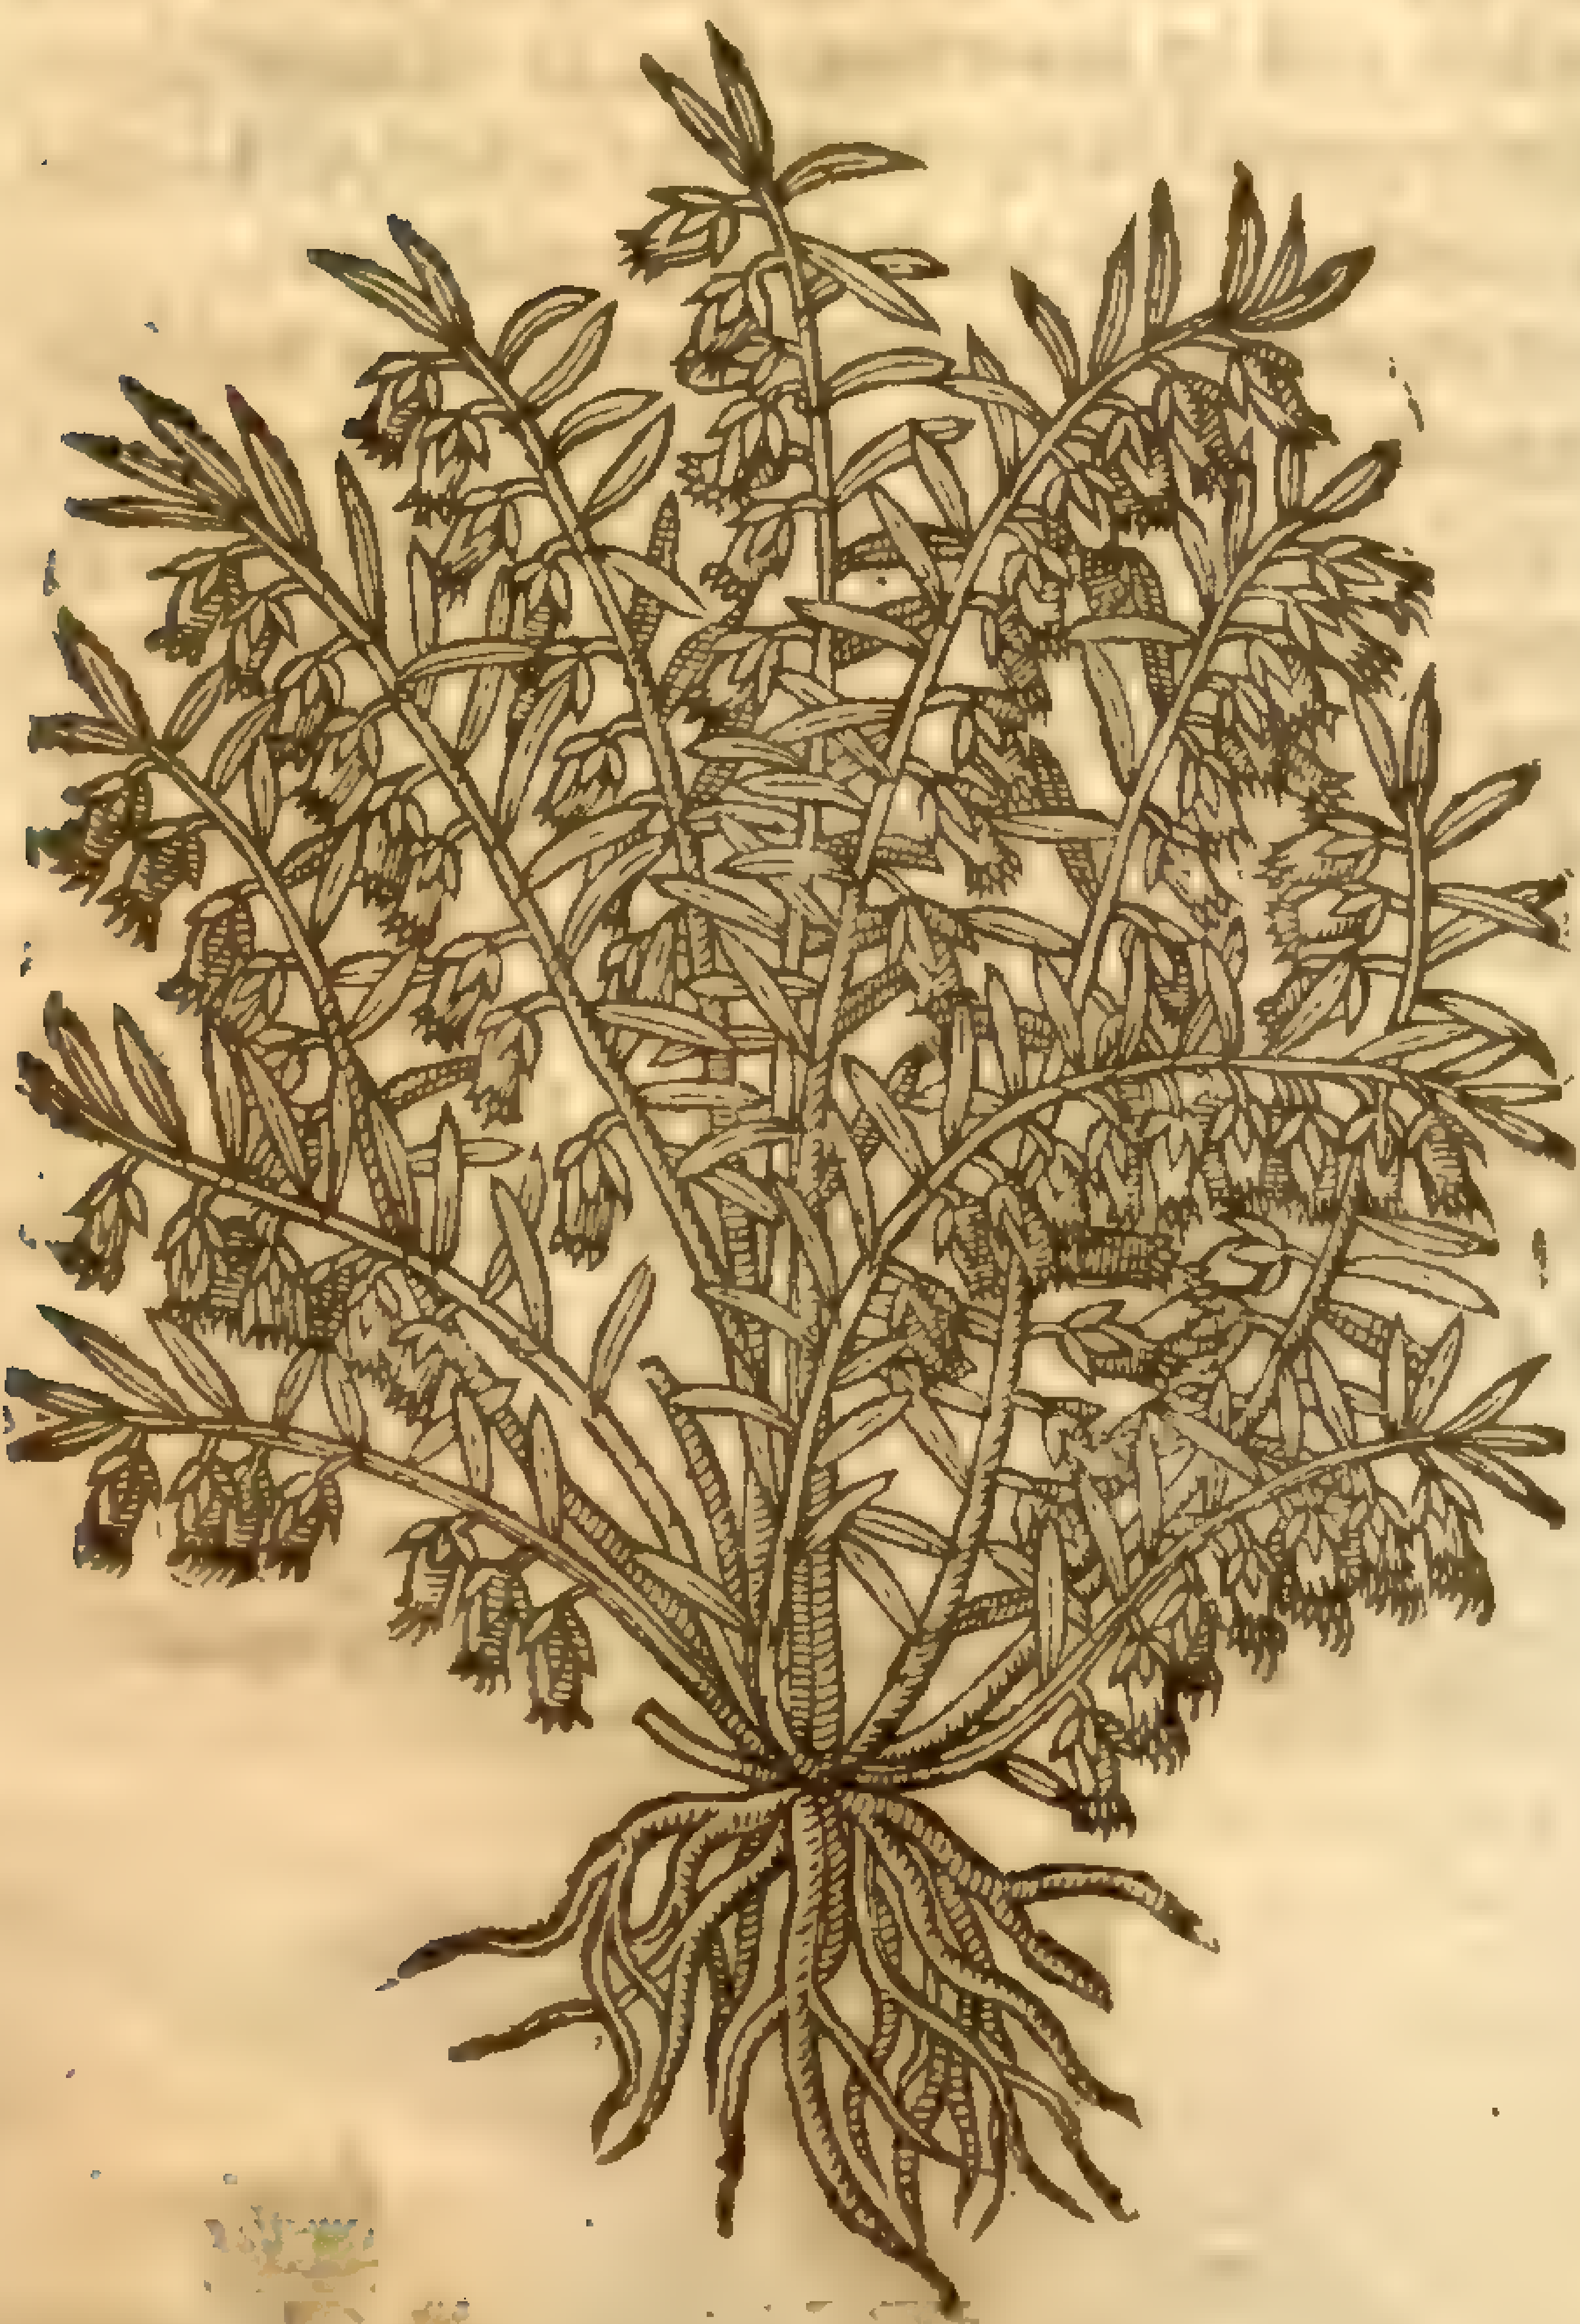


Lob. ic. 2. 213

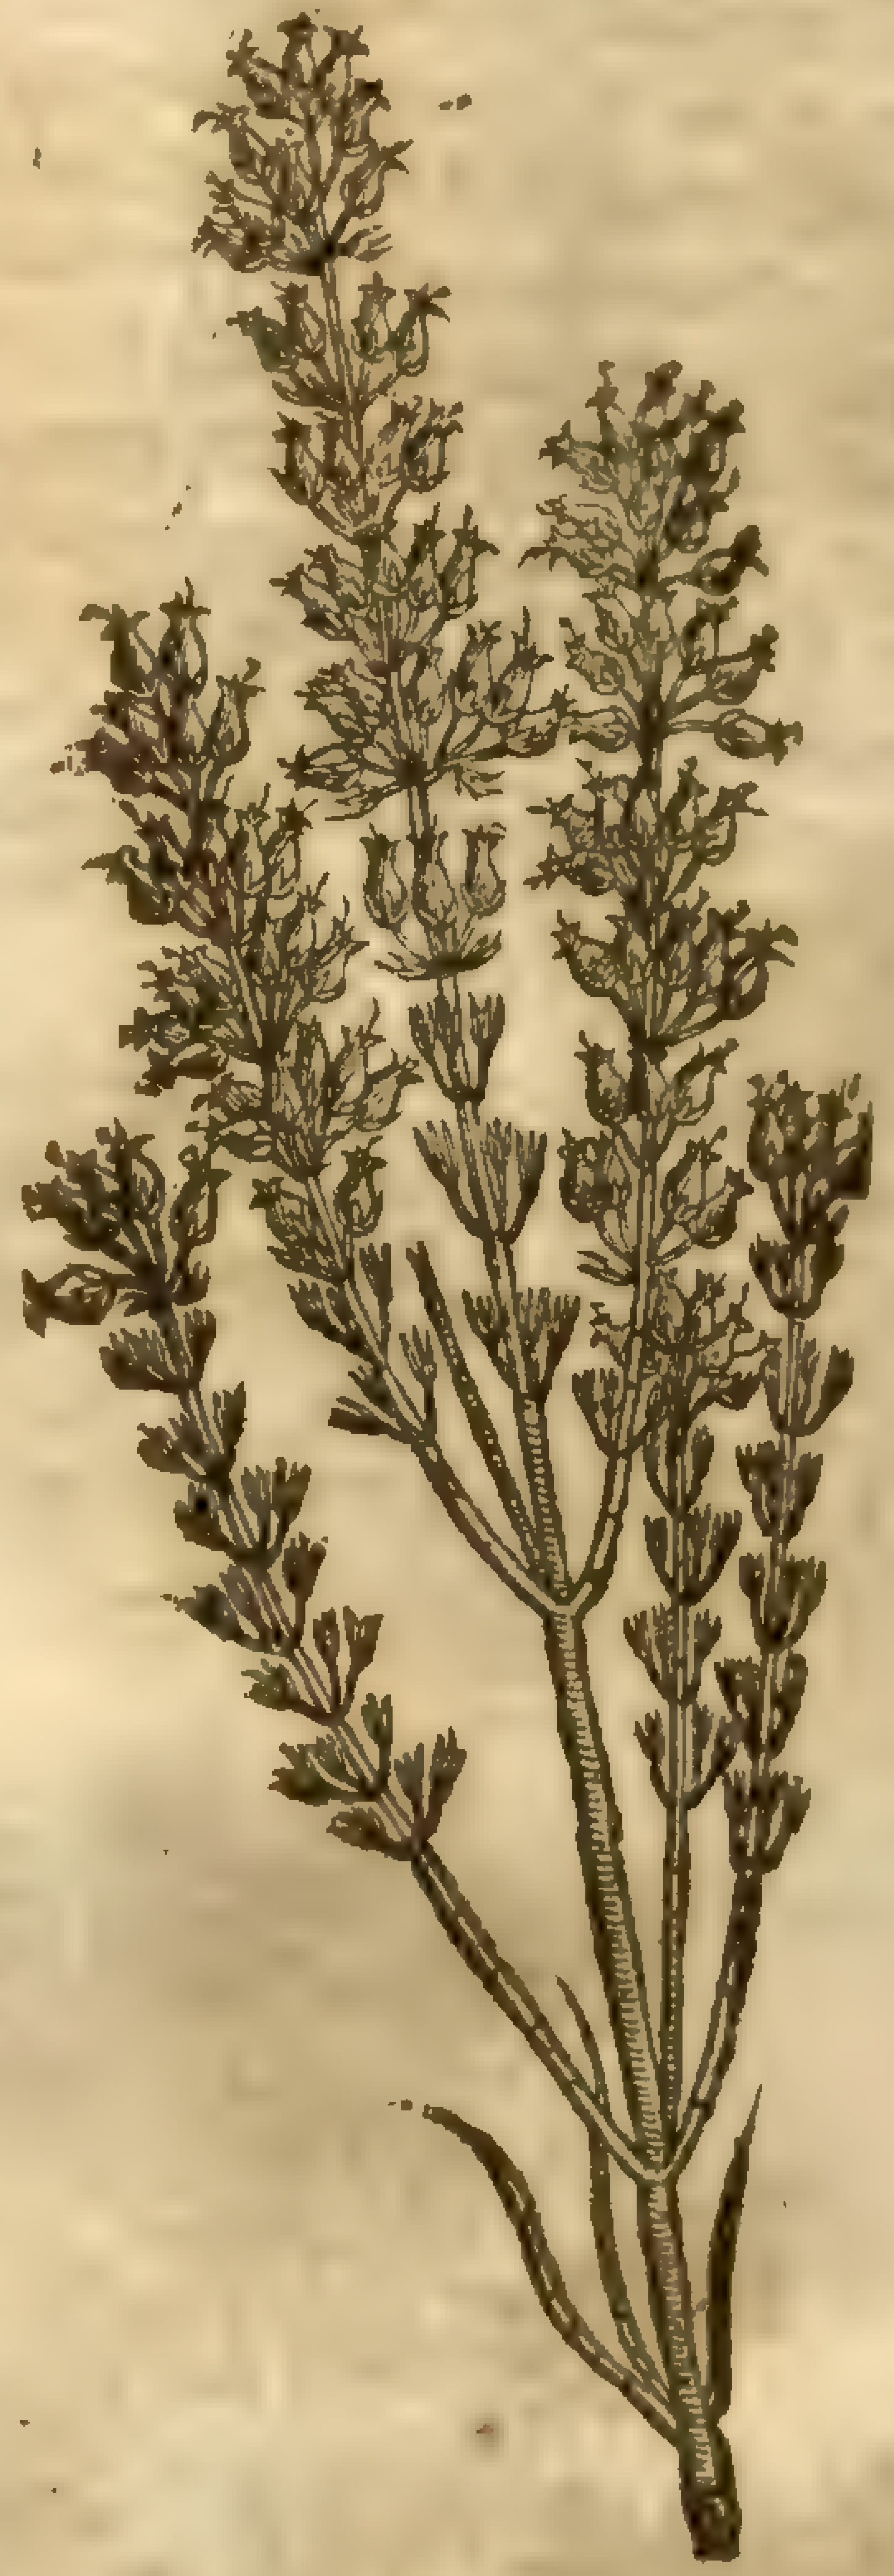
‡ 10 This which our Authour figured as you ſee in the tenth place (putting the deſcription of the former thereto) hath brittle branches growing ſome cubit high, couered with a bark blacker than the reſt: the leaues are like thoſe of the former, but blacker and ſmaller, growing about the ſtalks by threes, of a hottiſh taſte with ſome aſtriction: in September and October it caries a fruit on the tops of the branches different from the reſt, for it is very beautiful, white, tranſparent, reſembling dusky and vneuen pearles in forme and colour, ſucculent alſo and of an acide taſt, commonly containing three little ſeeds in each berrie: in Nouember this fruit becomes dry, and fals away of it ſelfe. *Cluſius* only obſerued this in Portugal, and at the firſt ſight afar off took the white berries to haue been graines of Manna. He calls it *Erica Coris folio* 10.

11 I remember (ſaith *Dodonæus*) that I obſerued another Heath which grew low, yet ſent forth many

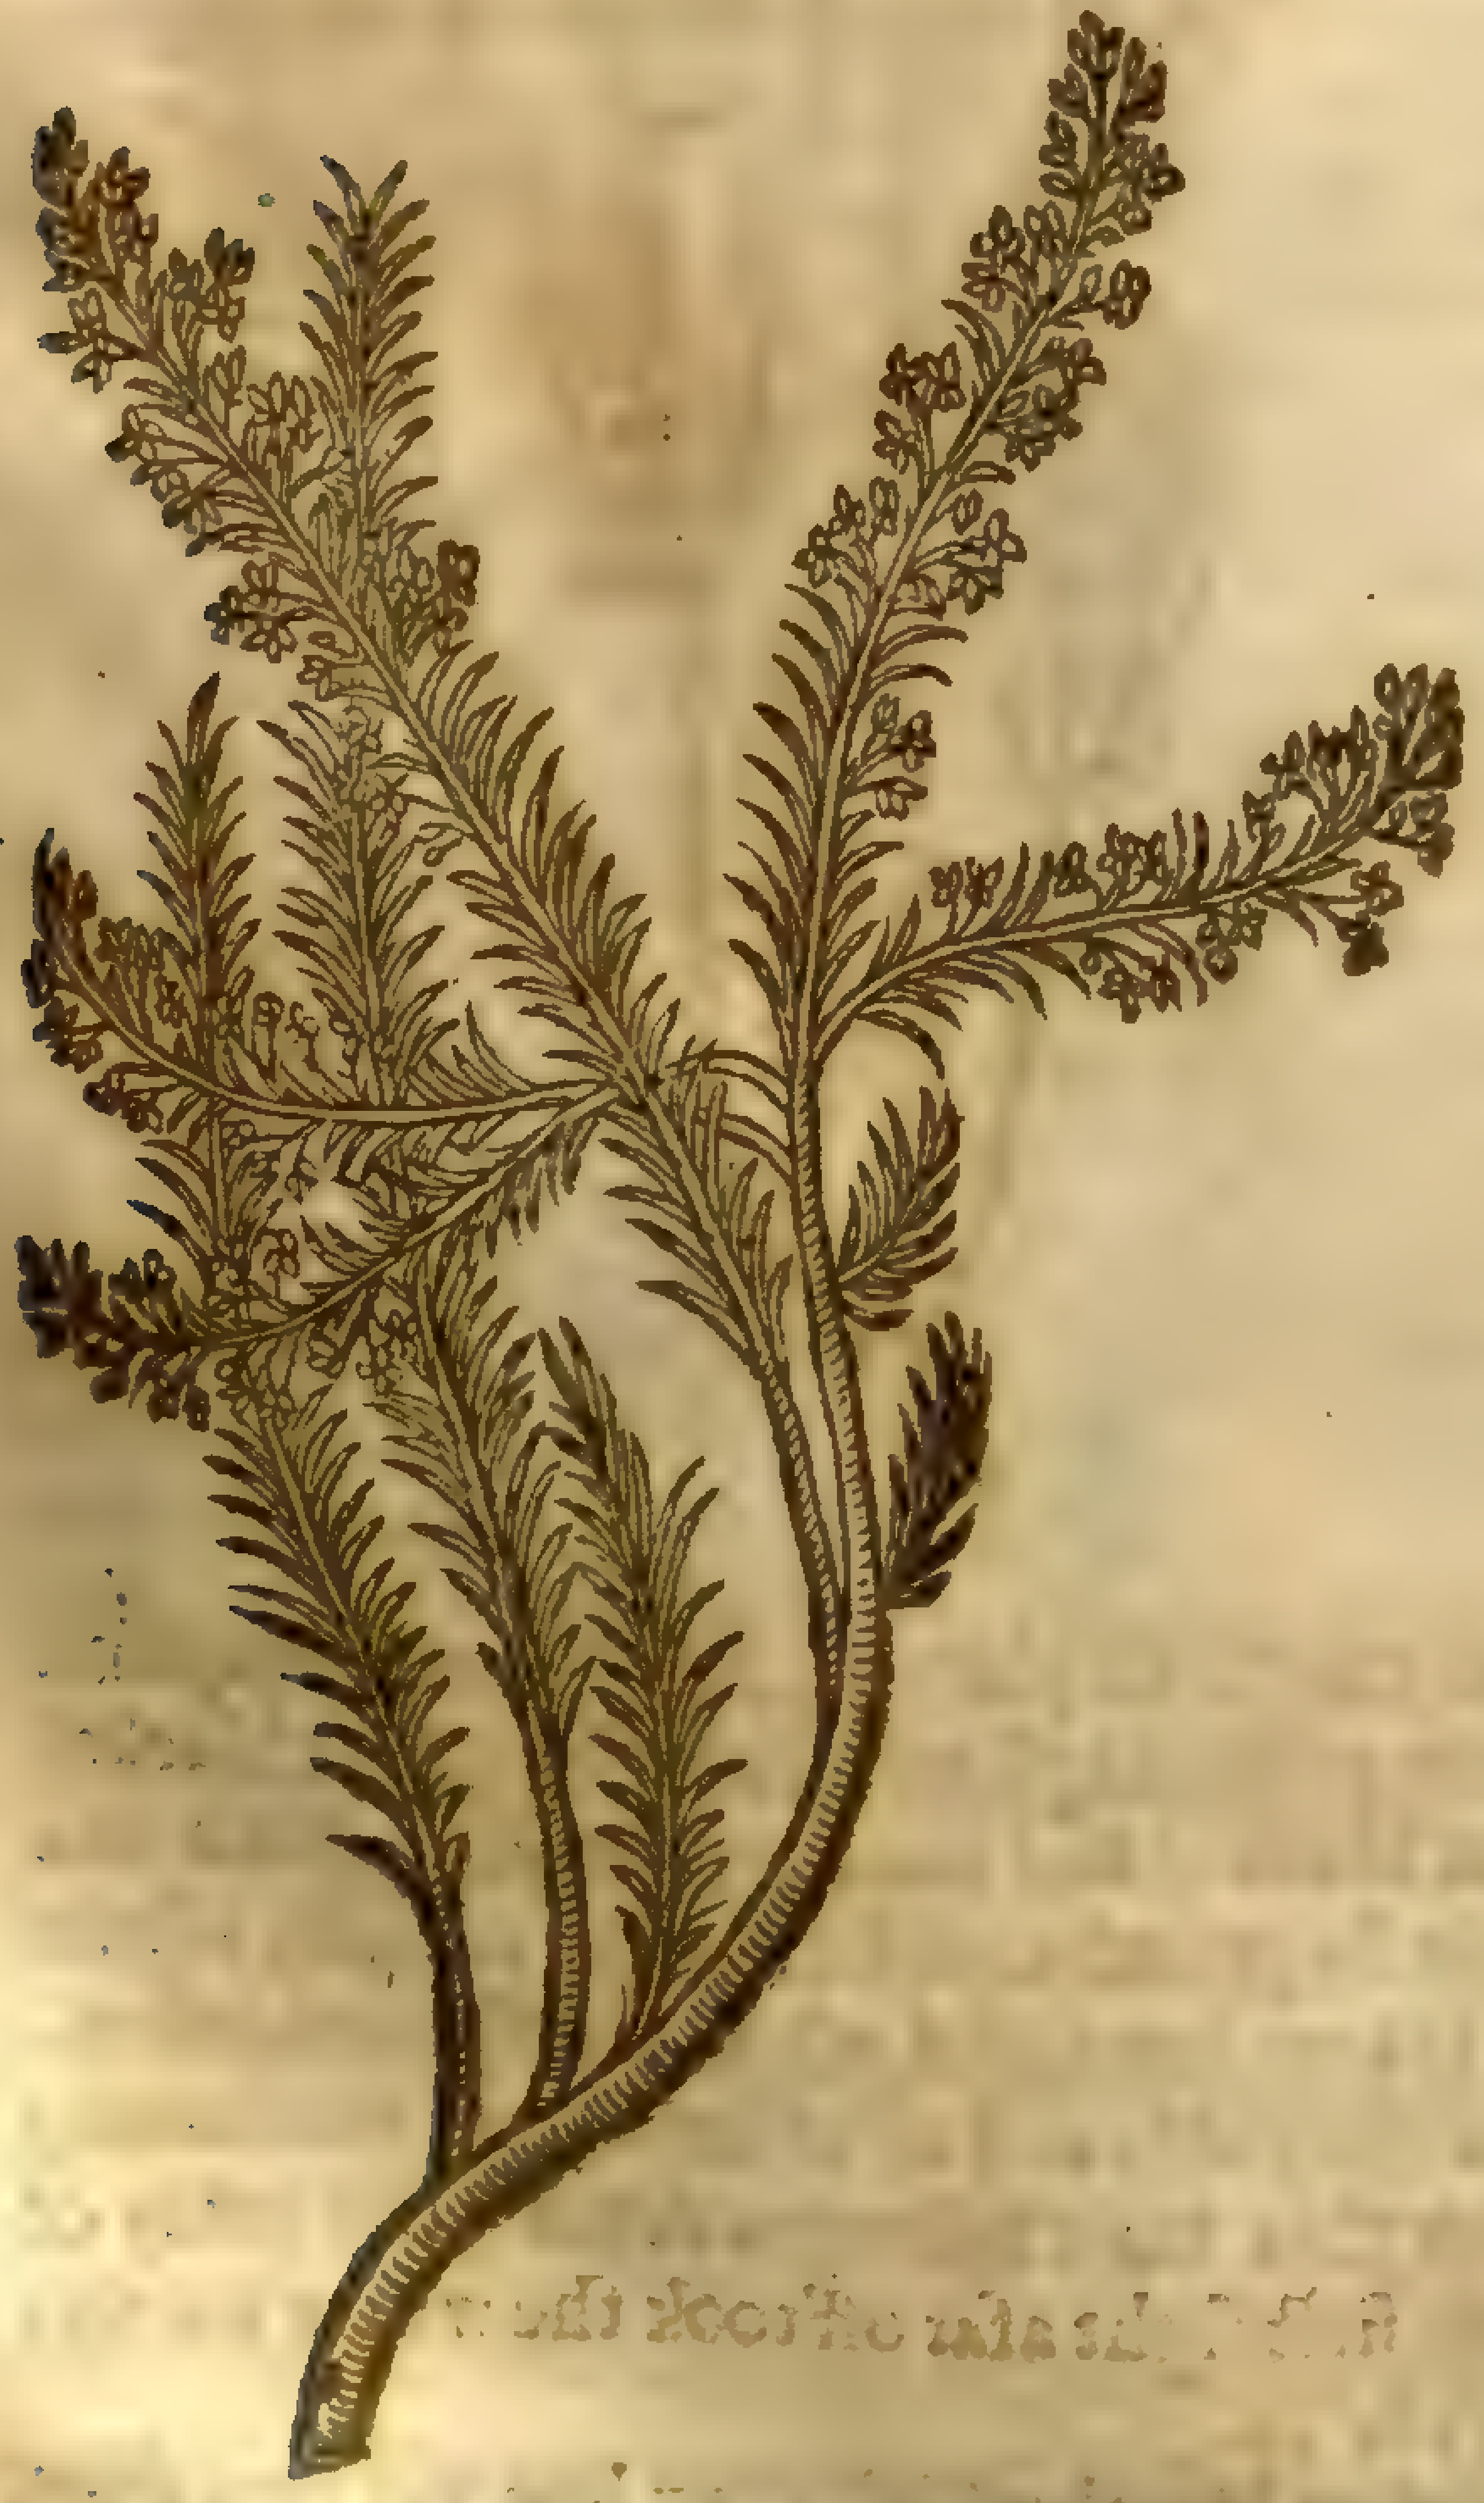
‡ 11 *Erica pumil. 3. Dod.*
Dodonæus his dwarfe Heath.



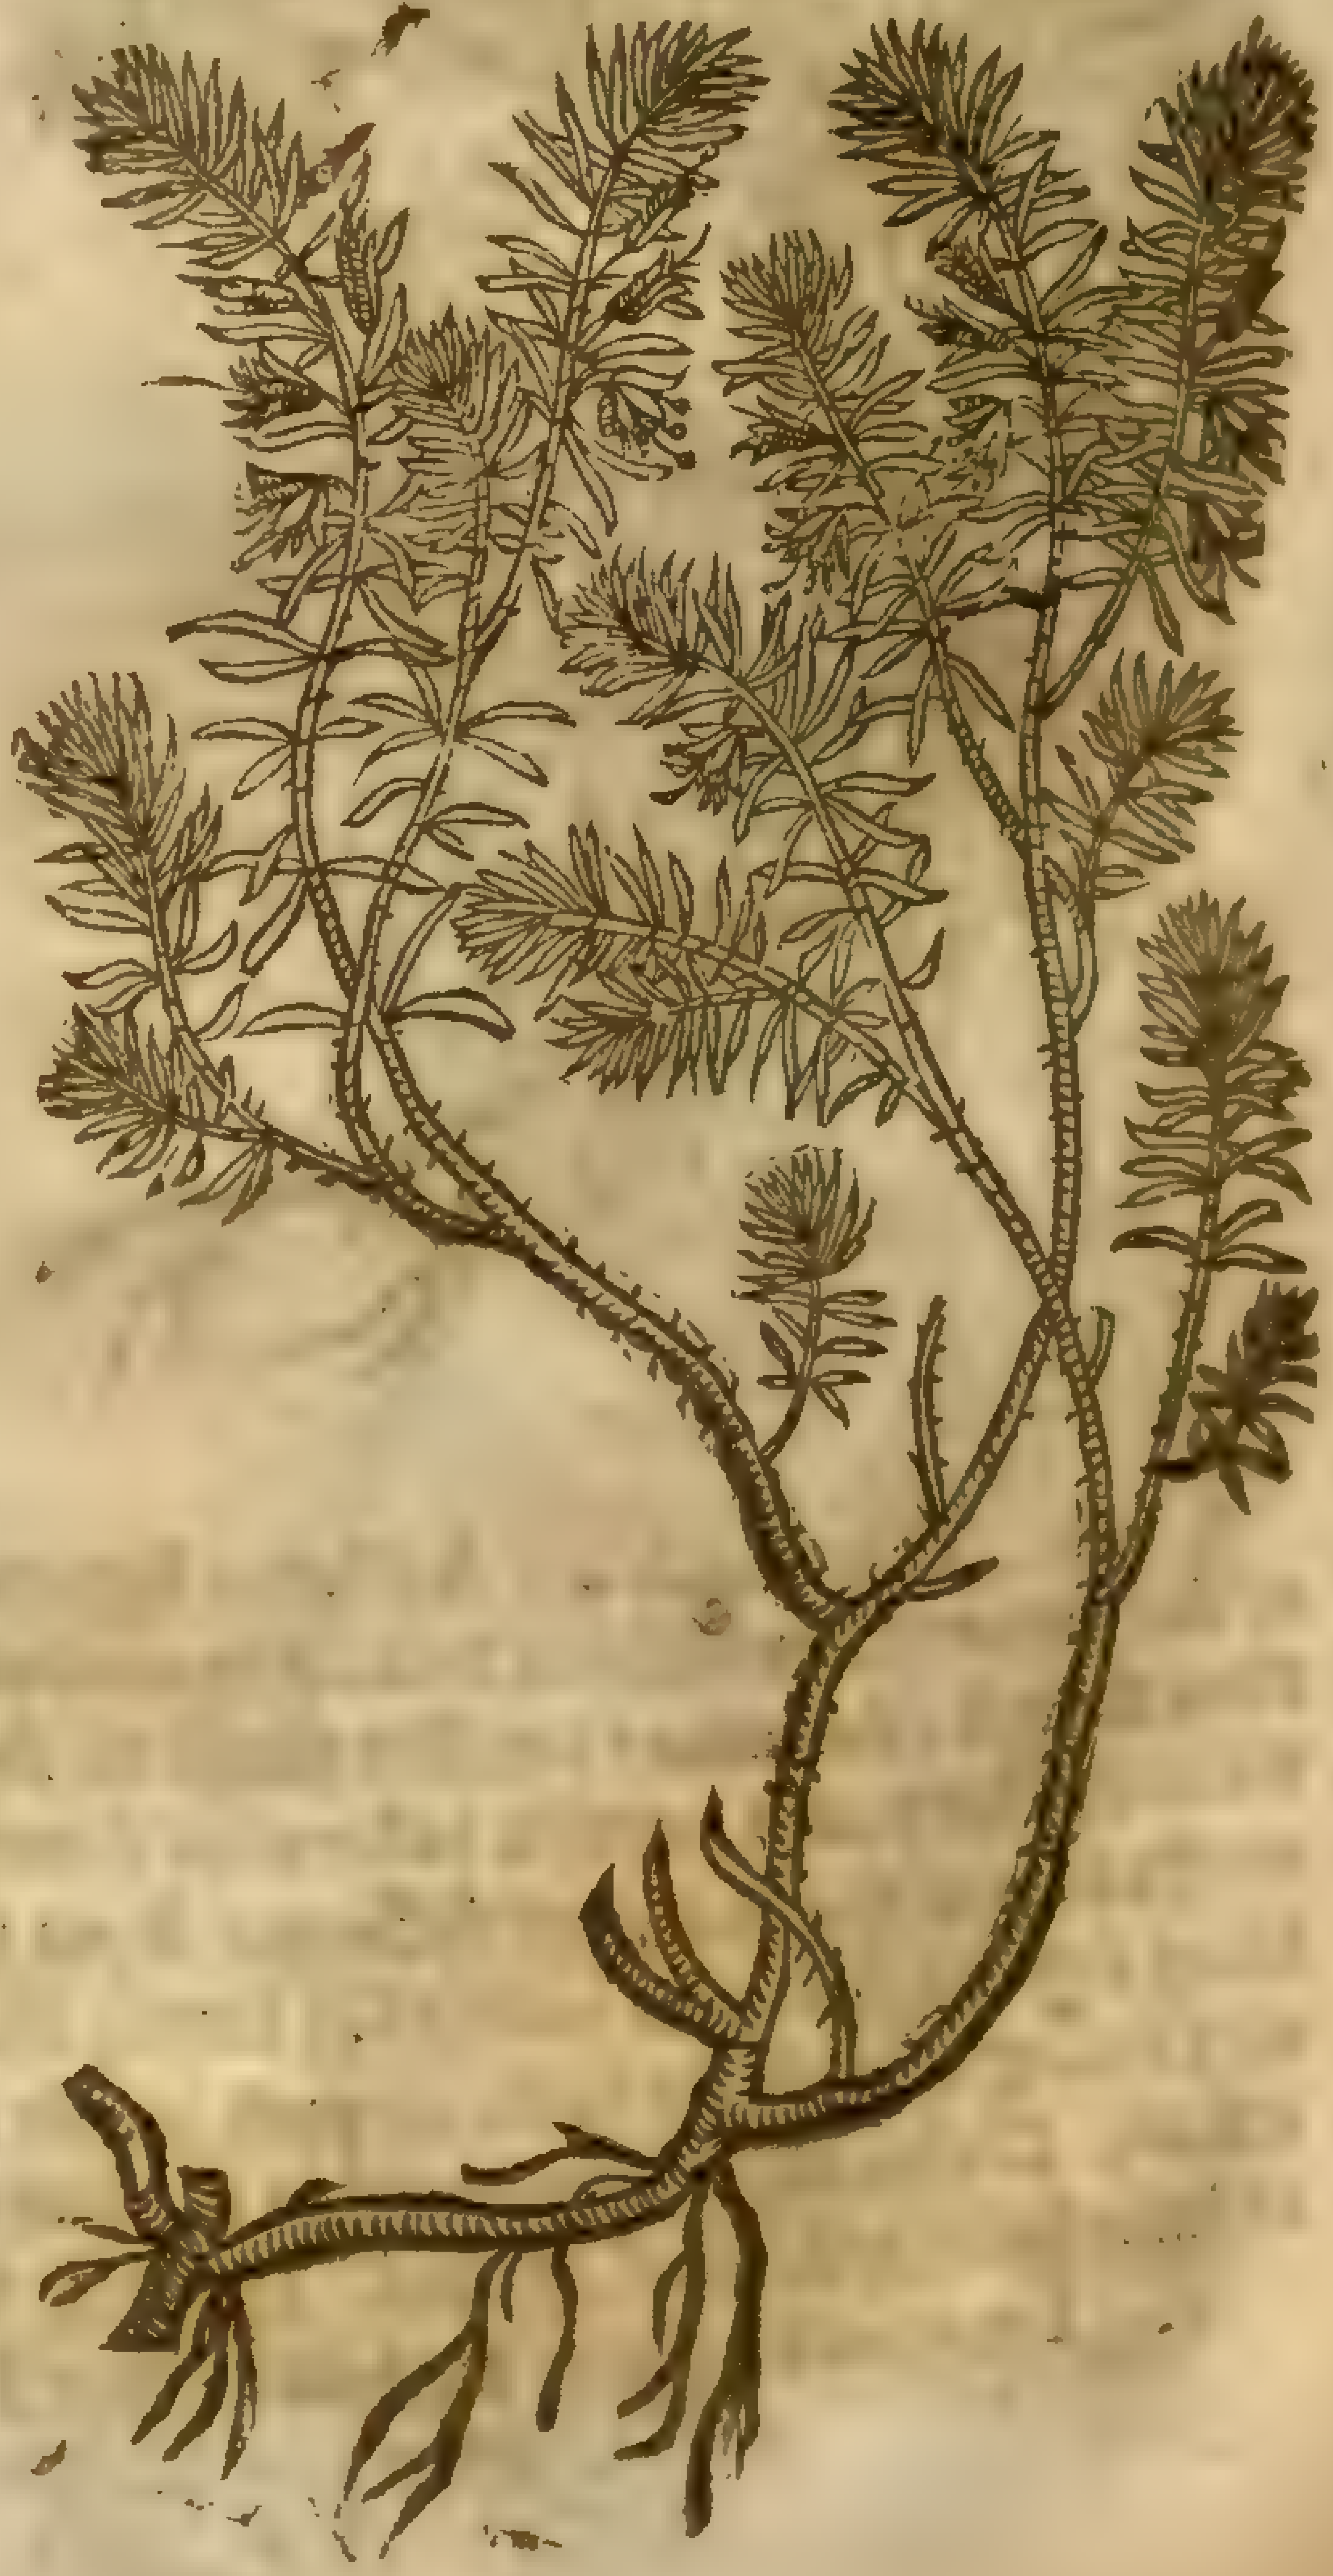
‡ 12 *Erica ternis per intervalla ramis.*
Heath with three branches at a joint.



‡ 13 *Erica peregrina Lobelij.*
Lobels ſtrange Heath.



‡ 14 *Erica Coris folio 7. Cluſij.*
Creeping Dutch Heath.



‡ 15 *Erica Coris folio.9.Cluſij.*
Small Auſtrian Heath.

many wooddy and twiggy branches, hauing vpon them little narrow and longiſh leaues; on theſe ſtalkes ſpike faſhion to the tops of them, yet but on one ſide, grow elegant redde floures, pointed with blacke. This growes in that tract of Germany which leads from Bohemia to Noremberg on dry and vntilled places, and neere woods. It floures in Aprill.

12 This ſhrubby Heath is commonly ſome cubit high, hauing ſlender branches which come out of the maine ſtemmes commonly three together; and the leaues alſo grow in the ſame order; the tops of the branches are adorned with many floures of a darke purple colour, hollow, round, biggeſt below, and ſtanding vpon long footſtalks. *Cluſius* found this growing in the vntilled places of Portingale aboue Lisbone, where it floured in December; he calls it *Erica Coris folio,5.*

13 Beſides all theſe (ſaith *Lobel*, hauing firſt treated of diuers plants of this kinde) there is a certaine rarer ſpecies growing like the reſt after the manner of a ſhrub in pots, in the Garden of Mr *Iohn Brancion*: the leafe is long, and the purple floures, which as far as I remember conſiſted of foure little leaues apiece, grow on the tops of the branches. I know not whence it was brought, and therfore for the rarity I call it *Erica peregrina*, that is, Strange or Forreine Heath.

14 This hath many round blackiſh purple branches ſome foot or cubit high, lying oft times along vpon the ground: theſe are beſet with many narrow little leaues, almoſt like thoſe of the third deſcribed, yet ſomewhat longer, commonly growing foure, yet ſometimes fiue together, of an aſtringent taſte; the little floures grow on the top of the branches, longiſh, hollow, and of a light purple colour, comming out of foure little leaues almoſt of the ſame colour; when theſe are ripe and dried they containe a blackiſh and ſmall ſeed; the root is hard, wooddy, and runnes diuers waies; the weake branches alſo that lie vpon the ground now and then take root againe. *Cluſius* found this growing plentifully in diuers mountanous places of Germany, where it floured in Iune and Iuly.

15 The weake ſtalkes of this are ſome foot high, which are ſet with many ſmall greene leaues growing commonly together by threes; the tops of the branches are deckt with little hollow and longiſh floures diuided at their ends into foure parts, of a fleſh colour, together with the foure little leaues out of which they grow, hauing eight blackiſh little threds in them, with a purpliſh pointall in the middle. The ſeed is blacke and ſmall, the root woody as in other plants of this kinde. *Cluſius* found this in ſome mountanous woods of Auſtria, where it floured in Aprill and May. ‡

¶ *The Place.*

Heath groweth vpon dry mountaines which are hungry and barren, as vpon Hampſteed Heath neere London, where all the ſorts do grow, except that with the white floures, and that which beareth berries. ‡ There are not aboue three or foure ſorts that I could euer obſerue to grow there. ‡

Heath with the white floures groweth vpon the downes neere vnto Grauesend.

Heath which beareth berries groweth in the North parts of England, namely, at a place called Crosby Lauenſwaith, and in Cragge cloſe alſo in the ſame country: from whence I haue receiued the red berries by the gift of a learned Gentleman called Mr *Iames Thwaits.*

¶ *The Time.*

Theſe kindes or ſorts of Heath do for the moſt part floure all the Summer, euen vntill the laſt of September.

¶ *The Names.*

Heath is called in Greeke, ἐρείκη: in Latine alſo *Erica*: diuers do falſly name it *Myrica*: in high and low Dutch, **Heyden**: in Italian, *Erica*: in Spaniſh, *Breſo Quirro*: in French, *Bruyre*: in Engliſh, Heath, Hather and Linge.

¶ *The Temperature.*

Heath hath, as *Galen* ſaith, a digeſting faculty, conſuming by vapors: the floures and leaues are to be vſed.

¶ *The Vertues.*

A The tender tops and floures, ſaith *Dioſcorides*, are good to be laid vpon the bitings and ſtingings of any venomous beaſt: of theſe floures the Bees do gather bad hony.

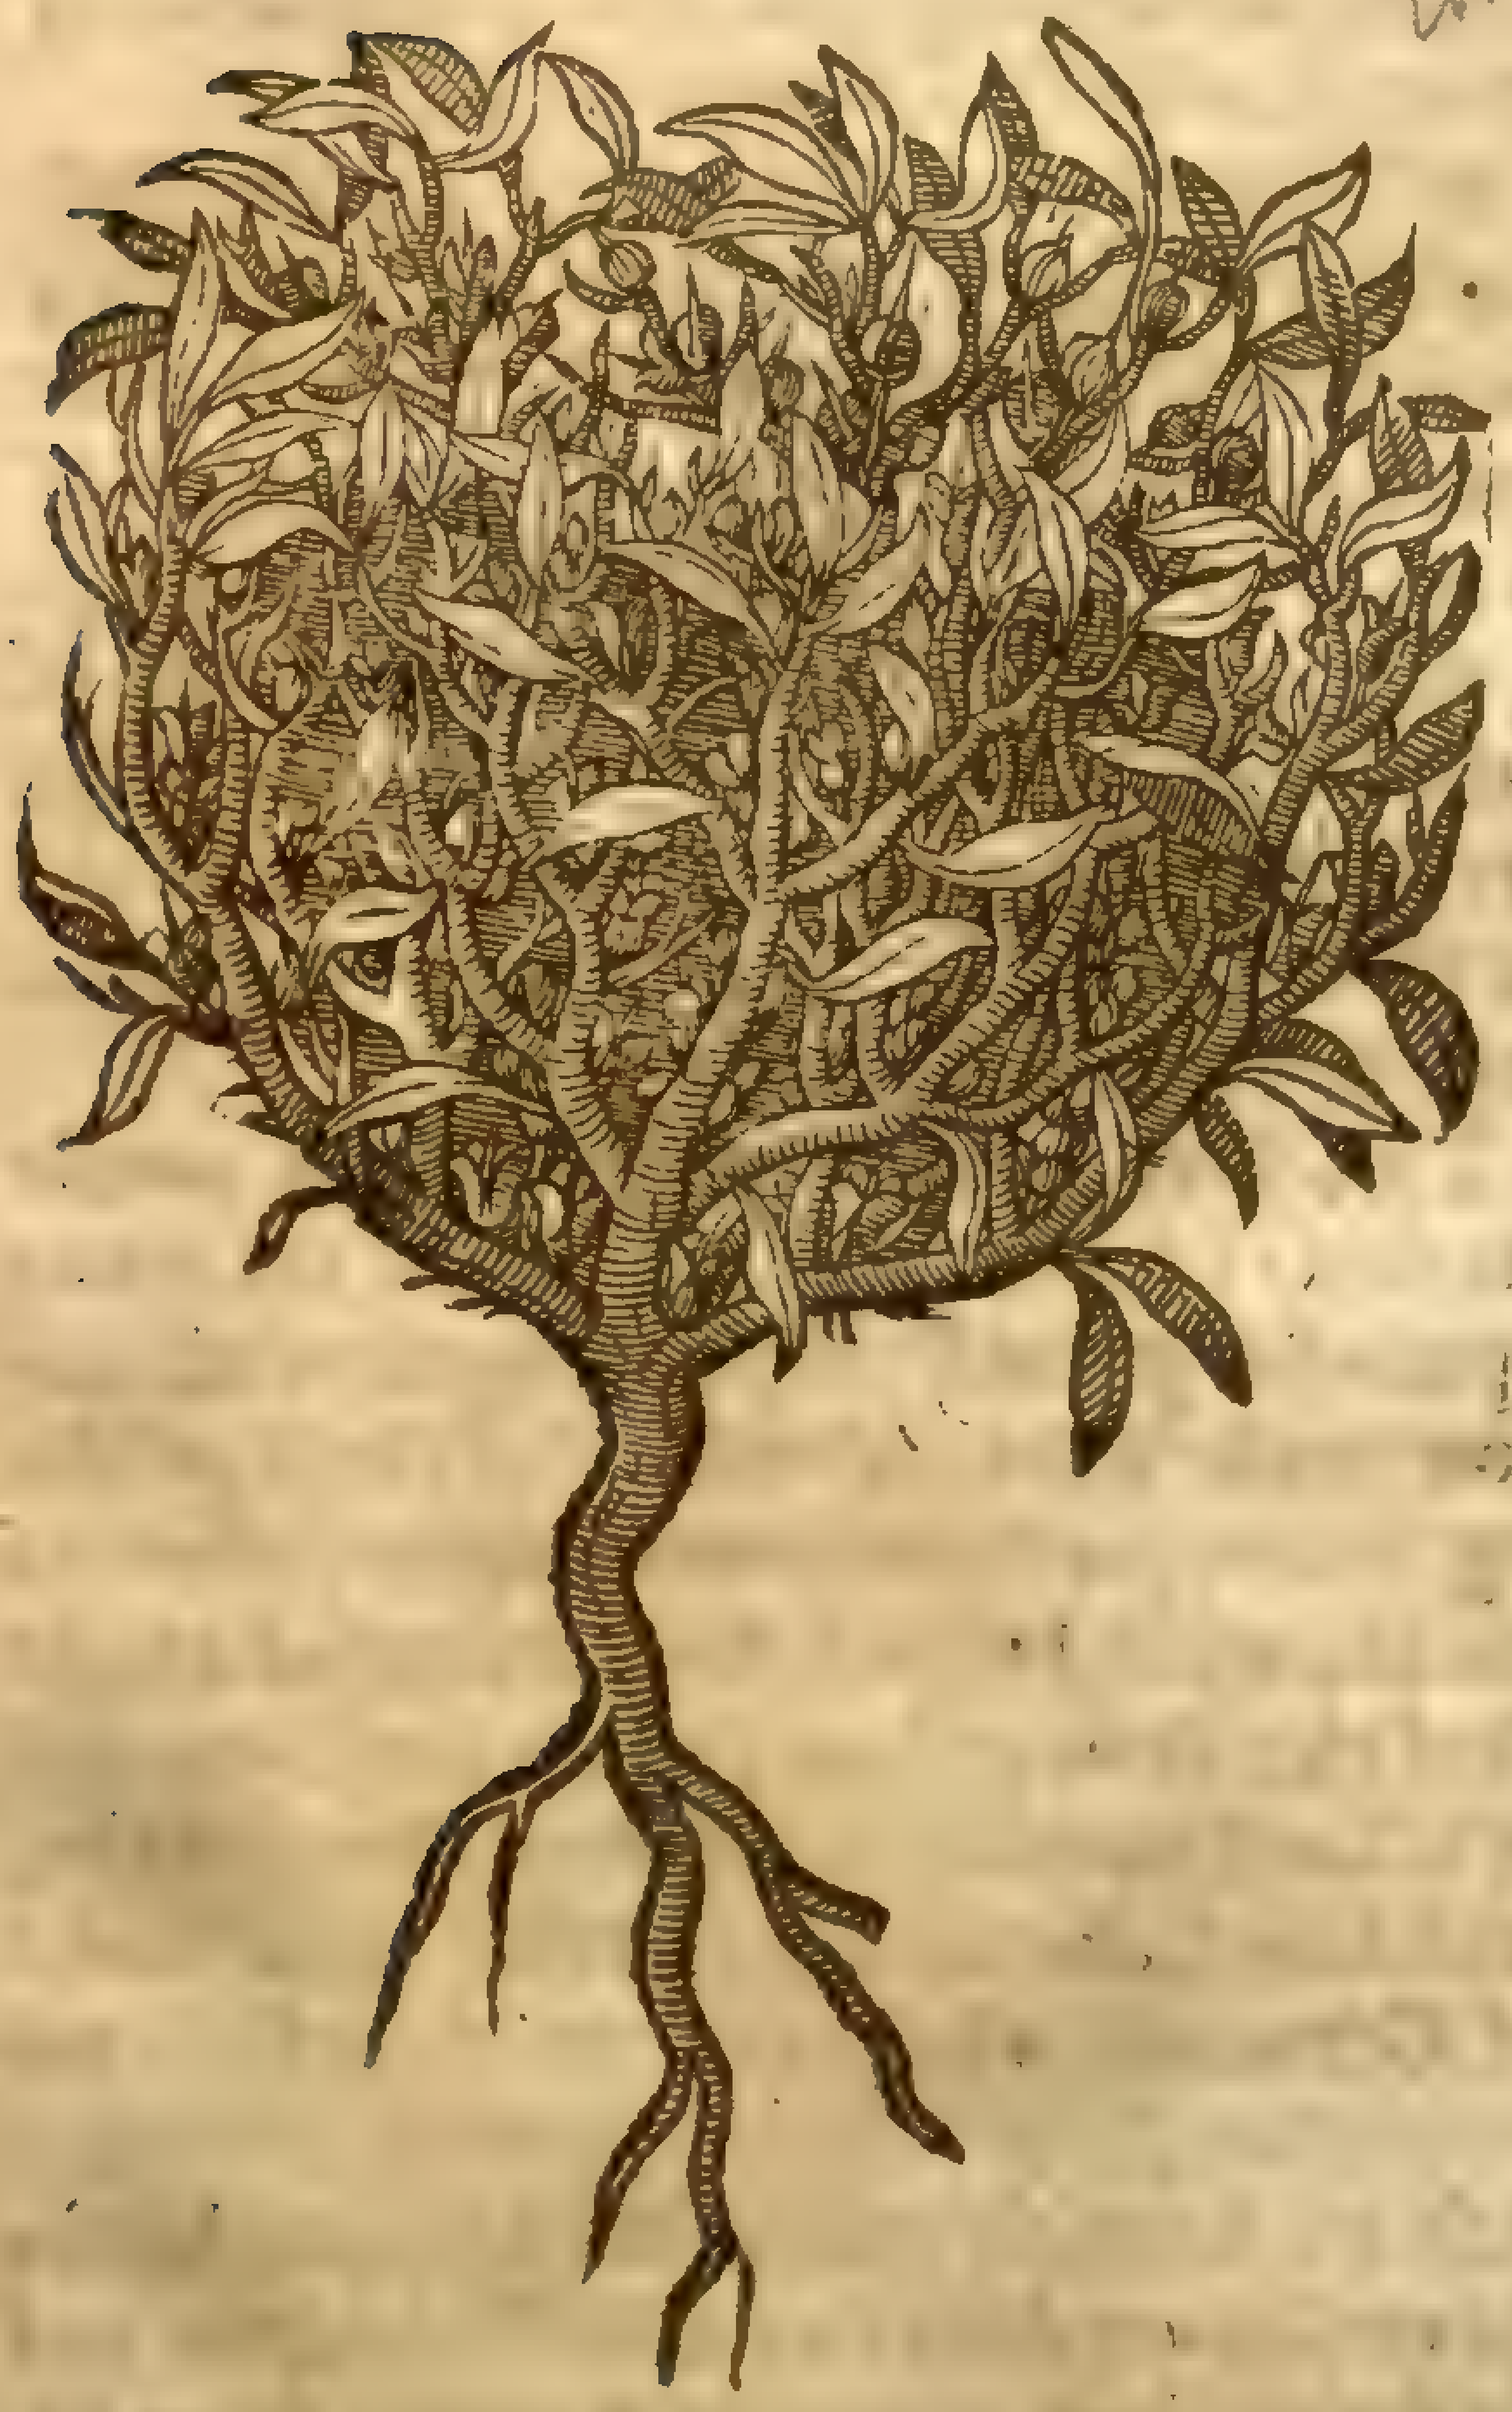
B The barke and leaues of Heath may be vſed for, and in the ſame cauſes that Tamariske is vſed.

† The figure which our Author gaue in the ninth place by the name of *Erica baccifera latifolia* I take to be the *Vitis Idæa*, 2. of *Cluſius* (which you ſhall finde in his due place) and in ſtead thereof I haue giuen you our ordinary berry-bearing Heath.

Chap. 53. *Of Heath of Iericho.*

1 *Roſa Hiericontea major.*
The Heath Roſe of Ierico.

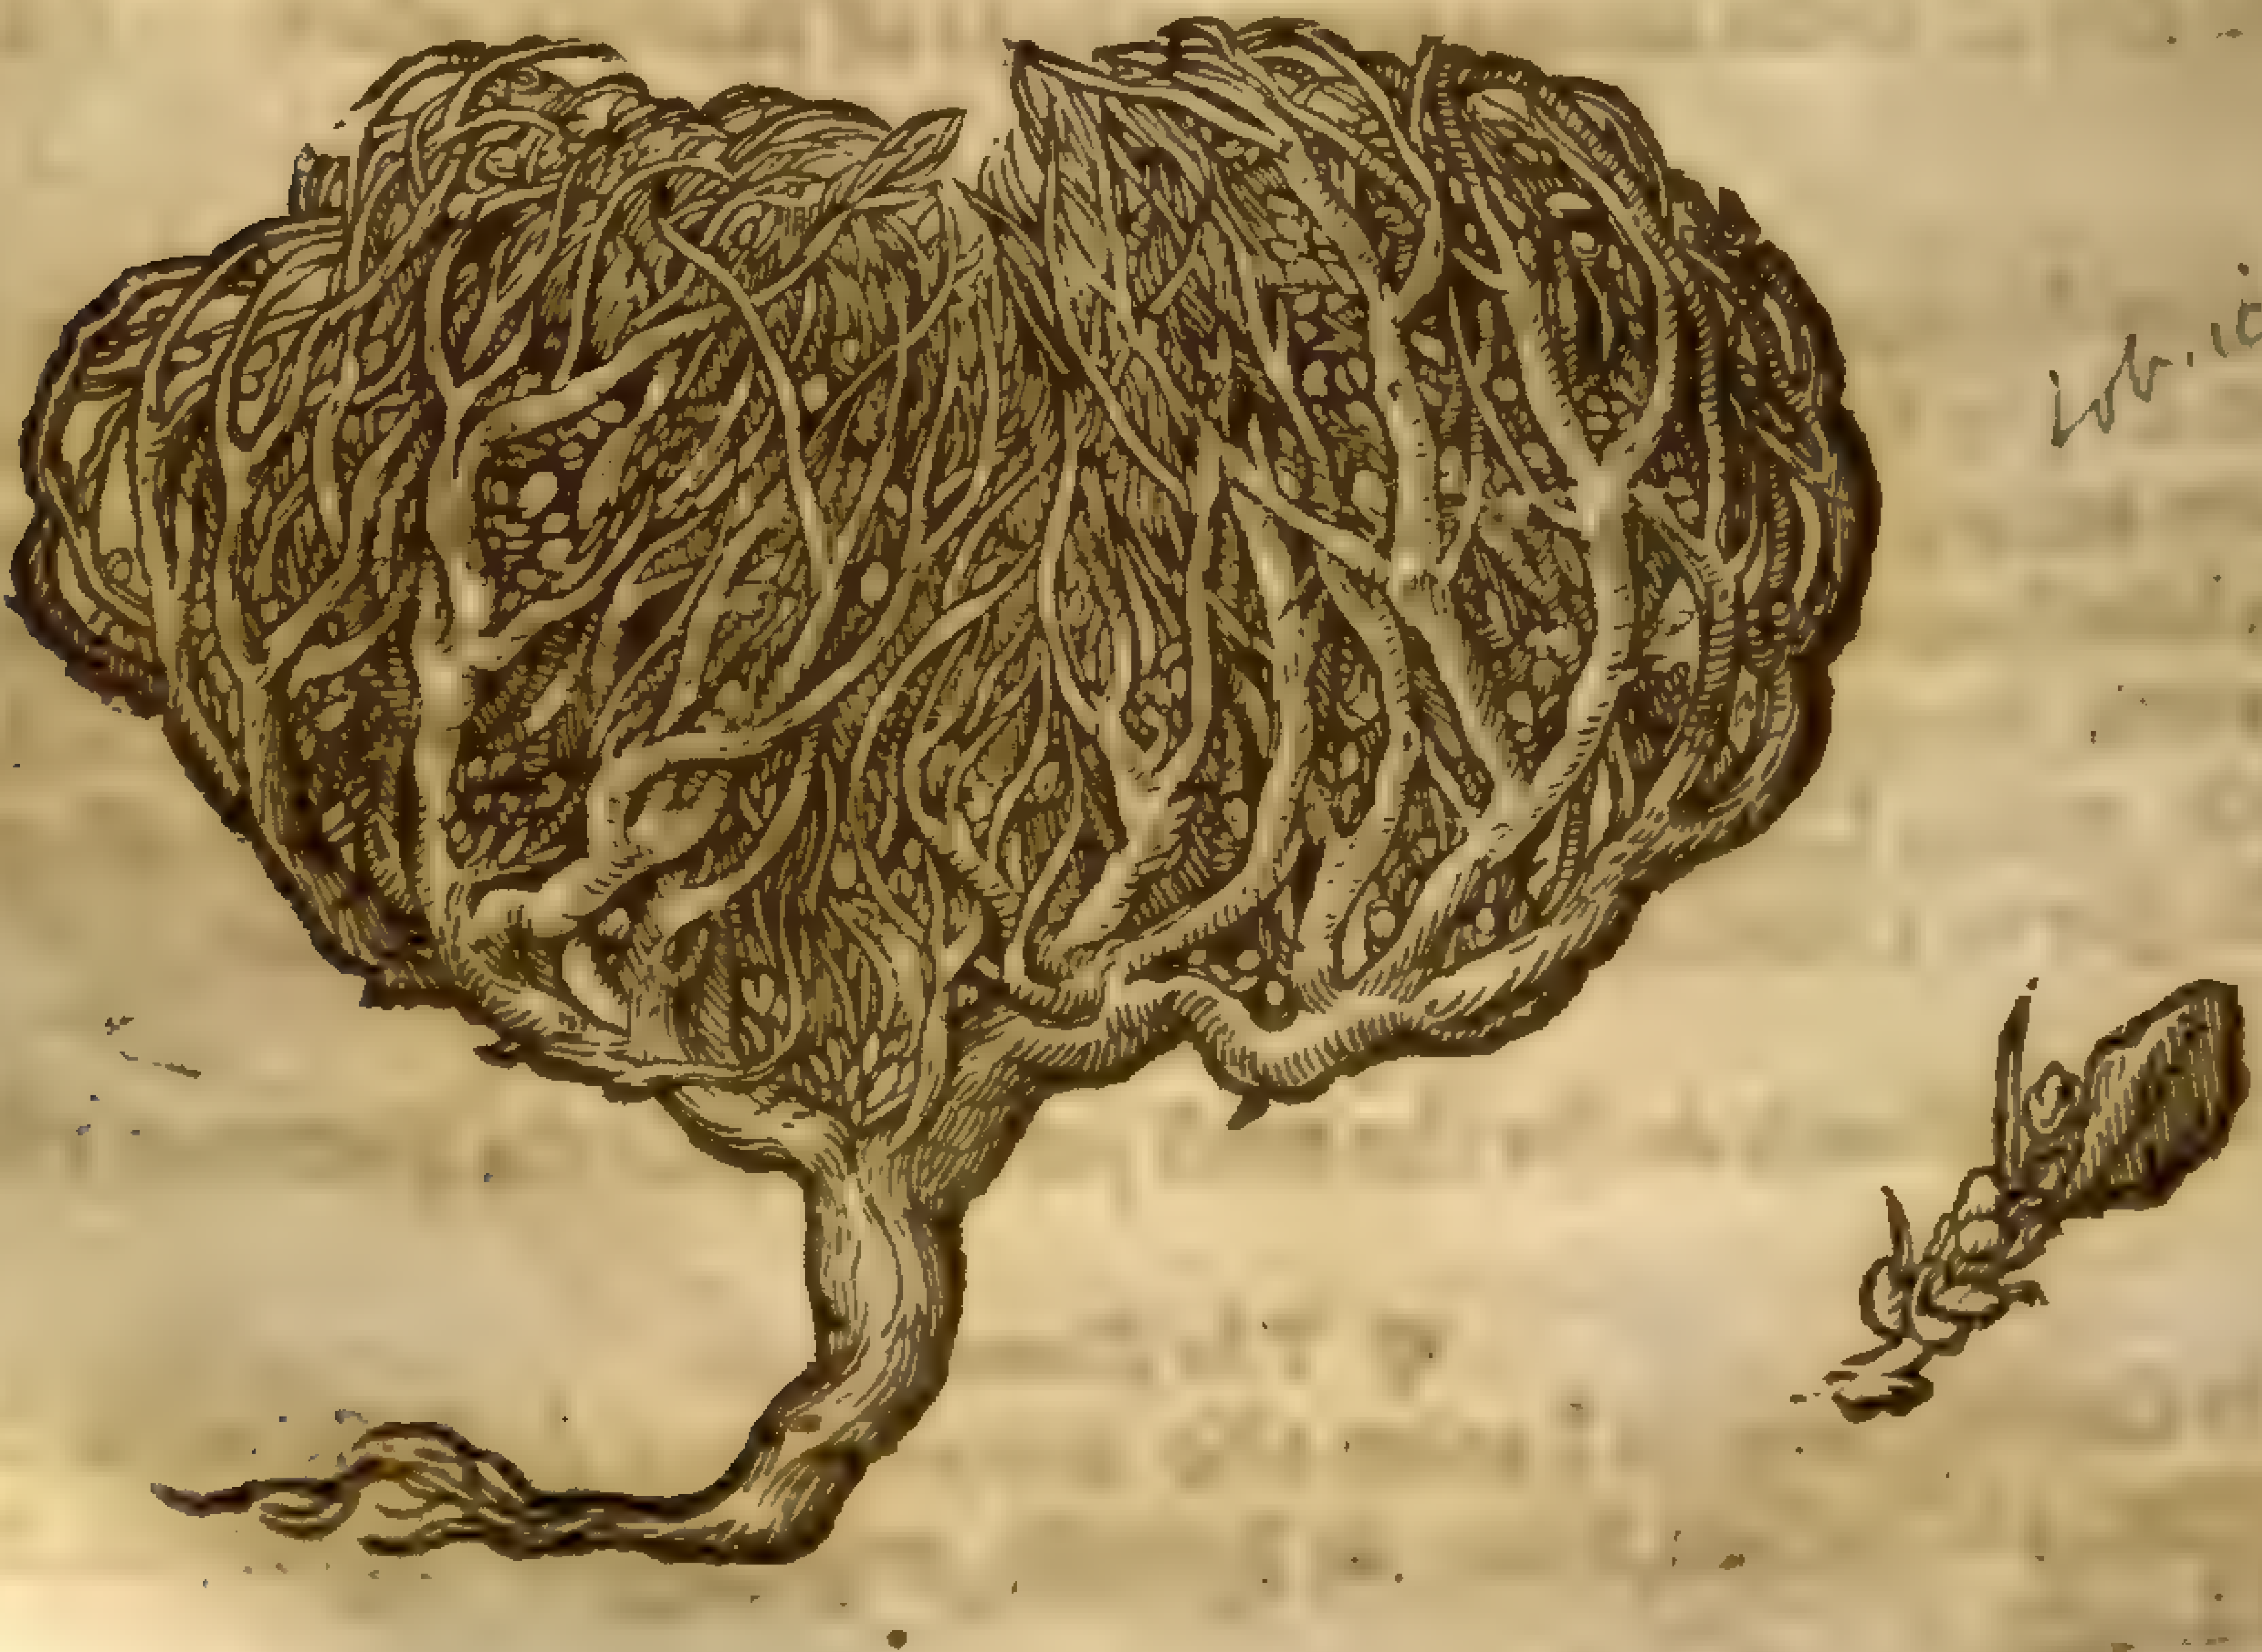
Lob. ic. 203



¶ *The Deſcription.*

1 This kinde of Heath which of the later writers hath beene called by the name *Roſa Hiericontea*; the coiner ſpoiled the name in the mint, for of all plants that haue bin written of, there is not any more vnlike vnto the Roſe, or any kinde thereof than this plant: what moued them thereto I know not: but thus much of my owne knowledge, it hath neither ſhape, nature, nor facultie agreeing with any Roſe; the which doubtleſſe is a kind of Heath, as the barren ſoile, and that among Heath, doth euidently ſhew, as alſo the Heathie matter wherewith the whole plant is poſſeſſed, agreeing with the kindes of Heath in very notable points. It riſeth vp out of the ground, of the height of four inches, or an hand breadth, compact or made of ſundry hard ſtickes, (which are the ſtalkes) claſping or ſhutting it ſelfe together into a round forme, intricately weauing it ſelfe one ſtick ouerthwart another, like a little net: vpon which wooddy ſticks do grow leaus not vnlike to thoſe of the Oliue tree, which maketh the whole plant of a round forme, and hollow within; among the leaues on the inſide grow ſmall moſſie floures, of a whitiſh herby colour, which

2 *Roſa Hiericontea ſiccata.* The Heath Roſe of Ierico dried.



Lob. ic. 203

turne into little ſeed, like the ſeed of Rocket, but leſſer: the whole plant is of the ſubſtance of heath, and wooddy.

2 The ſecond figure ſetteth forth the dried plant, as it is brought vnto vs from beyond the ſeas; which being ſet into a diſh of warme water, for halfe an houre, openeth it ſelfe in forme, as when it did grow, and taken forth vntill it be dry, returneth ſhut againe as before.

¶ *The Place.*

It groweth in the barren grounds of France, and other hot regions, among the Heath and ſuch like plants: it is a ſtranger in England, yet dried we haue them in great plenty. ‡ I haue not read nor heard that this growes wilde in France; but *Bellonius* ſaith it growes in Arabia *deſerta*: *Bauhine* ſaith it eaſily grew and flouriſhed many yeares in his garden at Baſill. ‡

¶ *The Time.*

The ſeed being ſowne in our cold climate, is ſowne in Aprill; it periſheth when it is ſprung vp, and bringeth neither floures nor ſeed.

¶ *The Names.*

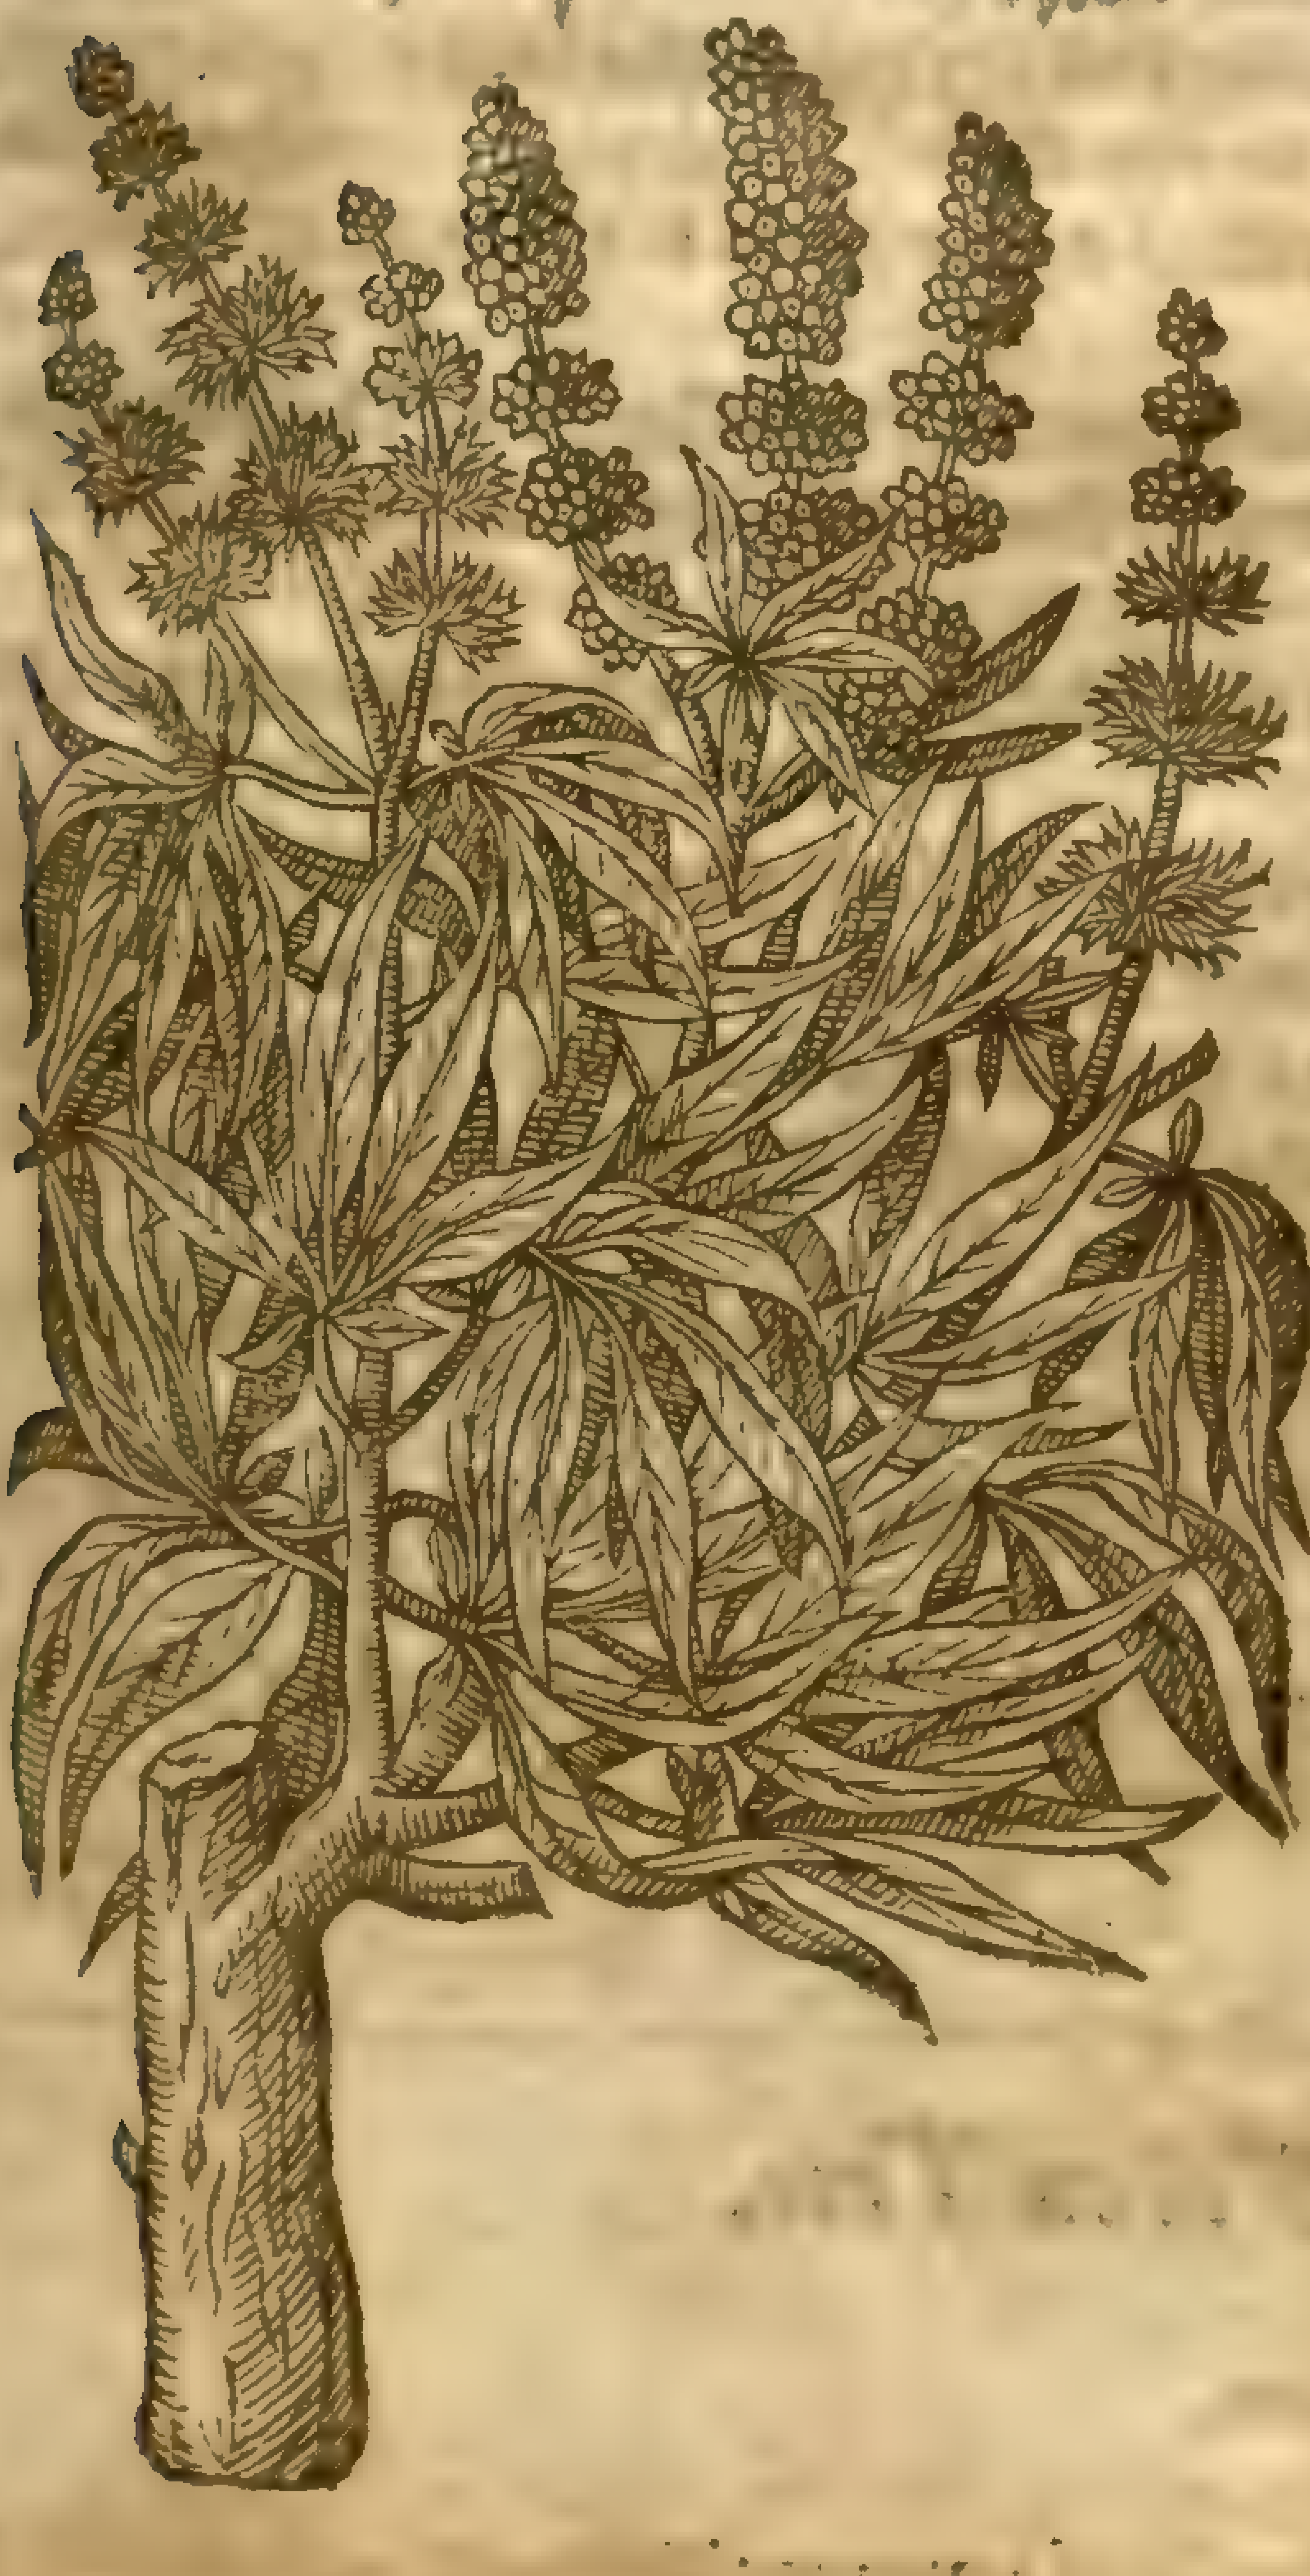
This kind of Heath is called *Roſa Hiericontea*, or *de Hiericho*, the Roſe of Ierico: of ſome, the Roſe of Ieruſalem, and alſo *Roſa Maria*: in Engliſh, the Heath Roſe.

¶ *The Temperature and Vertues.*

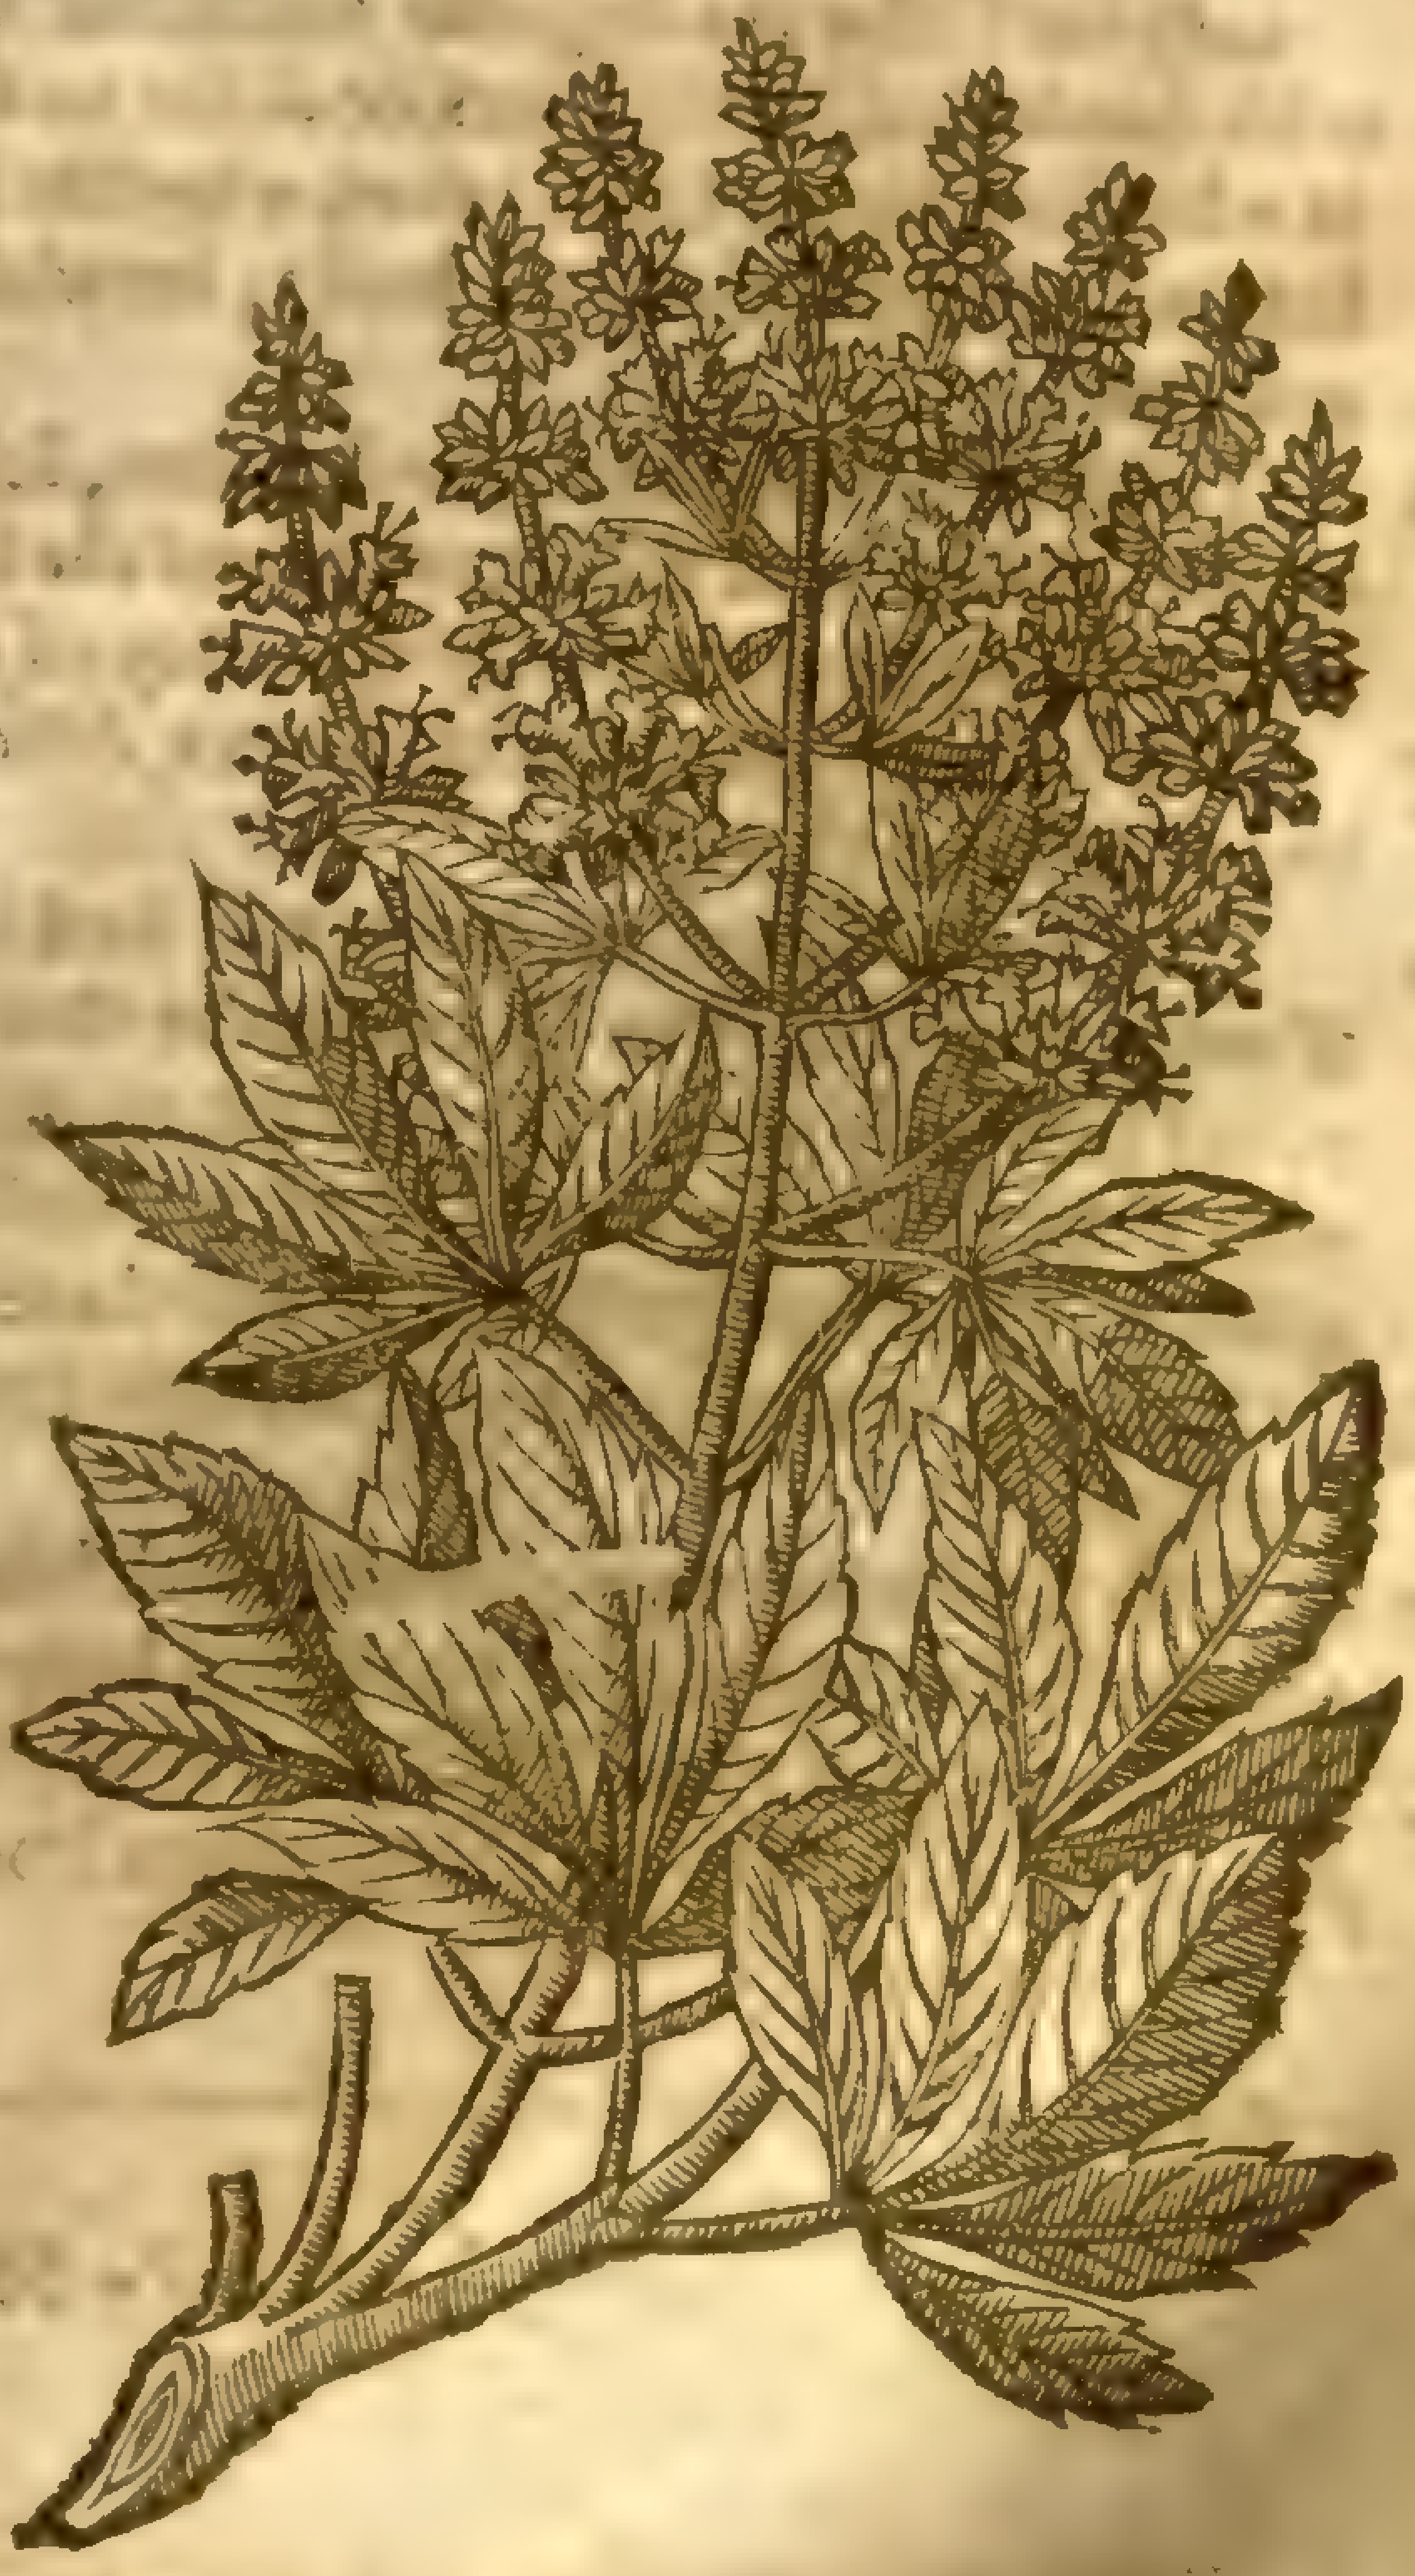
There is not any of the antient nor later writers that haue ſet downe any certainty of this plant as touching the temperature and faculties, but onely a bare picture with a ſlender deſcription.

Chap. 54. *Of the Chaſte tree.*

1 *Vitex, ſiue Agnus caſtus.*
The Chaſte tree.



‡ 2 *Vitex latiore ſerrato folio.*
Chaſte tree with cut leaues.



¶ *The*

¶ *The Deſcription.*

1 Vitex, or the Chaſte tree, groweth after the manner of a buſhie ſhrub or hedge tree, hauing many twiggie branches, very pliant and eaſie to be bent without breaking, like the Willow: the leaues are for the moſt part diuided into fiue or ſeuen ſections or diuiſions, much like the leaues of Hemp, whereof each part is long and narrow, very like vnto the willow leafe, but ſmaller: the floures do grow at the vppermoſt parts of the branches, like vnto ſpikie eares, cluſtering together about the branches, of a light purple or blew colour, and very ſweet ſmell: the fruit is ſmall and round, like vnto the graines or cornes of pepper.

‡ 2 *Lobel* mentions another variety hereof that differs from the former onely in that it hath broader leaues, and theſe alſo ſnipt about the edges. ‡

¶ *The Place.*

Vitex groweth naturally in Italy, and other hot regions, by water courſes and running ſtreames: I haue it growing in my garden.

¶ *The Time.*

Vitex beginneth to recouer his loſt leaues in May, and the floures come forth in Auguſt.

¶ *The Names.*

† The Grecians call this ſhrub ἄγνος, and λύγος: *Agnos* (i.) *Caſtus*, Chaſte: becauſe, ſaith *Pliny* in his 24. booke, 9. chapter, the Athenian Matrons in their feaſt called *Theſmophoria* dedicated to the honour of *Ceres*, deſirous to keepe themſelues chaſte, doe lay the leaues in their beds vnder them: the Latines name it *Vitex*, and of diuers it is termed, as wee finde among the baſtard and counterfeit names, ἄγνος: in Latine, *Salix marina*, or *Salix Amerina*, and *Piper Agreſte*: in high Dutch; **Schaffmulle, Keuſchbaum**: in low Dutch, and alſo of the Apothecaries, *Agnus Caſtus*: the Italians *Vitice*, *Agno caſto*: in Spaniſh, *Gattile caſto*: in Engliſh, Chaſte tree, Hempe tree, and of diuers, *Agnus caſtus*. ‡ The name *Agnus Caſtus* comes by confounding the Greeke name *Agnos* with *Caſtus*, the Latine interpretation thereof. ‡

¶ *The Temperature.*

The leaues and fruit of *Agnus caſtus* are hot and dry in the third degree: they are of very thinne parts, and waſte or conſume winde.

¶ *The Vertues.*

A *Agnus Caſtus* is a ſingular medicine and remedy for ſuch as would willingly liue chaſte, for it withſtandeth all vncleannes, or deſire to the fleſh, conſuming and drying vp the ſeed of generation, in what ſort ſoeuer it bee taken, whether in pouder onely, or the decoction drunke, or whether the leaues be carried about the body; for which cauſe it was called *Caſtus*; that is to ſay, chaſte, cleane, and pure.

B The ſeed of *Agnus Caſtus* drunken, driueth away, and diſſolueth all windineſſe of the ſtomacke, openeth and cureth the ſtoppings of the liuer and ſpleen; and in the beginning of dropſies, it is good to be drunke in wine to the quantity of a dram.

C The leaues ſtamped with butter, diſſolue and aſſwage the ſwelling of the genitories and cods, being applied thereto.

D The decoction of the herbe and ſeed is good againſt paine and inflammation about the matrix, if women be cauſed to ſit and bathe their priuie parts therein: the ſeed being drunke with Pennyroiall bringeth downe the menſes, as it doth alſo both in a fume and in a peſſarie: in a pultis it cureth the head-ache, the Phrenticke, and thoſe that haue the Lethargie are wont to be bathed herewith, oiſe and vineger being added thereto.

E The leaues vſed in a fume, and alſo ſtrowed, driue away ſerpents; and being laid on do cure their bitings.

F The ſeed laied on with water doth heale the clifts or rifts of the fundament; with the leaues, it is a remedy for lims out of joynt, and for wounds.

G It is reported that if ſuch as journey or trauell do carry with them a branch or rod of *Agnus Caſtus* in their hand, it will keepe them from Merry-galls, and wearineſſe: *Dioſcorides.*

Chap. 55. *Of the Willow Tree.*

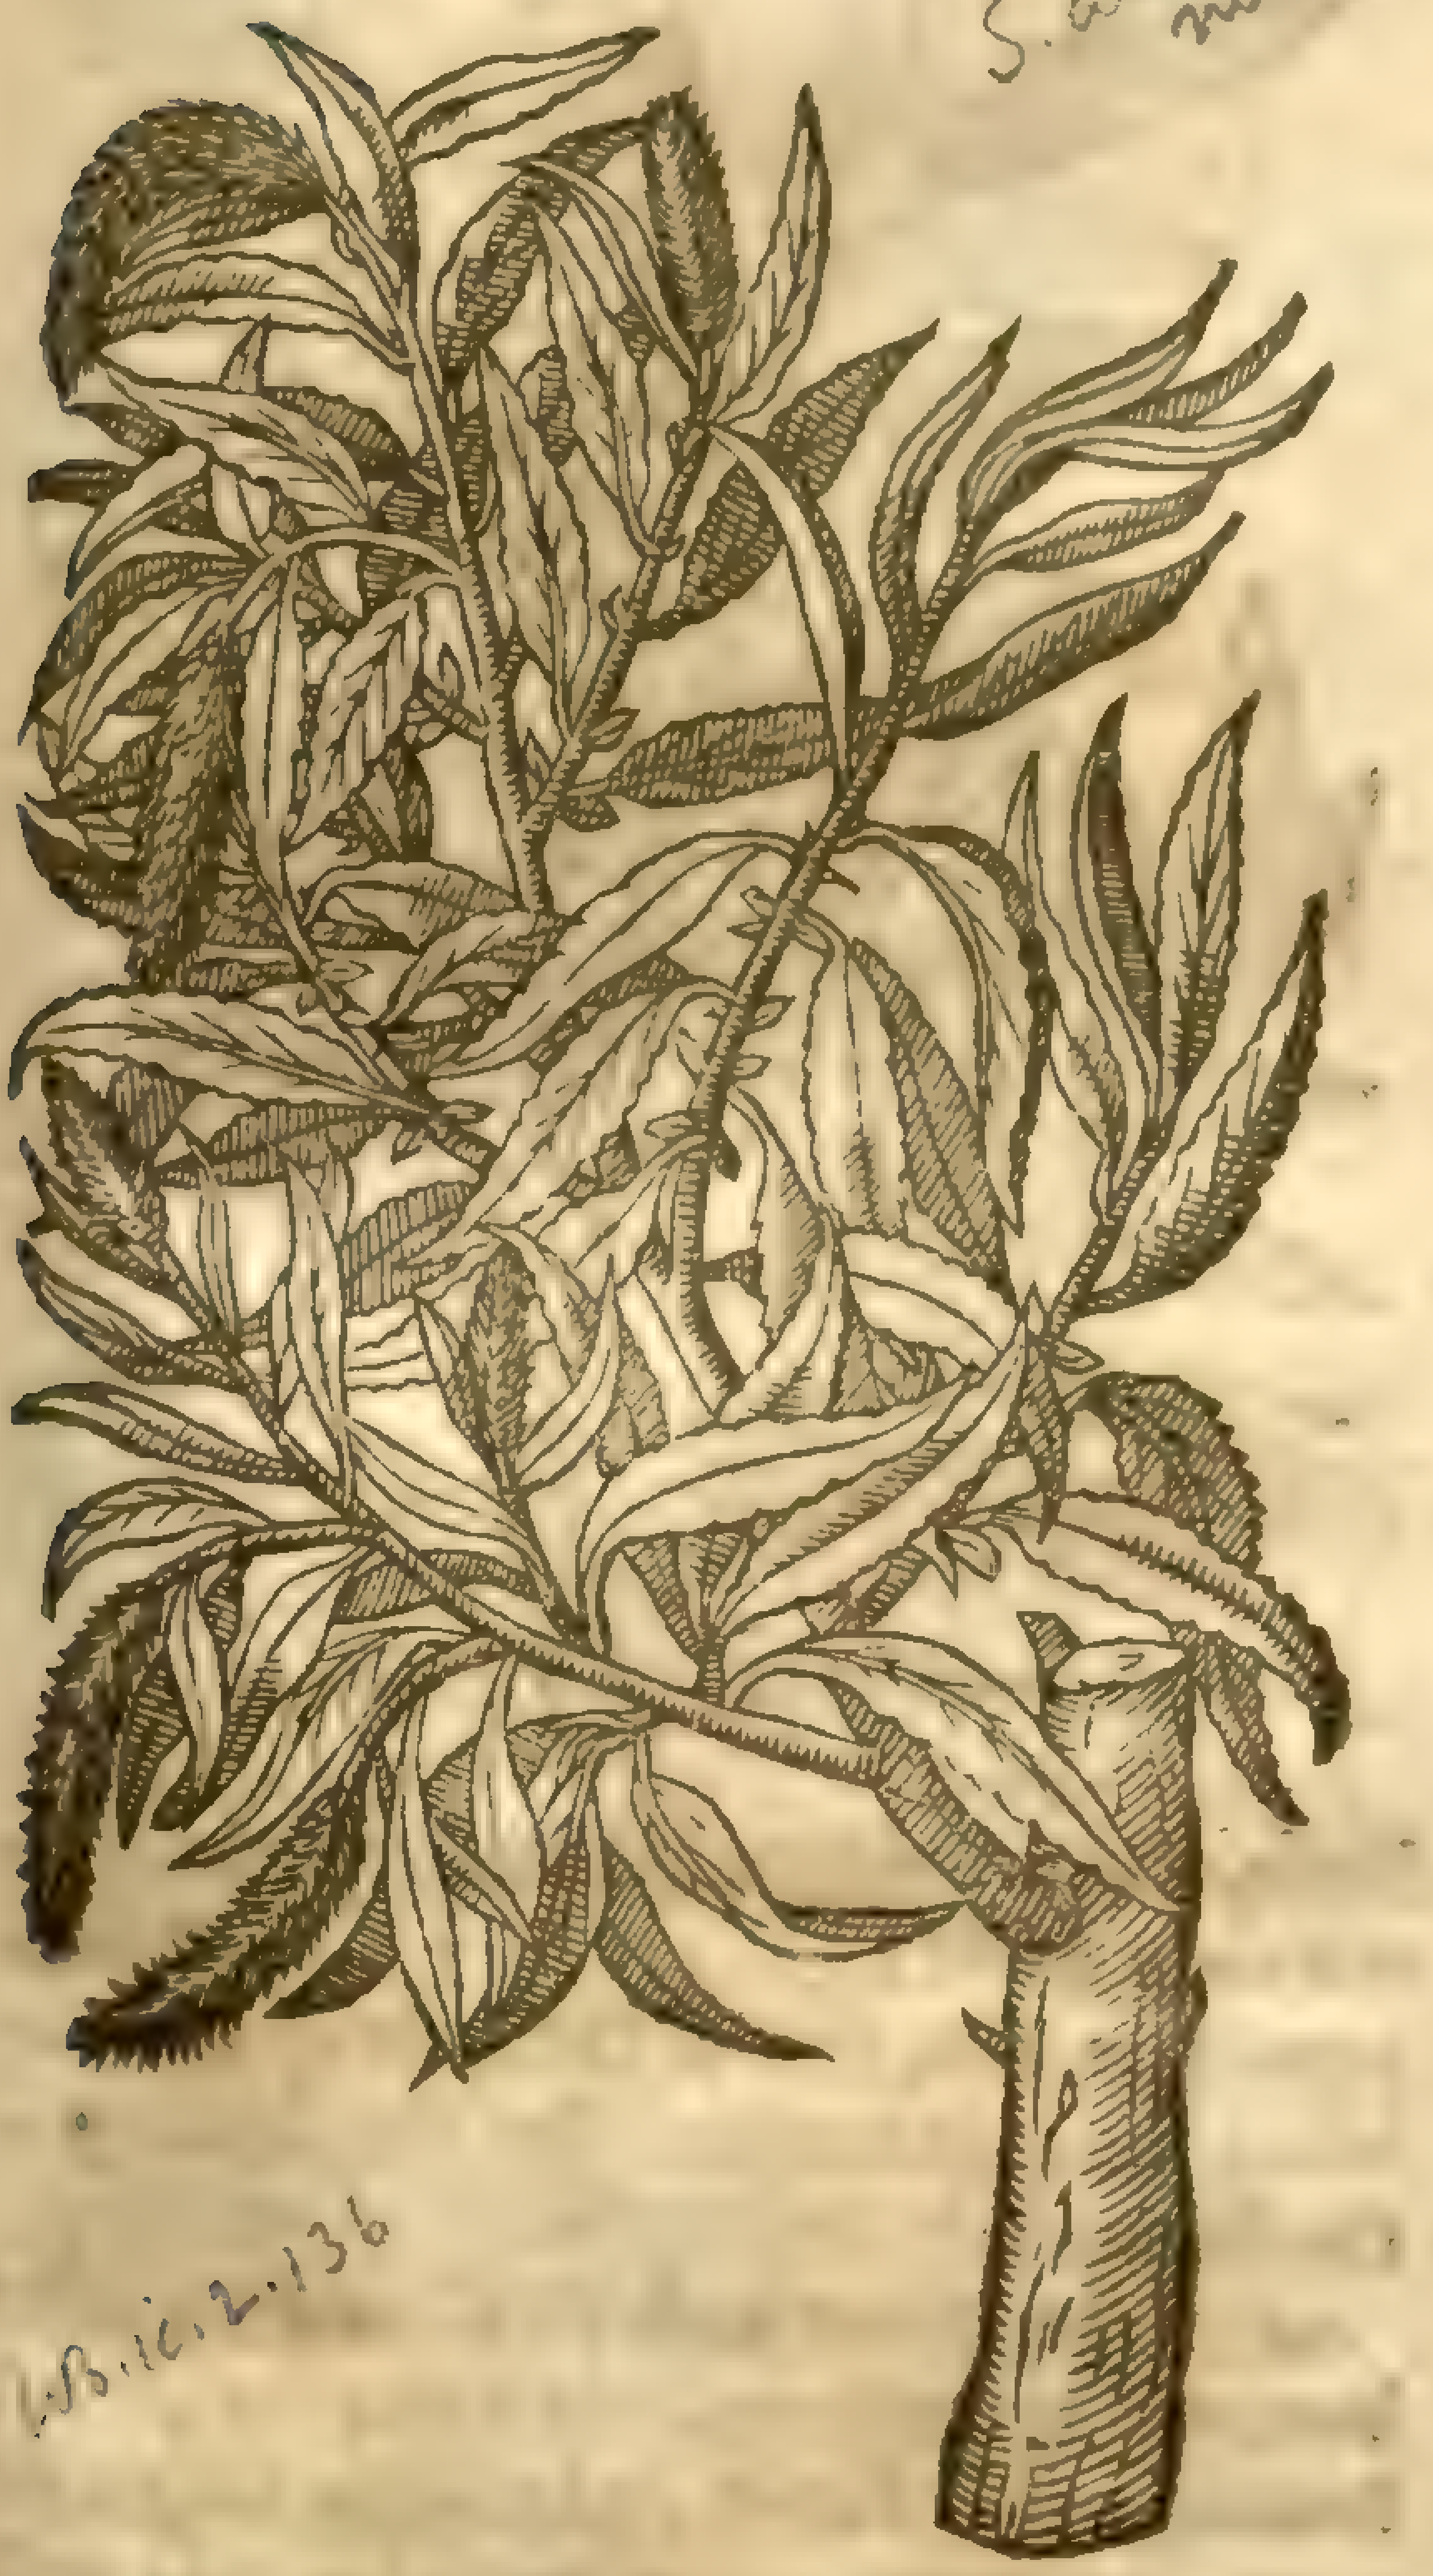
¶ *The Deſcription.*

1 The common Willow is an high tree, with a body of a meane thickneſſe, and riſeth vp as high as other trees doe if it be not topped in the beginning, ſoone after it is planted; the

barke thereof is ſmooth, tough, and flexible: the wood is white, tough, and hard to be broken: the leaues are long, leſſer and narrower than thoſe of the Peach tree, ſomewhat greene on the vpper ſide and ſlipperie, and on the nether ſide ſofter and whiter: the boughes be couered either with a purple, or elſe with a white barke: the catkins which grow on the toppes of the branches come firſt of all forth, being long and moſſie, and quickly turne into white and ſoft downe, that is carried away with the winde.

1 *Salix.*
The common Willow.

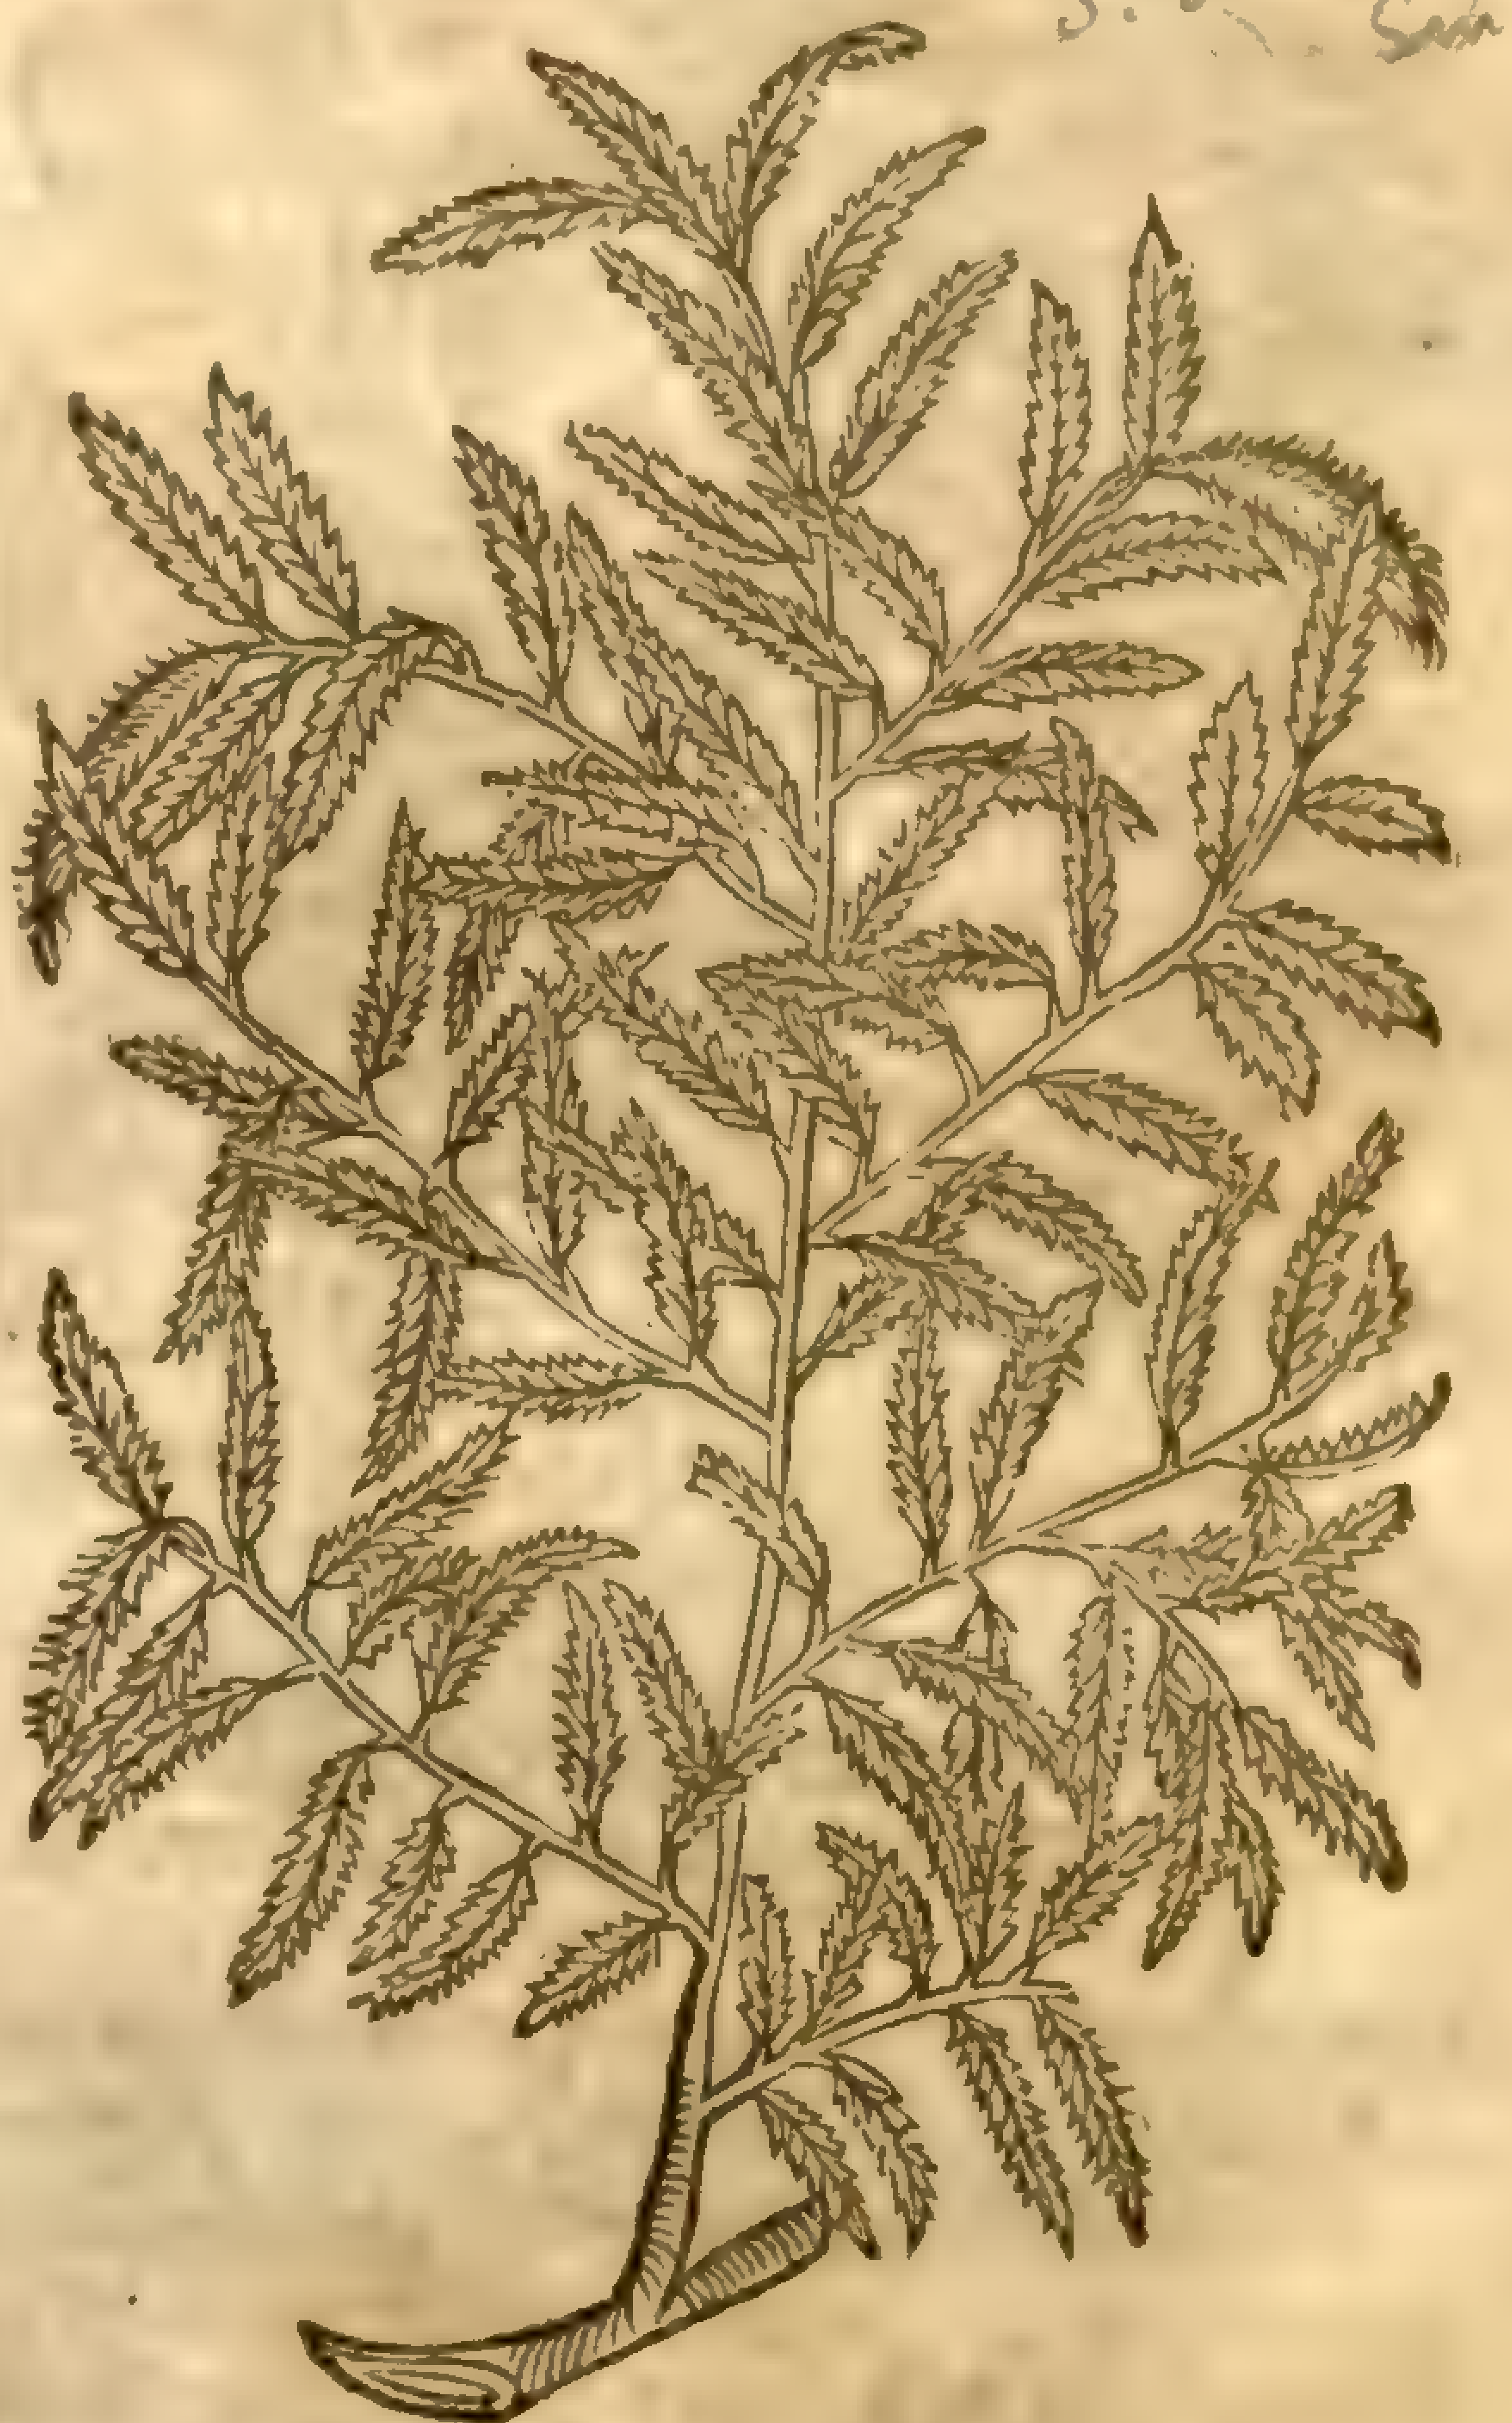
S. alba L. mill. dict.



J.B. 1. 2. 136

2 *Salix aquatica.*
The Oziar or water Willow.

S. viminalis L. Sm. fl. 4. 228



2 The leſſer bringeth forth of the head, which ſtandeth ſomewhat out, ſlender wands or twigs, with a reddiſh or greene barke, good to make baskets and ſuch like workes of: it is planted by the twigs or cods being thruſt into the earth, the vpper part whereof when they are growne vp, is cut off, ſo that which is called the head increaſeth vnder them, from whence the ſlender twigs doe grow, which being oftentimes cut, the head waxeth greater: many times alſo the long rods or wands of the higher Withy trees be lopped off and thruſt into the ground for plants, but deeper, and aboue mans height: of which do grow great rods, profitable for many things, and commonly for bands, wherewith tubs and casks are bound.

3 The Sallow tree or Goats Willow, groweth to a tree of a meane bigneſſe: the trunke or body is ſoft and hollow timber, couered with a whitiſh rough barke: the branches are ſet with leaues ſomewhat rough, greene aboue, and hoarie vnderneath: among which come forth round catkins, or aglets that turne into downe, which is carried away with the winde.

4 This other Sallow tree differeth not from the precedent, but in this one point, that is to ſay, the leaues are greater and longer, and euery part of the tree larger, wherein is the difference. ‡ Both thoſe laſt deſcribed hath little roundiſh leaues like little eares growing at the bottoms of the footſtalkes of the bigger leaues, whereby they may bee diſtinguiſhed from all other Plnats of this kinde. ‡

5 The Roſe Willow groweth vp likewiſe to the height and bigneſſe of a ſhrubby tree; the body whereof is couered with a ſcabby rough barke: the branches are many, whereupon do grow very many twigs of a reddiſh colour, garniſhed with ſmall long leaues, ſomewhat whitiſh: amongſt which come forth little floures, or rather a multiplication of leaues, joyned together in forme of a

Roſe, of a greeniſh white colour, which doe not only make a gallant ſhew, but alſo yeeld a moſt cooling aire in the heat of Summer, being ſet vp in houſes, for the decking of the ſame.

6 The low or baſe Willow growes but low, and leaneth weakely vpon the ground, hauing many ſmall and narrow leaues, ſet vpon limber and pliant branches, of a darke or blackiſh greene colour: amongſt which come forth long ſlender ſtems full of Moſſie floures, which turne into a light downy ſubſtance that flieth away with the winde.

7 The dwarfe Willow hath very ſmall and ſlender branches, ſeldome times aboue a foot, but neuer a cubit high, couered with a duskie barke, with very little and narrow leaues, of a greene colour aboue, and on the vpper ſide, but vnderneath of a hory or ouerworne greeniſh colour, in bigneſſe and faſhion of the leaues of garden Flax: among which come forth little duskiſh floures, which doe turne into downe that is carried away with the winde: the root is ſmall and threddy, of the bigneſſe of a finger, and of a blackiſh colour.

8 There is another kinde of willow like to the former, and differeth from it in that, the leaues of this kinde are ſmaller and narrower, as big as the leaues of Myrtle, hauing ſmall knobby floures of a duskiſh colour, which

which turne into downe that flyeth away with the winde: the root is ſmall and limber, not growing deepe, but running along vpon the vpper cruſt of the earth.

¶ *The Place.*

Theſe Willowes grow in diuers places of England: the Roſe-Willow groweth plentifully in Cambridge ſhire, by the riuers and ditches there in Cambridge towne they grow abundantly about the places called Paradiſe and Hell-mouth, in the way from Cambridge to Grandcheſter: I found the dwarfe Willowes growing neere to a bog or mariſh ground at the further end of Hampſted heath vpon the declining of the hill, in the ditch that incloſeth a ſmall Cottage there, not halfe a furlong from the ſaid houſe or cottage.

¶ *The Time.*

The Willowes doe floure at the beginning of the Spring.

¶ *The Names.*

The Willow tree is called in Greeke ἰτέα, in Latine, *Salix*: in high Dutch, **Weyden**: in low Dutch, **Wilgen**: in Italian, *Salice*, *Salcio*: in French, *Saux*: in Spaniſh, *Salgueiro*, *Salzer*, and *Sauz*: in Engliſh, Sallow, Withie, and Willow.

The greater is called in Latine *Salix perticalis*, common Withy, Willow, and Sallow, eſpecially that which being often lopped ſendeth out from one head many boughes: the kinde hereof with the red barke is called of *Theophraſtus*, blacke Withy; and the other white: *Pliny* calleth the blacke *Græca*, or Greeke Withie (the red, being the Greeke Withy) ſaith he, is eaſie to be cleft, and the whiter, *Amerina*.

Theophraſtus writeth, That the Arcadians doe call the leſſer Ἑλίκη, not Ἰτέα: *Pliny* alſo nameth this *Helice*: both of them doe make this to be *Salicis tertia ſpecies*, the third kinde of Sallow: the ſame is likewiſe called in Latine, *Salix pumila*, *Salix viminalis*, *Gallica Salix*; and by *Columella*, *Sabina*, which he ſaith that many doe terme *Amerina*: in high Dutch, **Kleyn Weyden**: in low Dutch, **Wijmen**: in Engliſh, Oſier, ſmall Withy, Twig Withy: *Petrus Creſcentius* nameth it *Vincus*.

¶ *The Temperature.*

The leaues, floures, ſeed, and barke of Willowes are cold and dry in the ſecond degree, and aſtringent.

¶ *The Vertues.*

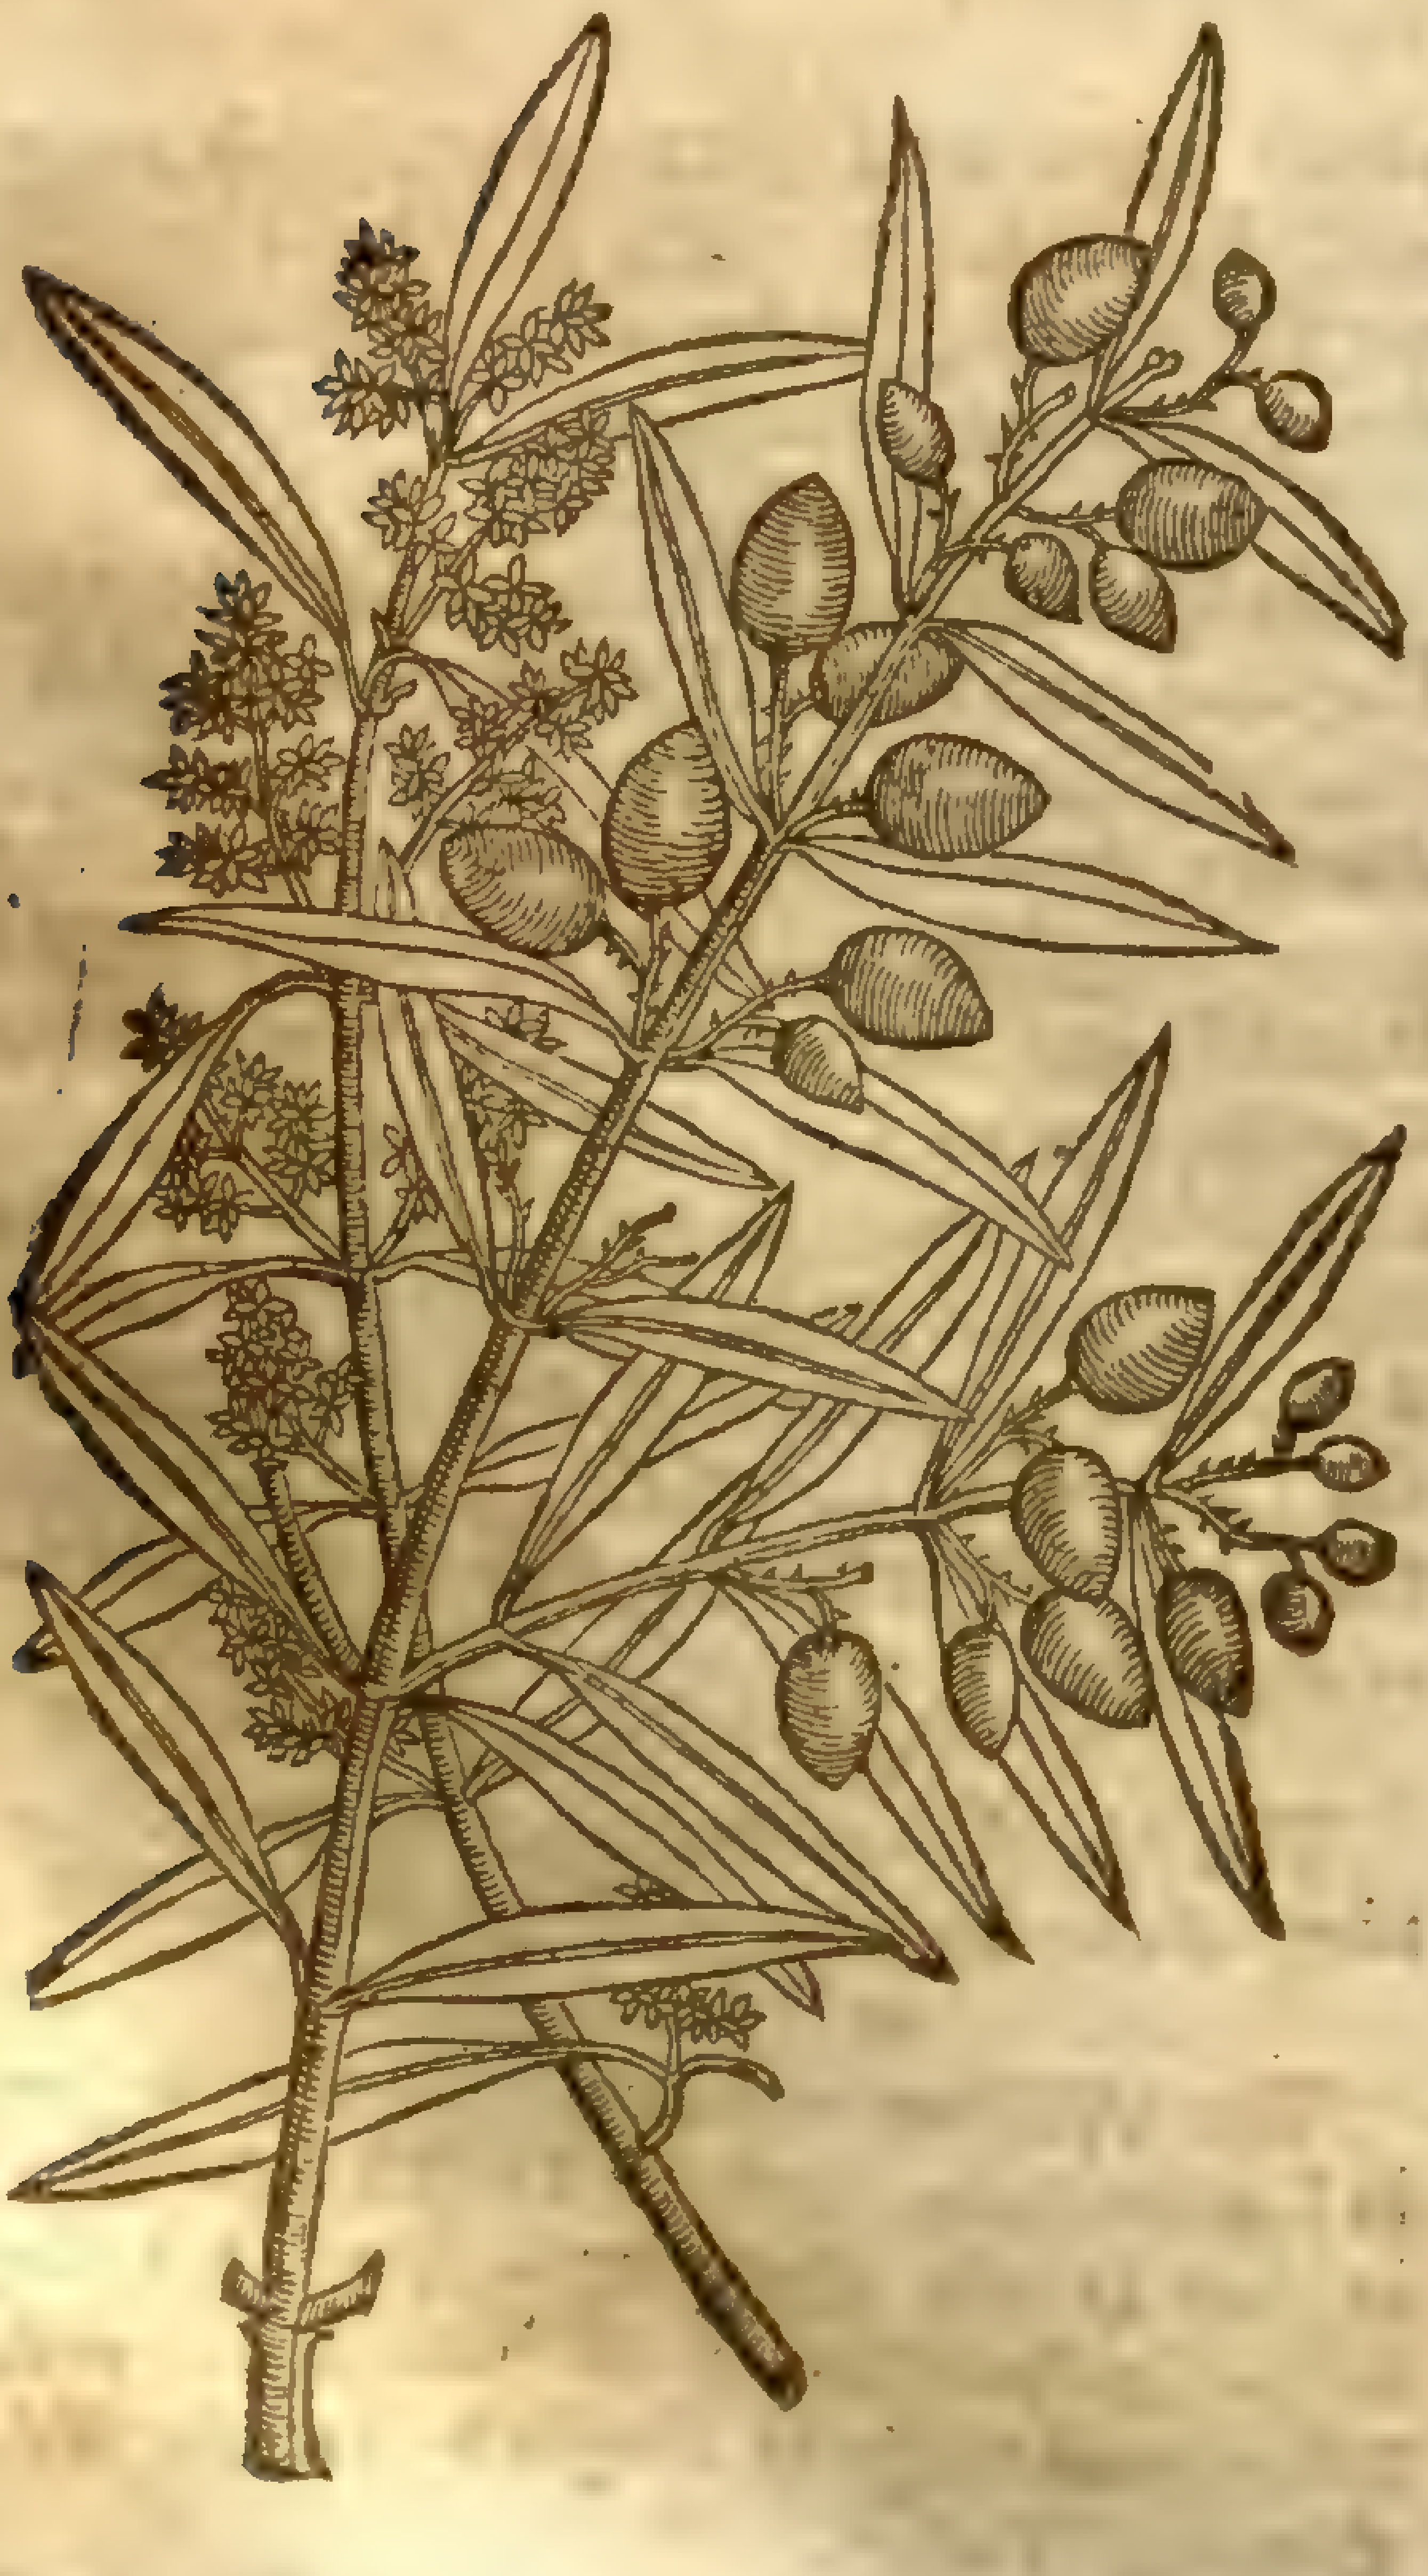
A The leaues and barke of Withy or Willowes do ſtay the ſpitting of bloud, and all other fluxes of bloud whatſoeuer in man or woman, if the ſaid leaues and barke be boyled in wine and drunke.

B The greene boughes with the leaues may very well be brought into chambers and ſet about the beds of thoſe that be ſicke of feuers, for they doe mightily coole the heate of the aire, which thing is a wonderfull refreſhing to the ſicke Patients.

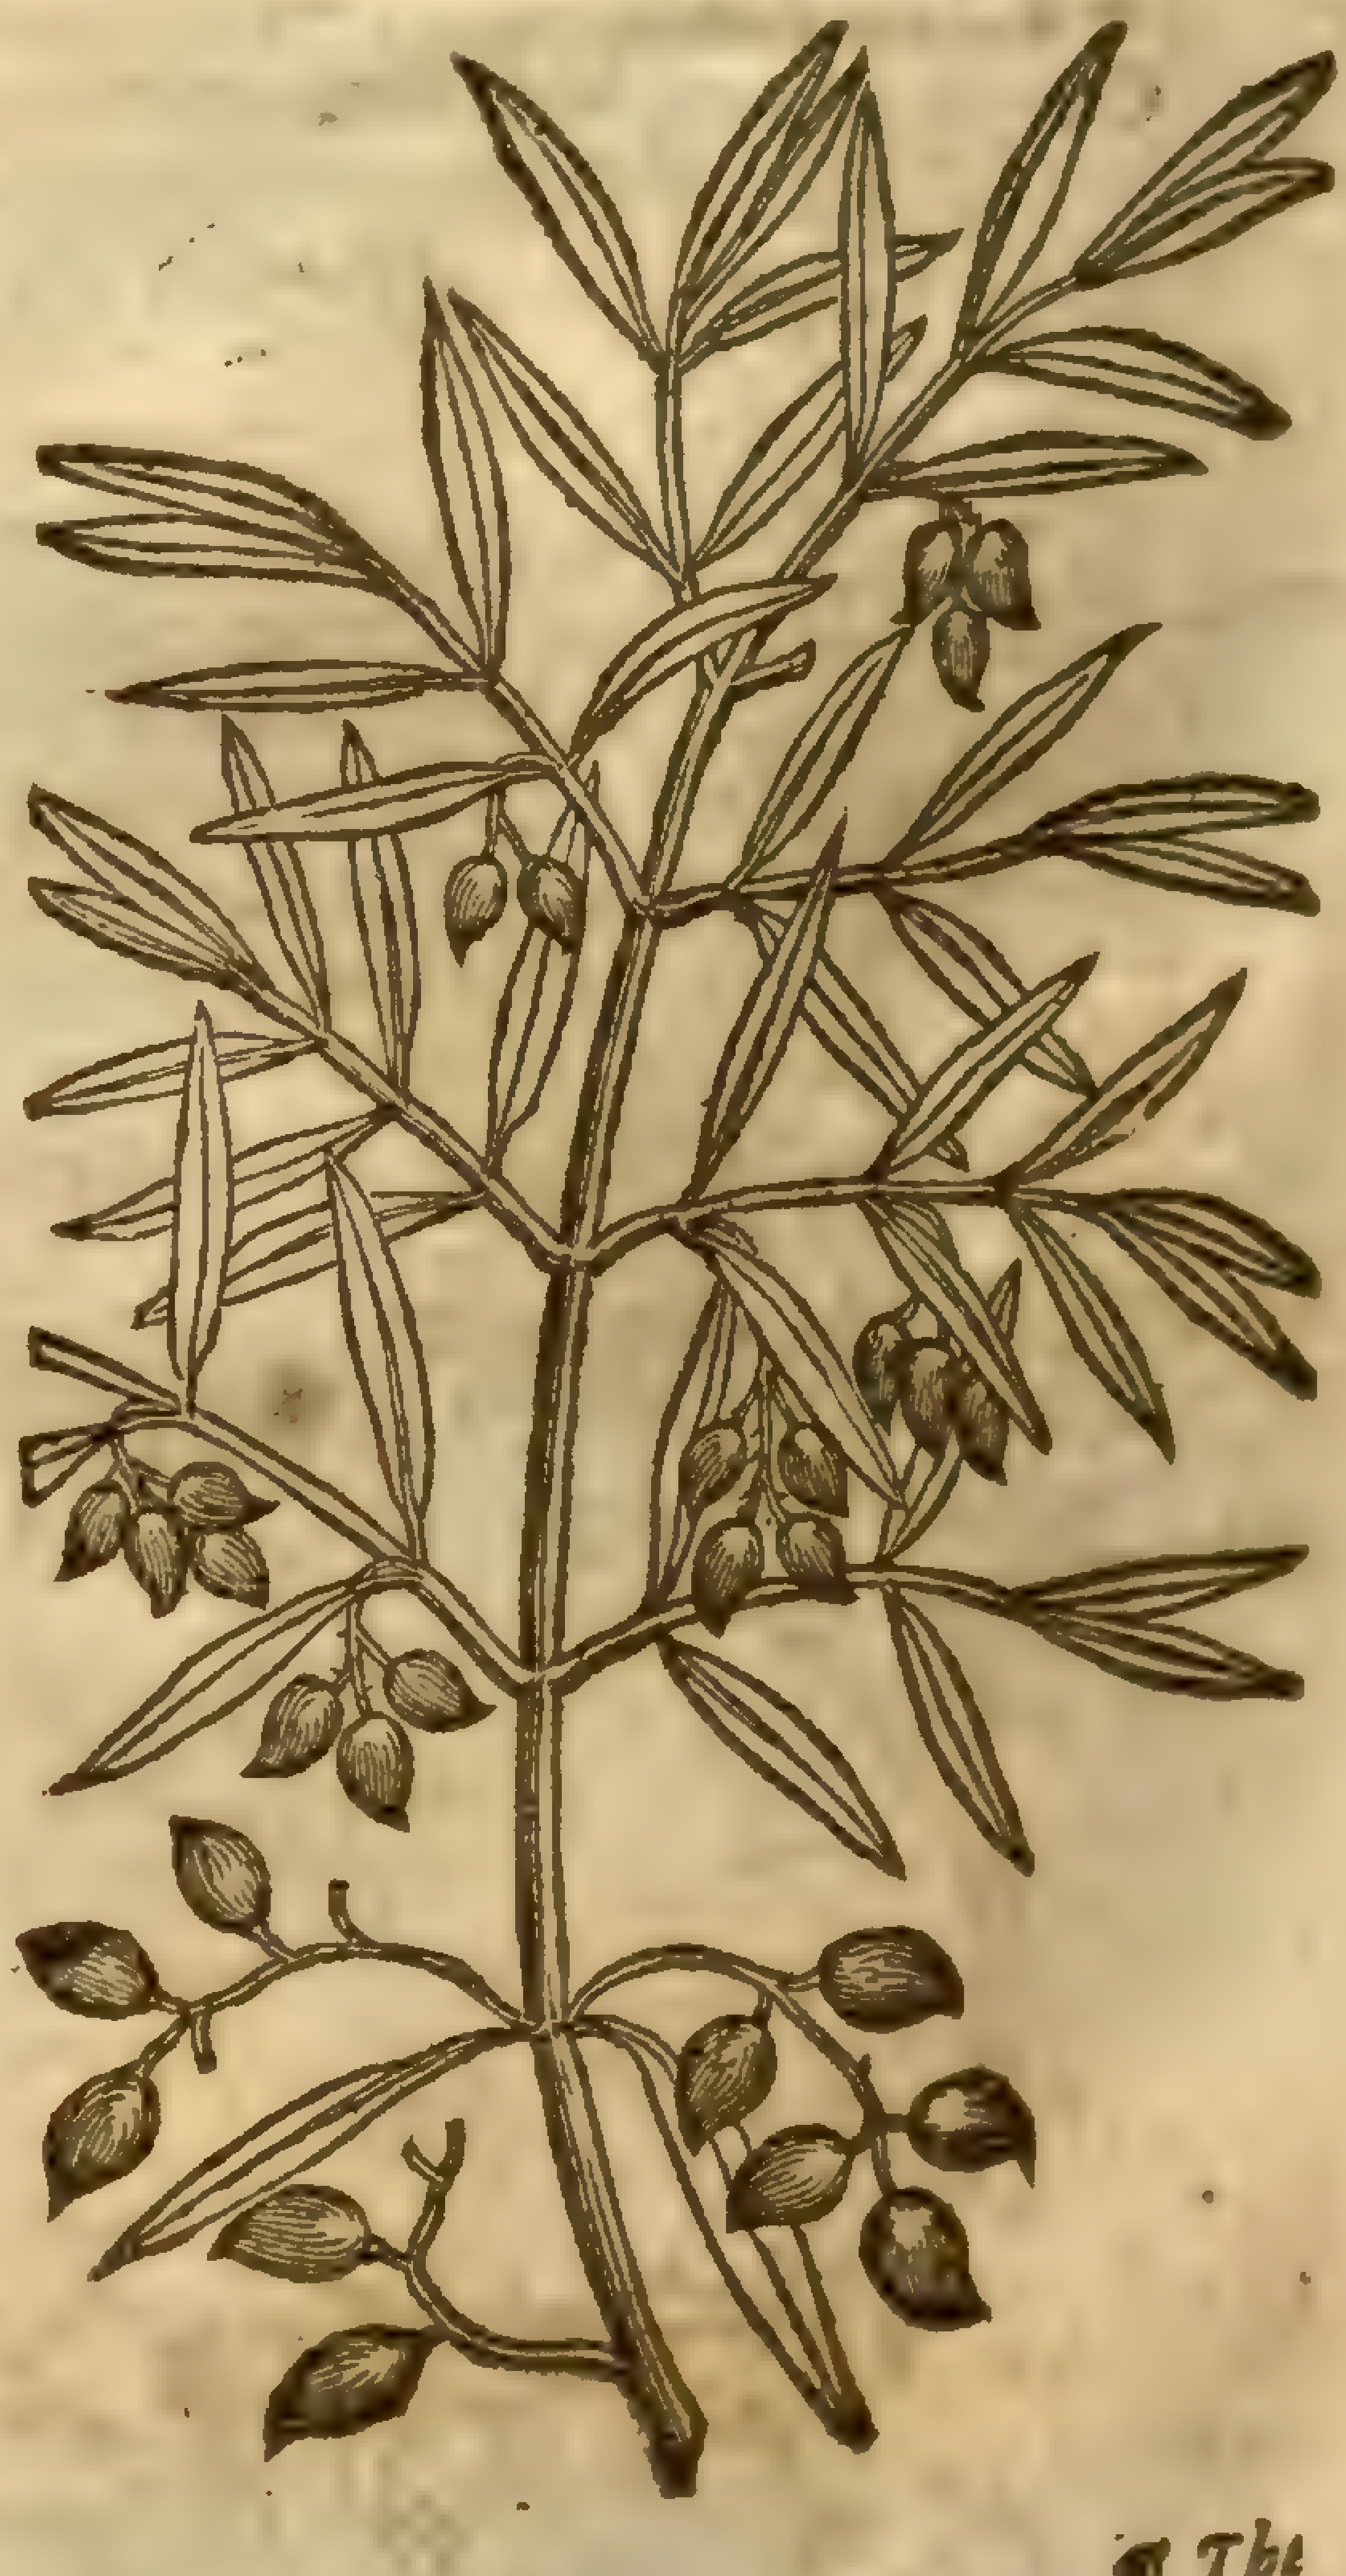
C The barke hath like vertues: *Dioſcorides* writeth, That this being burnt to aſhes, and ſteeped in vineger, takes away cornes and other like riſings in the feet and toes: diuers, ſaith *Galen*, doe ſlit the barke whileſt the Withy is in flouring, and gather a certain juyce with which they vſe to take away things that hinder the ſight, and this is when they are conſtrained to vſe a clenſing medicine of thin and ſubtill parts.

Chap. 56. *Of the Oliue tree.*

1 *Olea ſatiua.*
The manured Oliue tree.



2 *Olea ſylueſtris.*
The wilde Oliue tree.



¶ The

¶ *The Deſcription.*

1 The tame or manured Oliue tree groweth high and great with many branches, full of long narrow leaues not much vnlike the leaues of Willowes, but narrower and ſmaller: the floures be white and very ſmall, growing vpon cluſters or bunches: the fruit is long and round, wherein is an hard ſtone: from which fruit is preſſed that liquor which we call oyle Oliue.

2 The wilde Oliue is like vnto the tame or garden Oliue tree, ſauing that the leaues are ſomething ſmaller: among which ſometimes doe grow many prickly thornes: the fruit hereof is leſſer than of the former, and moe in number, which do ſeldome come to maturity or ripenes in ſo much that the oile which is made of thoſe berries, continueth euer greene, and is called oile Omphacine, or oile of vnripe Oliues.

¶ *The Place.*

Both the tame and the wilde Oliue trees grow in very many places of Italy, France, and Spaine, and alſo in the Iſlands adjoyning: they are reported to loue the ſea coaſts; for moſt doe thinke, as *Columella* writeth, that aboue ſixty miles from the ſea they either die, or elſe bring forth no fruit: but the beſt, and they that doe yeeld the moſt pleaſant oile are thoſe that grow in the Iſland called Candy.

¶ *The Time.*

All the Oliue trees floure in the moneth of Iune: the fruit is gathered in Nouember or December: when they be a little dried and begin to wrinkle they are put into the preſſe, and out of them is ſqueezed oyle, with water added in the preſſing: the Oliues which are to bee preſerued in ſalt and pickle muſt be gathered before they be ripe, and whileſt they are greene.

¶ *The Names.*

The tame or garden Oliue tree is called in Greeke Ἐλαία, and Ἐλαία ἥμερος: in Latine, *Olea ſatiua*, and *Vrbana*: in high Dutch, **Oelbaum**: in low Dutch, **Olijfboome**: in Italian, *Oliuo domeſtico*: in French, *Oliuier*: in Spaniſh, *Oliuo*, and *Oliuera*: in Engliſh, Oliue tree.

The berry is called *Oliua*: in Greeke alſo ἐλαία: in Spaniſh, *Azeytuna*: in French, Dutch, and Engliſh, Oliue.

Oliues preſerued in brine or pickle are called *Colymbades*.

The wilde Oliue tree is named in Greeke, Ἀγριελαία: in Latine, *Olea ſylueſtris*, *Oleaſter*, *Cotinus*, *Olea Æthiopica*: in Dutch, **Wald Oelbaum**: in Italian, *Oliuo ſaluatico*: in Spaniſh, *Azebuche*, *Azambulbeyro*: in French, *Oliuier ſauuage*: in Engliſh, wilde Oliue tree.

¶ *The Temperature and Vertues.*

The Oliues which be ſo ripe as that either they fall of themſelues, or be ready to fall, which are named in Greeke, δρυπεπεῖς, be moderately hot and moiſt, yet being eaten they yeeld to the body little nouriſhment. A

The vnripe Oliues are dry and binding. B

Thoſe that are preſerued in pickle, called *Colymbades*, doe dry vp the ouermuch moiſture of the ſtomacke, they remoue the loathing of meate, ſtirre vp an appetite; but there is no nouriſhment at all that is to be looked for in them, much leſſe good nouriſhment. C

The branches, leaues, and tender buds of the Oliue tree doe coole, dry, and binde, and eſpecially of the wild Oliue; for they be of greater force than thoſe of the tame: therefore by reaſon they be milder they are better for eye medicines, which haue need of binding things to be mixed with them. D

The ſame do ſtay S. Anthonies fire, the ſhingles, epinyctides, night wheales, carbuncles, and eating vlcers: being laid on with honey they take away eſchares, clenſe foule and filthy vlcers, and quench the heate of hot ſwellings, and be good for kernels in the flanke: they heale and skin wounds in the head, and being chewed they are a remedy for vlcers in the mouth. E

The juyce and decoction alſo are of the ſame effect: moreouer the juyce doth ſtay all manner of bleedings, and alſo the whites. F

The juyce is preſſed forth of the ſtamped leaues, with Wine added thereto (which is better) or with water, and being dried in the Sun it is made vp into little cakes like perfumes. G

The ſweat or oyle which iſſueth forth of the wood whileſt it is burning healeth tetters, ſcurfs and ſcabs, if they be annointed therewith. H

The ſame which is preſſed forth of the vnripe Oliues is as cold as it is binding. I

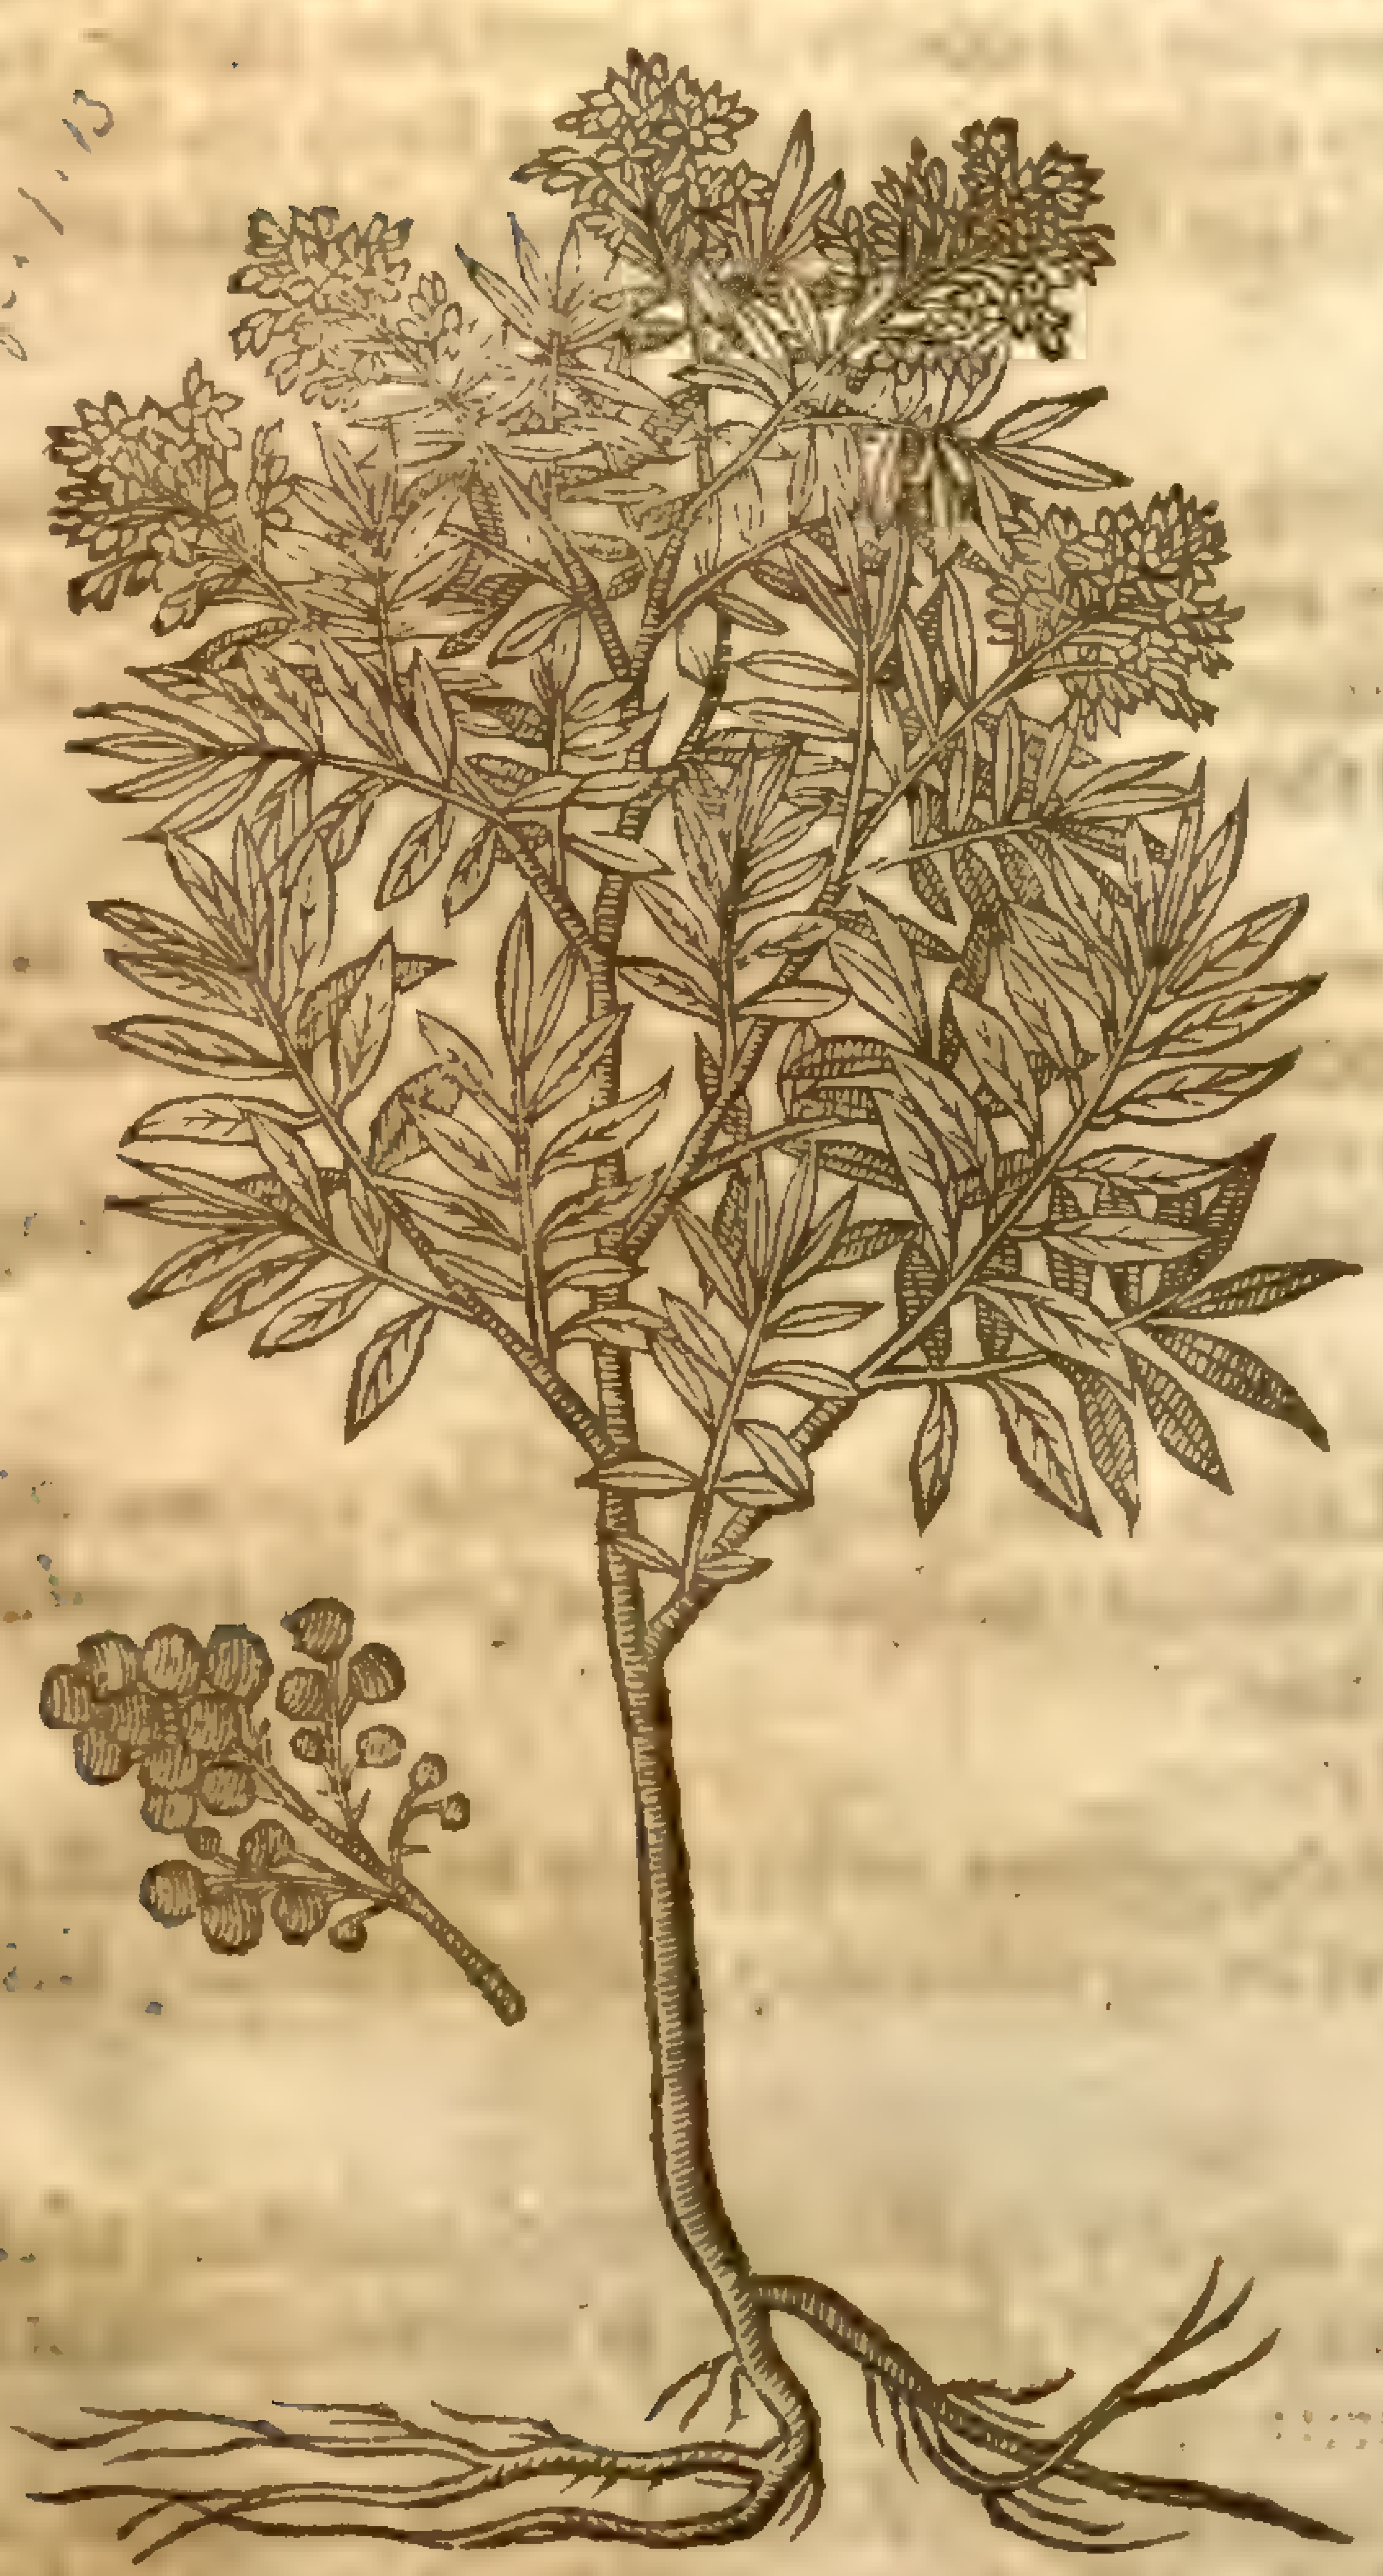
The old oile which is made of ſweet and ripe Oliues, being kept long, doth withall become hotter, and is of greater force to digeſt or waſte away; and that oile which was made of the vnripe Oliue, being old, doth as yet retaine ſome part of his former aſtriction, and is of a mixt faculty, that is to ſay, partly binding, and partly digeſting; for it hath got this digeſting or conſuming faculty by age, and the other property of binding of his owne nature. K

L The oile of ripe Oliues mollifieth and aſſwageth paine, diſſolueth tumors or ſwellings, is good for the ſtiffeneſſe of the joynts, and againſt cramps, eſpecially being mingled according to art, with good and wholeſome herbes appropriate vnto thoſe diſeaſes and griefes, as *Hypericon*, Cammomill, Dill, Lillies, Roſes, and many others, which do fortifie and increaſe his verrues.

M The oile of vnripe Oliues, called *Omphacinum Oleum*, doth ſtay, repreſſe, and driue away the beginning of tumors and inflammations, cooling the heate of burning vlcers and exulcerations.

CHAP. 57. *Of Priuet or Prim Print.*

Liguſtrum.
Priuet, or Prim Print.



L. vulgare L. [illegible] Sm. [illegible] 1,13

¶ *The Deſcription.*

PRiuet is a ſhrub growing like a hedge tree, the branches and twigs hereof be ſtraight, and couered with ſoft gliſtring leaues of a deepe green colour, like thoſe of Peruincle, but yet longer, greater alſo than the leaues of the Oliue tree: the floures be white, ſweet of ſmell, very little, growing in cluſters; which being vaded there ſucceed cluſters of berries, at the firſt greene, and when they be ripe blacke like a little cluſter of grapes, which yeeld a purple juyce: the root groweth euery way aſlope.

¶ *The Place.*

The common Priuet groweth naturally in euery wood, and in the hedge rowes of our London gardens: it is not found in the countrey of Polonia and other parts adjacent.

¶ *The Time.*

It floureth in the end of May, or in Iune: the berries are ripe in Autumne or about Winter, which now and then continue all the Winter long; but in the meane time the leaues fall away, and in the Spring new come vp in their places.

¶ *The Names.*

It is called in Latine, *Liguſtrum*: in Italian at this day, *Guiſtrico*, by a corrupt word drawne from *Liguſtrum*: it is the Grecians φιλλυρέα, and in no wiſe κύπρος: for Cypres is a ſhrub that groweth naturally in the Eaſt, and Priuet in the Weſt. They be very like one vnto another, as the deſcriptions doe declare; but yet in this they differ, as witneſſeth *Bellonius*, becauſe the leaues of Priuet do fall away in Winter, and the leaues of Cyprus are alwaies greene: Moreouer, the leaues of Cyprus doe make the haire red, as *Dioſcorides* ſaith, and (as *Bellonius* reporteth) doe giue a yellow colour: but the leaues of Priuet haue no vſe at all in dying. And therefore *Pliny, lib.*24.*cap.*10. was deceiued, in that hee judged Priuet to be the ſelfe ſame tree which Cyprus is in the Eaſt: which thing notwithſtanding he did not write as he himſelfe thought, but as other men ſuppoſe; for *lib.*12.*cap.* 14. he writeth thus, Some (ſaith he) affirme this, *viz.* Cyprus, to be that tree which is called in Italy, *Liguſtrum*; and that *Liguſtrum* or Priuet is that plant which the Grecians call φιλλυρέα, the deſcription doth declare.

Phylliria, ſaith *Dioſcorides*, is a tree like in bigneſſe to Cyprus, with leaues blacker and broader than thoſe of the Oliue tree: it hath fruit like to that of the Maſtick tree, blacke, ſomething ſweet, ſtanding in cluſters, and ſuch a tree for all the world is Priuet, as we haue before declared.

Serapio the Arabian, *cap.*44. doth call Priuet *Mahaleb*. There is alſo another *Mahaleb*, which is a graine or ſeed of which *Auicen* maketh mention, *cap.*478. that it doth by his warme and comfortable heate diſſolue and aſſwage paine. *Serapio* ſeemeth to intreate of them both, and to containe diuers of the *Mahaleb* vnder the title of one chapter: it is named in high Dutch, **Beinholtzlein, Mundtholtz, Rhein oder Schulweiden**: in low Dutch, **Keelcruyt, Monthout**: in French, *Troeſne*: in Engliſh, Priuet, Primprint, and Print.

Some there be that would haue the berries to be called *Vaccinia*, aud *Vaccinium* to be that of which *Vitruvius* hath made mention in his ſeuenth booke of Architecture or the art of building, chap. 14. of purple colours: after the ſame manner, ſaith hee, they temper *Vaccinium*, and putting milke vnto it doe make a gallant purple: in ſuch breuitie of the old Writers what can be certainly determined?

¶ *The Temperature.*

The leaues and fruit of Priuet are cold, dry, and aſtringent.

¶ *The Vertues.*

A The leaues of Priuet doe cure the ſwellings, apoſtumations, and vlcers of the mouth or throat, being gargariſed with the juyce or decoction thereof, and therefore they be excellent good to be put into lotions, to waſh the ſecret parts, and the ſcaldings with women, cankers and ſores in childrens mouthes.

Chap. 58. Of Mocke-Priuet.

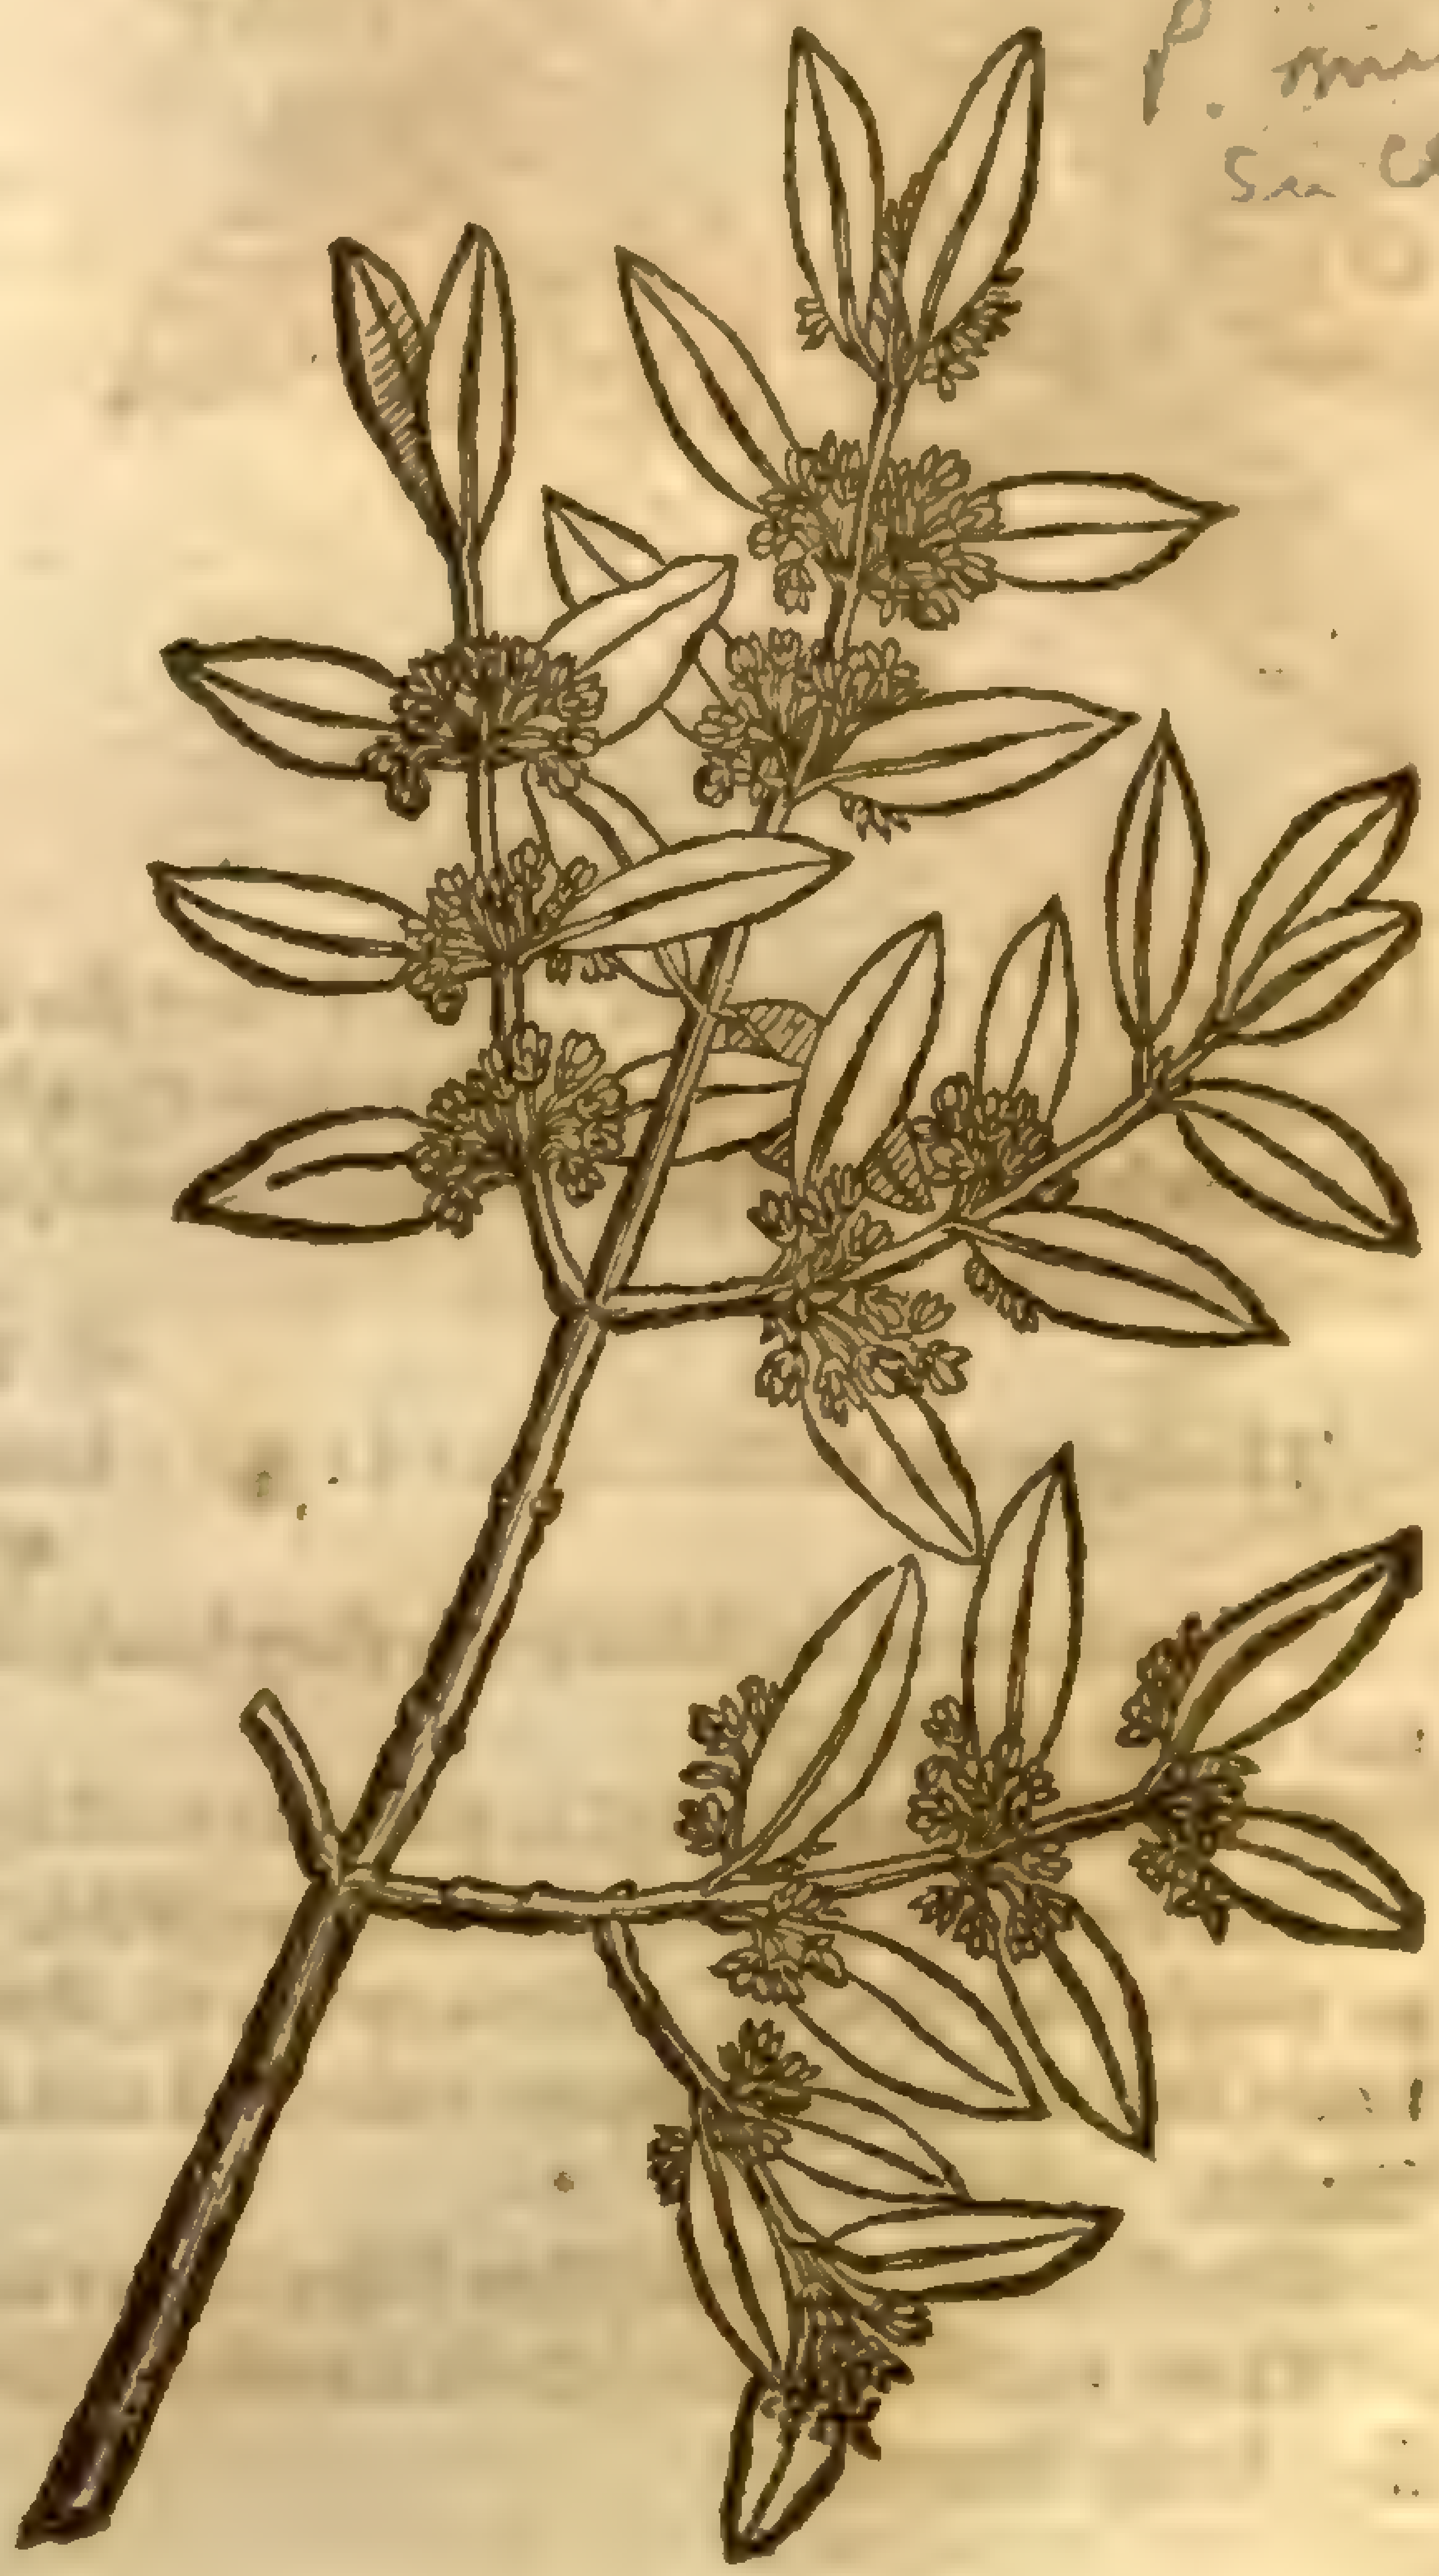
1 *Phillyrea anguſtifolia.*
Narrow leaued Mocke-Priuet.



2 *Phillyrea latiore folio.*
The broader leaued Mocke-Priuet.

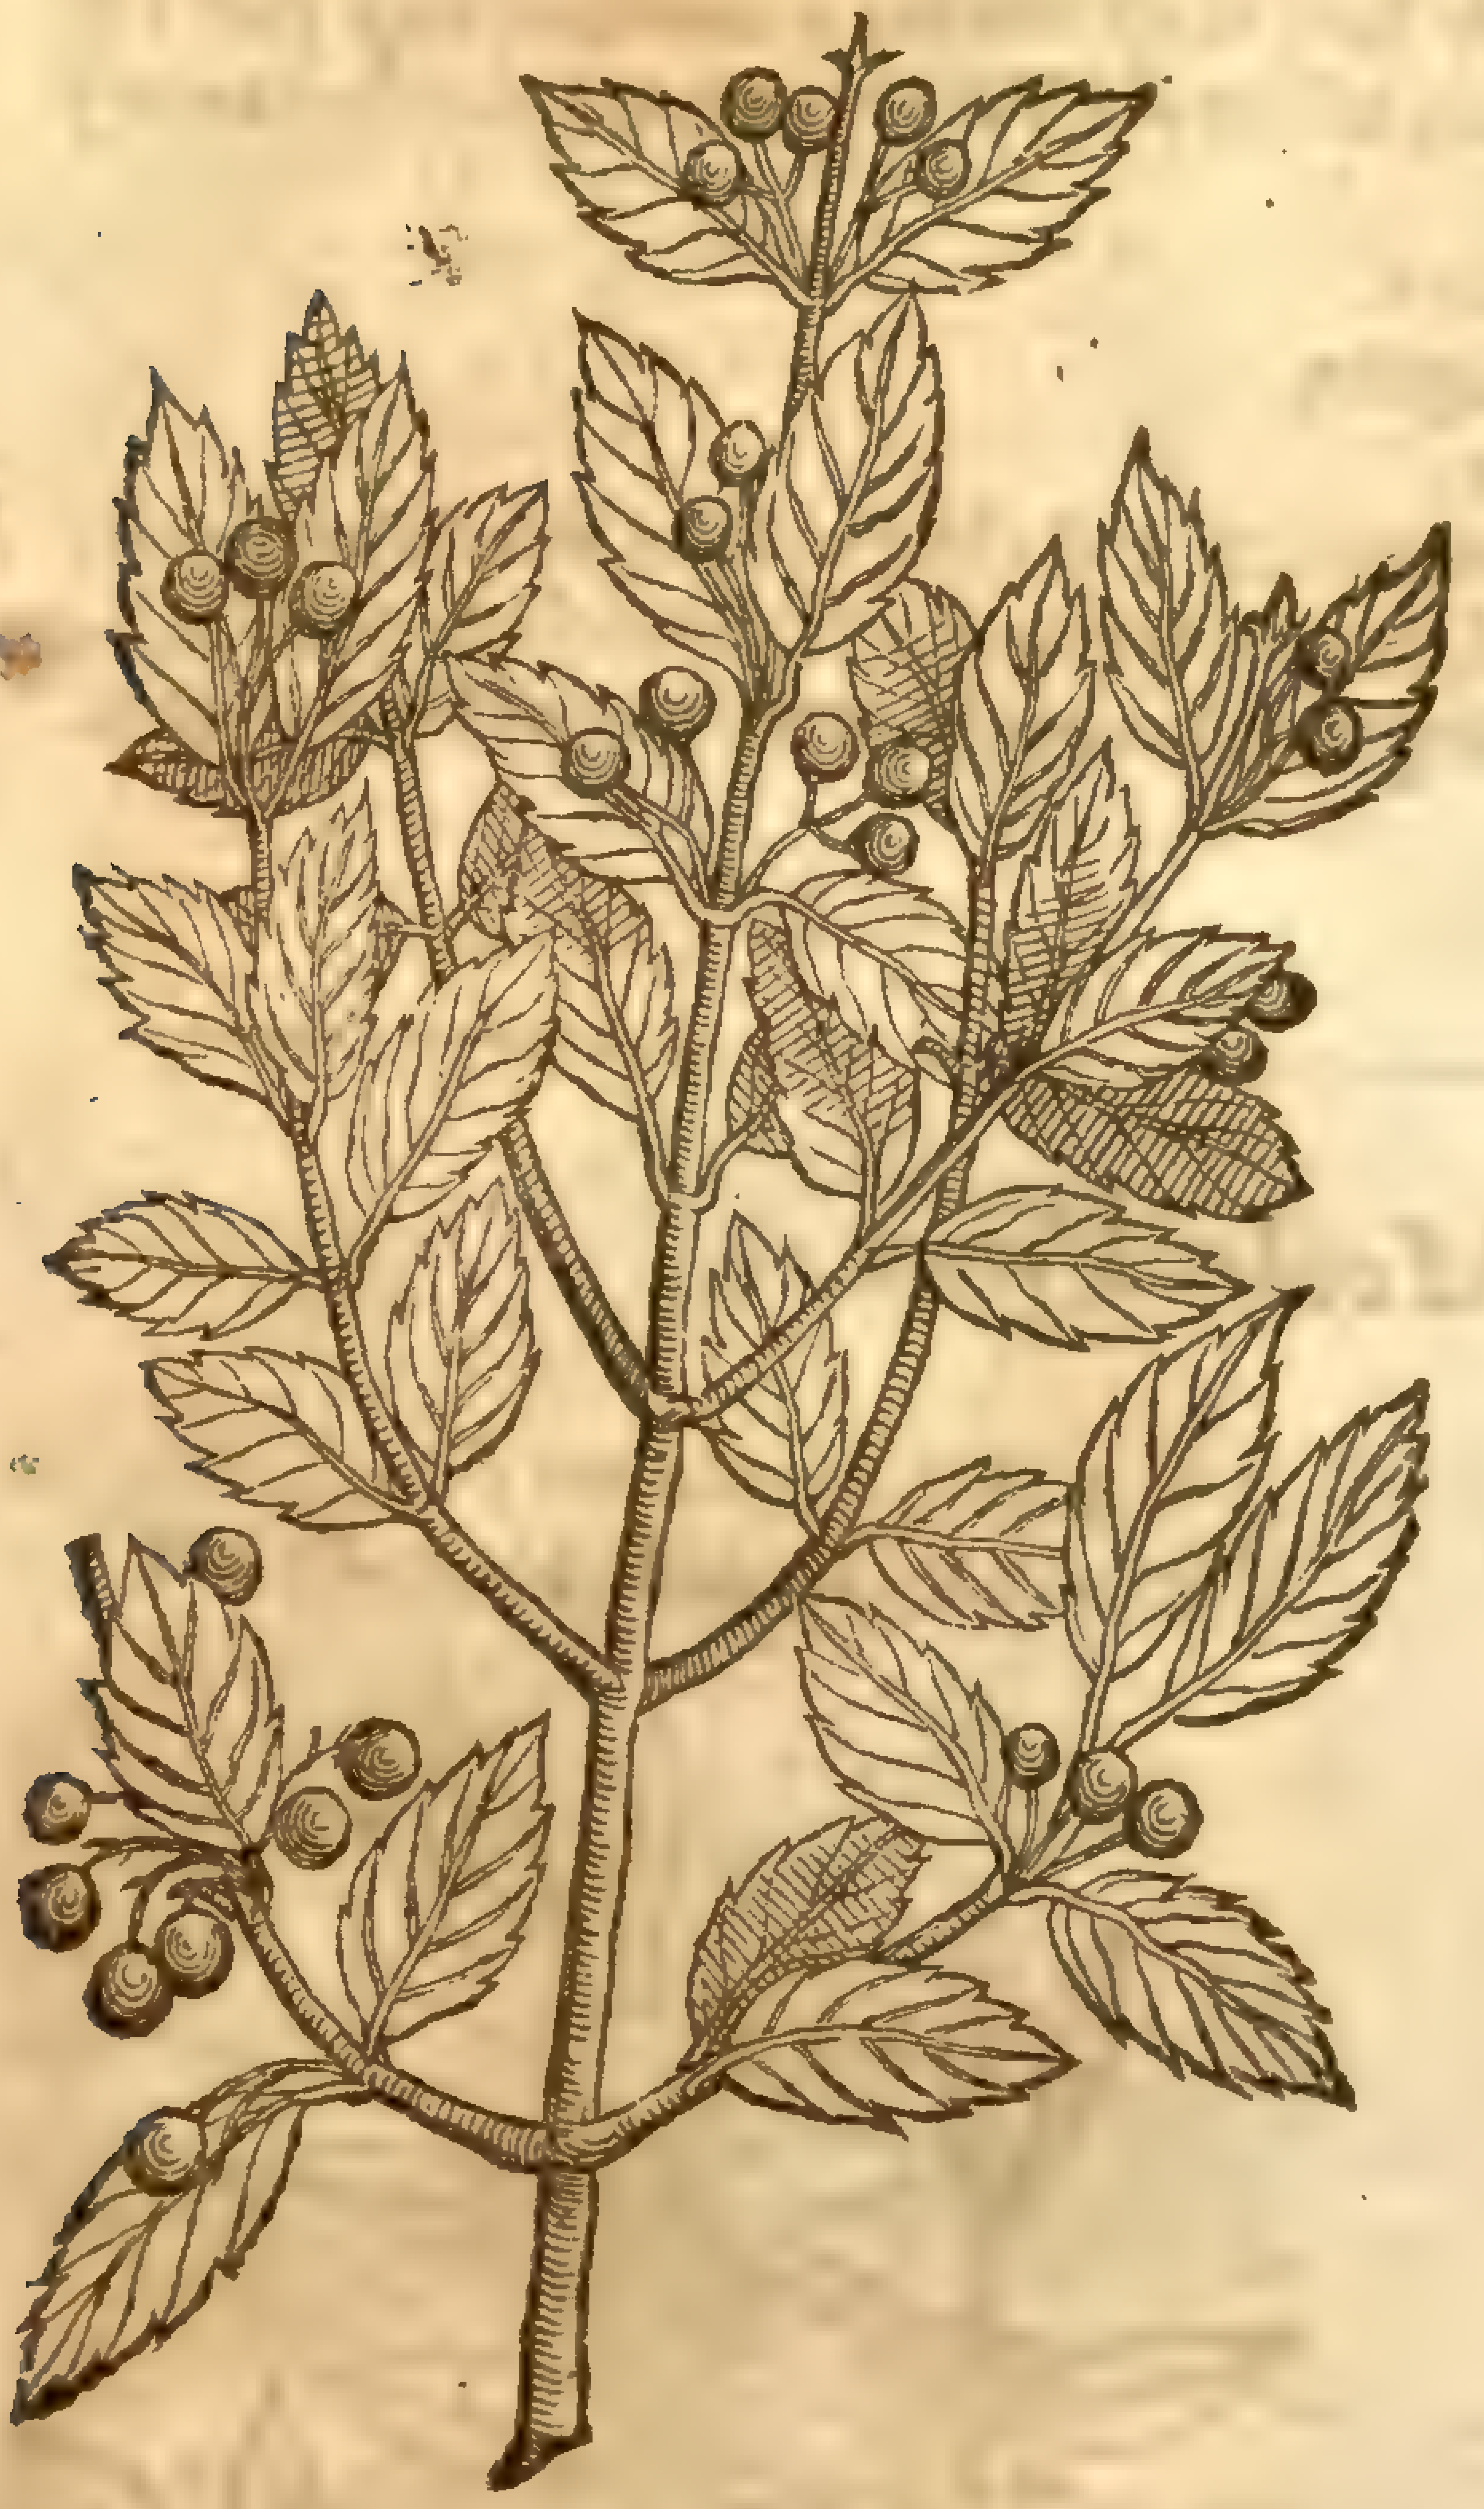
P. media, L. See Clus. 52

¶ *The Deſcription.*

1 Cyprus is a kinde of Priuet, and is called *Phillyrea*, which name all the ſorts or kindes thereof doe retaine, though for diſtinction ſake they paſſe vnder ſundry titles. This plant groweth like an hedge tree, ſometimes as big as a Pomegranate tree, beſet with ſlender twiggy boughes which are garniſhed with leaues growing by couples, very like the leaues of the Oliue tree, but broader, ſofter, and of a green colour: from the boſomes of theſe leaues come forth great bunches of ſmall white floures, of a pleaſanr ſweet ſmell: which being vaded, there ſucceed cluſters of blacke berries very like the berries of the Alder tree.

2 The ſecond Cyprus, called alſo *Phillyrea latifolia*, is very like the former in body, branches, leaues,

3 *Phillyrea ſerrata 2.Cluſij.*
The ſecond toothed Priuet of *Cluſius.*



leaues, floures, and fruit ; and the difference is this, that the leaues of this plant are broader, but in faculty they are like.

3 This kinde of Priuet riſeth vp like an hedge buſh, of the height of fiue or ſix cubits: the branches are long, fragile or brittle, coue-red with a whitiſh barke; whereon are ſet leaues ſomewhat broad, jagged on the edges like the teeth of a ſaw, and of a deepe greene colour: among which come forth the flours, which neither my Author nor my ſelfe haue ſeene: the berries grow vpon ſmall foot-ſtalkes, for the moſt part three together, being round, and of the bigneſſe of pepper graines, or Myrtle berries, of a blacke colour when they be ripe.

¶ *The Place.*

Theſe plants do grow in Syria neere the city Aſcalon, and were found by our induſtrious *Pena* in the mountaines neere Narbone and Montpelier in France: the which I planted in the garden at Barne-Elmes neere London, belonging to the right Honourable the Earle of Eſſex: I haue them growing in my garden likewiſe.

¶ *The Time.*

The leaues ſhoot forth in the firſt of the Spring: the floures ſhew themſelues in May and Iune: the fruit is ripe in September.

¶ *The Names.*

This Priuet is called in Greeke, κύπρος, and in Latine alſo *Cyprus*: they may be named in Engliſh, Eaſterlin Priuet, and Mock-Priuet, for the reaſon following: they are deceiued who taking *Pliny* for their Author, do thinke that it is *Ligustrum*, or our Weſterne Priuet, as we haue ſhewed in the former chapter, it is the Arabians *Alcanna*, or *Henne*: and it is alſo called of the Turkes *Henne* euen at this preſent time.

¶ *The Temperature.*

The leaues of theſe kindes of Priuet haue a binding quality, as *Dioſcorides* writeth.

¶ *The Vertues.*

A Being chewed in the mouth they heale the vlcers thereof, and are a remedy againſt inflammations or hot ſwellings.

B The decoction thereof is good againſt burnings and ſcaldings.

C The ſame being ſtamped and ſteeped in the juyce of Mullen and laid on, do make the haire red, as *Dioſcorides* noteth. *Bellonius* writeth, that not onely the haire, but alſo the nether parts of mans body and nailes likewiſe are coloured and died herewith, which is counted an ornament among the Turks.

D The floures being moiſtned in vineger and applied to the temples aſſwage head-ache.

E There is alſo made of theſe an oile called *Oleum Cyprinum*, ſweet of ſmell, and good to heate and ſupple the ſinewes.

Chap. 59. *Of baſtard Priuet.*

¶ *The Deſcription.*

1 This ſhrubby tree, called *Macaleb*, or *Mahaleb*, is alſo one of the Priuets: it riſeth vp like vnto a ſmall hedge tree, not vnlike vnto the Damſon or Bulleſſe tree, hauing many vpright ſtalkes and ſpreading branches: whereon do grow leaues not vnlike to thoſe of the *Phillyrea* of *Cluſius* deſcription: amongſt which come forth moſſie floures of a white colour, and of a perfect

ſweet ſmell, growing in cluſters, many hanging vpon one ſtem, which the Grauer hath omitted: after which come the berries, green at the firſt, and blacke when they be ripe, with a little hard ſtone within, in which lies a kernell.

2 *Geſner* and *Matthiolus* haue ſet forth another *Macaleb*, being alſo another baſtard Priuet. It groweth to a ſmall hedge tree, hauing many green branches ſet with round leaues like thoſe of the Elme tree, ſomwhat ſnipt about the edges: the flours are like thoſe of the precedent, the fruit, or rather the kernell thereof, is as hard as a bead of Corall, ſomwhat round, and of a ſhining blacke colour; which the cunning French perſumers do bore thorow, making thereof bracelets, chaines, and ſuch like trifling toyes, which they ſend into England, ſmeared ouer with ſome odde ſweet Compound or other, and they are here ſold vnto our curious ladies and gentlewomen for rare & ſtrange Pomanders, for great ſummes of mony.

Prunus mahaleb, L.
[illegible]

1 *Phillyria arbor, verior Macaleb.*
Baſtard Privet.

2 *Macaleb Geſneri.*
Corall Privet.

¶ *The Place.*

Theſe trees grow in diuers places of France, as about Tholouſe and ſundry other places. They are ſtrangers in England.

¶ *The Time.*

The floures bud forth in the Spring: the fruit is ripe in Nouember and December.

¶ *The Names.*

This baſtard Privet is that tree which diuers ſuſpect to be that *Mahaleb* or *Machaleb* of which *Avicen* writeth, *cap.* 478. and which alſo *Serapio* ſpeaketh of out of *Meſue*: but it is an hard thing to affirme any certaintie thereby, ſeeing that *Avicen* hath deſcribed it without marks. Notwithſtanding this is taken to be the ſame of moſt writers, and thoſe of the beſt. We may call it in Engliſh, Baſtard Privet, or Corall, or Pomander Privet, being without doubt a kinde thereof.

¶ *The Nature and Vertues.*

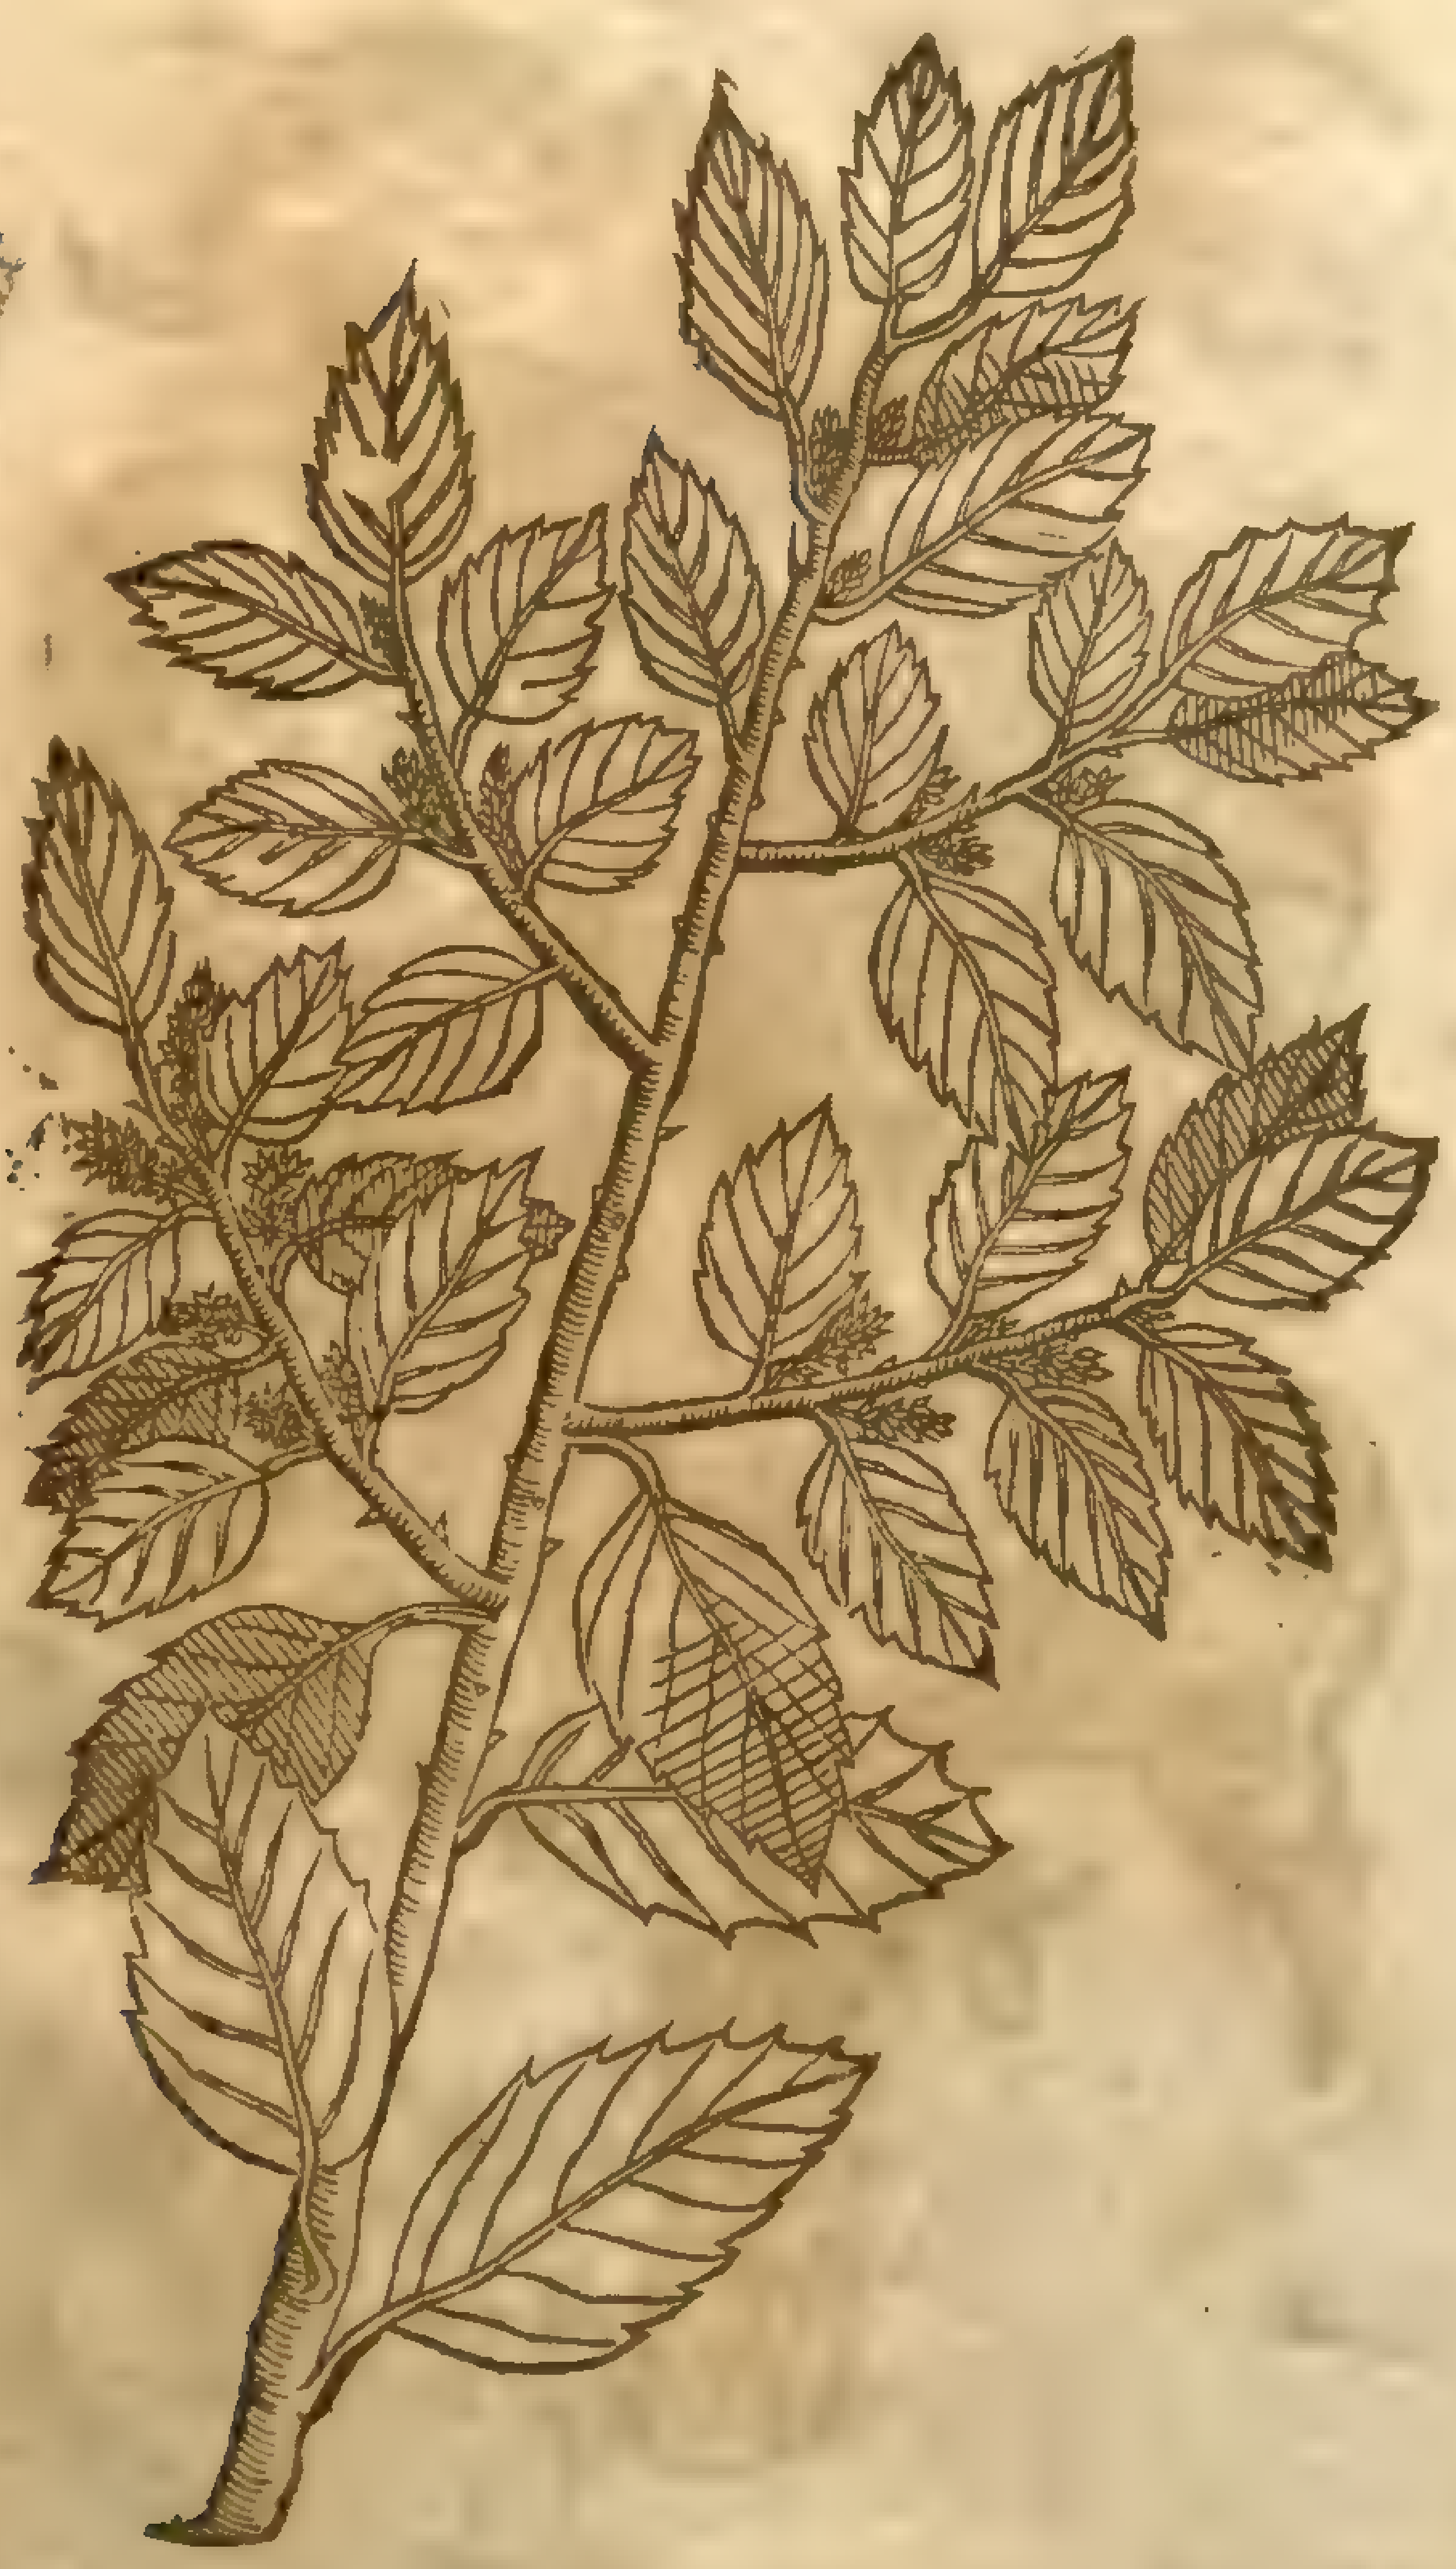
Concerning this baſtard Privet we haue learned as yet no vſe thereof in phyſicke. The kernels A that are found in the ſtones or fruit, as they be like in taſte to thoſe of Cherries, ſo be they alſo anſwerable to them in temperature; for they are of a temperat heate, and gently prouoke vrine, and be therefore good for the ſtone: more wee haue not to write than hath been ſpoken in the deſcription.

Chap. 60. *Of the fruitleſſe Privet.*

¶ *The Deſcription.*

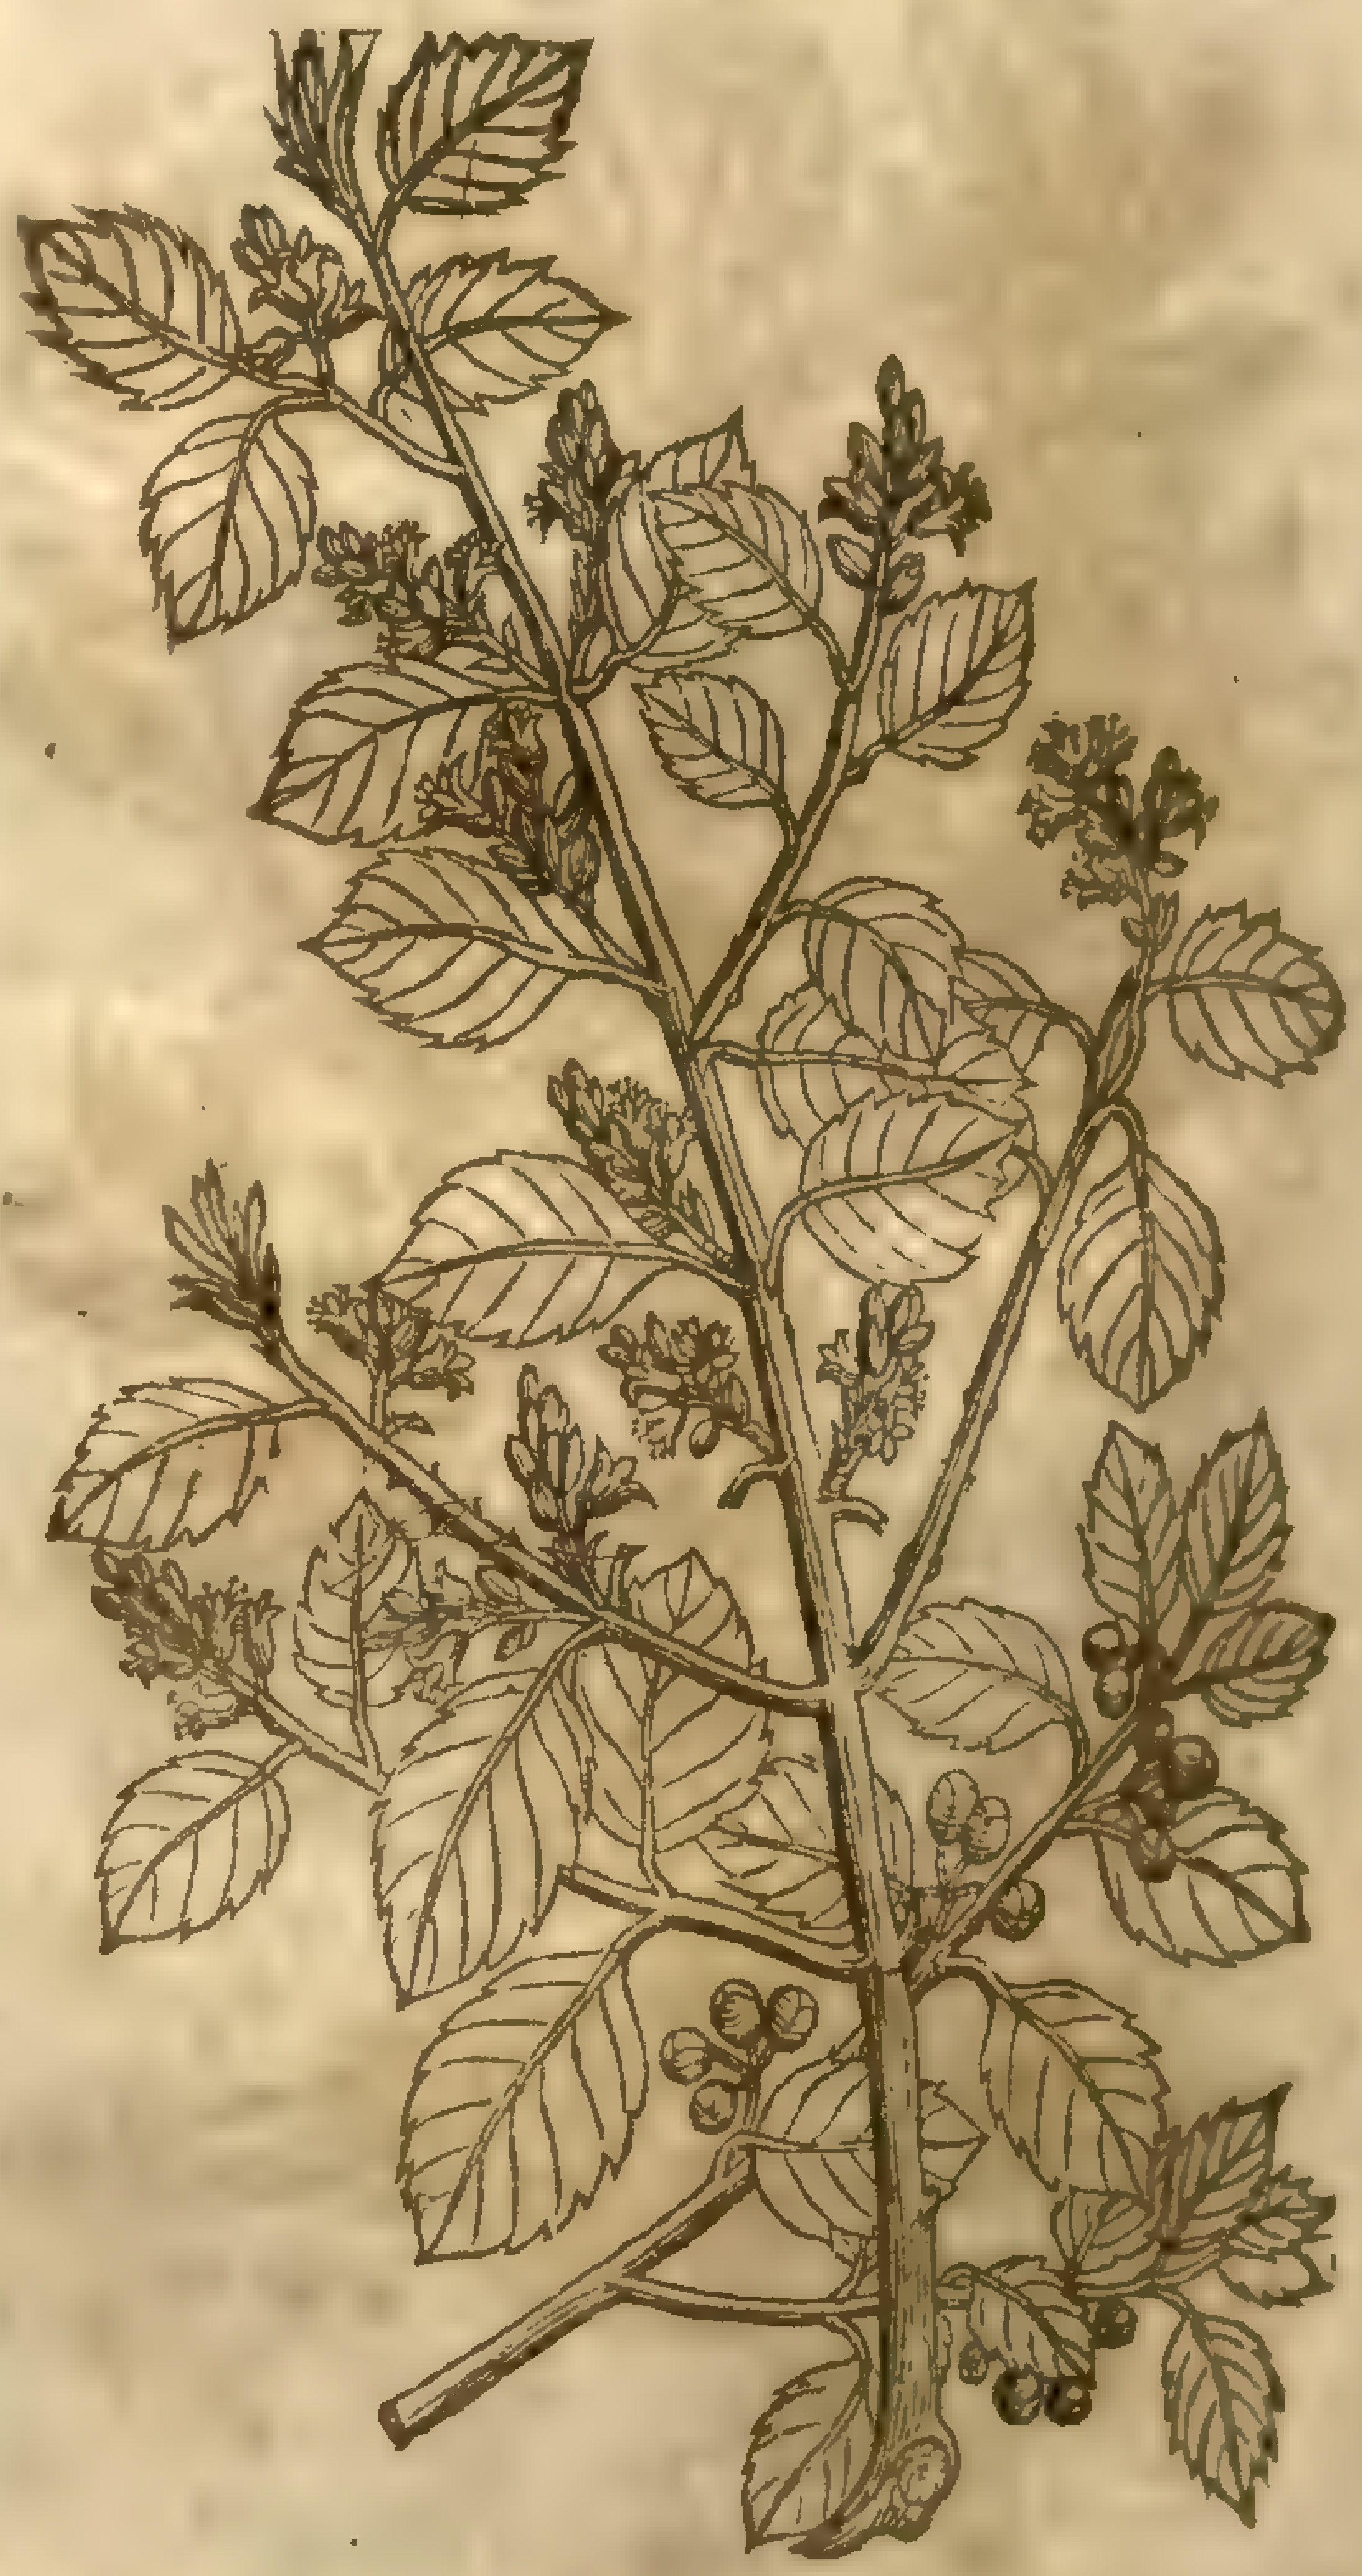
1 This ſhrubby buſh, called of *Pliny* and *Cluſius*, *Alaternus*, growes vp to a ſmal hedge tree, in forme like vnto a baſtard Privet, but the leaues are more like thoſe of *Ilex* or French Oke, yet ſtiffer and rounder than thoſe of *Macaleb*: among which come forth tufts of greeniſh yellow floures like thoſe of the Lentisk tree: vnder and among the leaues come forth the berries, like thoſe of *Laurus Tinus*, in which are contained two kernels like the acines or ſtones of the Grape.

1 *Alaternus Plinij.*
Fruitleſſe Privet.



Rhamnus alaternus, L. a
male, Smt

2 *Alaternus humilior.*
The lower fruitleſſe Privet.



(Rhamnus alaternus, L. [illegible]
male, Smt

2 The ſecond kinde of *Alaternus* is likewiſe a fruitleſſe kinde of Privet, hauing narrow leaues ſomwhat ſnipt about the edges; from the boſoms whereof come forth ſmall herby colored flours, which being vaded, the fruit ſucceedeth, whereof *Avicen* ſpeaketh, calling it *Fagaras*, being a fruit in bigneſſe & form like thoſe in ſhops called *Cocculus Indi*, and may be the ſame, for any thing that hath bin written to the contrary. This fruit hangs as it were in a darke aſh coloured skin or huske, which incloſeth a ſlender ſtiffe ſhell like the ſhell of a nut, couered with a thin or black filme, whether it be the fruit of this plant it is not cenſured; notwithſtanding you ſhall find the figure hereof among the Indian fruits, by the name *Fagaras*.

‡ This hath ſhorter branches and rounder leaues than the former: the floures are larger, and greener, to which ſucceed fruit cluſtering together, firſt green, then red, and afterwards blacke, and conſiſting of three kernels. It floures in February and the beginning of March, and growes in ſundry places of Spain. The fruit of this is not the *Fagaras*, neither doth the *Fagaras* mentioned by our Author any way agree with the *Cocculus Indi* of the ſhops, as ſhal be ſhewed hereafter in their fit places. ‡

¶ *The Place.*

Theſe Plants grow in the ſhadowy woods of France, and are ſtrangers in England.

¶ *The*

¶ *The Time.*

The Time anſwereth the reſt of the Priuets.

¶ *The Names.*

Alaternus of *Pliny* is the ſame *Phillyrea* which *Theophraſtus* hath written of by the name *Philyca*: and *Bellonius* alſo, *lib.* 1. *cap.* 42. of his Singularities, and the people of Candy call it *Elæprinon*: the Portugals, *Caſca*: in French, *Dalader*, and *Sangin blanc*: in Engliſh, barren or fruitleſſe Privet: notwithſtanding ſome haue thought it to beare fruit, which at this day is called *Fagaras*: with vs, *Cocculus Indi*, as we haue ſaid. ‡ I can by no meanes approue of the Engliſh name here giuen by our Author; but iudge the name of Euer-green Privet (giuen it by Mr *Parkinſon*) to be much more fitting to the thing. ‡

¶ *The Temperature and Vertues.*

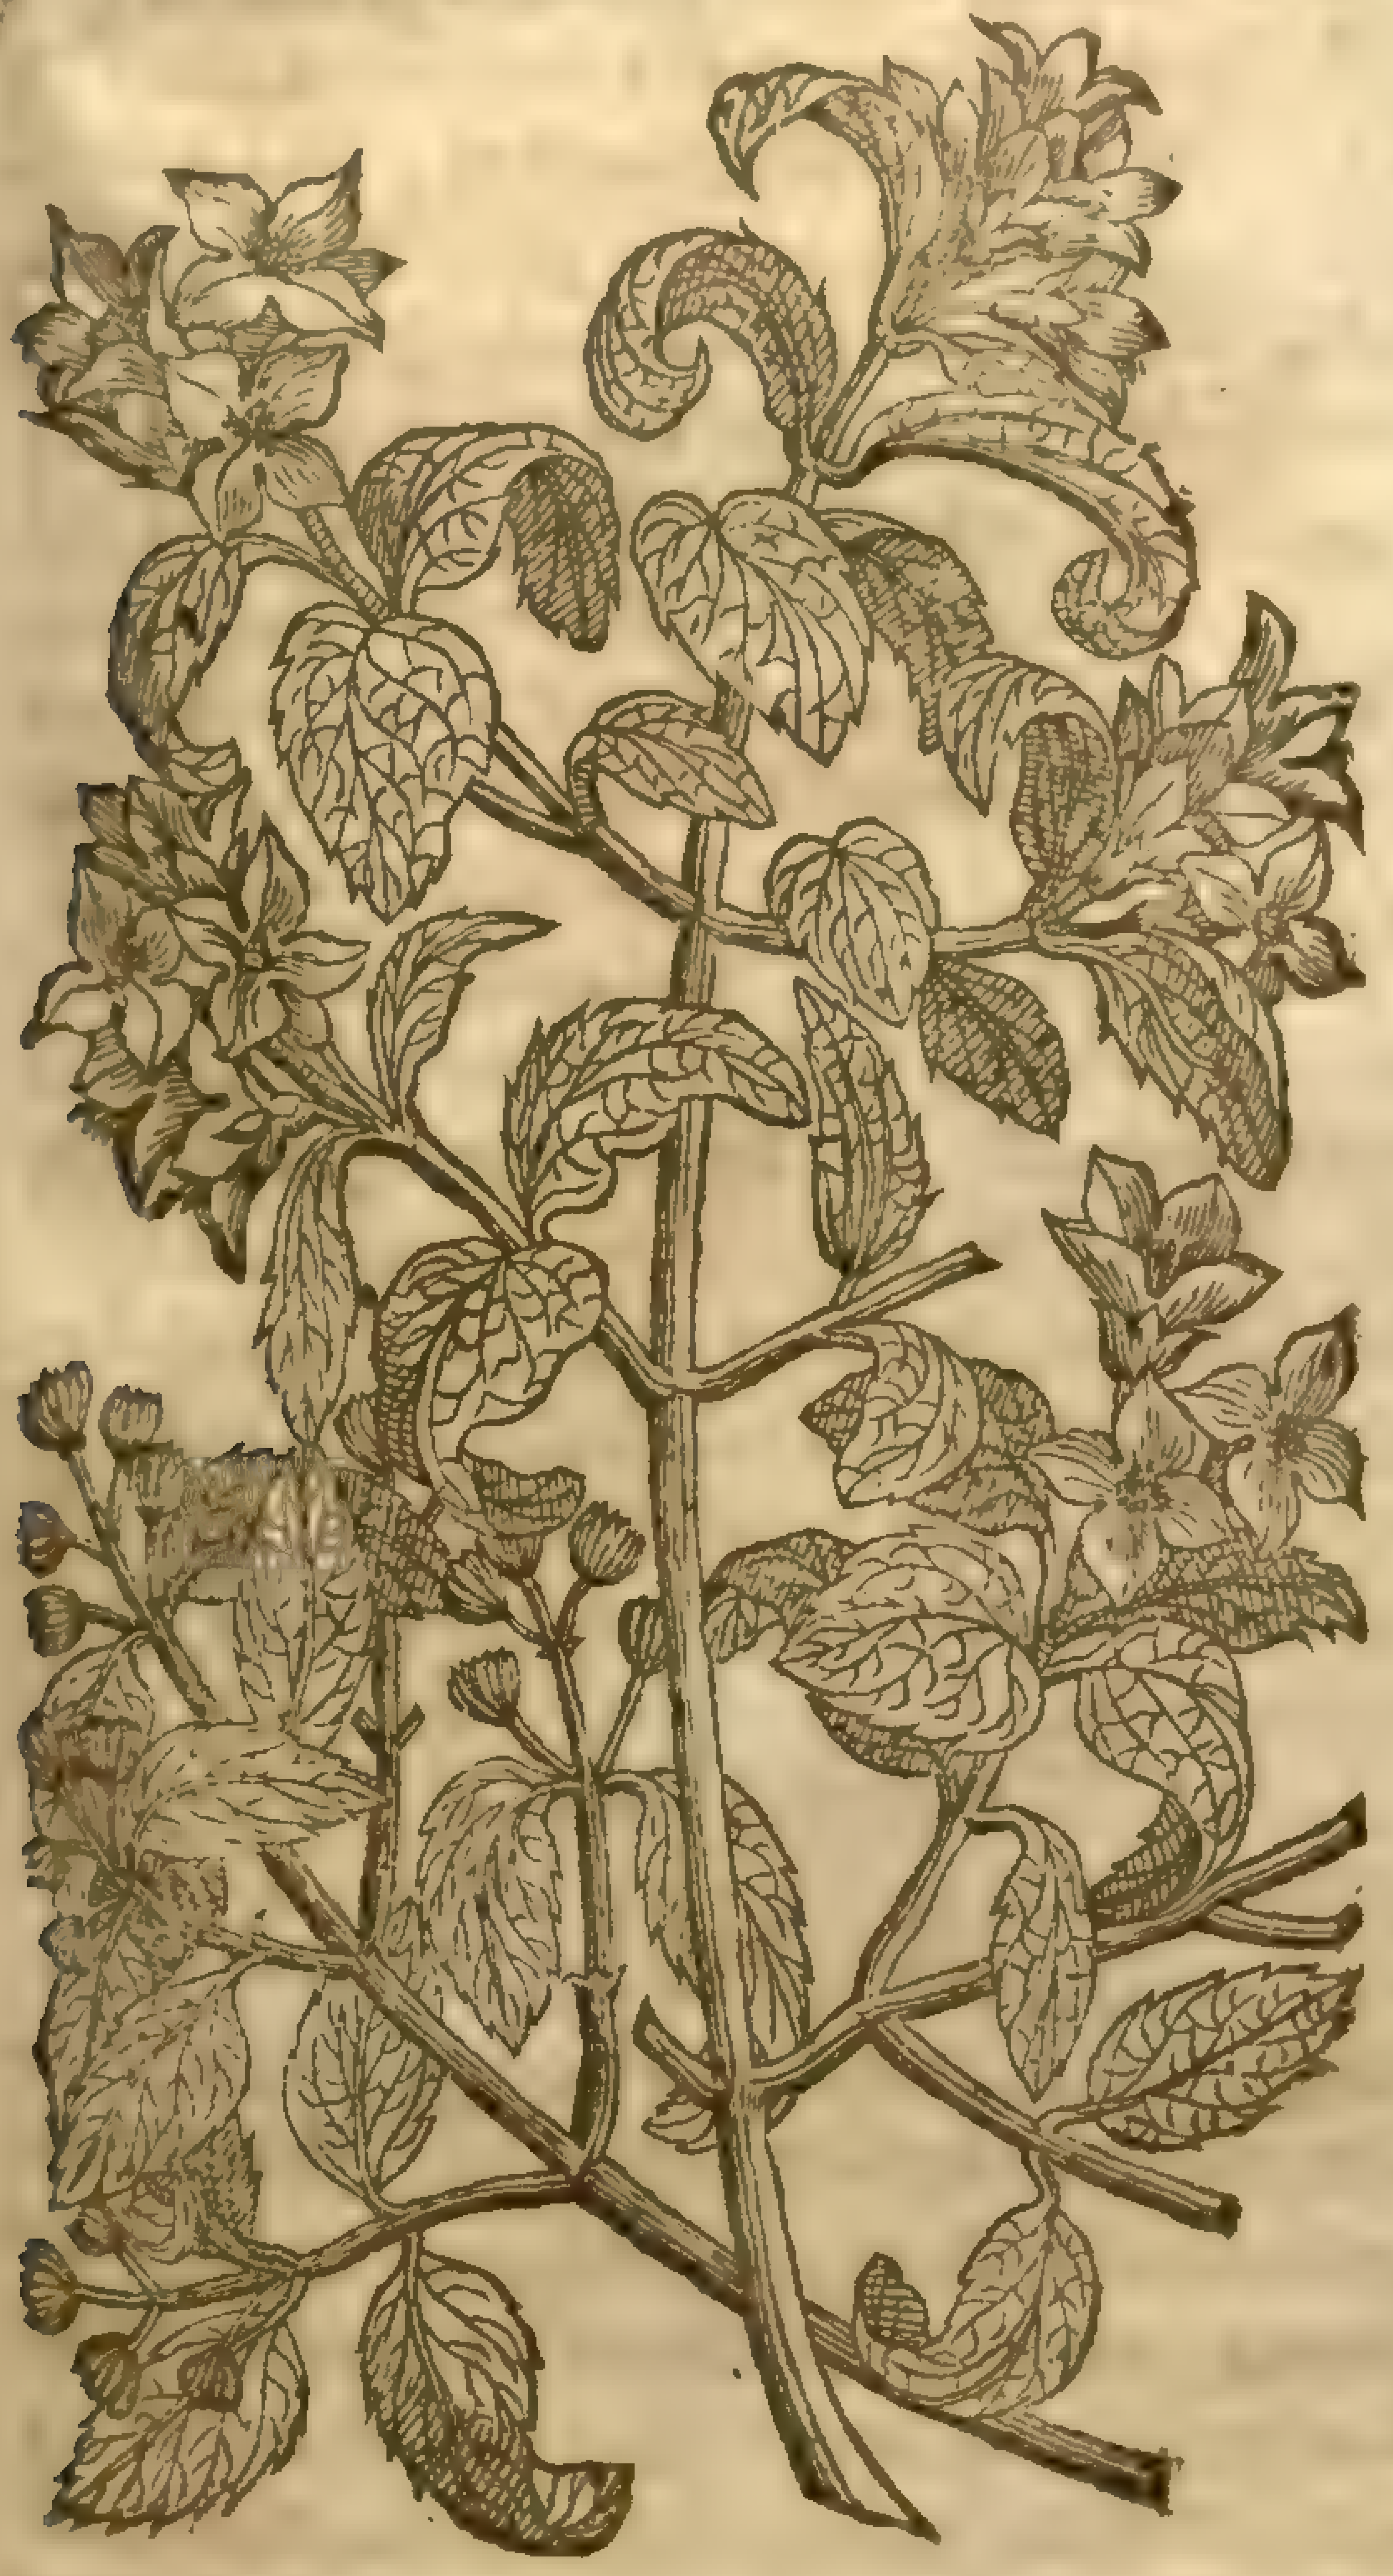
Whether the plant be vſed in medicine I cannot as yet learn: the fiſhermen of Portugall vſe to ſeethe the barke thereof in water, with the which decoction they colour their nets of a reddiſh colour, being very fit for that purpoſe: the wood alſo is vſed by Dyers to dye a dark black withall. A

CHAP. 61. *Of the white and blew Pipe Priuet.*

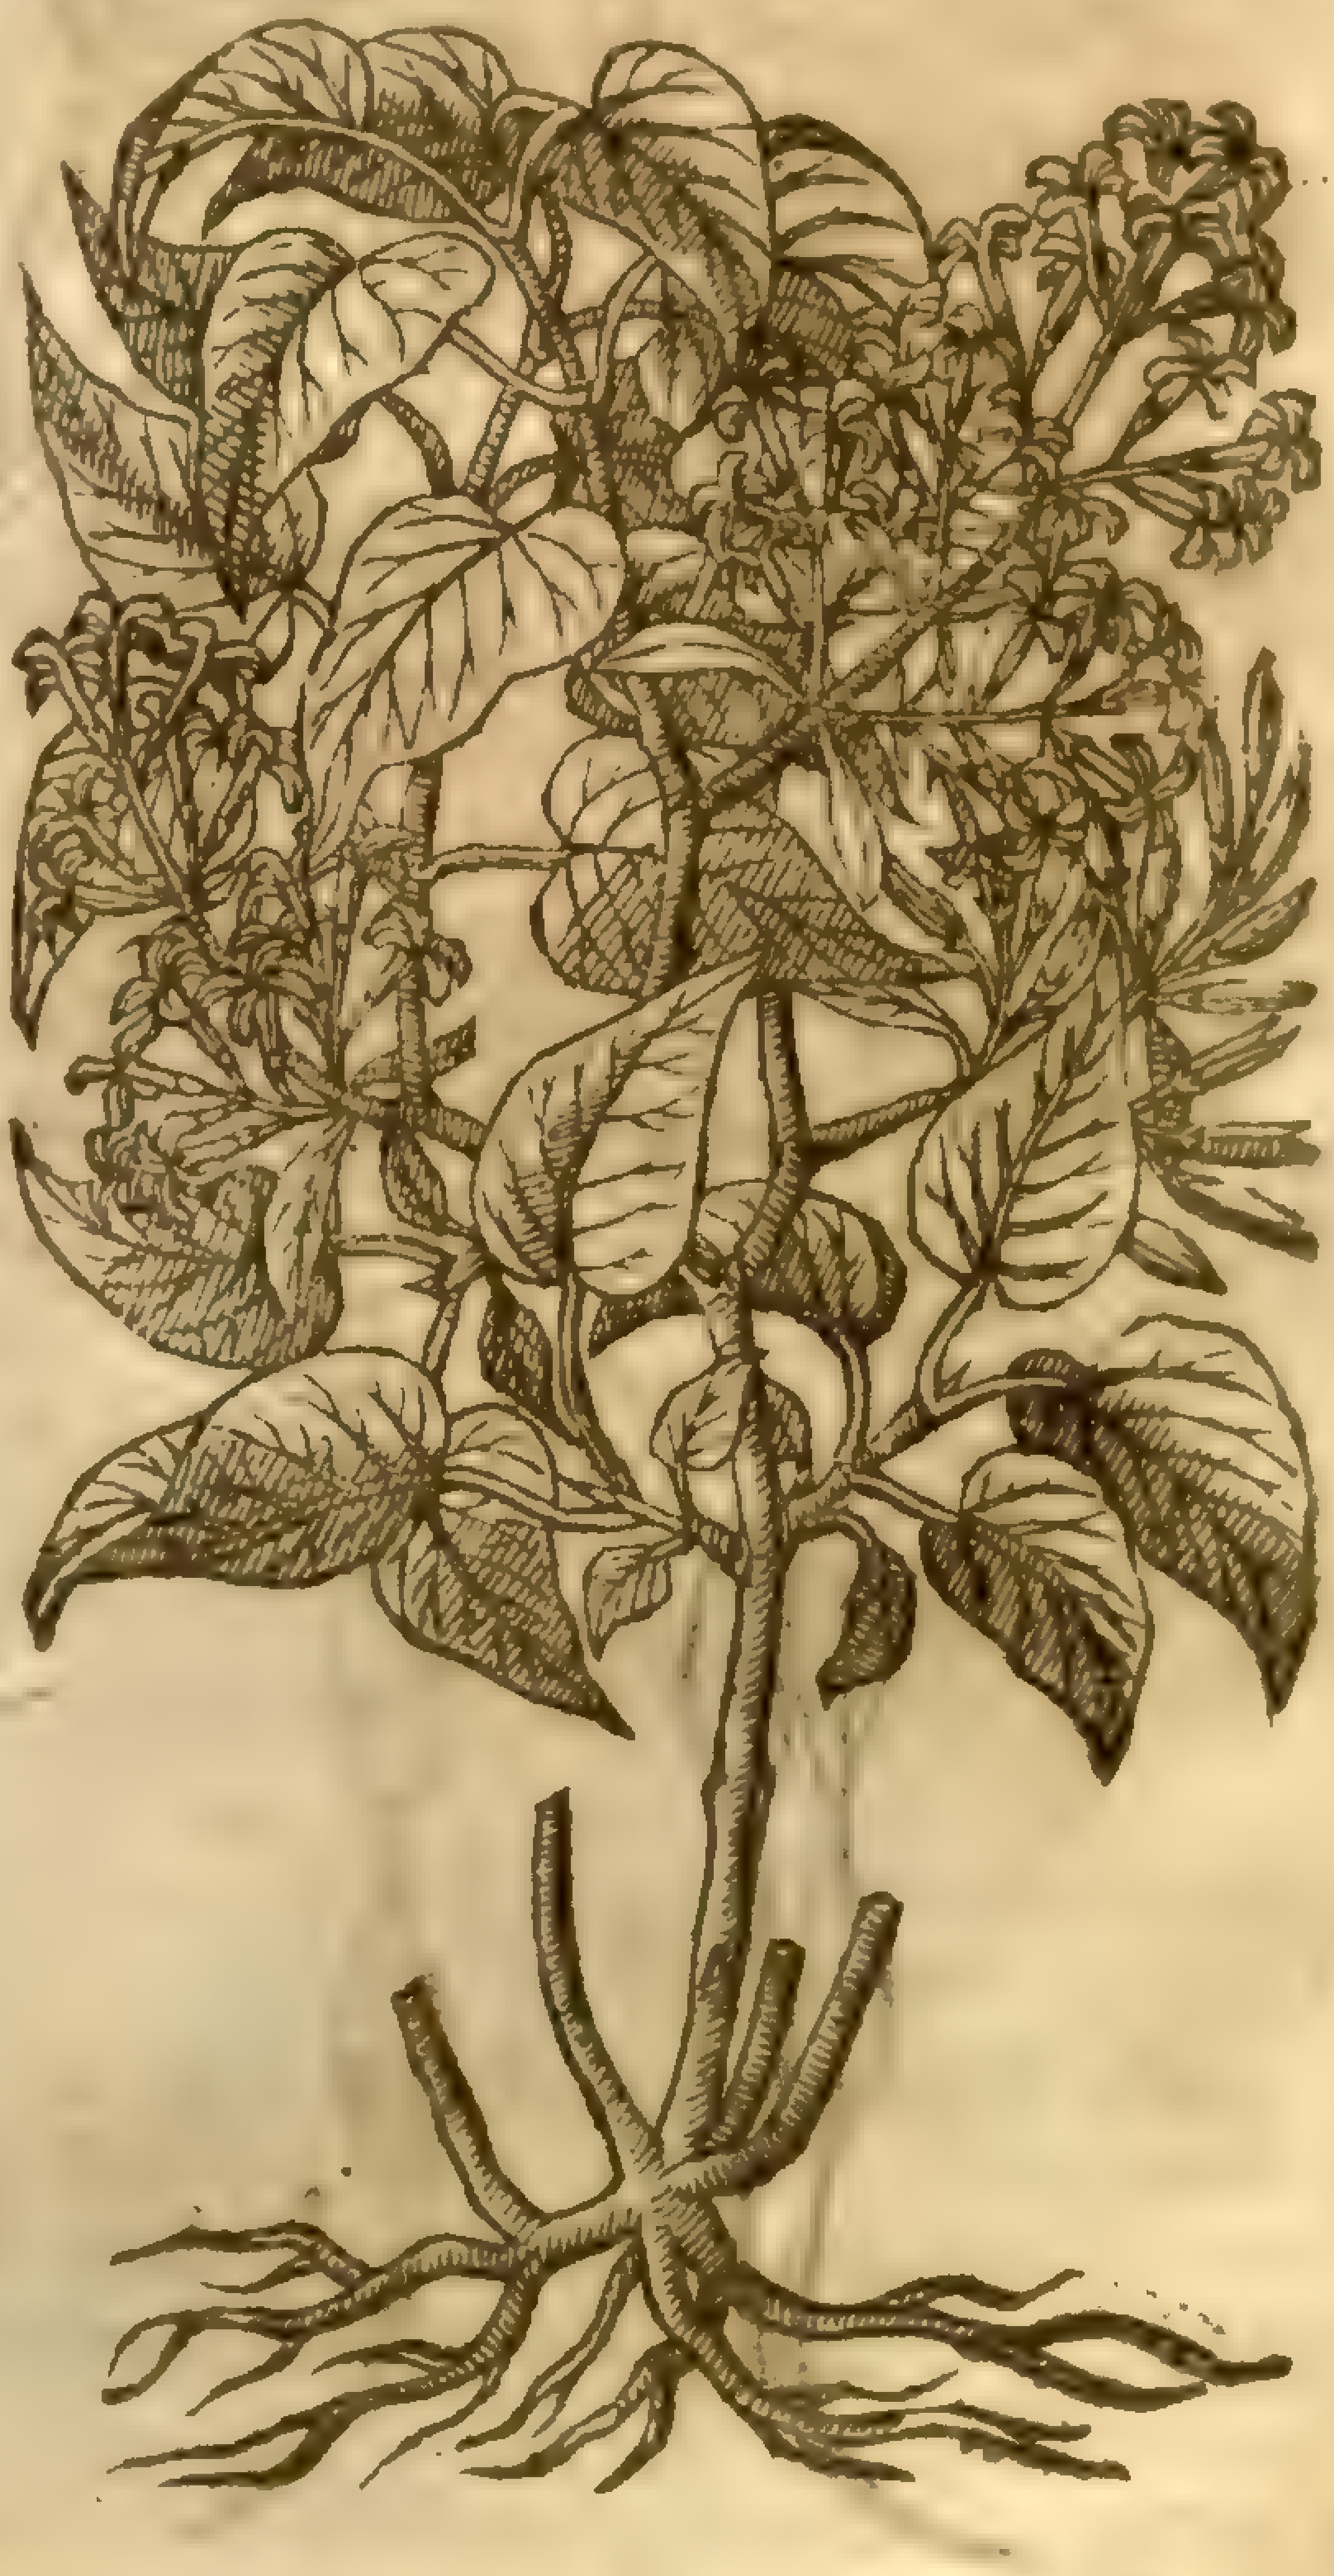
Philadelphus coronarius L. & mill. dict

S. vulgaris L. & mill. dict

1 *Syringa alba.*
White Pipe.



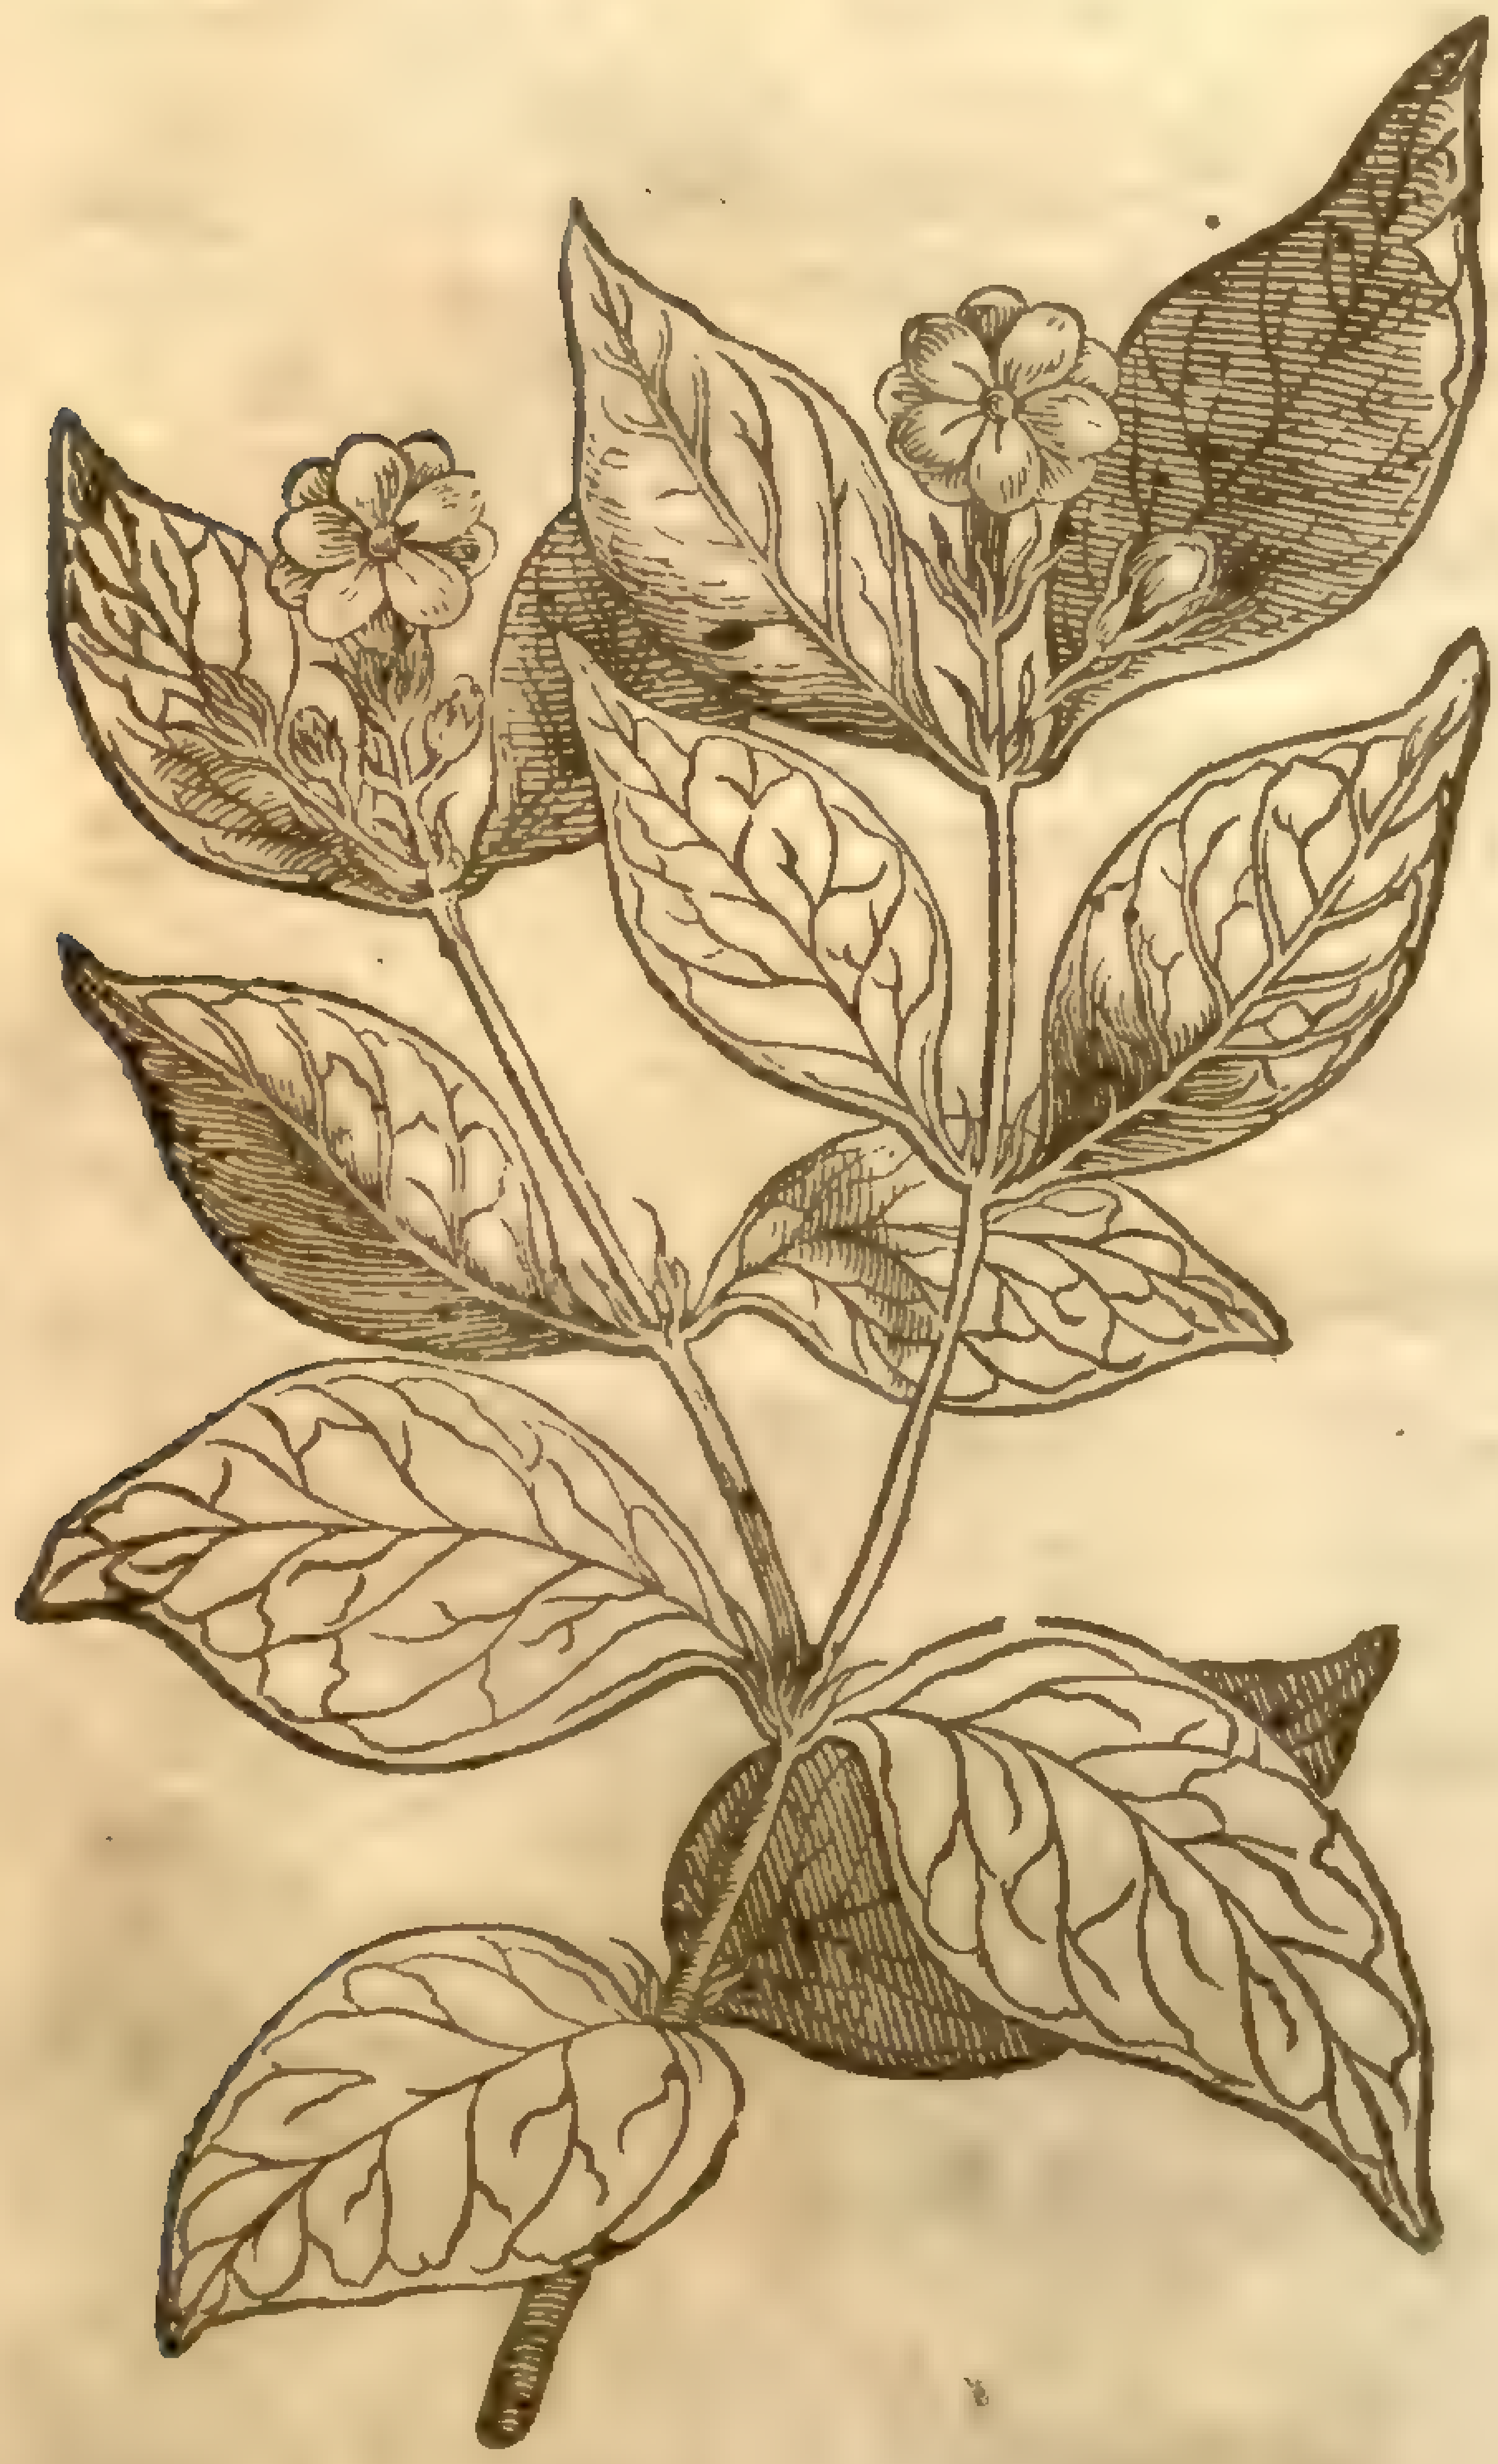
2 *Syringa cærulea.*
Blew Pipe.



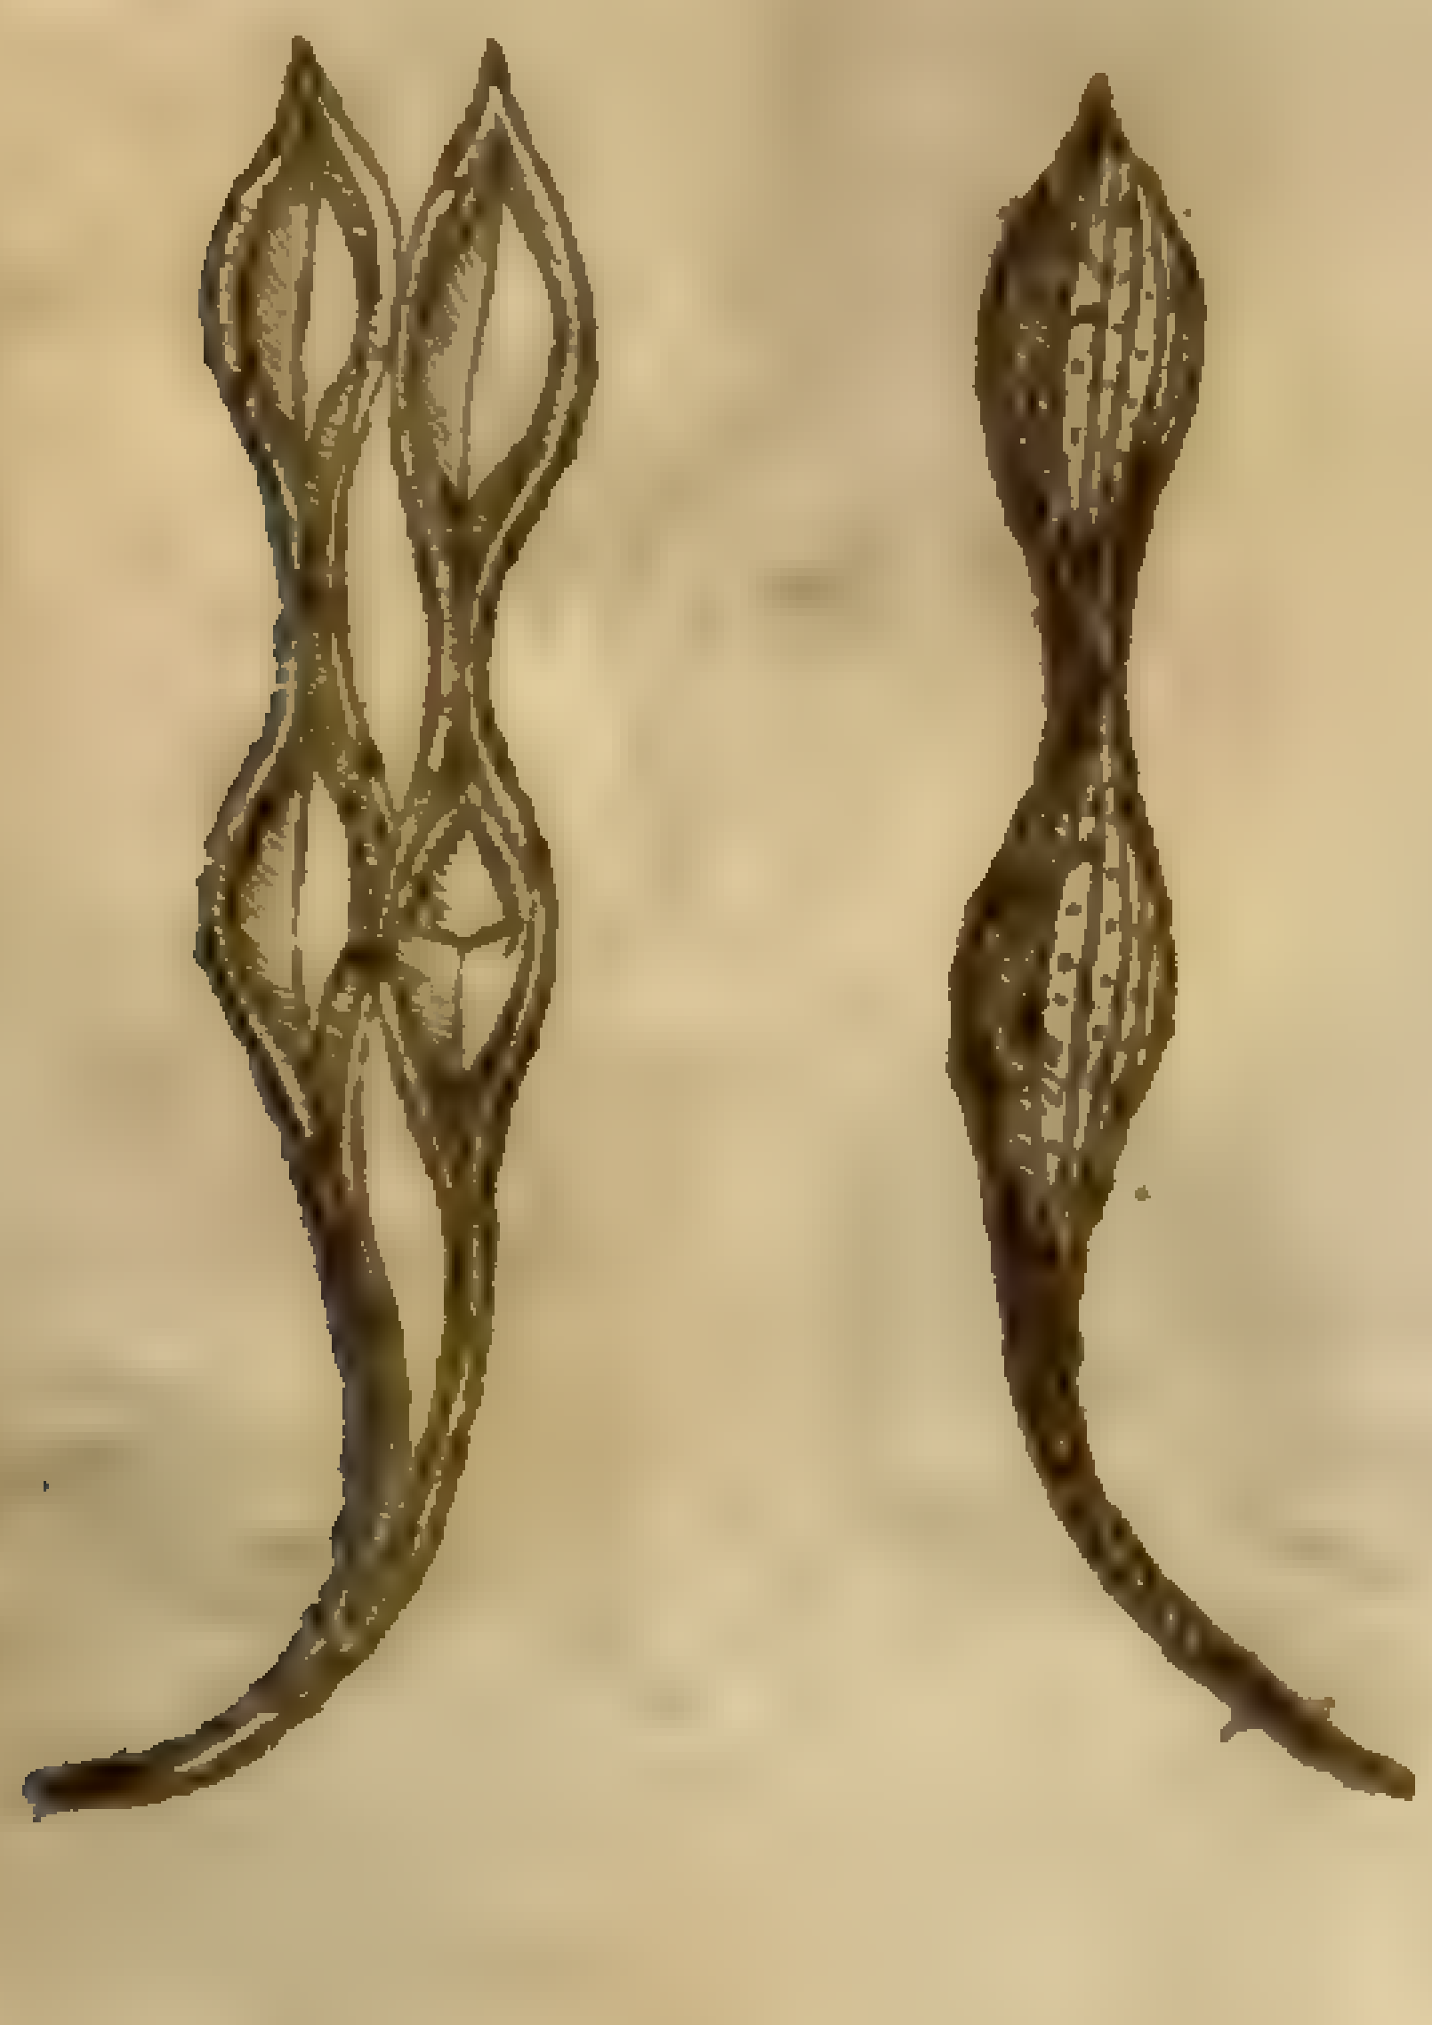
¶ *The Deſcription.*

1 THe white Pipe groweth like an hedge tree or buſhy ſhrub; from the root whereof ariſe many ſhoots which in ſhort time grow to be equall with the old ſtocke, whereby in a little time it increaſeth to infinit numbers, like the common Engliſh Prim or Priuet, whereof doubtleſſe it is a kinde, if wee conſider euery circumſtance. The branches are couered with a rugged gray barke: the timber is white, with ſome pith or ſpongie matter in the middeſt like Elder, but leſſe in quantitie. Theſe little branches are garniſhed with ſmall crumpled leaues of the ſhape and bigneſſe of the Peare tree leaues, and very like in form: among which come forth

‡ 3 *Syringa Arabica.*
Arabian Pipe.



4 *Balanus Myrepſica, ſiue Glans vnguentaria.*
The oily Acorne.



the flours, growing in tufts, compact of four ſmall leaues of a white colour, and of a pleaſant ſweet ſmell; but in my iudgment they are too ſweet, troubling and moleſting the head in very ſtrange manner. I once gathered the floures and layed them in my chamber window, which ſmelled more ſtrongly after they had lien together a few houres, with ſuch an vnacquainted ſauor that they awaked me out of ſleepe, ſo that I could not reſt till I had caſt them out of my chamber. The floures being vaded, the fruit follows, which is ſmall, curled, and as it were compact of many little folds, broad towards the vpper part, and narrow toward the ſtalke, and black when it is ripe, wherein is contained a ſlender long ſeed. The root hereof ſpreadeth it ſelfe abroad in the ground after the manner of the roots of ſuch ſhrubby trees.

2 The blew Pipe groweth likewiſe in manner of a ſmall hedge tree, with many ſhoots riſing from the root like the former, as our common Privet doth, whereof it is a kind. The branches haue a ſmall quantity of pith in the middle of the wood, and are couered with a darke blacke greeniſh barke or rinde. The leaues are exceeding greene, and crumpled or turned vp like the brimmes of a hat, in ſhape very like vnto the leaues of the Poplar tree: among which come the flours, of an exceeding faire blew colour, compact of many ſmal floures in the form of a bunch of grapes: each floure is in ſhew like thoſe of *Valeriana rubra Dodonæi*, conſiſting of four parts like a little ſtar, of an exceeding ſweet ſauour or ſmell, but not ſo ſtrong as the former. When theſe floures be gon there ſucceed flat cods, and ſomwhat long, which being ripe are of a light colour, with a thinne membrane or filme in the middeſt, wherein are ſeeds almoſt foure ſquare, narrow, and ruddy.

‡ 3 This (which *Cluſius* ſetteth forth by the name of *Iaſminum Arabicum*, or *Syringa Arabica*) groweth ſome two or three cubits high, diuided into many ſlender branches, whereon by couples at each joint ſtand leaues like thoſe of the firſt deſcribed, but thinner, and not ſnipt about the edges. On the tops of the branches grow the floures, wholly white, conſiſting of nine, tenne, or twelue leaues ſet in two ranks: theſe floures are ſweet, hauing a ſent as it were compounded of the Spaniſh Iaſmine and Orenge flours. It is a tender plant, and may be graffed on the common Iaſmine, whereon it thriues well, and floures moſt part of the Summer. It groweth plentifully in Egypt; and *Proſper Alpinus* is thought to mention this by the name of *Sambac Arabum, ſiue Gelſeminum Arabicum*. ‡

4 *Glans vnguentaria*, or the oily Acorne, is the fruit of a tree like Tamariske, of the bigneſſe of an Haſell nut; out of the kernell whereof, no otherwiſe than out of bitter Almonds, is preſſed an oily juyce, which is vſed in pretious Oyntments, as *Dioſcorides* affirmeth. Neither is it in our time wholly rejected; for the oile of this Fruit mixed with ſweete Odours ſerueth to perfume

gloues and diuers other things,and is vulgarly known by the name of oile of Ben.

¶ *The Place.*

1 2 Theſe trees grow not wild in England, but I haue them growing in my garden in very great plenty.

¶ *The Time.*

They floure in Aprill and May,but as yet they haue not borne any fruit in my garden,though in Italy and Spain their fruit is ripe in September.

¶ *The Names.*

The later Phyſitians call the firſt *Syringa*,or rather Σύριγξ,that is to ſay,a Pipe,becauſe the ſtalkes and branches therof when the pith is taken out are hollow like a Pipe: it is alſo many times ſyrnamed *Candida* or white,or *Syringa Candida flore*,or Pipe with a white floure, becauſe it ſhould differ from *Lillach*,which is ſomtimes named *Syringa cærulea*,or blew Pipe: in Engliſh,white Pipe.

Blew Pipe the later phyſitians, as we haue ſaid,do name *Lillach* or *Lilach*: of ſome,*Syringa cærulea*,or blew Pipe: moſt do expound the word *Lillach*,and call it *Ben*: *Serapio's* and the Arabians *Ben* is *Glans Vnguentaria*, which the Grecians name Βάλανος Μυρεψική: from which *Lillach* doth very much differ: amongſt other differences it is very apparant that *Lillach* bringeth forth no nut, howſoeuer *Matthiolus* doth falſly picture it with one; for it hath only a little cod,the ſeed whereof hath in it no oile at all. The figure of the *Balanus Myrepſica* we haue thought good to inſert in this Chapter,for want of a more conuenient roome.

¶ *The Temperature and Vertues.*

Concerning the vſe and faculties of theſe herbs neither we our ſelues haue found out any thing, nor learned ought of others.

‡ *Balanus Myrepſica* taken in the quantity of a dram cauſeth vomit;drunk with *Hydromel* it purgeth by the ſtoole,and is hurtfull to the ſtomacke. A

The oile preſſed out of this fruit,which is vſually termed oile of Ben,as it hath no good or pleaſing ſmell,ſo hath it no ill ſent,neither doth it become rancide by age, which is the reaſon that it is much vſed by Perfumers. B

The oile ſmoothes the skin,ſoftens and diſſolues hardneſſe,and conduces to the cure of all cold affects of the ſinues: and it is good for the pain and noiſe in the ears,being mixt with gooſe greaſe, and ſo dropped in warme in a ſmall quantitie. ‡ C

Chap. 62. *Of Widow-waile or Spurge Olive.*

¶ *The Deſcription.*

Widow-waile is a ſmall ſhrub about two cubits high. The ſtalke is of a woody ſubſtance, branched with many ſmall twigs full of little leaues like Privet,but ſmaller and blacker: on the ends whereof grow ſmall pale yellow floures; whith being paſt, there ſucceedeth a three cornered berry like the Tithymales,for which cauſe it was called *Tricoccos*, that is, three berried *Chamælea*. Theſe berries are green at the firſt,red afterward,and brown when they be withered, and contain in them an oily fatneſſe like that of the Oliue,being of an hot biting taſt,and burning the mouth as do both the leaues and rinde. The root is hard and wooddy.

¶ *The Place.*

It is found in moſt vntilled grounds in Italy and Languedoc in France, in rough and deſart places. I haue it growing in my garden.

¶ *The Time.*

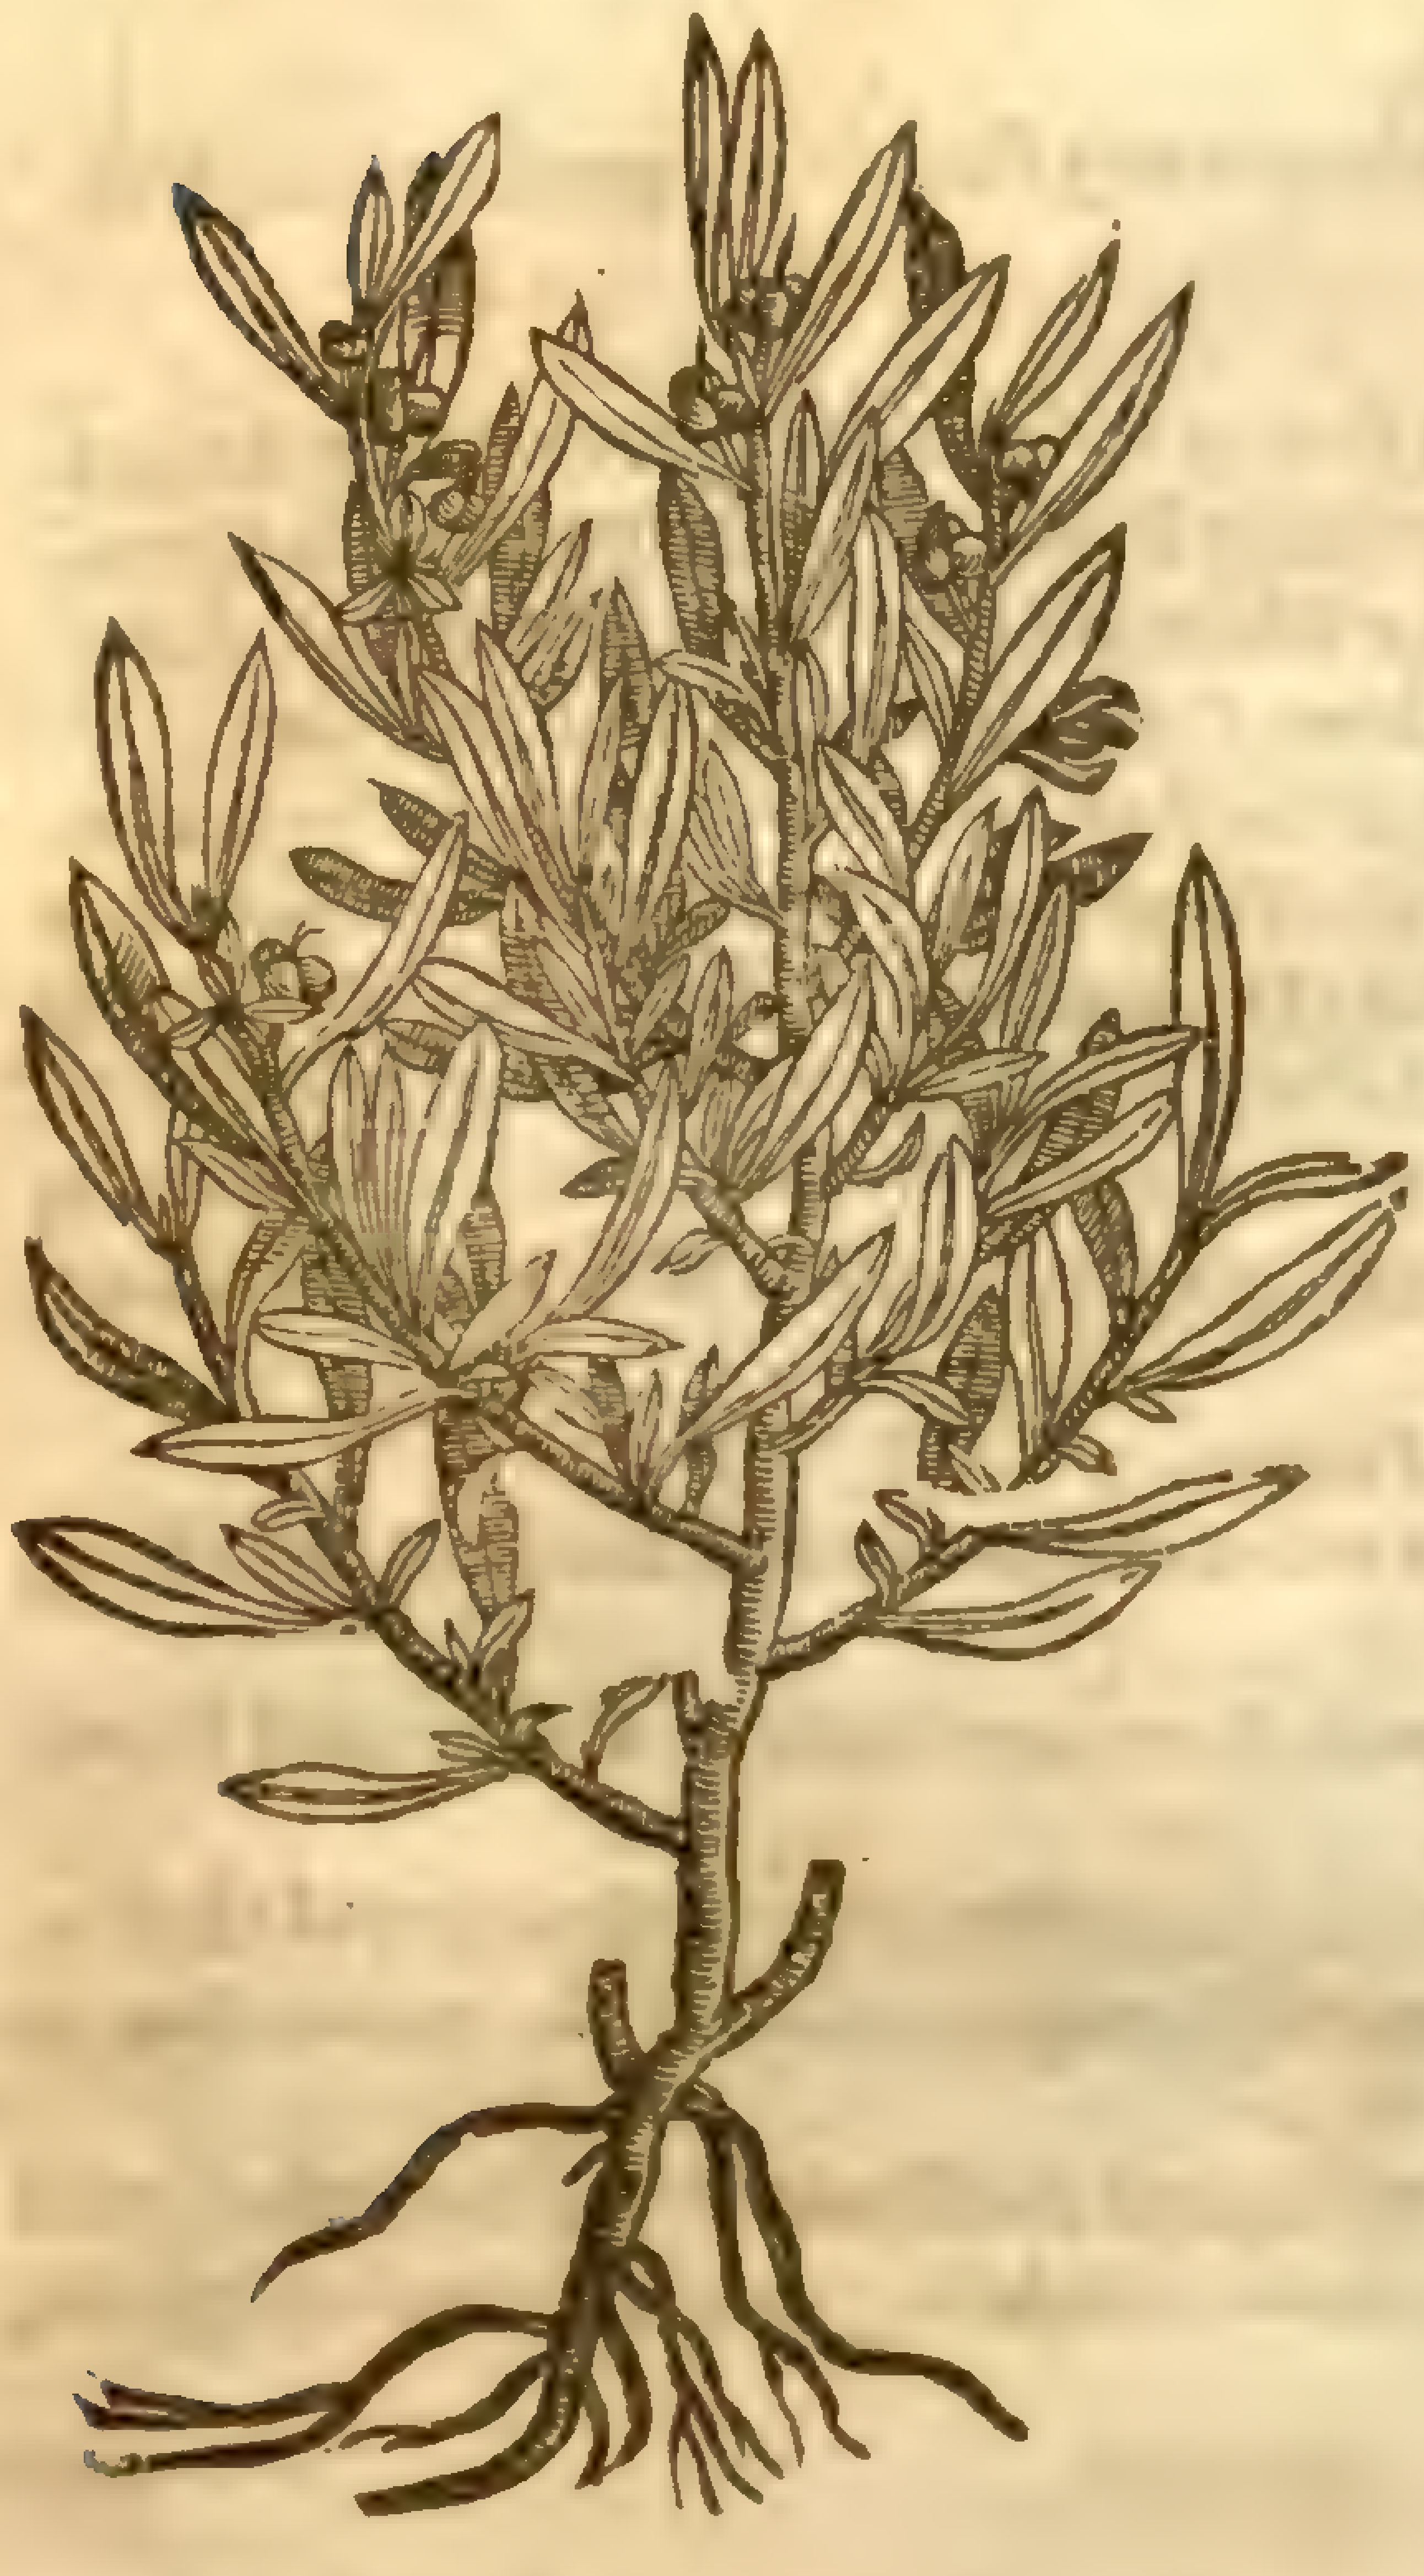
It is alwaies green: the ſeed is ripe in Autumne.

¶ *The Names.*

The Grecians call it χαμελαία, as though they ſhould ſay low or ſhort Oliue tree: the Latines,*Oleago*,& *Oleaſtellus*,and likewiſe *Citocacium*: it is alſo named of diuers,*Olivella*,as *Matthiolus Sylvaticus* ſaith: it is called in Engliſh, Widow-waile,*quia facit viduas*.

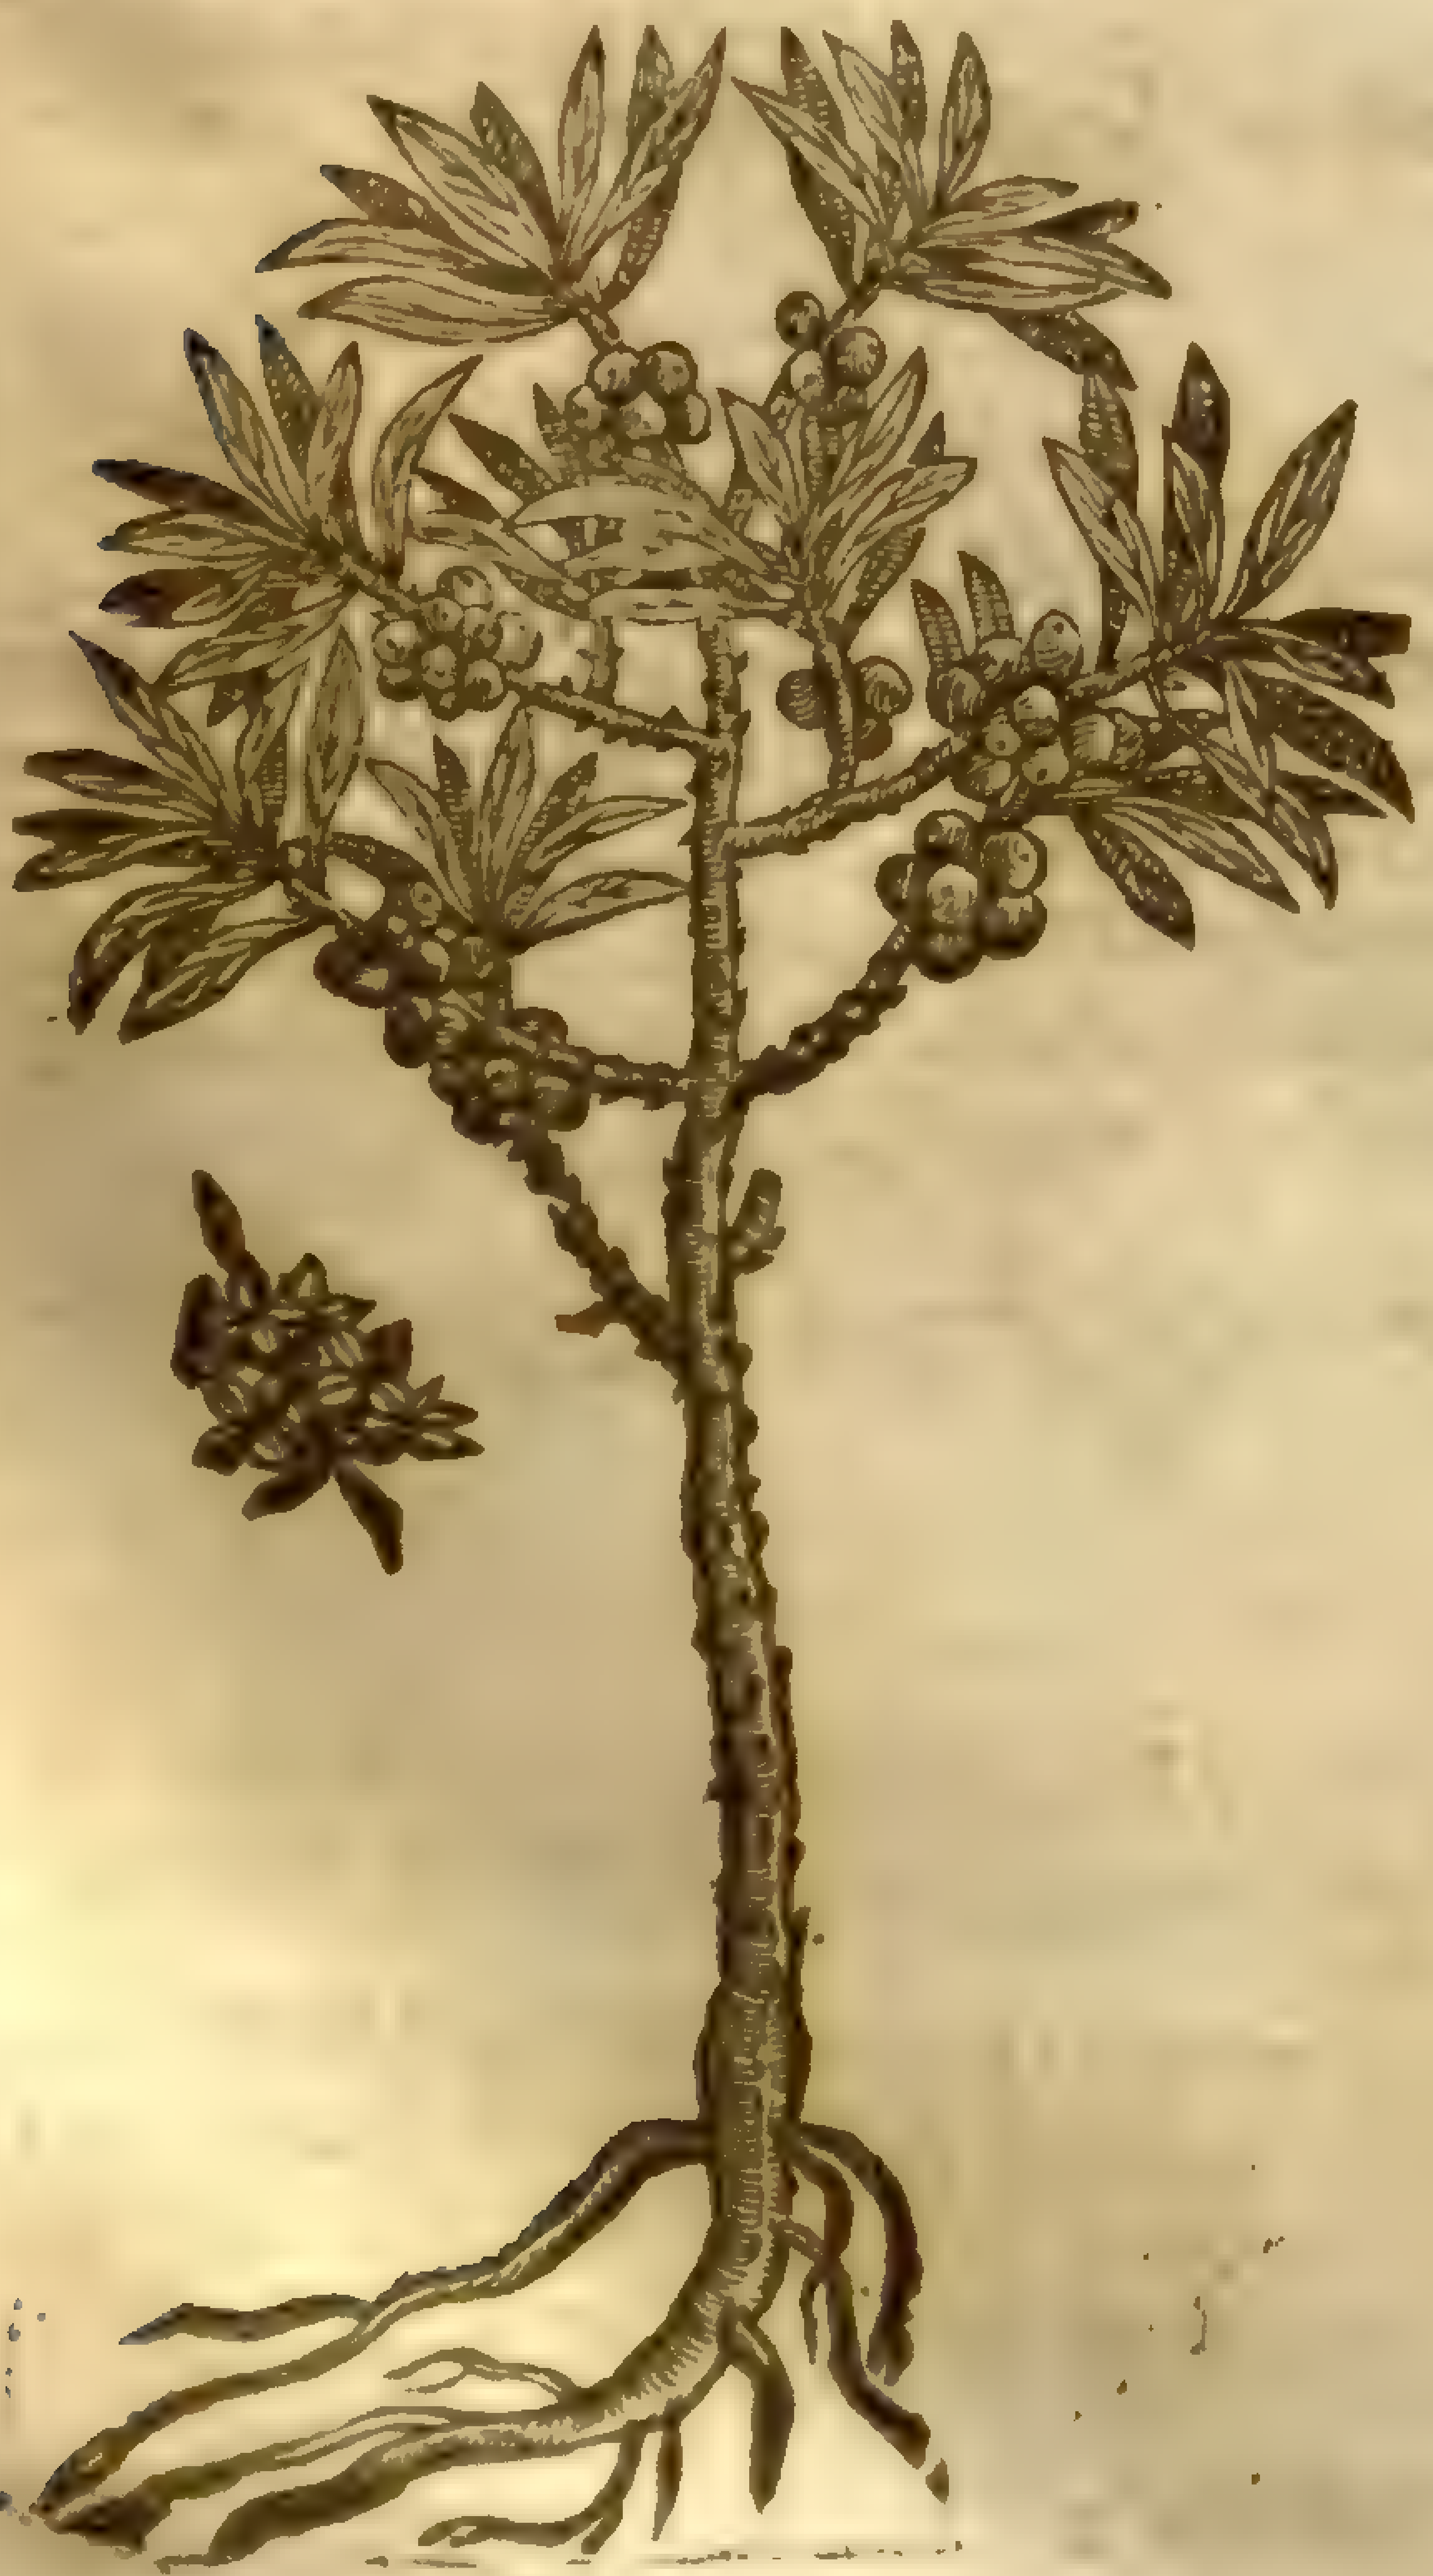
The fruit is named of diuers, Κόκκος κνίδιος: in Latine,*Coccus cnidius*: but he is deceiued,ſaith *Dioſcorides*,that nameth the fruit of Spurge Olive,*Coccus cnidius*. *Avicen* and *Serapio* call *Chamælea* or Spurge Olive, *Mezereon*; vnder which name notwithſtanding they haue alſo contained both the Chamæleons or Carlines,and ſo haue they confounded *Chamælea* or Spurge Olive with the Carlines,and likewiſe *Thymælea* or Spurge flax.

Chamælea Arabum Tricoccos.
Widow-waile.



Cneorum tricoccum, L. [illegible]

Chamælea Germanica, ſive Mezereon.
Spurge Flax, or the dwarfe Bay.



Daphne mezereum, L. [illegible]

¶ *The Temperature.*

Both the leaues and fruit of Spurge olive, as we haue ſaid, are of a burning and extreme hot temperature.

¶ *The Vertues.*

The leaues, ſaith *Dioſcorides*, purge both flegme and choler, eſpecially taken in pils, ſo that two parts of Wormwood be mixed with one of Spurge Olive, and made vp into pills with Mede or honied water: they melt not in the belly, but as many as be taken are voided whole.

Meſue alſo hath a deſcription of pils of the leaues of *Mezereon*, that is, *Chamælea* or ſpurge Olive (yet *Sylvius* expounds it *Thymælea*, or Spurge flax) but in ſtead of wormwood he taketh the outward ſubſtance of the yellow Mirobalans and *Cepula Mirobalans*, and maketh them vp with *Tereniabin*, that is, with Manna and ſoure Dates, which they call Tamarinds, diſſolued in Endive water; & appointeth the ſame leaues to be firſt tempered with very ſtrong vineger, and to be dried.

Theſe pills are commended againſt the dropſie, for they expell waterie humours, but are violent to nature; therefore wee muſt vſe them as little as may be. Further *Dioſcorides* addeth, that the leaues of Spurge olive beaten with hony do clenſe filthy or cruſted vlcers.

CHAP. 63.

Of Germane Olive Spurge.

¶ *The Deſcription.*

The dwarfe Bay tree, called of Dutchmen *Mezereon*, is a ſmal ſhrub two cubits high the branches be tough, limber, and eaſie to bend, very ſoft to be cut: whereon grow long leaues like thoſe of Privet, but thicker & fatter: the floures appeare before the leaues, oft times in Ianuarie, cluſtering together about the ſtalks at certain diſtances, of a whitiſh colour tending to purple, and of a fragrant pleaſant ſweet ſmell: after come the ſmall berries, green at the firſt, but beeing ripe of a ſhining red, and after of a darke blacke colour, of a very hot and burning taſt, inflaming the mouth and throat, with danger of choking. The root is wooddy.

¶ *The Place and Time.*

This plant growes naturally in moiſt and ſhadowy woods of moſt of the Eaſt countries eſpecially about Melvin in Poland, from whence I haue had great plenty for my Garden, where they flour in the firſt of the ſpring, and ripen their fruit in Auguſt.

¶ *The Names.*

It is vſually called in high-Dutch, **Zeillant**, **Zeidelbaſt**, **Leuſzkraut**, and **Killerhals**: the

Apothecaries of our countrey call it *Mezereon*, but wee had rather name it *Chamælea Germanica*, or Dutch Mezereon, or it may be called Germane Olive Spurge. We haue heard that diuers Italians do name the fruit thereof *Piper montanum*, or Mountain Pepper. Some ſay that *Laureola* or Spurge Laurell is this plant; but there is another *Laureola*, of which we will hereafter treat: but by what name it is called of the antient writers, & whether they knew it or no, it is hard to tel. It is thought to be *Cneoron album Theophraſti*, but by reaſon of his breuitie we can affirme no certaintie.

There is, ſaith he, two kindes of *Cneoron*, the white and the blacke, the white hath a long leaf like in forme to Spurge Olive, the blacke is full of ſubſtance like Myrtle; the low one is more white, the ſame is with ſmell, and the blacke without ſmell. The root of both, which groweth deepe, is great: the branches be many, thicke, wooddy, immediatly growing out of the earth, or little aboue the earth, tough; wherefore they vſe theſe to bind with, as with Oziars. They bud and floure when the Autumne Equinoctial is paſt, and a long time after. Thus much *Theophraſtus.*

The Germane Spurge Olive is not much vnlike to the Olive tree in leafe: the floure is ſweet of ſmell, the buds whereof, as we haue written, come forth after Autumne: the branches are wooddy and pliable, the root long, growing deep: all which ſhew that it hath great likeneſſe and affinitie with *Cneoron*, if it be not the very ſame.

¶ *The Temperature.*

This plant is likewiſe in all parts extreme hot: the fruit, leaues, and rinde are very ſharpe and biting; they bite the tongue, and ſet the throat on fire.

¶ *The Vertues.*

The leaues of Mezereon do purge downeward, flegme, choler, and wateriſh humours, with great violence. A

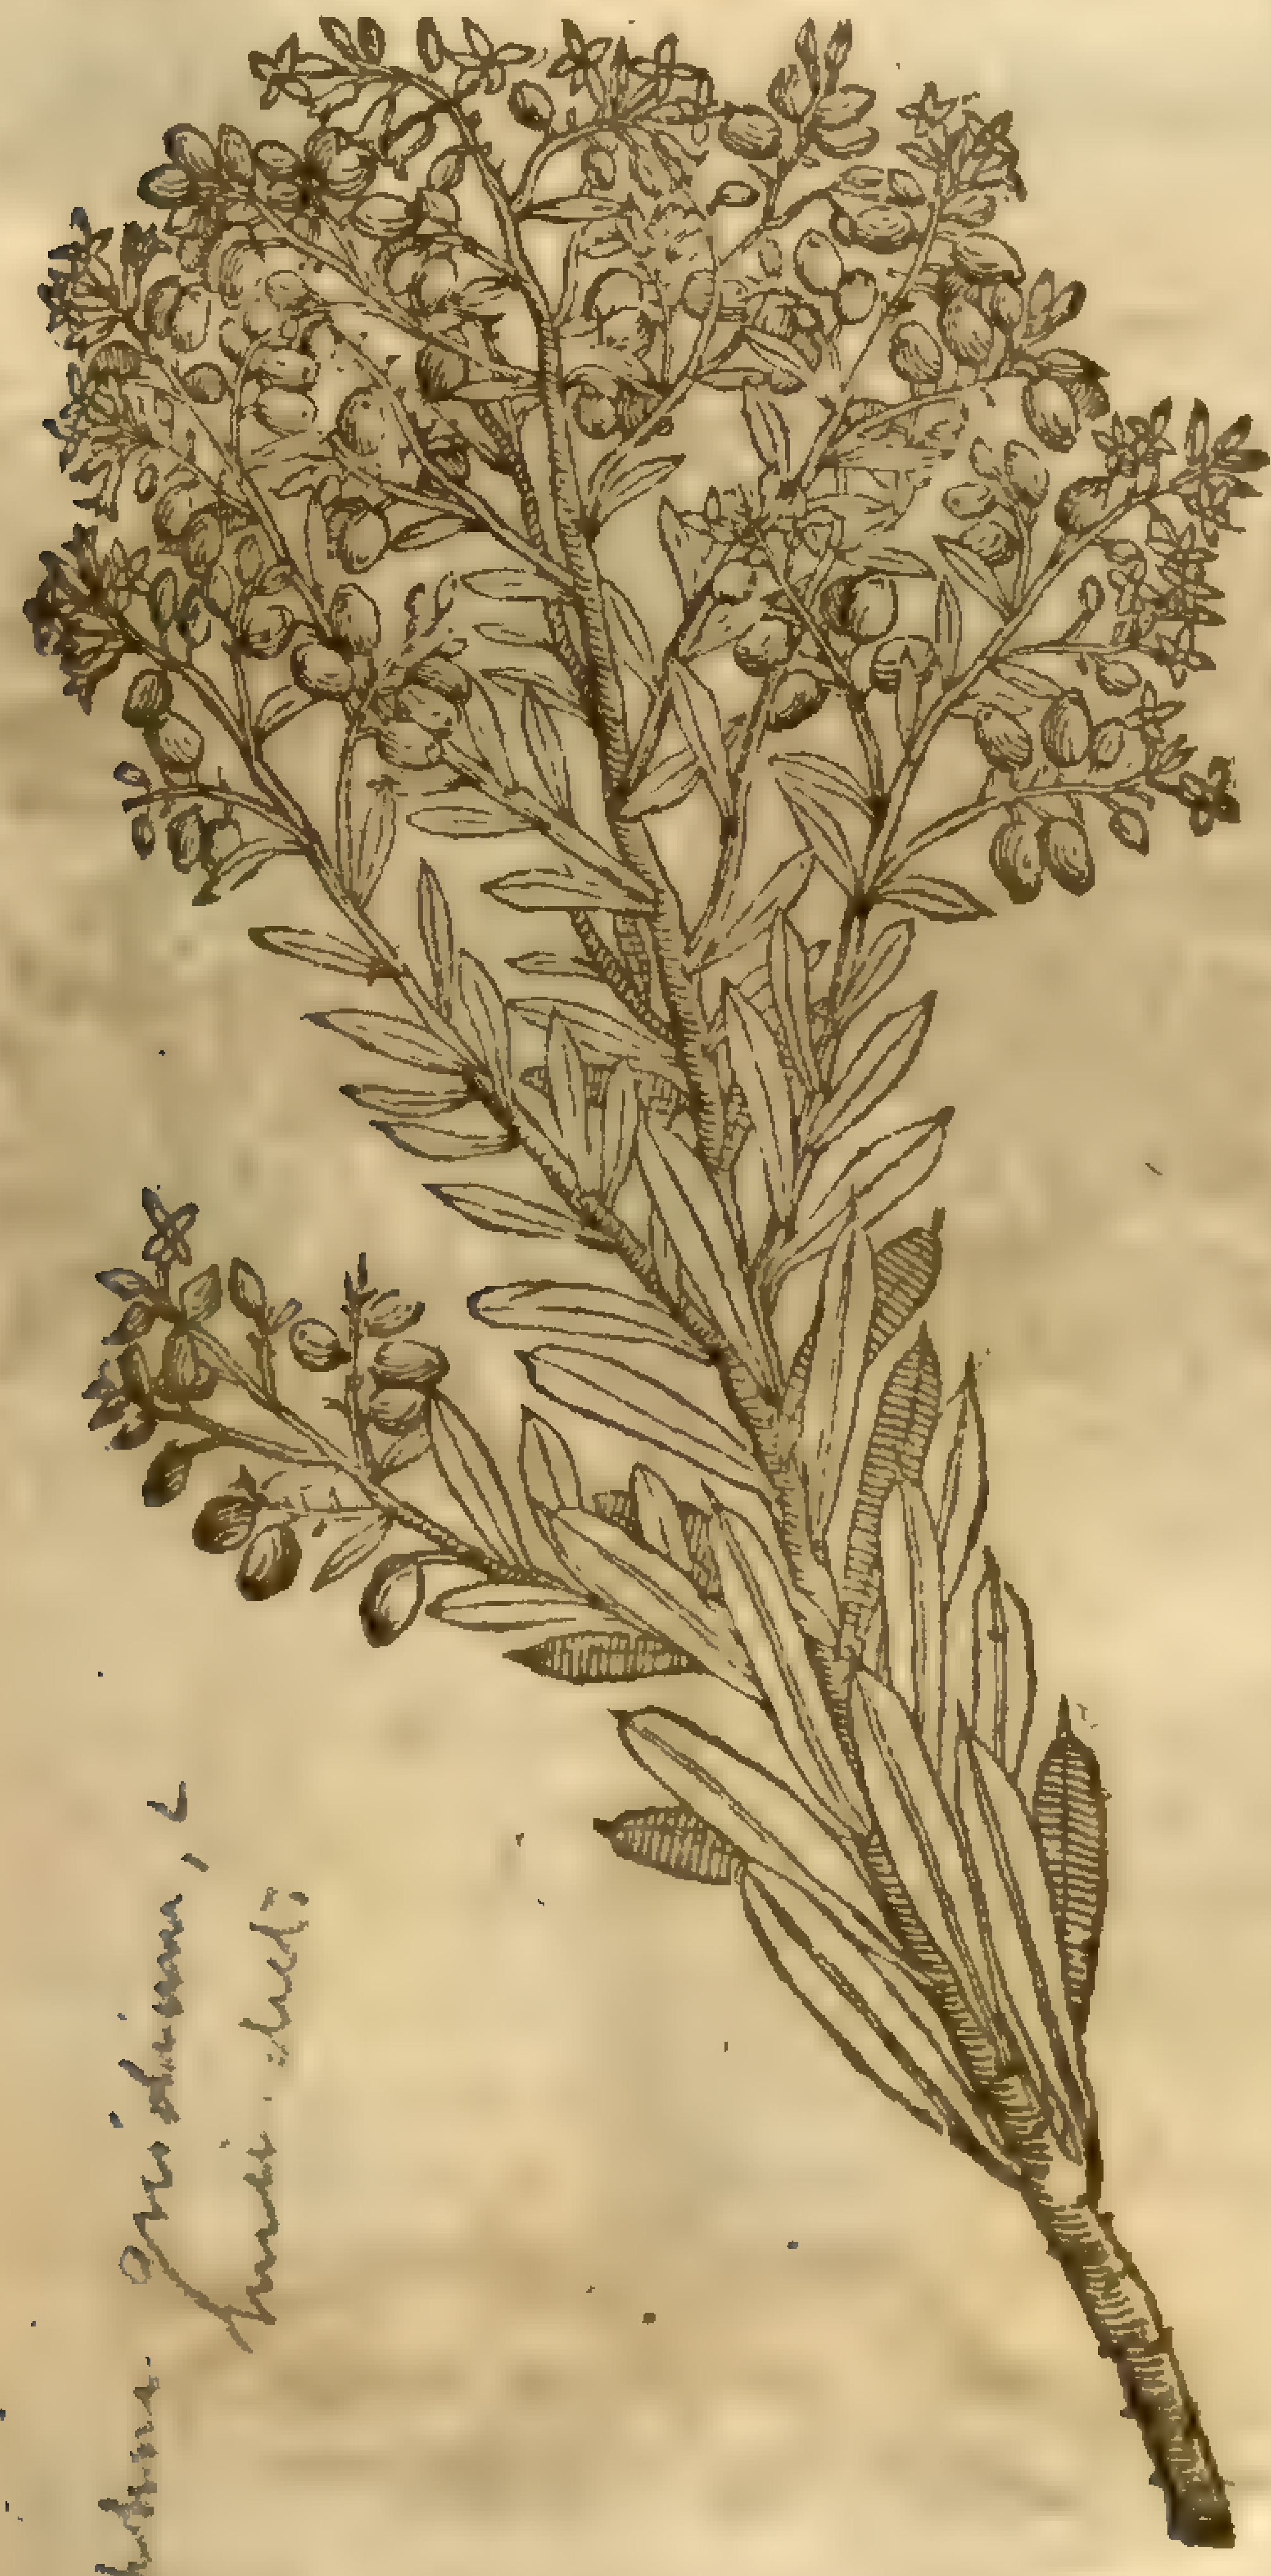
Alſo if a drunkard doe eat one graine or berry of this plant, hee cannot be allured to drinke any drinke at that time, ſuch will be the heate in his mouth and choking in the throat. B

This plant is very dangerous to be taken into the body, and in nature like to the ſea Tithymale, leauing (if it be chewed) ſuch an heate and burning in the throat, that it is hard to be quenched. C

The ſhops of Germany and the Low-countries do when need requires vſe the leaues hereof in ſtead of Spurge Olive; which may be done without error, for this Germane Spurge Olive is like in vertue and operation to the other: therefore it may be vſed in ſtead therof, and prepared after the ſelfe ſame manner. D

CHAP. 64. *Of Spurge Flax.*

Thymælea.
Spurge Flax, or mountaine Widow-waile.



Daphne Gnidium, L.
[illegible]

¶ *The Deſcription.*

SPurge Flax bringeth forth many ſlender branched ſprigs aboue a cubit high, couered round with long and narrow leaues like thoſe of Flax, narrower and leſſer than the leaues of Spurge Olive. The flours are white, ſmal, ſtanding on the vpper parts of the ſprigs: the fruit is round, greene at the firſt, but red when it is ripe, like almoſt to the round berries of the Hawthorne; in which is a white kernell couered with a blacke skin, very hot, and burning the mouth like Mezereon. The root is hard and wooddy.

¶ *The Place.*

It growes in rough mountaines and vntoiled places in hot regions. It groweth in my garden.

¶ *The Time.*

It is green at any time of the yeare, but the fruit is perfected in Autumne.

¶ *The Names.*

The Grecians cal it θυμελαια: the Syrians, as *Dioſcorides* witneſſeth, *Apolinon*: Diuers alſo *Chamælea*, but vnproperly. *Dioſcorides* ſaith the leafe is properly called *Cneoron*, and the fruit *Coccos Cnidios*: notwithſtanding thoſe which *Theophraſtus* calls *Cneora* ſeeme to differ from *Thymælea*, or Spurge flax, vnleſſe *Nigrum Cneoron*

ron be *Thymalea*: for *Theophraſtus* ſaith that there be two kindes of *Cneoron*, the one white, the other blacke. This may be called in Engliſh, Spurge flax, or mountain Widow-waile. The ſeed of *Thymalea* is called in ſhops *Granum Cnidium*.

¶ *The Temperature.*

Spurge Flax is naturally both in leaues and fruit extreme hot, biting, and of a burning qualitie.

¶ *The Vertues.*

A The graines or berries, as *Dioſcorides* ſaith, purge by ſiege choler, flegme, and water, if 20 graines of the inner part be drunke; but it burneth the mouth and throat: wherefore it is to be giuen with fine floure of Barly meale, or in Raiſins, or couered with clarified hony, that it may be ſwallowed.

B The ſame being ſtamped with Niter and vineger ſerueth to anoint thoſe with which can hardly ſweat.

C The leaues muſt be gathered about harueſt, and being dried in the ſhade, they are to be layd vp and reſerued.

D They that would giue them muſt beat them and take forth the ſtrings: the quantity of two ounces and two drammes put into Wine tempered with water, purgeth and draweth forth watery humors: but they purge more gently if they be boiled with Lentils, and mixed with pot-herbs chopped.

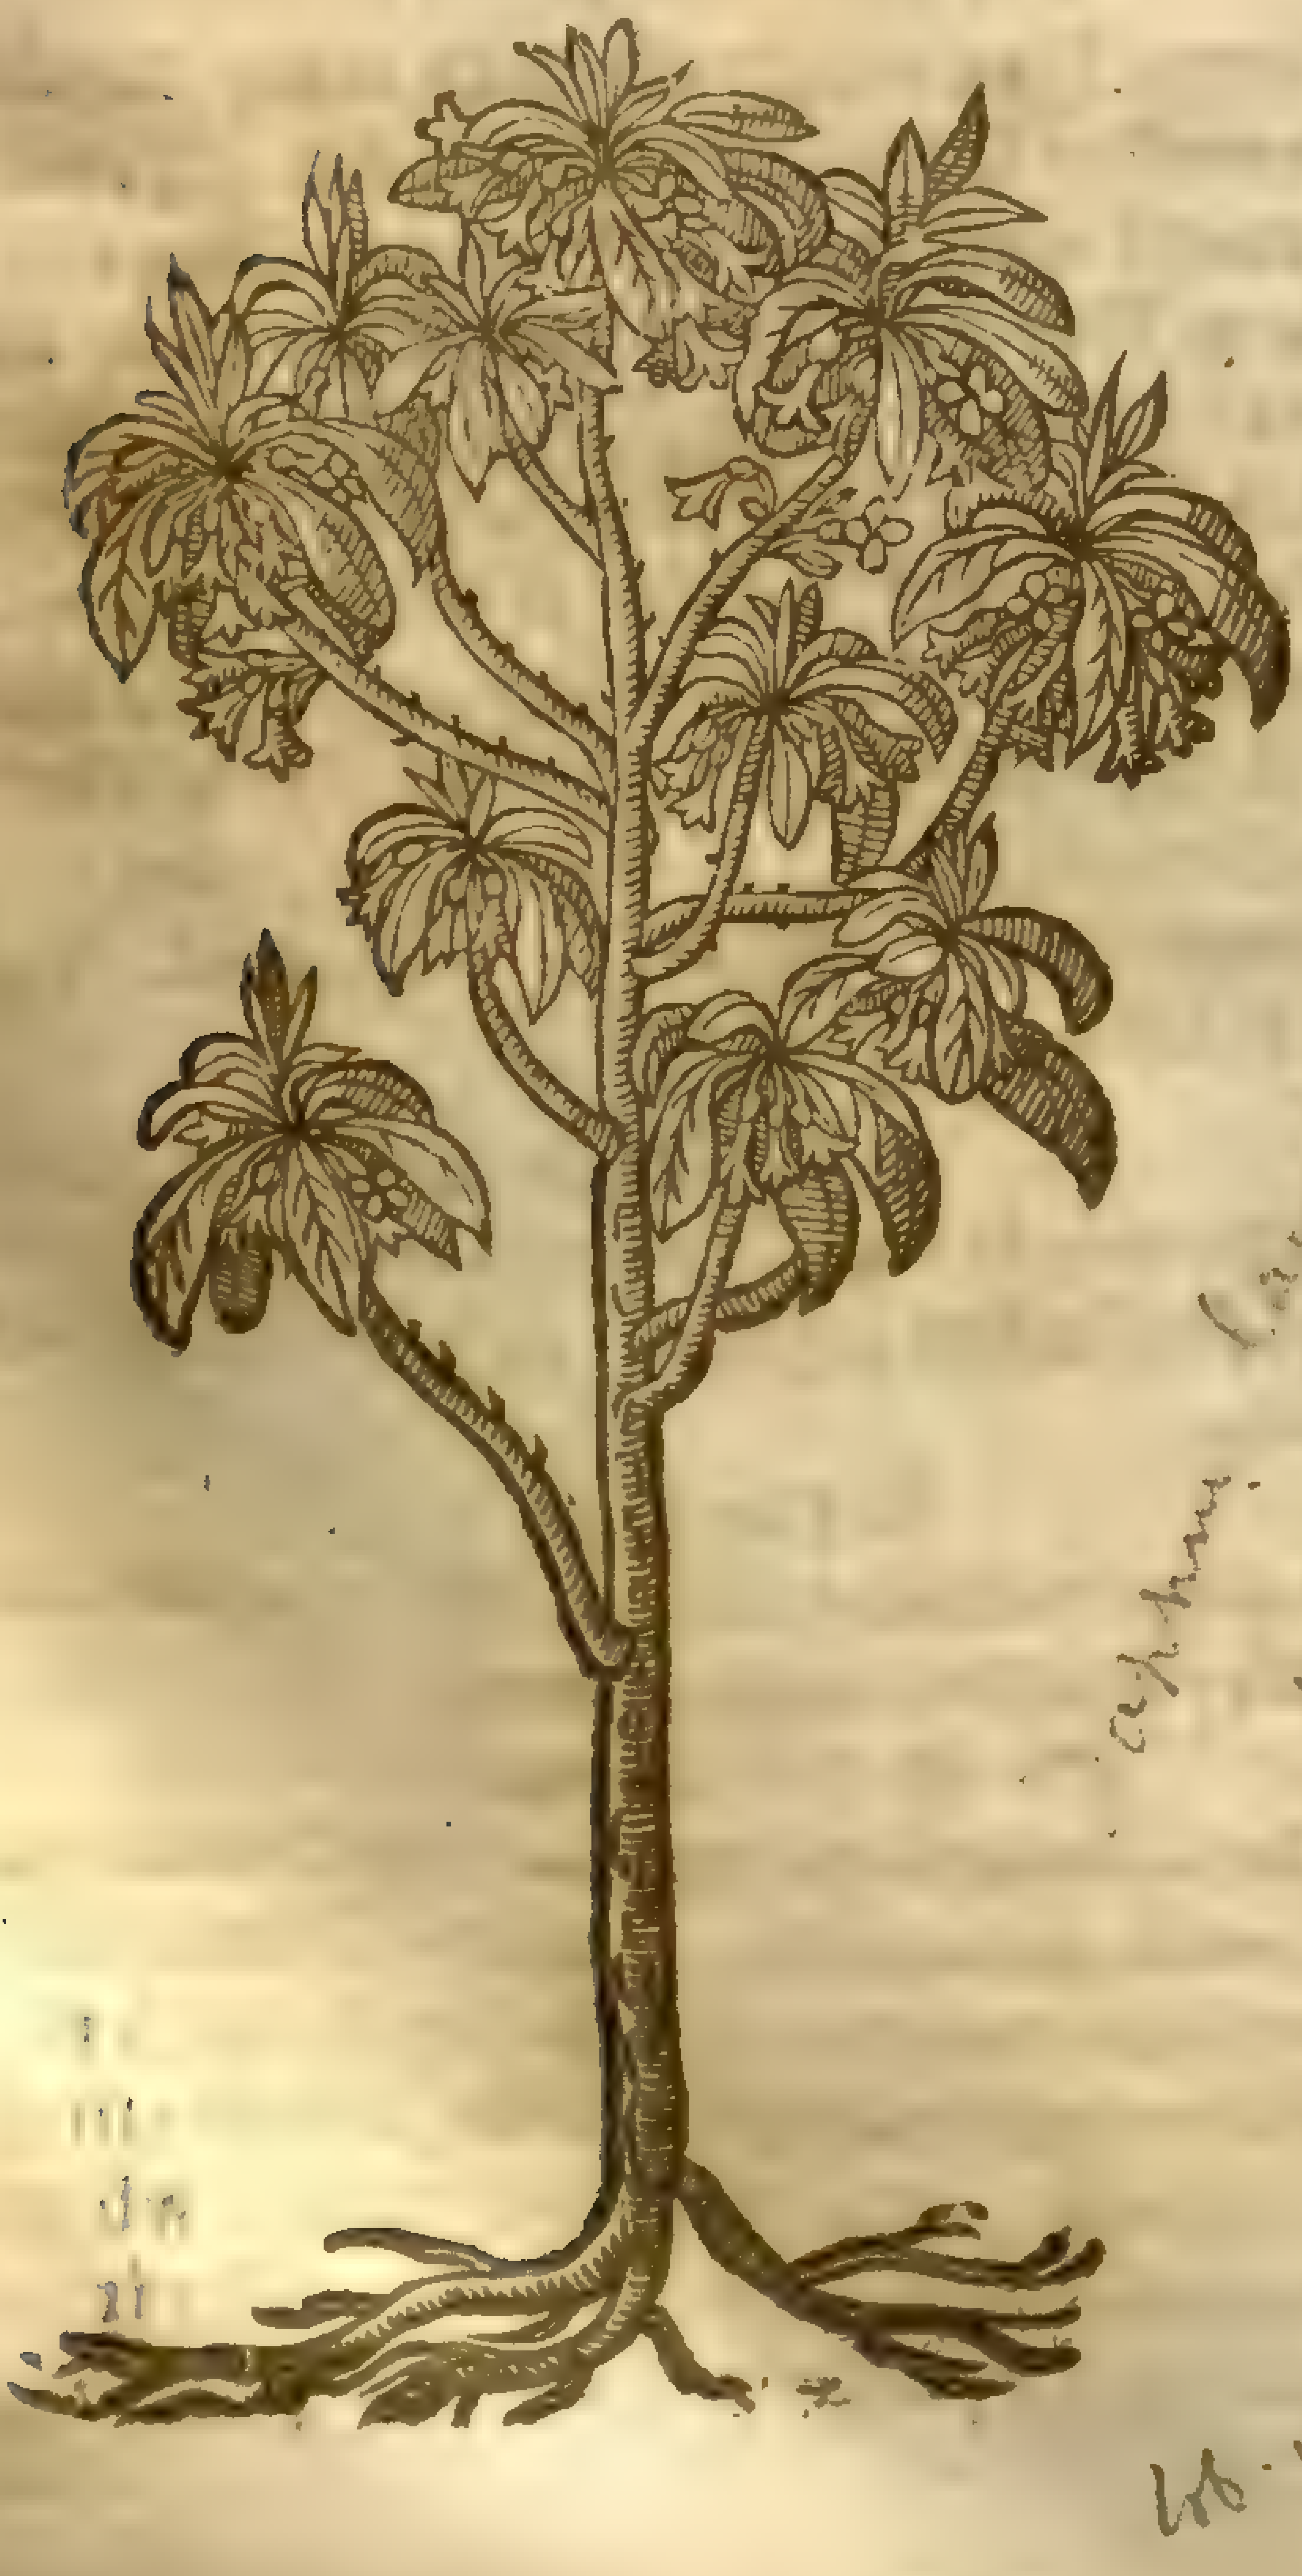
E The ſame leaues beaten to pouder and made vp into trochiskes or flat cakes with the iuyce of ſoure grapes, are reſerued for vſe.

F The herb is an enemie to the ſtomacke, which alſo deſtroyeth the birth if it be applied.

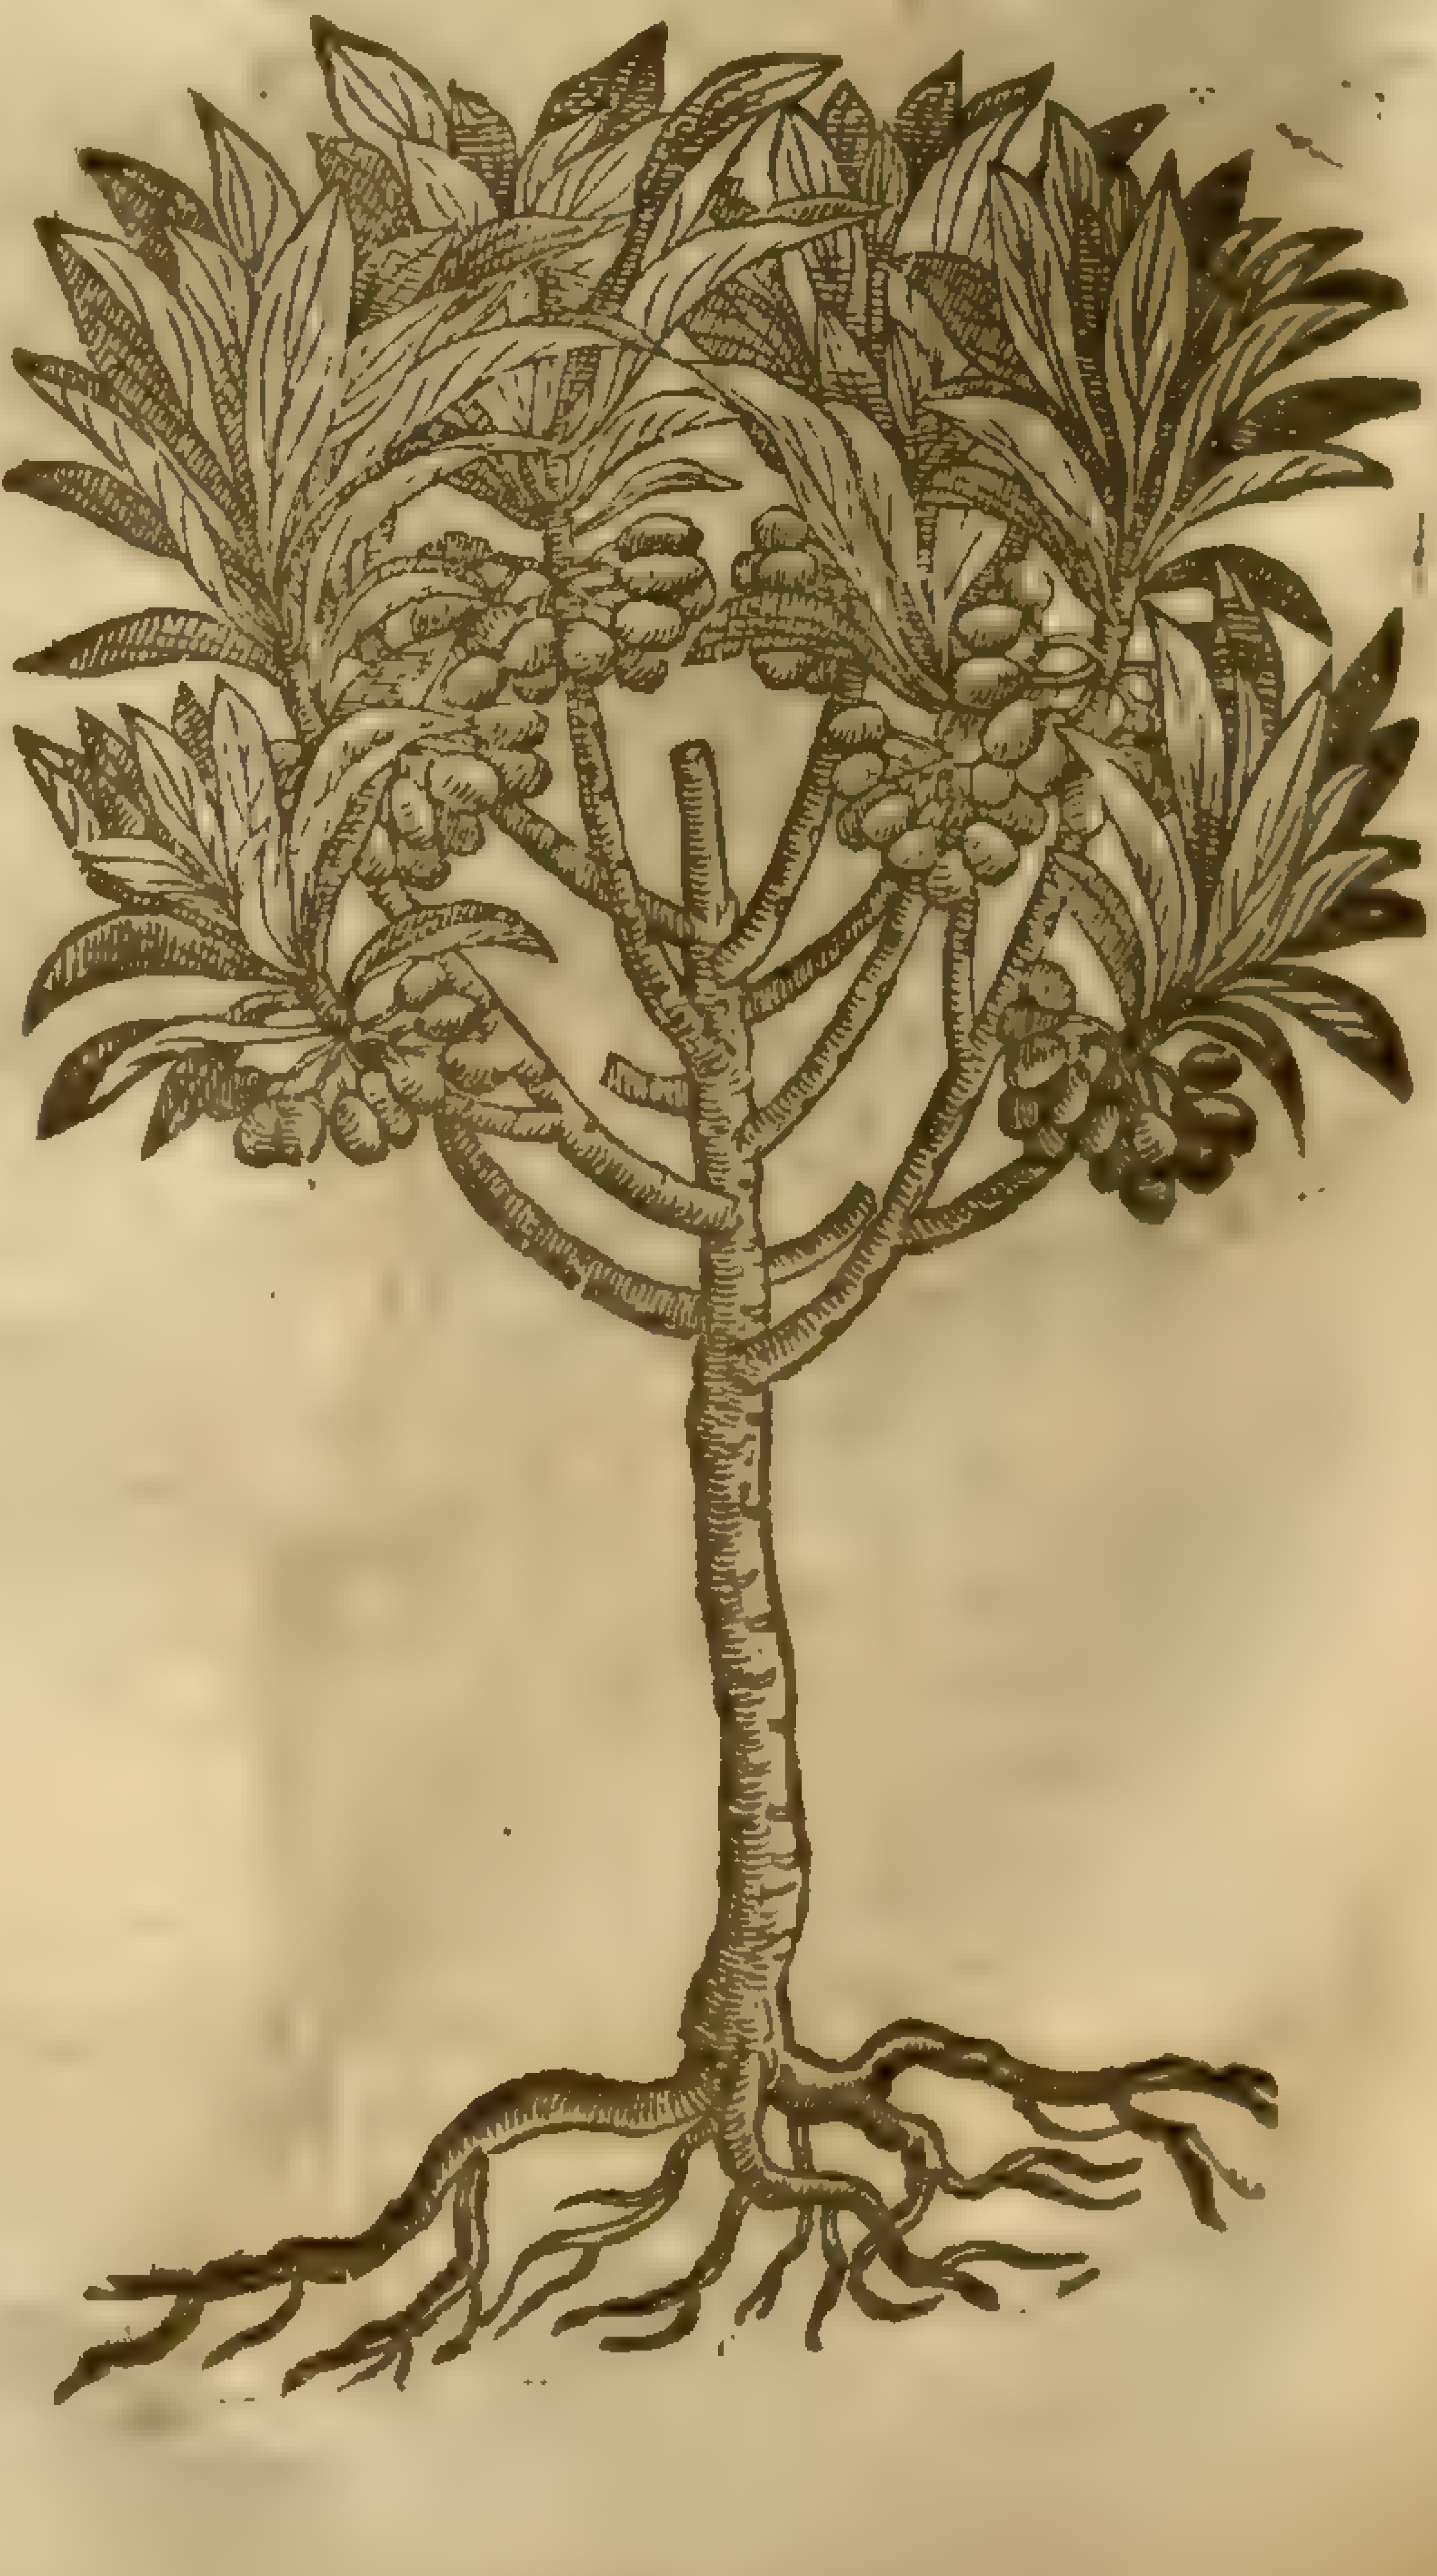
† Our Author formerly following *Tabern.* gaue two figures and deſcriptions in this Chap. but being both of one thing, I omitted the worſer figure and deſcription.

Chap. 65. *Of Spurge Laurel.*

Laureola florens.
Laurel or Spurge Laurell flouring.



Laureola cum fructu.
Laurel with his fruit.



[illegible] Laureola
[illegible]
Sp. pl. 2. 229

Lob. ic. 368

¶ *The Deſcription.*

Spurge Laurell is a ſhrub of a cubit high,oftentimes alſo of two, and ſpreadeth with many little boughes which are tough and lithy,and couered with a thicke rinde : the leaues be long,broad, groſſe,ſmooth,blackiſh green,ſhining like the leaues of Laurell,but leſſer,thicker,and without ſmell,very many at the top cluſtering together. The floures bee long,hollow,of a whitiſh greene, hanging beneath and among the leaues : the berries when they be ripe are blacke, with a hard kernell within,which is a little longer than the ſeed of Hemp : the pulpe or inner ſubſtance is white : the root wooddy,tough,long,and diuerſly parted,growing deep : the leaues,fruit,and bark,as well of the root as of the little boughes,do with their ſharpneſſe and burning qualitie bite and inflame the tongue and throat.

¶ *The Place.*

It is found on mountaines in vntilled rough ſhadowy and wooddy places,as by the lake of Lozanna in Geneva, and in many places neere the riuer of Rhene and of the Maze. ‡ It growes abundantly alſo in the woods in moſt parts of England. ‡

¶ *The Time.*

The floures bud very ſoon,a little after the Autumne Æquinoctial : they are full blown in winter or in the firſt Spring : the fruit is ripe in May and Iune ; the plant is alwaies greene, and endureth the cold ſtormes of winter.

¶ *The Names.*

It is called in Greeke Δαφνοειδὴς, of the likeneſſe it hath with the leaues of the Laurel or Bay tree: in Latine likewiſe *Daphnoides:* the later Latines for the ſame cauſe name it *Laureola*,as though they ſhould ſay *Minor Laurus* or little Laurel. It is called χαμαιδάφνη, and πέπλιον : notwithſtanding there is another *Chamædaphne* and another *Peplion*. This ſhrub is commonly called in Engliſh, Spurge Laurell ; of diuers,Lawrell or Lowry.

Some ſay that the Italians name the berries thereof *Piper montanum*,or mountain Pepper,as alſo the berries of Dutch Mezereon : others affirme them to be called in high-Dutch alſo **Zeilant**.

It may be *Theophraſtus* his *Cneoron* ; for it is very like the Myrtle in leafe , it is alſo a branched plant,tough and pliable,hauing a deep root without ſmell,with a blacke fruit.

¶ *The Temperature.*

It is like in temperature and facultie to the German Spurge Oliue, throughout the whole ſubſtance biting and extreme hot.

¶ *The Vertues.*

The dry or green leaues of Spurge Laurel,ſaith *Dioſcorides*,purgeth by ſiege flegmatick humors; it prouoketh vomit and bringeth downe the menſes,and being chewed it draweth water out of the head. A

It likewiſe cauſeth neeſing. Moreouer,fifteen grains of the ſeed thereof drunk are a purgation. B

Chap. 66. *Of Roſe-Bay or Oleander.*

¶ *The Deſcription.*

1 Roſe bay is a ſmal ſhrub of a gallant ſhew like the Bay tree,bearing leaues thicker,greater,longer,and rougher than the leaues of the Almond tree : the flours be of a fair red colour,diuided into fiue leaues,not much vnlike a little Roſe : the cod or fruit is long like *Aſclepias* or *Vincetoxicum*,and full of ſuch white down, among which the ſeed lieth hidden:the root is long,ſmooth,and wooddy.

2 The ſecond kinde of Roſe Bay is like the firſt,and differs in that, that this plant hath white floures ; but in other reſpects it is very like.

¶ The

Nerium oleander, [illegible]

1 *Nerium, ſiue Oleander.*
The Roſe Bay.

2 *Nerium flore albo.*
The Roſe Bay with white flours.

¶ *The Place.*

Theſe grow in Italy and other hot regions by riuers and the ſea ſide: I haue them growing in my garden.

¶ *The Time.*

In my garden they floure in Iuly and Auguſt: the cods be ripe afterwards.

¶ *The Names.*

This plant is named in Greeke Νήριον, by *Nicander*, Νήρις: in Latine likewiſe *Nerion* and alſo *Rhododendron*, and *Rhododaphne*, that is to ſay, *Roſea arbor*, or *Roſea Laurus*: in ſhops, *Oleander*: in Italian, *Oleandro*: in Spaniſh, *Adelfa*, *Eloendro*, and *Alendro*: in French, *Roſagine*: in Engliſh, Roſe tree, Roſe-Bay, Roſe Bay tree, and Oleander.

¶ *The Temperature and Vertues.*

A This tree being outwardly applied, as *Galen* ſaith, hath a digeſting facultie: but if it be inwardly taken it is deadly and poiſonſome, not only to men, but alſo to moſt kindes of beaſts.

B The flours and leaues kill dogs, aſſes, mules, and very many other foure footed beaſts: but if men drinke them in wine they are a remedy againſt the bitings of Serpents, and the rather if Rue be added.

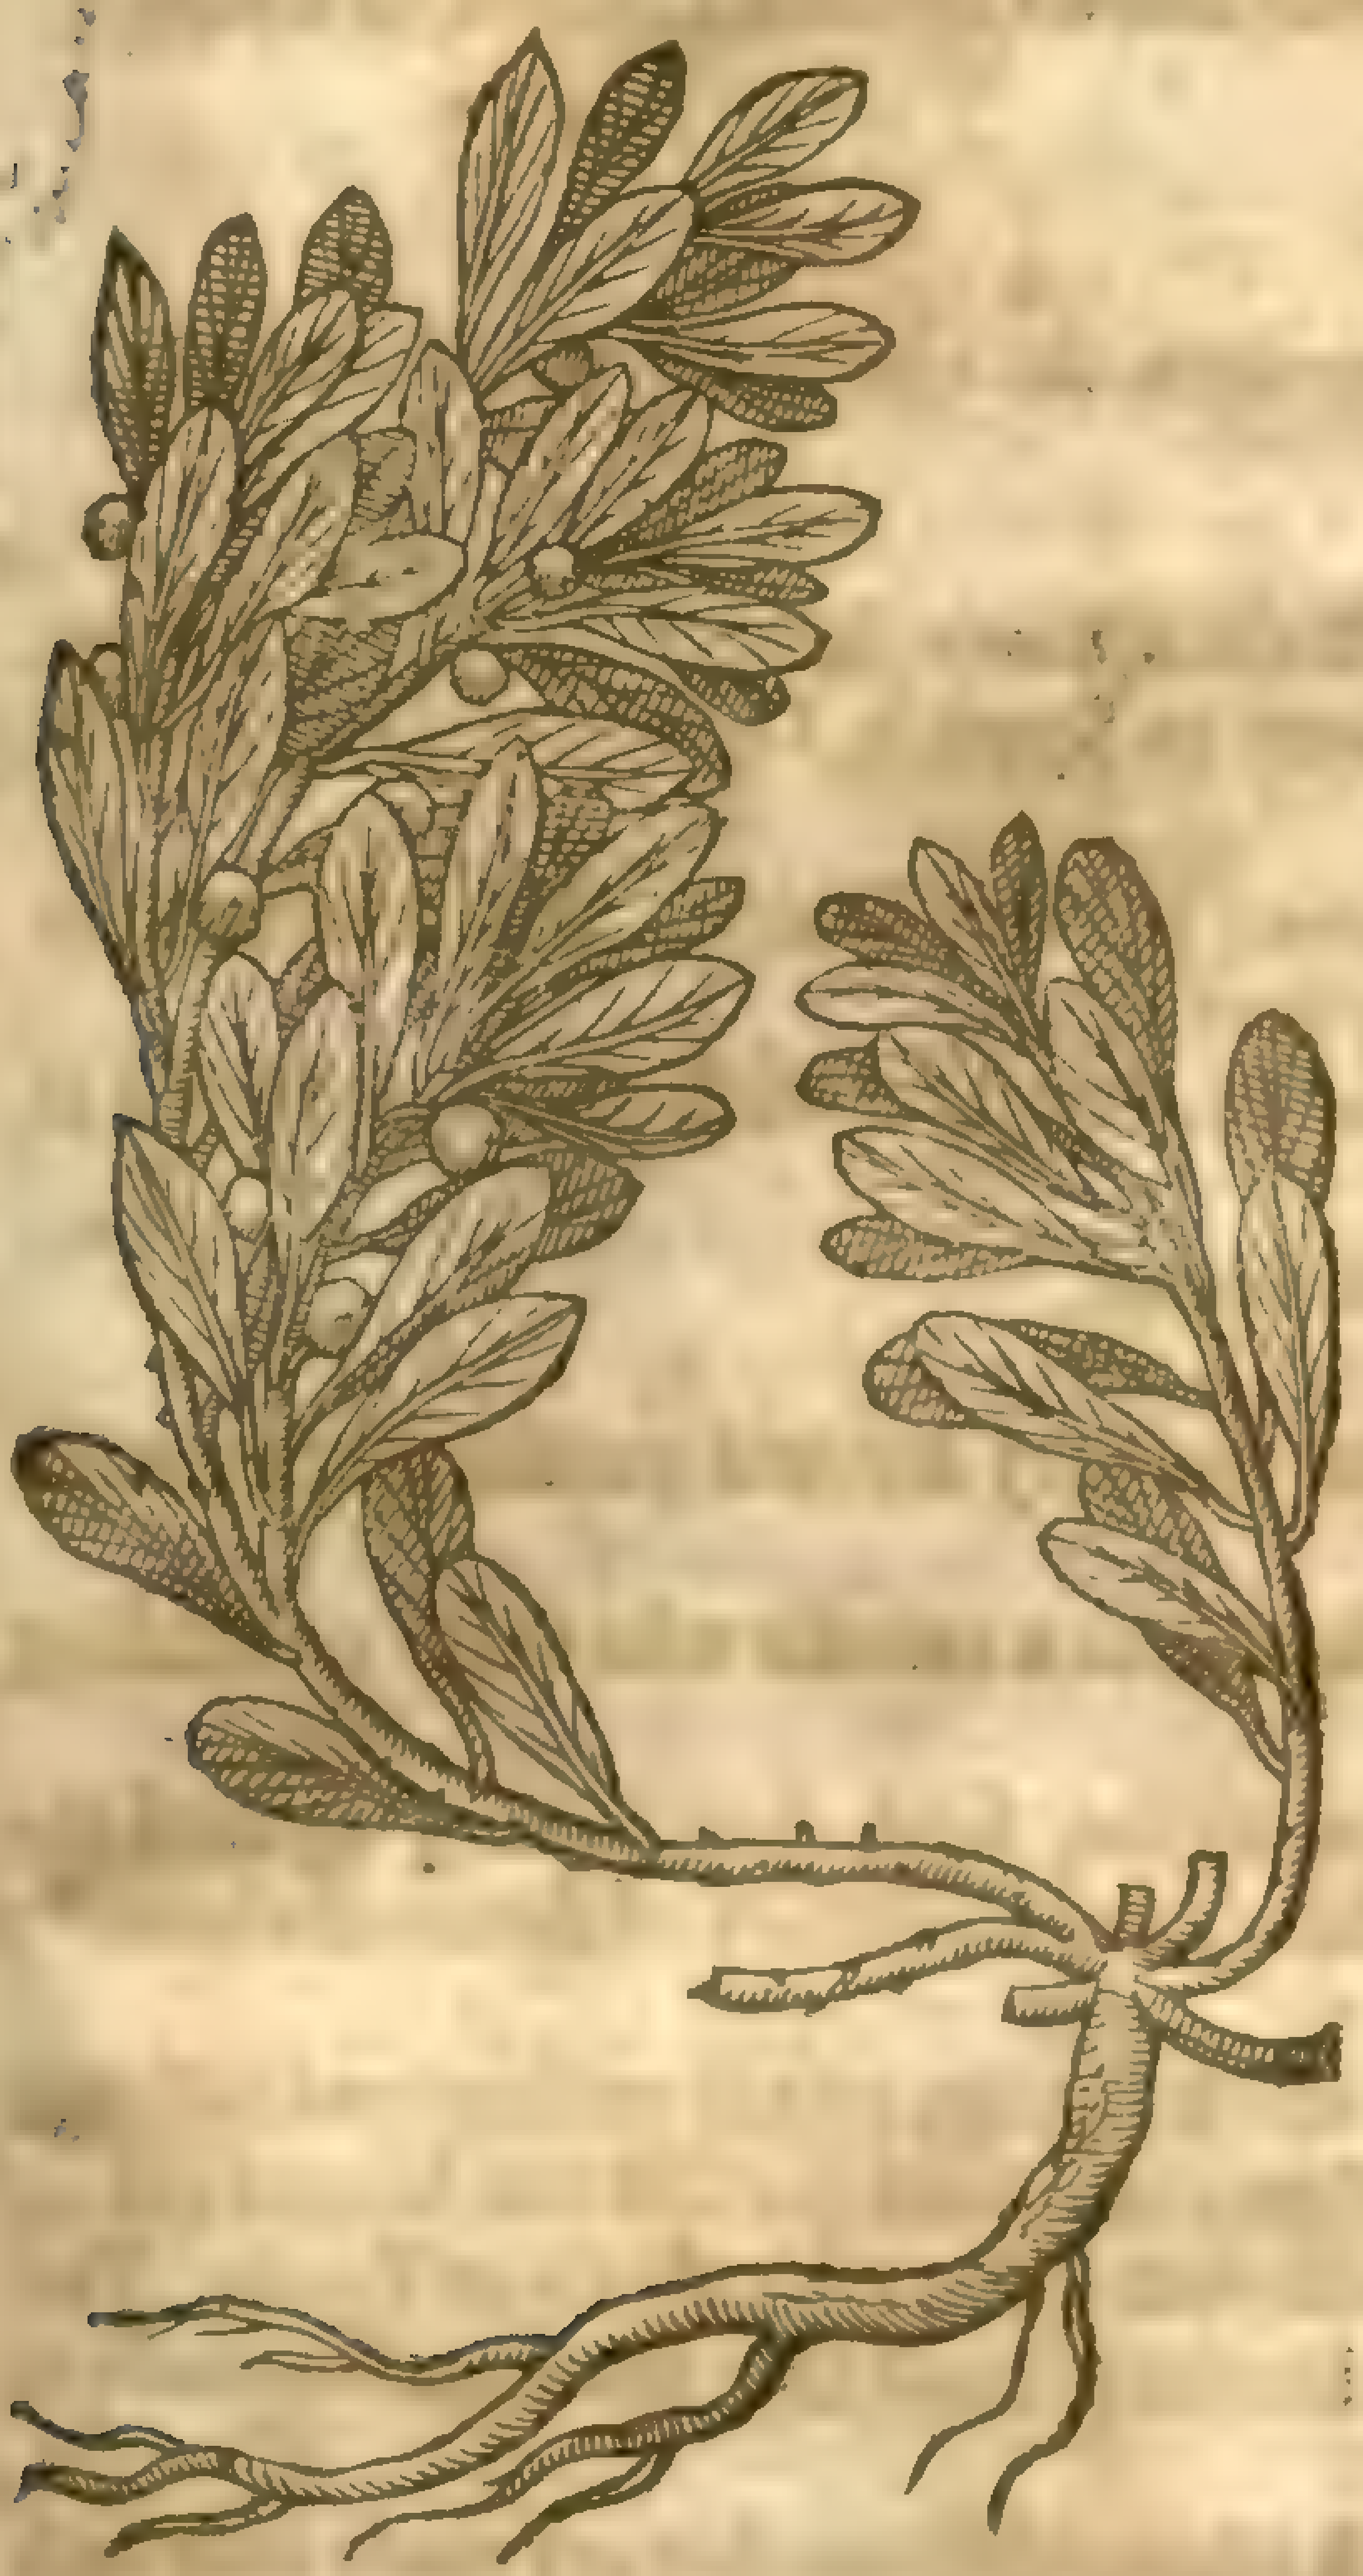
C The weaker ſort of Cattell, as ſheep and goats, if they drinke the water wherein the leaues haue been ſteeped, are ſure to die.

Chap. 67. *Of dwarfe Roſe Bay.*

¶ *The Deſcription.*

Dwarfe *Nerium* or Roſe Bay hath leaues which for the moſt part are alwaies green, rough, and ſmall, of a pale yellow colour like Box, far leſſer than Oleander: the whole plant is of a ſhrubby ſtature, leaning this way and that way, as not able to ſtand vpright without help; his branches are couered and ſet full of ſmall floures, of a ſhining ſkarlet or crimſon colour, growing vpon the

Chamærhodendros Alpigena.
Dwarſe Roſe Bay.



the hills as you goe from Trent to Verona, which in Iune and Iuly are as it were couered with a ſcarlet colored carpet, of an odoriferous ſauor and delectable aſpect; which being fallen, there commeth ſeed and faire berries like Aſparagus.

¶ *The Place.*

The place and time are expreſſed in the deſcription.

¶ *The Names.*

This may be called in Engliſh, dwarf roſe Bay of the Alps. I find nothing extant of the vertues, but am conſtrained to leaue the reſt vnto your owne diſcretion.

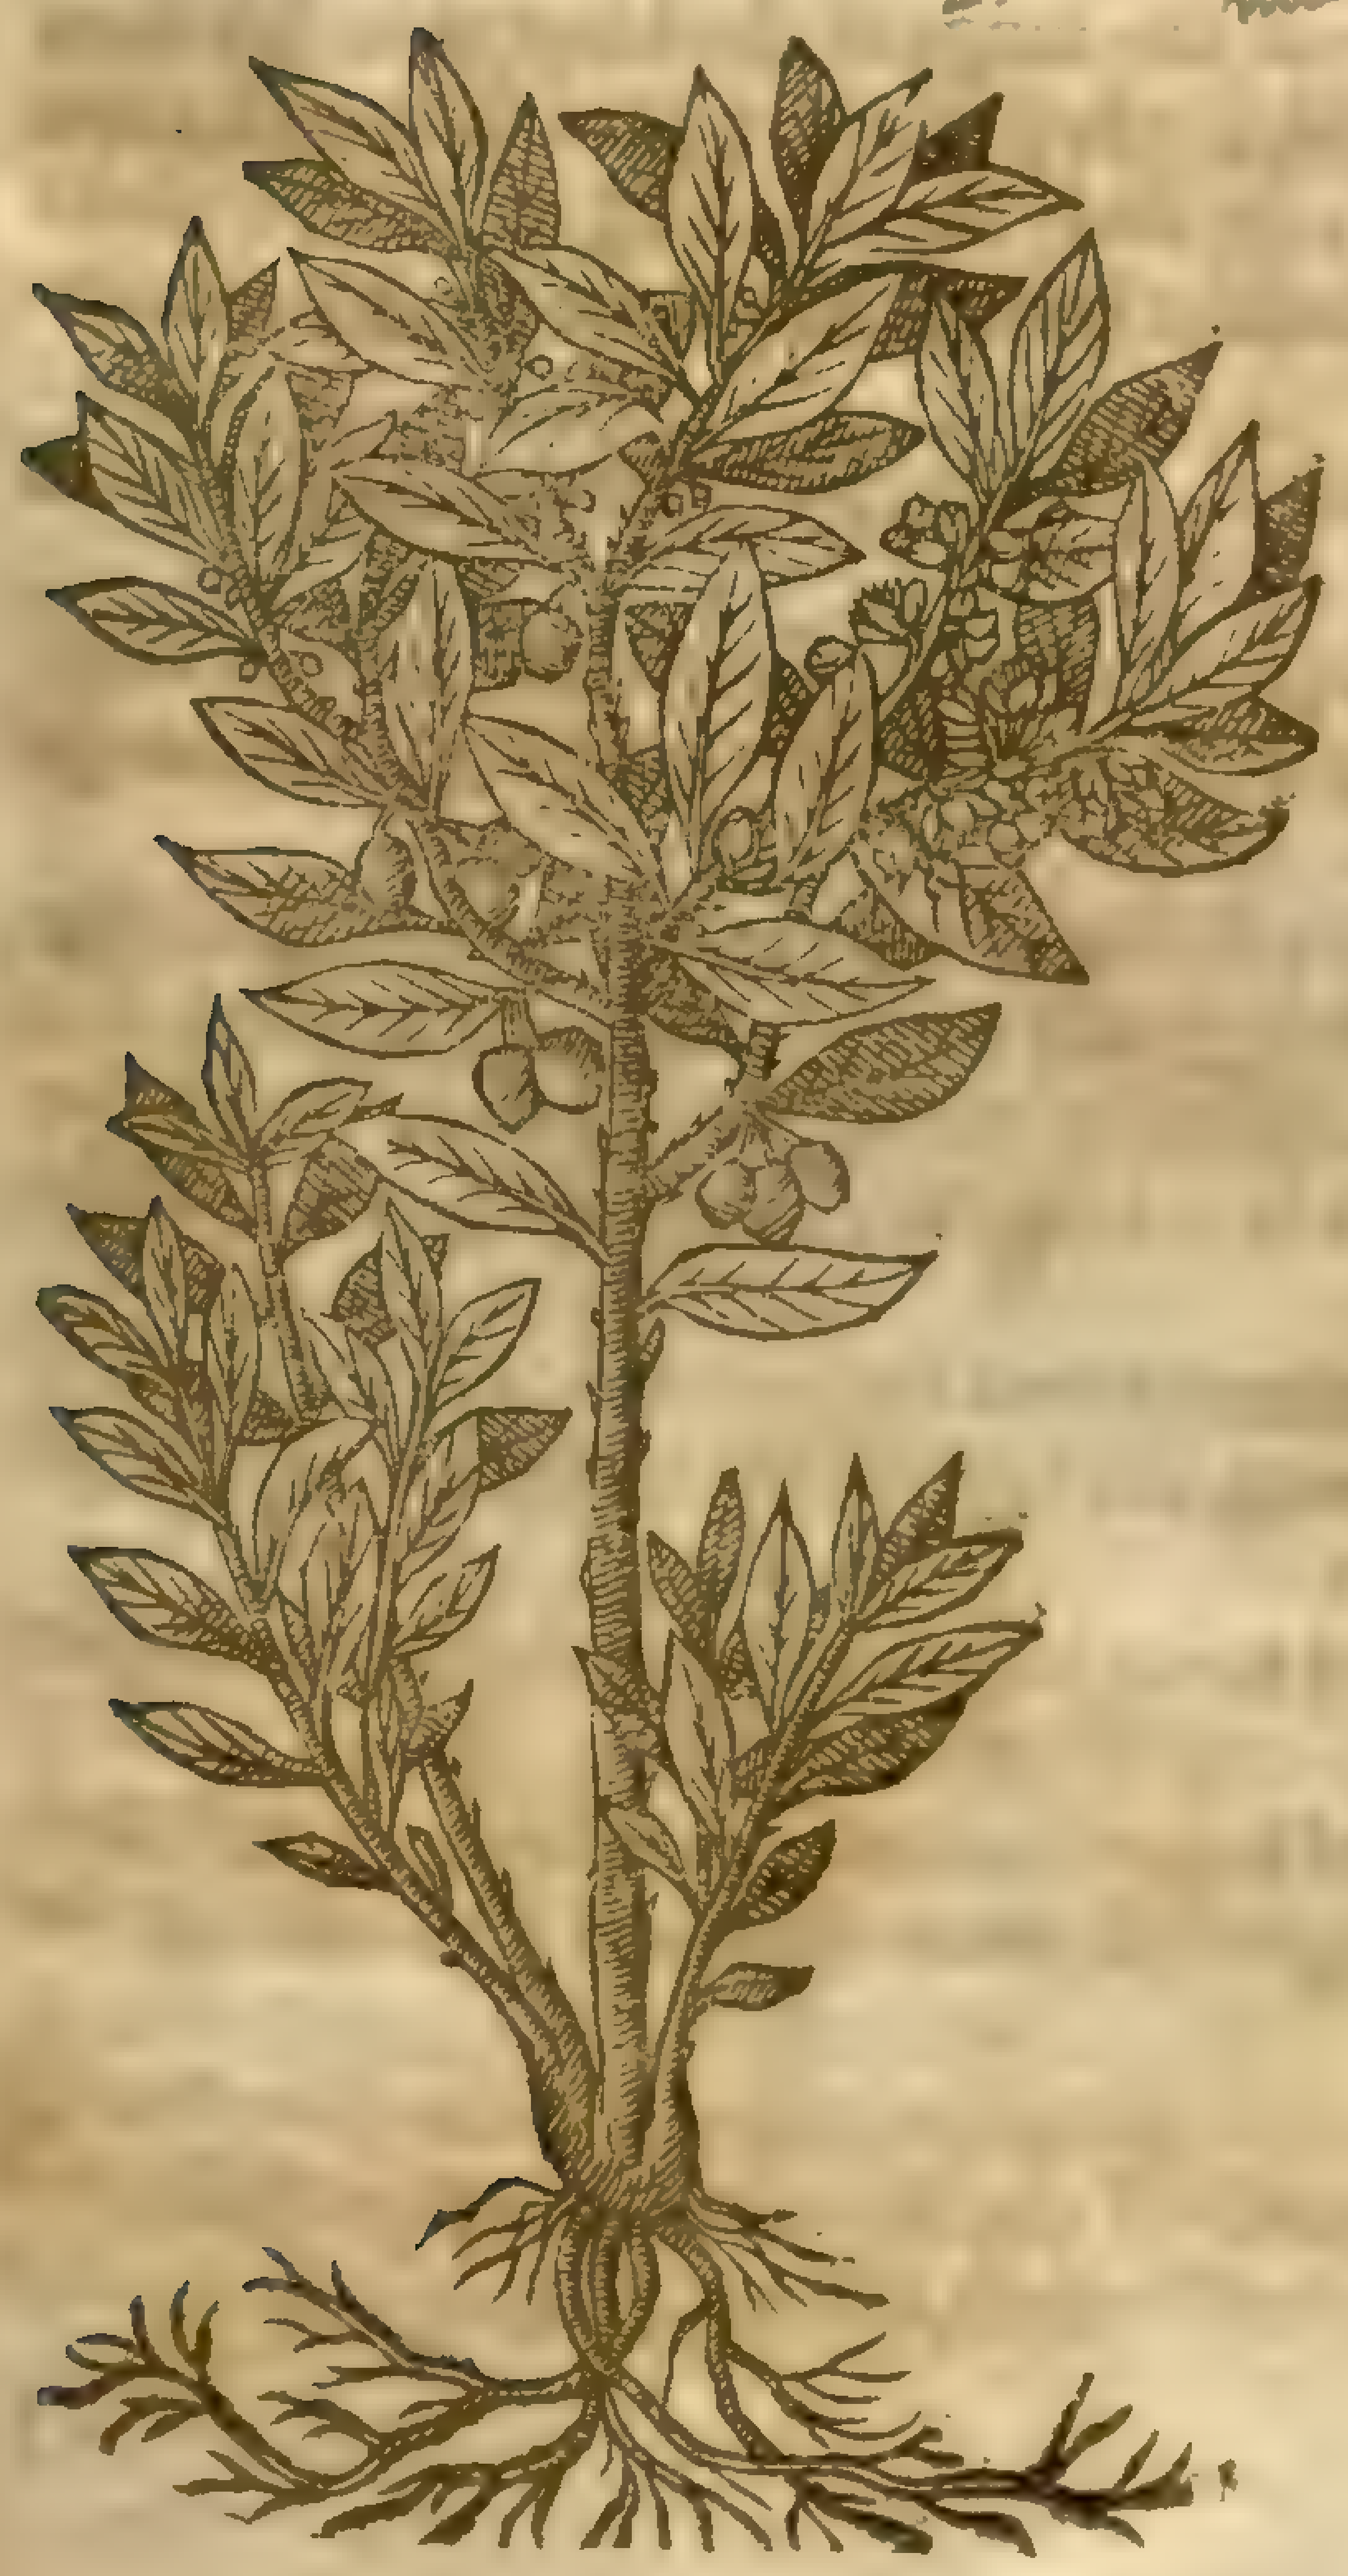
† The other plant of our Author, formerly deſcribed in this Chapter in the ſecond place, by the name of *Chamærododendros montana*, I haue here omitted, becauſe he ſet it forth before by the name of *Ciſtus Ledum Sileſiacum*, giuing two figures and one deſcription, in the 12 and 13 places of the 8 Chap. of this 3 Booke.

Chap. 68.

Of the Bay or Lawrel Tree.

Laurus.
The Bay tree.

L. nobilis, L.
mill. dict.



¶ *The Deſcription.*

1 THe Bay or Laurell tree commeth oftentimes to the height of a tree of a mean bigneſſe: it is full of boughes, couered with a green barke: the leaues thereof are long, broad, hard, of colour green, ſweetly ſmelling, and in taſte ſomewhat bitter. The flours alongſt the boughes and leaues are of a green colour; the beries are more long than round, and be couered with a blacke rinde or pill: the kernell within is clouen into two parts like that of the Peach and almond, and other ſuch, of a brown yellowiſh color, ſweet of ſmell, in taſte ſomewhat bitter, with a little ſharp or biting qualitie.

2 There is alſo a certaine other kinde hereof more like a ſhrub, ſending forth out of the roots many off-ſprings; which notwithſtanding growes not ſo high as the former, and the barkes of the boughes be ſomewhat red; the leaues be alſo tenderer, & not ſo hard; in other things not vnlike.

Theſe two Bay trees *Dioſcorides* was not ignorant of; for he ſaith that the one is narrow leafed, and the other broader or rather harder leafed, which is more like.

¶ *The Place.*

The Laurell or Bay tree groweth naturally in ly in Spaine and ſuch hot regions: we plant and ſet it in gardens, defending it from cold at the beginning of March eſpecially.

I haue not ſeen any one tree thereof growing in Denmarke, Suevia, Poland, Livonia, or Ruſſia, or in any of thoſe cold countries where I haue trauelled.

¶ *The Place.*

The Bay tree groweth green winter and ſummer: it floureth in the ſpring, and the black fruit is ripe in October.

¶ *The Names.*

This tree is called in Greeke δάφνη: in Latine, *Laurus*: in Italian, *Lauro*: in high-Dutch, **Loorbeerbaum**: in low-Dutch, **Laurusboom**: in French, *Laurier*: in Spaniſh, *Laurel*, *Lorel*, and *Laueriero*: in Engliſh, Laurel or Bay tree.

The fruit is named in Greeke δαφνίδες: in Latine, *Lauri baccæ*: in high-Dutch, **Looerbeeren**: in low-Dutch, **Bakeleer**: in Spaniſh, *Vayas*: in Engliſh, Bay berries.

The Poets feigne that it tooke his name of *Daphne*, *Lado* his daughter, with whom *Apollo* fell in loue.

¶ *The Temperature and Vertues.*

A The berries and leaues of the Bay tree, ſaith *Galen*, are hot and very dry, and yet the berries more than the leaues.

B The barke is not biting and hot, but more bitter, and it hath alſo a certain aſtrictiue or binding qualitie.

C The berries with Hony or Cute are good in a licking medicine, ſaith *Dioſcorides*; againſt the Ptyſicke or conſumption of the lungs, difficultie of breathing, and all kindes of fluxes or rheumes about the cheſt.

D Bay berries taken in wine are good againſt the bitings and ſtingings of any venomous beaſt, and againſt all venom and poiſon: they clenſe away the morphew: the juice preſſed out hereof is a remedie for pain in the eares, and deafneſſe, if it be dropped in with old wine and oile of Roſes. This is alſo mixed with ointments that are good againſt weariſomneſſe, and that heate and diſcuſſe or waſte away humors.

E Bay berries are put into Mithridate, Treacle, and ſuch like medicines that are made to refreſh ſuch people as are growne ſluggiſh and dull by means of taking opiate medicines, or ſuch as haue any venomous or poiſonous qualitie in them.

F They are good alſo againſt cramps and drawing together of ſinues.

G We in our time do not vſe the beries for the infirmities of the lungs or cheſt, but miniſter them againſt the diſeaſes of the ſtomacke, liuer, ſpleen, and bladder: they warme a cold ſtomacke, cauſe concoction of raw humours, ſtirre vp a decayed appetite, take away the loathing of meat, open the ſtopping of the liuer and ſpleene, prouoke vrin, bring downe the menſes, and driue forth the ſecondine.

H The oile preſſed out of theſe, or drawne forth by decoction, doth in ſhort time take away ſcabs and ſuch like filth of the skin.

I It cureth them that are beaten blacke and blew, and that be bruiſed by ſquats and falls: it remoueth blacke and blew ſpots and congealed bloud, and digeſteth and waſteth away the humours gathered about the grieued part.

K *Dioſcorides* ſaith that the leaues are good for the diſeaſes of the mother and bladder, if a bath be made thereof to bathe and ſit in: that the greene leaues doe gently binde, that being applied they are good againſt the ſtingings of waſps and Bees: that with barley meale parched and bread they aſſwage all kinde of inflammations: and that being taken in drinke they mitigate the paine of the ſtomacke, but procure vomit.

L The berries of the Bay tree ſtamped with a little Scammonie and ſaffron, and labored in a mortar with vineger and oile of Roſes to the forme of a liniment, and applied to the temples and forepart of the head, do greatly ceaſe the pain of the megrim.

M It is reported that common drunkards were accuſtomed to eat in the morning faſting two leaues thereof againſt drunkenneſſe.

N The later Phyſitions do often vſe to boile the leaues of Laurell with diuers meats, eſpecially fiſhes, and by ſo doing there hapneth no deſire of vomiting, but the meat ſeaſoned herewith becommeth more ſauorie and better for the ſtomacke.

O The barke of the root of the Bay tree, as *Galen* writeth, drunken in wine prouoketh vrine, breakes the ſtone and driueth forth grauell: it openeth the ſtoppings of the liuer, the ſpleene, and all other ſtoppings of the inward parts: which thing alſo *Dioſcorides* affirmeth, adding, That it kils the child in the mothers wombe.

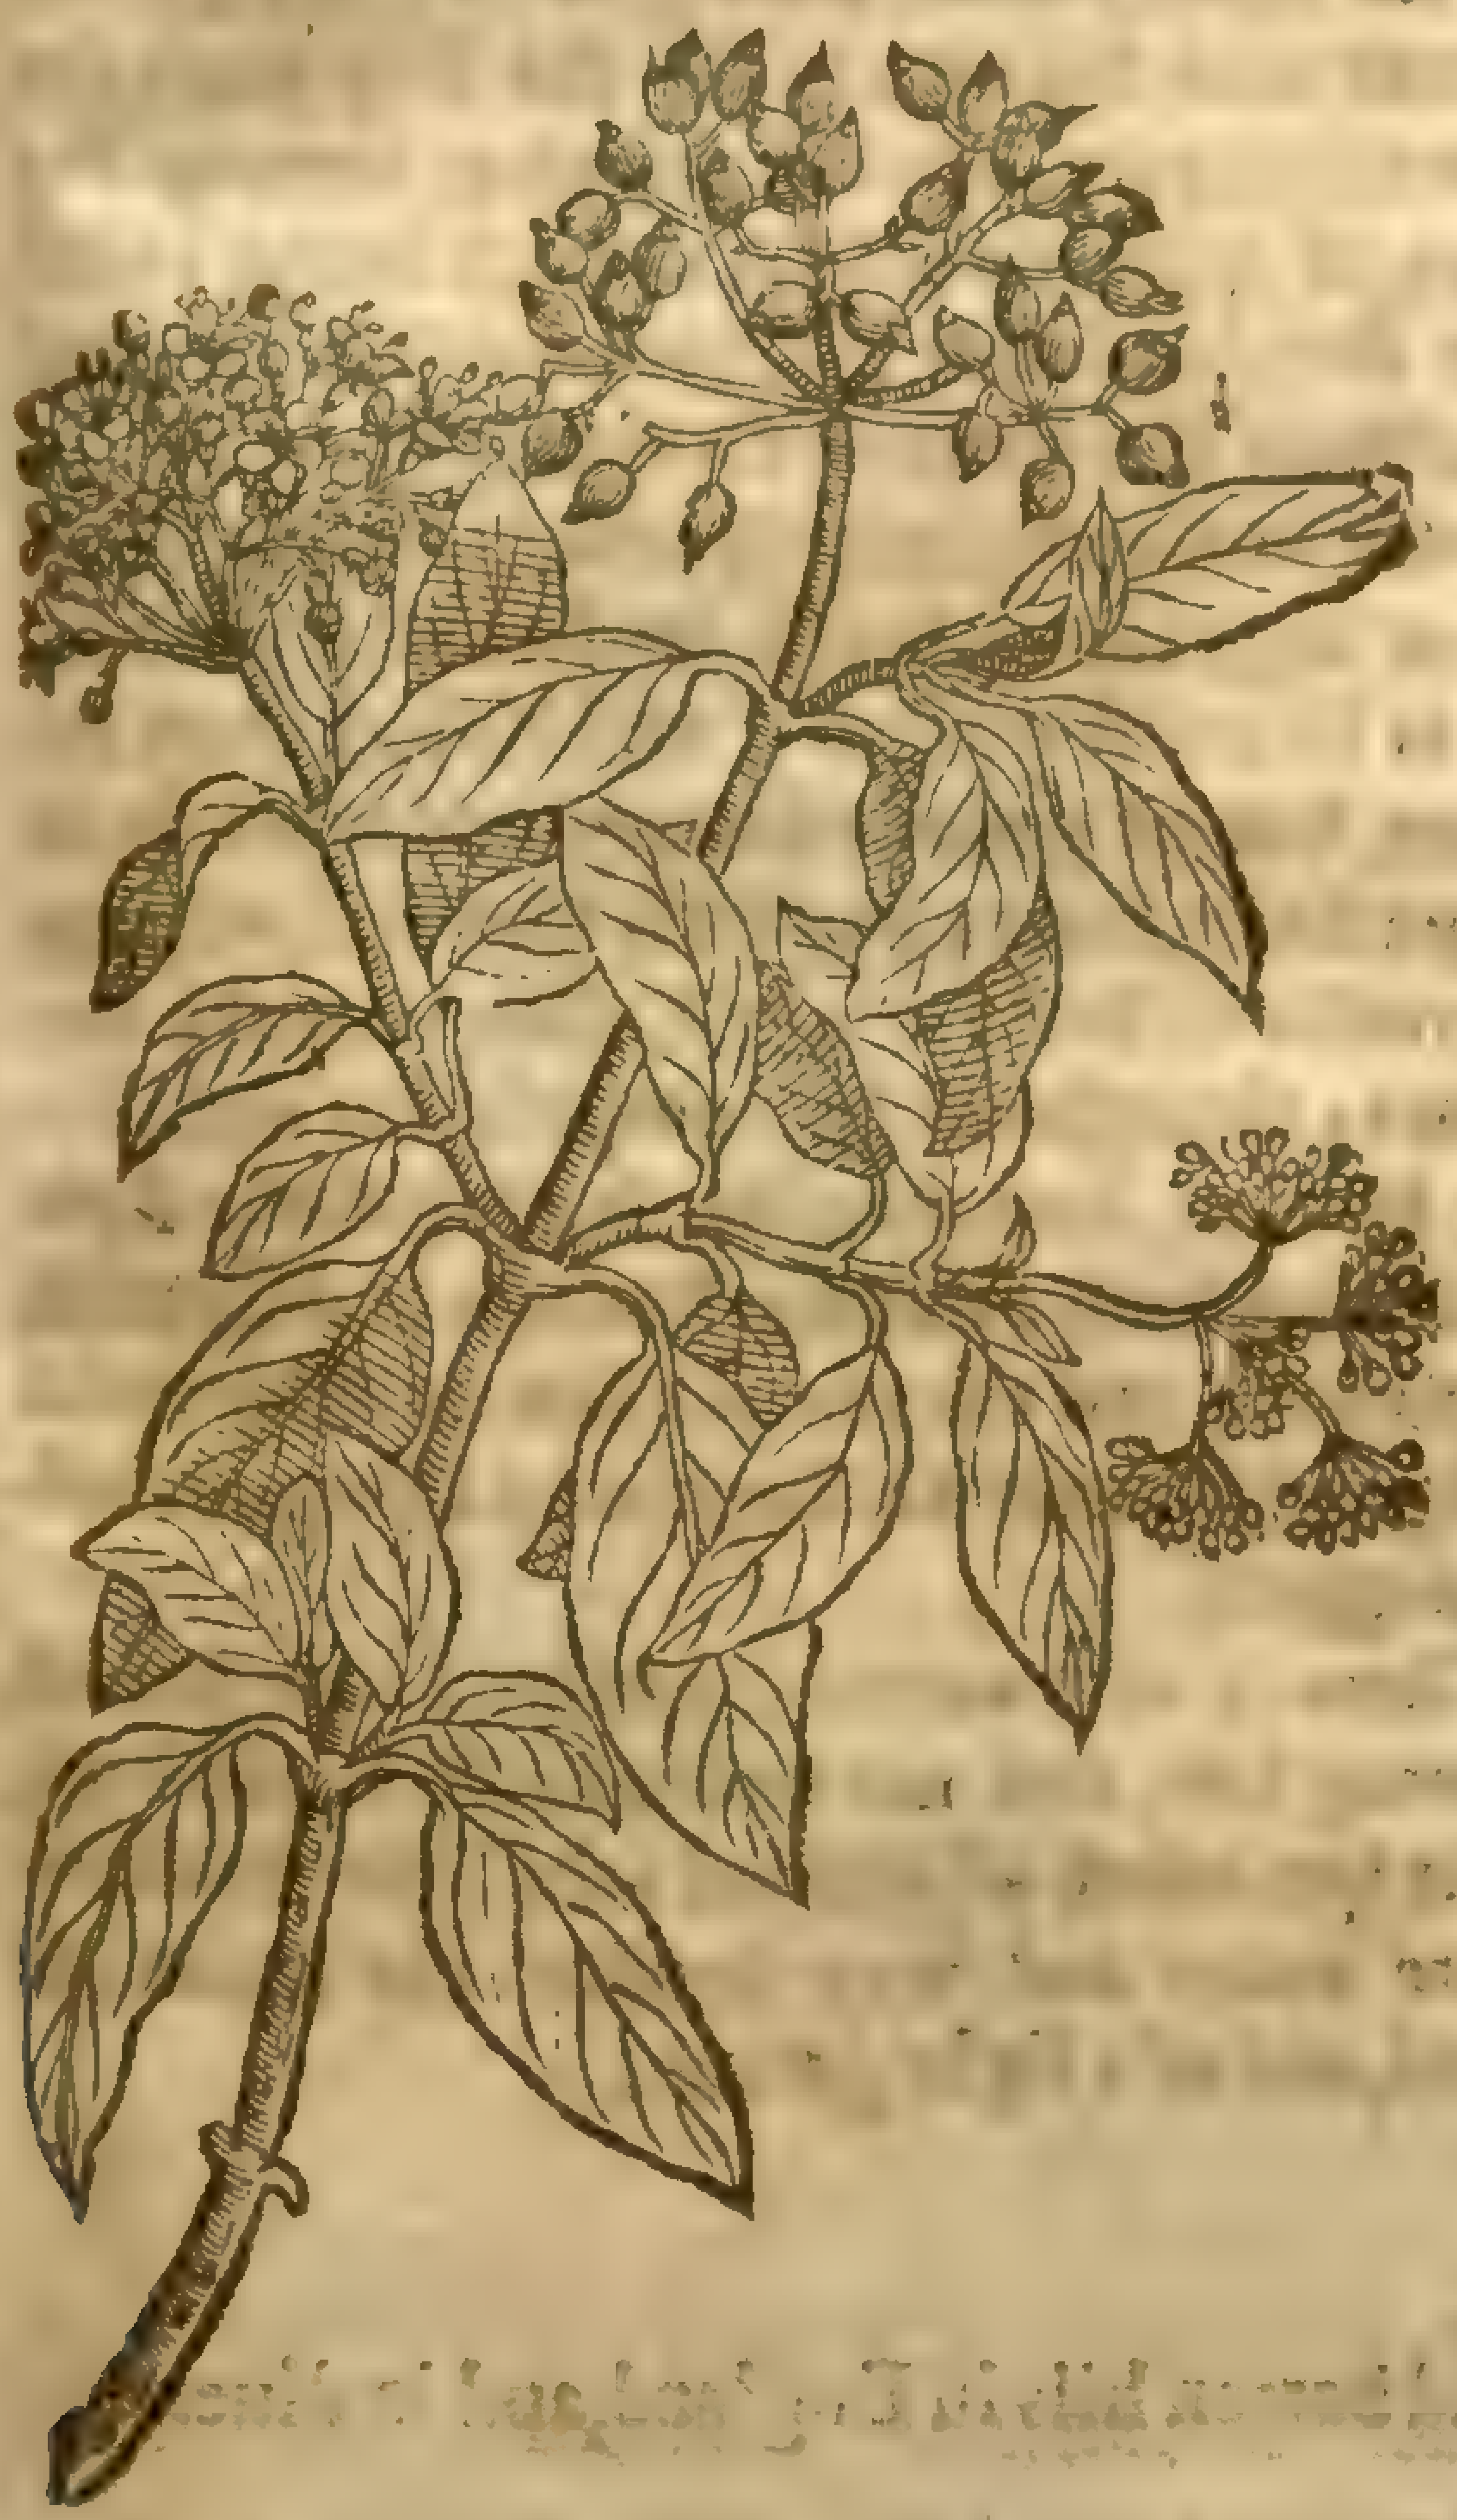
It helpeth the dropſie and the jaundiſe, and procureth vnto women their deſired ſickeneſſe. P

† Our Author here alſo gaue the two figures of *Tabernamontanus*; the firſt by the name of *Laurus mas*, or the male Bay tree, and the other by the name of *Laurus fœmina*, the female Bay: the difference in the figures was little or none, wherefore I haue made one ſerue.

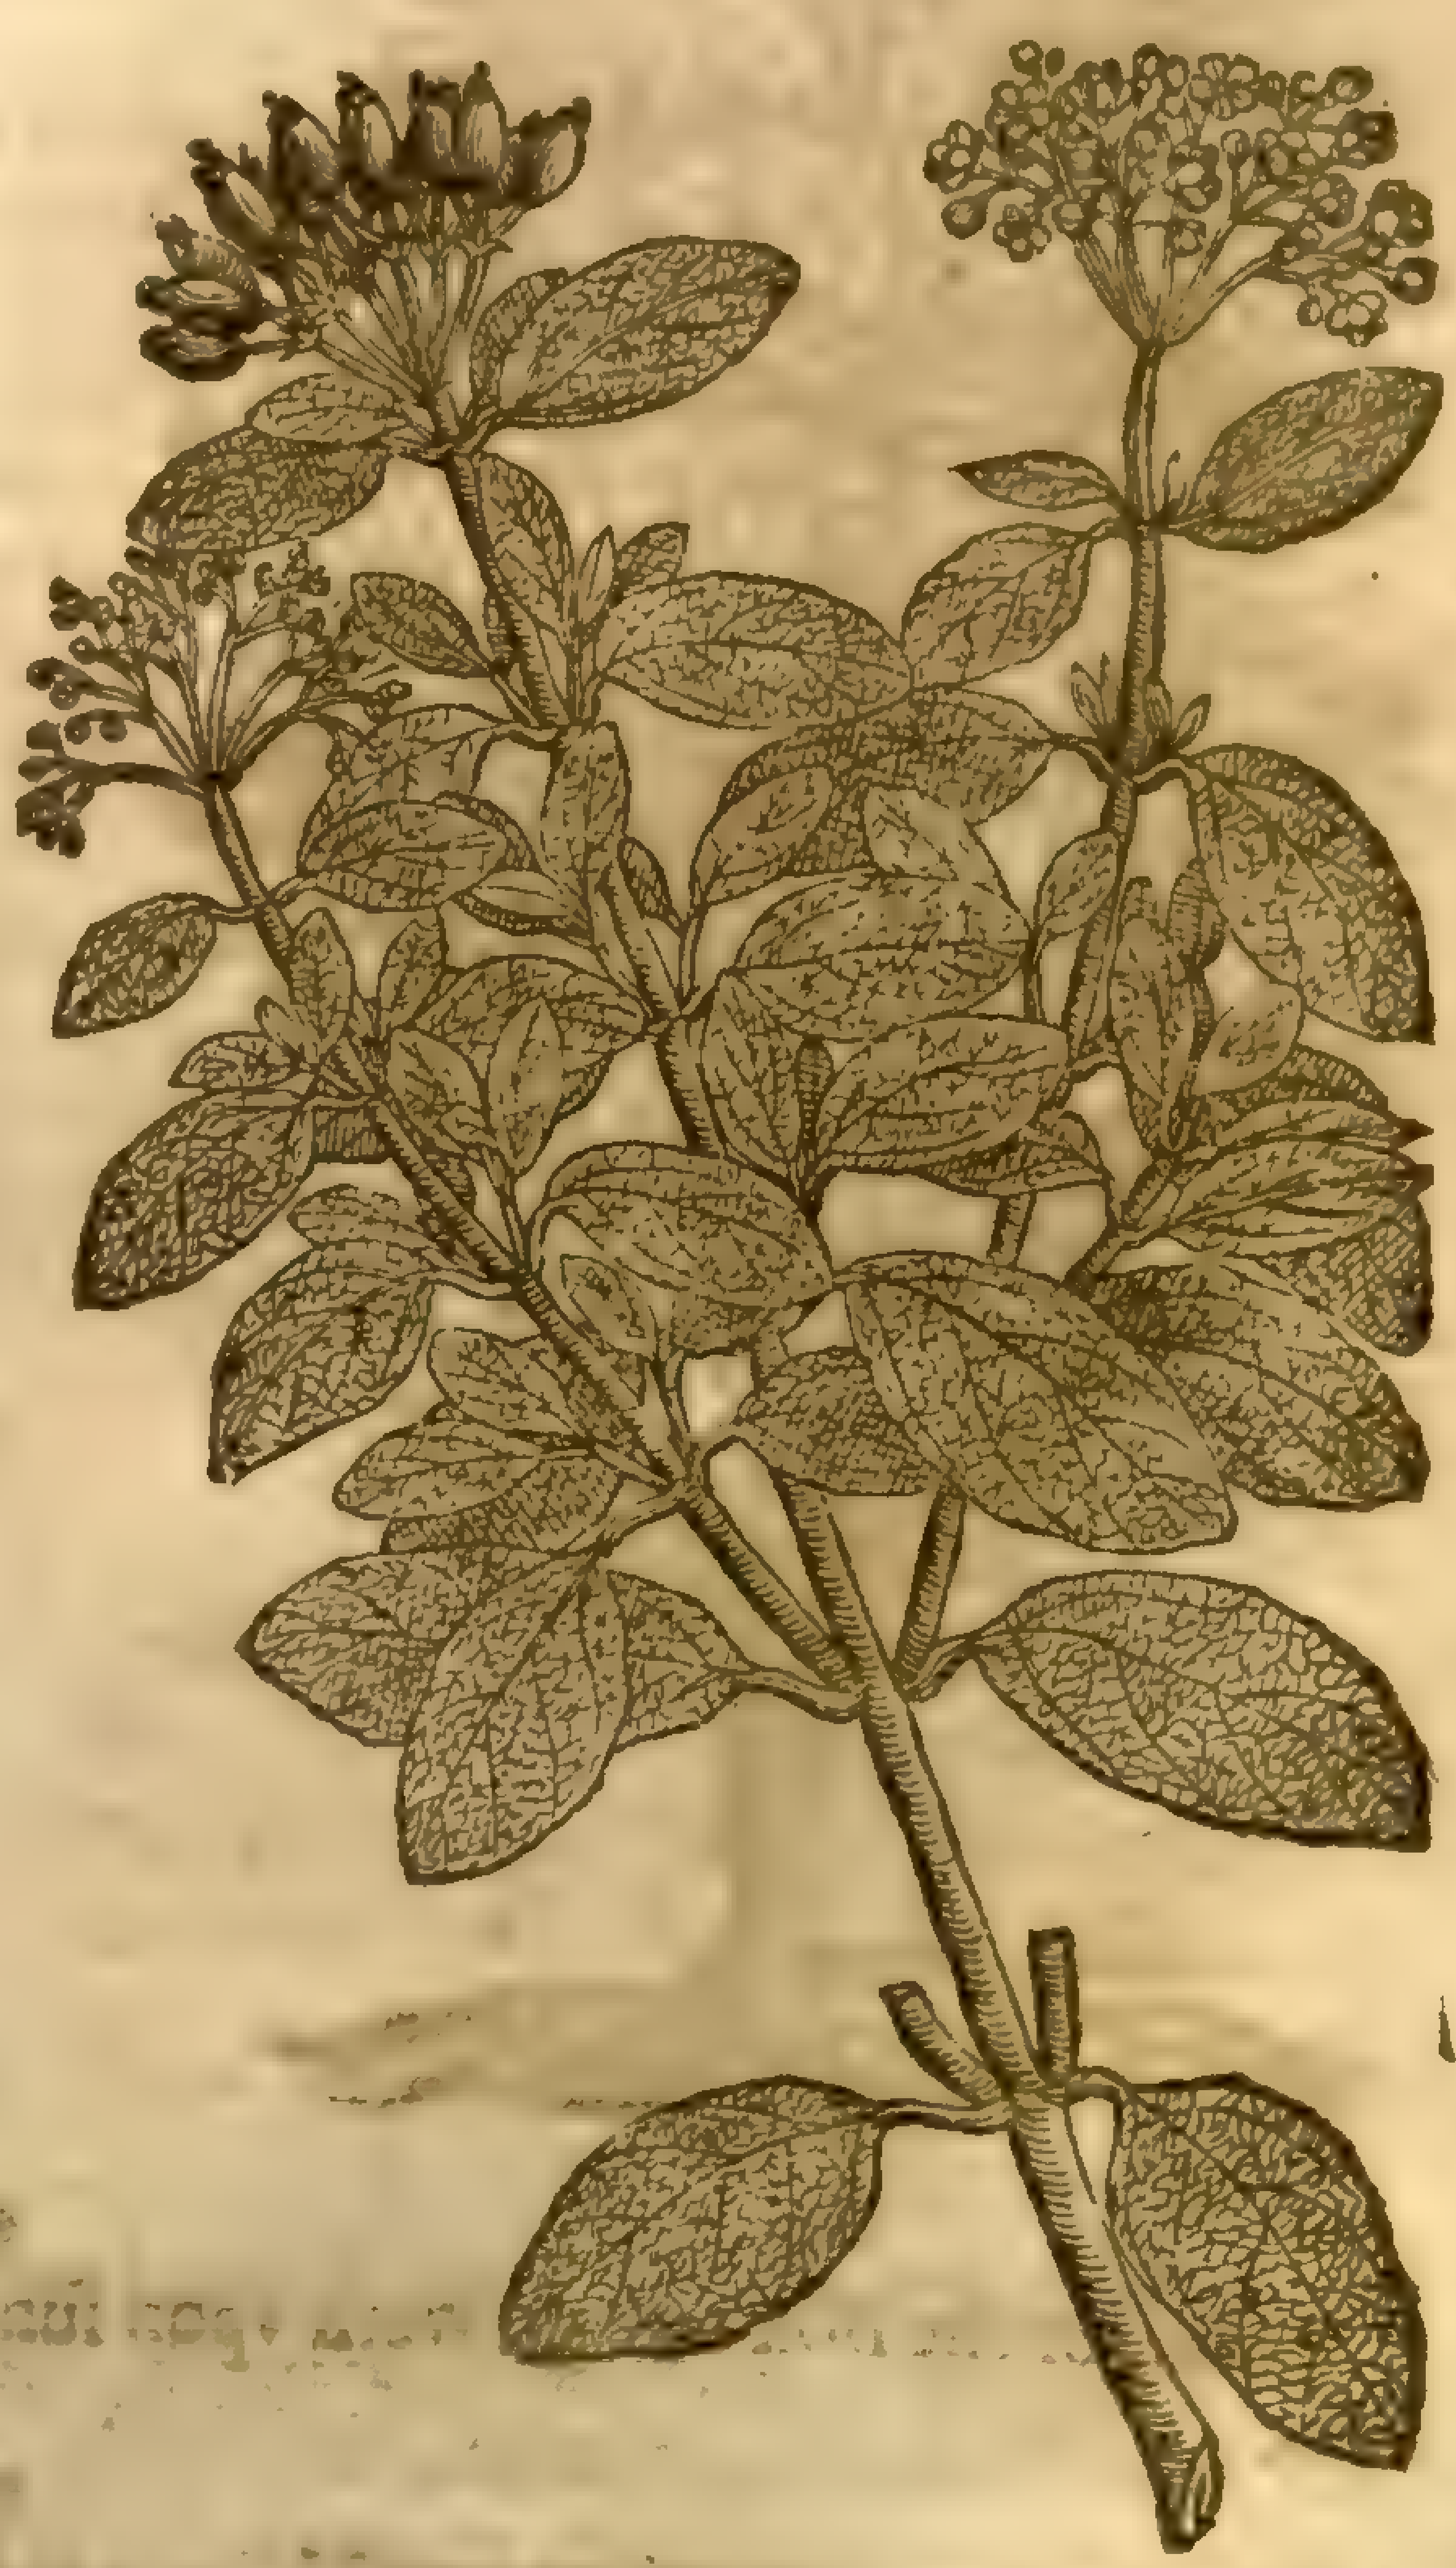
CHAP. 69. *Of the Wilde Bay tree.*

¶ *The Deſcription.*

1 *Laurus Tinus*, or the wilde Bay tree, groweth like a ſhrub or hedge buſh, hauing many tough and pliant branches, ſet full of leaues very like to the Bay leaues, but ſmaller and more crumpled, of a deepe and ſhining greene colour: among which come forth tufts of whitiſh floures, turning at the edges into a light purple: after which follow ſmall berries of a blew colour, containing a few graines or ſeeds like the ſtones or ſeeds of grapes: the leaues and all the parts of the plant are altogether without ſmell or ſauour.



1 *Laurus Tinus.*
The wilde Bay tree.



2 *Laurus Tinus Luſitanica.*
The Portingale wilde Bay tree.

2 *Tinus Luſitanica* groweth very like to *Cornus Fœmina*, or the Dog-berry tree, but the branches be thicker, and more ſtiffe, couered with a reddiſh barke mixed with greene: the leaues are like the former, but larger, hauing many ſinewes or veines running through the ſame like as in the leaues of Sage: the floures hereof grow in tufts like the precedent, but they are of a colour more declining to purple: the ſmall branches are likewiſe of a purple colour: the leaues haue no ſmell at all, either good or bad: the berries are ſmaller than the former, of a blew colour declining to blackneſſe.

¶ *The Place.*

The wilde Bay groweth plentifull in euery field of Italy, Spaine, and other regions, which differ according to the nature and ſcituation of thoſe countries: they grow in my garden and proſper very well.

¶ *The Time.*

The wilde Laurell is euer greene,and may oftentimes be ſeene moſt part of the Winter,and the beginning of the Spring,with the floures and ripe berries growing both at one ſeaſon.

¶ *The Names.*

It is called in Latine *Tinus*,and *Laurus ſylueſtris* : in Greeke, δάφνη ἀγρία : *Cato* nameth it *Laurus ſyluatica* : in Italian,*Lauro ſyluatico*: in Spaniſh, *Vua de perro*,otherwiſe *Follado* ; and of diuers, *Durillo* : in Engliſh,wilde Bay.

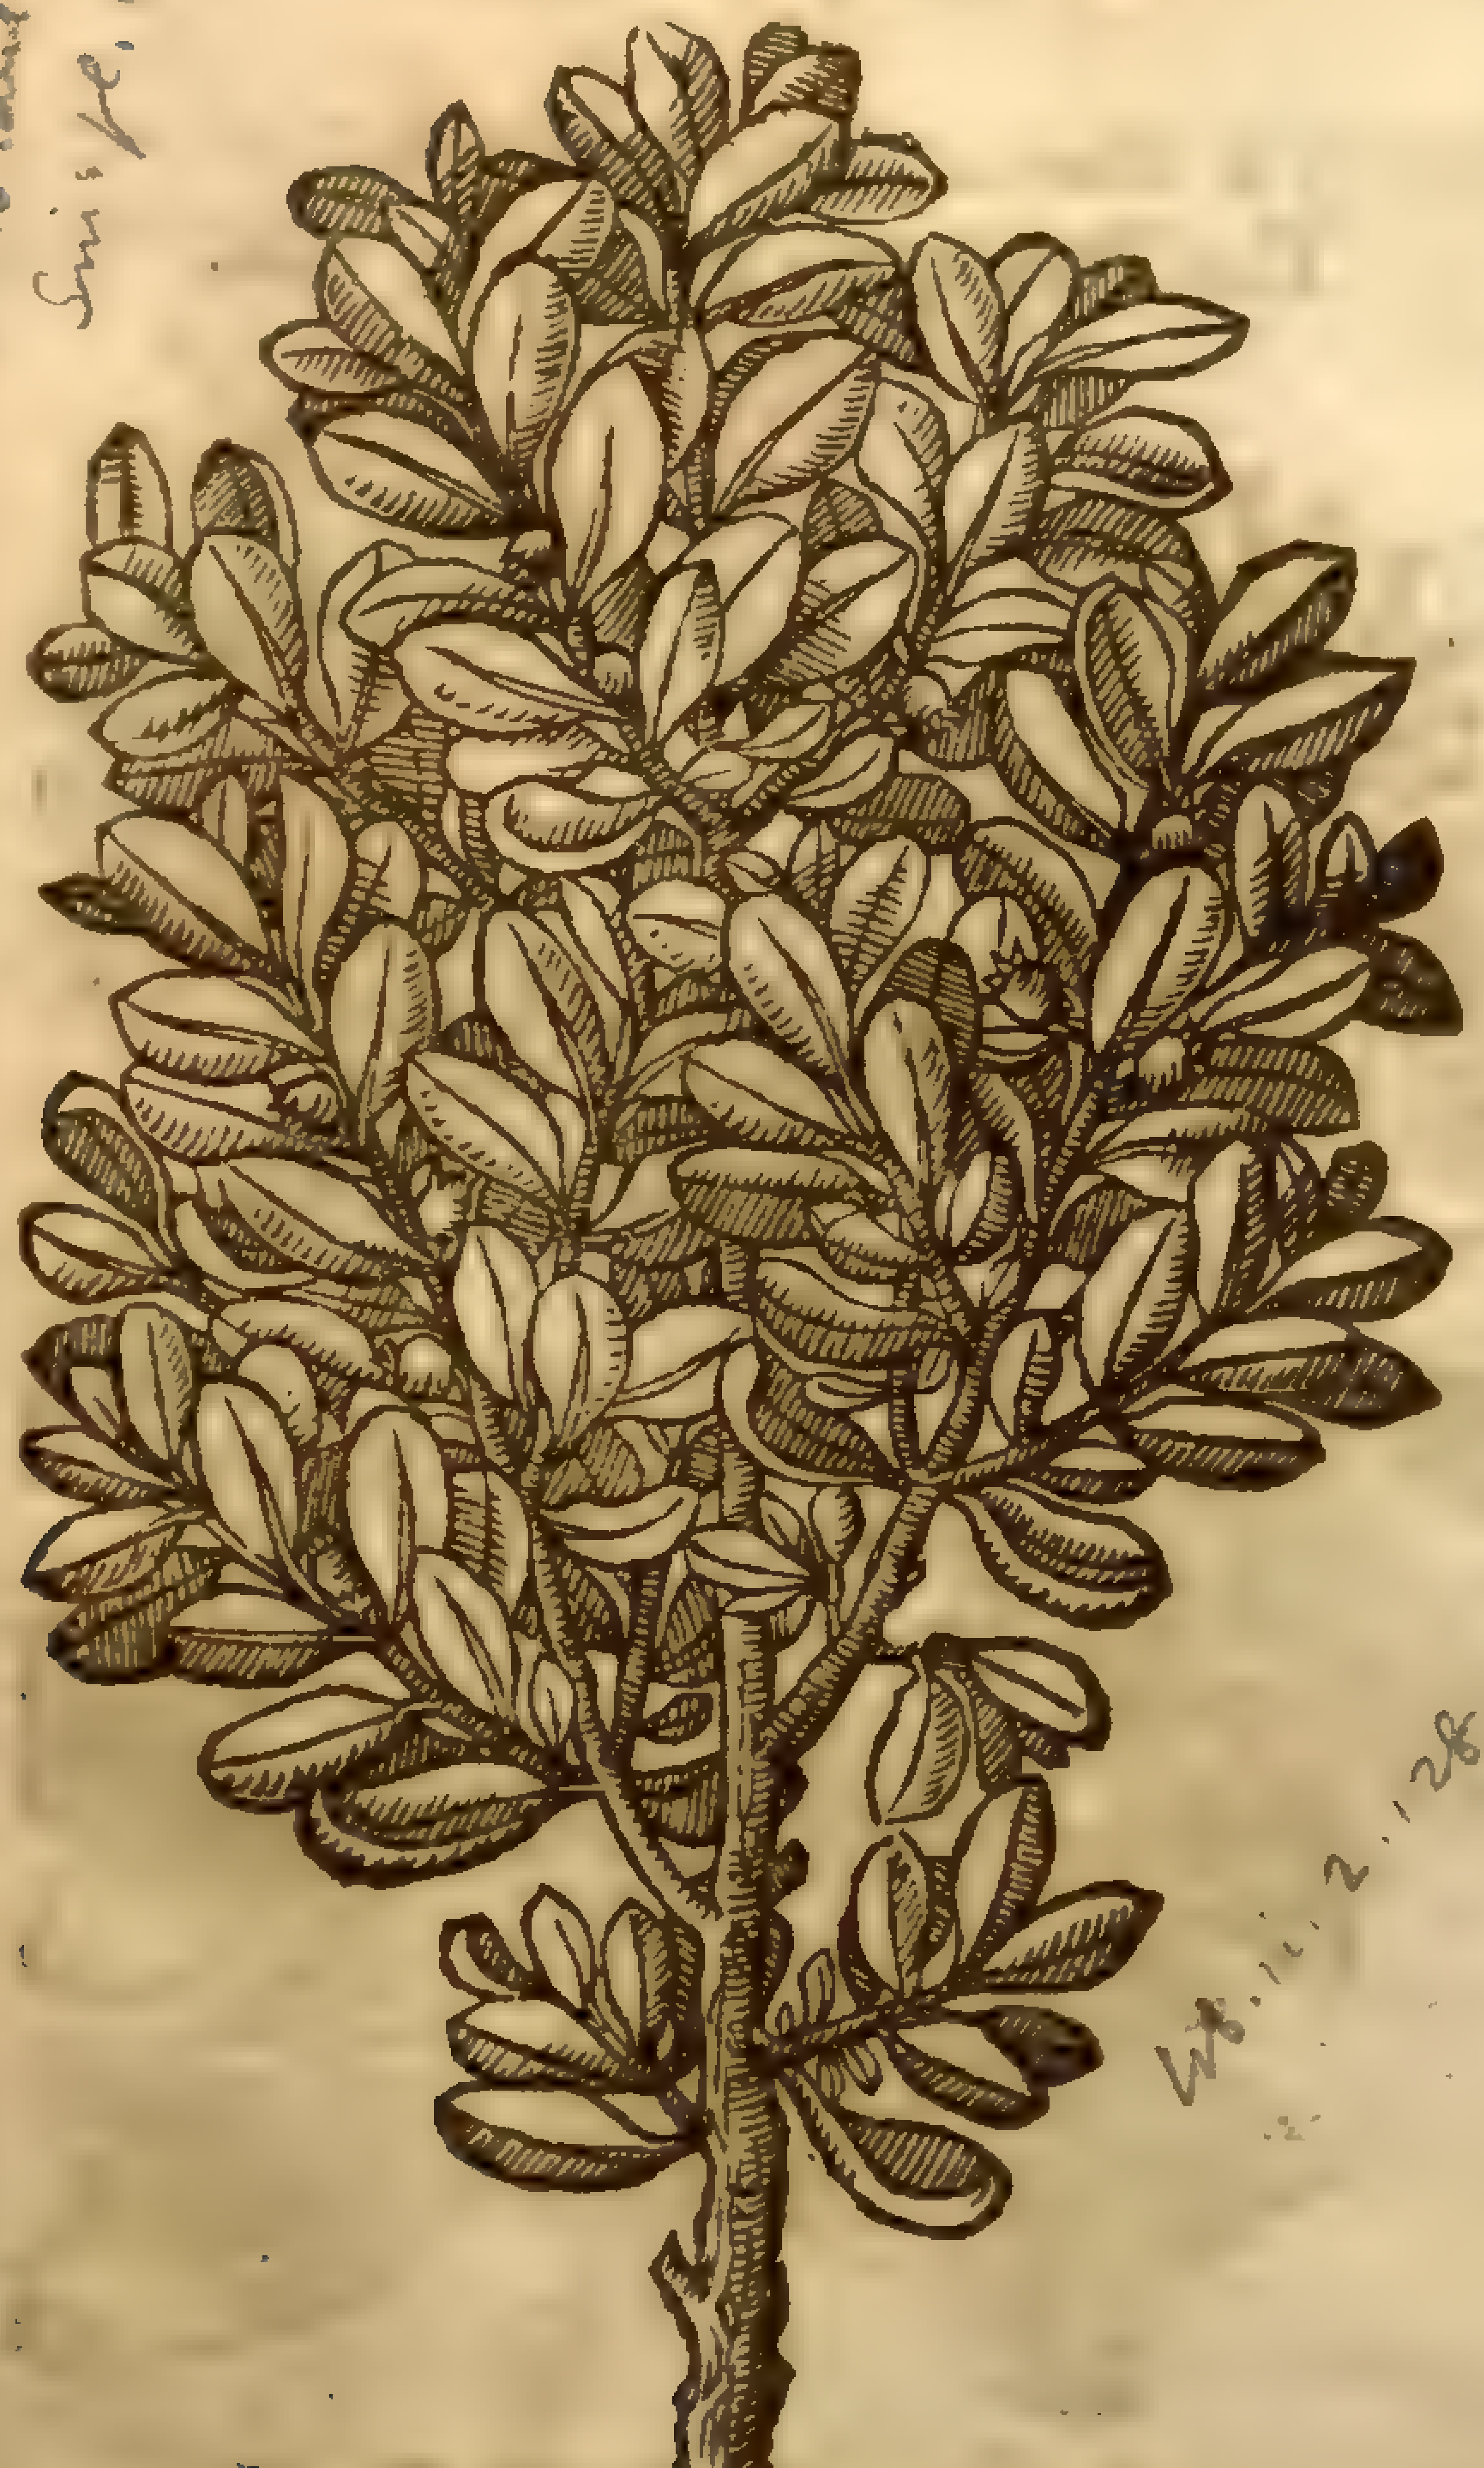
¶ *The Temperature and Vertues.*

Pliny nor any other of the Antients haue touched the faculties of this wilde Bay, neither haue we any vnderſtanding thereof by the later Writers,or by our owne experience.

Chap. 70. *Of the Box Tree.*

Buxus sempervirens
var. arb.
Lin. sp. 4. 133

Buxus.
The Box tree.



W. ii. 2. 128

¶ *The Deſcription.*

The great Box is a faire tree,bearing a great body or trunke: the wood or timber is yellow and very hard, and fit for ſundry workes, hauing many boughes and hard branches,beſet with ſundry ſmall hard greene leaues,both Winter and Summer like the Bay tree: the floures are very little, growing among the leaues,of a greene colour: which being vaded there ſucceed ſmall blacke ſhining berries,of bigneſſe of the ſeeds of Corianders, which are incloſed in round greeniſh huskes,hauing three feet or legs like a braſſe or boyling pot: the root is likewiſe yellow, and harder than the timber, but of geeater beauty, and more fit for dagger hafts,boxes,and ſuch like vſes,whereto the trunke or body ſerueth, than to make medicines; though fooliſh empericks and Women leaches, doe miniſter it againſt the Apoplexie,and ſuch diſeaſes:Turners and Cutlers, if I miſtake not the matter, doe call this wood Dudgeon,wherewith they make Dudgeon hafted daggers.

There is alſo a certaine other kinde hereof, growing low, and not aboue halfe a yard high, but it ſpreadeth all abroad: the branches hereof are many and very ſlender: the leaues bee round,and of a light greene.

¶ *The Place.*

Buxus, or the Box tree groweth vpon ſundry waſte and barren hils in England,and in diuers gardens.

¶ *The Time.*

The Box tree groweth greene Winter and Summer: it floureth in February and March, and the ſeed is ripe in September.

¶ *The Names.*

The Grecians call it πύξος: in Latine,*Buxus* : in high Dutch, **Buchſzbaum** : in low Dutch, **Burboom** : in Italian,*Boſſo* : in Engliſh,Box tree.

The leſſer may be called χαμαίπυξος: and in Latine,*Humi Buxus*,or *Humilis Buxus* : in Engliſh,dwarfe Box,or ground Box,and it is commonly called Dutch Box.

¶ *The Temperature and Vertues.*

A The leaues of the Box tree aree hot,dry,and aſtringent,of an euill and lothſome ſmell,not vſed in medicine,but onely as I ſaid before in the deſcription.

Chap.

CHAP. 71. *Of the Myrtle tree.*

¶ *The Deſcription.*

1 THe firſt and greateſt *Myrtus* is a ſmall tree, growing to the height of a man, hauing many faire and pliant branches, couered with a browne barke, and ſet full of leaues much like vnto the Laurell or Bay leafe, but thinner and ſmaller, ſomewhat reſembling the leaues of Peruincle, which being bruiſed do yeeld forth a moſt fragrant ſmell, not much inferiour vnto the ſmell of Cloues, as all the reſt of the kinds do: among theſe leaues come forth ſmall white floures, in ſhape like the flours of the Cherry tree, but much ſmaller, and of a pleaſant ſauour, which do turne into ſmall berries, greene at the firſt, and afterwards blacke.

1 *Myrtus Laurea maxima.*
The Myrtle tree.

‡ 2 *Myrtus Batica latifolia.*
Great Spaniſh Myrtle.

[illegible]

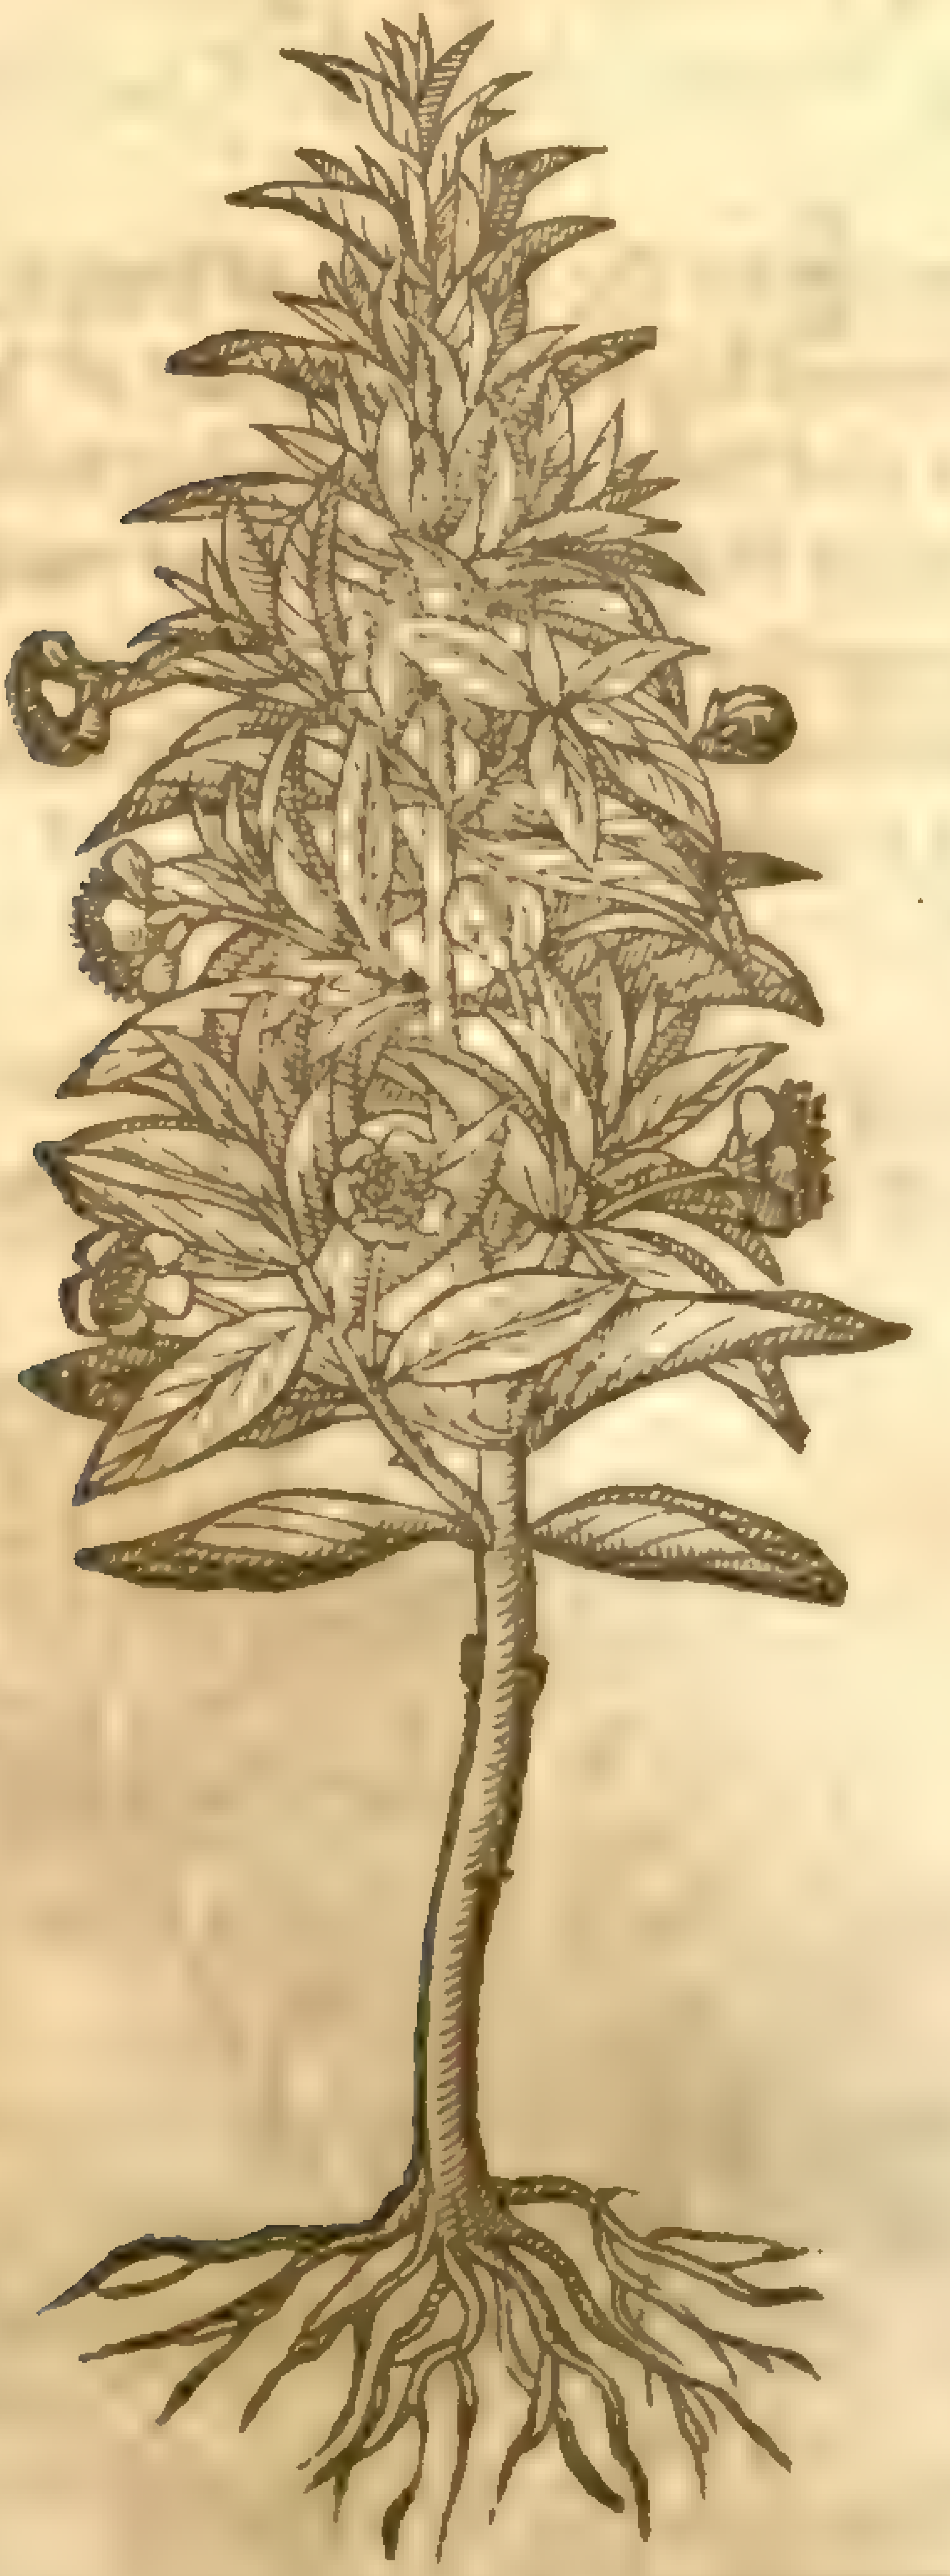
2 There is alſo another kinde of *Myrtus* called *Myrtus Batica latifolia*, according to *Cluſius*, *Myrtus Laurea*, that hath leaues alſo like Bay leaues, growing by couples vpon his pleaſant green branches, in a double row on both ſides of the ſtalkes, of a light greene colour, and ſomewhat thicker than the former, in ſent and ſmell ſweet: the floures and fruit are not much differing from the firſt kinde.

3 There is likewiſe another kinde of *Myrtus* called *Exotica*, that is ſtrange and not common: it groweth vpright vnto the height of a man like vnto the laſt before mentioned, but that it is repleniſhed with greater plenty of leaues, which do fold in themſelues hollow and almoſt double, broader pointed, and keeping no order in their growing, but one thruſting within another, and as it were croſſing one another confuſedly; in all other points agreeing with the precedent.

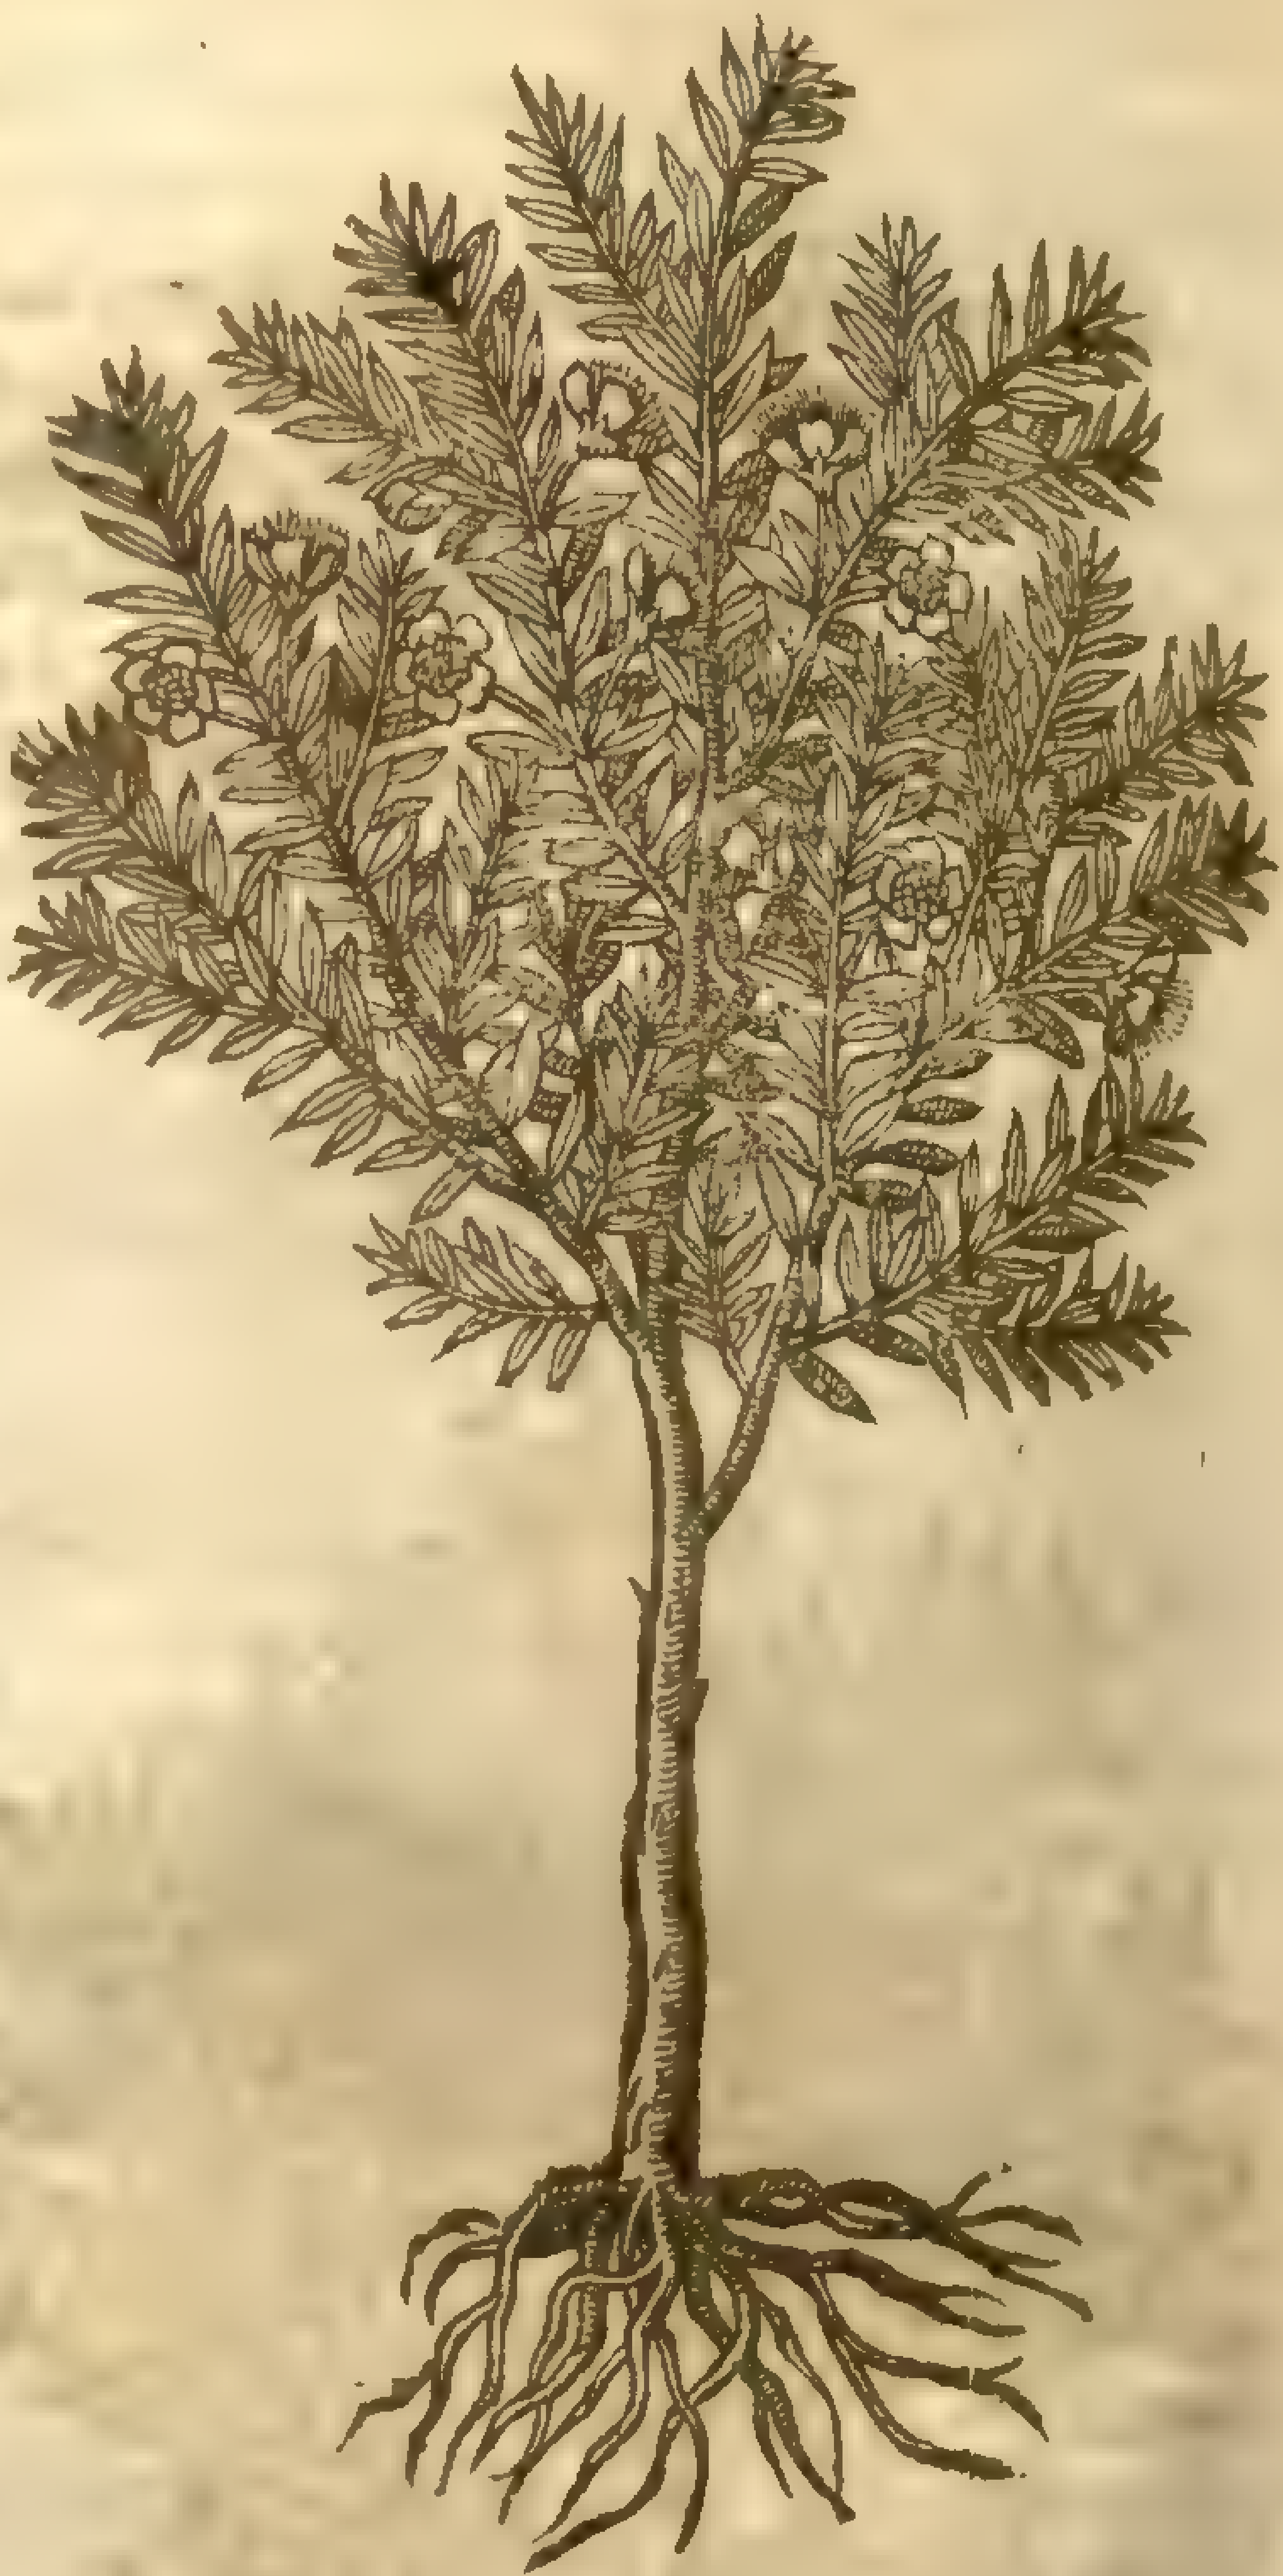
4 There is another ſort like vnto the former in floures and branches, but the leaues are ſmooth, flat and plaine, and not crumpled or folded at all, they are alſo much ſmaller than any of the former. The fruit is in ſhape like the other, but that it is of a white colour, wheras the fruit of the other is blacke.

5 There is alſo another kinde of Myrtle, called *Myrtus minor*, or noble Myrtle, as being the chiefe

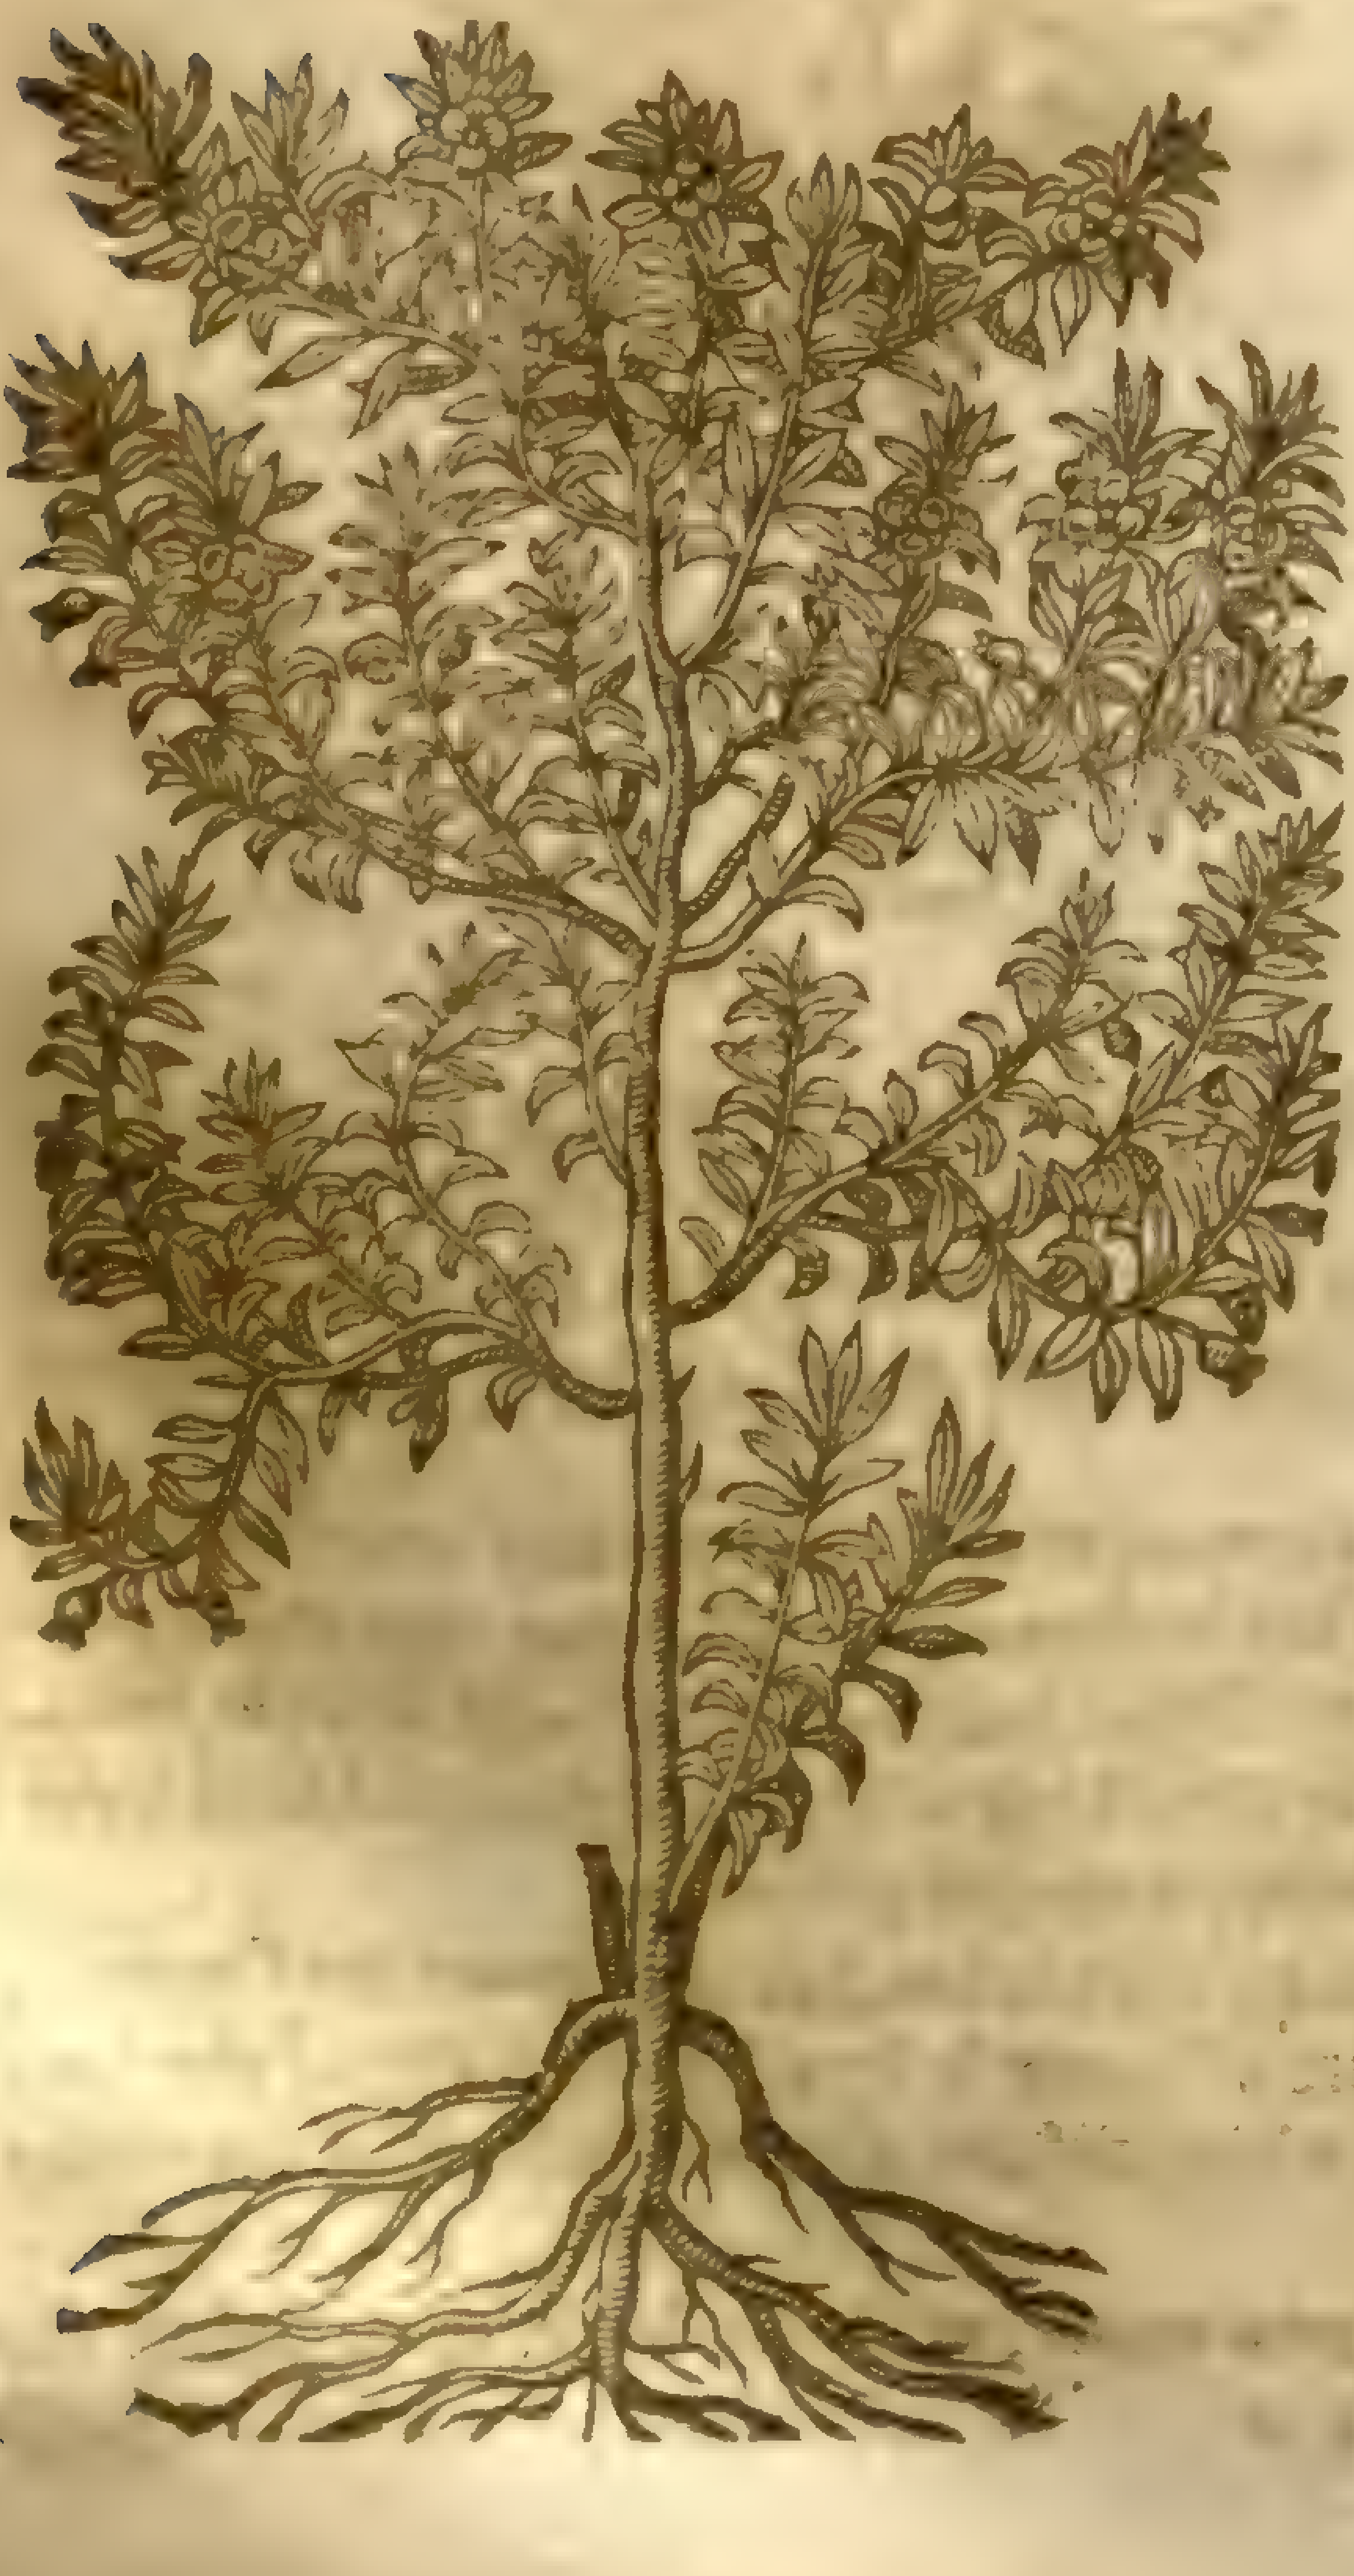
‡ 3 *Myrtus exotica.*
Strange Myrtle.



‡ 4 *Myrtus fructu albo.*
Myrtle with white berries.

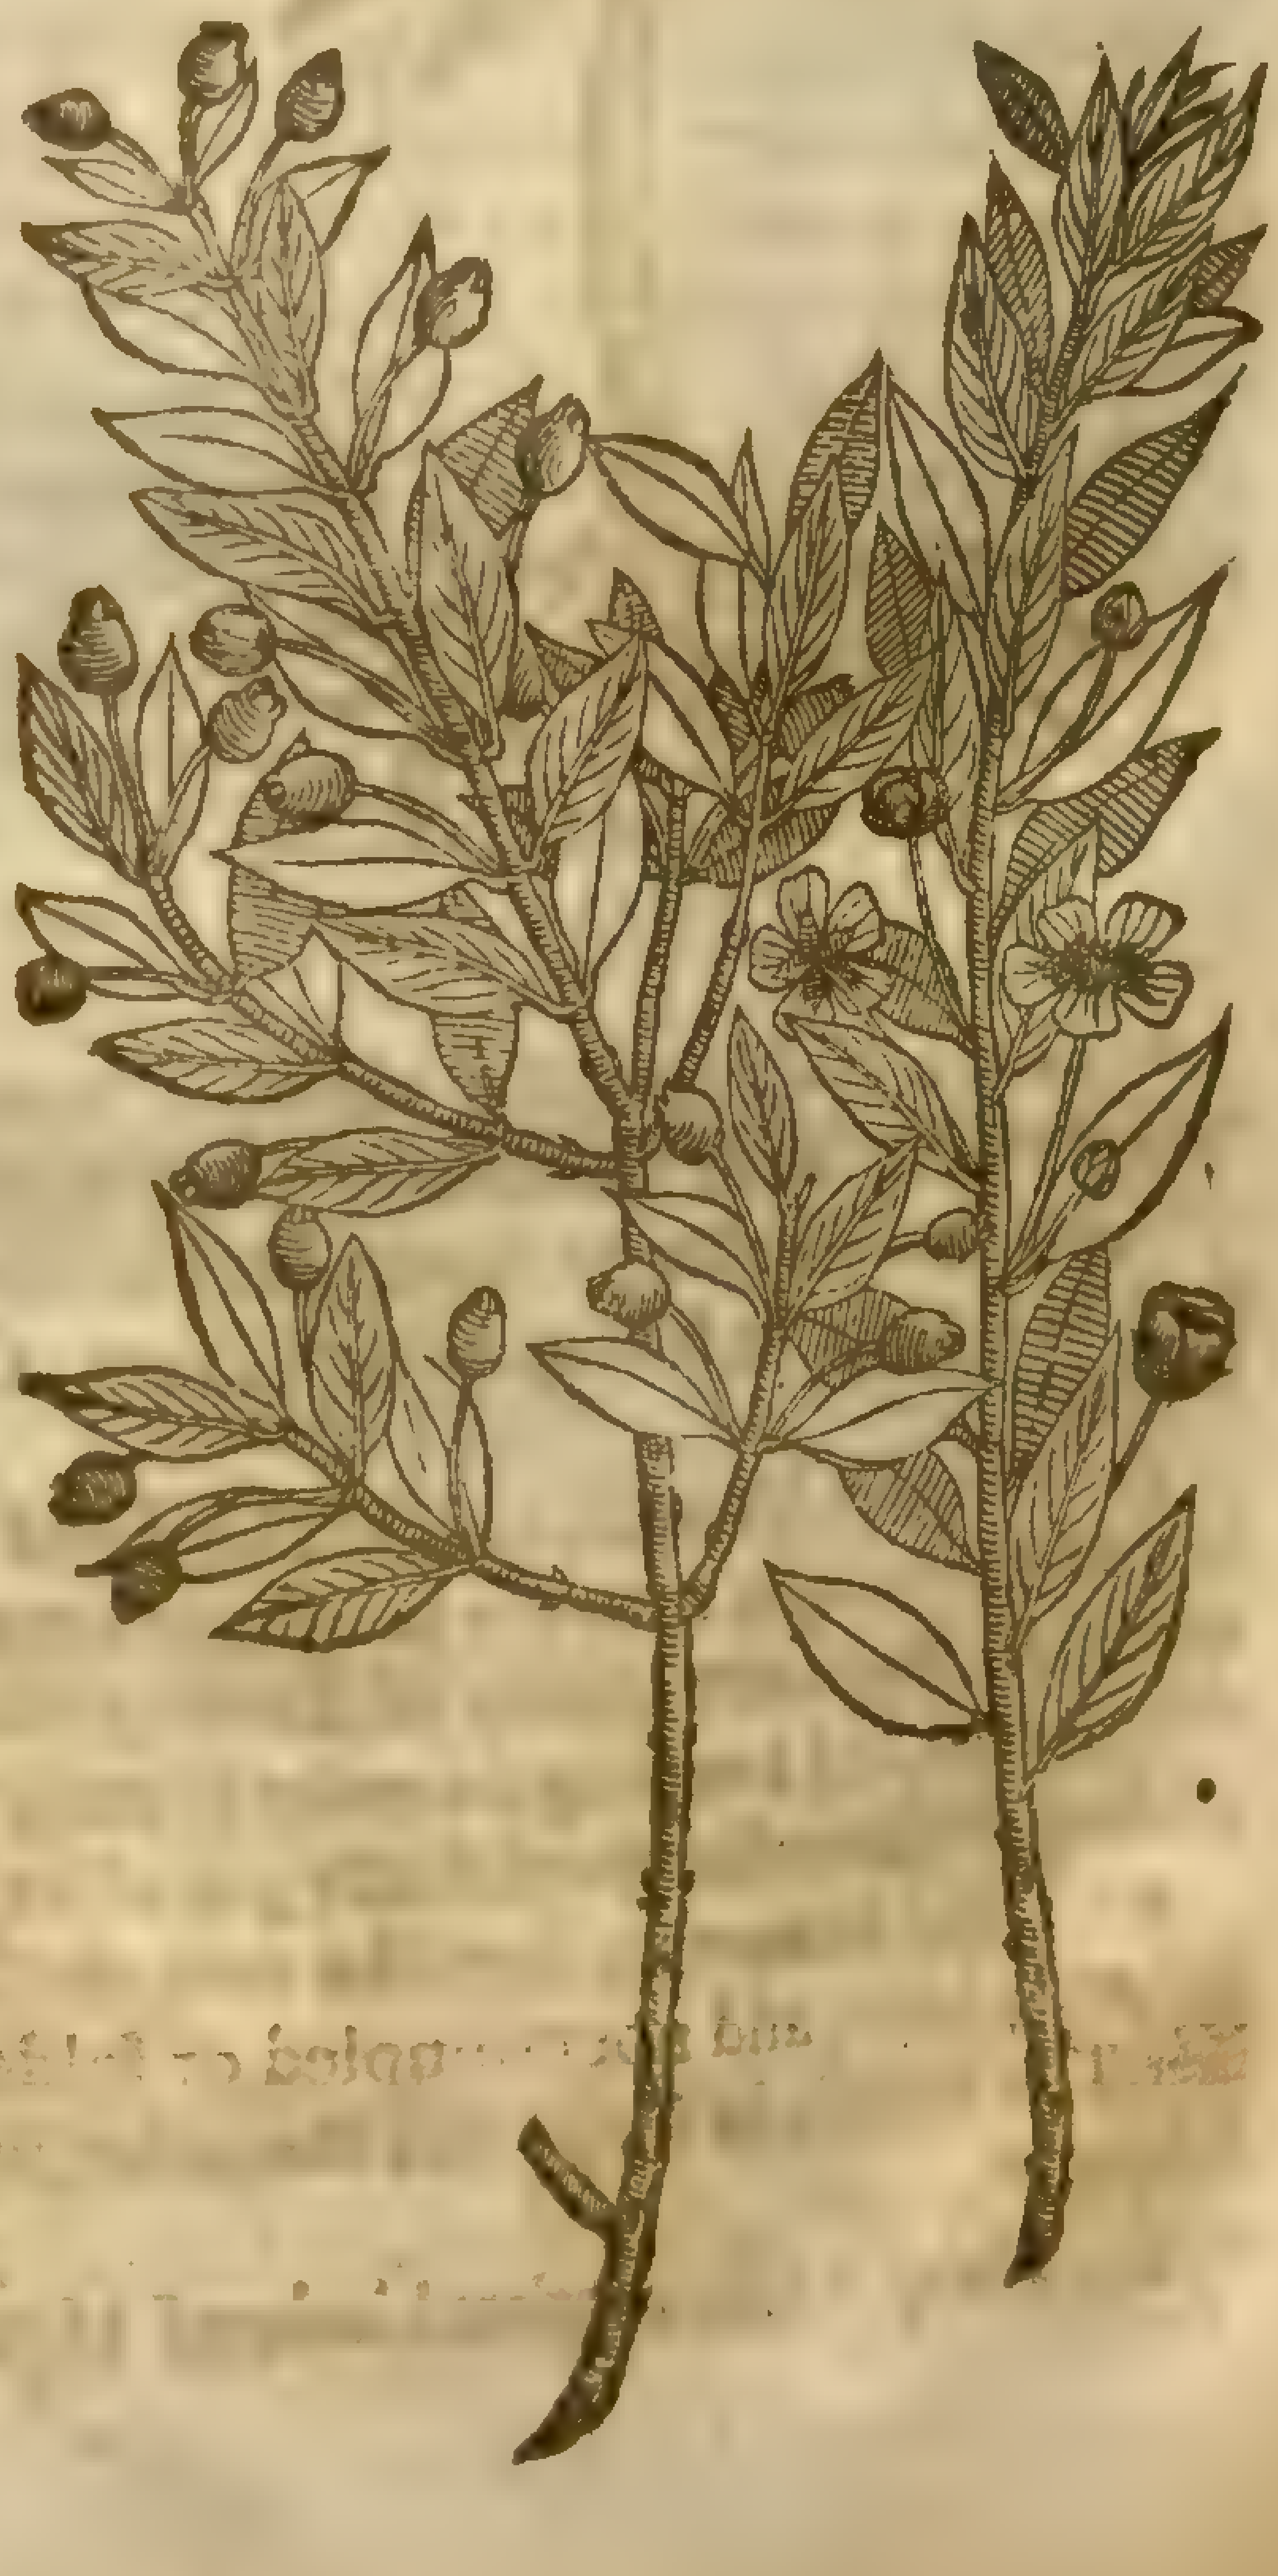


‡ 5 *Myrtus minor.*
The little Myrtle.



Myrtus communis, L. β
Mill. dict.

‡ 6 *Myrtus Baetica ſylueſtris.*
Wilde Spaniſh Myrtle.



chiefe of all the reſt) although moſt common and beſt knowne) and it groweth like a little ſhrub or hedge buſh, very like vnto the former, but much ſmaller: the leaues are ſmall and narrow, very much in ſhape reſembling the leaues of Maſticke Time called *Marum*, but of a freſher greene colour: the floures be white, nothing differing from the former ſauing in greatneſſe, and that ſometimes they are more double.

‡ 6 This growes not very high, neither is it ſo ſhrubby as the former: the branches are ſmall and brittle: the leaues are of a middle bigneſſe, ſharpe pointed, ſtanding by couples in two rowes, ſeldome in foure as the former, they are blackiſh alſo and well ſmelling, the floure is like that of the reſt: the fruit is round, growing vpon long ſtalkes out of the boſomes of the leaues, firſt greene, then whitiſh, laſtly blacke, of a winy and pleaſant taſte with ſome aſtriction. This growes wilde in diuers places of Portugall, where *Cluſius* found it flouring in October: he calls it *Myrtus Bætica ſylueſtris*. ‡

¶ *The Place.*

Theſe kindes of Myrtles grow naturally vpon the wooddy hills and fertill fields of Italy and Spaine. ‡ The two laſt are nouriſhed in the garden of Miſtriſſe *Tuggie* in Weſtminſter, and in ſome other gardens. ‡

¶ *The Time.*

Where they joy to grow of themſelues they floure when the Roſes doe: the fruit is ripe in Autumne: in England they neuer beare any fruit.

¶ *The Names.*

It is called in Greeke μύρσινη: in Latine, *Myrtus*: in the Arabicke tongue, *Alas*: in Italian, *Myrto*: in Spaniſh, *Arrayhan*: in the Portugale language, *Murta*, and *Murtella*: other Nations doe almoſt keepe the Latine name, as in Engliſh it is called Myrtle, or Myrtle tree.

Among the Myrtles that which hath the fine little leafe is ſurnamed of *Pliny*, *Tarentina*; and that which is ſo thicke and full of leaues is *Exotica*, ſtrange or forreine. *Nigra Myrtus* is that which hath the blacke berries: *Candida*, which hath the white berries, and the leaues of this alſo are of a lighter greene: *Satiua*, or the tame planted one is cheriſhed in gardens and orchards: *Syluestris*, or the wilde Myrtle is that which groweth of it ſelfe; the berries of this are oftentimes leſſer, and of the other, greater. *Pliny* doth alſo ſet downe other kindes; as *Patritia*, *Plebeia*, and *Conjugalis*: but what manner of ones they are he doth not declare: he alſo placeth among the Myrtles, *Oxymerſine*, or Kneeholm, which notwithſtanding is none of Myrtles, but a thorny ſhrub.

Pliny in his 14. booke, 16. chap. ſaith, that the wine which is made of the wild Myrtle tree is called *Myrtidanum*, if the copy be true. For *Dioſcorides* and likewiſe *Sotion* in his Geoponikes report, that wine is made of Myrtle berries when they be thorow ripe, but this is called *Vinum Murteum*, or *Myrtites*, Myrtle wine.

Moreouer, there is alſo a wine made of the berries and leaues of Myrtle ſtamped and ſteeped in Muſt, or wine new preſſed from the grape, which is called, as *Dioſcorides* ſaith, *Myrſinitē vinum*, or wine of Myrtles.

The Myrtle tree was in times paſt conſecrated to *Venus*. *Pliny* in his 15. booke, 29. chapter, ſaith thus, There was an old Alter belonging to *Venus*, which they now call *Murtia*.

¶ *The Temperature and Vertues.*

The Myrtle conſiſteth of contrary ſubſtances, a cold earthineſſe bearing the preheminence; it hath alſo a certaine ſubtill heate, therefore, as *Galen* ſaith, it drieth notably. A

The leaues, frut, buds, and juyce do binde, both outwardly applied and inwardly taken: they ſtay the ſpitting of bloud, and all other iſſues thereof: they ſtop both the whites and reds in women, if they ſit in a bath made therewith: after which manner and by fomenting alſo they ſtay the ſuperfluous courſe of the hemorrhoides. B

They are a remedy for laskes, and for the bloudy flix, they quench the fiery heate of the eies, if they be laid on with parched Barly meale. C

They be alſo with good ſucceſſe outwardly applied to all inflammations newly beginning, and alſo to new paine vpon ſome fall, ſtroke or ſtraine. D

They are wholeſome for a moiſt and watery ſtomacke: the fruit and leaues dried prouoke vrine: for the greene leaues containe in them a certaine ſuperfluous and hurtfull moiſture. E

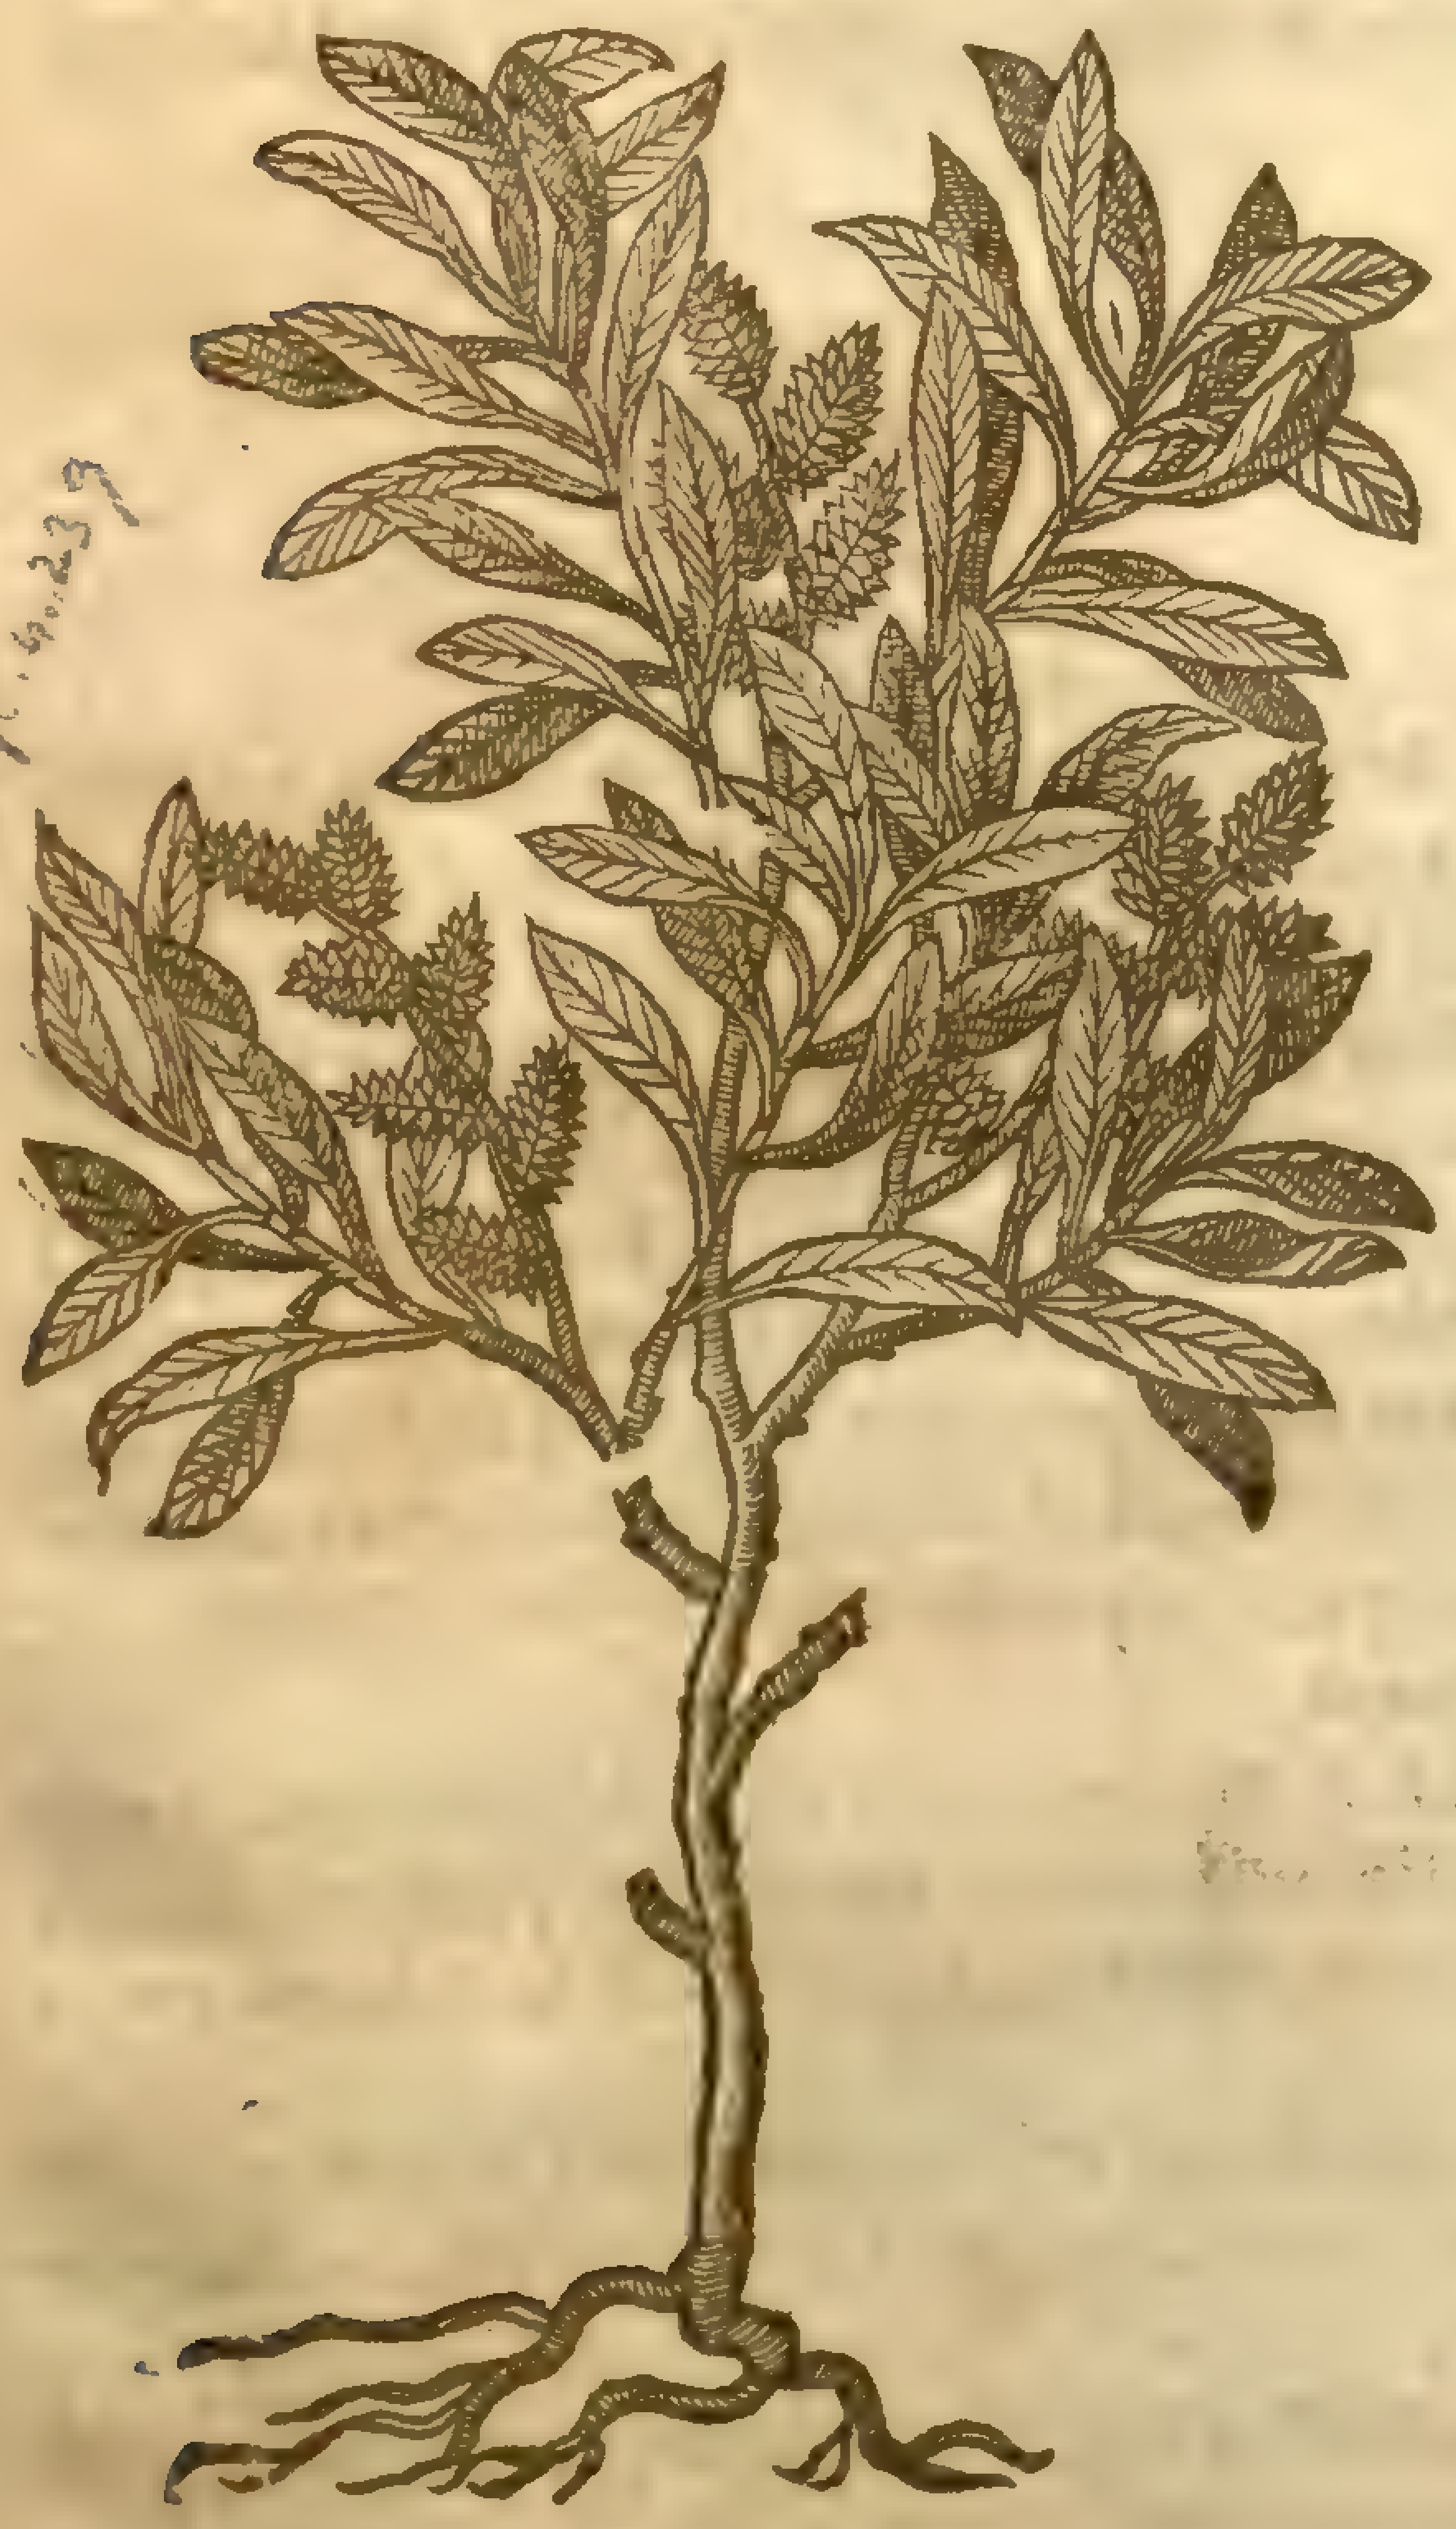
It is good with the decoction hereof made with wine, to bathe lims that are out of joint, and burſtings that are hard to be cured, and vlcers alſo of the outward parts: it helpeth ſpreading tetters, ſcoureth away the dandriffe and ſores of the head, maketh the haires blacke, and keepeth them from F from ſhedding; withſtanding drunkenneſſe, if it be taken faſting, and preuaileth againſt poiſon, and the bitings of any venomous beaſt.

G There is drawne out of the green berries thereof a juyce, which is dried and reſerued for the foreſaid vſes.

H There is likewiſe preſſed out of the leaues a juyce, by adding vnto them either old wine or raine water, which muſt be vſed when it is new made, for being once dry it putrifieth, and as *Dioſcorides* ſaith, loſeth his vertues.

Chap. 72. *Of ſweet Willow or Gaule.*

Myrtus Brabantica, ſiue Elæagnus Cordi.
Gaule, ſweet willow, or Dutch Myrtle tree.



Myrica gale, L.
Linn. diæc.
Sm. p. 6. 237

¶ *The Deſcription.*

Gaule is a low and little ſhrub or wooddy plant, hauing many browne & hard branches: whereupon doe grow leaues ſomewhat long, hard, thicke, and oileous, of an hot ſauour or ſmell ſomewhat like *Myrtus*: among the branches come forth other little ones, wherupon do grow many ſpoky eares or tufts, full of ſmall floures, and after them ſucceed great ſtore of ſquare ſeeds cluſtering together, of a ſtrong and bitter taſte. The root is hard, and of a wooddy ſubſtance.

¶ *The Place.*

This Gaule groweth plentifully in ſundry places of England, as in the Ile of Ely, & in the Fenny countries thereabouts, whereof there is ſuch ſtore in that countrey, that they make fagots of it and ſheaues, which they call Gaule ſheaues, to burn and heat their ouens. It groweth alſo by Colebrooke, and in ſundry other places.

¶ *The Time.*

The Gaule floureth in May and Iune, and the ſeed is ripe in Aguſt.

¶ *The Names.*

This tree is called of diuers in Latine, *Myrtus Brabantica*, and *Pſeudomyrſine*; and *Cordus* calleth it *Elæagnus*, *Chamæleagnus*, and *Myrtus Brabantica*. *Elæagnus* is deſcribed by *Theophraſtus* to be a ſhrubby plant like vnto the Chaſte tree, with a ſoft and downy leafe, and with the floure of the Poplar tree; and that which we haue deſcribed is no ſuch plant. It hath no name among the old writers for ought we know, vnleſſe it be *Rhus ſylueſtris Plinij*, or *Pliny* his wilde Sumach, of which he hath written in his 24. booke, 11. chap. [There is, ſaith he, a wilde herbe with ſhort ſtalkes, which is an enemy to poiſon, and a killer of mothes.] it is called in low Dutch, **Gagel**: in Engliſh, Gaule.

¶ *The Temperature.*

Gaule or the wilde Myrtle, eſpecially the ſeed, is hot and dry in the third degree: the leaues be hot and dry, but not ſo much.

¶ *The Vertues.*

A The fruit is troubleſome to the brain; being put into beere or ale whileſt it is in boyling (which many vſe to do) it maketh the ſame heady, fit to make a man quickely drunke.

B The whole ſhrubbe, fruit and all, being laied among clothes, keepeth them from mothes and wormes.

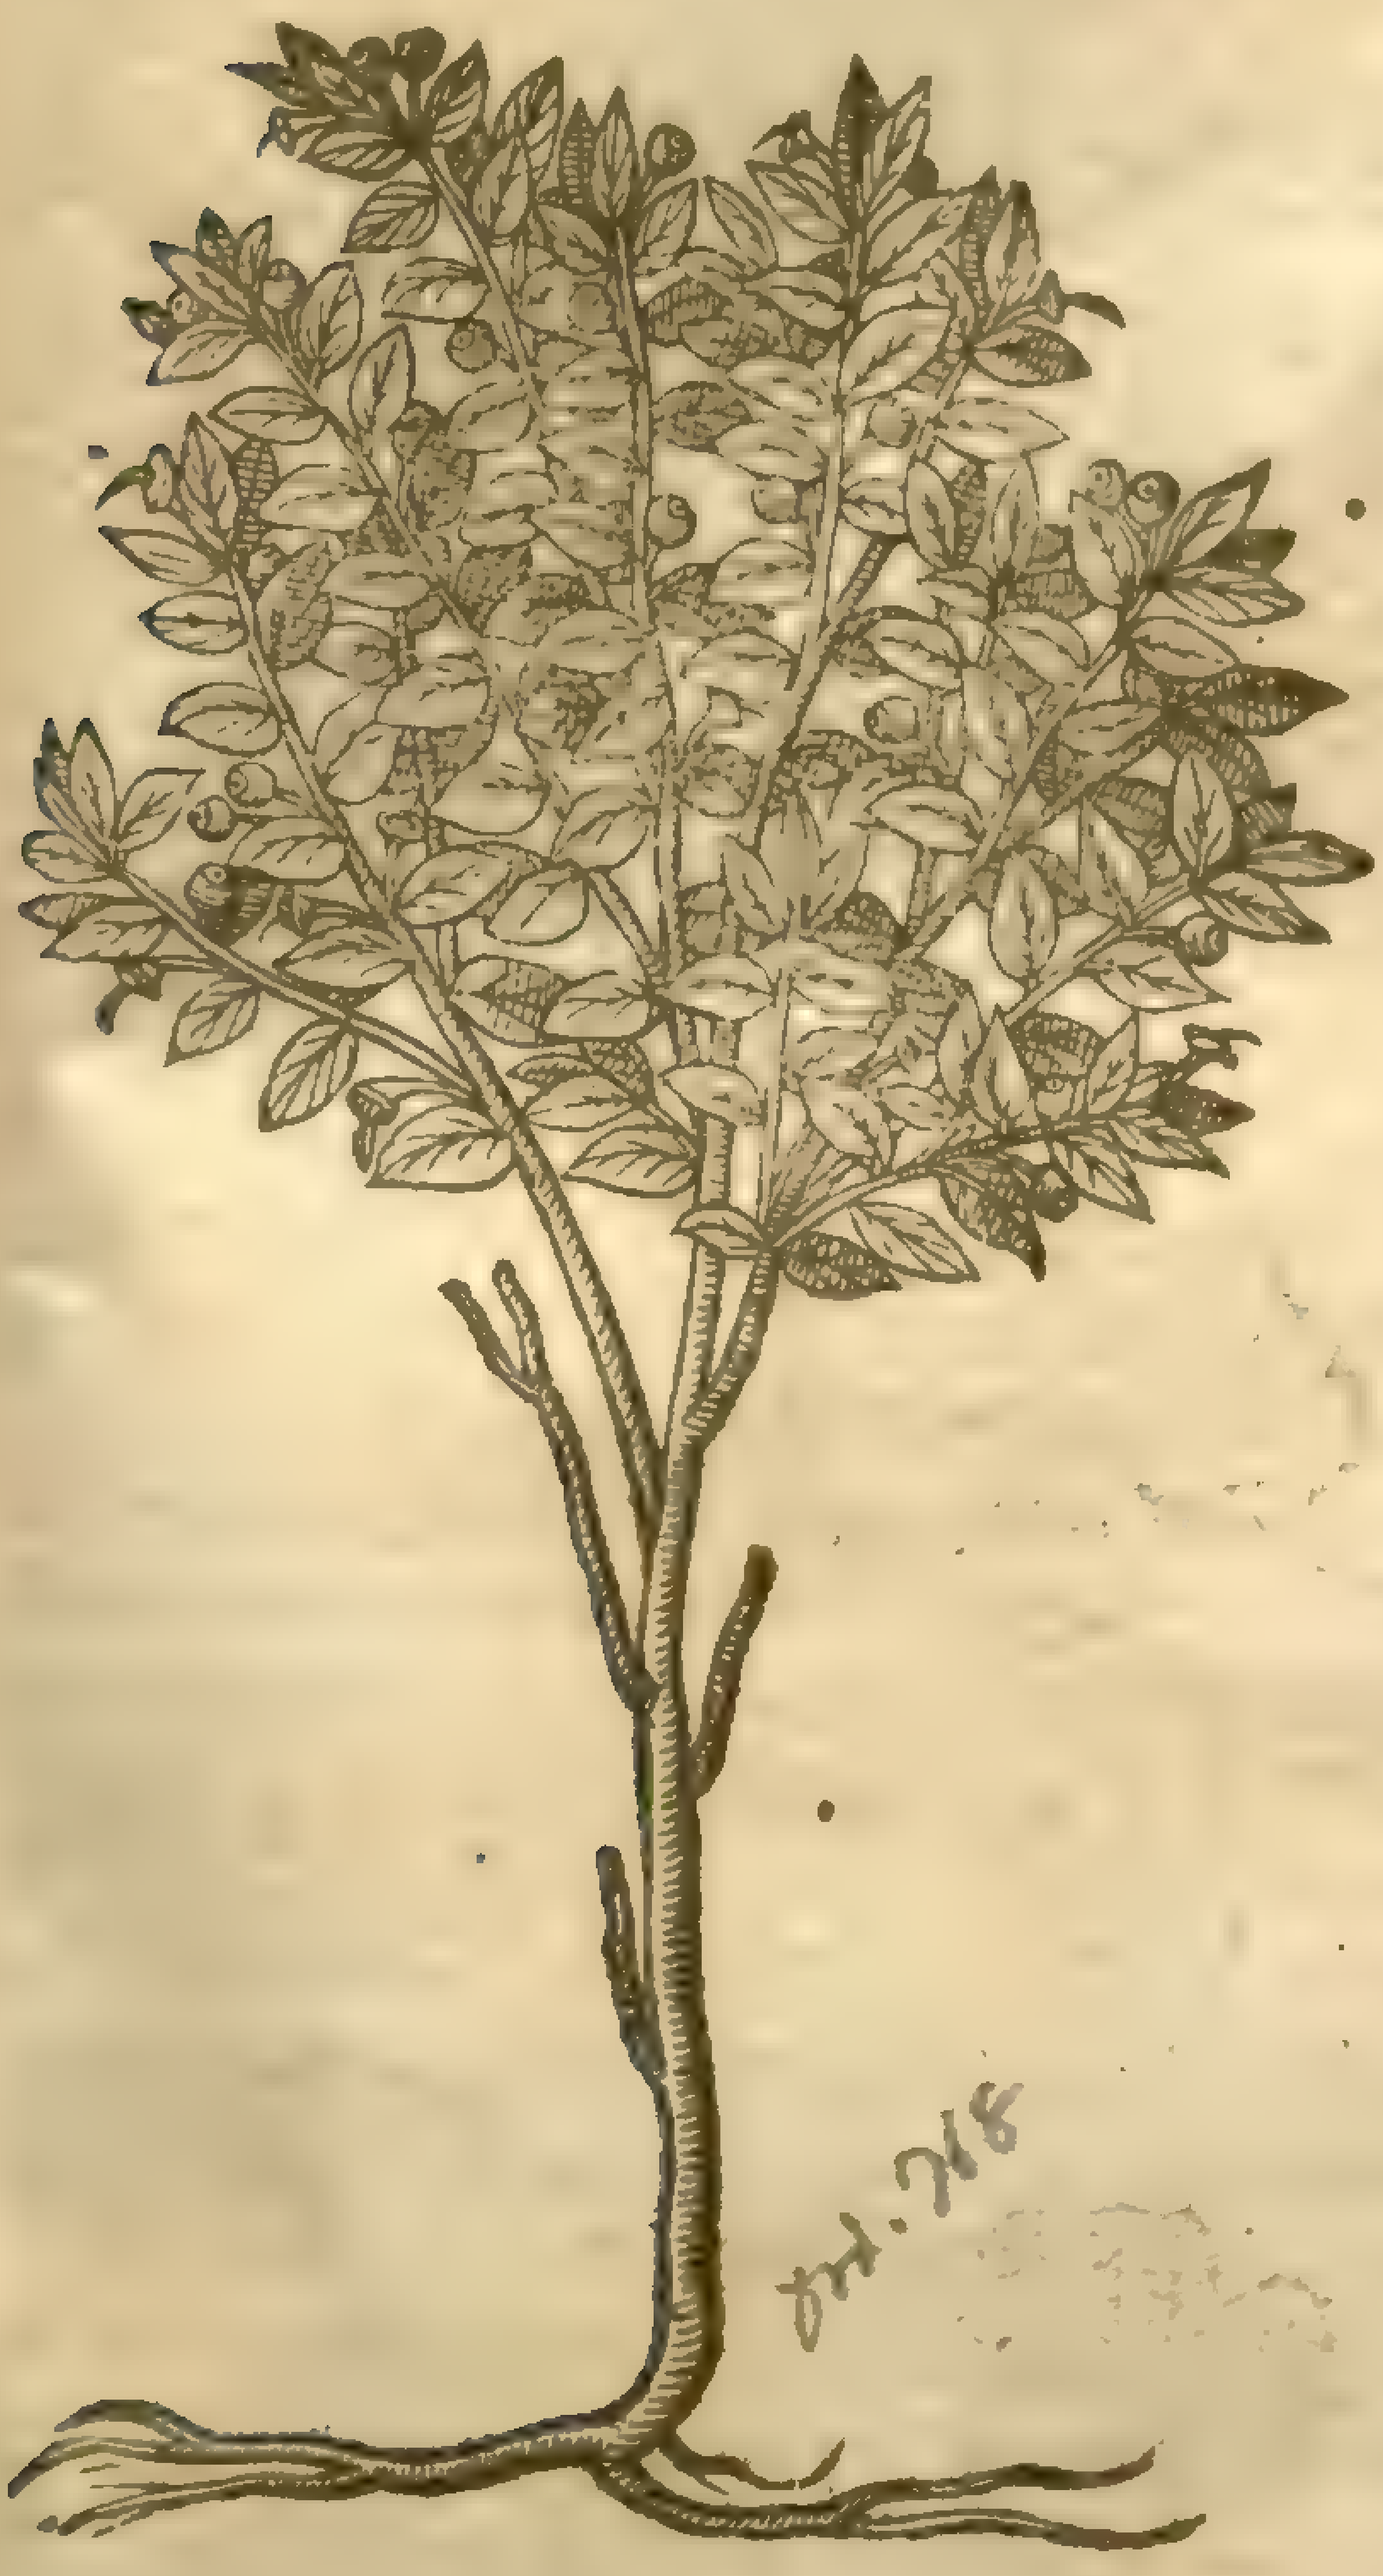
CHAP. 73. *Of Worts or Wortle berries.*

¶ *The Kindes.*

V*Accinia*, or Worts, of which we treat in this place, differ from Violets, neither are they eſteemed for their floures but berries: of theſe Worts there be diuers ſorts found out by the later Writers.

Vaccinium myrtillus, L. mat. dict. Sm. fl. 2.219

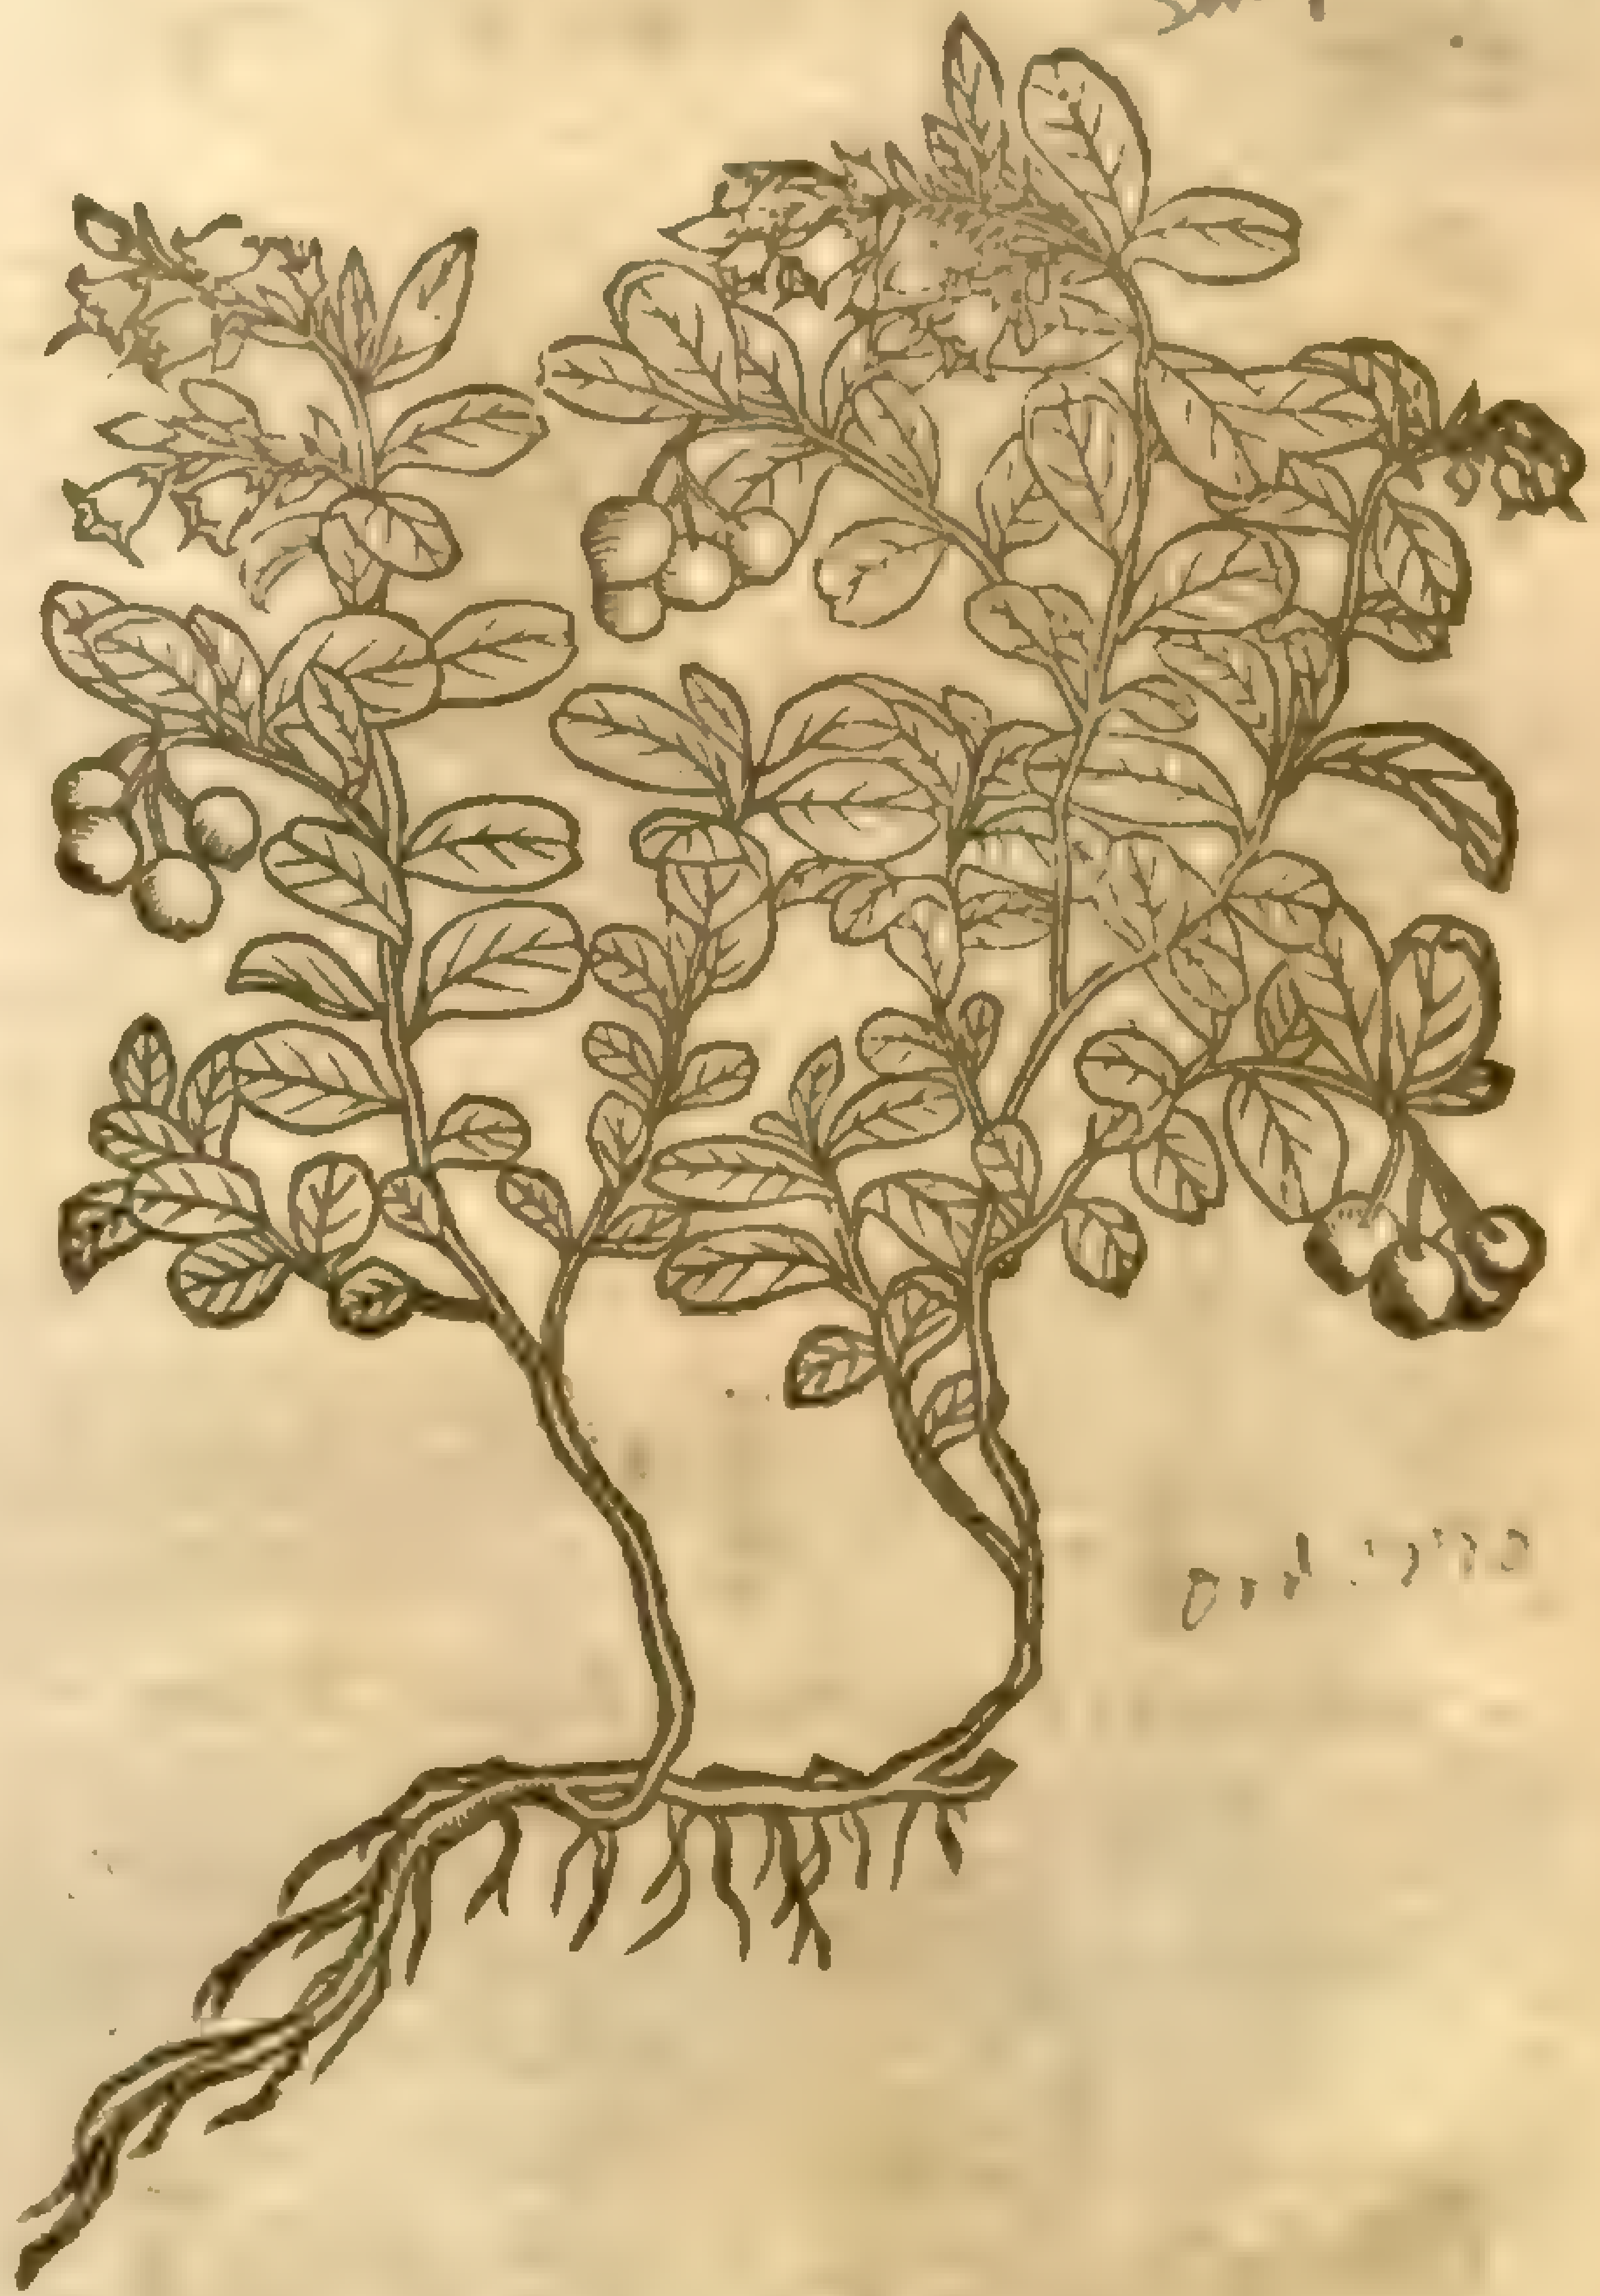
1 *Vaccinia nigra.*
Blacke Worts or Wortle berries.



Ord. 718

2 *Vaccinia rubra.*
Red Worts or Wortle berries.

Vaccinium vitis idaea, L. mat. dict. Sm. fl. 2.220



Ord. 770

¶ *The Deſcription.*

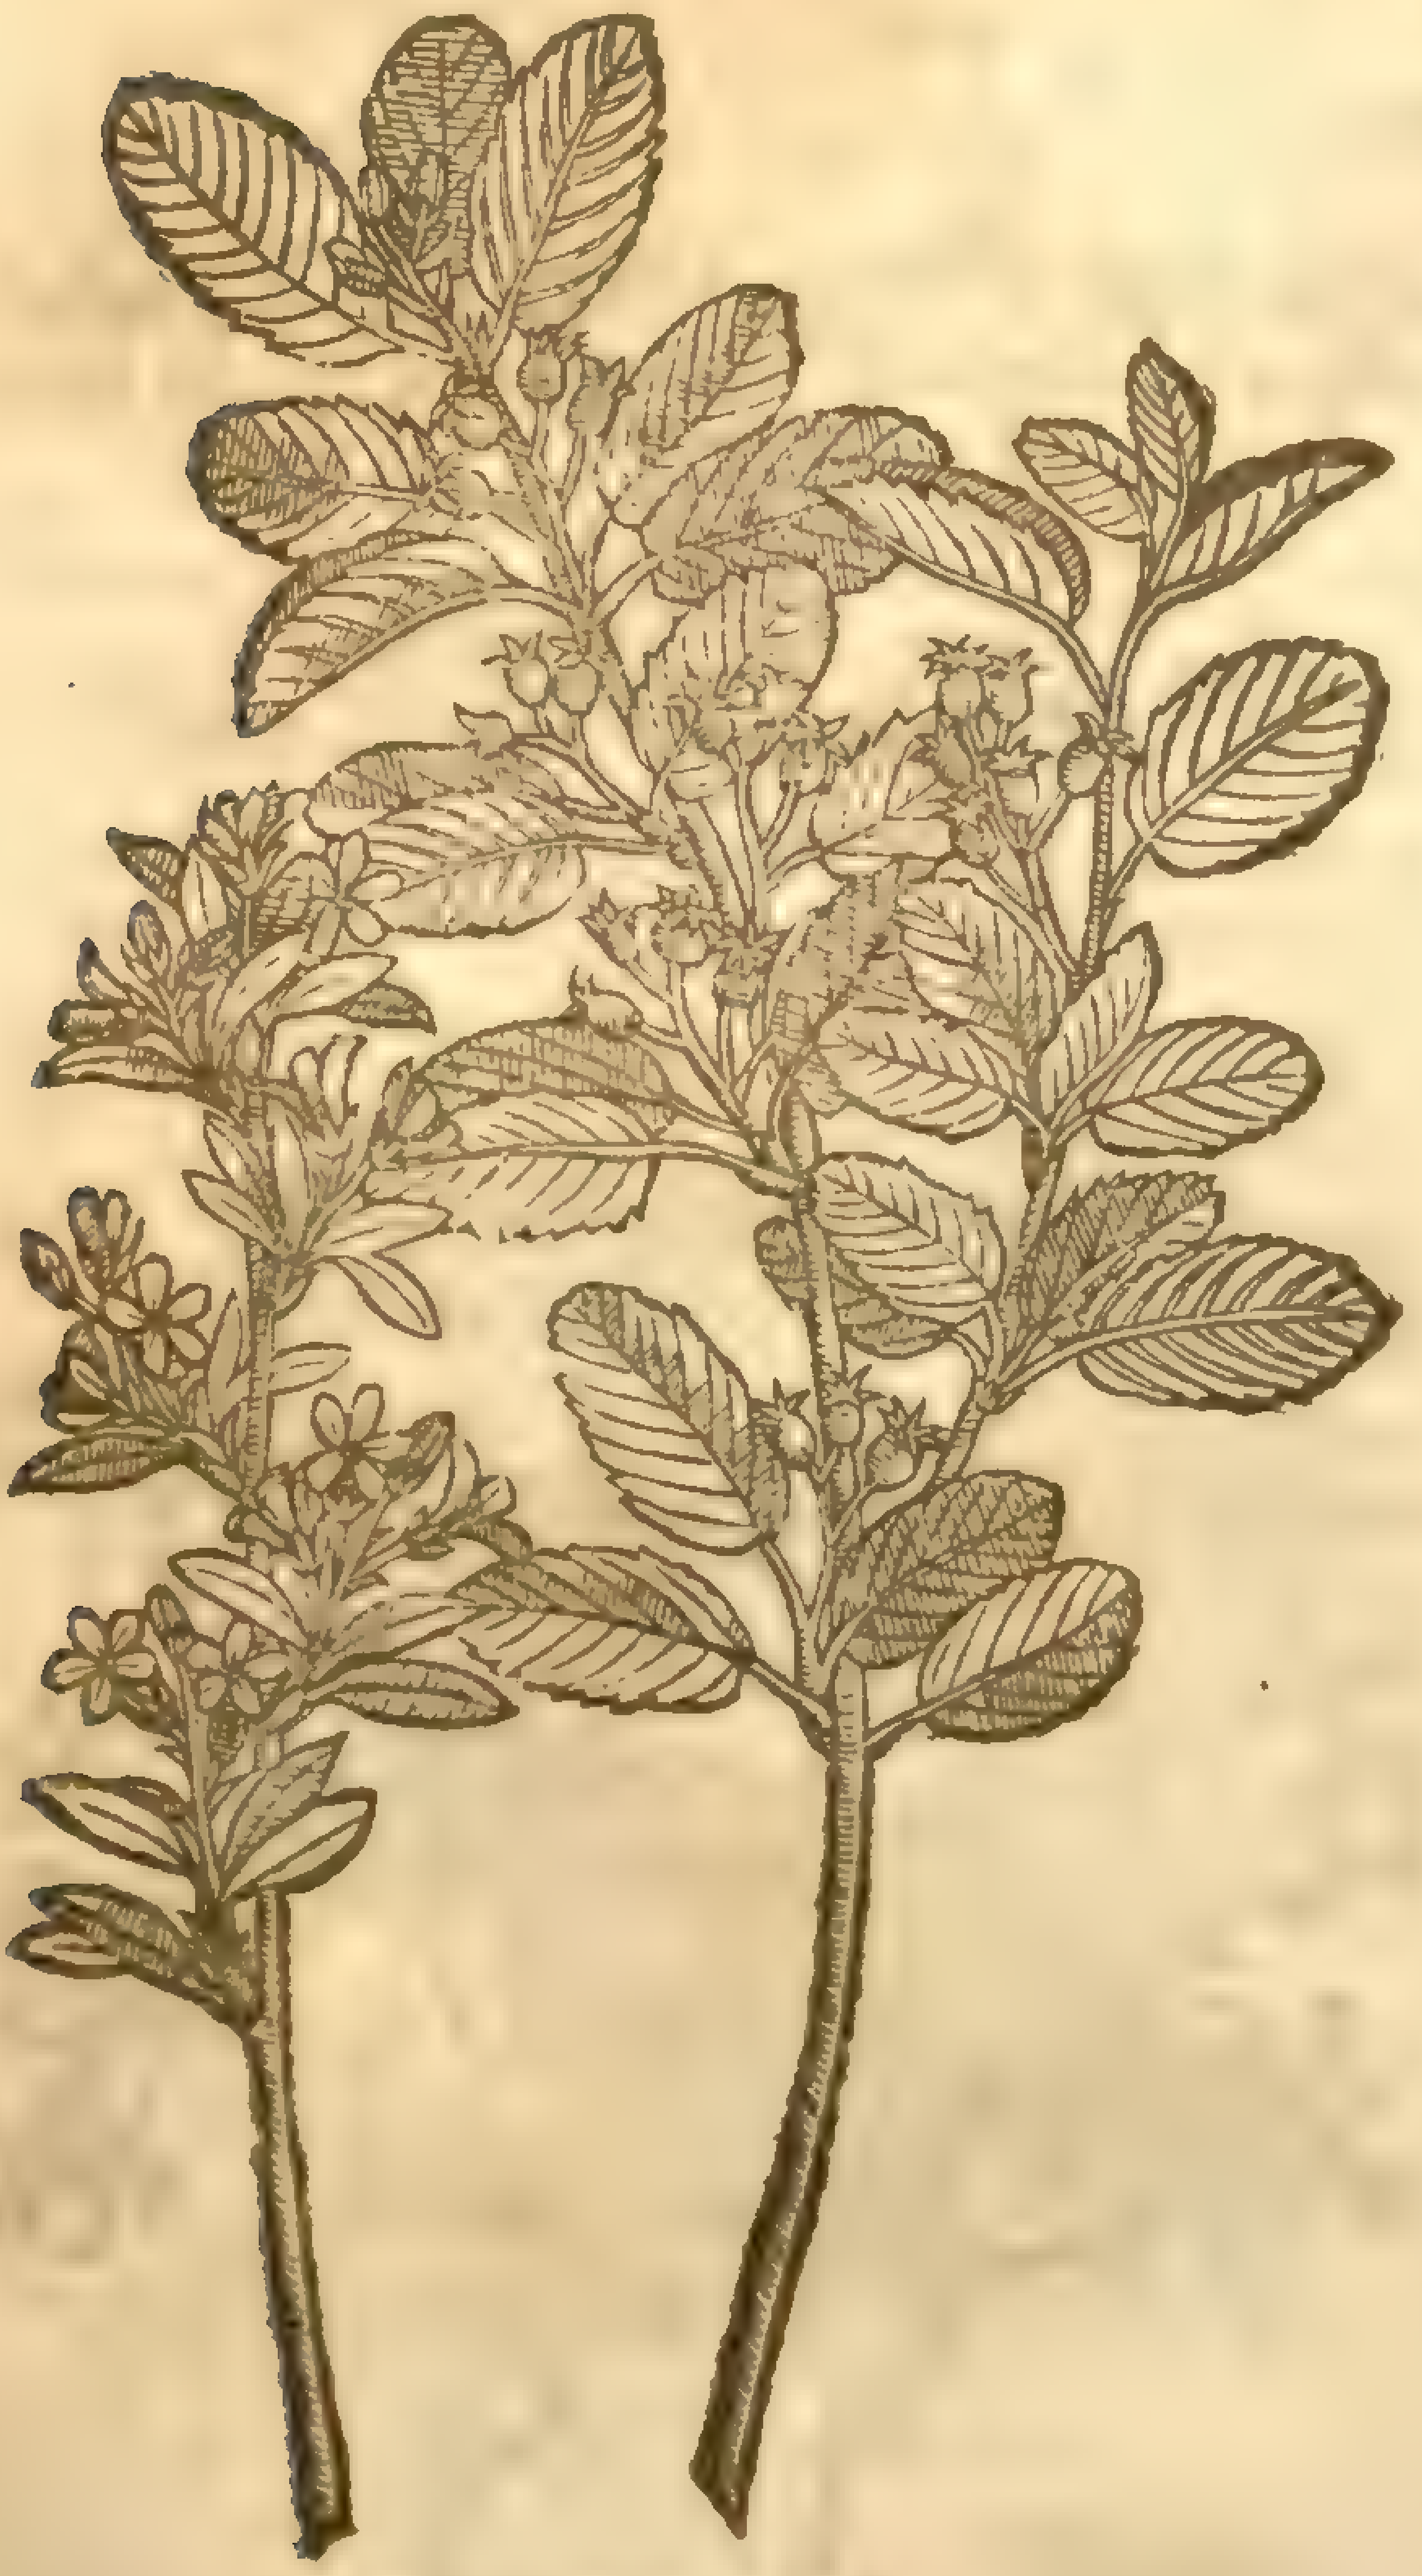
1 V*Accinia nigra*, the blacke Wortle or Hurtle, is a baſe and low ſhrub or wooddy plant, bringing forth many branches of a cubit high, ſet full of ſmall leaues of a darke greene colour, not much vnlike the leaues of Box or the Myrtle tree: amongſt which come forth little hollow floures turning into ſmall berries, greene at the firſt, afterward red, and at the laſt of a blacke colour, and full of a pleaſant and ſweet juyce: in which doe lie diuers little thinne whitiſh ſeeds: theſe berries do colour the mouth and lips of thoſe that eat them, with a blacke colour: the root is wooddy, ſlender, and now and then creeping.

2 *Vaccinia rubra*, or red Wortle, is like the former in the manner of growing, but that the leaues are greater and harder, almoſt like the leaues of the Box tree, abiding greene all the Winter long: among which come forth ſmall carnation floures, long and round, growing in cluſters at the top of the branches: after which ſucceed ſmall berries, in ſhew and bigneſſe like the former, but that they are of an excellent red colour and full of juyce, of ſo orient and beautifull a purple to limme withall, that Indian *Lacca* is not to be compared thereunto, eſpecially when this juyce is prepared and dreſſed with Allom according to art, as my ſelfe haue proued by experience: the taſte is rough and aſtringent: the root is of a wooddy ſubſtance.

3 *Vaccinia alba*, or the white Wortle, is like vnto the former, both in ſtalkes and leaues, but the berries are of a white colour, wherein conſiſteth the difference.

‡ The figure which our Author here giues in the third place hath need of a better deſcription, for

3 *Vaccinia alba.*
The white Worts or Wortle berries.



4 *Vaccinia Pannonica, ſiue Vitis Idæa.*
Hungarie Wortle berries.

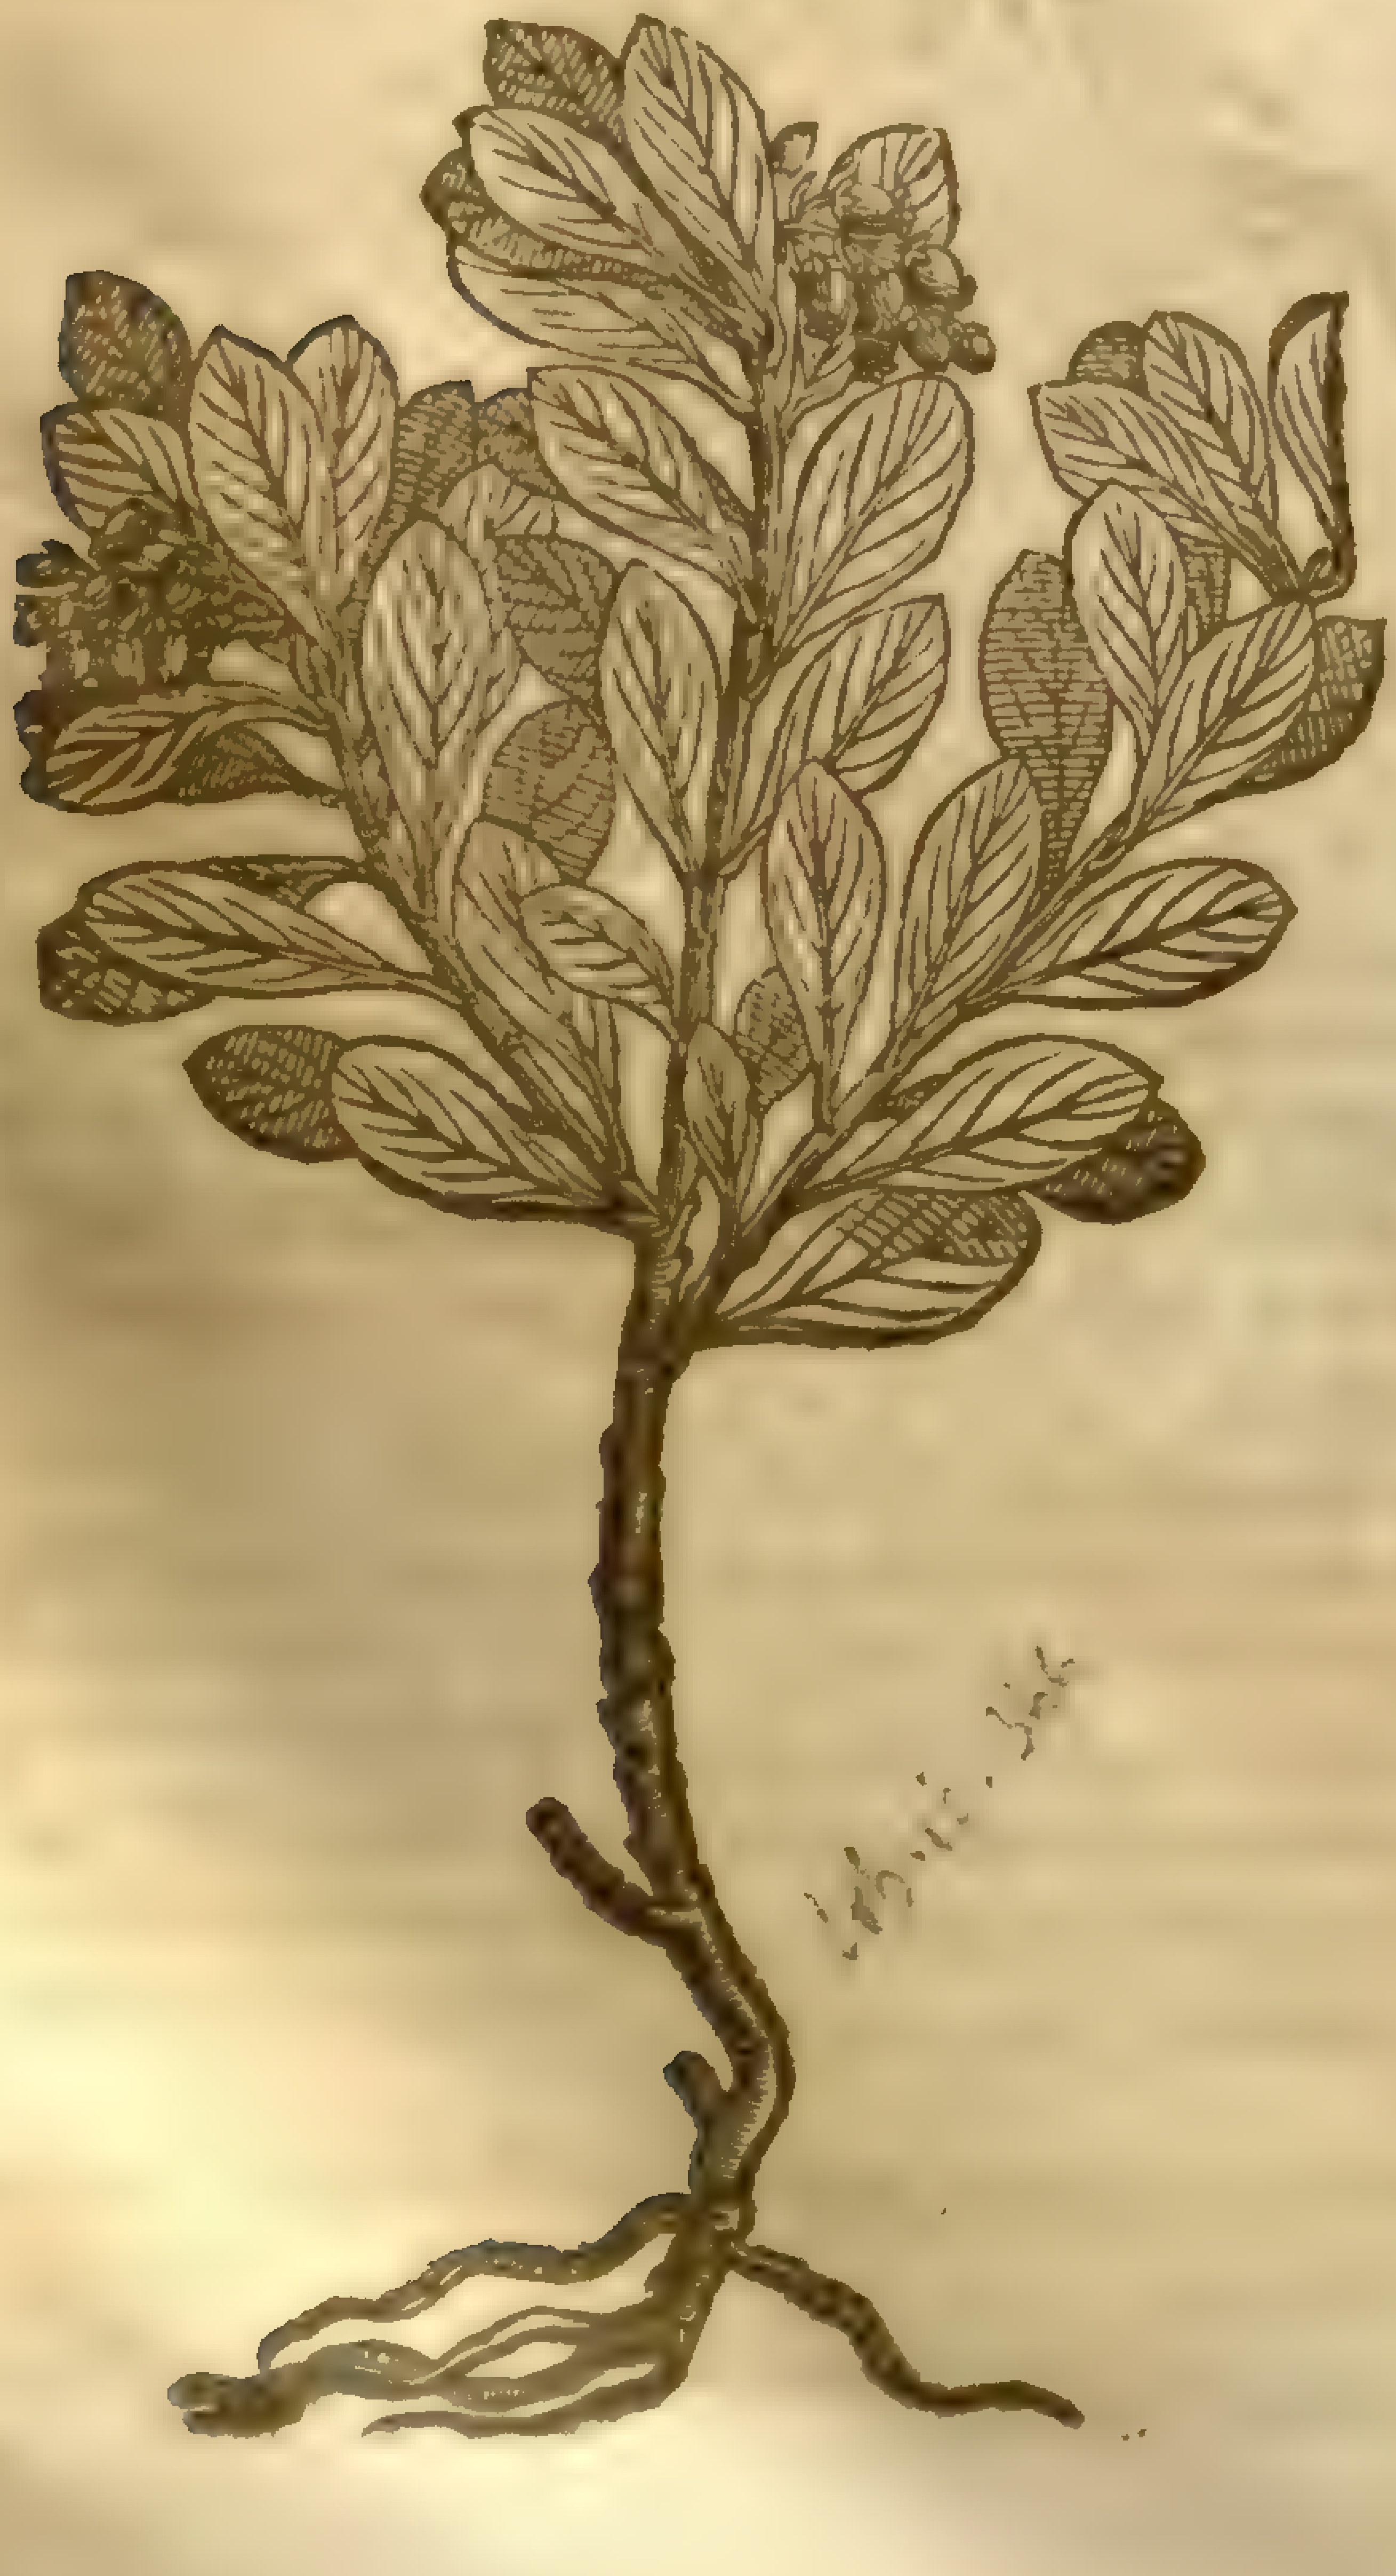
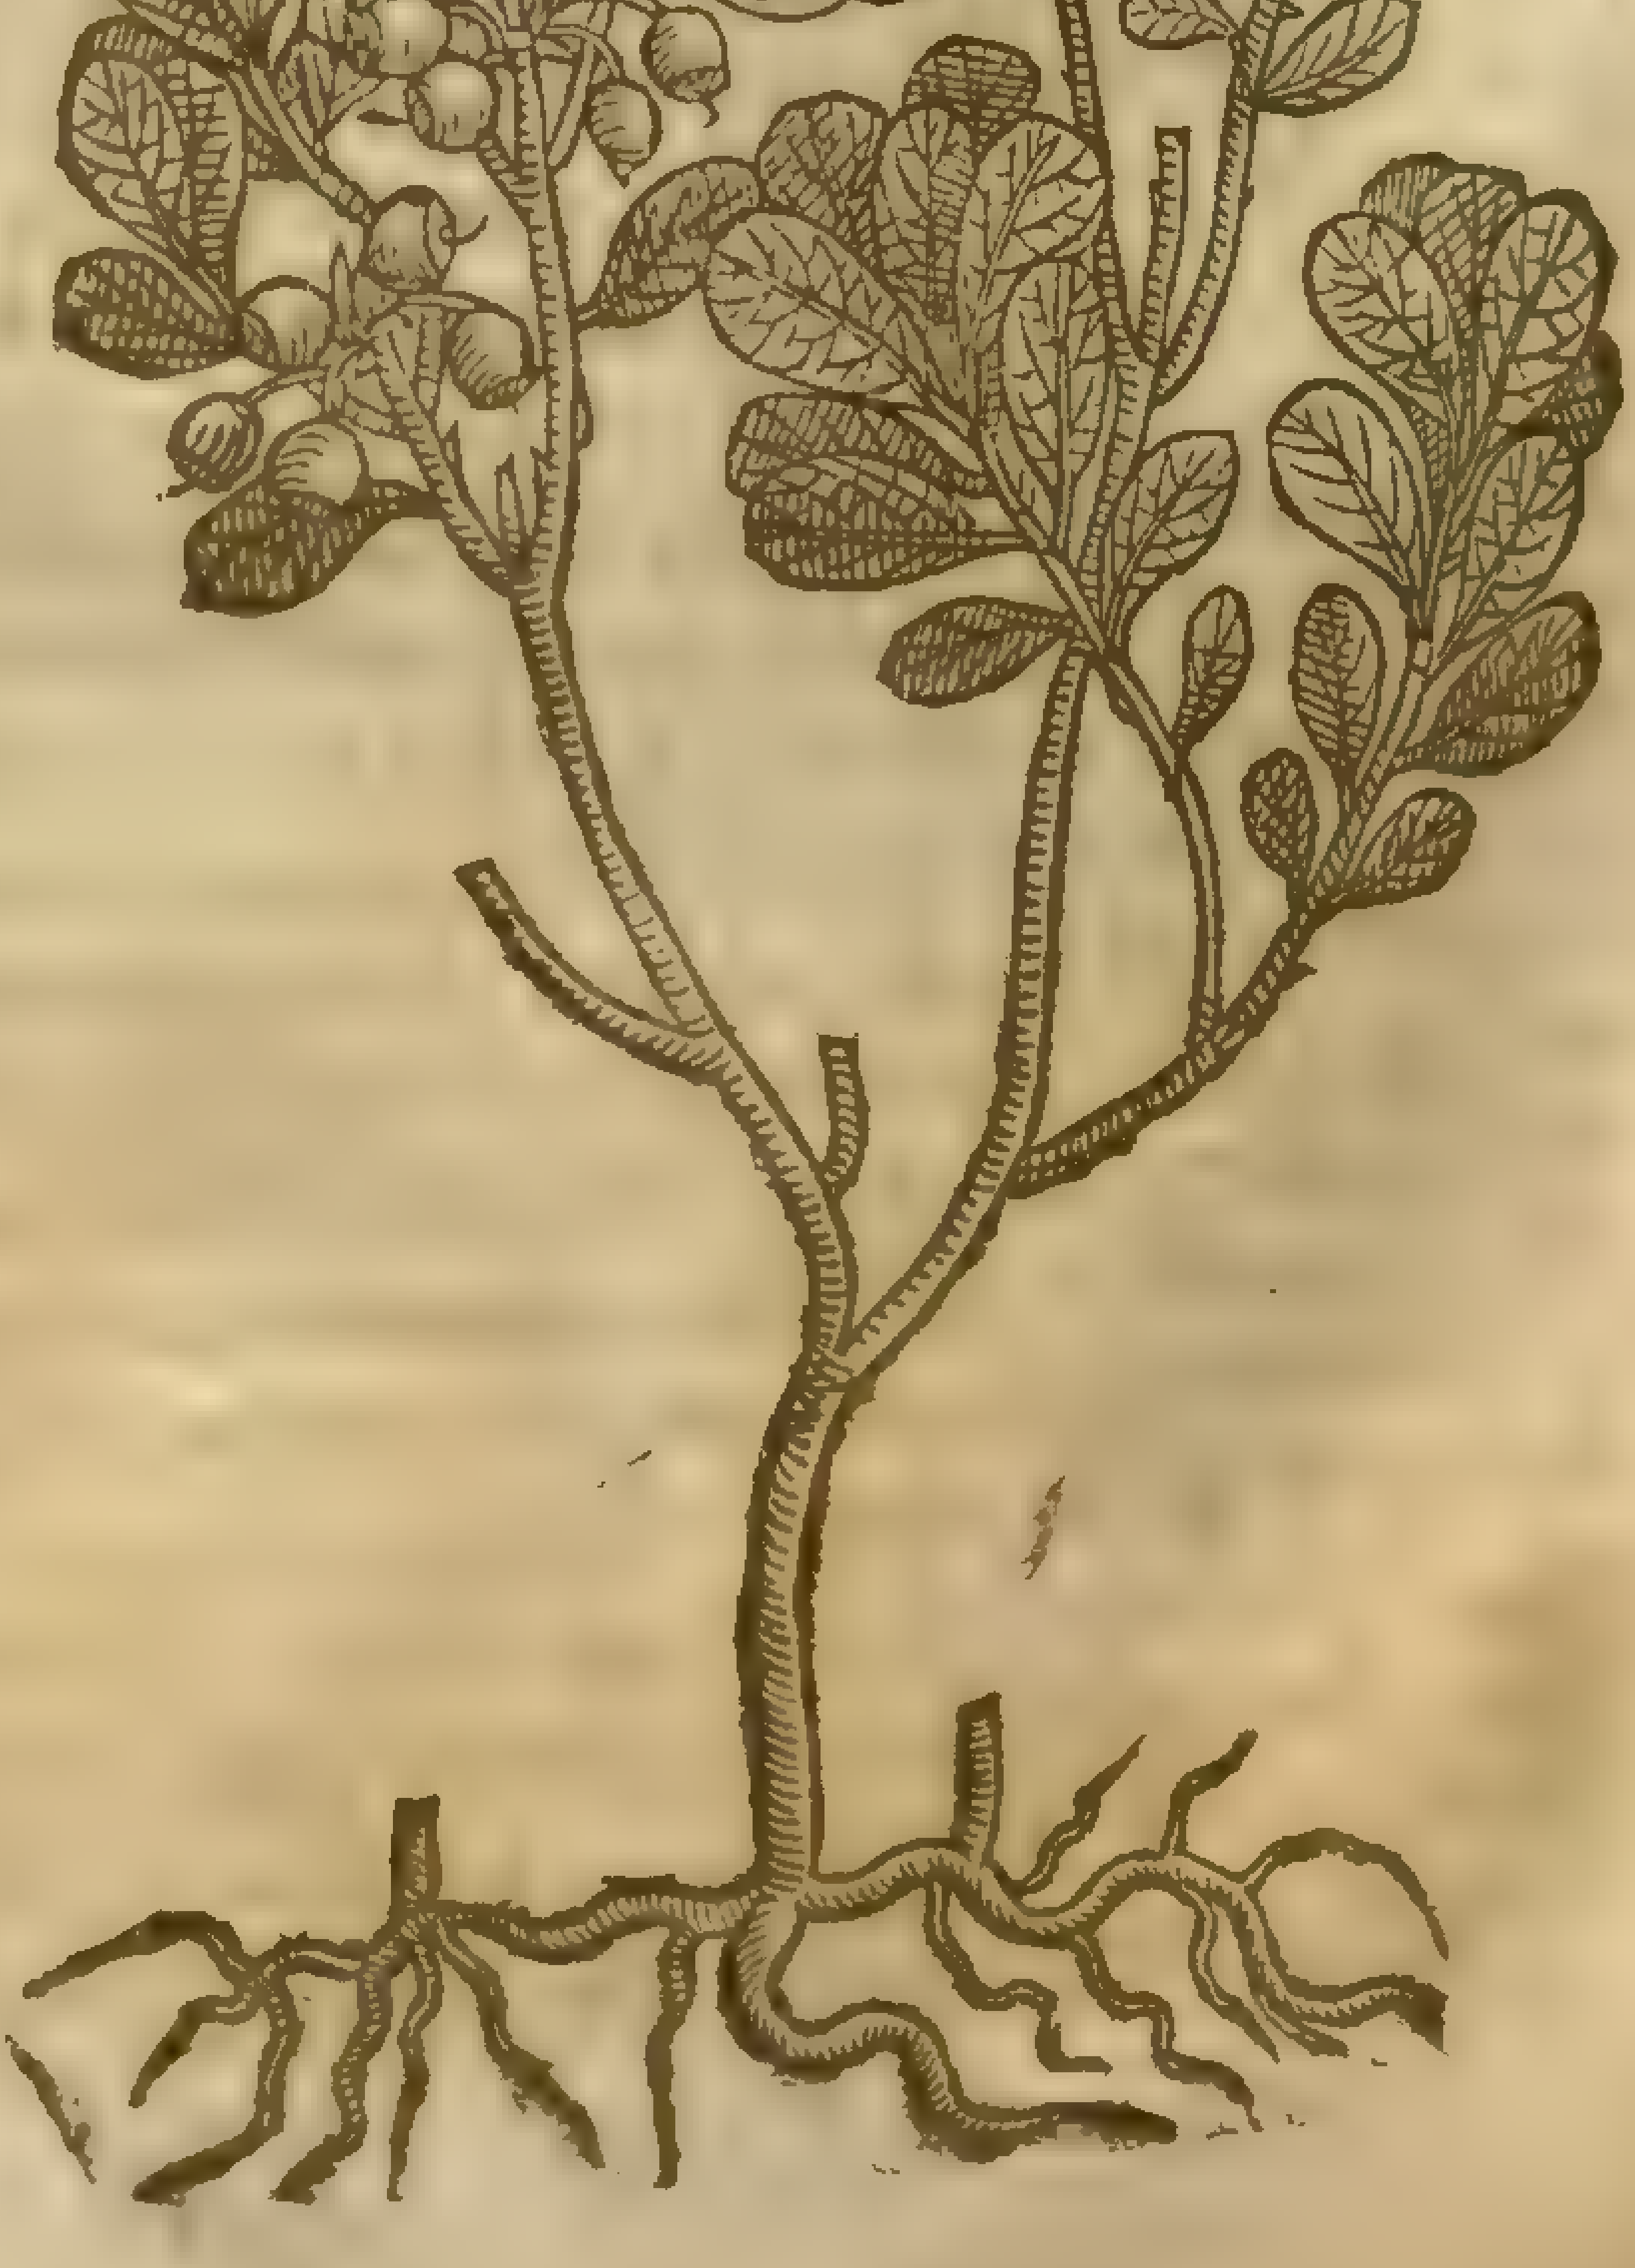
5 *Vaccinia Vrſi, ſiue Vua Vrſi apud Cluſium.*
Beare Wortle berries.



Arbutus uva ursi, L.
Engl. Bot.
Sm. fl. 2.254

† 6 *Vitis Idæa folijs ſubrotundis major.*
Great round leaued Wortle berries.

Vaccinium uliginosum, L.
Engl. Bot.
Sm. fl. 2.250



for the difference is not onely in the colour of the berries. This differs from the former in forme and bigneſſe; for it ſends forth many ſtalks from the root, and theſe three, foure, or fiue cubits high, thicke, and diuided into ſundry branches, couered for the moſt part with a blackiſh barke: at the beginning of the Spring from the buds at the ſides of the branches it ſends forth leaues all horie and hairy vnderneath, and greene aboue: from the midſt of theſe vpon little foot-ſtalkes ſtand cluſtering together many little floures, conſiſting of fiue white leaues apiece without ſmell; and then the leaues by little and little vnfold themſelues and caſt off their downineſſe, and become ſnipt about the edges. The fruit that ſucceeds the floures is round, blacke, ſomewhat like, but bigger than a Haw, full of juyce of a very ſweet taſte; wherein lies ten or more longiſh ſmooth blackiſh ſeeds. It growes vpon the Auſtrian and Stirian Alps, where the fruit is ripe in Auguſt. *Cluſius* calls it *Vitis Idæa* 3. *Pena* and *Lobel*, *Amelancher*: *Geſner* by diuers names, as *Myrtomalus, Petromelis, Pyrus ceruinus, &c.* ‡

4 *Carolus Cluſius* in his Pannonicke Obſeruations hath ſet downe another of the Wortle berries, vnder the name of *Vitis Idæa*, which differeth from the other Wortle berries, not onely in ſtature, but in leaues and fruit alſo. ‡ The leaues are long, narrow, ſharpe pointed, full of veines, a little hairy, and lightly ſnipt about the edges, greener aboue than below: the fruit growes from the tops of the branches of the former yeare, hanging vpon long foot-ſtalkes, and being as big as little Cherries, firſt greene, then red, and laſtly blacke, full of juyce, and that of no vnpleaſant taſte, containing no kernels, but flat white ſeeds commonly fiue in number: the ſtalks are weake, and commonly lie vpon the ground: *Cluſius* found it vpon the Auſtrian mountain Snealberg, with the fruit partly ripe, and partly vnripe in Auguſt. It is his *Vitis Idæa* 1. ‡

5 The ſame Author alſo ſetteth forth another of the Wortle berries, vnder the title of *Vua Vrſi*, which is likewiſe a ſhrubby plant, hauing many feeble branches, whereon grow long leaues blunt at the points, and of an ouerworne greene colour: among which, at the tops of the ſtalks come forth cluſters of bottle-like floures of an herby colour: the fruit followeth, growing likewiſe in cluſters, green at the firſt, and blacke when they be ripe: the root is of a wooddy ſubſtance. ‡ This is alwaies greene, and the floures are of a whitiſh purple colour. ‡

‡ 6 This differs from the ſecond, in that the leaues are thinner, more full of veines, and whiter vnderneath: the floure is like the common kind, whitiſh, purple, hollow, and diuided into fiue parts: the fruit alſo is blacke, and like that of the firſt deſcribed. This growes on diuers mountainous places of Germany, where *Cluſius* obſerued it, who made it his *Vitis Idæa* 2. ‡

¶ *The Place.*

Theſe plants proſper beſt in a leane barren ſoile, and in vntoiled wooddy places: they are now and then found on high hills ſubject to the winde, and vpon mountaines: they grow plentifully in both the Germanies, Bohemia, and in diuers places of France and England; namely in Middleſex on Hampſted heath, and in the woods thereto adjoyning, and alſo vpon the hills in Cheſhire called Broxen hills, neere Beeſton caſtle, ſeuen miles from the Nantwich; and in the wood by Highgate called Finchley wood, and in diuers other places.

☞ The red Wortle berry groweth in Weſtmerland at a place called Crosby Rauenſwaith, where alſo doth grow the Wortle with the white berry, and in Lancaſhire alſo vpon Pendle hills.

‡ I haue ſeene none of theſe but onely the firſt deſcribed, growing vpon Hampſted heath. The white formerly mentioned in the third deſcription, and here againe in the place, ſeems only a varietie of the ſecond hauing white berries, as far as I can gather by our Author; for it is moſt certaine, that it is not that which he figured, and I haue deſcribed in the third place. ‡

¶ *The Time.*

The Wortle berries do floure in May, and their fruit is ripe in Iune.

¶ *The Names.*

Wortle berries is called in high Dutch, **Heydelbeeren**: in low Dutch, **Crakebeſſen**, becauſe they make a certaine cracke whileſt they be broken betweene the teeth: of diuers, **Hauerbeſſen**: the French men, *Airelle*, or *Aurelle*, as *Iohannes de Choul* writeth: and we in England, Worts, Whortle berries, Blacke berries, Bill berries, and Bull berries, and in ſome places Win berries.

Moſt of the ſhops of Germany do call them *Myrtilli*, but properly *Myrtilli* are the fruit of the Myrtle tree, as the Apothecaries name them at this day. This plant hath no name for ought wee can learne, either among the Greekes or antient Latines; for whereas moſt doe take it to be *Vitis Idæa*, or the Corinth tree, which *Pliny* ſurnameth *Alexandrina*, it is vntrue; for *Vitis Idæa* is not onely like to the common Vine, but is alſo a kinde of Vine: and *Theophraſtus* who hath made mention hereof doth call it, without an Epethete, ἄμπελος, ſimply, as a little after we will declare; which without doubt he would not haue done if hee had found it to differ from the common Vine: For what things ſoeuer receiue a name of ſome plant, the ſame are expreſſed with ſome Epethit added to be known to differ from others; as *Laurus Alexandrina, Vitis alba, Vitis nigra, Vitis ſylueſtris*, and ſuch like.

Moreouer, thoſe things which haue borrowed a name from ſome plant are like thereunto, if not wholly, yet either in leafe or fruit, or in ſome other thing, *Vitis alba & nigra*, that is, the white and blacke Bryonies, haue leaues and claſping tendrels as hath the common Vine, and clyme alſo after the ſame manner: *Vitis ſylueſtris*, or the wilde Vine, hath ſuch like ſtalkes as the Vine hath, and bringeth forth fruit like to the little Grapes. *Laurus Alexandrina*, and *Chamedaphne*, and alſo *Daphnoides*, are like in leaues to the Laurell tree: *Sycomorus* is like in fruit to the Fig tree, and in leaues to the Mulberry tree: *Chamædrys* hath the leafe of an Oke; *Peucedanus* of the Pine tree: ſo of others which haue taken their names from ſome other: but this low ſhrub is not like the Vine either in any part, or in any other thing.

This *Vitis Idæa* groweth not on the vppermoſt and ſnowie parts of Mount Ida (as ſome would haue it) but about Ida, euen the hill Ida, not of Candy, but of Troas in the leſſer Aſia, which *Ptolomie* in his fifth booke of Geographie, chap. 3. doth call *Alexandri Troas*, or *Alexander* his Troy: whereupon it is alſo aduiſedly named of *Pliny, lib.* 14. *cap.* 3. *Vitis Alexandrina*, no otherwiſe than *Alexandrina Laurus* is ſaid of *Theophraſtus* to grow there: *Laurus*, ſyrnamed *Alexandrina*, and *Ficus quadam*, or a certaine Fig tree, and ἄμπελος, that is to ſay, the Vine, are reported, ſaith he, to grow properly about Ida. Like vnto this Vine are thoſe which *Philoſtratus* in the life of *Apollonius* reporteth to grow in Mæonia, and Lydia, ſcituated not far from Troy, comparing them to thoſe Vines which grow in India beyond Caucaſus: The Vines there, ſaith he, be very ſmall, like as be thoſe that doe grow in Mæonia and Lydia, yet is the wine which is preſſed out of them of a maruellous pleaſant taſte.

This Vine which growes neere to mount Ida is reported to be like a ſhrub, with little twigs and branches of the length of a cubit, about which are grapes growing aſlope, blacke, of the bigneſſe of a beane, ſweet, hauing within a certaine winie ſubſtance, ſoft: the leafe of this is round, vncut and little.

This is deſcribed by *Pliny, lib.* 14. *cap.* 3. almoſt in the ſelfe ſame words: it is called, ſaith he, *Alexandrina vitis*, and groweth neere vnto Phalacra: it is ſhort with branches a cubit long, with a blacke grape of the bigneſſe of the Latines Beane, with a ſoft pulpe and very little, with very ſweet cluſters growing aſlope, and a little round leafe without cuts.

And with this deſcription the little ſhrub which the Apothecaries of Germany do call *Myrtillus* doth nothing at all agree, as it is very manifeſt; for it is low, ſcarce a cubit high, with a few ſhort branches not growing to a cubit in length: it doth not bring forth cluſters or bunches, nor yet fruit like vnto grapes, but berries like thoſe of the Yew tree, not ſweet, but ſomewhat ſoure and aſtringent; in which alſo there are many little white flat ſeeds: the leafe is not round, but more long than round, not like to that of the Vine but of the Box tree. Moreouer, it is thought that this is not found in Italy, Greece, or in the leſſer Aſia, for that *Matthiolus* affirmeth the ſame to grow no where but in Germany and Bohemia; ſo far is it from being called or accounted to be *Vitis Idæa* or *Alexandrina*.

The fruit of this may be thought not without cauſe to be named *Vaccinia*, ſith they are berries; for they may be termed of *Baccæ*, berries, *Vaccinia*, as though they ſhould be called *Baccinia*. Yet this letteth not that there may be alſo other *Vaccinia's*: for *Vaccinia* is πολυώνυμος *dictio*, or a word of diuers ſignifications. *Virgil* in the firſt booke of his Bucolicks, *Eclog.* 10. affirmeth that the written Hyacinth is named of the Latines, *Vaccinium*, tranſlating into Latine *Theocritus* his verſe which is taken out of his tenth Eidyl.

Καὶ τὸ ἴον μέλαν ἐστὶ καὶ ἁ γραπτὰ ὑάκινθος:

Virgil:

Et nigræ Violæ, ſunt & Vaccinia nigra.

Vitruvius, lib. 7. of his Architecture doth alſo diſtinguiſh *Vaccinium* from the Violet, and ſheweth, that of it is made a gallant purple; which ſeeing that the written Hyacinth cannot do, it muſt needs be that this *Vaccinium* is another thing than the Hyacinth is, becauſe it ſerues to giue a purple die.

Pliny alſo, *lib.* 16. *cap.* 18. hath made mention of *Vaccinia*, which are vſed to dye bond-ſlaues garments with, and to giue them a purple colour.

But whether theſe be our *Vaccinia* or Whortle berries it is hard to affirme, eſpecially ſeeing that *Pliny* reckoneth vp *Vaccinia* amongſt thoſe plants which grow in watery places; but ours grow on high places vpon mountaines ſubiect to windes, neither is it certainely knowne to grow in Italy. Howſoeuer it is, theſe our Whortles may be called *Vaccinia*, and do agree with *Plinies* and *Vitruvius* his *Vaccinia*, becauſe garments and linnen cloath may take from theſe a purple die.

The red Whortle berries haue their name from the blacke Whortles, to which they be in form very like, and are called in Latine, *Vaccinia rubra*: in High Dutch, **Rooter Heidelbeere**: in Low Dutch, **Roode Crakebeſſen**: the French-men, *Aurelles Rouges*: they be named in Engliſh, Red Worts, or red Wortle berries. *Conradus Geſnerus* hath called this plant *Vitis Idæa rubris acinis*: but the growing of the berries doth ſhow, that this doth farre leſſe agree with *Vitis Idæa*, than the blacke; for they do not hang vpon the ſides of the branches as do the black (which deceiued them that thought it to be *Vitis Idæa*) but from the tops of the ſprings in cluſters.

As concerning the names of the other they are touched in their ſeuerall deſcriptions.

¶ *The Temperature.*

Theſe *Vaccinia* or Wortle berries are cold euen in the later end of the ſecond degree, and dry alſo, with a manifeſt aſtriction or binding quality.

Red Wortle berries are cold and dry, and alſo binding.

¶ *The Vertues.*

A The juyce of the blacke Wortle berries is boyled till it become thicke, and is prepared or kept by adding hony and ſugar vnto it: the Apothecaries call it *Rob*, which is preferred in all things before the raw berries themſelues; for many times whileſt they be eaten or taken raw they are offenſiue to a weake and cold ſtomacke, and ſo far are they from binding the belly, or ſtaying the laske, as that they alſo trouble the ſame through their cold and raw quality, which thing the boyled juyce called *Rob* doth not any whit at all.

B They be good for an hot ſtomacke, they quench thirſt, they mitigate and allay the heate of hot burning agues, they ſtop the belly, ſtay vomiting, cure the bloudy flix proceeding of choler, and helpe the felonie, or the purging of choler vpwards and downewards.

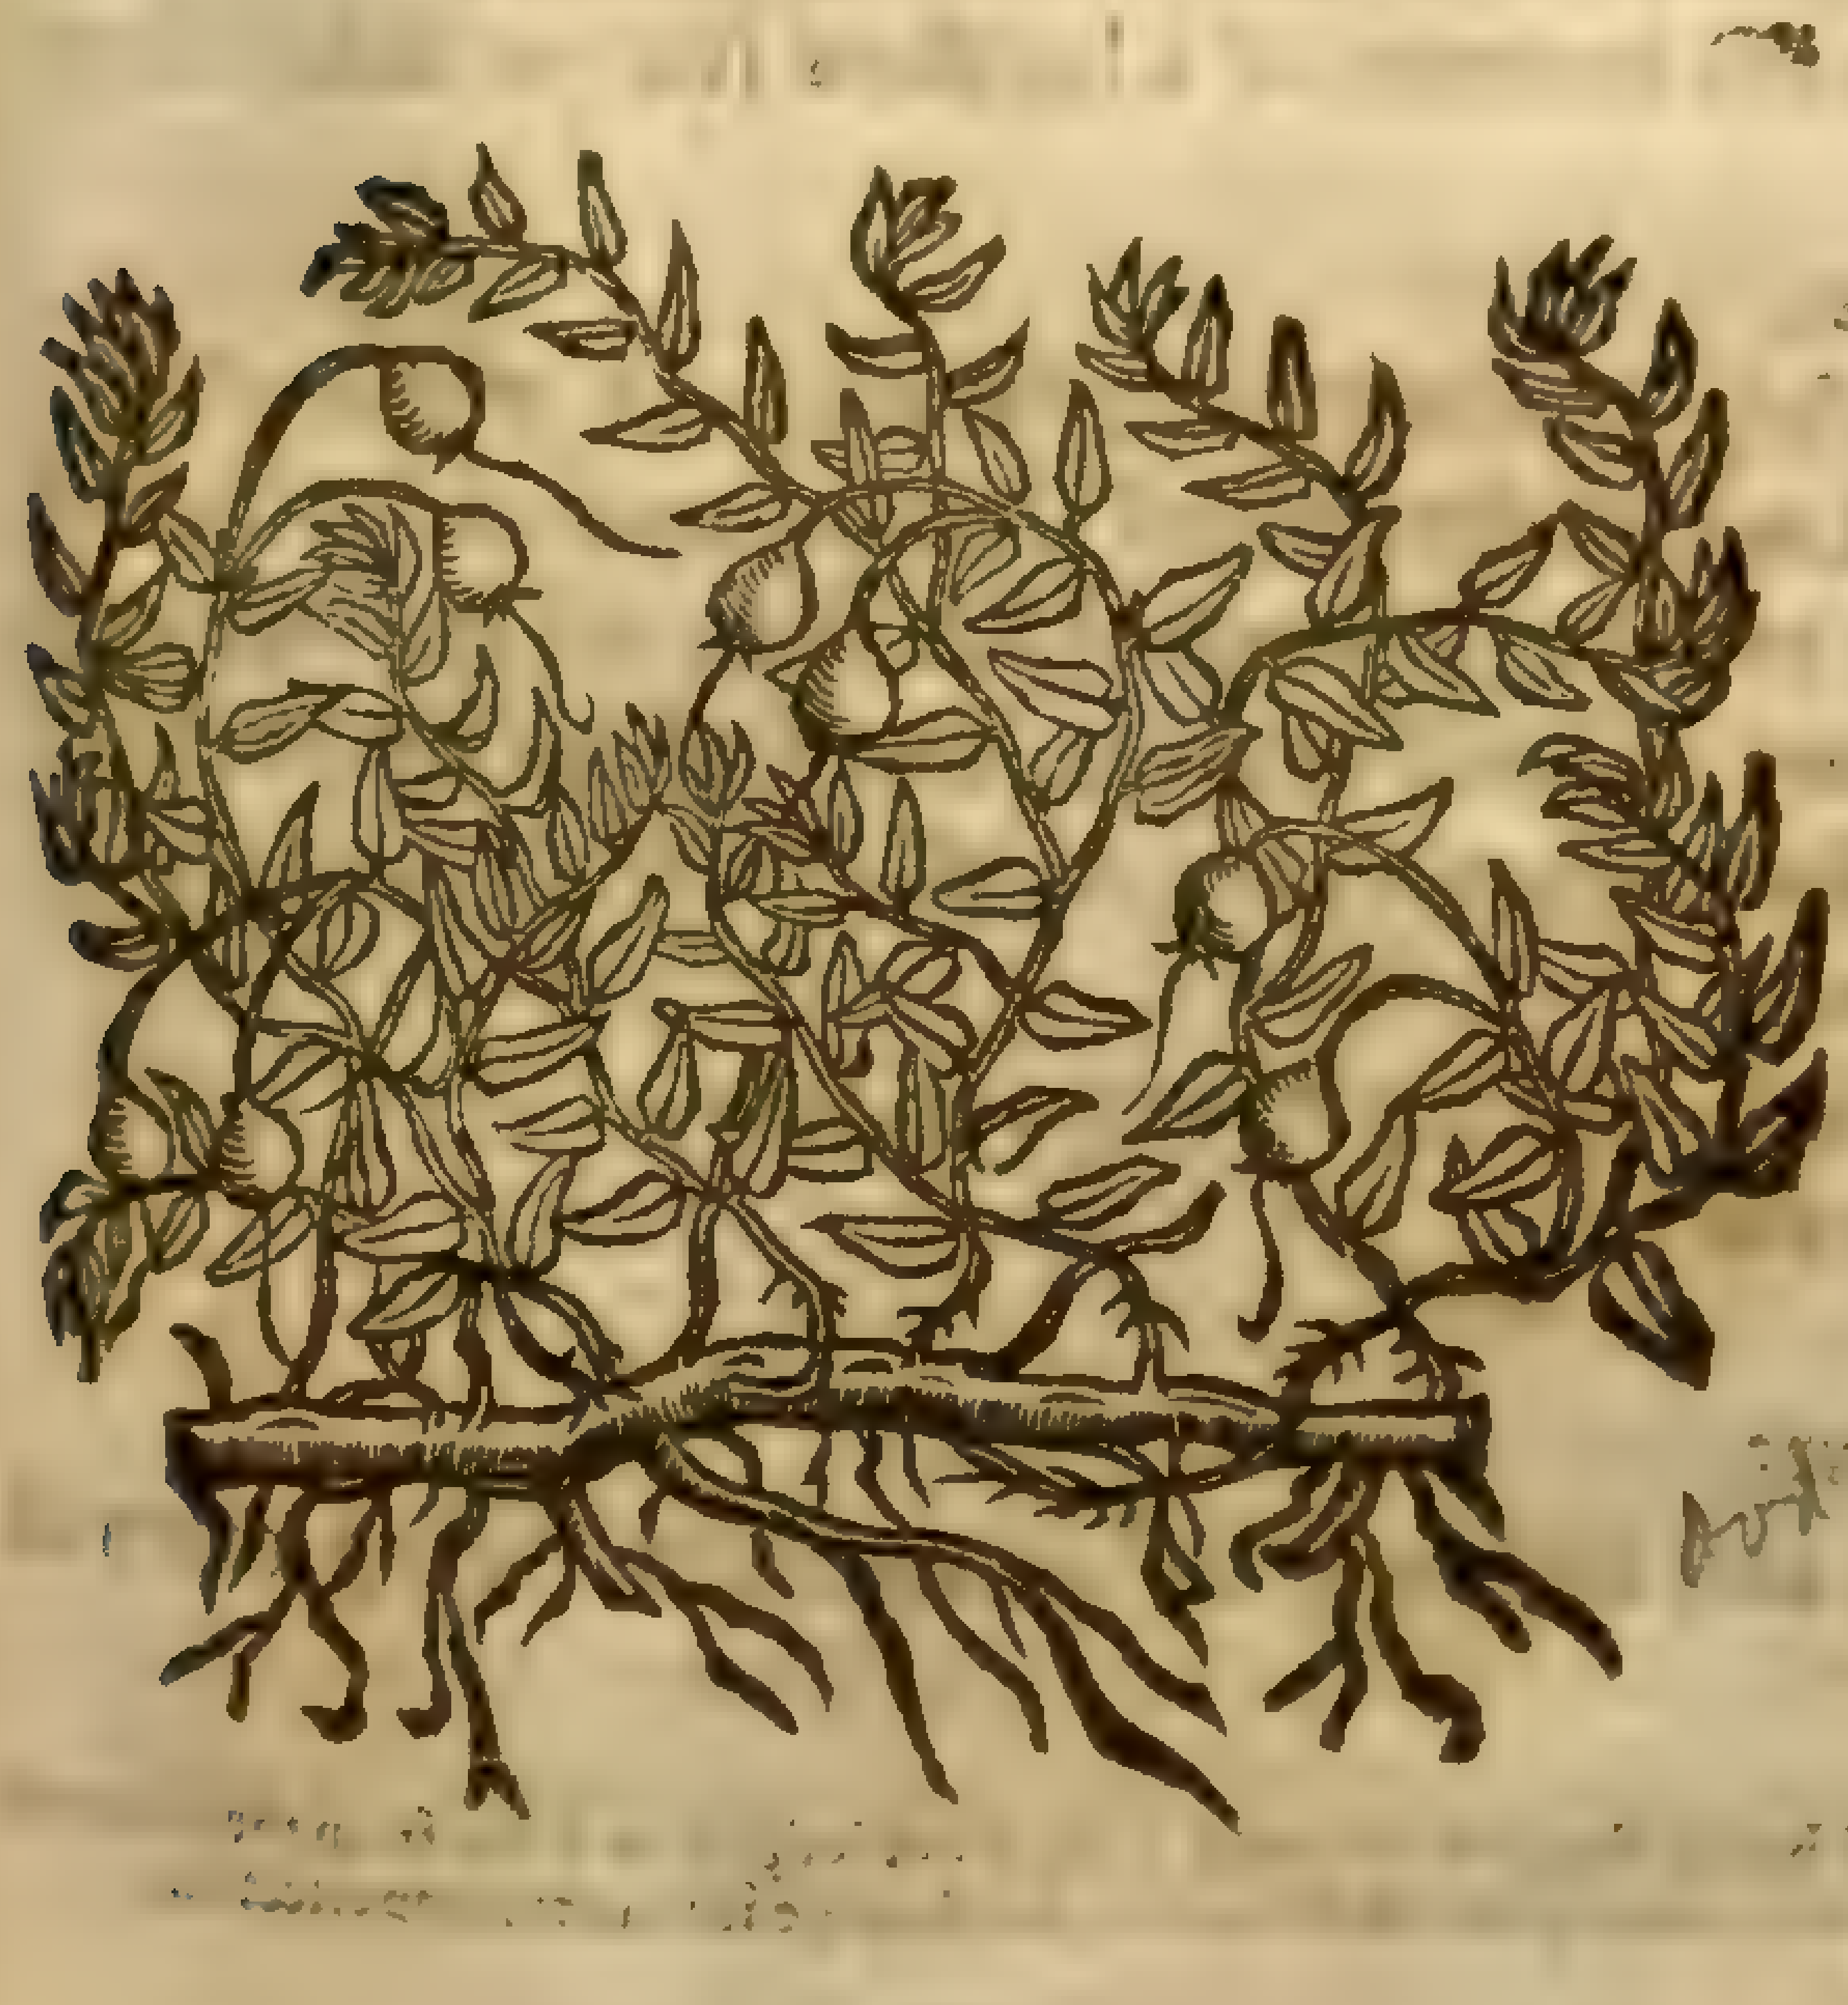
C The people of Cheſhire do eat the blacke Wortles in creame and milke, as in theſe South parts we eate Strawberries, which ſtop and binde the belly, putting away all the deſire to vomit.

D The Red Wortle is not of ſuch a pleaſant taſte as the blacke, and therfore not ſo much vſed to be eaten; but (as I ſaid before) they make the faireſt carnation colour in the World.

CHAP. 74.

Of the Mariſh Worts, or Fenne-Berries.

Vaccinia paluſtria.
Mariſh Worts.



¶ *The Deſcription.*

The Mariſh Wortle berries grow vpon the bogs in mariſh or mooriſh grounds, creeping thereupon like vnto wilde Time, hauing many ſmall limmer and tender ſtalkes laid almoſt flat vpon the ground, beſet with ſmal narrow leaues faſhioned almoſt like the leaues of Thyme, but leſſer: among which come forth little berries like vnto the common blacke Wortle berrie in ſhape, but ſomewhat longer, ſometimes all red, and ſometimes ſpotted or ſpecked with red ſpots of a deeper colour: in taſte, rough and aſtringent.

¶ *The Place.*

The Mariſh Wortle growes vpon bogs and ſuch like wateriſh and fenny places, eſpecially in Cheſhire and Staffordſhire, where I haue found it in great plenty.

¶ *The Time.*

The Berries are ripe about the end of Iuly, and in Auguſt.

¶ *The Names.*

They are called in high Dutch, **Moſzbeeren, Veenbeſſen**: that is to ſay, Fen-Grapes, or Fen-Berries, and Mariſh-worts, or Mariſh-Berries. *Valerius Cordus* nameth them *Oxycoccon*: we haue called them *Vaccinia paluſtria*, or Mariſh Wortle-berries, of the likeneſſe they haue to the other berries: ſome alſo call them Moſſe-Berries, or Moore-berries.

¶ *The Temperature.*

Theſe Wortle berries are cold and dry, hauing withall a certain thinneſſe of parts and *ſubſtance*, with a certaine binding quality joyned.

¶ *The Vertues.*

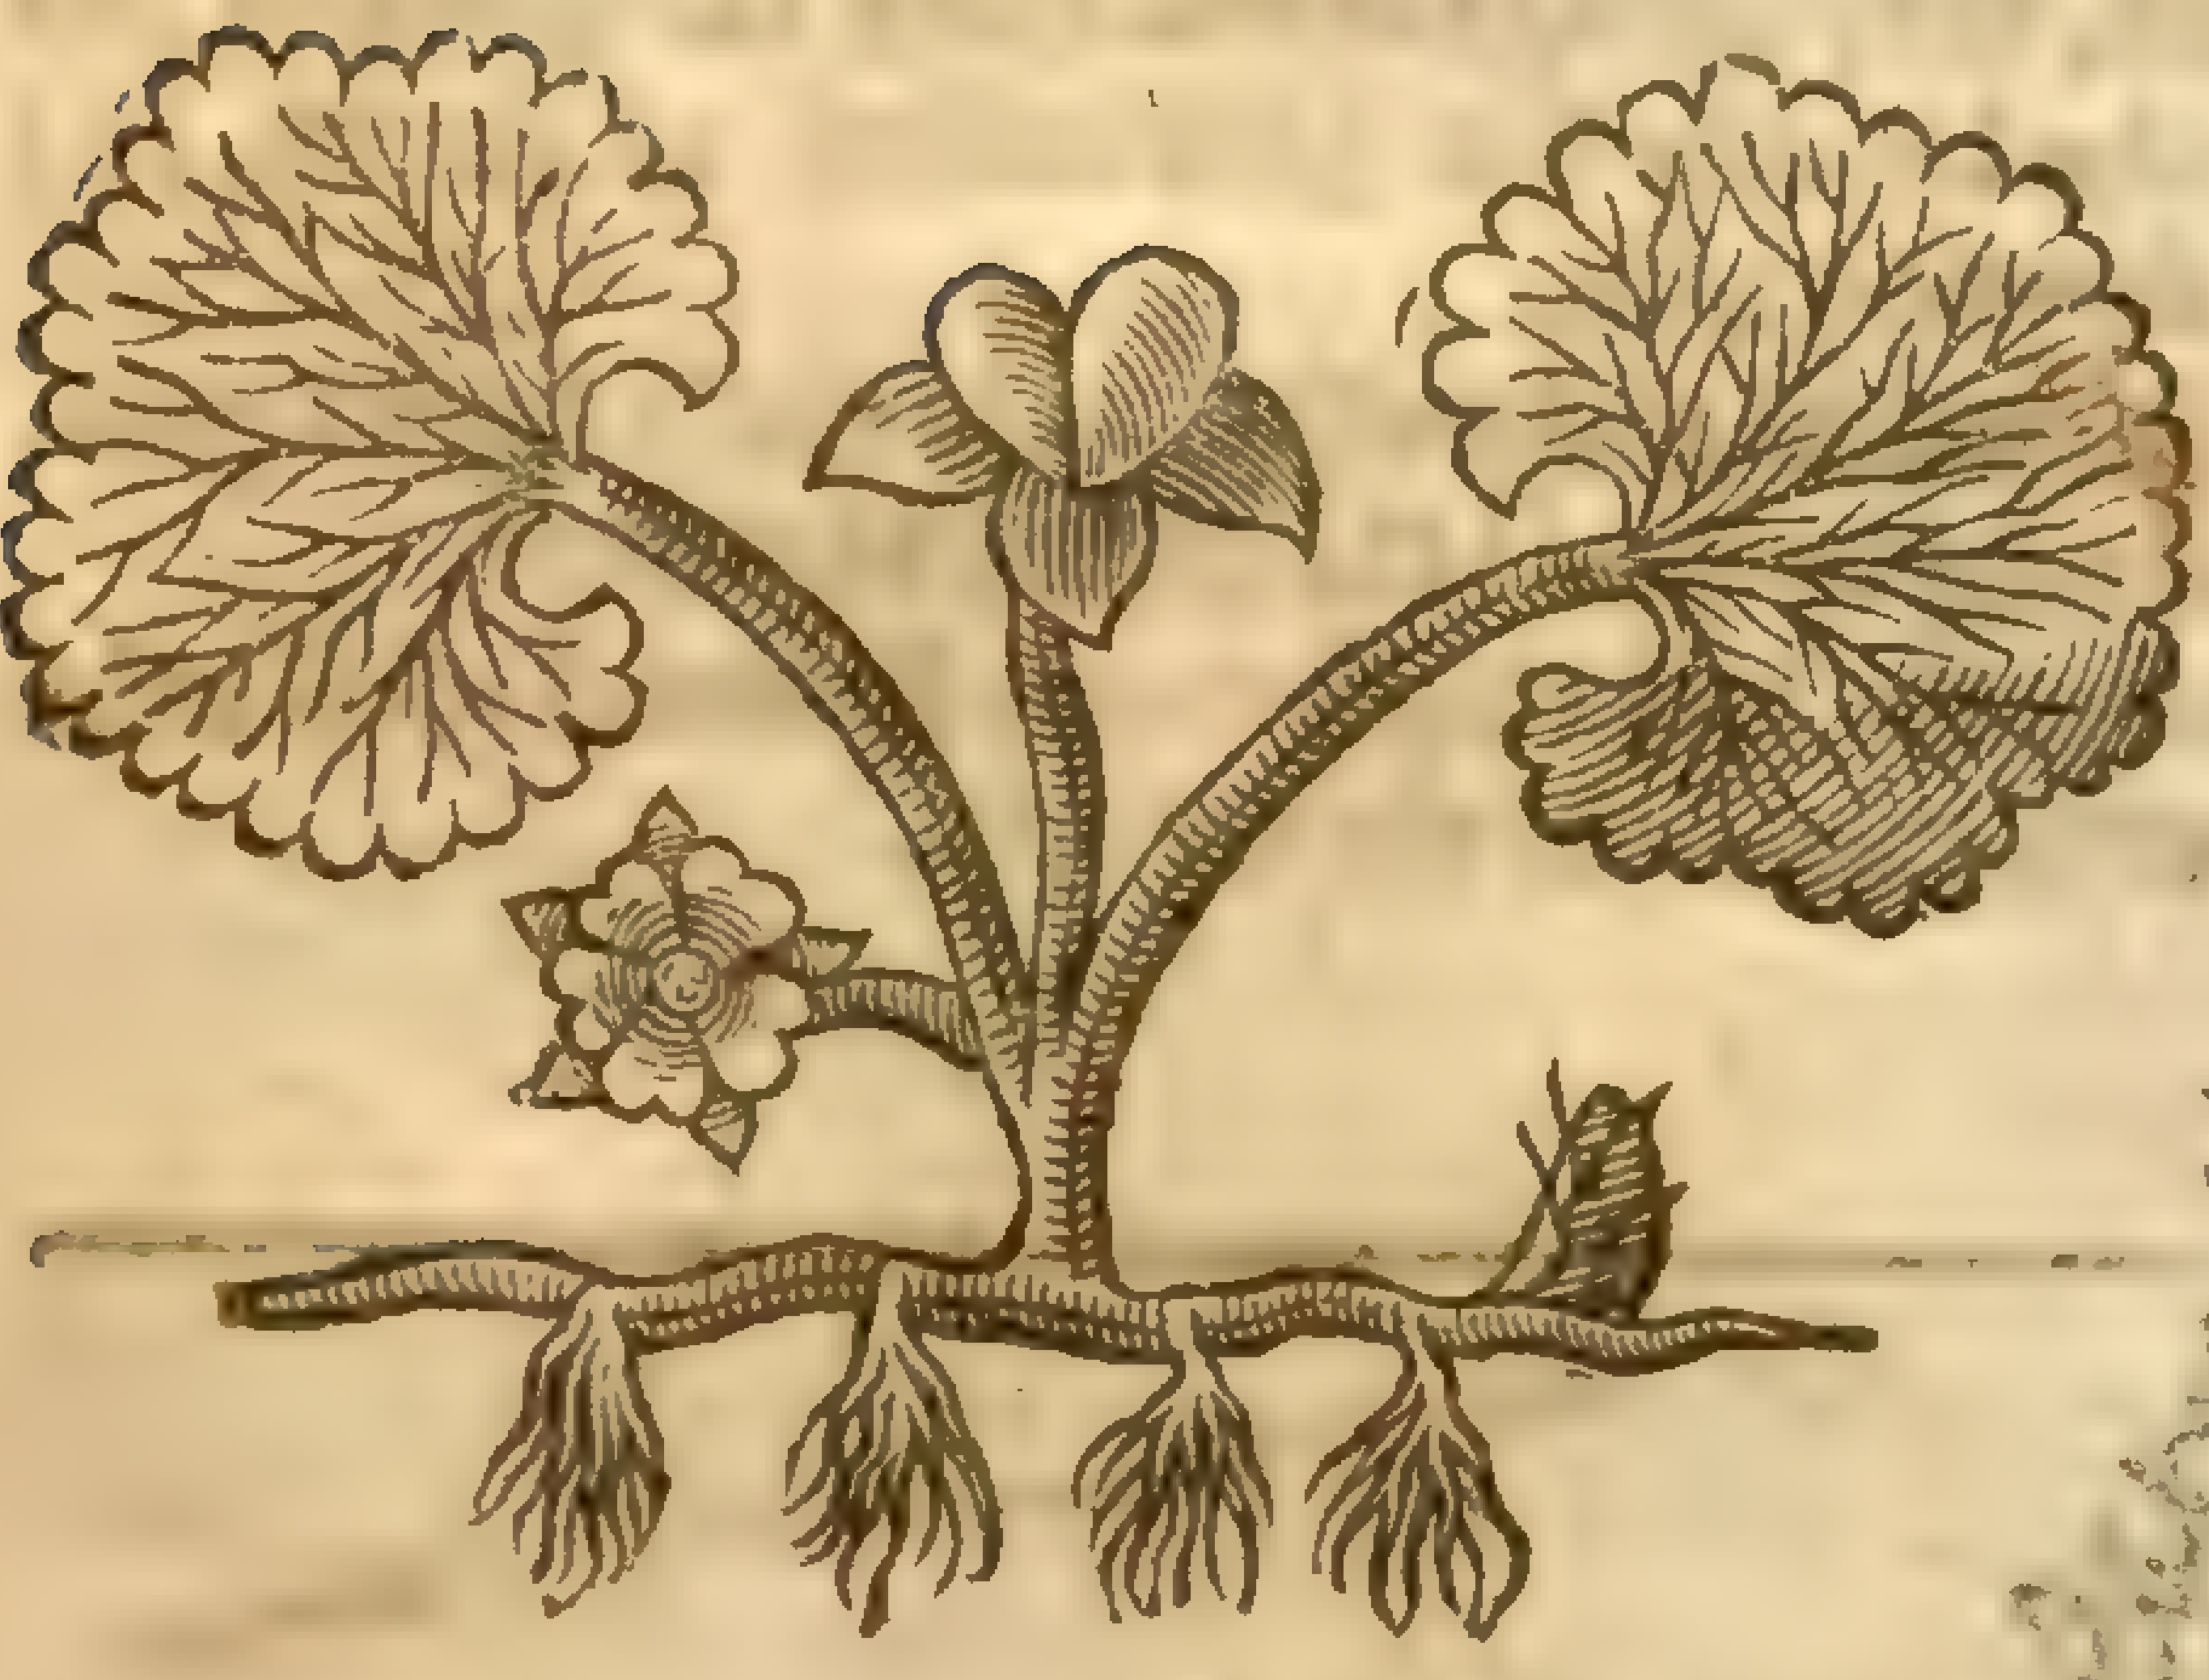
A They take away the heate of burning agues, and alſo the drought, they quench the furious heate of choler, they ſtay vomiting, reſtore an appetite to meate which was loſt by reaſon of cholericke and corrupt humors, and are good againſt the peſtilent diſeaſes.

B The juyce of theſe alſo is boyled till it be thicke, with ſuger added that it may be kept, which is good for all things that the berries are, yea, and far better.

† I haue brought this chapter and the next following from the place they formerly held, and ſeated them here amongſt the reſt of their kindred.

CHAP. 75. *Of Cloud-berry:*

Vaccinia Nubis.
Cloud-berries.



Rubus Chamaemorus
Sm. [illegible]

¶ *The Deſcription.*

THe Cloud-berry hath many ſmall threddy roots, creeping farre abroad vnder the vpper cruſt of the earth, and alſo the moſſe, like vnto Couch-graſſe, of an ouerworn reddiſh colour, ſet here and there with ſmall tufts of hairy ſtrings: from which riſe vp two ſmall ſtalks, hard, tough, and of a woody ſubſtance (neuer more nor leſſe) on which doe ſtand the leaues like thoſe of the wilde Mallow, and of the ſame colour, full of ſmall nerues or ſinewes running in each part of the ſame: between the leaues commeth vp a ſtalke likewiſe of a woody ſubſtance, whereon doth grow a ſmall floure conſiſting of fiue leaues, of an herby or yellowiſh green colour like thoſe of the wilde Auens. After commeth the fruit, greene at the firſt, after yellow, and the ſides next the Sun red when they be ripe; in forme almoſt like vnto a little heart, made as it were of two, but is no more but one, open aboue, and cloſed together in the bottom, of a harſh or ſharpe taſte, wherein is contontained three or foure little white ſeeds.

¶ *The Place.*

This plant groweth naturally vpon the tops of two high mountaines (among the moſſie places) one in Yorkeſhire called Ingleborough the other in Lancaſhire called Pendle, two of the higheſt mountaines in all England, where the cloudes are lower than the tops of the ſame all Winter long, whereupon the people of the countrey haue called them Cloud-berries, found there by a curious gentleman in the knowledge of plants, called M^r^ *Heſketh*, often remembred.

¶ *The Time.*

The leaues ſpring vp in May, at which time it floureth: the fruit is ripe in Iuly.

¶ *The Temperature.*

The fruit is cold and dry and very aſtringent.

¶ *The Vertues.*

A The fruit quencheth thirſt, cooleth the ſtomacke, and allayeth inflammations, being eaten as Worts are, or the decoction made and drunke.

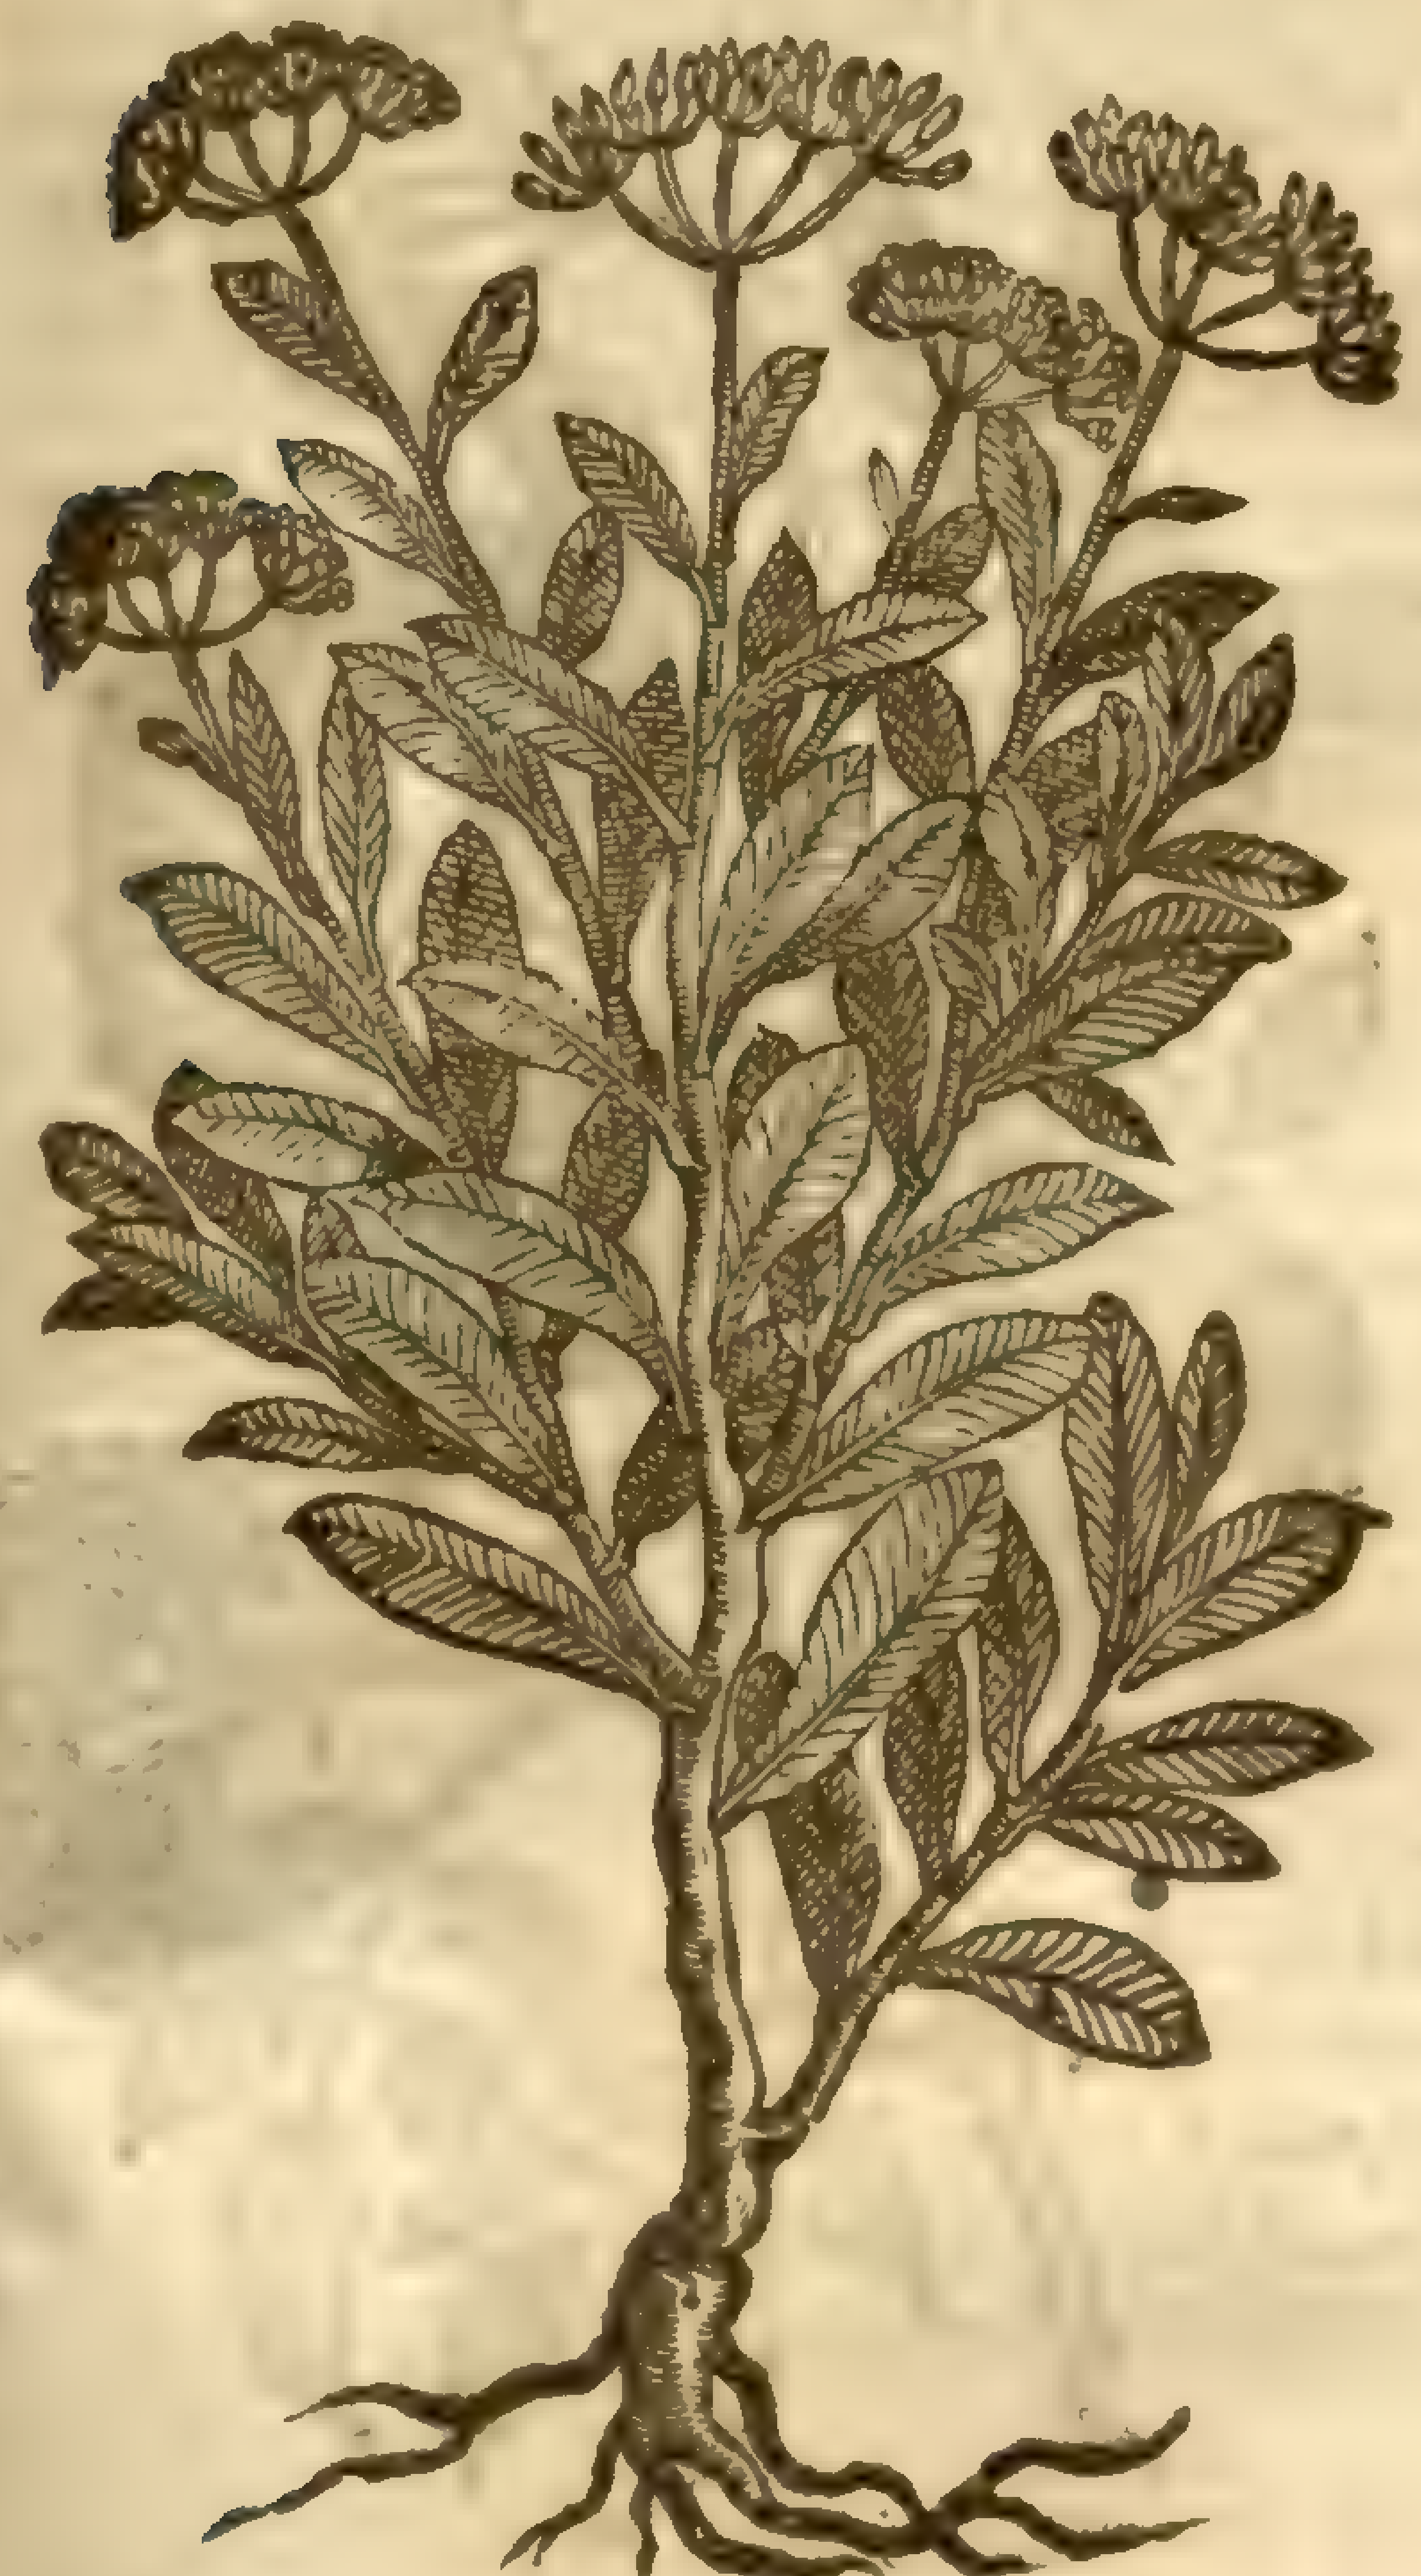
† My friend M. *Pimble* of Maribone receiued a plant hereof out of Lancaſhire: and by the ſhape of the leafe I could not iudge it to differ from the *Chamæmorus* formerly deſcribed, pag. 1273. neither do the deſcriptions much differ in any materiall point: the figures differ more; but I iudge this a very imperfect one.

CHAP. 76. *Of ſhrub Heart-wort of Æthiopia.*

¶ *The Deſcription.*

THis kind of Seſely, being the Æthiopian Seſely, hath blackiſh ſtalkes of a woody ſubſtance: this plant diuideth it ſelfe into ſundry other armes or branches, which are beſet with thicke fat and oileous leaues, faſhioned ſomewhat like the Wood-binde leaues, but thicker, and more

Seſeli Æthiopicum frutex.
Shrub Seſely, or Hart-wort of Ethiopia.



Bupleurum fruticosum

more gummy, approching very neere vnto the leaues of Oleander both in ſhape and ſubſtance, being of a deepe or darke greene colour, and of a very good ſauor and ſmell, and continueth green in my garden both winter and ſummer, like the Bay or Laurell. The floures grow at the tops of the branches, in yellow rundles like the flours of Dill: which being paſt, there ſucceedeth a darke or dusky ſeed reſembling the ſeed of Fennel, and of a bitter taſte. The root is thicke, and of a woody ſubſtance.

¶ *The Place.*

It is found in ſtony places and on the ſea coaſt not far from Marſilles, and likewiſe in other places of Languedoc: it alſo groweth in Ethyopia in the darke and deſart woods. It groweth in my garden.

¶ *The Time.*

It flouriſheth, floureth, and ſeedeth in Iuly and Auguſt.

¶ *The Names.*

The Grecians call it Αἰθιοπικὸν σέσελι: the Latines likewiſe *Æthiopicum Seſeli*: the Egyptians, κυνὸς φρίκη, that is, Dogs Horror: in Engliſh, Seſely of Ethiopia, or Ethiopian Hart-wort.

¶ *The Temperature and Vertues.*

Seſely of Ethiopia is thought to haue the ſame faculties that the Seſely of Marſilles hath, whereunto I refer it.

Chap. 77. *Of the Elder Tree.*

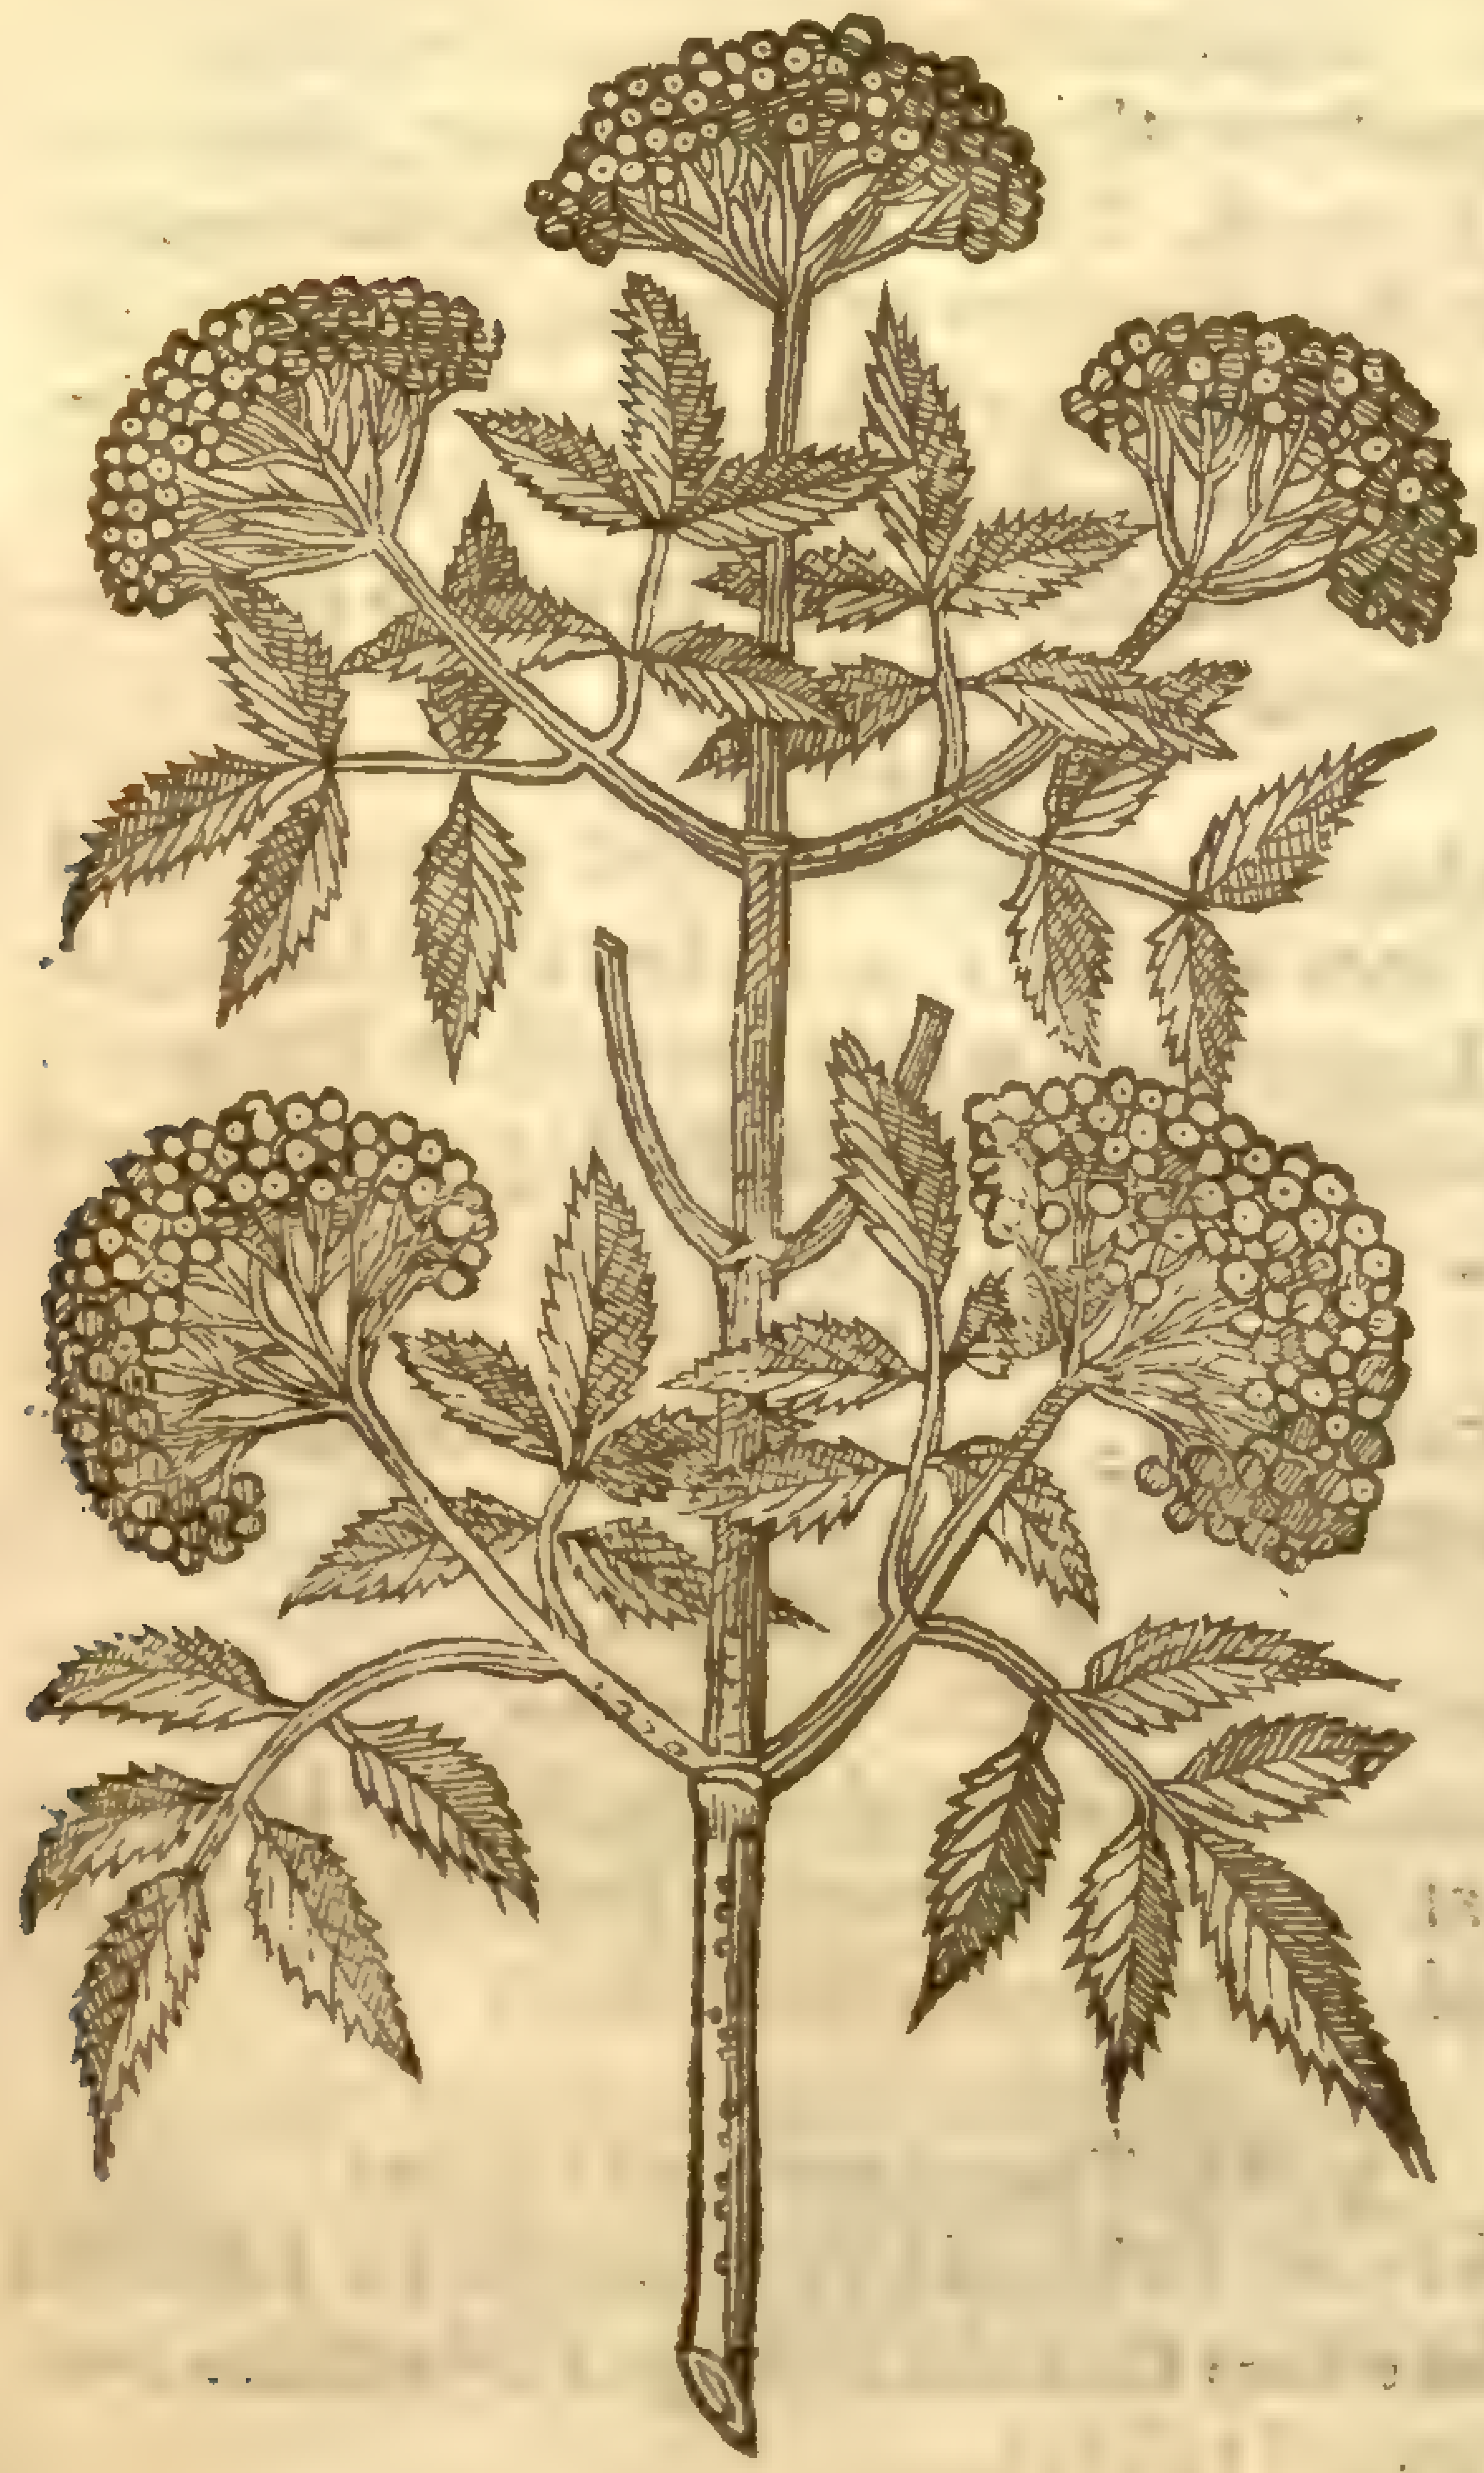
¶ *The Kindes.*

There be diuers ſorts of Elders, ſome of the land, and ſome of the water or mariſh grounds; ſome with very jagged leaues, and others with double floures, as ſhall be declared.

¶ *The Deſcription.*

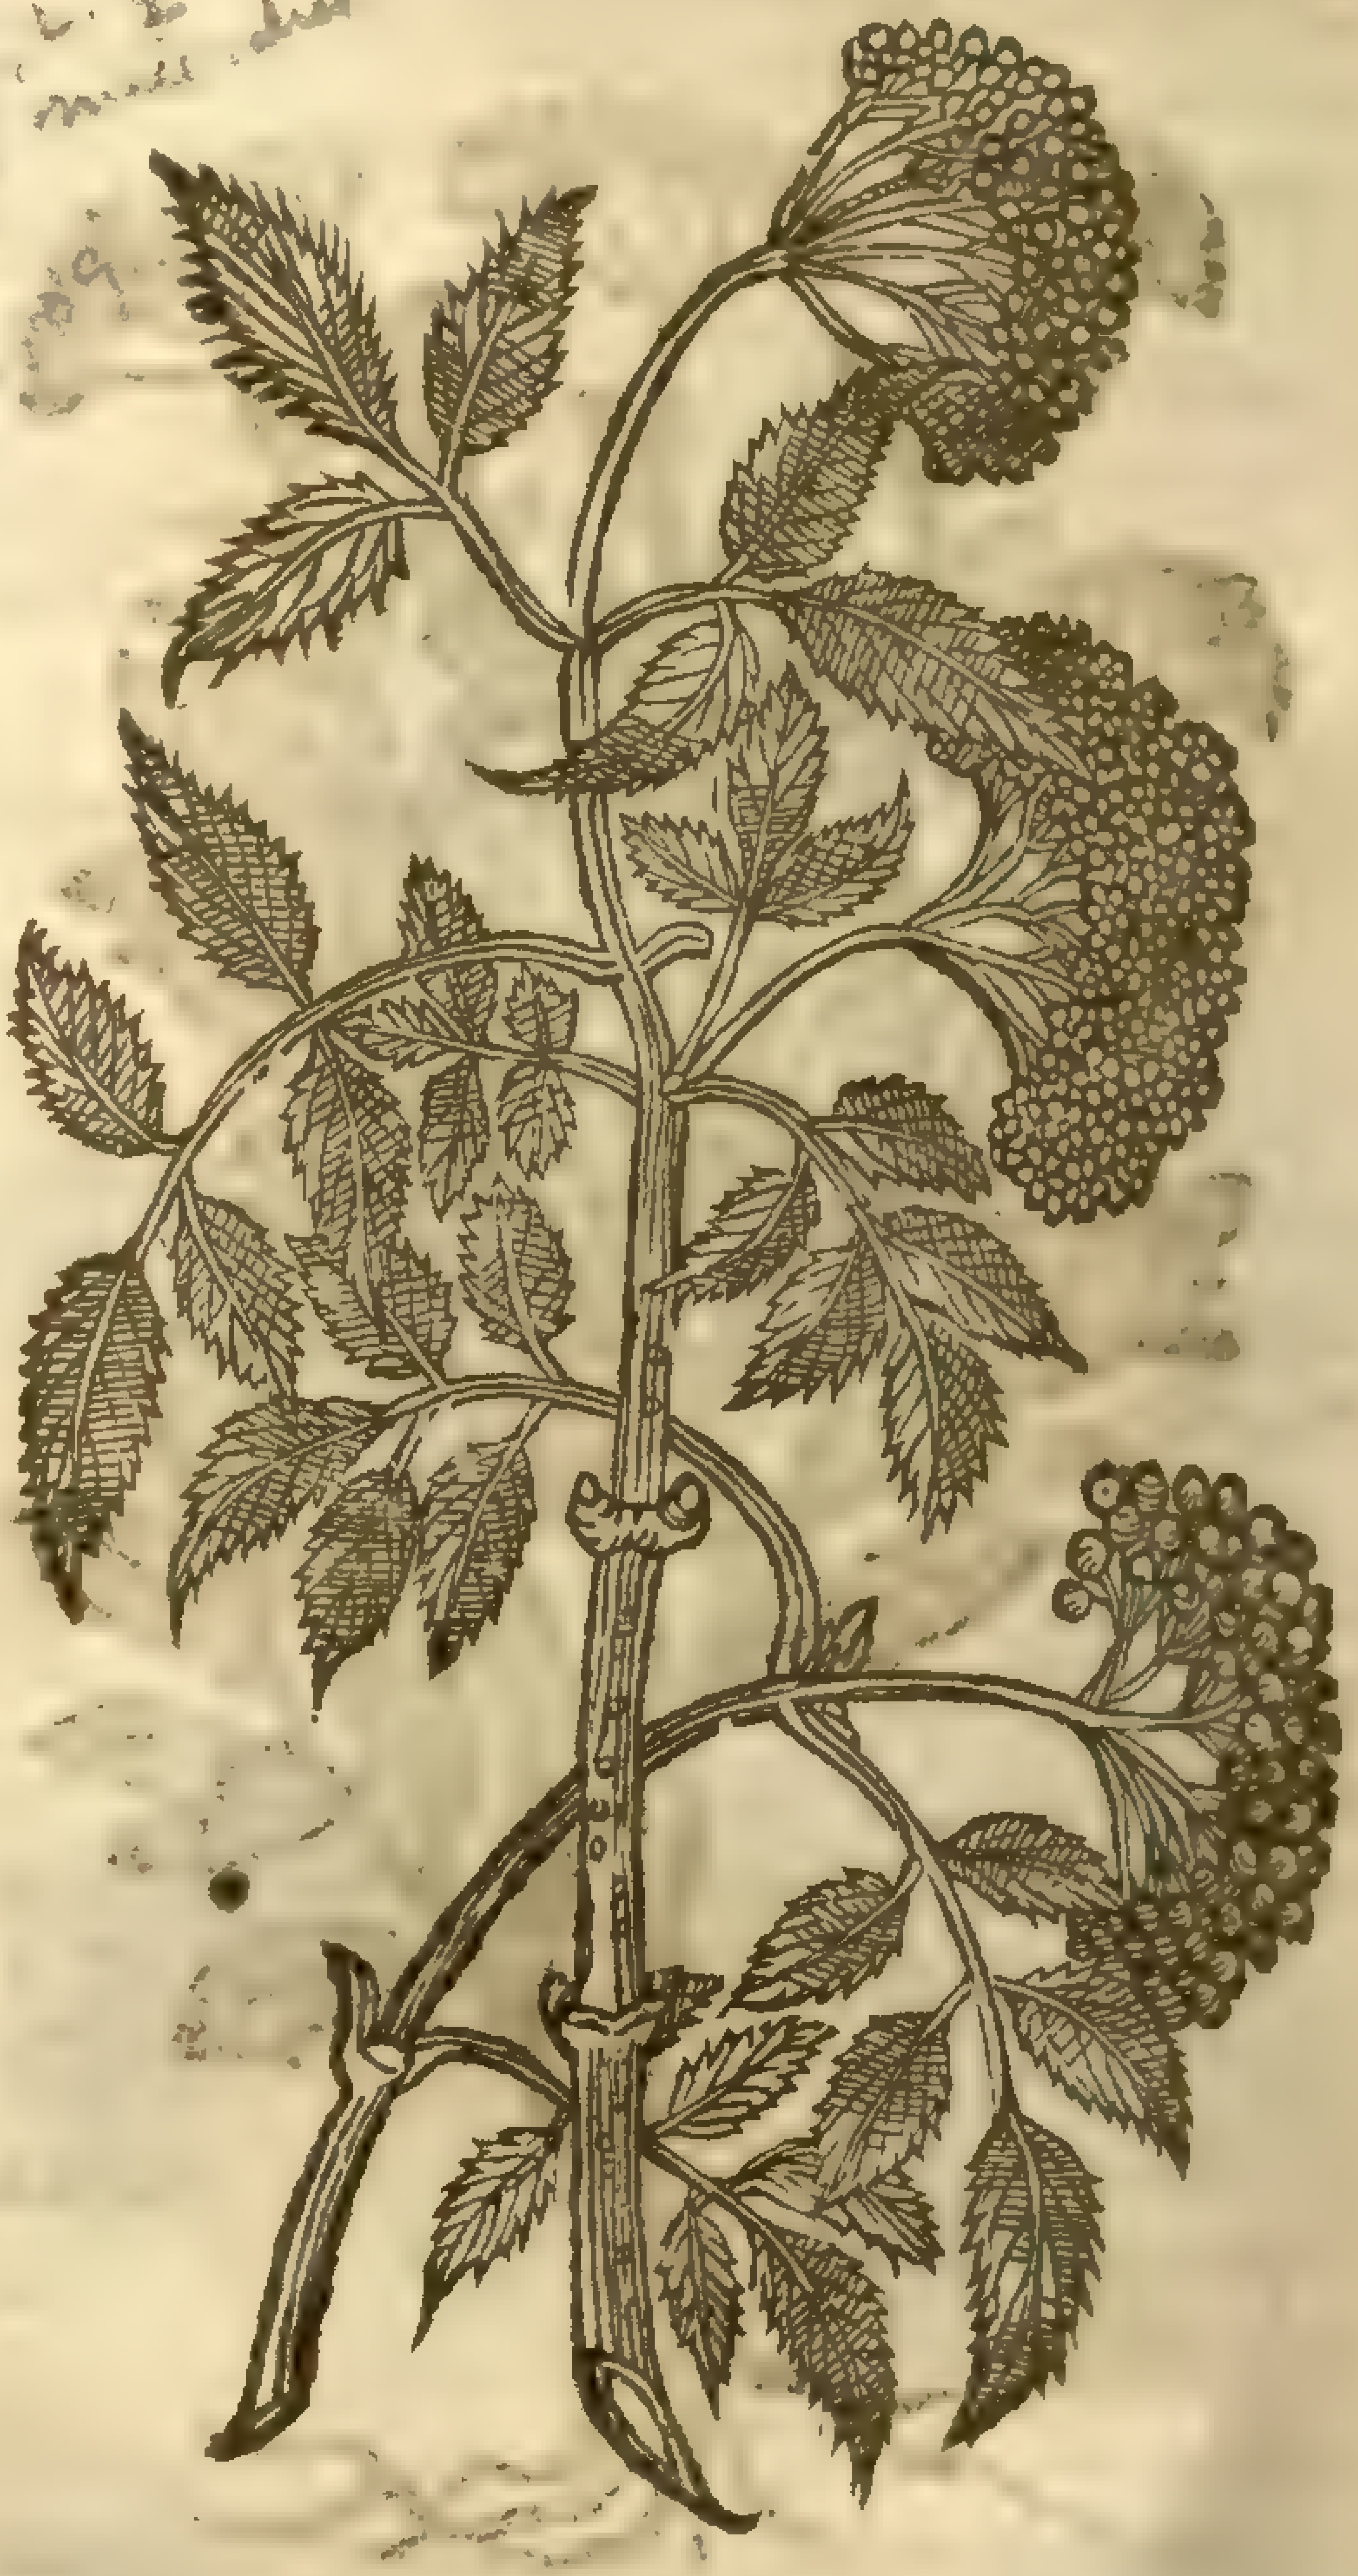
1 The common Elder groweth vp now and then to the bigneſſe of a mean tree, caſting his boughes all about, and oftentimes remaineth a ſhrub: the body is almoſt all wooddy, hauing very little pith within; but the boughs, and eſpecially the yong ones, which be jointed, are full of pith within, and haue but little wood without: the barke of the body and great armes is rough and full of chinks, and of an ilfauored wan colour like aſhes: that of the boughs is not very ſmooth, but in colour almoſt like; and that is the outward barke; for there is another vnder it neerer to the wood, of colour green: the ſubſtance of the wood is ſound, ſomwhat yellow, and that may be eaſily cleft: the leaues conſiſt of fiue or ſix particular ones faſtned to one ribbe, like thoſe of the Walnut tree, but euery particular one is leſſer, nicked in the edges, and of a ranke and ſtinking ſmell. The floures grow on ſpoky rundles, which be thin and ſcattered, of a white colour and ſweet ſmell: after them grow vp little berries, green at the firſt, afterwards blacke, whereout is preſſed a purple juice, which being boiled with Allom and ſuch like things, doth ſerue very well for the Painters vſe, as alſo to colour vineger: the ſeeds in theſe are a little flat and ſomwhat long. There groweth oftentimes vpon the bodies of thoſe old trees or ſhrubs a certaine excreſcence called *Auricula Iuda* or Iewes eare, which is ſoft, blackiſh, couered with a skin, ſomewhat like now and then to a mans eare, which being plucked off and dried, ſhrinketh together and becommeth hard. This Elder groweth euery where, and is the common Elder.

1 *Sambucus.*
The common Elder tree.

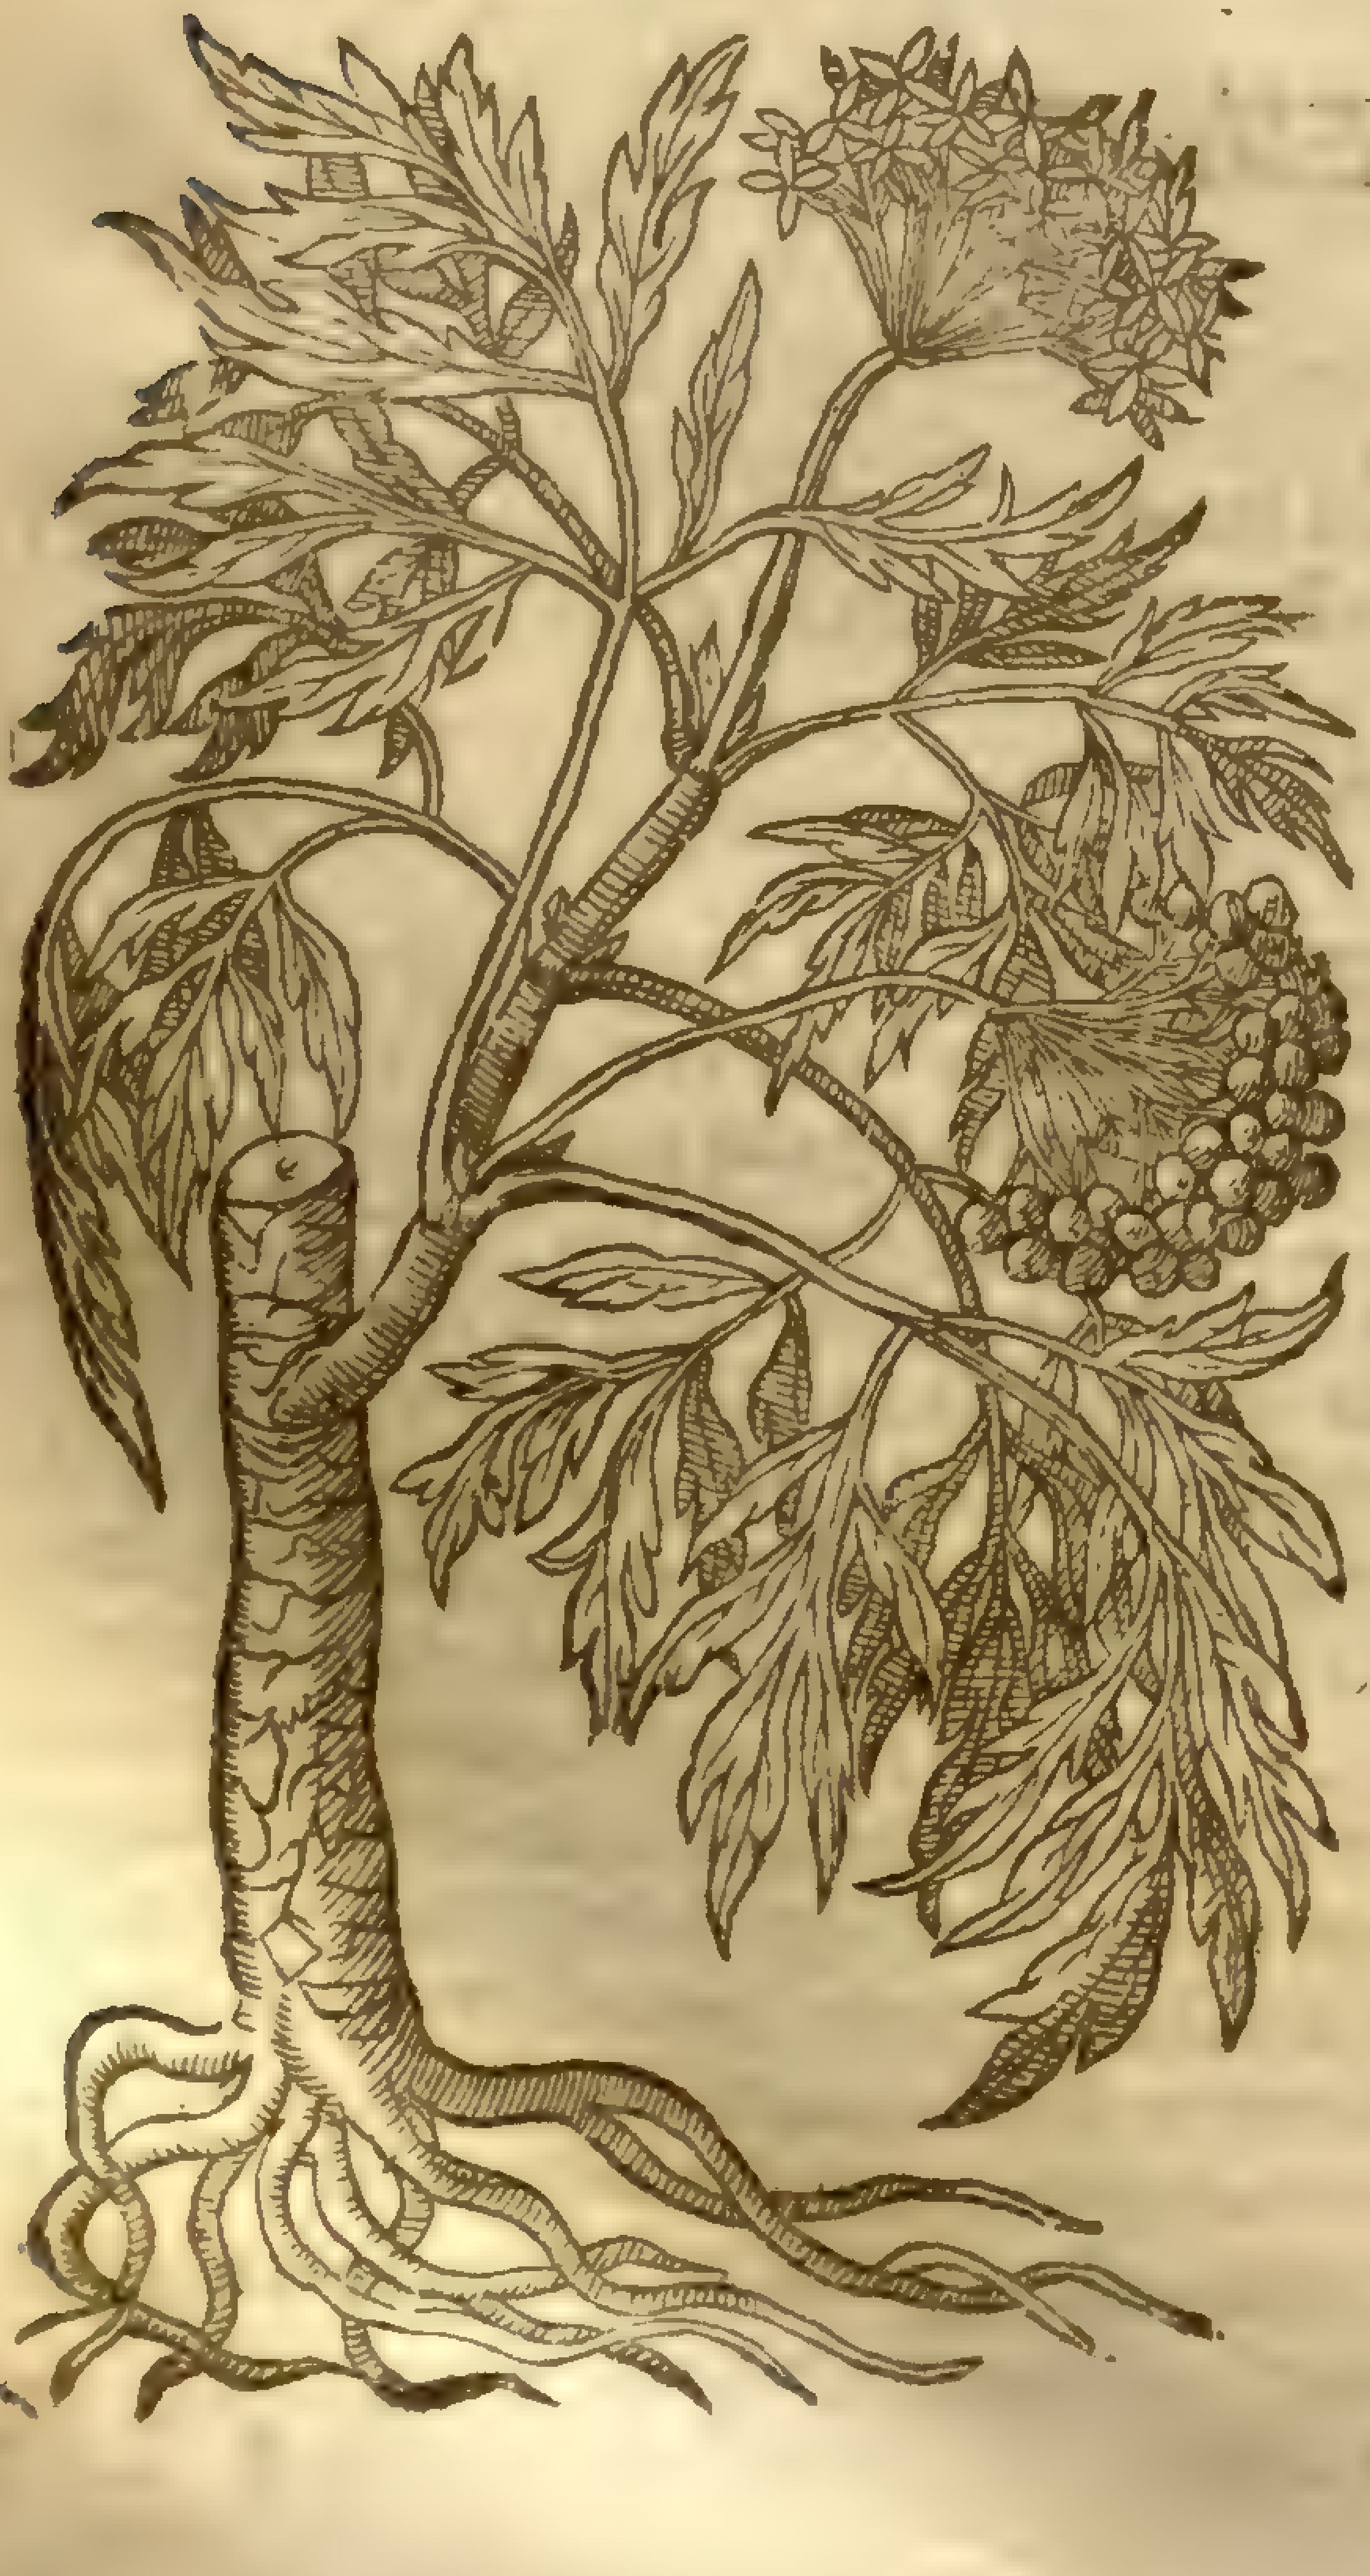


‡ 2 *Sambucus fructu albo.*
Elder with white berries.

? S. nigra L. β mult. dis.
[illegible]



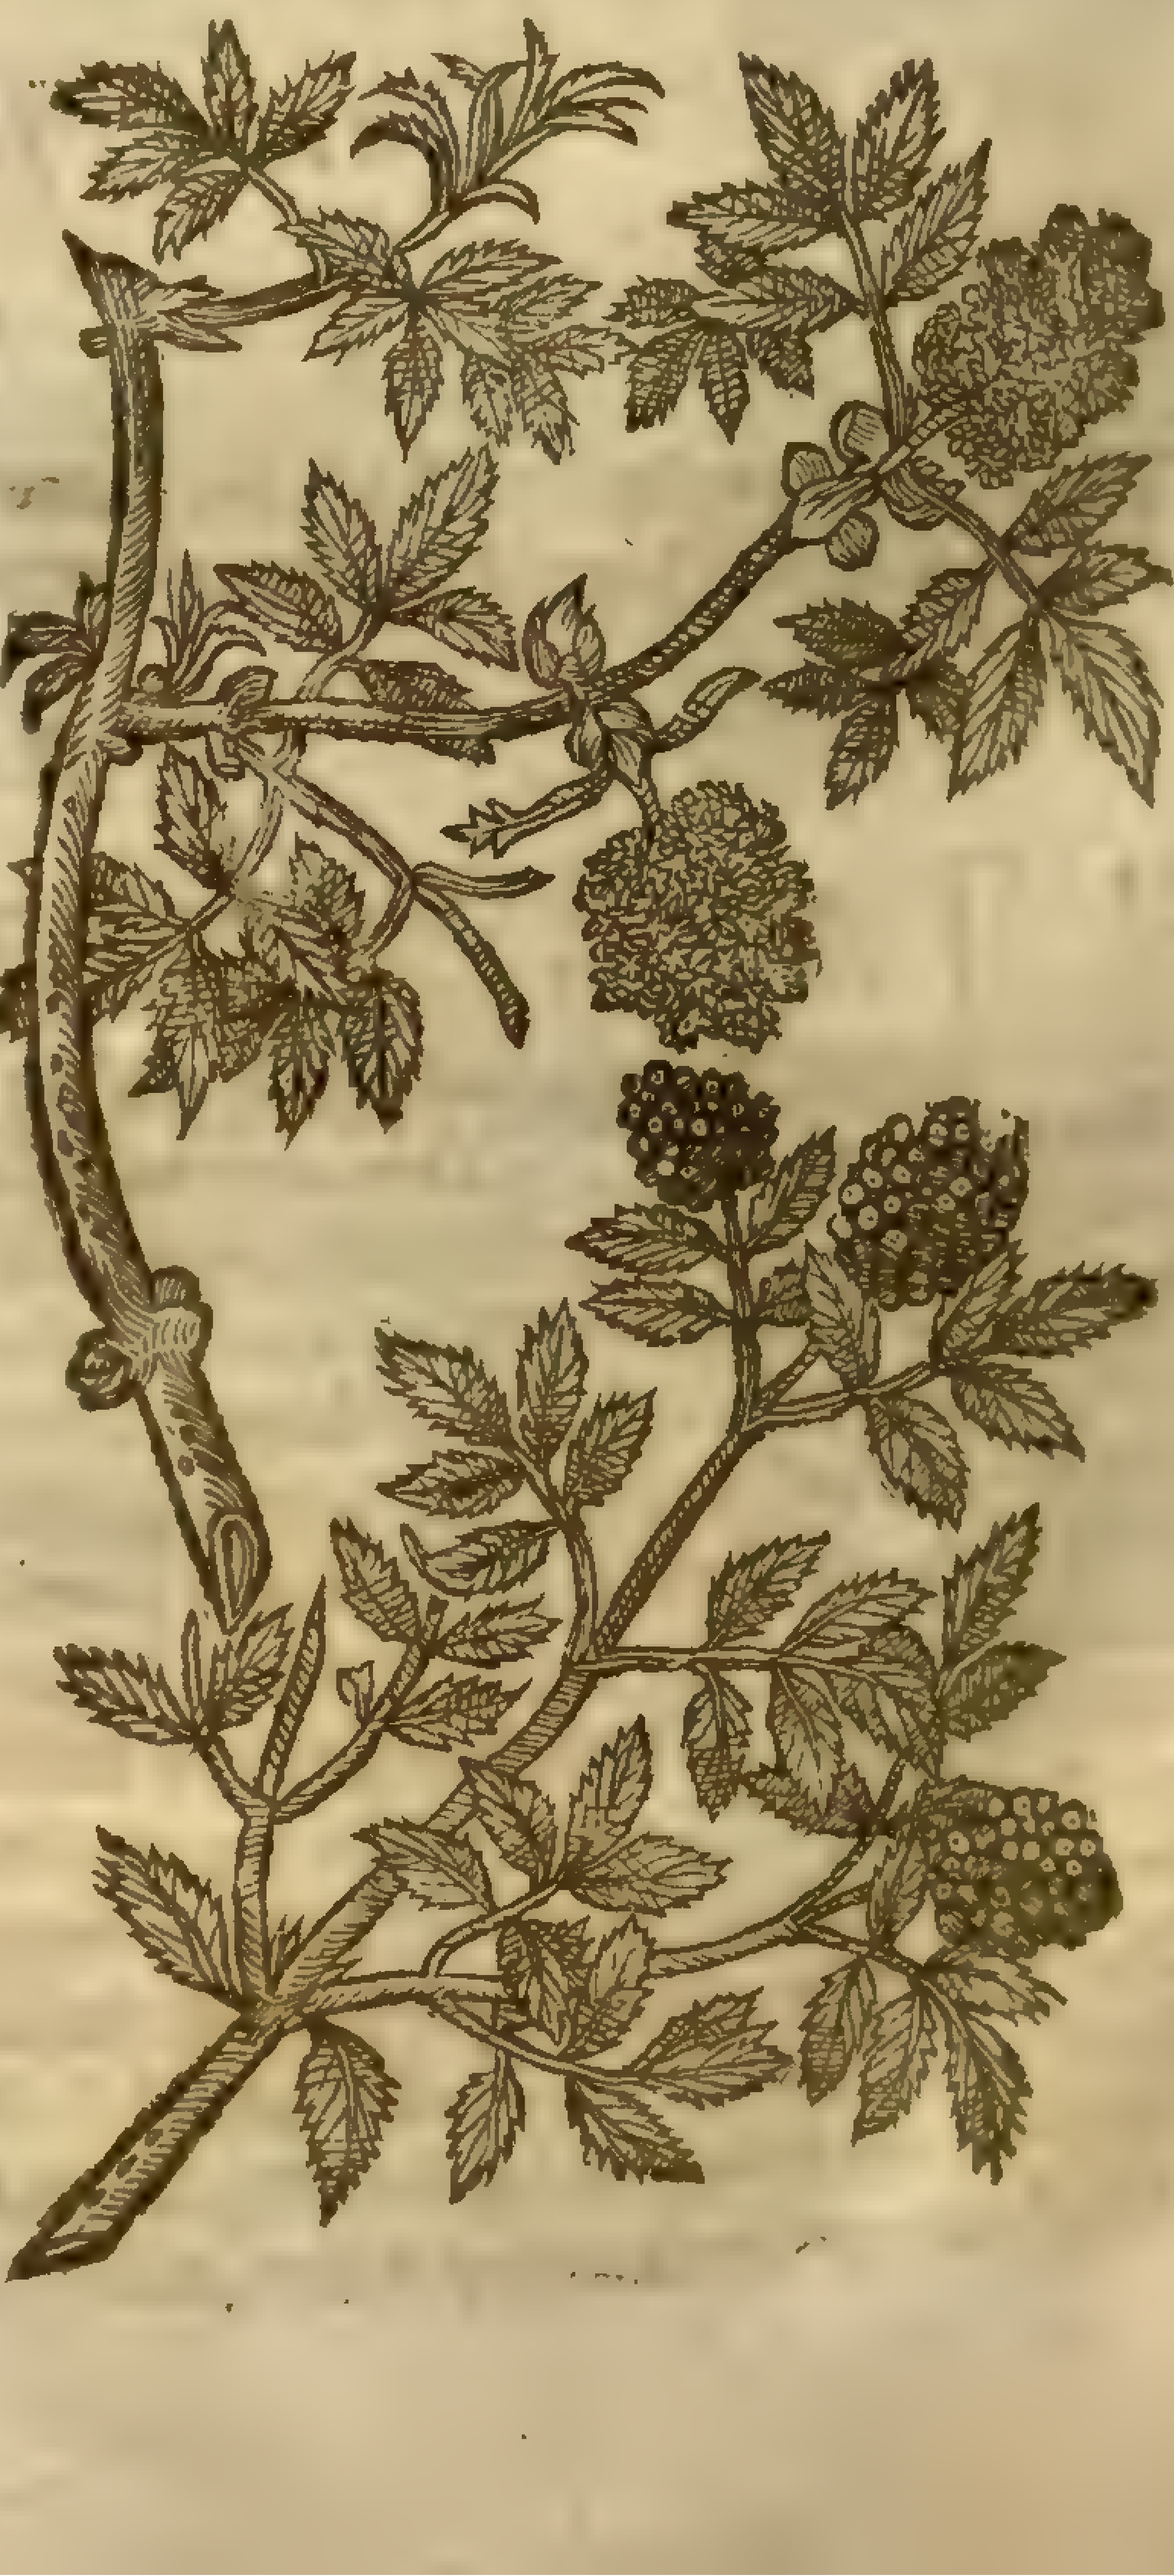
3 *Sambucus laciniatis folijs.*
The jagged Elder tree.



S. nigra, L. δ. mult. dis.
[illegible] 2. 107
Lob. ic. 2. 164.

4 *Sambucus racemoſa, vel Cervina.*
Harts Elder, or Cluſter Elder.

S. racemosa, L. mult. dis.



2 There is another alſo which is rare and ſtrange, for the berries of it are not black, but white: this is like in leaues to the former.

3 The jagged Elder tree growes like the common Elder in body, branches, ſhoots, pith, flours, fruit, and ſtinking ſmell, and differs onely in the faſhion of the leaues, which do ſo much diſguiſe the tree, and put it out of knowledge, that no man would take it for a kinde of Elder, vntill hee hath ſmelt thereunto, which will quickely ſhew from whence he is deſcended; for theſe ſtrange Elder leaues are very much jagged, rent or cut euen vnto the middle rib. From the trunke of this tree, as from others of the ſame kinde, proceedeth a certain fleſhy excreſcence like to the eare of a man, eſpecially from thoſe trees that are very old.

4 This kinde of Elder hath white floures, but red berries, and both are not contained in ſpoky rundles, but in cluſters, and grow after the manner of a cluſter of grapes: in leaues and other things it reſembleth the common Elder, ſaue that now and then it groweth higher.

¶ *The Place.*

The common Elder groweth euery where: it is planted about Cony-boroughs for the ſhadow of the Conies; but that with the white berries is rare: the other kindes grow in like places; but that with the cluſtered fruit groweth vpon mountains. That with the jagged leaues growes in my garden.

¶ *The Time.*

Theſe kindes of Elders floure in Aprill and May, and their fruit is ripe in September.

¶ *The Names.*

This tree is called in Greeke, ἀκτῆ: in Latine and of the Apothecaries, *Sambucus*: of *Gulielmus Salicetus*, *Beza*: in high-Dutch, **Holunder, Holder**: in low-Dutch, **Vlier**: in Italian, *Sambuco*: in French, *Hus*, and *Suin*: in Spaniſh, *Sauco*, *Sauch*, *Sambugueyro*: in Engliſh, Elder, and Elder tree: that with the white berries diuers would haue to be called *Sambucus ſylveſtris*, or wild Elder; but *Matthiolus* calls it *Montana*, or mountain Elder.

¶ *The Temperature and Vertues.*

A *Galen* attributeth the like facultie to Elder that he doth to Danewoort, and ſaith that it is of a drying qualitie, gluing, and moderatly digeſting: and it hath not onely theſe faculties, but others alſo; for the barke, leaues, firſt buds, floures, and fruit of Elder, doe not only dry, but alſo heate, and haue withall a purging qualitie, but not without trouble and hurt to the ſtomacke.

B The leaues and tender crops of common Elder taken in ſome broth or pottage open the belly, purging both ſlimy flegme and cholerick humors: the middle bark is of the ſame nature, but ſtronger, and purgeth the ſaid humors more violently.

C The ſeeds contained within the berries dried are good for ſuch as haue the Dropſie, and ſuch as are too fat and would faine be leaner, if they be taken in a morning to the quantitie of a dram with wine for a certain ſpace.

D The leaues of Elder boiled in water vntill they be very ſoft, and when they are almoſt boiled enough a little oile of ſweet Almonds added thereto, or a little Lineſeed oile, then taken forth, and laid vpon a red cloath or a piece of ſkarlet, and applied to the hemmorrhoids or Piles as hot as can be ſuffered, and ſo left remaining vpon the part affected vntill it be ſomewhat cold, hauing the like in a readineſſe, applying one after another vpon the diſeaſed part by the ſpace of an houre or more, and in the end ſome bound to the place, and the patient put warme a bed; it hath not as yet failed at the firſt dreſſing to cure the ſaid diſeaſe: but if the Patient be dreſſed twice it muſt needs help, if the firſt faile.

E The green leaues pouned with Deeres ſuet or Bulls tallow, are good to be laid to hot ſwellings and tumors, and doe aſſwage the pain of the gout.

F The inner and green bark doth more forcibly purge; it draweth forth choler and wateriſh humors; for which cauſe it is good for thoſe that haue the dropſie, beeing ſtamped, and the liquour preſſed out and drunke with wine or whay.

G Of like operation are alſo the freſh floures mixed with ſome kind of meat, as fried with egges; they likewiſe trouble the belly and moue to the ſtoole: being dried they loſe as wel their purging qualitie as their moiſture, and retain the digeſting and attenuating qualitie.

H The vineger in which the dried floures are ſteeped is wholeſome for the ſtomacke. Being vſed with meat it ſtirreth vp an appetite, it cutteth and attenuateth or maketh thin groſſe and raw humors.

I The facultie of the ſeed is ſomwhat gentler than that of the other parts, it alſo moues the belly, and draweth forth watery humors,being beaten to pouder,and giuen to a dram weight : being new gathered,ſteeped in vineger,and afterward dried, it is taken and that effectually in the like weight of the dried lees of wine,and with a few Aniſe ſeeds, for ſo it worketh without any maner of trouble, and helpeth thoſe that haue the dropſie : but it muſt be giuen for certain dayes together in a little wine to thoſe that haue need thereof.

K The gelly of the Elder,otherwiſe called Iewes eare,hath a binding and drying qualitie : the infuſion thereof,in which it hath bin ſteeped a few houres,taketh away inflammations of the mouth and almonds of the throat in the beginning,if the mouth and throat be waſhed therewith,and doth in like manner help the uvula.

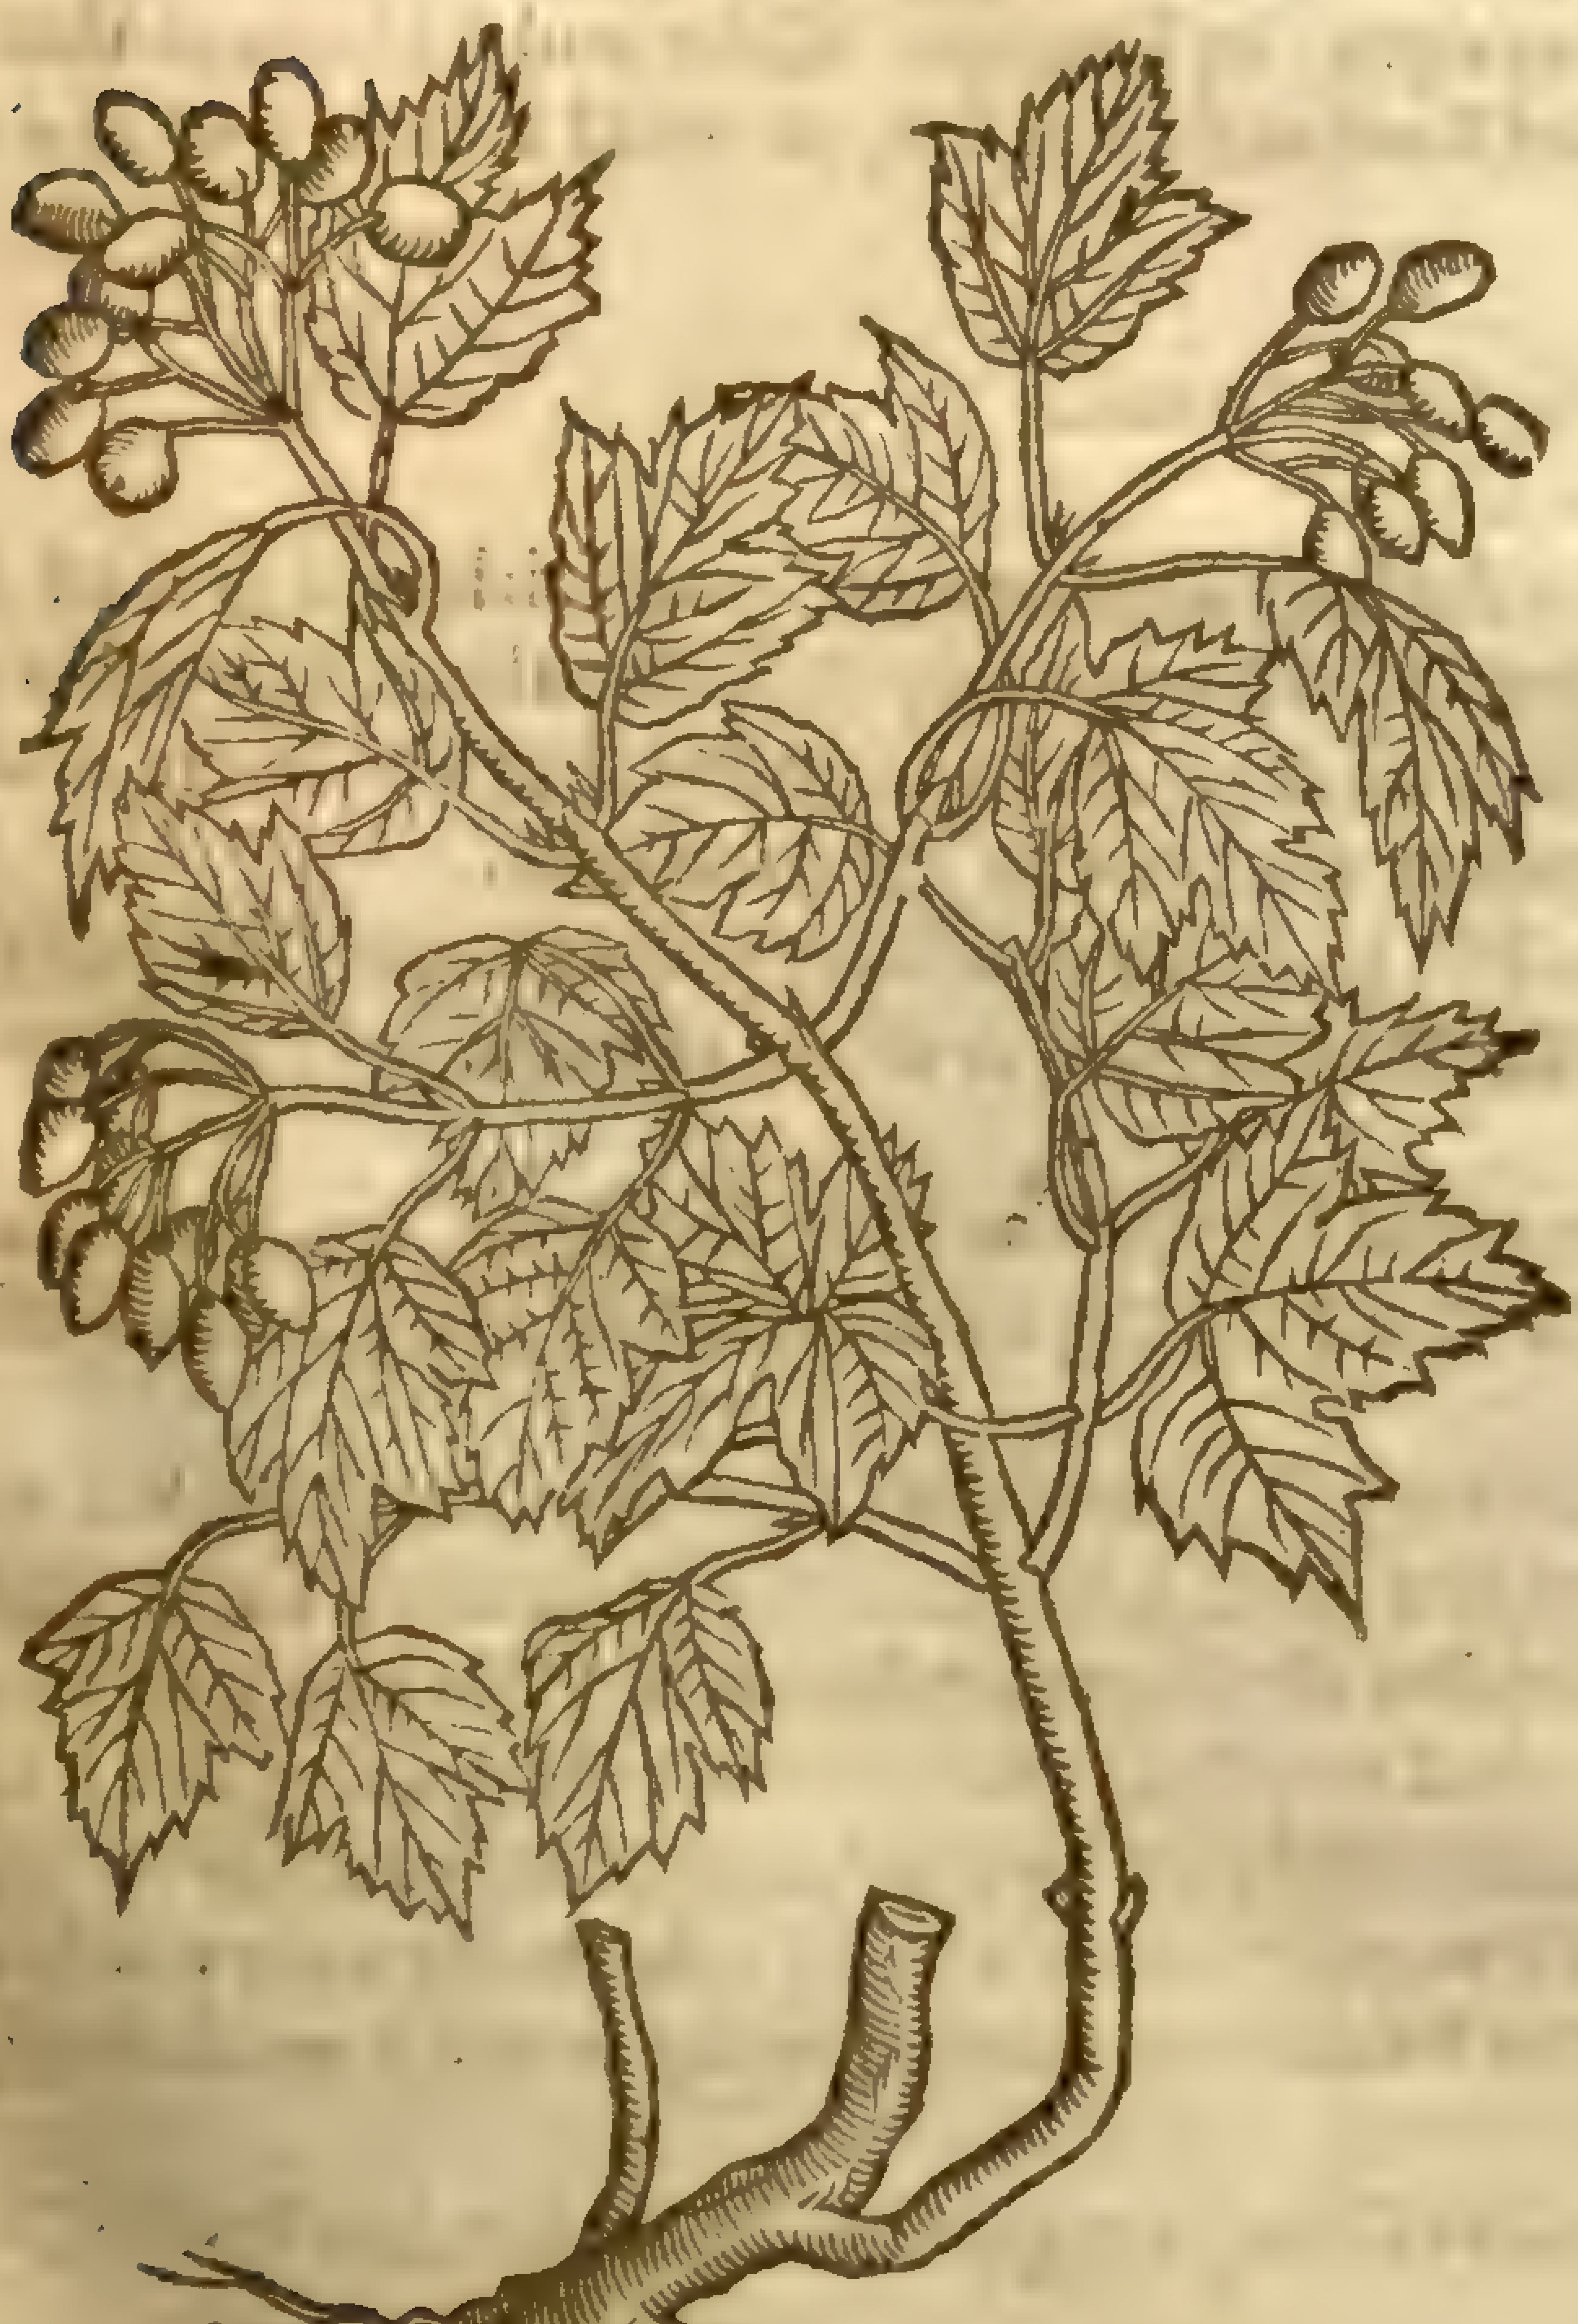
L *Dioſcorides* ſaith,that the tender green leaues of the Elder tree with parched Barly meale do remoue hot ſwellings,and are good for thoſe that are burnt or ſcalded,and for ſuch as be bitten with a mad dog,and that they glew and heale vp hollow vlcers.

M The pith of the yong boughes is without qualitie : which being dried,and ſomewhat preſſed or quaſhed together,is good to lay open the narrow orifices or holes of fiſtula's and iſſues,if it be put therein.

Chap. 78. *Of Mariſh or Water Elder.*

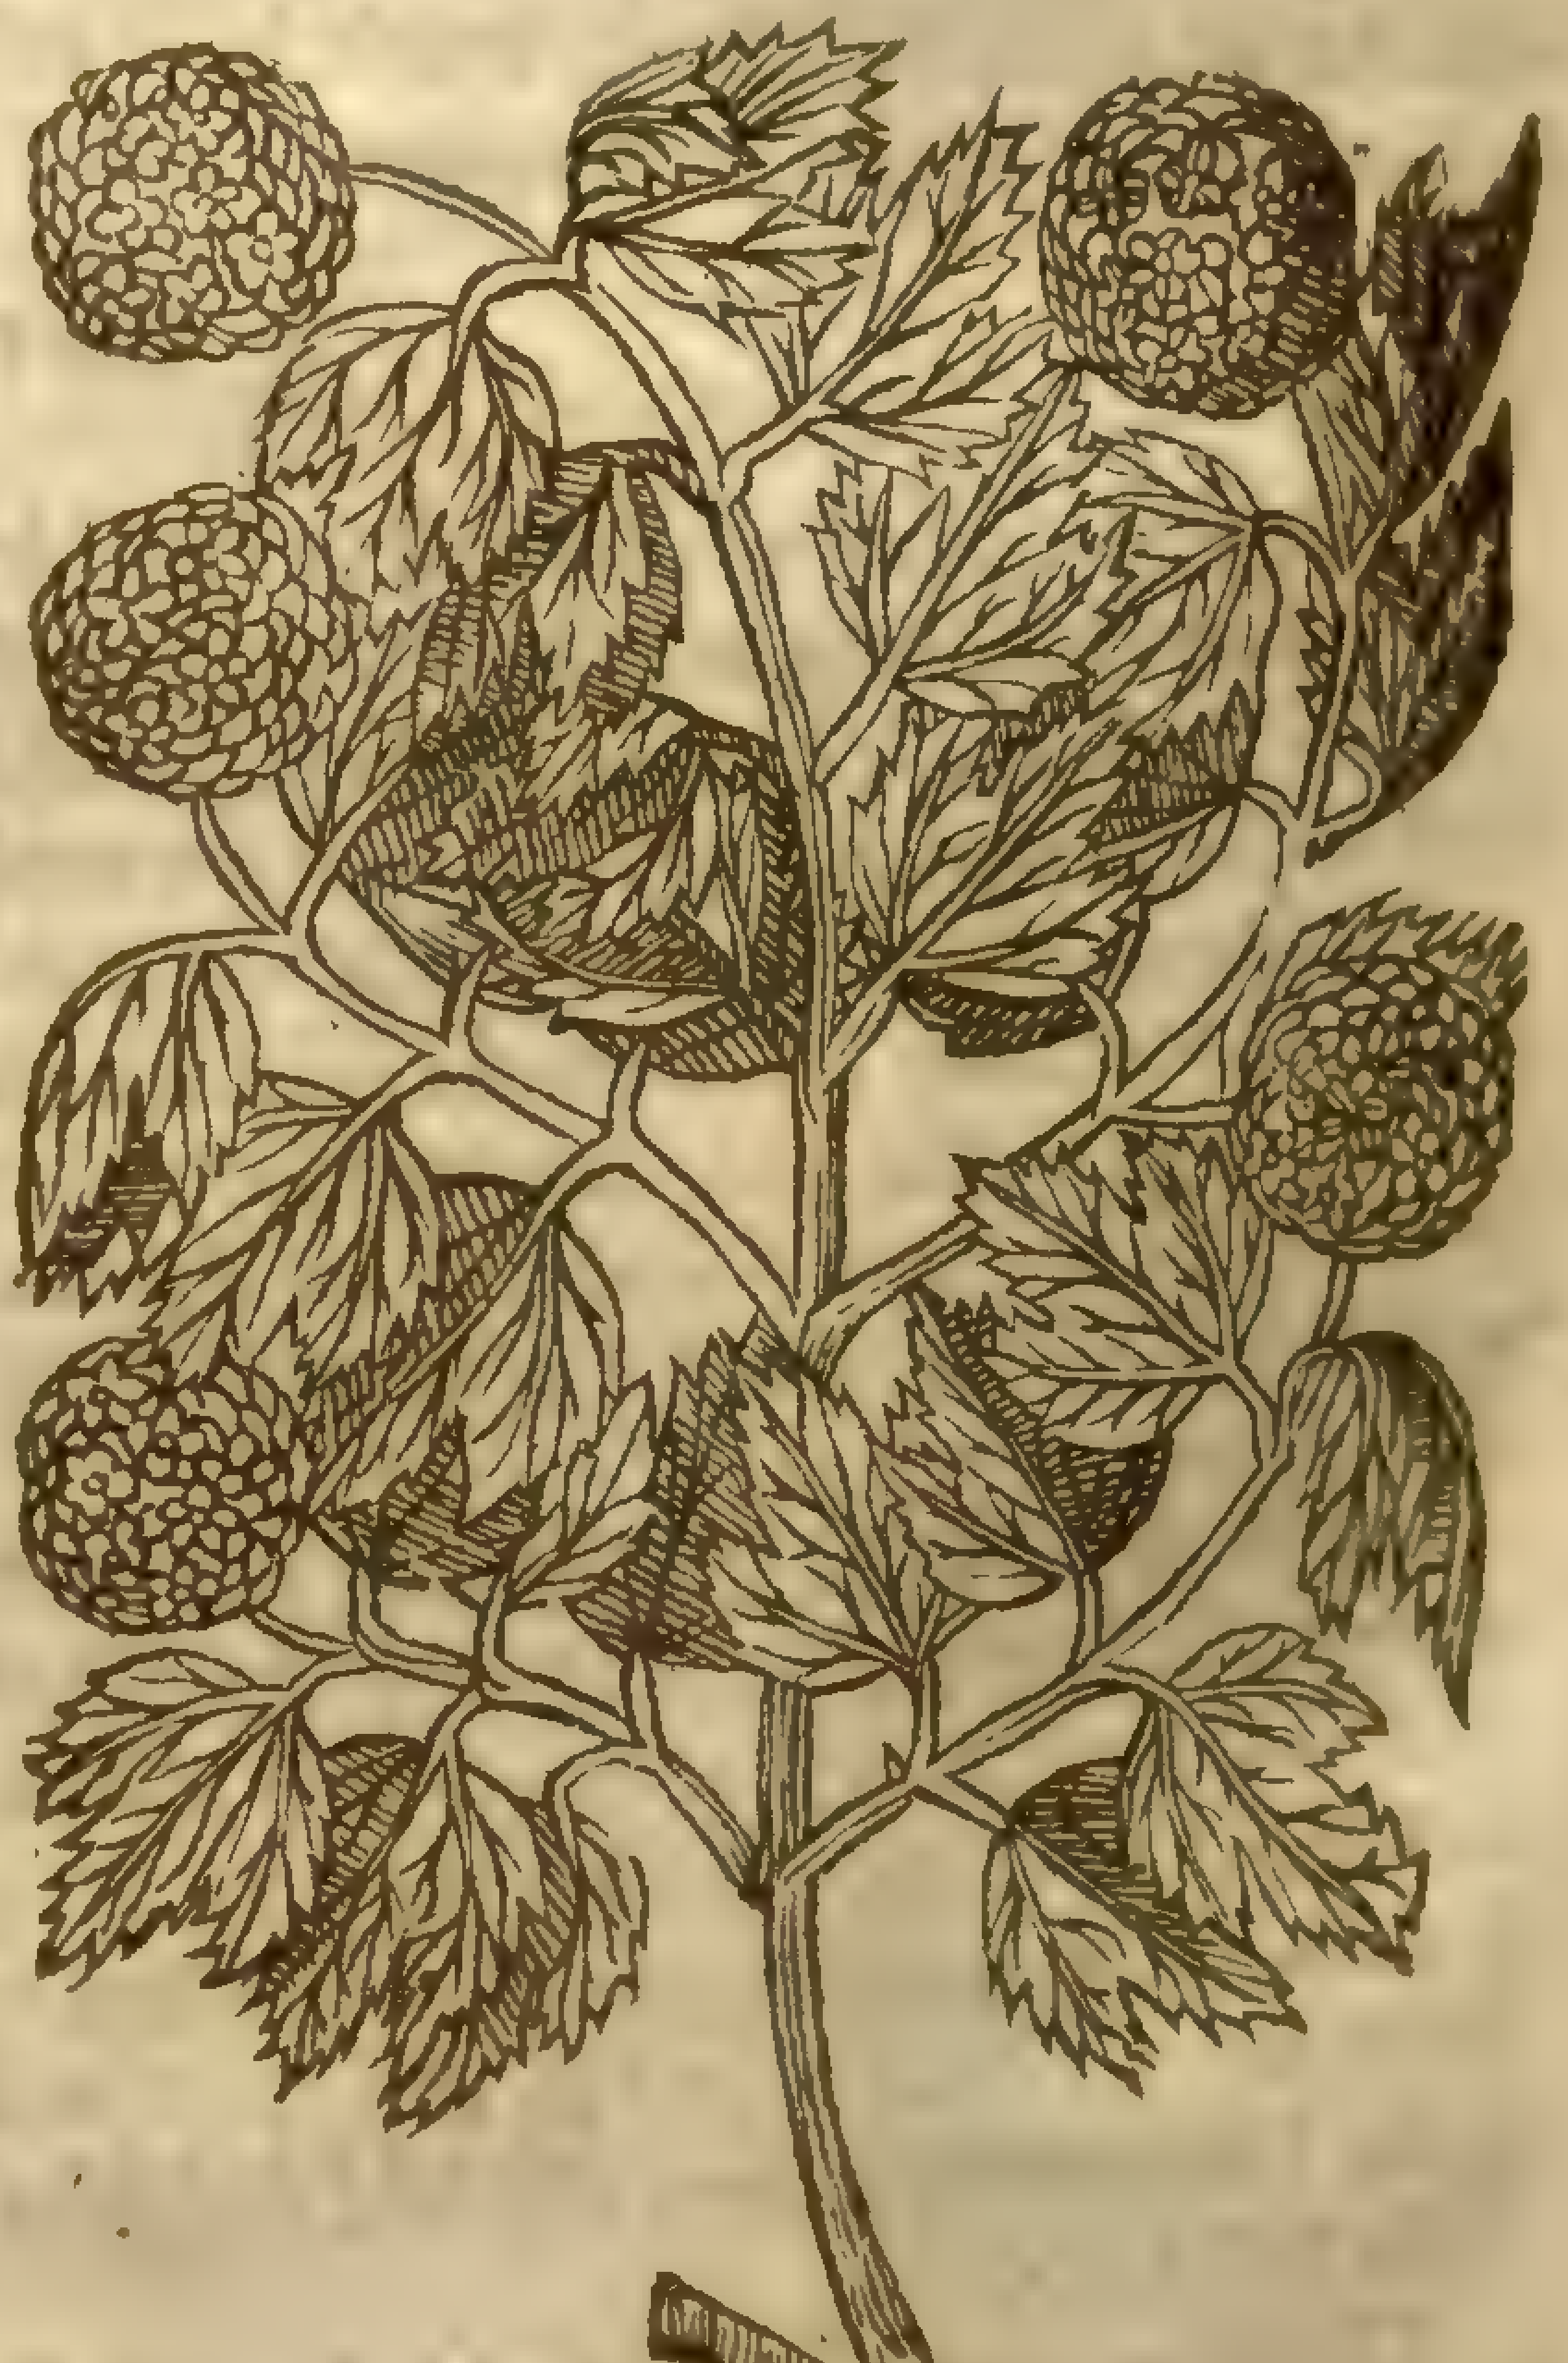
1 *Sambucus aquatilis, ſiue paluſtris.*
Mariſh or water Elder.

Viburnum Opulus L. α
mihi dict.
Sm. fl. 2. 105



2 *Sambucus Roſea.*
The Roſe Elder.

Viburnum Opulus L. β
mihi dict.



¶ The Deſcription.

1 MAriſh Elder is not like to the common Elder in leaues,but in boughes. It groweth after the manner of a little tree ; the boughes are couered with a barke of an ill fauoured Aſh colour , as be thoſe of the common Elder : they are ſet with ioynts by

certain diſtances, & haue in them great plenty of white pith, therfore they haue leſſe wood, which is white and brittle: the leaues be broad, cornered, like almoſt to Vine leaues, but leſſer and ſofter: among which come forth ſpoked rundles which bring forth little floures, the vttermoſt whereof alongſt the borders be greater, of a gallant white colour, euery little one conſiſting of fiue leaues: the other in the midſt and within the borders be ſmaller, and it floures by degrees, and the whole tuft is of a moſt ſweet ſmell: after which come the fruit or beries, that are round like thoſe of the common Elder, but greater, and of a ſhining red colour, and blacke when they be withered.

2 *Sambucus Roſea* or the Elder Roſe groweth like an hedge tree, hauing many knotty branches or ſhoots comming from the root, full of pith like the common Elder: the leaues are like the vine leaues, among which come forth goodly floures of a white colour, ſprinkled and daſhed heere and there with a light and thin carnation colour, and do grow thicke and cloſely compact together, in quantitie and bulke of a mans hand, or rather bigger, of great beauty, and ſauoring like the floures of the Hawthorne: but in my garden there groweth not any fruit vpon this tree, nor in any other place, for ought that I can vnderſtand.

3 This kinde is likewiſe an hedge tree, very like vnto the former in ſtalks and branches, which are jointed and knotted by diſtances, and it is full of white pith: the leaues be likewiſe cornered. The flours hereof grow not out of ſpoky rundles, but ſtand in a round thick and globed tuft, in bigneſſe alſo and faſhion like to the former, ſauing that they tend to a deeper purple colour, wherein only the difference conſiſts.

¶ *The Place.*

Sambucus paluſtris or water Elder growes by running ſtreames and water courſes, and in hedges by moiſt ditch ſides.

The Roſe Elder groweth in gardens, and the floures are there doubled by art, as it is ſuppoſed.

¶ *The Time.*

Theſe kindes of Elders floure in Aprill and May, and the fruit of the water Elder is ripe in September.

¶ *The Names.*

The water Elder is called in Latine, *Sambucus aquatica*, and *Sambucus paluſtris*: it is called *Opulus* and *Platanus*, and alſo *Chamæplatanus* or the dwarfe Plane tree, but vnproperly. *Valerius Cordus* maketh it to be *Lycoſtaphylos*: the Saxons, ſaith *Geſner*, doe call it *Vva lupina*; from whence *Cordus* inuented the name Λυκοστάφυλος: it is named in high-Dutch, **Walt holder**, and **Hirſch holder**: in Low-Dutch, **Swelcken**, and **Swelckenhout**: of certaine French men, *Obiere*: in Engliſh, Mariſh Elder, Whitten tree, Oppel tree, and dwarfe Plane tree.

The Roſe Elder is called in Latine, *Sambucus Roſea*, and *Sambucus aquatica*, being doubtles a kind of the former water Elder, the floures being doubled by art, as we haue ſaid. It is called in Dutch, **Ghelderſche Rooſe**: in Engliſh, Gelders Roſe, and Roſe Elder.

¶ *The Nature and Vertues.*

Concerning the faculties of theſe Elders, and the berries of the Water Elder, there is nothing found in any Writer, neither can we ſet downe any thing hereof of our owne knowledge.

CHAP. 79.

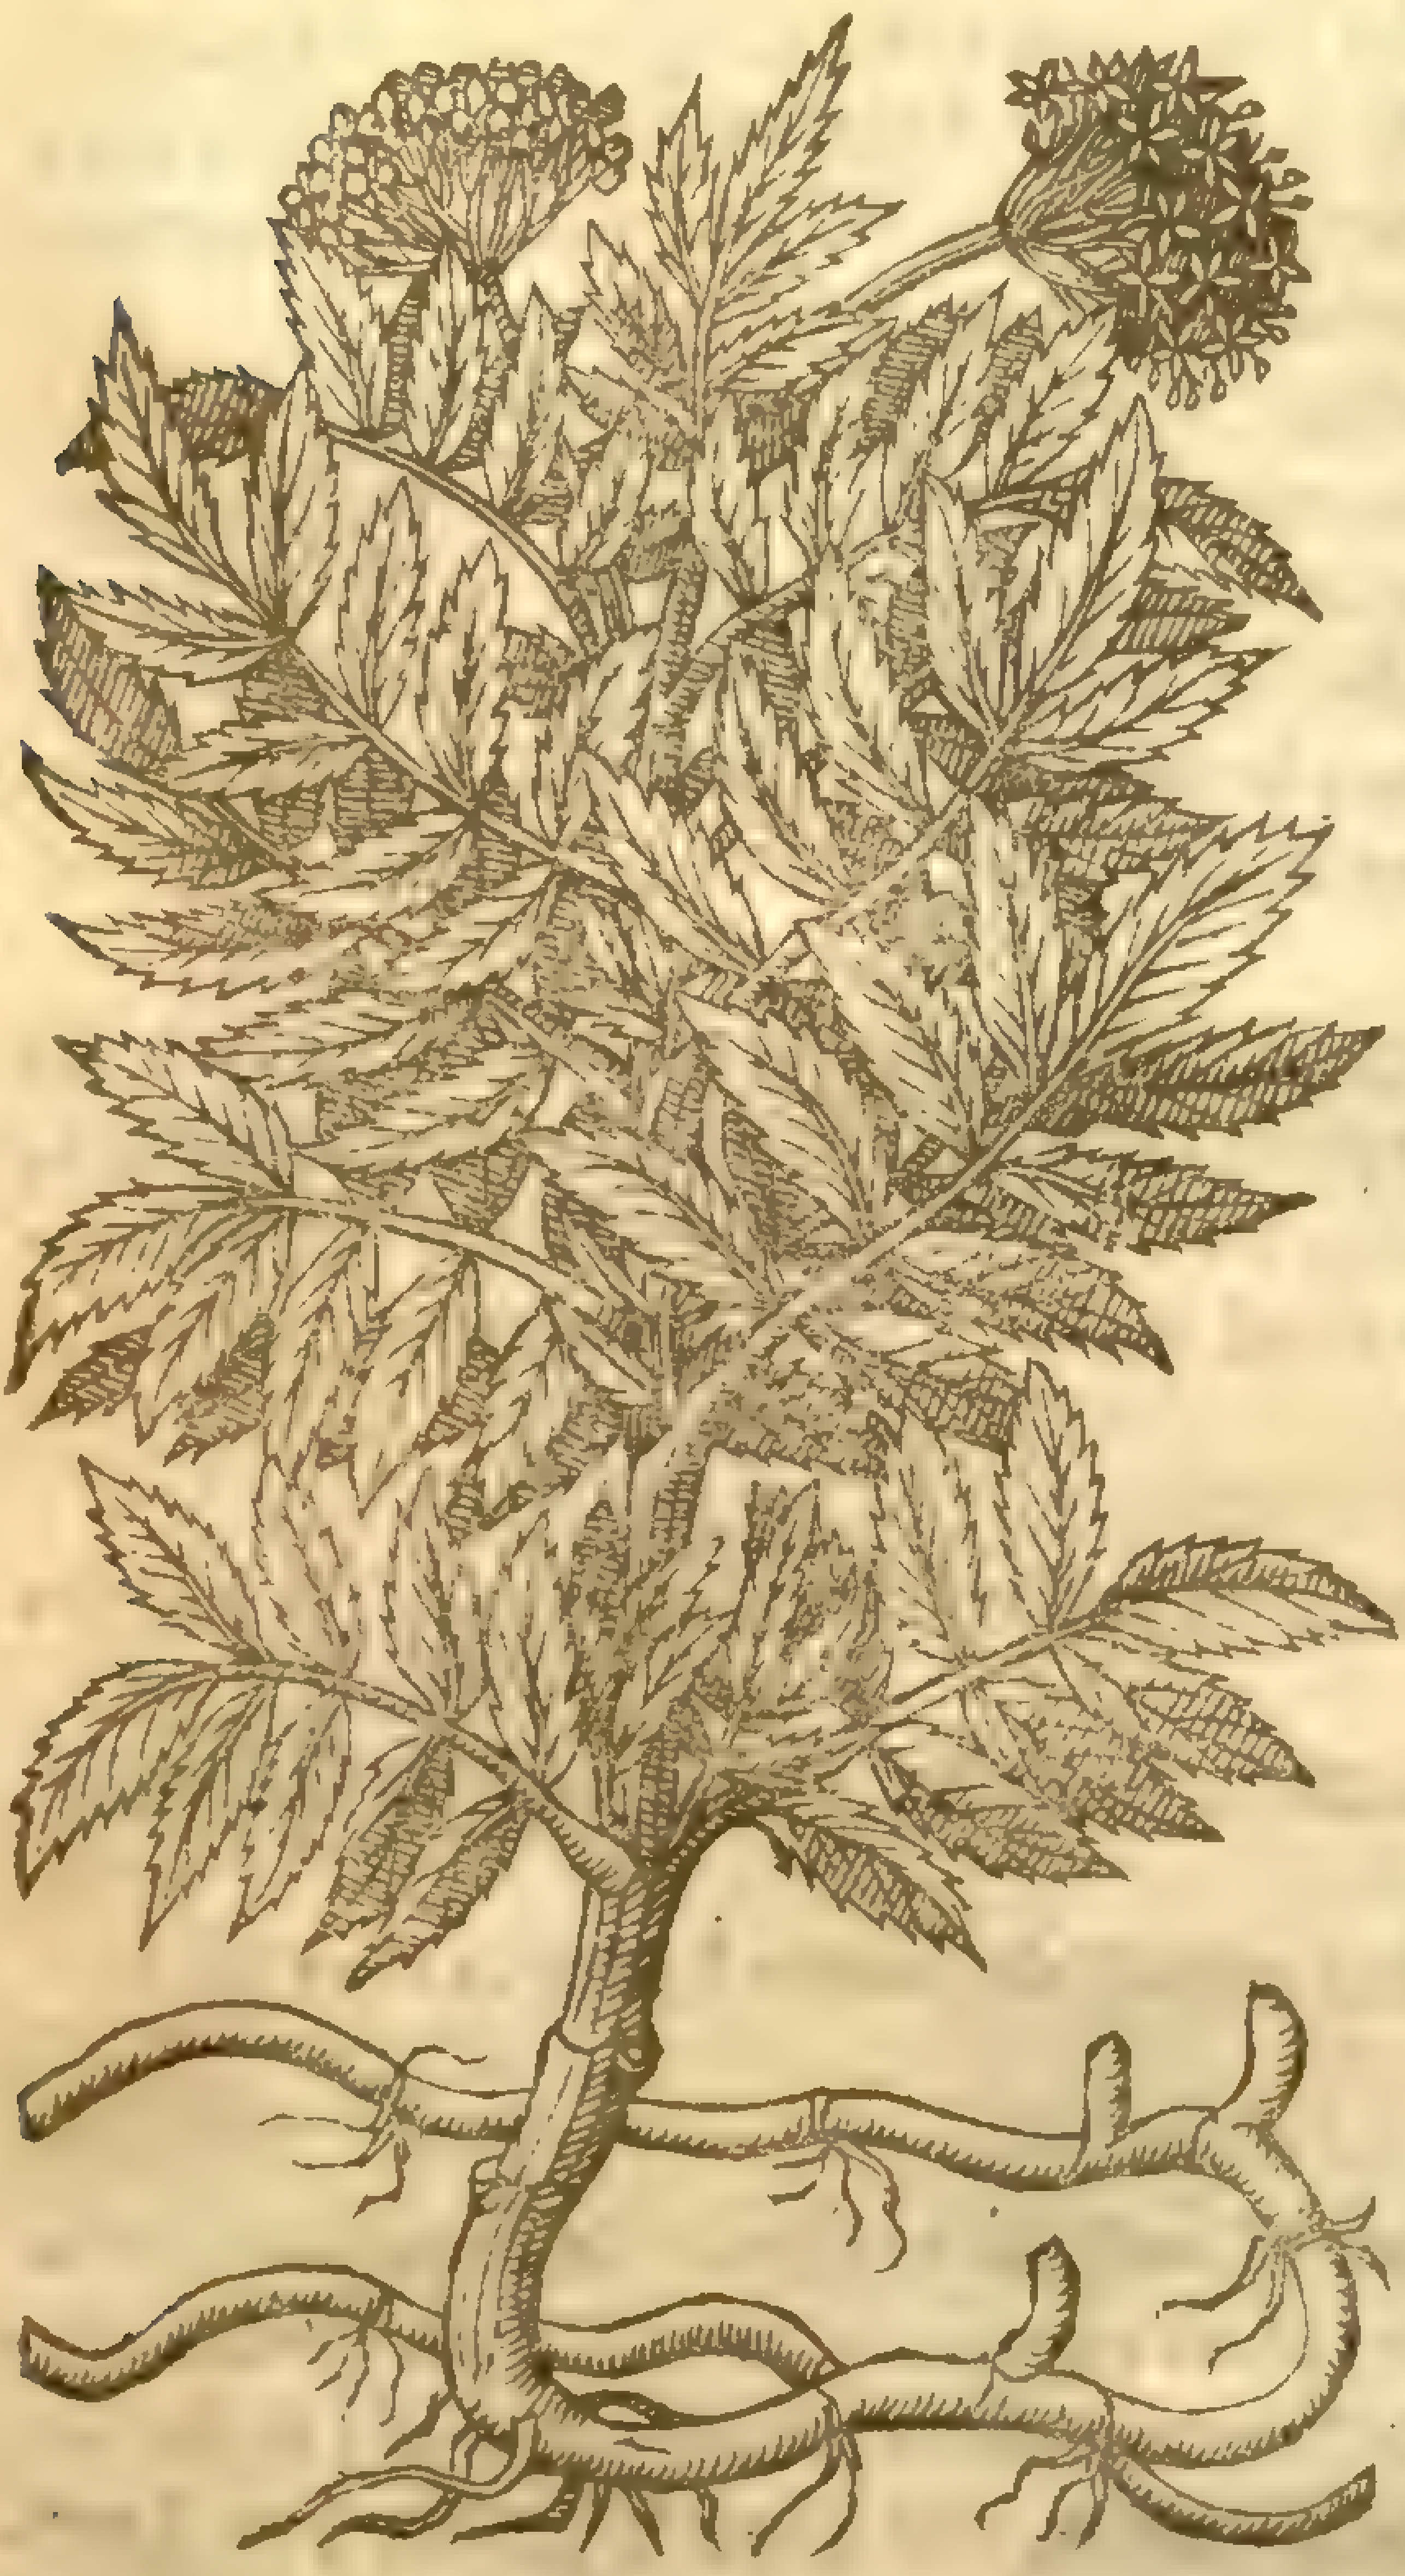
Of Dane-wort, Wall-wort, or dwarfe Elder.

¶ *The Deſcription.*

DAnewort, as it is not a ſhrub, neither is it altogether an herby plant, but as it were a plant participating of both, being doubtleſſe one of the Elders, as may appeare both by the leaues, floures, and fruit, as alſo by the ſmell and taſte.

Wall-wort is very like vnto Elder in leaues, ſpoky tufts, and fruit, but it hath not a woody ſtalk, it bringeth forth only green ſtalks, which wither away in winter: theſe are edged and ful of joints like to the yong branches and ſhoots of Elder; the leaues grow by couples with diſtances, wide, and conſiſt of many ſmall leaues which ſtand vpon a thicke ribbed ſtalke, of which euery one is long, broad, and cut in the edges like a ſaw, wider and greater than the leaues of the common Elder tree: at the top of the ſtalks there grow tufts of white floures tipt with red, with fiue little chiues in them pointed with blacke, which turne into blacke berries like the Elder, in which be little long ſeed: the root is tough, and of a good and reaſonable length, better for phyſicks vſe than the Elder leaves.

Ebulus, ſiue Sambucus humilis.
Dane-wort, or dwarfe Elder.



Sambucus ebulus, L.
[illegible] sheet
[illegible]

¶ *The Place.*

Dane-wort growes in vntoiled places neere to common wayes, and in the borders of fields. It groweth plentifully in the lane at Kilbury Abby by London: alſo in a field by S. *Ioans* neer Dartford in Kent; and in the highway at old Branford townes end next London, and in many other places.

¶ *The Time.*

The floures are perfected in Summer, and the berries in Autumne.

¶ *The Names.*

It is called in Greeke *χαμαιάκτη*, that is, *Humilis Sambucus*, or low Elder: in Latine, *Ebulus*, and *Ebulum*: in high-Dutch, **Attich**: in low-Dutch, **Hadich**: in Italian, *Ebulo*: in French, *Hieble*: in Spaniſh, *Yezgos*: in Engliſh, Wall-wort, Danewort, and dwarfe Elder.

¶ *The Temperature.*

Wall-woort is of temperature hot and dry in the third degree, and *Galen* doth attribute a ſingular qualitie vnto it to waſte and conſume. It hath alſo a ſtrange and ſpeciall facultie to purge by the ſtoole: the roots be of greateſt force; the leaues haue chiefeſt ſtrength to digeſt and conſume.

¶ *The Vertues.*

A The roots of Wall-woort boiled in wine and drunken are good againſt the dropſie, for they purge downwards watery humors.

B The leaues conſume and waſte way hard ſwellings, if they be applied pultiſwiſe, or in a fomentation or bath.

C *Dioſcorides* ſaith, that the roots of Wall-woort doe ſoften and open the matrix, and alſo correct the infirmities thereof, if they be boiled in a bath to ſit in; and diſſolue the ſwellings and pains of the belly.

D The juice of the root of Danewort maketh the haire blacke.

E The yong and tender leafe quencheth hot inflammations, applied with Barley meale. It is with good ſucceſſe laid vpon burnings, ſcaldings, and the bitings of mad dogs; and with Buls tallow or Goats ſuet it is a remedie for the gout.

F The ſeed of Wall-wort drunke in the quantitie of a dram is the moſt excellent purger of waterie humors in the world, and therefore moſt ſingular againſt the dropſie.

G If one ſcruple of the ſeed be bruiſed and taken with ſyrrup of Roſes and a little Secke, it cureth the dropſie and eaſeth the gout, mightily purging downwards watery humors, being taken once a weeke.

Chap. 80. *Of Beane Trefoile.*

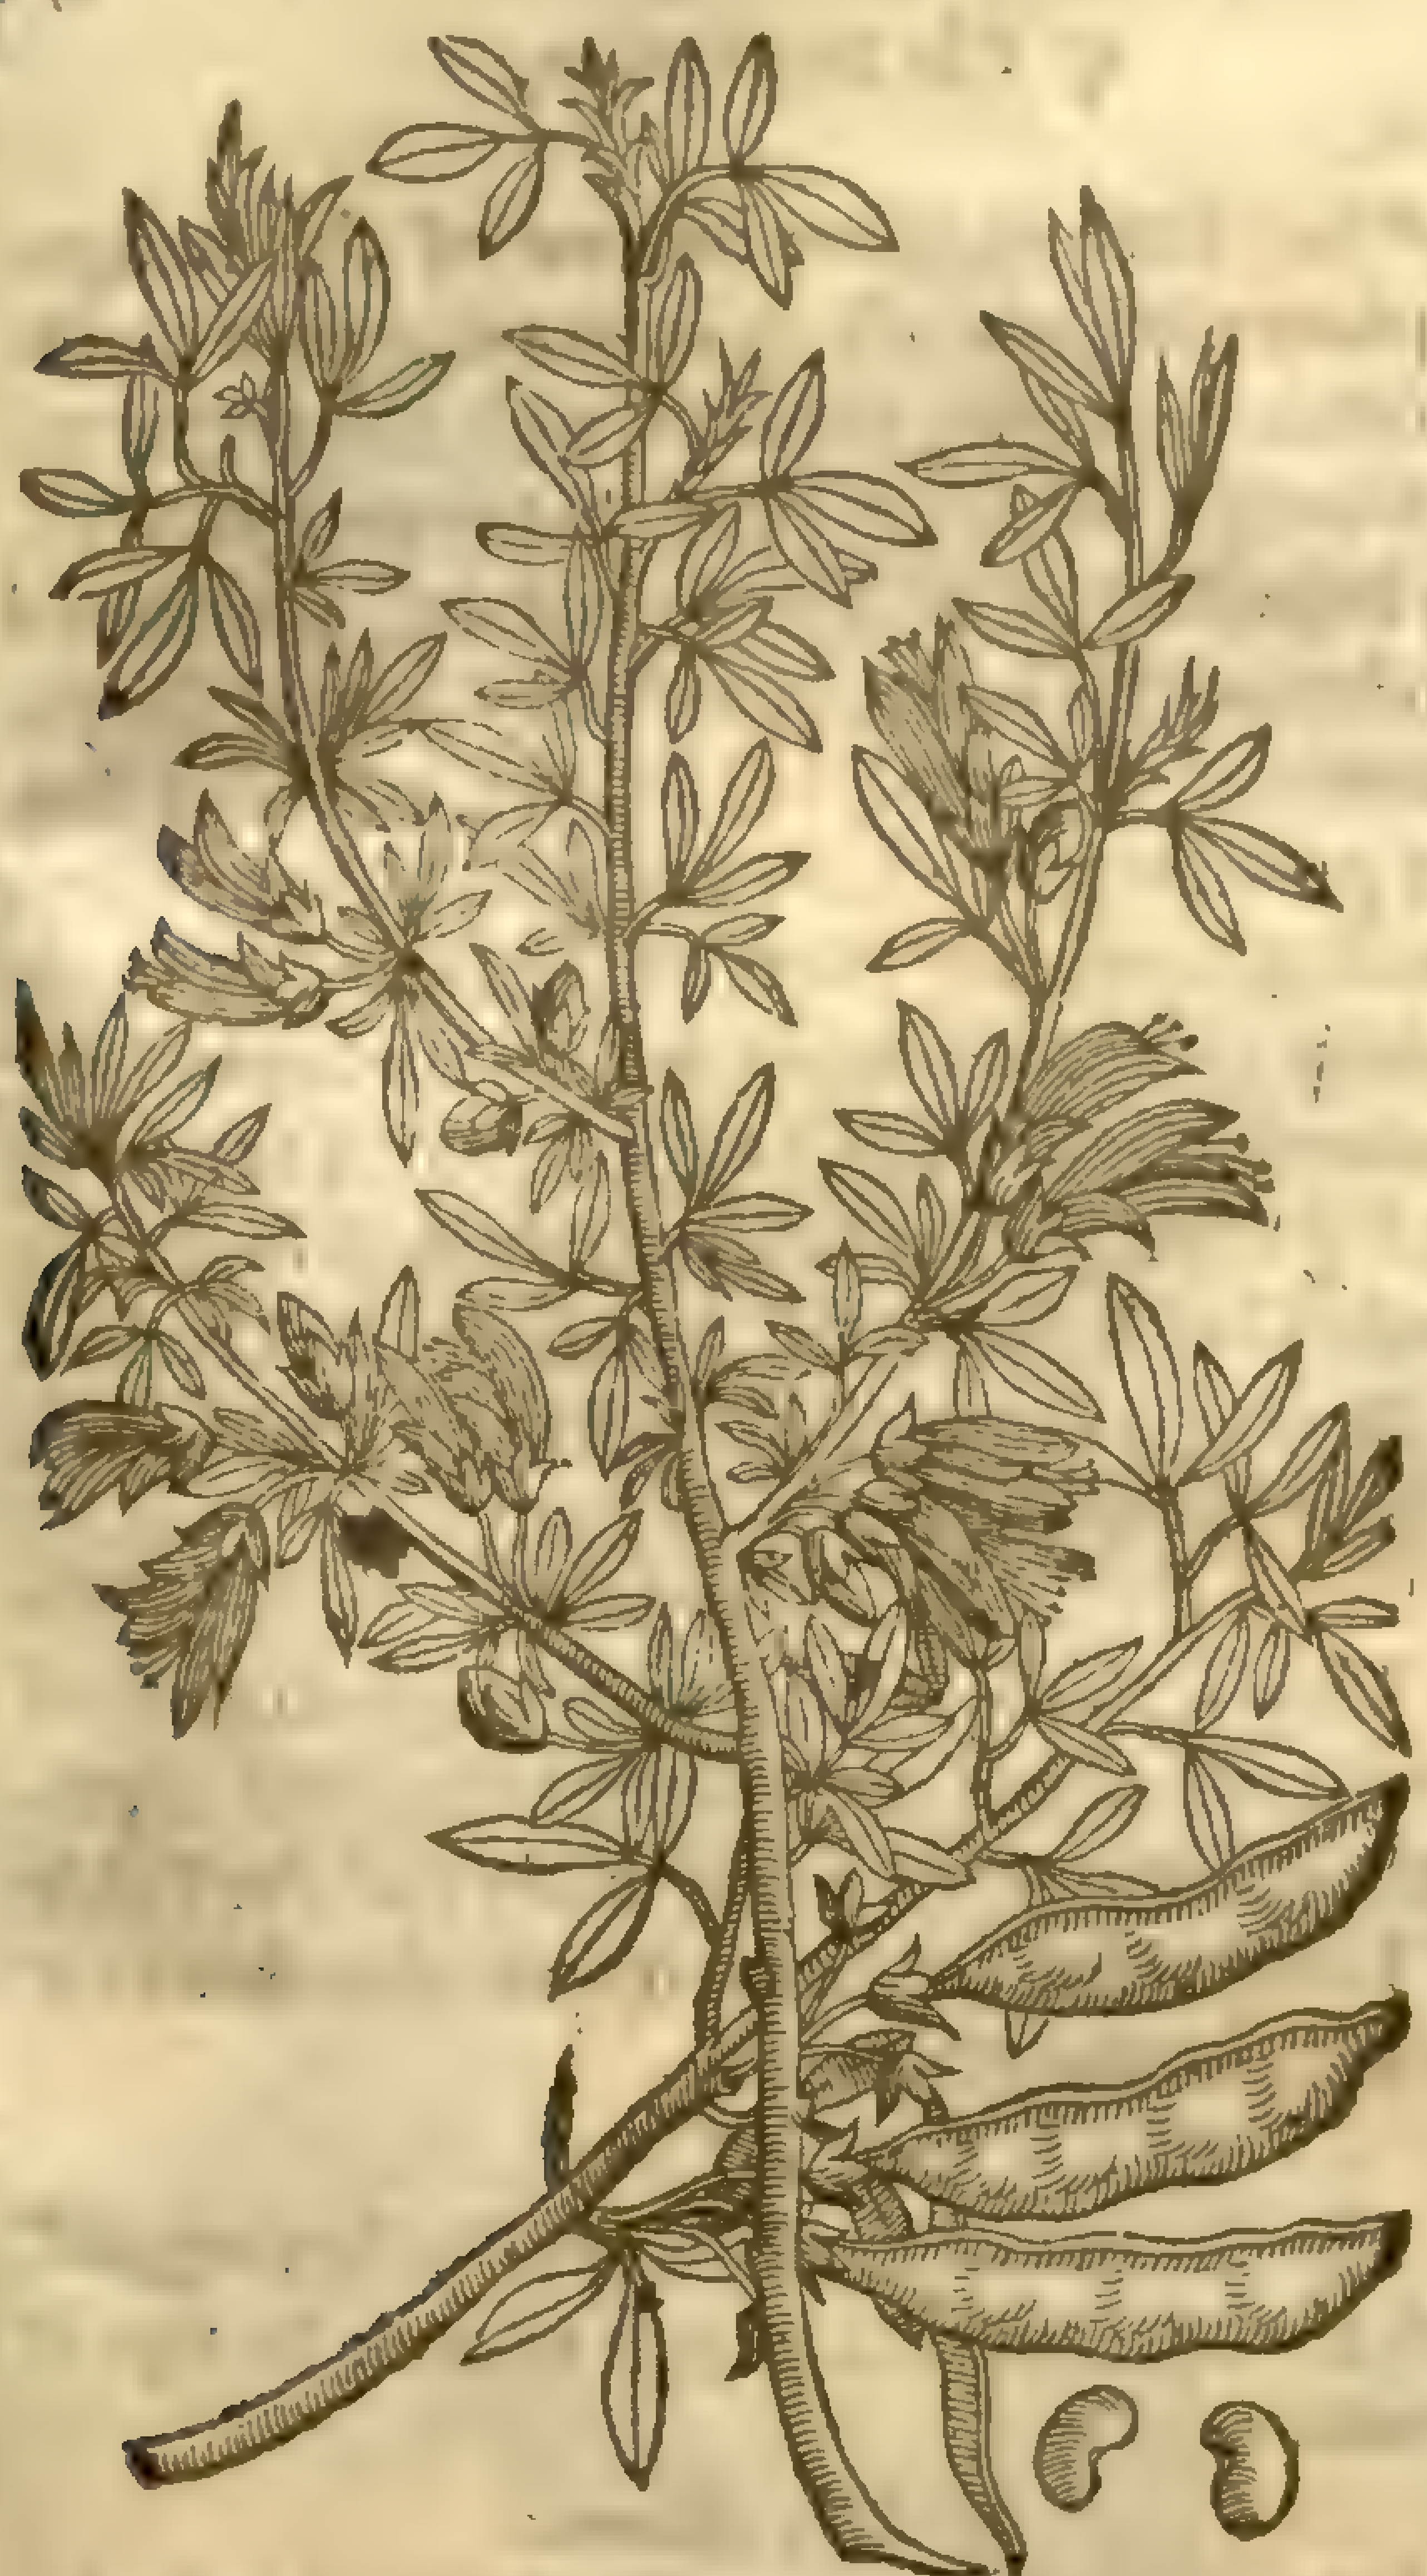
¶ *The Deſcription.*

1 The firſt kinde of *Anagyris* or *Laburnum* groweth like vnto a ſmall tree, garniſhed with many ſmall branches like the ſhoots of Oziars, ſet full of pale greene leaues, alwayes three together, like the *Lotus* or medow Trefoil, or rather like the leaues of *Vitex* or the Cytiſus buſh; among which come forth many tufts of floures of a yellow colour, not much vnlike the flours of Broom: when theſe floures be gon there ſucceed ſmall flat cods, wherein are contained ſeeds like *Galega* or the Cytiſus buſh. The whole plant hath little or no ſauor at all. The root is ſoft and gentle, yet of a wooddy ſubſtance.

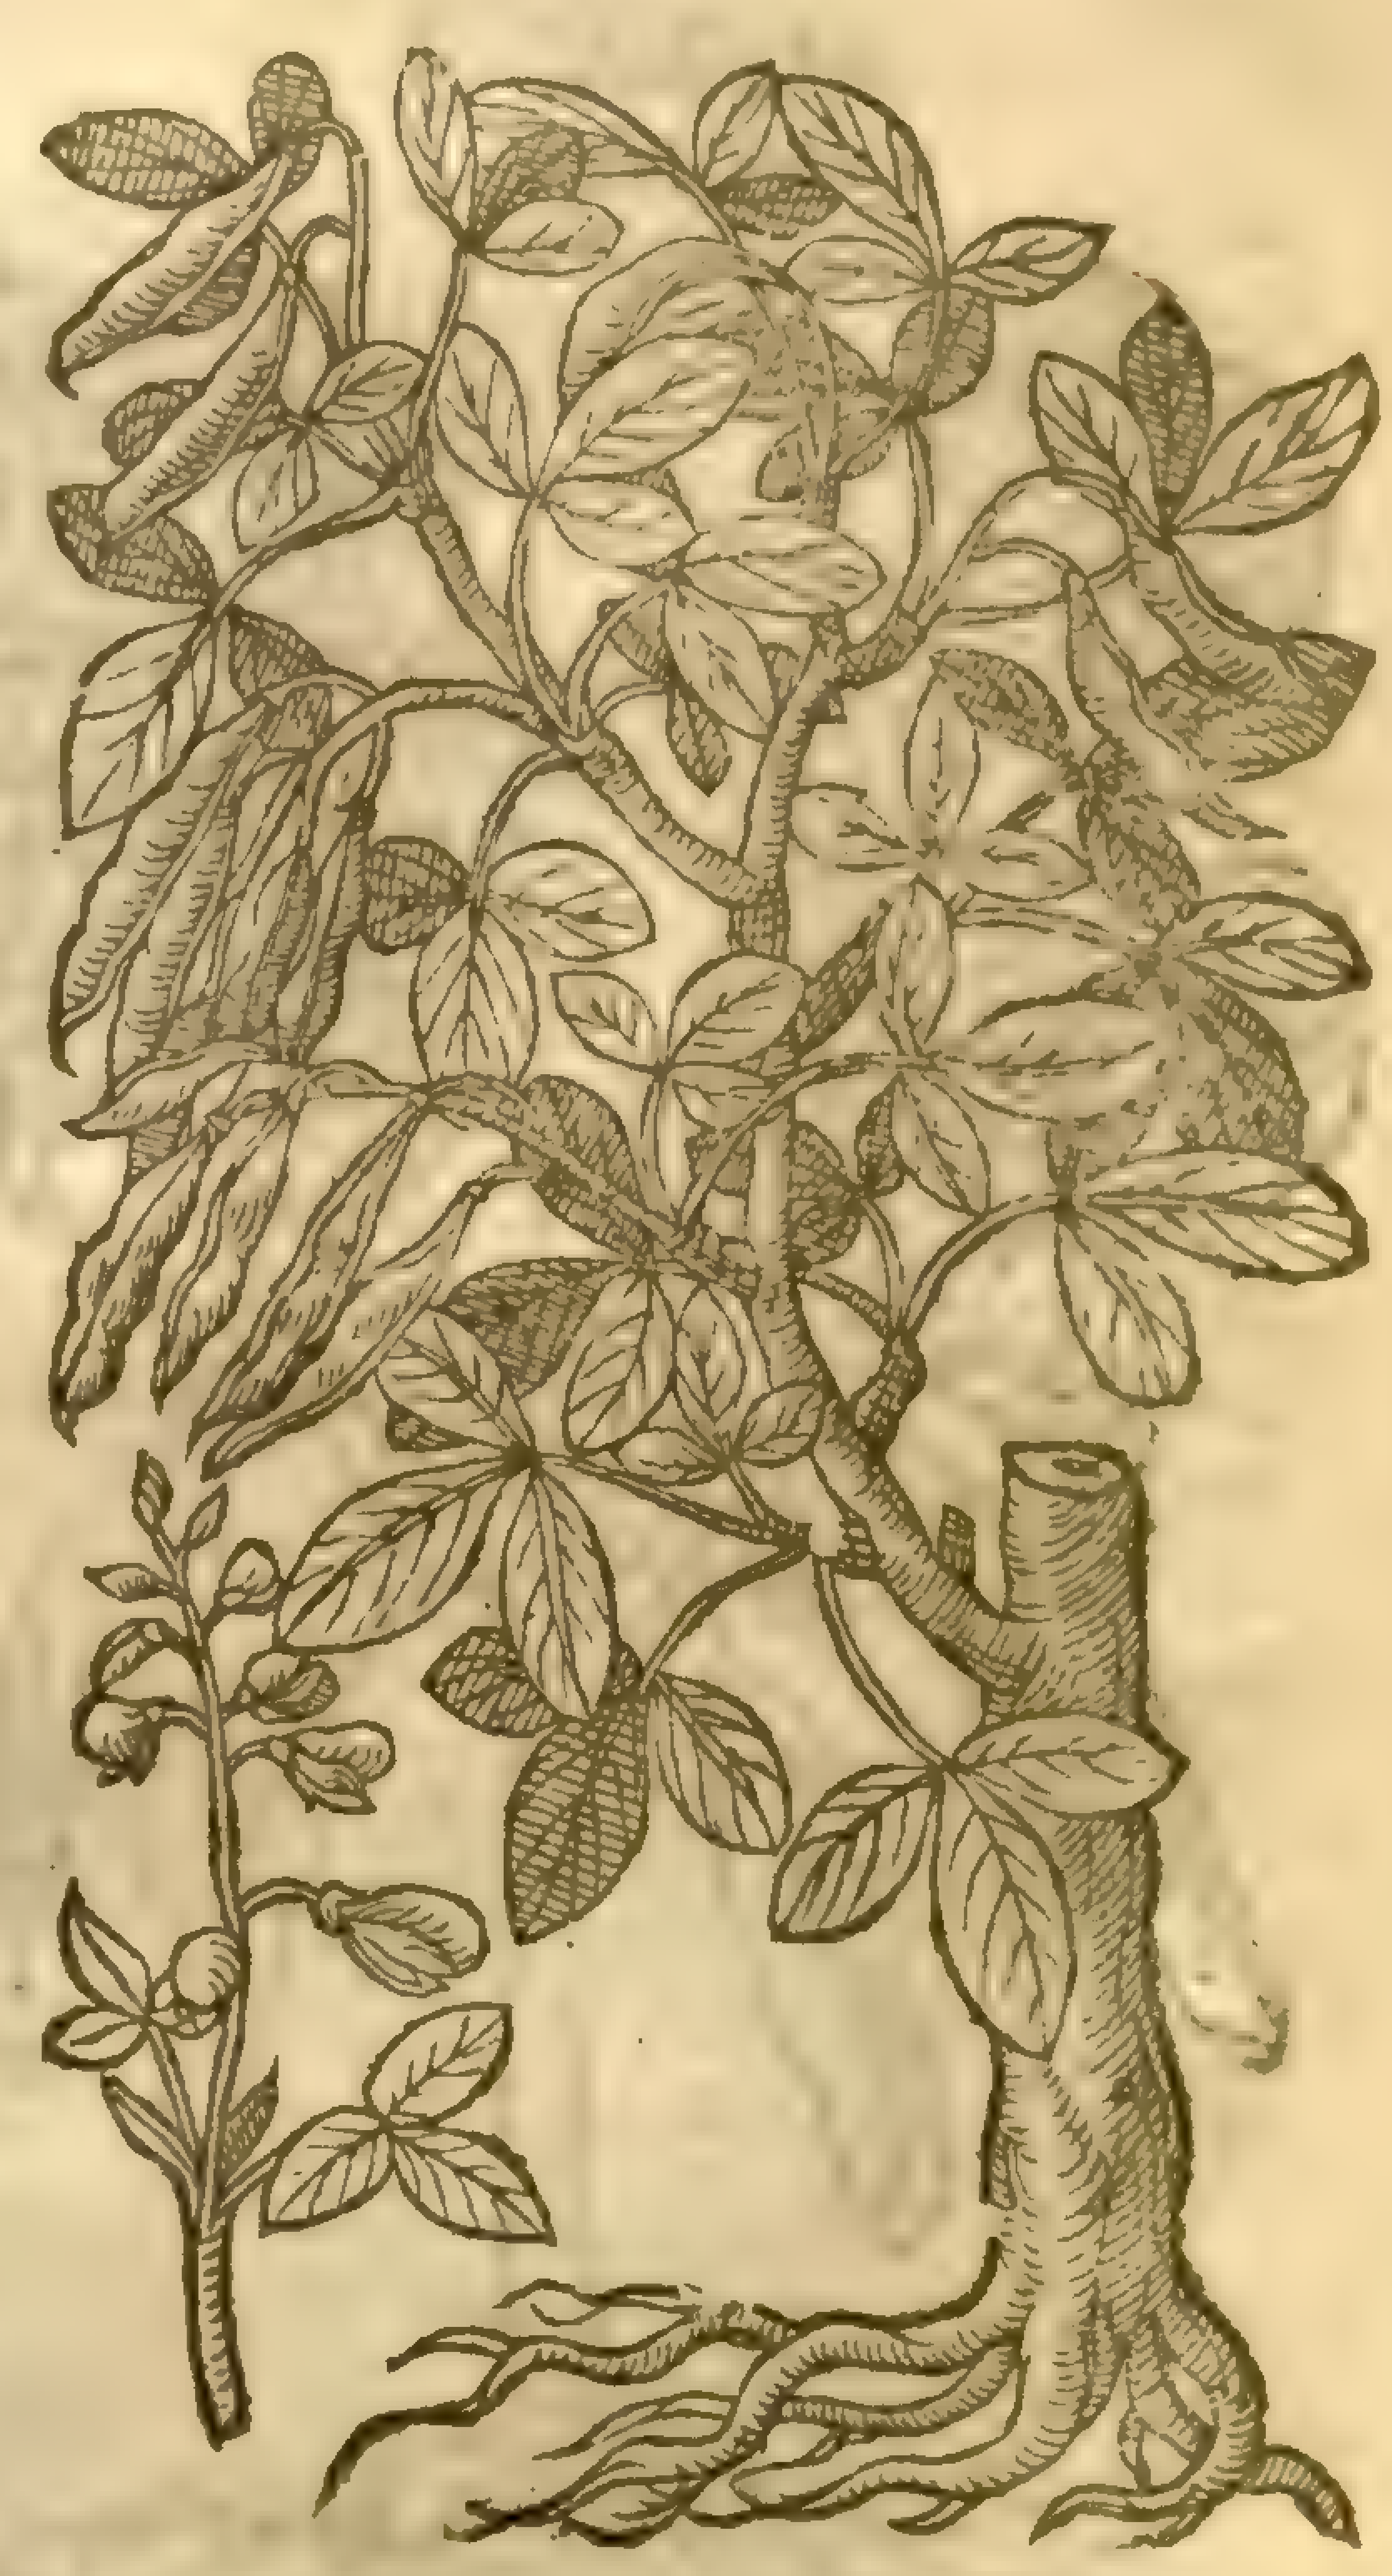
2 Stinking Trefoile is a ſhrub like to a little tree, riſing vp to the height of ſix or eight cubits or ſomtimes higher: it ſendeth forth of the ſtalks very many ſlender branches, the barke whereof is of a deepe greene colour: the leaues ſtand alwayes three together, like thoſe of *Lotus* or medow Trefoile, yet of a lighter green on the vpper ſide: the floures be long, as yellow as gold, very like to thoſe of Broom, two or three alſo joined together: after them come vp the cods, wherein lie hard fruit like Kidny beans, but leſſer, at the firſt white, afterwards tending to a purple, and laſt of all of a blackiſh blew. The leaues and floures haue a filthy ſmell like thoſe of ſtinking Gladdon, and ſo ranke withall, as euen the paſſers by are anoyed therewith.

[illegible] Laburnum [illegible]

1 *Anagyris.*
Bean Trefoile.



2 *Anagyris fœtida.*
Stinking Bean Trefoile.



‡ Of *Anagyris* there are foure kinds, two with ſtinking leaues; the one with longiſh leaues, the other with rounder.

Two other whoſe leaues do not ſtink; the one of theſe hath ſomtimes foure or fiue leaues vpon one ſtalke, and the leaues are long and large. The other hath them leſſer and narrower. ‡

¶ *The Place.*

Theſe grow of themſelues in moſt places of Languedoc and Spain, and in other countries alſo by high-waies, as in the Iſle of Candy, as *Bellonius* writeth. The firſt I haue in my garden; the other is a ſtranger in England. ‡ Mr *Tradeſcant* hath two ſorts hereof in his garden. ‡

¶ *The Time.*

They floure in Iune, and the ſeed is ripe in September.

¶ *The Names.*

The Bean Trefoile is called in Greeke ἀνάγυρις, which name remaineth vncorrupt in Candy euen to this day: in Latine alſo *Anagyris*, and *Laburnum*: of the people of Anagni in Italy, *Eghelo*, which is referred vnto *Laburnum*, wherof *Pliny* writeth, *lib.* 16. *cap.* 18. in Engliſh, Bean Trefoile, or the peſcod tree.

¶ *The Temperature.*

Bean Trefoile, as *Galen* writeth, hath an hot and digeſting facultie.

¶ The

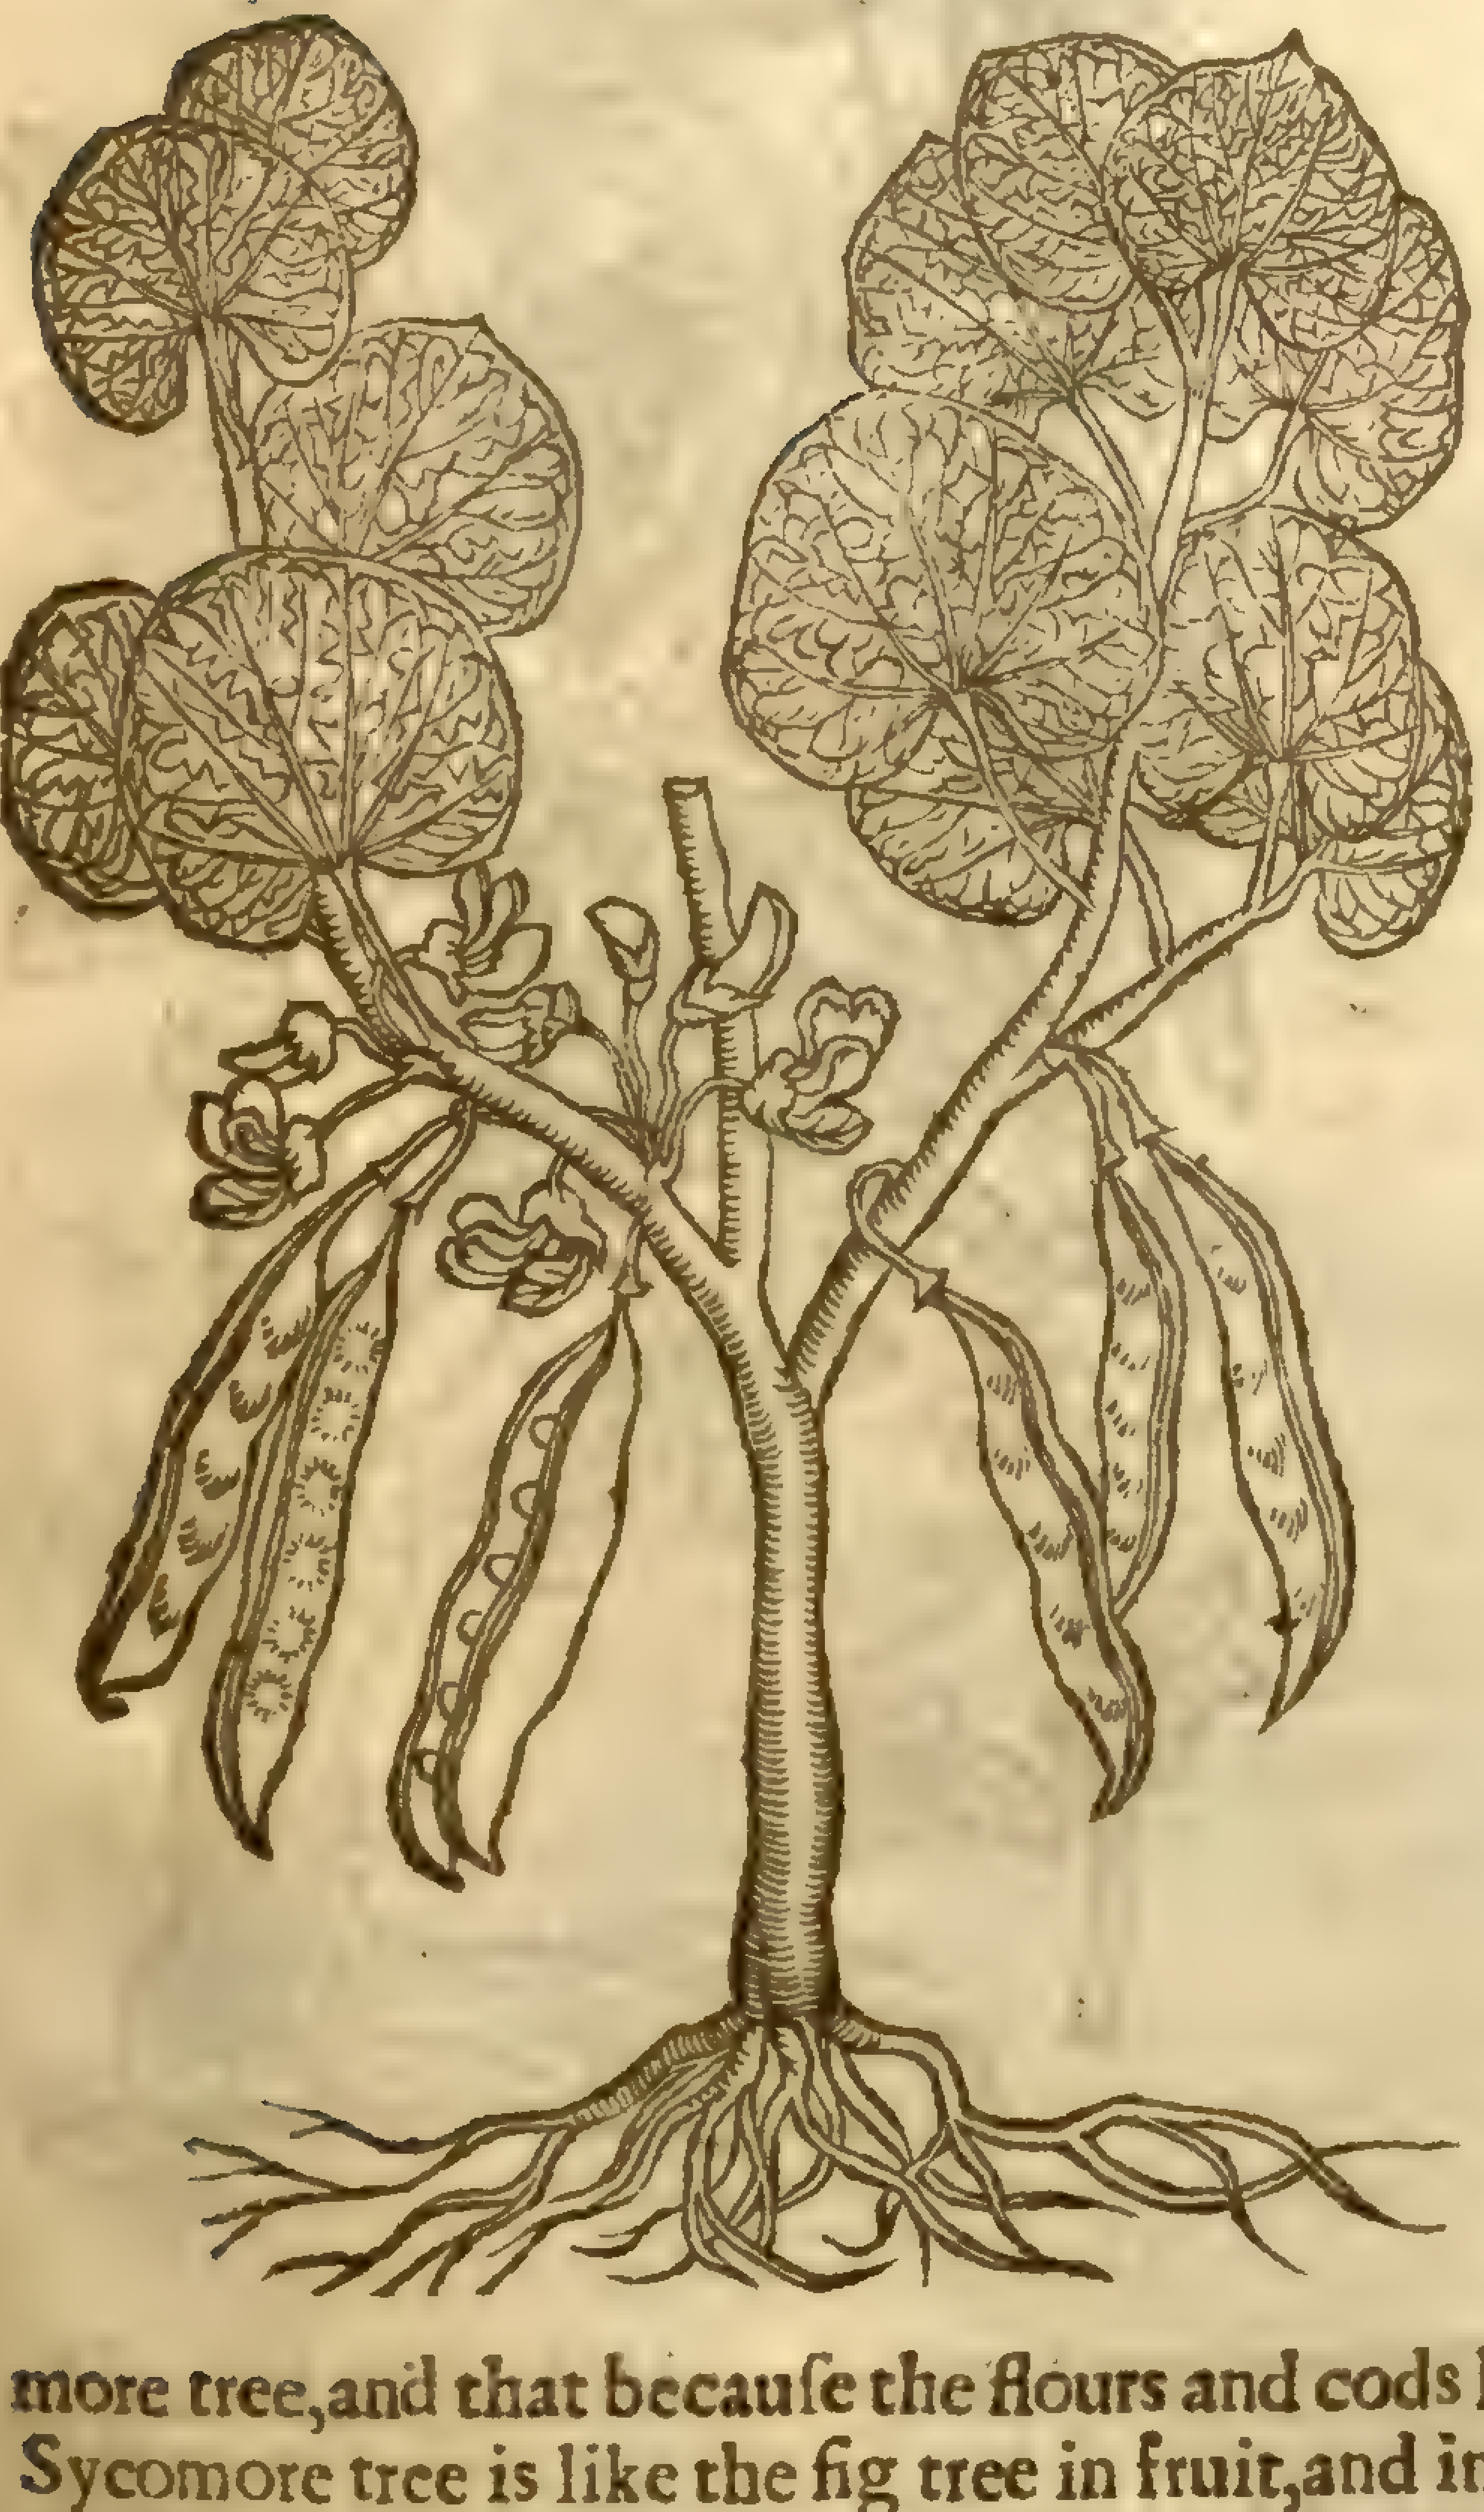
¶ *The Vertues.*

A The tender leaues, ſaith *Dioſcorides*, being ſtamped and laid vpon cold ſwellings, doe waſte away the ſame.

B They are drunke in Cute to the weight of a dram againſt the ſtuffing of the lungs, and do bring downe the menſes, the birth, and the after-birth.

C They cure the head-ache being drunke with wine; the juice of the root digeſteth and ripeneth; if the ſeed be taken it procureth vomit, which thing, ſaith *Matthiolus*, the ſeed not only of ſtinking Bean Trefoile doth effect, but that alſo of the other.

Chap. 81. *Of Iudas Tree.*



Arbor Iudæ.
Iudas Tree.

Cercis [illegible]

¶ *The Deſcription.*

Iudas Tree is likewiſe one of the hedge-plants; it groweth vp vnto a tree of a reaſonable bigneſſe, couered with a dark coloured barke, whereon grow many tough twiggy branches of a browne colour, garniſhed with round leaues like thoſe of round Birthwort or Sow-bread, but harder, and of a deeper green colour: amongſt which come forth ſmall floures like thoſe of peaſon, of a purple colour mixed with red, which turn into long flat cods preſſed hard together, of a tawny or wan colour, wherein is contained ſmall flat ſeeds like the Lentill, or rather like the ſeed of *Medica*, faſhioned like a little kidney. The root is great and wooddy.

¶ *The Place.*

This ſhrub is found in diuers prouinces of Spain, in hedges, & among briers and brambles; the mountaines of Italy and the fields of Languedoc are not without this ſhrub: it growes in my garden.

¶ *The Time.*

The floures come forth in the Spring, and before the leaues: the fruit or cods be ripe in ſummer.

¶ *The Names.*

It is commonly named in Latine, *Arbor Iudæ*: ſome haue named it *Sycomorus* or Sycomore tree, and that becauſe the flours and cods hang down from the bigger branches; but the right Sycomore tree is like the fig tree in fruit, and in leaues to the Mulberry tree, whereupon it is ſo named. Others take it to be Κερκις, of which *Theophraſtus* writeth thus; *Cercis* bringeth forth fruit in a cod: Which words are all ſo few, as that of this no certaintie can be gathered, for there be more ſhrubs that bring forth fruit in cods. The French men call it *Guainier*, as though they ſhould ſay, *Vaginula*, or a little ſheath: moſt of the Spaniards name it *Algorovo loco*, that is, *Siliqua ſylveſtris*, or *fatua*, wild or fooliſh Cod: others, *Arbal d' amor*, for the braueneſſe ſake: it may be called in Engliſh, *Iudas* tree, for that it is thought to be that whereon *Iudas* hanged himſelfe, and not vpon the Elder tree, as it is vulgarly ſaid.

¶ *The Temperature and Vertues.*

The temperature and vertues of this ſhrub are vnknowne; for whereas *Matthiolus* makes this to be *Acacia*, by adding falſly thornes vnto it, it is but a ſurmiſe.

Chap. 82. *Of the Carob tree or S. Iohns Bread.*

¶ *The Deſcription.*

THe Carob tree is alſo one of thoſe that beare cods, it is a tree of a middle bigneſſe, very ful of boughs, the leaues long, and conſiſt of many ſet together vpon one middle rib, like thoſe of the Aſh, but euery particular one of them is broader, harder, and rounder: the fruit or long cods in ſome places are a foot in length, in other places ſhorter by halfe, an inch broad, ſmooth and thicke, in which lie flat and broad ſeeds: the cods themſelues are of a ſweet taſte, and are eaten of diuers, but not before they be gathered and dried; for being green, though ripe, they are vnpleaſant to be eaten, by reaſon of their bad taſte.

Ceratia ſiliqua, ſive Ceratonia.
The Carob tree.

¶ *The Place.*

This groweth in Apulia a Prouince of the kingdome of Naples, and alſo in diuers vntoiled places in Spain: it is likewiſe found in India & other countries Eaſtward, where the cods are ſo full of ſweet juice as that it is vſed to preſerue Ginger, as *Matthiolus* ſheweth. *Strabo, lib.* 15. ſaith, That *Ariſtobulus* reporteth how there is a tree in India of no great bigneſſe, hauing great cods tenne inches long, full of hony, *Quas qui ederent non facile ſervare*: which thing peraduenture is only to be vnderſtood of the green cods, and thoſe that are not yet dry. It is very well known in the coaſts of Nicea and Liguria in Italy, as alſo in all the tracts and coaſts of the Weſt Indies and Virginea. It groweth alſo in ſundry places of Paleſtine, where there is ſuch plenty of it, that it is left vnto ſwine and other wilde beaſts to feed vpon, as our Acorns and Beech maſt. Moreouer, both yong and old feed thereon for pleaſure, and ſome haue eaten thereof to ſupply and help the neceſſarie nouriſhment of their bodies. This of ſome is called Saint *Iohns* bread, and thought to be that which is tranſlated Locuſts, whereon S. *Iohn* did feed when he was in the wilderneſſe, beſides the wilde Honey whereof hee did alſo eat: but there is ſmall certainty of this: but it is moſt certain, that the people of that country doe feed on theſe cods, called in Greeke κεράτια; in Latine *Siliquæ*: but Saint *Iohns* food is called in Greek ἀκρίδες, which word is often vſed in the Reuelation written by Saint *Iohn*, and tranſlated Locuſts. Now we muſt alſo remember that this Greek word hath two ſeuerall interpretations or ſignifications; for taken in the good part it ſignifieth a kinde of creeping creature or fly, which hoppeth or skippeth vp and downe as doth the Graſhopper; of which kinde of creatures it was lawfull to eat, *Levit.* 22. and *Matth.* 3. 4. It ſignifieth alſo thoſe Locuſts which came forth of the Bottomleſſe pit, mentioned, *Apoc.* 9. *v.* 3, 4. &c. which were like vnto horſes prepared for battell. The Hebrew word which the Engliſh Tranſlators haue turned Graſhoppers, *Tremelius* dares not giue the name Locuſt vnto it, but calleth it by the Hebrew name *Arbis*, after the letters and Hebrew name; ſaying thus in the note vpon the 22 verſe of the eleuenth chapter of *Levit.* Theſe kindes of creeping things neither the Hebrews nor the Hiſtoriographers, nor our ſelues do know what they mean; wherefore we ſtill retain the Hebrew words for all the foure kindes thereof. But it is certaine that the Eaſt countrey Graſhoppers and Locuſts were ſometimes vſed in meat; as *Matth.* 3. 4. and *Marc.* 1. 6. *Plin. Lib.* 11. *Natur. Hiſt. ca.* 26. & 29.

Thus far *Tremelius* and *Iunius*. By that which hath been ſaid it appeareth what S. *Iohn* Baptiſt fed of,vnder the title Locuſts,and that it is nothing like vnto this fruit *Ceratia ſiliqua.* I rather take the husks or ſhels of the fruit of this tree to be the cods or husks whereof the Prodigall childe would haue fed,but none gaue them vnto him,though the ſwine had their fill thereof. Theſe cods being dry are very like Bean cods,as I haue often ſeen. I haue ſowne the ſeeds in my garden,where they haue proſpered exceeding well.

‡ There is no doubt but the κεράτια or *Siliquæ* mentioned in S.*Lukes* Goſpell,*Cap.*15.*v.*16. were the cods or fruit of this tree. I cannot beleeue that either the fruit of this or the Locuſts were the ἀκρίδες mentioned by S.*Mathew*,*cap.*3.*v.*4. But I am of the opinion of the Greeke Father *Iſodor Peluſiota*,who,*lib.*1.*Epiſt.*132.hath theſe words; Αἱ ἀκρίδες, ἃς Ἰωάννης ἤσθιεν, οὐ ζῶά ἐστιν,ὥς τινες οἴονται ἀμαθῶς,κανθάροις παραπλήσια,μὴ γένοιτο ἀλλ' ἀκρέμονες βοτανῶν : οὔτε δὲ πόα τις ἐστι πάλιν τὸ μέλι ἄγριον, ἀλλὰ μέλι ὄρειον ὑπὸ μελισσῶν ἀγρίων γινόμενον, &c. That is; The *Acrides* which *Iohn* fed vpon are not liuing creatures like to Beetles,as ſome vnlearnedly think;but they are the tender buds of herbs and plants or trees. Neither on the other ſide is the *Meli agrion* any herb ſo called,but mountain hony gathered by wilde Bees,&c. ‡

¶ *The Time.*

The Carob tree bringeth forth fruit in the beginning of the Spring, which is not ripe till Autumne.

¶ *The Names.*

The Carob tree is called κερωνία : in Latine likewiſe *Ceratonia :* in Spaniſh,*Garovo :* in Engliſh, Carob tree,and of ſome,Bean tree,and S.*Iohns* Bread. The fruit or cod is named κεράτια : in Latine, *Siliqua*,or *Siliqua dulcis :* in diuers ſhops,*Xylocaracta :* in other ſhops of Italy,*Carobe*,or *Carobole :* of the Apothecaries of Apulia,*Salequa :* it is called in Spaniſh, *Alfarobas*,or *Algarovas*; and without an article,*Garovas :* in high-Dutch,**S. Iohans brot**,that is to ſay,*Sancti Iohan. panis*,or Saint *Iohns* bread; neither is it knowne by any other name in the Low-Countries. Some call it in Engliſh, Carob.

¶ *The Temperature.*

The Carob tree is dry and aſtringent,as is alſo the fruit,and containeth in it a certain ſweetnes, as *Galen* ſaith.

¶ *The Vertues.*

A The fruit of the Carob tree being eat when it is green doth gently looſe the belly; but beeing dry it is hard of digeſtion and ſtoppeth the belly,it prouoketh vrine, is good for the ſtomacke, and nouriſheth well,and much better than when it is green and freſh.

CHAP. 83. *Of* Caſſia fiſtula *or* *Pudding Pipe.*

¶ *The Deſcription.*

Caſſia purgatrix or *Caſſia fiſtula* groweth vp to be a faire tree,with a tough barke like leather, of the colour of Box,whereupon ſome haue ſuppoſed it to take the Greeke name κάσυς : in Latine, *Coriaceus :* the arms and branches of this are ſmall and limber, beſet with many goodly leaues like thoſe of the Walnut tree : among which come forth ſmall flours of a yellow colour,compact or conſiſting of ſix little leaues like the floures of *Chelidonium minus* or Pilewort. After theſe be vaded,there ſucceed goodly blacke round long cods,whereof ſome are two foot long,and of a woody ſubſtance: in theſe cods are contained a blacke pulp very ſweet and ſoft,of a pleaſant taſte,and ſeruing to many vſes in phyſicke; in which pulp lieth the ſeeds couched in little cels or partitions: the ſeed is flat and browniſh,not vnlike the ſeed of *Ceratia ſiliqua*, and in other reſpects very like vnto it alſo.

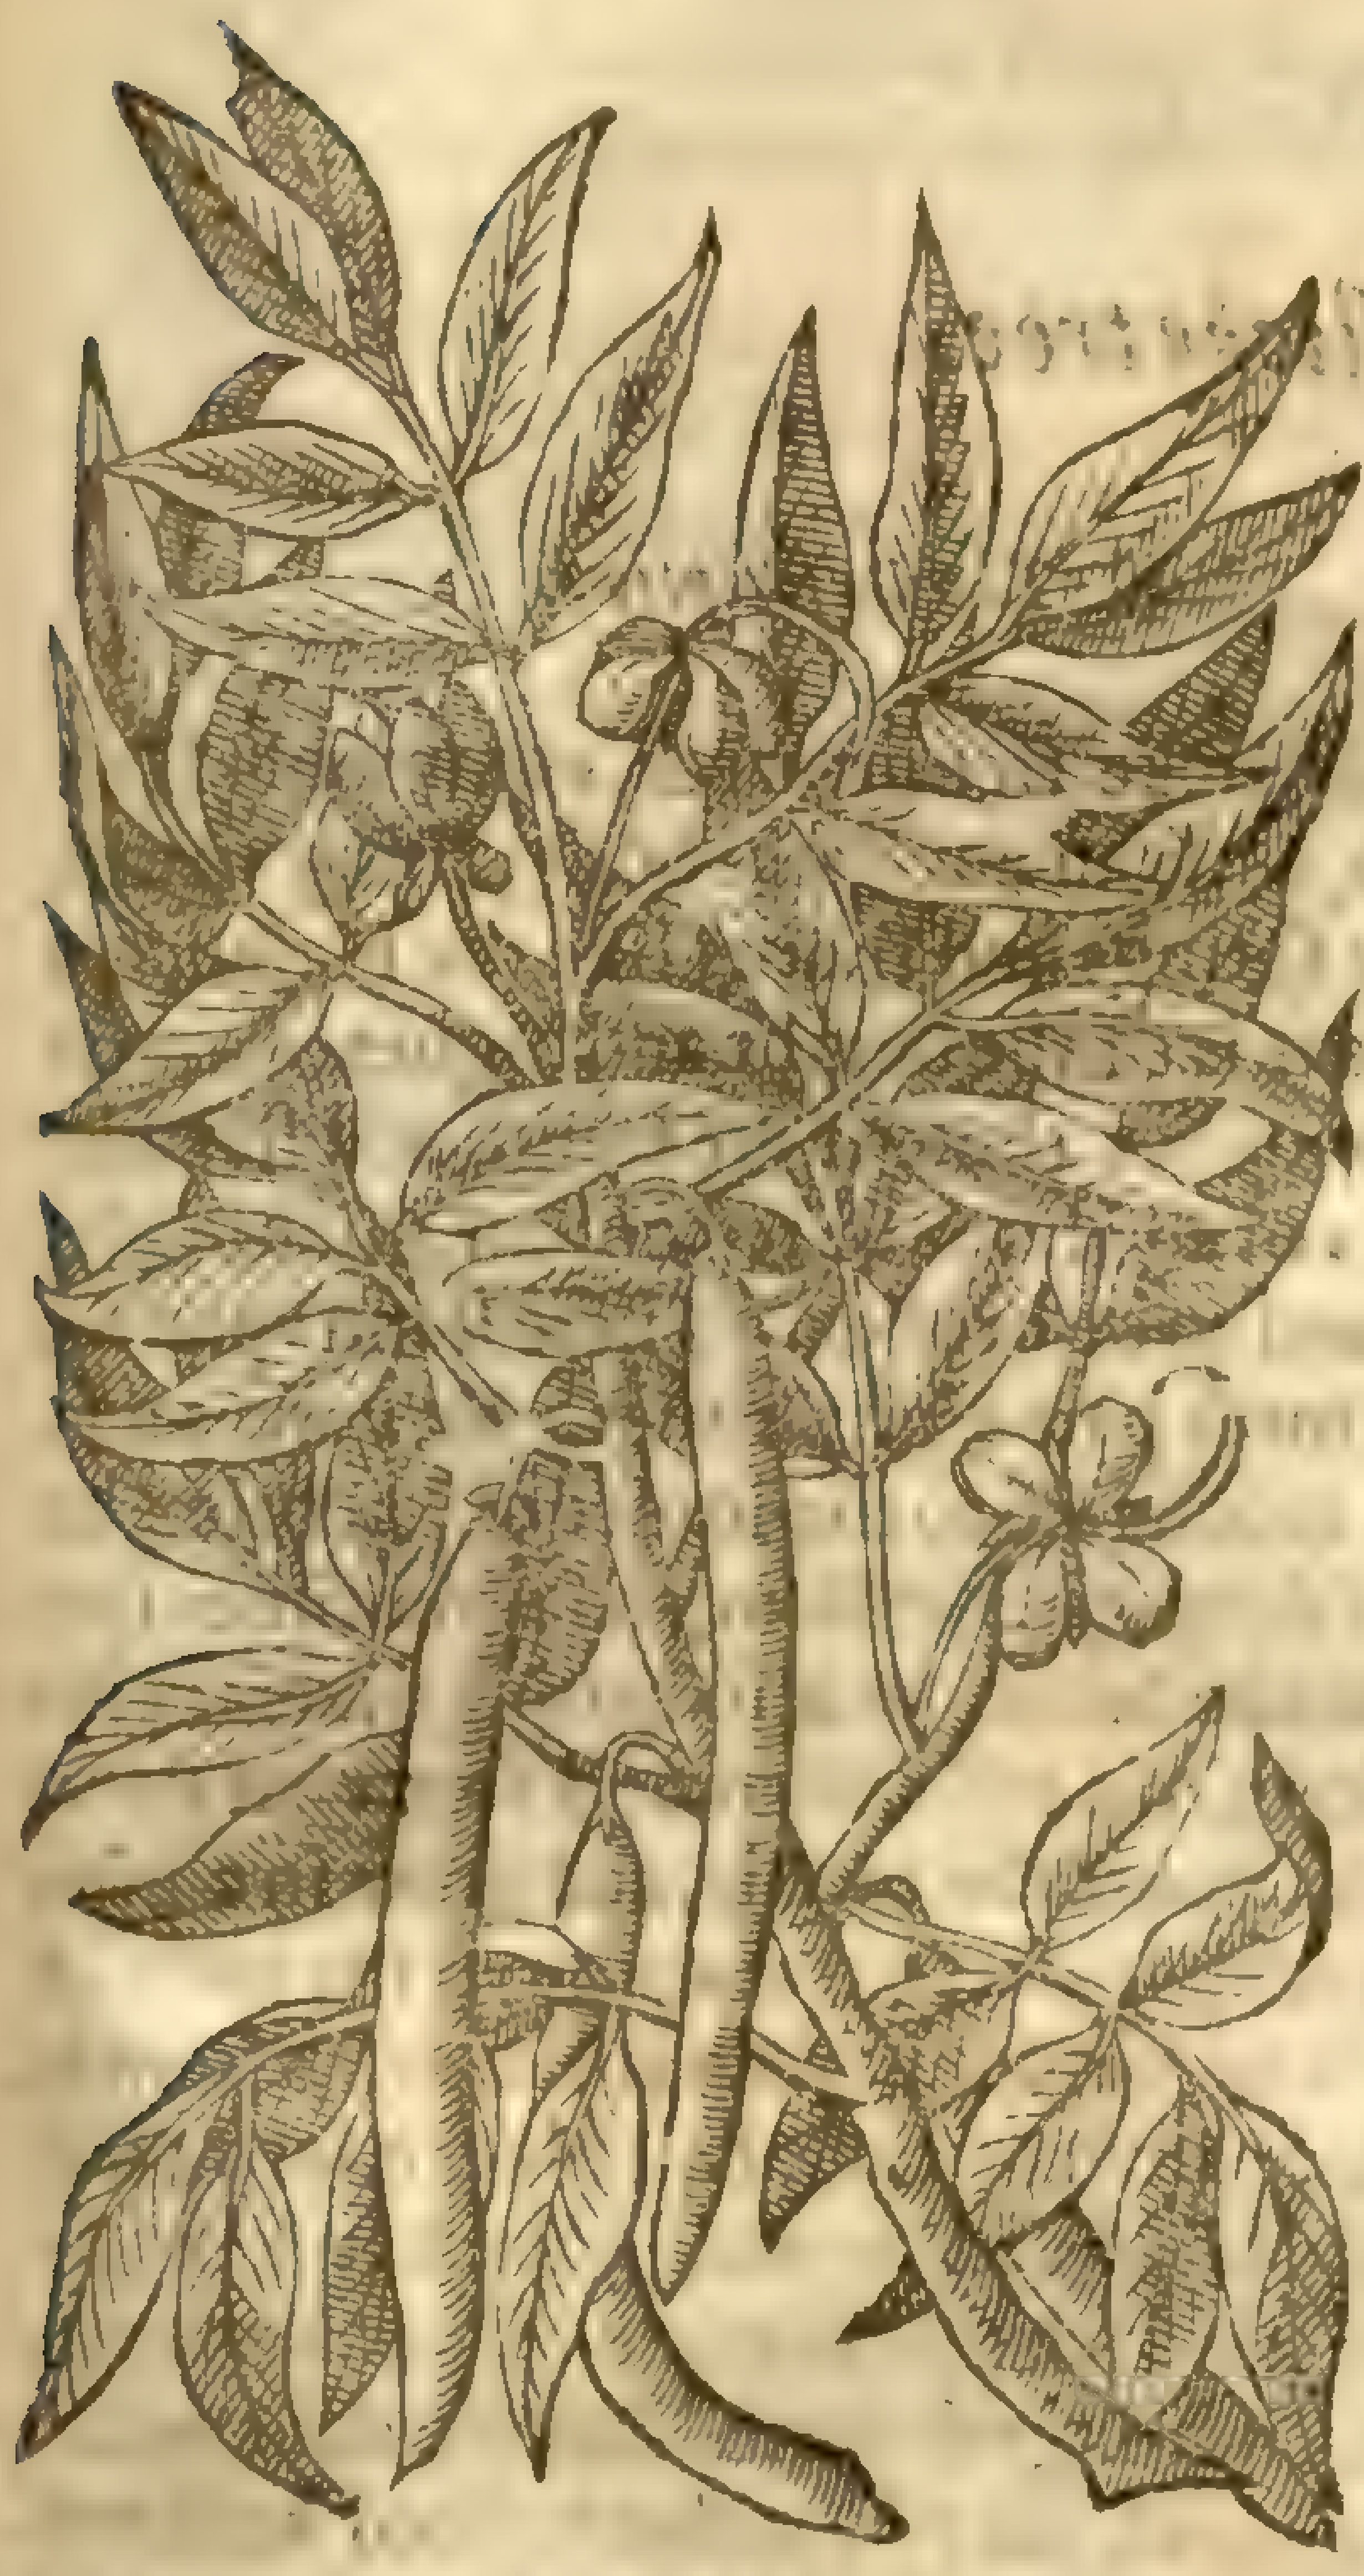
¶ *The Place.*

This tree groweth much in Egypt, eſpecially about Memphis and Alexandria, and moſt parts of Barbary,and is a ſtranger in theſe parts of Europe.

¶ *The Time.*

The Caſſia tree groweth greene winter and ſummer,it ſheds his old leaues when new are come, by means whereof it is neuer void of leaues : it floureth early in the ſpring, and the fruit is ripe in Autumne.

Caſsia fiſtula.
Pudding Pipe tree.



¶ *The Names.*

This tree was vnknown to the old writers, or ſo little accounted of, as that they haue made no mention of it at all: the Arabians were the firſt that eſteemed of it, by reaſon they knew the vſe of the pulp which is found in the pipes; and after them the later Grecians, as *Actuarius* and others of his time, by whom it was named κασία μέλαινα, that is to ſay in Latine, *Caſia nigra*: the fruit thereof, ſaith *Actuarius, lib.* 5. is like a long pipe, hauing within it a thicke humour or moiſture, which is not congealed all alike through the Pipe, but is ſeparated and diuided with many partitions, being thin woody ſtrings. The apothecaries call it *Caſia fiſtula*, and with a double *ſſ*, *Caſsia fiſtula*. It is called in Engliſh after the Apothecaries word, Caſſia fiſtula, and may alſo be Engliſhed Pudding Pipe, becauſe the cod or pipe is like a pudding. But the old Caſſia fiſtula or σύριγξ in Greeke, is that ſweet and odoriferous barke that is rolled together after the manner of a long and round pipe, now named of the Apothecaries *Caſsia lignea*, which is a kinde of Cinamon.

¶ *The Temperature.*

The pulp of this Pipe, which is chiefely in requeſt, is moiſt in the later end of the firſt degree, and little more than temperatly hot.

¶ *The Vertues.*

The pulp of Caſſia fiſtula extracted with violet water is a moſt ſweet and pleaſant medicine, and may be giuen without danger to all weak people, of what age and ſex ſoeuer they be, yea it may be miniſtred to women with childe, for it gently purgeth cholerick humors and ſlimy flegme, if it be taken in the weight of an ounce. A

Caſſia is good for ſuch as be vexed with hot agues, pleuriſies, iaundice, or any other inflammation of the liuer, being taken as afore is ſhewed. B

Caſſia is good for the reins and kidnies, driueth forth grauell and the ſtone, eſpecially if it bee mingled with the decoction of Parſly and Fennell roots, and drunke. C

It purgeth and purifieth the bloud, making it more clean than before, breaking therewith the acrimonie and ſharpneſſe of the mixture of bloud and choler together. D

It diſſolueth all phlegmons and inflamations of the breſt, lungs, and the rough artery called *Trachea arteria*, eaſing thoſe parts exceeding well. E

Caſſia abateth the vehemencie of thirſt in agues, or any hot diſeaſe whatſoeuer, eſpecially if it be taken with the iuyce of *Intybum, Cichoreum*, or *Solanum*, deputed according to Art. It abateth alſo the intemperat heat of the reins, if it be receiued with diuretick medicines, or with the decoction of Licorice only, and will not ſuffer the ſtone to grow in ſuch perſons as do receiue and vſe this medicine. F

The beſt Caſſia for your vſe is to be taken out of the moſt full, heauy, and faireſt cods or canes, and thoſe which ſhine without, and are full of ſoft pulpe within: that pulpe which is newly taken forth is better than that which is kept in boxes, by what art ſoeuer. G

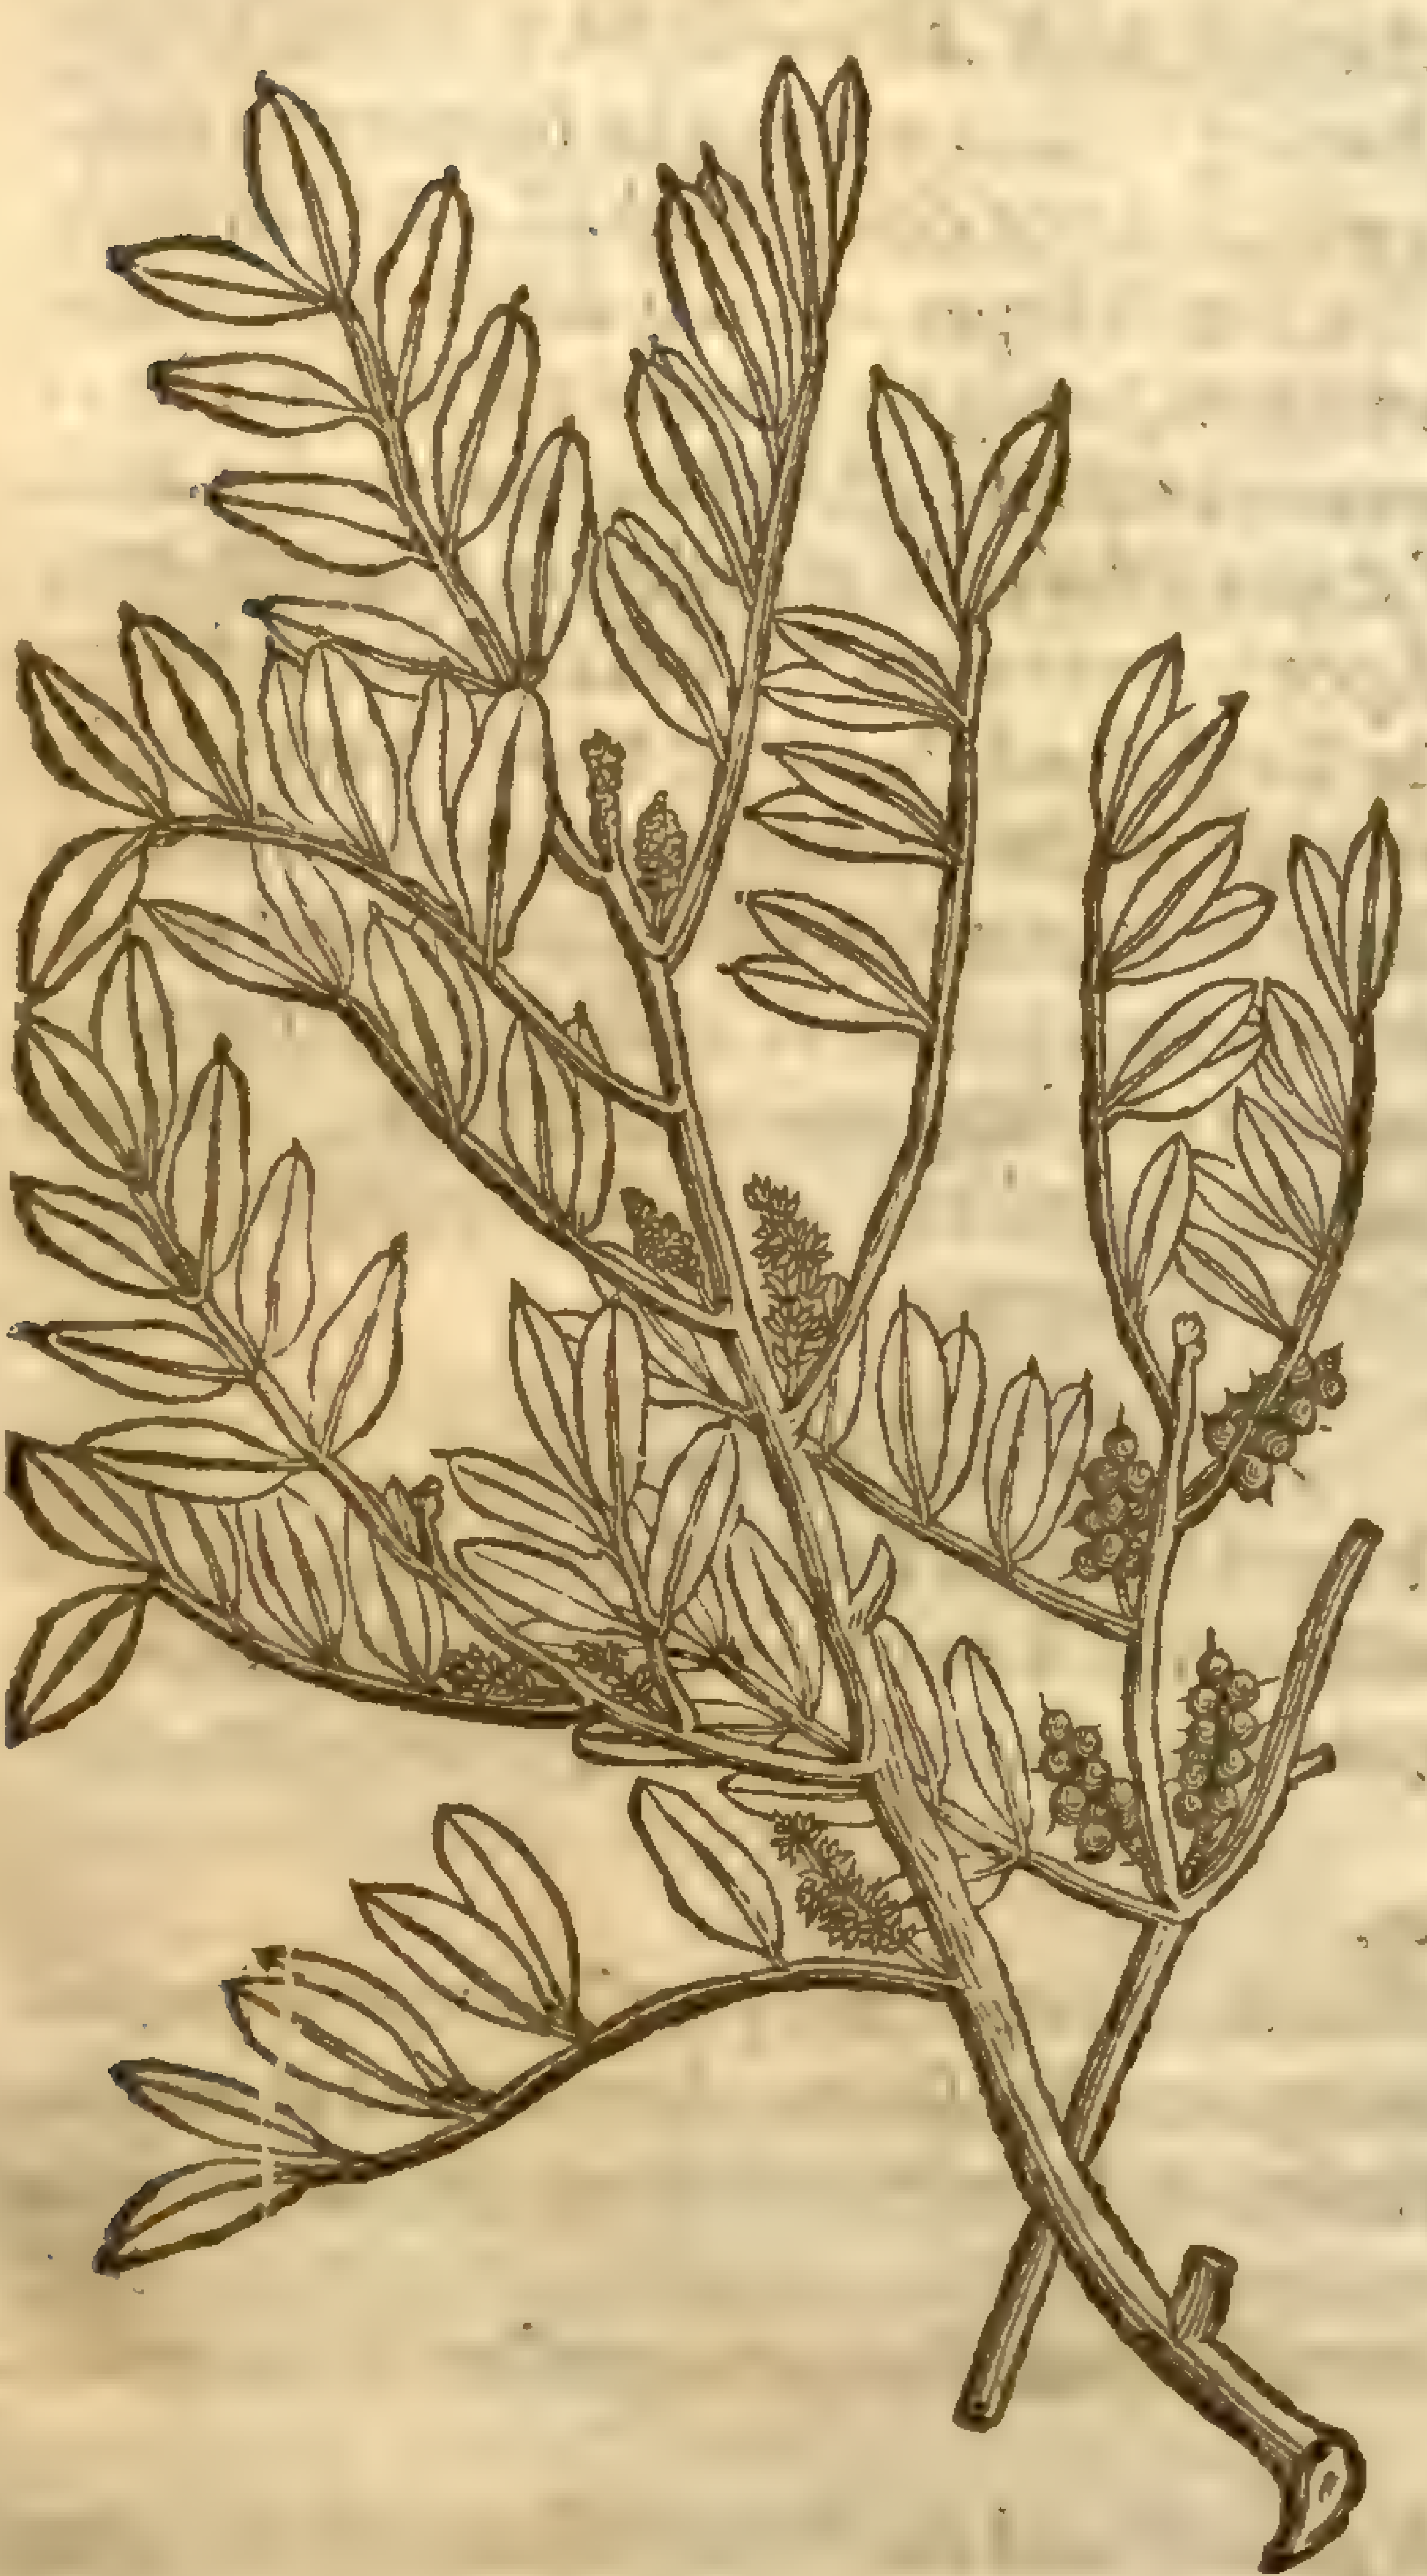
Caſſia being outwardly applied taketh away the roughneſſe of the skin, and being laid vpon hot ſwellings it bringeth them to ſuppuration. H

Many ſingular compound medicines are made with this Caſſia, which here to recite belongs not to my purpoſe or hiſtorie. I

Chap. 84.

Of the Lentiske or Maſticke tree.

Lentiſcus.
The Maſticke tree.



Piſtacia Lentiſcus, L. 2
[illegible]

¶ *The Deſcription.*

THe Maſticke tree groweth commonly like a ſhrub, without any great body, riſing vp with many ſprings and ſhoots like the Haſell, and oftentimes it is of the height and bignes of a mean tree: the boughes thereof are tough and flexible: the barke is of a yellowiſh red colour, pliable likewiſe and hard to be broken. There ſtand vpon one rib for the moſt part eight leaues, ſet vpon a middle ribbe, much like to the leaues of Licorice, but harder, of a deep green colour, and oftentimes ſomwhat red in the brims, as alſo hauing diuers veines running along, of a red colour, and ſomwhat ſtrong of ſmel: the floures be moſſie, and grow in cluſters vpon long ſtems: after them come vp the beries, of the bigneſſe of Vetches, green at the firſt, afterward of a purple colour, and laſt of all blacke, fat, & oily, with an hard blacke ſtone within, the kernel whereof is white, of which alſo is made oile, as *Dioſcorides* witneſſeth: it bringeth forth likewiſe cods beſides the fruit (which may be rather termed an excreſcence than a cod) wrythed like an horne; in which lieth at the firſt a liquor, and afterwards when this waxeth ſtale, little liuing things like vnto gnats, as in the Turpentine hornes, and in the folded leaues of the Elme tree. There comes forth of the maſtick tree a roſin, but dry, called Maſticke.

¶ *The Place.*

The Maſtick tree groweth in many regions, as in Syria, Candy, Italy, Languedock, and in moſt Prouinces of Spaine; but the chiefeſt is in Chios an Iſle in Greece, in which it is diligently and ſpecially looked vnto, and that for the Maſtick ſake, which is there gathered euery yeare moſt carefully from the husbanded Maſtick trees, and ſent into all parts of the world.

¶ *The Time.*

The floures be in their pride in the ſpring time, and the berries in Autumne. The Maſtick muſt be gathered about the time that Grapes be.

¶ *The Names.*

This tree is called in Greeke σχῖνος: in Latine, *Lentiſcus*: in Italian, *Lentiſque*: in Spaniſh, *Mata*, and *Arcoyra*: in Engliſh, Maſtick tree, and of ſome, Lentiske tree.

The Roſin is called in Greeke, ῥητίνη σχινίνη and μαστίχη: in Latine, *Lentiſcina Reſina*, and likewiſe *Maſtiche*: in ſhops, *Maſtix*: in Italian, *Maſtice*: in high and low Dutch and French alſo, *Maſtic*: in Spaniſh, *Almaſtiga*, *Maſtech*, and *Almecega*: in Engliſh, Maſtick.

Cluſius writeth, That the Spaniards call the oile that is preſſed out of the beries, *Azeyte de Mata.*

¶ *The Temperature.*

The leaues, barke, and gum of the Maſtick tree are of a meane and temperat heate, dry in the ſecond degree, and ſomwhat ſtringent.

¶ *The Vertues.*

A The leaues and barke of the Maſticke tree ſtop the laske, the bloudy flix, ſpitting of bloud, the piſſing of bloud, and all other fluxes of bloud: they are alſo good againſt the falling ſickeneſſe, the falling downe of the mother, and comming forth of the fundament.

The gum Maſticke hath the ſame vertue, if it be relented in wine and giuen to be drunke. B

Maſticke chewed in the mouth is good for the ſtomacke, ſtaieth vomiting, increaſeth appetite, comforteth the braines, ſtaieth the falling downe of the rheumes and watery humors, and maketh a ſweet breath. C

The ſame infuſed in Roſe water is excellent to waſh the mouth withall, to faſten looſe teeth, and to comfort the jawes. D

The ſame ſpred vpon a piece of leather or veluet, and laid plaiſterwiſe vpon the temples, ſtaieth the rheume from falling into the jawes and teeth, and eaſeth the paines thereof. E

It preuaileth much againſt vlcers and wounds, being put into digeſtiues and healing vnguents. F

It draweth flegme forth of the head gently and without trouble. G

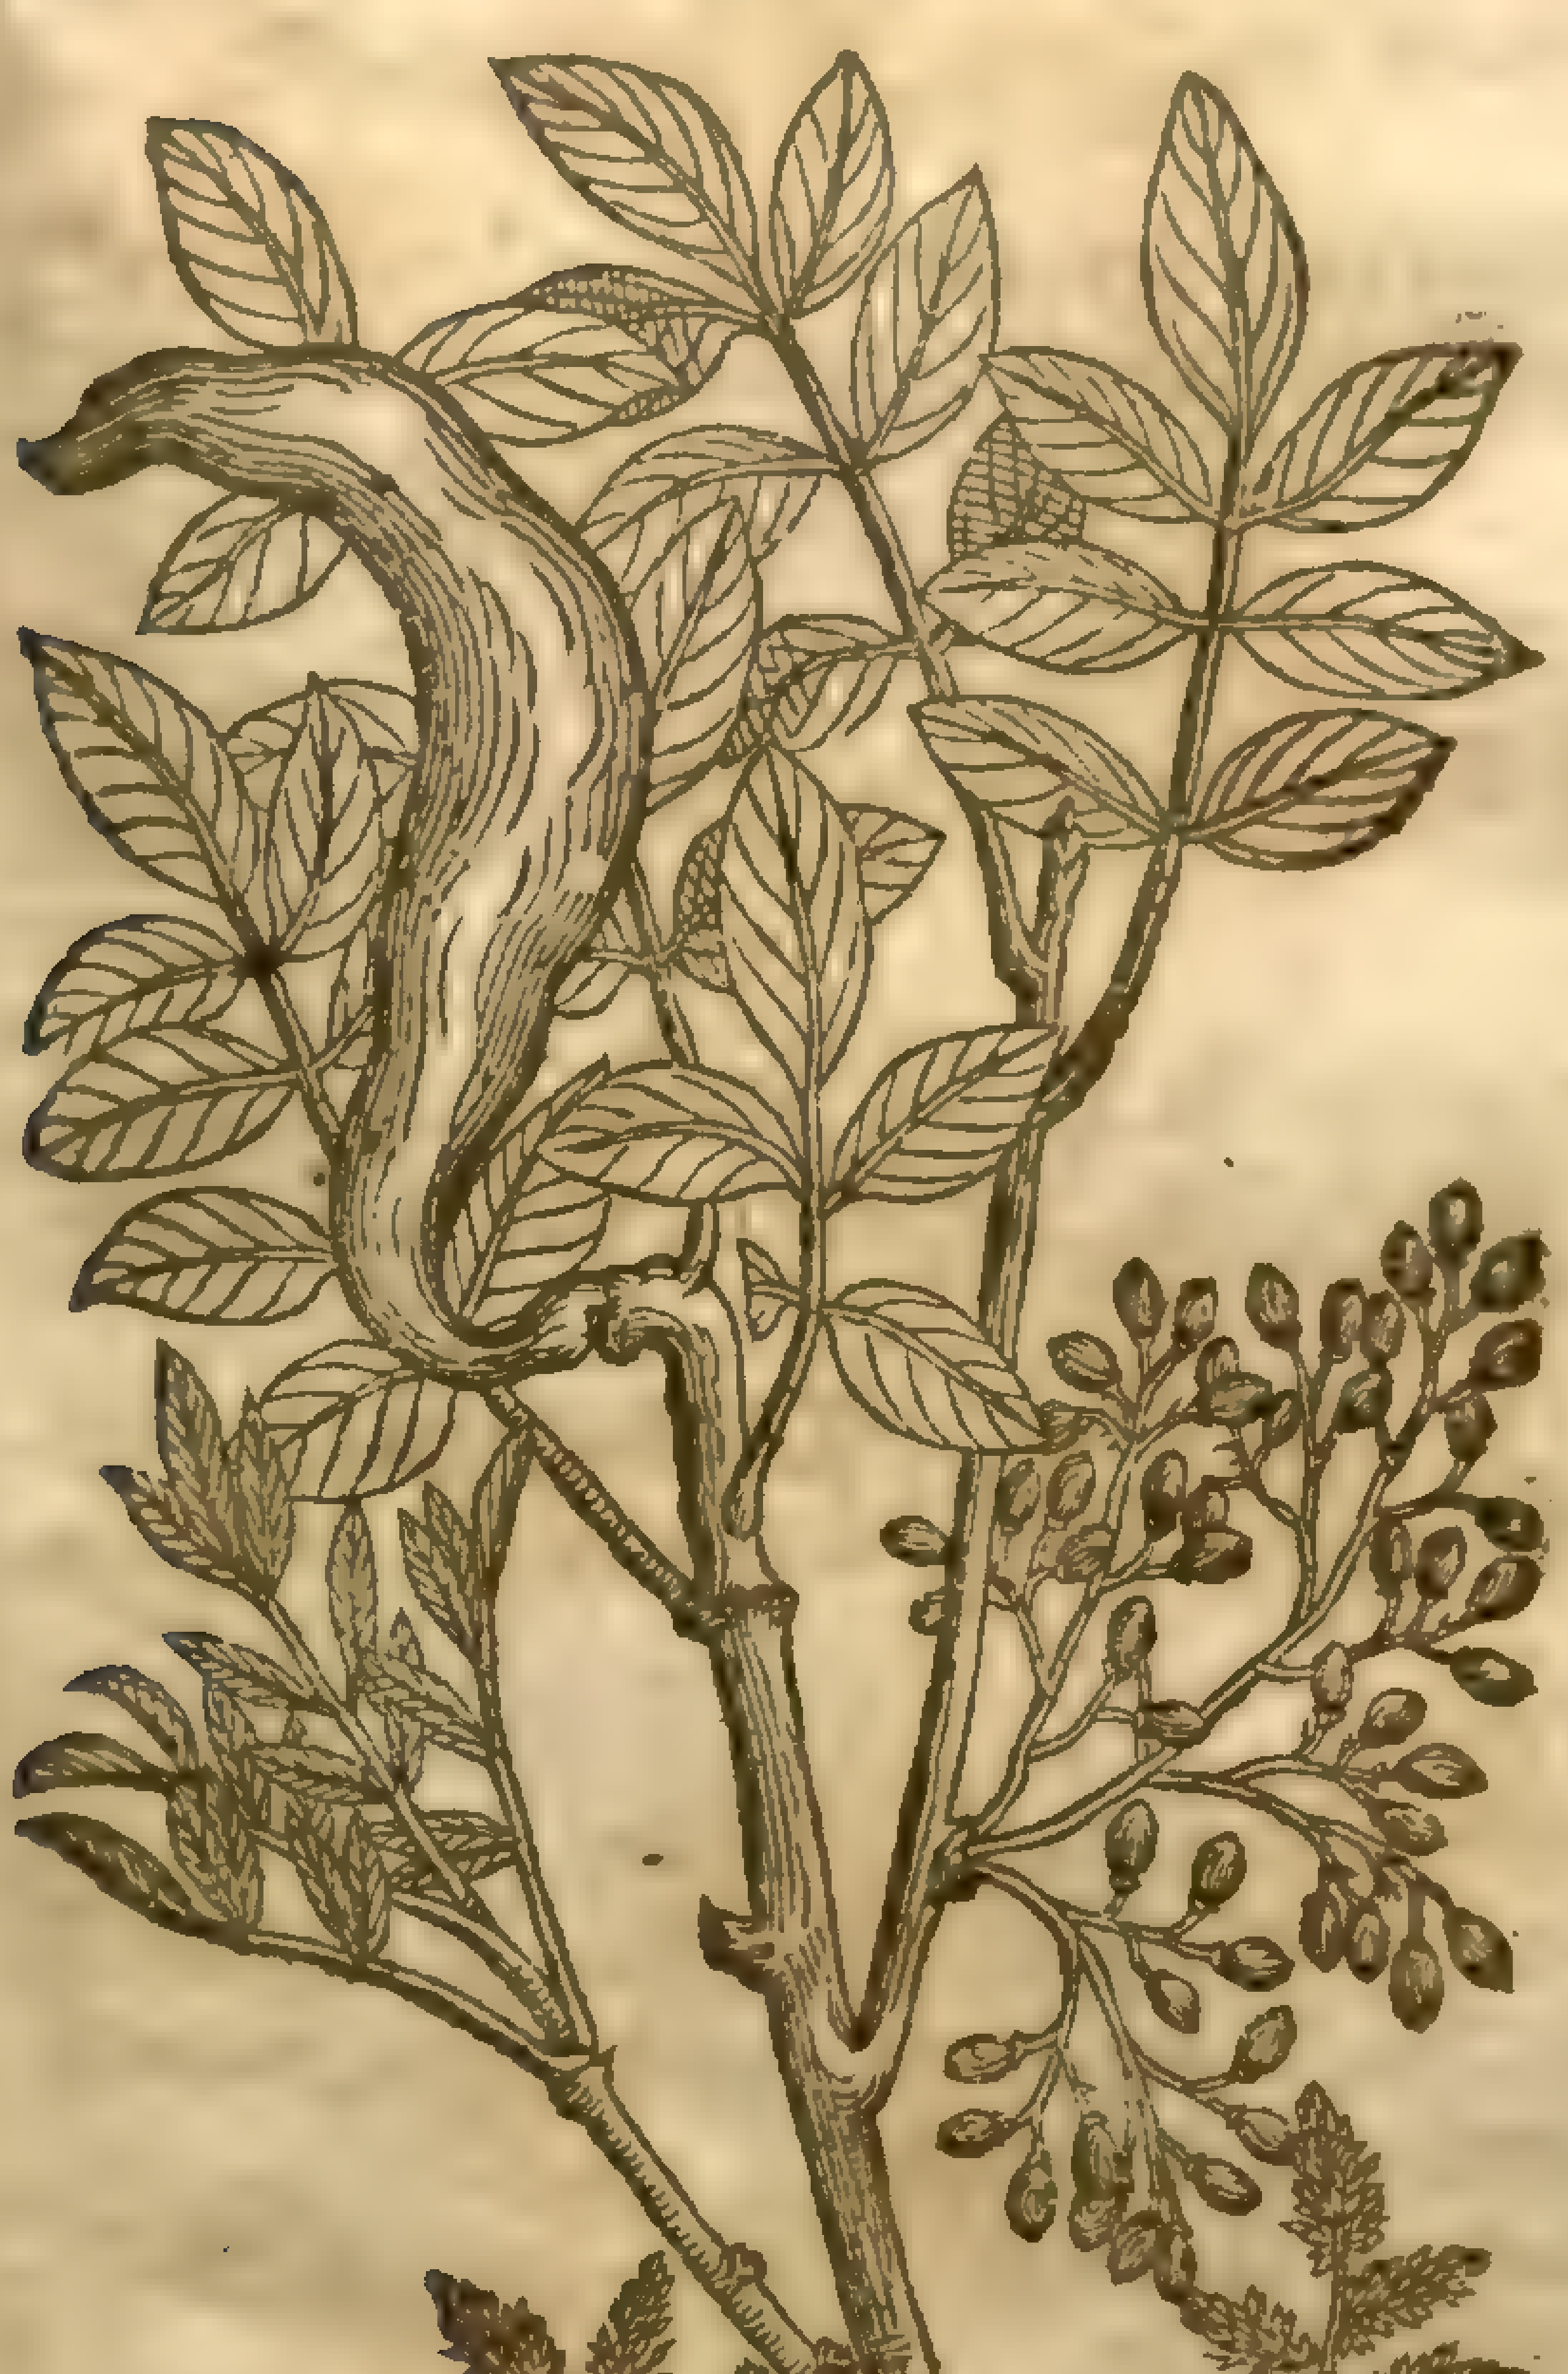
It is alſo vſed in waters which ſerue to clenſe and make faire the face with. H

The decoction of this filleth vp hollow vlcers with fleſh if they be bathed therewith. I

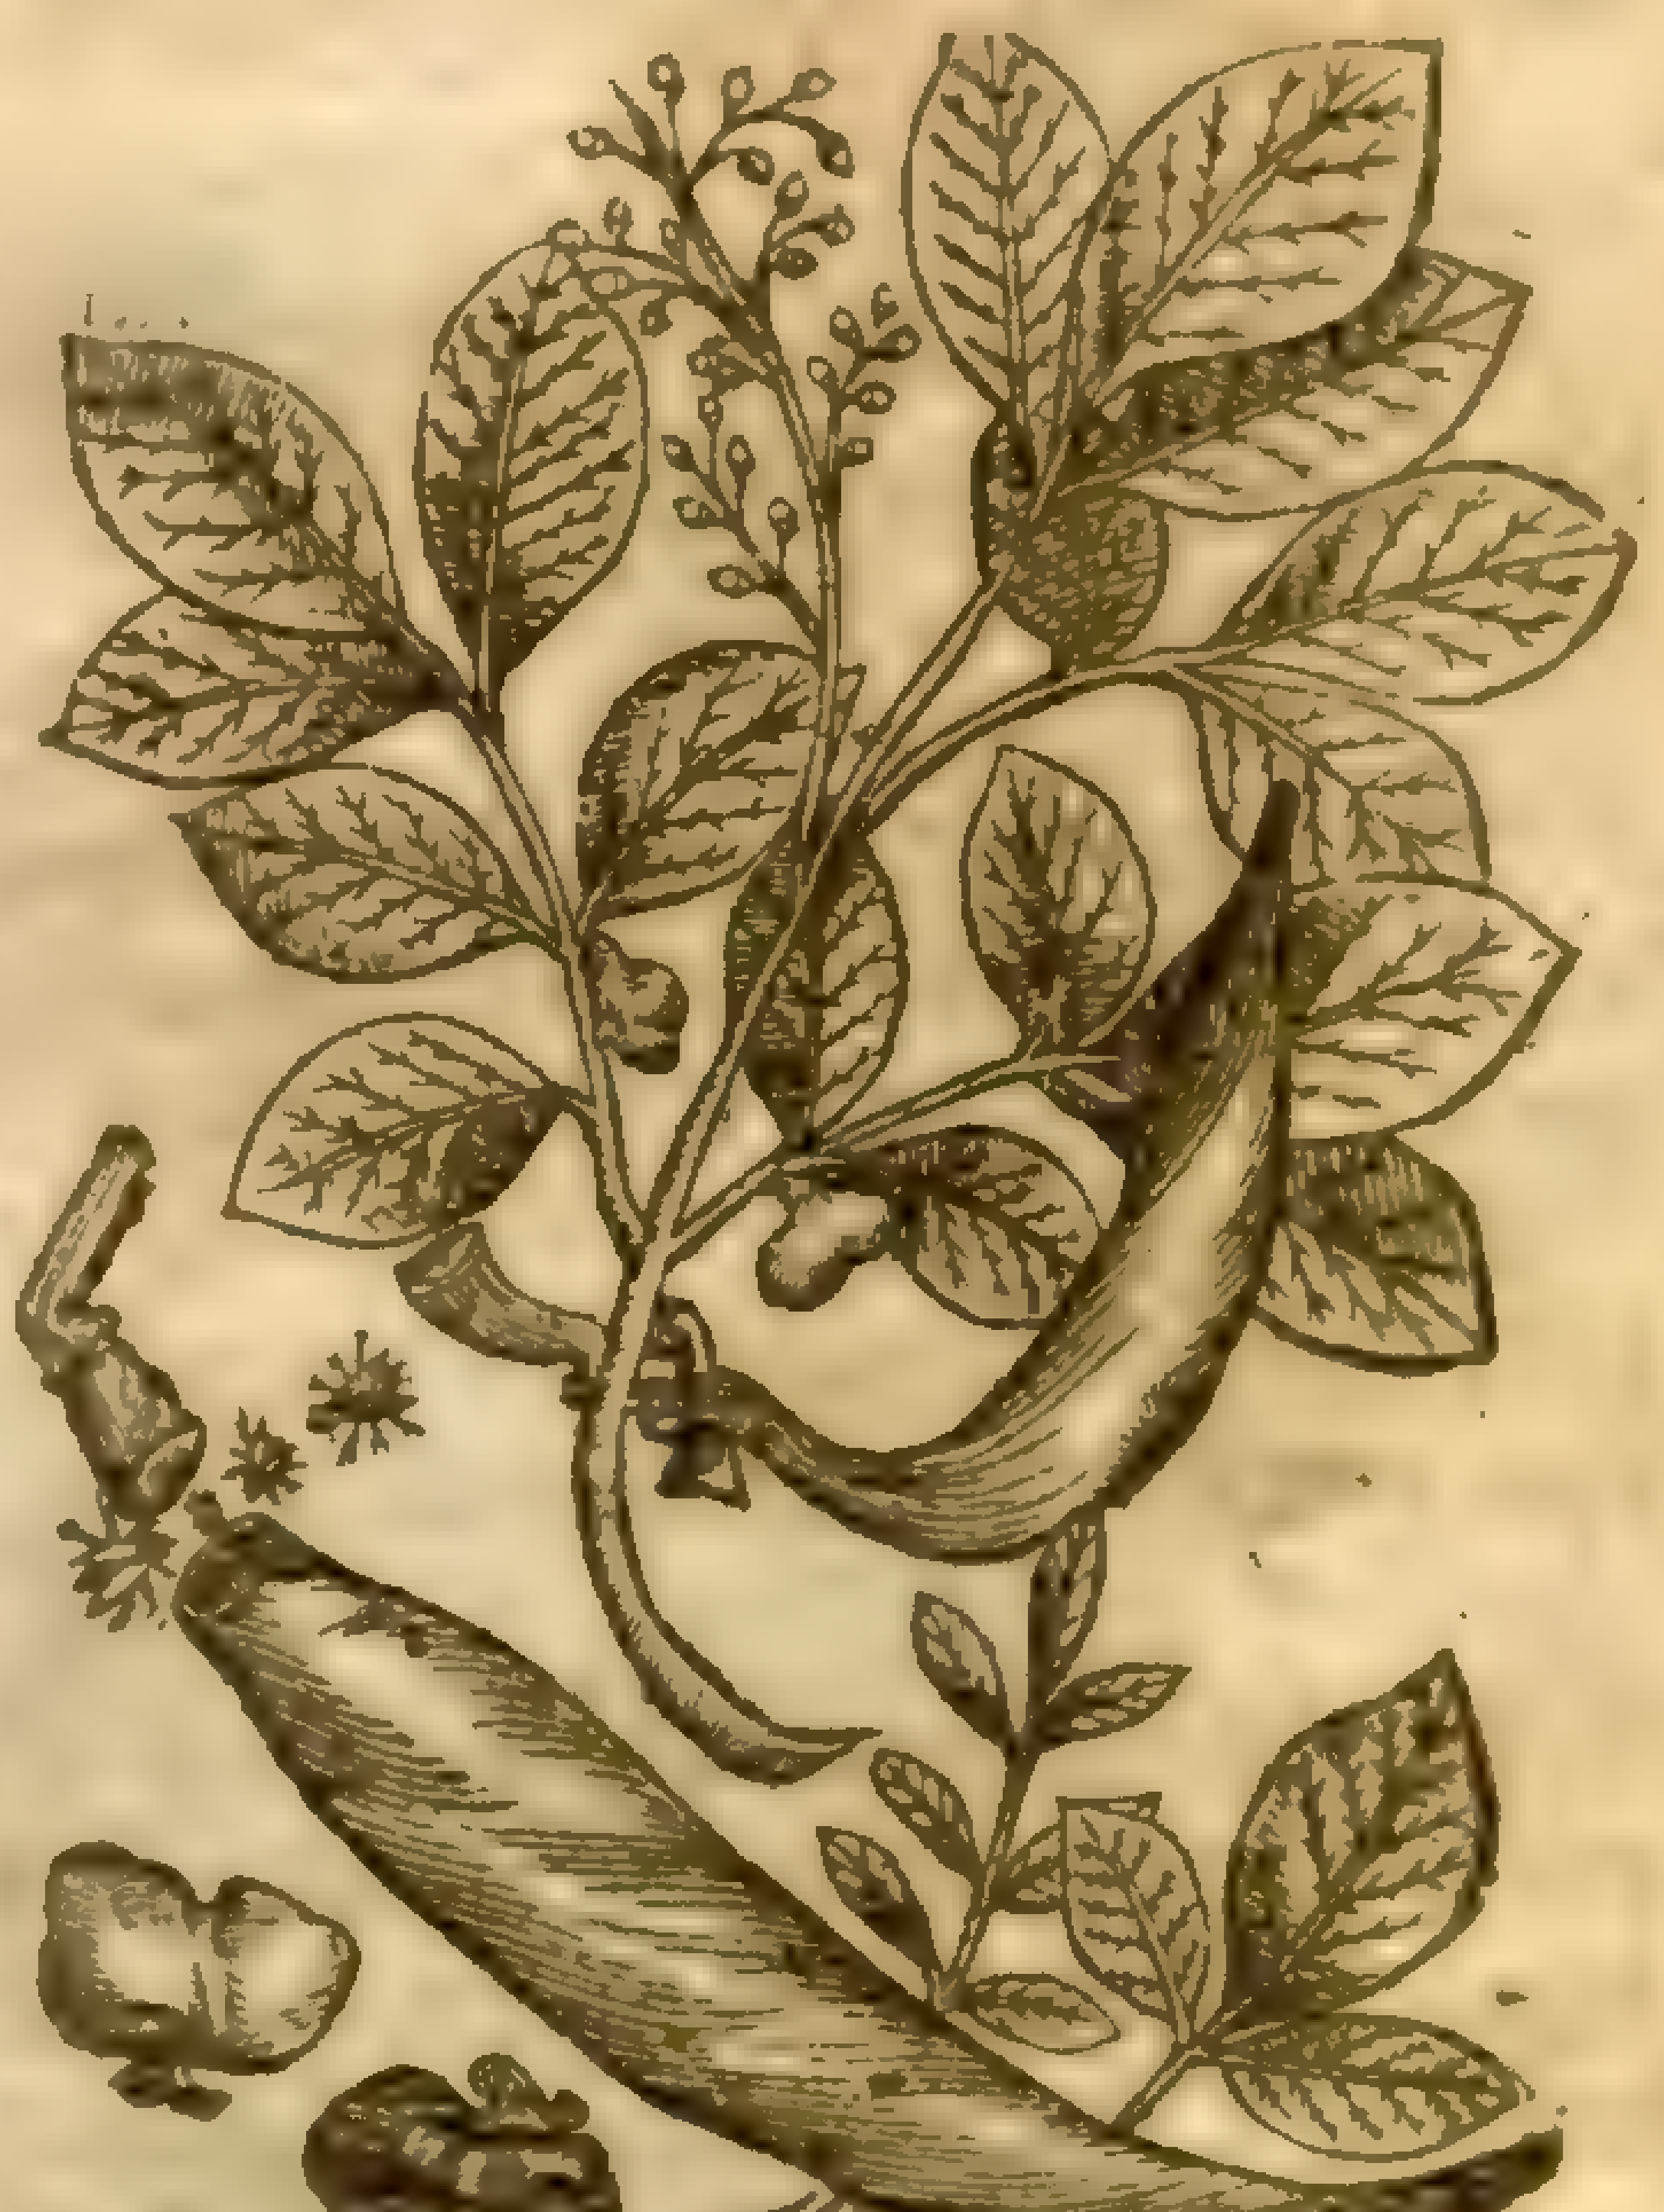
It knitteth broken bones, ſtaieth eating vlcers, and prouoketh vrine. K

CHAP. 85. *Of the Turpentine Tree.*

1 *Terebinthus.*
The Turpentine tree.



2 *Terebinthus latifolia.*
The broad leafed Turpentine tree.



The Deſcription.

1 THe firſt Turpentine Tree groweth to the height of a tall and faire tree, hauing many long boughes or branches, diſperſed abroad, beſet with long leaues, conſiſting of ſundry other ſmall leaues, each whereof reſembleth the Bay leafe, growing one againſt another vpon a little ſtem or middle rib, like vnto the leaues of the Aſh tree: the floures be ſmall and reddiſh, growing vpon cluſters or bunches that turne into round berries, which at their beginning are greene, afterwards reddiſh; but beeing ripe wax blacke, or of a darke blew colour, clammie, full of fat

and oilous in ſubſtance, and of a pleaſant ſauour: this plant beareth an empty cod, or crooked horne ſomewhat reddiſh, wherein are found ſmall flies, wormes or gnats, bred and ingendred of a certaine humorous matter, which cleaueth to the inner ſides of the ſaid cods or hornes, which wormes haue no phyſicall vſe at all. The right Turpentine iſſueth out of the branches of theſe trees, if you doe cut or wound them, the which is faire and cleere, and better than that which is gathered from the barke of the Firre tree.

2 The ſecond kinde of Turpentine tree is very like vnto the former, but that it groweth not ſo great: yet the leaues are greater and broader, and of the ſame faſhion, but very like to the leaues of the Piſtacia tree. The berries are firſt of a ſcarlet colour, and when they be ripe of a skie colour. The great horned cods are ſharpe pointed, and ſomewhat cornered, conſiſting as it were of the ſubſtance of griſtles. And out of thoſe bladders being broken, do creepe and come ſmall flies or gnats, bred of a fuliginous excrement, and ingendred in thoſe bladders. The tree doth alſo yeeld his Turpentine by dropping like the former.

¶ *The Place.*

Theſe trees grow, as *Dioſcorides* ſaith, in Iurie, Syria, Cyprus, Africke, and in the Iſlands called *Cyclades*. *Bellonius* reporteth that there are found great ſtore of them in Syria, and Cilicia, and are brought from thence to Damaſcus to be ſould. *Cluſius* ſaith, That it growes of it ſelfe in Languedocke, and in very many places of Portingale and Spaine, but for the moſt part like a ſhrub, and without bearing Turpentine.

Theophraſtus writeth, That it groweth about the hill Ida, and in Macedonia, ſhort, in manner of a ſhrub, and writhed; and in Damaſcus and Syria great, in manner of a ſmall tree: he alſo ſetteth downe a certaine male Turpentine tree, and a female: the male, ſaith he, is barren, and the female fruitfull. And of theſe he maketh the one with a berry red at the firſt, of the bigneſſe of a Lentill, which cannot come to ripeneſſe; and the other with the fruit greene at the firſt, afterwards ſomewhat of a yellowiſh red, and in the end blacke, waxing ripe in the Spring, of the bigneſſe of the Græcians Beane, and roſenny.

He alſo writeth of a certaine Indian Turpentine tree, that is to ſay, a tree like in boughes and leaues to the right Turpentine tree, but differing in fruit, which is like vnto Almonds.

¶ *The Time.*

The floures of the Turnentine tree come fotth in the Spring together with the new buds: the berries are ripe in September and October, in the time of Grape gathering. The hornes appeare about the ſame time.

¶ *The Names.*

This tree is called in Greeke τέρμινθος, and alſo many times τερέβινθος: in Latine, *Terebinthus*: in Italian, *Terebintho*: in Spaniſh, *Cornicabra*: in French, *Terebinte*: in Engliſh, Turpentine tree: the Arabians call it *Botin*, and with an article *Albotin*.

The Roſin is ſurnamed τερμινθίνη: in Latine, *Terebinthina*: in high Dutch, **Termentijn**: in Engliſh, Turpentine, and right Turpentine: in the Arabian language *Albotin*, who name the fruit *Granum viride*, or greene berries.

¶ *The Temperature and Vertues.*

A The barke, leaues, and fruit of the Turpentine tree doe ſomewhat binde, they are hot in the ſecond degree, and being greene they dry moderately; but when they are dried they dry in the ſecond degree; and the fruit approacheth more neere to thoſe that be dry in the third degree, and alſo hotter. This is fit to be eaten, as *Dioſcorides* ſaith, but it hurteth the ſtomacke.

B It prouoketh vrine, helpeth thoſe that haue bad ſpleenes, and is drunke in wine againſt the bitings of the poiſonſome ſpiders called *Phalangia*.

C The Roſin of the Turpentine tree excelleth all other Roſins, according to *Dioſcorides* his opinion: but *Galen* writeth, That the Roſin of the Maſticke tree beareth the preheminence, and then the Turpentine.

D This Roſin hath alſo an aſtringent or binding faculty, and yet not ſo much as Maſticke; but it hath withall a certaine bitterneſſe joyned, by reaſon whereof it digeſteth more than that of the Maſticke tree: through the ſame quality there is likewiſe in it ſo great a clenſing, as alſo it healeth ſcabs, in his eighth booke of the faculties of ſimple medicines; but in his booke of medicines according to the kindes, he maketh that of the Turpentine tree to be much like the Roſins of the Larch tree, which he affirmeth to be moiſter than all the reſt, and to be without both ſharpneſſe and biting.

E The fruit of Turpentine prouoketh vrine and ſtirreth vp fleſhly luſt.

F The Roſin of this tree, which is the right Turpentine, looſeth the belly, openeth the ſtoppings of the liuer and ſpleene, prouoketh vrine, and driueth forth grauell, being taken the quantity of two or three Beanes.

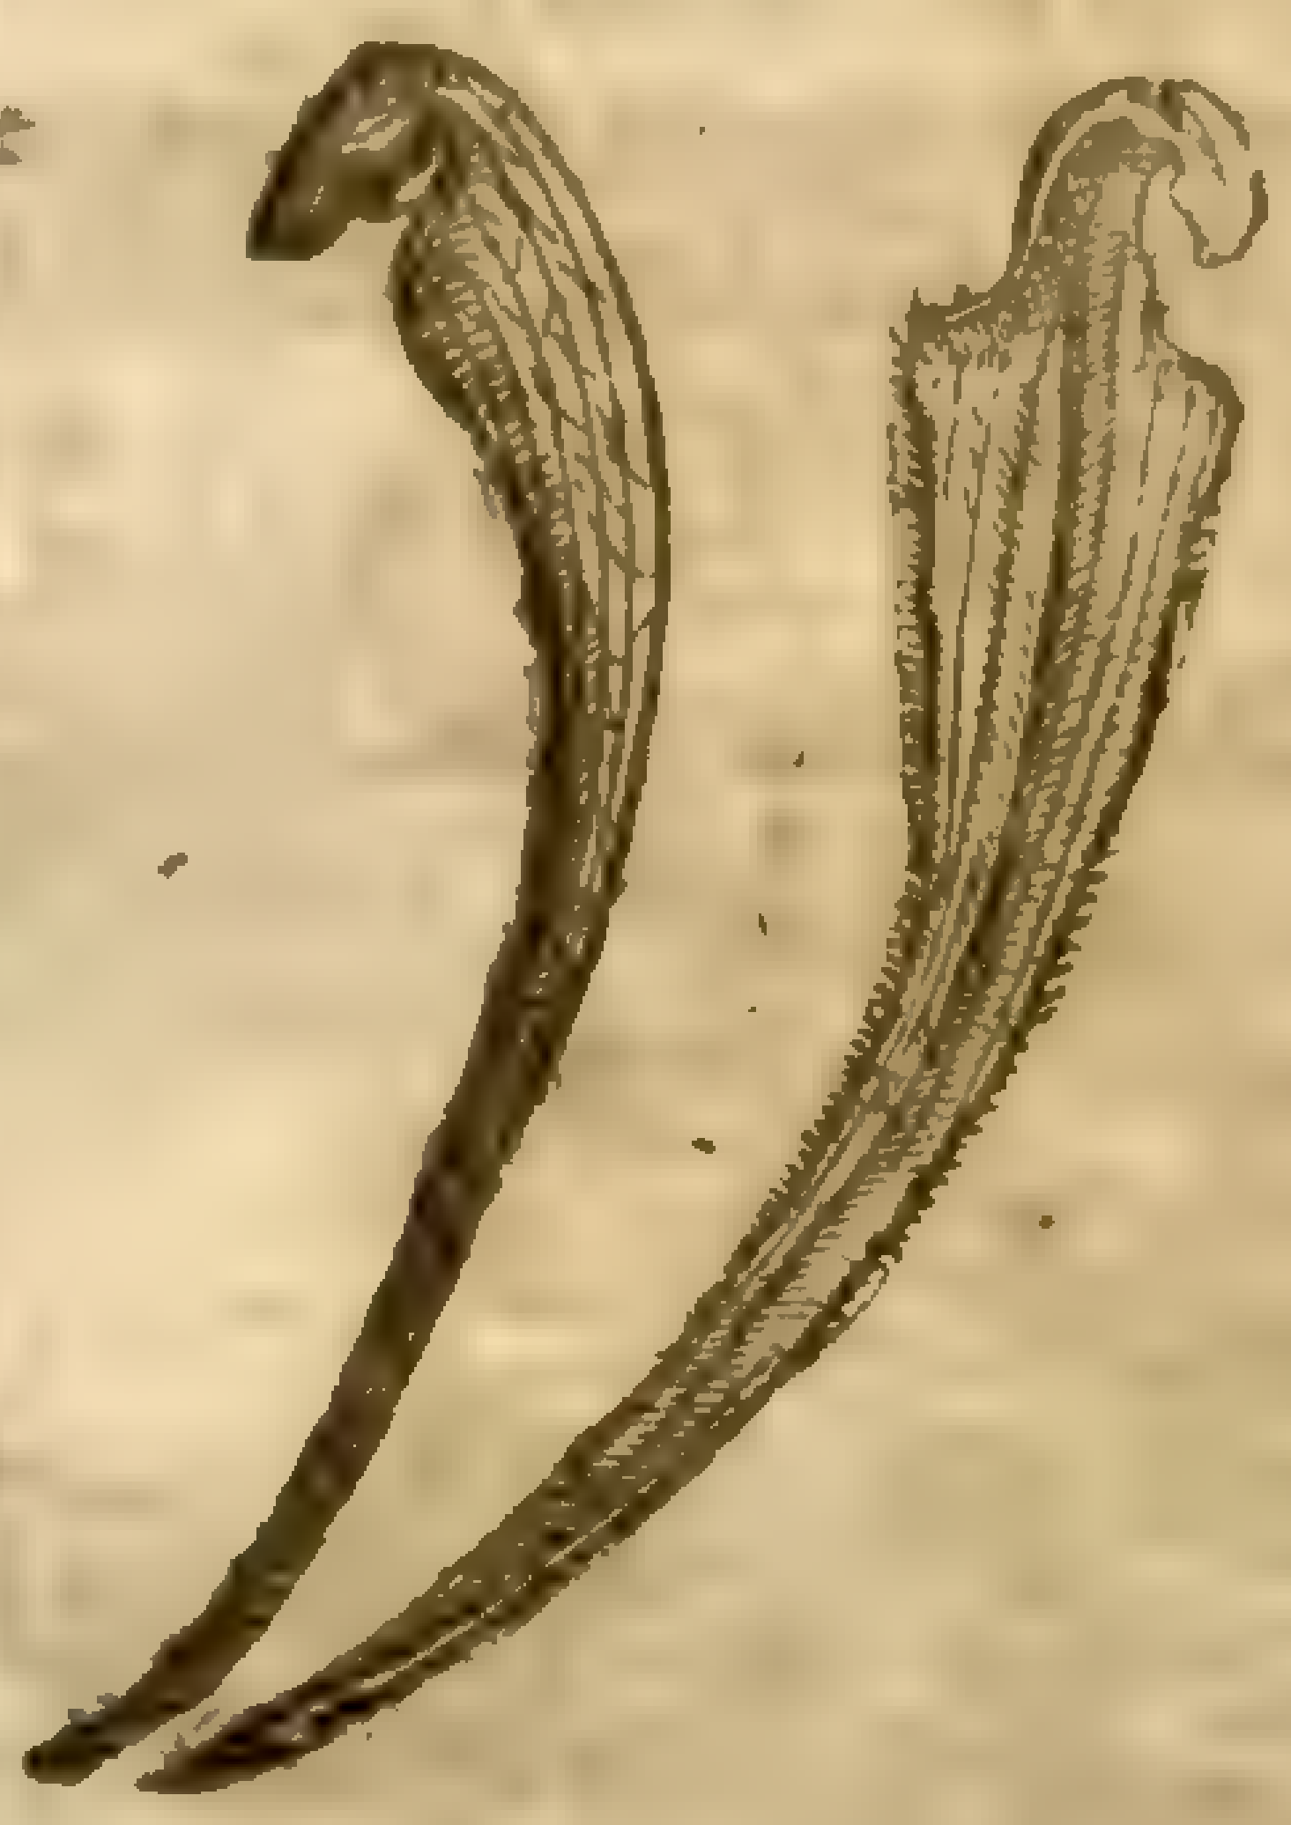
The like quantity waſhed in water diuers times vntill it be white, then muſt be put thereto the G like quantity of the yolk of an egge, and laboured together, adding thereto by little and little (continually ſtirring it) a ſmall draught of poſſit drinke made of white wine, and giuen to drinke in the morning faſting, it helpeth moſt ſpeedily the Gonorrhæa, or running of the reines, commonly at the firſt time, but the medicine neuer faileth at the ſecond time at the taking of it, which giues ſtooles from foure to eight, according to the age and ſtrength of the patient.

CHAP. 86. *Of the Frankincenſe Tree.*

¶ *The Deſcription.*

THe tree from which Frankincenſe floweth is but low, and hath leaues like the Maſticke tree; yet ſome are of opinion that the leafe is like the leafe of a Peare tree, and of a graſſie colour: the rinde is like that of the Bay tree, whereof there are two kindes: the one growing in mountains and rockie places, the other in the plaine: but thoſe in the plaines are much worſe than thoſe of the mountaines: the gum hereof is alſo blacker, fitter to mingle with Pitch, and ſuch other ſtuffe to trim ſhips, than for other vſes.

Arbor Thurifera.
The Frankincenſe tree.



Thuris Limpidi folium Lobelij.
The ſuppoſed leafe of the Frankincenſe tree.

Theuet in his Coſmographie ſaith, that the Frankincenſe tree doth reſemble a gummy or roſiny Pine tree, which yeeldeth a juyce that in time groweth hard, and is called *Thus*, Frankincenſe, in which is found ſometimes certaine ſmall graines like vnto grauell, which they call the Manna of Frankincenſe.

Of this there is in Arabia two other ſorts, the one, the gum whereof is gathered in the Dog daies when the Sun is in Leo, which is white, pure, cleare, and ſhining. *Pena* writeth, That he hath ſeene the cleare Frankincenſe called *Limpidum*, and yeelding a very ſweet ſmell when it is burnt, but the leafe hath been ſeldome ſeene, which the Phyſition *Launanus* gaue to *Pena* and *Lobel*, together with ſome pieces of the Roſine, which he had of certaine mariners, but he could affirme nothing of certainty whether it were the leafe of the Frankincenſe, or of ſome other Pine tree, yeelding the like juyce or gum. It is, ſaith he, (which doth ſeldom happen in other leaues) from the lower part or foot of the leafe to the vpper end, as it were doubled, conſiſting of two thin rindes or coats, with a ſheath a ſpan and a halfe long, at the top gaping open like a hood or fooles coxcombe, and as it were coueted with a helmet, which is a thing ſeldome ſeene in a leafe, but is proper to the floures of *Napellus*, or *Lonchitis*, as writers affirme; the other is gathered in the Spring, which is reddiſh, worſer than the other in price or value, becauſe it is not ſo well concocted in the heat of the Sunne. The Arabians wound this tree with a knife, that the liquor may flow out more abundantly, whereof ſome trees yeeld threeſcore pound of Frankincenſe.

¶ *The Place.*

Dioſcorides ſaith it groweth in Arabia, and eſpecially in that quarter which is called Thuriſera, the beſt in that country is called *Stagonias*, and is round, and if it be broken is fat within, and when it is burned doth quickly yeeld a ſmell: next to it in goodneſſe is that which groweth in Smilo, leſſer than the other, and more yellow.

¶ *The Time.*

The time is already declared in the deſcription.

¶ *The Names.*

Ir is called in Greeke λίβανος: in Latine, *Thus*: in Italian, *Incenſo*: in Dutch, **Weirauch**: in Spaniſh, *Encenſo*: in French, *Enceus*: in Engliſh, Frankincenſe, and Incenſe: in the Arabian tongue, *Louan*, and of ſome few, *Conder*. ‡ The Roſin carries the ſame name; but in ſhops it is called *Olibanum*, of the Greeke name and article put before it. ‡

¶ *The Temperature and Vertues.*

A It hath, as *Dioſcorides* ſaith, a power to heate and binde.

B It driueth away the dimneſſe of the eye-ſight, filleth vp hollow vlcers, it cloſeth raw wounds, ſtaieth all corruptions of bloud, although it fall from the head.

C *Galen* writeth thus of it; *Thus* doth heate in the ſecond degree, and dry in the firſt, and hath ſome ſmall aſtriction, but in the white there is a manifeſt aſtriction; the rinde doth manifeſtly binde and dry exceedingly, and that moſt certainely in the ſecond degree, for it is of more groſſer parts than Frankincenſe, and not ſo ſharpe, by reaſon whereof it is much vſed in ſpitting of bloud, ſwellings in the mouth, the collicke paſſion, the flux in the belly riſing from the ſtomacke, and bloudy flixes.

D The fume or ſmoke of it hath a more drier and hotter quality than the Frankincenſe it ſelfe, being dry in the third degree.

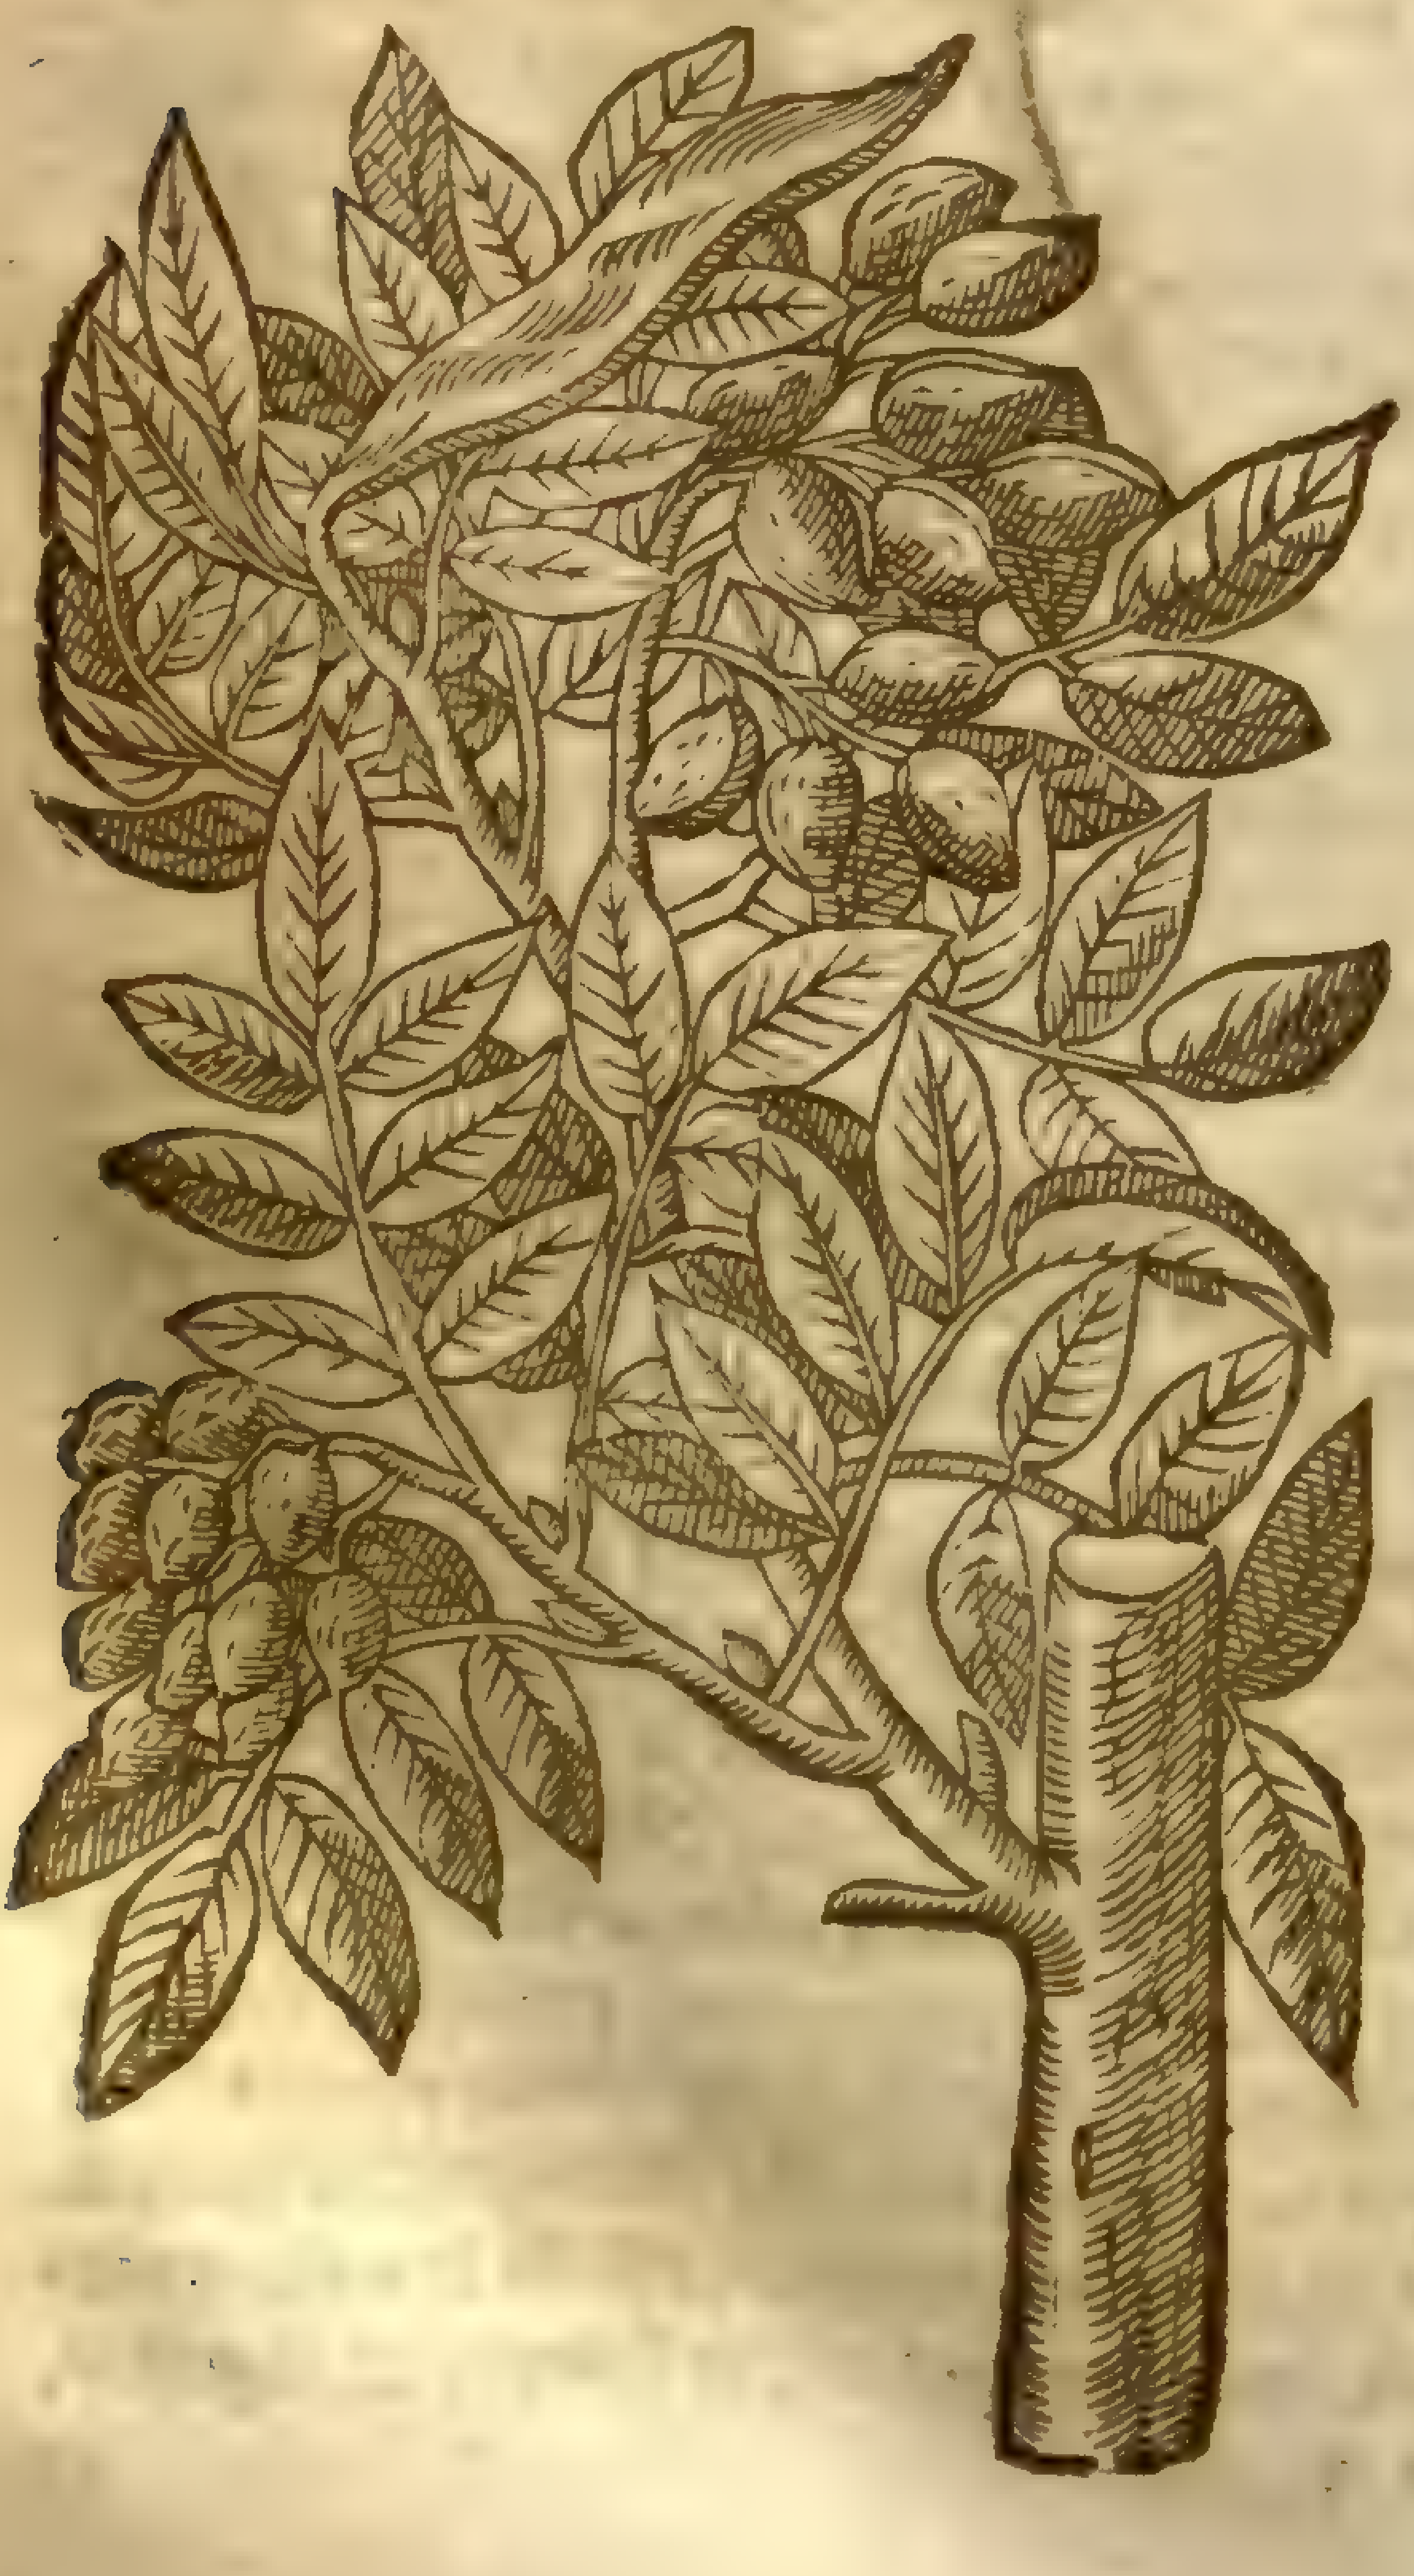
E It doth alſo clenſe and fill vp the vlcers in the eies, like vnto Myrrhe: thus far *Galen*.

F *Dioſcorides* ſaith, That if it be drunke by a man in health, it driueth him into a frenſie: but there are few Greekes of his minde.

G *Auicen* reporteth that it doth helpe and ſtrengthen the wit and vnderſtanding, but the often taking of it will breed the head-ache, and if too much of it be drunke with wine it killeth.

Chap. 87. *Of Fiſticke Nuts.*

Piſtacia. The Fiſticke Nut.



P. vera, L.
[illegible]

¶ *The Deſcription.*

The tree which beareth Fiſticke nuts is like to the Turpentine tree: the leaues hereof be greater than thoſe of the Maſticke tree, but ſet after the ſame maner, & in like order that they are, being of a faint yellow color out of a green; the fruit or Nuts do hang by their ſtalks in cluſters, being greater than the Nuts of Pine Apples, and much leſſer than Almonds: the huske without is of a grayiſh colour, ſometimes reddiſh, the ſhell brickle and white; the ſubſtance of the kernell greene; the taſte ſweet, pleaſant to be eaten, and ſomething ſweet of ſmell.

¶ *The Place.*

Fiſticke Nuts grow in Perſia, Arabia, Syria, and in India; now they are made free Denizons in Italy, as in Naples and in other Prouinces there.

¶ *The Time.*

This tree doth floure in May, and the fruit is ripe in September.

¶ *The Names.*

This Nut is called in Greeke πιστάκιον in *Athenæus*: *Nicander Colophonius* in his booke of Treacles nameth it ψιττάκιον: *Poſsidonius* nameth it βιστάκιον: others, φιστάκιον: the Latines obſeruing the ſame termes, haue named it *Piſtacion*, *Biſtacion*, or *Phiſtacion*:

ſtacion: the Apothecaries, *Fiſtici*: the Spaniards, *Alhocigos*, and *Fiſticos*: in Italian, *Piſtacchi*: in Engliſh, Fiſticke Nut.

¶ *The Temperature and Vertues.*

A The kernels of the Fiſticke Nuts are oftentimes eaten as be thoſe of the Pine Apples; they be of temperature hot and moiſt, they are not ſo eaſily concocted, but much eaſier than common nuts: the juyce is good, yet ſomewhat thicke; they yeeld to the body no ſmall nouriſhment, they nouriſh bodies that are conſumed: they recouer ſtrength.

B They are good for thoſe that haue the phthiſicke, or rotting away of the lungs.

C They concoct, ripen, and clenſe forth raw humors that cleaue to the lights and cheſt.

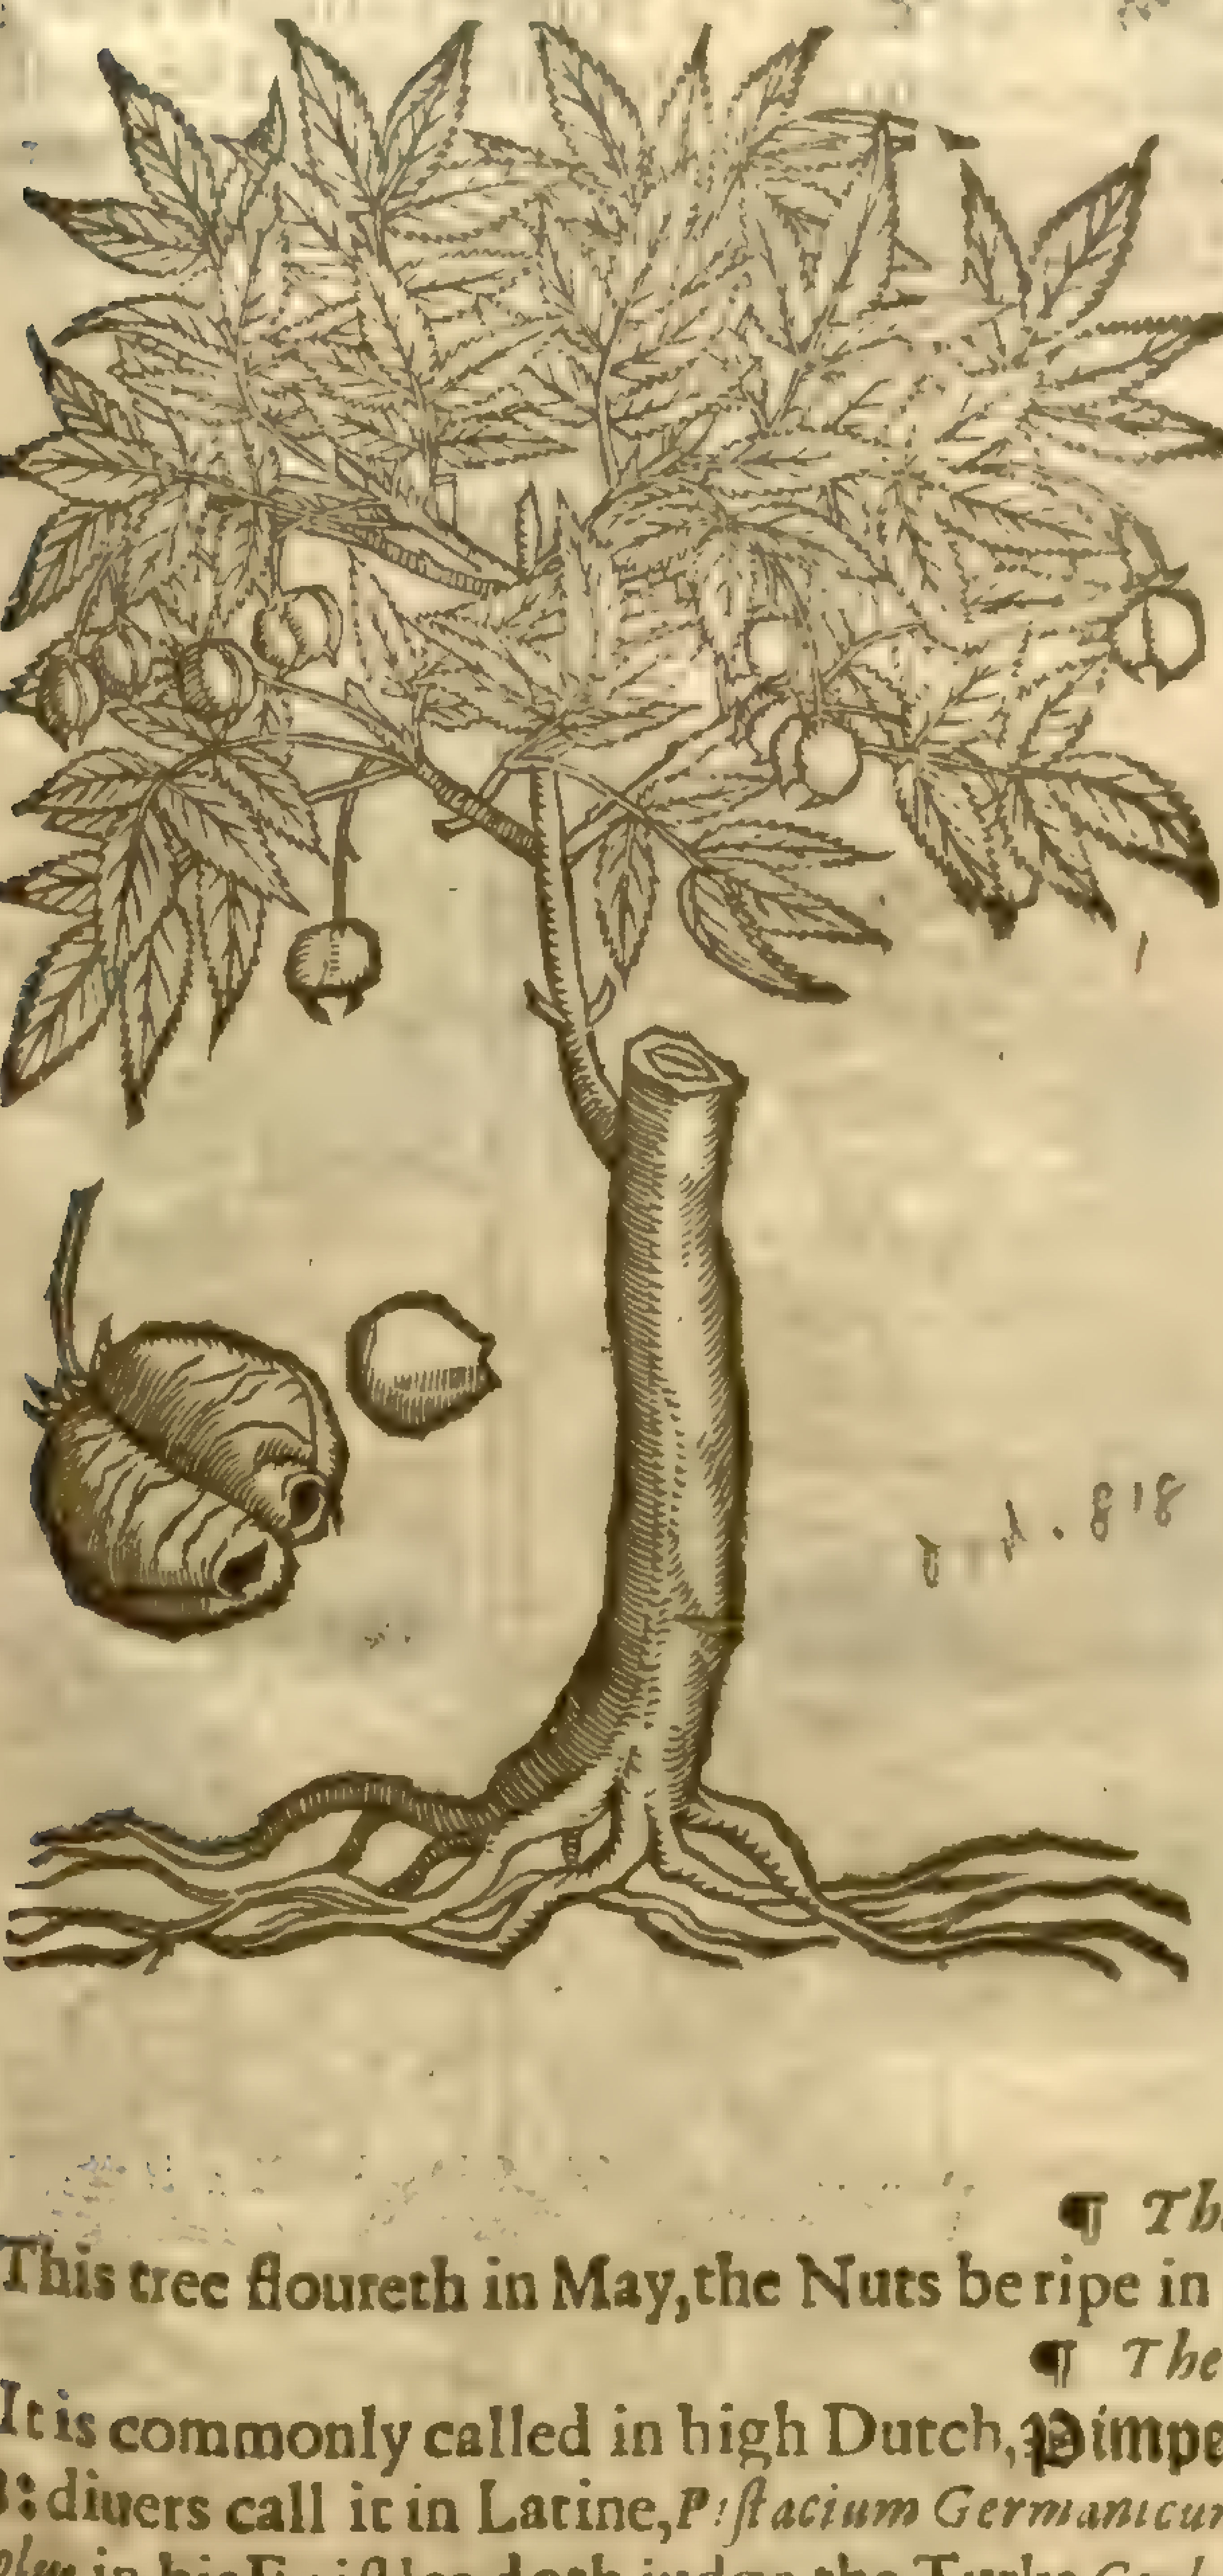
D They open the ſtoppings of the liuer, and be good for the infirmities of the kidnies; they alſo remoue out of the kidnies ſand and grauell; and aſſwage their paine: they are alſo good for vlcers.

E The kernels of Fiſticke nuts condited, or made into comfits, with Sugar, and eaten, doe procure bodily luſt, vnſtop the lungs and the breſt, are good againſt the ſhortneſſe of breath, and are an excellent preſeruatiue medicine being miniſtred in wine againſt the bitings of all manner of wilde beaſts.

CHAP. 88. Of the Bladder Nut.

Staphylea pinnata

Nux veſicaria.
The Bladder Nut.



¶ *The Deſcription.*

THis is a low tree, hauing diuers young ſprings growing forth of the root: the ſubſtance of the wood is white, very hard & ſound; the barke is of a light greene; the leaues conſiſt of fiue little ones, which be nicked in the edges like thoſe of the Elder, but leſſer, not ſo greene nor ranke of ſmell. It hath the pleaſant whitiſh floures of Bryony or *Labruſca*, both in ſmell and ſhape, which turne into ſmall cornered bladders of Winter Cherries, called Alkakengie, but of an ouerworne greeniſh colour: in theſe bladders are contained two little nuts, and ſometimes no more but one, leſſer than the Haſell nut, but greater than the Ram Cich, with a wooddy ſhell and ſomewhat red: the kernell within is ſomething greene; in taſte at the firſt ſweet, but afterwards lothſome and ready to prouoke vomit.

¶ *The Place.*

It groweth in Italy, Germany and France; it groweth likewiſe at the houſe of Sir *Walter Culpepper* neere Flimmewell in the Weild of Kent, as alſo in the Fryer-yard without Saint Paules gate in Stamford, and about Spalding Abbey, and in the garden of the right Honourable the Lord Treaſurer my very good Lord and Maſter, and by his houſe in the Strand. It groweth alſo in my Garden, and in the Garden hedges of Sir *Francis Carew* neere Croydon, ſeuen miles from London.

¶ *The Time.*

This tree floureth in May, the Nuts be ripe in Auguſt and September.

¶ *The Names.*

It is commonly called in high Dutch, **Pimpernuſz**: which ſignifieth in low Dutch, **Pimpernoten**: diuers call it in Latine, *Piſtacium Germanicum*: we thinke it beſt to call it *Nux veſicaria*. *Matthiolus* in his Epiſtles doth judge the Turks *Coulcoul* and *Hebulben*, to agree with this: *Gulielmus Quacelbenus* affirmeth, Coulcoul to be vſed of diuers in Conſtantinople for a daintie, eſpecially when they be new brought out of Egypt. This plant hath no old name, vnleſſe it be *Staphylodendron*, *Plinij*:

for which it is taken of the later writers:and *Pliny* hath written of it in 16. booke,16. chapter. There is alſo (ſaith he) beyound the Alps a tree, the timber whereof is very like to that of white Maple, and is called *Staphylodendron*, it beareth cods,and in thoſe kernels, hauing the taſt of the Haſel Nut. It is called in Engliſh, S. Anthonies nuts,wild Piſtacia,or Bladder nuts:the Italians call it *Piſtachio Saluaticke*: the French-men call it *Baguenaudes a patre noſtres*, for that the Friers do vſe to make beads of the Nuts.

¶ *The Temperature and Vertues.*

A These nuts are moiſt and full of ſuperfluous raw humors, and therefore they eaſily procure a readineſſe to vomit, and trouble the ſtomacke, by reaſon that withall they be ſomewhat binding, and therefore they be not to be eaten.

B They haue as yet no vſe in Medicine, yet notwithſtanding ſome haue attributed vnto them ſome vertues in prouoking of Venery.

Chap. 89. *Of the Haſell tree.*

¶ *The Deſcription.*

1 The Haſell tree groweth like a ſhrub or ſmall tree, parted into boughes without joints, tough and pliable:the leaues are broad,greater and fuller of wrinckles than thoſe of the Alder tree,cut in the edges like a ſaw,of colour greene,and on the back ſide more white, the barke is thin: the root is thicke,ſtrong,and growing deepe; in ſtead of floures hang downe catkins,aglets,or blowings,ſlender,and well compact: after which come the Nuts ſtanding in a tough cup of a greene colour,and jagged at the vpper end,like almoſt to the beards in Roſes. The ſhell is ſmooth and wooddy: the kernell within conſiſteth of a white,hard,and ſound pulpe,and is couered with a thin skin,oftentimes red, moſt commonly white; this kernell is ſweet and pleaſant vnto the taſte.

1 *Nux Auellana, ſiue Corylus.*
The Filberd Nut.

Corylus avellana, b. β
Mus. dict.

2 *Corylus ſylueſtris.*
The wilde hedge-Nut.

Sp. pl. 4. 151

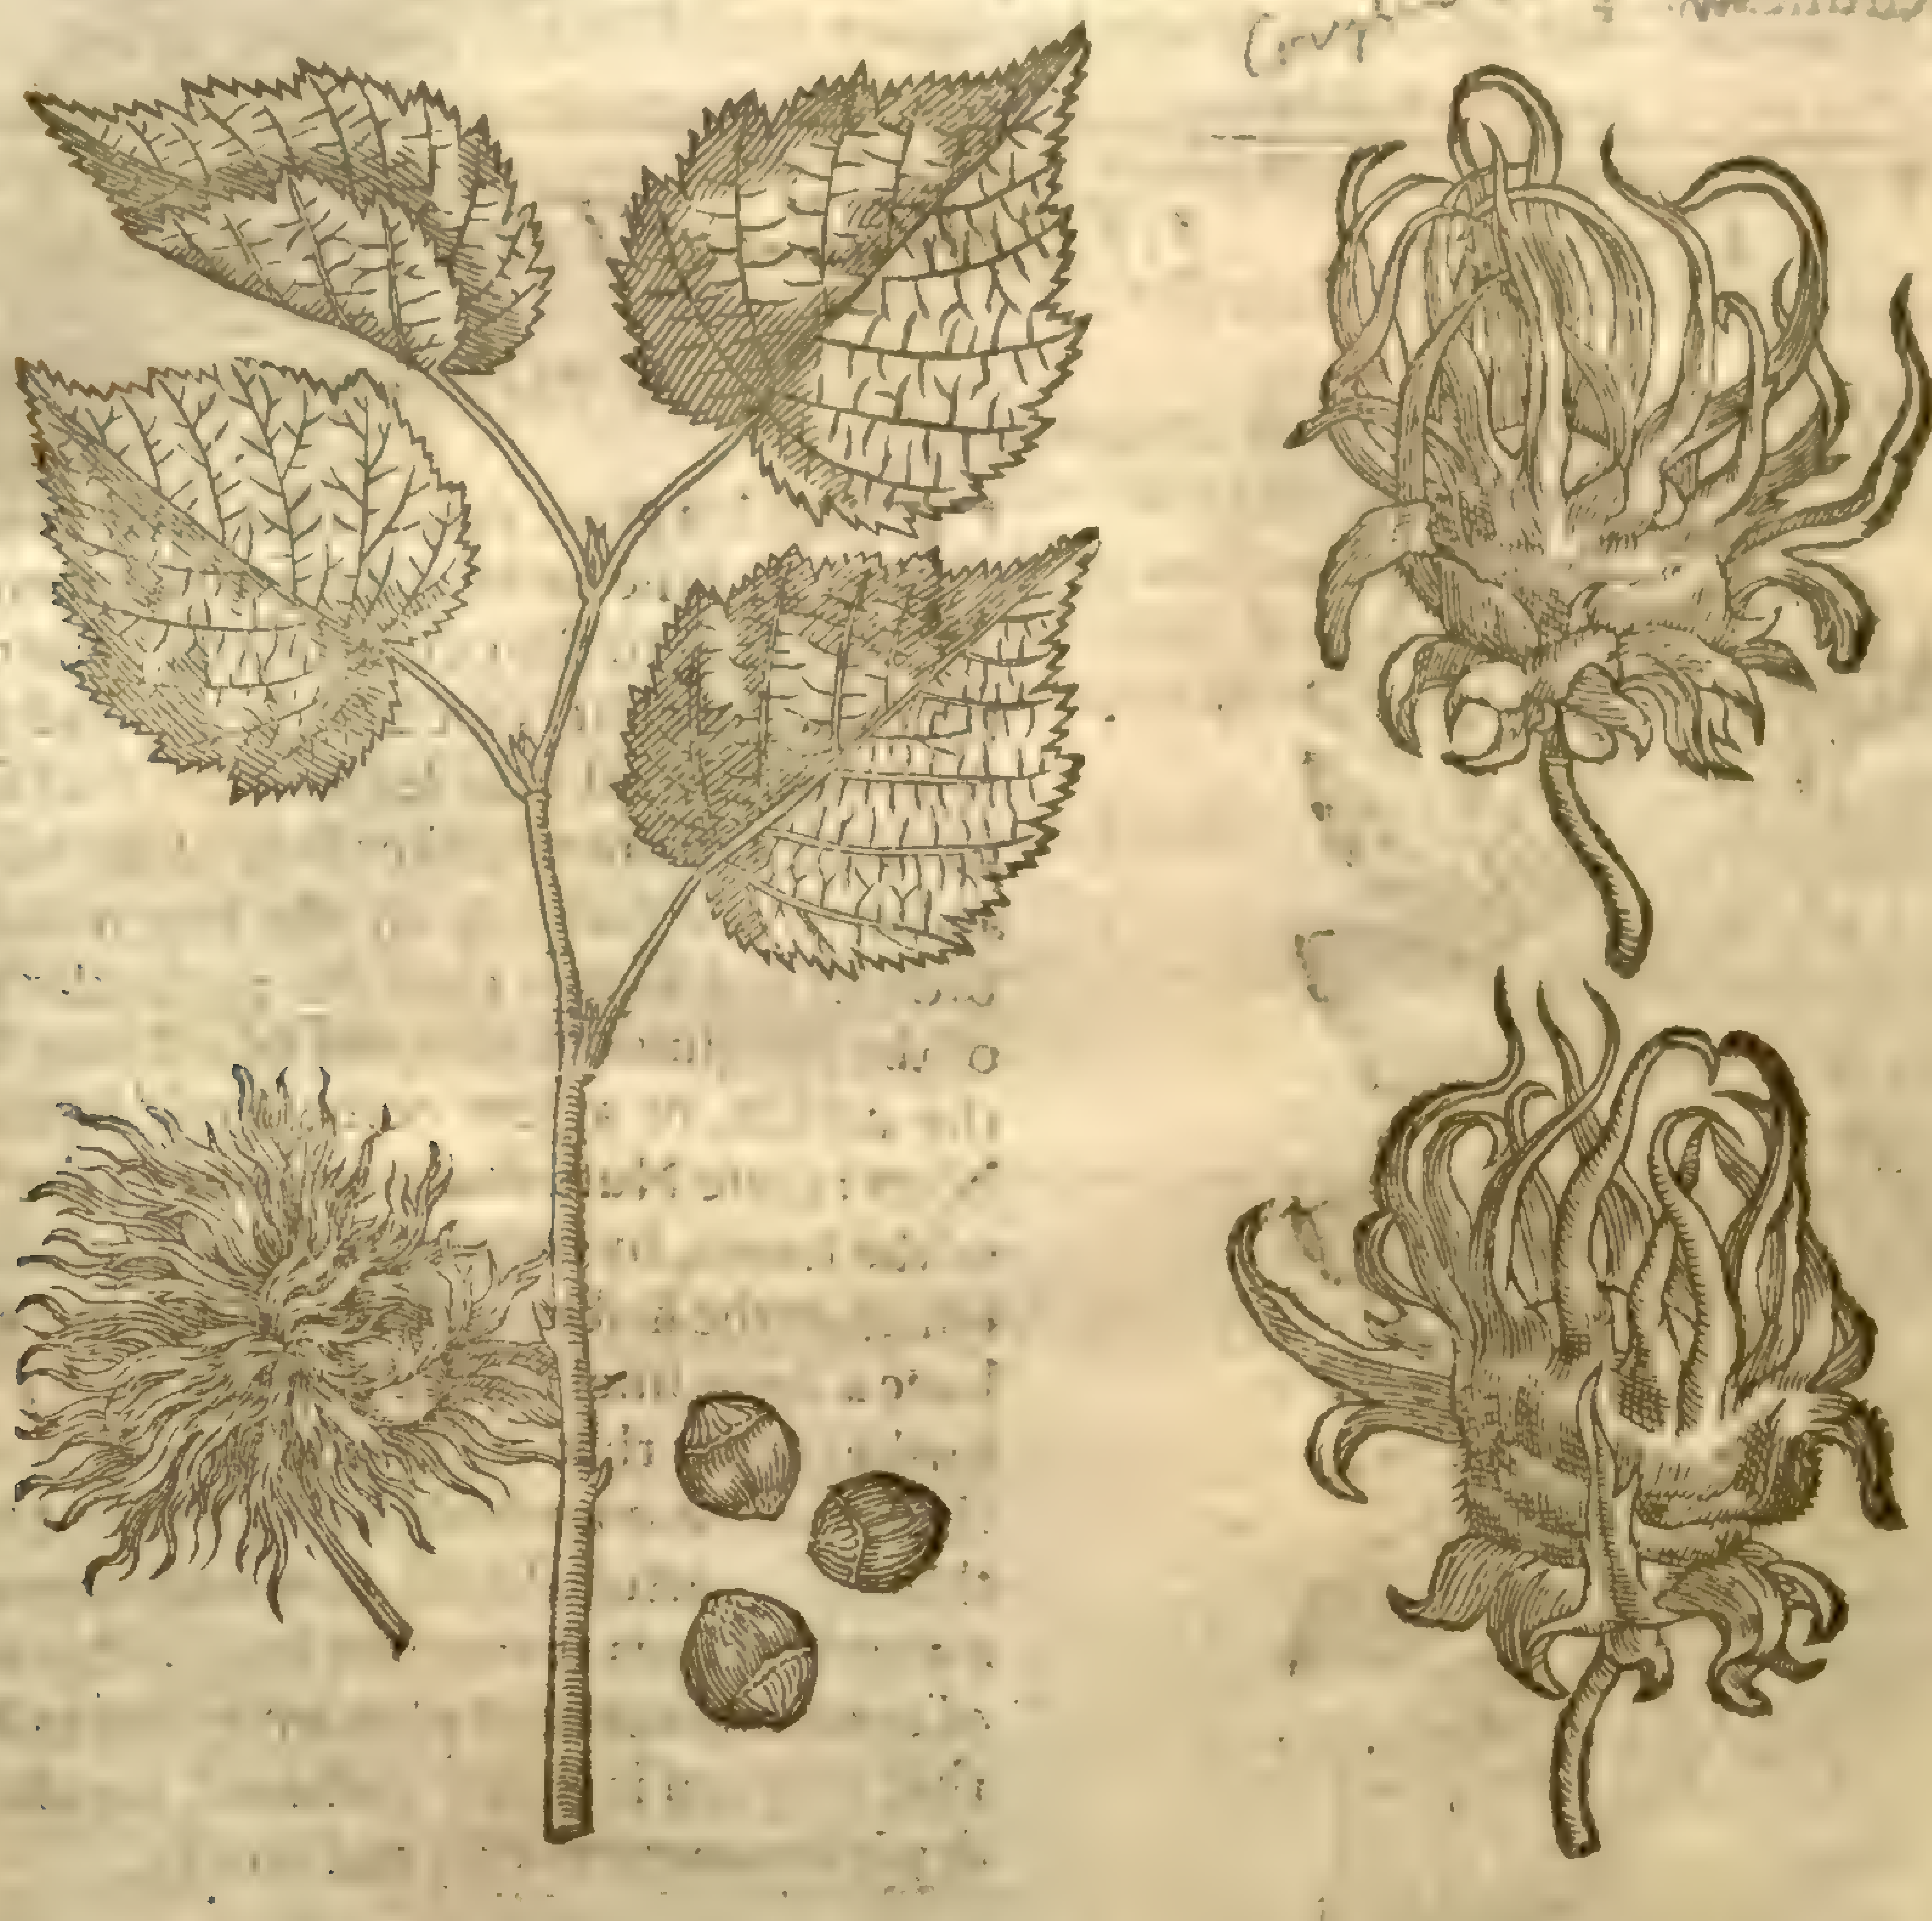
Corylus avellana, b. α
Mus. dict.

Lob. ic. 2. 192

2 *Corylus ſylueſtris* is our hedge Nut or Haſell Nut tree, which is very well knowne, and therefore needeth not any deſeription: whereof there are alſo ſundry ſorts, ſome great, ſome little, ſome rathe ripe, ſome later, as alſo one that is manured in our Gardens, which is very great, bigger than any Filberd, and yet a kinde of Hedge Nut: this then that hath beene ſaid ſhall ſuffice for Hedge-Nuts.

‡ 3 The ſmall Turky Nut tree growes but low, and the leaues grow without order, vpon the twigs, they are in ſhape like thoſe of the former, but ſomewhat longer: the chiefe difference conſiſts in the fruit, which is ſmall, and like an Haſell Nut, but ſhorter: the huske, wherein ſometimes one, otherwhiles more Nuts are contained, is very large, rough, and hard, diuided both aboue and below into a great many jags, which on euery ſide couer, and hold in the Nuts, and theſe cups are very rough without, but ſmooth on the inſide. *Cluſius* firſt ſet this forth (hauing receiued it from Conſtantinople) by the name of *Auellana pumila Byzantina*. ‡

3 *Auellana pumila Byzantina cum ſuo fructu.*
The Filberd Nut of Conſtantinople.



¶ *The Place.*

The Haſell trees doe commonly grow in Woods and in dankiſh vntoiled places: they are alſo ſet in Orchards, the Nuts whereof are better, and of a ſweeter taſte, and be moſt commonly redde within.

¶ *The Time.*

The catkins or Aglets come forth very timely, before winter be fully paſt, and fall away in March or Aprill, ſo ſoone as the leaues come forth: the Nuts be ripe in Auguſt.

¶ *The Names.*

This ſhrub is called in Latine, *Corylus*: in Greeke, κάρυα Ποντικά, that is, *Nux Pontica*, or Ponticke Nut: in high Dutch, **Haſelſtrauck**: in low Dutch, **Haſeleer**: in Engliſh, Haſell tree, and Filberd tree; but the Filberd tree is properly that which groweth in gardens and Orchards, and whoſe fruit is commonly wholly couered ouer with the huske, and the ſhell is thinner.

The Nut is named in Latine, *Nux Pontica, tenuis Nux, parua Nux*: it is alſo called *Nux Praeneſtina, Nux Heracleotica*, and commonly *Nux auellana*, by which name it is vſually knowne to the Apothecaries, in high Dutch, **Haſel Nuſz**: in low Dutch, **Haſel Noten**: in Italian, *Nocciuole, Auellane, Necelle*: in French, *Noiſettes, & Noiſelles*: in Spaniſh, *Auellanas*: in Engliſh, Haſell Nut, and Filberd.

These Nuts that haue their skins red are the garden and planted Nuts, and the right Ponticke Nuts or Filberds: they are called in high Dutch, **Rhurnuſz**, and **Rotnuſz**: in low Dutch, **Roode Haſel Noten**: in Engliſh, Filberds, and red Filberds.

The other Nuts which be white are iudged to be wilde.

¶ *The Temperature and Vertues.*

A Haſell Nuts newly gathered, and not as yet dry, containe in them a certaine ſuperfluous moiſture, by reaſon whereof they are windy: not onely the new gathered Nuts, but the dry alſo, be very hard of digeſtion; for they are of an earthy and cold eſſence, and of an hard and ſound ſubſtance, for which cauſe alſo they very ſlowly paſſe through the belly, therefore they are troubleſome and clogging to the ſtomacke, cauſe head-ache, eſpecially when they be eaten in too great a quantity.

B The kernells of Nuts made into milke like Almonds do mightily binde the belly, and are good for the laske and the bloudy flix.

C The ſame doth coole exceedingly in hot feuers and burning agues.

D The catkins are cold and dry, and likewiſe binding: they alſo ſtay the laske.

E ‡ The kernels of Nuts rather cauſe than cure the bloudy flix and laske, wherefore they are not to be vſed in ſuch diſeaſes. ‡

Chap. 90. Of the Wall-nut Tree.

Juglans nigra
[illegible]

Nux Iuglans.
The Walnut tree.

¶ *The Deſcription.*

This is a great tree with a thicke and tall body: the barke is ſomewhat greene, and tending to the colour of aſhes, and oftentimes full of clefts: the boughes ſpread themſelues far abroad: the leaues conſiſt of fiue or ſix faſtned to one rib, like thoſe of the aſh tree, and with one ſtanding on the top, which bee broader and longer than the particular leaues of the Aſh, ſmooth alſo, and of a ſtrong ſmell: the catkins or aglets come forth before the Nuts: theſe Nuts doe grow hard to the ſtalke of the leaues, by couples, or by three & three; which at the firſt when they be yet but tender haue a ſweet ſmel, and be couered with a green huske: vnder that is a wooddy ſhell in which the kernell is contained, being couered with a thin skin, parted almoſt into foure parts with a woody skin as it were: the inner pulpe whereof is white, ſweet and pleaſant to the taſt; and that is when it is new gathered, for after it is dry it becommeth oily and rancke.

¶ *The Place.*

The Walnut tree groweth in fields neere common high-wayes, in a fat and fruitfull ground, and in orchards: it proſpereth on high fruitfull bankes, it loueth not to grow in watery places.

¶ *The Time.*

The leaues together with the catkins come forth in the Spring: the Nuts are gathered in Auguſt.

¶ *The Names.*

The tree is called in Greeke, Κάρυα: in Latine, *Nux*, which name doth ſignifie both the tree and the fruit: in high Dutch, **Nuſzbaum**: in low Dutch, **Noote boome**, and **Nootelaer**: in French, *Neiſier*: in Spaniſh, *Nogueyra*: in Engliſh, Walnut tree, and of ſome, Walſh nut tree. The Nut is called in Greeke, Κάρυον βασιλικόν, that is to ſay, *Nux Regia*, or the Kingly Nut: it it likewiſe named

Nux Inglans, as though you ſhould ſay *Iouis glans*, Iupiters Acorne; or *Iuvans glans*, the helping Acorne: and of diuers, *Perſica Nux*, or the Perſian Nut: in high Dutch, **Welſch Nuſz**, and **Baumnuſz**: in low Dutch, **Okernoten, Walſch Noten**: in Italian, *Noci*: in French, *Noix*: in Spaniſh, *Nuezes*, and *Nous*: in Engliſh, Walnut; and of ſome, Walſh nut.

¶ *The Temperature and Vertues.*

The freſh kernels of the nuts newly gathered are pleaſant to the taſte: they are a little cold, and haue no ſmall moiſture, which is not perfectly concocted: they be hard of digeſtion, and nouriſh little: they ſlowly deſcend. A

The dry nuts are hot and dry, and thoſe more which become oily and ranke: theſe be very hurtfull to the ſtomacke, and beſides that they are hardly concocted, they increaſe choler, cauſe headache, and be hurtfull for the cheſt, and for thoſe that be troubled with the cough. B

Dry Nuts taken faſting with a fig and a little Rue withſtand poyſon, preuent and preſerue the body from the infection of the plague, and being plentifully eaten they driue wormes forth of the belly. C

The greene and tender Nuts boyled in Sugar and eaten as Suckad, are a moſt pleaſant and delectable meat, comfort the ſtomacke, and expell poiſon. D

The oyle of Walnuts made in ſuch manner as oyle of Almonds, maketh ſmooth the hands and face, and taketh away ſcales or ſcurfe, blacke and blew marks that come of ſtripes or bruiſes. E

Milke made of the kernels, as Almond milke is made, cooleth and pleaſeth the appetite of the languiſhing ſicke body. F

With onions, ſalt, and honey, they are good againſt the biting of a mad dog or man, if they be laid vpon the wound. G

Being both eaten, and alſo applied, they heale in ſhort time, as *Dioſcorides* ſaith, Gangrens, Carbuncles, ægilops, and the pilling away of the haire: this alſo is effectually done by the oyle that is preſſed out of them, which is of thin parts, digeſting and heating. H

The outward greene huske of the Nuts hath a notable binding faculty. I

Galen deuiſed and taught to make of the juyce thereof a medicine for the mouth, ſingular good againſt all inflammations thereof. K

The leaues and firſt buds haue a certaine binding quality, as the ſame Author ſheweth, yet there doth abound in them an hot and dry temperature. L

Some of the later Phyſitions vſe theſe for baths and lotions for the body, in which they haue a force to digeſt and alſo to procure ſweat. M

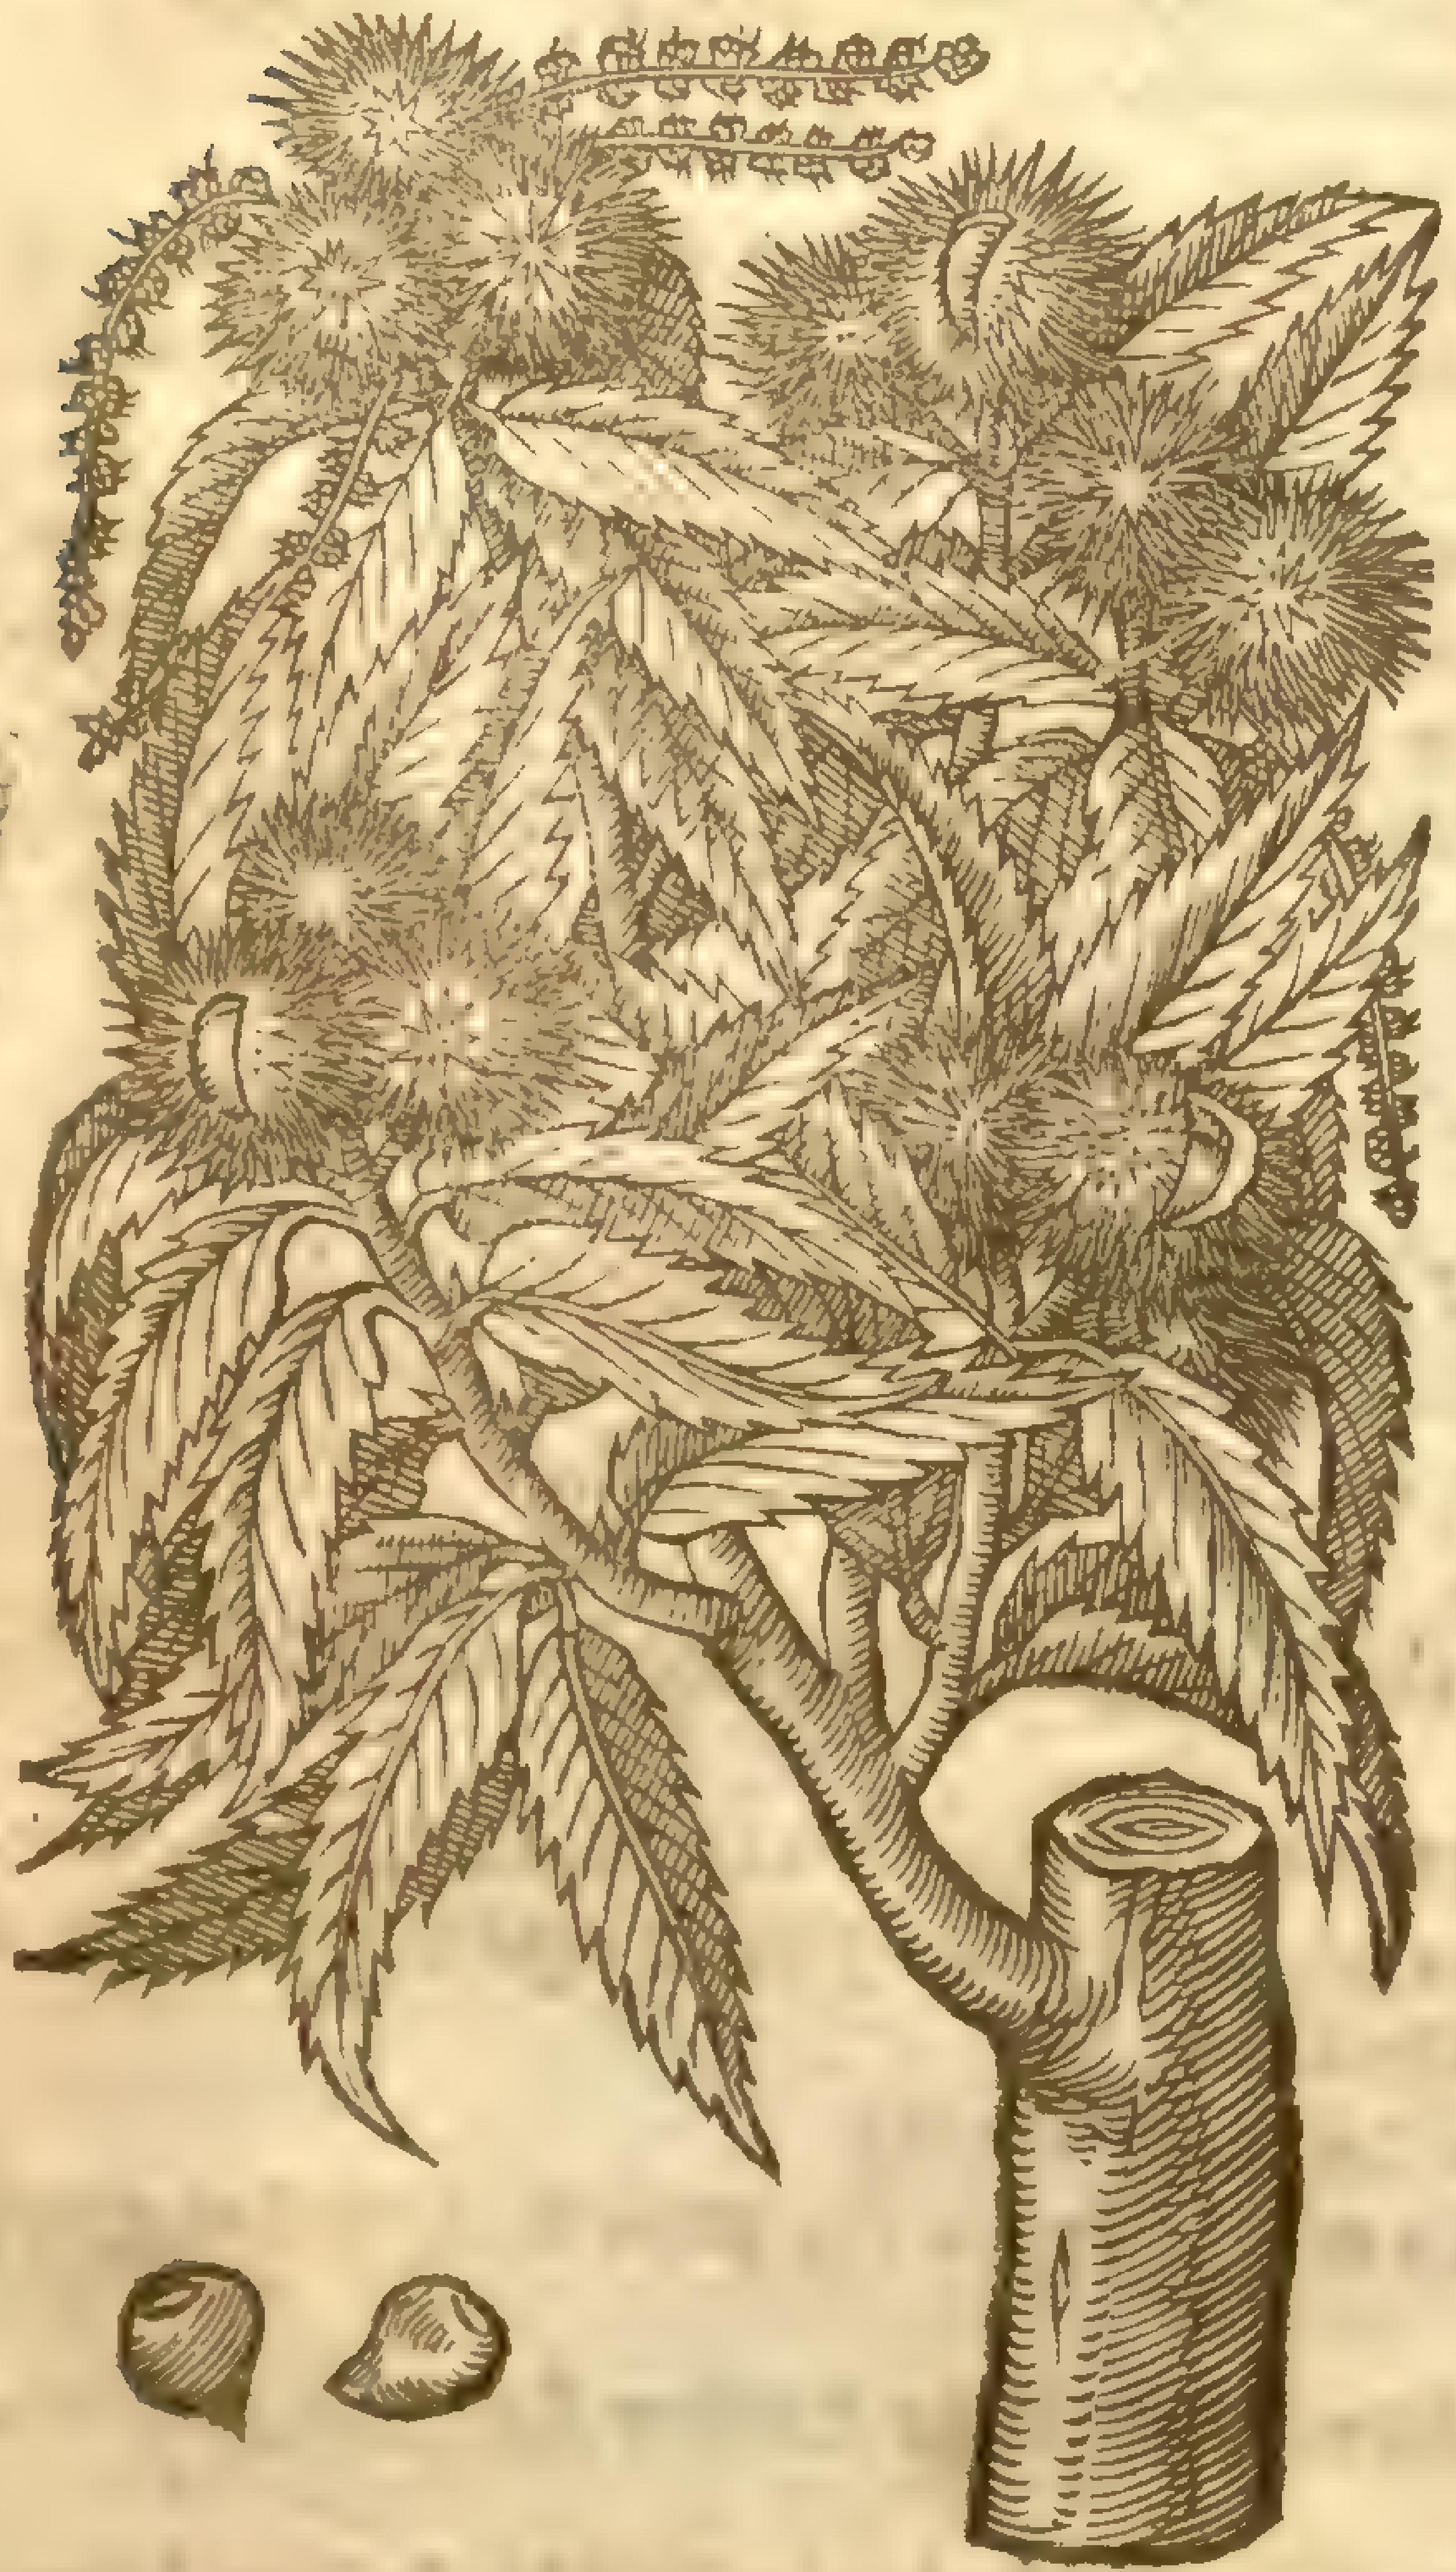
CHAP. 91. *Of the Cheſtnut tree.*

¶ *The Deſcription.*

1 THe Cheſtnut tree is a very great and high tree: it caſteth forth very many boughes: the body is thicke, and ſometimes of ſo great a compaſſe as that two men can hardly fathom it: the timber or ſubſtance of the wood is ſound and durable: the leaues bee great, rough, wrinkled, nicked in the edges, and greater than the particular leaues of the Walnut tree. The blowings or catkins be ſlender, long, and greene: the fruit is incloſed in a round rough and prickly huske like to an hedge-hog or Vrchin, which opening it ſelfe doth let fall the ripe fruit or Nut. This nut is not round, but flat on the one ſide, ſmooth, and ſharpe pointed: it is couered with a hard ſhell, which is tough and very ſmooth, of a darke browne colour: the meate or inner ſubſtance of the nut is hard and white, and couered with a thin skin which is vnder the ſhell.

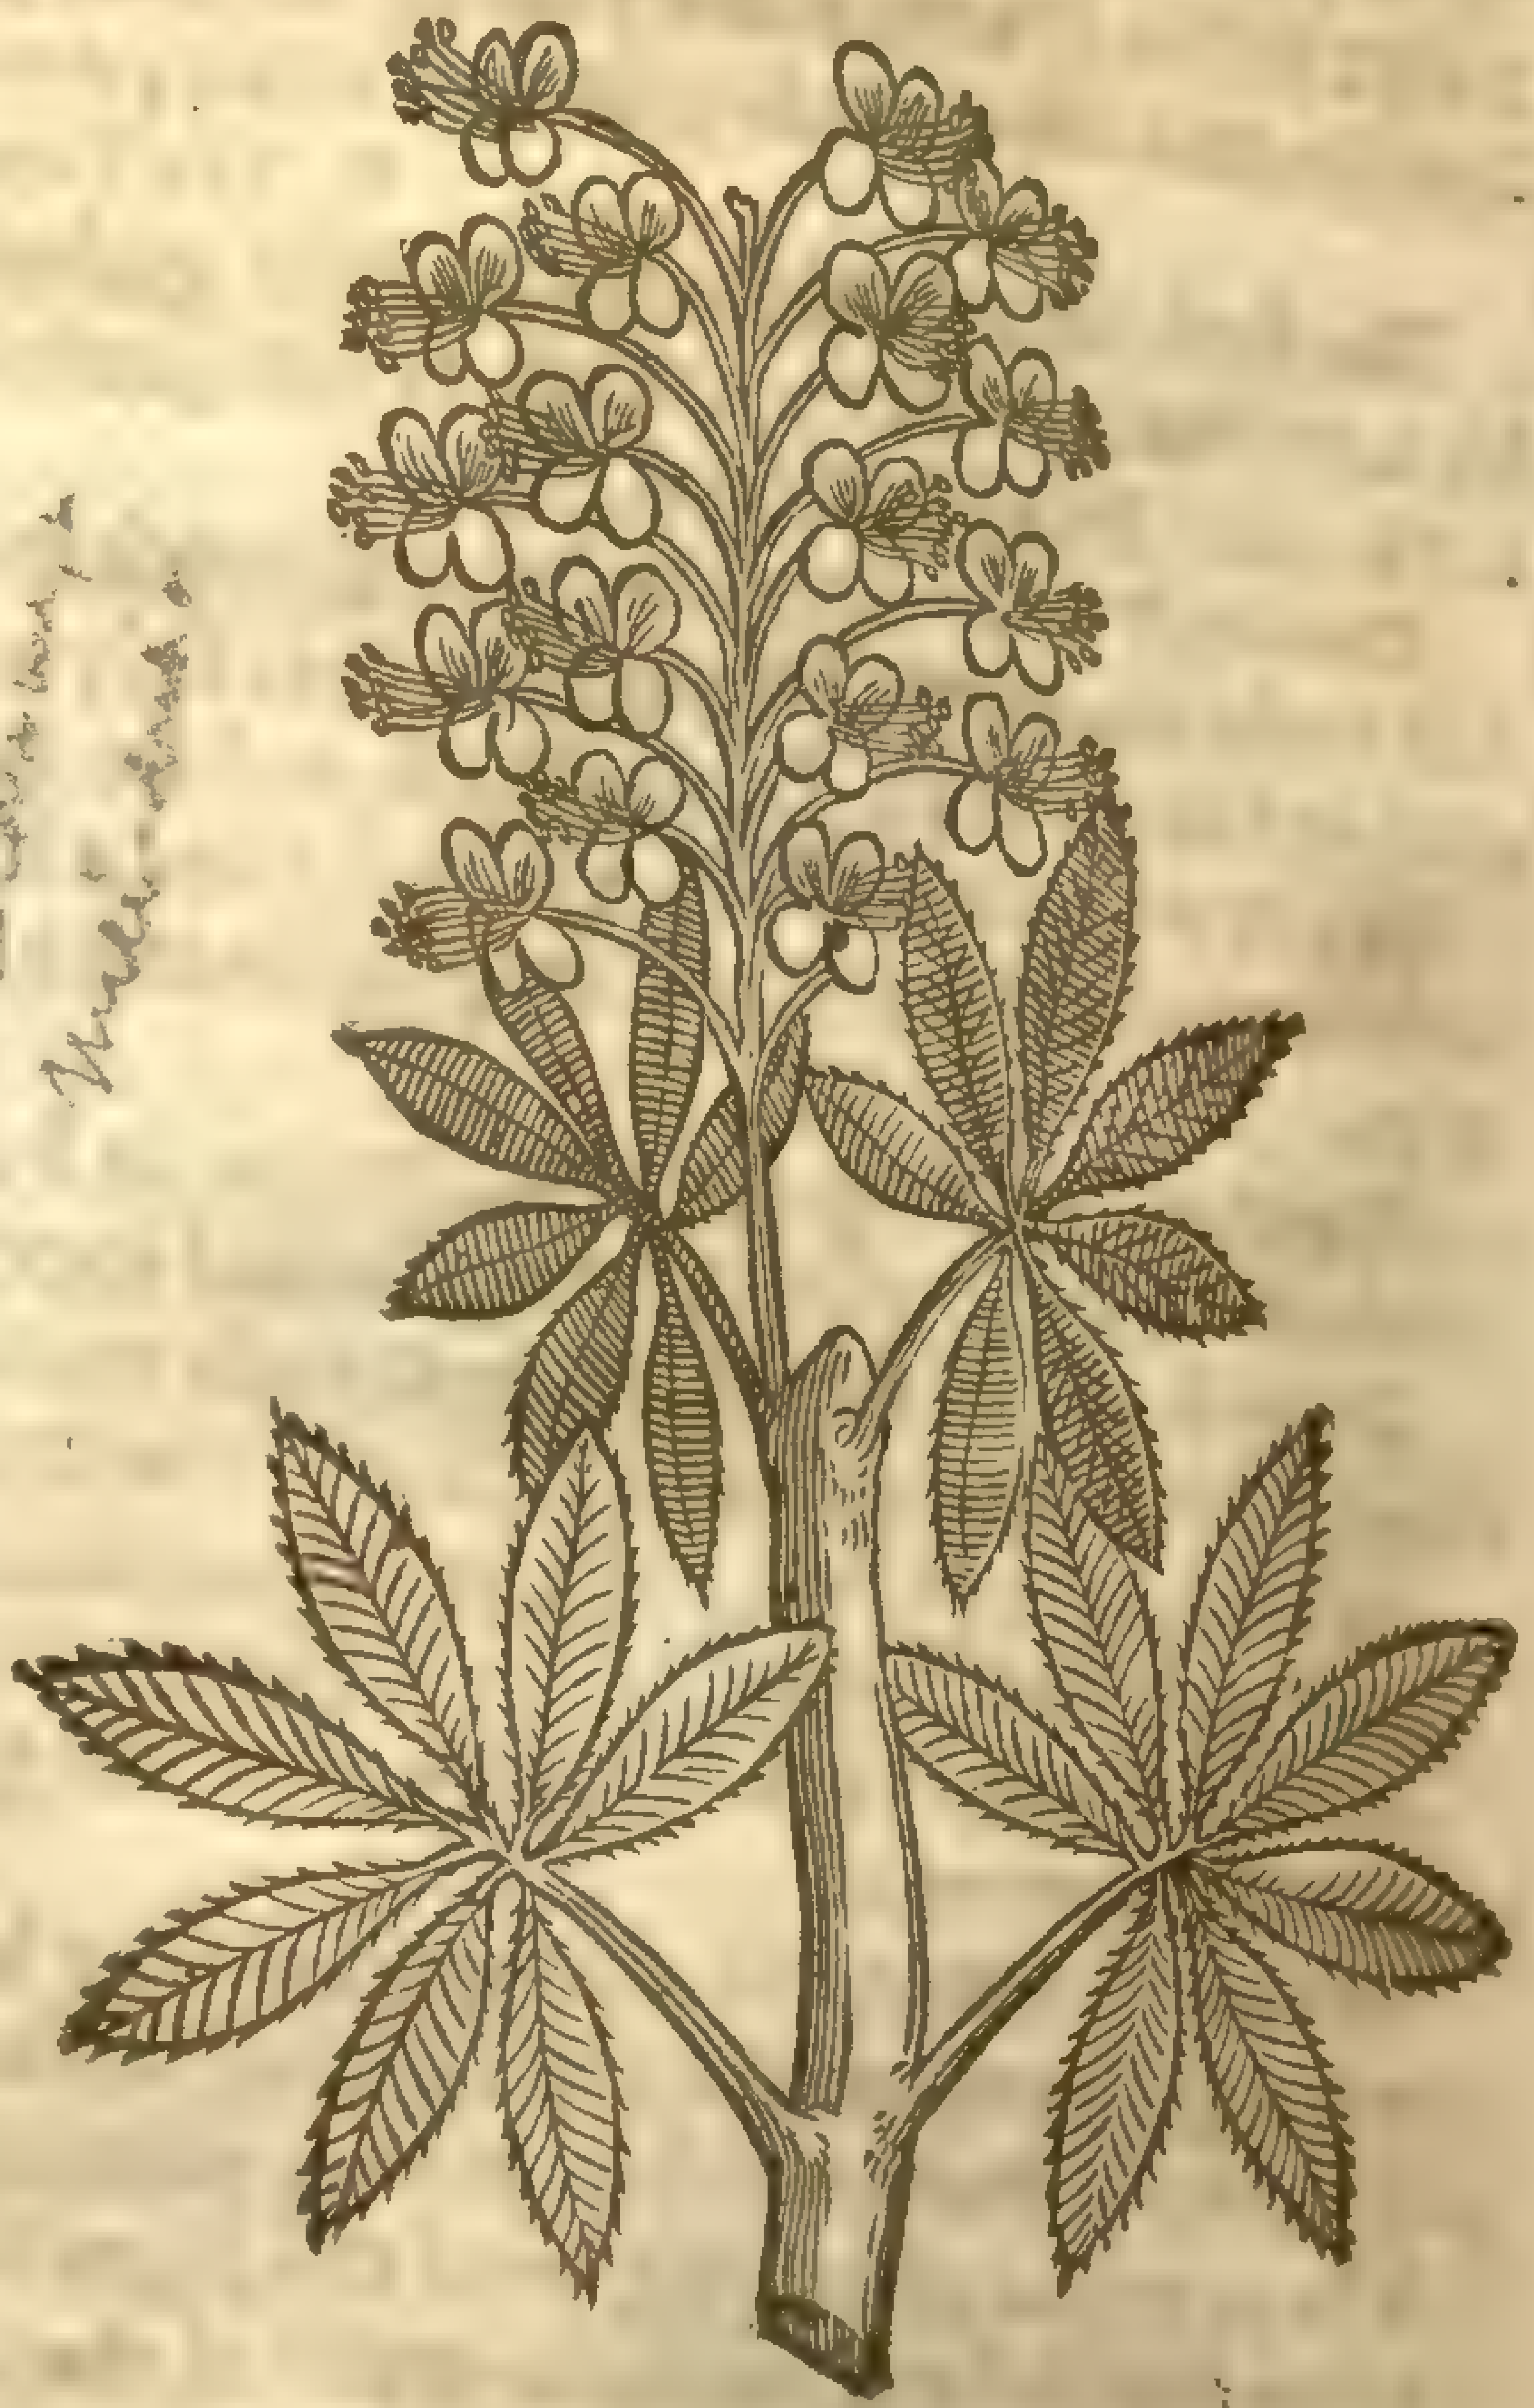
2 The Horſe Cheſtnut groweth likewiſe to be a very great tree, ſpreading his great and large armes or branches far abroad, by which meanes it maketh a very good coole ſhadow. Theſe branches are garniſhed with many beautifull leaues, cut or diuided into fiue, ſix, or ſeuen ſections or diuiſions like to the Cinkefoile, or rather like the leaues of *Ricinus*, but bigger. The floures grow at the top of the ſtalkes, conſiſting of foure ſmall leaues like the Cherry bloſſome, which turne into round rough prickly heads like the former, but more ſharpe and harder: the Nuts are alſo rounder. ‡ The floures of this, ſaith *Cluſius*, (whoſe figure of them I here giue you) come out of the boſome of the leafe which is the vppermoſt of the branch, and they are many in number growing vpon prettie long foot-ſtalkes, conſiſting each of them of foure white leaues of no great bigneſſe; the two vppermoſt are a little larger than the reſt, hauing round purple ſpots in their middles: out of the middle of the floure come forth many yellowiſh threds with golden pendants. The fruit is contained in a prickly huske that opens in three parts, and it is rounder and not ſo ſharpe pointed as

1 *Caſtanea.*
Cheſtnut tree.



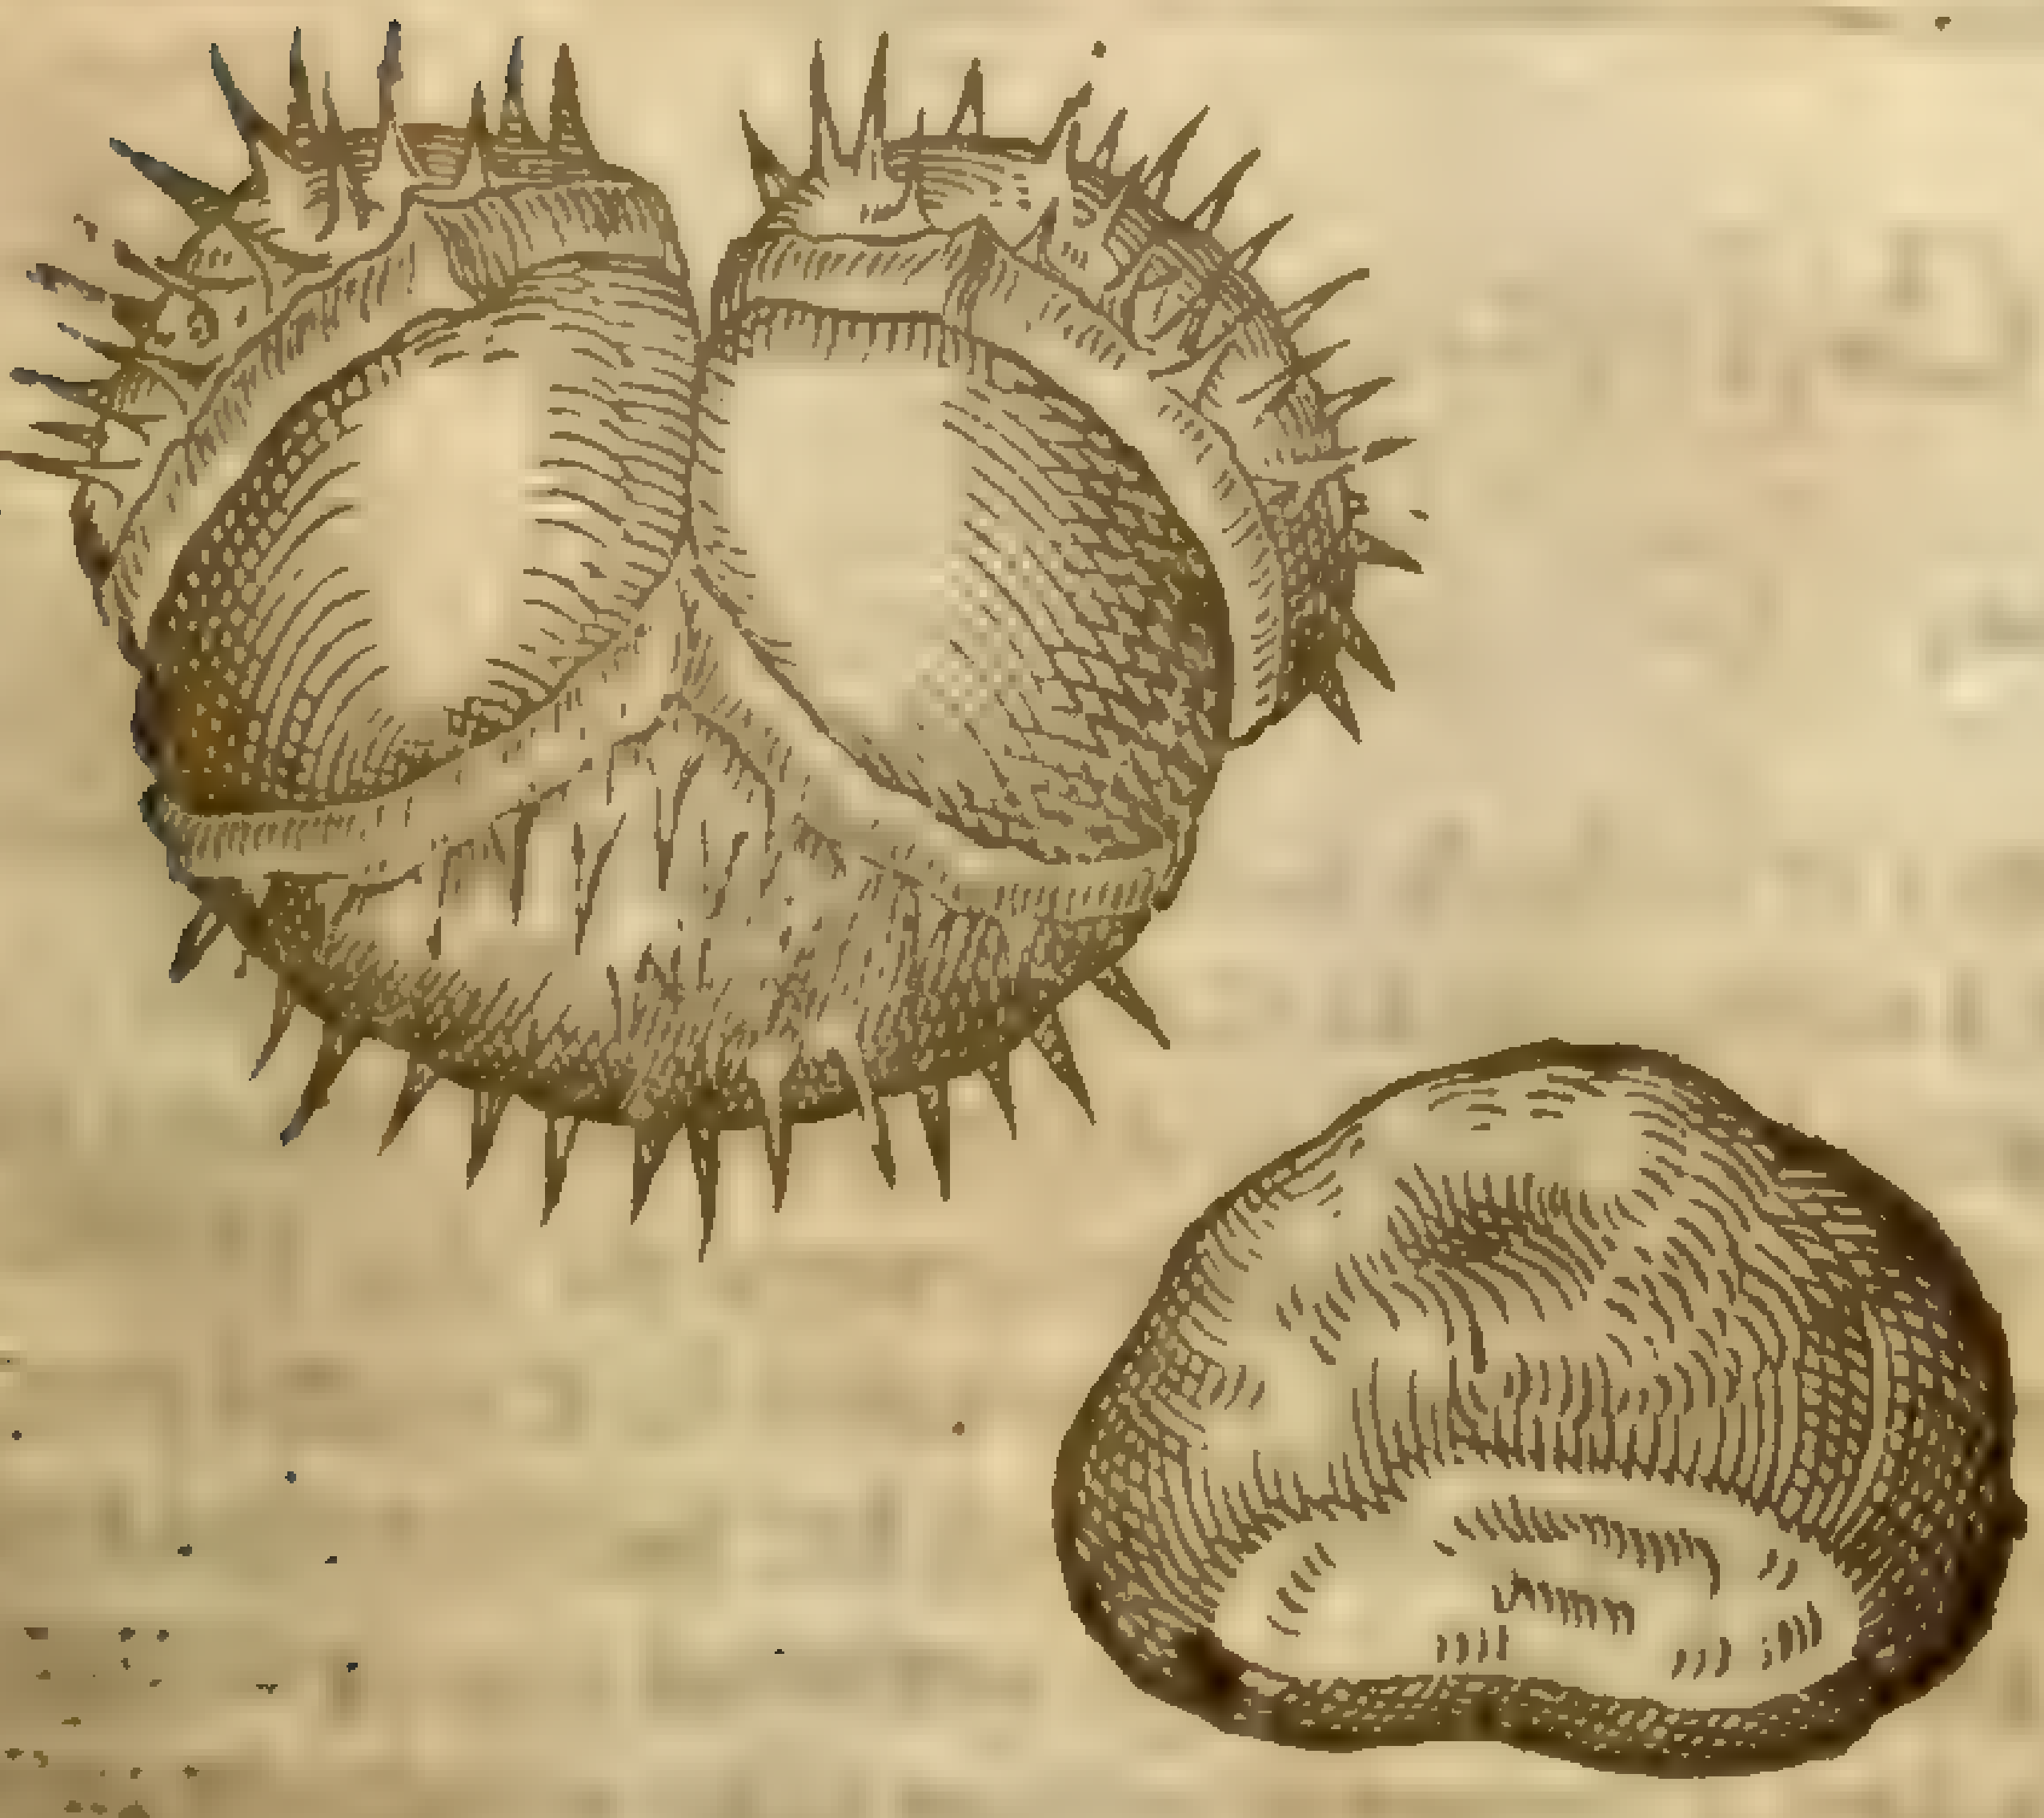
Fagus castanea, in Sm. Engl. Bot. 819
Lin. sp. 4. 151

2 *Caſtanea Equina cum flore.*
Horſe Cheſtnut tree in floure.

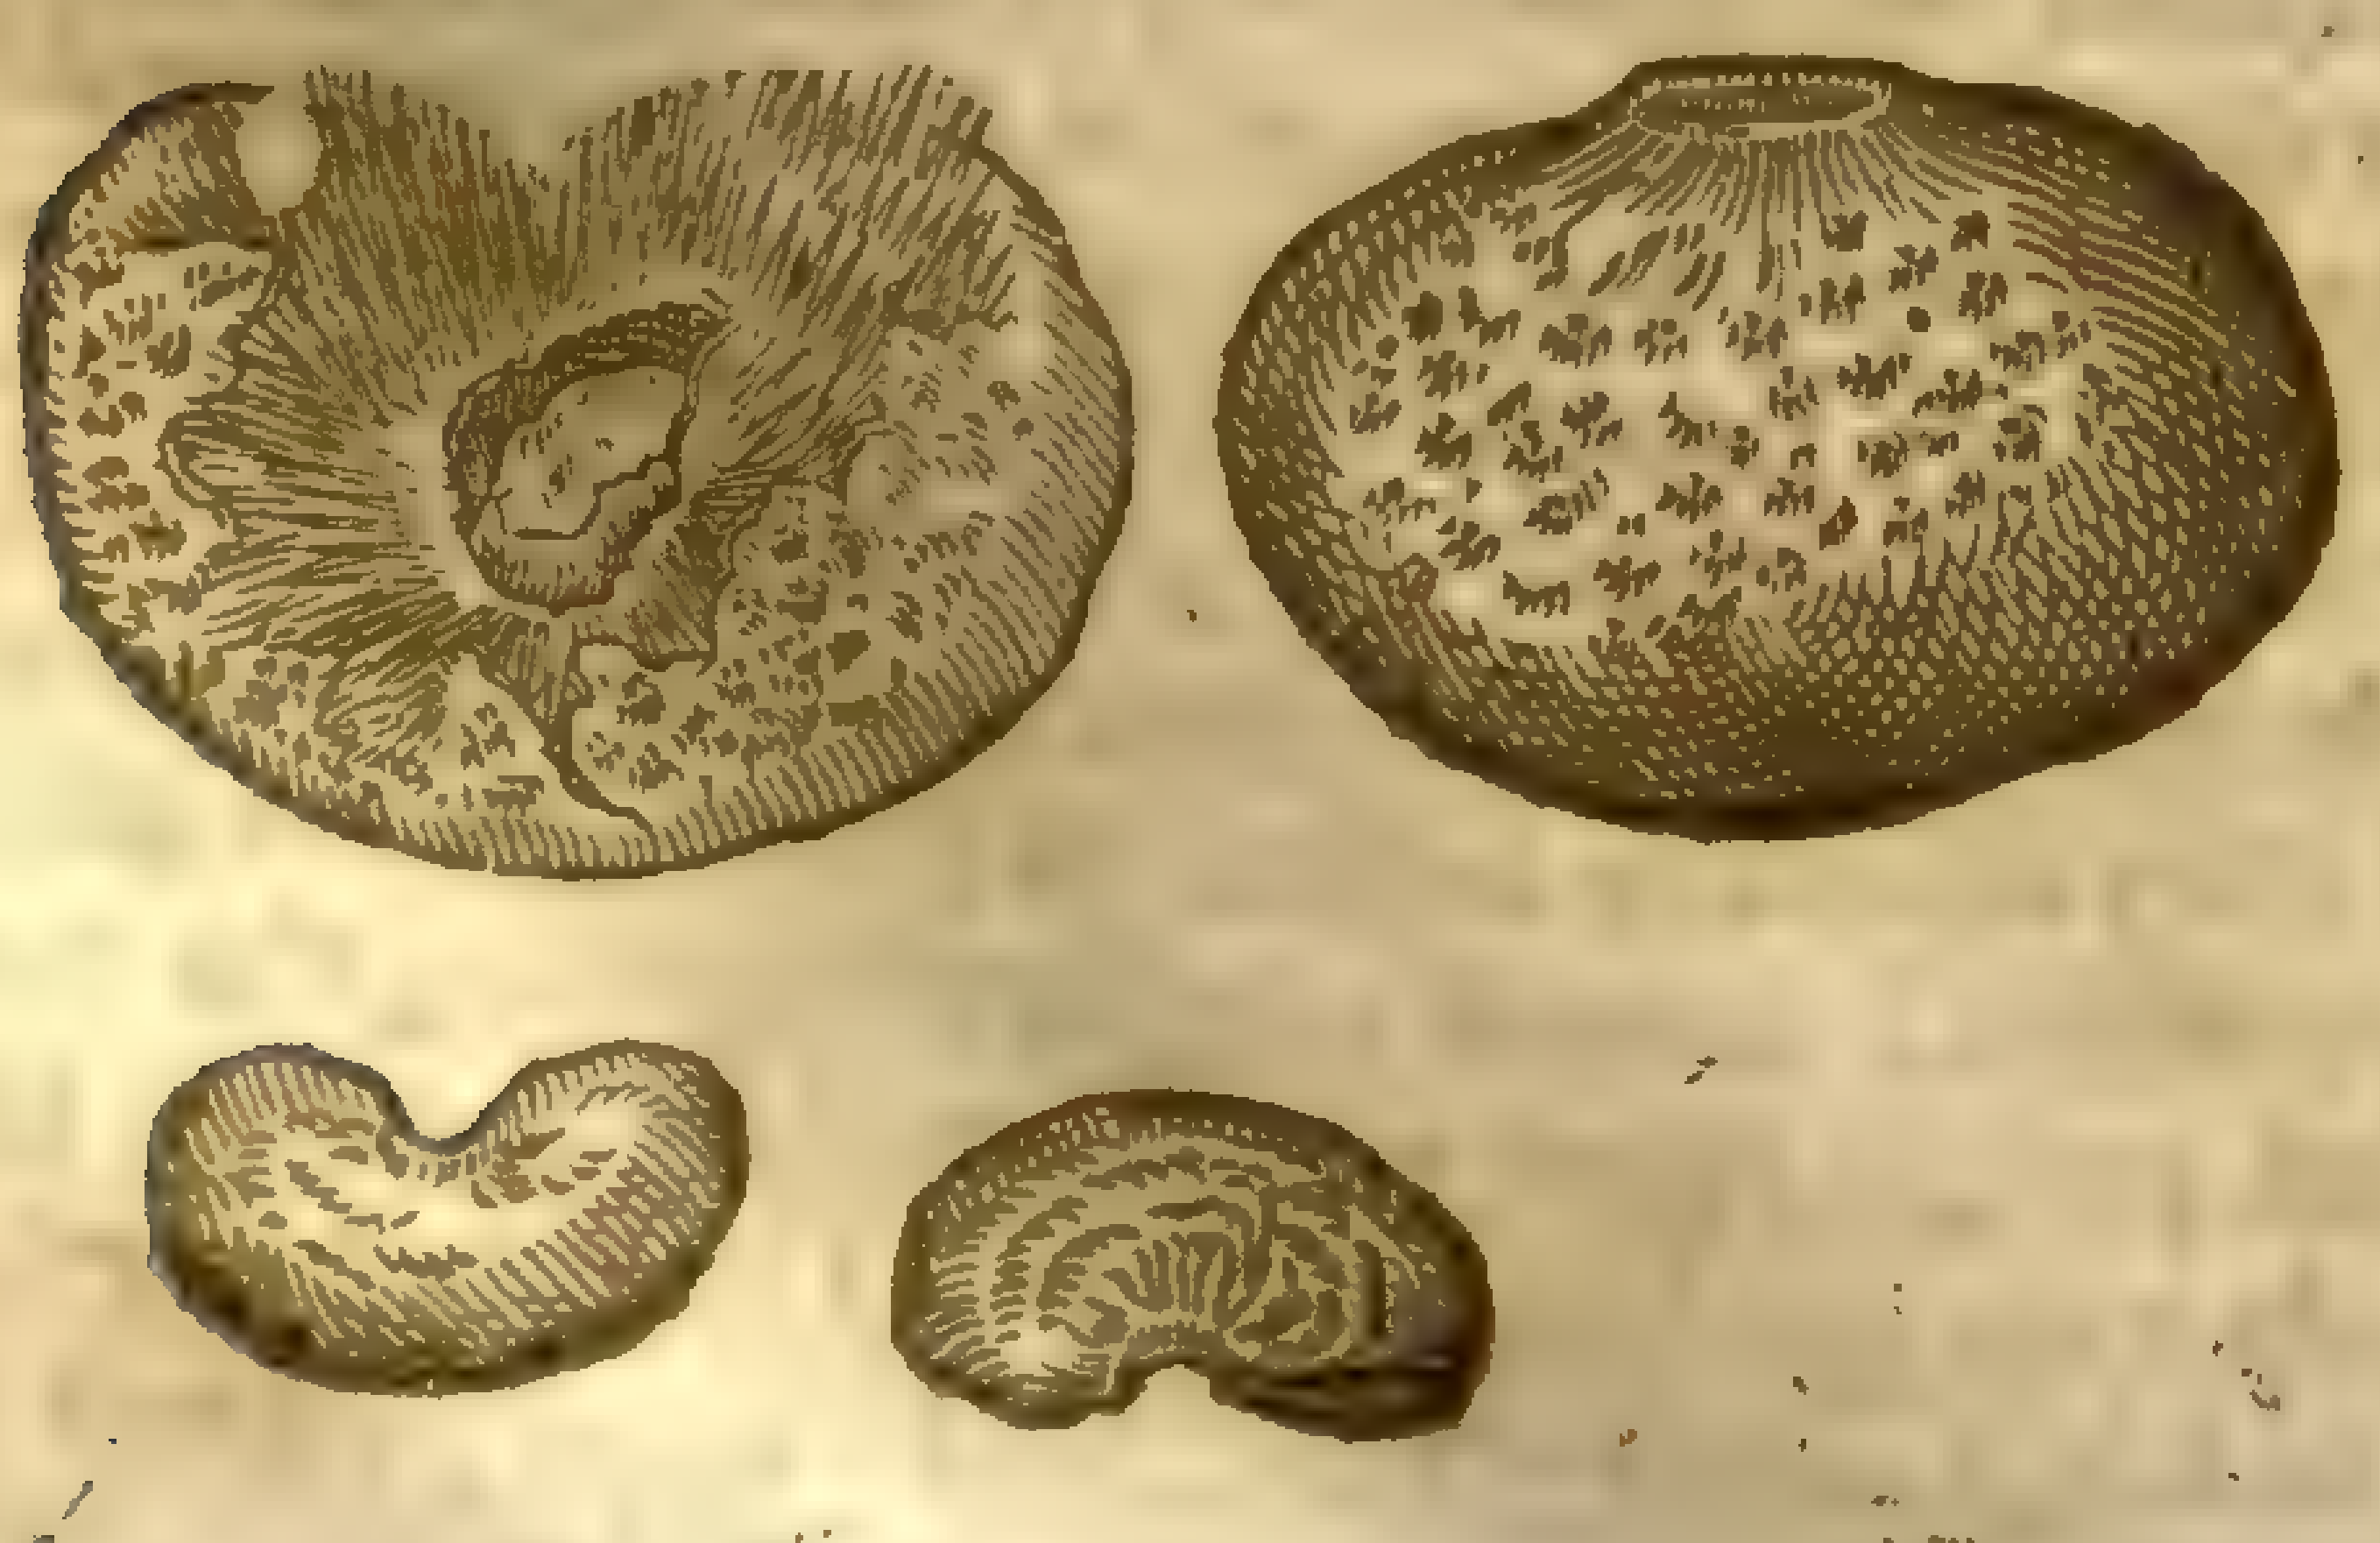


Aesculus hippocastanum, in Mill. dict.

Caſtanea Equina fructus.



‡ 3 *Caſtanea Peruana fructus.*



the ordinary Cheſtnut, neither vnder the vtter coat hath it any peeling within as the other hath, neither is it of ſo good a taſte. ‡

‡ 3 This Americane Cheſtnut is almoſt round, but that it is a little flatted on the ſides, eſpecially whereas it is faſtned to the ſtalke: the vtter coat is ſufficiently thicke, yet brittle, and as it were fungous, of a browniſh yellow colour: vnder this are aboundance of ſmall, yet ſtiffe prickes, faſt ſticking to the ſhell that containes the kernel: the ſhell it ſelfe is browniſh, not thick, but tough and hard to breake, ſmooth and ſhining on the inſide, wherin is contained a kernell of the bigneſſe and color of an hares kidney, white within, and ſweet in taſte, like an almond or the common Cheſtnut. *Cluſius* cals this *Caſtanea Peruana*, or Cheſtnut of Peru; and hee ſaith hee had it from the famous Geographer *Abraham Ortelius*, who had it ſent him by *Benedictus Areas Montanus*. The figure is expreſt vnder that of the Horſe Cheſtnut. ‡

¶ *The Place.*

The firſt growes on mountaines and ſhadowie places, and many times in the vallies: they loue a ſoft and blackeſoile. There be ſundry woods of Cheſtnuts in England, as a mile and a halfe from Feuerſham in Kent, and in ſundry other places: in ſome countries they be greater and pleaſanter: in others ſmaller, and of worſe taſte.

The Horſe Cheſtnut groweth in Italy, and in ſundry places of the Eaſt-countries. ‡ It is now growing with Mr *Tradeſcant* at South Lambeth. ‡

¶ *The Time.*

The blowings or aglets come forth with the leaues in Aprill; but the Nuts later, and be not ripe till Autumne.

¶ *The Names.*

The Cheſtnut tree beares the name of the Nut both in Greeke and Latine: in high Dutch, **Keſtenbaum**, and **Kaſtanibaum**: in low Dutch, **Caſtaniboom**: in French, *Caſtaignier*: in Engliſh, Cheſtnut tree.

The Nut is called in Greeke, κάστανον: in Latine, *Caſtanea, Iouis glans, Sardinia glans*: in high Dutch, **Keſten**: in low Dutch, **Caſtanien**: in Italian, *Caſtagne*: in French, *Chaſtaigne*: in Spaniſh, *Morones, Caſtanas*: in Engliſh, Cheſtnut: the greater Nuts be named of the Italians, *Marroni*: of the French men and of diuers baſe Almanes, *Marons*.

The Horſe Cheſtnut is called in Latine, *Equina Caſtanea*: in Engliſh, Horſe Cheſtnut, for that the people of the Eaſt countries do with the fruit thereof cure their horſes of the cough, ſhortneſſe of breath, and ſuch like diſeaſes.

¶ *The Temperature and Vertues.*

Our common Cheſtnuts are very dry and binding, and be neither hot nor cold, but in a mean betweene both: yet haue they in them a certaine windineſſe, and by reaſon of this, vnleſſe the ſhell be firſt cut, they skip ſuddenly with a cracke out of the fire whileſt they be roſting. A

Of all the Acornes, ſaith *Galen*, the Cheſtnuts are the chiefeſt, and do onely of all the wilde fruits yeeld to the body commendable nouriſhment; but they ſlowly deſcend, they be hardly concocted, they make a thicke bloud, and ingender winde: they alſo ſtay the belly, eſpecially if they be eaten raw. B

Being boiled or roſted they are not of ſo hard digeſtion, they more eaſily deſcend, and are leſſe windy, and yet they alſo make the body coſtiue. C

Some affirme, That of raw Cheſtnuts dried, and afterwards turned into meale, there is made a kinde of bread: yet it muſt needs be, that this ſhould be dry and brittle, hardly concocted and very ſlow in paſſing through the belly; but this bread may be good againſt the laske and bloudy flix. D

An Electuary of the meale of Cheſtnuts and honey is very good againſt the cough and ſpitting of bloud. E

The barke of the Cheſtnut tree boyled in wine and drunke, ſtops the laske, the bloudy flix, and all other iſſues of bloud. F

Chap. 92. *Of the Beech tree.*

¶ *The Deſcription.*

The Beech is an high tree, with boughes ſpreading oftentimes in manner of a circle, and with a thicke body hauing many armes: the barke is ſmooth: the timber is white, hard, and very profitable: the leaues be ſmooth, thin, broad, and leſſer than thoſe of the blacke Poplar: the catkins or blowings be alſo leſſer and ſhorter than thoſe of the Birch tree and yellow: the fruit or Maſt is contained in a huske or cup that is prickly, and rough briſtled, yet not ſo much as that of the Cheſtnut: which fruit being taken forth of the ſhells or vrchin huskes, be couered with a ſoft and ſmooth skin like in colour and ſmoothneſſe to the Cheſtnuts, but they be much leſſer, and of another forme, that is to ſay, triangled or three cornered: the kernell within is ſweet, with a certaine aſtriction or binding qurlitie: the roots be few, and grow not deepe, and little lower than vnder the turfe.

¶ *The Place.*

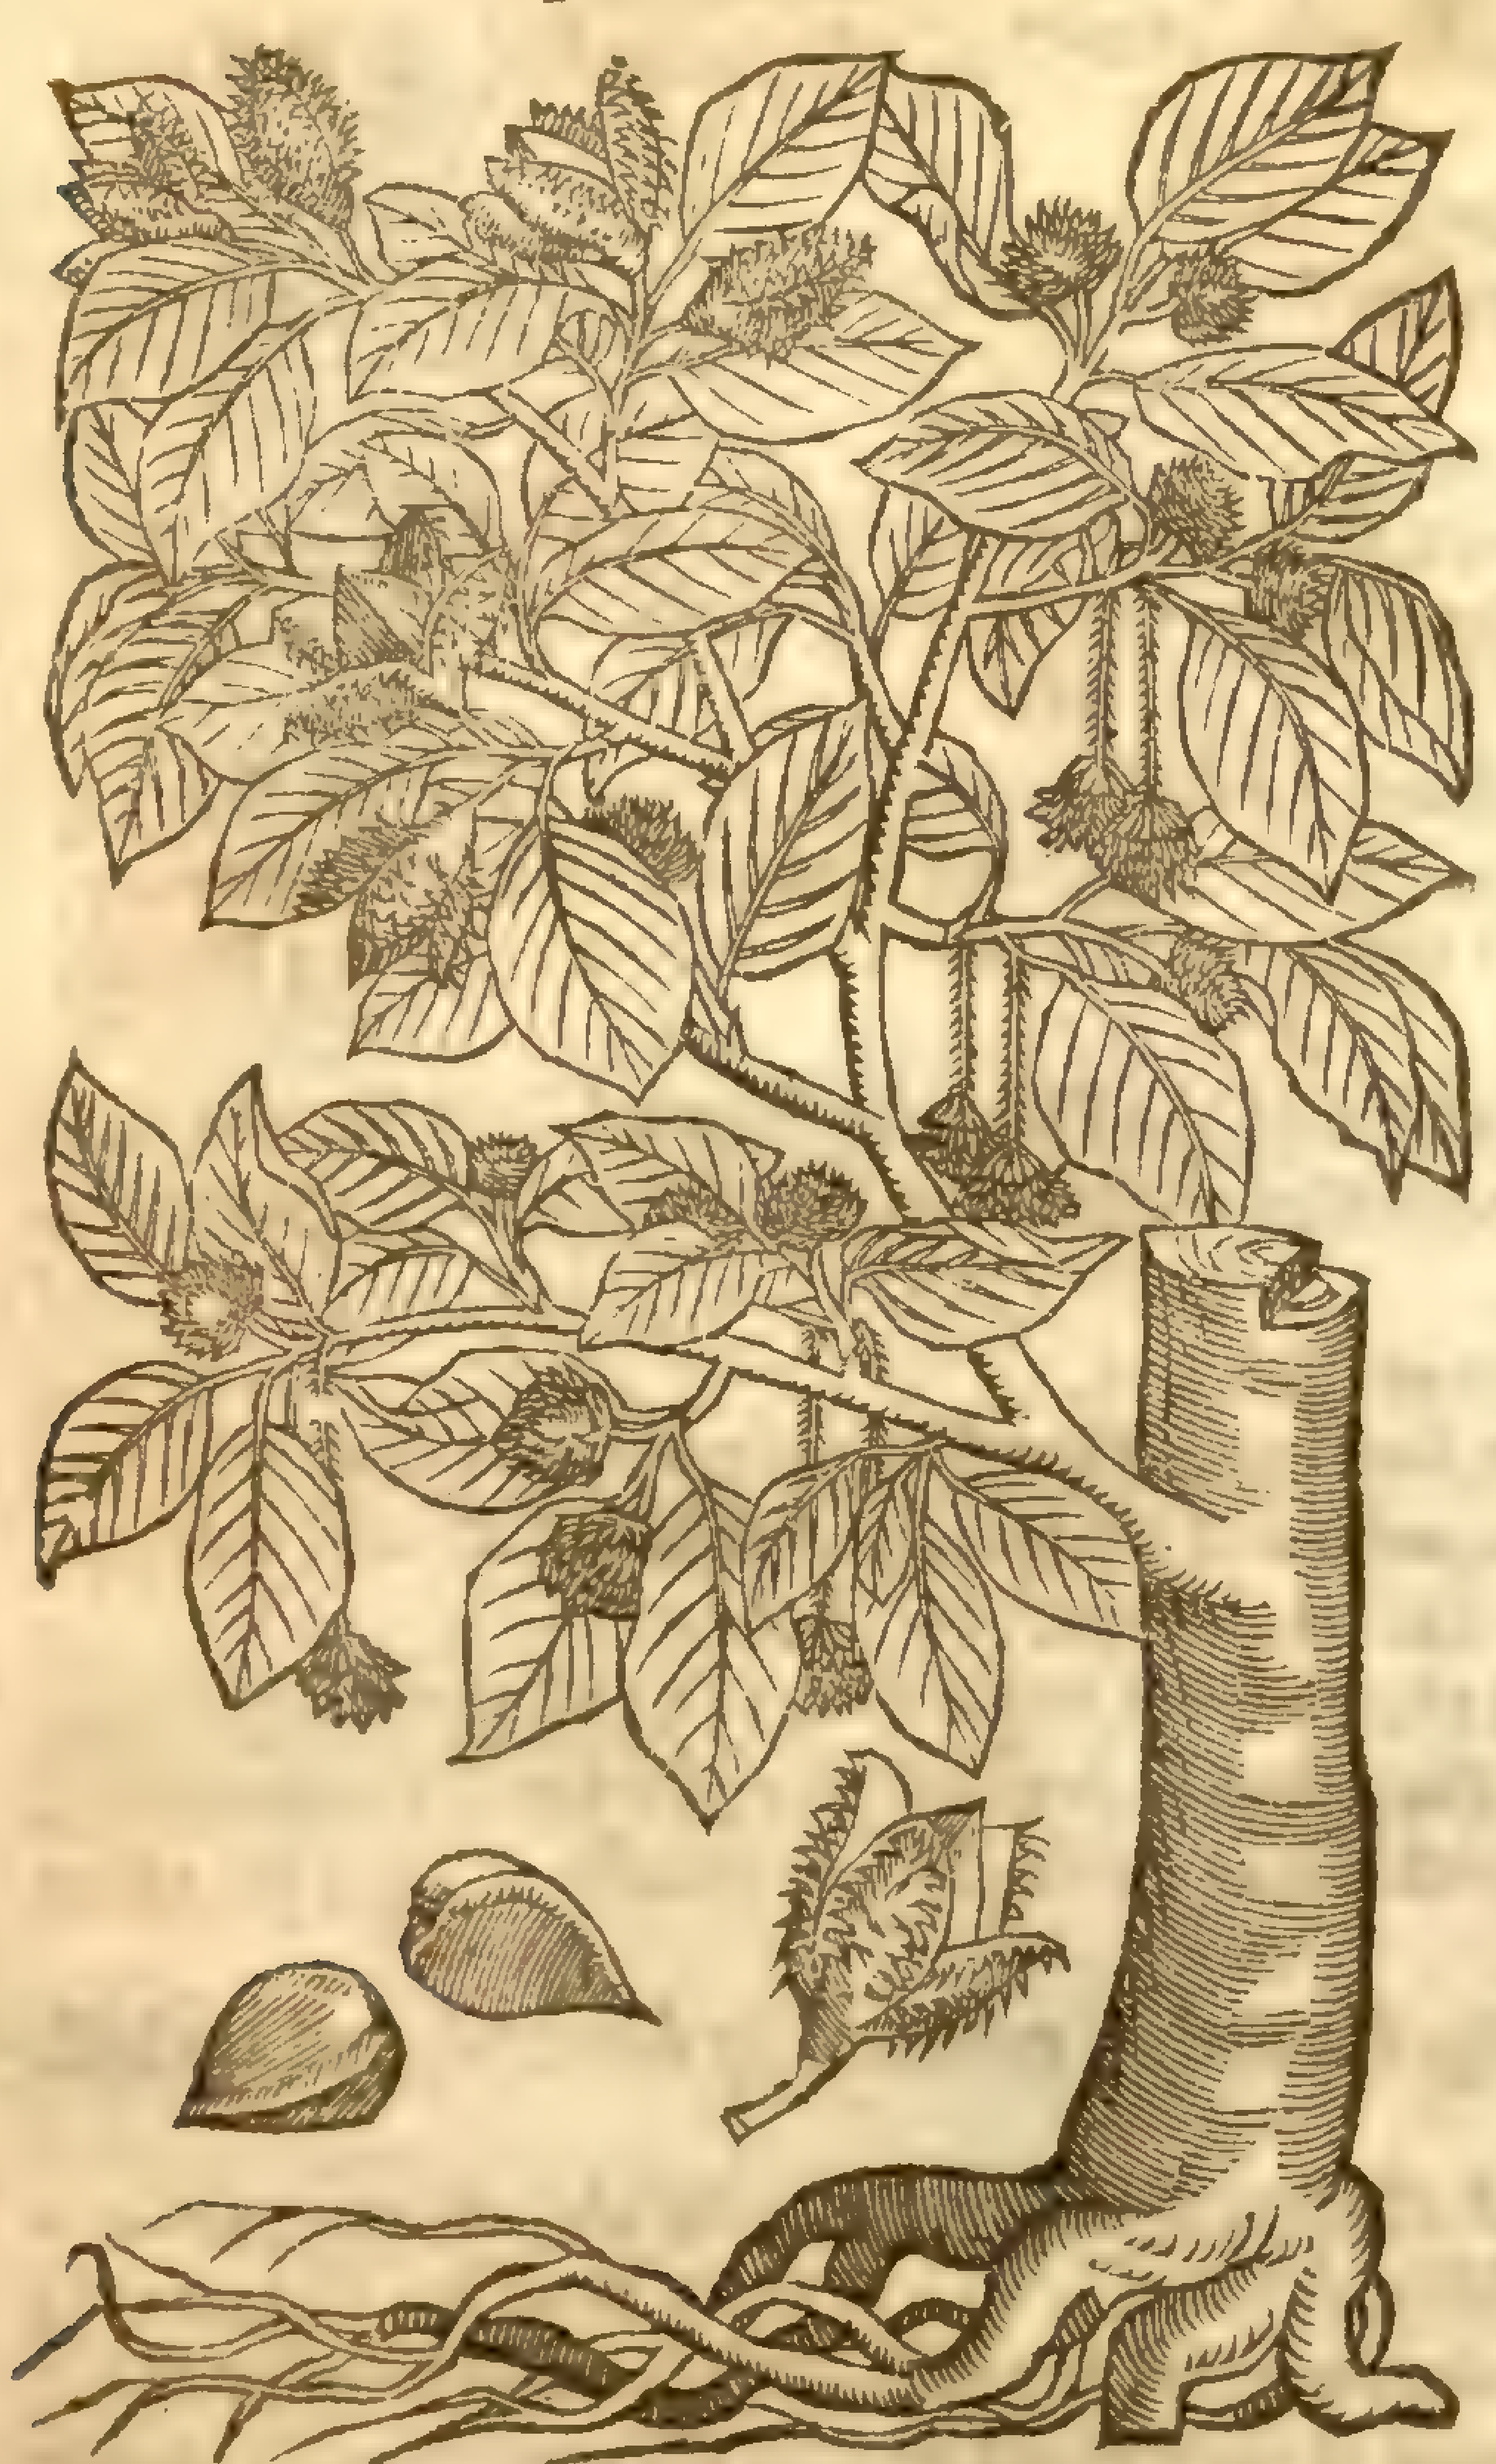
The Beech tree loueth a plaine and open country, and groweth very plentifully in many Forreſts and deſart places of Suſſex, Kent, and ſundry other countries.

¶ *The Time.*

The Beech floureth in Aprill and May, and the fruit is ripe in September, at what time the Deere do eate the ſame very greedily, as greatly delighting therein; which hath cauſed forreſters and huntſmen to call it Buck-maſt.

¶ *The*

Fagus.
The Beech.



F. sylvatica L.
Sm. H. 6. 45

Fl. 832

¶ *The Names.*

The tree is called in Greeke, φηγός: in Latine, *Fagus*: in high Dutch, **Buchbaum**, or **Buch**: in low Dutch, **Bukenboom**: in Italian, *Faggi*: in Spaniſh, *Haia*, *Faia*, and *Fax*: in French, *Fau*, or *Heſtre*: in Engliſh, Beech tree, Beech-maſt, and Buck-maſt.

The fruit is called in Latine, *Nuces Fagi*: in Greeke, βάλανοι τȣ̃ φηγȣ̃: in low Dutch, **Bueken nootkens**: in French, *Faine*: in Engliſh, Beech-maſt. *Dioſcorides* reckons the Beech among the Acorne trees; and yet is the maſt nothing at all like to an Acorne. Of *Theophraſtus* it is called *Oxya*: of *Gaza*, *Sciſcina*.

Pliny alſo makes mention of this tree, but vnder the name of *Oſtrya* (if ſo be in ſtead of *Oſtrya* we muſt not reade *Oxya*) *lib.* 13. *ca.* 21. It brings forth, (ſaith he, meaning Greece) the tree *Oſtrys*, which they likewiſe call *Oſtrya*, growing alone among watery ſtones, like to the Aſh tree in barke and boughes, with leaues like thoſe of the Peare tree, but ſomwhat longer and thicker, and with wrinkled cuts which run quite through, with a ſeed like in colour to a Cheſtnut, and not to barley: the wood is hard and firme, which being brought into the houſe there follows hard trauell of child, and miſerable deaths, as it is reported; and therefore it is to be forborne, and not vſed as fire wood, if *Plinies* copies be not corrupted.

¶ *The Temperature.*

The leaues of Beech do coole: the kernell of the Nut is ſomewhat moiſt.

¶ *The Vertues.*

A The leaues of Beech are very profitably applied vnto hot ſwellings, bliſters, and excoriations; and being chewed they are good for chapped lips, and paine of the gums.

B The kernels or maſt within are reported to eaſe the paine of the kidnies proceeding of the ſtone, if they be eaten, and to cauſe the grauell and ſand the eaſier to come forth. With theſe, mice and Sqirrels are greatly delighted, who do mightily increaſe by feeding thereon: Swine alſo be fatned herewith, and certaine other beaſts: alſo Deere doe feed thereon very greedily: they be likewiſe pleaſant to Thruſhes and Pigeons.

C *Petrus Creſcentius* writeth, That the aſhes of the wood is good to make glaſſe with.

D The water that is found in the hollowneſſe of Beeches cureth the naughty ſcurſe, tetters, and ſcabs of men, horſes, kine, and ſheepe, if they be waſhed therewith.

Chap. 93. *Of the Almond tree.*

¶ *The Deſcription.*

THe Almond tree is like the Peach-tree, yet is it higher, bigger, of longer continuance: the leaues be very long, ſharpe pointed, ſnipt about the edges like thoſe of the Peach tree: the floures be alike: the fruit is alſo like a Peach, hauing on one ſide a cleft, with a ſoft skin without, and couered with a thin cotton; but vnder this there is none, or very little pulpe, which is hard like a griſtle not eaten: the nut or ſtone within is longer than that of the Peach, not ſo rugged, but ſmooth; in which is contained the kernel, in taſte ſweet, and many times bitter: the root of the tree groweth deepe: the gum which ſoketh out hereof is like that of the Peach tree.

‡ There are diuers ſorts of Almonds, differing in largenes and taſte: we commonly haue three or foure ſorts brought to vs, a large ſweet Almond, vulgarly termed a Iordan Almond; and a leſſer, called a Valence Almond: a bitter Almond of the bigneſſe of the Valence Almond, and ſomtimes another bitter one leſſe than it. ‡

¶ The

Amygdalus.
The Almond tree.

¶ *The Place.*

The naturall place of the Almond is in the hot regions, yet we haue them in our London gardens and orchards in great plenty.

¶ *The Time.*

The Almond floureth betimes with the Peach: the fruit is ripe in Auguſt.

¶ *The Names.*

The tree is called in Greeke, Ἀμυγδάλη: in Latine, *Amigdalus*: in French, *Amandier*: in Engliſh, Almond tree.

The fruit is called in Greeke, Ἀμύγδαλα: in Latine, *Amygdalum*: in ſhops, *Amygdala*: in high Dutch, **Mandel**: in low Dutch, **Amandelen**: in Italian *Mandole* in Spaniſh, *Almendras, Amelles*, and *Amendoas*: in French, *Amandes*: in Engliſh Almond.

¶ *The Temperature and Vertues.*

A Sweet Almonds when they be dry be moderately hot; but the bitter ones are hot and dry in the ſecond degree. There is in both of them a certain fat and oily ſubſtance, which is drawne out by preſſing.

B Sweet Almonds beeing new gathered are pleaſant to the taſte, they yeeld ſome kinde of nouriſhment, but the ſame groſſe and earthy, and groſſer than thoſe that be dry, and not as yet withered. Theſe doe likewiſe ſlowly deſcend, eſpecially being eaten without their skins; for euen as the huskes or branny parts of corne doe ſerue to driue downe the groſſe excrements of the belly, ſo doe likewiſe the skins or huskes of the almonds: therefore thoſe that be blanched do ſo ſlowly deſcend, as that they do withall binde the belly; whereupon they are giuen with good ſucceſſe vnto thoſe that haue the laske or the bloudy flix.

C There is drawne out of ſweet Almonds, with liquor added, a white juyce like milke, which ouer and beſides that it nouriſheth, and is good for thoſe that are troubled with the laske and bloudy flix, it is profitable for thoſe that haue the pluriſie and ſpit vp filthy matter, as *Alexander Trallianus* witneſſeth: for there is likewiſe in the Almonds an opening and concocting quality, with a certaine clenſing faculty, by which they are medicinable to the cheſt and lungs, or lights, and ſerue for raiſing vp of flegme and rotten humors.

D Almonds taken before meate do ſtop the belly, and nouriſh but little; notwithſtanding many excellent meates and medicines are therewith made for ſundry griefes, yea very delicat and wholſome meates, as Almond butter, creame of Almonds, marchpane, and ſuch like, which dry and ſtay the belly more than the extracted juyce or milke; and they are alſo as good for the cheſt and lungs.

E They doe ſerue alſo to make the Phyſicall Barley Water, and Barley Creame, which are giuen in hot Feuers, as alſo for other ſicke and feeble perſons, for their further refreſhing and nouriſhments.

F The oyle which is newly preſſed out of the ſweet Almonds is a mitigater of paine and all maner of aches. It is giuen to thoſe that haue the pleuriſie, being firſt let bloud; but eſpecially to thoſe that are troubled with the ſtone in the kidnies: it ſlackens the paſſages of the vrine, and maketh them glib or ſlippery, and more ready to ſuffer the ſtone to haue free paſſage: it maketh the belly ſoluble, and therefore it is likewiſe vſed for the collicke.

G It is good for women that are newly deliuered; for it quickly remoueth the throwes which remaine after their deliuery.

H The oile of Almonds makes ſmooth the hands and face of delicat perſons, and clenſeth the skin from all ſpots, pimples, and lentils.

I Bitter Almonds doe make thin and open, they remoue ſtoppings out of the liuer and ſpleene, therefore they be good againſt paine in the ſides: they make the body ſoluble, prouoke vrine, bring downe the menſes, helpe the ſtrangury, aud clenſe forth of the cheſt and lungs clammie humors: if they be mixed with ſome kinde of looch or medicine to licke on: with ſtarch they ſtay the ſpitting of bloud.

L And it is reported that fiue or ſix being taken faſting do keepe a man from being drunke.

M Theſe alſo clenſe and take away ſpots and blemiſhes in the face, and in other parts of the body; they mundifie and make cleane foule eating vlcers.

N With hony they are laid vpon the biting of mad dogs; being applied to the temples with vineger or oile of Roſes, they take away the head-ache, as *Dioſcorides* writeth.

O They are alſo good againſt the cough and ſhortneſſe of winde.

P They are likewiſe good for thoſe that ſpit bloud, if they be taken with the fine floure of *Amylum*.

Q There is alſo preſſed out of theſe an oile which pruoketh vrine, but eſpecially if a few ſcorpions be drowned and ſteeped therein.

R With oile it is ſingular good for thoſe that haue the ſtone, and cannot eaſily make water but with extremitie of paine, if the ſhare and place betweene the cods and fundament be anoynted therewith.

S *Dioſcorides* ſaith, That the gum doth heate and binde, which qualities notwithſtanding are not perceiued in it.

T It helpeth them that ſpit bloud, not by a binding faculty, but through the clammineſſe of his ſubſtance, and that is by cloſing vp of the paſſages and pores, and ſo may it alſo cure old coughes, and mitigate extreme paines that proceed of the ſtone, and eſpecially take away the ſharpeneſſe of vrine, if it be drunke with Baſtard, or with any other ſweet potion, as with the decoction of Licorice, or of Raiſons of the ſunne. The ſame doth likewiſe kill tetters in the outward parts of the body (as *Dioſcorides* addeth) if it be diſſolued in vineger.

Chap. 94. *Of the Peach tree.*

¶ *The Kindes.*

‡ There are diuers ſorts of Peaches beſides the foure here ſet forth by our Author, but the trees do not much differ in ſhape, but the difference chiefely conſiſts in the fruit, whereof I will giue you the names of the choiſe ones, and ſuch as are to be had from my friend Mr *Millen* in Old-ſtreet, which are theſe; two ſorts of Nutmeg Peaches; The Queenes Peach; The Newington Peach; The grand Carnation Peach; The Carnation Peach; The blacke Peach; The Melocotone; The White; The Romane; The Alberza; The Iſland Peach; Peach du Troy. Theſe are all good ones. He hath alſo of that kinde of Peach which ſome call *Nuciperſica* or Nectorins, theſe following kindes; the Roman red, the beſt of fruits; the baſtard Red; the little dainty greene; the Yellow; the White; the Ruſſet, which is not ſo good as the reſt. Thoſe that would ſee any fuller diſcourſe of theſe may haue recourſe to the late worke of Mr *Iohn Parkinſon*, where they may finde more varieties, and more largely handled, and therefore not neceſſary for me in this place to inſiſt vpon them. ‡

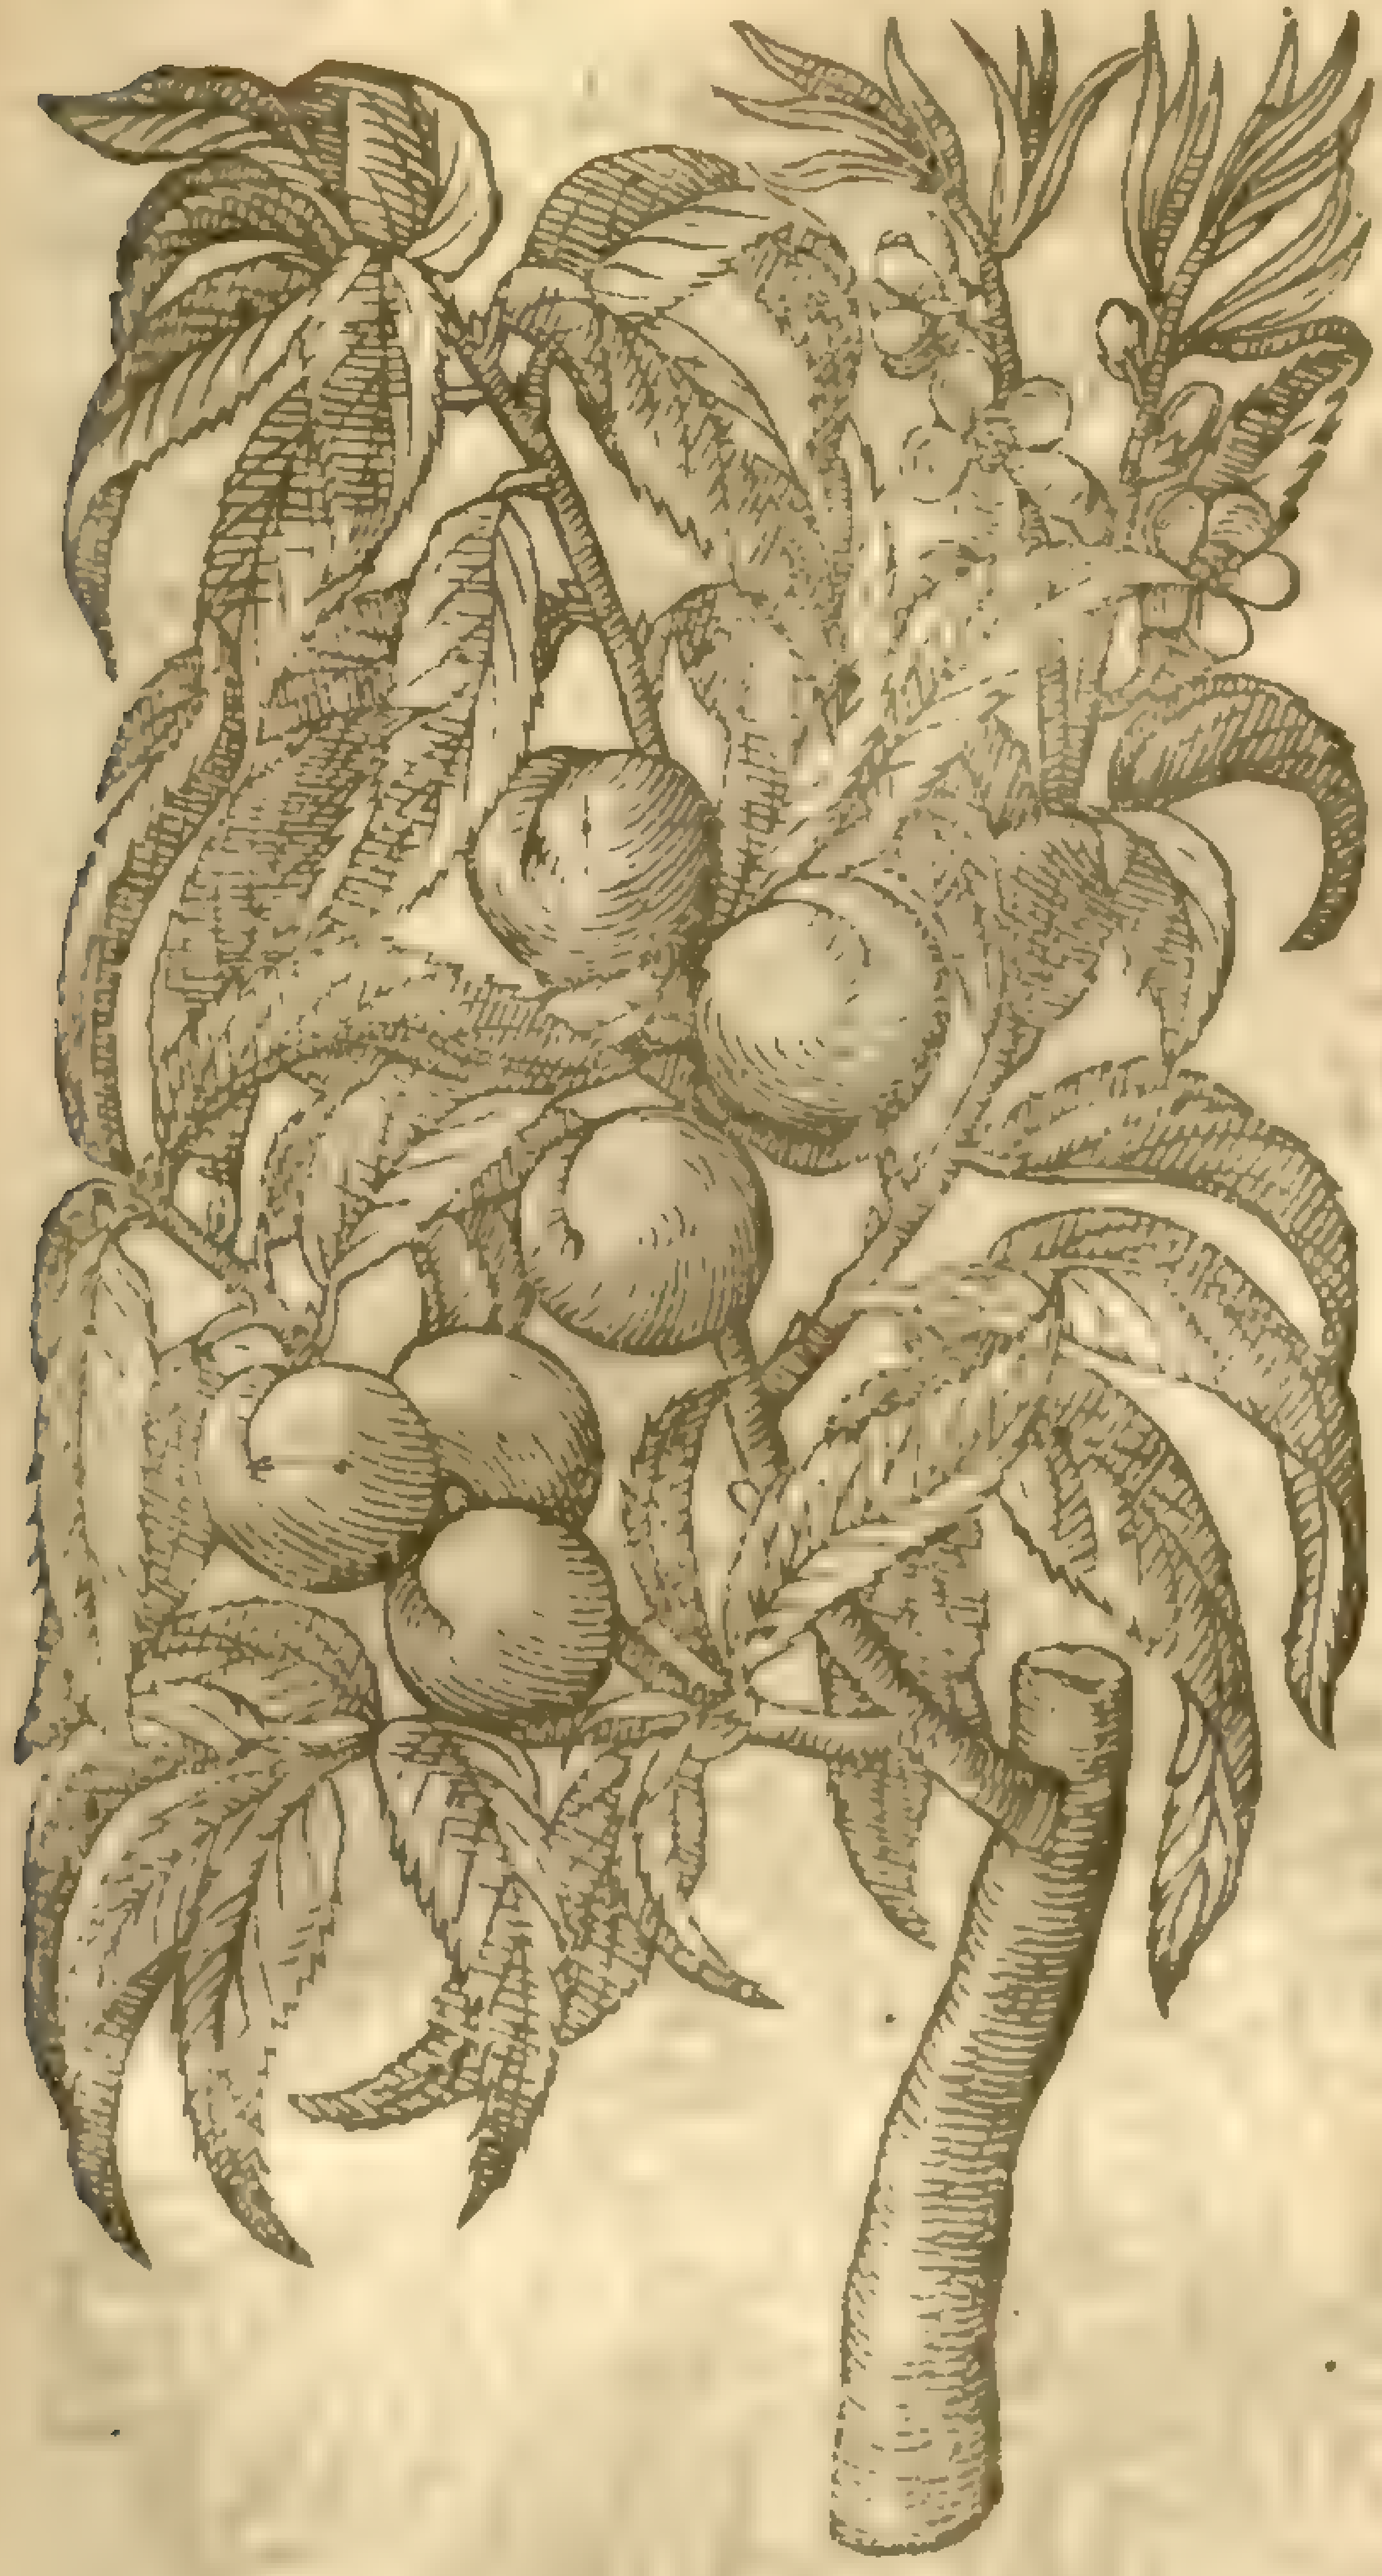
¶ *The Deſcription.*

1 The Peach tree is a tree of no great bigneſſe: it ſendeth forth diuers boughes, which be ſo brittle, as oftentimes they are broken with the weight of the fruit or with the winde. The leaues be long, nicked in the edges, like almoſt to thoſe of the Walnut tree, and in taſte bitter: the floures be of a light purple colour. The fruit or Peaches be round, and haue as it were a chinke or cleft on the one ſide; they are couered with a ſoft and thin downe or hairy cotton, being white without, and of a pleaſant taſte; in the middle whereof is a rough or rugged ſtone, wherein is contained a kernell like vnto the Almond; the meate about the ſtone is of a white color. The root is tough and yellowiſh.

2 The red Peach tree is likewiſe a tree of no great bigneſſe: it alſo ſendeth forth diuers boughes or branches which be very brittle. The leaues be long, and nicked in the edges like to the precedent. The floures be alſo like vnto the former; the fruit or Peaches be round, and of a red colour on the outſide; the meate likewiſe about the ſtone is of a gallant red colour. Theſe kindes of Peaches are very like to wine in taſte, and therefore maruellous pleaſant.

3 *Perſica præcocia*, or the d'auant Peach tree is like vnto the former, but his leaues are greater and larger. The fruit or Peaches be of a ruſſet colour on the one ſide, and on the other ſide next vnto the Sun of a red colour, but much greater than the red Peach: the ſtones whereof are like vnto the former: the pulpe or meate within is of a golden yellow colour, and of a pleaſant taſte.

Perſica alba.
The white Peach.



4 *Perſica lutea*, or the yellow Peach tree is like vnto the former in leaues and flours, his fruit is of a yellow color on the out ſide, and likewiſe on the in ſide, harder than the reſt: in the middle of the Peach is a wooddy hard and rough ſtone full of creſts and gutters, in which doth ly a kernel much like to that of the almond, and with ſuch a like skin: the ſubſtance within is white, and of taſte ſomewhat bitter. The fruit hereof is of greateſt pleaſure, and of beſt taſte of all the other of his kinde; although there be found at this day diuers other ſorts that are of very good taſte, not remembred of the antient, or ſet down by the later Writers, whereof to ſpeake particularly would not bee great to our pretended purpoſe, conſidering wee haſten to an end.

‡ 5 There is alſo kept in ſome of our choice gardens a kind of Peach which hath a very double and beautifull floure, but it is ſeldom ſucceeded by any fruit: they call this *Perſica flore pleno*, The double bloſſomed Peach. ‡

¶ *The Place.*

They are ſet and planted in gardens and Vineyards. I haue them all in my garden, with many other ſorts.

¶ *The Time.*

The Peach tree ſoone comes vp, it beares fruit the third or fourth yeare after it is planted, and it ſoon decayeth, being not of long continuance. It flours in Aprill, or a little after the leaues appeare, and ripens his fruit in September.

¶ *The Names.*

The Peach tree is called in Greeke, Μηλέα Περσική: in Latine, *Malus Perſica*, and *Perſica*: in High-Dutch, **Perſichboum**: in low-Dutch, **Perſe boom**: in French, *Perſcher*: in Engliſh, Peach tree.

The fruit, as *Galen* teſtifieth, is named Μῆλον Περσικόν, and Περσικόν alſo, without any addition: in Latine, *Malum Perſicum*, and *Perſicum*: in high-Dutch, **Pferſing**: in low-Dutch, **Perſen**: in Italy, *Peſche*: in Spaniſh, *Pexegos*: in French, *Piſches*: in Engliſh, Peach.

¶ *The Nature and Vertues.*

Peaches be cold and moiſt, and that in the ſecond degree, they haue a juice and alſo a ſubſtance that doth eaſily putrifie, which yeeldeth no nouriſhment, but bringeth hurt, eſpecially eaten after other meats, for then they cauſe the other meats to putrifie. But they are leſſe hurtfull if they be taken firſt; for by reaſon that they are moiſt and ſlippery, they eaſily and quickly deſcend, and by making the belly ſlippery, they cauſe other meats to ſlip down the ſooner. A

The kernels of the Peaches be hot and dry, they open and clenſe, and are good for the ſtoppings of the liuer and ſpleen. B

Peaches before they be ripe do ſtop the laske, but being ripe they looſe the belly, and ingender naughty humors, for they are ſoon corrupted in the ſtomacke. C

The leaues of the Peach tree do open the ſtoppings of the liuer, and do gently looſen the belly: and being applied plaiſterwiſe vnto the nauel of yong children, they kil the worms, and driue them forth. D

The ſame leaues boiled in milke do kill the wormes in children very ſpeedily. E

The ſame being dried and caſt vpon green wounds cure them. F

The floures of the Peach tree infuſed in warme water for the ſpace of ten or twelue houres, and ſtrained, and more floures put to the ſaid liquor to infuſe after the ſame manner, and ſo iterated ſix or eight times and ſtrained againe, then as much ſugar as it will require added to the ſame liquor, and boiled vnto the conſiſtence or thickneſſe of a ſyrrup, and two ſpoonefulls hereof taken, doth ſo ſingularly well purge the belly, that there is neither Rubarb, Agarick, nor any other purger comparable vnto it; for this purgeth down wateriſh humors mightily, and yet without griefe or trouble, either to the ſtomacke or lower parts of the body. G

H The kernell within the Peach ſtone ſtamped ſmall, and boiled with vineger vntill it be brought to the form of an ointment, is good to reſtore and bring again the haire of ſuch as be troubled with the *Alopecia*.

I There is drawn forth of the kernels of peaches, with Peniroyall water, a juice like to milk, which is good for thoſe that haue the Apoplexy: if the ſame be oftentimes held in the mouth, it draweth forth water and recouereth ſpeech.

K The gum is of a meane temperature, but the ſubſtance thereof is tough and clammy, by reaſon whereof it dulleth the ſharpnes of thin humors: it ſerueth in a looch or licking medicine for thoſe that be troubled with the cough, and haue rotten lungs, and ſtoppeth the ſpitting and raiſing vp of bloud, and alſo ſtayeth other fluxes.

Chap. 95.

Of the Aprecocke or Abrecocke tree.

1 *Armeniaca malus major.*
The greater Aprecocke tree.

Prunus armeniaca, L. [illegible]

2 *Armeniaca malus minor.*
The leſſer Aprecocke tree.

Prunus armeniaca [illegible]

¶ *The Deſcription.*

1 This tree is greater than the Peach tree, and hath a bigger body, it laſteth longer, eſpecially if it be graffed or inoculated: the leaues hereof are broad and ſharp pointed, like thoſe of blacke Poplar, but leſſer, and comming more neere to the leaues of Birch, nicked in the edges: the floures are ſomewhat white, the fruit round like a Peach, yellow within and without, in which doth lie a browne ſtone nothing rough at all as is that of the Peach, ſhorter alſo and leſſer, in which is included a ſweet kernell.

2 We haue another ſort of Aprecock, whoſe trunke or body is equal with the other in greatneſſe, it is like alſo in leaues and brittle branches: his time of flouring, flouriſhing, and manner of growing accordeth: the only point wherein they differ is, that this tree bringeth forth leſſe fruit, and not ſo good in taſte, in euery other reſpect it is like.

‡ Of this alſo Mr *Parkinſon* hath ſet forth diuers varieties, and my fore mentioned friend Mr *Millen* hath theſe fiue ſorts, the common, the long and great, the Muske, the Barbary, and the early Aprecocke. ‡

¶ The

¶ *The Place.*

Theſe trees grow in my garden, and now adaies in many other gentlemens gardens throughout England.

¶ *The Time.*

They floure and flouriſh in Aprill, and their fruit is ripe in Iuly.

¶ *The Names.*

The tree is called in Greeke, Μηλέα Ἀρμενιακὴ: in Latine, *Malus Armeniaca*: in Engliſh, Abrecock tree and Aprecock tree.

The fruit is named Μῆλον Ἀρμενιακὸν, and of diuers, πραικόκκιον, or βερικόκκιον, which bee words corrupted from the Latine; for *Præcox* in Latine is diuers times called *Præcoquum*: it is named *Malum Armeniacum*, and commonly *Armeniacum*: in high-Dutch, **Molletten Mollelin, S. Johans Pferſing**: in low-Dutch, **Vroege Perſen, Auant Perſen**: in Italian, *Armeniache, Bacoche, Criſomele, Moniache*: in French, *Abricoz*: in Spaniſh, *Alvarcoques, Alvarchigas*, and *Albercocs*: in Engliſh, Abrecocke, Aprecock, and Aprecox.

Galen ſeems to make a difference between *Præcocia* and *Armeniaca*, in his book of the Faculties of Nouriſhments, preferring *Præcocia* before *Armeniaca*: yet he doth confeſſe that both of them bee called *Armeniaca*. Others pronounce them *Armenia* with foure ſyllables. And in his book of the Faculties of ſimple medicines he affirmeth, that both the fruit and the tree are called πραικόκκιον: Diuers alſo of the later phyſitians do betwixt theſe make a difference, ſaying, that the greater ones & thoſe that are graffed be *Armeniaca* (which the French men call *Avant Perſes*) and the leſſer *Præcocia*: in French, *Abricoz*.

¶ *The Temperature and Vertues.*

Aprecockes are cold and moiſt in the ſecond degree, but yet not ſo moiſt as Peaches, for which cauſe they do not ſo ſoon putrifie; they are alſo more wholſome to the ſtomack and pleaſant to the taſte, yet doe they likewiſe putrifie and yeeld but little nouriſhment, and the ſame cold, moiſt, and full of excrements. Being taken after meat they corrupt and putrifie in the ſtomack; being firſt eaten before meat they eaſily deſcend, and cauſe other meats to paſſe down the ſooner, like as alſo the Peaches do. A

The kernel within it is ſweet, and nothing at all in facultie like that of the Peach. B

The vertues of the leaues of this tree are not yet found out. C

Chap. 96. *Of the Pomegranat tree.*

¶ *The Kindes.*

As there be ſundry ſorts of Apples, Peares, Plums, and ſuch like fruits; ſo there are two ſorts of Pomegranats, the garden and the wilde, and a third ſort which is barren and fruitleſſe: the fruit of the garden Pomegranat is of three ſorts; one hauing a ſoure juice or liquor, another a very ſweet and pleaſant liquor, and the third the taſt of wine. Of the wild alſo there be two ſorts, and the difference between them is no more than betwixt crabs and weildings, which are both wilde kindes of apples. Therefore the deſcription of the garden Pomegranat ſhall ſuffice for the reſt.

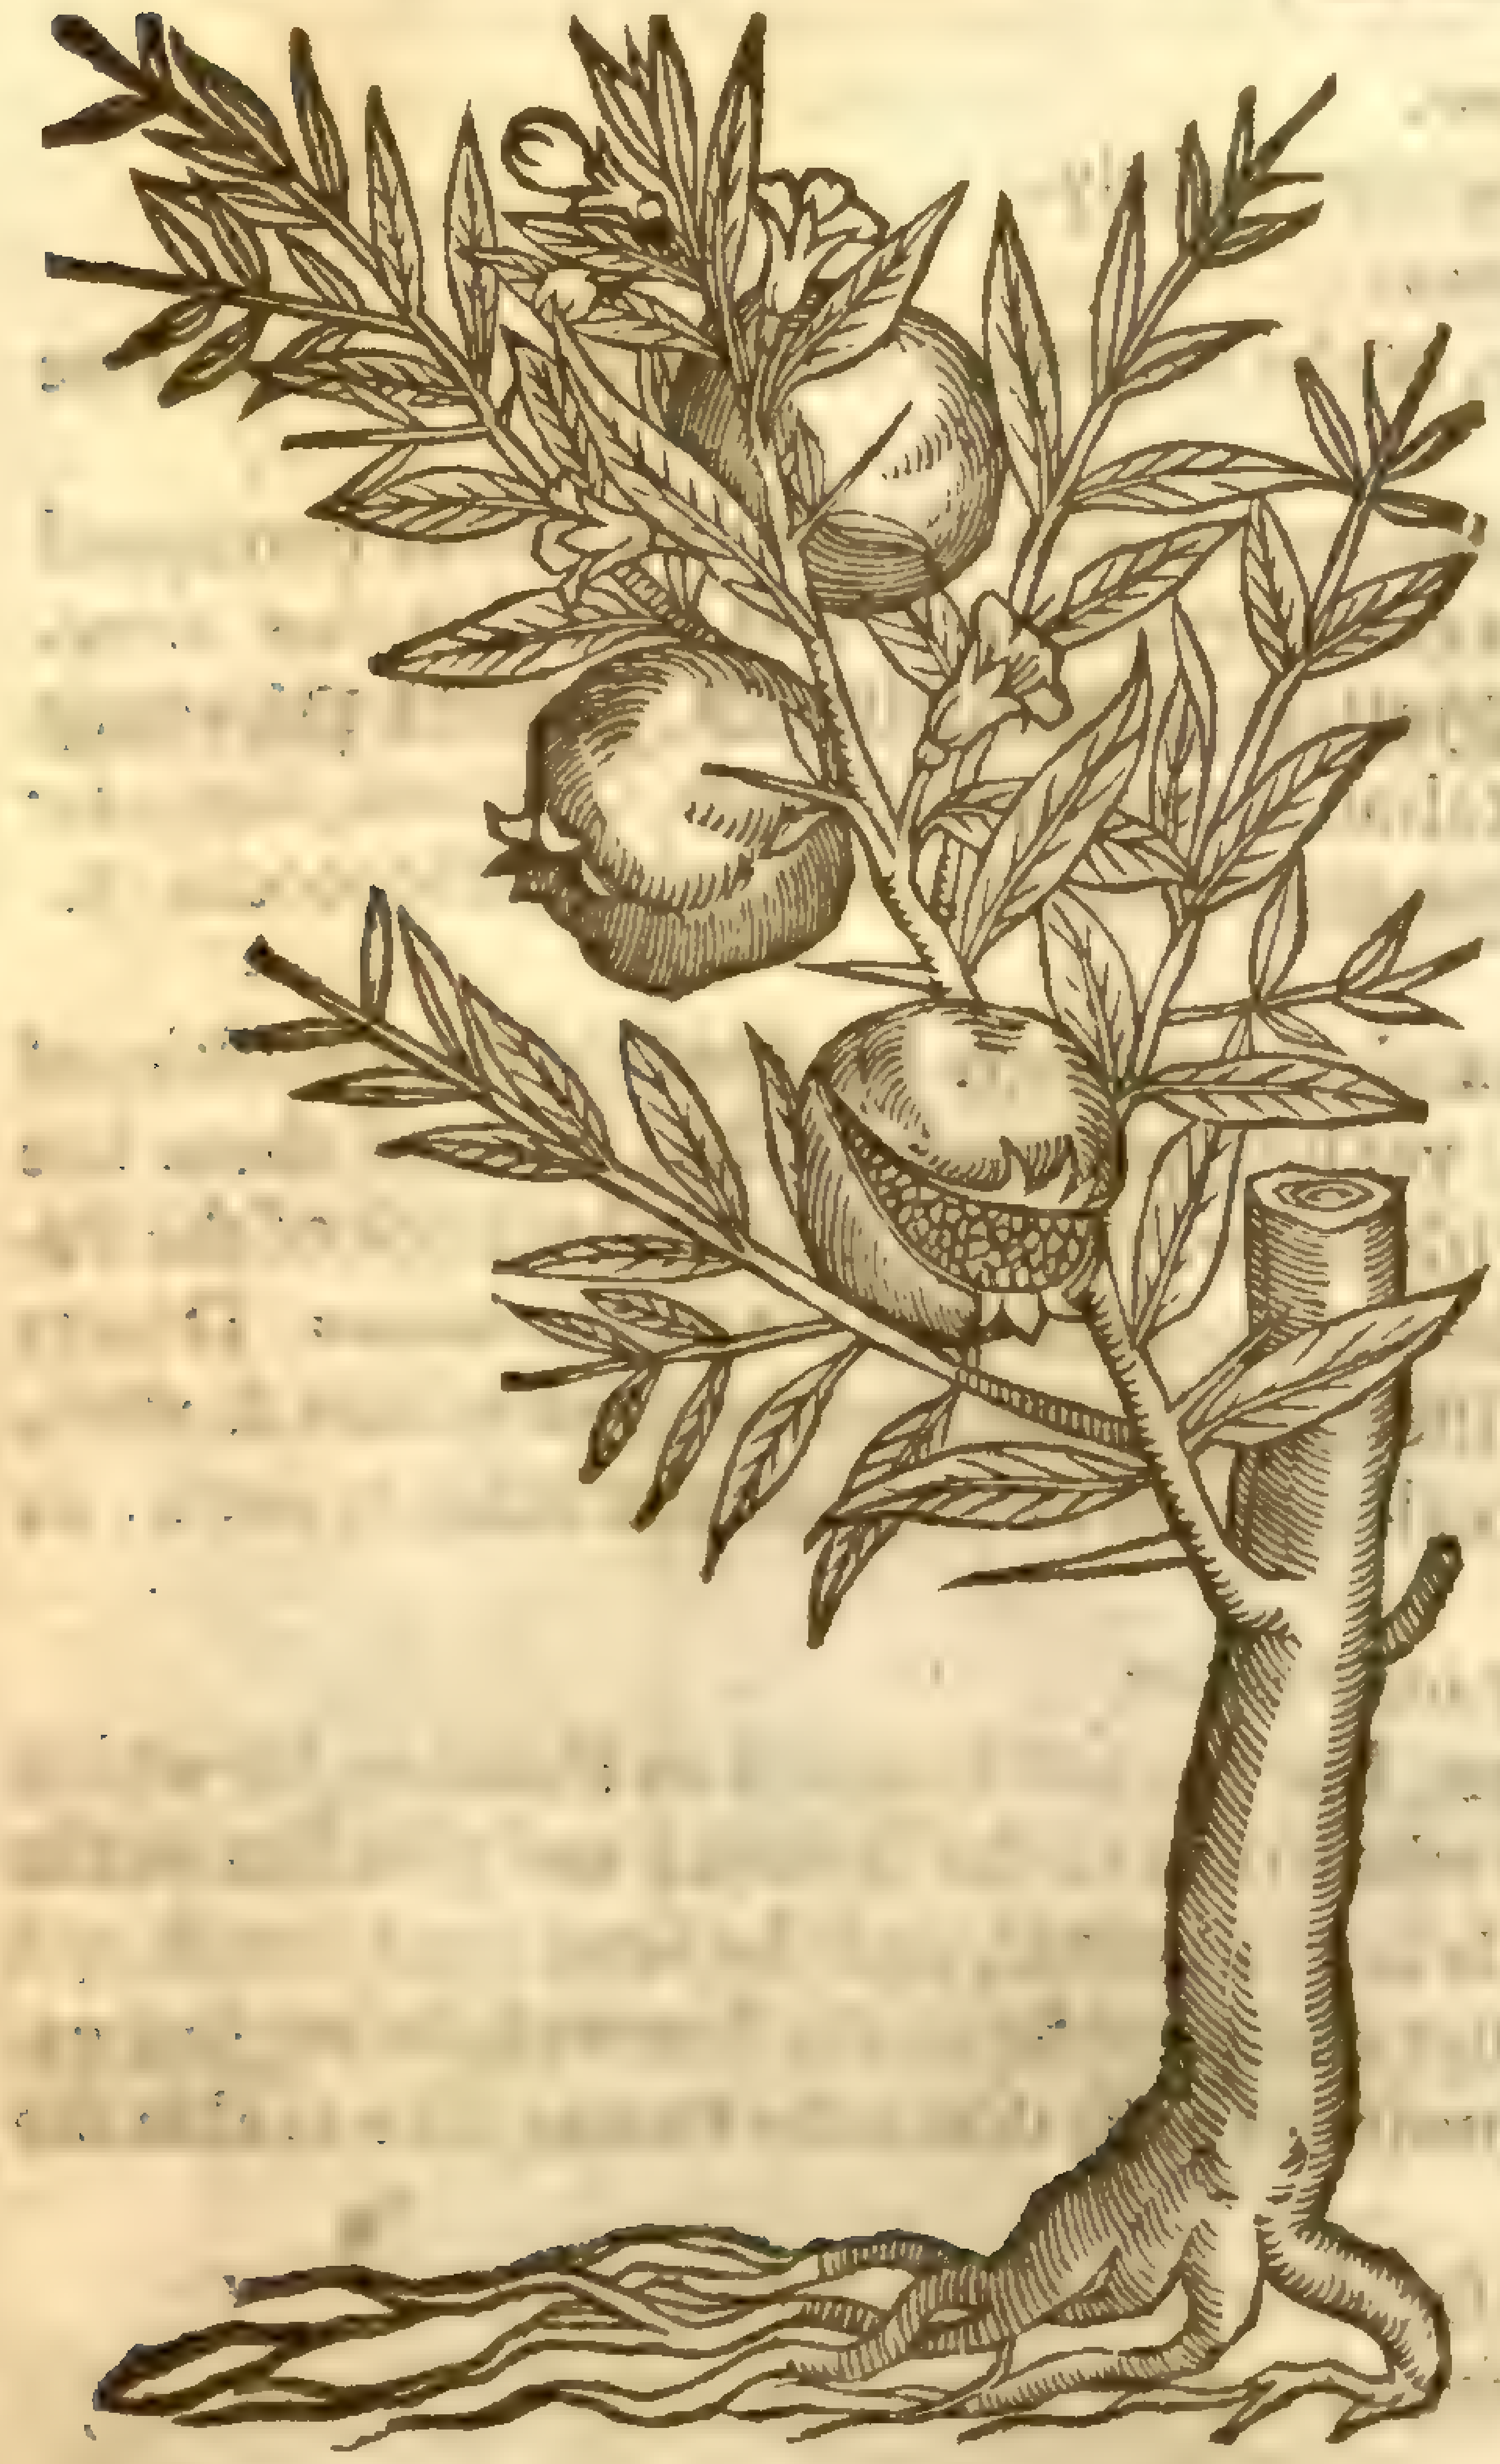
¶ *The Deſcription.*

1 The manured Pomegranat tree groweth vp to the height of an hedge tree, beeing ſeuen or eight cubits high, hauing many pliant twiggy branches, very limber, tough, and of a browne colour, whereon are ſet very many leaues in ſhape like thoſe of the Privet, but more like thoſe of the Myrtle tree, of a bright ſhining green colour tending to yellowneſſe: among which ſtand certain ſharp thorns confuſedly ſet, and likewiſe hollow floures like to the hedge roſe, indented on the edges like a ſtar, of a Carnation colour, and very ſingle: after which commeth the fruit, couered with an hard bark of an ouerworne purpliſh colour, full of grains and kernells, which after they be ripe are of a crimſon colour, and full of juice, which differeth in taſt according to the ſoile, clymat, and country where they grow; ſome be ſweet, others ſoure, and the third are in a middle between them both, hauing the taſte of wine.

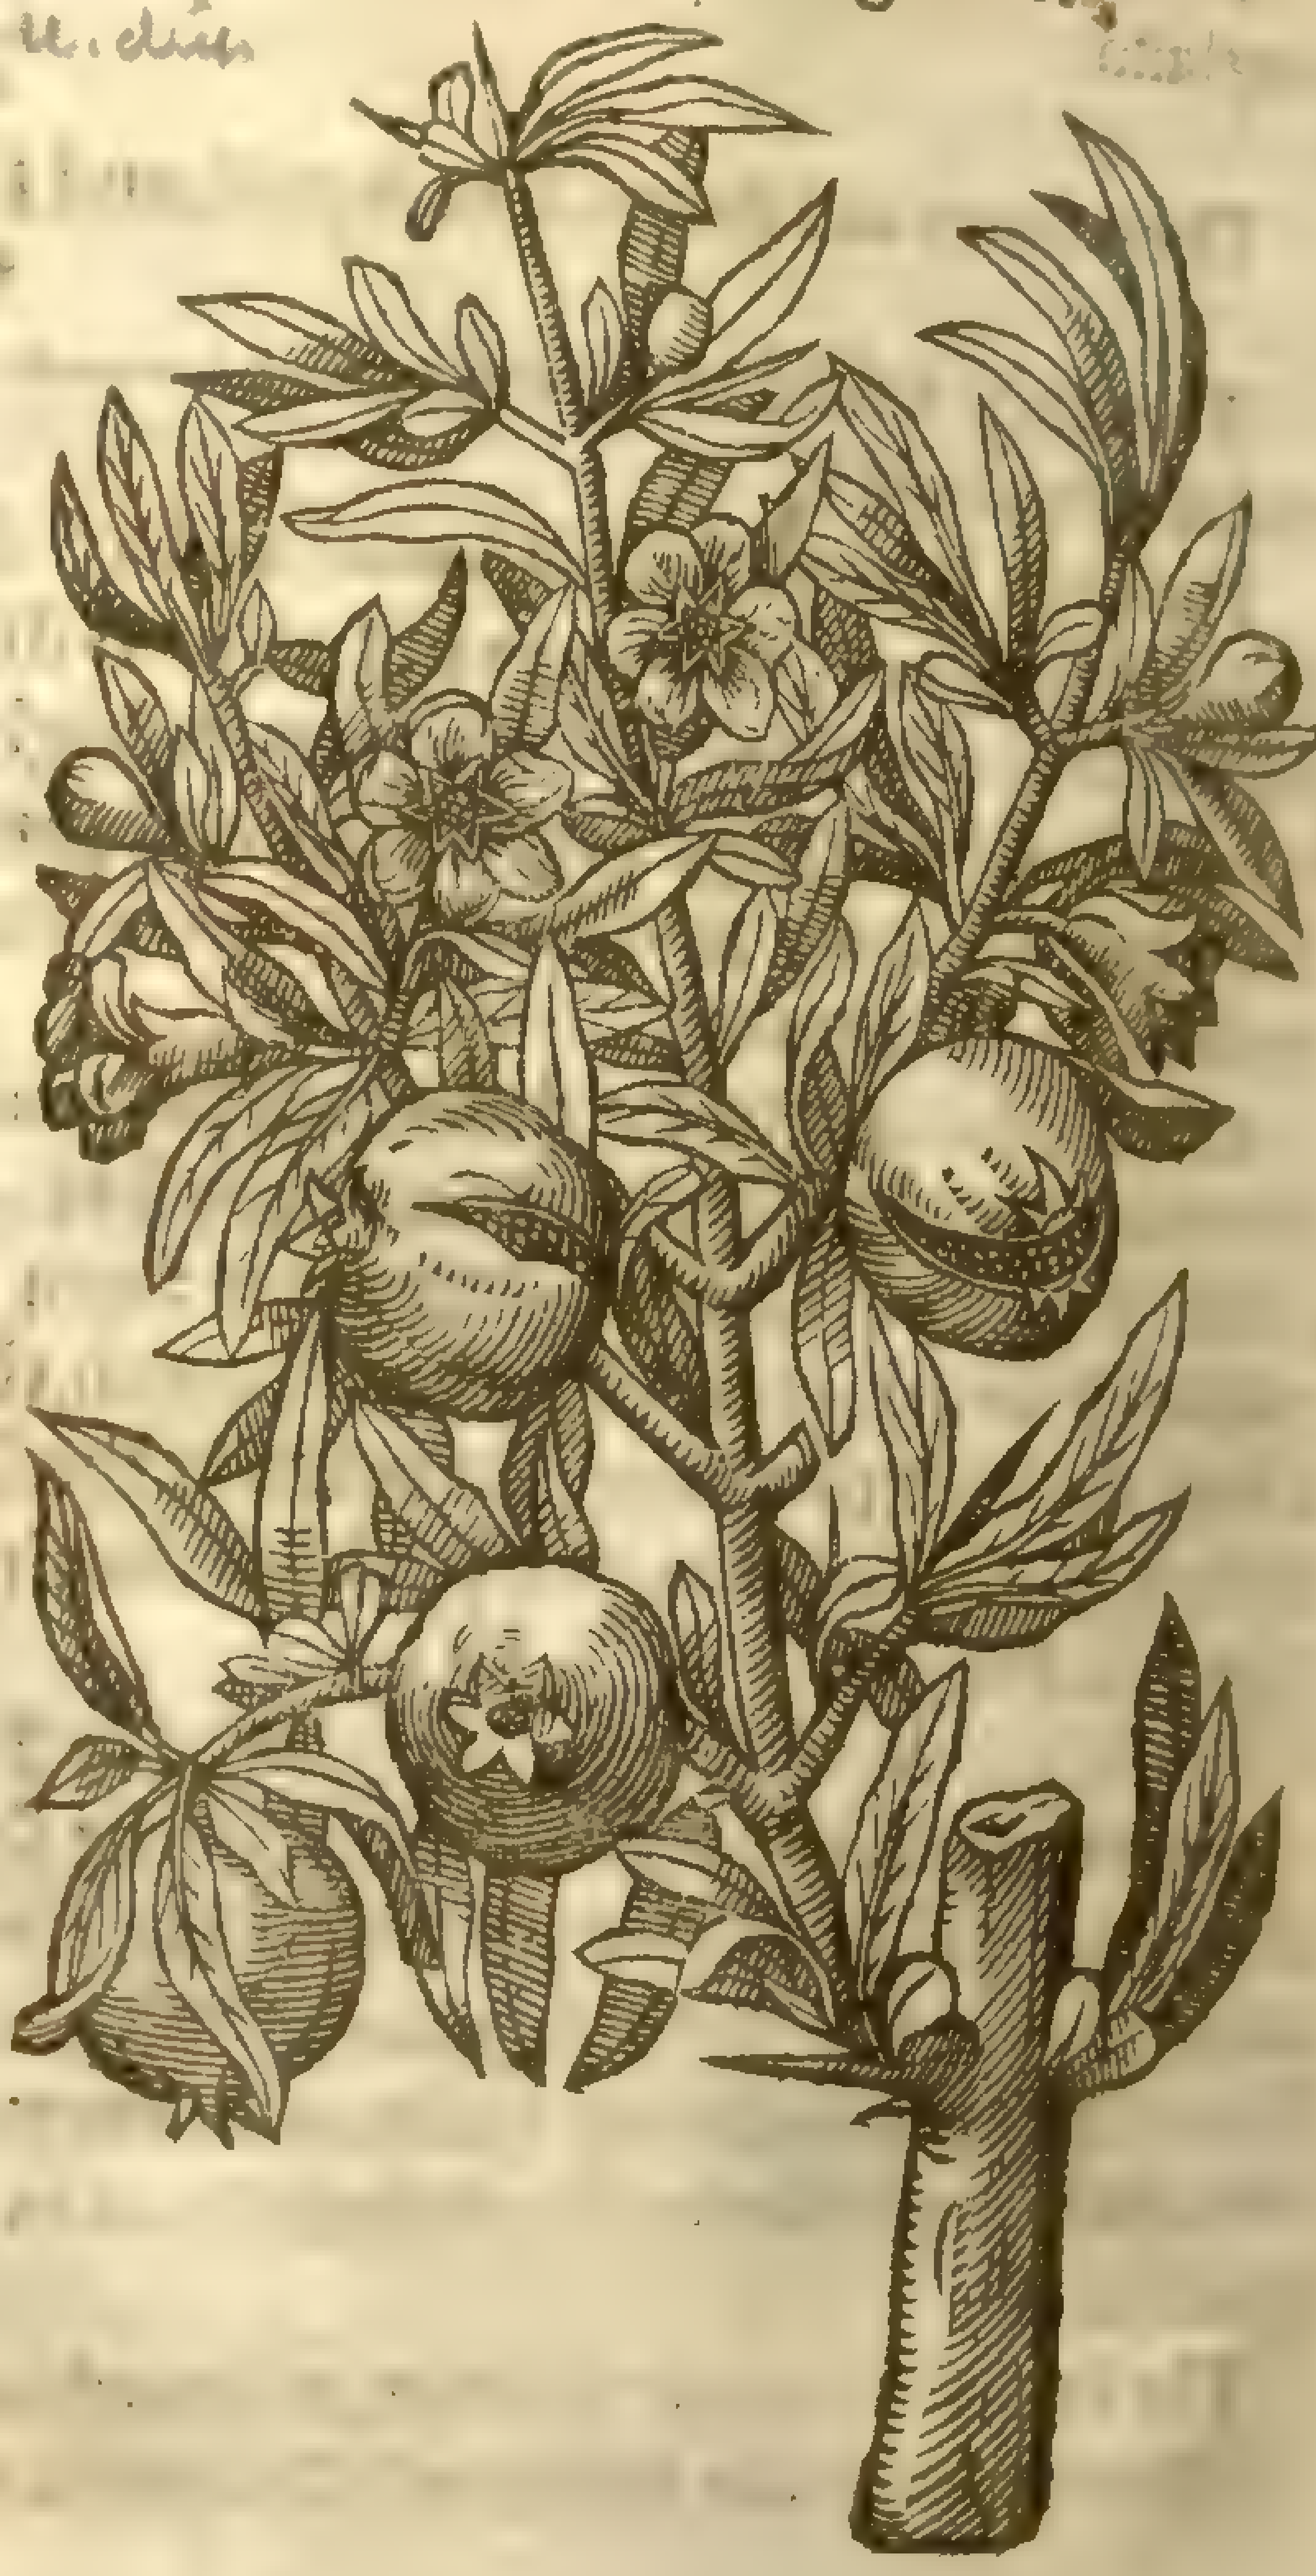
† 2 The wild Pomegranat tree is like the other in leaues and twiggy branches, but it is more prickly and horrid. Of this there are two ſorts, the one hauing ſuch floures and fruit as the tame Pomegranat, the other bearing floures very double, as may appeare by the figure, which wither and fall away leauing no fruit behind them, as the double floured Cherry doth, and diuers other herbes

and

1 *Malus granata ſive Punica.*
The Pomegranat tree.

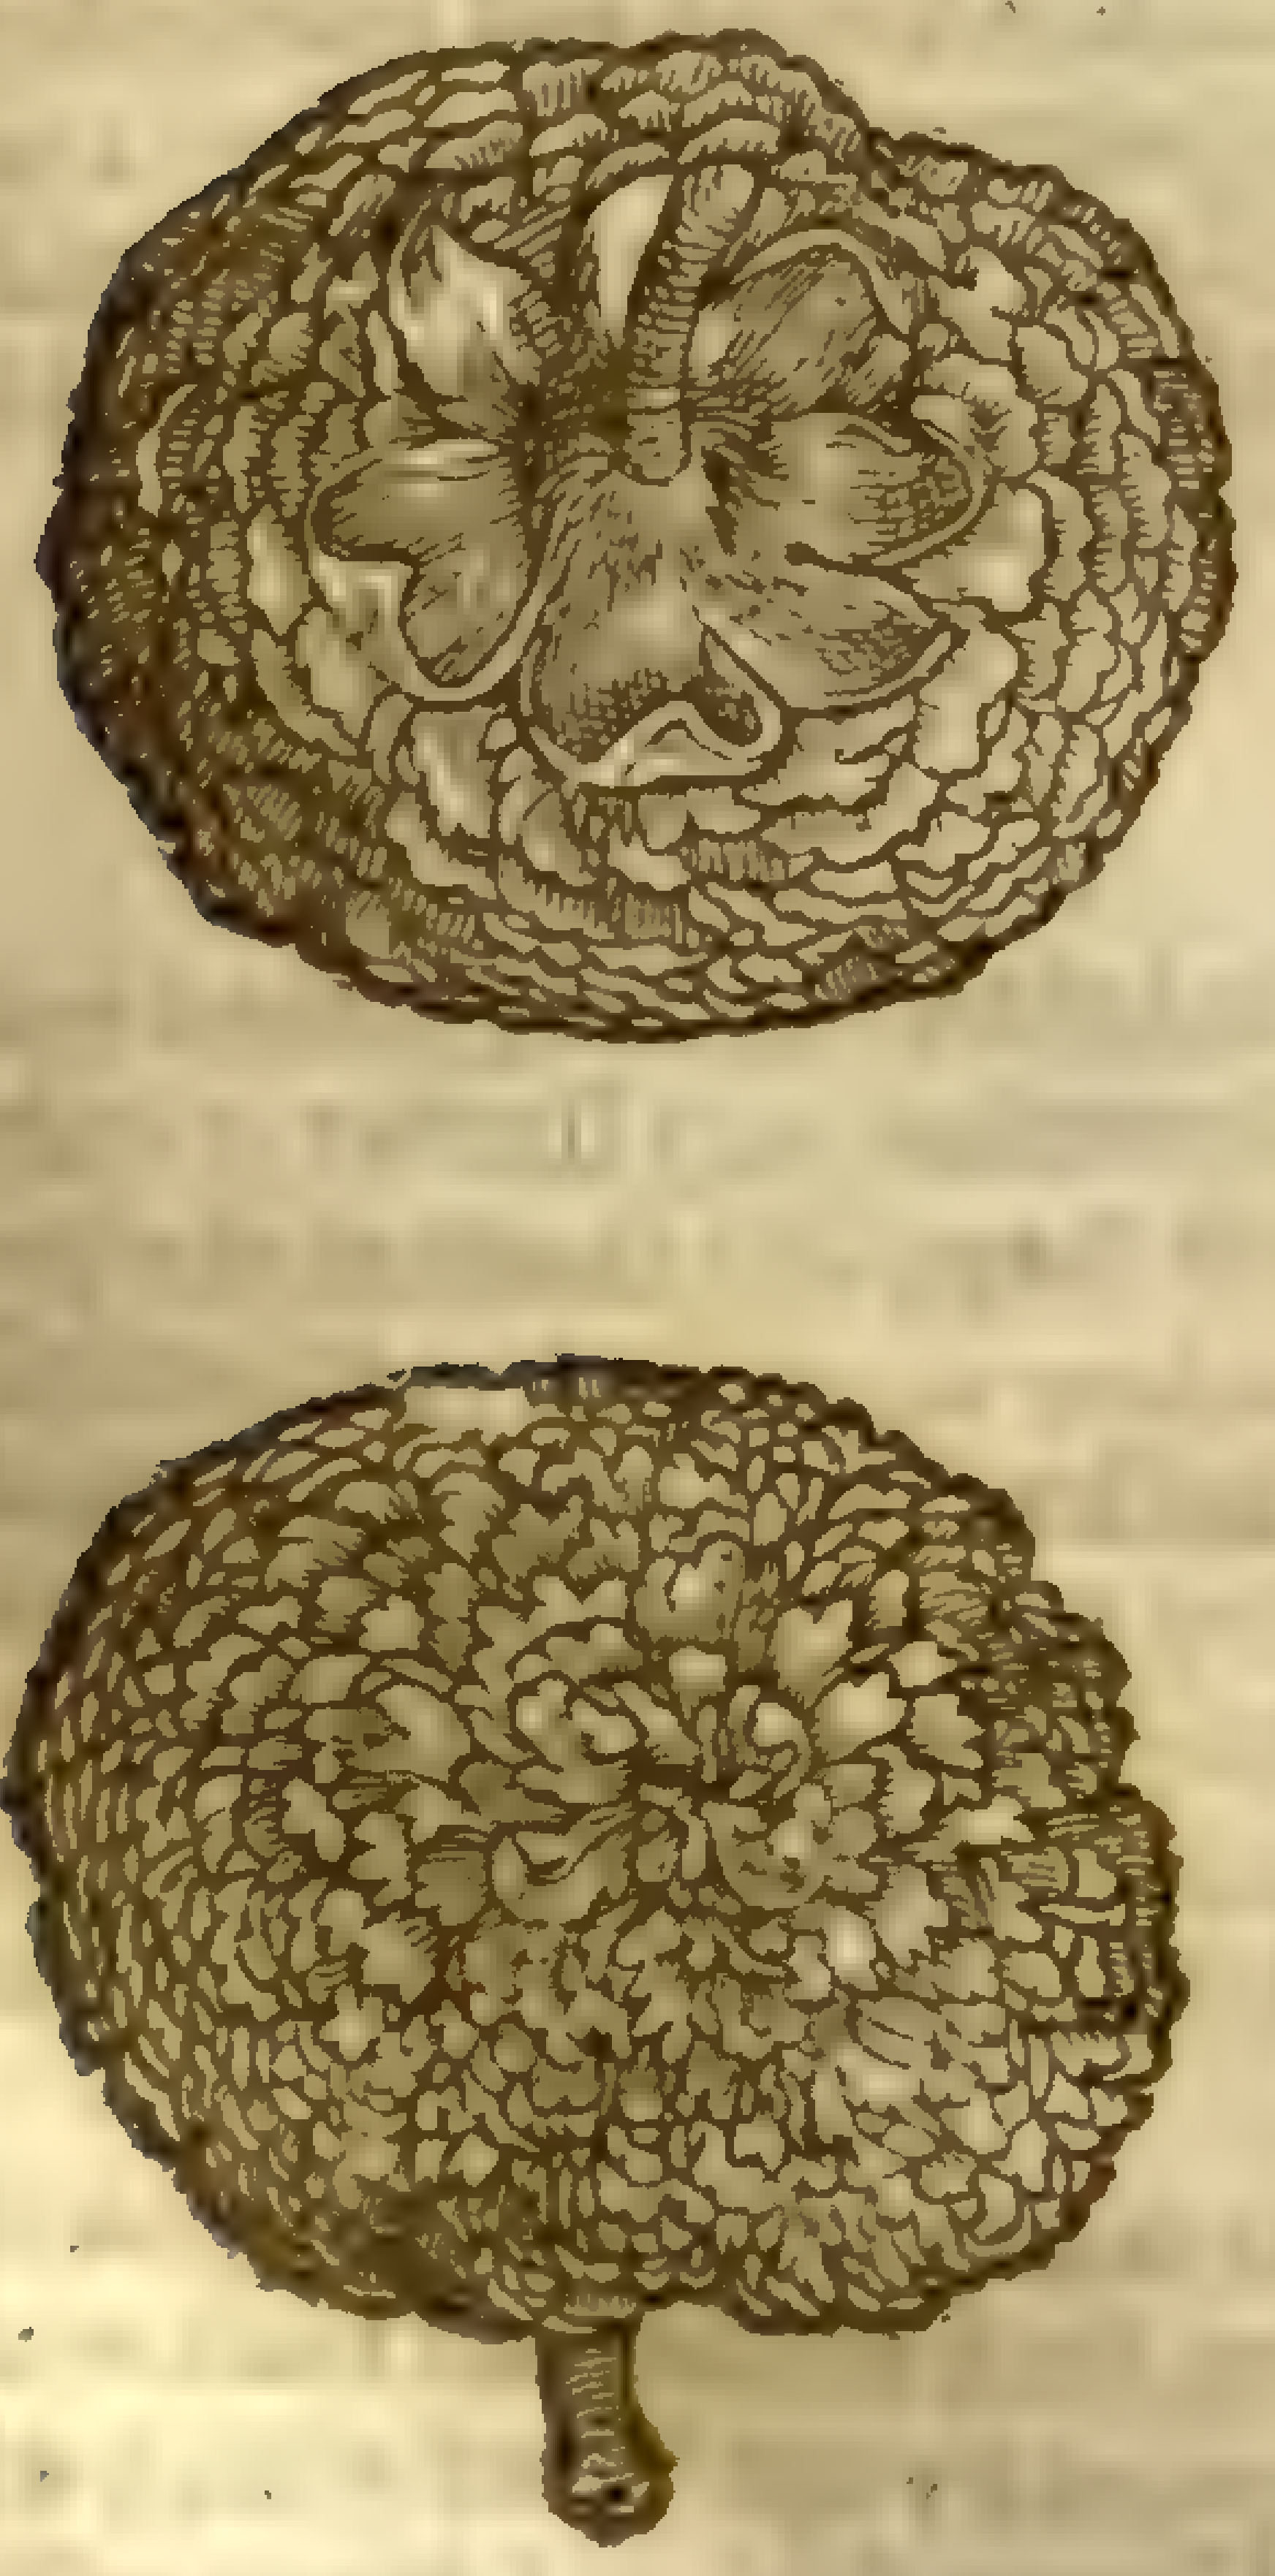


2 *Malus Punica ſylveſtris.*
The wilde Pomegranat.



Balauſtia, ſive pleni flores Gran ſyl.
The double floures of wild Pomegranat.

Punica granatum, L. β
[illegible]



and trees alſo, and it is altogether barren of fruit. Of this *Dioſcorides* makes ſundry ſorts, differing in colour, one is white, ſaith hee, another yellowiſh red, and a third ſort of the colour of the Roſe. This with red floures is beſt known to Apothecaries.

¶ *The Place.*

Pomgranats grow in hot countries toward the South, In Italy, Spain, and chiefely in the kingdome of Granado, which is to be ſo named of the great multitude of Pomegranates, which be commonly called *Granata.* They grow in a number of places alſo without manuring, yet being manured they proſper better; for in gardens, vineyards, orchards, & ſuch other husbanded grounds they come vp more chearfully. I haue recouered diuers yong trees hereof by ſowing the ſeed or graines, of three or foure cubits high, attending Gods leiſure for floures and fruit.

¶ *The Time.*

The Pomegranat floureth in the months of May and Iune. The fruit is ripe in the end of Auguſt.

¶ *The Names.*

The Pomegranat tree is called in Latine, *Malus Punica*: in Greeke of the Athenians, ῥόα and ῥόα, as *Galen* ſaith; in Engliſh, Pomegranat tree.

The Fruit alſo is named ῥοιὰ, and ῥόα, in Latine, *Malum Punicum* : in ſhops, *Malum*, or *Pomum Granatum* : in high-Dutch, **Granatopffel** : in low-Dutch, **Gratappel** : in Italian, *Melagrano*, and *Pomo Granato* : in Spaniſh, *Granadas*, and *Romanas* : in French, *Pommes Granades* : in Engliſh, Pomegranat.

The floure of the fruitfull Pomgranat tree is called of the Grecians κύτινος, which is notwithſtanding properly the cup of the floure : the Latines name it alſo *Cytinus*.

The floure of the wild and barren Pomegranat tree is called βαλαύστιον : the Apothecaries likewiſe term it *Balauſtium*.

The pill or rinde of the Pomegranat, ſo much in vſe, is named in Greeke σίδιον : in Latine, *Malicorium*, and *Sidium* : in ſhops, *Cortex Granatorum*, or Pomegranat pill.

¶ *The Nature and Vertues.*

A The juicy grains of the Pomegranat are good to be eaten, hauing in them a meetly good juyce; they are wholſome for the ſtomack, yet contain but thin and ſmall nouriſhment or none at all.

B The ſweet ones be not ſo cold as the reſt, but they eaſily cauſe hot ſwellings to ariſe, and are not ſo much commended for agues.

C The ſoure ones, eſpecially if they be withall ſomthing harſh, do euidently coole, dry, and ſomewhat binde.

D They are good for the heart-burn, they repreſſe and ſtay the ouermuch vomiting of choler, called the Felony; they help the bloudy flix, aptneſſe to vomit, and vomiting.

E There is made of the juice of theſe ſoure pomegranates a ſyrrup ſeruing for the ſame purpoſes, and is alſo many times very profitable againſt the longing of women with childe, vnleſſe the coldneſſe of the ſtomack hinder it.

F The ſeeds of the grains, and eſpecially of the ſoure Pomegranat, being dried, do alſo coole and binde.

G They ſtop the flix, ſtay vomiting and ſpitting vp of bloud, and ſtrengthen the ſtomacke.

H Of the ſame effect be the floures both of the tame and wilde Pomegranat tree, being like to the ſeeds in temperature and vertues.

I They faſten the teeth and ſtrengthen the gums, if they be waſhed therewith.

K They are good againſt Burſtings that come by falling down of the guts, if they be vſed in plaiſters and applied.

L The rinde or pill is not only like in facultie to the ſeeds, and both the ſorts of floures, but alſo more auailable; for it cooleth and bindeth more forcibly; it bringeth downe the hot ſwellings of the almonds in the throat, being vſed in a gargariſm or lotion for the throat, and is a ſingular remedie for all things that need cooling and binding.

M *Dioſcorides* writeth, that there is alſo gathered a juice out of both theſe ſorts of floures, which is very like in facultie to *Hypociſtis*.

N The bloſſoms of the tame and wild Pomegranats, as alſo the rind or ſhel thereof made into pouder, and drunk in red wine, or boiled in red wine, and the decoction drunk, is good againſt the bloudy flix and all other iſſues of bloud; yea it is good for women to ſit ouer and bathe themſelues in the decoction hereof. The bloſſoms and ſhels alſo are good to be put into reſtraining pouders, to ſtanch bloud in wounds.

O The ſeeds or ſtones of Pomegranats dried in the Sun and beaten to pouder, are of like operation with the floures : they ſtop the lask and all iſſues of bloud in man or woman, being taken as aforeſaid.

Chap. 97. *Of the Quince tree.*

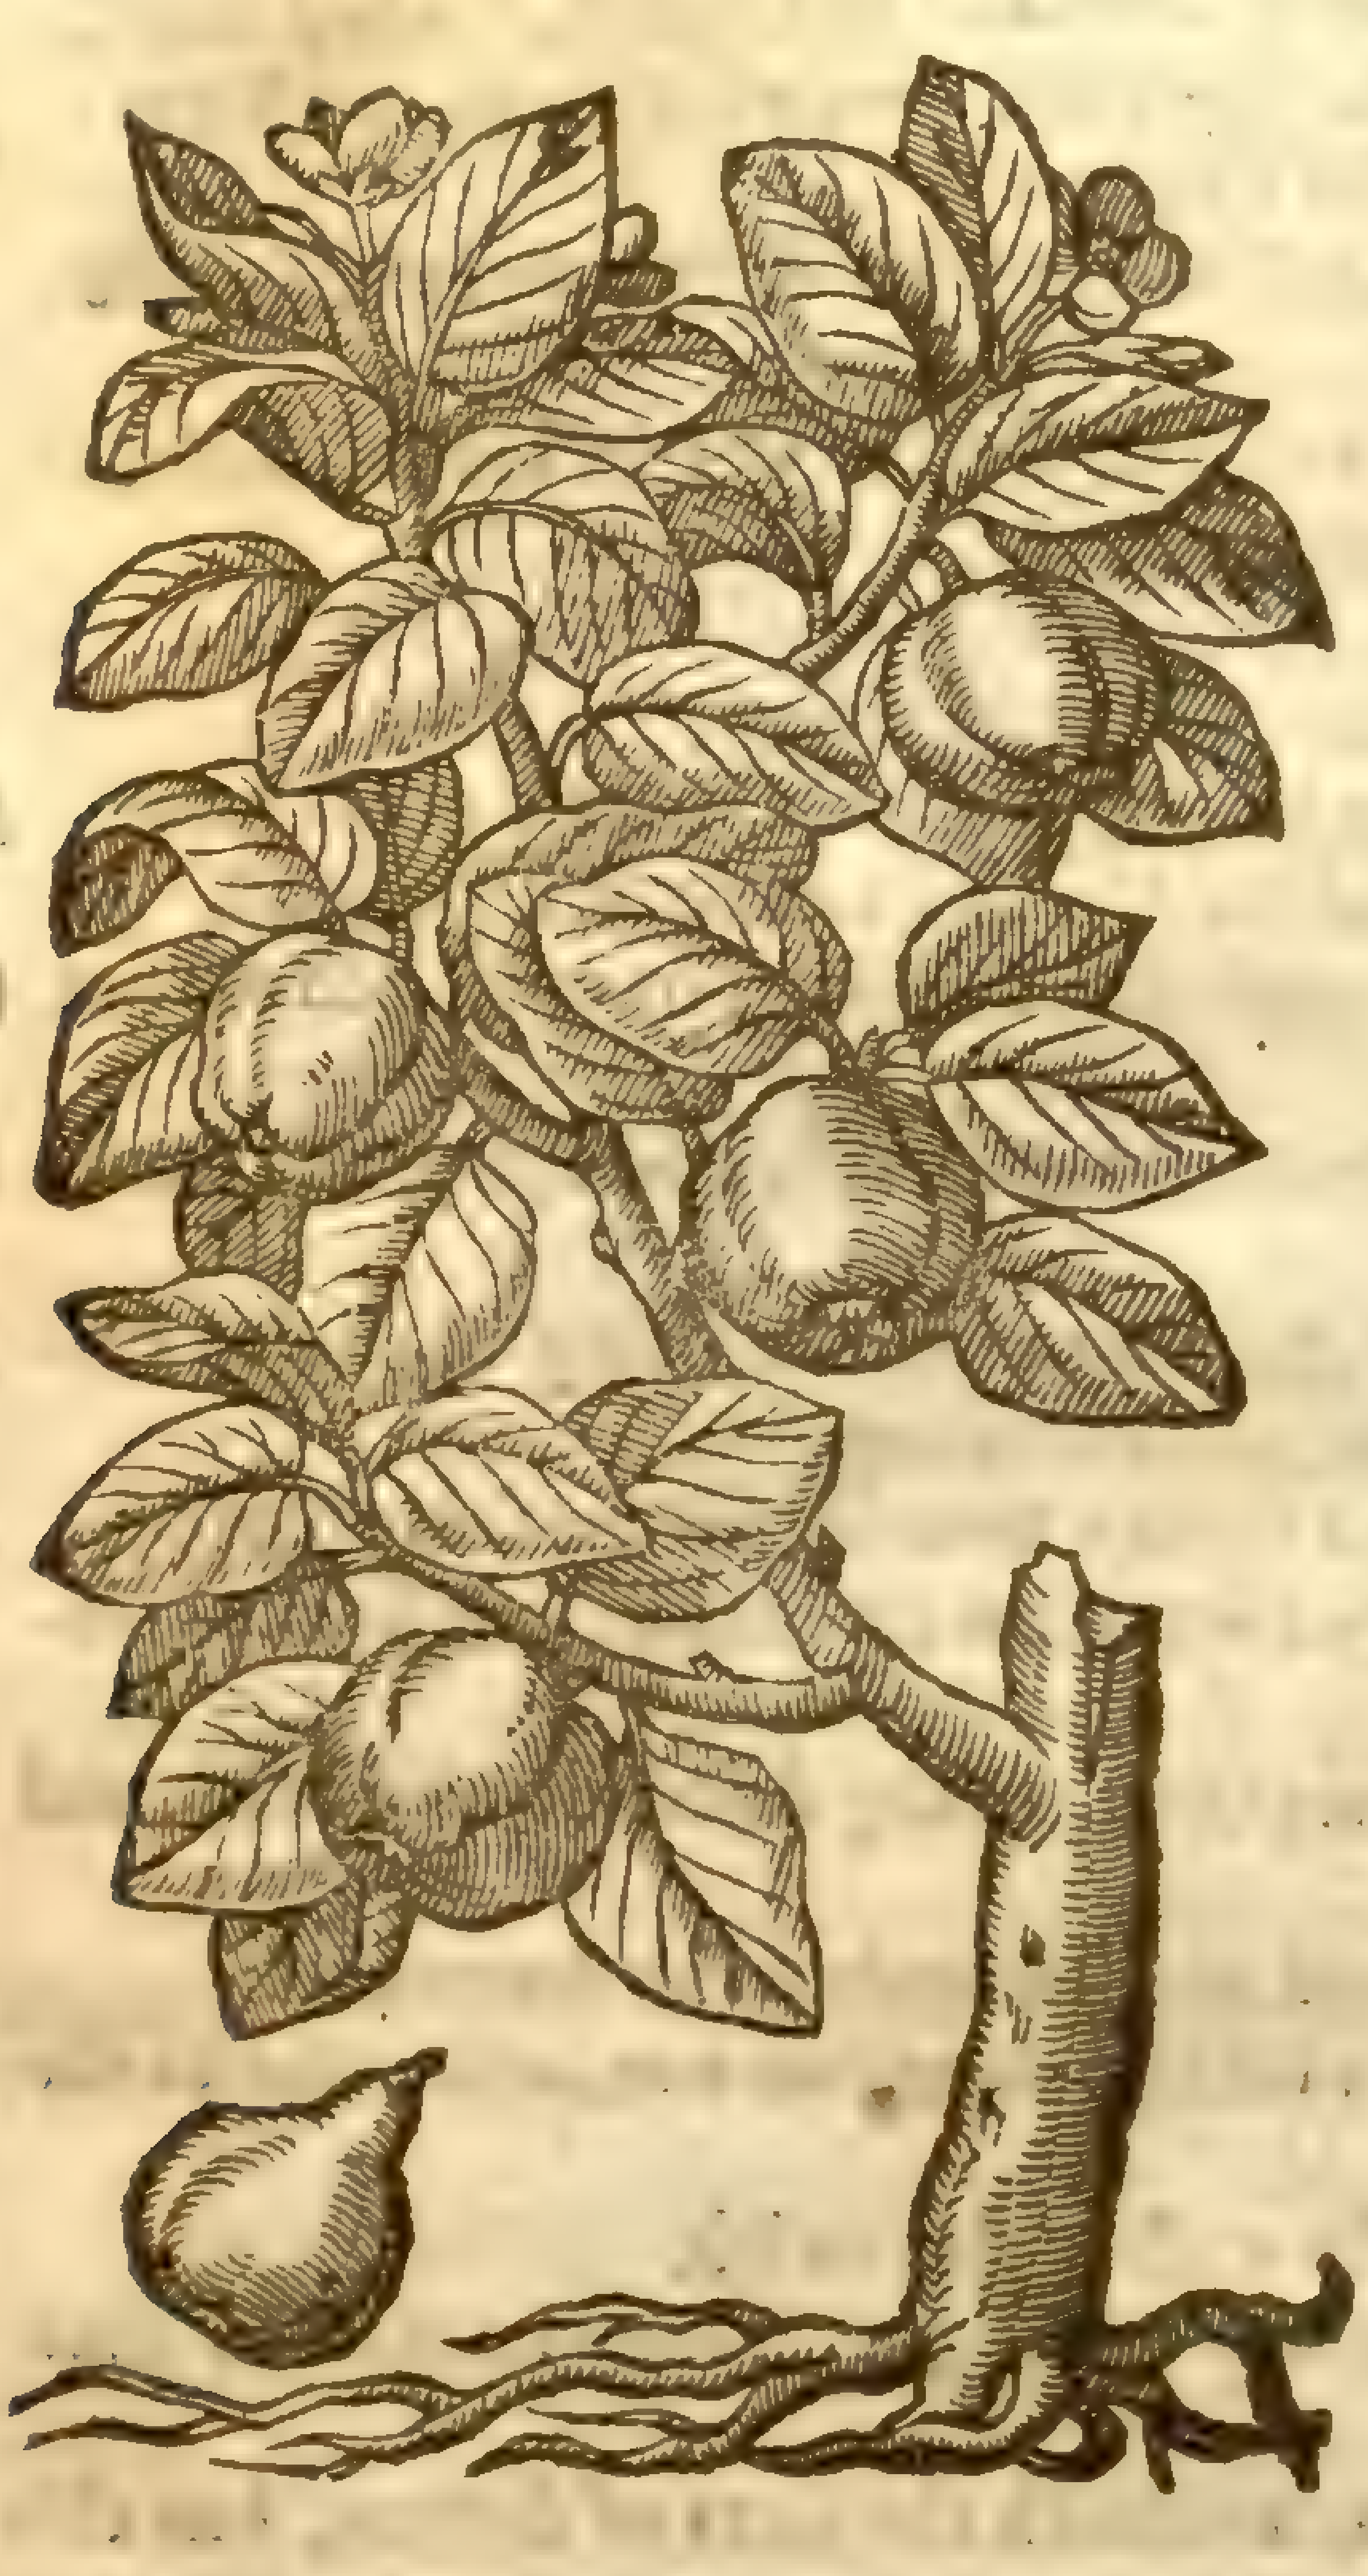
¶ *The Kindes.*

Columella maketh three kindes of Quinces, *Struthia*, *Chryſomeliana*, and *Muſtela*, but what maner ones they be he doth not declare. Notwithſtanding we finde diuers ſorts, differing as well in forme, as taſte and ſubſtance of the fruit, whereof ſome haue much core and many kernels, and others fewer.

¶ The

Pyrus cydonia [illegible] Mill. dict.

Malus Cotonea.
The Quince tree.



¶ *The Deſcription.*

THe Quince tree is not great, but growes low, and many times in maner of a ſhrub: it is couered with a rugged barke, which hath on it now and then certain ſcales: it ſpreadeth his boughes in compaſſe like other trees, about which ſtand leaues ſomewhat round like thoſe of the common Apple tree, greene and ſmooth aboue, and vnderneath ſoft and white: the flours be of a white purple colour: the fruit is like an Apple, ſauing that many times it hath certain embowed (& ſwelling diuiſions: it differeth in faſhion and bigneſſe; for ſome Quinces are leſſer and round, truſt vp together at the top with wrinckles, others longer and greater: the third ſort be of a middle manner betwixt both; they are all of them ſet with a thinne cotton or freeſe, and be of the colour of gold, and hurtfull to the head by reaſon of their ſtrong ſmell; they all likewiſe haue a kinde of choking taſt: the pulp within is yellow, and the ſeed blackiſh, lying in hard skins as do the kernels of other apples.

¶ *The Place.*

The Quince groweth in gardens and orchards, and is planted oftentimes in hedges and Fences belonging to Gardens and Vineyards: it delighteth to grow on plain and euen grounds, and ſomwhat moiſt withall.

¶ *The Time.*

Theſe apples be ripe in the fall of the leaſe, and chiefly in October.

¶ *The Names.*

The tree is called in Greek Μηλέα κυδωνία: in Latine, *Malus Cotonea*: in Engliſh, Quincetree. The fruit is named Μῆλον κυδώνιον, *Malum Cotoneum*, *Pomum Cydonium*, and many times *Cydonium* without any addition; by which name it is knowne to the Apothecaries: it is called in high-Dutch, **Quitten**, **Quitetenopfell**, or **Kuttenopffel**: in low-Dutch, **Queappel**: in Italian, *Mele cotogne*: in Spaniſh, *Codoyons*, *Membrilhos*, and *Marmellos*: in French, *Pomme de coing*: in Engliſh, Quince.

¶ *The Temperature and Vertues.*

A Quinces be cold & dry in the ſecond degree, and alſo very much binding, eſpecially when they be raw; they haue likewiſe in them a certain ſuperfluous and excremental moiſture, which wil not ſuffer them to lie long without rotting: they are ſeldom eaten raw, being roſted or baked they are more pleaſant.

B They ſtrengthen the ſtomack, ſtay vomiting, ſtop lasks and alſo the bloudy flix.

C They are good for thoſe that ſpit or vomit bloud, and for women alſo that haue too great plenty of their monethly courſes.

D *Simeon Sethi* writeth, that the woman with childe that eateth many Quinces during the time of her breeding, ſhall bring forth wiſe children and of good vnderſtanding.

E The Marmalad or Cotiniat made of quinces and ſugar is good and profitable to ſtrengthen the ſtomack, that it may retain and keep the meat therein vntill it be perfectly digeſted; it alſo ſtaieth all kindes of fluxes both of the belly and other parts, and alſo of bloud. Which Cotiniat is made in this manner:

F Take faire Quinces, paire them, cut them in pieces, and caſt away the core, then put vnto euery pound of Quinces a pound of Sugar, and to euery pound of Sugar a pinte of water: theſe muſt be boiled together ouer a ſtil fire till they be very ſoft, then let it be ſtrained or rather rubbed through a ſtrainer or an hairy Siue, which is better, and then ſet it ouer the fire to boile againe, vntill it be ſtiffe,and ſo box it vp,and as it cooleth put thereto a little Roſe water, and a few graines of muske mingled together,which will giue a goodly taſte to the Cotiniat. This is the way to make Marmalad.

Take whole Quinces and boile them in water vntil they be as ſoft as a ſcalded codling or apple, then pill off the skin,and cut off the fleſh,and ſtamp it in a ſtone morter,then ſtraine it as you did the Cotiniat; afterward put it in a pan to dry,but not to ſeeth at all, and vnto euery pound of the fleſh of quinces put three quarters of a pound of ſugar,and in the cooling you may put in roſe water and a little muske,as was ſaid before. G

There is boiled with Quinces oile,which therefore is called in Greeke *Melinon* or oile of Quinces,which we vſe,ſaith *Dioſcorides*,ſo oft as we haue need of a binding thing. H

The ſeed of Quinces tempered with water doth make a muſcilage, or a thing like jelly, which being held in the mouth,is maruellous good to take away the roughneſſe of the tongue in hot burning feuers. I

The ſame is good to be laid vpon burnings and ſcaldings,and to be put into cliſters againſt the bloudy flix;for it eaſeth the pain of the guts,and allayeth the ſharpneſſe of biting humors. K

Many other excellent dainty and wholſome Confections are to be made of Quinces, as jelly of Quinces,and ſuch like conceits,which for breuities ſake I do now let paſſe. L

Chap. 98. *Of the Medlar tree.*

¶ *The Kindes.*

There be diuers ſorts of Medlars,ſome greater,others leſſer ; ſome ſweet,and others of a more harſh taſt: ſome with much core and many great ſtony kernels,others fewer ; and likewiſe one of Naples called Aronia.

M. germanica, β
minor dict

1 *Meſpilus ſativa.*
The manured Medlar.

[illegible]

‡ 2 *Meſpilus ſativa altera.*
The other garden Medlar.

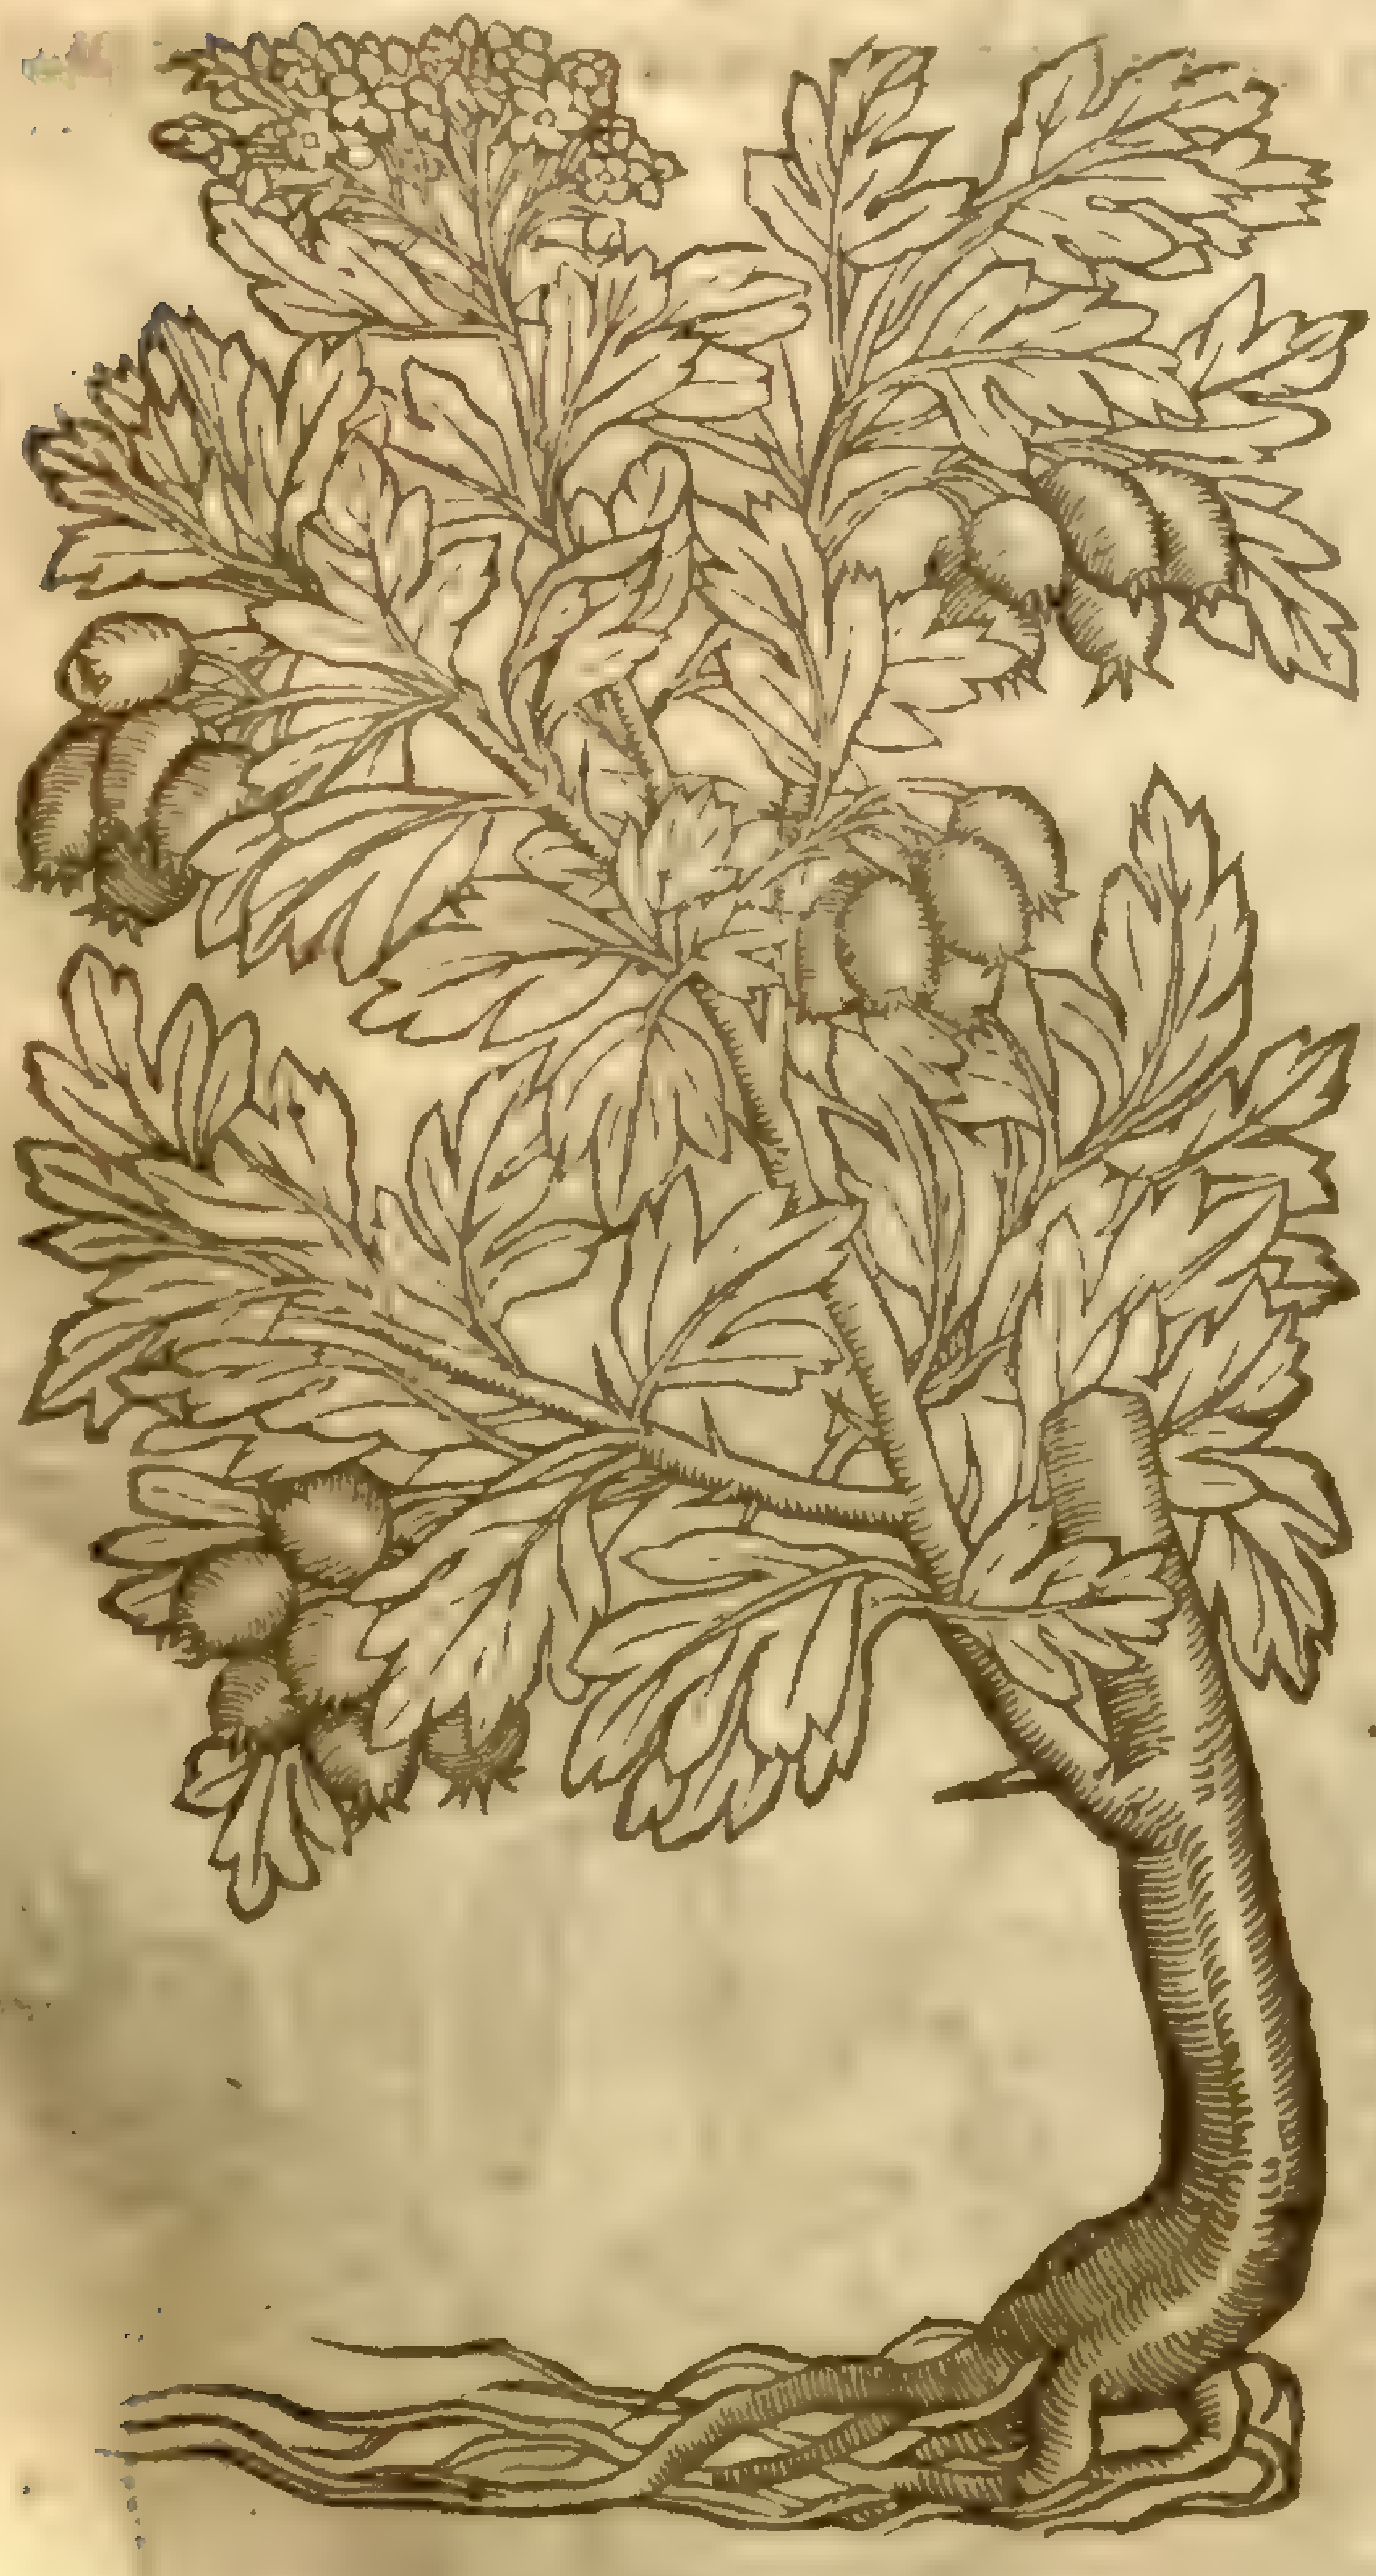
¶ *The Deſcription.*

1 THe manured Medlar tree is not great, the body whereof is wrythed, the boughes hard, not eaſie to be broken: the leaues be longer, yet narrower than thoſe of the Apple tree, darke, green aboue, and ſomwhat whiter and hairy below: the flours are white & great, hauing fiue leaues apiece: the fruit is ſmall, round, and hath a broad compaſſed nauel or crowne at the top: the pulp or meat is at the firſt white, and ſo harſh or choking, that it canot be eaten vntill it become ſoft, in which are contained fiue ſeeds or ſtones, which be flat and hard.

‡ 2 There is another which differs from the laſt deſcribed, in that the leaues are longer and narrower, the ſtocke hath no prickles vpon it, the fruit alſo is larger, and better taſted: in other reſpects it is like to the laſt deſcribed. This is the *Meſpilus fructu præſtantiore* of *Tragus*; and *Meſpilus domeſtica* of *Lobel*. ‡

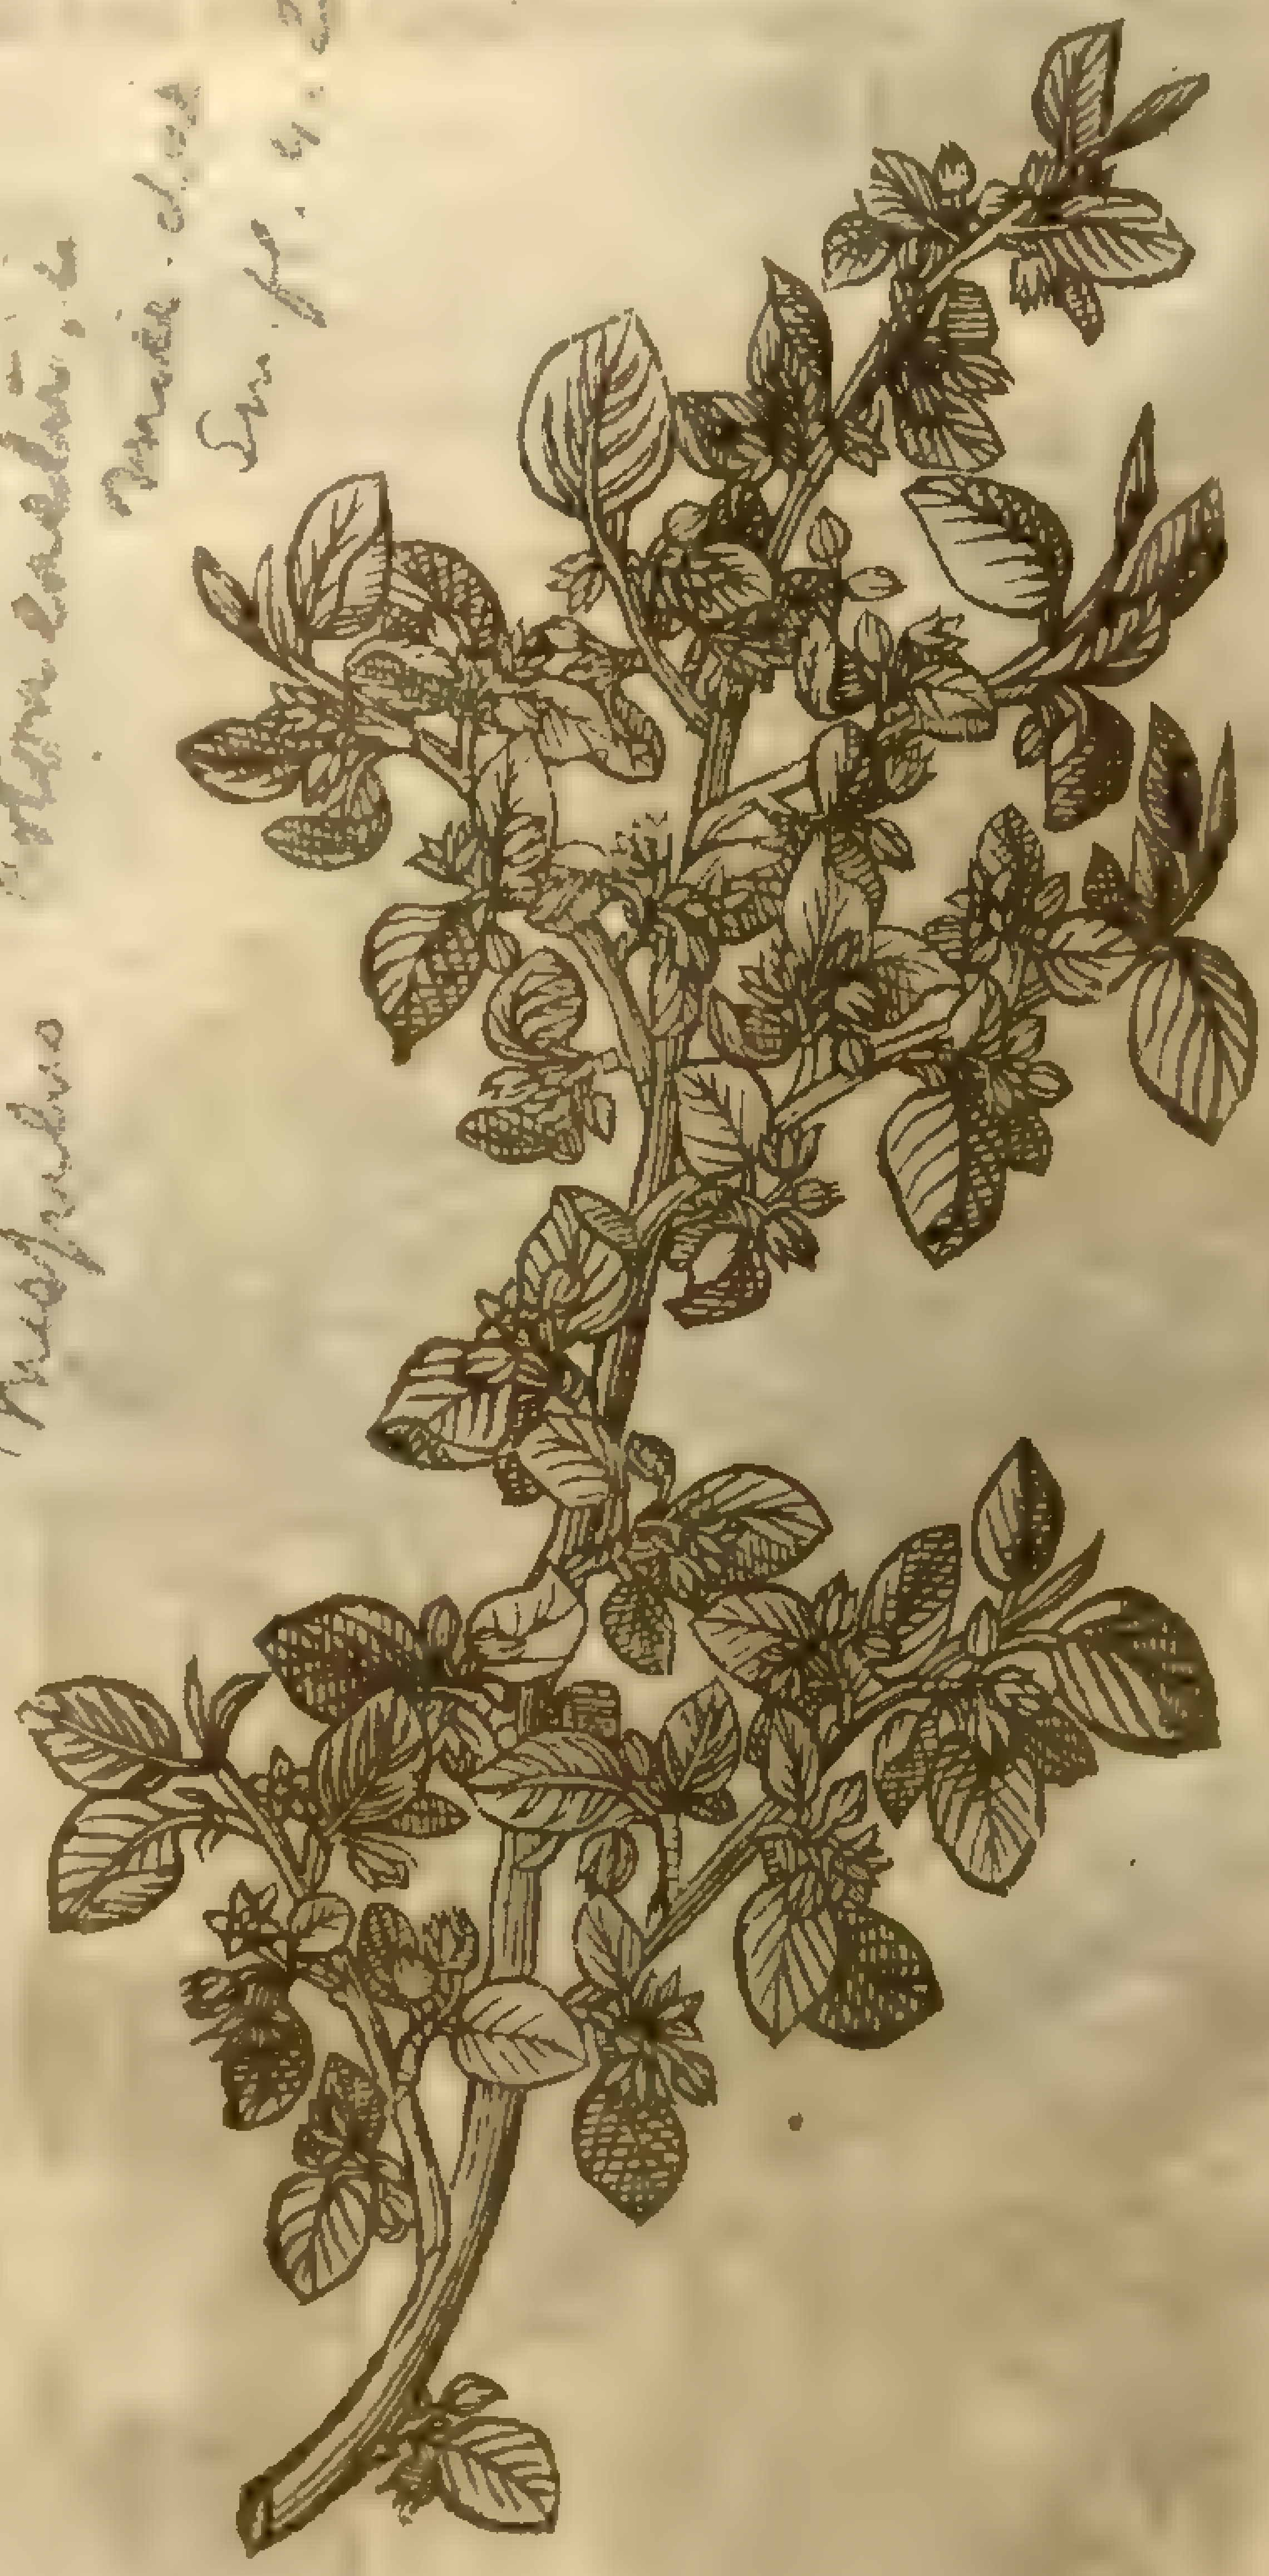
3 The Neapolitan Medlar tree groweth to the height and greatneſſe of an apple tree, hauing many tough and hard boughes or branches, ſet with ſharp thornes like the white Thorne or Hawthorn: the leaues are very much cut or jagged like the Hawthorn leaues, but greater, and more like Smallage or Parſley: which leaues before they fall from the tree do wax red: amongſt theſe leaues come forth great tufts of flours of a pale herby colour: which being paſt, there ſucceed ſmall long fruit leſſer than the ſmalleſt Medlar, which at the firſt are hard, and green of colour, but when they be ripe they are both ſoft and red, of a ſweet and pleaſant taſte; wherein is contained three ſmall hard ſtones as in the former, which be the kernels or ſeeds thereof.

3 *Meſpilus Aronia.*
The Neapolitan Medlar.



Crataegus azarolus L. mihi dict.

‡ 4 *Chamæmeſpilus.*
Dwarfe Medlar.



Mespilus cotoneaster L. mihi dict. Sm. fl. 4. 26

4 There is a dwarfe kinde of Medlar growing naturally vpon the Alps and hills of Narbone, and on the rocks of mount Baldus nigh Verona, which hath bin by ſome of the beſt Learned eſteemed for a kinde of Medlar: others, whoſe judgements cannot ſtand with truth or probability, haue ſuppoſed it to be *Euonymus* of the Alpes. This dwarfe Medlar groweth like a ſmall hedge tree, of four or fiue cubits high, bearing many ſmal twiggy wands or crops, beſet with many ſlender leaues greene aboue, and of a ſkye colour vnderneath, in ſhew like to a dwarfe Apple tree, but the fruit is

very like the Haw, or fruit of the white Thorne, and of a red colour. ‡ The floures come forth in the Spring three or foure together, hollow, and of an herby colour, it growes in diuers places of the Alpes: it is the *Chamæmeſpilum* of the *Aduerſ.* and the *Chamæmeſpilus Geſneri,* of *Cluſius.* ‡

¶ *The Place.*

The Medlar trees do grow in Orchards, and oftentimes in hedges among briers and brambles; being grafted in a White Thorne it proſpereth wonderfull well, and bringeth forth fruit twiſe or thriſe bigger than thoſe that are not grafted at all, almoſt as great as little apples: we haue diuers ſorts of them in our Orchards.

¶ *The Time.*

It is very late before Medlars be ripe, which is in the end of October, but the floures come forth timely enough.

¶ *The Names.*

The firſt is called in Greeke by *Theophraſtus* μεσπίλη: in Latine, *Meſpilus*: in high Dutch, **Meſpelbaum**: in low Dutch, **Miſpelboome**: in French, *Neſflier*: in Engliſh, Medlar tree.

The Apple or fruit is named in Greeke, μέσπιλον: in Latine likewiſe, *Meſpilum*: in high Dutch, **Meſpel**, in low Dutch, **Miſpele**: in Italian, *Neſpolo*: in French, *Neſfle*: in Spaniſh, *Neſperas*: in Engliſh, Medlar.

Dioſcorides affirmeth, That this Medlar tree is called ἐπιμηλίς, and of diuers, *Sitanion*: *Galen* alſo in his booke of the faculties of ſimple medicines nameth this *Epimelis*: which is called, as he ſaith, by the country-men in Italy, *Vnedo,* and groweth plentifully in Calabria; for vnder the name of *Meſpilus,* or Medlar tree, he meaneth no other than *Tricoccus,* which is alſo named *Aronia.*

The Neapolitane Medlar tree is called in Greeke μέσπιλος, and μεσπίλη: *Galen* calleth it *Epimelis.*

The fruit hereof is called *Tricoccos,* of the three graines or ſtones that it hath: they of Naples call it *Azarolo*: and we may name it in Engliſh, three graine Medlar, or Neapolitane Medlar, or Medlar of Naples.

¶ *The Temperature.*

The Medlars are cold, dry, and aſtringent; the leaues are of the ſame nature: the dwarfe Medlar is dry, ſharpe, and aſtringent.

¶ *The Vertues.*

Medlars do ſtop the belly, eſpecially when they be greene and hard, for after that they haue been kept a while ſo that they become ſoft and tender, they doe not binde or ſtop ſo much, but are then more fit to be eaten. A

The fruit of the three graine Medlar, is eaten both raw and boyled, and is more wholeſom for the ſtomacke. B

Theſe Medlars be oftentimes preſerued with ſugar or hony: and being ſo prepared they are pleaſant and delightfull to the taſte. C

Moreouer, they are ſingular good for women with childe: for they ſtrengthen the ſtomacke, and ſtay the lothſomeneſſe thereof. D

The ſtones or kernels of the Medlars, made into pouder and drunke, doe breake the ſtone, expell grauell, and procure vrine. E

CHAP. 99. *Of the Peare tree.*

¶ *The Kindes.*

TO write of Peares and Apples in particular, would require a particular volume: the ſtocke or kindred of Peares are not to be numbred: euery country hath his peculiar fruit: my ſelfe knowes one curious in graffing & planting of fruits, who hath in one piece of ground, at the point of threeſcore ſundry ſorts of Peares, and thoſe exceeding good, not doubting but if his minde had beene to ſeeke after multitudes, he might haue gotten together the like number of thoſe of worſe kinds: beſides, the diuerſities of thoſe that be wilde, experience ſheweth ſundry ſorts: and therefore I thinke it not amiſſe to ſet downe the figures of ſome few, with their ſeuerall titles, as well in Latine as Engliſh, and one generall deſcription for that, that might be ſaid of many, which to deſcribe apart, were to ſend an owle to Athens, or to number thoſe things which are without number.

‡ Our Author in this chapter gaue eight figures with ſeuerall titles to them, ſo I pluckt a peare from each tree, and put his title to it, but not in the ſame order that he obſerued, for hee made the Katherine peare tree the ſeuenth, which I haue now made the firſt, becauſe the figure expreſſes the whole tree. ‡

¶ The

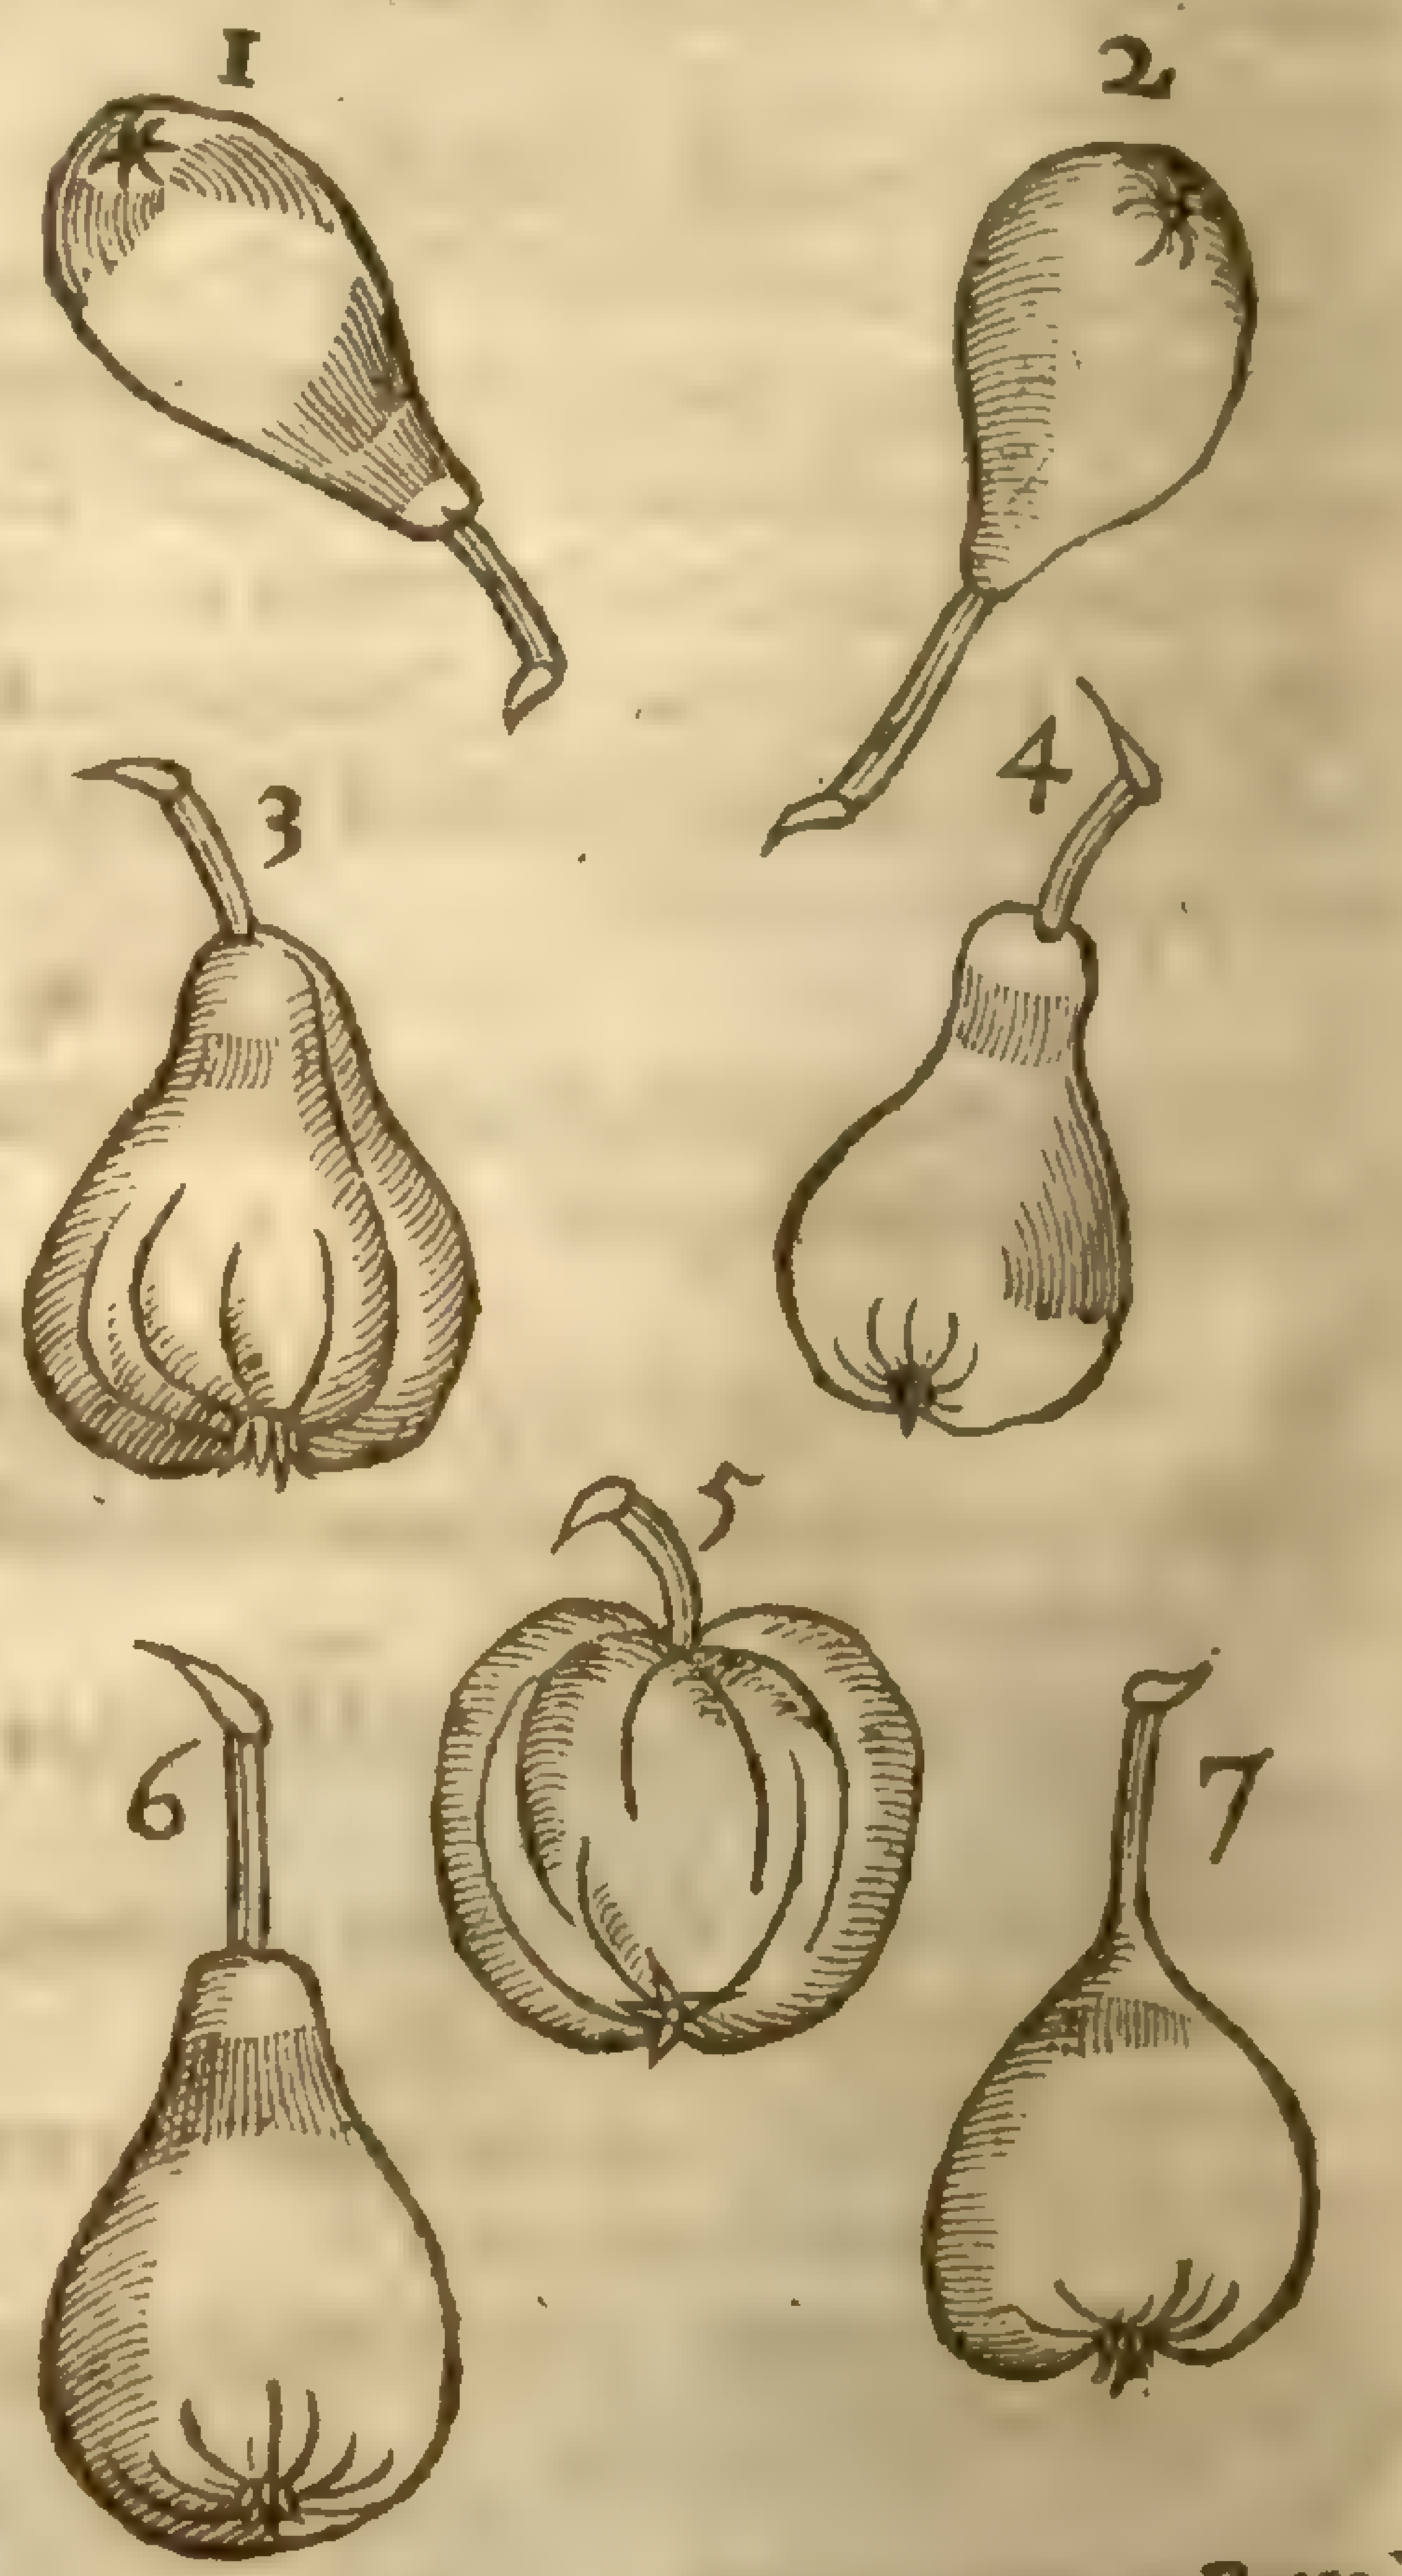
¶ *The generall Deſcription.*

THe Peare tree is for the moſt part higher than the Apple tree, hauing boughes not ſpread abroad, but growing vp in height; the body is many times great: the timber or wood it ſelfe is very tractable or eaſie to be wrought vpon, exceeding fit to make moulds or prints to be grauen on, of colour tending to yellowneſſe: the leafe is ſomewhat broad, finely nicked in the edges, greene aboue, and ſomewhat whiter vnderneath: the floures are white: the Peares, that is to ſay, the fruit, are for the moſt part long, and in forme like a Top; but in greatneſſe, colour, forme, and taſte very much differing among themſelues; they be alſo couered with skins or coats of ſundry colours: the pulpe or meate differeth, as well in colour as taſte: there is contained in them kernels, blacke when they be ripe: the root groweth ſtraight downe with ſome branches running aſlope.

Pirus ſuperba, ſiue Katherina.
The Katherine Peare tree.

Pyrus [illegible],
mill. dict.

1 *Pyra Præcocia.* The Ienneting Peare.
2 *Pyra Iacobæa.* Saint Iames Peare.
3 *Pyrum regale.* The Peare royall.



4 *Pyrum Palatinum.* The Burgomot Peare.
5 *Pyrum Cydonium.* The Quince peare.
6 *Pyrum Epiſcopatum.* The Biſhops Peare.
7 *Pyrum hyemale.* The Winter Peare.

¶ *The Place.*

The tame Peare trees are planted in Orchards, as be the apple trees, and by grafting, though vpon wilde ſtockes, come much variety of good and pleaſant fruits. All theſe before ſpecified, and many ſorts more, and thoſe moſt rare and good, are growing in the ground of Maſter *Richard Pointer*, a moſt cunning and curious graffer and planter of all manner of rare fruits, dwelling in a ſmall village neere London called Twicknam; and alſo in the ground of an excellent graffer and painfull planter, Mr *Henry Banbury*, of Touthill ſtreet neere Weſtminſter, and likewiſe in the ground of a diligent and moſt affectionate louer of Plants Mr *Warner* neere Horſey downe by London, and in diuers other grounds about London. ‡ Moſt of the beſt peares are at this day to be had with Mr *Iohn Millen* in Old-ſtreet, in whoſe nurſery are to be found the choiſeſt fruits this kingdome yeelds. ‡

¶ *The Time.*

The floures doe for the moſt part come forth in Aprill, the leaues afterwards: all peares are not ripe at one time: ſome be ripe in Iuly, others in Auguſt, and diuers in September and later.

¶ *The Names.*

The tame or Orchard peare tree is called in Greeke ἄπιος, or with a double ππ ἄππιος: in Latine, *Pyrus Vrbana*,

vrbana, or *Cultiua*: of *Tarentinus* in his Geoponikes ἀπιδέα: in high Dutch, **Biјrbaum**: in low Dutch, **Peerboom**: in French, *Porrier*.

The Peare or fruit it ſelfe is called in Greeke ἄπιον: in Latine, *Pyrum*: in high Dutch, **Birn**: in low Dutch, **Peere**: in Italian, *Pere*: in French, *Poyre*: in Spaniſh, *Peras*: in Engliſh, Peare.

¶ *The Temperature and Vertues.*

Leauing the diuers and ſundry ſurnames of Peares, let vs come to the faculties which the Phyſitions ought to know; which alſo vary according to the differences of their taſtes: for ſome Peares are ſweet, diuers fat and vnctious, others ſoure, and moſt are harſh, eſpecially the wilde peares, and ſome conſiſt of diuers mixtures of taſts, and ſome hauing no taſte at all, but as it were a wateriſh taſte. A

All Peares are cold, and all haue a binding quality and an earthie ſubſtance: but the Choke pears and thoſe that are harſh be more earthie and the ſweet ones leſſe: which ſubſtance is ſo full of ſuperfluous moiſture in ſome, as that they cannot be eaten raw. All manner of Peares do binde and ſtop the belly, eſpecially the Choke and harſh ones, which are good to be eaten of thoſe that haue the laske and the bloudy flix. B

The harſh and auſtere Peares may with good ſucceſſe be laid vpon hot ſwellings in the beginning, as may be the leaues of the tree, which do both binde and coole. C

Wine made of the iuyce of Peares called in Engliſh, Perry, is ſoluble, purgeth thoſe that are not accuſtomed to drinke thereof, eſpecially when it is new; notwithſtanding it is as wholeſome a drinke being taken in ſmall quantity as wine; it comforteth and warmeth the ſtomacke, and cauſeth good digeſtion. D

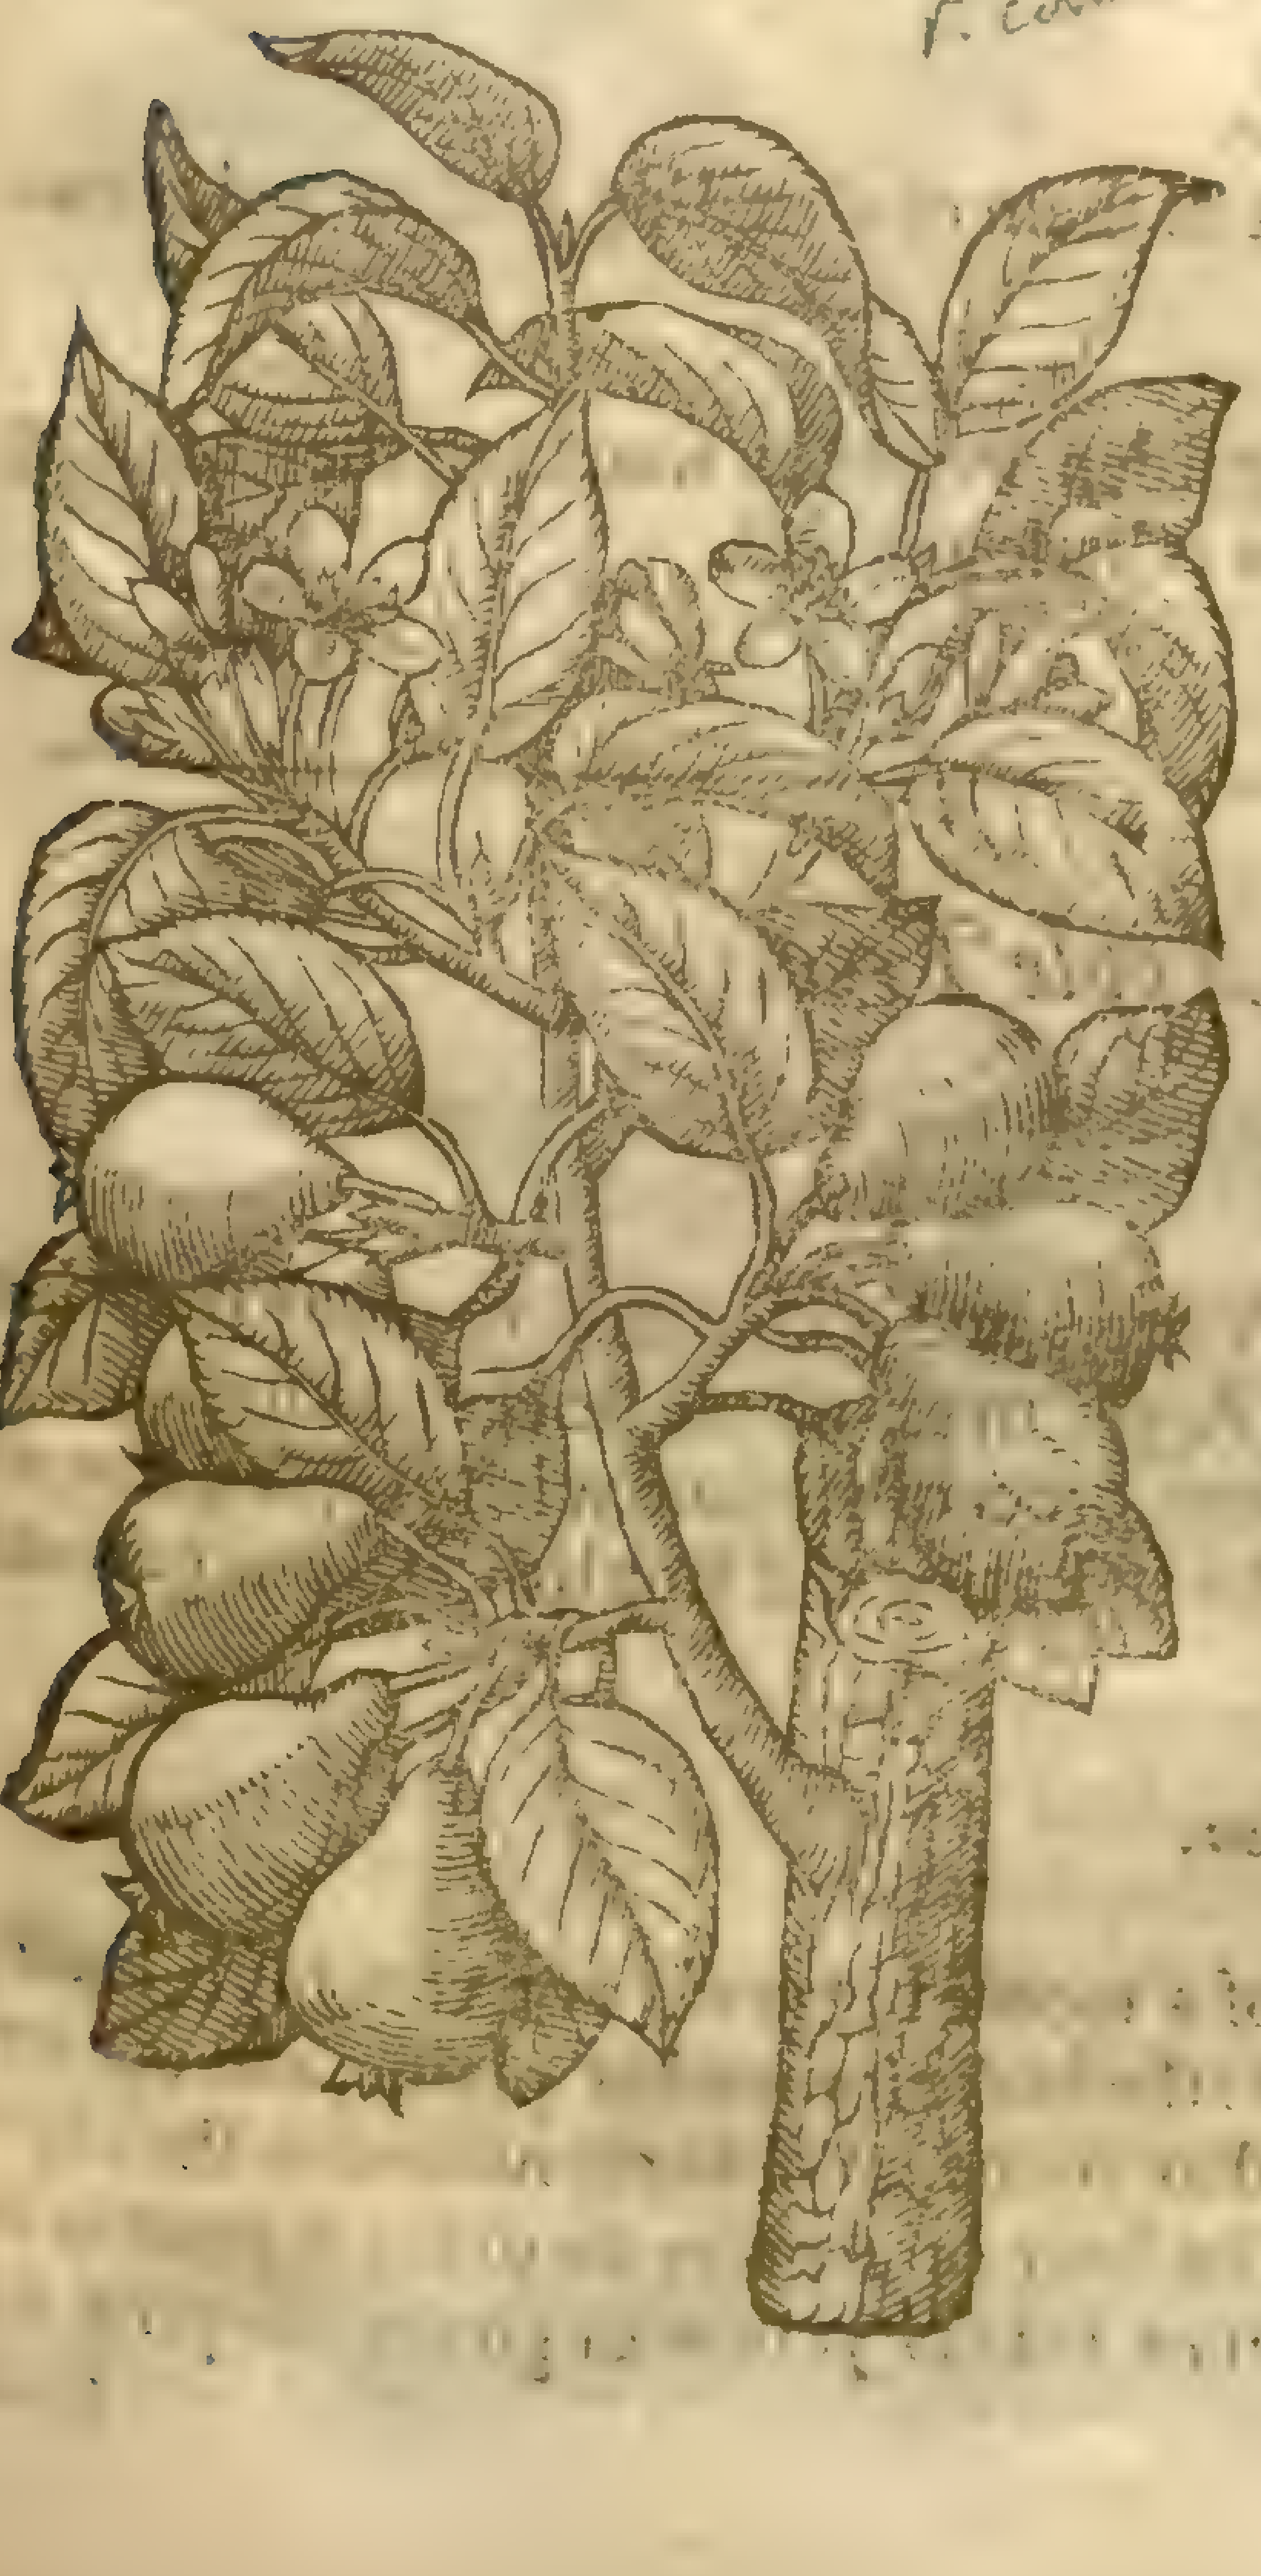
CHAP. 100. *Of the wilde Peare tree.*

¶ *The Kindes.*

AS there be ſundry kindes of the manured Peares, ſo are there ſundry wilde; whereof to write apart were to ſmall purpoſe: therefore one deſcription with their ſeuerall titles ſhall be ſufficient for their diſtinctions.

1 *Pyrum ſtrangulatorium majus.*
The great Choke Peare.

P. communis [illegible]



¶ *The generall Deſcription.*

THe wilde Peare tree growes likewiſe great, vpright, full of branches, for the moſt part Pyramides like, or of the faſhion of a ſteeple, not ſpred abroad as is the Apple or Crab tree: the timber of the trunke or body of the tree is very firme and ſollid, and likewiſe ſmooth, a wood very fit to make diuers ſorts of inſtruments of, as alſo the hafts of ſundry tooles to worke withal; and likewiſe ſerueth to be cut into many kindes of moulds, not only ſuch prints as theſe figures are made of, but alſo many ſorts of pretty toies, for coifes, breſt-plates, and ſuch like, vſed among our Engliſh gentlewomen: the branches are ſmooth, couered with a blackiſh barke, very fragile or eaſie to breake, wheron do grow leaues, in ſome greater, in other leſſer: the floures are like thoſe of the manured Pear tree, yet ſome whiter than others; the fruit differ not in ſhape, yet ſome greater than others; but in taſte they differ among themſelues in diuers points, ſome are ſharpe, ſoure and of an auſtere taſte; ſome more pleaſant, others harſh and bitter, and ſome of ſuch a choking taſte, that they are not to be eaten of hogs & wild beaſts, much leſſe of men: they alſo differ in colour, euery circumſtance, whereof to diſtinguiſh apart would greatly enlarge our volume, and bring to the Reader ſmall profit or commodity.

2 *Pyrum ſtrangulatorium minus.*
The ſmall Choke peare.

3 *Pyrus ſylueſtris.*
The wilde hedge Peare tree.

4 *Pyrus ſylueſtris minima.*
The wilde Crab Peare tree.

5 *Pyrus Pedicularia.*
The Lowſie wilde Peare.

6 *Pyrus Coruina.*
The Crow Peare tree.

3

2

4

6

5

¶ *The Place.*

The wilde Peares grow of themſelues without manuring in moſt places, as woods, or in the borders of fields, and neere to high waies.

¶ *The Time.*

The Time of wilde Peares anſwereth the tame or manured Peare, notwithſtanding for the moſt part they are not ripe much before Winter.

¶ *The Names.*

The wilde Peare tree is called in Latine, *Pyrus ſylueſtris* and *Pyraſter*: in Greeke, ἀχράς by which name both the fruit and tree are known. Peares haue diuers ſyrnames among the antient Writers, and eſpecially in *Pliny*, in his 15 booke, 15 chapter, none of which are knowne to the later Writers (or not deſired:) euery city or euery country haue names of them ſelues, and Peares haue alſo diuers names according to the places.

¶ *The Temperature.*

All Peares are of a cold temperature, and the moſt part of them of a binding quality and an earthy ſubſtance.

¶ *The Vertues.*

The vertues of the wilde Peares are referred vnto the garden Peares as touching their binding faculty, but are not to be eaten, becauſe their nouriſhment is little and bad.

Chap. 101. *Of the Apple Tree.*

¶ *The Kindes.*

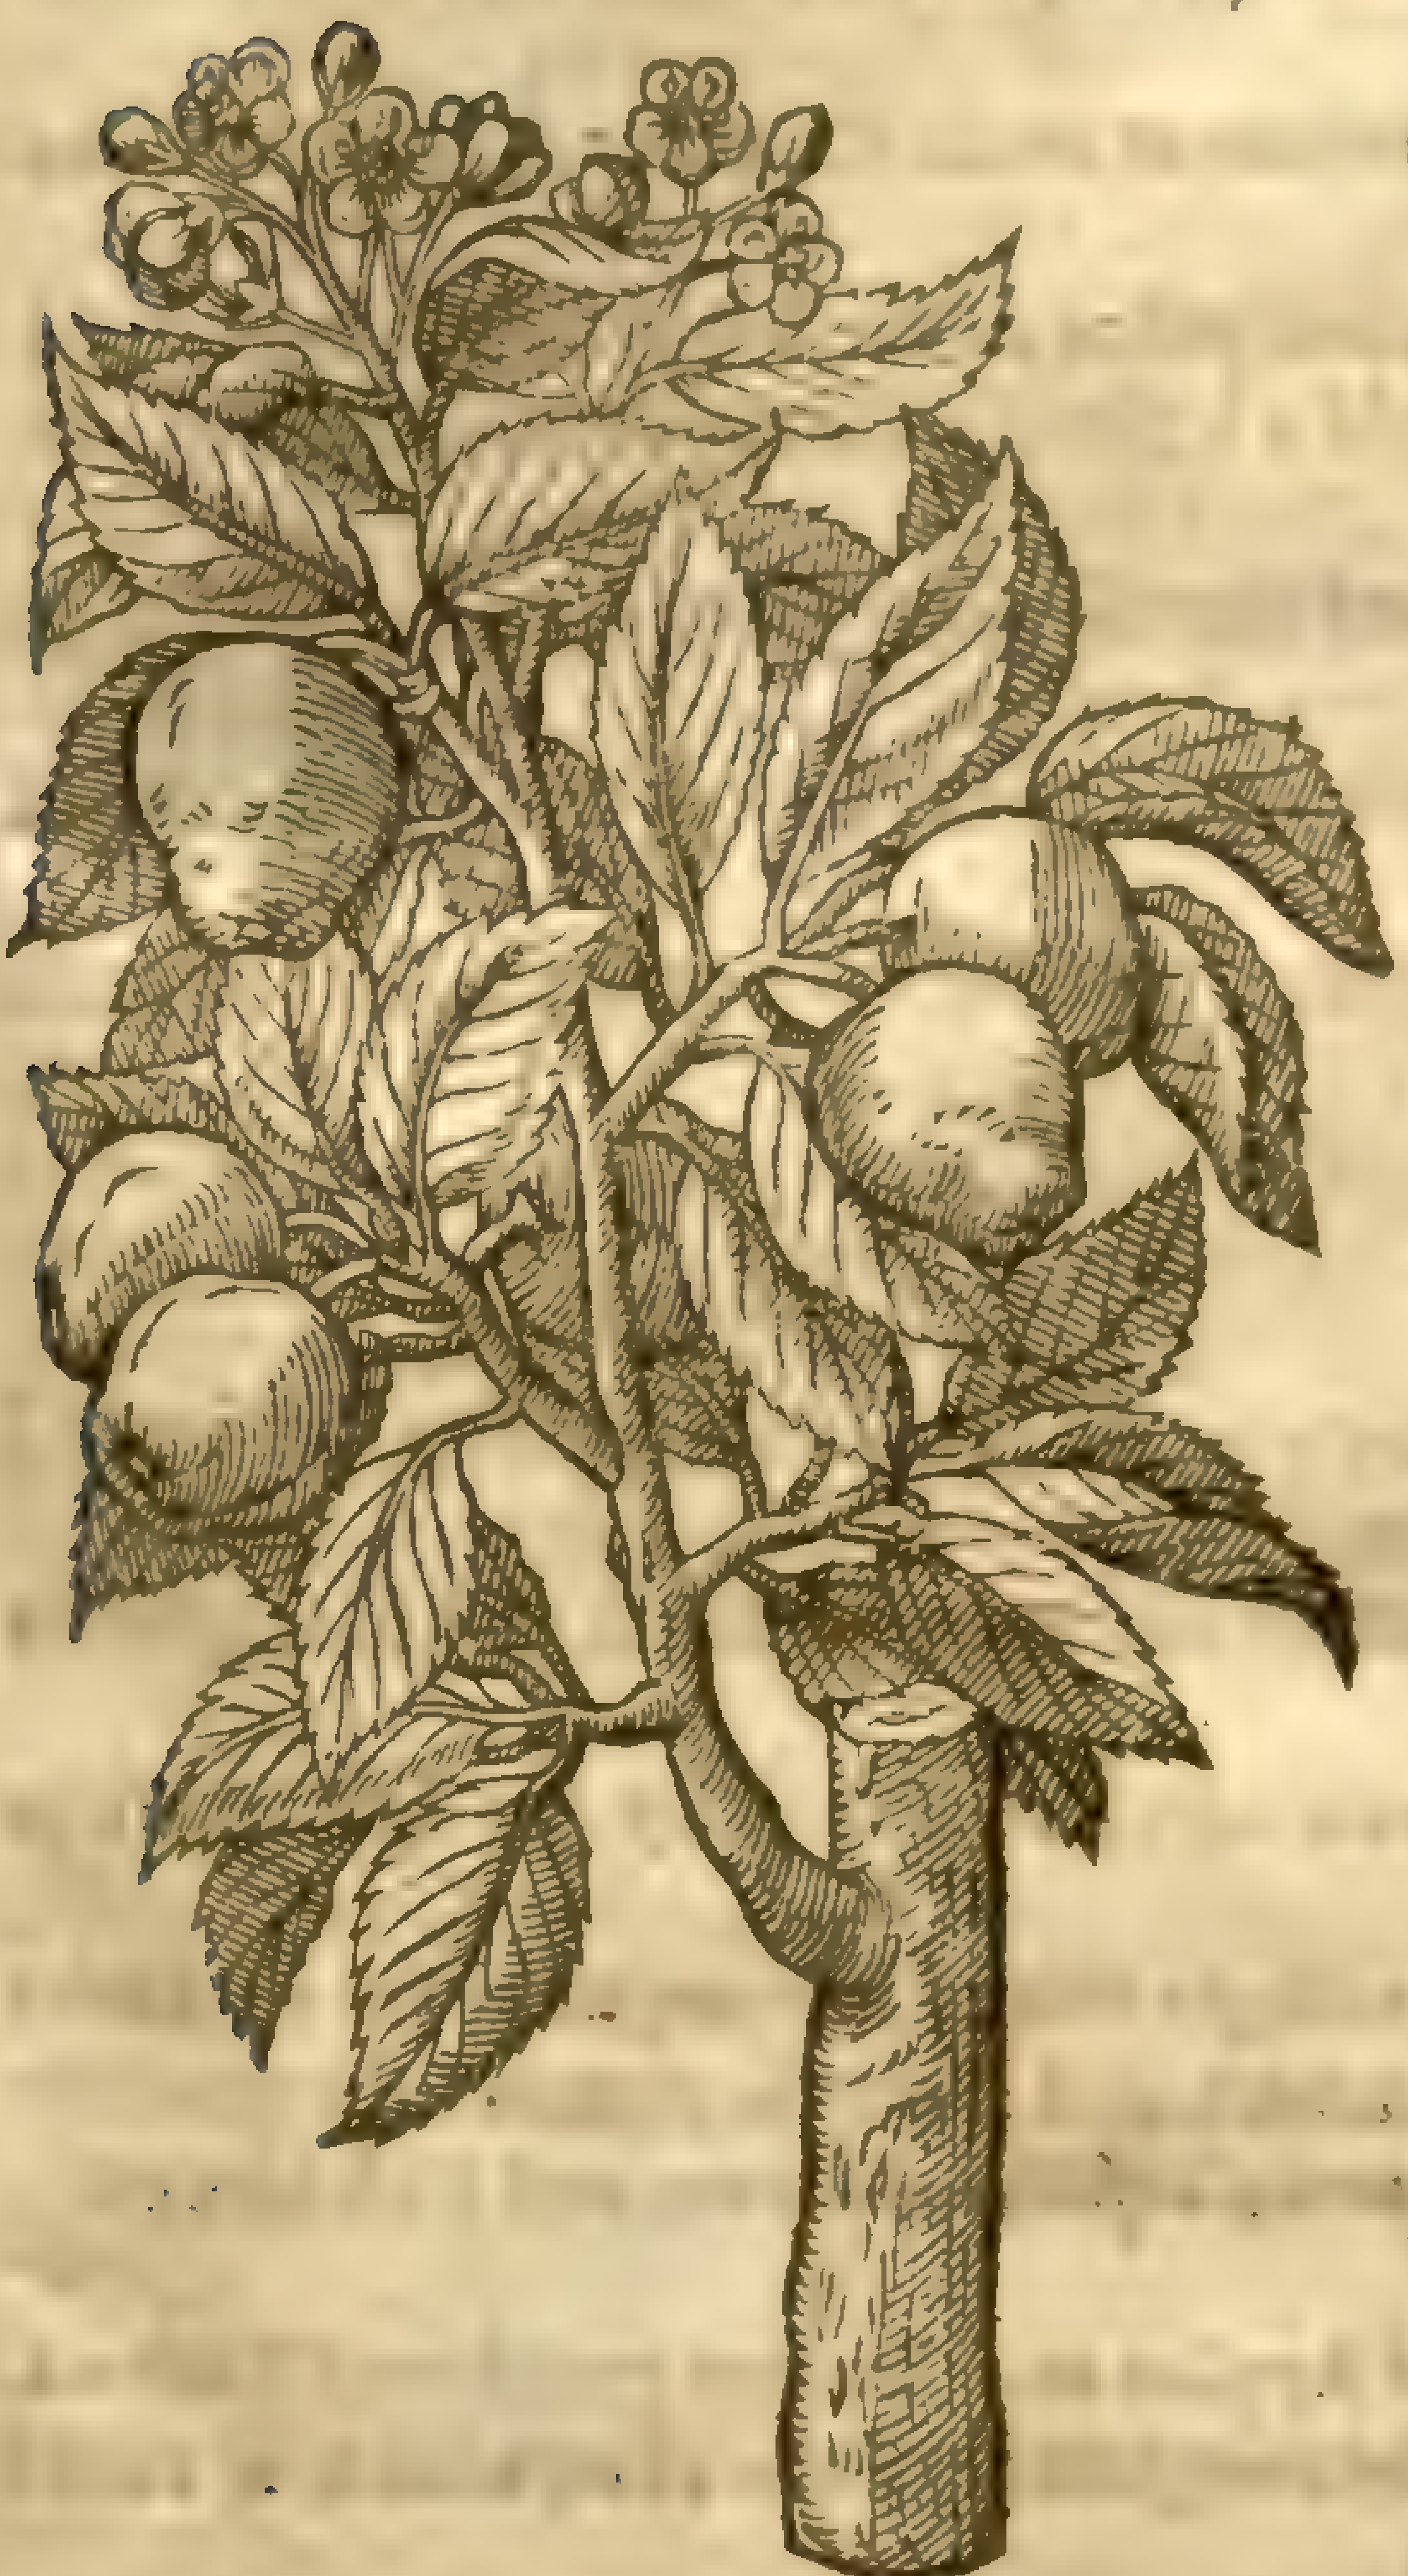
THe Latine name *Malus* reacheth far among the old Writers, and is common to many trees, but we will briefely firſt intreat of *Mali*, properly called Apple trees, whoſe ſtocke or kindred is ſo infinite, that we haue thought it not amiſſe to vſe the ſame order or method with Apples, that we haue done with Peares; that is, to giue them ſeuerall titles in Latine and Engliſh, and one generall deſcription for the whole.

¶ *The Deſcription.*

THe Apple tree hath a body or trunke commonly of a meane bigneſſe, not very high, hauing long armes or branches, and the ſame diſordered: the barke ſomewhat plaine, and not very rugged: the leaues bee alſo broad, more long than round, and finely nicked in the edges. The floures are whitiſh tending vnto a bluſh colour. The fruit or Apples do differ in greatneſſe, forme, colour, and taſte; ſome couered with a redde skinne, others yellow or greene, varying infinitely according to the ſoyle and climate, ſome very great, ſome little, and many of a middle ſort; ſome are ſweet of taſte, or ſomething ſoure; moſt be of a middle taſte betweene ſweet and ſoure, the which to diſtinguiſh I thinke it impoſſible; notwithſtanding I heare of one that intendeth to write a peculiar volume of Apples, and the vſe of them; yet when he hath done what he can doe, hee hath done nothing touching their ſeuerall kindes to diſtinguiſh them. This that hath beene ſaid ſhall ſuffice for our Hiſtory.

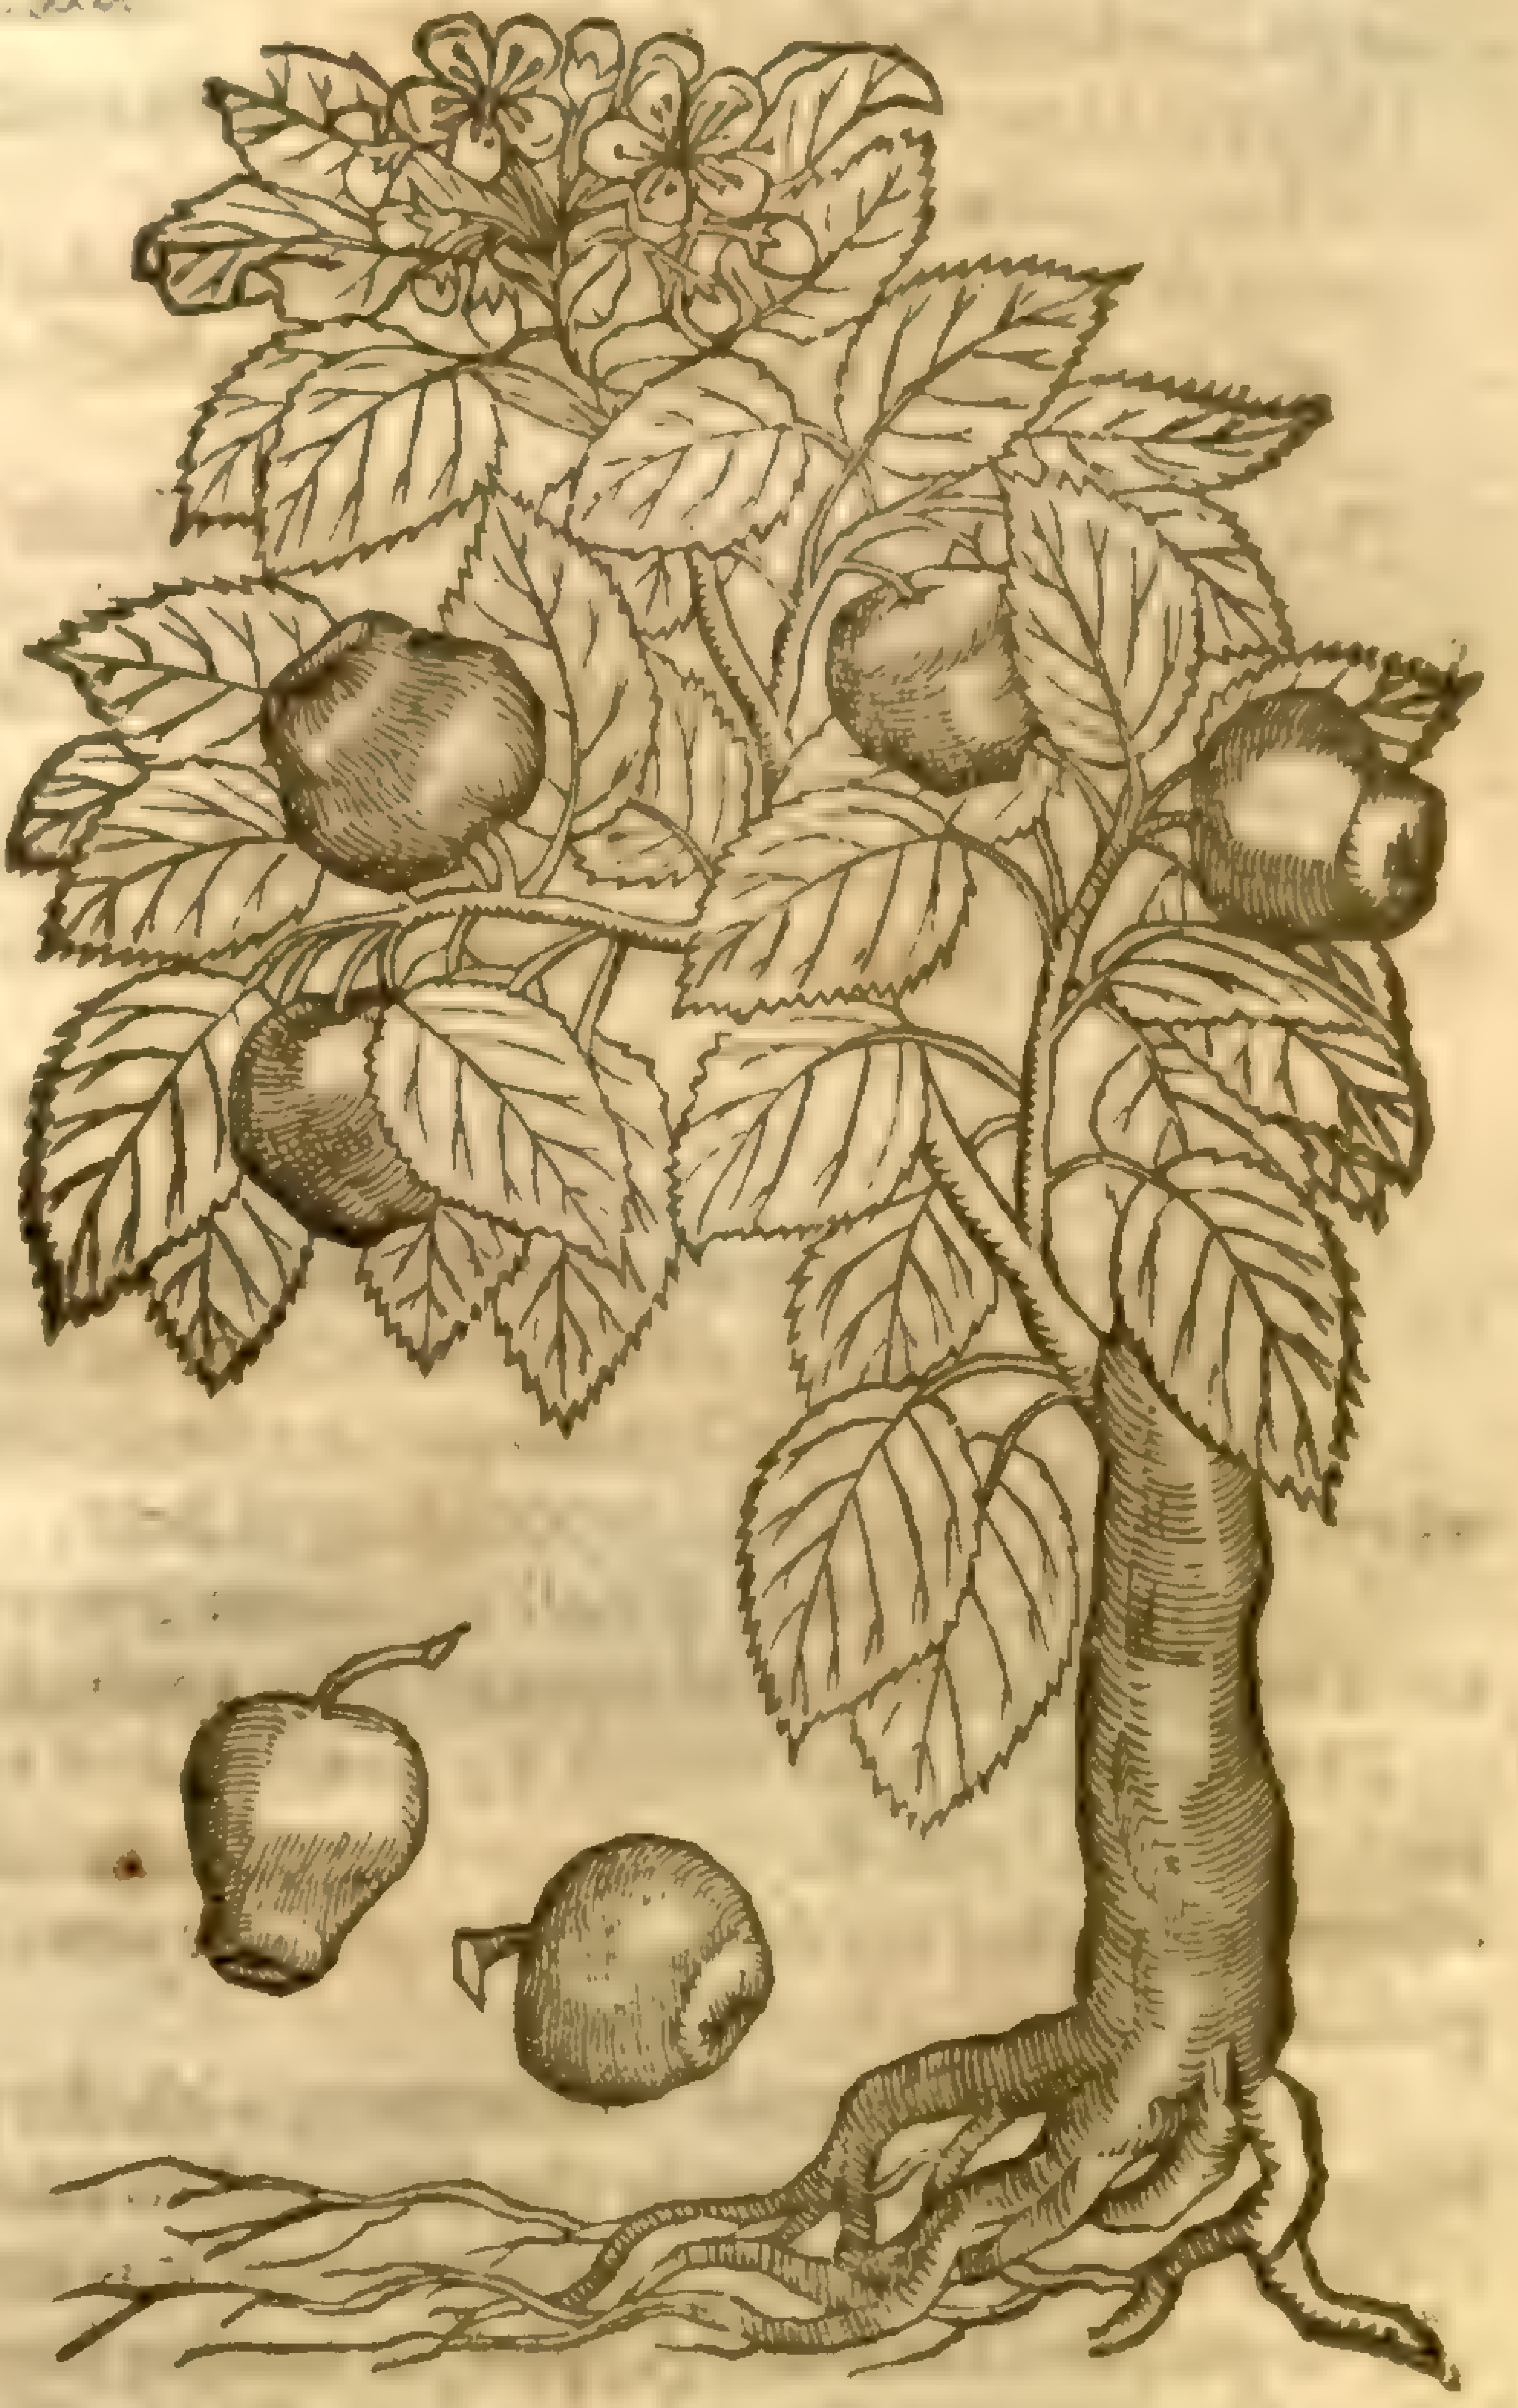
‡ Our Author gaue foure figures more out of *Tabernamontanus*, with theſe titles. 3. *Malum reginale*, the Qneening or Queene of Apples. 5 *Platomela ſiue Pyra æſtiua*: The Summer Pearemaine. 6 *Platurchapia ſiue Pyra hyemalia*: the Winter Pearemaine. ‡

1 *Malus Carbonaria.*
The Pome-Water tree.



[illegible]

2 *Malus Carbonaria longo fructu.*
The Bakers ditch Apple tree.



¶ *The Place.*

The tame and graffed Apple trees are planted and ſet in gardens and orchards made for that purpoſe: they delight to grow in good and fertile grounds: Kent doth abound with Apples of moſt ſorts. But I haue ſeene in the paſtures and hedge-rows about the grounds of a worſhipfull Gentleman dwelling two miles frow Hereford, called Maſter *Roger Bodnome*, ſo many trees of all ſorts, that the ſeruants drinke for the moſt part no other drinke but that which is made of Apples; The quantity is ſuch, that by the report of the gentleman himſelfe, the Parſon hath for tithe many hogſheads of Syder. The hogs are fed with the fallings of them, which are ſo many, that they make choiſe of thoſe Apples they do eate, who will not taſte of any but of the beſt. An example doubtleſſe to be followed of Gentlemen that haue land and liuing: but enuie ſaith, the poore will breake downe our hedges, and wee ſhall haue the leaſt part of the fruit; but forward in the name of God, graffe, ſet, plant and nouriſh vp trees in euery corner of your ground, the labour is ſmall, the coſt is nothing, the commodity is great, your ſelues ſhall haue plenty, the poore ſhall haue ſomwhat in time of want to relieue their neceſſitie, and God ſhall reward your good mindes and diligence.

¶ *The Time.*

They bloome about the end of Aprill, or in the beginning of May. The forward Apples be ripe about the Calends of Iuly, others in September.

¶ *The Names.*

The Apple tree is called in Greeke μηλέα: in Latine, *Malus* and *Pomus*: in high Dutch, **Opffelbaum**: in low Dutch, **Appelboom**: in French, *Pommier*: in Engliſh, Apple-tree.

The Grecians name the fruit μῆλον: the Latines, *Malum* or *Pomum*: in high Dutch, **Opffell**: in low Dutch, **Appel**: in French and Spaniſh, *Manſanas*: in Engliſh, Apple.

¶ *The Temperature.*

All Apples be of temperature cold and moiſt, and haue joyned with them a certaine excrementall or ſuperfluous moiſture: but as they be not all of like coldneſſe, ſo neither haue they like quantitie of ſuperfluous moiſture. They are ſooneſt rotten that haue greateſt ſtore of moiſture, and they may be longer kept in which there is leſſe ſtore: for the abundance of excrementall moiſture is the cauſe why they rot.

Sweet Apples are not ſo cold and moiſt, which being roſted or boyled, or otherwiſe kept, retaine or keepe the ſoundneſſe of their pulpe.

They yeeld more nouriſhment, and not ſo moiſt a nouriſhment as do the other Apples, and doe not ſo eaſily paſſe through the belly.

Soure Apples are colder and alſo moiſter: the ſubſtance or pulpe of theſe when they bee boiled doth run abroad, and retaineth not his ſoundneſſe: they yeeld a leſſer nouriſhment, and the ſame raw and cold.

They do eaſily and ſpeedily paſſe through the belly, and therefore they doe mollifie the belly, eſpecially being taken before meat.

Harſh or Auſtere Apples being vnripe, are cold; they ingender groſſe bloud, and great ſtore of winde, and often bring the Collicke.

Thoſe Apples which be of a middle taſte contain in them oftentimes two or three ſorts of taſts, and yet do they retaine the faculties of the other.

¶ *The Vertues.*

A Roſted Apples are alwaies better than the raw, the harme whereof is both mended by the fire, and may alſo be corrected by adding vnto them ſeeds or ſpices.

B Apples be good for an hot ſtomacke: thoſe that are auſtere or ſomewhat harſh doe ſtrengthen a weake and feeble ſtomacke proceeding of heat.

C Apples are alſo good for all inflammations or hot ſwellings, but eſpecially for ſuch as are in their beginning, if the ſame be outwardly applied.

D The juyce of Apples which be ſweet and of a middle taſte, is mixed in compoſitions of diuers medicines, and alſo for the tempering of melancholy humours, and likewiſe to mend the qualities of medicines that are dry: as are *Serapium ex pomis Regis Saporis*, *Confectio Alkermes*, and ſuch like compoſitions.

E There is likewiſe made an ointment with the pulpe of Apples and Swines greaſe and Roſe water, which is vſed to beautifie the face, and to take away the roughneſſe of the skin, which is called in ſhops *Pomatum*: of the Apples whereof it is made.

F The pulpe of the roſted Apples, in number foure or fiue, according to the greatneſſe of the Apples, eſpecially the Pome-water, mixed in a wine quart of faire water, laboured together vntill it come to be as Apples and Ale, which wee call Lambes Wooll, and the whole quart drunke laſt at night, within the ſpace of an houre, doth in one night cure thoſe that piſſe by droppes with great anguiſh and dolour; the ſtrangury, and all other diſeaſes proceeding of the difficulty of making water; but in twiſe taking, it neuer faileth in any: oftentimes there happeneth with the foreſaid diſeaſes the Gonorrhæa, or running of the Raines, which it likewiſe healeth in thoſe perſons; but not generally in all; which my ſelfe haue often proued, and gained thereby both crownes and credit.

G The leaues of the tree doth coole and binde, and be alſo counted good for inflammations, in the beginning.

H Apples cut in pieces, and diſtilled with a quantitie of Camphire and butter-milke, take away the markes and ſcarres gotten by the ſmall pockes, being waſhed therewith when they grow vnto their ſtate and ripeneſſe: prouided that you giue vnto the patienr a little milke and Saffron, or milke and mithridate to drinke, to expell to the extreme parts that venome which may lie hid, and as yet not ſeene.

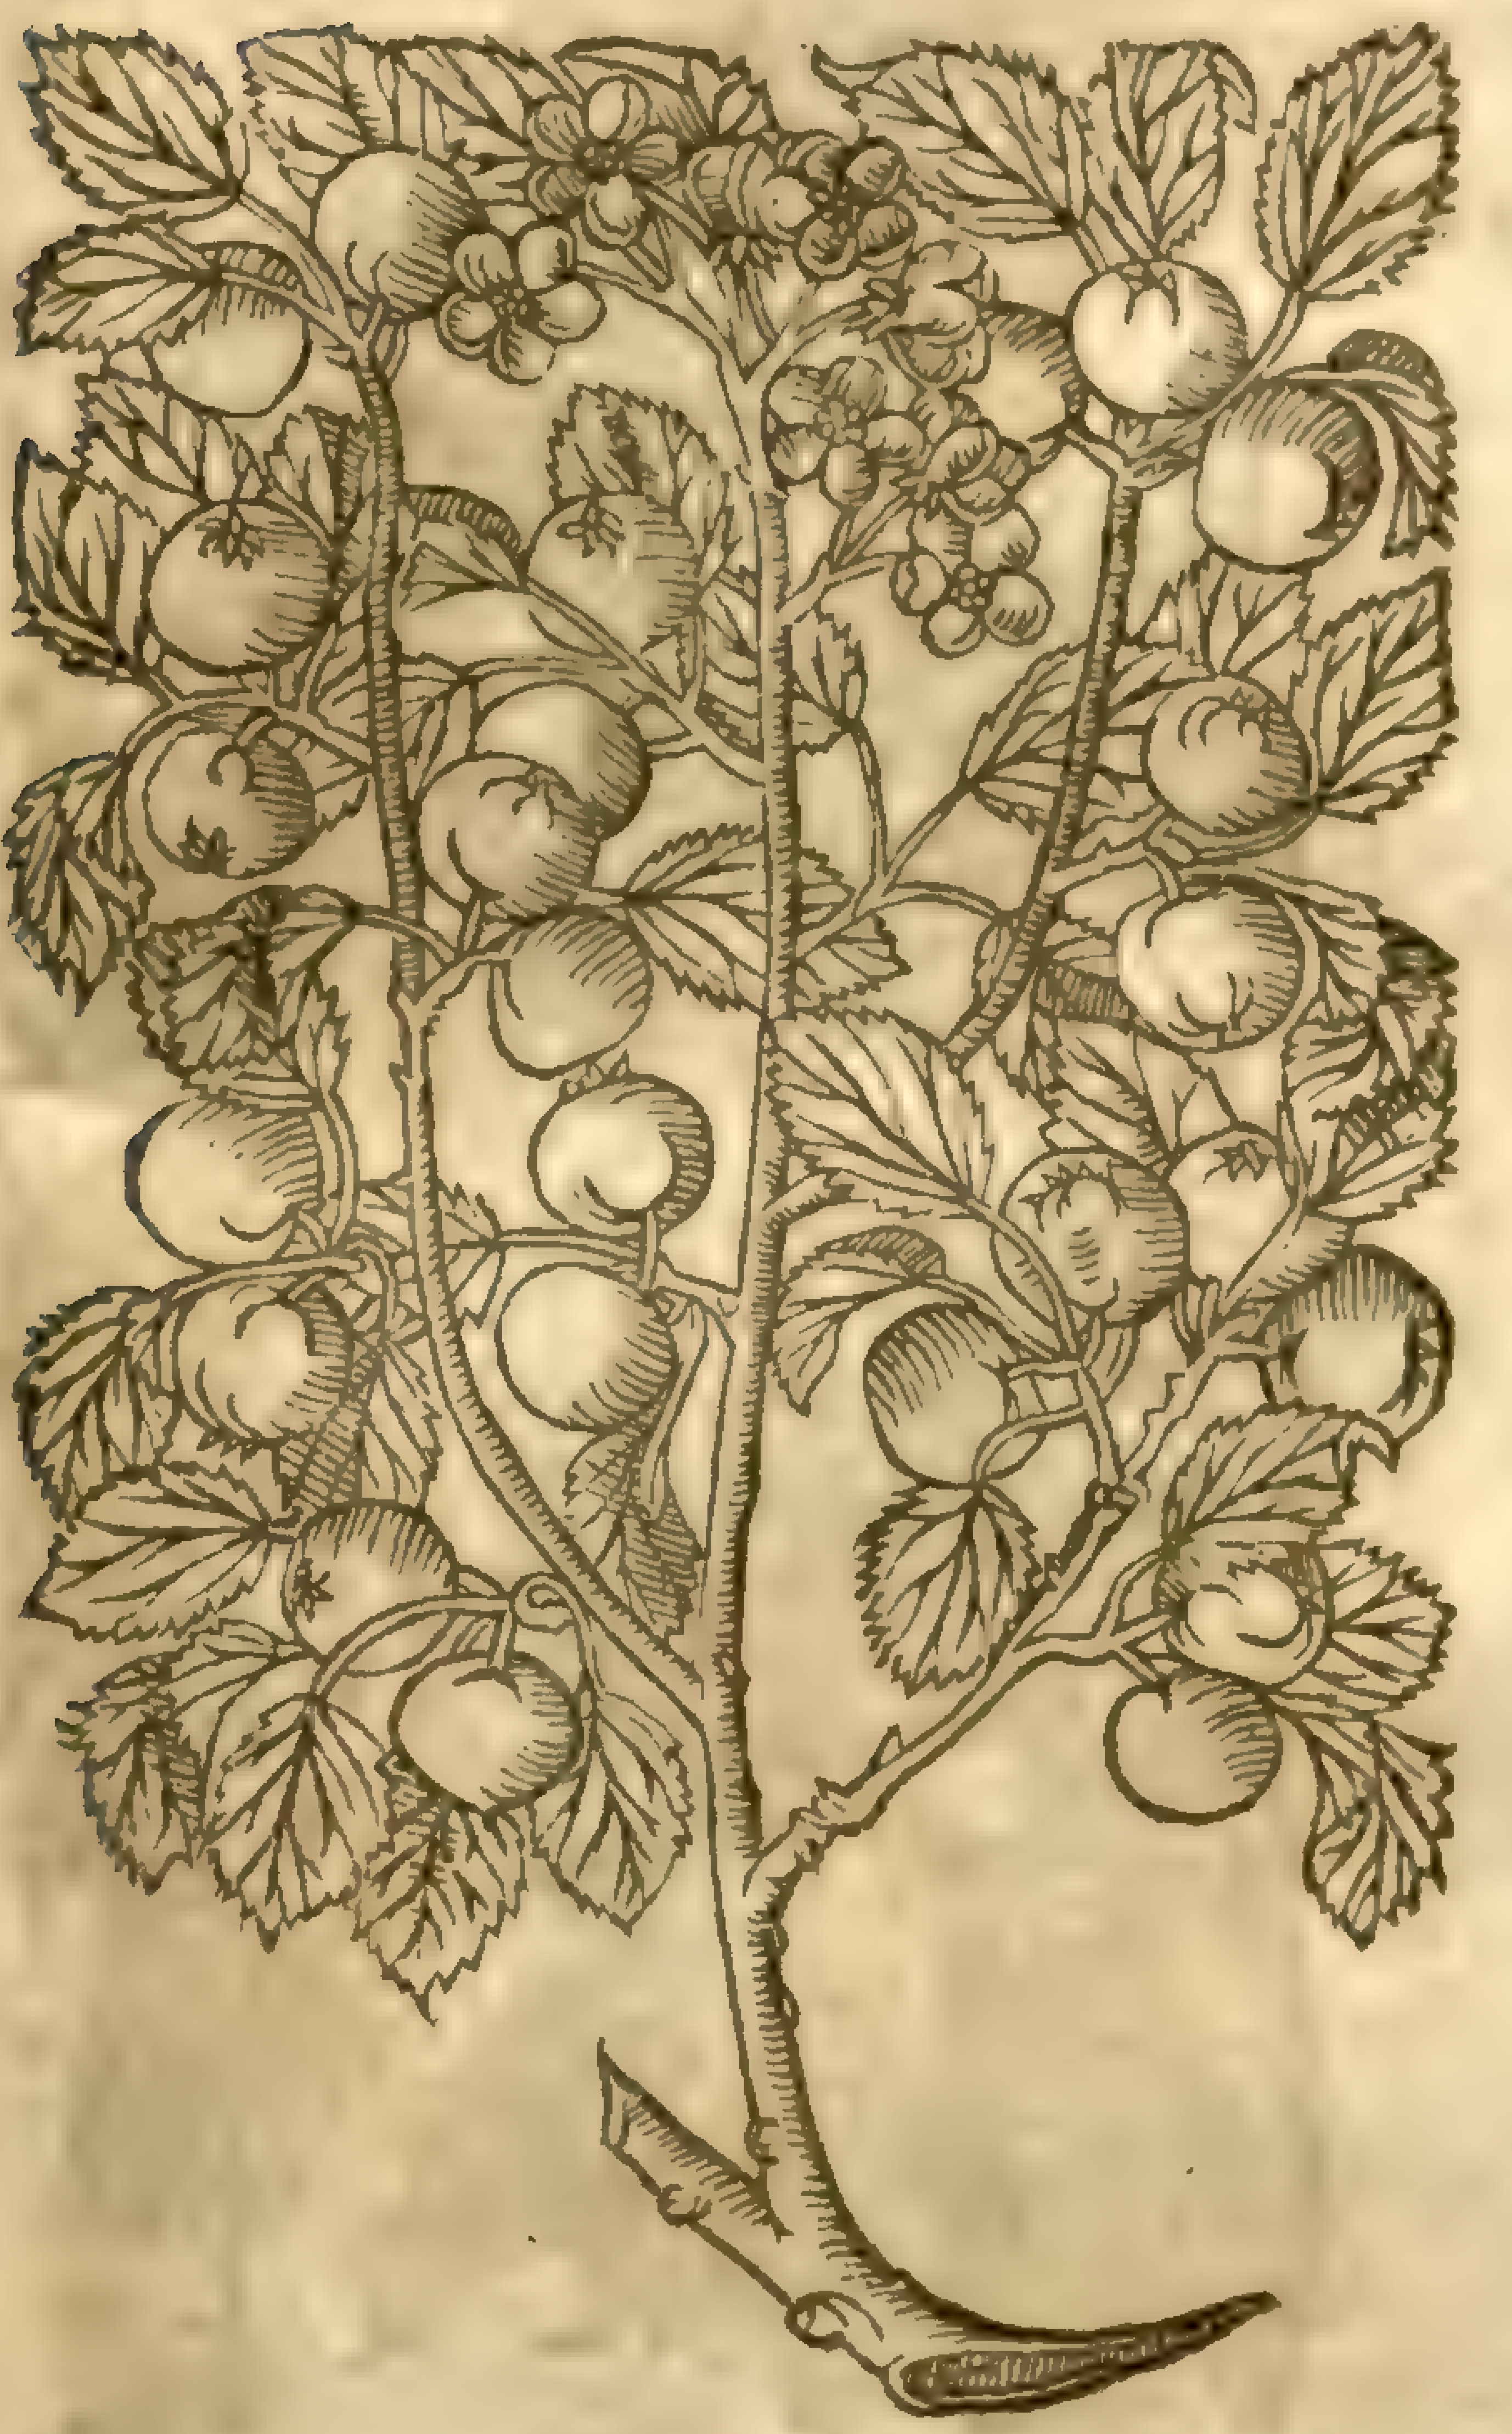
CHAP. 102. *Of the Wilding or Crab tree.*

¶ *The Kindes.*

LIke as there be diuers manured Apples, ſo are there ſundry wilde Apples, or Crabs, whereof to write apart were to ſmall purpoſe, and therefore one deſcription ſhall ſuffice for the reſt.

Malus ſylueſtris.
The Wilding or Crab tree.

Pyrus malus, [illegible]



¶ *The generall Deſcription.*

THere be diuers wilde Apple trees not huſbanded, that is to ſay, not grafted; the fruit whereof is harſh and binding: for by grafting both Apples and Peares become more milde and pleaſant. The crab or wilding tree growes oftentimes to a reaſonable greatneſſe, equall with the Apple tree: the wood is hard, firme, and ſollid; the barke rough; the branches or boughes many; the floures and fruit like thoſe of the Apple tree, ſome red, others white, ſome greater, others leſſer: the difference is knowne to all, therefore it ſhall ſuffice what hath been ſaid for their ſeuerall diſtinctions: we haue in our London gardens a dwarfe kinde of ſweet Apple, called *Chamæmalus*, the dwarfe Apple tree, or Paradiſe Apple, which beareth Apples very timely without grafting.

‡ Our Author here alſo (out of *Tabernamontanus*) gaue foure figures, whereof I onely retaine the beſt, with their ſeuerall titles. 1 *Malus ſylueſtris rubens*. The great Wilding or red Crab tree. 2 *Malus ſylueſtris alba*. The white Wilding or Crab tree. 3 *Malus ſylueſtris minor*. The ſmaller Crab tree. 4 *Malus duracina ſylueſtris*. The choking leane Crab tree. ‡

¶ *The Place.*

The Crab tree groweth wilde in woods and hedge rowes almoſt euery where.

¶ *The Time.*

The time anſwereth thoſe of the garden.

¶ *The Names.*

Their titles doth ſet forth their names in Latine and Engliſh.

¶ *The Temperature.*

Of the temperature of wilde Apples hath been ſufficiently ſpoken in the former chapter.

¶ *The Vertues.*

The juyce of wilde Apples or crabs taketh away the heat of burnings, ſcaldings, and all inflammations: and being laid on in ſhort time after it is ſcalded, it keepeth it from bliſtering. A

The juyce of crabs or Verjuice is aſtringent or binding, and hath withall an abſterſiue or clenſing qualitie, being mixed with hard yeeſt of Ale or Beere, and applied in manner of a cold ointment, that is, ſpread vpon a cloth firſt wet in the Verjuyce and wrung out, and then laid to, taketh away the heat of S. Anthonies fire, all inflammations whatſoeuer, healeth ſcab'd legs, burnings and ſcaldings whereſoeuer it be. B

Chap. 103.

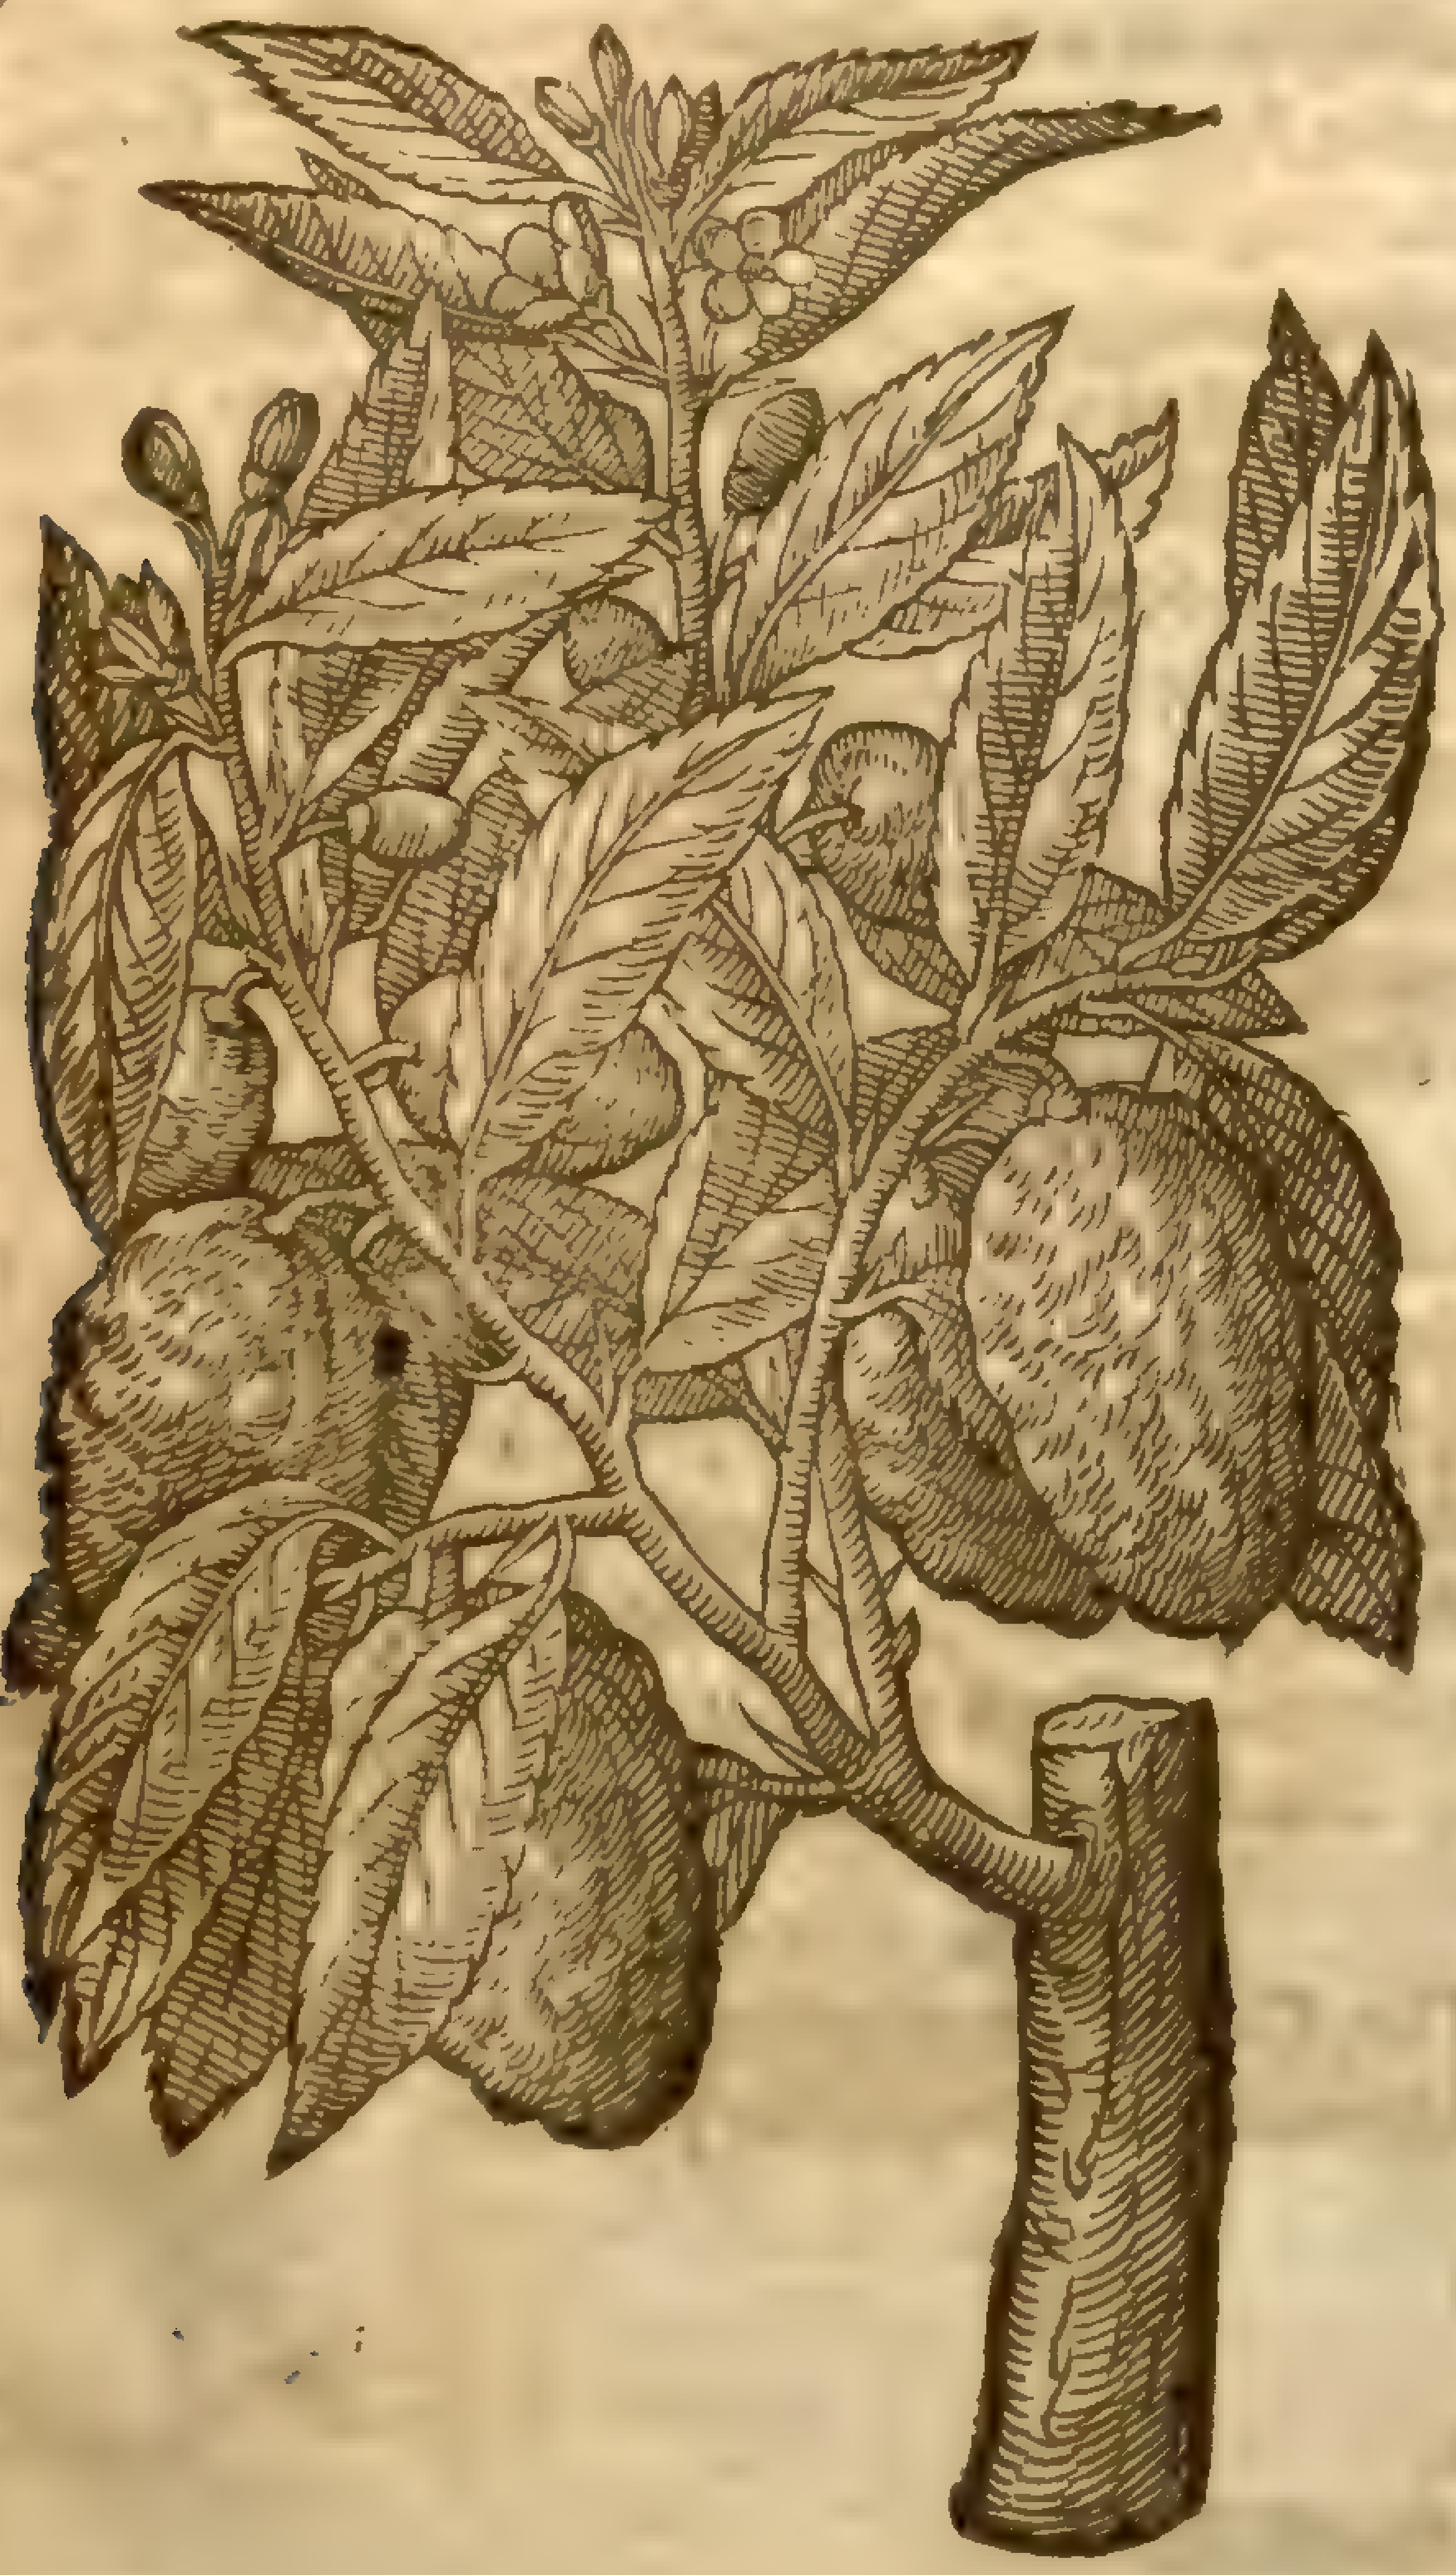
Of the Citron, Limon, Orange, and Aſſyrian Apple trees.

¶ *The Kindes.*

THe Citron tree is of kindred with the Limon tree, the Orange is of the ſame houſe or ſtocke, and the Aſſyrian Apple tree claimeth a place as neereſt in kindred and neighbourhood: wherefore I intend to comprehend them all in this one chapter.

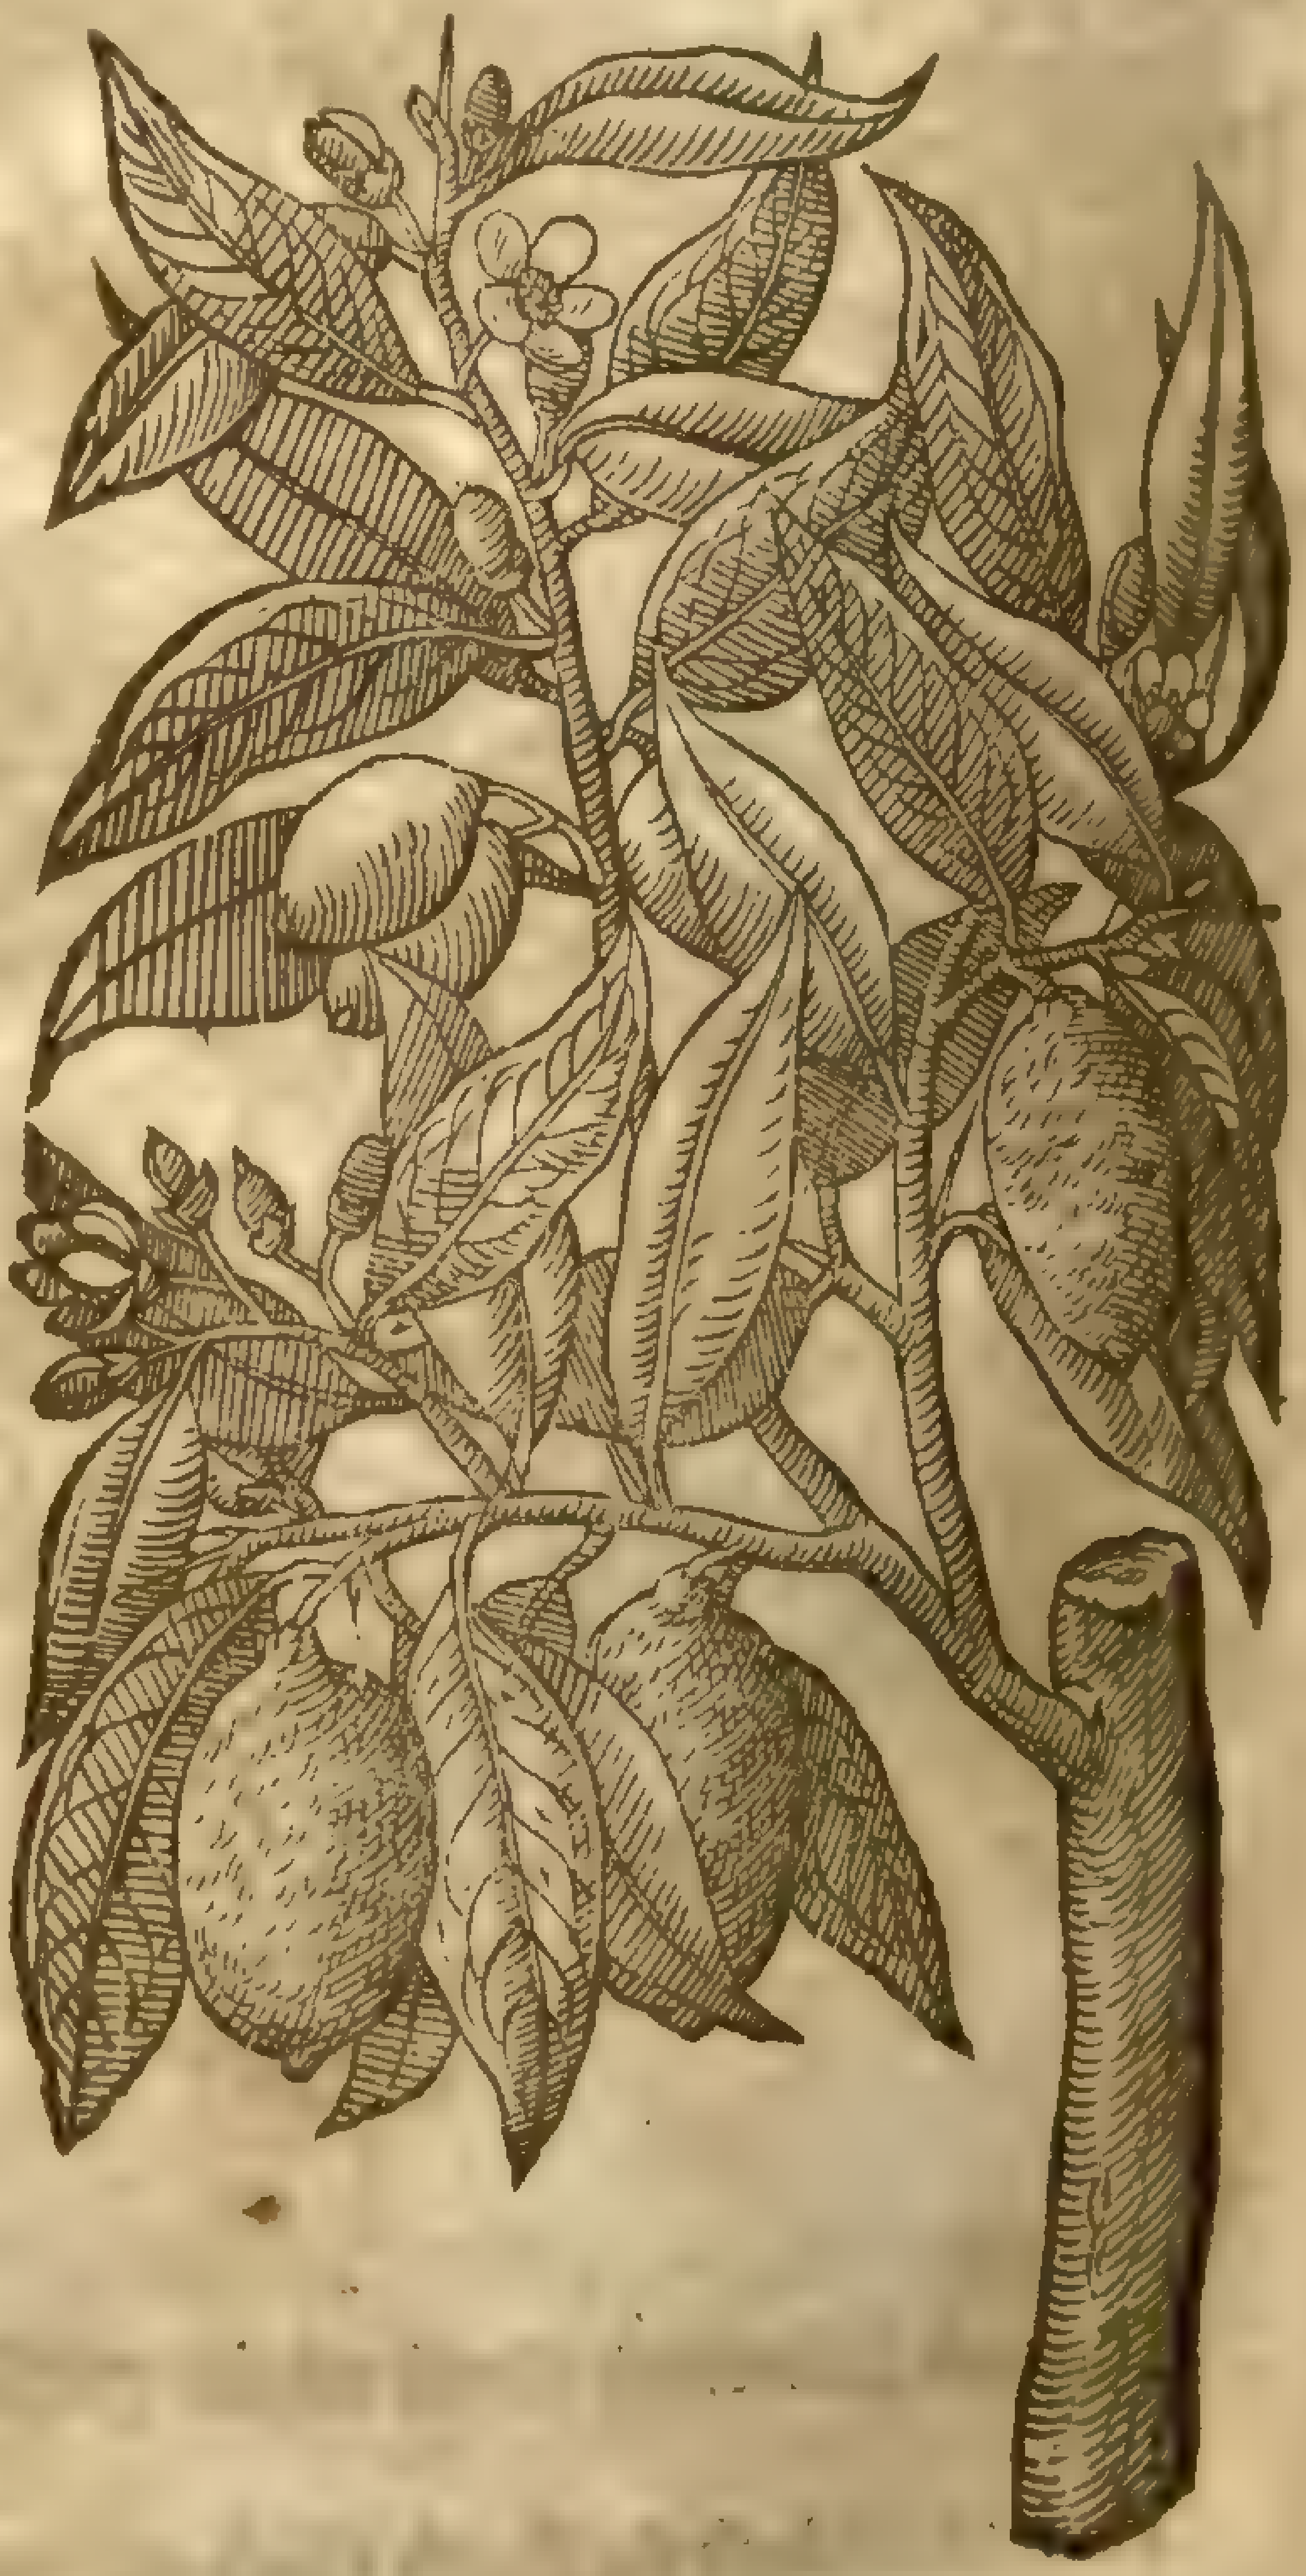
C. medica: Miller: dict

1 *Malus medica.*
The Pome Citron tree.



C. medica, Limon Miller: dict

2 *Malus Limonia.*
The Limon tree.



¶ *The Deſcription.*

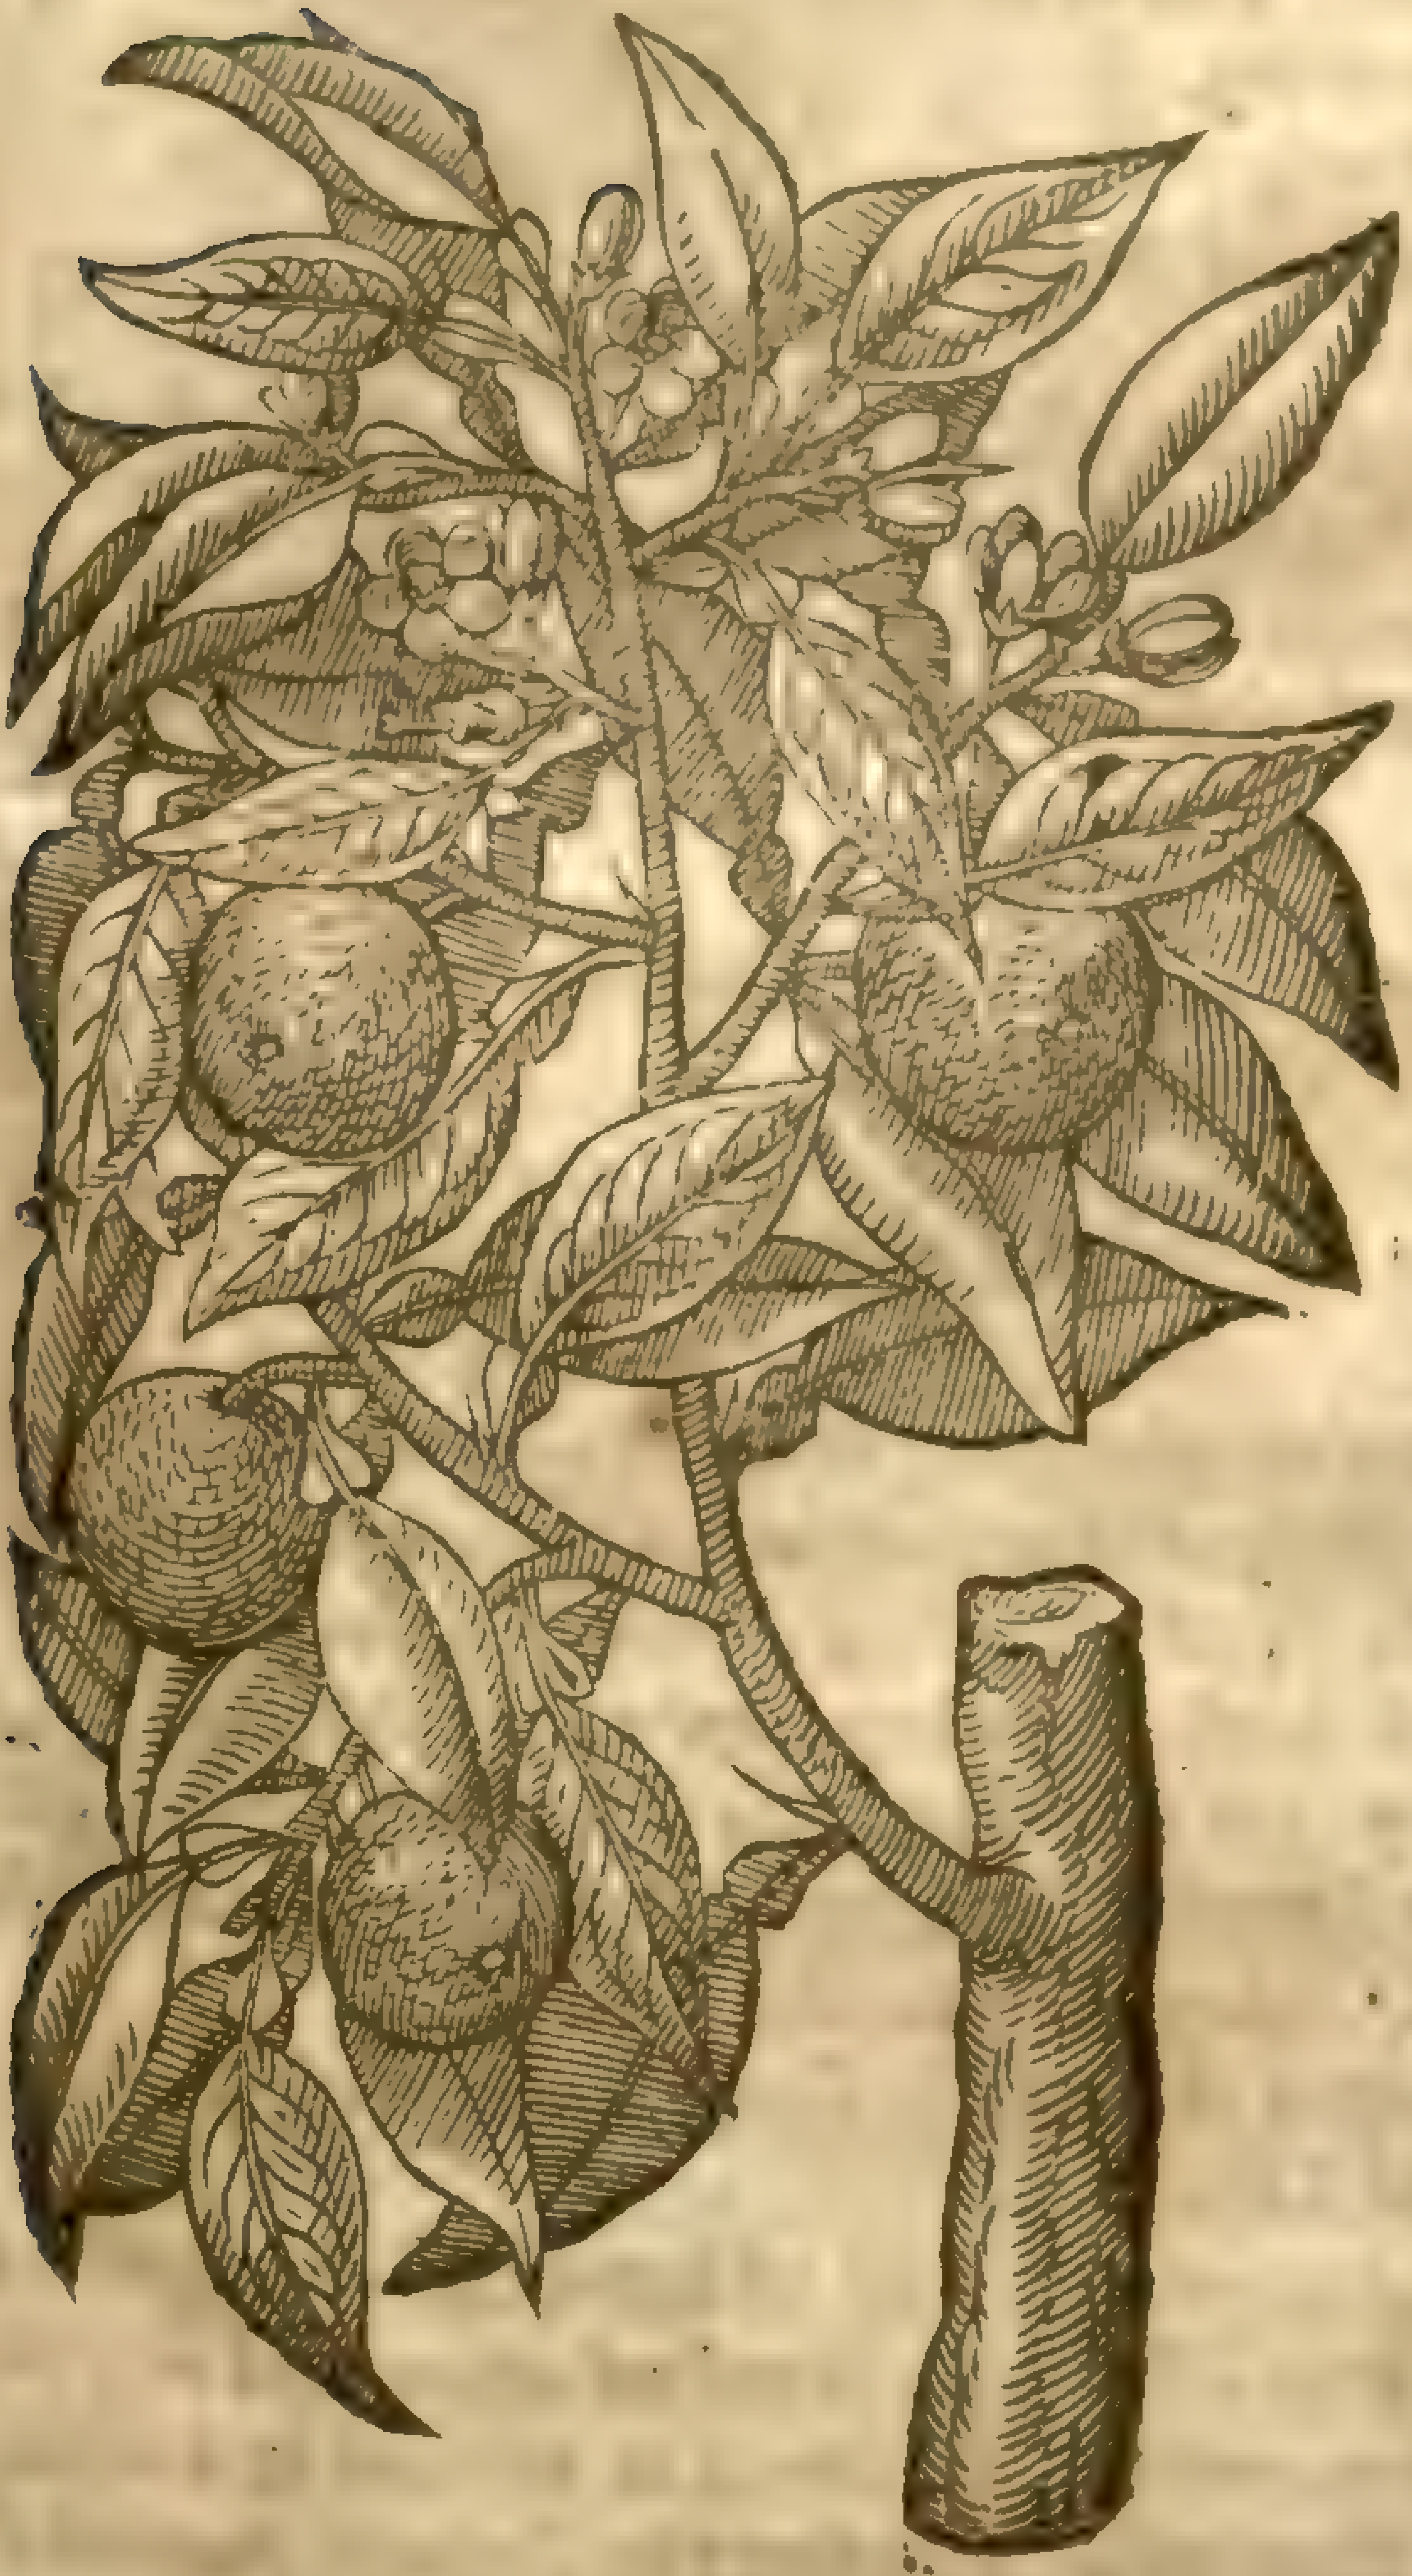
1 THe Citron tree is not very great, hauing many boughes or branches, tough and pliable, couered with a greene barke: whereon do grow greene leaues, long, ſomewhat broad, very ſmooth, and ſweet of ſmell like thoſe of the Bay tree: among which come forth here and there certaine prickles, ſet far in ſunder: from the boſome whereof come forth ſmall floures, conſiſting of fiue little leaues, of a white colour tending to purple, with certaine threds like haires growing in the middle: the fruit is long, greater many times than the Cucumber, often leſſer, and not much greater than the Limon: the barke or rinde is of a light golden colour, ſet with diuers knobs or bumps, and of a very pleaſant ſmell: the pulpe or ſubſtance next vnto it is thicke, white, hauing a kinde of aromaticall or ſpicie ſmell, almoſt without any taſte at all: the ſofter pulpe within that, is not ſo firme or ſollid, but more ſpungie, and full of a ſower juyce, in which the ſeed lieth hid, greater and thicker than a graine of Barley.

2 The Limon tree is like vnto the Pome Citron tree in growth, thorny branches, and leaues of a pleaſant ſweet ſmell, like thoſe of the Bay-tree: the floures hereof are whiter than thoſe of the Citron tree, and of a moſt ſweet ſmell: the fruit is long and thicke, leſſer than the Pome Citron:

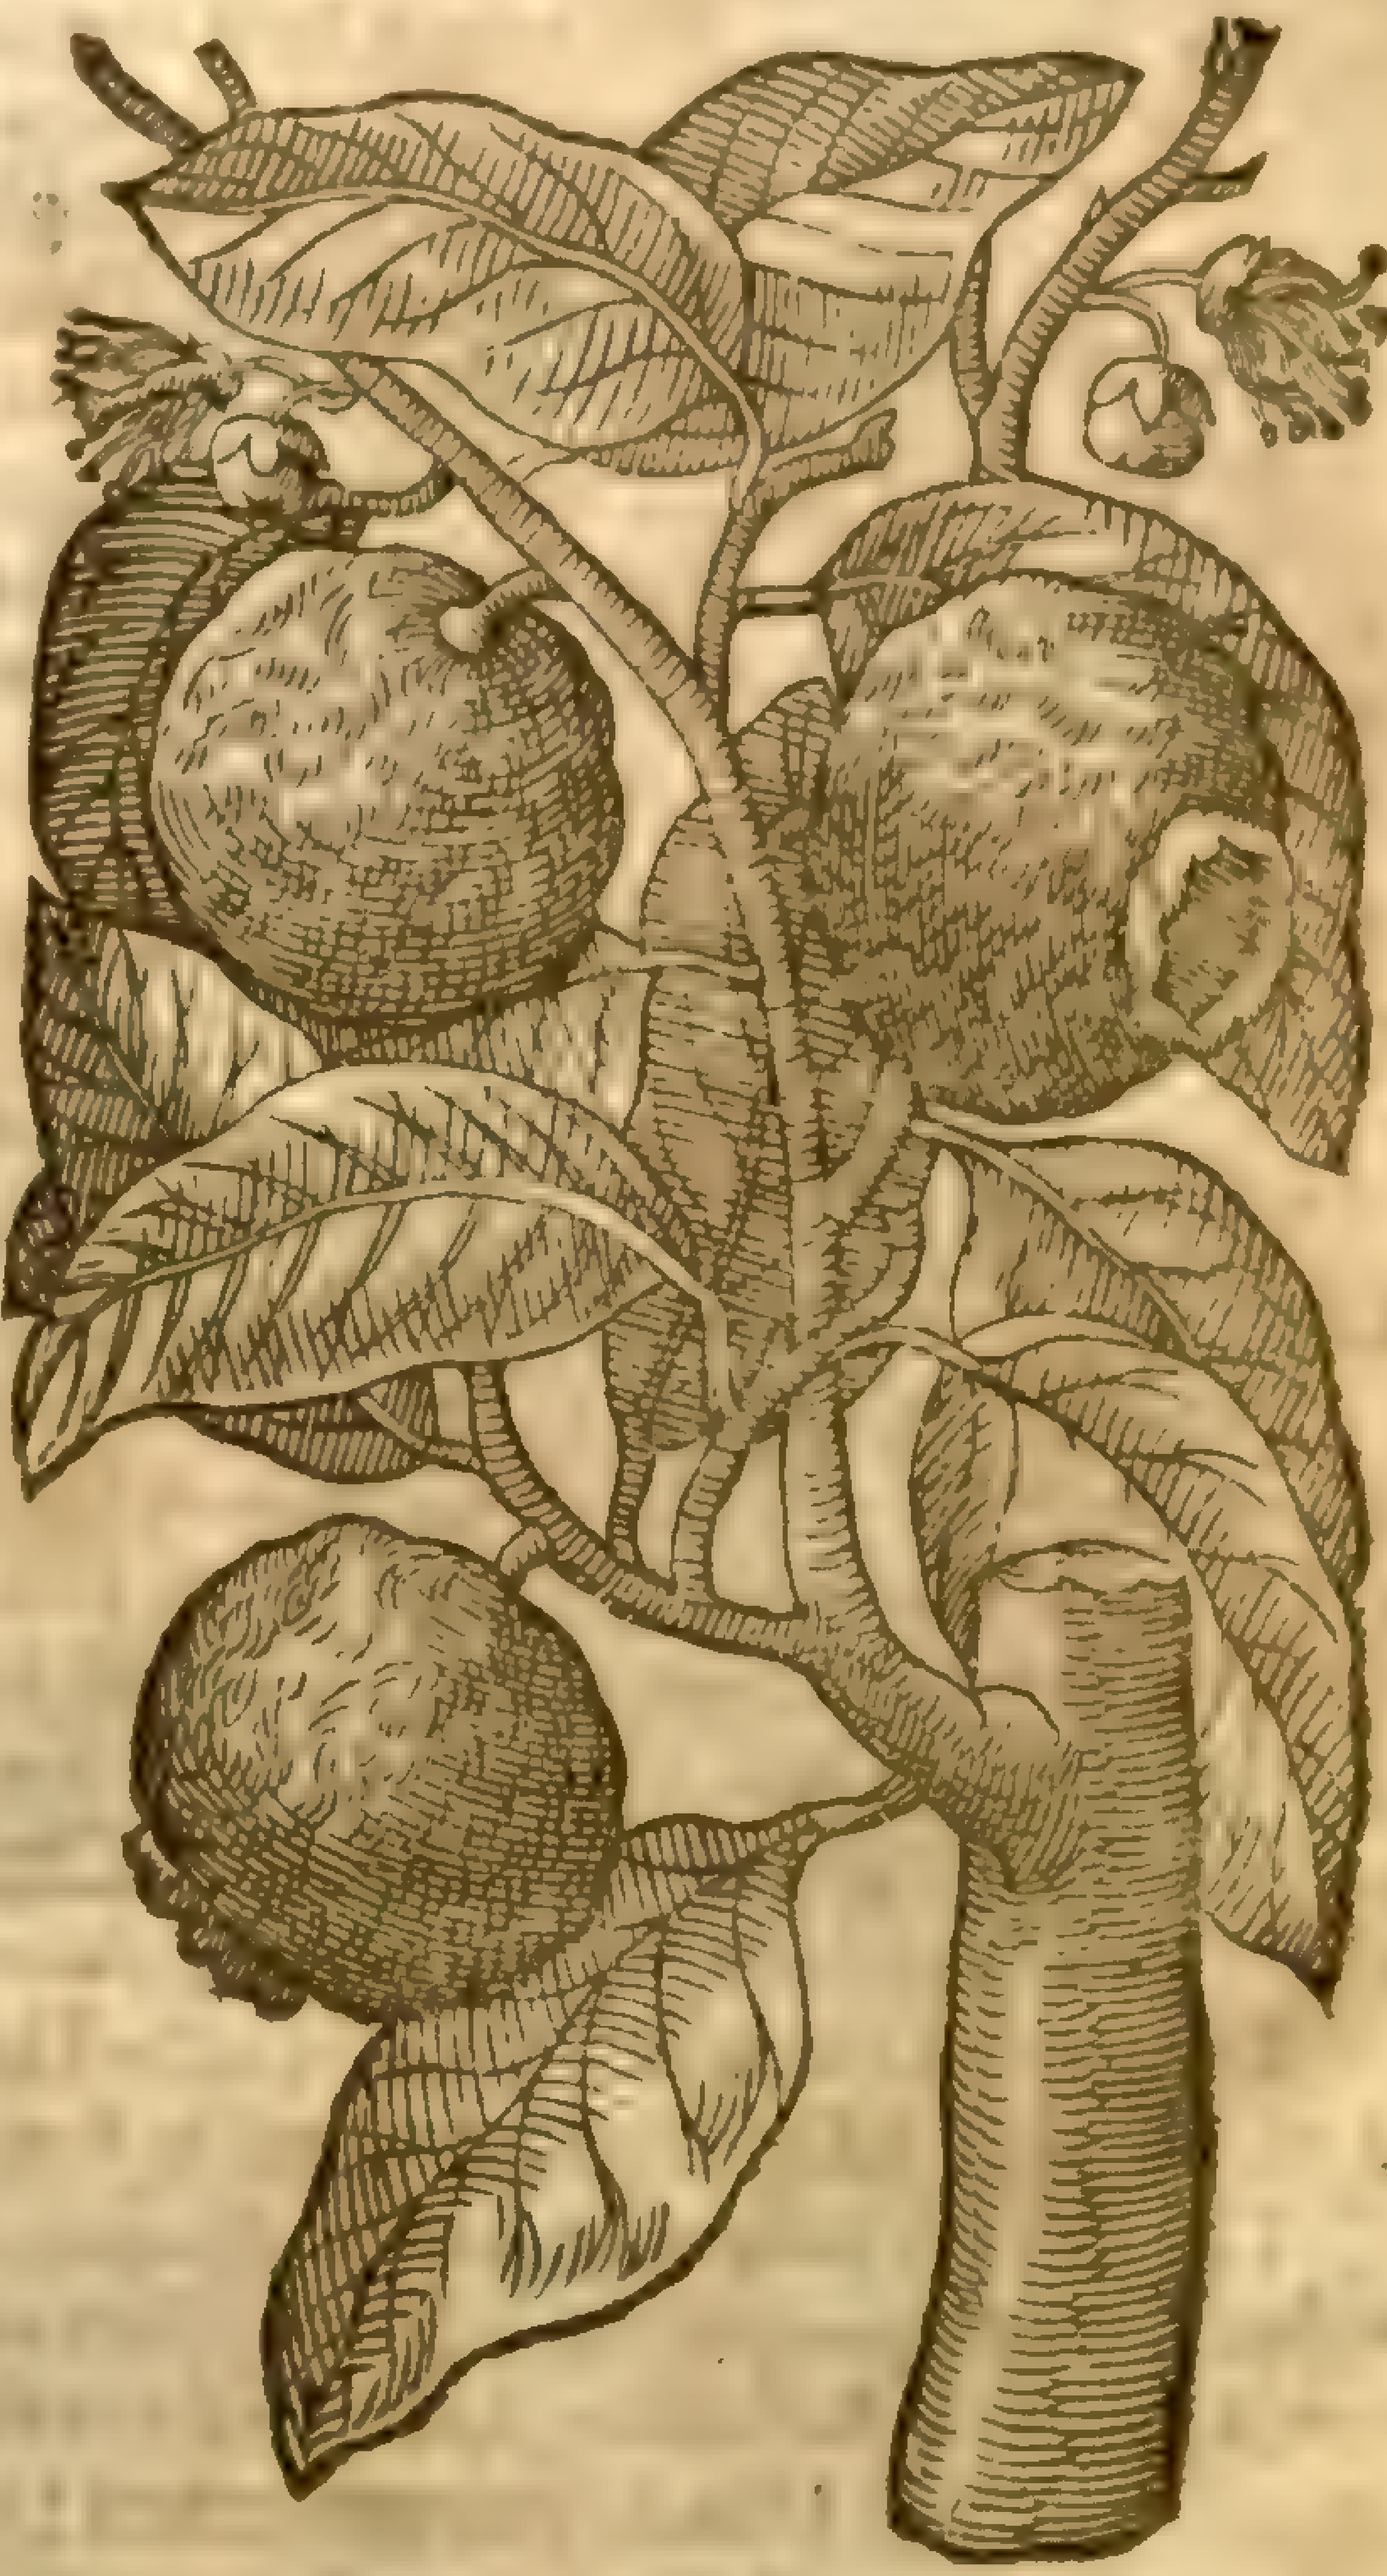
the rinde is yellow, ſomwhat bitter in taſte, and ſweet of ſmell: the pulpe is white, more in quantity than that of the Citròn, reſpecting the bigneſſe; in the middle part whereof is contained more ſoft ſpungie pulpe, and fuller of ſoure juyce: the ſeeds are like thoſe of the Pome Citron.

3 The Orenge tree groweth vp to the height of a ſmal Peare tree, hauing many thorny boughes or branches, like thoſe of the Citron tree: the leaues are alſo like thoſe of the Bay-tree, ‡ but that they differ in this, that at the lower end next the ſtalke there is a leſſer leafe made almoſt after the vulgar figure of an heart, whereon the bigger leafe doth ſtand, or is faſtned: ‡ and they are of a ſweet ſmell: the floures are white of a moſt pleaſant ſweet ſmell alſo: the fruit is round like a ball, euery circumſtance belonging to the forme is very well knowne to all: the taſte is ſoure, ſomtimes ſweet, and often of a taſte betweene both: the ſeeds are like thoſe of the Limon.

Citrus aurantium, Lin.
Mill. dict.



3 *Malus arantia.*
The Orange tree.



4 *Malus Aſſyria.*
The Aſſyrian Apple tree.

4 The Aſſyrian Apple tree is like vnto the Orange tree: the branches are like: the leaues are greater: the floures are like thoſe of the Citron tree: the fruit is round, three times as big as the Orange: the barke or peeling is thicke, rough, and of a pale yellow colour, wherein appeare often as it were ſmall clifts or crackes: the pulpe or inner ſubſtance is full of juyce, in taſte ſharpe, as that of the Limon, but not ſo pleaſant: the ſeeds are like thoſe of the Citron.

¶ *The Place.*

The Citron, Limon, and Orenge trees doe grow eſpecially on the ſea coaſts of Italy, and on the Iſlands of the Adriaticke Tyrrhene, and alſo Ægæan ſeas, and likewiſe on the maine land neer vnto meeres and great lakes: there is alſo great ſtore of them in Spaine, but in places eſpecially joyning to the ſea, or not farre off: they are alſo found in certaine Prouinces of France which lie vpon the midland ſea. They were firſt brought out of Media, as not onely *Pliny* writeth, but alſo the Poët *Virgil* affirmeth in the ſecond booke of his Georgickes, writing of the Citron tree after this maner:

Media fert triſtes ſuccos, tardumque ſaporem
Felicis mali, quo non præſentius vllum,
Pocula ſi quando ſæua infecere nouerca,

Miſcueruntque herbas, & non innoxia verba,
Auxilium venit, ac membris agit atra venena.
Ipſa ingens arbos, facieſque ſimillima Lauro;
Et, ſi non alium late jactaret odorem,
Laurus erat; folia haud vllis labentia ventis;
Flos apprime tenax. Animas & olentia Medi
Ora fouent illo, & ſenibus medicantur anhelis.

The Countrey Media beareth juyces ſad,
And dulling taſtes of happy Citron fruit,
Than which, no helpe more preſent can be had,
If any time ſtepmothers worſe than brute
Haue poyſon'd pots, and mingled herbs of ſute
with hurtfull charmes: this Citron fruit doth chaſe
Blacke venome from the body in euery place.
The tree it ſelfe in growth is large and big,
And very like in ſhew to th'Laurell tree;
And would be thought a Laurell, leafe and twig,
But that the ſmell it caſts doth diſagree:
The floure it holds as faſt as floure may be:
Therewith the Medes a remedy do finde
For ſtinking breaths and mouthes, a cure moſt kinde,
And helpe old men which hardly fetch their winde.

¶ *The Time.*

Theſe trees be alwaies greene, and do, as *Pliny* ſaith, beare fruit at all times of the yeare, ſome falling off, others waxing ripe, and others newly comming forth.

¶ *The Names.*

The firſt is called in Greeke, Μηλέα μηδική: in Latine, *Malus Medica*, and *Malus Citria*: in Engliſh, Citron tree, and Pomecitron tree.

The fruit is named in Greeke, Μῆλον μηδικόν: in Latine, *Malum Medicum*, and *Malum Citrium*: and *Citromalum*. *Æmilyanus* in *Athenæus* ſheweth, that *Iuba* King of Mauritania hath made mention of the Citron, who ſaith that this Apple is named among them, *Malum Heſpericum*: *Galen* denieth it to be called any longer *Malum Medicum*, but *Citrium*; and ſaith that they who call it *Medicum* doe it to the end that no man ſhould vnderſtand what they ſay: the Apothecaries call theſe Apples *Citrones*: in high Dutch, **Citrin opffell, Citrinaten**: in low Dutch, **Citroenen**: in Italian, *Citroni*, and *Cedri*: in Spaniſh, *Cidras*: in French, *Citrons*: in Engliſh, Citron Apple, and Citron.

The ſecond kinde of Citron is called in Latine, *Limonium Malum*; in ſhops, *Limones*: in French, *Limons*: in low Dutch, **Limonen**: in Engliſh, Limon, and Lemon.

The third is named in Latine, *Malum anarantium* or *Anerantium*: and of ſome, *Aurantium*: of others, *Aurengium*, of the yellow colour of Gold: ſome would haue them called *Arantia*, of *Arantium*, a towne in Achaia or Arania, of a country bearing that name in Perſia: it is termed in Italian, *Arancio*: in high Dutch, **Pomeranken**: in low Dutch, **Araengie Appelen**: in French, *Pommes d'Orenges*: in Spaniſh, *Naranſas*: in Engliſh, Orenges.

The fourth is named of diuers, *Pomum Aſſyrium*, or the Citron of Aſſyria, and may be Engliſhed Adams Apple, after the Italian name; and among the vulgar ſort of Italians, *Lomie*, of whom it is alſo called *Pomum Adami*, or Adams Apple; and that came by the opinion of the common rude people, who thinke it to be the ſame Apple which *Adam* did eate of in Paradiſe, when he tranſgreſſed Gods commandement; whereupon alſo the prints of the biting appeare therein, as they ſay: but others ſay that this is not the Apple, but that which the Arabians do call *Muſa* or *Moſa*, whereof *Auicen, cap*. 395. maketh mention: for diuers of the Iewes take this for that, through which by eating, *Adam* offended, as *Andrew Theuet* ſheweth.

¶ *The Temperature and Vertues.*

A All theſe fruits conſiſt of vnlike parts, and much differing in faculty.

B The rindes are ſweet of ſmell, bitter, hot, and dry.

C The white pulpe is cold, and containeth in it a groſſe juyce, eſpecially the Citron.

D The inner ſubſtance or pap is ſoure, as of the Citrons and Limons, cold and dry, with thinneſſe of parts.

E The ſeed becauſe it is bitter is hot and dry.

F The rinde of the Pomecitron is good againſt all poyſons, for which cauſe it is put into treacles and ſuch like confections.

G It is good to be eaten againſt a ſtinking breath, for it maketh the breath ſweet; and being ſo taken it comforteth the cold ſtomacke exceedingly.

H The white, ſound, and hard pulpe is now and then eaten, but very hardly concocted, and ingendreth a groſſe, cold, and phlegmaticke juyce, but being condite with ſugar, it is both pleaſant in taſte, and eaſie to be digeſted, more nouriſhing, and leſſe apt to obſtruction and binding or ſtopping.

I *Galen* reporteth, That the inner juyce of the Pomecitron was not wont to be eaten, but it is now vſed for ſauce; and being often vſed, it repreſſeth choler which is in the ſtomacke, and procures appetite: it is excellent good alſo to be giuen in vehement and burning feuers, and againſt all peſtilent and venomous or infectious diſeaſes: it comforteth the heart, cooleth the inward parts, cutteth, diuideth, and maketh thin, groſſe, tough, and ſlimy humors.

K Of this foreſaid ſharpe juyce there is a ſyrrup prepared, which is called in ſhops, *Syrupus de Acetoſitate Citri*, very good againſt the foreſaid infirmities.

L Such a ſyrrup is alſo prepared of the ſharpe juyce of Limons, of the ſame quality and operation, ſo that in ſtead of the one, the other will ſerue very well.

M A dozen of Orenges cut in ſlices and put into a gallon of water, adding thereto an ounce of Mercurie ſublimate, and boyled to the conſumption of the halfe, cureth the itch and mangineſſe of the body.

N Men in old time (as *Theophraſtus* writeth in his fourth booke) did not eate Citrons, but were contented with the ſmell, and to lay them amongſt cloathes, to preſerue them from Moths.

O As often as need required they vſed them againſt deadly poyſons; for which thing they were eſpecially commanded by *Virgils* verſes, which we haue before alledged.

P *Athenæus, lib.* 3, hath extant a ſtory of ſome that for certaine notorious offences were condemned to be deſtroied of Serpents, who were preſerued and kept in health and ſafety by the eating of Citrons.

Q The diſtilled water of the whole Limons, rinde and all, drawne out by a glaſſe Still, takes away tetters and blemiſhes of the skin, and maketh the face faire and ſmooth.

R The ſame being drunke prouoketh vrine, diſſolueth the ſtone, breaketh and expelleth it.

S The rinde of Orenges is much like in faculty to that of the Citrons and Limons, yet it is ſo much the more hot as it is more biting and bitter.

T The inner ſubſtance or ſoure pap which is full of juyce is of like faculty, or not much inferiour to the faculty of the pap of Citrons or Limons; but the ſweet pap doth not much coole or drie, but doth temperately heate and moiſten, being pleaſant to the taſte: it alſo nouriſheth more than doth the ſoure pap, but the ſame nouriſhment is thin and little; and that which is of a middle taſt, hauing the ſmacke of wine, is after a middle ſort more cold than ſweet, and leſſer cold than ſoure: the ſweet and odoriferous floures of Orenges be vſed of the perfumers in their ſweet ſmelling ointments.

V Two ounces of the juyce of Limons, mixed with the like quantity of the ſpirit of wine, or the beſt *Aqua vitæ* (but the ſpirit of wine rectified is much better) and drunk at the firſt approach of the fit of an ague, taketh away the ſhaking preſently: the medicine ſeldome faileth at the ſecond time of the taking thereof perfectly to cure the ſame; but neuer at the third time, prouided that the Patient be couered warme in a bed, and cauſed to ſweat.

X There is alſo diſtilled out of them in a glaſſe ſtill, a water of a maruellous ſweet ſmell, which being inwardly taken in the weight of an ounce and a halfe, moueth ſweat, and healeth the ague.

Y The ſeed of all theſe doth kill wormes in the belly, and driueth them forth: it doth alſo mightily reſiſt poyſon, and is good for the ſtinging of Scorpions, if it be inwardly taken.

Z Thoſe which be called Adams Apples are thought to bee like in faculties to the ſoure juyce, eſpecially of the Limons, but yet they be not ſo effectuall.

Chap. 104. *Of the Cornell tree.*

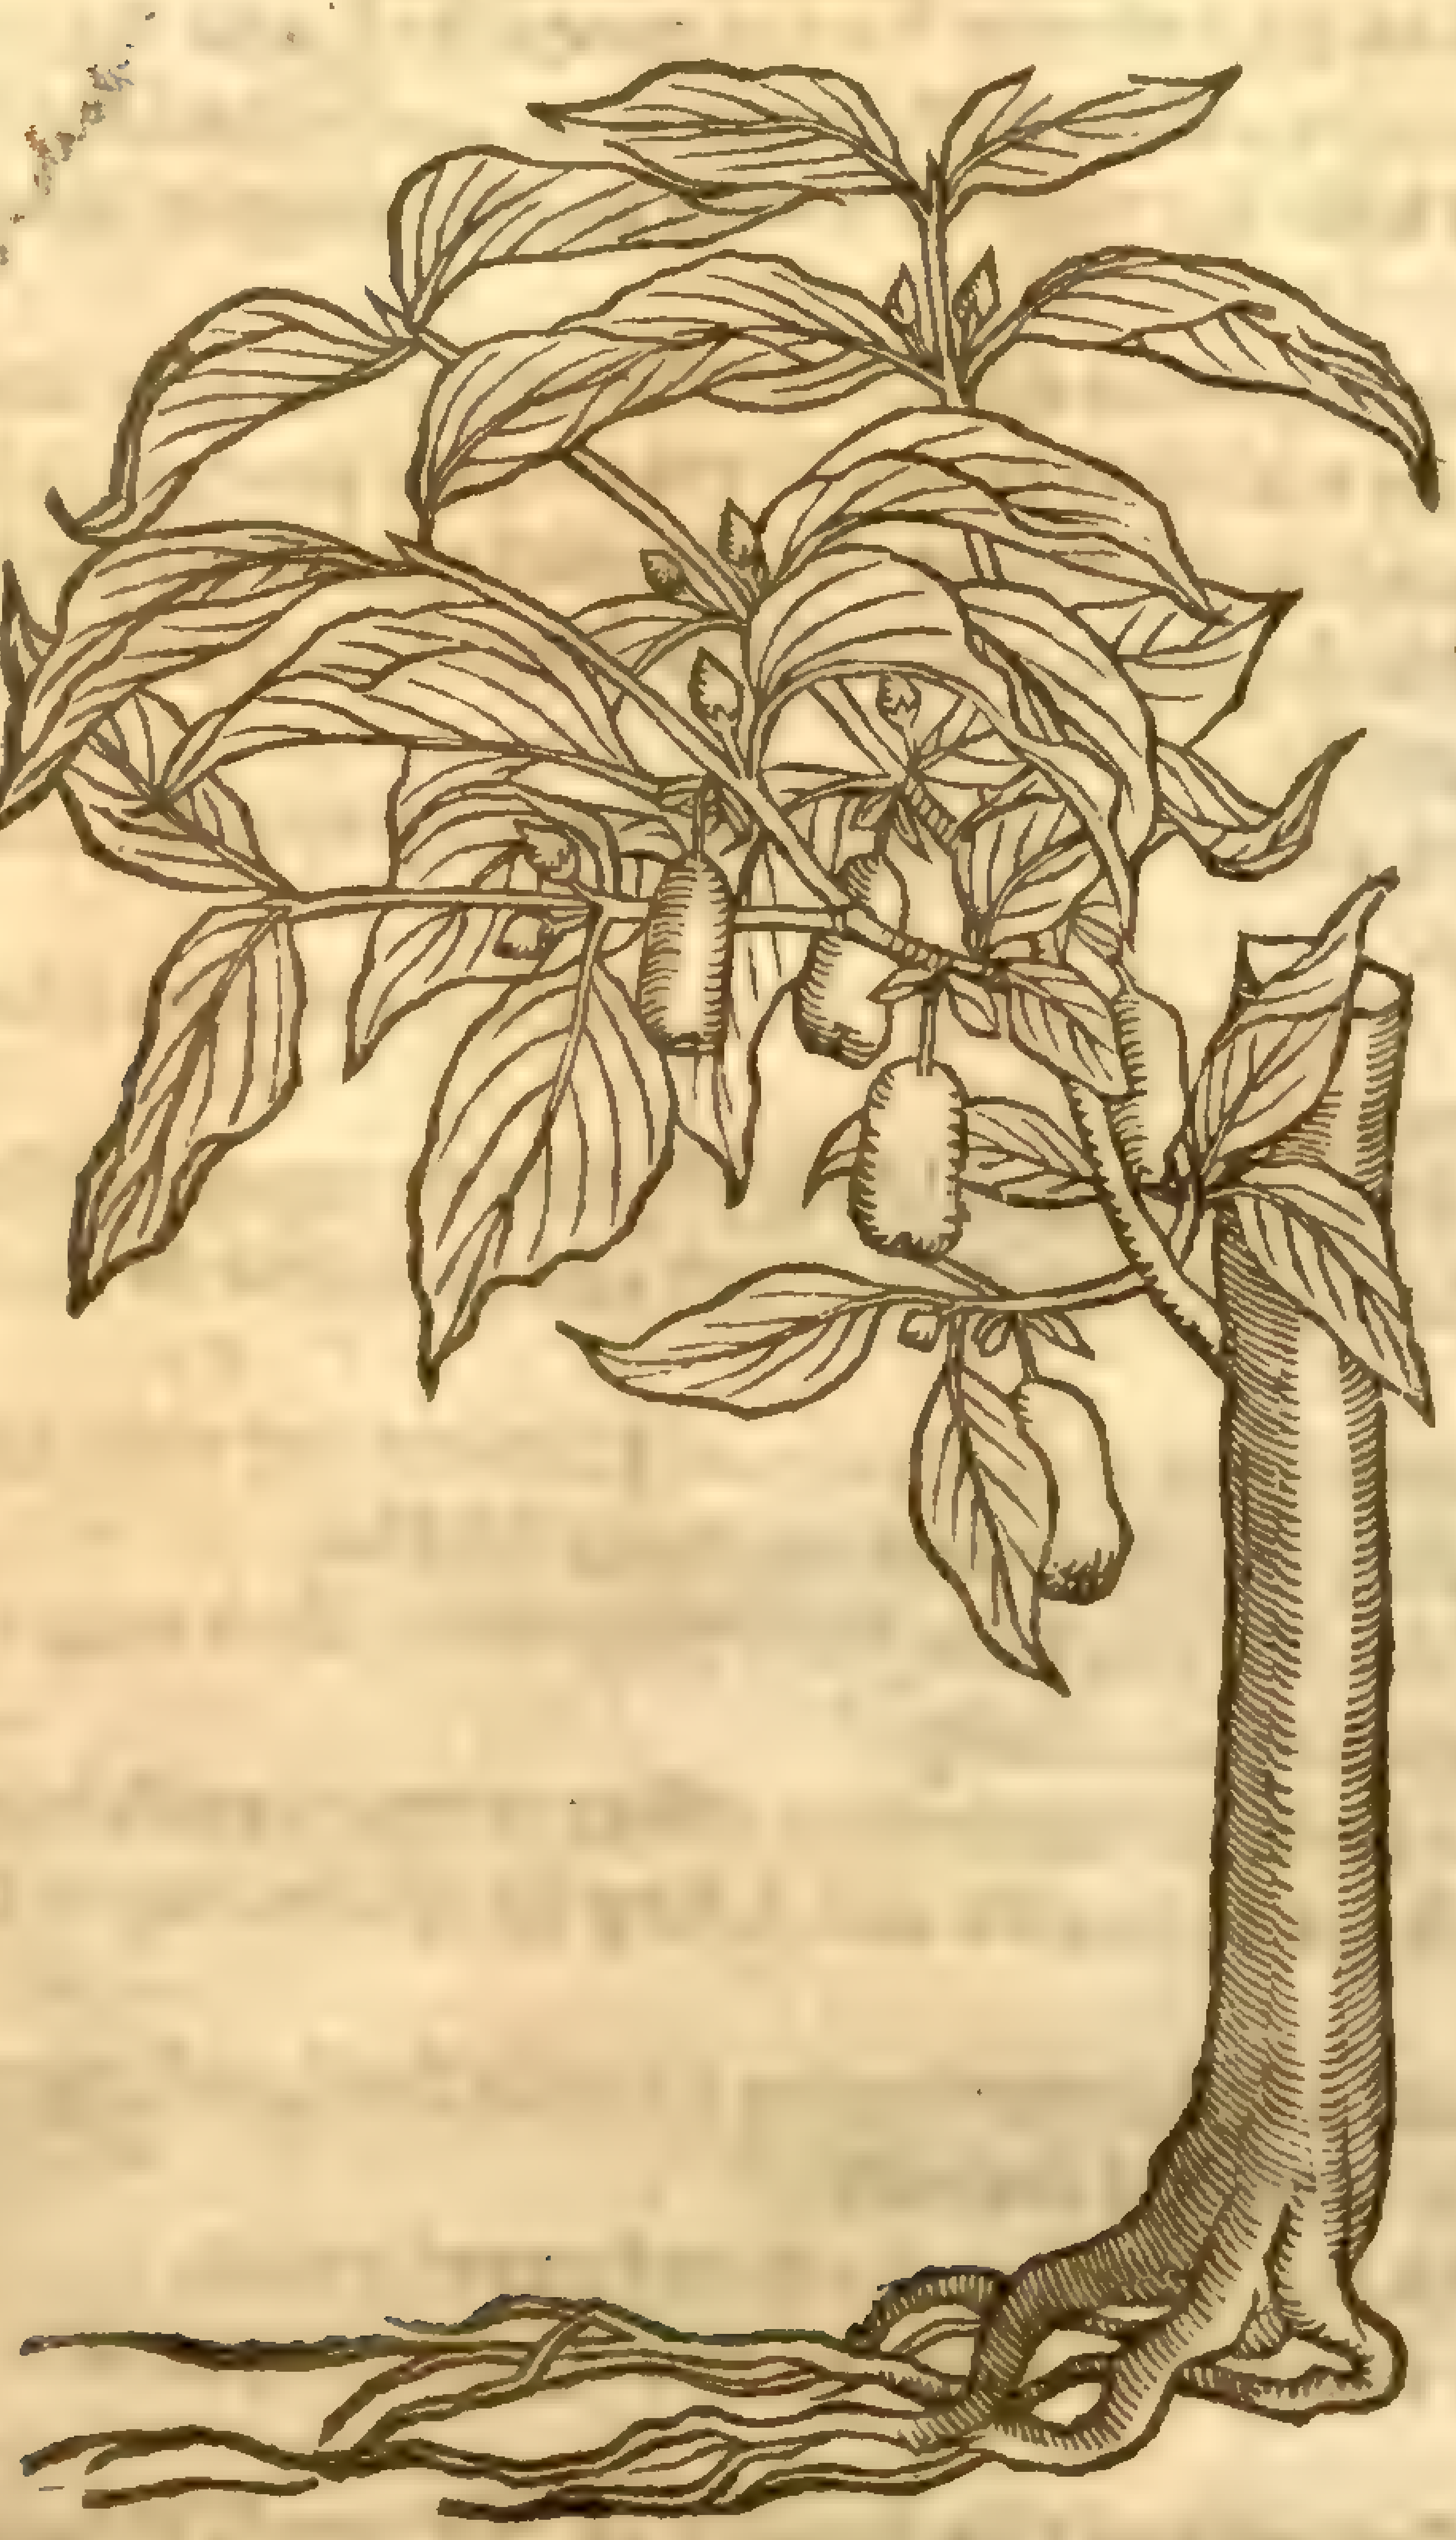
¶ *The Deſcription.*

THe tame Cornell tree groweth ſomtime of the height and bigneſſe of a ſmal tree, with a great number of ſprings: it is couered with a rugged barke: the wood or timber is very hard and dry, without any great quantity of ſap therein: the leaues are like vnto the Dog-berry leaues, crumpled, rugged, and of an ouerworne colour: the floures grow in ſmall bunches before any leaues do appeare, of colour yellow, and of no great value (they are ſo ſmall) in ſhew like the floures of the

Oliue

Cornus [illegible]

Cornus mas.
The male Cornell tree.



Oliue tree: which being vaded, there come ſmall long berries, which at the firſt bee greene and red when they be ripe; of an auſtere and harſh taſte, with a certaine ſoureneſſe: within this berry is a ſmall ſtone, exceeding hard, white within like that of the Oliue, wherunto it is like both in the faſhion and oftentimes in the bigneſſe of the fruit.

¶ *The Place.*

This groweth in moſt places of Germanie without manuring: it growes not wild in England. But yet there be ſundry trees of them growing in the gardens of ſuch as loue rare and dainty plants, wherof I haue a tree or two in my garden.

¶ *The Time.*

The tame Cornell tree floureth ſometime in February, & commonly in March, and afterwards the leaues come forth as an vntimely birth: the berries or fruit are ripe in Auguſt.

¶ *The Names.*

The Grecians call it Κρανία: the Latines, *Cornus*: in high Dutch, **Cornelbaum**: in low Dutch, **Cornoele boom**: the Italians, *Corniolo*: in French, *Cornillier*: in Spaniſh, *Cornizolos*: in Engliſh, the Cornell tree, and the Cornelia tree; of ſome, long Cherrie tree.

The fruit is named in Latine, *Cornum*: in high Dutch, **Cornell**: in low Dutch, **Cornoele**: in Italian, *Cornole*: in Engliſh, Cornell berries and Cornelian Cherries.

This is *Cornus mas Theophraſti*, or *Theophraſtus* his ſmall Cornell tree; for he ſetteth downe two ſorts of the Cornell trees, the male, and the female: he maketh the wood of the male to be ſound, as in this Cornell tree; which we both for this cauſe and for others alſo haue made to be the male. The female is that which is commonly called *Virga ſanguinea*, or Dogs berry tree, and *Cornus ſylueſtris*, or the wilde Cornell tree, of which we will treat in the next chapter following.

¶ *The Temperature and Vertues.*

A The fruit of the Cornell tree hath a very harſh or choking taſte: it cooleth, drieth, and bindeth, yet may it alſo be eaten, as it is oftentimes.

B It is a remedy againſt the laske and bloudy flix, it is hurtfull to a cold ſtomacke, and increaſeth the rawneſſe thereof: the leaues and tender crops of the tree are likewiſe of an harſh and choking taſte, and do mightily dry.

C They heale greene wounds that are great and deepe, eſpecially in hard bodies, but they are not ſo good for ſmall wounds and tender bodies, as *Galen* writeth.

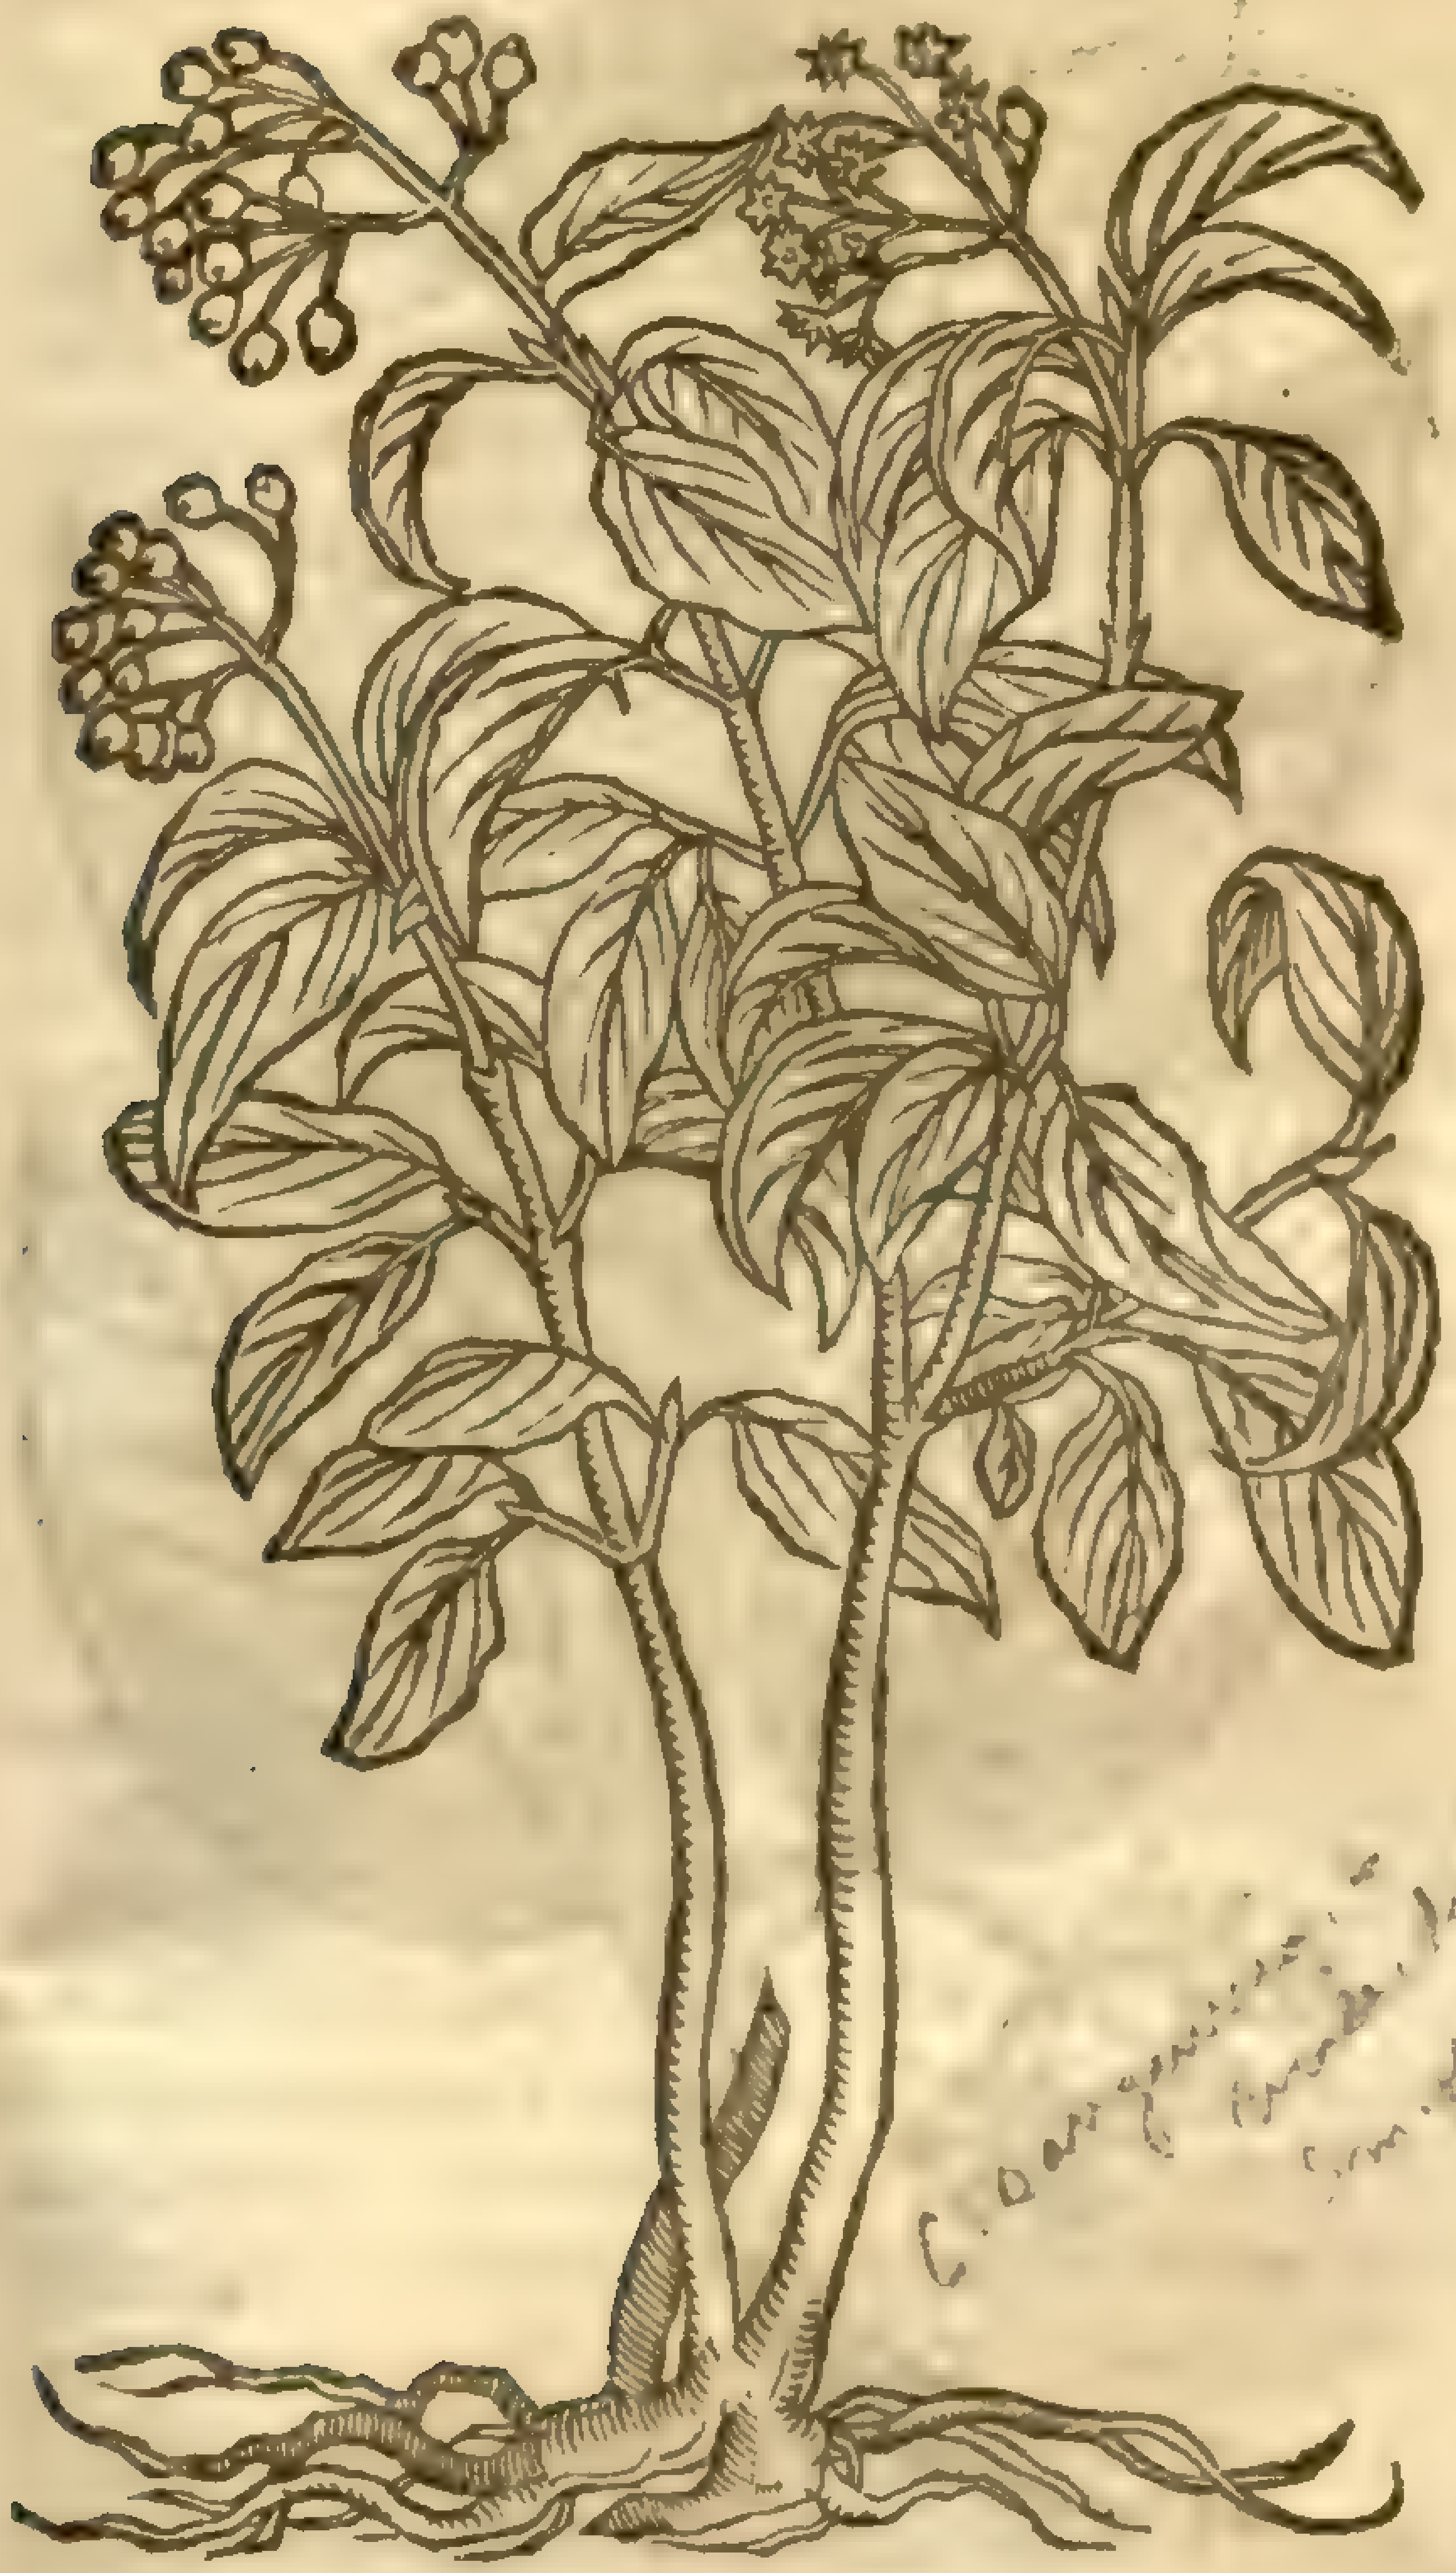
CHAP. 105.

Of the female Cornell or Dog-berry tree.

¶ *The Deſcription.*

THat which the Italians call *Virga ſanguinea*, or the bloudy Rod, is like to the Cornell tree, yet it groweth not into a tree, but remaineth a ſhrub: the young branches thereof are jointed, and be of an obſcure red purple: they haue within a white ſpongie pith like that of Elder, but the old ſtalkes are hard and ſtiffe, the ſubſtance of the which is alſo white, and anſwerable to thoſe of the Cornell tree: the leaues are alſo like, the middle rib whereof as alſo the brittle foot-ſtalkes are ſomewhat reddiſh: at the top whereof ſtand white floures in ſpokie rundles, which turne into berries,

Cornus fœmina.
The Dog-berry tree.



greene at the firſt, and of a ſhining blacke colour when they bee ripe, in taſte vnpleaſant, and not cared for of the birds.

¶ *The Place.*

This ſhrub groweth in hedges and buſhes in euery country of England.

¶ *The Time.*

The floures come forth in the Spring in the moneth of Aprill: the berries are ripe in Autumne.

¶ *The Names.*

The Italians doe commonly call it *Sanguino*, and *Sanguinello*. *Petrus Creſcentius* termes it *Sanguinus*; and *Matthiolus*, *Virga ſanguinea*: *Pliny*, *lib.24.cap.10.* hath written a little of *Virga Sanguinea*: Neither is *Virga ſanguinea*, ſaith hee, counted more happy; the inner barke whereof doth breake open the ſcarres which they before haue healed. It is an hard thing, or peraduenture a raſh part, to affirme by theſe few words, that *Pliny* his *Virga ſanguinea* is the ſame that the Italian *Sanguino* is. This is called in high Dutch, **Hartriegel**: in low Dutch, **Wilde Cornoelle**, that is to ſay, *Cornus ſylueſtris*, or wilde Cornell tree: and in French, *Cornellier ſauuage*: in Engliſh, Hounds tree, Hounds berry, Dogs berry tree, Pricke-Timber: in the North countrey they call it Gaten tree, or Gater tree; the berries whereof ſeeme to be thoſe which *Chaucer* calleth Gater berries: *Valerius Cordus* nameth it ψευδόκρανον, that is to ſay, *Falſa* or *Spuria Cornus*, falſe or baſtard Cornell tree: this ſeemeth alſo to be *Theophraſtus* his θηλυκρανία, or *Cornus fœmina*, female Cornell tree. This hath little branches hauing pith within, neither be they hard nor ſound, like thoſe of the male: the fruit is ἄβρωτος, that is, not fit to be eaten, and a late fruit which is not ripe till after the Autumne Æquinoctiall; and ſuch is the wilde Cornell tree or Gater tree, the young and tender branches whereof be red, and haue (as we haue written) a pith within: the fruit or berries be vnpleaſant, and require a long time before they can be ripe.

¶ *The Temperature.*

The berries hereof are of vnlike parts; for they haue ſome hot, bitter, and clenſing, and very many cold, dry, harſh, and binding, yet they haue no vſe in medicine.

¶ *The Vertues.*

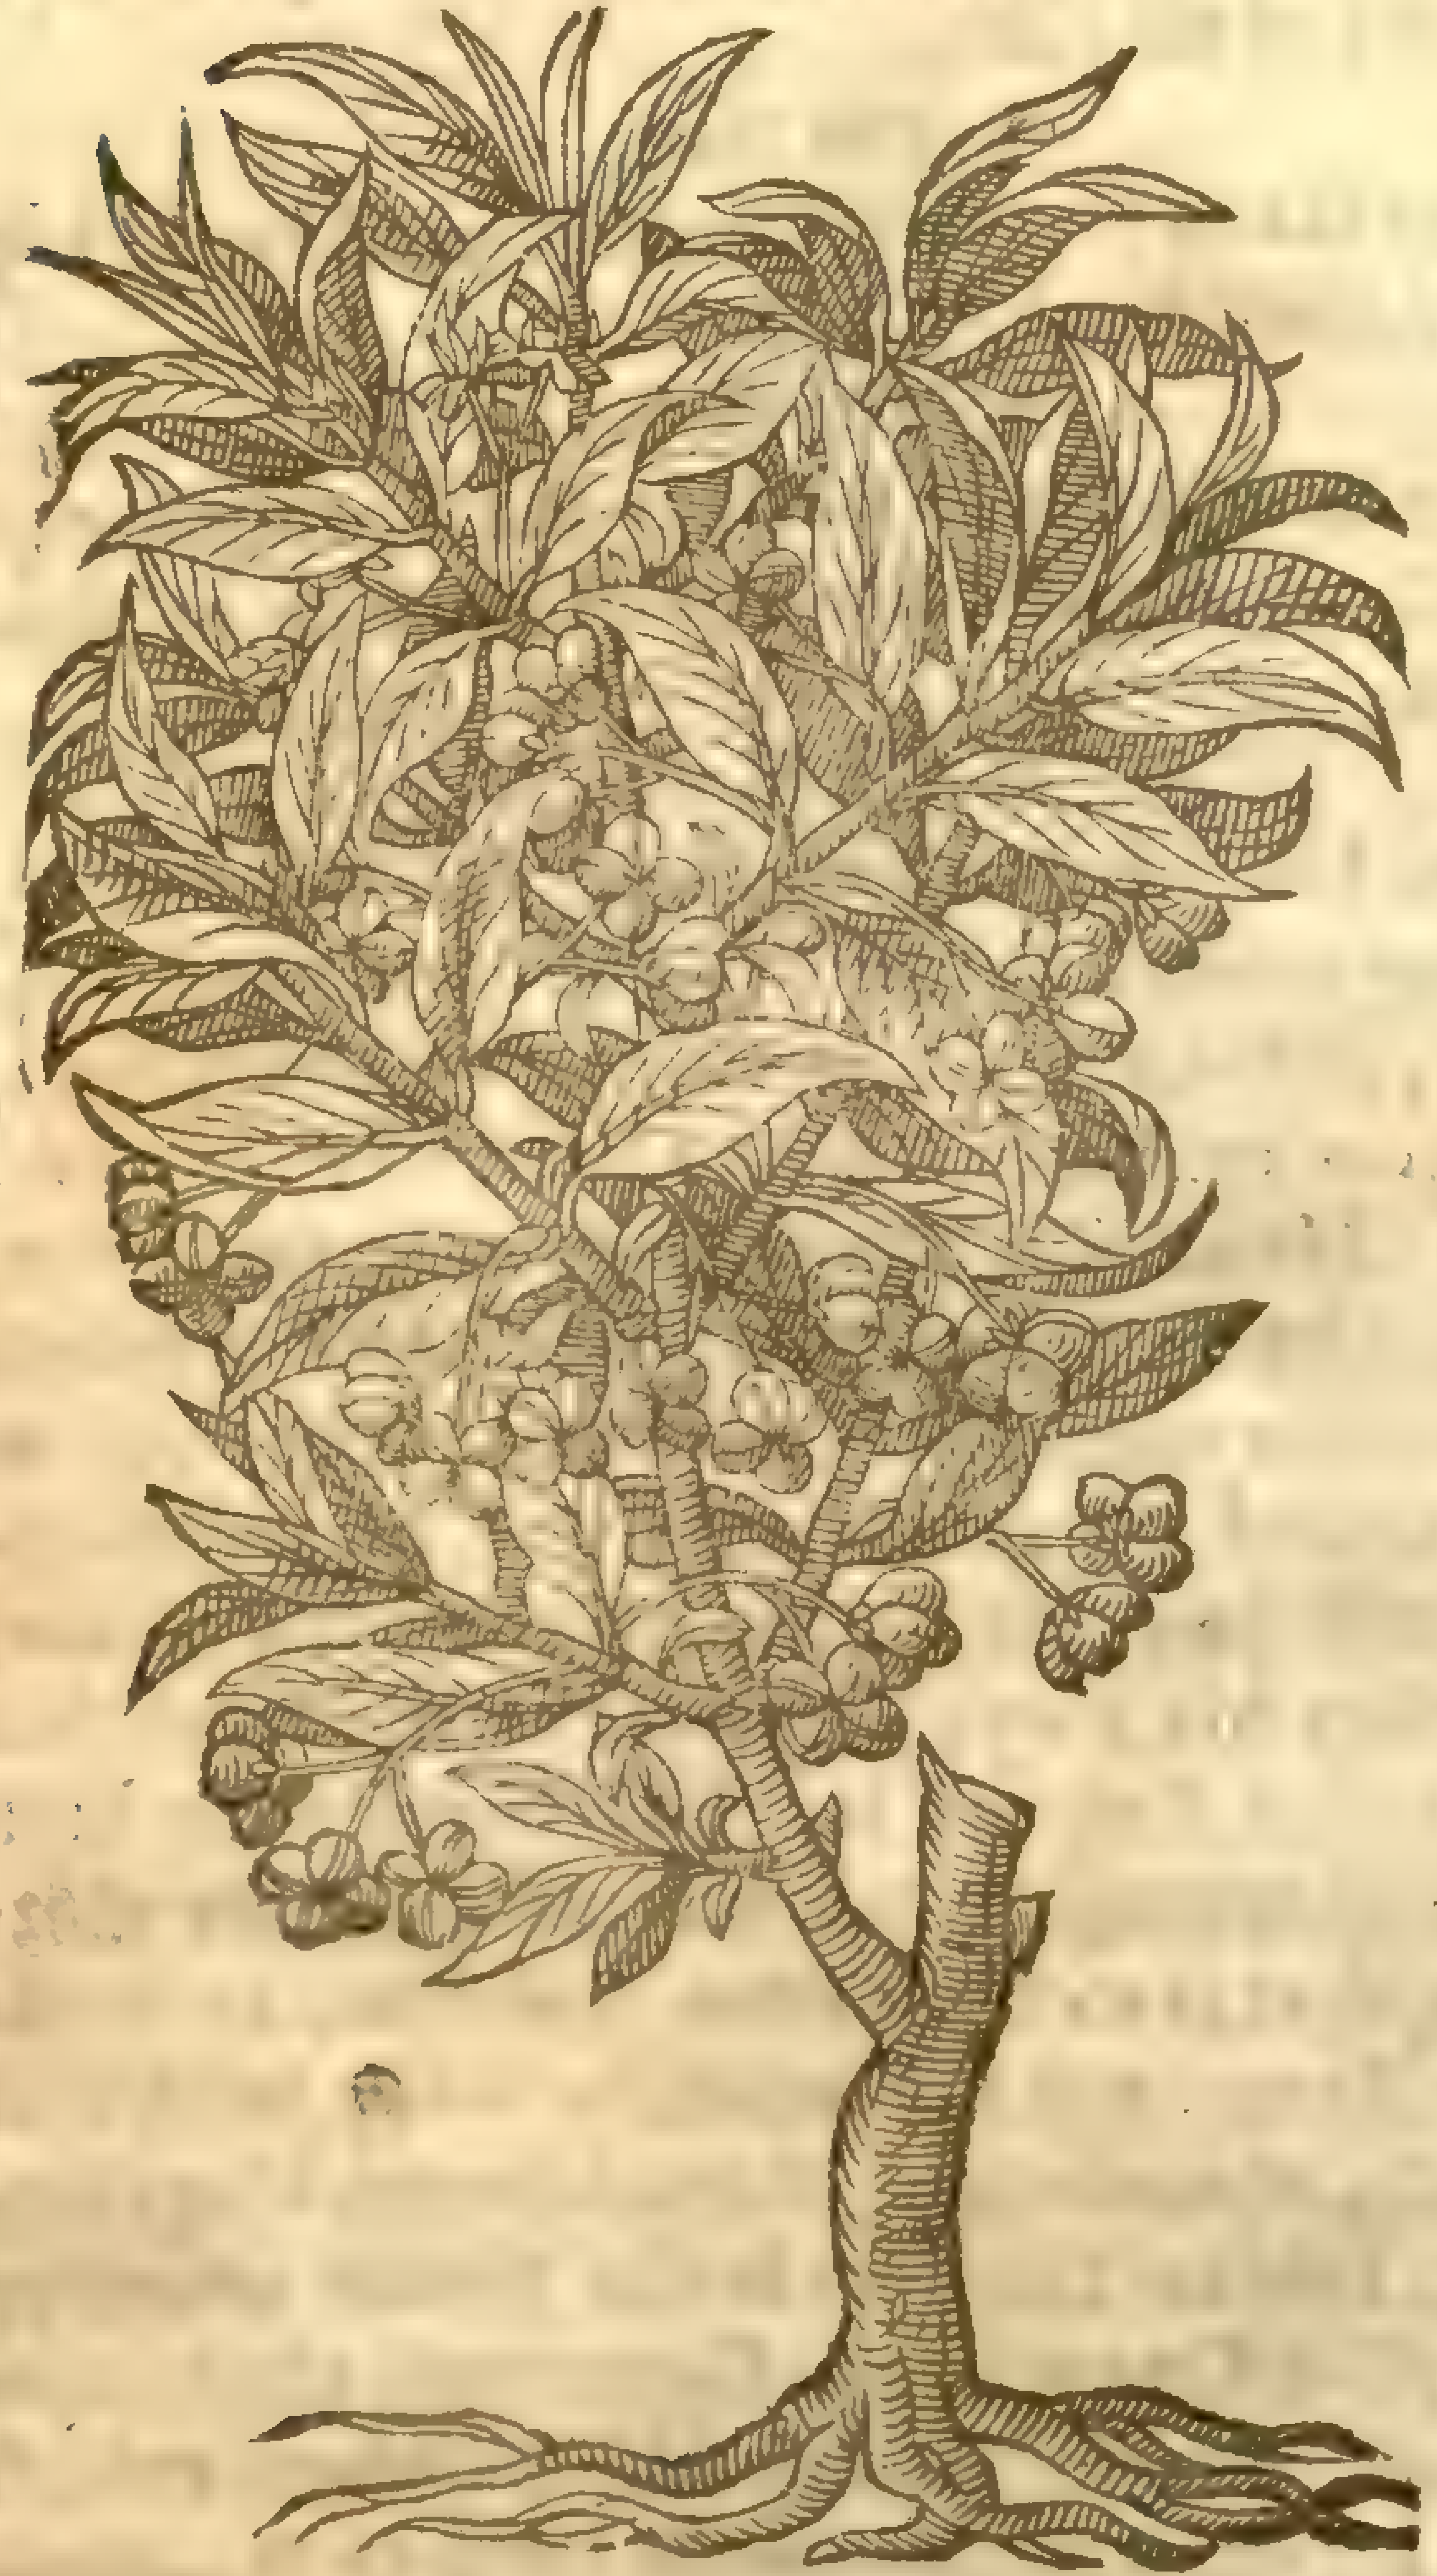
A *Matthiolus* writeth, That out of the berries firſt boyled, and afterwards preſſed, there iſſueth an oyle which the Anagnian country people do vſe in lamps: but it is not certaine nor very like, that the barke of this wilde Cornell tree hath that operation which *Pliny* reporteth, of *Virga Sanguinea*; for he ſaith, as we haue already ſet downe, that the inner barke thereof doth breake and lay open the ſcars which they before haue healed.

Chap. 106. *Of Spindle tree or Pricke-wood.*

¶ *The Deſcription.*

1 Pricke-wood is no high ſhrub, of the bigneſſe of the Pomegranat tree: it ſpreadeth farre with his branches: the old ſtalks haue their barke ſomewhat white; the new and thoſe that be lately growne bee greene, and foure ſquare: the ſubſtance of the wood is hard, and mixed with a light yellow: the leaues be long, broad, ſlender, and ſoft: the floures bee white, many ſtanding vpon one foot-ſtalke, like almoſt to a ſpoked rundle: the fruit is foure ſquare, red, and containing foure white ſeeds, euery one whereof is couered with a yellow coat, which being taken off giueth a yellow die.

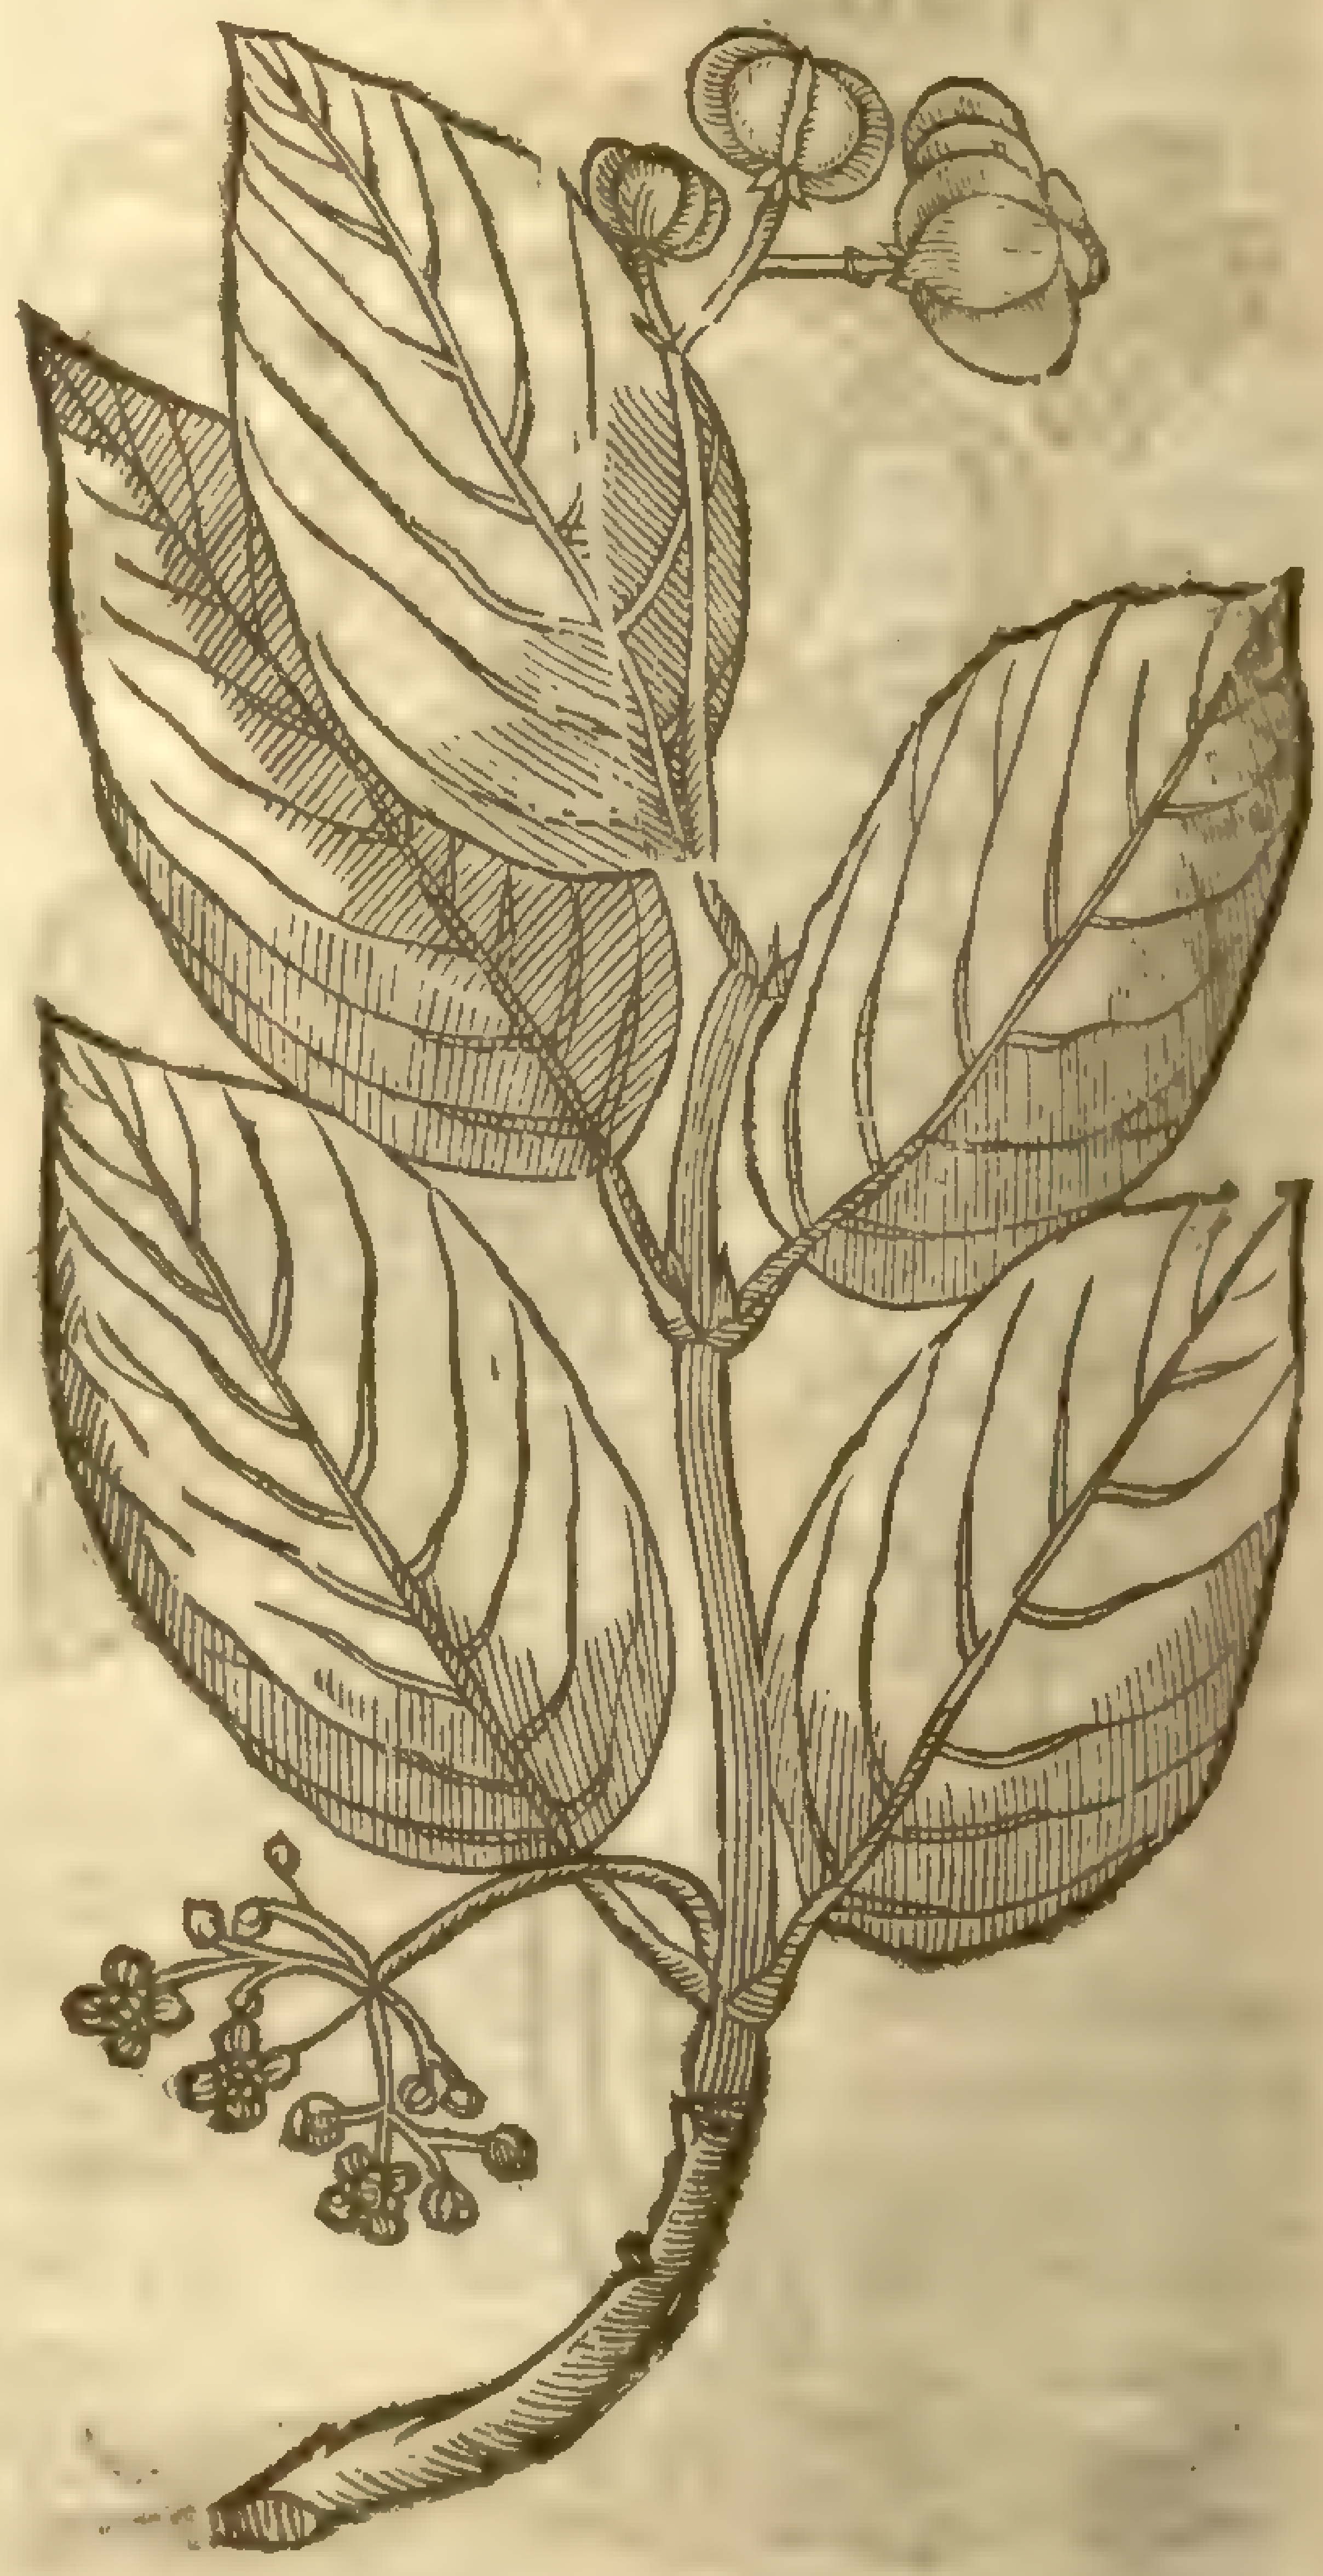
1 *Euonymus Theophraſti.*
English Prick-timber tree.



E. europaeus

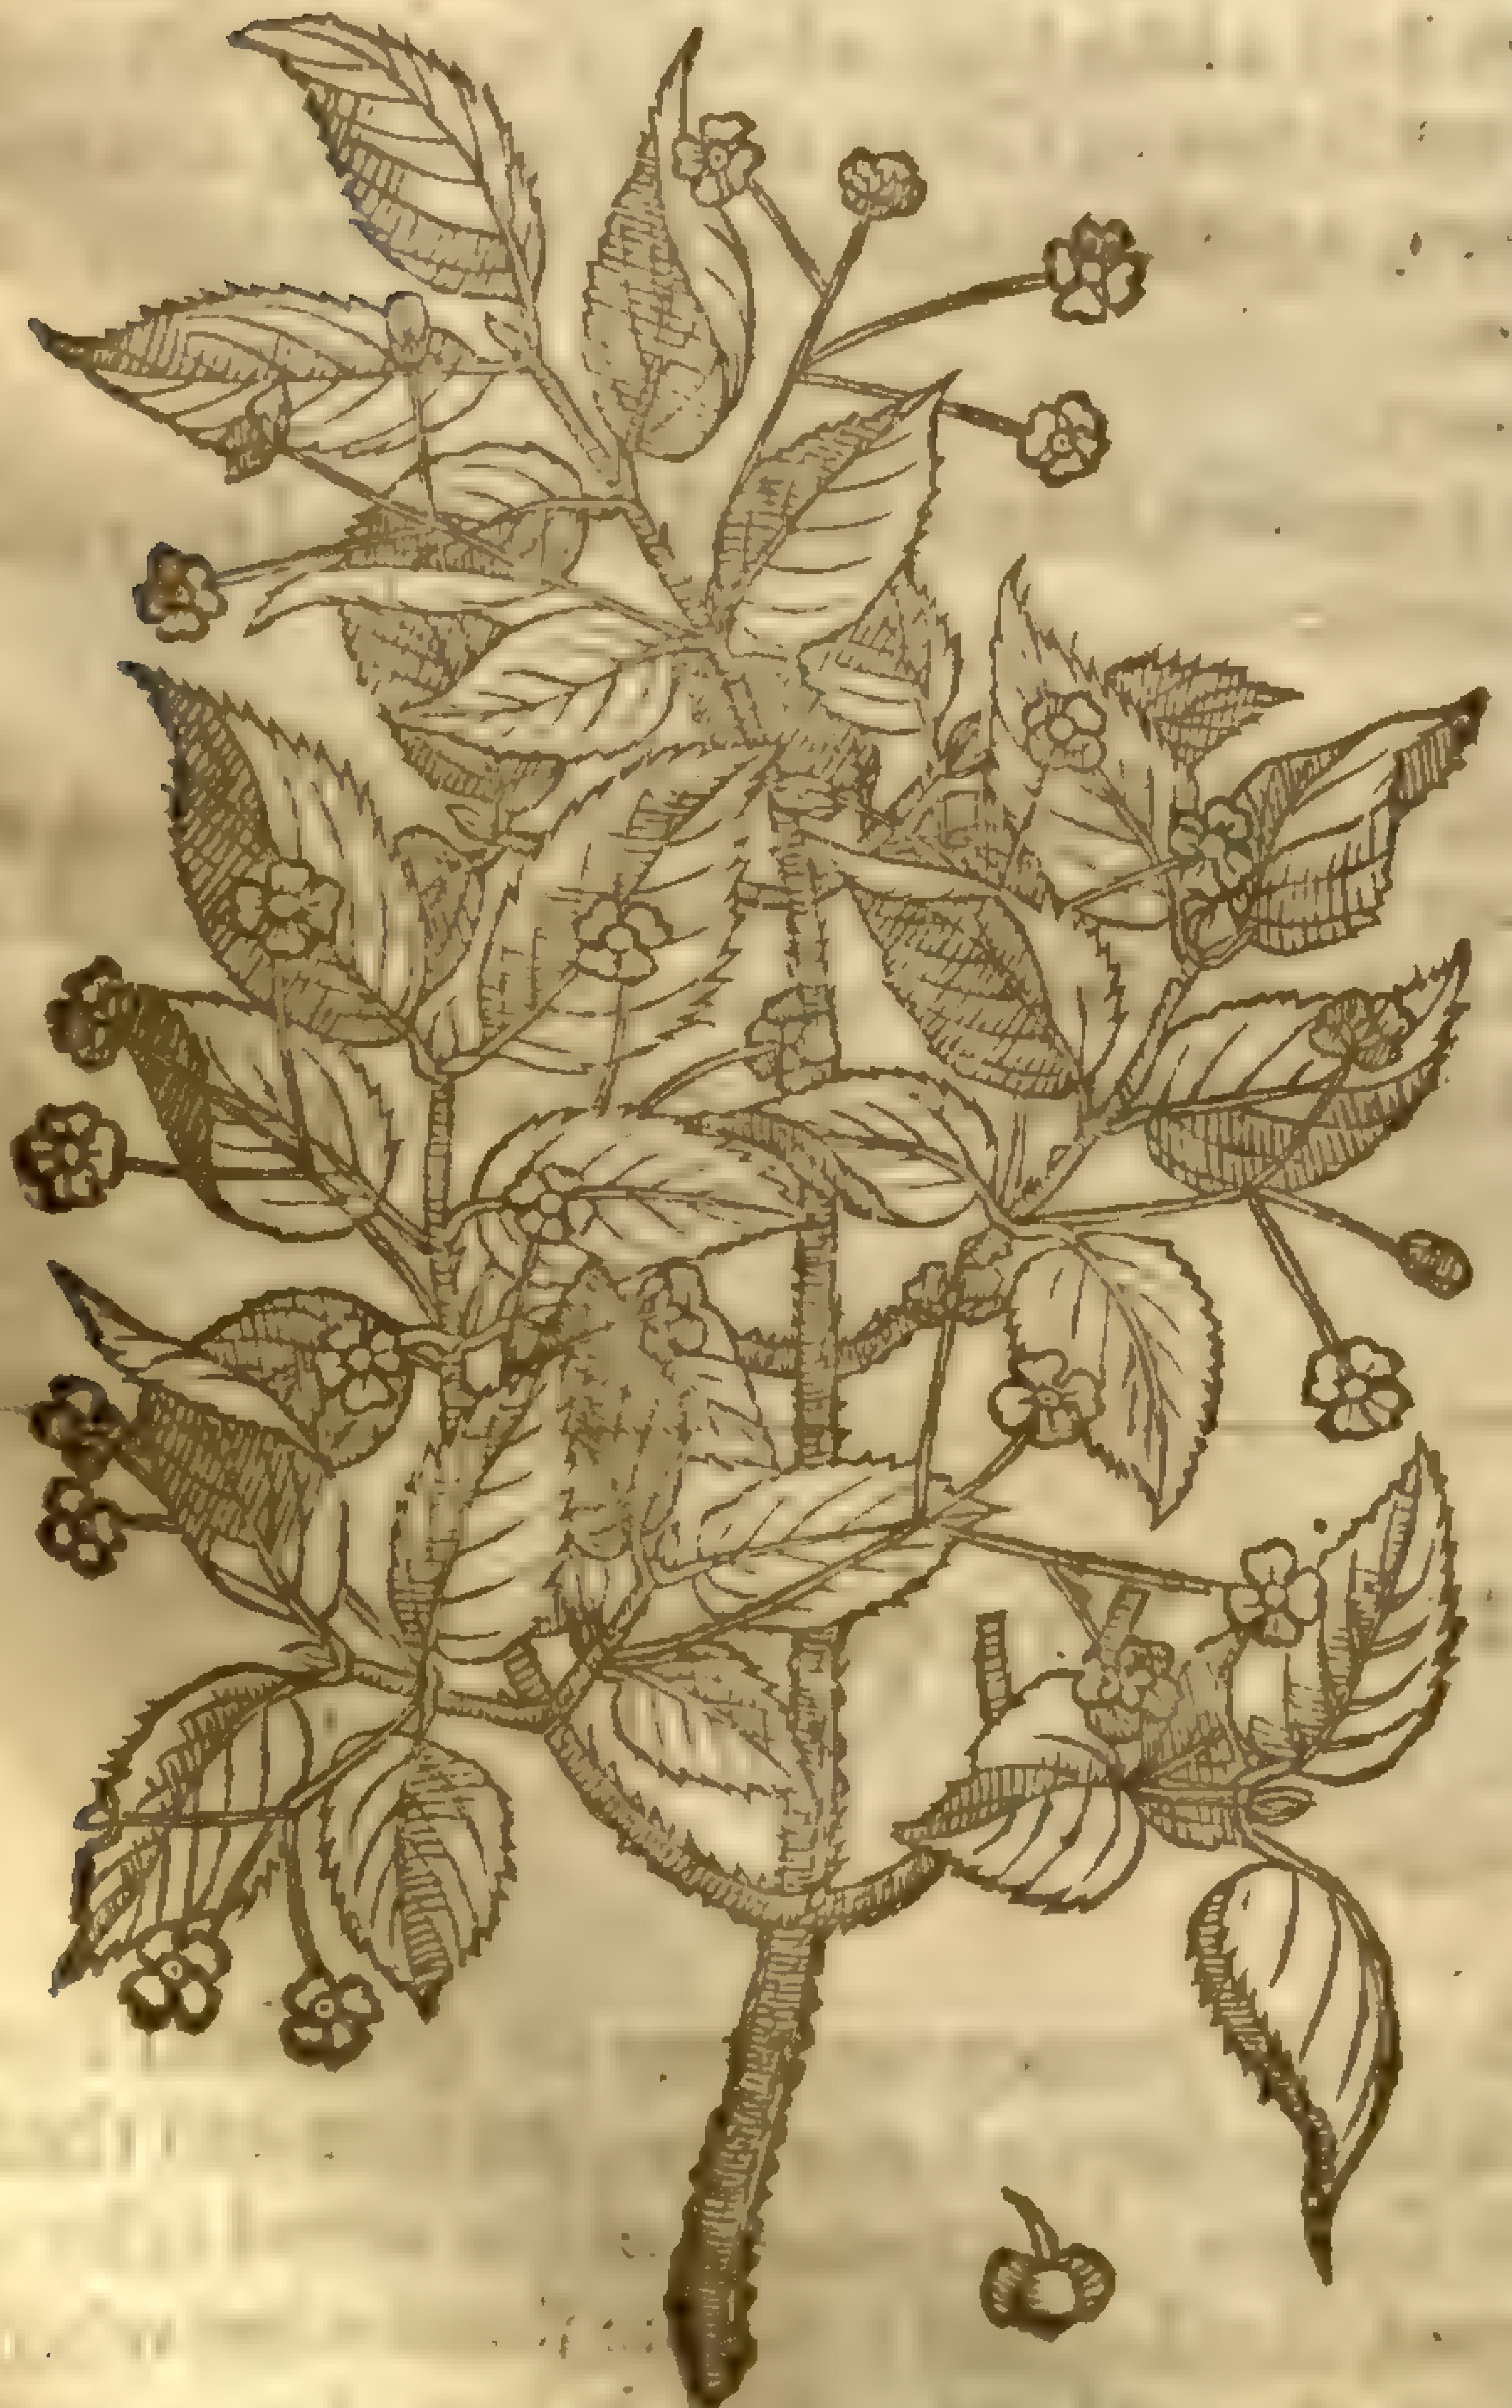
Ort. 783

2 *Euonymus latifolius.*
Broad leafed Spindle tree.



E. latifolius

3 *Enonymus Pannonicus.*
Hungary Spindle tree.



E. verrucosus

2 This other ſort of *Euonymus* groweth to the forme of an hedge tree, of a meane bigneſſe; the trunke or body whereof is of the thickeneſſe of a mans leg, couered with a rough or ſcabbed barke of an ouerworn ruſſet colour. The branches thereof are many, ſlender, and very euen, couered with a greene barke whileſt they be yet young and tender; they are alſo very brittle, with ſome pith in the middle like that of the Elder. The leaues are few in number, full of nerues or ſinewes diſperſed like thoſe of Plantaine, in ſhape like thoſe of the Pomecitron tree, of a lothſome ſmell and bitter taſte: amongſt which come forth ſlender foot-ſtalks very long and naked, whereon do grow ſmall floures conſiſting of foure ſmall leaues like thoſe of the Cherry tree, but leſſer, of a white colour tending to a bluſh, with ſome yellowneſſe in the middle: after commeth the fruit, which is larger than the former, and as it were winged, parted commonly into foure, yet ſomtimes into fiue parts, and opening when it is ripe, it ſheweth the white graines filled with a yellow pulpe. The root is tough and wooddy, diſperſing it ſelfe farre abroad vnder the vpper cruſt of the earth.

3 The ſame Author ſets forth another ſort, which he found in the mountains of Moravia and Hungary, hauing a trunk or ſtock of the height of three or foure cubits, couered with a bark green at the firſt, afterwards ſprinkled ouer with many blacke ſpots: the boughs are diuided toward the top into diuers ſmall branches, very brittle and eaſie to breake, whereon are placed leaues by couples alſo, one oppoſite to another, ſomewhat ſnipt about the edges, in ſhape like thoſe of the great Myrtle, of an aſtringent taſte at the beginning, after ſomewhat hot and bitter: among which come forth ſmall floures ſtanding vpon long naked footſtalks, conſiſting of foure little leaues of a bright ſhining purple colour, hauing in the middle ſome few ſpots of yellow: after comes the fruit, foure cornered, not vnlike to the common kind, of a ſpongious ſubſtance, and a gold yellow color, wherein is contained not red berries like the other, but black, very like to thoſe of *Fraxinella*, of a ſhining blacke colour like vnto brandiſhed horne; which are deuoured of birds when they be ripe, and the rather becauſe they fall of themſelues out of their husks, otherwiſe the bitterneſſe of the huskes would take away the delight.

¶ *The Place.*

The firſt commeth vp in vntoiled places and amongſt ſhrubs, vpon rough bankes and heapes of earth: it ſerueth alſo oftentimes for hedges in fields, growing amongſt Brambles and ſuch other thornes.

The other ſorts *Cluſius* found in a wood in Hungary beyond the riuer Drauus, and alſo vpon the mountaines of Moravia and other places adiacent.

¶ *The Time.*

The floures appeare in April, the fruit is ripe in the end of Auguſt, or in the moneth of September.

¶ *The Names.*

Theophraſtus calleth this ſhrub Εὐώνυμος, and deſcribeth it, *lib*. 3. of the Hiſtorie of Plants. Diuers alſo falſly reade it *Anonymos*: *Petrus Creſcentius* calleth it *Fuſanum*, becauſe ſpindles be made of the wood hereof; and for that cauſe it is called in high-Dutch, **Spindelbaum**, yet moſt of them **Hanhodlin**: in low-Dutch, **Papenhout**: in Italian, *Fuſano*: in French, *Fuſin*, and *Bonnet de preſtre*: in Engliſh, Spindle tree, Prickwood, and Prick-timber.

¶ *The Temperature and Vertues.*

A This ſhrub is hurtfull to all things, as *Theophraſtus* writeth, and namely to Goats: hee ſaith the fruit hereof killeth; ſo doth the leaues and fruit deſtroy goats eſpecially, vnleſſe they ſcour as wel vpwards as downewards: if three or foure of theſe fruits be giuen to a man they purge by vomit and ſtoole.

Chap. 107. *Of the blacke Aller Tree.*

¶ *The Deſcription.*

The blacke Aller tree bringeth forth from the root ſtraight ſtalks diuided into diuers branches, the outward barke whereof is blacke, and that next to the wood yellow, and giueth a colour as yellow as Saffron: the ſubſtance of the wood is white and brittle, with a reddiſh pith in the midſt: the leaues be like thoſe of the Alder tree, or of the Cherry tree, yet blacker, and a little rounder: the floures be ſomwhat white; the fruit are round berries, in which appeare a certaine rift or chinke as though two were ioined together, at the firſt green, afterward red, and laſtly black; in this there be two little ſtones: the root runneth along in the earth.

¶ *The Place.*

The Aller tree groweth in moiſt woods and copſes: I found great plenty of it in a wood a mile from Iſlington, in the way from thence to a ſmall village called Harnſey, lying vpon the right hand of the way; and in the woods at Hampſted neere London, and in moſt Woods in the parts about London.

¶ *The Time.*

The leaues and floures appeare in the beginning of the ſpring, and the berries about Autumne.

¶ *The Names.*

This ſhrub is called *Alnus nigra*, or blacke Alder; and by others *Frangula*: *Petrus Creſcentius* nameth it *Avernus*: in low-Dutch, **Sparkenhout**, and oftentimes **Pijlhout**, becauſe boyes make for themſelues arrowes thereof: in high-Dutch, **Faulbaum**: in Engliſh, blacke Aller tree, and of diuers, Butchers pricke tree.

Alnus nigra ſive frangula.
The blacke Aller tree.

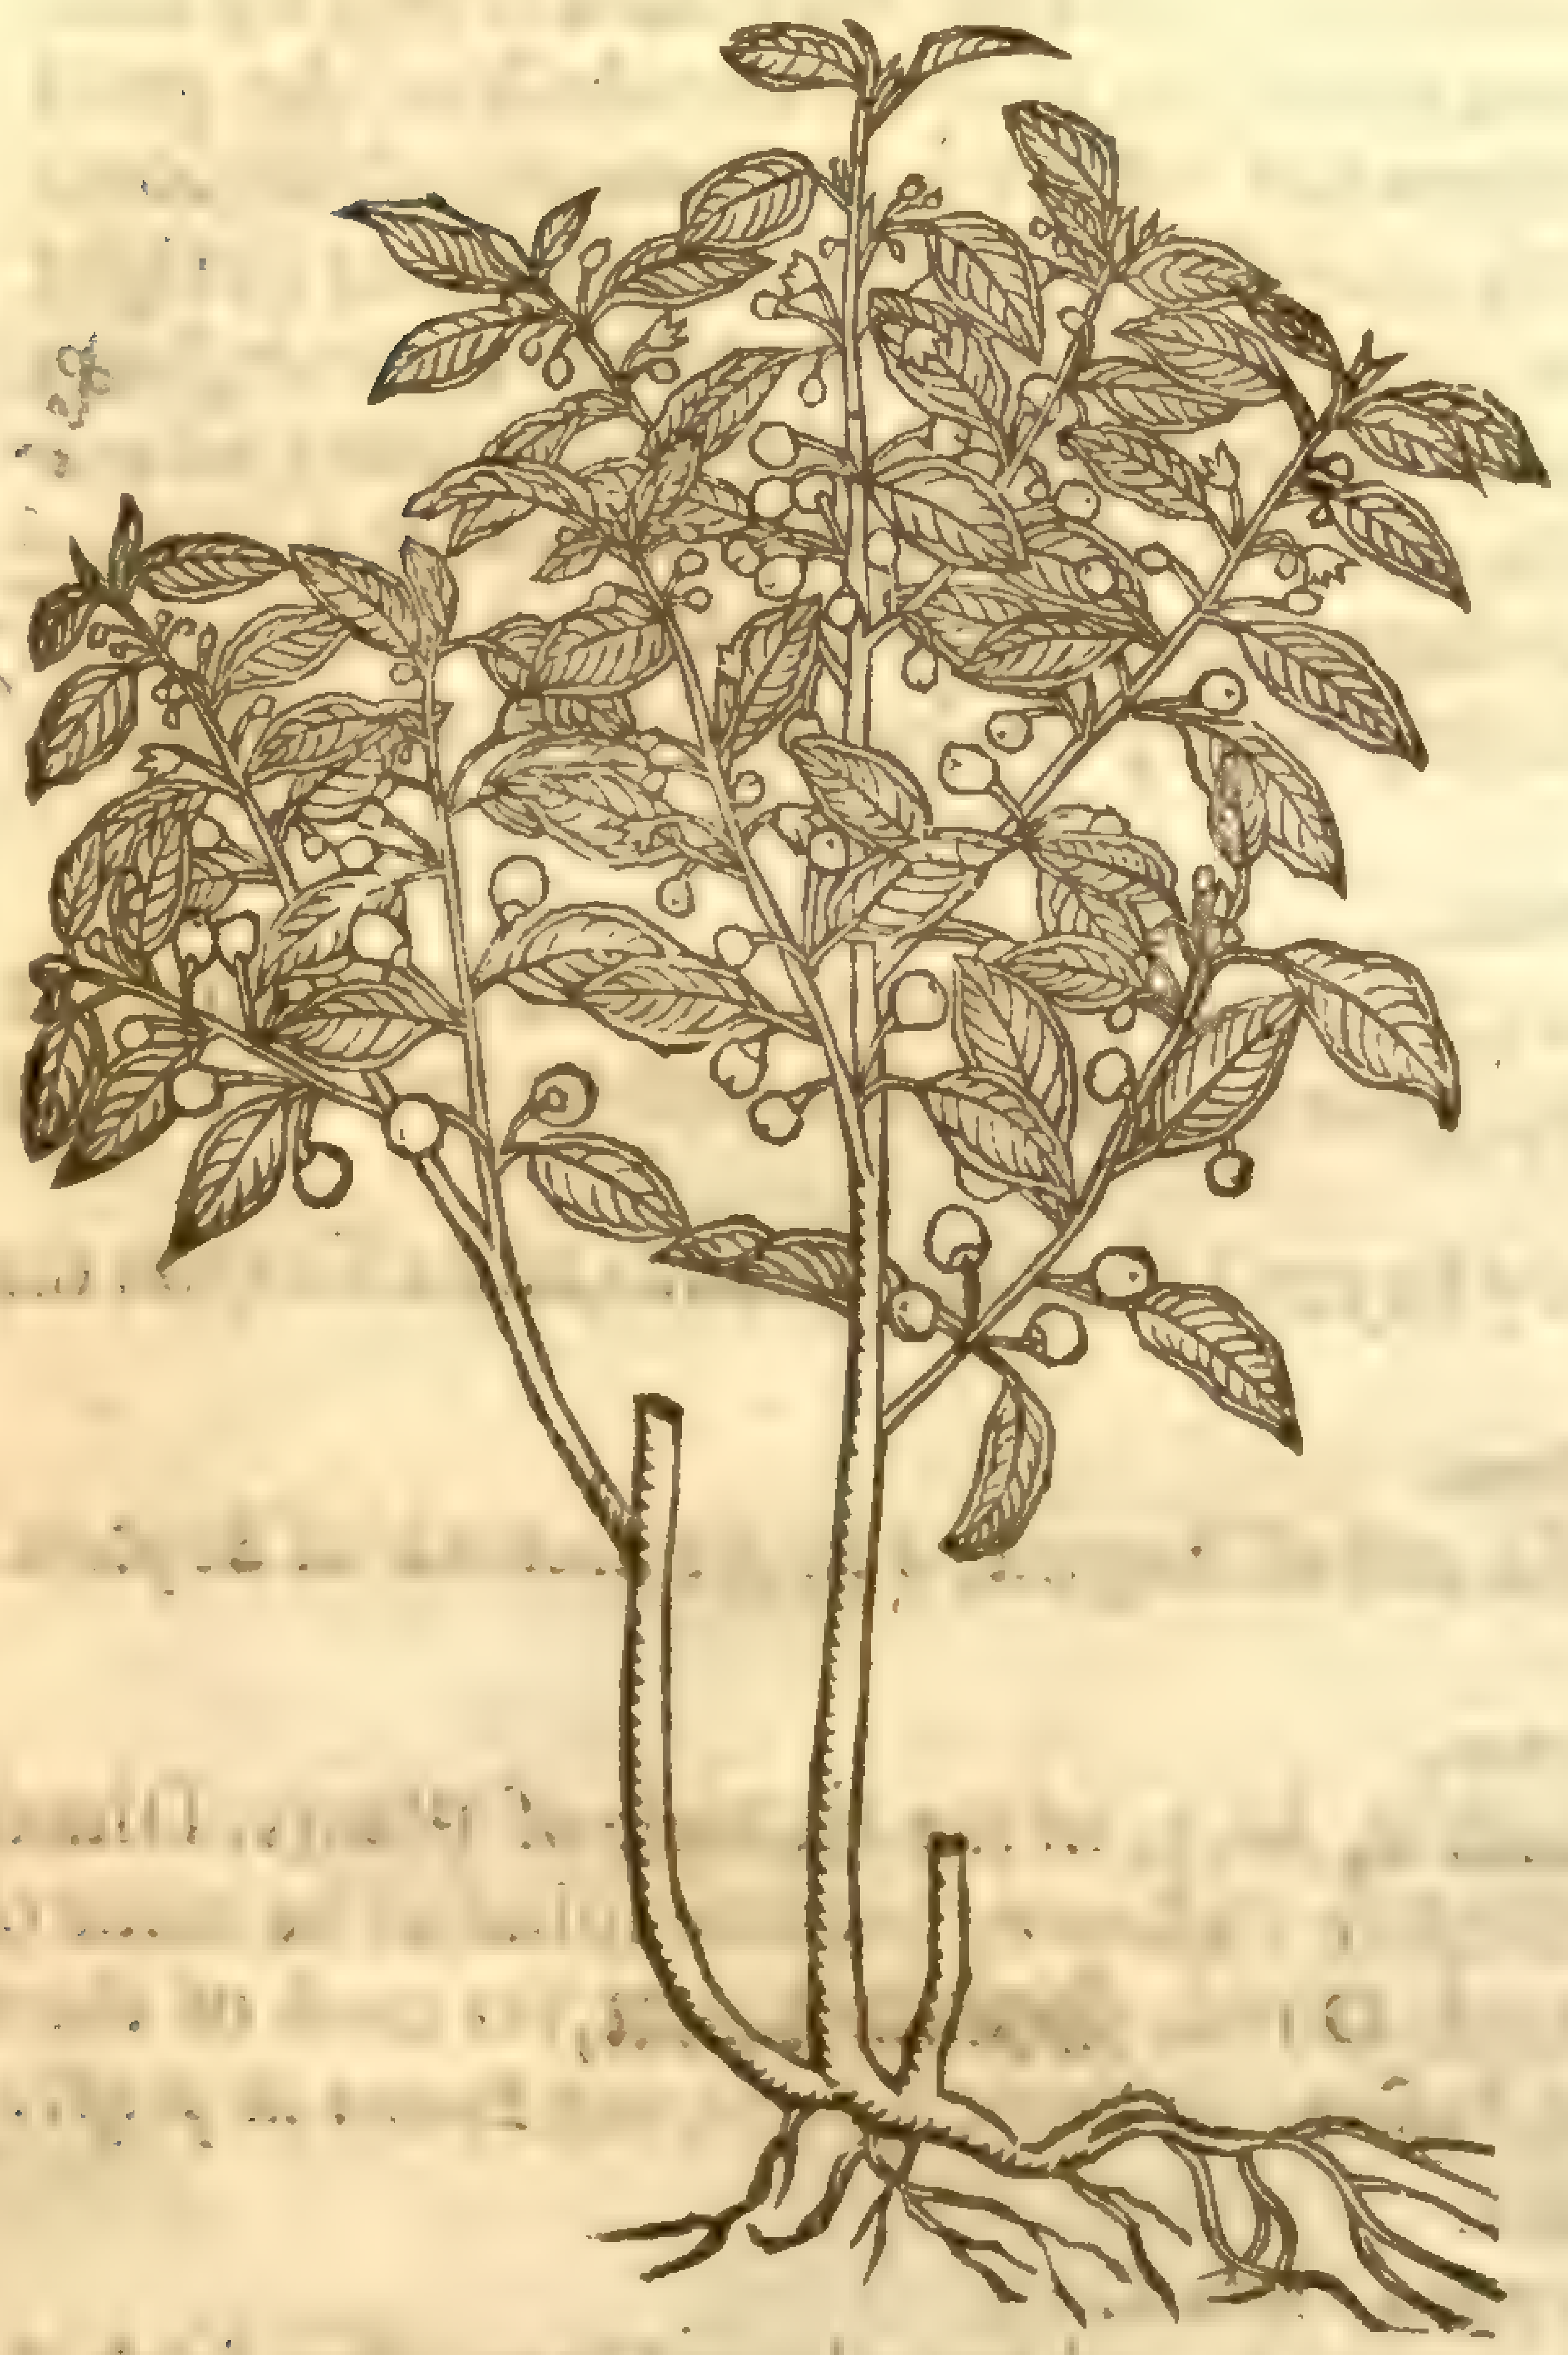
Rhamnus frangula [illegible]

A

B

C

D



¶ *The Temperature.*

The inner barke of the blacke Aller tree is of a purging and dry qualitie.

¶ *The Vertues.*

The inner barke hereof is vſed of diuers countrymen, who drinke the infuſion therof when they would be purged: it purges thick flegmatick humors and alſo cholerick, not only by the ſtoole, but oft times alſo by vomit, not without great trouble and paine to the ſtomack: it is therfore a medicine more fit for clownes than for ciuil people, and rather for thoſe that feed groſſely, than for dainty people.

Others affirme the dried barke is more gentle, and cauſeth leſſe pain; for the green barke (ſay they) which is not yet dried, contains a ſuperfluous moiſture which cauſeth gripings and vomitings, and troubles the ſtomacke.

The ſame bark boiled in wine or vineger makes a lotion for the tooth-ache, and is commended againſt ſcabs and filthineſſe of the skin.

The leaues are reported to be good fodder for cattell, eſpecially for Kine, cauſing them to yeeld good ſtore of milke.

Chap. 108. *Of the Service Tree.*

¶ *The Deſcription.*

1 THe Servis tree groweth to the height and bigneſſe of a great tree, charged with many great armes or boughs, which are ſet with ſundry ſmall branches, garniſhed with many great leaues ſomwhat long like thoſe of the Aſh: the flours are white, and ſtand in cluſters, which turne into ſmall brown berries ſomewhat long, which are not good to be eaten til they haue lien a while and are ſoft like the Medlar, whereto it is like in taſte and operation.

2 The common Servis tree growes likewiſe to the height of a great tree, with a ſtraight body of a browniſh colour, full of branches, ſet with large diſplaied leaues like the Maple or White-thorne, ſauing that they are broader and longer: the floures are white, and grow in tufts; which being fallen, there come in place thereof ſmal round berries, brown vpon one ſide, and reddiſh toward the Sun, of an vnpleaſant taſte in reſpect of the former, in which are contained little blackiſh kernels.

¶ *The Place.*

Theſe trees are found in woods and groues in moſt places of England: there be many ſmall trees thereof in a little wood a mile beyond Iſlington by London: in Kent it groweth in great aboundance, eſpecially about Southfleet and Grauesend. ‡ The later of theſe I haue ſeen growing wild in diuers places, but not the former at any time as yet. ‡

¶ *The Time.*

They floure in March, and their fruit is ripe in September.

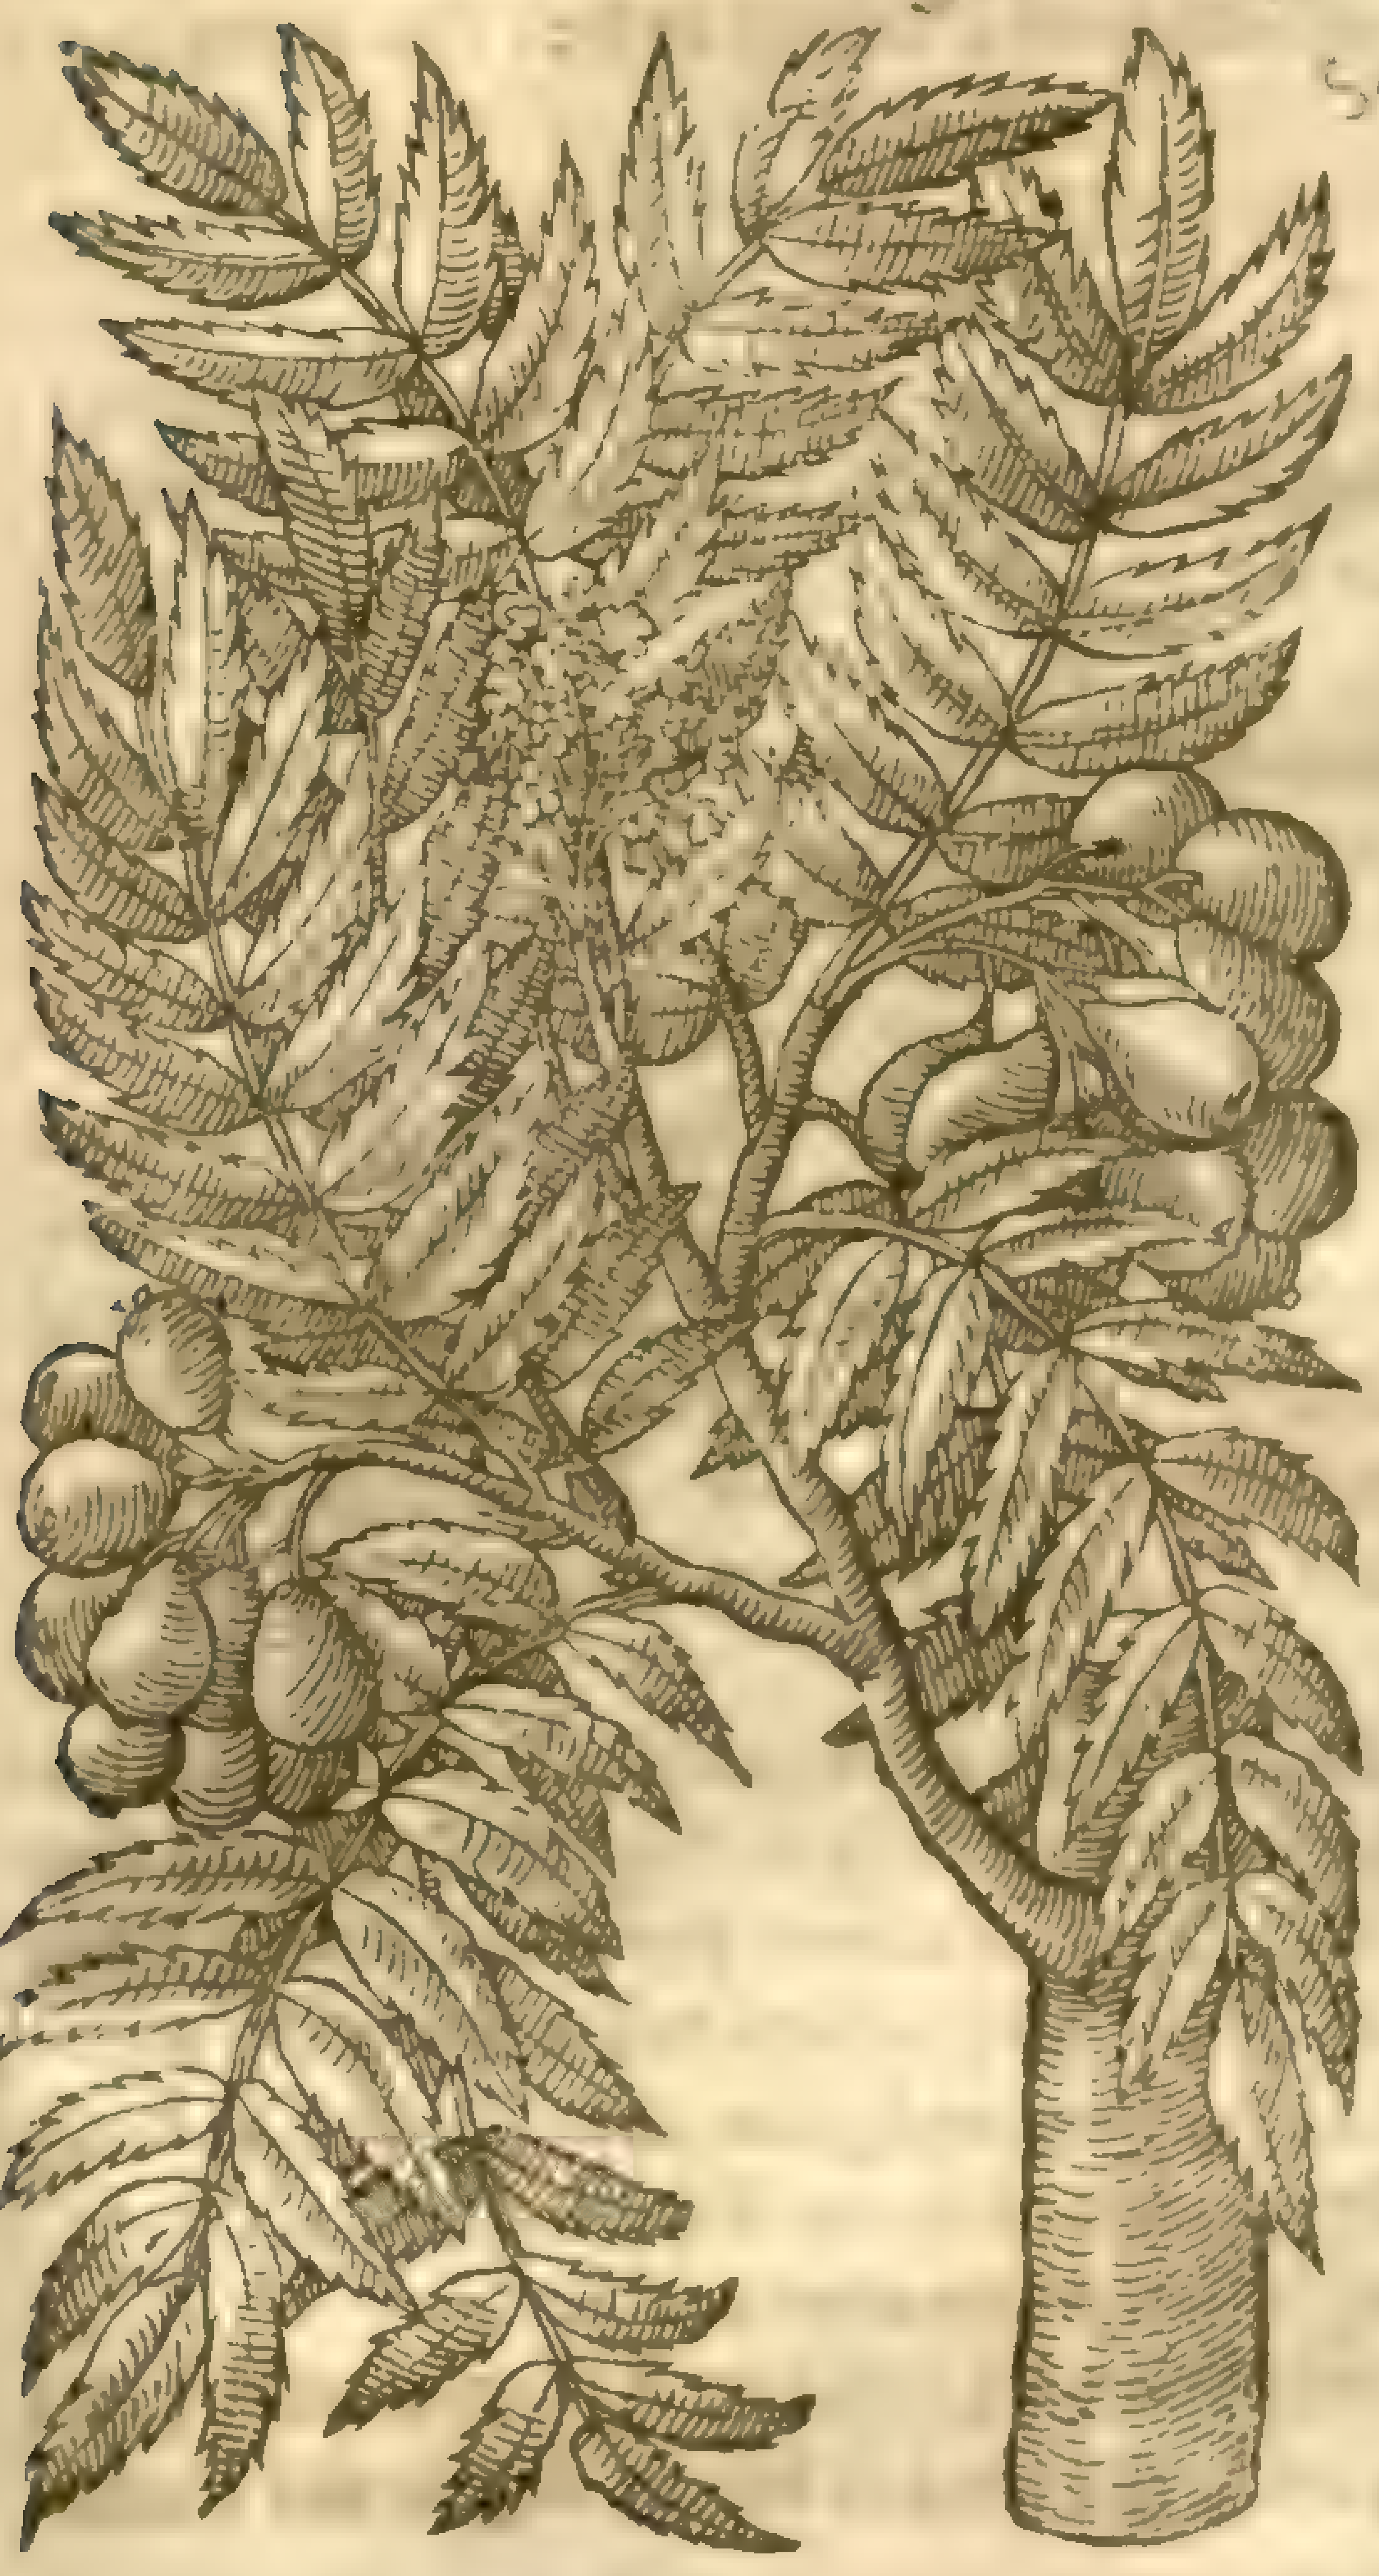
¶ *The Names.*

The firſt is called in Greeke ὄα, and οὔα: in Latine, *Sorbus*: in high-Dutch, **Sperwerbaum**: in low-Dutch, **Sorbedboom**: in French, *Cormier*: in Engliſh, Servis tree, and of ſome after the Latin Sorb tree.

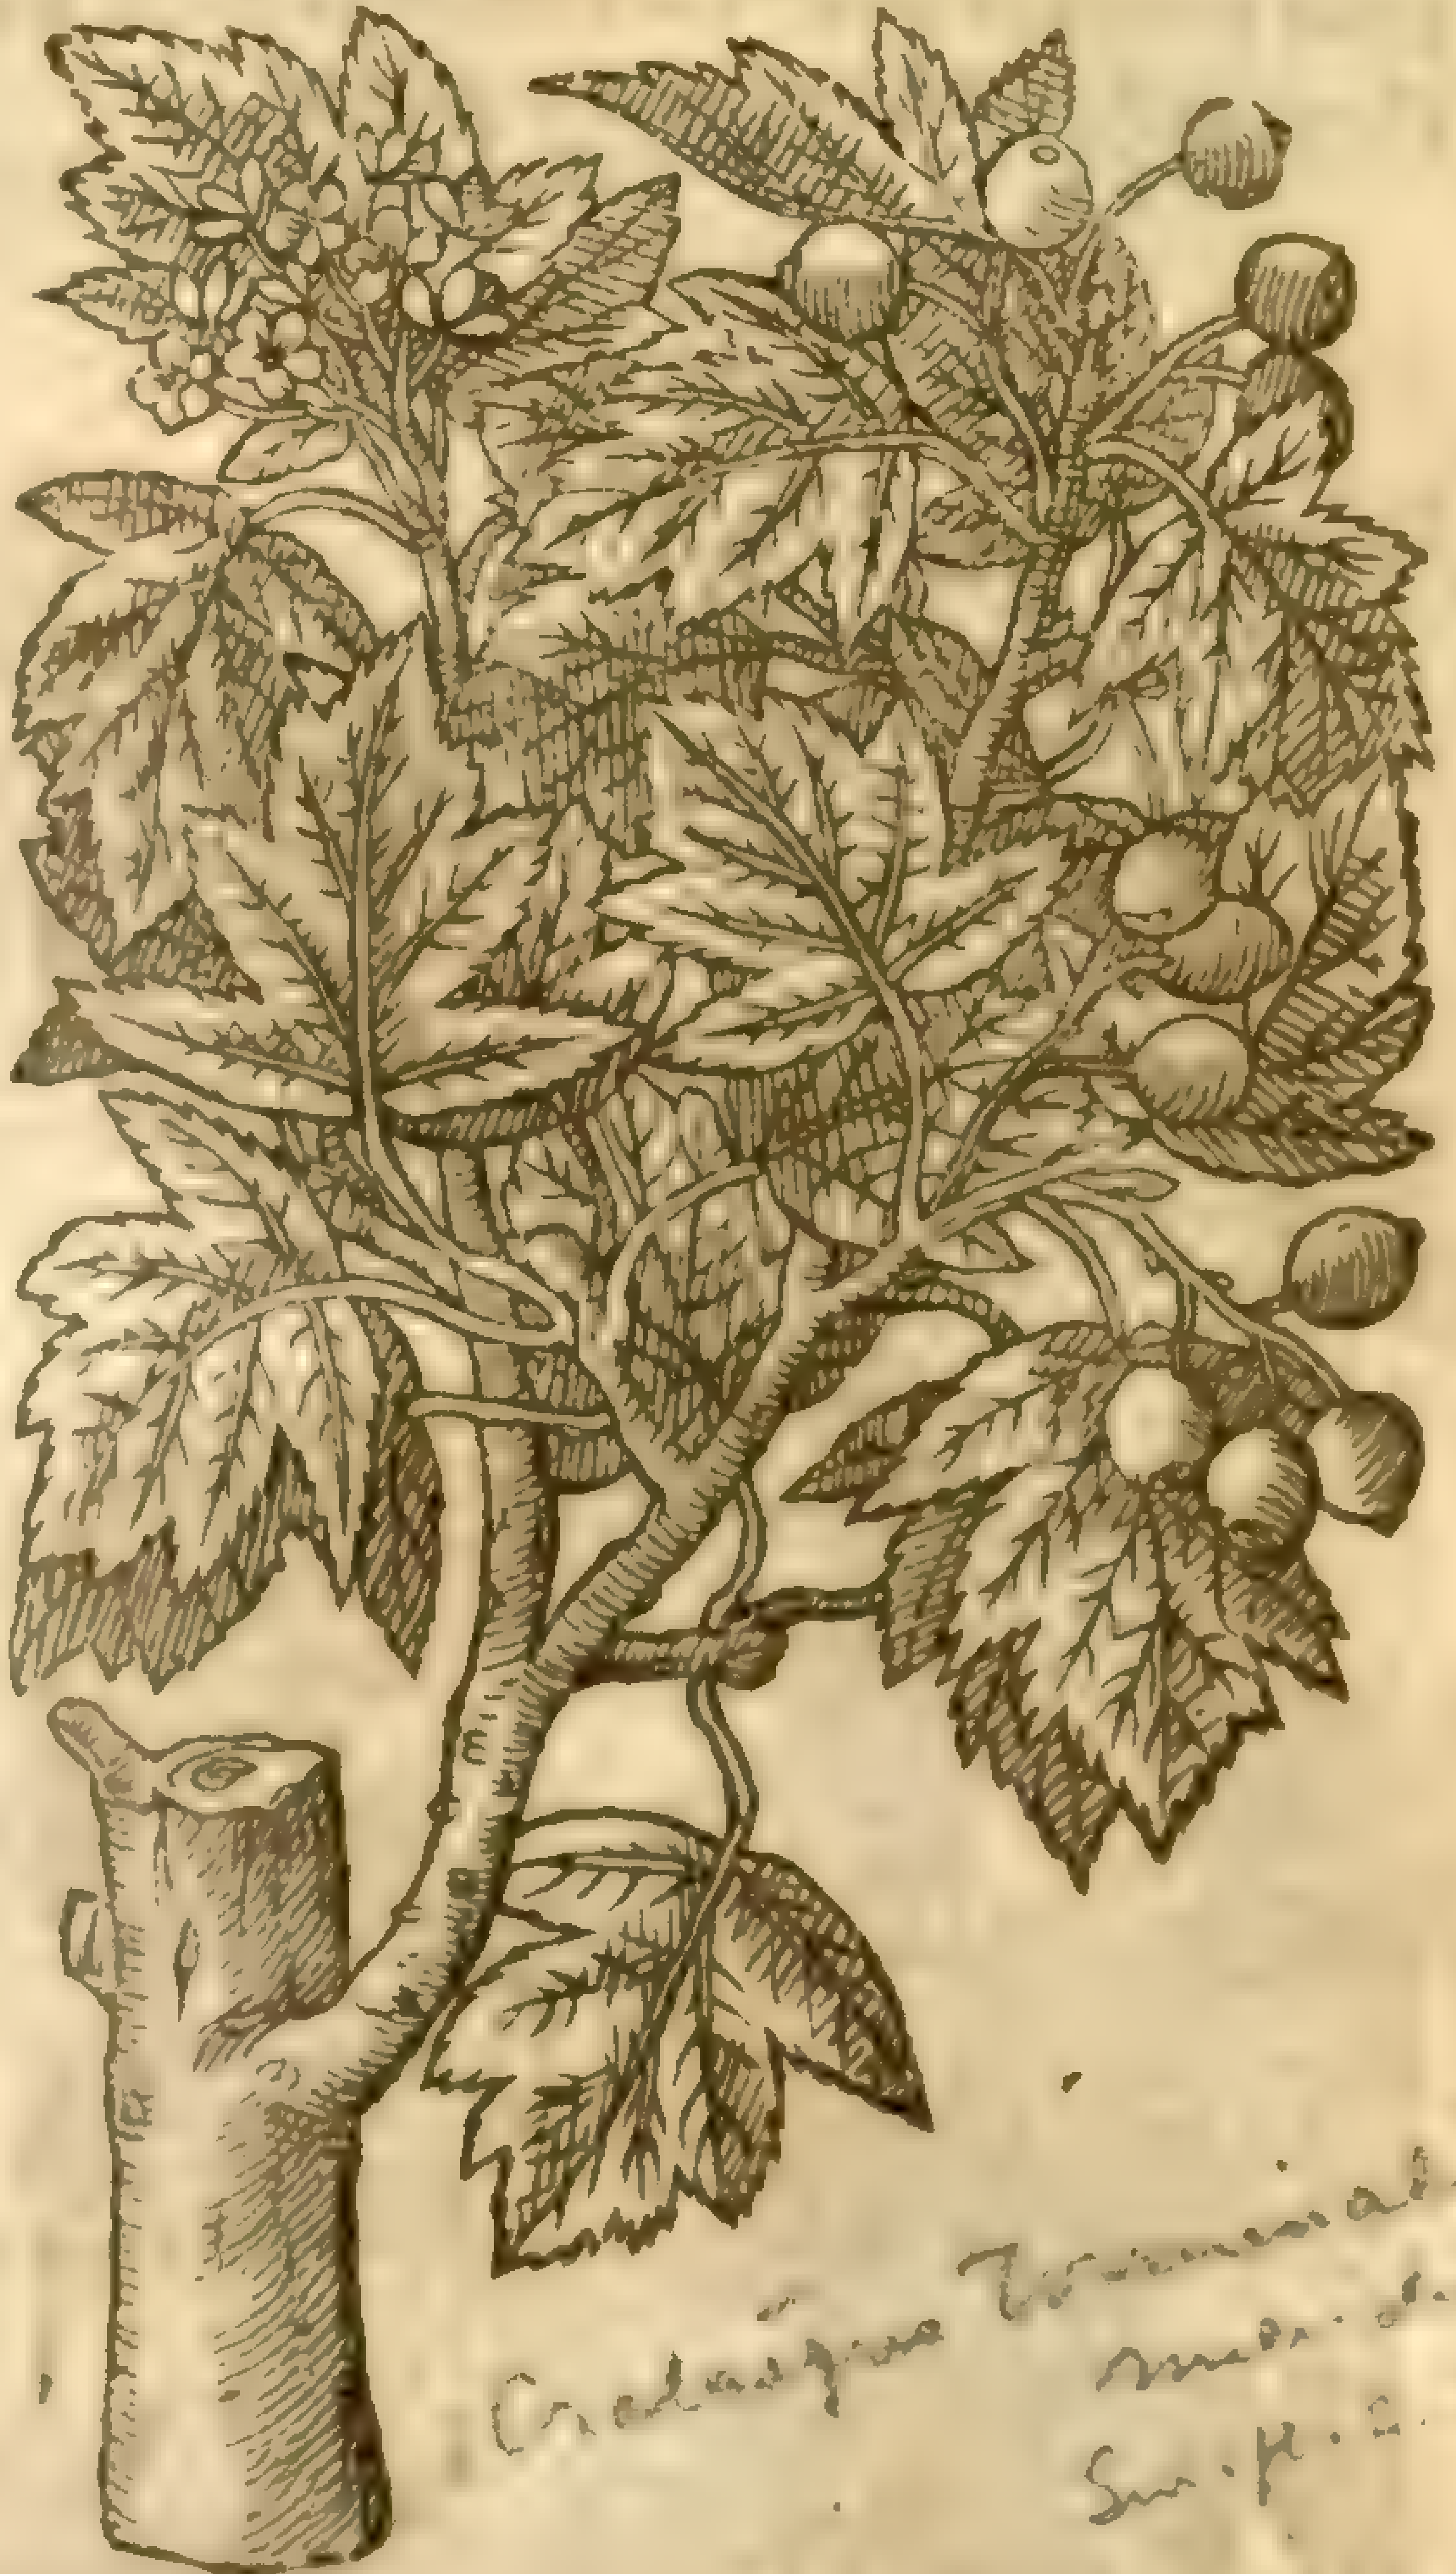
The

1 *Sorbus.*
The Servis tree.

S. domestica [illegible]
Sm. p. 2. [illegible]



2 *Sorbus torminalis.*
Common Servis tree.



Crataegus Torminalis
[illegible]
Sm. p. 2. 212

The common Servis tree is named of *Pliny*, *Sorbus torminalis*: in high-Dutch, **Areſſel**, **Eſchroſel** and **Wilder Sperwerbaum**: in Engliſh, Common Servis tree.

The berries or fruit of the Servis tree is callled ὄα, and ὄυα: in Latine, *Sorbum*: in high-Dutch, **Speierling**, **Sporopffel**: in low-Dutch, **Sorben**: in Italian, *Sorbe*, and *Sorbole*: in French, *Corme*: in Spaniſh, *Servas*, and *Sorbas*: in Engliſh, Servis: of ſome, Sorbe Apple.

¶ *The Temperature and Vertues.*

Servis berries are cold and binding, and much more when they be hard, than when they are mild and ſoft: in ſome places they are quickely ſoft, either hanged in a place which is not altogether cold, or laid in hay or chaffe: theſe Serviſes are eaten when the belly is too ſoluble, for they ſtay the ſame; and if they yeeld any nouriſhment at all, the ſame is very little, groſſe and cold; wherefore it is not good to eat of theſe or other-like fruits, nor to vſe them otherwiſe than in medicines. A

They ſtay all maner of fluxes in the belly, the bloudy flix, and vomiting: they ſtanch bleeding, if they be cut and dried in the ſun before they be ripe, and ſo reſerued for vſe. Theſe we may vſe diuers waies, according to the manner of the griefe and grieued part. B

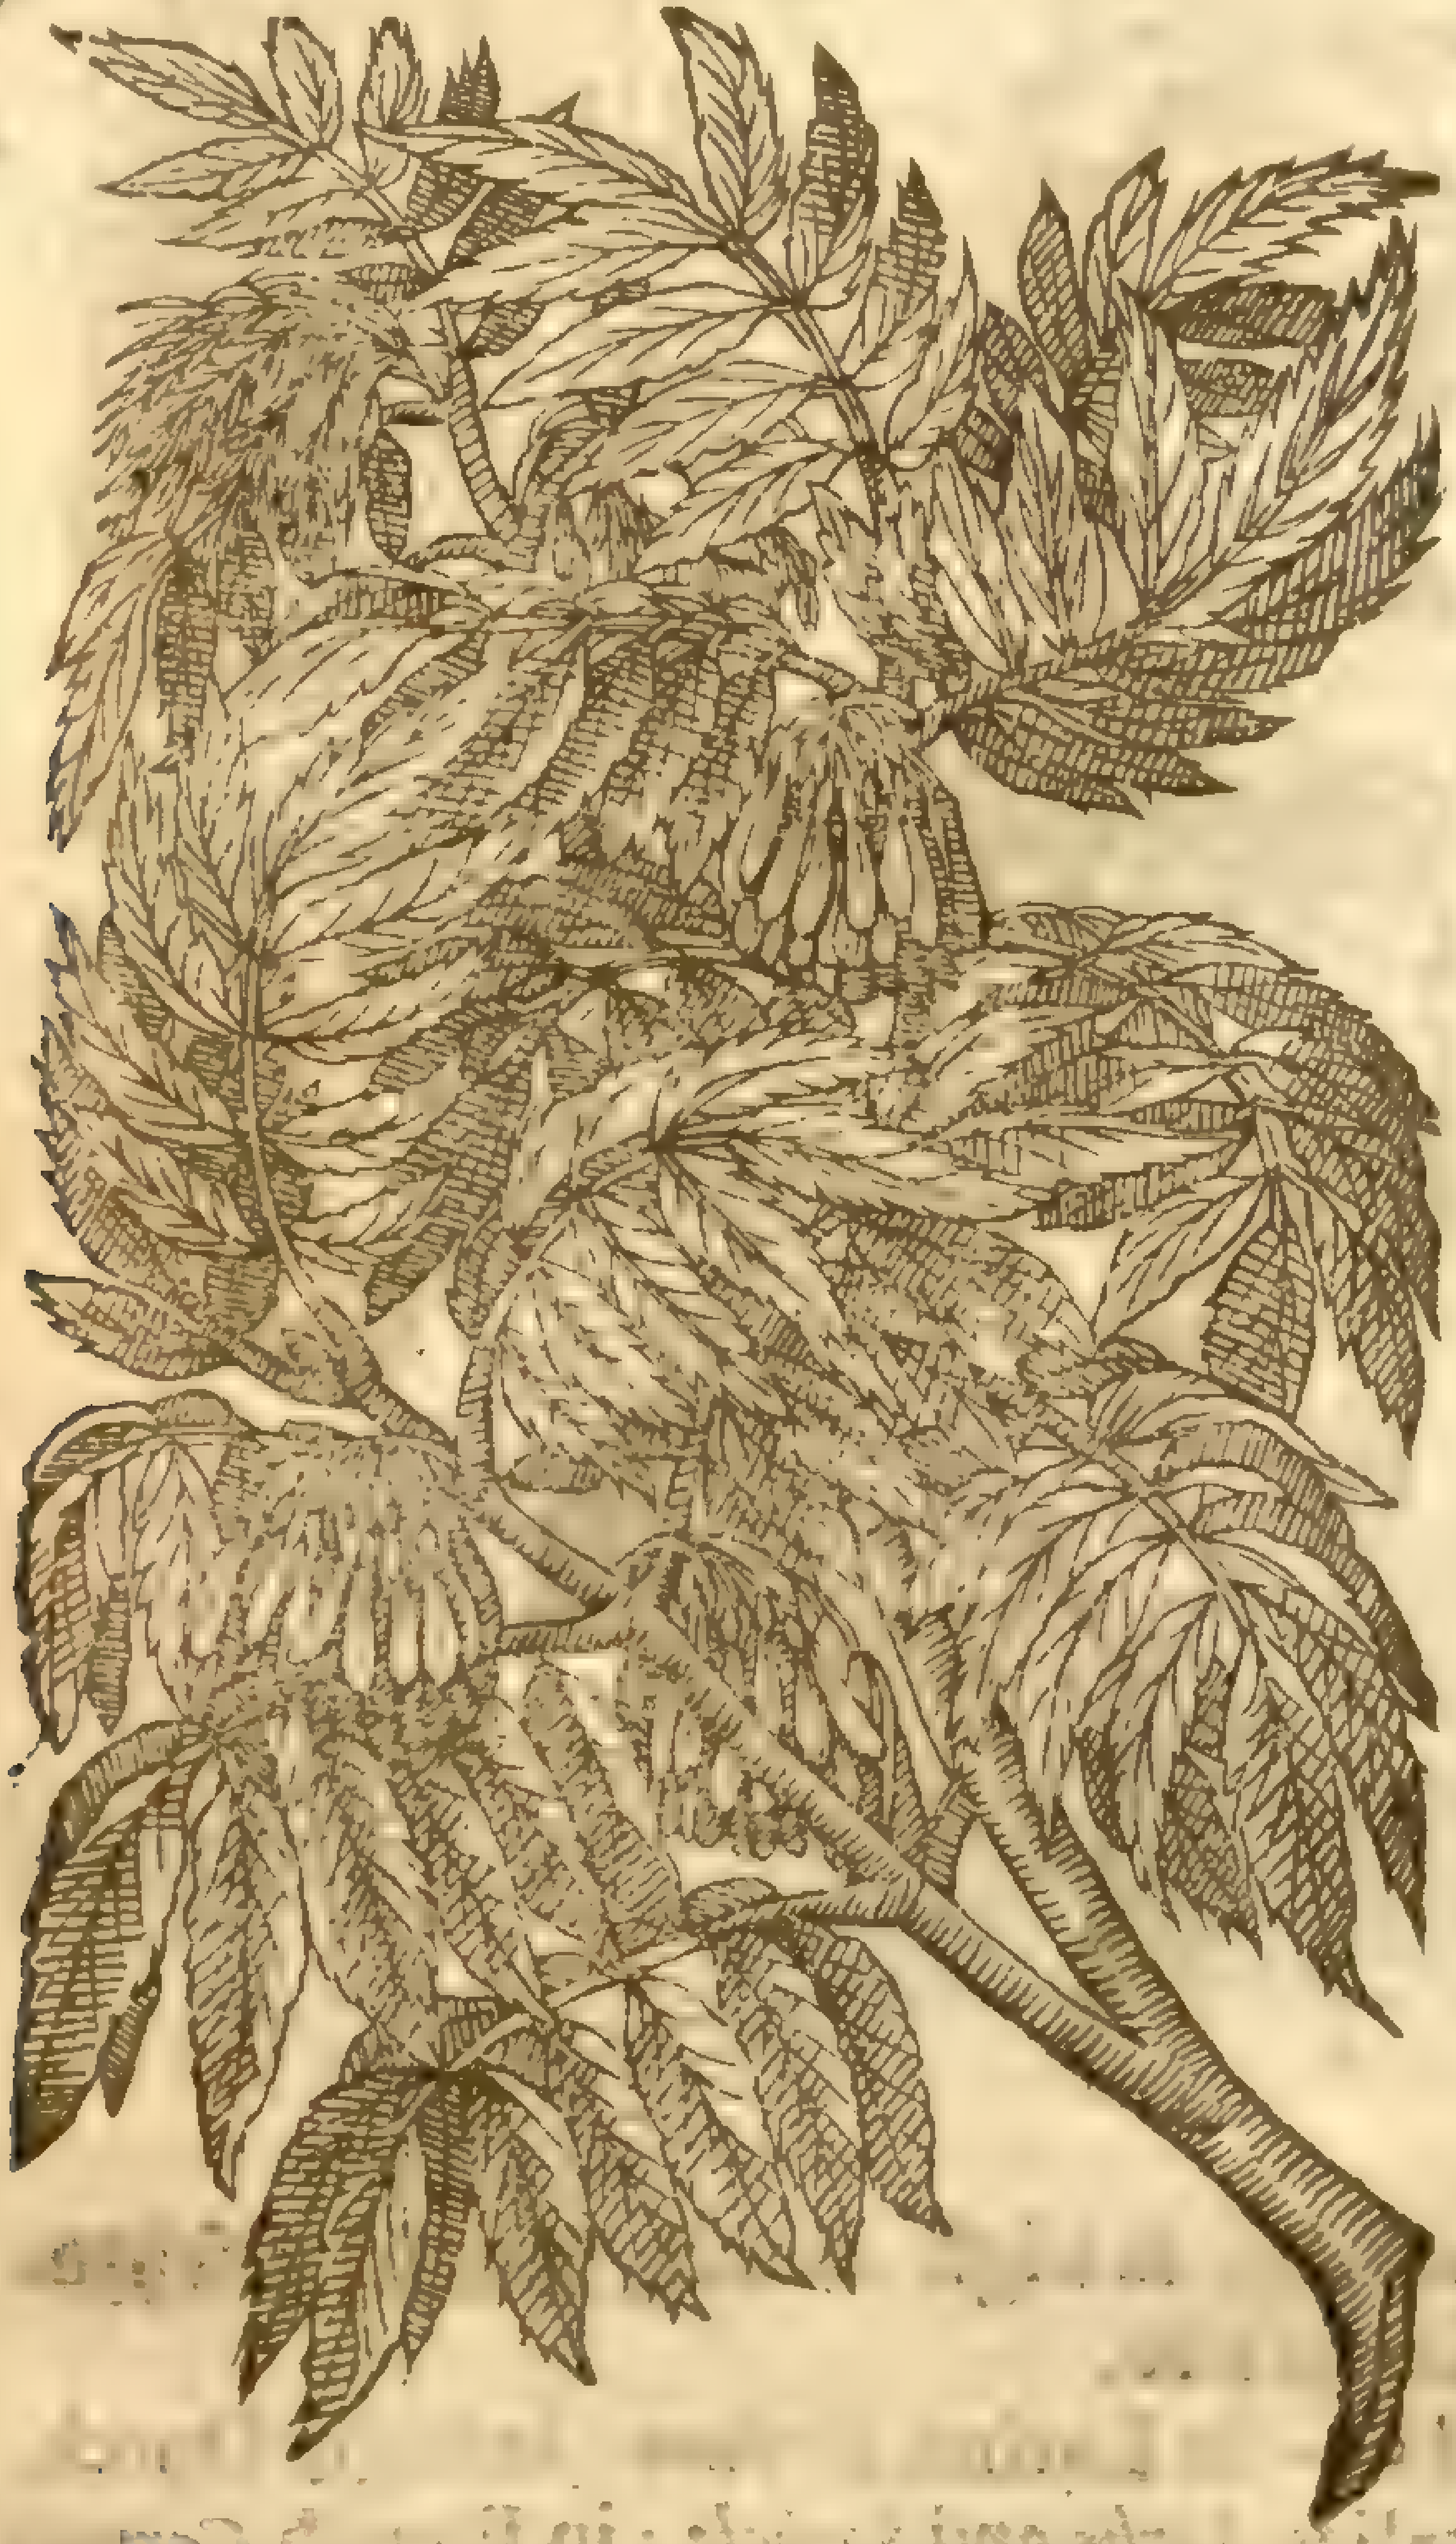
Chap. 109. *Of the Aſh Tree.*

¶ *The Deſcription.*

1 The Aſh is alſo an high and tall tree, it riſeth vp with a ſtraight body, now and then of no ſmall bigneſſe, now and then of a middle ſiſe, and is couered with a ſmooth barke; the wood is white, ſmooth, hard, and ſomewhat rough grained: the tender branches hereof and ſuch as be new grown vp are ſet with certaine ioynts, and haue within a white and ſpongie pith; but the old boughes are wooddy throughout, and be without either ioints or much pith: the leaues are long and winged, conſiſting of many ſtanding by couples one right againſt another vpon one rib or ſtalke, the vppermoſt of all excepted, which ſtandeth alone; of which euery particular one is long, broad, like to a Bay leafe, but ſofter, and of a lighter greene, without any ſweete

ſmell,and nicked round about the edges ; out of the yonger ſort of the boughs, hard to the ſetting on of the leaues, grow forth hanging together, many long narrow and flat cods,as it were like almoſt to diuers birds tongues,where the ſeed is perfected, which is of a bitter taſte : the roots bee many,and grow deep in the ground.

Fraxinus.
The Aſh tree.



¶ *The Place.*

The Aſh doth better proſper in moiſt places,as about the borders of medows and riuers ſides, than in dry grounds.

¶ *The Time.*

The leaues and keyes come forth in Aprill and May,yet is not the ſeed ripe before the fall of the leafe.

¶ *The Names.*

This tree is called in Greeke Μελία, and of diuers, Μίλεα: it is named of the Latines, *Fraxinus* : in high-Dutch, **Eſchernbaum**, **Eſchernholtz**, and **Steyneſchern**: in low-Dutch, **Eſſchen**, and **Eſſchenboom** : in Italian, *Fraſſino* : in French, *Freſne* : in Spaniſh, *Freſno*, *Fraxino*, and *Freixo* : in Engliſh, Aſh tree.

The fruit like vnto cods is called of the apothecaries, *Lingua avis*, and *Lingua Paſſerina* : it may bee named in Greeke, 'Ορνιθόγλωσσον : yet ſome would haue it called *Orneoglosſum* : others make *Ornus* or wilde Aſh to be called *Orneogloſſum*: it is termed in Engliſh, Aſh-keyes, and of ſome Kite-keyes.

¶ *The Temperature and Vertues.*

The leaues and barke of the Aſh tree are dry and moderatly hot, the ſeed is hot & dry in the ſecond degree.

A The juice of the leaues or the leaues themſelues being applied, or taken with wine, cure the bitings of vipers, as *Dioſcorides* ſaith.

B The leaues of this tree are of ſo great vertue againſt ſerpents, that they dare not ſo much as touch the morning and euening ſhadowes of the tree, but ſhun them afar off, as *Pliny* reports, *lib.16.ca.13.* He alſo affirmeth, that the ſerpent being penned in with boughes laid round about, will ſooner run into the fire, if any be there, than come neere the boughs of the Aſh ; and that the Aſh floureth before the ſerpents appeare, and doth not caſt his leaues before they be gon againe.

C We write (ſaith he) vpon experience, that if the ſerpent be ſet within a circle of fire & the branches, the ſerpent will ſooner run into the fire than into the boughes. It is a wonderfull courteſie in nature, that the Aſh ſhould floure before the Serpents appeare, and not caſt his leaues before they be gon againe.

D Both the leaues and barke are reported to ſtop the belly, and being boiled with vineger & water, do ſtay vomiting, if they be laid vpon the ſtomacke.

E The leaues and barke of the Aſh tree boiled in wine and drunke, do open the ſtoppings of the liuer and ſpleen, and do greatly comfort them.

F Three or foure leaues of the Aſh tree taken in wine each morning from time to time, doe make thoſe lean that are fat, and keep them from feeding that begin to wax fat.

G The ſeed or Aſh keyes prouoke vrine, increaſe naturall ſeed, and ſtirre vp bodily luſt, eſpecially being poudered with nutmegs and drunke.

H The wood is profitable for many things, being highly exalted by *Homer*, and by *Achilles* ſpeare, as *Pliny* writeth.

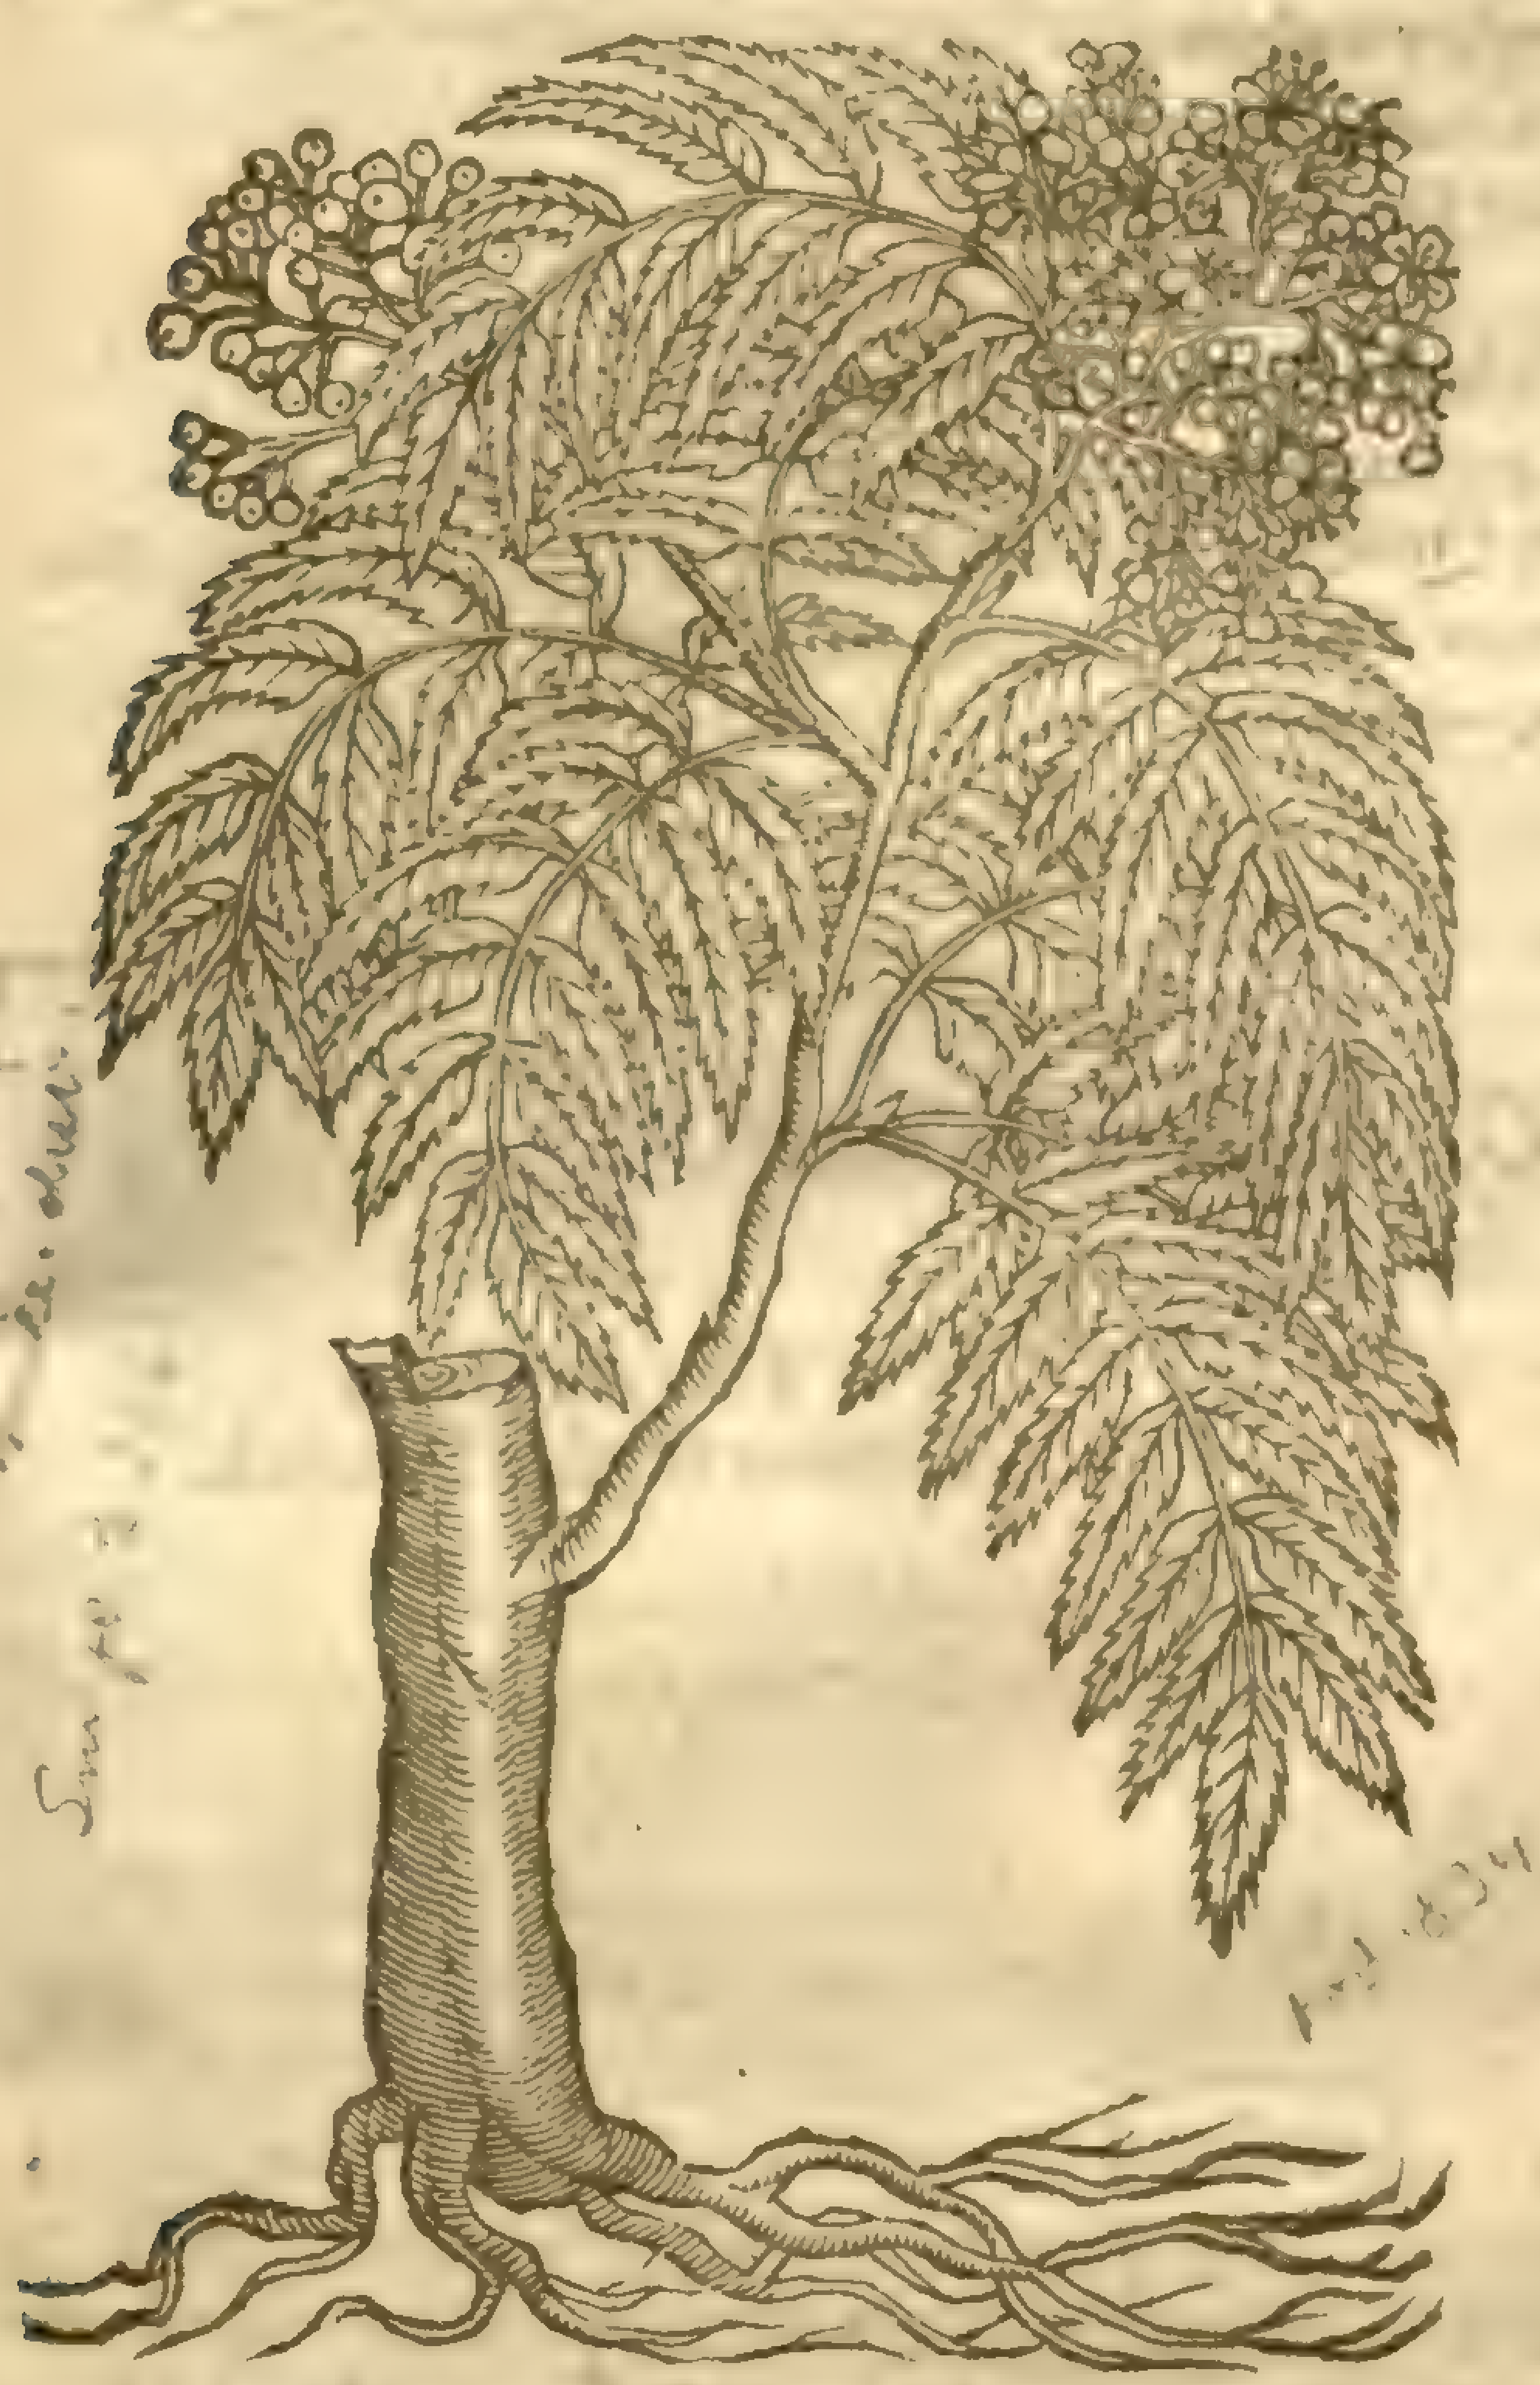
I The ſhauings or ſmall pieces being drunke, are ſaid to be pernitious and deadly, as *Dioſcorides* affirmeth.

K The Lee which is made of the aſhes of the barke cureth the white ſcurfe, and ſuch other roughneſſe of the skin, as *Pliny* teſtifieth.

CHAP. 110.

Of the wilde Aſh, otherwiſe called Quicke-Beam, or Quicken-tree.

Sorbus ſylveſtris, ſive Fraxinus Bubula.
The Quicken-tree, wild Aſh, or wild Servis tree.



Sorbus aucuparia

¶ *The Deſcription.*

THe wilde or Aſh Quicken tree *Pena* ſetteth forth for the wilde Service. This tree groweth ſeldom or neuer to the ſtature and height of the Aſh tree, notwithſtanding it growes to the bignes of a large tree. The leaues be great and long, and ſcarce be diſcerned from the leaues of the Service Tree. The floures be white, ſweet of ſmell, and grow in tuft, which do turn into round berries, green at the firſt, but when they bee ripe of a deepe red colour, and of an vnpleaſant taſte. The branches are as full of juice as the oſiar; which is the cauſe that Boies do make pipes of the barke thereof, as they doe with Willowes.

¶ *The Place.*

The wilde Aſh or Quicken tree groweth on high mountains and in thicke Woods in moſt places of England, eſpecially about Namptwich in Cheſhire, in the Weilds of Kent, in Suſſex and diuers other places.

¶ *The Time.*

The wild Aſh flours in May, and the berries are ripe in September.

¶ *The Names.*

The Latines call this tree *Ornus*, and oftentimes *Sylveſtris Fraxinus* or wilde Aſh; and it is alſo *Fraxini ſpecies*, or a kind of Aſh: for the Grecians (as not onely *Pliny* writeth, but alſo *Theophraſtus*) haue made two kinds of Aſh, the one high and tall, the other lower; the high and tall one is *Fraxinus vulgaris*, or the common Aſh; and the lower, *Ornus*, which alſo is named Ὀρειμελία, or *Montana Fraxinus*, mountain Aſh; as the other, πεδινὴ or field Aſh, which is alſo named Βουμελία, or as *Gaza* tranſlateth it, *Bubula fraxinus*, but more truly *Magna Fraxinus*, or Great Aſh; for the ſyllable Βοῦ is a ſigne of bignes. This *Ornus* or great Aſh is named in high-Dutch, **Walbaum**: in low-Dutch, **Hauereſſchen**, or **Quereſchen**, of diuers, **Qualſter**: in French, *Freſne ſauvage*: in Engliſh, Wilde Aſh, Quicken tree, Quick-beam tree, and Wicken tree. *Matthiolus* makes this to bee *Sorbus ſylveſtris*, or wilde Service tree.

¶ *The Temperature and Vertues.*

A Touching the faculties of the leaues, barke, or berries, as there is nothing found among the old, ſo is there nothing noted among the later writers: but *Pliny* ſeems to make this wilde Aſh like in faculties to the common Aſh; for *lib.* 16. *cap.* 13. where he writes of both the Aſhes, hee ſaith, that the common Aſh is *Criſpa*, and the mountain Aſh *Spiſſa*. And forthwith he adds this: The Grecians write that the leaues of them do kill cattel, and yet hurt not thoſe that chew their cud. Which the old Writers haue noted of the Yew tree, and not of the Aſh tree. *Pliny* was deceiued by the neerneſſe of the words Μίλος, and Μελία: Μίλος is the Yew tree, and Μελία the Aſh tree: ſo that hee hath falſly attributed that deadly facultie to the Aſh tree, which belongeth to the Yew tree.

B The leaues of the wilde Aſh tree boiled in wine are good againſt the pain in the ſides, and ſtopping of the liuer, and aſſwage the bellies of thoſe that haue the tympany and dropſie.

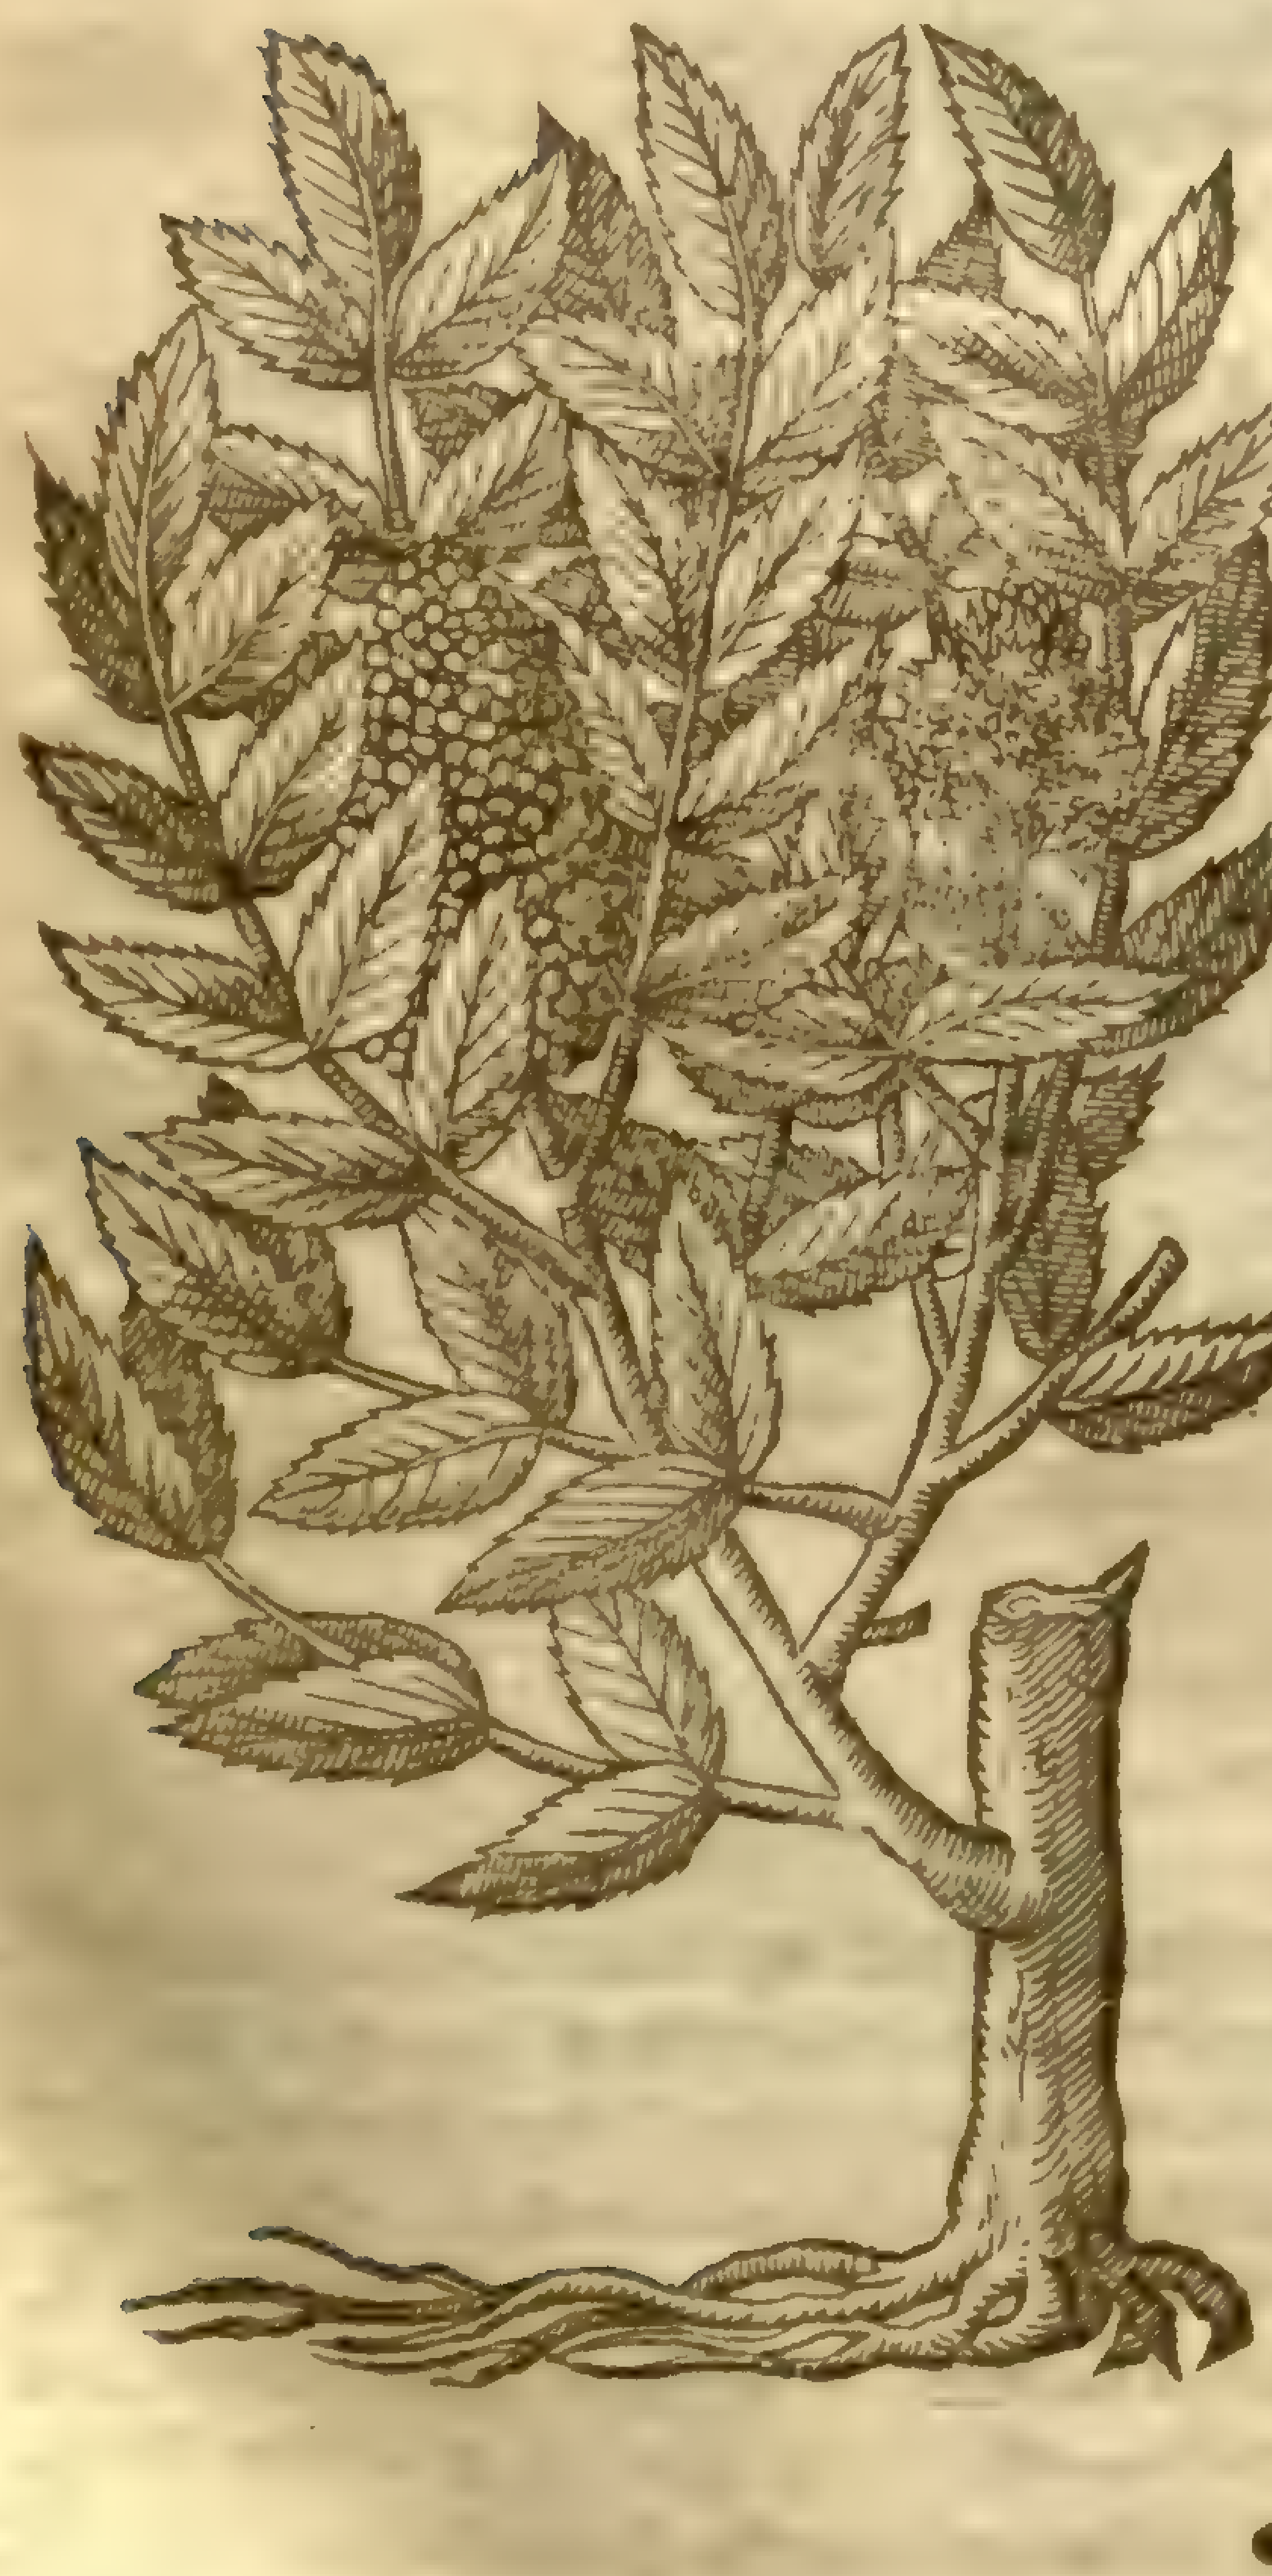
C *Benedictus Curtius Symphorianus* is deceiued in the hiſtory of *Ornus*, when he thinks out of *Virgils Georgicks*, that *Ornus* hath the floure of the Peare tree; for out of *Virgils* Verſes no ſuch thing at all can be gathered; for he intreateth not of the formes of trees, but of the graffing of diuers into others, vnlike and differing in nature; as of the graffing of the Nut tree into the Strawbery tree; the Apple into the Plane tree; the Beech into the Cheſtnut tree; the Peare into the wild Aſh or quick-Beam tree, the Oke into the Elm tree: and in this reſpect he writeth, that the Plane tree bringeth forth an apple, the Beech tree a Cheſtnut; the wilde Aſh bringeth forth the white floure of the Peare tree; as is moſt manifeſt out of *Virgils* owne words, after this maner, *lib.* 2. of his *Georgicks*:

Inſeritur vero ex fœtu nucis Arbutus horrida,
Et ſteriles Platani malos geſſere valentes,
Caſtaneæ Fagos: Ornus incanuit albo
Flore Pyri, glandémque ſues fregere ſub Vlmis.

The tree-Strawb'ry on Walnuts ſtock doth grow,
And barren Planes faire Apples oft haue borne;
Cheſtnuts, Beeſt-maſt; the Quicken-tree doth ſhow
The Peares white floure; and Swine oft times th' Acorn
Haue gather'd vnder Elms. ——

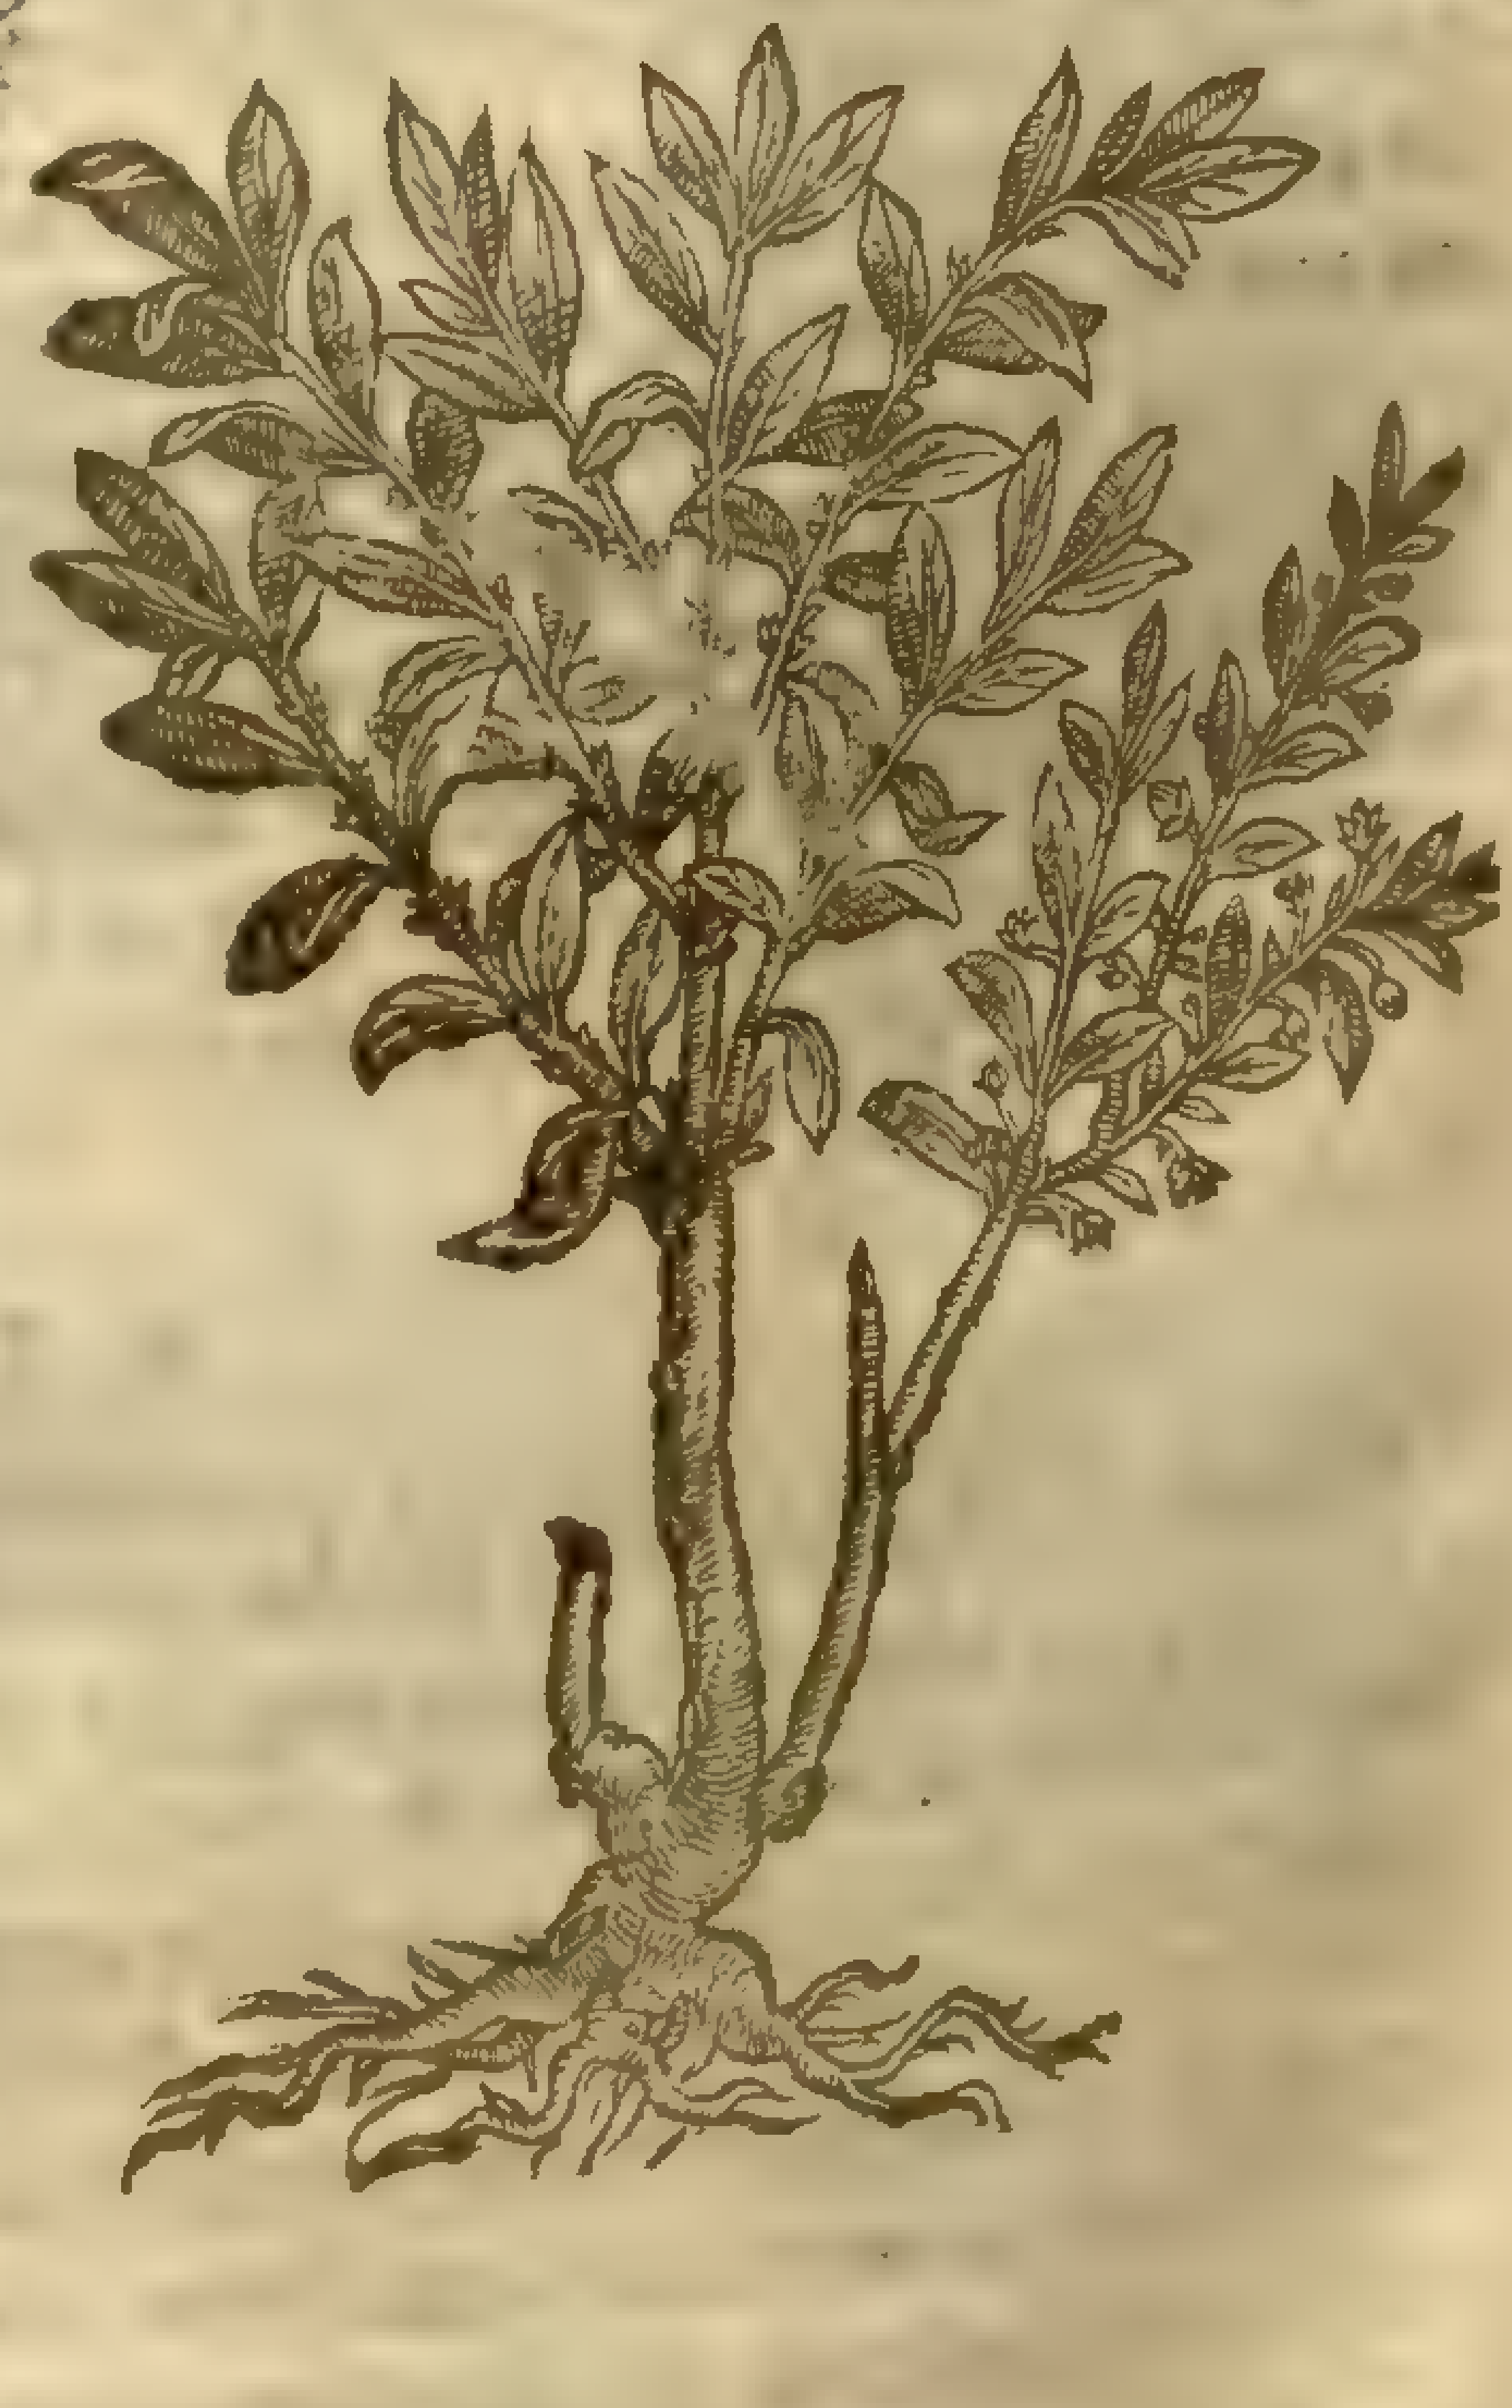
Chap. III. *Of Coriars Sumach.*

1 *Rhus Coriaria.*
Coriar Sumach.



R. coriaria L.
Mus. aut.

2 *Rhus Myrtifolia.*
Wilde or Myrtle Sumach.



Coriaria myrtifolia L. [illegible]

¶ *The Deſcription.*

2 Coriars Sumach groweth vp vnto the height of an hedge tree, after the manner of the Elder tree, bigger than *Dioſcorides* reporteth it to be, or others, who affirme that *Rhus* groweth two cubits high; whoſe errors are the greater: but this *Rhus* is ſo like to the

Service tree in ſhape and manner of growing, that it is hard to know one from the other, but that the leaues are ſoft and hairy, hauing a red ſinue or rib thorow the midſt of the leaf: the flours grow with the leaues vpon long ſtems cluſtering together like Cats taile or the catkins of the Nut tree, but greater, and of a whitiſh green colour; after which come cluſters of round berries, growing in bunches like Grapes.

2 The Sumach of *Plinies* deſcription groweth like a ſmall hedge tree, hauing many ſlender twiggy branches garniſhed with leaues like *Myrtus*, or rather like the leaues of the Iuiube tree. Among which come forth ſlender moſſie flours, of no great account or value, which bring forth ſmal ſeeds, incloſed within a cornered caſe or huske faſhioned like a ſpoon. The trunk or body of both theſe kindes of Sumach being wounded with ſome iron inſtrument, yeeldeth a gum or liquour.

¶ *The Place.*

Sumach groweth, as *Dioſcorides* ſaith, in ſtony places: it is found in diuers mountains & woods in Spain, and in many places on the mount Apennine in Italy, and alſo neere vnto Pontus. *Archigenes* in *Galen, lib.* 8. of Medicines according to the places affected, ſheweth, that it groweth in Syria, making choice of that of Syria.

¶ *The Time.*

The floures of Sumach come forth in Iuly: the ſeed with the berries are ripe in Autumne.

¶ *The Names.*

This is called in Greeke Ῥοῦς: *Rhus*, ſaith *Pliny*, hath no Latine name, yet *Gaza* after the ſignification of the Greeke word, feigneth a name, calling it *Fluida*: the Arabians name it *Sumach*: the Italians, *Sumacho*: the Spaniards, *Sumagre*: in low-Dutch, by contracting the word, they cal it **Sumac** or **Sumach** in Engliſh, Sumach, Coriars Sumach, and leather Sumach: the leaues of the ſhrub be called Ῥοῦς βυρσοδεψική: in Latine, *Rhus Coriaria*, or *Rhoe*.

The ſeed is named *Eruthro*, and Ῥοῦς ἐπὶ τὰ ὄψα: in Latine, *Rhus culinaria*, and *Rhus obſoniorum*: in Engliſh, Meat Sumach, and Sauce Sumach.

¶ *The Temperature.*

The fruit, leaues, and ſeed hereof do very much binde: they alſo coole and dry: dry they are in the third degree, and cold in the ſecond, as *Galen* ſaith.

¶ *The Vertues.*

The leaues of Sumach boiled in wine and drunken, do ſtop the lask, the inordinat courſe of womens ſickneſſes, and all other inordinat iſſues of bloud. A

The ſeeds of Sumach eaten in Sauces with meat ſtop all maner of fluxes of the belly, the bloudie flix, and all other iſſues, eſpecially the Whites of women, B

The decoction of the leaues maketh haires blacke, and is put into ſtooles to fume vpward into the bodies of ſuch as haue the Dyſenterie, and is to be giuen them alſo in drinke. C

The leaues made into an ointment or plaiſter with hony and vineger, ſtayes the ſpreding nature of gangrens and *Pterygia*. D

The dry leaues ſodden in water vntill the decoction be as thicke as honey, yeeld forth a certaine oilineſſe which performeth all the effects of *Licium*. E

The ſeed is no leſſe effectuall to be ſtrewed in pouder vpon their meats that are *Cœliaci* or *Dyſenterici*. F

The ſeeds pouned, mixed with hony and the pouder of oke coles, heale the hemorrhoids. G

There iſſueth out of the ſhrub a gum, which being put into the hollowneſſe of the teeth, taketh away the pain, as *Dioſcorides* ſaith. H

CHAP. 112. *Of Red Sumach.*

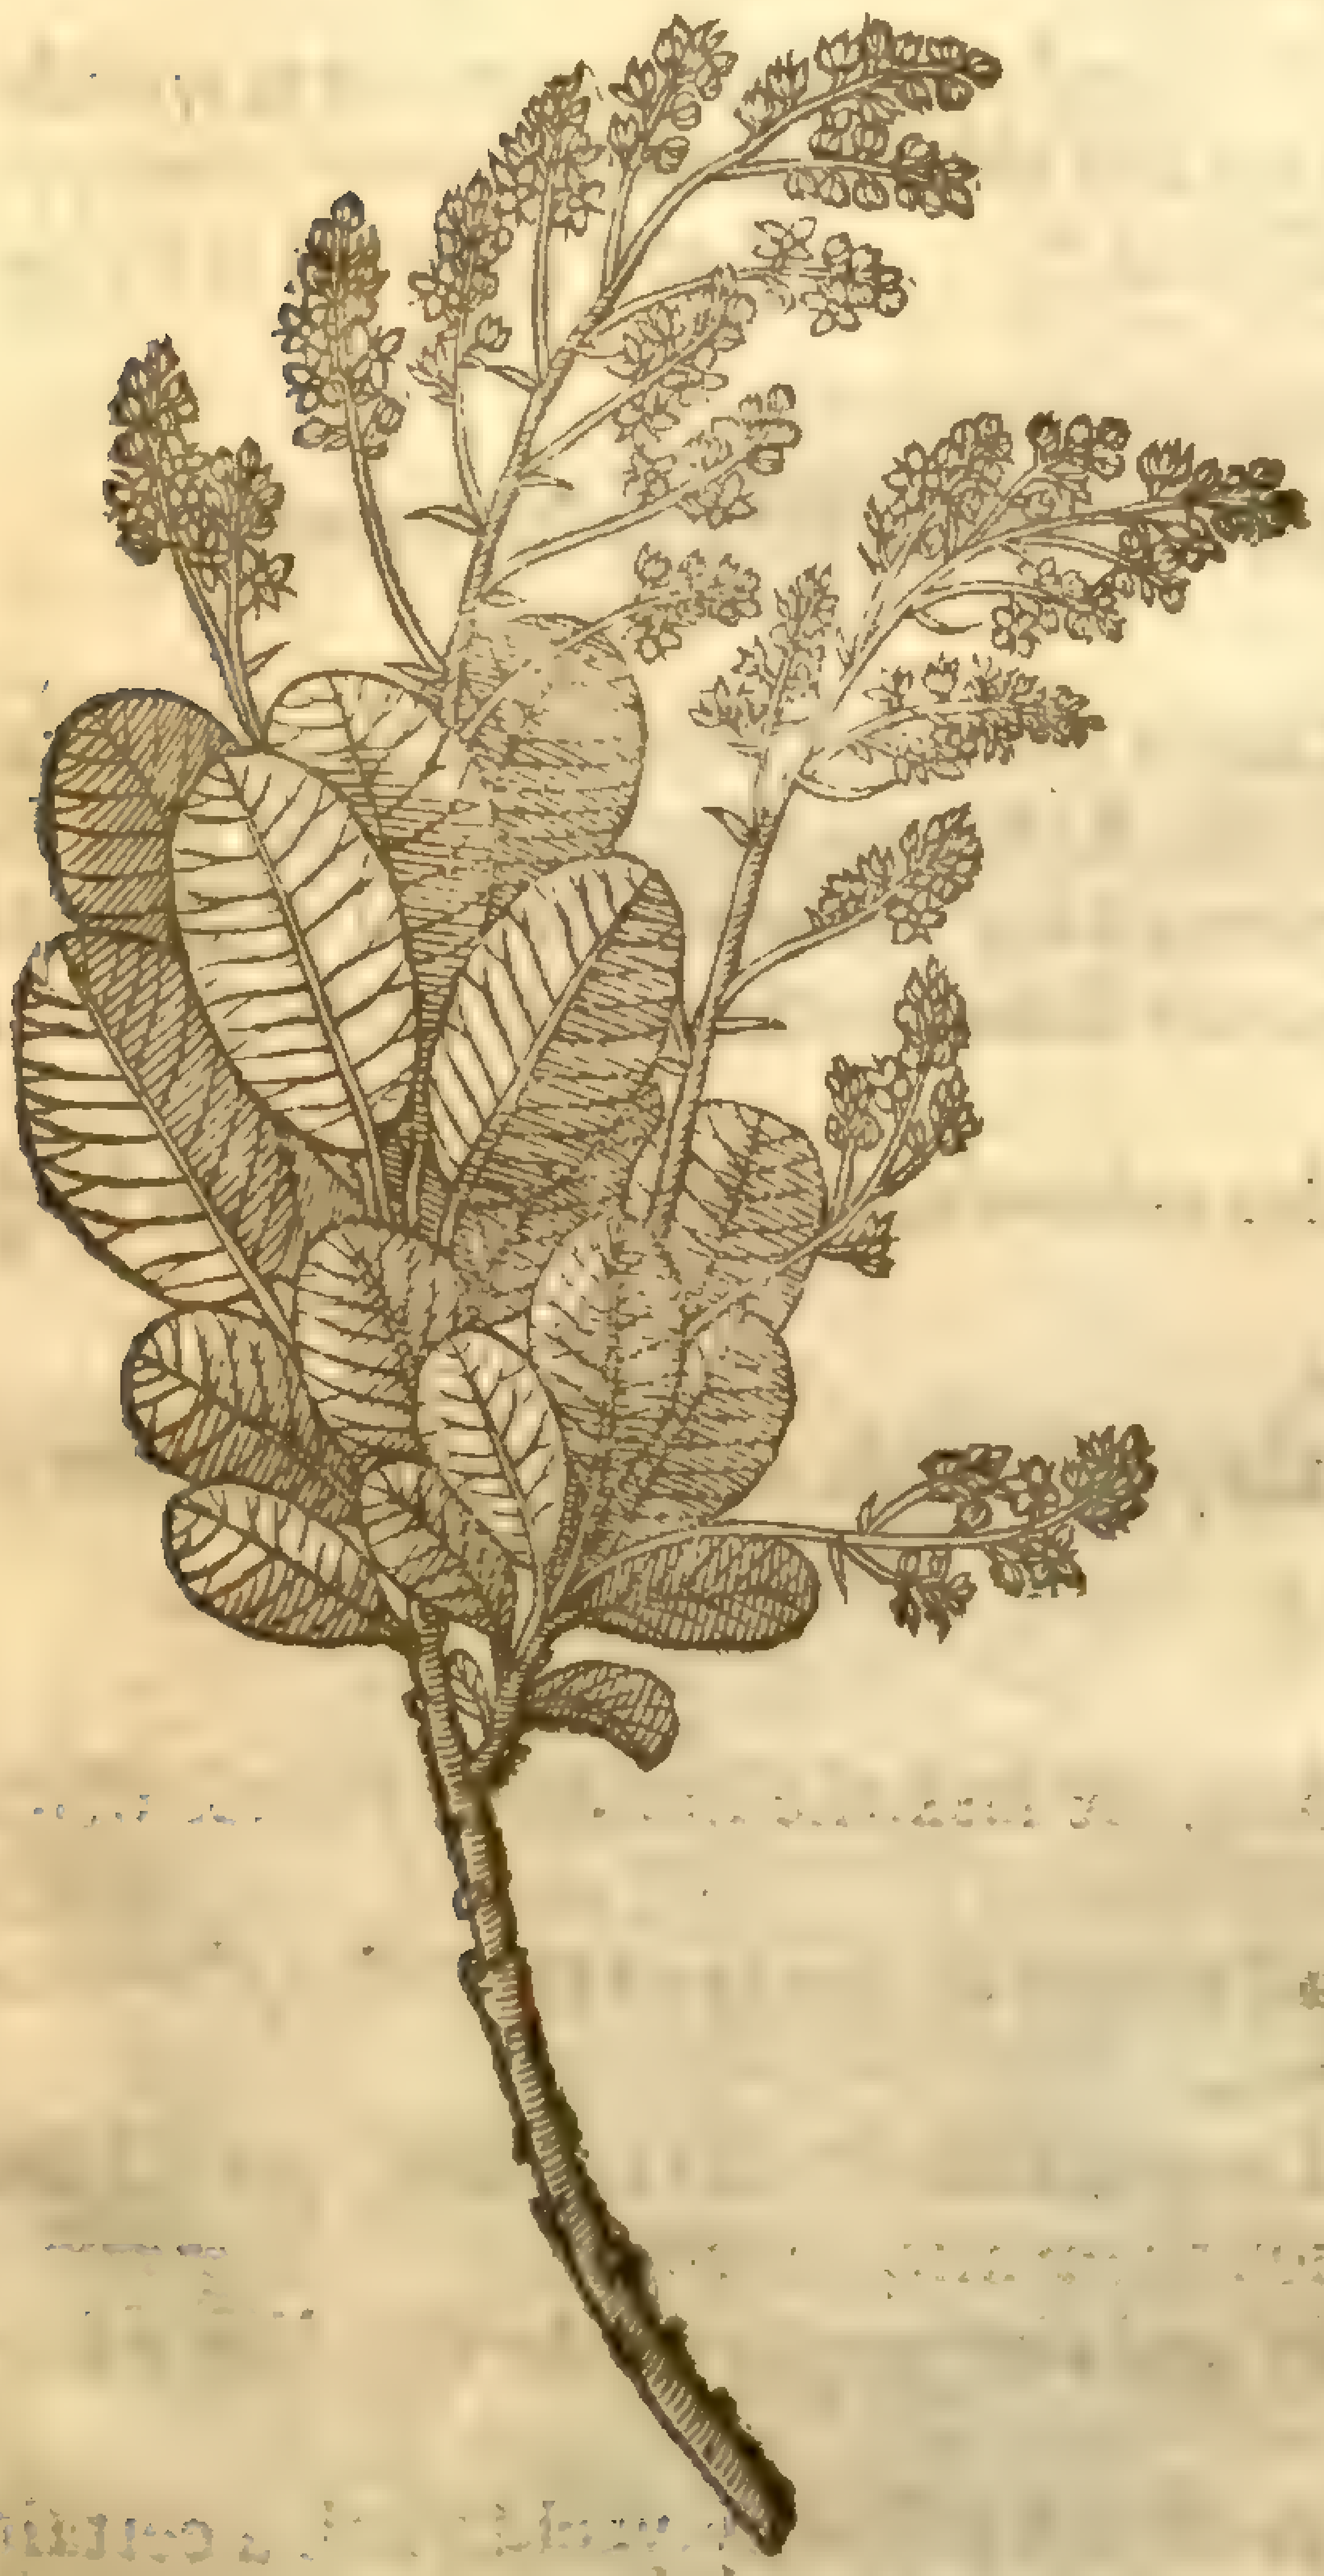
¶ *The Deſcription.*

1 THeſe two figures are of one and the ſelfe ſame plant; the firſt ſheweth the ſhrub being in floure, the other when it is ful floured with the fruit grown to ripeneſſe: notwithſtanding ſome haue deemed them to be of two kinds, wherein they were deceiued.

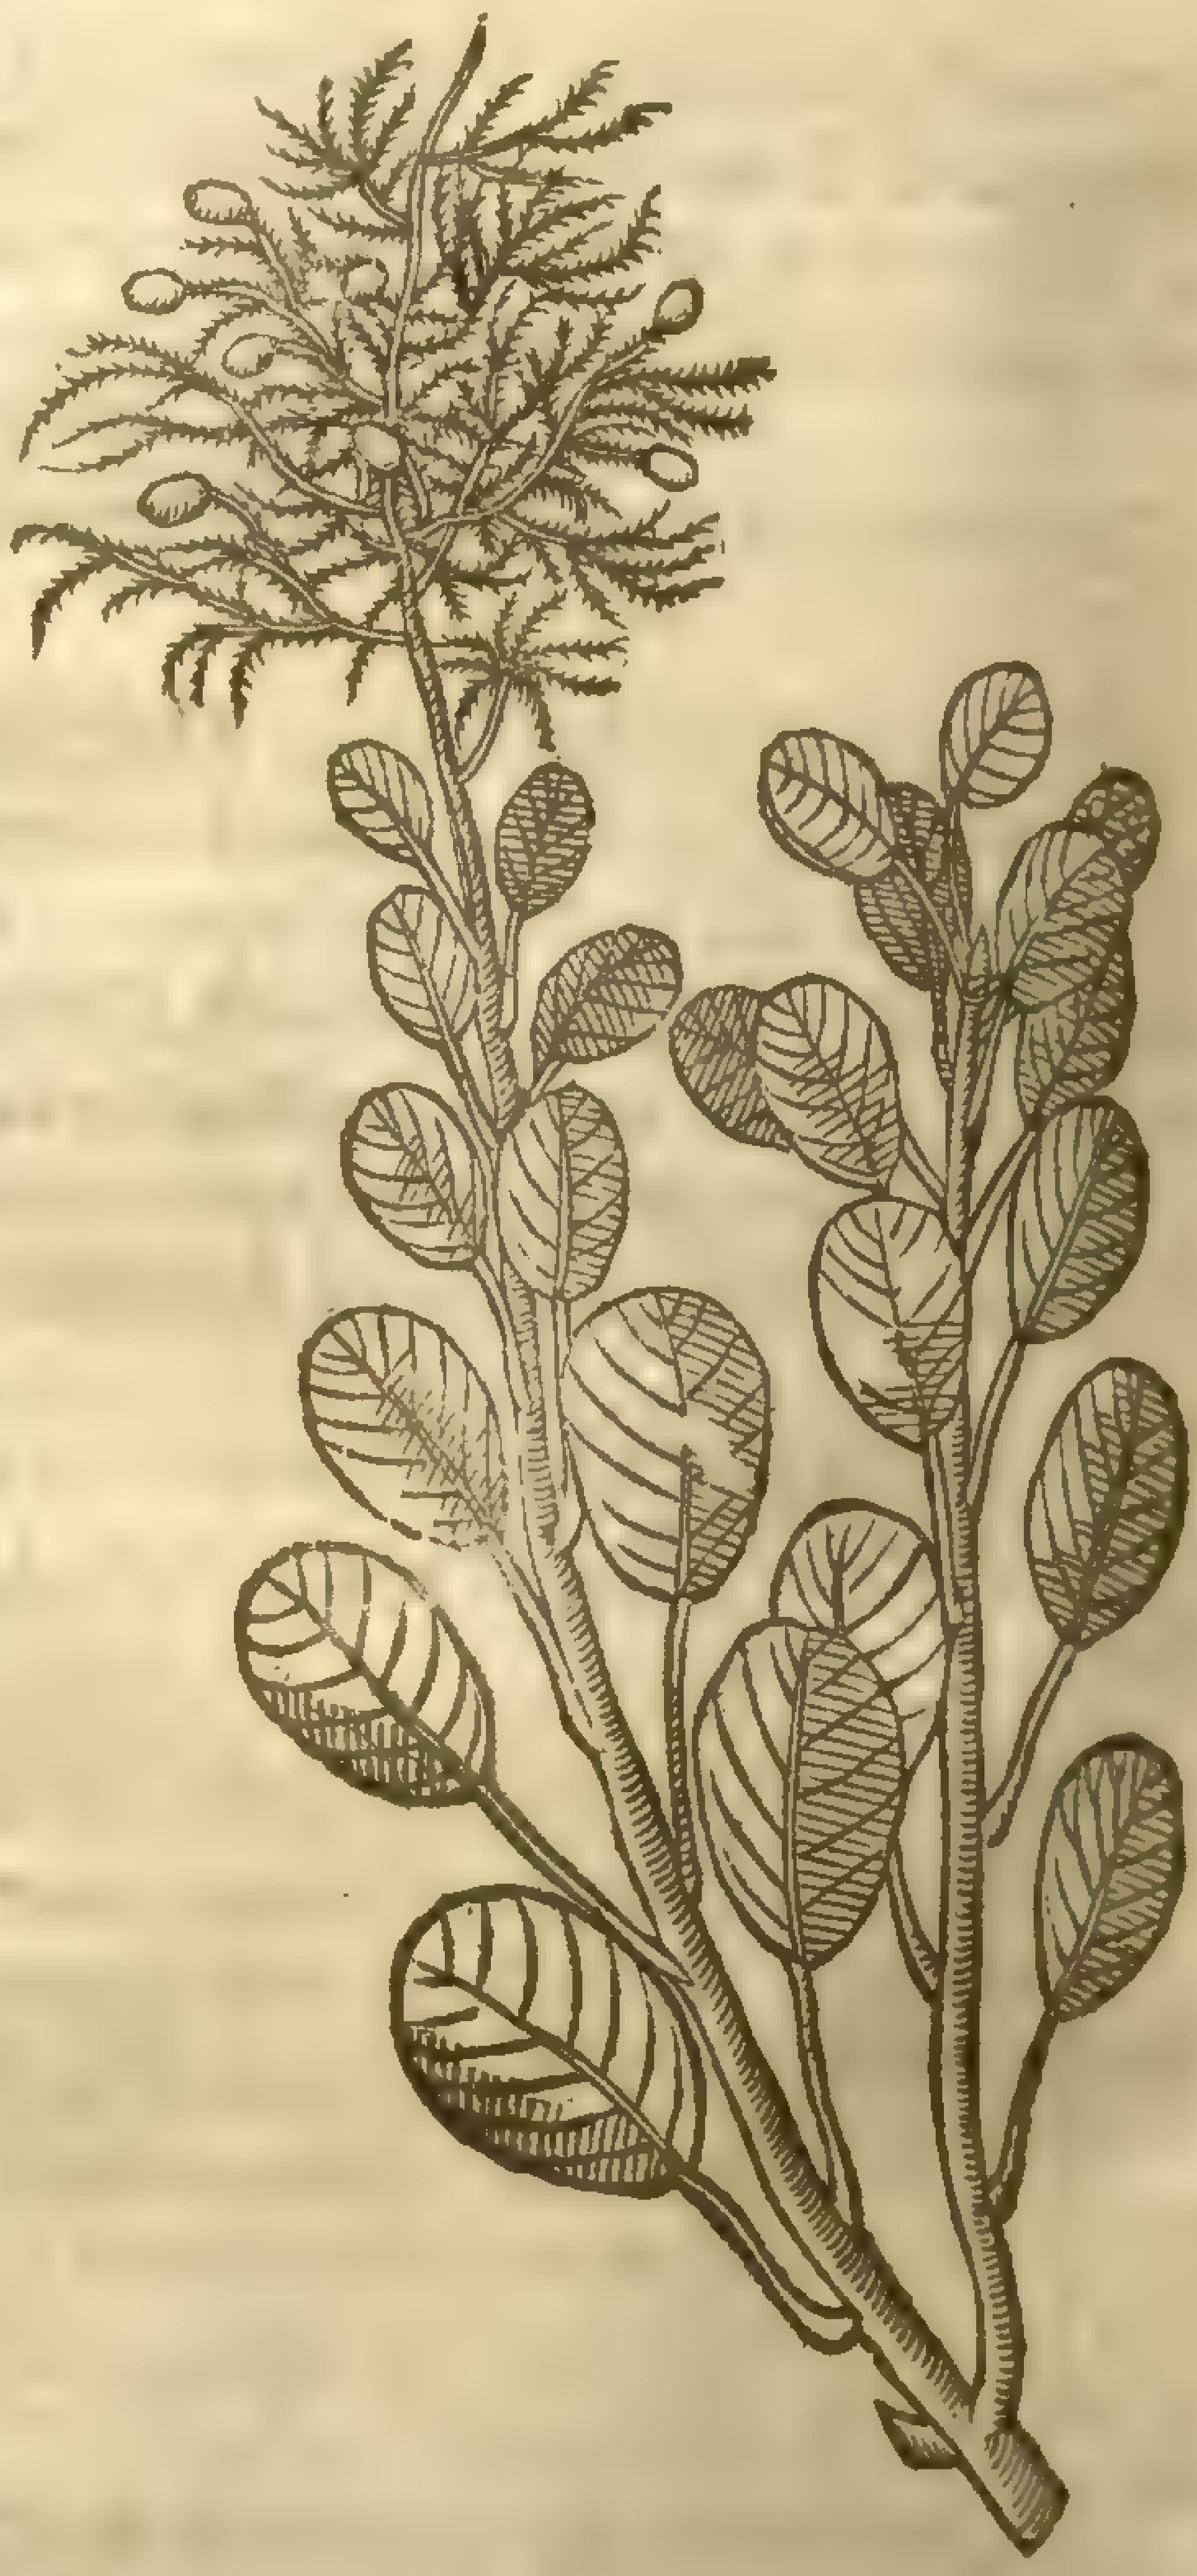
† This excellent and moſt beautifull plant *Coggygria* (beeing reputed of the Italians and the Venetians for a kind of *Rhus* or Sumach, becauſe it is vſed for the ſame purpoſes whereto *Rhus* ſerueth,

neth and therein doth farre excell it) is an hedge plant growing not aboue the height of foure or fiue cubits, hauing tough and pliant ſtalkes and twiggy branches like to Oziers, of a brown colour. The leaues be round, thick, and ſtiffe like the leaues of *Capparis*, in colour & ſauor of *Piſtacia* leaues, or *Terebinthus*; among which ariſes a ſmall vpright ſprig, bearing many ſmal cluſtering little greeniſh yellow floures, vpon long and red ſtalks. After which follow ſmall reddiſh Lentill-like ſeeds that carry at the tops a moſt fine woolly or flocky tuft, criſped and curled like a curious wrought ſilken fleece, which curleth and foldeth it ſelfe abroad like a large buſh of haires.

1 *Coggygria Theophraſti.* *vel* *Cotinus Coriarius Plinij.*
Venice Sumach. or Red Sumach.



Rhus Cotinus [illegible]
both [illegible]



¶ *The Place.*

Coggygria groweth in Orelans neere Auignion, and in diuers places of Italy, vpon the Alpes of Styria, and many other places. It groweth on moſt of the hils of France, in the high woods of the vpper Pannonia or Auſtria, and alſo of Hungaria and Bohemia.

¶ *The Time.*

They floure and flouriſh for the moſt part in Iuly.

¶ *The Names.*

The firſt is called *Coggygria*, and *Coccygria*: in Engliſh, Venice Sumach, or Silken Sumach; of *Pliny*, *Cotinus*, in his 16. booke, 18. chapter. There is, ſaith he, on mount Apennine a ſhrub which is called *Cotinus ad lineamenta modo Conchylij colore inſignis*, and yet *Cotinus* is *Oleaſter*, or *Olea ſylueſtris*, the wild Oliue tree, from which this ſhrub doth much differ; and therfore it may rightly be called *Cotinus Coriaria*. Diuers would haue named it *Scotinus*, which name is not found in any of the old writers. The Pannonians do cal it *Farblauff*: it is alſo thought that this ſhrub is *Coggygria Plinij*, of which in his 13 book, 22. chapter he writeth in theſe words: *Coggygria* is alſo like to *Vnedo* in leafe, not ſo great; it hath a propertie to looſe the fruit with down, which thing happeneth vnto no other tree.

¶ *The Temperature.*

The leaues and ſlender branches together with the ſeeds are very much binding, cold and dry as the other kindes of Sumach are.

¶ *The Vertues.*

A The leaues of *Coggygria*, or Silken Sumach, are ſold in the markets of Spaine and Italy for great ſummes of mony, vnto thoſe that dreſſe Spaniſh skins, for which purpoſe they are very excellent.

The root of *Cotinus*, as *Anguillara* noteth, ſerueth to die with, giuing to wooll and cloth a reddiſh colour: which *Pliny* knew, ſhewing that this ſhrub (that is to ſay the root) is *ad lineamenta modo conchylij colore inſignis.* B

Chap. 113. *Of the Alder Tree.*

¶ *The Deſcription.*

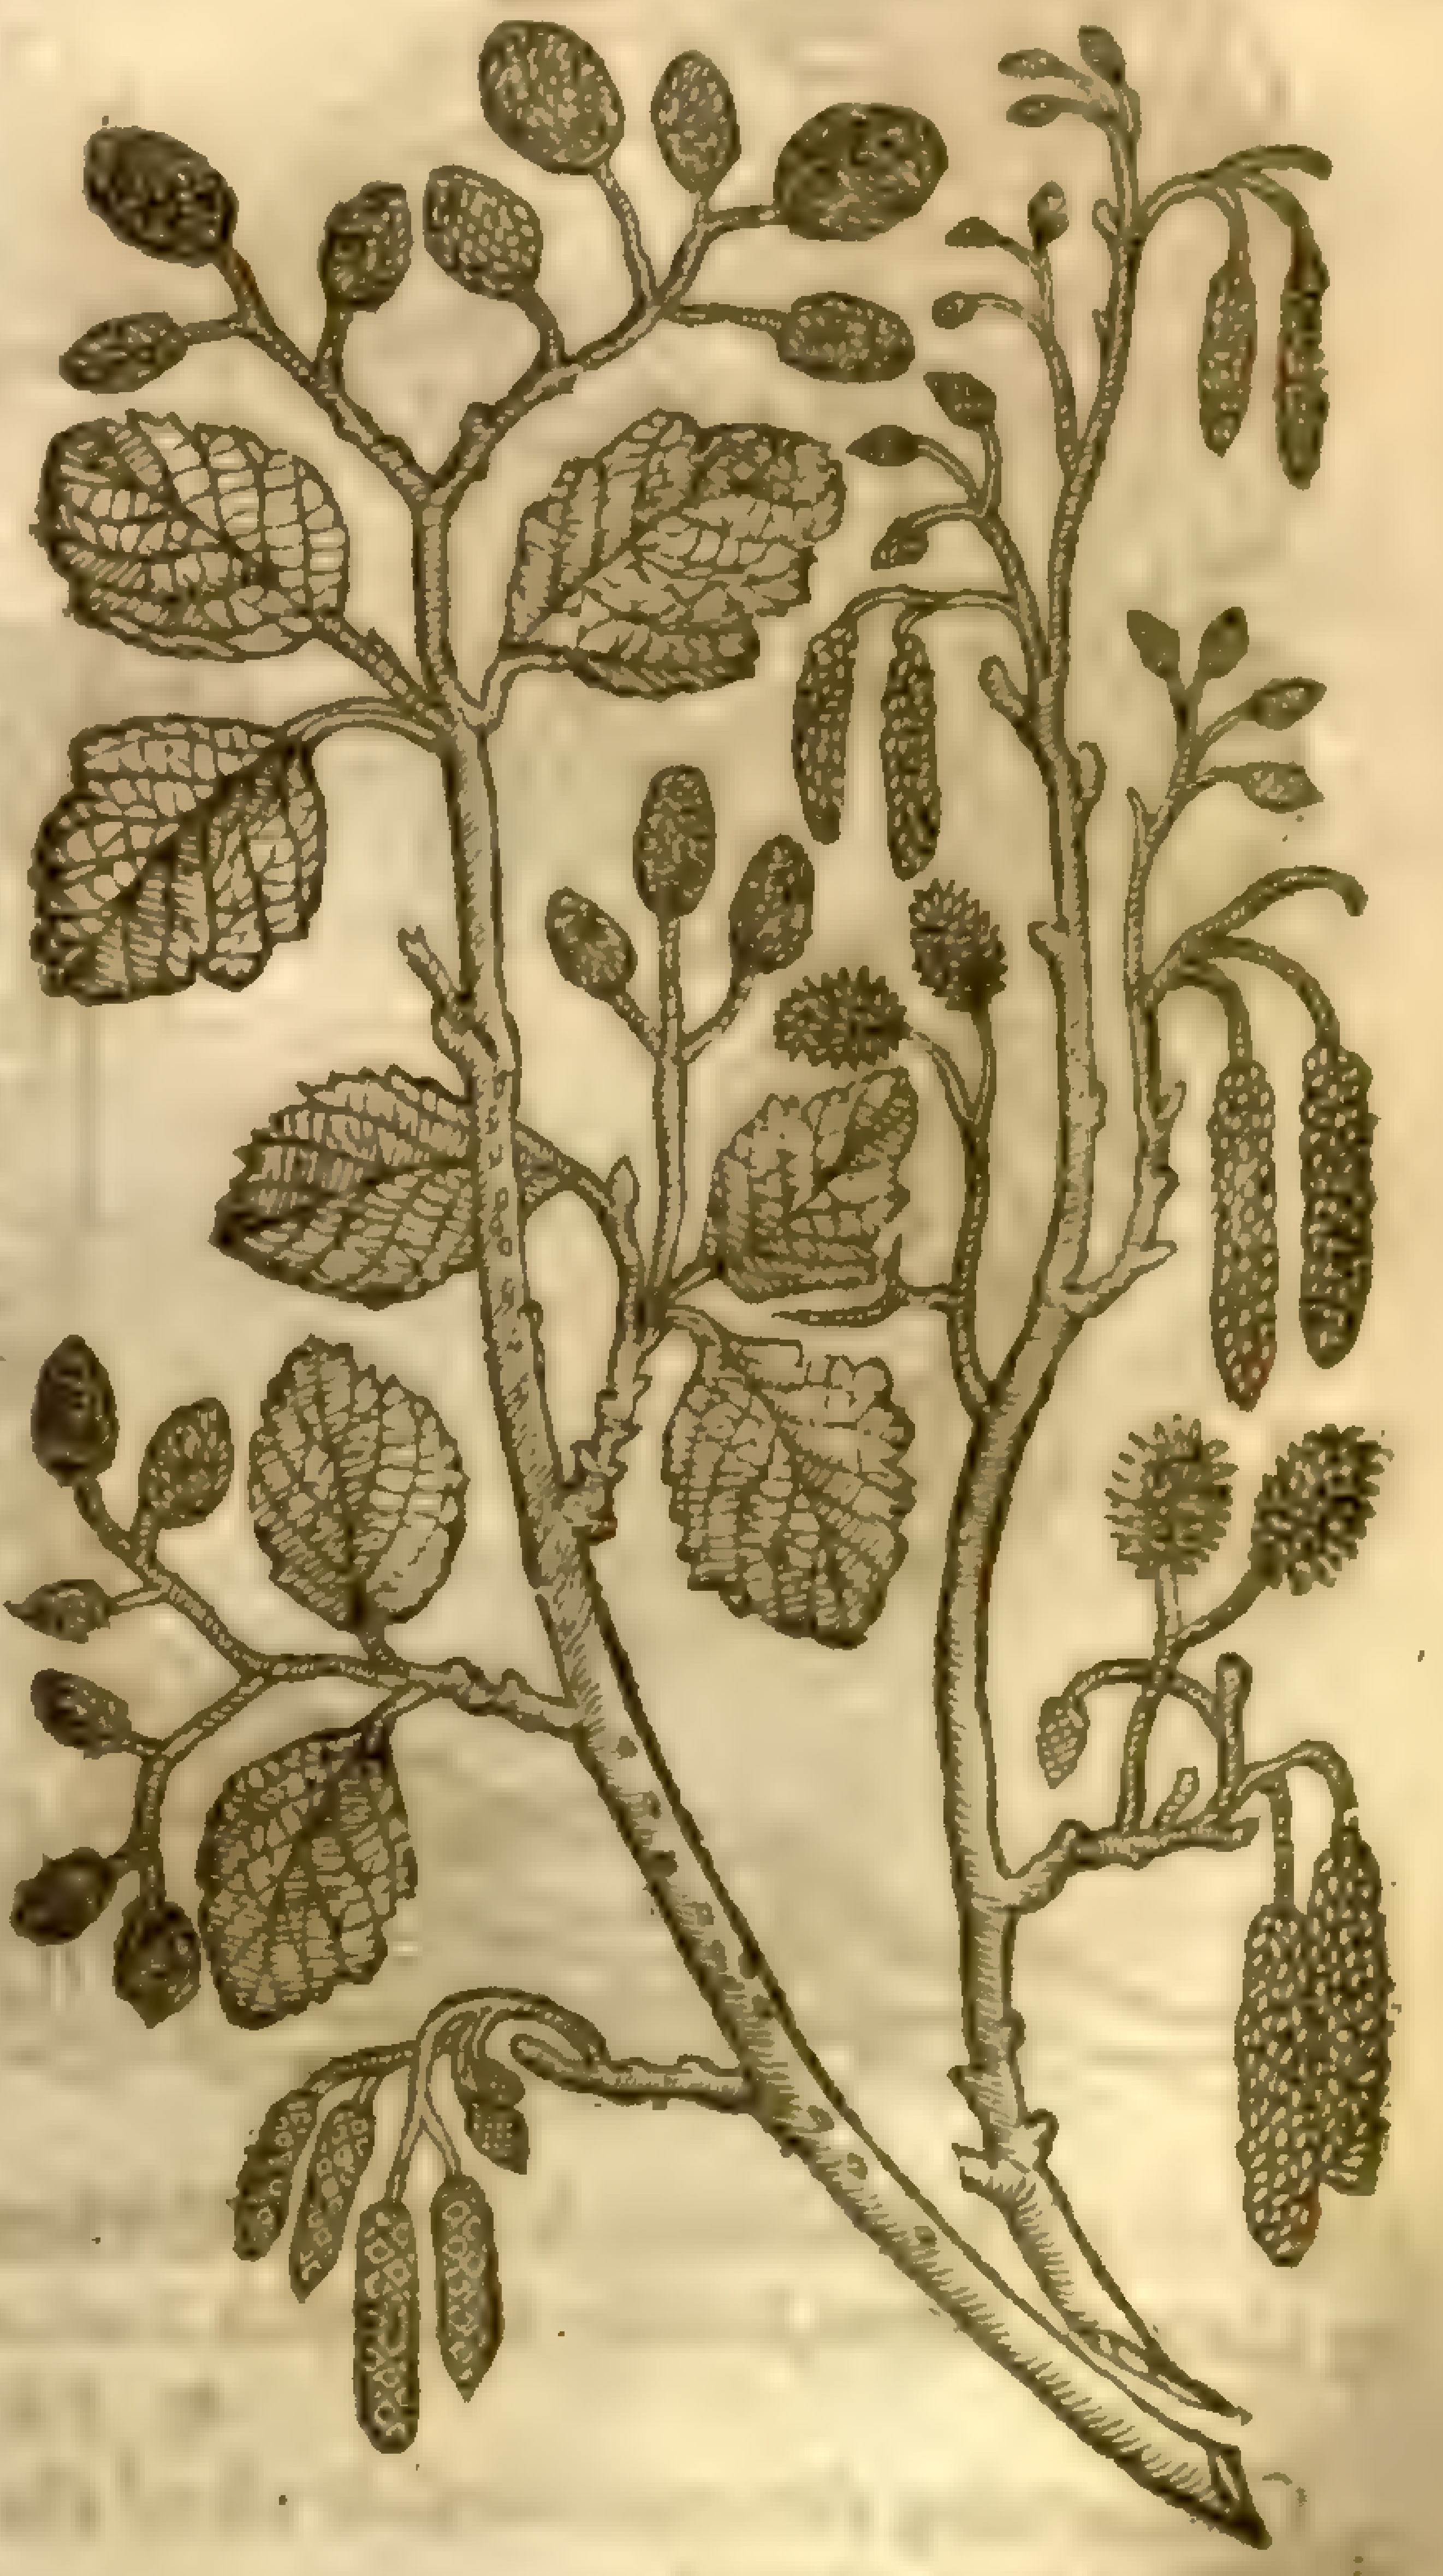
1 The Alder or Aller tree is a great high tree hauing many brittle branches, the bark is of a brown colour, the wood or timber is not hard, and yet it will laſt and endure very long vnder the water, yea longer than any other timber whatſoeuer; wherefore in fenny and ſoft mariſh grounds they vſe to make piles and poſts thereof, for the ſtrengthening of the walls and ſuch like. This timber doth alſo ſerue very well to make troughs to conuey water in ſtead of pipes of Lead. The leaues of this tree are in ſhape ſomewhat like the Haſell, but they are blacker and more wrinkled, very clammy to handle, as though they were ſprinkled with hony. The bloſſoms or floures are like the aglets of the Birch tree, which beeing vaded, there followeth a ſcaly fruit cloſely growing together, as big as a Pigeons egg; which toward Autumne doth open, and the ſeed falleth out and is loſt.

1 *Alnus.*
The Alder tree.

Alnus glutinosa [illegible] 1921

‡ 2 *Alnus hirſuta.*
Rough leafed Alder.

[illegible] 2.191



‡ 2 *Cluſius* and *Bauhine* haue obſerued another kinde of this, which differs from the ordinary, in that it hath larger and more cut leaues, and theſe not ſhining aboue, but hoary vnderneath. The catkins as alſo the rough heads are not ſo large as thoſe of the former; the bark alſo is whiter. *Cluſius* makes it his *Alnus altera*: and *Bauhine*, his *Alnus hirſutus*, or *folio incano*. ‡

¶ *The Place.*

The Aller or Alder tree delighteth to grow in low and moiſt wateriſh places.

¶ *The Time.*

The Aller bringeth forth new leaues in Aprill; the fruit whereof is ripe in September.

¶ *The Names.*

The tree is called in Greeke κλήθρα: in Latine *Alnus*: *Petrus Creſcentius* nameth it *Amedanus*: it is called in high-Dutch, **Erlenbaum** and **Ellernbaum**: in low-Dutch, **Elſen**, and **Elſen boom**: in Italian, *Alno*: in French, *Aulne*: in Engliſh, Alder, and Aller.

¶ *The Temperature.*

The leaues and barke of the Alder are cold, dry, and aſtringent.

¶ *The Vertues.*

A The leaues of Alder are much vſed againſt hot ſwellings, vlcers, and all inward inflammations, eſpecially of the almonds and kernels of the throat.

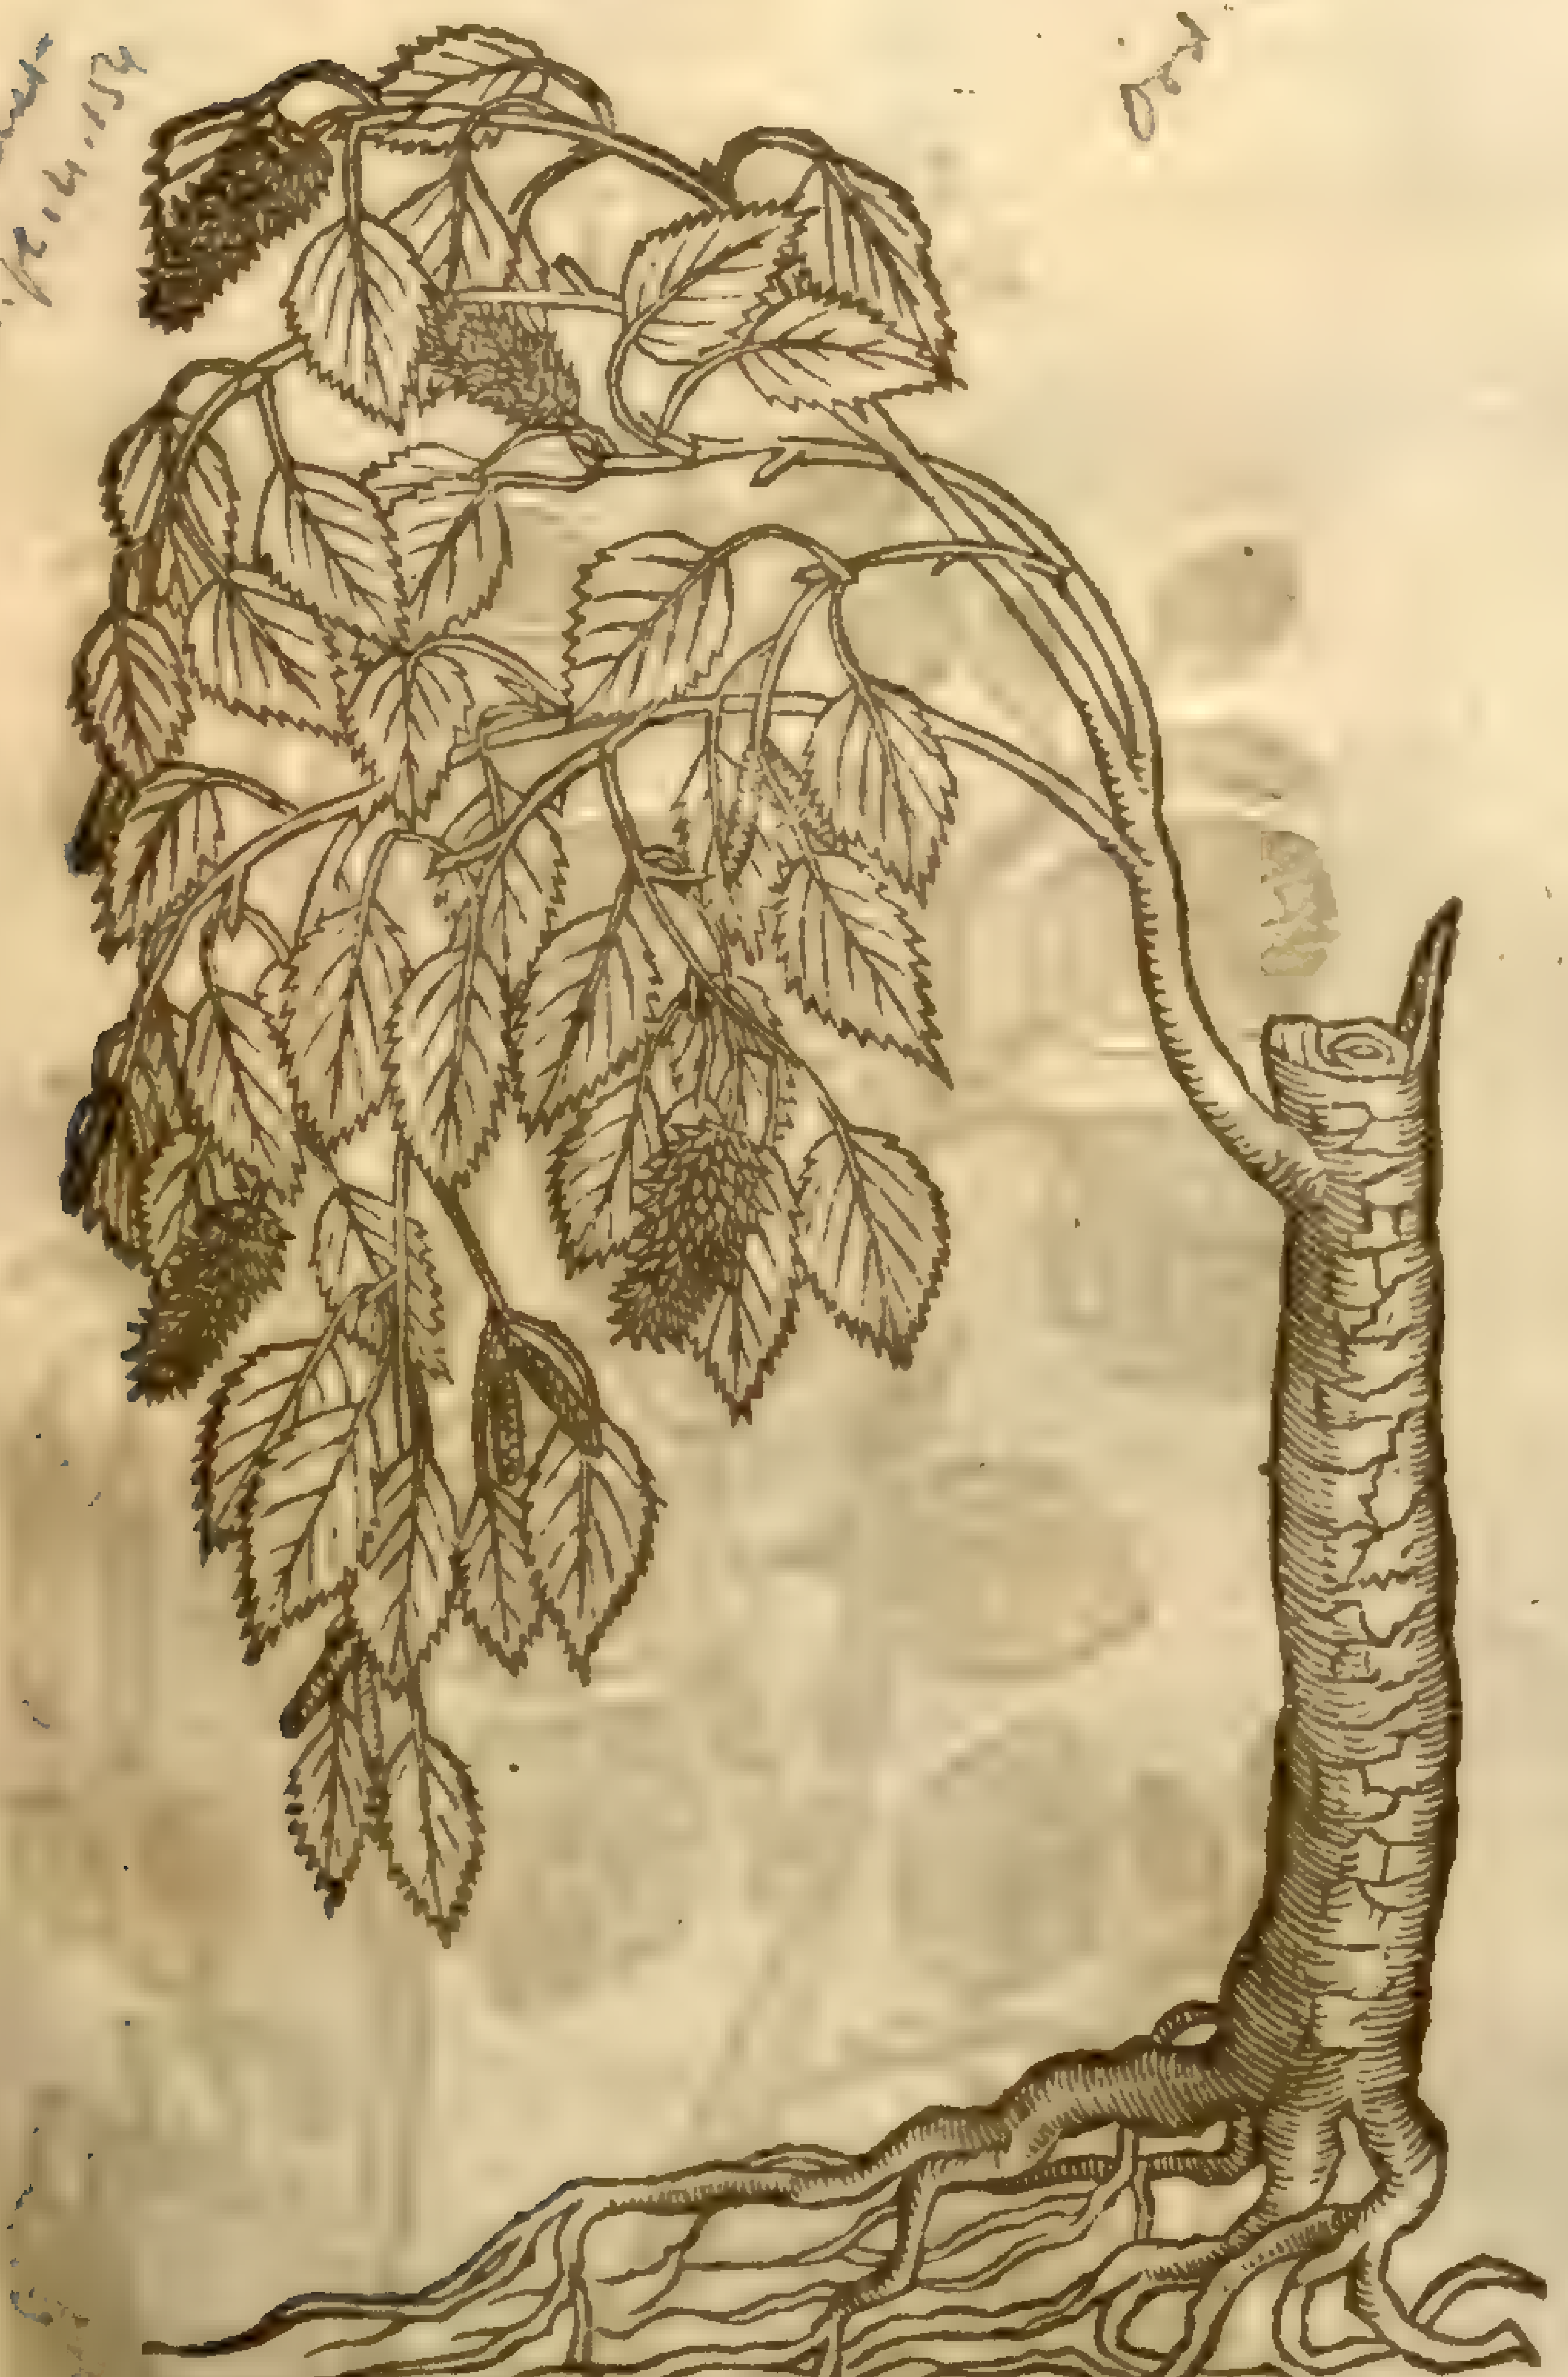
B The bark is much vſed of poore country Diers for the dying of courſe cloath, caps, hoſe, & ſuch like into a blacke colour, whereto it ſerueth very well.

Chap. 114. *Of the Birch Tree.*

Betula.
The Birch tree.

[illegible] Sm. fl. iv. 154

Od. 839



¶ *The Deſcription.*

The common Birch tree waxeth likewiſe a great tree, hauing many boughs beſet with many ſmall rods or twigs, very limber and pliant; the barke of the yong twigs and branches is plain, ſmooth, and full of ſap, in colour like the cheſtnut, but the rind of the body or trunk is hard without, white, rough, and vneuen, full of chinks or creviſes: vnder which is found another fine barke, plaine, ſmooth, and as thin as paper, which heretofore was vſed in ſtead of paper to write on, before the making of paper was knowne: in Ruſſia and theſe cold countries it ſerueth in ſtead of tiles and ſlate to couer their houſes withall. This tree beareth for his flours certaine aglets like the Haſel tree, but ſmaller, wherein the ſeed is contained.

¶ *The Place.*

This common Birch tree grows in woods, fenny grounds, and mountains, in moſt places of England.

¶ *The Time.*

The catkins or aglets do firſt appear, and then the leaues, in Aprill or a little later.

¶ *The Names.*

Theophraſtus calleth this tree in Greeke, σημύδα: diuers, σημυς: others σιμος: it is named in Latine, *Betula*: diuers alſo write it with a double *ll Betulla*, as ſome of *Plinies* Copies haue it: it is called in high-Dutch, **Birkenbaum**: in low-Dutch, **Berckenboom**: in Italian, *Betula*: by them of Trent, *Bedallo*: in French, *Bouleau*: in Engliſh, Birch tree.

¶ *The Nature and Vertues.*

Concerning the medicinable vſe of the Birch tree, or his parts, there is nothing extant either in the old or new writers.

This tree, ſaith *Pliny, lib.* 16. *cap.* 18. *Mirabili candore & tenuitate terribilis magiſtratuum virgis*: for in times paſt the magiſtrats rods were made thereof; and in our time alſo Schoolmaſters and Parents do terrifie their children with rods made of Birch.

It ſerueth well to the decking vp of houſes and banqueting rooms, for places of pleaſure, and for beautifying of ſtreets in the Croſſe and Gang weeke, and ſuch like.

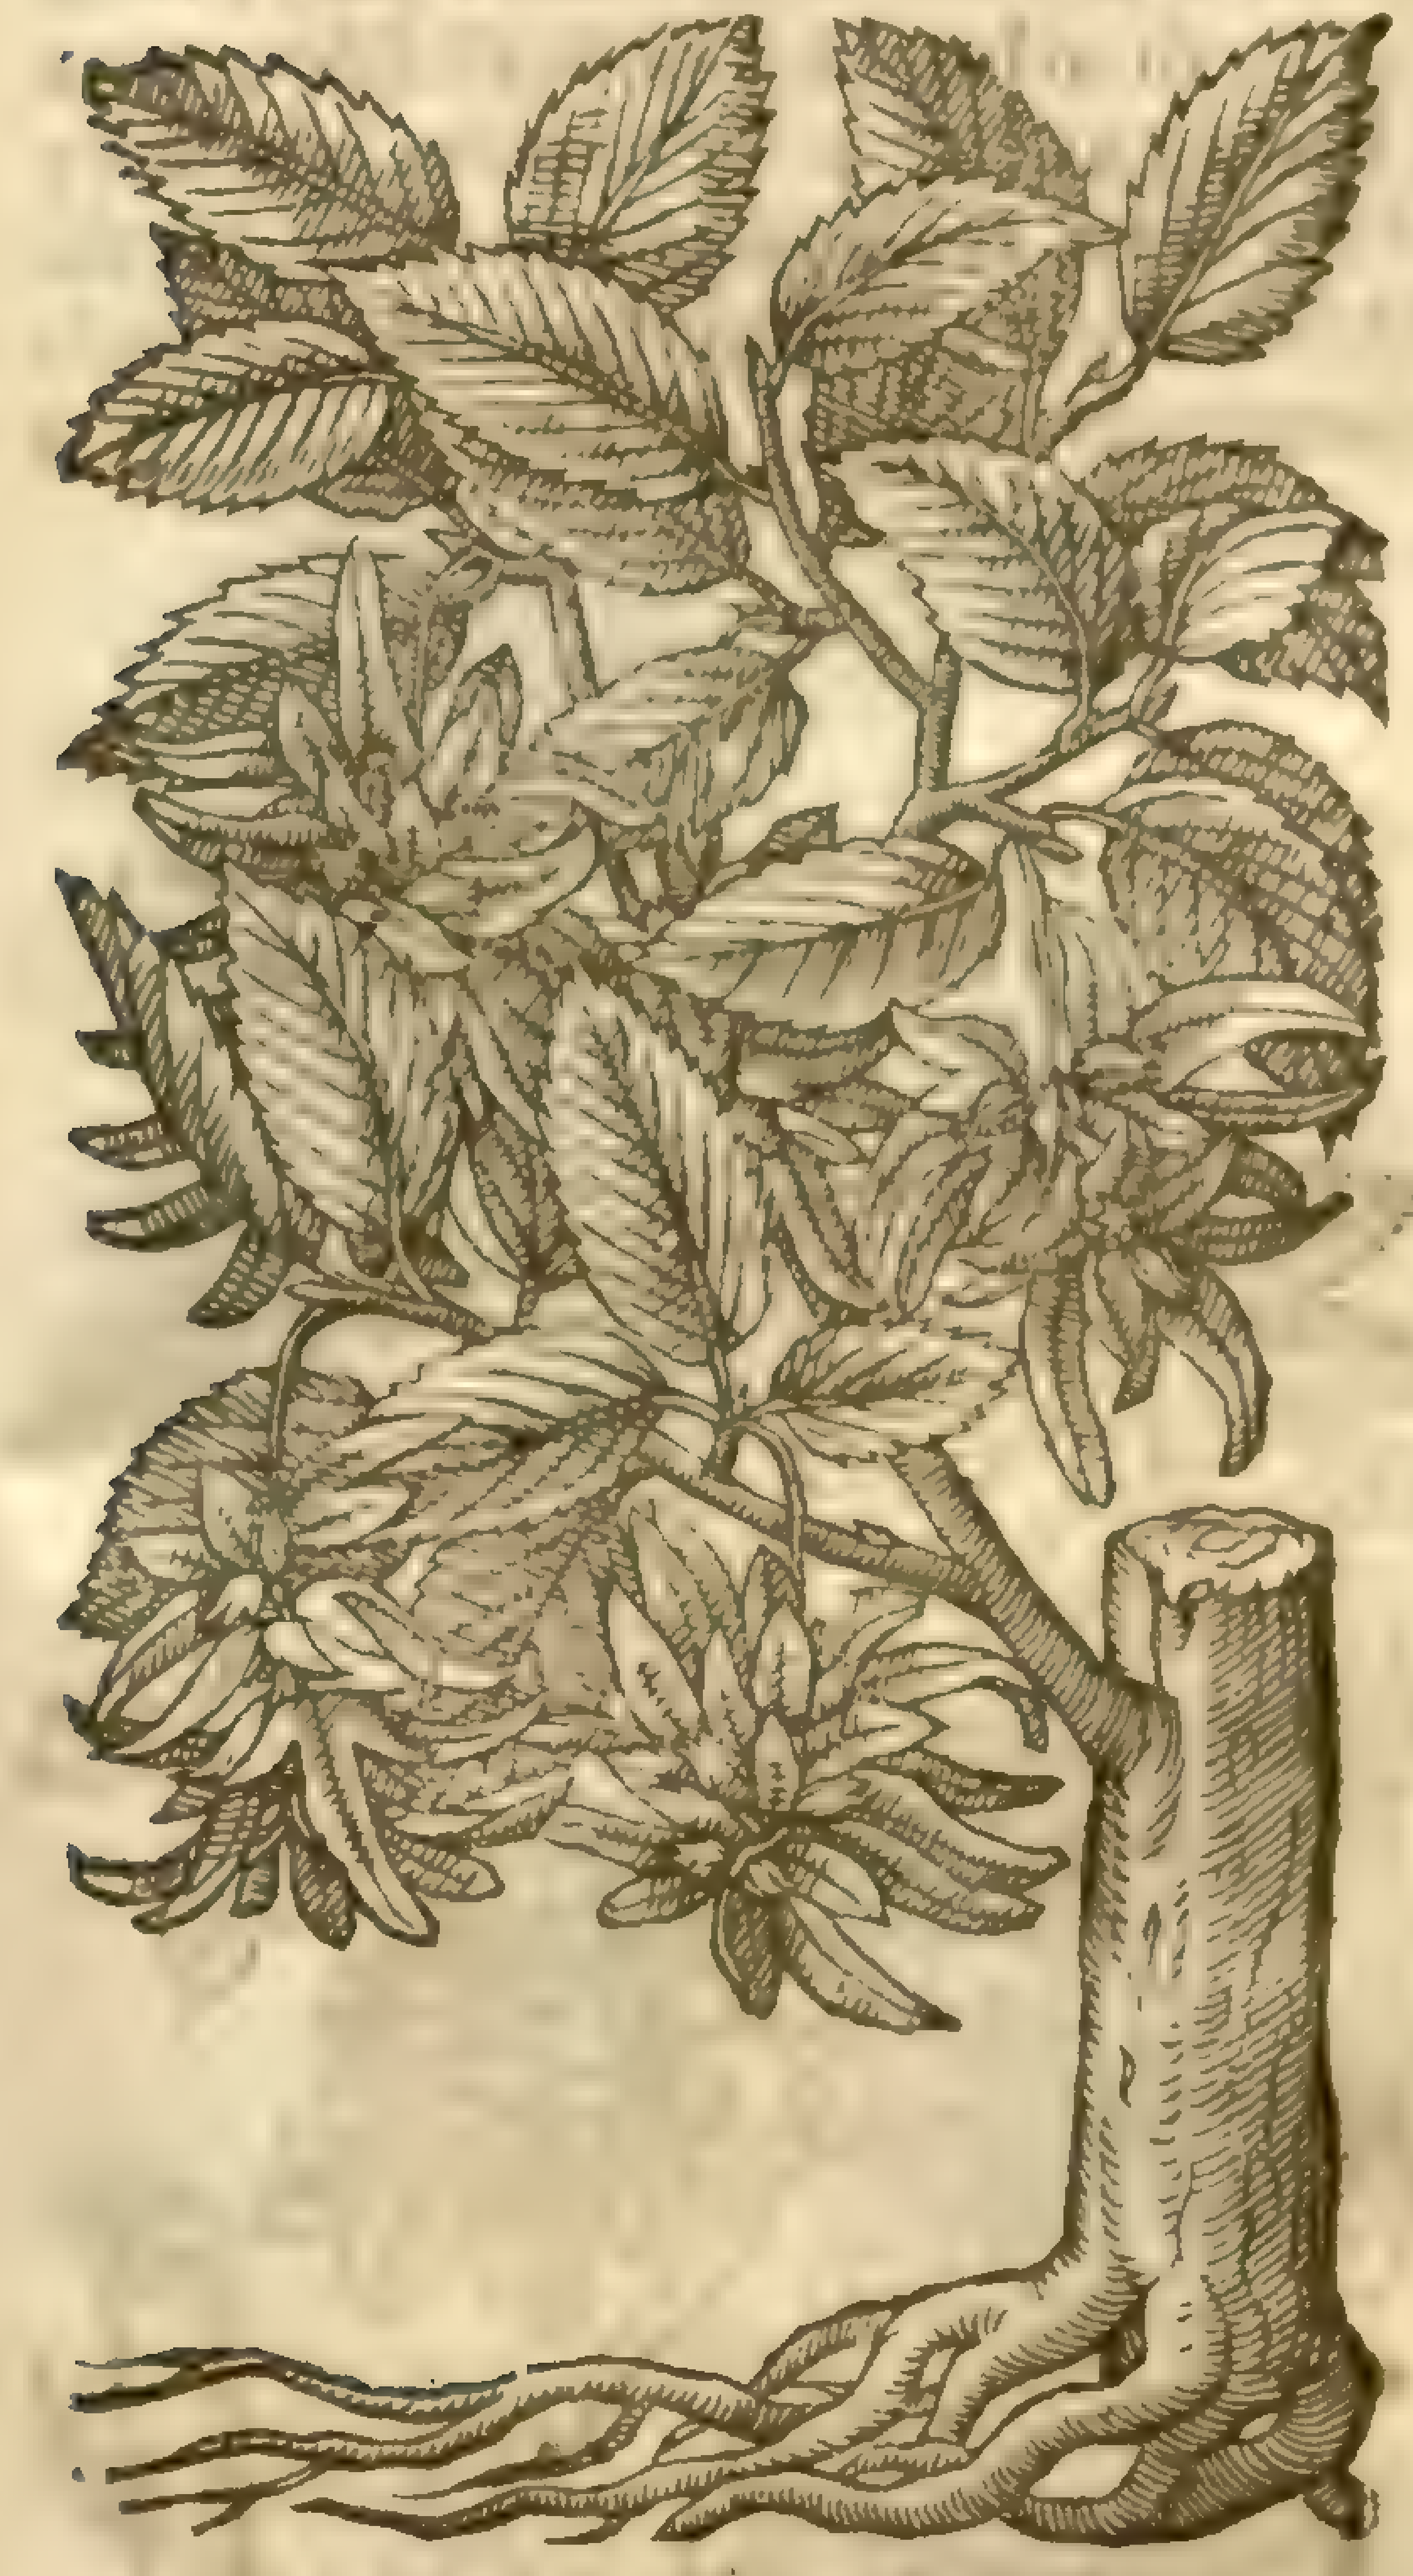
Carpinus [illegible]

CHAP. 115.

Of the Horne-beame or hard Beame Tree.

Betulus, ſiue Carpinus.
The Horn-beam tree.

[illegible]



¶ *The Deſcription.*

BEtulus or the Horn-beame tree growes great; and very like vnto the Elme or Wich-Haſell tree, hauing a great body, the wood or timber whereof is better for arrowes and ſhafts, pulleyes for mils, and ſuch like deuices, than Elm or Wich Haſell; for in time it waxeth ſo hard, that the toughneſſe and hardnes of it may be rather compared to horn than vnto wood, and therfore it was called Horne-beam or Hard-beam: the leaues of it are like the Elme, ſauing that they be tenderer; among thoſe hang certaine triangled things, vpon which be found knaps or little heads of the bigneſſe of Ciches, in which is contained the fruit or ſeed: the root is ſtrong and thicke.

¶ *The Place.*

Betulus or the Horn-beam tree grows plentifully in Northampton ſhire, and in Kent by Graueſend, where it is commonly taken for a kinde of Elme.

¶ *The Time.*

This tree ſprings in Aprill, and the ſeed is ripe in September.

¶ *The Names.*

The Horn-beame tree is called in Greeke, ζυγία: which is as much to ſay as *Conjugalis*, or belonging to the yoke, becauſe it ſerues well to make ζυγία of, in Latine *Iuga*, yokes wherwith oxen are yoked together; which are alſo euen at this time made thereof, as witneſſeth *Benedictus Curtius Symphorianus*, and our ſelues haue ſufficient knowledge thereof in our owne country, and therefore it may be Engliſhed, Yoke Elm. It is called of ſome *Carpinus*, and *Zugia*· it is alſo called *Betulus*, as if it were a kinde of Birch; but my ſelfe better like it ſhould be one of the Elmes: in high-Dutch, **Ÿ Horn**: in French *Carne*: in Italian, *Carpino*: in Engliſh, Horn-beam, Hard-beam, Yoke-Elme, and in ſome places Witch Haſell.

¶ *The Temperature and Vertues.*

This tree is not vſed in medicine, the vertues are not expreſſed of the Antients, neither haue we any certain experiments of our owne knowledge, more than hath been ſaid for the vſe of Husbandry.

CHAP. 116. *Of the Elme tree.*

‡ OVr Author onely deſcribed two Elmes, and thoſe not ſo accuratly but I think I ſhall giue the Reader content, in exchanging them for better, receiued from Mr *Goodyer*, the which are theſe.

Vlmus vulgatiſſima folio lato ſcabro. The common Elme.

1 THis Elme is a very great high tree, the bark of the yong trees, and boughes, of the elder, which are vſually lopped or ſhred, is ſmooth and very tough, and will ſtrip or pill from the wood a great length without breaking: the bark of the body of the old tree as the trees grow in bigneſſe teares or rents, which makes it very rough. The innermoſt wood of the tree is of a reddiſh

yellow or browniſh colour, and curled, and after it is dry, very tough, hard to cleaue or rent, whereof aves of carts are commonly made: the wood next the bark, which is called the ſap, is white. Before the leaues come forth, the floures appeare about the end of March, which grow on the twigges or branches, cloſely compacted or thruſt together, and are like to the chiues growing in the middle of moſt floures; of a red colour: after which come flat ſeed, more long than broad, not much vnlike the garden Arach ſeed in form and bigneſſe, and do for the moſt part fal away before or ſhortly after the leaues ſpring forth, and ſome hang on a great part of ſummer: the leaues hang on the twigs, of a darke green colour, the middle ſiſe whereof are two inches broad and three inches long; ſome are longer and broader, ſome narrower and ſhorter, rough or harſh in handling on both ſides, nickt or indented about the edges, and many times crumpled, hauing a nerve in the middle, and many ſmaller nerues growing from him: the leafe on one ſide of the nerve is alwaies longer than on the other. On theſe leaues oftentimes grow bliſters or ſmall bladders, in which at the ſpring are little wormes about the bigneſſe of bed-fleas. This Elme is common in all parts of England where I haue trauelled.

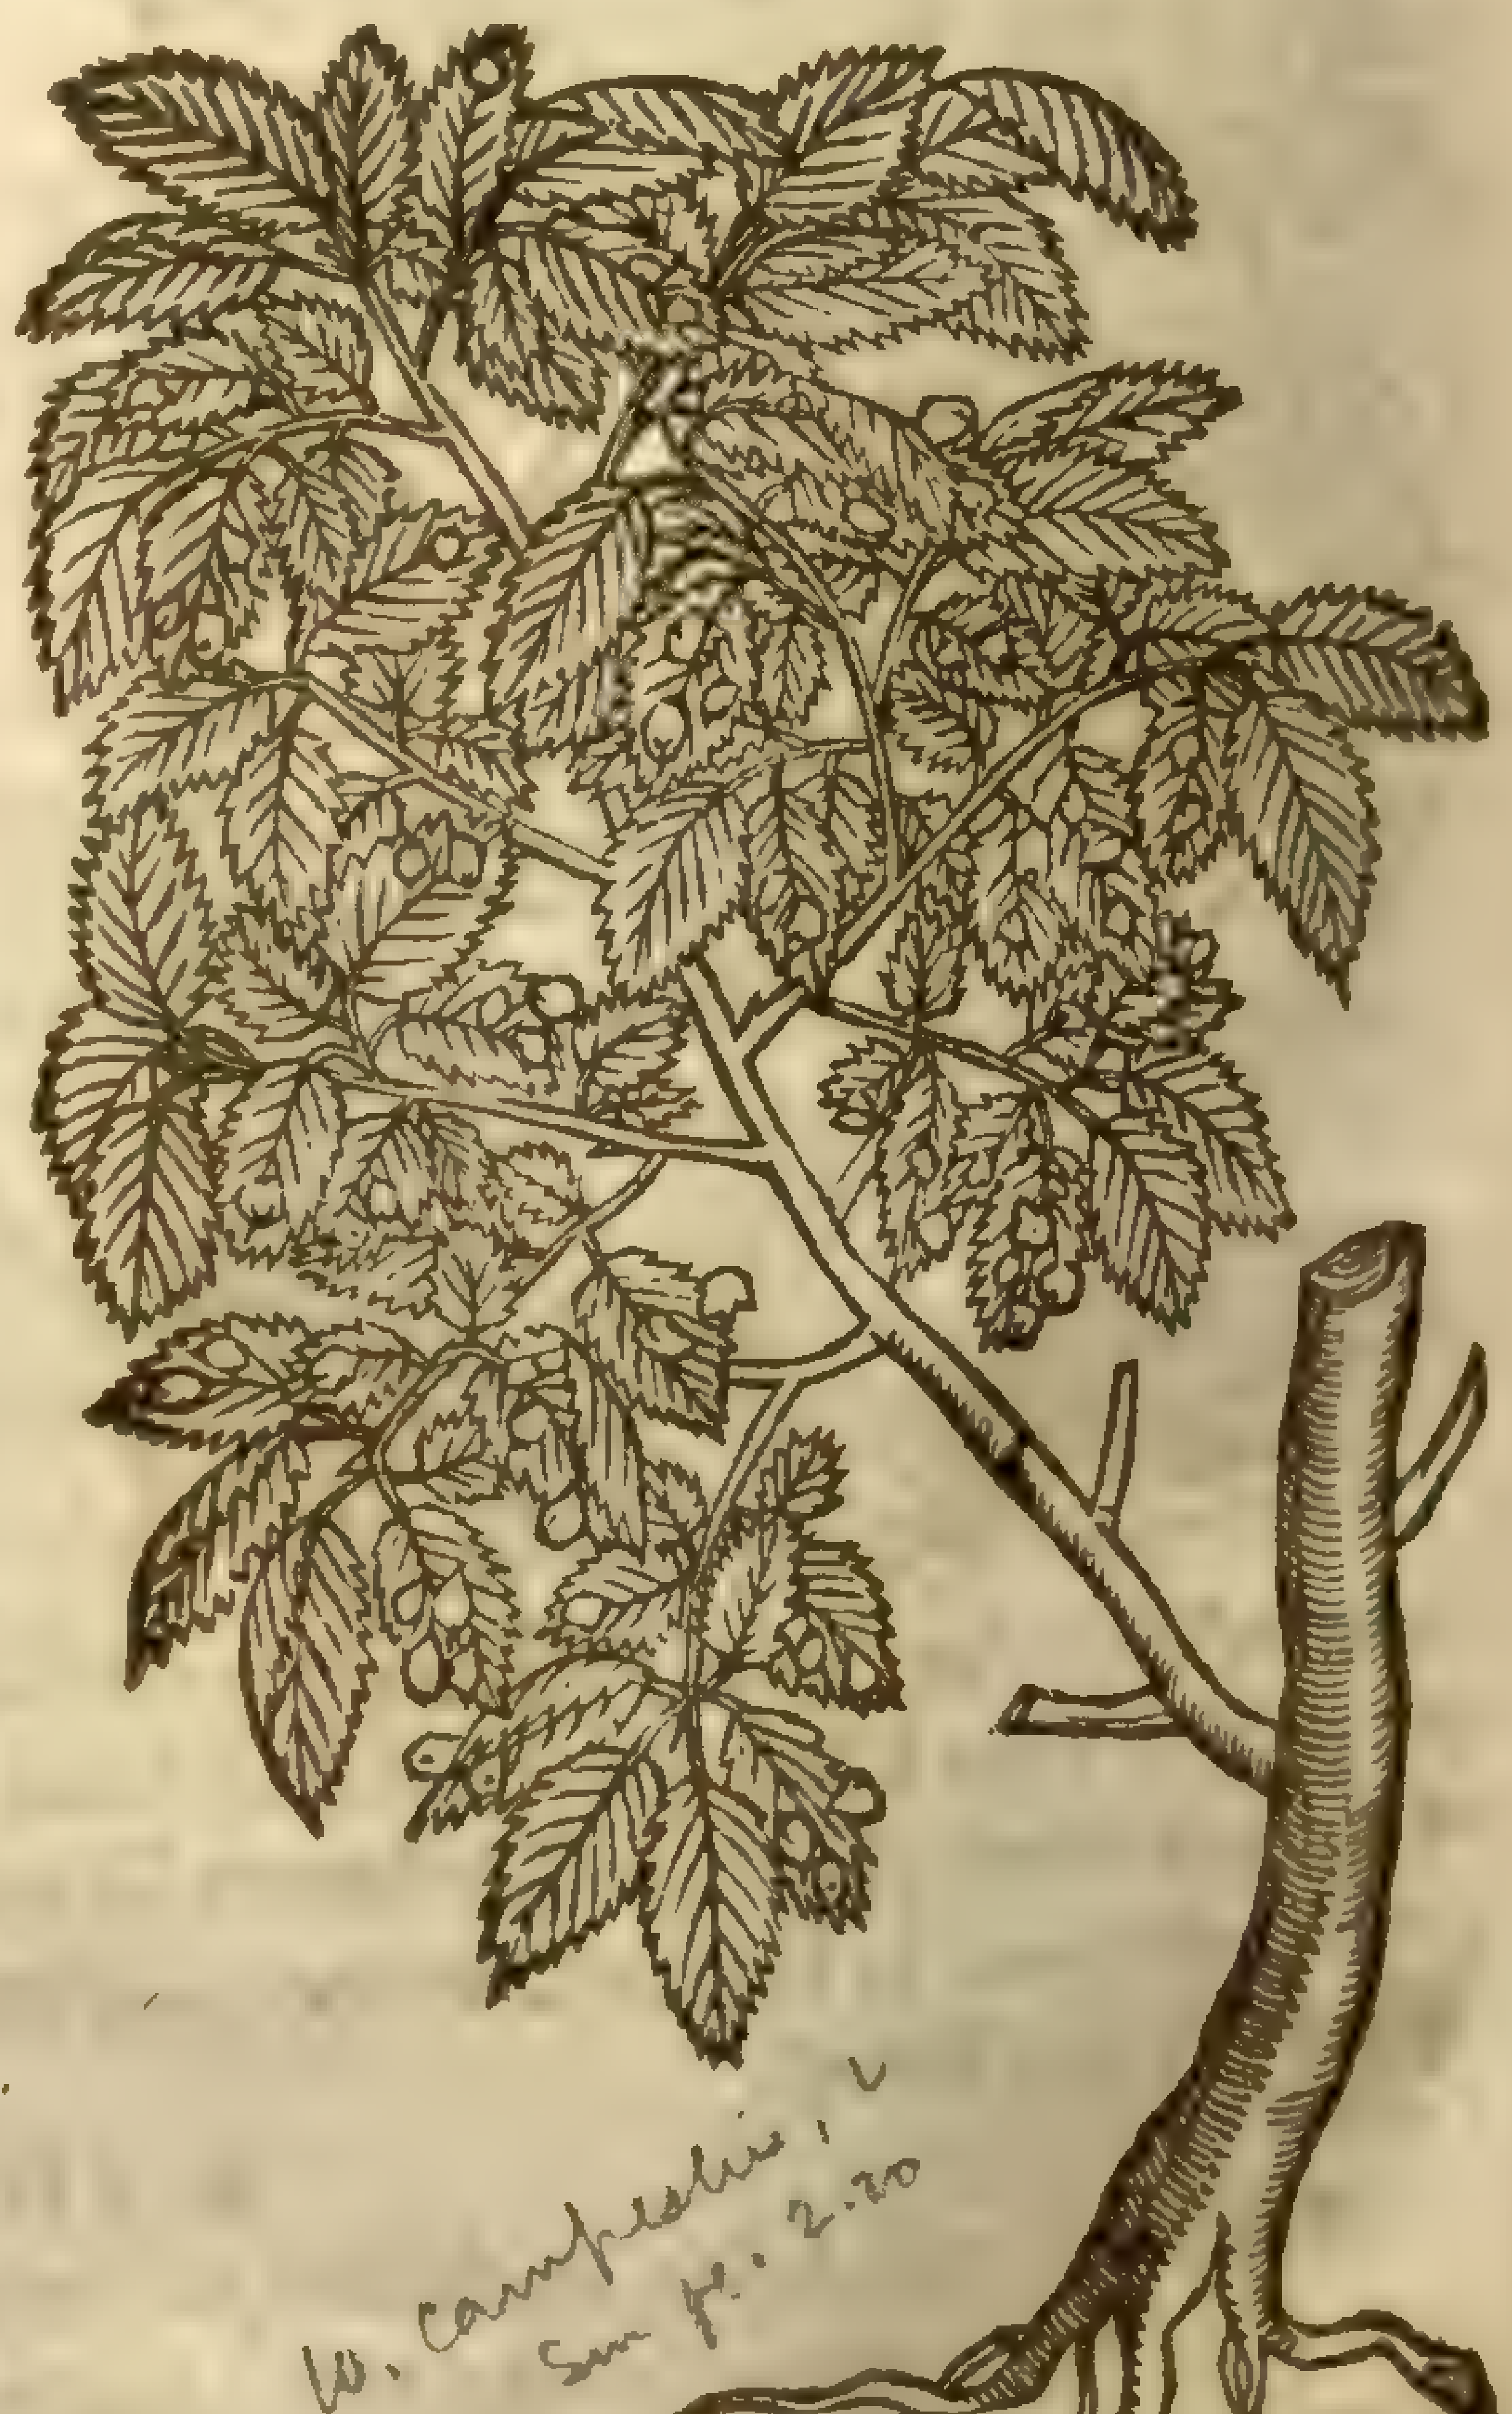
The narrow leaued Elme.



U. campestris, 2
Sm. fl. B. 2. 20

Vlmus minor folio anguſto ſcabro.
The narrow leafed Elme.

2 This tree is like the other, but much leſſer and lower; the leaues are vſually about two inches and a halfe long, and an inch or an inch and a quarter broad, nickt or indented about the edges, and hath one ſide longer than the other, as the firſt hath, and are alſo harſh or rough on both ſides, the barke or Rinde will alſo ſtrip as the firſt doth. Hitherto I haue not obſerued either the floures or ſeed, or bliſters on the leaues, nor haue I had any ſight of the Timber, or heard of any vſe thereof. This Kinde I haue ſeene growing but once, and that in the hedges by the highway, as I rode betweene Chriſt Church and Limmington in the New Forreſt in Hampeſhire,

about the middle of September 1624. from whence I brought ſome ſmall plants of it, not a foot in length, which now, 1633. are riſen vp ten or twelue foot high, & grow with me by the firſt kind, but are eaſily to be diſcerned apart, by any that will looke on both.

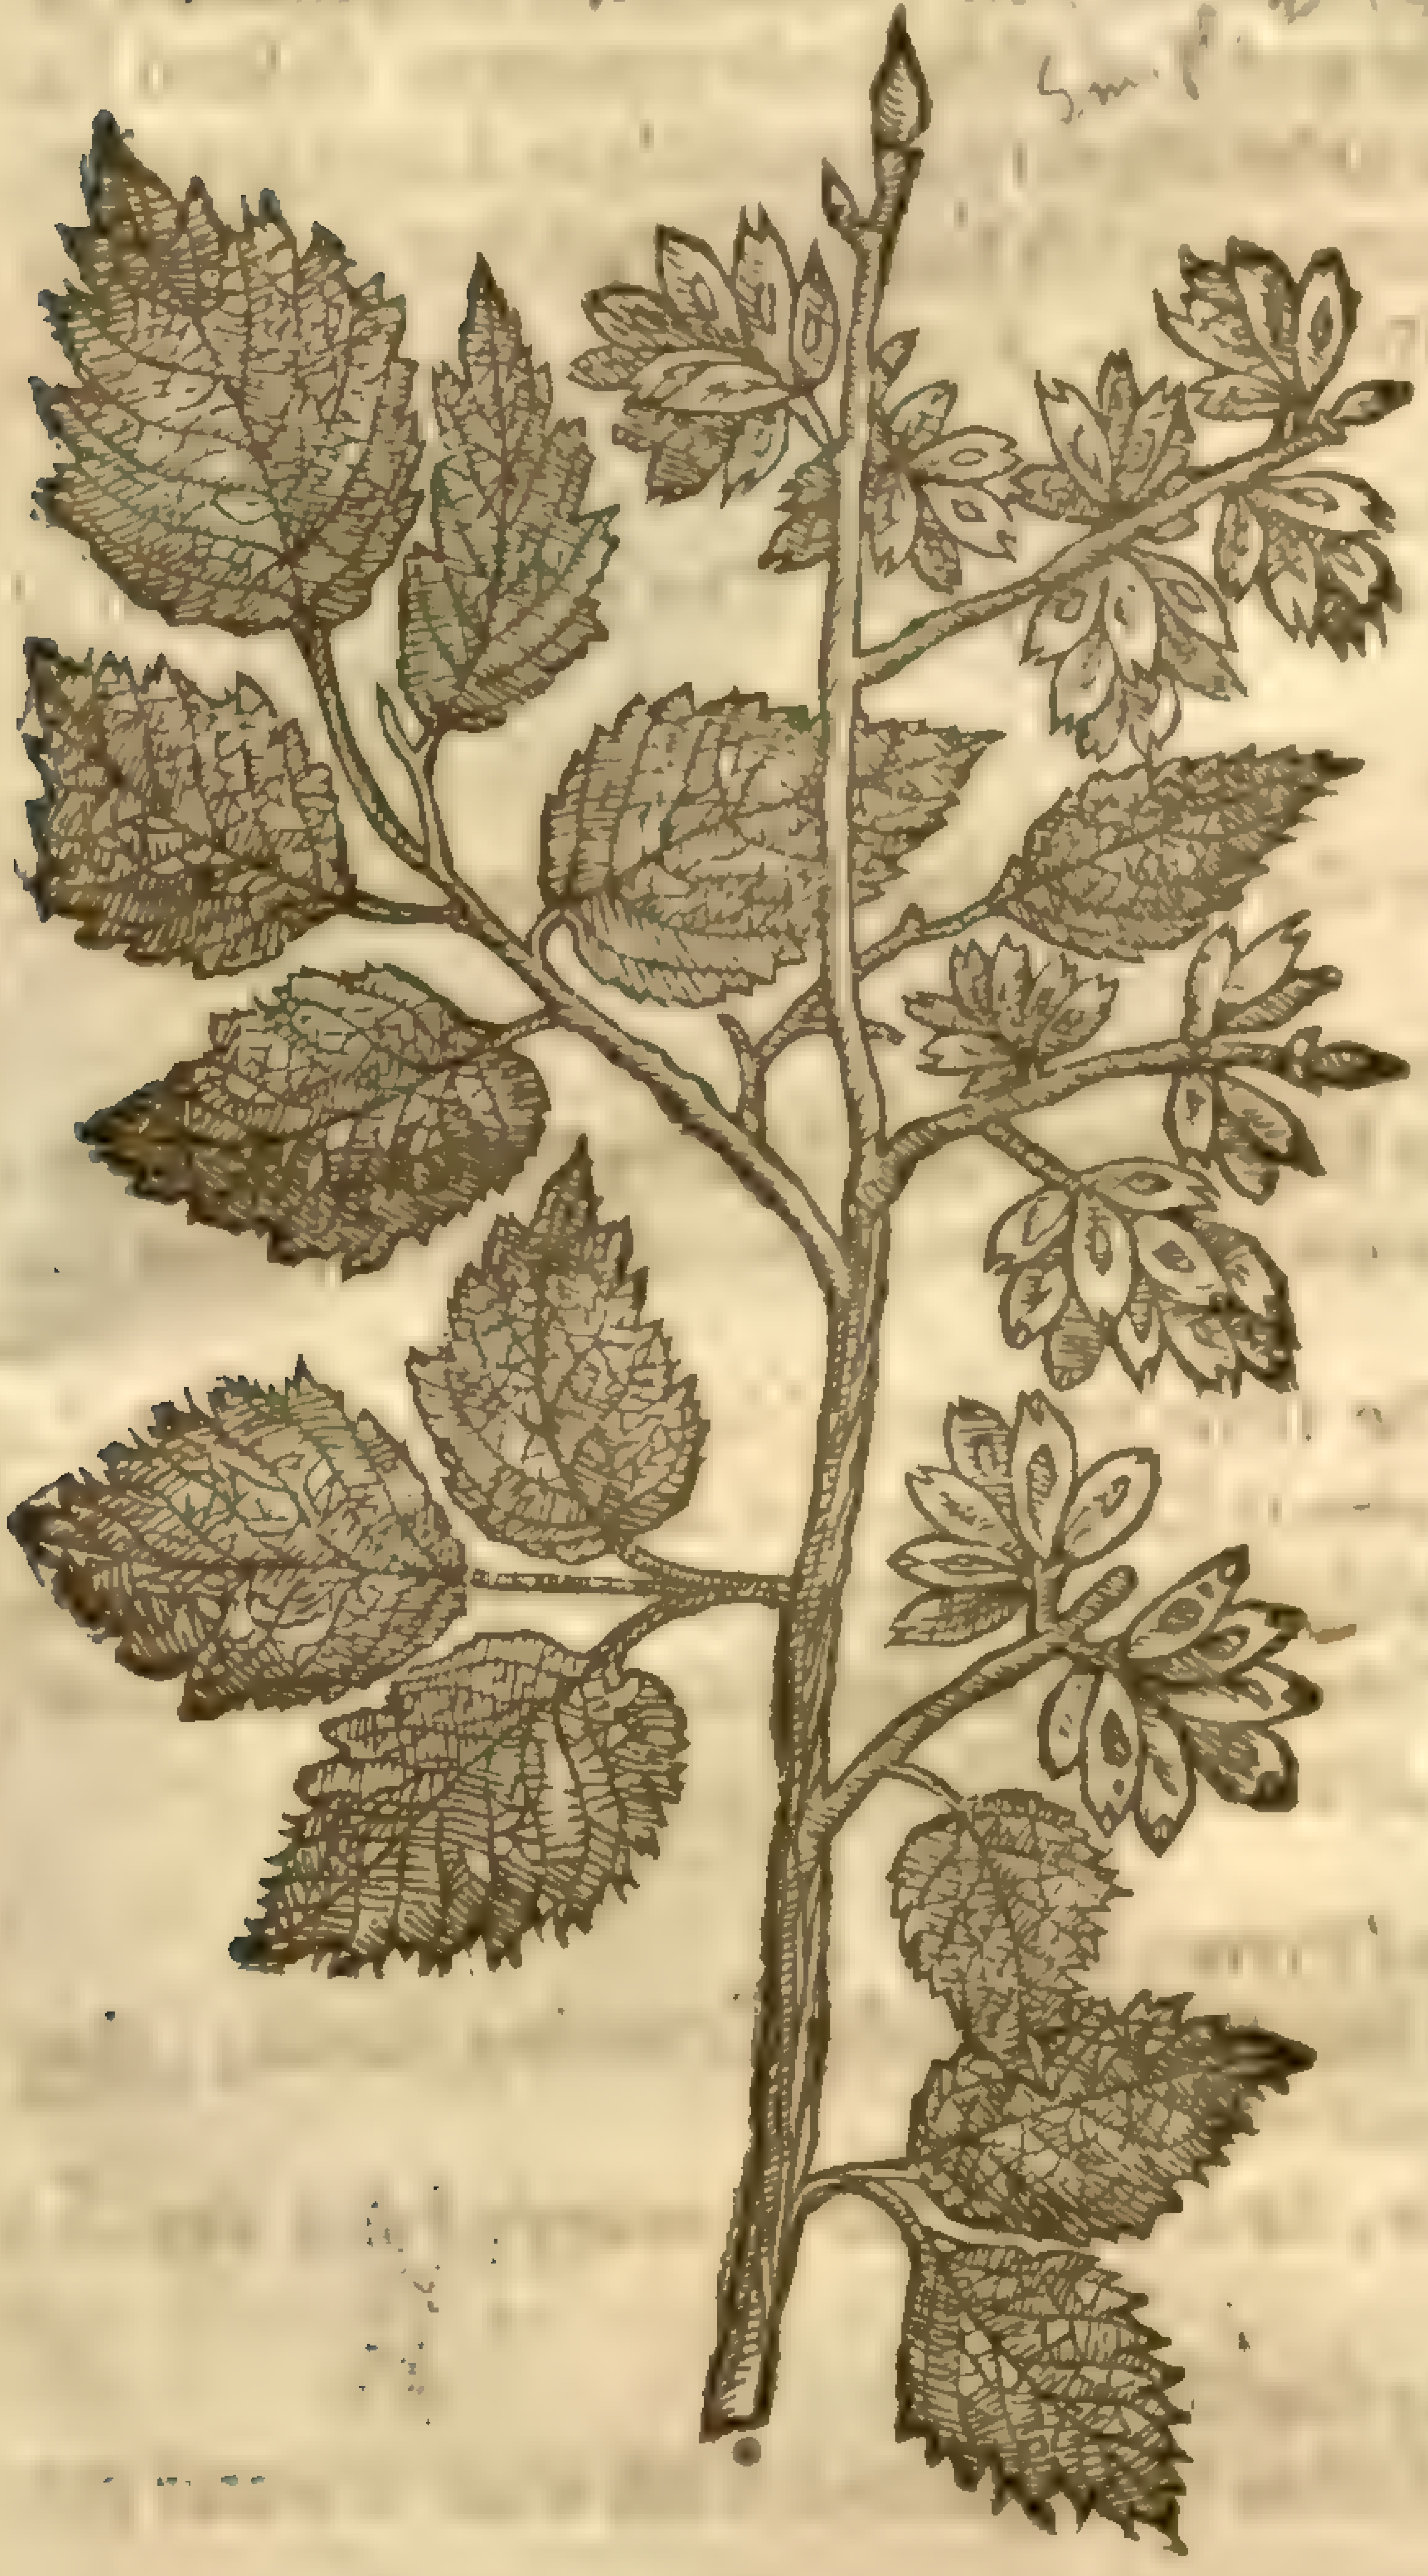
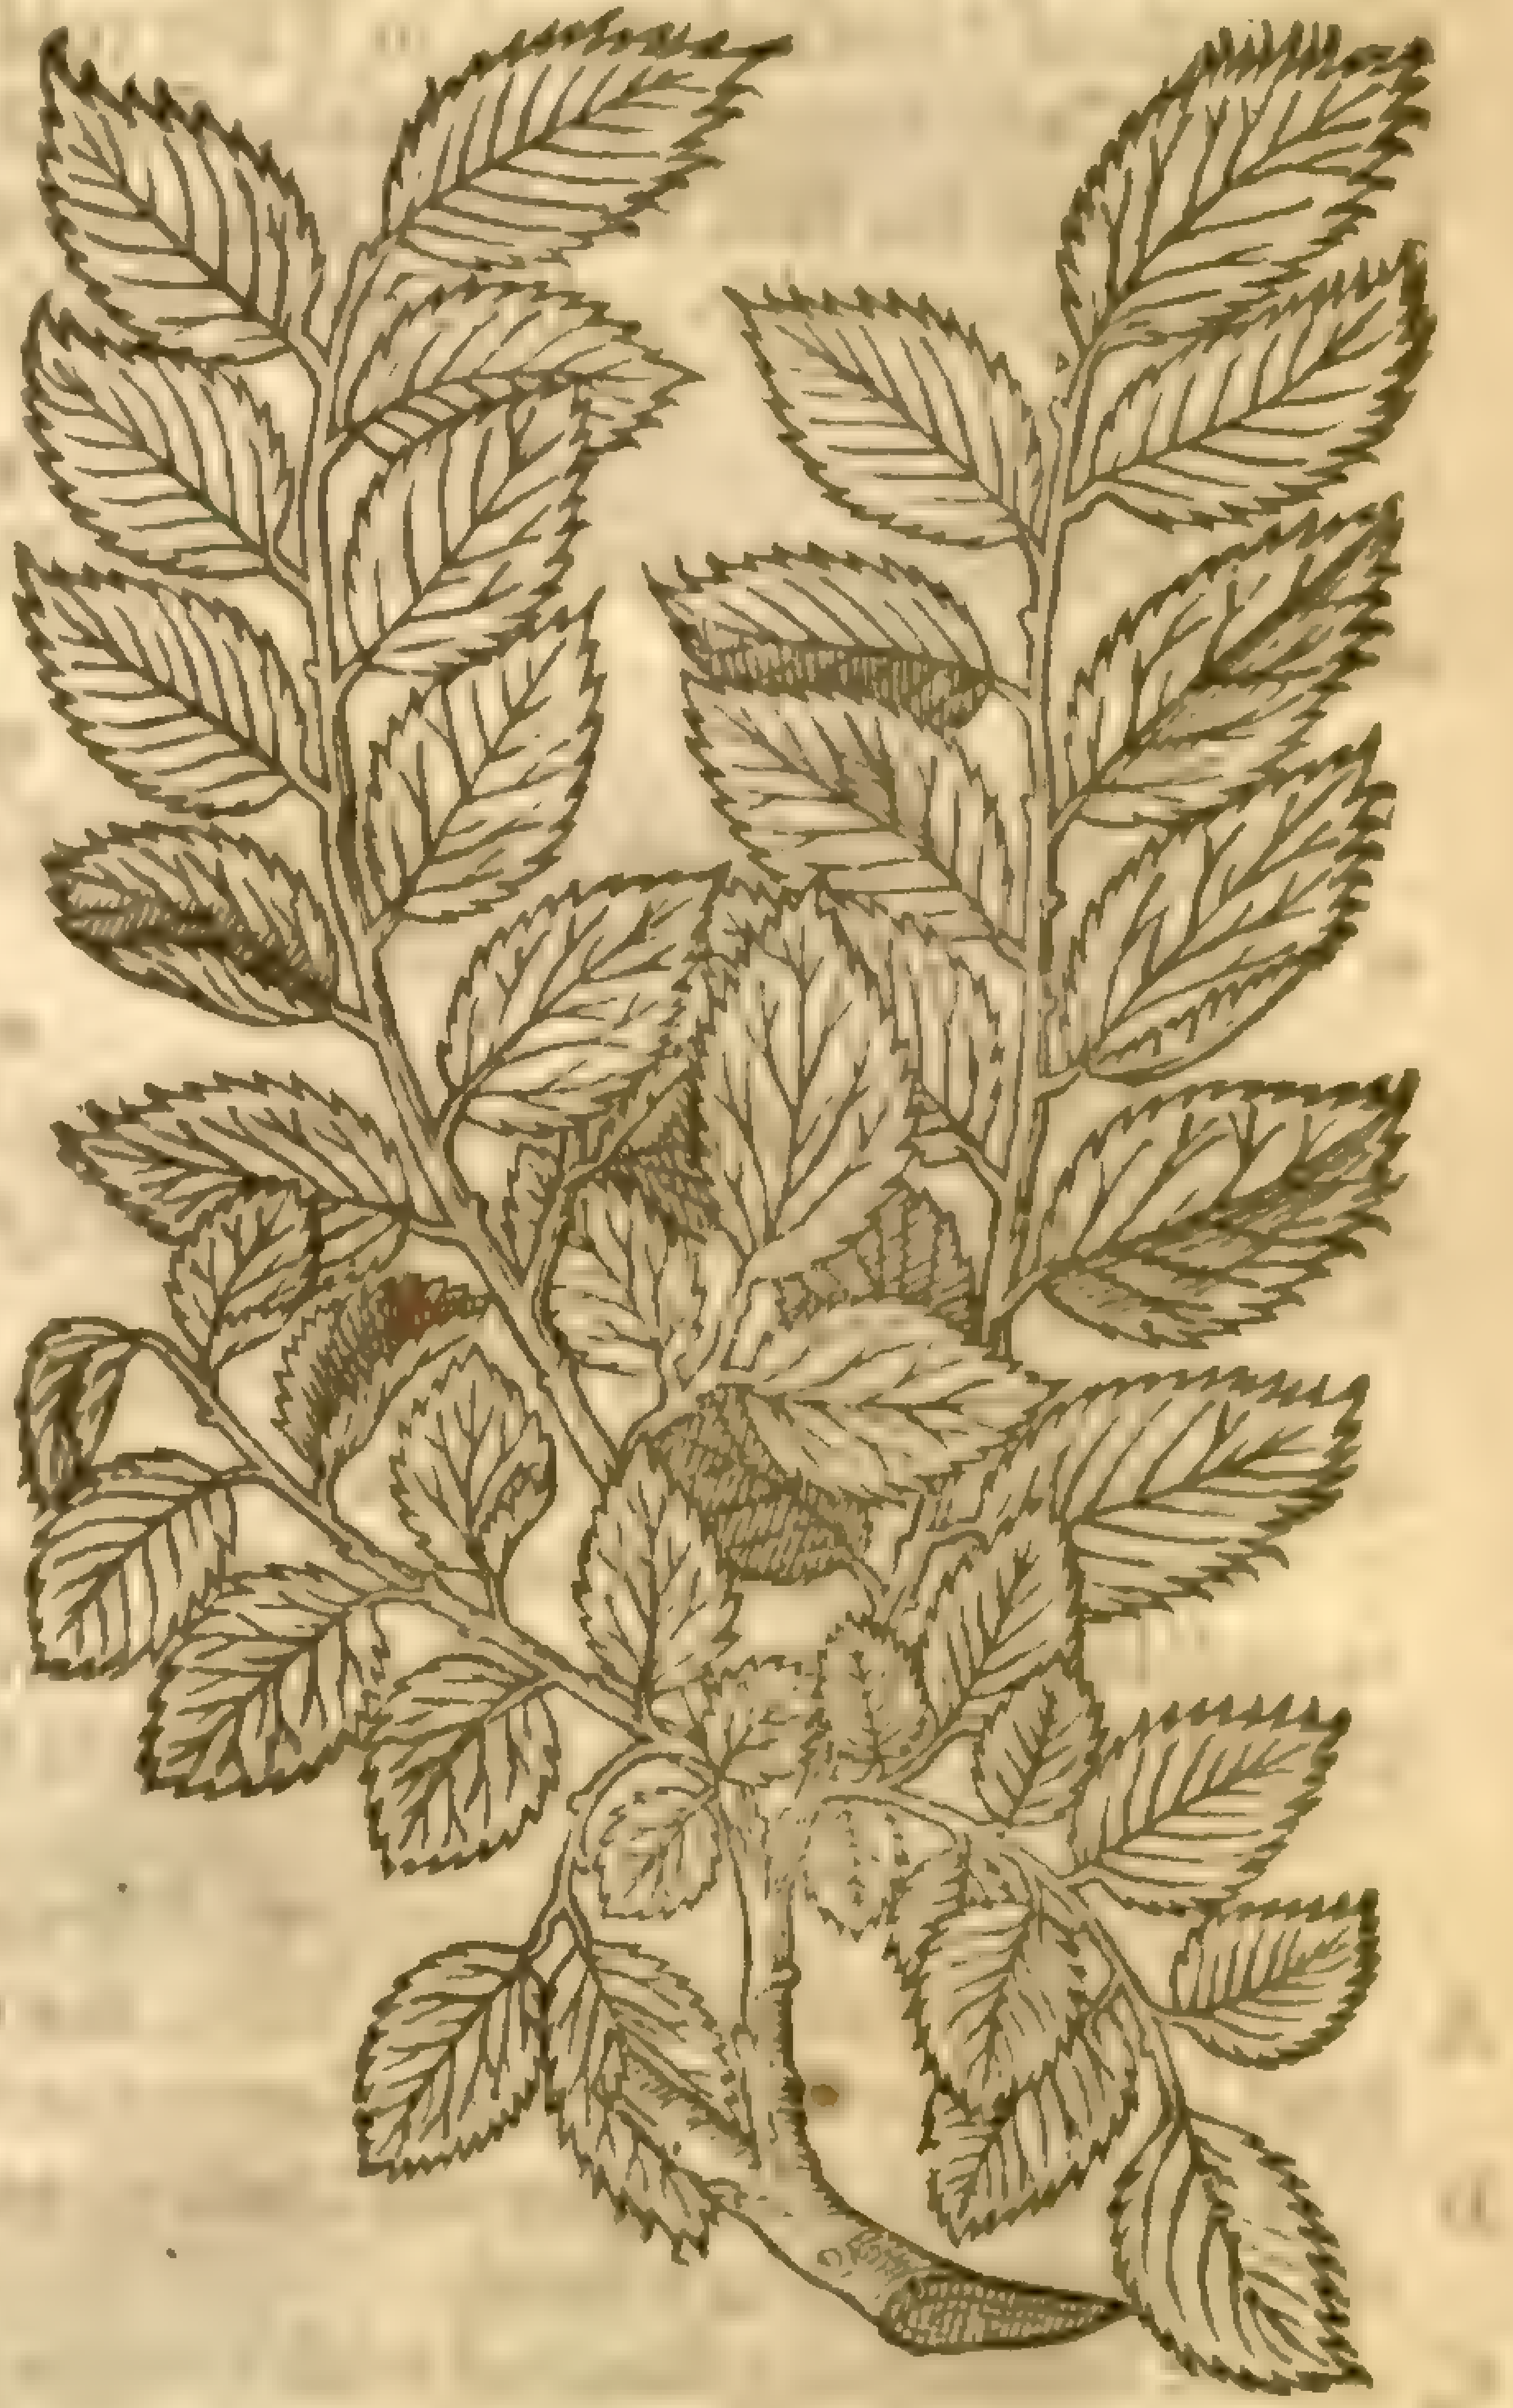
Witch Haſell, or the broadeſt leaued Elme.

Ulmus [illegible] [illegible], dict.

Sm. [illegible]



4 *Vlmus folio glabro.*
Witch Elme, or ſmooth leaued Elme.



Vlmus folio latiſsimo ſcabro.
Witch Haſell, or the broadeſt leaued Elme.

3 This groweth to be a very great tree, and alſo very high, eſpecially when he groweth in woods amongſt other trees: the barke on the outſide is blacker than that of the firſt, and is alſo very tough, ſo that when there is plenty of ſap it will ſtrip or peele from the wood of the boughes from the one end to the other, a dozen foot in length or more, without breaking, whereof are often made cords or ropes: the timber hereof is in colour neere like the firſt; it is nothing ſo firme or ſtrong for naues of Carts as the fruit is, but will more eaſily cleaue; this timber is alſo couered with a white ſappe next the barke: the branches or young boughes are groſſer and bigger, and doe ſpread themſelues broader, and hang more downewards than thoſe of the firſt; the floures are nothing but chiues, very like thoſe of the firſt kinde: the ſeed is alſo like, but ſomething bigger: the leaues are much broader and longer than any of the kindes of Elme, vſually three or foure inches broad, and fiue or ſix inches long, alſo rough or harſh in handling on both ſides, ſnipt or indented about the edges, neere reſembling the leaues of the Haſell: the one ſide of the leaues are alſo moſt commonly longer than the other, alſo on the leaues of this Elme are ſometimes bliſters or bladders like thoſe of the firſt kinde. This proſpereth and naturally groweth in any ſoile moiſt or dry, on high hills, and in low vallies in good plenty in moſt places in Hampſhire, where it is commonly called Witch Haſell. Old men affirme, that when long boughes were in great vſe, there were very many made of the wood of this tree, for which purpoſe it is mentioned in the ſtatutes of England by the name of Witch Haſell, as 8. *El.* 10. This hath little affinitie with *Carpinus*, which in Eſſex is called Witch Haſell,

Vlmus folio glabro.
Witch Elme, or ſmooth leauen Elme.

4 This kinde is in bigneſſe and height like the firſt, the boughes grow as thoſe of the Witch Haſell do, that is hanged more downewards than thoſe of the common Elme, the barke is blacker, than that of the firſt kinde, it will alſo peele from the boughes: the floures are like the firſt, and ſo are the ſeeds: the leaues in forme are like thoſe of the firſt kind, but are ſmooth in handling on both ſides. My worthy friend and excellent Herbariſt of happy memory Mr *William Coys* of Stubbers in the Pariſh of Northokington in Eſſex told me, that the wood of this kinde was more deſired for naues of Carts than the wood of the firſt. I obſerued it growing very plentifully as I rode between Rumford and the ſaid Stubbers, in the yeare 1620. intermixed with the firſt kinde, but eaſily to be diſcerned apart, and is in thoſe parts vſually called Witch Elme. ‡

¶ *The Place.*

The firſt kinde of Elme groweth plentifully in all places of England. The reſt are ſet forth in their deſcriptions.

¶ *The Time.*

The ſeeds of the Elme ſheweth it ſelfe firſt, and before the leaues; it falleth in the end of Aprill, at what time the leaues begin to ſpring.

¶ *The Names.*

The firſt is called in Greeke, πτελέα: in Latine, *Vlmus*: in high Dutch, **Ruſt holtz, Ruſtbaum, Ulmbaum**: in low Dutch **Olmen**: in French, *Orme*, and *Omeau*: in Italian, *Olmo*: in Spaniſh, *Vlmo*: in Engliſh, Elme tree.

The ſeed is named by *Pliny* and *Columella*, *Samera*. The little wormes which are found with the liquor within the ſmall bladders be named in Greeke, κνῖπες: it Latine *Culices*, and *Muliones*.

The other Elme is called by *Theophraſtus*, ὀρειπτελέα; which *Gaza* tranſlateth *Montiulmus* or mountaine Elme. *Columella* nameth it *Vernacula*, or *Noſtras Vlmus*, that is to ſay, *Italica*, or Italian Elme: it is called in low Dutch, **Herſeleer**, and in ſome places, **Heerenteer.**

¶ *The Temperature and Vertues.*

A The leaues and barke of the Elme bee moderately hot, with an euident clenſing faculty; they haue in the chewing a certaine clammy and glewing quality.

B The leaues of Elme glew and heale vp greene wounds, ſo doth the barke wrapped and ſwadled about the wound like a band.

C The leaues being ſtamped with vineger do take away ſcurffe.

D *Dioſcorides* writeth, That one ounce weight of the thicker barke drunke with wine or water purgeth flegme.

E The decoction of Elme leaues, as alſo of the barke or root, healeth broken bones very ſpeedily, if they be fomented or bathed therewith.

F The liquor that is found in the bliſters doth beautifie the face, and ſcoureth away all ſpots, freckles, pimples, ſpreading tetters, and ſuch like, being applied thereto.

G It healeth greene wounds, and cureth ruptures newly made, being laid on with Spleenwoort and the truſſe cloſely ſet vnto it.

Chap. 117. *Of the Line or Linden Tree.*

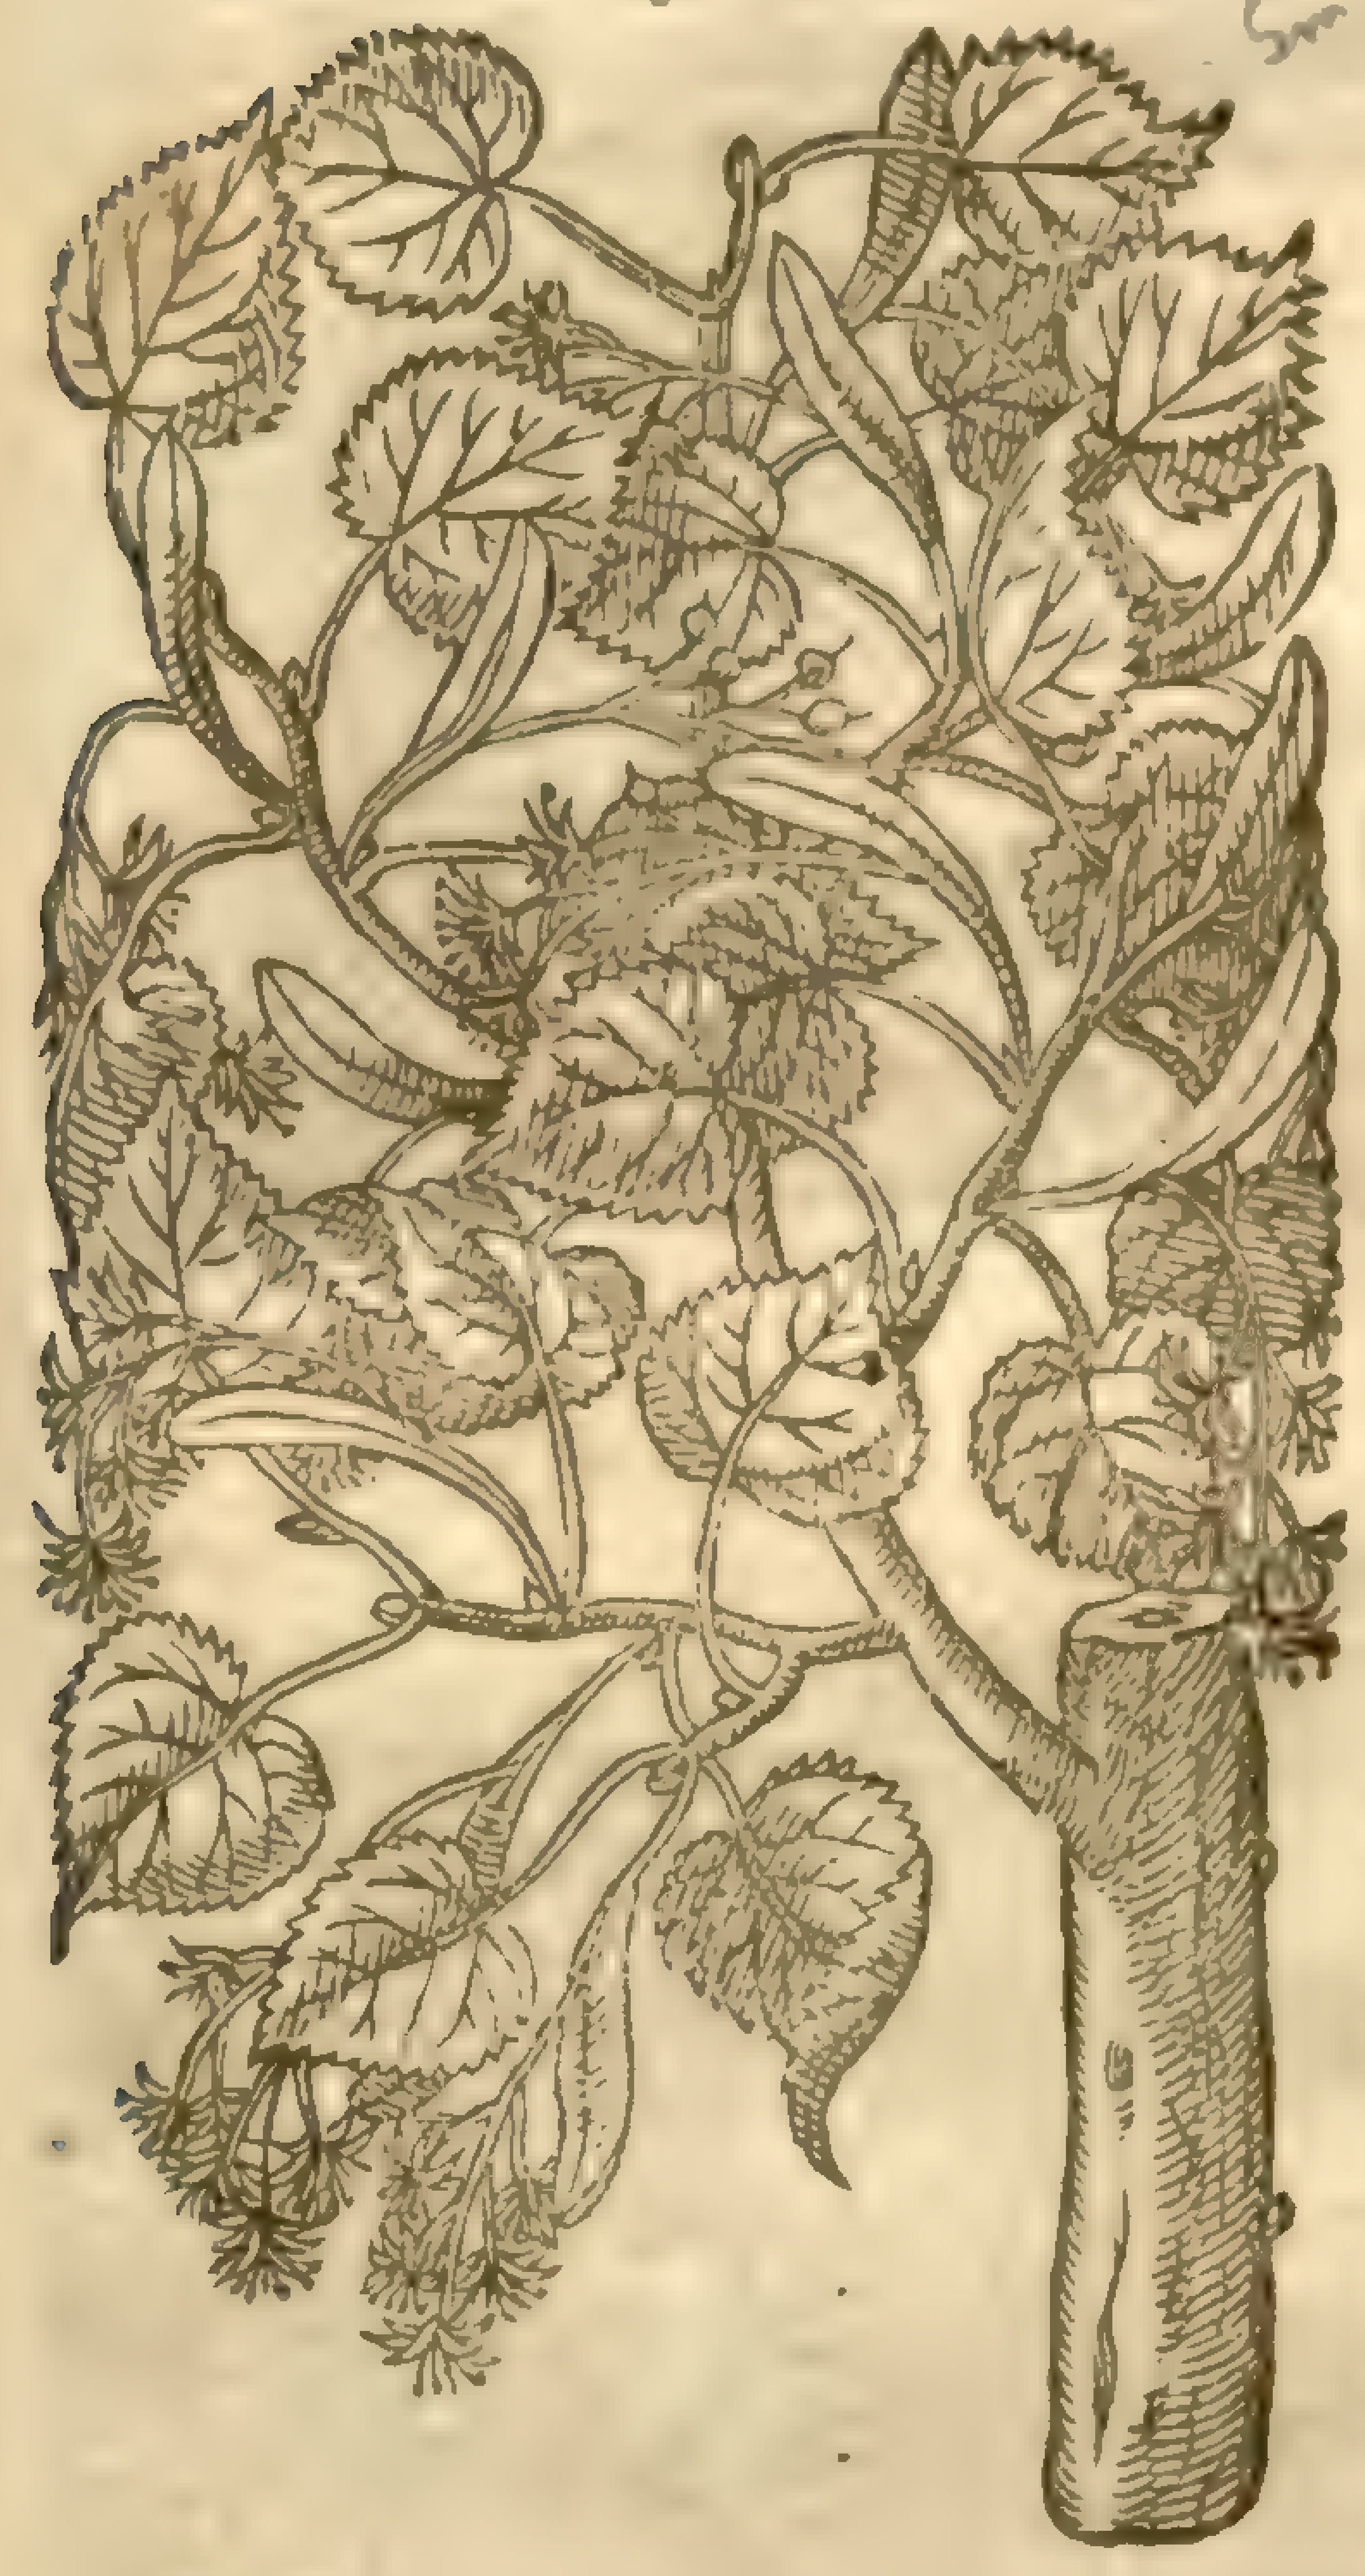
¶ *The Deſcription.*

1 The female Line or Linden tree waxeth very great and thicke, ſpreading forth his branches wide and farre abroad, being a tree which yeeldeth a moſt pleaſant ſhadow, vnder and within whoſe boughes may be made braue ſummer houſes and banqueting arbors, becauſe the more that it is ſurcharged with weight of timber and ſuch like, the better it doth flouriſh. The barke is browniſh, very ſmooth, and plaine on the outſide, but that which is next to the timber is white, moiſt and tough, ſeruing very well for ropes, traſes, and halters. The timber is whitiſh, plaine and without knots, yea very ſoft and gentle in the cutting or handling. Better gunpouder is made of the coales of this wood than of Willow coales. The leaues are greene,

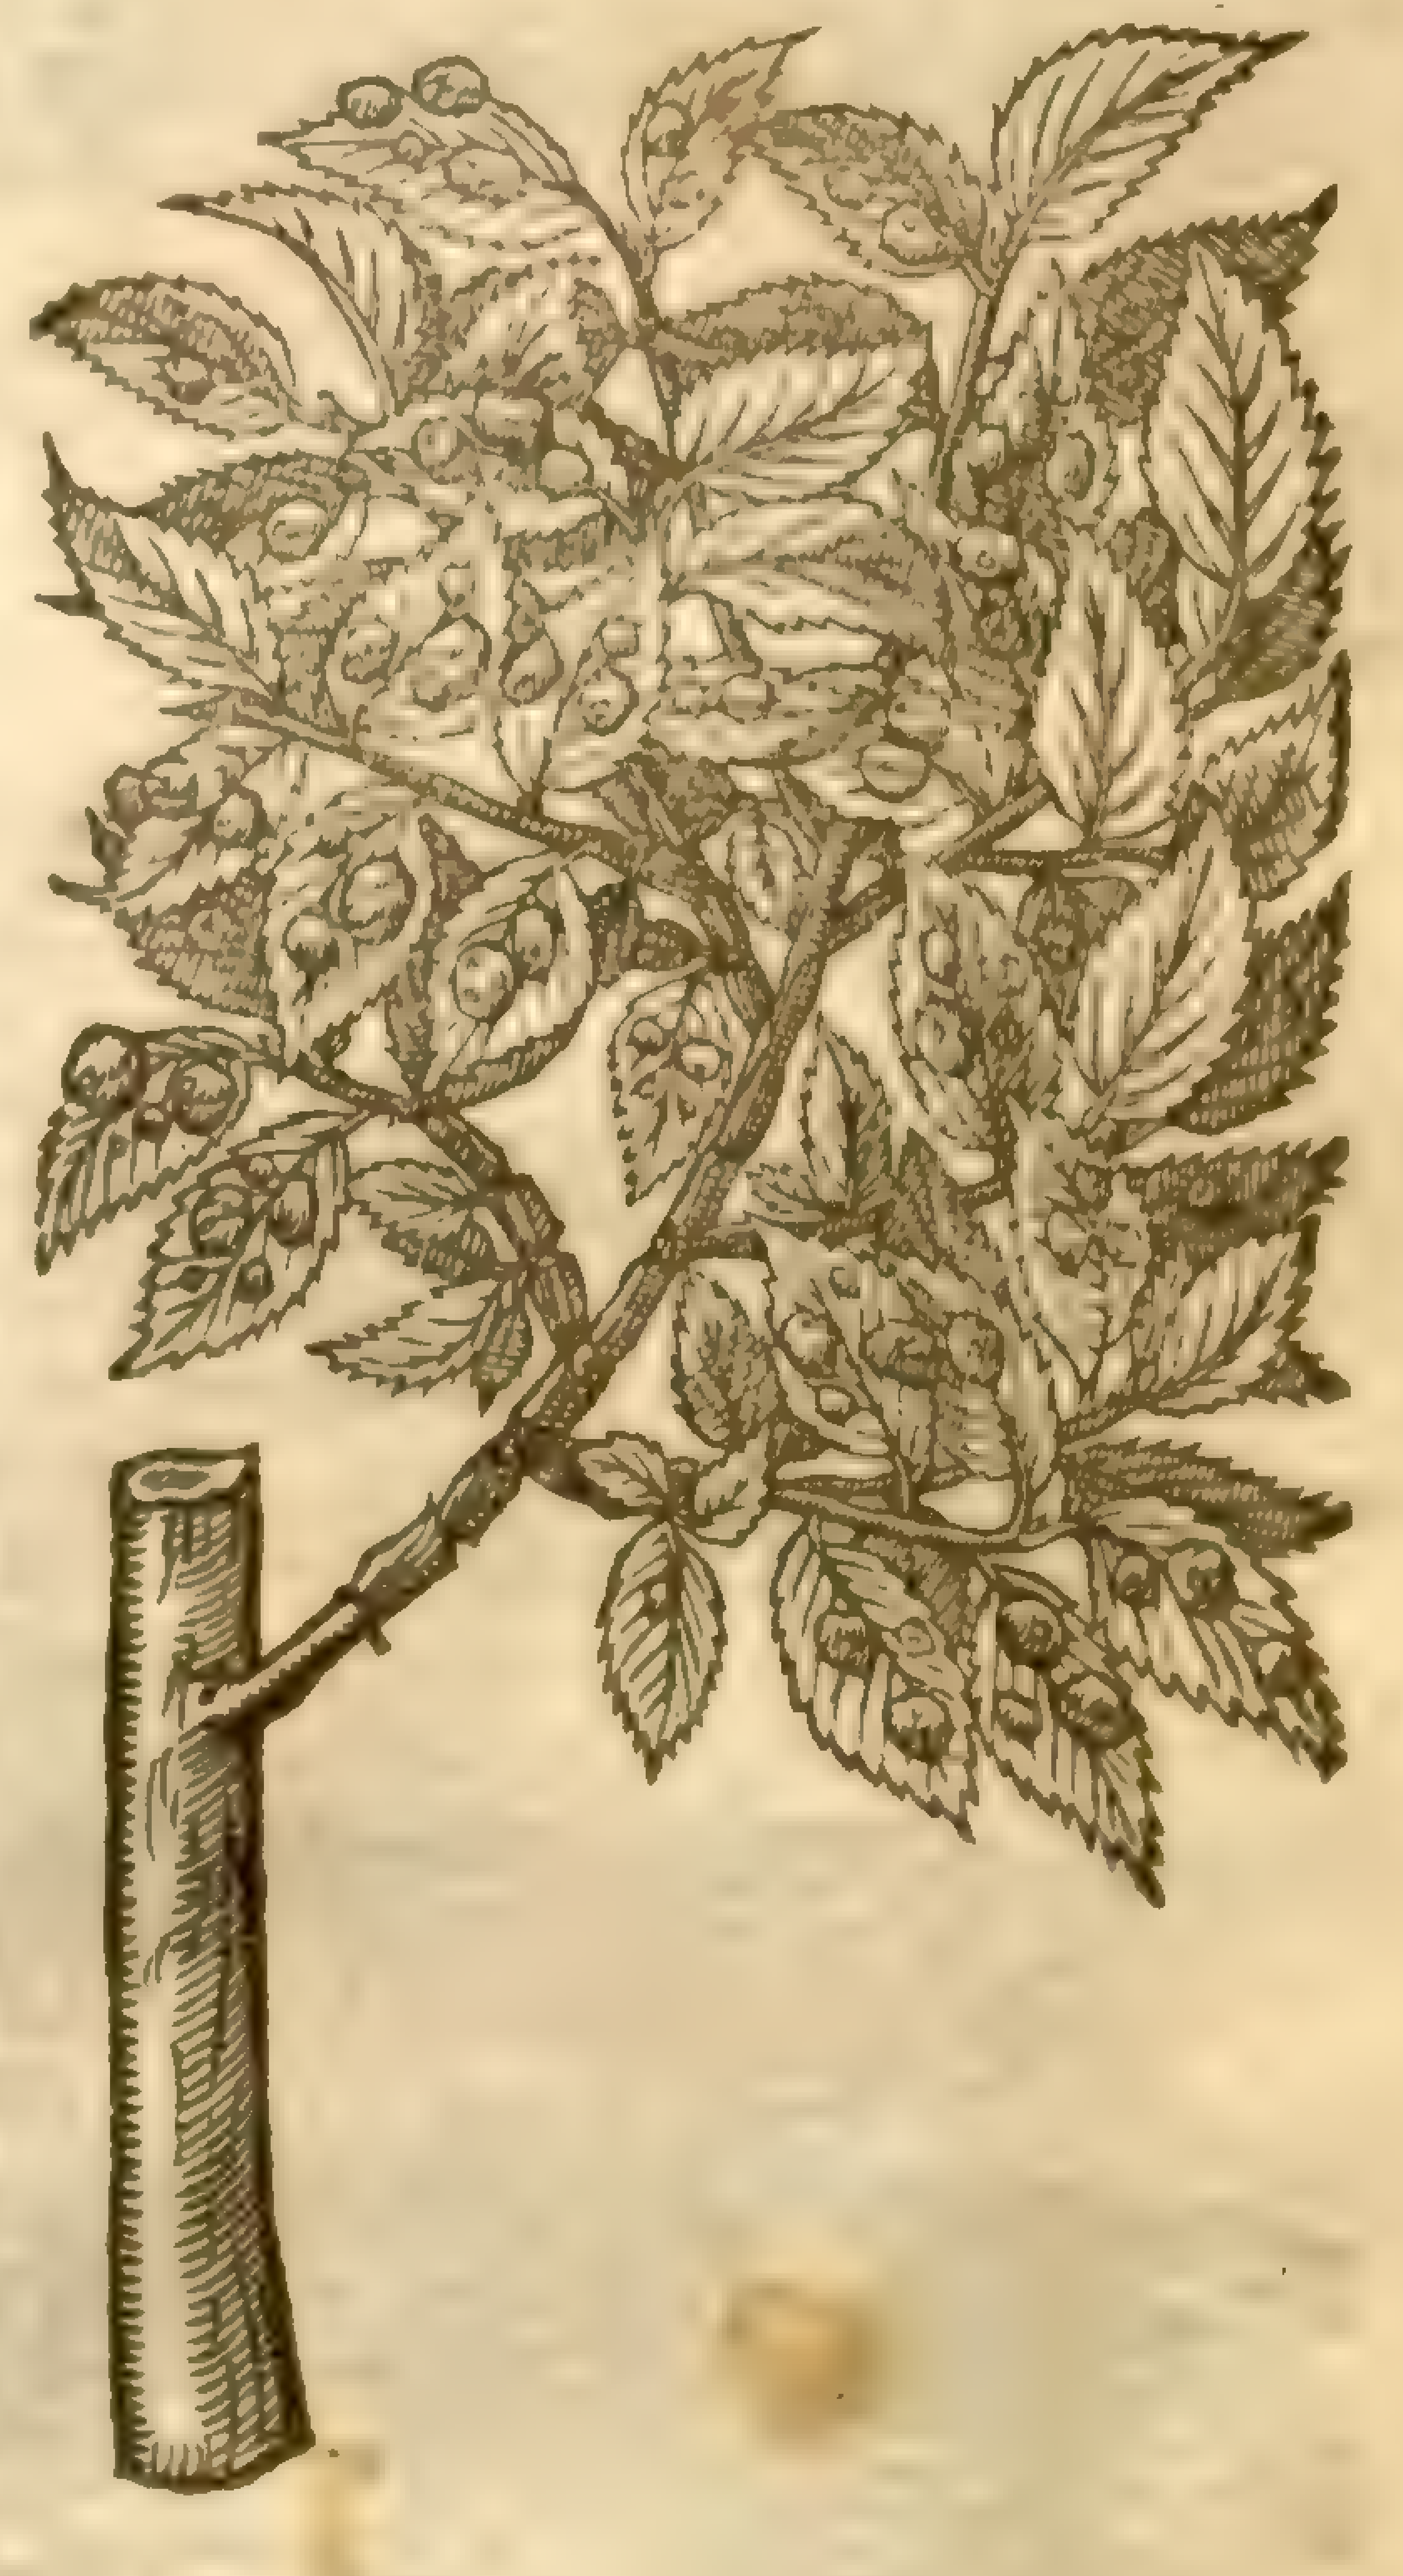
ſmooth, ſhining, and large, ſomewhat ſnipt or toothed about the edges: the floures are little, whitiſh, of a good ſauour, and very many in number, growing cluſtering together from out of the middle of the leafe: out of which proceedeth a ſmall whitiſh long narrow leafe: after the floures ſucceed cornered ſharpe pointed Nuts, of the bigneſſe of Haſell Nuts. This tree ſeemeth to be a kinde of Elme, and the people of Eſſex about Heningham (wheras great plenty groweth by the way ſides) do call it broad leafed Elme.

1 *Tilia fœmina*;
The female Line tree.

T. Europaea, [illegible] Brit. Eng. Fl. 3.19



2 *Tilia mas.*
The male Line tree.



2 The male *Tilia* or Line tree groweth alſo very great and thicke, ſpreading it ſelfe far abroad like the other Linden tree: his barke is very tough and pliant, and ſerueth to make cords and halters of. The timber of this tree is much harder, more knotty, and more yellow than the timber of the other, not much differing from the timber of the Elme tree: the leaues hereof are not much vnlike Iuy leaues, not very greene, ſomewhat ſnipt about the edges: from the middle whereof come forth cluſters of litle white flours like the former: which being vaded, there ſucceed ſmall round pellets, growing cluſtering together like Iuy berries, within which is contained a little round blackiſh ſeed, which falleth out when the berry is ripe.

¶ *The Place.*

The female Linden tree groweth in ſome woods in Northampton ſhire; alſo neere Colcheſter, and in many places alongſt the high way leading from London to Henningham, in the county of Eſſex.

The male Linden tree groweth in my Lord Treaſurers garden in the Strand, and in ſundry other places, as at Barn-elmes, and in a garden at Saint Katherines neere London. ‡ The female growes in the places here named, but I haue not yet obſerued the male. ‡

¶ *The Time.*

The trees floure in May, and their fruit is ripe in Auguſt.

¶ *The Names.*

The Linden tree is called in Greeke φιλύρα: in Latine, *Tilia*: in high Dutch, **Linden**, and **Lindenbaum**: in low Dutch, **Linde**, and **Lindenboom**: the Italians, *Tilia*: the Spaniard, *Teia*: in French, *Tilet* and *Tilieul*: in Engliſh, Linden tree, and Line tree.

¶ *The Temperature.*

The barke and leaues of the Linden or Line tree, are of a temperate heate, ſomewhat drying and aſtringent.

¶ *The Vertues.*

A The leaues of *Tilia* boyled in Smithes water with a piece of Allum and a little honey, cure the ſores in childrens mouthes.

B The leaues boiled vntill they be tender; and pouned very ſmall with hogs greaſe, and the pouder of Fenugreeke and Lineſeed, take away hot ſwellings and bring impoſtumes to maturation, being applied thereto very hot.

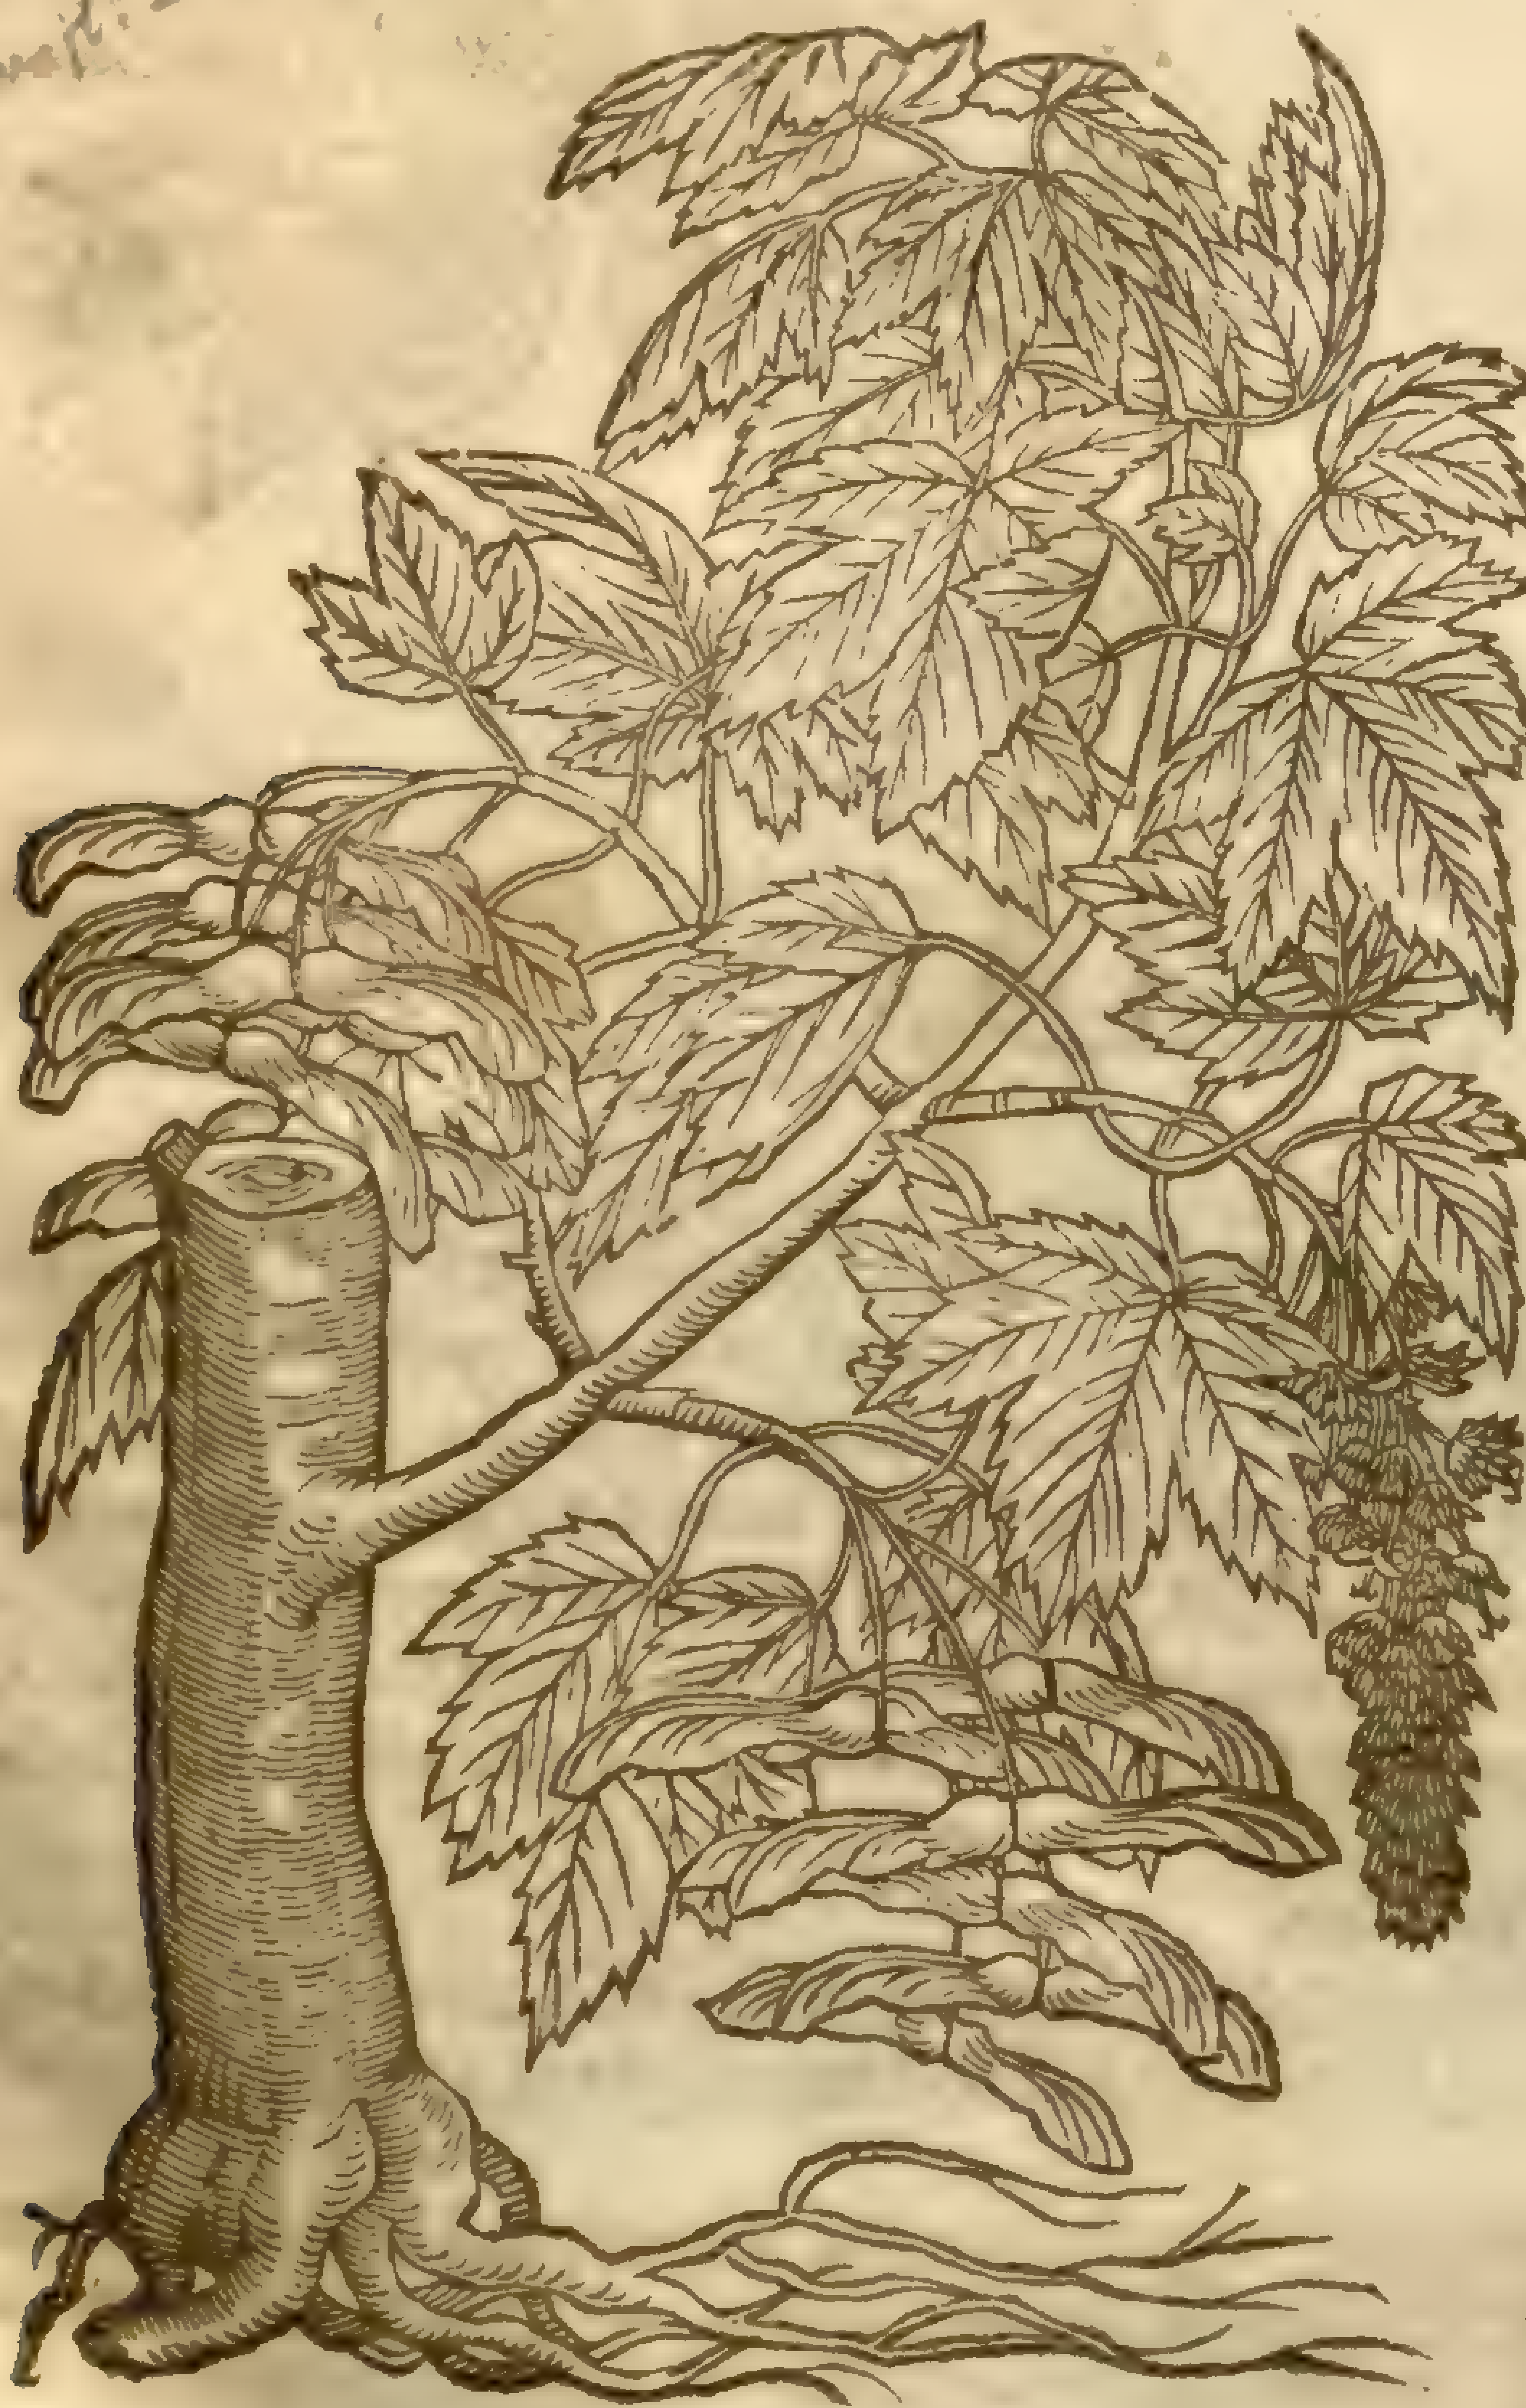
C The floures are commended by diuers againſt paine of the head proceeding of a cold cauſe, againſt diſſineſſe, the Apoplexie, and alſo the falling ſickneſſe, and not onely the floures, but the diſtilled water thereof.

D The leaues of the Linden (ſaith *Theophraſtus*) are very ſweet, and be a fodder for moſt kind of cattle: the fruit can be eaten of none.

Chap. 118. *Of the Maple tree.*

A. pseudo platanus. L
[illegible]
Sm. fl. 2.230

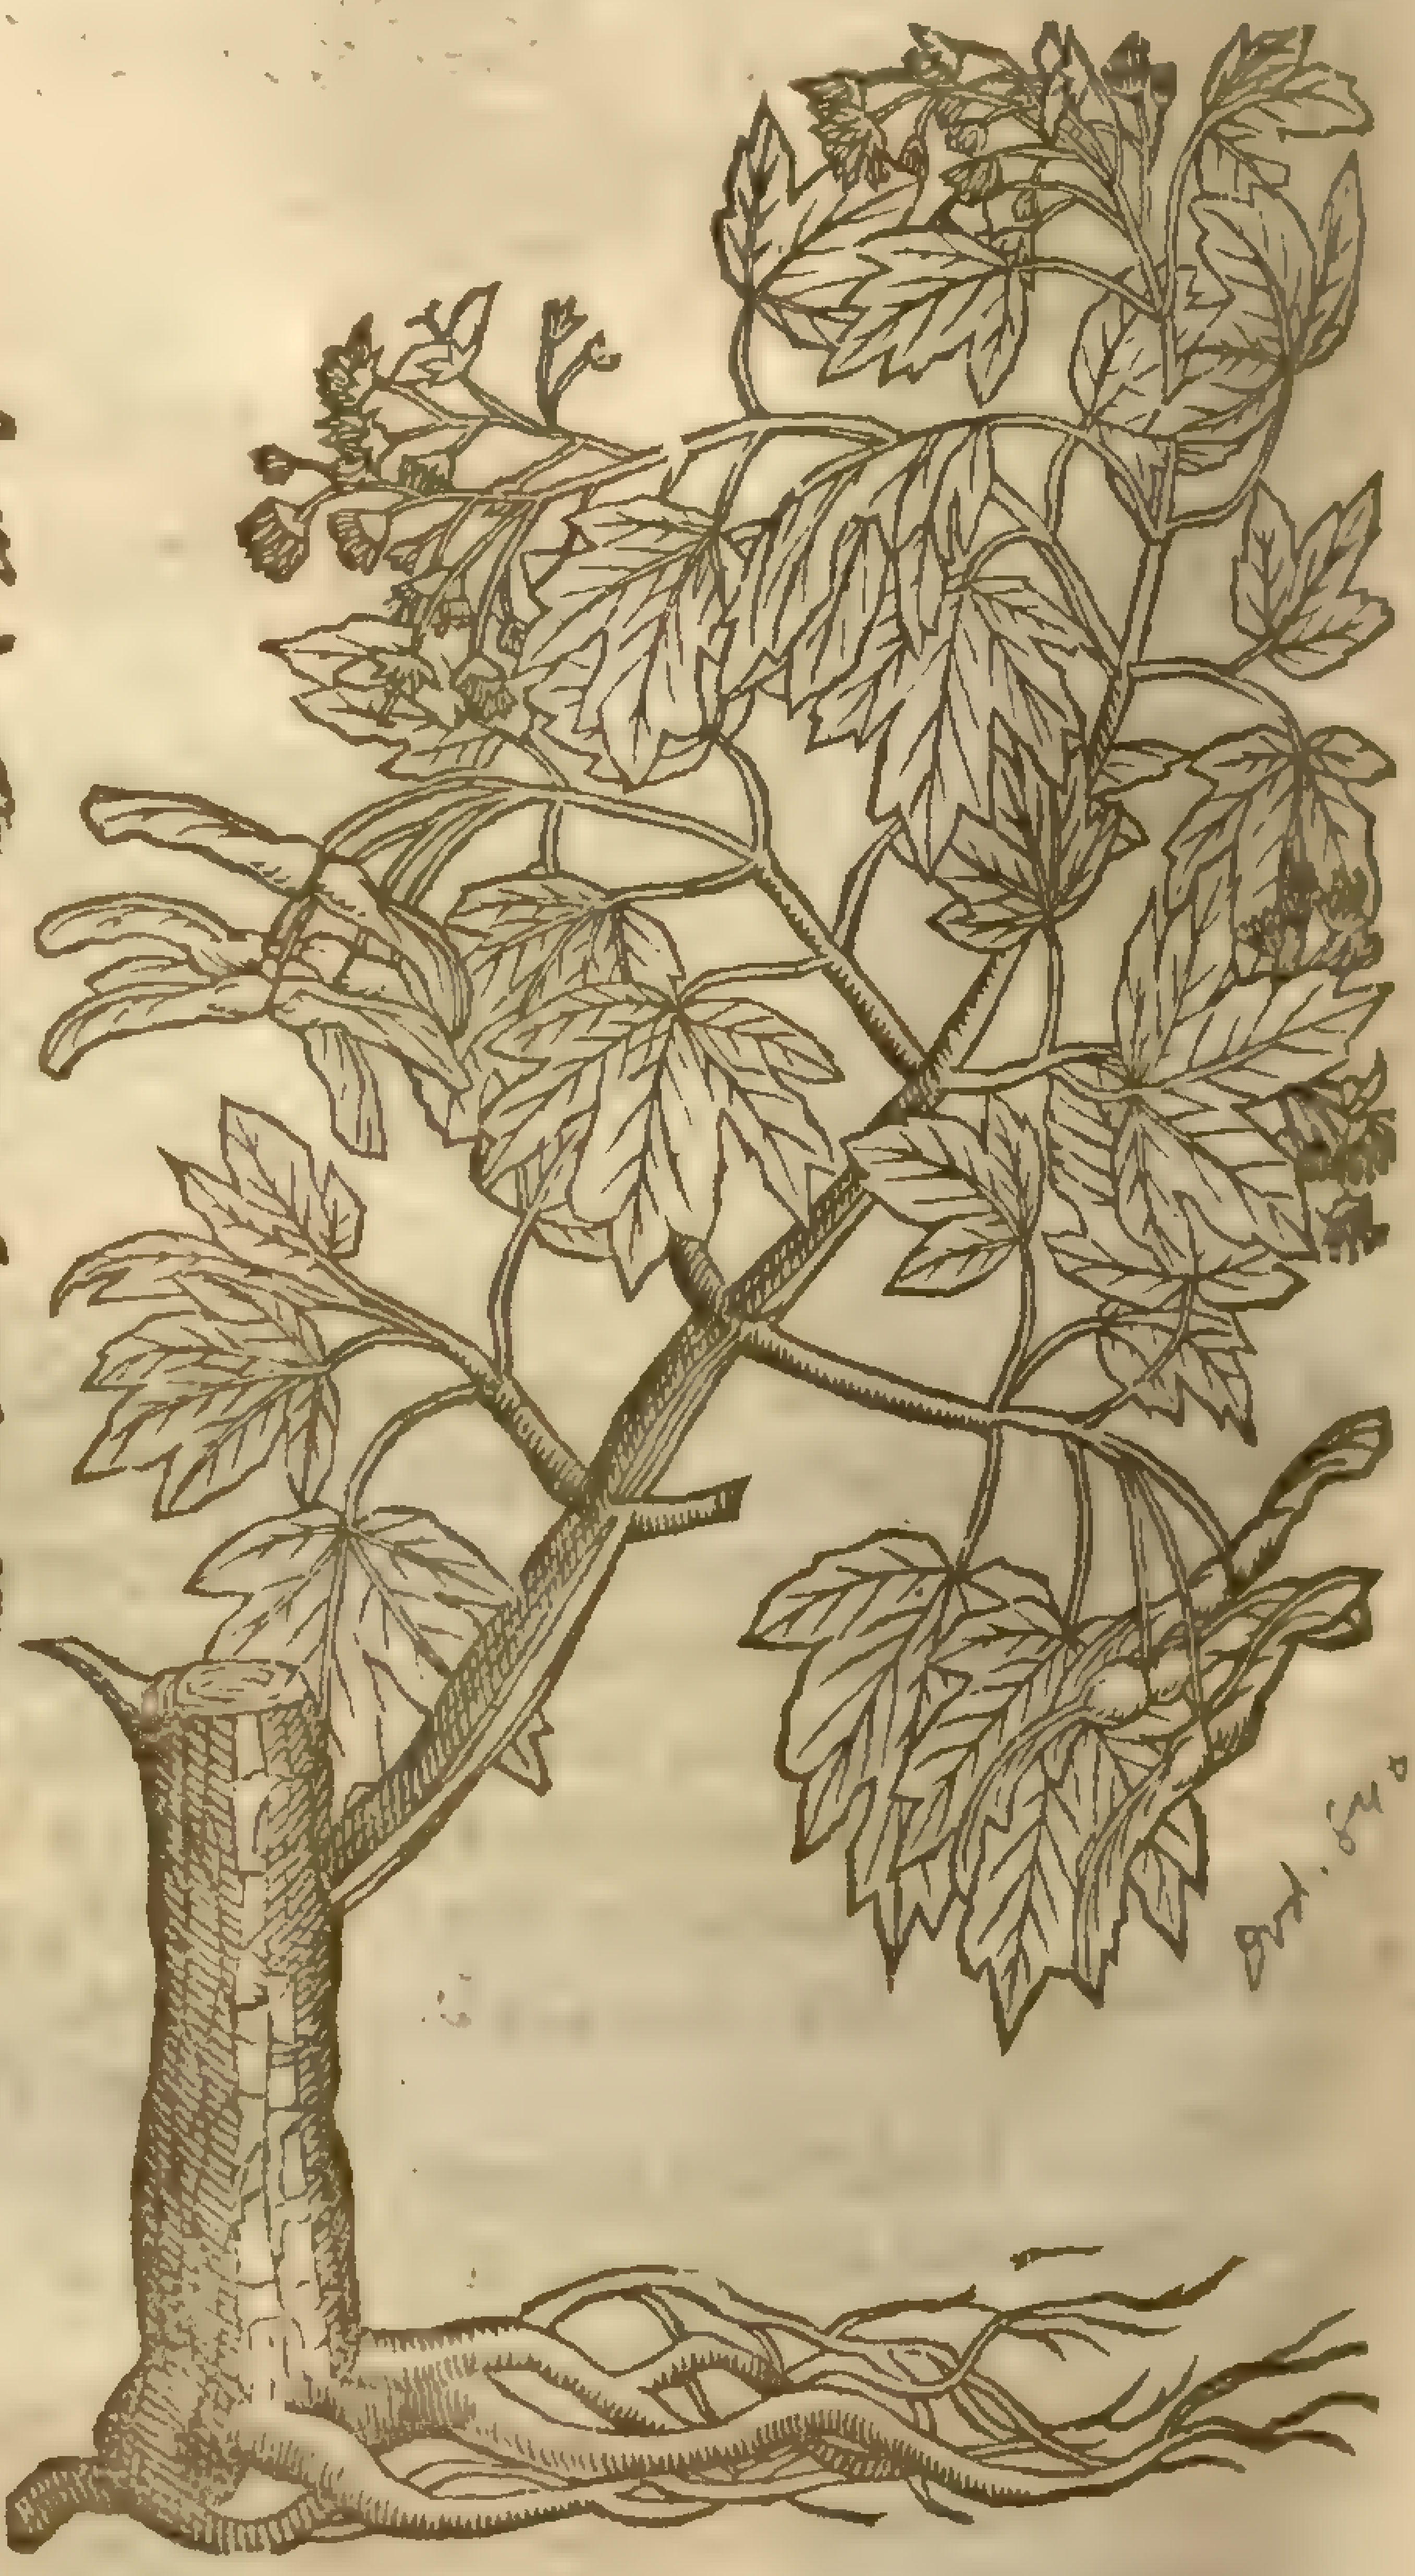
‡ 1 *Acer majus.*
The great Maple.



Dod. 840

A. campestre. L
[illegible]
Sm. fl. 2.231

† 2 *Acer minus.*
The leſſer Maple.



Dod. 840

¶ *The Deſcription.*

THe great Maple is a beautifull and high tree, with a barke of a meane ſmoothneſſe: the ſubſtance of the wood is tender and eaſie to worke on; it ſendeth forth on euery ſide very many goodly boughes and branches, which make an excellent ſhadow againſt the heat of the Sun; vpon which are great, broad, and cornered leaues, much like to thoſe of the Vine, hanging by long reddiſh ſtalkes; the floures hang by cluſters, of a whitiſh greene colour; after them commeth vp long fruit faſtened together by couples, one right againſt another, with kernels bumping out neere to the place in which they are combined: in all the other parts flat and thin like vnto parchment, or reſembling the innermoſt wings of graſhoppers: the kernels be white and little.

2 There is a ſmall Maple which doth oftentimes come to the bigneſſe of a tree, but moſt commonly it groweth low after the manner of a ſhrub: the barke of the young ſhoots hereof is likewiſe ſmooth; the ſubſtance of the wood is white, and eaſie to be wrought on: the leaues are cornered like thoſe of the former, ſlippery, and faſtened with a reddiſh ſtalke, but much leſſer, very like in bigneſſe and ſmoothneſſe to the leafe of Sanicle, but that the cuts are deeper: the floures be as thoſe of the former, greene, yet not growing in cluſters, but vpon ſpoked rundles: the fruit ſtandeth by two and two vpon a ſtem or foot-ſtalke.

¶ *The Place.*

The ſmall or hedge Maple groweth almoſt euery where in hedges and low woods.

The great Maple is a ſtranger in England, onely it groweth in the walkes and places of pleaſure of noble men, where it eſpecially is planted for the ſhadow ſake, and vnder the name of Sycomore tree.

¶ *The Time.*

Theſe trees floure about the end of March, and their fruit is ripe in September.

¶ *The Names.*

This tree is called in Greeke σφένδαμνος: in Latine, *Acer*: in Engliſh, Maple, or Maple tree.

The great Maple is called in high Dutch, **Ahorne**, and **Waldeſcherne**: the French-men, *Grand Erable*, and *Plaſne* abuſiuely, and this is thought to be properly called σφένδαμνον: but they are far deceiued that take this for *Platanus*, or the Plane tree, being drawne into this errour by the neereneſſe of the French word; for the Plane tree doth much differ from this. ‡ This is now commonly (yet not rightly) called the Sycomore tree. And ſeeing vſe will haue it ſo, I thinke it were not vnfit to call it the baſtard Sycomore. ‡

The other is called in Latine, *Acer minor*: in high Dutch, **Maſholder**: in low Dutch, **Booghout**: in French, *Erable*: in Engliſh, ſmall Maple, and common Maple.

¶ *The Temperature and Vertues.*

What vſe the Maple hath in medicine we finde nothing written of the Grecians, but *Pliny* in his 14 booke, 8 chapter affirmeth, That the root pouned and applied, is a ſingular remedy for the paine of the liuer. *Serenus Sammonicus* writeth, that it is drunke with wine againſt the paines of the ſide. A

Si latus immeritum morbo tentatur acuto,
Accenſum tinges lapidem ſtridentibus vndis.
Hinc bibis: aut Aceris radicem tundis, & vna
Cum vino capis: hoc præſens medicamen habetur.

Thy harmeleſſe ſide if ſharpe diſeaſe inuade,
In hiſſing water quench a heated ſtone:
This drinke. Or Maple root in pouder made,
Take off in wine, a preſent med'cine knowne.

Chap. 119. *Of the Poplar Tree.*

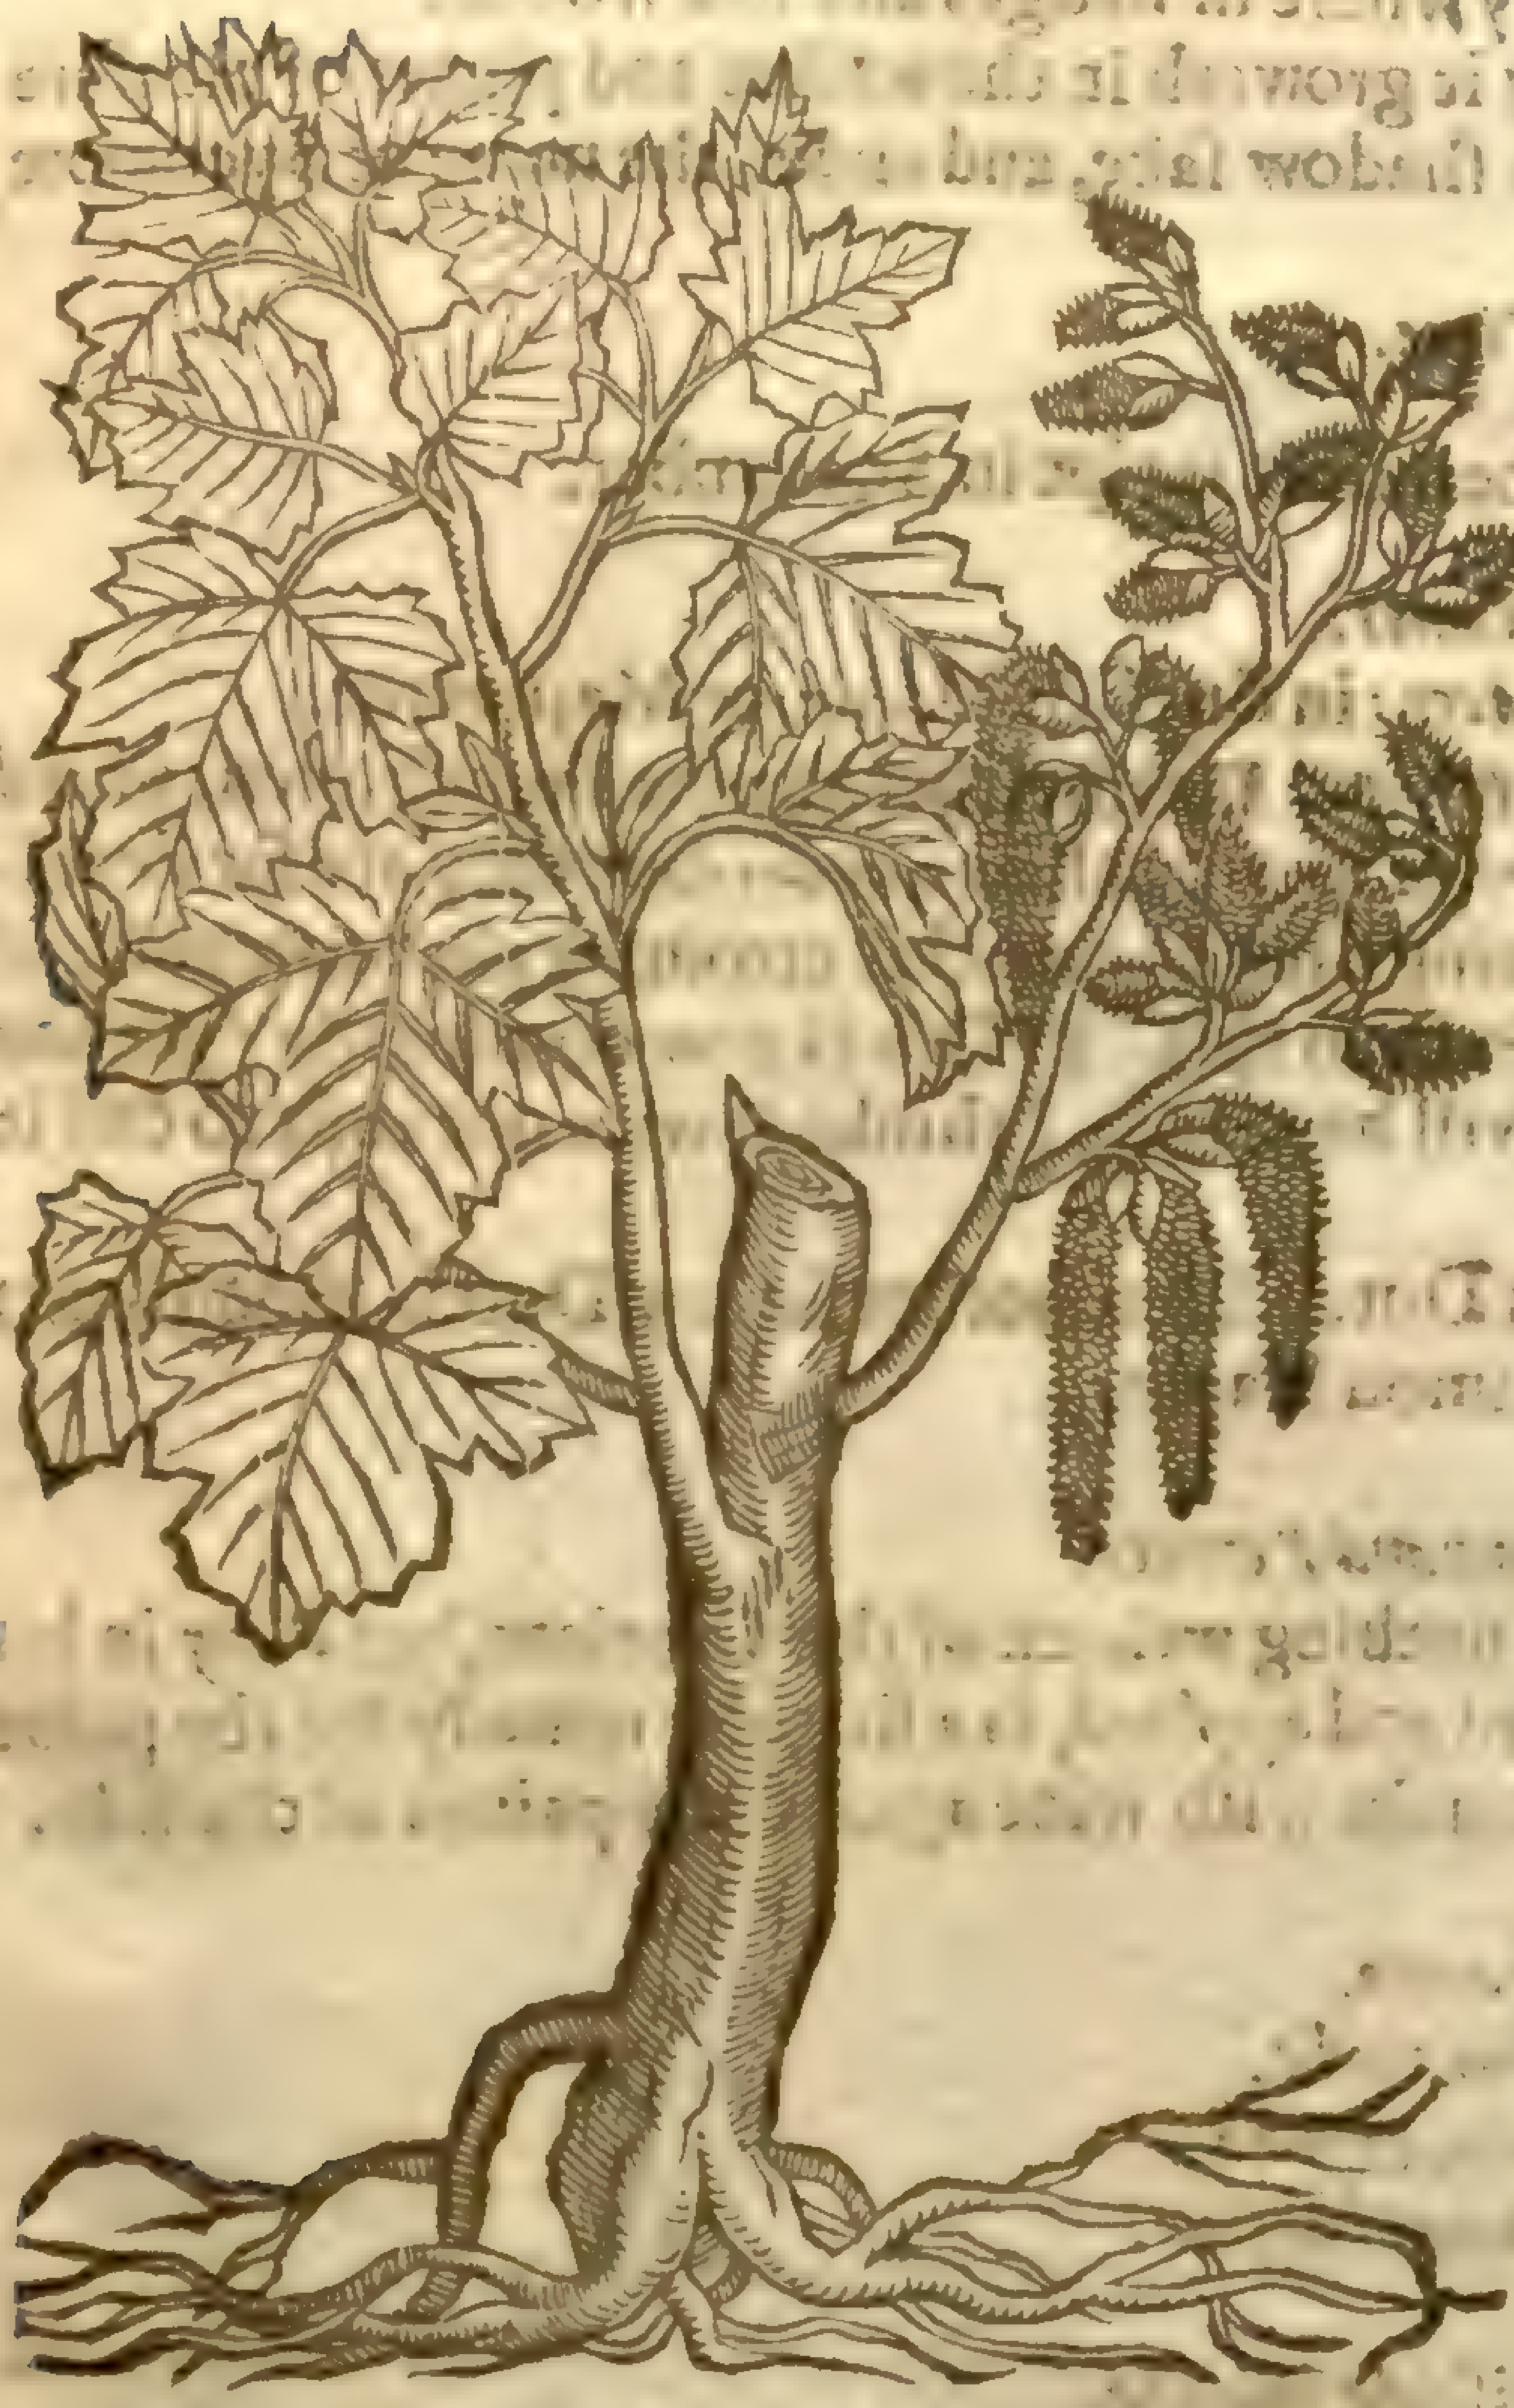
¶ *The Kindes.*

There be diuers trees vnder the title of Poplar, yet differing very notably, as ſhall be declared in the deſcriptions, whereof one is the white, another the blacke, and a third ſort ſet downe by *Pliny*, which is the Aſpe, named by him *Lybaca*; and by *Theophraſtus*, *Kerkis*: likewiſe there is another of America, or of the Indies, which is not to be found in theſe regions of Europe.

¶ *The Deſcription.*

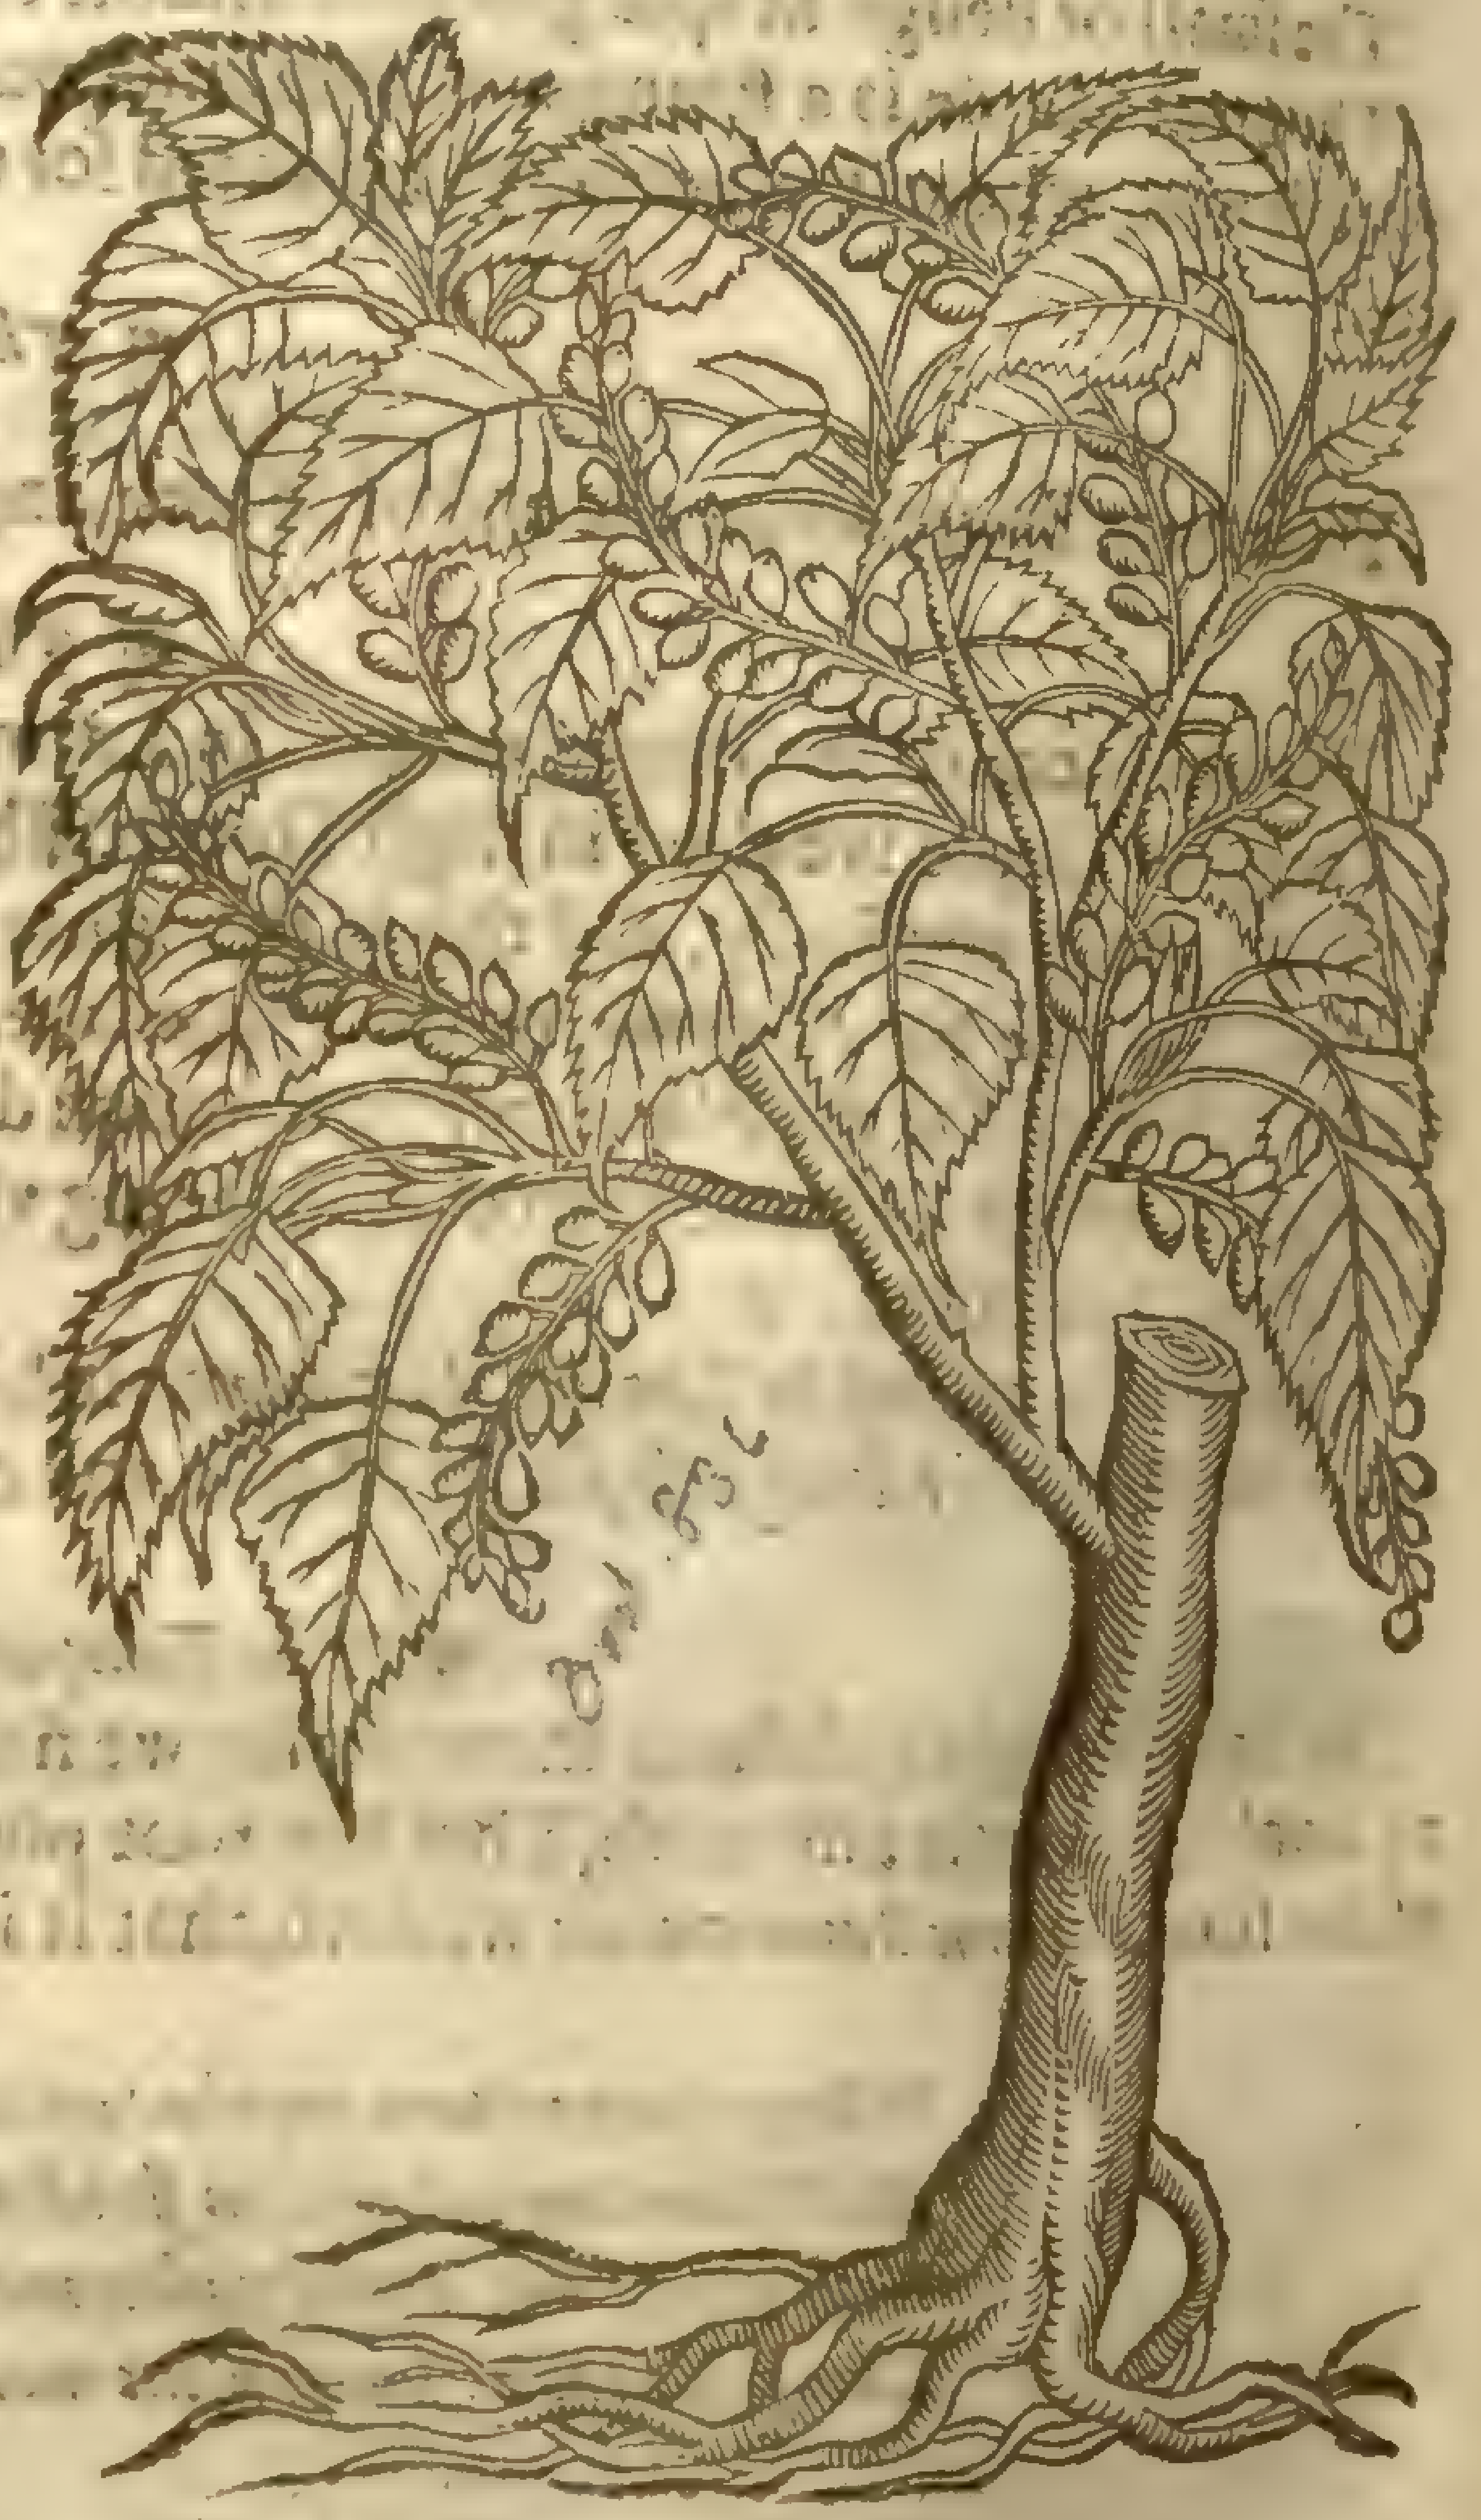
1 THe white Poplar tree commeth ſoone to perfection, and growes high in ſhort time, full of boughes at the top: the barke of the body is ſmooth, and that of the boughes is likewiſe white withall: the wood is white, eaſie to be cleft: the leaues are broad, deeply gaſhed, and cornered like almoſt to thoſe of the Vine, but much leſſer, ſmooth on the vpper ſide, glib, and ſomewhat greene; and on the nether ſide white and woolly: the catkins are long, downy, at the firſt of a purpliſh colour: the roots ſpread many waies, lying vnder the turfe, and not growing deep, and therefore it happeneth that theſe trees be oftentimes blowne downe with the winde.

1 *Populus alba.*
The white Poplar tree.



Sm. Fl. 4. 243

2 *Populus nigra.*
The blacke Poplar tree.



A

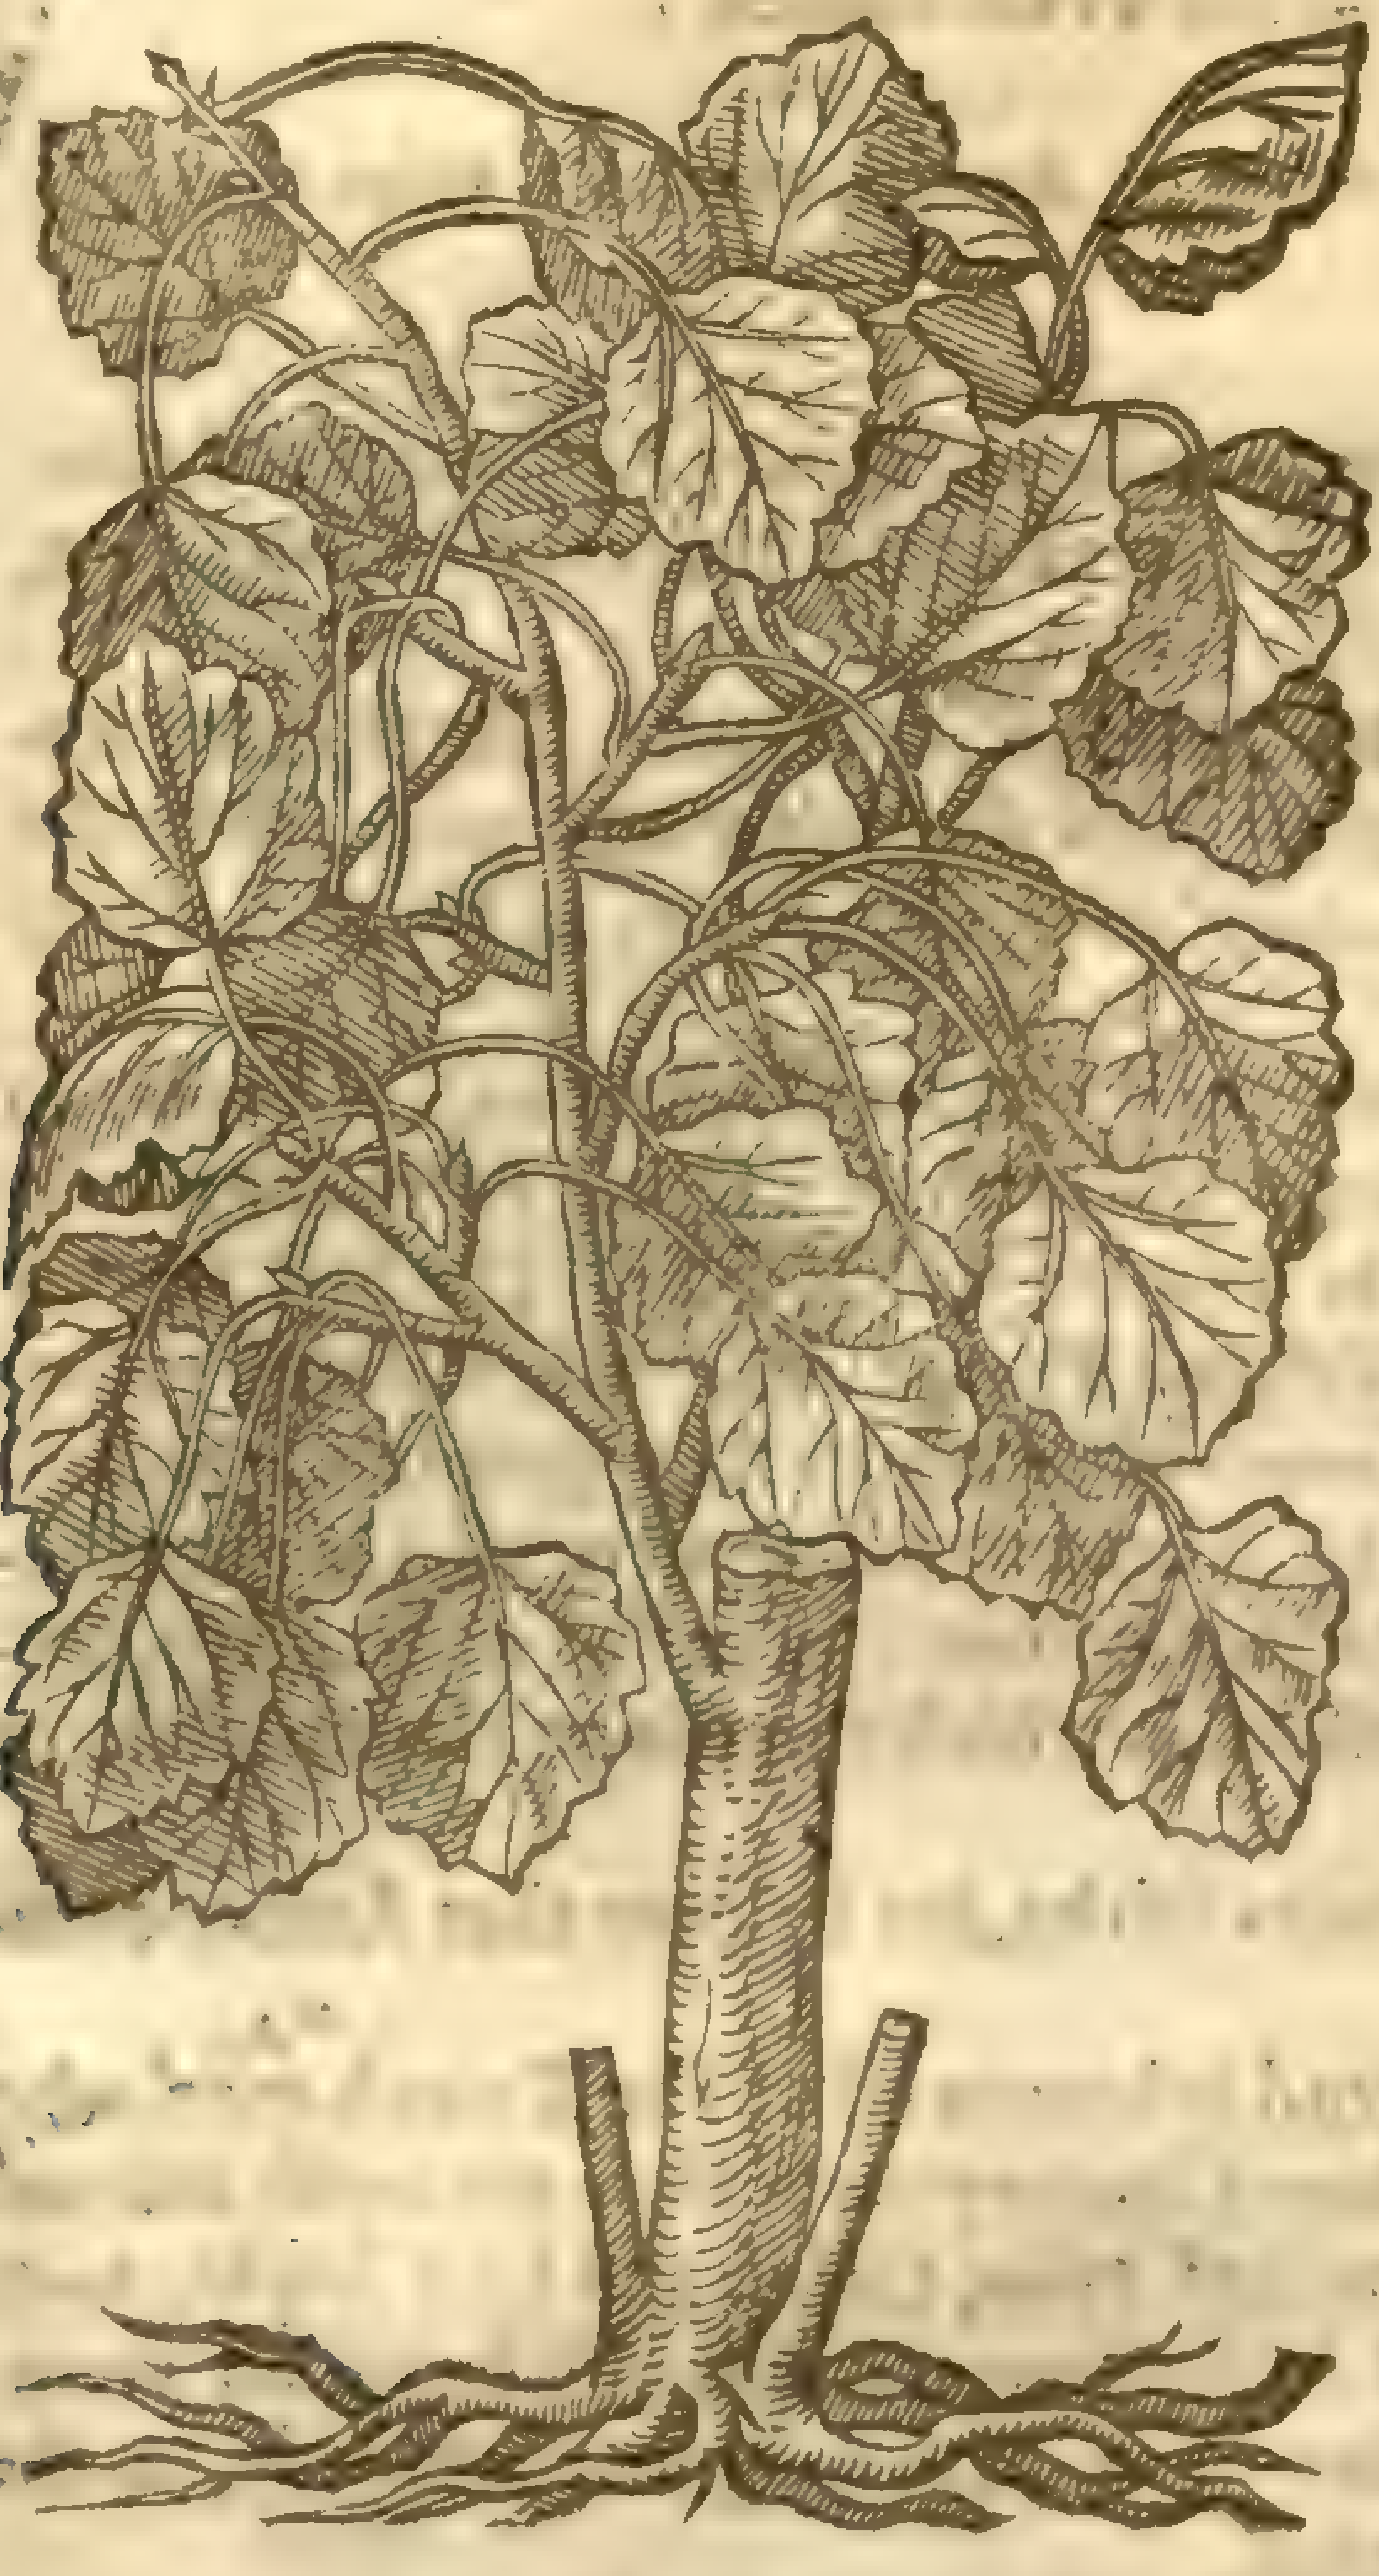
2 The blacke Poplar tree is as high as the white, and now and then higher, oftentimes fuller of boughes, and with a thicker body: the barke thereof is likewiſe ſmooth, but the ſubſtance of the wood is harder, yellower, and not ſo white, fuller of veines, and not ſo eaſily cleft: the leaues be ſomwhat long, and broad below toward the ſtem, ſharpe at the point, and a little ſnipt about the edges, neither white nor woolly, like the leaues of the former, but of a pleaſant greene colour: amongſt which come forth long aglets or catkins, which do turne into cluſters: the buds which ſhew themſelues before the leaues ſpring out, are of a reaſonable good ſauour, of the which is made that profitable ointment called *Vnguentum Populeon.*

3 The third kinde of Poplar is alſo a great tree: the barke and ſubſtance of the wood is ſomewhat like that of the former: this tree is garniſhed with many brittle and tender branches, ſet full of leaues, in a manner round, much blacker and harder than the blacke Poplar, hanging vpon long and ſlender ſtems, which are for the moſt part ſtill wauering, and make a great noiſe by being beaten one to another, yea though the weather be calme, and ſcarce any winde blowing; and it is known by the name of the Aſpen tree; the roots hereof are ſtronger, and grow deeper into the ground than thoſe of the white Poplar.

4 This ſtrange Poplar, which ſome do cal *Populus rotundifolia,* in Engliſh, the round leafed Poplar of India, waxeth a great tree, bedeckt with many goodly twiggie branches, tough and limmer like the

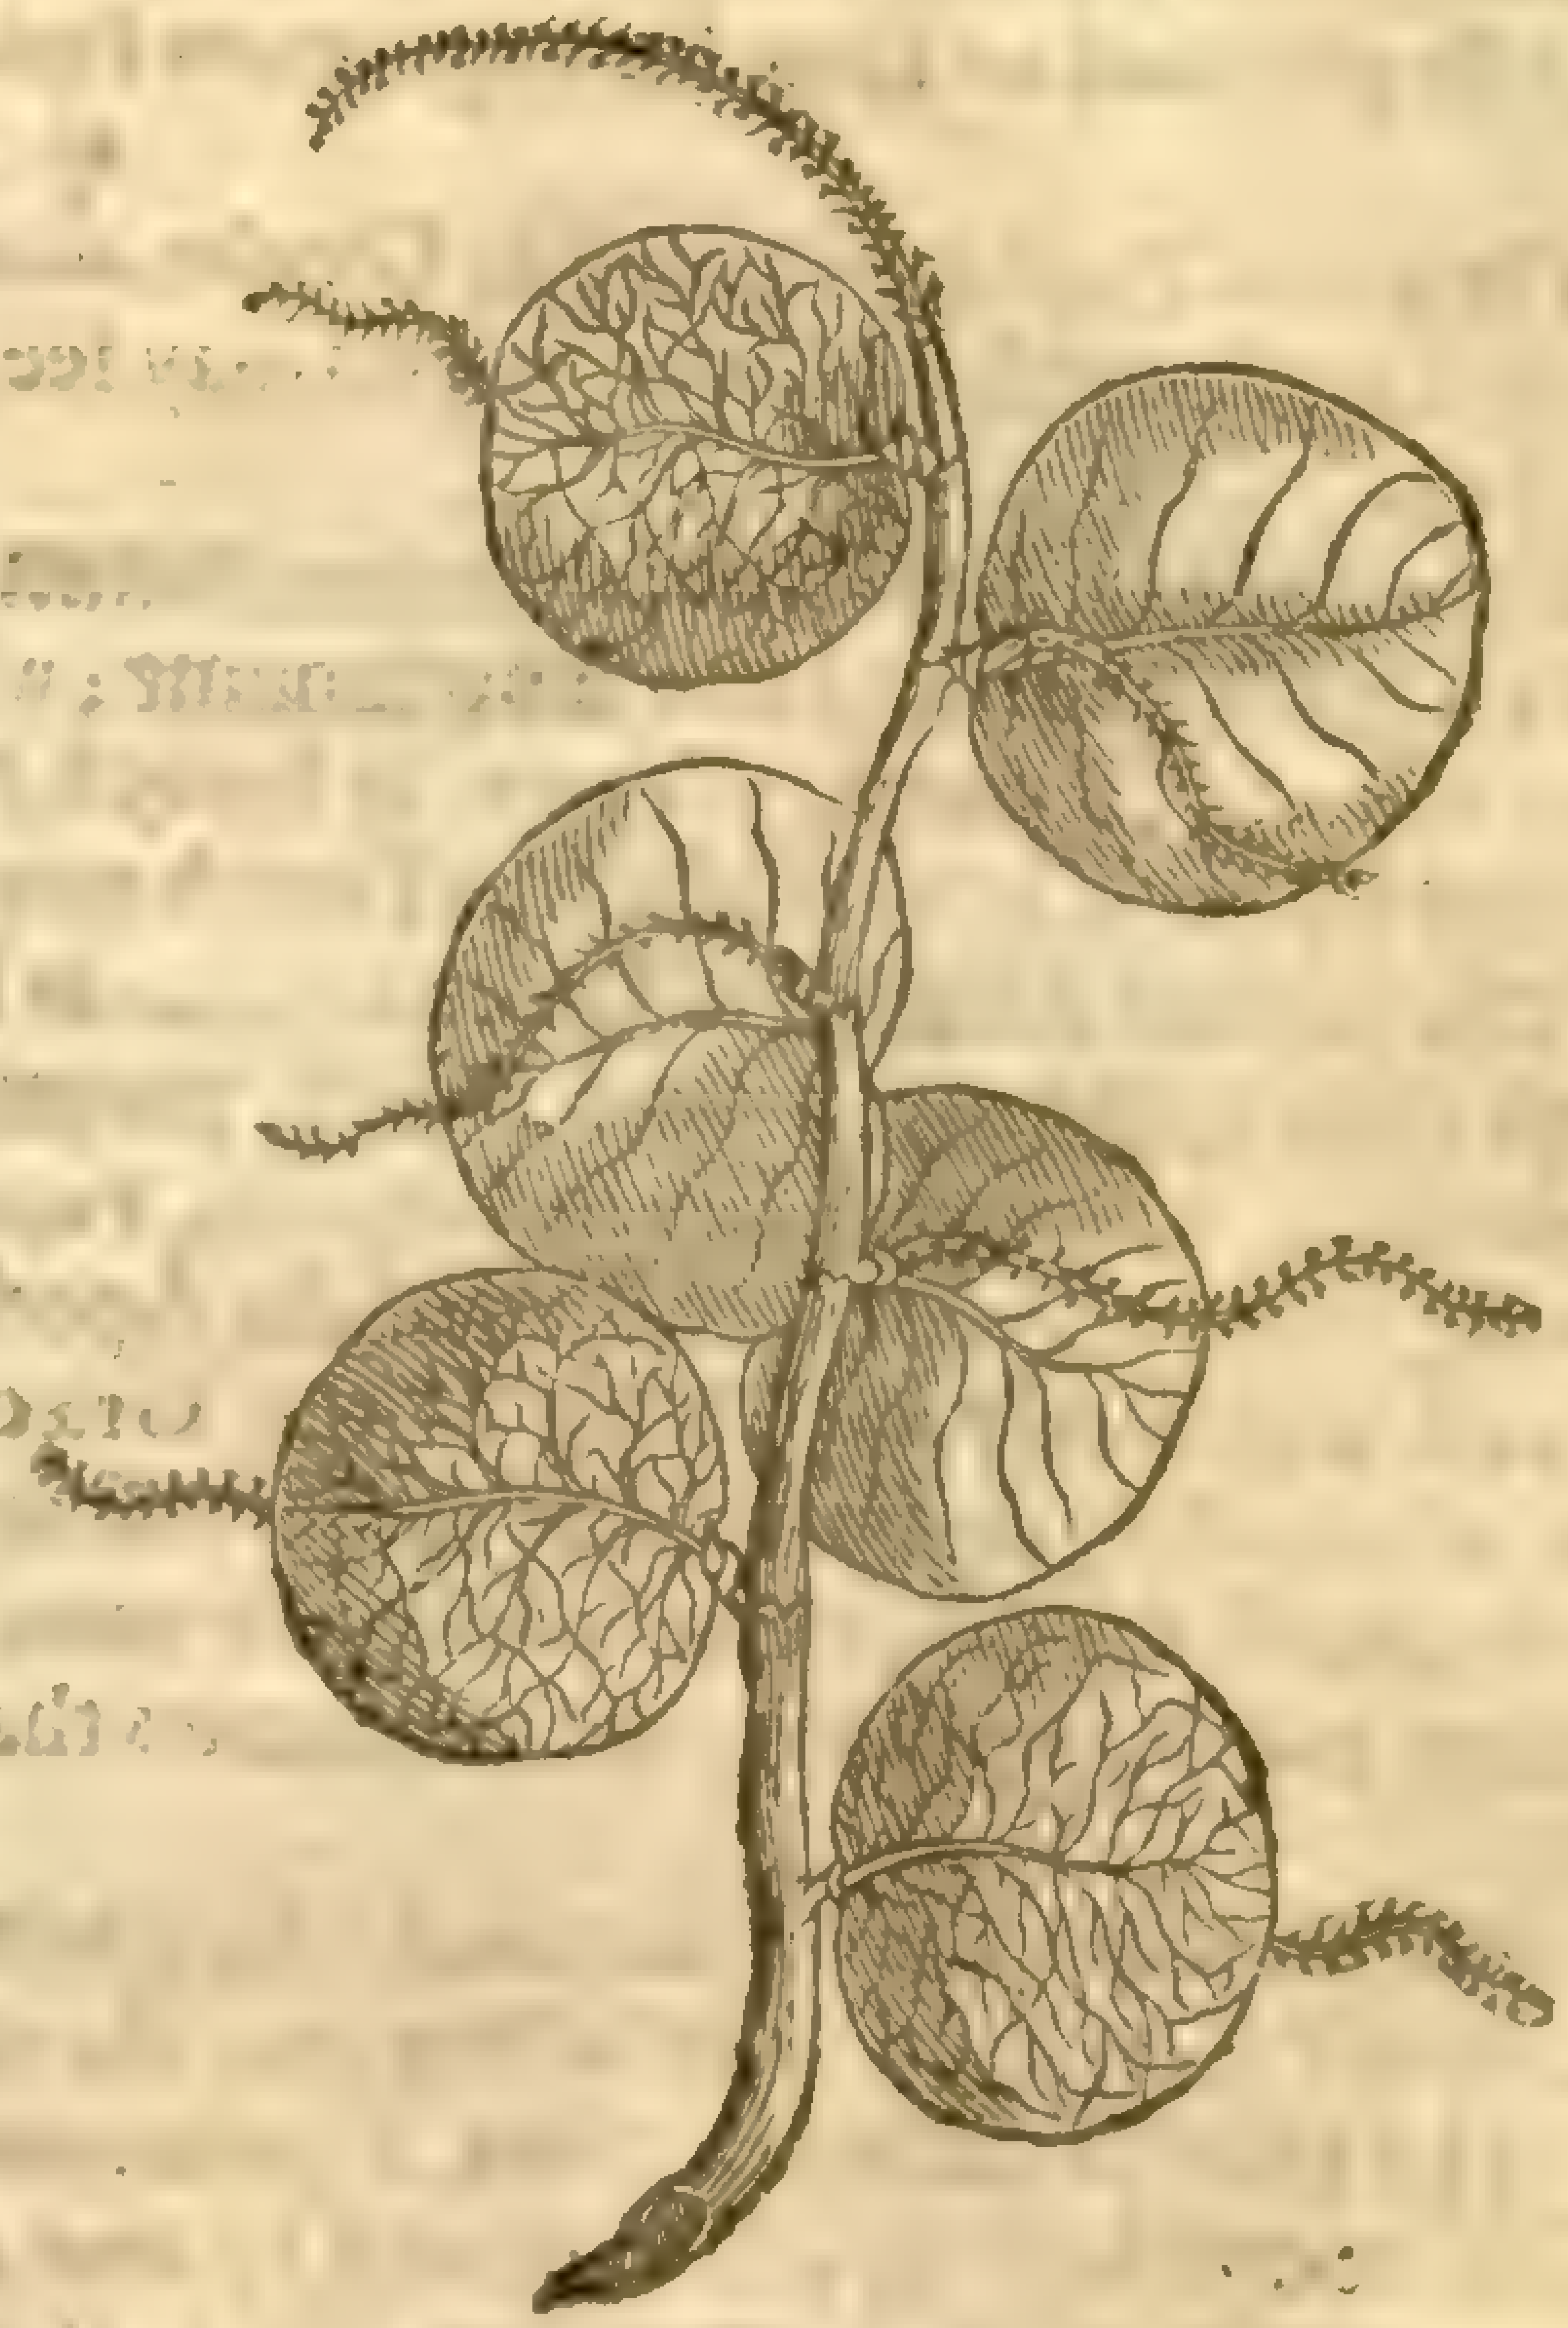
3 *Populus Libyca.*
The Aſpen tree.

P. tremula L.
Sm. fl. 4:244



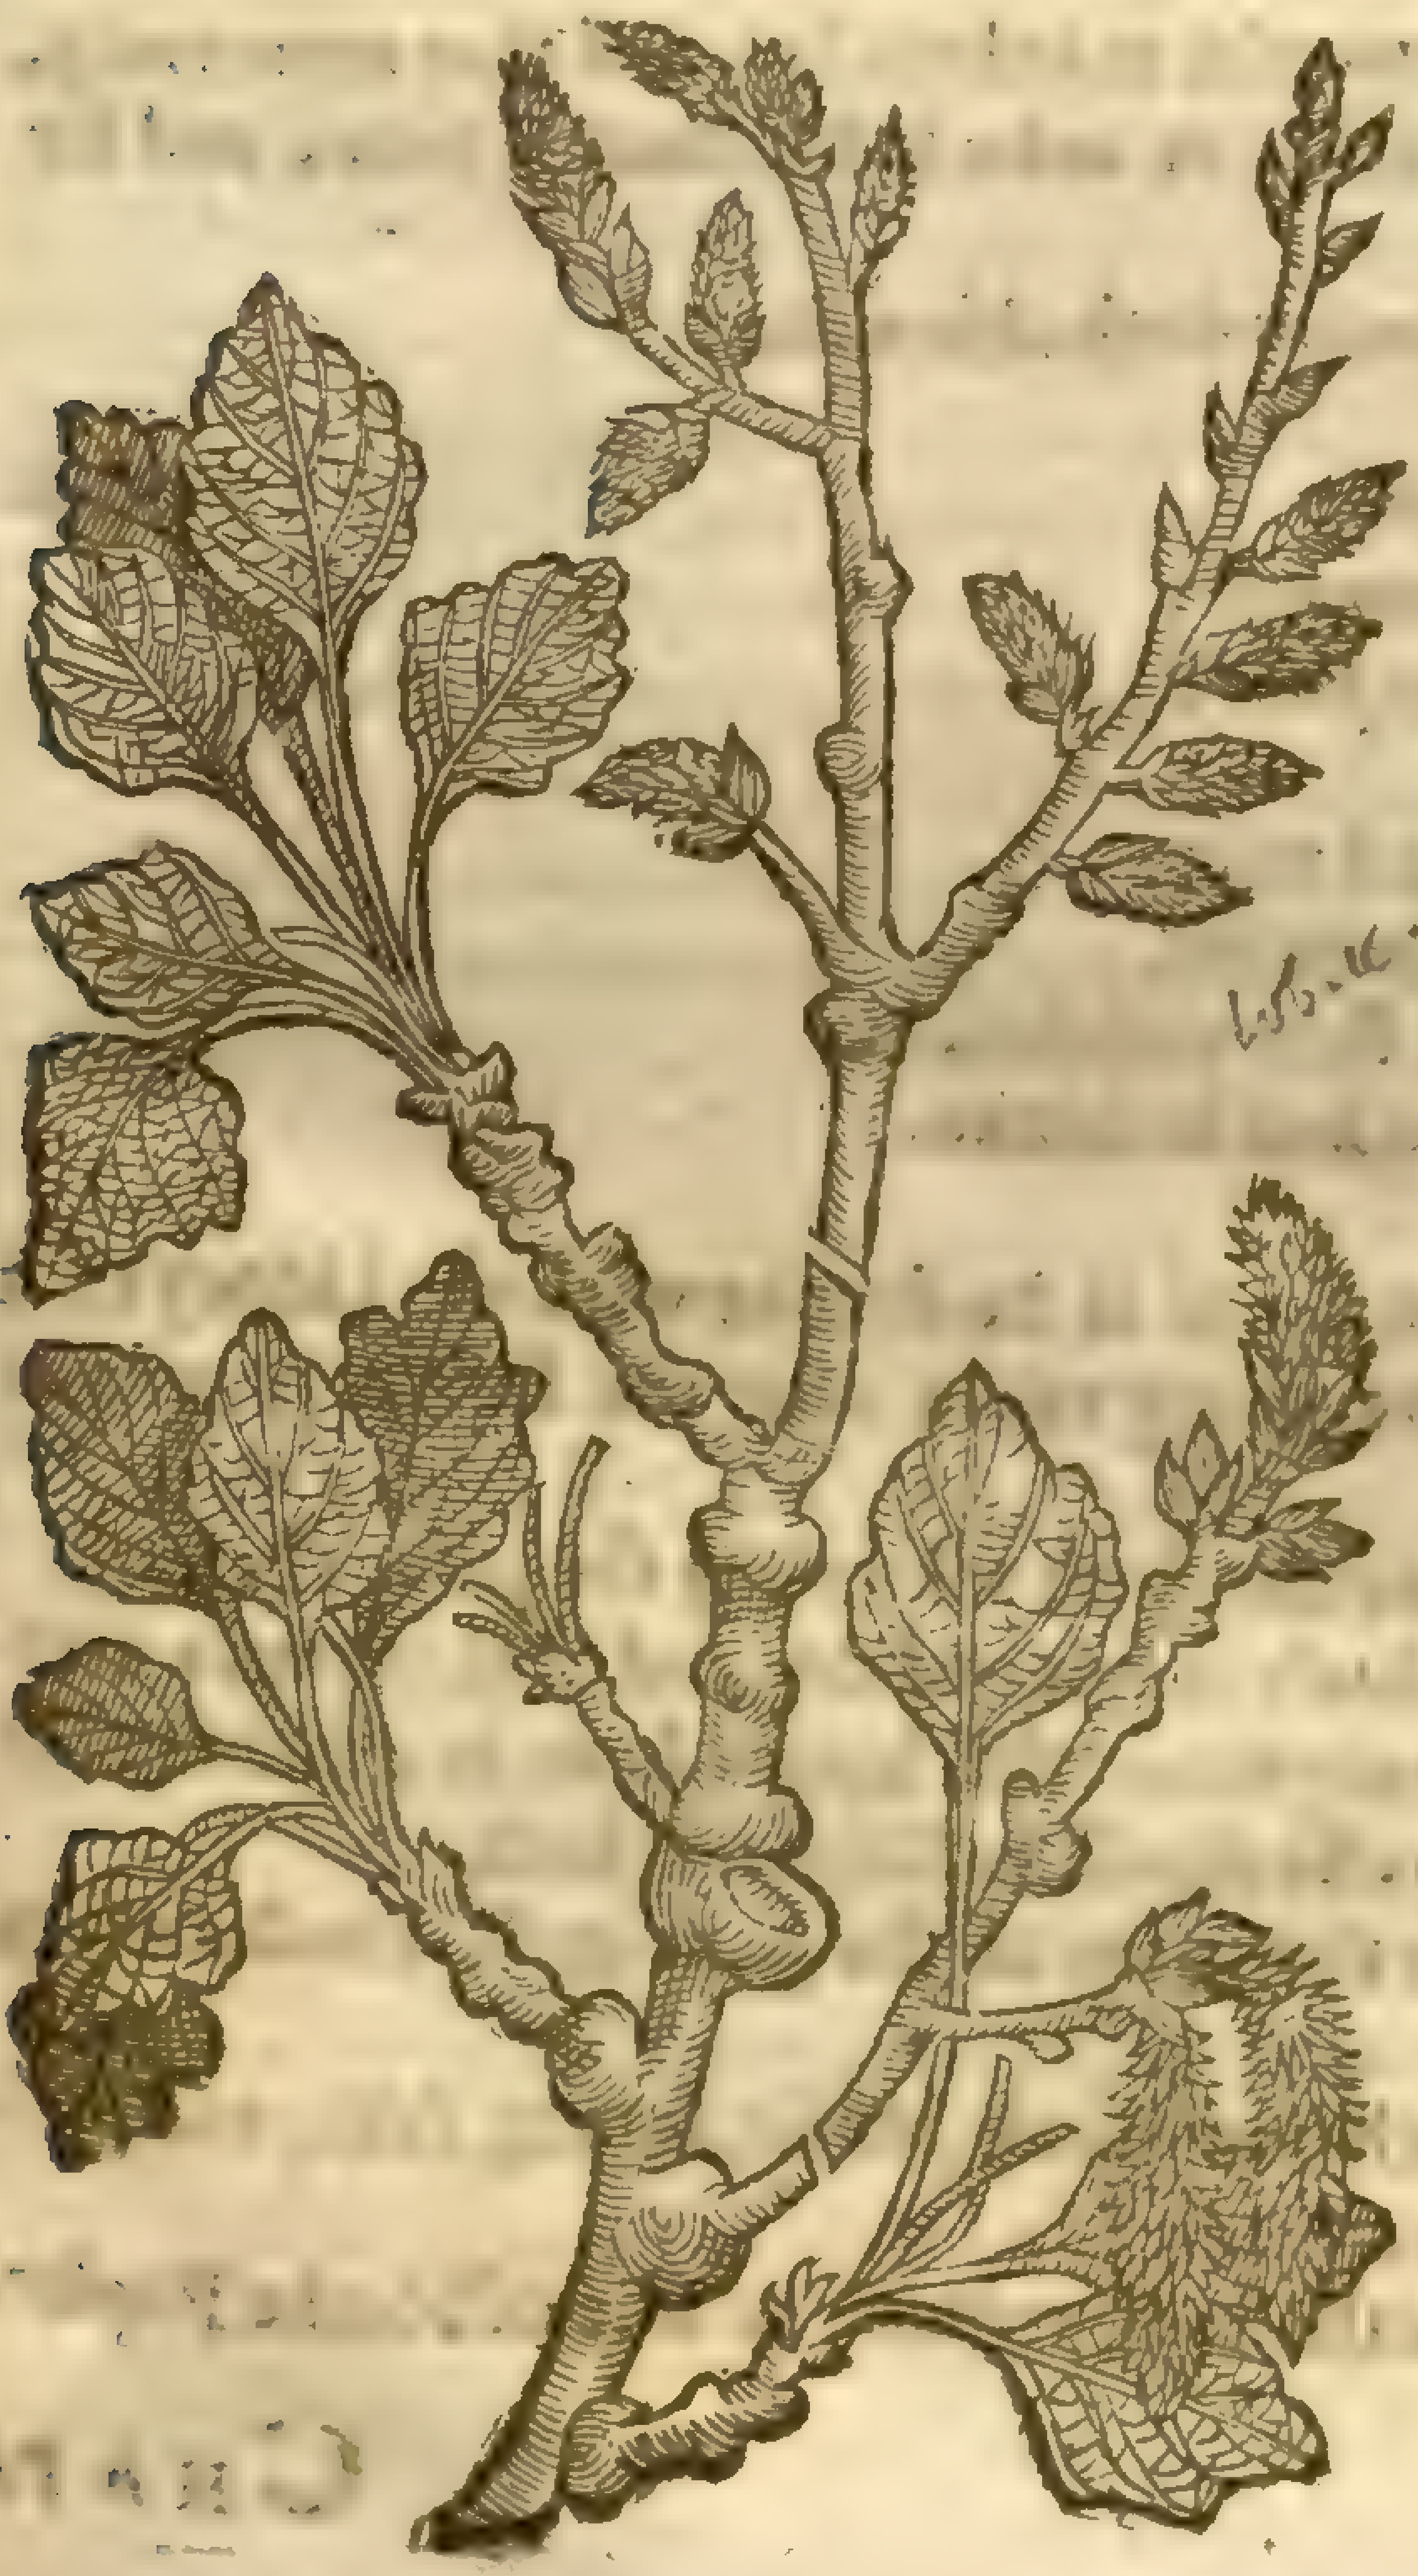
4 *Populus Americana.*
The Indian Poplar tree.

Wb. ii. 2.194



‡ 5 *Populus alba folijs minoribus.*
The leſſer leaued white Poplar.

Wb. ii. 2.193



P. canescens Willd
Sm. fl. 4:243

the Willow, full of ioynts where the leaues doe grow, of a perfect roundneſſe, ſaue where it cleaueth or groweth to the ſtalke: from the boſoms or corners of theſe leaues come forth ſmall aglets, like vnto our Poplar, but ſmaller: the leafe is thicke, and very like the leaues of *Arbor Iuda*, but broader, of an aſtringent taſte, ſomewhat heating the mouth, and ſaltiſh.

5 There is alſo another ſort of Poplar which groweth likewiſe vnto a great tree, the branches whereof are knotty and bunched forth as though it were full of ſcabs or ſores: the leaues come forth in tufts moſt commonly at the end of the boughes, not cut or jagged, but reſembling the leaues of that *Atriplex* called *Pes Anſerinus*; in colour like the former, but the aglets are not ſo cloſely packed together, otherwiſe it is like.

¶ *The Place.*

Theſe trees doe grow in low moiſt places, as in medowes neere vnto ditches, ſtanding waters and riuers.

The firſt kinde of white Poplar groweth not very common in England, but in ſome places here and there a tree: I found many both ſmall & great growing in a low medow turning vp a lane at the farther end of a village called Blacke-wall, from London; and in Eſſex at a place called Ouenden, and in diuers other places.

The Indian Poplar groweth in moſt parts of the Iſlands of the Weſt-Indies.

¶ *The Time.*

Theſe trees do bud forth in the end of March and beginning of Aprill, at which time the buds muſt be gathered to ſerue for *Vnguentum Populeon*.

¶ *The Names.*

The white Poplar is called in Greeke, Λευκή: in Latine, *Populus alba*: of diuers, *Farfarus*, as of *Plautus* in his Comedie *Penulus*, as you may ſee by his words ſet downe in the chapter of Colts-foot, *pag*. 813.

It is called in high Dutch, **Poppelbaum, Weiſz Albarbaum**: in low Dutch, **Abeel**, of his horie or aged colour, and alſo **Abeelboome**; which the Grammarians doe falſly interpret *Abies*, the Firre tree: in Italian, *Popolo nero*: in French, *Peuplier blanc*, *Aubel*, *Obel*, or *Aubeau*: in Engliſh, white Poplar tree, and Abeell, after the Dutch name.

The ſecond is called in Greeke, Αἴγειρος: in Latine, *Populus nigra*: by *Petrus Creſcentius*, *Albarus*: in high Dutch, **Aſpen**: in low Dutch, **Populier**: in Italian, *Popolo nero*: in French, *Peuplier noir*: in Spaniſh, *Alamo nigailho*: in Engliſh, Poplar tree, blacke Poplar, and Peplar. The firſt or new ſprung buds whereof are called of the Apothecaries, *Oculi Populi*, Poplar buds: others chuſe rather to call it *Gemma Populi*: ſome of the Græcians name it Σπίμα: whereupon they grounded their error, who raſhly ſuppoſed that thoſe roſenny or clammy buds are not to be put or vſed in the compoſition of the ointment bearing the name of the Poplar, and commonly called in Engliſh, Popilion and Pompillion; but the berries that grow in cluſters, in which there is no clammineſſe at all.

They are alſo as farre deceiued, who giuing credit to Poëts fables, doe beleeue that Amber commeth of the clammy roſin falling into the riuer Poo.

The third is called of diues, *Populus tremula*, which word is borrowed of the French-men, who name it *Tremble*: it alſo receiued a name amongſt the low-Country men, from the noiſe and ratling of the leaues, *viz*. **Rateeler**: this is that which is named of *Pliny*, *Libica*: and by *Theophr*. Κερκίς, which *Gaza* calleth *Populus montana*: in Engliſh, Aſpe, and Aſpen tree, and may alſo be called Tremble, after the French name, conſidering it is the matter whereof womens tongues were made, (as the Poets and ſome others report) which ſeldome ceaſe wagging.

¶ *The Temperature and Vertues.*

A The white Poplar hath a clenſing faculty, ſaith *Galen*, and a mixt temperature, conſiſting of a watery warme eſſence, and alſo a thin earthy ſubſtance.

B The barke as *Dioſcorides* writeth, to the weight of an ounce (or as others ſay, and that more truly, of little more than a dram) is a good remedy for the Sciatica or ache in the huckle bones, and for the ſtrangury.

C That this barke is good for the Sciatica, *Serenus Sammonicus* doth alſo write:

Sæpius occultus victa coxendice morbus
Perfurit, & greſſus diro languore moratur:
Populus alba dabit medicos de cortice potus.

An hidden diſeaſe doth oft rage and raine,
The hip ouercome and vex with the paine,
It makes with vile aking one tread ſlow and ſhrinke;
The barke of white Poplar is helpe had in drinke.

D The ſame barke is alſo reported to make a woman barren, if it be drunke with the kidney of a Mule, which thing the leaues alſo are thought to performe, being taken after the floures or reds be ended.

E The warme juice of the leaues being dropped into the eares doth take away the paine thereof.

F The Roſin or clammy ſubſtance of the blacke Poplar buds is hot and dry, and of thin parts, attenuating and mollifying: it is alſo fitly mixed *acopis & malegmatis*: the leaues haue in a manner the like operation for all theſe things, yet weaker and not ſo effectuall, as *Galen* teacheth.

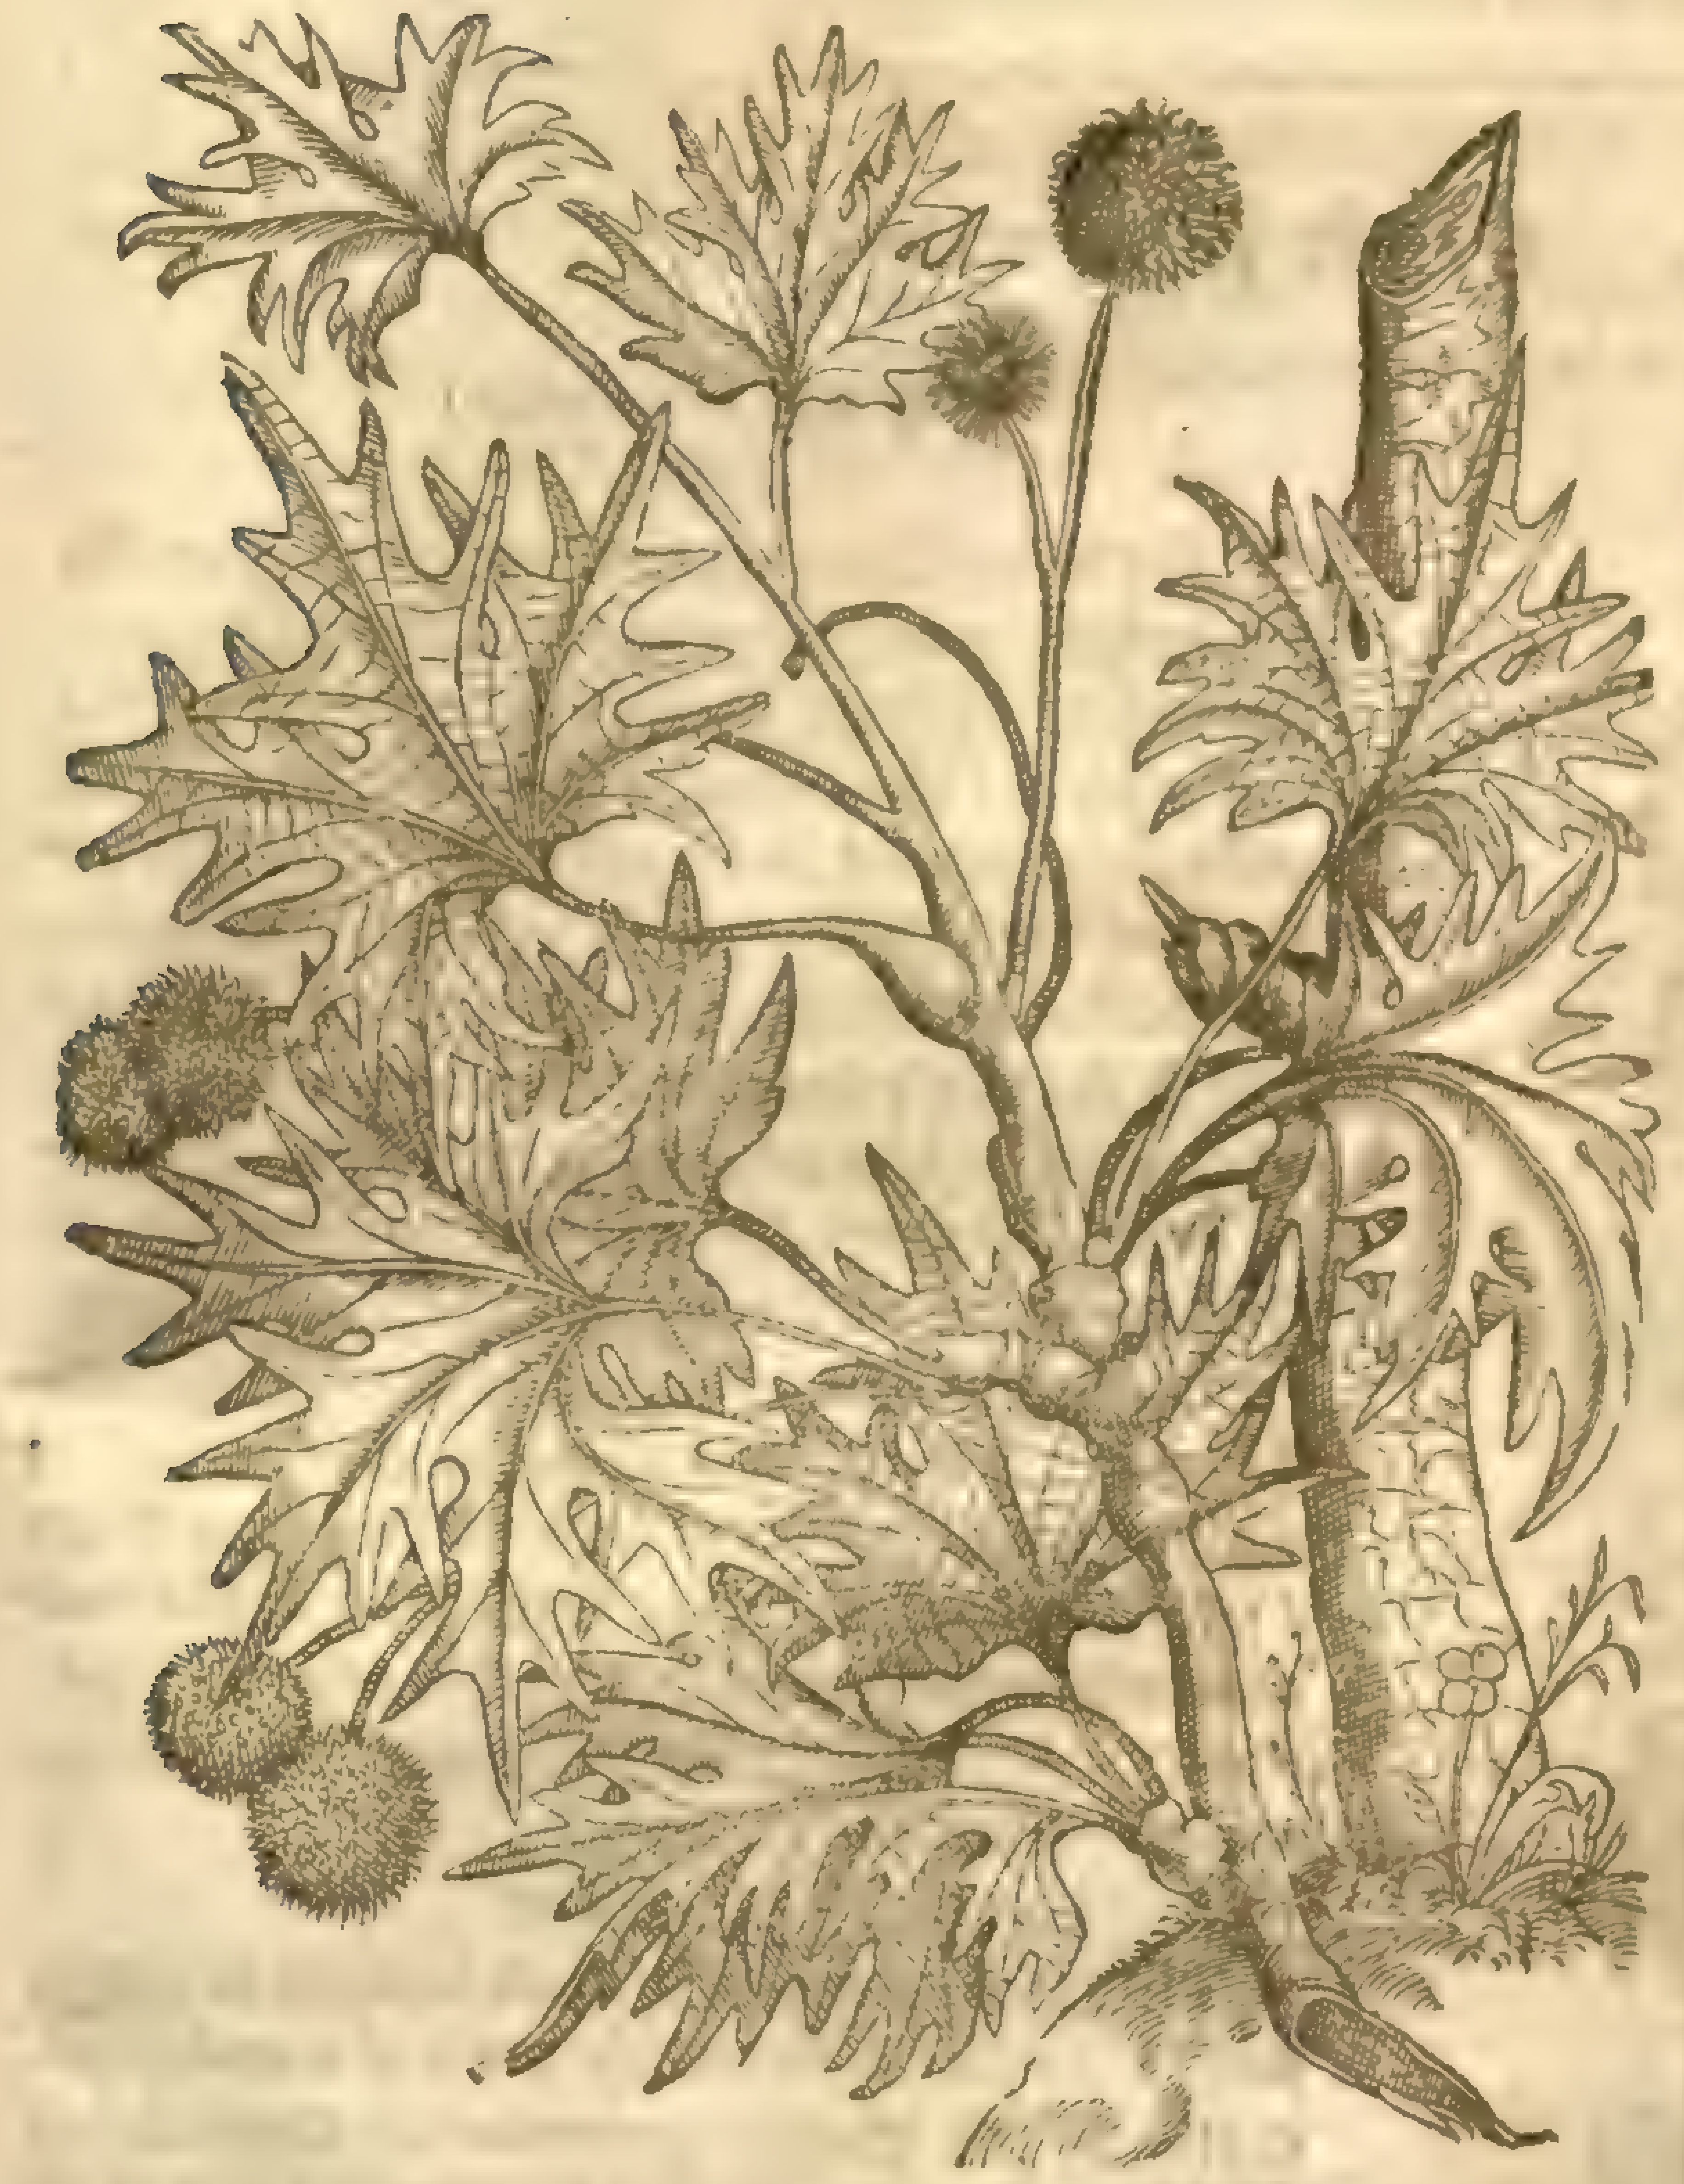
G The leaues and young buds of blacke Poplar aſſwage the paine of the gout in the hands or feet, being made into an ointment with May butter.

H The ointment made of the buds is good againſt all inflammations, bruſes, ſquats, falls, and ſuch like: this ointment is very well knowne to the Apothecaries.

I *Paulus Ægineta* teacheth to make an oile alſo hereof, called *Ægyrinum*, or oile of blacke Poplar.

CHAP. 120. *Of the Plane tree.*

Platanus.
The Plane tree.



¶ *The Deſcription.*

THe Plane is a great tree, hauing very long and farre ſpreading boughes caſting a wonderfull broad ſhadow, by reaſon wherof it was highly commended and eſteemed of among the old Romans: the leaues are cornered like thoſe of *Palma Chriſti*, greater than Vine leaues, and hanging vpon little red foot-ſtalkes: the floures are ſmall and moſſie, and of a pale yellowiſh colour: the fruit is round like a ball, rugged, and ſomewhat hairy; but in Aſia more hairy and greater, almoſt as big as a Walnut: the root is great, diſperſing it ſelfe far abroad.

¶ *The Place.*

The Plane tree delighteth to grow by ſprings or riuers: *Pliny* reports that they were wont to bee cheriſhed with wine: they grew afterward (ſaith he) to bee of ſo great honour (meaning the Plane trees) as that they were cheriſhed and watered with wine: and it is found by experience that the ſame is very comfortable to the roots, and wee haue already taught, that trees deſire to drinke Wine. This tree is ſtrange in Italy, it is no where ſeene in Germany, nor in the low-Countries: in Aſia it groweth plentifully: it is found alſo in Candy, growing in vallies, and neere vnto the hill Athos, as *Petrus Bellonius* in his Singularities doth declare: it groweth in many places of Greece, and is found planted in ſome places of Italy, for pleaſure rather than for profit. My ſeruant *William Marſhall* (whom I ſent into the Mediterranean ſea as Surgeon vnto the Hercules of London) found diuers trees hereof growing in Lepanto, hard by the ſea ſide, at the entrance into the towne, a port of Morea, beeing a part of Greece, and from thence brought one of theſe rough buttons, being the fruit thereof. ‡ There are one or two yong ones at this time growing with M^r^ *Tradeſcant*. ‡

The Plane trees caſt their leaues in Winter, as *Bellonius* teſtifieth, and therefore it is no maruell that they keepe away the Sun in Summer, and not at all in Winter: there is, ſaith *Pliny*, no greater commendation of the tree, than that it keepeth away the Sunne in Summer, and entertaineth it in Winter.

¶ *The Names.*

This tree is called in Greeke, Πλάτανος: and likewiſe in Latine *Platanus*: it beareth his name of the bredth: the French-mens *Plaſne* doth far differ from this, which is a kinde of Maple: this tree is named in Engliſh, Plane tree.

¶ *The Temperature and Vertues.*

The Plane tree is of a cold and moiſt eſſence, as *Galen* ſaith: the greene leaues are good to be laid vpon hot ſwellings and inflammations in the beginning. A

Being boiled in wine they are a remedy for the running and the watering of the eies, if they bee applied. B

The barke and balls do dry: the barke boyled in vineger helpeth the tooth-ache. C

The fruit of the Plane tree drunke with Wine helpeth the biting of mad dogs and ſerpents, and mixed with hogs greaſe it maketh a good ointment againſt burning and ſcalding. D

The burned barke doth mightily dry, and ſcoureth withall; it remoueth the white ſcurfe, and cureth moiſt vlcers. E

The

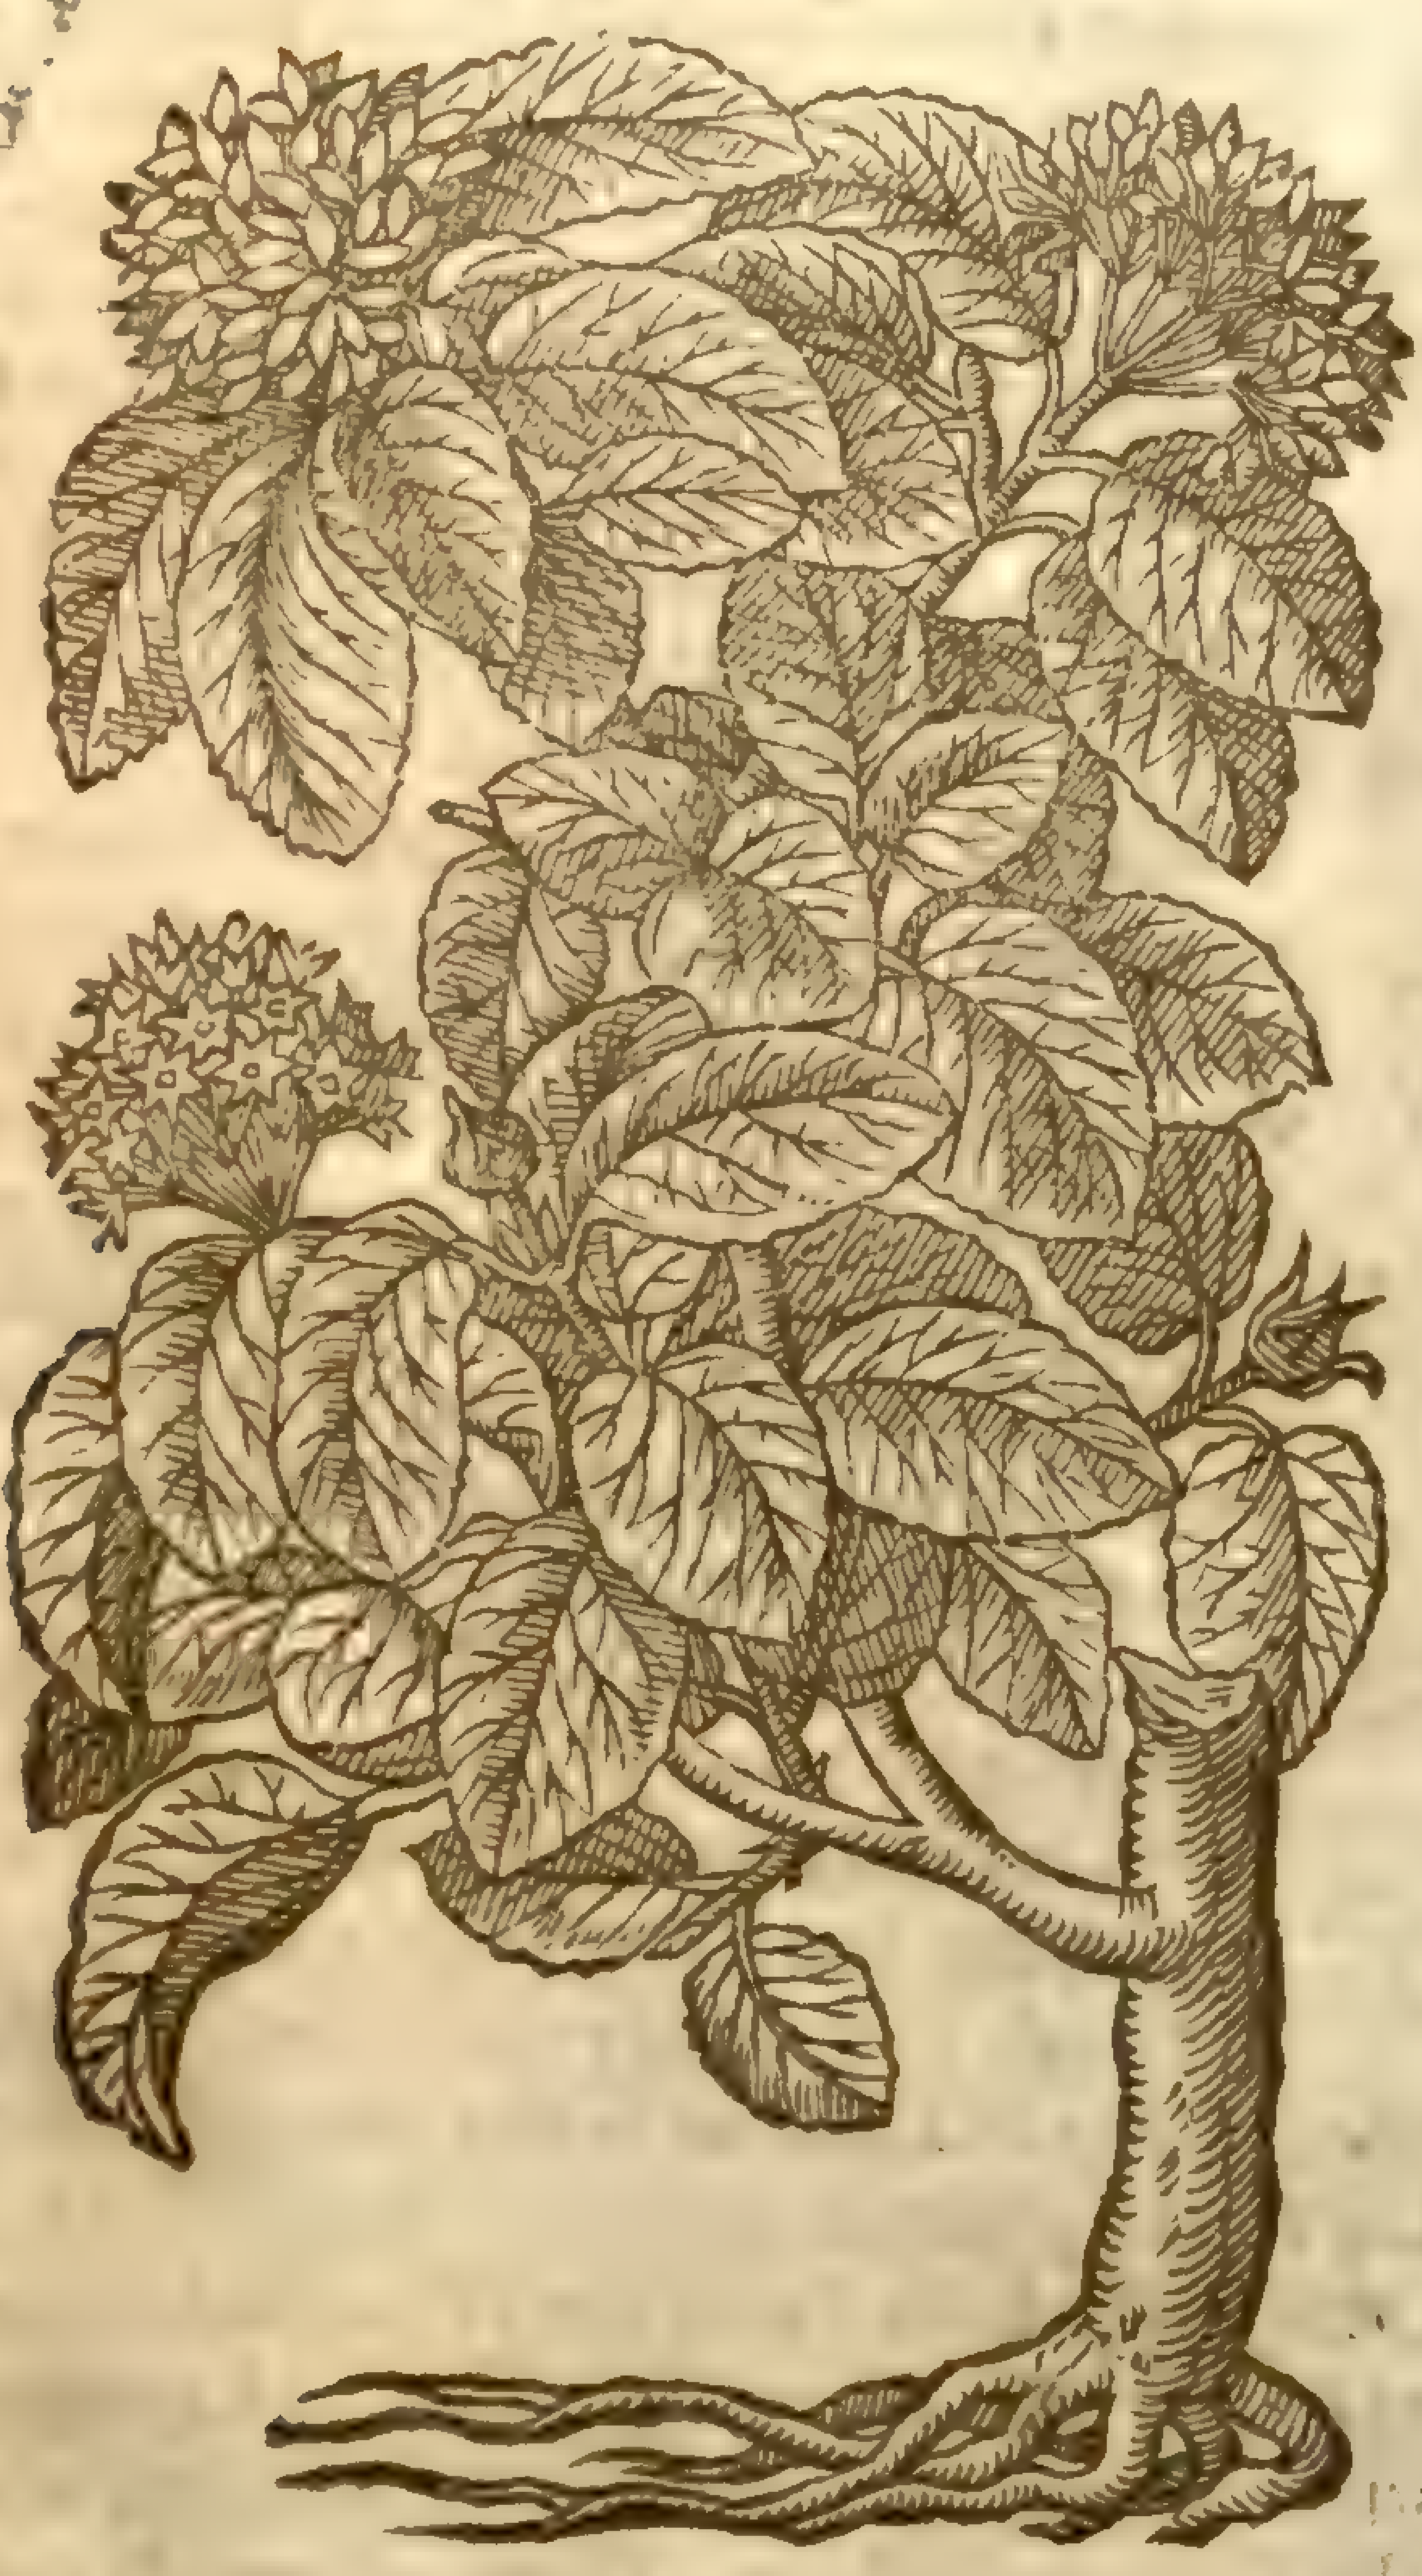
F The duſt or downe, ſaith *Galen*, that lieth on the leaues of the tree is to be taken heed of, for if it be drawne in with the breath, it is offenſiue to the winde-pipe by his extreme dryneſſe, and making the ſame rough, and hurting the voice, as it doth alſo the ſight and hearing, if it fall into the eyes or eares. *Dioſcorides* doth not attribute this to the duſt or downe of the leaues onely, but alſo to that of the balls.

Chap. 121. *Of the Wayfaring tree.*

Lantana, ſiue Viburnum.
The Wayfaring tree.

Viburnum Lantana L.
Sp. pl. 2.

Wh. ic. 2. 168



¶ *The Deſcription.*

The Wayfaring mans tree growes vp to the height of an hedge tree, of a meane bignes: the trunke or body thereof is couered with a ruſſet barke: the branches are long, tough, and eaſie to be bowed, and hard to be broken, as are thoſe of the Willow, couered with a ſoft whitiſh barke, whereon are broad leaues thicke and rough, ſleightly indented about the edges, of a white colour, and ſomewhat hairy whileſt they be freſh and green; but when they begin to wither and fall away, they are reddiſh, and ſet together by couples one oppoſit to another. The floures are white, and grow in cluſters: after which come cluſters of fruit of the bigneſſe of a peaſe, ſomewhat flat on both ſides, at the firſt greene, after red, and blacke when they be ripe: the root diſperſeth it ſelfe far abroad vnder the vpper cruſt of the earth.

¶ *The Place.*

This tree groweth in moſt hedges in rough and ſtony places, vpon hils and low woods, ſpecially in the chalky grounds of Kent about Cobham, Southfleet, and Grauefend, and in all the tract to Canterbury.

¶ *The Time.*

The floures appeare in Summer: the berries are ripe in the end of Autumne, and new leaues come forth in the Spring.

¶ *The Names.*

This hedge tree is called *Viurna* of *Ruellius*: in French, *Viorne*, and *Viorna*: in Italian, *Lantana*: it is reputed for the tree *Viburnum*, of which *Virgill* maketh mention in the firſt Eclog, where hee commendeth the City Rome for the loftineſſe and ſtatelineſſe thereof, aboue other Cities, ſaying, that as the tall Cypres trees do ſhew themſelues aboue the low and ſhrubby Viorne, ſo doth Rome aboue other Cities lift vp her head very high; in theſe verſes:

Verum hæc tantùm alias inter caput extulit vrbes,
Quantum lenta ſolent inter viburna cupreſſi.

But this all other cities ſo excels,
As Cypreſſe, which 'mongſt bending Viornes dwels.

‡ I judge *Viburnum* not to be a name to any particular plant, but a generall name to all low and bending ſhrubs; amongſt which this here deſcribed may take place as one. I enquired of a country man in Eſſex, if he knew any name of this: he anſwered, it was called the Cotton tree, by reaſon of the ſoftneſſe of the leaues. ‡

¶ *The Temperature.*

The leaues and berries of Lantana are cold and dry, and of a binding quality.

¶ *The Vertues.*

The decoction of the leaues of Lantaua is very good to be gargled in the mouth againſt all ſwellings and inflammations thereof, againſt the ſcuruie and other diſeaſes of the gums, and faſtneth looſe teeth. A

The ſame boyled in lee doth make the haires blacke if they be bathed or waſhed therewith, and ſuffered to dry of it ſelfe. B

The berries are of the like faculty, the pouder whereof when they be dried ſtay the laske, all iſſues of bloud, and alſo the whites. C

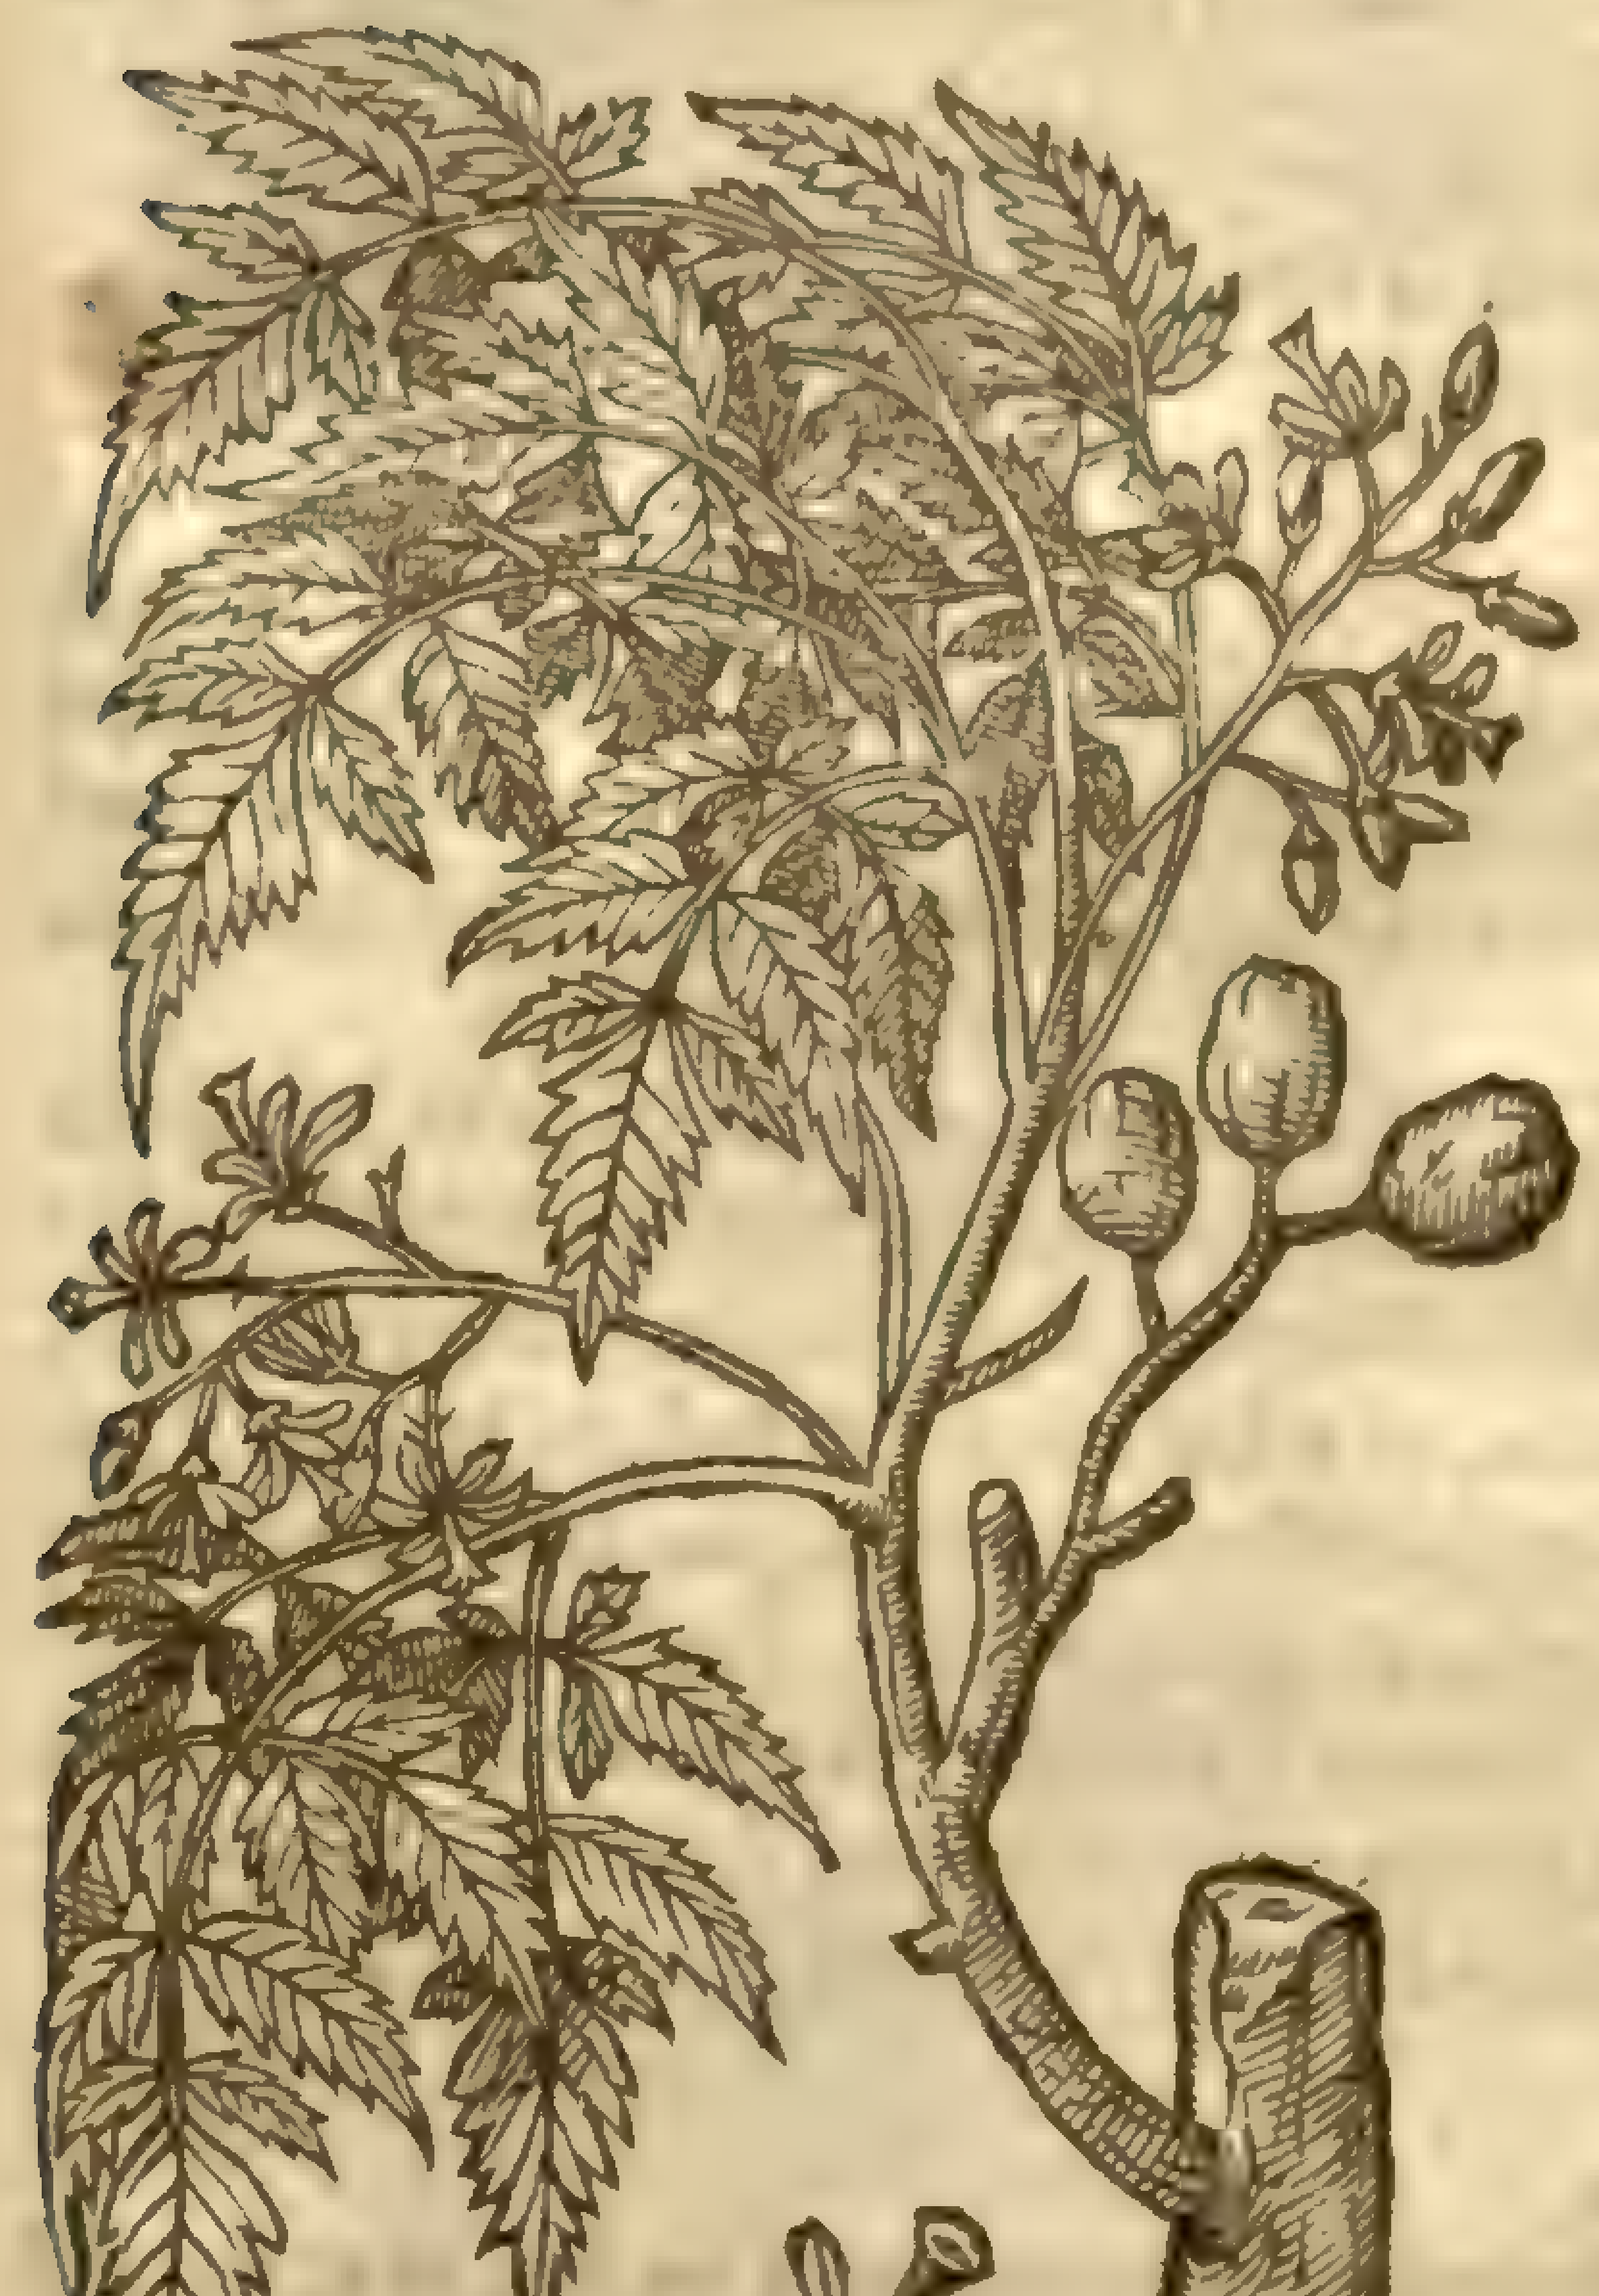
It is reported that the barke of the root of the tree buried a certaine time in the earth, and afterwards boyled and ſtamped according to Art, maketh good Bird-lime for Fowlers to catch Birds with. D

---

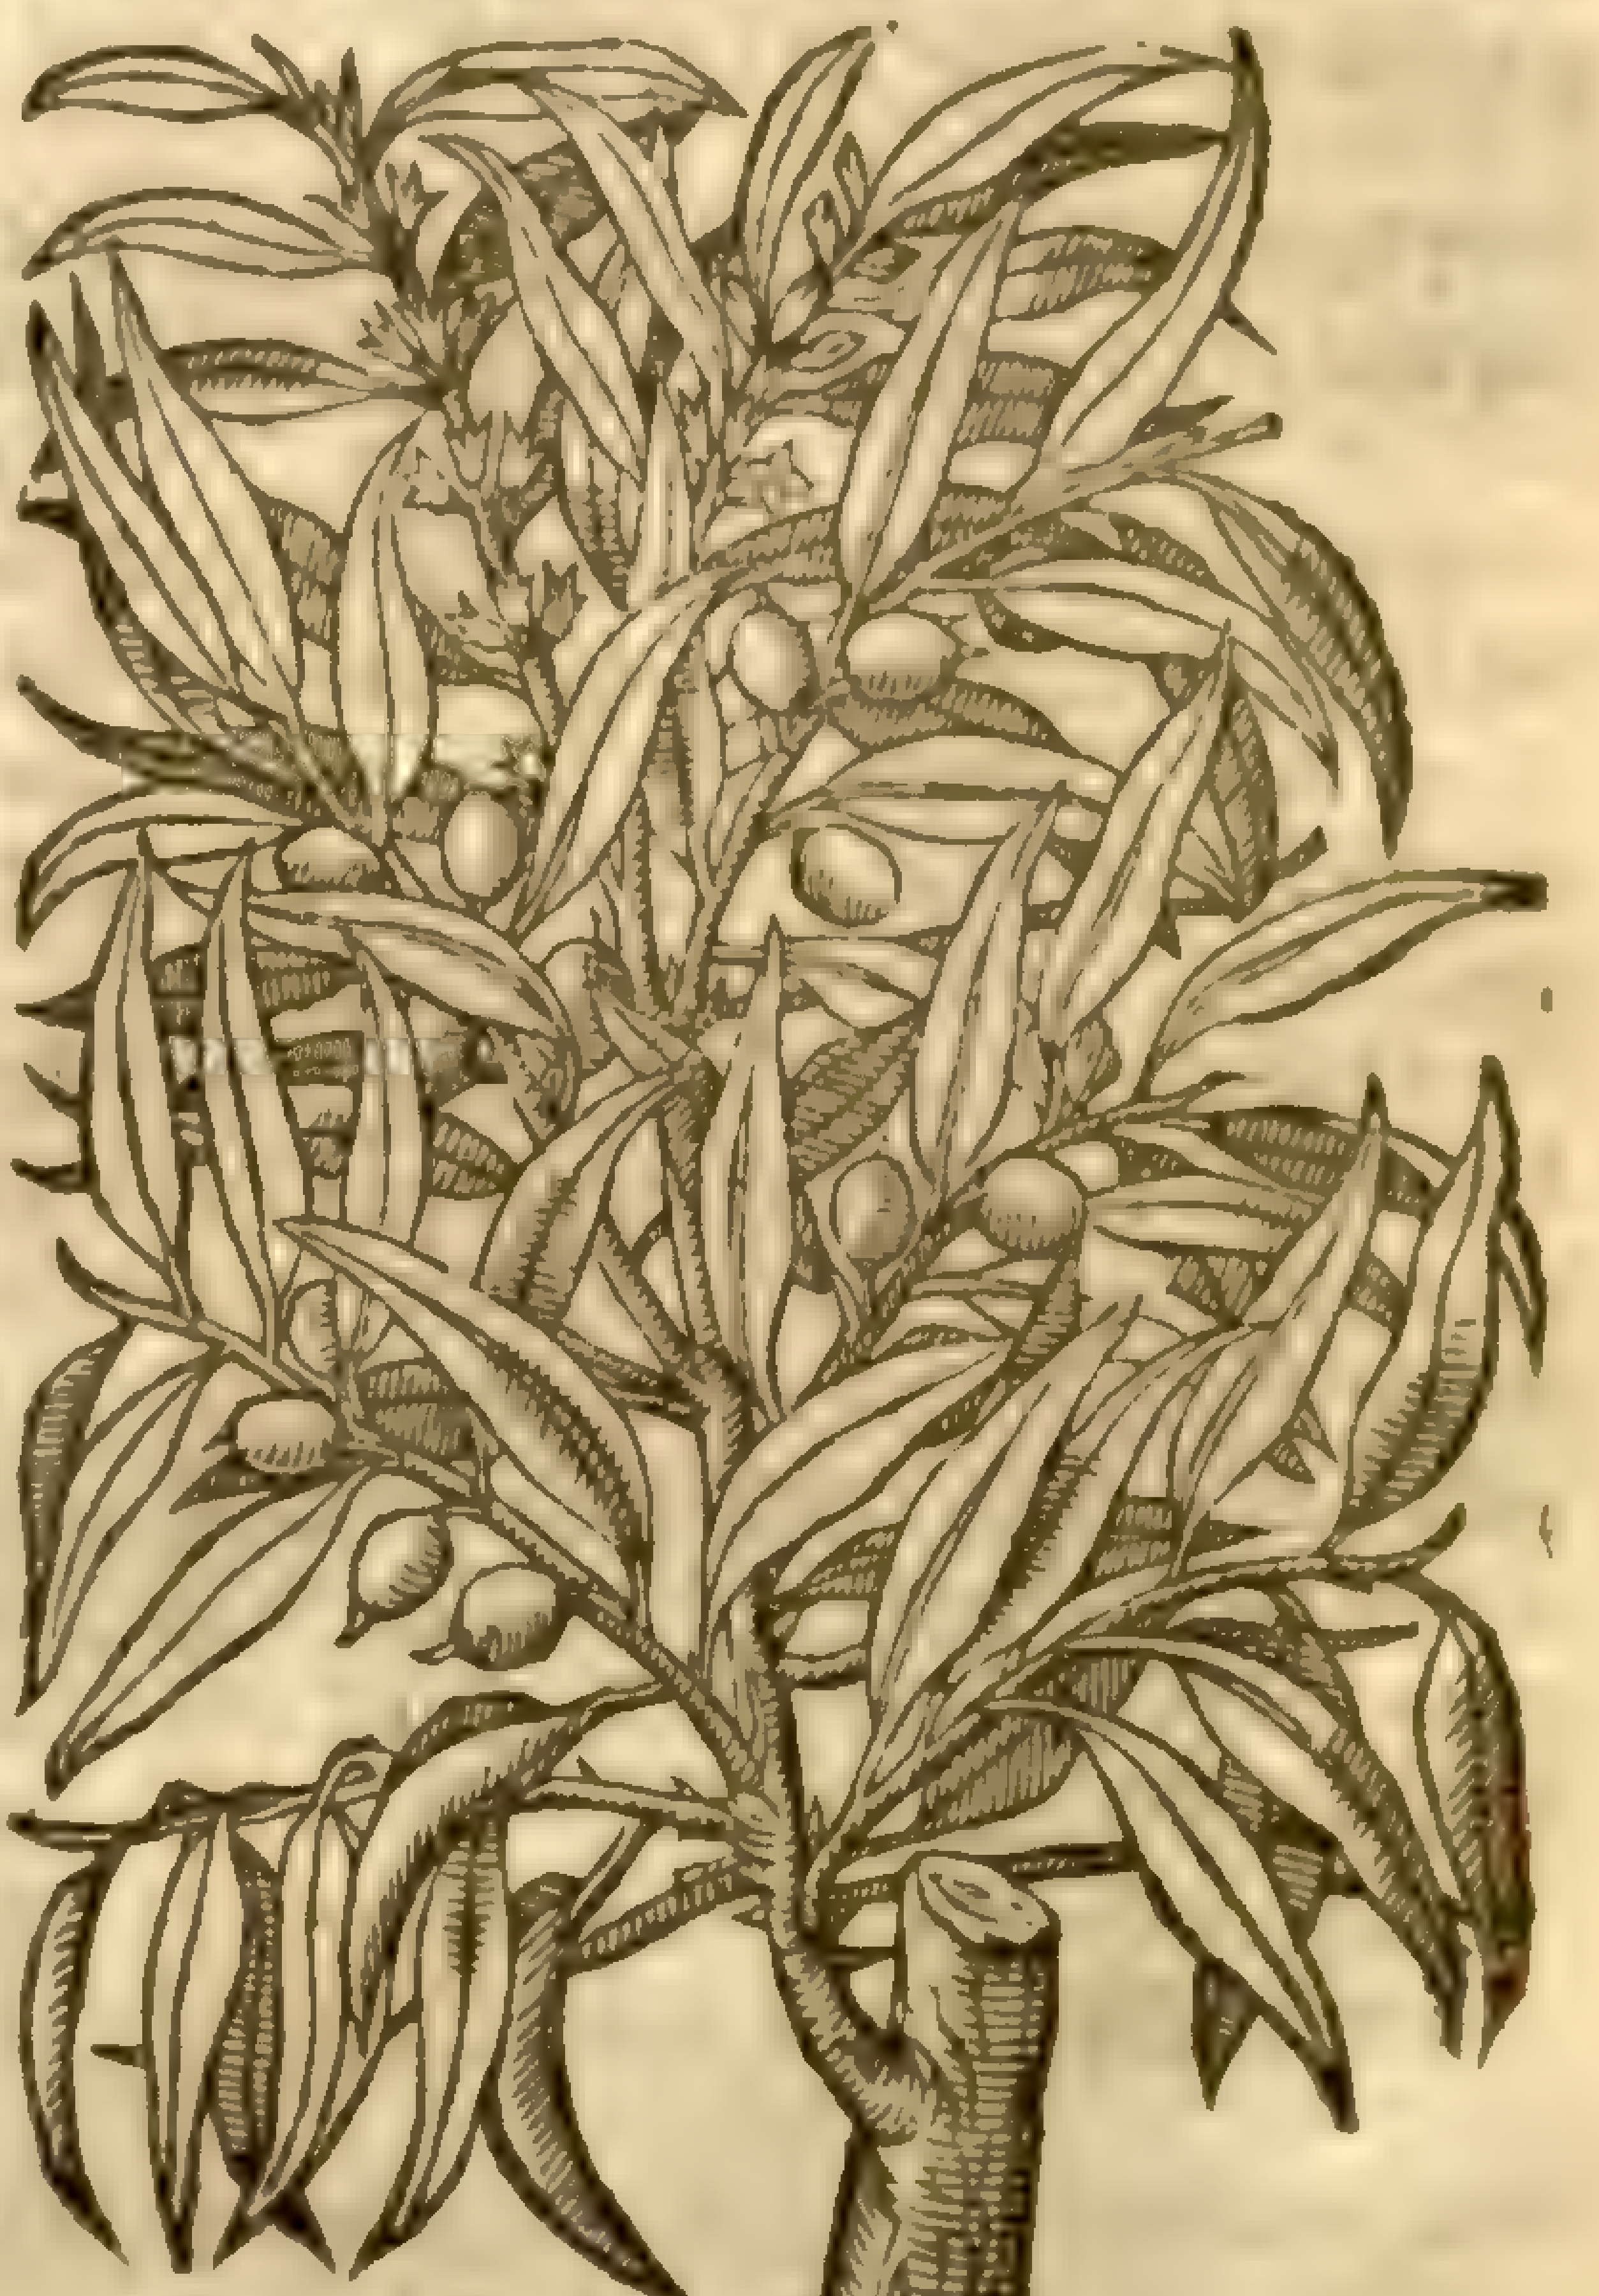
melia azedarach L. mill. dict.

Chap. 122. *Of the Beade tree.*

Elaeagnus angustifolia L. mill. dict.



1 *Zizypha candida.*
The Beade tree.



‡ 2 *Zizypha Cappadocica.*
The Beade tree of Cappadocia.

¶ *The Deſcription.*

1 THis tree was called *Zizypha candida* by the Herbariſts of Montpellier; and by the Venetians and Italians, *Sycomorus*, but vntruly: the Portugals haue termed it *Arbor Paradiſo*: all which and each whereof haue erred together, both in reſpect of the fruit and of the whole tree: ſome haue called it *Zizypha*, though in faculty it is nothing like; for the taſte of this fruit is very vnpleaſant, virulent and bitter. But deciding all controuerſies, this is the tree which *Auicen* calleth *Azederach*, which is very great, charged with many large armes, that are garniſhed with twiggie branches, ſet full of great leaues conſiſting of ſundry ſmall leaues, one growing right oppoſite to another like the leaues of the aſh tree or Wicken tree, but more deepely cut about the edges like the teeth of a ſaw: among which come the floures, conſiſting of fiue ſmall blew leaues layd abroad in manner of a ſtarre: from the middeſt whereof groweth forth a ſmall hollow cup

reſembling a Chalice: after which ſucceedeth the fruit, couered with a browniſh yellow ſhell, very like vnto the fruit of Iujubes (whereof *Dodonæus* in his laſt edition maketh it a kinde) of a rancke, bitter, and vnpleaſant taſte, with a ſix cornered ſtone within, which being drawne on a ſtring, ſerueth to make beades of, for want of other things.

2 *Zizyphus Cappadocica* groweth not ſo great as the former, but is of a meane ſtature, and full of boughes: the barke is ſmooth and euen, and that which groweth vpon the trunke and great boughes is of a ſhining ſcarlet colour: out of theſe great armes or boughes grow ſlender twigges, white and ſoft, which are ſet full of whitiſh leaues, but more white on the contrary or backe part, and are like to the leaues of Willow, but narrower, and whiter: amongſt theſe leaues come forth ſmall hollow yellowiſh floures, growing at the joynts of the branches, moſt commonly three together, and of a pleaſant ſauour, with ſome few threds or chiues in the middle thereof. After which ſucceedeth the fruit, of the bigneſſe and faſhion of the ſmalleſt Oliue, white both within and without, wherein is contained a ſmall ſtone which yeeldeth a kernell of a pleaſant taſte and very ſweet.

¶ *The Place.*

Matthiolus writeth, that *Ziziphus candida* is found in the cloiſters of many monaſteries in Italy; *Lobel* ſaith that it groweth in many places in Venice and Narbon; and it is wont now of late to be planted and cheriſhed in the goodlieſt orchards of all the low-Countries.

Zizyphus Cappadocica groweth likewiſe in many places of Italy, and ſpecially in Spaine: it is alſo cheriſhed in gardens both in Germany and in the low-Countries. ‡ It groweth alſo here in the garden of Mr *Iohn Parkinſon.* ‡

¶ *The Time.*

Theſe trees floure in Iune, in Italy and Spaine; their fruit is ripe in September; but in Germany and the low-Countries there doth no fruit follow the floures.

¶ *The Names.*

Zizyphus candida Auicen calleth *Azederach*, or as diuers read it, *Azederaeth*: and they name it, ſaith he, in Rechi, *Arbor Mirobalanorum*, or the Mirobalane tree, but not properly, and in Tabraſten, and Kien, and Thihich. The later writers are farre deceiued in taking it to be the Sycomore tree; and they as much, that would haue it to be the Lote or Nettle tree: it may be named in Engliſh, Beade tree, for the cauſe before alledged.

The other is *altera ſpecies Zizyphi*, or the ſecond kinde of Iuiube tree, which *Columella* in his ninth booke and fourth chapter doth call *Zizyphus alba*, or white Iuiube tree, for difference from the other that is ſyrnamed *Rutila*, or glittering redde. *Pliny* calleth this *Zizyphus Cappadocica*, in his 21 booke, ninth chapter, where he entreateth of the honour of Garlands, of which hee ſaith there be two ſorts, whereof ſome be made of floures, and others of leaues: I would call the floures (ſaith he) broomes, for of thoſe is gathered a yellow floure, and *Rhododendron*, alſo *Zizypha*, which is called *Cappadocica*. The floures of theſe are ſweet of ſmell, and like to Oliue floures. Neither doth *Colnmella* or *Pliny* vnaduiſedly take this for *Ziziphus*, for both the leaues and floures grow out of the tender and yong ſprung twigs, as they likewiſe do out of the former: the floures are very ſweet of ſmell, and caſt their ſauor far abroad: the fruit alſo is like that of the former.

¶ *The Temperature.*

Auicen writing and intreating of *Azadaraeth*, ſaith, that the floures thereof be hot in the third degree, and dry in the end of the firſt.

Zizyphus Cappadocica is cold and dry of complexion.

¶ *The Vertues.*

A The floures of *Zyzyphus*, or *Azadaraeth* open the obſtructions of the braine.

B The diſtilled water thereof killeth nits and lice, preſerueth the haire of the head from falling, eſpecially being mixed with whitewine, and the head bathed with it.

C The fruit is very hurtfull to the cheſt, and a troubleſome enemy to the ſtomacke; it is dangerous, and peraduenture deadly.

D Moreouer, it is reported, That the decoction of the barke and of Fumitory, with Mirobalans added, is good for agues proceeding of flegme.

E The juyce of the vppermoſt leaues with hony is a remedy againſt poyſon.

F The like alſo hath *Rhaſis*: the Beade tree, ſaith hee, is hot and dry: it is good for ſtoppings of the head: it maketh the haire long; yet is the fruit thereof very offenſiue to the ſtomacke, and oftentimes found to be pernitious and deadly.

G *Matthiolus* writeth, that the leaues and wood bringeth death euen vnto beaſts, and that the poyſon thereof is reſiſted by the ſame remedies that *Oleander* is.

H *Zizyphus Cappadocica* preuaileth againſt the diſeaſes aforeſaid, but the decoction therof is very good for thoſe whoſe water ſcaldeth them with the continuall iſſuing thereof, as alſo for ſuch as haue the running of the reines and the exulcerations of the bladder and priuy parts.

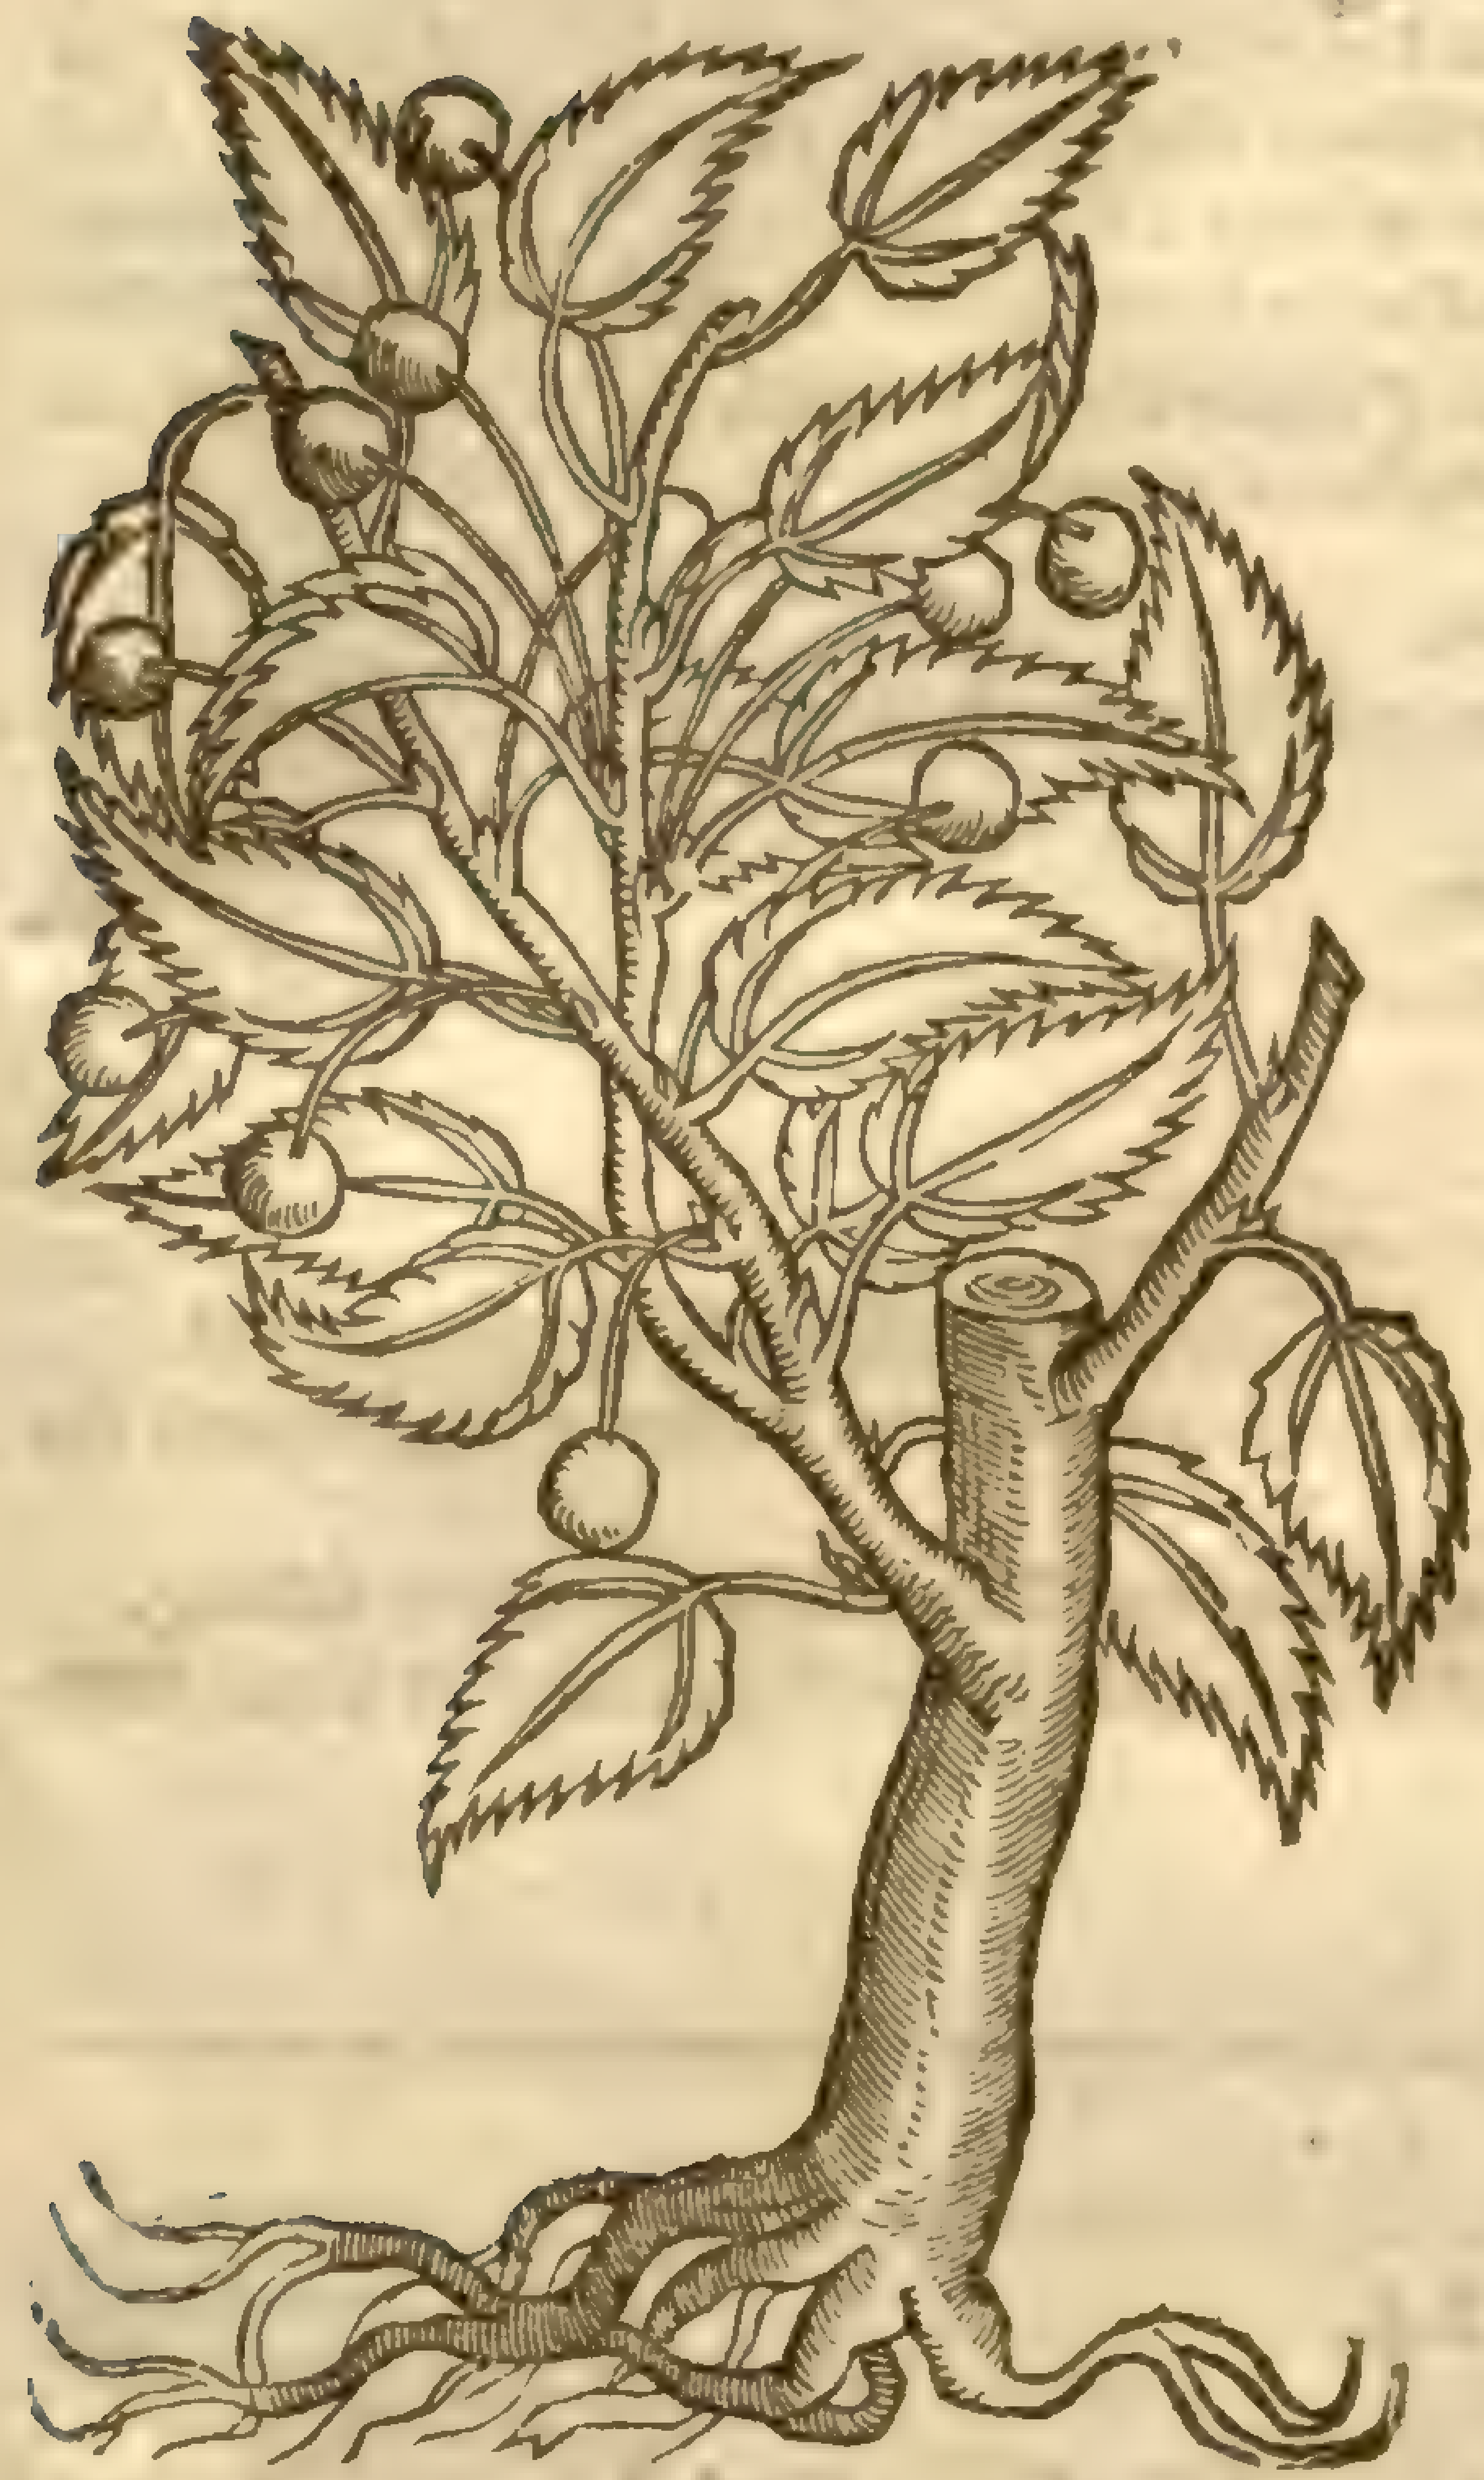
A looch or licking medicine made of it or the ſyrrup is excellent good againſt the ſpitting of bloud proceeding of the diſtillations of ſharp or ſalt humors. G

† The figure that formerly was in the ſecond place was of the narrow leafed kind of *Guaiacum Patavinum*, which you ſhall finde in the ſecond place of the next Chapter ſaue one.

Chap. 123. *Of the Lote or Nettle tree.*

Lotus arbor.
The Nettle tree.

Celtis australis [illegible]



¶ *The Deſcription.*

This Lote whereof we write is a tree as big as a Pear tree, or bigger & higher: the body and arms are very thick, the bark whereof is ſmooth, of a gallant greene colour tending to blewneſſe, the boughs are long, and ſpred themſelues all abroad: the leaues be like thoſe of the Nettle, ſharpe pointed and nickt in the edges like a ſaw, and daſht here and there with ſtripes of a yellowiſh white color: the beries be round and hang vpon long ſtalks like cherries, of a yellowiſh white colour at the firſt, and afterward red, but being ripe they are ſomwhat black.

¶ *The Place.*

This is a rare and ſtrange tree in both the Germanies; it was brought out of Italy, where there is found ſtore thereof, as *Matthiolus* teſtifieth. I haue a ſmall tree thereof in my garden. There is alſo a tree thereof in the garden vnder London wall, ſomtime belonging to M^r *Gray* an apothecarie of London; and another great tree in a garden neere Colemanſtreet in London, belonging to the Queens Apothecarie at the impreſſion hereof, called M^r *Hugh Morgan*, a curious Conſeruer of rare Simples. The Lote tree doth alſo grow in Africke, but it ſomewhat differs from the Italians Lote in fruit, as *Pliny* in plain words ſheweth, *lib.* 13. *cap.* 17. That part of Africk, ſaith he, that lieth toward vs, brings forth the famous Lote tree which they call *Celtis*, and the ſame well known in Italy, but altered by the ſoile: it is as big as the Peare tree, although *Nepos Cornelius* reporteth it to be ſhorter; the leaues are full of fine cuts, otherwiſe they be thought to be like thoſe of the Holme tree. There be many differences, but the ſame are made ſpecially by the fruit, which is as big as a beane, of the colour of Saffron, but before it is thorow ripe it changeth his colour as doth the grape. It growes thick among the boughs after the maner of Myrtle, not as in Italy, after the maner of the Cherry: the fruit of it is there ſo ſweet, as it hath alſo giuen a name to that Country and land, Too hoſpitable to ſtrangers, and forgetfull of their own country.

It is reported that they are troubled with no diſeaſes of the belly that eat it. The better is that which hath no kernell, which in the other kind is ſtony; there is alſo preſſed out of it a Wine like to a ſweet wine, which the ſame *Nepos* denieth to endure aboue ten daies, and the berries ſtamped with *Alica* are reſerued in veſſels for food. Moreouer, we haue heard ſay that armies haue beene fed therewith as they haue paſſed to and fro thorow Africk. The colour of the wood is black, they vſe to make flutes and pipes of it; the root ſerueth for knife hafts and other ſhort works; this is there the nature of the tree. Thus far *Pliny*. In the ſame place he ſaith that this renowned tree groweth about Syrtes and Naſamonæ. And *lib.* 5. *ca.* 7. he ſheweth, that there is not far from the leſſer Syrtes the Iſland Menynx, ſyrnamed Lotophagitis, of the plenty of Lote trees.

*Strabo,li.*17. affirmeth,that not only Menynx but alſo the leſſer Syrtis is thought to be *Lotophagitis*: Firſt,ſaith he,lieth Syrtis,a certain long Iſland by the name Cercinna,and another leſſer,called Cercinnitis; next to this is the leſſer Syrtis,which they cal Lotophagitis Syrtis:the compaſſe of this gulfe is almoſt 1600 furlongs, the bredth of the mouth 600. By both the capes there be Iſlands ioined to the main land,that is,Circinna and Menynx,of like bigneſſe:they think that Menynx is the country of the Lotophagi,or thoſe that feed of the Lote trees. Of which country *Homer* maketh mention,and there are certain monuments to be ſeen,and *Vlyſſes* altar,and the fruit it ſelfe, for there be in it great plenty of Lote trees,whoſe fruit is wonderfull ſweet. So ſaith *Strabo*.

This Lote is alſo deſcribed by *Theophraſtus,li.*4.where he ſaith there are very many kinds which be ſeuered by the fruit: the fruit is of the bignes of a bean, which when it waxeth ripe altereth his colour as Grapes do. The fruit of which the Lotophagi eat is ſweet, pleaſant,harmleſſe,and wholſome for the belly,but that is pleaſanter which is without kernels,whereof they make their wine.

This Lote tree,as the ſame author affirmeth,is by nature euerlaſting,witneſſe thoſe wherof *Pliny* writ,*lib.*16.*cap.*44. At Rome(ſaith he)the Lote tree in *Lucina's* court, how much elder it was than the church of the city (built in the yeare which was without magiſtrats, 469) is vncertaine. But doubtleſſe it was elder, becauſe *Lucina* bare the name of that *Lucus* or groue. This is now about 450 yeares old. That is elder which is ſyrnamed *Capillata* or hairy,becauſe the haire of the Veſtal Virgins was brought vnto it:but the other Lote tree in *Vulcans* church,which *Romulus* built by the victorie of tenths,is taken to be as old as the city,as *Maſſurius* witneſſeth.

¶ *The Time.*

They loſe their leaues at the firſt approch of winter, and recouer them again in Aprill:the fruit is ripe in September.

¶ *The Names.*

The tree is called in Greek, Λωτὸς: in Latine by *Pliny*,*Celtis*: in Italian, *Perlaro*: by thoſe of Trent, *Bagolaro*: in Engliſh,Lote tree,and Nettle tree.

¶ *The Temperature and Vertues.*

A The Lote tree is not greatly binding,as *Galen* ſaith,but of thin parts,and of a drying nature.

B The decoction of the wood beaten ſmall, being either drunke or vſed cliſter-wiſe, helpeth the bloudy flix,the whites and reds.

C It ſtops the laſk,and maketh the haire yellow,and as *Galen* ſaith keepeth haires from falling.

D The ſhiuers or ſmall pieces thereof,as the ſame Author ſaith,are boiled ſomtimes in water,ſomtimes in wine,as need ſhall require.

Chap. 124.

Of Italian Wood of Life,or Pock-wood, vulgarly called Lignum vitæ.

¶ *The Deſcription.*

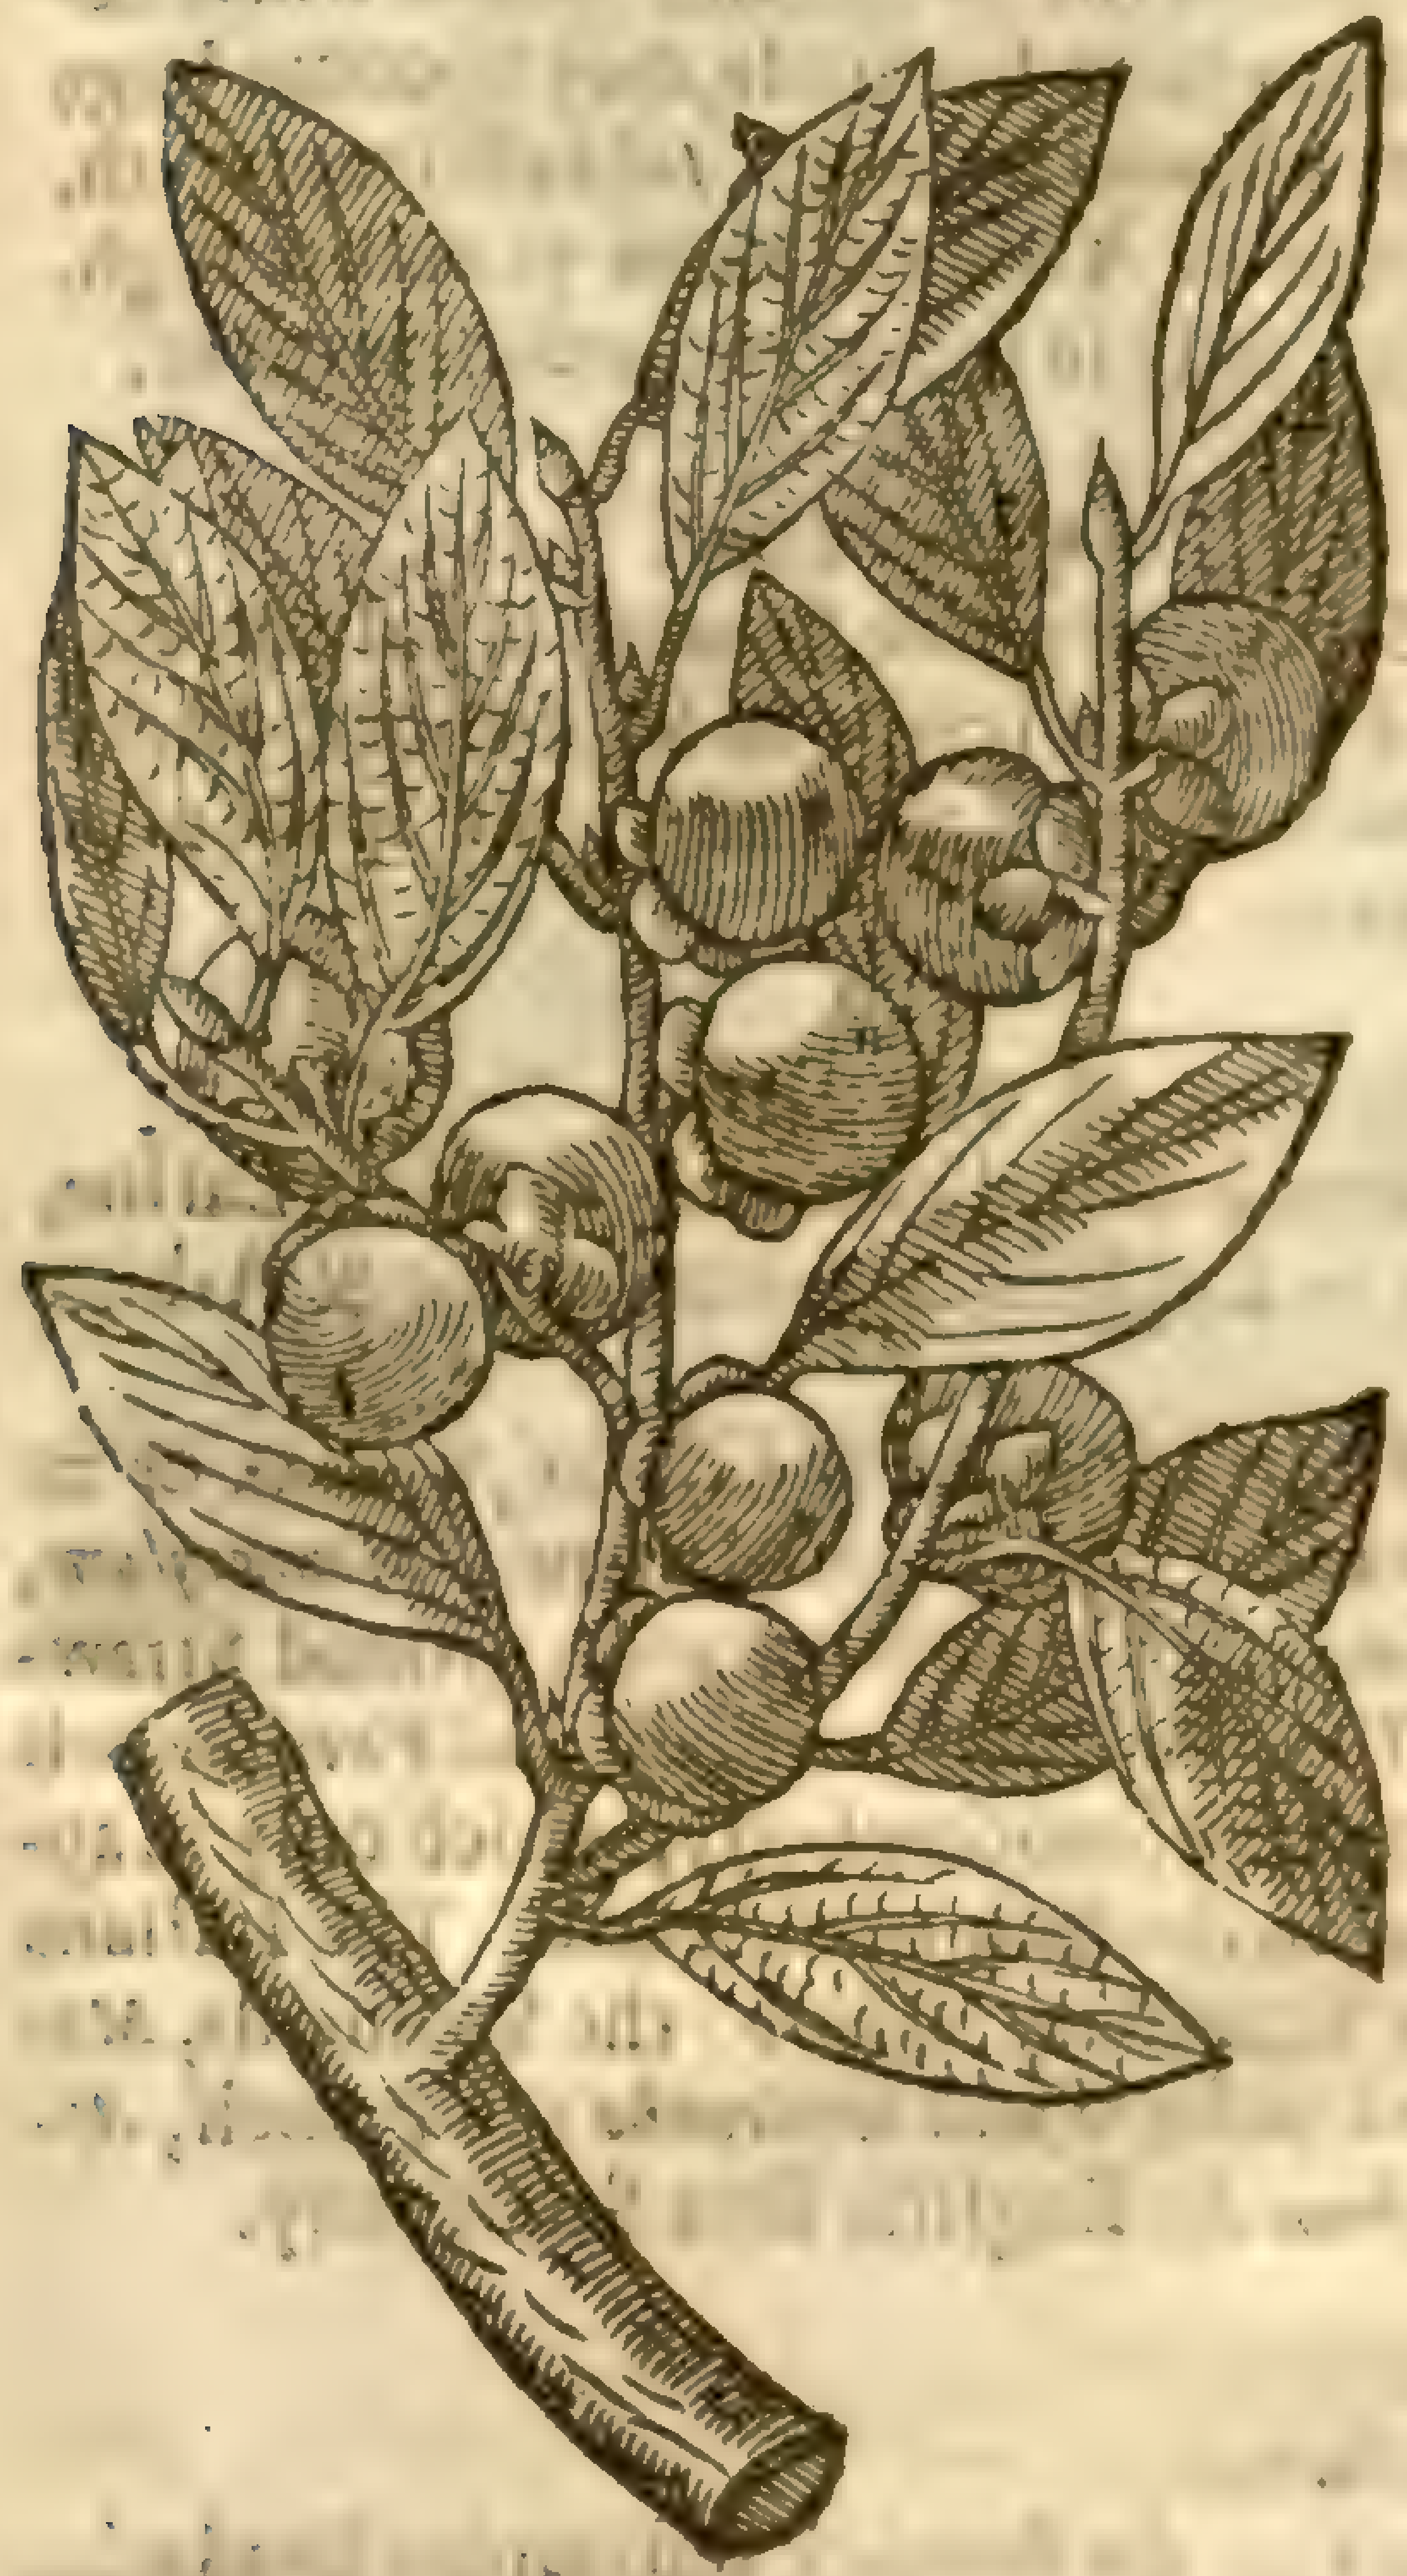
1 Italian *Lignum vitæ* or Wood of life grows to a faire and beautifull tree,hauing a ſtraight and vpright body couered ouer with a ſmooth and dark green barke, yeelding forth many twiggy branches ſet forth of goodly leaues like thoſe of the Pear tree,but of greater beauty,and ſomwhat broader; amongſt which comes forth the fruit, growing cloſe to the branches,almoſt without ſtalks; this fruit is round,at the firſt green,but black when it is ripe, as big as Cherries,of an excellent ſweet taſt when it is dried. But this is not the Indian *Lignum ſanctum* or *Guaiacum* whereof our bowles and phyſical drinks be made,but it is a baſtard kinde thereof, firſt planted in the common garden at Padua by the learned *Fallopius*,who ſuppoſed it to be the right *Guaiacum*.

‡ 2 The leaues of this are longer and narower than the former,but firm alſo and neruous like as they are; the fruit is in ſhape like Sebeſtens,but much leſſe, of a blewiſh colour when it is ripe, with many little ſtones within; the taſte hereof is not vnpleaſant. *Matthiolus* cals this *Pſeudolotus*; and *Tabern.* *Lotus Africana*; whoſe figure our Author in the laſt chapter ſaue one gaue vnfitly for the *Zizyphus Cappadocica.* ‡

¶ *The Place.*

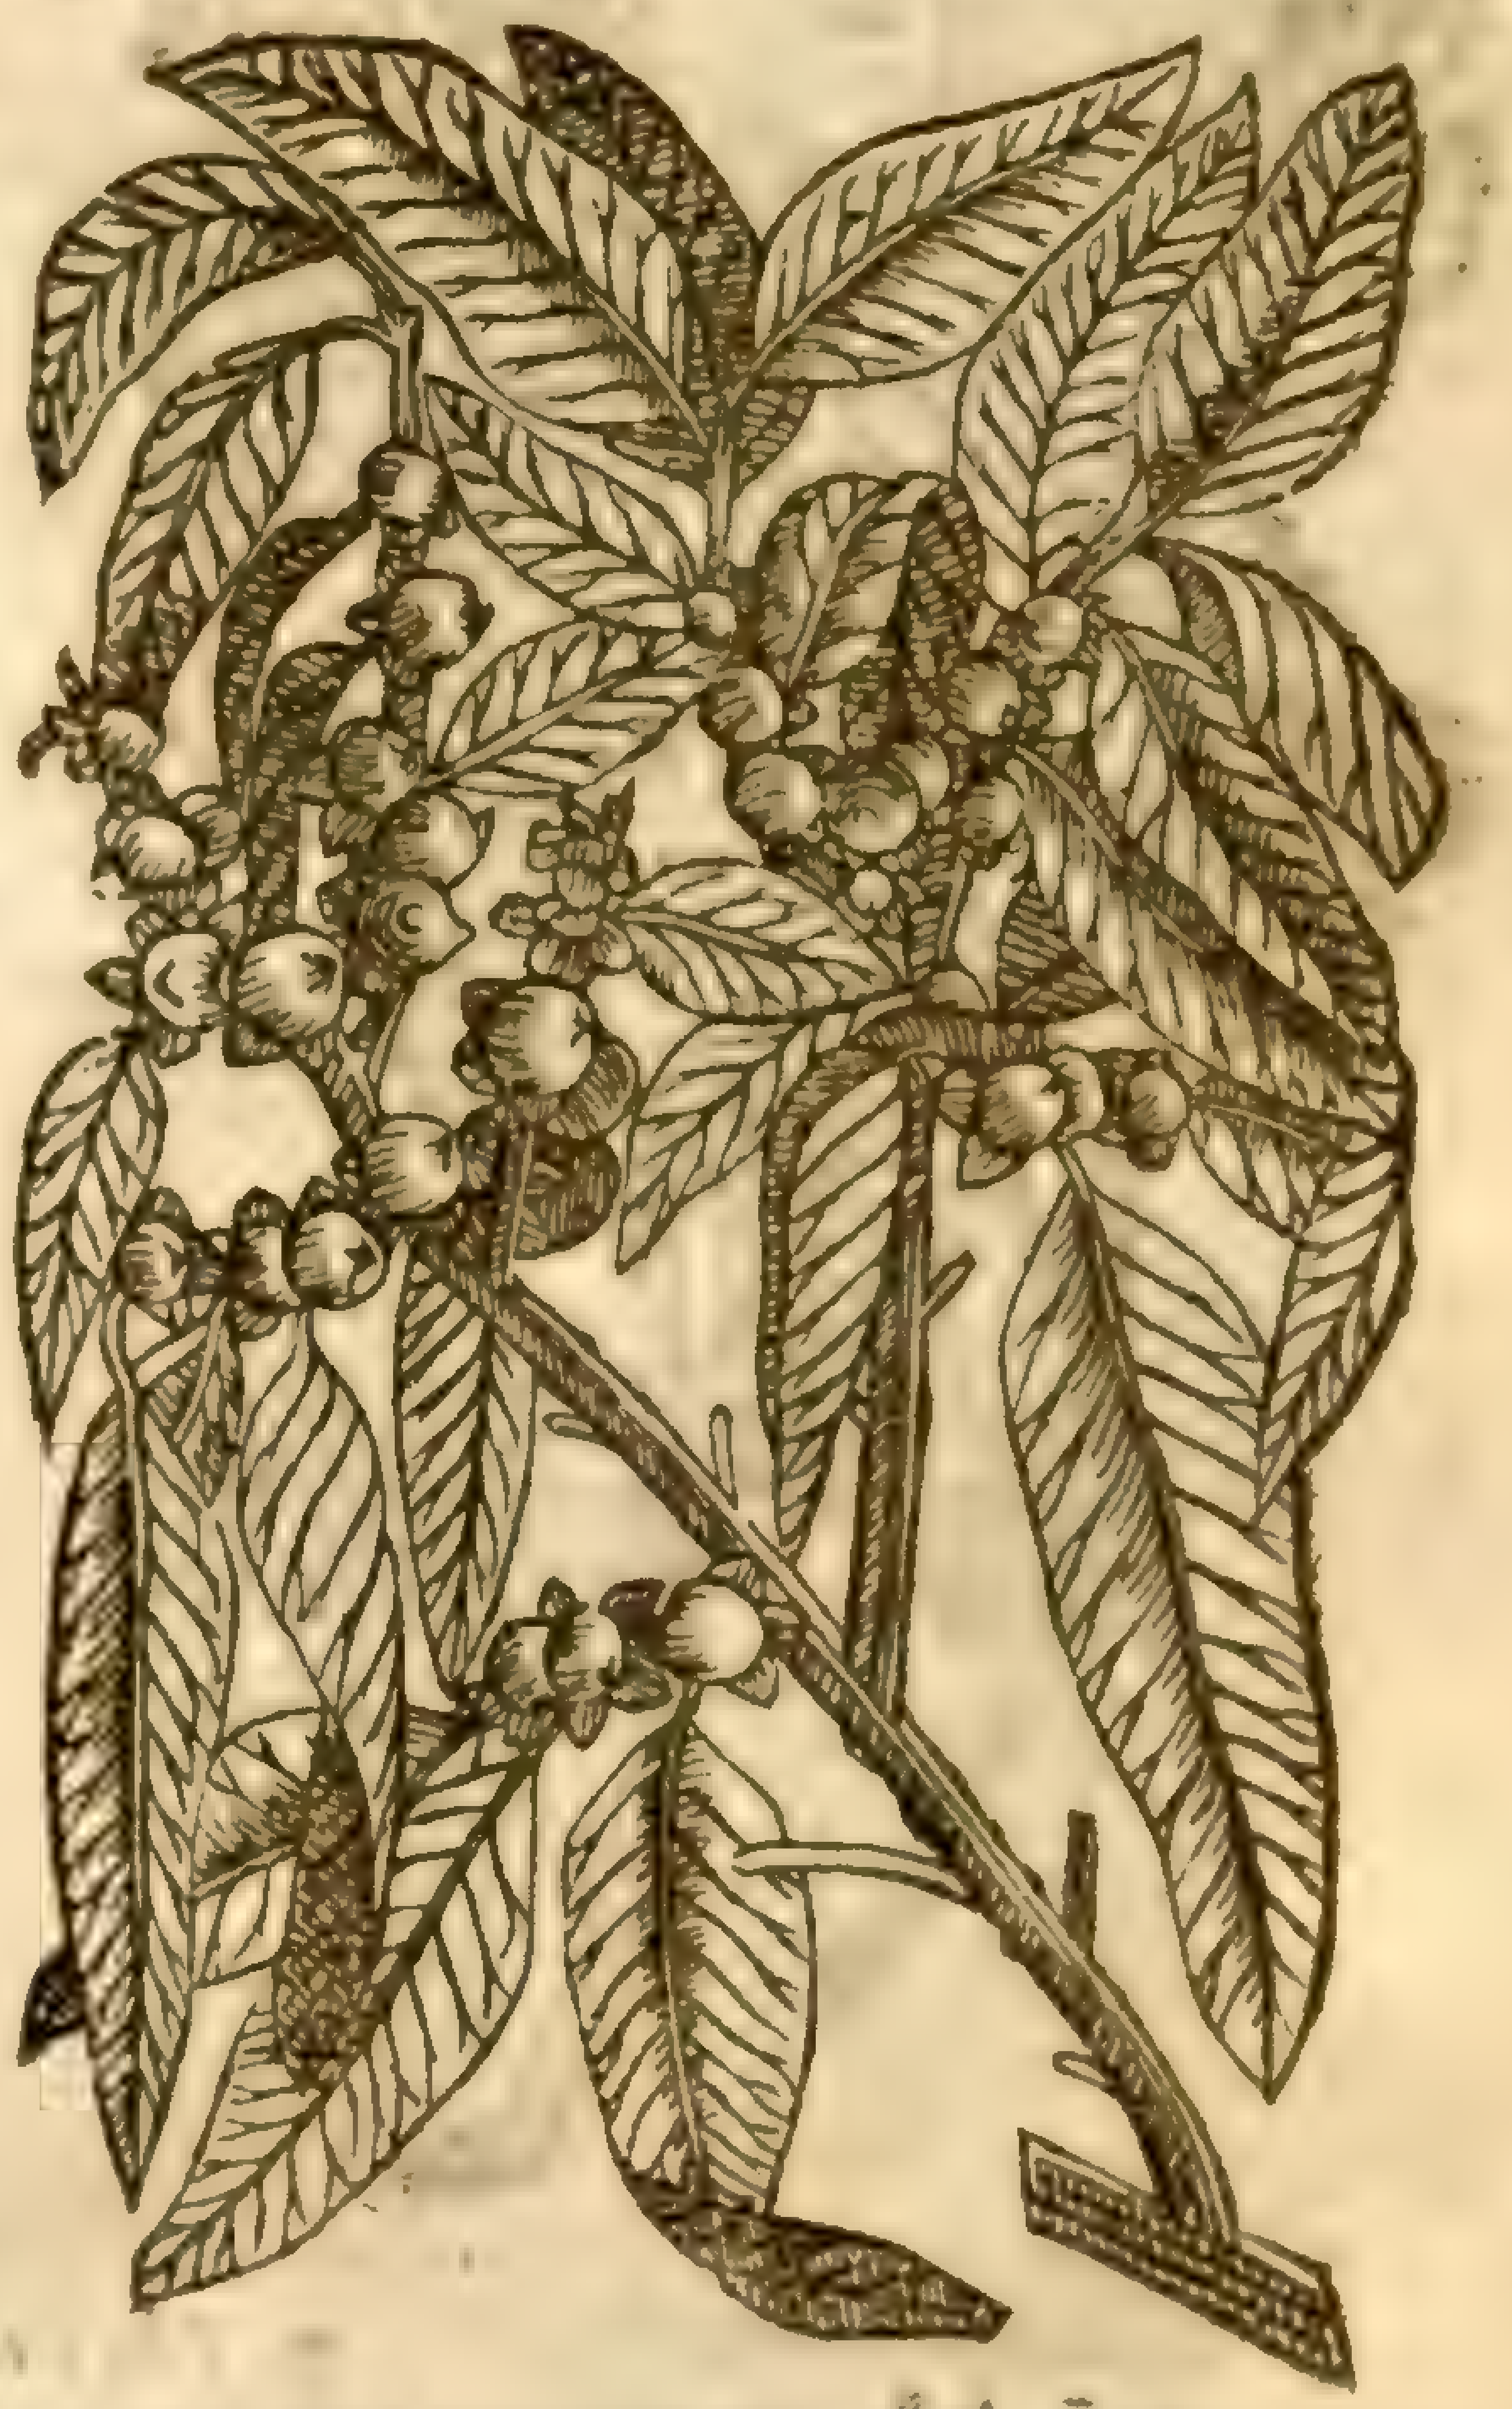
Guaiacum Patauinum groweth plentifully about Lugdunum or Lyons in France. I planted it in the garden of Barn-Elmes neere London two trees: beſides, there groweth another in the garden of Mr *Gray* an Apothecary of London, and in my garden likewiſe.

1. *Guaiacum Patavinum latifolium.*
Broad leafed Italian Wood of life.



Dioſpyros lotus, [illegible]

2 *Guaiacum Patavinum anguſtifol.*
Narrow leafed Italian Guaiacum.



Dioſpyros lotus, [illegible]

¶ *The Time.*

It floureth in May, and the fruit is ripe in September.

¶ *The Names.*

Guaiacum Patavinum hath bin reputed for the *Lotus* of *Theophraſtus*: in Engliſh it is called the baſtard Meuynwood.

‡ This hath no affinity with the true Indian Guajacum which is freqnently vſed in medicine.

¶ *The Nature and Vertues.*

The fruit of this is thought to be of the ſame temper and quality with that of the Nettle tree. ‡

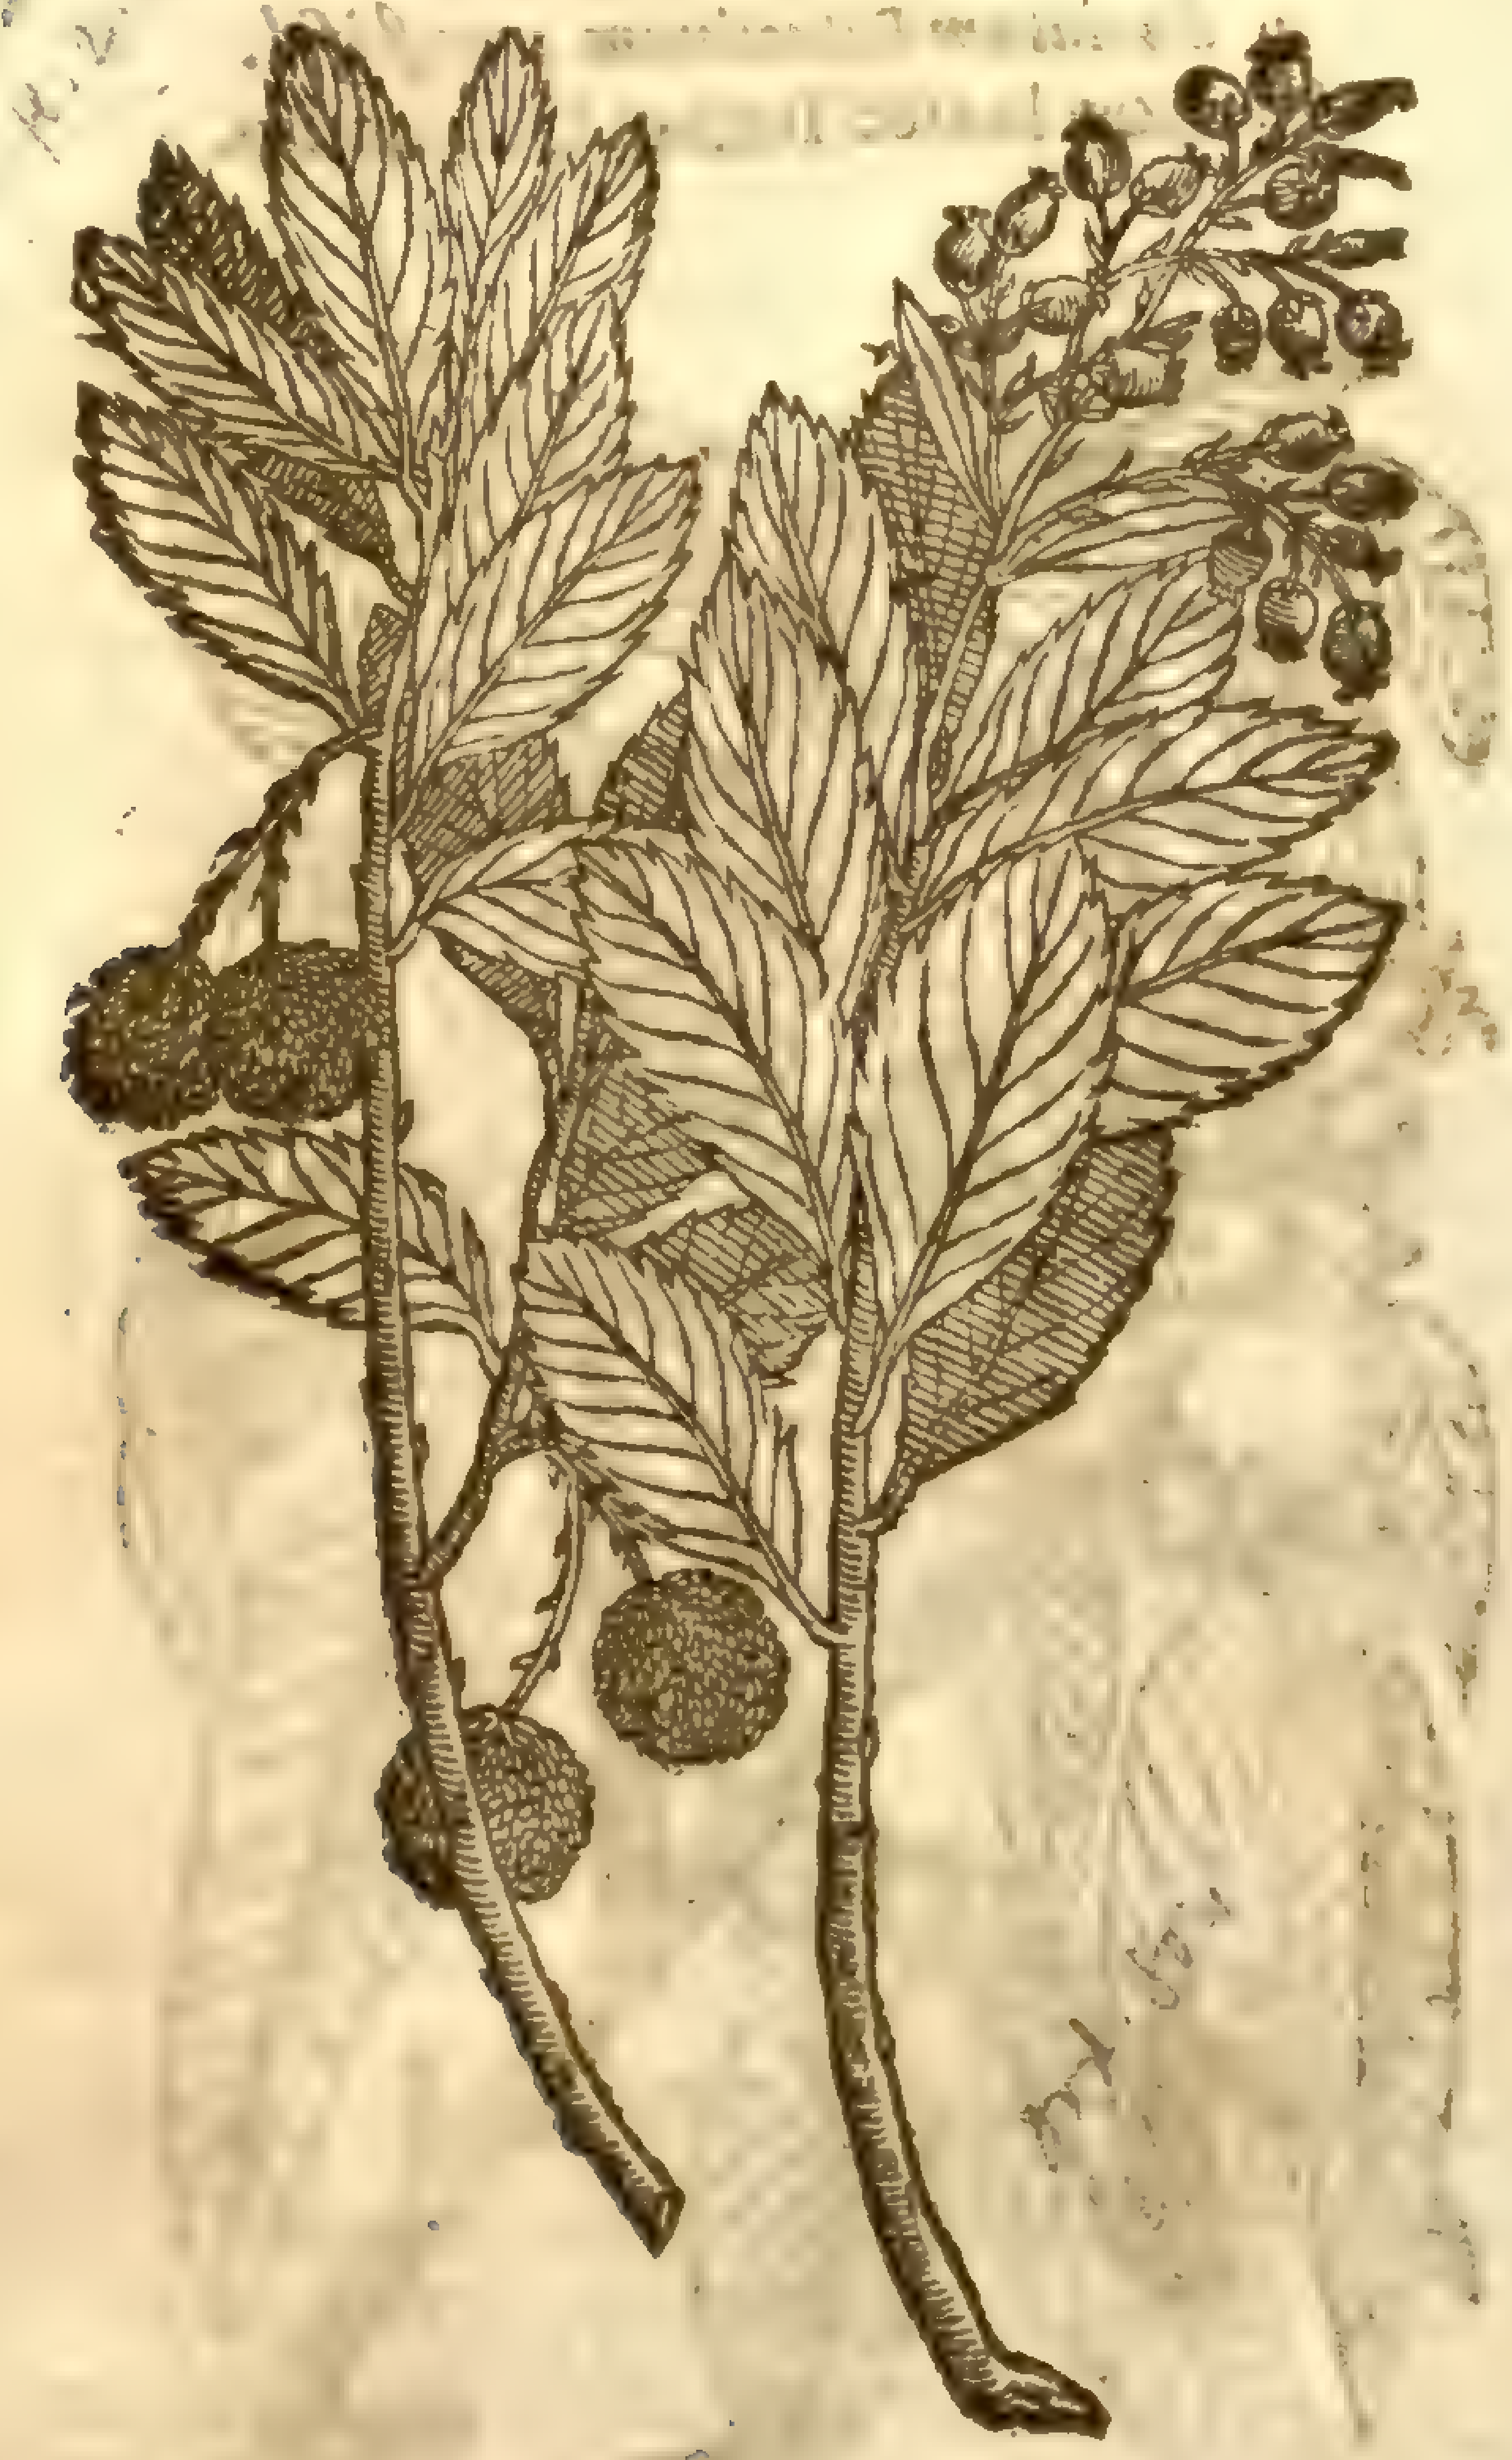
Chap. 125. *Of the Strawberry tree.*

¶ *The Deſcription.*

THe Strawberry tree groweth for the moſt part low, very like in bigneſſe vnto the Quince tree (whereunto *Dioſcorides* compareth it.) The body is couered with a reddiſh barke both rough and ſcaly: the boughes ſtand thicke on the top, ſomwhat reddiſh. The leaues be broad, long and ſmooth like thoſe of Bayes, ſomwhat nicked in the edges, and of a pale green colour: the flours grow in cluſters, being hollow and white, and now and then on the one ſide ſomwhat of a purple colour: in their places come forth certain berries hanging down vpon little long ſtems like to Strawberries, but greater, without, a ſtone within, but onely with little ſeeds, at the firſt greene, and being ripe they are of a gallant red colour, in taſte ſomwhat harſh, and in a manner without any reliſh; of which Thruſhes and Black-birds do feed in winter.

[illegible]

Arbutus.
The Strawberry tree.



¶ *The Place.*

The Strawberry tree groweth in moſt countries of Greece, in Candy, Italy, and Spaine, alſo in the vallies of the mountaine Athos, where being in other places but little, they become huge trees, as *P. Bellonius* writeth. *Iuba* alſo reporteth, that there be in Arabia of them 50 cubits high. They grow only in ſome few gardens with vs.

¶ *The Time.*

The Strawberry tree floureth in Iuly & Auguſt, and the fruit is ripe in September, after it hath remained vpon the tree by the ſpace of an whole yeare.

¶ *The Names.*

This tree is called in Greek, Κόμαρος: in Latine, *Arbutus*: in Engliſh, Strawberry tree, & Arbute tree.

The Fruit is named in Greeke, Μιμαίκυλον, or as others reade it, Μεμαίκυλον: in Latine, *Memecylum*, and *Arbutus*. *Pliny* calls it *Vnedo*; ground Strawberries (ſaith he) haue one body, and *Vnedo*, much like vnto them, another body, which only in apple is like to the fruit of the earth. The Italians call this Strawbery *Albatro*: the Spaniards, *Madrono*, *Medronheyro*, and *Medronho*: in French, *Arboutes*, *Arbous*. In Engliſh, Tree Strawberry.

¶ *The Temperature and Vertues.*

The fruit of the Strawberry tree is of a cold temper, hurting the ſtomack and cauſing headache, wherefore no wholſome food, though it be eaten in ſome places by the poorer ſort of people.

Chap. 126. *Of the Plum Tree.*

¶ *The Kindes.*

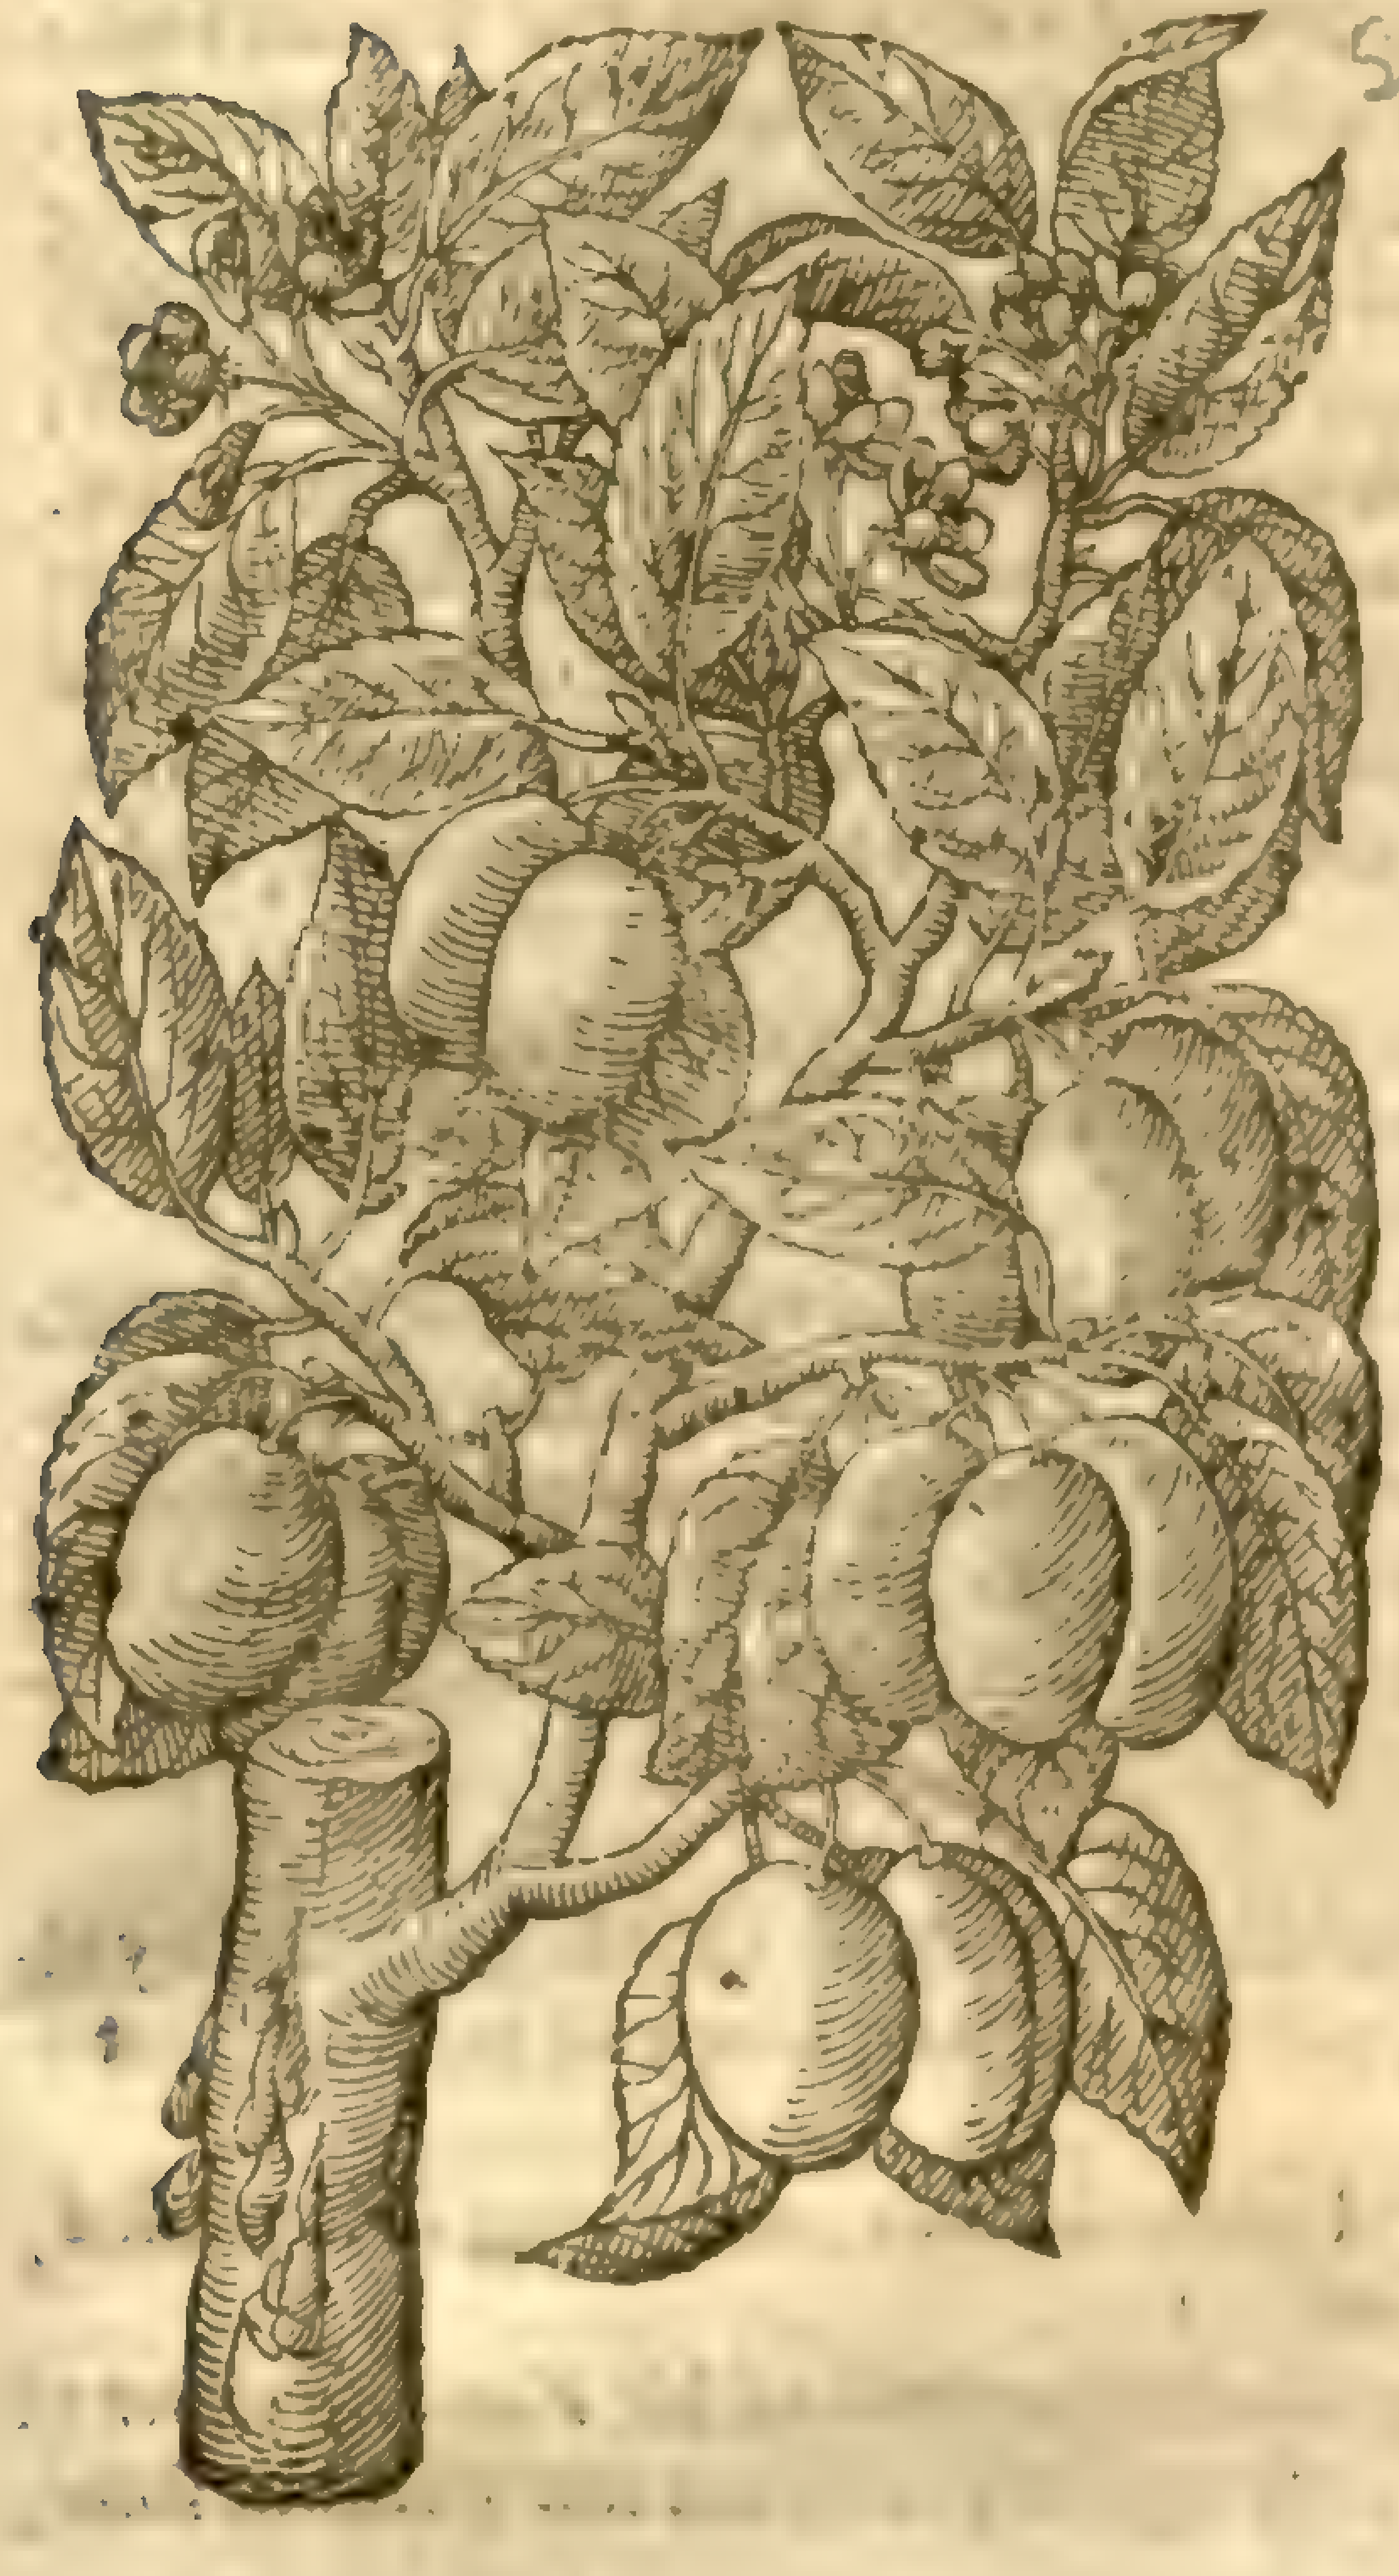
TO write of Plums particularly would require a peculiar Volume, and yet the end not be attained vnto, nor the ſtock or kindred perfectly known, neither to be diſtinguiſhed apart: the numbers of the ſorts or kinds are not known to any one Country, euery clymat hath his own fruit, farre differing from that of other places: my ſelfe haue ſixty ſorts in my garden, and all ſtrange and rare: there be in other places many more common, and yet yearly commeth to our hands others not before known; therefore a few figures ſhall ſerue for the reſt. ‡ Let ſuch as require a larger hiſtory of theſe varieties haue recourſe to the oft mentioned Work of Mr *Parkinſon*: and ſuch as deſire the things themſelues may find moſt of the beſt with Mr *Iohn Millen* in Old ſtreet. ‡

¶ *The Deſcription.*

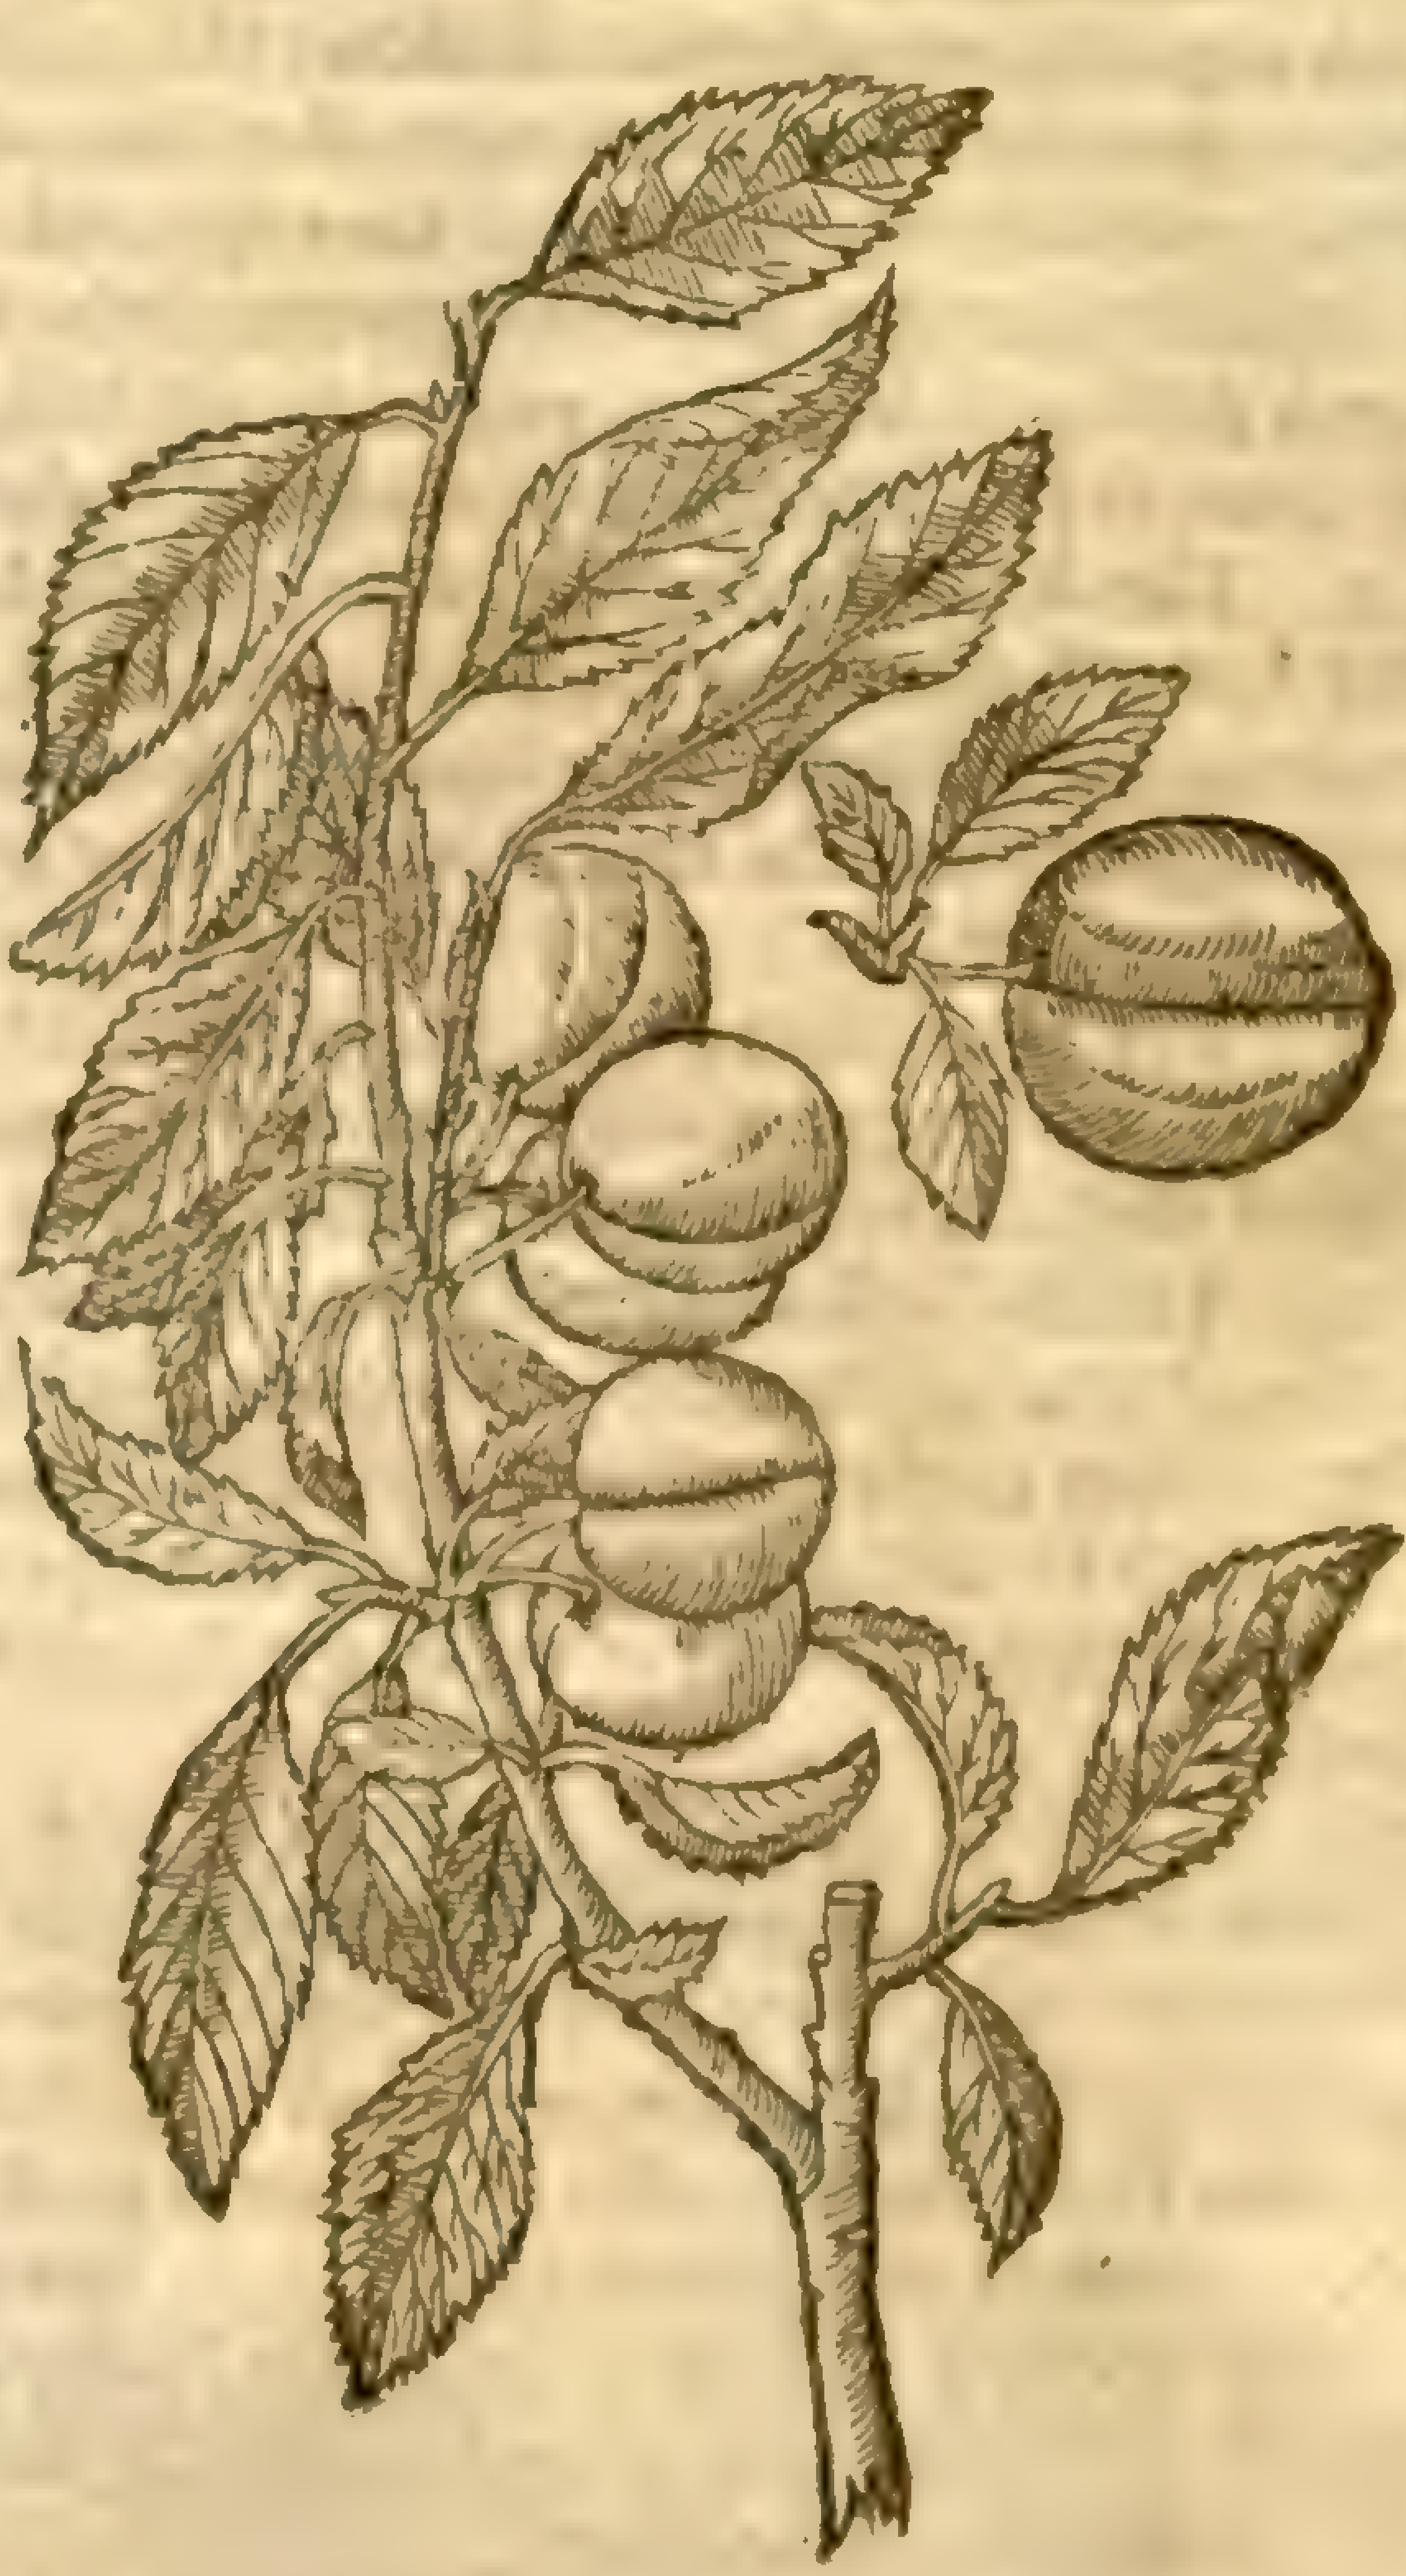
‡ THe Plum or Damſon tree is of a mean bigneſſe, it is couered with a ſmooth barke: the branches are long, whereon do grow broad leaues more long than round, nicked in the edges: the floures are white; the plums do differ in colour, faſhion, and bigneſſe, they all conſiſt of pulp and skin, and alſo of kernell, which is ſhut vp in a ſhell or ſtone. Some plums are of a blackiſh blew, of which ſome be longer, others rounder, others of the colour of yellow wax, diuers of a crimſon red, greater for the moſt part than the reſt. There be alſo green plums, and withall very long, of a ſweet and pleaſant taſte: moreouer, the pulp or meat of ſome is drier, and eaſilier ſeparated from the ſtone; of other-ſome it is moiſter, and cleaueth faſter. Our common Damſon is known to all, and therefore not to be ſtood vpon.

1 *Prunus domeſtica.*
The Damſon tree.

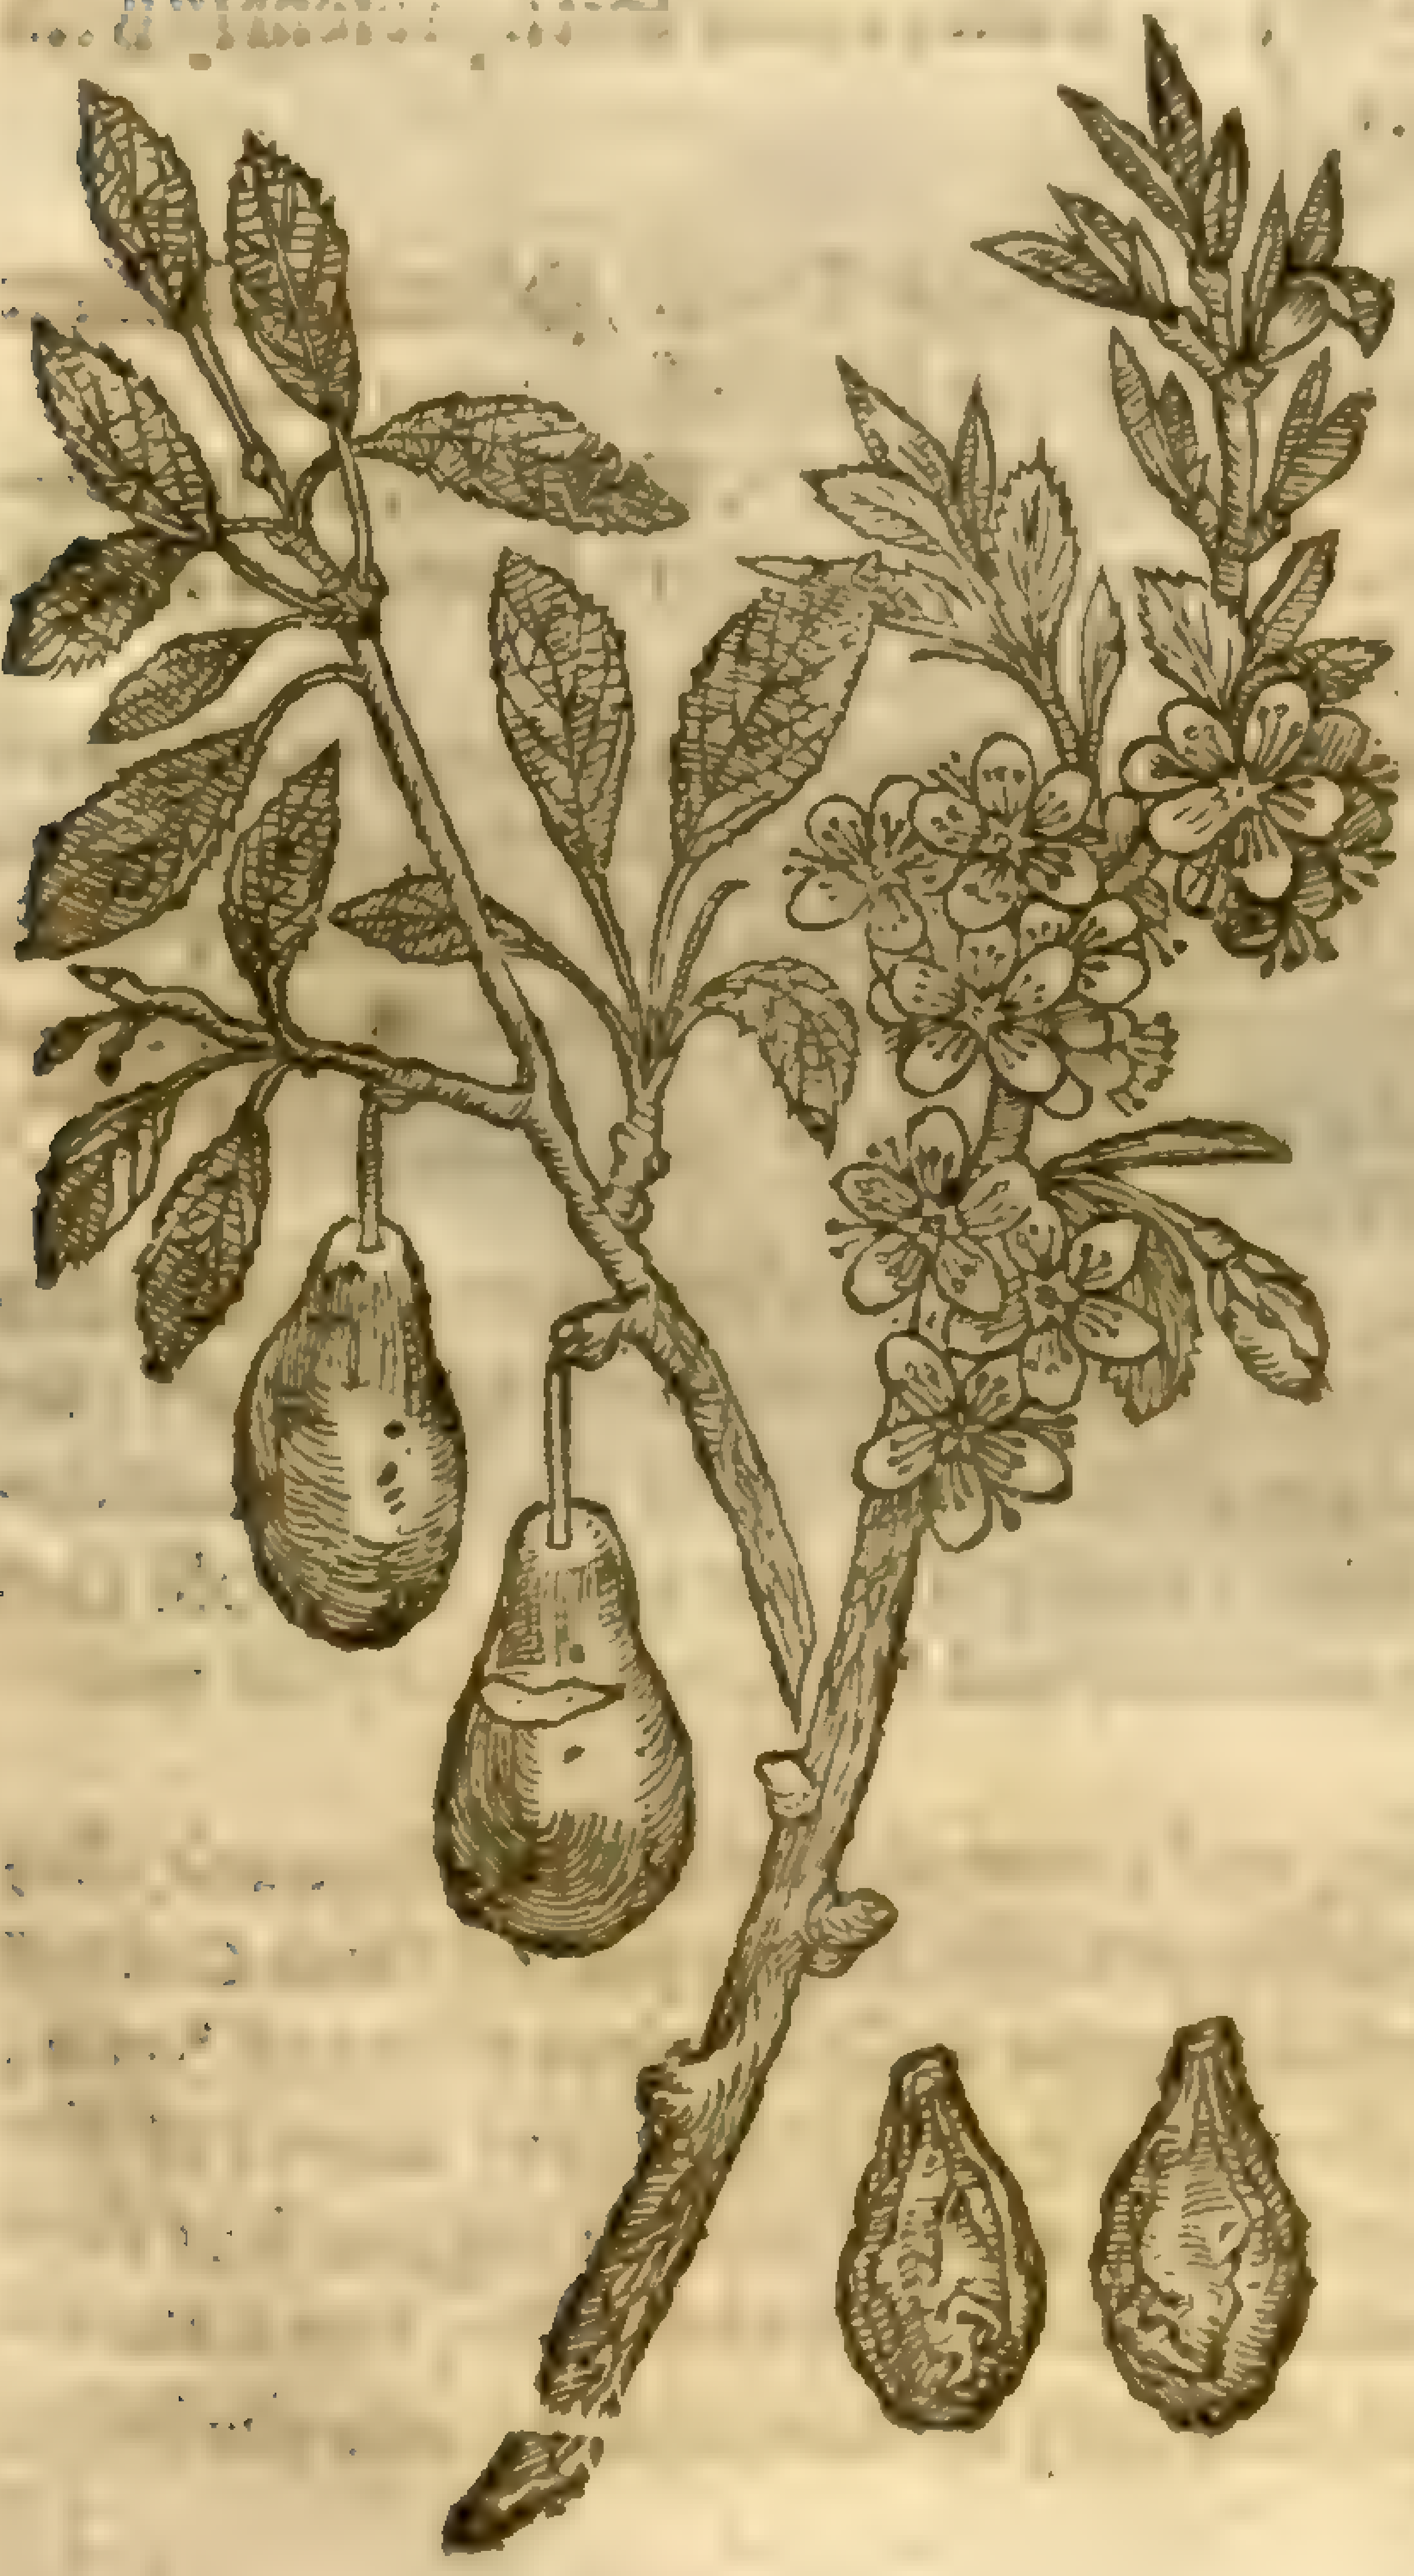
P. domestica, L.
mill. dict.
Sim. pl. p. [illegible]



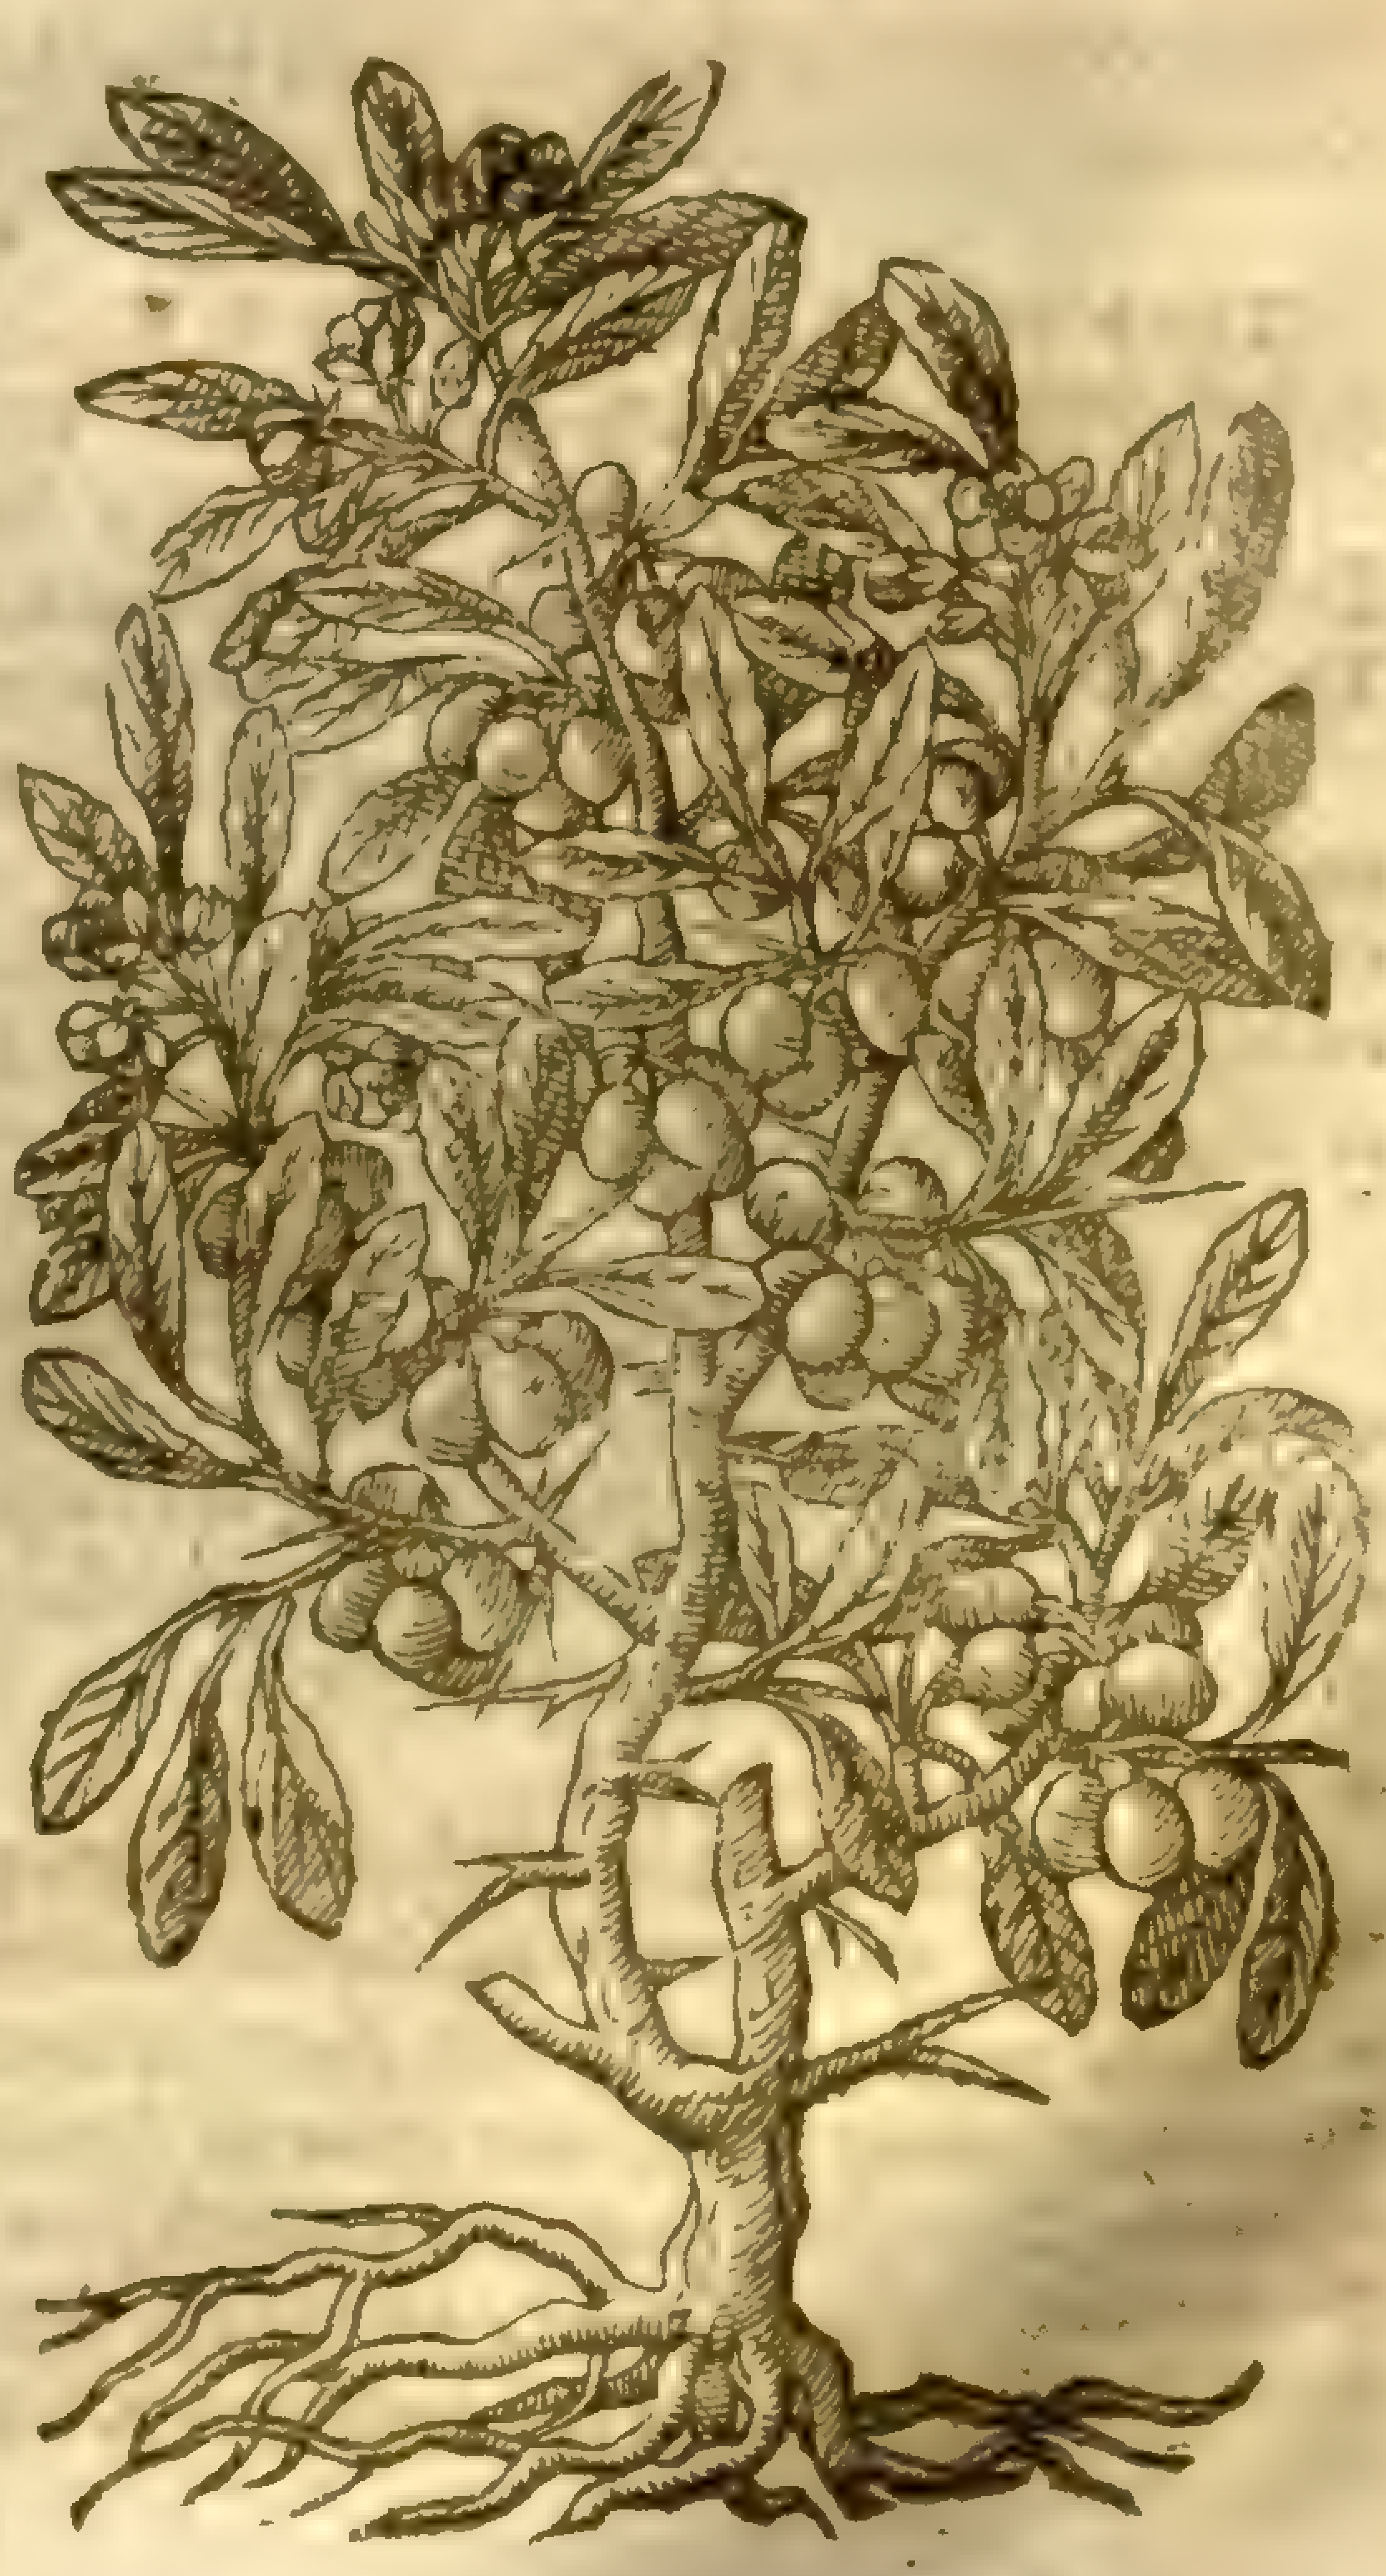
2 *Prunus Mirobalana.*
The Mirobalan Plum tree.



3 *Prunus Amygdalina.*
The Almond Plum tree.



5 *Prunus ſylveſtris.*
The Sloe tree.



P. spinosa, L.
mill. dict.
[illegible] pl. p. [illegible]

2 The Mirobalan Plum tree groweth to the height of a great tree, charged with many great armes or boughes, which diuide themſelues into ſmall twiggy branches, by means whereof it yeeldeth a goodly and pleaſant ſhadow: the trunke or body is couered with a finer and thinner barke than any of the other Plum trees: the leaues do ſomewhat reſemble thoſe of the Cherrie tree, they are very tender, indented about the edges: the flours be white: the fruit is round, hanging vpon long foot-ſtalks pleaſant to behold, greene in the beginning, red when it is almoſt ripe, and beeing full ripe it gliſtereth like purple mixed with blacke: the fleſh or meat is full of juice, pleaſant in taſt: the ſtone is ſmall, or of a meane bigneſſe: the tree bringeth forth plenty of fruit euery other yeare.

3 The Almond tree groweth vp to the height of a tree of a meane bigneſſe: the branches are long, ſmooth, and euen: the leaues are broad, ſomthing long, and ribbed in diuers places, with ſmal nerues running through the ſame: the flours are white, ſprinkled with a little daſh of purple ſcarcely to be perceiued: the fruit is long, hauing a cleft downe the middle, of a brown red colour, and of a pleaſant taſte.

4 ‡ The Damaſcen Plum tree groweth likewiſe to a meane height, the branches very brittle; the leaues of a deep green colour: the fruit is round, of a blewiſh blacke colour: the ſtone is like vnto that of the Cherry, wherein it differeth from all other Plums.

5 The Bulleſſe and the Sloe tree are wilde kindes of Plums, which do vary in their kind, euen as the greater and manured Plums do. Of the Bulleſſe, ſome are greater and of better taſte than others. Sloes are ſome of one taſte, and ſome of others, more ſharp; ſome greater, and others leſſer; the which to diſtinguiſh with long deſcriptions were to ſmall purpoſe, conſidering they be all and euery of them knowne euen vnto the ſimpleſt: therefore this ſhall ſuffice for their ſeuerall deſcriptions.

¶ *The Place.*

The Plum trees grow in all knowne countries of the world: they require a looſe ground, they alſo receiue a difference from the regions where they grow, not only of the forme or faſhion, but eſpecially of the faculties, as we will forthwith declare.

The Plum trees are alſo many times graffed into trees of other kindes, and being ſo ingraffed, they *faciem parentis, ſuccum adoptionis, vt Plinius dicit, exhibent.*

The greateſt variety of theſe rare Plums are to be found in the grounds of Mr *Vincent Pointer* of Twicknam before remembred in the chapter of Apples: although my ſelfe am not without ſome, and thoſe rare and delicate.

The wilde Plums grow in moſt hedges through England.

¶ *The Time.*

The common and garden Plum trees do bloome in April; the leaues come forth preſently with them: the fruit is ripe in Summer, ſome ſooner, ſome later.

¶ *The Names.*

The Plum tree is called in Greek, Κοκκυμηλέα: in Latine, *Prunus*: in high-Dutch, **Pflaumenbaum**: in low-Dutch, **Pruymen**: in Spaniſh, *Ciruelo*: in French, *Prunier*: in Engliſh, Plum tree.

The fruit is called in Greeke, Κοκκύμηλον: in Latine, *Prunum*: in high-Dutch, **Pflaumen**: in low-Dutch, **Pruymen**: in Italian and French, *Prune*: in Spaniſh, *Prunas*: in Engliſh, Prune, and Plum. Theſe haue alſo names from the regions and countries where they grow.

The old Writers haue called thoſe that grow in Syria neere vnto Damaſcus, *Damaſcena Pruna*: in Engliſh, Damſons, or Damask Prunes: and thoſe that grow in Spain, *Hiſpanica*, Spaniſh Prunes or Plums. So in our age we vſe to call thoſe that grow in Hungarie, *Hungarica*, or *Pannonica*, Plums of Hungarie: ſome, *Gallica Pruna*, or French Prunes, of the country of France. *Clearcus Peripateticus* ſaith, that they of Rhodes and Sicilia do call the Damaske Prunes *Brabula*.

¶ *The Temperature and Vertues.*

A Plummes that be ripe and new gathered from the tree, what ſort ſoeuer they are of, do moiſten and coole, and yeeld vnto the body very little nouriſhment, and the ſame nothing good at all: for as Plummes do very quickly rot, ſo is alſo the juice of them apt to putrifie in the body, and likewiſe to cauſe the meat to putrifie which is taken with them: onely they are good for thoſe that would keep their bodies ſoluble and coole; for by their moiſture and ſlipperineſſe they do mollifie the belly.

B Dried Plums, commonly called Prunes, are wholſomer, and more pleaſant to the ſtomack, they yeeld more nouriſhment and better, and ſuch as cannot eaſily putrifie. It is reported, ſaith *Galen* in his booke of the faculties of Nouriſhments, that the beſt doe grow in Damaſcus a city of Syria; and next to thoſe, they that grow in Spaine: but theſe do nothing at all binde, yet diuers of the Damaske Damſon Prunes very much; for Damaske Damſon Prunes are more aſtringent, but they of Spaine be ſweeter. *Dioſcorides* ſaith, that Damaske Prunes dried do ſtay the belly; but *Galen* affirmeth in his books of the faculties of ſimple medicines, that they do manifeſtly looſe the belly, yet leſſer than they that be brought out of Spain, beeing boiled with Mede or honied water which hath a good quantity of hony in it, they looſe the belly very much (as the ſame Author ſaith) although taken by themſelues, much more if the Mede be ſupped after them. We commend thoſe of Hungary, which be long and ſweet, yet more thoſe of Moravia, the chiefe and principall city in times paſt of the prouince of the Marcomans; for theſe after they be dried, that the watery humor may be conſumed away, be moſt pleaſant to the taſte, and do eaſily without any trouble ſo mollifie the belly, as that in that reſpect they go beyond Caſſia and Manna, as *Tho. Iordanus* affirmeth.

C The leaues of the Plum tree are good againſt the ſwelling of the Vvula, the throat, gums, and kernels vnder the throat nnd jawes; they ſtop the rheum and falling down of humours, if the decoction thereof be made in wine, and gargled in the mouth and throat.

D The gum which comes out of the Plum tree doth glue and faſten together, as *Dioſcorides* ſaith.

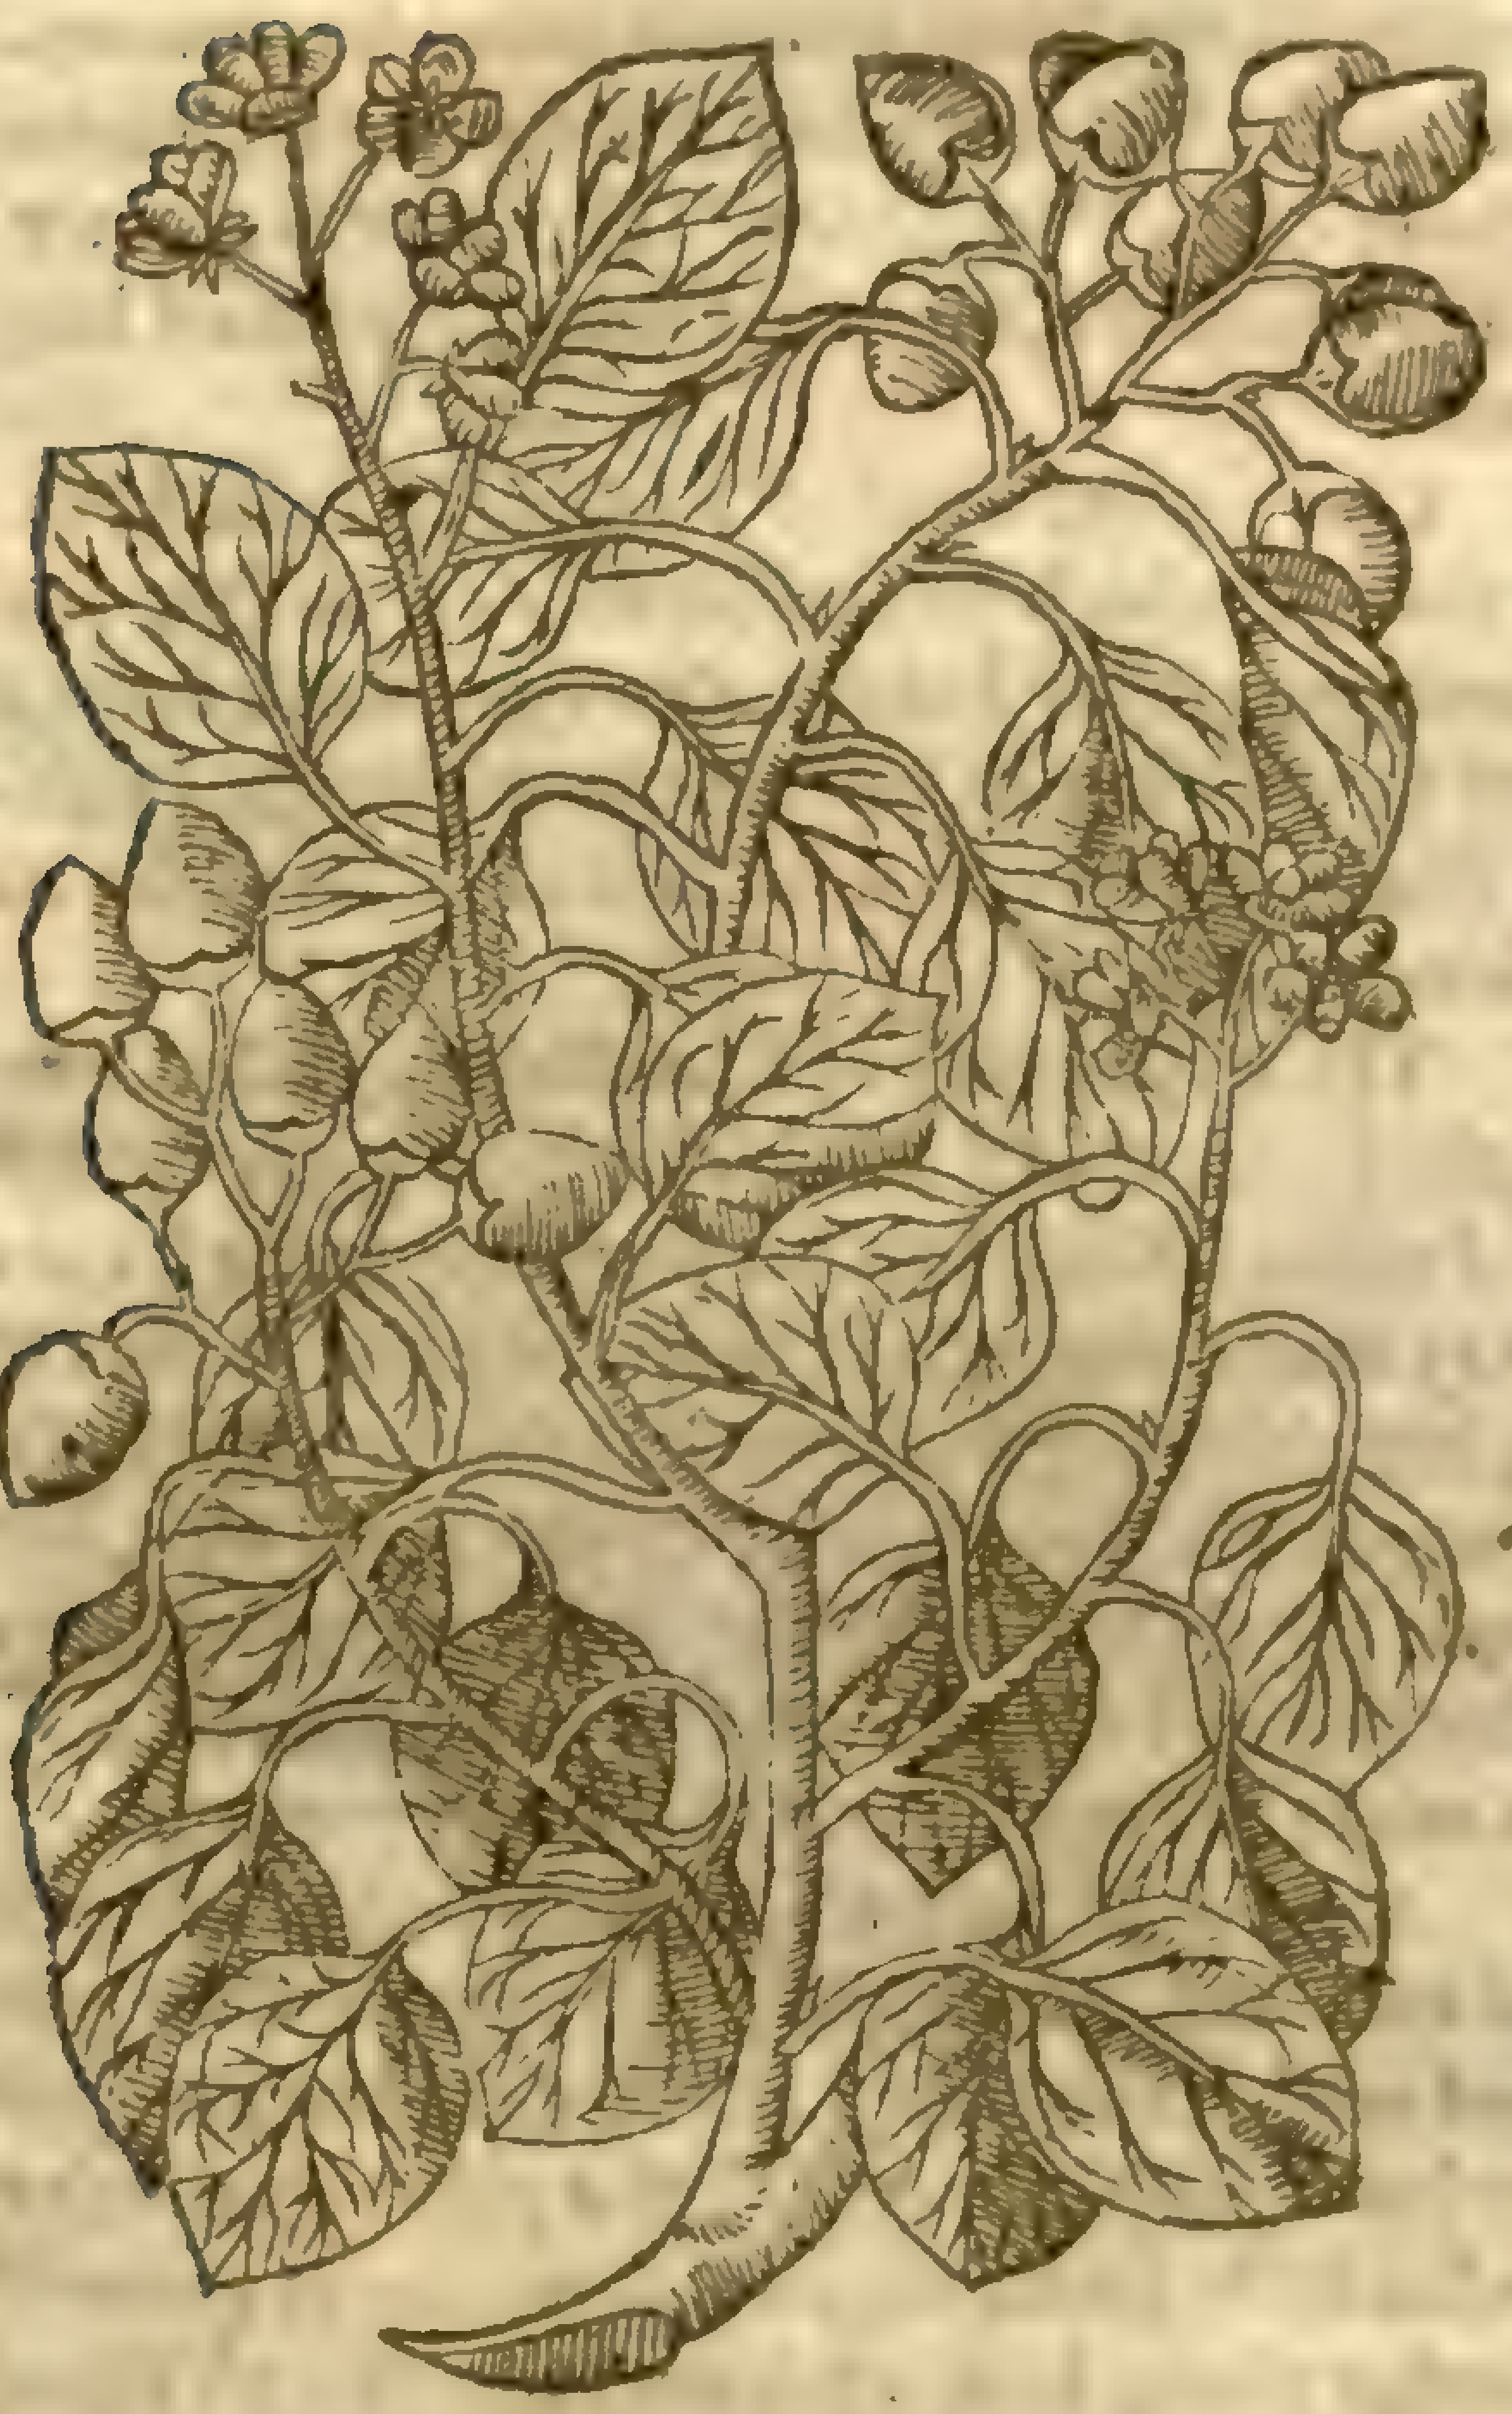
E Being drunk in wine it waſteth away the ſtone and heales Lichens in infants and yong children: if laid on with vineger, it works the ſame effects that the gum of the Peach & Cherry tree doth.

F The wilde Plums do ſtay and binde the belly, and ſo doe the vnripe plums of what ſort ſoeuer, while they are ſharp and ſoure, for then they are aſtringent.

G The juice of Sloes doth ſtop the belly, the lask and bloudy flix, the inordinat courſe of womens termes, and all other iſſues of bloud in man or woman, and may very wel be vſed in ſtead of Acatia, which is a thorny tree growing in Egypt, very hard to be gotten, and of a deare price, and therefore the better for wantons, albeit the Plums of this country are equall vnto it in vertues.

CHAP. 127. *Of Sebeſten or the Aſſyrian Plum.*

Sebeſtena, Myxa, ſiue Myxara.
Aſſyrian Plums.



¶ *The Deſcription.*

Sebeſtens are alſo a kinde of Plums, the tree whereof is not vnlike to the Plum tree, ſaving it groweth lower than moſt of the manured Plumme trees: the leaues be harder and rounder: the floures grow at the tops of the branches, conſiſting of fiue ſmall white leaues, with pale yellow threds in the middle like to thoſe of the Plumme tree. After followeth the fruit like little Plums, faſtned in little skinny cups, which when they be ripe are of a greeniſh black colour, wherein is contained a ſmal hard ſtone. The fruit is ſweet in taſte, the pulp or meat is very tough and clammy.

¶ *The Place.*

The Sebeſten trees grow plentifully in Syria and Egypt; they were in times paſt forrein and ſtrange in Italy, now they grow almoſt in euery garden, beeing firſt brought thither in *Plinies* time: Now do the Sebeſten trees, ſaith hee, *lib.15. cap.18.* begin to grow in Rome among the Service trees.

¶ *The Time.*

The time doth anſwer the other common Plums.

¶ *The Names.*

Pliny calleth the tree *Myxa*: it may be ſuſpected that this is the tree which *Matron Paradus* in his Attick banquet in *Athenæus*, calls [illegible]: but we canot certainly affirm it, and eſpecially becauſe diuers haue diuerſly deemed thereof. The berry or fruit is named *Myxon*, and *Myxarion*, neither haue the Latines any other name. The Arabians and the Apothecaries doe call it Sebeſten, which is alſo made an Engliſh name. We may call it the Aſſyrian Plum.

¶ *The Temperature and Vertues.*

A Sebeſtens be very temperatly cold and moiſt, and haue a thick and clammy ſubſtance, therefore they nouriſh more than moſt fruits do; but withall they eaſily ſtop the intrals, and ſtuf vp the narrow paſſages, and breed inflammations.

B They take away the ruggedneſſe of the throat and lungs, and alſo quench thirſt, being taken in a looch or licking medicine, or taken any other way, or by themſelues.

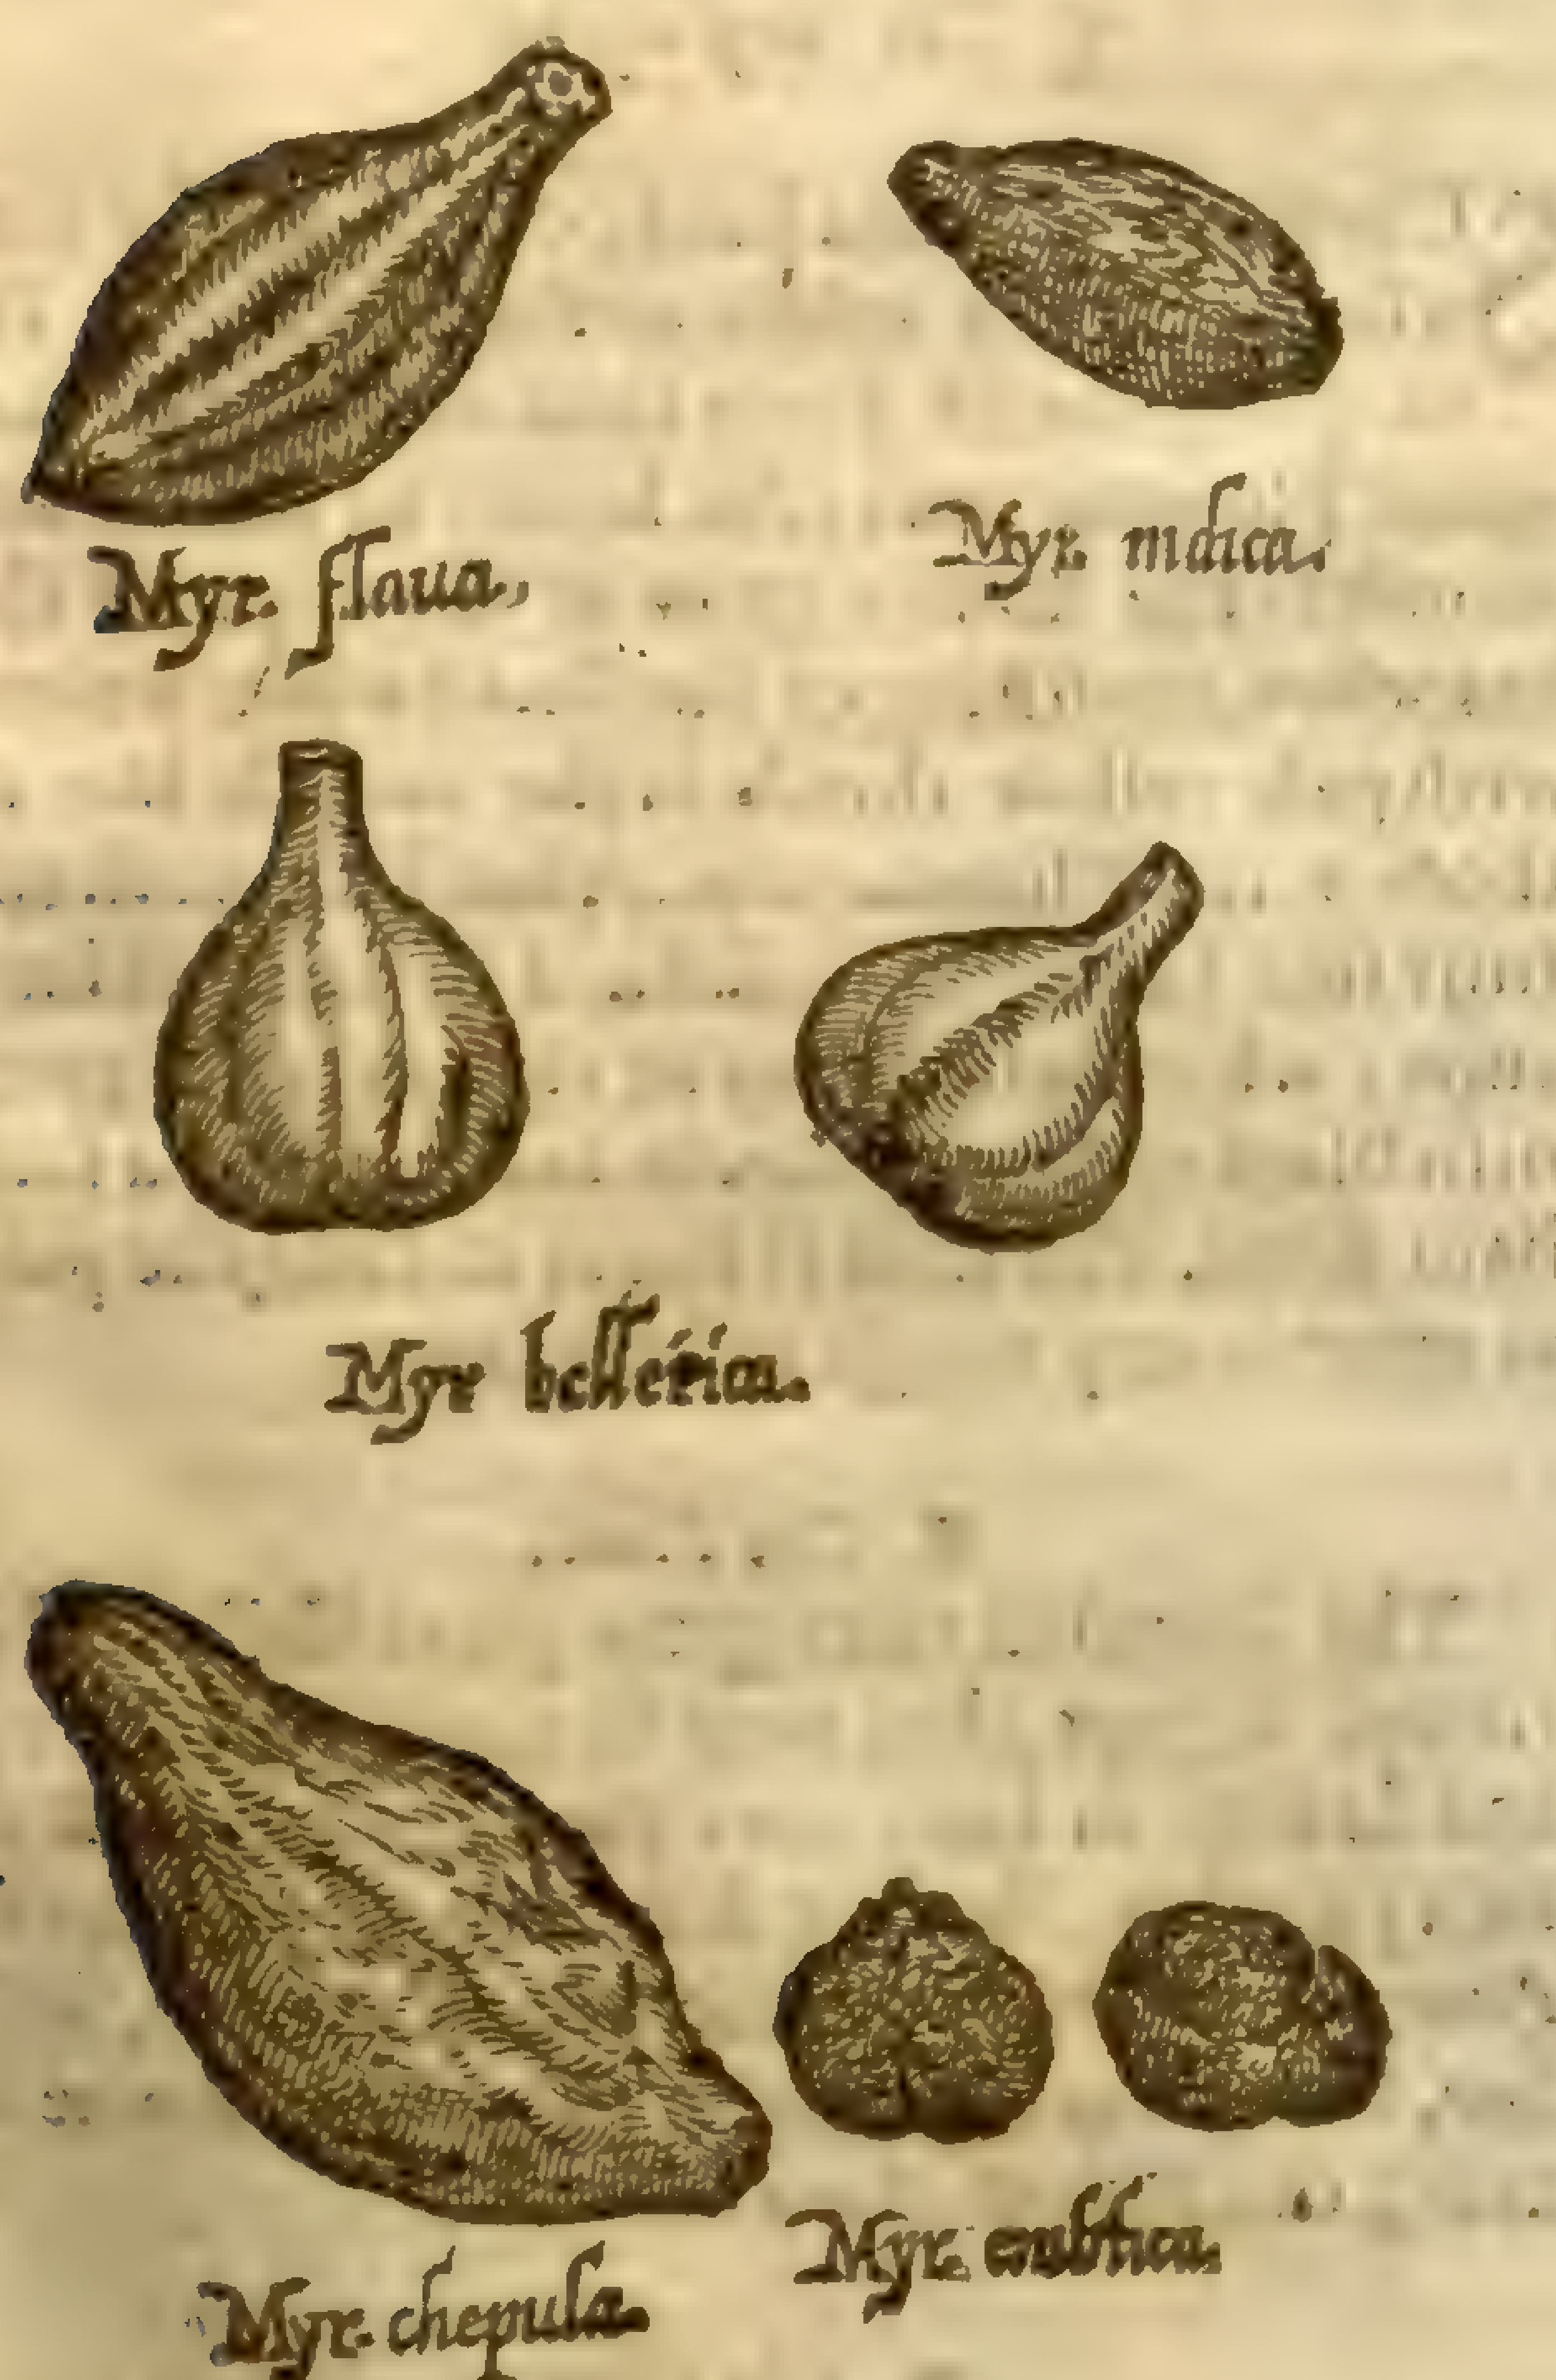
C Ten drams or an ounce and halfe of the pap or pulp hereof being inwardly taken doth looſe the belly.

D There is alſo made of this fruit a purging Electuarie, but ſuch an one as quickly mouldeth, and therefore not to be vſed but when it is new made.

Chap. 128. *Of the Indian Plums or Mirobalans.*

¶ *The Kindes.*

There be diuers kinds of Mirobalans, as *Chebula, Bellirica, Emblica, &c.* They likewiſe grow vpon diuers trees, and in countries far diſtant one from another; and *Garcias* the Portugal phyſitian is of opinion that the fiue kindes grow vpon fiue diuers trees.



Myr. flaua.
Myr. indica.
Myr bellerica.
Myr. chepula.
Myr. emblica.

¶ *The Deſcription.*

1 The firſt of the Mirobalan trees, called *Chebula*, is a ſhrubby tree altogether wild (which the Indians call *Aretca*) in ſtature not vnlike to the Plum tree: the branches are many, and grow thick together, wheron are ſet leaues like thoſe of the Peach tree. The fruit is greater than any of the reſt, ſomwhat long, faſhioned like a Peare.

2 This ſecond kind of Mirobalan, called *Flava*, or *Citrina*, which ſome do call *Aritiqui*, but the common people of India, *Arare*, groweth vpon a tree of meane ſtature, hauing many boughes ſtanding finely in order, and ſet full of leaues like to the Seruice tree.

3 The third kinde of Mirobalans, called *Emblica*, the Indians call *Amiale*; which grow vpon a tree of mean ſtature like the former, but the leaues are very much jagged, in ſhape like the leaues of Fern, but that they be ſomwhat thicker; the Indians put not the fruit hereof to phyſicall vſes, but occupie it for the thickning and tanning of their leather in ſtead of *Rhus* or Coriars Sumach, as alſo to make inke and bletch for other purpoſes.

4 *Mirobalani Bellirica*, called of the Sauages, *Gotni* and *Guti*, groweth vp to a mean ſtature, garniſhed with leaues like Laurel or the bay tree, but ſomwhat leſſer, thinner, and of a pale green color.

5 The fift kinde of Mirobalans is called *Indica*, which the Indians call *Rez annale*: it groweth vpon a tree of mean ſtature, or rather vpon a ſhrub or hedge plant, bearing leaues like the Willow, and a fruit eight ſquare. There is a fift kinde, the tree whereof is not mentioned by Authors.

¶ *The Place and Time.*

The laſt foure kinds of Mirobalans grow in the kingdome of Cambaia: they grow likewiſe in Goa, Batecala, Malanor, and Dabul: the *Kebula* in Biſnager, Decan, Guzarat, Bengala, and in many other places of the Eaſt Indies. The time agrees with other fruits in thoſe countries.

¶ *The Names.*

Thoſe which we haue ſaid to be yellow, the Inhabitants of thoſe countries where they grow, do call them *Arare* : thoſe that be black they call *BeZamale* : the *Bellerica*, *Gotim* ; the *Chebula*, *Aretea*; the *Emblica* are called *Aretiqui*.

¶ *The Temperature and Vertues.*

All the kinds of Mirobalans are in taſte aſtringent and ſharpe, like to the vnripe Sorbus or Seruice berries, and therefore they are of complexion cold and dry.

The Indians vſe them rather to bind than purge; but if they vſe them for a purge, it is onely the decoction much conſerued in ſugar, and eſpecially the *Chebule*: the yellow and black be good that way likewiſe. A

The yellow and *Bellerica* taken before meat ſtop the laske, and help the weak ſtomack, as *Garcias* writeth. B

The yellow and blacke, or *Indica* and the *Chebula*, purge lightly, if two or three drams be taken, and draw ſuperfluous humors from the head. C

The yellow, as ſome write, purge choler, *Chebule* flegme, *Indica* melancholy, and ſtrengthen the inward parts; but roſted in the embers, or otherwiſe waſted, they dry more than they purge. D

There are two ſorts eſpecially brought into theſe parts of the world conſerued, the *Chebule*, and of them the beſt are ſomwhat long like a ſmall Limon, with a hard rind and black pith of the taſte of a conſerued Walnut; and the *Bellerica*, which are round and leſſer, and tenderer in eating. E

Lobel writeth, that of them the *Emblica* do meanely coole, ſome do dry in the firſt degree, they purge the ſtomack of rotten flegme, they comfort the brain, the ſinues, the heart, and liuer, procure appetite, ſtay vomit, and coole the heate of choler, helpe the vnderſtanding, quench thirſt and heate of the intrals. The greateſt and heauieſt are the beſt. F

They purge beſt and with leſſe pain, if they be laid in water in the ſun vntill they ſwell, and ſod on a ſoft fire, & after they haue ſod and be cold, preſerued in foure times ſo much white honey, put to them. G

Garcias found the diſtilled water very helpful againſt the French diſeaſe & ſuch like infections. H

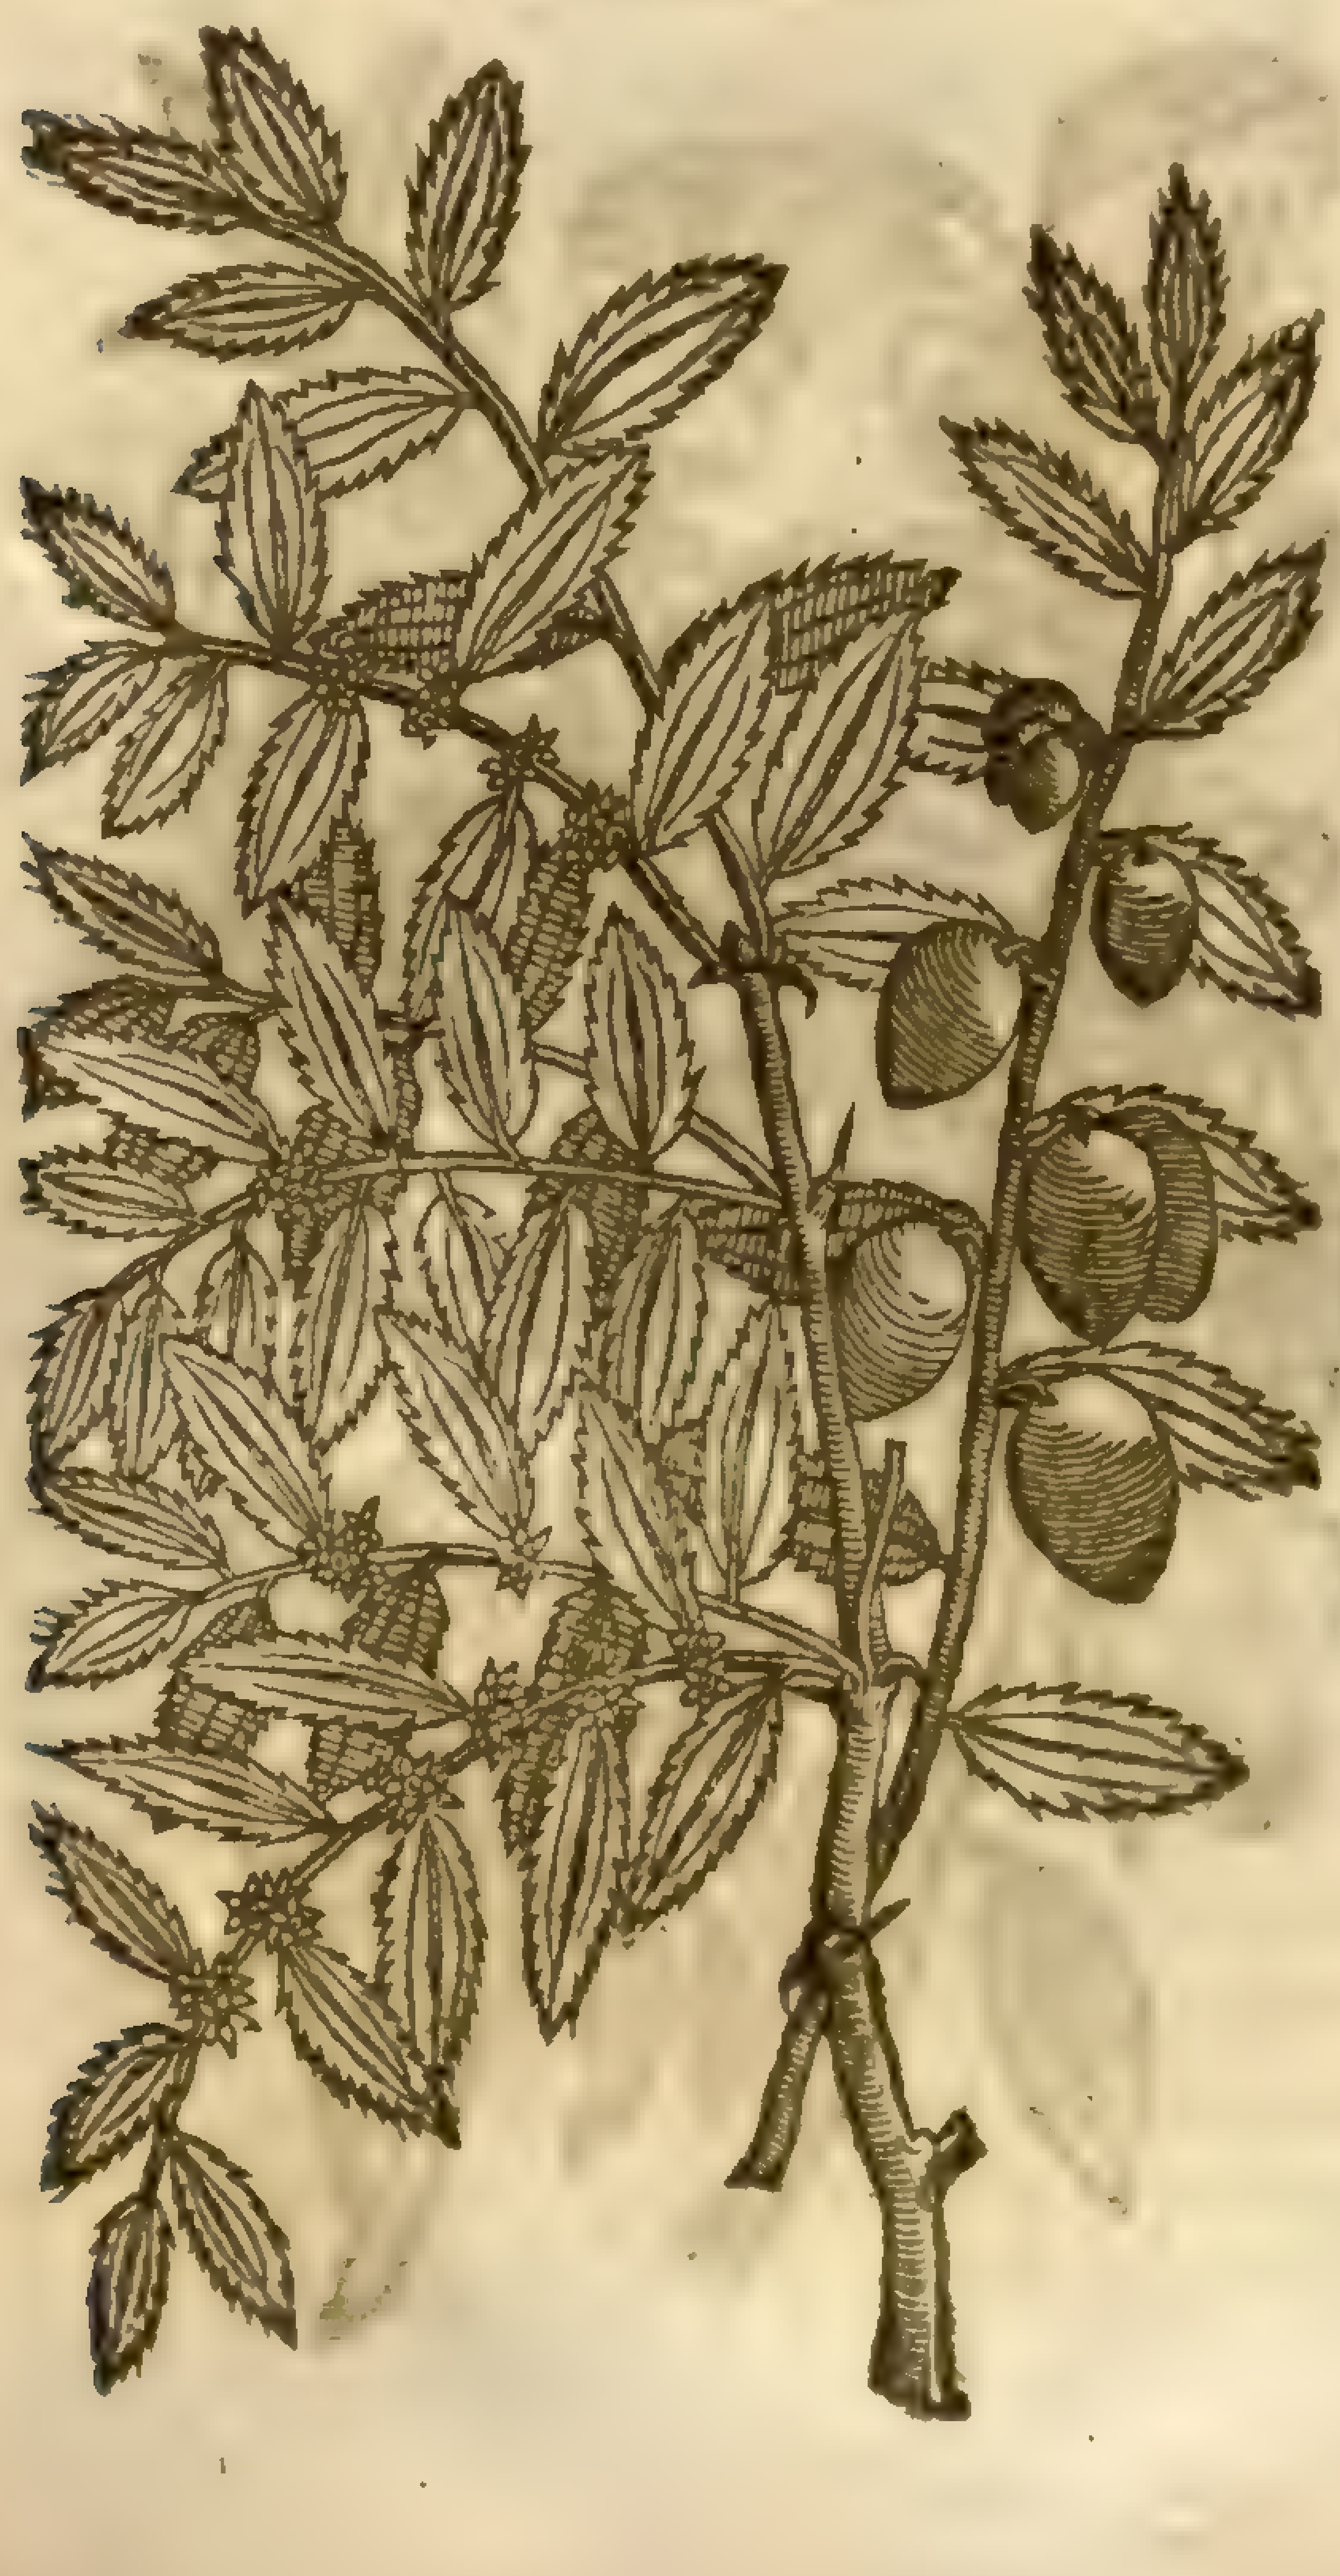
The *Bellerice* are alſo of a mild operation, and do comfort: they are cold in the firſt degree, and dry in the ſecond: the others come neere to the *Emblica* in operation. I

---

† I haue in this Chapter contented my ſelfe with the expreſſing of the fruits out of *Cluſius* and *Lobel*, and omitted the figures of the three Mirobalan trees, which our Author gaue vs out of *Tabern.* becauſe I iudge them rather drawne by fancy than by the things themſelues.

Chap. 129. *Of the Iujube tree.*

Iujube Arabum, ſiue Ziziphus Dodonai.
The Iujube tree.



¶ *The Deſcription.*

The Iujube tree is not much leſſe than *Ziziphus Candida*, hauing a wreathed trunk or body, and a rough barke full of rifts or crannies, and ſtiffe branches beſet with ſtrong and hard prickles, from whence grow out many long twigs or little ſtalks half a foot or more in length, in ſhew like Ruſhes, limmer, and eaſily bowing themſelues, and very ſlender like the twigs of *Spartum*: about which come forth leaues one aboue another, which are ſomewhat long, not very great, but hard and tough like to the leaves of *Peruinca* or Peruincle, & among theſe leaues come forth pale & moſſie little flours: after which ſucceed long red wel taſted ſweet berries as big as Oliues (of a mean quantitie) or little Prunes, or ſmall plums, wherein there are hard ſtones, or in which a ſmall kernell is contained.

¶ *The Place.*

There be now at this day Iujube trees growing in very many places of Italy, which in times paſt were newly brought thither out of Syria, and that about *Plinies* time, as hee himſelfe hath written, *lib.* 17. *cap.* 10.

¶ *The Time.*

It floureth in Aprill, at which time the ſeeds or ſtones are to be ſet or ſown for increaſe.

¶ *The Names.*

This tree is called in Greeke ζίζυφον and ζίζυφος, with *Iota* in the ſecond ſyllable: in Latine likewiſe *Zizyphus*; and of *Petrus Creſcentius*, *Zezulus*: in Engliſh, Iuiube tree.

The fruit or plums are named in Greeke, ζίζυφα, ζίζυφον: *Galen* calleth them σηρικά, as *Avicen* plainely ſheweth, *cap.* 369. intreating of the Iujube, in which be ſet down thoſe things that are mentioned concerning *Serica* in *Galens* books of the faculties of nouriſhments: in Latine likewiſe *Zizypha* and *Serica*: in ſhops, *Iujuba*: in Engliſh, Iujubes.

¶ *The Temperature.*

Iujubes are temperat in heate and moiſture.

¶ *The Vertues.*

A The fruit of the Iujube tree eaten is of hard digeſtion and nouriſheth very little; but being taken in ſyrrups, electuaries, and ſuch like confections, it appeaſeth and mollifieth the roughneſſe of the throat, the breſt and lungs, and is good againſt the cough, but very good for the reins of the back, the kidnies and bladder.

Chap. 130. *Of the Cherry tree.*

¶ *The Kindes.*

The antient Herbariſts haue ſet down four kinds of Cherry trees; the firſt is great and wild, the ſecond tame or of the garden, the third hath ſour fruit, the fourth is that which is called in Latine *Chamæceraſus*, or the dwarfe Cherry tree. The later writers haue found diuers ſorts more, ſome bringing forth great fruit, others leſſer; ſome with white fruit, ſome with blacke, others of the colour of black bloud, varying infinitely according to the clymat and country where they grow.

1 *Ceraſus vulgaris.*
The common Engliſh Cherry tree.

Prunus Cerasus L. a) Mill.
Sm. p. 2. 354

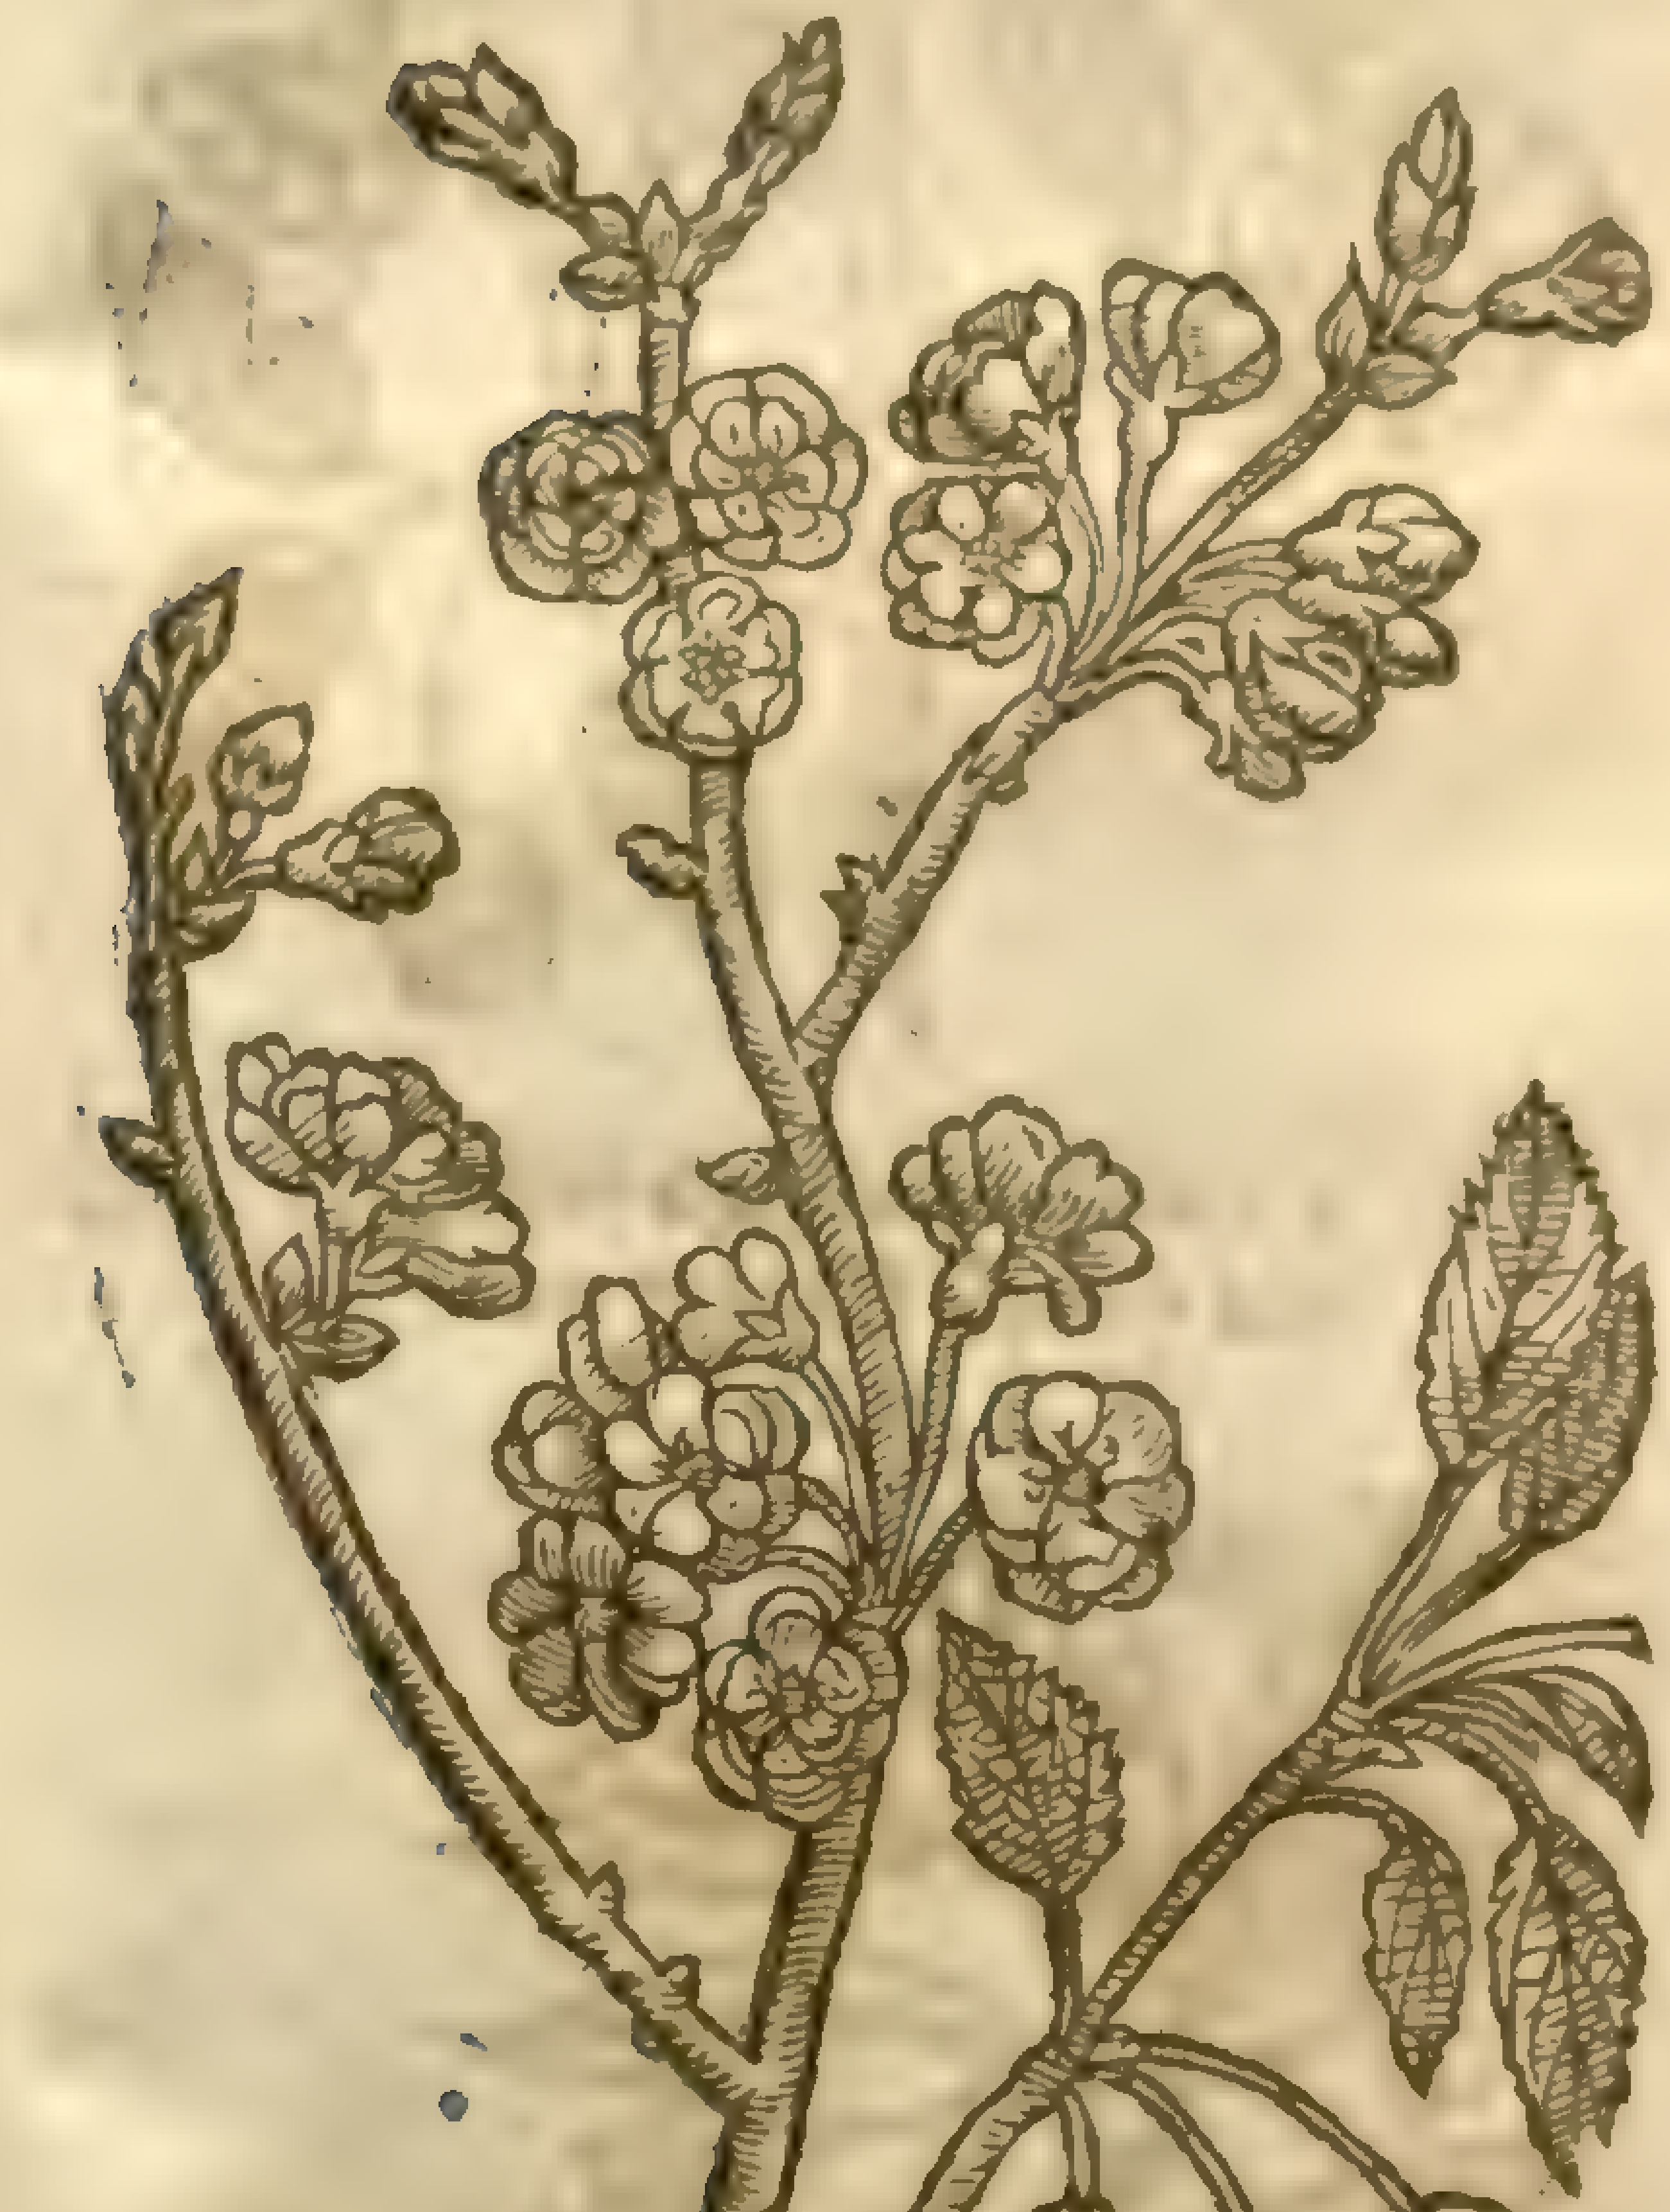
3 *Ceraſus Hiſpanica.*
The Spaniſh Cherry tree.

¶ *The Deſcription.*

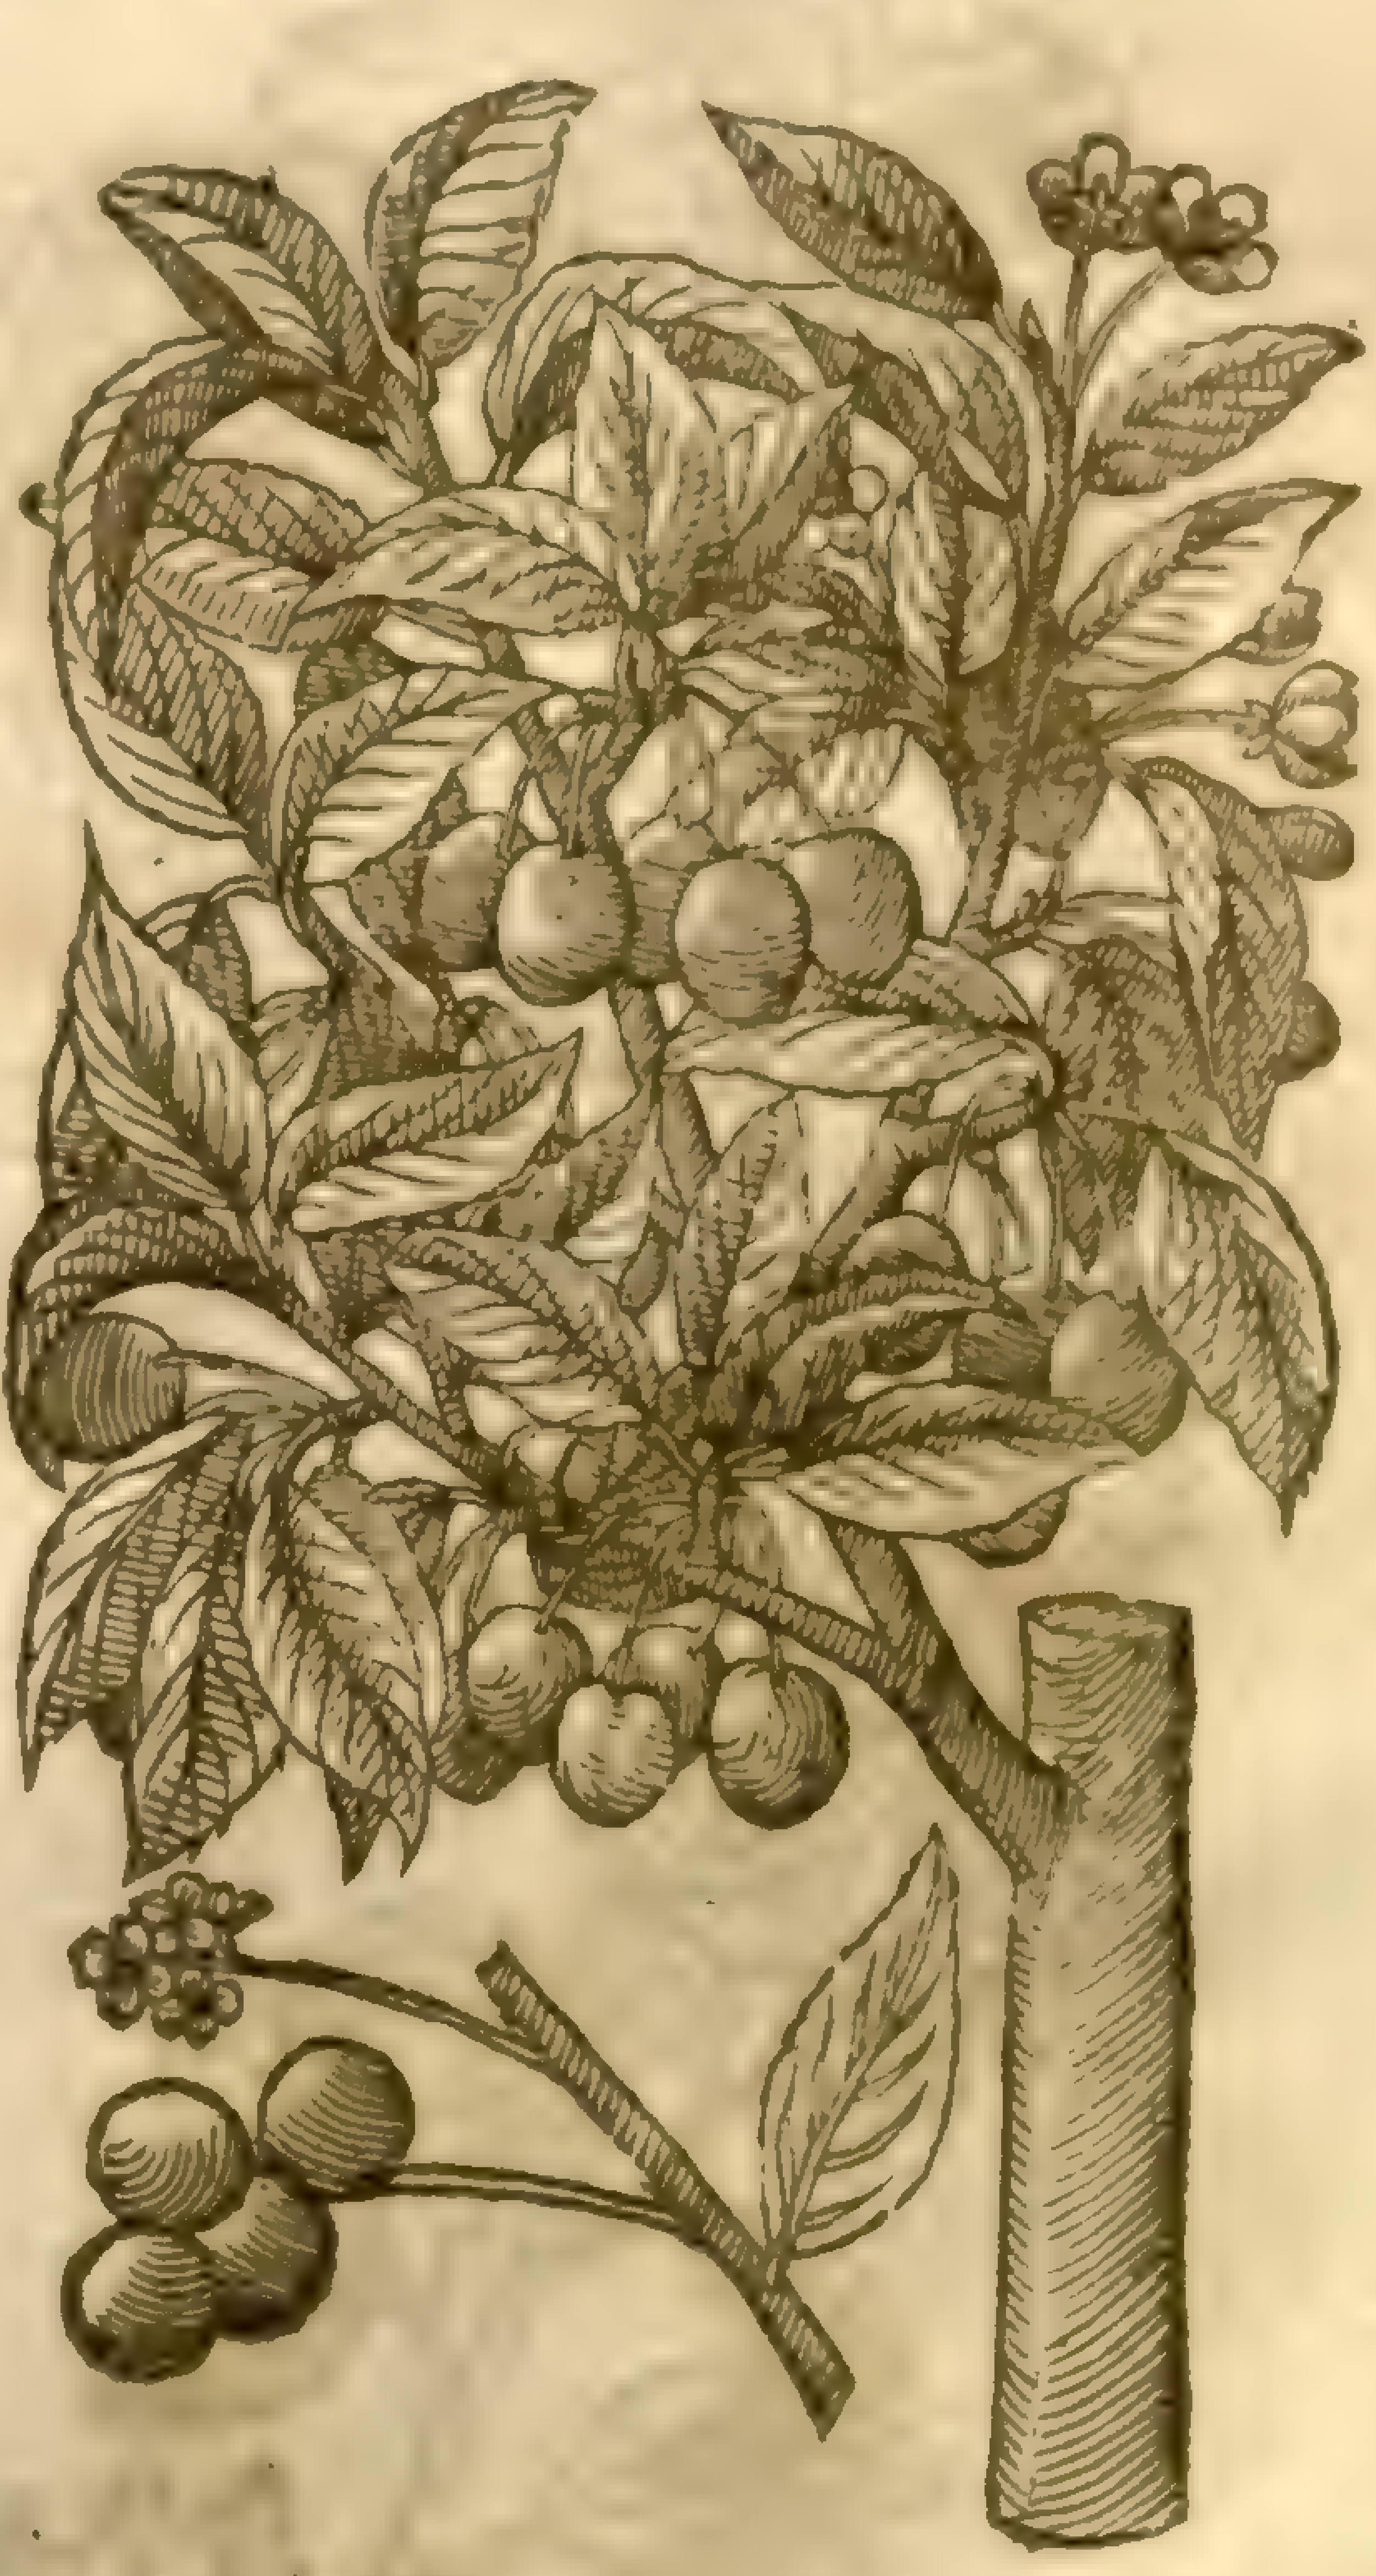
1 THe Engliſh Cherry tree groweth to an high and great tree, the body whereof is of a mean bigneſſe, which is parted aboue into very many boughes, with a barke ſomewhat ſmooth, of a brown crimſon colour, tough and pliable; the ſubſtance or timber is alſo brown in the middle, and the outer part is ſomwhat white: the leaues be great, broad, long, ſet with veins or nerves, and ſleightly nicked about the edges: the floures are white, of a mean bignes, conſiſting of fiue leaues, and hauing certain threds in the middle of the like colour. The Cherries be round, hanging vpon long ſtems or footſtalks, with a ſtone in the middeſt which is couered with a pulp or ſoft meat; the kernell thereof is not vnpleaſant to the taſte, though ſomwhat bitter.

2 The Flanders Cherry tree differeth not from our Engliſh Cherry tree in ſtature or form of leaues or floures, the only difference is, that this tree brings forth his fruit ſooner and greater than the other, wherefore it may be called in Latine, *Ceraſus præcox, ſive Belgica.*

5 *Ceraſus Serotina.*
Late ripe Cherry tree.



6 *Ceraſus vno pediculo plura.*
The Cluſter Cherry tree.

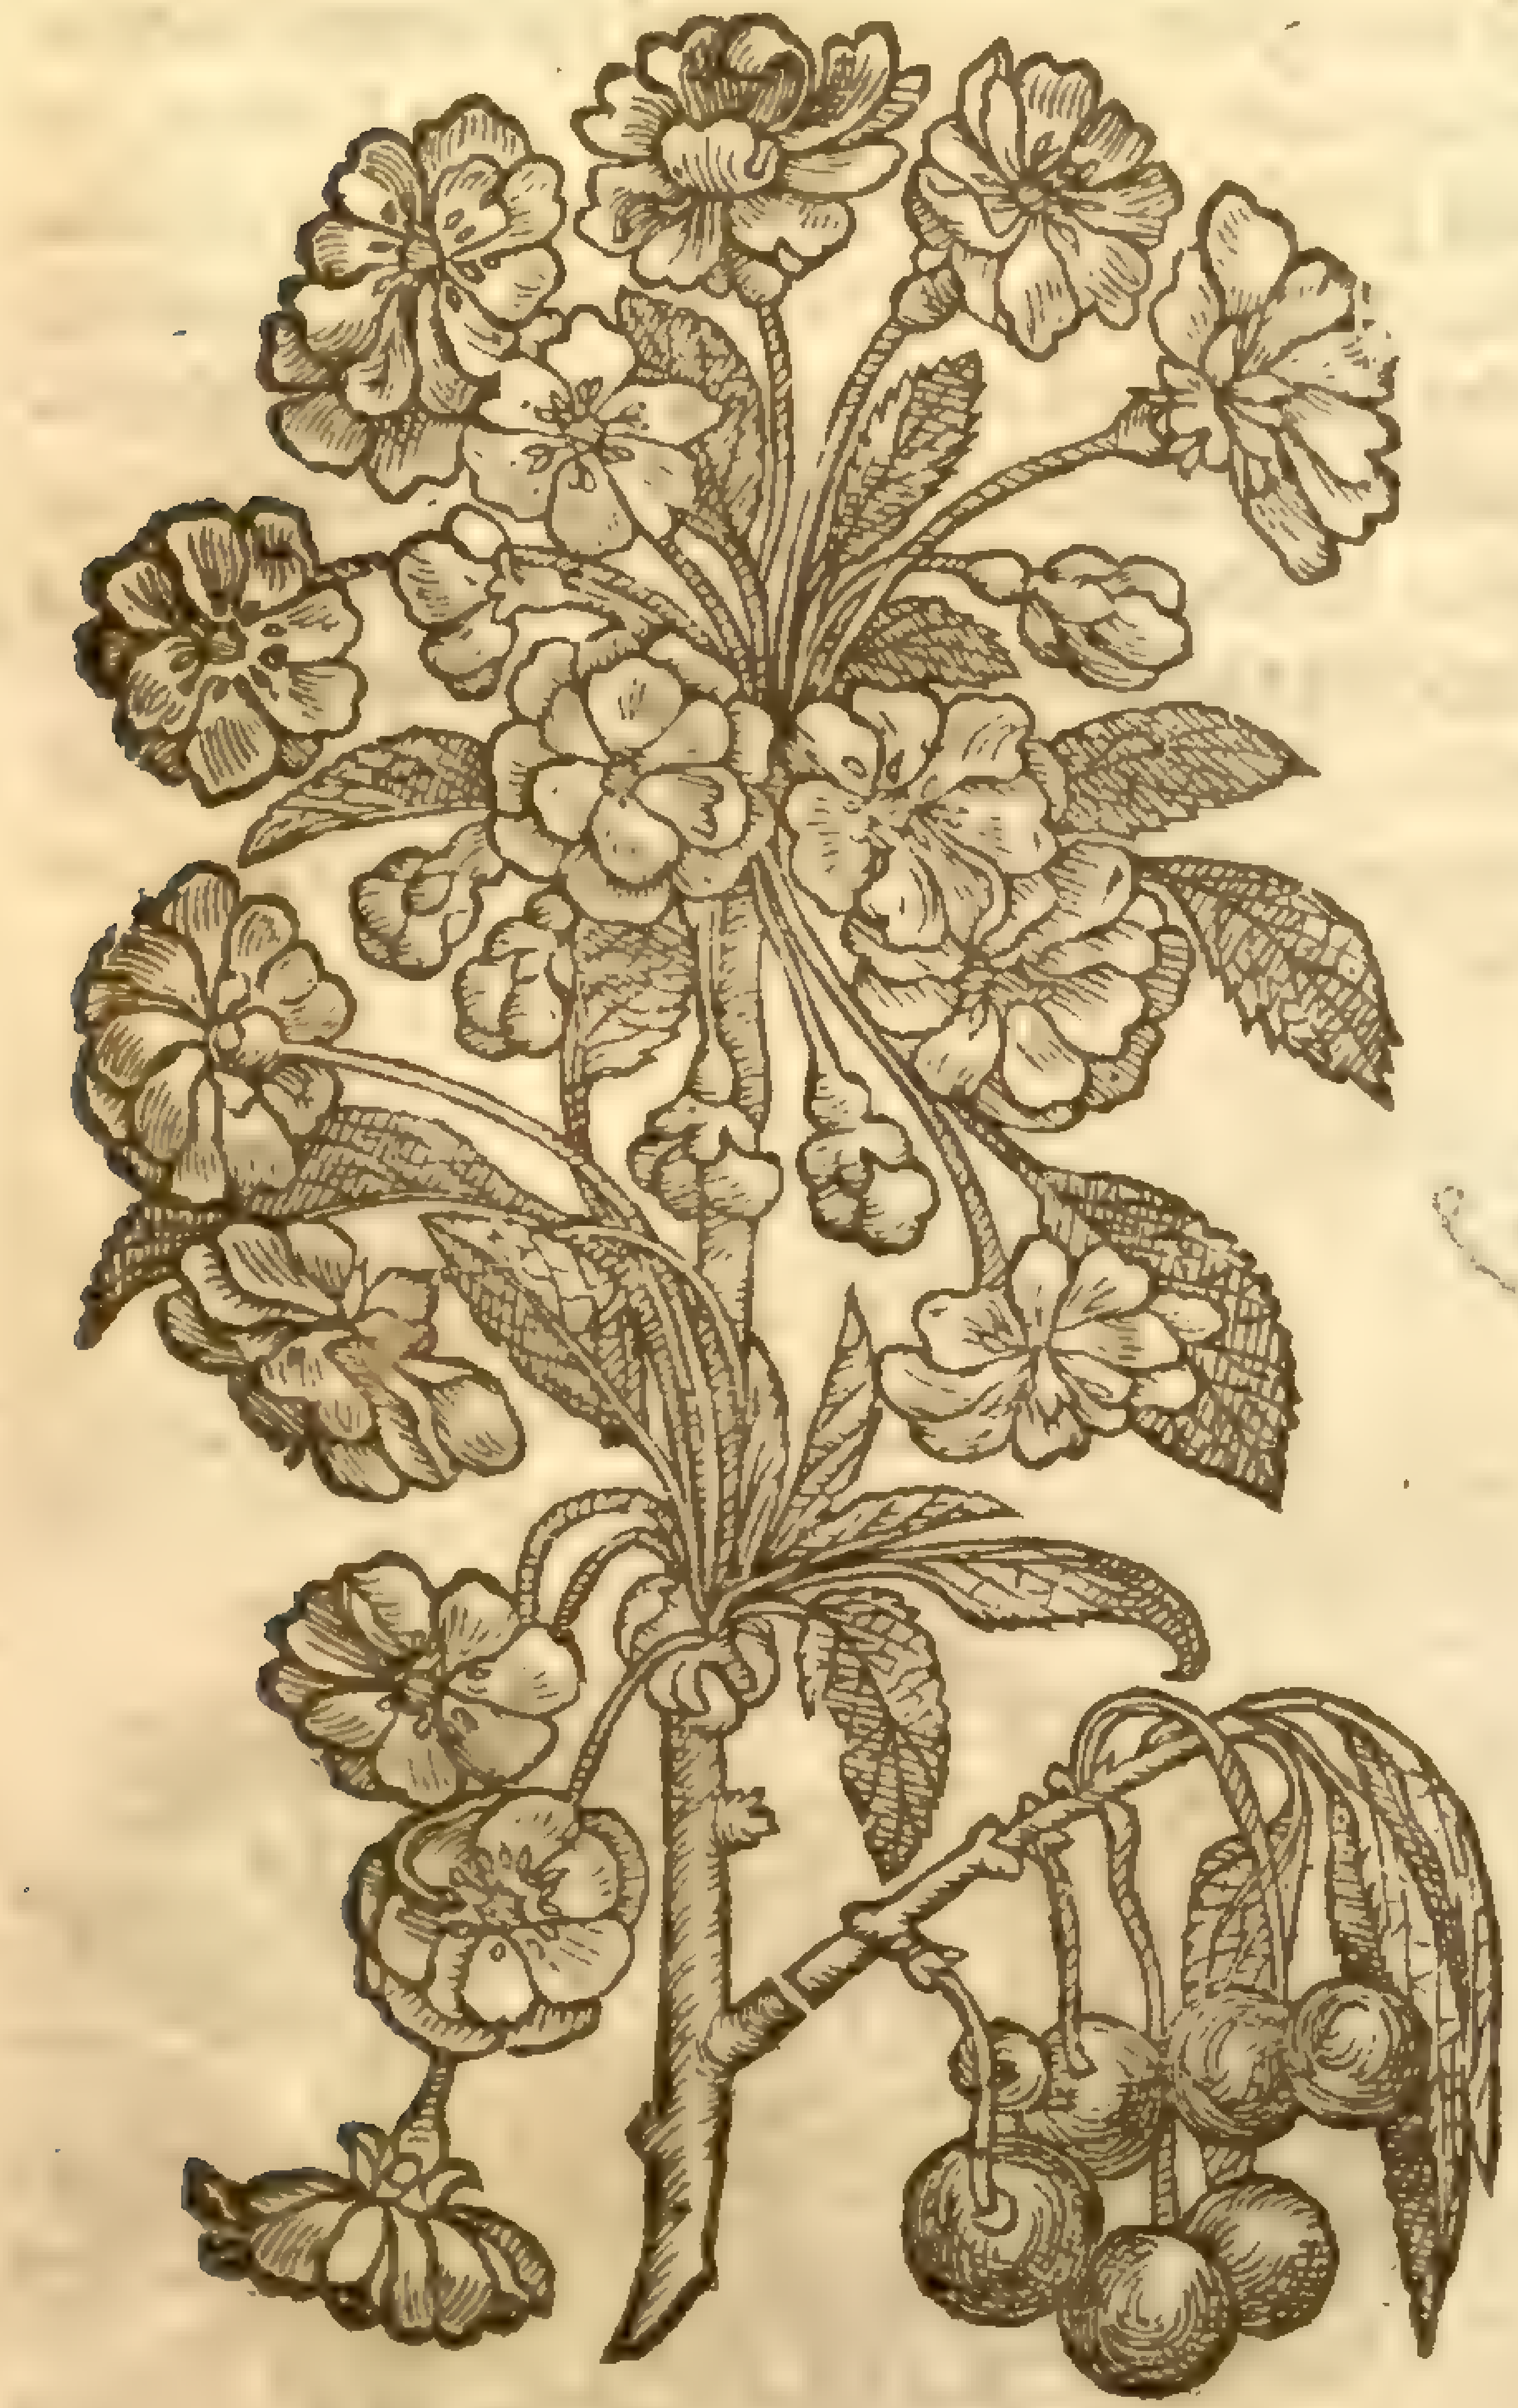


3 The Spaniſh Cherry tree groweth vp to the height of our common Cherry tree, the wood or timber is ſoft and looſe, couered with a whitiſh ſcaly barke, the branches are knotty, greater and fuller of ſubſtance than any other Cherry tree; the leaues are likewiſe greater and longer than any of the reſt, in ſhape like thoſe of the Cheſtnut tree: the floures are like the others in form, but whiter of colour; the fruit is greater and longer than any, white for the moſt part all ouer, except thoſe that ſtand in the hotteſt place where the ſun hath ſome reflexion againſt a wall: they are alſo white within, and of a pleaſant taſte.

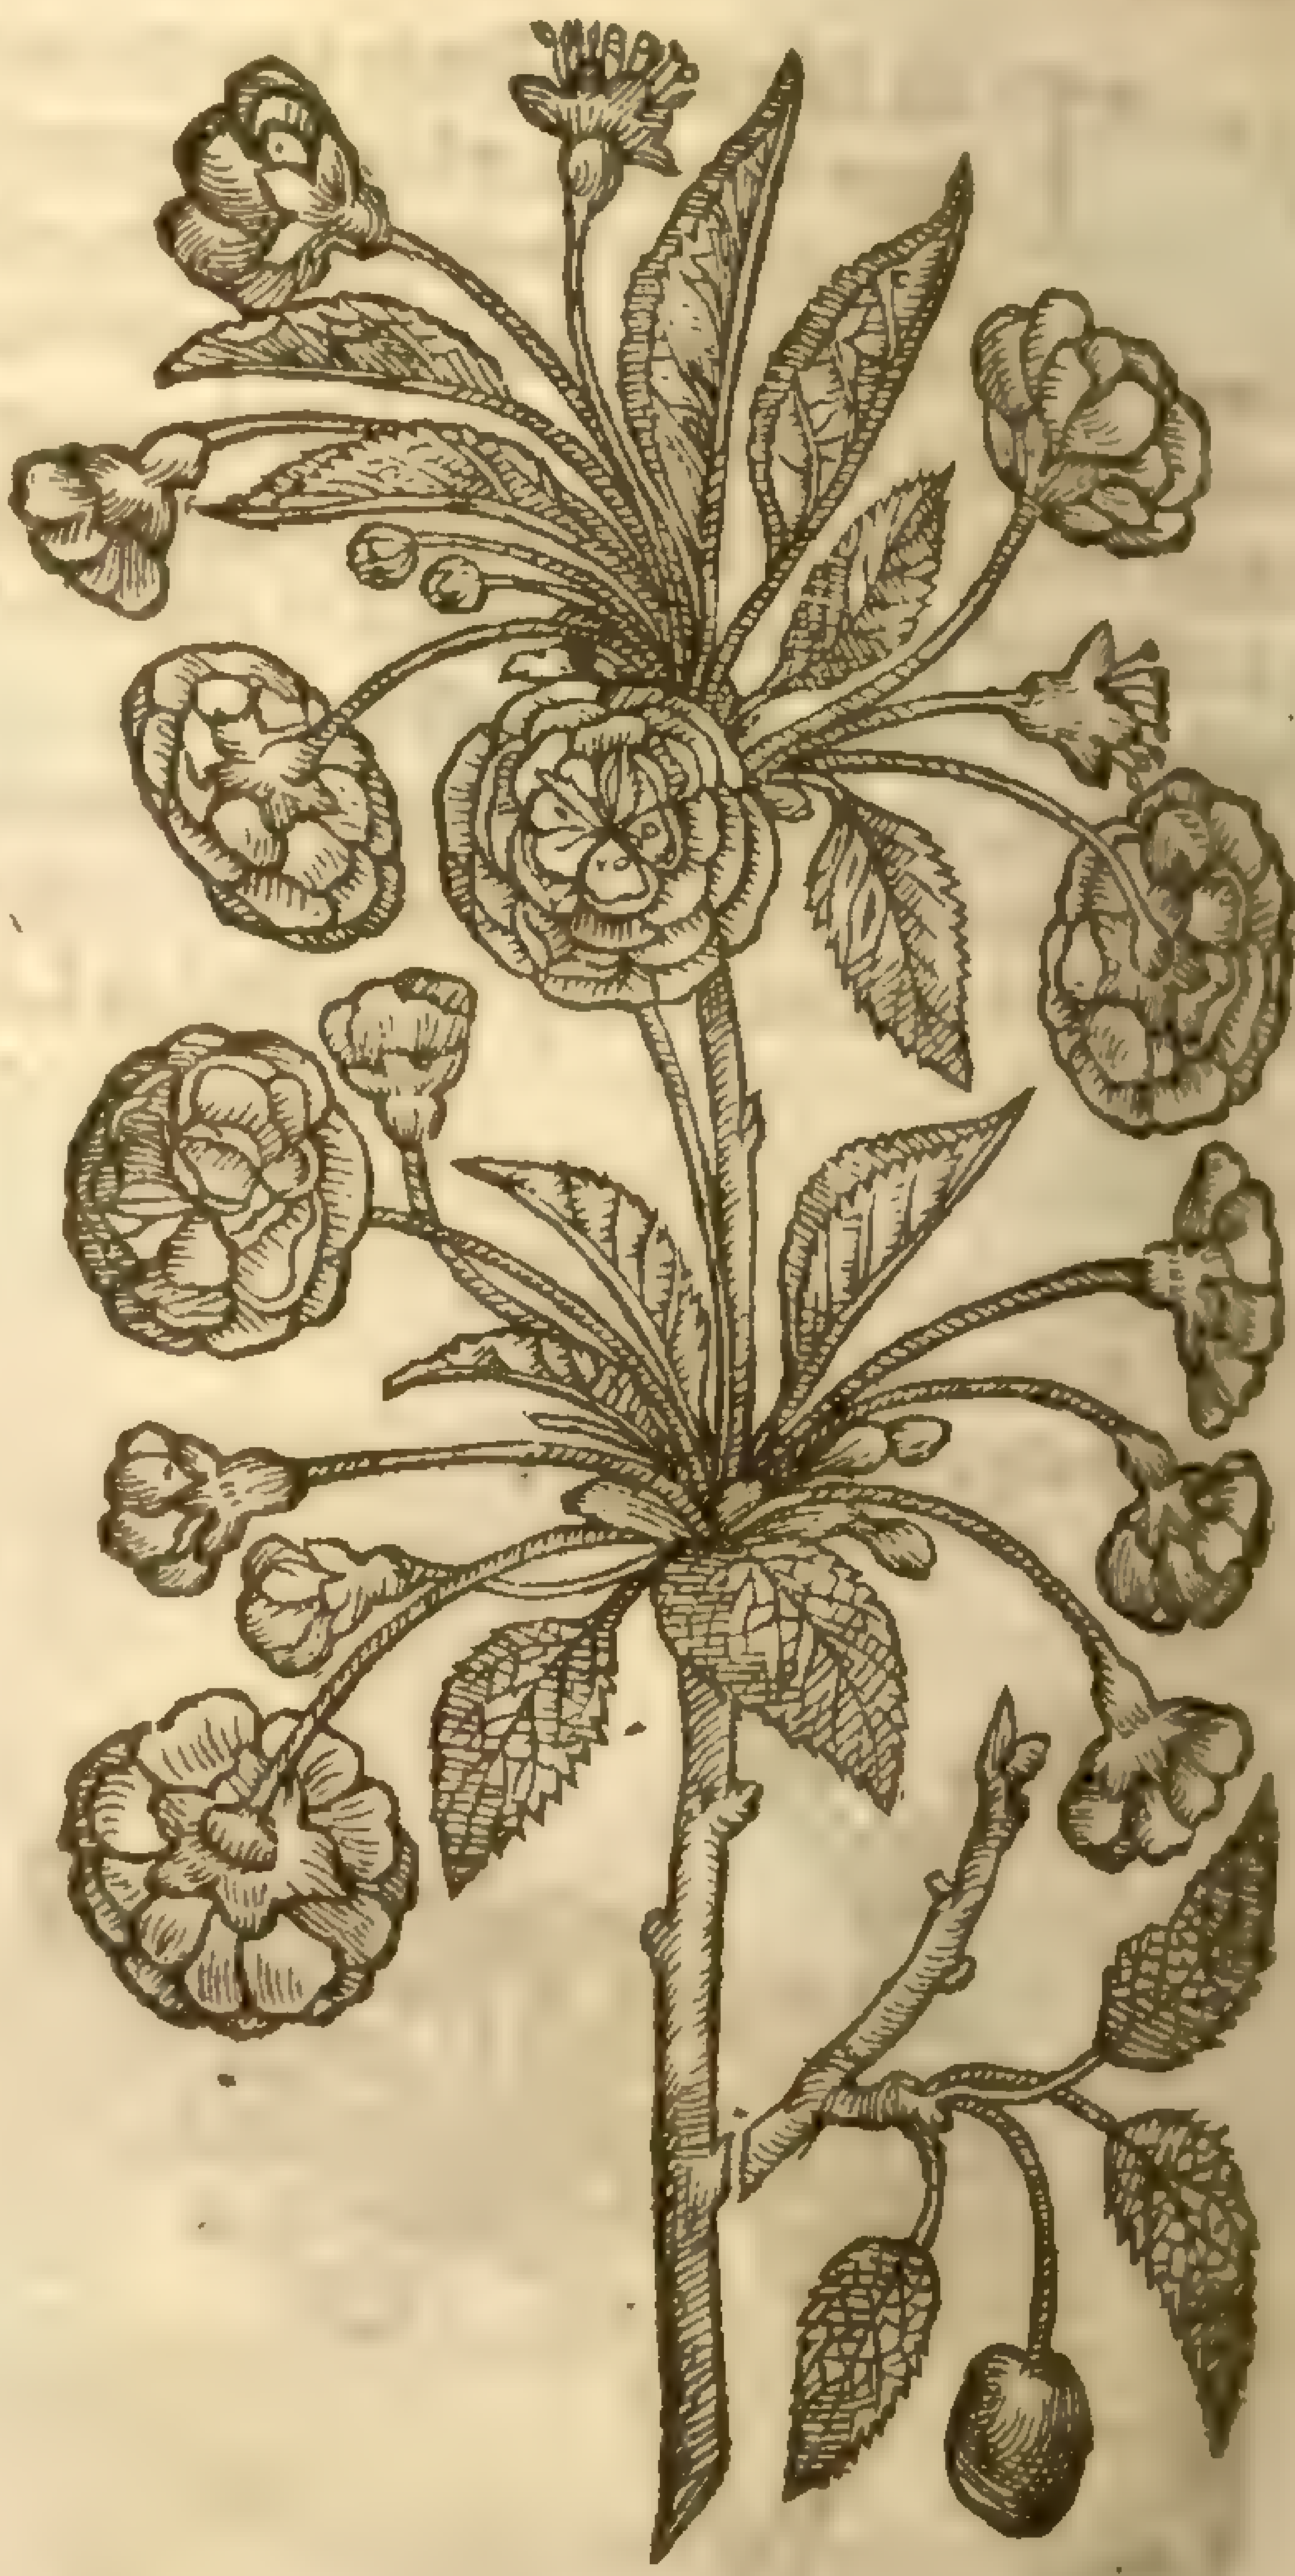
4 The Gaſcoin Cherry tree groweth very like to the Spaniſh cherry tree in ſtature, flours and leaues: it differeth in that it bringeth forth very great Cherries, long, ſharp pointed, with a certain hollowneſſe vpon one ſide, and ſpotted here and there with certain prickles of purple color as ſmal as ſand. The taſte is moſt pleaſant, and excelleth in beauty.

5 The late ripe Cherry tree groweth vp like vnto our wild Engliſh Cherry tree, with the like leaues;

7 *Ceraſus multiflora fructus edens.*
The double floured Cherry tree bearing fruit.

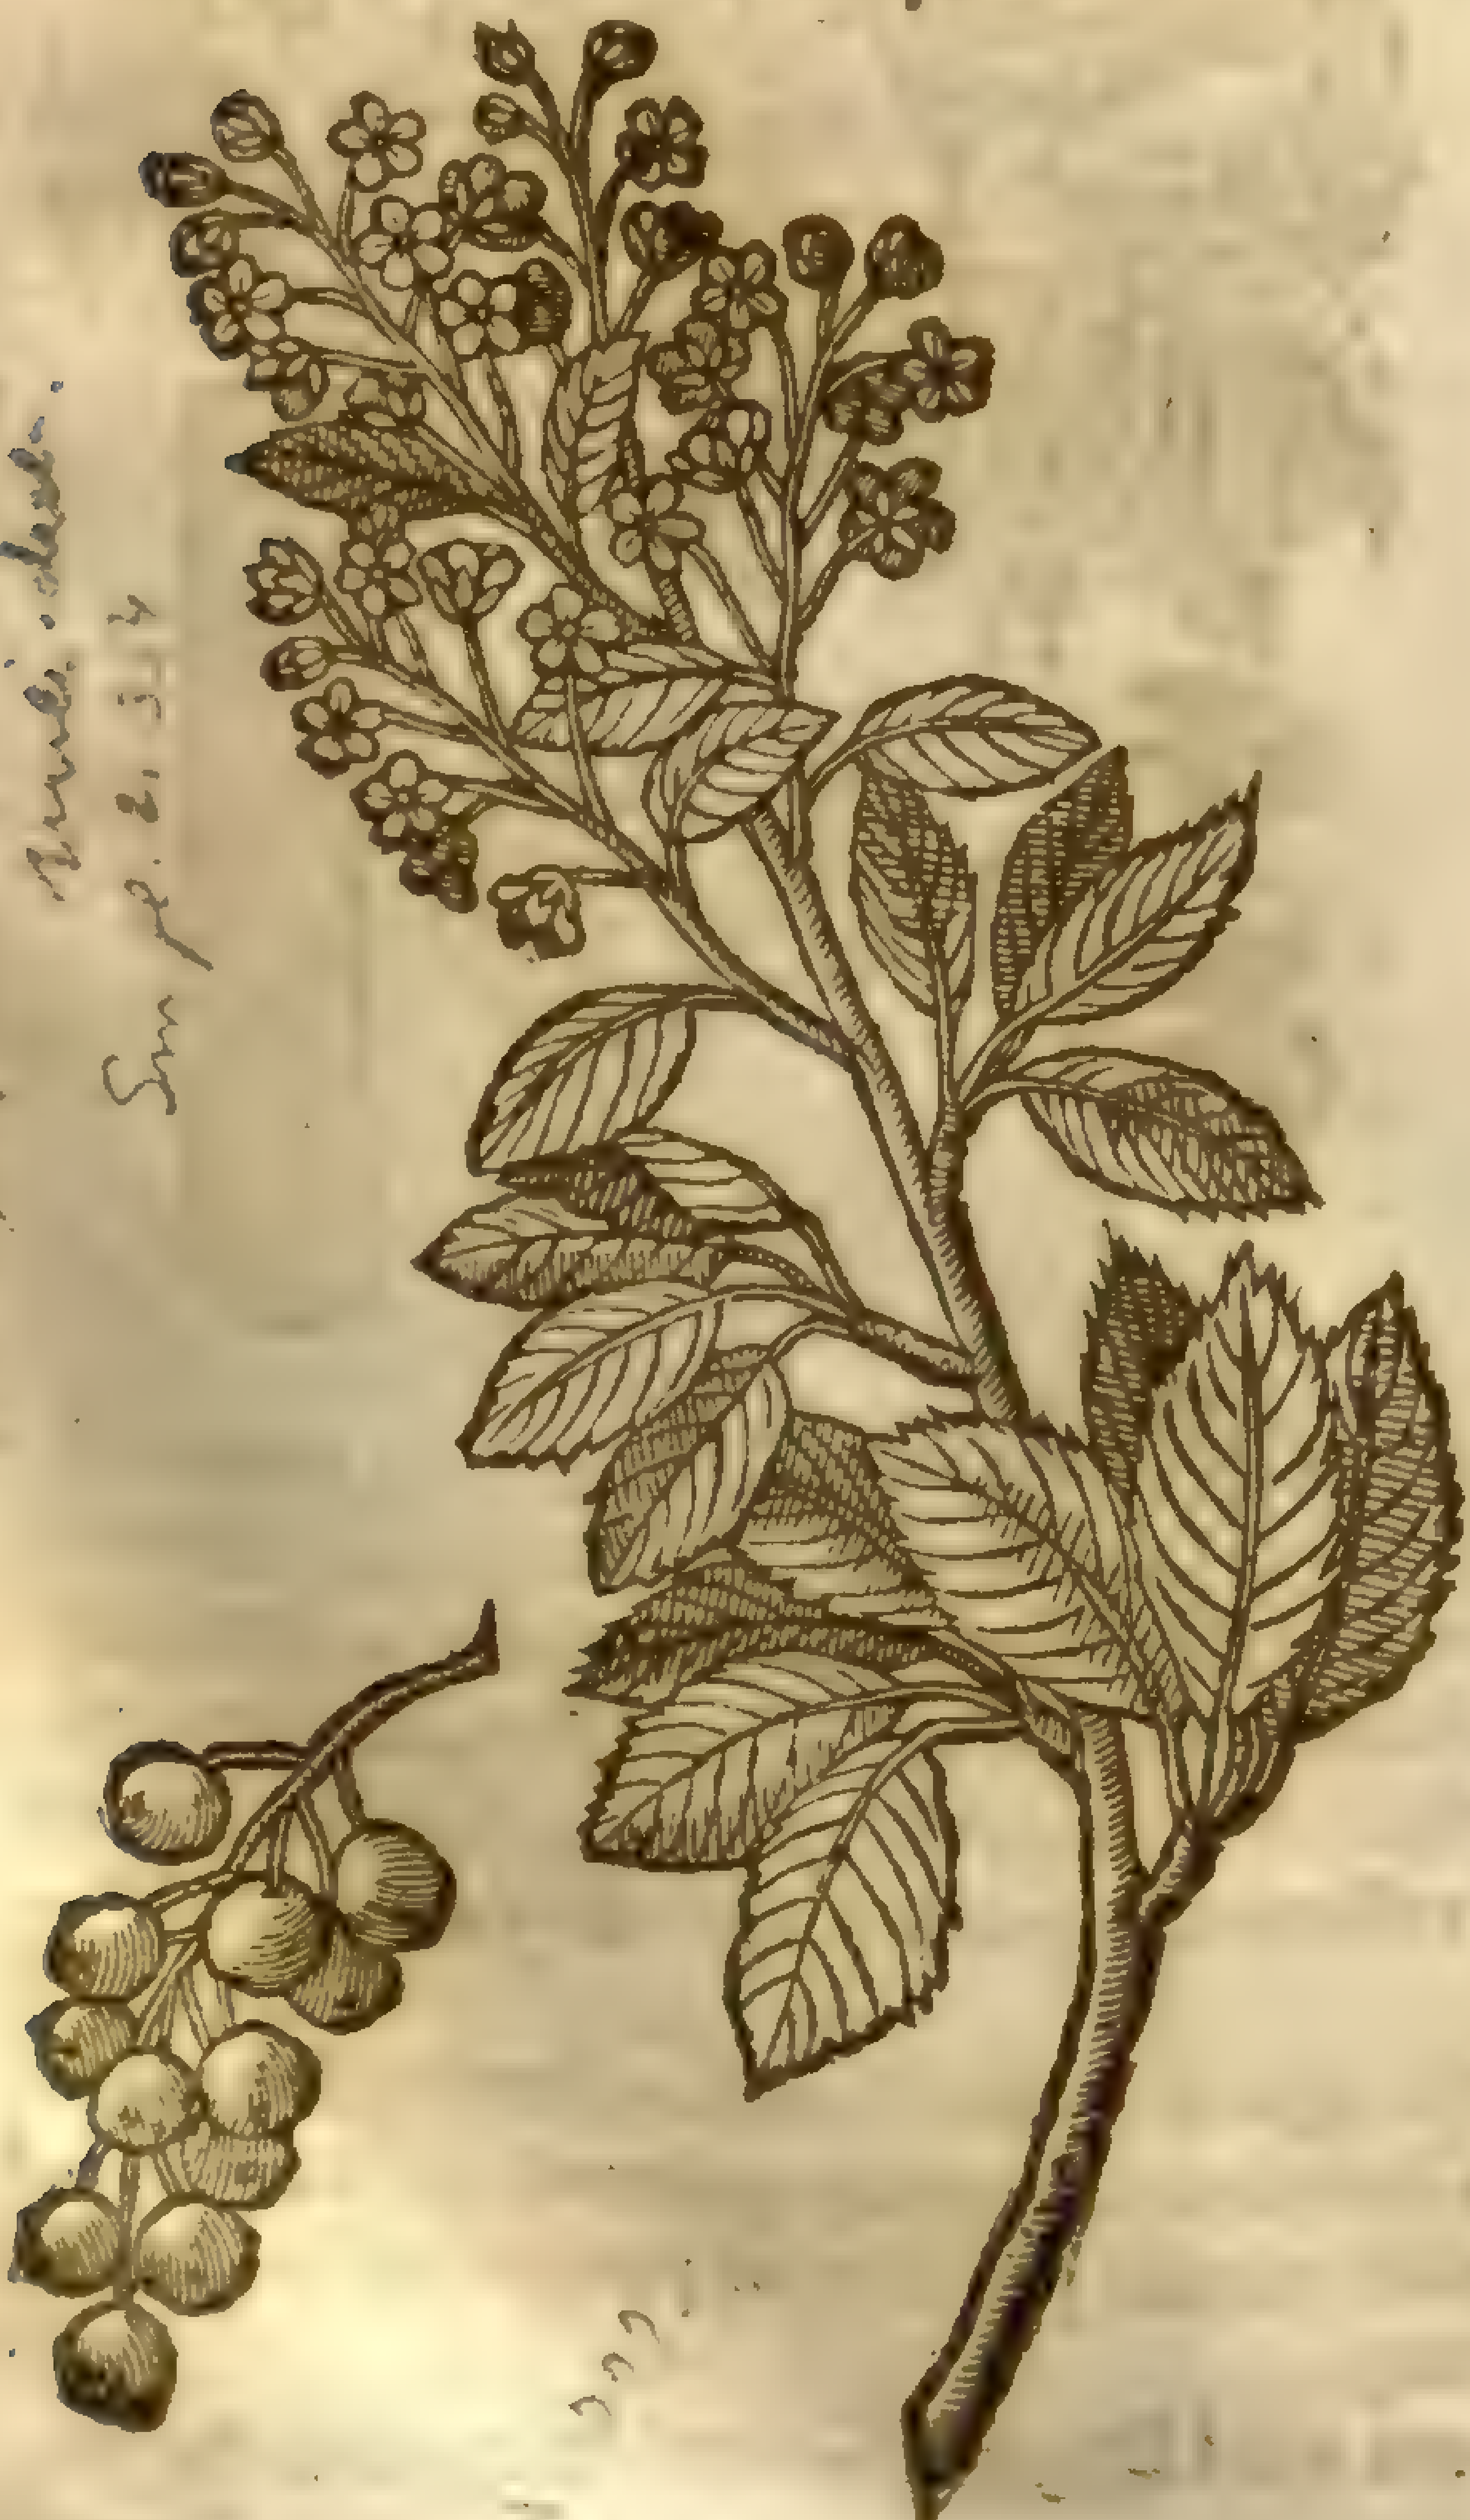


8 *Ceraſus multiflora pauciores fructus edens.*
The double floured barren Cherry tree.



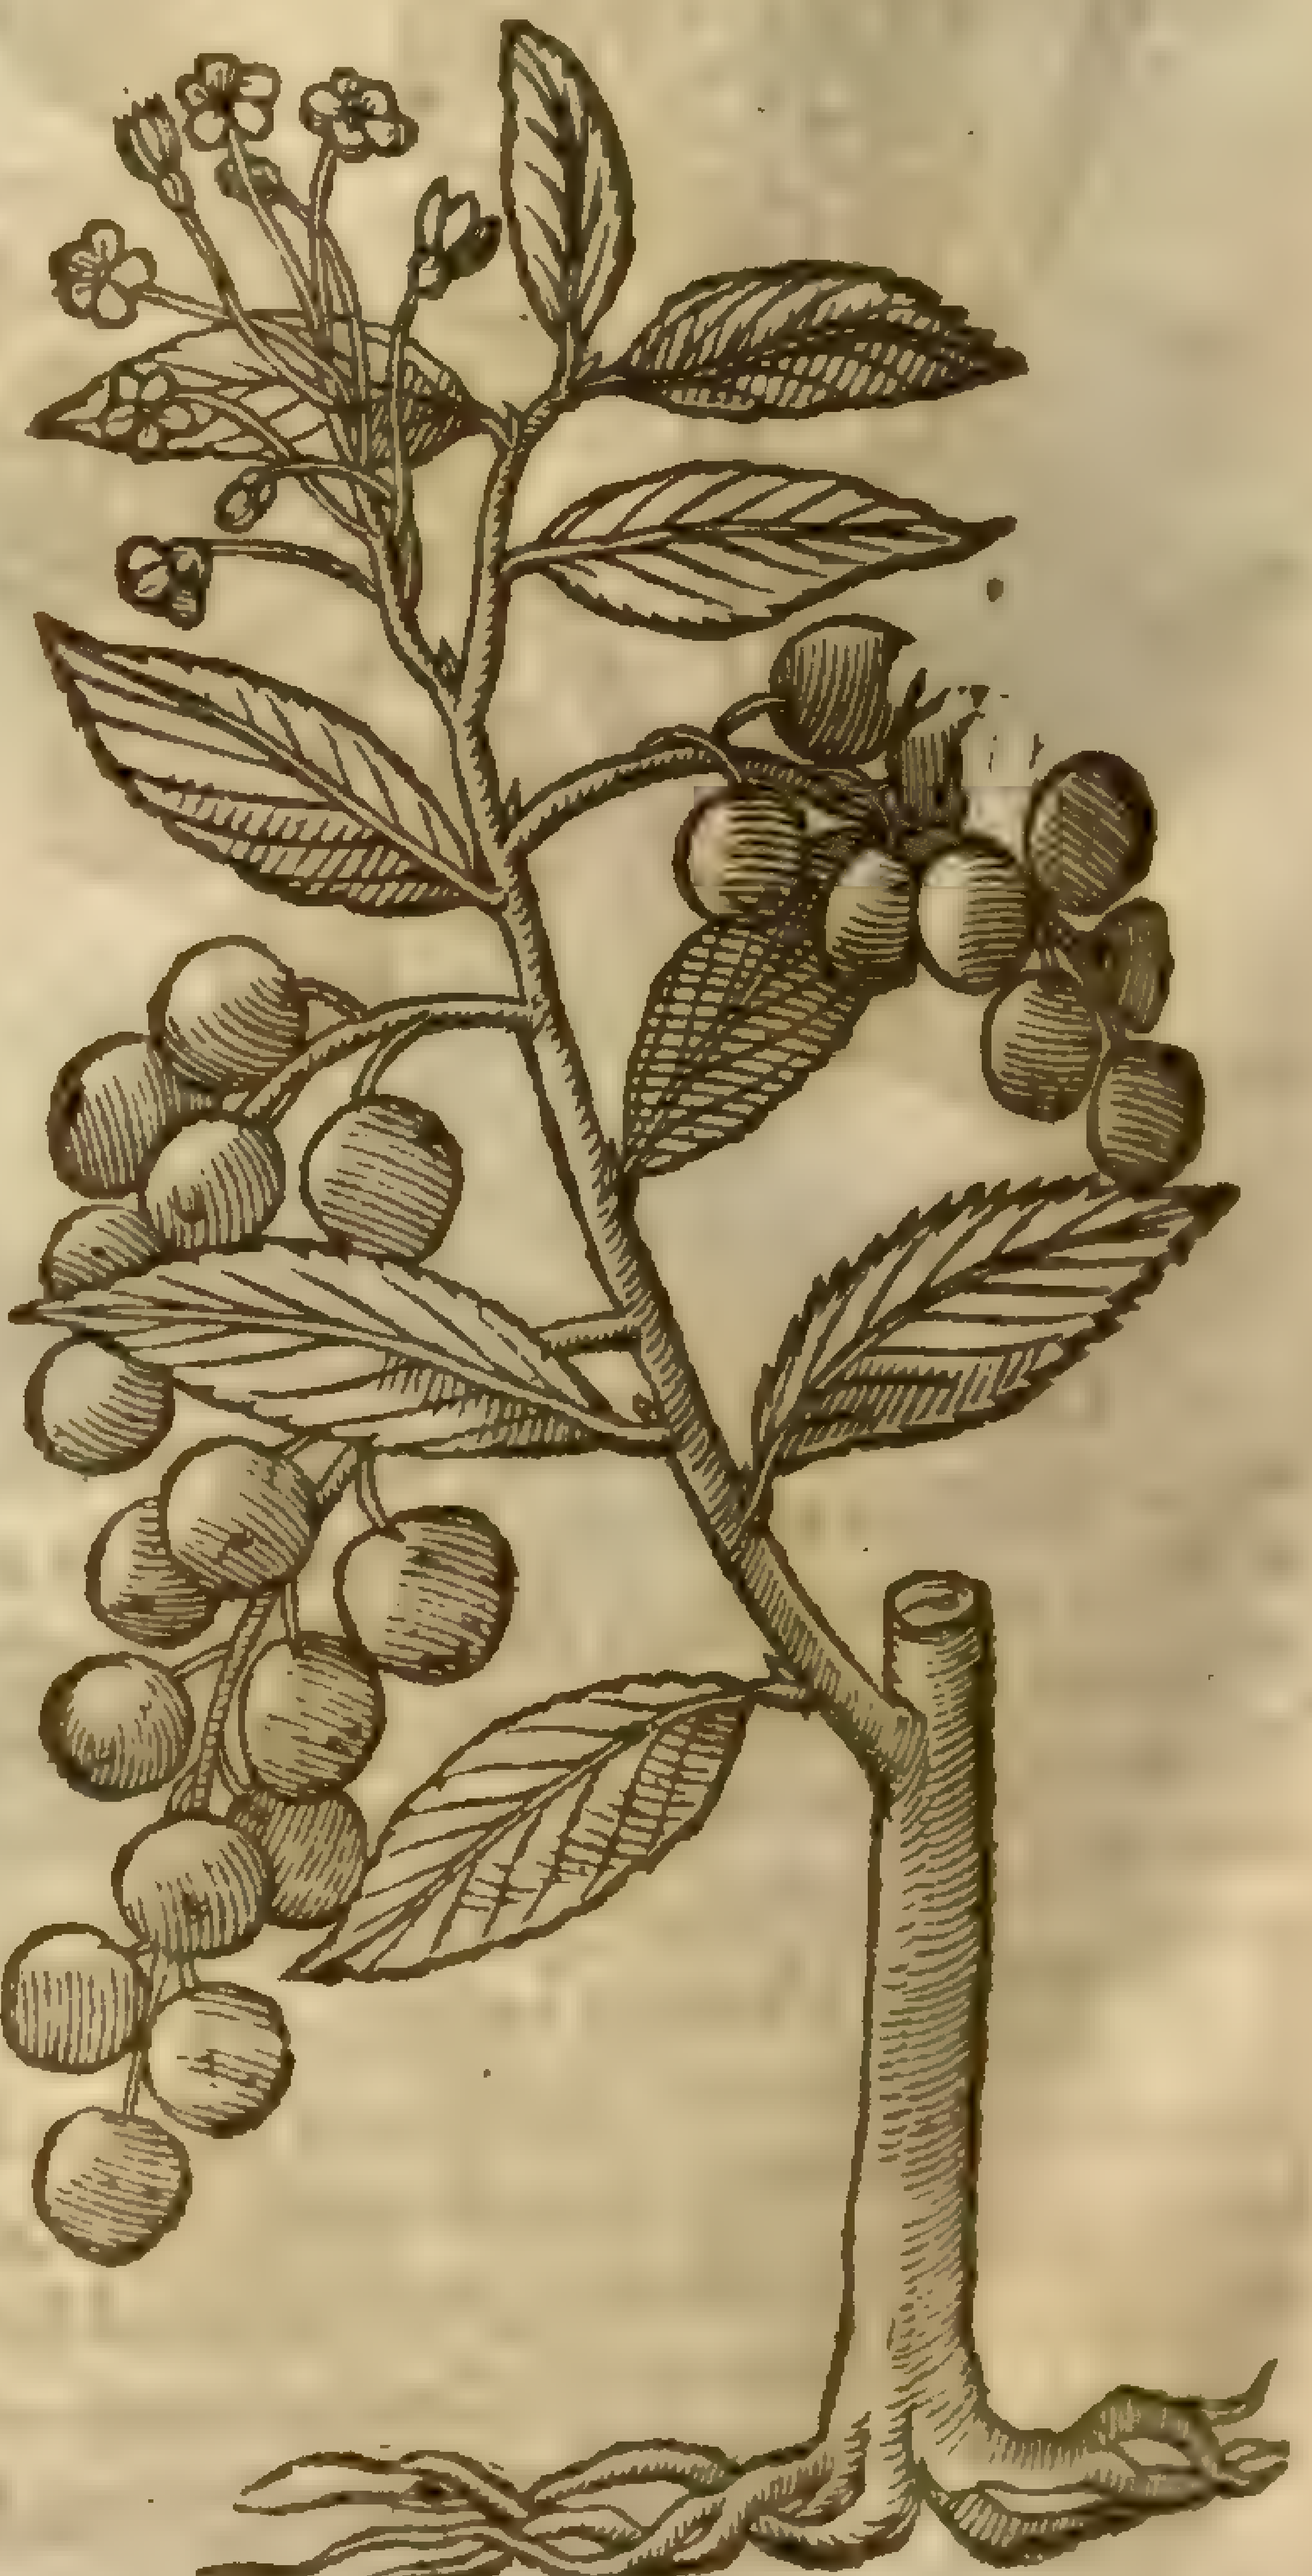
Prunus [illegible]

9 *Ceraſus avium nigra & racemoſa.*
Birds Cherry, and black grape Cherry tree.



? Prunus padus, L. [illegible]
Sm. p. 2. 334

2 *Ceraſus racemoſa rubra.*
Red Grape Cherry tree.



leaues, branches, and floures, ſauing that they are ſomtimes once doubled: the fruit is ſmall, round, and of a darke bloudy colour when they be ripe, which the French-men gather with their ſtalkes, and hang them vp in their houſes in bunches or handfulls againſt Winter, which the Phyſitions do giue vnto their patients in hot and burning feuers, being firſt ſteeped in a little warme water, that cauſeth them to ſwell and plumpe as full and freſh as when they did grow vpon the tree.

6 The Cluſter Cherry tree differeth not from the laſt deſcribed either in leaues, branches, or ſtature: the floures are alſo like, but neuer commeth any one of them to be double. The fruit is round, red when they be ripe, and many growing vpon one ſtem or foot-ſtalke in cluſters, like as the Grapes do. The taſte is not vnpleaſant although ſomewhat ſoure.

7 This Cherrie-tree with double floures growes vp vnto a ſmall tree, not vnlike to the common Cherrie-tree in each reſpect, ſauing that the floures are ſomewhat double, that is to ſay, three or foure times double; after which commeth fruit (though in ſmall quantitie) like the other common Cherry.

8 The double floured Cherry-tree growes vp like vnto an hedge buſh, but not ſo great nor high as any of the others; the leaues and branches differ not from the reſt of the Cherry-trees. The floures hereof are exceeding double, as are the flours of Marigolds, but of a white colour, and ſmelling ſomewhat like the Hawthorne floures; after which come ſeldome or neuer any fruit, although ſome Authors haue ſaid that it beareth ſometimes fruit, which my ſelfe haue not at any time ſeen; notwithſtanding the tree hath growne in my Garden many yeeres, and that in an excellent good place by a bricke wall, where it hath the reflection of the South Sunne, fit for a tree that is not willing to beare fruit in our cold climat.

11 *Ceraſus nigra.*
The common blacke Cherry-tree.

12 *Chamaceraſus.*
The dwarfe Cherry-tree.

9 The Birds Cherry-tree, or the blacke Cherry-tree, that bringeth forth very much fruit vpon one branch (which better may be vnderſtood by ſight of the figure, than by words) ſpringeth vp like an Hedge tree of ſmall ſtature, it groweth in the wilde woods of Kent, and are there vſed for ſtockes to graft other Cherries vpon, of better taſt, and more profit, as eſpecially thoſe called the Flanders Cherries: this wilde tree growes very plentifully in the North of England, eſpecially at a place called Heggdale, neere vnto Roſgill in Weſtmerland, and in diuers other places about Croſbie Rauenſwaith, and there called Hegberrie-tree; it groweth likewiſe in Martome Parke, foure

miles from Blackeburne, and in Harward neere thereunto; in Lancaſhire almoſt in euery hedge: the leaues and branches differ not from thoſe of the wilde Cherry-tree: the floures grow alongſt the ſmall branches, conſiſting of fiue ſmall white leaues, with ſome greeniſh and yellow thrums in the middle: after which come the fruit, greene at the firſt, blacke when they be ripe, and of the bigneſſe of Sloes; of an harſh an vnpleaſant taſte.

10 The other birds Cherry-tree differeth not from the former in any reſpect, but in the colour of the berries; for as they are blacke; ſo on the contrary, theſe are red when they be ripe, wherein they differ.

11 The common blacke Cherry-tree growes vp in ſome places to a great ſtature: there is no difference betweene it and our common Cherry tree, ſauing that the fruit hereof is very little in reſpect of other Cherries, and of a blacke colour.

12 The dwarfe Cherry-tree groweth very ſeldome to the height of three cubits: the trunke or body ſmall, couered with a darke coloured blacke: wherupon do grow very limber and pliant twiggie branches: the leaues are very ſmall, not much vnlike to thoſe of the Priuite buſh: the floures are ſmall and white: after which come Cherries of a deepe red colour when they be ripe, of taſte ſomewhat ſharpe, but not greatly vnpleaſant: the branches laid downe in the earth, quickely take root, whereby it is greatly increaſed.

My ſelfe with diuers others haue ſundry other ſorts in our gardens, one called the Hart Cherry, the greater and the leſſer; one of the great bigneſſe, and moſt pleaſant in taſte, which we call *Luke Wardes* Cherry, becauſe he was the firſt that brought the ſame out of Italy; another we haue called the Naples Cherry, becauſe it was firſt brought into theſe parts from Naples: the fruit is very great, ſharpe pointed, ſomewhat like a mans heart in ſhape, of a pleaſant taſte, and of a deepe blackiſh colour when it is ripe, as it were of the colour of dried bloud.

We haue another that bringeth forth Cherries alſo very great, bigger than any Flanders Cherrie, of the colour of Iet, or burniſhed horne, and of a moſt pleaſant taſte, as witneſſeth Mr. *Bull*, the Queenes Majeſties Clockemaker, who did taſte of the fruit (the tree bearing onely one Cherry, which he did eate; but my ſelfe neuer taſted of it) at the impreſſion hereof. We haue alſo another, called the Agriot Cherry, of a reaſonable good taſte. Another we haue with fruit of a dun colour, tending to a watchet. We haue one of the dwarfe Cherries, that bringeth forth fruit as great as moſt of our Flanders Cherries, whereas the common ſort hath very ſmall Cherries, and thoſe of an harſh taſte. Theſe and many ſorts more we haue in our London gardens, whereof to write particularly would greatly enlarge our volume, and to ſmall purpoſe: therefore what hath beene ſaid ſhall ſuffice. ‡ I muſt here (as I haue formerly done, in Peares, Apples, and other ſuch fruites) refer you to my two friends Mr. *Iohn Parkinſon*, and Mr. *Iohn Millen*, the one to furniſh you with the hiſtory, and the other with the things themſelues, if you deſire them. ‡

¶ *The Time.*

The Cherrie-treee bloome in Aprill; ſome bring forth their fruit ſooner; ſome later: the red Cherries be alwaies better than the blacke of their owne kinde.

¶ *The Names.*

The Cherry-tree is called in Greeke, κέρασος: and alſo in Latine, *Ceraſus*: in high Dutch, **Kirſchenbaum**: in low Dutch, **Kerſenboome** and **Crieckenboom**: in French, *Ceriſier*: in Engliſh, Cherry-tree.

The fruit or Cherries be called in Greeke, κεράσια and κεράσα: and in Latine likewiſe, *Ceraſa*: in Engliſh, Cherries: the Latine and Engliſh names in their ſeuerall titles ſhall ſuffice for the reſt that might be ſaid.

¶ *The Temperature and Vertues.*

A The beſt and principall Cherries be thoſe that are ſomewhat ſower: thoſe little ſweet ones which be wild and ſooneſt wripe be the worſt: they contain bad juyce, they very ſoone putrifie, and doe ingender ill bloud, by reaſon whereof they do not onely breed wormes in the belly, but troubleſome agues, and often peſtilent feuers: and therefore in well gouerned common wealths it is carefully prouided that they ſhould not be ſold in the markets in the plague time.

B Spaniſh Cherries are like to theſe in faculties, but they doe not ſo ſoone putrifie: they be likewiſe cold, and the juyce they make is not good.

C The Flanders or Kentiſh Cherries that are through ripe, haue a better juice, but watery, cold and moiſt: they quench thirſt, they are good for an hot ſtomacke, and profitable for thoſe that haue the ague: they eaſily deſcend, and make the body ſoluble: they nouriſh nothing at all.

D The late ripe Cherries which the French-men keepe dried againſt Winter, and are by them called *Morelle*, and wee after the ſame name call them Morell Cherries, are dry and do ſomwhat binde, and theſe being dried are pleaſant to the taſte, and wholeſome for the ſtomacke, like as Prunnes be, and do ſtop the belly.

Generally all the kindes of Cherries are cold and moiſt of temperature, although ſome more cold and moiſt than others: which beeing eaten before meate doe ſoften the belly very gently, they are vnwholeſome either vnto moiſt and rheumaticke bodies, or for vnhealthie and cold ſtomackes. E

The common blacke Cherries do ſtrengthen the ſtomacke, and are wholeſomer than the redde Cherries, the which being dried do ſtop the laske. F

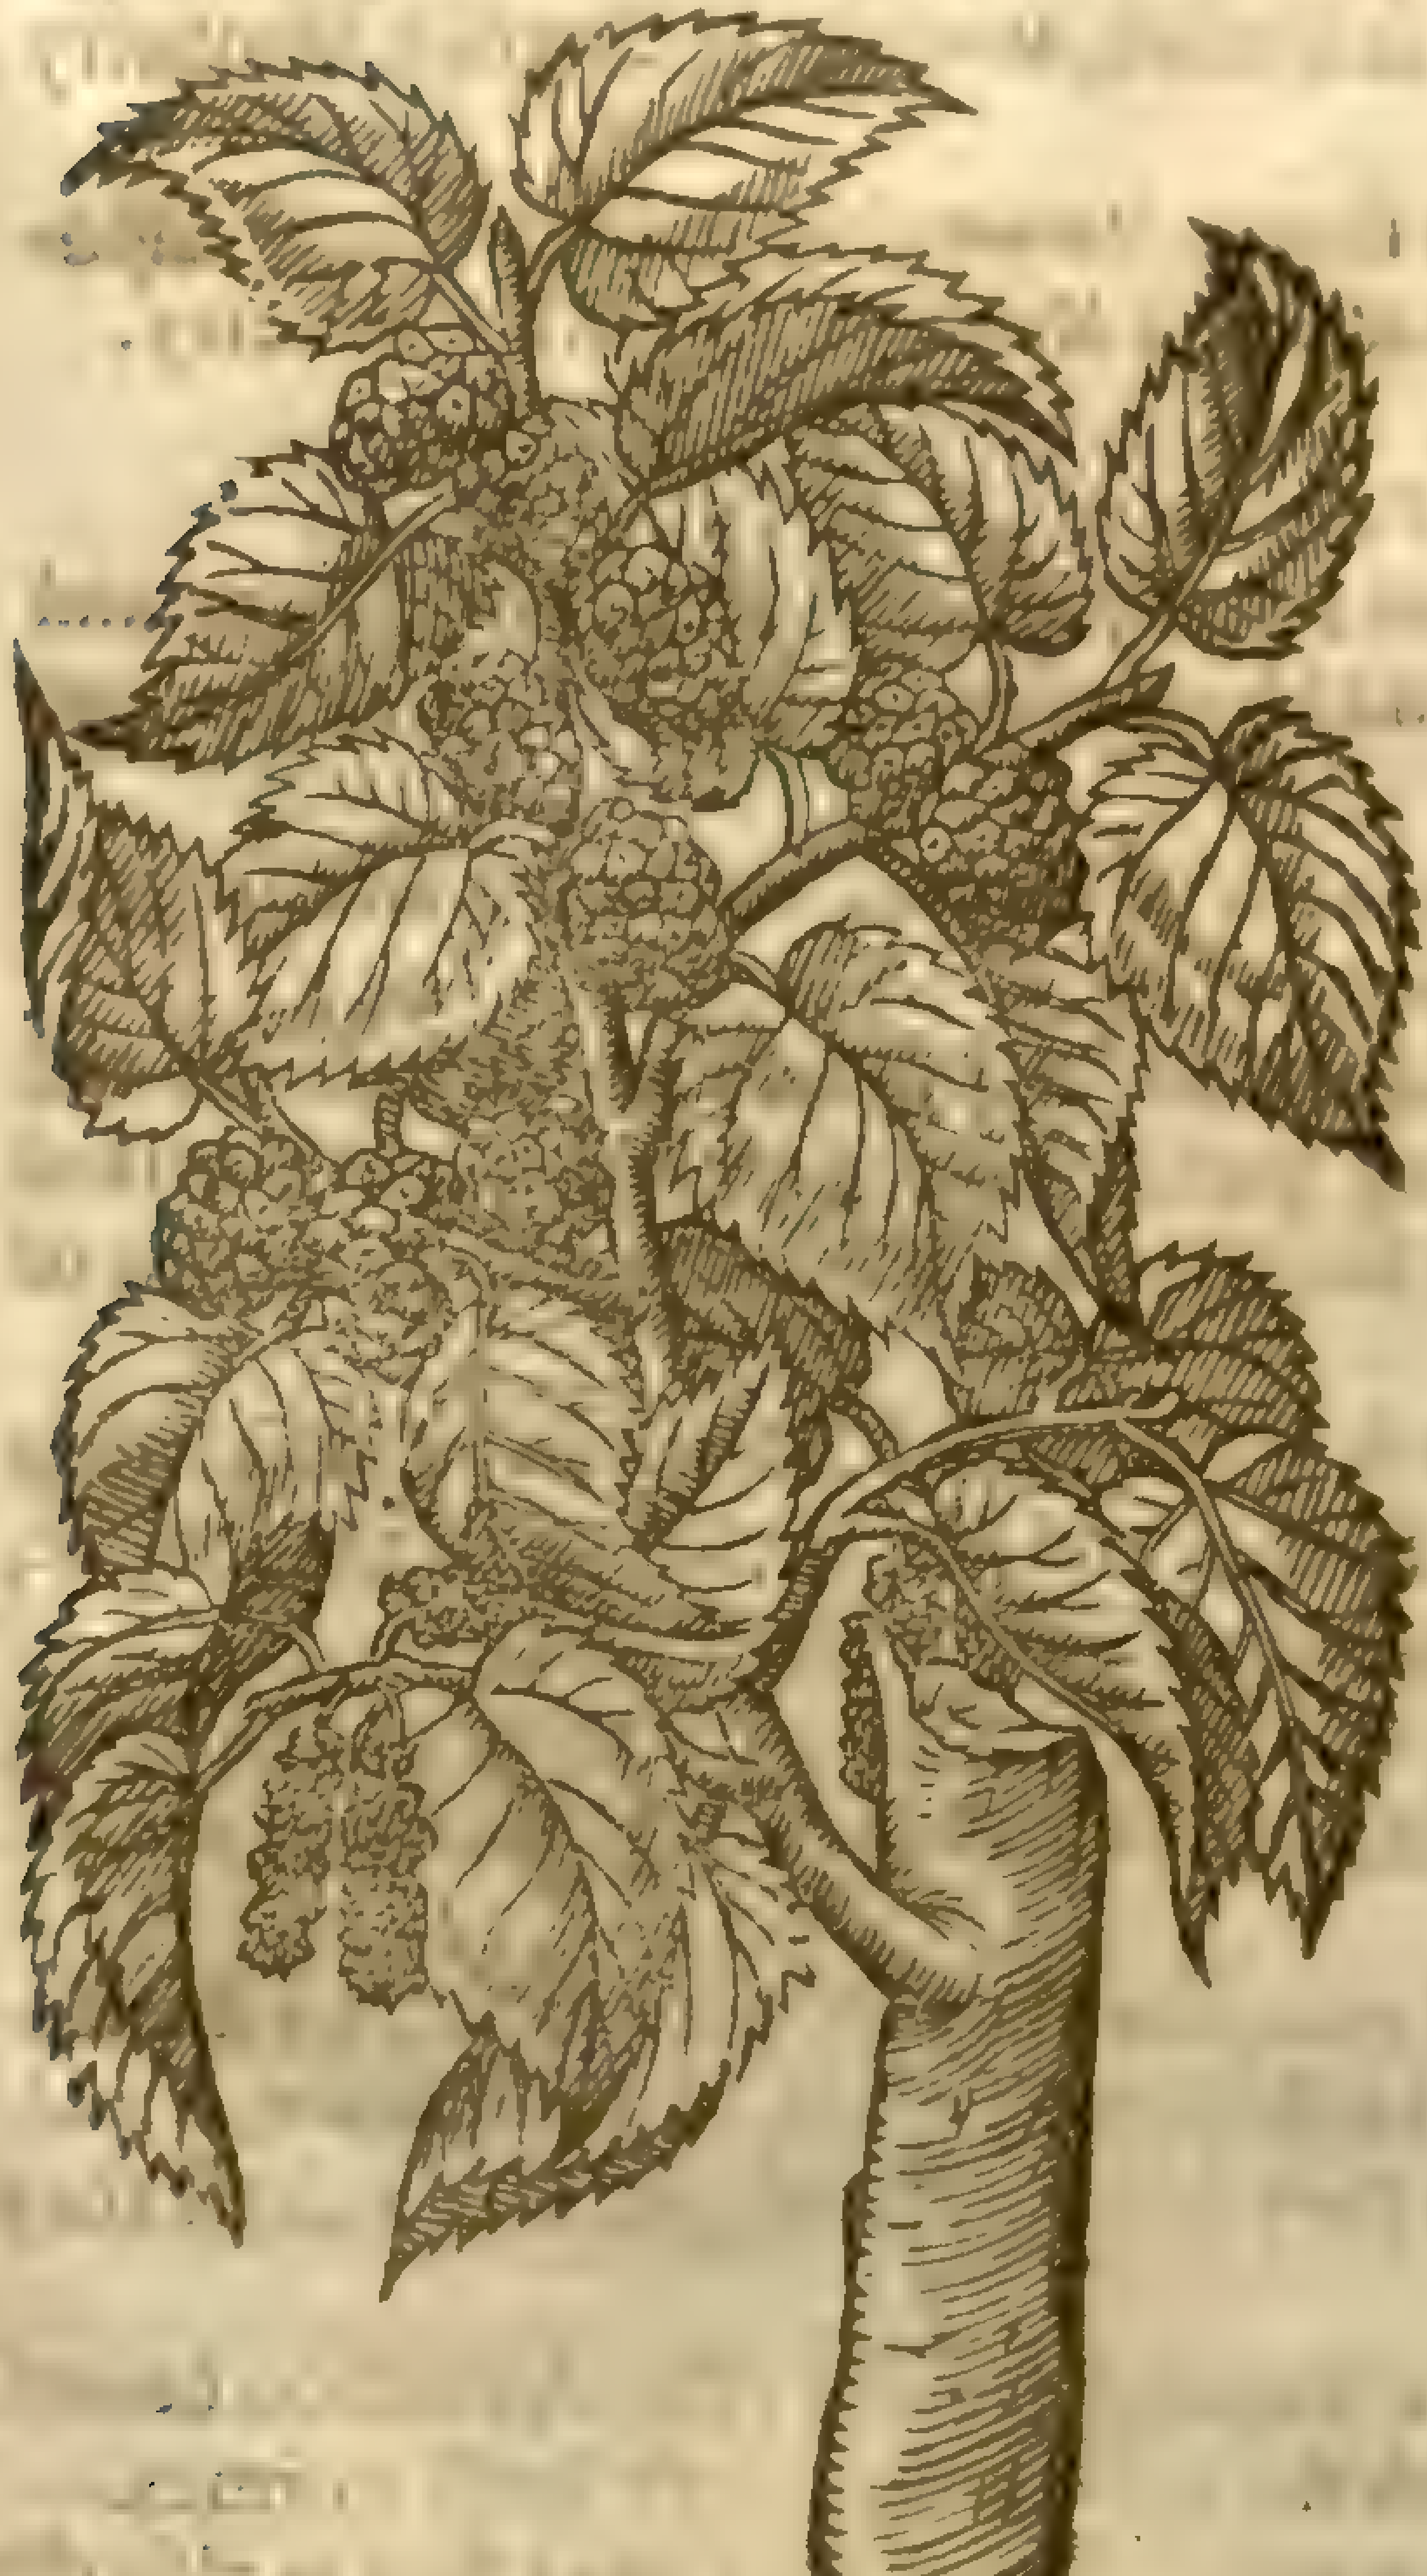
The diſtilled water of Cherries is good for thoſe that are troubled with heate and inflammations in their ſtomackes, and preuaileth againſt the falling ſickeneſſe giuen mixed with wine. G

Many excellent Tarts and other pleaſant meats are made with Cherries, ſugar, and other delicat ſpices, whereof to write were to ſmall purpoſe. H

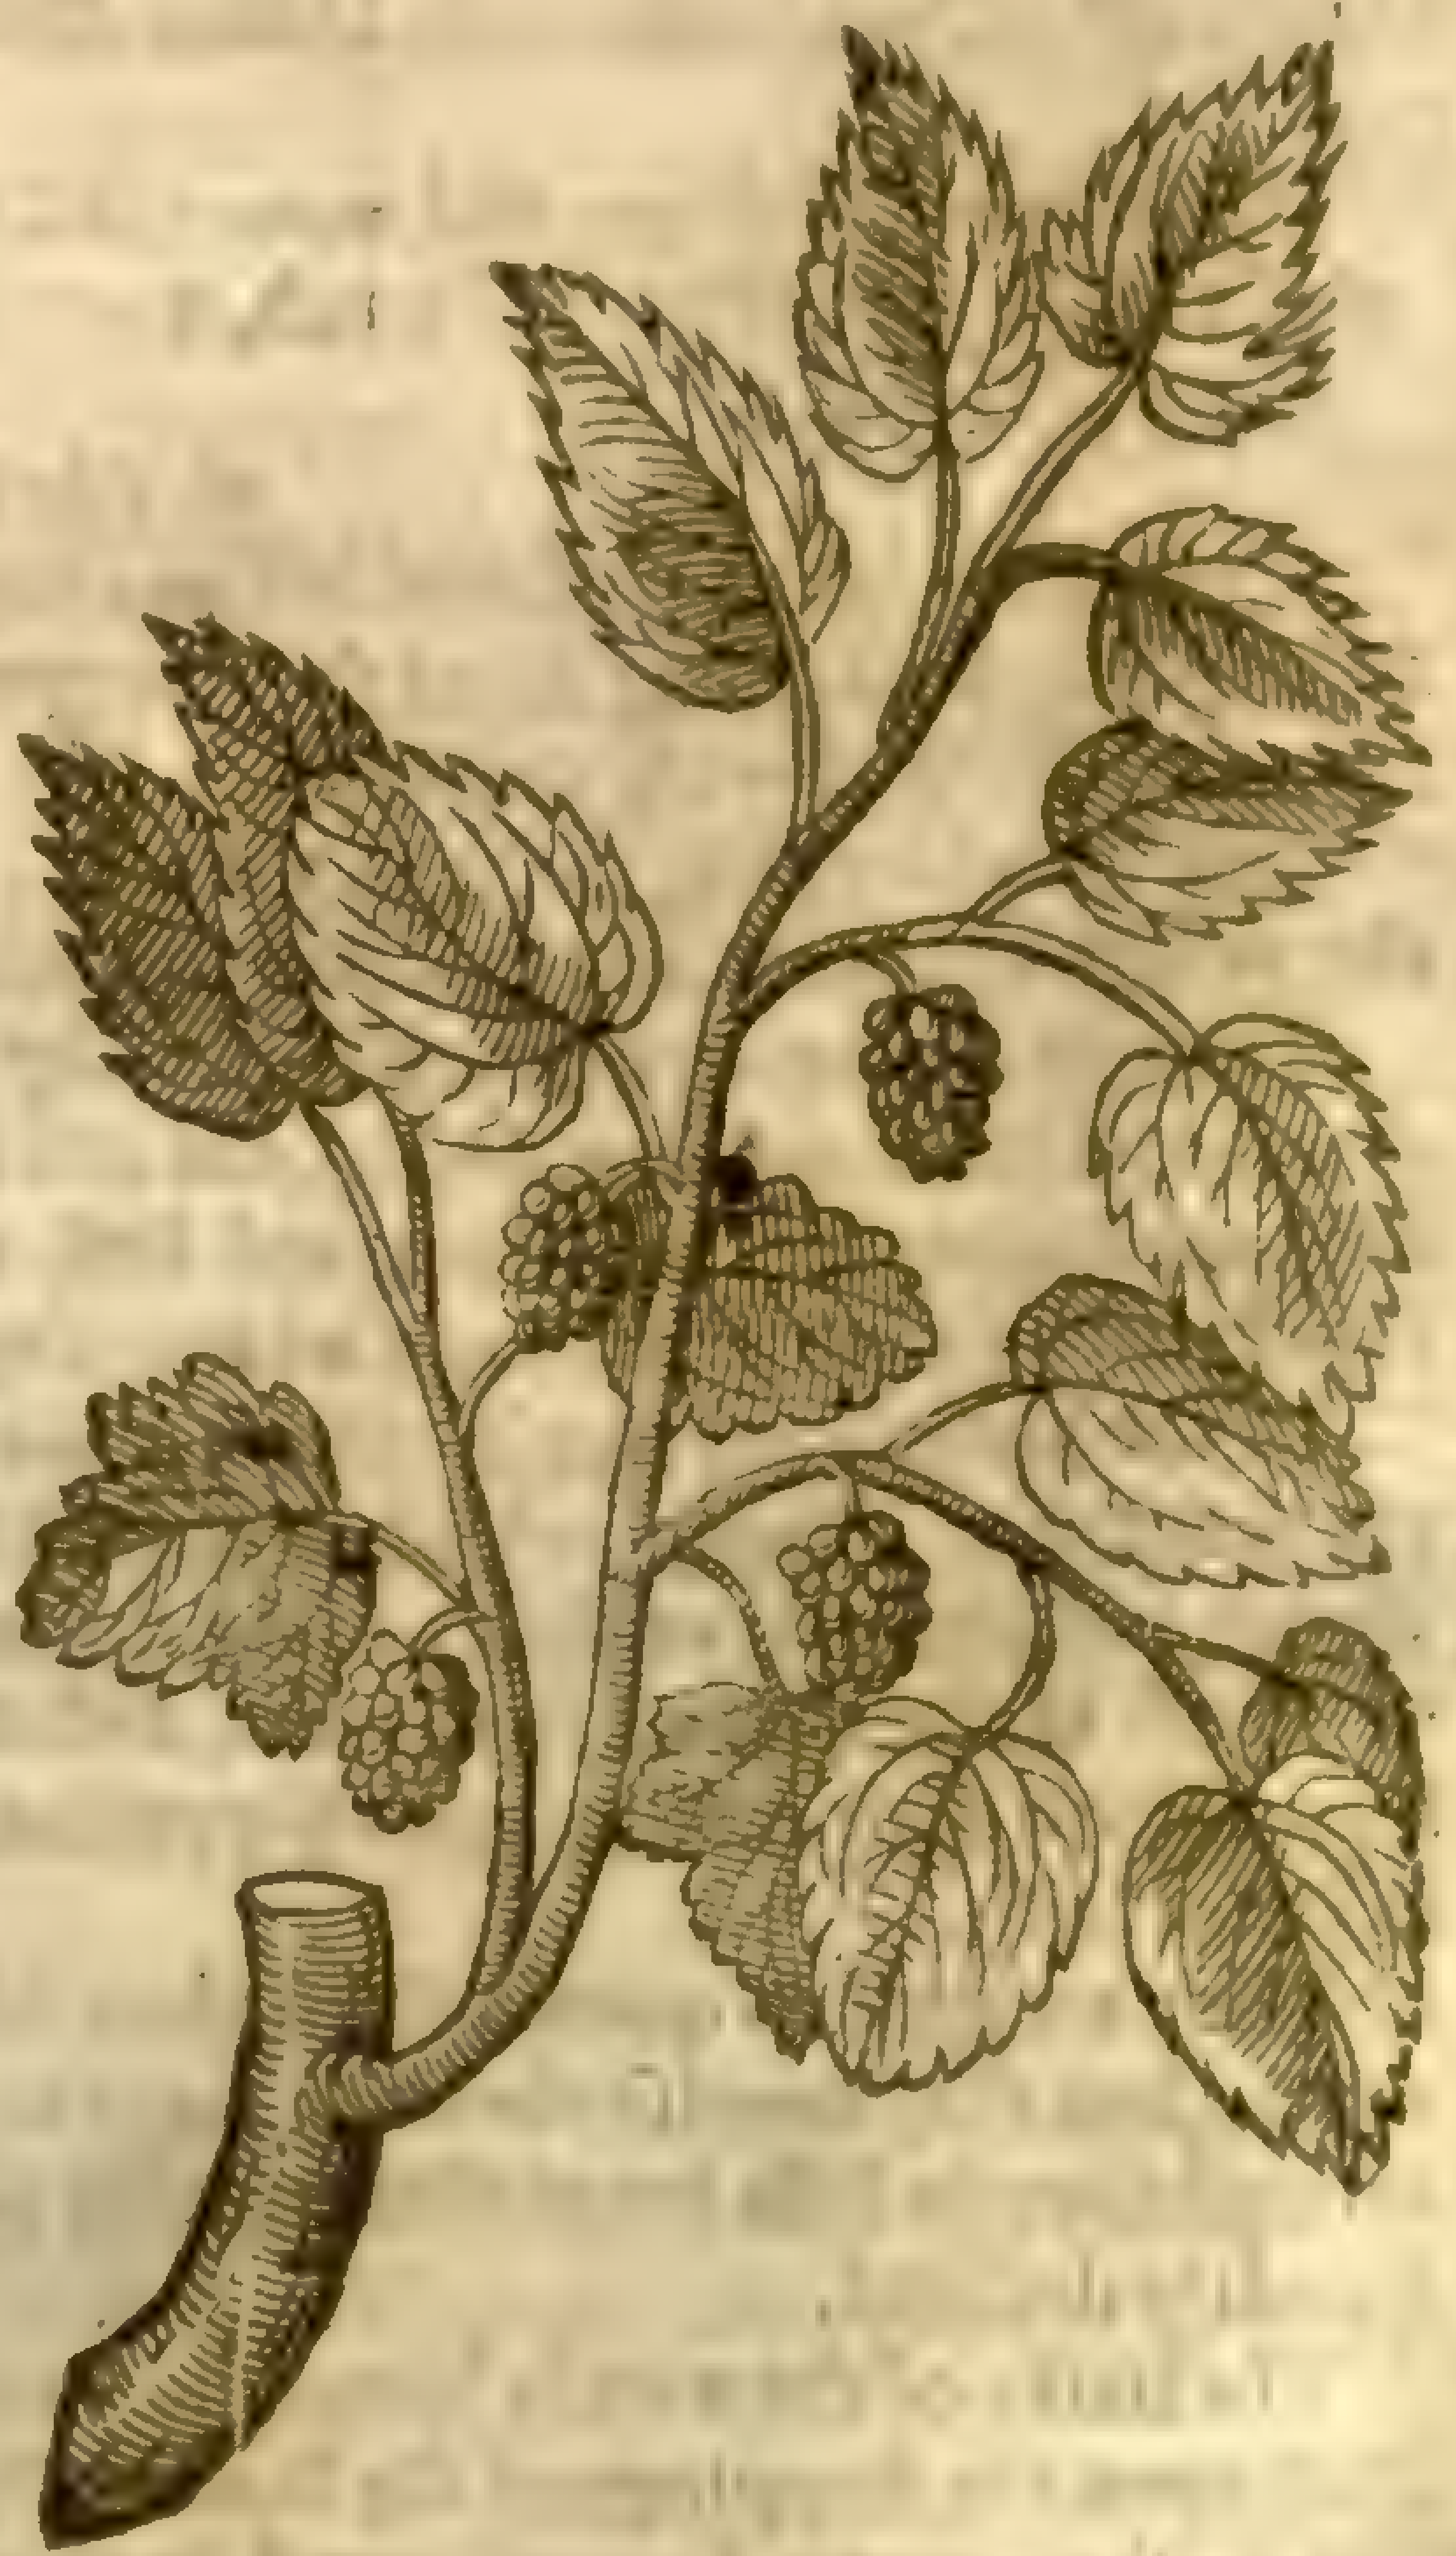
The gum of the Cherry tree taken with wine and water, is reported to helpe the ſtone; it may do good by making the paſſages ſlippery, and by tempering and alaying the ſharpneſſe of the humors; and in this manner it is a remedy alſo for an old cough. *Dioſcorides* addeth, that it maketh one well coloured, cleareth the ſight, and cauſeth a good appetite to meat. I

Chap. 131. *Of the Mulberrie Tree.*

1 *Morus.*
The Mulberrie tree.



2 *Morus alba.*
The white Mulberrie tree.



¶ *The Deſcription.*

1 The common Mulberrie tree is high, and ful of boughes: the body wherof is many times great, the barke rugged; and that of the root yellow: the leaues are broad and ſharpe pointed, ſomething hard, and nicked on the edges; in ſtead of floures, are blowings or catkins, which are downy: the fruit is long, made vp of a number of little graines, like vnto a *black-Berrie*, but thicker, longer, and much greater, at the firſt greene, and when it is ripe blacke, yet is the juyce (whereof it is full) red: the root is parted many waies.

2 The white Mulberrie tree groweth vntill it be come vnto a great and goodly ſtature, almoſt as big as the former: the leaues are rounder, not ſo ſharpe pointed, nor ſo deepely ſnipt about the edges, yet ſometimes ſinuated or deeply cut in on the ſides, the fruit is like the former, but that it is white and ſomewhat more taſting like wine.

¶ *The Place.*

The Mulberrie trees grow plentifully in Italy and other hot regions, where they doe maintaine great woods and groues of them, that their Silke wormes may feed thereon. The Mulberry tree is fitly ſet by the ſlip; it may alſo be grafted or inoculated into many trees, being grafted in a white Poplar, it bringeth forth white Mulberries, as *Beritius* in his Geoponickes reporteth. Theſe grow in ſundry gardens in England.

¶ *The Time.*

Of all the trees in the Orchard the Mulberry doth laſt bloome, and not before the cold weather is gone in May (therefore the old Writers were wont to call it the wiſeſt tree) at which time the Silke wormes do ſeeme to reuiue, as hauing then wherewith to feed and nouriſh themſelues, which all the winter before do lie like ſmall graines or ſeeds, or rather like the dunging of a fleſh flie vpon a glaſſe, or ſome ſuch thing, as knowing their proper times both to performe their duties for which they were created, and alſo when they may haue wherewith to maintaine and preſerue their owne bodies, vnto their buſineſſe aforeſaid.

The berries are ripe in Auguſt and September. *Hegeſander* in *Athenæus* affirmeth, that the Mulbery trees in his time did not bring forth fruit in twenty yeares together, and that ſo great a plague of the gout then raigned and raged ſo generally, as not onely men, but boies, wenches, eunuches, and women were troubled with that diſeaſe.

¶ *The Names.*

This tree is named in Greeke μορέα: and συκάμινα: in Latine, *Morus*: in ſhops, *Morus Celſi*: in high Dutch, **Maulberbaum**: in low Dutch, **Moerbeſſe boom**; in French, *Meurier*: in Engliſh, Mulberry tree.

The fruit is called μόρον, and συκάμινον: in Latine, *Morum*: in ſhops, *Morum Celſi*: in high Dutch, **Morbeſſe**: in Italian, *Moro*: in French, *Meure*: in Spaniſh, *Moras* and *Mores*: in Engliſh Mulberry.

¶ *The Temperature and Vertues.*

A Mulberries being gathered before they be ripe, are cold and dry almoſt in the third degree, and do mightily bind; being dried they are good for the lask and bloudy flix, the pouder is vſed in meat, and is drunke with wine and water.

B They ſtay bleeding, and alſo the reds; they are good againſt inflammations or hot ſwellings of the mouth and jawes, and for other inflammations newly beginning.

C The ripe and new gathered Mulberries are likewiſe cold and be full of juyce, which hath the taſt of wine, and is ſomething drying, and not without a binding quality: and therefore it is alſo mixed with medicines for the mouth, and ſuch as helpe the hot ſwellings of the mouth, and Almonds of the throat; for which infirmities it is ſingular good.

D Of the juyce of the ripe berries is made a confection with ſugar, called *Diamorum*: that is, after the manner of a ſyrrup, which is exceeding good for the vlcers and hot ſwellings of the tongue, throat, and almonds, or Vvula of the throat, or any other malady ariſing in thoſe parts.

E Theſe Mulberries taken in meat, and alſo before meat, do very ſpeedily paſſe through the belly, by reaſon of their moiſture and ſlipperineſſe of their ſubſtance, and make a paſſage for other meats, as *Galen* ſaith.

F They are good to quench thirſt, they ſtir vp an appetite to meate, they are not hurtfull to the ſtomacke, but they nouriſh the body very little, being taken in the ſecond place, or after meate, for although they be leſſe hurtfull than other like fruits, yet are they corrupted and putrified, vnleſſe they ſpeedily deſcend.

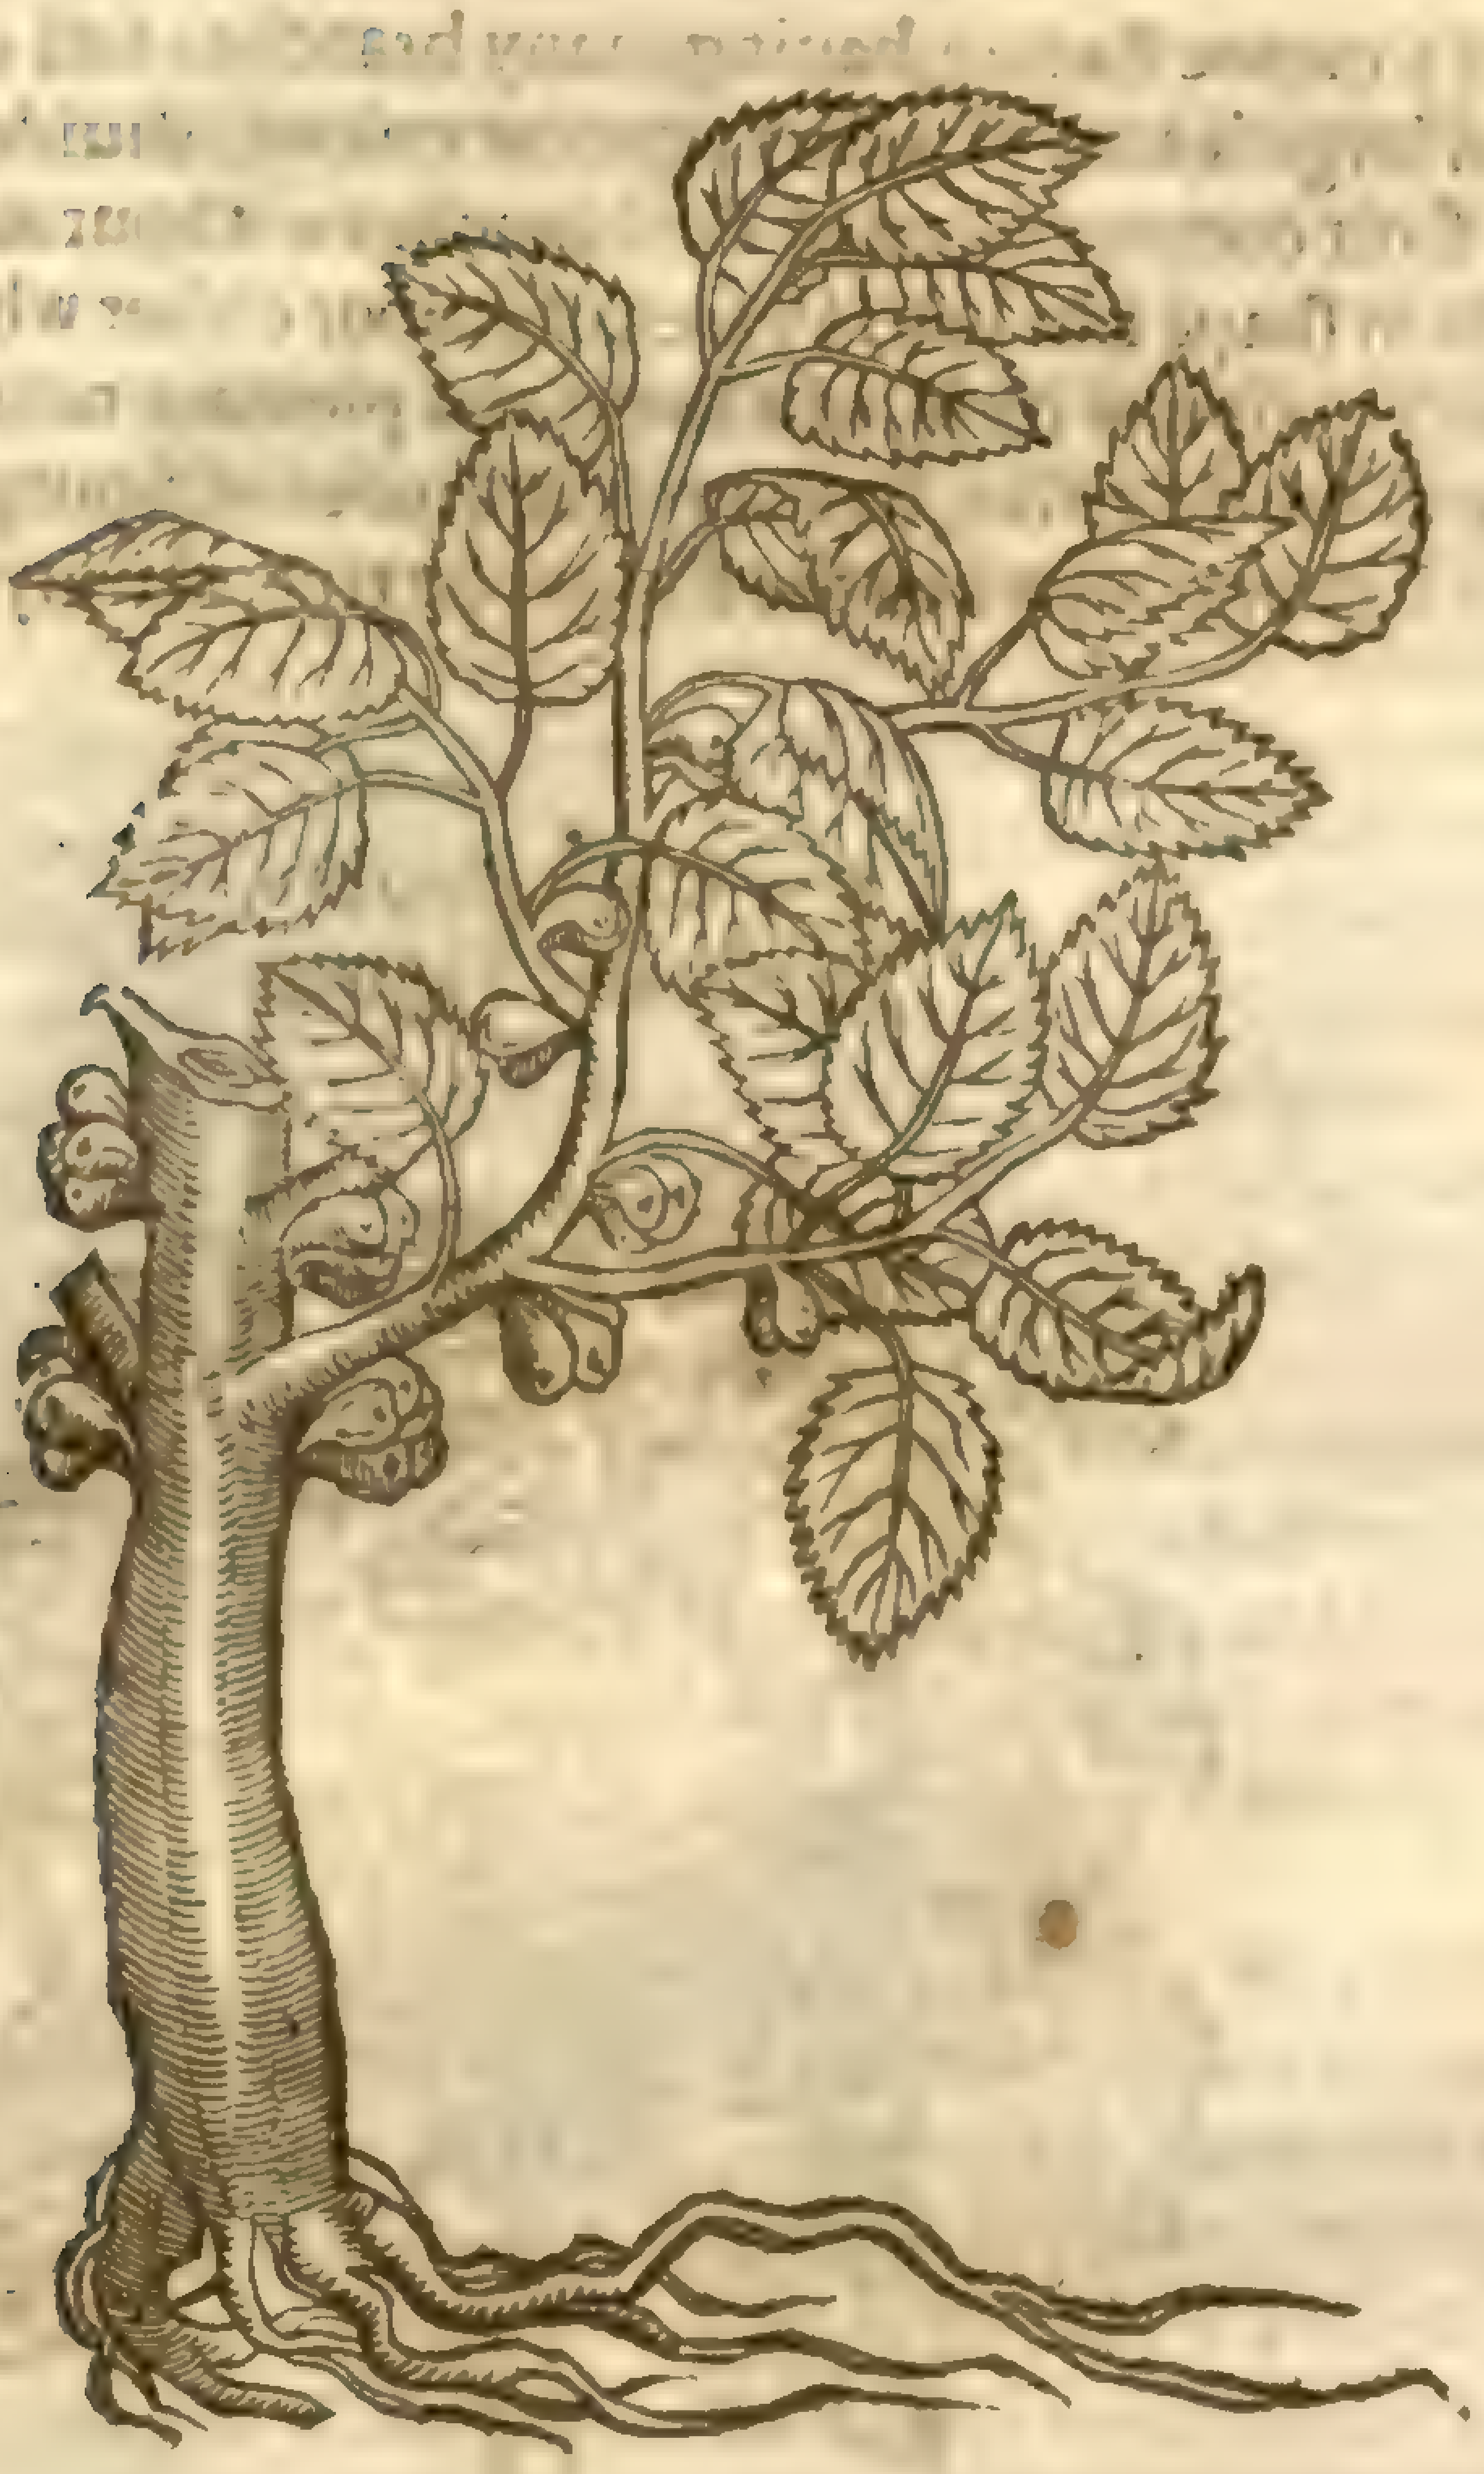
G The barke of the root is bitter, hot, and dry, and hath a ſcouring faculty: the decoction hereof doth open the ſtoppings of the liuer and ſpleene, it purgeth the belly and driueth forth wormes.

H The ſame barke being ſteeped in vineger helpeth the tooth-ache: of the ſame effect is alſo the decoction of the leaues and barke, ſaith *Dioſcorides*, who ſheweth that about harueſt time there iſſueth out of the root a juyce, which the next day after is found to be hard, and that the ſame is very good againſt the tooth-ache; that it waſteth away *Phyma*, and purgeth the belly.

I *Galen* ſaith, that there is in the leaues and firſt buds of this tree a certaine middle faculty, both to binde and ſcoure.

CHAP. 132. Of the Sycomore Tree.

Sycomorus.
The Sycomore tree.



¶ *The Deſcription.*

THe Sycomore tree is of no ſmall height, being very like to the mulberie tree in bigneſſe & ſhew, as alſo in leafe: the fruit is as great as a Fig, and of the ſame faſhion, very like in juyce and taſte to the wilde Fig, but ſweeter, and without any graines or ſeeds within, which groweth not forth of the tender boughes, but out of the body and great old armes very fruitfully: this tree hath in it plenty of milkie juyce, which ſo ſoone as any part is broken or cut, doth iſſue forth.

¶ *The Place.*

It groweth, as *Dioſcorides* writeth, very plentifully in Caria and Rhodes, and in ſundry places of Ægypt, as at the great Cayre or Alkaire, and in places that doe not bring forth much wheat, in which it is an helpe, and ſufficeth in ſtead of bread & corne where there is ſcarſitie of victuals. *Galen* writeth, that hee ſaw a plant of the Sycomore tree like to the wilde Fig tree, fruit and all.

¶ *The Place.*

It bringeth forth fruit three or foure times in one yeare, and oftner if it be ſcraped with an iron knife, or other like inſtrument.

¶ *The Names.*

This tree is called in Greeke, συκόμορος, of the Fig tree and the Mulbery tree: in Latine, *Sycomorus*: *Cornelius Celſus* nameth it backeward *Moroſycos*: the Egyptians of our time do call it *Ficus Pharaonis*, or *Pharao* his Fig tree, as witneſſeth *Bellonius*: and it is likewiſe termed *Ficus Ægyptia*, Ægyptian Fig tree, and alſo *Morus Ægyptia*, or Ægyptian Mulbery tree. We call it in Engliſh, Sycomore tree after the Greeke and Latine, and alſo Mulberry Fig tree, which is the right Sycomore tree, and not the great Maple, as we haue ſaid in the chapter of Maple.

The fruit is named in Greeke *Sycomoron*, and in Italian, *Sycomoro* and *Fico d'Egitto*.

¶ *The Temperature and Vertues.*

A The fruit of the Sycomore tree hath no ſharpneſſe in it at all, as *Galen* ſaith. It is ſomwhat ſweet in taſte, and is of temperature moiſt after a ſort, and cold as be Mulberries.

B It is good, ſaith *Dioſcorides*, for the belly; but it is ἄτροφον, that is, without any nouriſhment, and troubleſome to the ſtomacke.

C There iſſueth forth of the barke of this tree in the beginning of the Spring, before the fruit appeareth a liquour, which beeing taken vp with a ſpunge, or a little wooll, is dried, made vp into fine cakes, and kept in gallie pots: this mollifieth, cloſeth wounds together, and diſſolueth groſſe humours.

D It is both inwardly taken and outwardly applied againſt the biting of ſerpents, hardneſſe of the milt or ſpleene: and paine of the ſtomacke proceeding of a cold cauſe: this liquor doth very quickly putrifie.

Chap. 133. *Of the Fig Tree.*

¶ *The Deſcription.*

1 THe garden Figtree becommeth a tree of a meane ſtature, hauing many branches full of white pith within, like Elderne pith, and large leaues of a darke greene colour, diuided into ſundry ſections or diuiſions. The fruit commeth out of the branches without any floure at all that euer I could perceiue, which fruit is in ſhape like vnto Peares, of colour either whitiſh, or ſomewhat red, or of a deepe blew, full of ſmall graines within, of a ſweet and pleaſant taſte; which being broken before it be ripe, doth yeeld moſt white milke, like vnto the kindes of Spurge, and the leaues alſo being broken doe yeeld the like liquor; but when the Figges be ripe, the juyce thereof is like hony.

1 *Ficus.*
The Fig tree.

F. Carica L. Mill. Dict.

‡ 2 *Chamæficus.*
The dwarfe Fig tree.

Ficus carica β [illegible]

2 The dwarfe Fig tree is like vnto the former in leaues and fruit, but it neuer groweth aboue the height of a man, and hath many ſmall ſhoots comming from the roots, whereby it greatly increaſeth.

There is alſo another wilde kinde, whoſe fruit is neuer ripe; *Theophraſtus* nameth it *Erineos*; *Pliny*, *Caprificus*.

¶ *The Place.*

The Fig trees do grow plentifully in Spaine and Italy, and many other countries, as in England; where they beare fruit, but it neuer commeth to kindely maturity, except the tree be planted vnder an hot wall, whereto neither North, nor North-eaſt windes can come.

¶ *The Time.*

The dwarfe Fig tree groweth in my Garden, and bringeth forth ripe and very great fruit in the moneth of Auguſt, of which Figs ſundry perſons haue eaten at pleaſure.

In England the Fig trees put not forth their leaues vntill the end of May, where oftentimes the fruit commeth before the leaues appeare.

¶ *The Names.*

The fig tree is called in Greeke, συκῆ, and of diuers,for difference ſake betweene it and the wilde Fig tree, συκῆ ἥμερος: in Latine, *Ficus*, and *Ficus ſatiua*, and *Vrbana*: in high Dutch, **Feygenbaum**: in low Dutch, **Vijgheboom**: in French, *Figuier*: in Italian, *Fico*: in Spaniſh, *Higuera*: in Engliſh, Fig tree.

The fruit is named in Greeke, σῦκον: in Latine, *Ficus*: and the vnripe fruit, ὄλυνθοι in Latine, *Groſſus*: that which is dried is called in Greeke, ἰσχάς: in Latine, *Carica*: in high Dutch, **Feygen**: in low Dutch, **Vijghen**: in French, *Figues*: in Italian, *Fichi*: in Spaniſh, *Higos*: in Engliſh Fig: the little ſeeds which are found in them are named by *Galen*, κεγχραμίδες, *Cechramides*.

¶ *The Temperature.*

The greene Figs new gathered are ſomewhat warme and moiſt: the dry and ripe Figs are hot almoſt in the third degree,and withall ſharpe and biting.

The leaues alſo haue ſome ſharpeneſſe,with an opening power,but not ſo ſtrong as the juice.

¶ *The Vertues.*

A The dry Figs doe nouriſh better than the greene or new Figs; notwithſtanding they ingender not very good bloud,for ſuch people as do feed much thereon become lowſie.

B Figs be good for the throat and lungs, they mitigate the cough, and are good for them that bee ſhort winded: they ripen flegme, cauſing the ſame to be eaſily ſpit out, eſpecially when they bee ſodden with Hyſſop,and the decoction drunke.

C Figges ſtamped with Salt, Rew, and the kernels of Nuts withſtand all poyſon and corruption of the aire. The King of Pontus, called *Mithridates,* vſed this preſeruatiue againſt all venom and poyſon.

D Figs ſtamped and made into the forme of a plaiſter with wheate meale,the pouder of Fenugreek, and Lineſeed,and the roots of Mariſh Mallowes,applied warme,doe ſoften and ripen impoſtumes, phlegmons,all hot and angry ſwellings and tumors behind the eares: and if you adde thereto the roots of Lillies, it ripeneth and breaketh Venerious impoſtumes that come in the flanke, which impoſtume is called *Bubo*, by reaſon of his lurking in ſuch ſecret places: in plaine Engliſh termes they are called botches.

E Figs boiled in Wormewood wine with ſome Barly meale are very good to be applied as an implaiſter vpon the bellies of ſuch as haue the dropſie.

F Dry Figs haue power to ſoften, conſume and make thinne, and may be vſed both outwardly and inwardly,whether it be to ripen or ſoften impoſtumes,or to ſcatter,diſſolue and conſume them.

G The leaues of the Fig tree doe waſte and conſume the Kings Euill, or ſwelling kernels in the throat,and doe mollifie,waſte,and conſume all other tumors,being finely pouned and laid thereon: but after my practiſe, being boyled with the roots of Mariſh Mallowes vntill they bee ſoft, and ſo incorporated together,and applied in forme of a plaiſter.

H The milkie juyce either of the Figs or leaues is good againſt all roughneſſe of the skin,lepries, ſpreading ſores, tetters, ſmall pockes,meaſels,puſhes, wheales, freckles, lentils,and all other ſpots, ſcuruineſſe, and deformity of the body and face, beeing mixed with Barley meale and applied: it doth alſo take away warts and ſuch like excreſcences, if it bee mingled with ſome fatty or greaſie thing.

I The milke doth alſo cure the tooth-ache,if a little lint or cotten be wet therein,and put into the hollowneſſe of the tooth.

K It openeth the veines of the hemorrhoids,and looſeneth the belly, being applied to the fundament.

L Figs ſtamped with the pouder of Fenugreeke,and vineger, and applied plaiſterwiſe,doe eaſe the intollerable paine of the hot gout,eſpecially the gout of the feet.

M The milke thereof put into the wound proceeding of the biting of a mad dog,or any other venomous beaſt,preſerueth the parts adjoyning,taketh away the paine preſently,and cureth the hurt.

N The greene and ripe Figs are good for thoſe that be troubled with the ſtone of the kidneies, for they make the conduits ſlippery, and open them, and doe alſo ſomewhat clenſe: whereupon after the eating of the ſame,it happeneth that much grauell and ſand is conueighed forth.

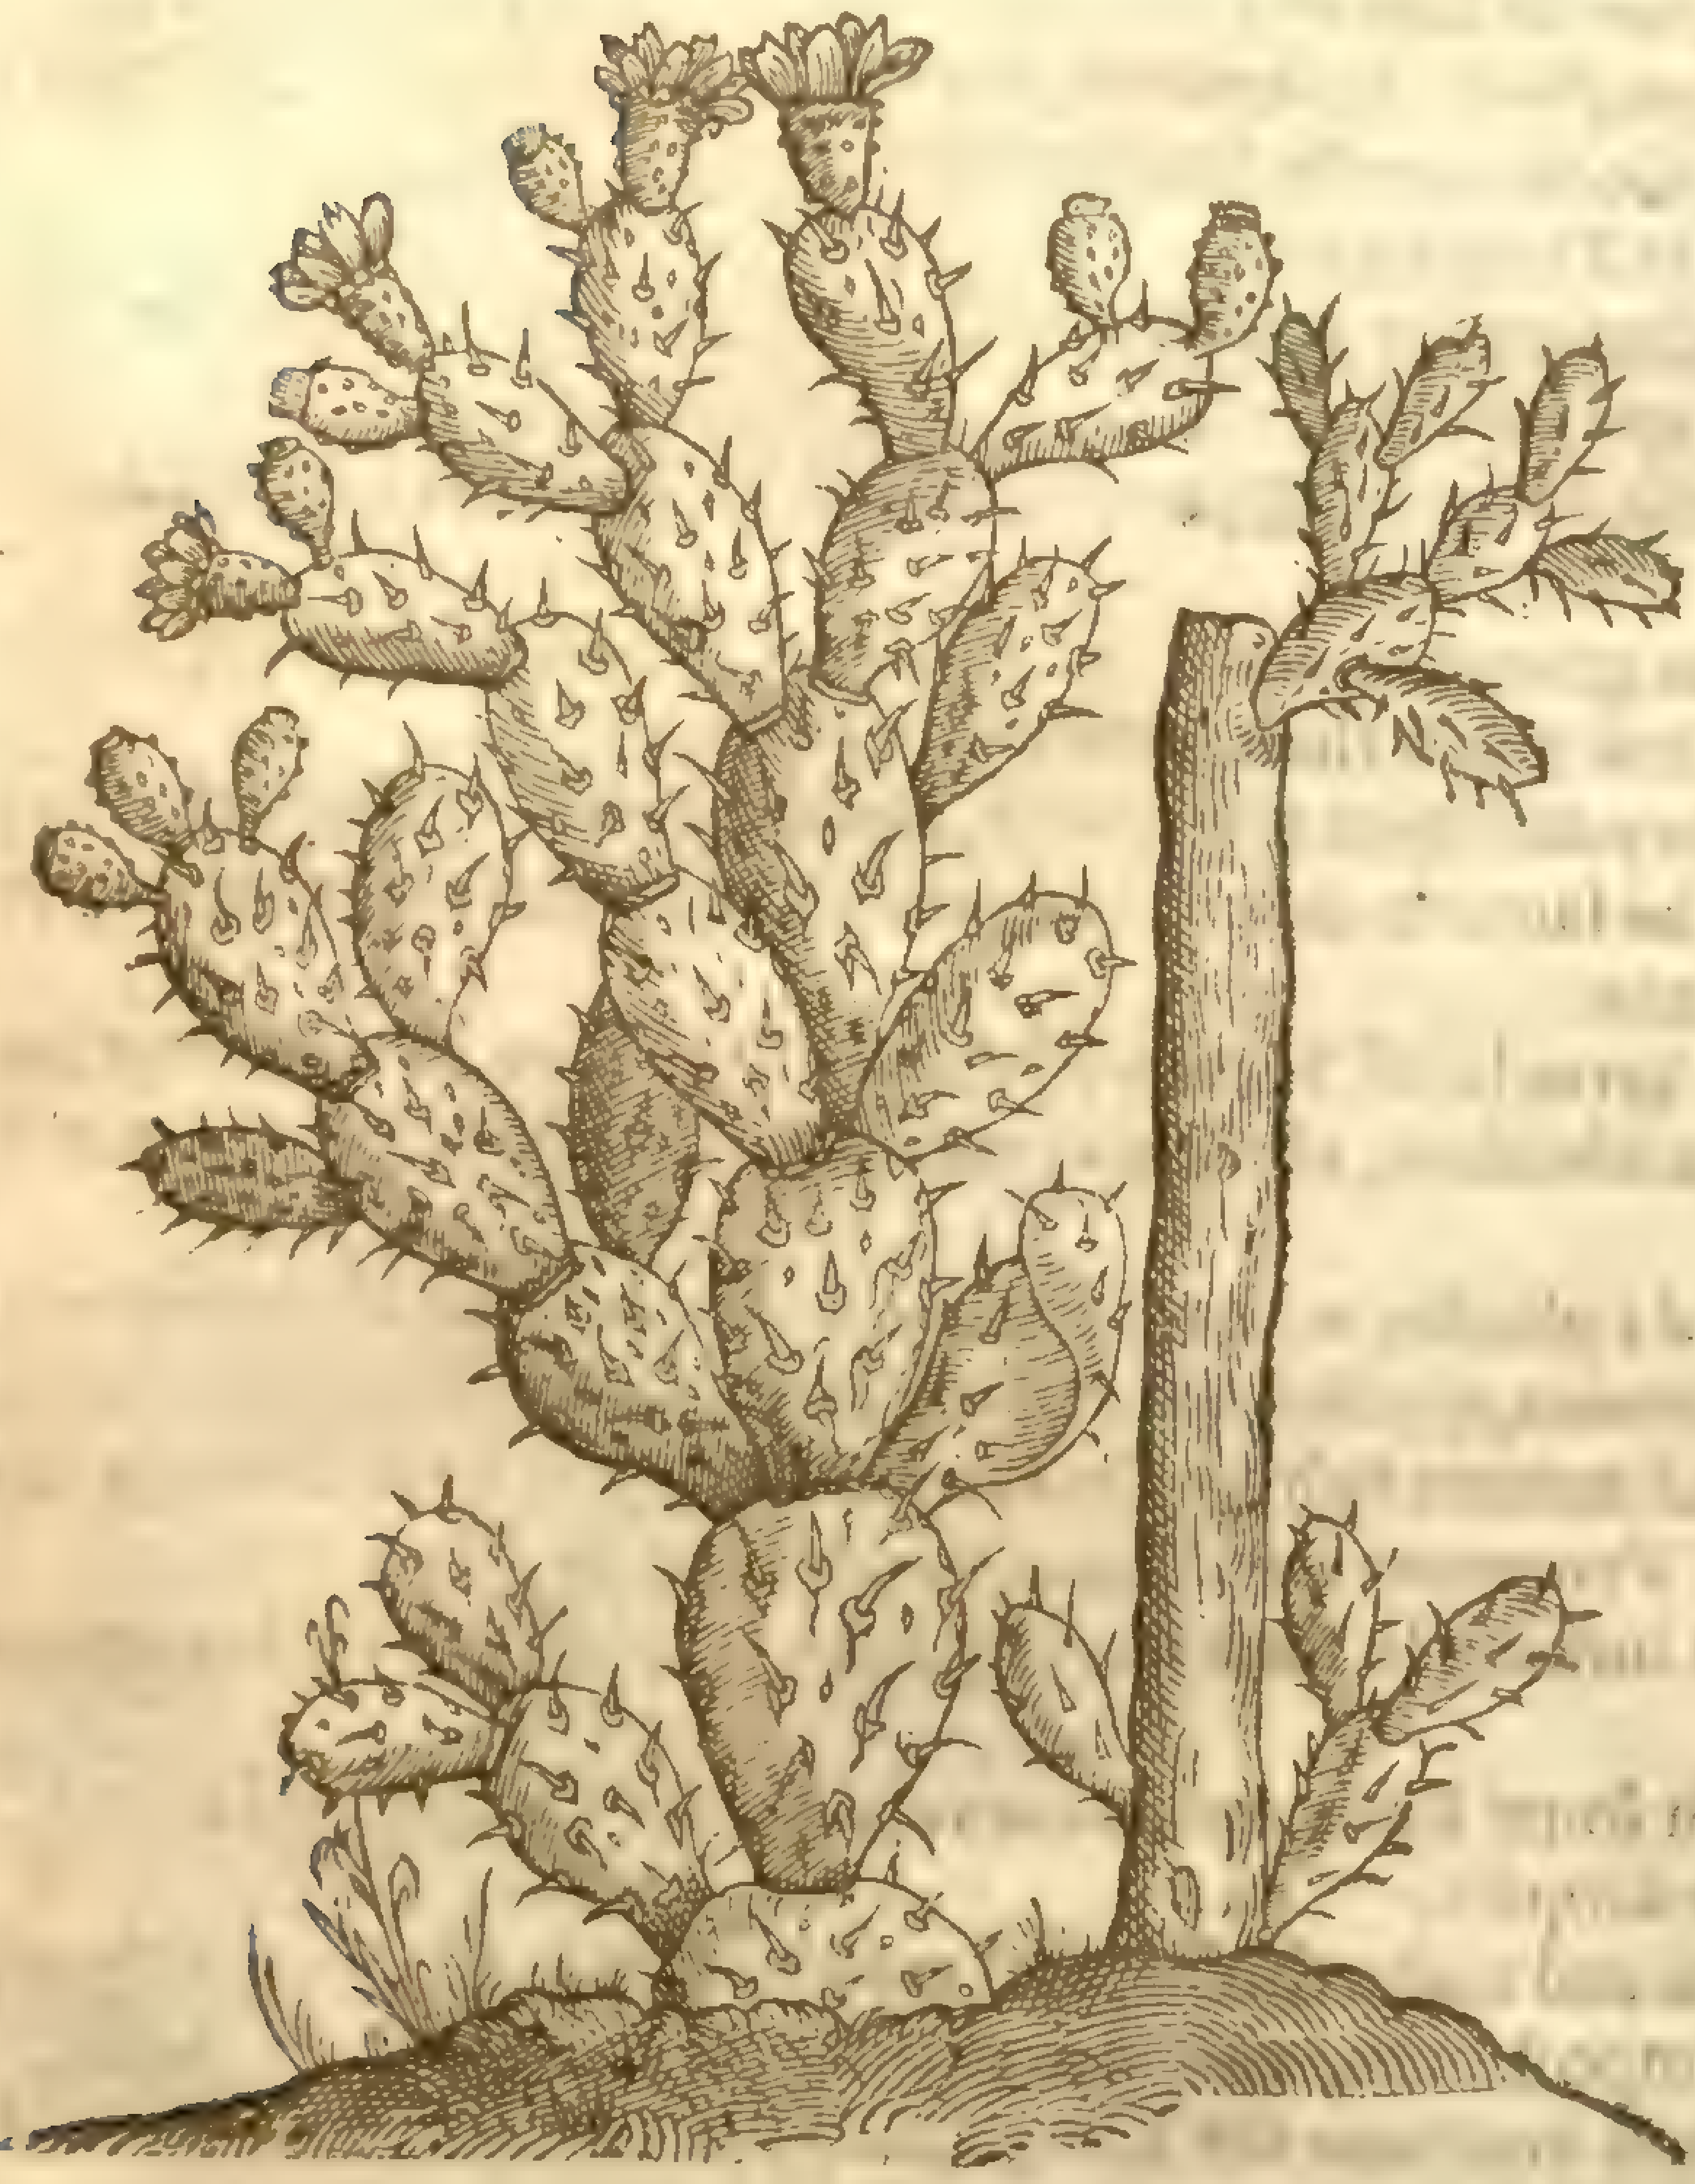
O Dry or barrell Figs, called in Latine *Carica*, are a remedy for the belly,the cough, and for old infirmities of the cheſt and lungs: they ſcoure the kidneies, and clenſe forth the ſand, they mitigate the paine of the bladder,and cauſe women with childe to haue the eaſier deliuerance, if they feed thereof for certaine daies together before their time.

P *Dioſcorides* ſaith,that the white liquor of the Fig tree,and juyce of the leaues,do curdle milke as rennet doth,and diſſolue the milke that is cluttered in the ſtomacke,as doth vineger.

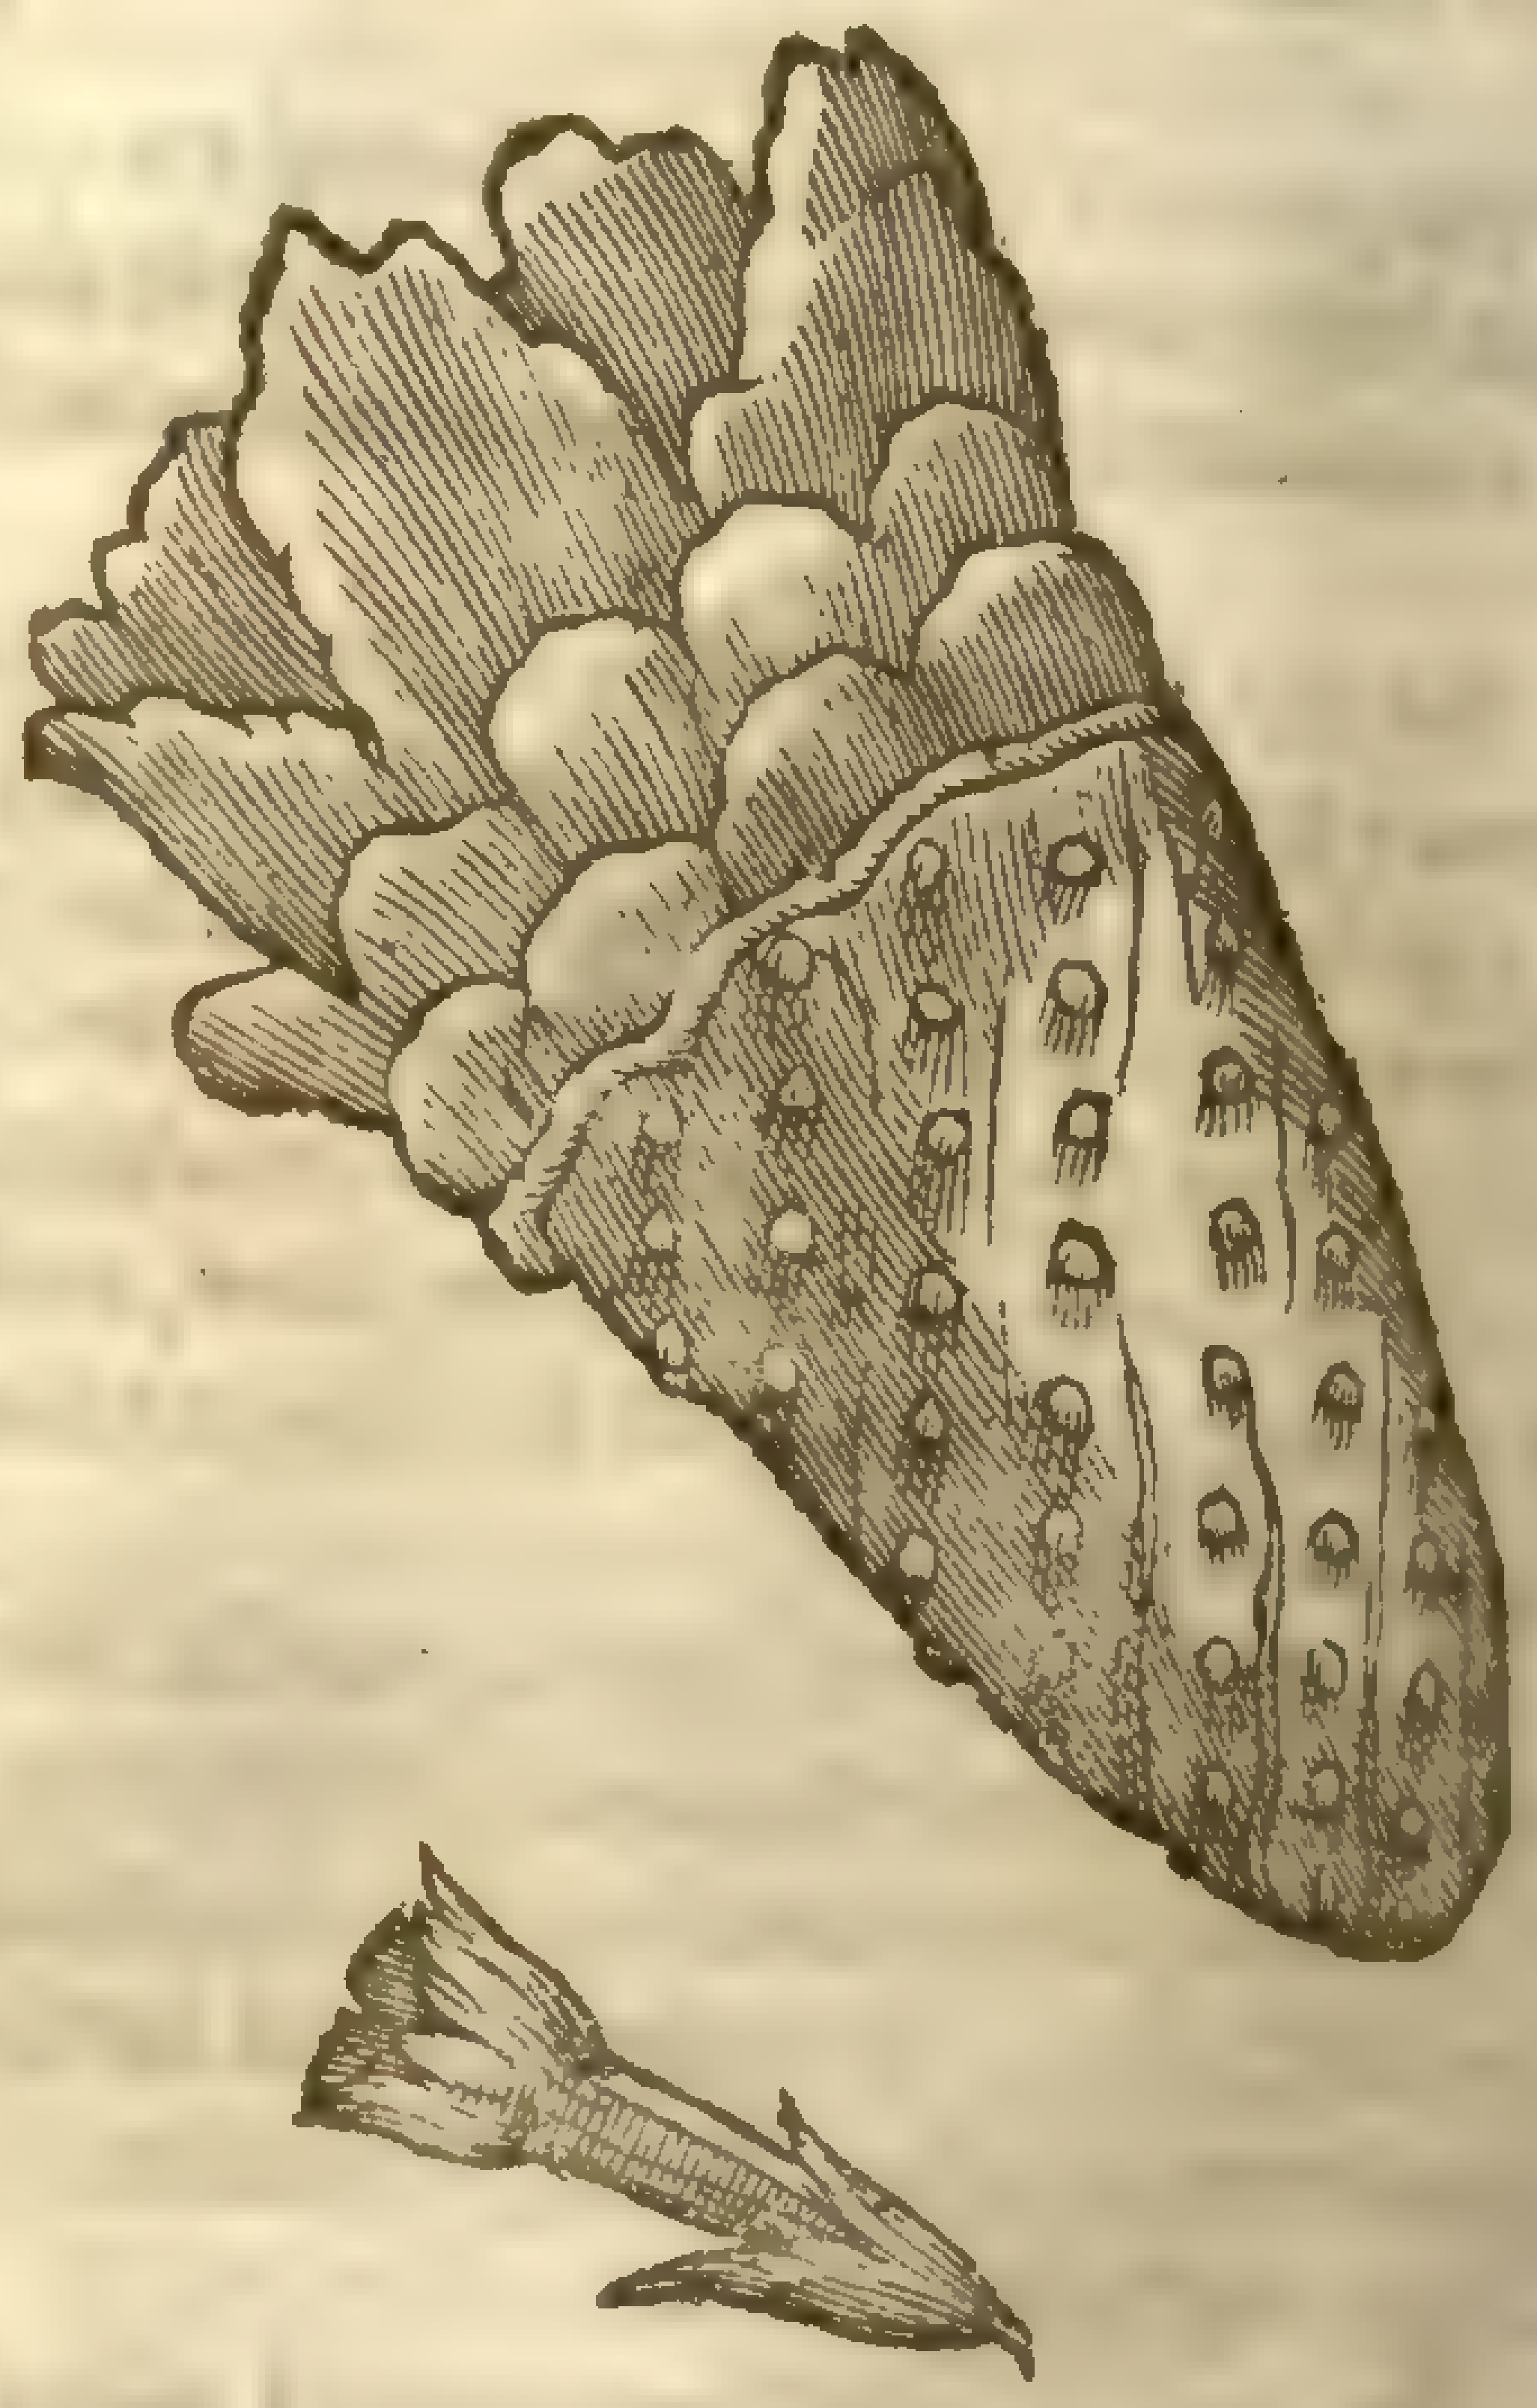
Q It bringeth downe the menſes,if it be applied with the yolke of an egge,or with yellow wax.

Chap. 134. *Of the prickly Indian Fig Tree.*

Cactus ficus indicus
[illegible]



Ficus Indica.
The Indian Fig tree.



Fructus.
The fruit.

¶ *The Deſcription.*

This ſtrange and admirable plant called *Ficus Indica*, ſeemes to be no other thing than a multiplication of leaues, that is, a tree made of leaues, without body or boughes; for the leafe ſet in the ground doth in ſhort ſpace take root, and bringeth out of it ſelfe other leaues, from which do grow others one after another, till ſuch time as they come to the height of a tree, hauing alſo in the meane ſeaſon boughes as it were comming from thoſe leaues, ſomtimes more, otherwhiles fewer, as Nature liſt to beſtow, adding leafe vnto leafe, whereby it occupieth a great piece of ground: theſe leaues are long and broad, as thicke as a mans thumbe, of a deepe green colour, ſet full of long, ſlender, ſharpe and whitiſh prickles: on the tops of which leaues come forth long flours not vnlike to thoſe of the manured Pomegranate tree, of a yellow colour: after which commeth the fruit like vnto the common Fig, narrow below, and bigger aboue, of a greene colour, and ſtuffed full of a red pulpe and juyce, ſtaining the hands of them that touch it, as doe the Mulberries, with a bloudy or ſanguine colour: the top of which Figs are inuironed with certain ſcaly leaues like a crowne, wherein are alſo contained ſmall graines that are the ſeeds: the which being ſowne, do bring forth plants round bodied, like vnto the trunke of other trees, with leaues placed thereon like the other; which being ſet in the ground bring forth trees of leaues, as we haue ſhewed.

‡ Vpon this plaut in ſome parts of the Weſt-Indies grow certaine excreſcences, which in continuance of time turne into inſects; and theſe out-growings are that high prized Cochenele wherewith they die colours in graine. ‡

¶ *The Place.*

This plant groweth in all the tract of the Eaſt and Weſt-Indies, and alſo in the countrey Norembega, now called Virginia, from whence it hath beene brought into Italy, Spaine, England, and other countries; in Italy it ſometimes beareth fruit, but more often in Spaine, and neuer as yet in England, although I haue beſtowed great paines and coſt in keeping it from the iniury of our cold clymate.

It groweth alſo at S. Crux and other places of Barbary, and alſo in an Iſland of the Mediterranean ſea, called Zante, about a day and nights ſailing with a meane winde from Petraſſe a port in Morea, where my ſeruant *William Marſhall* (before remembred) did ſee not onely great ſtore of thoſe trees made of leaues, but alſo diuers other round bodied plants of a woody ſubſtance: from whence he brought me diuers plants thereof in tubs of earth, very freſh and greene, which flouriſhed in my garden at the impreſſion hereof.

¶ *The Time.*

Theſe plants doe grow greene and freſh both Winter and Summer, by the relation of my foreſaid ſeruant: notwithſtanding they muſt bee very carefully kept in theſe countries from the extremitie of Winter.

¶ *The Names.*

This is thought to be the plant called of *Pliny*, *Opuntium*; whereof he hath written, *lib.* 21. *ca.* 17. in this manner: About Opuns is the herbe *Opuntia*, to mans taſte ſweet, and it is to be maruelled, that the root ſhould be made of the leaues, and that it ſhould ſo grow. Opuns is a City neere vnto Phocis in Greece, as *Pauſanias*, *Strabo*, and *Pliny* teſtifie: but it is commonly called in Latine, *Ficus Indica*: of the Indians, *Tunc*, and *Tunas*, and alſo *Anapallas*, as teſtifieth *Bellouius*: in Engliſh, Indian Fig tree.

There is a certaine other deſcribed for the Indian Fig tree, by *Theophraſtus*, *lib.* 4. which *Pliny*, *lib.* 12. *cap.* 5. doth eloquently expreſſe almoſt in the ſame words, but turned into Latine, whereof we intend to ſpeake in the next chapter.

¶ *The Temperature and Vertues.*

A We haue no certaine inſtruction from the Antients, of the temperature or faculty of this plant, or of the fruit thereof: neither haue we any thing whereof to write of our owne knowledge, more than that we haue heard reported of ſuch as haue eaten liberally of the fruit thereof, that it changed their vrine to the colour of bloud; who at the firſt ſight thereof ſtood in great doubt of their life, thinking it had beene bloud, whereas it proued afterwards by experience to be nothing but the tincture or colour the vrine had taken from the juyce of the fruit, and that without all hurt or griefe at all.

B It is reported of ſome, that the juyce of the fruit is excellent good againſt vlcers of long continuance.

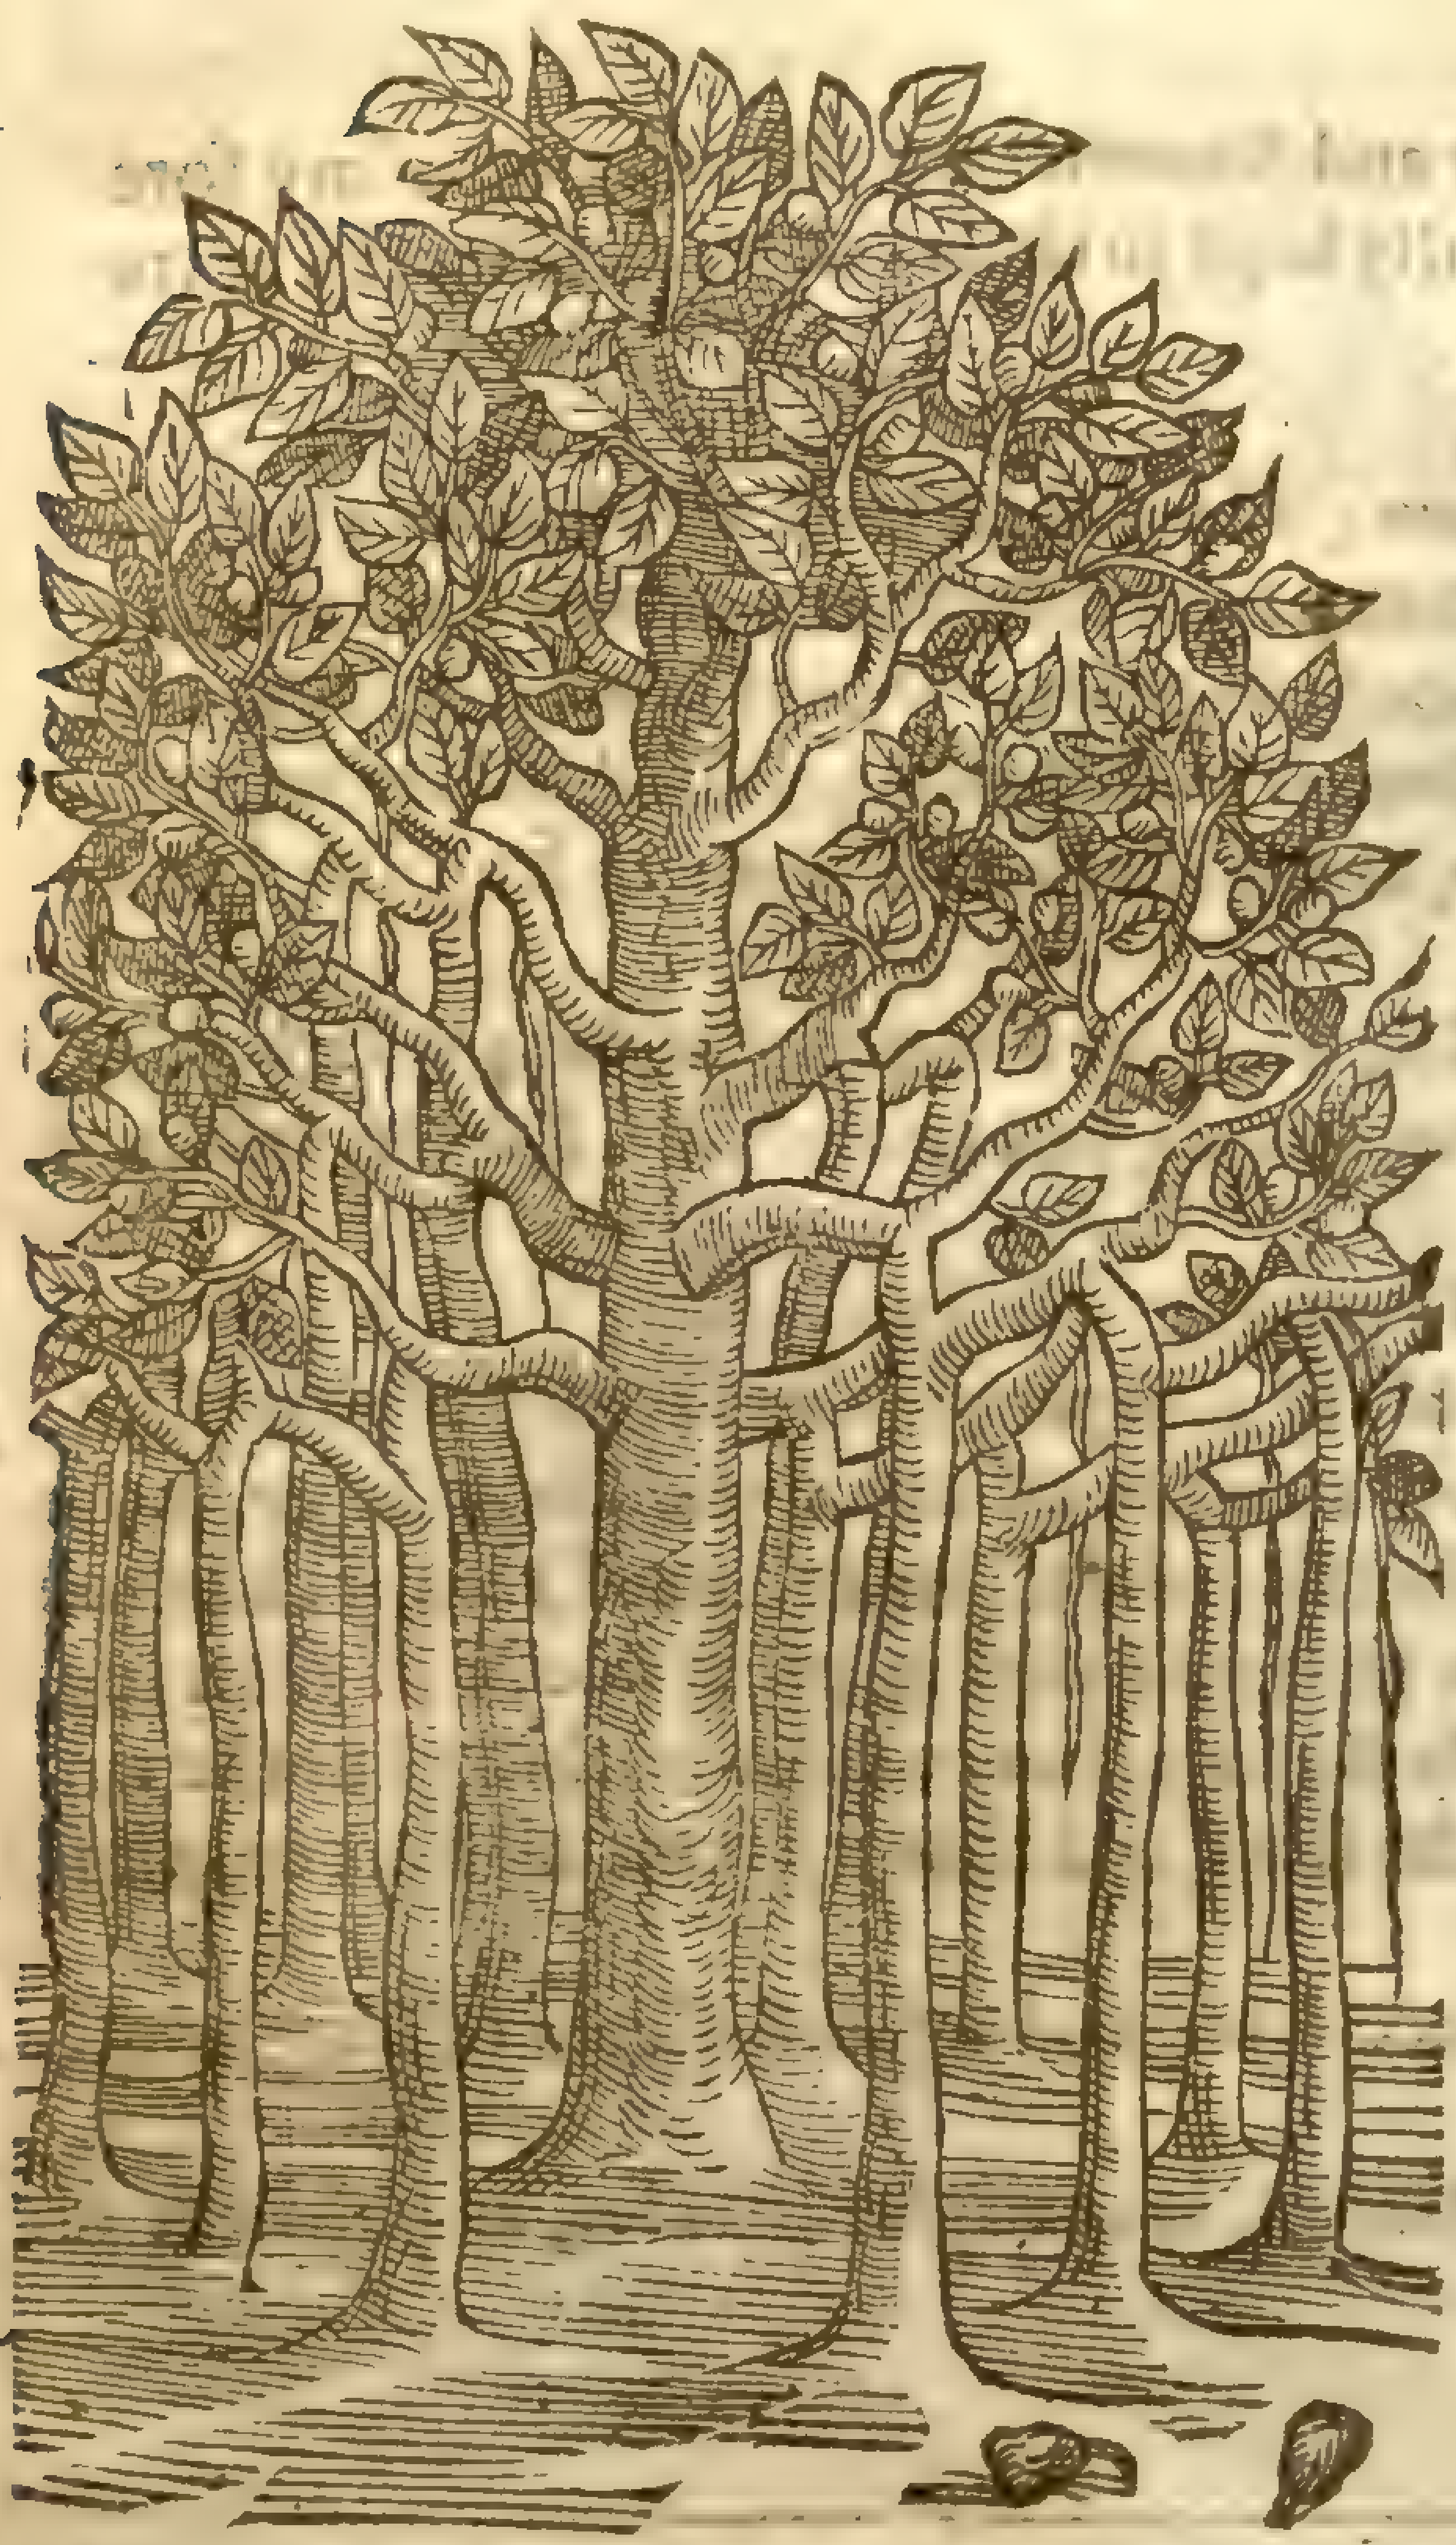
C ‡ Cochenele is giuen alone, and mixed with other things, in maligne diſeaſes, as peſtilent feuers and the like, but with what ſucceſſe I know not. ‡

CHAP. 135. *Of the arched Indian Fig tree.*

¶ *The Deſcription.*

THis rare and admirable tree is very great, ſtraight, and couered with a yellow barke tending to tawny: the boughes and branches are many, very long, tough, and flexible, growing very long in ſhort ſpace, as doe the twigs of Oziars, and thoſe ſo long and weake, that the ends thereof hang downe and touch the ground, where they take root and grow in ſuch ſort, that thoſe twigs become great trees: and theſe being growne vp vnto the like greatneſſe, doe caſt their branches or twiggy tendrels vnto the earth, where they likewiſe take hold and root; by meanes whereof it commeth to paſſe, that of one tree is made a great wood or deſart of trees, which the Indians doe vſe for couerture againſt the extreme heat of the Sun, wherewith they are grieuouſly vexed: ſome likewiſe vſe them for pleaſure, cutting downe by a direct line a long walke, or as it were a vault, through the thickeſt part, from which alſo they cut certaine loope-holes or windowes in ſome places, to the end to receiue thereby the freſh coole aire that entreth thereat, as alſo for light, that they may ſee their cattell that feed thereby, to auoid any danger that might happen vnto them either by the enemy or wilde beaſts: from which vault or cloſe walke doth rebound ſuch an admirable eccho or anſwering voice, if one of them ſpeake vnto another aloud, that it doth reſound or anſwer againe foure or fiue times, according to the height of the voice, to which it doth anſwer, and that ſo plainely, that it cannot be known from the voice it ſelfe: the firſt or mother of this wood or deſart of trees is hard to bee knowne from the children, but by the greatneſſe of the body, which three men can ſcarſely fathom about: vpon the branches whereof grow leaues hard and wrinkled, in ſhape like thoſe of the Quince tree, greene aboue, and of a whitiſh hoary colour vnderneath, whereupon the Elephants delight to feed: among which leaues come forth the fruit, of the bigneſſe of a mans thumbe, in ſhape like a ſmall Fig, but of a ſanguine or bloudy colour, and of a ſweet taſt;

but not ſo pleaſant as the Figs of Spaine; notwithſtanding they are good to be eaten, and withall very wholeſome.



Arbor ex Goa, ſiue Indica.
The arched Indian Fig tree.

¶ *The Place.*

This wondrous tree groweth in diuers places of the East-Indies, eſpecially neere vnto Goa, and alſo in Malaca: it is a ſtranger in moſt parts of the World.

¶ *The Time.*

This tree keepeth his leaues greene Winter and Summer.

¶ *The Names.*

This tree is called of thoſe that haue trauelled, *Ficus Indica*; the Indian Fig; and *Arbor Goa*, of the place where it groweth in greateſt plenty: we may call it in Engliſh, the arched Fig tree.

‡ Such as deſire to ſee more of this Fig-tree, may haue recourſe to *Cluſius* his *Exoticks*, *lib.* 1. *cap.* 1. where he ſhewes it was mentioned by diuers antient Writers, as *Q. Curtius, lib.* 9. *Pliny, lib.* 12. *cap.* 5. *Strabo, lib.* 5. and *Theophraſt. Hiſt. Plant. lib.* 4. *cap.* 5. by the name of *Ficus Indica.* ‡

¶ *The Temperature and Vertues.*

We haue nothing to write of the temperature or vertues of this tree, of our owne knowledge: neither haue we receiued from others more, than that the fruit hereof is generally eaten, and that without any hurt at all, but rather good, and alſo nouriſhing.

Chap. 136.

Of Adams Apple tree, or the West-Indian Plantane.

¶ *The Deſcription.*

Whether this plant may be reckoned for a tree properly, or for an herby Plant, it is diſputable, conſidering the ſoft and herby ſubſtance whereof it is made; that is to ſay, when it hath attained to the height of ſix or ſeuen cubits, and of the bigneſſe of a mans thigh, notwithſtanding it may be cut downe with one ſtroke of a ſword, or two or three cuts with a knife, euen with as much eaſe as the root of a reddiſh or Carrot of the like bigneſſe: from a thicke fat threddy root riſe immediately diuers great leaues, of the length of three cubits and a halfe, ſometimes more, according to the ſoile where it groweth, and of a cubit and more broad, of bigneſſe ſufficient to wrap a childe in of two yeares old, in ſhape like thoſe of Mandrake, of an ouerworne green colour, hauing a broad ribbe running through the middle thereof: which leaues, whether by reaſon of the extreme hot ſcorching Sun, or of their owne nature, in September are ſo drie and withered, that there is nothing thereof left or to bee ſeene but onely the middle rib. From the middeſt of theſe leaues riſeth vp a thicke trunke, whereon doth grow the like leaues, which the people do cut off, as alſo thoſe next the ground, by meanes whereof it riſeth vp to the height of a tree, which otherwiſe would remaine a low and baſe plant. This manner of cutting they vſe from time to time, vntill it came to a certaine height, aboue the reach of the Elephant, which greedily ſeeketh after the fruit. In the middeſt of the top among the leaues commeth forth a ſoft and fungous ſtumpe, whereon do grow diuers apples in forme like a ſmall Cucumber, and of the ſame bigneſſe, couered with a thin rinde like that of the Fig, of a yellow colour when they be ripe: the pulpe or ſubſtance of the meate is like that of the Pompion, without either ſeeds, ſtones or kernels, in taſte not greatly perceiued at the firſt, but preſently after it pleaſeth, and entiſeth a man to eate liberally thereof, by a certaine entiſing ſweetneſſe it yeelds: in which fruit, if it be cut according to the length (ſaith mine Author) oblique, tranſuerſe, or any other way whatſoeuer, may be ſeene the ſhape and forme of a croſſe, with a man faſtned thereto. My ſelfe haue ſeene the fruit, and cut it in pieces, which was brought me from Aleppo in pickle; the croſſe I might perceiue, as the forme of a ſpred Egle, in the root of Ferne; but the man I leaue to be ſought for by thoſe which haue better eies and judgement than my ſelfe.

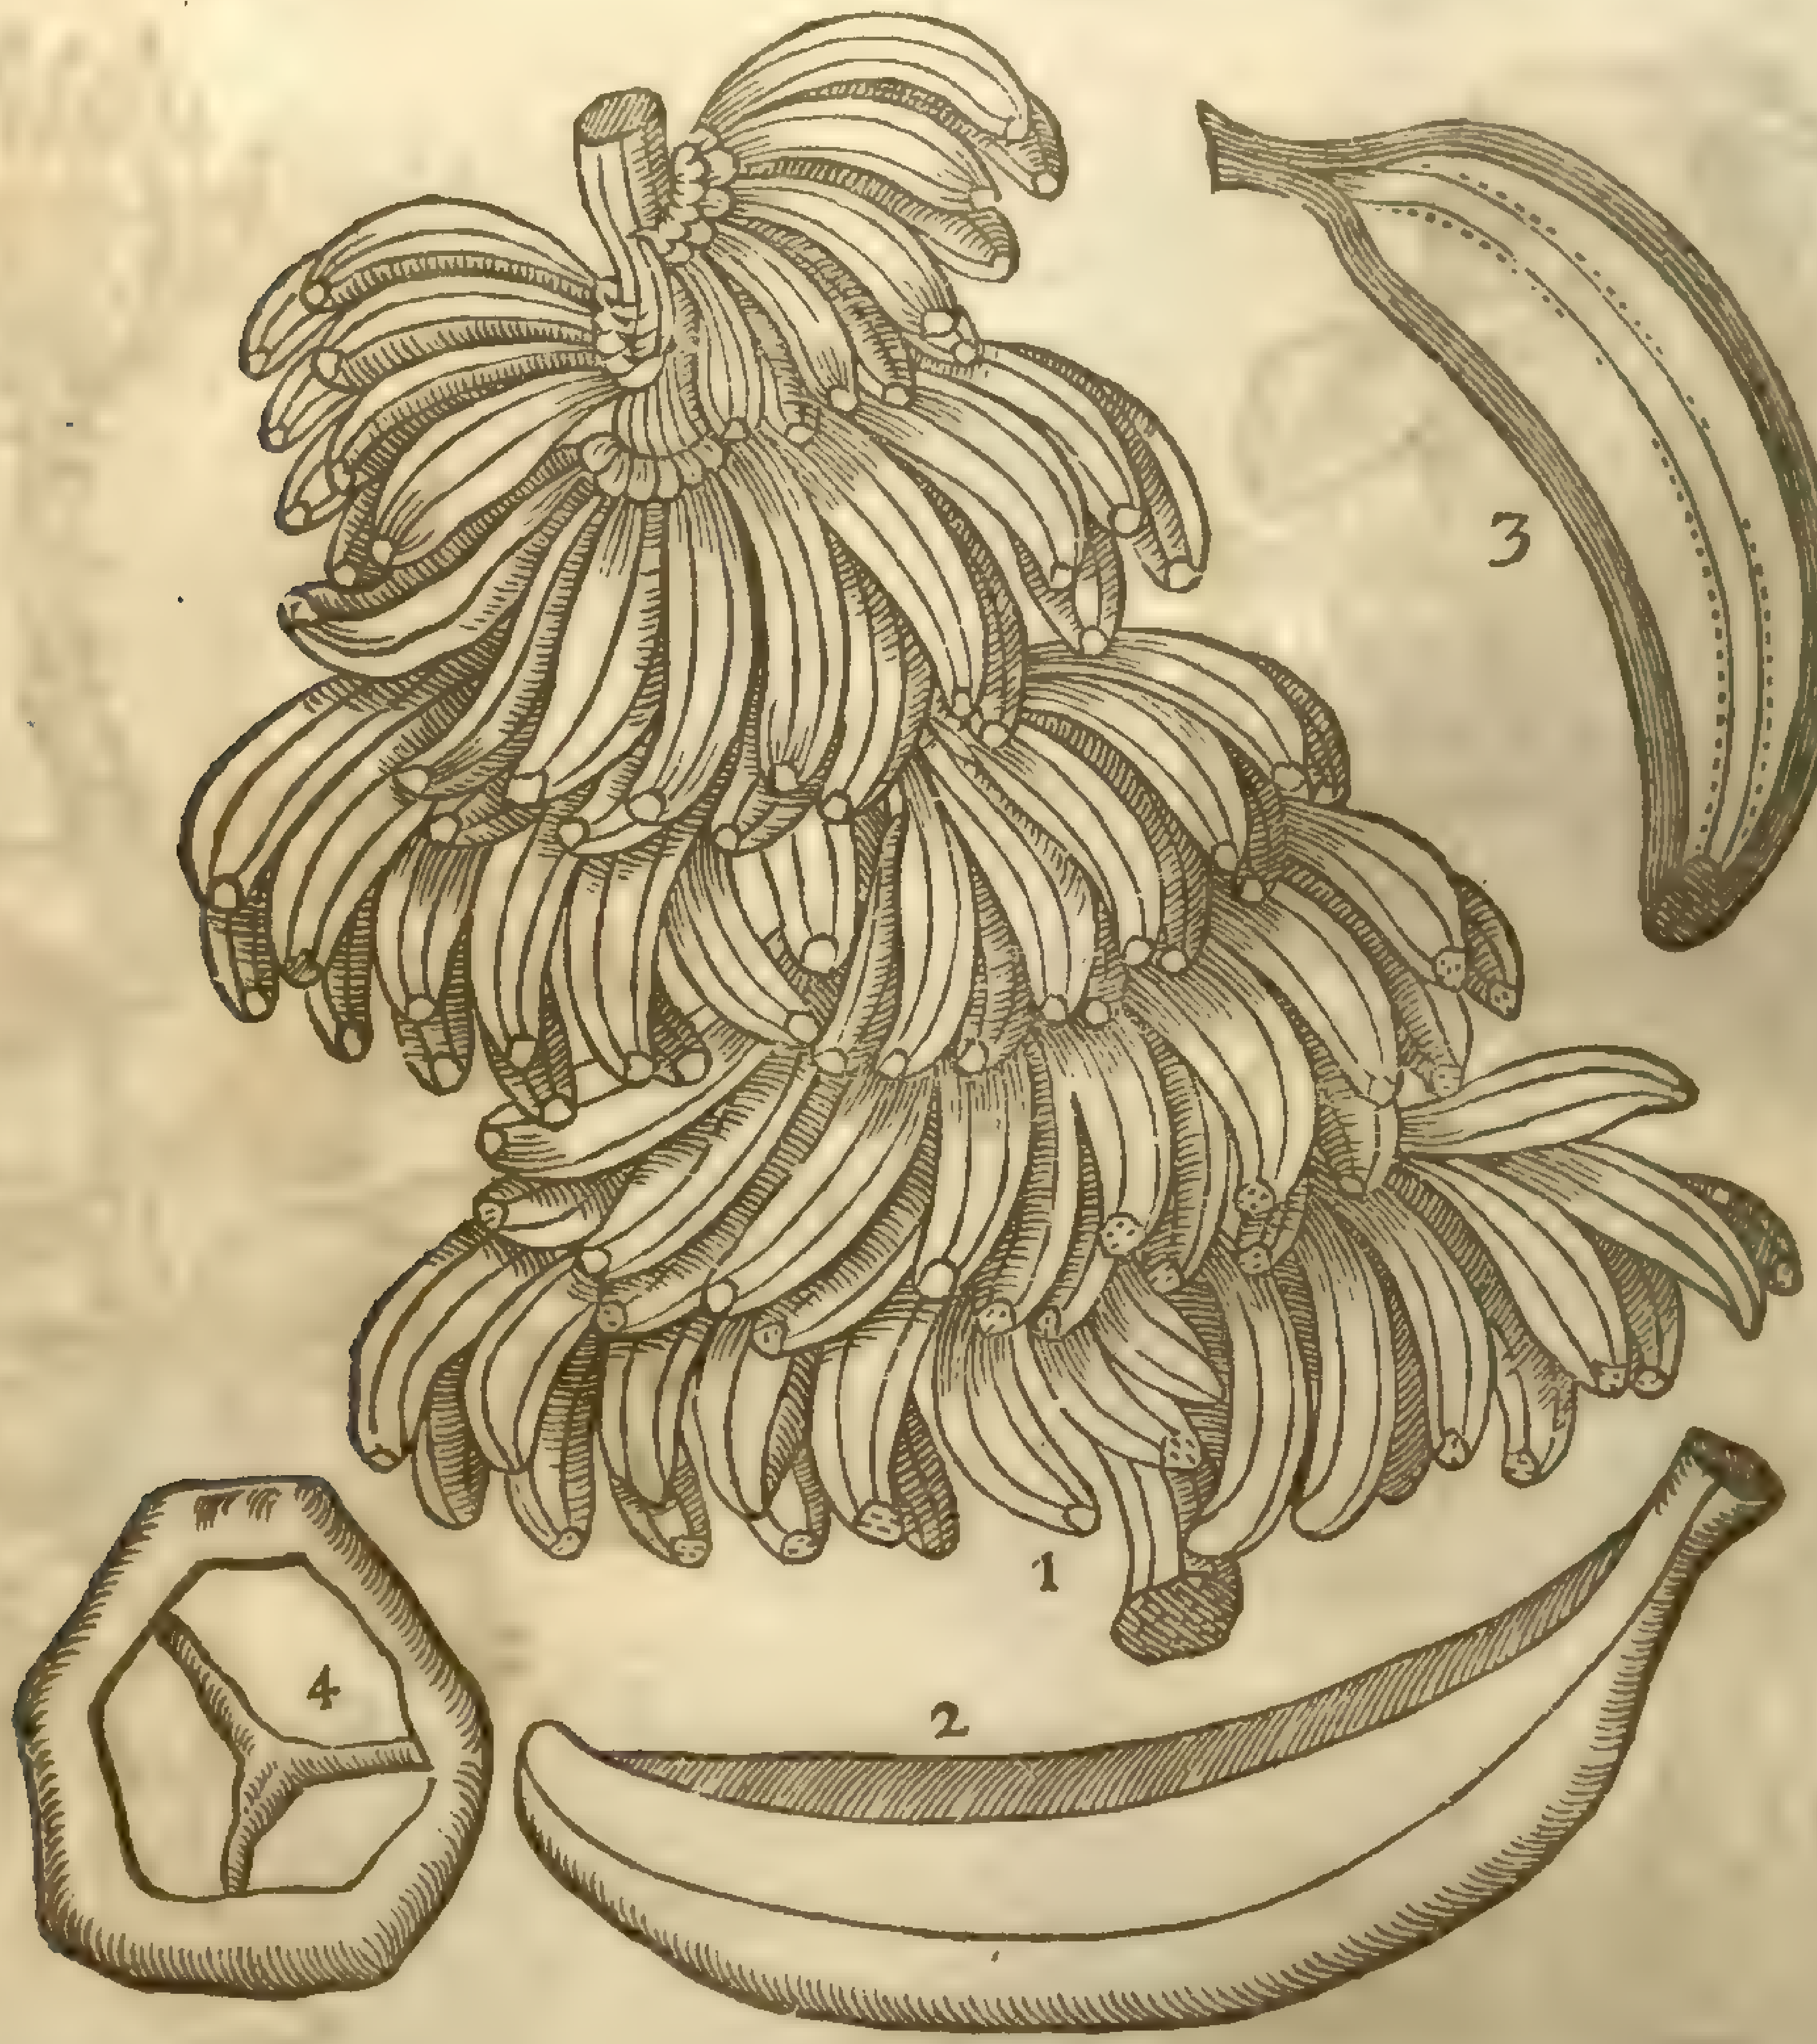
Muſa Serapionis.
Adams Apple-tree. [illegible]

Muſa Fructus.
Adams Apple.

‡ Aprill 10. 1633. my much honoured friend Dr. *Argent* (now Preſident of the Colledge of Phyſitions of London) gaue me a plant hee receiued from the Bermuda's: the length of the ſtalke was ſome two foot; the thickeneſſe thereof ſome ſeuen inches about, being creſted, and full of a ſoft pith, ſo that one might eaſily with a knife cut it aſunder. It was crooked a little or indented, ſo that at each two or three inches ſpace it put forth a knot of ſome halfe inch thickneſſe, and ſome inch in length, which encompaſſed it more than halfe about, and vpon each of theſe joints or knots, in two rankes one aboue another, grew the fruit, ſome twentie, nineteene, eighteene, &c. more or leſſe, at each knot: for the branch I had, conteined nine knots or diuiſions, and vpon the loweſt knot grew twenty, and vpon the vppermoſt fifteene. The fruit which I receiued was not ripe, but greene, each of them was about the bigneſſe of a large Beane; the length of them ſome fiue inches, and the bredth ſome inch and halfe: they all hang their heads downewards, haue rough or vneuen ends, and are fiue cornered; and if you turne the vpper ſide downeward, they ſomewhat reſemble a boat, as you may ſee by one of them expreſt by it ſelfe: the huske is as thicke as a Beane, and will eaſily ſhell off it: the pulpe is white and ſoft: the ſtalke whereby it is faſtned to the knot is very ſhort and almoſt as thicke as ones little finger. Tſte ſtalke with the fruit thereon I hanged vp in my ſhop, where it became ripe about the beginning of May, and laſted vntill Iune: the pulp or meat was very ſoft and tender, and it did eate ſomewhat like a Muske-Melon. I haue giuen you the figure of the whole branch, with the fruit thereon, which I drew as ſoone as I receiued it, and it is marked with this figure 1. The figure 2 ſheweth the ſhape of one particular fruit, with the lower

ſide vpwards. 3 The ſame cut through the middle long waies. 4 The ſame cut ſide waies, I haue been told (but how certainely it is I know not) that the floures which precede the fruit are bell-faſhioned, and of a blew colour. I could obſerue no ſeed in the fruit; it may be it was becauſe it had beene cut from the ſtocke ſo long before it came to maturity. This plant is found in many places of Aſia, Africke, and America, eſpecially in the hot regions: you may finde frequent mention of it amongſt the ſea voiages to the Eaſt and Weſt Indies, by the name of Plantaines, or *Platanus, Bannanas, Bouanas, Dauanas, Poco, &c.* ſome (as our Author hath ſaid) haue judged it the forbidden fruit; otherſome, the Grapes brought to *Moſes* out of the Holy-land. ‡

Muſa fructus exactior Icon.
An exacter figure of the Plantaine fruit.



¶ *The Place.*

This admirable tree groweth in Ægypt, Cyprus, and Syria, neere vnto a chiefe city there called Alep, which we call Aleppo; and alſo by Tripolis, not far from thence: it groweth alſo in Canara, Decan, Guzarate, and Bengala, places of the Eaſt-Indies.

¶ *The Time.*

From the root of this tree ſhooteth forth young ſprings or ſhoots, which the people take vp and plant for the increaſe of the Spring of the yeare. The leaues wither away in September, as is aboue ſaid.

¶ *The Names.*

It is called *Muſa* by ſuch as trauell to Aleppo: by the Arabians, *Muſa Maum*: in Syria, *Moſe*: The Grecians and Chriſtians which inhabit Syria, and the Iewes alſo, ſuppoſe it to be that tree of whoſe fruit *Adam* did taſte; which others thinke it to be a rediculous fable: of *Pliny, Opuntia.*

It is called in the Eaſt-Indies (as at Malauar where it alſo groweth) *Palan*: in Malayo, *Pican*: and in that part of Africa which we call Ginny, *Bananas*: in Engliſh, Adams Apple tree.

¶ *The Temperature.*

Serapio judges, that it heateth in the end of the firſt degree, and moiſtneth in the end of the ſame.

¶ *The Vertues.*

A The fruit hereof yeeldeth but little nouriſhment: it is good for the heate of the breaſt, lungs, and bladder: it ſtoppeth the liuer, and hurteth the ſtomacke if too much of it be eaten, and procureth looſneſſe in the belly : whereupon it is requiſit for ſuch as are of a cold conſtitution, in the eating thereof to put vnto it a little Ginger or other ſpice.

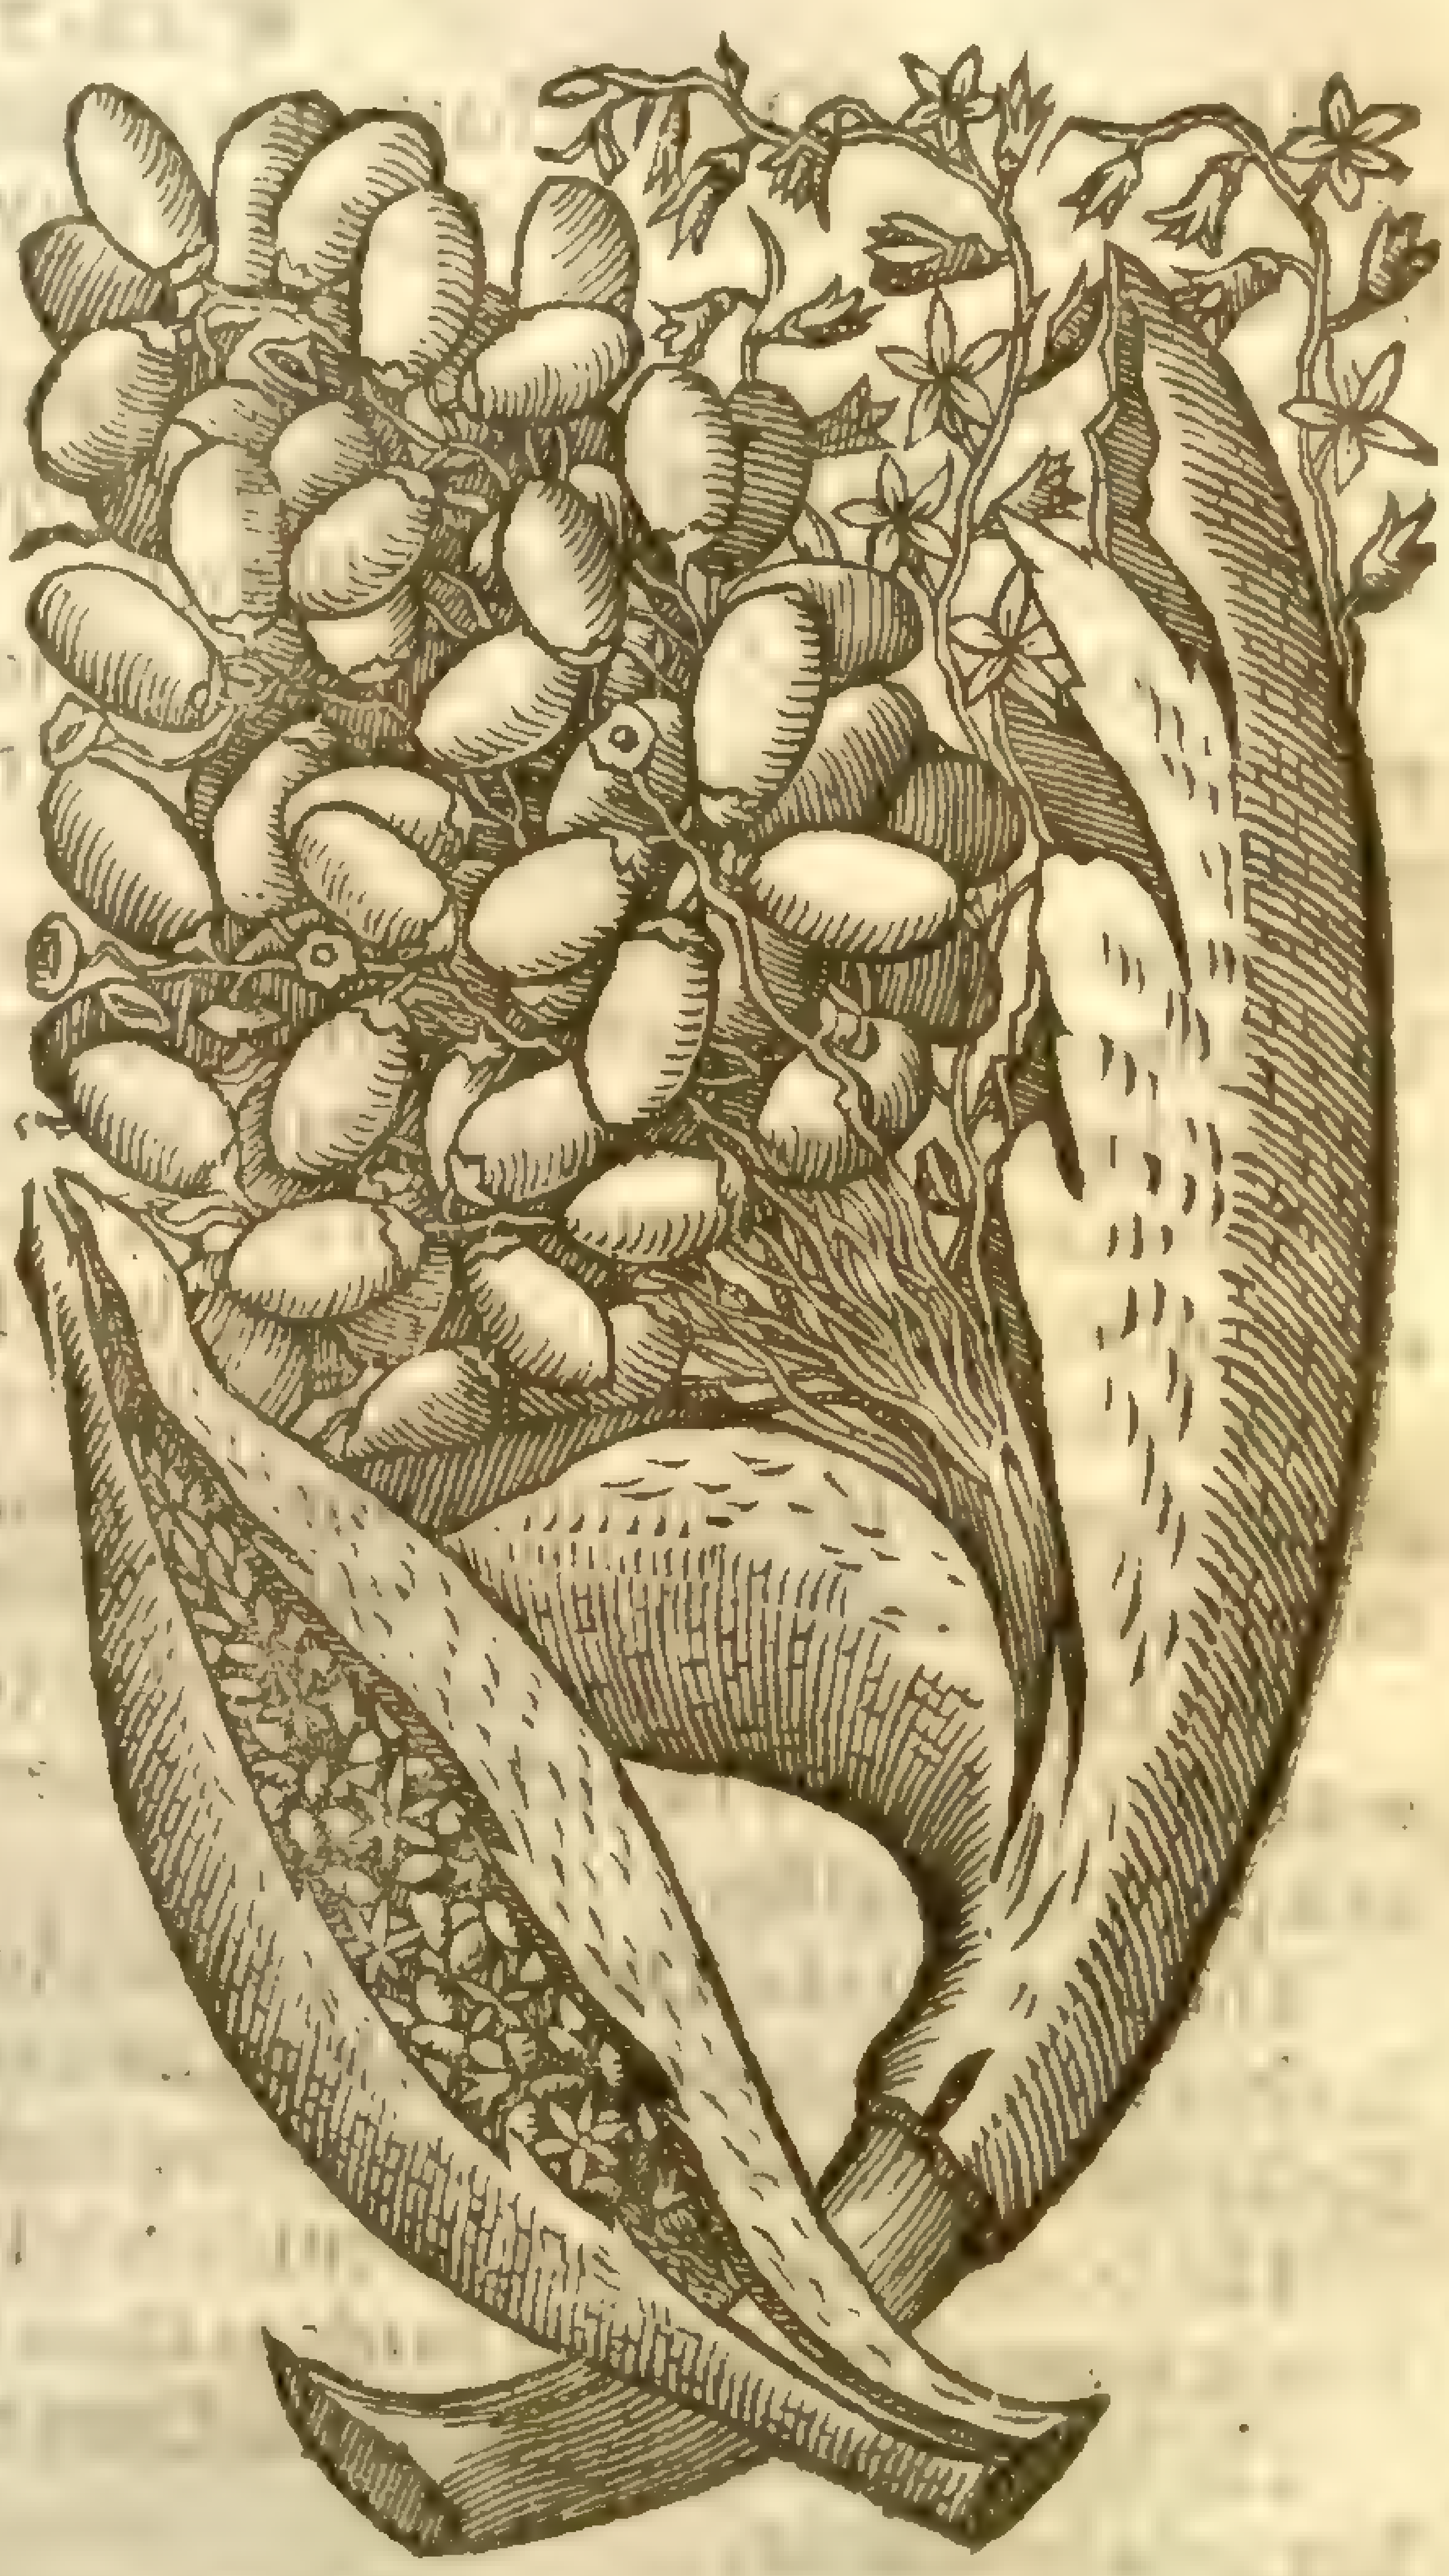
B It is alſo good for the reins or kidnies, and to prouoke vrine : it nouriſheth the child in the mothers wombe, and ſtirreth to generation.

Phoenix dactylifera L. [illegible]

Chap. 137. *Of the Date tree.*

Palma.
The Date tree.

Palmarum fructus & flores cum Elate.
The fruit and floures of the Date tree.



¶ *The Deſcription.*

The Date tree growes very great and high ; the body or trunke thereof is thicke, and couered with a ſcaly rugged bark, cauſed by the falling away of the leaues : the boughs grow only on the top, conſiſting of leaues ſet vpon a wooddy middle rib like thoſe of reeds or flags: the inner part of which rib or ſtalk is ſoft, light, hollow, and ſpongie. Among the leaues come forth the floures, included in a long skinny membrane as it were a ſheath or hoſe, like that which couereth the floure de-luce before it be blown ; which being opened of it ſelfe, white flours ſtart forth, ſtanding vpon ſhort and ſlender footſtalks, which are faſtned with certain ſmall filaments or threddie ſtrings like vnto little branches : after which ſpring out from the ſame branches the fruit or dates, which be in faſhion long and round, in taſte ſweet, and many times ſomewhat harſh, of a yellowiſh red colour ; wherein is contained a long hard ſtone, which is in ſtead of kernel and ſeed ; the which I haue planted many times in my garden, and haue grown to the height of three foot : but the firſt froſt hath nipped them in ſuch ſort, that ſoon after they periſhed, notwithſtanding my induſtry by couering them, or what elſe I could do for their ſuccour.

¶ *The Place.*

The Date trees grow plentifully in Affrica and Ægypt ; but thoſe which are in Paleſtina and

Syria be the beſt: they grow likewiſe in moſt places of the Eaſt and Weſt Indies, where there be diuers ſorts, as well wild, as tame or manured.

¶ *The Time.*

The Date tree is alwaies greene, and floureth in the ſpring time: the fruit is ripe in September, and being then gathered they are dried in the Sunne, that they may be the better both tranſported into other countries far diſtant, as alſo preſerued from rotting at home.

¶ *The Names.*

The tree is called in Greeke, φοῖνιξ: in Latine *Palma*: in Engliſh, Date tree.

The fruit is named in Greeke, βάλανος φοινίκων: that is to ſay, *Glans Palmarum*, or the fruit of the Date trees: and by one word, φοινικοβάλανος: in Latine *Palmula*: in ſhops, *Dactylus*: in high-Dutch, **Dattelen**: in low-Dutch, **Dadelen**: in Italian, *Dattoli*: in French, *Dattis*: in Spaniſh, *Tamaras*, and *Datiles*: in Engliſh, Date.

The cod or ſheath wherein the floures and Dates are wrapped, is called ἐλάτη, and of ſome, βόρασσος.

¶ *The Temperature and Vertues.*

A All manner of Dates whatſoeuer are hard of digeſtion, and cauſe head-ache: the worſer ſort be thoſe that be dry and binding, as the Egyptian Dates; but the ſoft moiſt and ſweet ones are leſſe hurtfull.

B The bloud which is ingendred of Dates in mans body is altogether groſſe, and ſomewhat clammy: by theſe the liuer is very quickly ſtopped, eſpecially being inflamed and troubled with ſome hard ſwelling: ſo is the ſpleen likewiſe.

C The Dates which grow in colder regions, when they cannot come to perfect ripeneſſe, if eaten too plentifully, they fill the body full of raw humors, ingender wind, and oftentimes cauſe the Leproſie.

D The drier ſorts of Dates, as *Dioſcorides* ſaith, be good for thoſe that ſpit bloud, for ſuch as haue bad ſtomacks, and for thoſe alſo that be troubled with the bloudy flix.

E The beſt Dates, called in Latine *Caryota*, are good for the roughneſſe of the throat and lungs.

F There are made hereof both by the cunning Confectioners & Cooks, diuers excellent, cordial, comfortable and nouriſhing medicines, that procure luſt of the body very mightily.

G They do alſo refreſh and reſtore ſuch vnto ſtrength as are entring into a conſumption, for they ſtrengthen the feebleneſſe of the liuer and ſpleen, being made into conuenient broths and phyſical medicines directed by a learned Phyſition.

H Dry Dates do ſtop the belly and ſtay vomiting, and the wambling of womens ſtomacks that are with childe, if they be either eaten in meats or otherwiſe, or ſtamped and applied vnto the ſtomack as a pectoral plaiſter.

I The aſhes of the Date ſtones haue a binding qualitie and emplaſtick facultie, they heal puſhes in the eies, *Staphylomata*, and falling away of the haire of the eie-lids, beeing applied together with Spikenard: with wine it keeps proud fleſh from growing in wounds.

K The boughs and leaues do euidently bind, but eſpecially the hoſe or caſe of the floures: wherefore it is good to vſe theſe ſo oft as there is need of binding.

L The leaues and branches of the Date tree doe heale green wounds and vlcers, refreſh and coole hot inflammations.

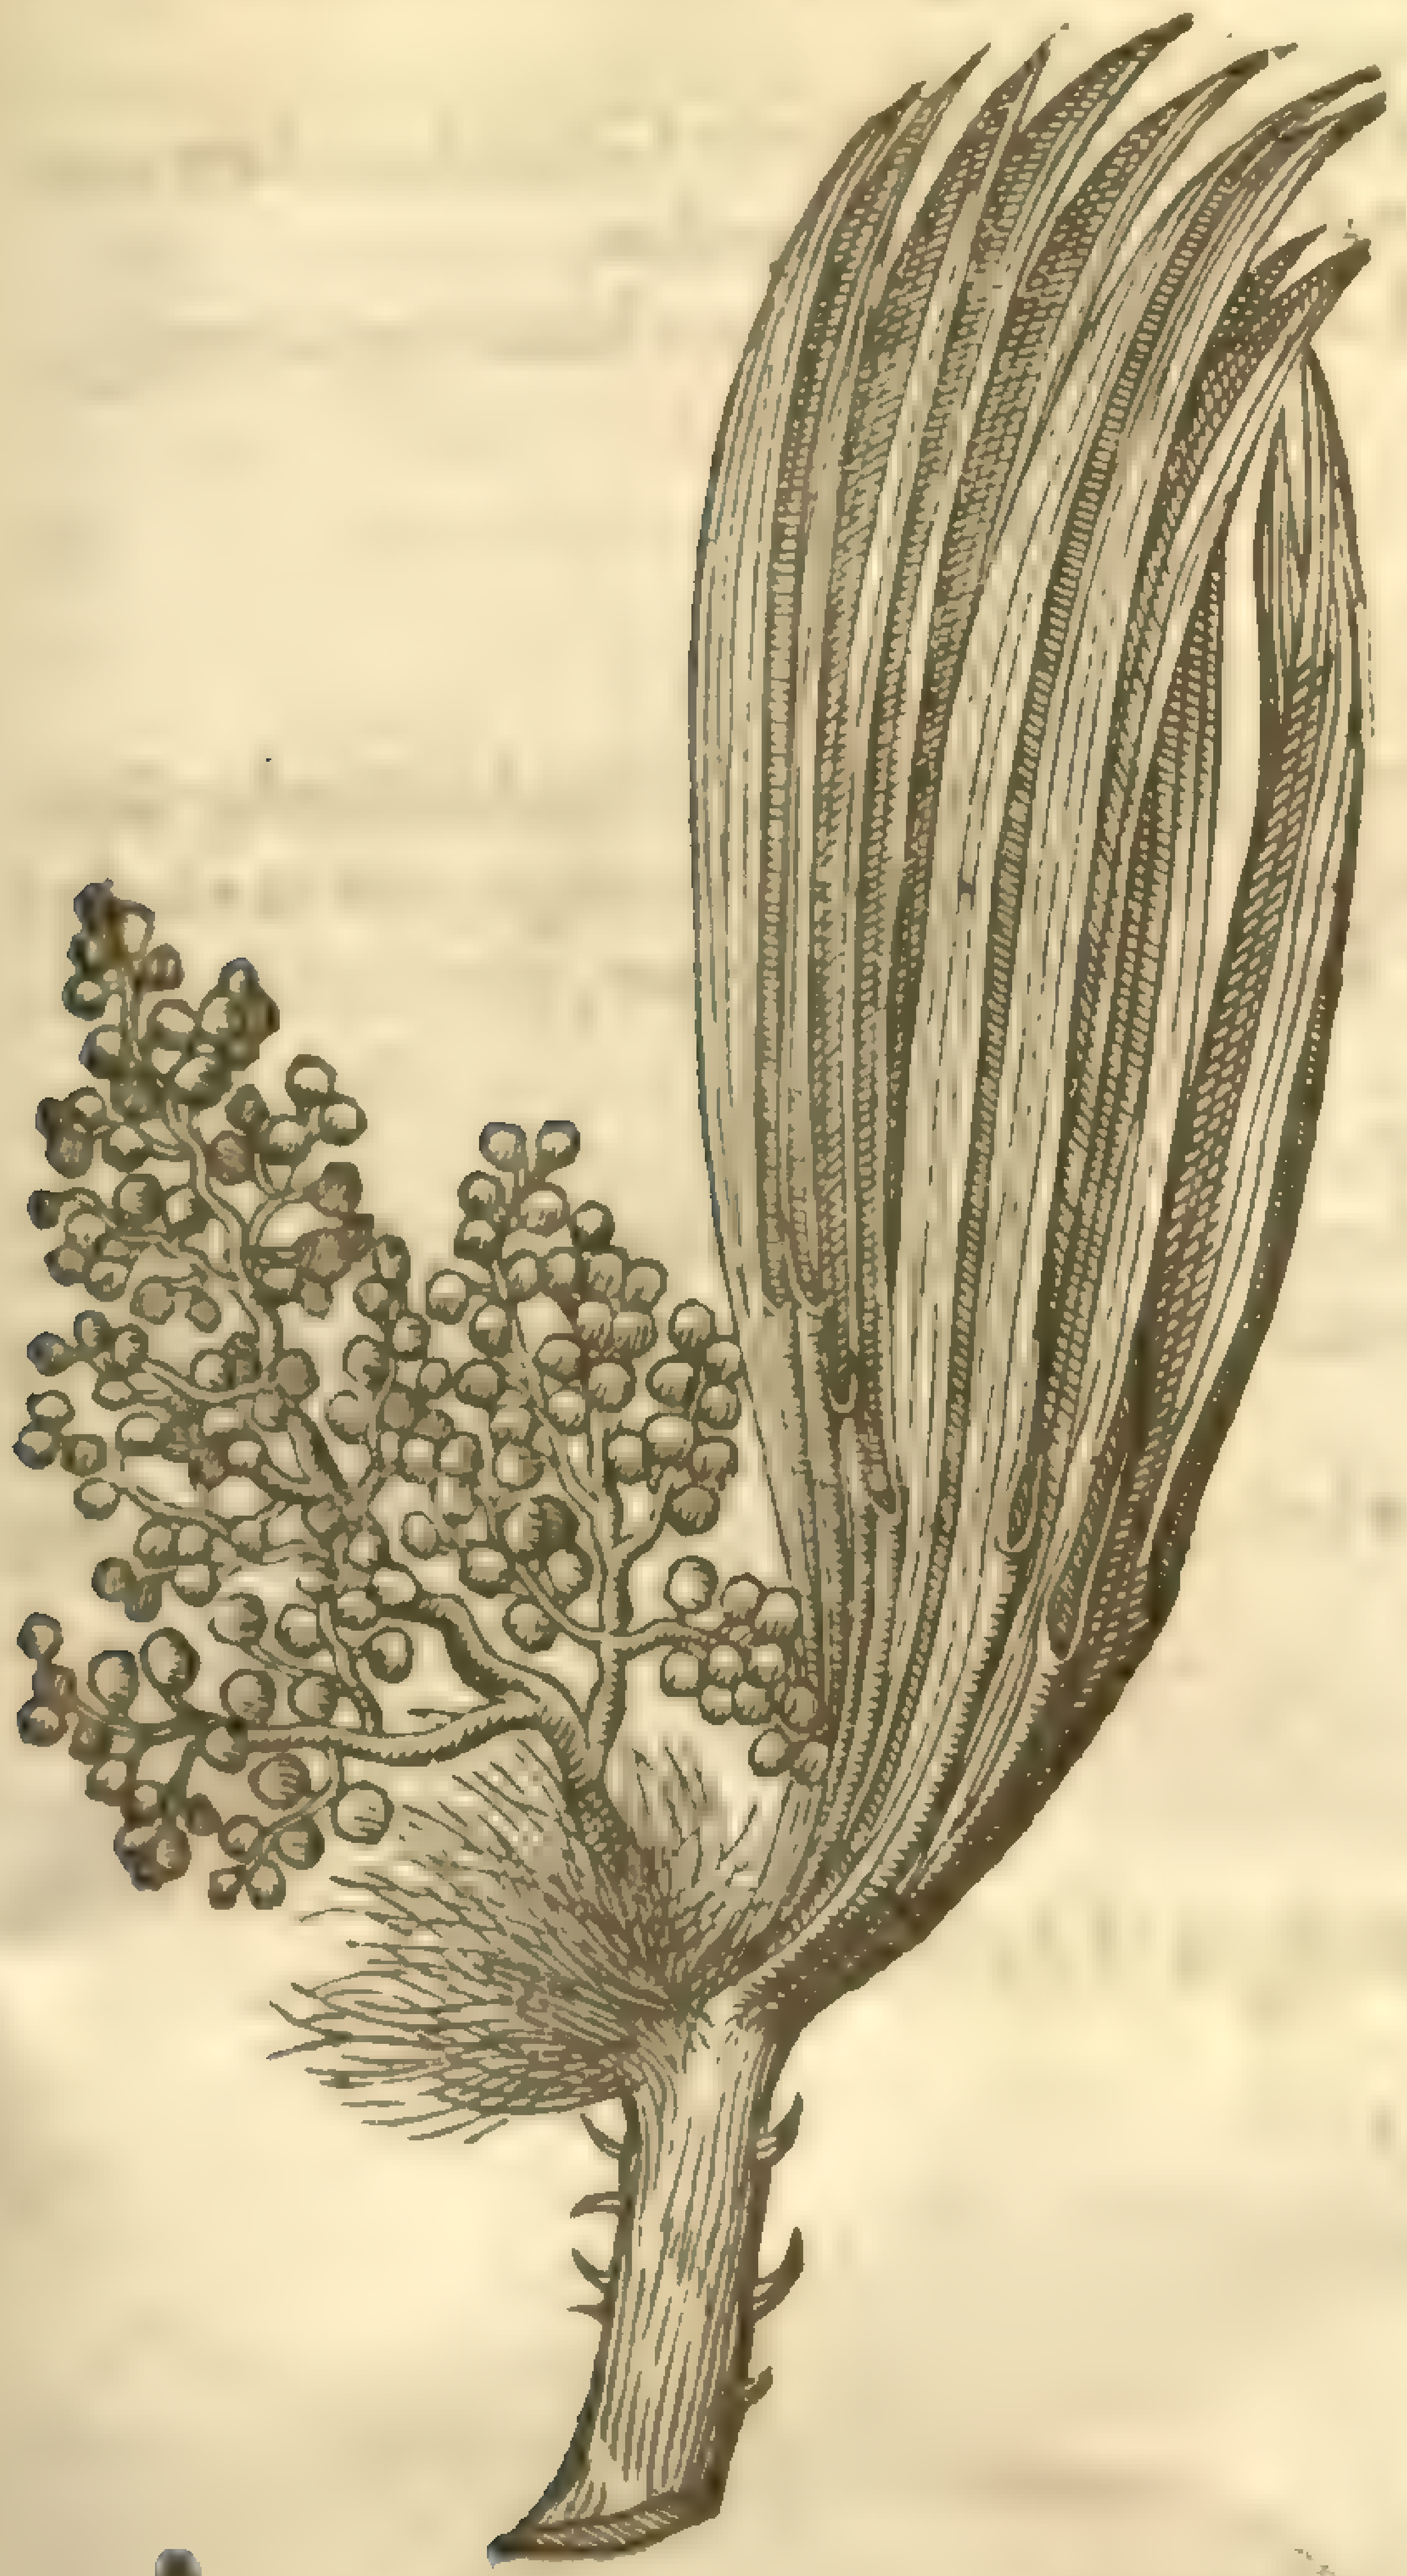
M *Galen* in his booke of medicines according to the kinds, mentioneth a compoſition called *Diapalma*, which is to be ſtirred with the bough of a date tree in ſtead of a ſpature or thing to ſtir with, for no other cauſe than that it may receiue thereby ſome kind of aſtriction or binding force.

Chap. 138. *Of the wilde Date trees.*

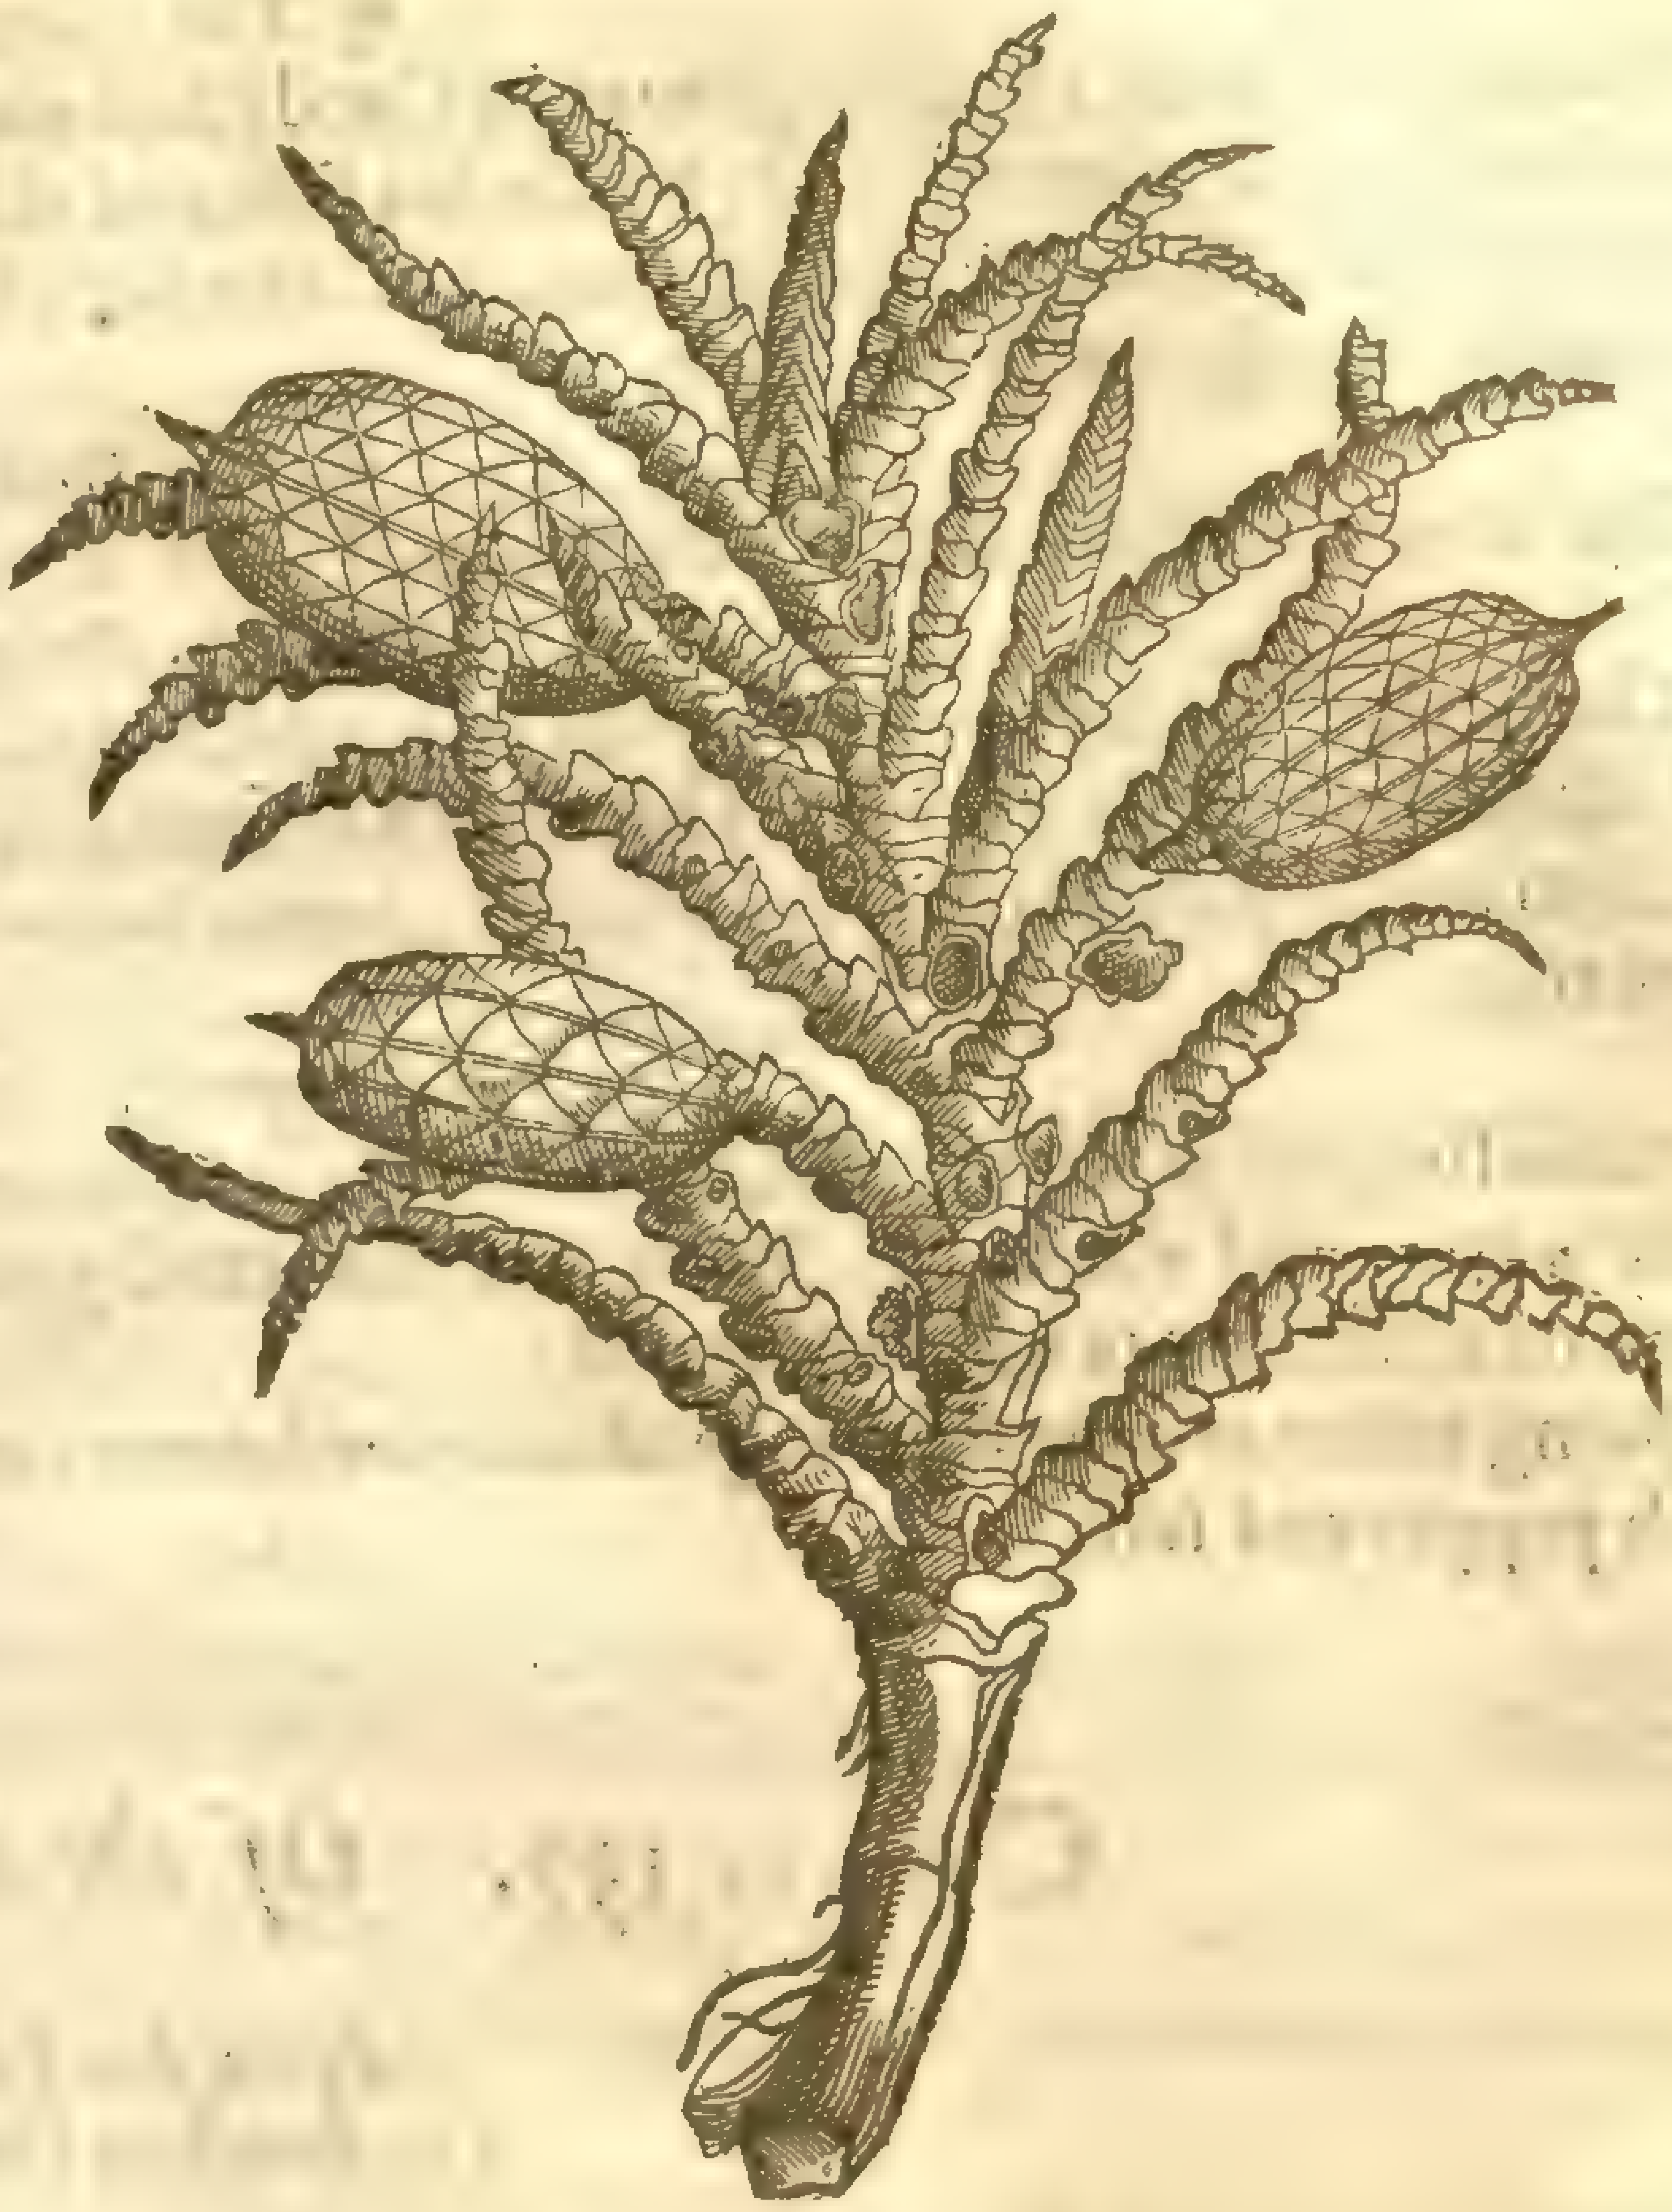
¶ *The Deſcription.*

1 Theophraſtus maketh this plant to be a kinde of Date tree, but low and of ſmall growth, ſeldome attaining aboue the height of a cubit; on the top whereof ſhoot forth for the moſt part long leaues like thoſe of the Date tree, but leſſer and ſhorter: from the ſides whereof breake forth a buſh of threddy ſtrings, amongſt which riſeth vp ſmall branches garniſhed with cluſters of white floures, in which before they be opened are to bee ſeene vnperfect ſhapes of leaues, cloſely compaſſed about with an innumerable ſort of thinne skinny huls; which rude ſhapes with the flours are ſerued vp and eaten at the ſecond courſe among other junkets, with a little ſalt and pepper, being pleaſant to the taſte. ‡ The ſtalke is about the thickneſſe of ones little

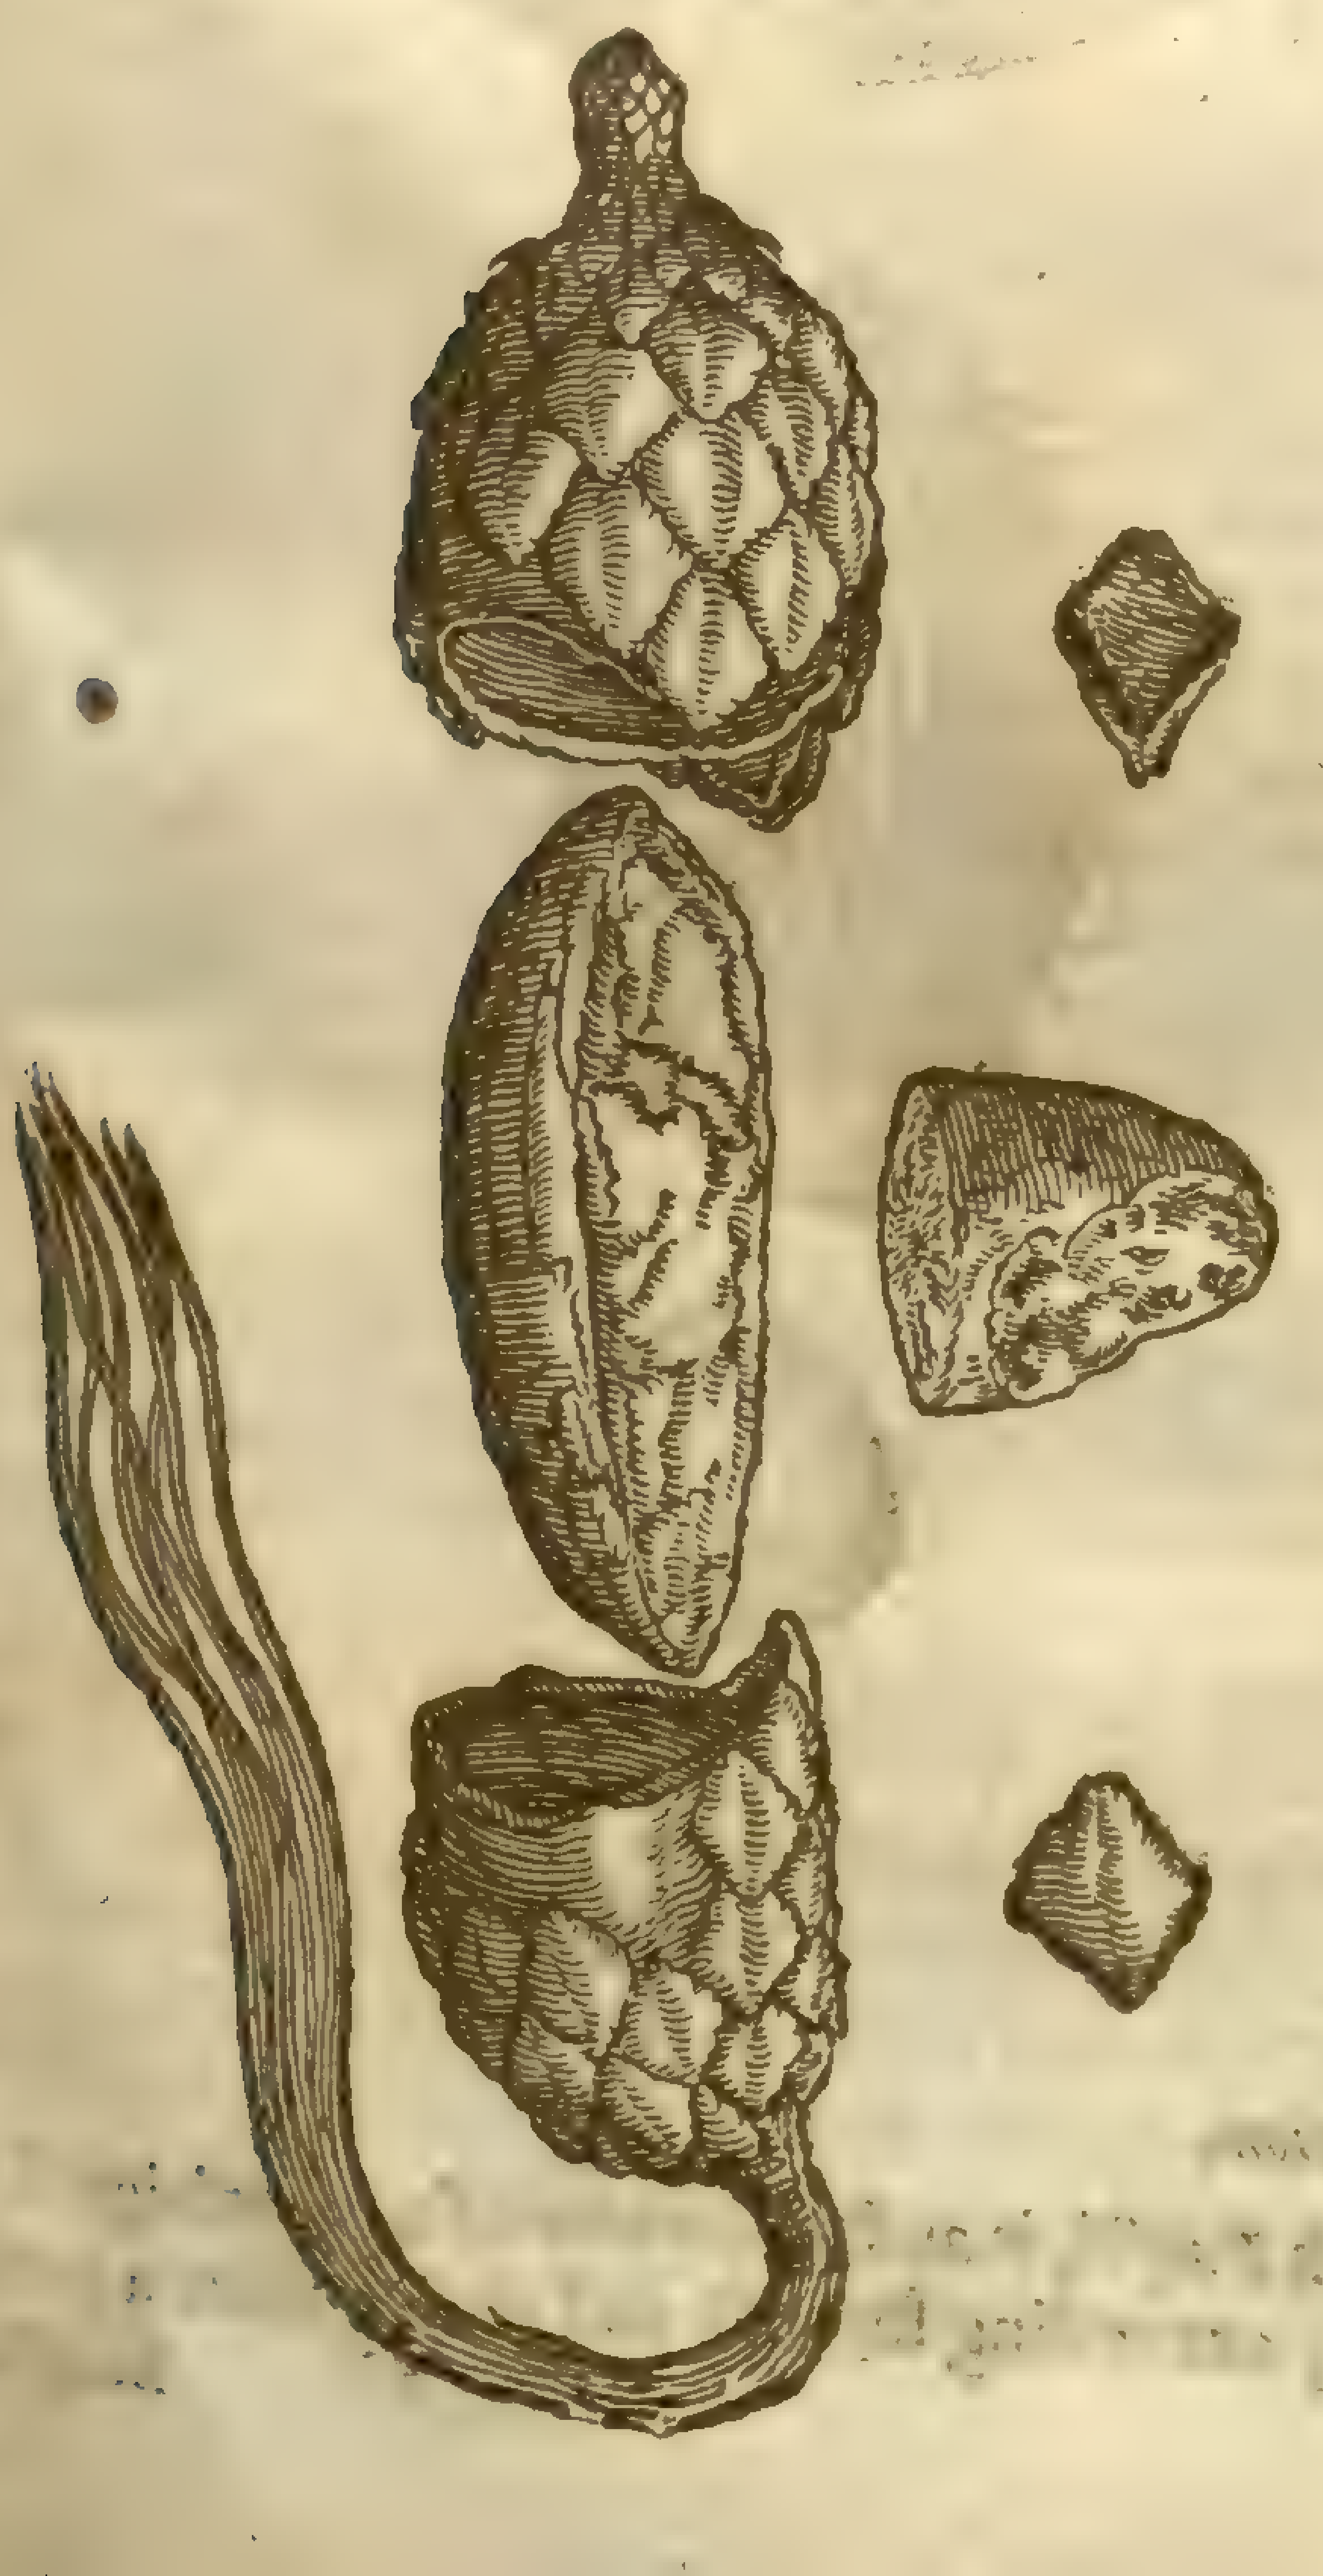
1 *Palmites, ſive Chamærriphes.*
The little wilde Date tree.



2 *Palmapinus, ſive Palma conifera.*
The wilde Date tree bearing cones.



‡ *Fructus Palmapini.*
The fruit of the Cone Date.



little finger, here & there ſet with a few crooked prickes: the leaues within ſome handfull or two of the ſtalke are cut vp and made into little beſomes, which are ſold in many glaſſe ſhops here in London.

2 The wilde Date tree that brings forth cones of key clogs, is of moſt trauellers into the Indies thought to be barren of Dates, except ſometimes it yeeldeth forth ſome ſmall berries like vnto Dates, but dry, and nothing worth. This groweth vp to the height and bigneſſe of a low tree, the trunke or body whereof is ſoft, of a fungous or pithy ſubſtance, vnfit for building, as is the mannured Date tree. The branch it ſelfe was brought vnto vs from the Indies, dry & void of leaues, wherefore we muſt deſcribe the leaues by report of the bringer. The branches, ſaith my Authour, are couered ouer with long flaggie leaues, hanging downe of a great length like thoſe of the Date tree: the branches are alſo couered with a ſcaly or ſcabbed barke, very rough, one ſcale or plate lying ouer another, as tiles vpon a houſe: the fruit growes at the end of the branches, not vnlike a great Pine Apple cone, couered ouer with a ſkinne like the Indian Nut, wherein is contained a ſhell, within which ſhell lieth hid an acorn or long

kernell of an inch long, and ſometimes longer, very hard to be broken, in taſte like the Cheſtnut; which the ſauage people do grate and ſtamp to pouder to make them bread.

¶ *The Place.*

Theophraſtus ſaith, the firſt growes in Candy, but much more plentifully in Cilicia, and are now found in certaine places of Italy by the ſea ſide, and alſo in diuers parts of Spaine.

The other hath been found by trauellers into the Weſt-Indies, from whence haue been brought the naked branches with the fruit.

¶ *The Time.*

The time anſwereth that of the manured Date tree.

¶ *The Names.*

The little Date tree or wilde Date tree is named of *Theophraſtus*, χαμαιριφεῖς: in Naples, *Cephaglione*: in Latine commonly *Palmites*. That which is found in the midſt of the yong ſprings, and is vſed to be eaten in banquets, is called in Greeke, ἐγκέφαλος φοίνικος: in Latine, *Palmæ cerebrum*, the braine of the Date tree.

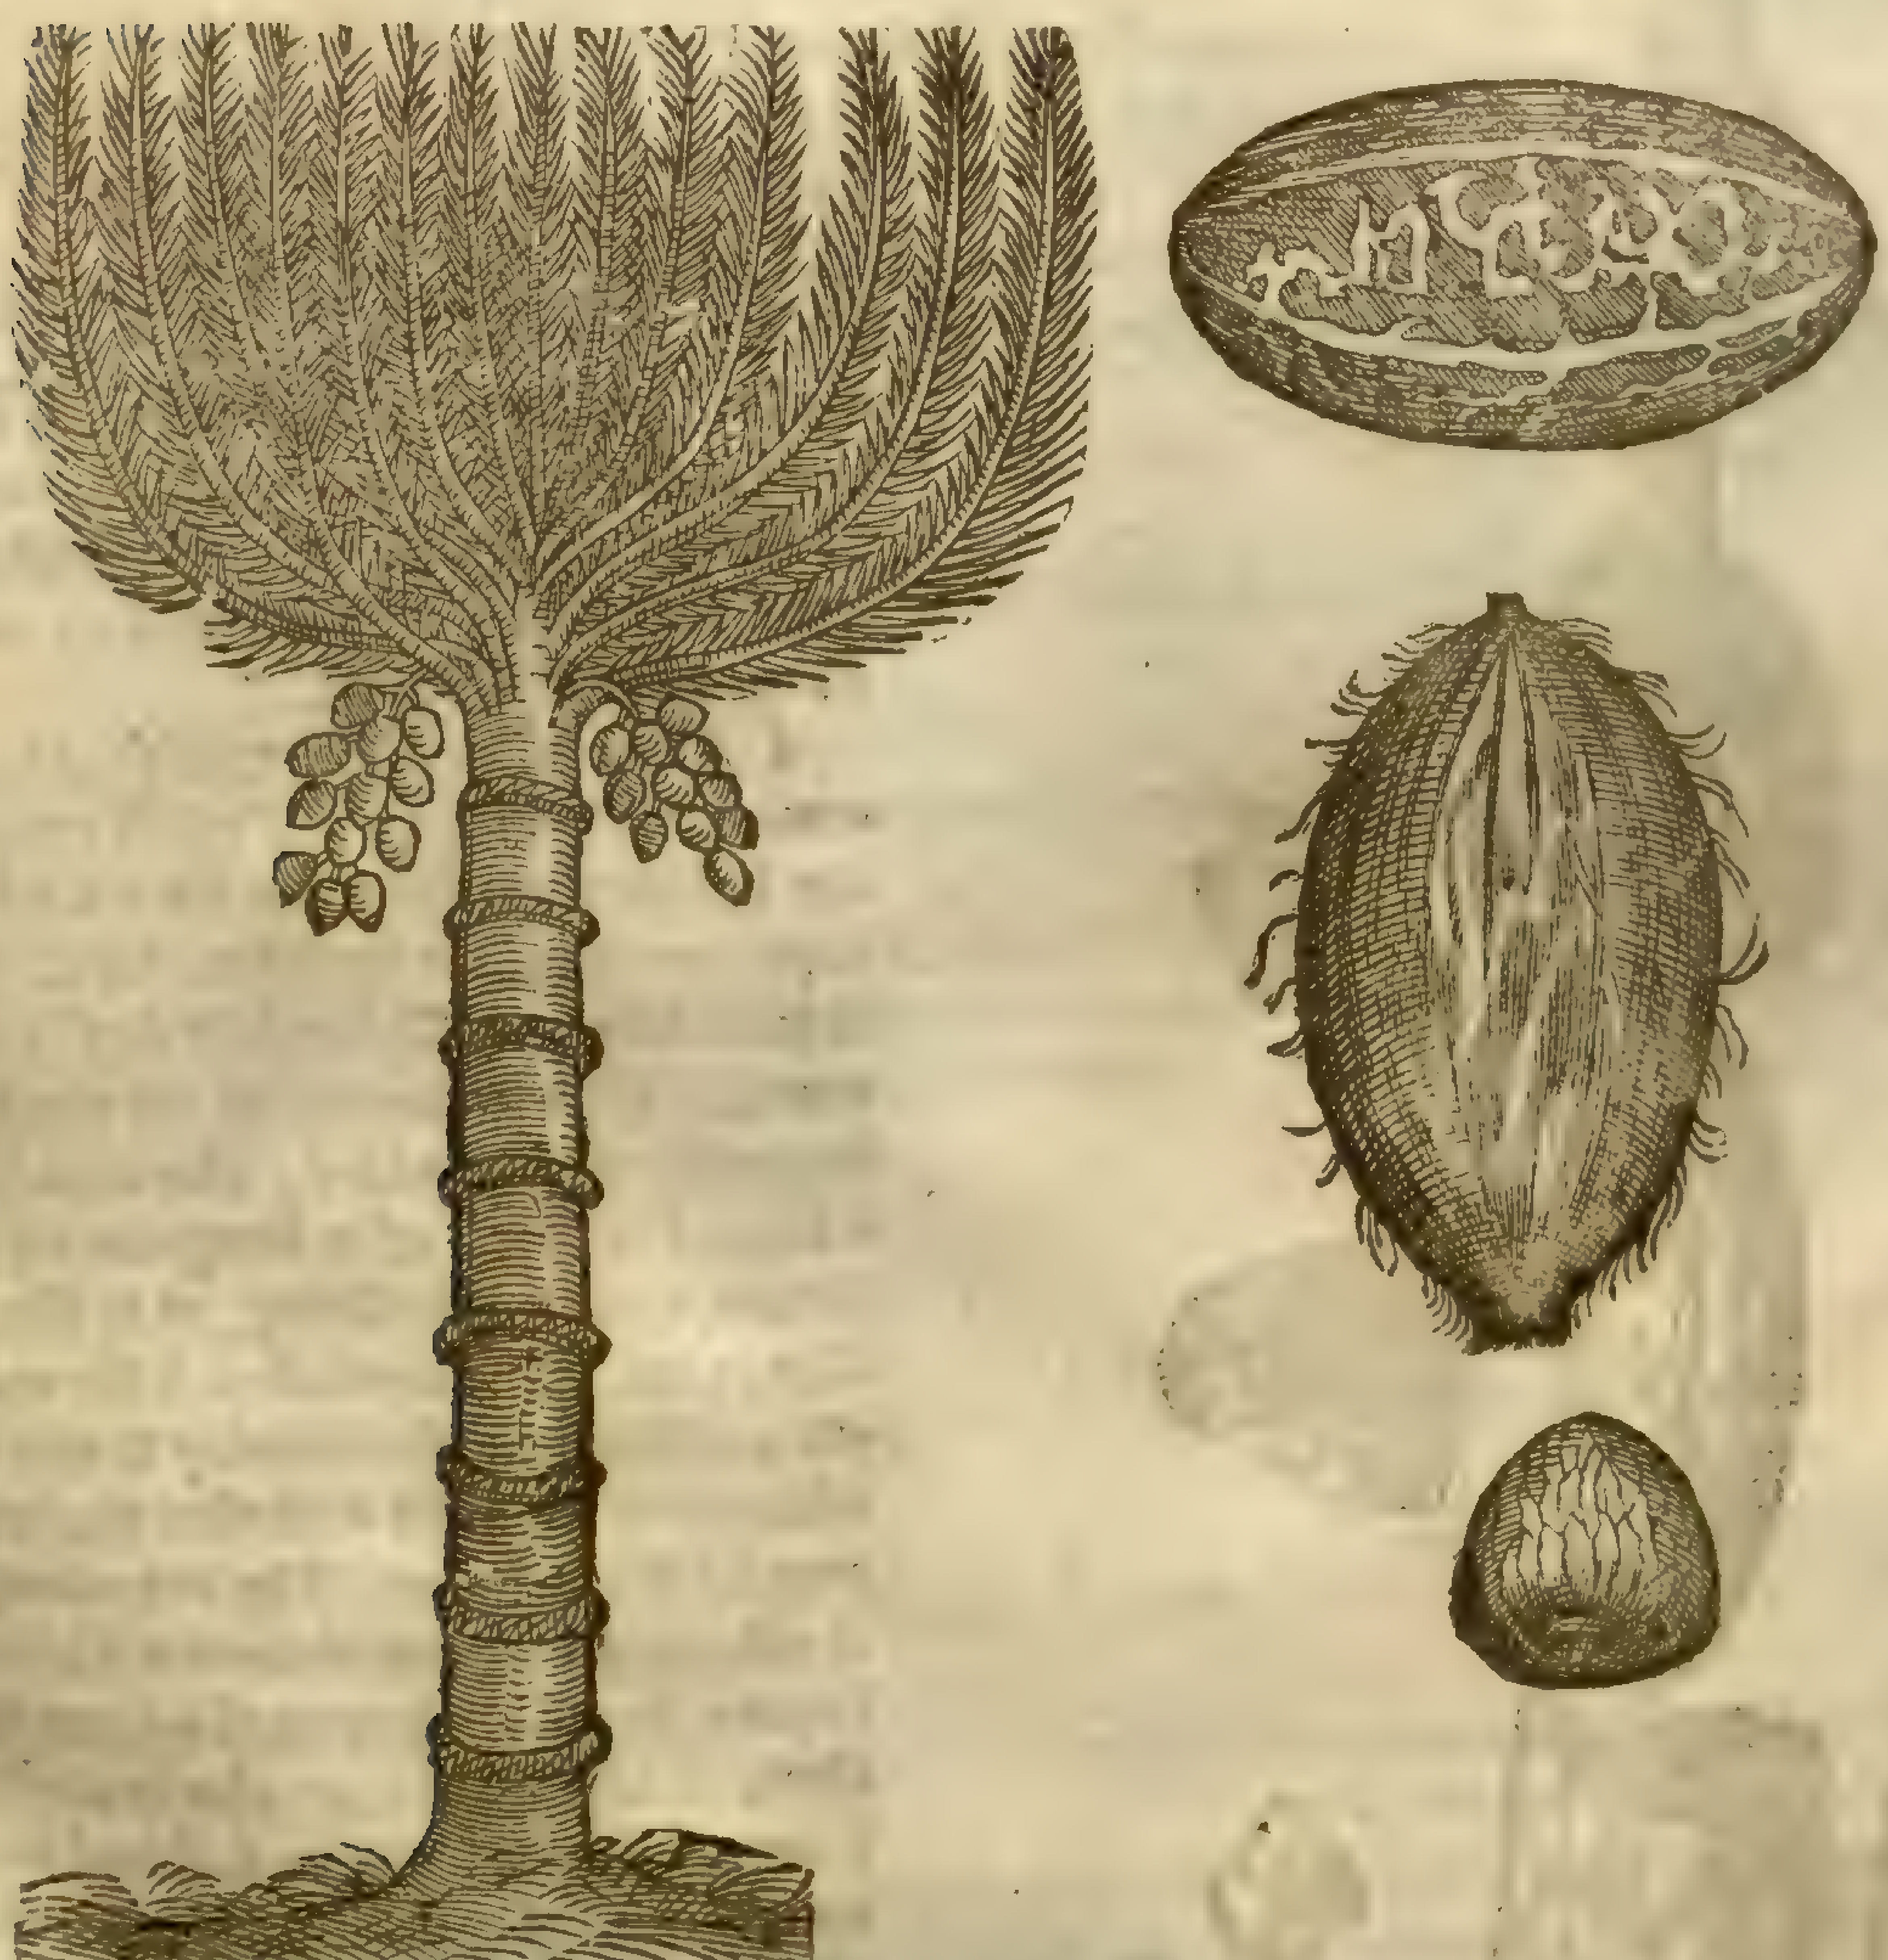
¶ *The Temperature and Vertues.*

A *Galen* ſuppoſeth that the braine of the Date tree conſiſteth of ſundry parts, that is to ſay, of a certaine watery and warme ſubſtance, and of an earthy and cold; therefore it is moiſt and cold, with a certaine aſtriction or binding quality.

B Being taken as a meate it ingendreth raw humors and winde, and therefore it is good to be eaten with pepper and ſalt.

Chap. 139. *Of the drunken Date tree.*

Areca, ſiue Fauſel.
The drunken Date tree.



¶ *The Deſcription.*

The drunken Date tree, which *Carolus Cluſius* calleth *Fauſel*, is an Indian tree of a great bigneſſe, the timber whereof is very ſoft and ſpongious, exceeding ſmooth and plaine vnto a great height, not poſſible to be climbed vp; and therefore the Indians for their eaſier aſcending vp, at ſome diſtances doe tie round about the tree certaine wyths or ropes made of the barkes of trees, as may be perceiued by the figure, wherby very eaſily they go vp and down to gather the fruit at their pleaſure. The top of the tree is diuided into ſundry branches, in ſubſtance like to the great cane; whereupon do grow faire flaggy leaues like thoſe of the Palme or Date tree, whereof doubtleſſe it is a wild kind: from the bottom of which branches comes forth fruit in long branches like traces of Onions, couered with a ſoft pulp like vnto the walnut, rough, and very ful of haire of a yellowiſh colour, and like the dried date when it is ripe: within which huske is contained fruit like vnto the Nutmeg, but greater, very hard, and ſtriped ouer with red and white veins or ſinues.

¶ *The Place, Time, and Names.*

This Date tree, which the Arabians call *Fauſel*, that is by interpretation, *Auellana Indica*, the Indian nut or filberd, *Auicen* and *Serapio* call *Filſel* and *Fufel*. It groweth in the Eaſt Indies in diuers and ſundry places, as in Malauar, where vulgarly it is called *Pac*: and of the Nobles & gentlemen, *Areca*; which name is vſed among the Portugals that dwell in thoſe Indies: in Guzarat & Decan it is called *Cupare*: in Zeilan, *Poaz*: in Malaca, *Pilan*: in Cochin, *Chacani*: in Engliſh, the drunken Date tree, which name we haue coined from his qualitie, becauſe the fruit makes one drunke that eats thereof.

¶ *The Temperature.*

It is cold and dry in the ſecond degree.

¶ *The Vertues.*

The fruit of *Areca* before it be ripe is reckoned among the ſtupefactiue and aſtoniſhing medicines, for whoſoeuer eateth thereof waxeth drunk, becauſe it doth exceedingly amaſe and aſtoniſh the ſences. A

When the Indians are vexed with ſome intolerable ache or paine, or muſt of neceſſitie endure ſome great torment or torture, they eat of this fruit, wherby the rigor of that pain which otherwiſe they ſhould feele, is very much mitigated. B

The iuice of the fruit of *Areca* ſtrengthens the gums, faſtens the teeth, comforts the ſtomacke, ſtayes vomiting and looſneſſe of the belly: it doth alſo purge the body from congealed or clotted bloud gathered within the ſame. C

CHAP. 140. *Of the Indian Nut tree.*

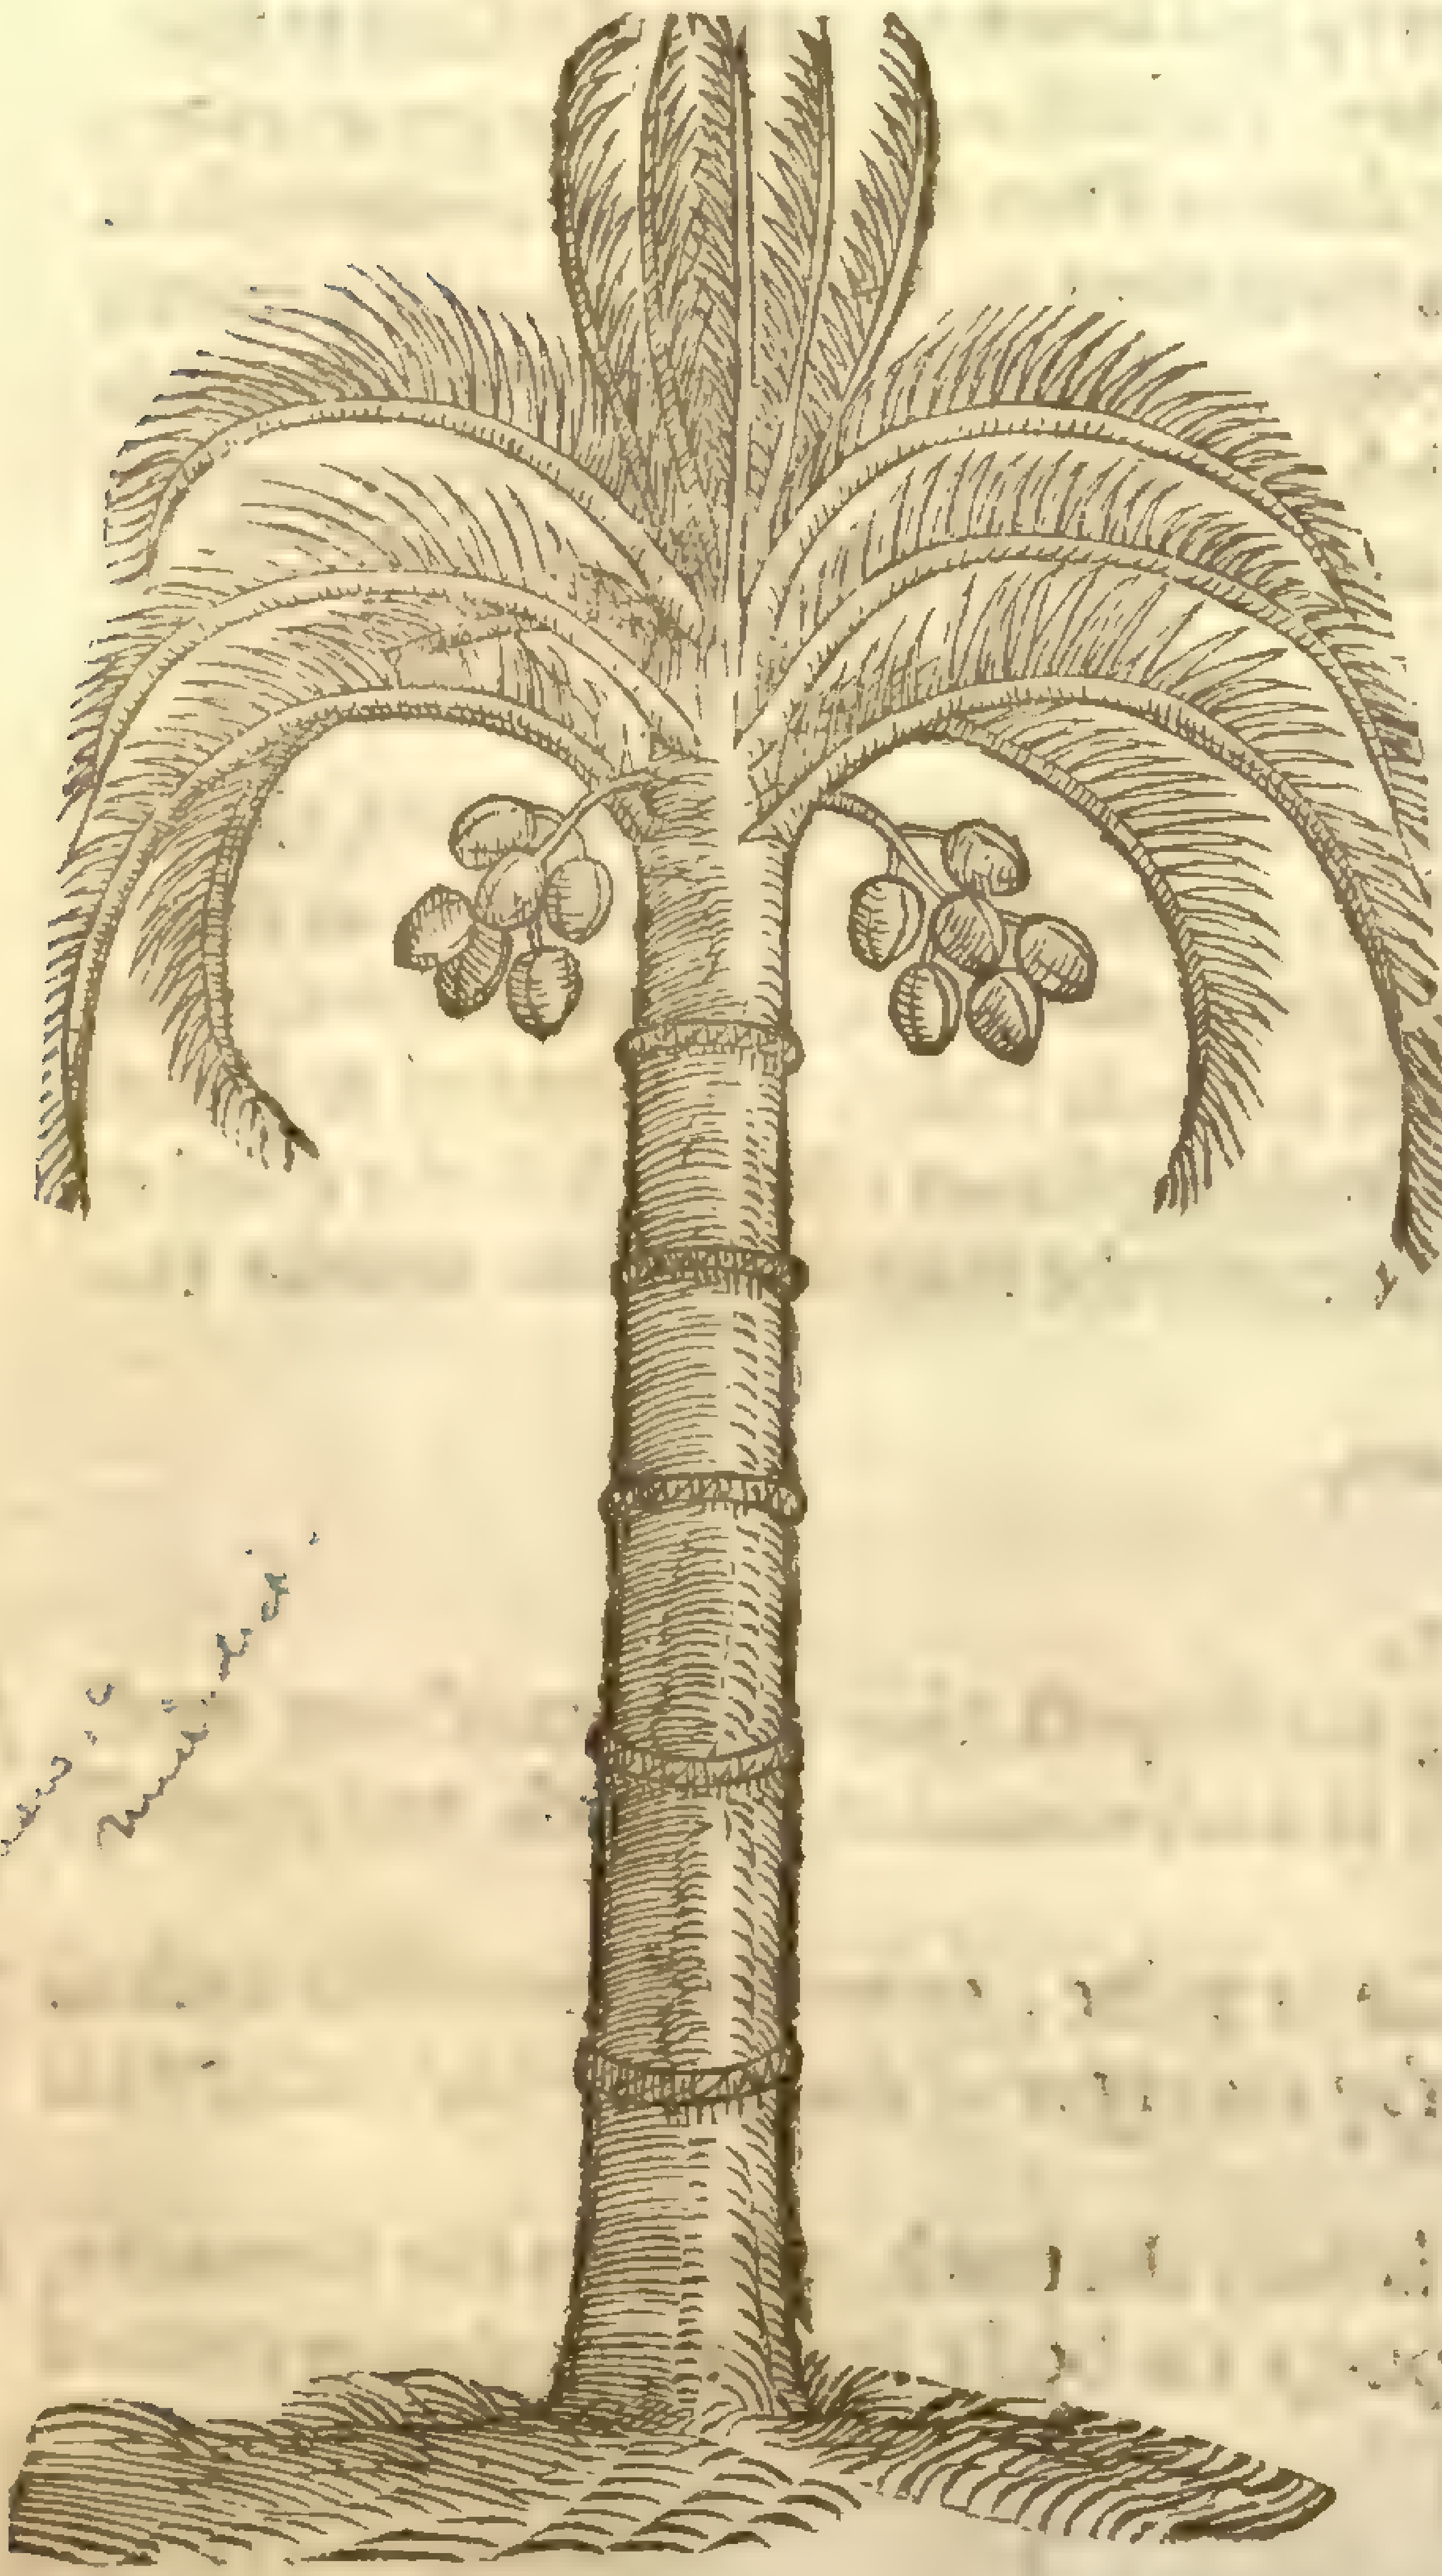
¶ *The Deſcription.*

1 THe Grecians haue not known, but the Arabians haue mentioned this Indian Nut tree, the body wherof is very great, ſmooth, and plaine, void of boughs or branches of a great height; wherefore the Indians do wrap ropes about the body thereof, as they do about the tree laſt deſcribed, for their more eaſe in gathering the fruit: the timber wherof is very ſpongy within, but hard without, a matter fit to make their Canoos & boats of: on the top of the tree grow the leaues like thoſe of the Date tree, but broad, and ſharpe at the point as thornes, whereof they vſe to make needles, bodkins, and ſuch like inſtruments, wherewith they ſow the ſailes of their ſhips, & do ſuch buſineſſe: among theſe leaues come forth cluſters of floures like thoſe of the Cheſtnut tree, which turn into great fruit of a round form, and ſomwhat ſharp at one end; in that end next vnto the tree is one hole, ſomtimes two bored through: this Nut or fruit is wrapped in a couerture conſiſting of a ſubſtance not vnlike to hemp before it be beaten ſoft; there is alſo a finer and gentler ſtuffe next vnto the ſhell, like vnto Flax before it bee made ſoft: in the middle whereof is contained a great nut couered with a very hard ſhel, of a brown colour before it be poliſhed, afterward of a black ſhining colour like burniſhed horne. Next vnto the ſhell vpon the inſide there cleaueth a white cornelly ſubſtance firm and ſollid, of the colour and taſt of a blanched almond: within the cauitie or hollowneſſe thereof is contained a moſt delectable liquour like vnto milke, and of a moſt pleaſant taſte.

2 We haue no certain knowledge from thoſe that haue trauelled into the Indies, of the tree which beareth this little Indian nut; neither haue we any thing of our own knowledge, more than that we ſee by experience the fruit hereof is leſſer, wherein conſiſteth the difference.

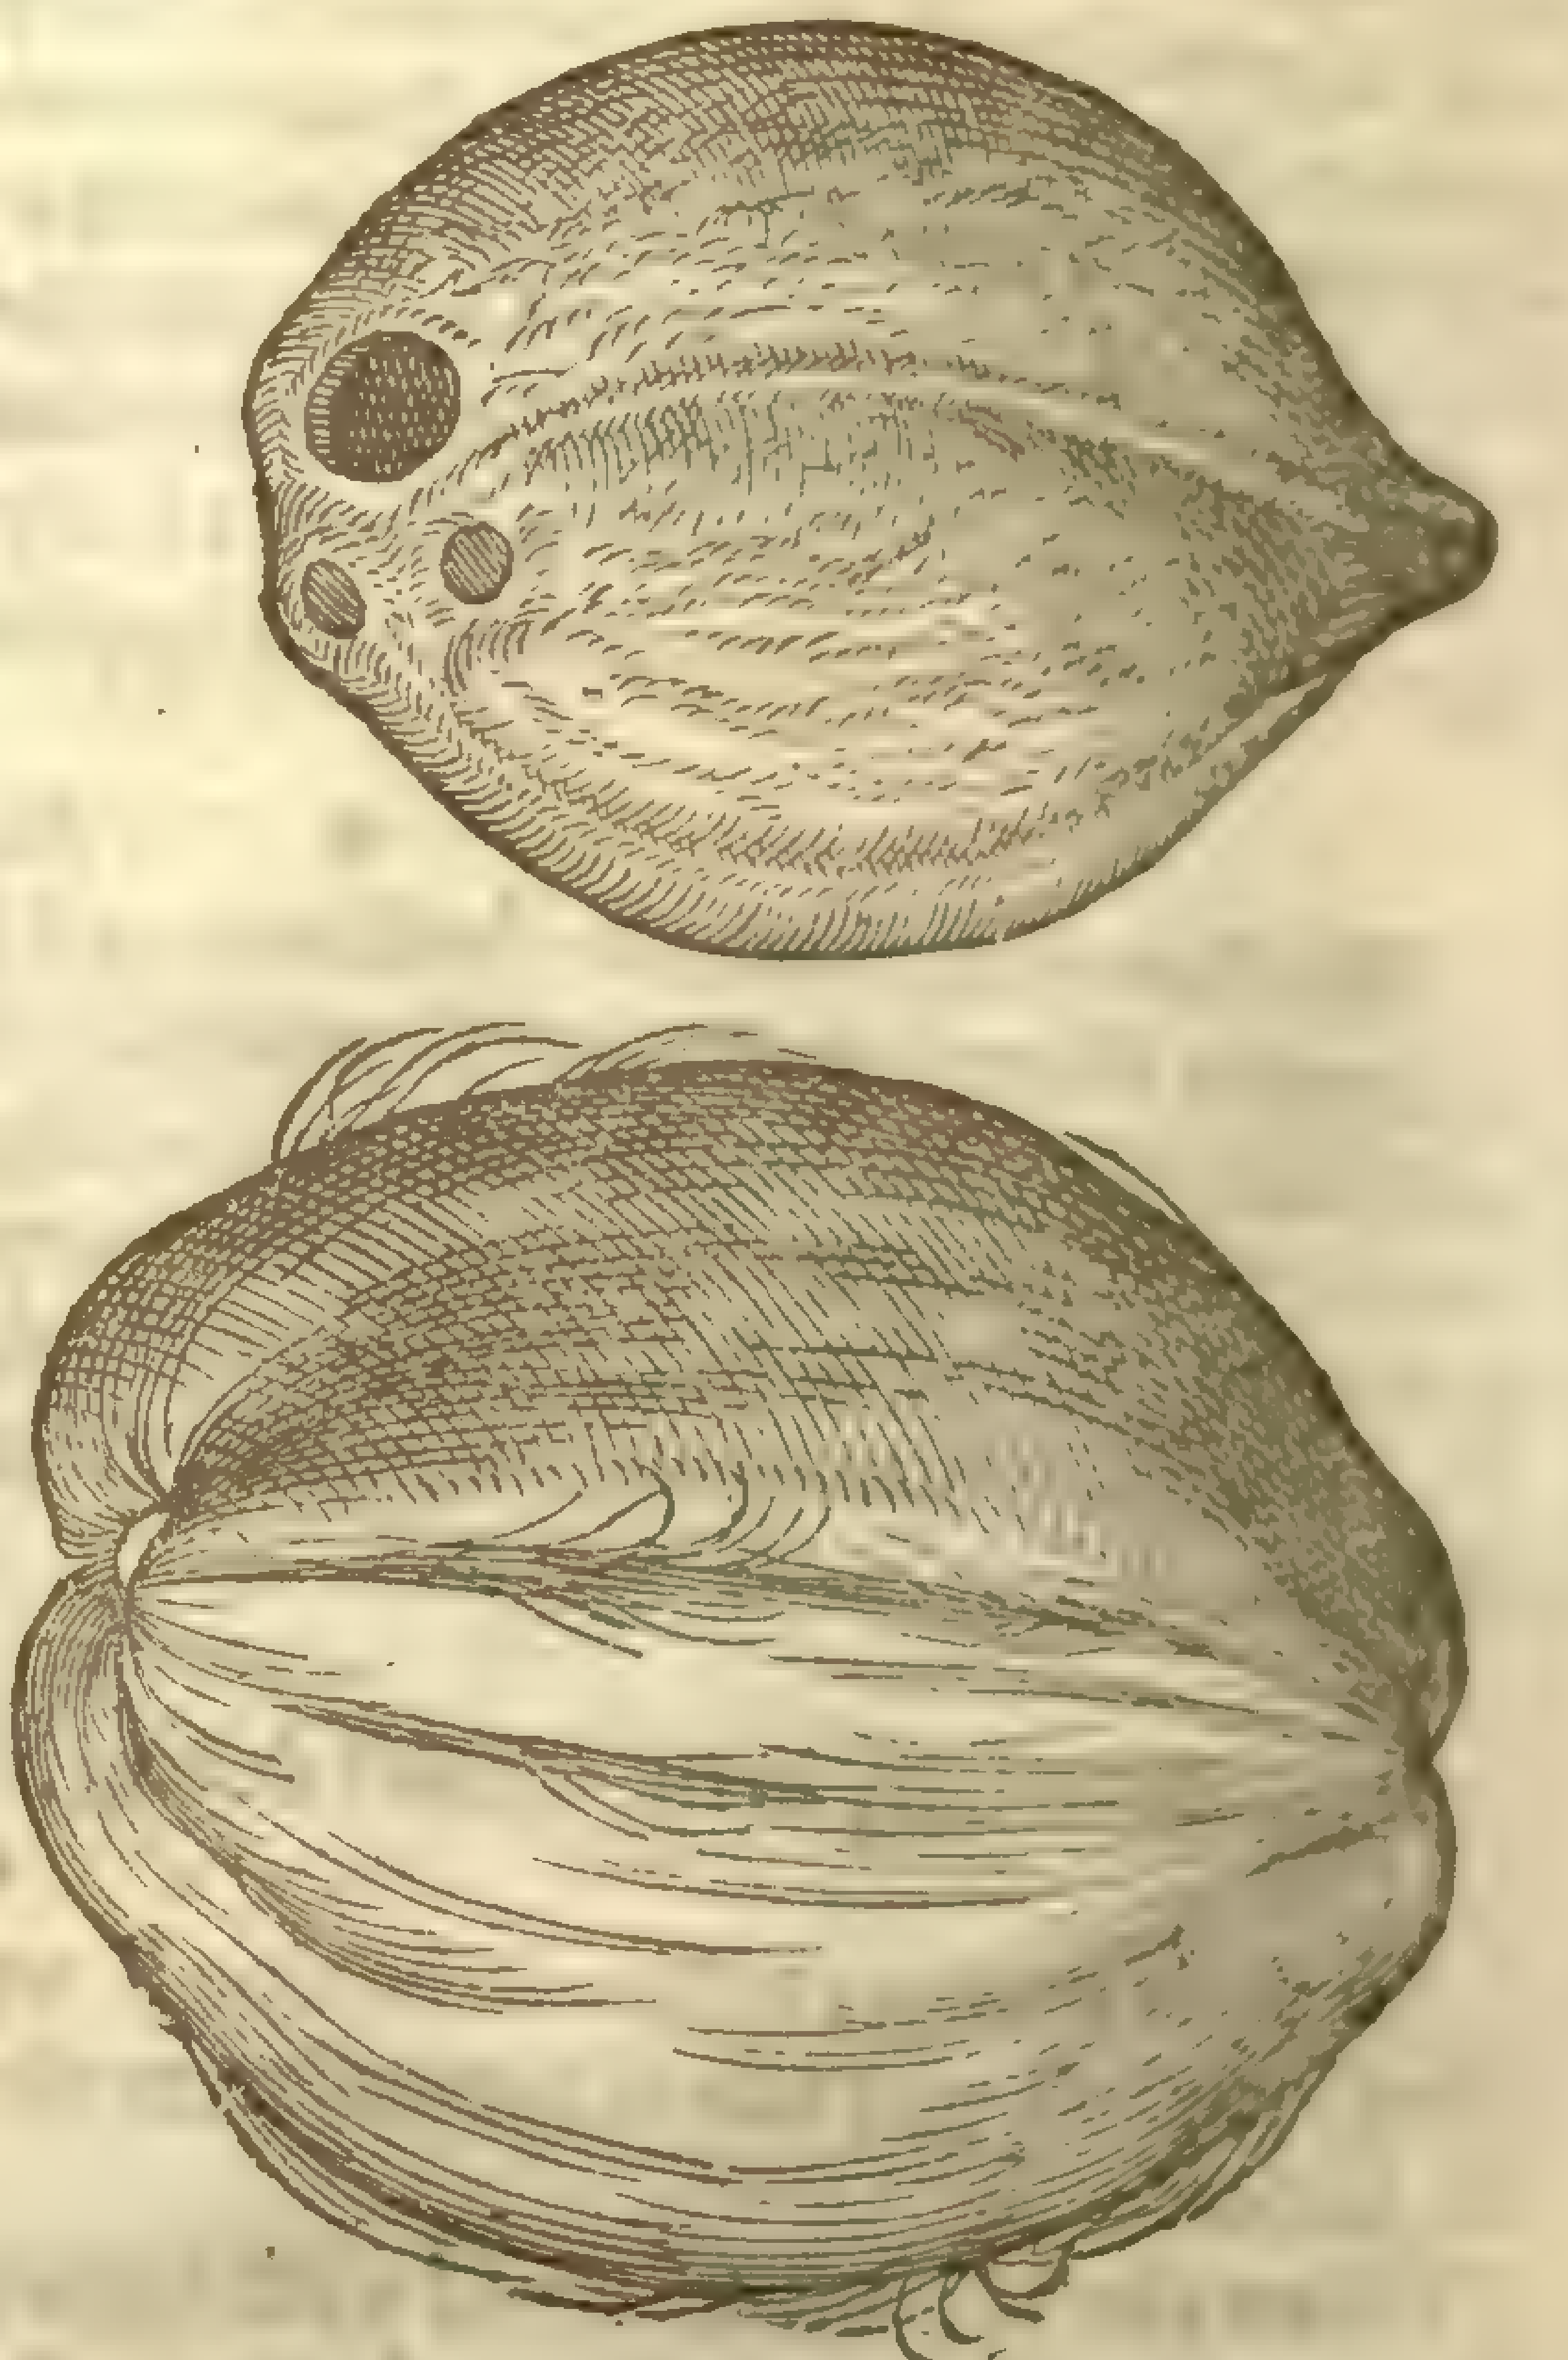
‡ The other, expreſſed in the ſame table with the former, by the name of *Mehenbethene*, *Cluſius* receiued it by the ſame name from *Cortuſus* of Padua; yet it doth not (as hee ſaith) well agree with the deſcription; and he rather approues of their opinion who refer it to the *Nux vnguentaria*,

1 *Nux Indica arbor.*
The Indian Nut tree.

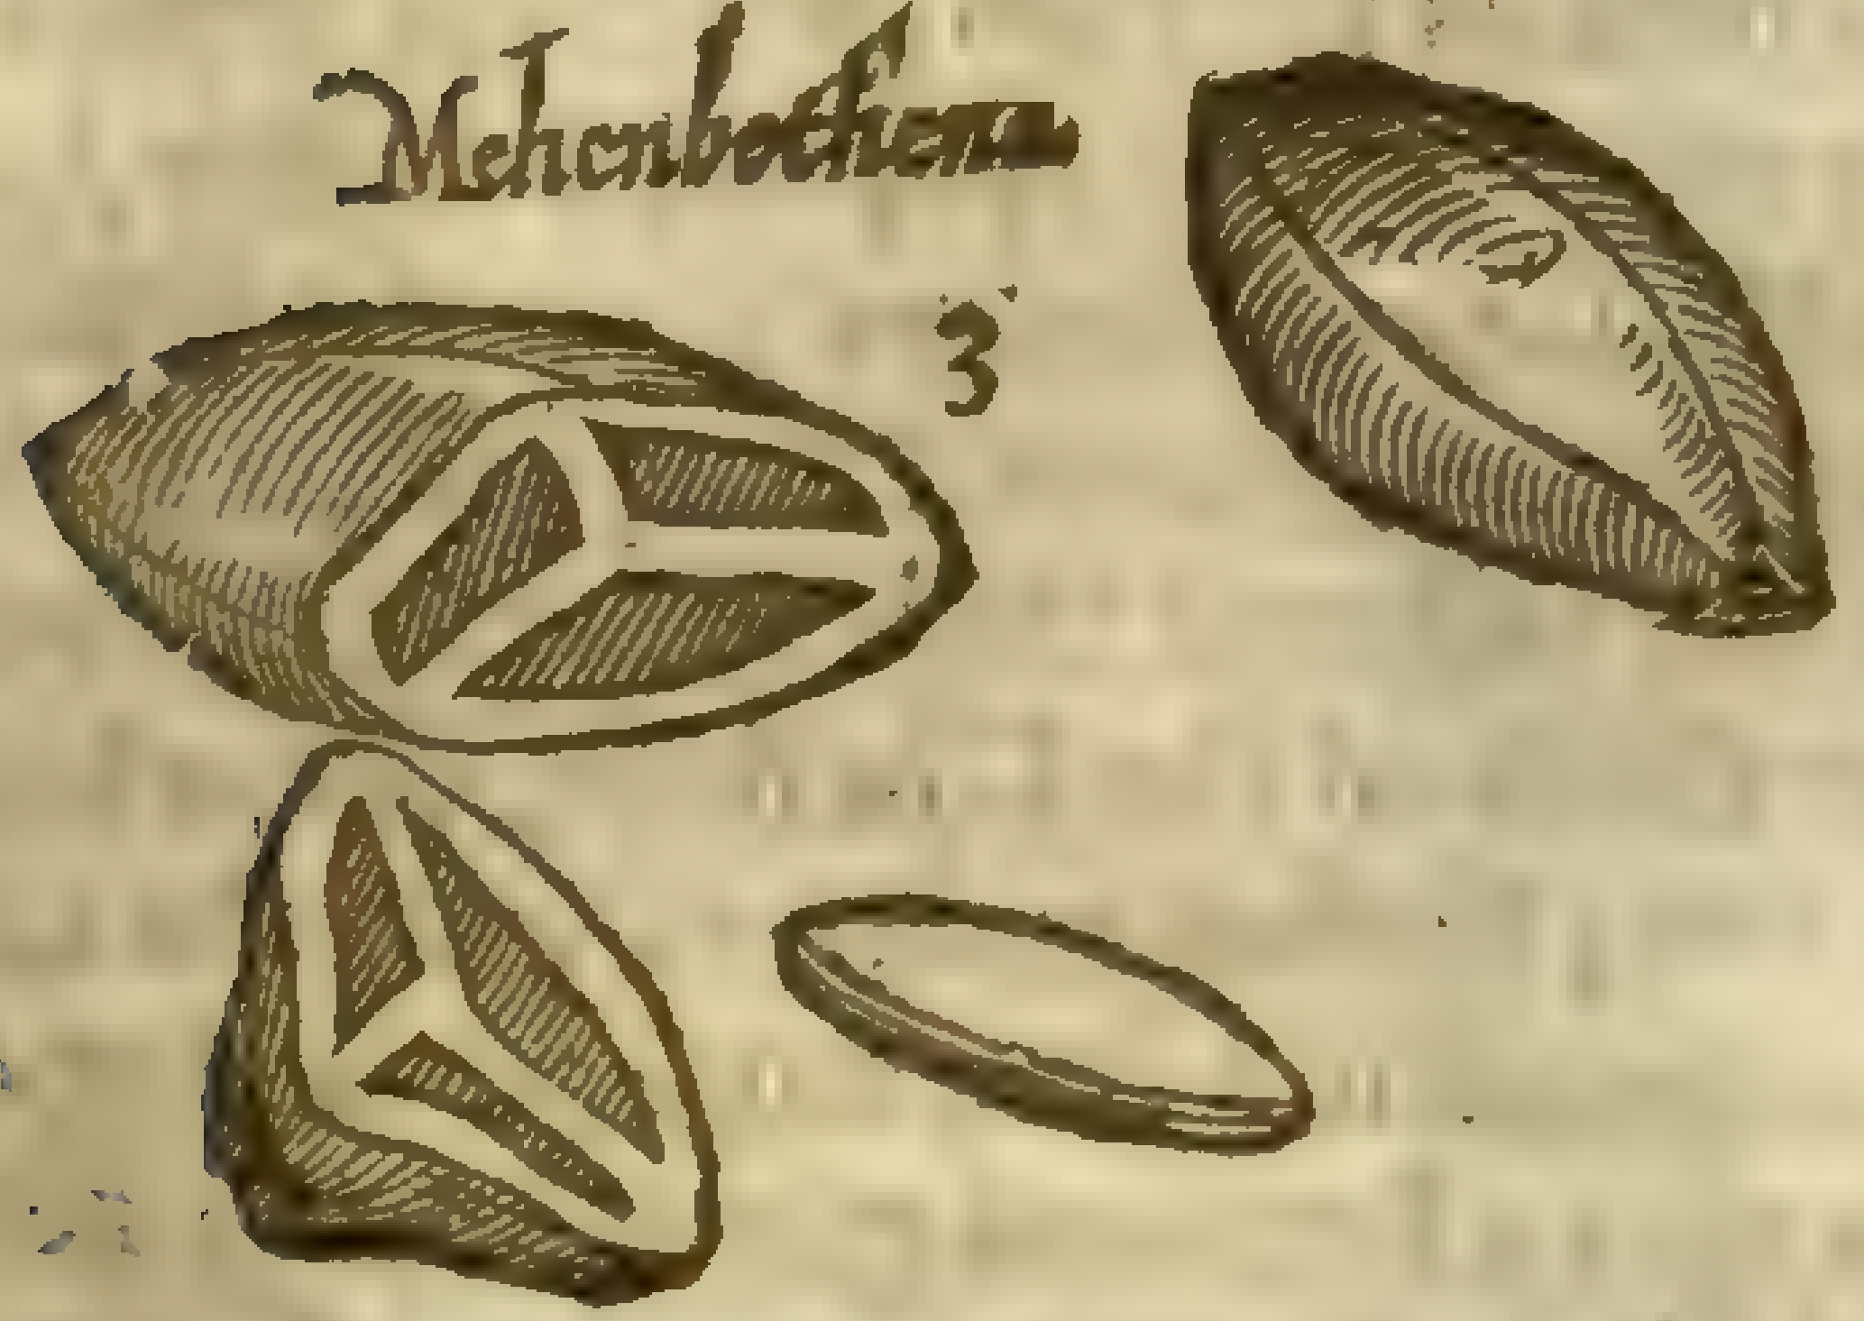


Cocos [illegible] [illegible]

Nux Indica.
The Indian Nut.



2 *Nucula Indica.*
The little Indian Nut.



or *Ben.* It is ſome inch long, of a triangular figure, with a hard and woody ſhell: which broken ſhewes 3 cels or partitions, in each of which is contained a long kernell white and ſweet. ‡

¶ *The Place.*

This Indian Nut groweth in ſome places of Africa, and in the Eaſt Indies, & in all the Iſlands of Weſt India, eſpecially in Hiſpaniola, Cuba, and S. Iohns Iſland, and alſo vpon the continent by Carthagena, Nombre de dios, and Panama, and in Virginea, otherwiſe called Norembega, part of the ſame Continent, for the moſt part neere vnto the ſea ſide and in moiſt places, but it is ſeldom found in the vplandiſh countries.

¶ *The Time.*

It groweth green Winter and Summer.

¶ *The Names.*

The fruit is called in Latine *Nux Indica*: of the Indians, *Cocus*: of the Portugals that dwel in the Eaſt Indies, *Cocco*, taken from the end, wherein are three holes repreſenting the head of a monkey: *Serapio* and *Rhaſis* cal this tree, *Iarralnare*, i. *Arborem nuciferam*, the tree bearing nuts: of *Auicen*, *Glanci al hend*: of the vulgar people *Maro*, and the fruit *Narel*; which name *Narel* is common among the Perſians and Arabians. It is called in Malauar, *Tengamaran*: the ripe fruit *Tenga*, and the greene fruit *Eleri* · in Goa it is called *Lanhan*: in Malaio, *Triccan*: and the nut *Nihor*.

The diſtilled liquor is called *Sula*; and the oile that is made thereof, *Copra*,

¶ The

¶ *The Temperature.*

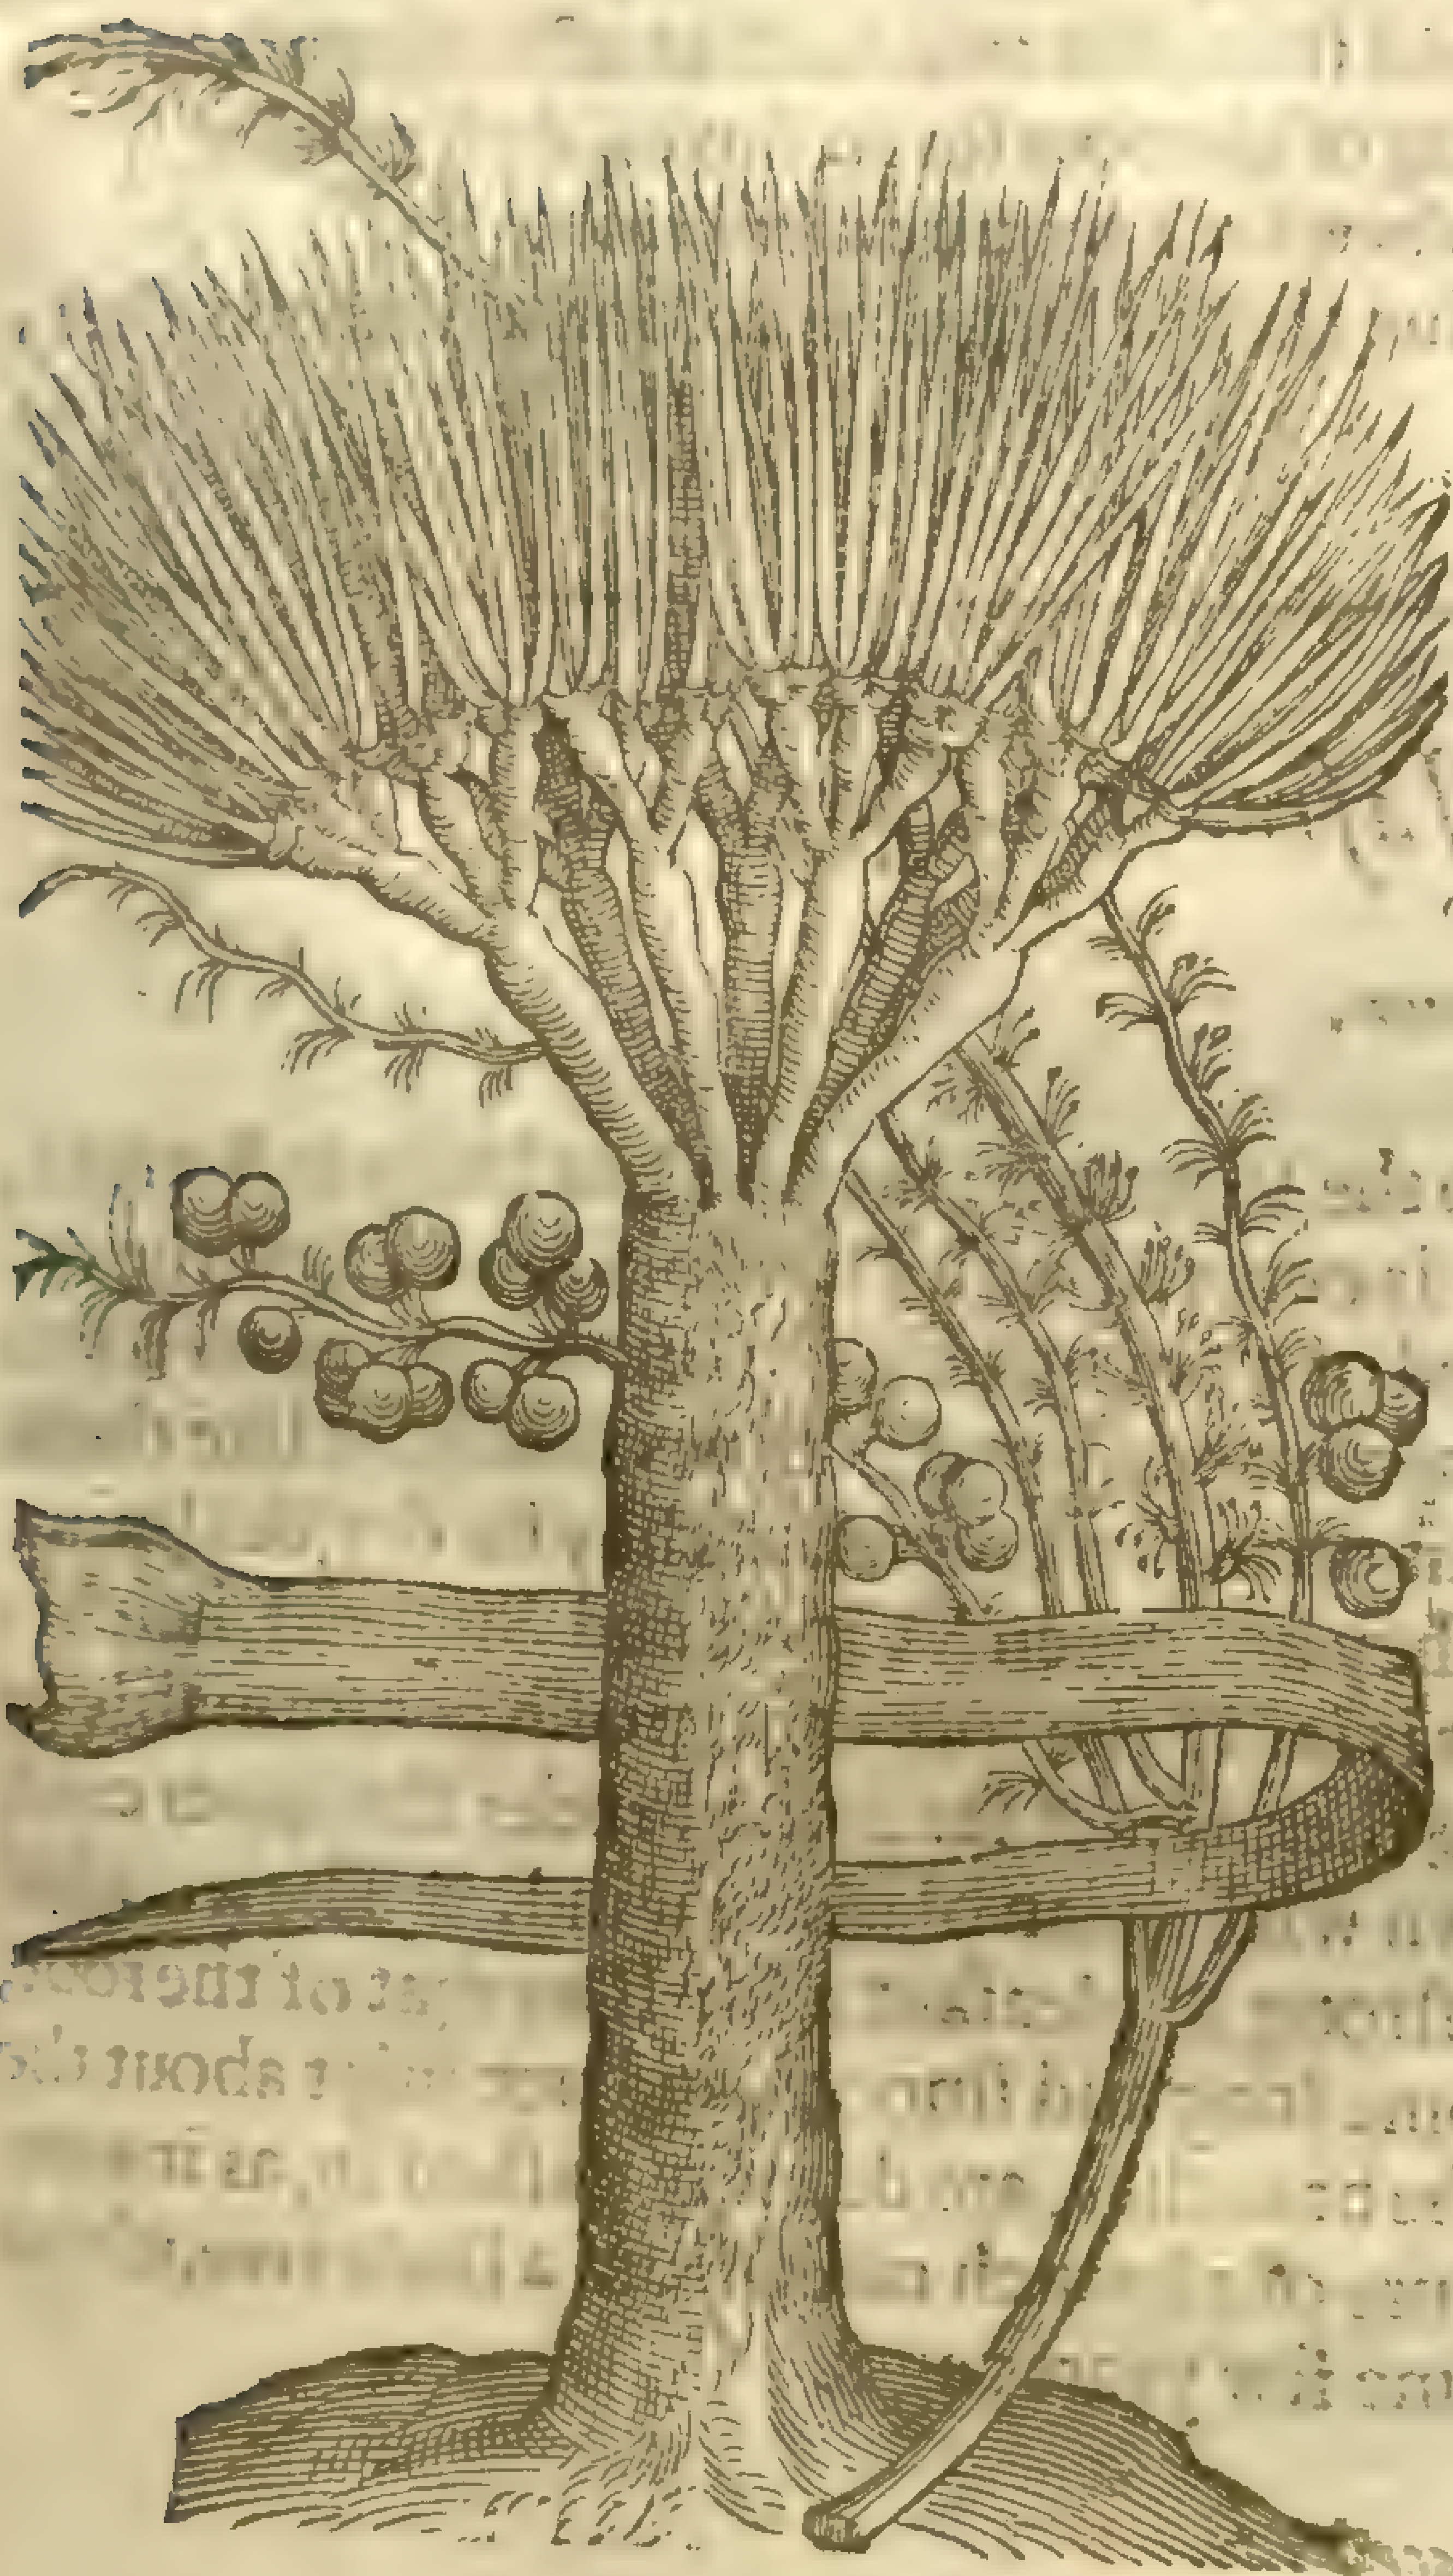
It is of a mean temper betwixt hot and cold.

¶ *The Vertues and Vſe.*

A The Indians vſe to cut the twigs and tender branches toward the euening, at the ends whereof they haue bottle gourds, hollow canes, and ſuch like things, fit to receiue the water that droppeth from the branches thereof; which pleaſant liquor they drinke in ſtead of wine: from the which is drawn a ſtrong & comfortable Aqua vitæ, which they vſe in time of need againſt all maner of ſickneſſes. Of the branches and boughs they make their houſes, of the trunke or body of the tree ſhips and boats; of the hemp on the outward part of the fruit they make ropes and cables, and of the finer ſtuffe ſailes for their ſhips.

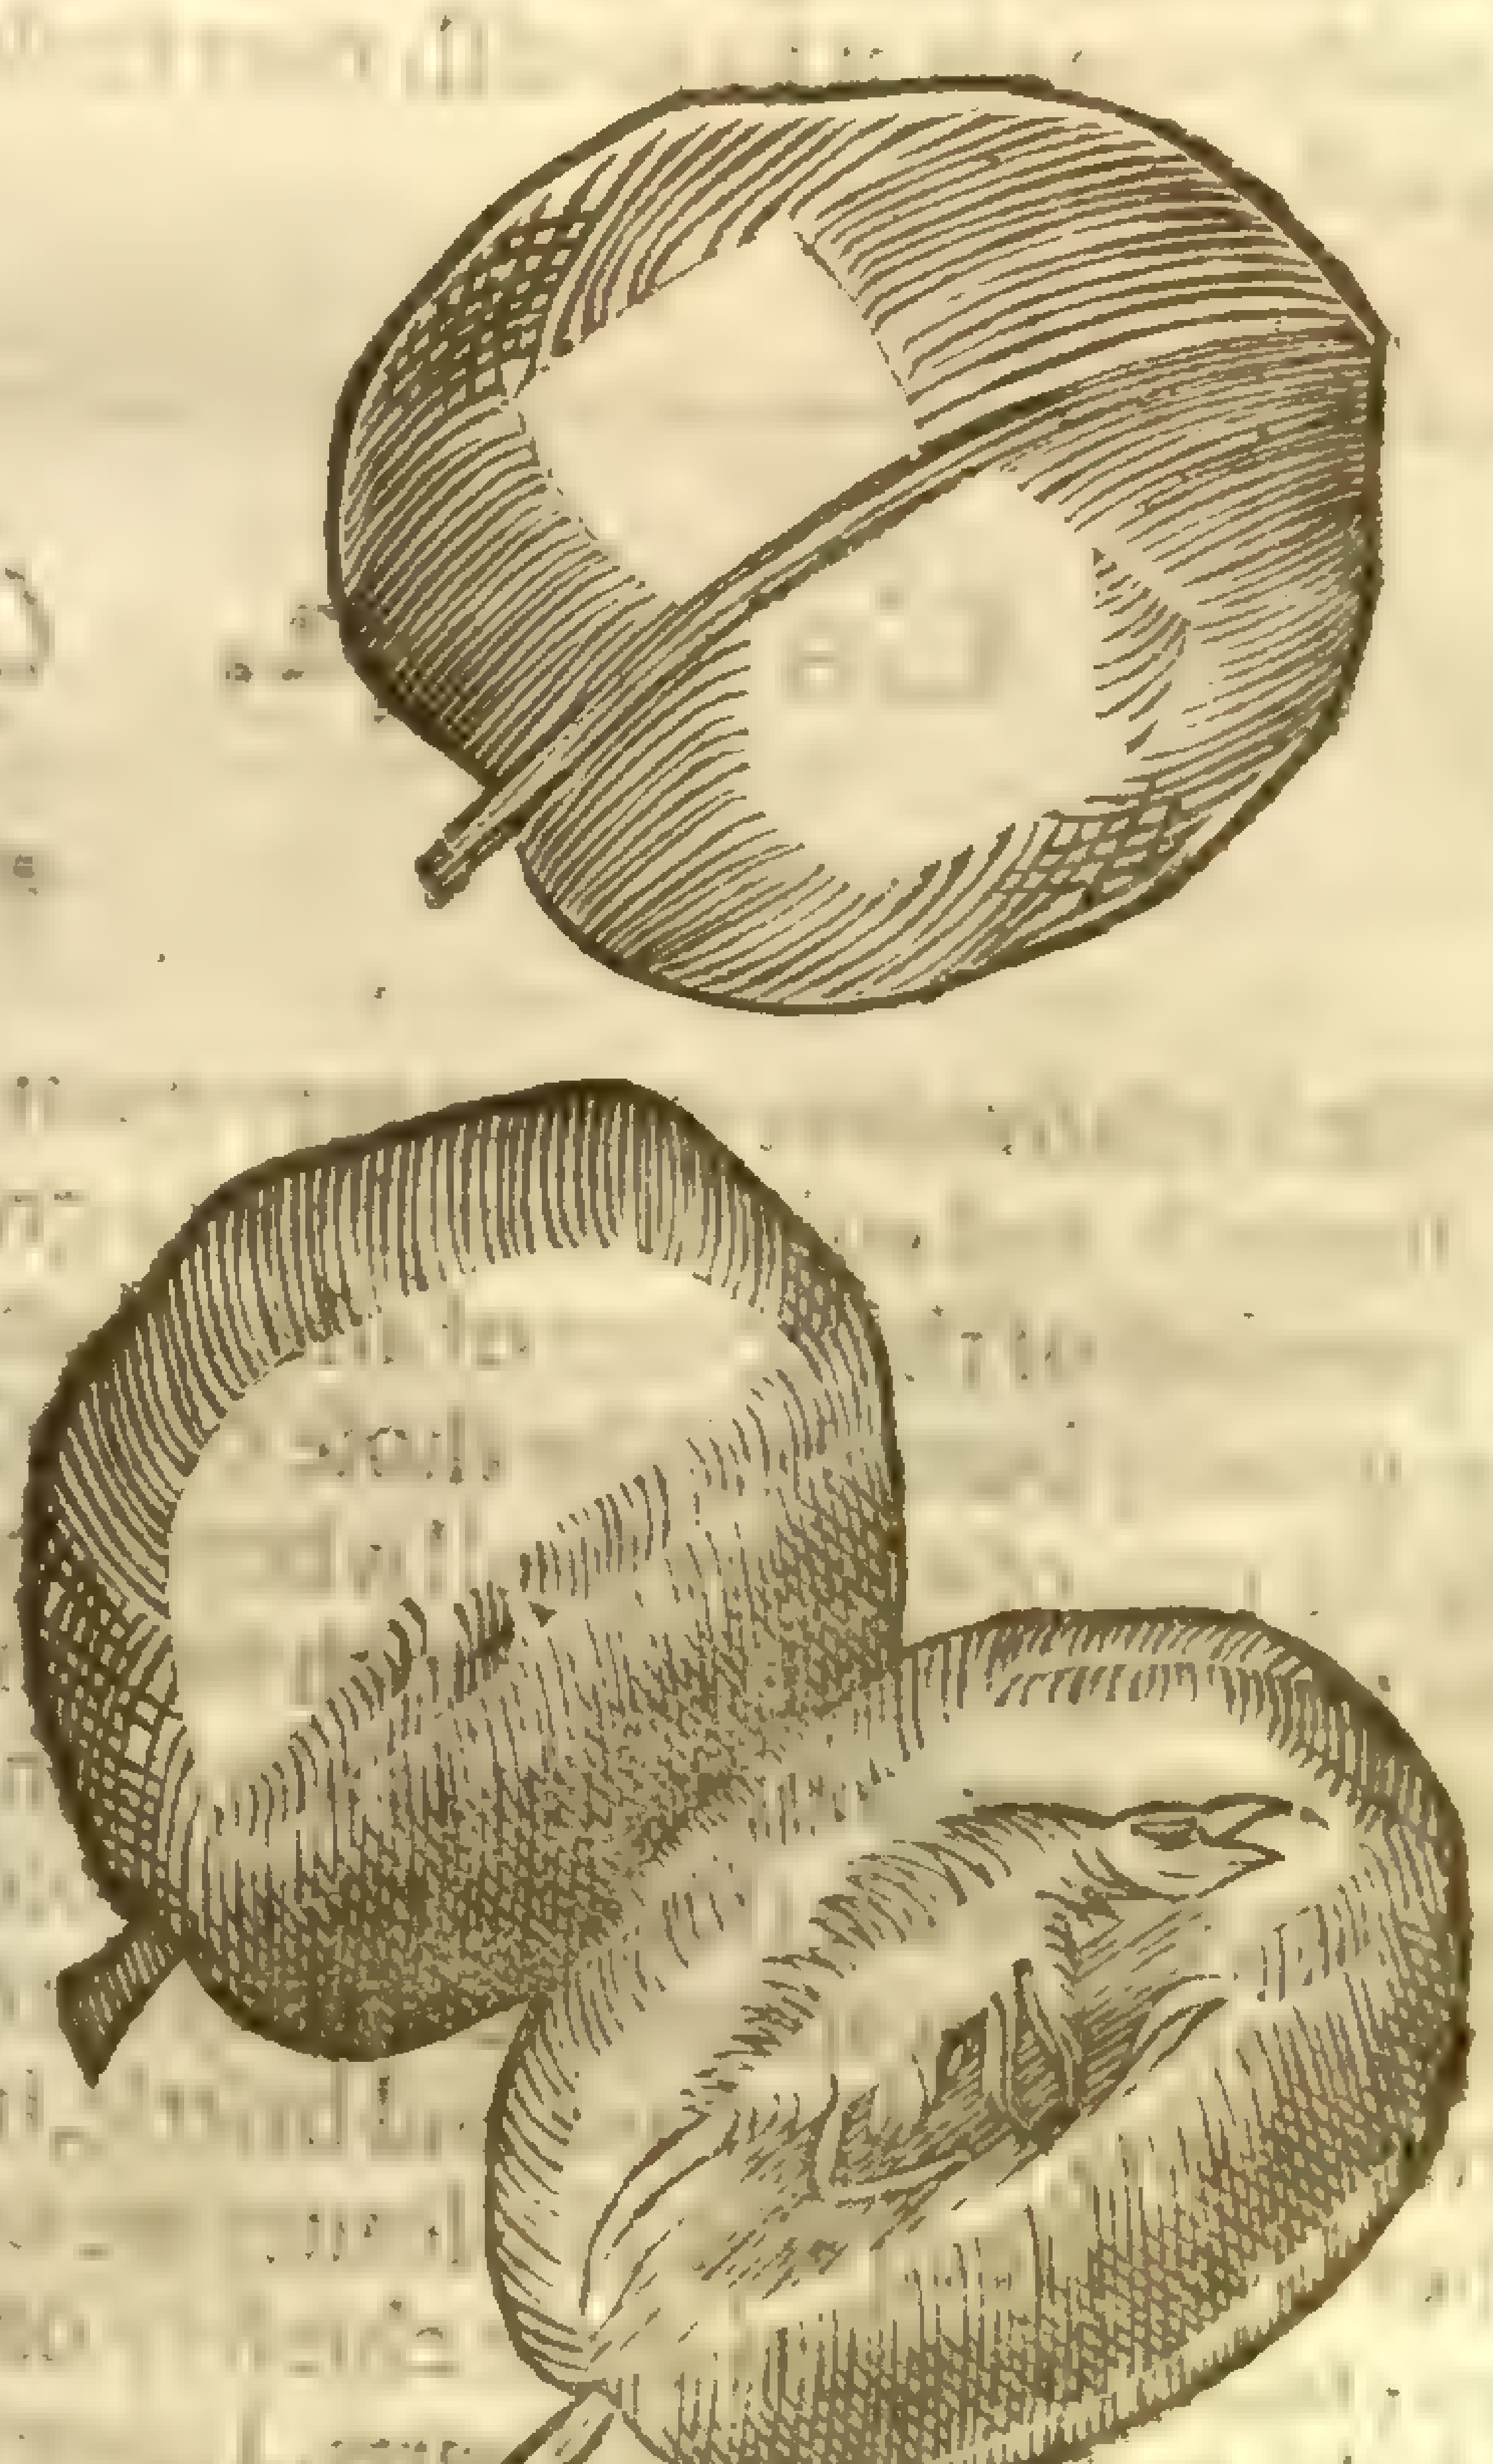
B Likewiſe they make of the ſhell of the nut cups to drink in, which wee likewiſe vſe in England, garniſhed with ſiluer for the ſame purpoſes. The kernel ſerues them for bread and meat: the milky juice doth ſerue to coole and refreſh their wearied ſpirits: out of the kernell when it is ſtamped is preſſed a moſt pretious oile, not only good for meat, but alſo for medicine, wherewith they annoint their feeble lims after their tedious trauel; by means wherof the ach and pain is mitigated, & other infirmities quite taken away proceeding of other cauſes.

CHAP. 141. *Of the Dragon Tree.*



1 *Draco arbor.*
The Dragon tree.

Dracaena draco, L.
mihi videtur.



Draconis fructus.
The Dragon tree fruit.

¶ *The Deſcription.*

THis ſtrange and admirable tree groweth very great, reſembling the Pine tree, by reaſon it doth alwaies flouriſh, and hath his boughs or branches of equal length and bigneſſe, which are bare and naked, of eight or nine cubits long, and of the bigneſſe of a mans arme: from the ends of which do ſhoot out leaues of a cubit and a halfe long, and full two inches broad, ſomewhat thick, & raiſed vp in the middle, then thinner and thinner like a two edged ſword: among which come forth little moſſie floures, of ſmall moment, and turn into berries of the bigneſſe of Cherries, of a yellowiſh colour;

colour,round,light,and bitter,couered with a threefold skin or film,wherin is to be ſeen,as *Monardus* and diuers others report,the form of a dragon, hauing a long neck and gaping mouth,the ridge or back armed with ſharp prickles like the Porcupine;with a long taile and foure feet very eaſie to be diſcerned : the figure of it we haue ſet forth vnto you according to the greatnes thereof,becauſe our words and meaning may be the better vnderſtood ; and alſo the leafe of the tree in his ful bigneſſe,becauſe it is impoſſible to be expreſſed in the figure:the trunk or body of the tree is couered with a tough bark,very thin and eaſie to be opened or wounded with any ſmall toole or inſtrument; which being ſo wounded in the dog days,bruiſed or bored,yeelds forth drops of a thick red liquor, of the name of the tree called Dragons tears,or *Sanguis draconis*,Dragons bloud : diuers haue doubted whether the liquor or bloud were all one with *Cinnabaris* of *Dioſcorides*(not meaning that *Cinaber* made of Quickſiluer)but the receiued opinion is,they differ not,by reaſon their quality & temperature worke the like effect.

¶ *The Place.*

This tree groweth in an Iſland which the Portugals call Madera,and in one of the Canary Iſles called *Inſula portus ſancti* ; and as it ſeemes it was firſt brought out of Africke,though ſome are of a contrarie opinion,and ſay that it was firſt brought from Carthagena in America,by the Biſhop of the ſame prouince.

¶ *The Time.*

The time of his growing we haue touched in the deſcription,where wee ſaid that it flouriſheth and groweth green all the yeare.

¶ *The Names.*

The names haue been ſufficiently ſpoken of in the deſcription,and in their ſeuerall titles.

¶ *The Nature and Vertues.*

A ‡ The *Sanguis Draconis* which is thought to proceed from this tree,hath an aſtringent faculty, and is with good ſucceſſe vſed in the ouermuch flowing of the courſes,in fluxes, dyſenteries, ſpitting of bloud,faſtning looſe teeth,and ſuch other affects which require aſtriction.

B Smiths alſo vſe it to vernish ouer their works, to giue them a ſanguine colour, and keepe them from ruſt. ‡

Chap. 142. *Of the Saſſafras or Ague tree.*

¶ *The Deſcription.*

The Saſſafras tree growes very great much like to the Pine tree : the trunk or body is ſtraight, ſmooth,and void of boughs,of a great height : it is couered with a twofold groſſe rind,the vppermoſt of the colour of aſhes,that next the wood of a tawny colour : on the top come forth many goodly branches like thoſe of the Palm tree,whereon grow green leaues ſomwhat like thoſe of the fig tree,of a ſweet ſmell when they be greene,but much ſweeter when they be dry,declining to the ſmell of fennel,with much ſweetneſſe in taſt : they are green Winter and Summer, neither bearing fruit nor floures,but is altogether barren as it is ſaid : the roots are groſſe,conformable to the greatneſſe of the tree,of a tawny colour,diſperſing themſelues far abroad vnder the vpper cruſt of the earth,by means whereof they are often caſt down with mean blaſts of wind. ‡ The wood of the tree is very ſtrong,hard,and brittle,it hath not ſo ſtrong & pleaſant a ſmell as that of the root, neither is it in ſuch vſe. The leaues are of two ſorts,ſome long and ſmooth,and not ſnipt about the edges ; otherſome,and thoſe chiefely on the end of the branches, are deepely gaſhed in,as it were diuided into three ſeuerall parts. I haue giuen the figure of a branch taken from a little tree,which grew in the garden of M^r^ *Wilmot* at Bow;who died ſome few yeares ago.

¶ *The Place.*

This tree groweth in moſt parts of the Weſt Indies,ſpecially about the cape of Florida, Wingandico,and Virginia,otherwiſe named Norembega.

¶ *The Time.*

It flouriſheth and keepeth green Winter and Summer.

Saſſafras.
The Saſſafras tree.

¶ *The Names.*

The Spaniards and French-men haue named this tree, *Saſſafras*: the Indians in their tongue, *Pauame*: for want of an Engliſh name we are contented to call it the Ague tree, of his vertue in healing the Ague.

¶ *The Tmperature.*

The boughes and branches hereof are hot and dry in the ſecond degree; the rinde is hotter, for that it entreth into the third degree of heate and dryneſſe, as is manifeſtly perceiued in the decoction.

¶ *The Vertues.*

A The beſt of all the tree is the root, and that worketh the beſt effect, the which hath the rinde cleauing very faſt to the inner part, and is of colour tawny, and much more ſweet of ſmell than all the tree and his branches.

B The rinde taſteth of a more ſweet ſmell than the tree: and the water beeing ſod with the root is of greater and better effects than any other part of the tree, and is of a more ſweet ſmell, and therefore the Spaniards vſe it, for that it worketh better and greater effects.

C It is a tree that groweth neere vnto the ſea, and in temperate places that haue not much drouth, nor moiſture. There be mountaines growing full of them, and they caſt forth a moſt ſweet ſmell, ſo that at the beginning when they ſaw them firſt, they thought they had been trees of Cinnamon, and in part they were not deceiued: for that the rinde of this tree hath as ſweet a ſmell as Cinnamon hath, and doth imitate it in colour and ſharpneſſe of taſte, and pleaſantneſſe of ſmell: and ſo the water that is made of it is of a moſt ſweet ſmell and taſte, as the Cinamon is, and procureth the ſame workes and effects as Cinnamon doth.

D The wood hereof cut in ſmall pieces and boyled in water, to the colour of Claret wine, and drunk for certain daies together, helpeth the dropſie, remoueth oppilation or ſtopping of the liuer, cureth quotidian and tertian agues, and long feuers

E The root of Saſſafras hath power to comfort the liuer, and to free from oppilations, to comfort the weake and feeble ſtomacke, to cauſe good appetite, to conſume windineſſe, the chiefeſt cauſe of cruditie and digeſtion, ſtay vomiting, and make ſweet a ſtinking breath.

F It prouoketh vrine, remoueth the impediments that doe cauſe barrenneſſe, and maketh women apt to conceiue.

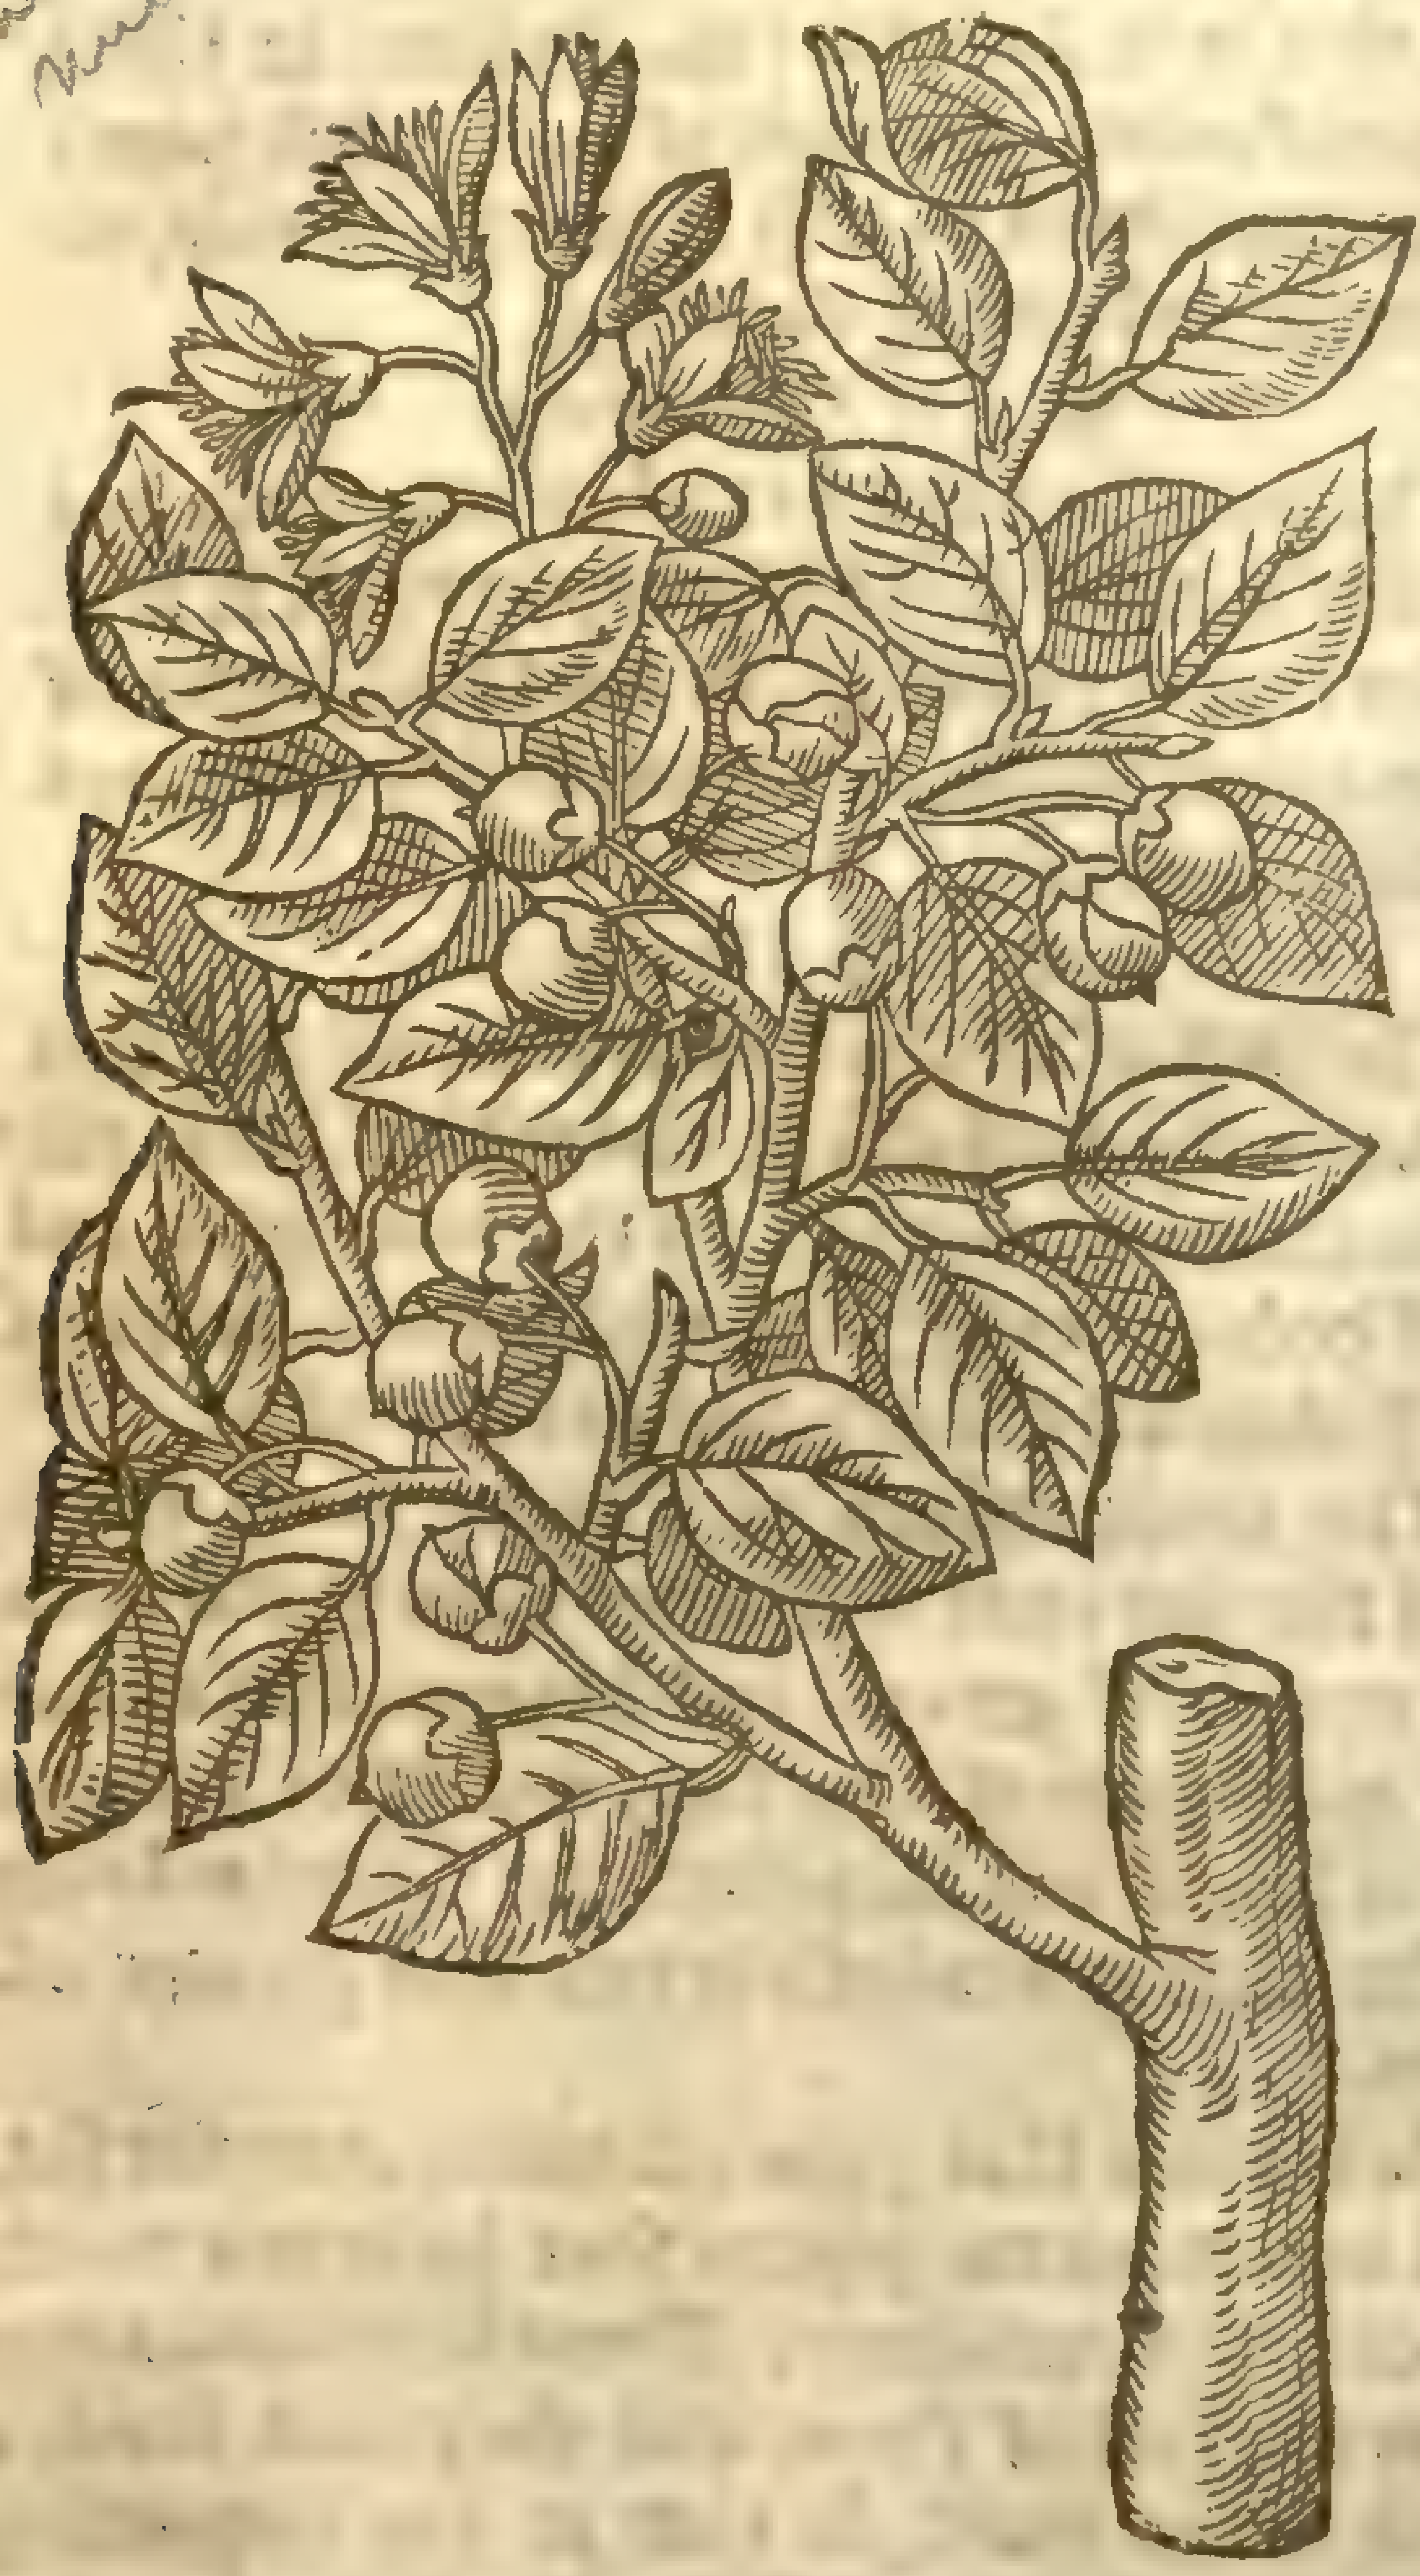
CHAP. 143. *Of the Storax tree.*

¶ *The Deſcription.*

THe Storax tree groweth to the height and bigneſſe of the Quince tree: the trunke or body is couered with a barke or rinde like vnto the Birch tree: the branches are ſmall and limmer: wheron do grow leaues like thoſe of the Quince tree, greeniſh aboue, and whitiſh vnderneath: among which come forth white floures, like thoſe of the Orange tree, of an vnpleaſant ſmell: after commeth the fruit or berries, ſtanding vpon long and ſlender foot-ſtalkes, couered ouer with a little woollineſſe, of the bigneſſe of a bladder nut, of of the ſame colour; wherein is contained ſmall ſeed,

S. officinalis [illegible]

Styrax arbor.
The Storax tree.



ſeed, whereto alſo cleaue certain gummy tears bearing the name of the tree, and which iſſue from the trunk or body when it is wounded.

¶ *The Place.*

This tree groweth in diuers places of France, Italy, and Spaine, where it bringeth forth little or no gum at all. It groweth in Iudæa, Pamphilia, Siria, Piſidia, Sidon, and many other places of Iury or Paleſtine, as alſo in diuers Iſlands in the Mediterranean ſea, namely Cyprus, Candy, Zant, and other places, where it bringeth forth his gummy liquour in full perfection of ſweetneſſe, and alſo in great plenty, where it is gathered and put into great Canes or Reeds, whereof as ſome deem it took the name *Calamita*; others thinke of the leaues of reeds wherein they wrap it. Hereof I haue two ſmal trees in my garden, the which I raiſed of ſeed.

¶ *The Time.*

It flours in May, and the fruit is ripe in September.

¶ *The Names.*

This tree, as may be gathered by ſome, was called *Styrax*, by reaſon of the gum or liquor which droppeth out of the ſame, being like to the hollow pipes of ice that hang at the eaves of houſes in winter, called *Styria*, or of the Canes or leaues of Reeds ſpoken of before: in Latine, *Storax Calamita*: in Engliſh, Storax, which is kept in canes or the leaues of Reeds. There floweth from ſome of theſe trees a certaine gummie liquour, which neuer groweth naturally hard, but remaineth alwayes thinne, the which is called liquid Styrax or Storax.

¶ *The Temperature.*

The gum of this tree is of an heating, mollifying, and concocting qualitie.

¶ *The Vertues.*

A It helpeth the cough, the falling down of rheums and humors into the cheſt, and hoarſeneſſe of the voice; It alſo helpeth the noiſe and ſounding of the ears, preuaileth againſt *Strumas* or the kings Euill, nodes on the nerues, and hard ſwellings proceeding of a cold cauſe, as alſo againſt all cold poiſons, as Hemlock and the like.

B Of this gum there are made ſundry excellent perfumes, pomanders, ſweet waters, ſweet bags, and ſweet waſhing balls, and diuers other ſweet chaines and bracelets, whereof to write were impertinent to this hiſtorie.

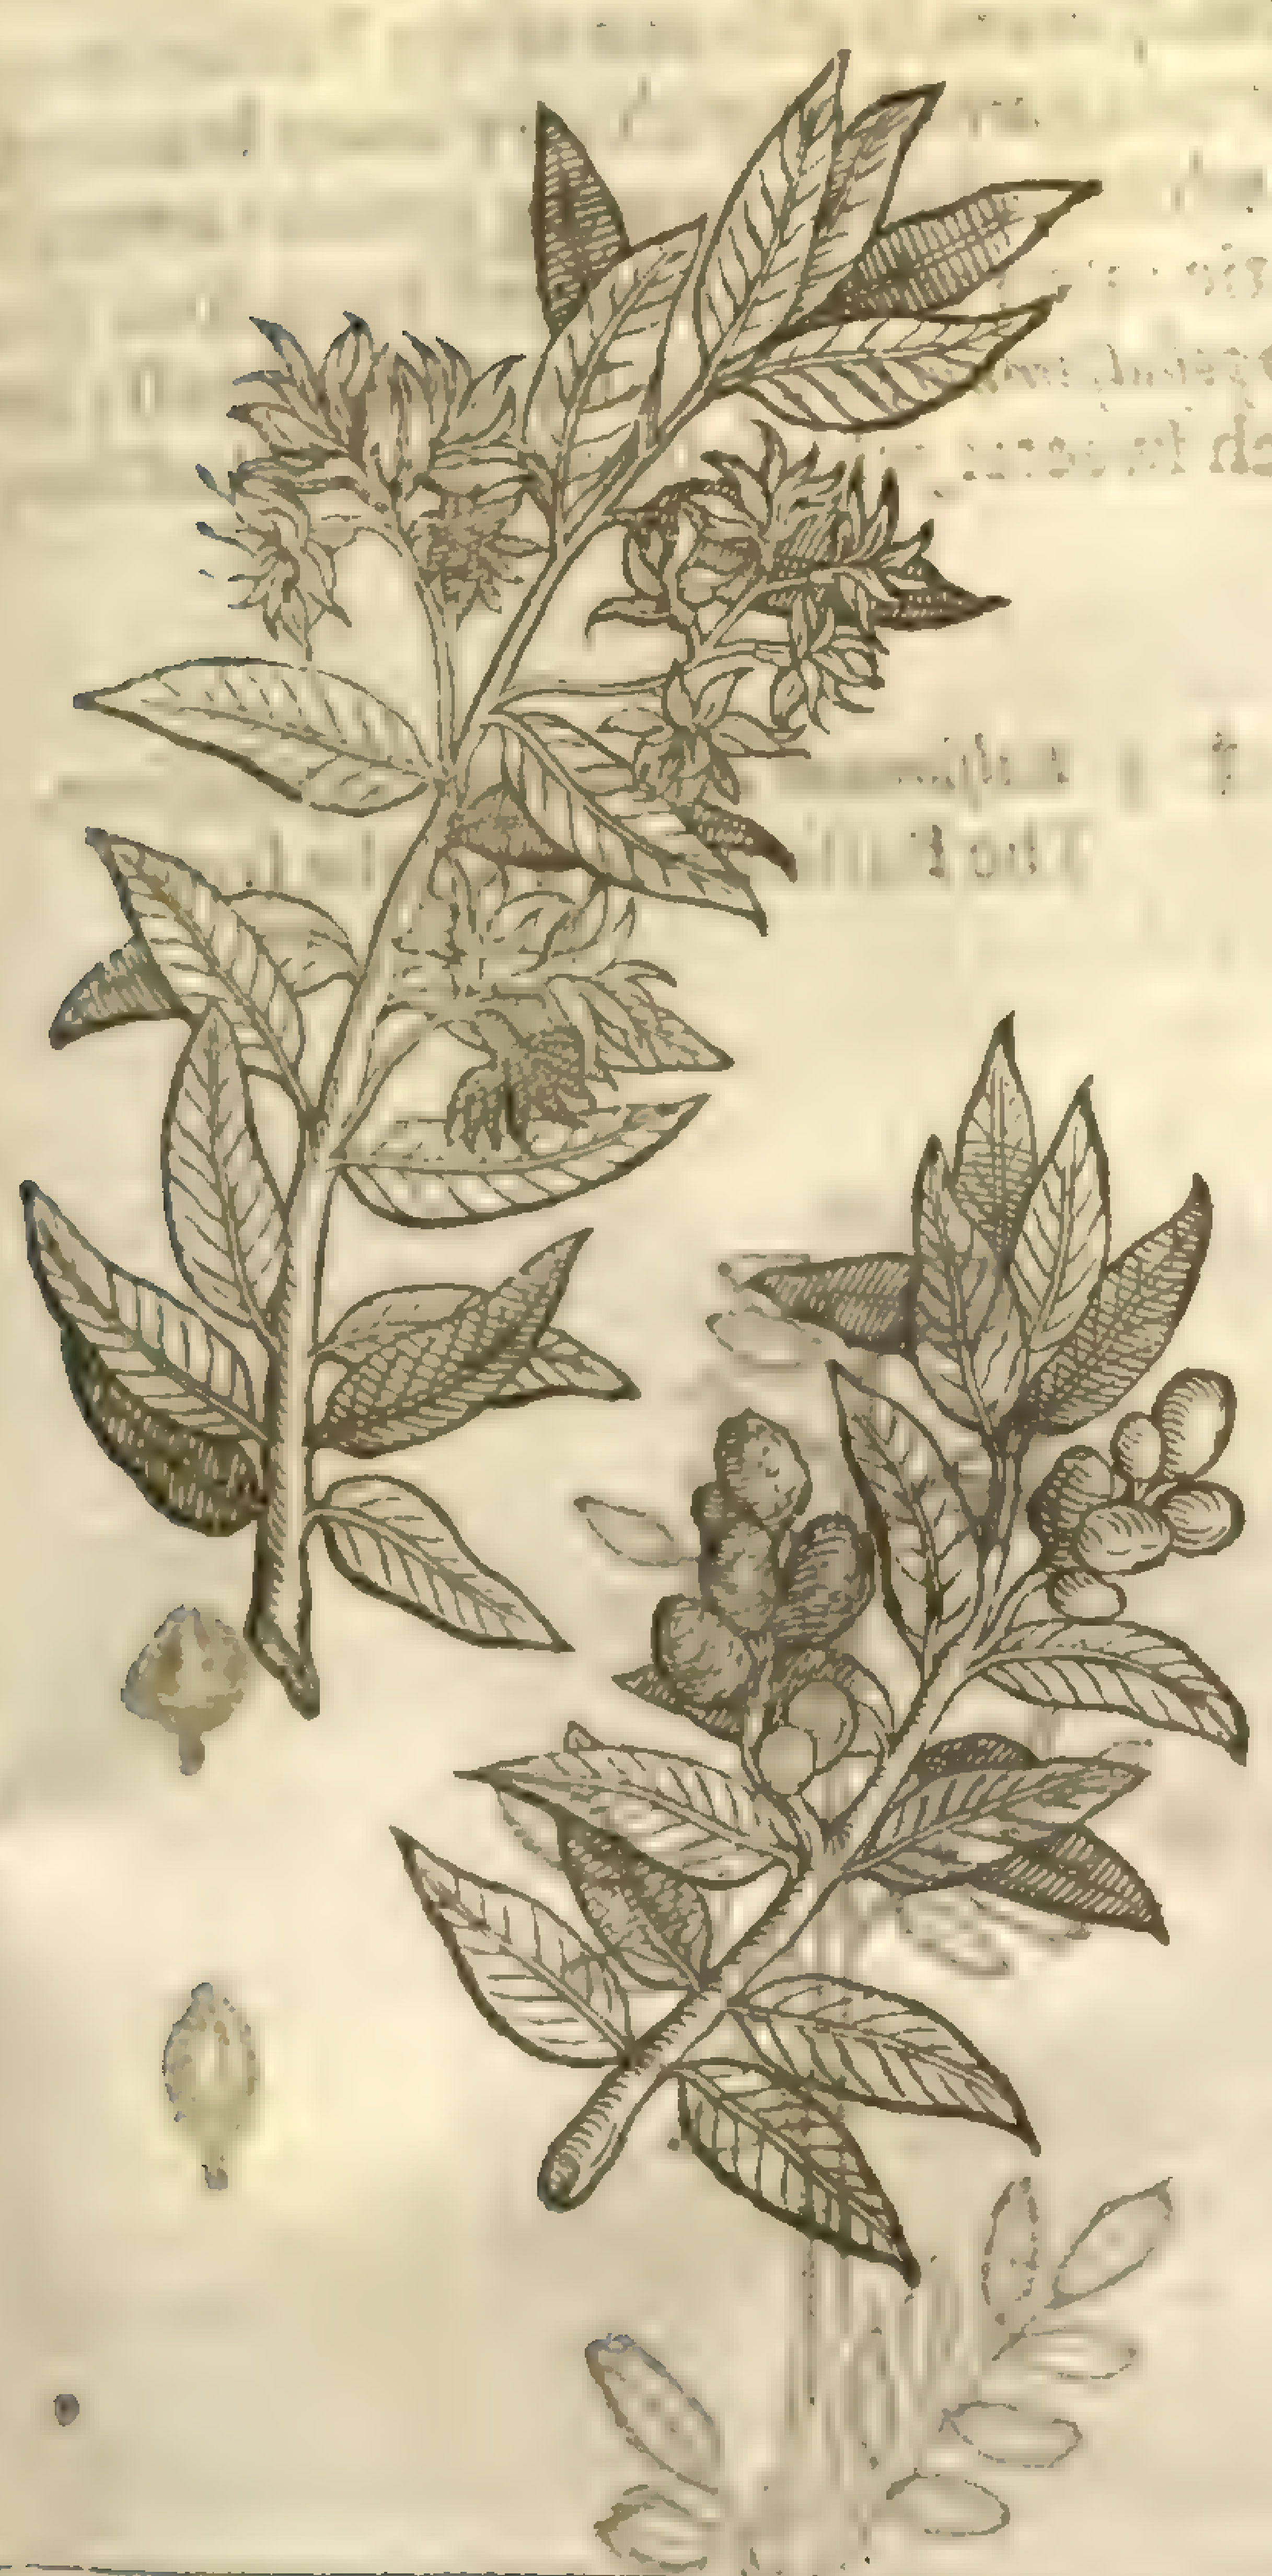
CHAP. 144.

Of the Sorrowfull Tree, or Indian Mourner.

¶ *The Deſcription.*

Arbor Triſtis, the Sad or ſorrowfull tree, waxeth as big as an Olive tree, garniſhed with many goodly branches ſet full of leaues like thoſe of the Plum tree; among which come forth moſt odoriferous and ſweet ſmelling floures, whoſe ſtalkes are of the colour of Saffron, which flouriſh and ſhew themſelues only in the night time, and in the day time looke withered and with a mourning cheere; the leaues alſo at that time ſhrink in themſelues together, much like a tender Plant that is froſt-bitten, very ſadly lumping, lowring, and hanging downe the head, as though it loathed the light, and could not abide the heate of the Sunne. I ſhould but in vain loſe labor in repeating a fooliſh fanſie of the poëtical Indians, who would make fooles beleeue that this tree was once a fair daughter of a great Lord or King, and that the Sun was in loue with her; with other toies which I omit.

Arbor triſtis.
The ſorrowfull tree.



omit. ‡ The floures are white, ſomewhat like thoſe of Iaſmine, but more double, and they are of a very ſweet ſmell. There ſucceed them many little cods, containing ſome ſixe ſeeds apiece ſomewhat like thoſe of *Stramonium.* ‡

¶ *The Place, Time, and Names.*

This tree growes in the Eaſt Indies, eſpecially in Goa and Malayo: in Goa it is called *Parizataco*: in Malayo, *Singadi*: in Decan, *Pul*: of the Arabians, *Guart*: of the Perſians and Turks, *Gul*: in Engliſh, the ſad or ſorrowfull tree, or the Indian mourner. The time is ſpecified in the deſcription.

¶ *The Nature and Vertues.*

A Wee haue no certaine knowledge of the temperature hereof; neuertheleſſe we reade, that the Indians doe colour their broths and meats with the ſtalks of the floures hereof in ſtead of Saffron; or whatſoeuer they deſire to haue of a yellow colour.

B It is reported, That if a linnen cloath bee ſteeped in the diſtilled water of the flours, & the eies bathed and waſhed therwith, it helpeth the itching and pain thereof, and ſtayes the humors that fall down to the ſame.

C There is made of the ſplinters of the wood certain tooth-picks, and many prety toies for pleaſure.

CHAP. 145. *Of the Balſam tree.*

¶ *The Kindes.*

THere be diuers ſorts of trees from which do flow Balſams, very different one from another, not only in form, but alſo in fruit, liquor, and place of growing; the which to diſtinguiſh would require more time and trauell than either our ſmall time will afford, or riches for our maintenance to diſcouer the ſame in their natural countries: which otherwiſe by report to ſet downe certain matter by incertainties, would diſcredit the Author, and no profit thereby ſhall ariſe to the Reader: notwithſtanding we wil ſet down ſo much as we haue found in the works of ſome trauellers, which beſt agree with the truth of the hiſtorie.

¶ *The Deſcription.*

1 THere be diuers trees growing in the Indies, whoſe fruits are called by the name of the fruit of the Balſam tree: among the reſt this whoſe figure wee here ſet forth vnto your view, we our ſelues haue ſeen & handled, and therfore are the better able to deſcribe it. It is a fruit very crooked, & hollowed like the palm of an hand, two inches long, half an inch thick, couered with a thick ſmooth rind, of the colour of a dry oken leafe; wherein is contained a kernell (of the ſame length and thickneſſe, apt to fil the ſaid ſhel or rinde) of the ſubſtance of an almond, of the colour of aſhes, fat and oily, of a good ſmell, but very vnpleaſant in taſt.

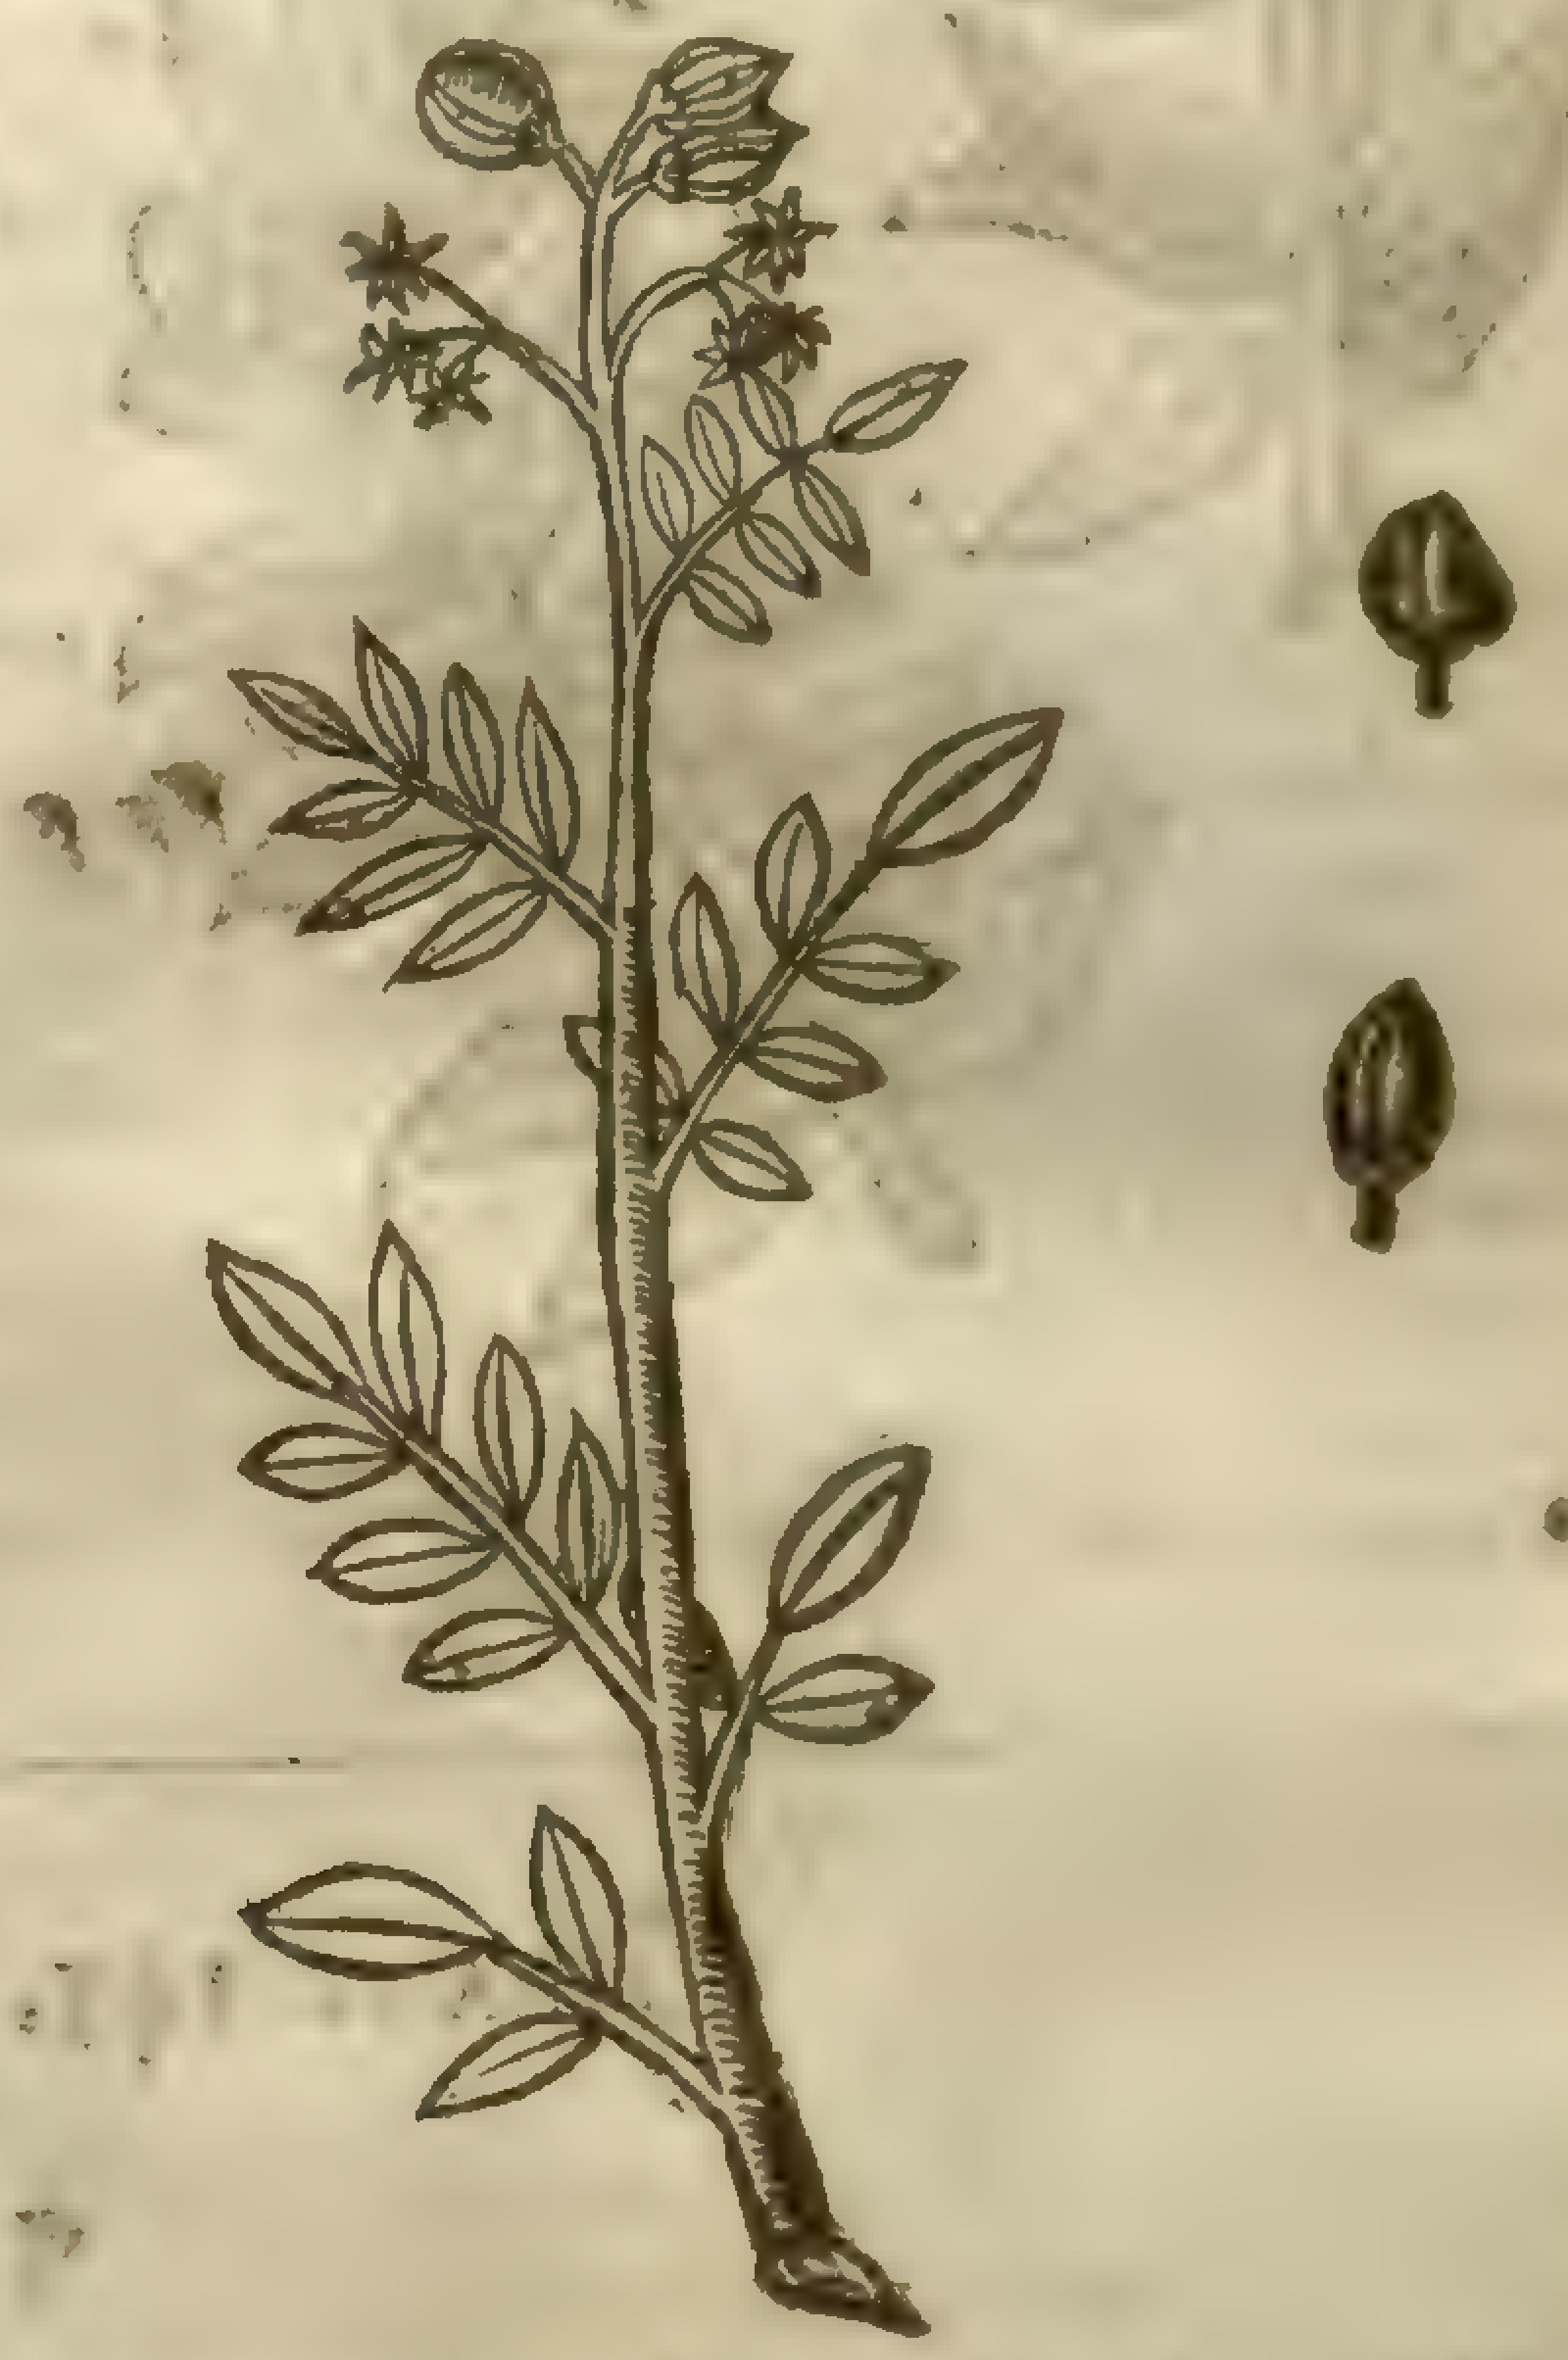
2 The wood we haue dry brought vnto vs from the Indies for our vſe in phyſicke (a ſmall deſcription may ſerue for a dry ſticke) neuertheleſſe wee haue other fruits brought from the Indies, whoſe figures are not ſet forth, by reaſon they are not ſo well knowne as deſired; whereof one is of the bigneſſe of a walnut, ſomewhat broad on the vpper ſide, with a rough or rugged ſhell, vneuen, blacke of colour, and full of a white kernell, with much juice in it, of a pleaſant taſt and ſmell, like the oile of Mace: the whole fruit is exceeding light, in reſpect of the quantity or bigneſſe, euen as

it were a piece of corke, which notwithſtanding ſinketh to the bottom when it fals into the water, like as doth a ſtone.

3 This tree, ſaith *Garcias*, that beareth the fruit *Carpobalſamum*, is alſo one of the Balſam trees: it groweth to the height and bigneſſe of the Pomegranat tree, garniſhed with very many branches, whereon do grow leaues like thoſe of Rue, but of colour whiter, alwaies growing greene: amongſt which come forth floures, whereof wee haue no certaintie: after which commeth forth fruit like that of the Turpentine tree, which in ſhops is called *Carpobalſamum*, of a pleaſant ſweet ſmell; but the liquor which floweth from the wounded tree is much ſweeter, which liquor is called of ſome, *Opobalſamum*.

1 *Balſami fructus.*
The fruit of the Balſam tree.

‡ 3 *Balſamum Alpini cum Carpobalſamo.*
The Balſam tree with the fruit.



‡ *Proſper Alpinus* hath writ a large Dialogue of the Balſam of the Antients, and alſo figured and deliuered the hiſtorie thereof in his book *De Plant. Ægypti, cap.* 14. whither I refer the curious. I haue preſented you with a ſlip from his tree, & the *Carpobalſamum* ſet forth by our Author, which ſeems to be of the ſame plant. The leaues of this are like to thoſe of *Lentiſcus*, alwaies greene, and winged, growing three, fiue, or ſeuen faſtned to one footſtalke: the root is gummy, reddiſh, and wel ſmelling: the floures are ſmal and white like thoſe of *Acacia*, growing vſually three nigh together. The fruit is of the ſhape and bigneſſe of that of the Turpentine tree, containing yellow and well-ſmelling ſeeds filled with a yellowiſh moiſture like hony. Their taſt is bitteriſh, and ſomwhat biting the tongue. ‡

Of theſe Balſam trees there is another ſort, the fruit whereof is as it were a kernell without a ſhell, couered with a thin skin ſtraked with many veins, of a brown colour; the meat is firm and ſolid like the kernell of the Indian nut, of a white colour, and without ſmell, but of a gratefull taſte; and it is thought to be hot in the firſt degree, or in the beginning of the ſecond.

There be diuers ſorts more, which might be omitted becauſe of tediouſneſſe, neuertheles I will trouble you with two ſpecial trees worth the noting; There is, ſaith my author, in America a great tree of monſtrous hugeneſſe, beſet with leaues and boughes euen to the ground, the trunk whereof is couered with a twofold bark, the one thicke like vnto Cork, aed another thin next the tree: from betweene which barks doth flow (the vpper barke being wounded) a white Balſam like vnto teares or drops,of a moſt ſweet ſauor and ſingular effects,for one drop of this which thus diſtilleth out of the tree, is worth a pound of that which is made by decoction. The fruit herof is ſmal in reſpect of the others; it ſeldome exceedeth the bigneſſe of a peaſe, of a bitter taſt,incloſed in a narrow husk of the length of a finger,ſomthing thin,and of a white colour, which the Indians vſe againſt headache: which fruit of moſt is that we haue before deſcribed,called *Carpobalſamum.*

It is alſo written that in the Iſland called Hiſpaniola,there growes a ſmall tree of the height of two men,without the induſtry of man,hauing ſtalks and ſtems of the colour of aſhes; whereon do grow green leaues,ſharp at both ends,but more green on the vpper ſide than on the lower,hauing a middle rib ſomewhat thicke and ſtanding out: the footſtalke whereon they grow is ſomwhat reddiſh: among which leaues comes fruit growing by cluſters,as long as a mans hand. The ſtones or graines in the fruit be few, and greene, but growing to redneſſe more and more as the fruit waxeth ripe: from the which is gathered a juice after this manner; they take the yong ſhoots and buds of the tree,and alſo the cluſters of the fruit, which they bruiſe and boile in water to the thickneſſe of hony,which being ſtrained,they keep for their vſes.

They vſe it againſt wounds and vlcers,it ſtops and ſtancheth the bloud,maketh them clean,bringeth vp the fleſh,and healeth them mightily,and with better ſucceſſe than true Balſam. The branches of the tree being cut,do caſt forth by drops a certain cleare water, more worth than *Aqua vitæ,* moſt wholſome againſt wounds and all other diſeaſes proceeding from cold cauſes, being drunke ſome few daies together.

¶ *The Place.*

Theſe trees grow in diuers parts of the world,ſome in Egypt and moſt of thoſe countries adjacent. There groweth of them in the Eaſt and Weſt Indies,as trauellers in thoſe parts report.

¶ *The Time.*

Theſe trees for the moſt part keepe green Winter and Summer.

¶ *The Names.*

Balſam is called in Greek, Βάλσαμον: in Latine alſo *Balſamum:* of the Arabians,*Balſeni,Baleſina,*and *Belſan:* in Italian, *Balſamo:* in French, *Baume.*

The liquor that flowes out of the tree when it is wounded, is called *Opobalſamum:* the wood, *Xylobalſamum:* the fruit,*Carpobalſamum:*and the liquor which naturally flowes from the tree in Egypt, *Balſamum.*

¶ *The Temperature.*

Balſam is hot and dry in the ſecond degree,with aſtriction.

¶ *The Vertues.*

Natural Balſam taken in a morning faſting,with a little Roſe water or Wine,to the quantity of A
fiue or ſix drops, helpeth thoſe that be aſthmatick or ſhort winded: it preuaileth againſt the pains of the bladder and ſtomack,comforting the ſame mightily: it alſo amendeth a ſtinking breath,and takes away the ſhaking fits of the quotidian ague,if it be taken two or three times.

It helpeth conſumptions,clenſeth the barren wombe, eſpecially being annointed vpon a peſſary B
or mother ſuppoſitorie,and vſed.

The ſtomack being anointed therewith,digeſtion is helped thereby; it alſo preſerueth the ſto- C
mack from obſtruction and windineſſe;it helps the hardneſſe of the ſpleen,eaſeth the griefs of the reins and belly,proceeding of cold cauſes.

It alſo takes away all manner of aches occaſioned by cold, if they be annointed therewith; but D
more ſpeedily,if a linnen cloth be wet therein and laid thereon: vſed in the ſame manner it diſſolueth hard tumors called *œdemata;*and ſtrengthneth the weak members.

The ſame refreſheth the brain,and comforteth the parts adioyning; it helpeth the palſie, Con- E
vulſions,and all griefes of the ſinues,being anointed therewith.

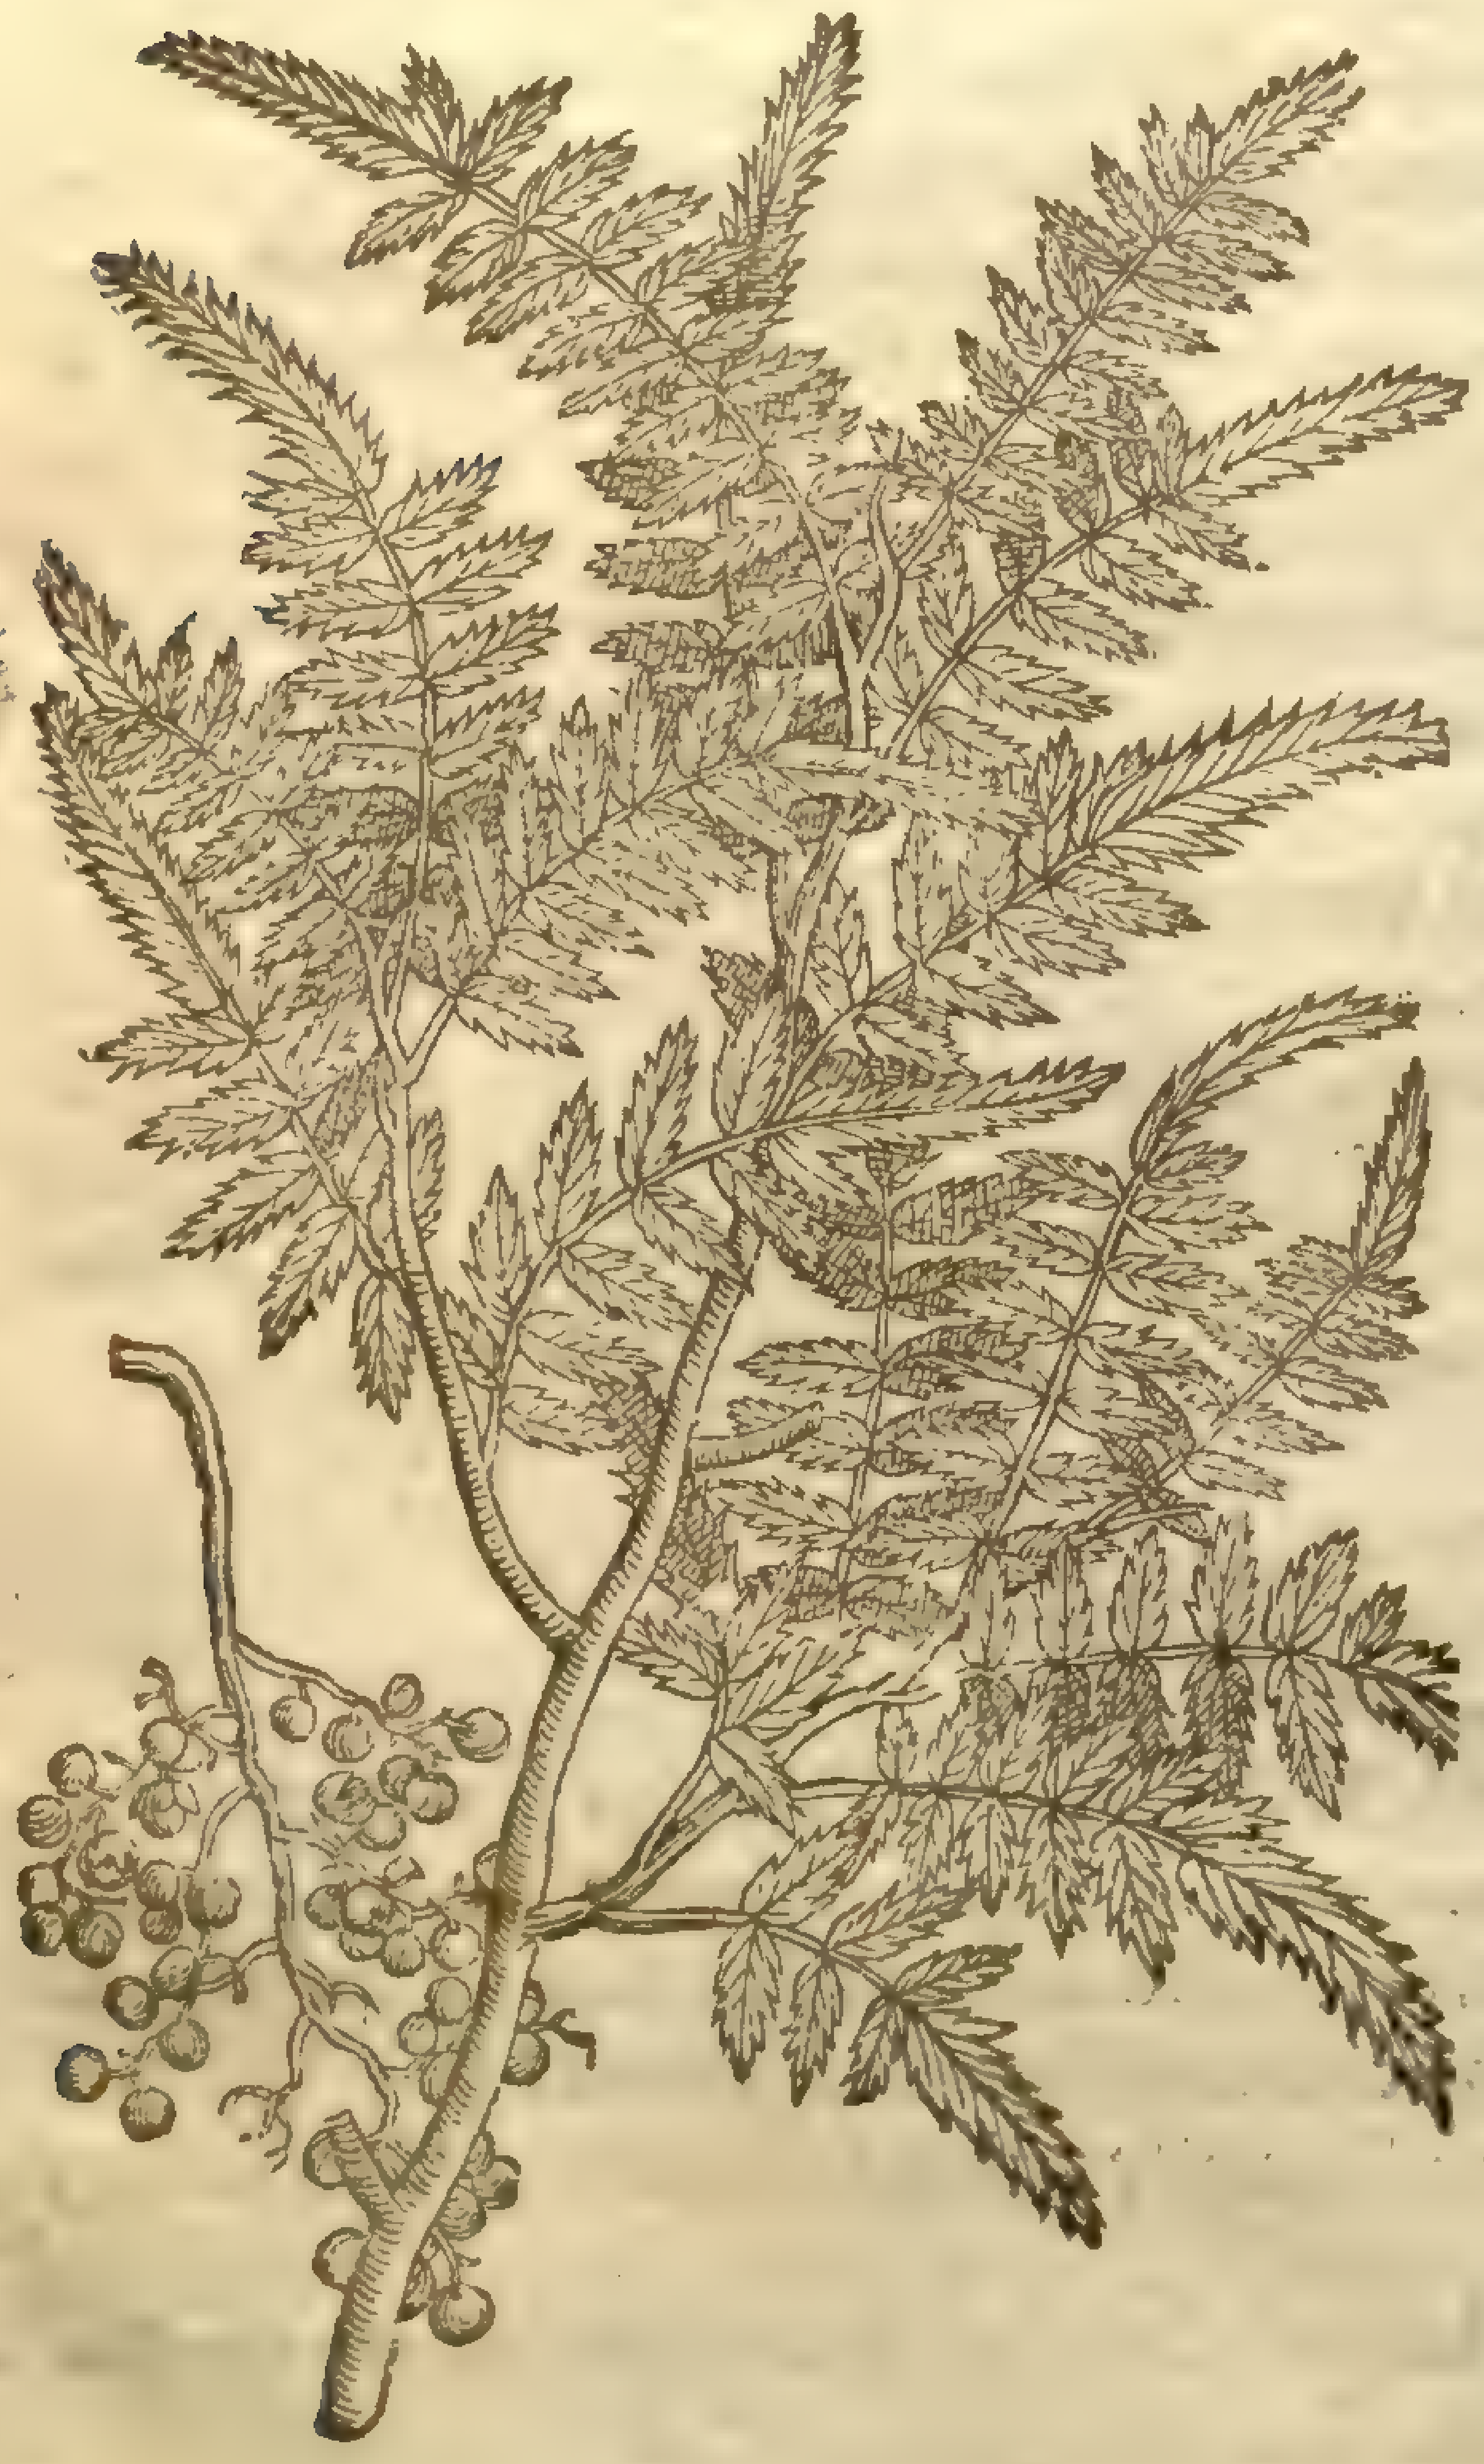
The maruellous effects it worketh in new and green wounds,were here too long to ſet down,and F
alſo ſuperfluous,conſidering the skilfull Surgeon,whom it moſt concernes,knoweth the vſe thereof: and as for the beggerly Quackſaluers,Runnagates,and knauiſh Mountibankes,we are not willing to inſtruct them in things ſo far aboue their reach, capacitie,and worthineſſe.

Chap. 146. *Of a kinde of Balme or Balſam tree.*

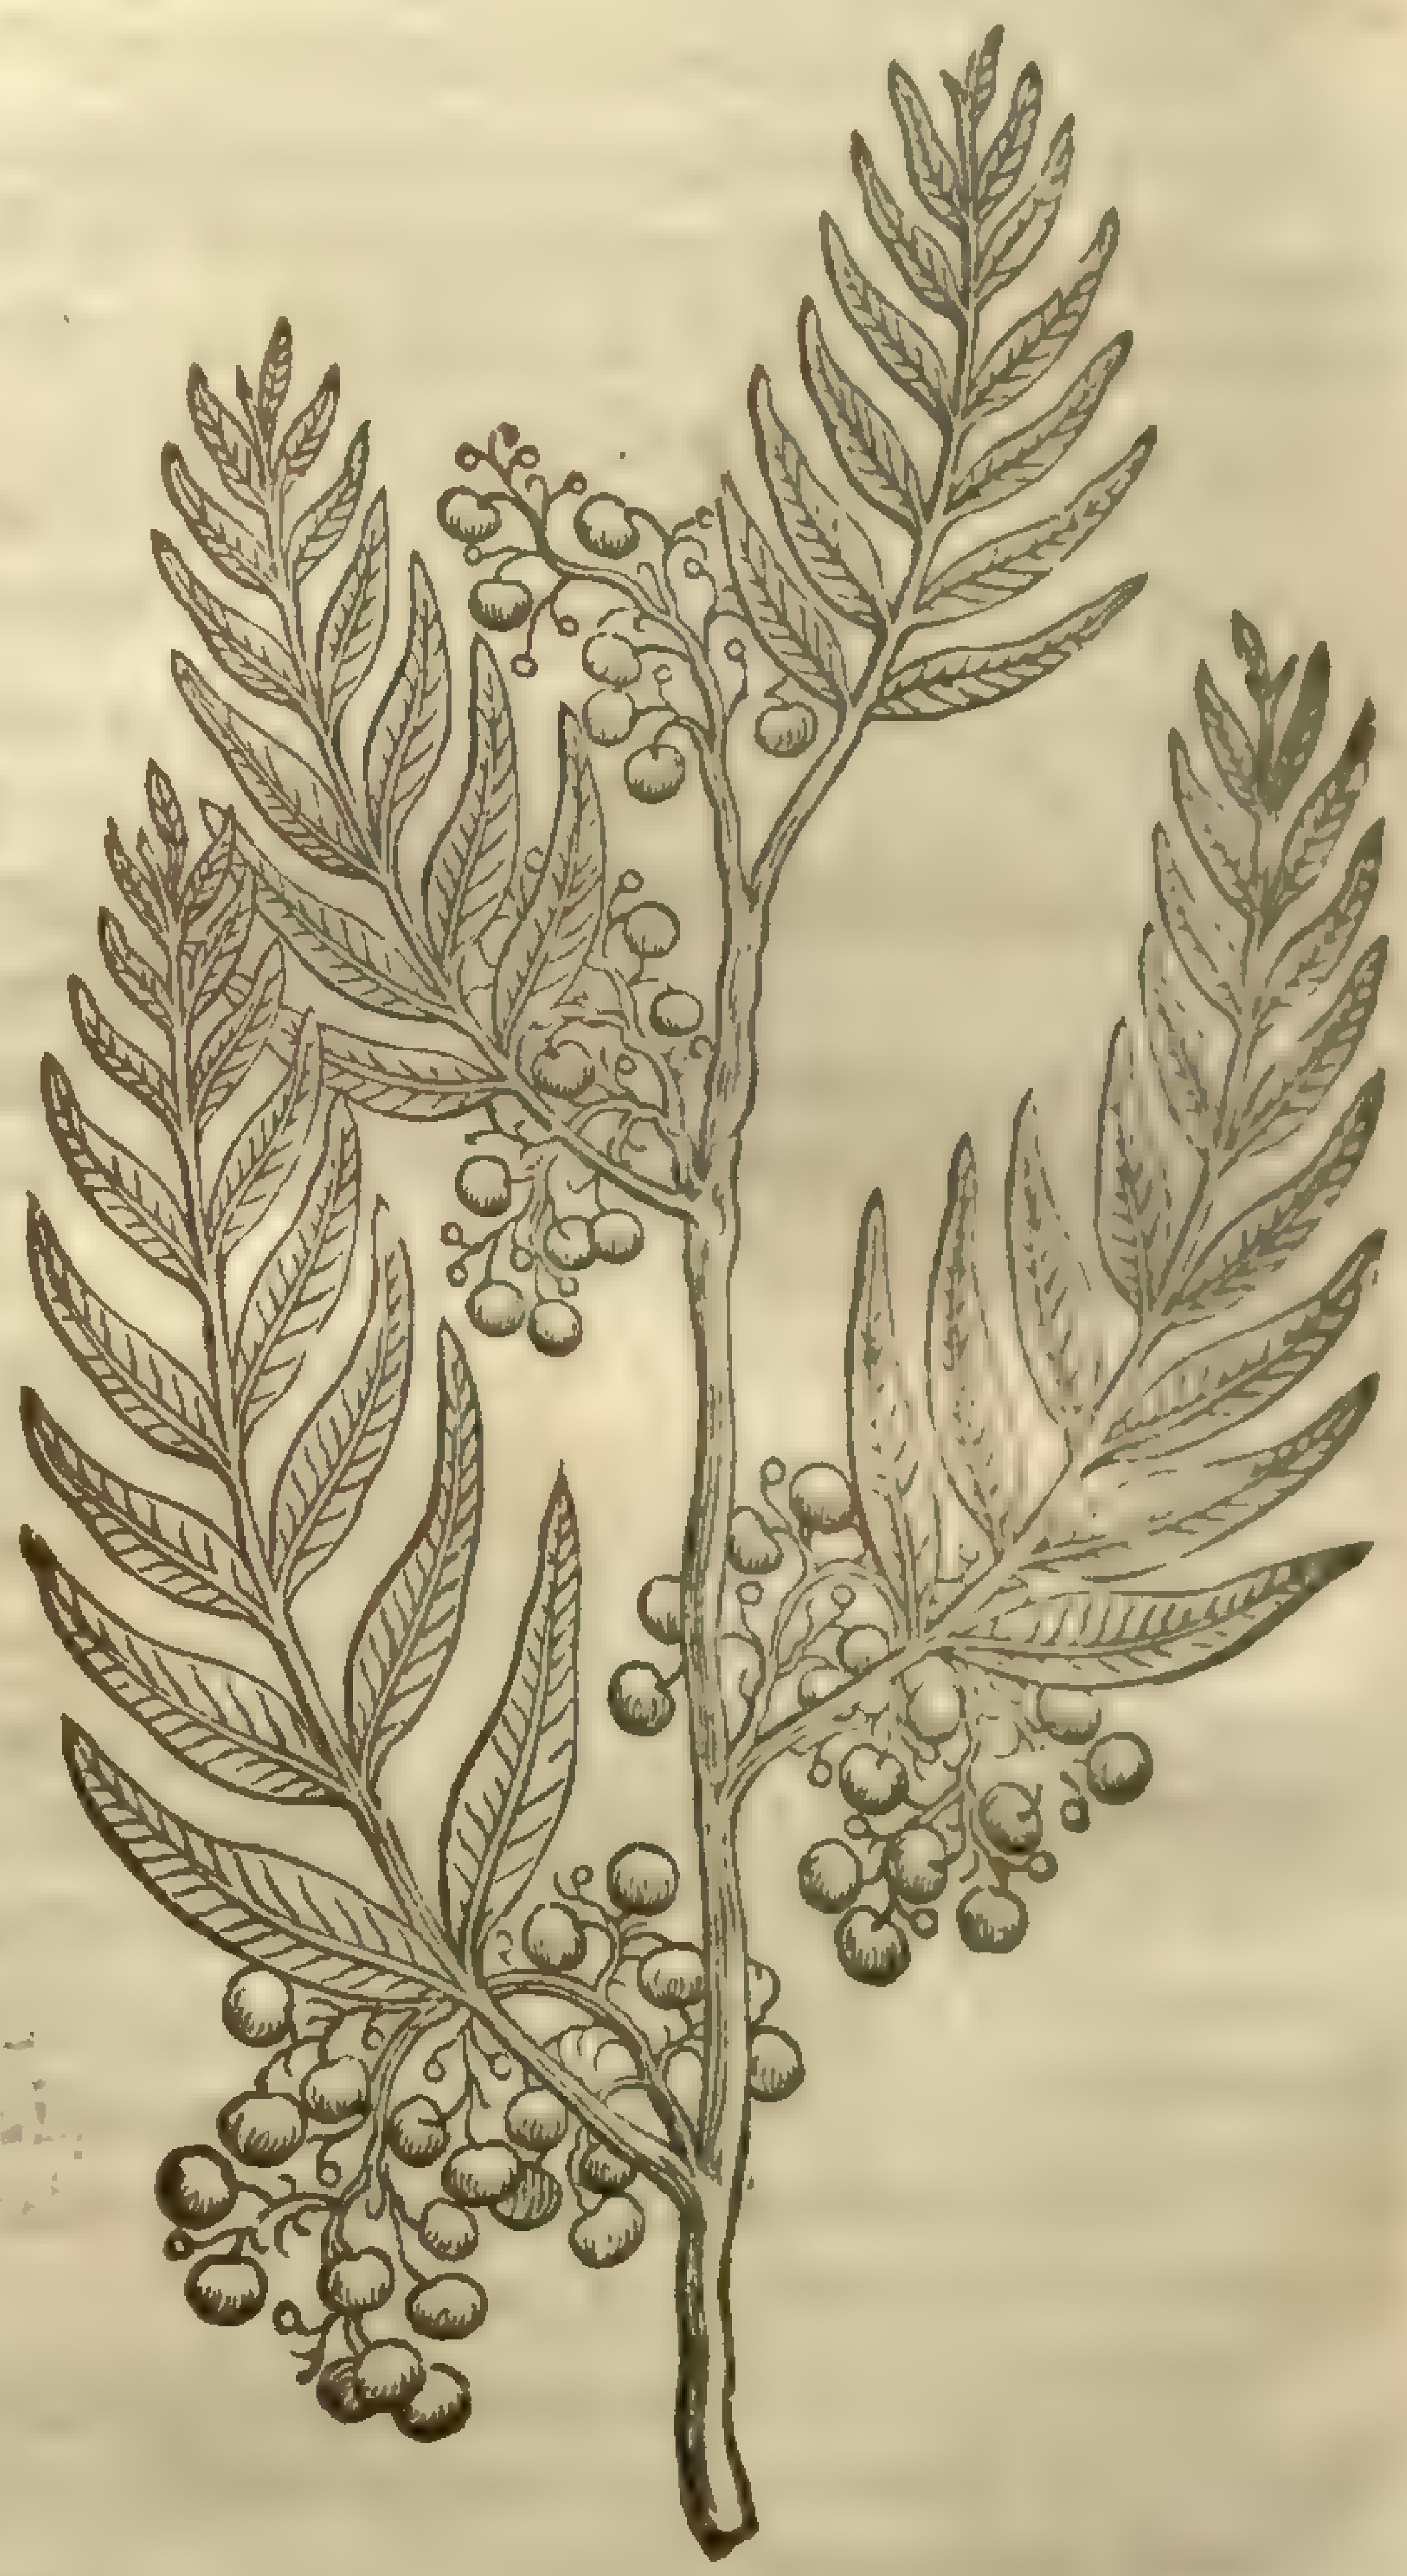
¶ *The Deſcription.*

This tree which the people of the Indies do call *Molli,* groweth to the bigneſſe of a great tree, hauing a trunke or bodie of a darke greene colour, ſprinkeled ouer with many aſh-coloured ſpots: the branches are many, and of very great beauty, whereupon grow leaues not vnlike thoſe of the aſh tree, conſiſting of many ſmal leaues ſet vpon a middle ribbe, growing narrower euer toward the point, euery particular one jagged on the ſides like the teeth of a Saw; which beeing plucked from the ſtem, yeelds forth a milky juice tough and clammy, ſauouring like the bruiſed leaues of fenell, and in taſt ſeems ſomewhat aſtringent: the floures grow in cluſters on the twiggy branches, like thoſe of the Vine a little before the grapes are formed: after followes the fruit or berries, ſomwhat greater than pepper corns, of an oily ſubſtance, green at the firſt, and of a dark reddiſh colour when they be ripe. ‡ The firſt of the figures was taken from a tree only of three years growth, but the later from a tree come to his full growth, as it is affirmed by *Cluſius* in his *Cur. Poſt.* It differs only, in that the leaues of the old tree are not at all ſnipt or diuided about the edges. ‡

Schinus molle [illegible]



1 *Molli, ſiue Molly Cluſij & Lobelij.*
The Balſam tree of *Cluſius* and *Lobels* deſcription.



‡ 2 *Molle arboris adulti ramus.*
A branch of the old tree of Molle.

¶ *The Place.*

This tree, ſaith a learned Phyſition *Ioh. Fragoſus*, growes in the king of Spains garden at Madril, which was the firſt that euer he had ſeen: ſince which time, *John Ferdinando*, Secretarie to the ſaid King, did ſhew vnto the ſaid *Fragoſus* in his own garden a tree ſo large, and of ſuch beauty, that he was neuer ſatisfied with looking on it, and meditating vpon the vertues thereof. Which words I receiued from the hands of a famous learned man called Mr *Lancelot Browne*, Dr in phyſick, and phiſition to the Queenes Maieſtie at the impreſſion hereof; faithfully tranſlated out of the Spaniſh tongue, without adding or taking any thing away.

They grow plentifully in the vales and low grounds of Peru, as all affirm that haue trauelled to the Weſt Indies; as alſo thoſe that haue deſcribed the ſingularities thereof. My ſelfe with diuers others, as namely Mr *Nicholas Lete* a Worſhipfull Merchant of the Citie of London; and alſo a moſt skilful Apothecarie Mr *Iames Garret*, who haue receiued ſeeds hereof from the right honorable the Lord *Hunſdon* Lord high Chamberlaine of England; who is worthy of triple honor, for his care in getting, as alſo for his curious keeping ſuch rare and ſtrange things brought from the fartheſt parts of the world. Which ſeeds we haue ſown in our gardens, where they haue brought forth plants of a foot high, and alſo their beautifull leaues; notwithſtanding our care, diligence, and induſtry, they haue periſhed at the firſt approch of winter, as not being able by reaſon of their tenderneſſe to endure the cold of our winter blaſts.

¶ *The Time.*

As touching the time of his flouriſhing and bringing his fruit to maturitie, wee haue as yet no certain knowledge, but is thought to be green both winter and ſummer.

¶ *The Names.*

This moſt notable tree is called by the Indian name *Molle*: of ſome, *Molly* and *Muelle*, taken from his tender ſoftneſſe, as ſome haue deemed: it may be called the Fenel tree, or one of the Balme or Balſam trees.

¶ *The Temperature.*

This tree is thought to be of an aſtringent or binding qualitie, whereby it appeares, beſides the hot temperature it hath, to be compounded of diuers other faculties.

¶ *The Vertues.*

A The Indians vſe to ſeeth the fruit or berries hereof in water, and by a ſpeciall skill they haue in the boiling, do make a moſt wholſome wine or drinke, as alſo a kinde of vineger, and ſomtimes hony; which are very ſtrange effects, theſe three things being ſo contrary in taſte.

B The leaues boiled and the decoction drunke, helpeth them of any diſeaſe proceeding of a cold cauſe.

C The gum which iſſueth from the tree, being white like vnto Manna, diſſolued in milke, taketh away the web of the eies, and cleareth the ſight, being wiped ouer with it.

D The barke of this tree boiled, and the legs that be ſwoln and full of paine bathed with the decoction diuers times, taketh away both the infirmities in ſhort ſpace.

E This tree is of ſuch eſtimation among the Indians, that they worſhip it as a god, according to their ſavage rites and ceremonies. Like as *Pliny* reporteth of *Homers Moly*, the moſt renowned of all plants, which they of old time had in ſuch eſtimation and reuerence, that, as it is recorded, the gods gaue it the name of *Moly*, and ſo writeth *Ovid*,

Pacifer huic dederat florem Cyllenius album,
Moly vocant Superi, nigra radice tenetur.

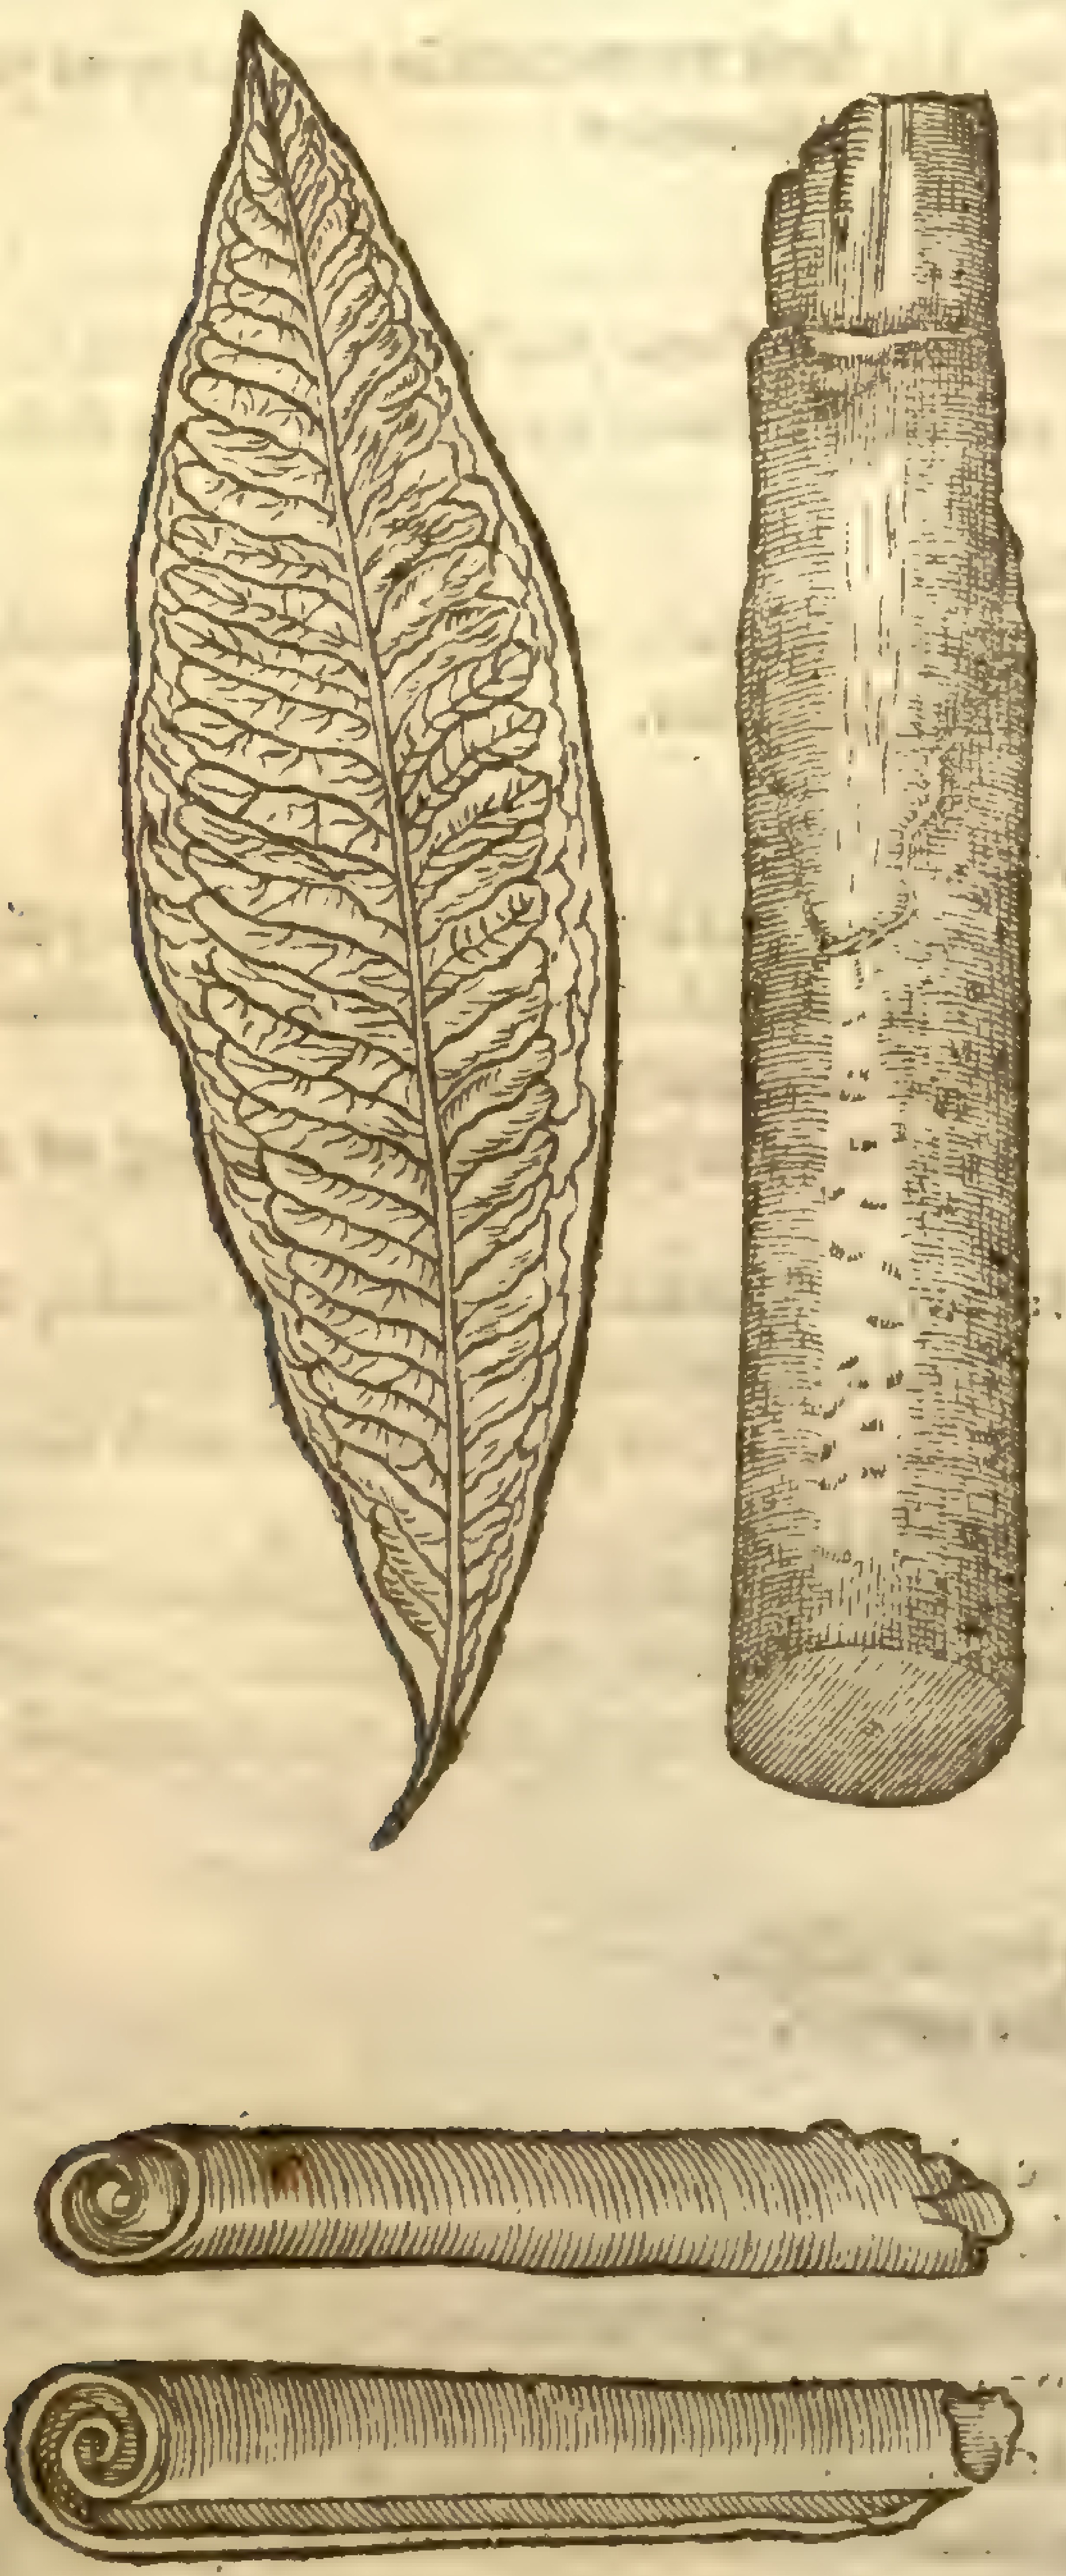
F If any be deſirous to ſee more hereof, they may reade a learned diſcourſe of it ſet forth in Latine by the learned *Lobel*, who hath at large written the hiſtorie thereof, dedicated to the right honorable the Lord Chamberlain at the impreſſion hereof, faithfully examined by the aforeſaid learned phyſitian D^r^ *Browne*, and his cenſure vpon the ſame: ‡ together with *Lobels* Reply, who iudged this plant (and not without good reaſon) to be a kind of the true Balſam of the Antients, and not much differing from that ſet forth by *Proſper Alpinus*, whereof I haue made mention in the foregoing chapter. ‡

CHAP. 147. *Of the Canell or Cinnamon tree.*

¶ *The Deſcription.*

1 THe tree which hath the Cinamon for his bark is of the ſtature of an Olive tree, hauing a
body as thick as a mans thigh, from whence the Cinamon is taken; but that taken from
the ſmaller branches is much better: which branches or boughes are many and very ſtraight, wher-
on grow beautifull leaues in ſhape like thoſe of the Orenge tree, and of the colour of the Bay leaf,
not as it hath been reported, like vnto the leaues of flags or Flour-de-Lys. Among theſe pleaſant
leaues and branches come forth many faire white floures, which turn into round black fruit or ber-
ries of the bigneſſe of an Haſell nut or the Olive berry, and of a black colour; out of which is preſ-
ſed an oile that hath no ſmell at all vntill it be rubbed and chafed between the hands: the trunk or
body with the greater arms or boughs of the tree are couered wtth a double or twofold barke like
that of the Corke tree, the innermoſt whereof is the true and pleaſant Cinnamon, which is taken
from the tree and caſt vpon the ground in the heate of the Sun, through whoſe heate it turneth and

Canellæ folium Bacillus, & Cortex.
The leafe, barke, and trunke of the Cinamon tree.



foldeth it ſelfe round together, as we daily ſee by viewing the thing it ſelfe. This tree being thus peeled recouereth a new bark in the ſpace of three yeares, and is then readie to be disbarked as afore. That Cinnamon which is of a pale colour hath not bin well dried in the ſun: that of a fair brown color is beſt, and that which is blackeſt hath bin too much dried, and alſo hath taken ſome wet in the time of drying.

‡ 2 Beſides the Cinnamon vulgarly known & vſed, there is another ſort, which alſo is commonly receiued for the *Caſſia* of *Dioſcorides* and the Antients. Now this differs from the former, in that it is of a redder colour, of a more hard ſollid and compact ſubſtance, commonly alſo thicker, and if you chew it, more clammy and viſcous. The taſte and ſmell are much like Cinnamon, yet not altogether ſo ſtrong as that of the beſt Cinnamon. There is much controuerſie in late Writers, concerning both the true Cinnamon and Caſſia of the Antients: the which I haue not time nor ſpace here to mention, much leſſe to inſiſt vpon. I haue obſerued, that both the Cinnamon & Caſſia that we haue are couered ouer with a rough grayiſh barke like that of an Oke or other ſuch tree, which is clean ſcraped off and taken away before it be brought vnto vs. ‡

¶ *The Place.*

The chiefeſt places where the trees doe grow that beare Cinnamon, are Zeilan and Malavar; but thoſe of Zeilan are the beſt. They grow in other of the Molucca Iſles, as Iaoa and Iava, the greater and the leſſe, and alſo in Mindanoa, for the moſt part vpon mountaines.

¶ *The Time.*

The Cinnamon tree groweth green Winter and Summer, as do all the others of the Molucca's and Eaſt Indies for the moſt part; the boughs whereof are cut off at ſeaſonable times, by expreſſe commandement of the King of the country, and not before he appoints the time.

There hath bin ſome controuerſie among writers concerning the tree whoſe bark is Caſſia and that tree that beareth Cinnamon, making them both one tree; but that opinion is not to be receiued, for there is a great difference betwixt them, as there is betwixt an Oke and a Cheſtnut tree; for the tree whoſe bark is Caſſia is doubtleſſe a baſtard kinde of Canell or Cinnamon, in ſhew it is very like, but in ſweetneſſe of ſmell and other circumſtances belonging to Cinnamon far inferior.

¶ *The Names.*

Cinnamon is called in Italian, *Canella*: in Spaniſh, *Canola*: in French, *Canelle*: in high-Dutch, **Zimmet coezlin**: in Greek, Κιννάμωμον: in Latine likewiſe *Cinnamomum*: the Arabians, *Darſeni*, and as ſome ſay, *Querſaa*, others, *Querſe*: in Zeilan, *Cuurde*: in the Iſland Iava they name it *Cameaa*: in Ormus, *Darchini* (i.) *Lignum Chinenſe*, Wood of China: in Malavar, *Cais mains*, which ſignifies *Dulce lignum*, or Sweet wood: in Engliſh, Cinnamome, Cinnamon, and Canel. The other is called *Caſſia*, and *Caſſia lignea*.

¶ *The Temperature and Vertues.*

Dioſcorides writeth, that Cinnamon hath power to warme, and is of thinne parts. It is alſo dry and aſtringent, it prouoketh vrine, cleereth the eies and maketh ſweet breath.

B The decoction bringeth downe the menſes, preuaileth againſt the bitings of venomous beaſts, the inflammotions of the inteſtines and reines.

C The diſtilled water hereof is profitable to many, and for diuers infirmites, it comforteth the weake, cold, and feeble ſtomacke, eaſeth the paines and frettings of the guts and entrailes proceeding of cold cauſes, it amendeth the euill colour of the face, maketh ſweet breath, and giueth a moſt pleaſant taſte vnto diuers ſorts of meates, and maketh the ſame not onely more pleaſant, but alſo more wholeſome for any bodies of what conſtitution ſoeuer they be, notwithſtanding the binding quality.

D The oile drawne chimically preuaileth againſt the paines of the breſt, comforteth the ſtomacke, breaketh windineſſe, cauſeth good digeſtion, and being mixed with ſome hony, taketh away ſpots from the face being annointed therewith.

E The diſtilled water of the floures of the tree, as *Garcias* the Luſitanian Phyſition writeth, excelleth far in ſweetneſſe all other waters whatſoeuer, which is profitable for ſuch things as the barke it ſelfe is.

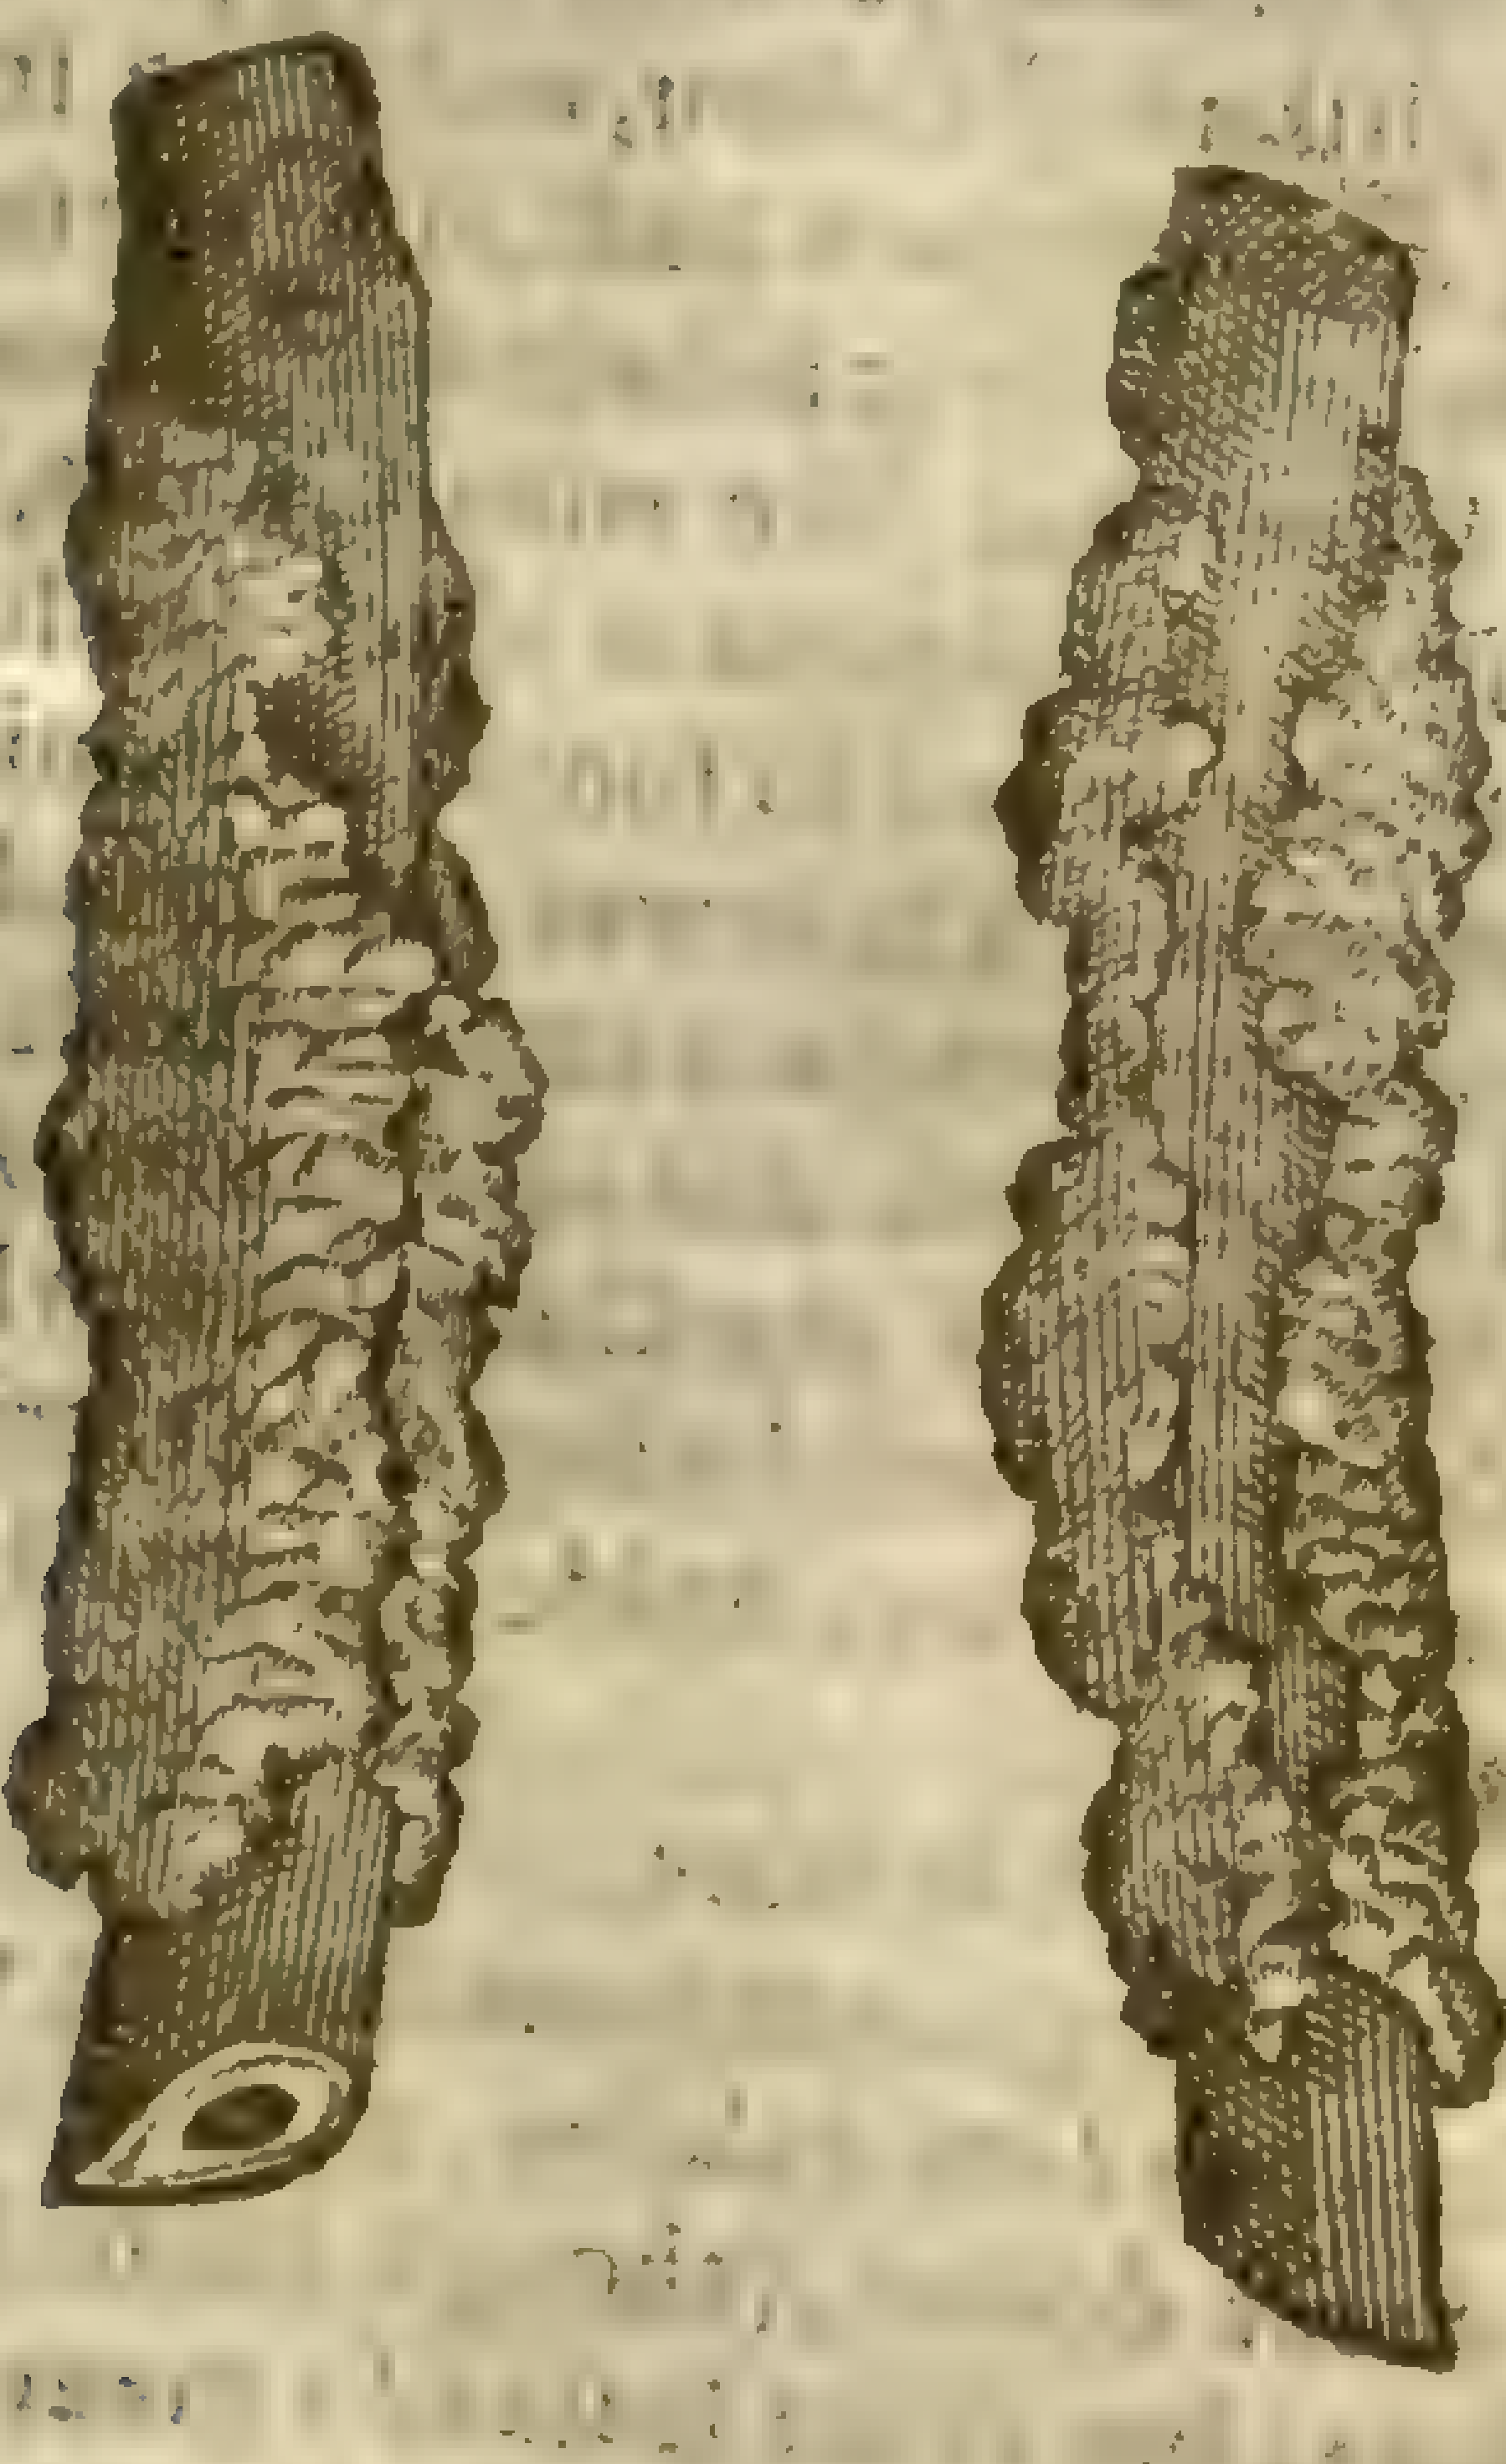
F Out of the berries of this tree is drawn by expreſſion, as out of the berries of the Oliue tree, a certaine oile, or rather a kinde of fat like butter, without any ſmell at all, except it be made warme, and then it ſmelleth as the Cinnamon doth, and is much vſed againſt the coldneſſe of the ſinewes, all paines of the joynts, and alſo the paines and diſtemperature of the ſtomacke and breaſt.

G To write as the worthineſſe of the ſubject requireth, would aske more time than we haue to beſtow vpon any one plant; therefore theſe few ſhall ſuffice, knowing that the thing is of great vſe among many, and knowne to moſt.

H ‡ *Caſsia* vſed in a larger quantity ſerueth well for the ſame purpoſes which Cinnamon doth. ‡

CHAP. 148. *Of Gum Lacke and his rotten tree.*

Lacca cum ſuis bacillis.
Gum Lacke with his ſtaffe or ſticke.



¶ *The Deſcription.*

THe tree that bringeth forth that excrementall ſubſtance called *Lacca*, both in the ſhops of Europ and elſewhere, is called of the Arabians, Perſians, and Turkes, *Loc Sumutri*, as who ſhould ſay, *Lacca* of Sumutra: ſome which haue ſo termed it haue thought that the firſt plenty thereof came from Sumutra, but herein they haue erred, for the abundant ſtore thereof came from Pegu, where the inhabitants therof do cal it *Lac*, & others of the ſame prouince, *Trec*: the hiſtory of which tree, according to that famous Herbariſt *Cluſius* is as followeth. [There is in the country of Pegu and Malabar, a great tree, whoſe leaues are like them of the Plum tree, hauing many ſmall twiggy branches; when the trunk or body of the tree waxeth old, it rotteth in ſundry places, wherin do breed certain great Ants or Piſmires, which continually work and labour in the time of Harueſt and Summer, againſt the penury of Winter: ſuch is the diligence of thoſe Ants, or ſuch is the nature of the tree wherein they harbour, or both, that they prouide for their winter food, a lumpe or maſſe of ſubſtance, which is of a crimſon colour, ſo beautifull and ſo faire, as in the whole World the like is not ſeene, which ſerueth not onely to phyſicall vſes, but is a perfect and coſtly colour for Painters, called by vs, Indian Lack. The Piſmires (as I ſaid) worke out this colour, by ſucking the ſubſtance or matter of Lacca from the tree, as bees doe make hony and wax, by ſucking the matter thereof from all herbes, trees, and floures, and the inhabitants of that country, do as diligently ſeeke for this Lacca, as we in England and in other countries ſeeke in the woods for hony; which Lacca after they haue found, they take from the tree, and dry it into a lumpe; among which ſometimes there come ouer ſome ſtickes and pieces of the tree with the wings of the Ants, which haue fallen among it, as we daily ſee.

‡ The Indian Lacke or Lake which is the rich colour vſed by Painters, is none of that which is vſed in ſhops, nor here figured or deſcribed by *Cluſius*, wherefore our Author was much miſtaken in that hee here confounds together things ſo different; for this is of a reſinous ſubſtance, and a faint red colour, and wholly vnfit for painters, but vſed alone and in compoſition to make the beſt hard ſealing wax. The other ſeemes to bee an artificiall thing, and is of an exquiſite crimſon colour, but of what it is, or how made, I haue not as yet found any thing that carries any probabilitie of truth. ‡

¶ *The Place.*

The tree which beareth Lacca groweth in Zeilan and Malauar, and in other parts of the Eaſt-Indies.

¶ *The Time.*

Of the time we haue no certaine knowledge.

¶ *The Names.*

Indian Lacke is called in ſhops *Lacca*: in Italian, *Lachetta*: *Auicen* calleth it *Luch*: *Paulus* and *Dioſcorides*, as ſome haue thought, *Cancamum*: the other names are expreſſed in the deſcription.

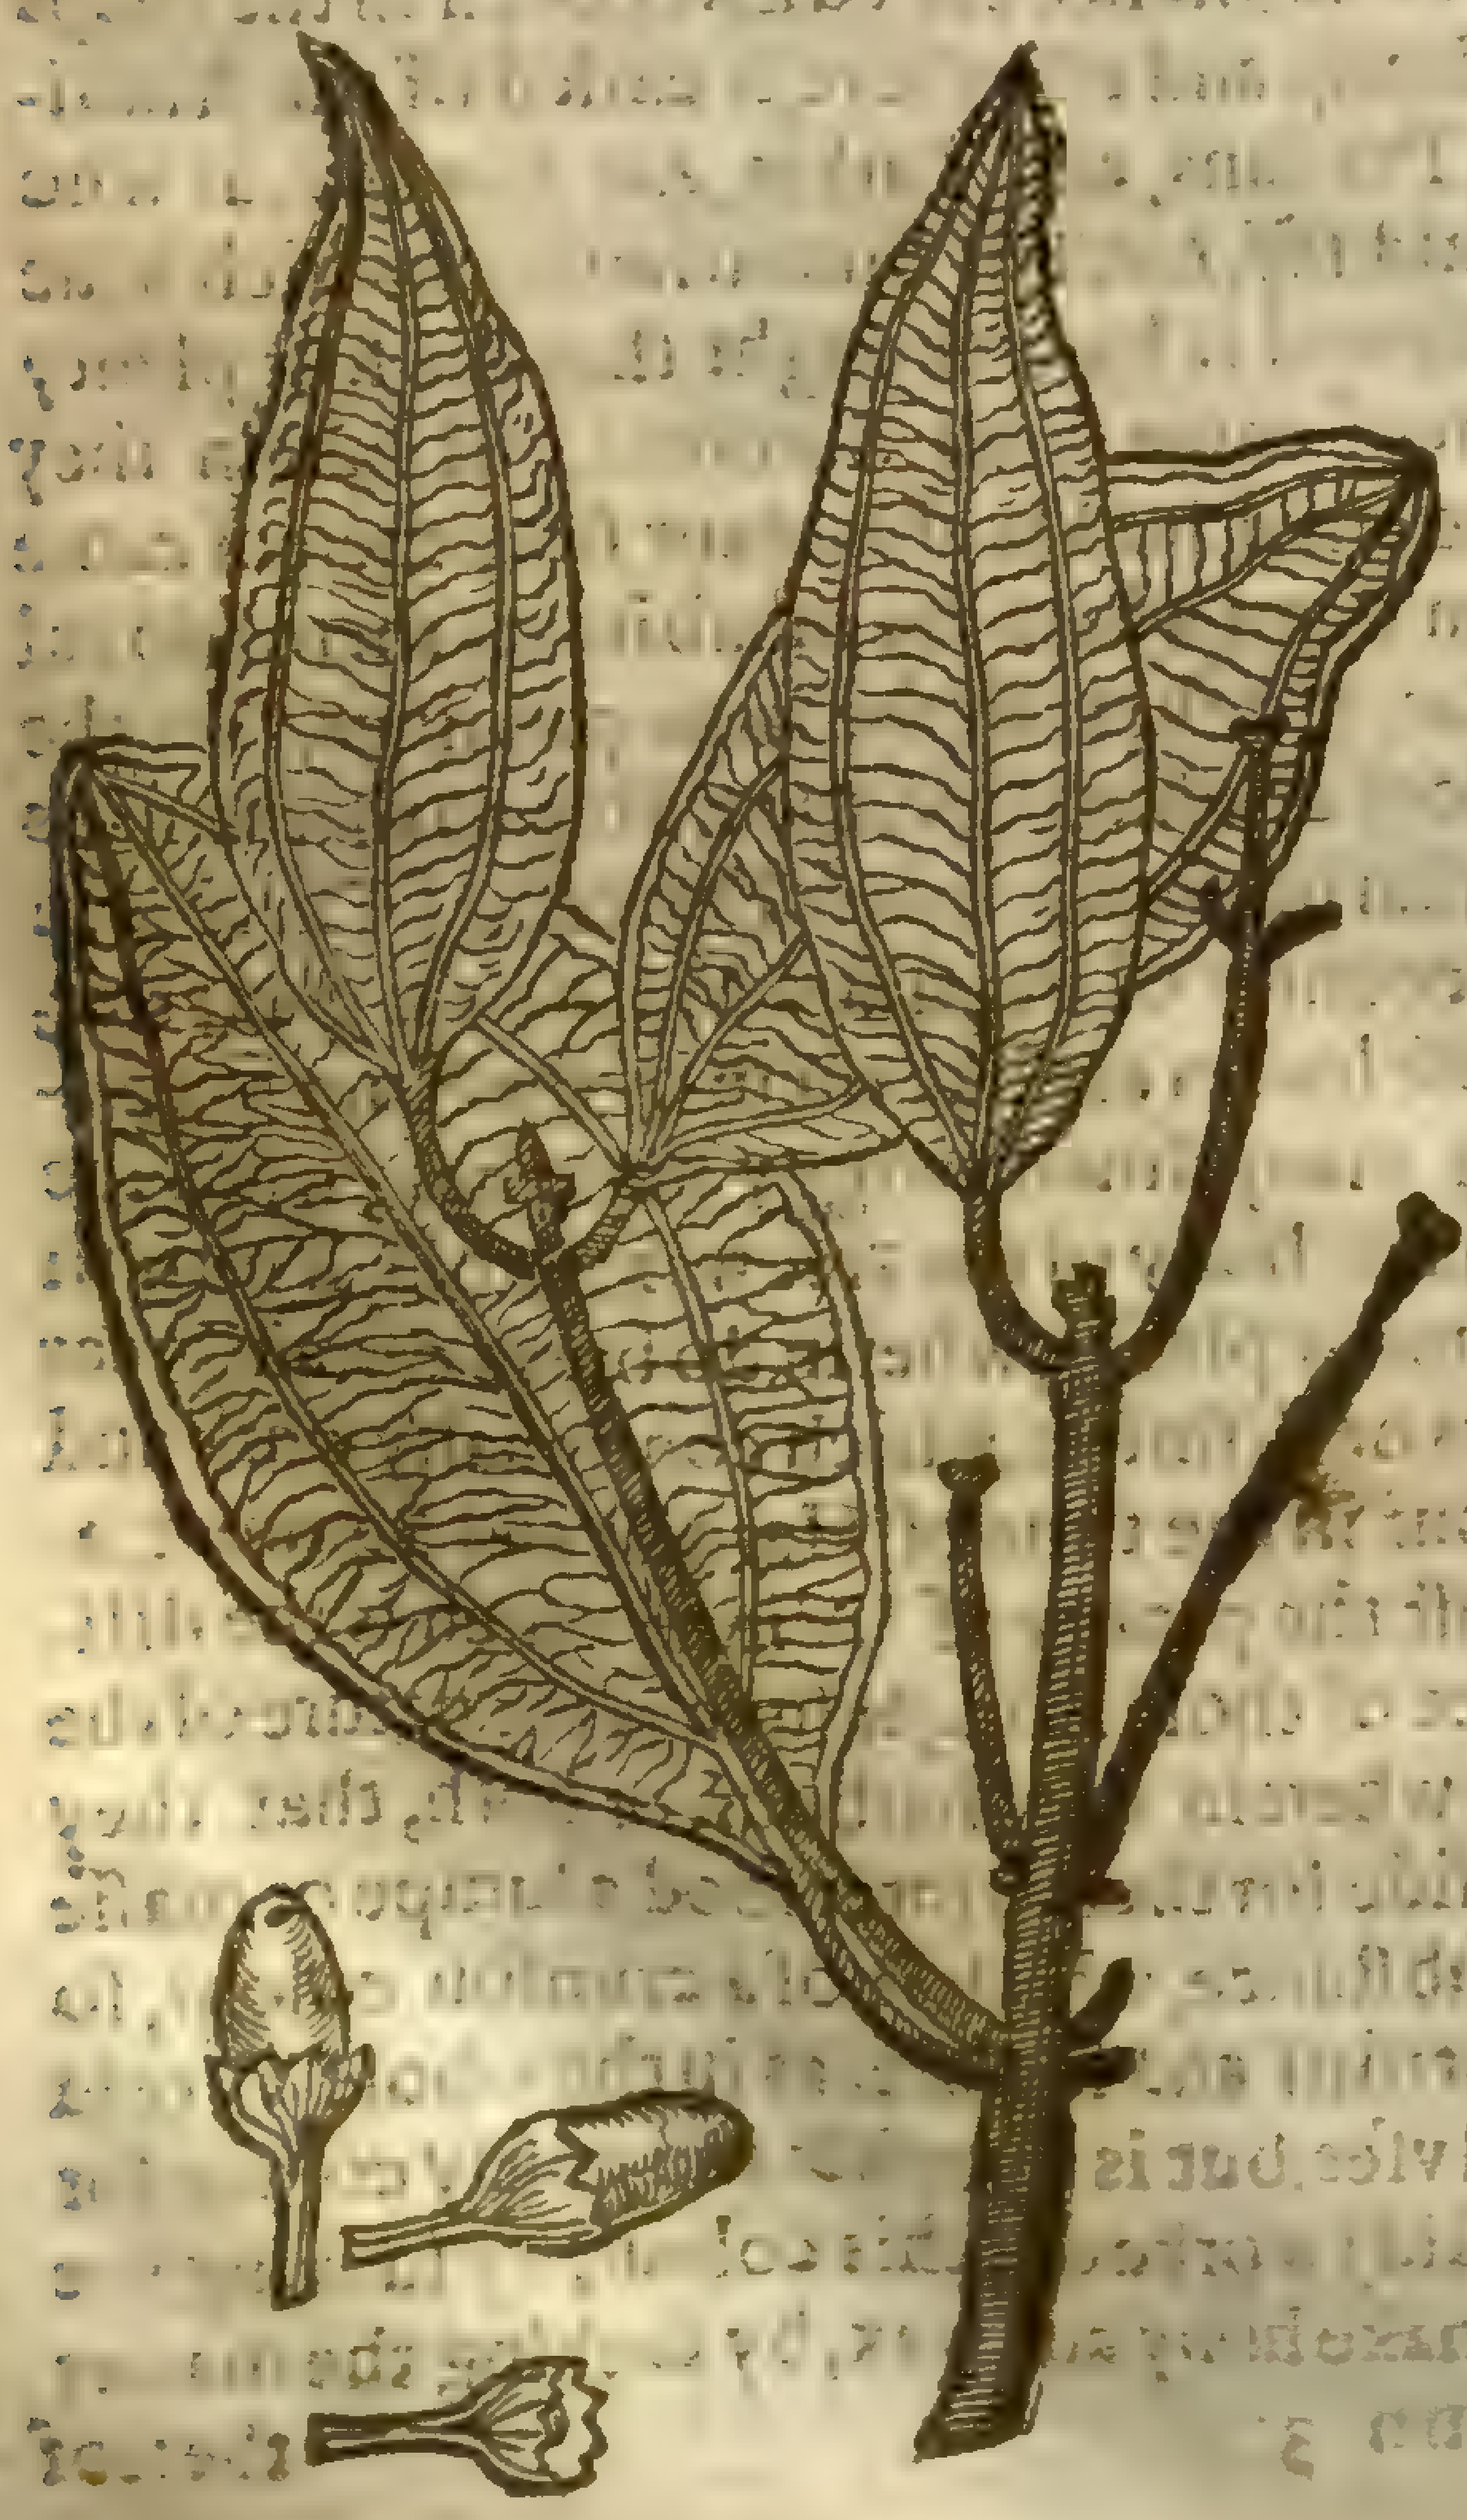
¶ *The Temperature and Vertues.*

A Lacke or Lacca is hot in the ſecond degree, it comforteth the heart and liuer, openeth obſtructions, expelleth vrine, and preuaileth againſt the dropſie.

B There is an artificiall Lacke made of the ſcrapings of Braſill and Saffron, which is vſed of Painters, and not to be vſed in Phyſicke as the other naturall Lacca.

Chap. 149. *Of the Indian leafe.*

Tamalapatra.
The Indian leafe.



¶ *The Deſcription.*

Tamalapatra, or the Indian leafe grows vpon a great tree like the Orenge tree, with like leaues alſo, but broader, a little ſharp pointed, of a greene gliſtering colour, and three ſmall ribs running through each leafe, after the manner of Ribwort, wherby it is eaſie to be known: it ſmelleth ſomewhat like vnto Cloues, but not ſo ſtrong as Spikenard or Mace (as ſome haue deemed) nor yet of ſo ſubtill and quick a ſent as Cinnamon. There was ſent or added vnto this figure by *Cortuſus* a certaine fruit like vnto a ſmall Acorn, with this inſcription, *Fructus Canellæ*, the fruit of the Canell tree, which may be doubted of, conſidering the deſcription of the forenamed tree holden generally of moſt to be perfect.

¶ *The Place.*

The Indian leafe groweth not fleeting vpon the water like vnto *Lens Paluſtris*, as *Dioſcorides* and *Pliny* doe ſet downe, (though learned and painfull writers) but is the leafe of a great tree, a branch whereof we haue ſet forth vnto your view, which groweth in Arabia and Cambaya, far from the water ſide.

¶ *The Time.*

Of the time we haue no certain knowledge, but it is ſuppoſed to bee greene Winter and Summer.

¶ *The Names.*

Tamalapatra is called of the Indians in their mother tongue, eſpecially of the Arabians, *Cadegi Indi*, or *Ladegi Indi*, that is, *Folium Indicum*, or *Indum*, the Indian leafe: but the Mauritanians doe call it *Tembul*. The Latines and Græcians following ſome of the Arabians, haue called it *Malabathrum*.

¶ *The Temperature and Vertues.*

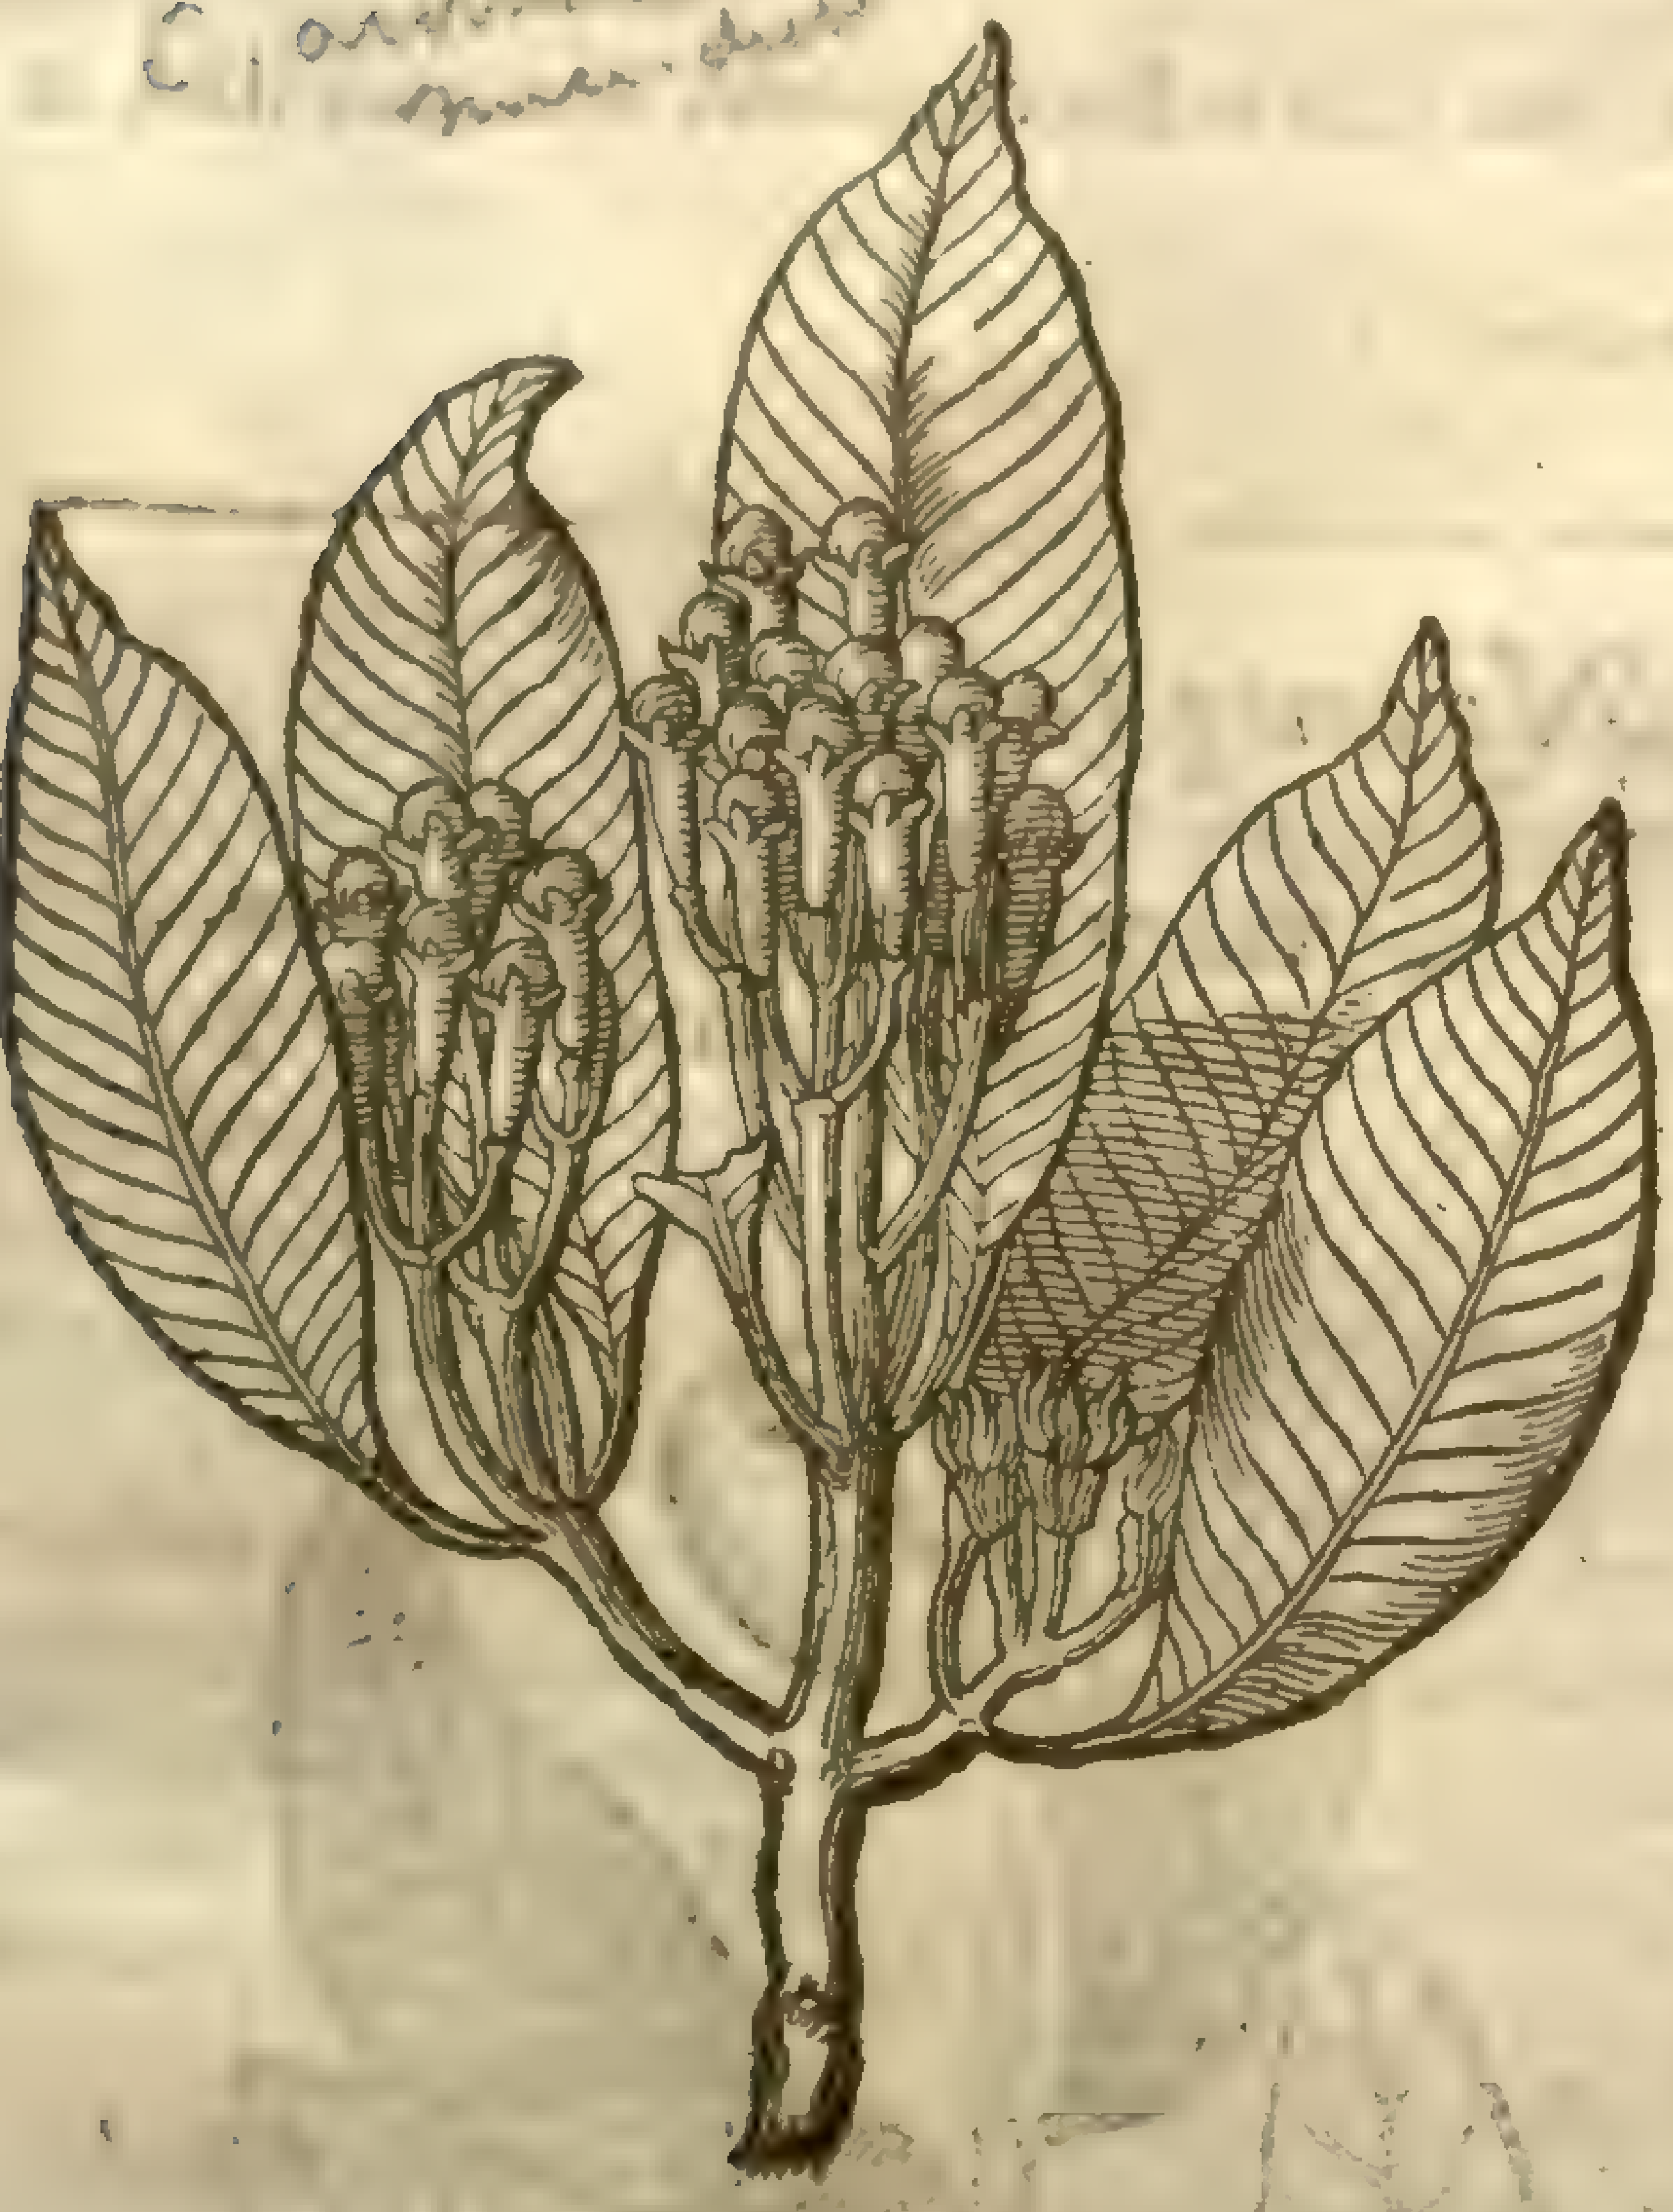
The Indian leafe is hot and dry in the ſecond degree, agreeing with Nardus in temperature, or as others report with Mace: it prouoketh vrine mightily, warmeth and comforteth the ſtomacke, and helpeth digeſtion. A

It preuaileth againſt the pin and web in the eies, the inflamed and waterie eies, and all other infirmities of the ſame. B

It is laid among cloathes, as well to keepe them from mothes and other vermine, as alſo to giue vnto them a ſweet ſmell. C

CHAP. 150. *Of the Cloue tree.*

Caryophylli veri Cluſij.
The true forme of the Cloue tree.



¶ *The Deſcription.*

THe Cloue tree groweth great in forme like vnto the Bay tree, the trunke or body whereof is couered with a ruſſet barke: the branches are many, long, and very brittle, whereupon doe grow leaues like thoſe of the Bay tree, but ſomewhat narrower: amongſt which come the floures, white at the firſt, after of a greeniſh colour, waxing of a darke red colour in the end: which floures are the very cloues when they grow hard: after when they bee dried in the Sunne they become of that dusky black colour which we daily ſee, wherein they continue. For thoſe that wee haue in eſtimation are beaten downe to the ground before they be ripe, and are ſuffered there to lie vpon the ground vntill they bee dried throughly, where there is neither graſſe, weeds, nor any other herbes growing to hinder the ſame, by reaſon the tree draweth vnto it ſelfe for his nouriſhment all the moiſture of the earth a great circuit round about, ſo that nothing can there grow for want of moiſture, and therfore the more conuenient for the drying of the Cloues. Contrariwiſe, that groſſe kinde of Cloues which hath beene ſuppoſed to be the male, are nothing elſe than fruit of the ſame tree tarrying there vntill it fall downe of it ſelfe vnto the ground, where by reaſon of his long lying, and meeting with ſome raine in the meane ſeaſon, it loſeth the quicke taſte that the others haue. Some haue called theſe *Fuſti*, whereof we may Engliſh them Fuſſes. Some affirme that the floures hereof ſurpaſſe all other floures in ſweetneſſe when they are greene; and hold the opinion, that the hardned floures are not the Cloues themſelues, (as we haue written) but thinke them rather to be the ſeat or huske wherein the floures doe grow: the greater number hold the former opinion. And further, that the trees are increaſed without labour, graffing, planting, or other induſtrie, but by the falling of the fruit, which beare fruit within eight yeares after they be riſen vp, and ſo continue bearing for an hundred yeares together, as the inhabitants of that country do affirme.

¶ *The Place.*

The Cloue tree groweth in ſome few places of the Molucca Iſlands, as in Zeilan, Iaua the greater and the leſſer, and in diuers other places.

¶ The

¶ *The Time.*

The Cloues are gathered from the fifteenth of September vnto the end of February, not with hands, as we gather Apples, Cherries, and ſuch like fruit, but by beating the tree, as Wall-nuts are gotten, as we haue written in the deſcription.

¶ *The Names.*

The fruit hereof was vnknowne to the antient Grecians: of the later writers called Καρυόφυλλον: in Latine alſo *Caryophyllus*, and *Clavus*: in French, *Clou de Gyrofle*: the Mauritanians, *Charumfel*: in Italian, *Carofano*: in high Dutch, **Naegel**: in Spaniſh, *Clauo de eſpecia*: of the Indians, *Calafur*: in the Molucca's, *Changue*: of the Pandets, *Arumfel*, and *Charumfel*: in Engliſh, Cloue tree, and Cloues.

¶ *The Temperature.*

Cloues are hot and dry in the third degree.

¶ *The Vertues.*

A Cloues ſtrengthen the ſtomacke, liuer, and heart, helpe digeſtion, and prouoketh vrine.

B The Portugall women that dwell in the Eaſt Indies draw from the Cloues when they bee yet greene, a certaine liquor by diſtillation, of a moſt fragrant ſmell, which comforteth the heart, and is of all Cordials the moſt effectuall.

C Cloues ſtop the belly: the oile or water thereof dropped into the eies, ſharpens the ſight, and clenſeth away the cloud or web in the ſame.

D The weight of foure drams of the pouder of Cloues taken in milke procureth the act of generation.

E There is extracted from the Cloues a certaine oile or rather thicke butter of a yellow colour; which being chafed in the hands ſmelleth like the Cloues themſelues, wherewith the Indians doe cure their wounds and other hurts, as we do with Balſam.

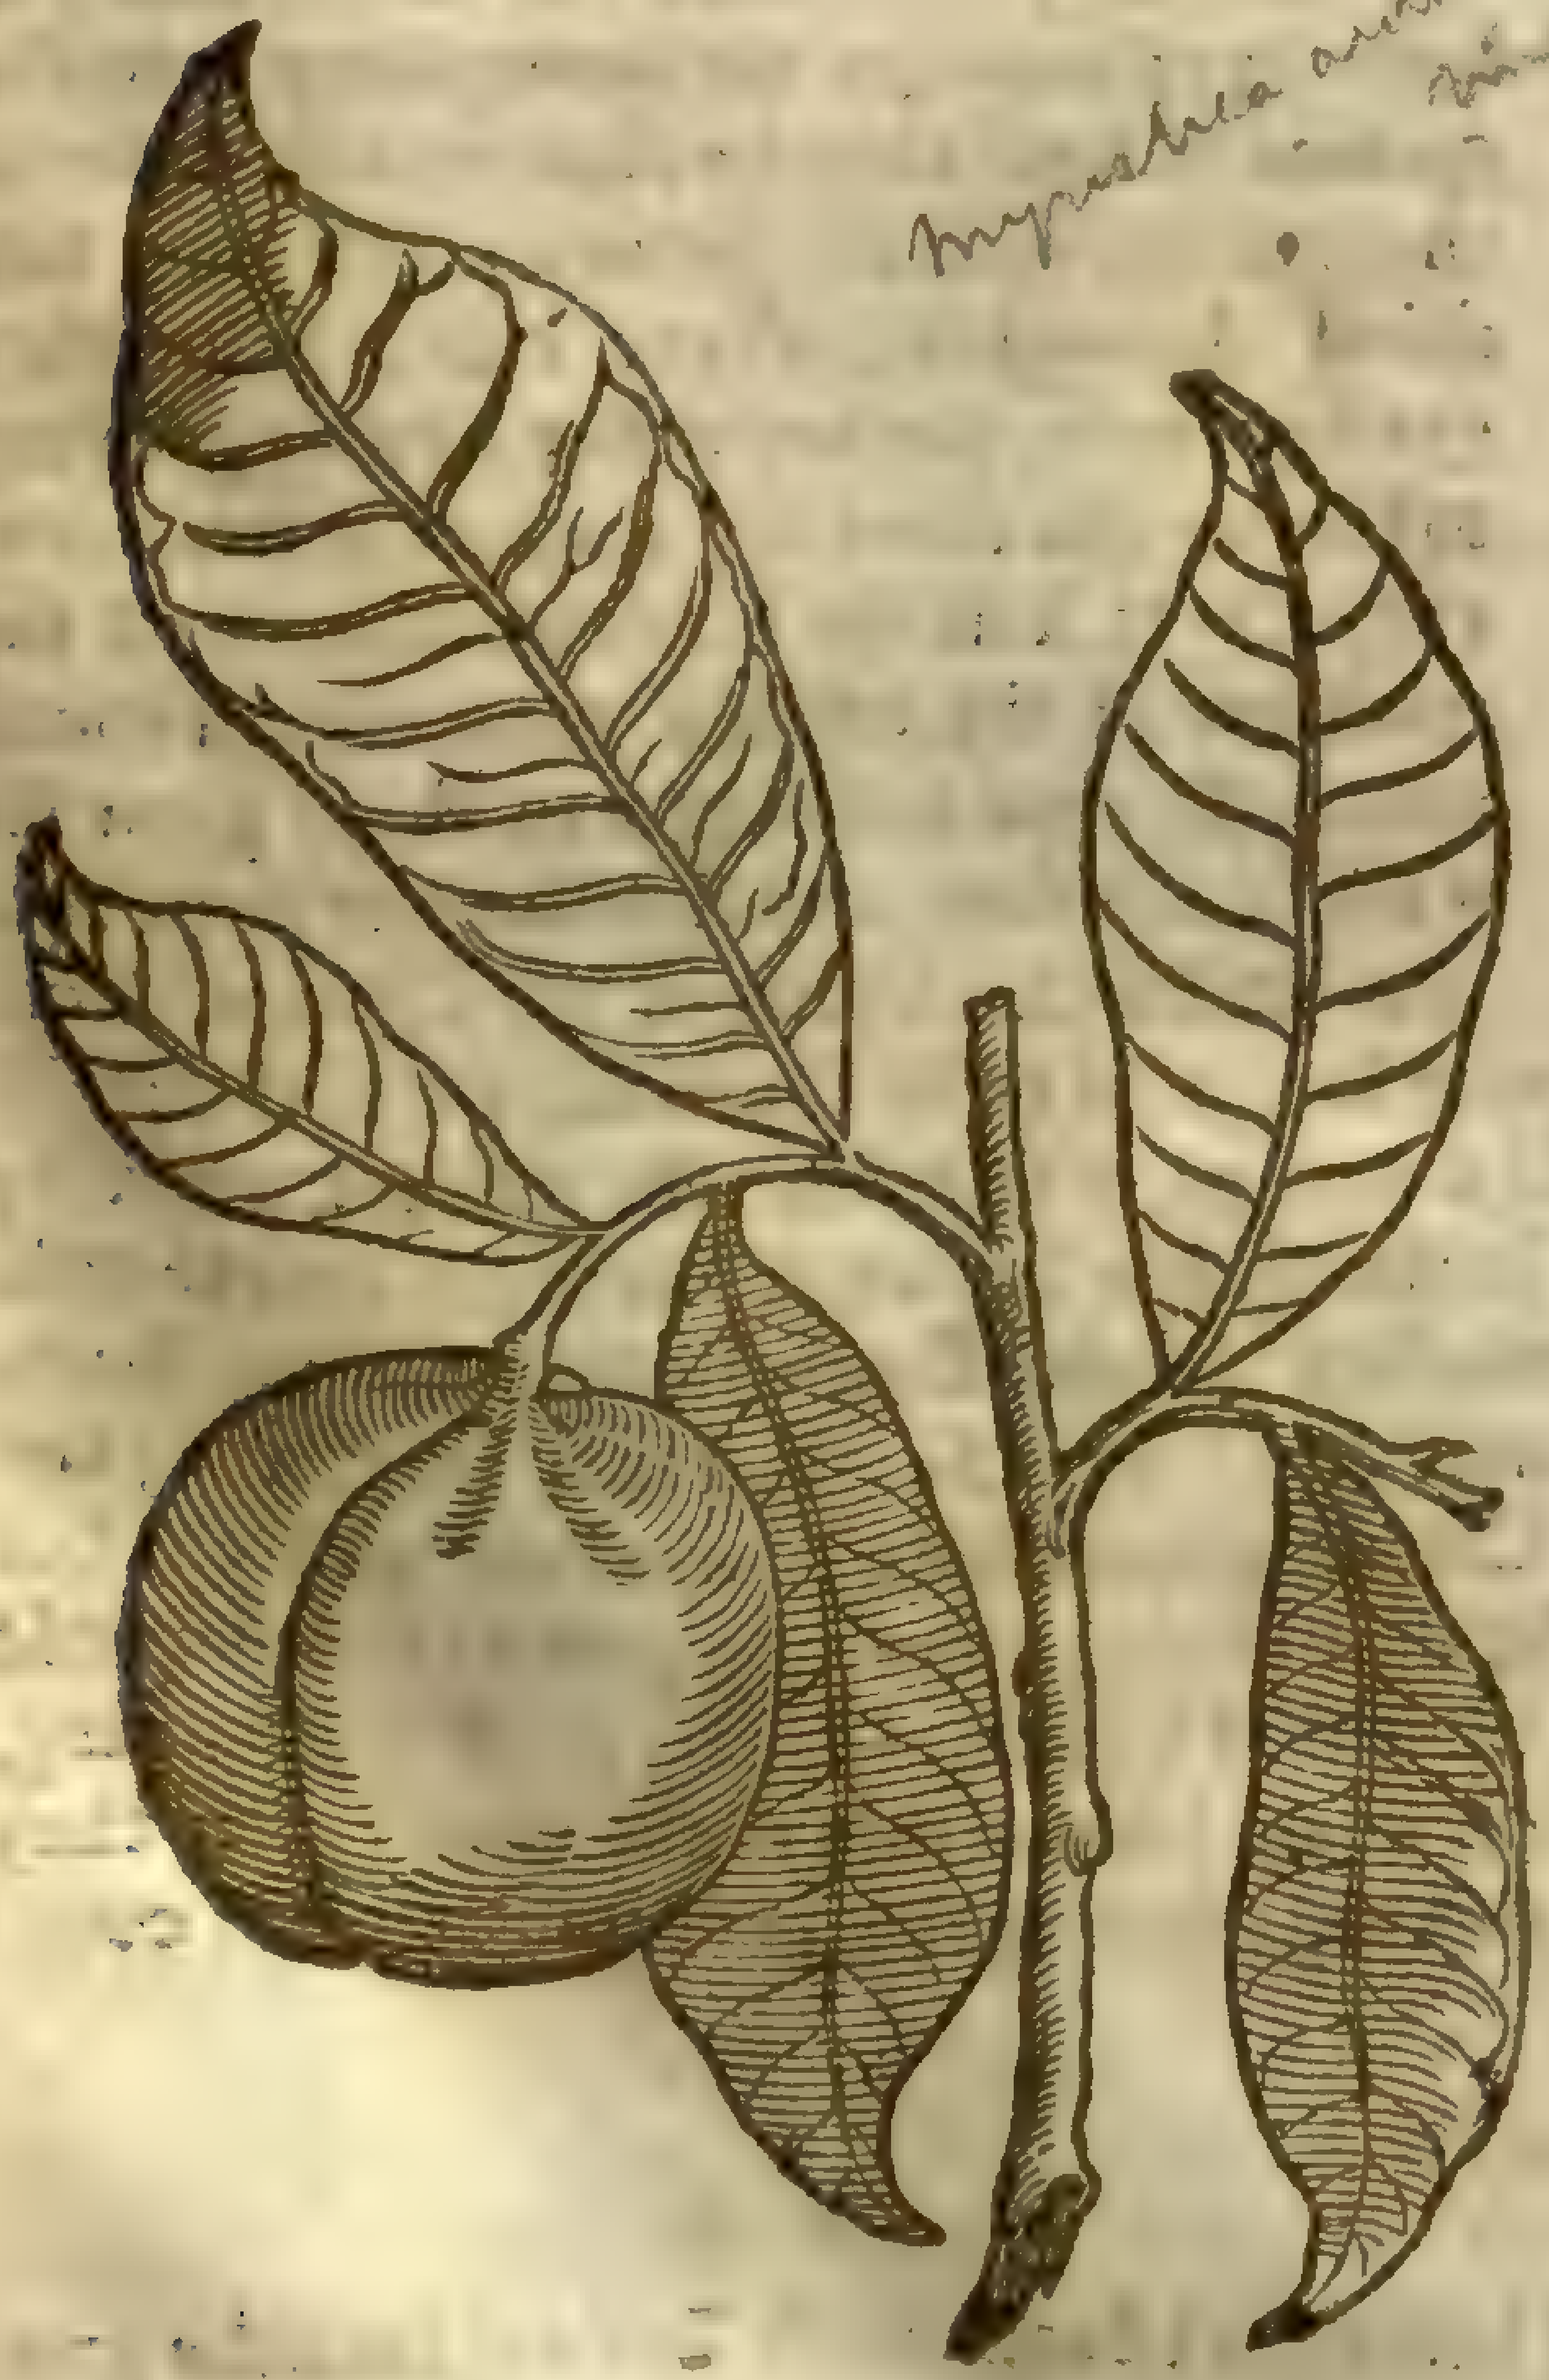
F The vſe of Cloues, not onely in meate and medicine, but alſo in ſweet pouder and ſuch like, is ſufficiently knowne: therefore this ſhall ſuffice.

† There were formerly three figures in this chapter: wherefore I omitted two as impertinent.

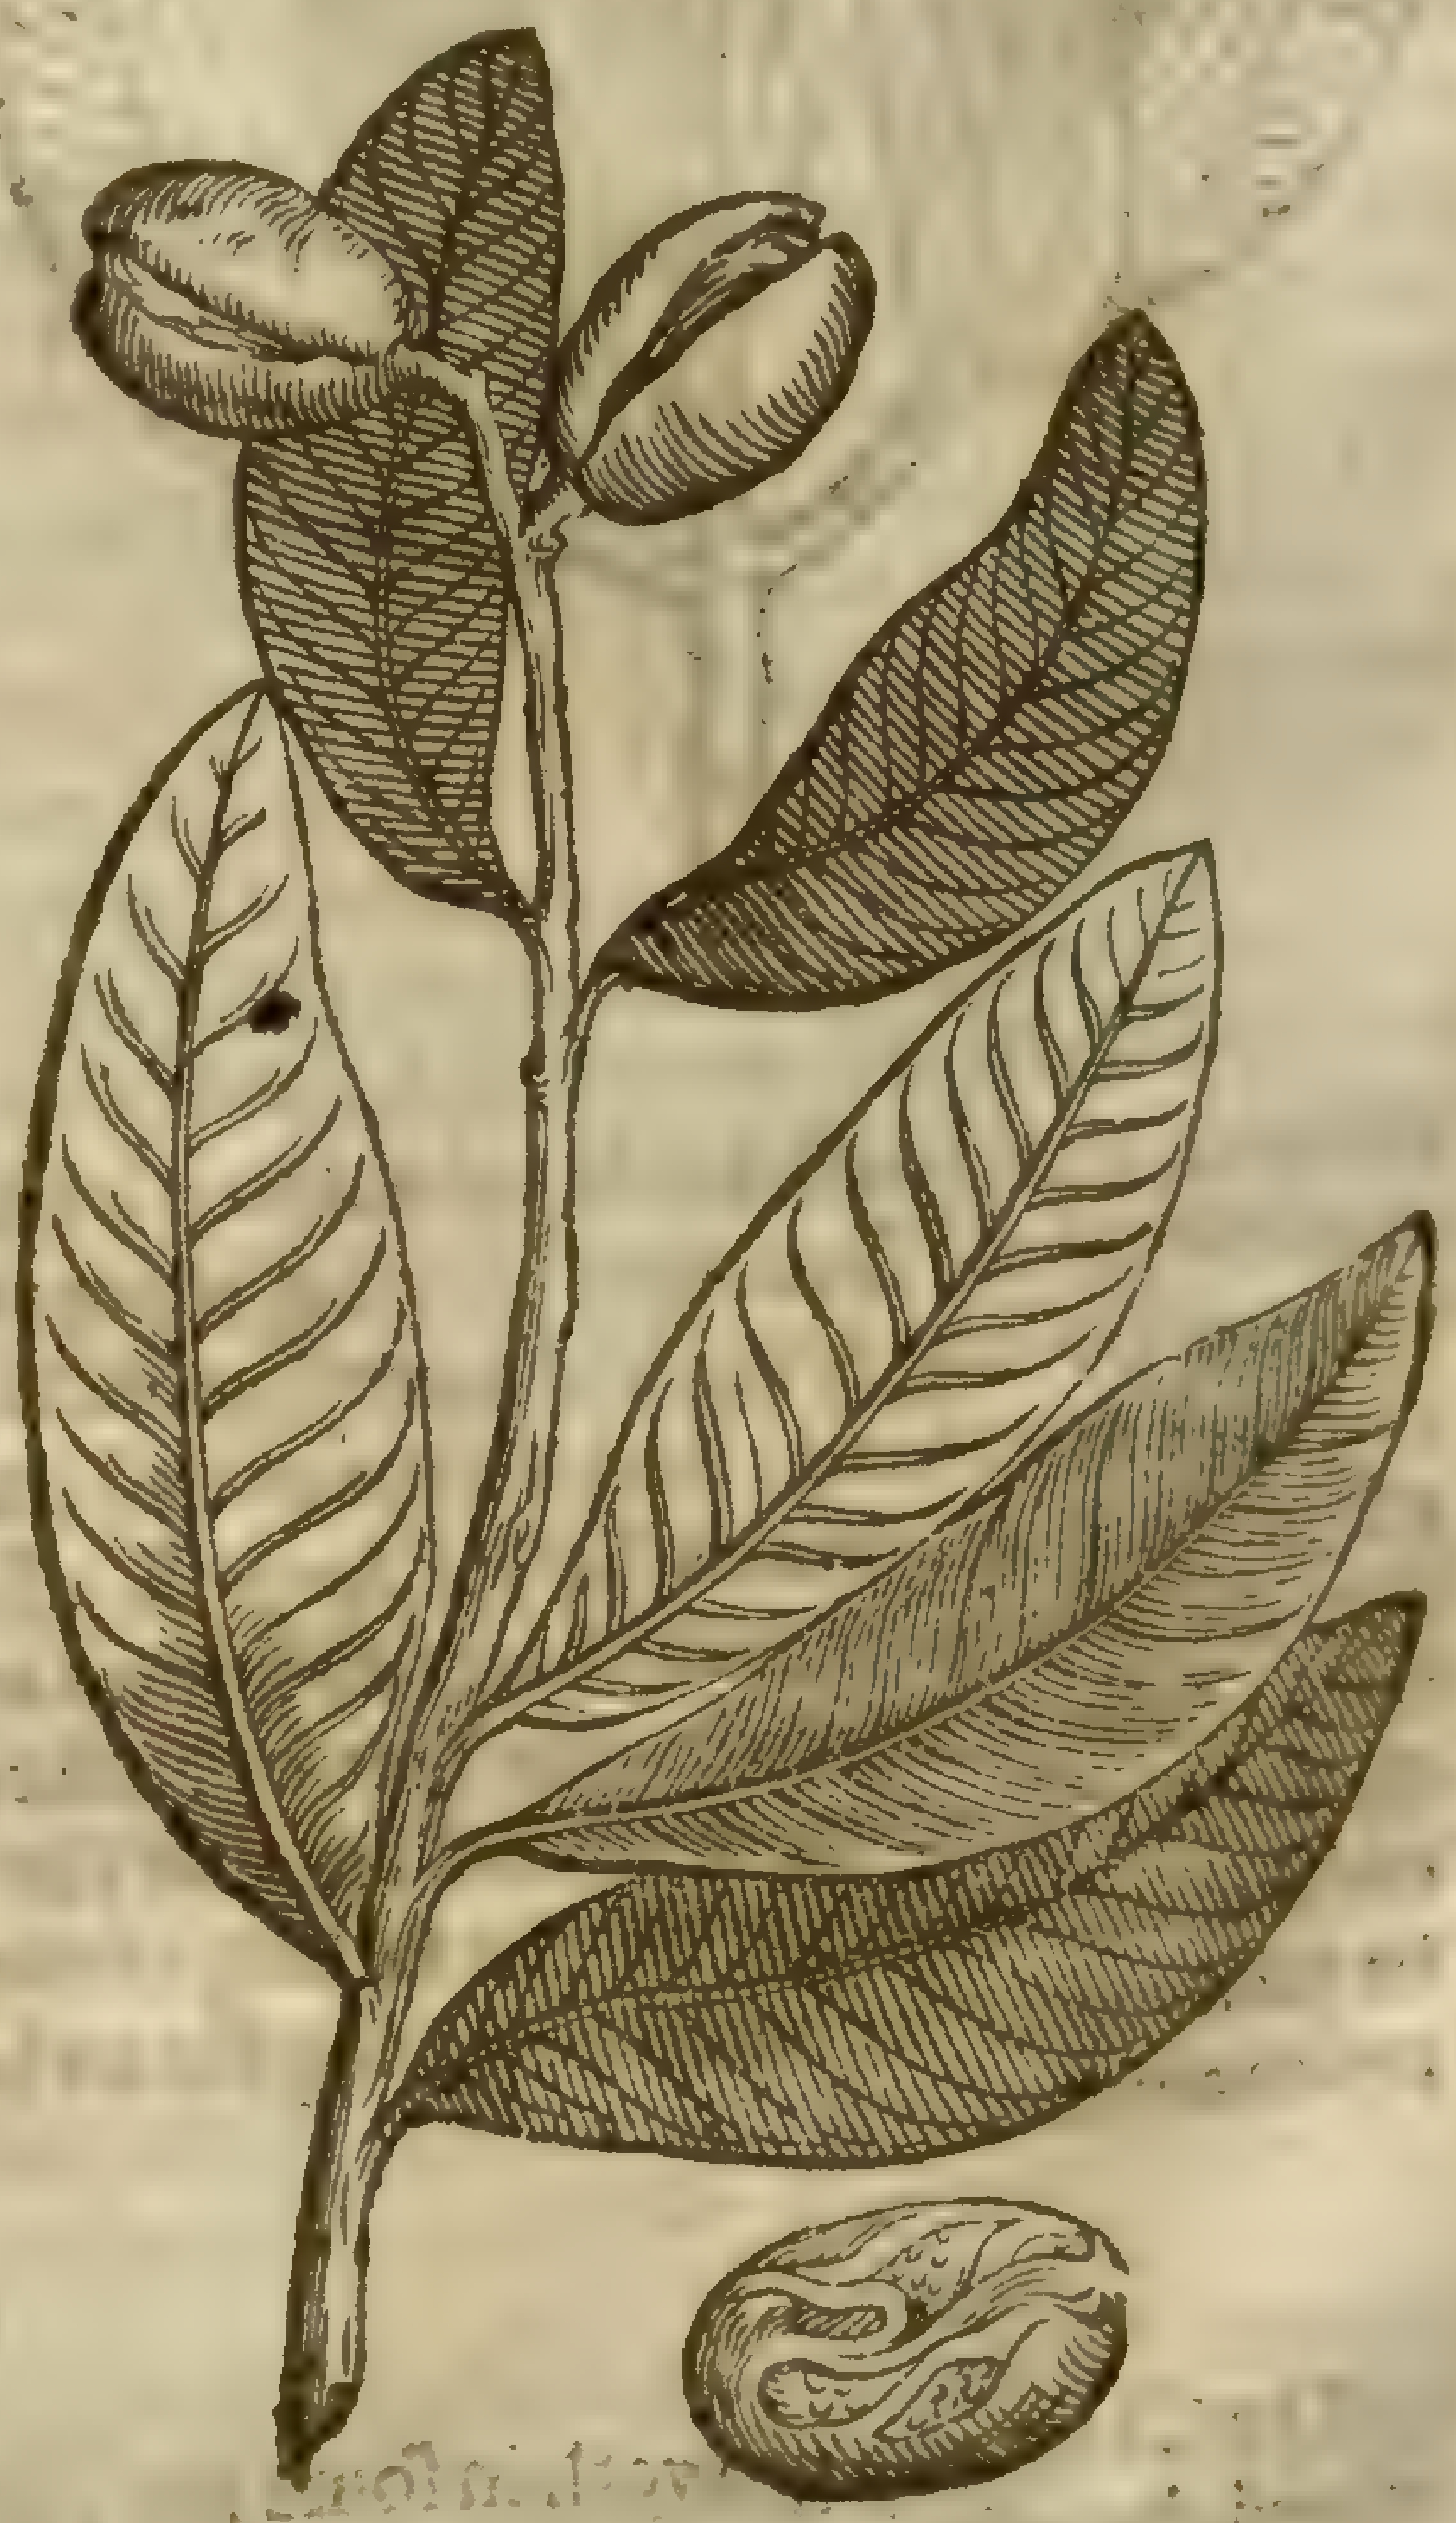
Chap. 151. *Of the Nutmeg tree.*

1 *Nux Muſcata rotunda, ſiue fœmina.*
The round or female Nutmeg.

Myristica aromatica [illegible]

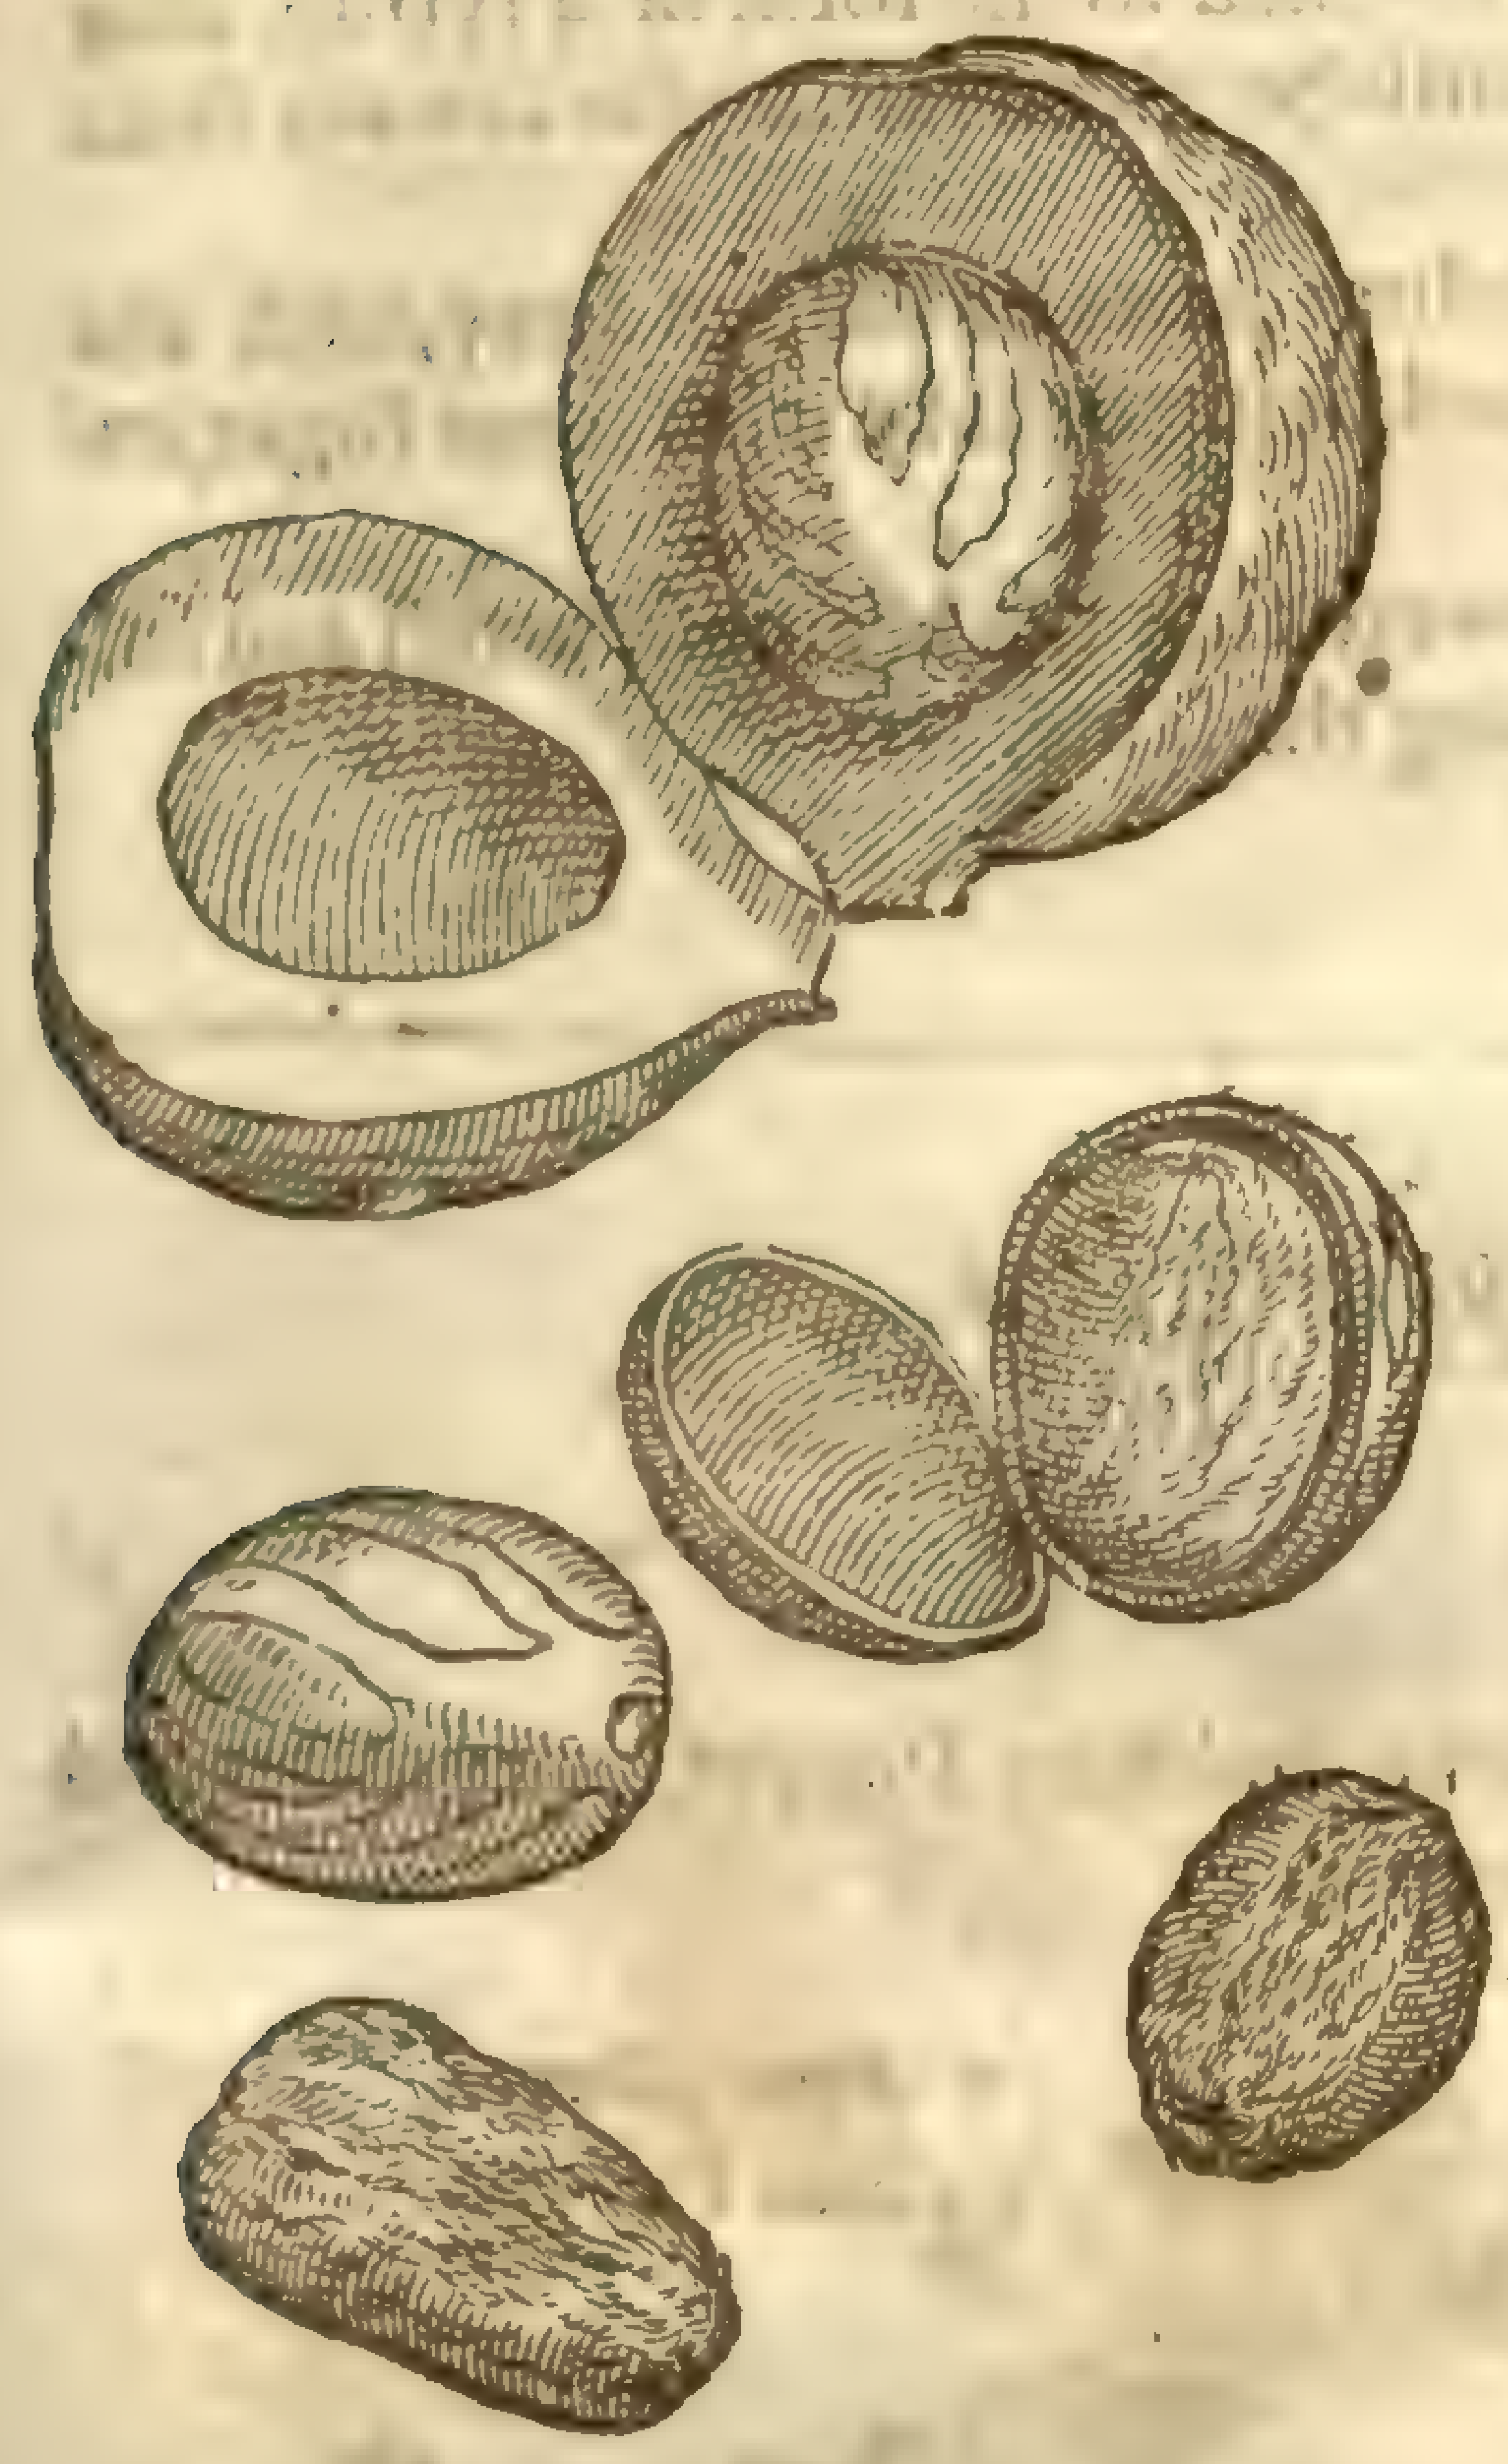


2 *Nux Myriſtica oblonga, ſiue mas.*
The longiſh or male Nutmeg.



Nux Moſchata cum ſua Maci.
The Nutmeg with his Mace about him.

Myristica [illegible]



¶ *The Deſcription.*

1 The tree that beareth the Nutmeg and the Mace is in form like to the Peare tree, but the leaues of it are like thoſe of the Orenge tree, alwaies green on the vpper ſide, and more whitiſh vnderneath; amongſt which come forth the Nut and Mace as it were the floures. The Nut appeares firſt, compaſſed about with the Mace, as it were in the middle of a ſingle roſe, which in proces of time doth wrap and incloſe the Nut round on euery ſide: after commeth the huske like that of the Wallnut, but of an harder ſubſtance, which incloſeth the Nut with his Mace as the Walll-nut husk doth couer the Nut, which in time of ripeneſſe cleaueth of it ſelf as the walnut huske doth, and ſheweth his Mace, which then is of a perfect crimſon colour, and makes a moſt goodly ſhew, eſpecially when the tree is well laden with fruit: after the Nut becomes dry, the Mace likewiſe gapeth and forſaketh the nut, euen as the firſt husk or couerture, and leaueth it bare as we all doe know. At which time it getteth to it ſelfe a kinde of darke yellow colour, and loſeth that braue crimſon dye which it had at the firſt.

‡ 2 The tree which carrieth the male Nutmeg (according to *Cluſius*) thus differs from the laſt deſcribed: the leaues are like thoſe of the former in ſhape, much bigger, being ſometimes a foot long, and three or foure inches broad; their common length is ſeuen or eight inches, and bredth two and a halfe: they are of a whitiſh colour vnderneath, and green and ſhining aboue. The Nuts alſo grow at the very ends of the branches, ſomtimes two or three together, and not only one, as in the common kinde. The nut it ſelfe is alſo larger and longer: the Mace that incompaſſeth it is of a more elegant colour, but not ſo ſtrong as that of the former.

‡ I can ſcarſe beleeue our Authors aſſertion in the foregoing deſcription, that the Nut appeareth firſt, compaſſed about with the Mace as it were in the midſt of a ſingle Roſe, &c. But I rather thinke they all come forth together, the Nutmeg, Mace, the green outward husk and all, iuſt as we ſee Walnuts do, and only open themſelues when they come to full maturitie. In the third figure you may ſee expreſt the whole manner of the growing of the Nutmeg, together with both ſorts of Nutmegs taken forth of their ſhels. ‡

¶ *The Place.*

The Nutmeg tree groweth in the Indies, in an Iſland eſpecially called Banda, in the Iſlands of Molucca, and in Zeilan, though not ſo good as the firſt.

¶ *The Time.*

The fruit is gathered in September in great aboundance, all things beeing common in thoſe countries.

¶ *The Names.*

The Nutmeg tree is called of the Grecians Κάρυον μυρεψικόν: of the Latines, *Nux Moſchata*, and *Nux Myriſtica*: in Italian, *Noce Moſcada*: in Spaniſh, *Nuez de eſcetie*: in French, *Noix Muſcade*: in high-Dutch, **Moſchat Nuſz**: of the Arabians, *LeuZbane*, or *GianZiban*: of the country people where they grow, *Palla*; the Maces, *Bunapalla*. In Decan the Nut is called *Iapatri*; and the Maces, *Iaifol*: of *Auicen*, *Iauſiband* (i.) *Nux Bandenſis*. The Mace he calleth *Beſbaſe*. In Engliſh, Nutmeg.

¶ *The Temperature.*

The Nutmeg, as the Mauritanians write, is hot and dry in the ſecond degree compleat, and ſomwhat aſtringent.

¶ *The Vertues.*

A Nutmegs cauſe a ſweet breath, and mend thoſe that ſtinke, if they be much chewed and holden in the mouth.

B The Nutmeg is good agaiſt freckles in the face, quickneth the ſight, ſtrengthens the belly and feeble liuer, taketh away the ſwelling in the ſpleen, ſtayeth the laske, breaketh wind, and is good againſt all cold diſeaſes in the body.

C Nutmegs bruiſed and boiled in Aqua vitæ vntill they haue waſted and conſumed the moiſture, adding thereunto hony of Roſes, gently boiling them, being ſtrained to the form of a ſyrrup, cure all pains proceeding of windy and cold cauſes, if three ſpoonfulls be giuen faſting for certain daies together.

D The ſame bruiſed and boiled in ſtrong white Wine vntill three parts be ſodden away, with the roots of Motherwort added thereto in the boiling, and ſtrained, being drunke with ſome ſugar, cureth all gripings in the belly proceeding of windineſſe.

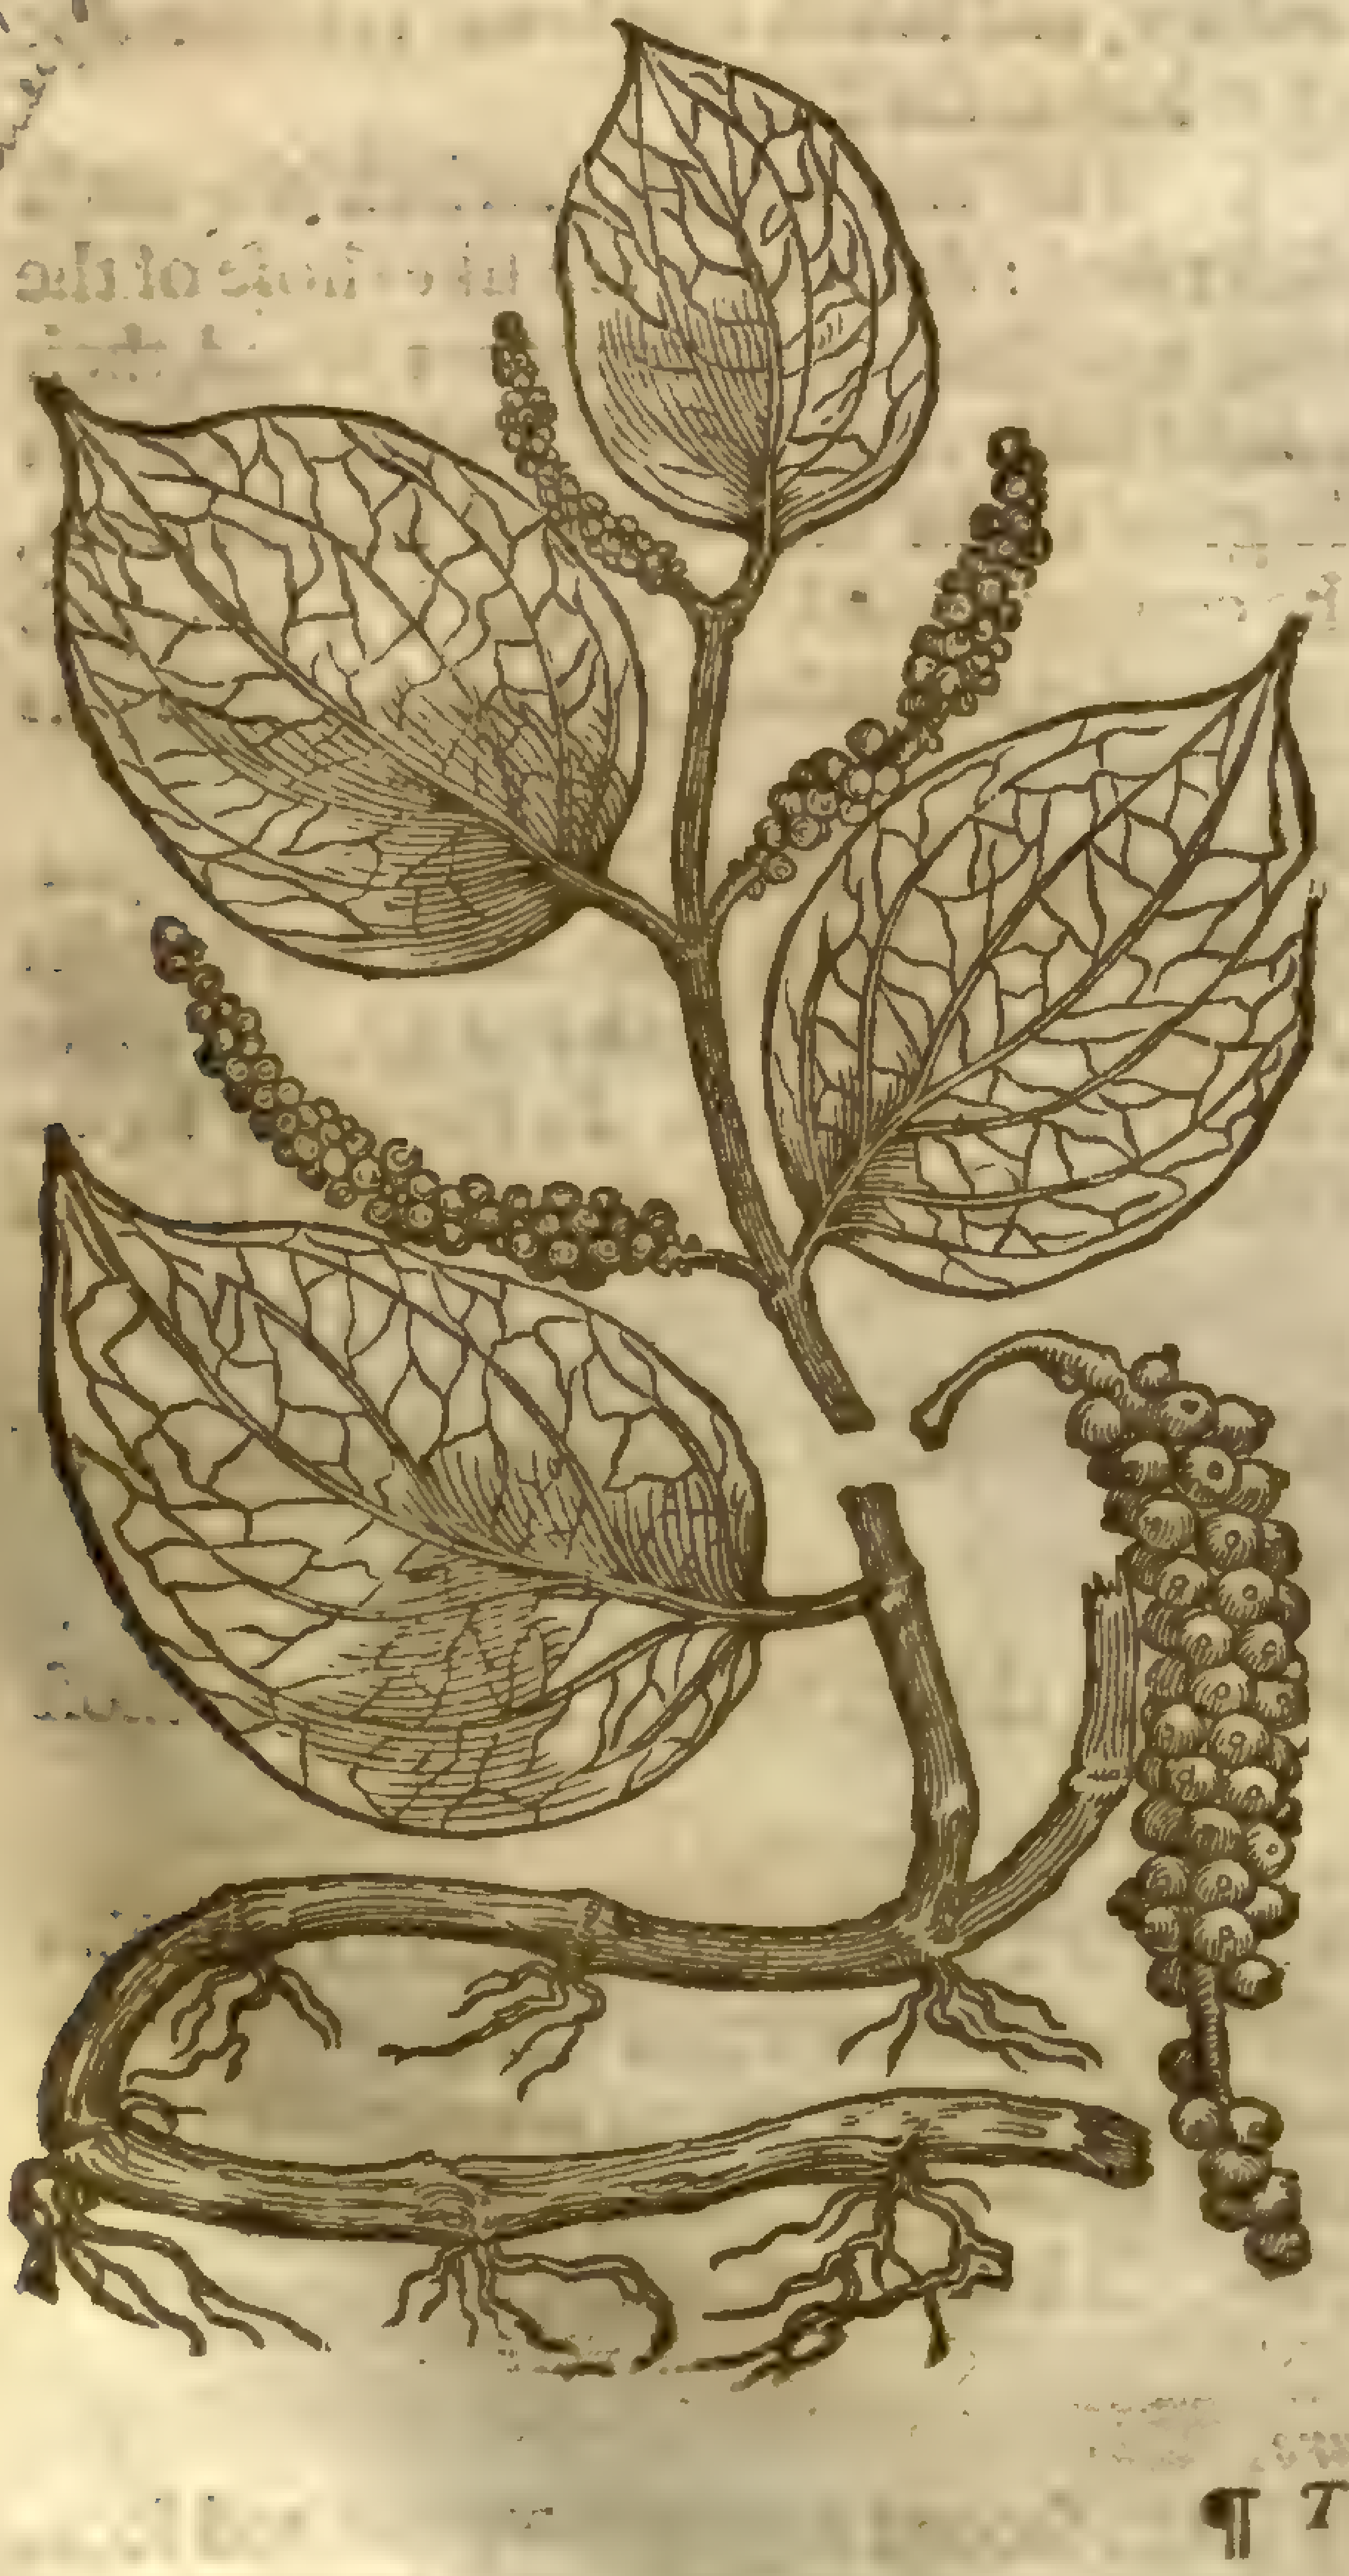
E As touching the choice, there is not any ſo ſimple but knoweth that the heauieſt, fatteſt and fulleſt of juice are beſt, which may eaſily be found out by pricking the ſame.

Chap. 152. *Of the Pepper Plant.*

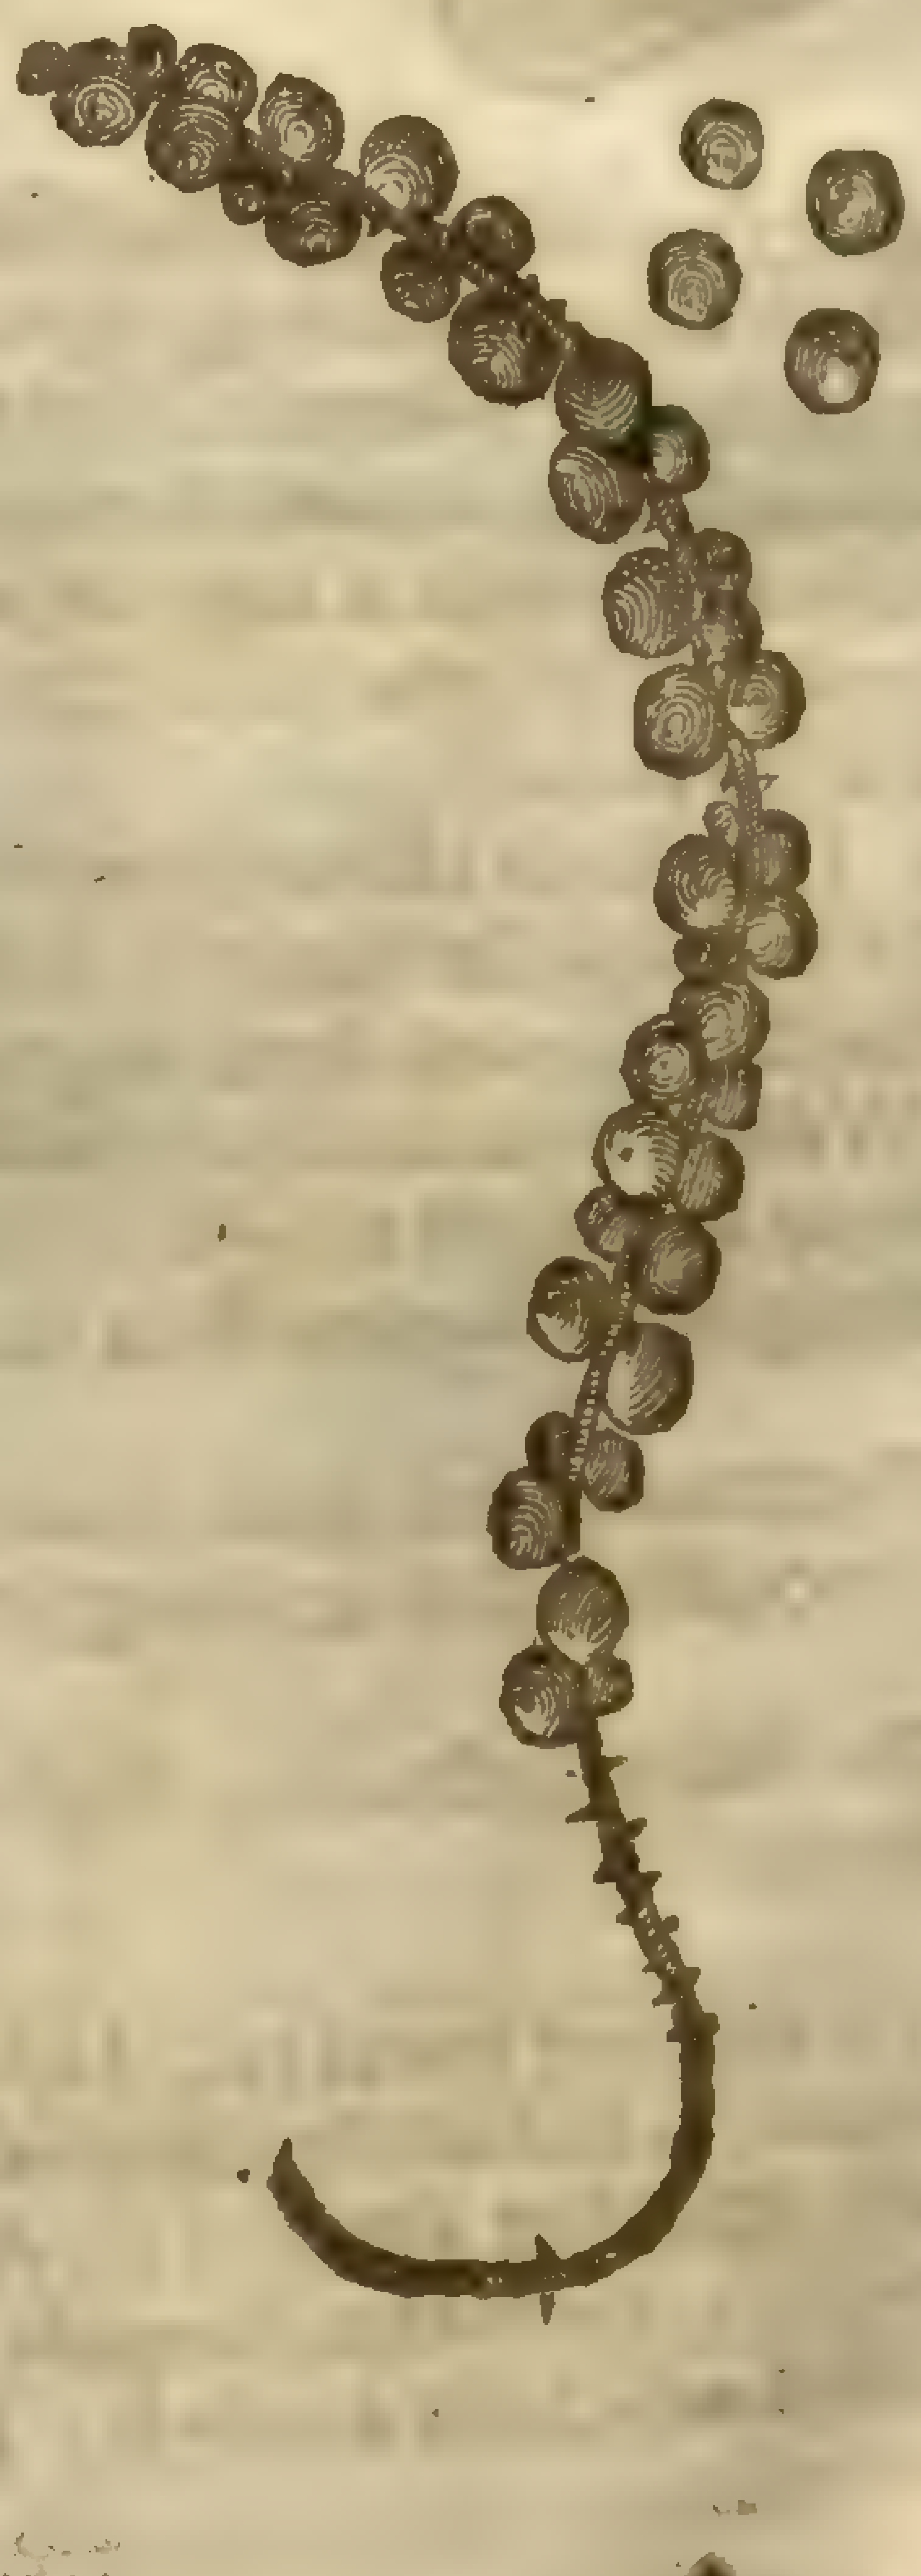
¶ *The Kindes.*

THere be diuers ſorts of Pepper, that is to ſay, white, blacke, and long Pepper, one greater and longer than the other; and alſo a kinde of Ethiopian Pepper.

P. nigrum, L. [illegible]



1 *Piper nigrum.*
Blacke Pepper.



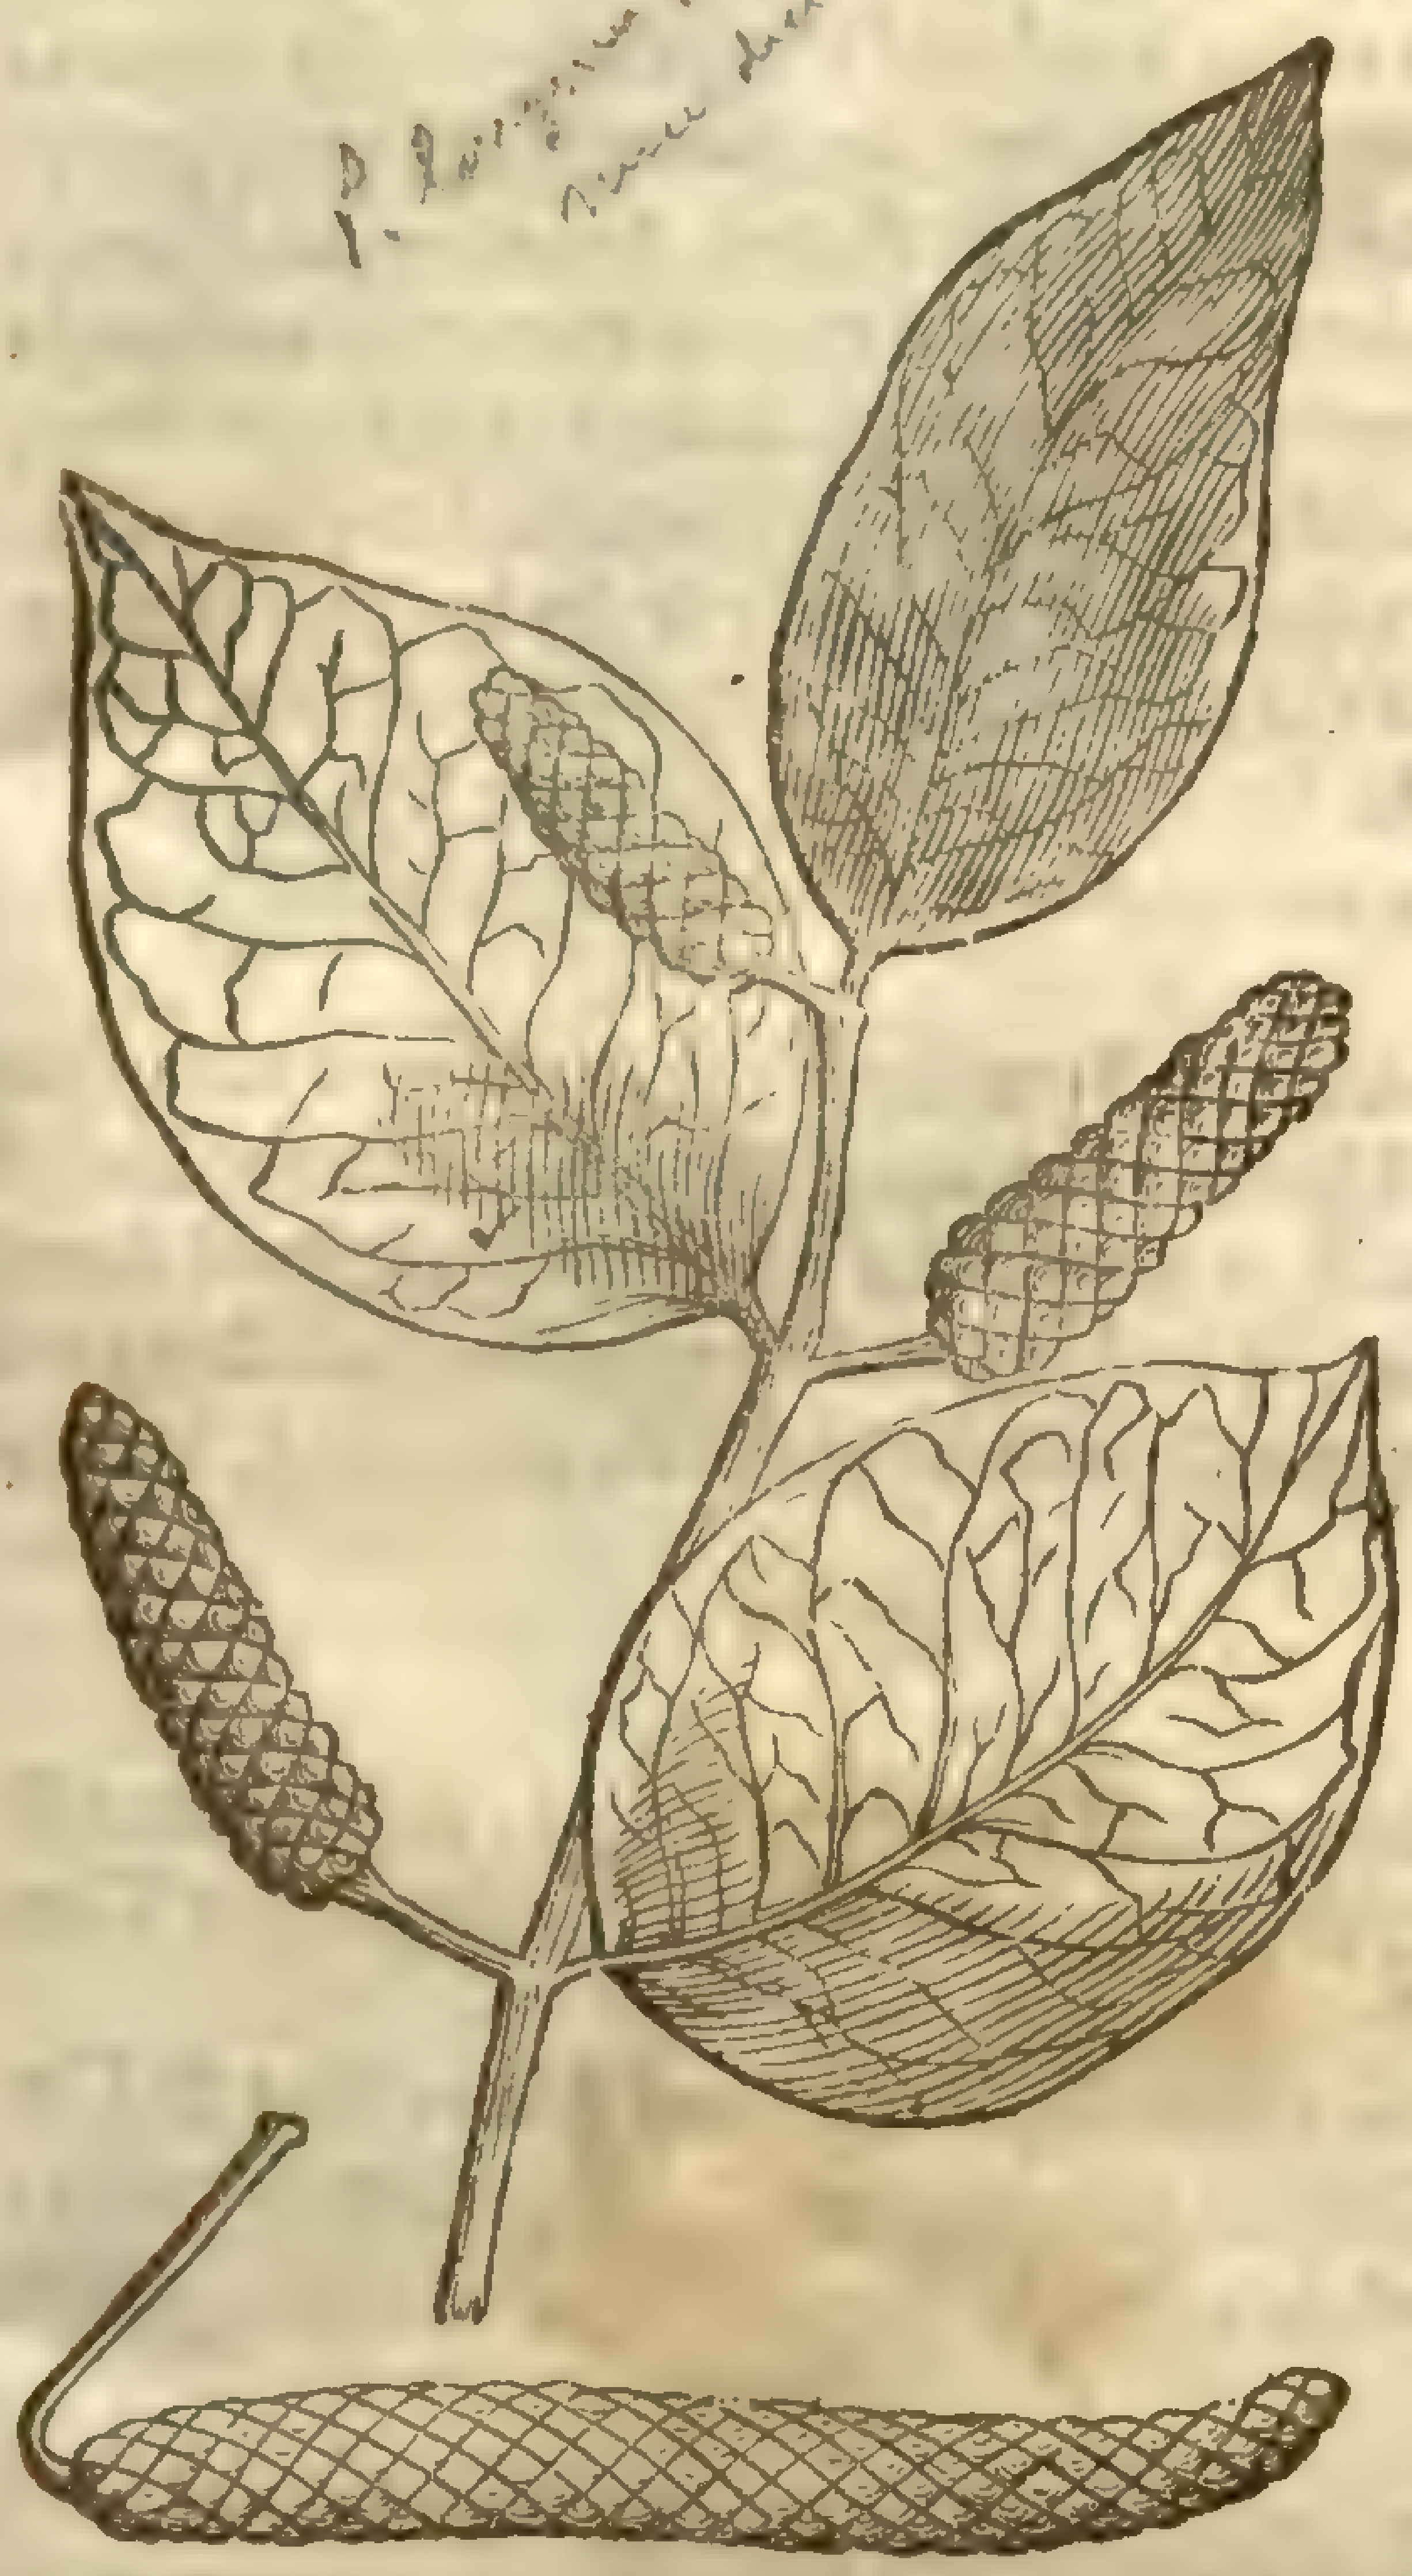
2 *Piper album.*
White Pepper.

¶ *The Deſcription.*

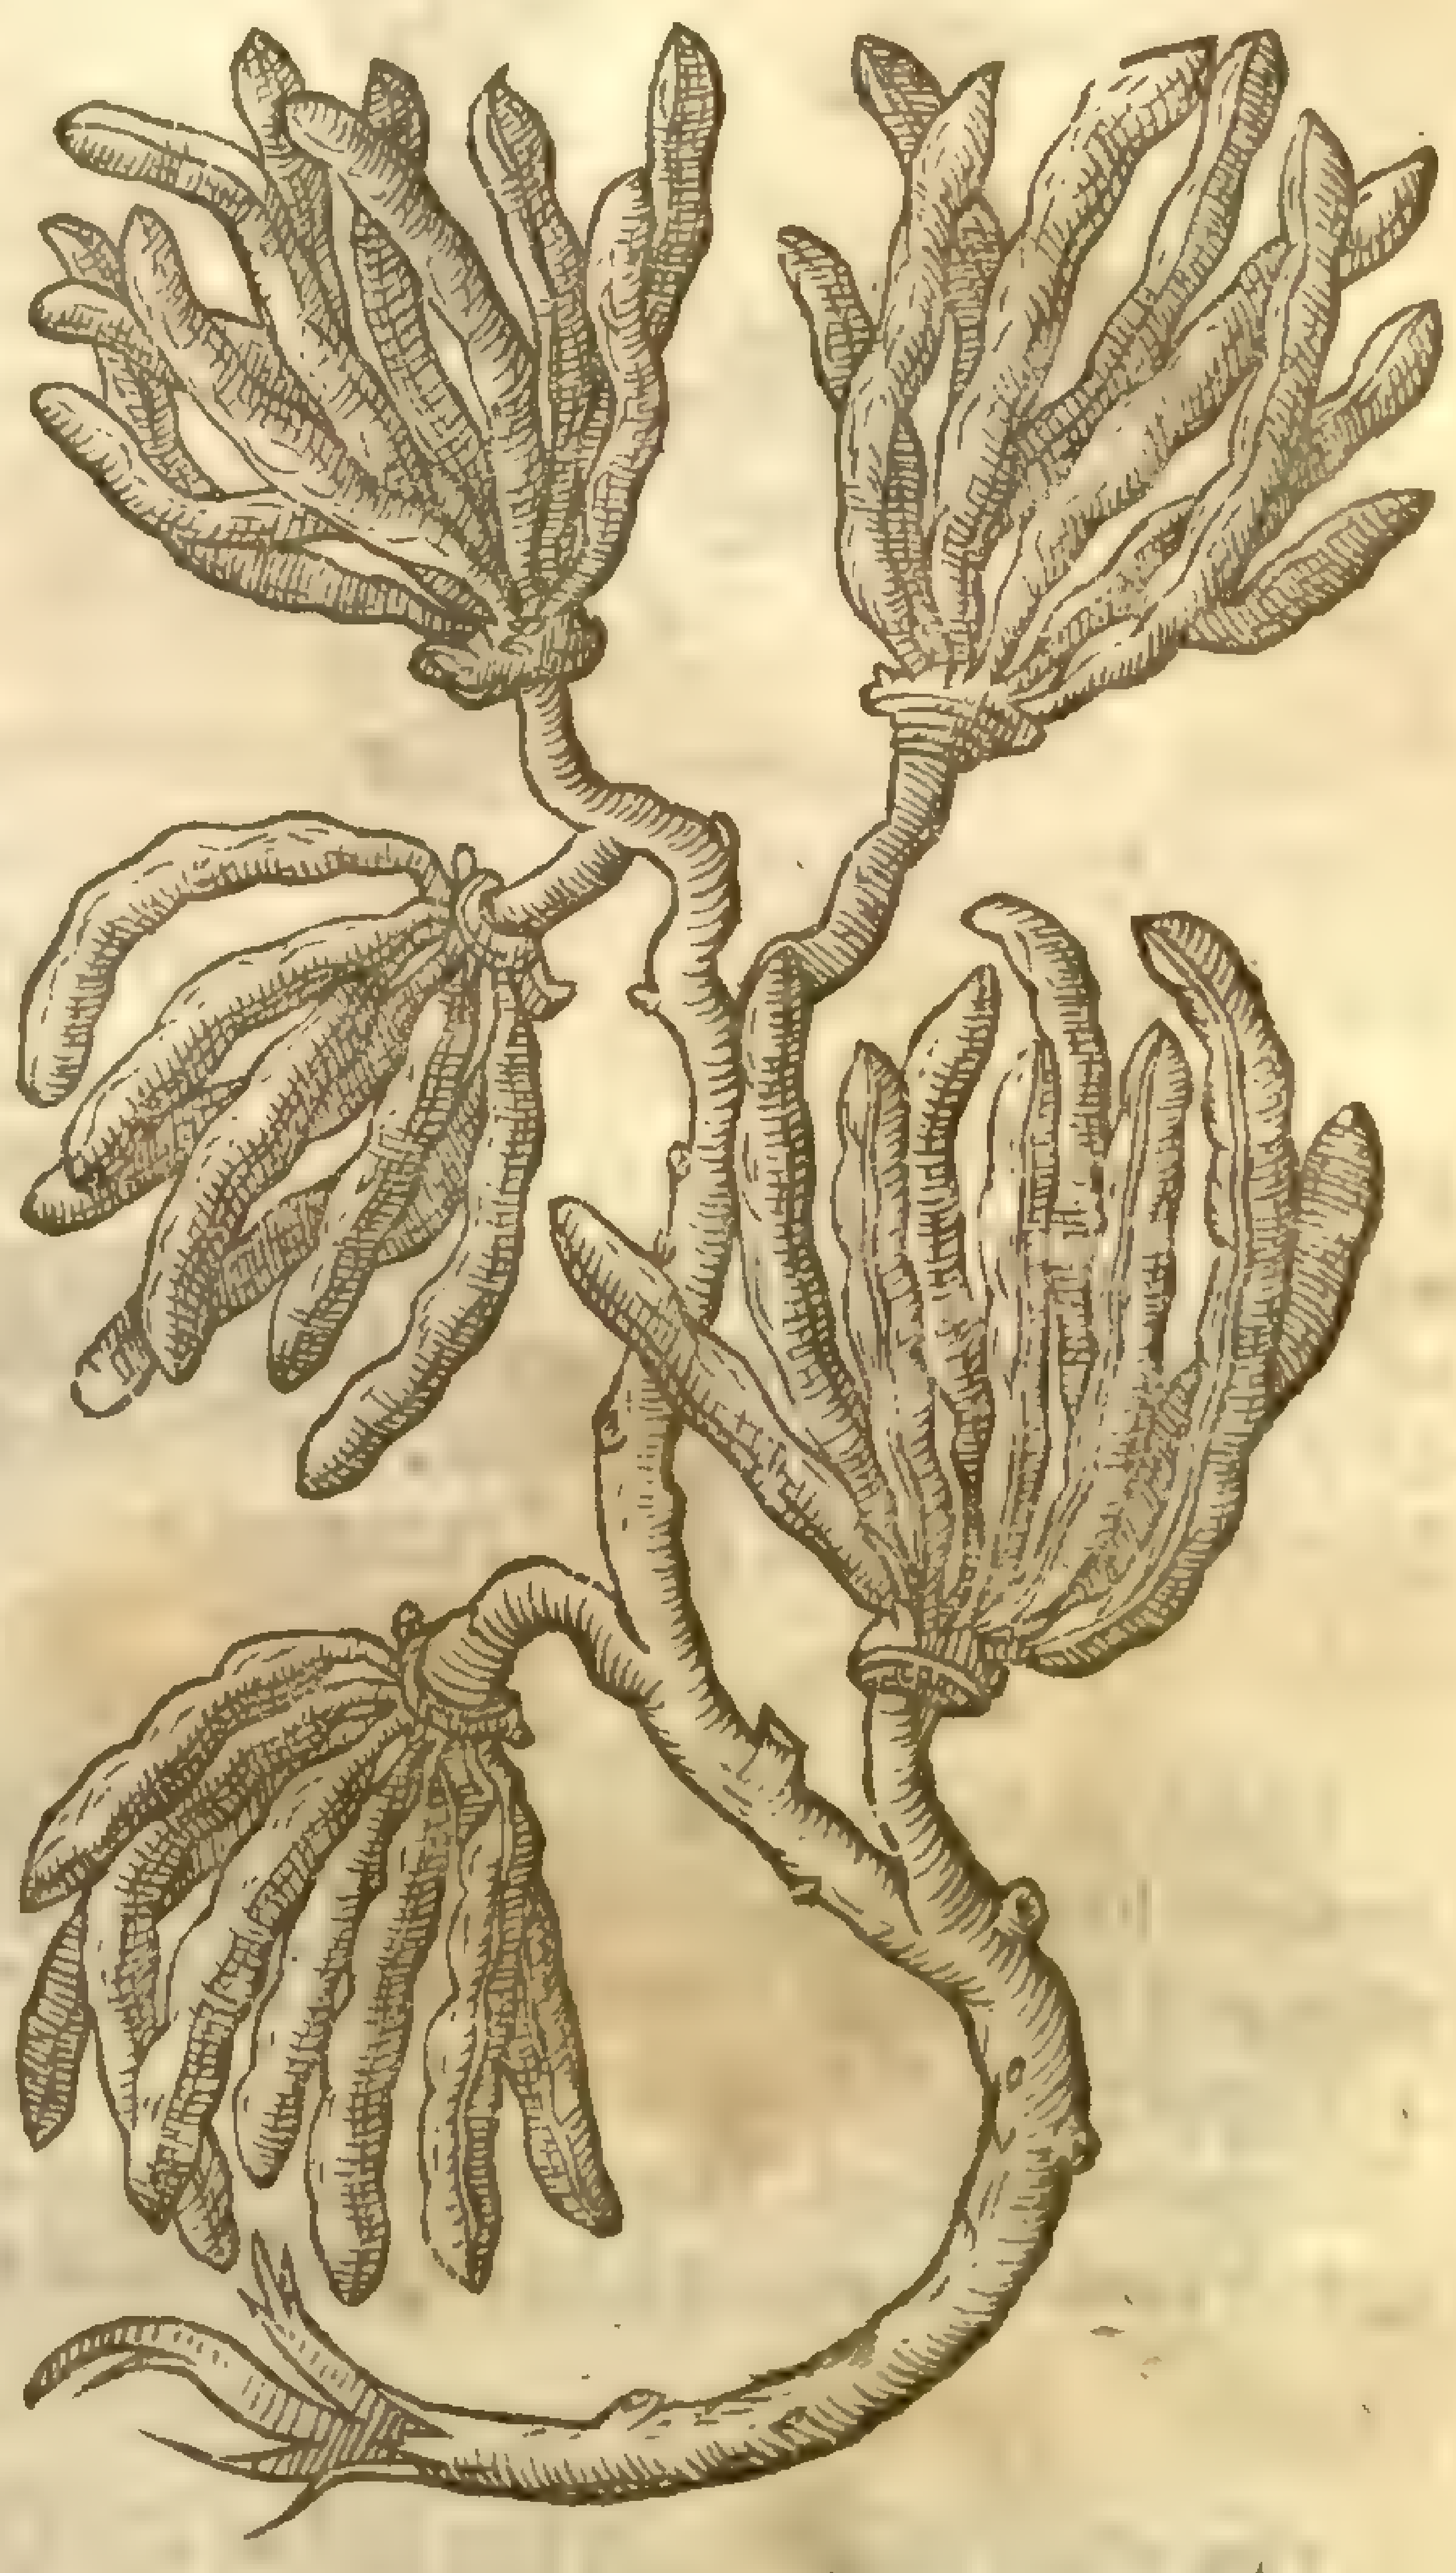
1 THe Plant that beareth the blacke Pepper groweth vp like a Vine, amongſt buſhes and brambles, where it naturally groweth; but where it is manured it is ſowne at the bottom of the tree *Fauſel* and the Date trees, whereon it taketh hold and clymbeth vp euen vnto the top, as doth the Vine, ramping and taking hold with his claſping tendrels of any other

thing it meets withall. The leaues are few in number, ‡ growing at each joint one, firſt on one ſide of the ſtalk, then on the other, like in ſhape to the long vndiuided leaues of Iuy, but thinner, ſharp pointed, and ſometimes ſo broad that they are foure inches ouer, but moſt commonly two inches broad and foure long, hauing alwaies fiue pretty large nerues running along them. The fruit grow cluſtering together vpon long ſtalks, which come forth at the joints againſt the leaues, as you may ſee in the figure: the root (as one may coniecture) is creeping, for the branches that ly on the ground do at their joints put forth new fibres or roots. Wee are beholden to *Cluſius* for this exact figure and deſcription, which hee made by certaine branches brought home by the Hollanders from the Eaſt Indies. The Curious may ſee more hereof in his Exoticks and notes vpon *Garcias*.

† 3 *Piper longum.*
Long Pepper.



4 *Piper Æthiopicum, ſiue Vita longa.*
Pepper of Æthiopia.

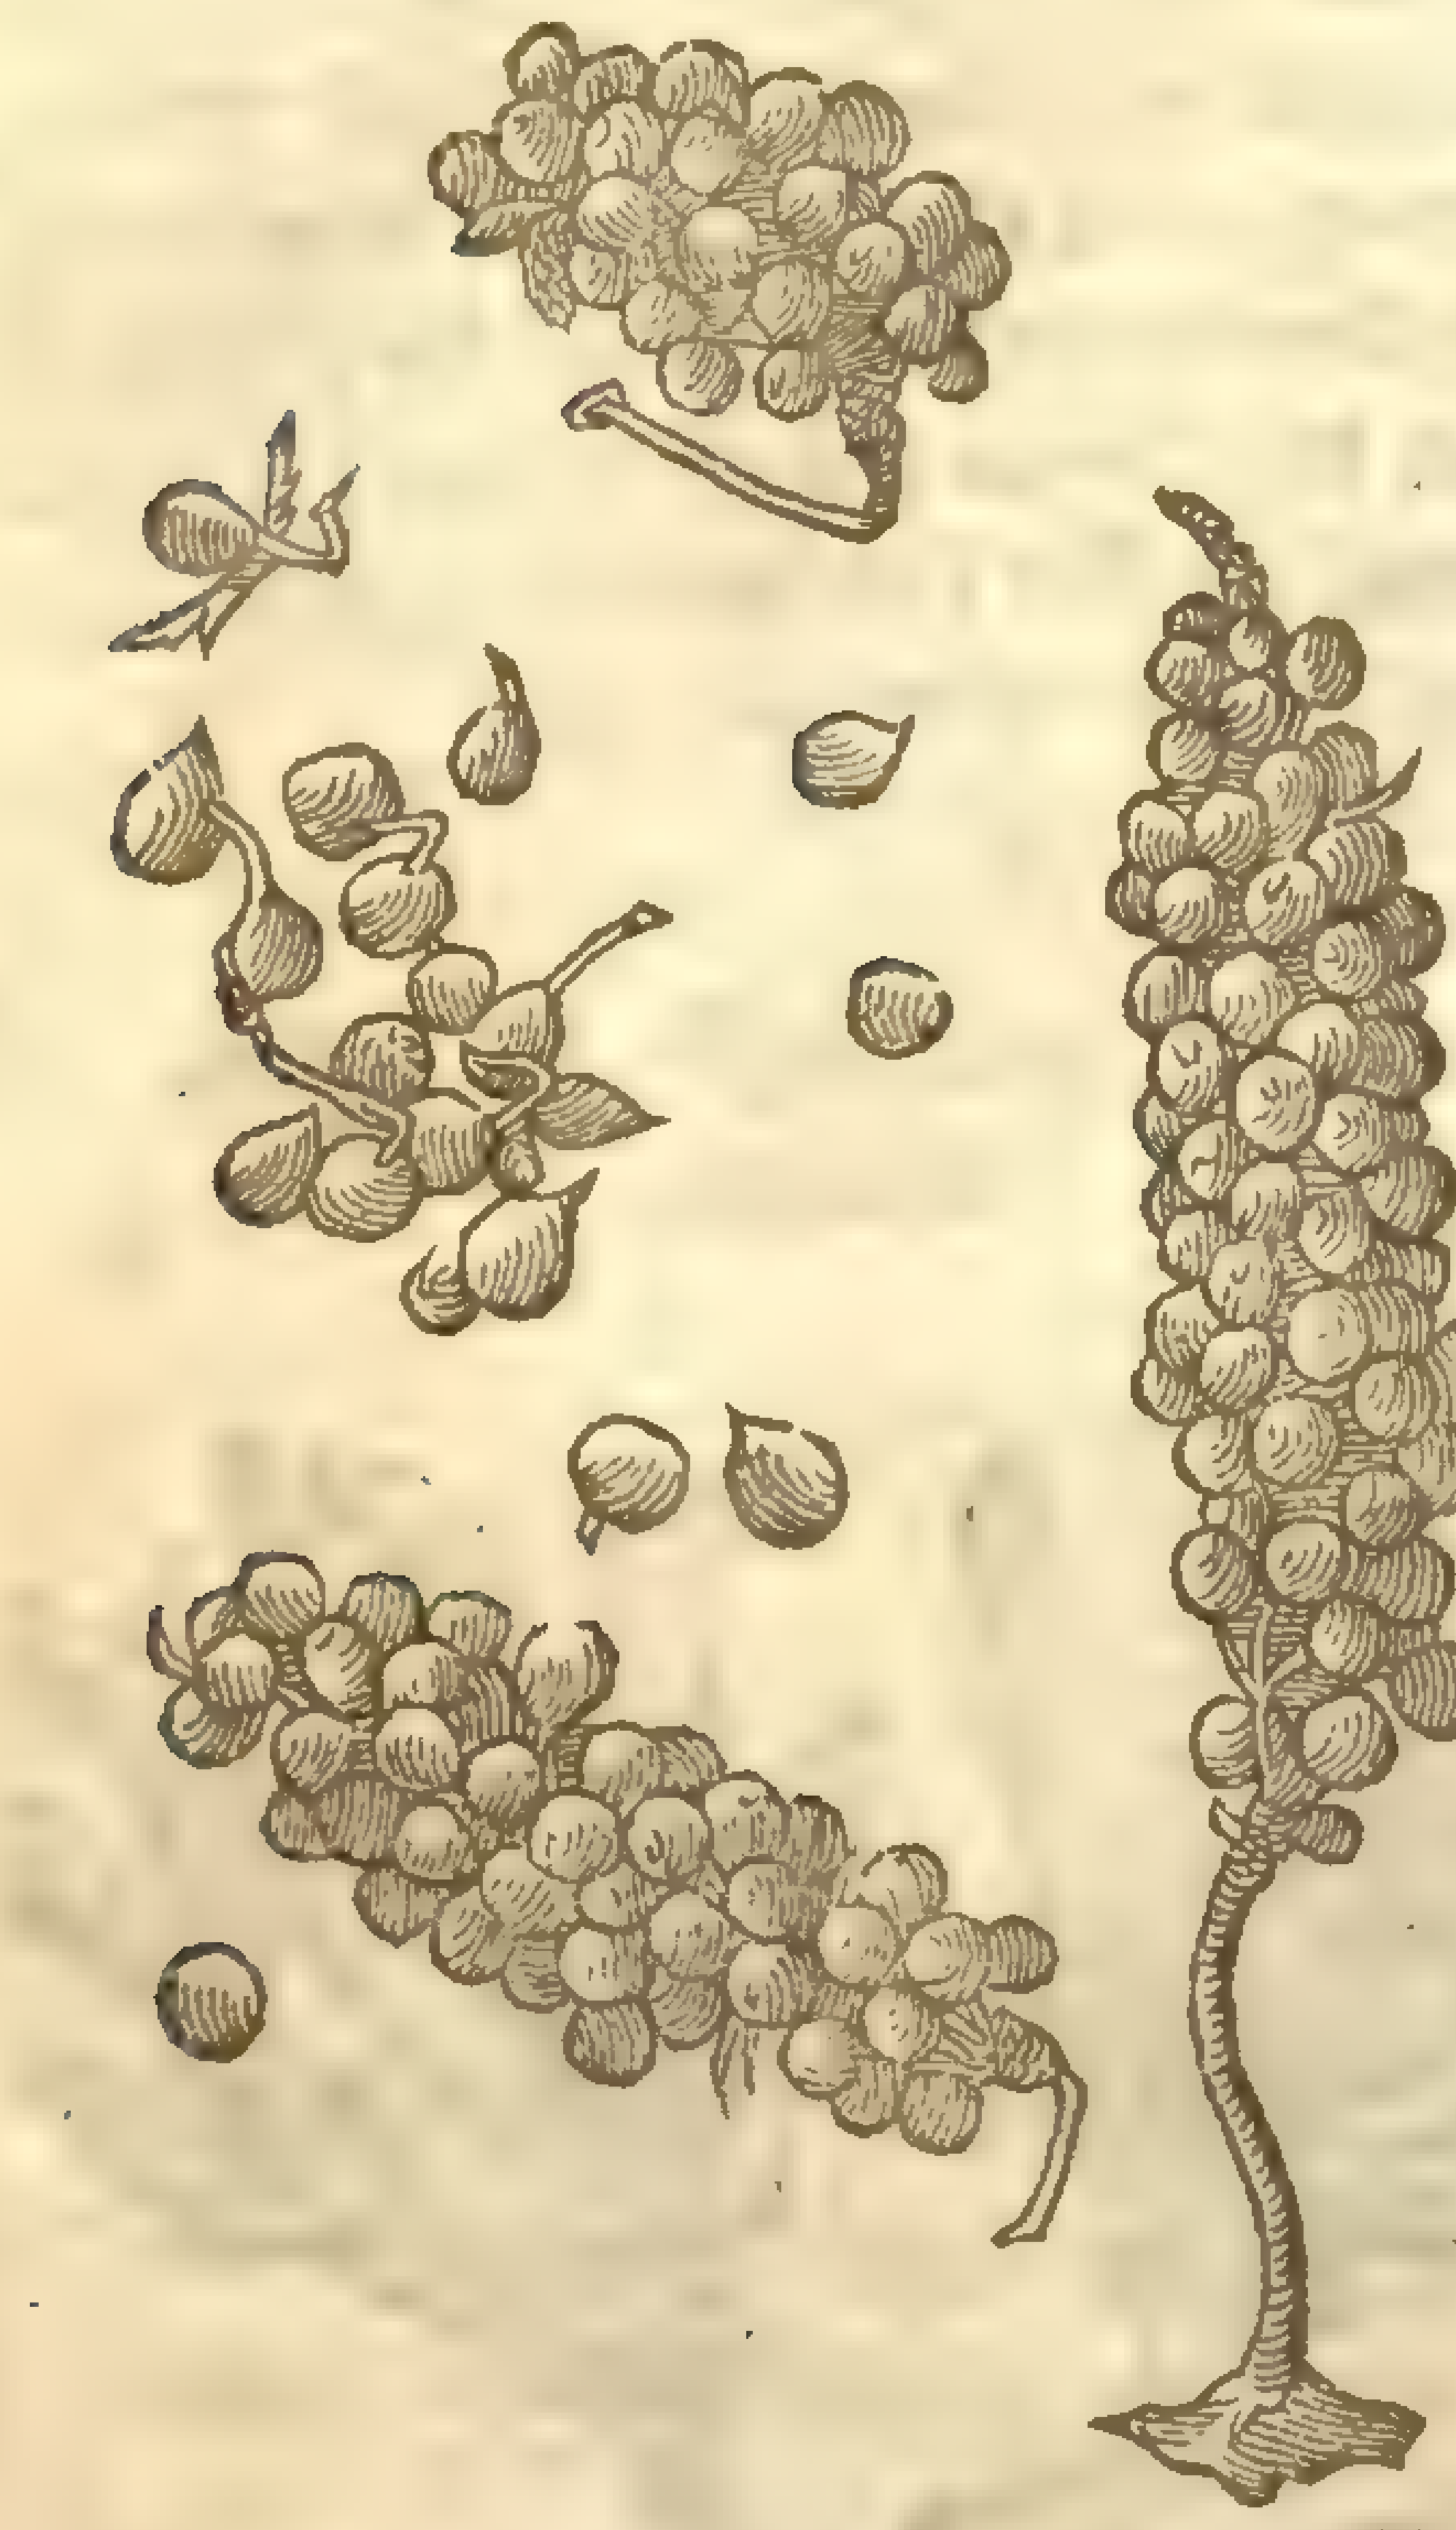


2 The plant that brings white Pepper is not to be diſtinguiſhed from the other plant, but only by the colour of the fruit, no more than a Vine that beareth blacke grapes, from that which brings white: and of ſome it is thought, that the ſelfe ſame plant doth ſomtimes change it ſelf from black to white, as diuers other plants doe. ‡ Neither *Cluſius*, nor any other elſe that I haue yet met with, haue deliuered vs any thing of certaine, of the plant whereon white Pepper growes; *Cluſius* onely hath giuen vs the maner how it growes vpon the ſtalks, as you may ſee it here expreſt. ‡

There is alſo another kind of Pepper, ſeldome brought into theſe parts of Europe, called *Piper Canarium*: it is hollow within, light, and empty, but good to draw flegme from the head, to helpe the tooth-ache and cholericke affects.

3 The tree that beareth long pepper hath no ſimilitude at all with the plant that brings black and white Pepper: ſome haue deemed them to grow all on one tree; which is not conſonant to truth: for they grow in countries far diſtant one from another, and alſo that countrey where there is blacke Pepper, hath not any of the long Pepper. And therefore *Galen* following *Dioſcorides*, were together both ouerſeene in this point. This tree, ſaith *Monardus*, is not great, yet of a wooddy ſubſtance, diſperſing here and there his claſping tendrels, wherewith it taketh hold of other trees and ſuch other things as do grow neere vnto it. The branches are many and twiggy, whereon groweth the fruit, conſiſting of many graines growing vpon a ſlender foot-ſtalke, thruſt or compact cloſe

‡ 5 *Piper Caudatum.*
Tailed Pepper.



together,green at the firſt, and afterward blackiſh;in taſt ſharper and hotter than common blacke pepper, yet ſweeter and of better taſt. ‡ For this figure alſo I acknowledge my ſelfe beholden to the learned and diligent *Cluſius*, who cauſed it to be drawne from a branch of ſome foot in length,that he receiued from Dr *Lambert Hortenſius*, who brought it from the Indies. The order of growing of the leaues and fruit is like that of the black,but the joints ſtand ſomewhat thicker together; the leaf alſo doth little differ from that of the black,only it is thinner,of a lighter green and (as *Cluſius* thought) hath a ſhorter footſtalke,the veins or nerues alſo were leſſe eminent,more in number, and run from the middle rib to the ſides, rather than alongſt the leafe. ‡

4 This other kinde of Pepper, brought vnto vs from Æthiopia,called of the country where it groweth,*Piper Æthiopicum*: in ſhops, *Amomum*, and *Longa Vita*. It growes vpon a ſmal tree in maner of an hedge buſh,wherupon grow cods in bunches, a finger long, of a brown colour,vneuen,and bunched or puft vp in diuers places,diuided into fiue or ſix lockers or cels, each wherof containeth a round ſeed ſomwhat long, leſſe than the ſeeds of Peony, in taſte like common Pepper or *Cardamomum*, whoſe facultie and temper it is thought to haue,whereof we hold it a kind.

5 Another kind of Pepper is ſomtimes brought,which the Spaniards cal *Pimenta de rabo*,that is,Pepper with a taile: it is like vnto Cubebes,round,full,ſomewhat rough,black of colour,and of a ſharp quick taſt like the common pepper,of a good ſmell: it growes by cluſters vpon ſmal ſtems or ſtalks,which ſome haue vnaduiſedly taken for *Amomum*. The king of Portugal forbad this kind of Pepper to be brought ouer, for feare leſt the right Pepper ſhould be the leſſe eſteemed, and ſo himſelfe hindred in the ſale thereof.

¶ *The Place.*

Black and white Pepper grow in the kingdom of Malauar, and that very good; in Malaca alſo, but not ſo good; as alſo in the Iſlands Sunde and Cude: there is great ſtore growing in the Kingdome of China,and ſome in Cananor,but not much.

Pepper of Æthiopia growes alſo in America, in all the tract of the country where Nat & Carthago are ſituated. The reſt haue bin ſpoken of in their ſeueral deſcriptions. The white Pepper is not ſo common as the blacke,and is vſed there in ſtead of ſalt.

¶ *The Time.*

The plant riſeth vp in the firſt of the ſpring: the fruit is gathered in Auguſt.

¶ *The Names.*

The Grecians who had beſt knowledge of Pepper, do cal it πέπερι: the Latines, *Piper*: the Arabians, *Fulfel*,and *Fulful*: in Italian, *Pepe*: in Spaniſh, *Pimenta*: in French, *Poiure*: in high-Dutch, **Pfeffer**: in Engliſh, Pepper.

That of Æthiopia is called *Piper Æthiopicum*, *Amomum*, *Vita longa*, and of ſome *Cardamomum*. I receiued a branch hereof at the hands of a learned Phyſition of London,called Mr *Stephen Bredwel*, with his fruit alſo.

¶ *The Temperature.*

The Arabian and Perſian Phyſitions iudge, that Pepper is hot in the third degree. But the Indian Phyſitions (which for the moſt part are Empericke) hold, that Pepper is cold, as almoſt all other ſpice,which are hot indeed: the long Pepper is hot alſo in the third degree, and as wee haue ſaid,is thought to be the beſt of all the kinds.

¶ *The Vertues.*

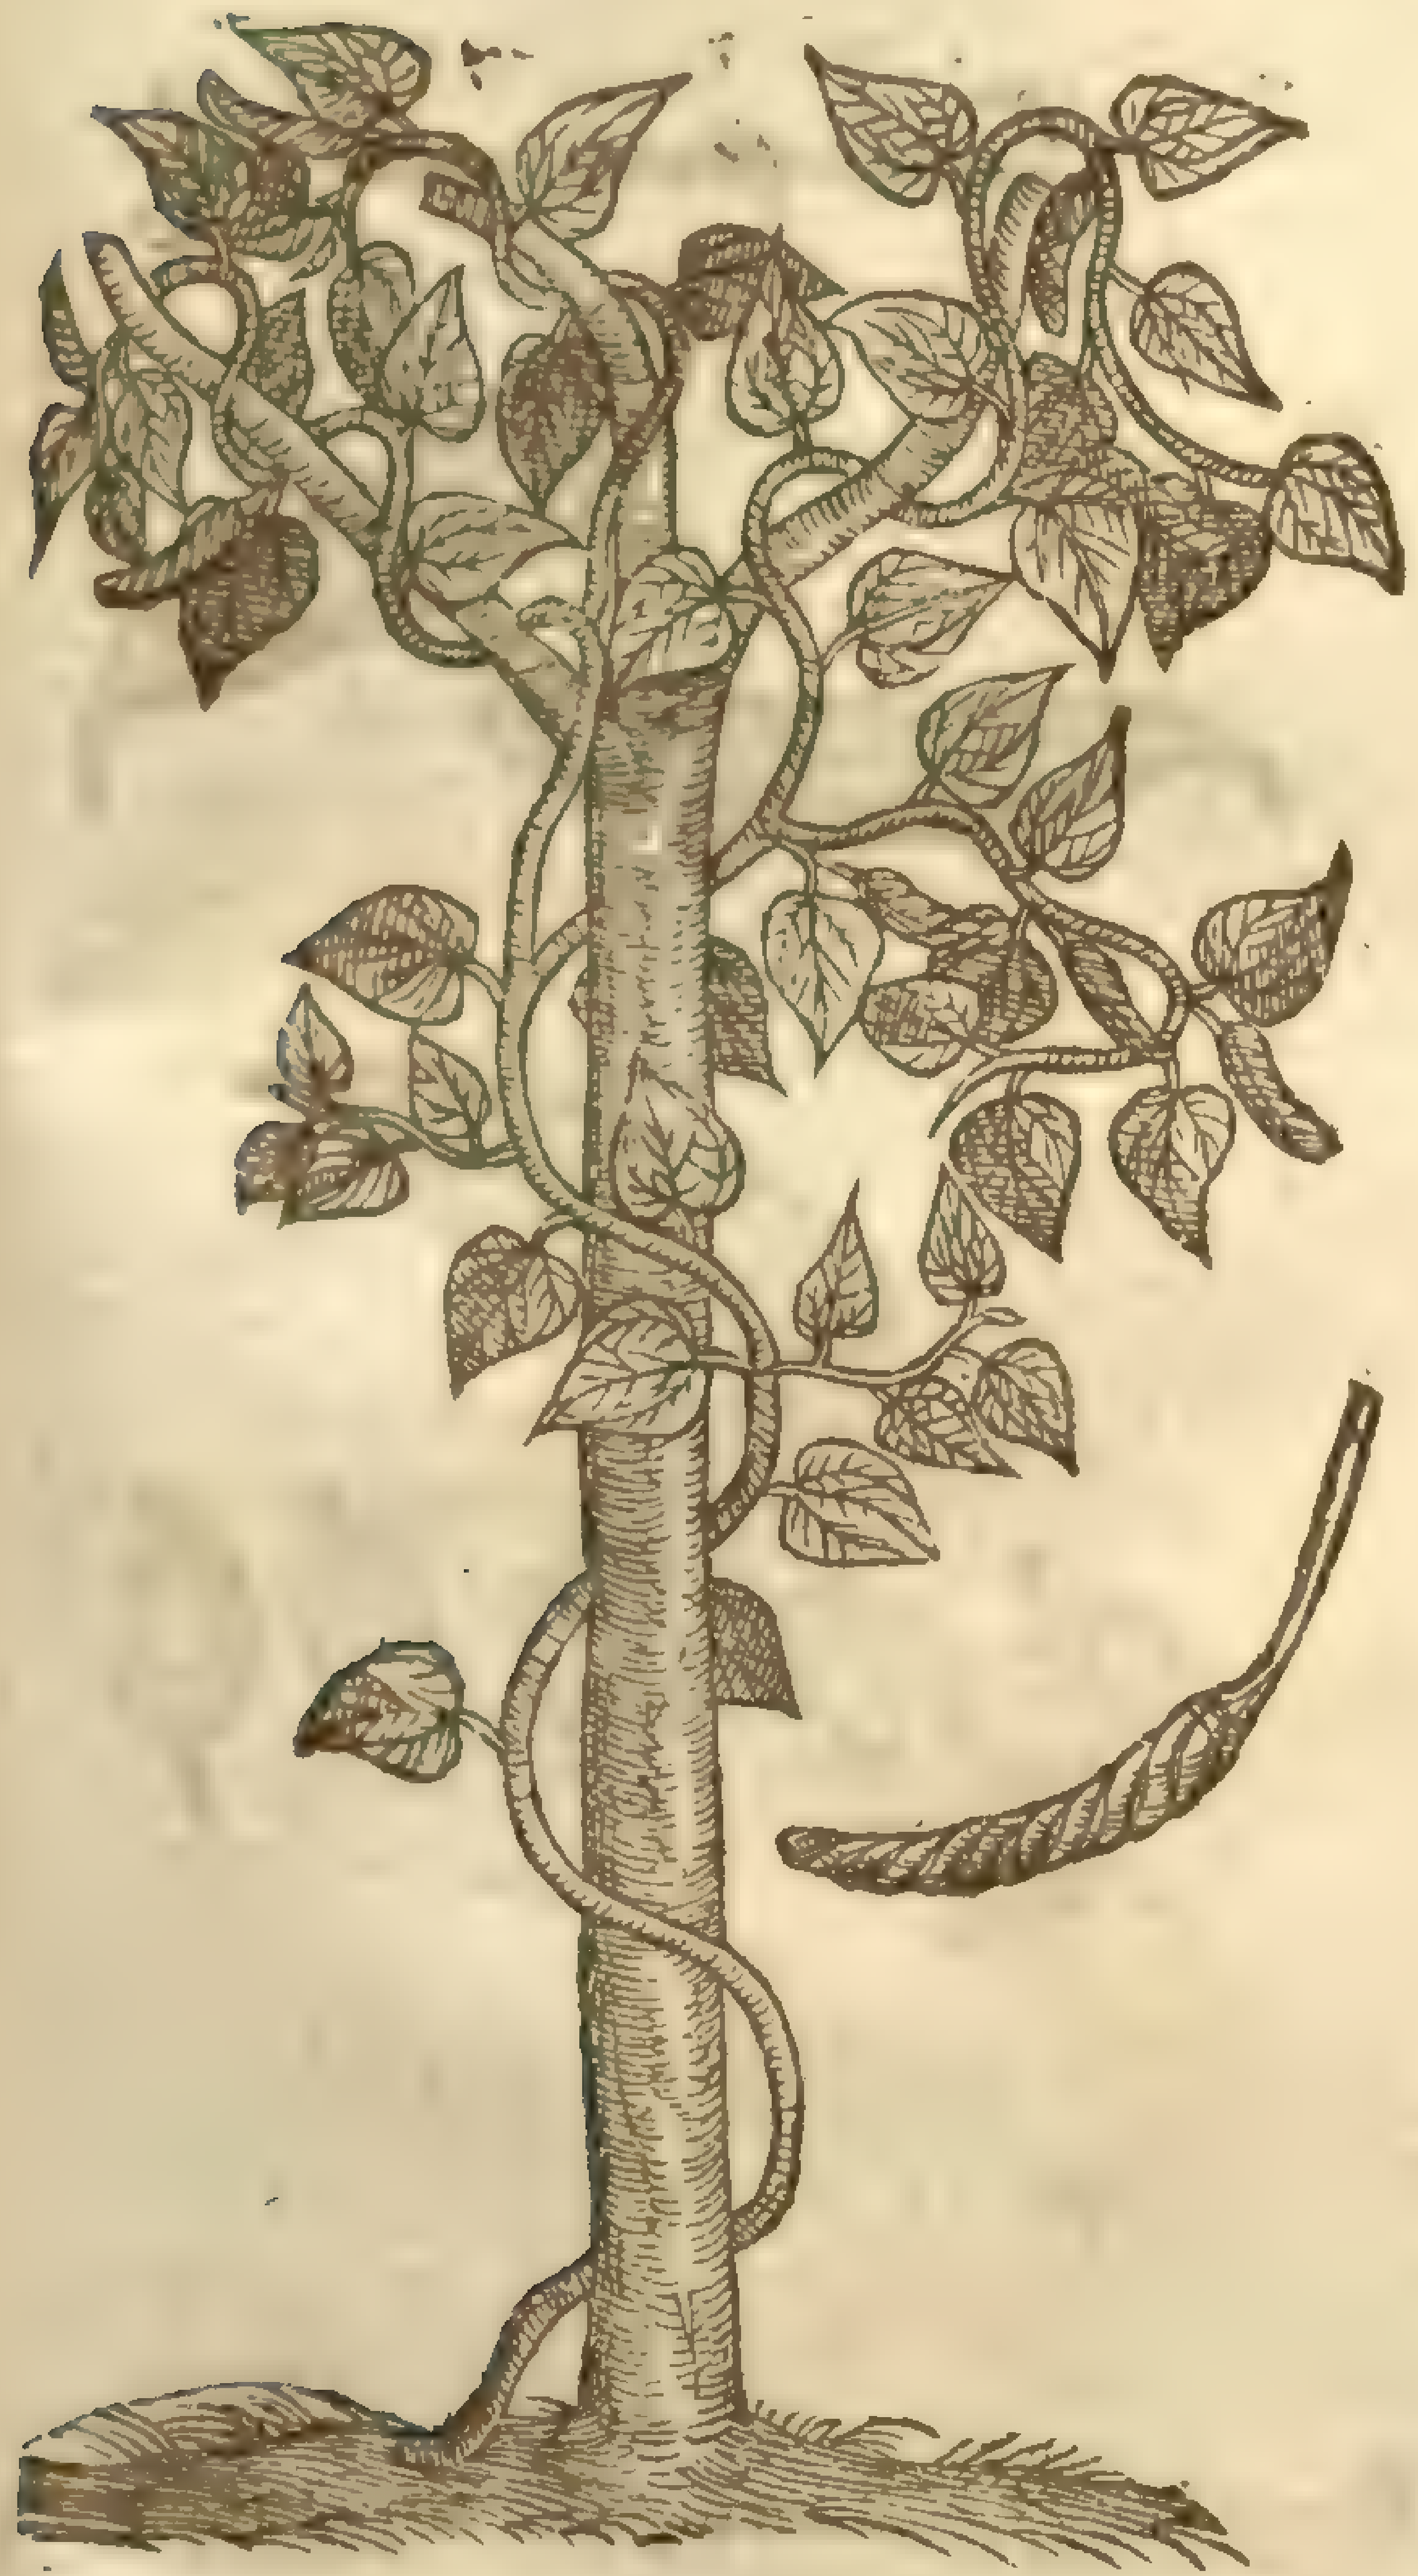
A *Dioſcorides* and others agreeing with him affirme,that Pepper reſiſteth poiſon, and is good to be put into medicaments for the eies.

All Pepper heateth, prouoketh vrin, digeſteth, draweth, diſperſeth, and clenſeth the dimneſſe of the ſight, as *Dioſcorides* noteth. B

† I haue omitted in this chapter *Matthiolus* his counterfeit figure which was formerly here.

CHAP. 153. *Of baſtard Pepper, called Betle or Betre.*

Betle ſive Betre.
Baſtard Pepper.



¶ *The Deſcription.*

THis plant climeth and rampeth vpon trees, buſhes, or whatſoeuer elſe it meets withall, like to the Vine, or the black Pepper, whereof ſome hold it for a kinde. The leaues are like thoſe of the greater Binde-weed, but ſomewhat longer, of a duſty colour, with diuers veins or ribs running through the ſame. The fruit groweth among the leaues, very crookedly writhed, in ſhape like the taile of a Lizard, of the taſte of Pepper, yet very pleaſant to the palate.

¶ *The Place.*

It groweth among the Date trees, and *Areca*, in moſt of the Molucca Iſlands, eſpecially in the mariſh grounds.

¶ *The Time.*

The time anſwereth that of Pepper.

¶ *The Names.*

It hath been taken for the Indian leafe, but not properly: of moſt it is called *Tembul*, and *Tambul*: in Malavar, *Betre*: in Decan, Guzarat, and Canam it is called *Pam*: in Molaio, *Siri*.

¶ *The Vſe and Temperature.*

The leaues chewed in the mouth are of a bitter taſte; whereupon (ſaith *Garcias*) they put thereto ſome Areca, with the lime made of oiſter ſhells; whereunto they alſo adde ſome Amber greece, *Lignum Aloes*, and ſuch like, which they ſtamp together, making it into a paſte which they rolle vp into round balls, keepe dry for their vſe, and carry the ſame in their mouthes vntill by little and little it is conſumed; as when we carry ſugar-Candy in our mouthes, or the juice of Licorice: which is not only meat to the ſilly Indians, but alſo drink in their tedious trauels, refreſhing their wearied ſpirits, and helping memory; which is eſteemed amongſt the Empericke phyſitians to be hot and dry in the ſecond degree. ‡ *Garcias* doth not affirm that the Indians eat it for meat, or in want of drinke, but that they eat it after meat, and that to giue the breath a pleaſant ſent, which they count a great grace, ſo that if an inferior perſon that hath not chewed Betre or ſome ſuch thing, chance to ſpeak with any great man, he holds his hand before his mouth, leſt his breath ſhould offend him. ‡

CHAP. 154. *Of Graines, or Graines of Paradice.*

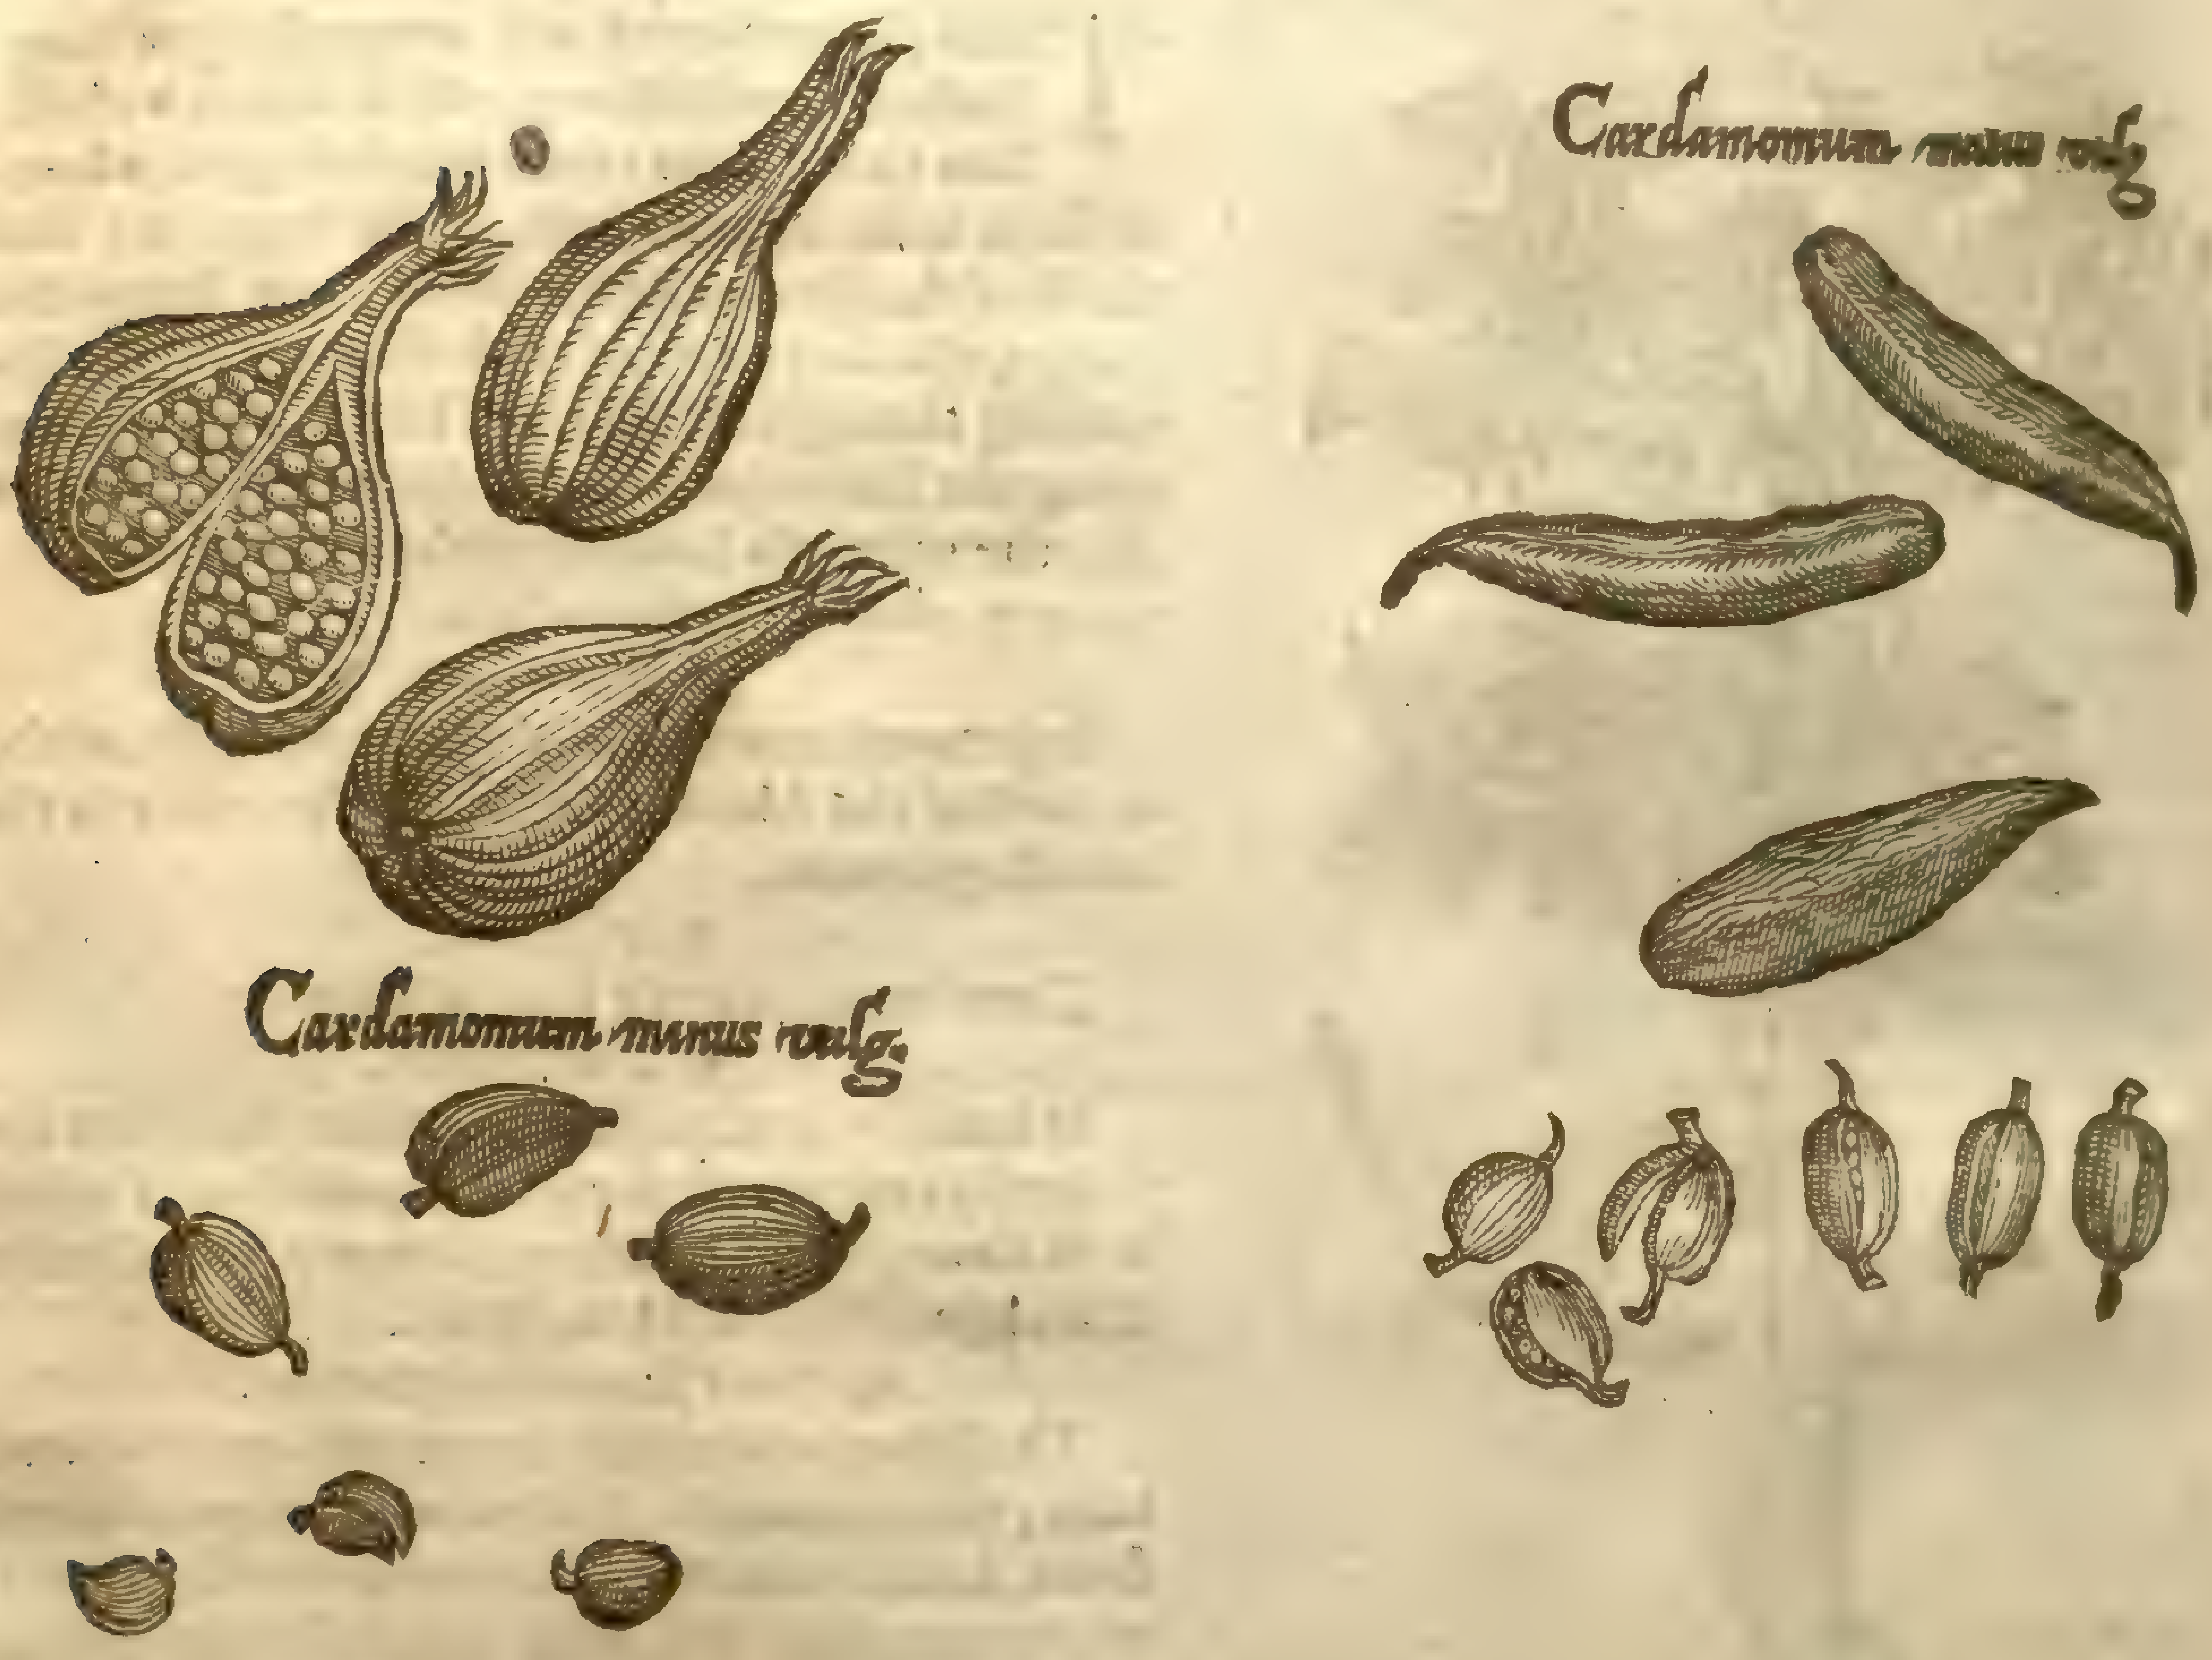
¶ *The Kindes.*

THere be diuers ſorts of Graines, ſome long, others Peare-faſhioned; ſome greater, and others leſſer.

¶ *The Deſcription.*

† THe figure hereof ſetteth forth to your view the cod wherein the hot ſpice lies, which we cal Graines; in ſhops, *Grana Paradiſi*: it growes, by the report of the Learned, vpon a low herby plant; the leaues are ſome foure inches long, and three broad, with ſomewhat a thicke middle rib, from which run tranſverſe fibres, they much in ſhape reſemble thoſe of Cloues. The fruit is like a great cod or huſke, in ſhape like a fig when it groweth vpon the tree, but of colour ruſſet, thruſt full of ſmall ſeeds or grains of a darke reddiſh colour (as the figure ſheweth which is diuided) of an exceeding hot taſte.

Cardamomi genera.
The kindes or ſorts of Graines.



Cardamomum maius vulg.
Cardamomum minus vulg.

The other ſorts may be diſtinguiſhed by the ſight of the picture, conſidering the only difference conſiſts in forme.

¶ *The Place.*

Graines grow in Ginny, and the Cardamones in all the Eaſt Indies, from the port of Calecute vnto Cananor: it groweth in Malavar, in Ioa, and in diuers other places.

¶ *The Time.*

They ſpring vp in May being ſowne of ſeed, and ripen their fruit in September.

¶ *The Names.*

Graines are called in Greeke Καρδάμωμον: in Latine, *Cardamomum*: of the Arabians, *Corrumeni*: of diuers Gentiles, *Dore*: of *Avicen*, *Saccolaa quebir* (i.) *magnum*: the other, *Saccolaa ceguer* (i.) *minus*. It is called in Malavar *Etremelli*: in Zeilan, *Ençal*: in Bengala, Guzarat, and Decan, *Hil*, and *Eluchi*: The firſt and largeſt ſort are called of ſome *Mileguetta*, and *Milegetta*; in Engliſh, Grains, & Grains of Paradice.

¶ *The Temperature.*

Avicen writeth, that *Saccolaa*, *Cardamomum*, or *Grana Paradiſi*, are hot and dry in the third degree, with aſtriction.

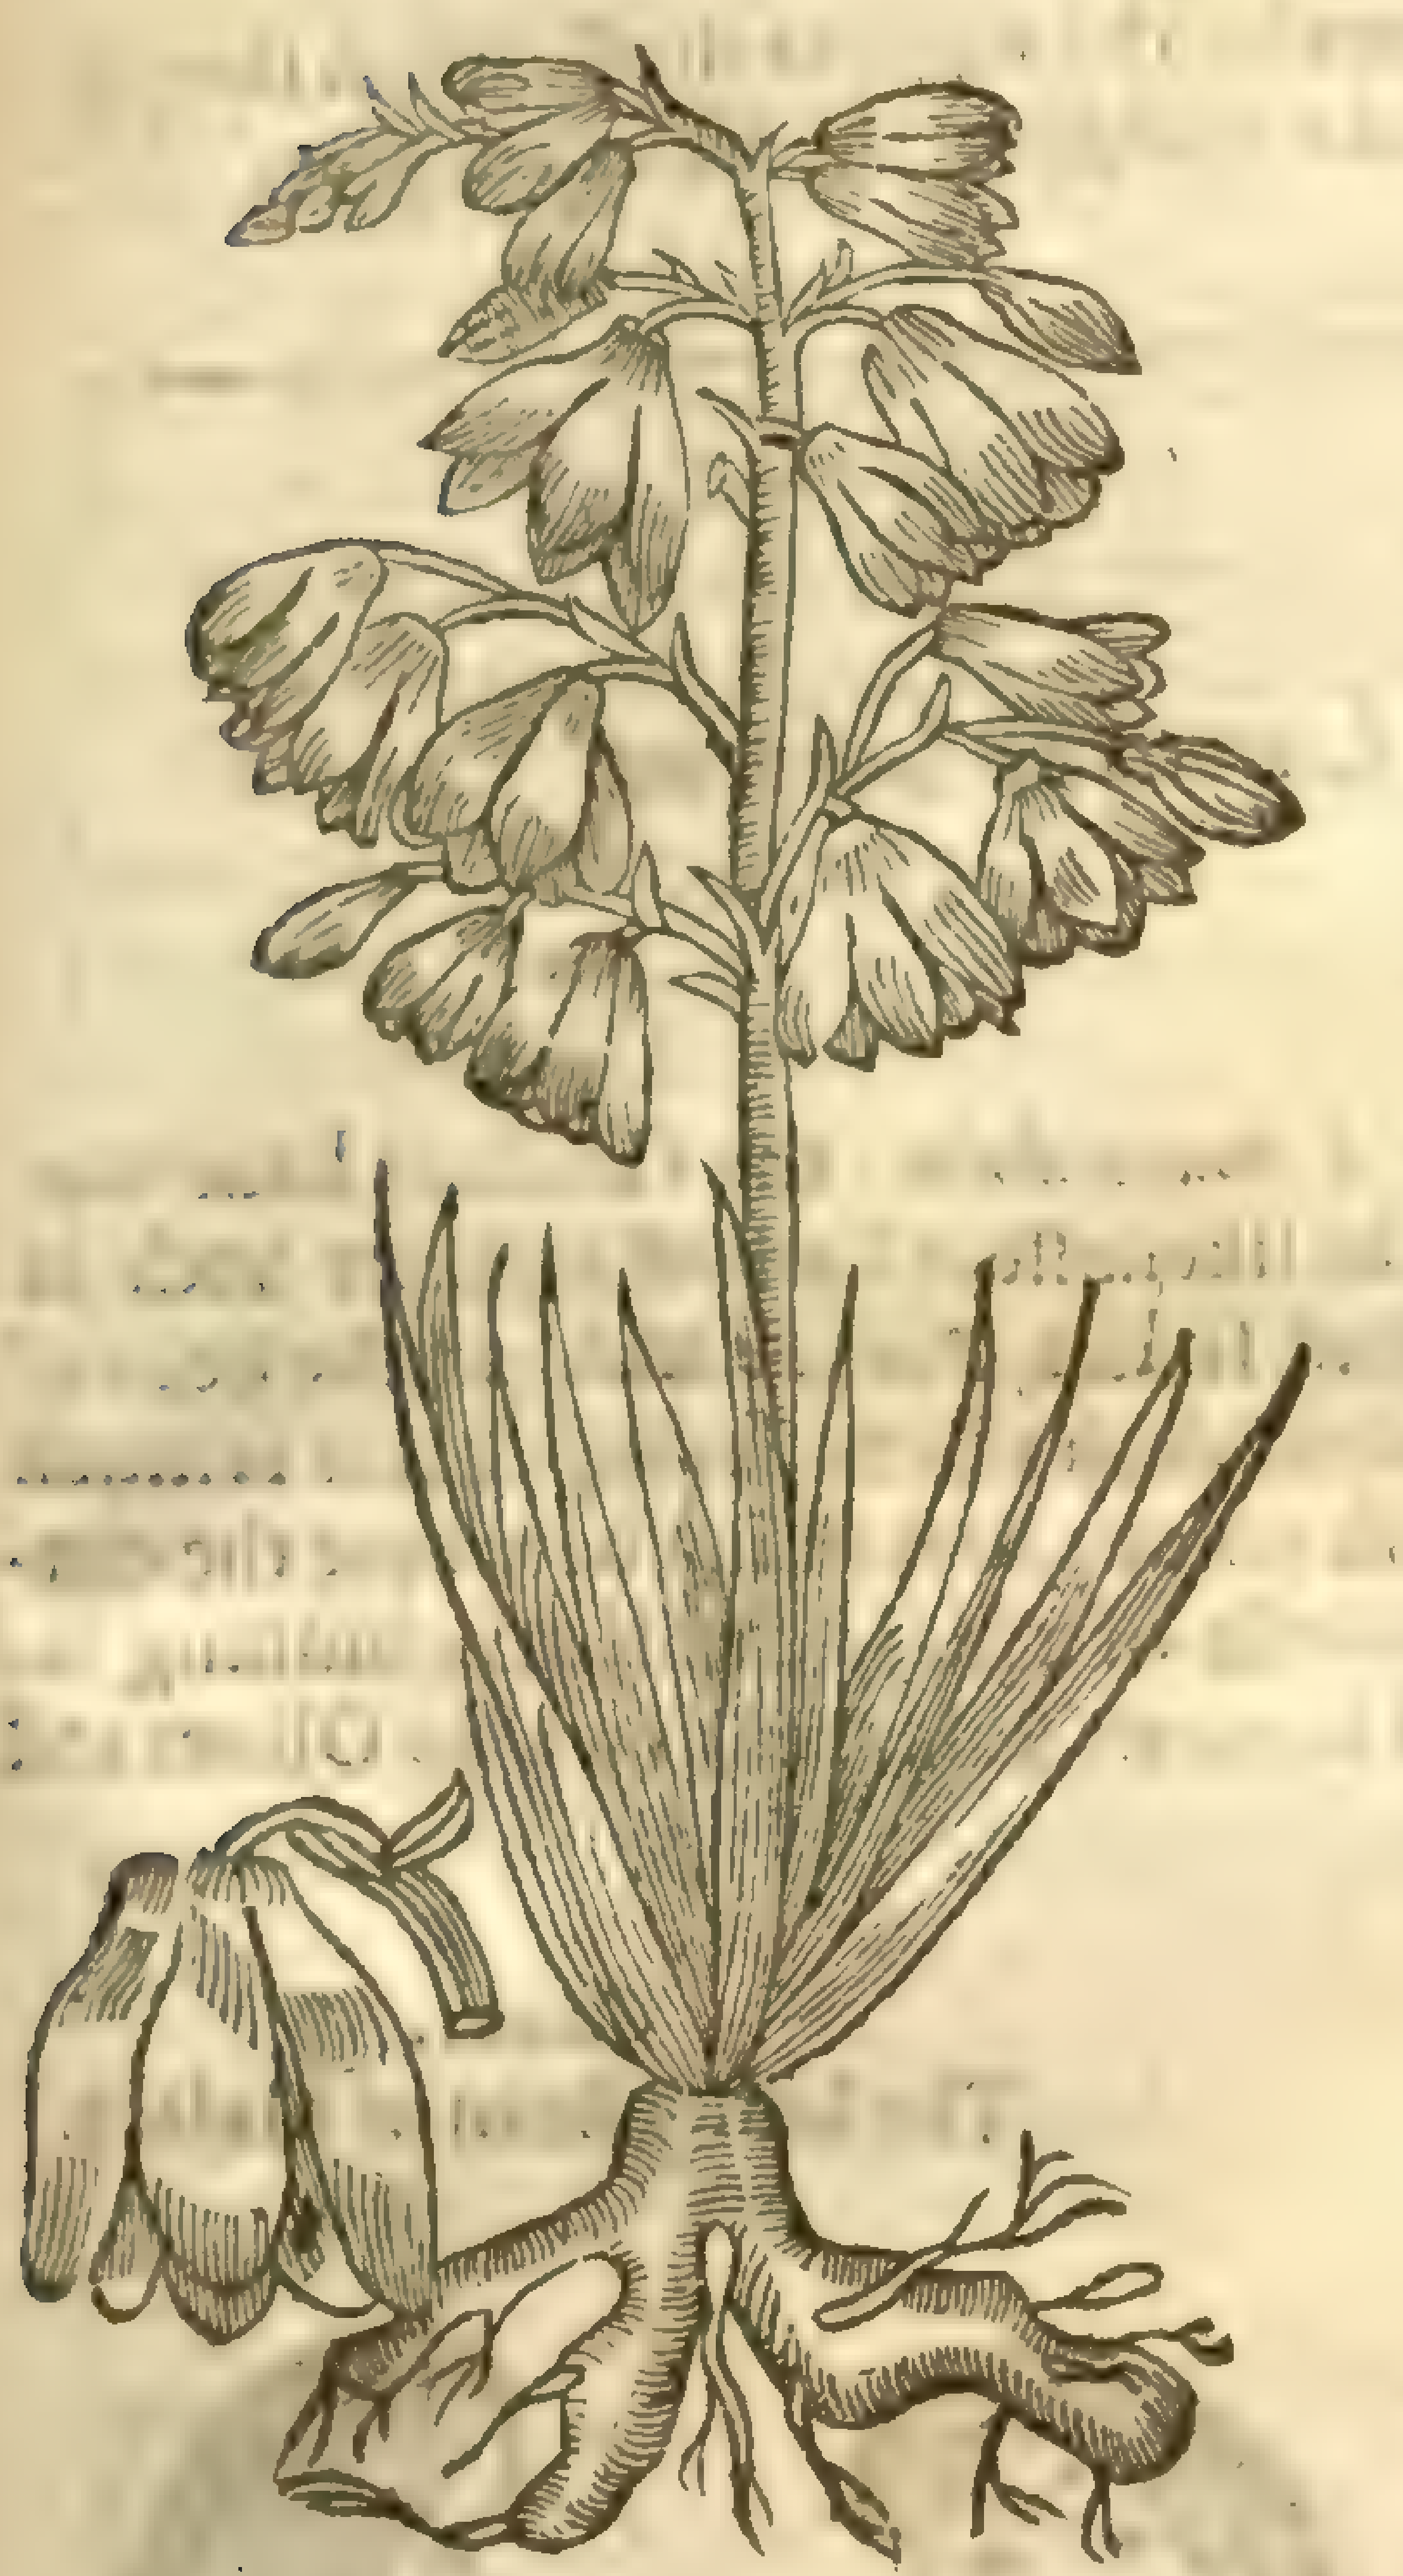
¶ *The Vertues.*

A The Graines chewed in the mouth draw forth from the head and ſtomacke wateriſh and pituitous humors.

B They alſo comfort and warm the weake cold and feeble ſtomack, help the ague, and rid the ſhaking fits, being drunke with Sacke.

Chap. 155. *Of Yucca or Iucca.*

Yucca, ſiue Iucca Peruana.
The root whereof the bread Caſua or Cazava is made.



¶ *The Deſcription.*

THe Plant of whoſe root the Indian bread called Cazava is made, is a low herbe conſiſting onely of leaues and roots: it hath neither ſtalks, flours, nor fruit, that I can vnderſtand of others, or by experience of the plant it ſelfe, which hath grown in my garden four yeres together, and yet doth grow and proſper exceedingly; neuertheleſſe without ſtalke, fruit, or floures, as aforeſaid. It hath a very great root, thick and tuberous, and very knobby, ful of iuice ſomwhat ſweet in taſte, but of a pernitious qualitie, as ſaith my Author. From which root riſeth vp immediatly forth of the ground very many leaues ioyned vnto the head of the root in a round circle; the which are long, of the length of a cubit, hollowed like a gutter or trough, very ſmooth, and of a green colour like that of woad: the edges of the leaues are ſharpe like the edge of a knife, and of a brown colour, the point of the leafe is a prick as ſharpe as a Needle, which hurteth thoſe that vnaduiſedly paſſe by it. The leafe with aduiſed eye viewed is like to a little Wherry or ſuch like boat; they are alſo very tough, hard to break, and not eaſie to be cut, except the knife be very ſharp.

‡ *Lobel* in the ſecond part of his *Adverſaria* largely deſcribes and figures this plant; & there he affirmes hee wrot a Deſcription (which hee there ſets down) for our Author, but hee did not follow it, and therefore committed theſe errors: firſt, in that he ſaith it is the root wherof Cazava bread was made; when as *Lobel* in his deſcription ſaid he thought it to be *Alia ſpecies à Yucca Indica ex qua panis communis fit.* Secondly, in that he ſet down the place out of the *Hiſt. Lugd.* (who tooke it out of *Theuet*) endeauoring by that meanes to confound it with that there mentioned, when as he had his from Mr *Edwards* his man: and thirdly (for which indeed he was moſt blame-worthy, and wherein he moſt ſhewed his weakneſſe) for that he doth confound it with the *Manihot* or true *Yuicca*, which all affirme to haue a leaf like that of Hemp, parted into ſeuen or more diuiſions; and alſo for that he puts it to the *Arachidna* of *Theophraſtus*, when as he denies it both floure and fruit; yet within ſome few yeares after our Authour had ſet forth this Worke it floured in his garden.

This ſome yeares puts forth a pretty ſtiffe round ſtalke ſome three cubits high, diuided into diuers vnequall branches carrying many prety large floures, ſhaped ſomwhat like thoſe of *Fritillaria*, but that they are narrower at their bottoms: the leaues of the floure are ſix, the colour on the Inſide white, but on the out ſide of an ouerworn reddiſh colour from the ſtalke to the middeſt of the leafe; ſo that it is a floure of no great beauty, yet to be eſteemed for the raritie. I ſaw it once floure in the garden of Mr *Wilmot* at Bow, but neuer ſince, though it hath bin kept for ſundry yeres in many other gardens, as with Mr *Parkinſon* and Mr *Tuggy*. This was firſt written of by our Author, and ſince by *Lobel* and Mr *Parkinſon*, who keepe the ſame name, as alſo *Bauhine*; who to diſtinguiſh it from the other calls it *Yucca foliis Aloes.* ‡

¶ *The Place.*

This Plant groweth in all the tract of the Indies, from the Magellane ſtraights vnto the cape of Florida, and in moſt of the Iſlands of the Canibals, and others adjoining, from whence I had that plant brought me that groweth in my garden, by a ſeruant of a learned and ſkilfull Apothecary of Exceſter, named Mr *Tho. Edwards*.

¶ *The Time.*

It keepeth green both Winter and ſummer in my garden, without any couerture at all, notwithſtanding the injurie of our cold clymat.

¶ *The Names.*

It is reported vnto me by Trauellers, that the Indians do call it in ſome parts, *Manihot*, but generally *Yucca* and *Iucca*. It is thought to be the plant called of *Theophraſtus*, *Arachidna*: of *Pliny*, *Aracidna*.

¶ *The Temperature.*

This plant is hot and dry in the firſt degree, which is meant by the feces or droſſe, when the poiſonous juice is preſſed or ſtrained forth; and is alſo dry in the middle of the ſecond degree.

Chap. 156.

Of the Fruit Anacardium, and Caious or Caiocus.

¶ *The Deſcription.*

THe antient writers haue bin very briefe in the hiſtorie of *Anacardium*: the Grecians haue touched it by the name of Ἀνακάρδιον, taking the name from the likeneſſe it hath of an heart both in ſhape and colour, called of the Portugals that inhabit the Eaſt Indies, *Fava de Malaqua*, the bean of Malaca; for being green, and as it hangeth on the tree, it reſembleth a Bean, ſauing that it is much bigger: but when they be dry they are of a ſhining blackiſh colour, containing betweene the outward rinde and the kernell, which is like an almond, a certain oile of a ſharp cauſtick or burning facultie, called *Mel Anacardinum*, although the kernell is vſed in meats & ſauces, as we do Oliues and ſuch like, to procure appetite.

Anacardium.
The Bean of Malaca.

Caious.
The kidny Bean of Malaca.

The other fruit groweth vpon a tree of the bigneſſe of a Peare tree: the leaues are much like to thoſe of the Olive tree, but thicker and fatter, of a feint greene colour: the floures are white, conſiſting of many ſmall leaues much like the floures of the Cherry tree, but much doubled, without ſmell: after commeth the fruit, according to *Cluſius*, of the forme and magnitude of a gooſe egge, full of juice, in the end whereof is a nut, in ſhape like an Hares kidny, hauing two rindes, betweene which is contained a moſt hot and ſharp oile like that of *Anacardium*, whereof it is a kinde.

The bean or kernell it ſelfe is no leſſe pleaſant and wholeſome in eating, than the *Piſtacia* or Fiſtick nut, whereof the Indians do eat with great delight, affirming that it prouoketh venery, wherein is their chiefeſt felicitie. The fruit is contained in long cods like thoſe of beanes, but greater; neere vnto which cods commeth forth an excreſcence like vnto an apple, very yellow, of a good ſmell, ſpungeous within, and full of juice, without any ſeeds, ſtones, or grains at all, ſomwhat ſweet in taſte, at the one end narrower than the other, Peare-faſhion, or like a little bottle, which hath bin reputed of ſome for the fruit, but not rightly; for it is rather an excreſcence, as is the Oke apple.

¶ *The Place.*

The firſt growes in moſt parts of the Eaſt Indies, eſpecially in Cananor, Calecute, Cambaya, and Decan. The later in Braſile.

¶ *The Time.*

Theſe trees floure and flouriſh Winter and Summer.

¶ *The Names.*

Their names haue bin touched in their deſcriptions. The firſt is called *Anacardium*, of the likeneſſe it hath with an heart: of the Arabians *Balador*: of the Indians *Bibo*.

The ſecond is called *Caious*; and is written *Caiöüs*; and *Caius*: of ſome, *Caiocus*.

¶ *The Temperature and Vertues.*

The oile of the fruit is hot and dry in the fourth degree; it hath alſo a cauſtick or corroſiue qualitie: it taketh away warts, breaketh impoſtumes, preuaileth againſt lepry, *alopecia*, and eaſeth the pain of the teeth, being put into the hollowneſſe thereof. A

The people of Malavar do vſe the ſaid oile migled with chalke, to marke their cloathes or any other thing they deſire to be coloured or marked, as we vſe chalke, okar, and red marking ſtones, but their colour will not be taken forth again by any art whatſoeuer. B

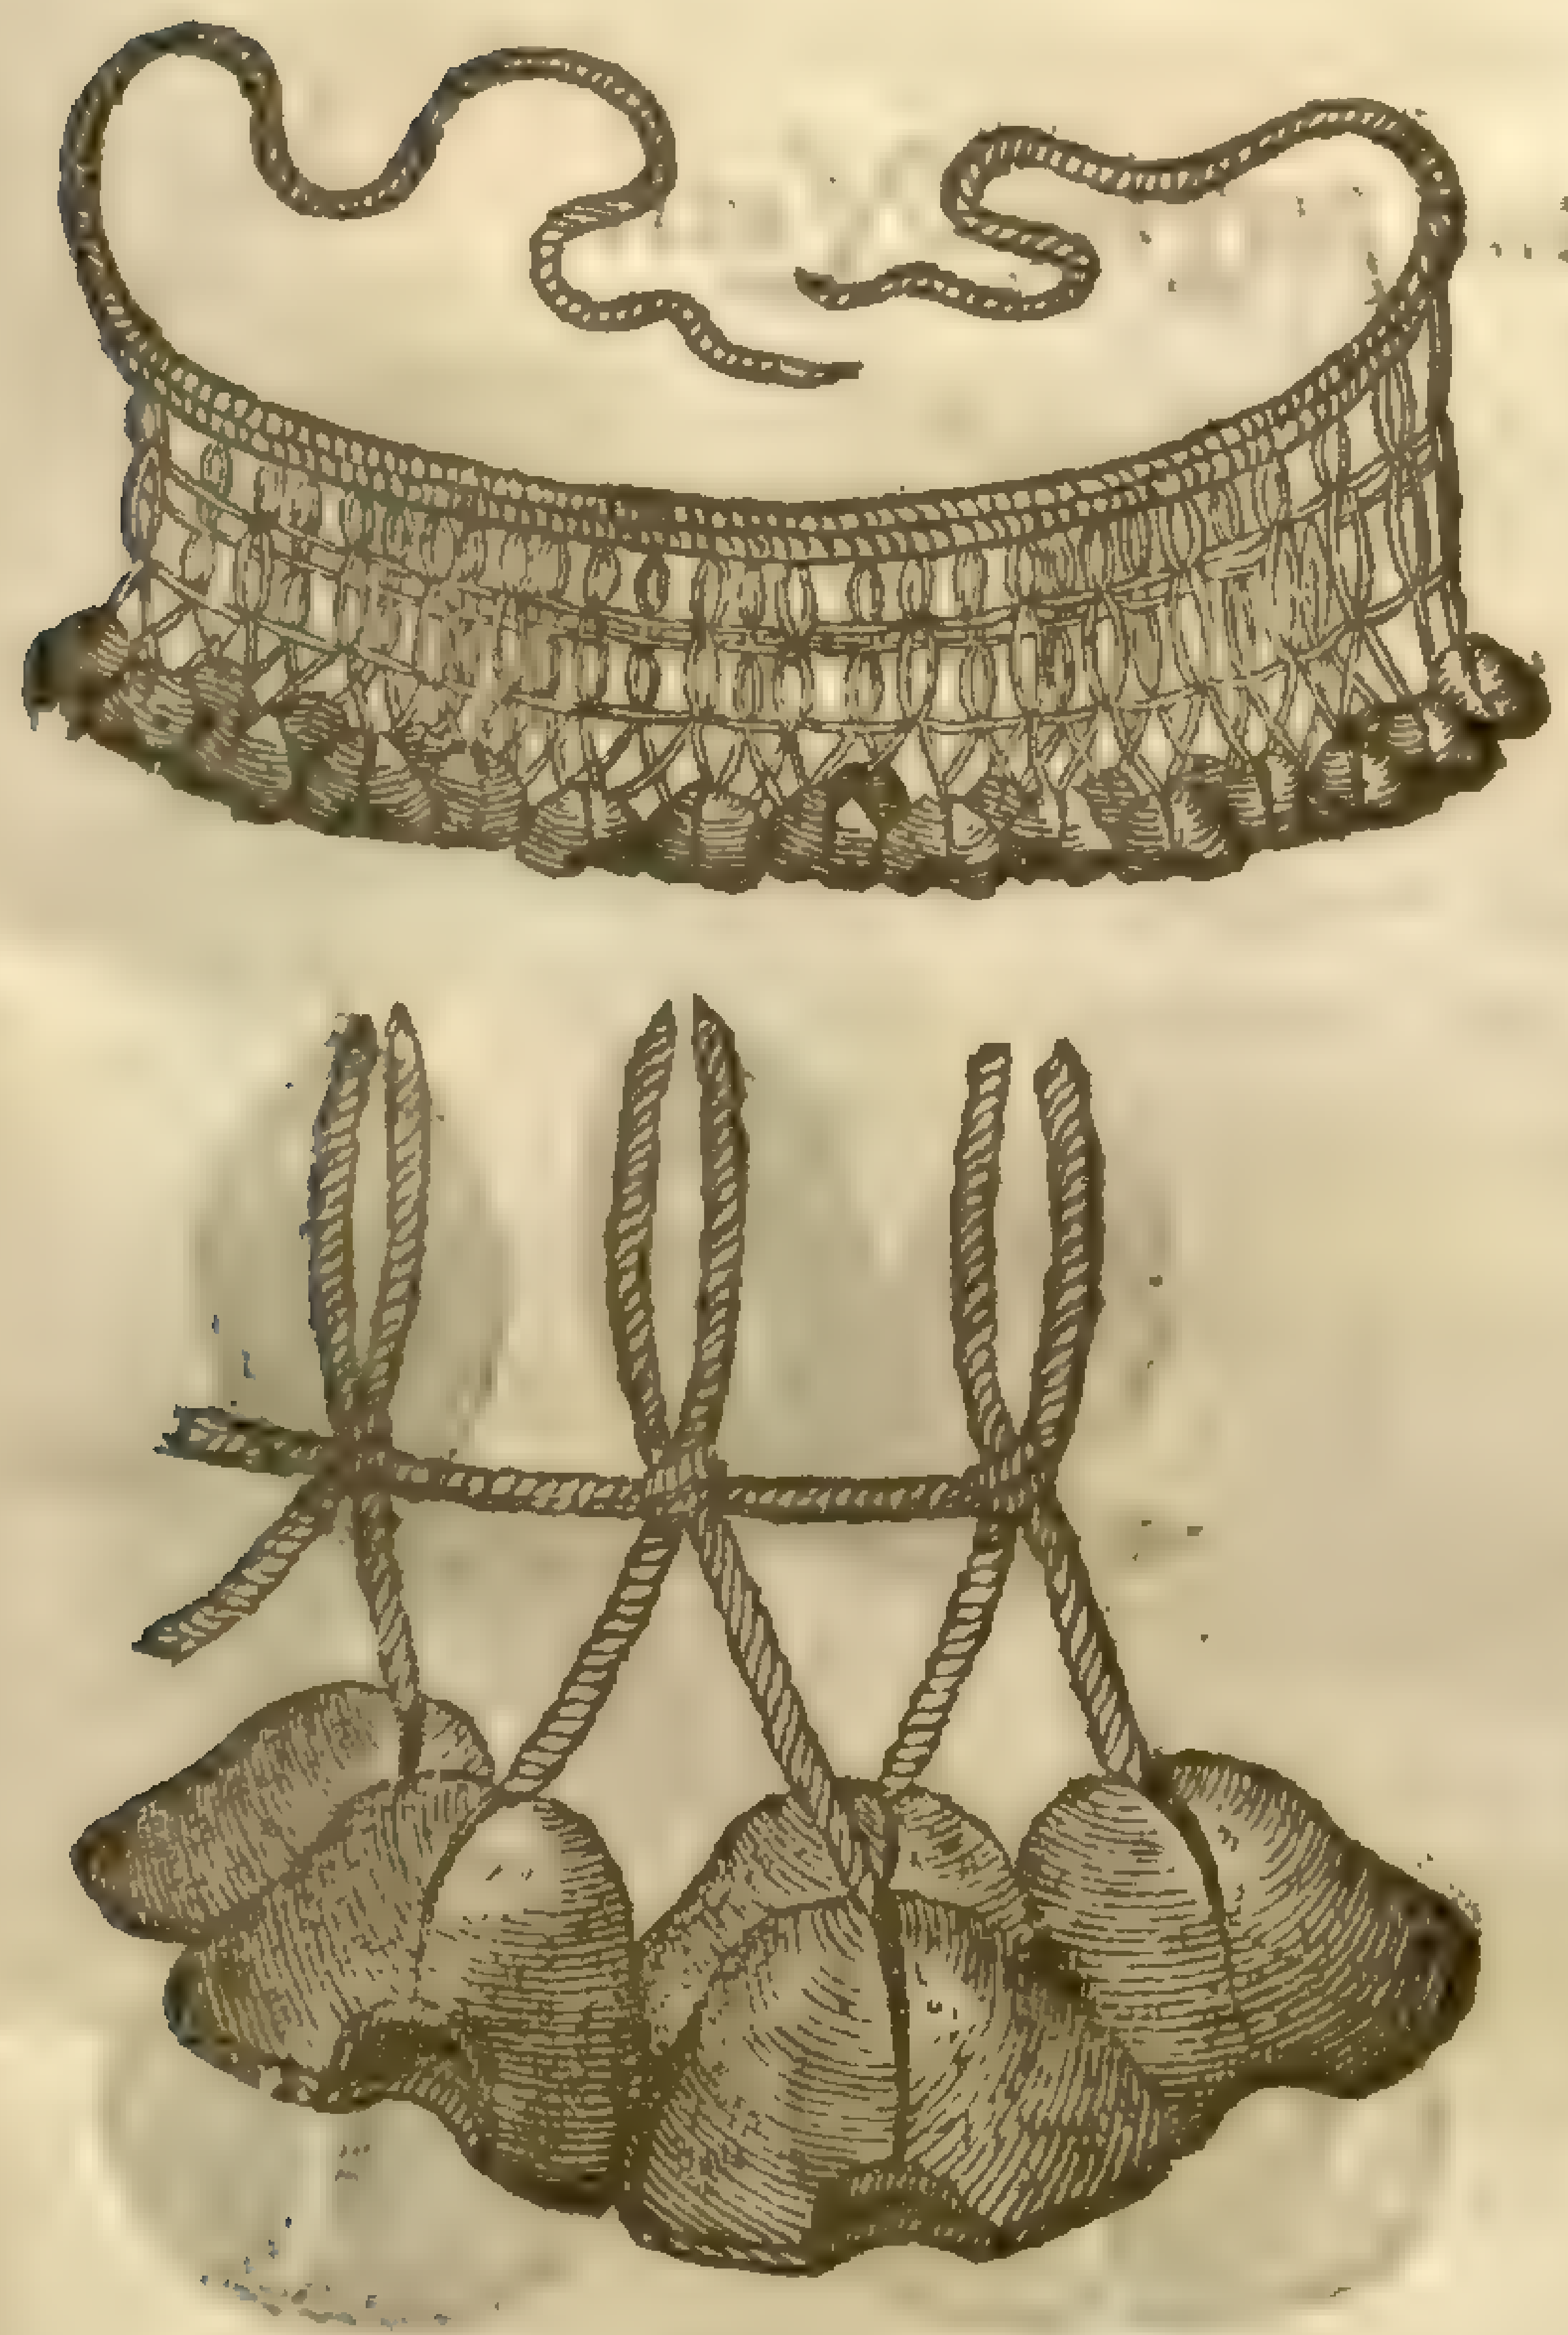
They alſo giue the kernell ſteeped in whay to them that be aſthmaticke or ſhort winded; and when the ſame is green they drinke the ſame ſo ſteeped againſt the wormes. C

The Indians for their pleaſure will giue the fruit vpon a thorne or ſome other ſharpe thing, and hold it in the flame of a candle or any other flame, which there wll burn with ſuch crackings, lightnings, and withall yeeld ſo many ſtrange colors, that it is great pleaſure to the beholders who haue not ſeen the like before. D

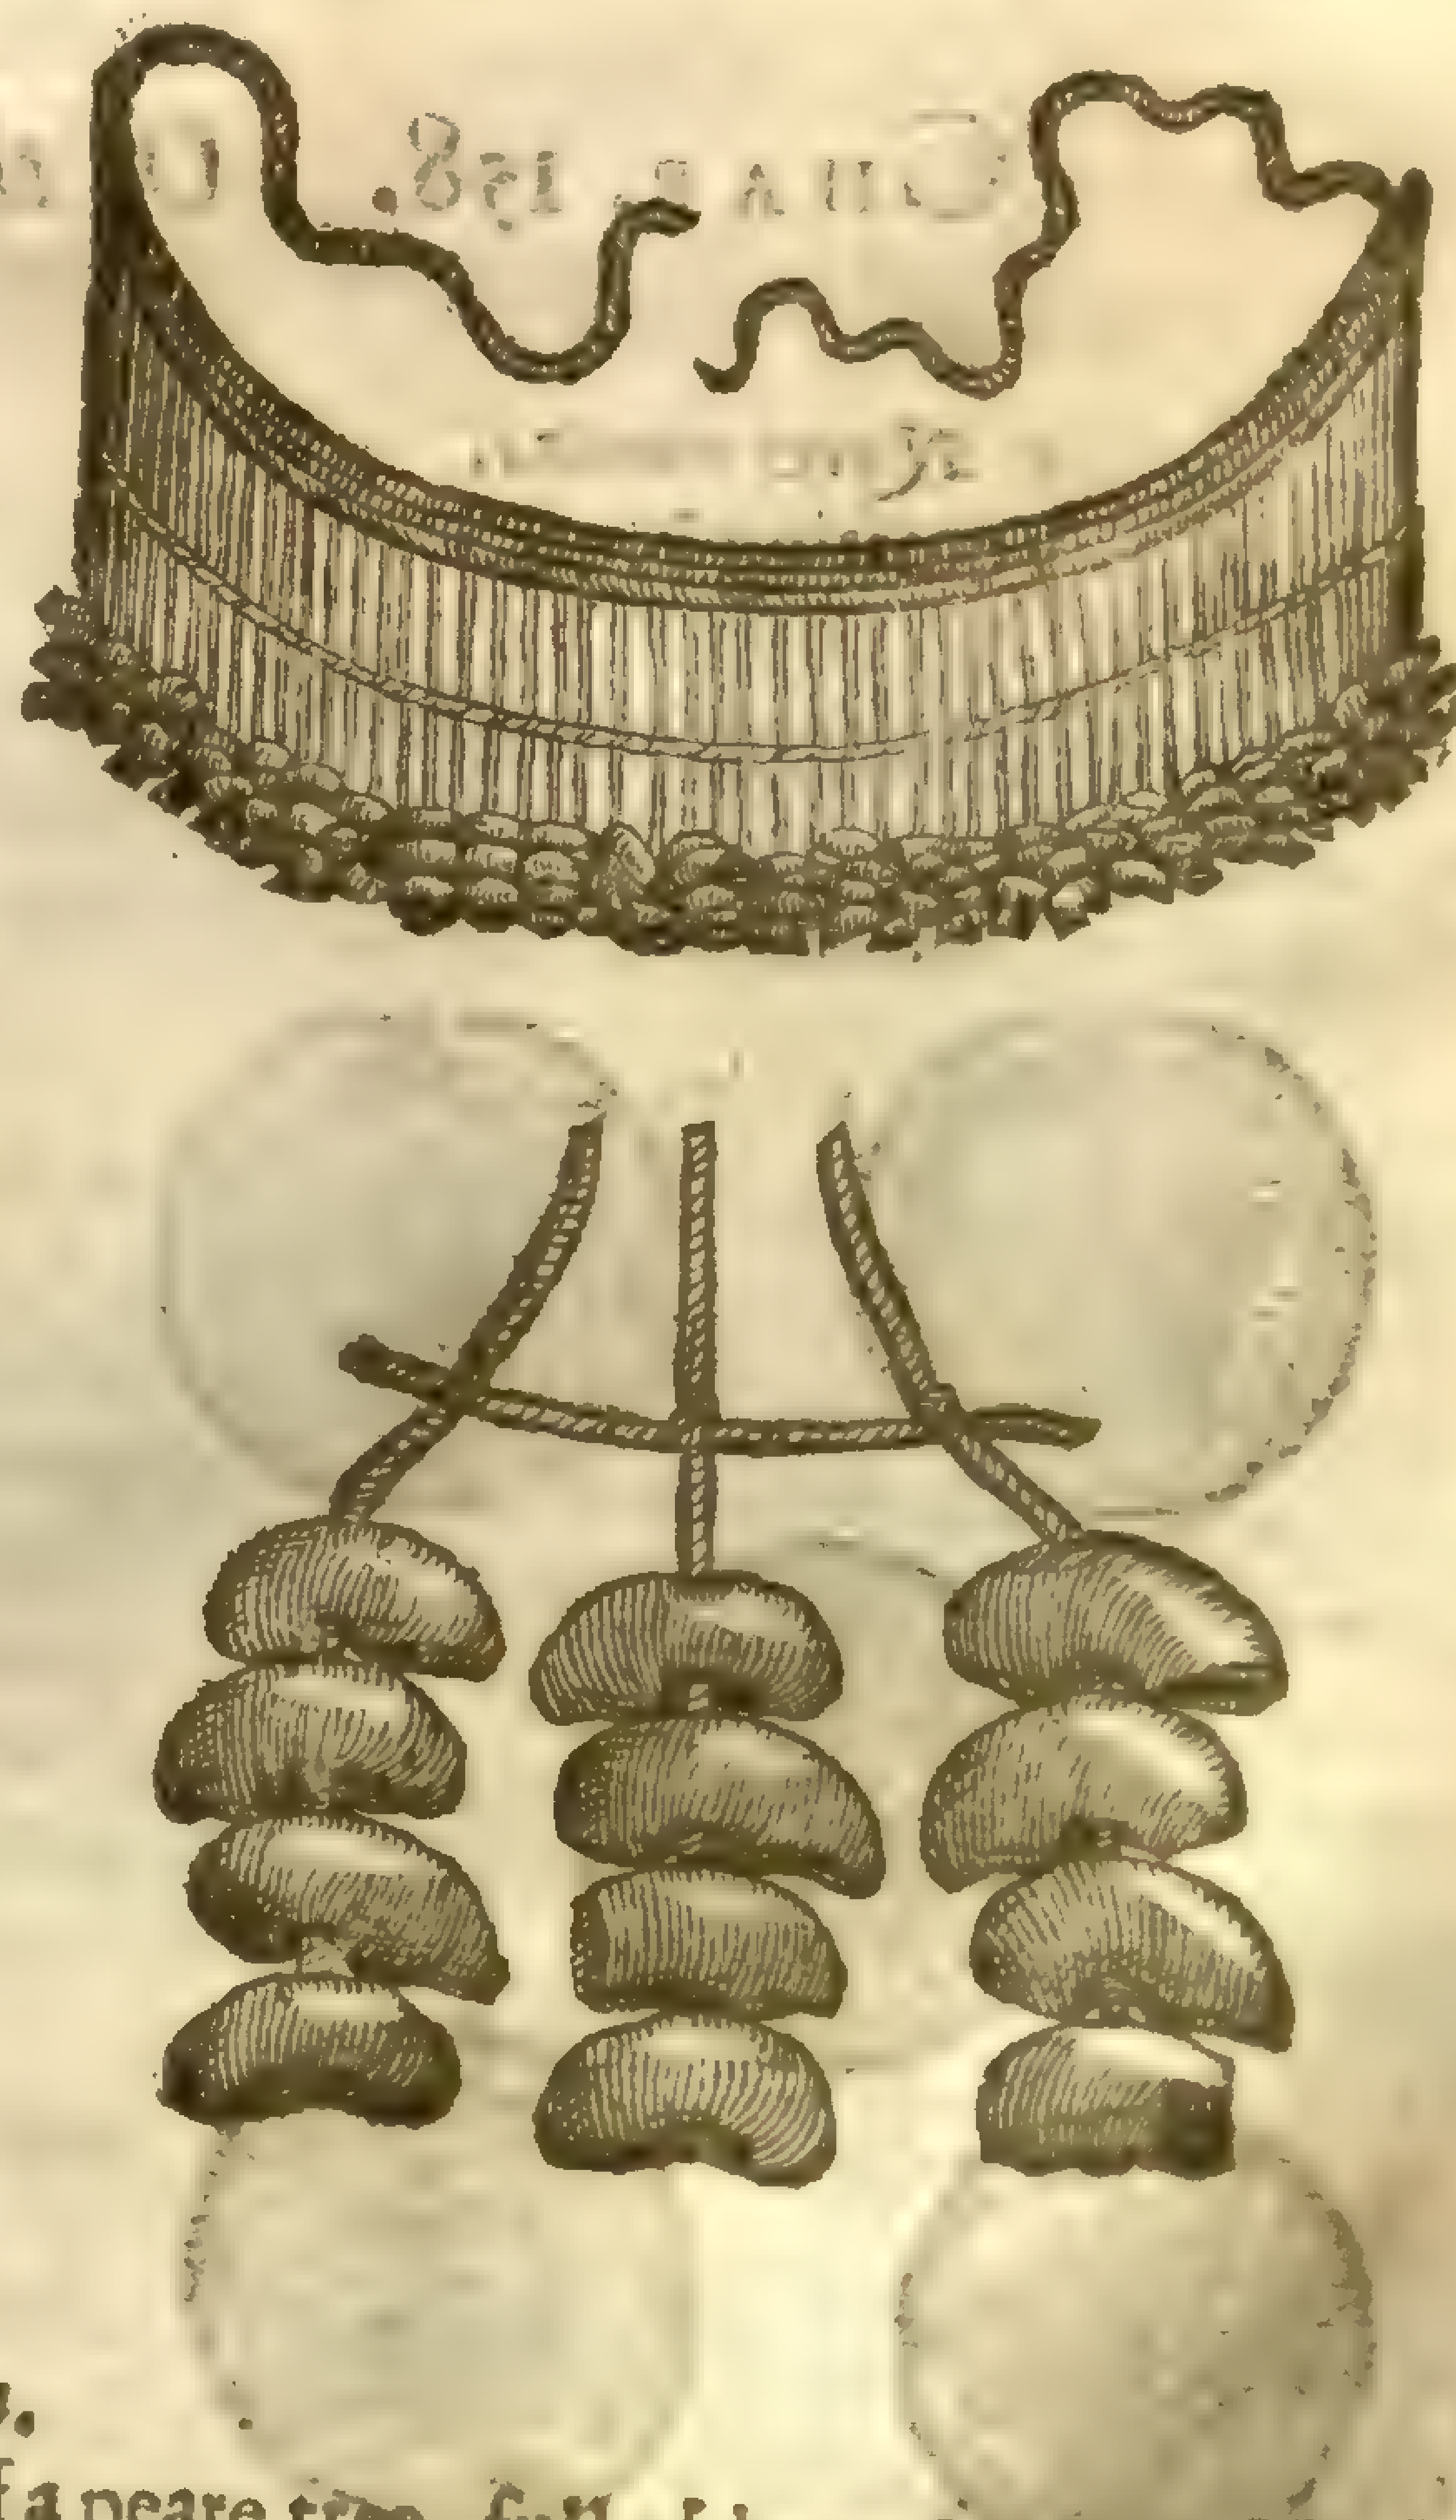
Chap. 157.

Of Indian Morrice bells, and diuers other Indian Fruits.

† 1 *Abouay Theueti.*
Indian Morrice bells.



† 2 *Fructus Higuero.*
Indian Moroſco bells.



¶ *The Deſcription.*

This fruit groweth vpon a great tree of the bigneſſe of a peare tree, full of branches, garniſhed with many leaues which are alwayes greene, three or foure fingers long, and in bredth two: when the branches are cut off there iſſueth a milky iuyce not inferior to the fruit in his venomous qualitie. The trunk or body is couered with a grayiſh barke: the timber is white and ſoft, not fit to make fire of, much leſſe for any other vſe; for being cut and put to the fire to burne, it yeeldeth forth ſuch a loathſome and horrible ſtinke, that neither man nor beaſt are able to endure it; wherefore the Indians haue no vſe thereof, but only of the fruit, which in ſhape is like the Greeke letter Δ, of the bigneſſe of a Cheſtnut, and couered with a moſt hard ſhell, wherein is contained a kernell of a moſt venomous and poiſonſome qualitie, wherewith the men beeing angry with their wiues doe poiſon them, and likewiſe the women their husbands: they likewiſe vſe to dip or anoint and invenom their arrowes therewith, the more ſpeedily to diſpatch their enemies. Which kernel they take forth with ſome conuenient inſtrument, leauing the ſhel as whole as may be, not touching the kernell with their hands becauſe of its venomous qualitie, which would ſpoile their hands, and ſometimes take away their life alſo. In which ſhells they put ſome little ſtones and tie them on ſtrings, (as you may perceiue by the figure) which they dry in the Sun, and after tie them about their legs as we do bels, to ſet forth their dances and Moroſco Matachina's, wherein they take great pleaſure, by reaſon they think themſelues to excell in thoſe kindes of dances. Which ratling ſound doth much delight them, becauſe it ſetteth forth the diſtinction of ſounds, for they tune and mix them with great ones and little ones, in ſuch ſort as we do chimes or bells.

2 There is alſo another ſort herof, differing only in forme, being of the like venomous quality, and vſed for the ſame perpoſe. ‡ The fruit of *Higuerro* is like that of a Gourd in pulpe, and may be eaten: the ſhape of the fruit is round, whereas the other is three cornered. ‡

¶ *The Place.*

Theſe grow in moſt parts of the Weſt Indies, eſpecially in ſome of the Iſlands of the Canibals, who vſe them in their dances more than any of the other Indians. ‡ You may ſee theſe on ſtrings as they are here figured, among many other rarities, with M^r^ *Iohn Tradeſcant* at South Lambeth. ‡

¶ *The Time.*

We haue no certain knowledge of the time of flouring or bringing the fruit to maturitie.

¶ *The Names and Vſe.*

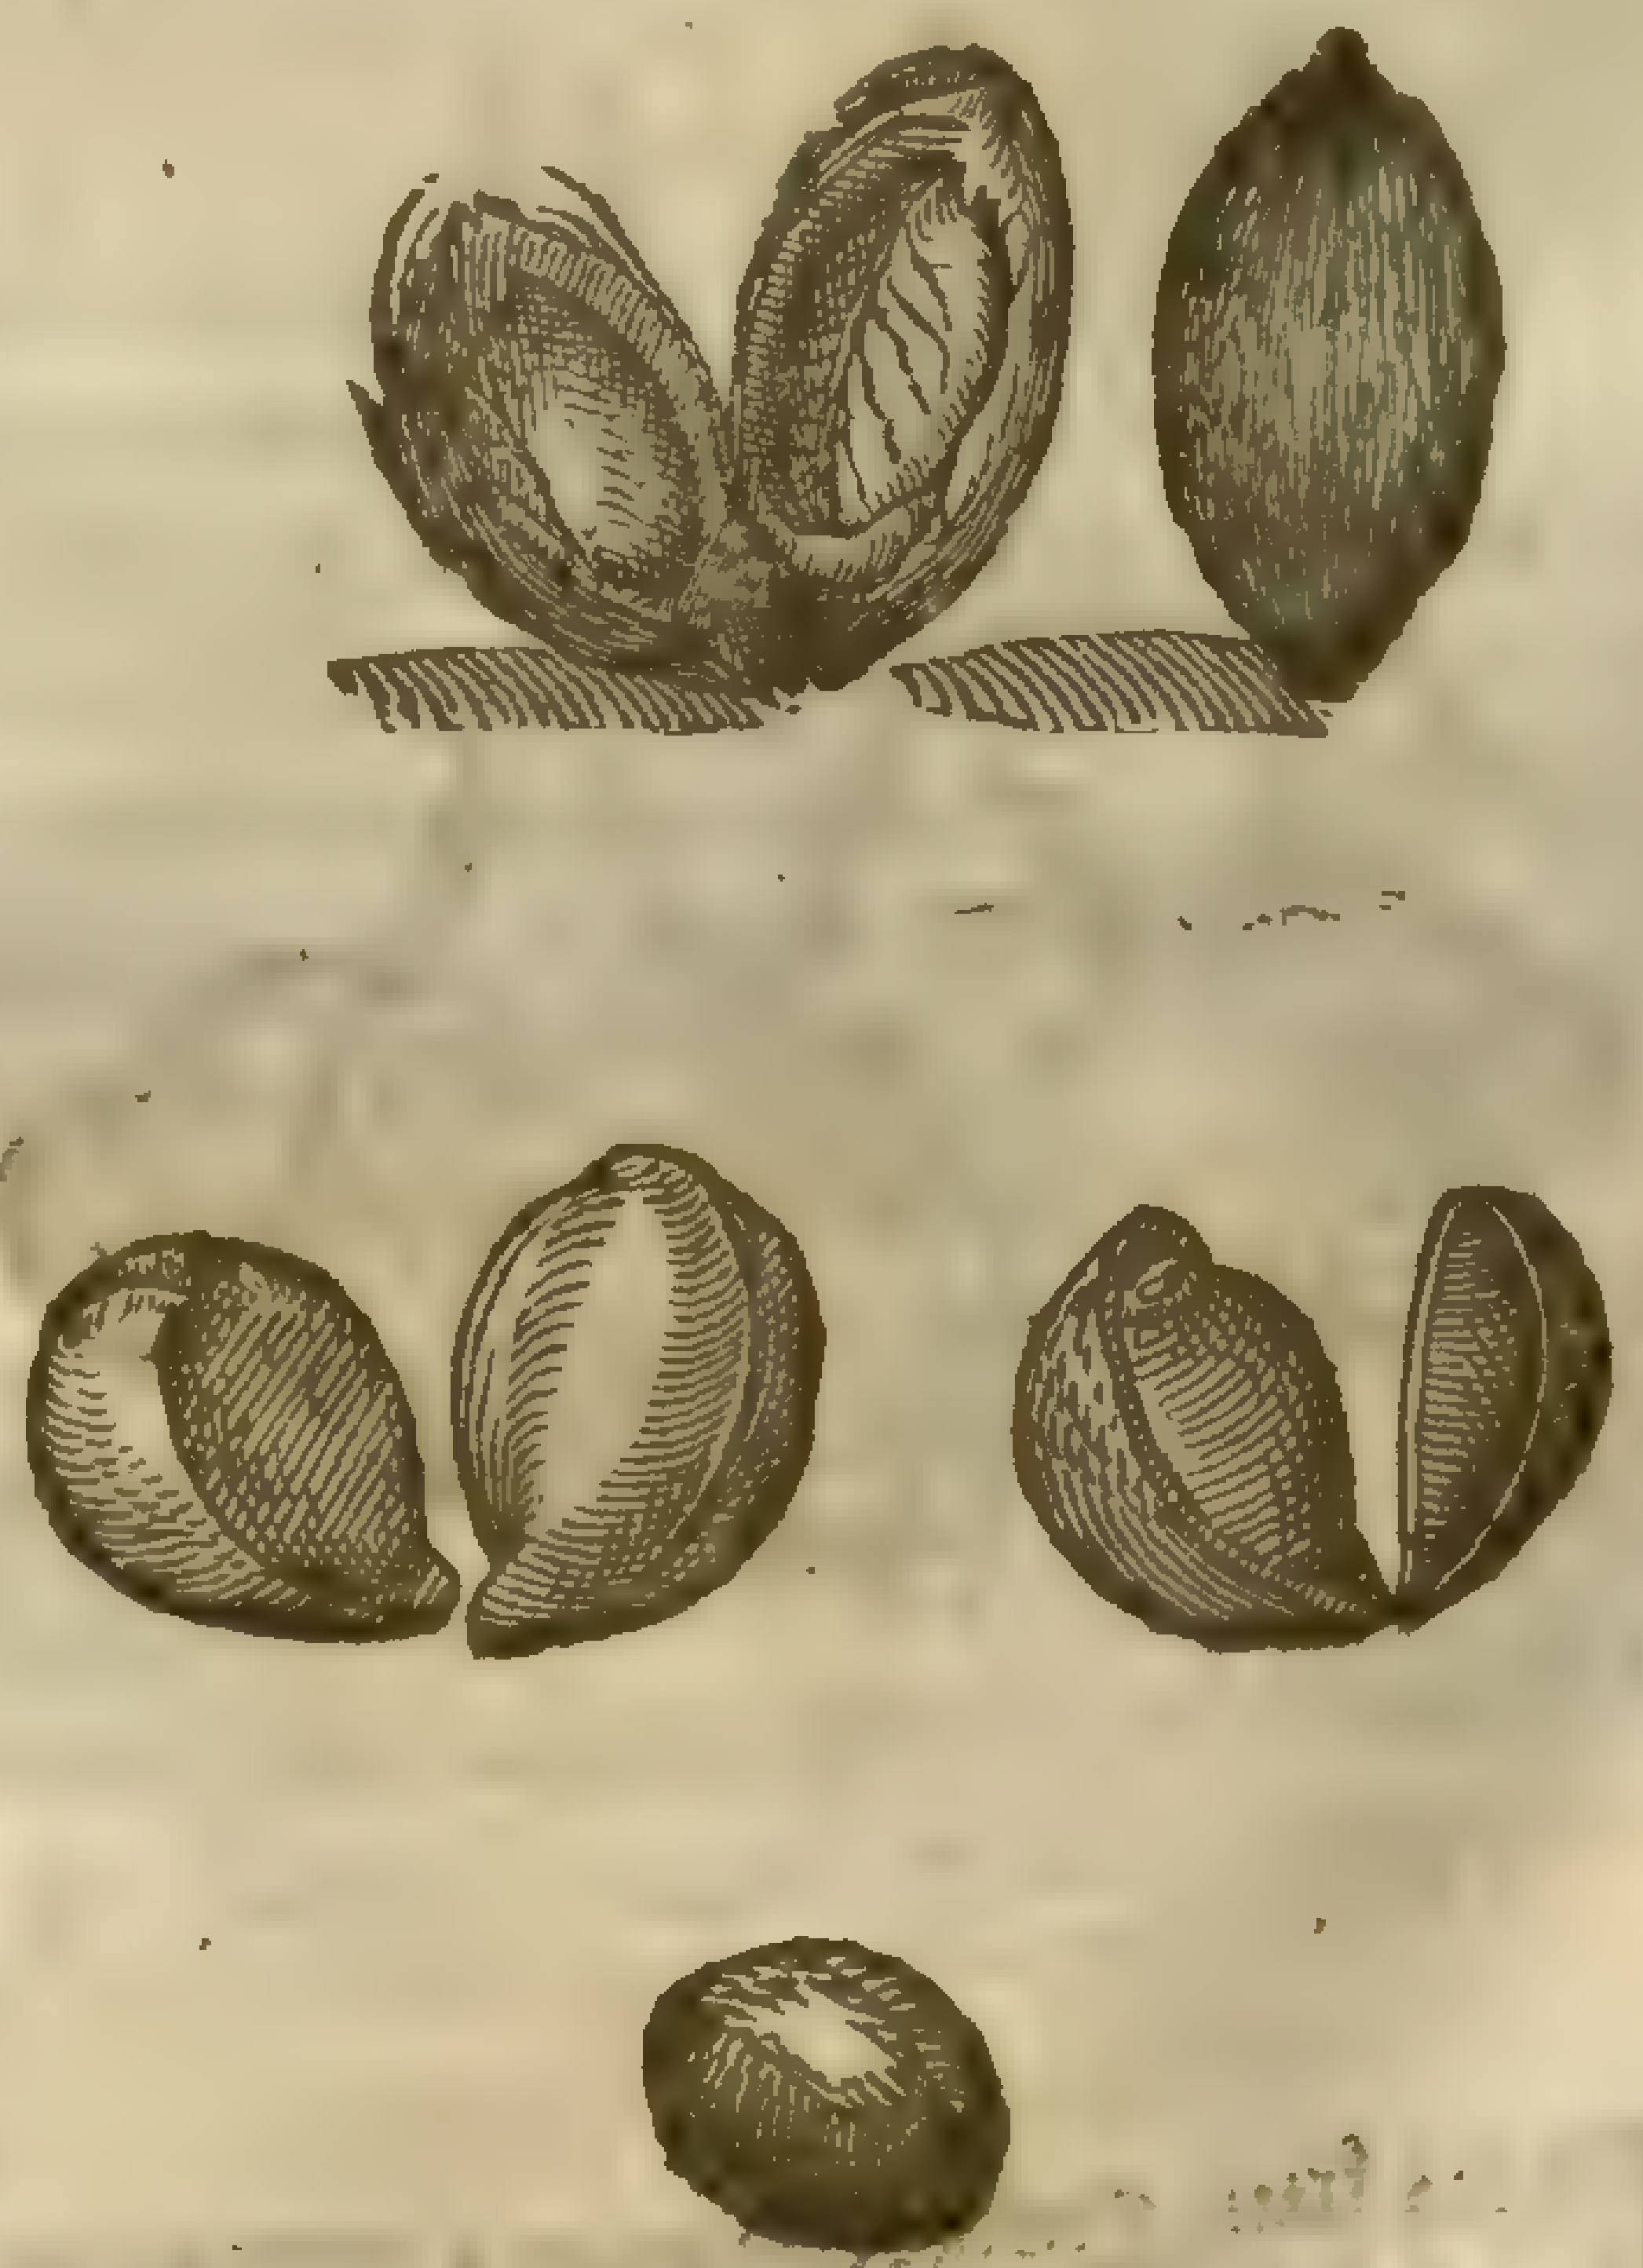
We haue ſufficiently ſpoken of the names and vſe hereof, therefore what hath beene ſayd may ſuffice.

† The figures were tranſpoſed.

Chap. 158. *Of the vomiting and purging Nuts.*

1 *Nuces vomicæ.*
Vomiting Nuts.

2 *Nuces purgantes.*
Purging Nuts.



¶ *The*

¶ *The Deſcription.*

1 A*Vicen* and *Serapio* make *Nux vomica* and *Nux Methel* to be one, whereabout there hath been much cauilling: yet the caſe is plain, if the text be true, that the Thorn Apple is *Nux Methel*. Of the tree that beareth the fruit called in ſhops *Nux vomica* and *Nux methel*, we haue no certain knowledge: ſome are of opinion that the fruit is the root of an herb, & not the nut of a tree: wherefore ſince the caſe among the Learned reſteth doubtfull, we leaue what els might be ſaid to a further conſideration. The fruit is round, flat like a little cake, of a ruſſet ouerworne colour, fat and firme, in taſte ſweet, and of ſuch an oily ſubſtance, that it is not poſſible to ſtamp it in a mortar to pouder, but when it is to be vſed it muſt be grated or ſcraped with ſome inſtrument for that purpoſe.

2 There be certain nuts brought from the Indies, called Purging nuts, of their quality in purging groſſe and filthy humors: for want of good inſtruction from thoſe that haue trauelled to the Indies, we can write nothing of the tree it ſelfe: the Nut is ſomwhat long, oual, or in ſhape like an Egge, of a browne colour: within the ſhell is contained a kernell, in taſte ſweet, and of a purging facultie.

¶ *The Place and Time.*

Theſe Nuts do grow in the deſarts of Arabia, and in ſome places of the Eaſt Indies: we haue no certain knowledge of their ſpringing or time of maturitie.

¶ *The Names.*

Avicen affirmeth the Vomiting nut to be of a poiſonous qualitie, cold in the fourth degree, hauing a ſtupifying nature, and bringing deadly ſleepe.

¶ *The Vertues.*

A Of the phyſicall vertues of the Vomiting Nuts we thinke it not neceſſarie to write, becauſe the danger is great, and not to be giuen inwardly, but mixed with other Compoſitions, and that very curiouſly by the hands of a faithfull Apothecarie.

B The pouder of the nut mixed with ſome fleſh and caſt vnto Crowes and other rauenous Fowles, doth kill, at the leaſt ſo dull their ſences, that you may take them with your hands.

C They make alſo an excellent ſallet, mixed with ſome meat or butter, and laid in a garden where Cats vſe to ſcrape to bury their excrements, ſpoiling both herbs and alſo ſeeds new ſowne.

CHAP. 159. *Of diuers ſorts of Indian Fruits.*

¶ *The Kindes.*

THeſe fruits are of diuers ſorts and kinds, wherof we haue little knowledge, more than the fruits themſelues, with the names of ſome of them: wherefore it ſhall ſuffice to ſet forth vnto your view the form only, leauing vnto Time, and thoſe that ſhall ſucceed, to write of them at large, who in time may know that which at this time is vnknowne.

‡ OVr Author formerly in this chapter ſet forth diuers ſorts of Indian fruits, and among the reſt, *Beritinus*, *Cacao*, *Cocci Orientales*, *Buna*, *Fagaras*, *Cububæ*, &c. but he gaue but only three deſcriptions, and theſe either falſe, or to no purpoſe; wherefore I haue omitted them, and in this chapter giuen you moſt of theſe fruits which were formerly figured therein, together with an addition of ſundry other out of *Cluſius* his *Exoticks*, whoſe figures I haue made vſe of, and here giuen you al thoſe which came to my hands, though nothing ſo many as are ſet forth in his *Exoticks*; neither if I ſhould haue had the figures, would the ſhortneſſe of my time, nor bigneſſe of the book (being already grown to ſo large a volume) ſuffer me to haue inſerted them: therefore take in good part thoſe I here giue, together with the briefe hiſtories of them.

¶ *The Deſcription.*

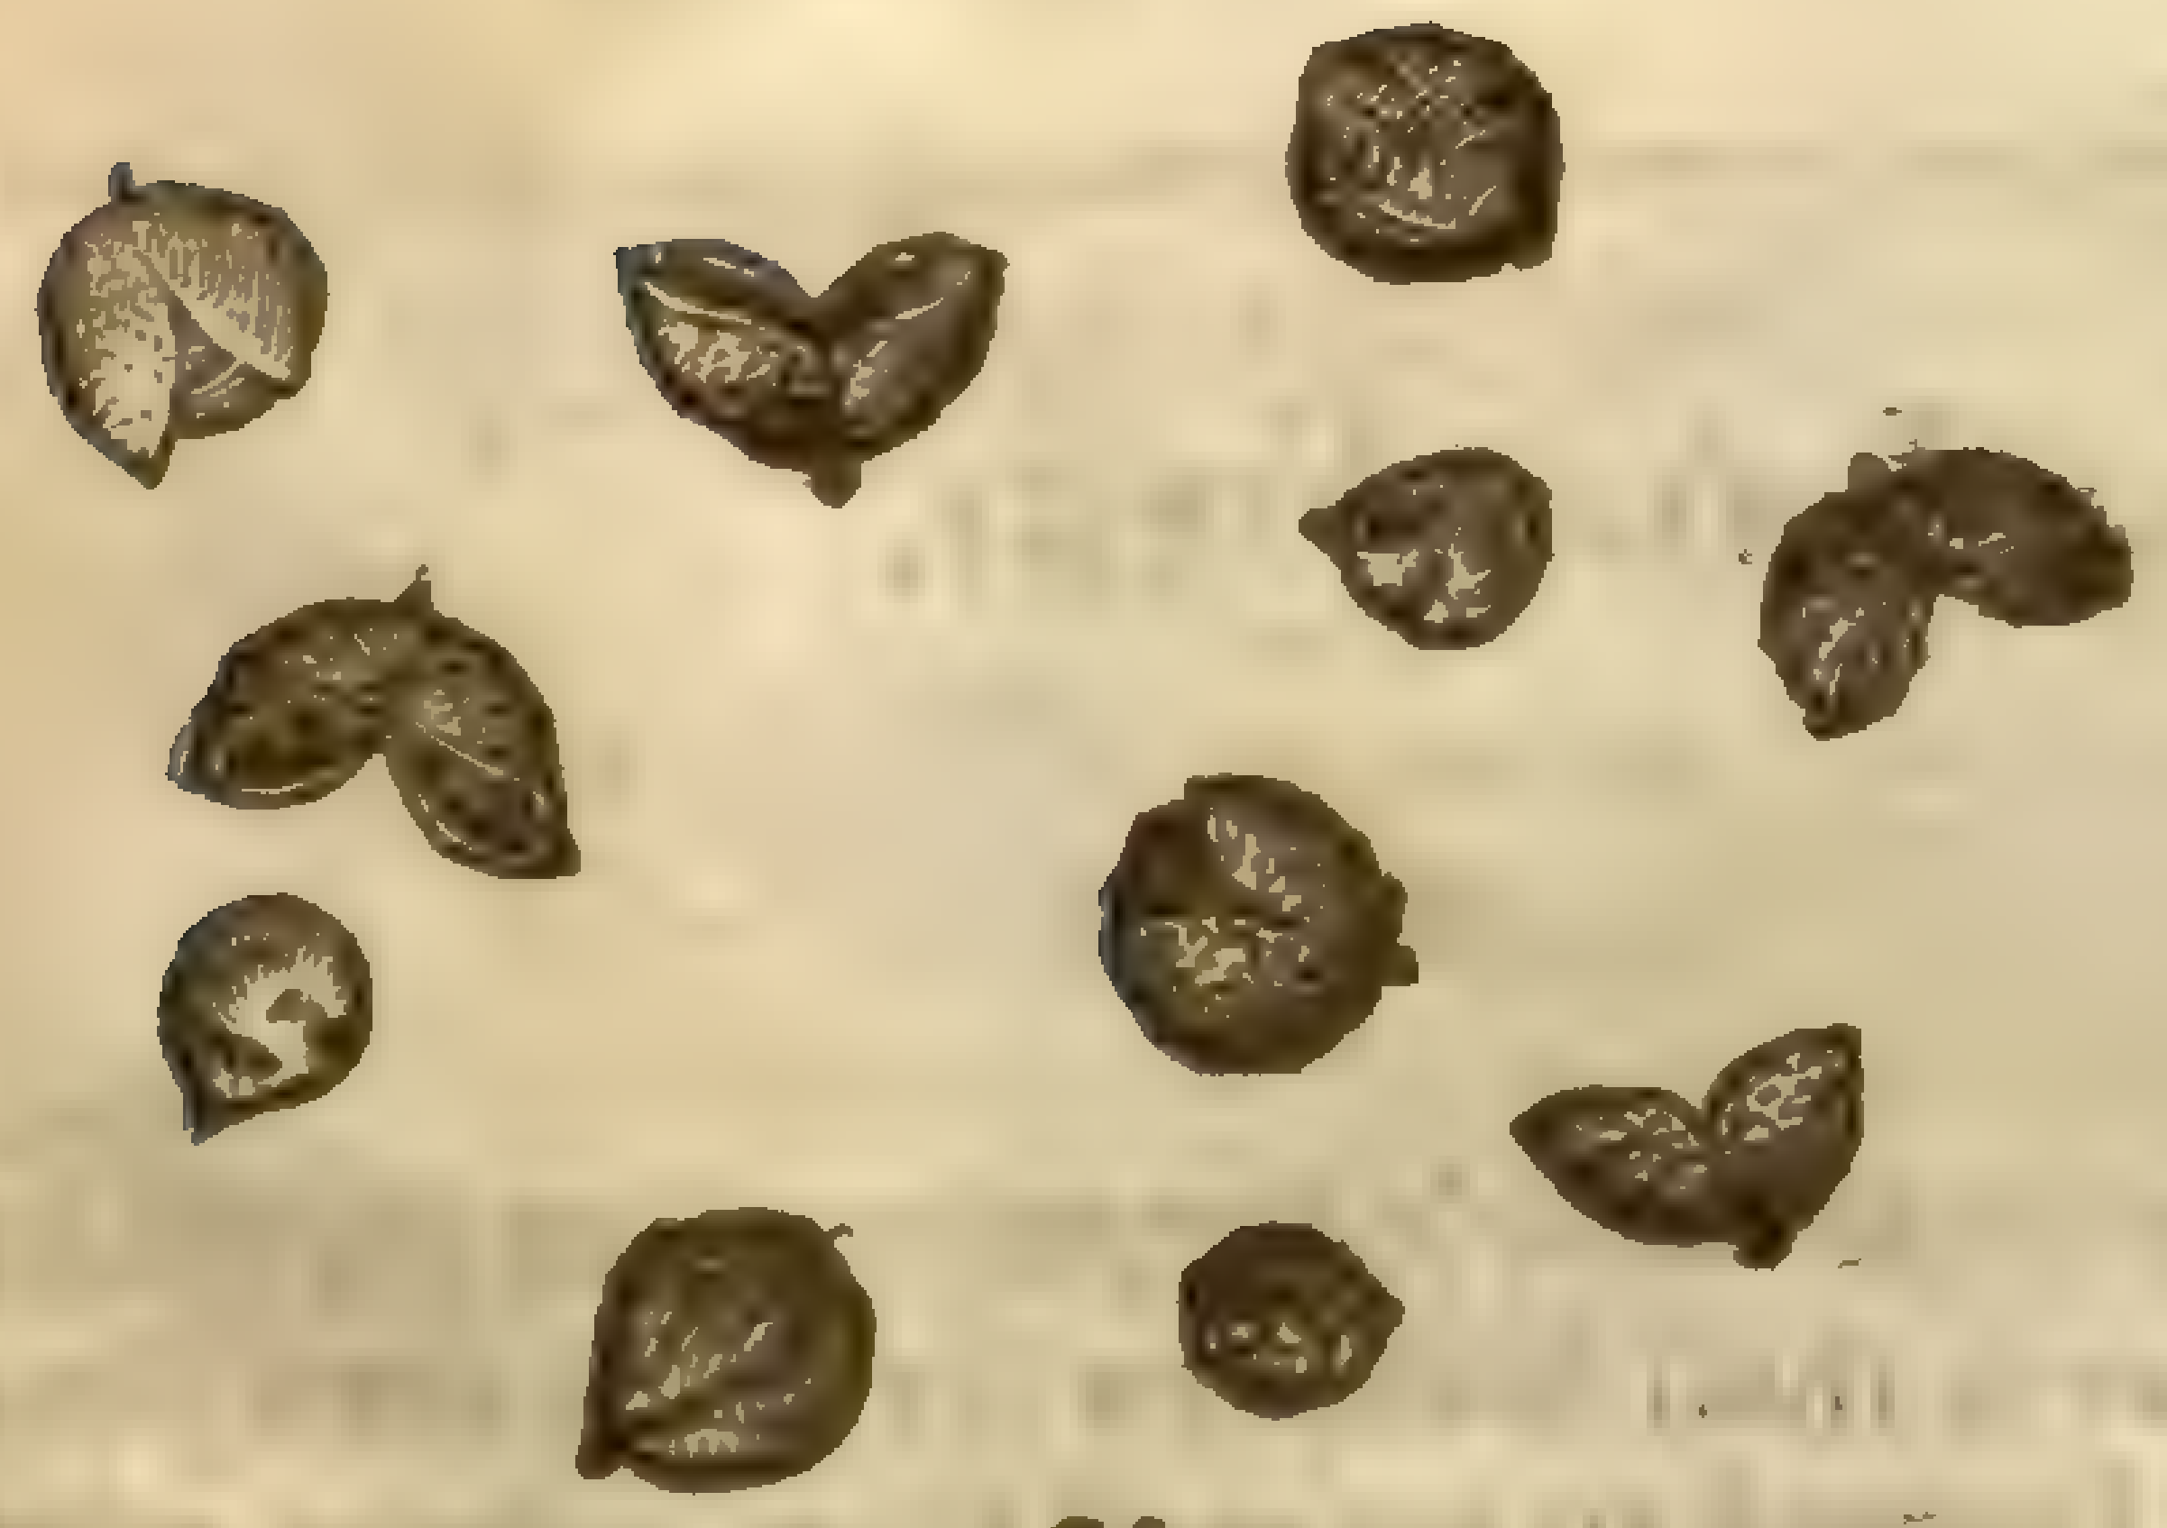
1 THe firſt and one of the beſt knowne of theſe fruits, are the *Cubibæ*, called of the Arabian Phyſitions, *Cubibe*, and *Quabeb*; but of the Vulgar, *Quabebochini*; in Iaoa where they plentifully grow, *Cumuc*: the other Indians (the Malayans excepted) call them *Cubas ſini*, not becauſe they grow in China, but becauſe the Chinois vſe to buy them in Iaoa and Sunda, and ſo carry them to the other ports of India. The Plant which carrieth this fruit hath leaues

like

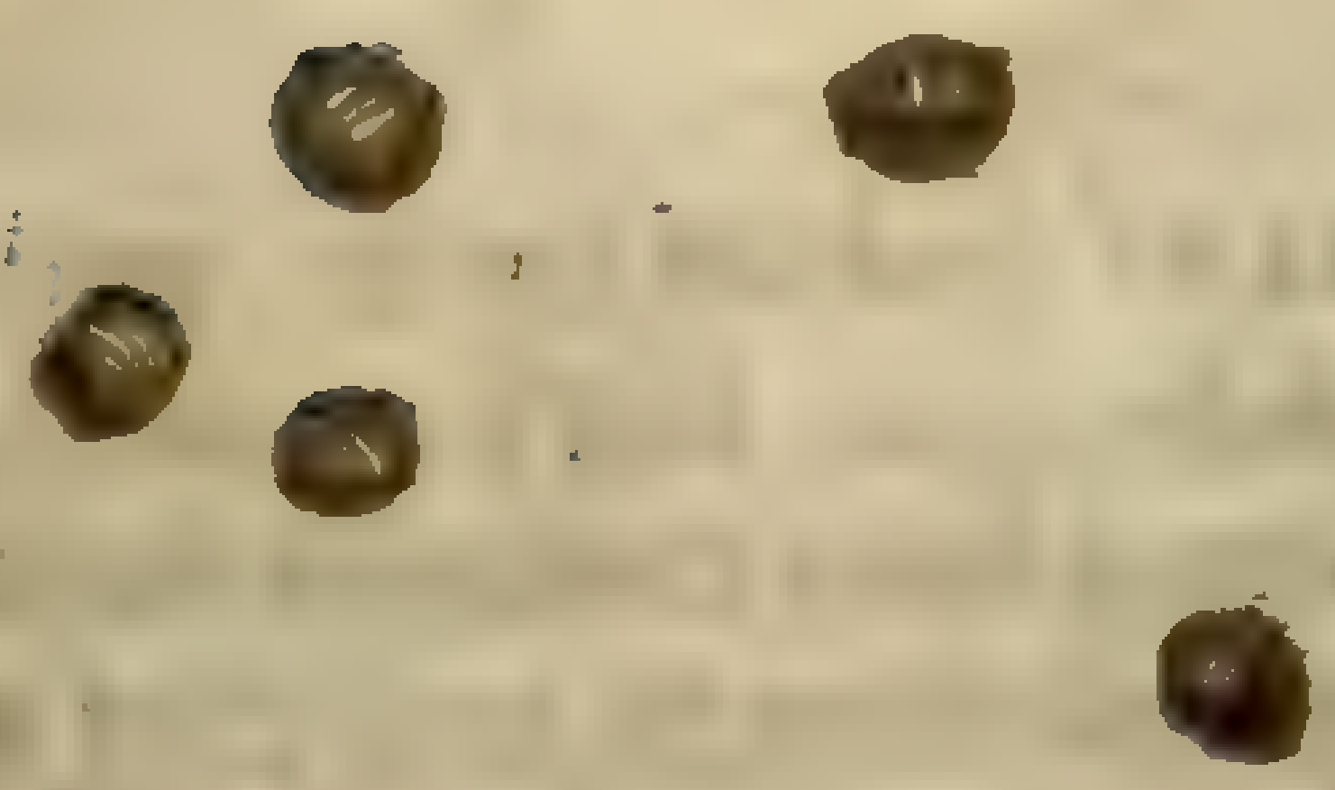
Cubibæ. Cubi bs.

2 *Cocci Orientales. Cocculus Indi.*

3 *Fagara.*



4 *Mungo.*



5 *Buna.*

‡ 6 *Amomum verum.*

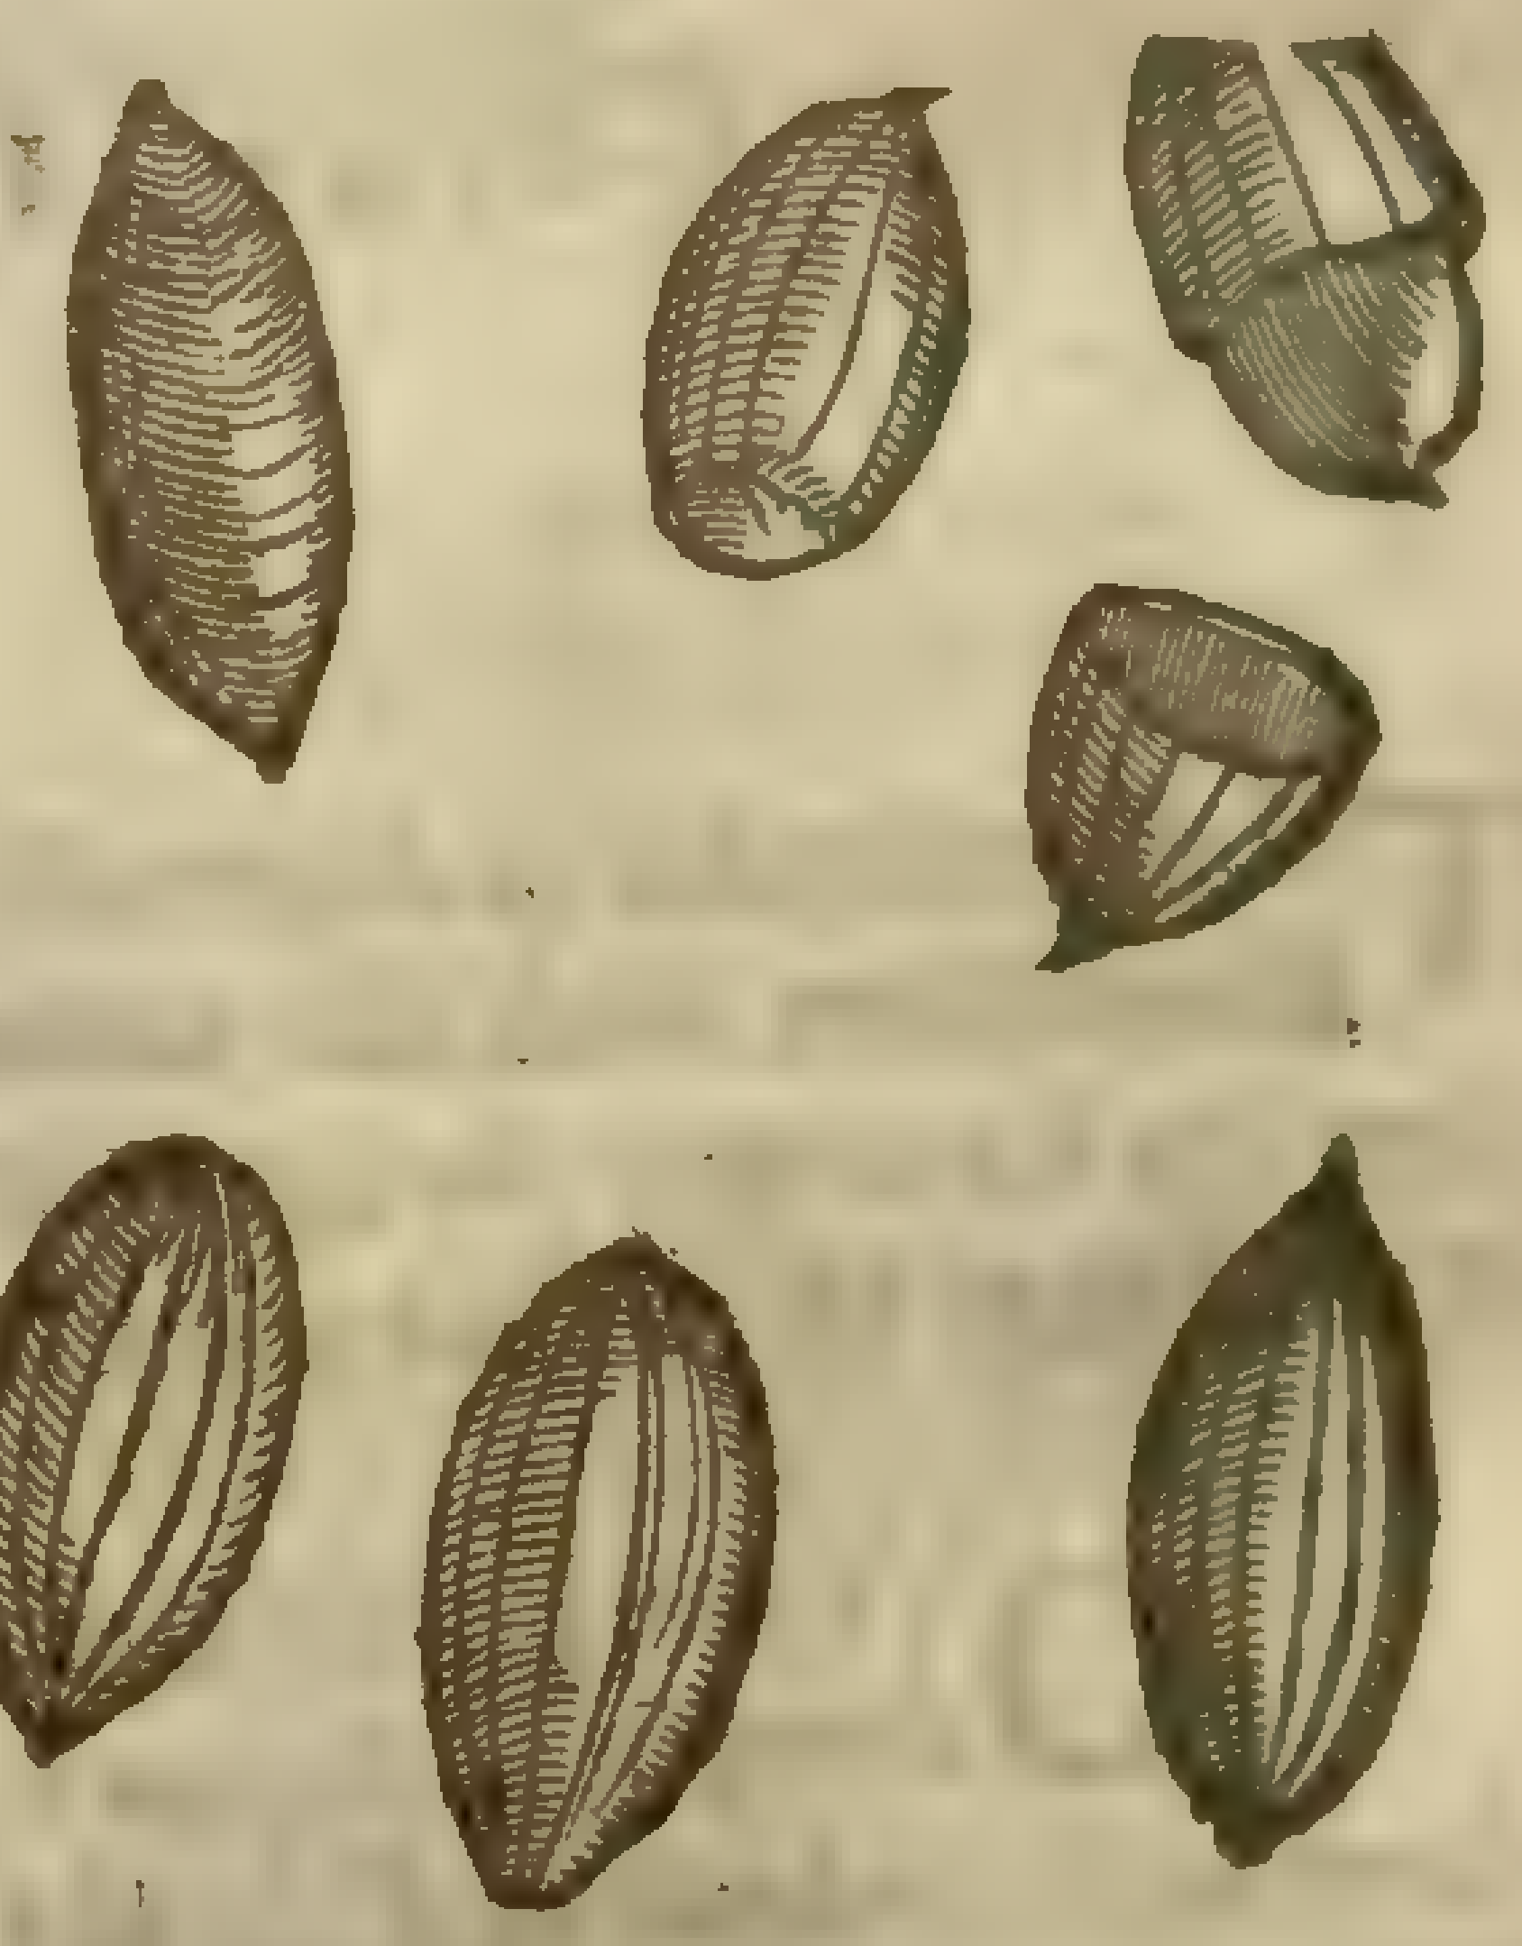
9 *Beritinus.*



‡. 10 *Nuces inſanæ.*
Mad Nuts.

like thoſe of Pepper,but narrower,and it alſo windes about trees like as Ivy or Pepper doth. The fruit hangs in cluſters like as thoſe we call red Currans, and not cloſe thruſt together in bunches, as Grapes:the fruit or berries are of the bigneſſe of Pepper cornes,wrinkled,and of a browniſh colour;they are of a hot and biting aromaticke taſte,and oft times hollow within,but if they be not hollow,then haue they a pretty reddiſh ſmooth round ſeed vnder their rough vtter huske, each of theſe berries commonly hath a piece of his footſtalke adhering to it. It is reported,That the Natiues where it growes firſt gently boile or ſcald theſe berries before they ſel them, that ſo none els may haue them,by ſowing the ſeeds. Some haue thought theſe to haue been the *Carpeſium* of the Antients ; and other-ſome haue iudged them the ſeeds of *Agnus Caſtus*,but both theſe opinions are erronious.

A These are hot and dry in the beginning of the third degree, wherfore they are good againſt the cold and moiſt affects of the ſtomacke,and flatulencies ; they help to clenſe the breſt of tough and thicke humors,they are good for the ſpleen,for hoarſeneſſe and cold affects of the womb ; chewed with Maſtick they draw much flegmatick matter from the head,they heate and comfort the brain. The Indians vſe them macerated in wine to excite venery.

2 The plant which caries this fruit is vnknowne,but the berry is well knowne in ſhops by the name of *Cocculus Indicus* , ſome call them *Cocci Orientales* ; others,*Coccula Orientales* ; others,as *Cordus* for one,thinke them the fruit of *Solanum furioſum* ; others iudge them the fruit of a Tithymale, or of a *Clematis*. Theſe beries are of the bigneſſe of Bay beries,commonly round,and growing but one vpon a ſtalke ; yet ſomtimes they are a little cornered, and grow two or three cluſtering together : their outer coat or ſhel is hard,rough,and of a browniſh dusky colour ; their inner ſubſtance is very oily,of a bitter taſte.

B They are vſed with good ſucceſſe to kill lice in childrens heads,being made into pouder and ſo ſtrowed amongſt the haire. They haue alſo another facultie which our Author formerly ſet down in the chapter of *Alaternus*(where he confounded theſe with *Fagaras*) in theſe words,which I haue there omitted,to inſert here:

C In England we vſe the fruit called *Cocculus Indi* in pouder,mixed with floure,hony,and crums of bread,to catch fiſh with,it being a numming, ſoporiferous, or ſleeping medicine, cauſeth the fiſh to turn vp their bellies,as being ſenſeleſſe for a time.

3 *Fagara* is a fruit of the bigneſſe of a Cich peaſe, couered with a thin coat of a blackiſh Aſh colour,vnder which outer coat is a ſlender ſhell containing a ſollid kernel involved in a thin black filme. The whole fruit both in magnitude,form,and colour,is ſo like the *Cocculus Indus* laſt deſcribed,that at the firſt ſight one would take it to be the ſame. *Avicen* mentions this,*cap.*266.after this manner : What is *Fagara ?* It is a fruit like a Chich,hauing the ſeed of *Mahaleb*,and in the hollowneſſe is a black kernell as in *Schehedenegi*,and it is brought out of Sofale.

He places it amongſt thoſe that heate and dry in the third degree, and commends it againſt the coldneſſe of the ſtomacke and liuer,it helps concoction,and bindes the belly.

4 This,which *Cluſius* thinks to be *Mungo*(which is vſed in the Eaſt Indies about Guzarat and Decan for prouender for horſes)is a ſmall fruit of the bigneſſe of Pepper,creſted,very like Coriander ſeed,but that it is bigger and blacke,it is of an hot taſte.

5 *Buna* is a fruit of the bigneſſe of *Fagara*, or ſomewhat bigger or longer, of a blackiſh Aſh colour,couered with a thinne skin furrowed on both ſides longwiſe,whereby it is eaſily diuided into two parts,which contain each a kernell longiſh and flat vpon one ſide,of a yellowiſh colour, and acide taſte. They ſay that in Alexandria they make a certain very cooling drinke hereof. *Rauwolfius* in his Iournall ſeems to deſcribe this fruit by the name of *Bumu* ; and by the appellation,form,and faculties,he thinks it may be the *Buncho* of *Avicen*,and *Buncha* of *Rhaſis*,to *Almanſor*. *Cluſ.*

6 This is a kinde of Cardamome, and by diuers it is thought to be the true *Amomum* of the Antients : and to this purpoſe *Nicolas Morogna* a phyſitian of Verona hath written a treatiſe which is ſet forth at the later end of *Pona's* deſcription of Mount Baldus, to which I refer the Curious. Theſe cods or berries(whether you pleaſe to call them) grow thicke cluſtering together, they are round,and commonly of the bigneſſe of a cherry;the outer skin is tough,ſmoother,whiter, & leſſe creſted than that of the Cardamome:within this filme lie the ſeeds cluſtering together,yet with a thin filme parted into three : the particular ſeeds are cornered, ſomwhat ſmoother and larger than thoſe of Cardamomes,but of the ſame aromatick taſte,and of a brown colour. Their temperature and faculties may be referred to thoſe of Cardamones.

7. 8. This with the next inſuing are by *Cluſius* ſet forth by the names I here giue you them, though,as he ſaith,neither of them agree with the *Amomum* of *Dioſcorides*, they were only branches ſet thick with leaues,hauing neither any obſeruable ſmell or taſt:they were ſent to the learned and diligent Apothecarie *Walarandus Donrez* of Lyons, from Ormuz the famous mart and port towne in the Perſian Bay.

light vpon a certaine deſart Iſland, wherein grew many very tall trees, and looking for ſomething amongſt theſe to refreſh themſelues, amongſt others they obſerued ſome bigger than Okes, hauing leaues like thoſe of the Bay tree, thicke and ſhining, not ſnipt about the edges, their fruit was longiſh like to the ſmall acornes of the Ilex or Holme-Oke, but without any cup, yet couered with a thin ſhel of an aſh colour, and ſomtimes blacke, hauing within it a longiſh white kernell wrapped in a thin peeling, being without any manifeſt taſt. They when they found it, though much oppreſt with hunger, yet durſt not taſte thereof, leſt it ſhould haue bin poiſonous: but afterward comming to the Iſland Beretina, not far from this, they found it to abound with theſe trees, and learned that the fruit was not poiſonous, but might be eaten: whereupon afterwards they in want of other victuals, boiled ſome as they doe peaſe, and ground others into floure, wherewith they made puddings. They found this tree alſo in the Molucco's.

10 The firſt expreſſed in this table is the Mad plum, or as *Cluſius* had rather term it, the Mad Nut, for he cals them κάρυα μανικά, or *Inſanæ Nuces*. The Hollanders finding them in their return from the Eaſt Indies, and eating the kernels, were for a time diſtracted, and that variouſly, according to the particular temperature of each that ate of them; as you may ſee in *Cluſius Exot. lib. 2. cap. 26.* This was round, little more than two inches about, with a ſhell not thicke, but ſufficiently ſtrong, browniſh on the out ſide, and not ſmooth, but on the in ſide of a yellowiſh colour, and ſmooth, containing a membranous ſtone or kernell couered with a black pulp, in form and bigneſſe not much vnlike a Bullas or Sloe, hauing a large white ſpot on the lower part whereas it was faſtned to the ſtalke: vnder the pulp lay the kernell, ſomwhat hard, and of an Aſh colour: the footſtalk was ſhort and commonly caried but one fruit, yet ſometimes they obſerued two growing together: the tree whereon this fruit grew was of the bigneſſe of a Cherry tree, hauing long narrow leaues like thoſe of the Peach tree: the other fruit figured in the ſecond place was of a browniſh yellow color, ſomwhat bigger, but not vnlike a ſmall nut, an inch long, and ſomewhat more about, ſmaller below, and bigger aboue, and as it were parted into foure, beeing very hard and ſollid. Of this ſee more in the fourteenth place.

11 The *Cacoa* is a fruit well knowne in diuers parts of America, for they in ſome places vſe it in ſtead of mony, and to make a drink, of which, though bitter, they highly eſteem. The trees which beare them are but ſmall, hauing long narrow leaues, and will onely grow well in places ſhadowed from the Sun. The fruit is like an Almond taken out of the huske, and it is couered with a thinne black skin, wherein is contained a kernell obliquely diuided into two or three parts, browniſh, and diſtinguiſhed with aſh coloured veines, of an aſtringent and vngratefull taſte.

12 This, which *Cluſius* had from *Cortuſus* for the fruit of *Bdellium*, is thought to be the *Cuci* of *Pliny*, and is the *Cuciophera* of *Matthiolus*, and by that name our Author had it in this Chapter. The whole fruit is of the bigneſſe of a Quince, and of the ſame colour, with a ſweet and fibrous fleſh; vnder which is a nut of the bignes of a large walnut or ſomwhat more, almoſt of a triangular form, bigger below, and ſmaller aboue, well ſmelling, of a darke aſh colour, with a very hard ſhell, which broken, there is therein contained an hard kernell of the colour and hardneſſe of marble, hauing an hollowneſſe in the middle, as much as may contain an Haſell nut.

13 In this table are foure ſeuerall fruits deſcribed by *Cluſius, Exot. lib. 2. ca. 21.* The firſt is called *Barnce*, and is ſaid to grow vpon a high tree in Guyana called Hura. It conſiſted of many Nuts ſome inch long, ſtrongly faſtned or knit together, each hauing a hard wooddy ſhel, falling into two parts, containing a round and ſmooth kernell couered with an aſh coloured filme.

They ſay the Natiues there vſe this fruit to purge and vomit. A

The ſecond called Arara growes in Kaiana, but how it is not knowne: it was ſome inch long, couered with a skin ſufficiently hard and blacke, faſtened to a long and rugged ſtalke that ſeemed to haue carried more than one fruit: the kernell is black, and of the bigneſſe of a wilde Olive.

The Natiues vſe the decoction hereof to waſh maligne vlcers, and they ſay the kernel will looſe the belly. B

The third named *Orukoria* is the fruit of a tree in Wiapock called *Iuruwa*. This fruit is flat, almoſt an inch broad and two long, writhen like the cod of the true Cytiſus, but much bigger, very wrinkled, of an aſh color, containing a ſmooth ſeed.

They vſe this to cure their wounds, dropping the juice of the fruit into them.

The fourth called *Cropiot* is a ſmall and ſhriveled fruit, not much vnlike the particular joints of the Ethiopian Pepper.

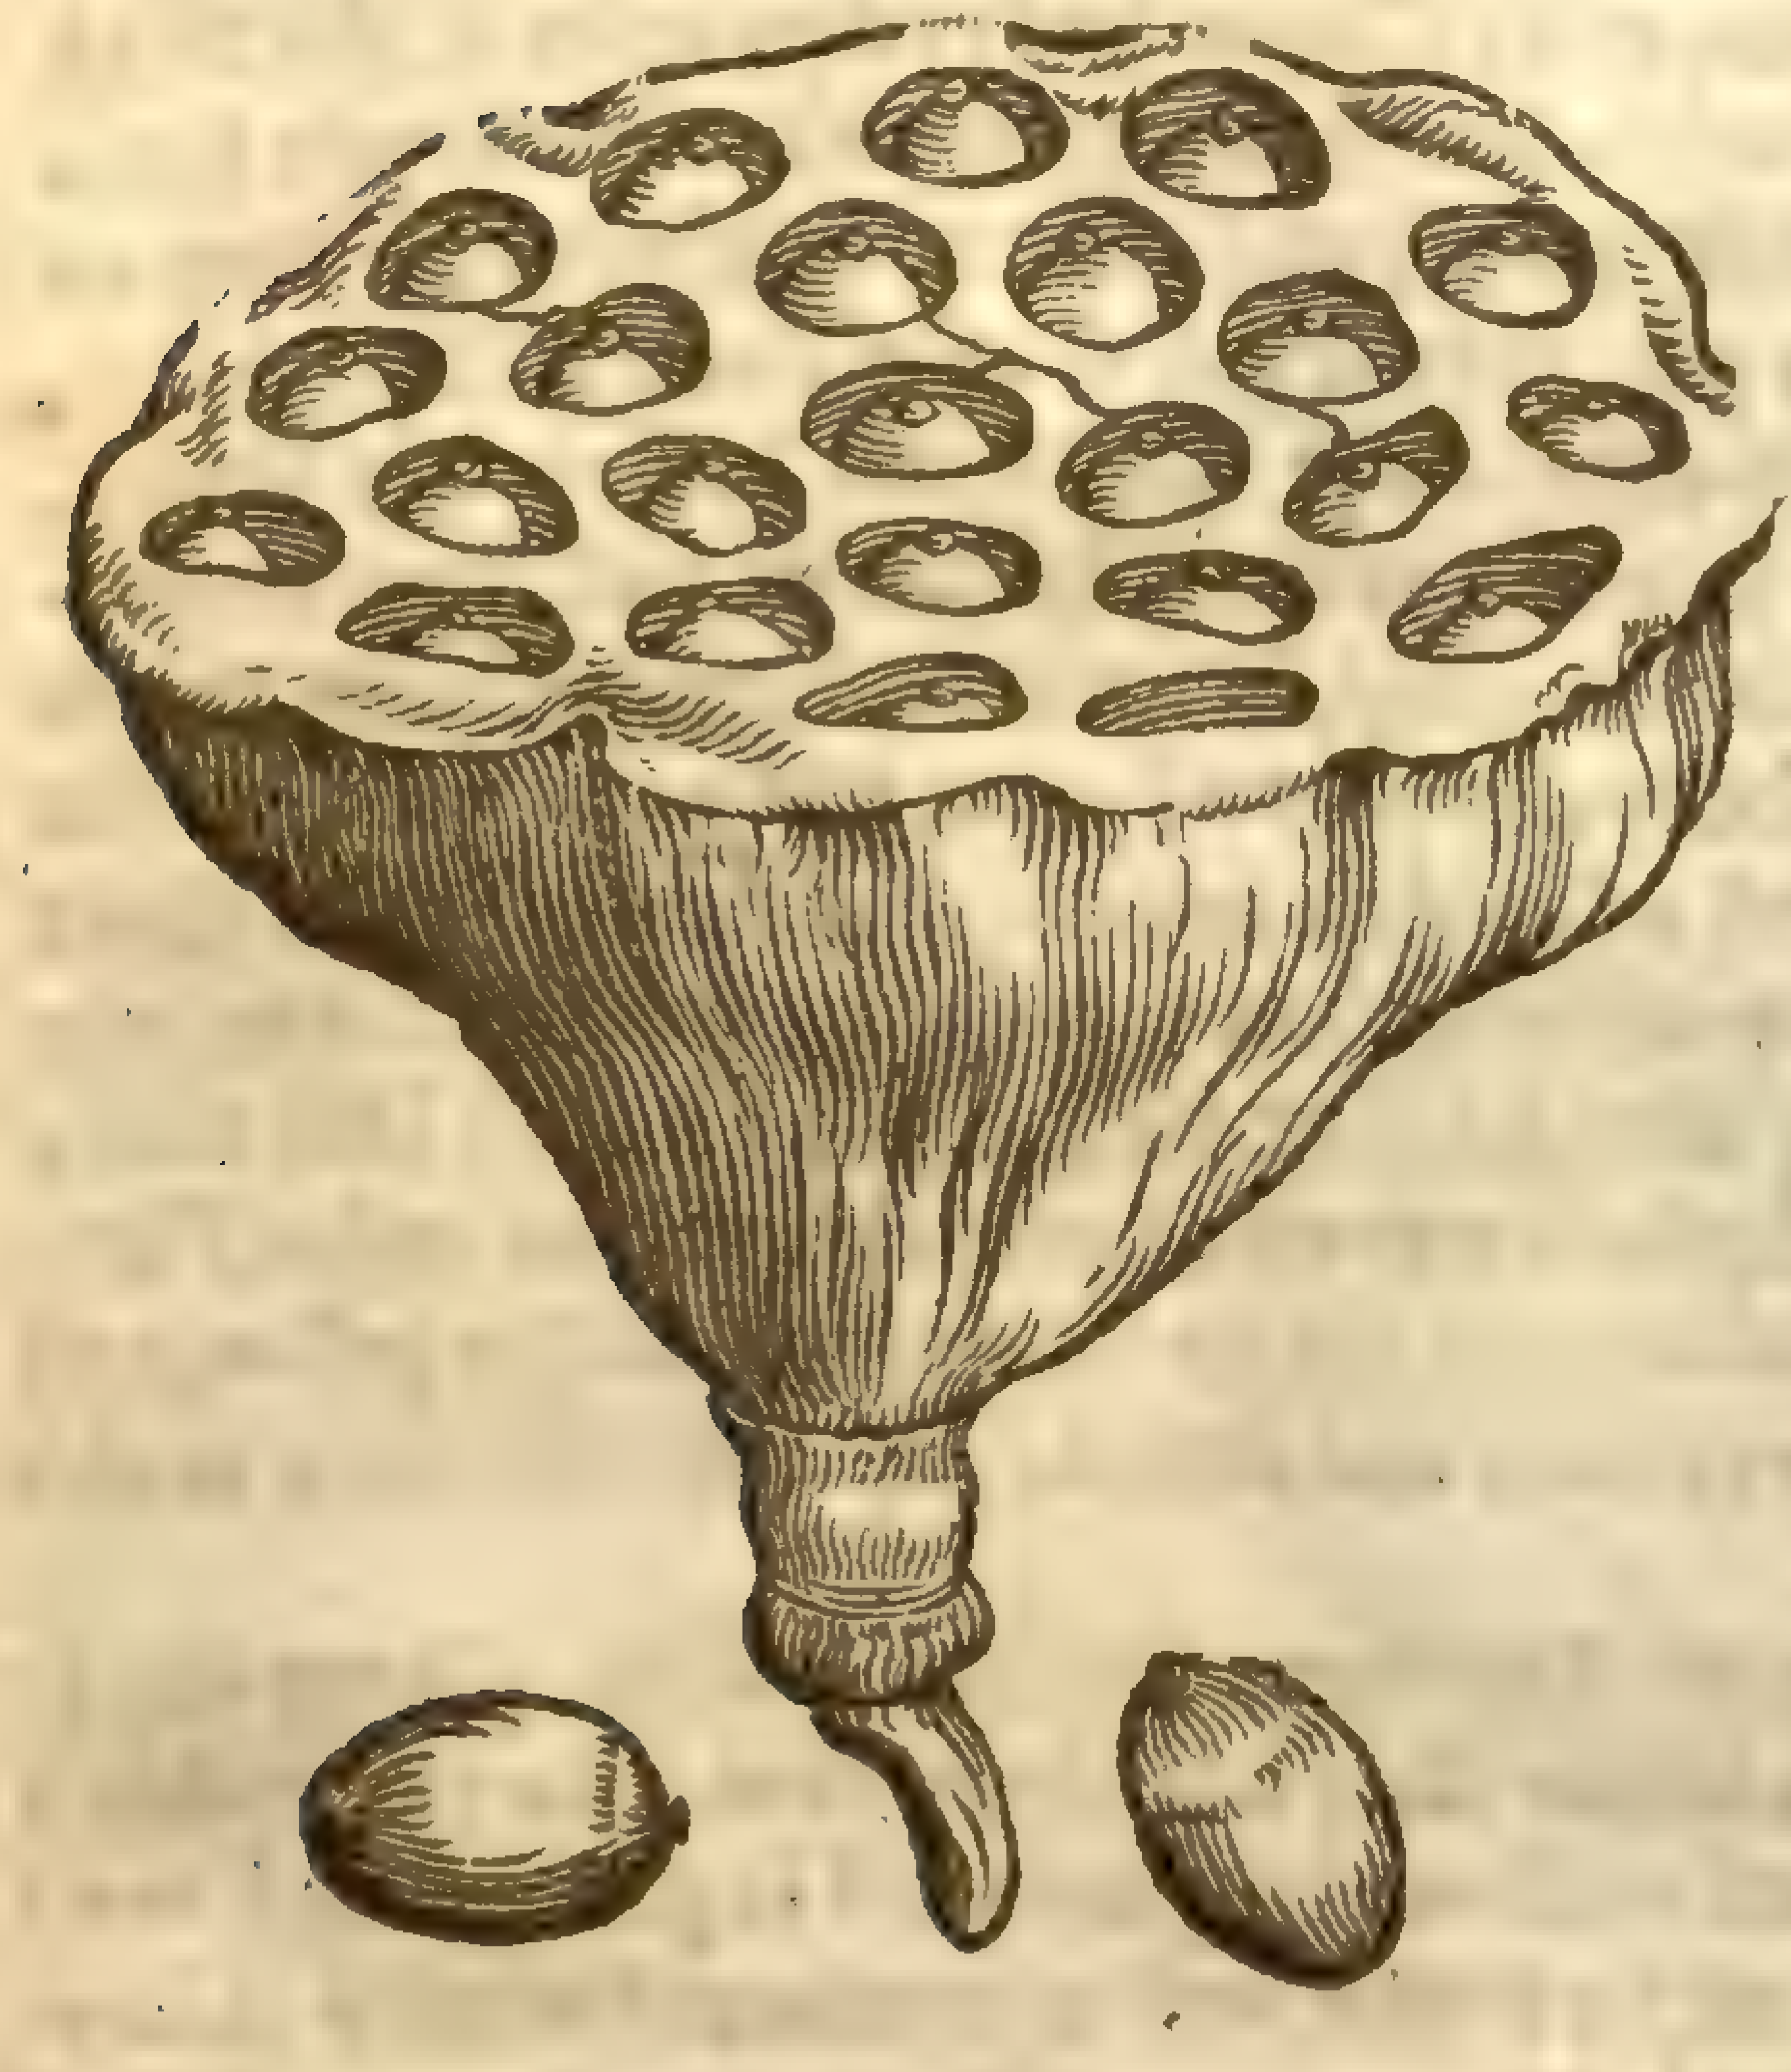
The Savages vſe to take it mixt amongſt their Tabaco, to aſſwage head-ache: there were diuers of them put vpon a ſtring (as you may ſee in the figure) the better to dry them. C

14 This, which by *Cluſius* and *Lobel* is thought to be the *Guanabanus* mentioned by *Scaliger, Exerc. 281. part. 6.* is a thick fruit ſome foot and halfe long, couered with a thick and hard rind, freezed ouer with a ſoft downineſſe like as a Quince is, but of a greeniſh colour, with ſome veines, or rather furrowes running alongſt it as in Melons: the lower end is ſomewhat ſharpe, at the vpper end it is

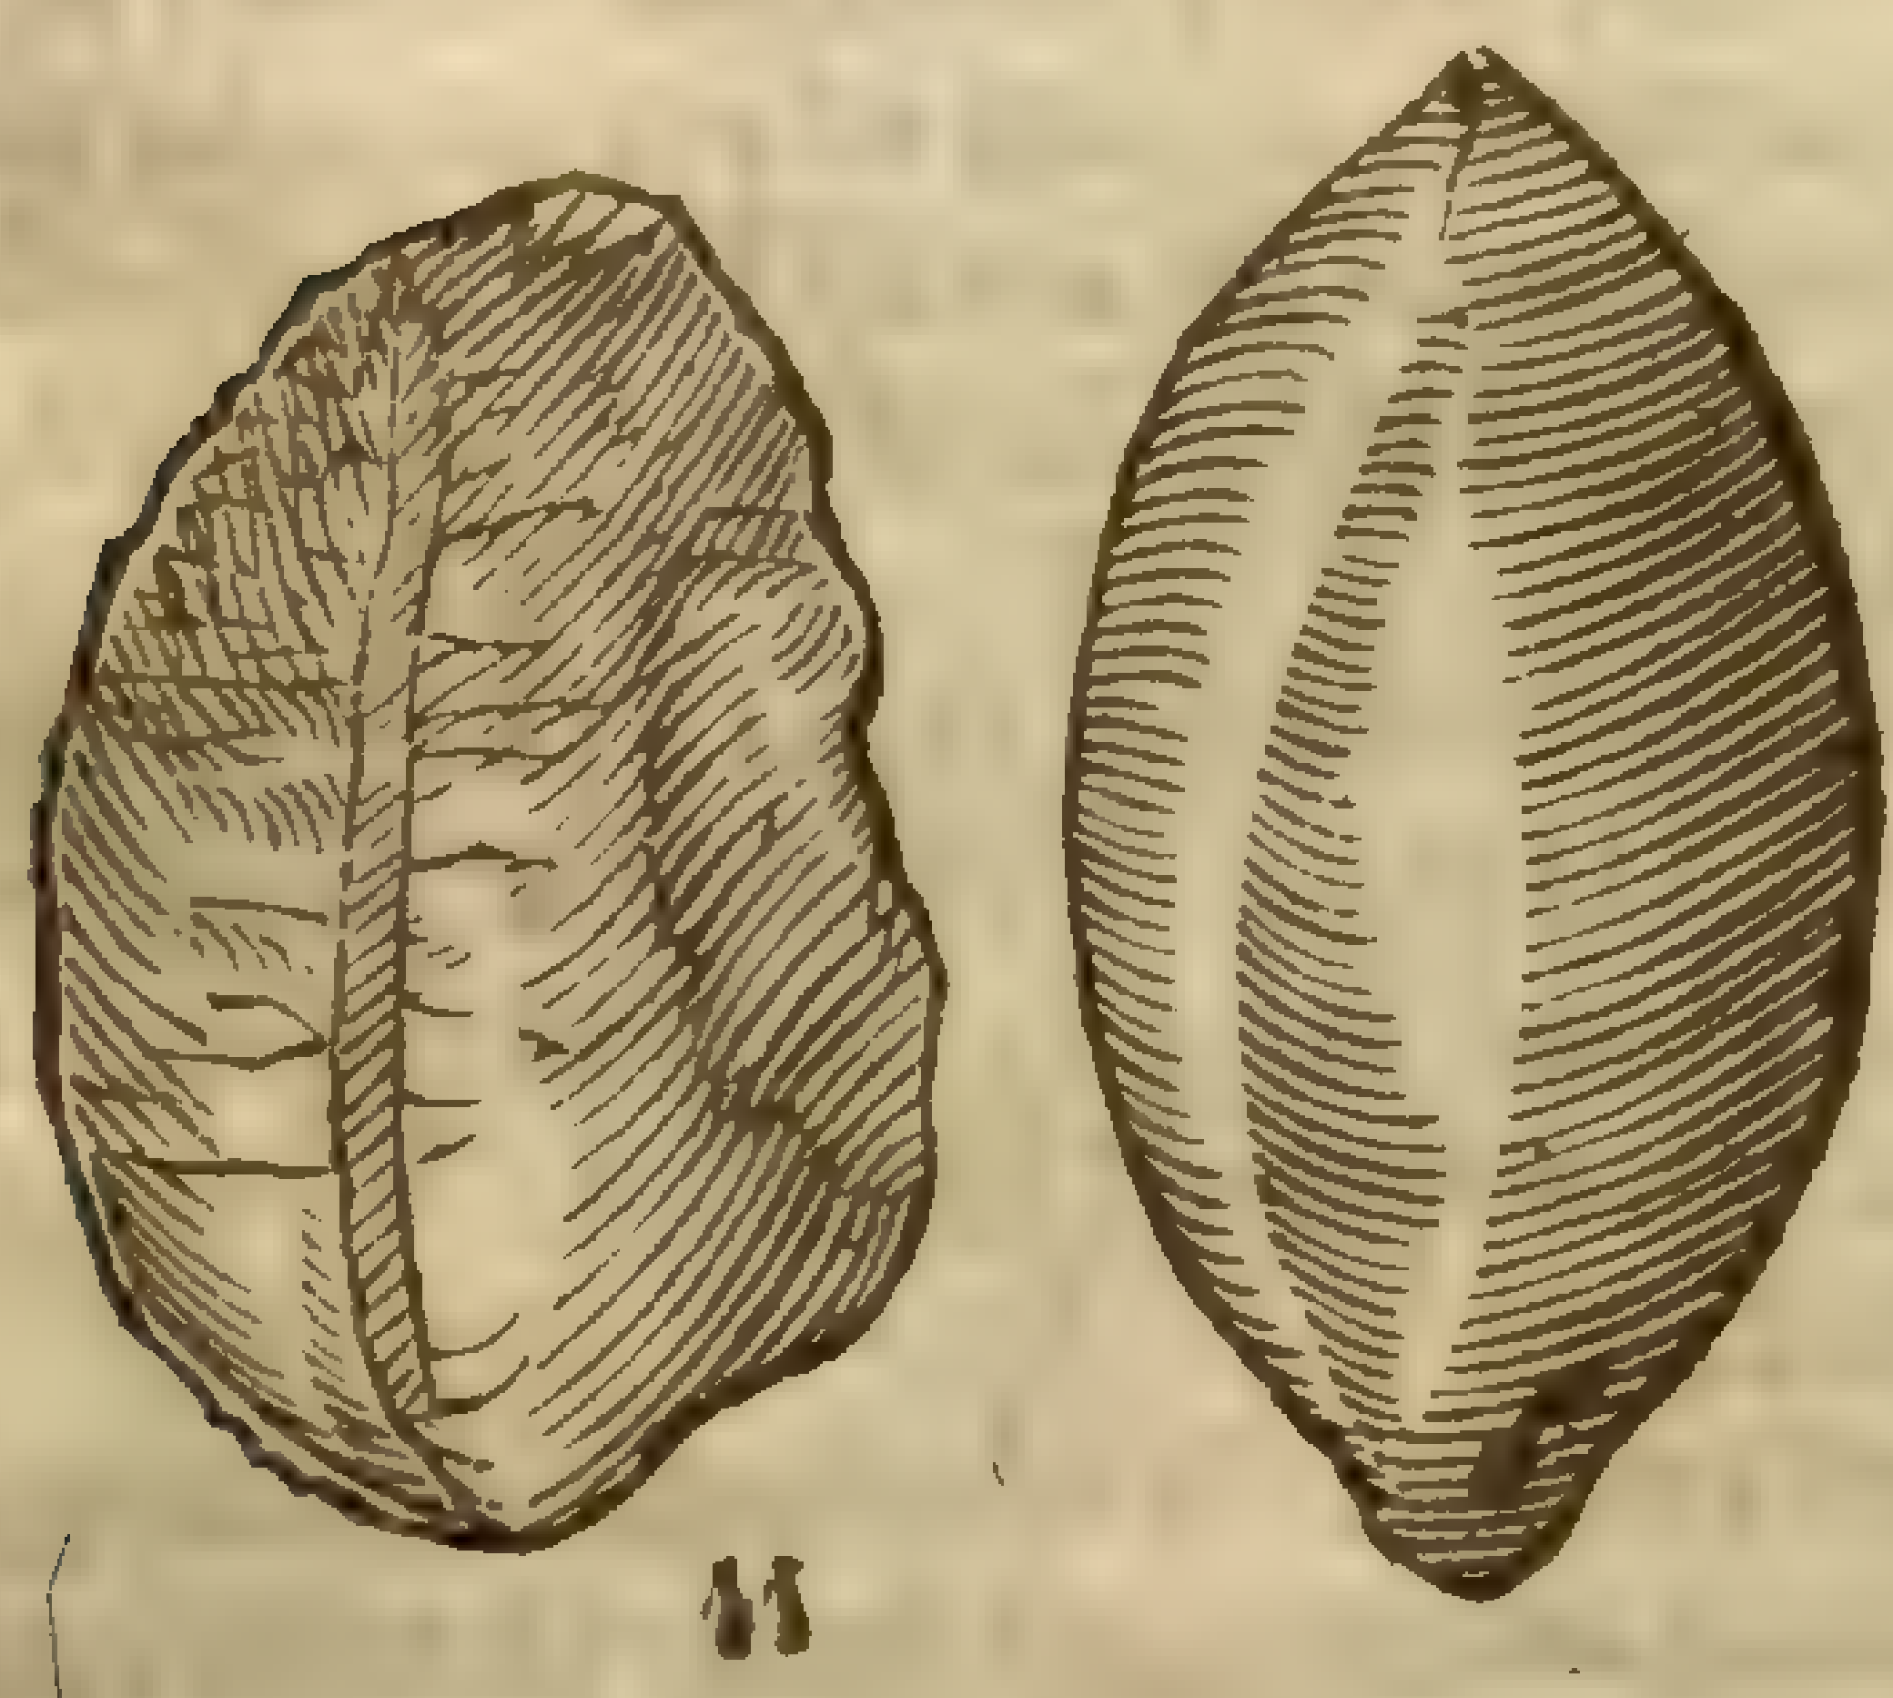
faſtned to the boughes with a firme hard and fibrous ſtalke: this fruit containeth a whitiſh pulpe, which the Ethiopians vſe in burning feuers to quench the thirſt, for it hath a pleaſant tartneſſe: this dried becomes friable, ſo that it may be brought into pouder with ones fingers, yet retains it's aciditie: in this pulp lie ſeeds like little kidnies or the ſeeds of the true *Anagyris*, of a blacke ſhining colour, with ſome fibres comming out of their middles: theſe ſowne brought forth a plant hauing leaues like the Bay tree, but it died at the approch of Winter. *Cluſ.*

15 *Ananas Pinias*, or Pine Thiſtle, is a plant hauing leaues like the *AiZoon aquaticum*, or Water

‡ 16 *Fabæ Ægyptiæ affinis.*



‡ 17 *Coxco Cypote. Amygdalæ Peruanæ.* Almonds of Peru.



‡ 18 *Buenas Noches.*

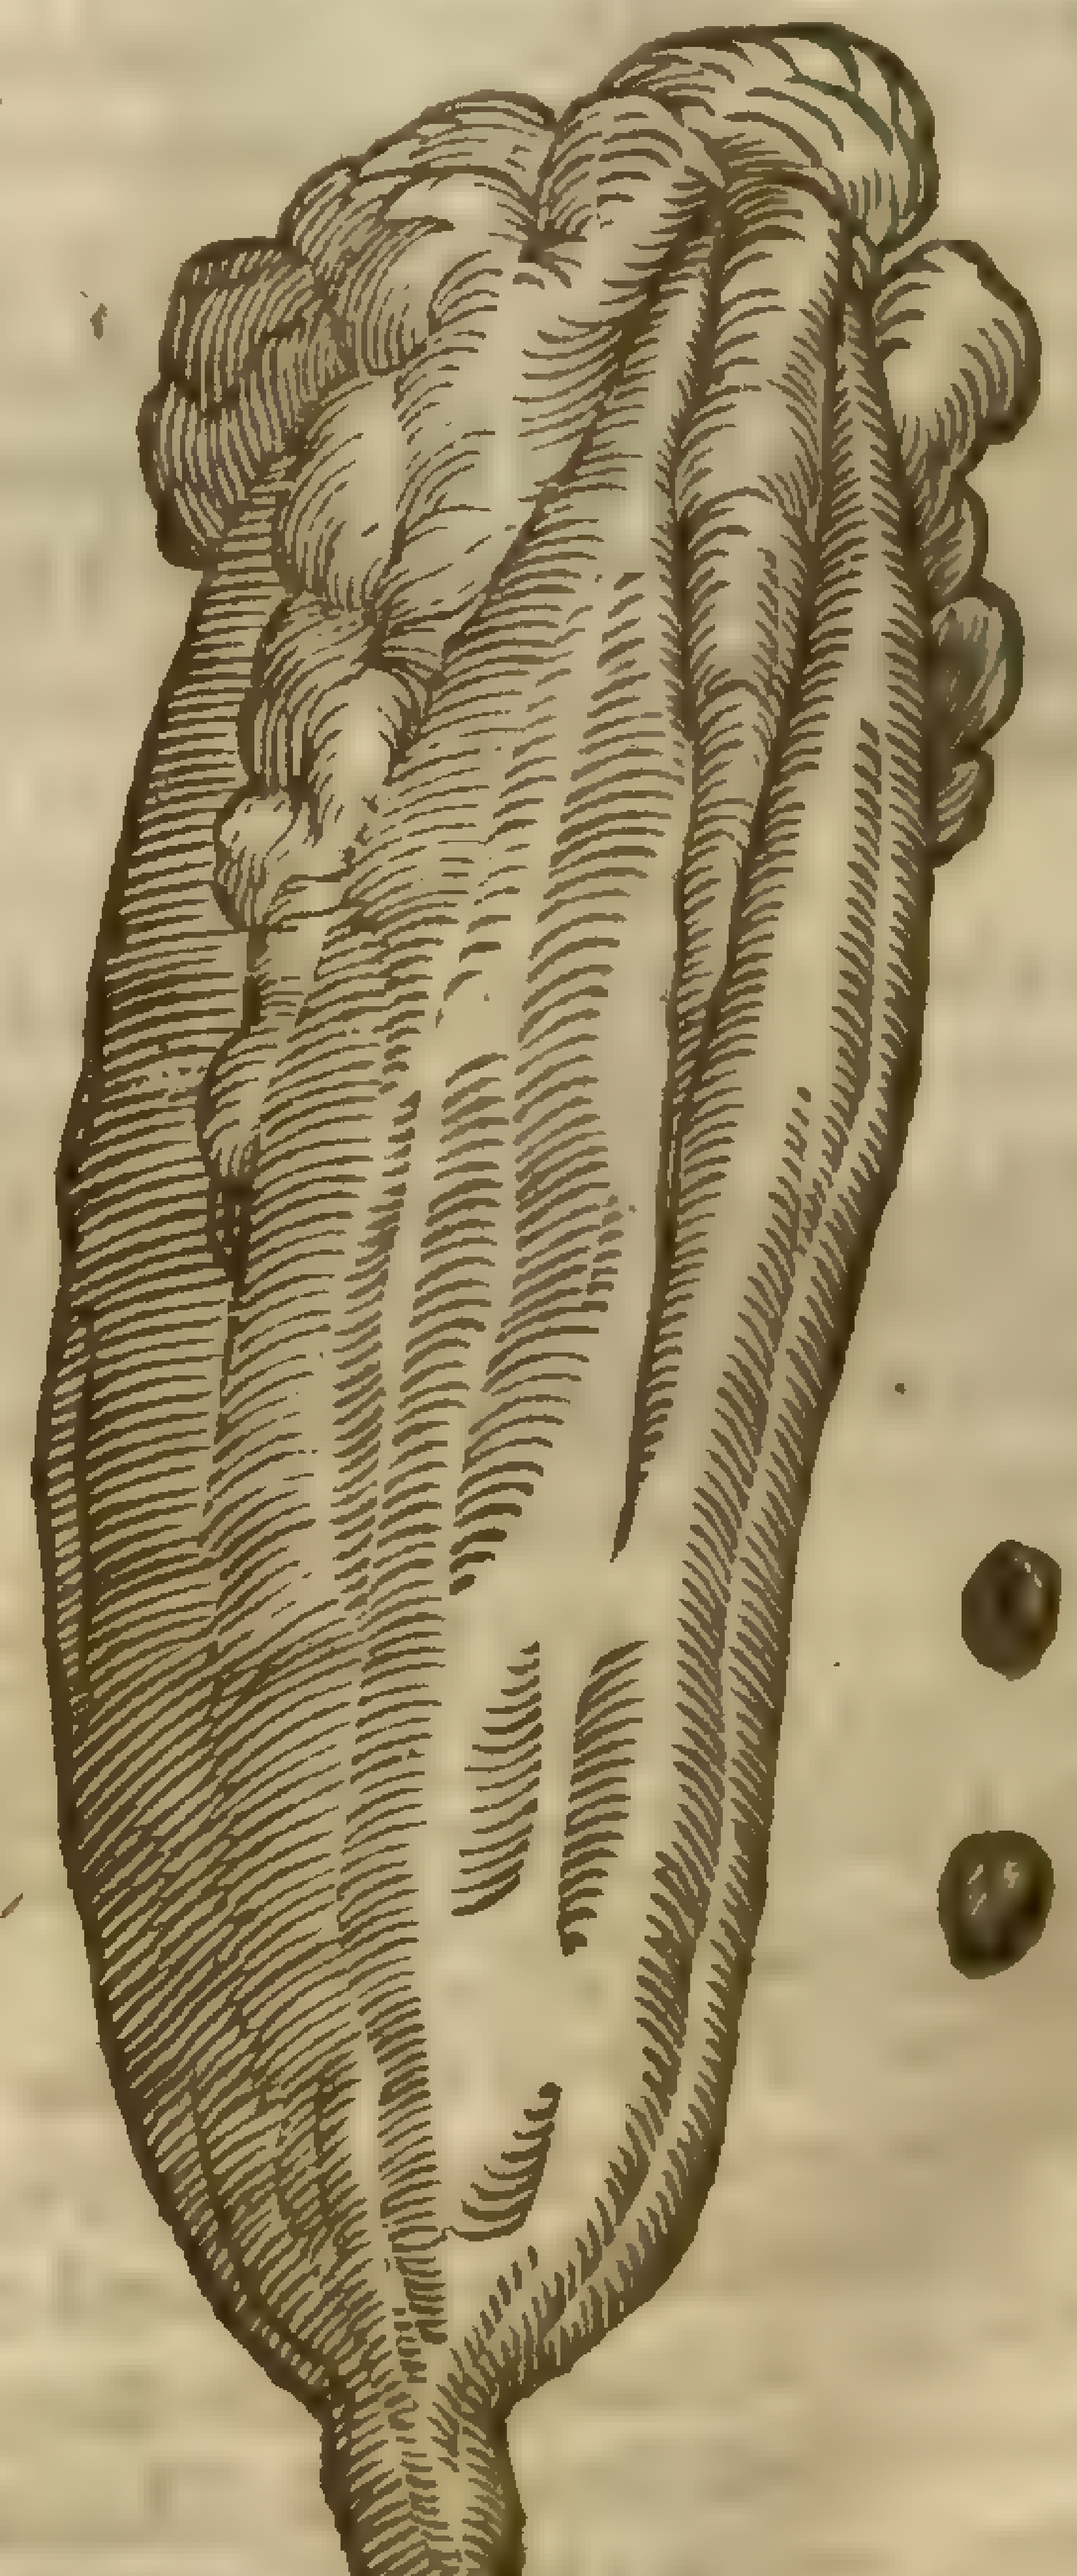
‡ 20 *Arboris laniferæ ſiliqua.* A cod of the Wooll-bearing tree.

Bombax pentandrum
Sen J. B.



Sengreene, ſomewhat ſharpe and prickly about the edges: the ſtalke is round, carrying at the top therof one fruit of a yellowiſh colour when it is ripe, of the bignes of a Melon, couered with a ſcale-like rinde: the ſmell is gratefull, ſomewhat like that of the Malecotone: at the top of the fruit, and ſometimes below it come forth ſuch buds as you ſee here preſented in the figure, which they ſet in the ground and preſerue the kind by in ſtead of ſeed: the meat of this fruit is ſweet & very pleaſant of taſte, & yeelds good nouriſhment; there are certaine ſmall fibres in the meat thereof, which though they do not offend the mouth, yet hurt they the gums of ſuch as too frequently feed thereon.

16 The forme of this is ſomwhat ſtrange, for it is like a large Poppy head cut off nigh the top: the ſubſtance thereof was membranous and wrinckled, of a browniſh colour, very ſmooth: the circumference at the top is about nine inches, and ſo it growes ſmaller and ſmaller euen to the ſtalke, which ſeems to haue carried a floure whereto this fruit ſucceeded: the top of the fruit was euen, and in it were orderly placed 24. concauities, in each whereof was contained a little Nut like an Acorn, almoſt an inch long, and as much thick; the vpper part was of a browniſh colour, and the kernel within was all rank and mouldy. *Cluſius* could learne neither whence this came, nor how it grew, but with a great deale of probability thinks it may be that which the Antients deſcribed by the name of *Faba Ægyptia.*

17 The former of theſe two *Cluſius* receiued by the name of *Coxco Cypote*, that is, the Nut Cypote: It is of a dusky browne colour, ſmooth, and ſhining, but on the lower part of an aſh colour, rough, which the Painter did not well expreſſe in drawing the figure. The 2. he receiued by the name of *Almendras del Peru*, (i.) Almonds of Peru: the ſhell was like in colour and ſubſtance to that of an almond, and the kernell not vnlike neither in ſubſtance nor taſte: yet the forme of the ſhell was different, for it was triangular, with a backe ſtanding vp, and two ſharpe ſides, and theſe very rough.

18 This was the fruit of a large kinde of *Convolvulus* which the Spaniards called *Buenas noches*, or Good-night, becauſe the floures vſe to fade as ſoone as night came. The ſeeds were of a ſooty colour as big as large Peaſe, being three of them contained in a skinny three cornered head. You may ſee more hereof in *Cluſius Exot. lib. 2. cap.* 18.

19 This is the figure of a ſquare fruit which *Cluſius* conjectures to haue been ſome kind of Indian Nut or Coco: it was couered with a ſmooth rinde, was ſeuen inches long, and a foot and halfe about, being foure inches and a halfe from ſquare to ſquare.

20 About Bantam in the Eaſt-Indies growes a tall tree ſending forth many branches, which are ſet thicke with leaues long and narrow, bigger than thoſe of Roſemary: it carries cods ſix inches long, and fiue about, couered with a thin skin, wrinkled and ſharp pointed, which open themſelues from below into fiue parts, and are full of a ſoft woolly or Cottony matter, wherewith they ſtuffe cuſhions, pillowes and the like, and alſo ſpin ſome for certaine vſes: amongſt the downe lie blacke ſeeds like thoſe of Cotton, but leſſe and not faſtned to the downe.

21 This which *Cluſ.* calls *Palma ſaccifera*, or the Bag Date, becauſe it carries the figure of an Hipocras bag, was found in a deſart Iſland in the Antlanticke ocean, by certaine Dutch mariners who obſerued whole woods thereof: theſe bags were ſome of them 22. or more inches long, and ſome ſeuen inches broad in the broadeſt place, ſtrongly woue with threds croſſing one another, of a browniſh yellow colour. Theſe ſachels (as they report who cut them from the tree) were filled with fruit of the bigneſſe of a Walnut, huske and all: within theſe were others, as round as if they had bin turned, and ſo hard that you could ſcarce breake them with a hammer: in the midſt of theſe were white kernels, taſting at the firſt ſomewhat like pulſe, but afterwards bitter like a Lupine.

22 The tree which carries this rough cod is very large, as I haue been told by diuers: ſome who ſaw it in Perſia, and others that obſerued it in Mauritius Iſland. *Cluſius* alſo notes that they haue bin brought from diuers places: the cod is ſome three inches long, and ſome two inches broad, of a duskie red colour, and all rough and prickly: in theſe cods are contained one, two, or more round nuts or ſeeds of a grayiſh aſh-colour, hauing a little ſpot on one ſide, where they are faſtened to the cod they are exceeding hard, and difficult to break, but broken they ſhew a white kernel very bitter and vnpleaſant of taſte. I haue ſeen very many and haue ſome of theſe, and ſome haue offered to ſel them for Eaſt-Indian *Beazor*, whereto they haue ſome ſmall reſemblance, though nothing in faculty like them (if I may credit report, which I had rather doe than make triall) for I haue been told by ſome that they are poyſonous: and by others, that they ſtrongly procure vomit.

23 The long cod expreſſed in this figure is called in the Eaſt-Indies (as *Cluſius* was told) *Kayo baka*, it was round, the thickneſſe of ones little finger, and ſix inches long: the rinde was thick, black, hard and wrinkled, and it contained a hard pulpe of a ſouriſh taſte, which they affirme was eatable. The other was a cod of ſome inch and halfe long, and ſome inch broad, membranous, rough, and of a browniſh colour, ſharp pointed, and opening into two parts, and diſtinguiſhed with a thin filme into foure cels, wherein were contained ſcarlet Peare faſhioned little berries, hauing golden ſpots eſpecially in the middles. This growes in Braſile, and as *Cluſius* was informed was called *Daburi.*

24 In the ſecond place of the tenth figure and deſcription in this chapter you may finde the

ſingle Nut here figured, deſcribed, & ſet forth; but this figure better expreſſes the manner of growing therof: for firſt it preſents to the view the nuts in their outer husks growing cloſe together, then the ſingle nuts in and out of their husks, and laſtly their kernell: the ſhell of this nut containes in it a certaine oilie ſubſtance, ſomwhat reſembling the oile of ſweet almonds: the tree whereof this nut is the fruit growes in Ginny, & is much vſed by the people there, for they preſſe a liquor forth of the leaues, or elſe boile them in water, and this ſerues them in ſtead of wine and beere, or at leaſt for a common drinke, of the fruit they make bread of a ſweet and pleaſant taſte.

25 Theſe ſcaily fruits are ſet forth by *Cluſius, Exot. l. 2. c. 3.* The firſt was three inches long and two inches about, and had it in a longiſh hard ſollid kernell, with many veines diſperſed ouer it, & ſuch kernels are ſomtimes poliſhed, whereby they become white, and then their blacke veines make a fine ſhew, which hath giuen occaſion to ſome impoſters to put them to ſaile for rare and pretious ſtones.

The ſecond was ſmall, round and ſcaily, and the ſcailes turned their points downewards towards the ſtalke.

The third was alſo ſcaily, of the bigneſſe of a Walnut in his huske, with the ſcales very orderly placed, and of browniſh colour: it had a kernel which ratled in it when it was ſhaken.

26 The firſt of the two in the former table was brought from Ginny, it was of the bigneſſe and ſhape of a plum, two inches long, and one and halfe broad, of a thicke fungous ſubſtance, ſomewhat wrinckled, and blackiſh on the outſide, and within containing a certaine whitiſh inſiped friable pulpe, wherein lay a few ſmall ſeeds.

The ſecond was ſome inch and halfe long, an inch thicke, couered with an aſh coloured skin, compoſed within of many fibres almoſt like the huske of the Nut Fauſell, at the lower end it ſtood in a double cup, and it was ſharp pointed at the vpper end: in this skin was contained a kernell, or rather nut, blacke, hard, and very wrinckled not much vnlike to that of Faufell, whereto I refer it as a kinde thereof. Theſe two are treated of by *Cluſius, Exot. lib. 2. cap. 23.*

The firſt of the ſecond table (wherein are contained foure figures) was of a round forme, yet a little flat on one ſide, diſtinguiſhed vnder the black and ſhining coat wherewith it was couered, with furrowes running euery way, not vnlike to the Nut Faufell taken forth of his couer: the inner pulpe was hard and whitiſh, firſt of a ſalt, and then of an aſtringent taſte.

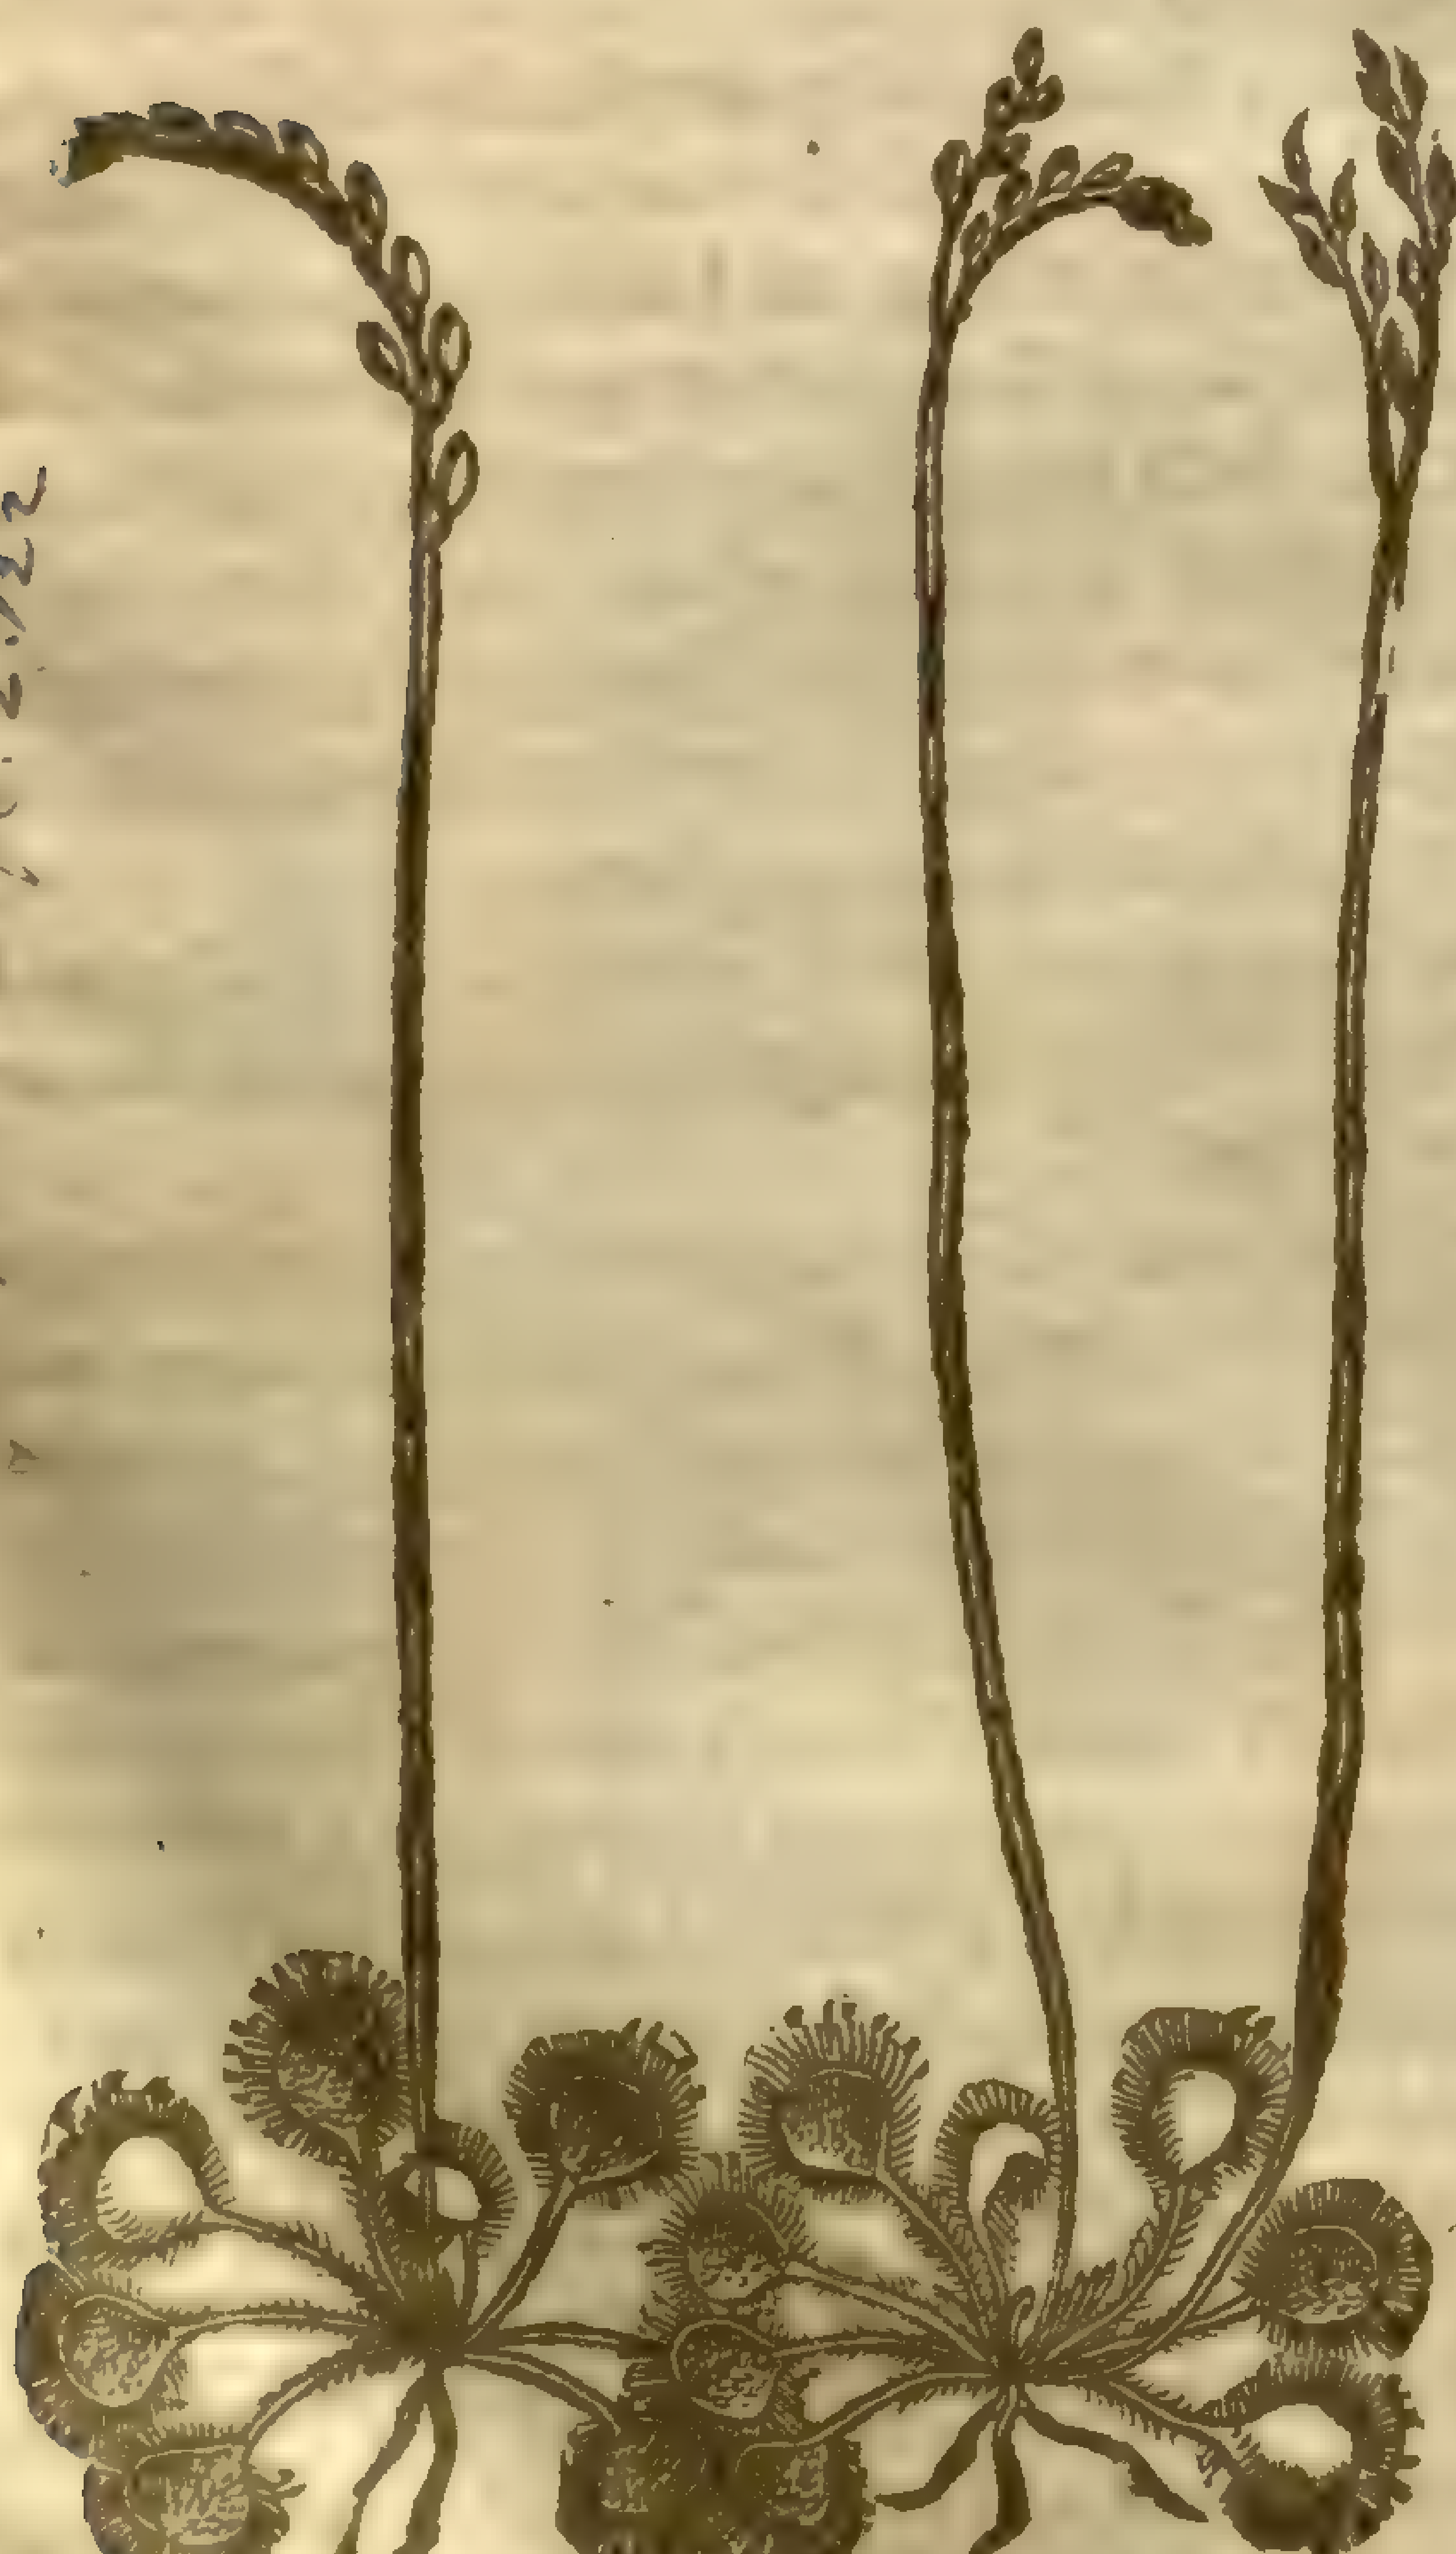
The ſecond of theſe was an inch long, but rather the kernell of a fruit, than a fruit it ſelfe; it was round except at the one end, and all ouer knobby (though the picture expreſſe not ſo much) there was alſo ſome ſhew of a triangular forme at the each end.

The third was two inches and a halfe long, and in the broadeſt part ſome inch and more broad: it was ſomewhat crooked, the backe high and riſing, the top narrow, and the loweſt part ſharp pointed, of an aſh colour, with thicke and eminent nerues running alongſt the back from the top to the lower part, expreſt with ſuch art, as if they had been done by ſome curious hand: it ſeemeth to haue bin couered ouer with another rinde, but it was worne off by the beating of the waues of the ſea vpon the ſhore.

The fruit *Cunane* figured in the fourth place of this table, was two inches long, and an inch broad at the head, and ſo ſmaller by little and little, with a backe ſtanding out, ſmooth, black, and ſhining, hauing three holes at the top, one aboue, and two below: they ſaid it grew vpon a ſmall tree called Morremor, and was yet vnripe, but when it was ripe it would be as big againe, and that the natiues where it grew (which was as I take it about Wiapock) roſt it vpon the coles, and eate it againſt the head-ache. *Cluſius* ſets forth theſe foure in his *Exot. l. 2. c. 22.* he deſcribes *Cunane cap. 21.* ‡

Chap. 160. *Of Sun-Dew, Youthwort, Ros Solis.*

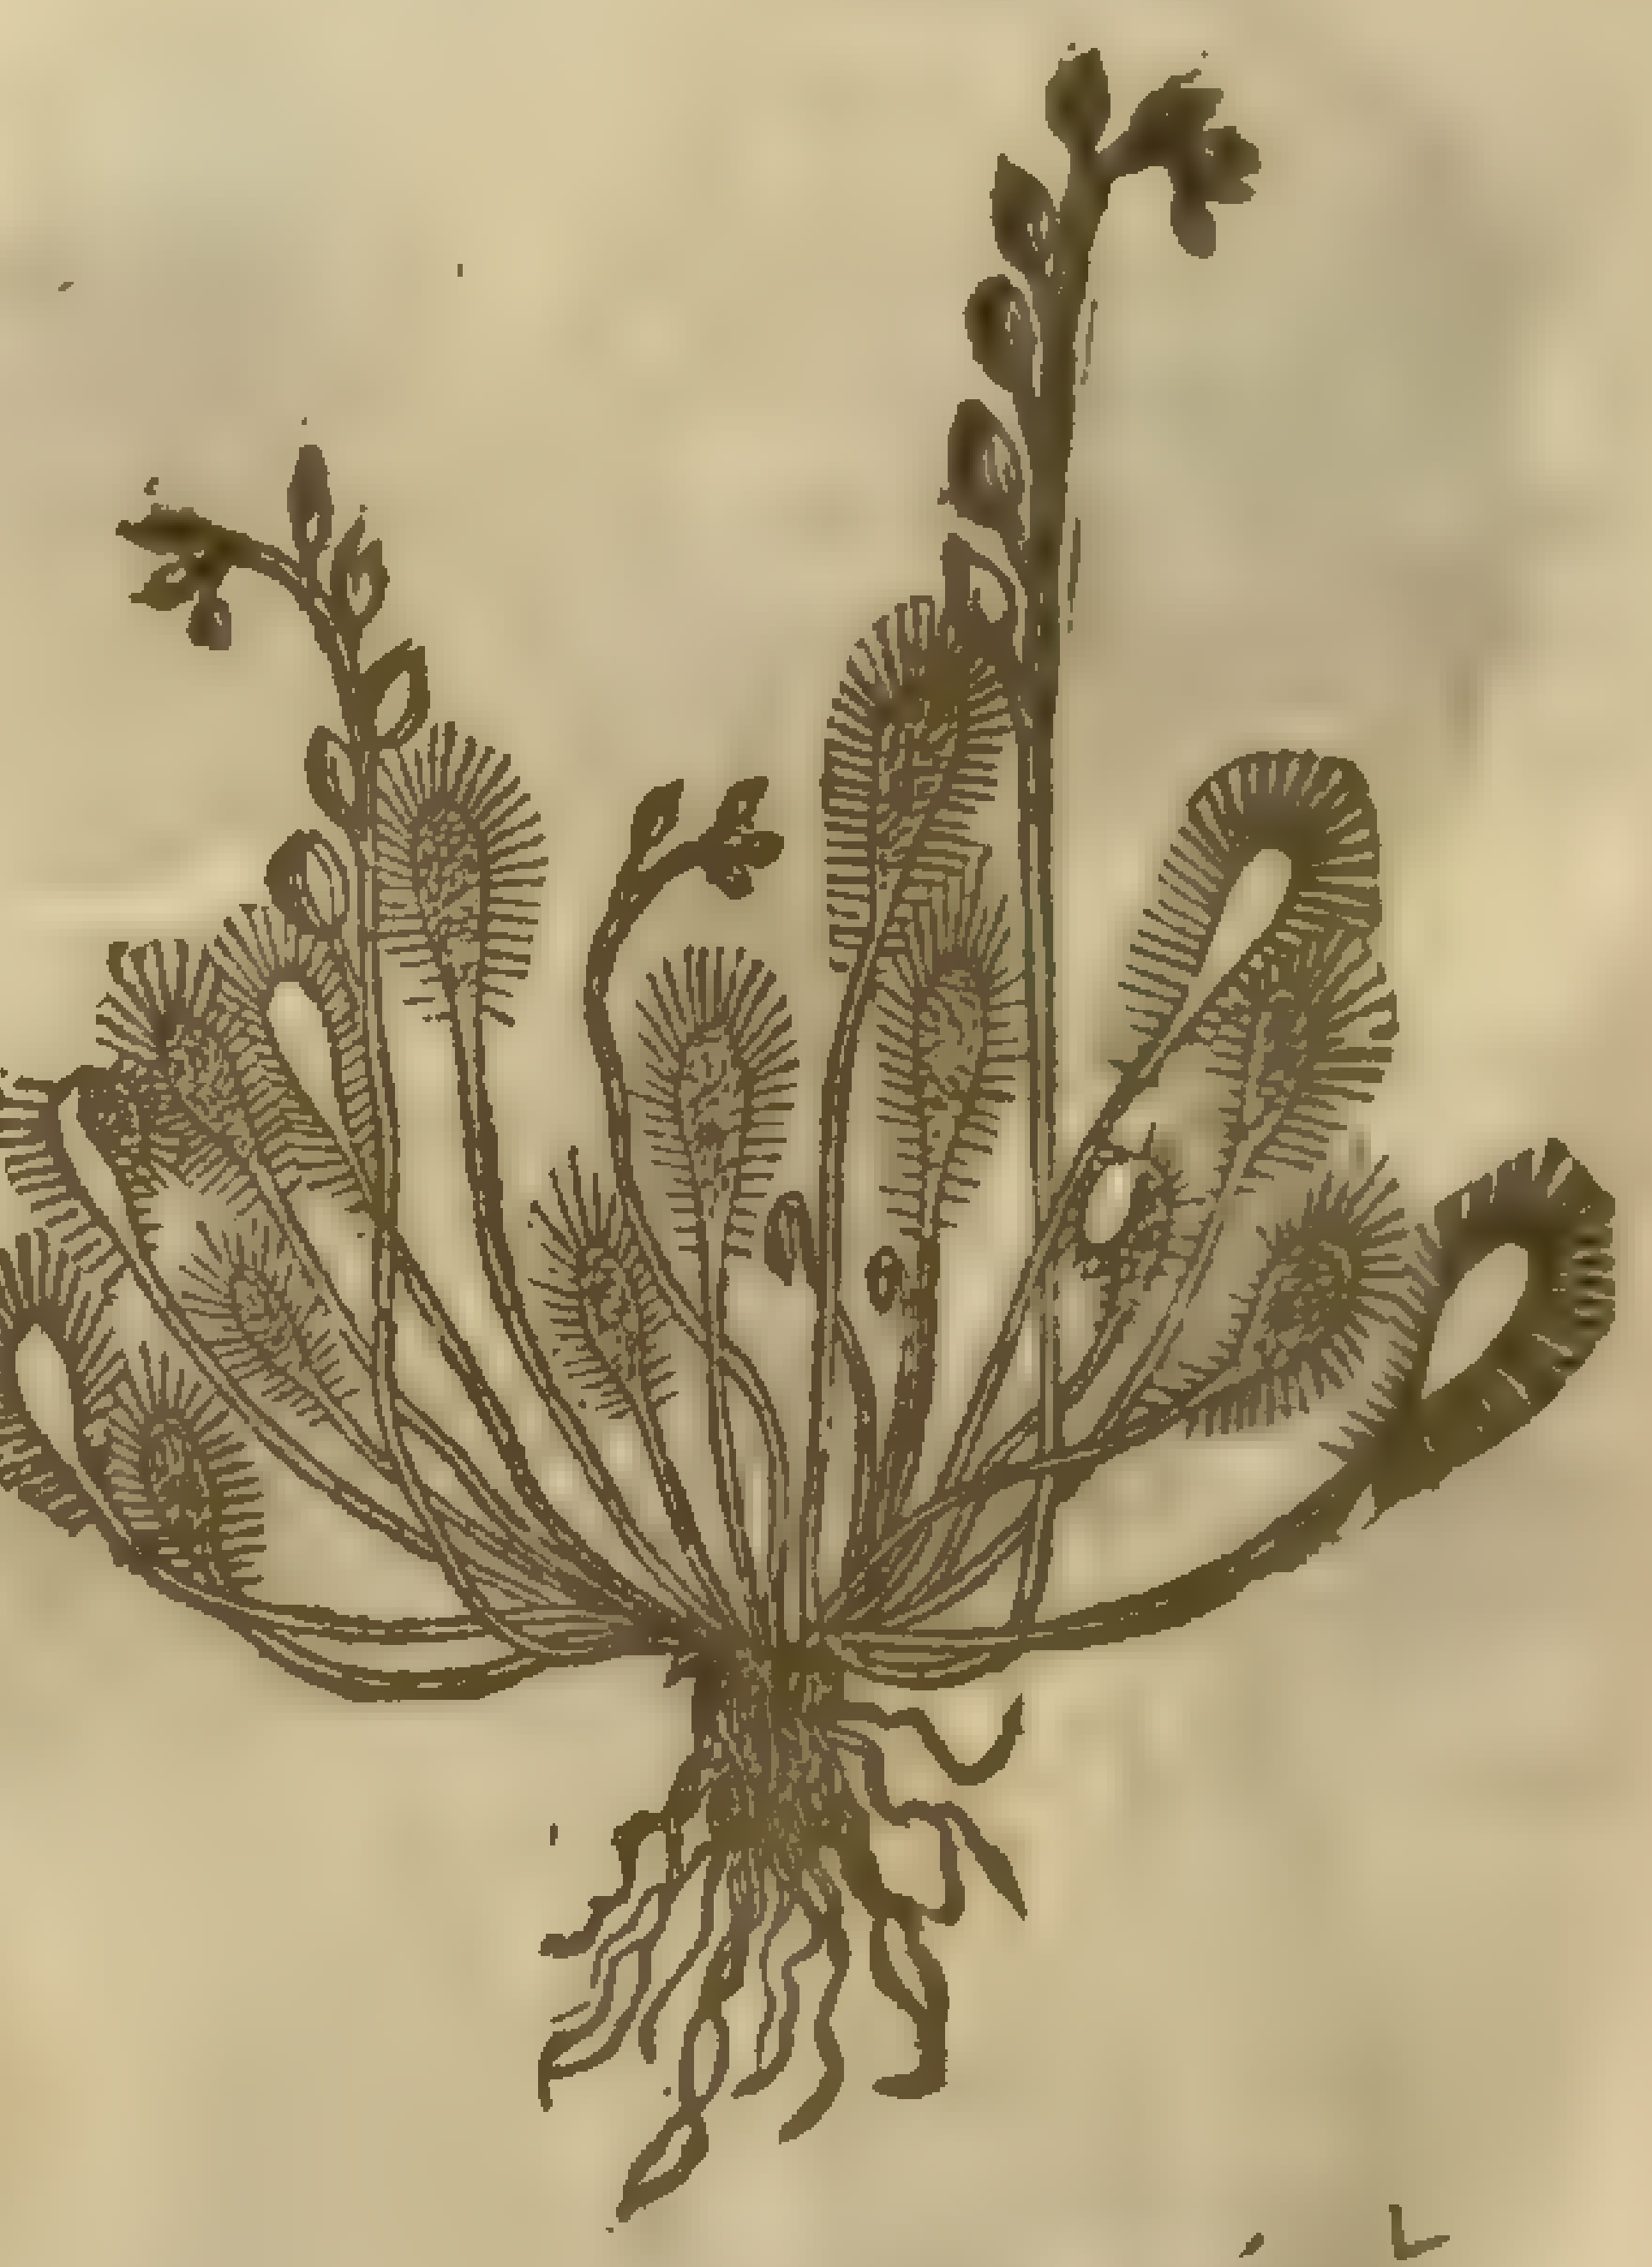
1 *Ros Solis folio rotundo.*
Sun-Dew with round leaues.



Drosera rotundifolia L
Huds. angl.
Sm. fl. 2.122

Lob. ic. 811

2 *Ros Solis folio oblongo.*
Sun Dew with longiſh leaues.



Drosera longifolia L
Spec. hist.
mill. dict
Sm. fl. 2.123

Dod. 474

¶ *The*

¶ *The Deſcription.*

1 Sun-Dew is a little herbe, and groweth very low, it hath a few leaues ſtanding vpon ſlender ſtems very ſmall, ſomething round, a little hollow, and like an eare picker, hairy and reddiſh as be alſo the ſtems, hauing dew and moiſture vpon them at the drieſt time of the yeare, and when the Sun ſhineth hotteſt euen at high noone; and a moneth after there ſpring vp little ſtalks, a hand bredth high, on which ſtand ſmall whitiſh floures: the roots are very ſlender, and like vnto haires.

2 The ſecond kinde is like vnto the former, in ſtalkes and floures, but larger, and the leaues are longer, and not ſo round, wherein conſiſteth the difference,

¶ *The Place.*

They grow in deſart, ſandie, and ſunnie places, but yet watery, and ſeldome other where than among the white mariſh moſſe which groweth on the ground and alſo vpon bogs.

¶ *The Time.*

Sun-Dew flouriſheth in Summer, it floureth in May and Iune: it is to be gathered when the weather is moſt dry, and calme. The diſtilled water hereof that is drawne forth with a glaſſe ſtill, is of a glittering yellow colour like gold, and coloureth ſiluer put therein like gold.

¶ *The Names.*

It is called in Latine, *Ros Solis*: of diuers, *Rorella*: it is named of others, *Salſi Roſa*, of the dew which hangeth vpon it, when the Sun is at the hotteſt: it is called in high Dutch, **Sondaw**, and **Sundew**: in low Dutch, **Loopichecruit**, which in Engliſh ſignifieth Luſtwoort, becauſe ſheepe and other cattell, if they do but only taſt of it, are prouoked to luſt. It is called in Engliſh, Sun-Dew, Ros Solis, Youth-woort: in the Northerne parts, Red Rot, becauſe it rotteth ſheepe; and in Yorkſhire, Moore graſſe.

¶ *The Temperature.*

It is a ſearing or cauſticke herbe, and very much biting, being hot and dry in the fourth degree.

¶ *The Vertues.*

A The leaues being ſtamped with ſalt do exulcerate and raiſe bliſters, to what part of the body ſoeuer they be applied.

B The later Phyſitions haue thought this herbe to be a rare and ſingular remedy for all thoſe that be in a conſumption of the lungs, and eſpecially the diſtilled water thereof: for as the herbe doth keep and hold faſt the moiſture and dew, and ſo faſt, that the extreme drying heate of the Sun cannot conſume and waſte away the ſame: ſo likewiſe men thought that herewith the naturall and radical humidity in mens bodies is preſerued and cheriſhed. But the vſe therof doth otherwiſe teach, and reaſon ſheweth the contrary: for ſeeing it is an extreme biting herbe, and that the diſtilled water is not altogether without this biting quality, it cannot be taken with ſafety: for it hath alſo been obſerued, that they haue ſooner periſhed that vſed the diſtilled water hereof, than thoſe that abſtained from it, and haue followed the right and ordinary courſe of diet.

C Cattell of the female kind are ſtirred vp to luſt by eating euen of a ſmall quantity: which thing hath greatly increaſed their vain opinion, without ſence or reaſon; for it doth not moue nor prouoke cattell to luſt, for that it increaſeth the ſubſtance of the ſeed, but becauſe through his ſharp and biting quality it ſtirreth vp a deſire to luſt, which before was dulled and as it were aſleepe.

D It ſtrengthneth and nouriſheth the body, eſpecially if it be diſtilled with wine, and that liquor made thereof which the common people do call Roſa Solis.

E If any be deſirous to haue the ſaid drinke effectuall for the purpoſes aforeſaid, let them lay the leaues of Roſa Solis in the ſpirit of wine, adding thereto Cinnamon, Cloues, Maces, Ginger, Nutmegs, Sugar, and a few graines of Muske, ſuffering it ſo to ſtand in a glaſſe cloſe ſtopt from the aire, and ſet in the Sun by the ſpace of ten daies, then ſtraine the ſame and keep it for your vſe.

Chap. 161. *Of the Moſſe of Trees.*

¶ *The Deſcription.*

Tree Moſſe hath certaine things like haires, made vp as it were of a multitude of ſlender leaues, now and then all to be jagged, hackt, and finely carued, twiſted and interlaced one in another, which cleaue faſt to the barkes of trees, hanging downe from the bodies: one of this kinde is more

Muſcus quernus.
The Moſſe of the Oke and of other trees.

ſlender and thinne, another more thicke, another ſhorter, another longer; all of them for the moſt being of a whitiſh colour, yet oftentimes there is a certaine one alſo which is blacke, but leſſer and thinner: the moſt commendable of them all, as *Pliny* ſaith, be thoſe that are whitiſh, then the reddiſh, and laſtly ſuch as be blacke.

¶ *The Place.*

This Moſſe is found on the Oke tree, the white and blacke Poplar tree, the Oliue tree, the Birch tree, the Apple tree, the Peare tree, the Pine tree, the wilde Pine tree, the Pitch tree, the Firre tree, the Cedar tree, the Larch tree, and on a great ſort of other trees. The beſt, as *Dioſcorides* ſaith, is that of the Cedar tree, the next of the Poplar, in which kinde the White and the ſweet ſmelling Moſſe is the chiefeſt; the blackiſh ſort is of no account. *Matthiolus* writeth, that in Italy that Moſſe is ſweet which groweth on the Pine tree, the Pitch tree, the Fir tree, and the Larch tree, and the ſweeteſt, that of the Larch tree.

¶ *The Time.*

Moſſe vpon the trees continueth all the yeare long.

¶ *The Names.*

It is called of the Grecians βρύον: of the Latines, *Muſcus*: the Arabians and ſome Apothecaries in other countries call it *Vſnea*: in high Dutch, **Moſz**: in low Dutch, **Moſch**: the French-men, *La Mouſch*: the Italians, *Muſgo*: in Spaniſh, *Muſ o de los arbores*: in Engliſh, Moſſe, tree Moſſe, or Moſſe of trees.

¶ *The Temperature.*

Moſſe is ſomewhat cold and binding, which notwithſtanding is more or leſſe according vnto the nature and faculty of that tree on which it groweth, and eſpecially of his barke: for it taketh vnto it ſelfe and alſo retaineth a certaine property of that barke, as of his breeder of which hee is ingendred: therefore the Moſſe which commeth of the Oke doth coole and very much binde, beſides his owne and proper faculty, it receiueth alſo the extreme binding quality of the Oke barke it ſelfe.

The Moſſe which commeth of the Cedar tree, the Pine tree, the Pitch tree, the Fir tree, the Larch tree, and generally all the Roſine trees are binding, and do moreouer digeſt and ſoften.

¶ *The Vertues.*

A *Serapio* ſaith, that the wine in which Moſſe hath been ſteeped certain daies, bringeth ſound ſleep, ſtrengthneth the ſtomacke, ſtaieth vomiting, and ſtoppeth the belly.

B *Dioſcorides* writeth, That the decoction of Moſſe is good for women to ſit in, that are troubled with the whites; it is mixed with the oile of Ben, and with oiles to thicken them withall.

C It is fit to be vſed in compoſitions which ſerue for ſweet perfumes, and that take away weariſomneſſe; for which things that is beſt of all which is moſt ſweet of ſmell.

CHAP. 162. *Of ground Moſſe.*

¶ *The Kindes.*

THere groweth alſo on the ſuperficiall or vppermoſt part of the earth diuers Moſſes, as alſo vpon rocks and ſtony places, and mariſh grounds, differing in forme not a little.

¶ *The Deſcription.*

1 THe common Moſſe groweth vpon the earth, and the bottome of old and antient trees, but ſpecially vpon ſuch as grow in ſhadowie woods, and alſo at the bottom of ſhadowie hedges,

1 *Muſcus terreſtris vulgaris.*
Common ground Moſſe.

2 *Muſcus terreſtris ſcoparius.*
Beeſome ground Moſſe.

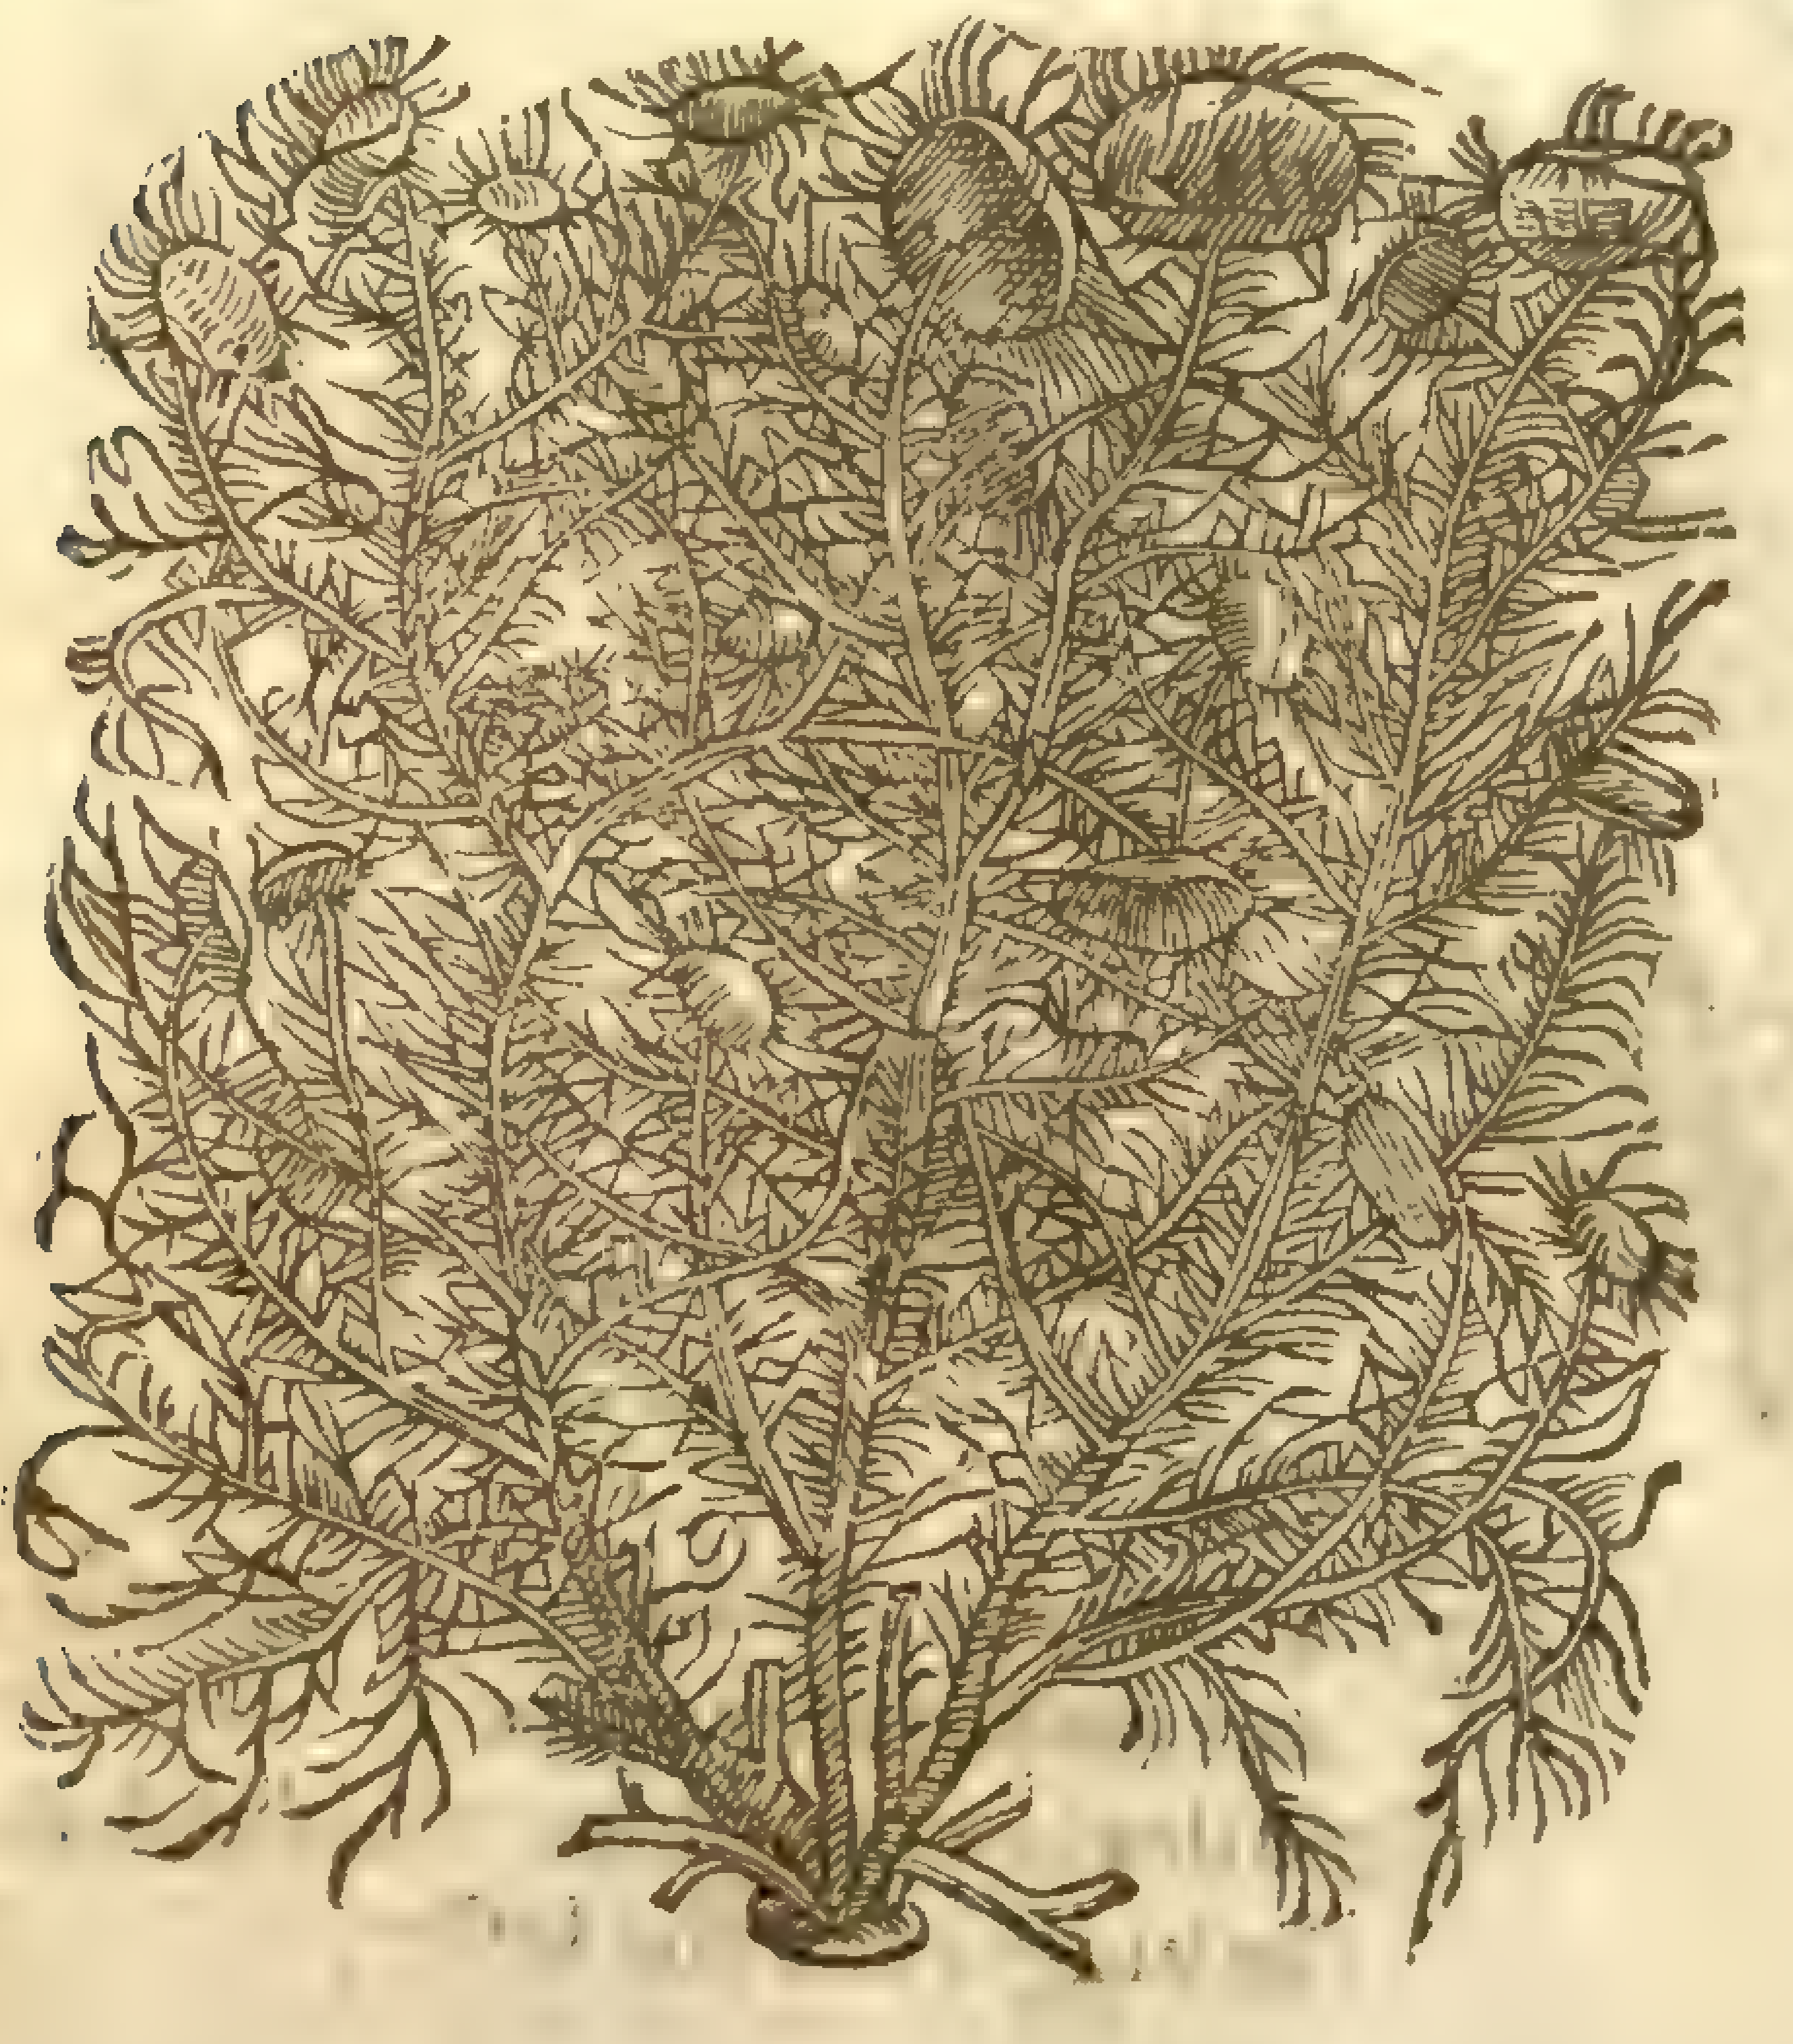
3. 4. *Muſcus capillaris, ſiue Adianthum aureum majus & minus.*
Goldilockes or golden Maiden-haire the bigger and the leſſer.

hedges and ditches, and ſuch like places: it is very well knowne by the ſoftneſſe and length thereof, being a moſſe moſt common, and therefore needeth not any further deſcription.

2 Beeſome Moſſe, which ſeldome or neuer is found but in bogs and mariſh places, yet ſometimes haue I found it in ſhadowie dry ditches, where the Sunne neuer ſheweth his face: it groweth vp halfe a cubit high, euery particular leafe conſiſting of an innumerable ſort of hairy threds ſet vpon a middle rib, of a ſhining blacke colour like that of Maiden-haire, or the Capillare Moſſe *Adianthum aureum*, whereof it is a kinde.

3 This kinde of Moſſe, called *Muſcus capillaris*, is ſeldome found but vpon bogs and mooriſh places, and alſo in ſome ſhadowie dry ditches where the Sun doth not come. I found it in great aboundance in a ſhadowie ditch vpon the left hand neere vnto a gate that leadeth from Hamſtead heath,

5 *Muſcus ramoſus floridus.*
Flouring branched Moſſe.



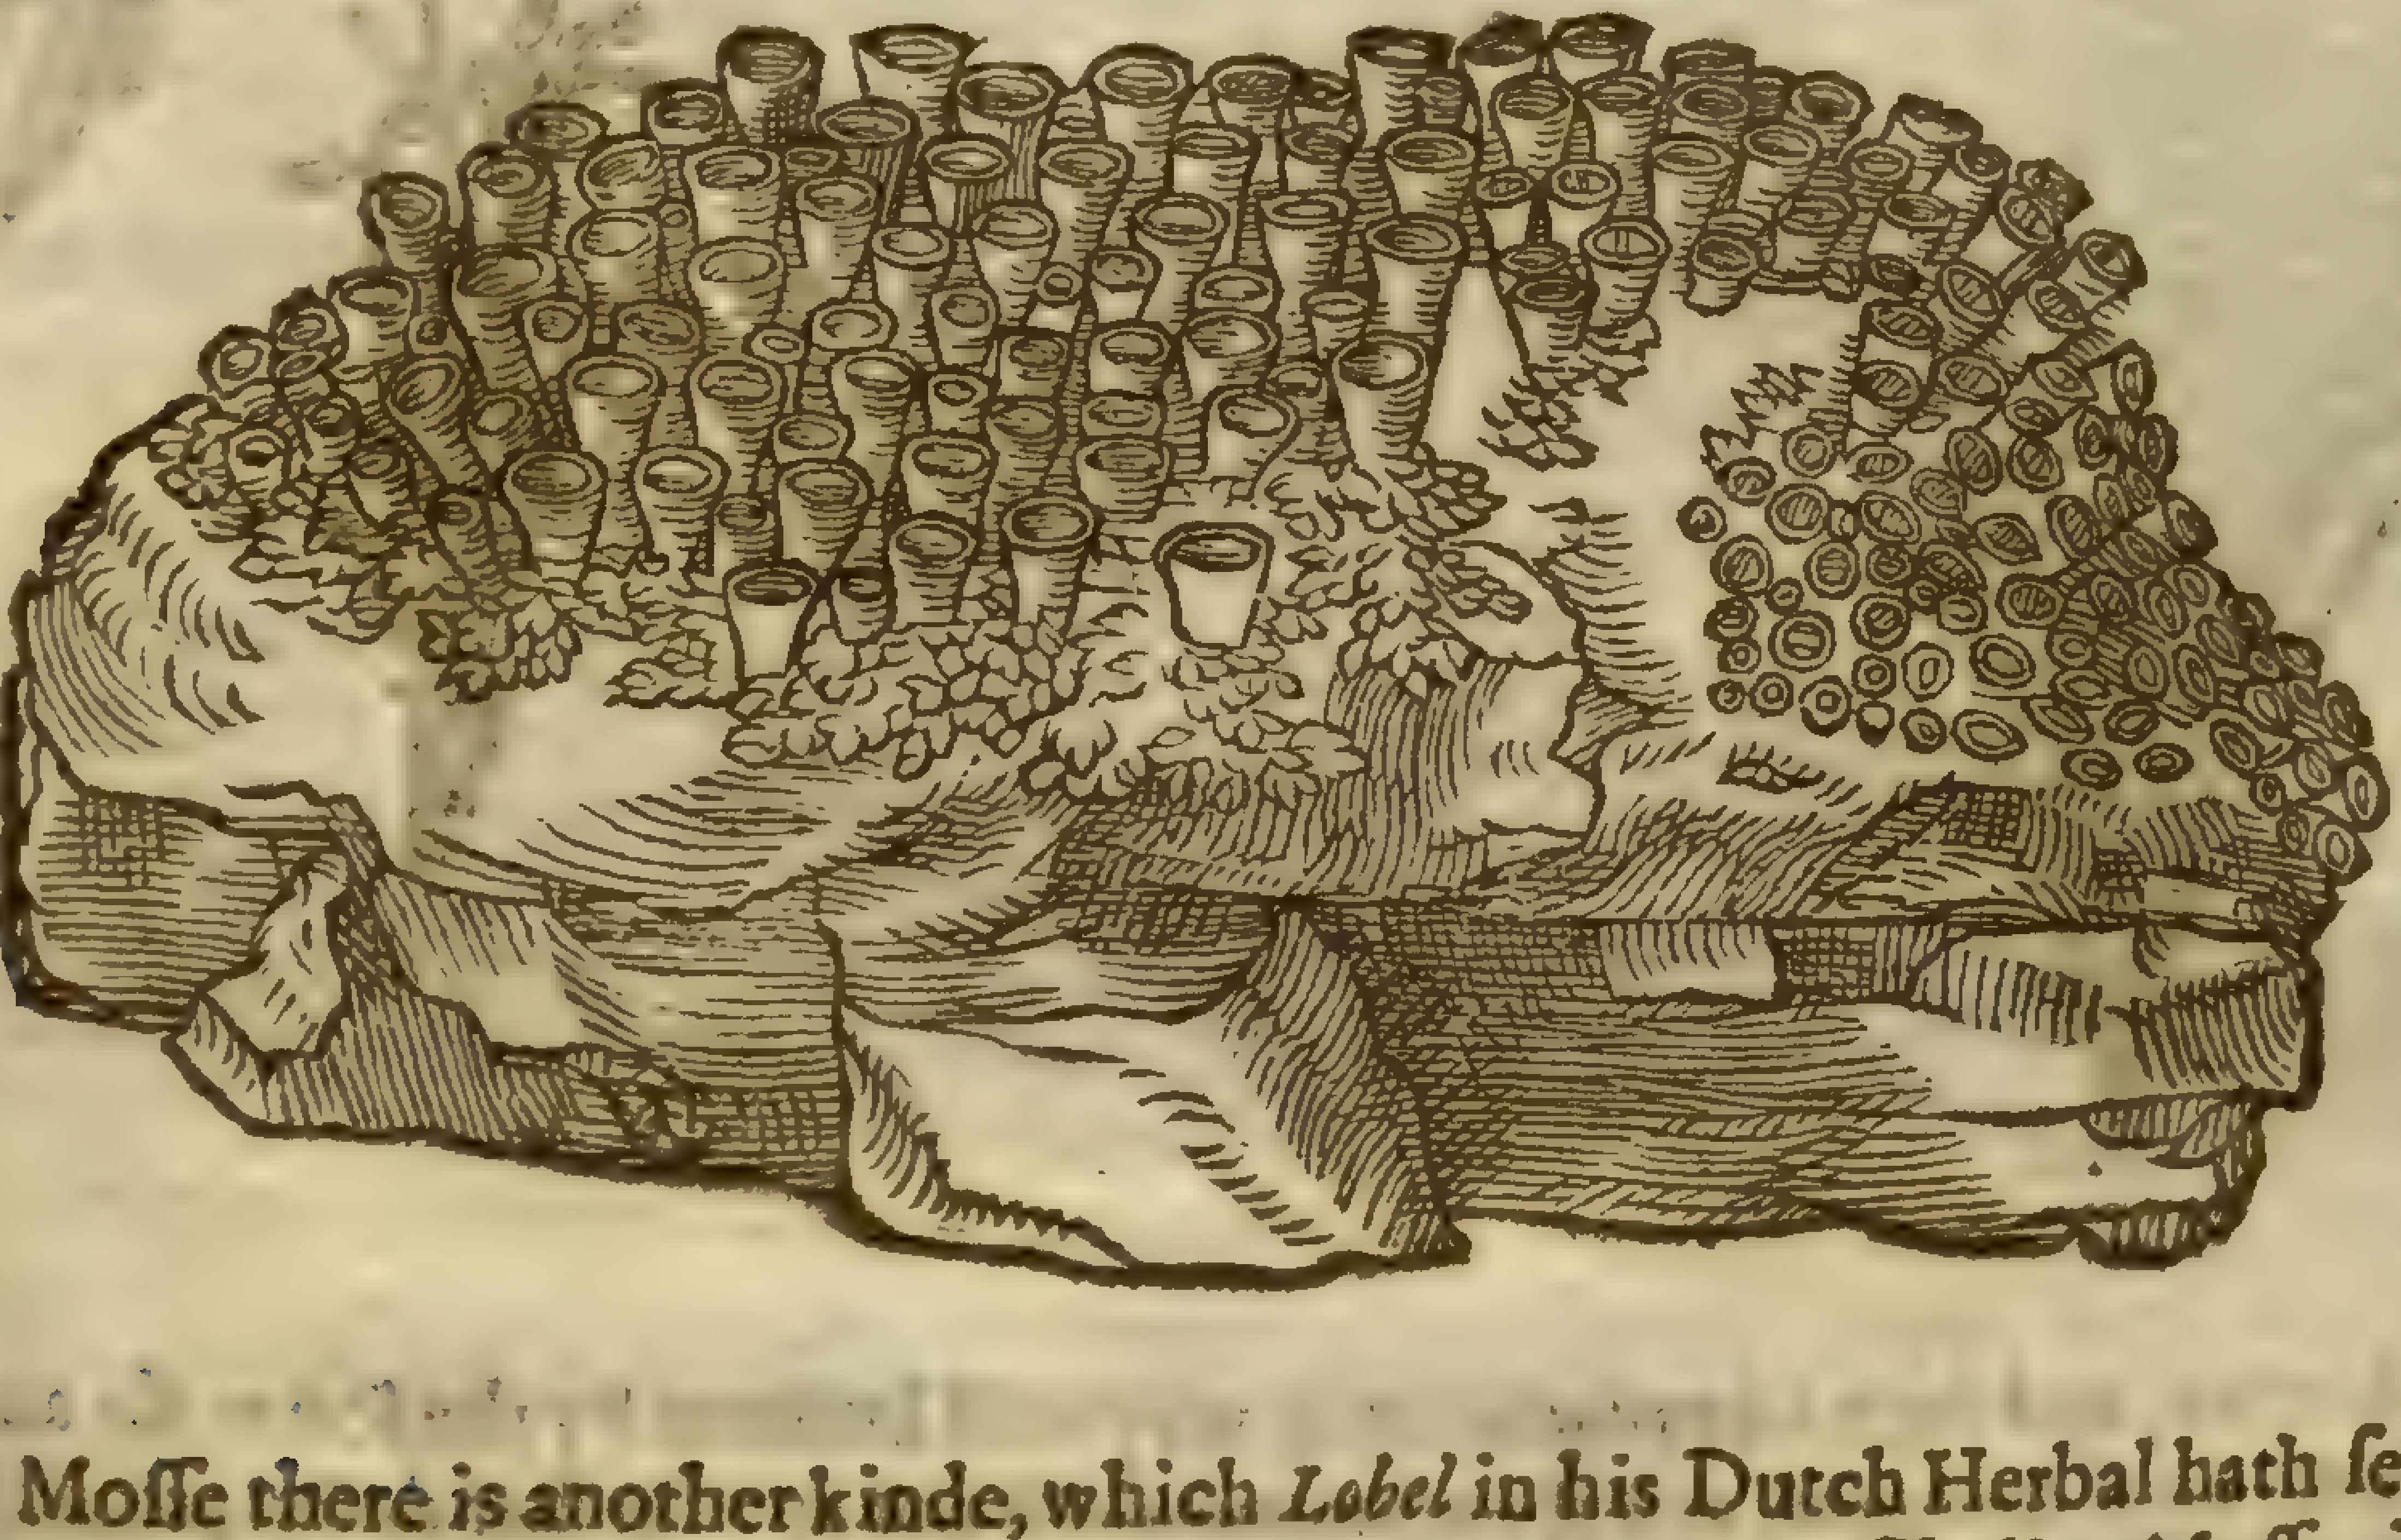
heath toward Highgate;which place I haue ſhewed vnto diuers expert Surgeons of London, in our wandering abroad for our farther knowledge in Simples. This kind of Moſſe, the ſtalkes thereof are not aboue one handfull high,couered with ſhort haires ſtanding very thicke together, of an obſcure yellow green colour; out of which ſtalkes ſpring vp ſometimes very fine naked ſtems, ſomewhat blacke, vpon the tops of which hang as it were little graines like wheat cornes. The roots are very ſlender and maruellous fine.

‡ Of this *Adianthum aureum* there are three kindes, different onely in magnitude, and that the two bigger haue many hairie threds vpon their branches,when as the leaſt hath onely three or foure cloſe to the root; and this is the leaſt of plants that I euer yet ſaw grow. ‡

4 Of this there is alſo another kinde altogether leſſer and lower. This kind of moſſe groweth in moiſt places alſo, commonly in old moſſie and rotten trees, likewiſe vpon rocks,and oftentimes in the chinks and crannies of ſtone walls.

† 5 There is oftentimes found vpon old Okes and Beeches,and ſuch like ouer-growne trees, a kind of Moſſe hauing many ſlender branches,which diuide themſelues into other leſſer branches; whereon are placed confuſedly very many ſmall threds like haires, of a greeniſh aſh-colour: vpon the ends of the tender branches ſometimes there commeth forth a floure in ſhape like vnto a little buckler or hollow Muſhrom,of a whitiſh colour tending to yellownes, and garniſhed with the like leaues of thoſe vpon the lower branches.

6 *Muſcus Pyxidatus.*
Cup or Chalice Moſſe.

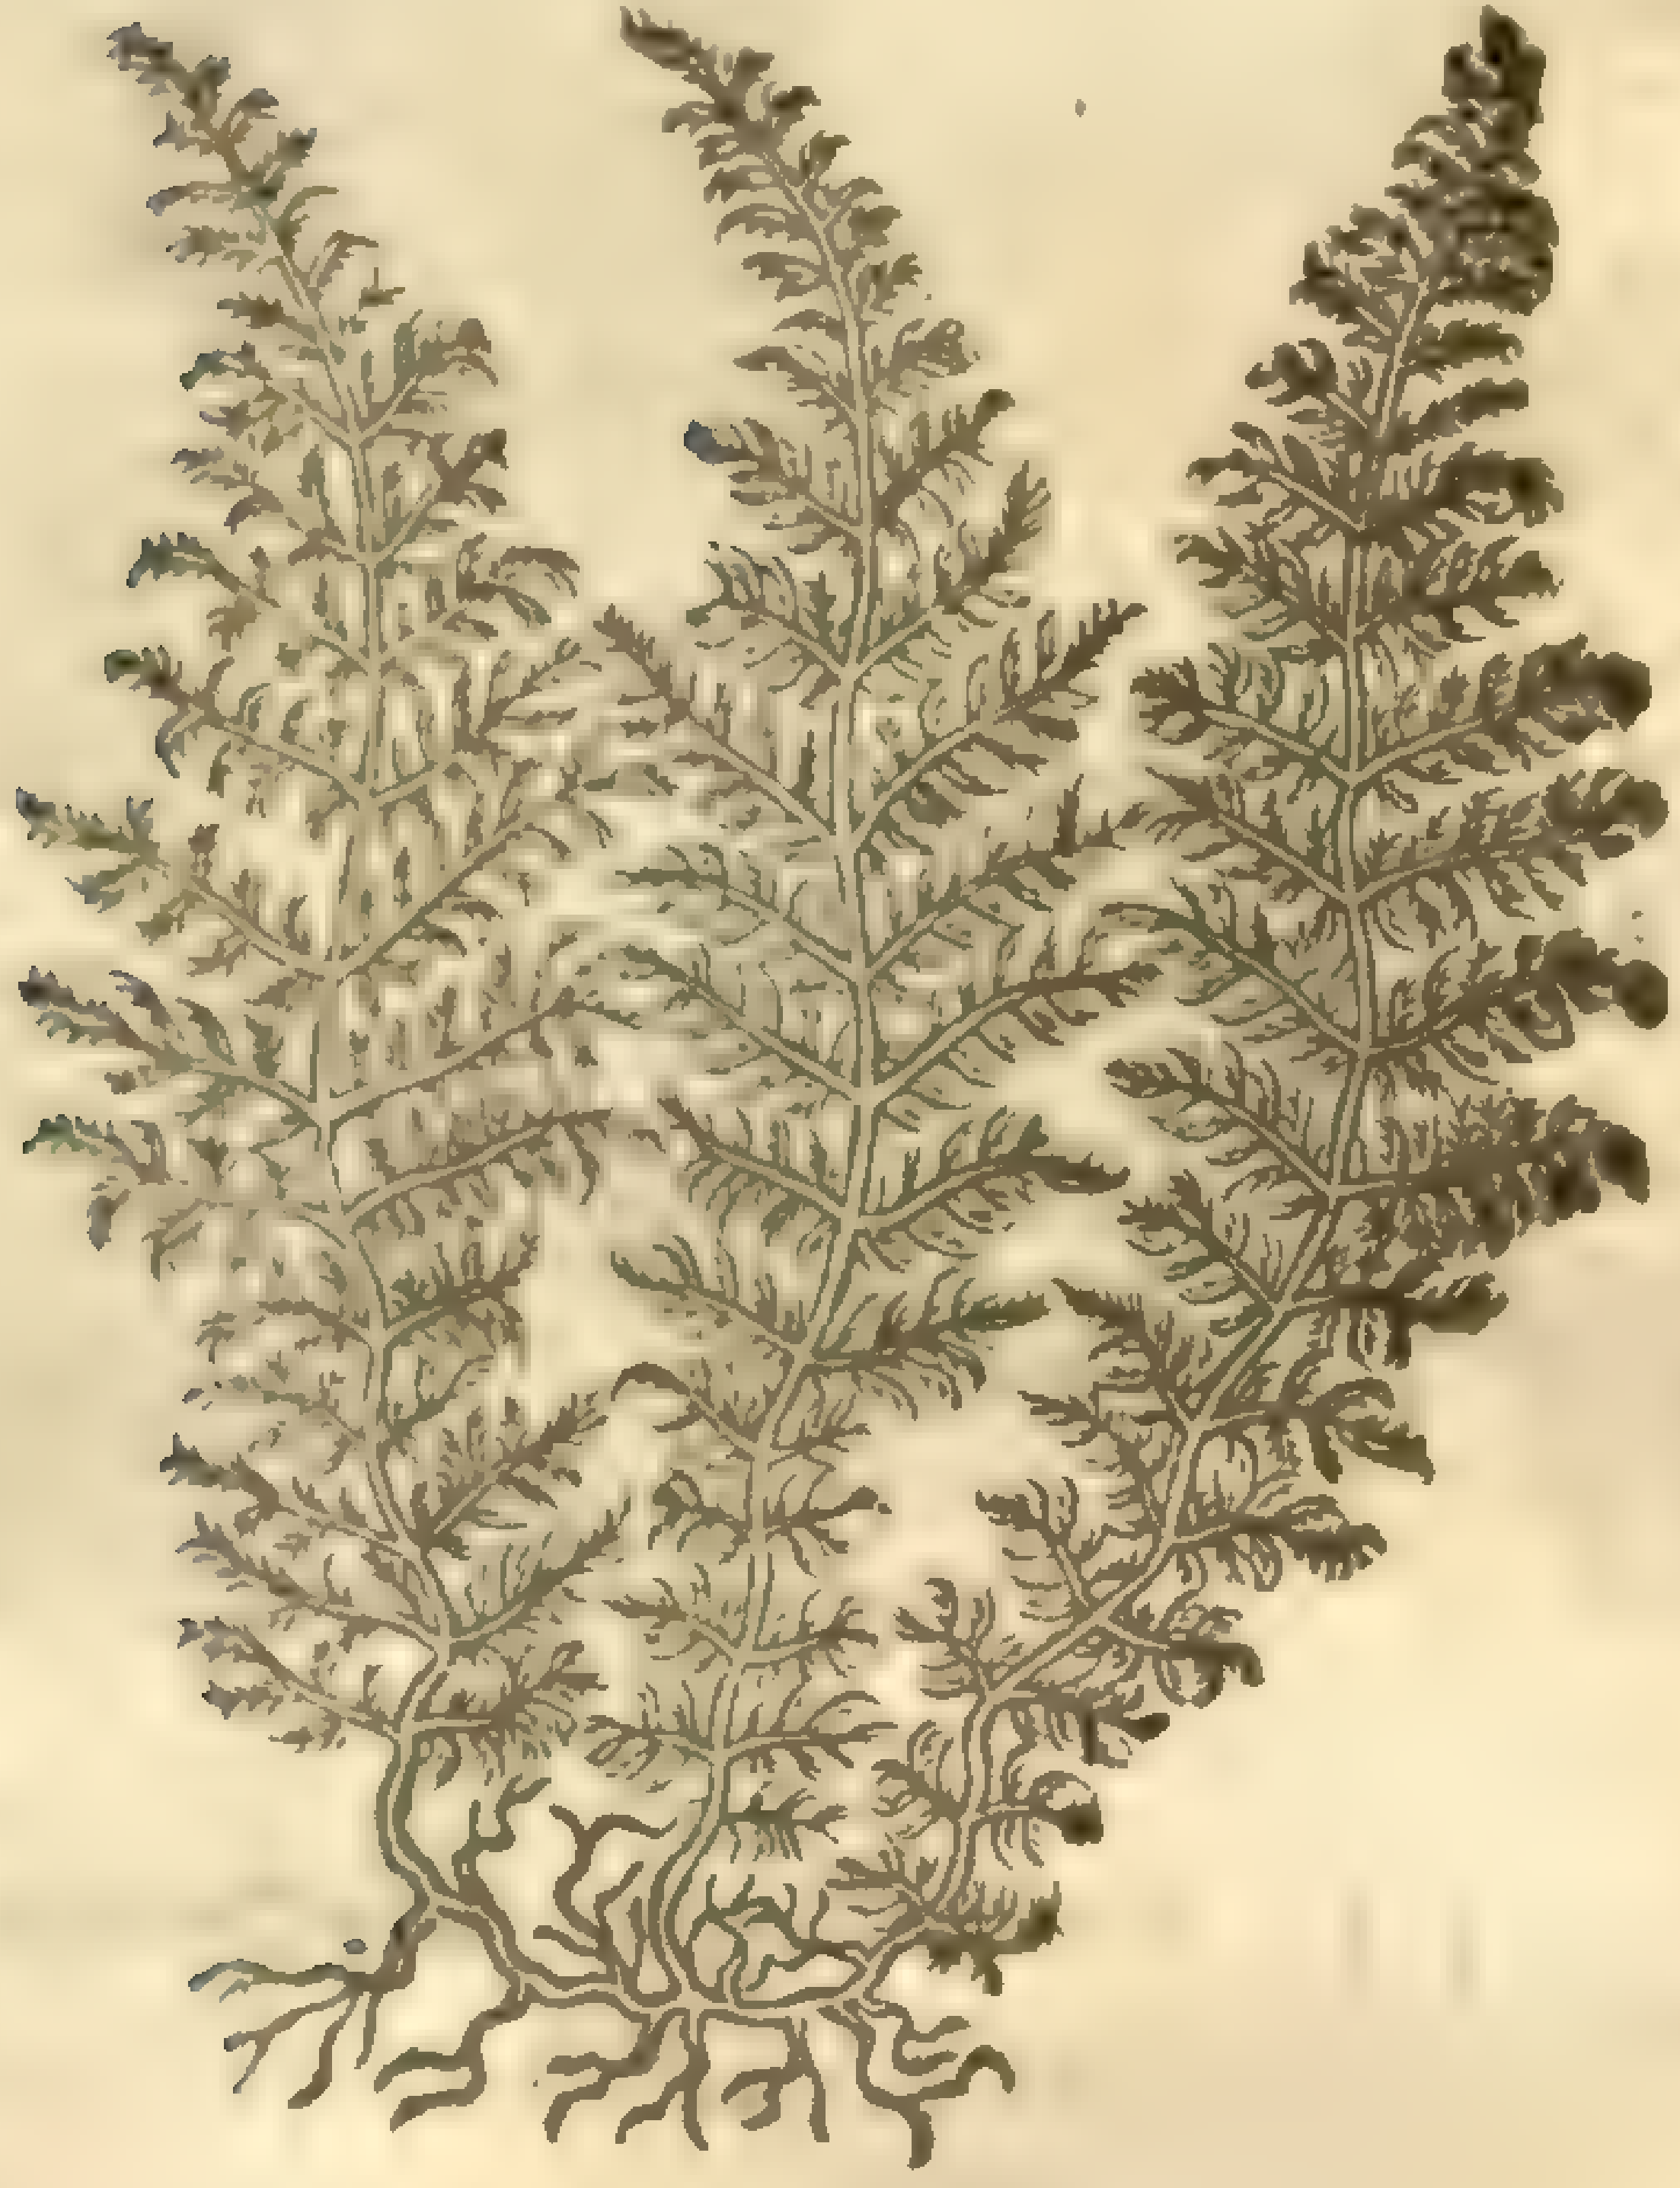


6 Of this Moſſe there is another kinde, which *Lobel* in his Dutch Herbal hath ſet forth vnder the title of *Muſcus Pyxidatus*, which I haue Engliſhed, Cup Moſſe or Chalice Moſſe: it groweth in the moſt barren dry and grauelly ditch bankes, creeping flat vpon the ground like vnto Liuerwort, but of a yellowiſh white colour: among which leaues ſtart vp here and there certaine little things faſhioned like a little cup called a Beaker or Chalice, and of the ſame colour and ſubſtance of the lower leaues, which vndoubtedly may be taken for the floures: the pouder of which Moſſe giuen to children in any liquor for certaine daies together, is a moſt certaine remedy againſt that perillous malady called the Chin cough.

7 There is likewiſe found in the ſhadowie places of high mountaines, and at the foot of old

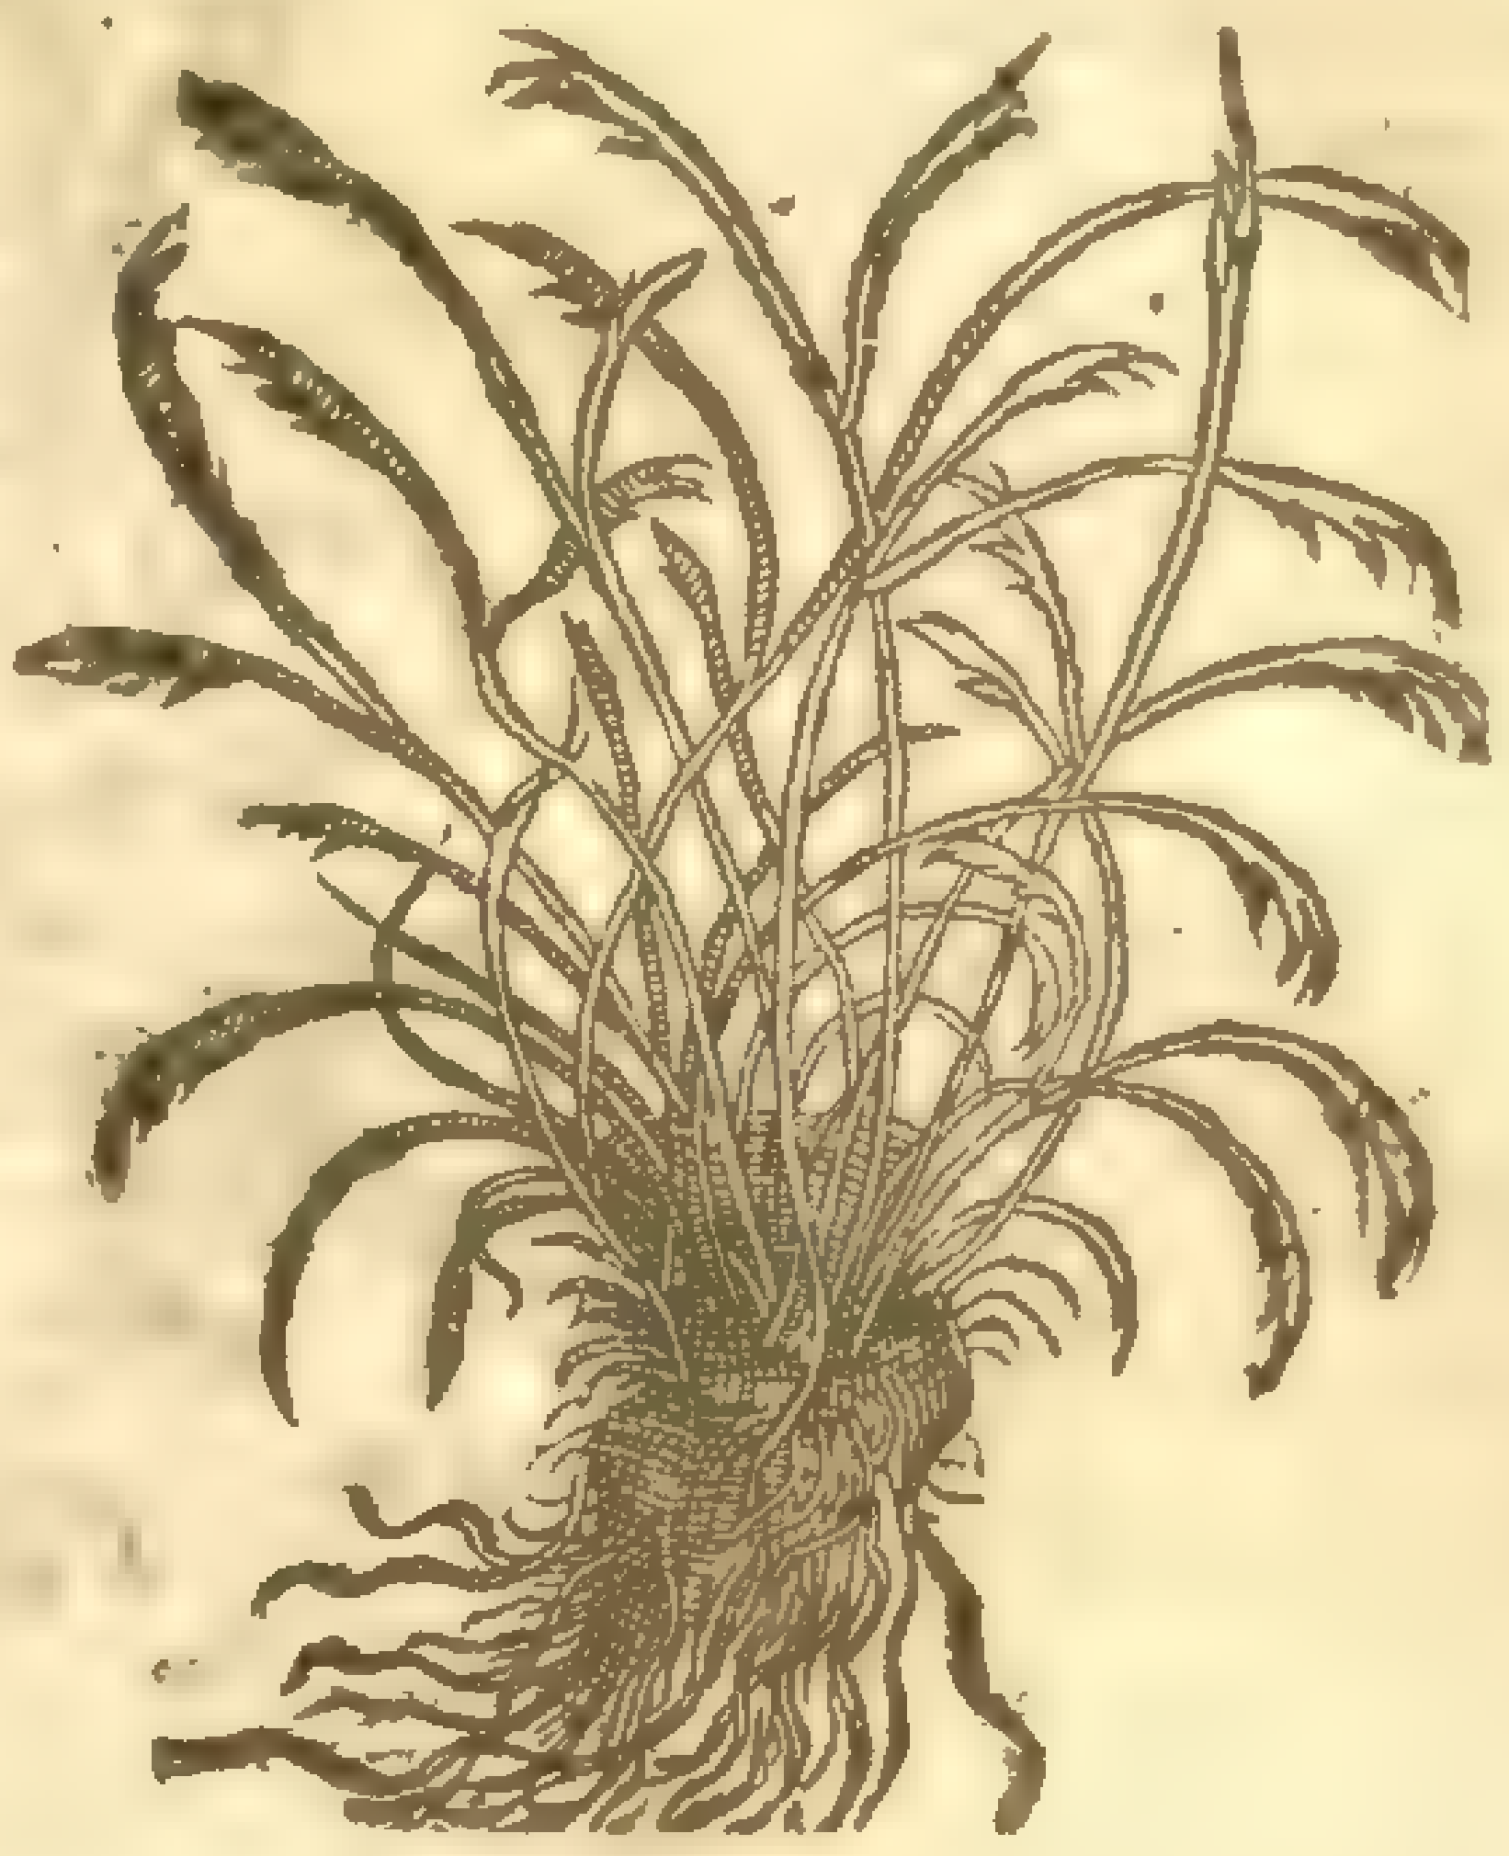
and rotten trees, a certaine kinde of moſſe in face and ſhew not vnlike to that kinde of Oke Ferne called *Dryopteris*. It creepeth vpon the ground, hauing diuers long branches, conſiſting of many ſmall leaues, euery particular leafe made vp of ſundry little leaues, ſet vpon a middle rib one oppoſit to another.

7 *Muſcus Filicinus.*
Moſſe Ferne.

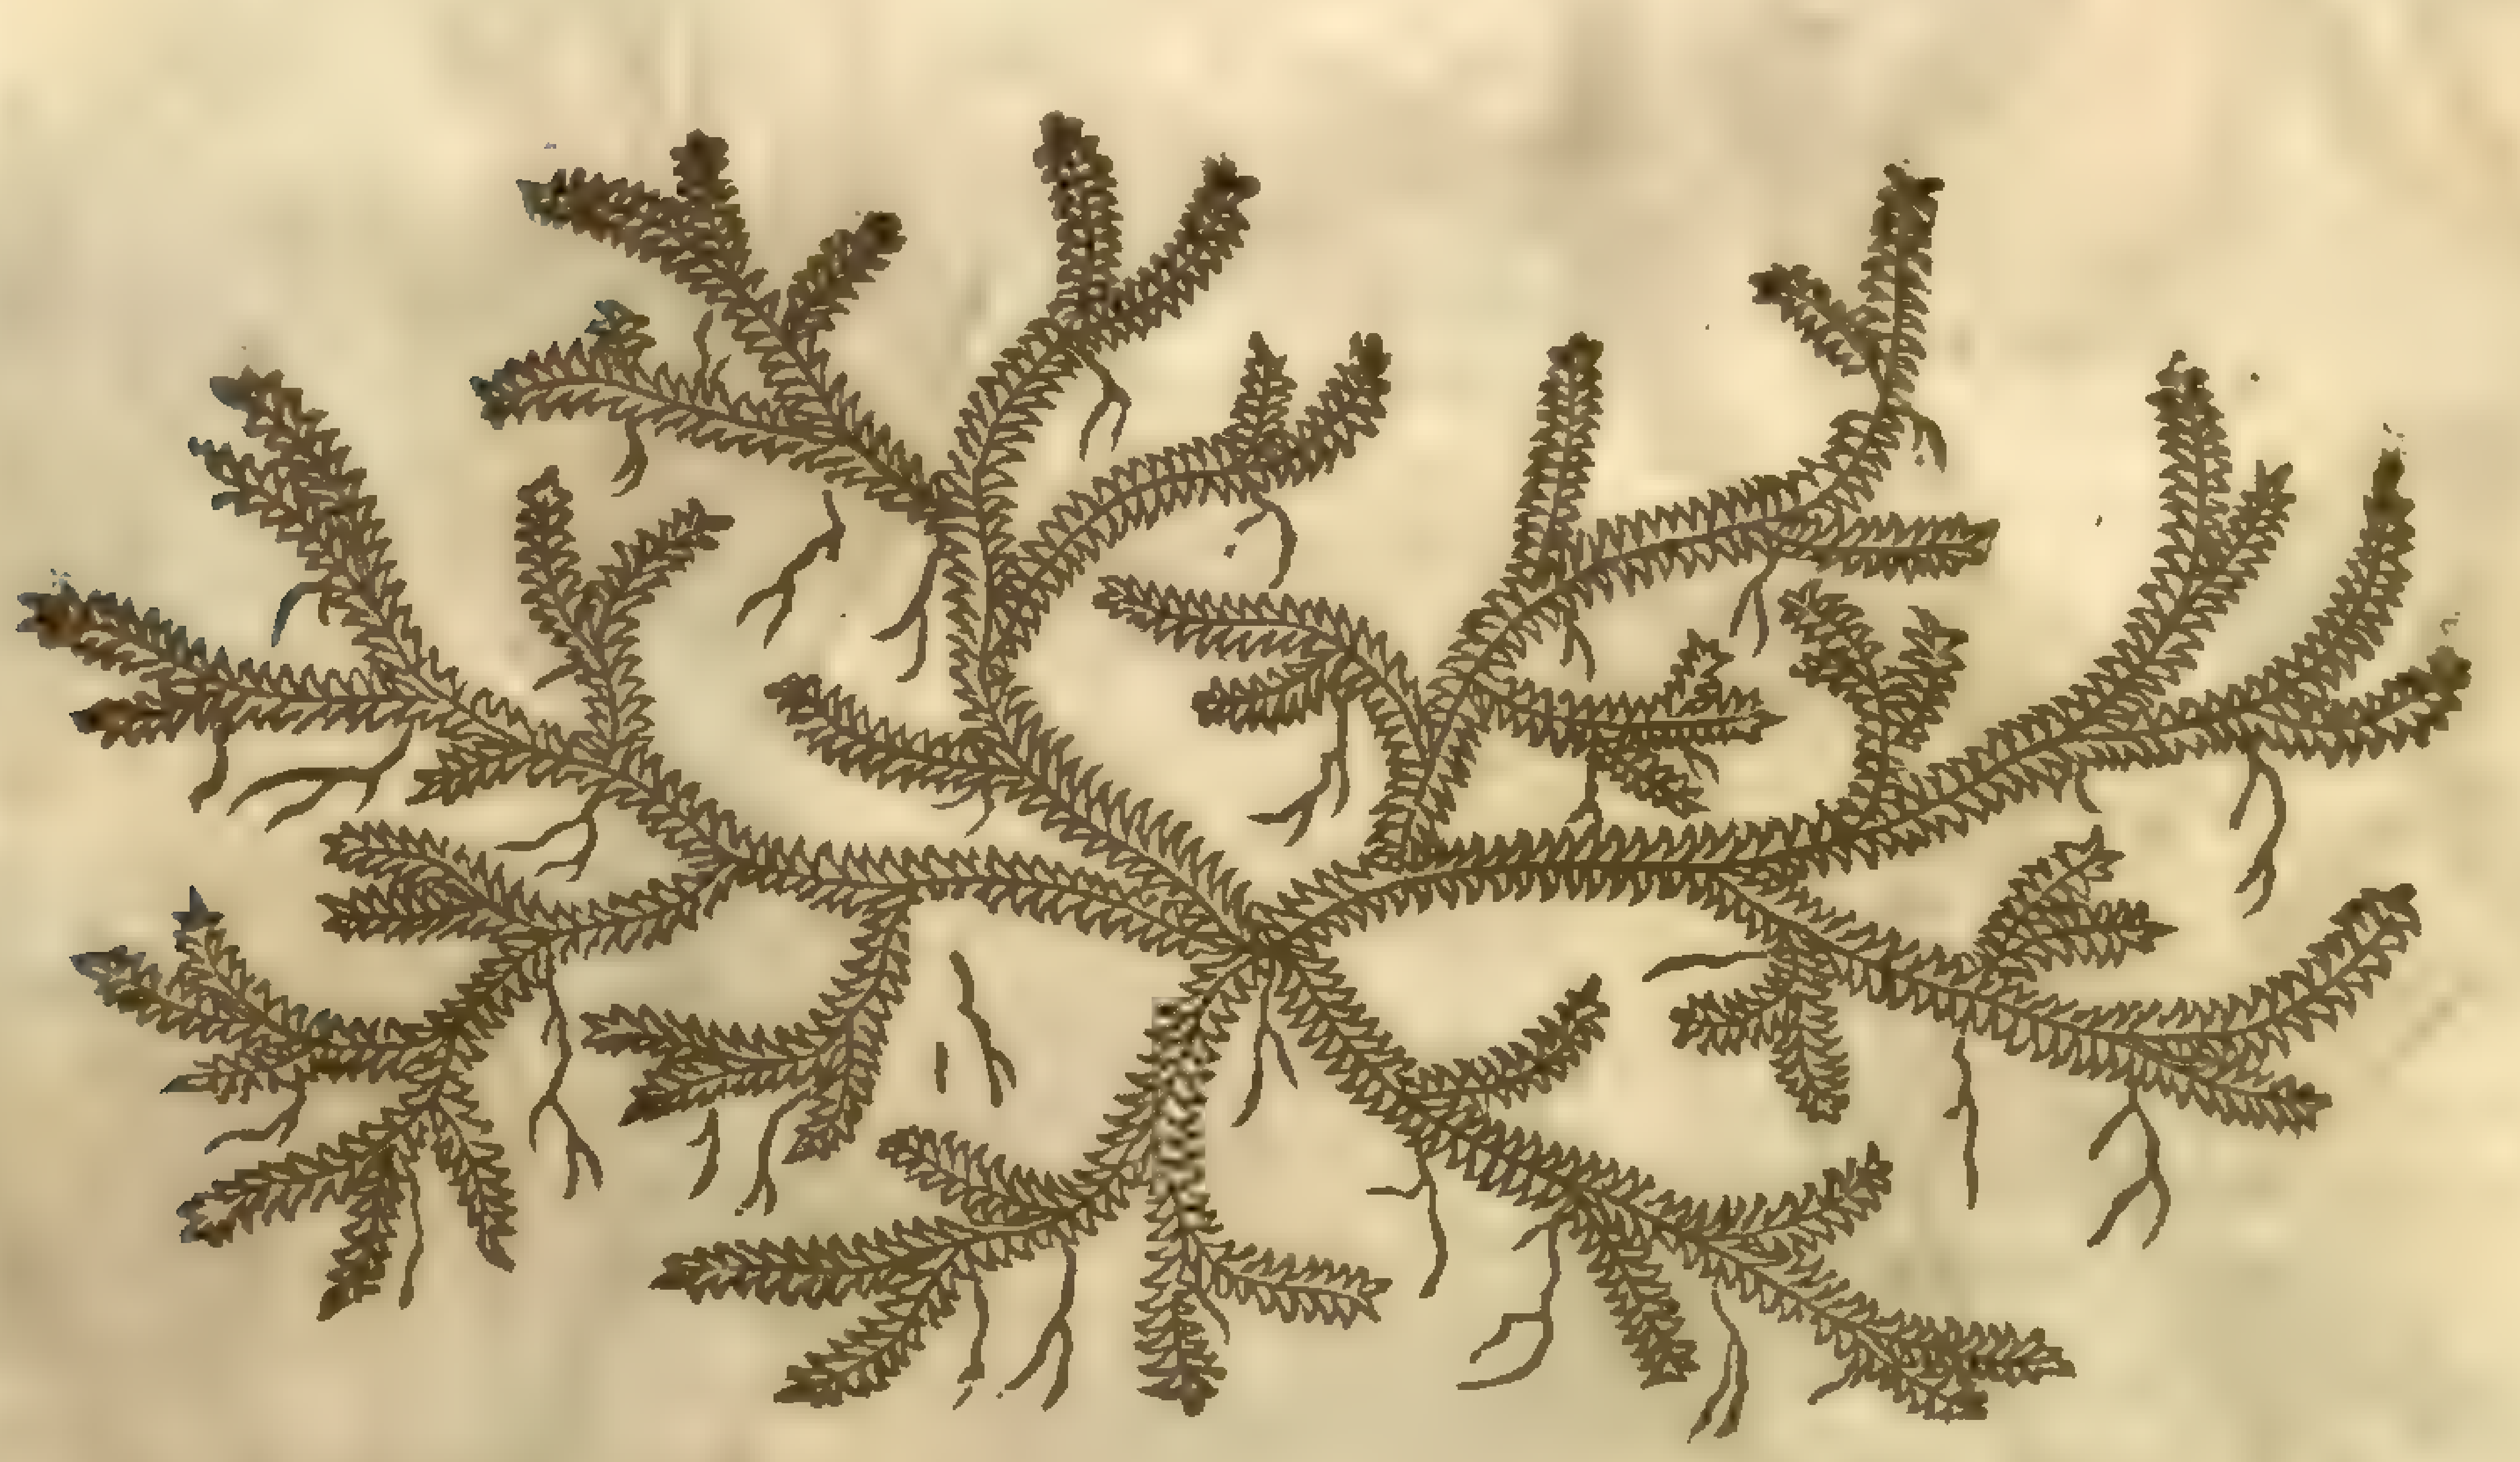


8 *Muſcus corniculatus.*
Horned or knagged Moſſe.

acrostichum septen[illegible]
[illegible]
Lobel [illegible]
[illegible] 4. 30[illegible]



9 *Muſcus denticulatus.*
Toothed Moſſe.



8 There is found vpon the tops of our moſt barren mountaines, but eſpecially where ſea Coles are accuſtomed to be digged, ſtone to make iron of, and alſo where ore is gotten for tinne and lead, a certaine ſmall plant: it riſeth forth of the ground with many bare and naked branches, diuiding themſelues at the top into ſundry knags like the forked hornes of a Deere, euery part whereof is of an ouerworne whitiſh colour.

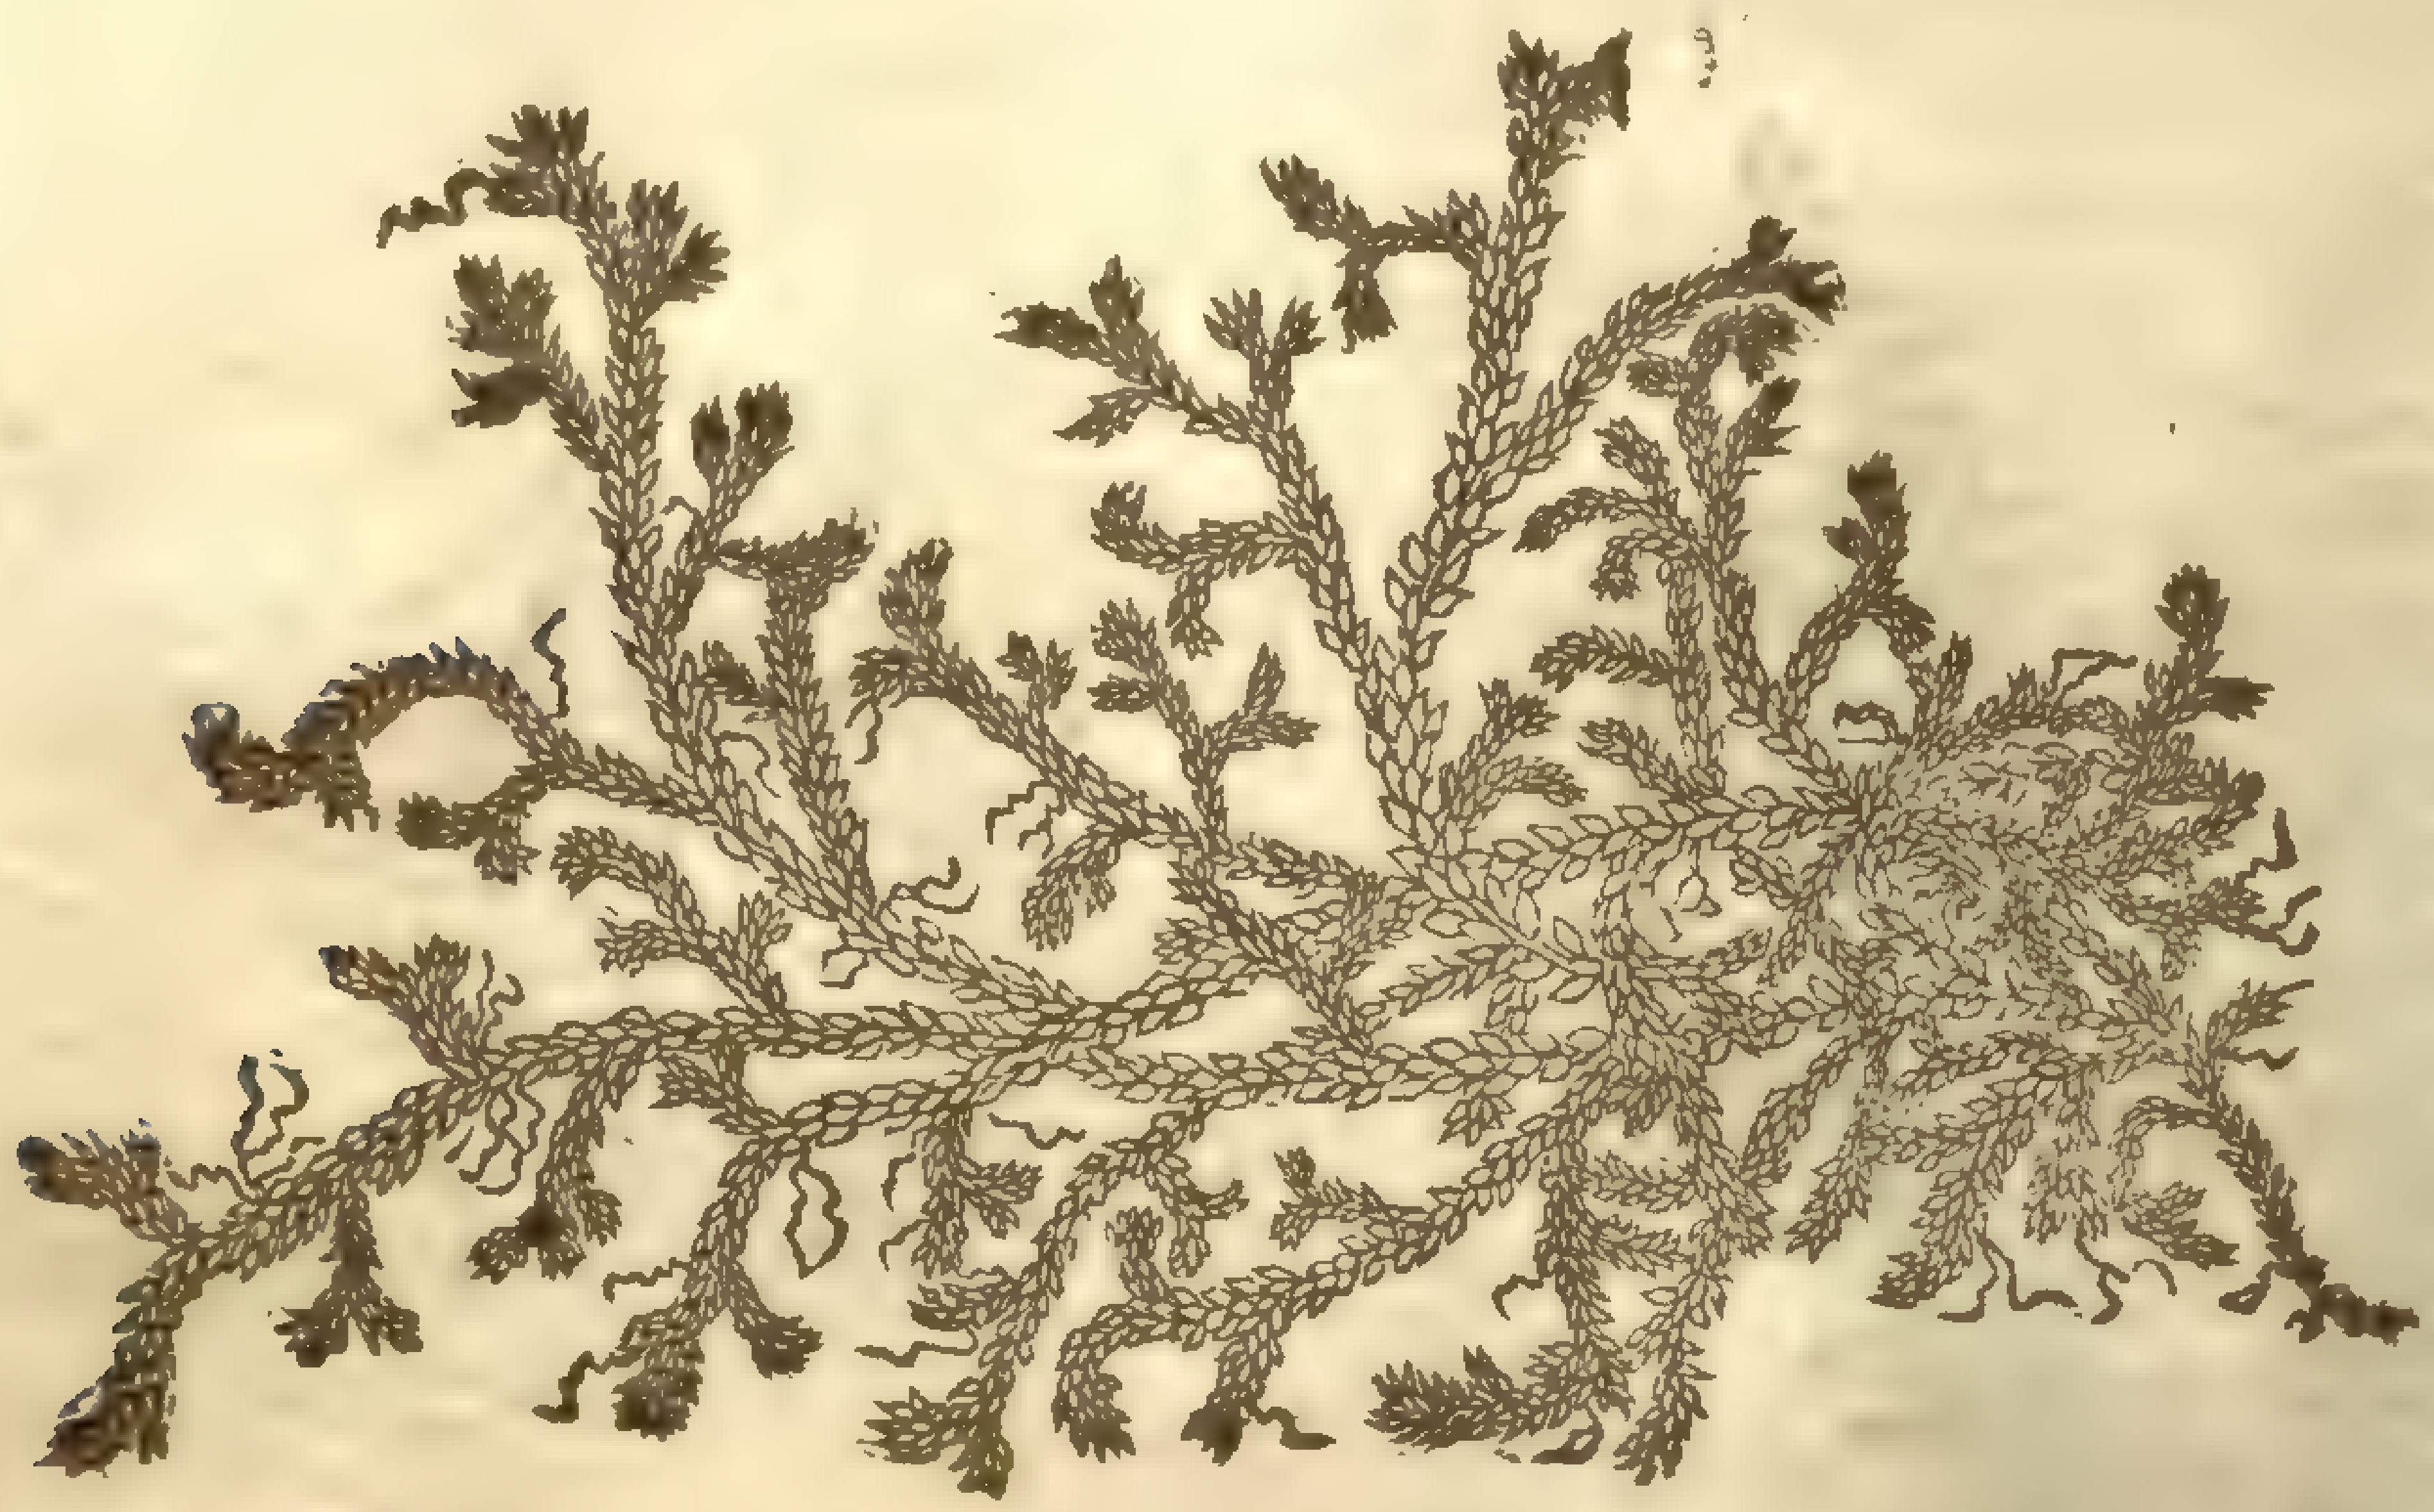
‡ Our Author formerly gaue another figure and deſcription of this plant, by the name of *Holoſteum petraeum*, which I haue omitted, thinking this the better. *Tragus*, *Lonicerus*, and *Bauhine* refer this to the Fernes; and the laſt of them calleth it *Filex ſaxatilis corniculata*: *Pena* and *Lobel* made it their *Holoſtium alterum*: *Thalius* calls it *Adianthum acroſchiſton, ſeu furcatum*. ‡

9 There is found creeping vpon the ground a certaine kinde of moſſe at the bottome of Heath and Ling, and ſuch like buſhes growing vpon barren mountaines, conſiſting as it were of ſcales made vp into a long rope or cord, diſperſing it ſelfe far abroad into ſundry branches, thruſting out

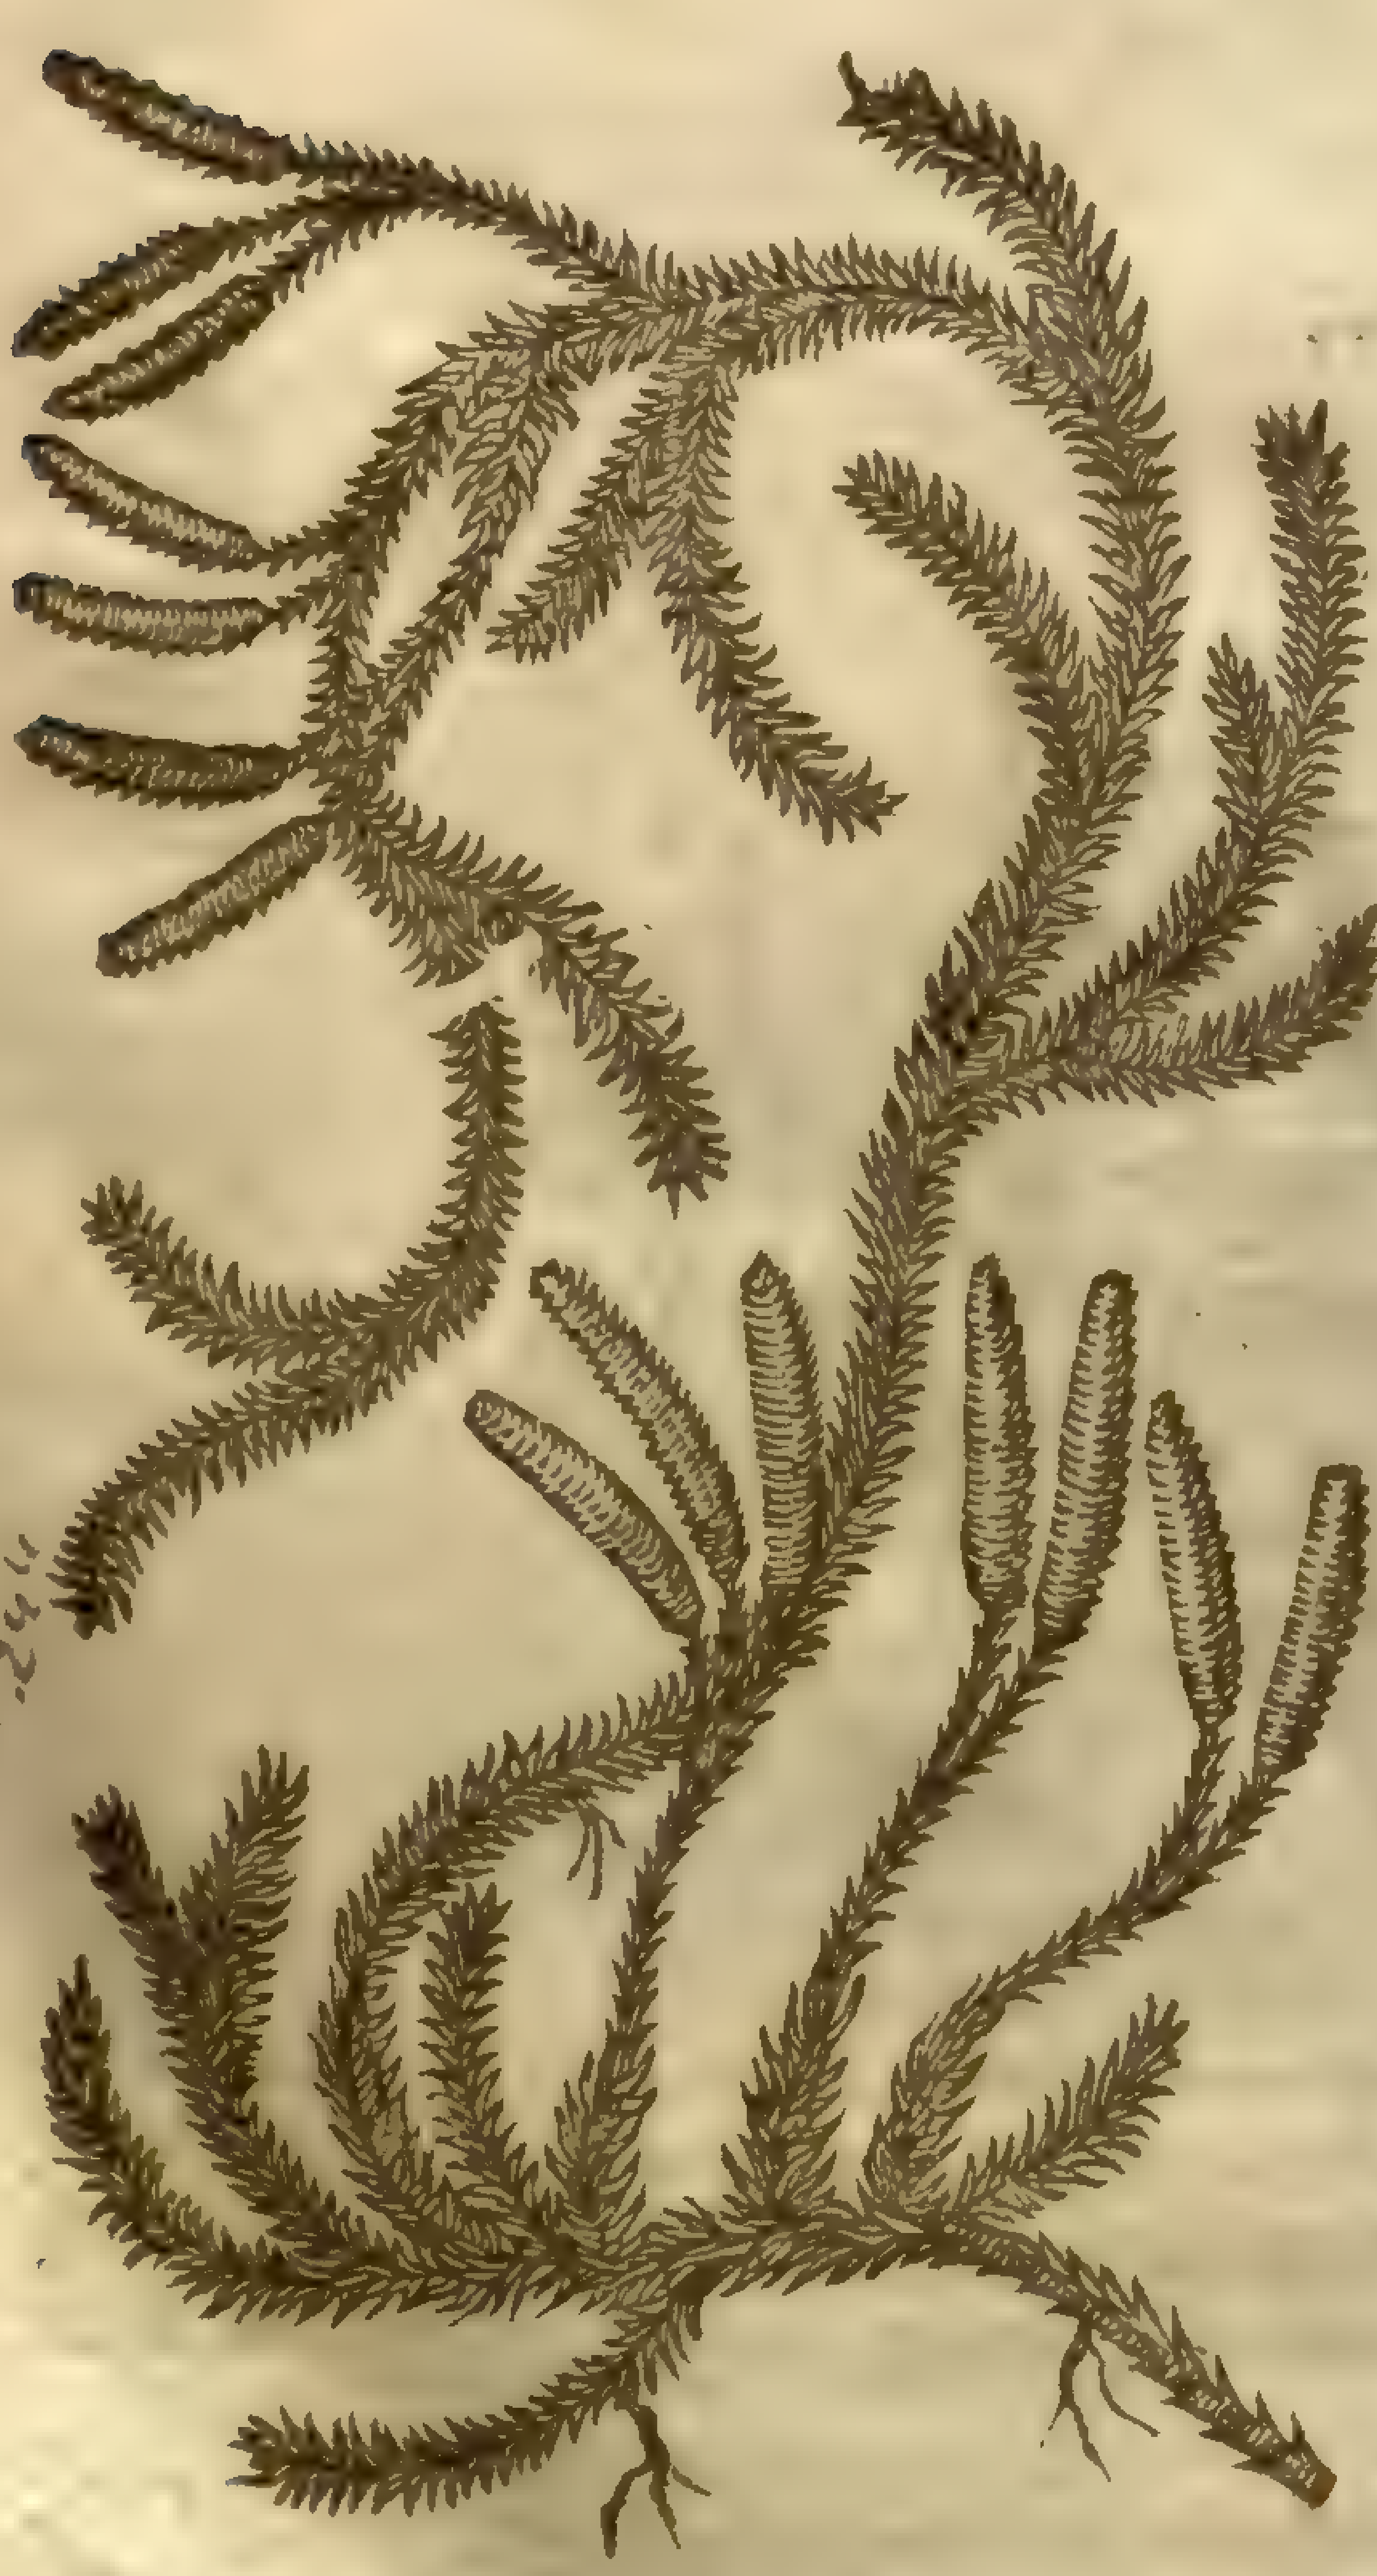
here and there certaine roots like threds, which take hold vpon the vpper cruſt of the earth, whereby it is ſent and diſperſed far abroad: the whole plant is of a yellowiſh greene colour.

10 This other kinde of moſſe is found in the like places: it alſo diſperceth it ſelfe far abroad, and is altogether leſſer than the precedent, wherein conſiſts the difference.

10 *Muſcus minor denticulatus.*
Little toothed Moſſe.



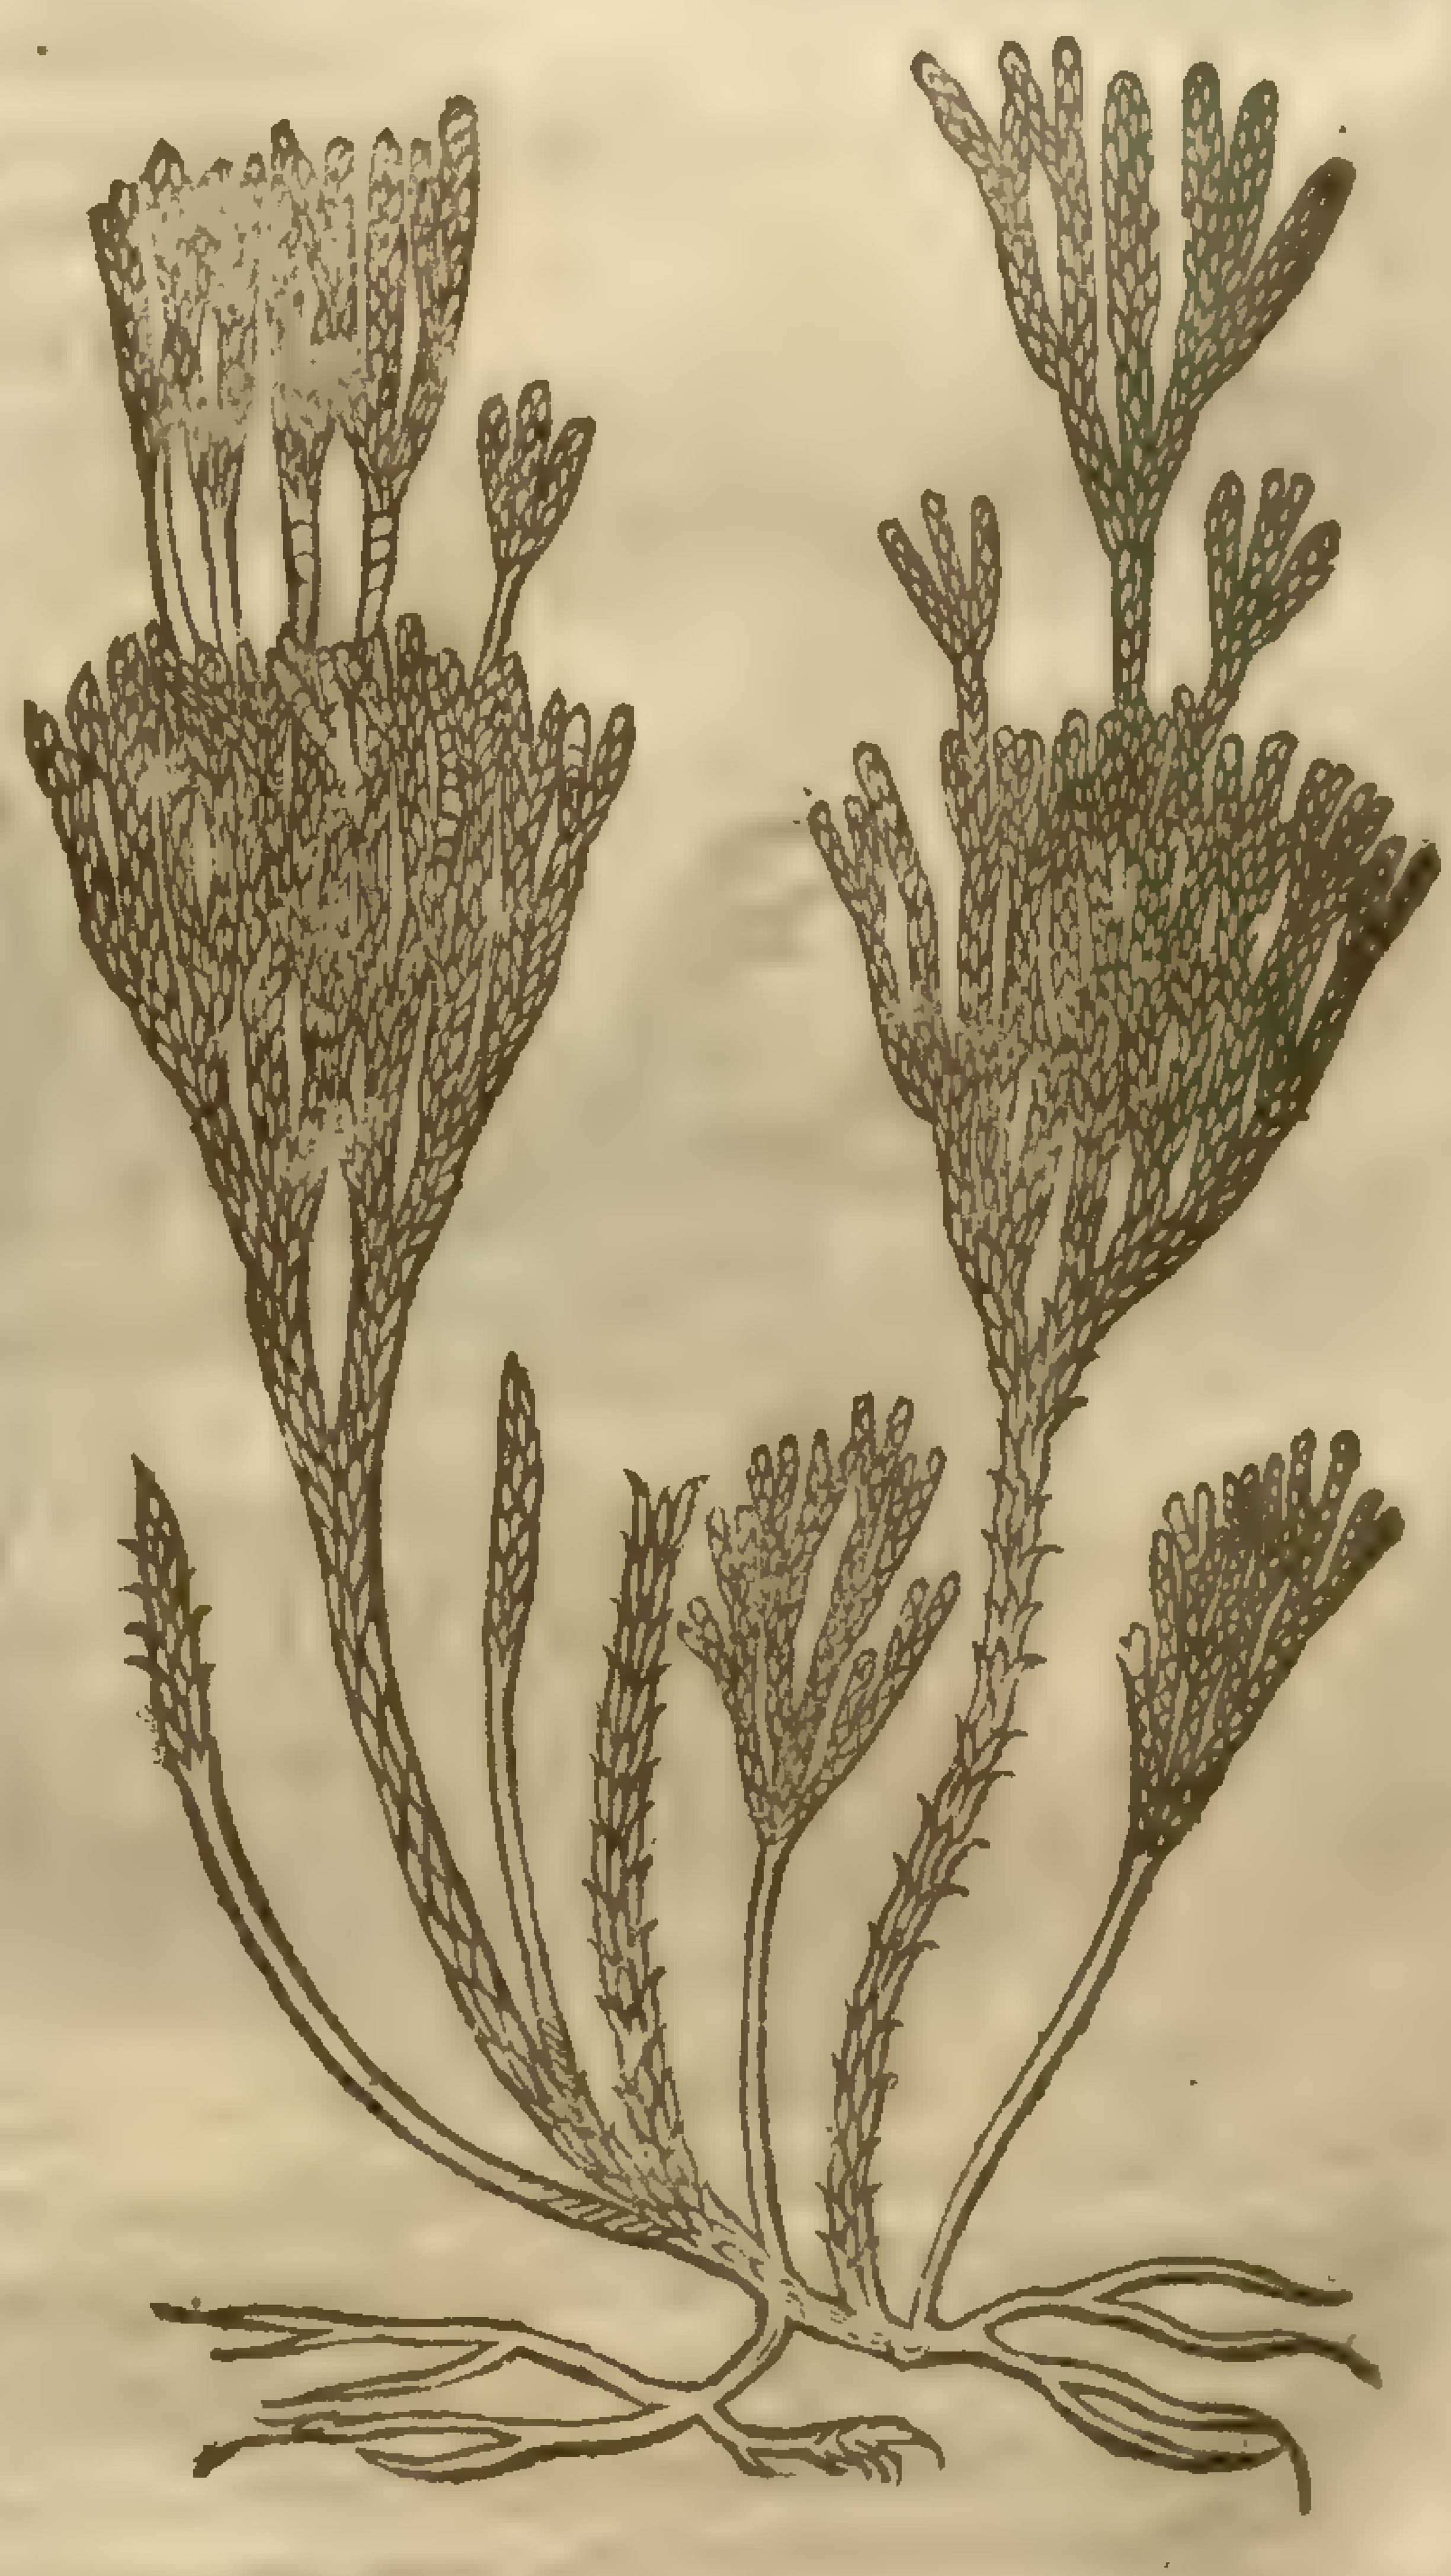
11 *Muſcus clauatus, ſiue Lycopodium.*
Club Moſſe, or Wolfe claw Moſſe.



Lycopodium clavatum L.
Sm. pl. 4. 531

Lob. ic. 2.241

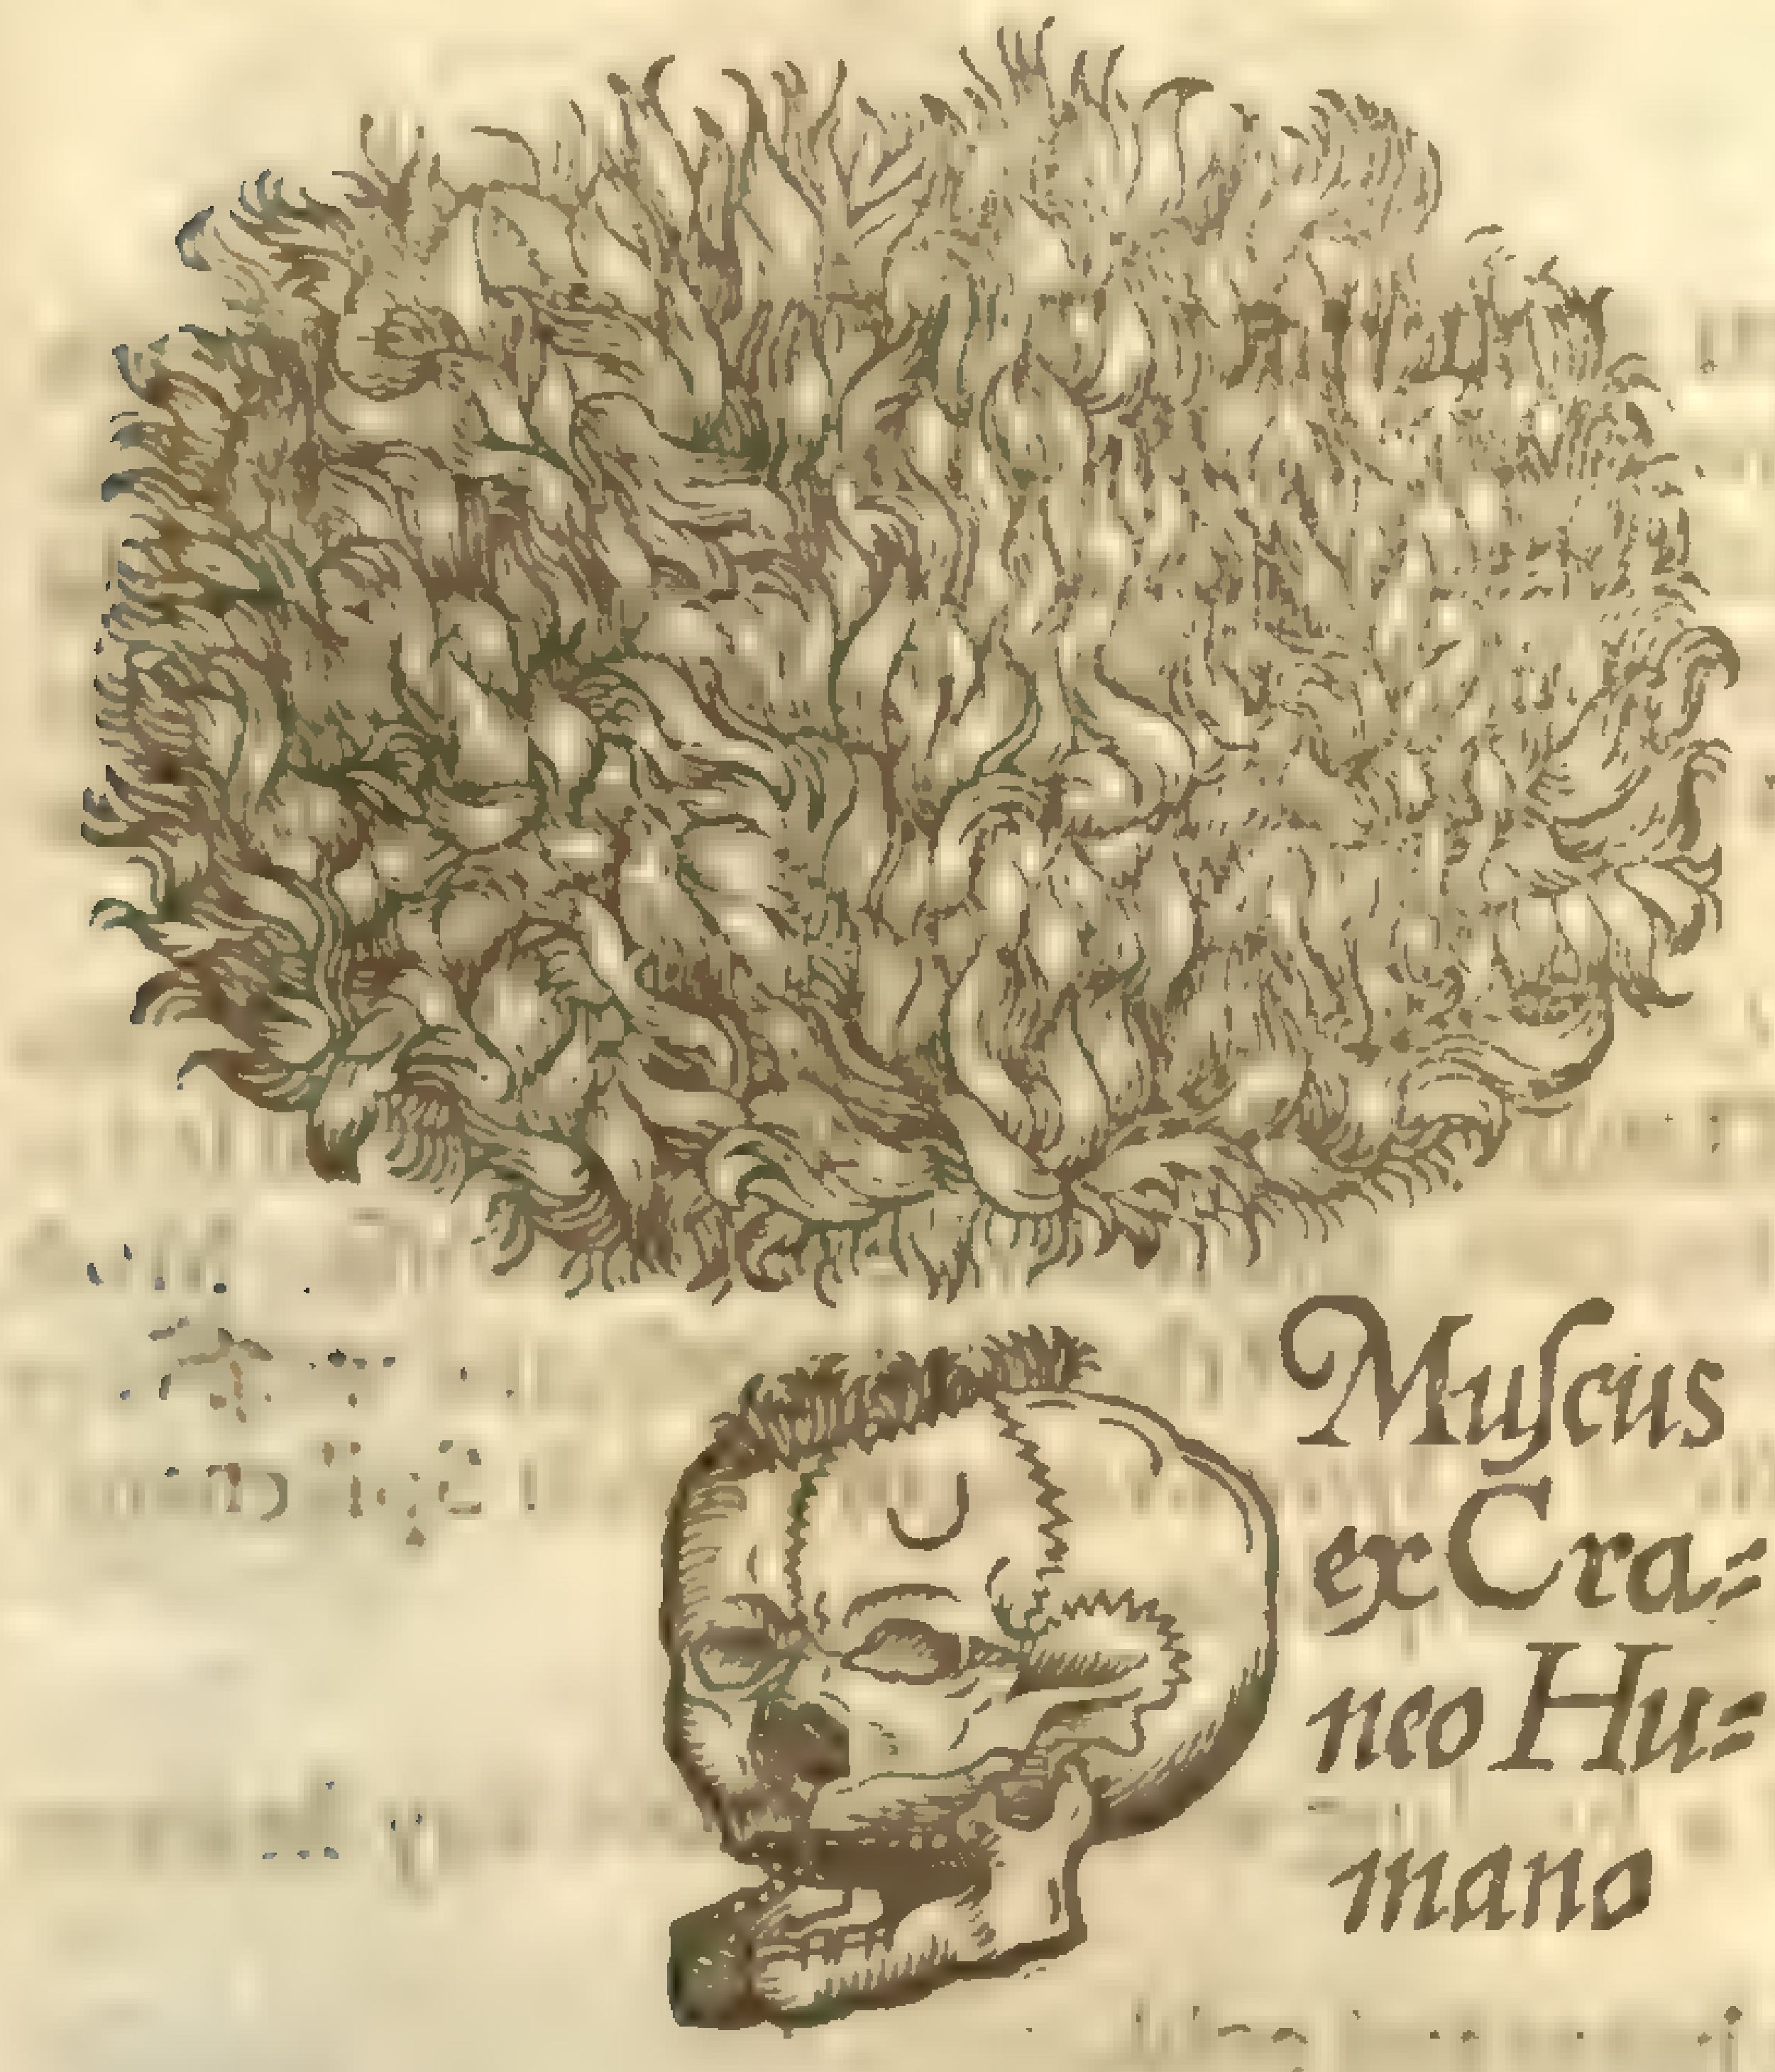
† 12 *Muſcus clauatus folijs Cupreſſi.*
Heath Cypres.



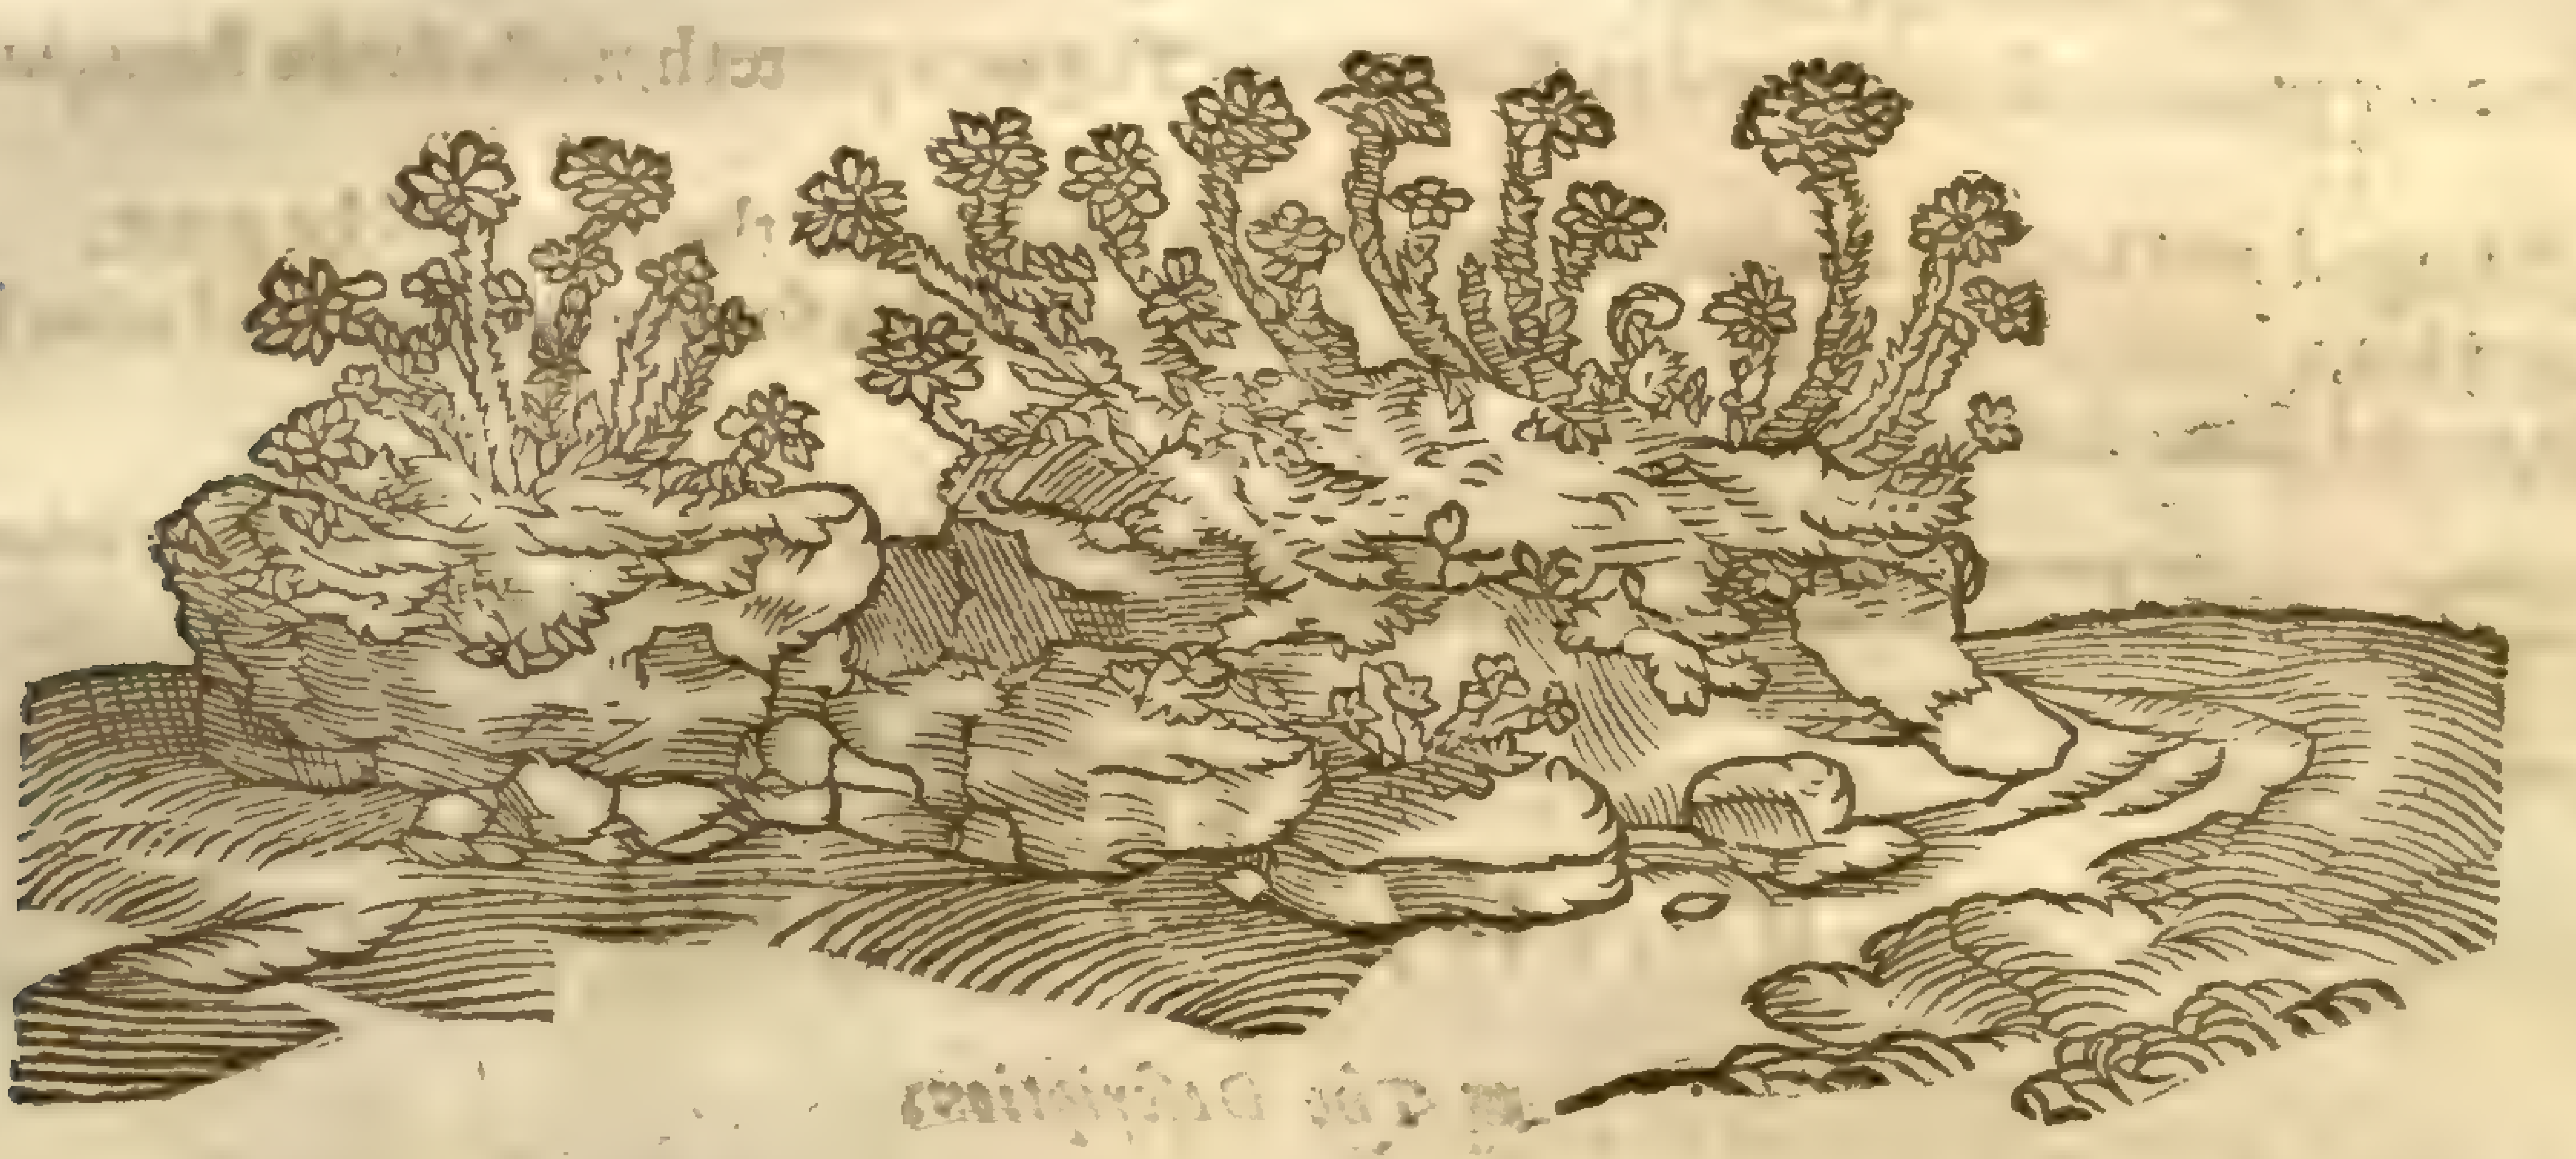
11 There is likewiſe another kinde of Moſſe, which I haue not elſewhere found than vpon Hampſted heath, neere vnto a little cottage, growing cloſe vpon the ground amongſt buſhes and brakes, which I haue ſhewed vnto diuers Surgeons of London, that haue walked thither with mee for their further knowledge in Simples, who haue gathered this kinde of moſſe, whereof ſome haue

made them hat-bands, girdles, and alſo bands to tye ſuch things as they had before gathered, for the which purpoſe it moſt fitly ſerued; ſome pieces whereof are ſix or eight foot long, conſiſting as it were of many hairie leaues ſet vpon a tough ſtring, very cloſe couched and compact together, from which is alſo ſent forth certain other branches like the firſt: in ſundry places there be ſent down fine little ſtrings, which ſerue in ſtead of roots, wherewith it is faſtened to the vpper part of the earth, and taketh hold likewiſe vpon ſuch things as grow next vnto it. There ſpring alſo from the branches bare & naked ſtalkes, on which grow certaine eares as it were like the catkins or blowings of the Haſell tree, in ſhape like a little club or the reed Mace, ſauing that it is much leſſer, and of a yellowiſh white colour, very wel reſembling the claw of a Wolfe, whereof it tooke his name; which knobby catkins are altogether barren, and bring forth neither ſeed nor floure.

13 *Muſcus ex cranio humano.*
Moſſe growing vpon the ſkull of a man.



‡ 14 *Muſcus paruus ſtellaris.*
Small Heath Moſſe.



‡ 12 This, whoſe figure in the former edition was by our Author vnfitly put for Lauander Cotton (hauing more regard to the title of the figure in *Tabernamontanus*, than to ſee whether it were that which he there deſcribed) it is no other than a kind of *Muſcus Clauatus*, or Club-Moſſe. It is thought to be the *Selago* mentioned by *Pliny, lib.25.cap.11. Tragus* and ſome others call it *Sauina ſylueſtris: Turner* and *Tabernamontanus, Chamæcypariſſus*: but *Bauhine* the moſt fitly nameth it *Muſcus clauatus folijs Cypreßi*: and *Turner* not vnfitly in Engliſh, Heath Cypreſſe. This is a low plant, and keepes greene Winter and Summer: the leaues are like thoſe of Cypreſſe, bitter in taſte, but without ſmell: it carries ſuch eares or catkins as the former, and thoſe of a yellowiſh colour: it is found growing in diuers wooddy mountainous places of Germany, where they call it **Wald Seuenbaum**, or wilde Sauine. ‡

13 This kinde of Moſſe is found vpon the skulls or bare ſcalpes of men and women, lying long in charnell houſes or other places, where the bones of men and women are kept together: it growes very thicke, green, and like vnto the ſhort moſſe vpon the trunkes of old Okes: it is thought to be a ſingular remedie againſt the falling Euill and the Chin-cough in children, if it be poudered, and then giuen in ſweet wine for certaine daies together.

‡ 14 Vpon diuers heathy places in the moneth of May is to be found growing a little ſhort Moſſe not much in ſhape different from the firſt deſcribed, but much leſſe, and parted at the top into ſtar-faſhioned heads. *Lobel* calls this, *Muſcus in Ericetis prouenienſ*. ‡

¶ *The*

¶ *The Place.*

Their ſeuerall deſcriptions ſet forth their naturall places of growing.

¶ *The Time.*

They flouriſh eſpecially in the Summer moneths.

¶ *The Names.*

Goldilocks is called in high Dutch, **Widertodt, golden Wedertodt, Jung Vrauwen har**: in low Dutch, **Gulden Wederdoot**: *Fuchſius* nameth it *Polytrichon Apuleij*, or *Apuleius* his Maiden-haire; neuertheleſſe *Apuleius* Maiden-haire is nothing elſe but *Dioſcorides* his *Trichomanes*, called Engliſh Maiden-haire; and for that cauſe we had rather it ſhould be termed *Muſcus Capillaris*, or hairy Moſſe. This is called in Engliſh, Goldilockes: it might alſo be termed Golden Moſſe, or Hairy Moſſe.

Wolfes claw is called of diuers Herbariſts in our age, *Muſcus terreſtris*: in high Dutch, **Beerclay, Surtelkraut, Seilkraut**: in low Dutch, **Wolfs Clauwen**; whereupon we firſt named it *Lycopodium*, and *Pes Lupi*: in Engliſh, Wolfes foot, or Wolfes claw, and likewiſe Club moſſe. Moſt ſhops of Germany in former times did falſly terme it *Spica celtica*: but they did worſe, and were very much too blame, that vſed it in compound medicines in ſtead of *Spica Celtica*, or French Spikenard: as touching the reſt, they are ſufficiently ſpoken of in their deſcriptions.

¶ *The Temperature.*

The Moſſes of the earth are dry and aſtringent, of a binding quality, without any heate or cold.

Goldilockes and the Wolfes clawes are temperate in heate and cold.

¶ *The Vertues.*

A The Arabian Phyſitians doe put moſſe among their cordiall medicines, as fortifying the ſtomacke, to ſtay vomit, and to ſtop the laske.

B Moſſe boiled in Wine and drunke ſtoppeth the ſpitting of bloud, piſſing of bloud, the termes, and bloudy flix.

C Moſſe made into pouder is good to ſtanch the bleeding of greene and freſh wounds, and is a great helpe vnto the cure of the ſame.

D Wolfes claw prouoketh vrine, and as *Hieronymus Tragus* reporteth, waſteth the ſtone, and driueth it forth.

E Being ſtamped and boiled in wine and applied, it mitigateth the paine of the gout.

F Floting wine, which is now become ſlimie, is reſtored to his former goodneſſe, if it be hanged in the veſſell, as the ſame Author teſtifieth.

† The figure formerly in the firſt place was of the *Muſcus Montanus* of Tabern. being a ſmall kinde of *Muſcus denticulatus*. The fifth and ſixth were both of one; and ſo of the two deſcriptions I haue made one more accurate, and reſerued the better figure.

CHAP. 163. *Of Liuerwort.*

¶ *The Deſcription.*

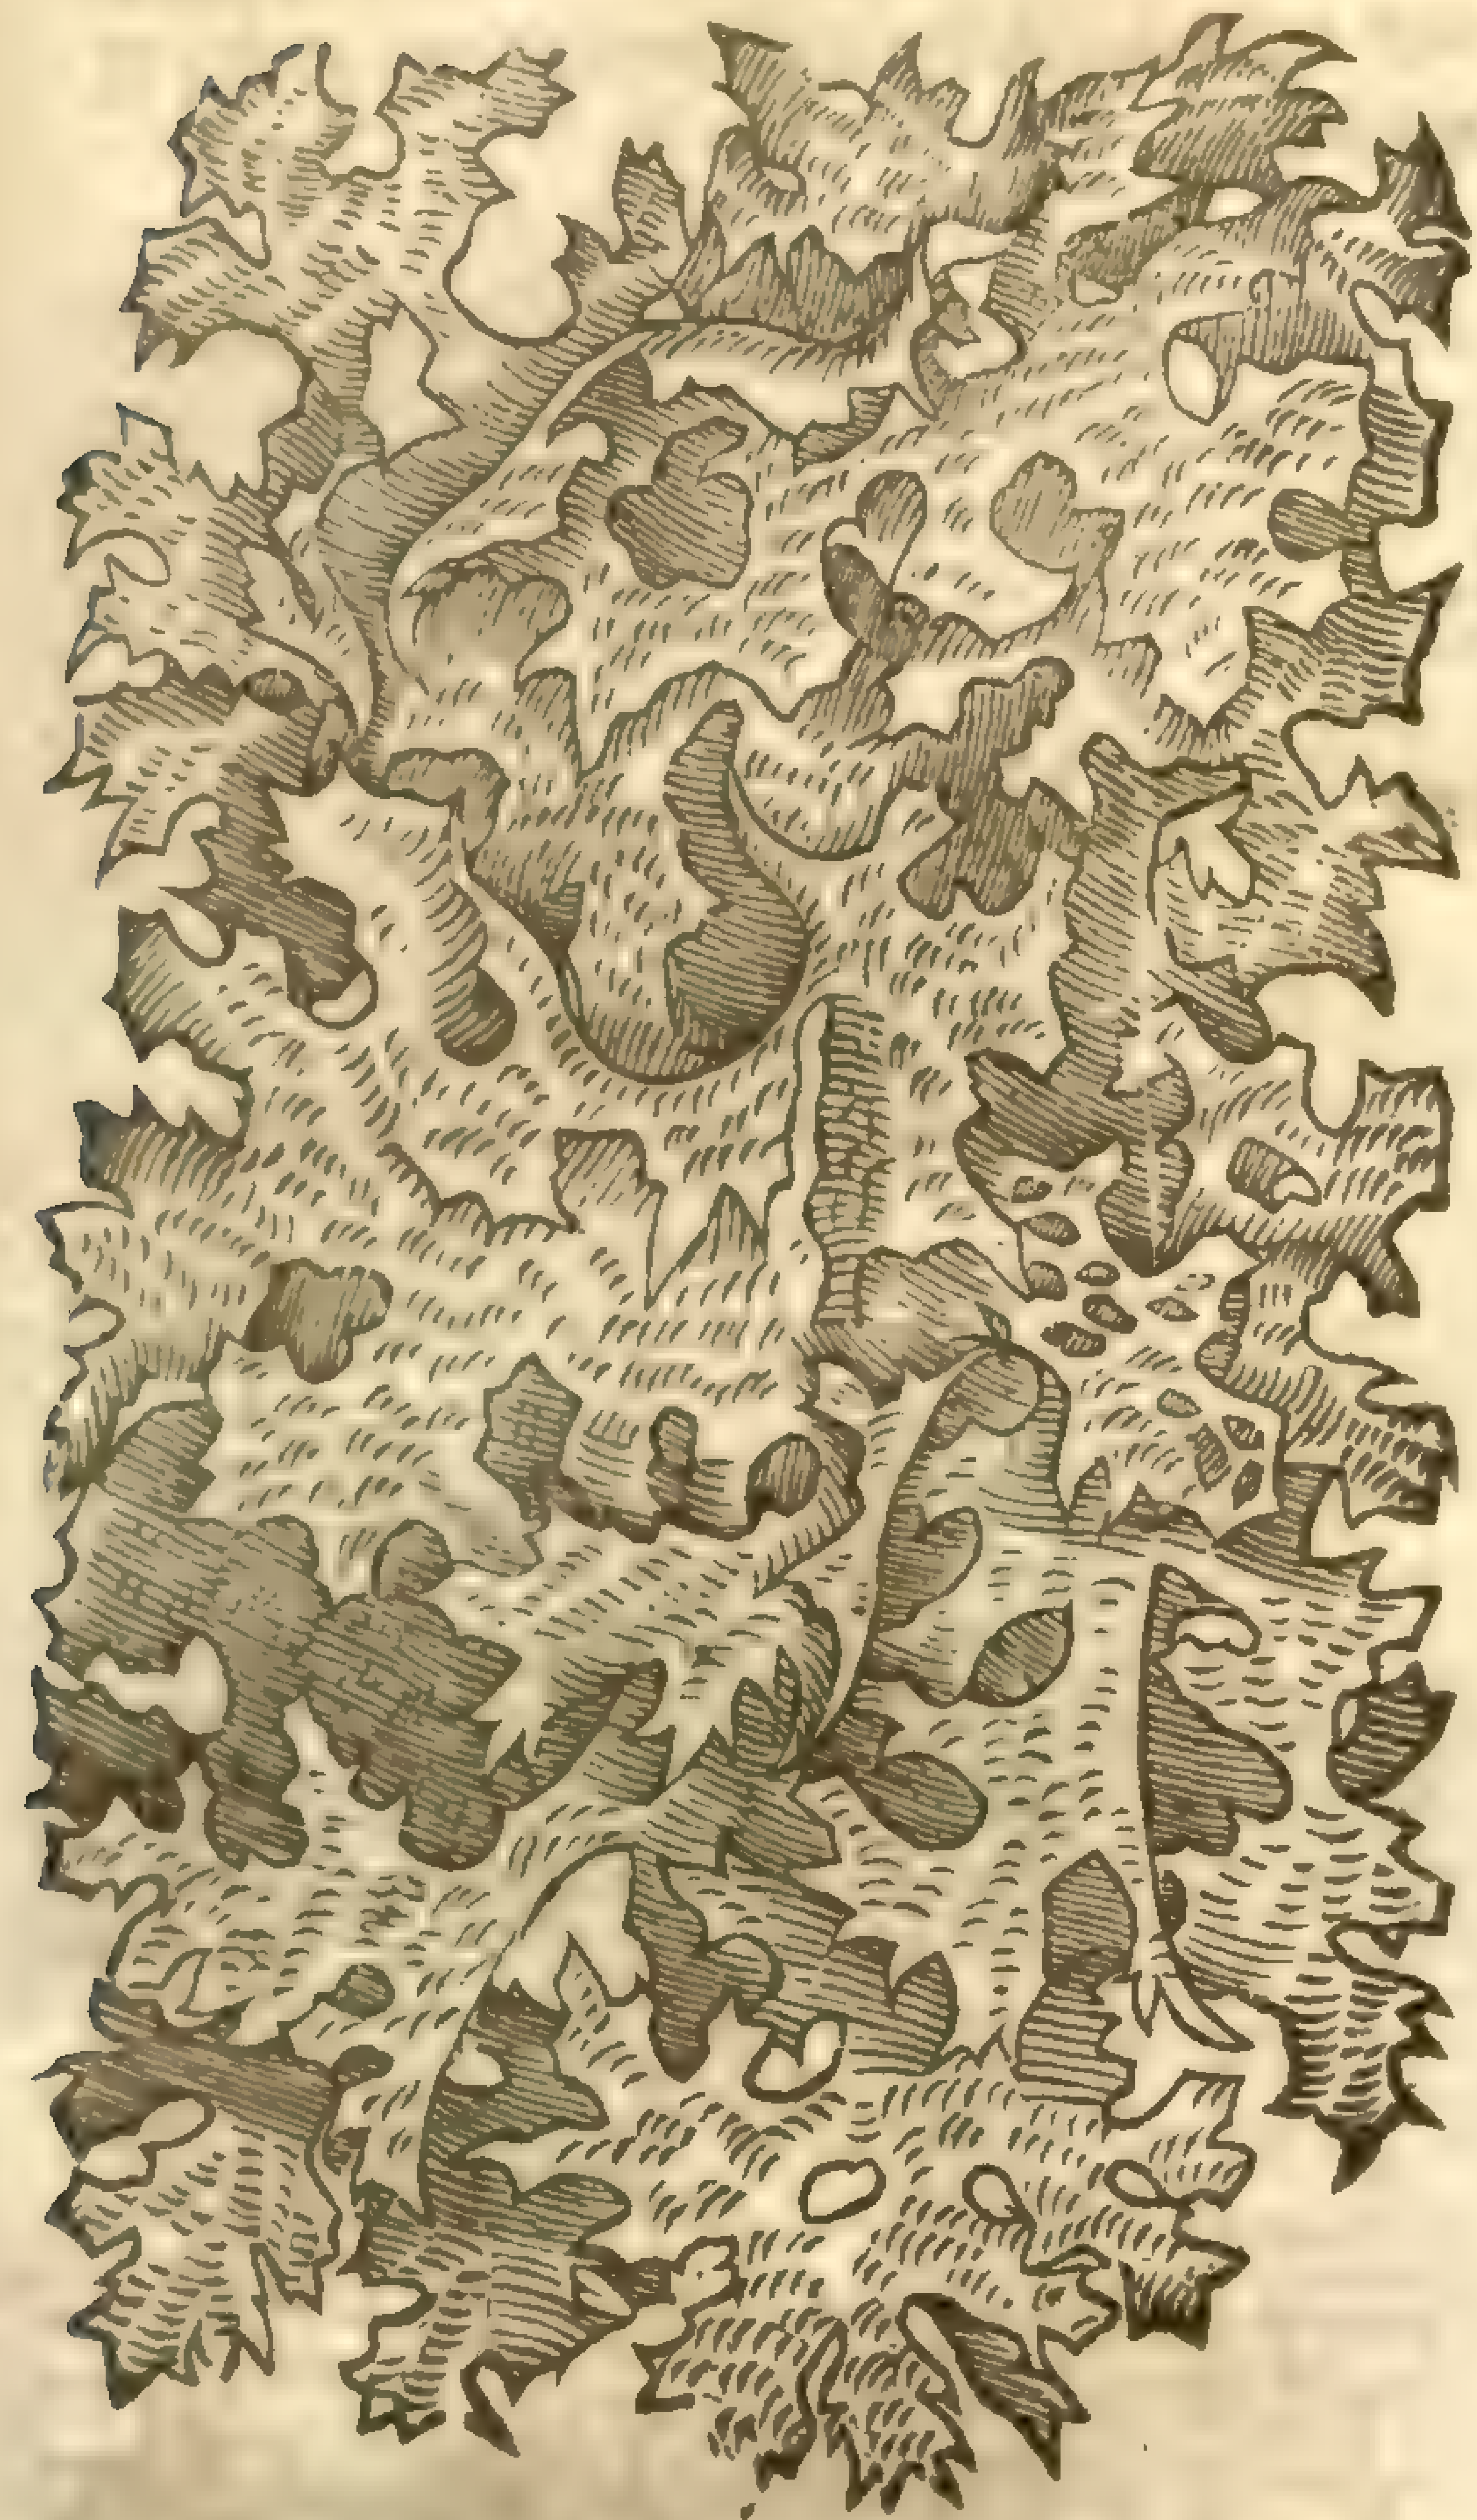
1 Liuerwort is alſo a kinde of Moſſe which ſpreadeth it ſelfe abroad vpon the ground, hauing many vneuen or crumpled leaues lying one ouer another, as the ſcales of Fiſhes do, greene aboue, and browne vnderneath: amongſt theſe grow vp ſmall ſhort ſtalkes, ſpred at the top like a blaſing ſtarre, and certaine fine little threds are ſent downe, by which it cleaueth and ſticketh faſt vpon ſtones, and vpon the ground, by which it liueth and flouriſheth.

2 The ſecond kinde of Liuerwort differeth not but in ſtature, being altogether leſſe, and more ſmooth or euen: the floures on the tops of the ſlender ſtems are not ſo much laid open like a ſtar; but the eſpeciall difference conſiſteth in one chiefe point, that is to ſay, this kinde being planted in a pot, and ſet in a garden aboue the ground, notwithſtanding it ſpitteth or caſteth round about the place great ſtore of the ſame fruit, where neuer any did grow before.

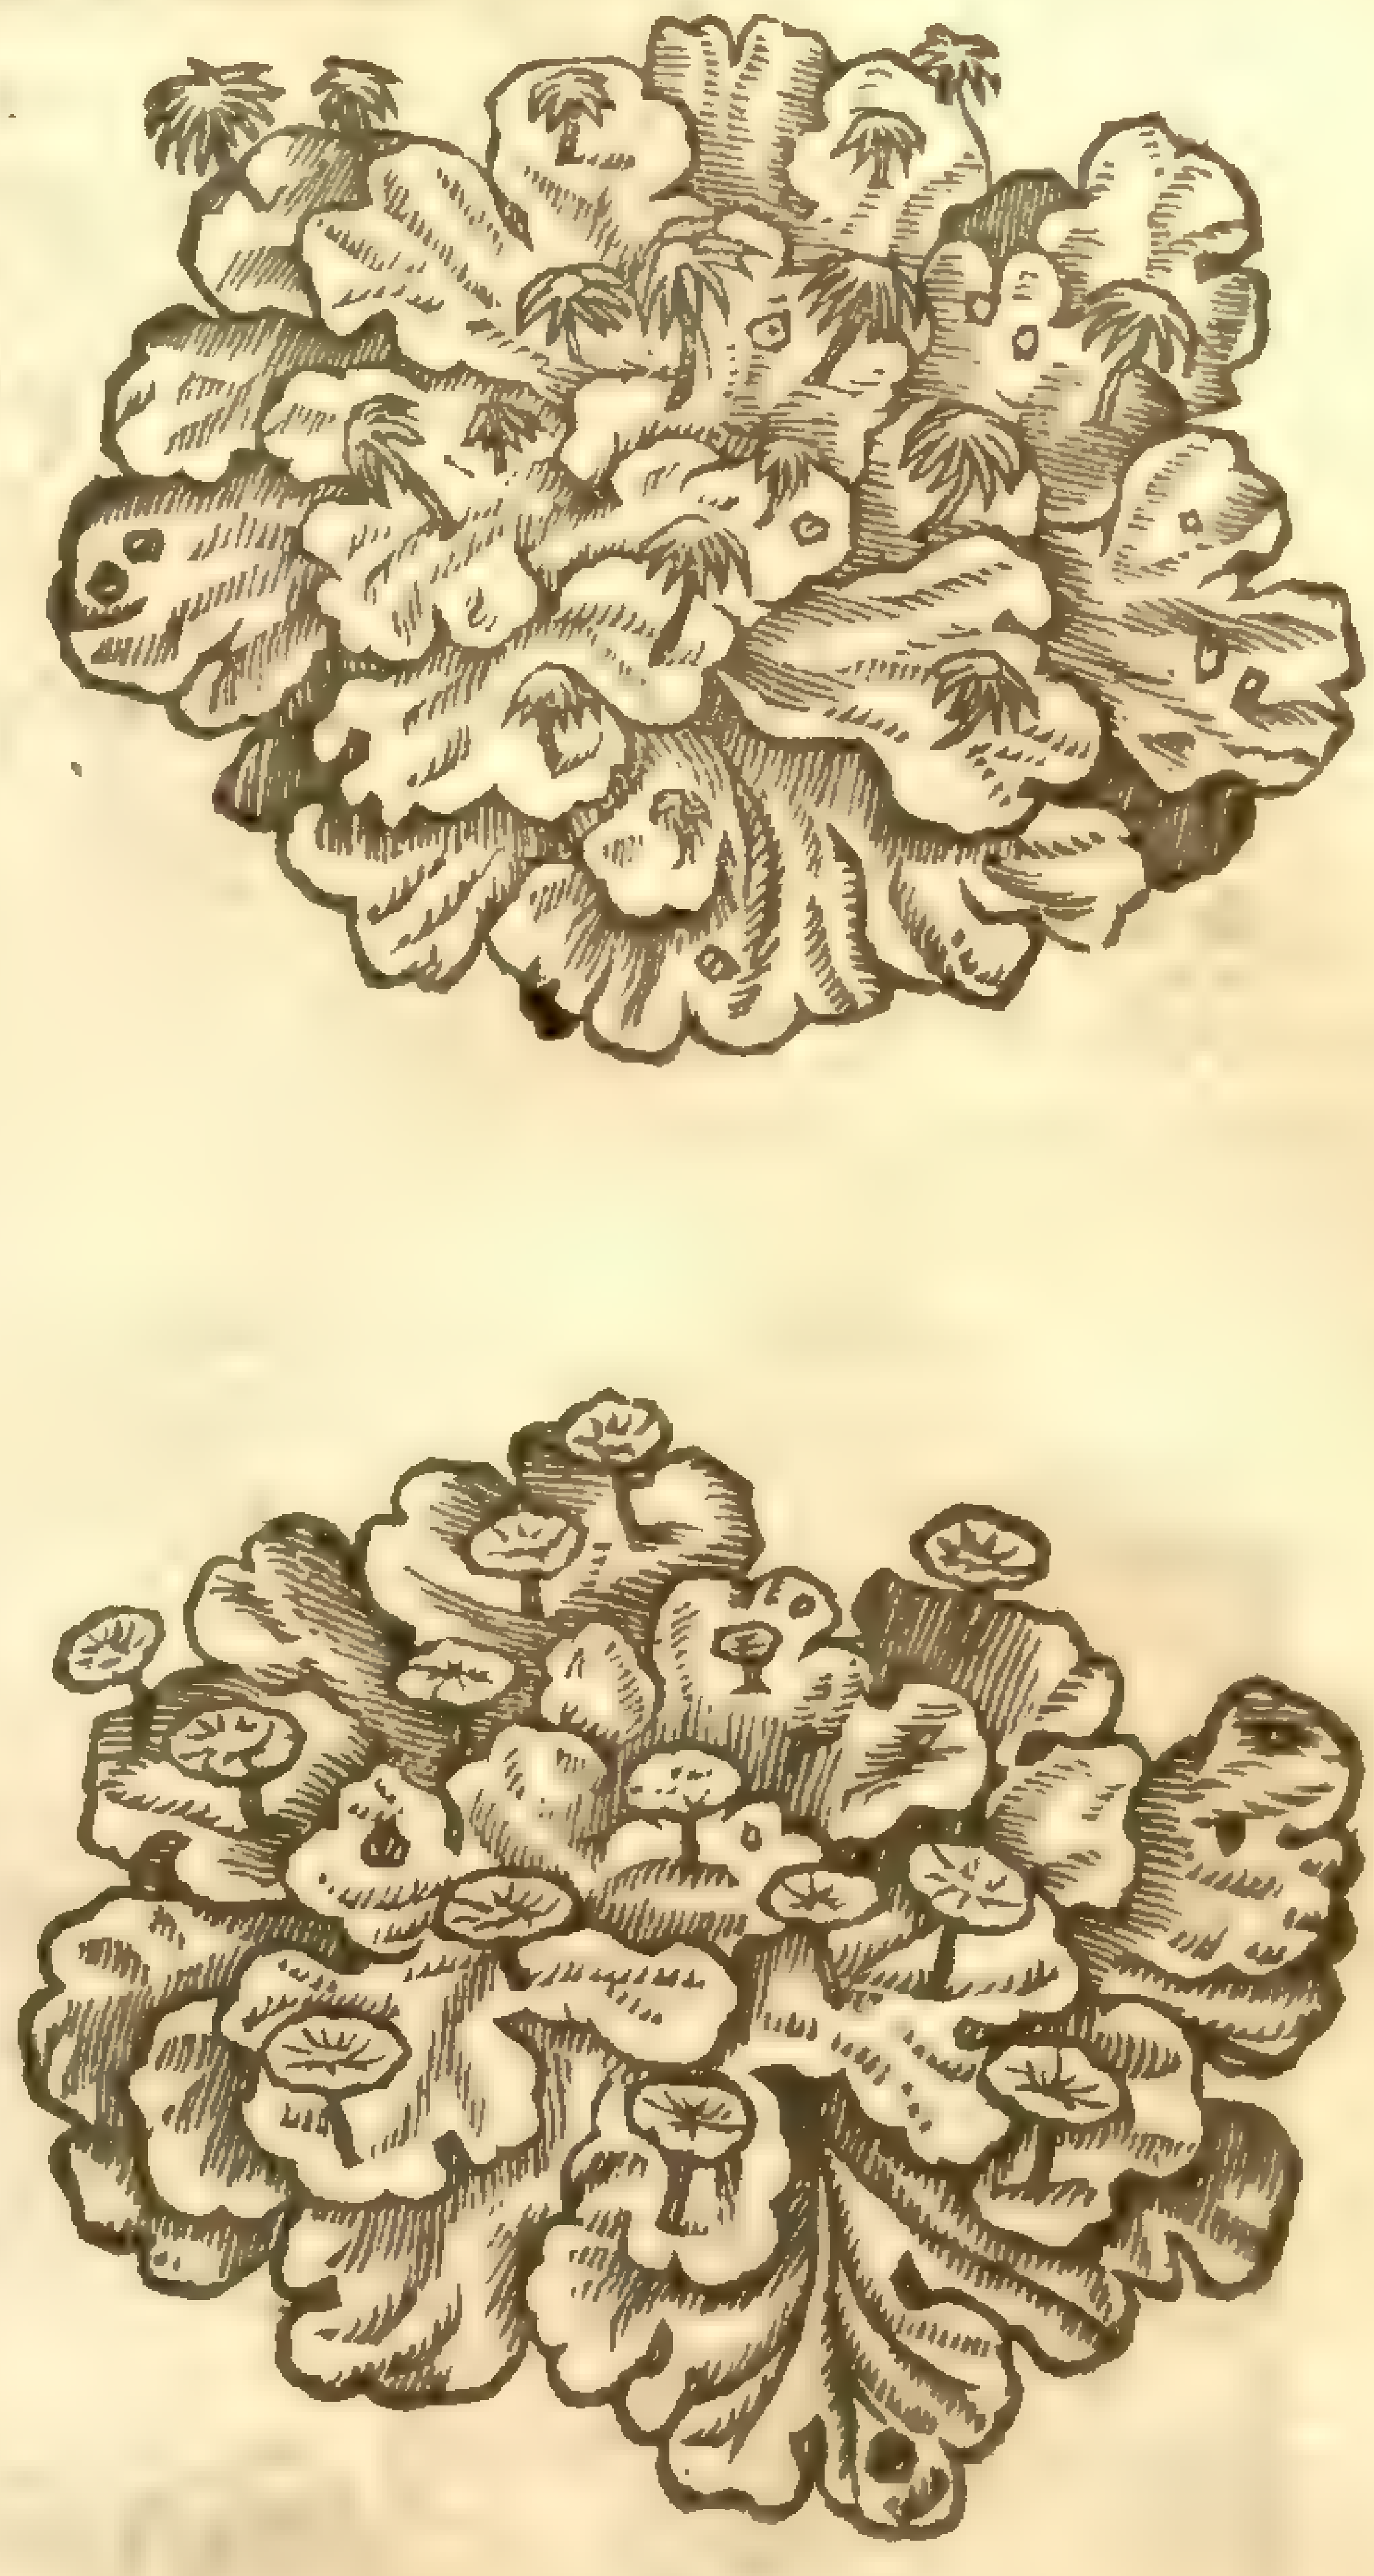
‡ Of this ſort which is ſmall, and oftentimes found growing in moiſt gardens among Beares-eares, and ſuch plants, when they are kept in pots, there are two varieties, one hauing little ſtalkes ſome inch long, with a ſtarre-faſhioned head at the top: the other hath the like tender ſtalke, and a round head at the top thereof. ‡

3 This is found vpon rockes and ſtony places, as well neere vnto the ſea, as further into the land: it groweth flat vpon the ſtones, and creepeth not far abroad as the ground Liuerwort doth, it only reſteth it ſelfe in ſpots and tufts ſet here and there, of a duſty ruſſet colour aboue, and blackiſh vnderneath: among the crumpled leaues riſe vp diuers ſmall ſtems, whereupon do grow little ſtarlike floures of the colour of the leaues: it is often found at the bottom of high trees growing vpon high

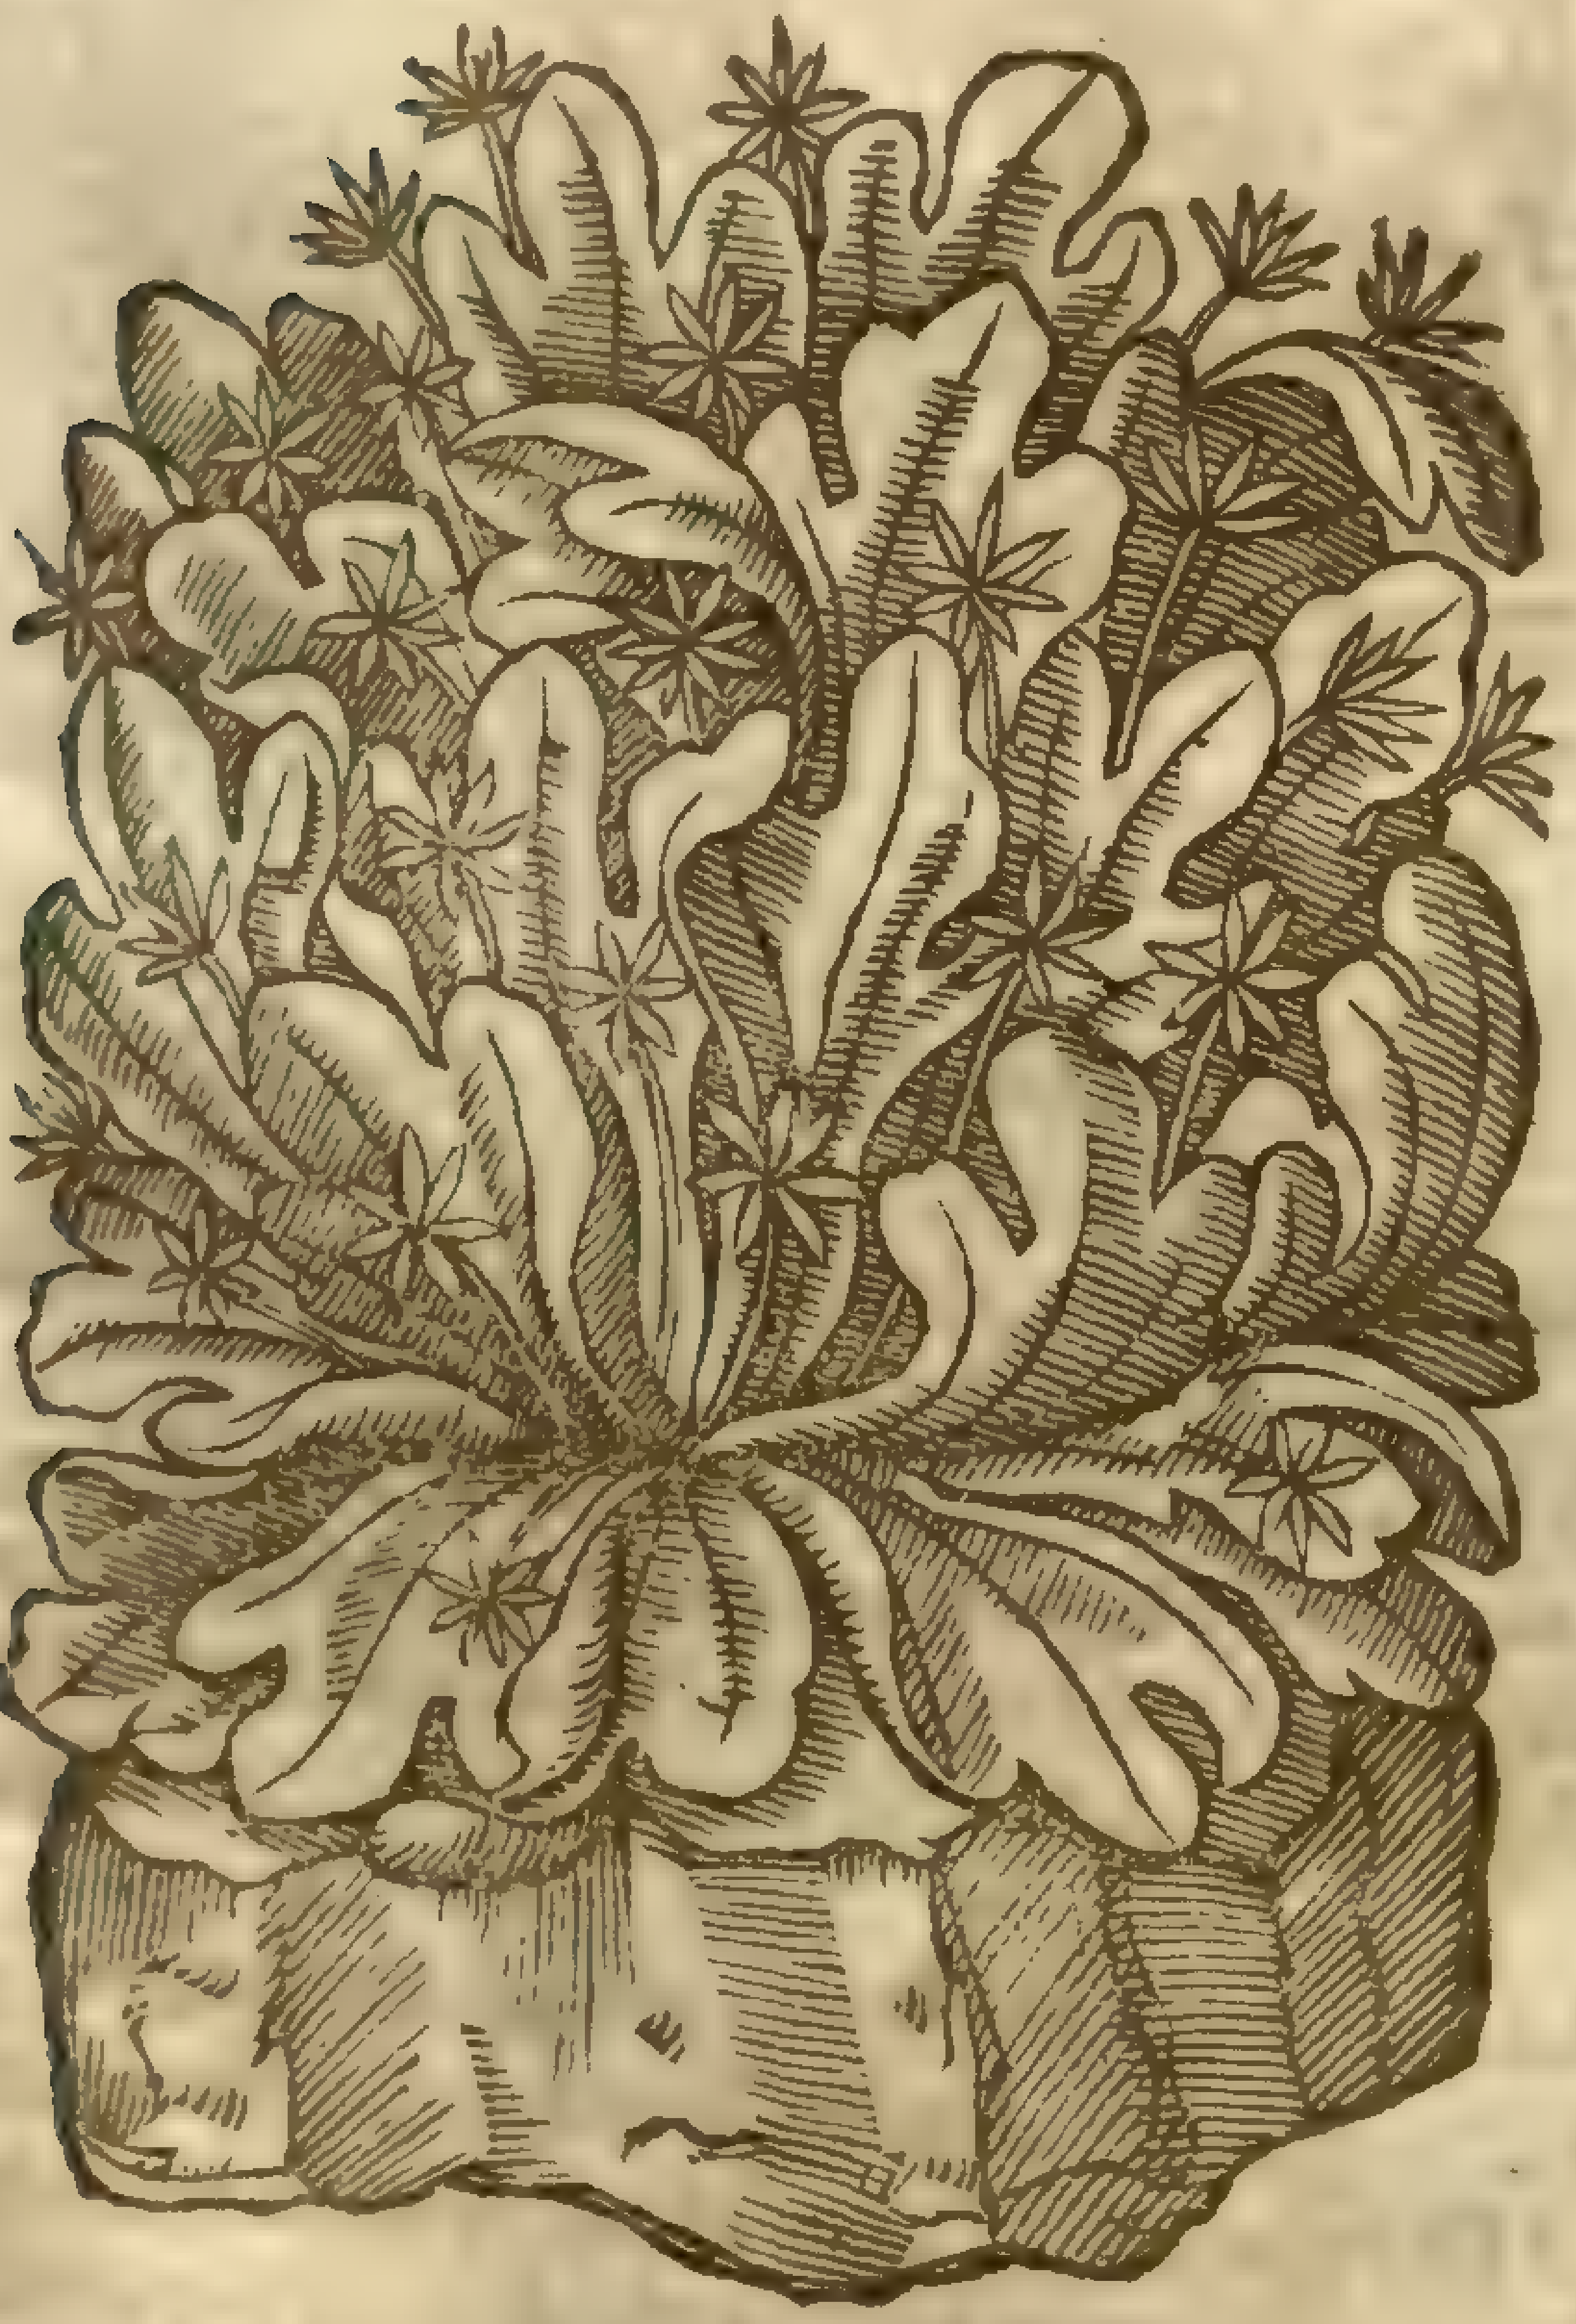
1 *Hepatica terreſtris.*
Ground Liuer-wort.



2 *Hepatica ſtellata & vmbellata.*
Small Liuerwort with ſtarry and round heads.



3 *Hepatica petræa.*
Stone Liver-wort.



high mountains, eſpecially in ſhadowy places.

¶ *The Place.*

This is often found in ſhadowy and moiſt places, on rockes and great ſtones laid by the highway, and in other common paths where the ſun beams do ſeldome come, and where no traueller frequenteth.

¶ *The Time.*

It brings forth his blaſing ſtarres and leaues oftentimes in Iune and Iuly.

¶ *The Names.*

It is called of the Grecians, Λειχὴν: of the Latines, *Lichen*: of ſome, Βρύον, that is to ſay, *Muſcus* or Moſſe, as *Dioſcorides* witneſſeth. It is named in ſhops *Hepatica*, yet there are alſo many other herbs named *Hepatica*, or Liverworts; for difference whereof this may fitly be called *Hepatica petræa* or ſtone Liverwort, hauing taken that name from the Germans, who call this Liver-woort, **Steyn Leberkraut**: and in Low-Dutch, **Steen Leuercruyt**, In Engliſh, Liverwort.

¶ *The Temperature.*

Stone Liverwort is cold and dry, and ſomwhat binding.

¶ *The Vertues.*

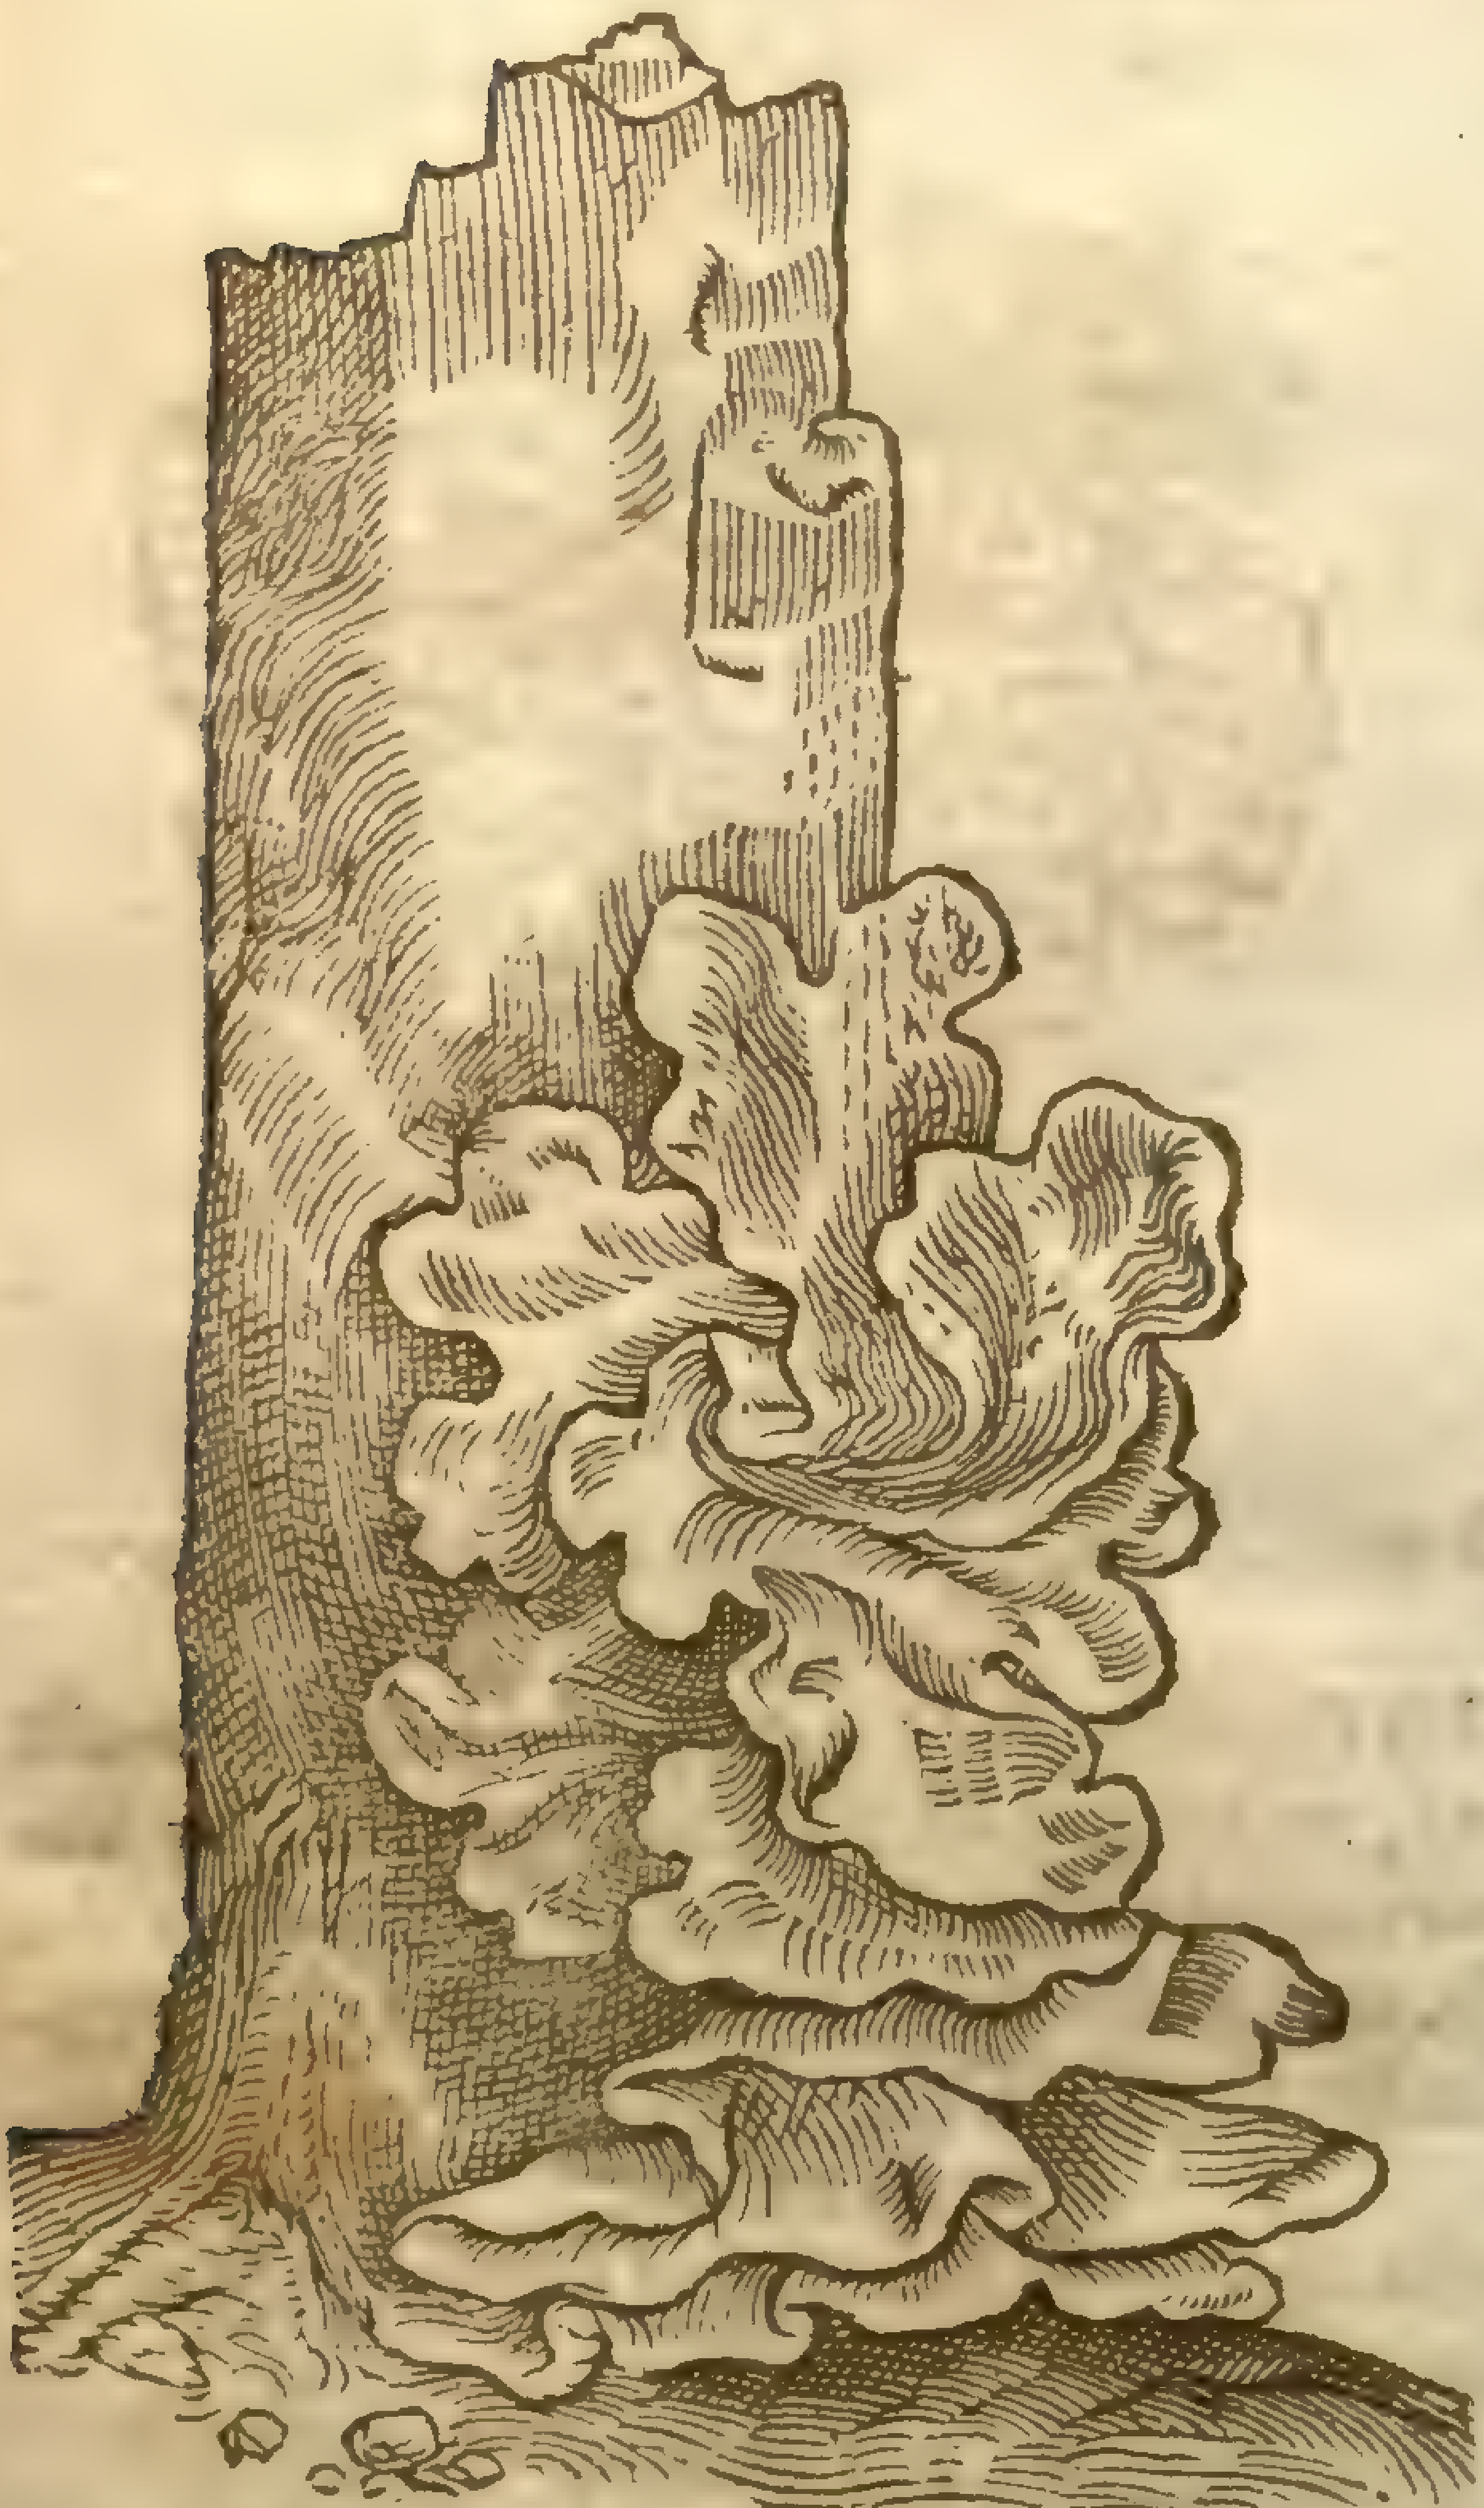
It is ſingular good againſt the inflammations of the liuer, hot and ſharp agues, and tertians that A proceed of choler.

B *Dioſcorides* teacheth, That Liverwort being applied to the place ſtancheth bleeding, takes away all inflammations, and is good for a tettar or ringworme called in Greek λειχὴν: and that it is a remedie for them that haue the yellow jaundice, euen that which commeth by inflammation of the liuer; and that it alſo quencheth the inflammations of the tongue.

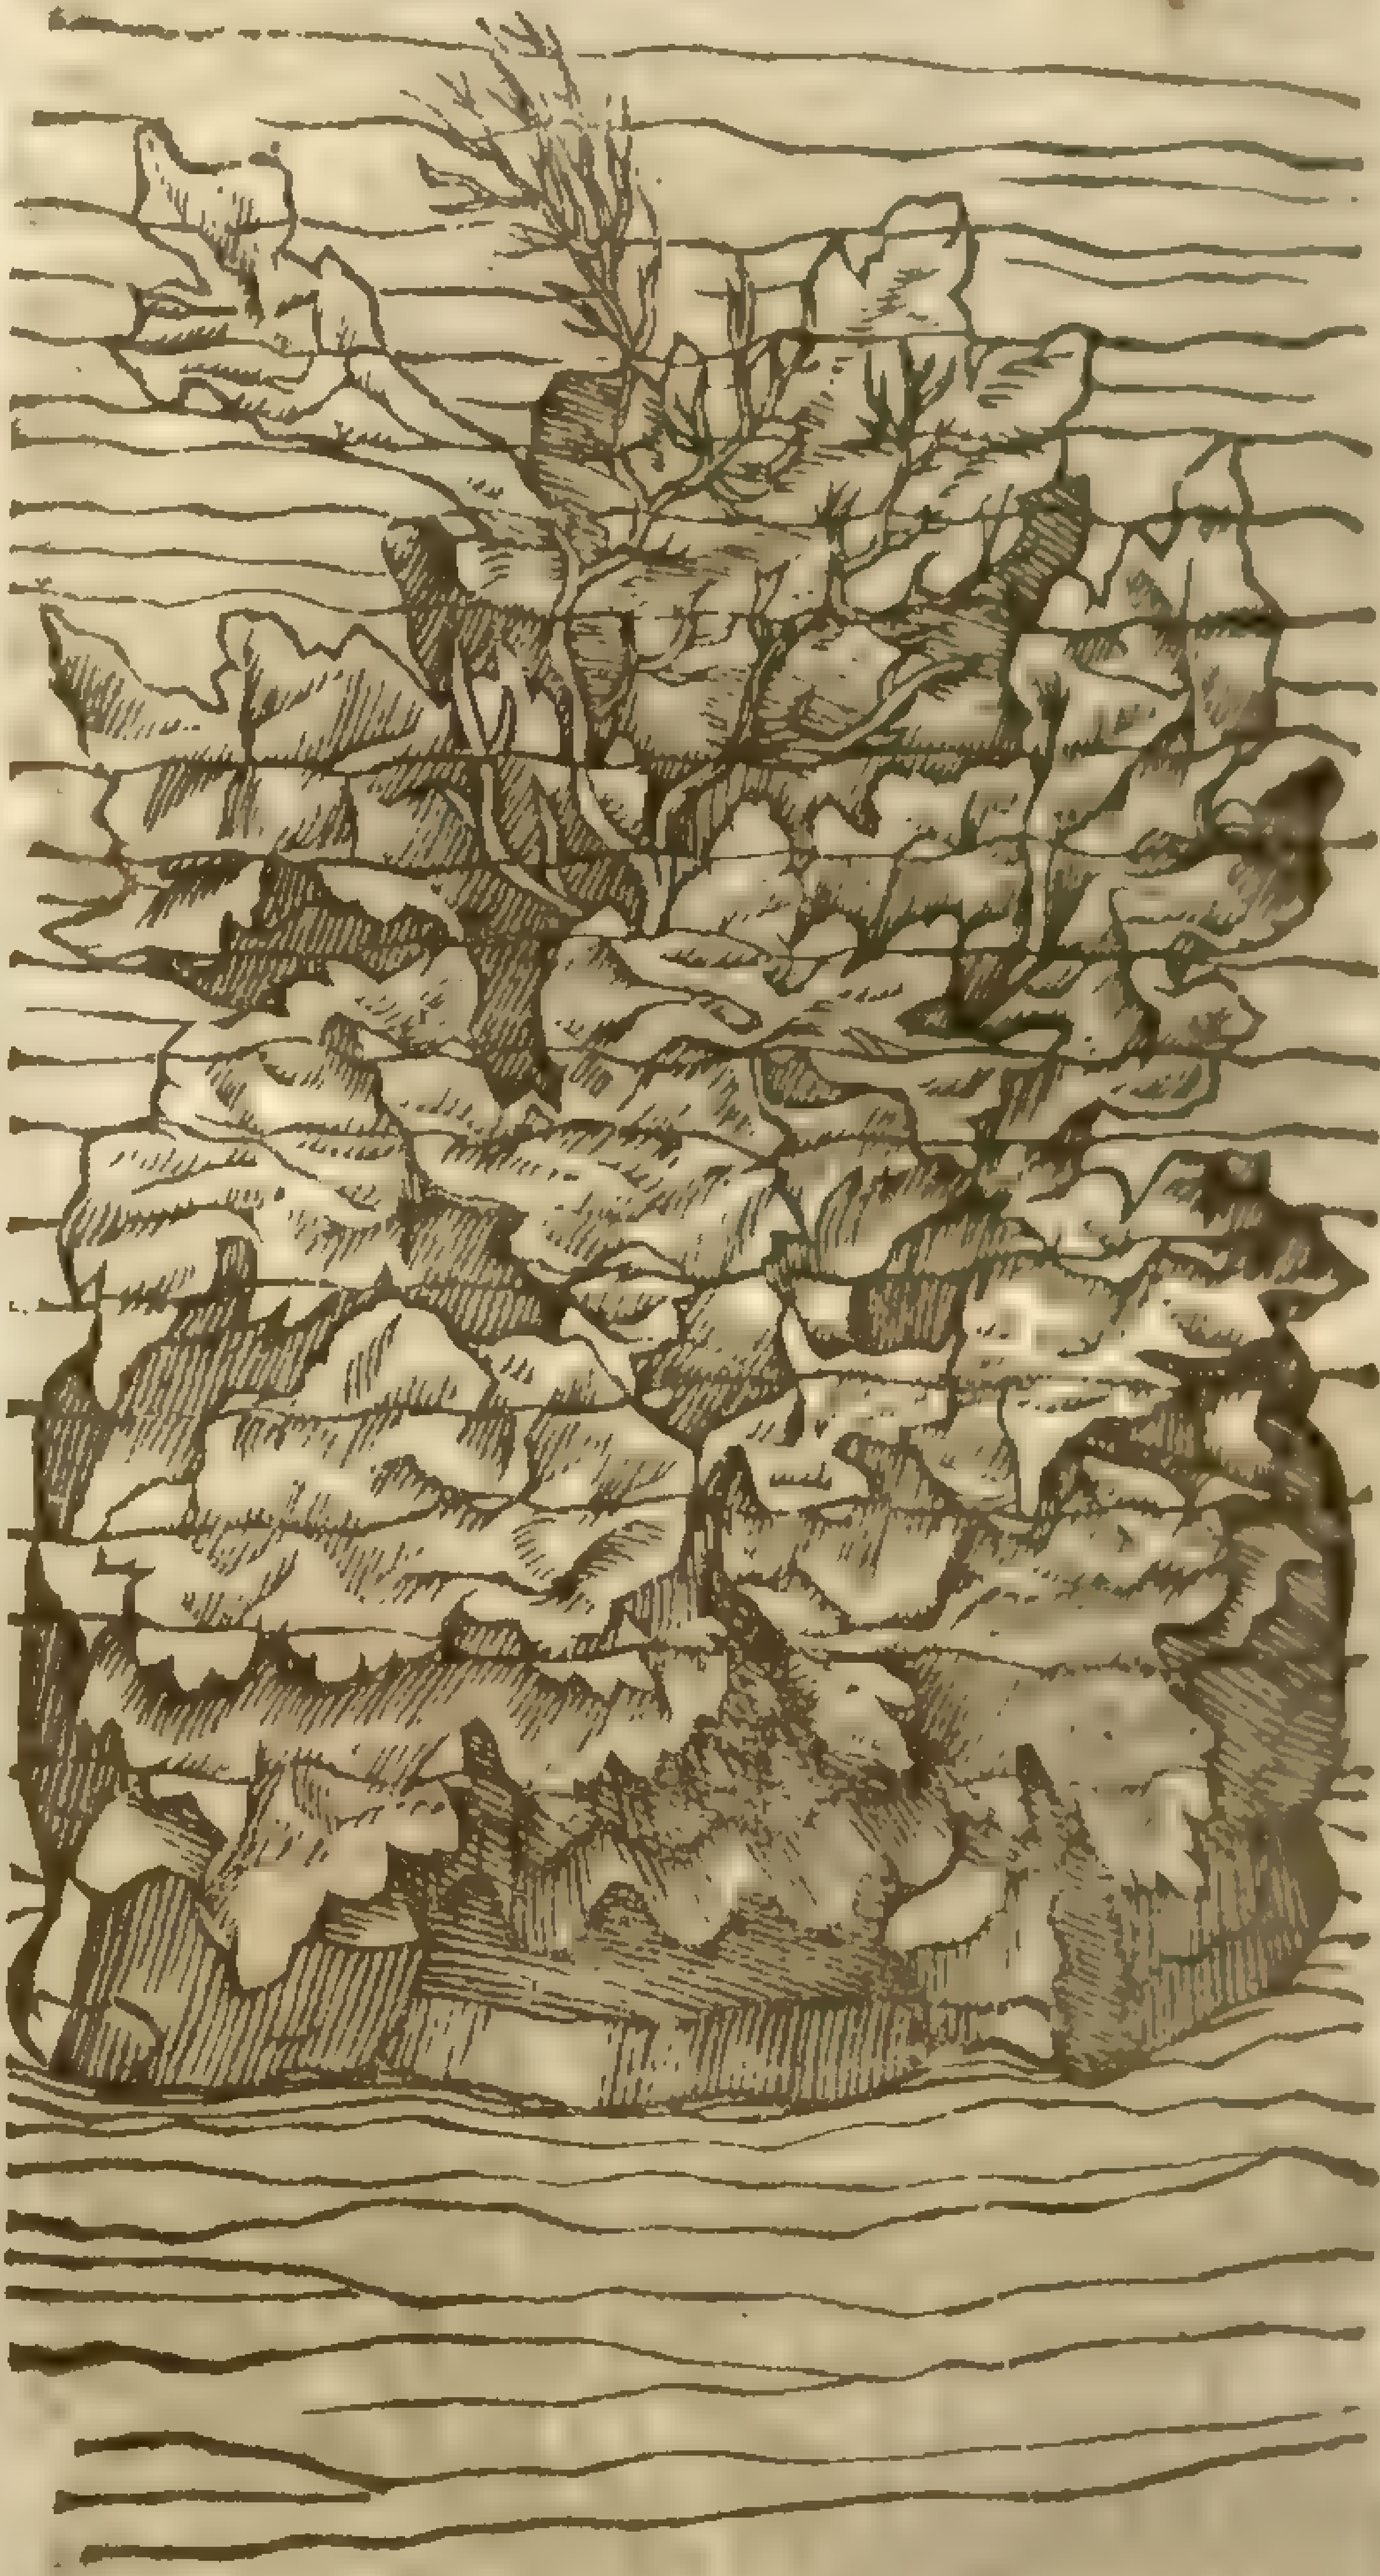
Chap. 164.

Of Lung-wort or wood Liver-wort, and Oiſter-greene.

1 *Lichen arborum.*
Tree Lung-wort.



2 *Lichen marinus.*
Sea Lung-wort, or Oiſter-greene.



¶ *The Deſcription.*

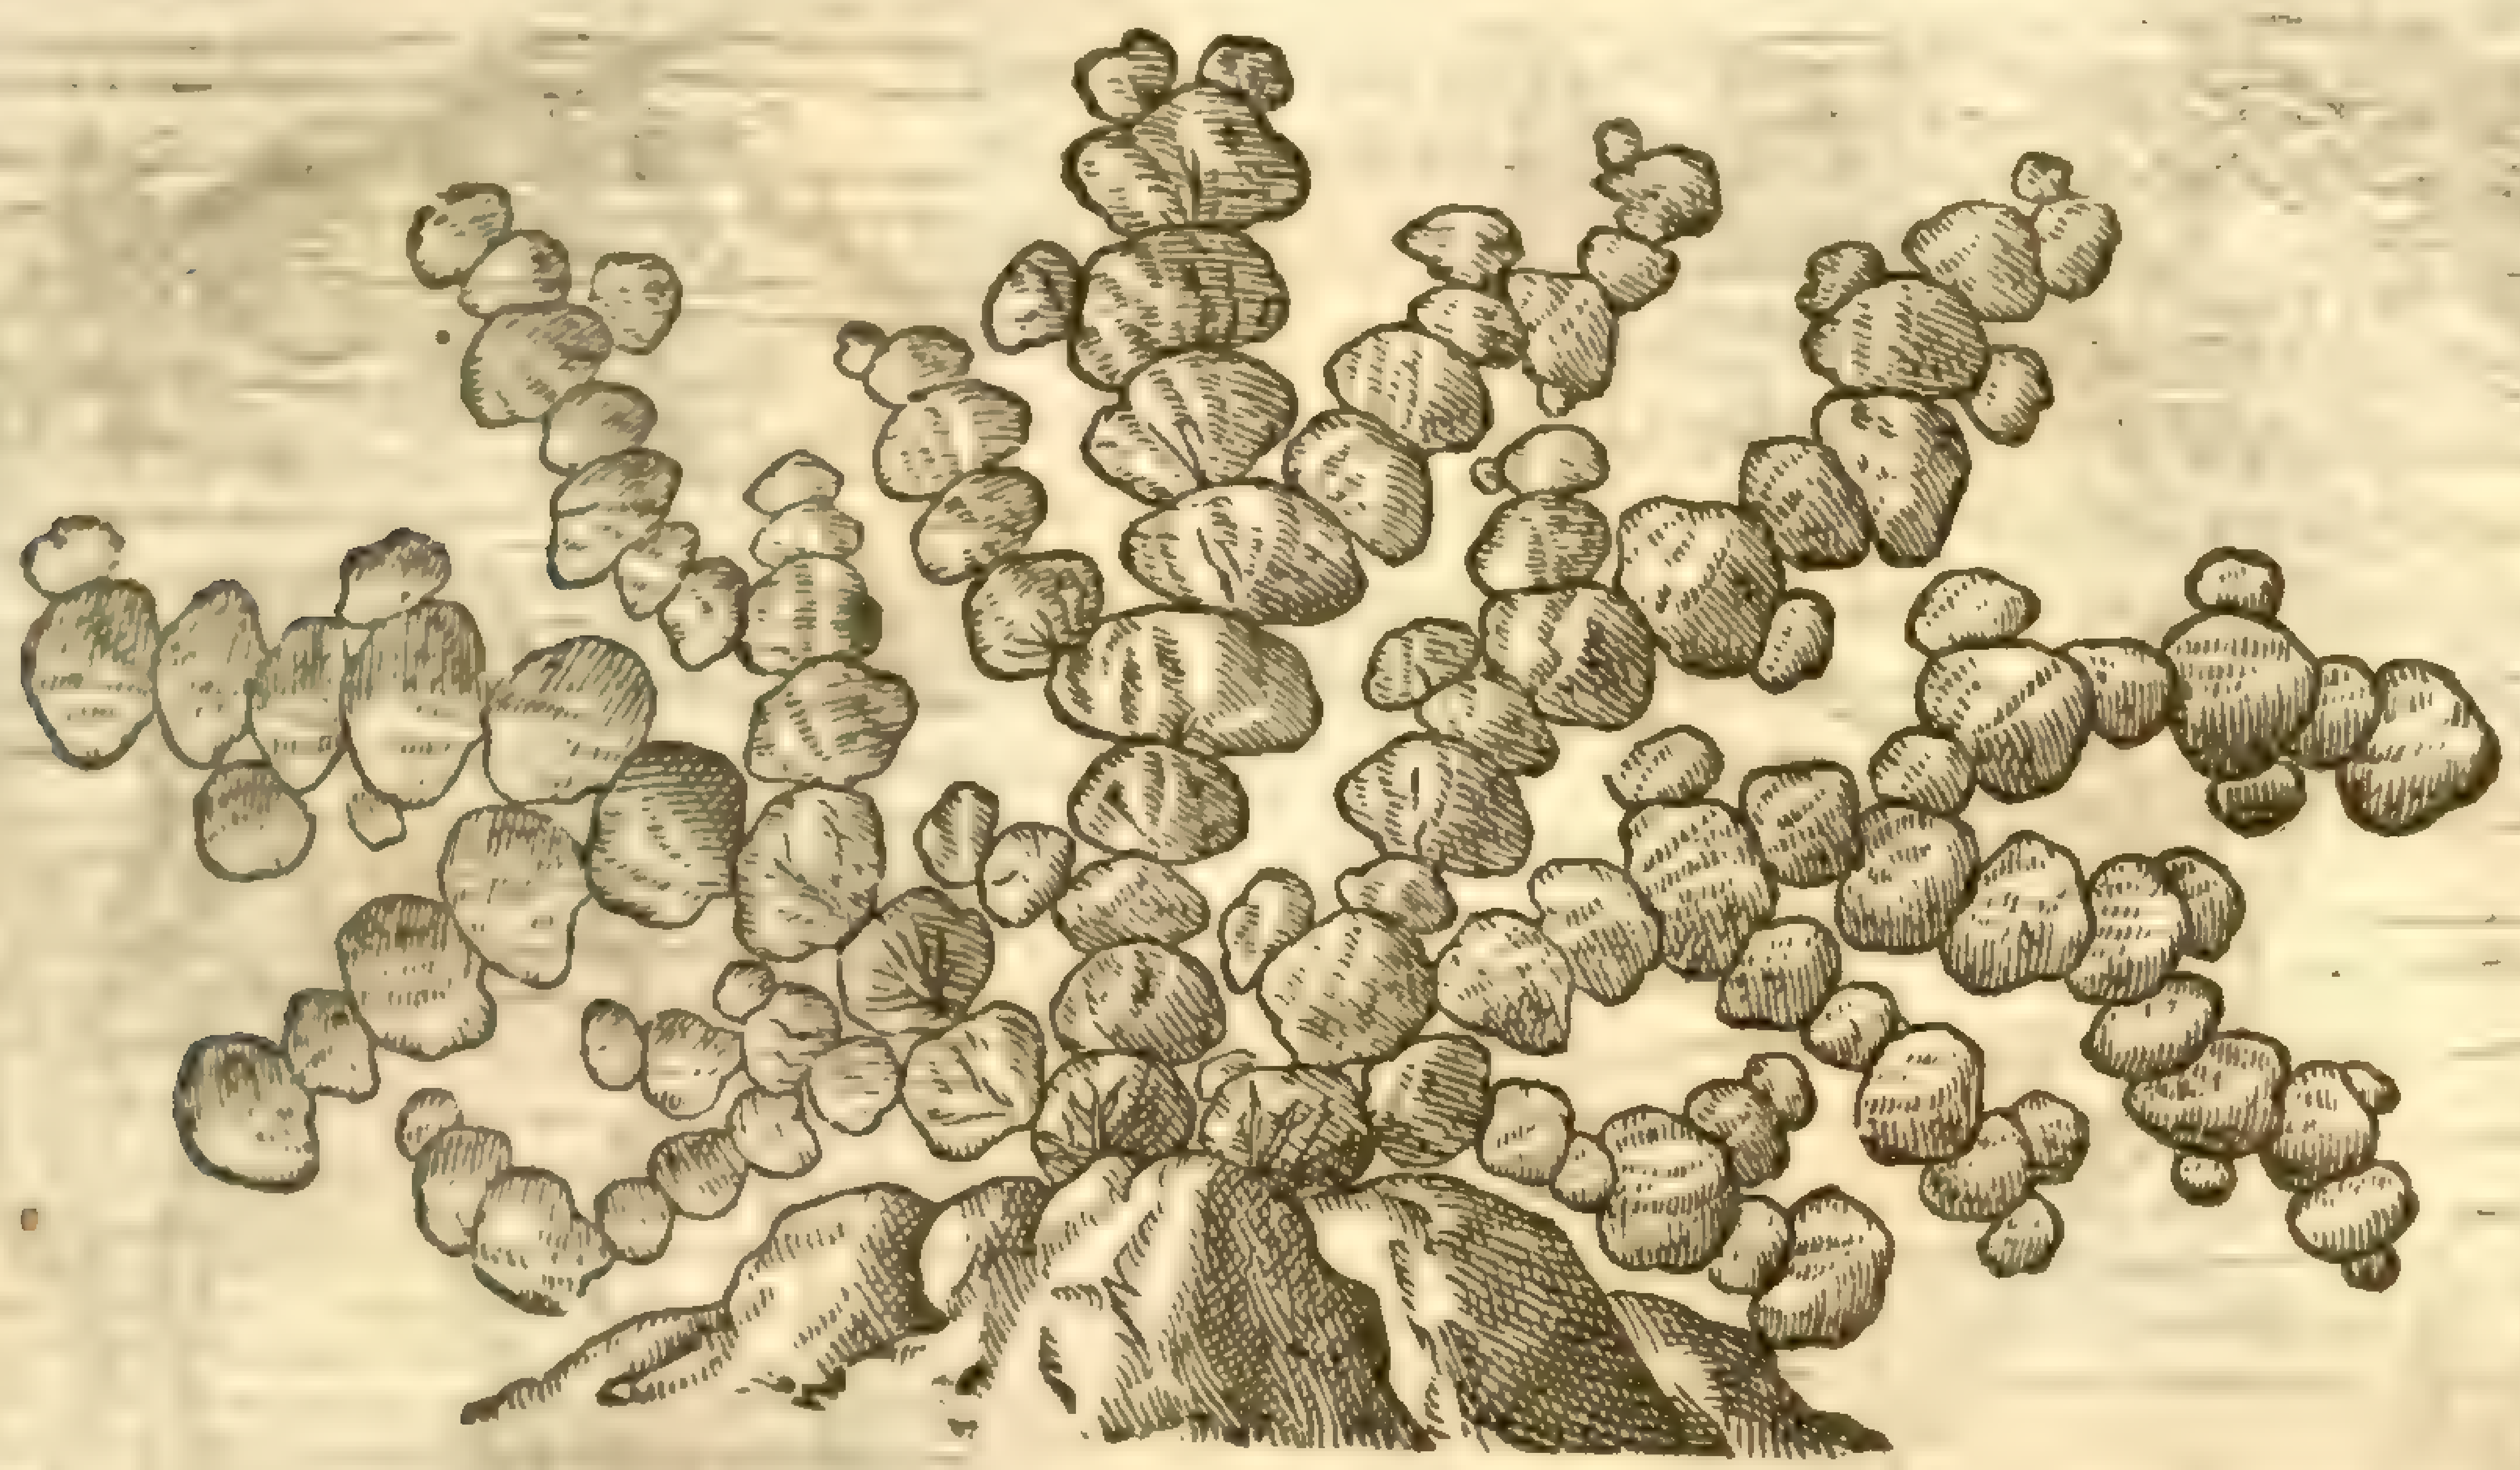
1 TO Liver-wort there is ioyned Lung-wort, which is alſo another kinde of Moſſe, drier, broader, of a larger ſize, and ſet with skales: the leaues hereof are greater, and diuerſly folded one in another, not ſo ſmooth, but more wrinckled, rough and thicke almoſt like a Fel or hide, and tough withall; on the vpper ſide whitiſh, and on the nether ſide blackiſh or duſty: it ſeems after a ſort to reſemble lungs or lights.

2 This kind of ſea Moſſe is an herby matter much like vnto Liver-wort, altogether without ſtalke or ſtem, bearing many green leaues very vneuen or crumpled, and full of wrinkles, ſomewhat broad, not much differing from leaues of criſpe or curled Lettuce. This growes vpon rocks within the bowels of the ſea, but eſpecially amongſt oiſters, and in great plenty among thoſe oiſters called Wal-fleet oiſters. It is very well known euen to the poore oiſter women which carry oiſters to ſell vp and down, who are greatly deſirous of the ſaid moſſe for the decking and beautifying of their oiſters, to make them ſell the better. This moſſe they call Oiſter-green.

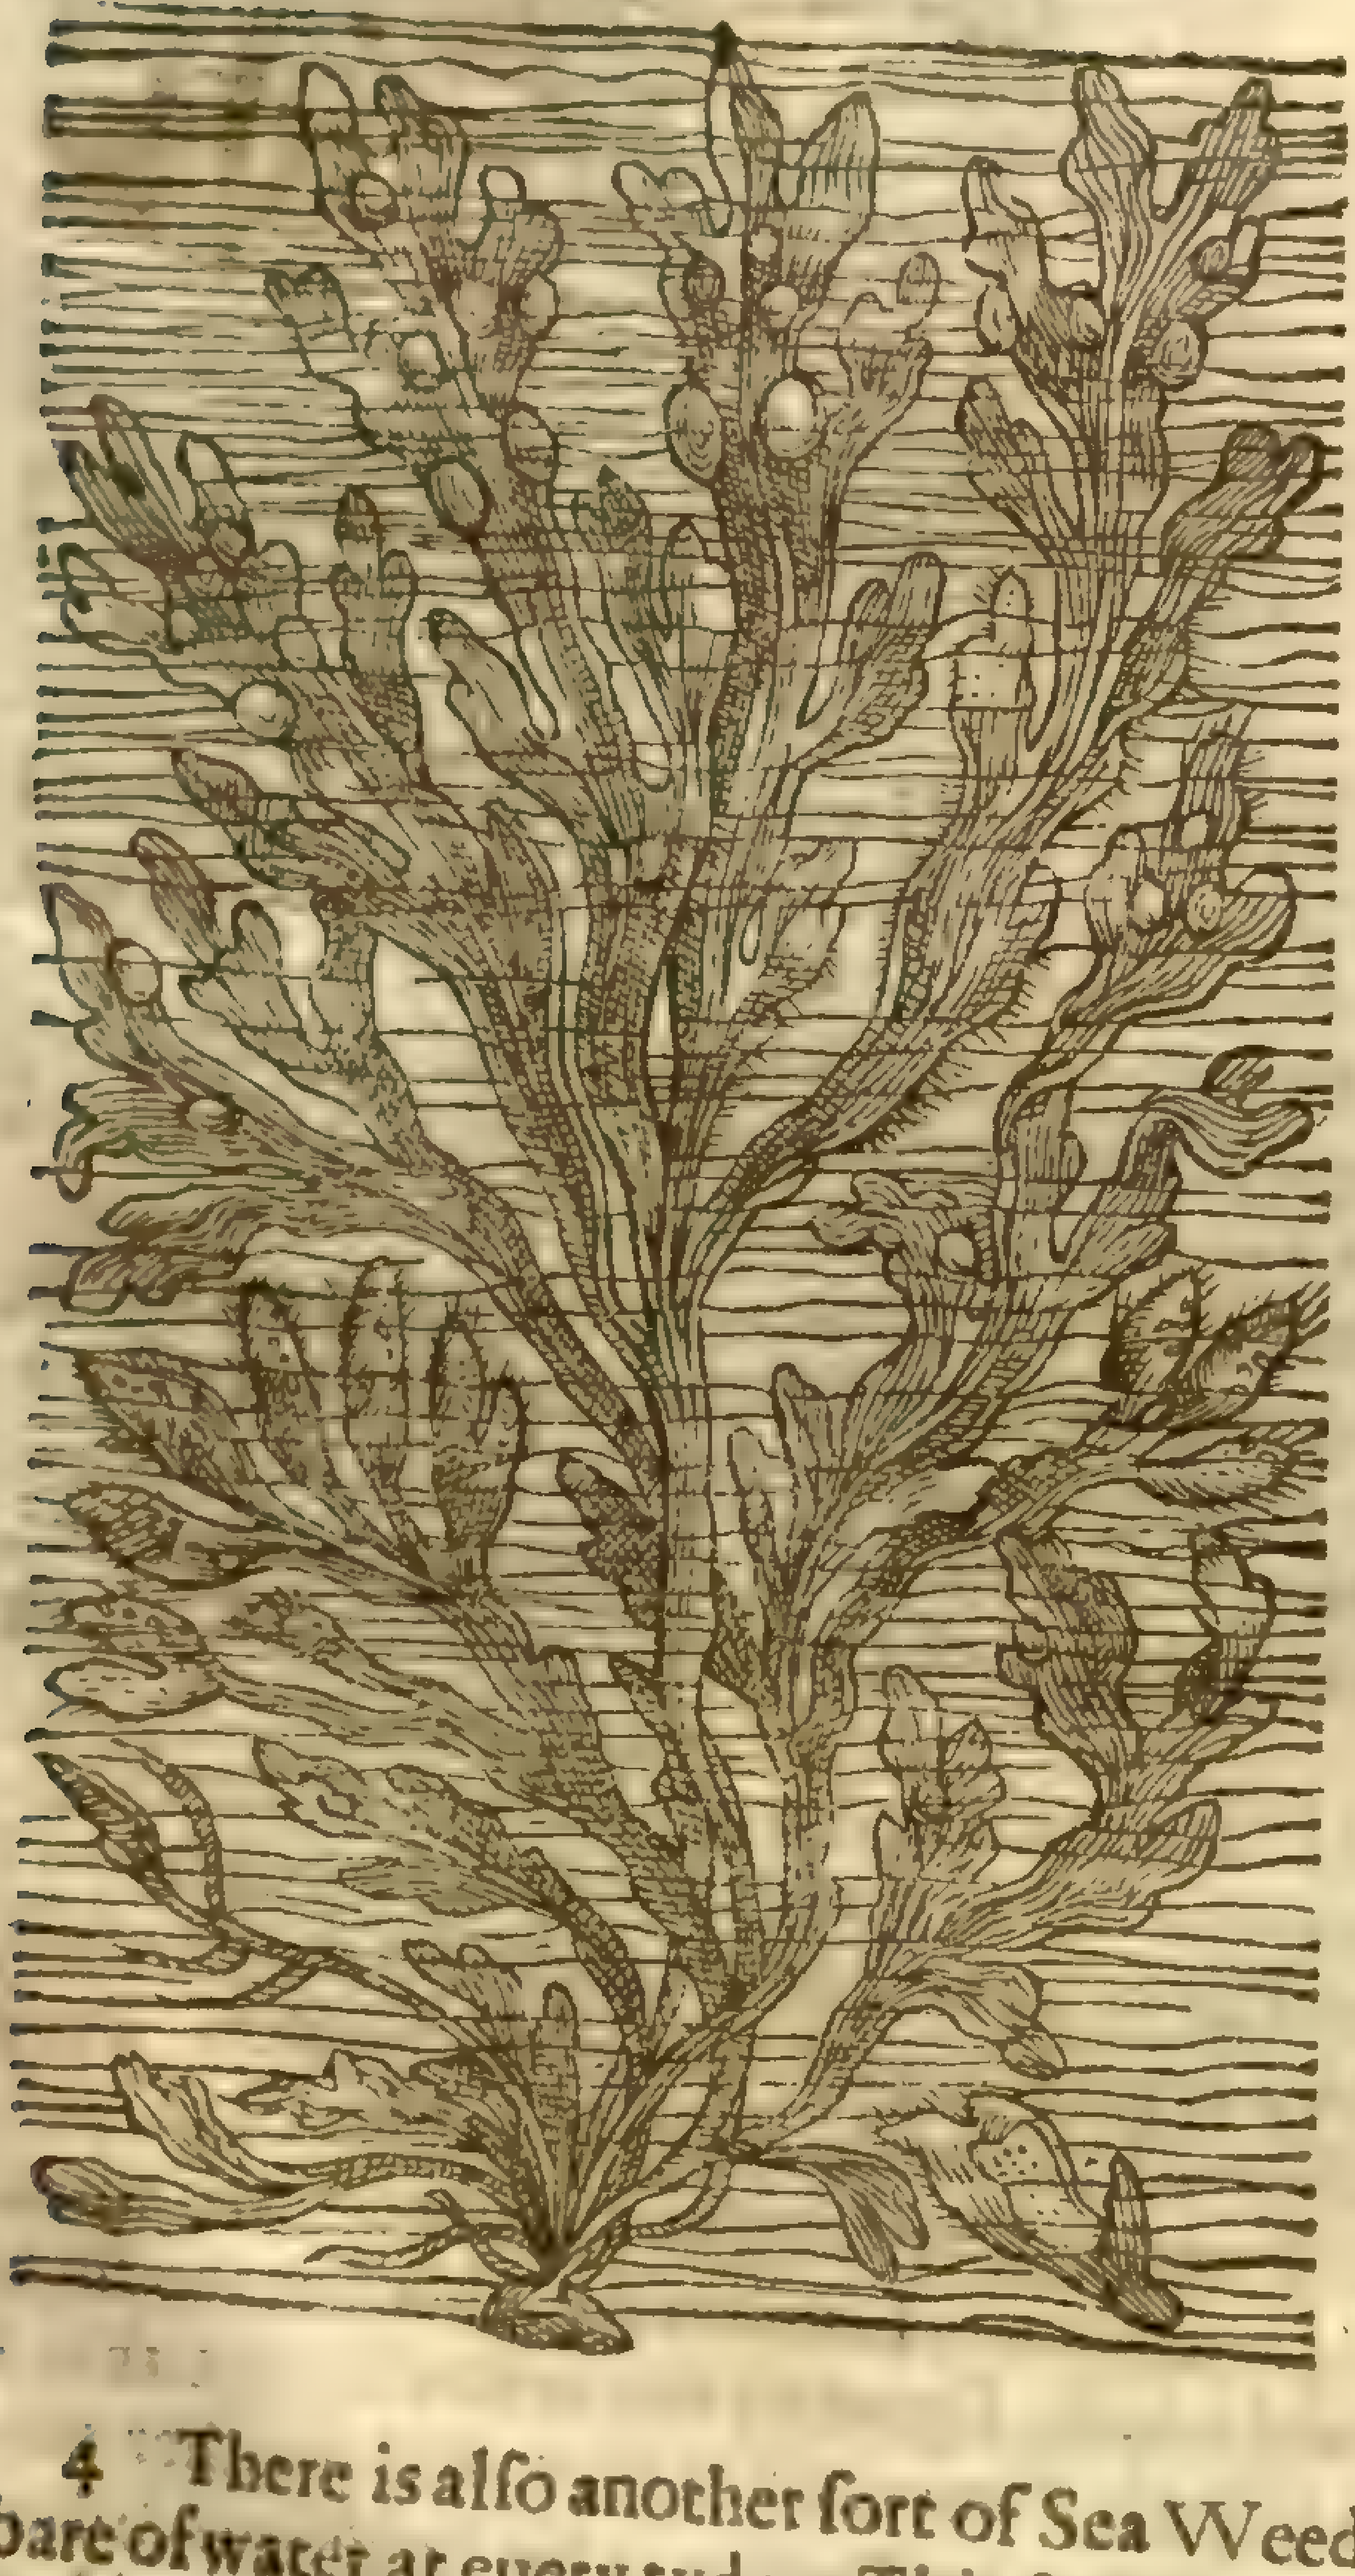
‡ 3 The branches of this elegant plant are ſome handfull or better high, ſpred abroad on euery ſide, and only conſiſting of ſundry ſingle roundiſh leaues, whereto are faſtned ſometimes one,

ſometimes two or more ſuch leaues, ſo that the whole plant conſiſts of branches made vp of ſuch round leaues, faſtned together by diuers little and very ſmall threds: the lower leaues which ſticke faſt to the rockes are of a browniſh colour, the other of a whitiſh or light greene colour, ſmooth and ſhining. This growes vpon rocks in diuers parts of the Mediterranean. *Cluſius* ſets it forth by the name of *Lichen marinus*; and he receiued it from *Imperato* by the name of *Sertuloria*: and *Cortuſus* had it from Corſica by the title of *Corallina latifolia*; and he called it *Opuntia Marina*, hauing reference to that mentioned by *Theophraſt. lib. 1. cap. 12. Hiſt. plant.* ‡

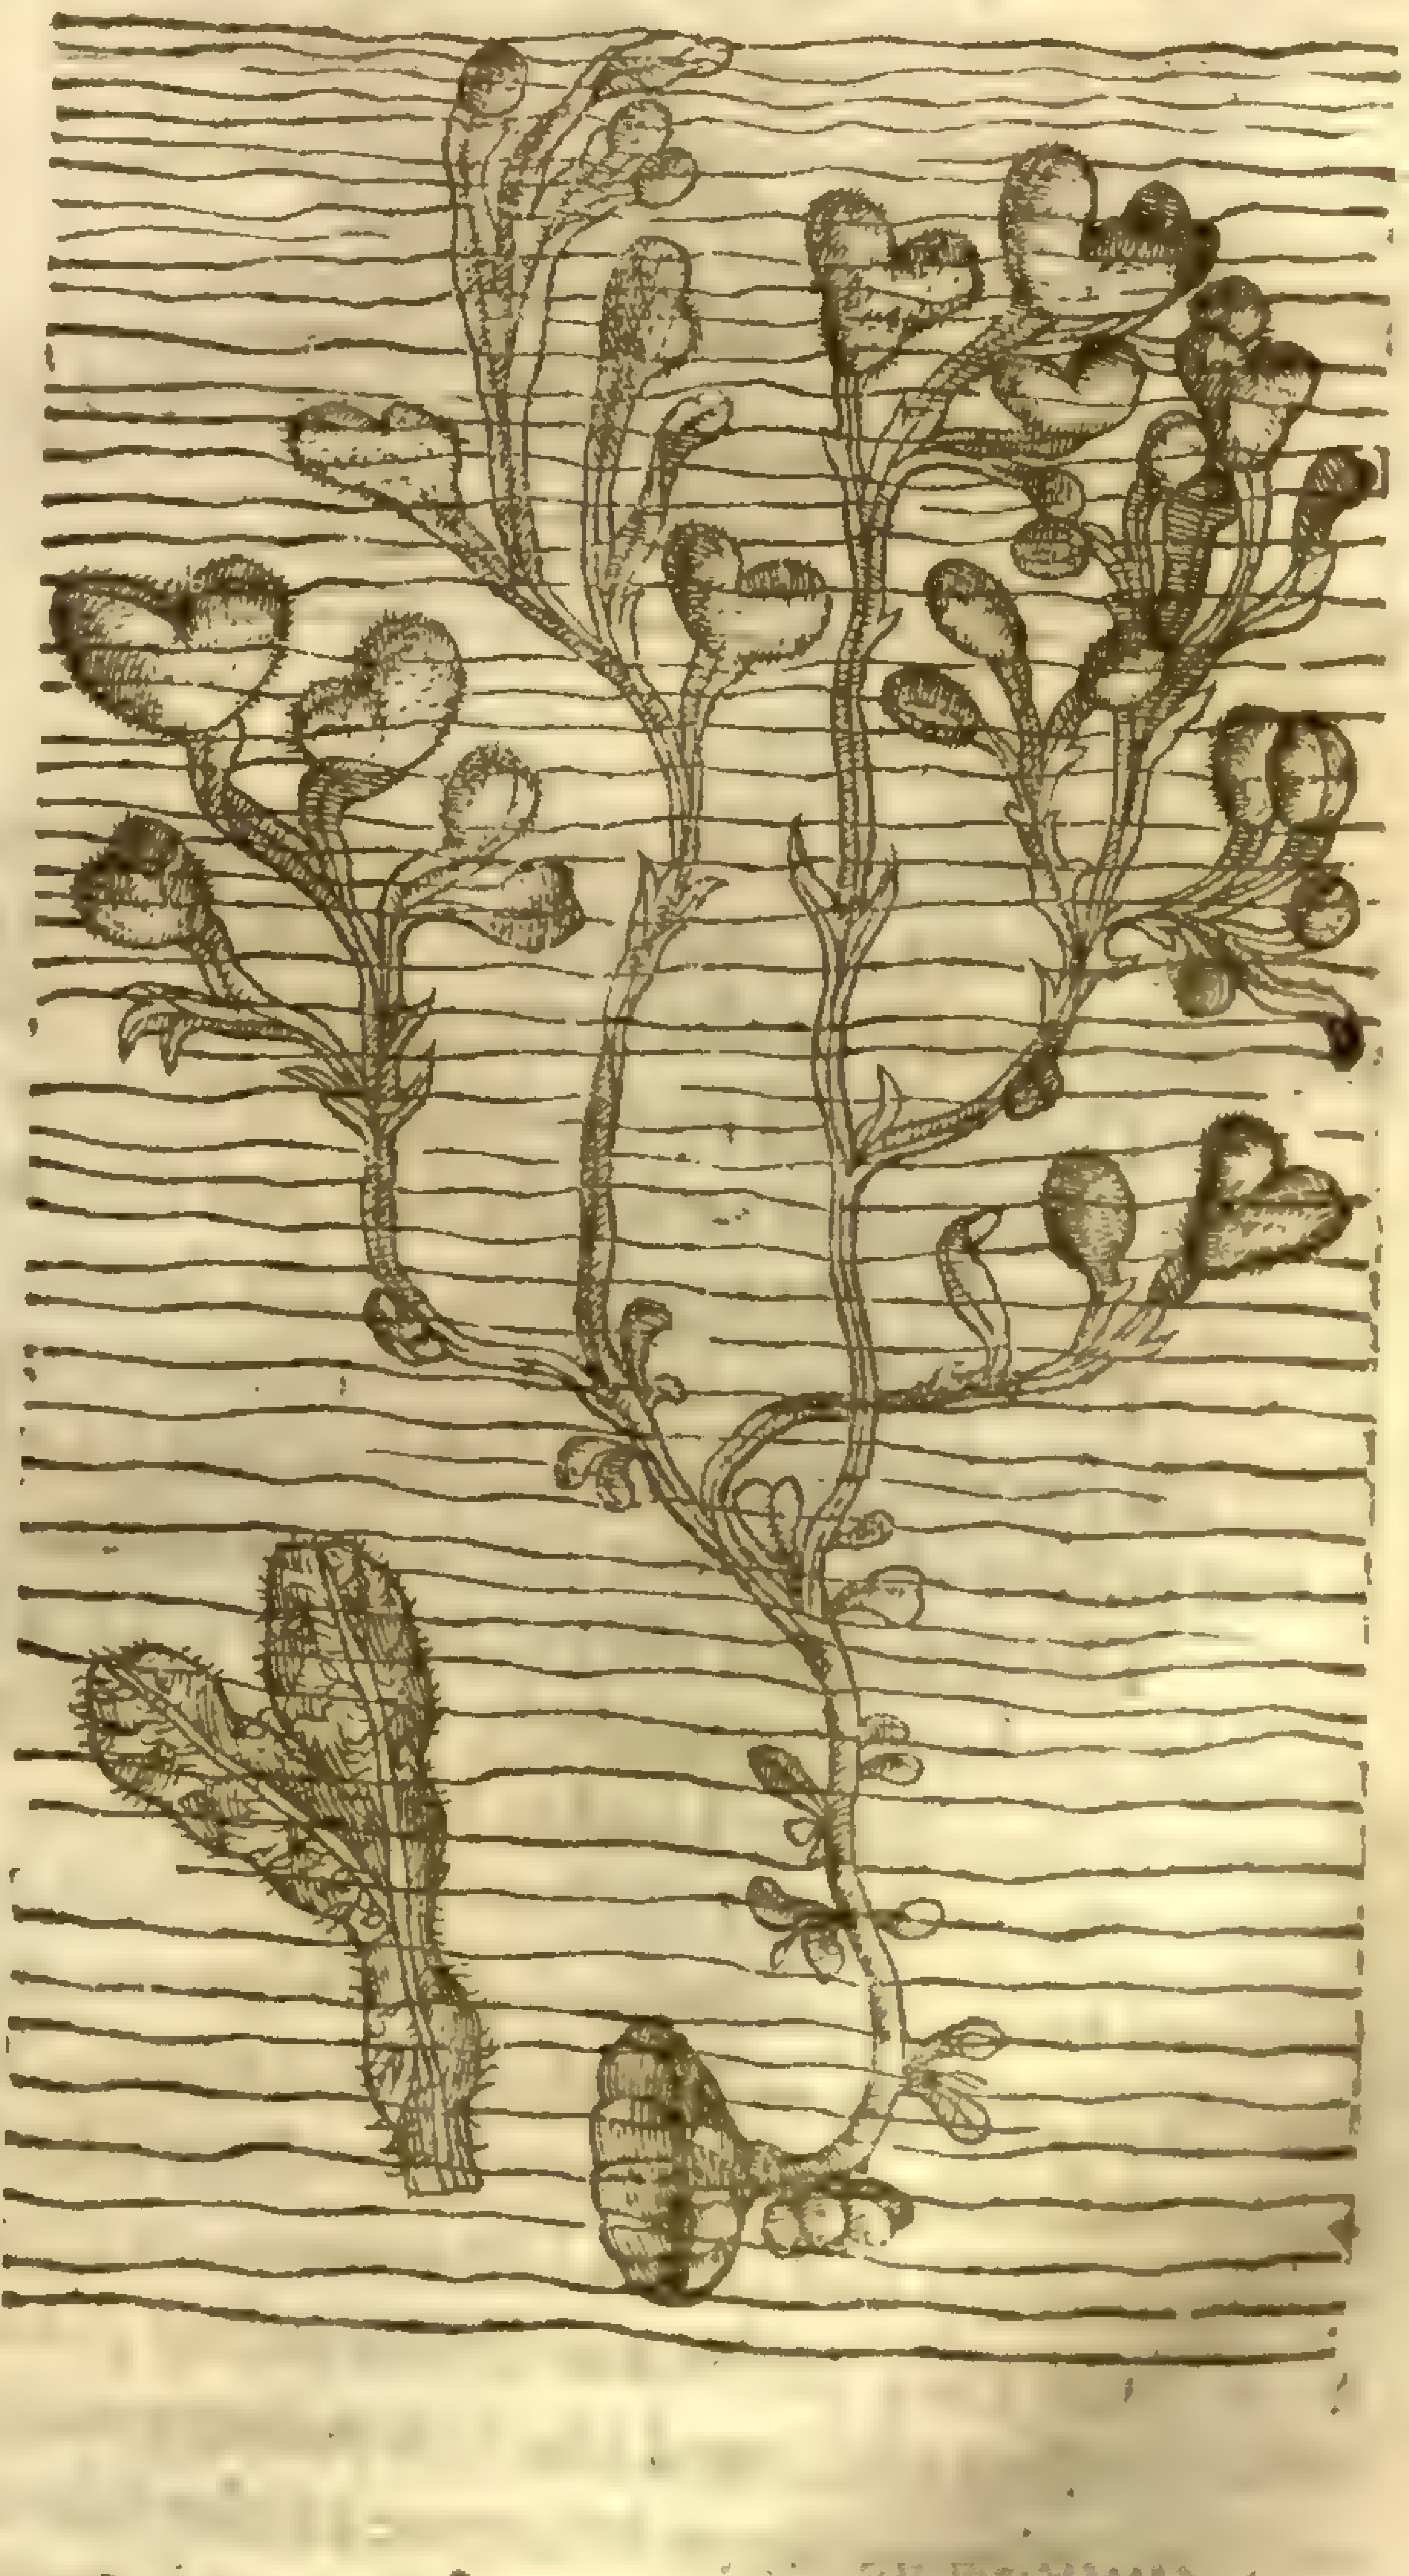
‡ 3 *Lichen marinus rotundifolius.* Round leaued Oiſter-weed.



4 *Quercus marina.*
Sea Oke or Wrack.

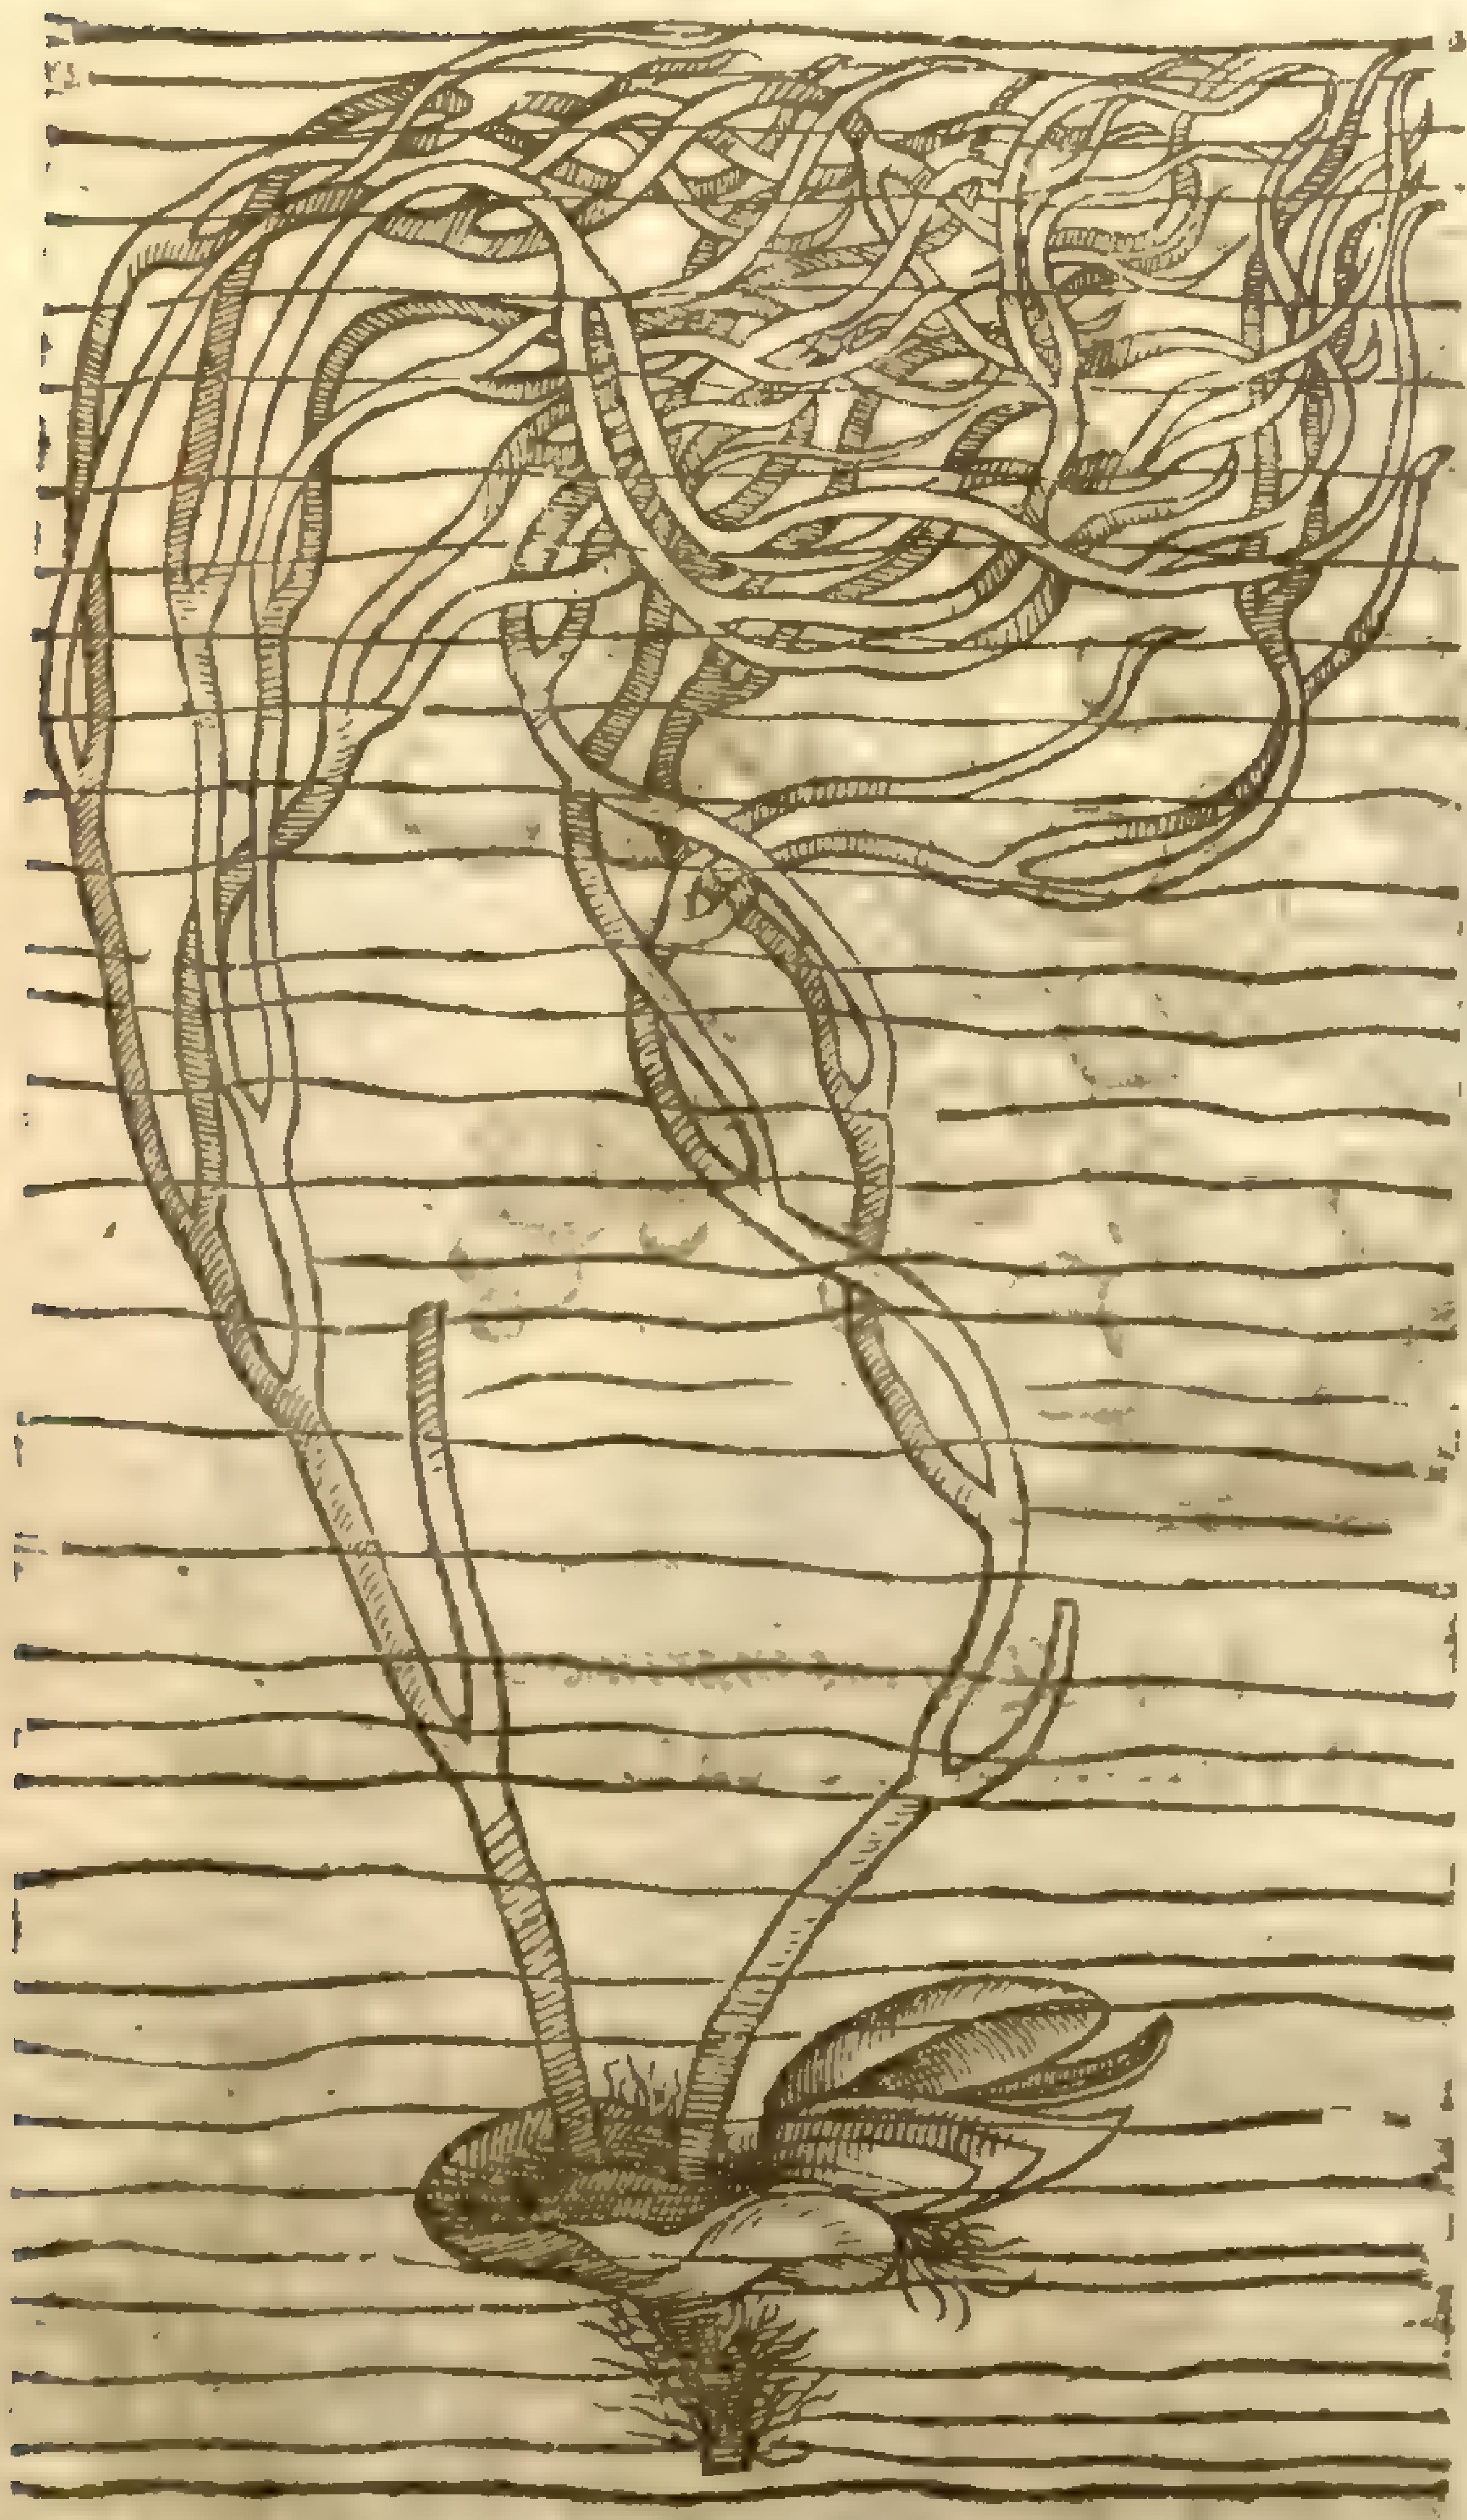


‡ 4 *Quercus marina varietas.*
A varietie of the ſea Oke or Wrack.

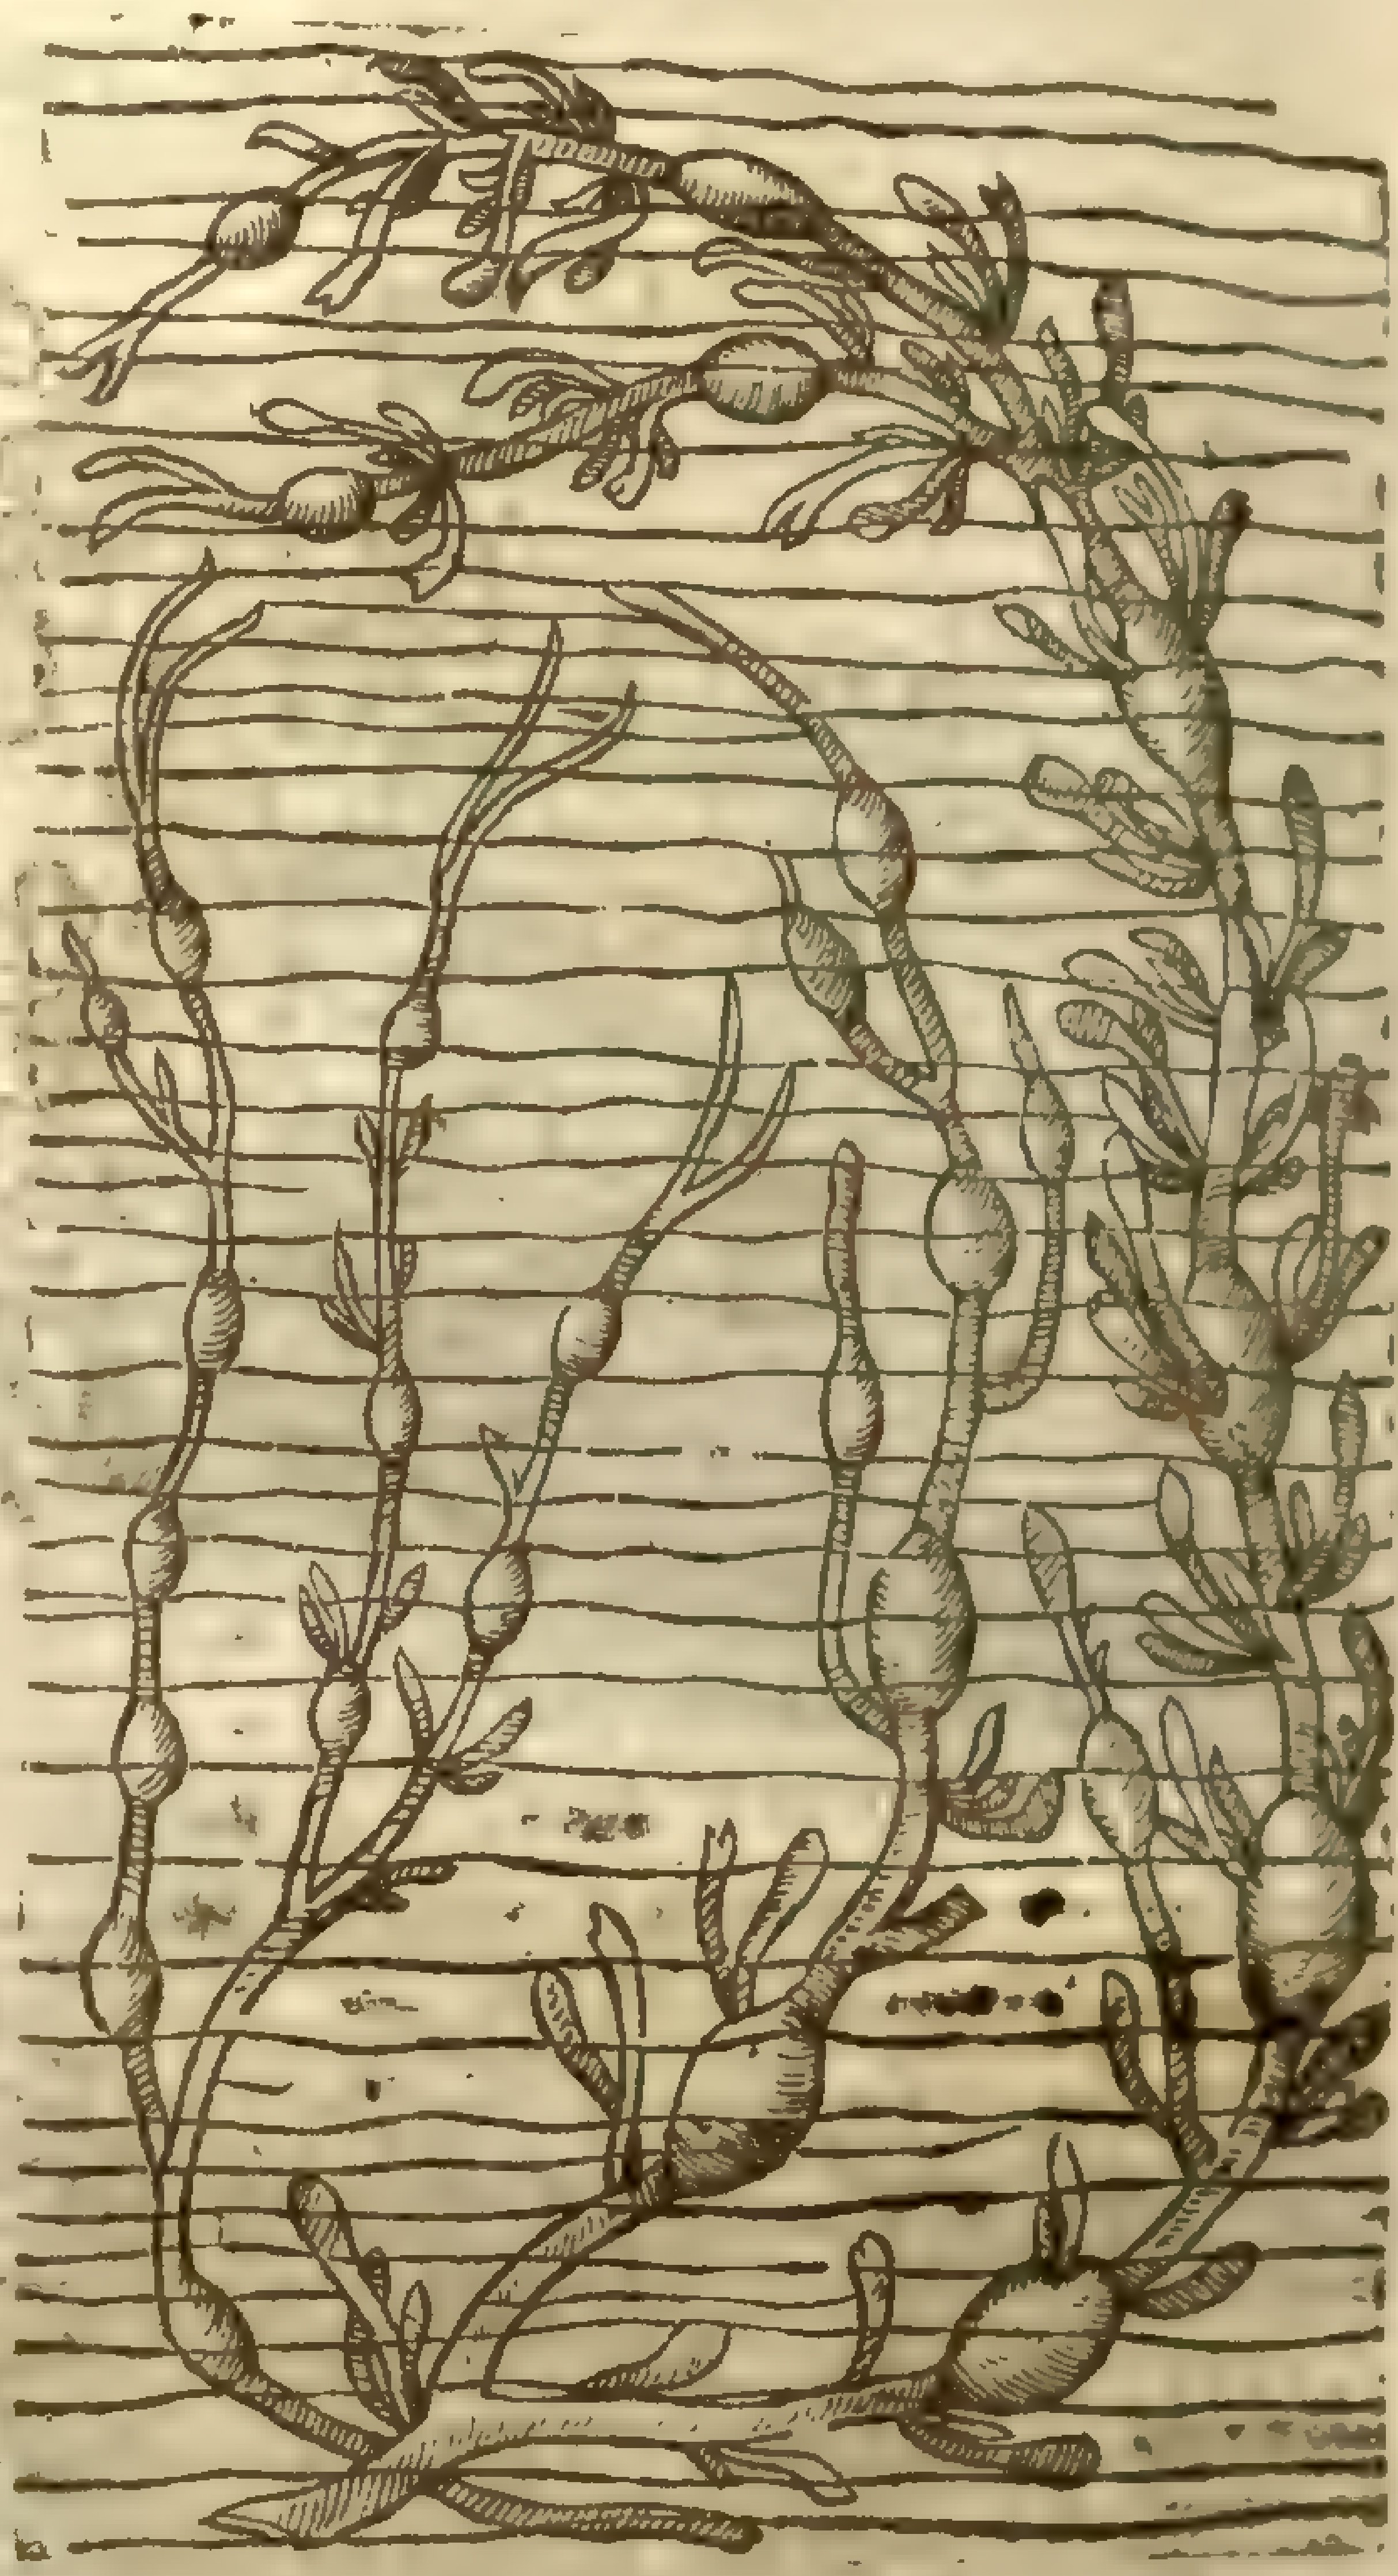


4 There is alſo another ſort of Sea Weed found vpon the drowned rocks which are naked and bare of water at euery tyde. This ſea Weed groweth vnto the rocke, faſtned vnto the ſame at one

end,being a ſoft herby plant very ſlippery, inſomuch as it is an hard matter to ſtand vpon it without falling; it rampeth far abroad,and here and there is ſet with certaine puft vp tubercles or bladders full of winde,which giue a cracke being broken: the leafe it ſelfe doth ſomwhat reſemble the Oken leafe,whereof it took his name *Quercus marina* or ſea Oke: of ſome, Wrack,and Crow gall. His vſe in phyſick hath not bin ſet forth,and therefore this bare deſcription may ſuffice.



‡ 5 *Quercus marina ſecunda.*
Sea Thongs.



‡ 6 *Quercus marina tertia.*
The third ſea Wrack.

‡ Of this *Quercus marina* or *Fucus* there are diuers ſorts,whereof I will giue you the figures and a briefe hiſtory. The firſt of theſe is onely a varietie of the laſt deſcribed, differing therefrom in the narrowneſſe of the leaues,and largeneſſe of the ſwolne bladders.

5 This growes to the length of fiue or ſix foot,is ſmooth and membranous, being ſome halfe fingers bredth,and variouſly diuided like wet parchment or leather cut into thongs. This hath no ſwoln knots or bladders like as the former; and is the *Fucus marinus ſecundus* of *Dodonæus*.

6 This Wrack or Sea Weed hath long and flat ſtalks like the former,but the ſtalks are thicke ſet with ſwolne knots or bladders,out of which ſomtimes grow little leaues; in other reſpects it is not vnlike the former kindes. *Dodonæus* makes this his *Fucus marinus 3.*

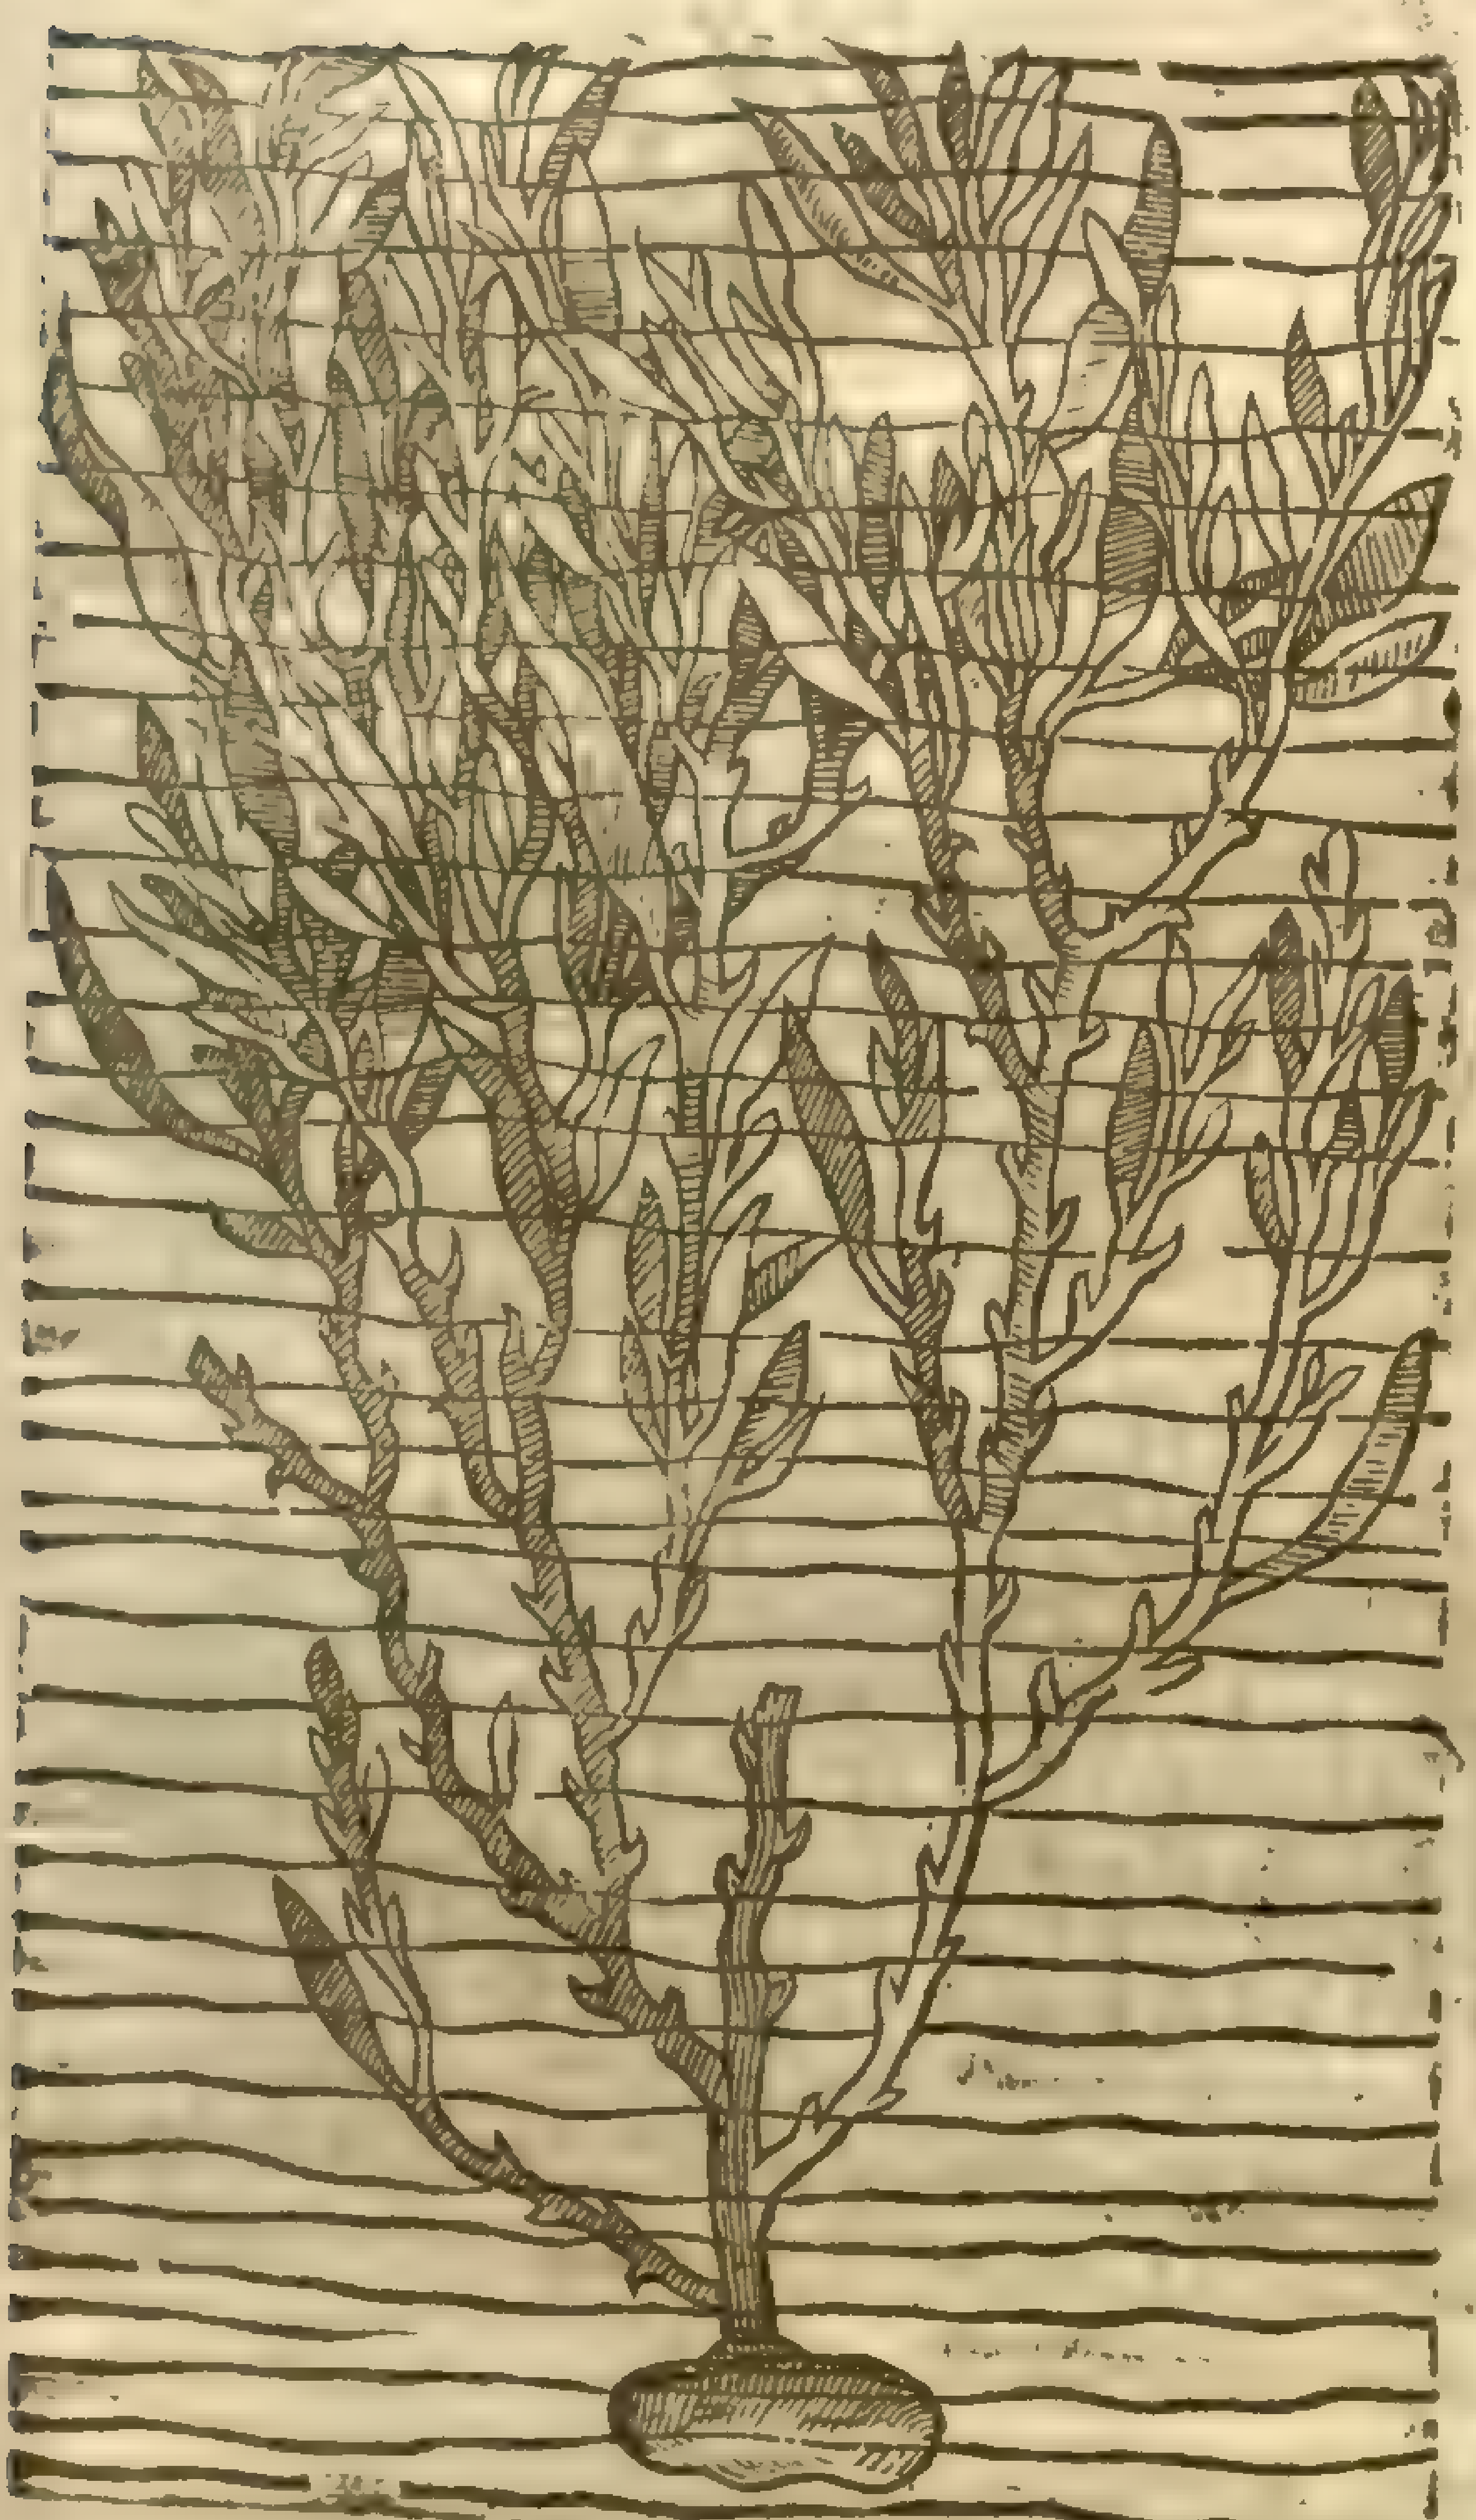
7 The leaues of this other Wracke,which *Dodonæus* makes his *Fucus marinus 4.* are narrower, ſmaller,and much diuided; and this hath either none or very few of thoſe ſwolne bladders which ſome of the former kindes haue.

8 This,which *Lobel* cals *Alga marina*,hath jointed black branched creeping roots of the thickneſſe of ones finger,which end as it were in diuers eares or hairy awnes, compoſed of whitiſh hairy threds ſomwhat reſembling Spikenard; from the tops wherof come forth leaues long,narrow,ſoft, and graſſe-like,firſt greene,but white when they are dry. It growes in the ſea as the former. They vſe it in Italy and other hot countries to pack vp glaſſes with, to keepe them from breaking.

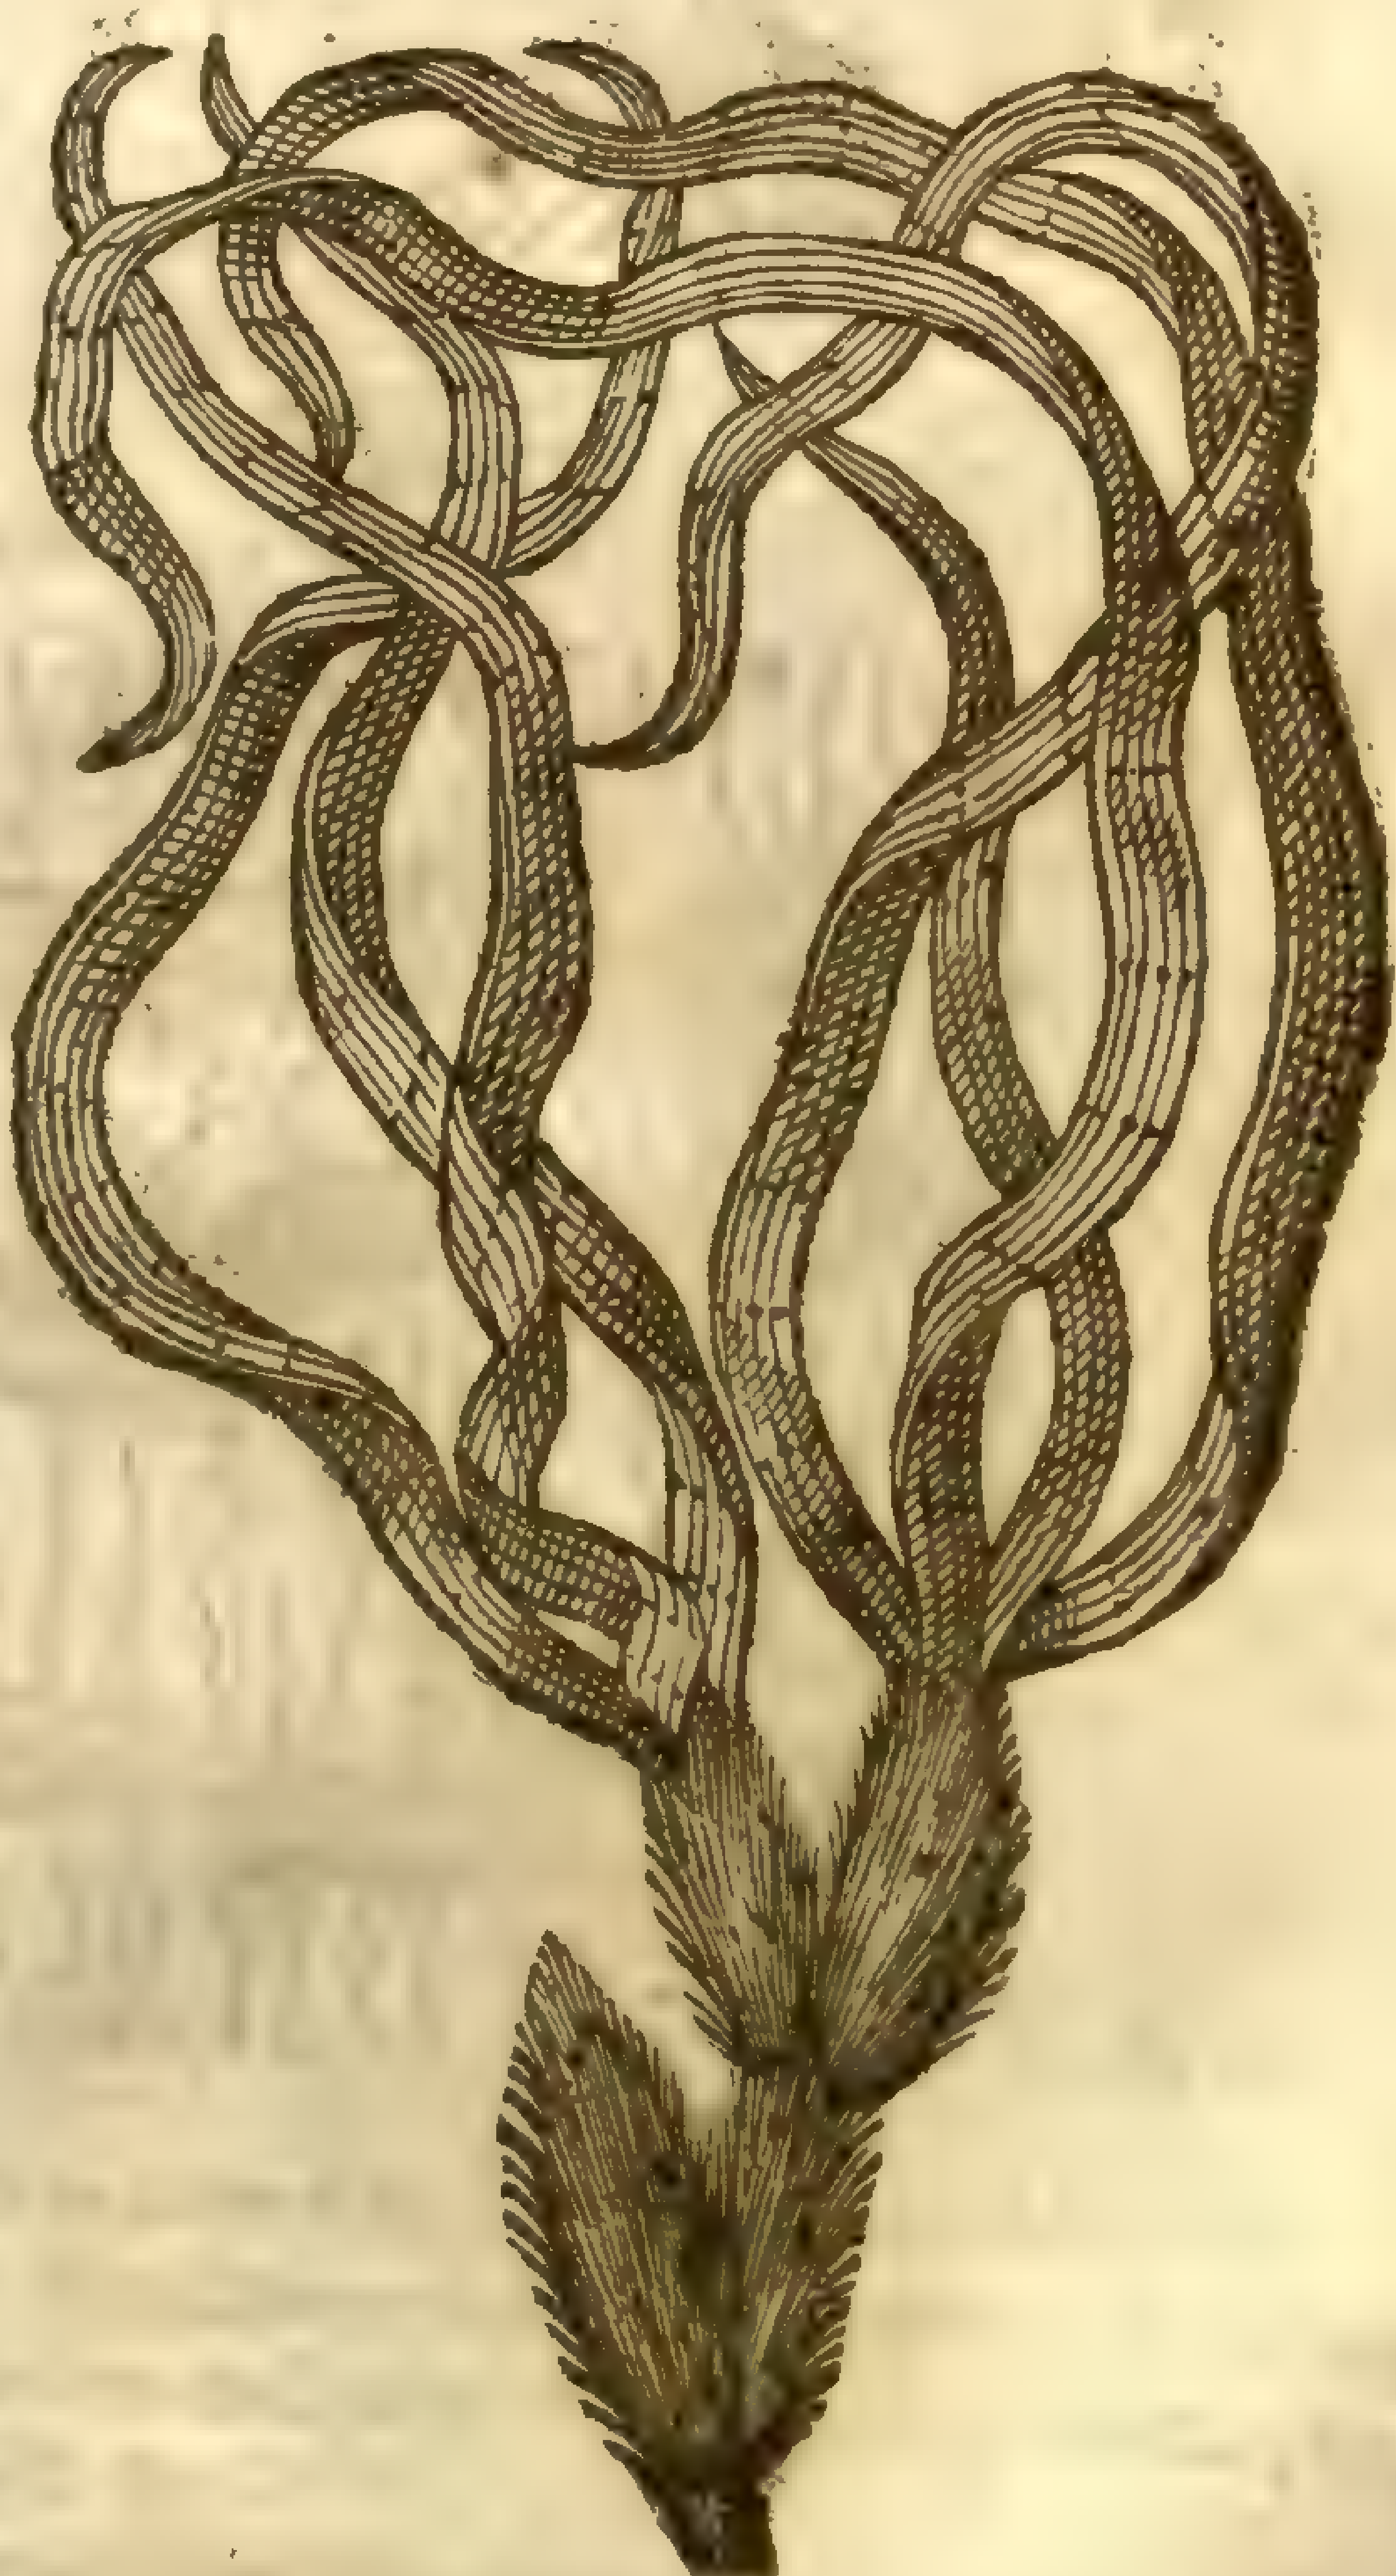
9 Of this Tribe are diuers other plants; but I will onely giue you the hiſtory of two more, which I firſt obſerued the laſt yeare,going in company with diuers London Apothecaries to finde out Simples,as far as Margate in the Iſle of Tenet; and whoſe figures (not before extant that I know of) I firſt gaue in my Iournall or enumeration of ſuch Plants as wee there and in other places found. The firſt of theſe by reaſon of his various growth is by *Bauhine* in his *Prodromus* diſtin-

guiſhed into two, and deſcribed in the ſecond and third places. The third he calls *Fucus longiſſimo, latiſſimo, craſſóque folio*, and this is marked with the figure 1. The ſecond he calls *Fucus arboreus Polyſchides*, and this you may ſee marked with the figure 2. This Sea weed (as I haue ſaid) hath a various face; for ſomtimes from a fibrous root, which commonly groweth to a pibble ſtone, or faſtned to a rock, it ſends forth a round ſtalk ſeldom ſo thick as ones little finger, and about ſome half foot in length, at the top whereof grows out a ſingle leafe, ſomtimes an ell long, and then it is about the bredth of ones hand, ending in a ſharpe point, ſo that it very well reſembles a two edged ſword. Somtimes from the ſame root come forth two ſuch faſhioned leaues, but then commonly they are leſſer. Otherwhiles at the top of the ſtalke it diuides it ſelfe into eight, nine, ten, twelue, more or fewer parts, and that iuſt at the top of the ſtalk, and theſe neuer come to that length that the ſingle leaues do. Now this I iudge to be the *Fucus polyſchides* of *Bauhine*. That theſe two are not ſeueral kinds I am certain; for I haue marked both theſe varieties from one and the ſame root, as you may ſee them here expreſt in the figure. At Margate where they grow they cal them ſea Girdles: which name well befits the ſingle one; and the diuided one they may call ſea Hangers, for if you hang the tops downward they do reaſonable wel reſemble the old faſhioned ſword hangers. Thus much for their ſhape: now for their colour, which is not the ſame in all; for ſome are more greene, and theſe can ſcarce be dried; otherſome are whitiſh, and theſe do quickly dry, and then both in colour and ſubſtance are ſo like Parchment, that ſuch as know them not would at the firſt view take them to be nothing els. This is of a glutinous ſubſtance and a little ſaltiſh taſt, and diuers haue told me they are good meat, being boiled tender, and ſo eaten with butter, vineger and pepper.

‡ 7 *Quercus marina quarta.*
Iagged ſea Wrack.

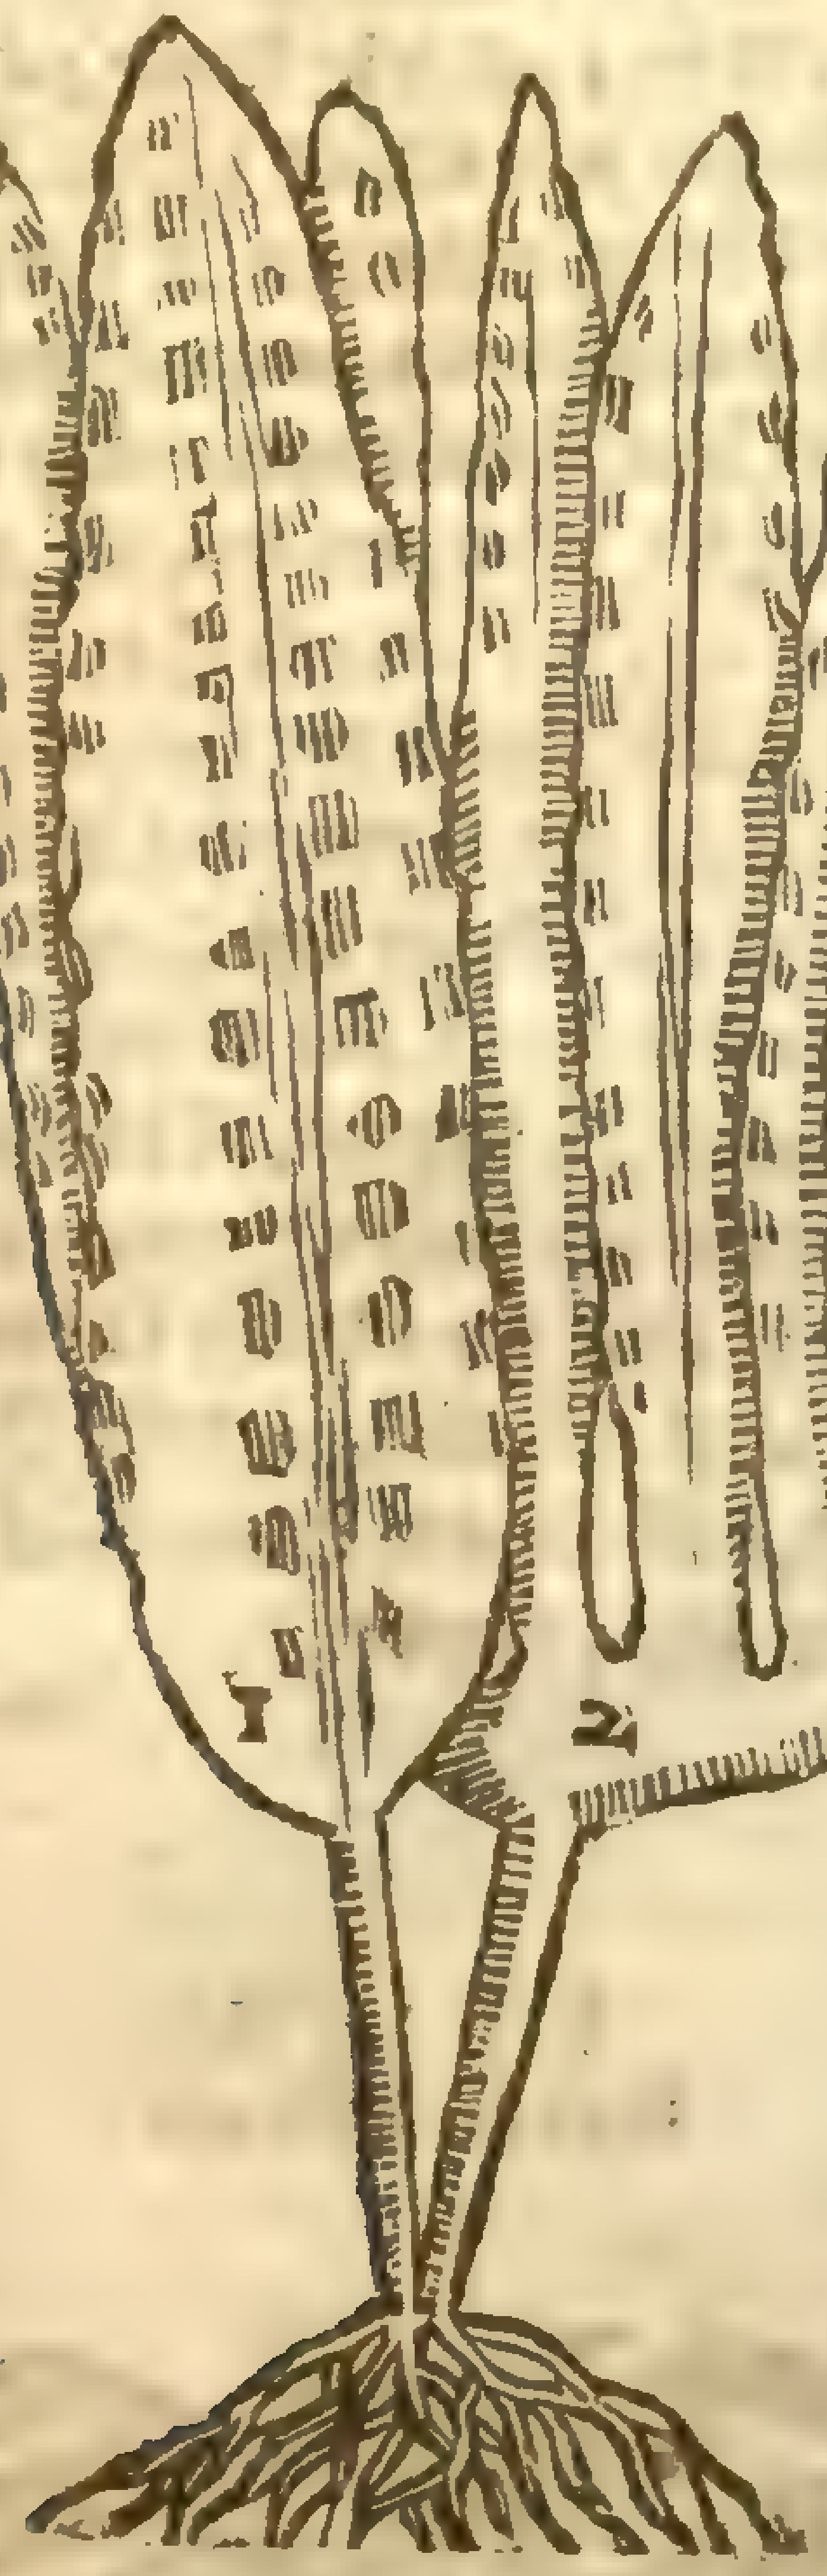


† 8 *Alga.*
Graſſe Wrack.



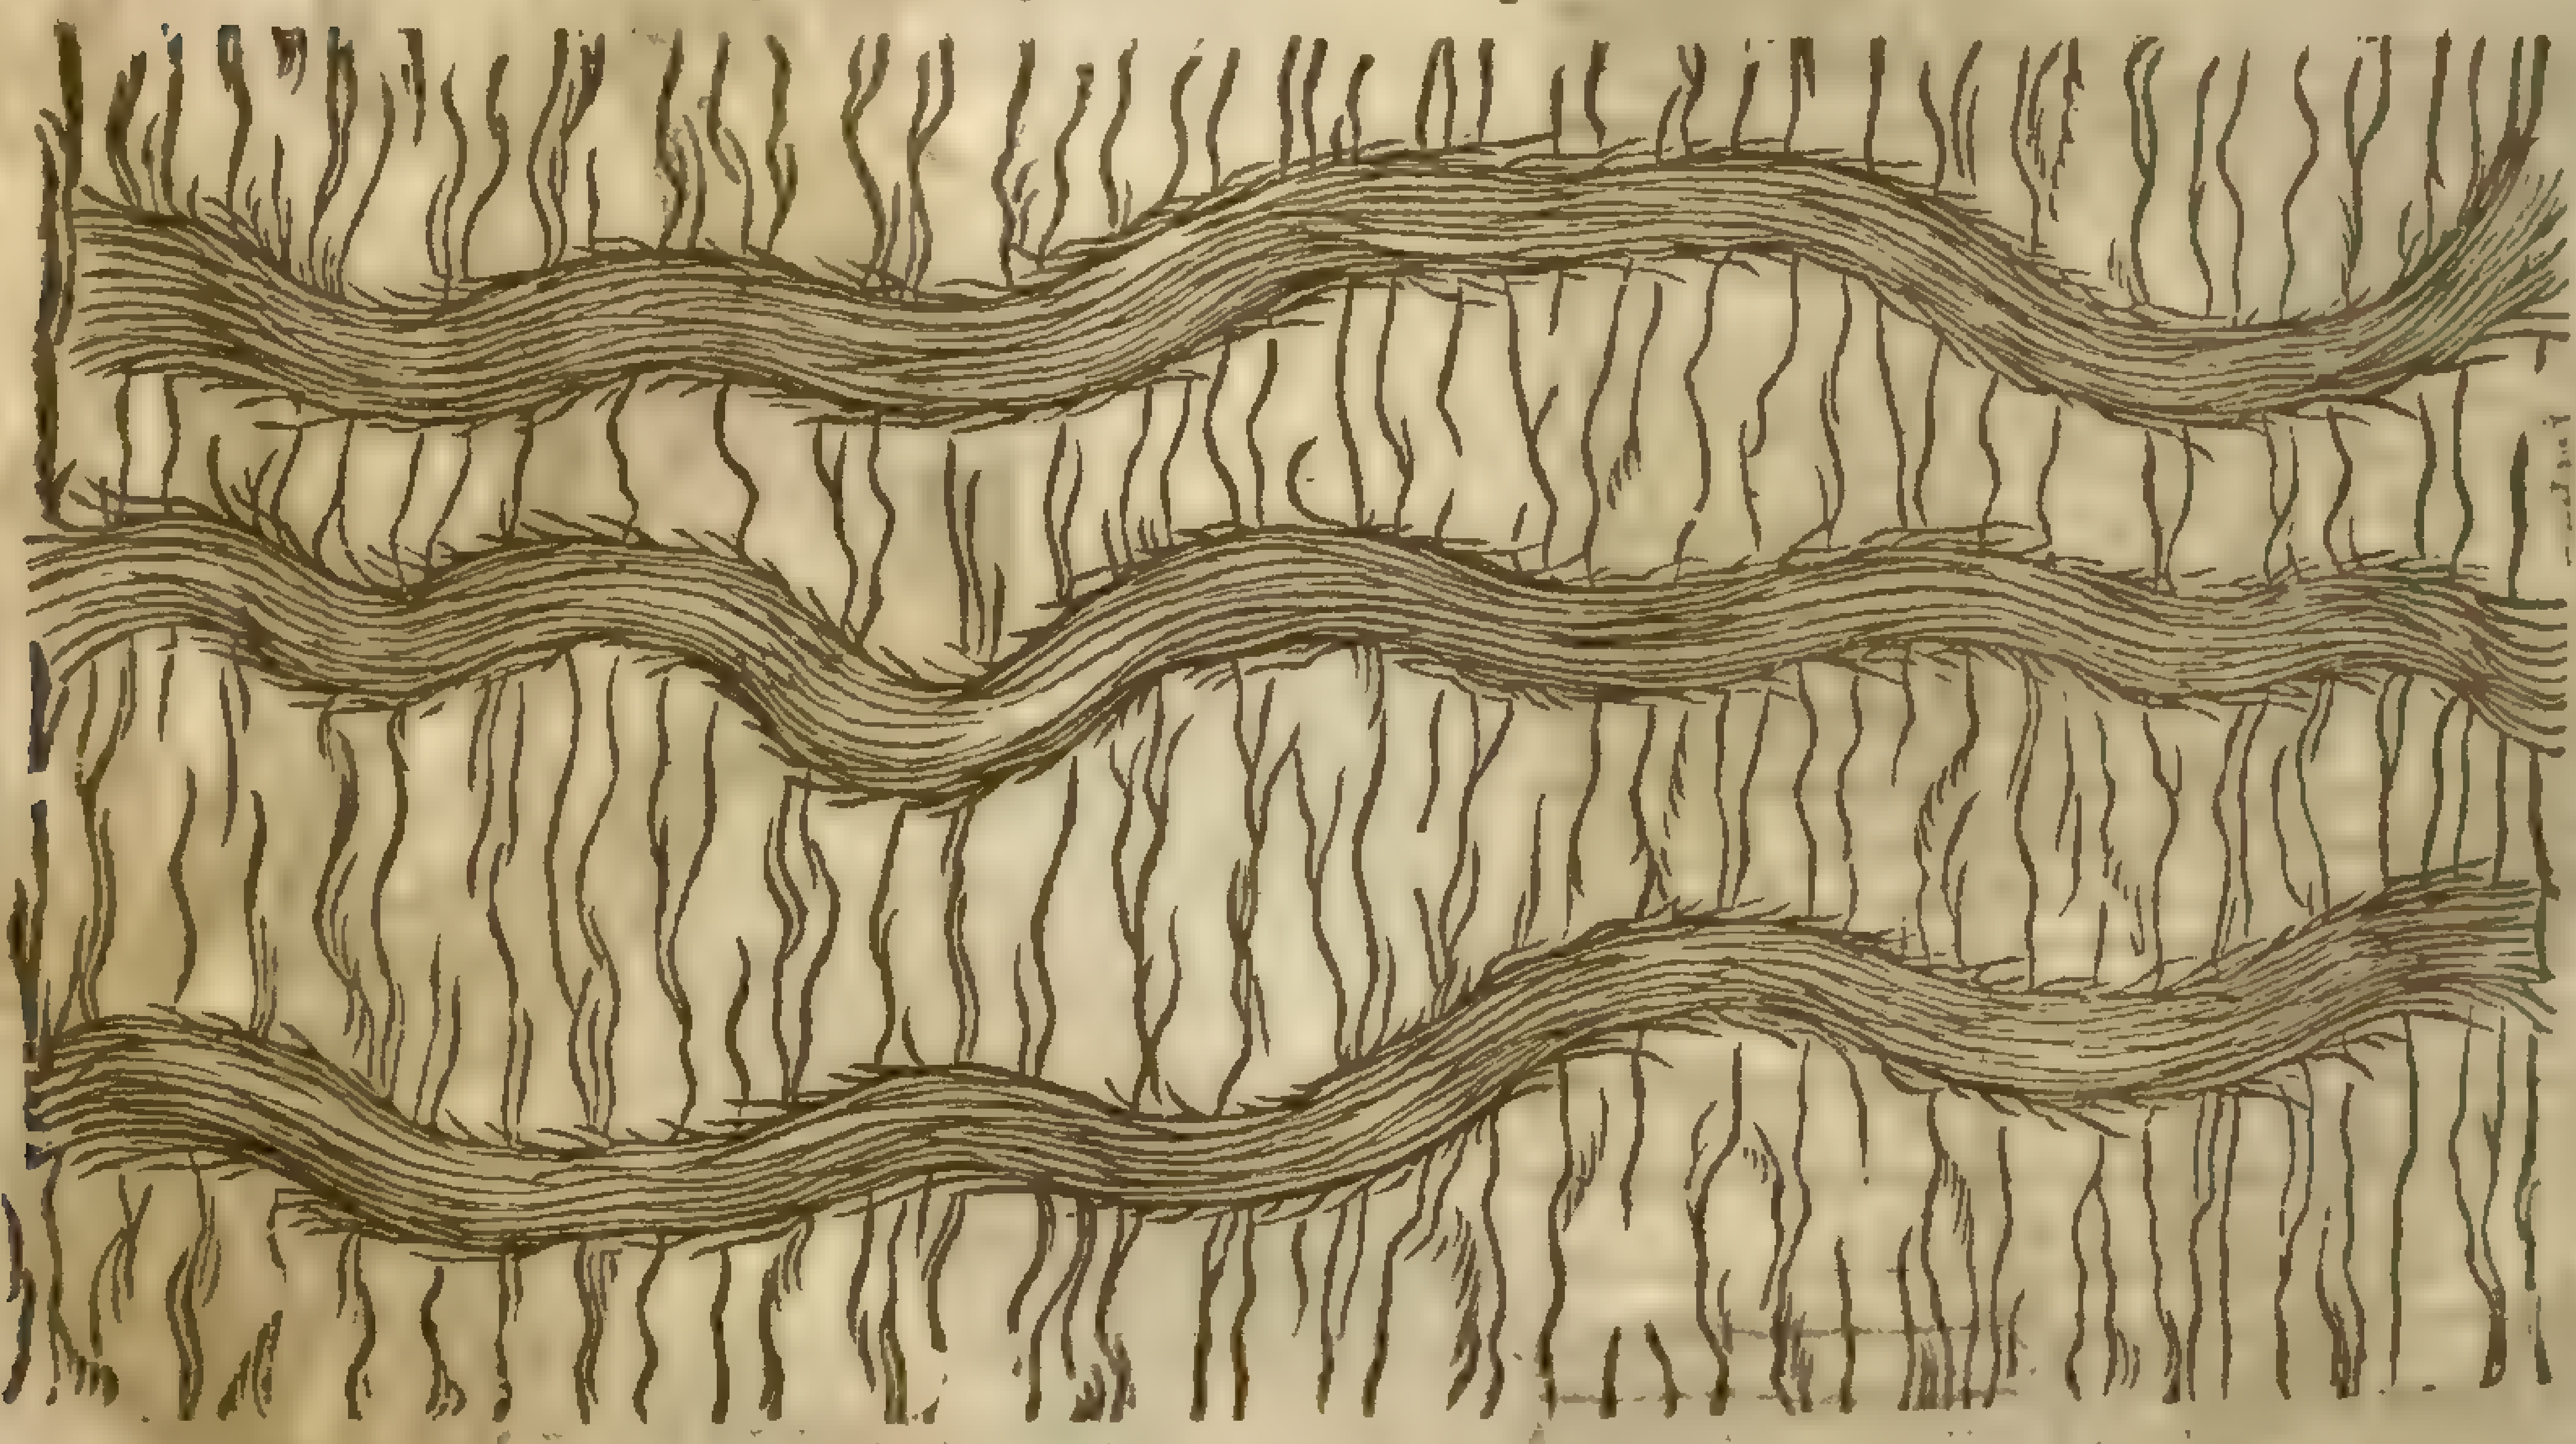
10 This which I giue you in the tenth place is not figured or deſcribed by any that as yet I haue met with; wherefore I gaue the Figure and Deſcription in the fore-mentioned journal, which I will here repeat. This is a very ſucculent and fungous plant, of the thickneſſe of ones thumb; it is of a dark yellowiſh colour, and buncheth forth on euery ſide with many vnequall tuberoſities or knots: whereupon Mr *Tho. Hicks* being in our company did fitly name it ſea Ragged ſtaffe. We did not obſerue it growing, but found one or two plants thereof ſome foot long apiece.

‡ 9. *Fucus phaſganoides & polyſchides.*
Sea Girdle and Hangers.



‡ 10 *Fucus ſpongioſus nodoſus.*
Sea ragged Staffe.

‡ 11 *Conferva.* Hairy Riuer-weed.



11 In ſome ſlow running waters is to be found this long green hairy weed, thought to be the *Conferva* of *Pliny*: it is made vp only of long hairy green threds, thick thrummed together without any particular ſhape or faſhion, but only following the current of the ſtream. ‡

¶ *The Place, Time, and Names.*

It growes vpon the bodies of old Okes, Beech, and other wild trees, in dark and thick woods: it is oftentimes found growing vpon rocks, and alſo in other ſhadowy places.

It flouriſheth eſpecially in the ſummer moneths.

It taketh his name *Pulmonaria* of the likeneſſe it hath with lungs or lights, called in Latine *Pulmones*, of ſome *Lichen*: it is called in high-Dutch, **Lungenkraut**: in low-Dutch, **Longhencruyt**: in French, *Herbe à Poulmon*: in Engliſh, Lungwort, and wood Liverwort.

¶ *The Temperature.*

This ſeemeth to be cold and dry.

¶ The Vertues.

A It is reported, That ſhepheards and certain horſeleeches do with good ſucceſſe giue the pouder hereof with ſalt vnto their ſheep and other cattell that be troubled with the cough and be broken winded.

B Lungwort is much commended of the learned Phyſitions of our time, againſt the diſeaſes of the lungs, eſpecially for the inflammations and vlcers of the ſame, being brought into pouder & drunk with water.

C It is likewiſe commended for bloudy and green wounds, and for vlcers in the ſecret parts, and alſo to ſtay the reds.

D Moreouer, it ſtops the bloudy flix and other flixes and ſcourings, either vpwards or downwards eſpecially if they proceed of choler: it ſtayeth vomiting, as ſome ſay, and alſo ſtops the belly.

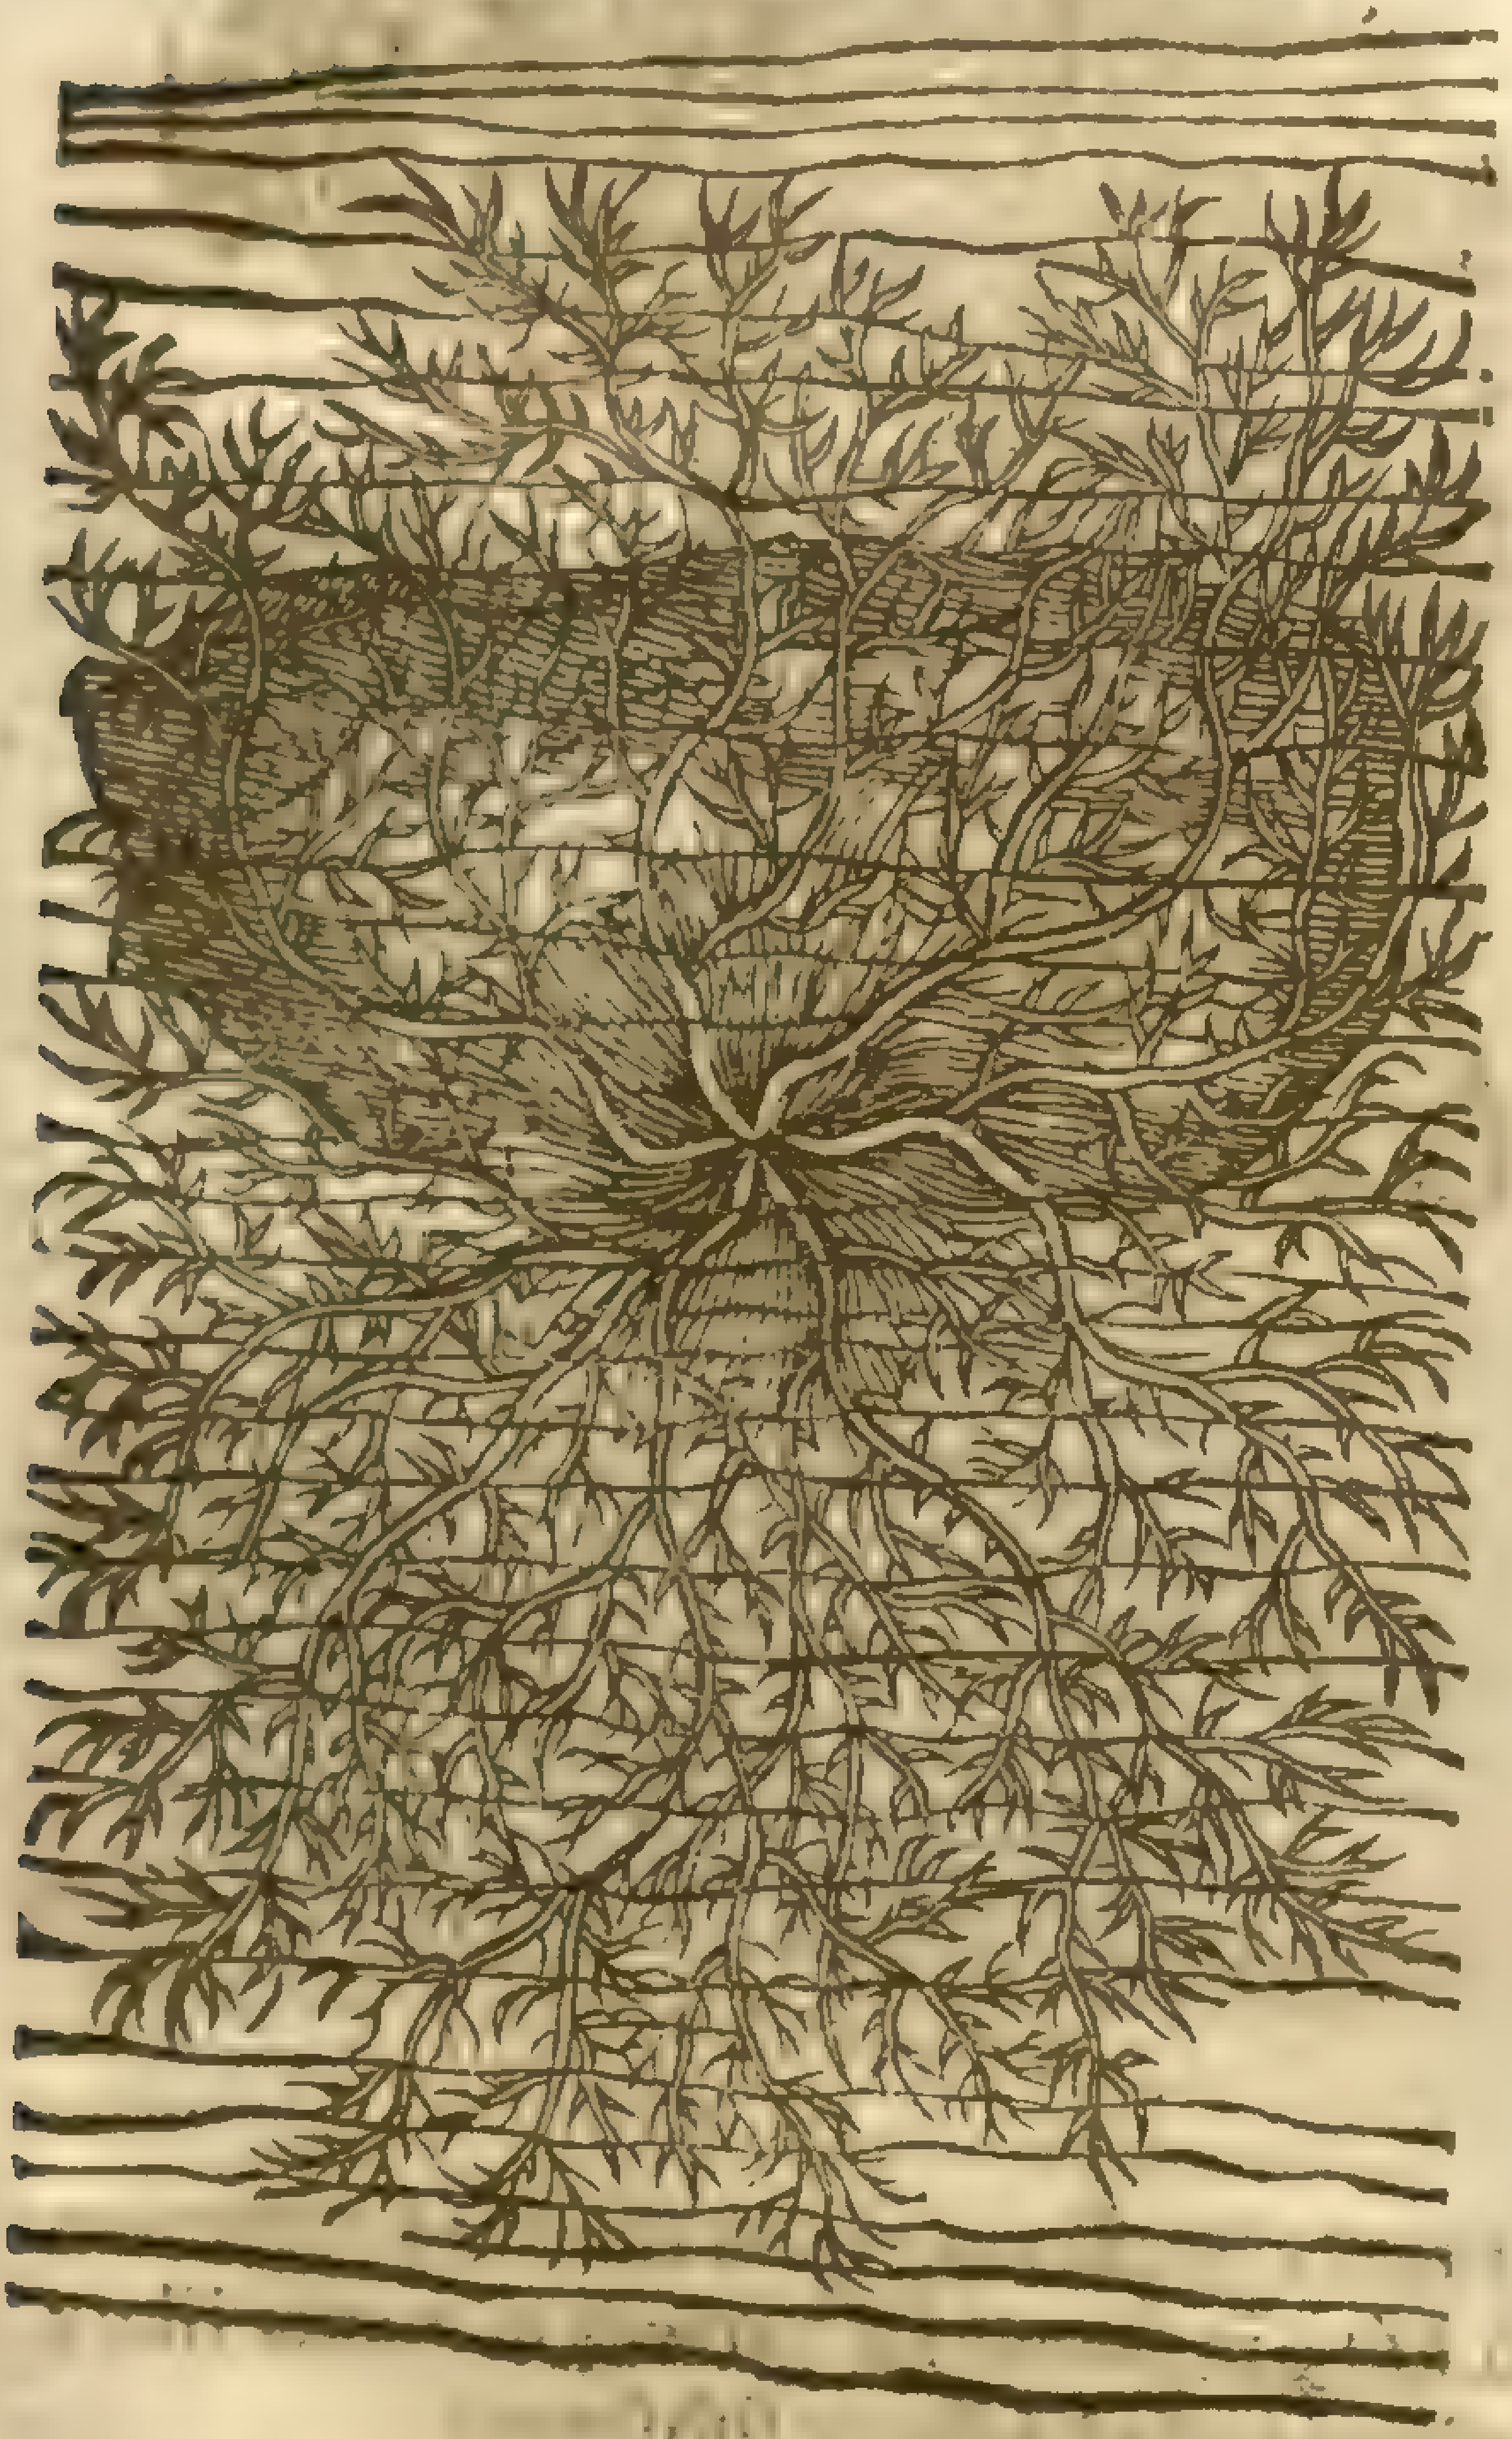
E Oiſter-green fried with egges and made into a tanſie and eaten, is a ſingular remedie to ſtrengthen the weakneſſe of the backe.

Chap. 165. *Of Sea Moſſe or Coralline.*

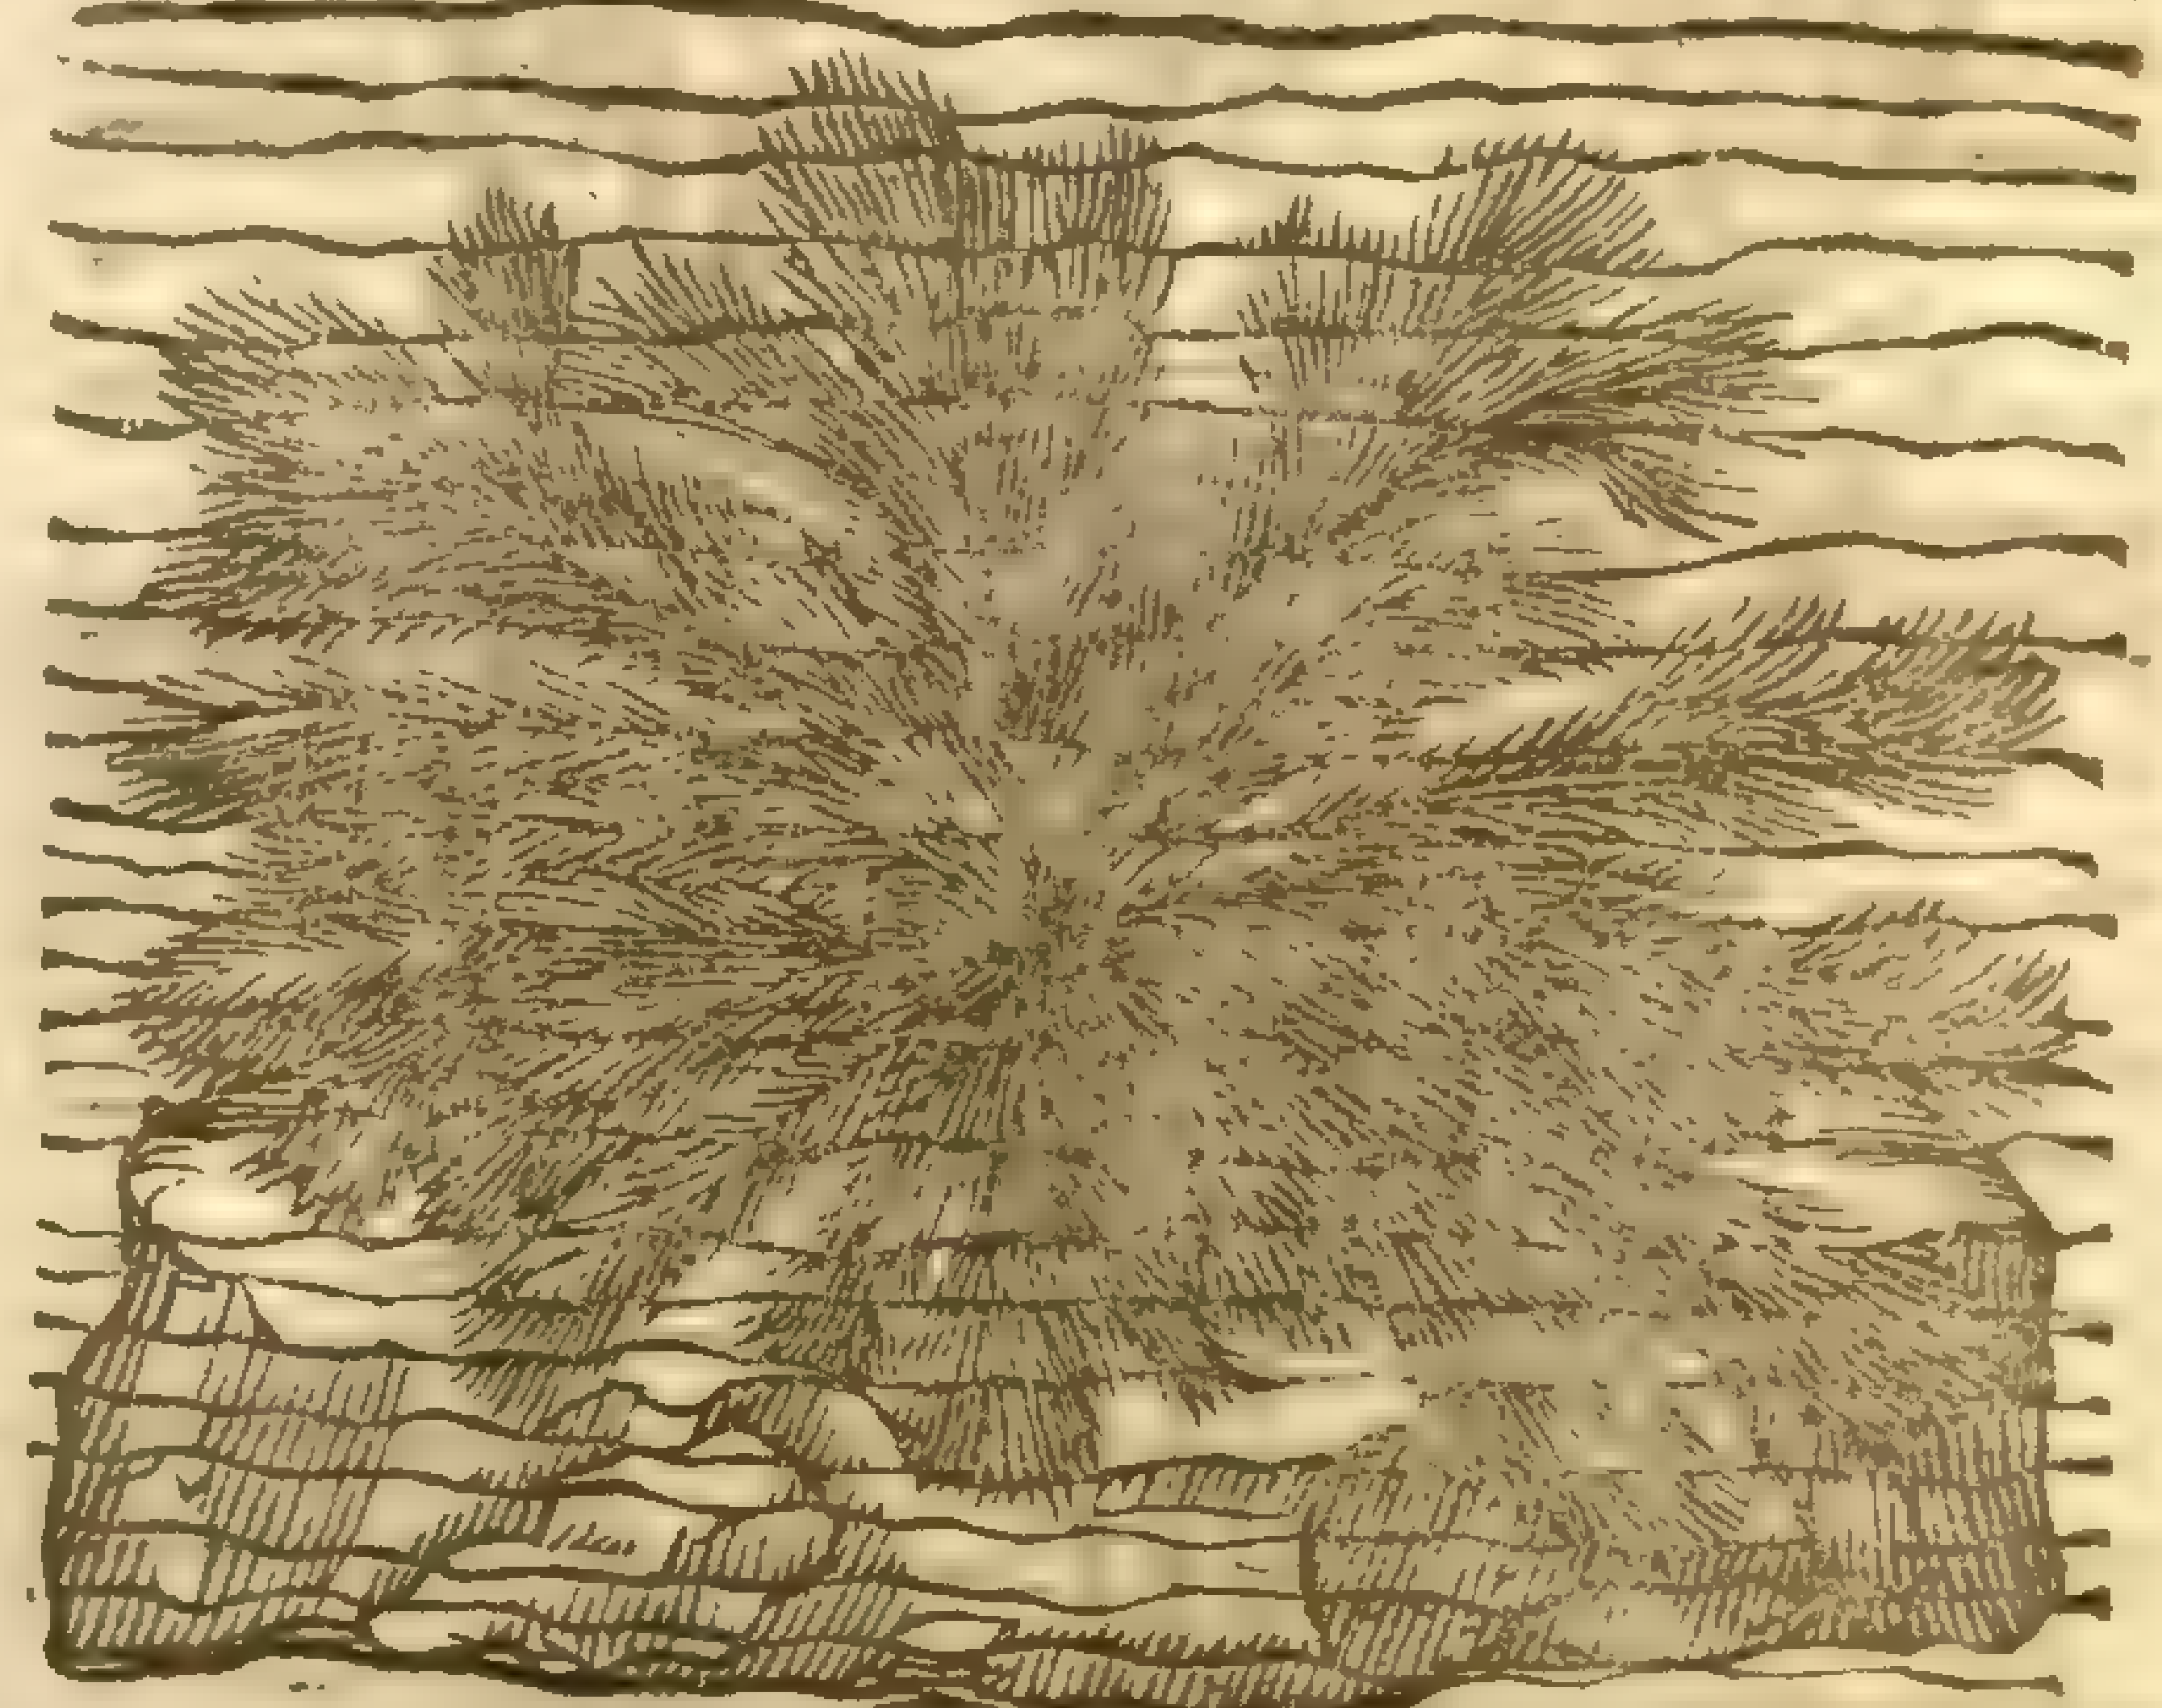
¶ The Kindes.

There be diuers ſorts of Moſſe, growing as well within the bowels of the ſea, as vpon the rocks, diſtinguiſhed vnder ſundry titles.

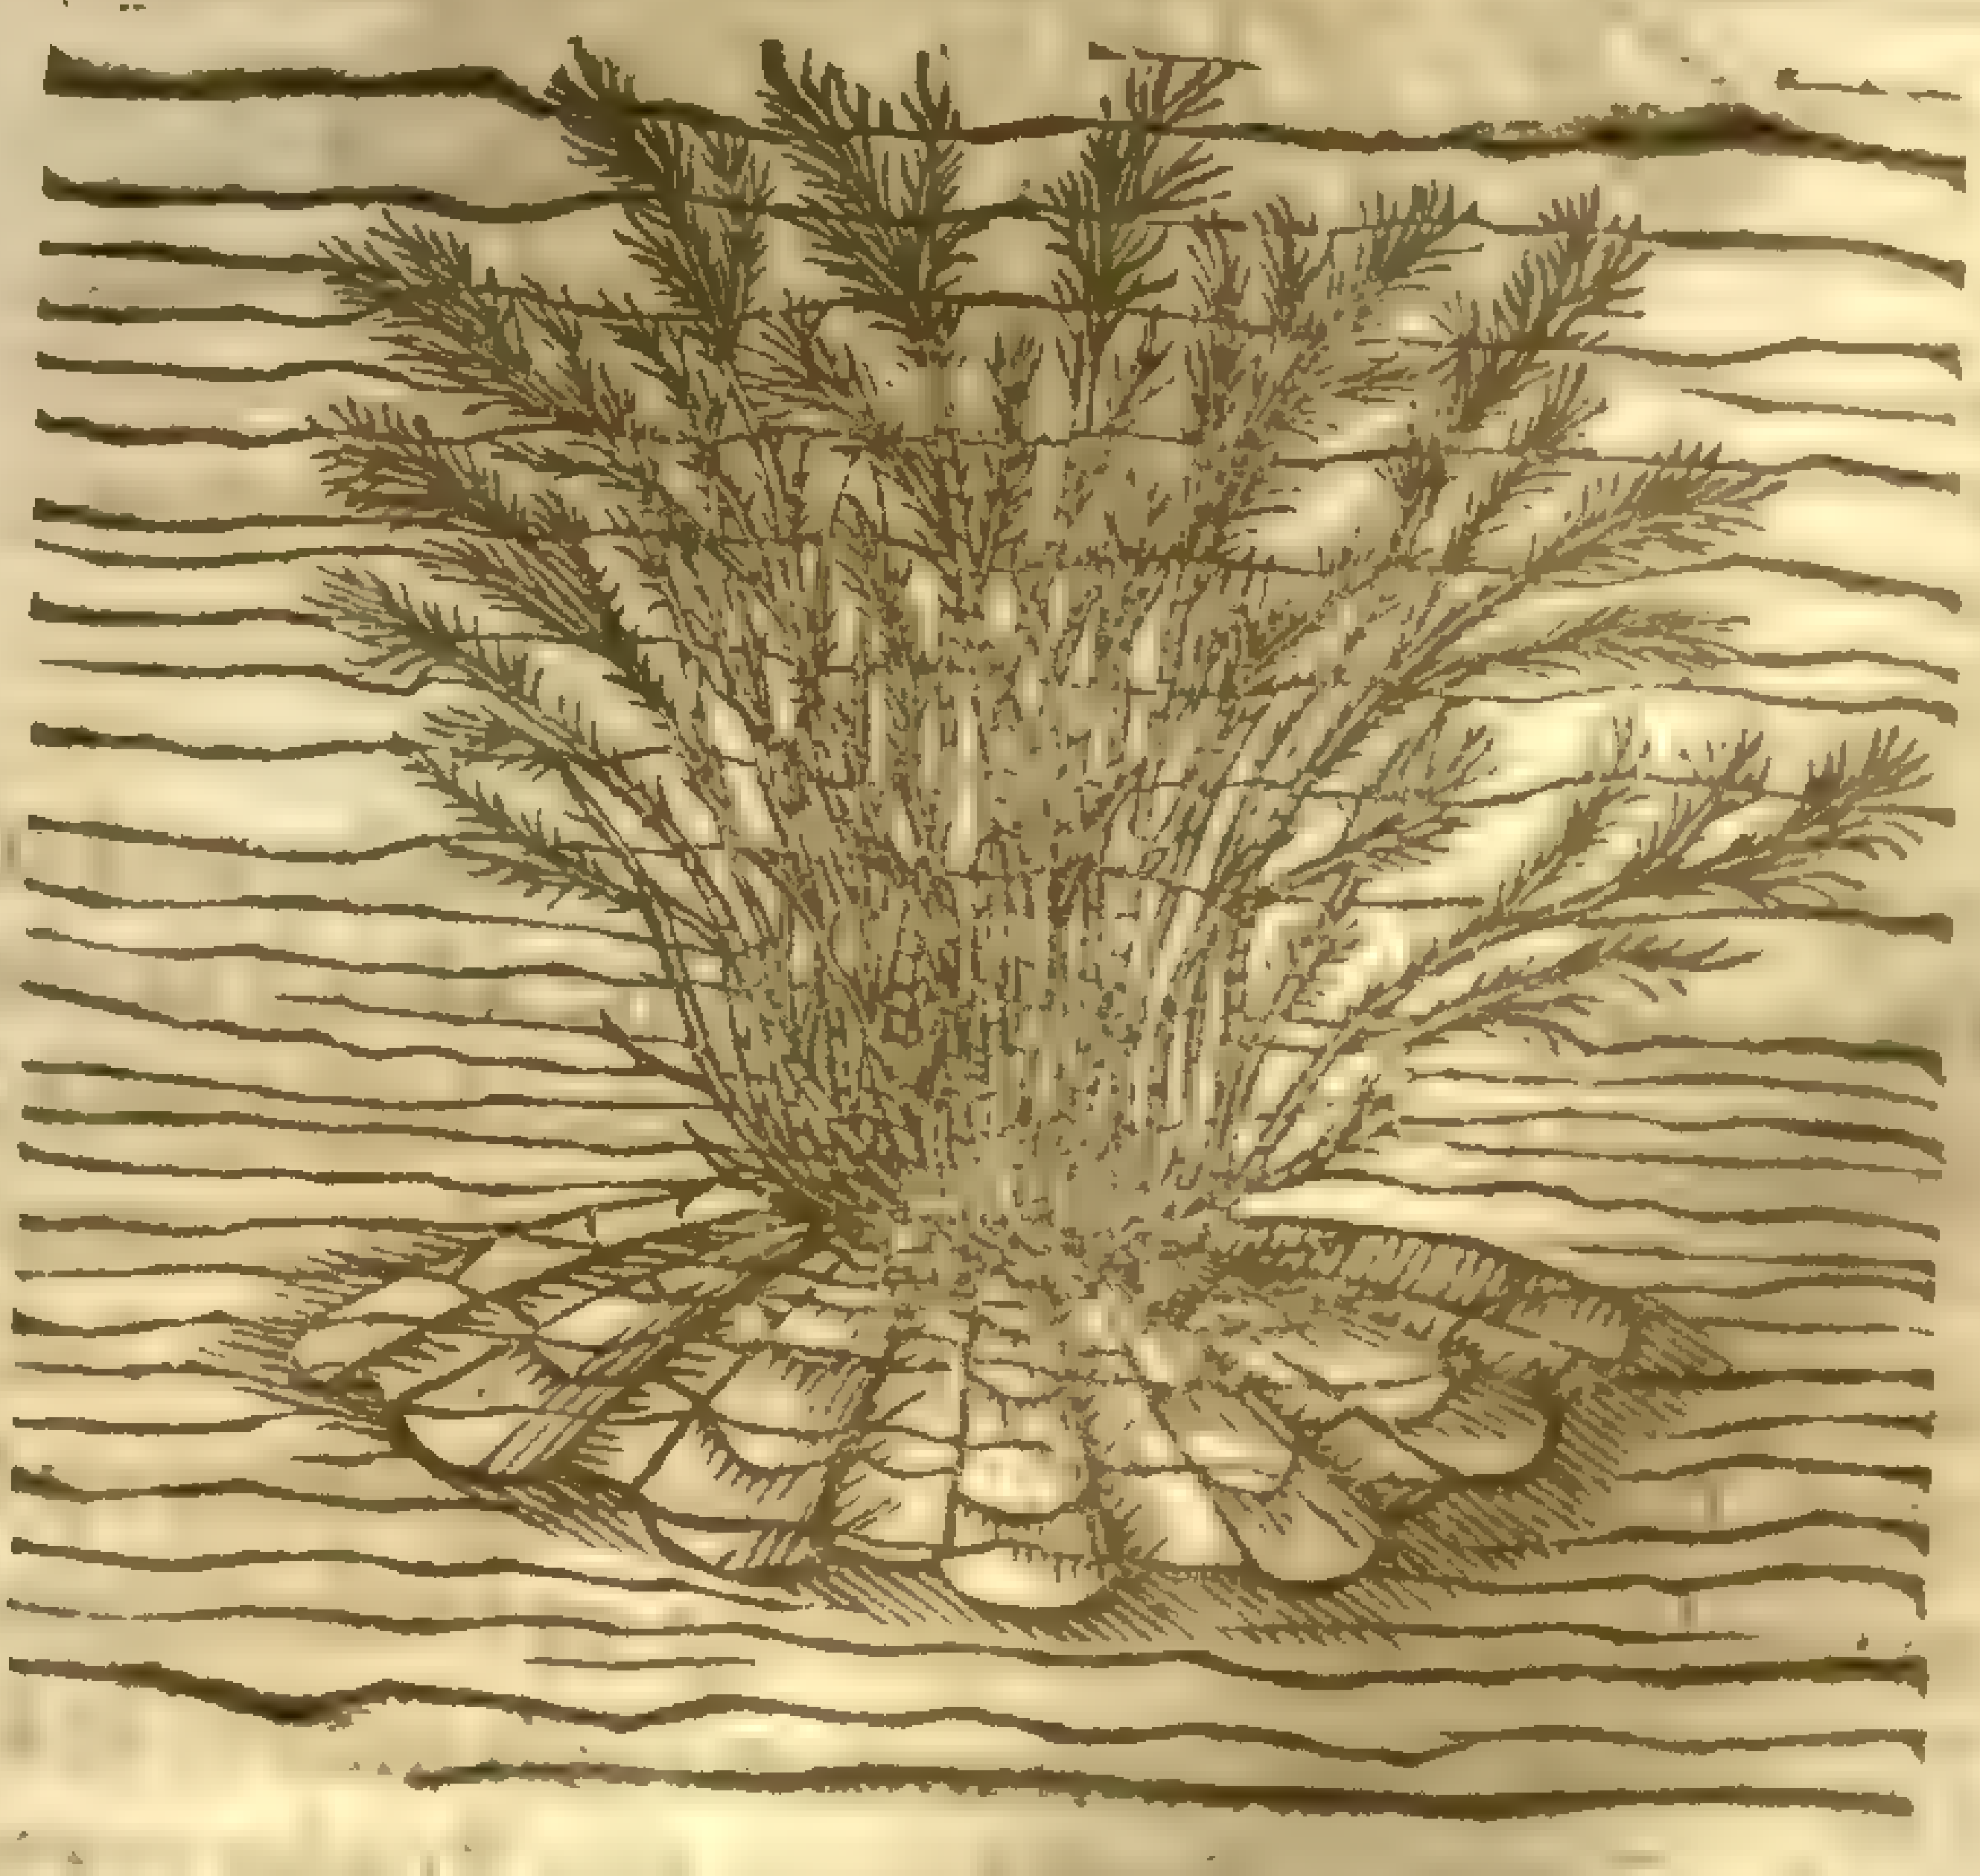
1 *Muſcus marinus, ſive Corallina alba.*
White Coralline or Sea moſſe.



† 2 *Muſcus marinus albidus.*
White Sea Moſſe.



3 *Corallina Anglica.*
Engliſh Coralline.



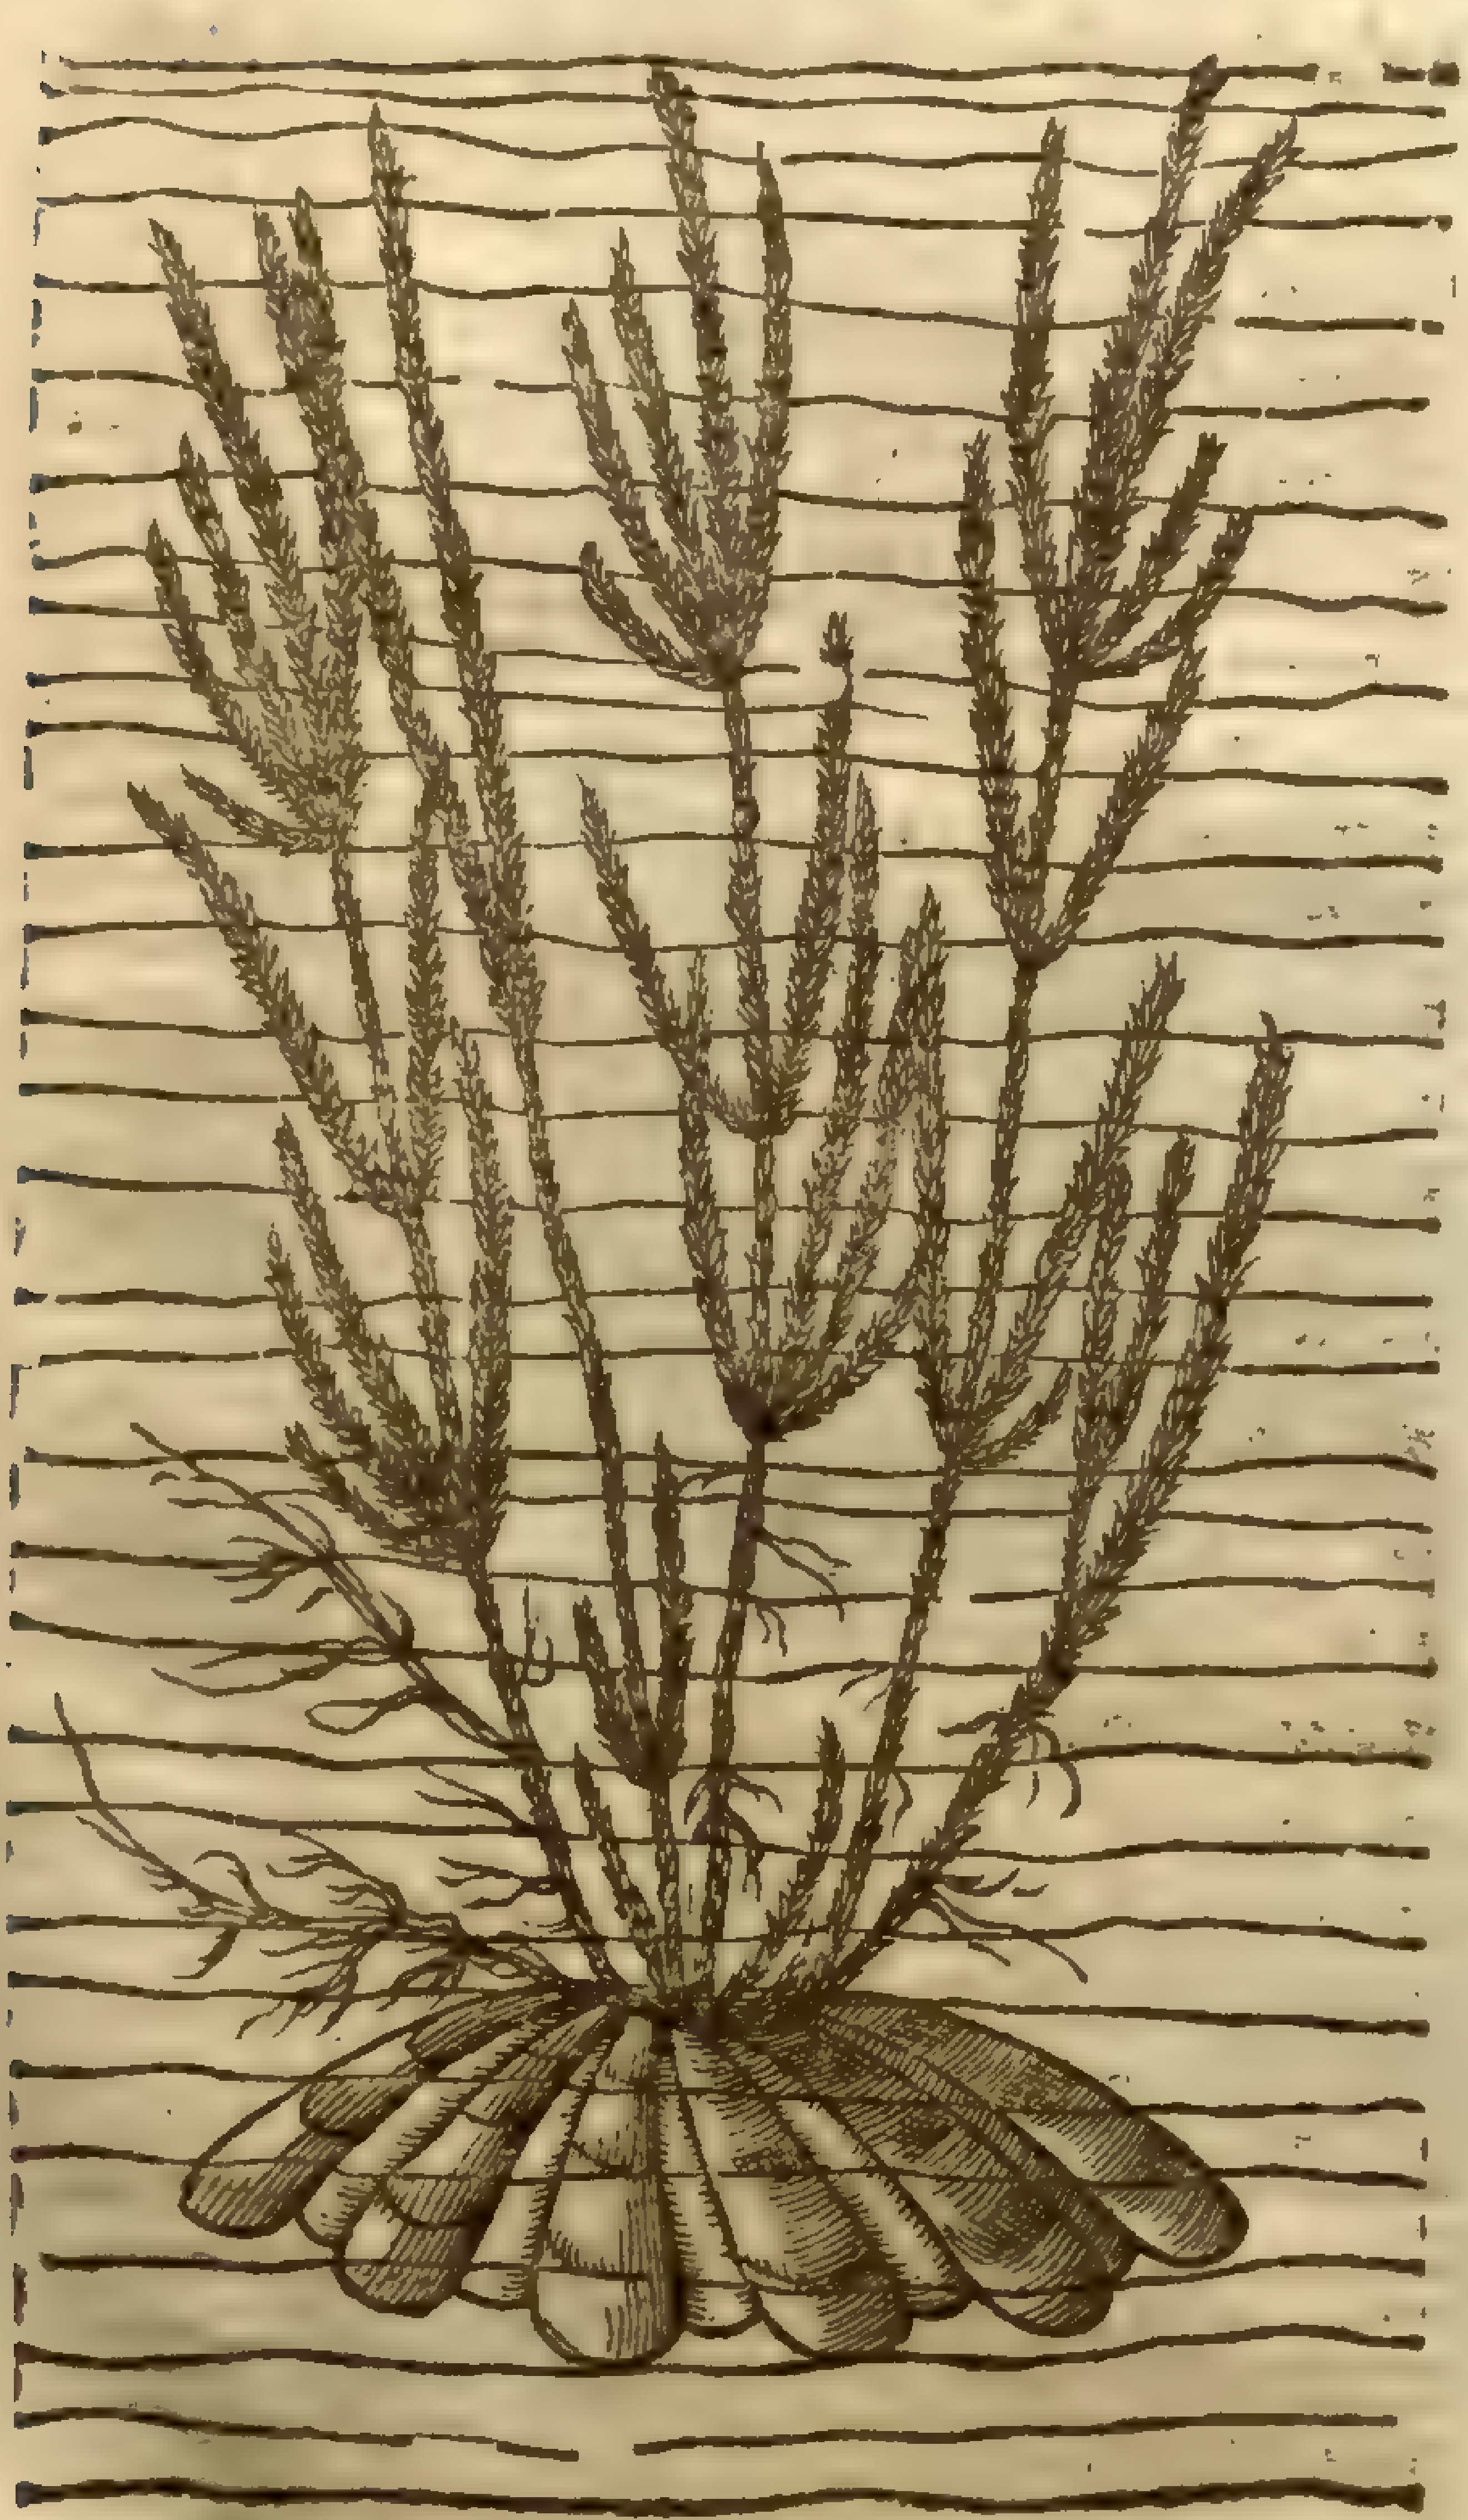
¶ *The Deſcription.*

1 This kinde of Sea moſſe hath many ſmall ſtalks finely couered or ſet ouer with ſmall leaues,very much cut or jagged euen like the leaues of Dill, but hard, and of a ſtony ſubſtance.

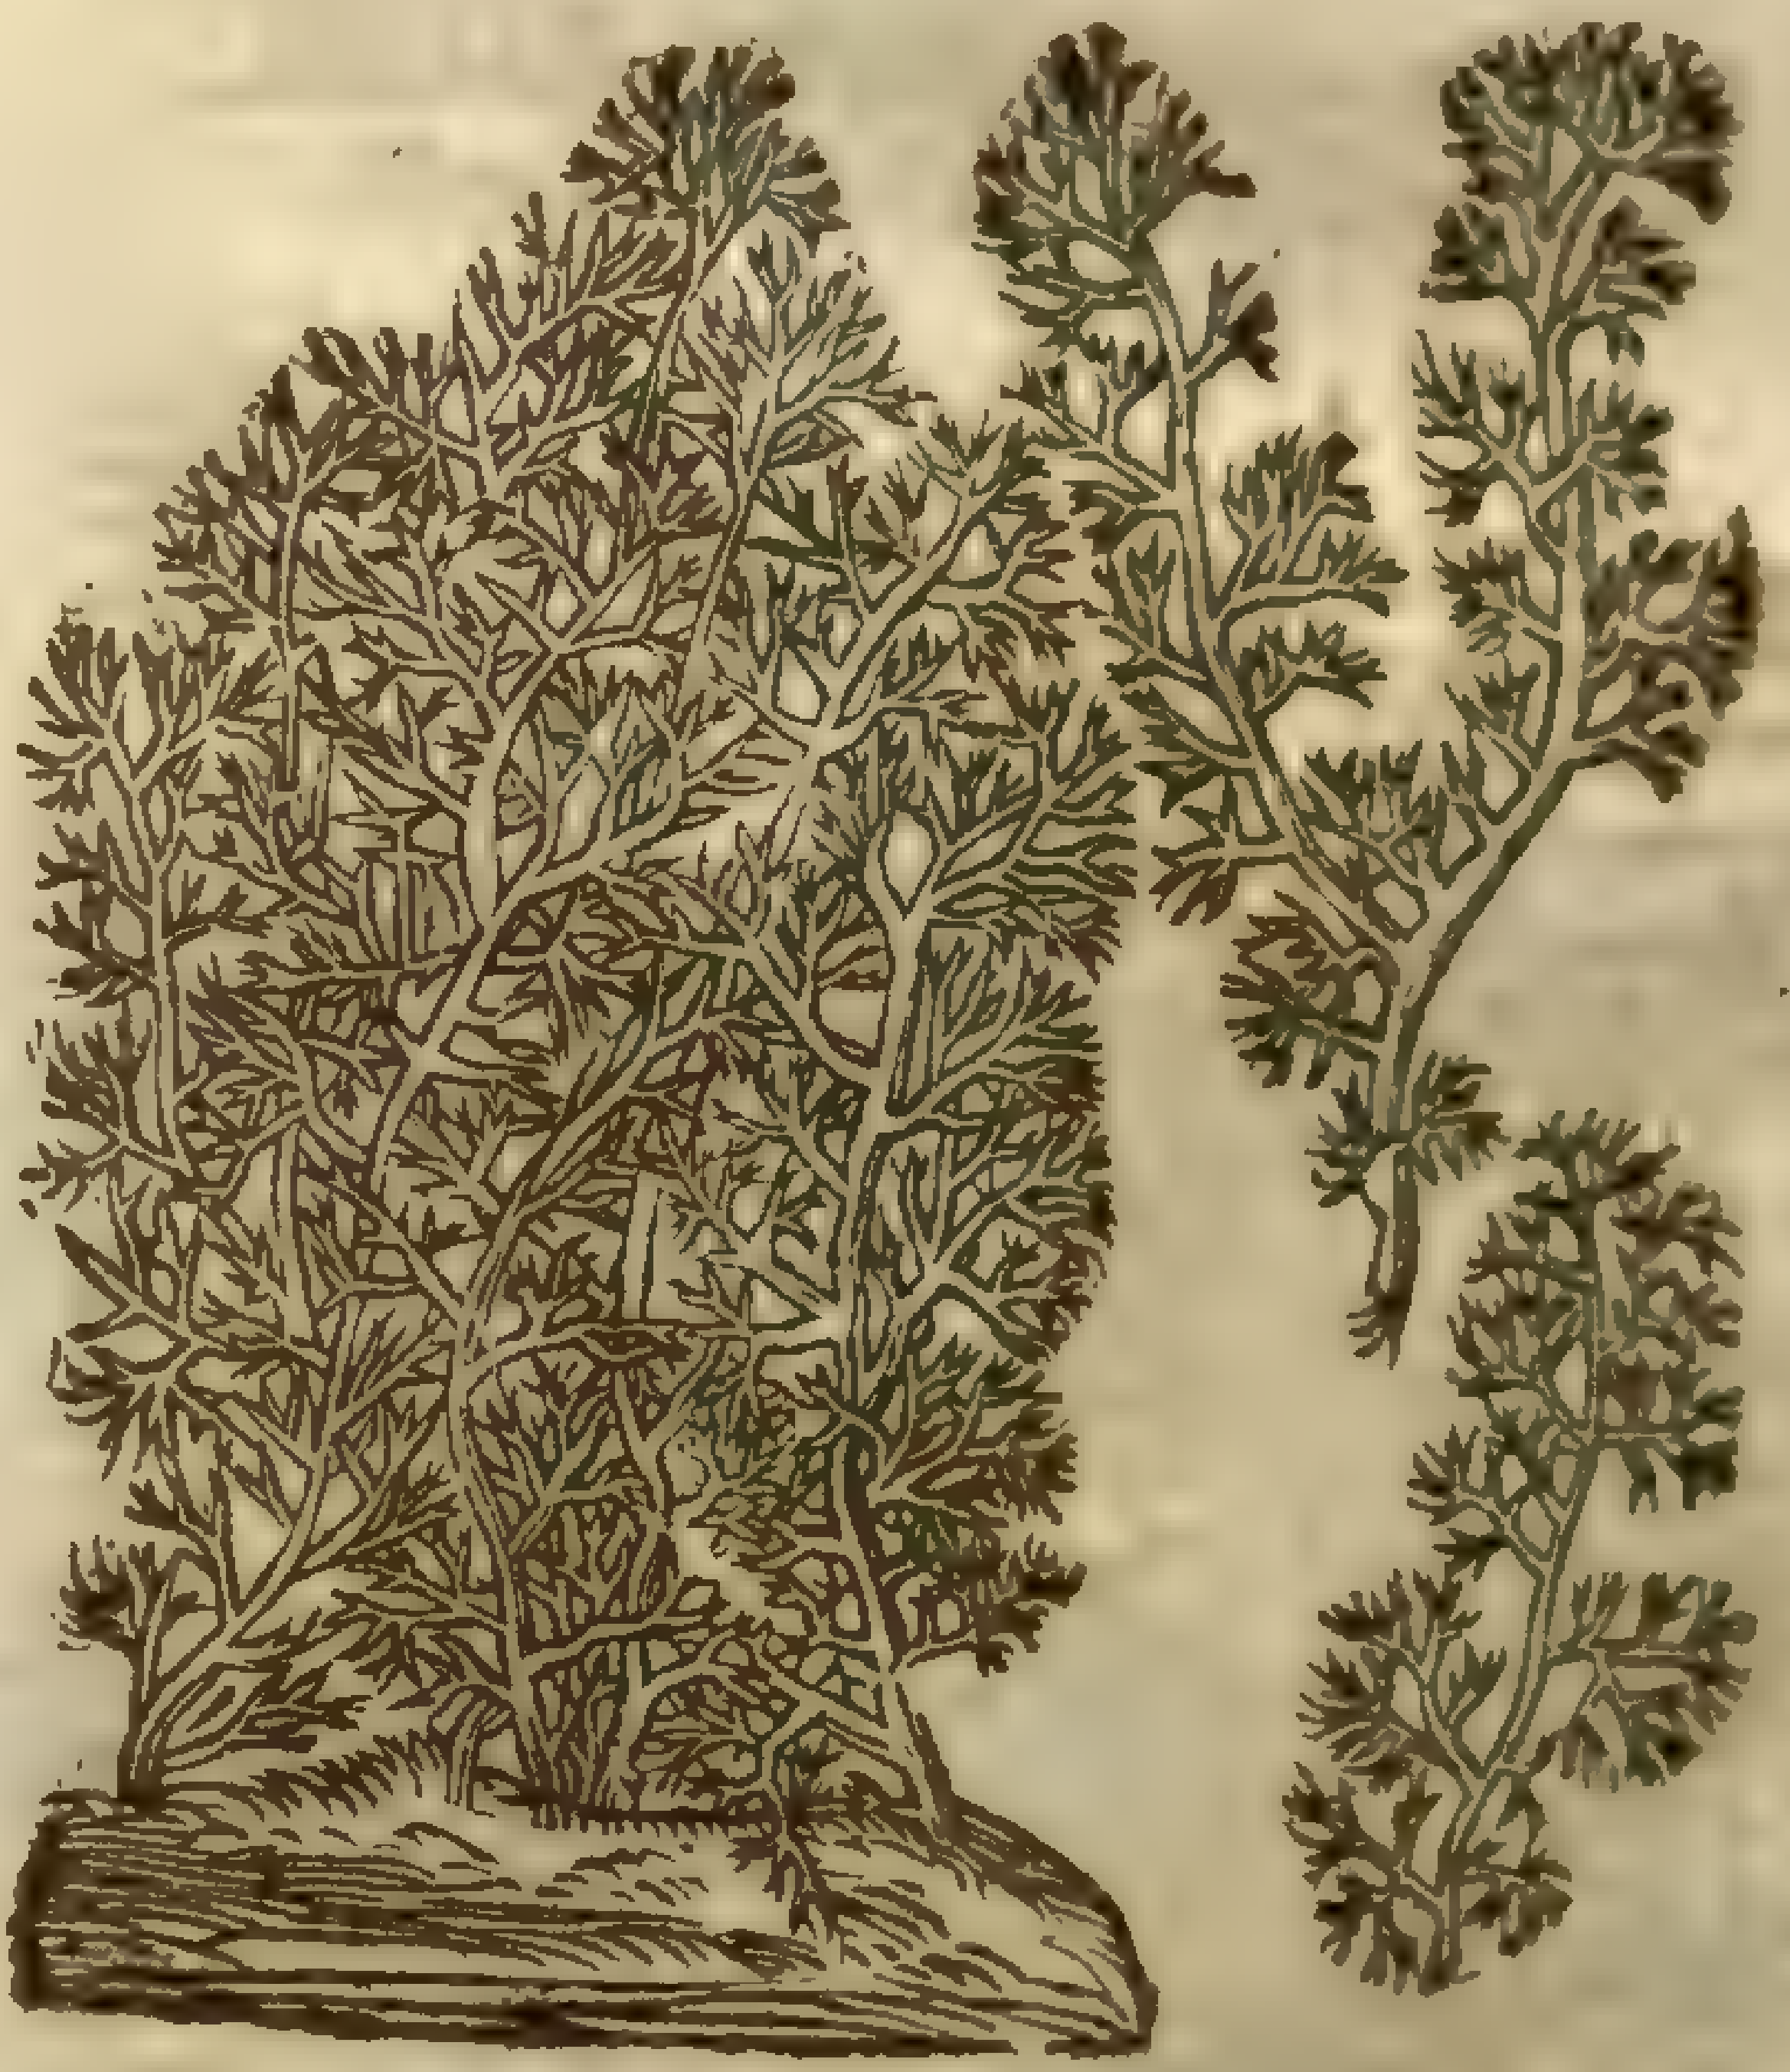
2 The ſecond is much like the former,yet not ſtony,but more finely cut,and growing more vpright,branching it ſelfe into many diuiſions at the top, growing very thicke together,and in great quantity,out of a piece of ſtone, which is faſhioned like an hat or ſmall ſtony head, whereby it is faſtned vnto the rocks.

3 This third kind of Sea moſſe is very well known in ſhops by the name *Corallina*: it yeeldeth forth a great number of ſhoots in ſhape much like to Corall, being full of ſmall branches diſperſed here and there,diuerſly varying his colour according to the place where it is found, beeing in ſome places red,in others yellow and of an herby colour,in ſome gray or of an aſh colour,in other ſome very white.

4 This Sea moſſe is ſomwhat like the former,but ſmaller,and not ſo plentiful where it groweth,proſpering alwaies vpon ſhels,as of Oiſters,Muſcles,and Scallops, as alſo vpon rolling ſtones in the bottom of the water,which haue tumbled down from the high clifs and rocks, notwithſtanding the old Prouerb,That rolling ſtones neuer gather moſſe.



4 *Corallina minima.*
The ſmalleſt Coralline.



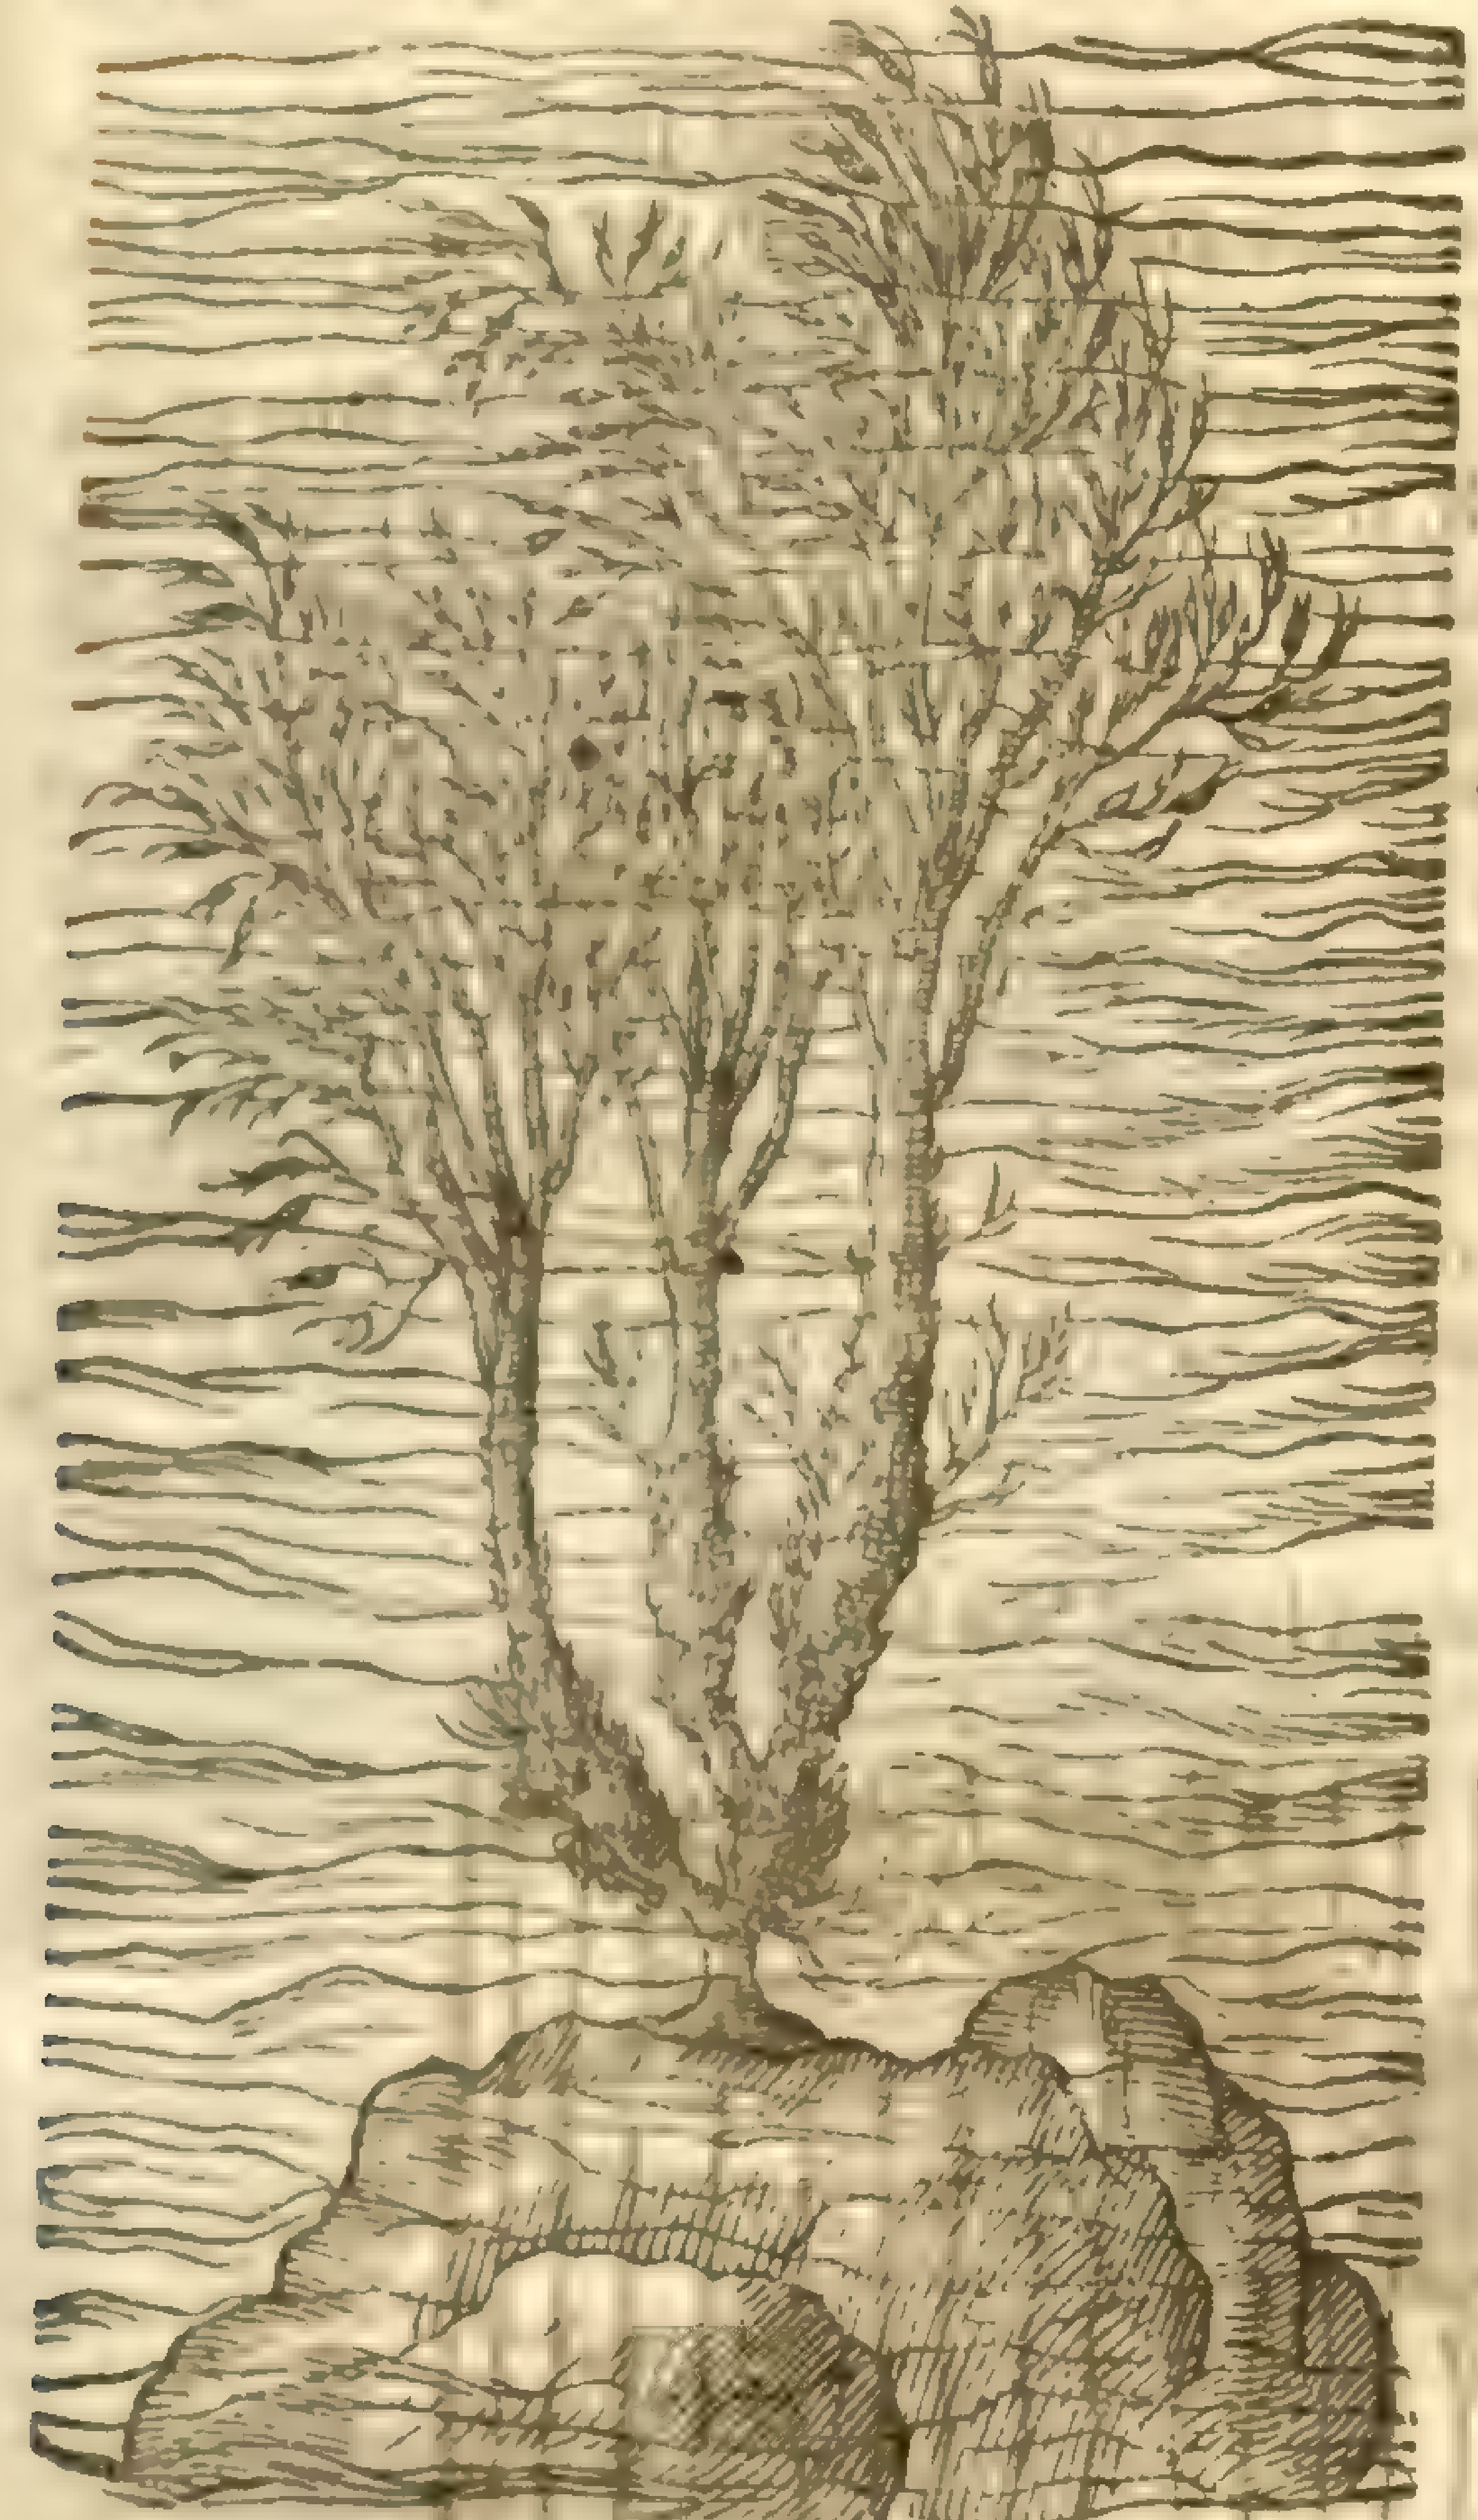
5 *Muſcus Corallinus, ſiue Corallina montana.*
Corall moſſe, or mountain Coralline.

5 There is found vpon the rocks and mountains of France bordering vpon the Mediterranian ſea,a certain kind of Coralline which in theſe parts hath not bin found: it growes in maner like a branch of Corall,but altogether leſſer,of a ſhining red colour,and of a ſtony ſubſtance.

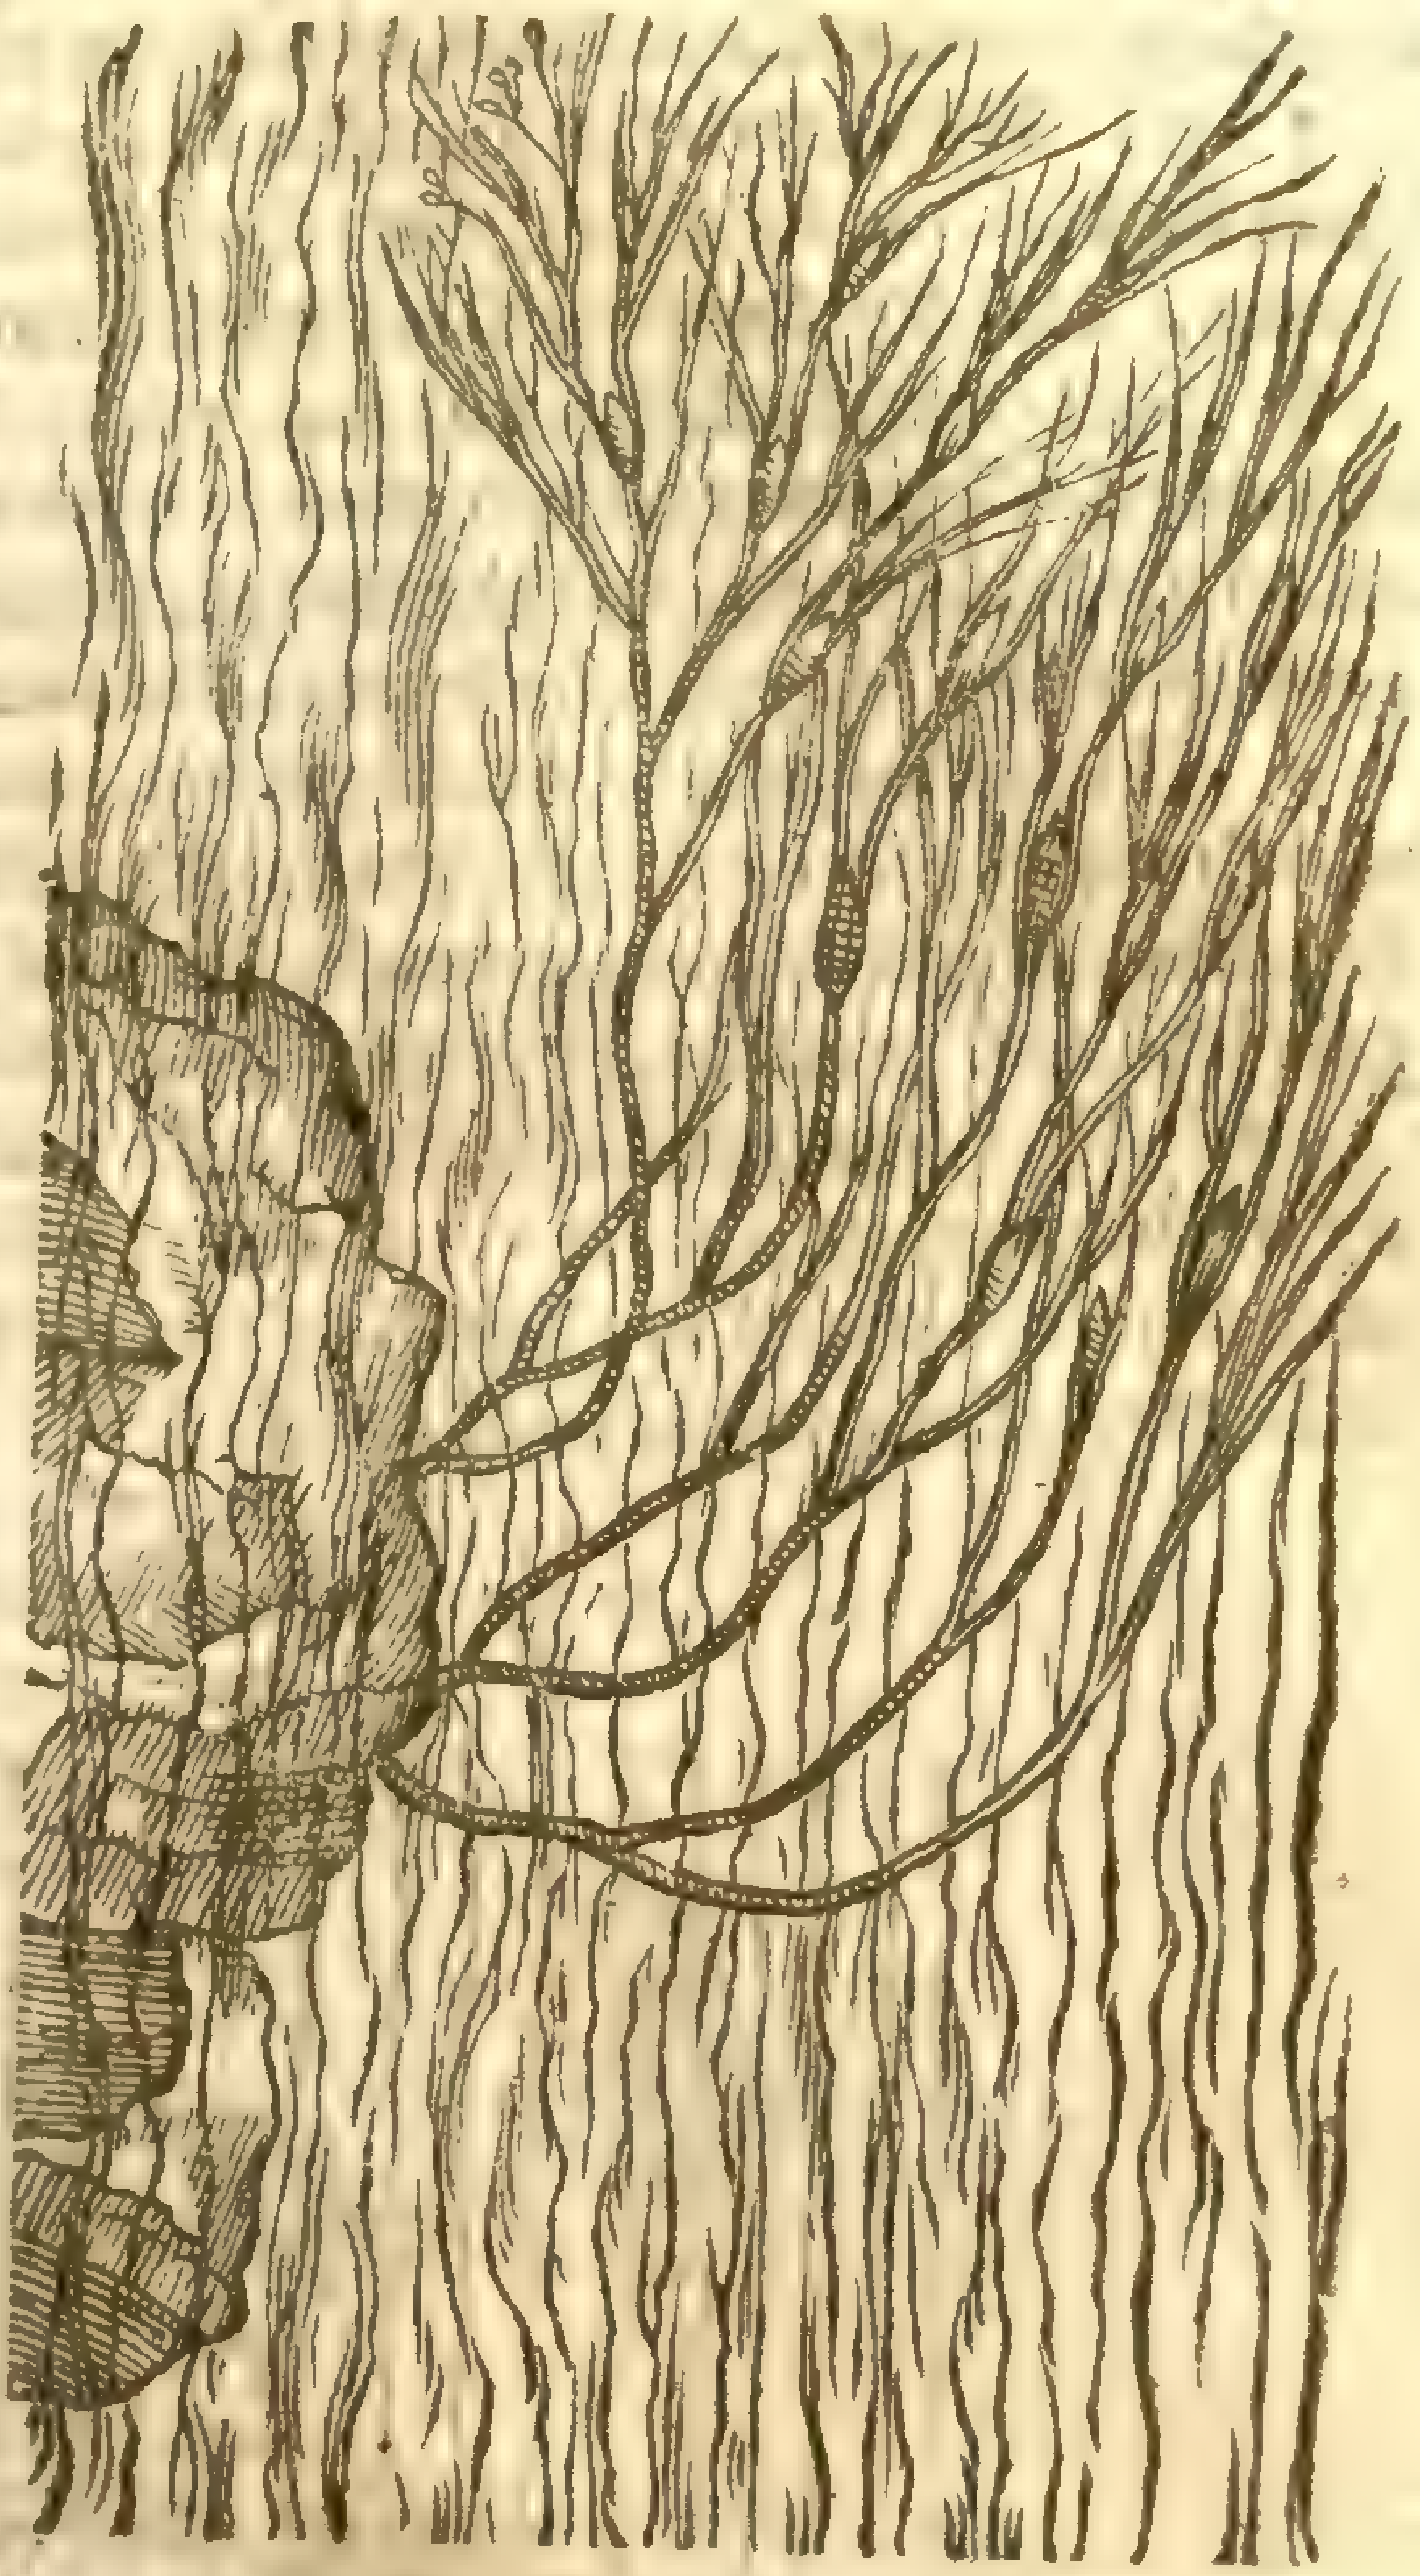
‡ I know not what our Author meant by this deſcription,but the plant which here is figured out of *Tabern*.(and by the ſame title he hath it) is of a moſſe growing vpon Hampſtead heath, and moſt ſuch places of England:it growes vp ſome two or three inches high,and is diuided into very many little branches ending in little threaddy chiues; all the branches are hollow, and of a very light white dry ſubſtance,which makes it ſomwhat reſemble Coralline,yet is it not ſtony at all. ‡

6 There is found vpon the Rocks neere vnto Narbone in France, and not far from the ſea, a kinde

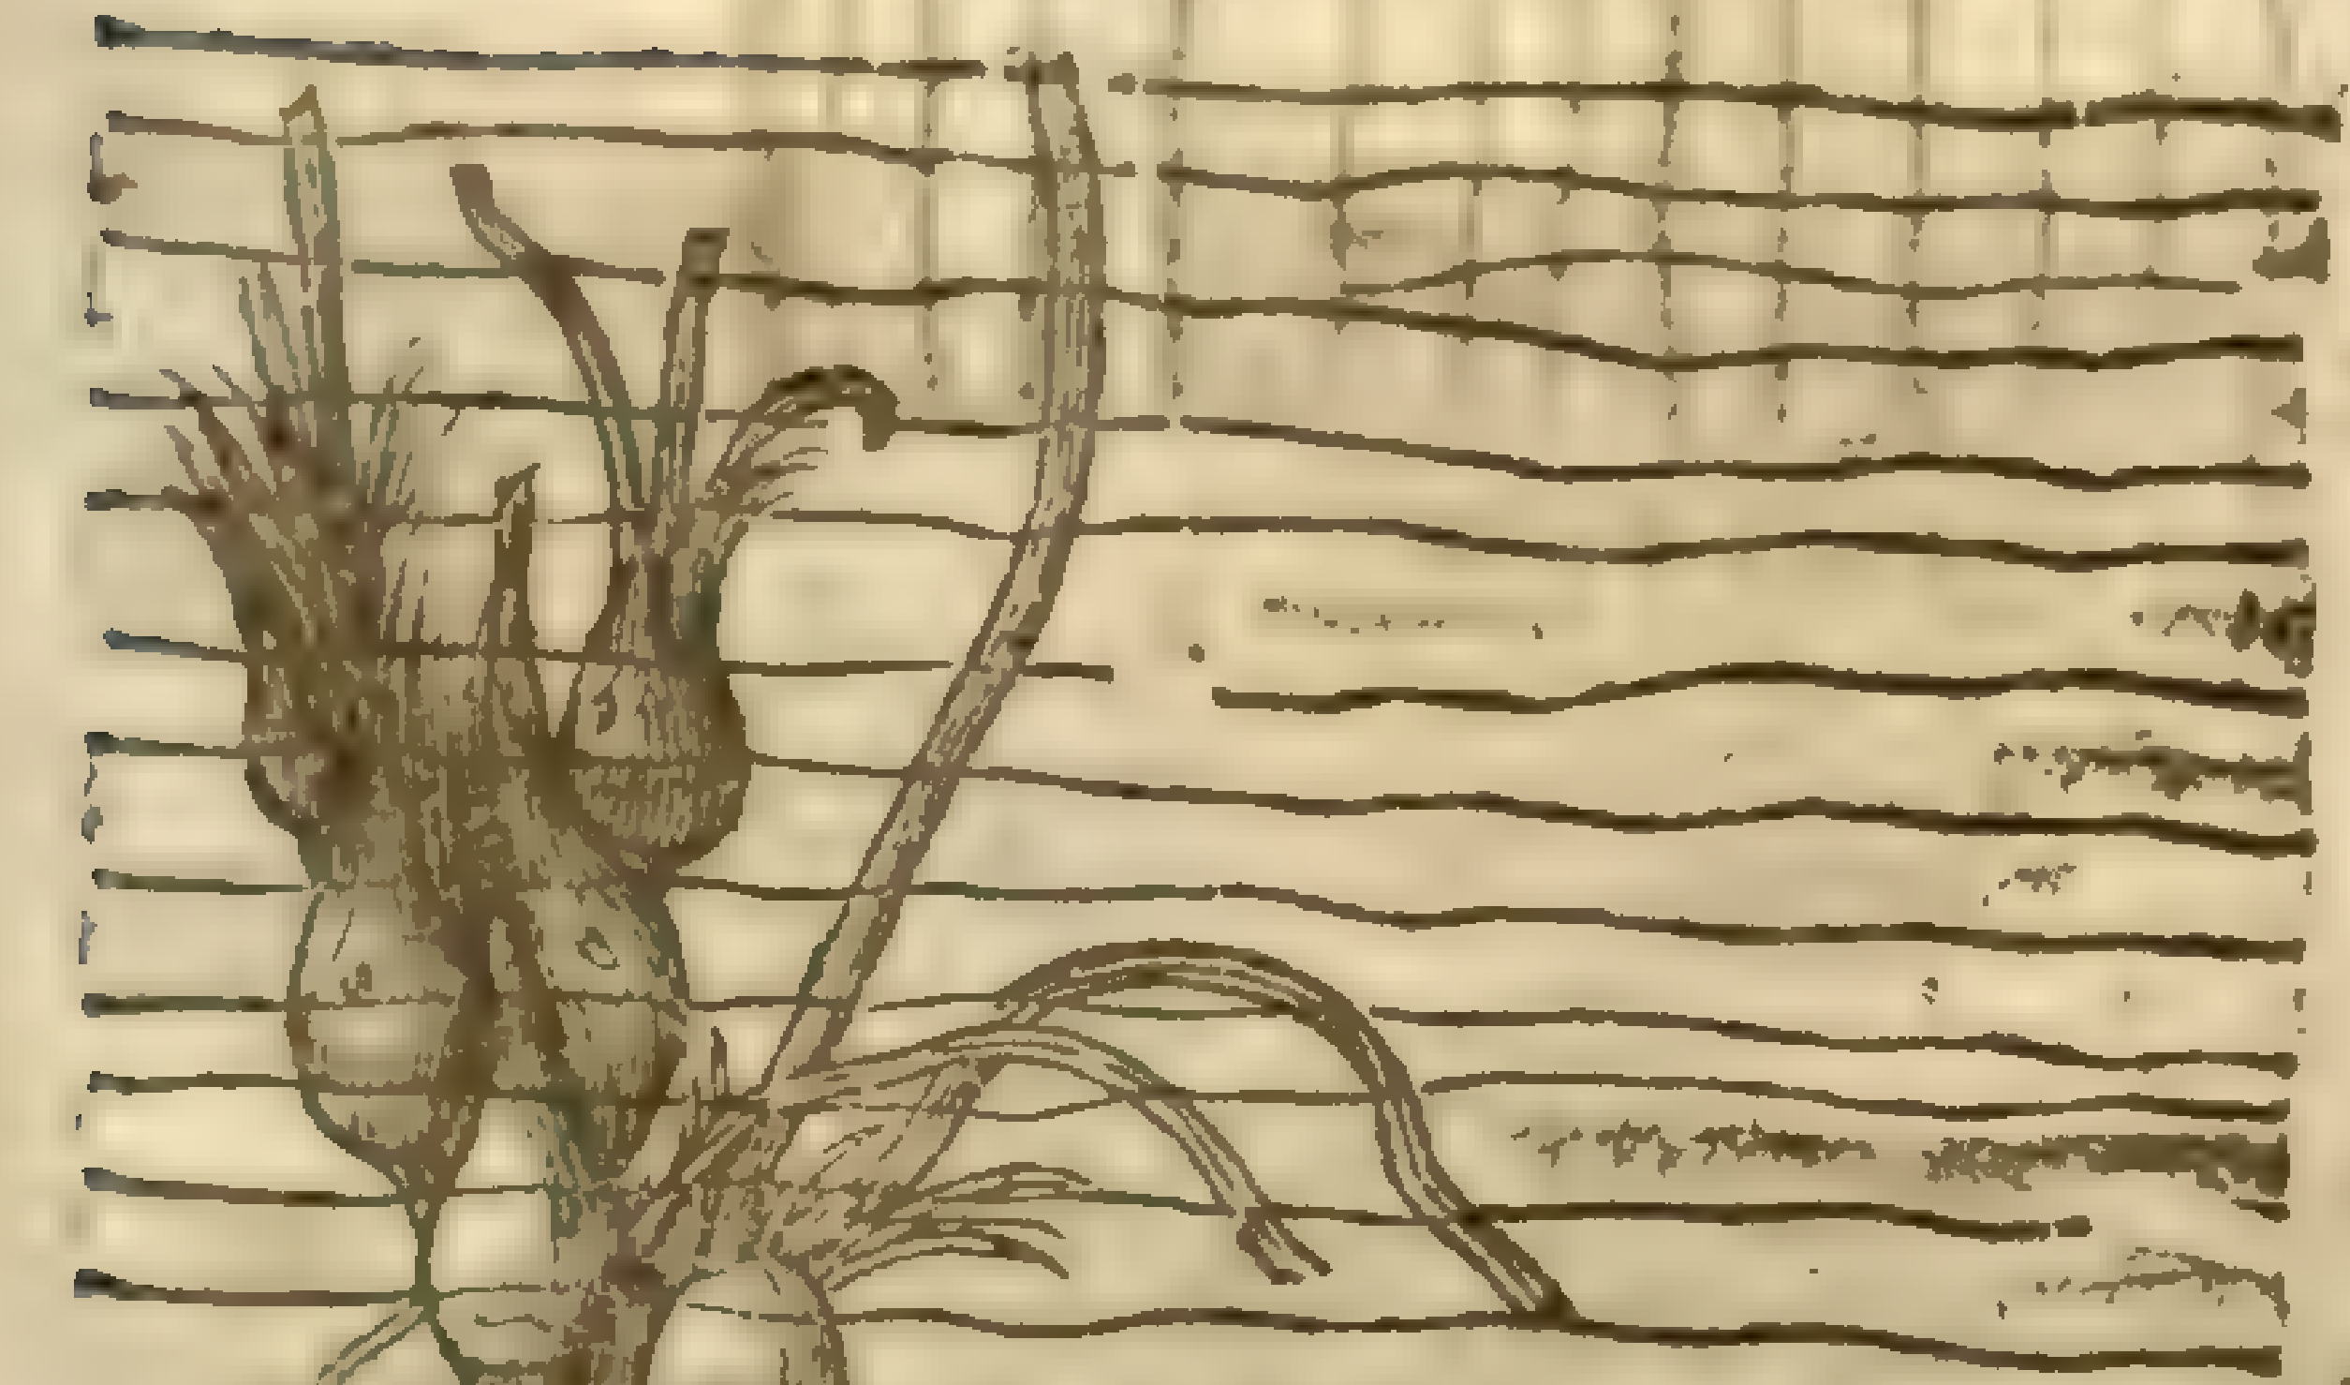
6 *Fucus marinus tenuifolius.*
Fenell Coralline or Fenell Moſſe.



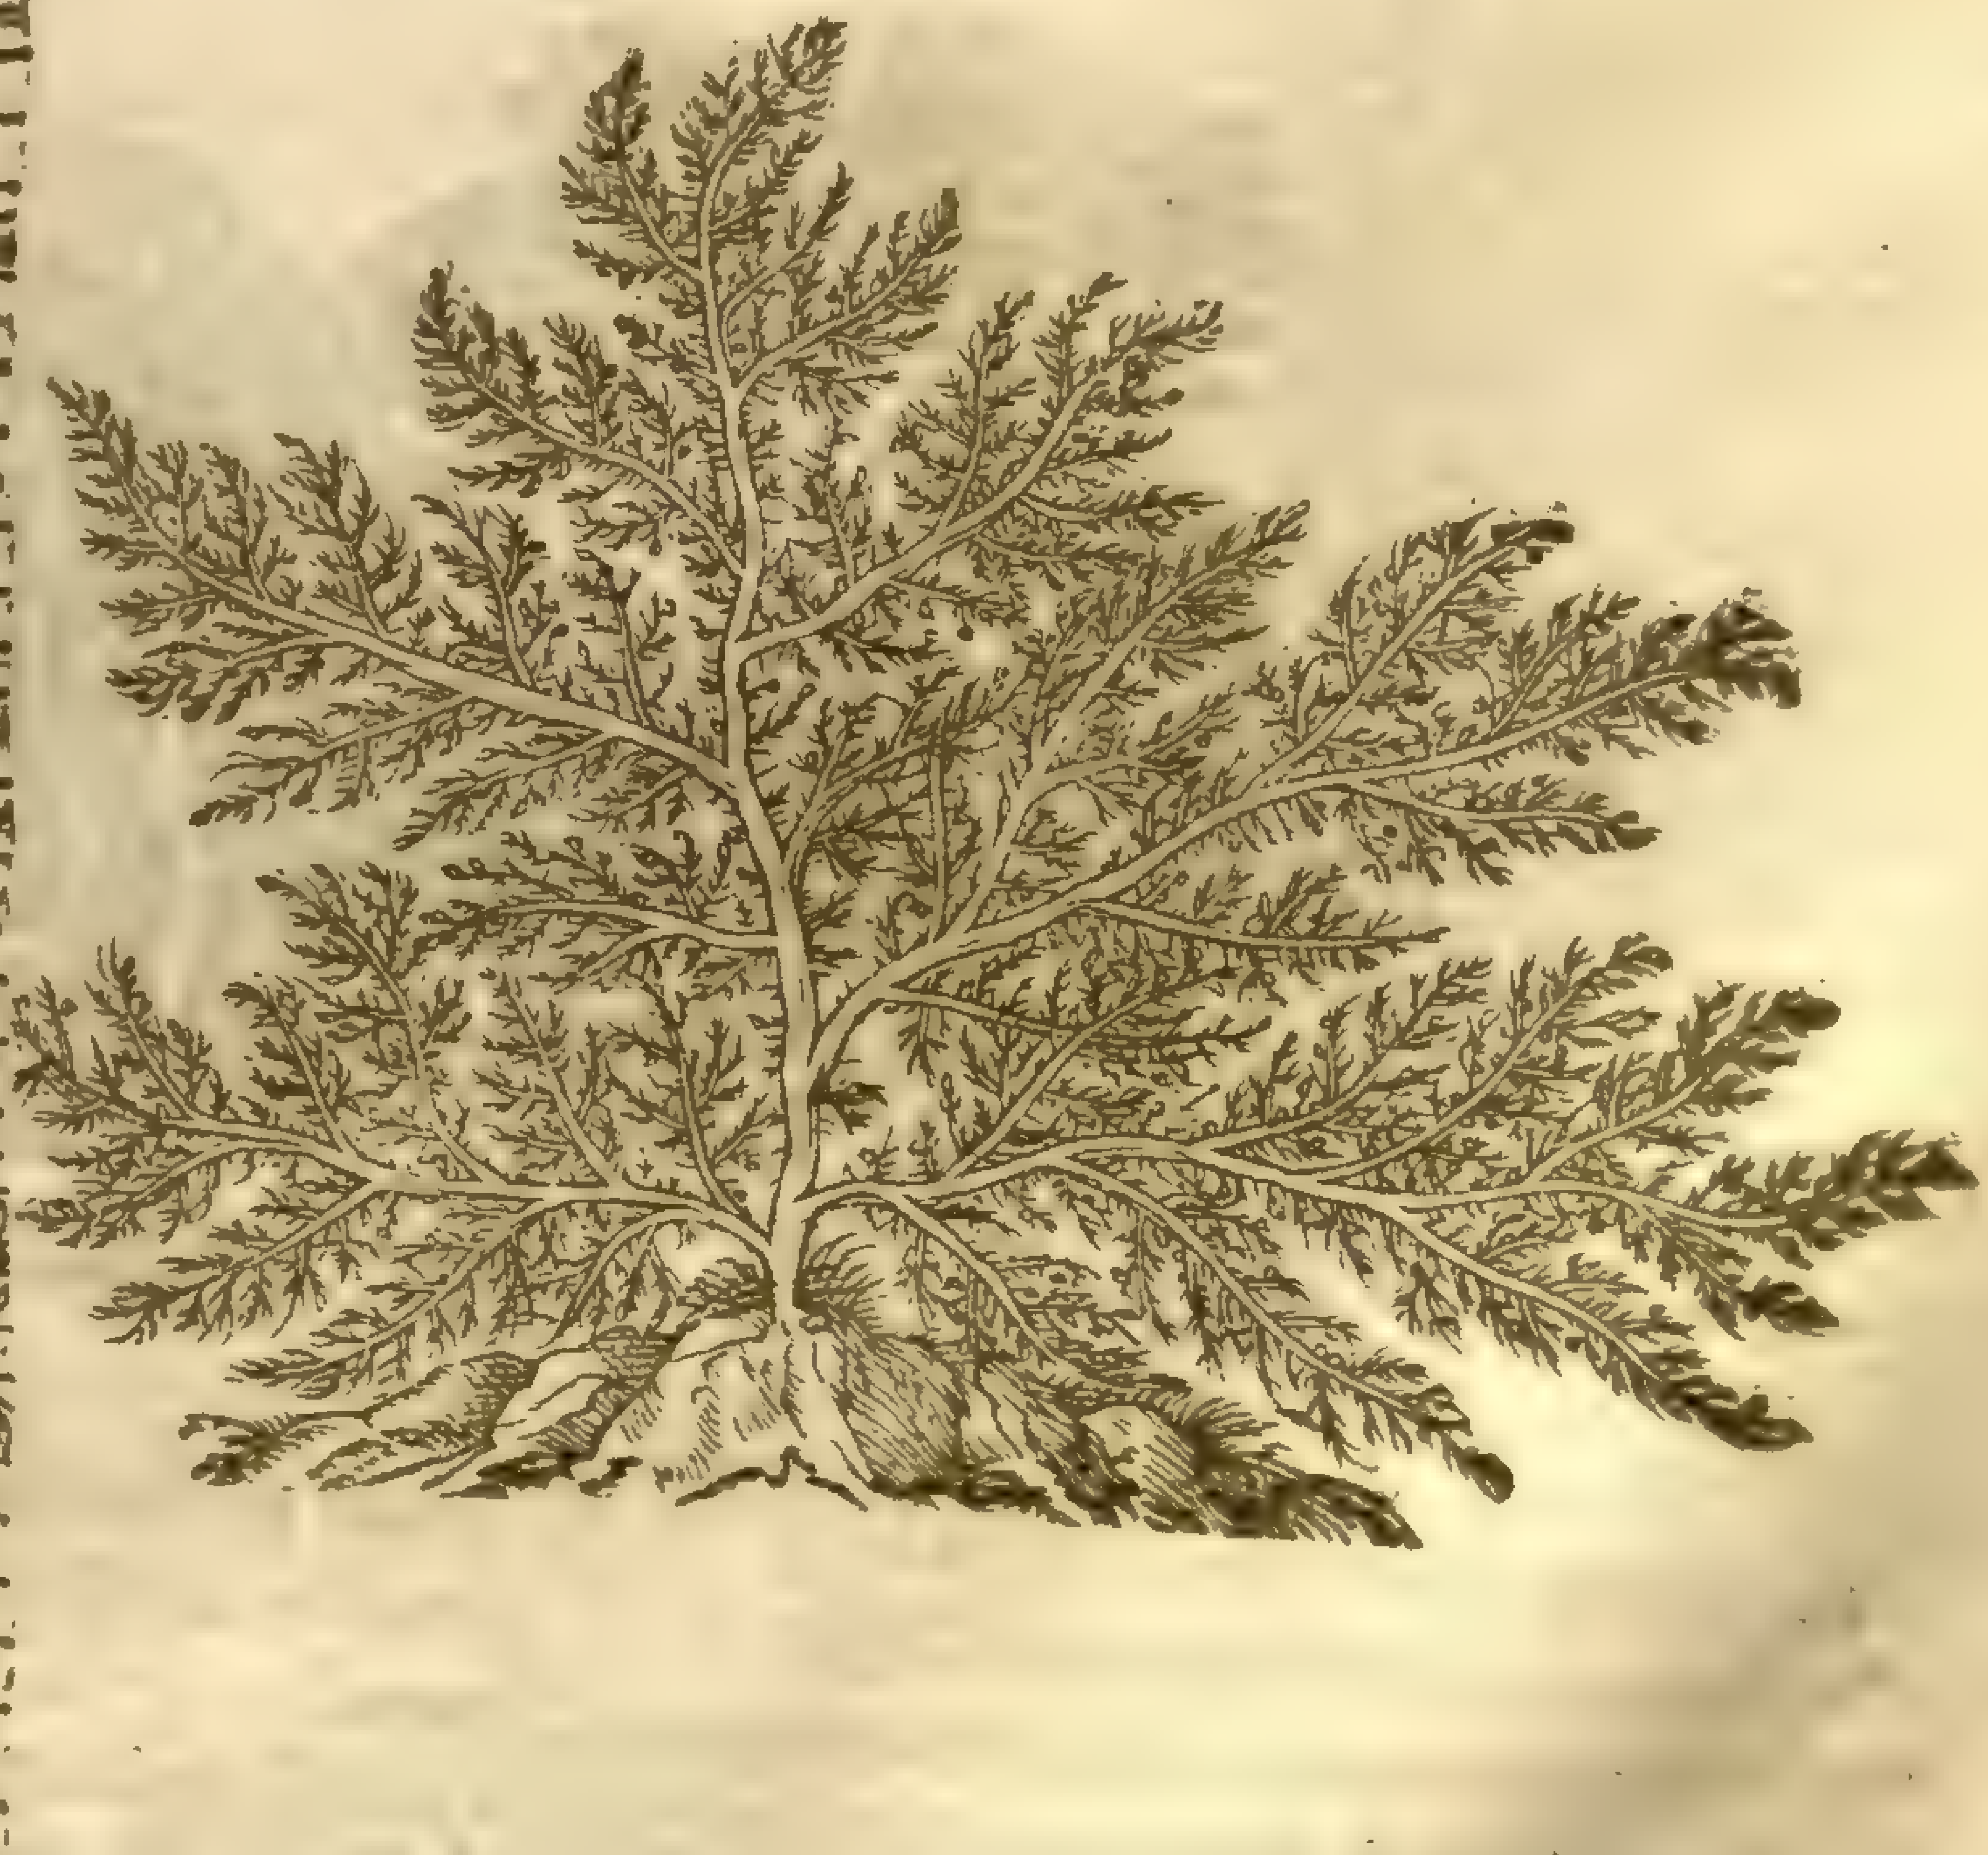
‡ 7 *Fucus ferulaceus.*
Sea Fenell. [illegible]



‡ 8 *Fucus tenuifolius alter.*
Bulbous ſea Fenell.



‡ 9 *Muſcus marinus Cluſij.*
Branched ſea Moſſe.



kinde of Coralline: it groweth vp to the form of a ſmall ſhrub,branched diuerſly,wheron do grow ſmall graſſe-like leaues very finely cut or jagged like to Fenell,yet are they of a ſtony ſubſtance as are the reſt of the Corallines,of a darke ruſſet colour.

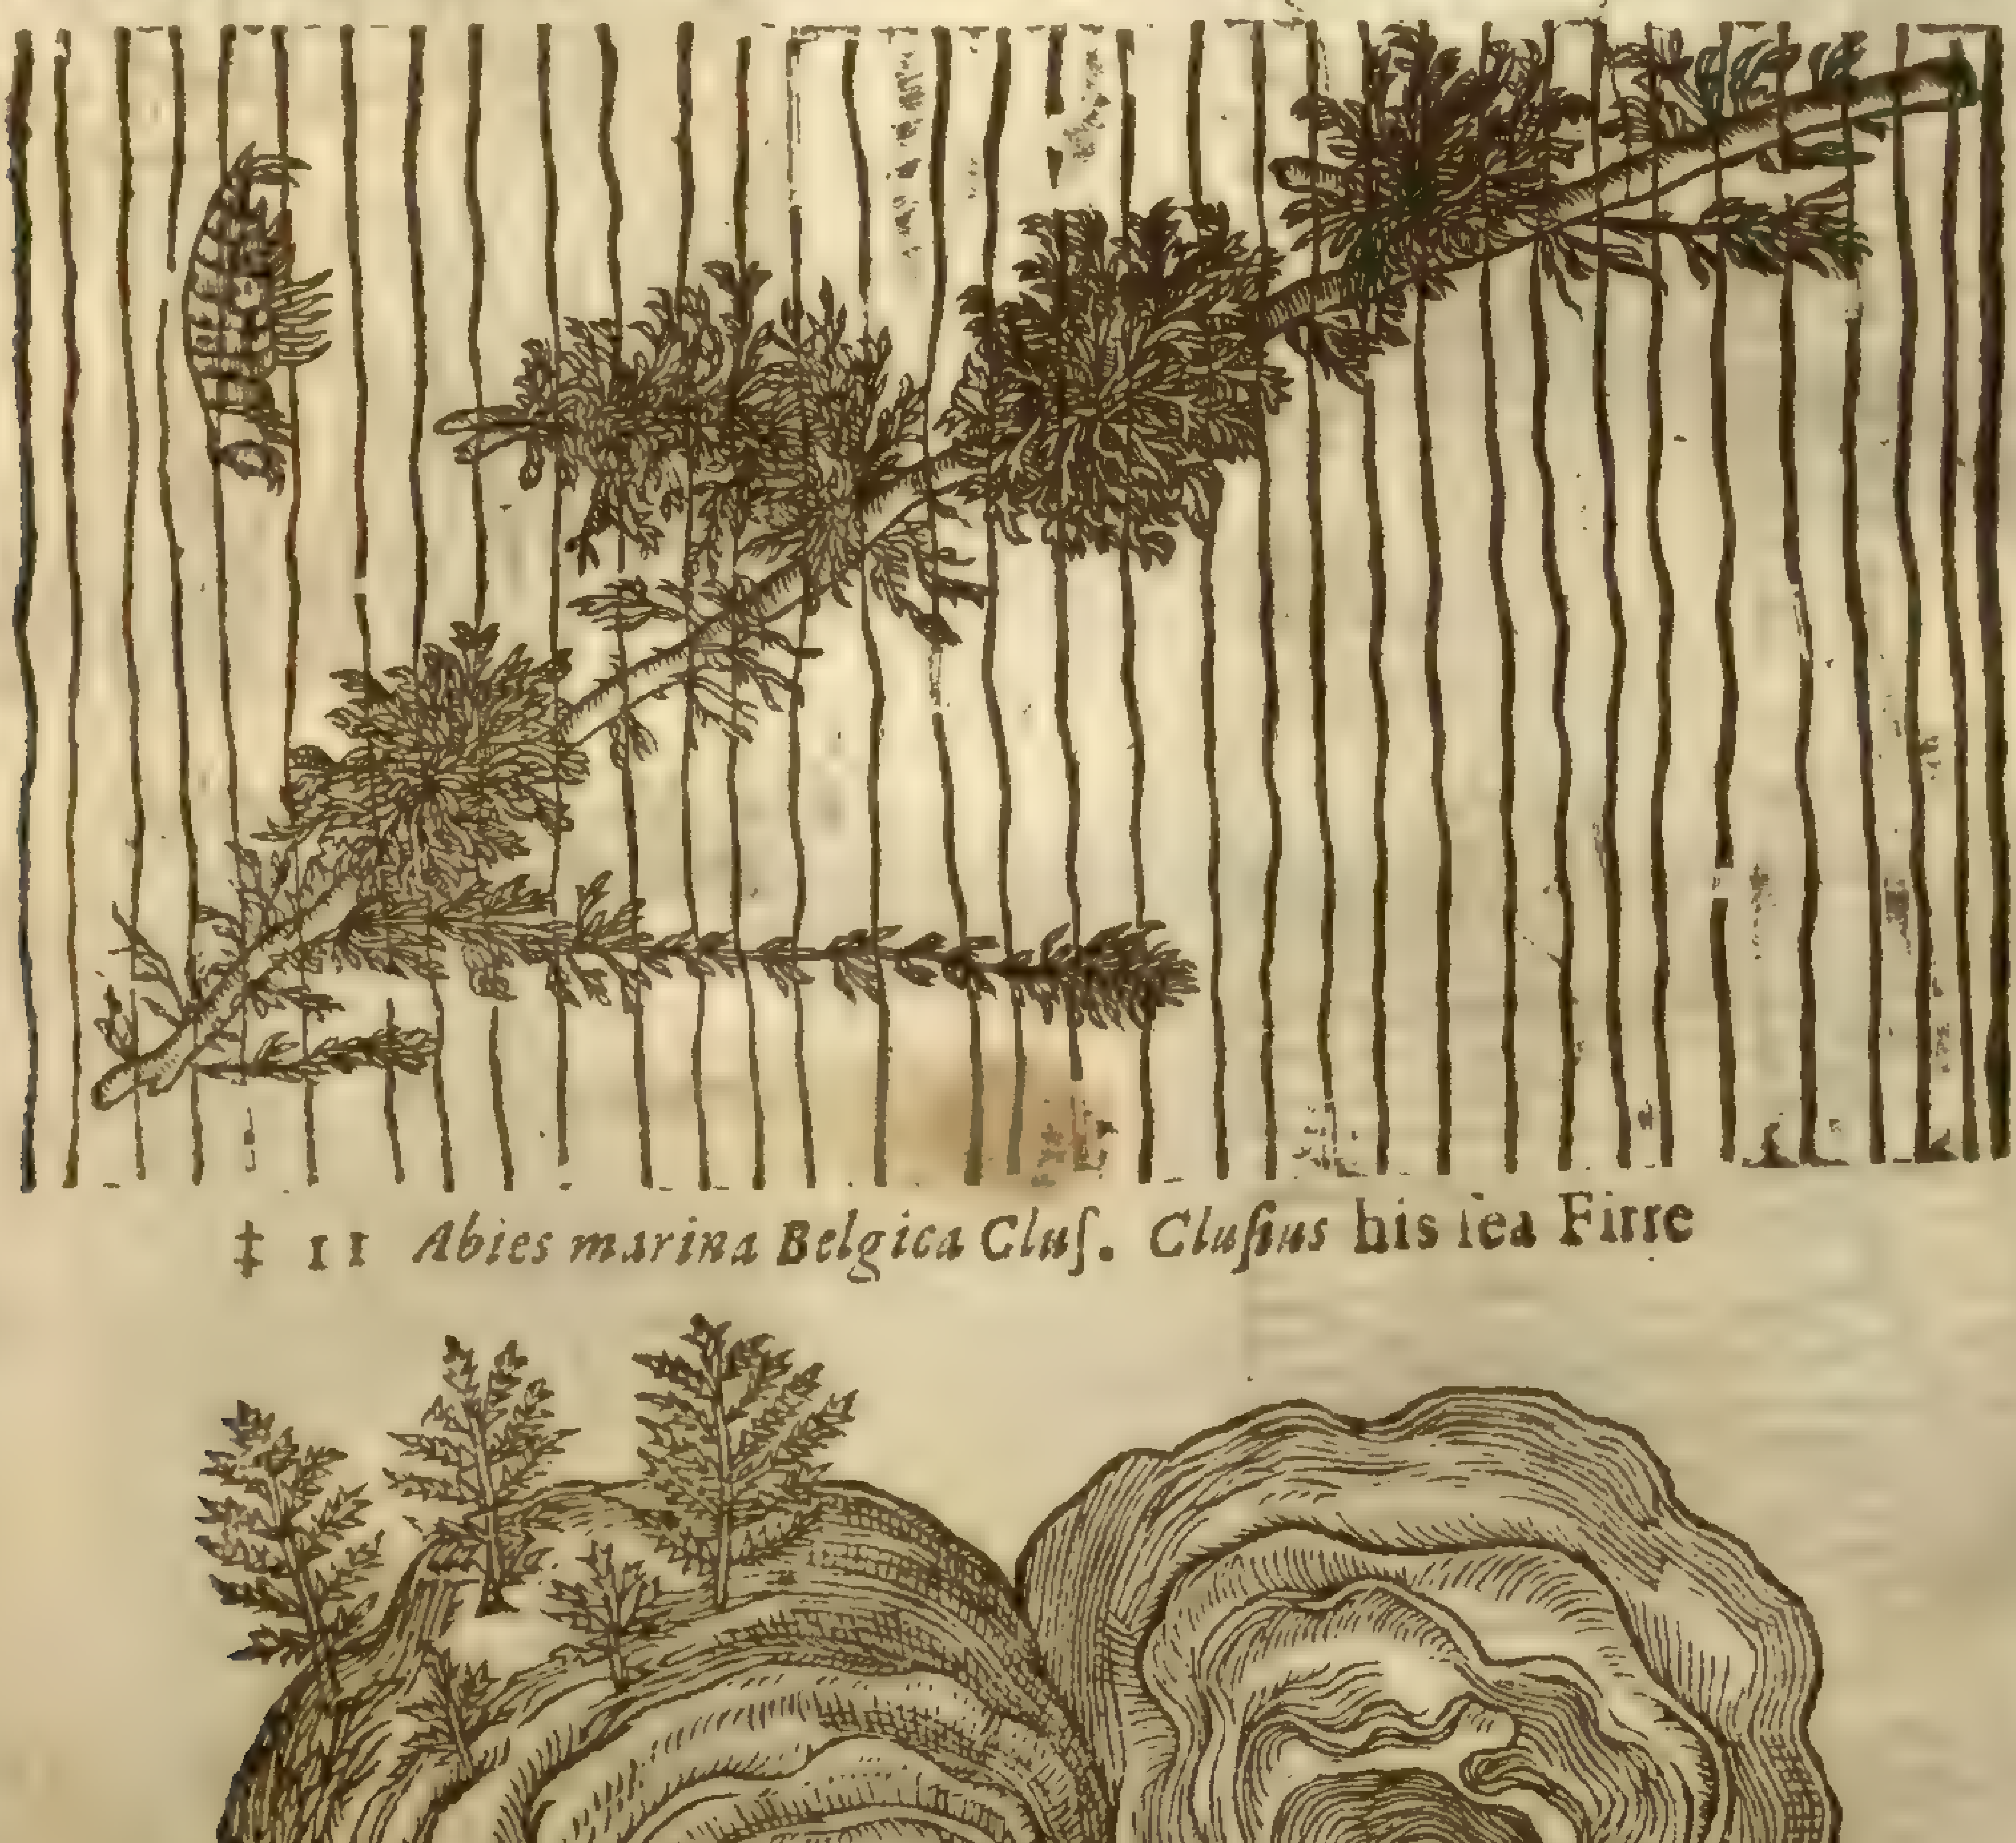
‡ 7 This growes alſo in the like places,hauing many ſmall long Fennel-like diuided leaues vpon ſtalks ſome foot long,with ſome ſwelling eminences here and there ſet in the diuiſions of the leaues. This by *Lobel* is called by the name I here giue you it.

8 This alſo hath fine cut leaues like thoſe of Fenel,but much leſſe and ſhorter,of a faire green colour: theſe grow vp from round tuberous roots,which, together with the fibres they ſend forth, are of a blackiſh colour: the ſtalks alſo are tuberous and ſwoln as in other plants of this kinde. It growes in the ſea with the former. *Dodonæus* calls this *Fucus marinus virens tenuifolius.*

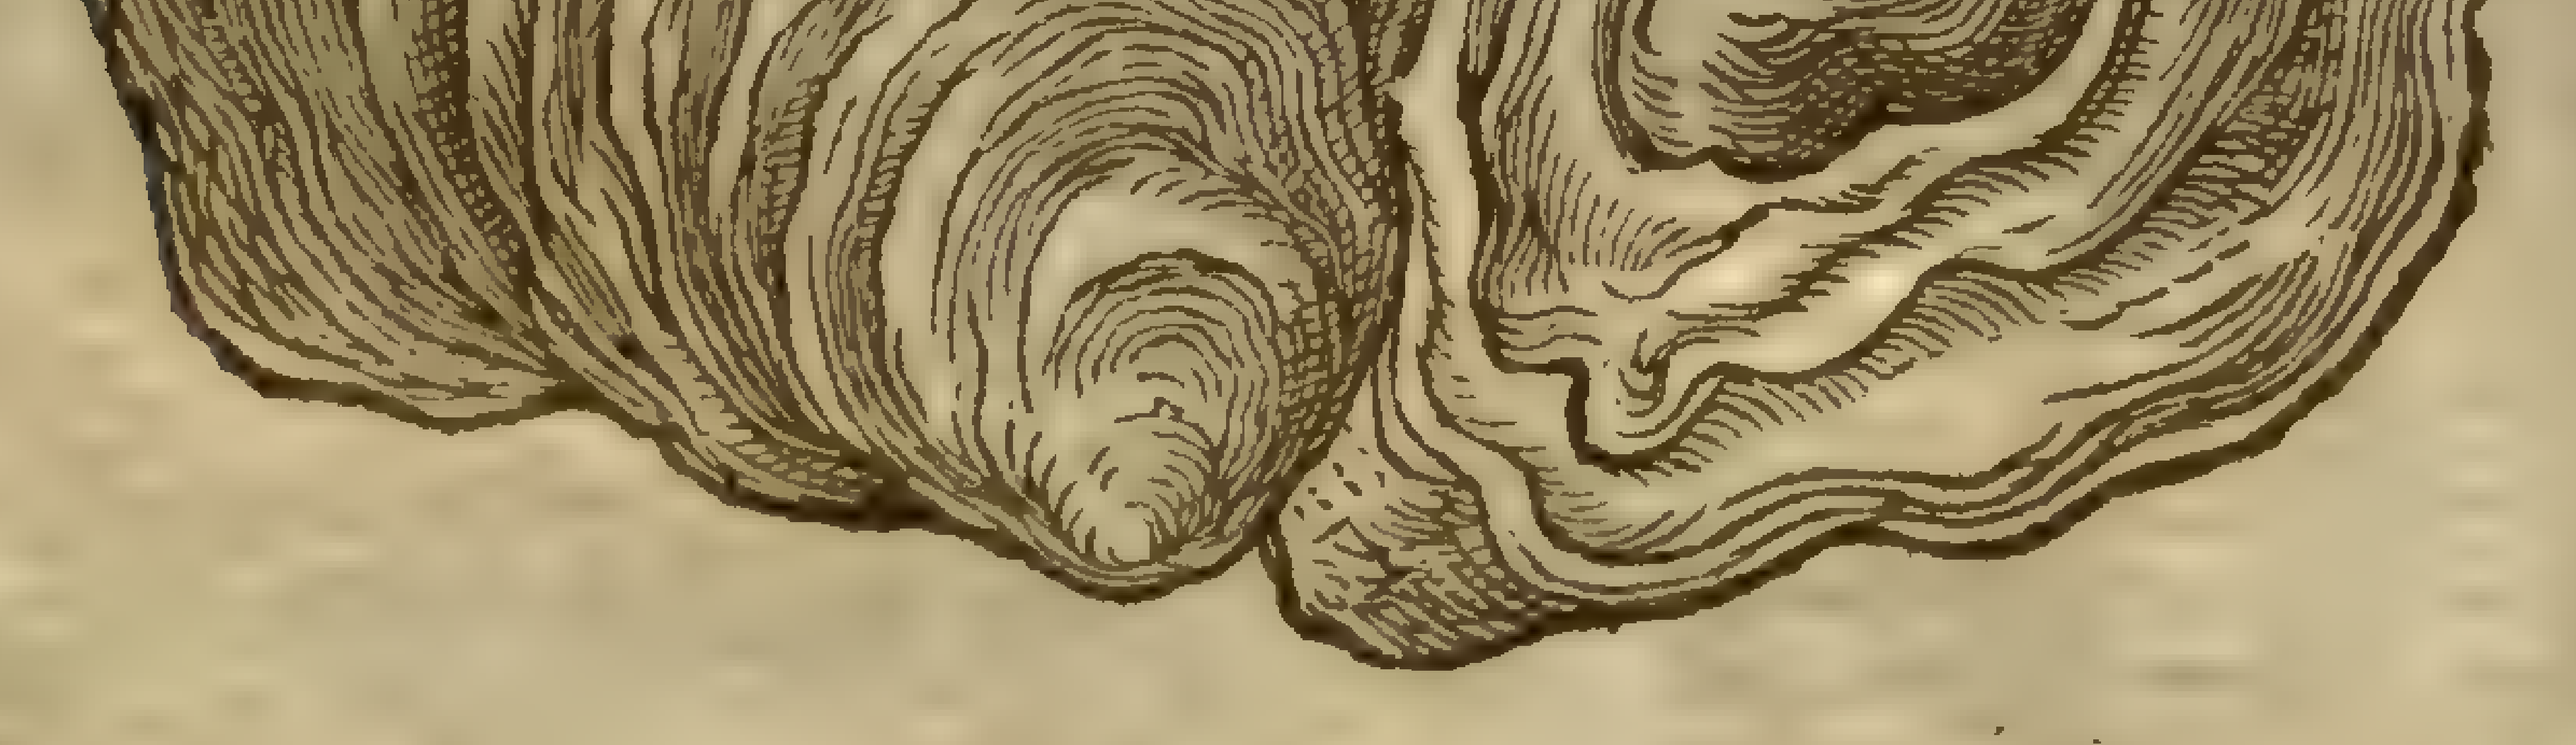
9 This kind of Sea moſſe grows ſome foure or more inches long,diuided into many branches which are ſubdiuided into ſmaller,ſet with leaues finely jagged like thoſe of Camomil;at firſt ſoft flexible and tranſparent,green below,and purpliſh aboue: being dried it becommeth rough & fragile like as Coralline. It growes in the Mediterranian ſea.

10 This Sea moſſe is a low little excreſcence,hauing ſomwhat broad cut leaues growing many from one root: in the whole face it reſembles the moſſe that growes vpon the branches of okes and other trees,and is alſo white and very like it,but much more brittle. This by *Dodonæus* is called *Muſcus marinus tertius.*

‡ 10 *Muſcus marinus 3. Dod.* Broad leafed Sea Moſſe.



‡ 11 *Abies marina Belgica Cluſ. Cluſius* his ſea Firre



11 Vpon the rocks and ſhels of ſea fiſhes are to be found diuers ſmall plants reſembling others that grow on the land; and *Cluſius* ſaith,vpon the coaſt of the Low-countries he obſerued one that very much reſembled the Fir tree,hauing branches growing orderly on both ſides, but thoſe very brittle and ſmall,ſeldome exceeding an handfull in height,and couered as it were with many ſmall ſcales. He obſerued others that reſembled Cypreſſe trees,and other branches that reſembled Tamariske or Heath. ‡

¶ *The*

¶ *The Place.*

Theſe Moſſes grow in the ſea vpon the rocks, and are often found vpon oiſter ſhels, muskle ſhels, and ſtones. I found great plenty thereof vnder Reculuers and Margate, in the Iſle of Tenet, and in other places alongſt the ſands from thence to Dover.

¶ *The Time.*

The time anſwereth the other Moſſes, and are found at all times of the yeare.

¶ *The Names.*

Sea moſſe is called in Greeke, Βρύον θαλάσσιον; in Latine, *Muſcus marinus*: of the Apothecaries, Italians, and French men, *Corallina*: in Spaniſh, *Malharquiana yerva*: in high-Dutch, **Meermoſz**: in low-Dutch, **Zee Moſch**: in Engliſh, Sea moſſe, and of many Corallina, after the Apothecaries word, and it may be called Corall moſſe. The titles diſtinguiſh the other kindes.

¶ *The Temperature.*

Corallina conſiſteth, as *Galen* ſaith, of an earthy and wateriſh eſſence, both of them cold: for by his taſte he bindeth, and being applied to any hot infirmitie it alſo euidently cooleth. The earthy eſſence of this moſſe hath in it alſo a certain ſaltneſſe, by reaſon wherof it likewiſe dries mightily.

¶ *The Vertues.*

Dioſcorides commendeth it to be good for the gout which hath need of cooling. A

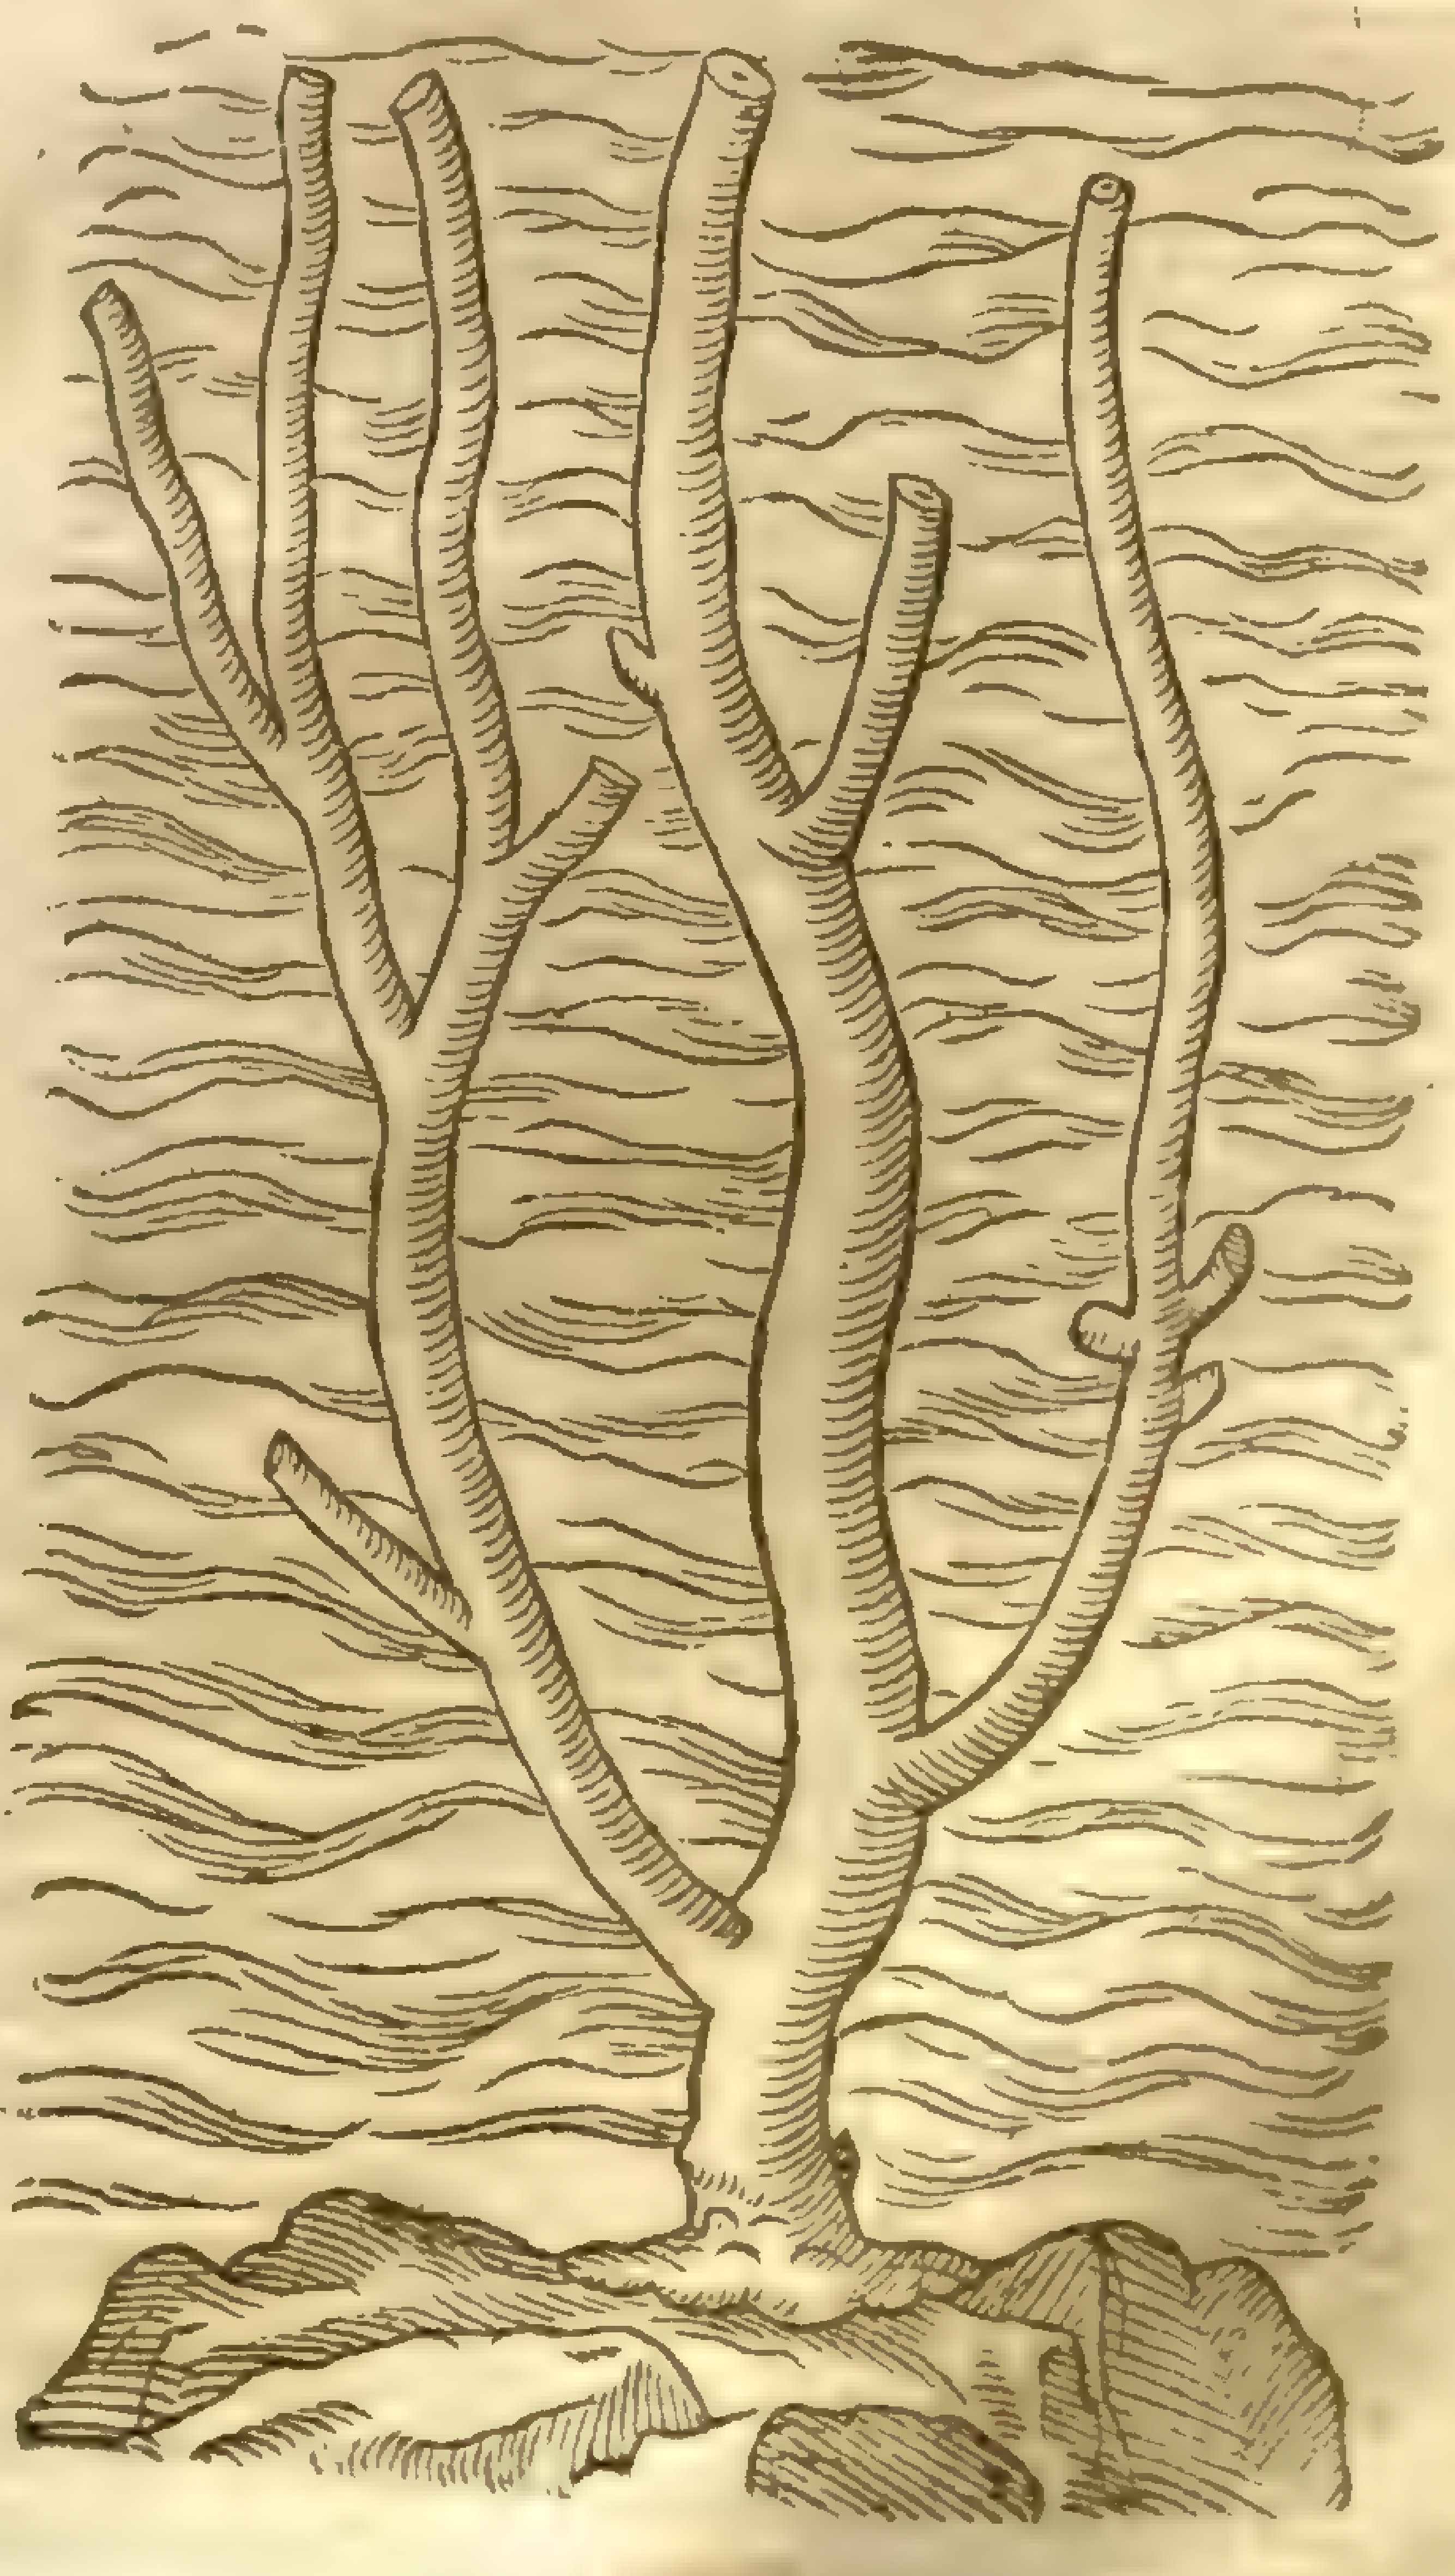
The later phyſitians haue found by experience that it killeth wormes in the belly. It is giuen to this purpoſe to children in the weight of a dram or thereabouts. B

That which cleaueth to Corall, and is of a reddiſh colour, is of ſome preferred and taken for the beſt: they count that which is whitiſh to be the worſer; notwithſtanding in the French ocean, the Britain, the Low-country, and the German ocean ſea there is ſcarce found any but the whitiſh Coralline, which the nations neere adioyning do effectually vſe. C

Chap. 166. *Of Corall.*

1 *Corallium rubrum.*
Red Corall.

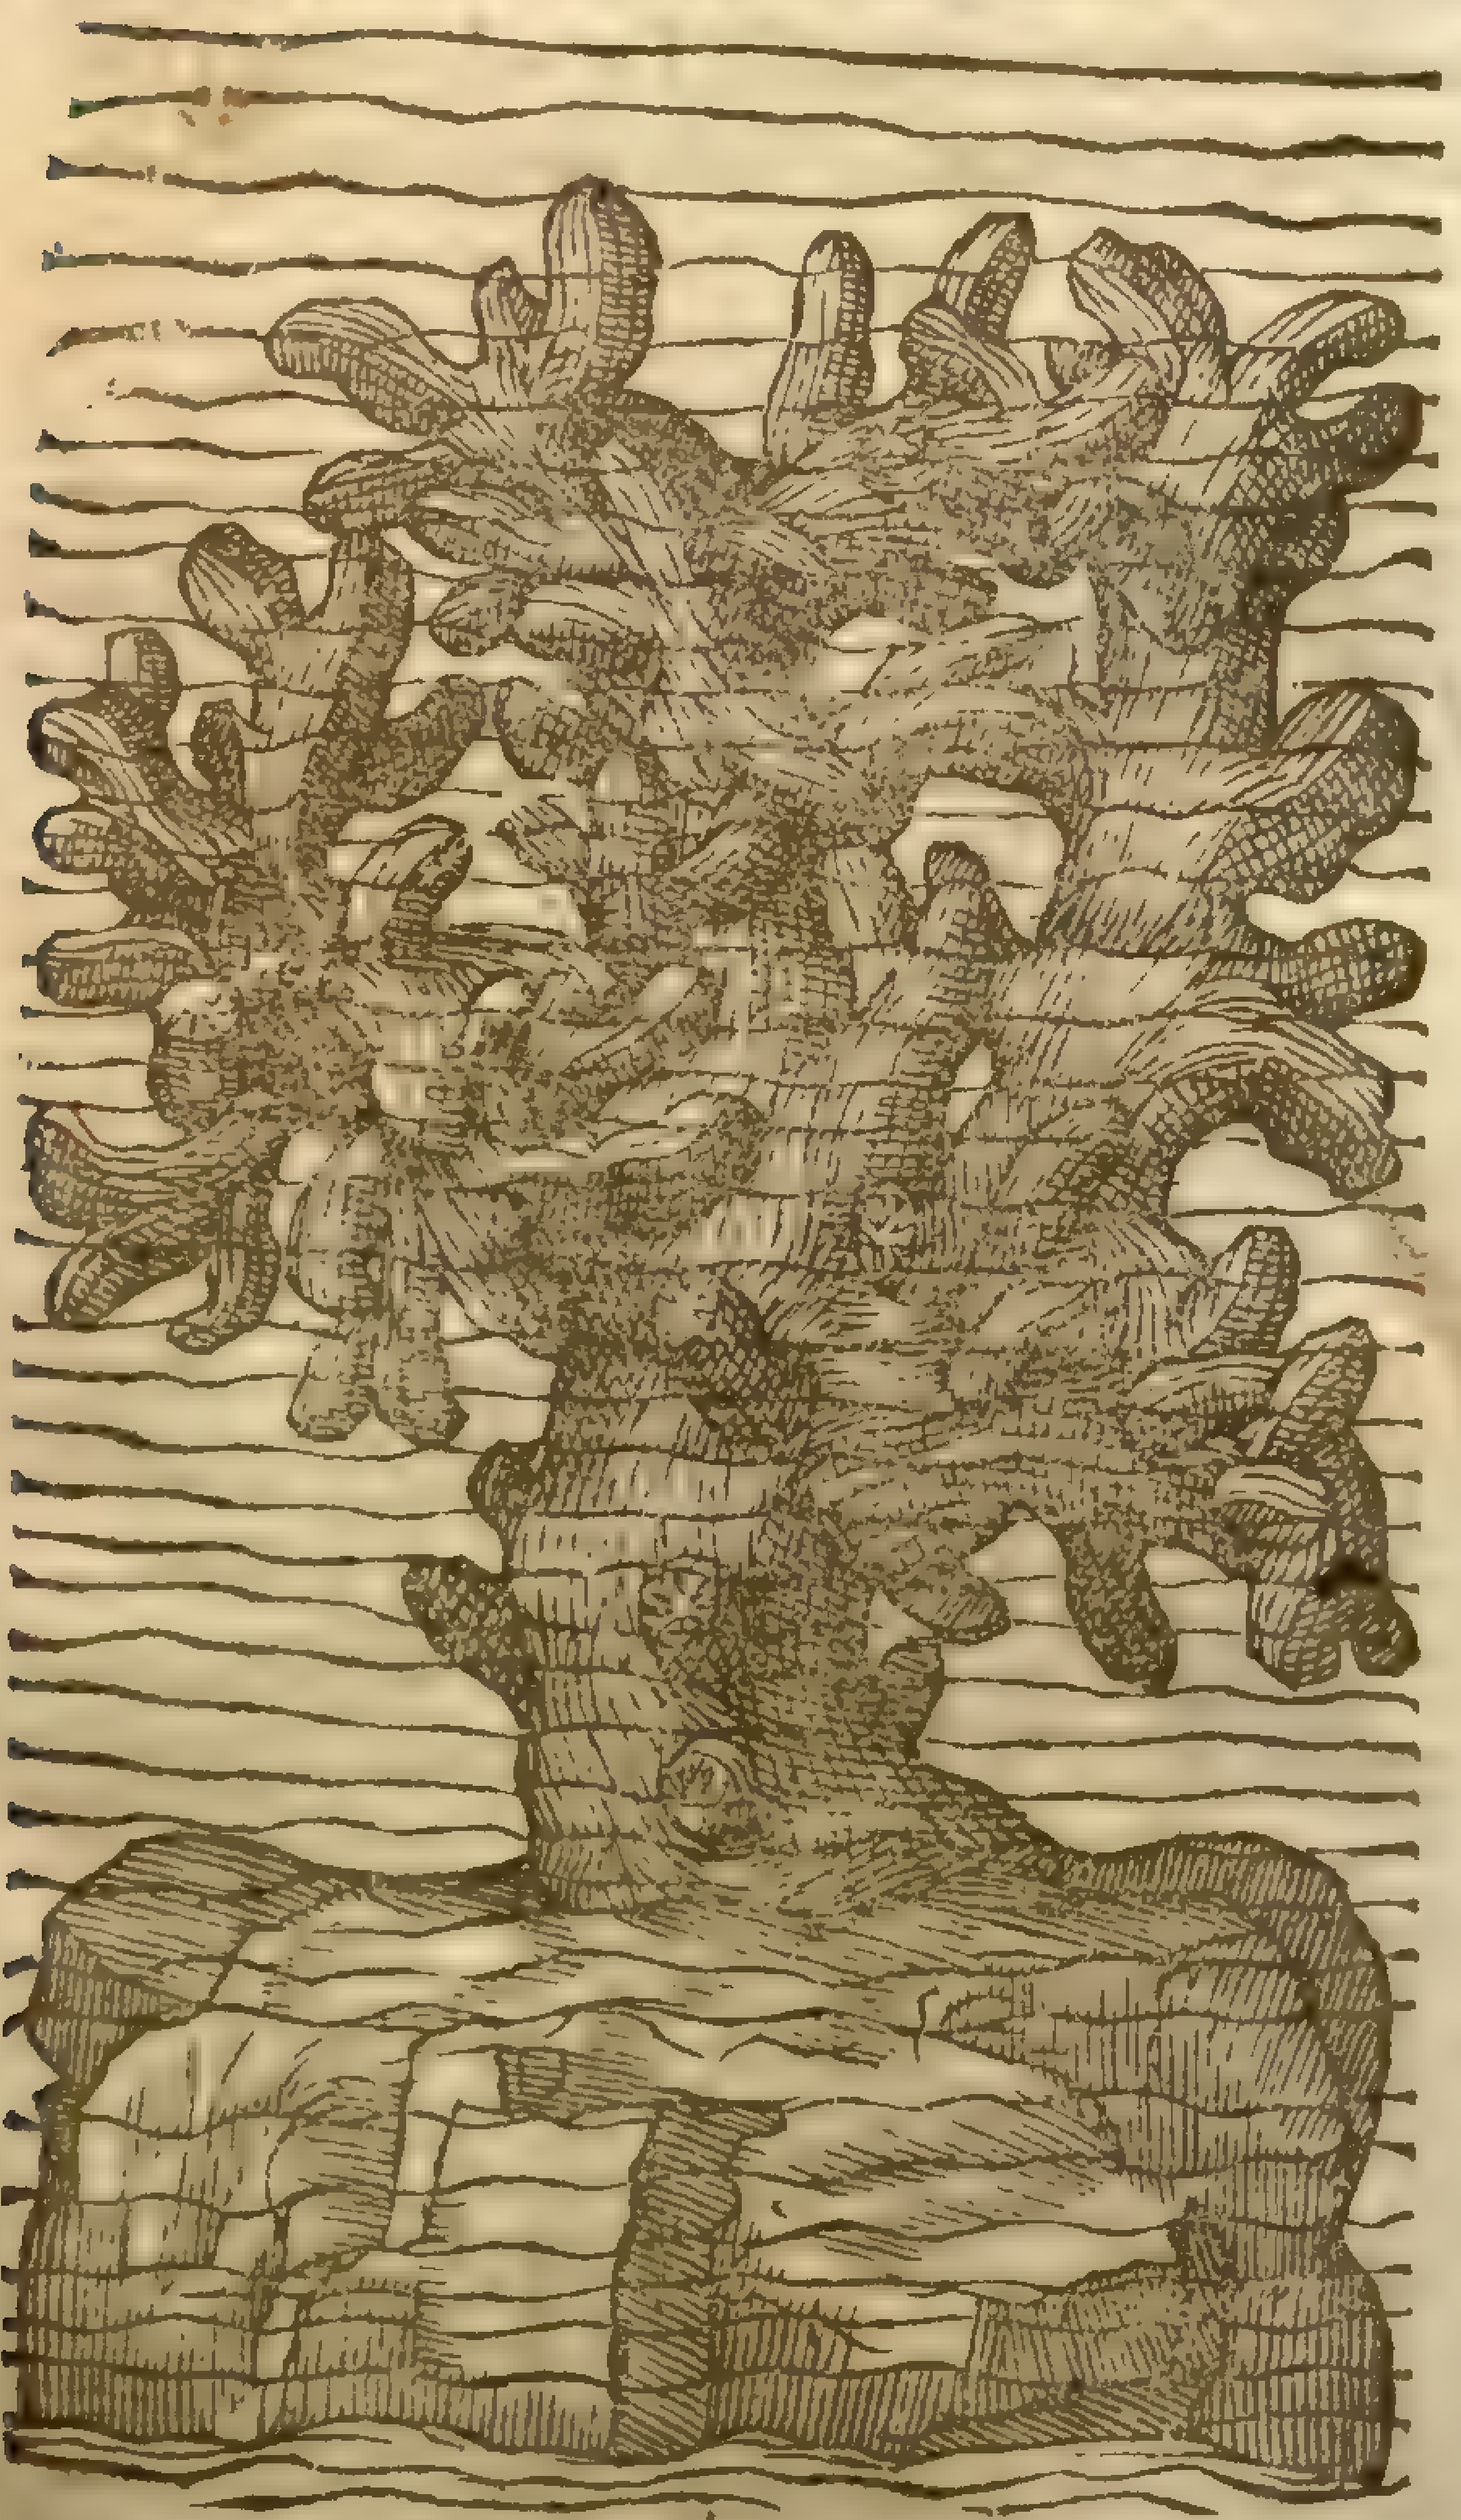
2 *Corallium nigrum, ſiue Antipathes.*
Blacke Corall.



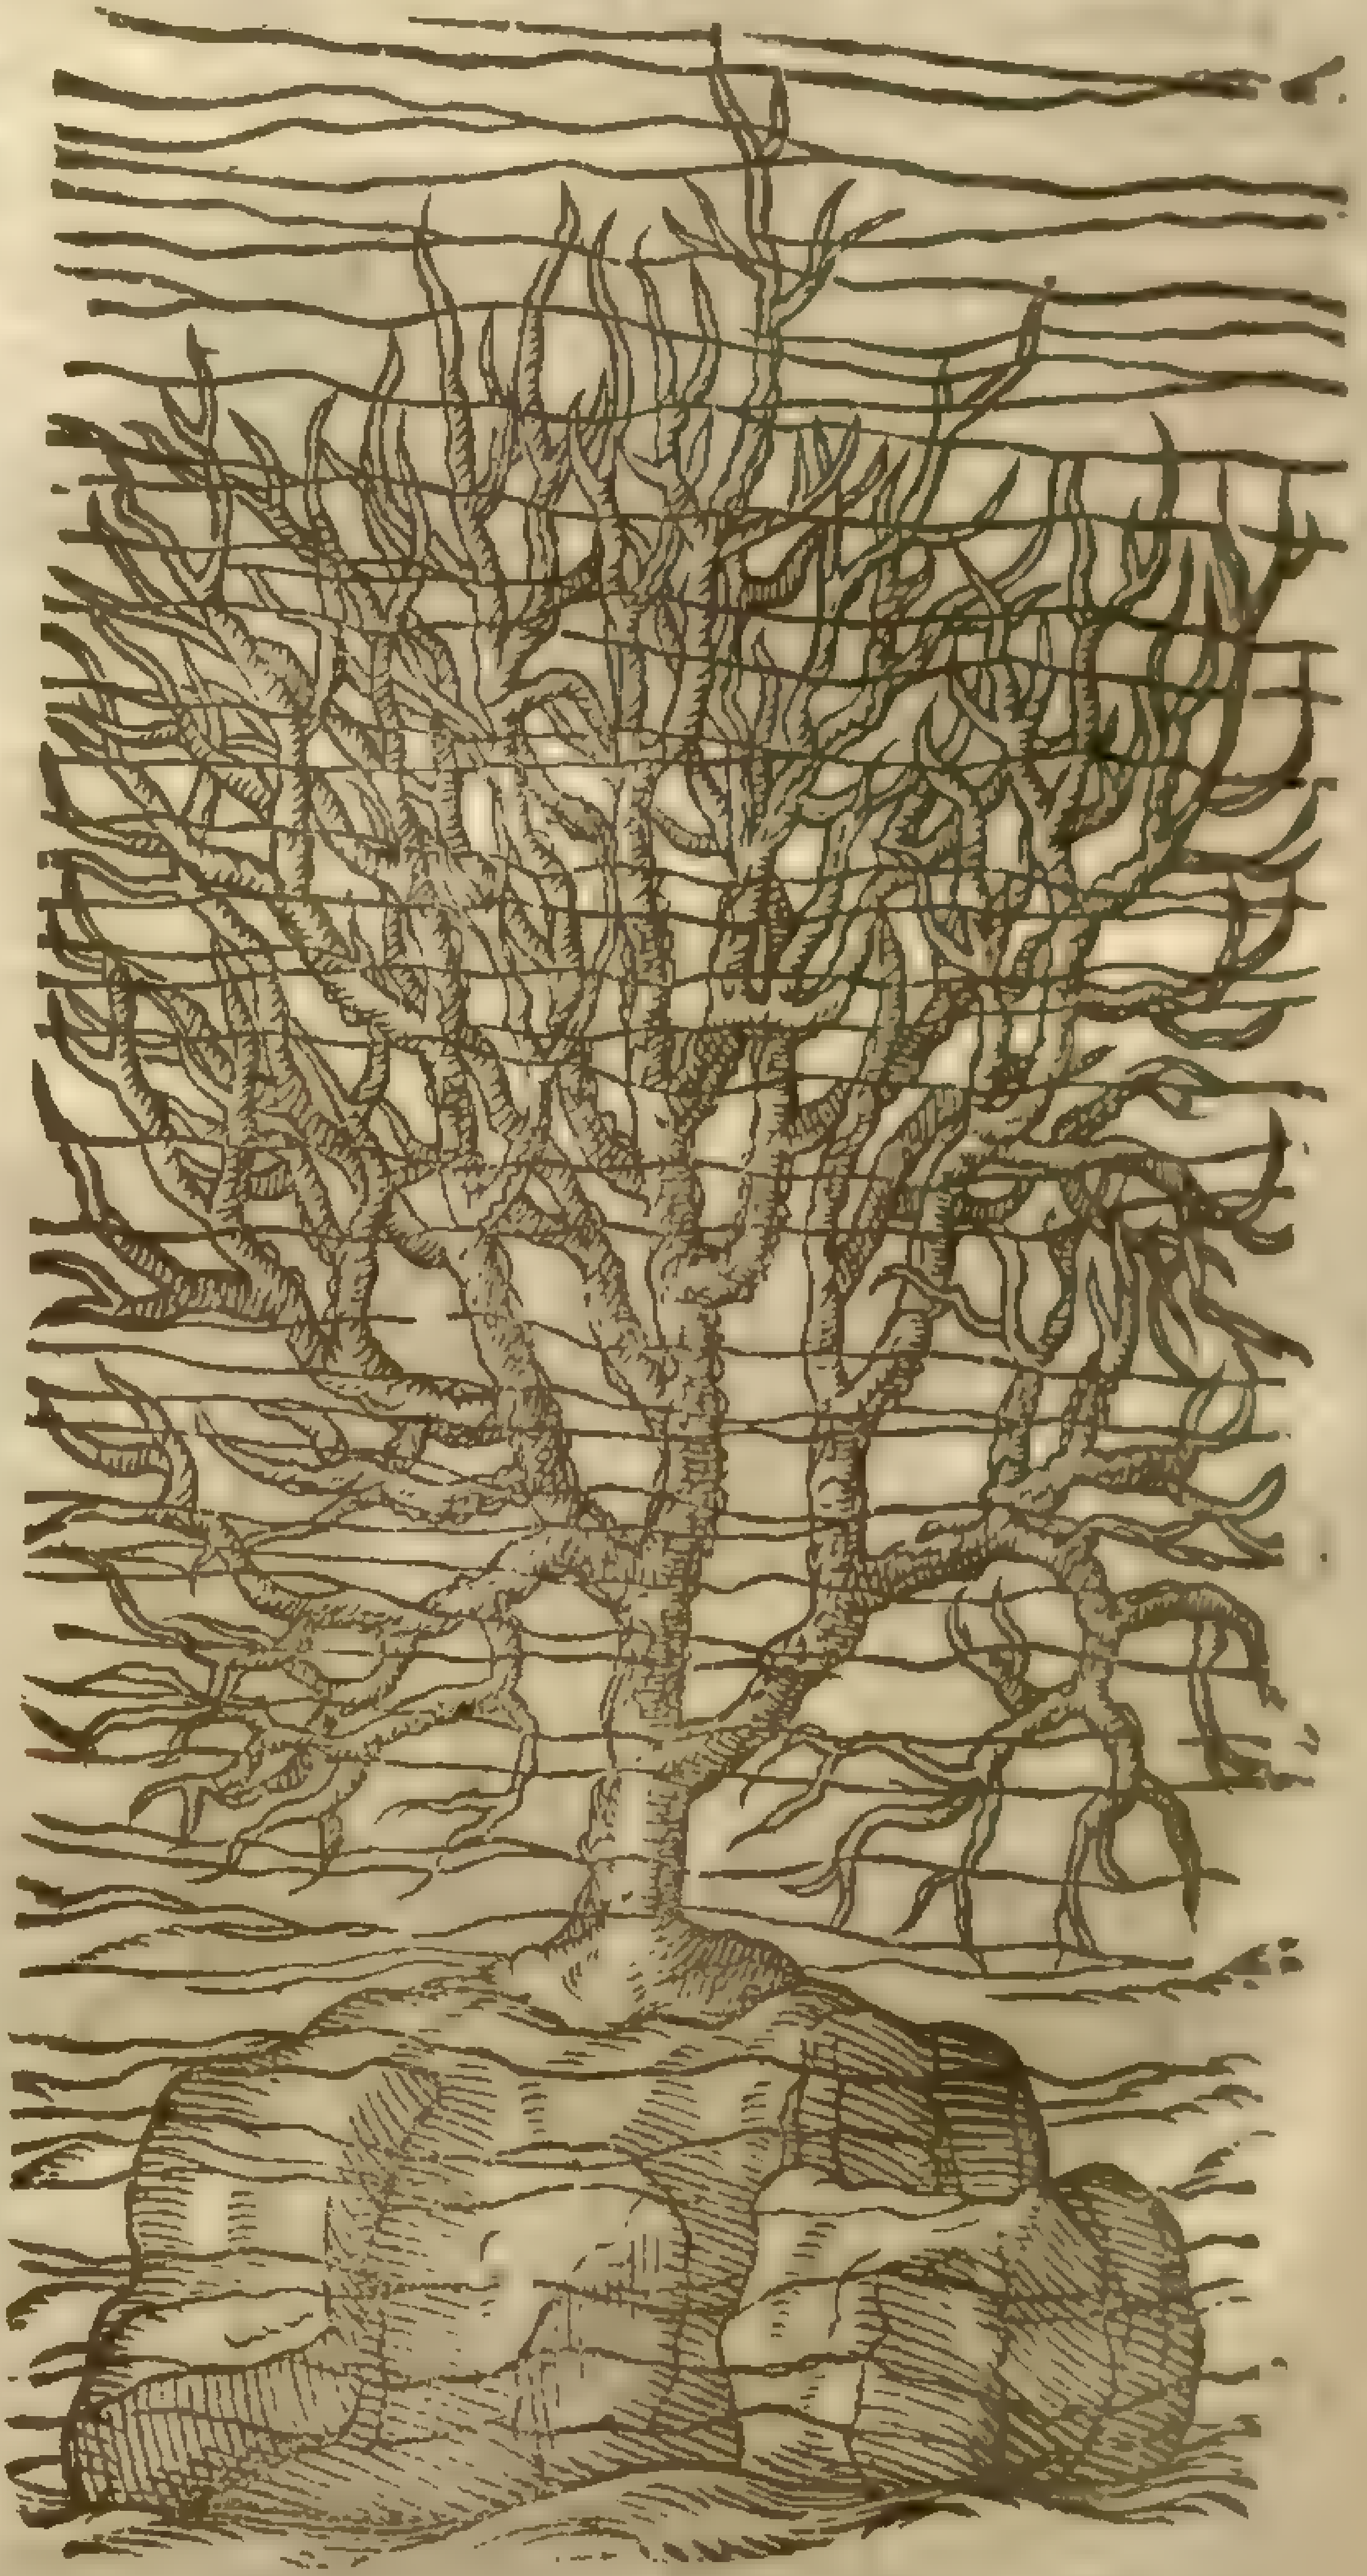
¶ The

3 *Corallium album.* White Corall.

4 *Corallium album alterum.*
The other white or yellow Corall.



‡ 5 *Coralloides albicans.*
Baſtard whitiſh Corall.



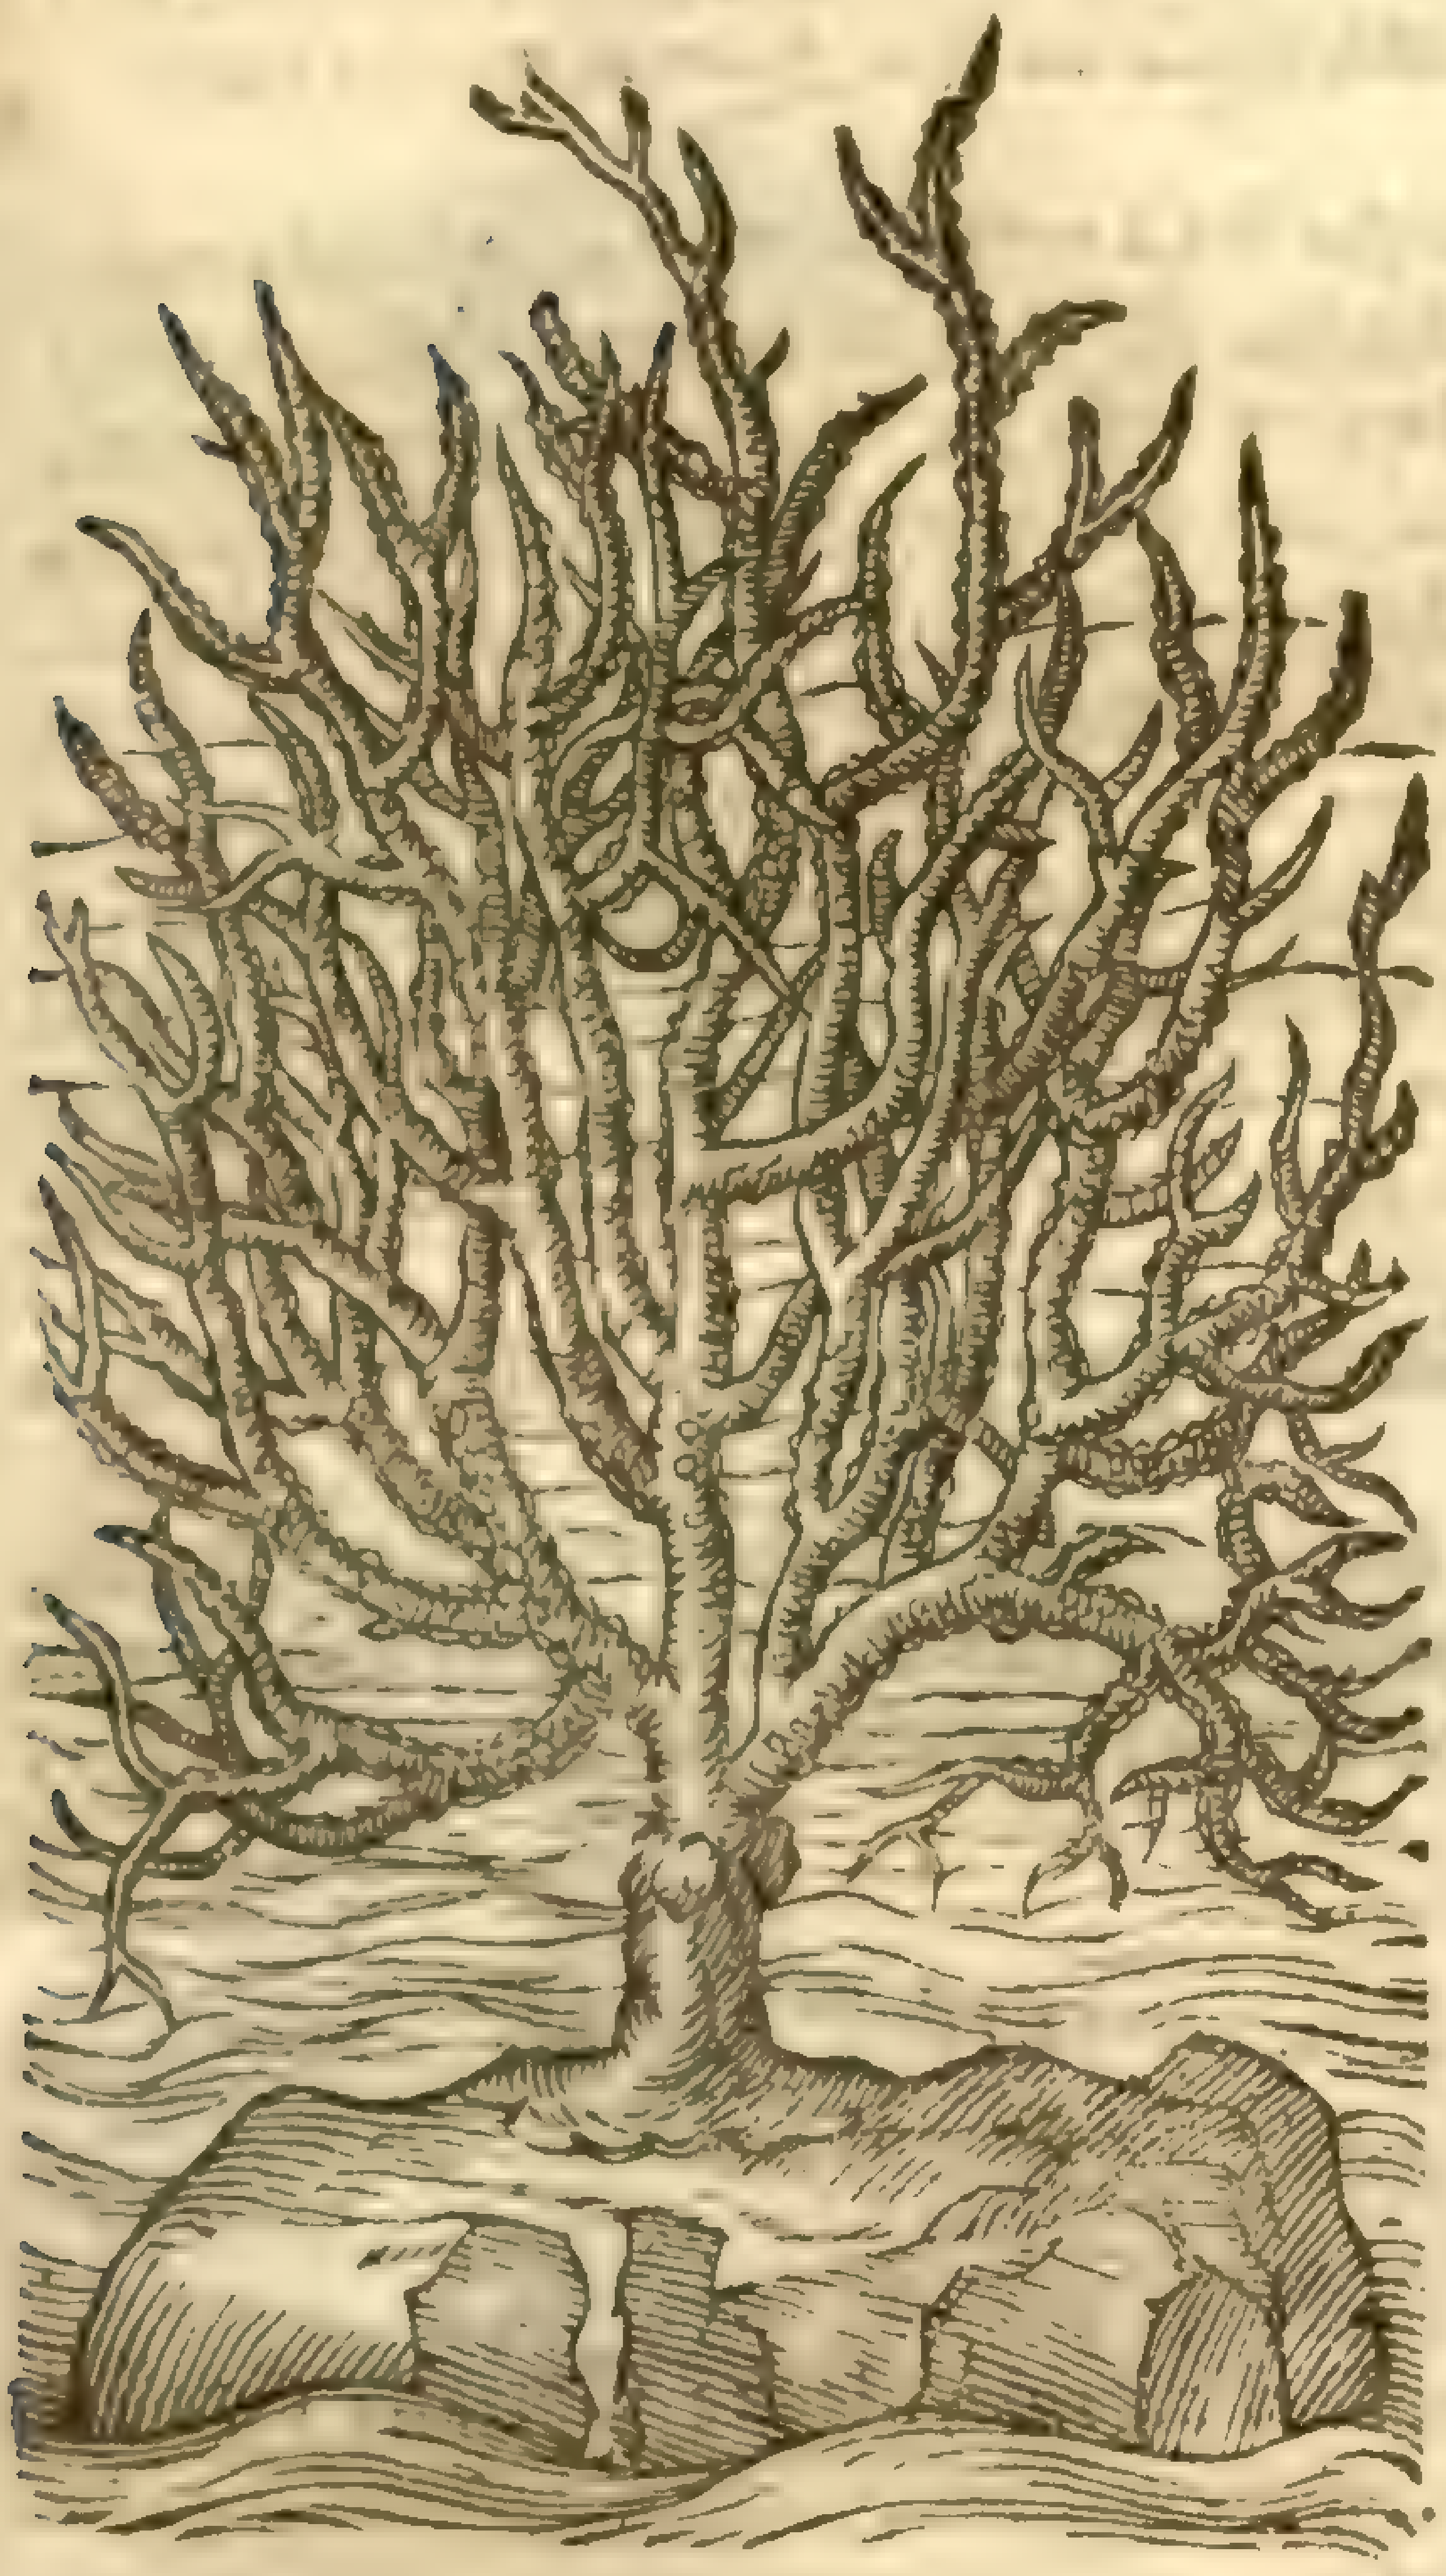
¶ *The Deſcription.*

1 ALthough Corall be a matter or ſubſtance euen as hard as ſtones; yet I think it not amiſſe to inſert it here next the moſſes; and the rather for that the kinds thereof do ſhew themſelues as well in the maner of their growing, as in their place & form, like to the Moſſes. This later age wherein we liue, hath found more kinds therof than euer were known or mentioned among the old Writers. Some of theſe Corals grow in the likeneſſe of a ſhrub or ſtony matter, others in a ſtraight form with crags and joints, ſuch as we ſee by experience; which being ſo well known, and in ſuch requeſt for phyſick, I will not ſtand to deſcribe; only remember this, That ſome Corall is of a pale colour, others red, and ſome white.

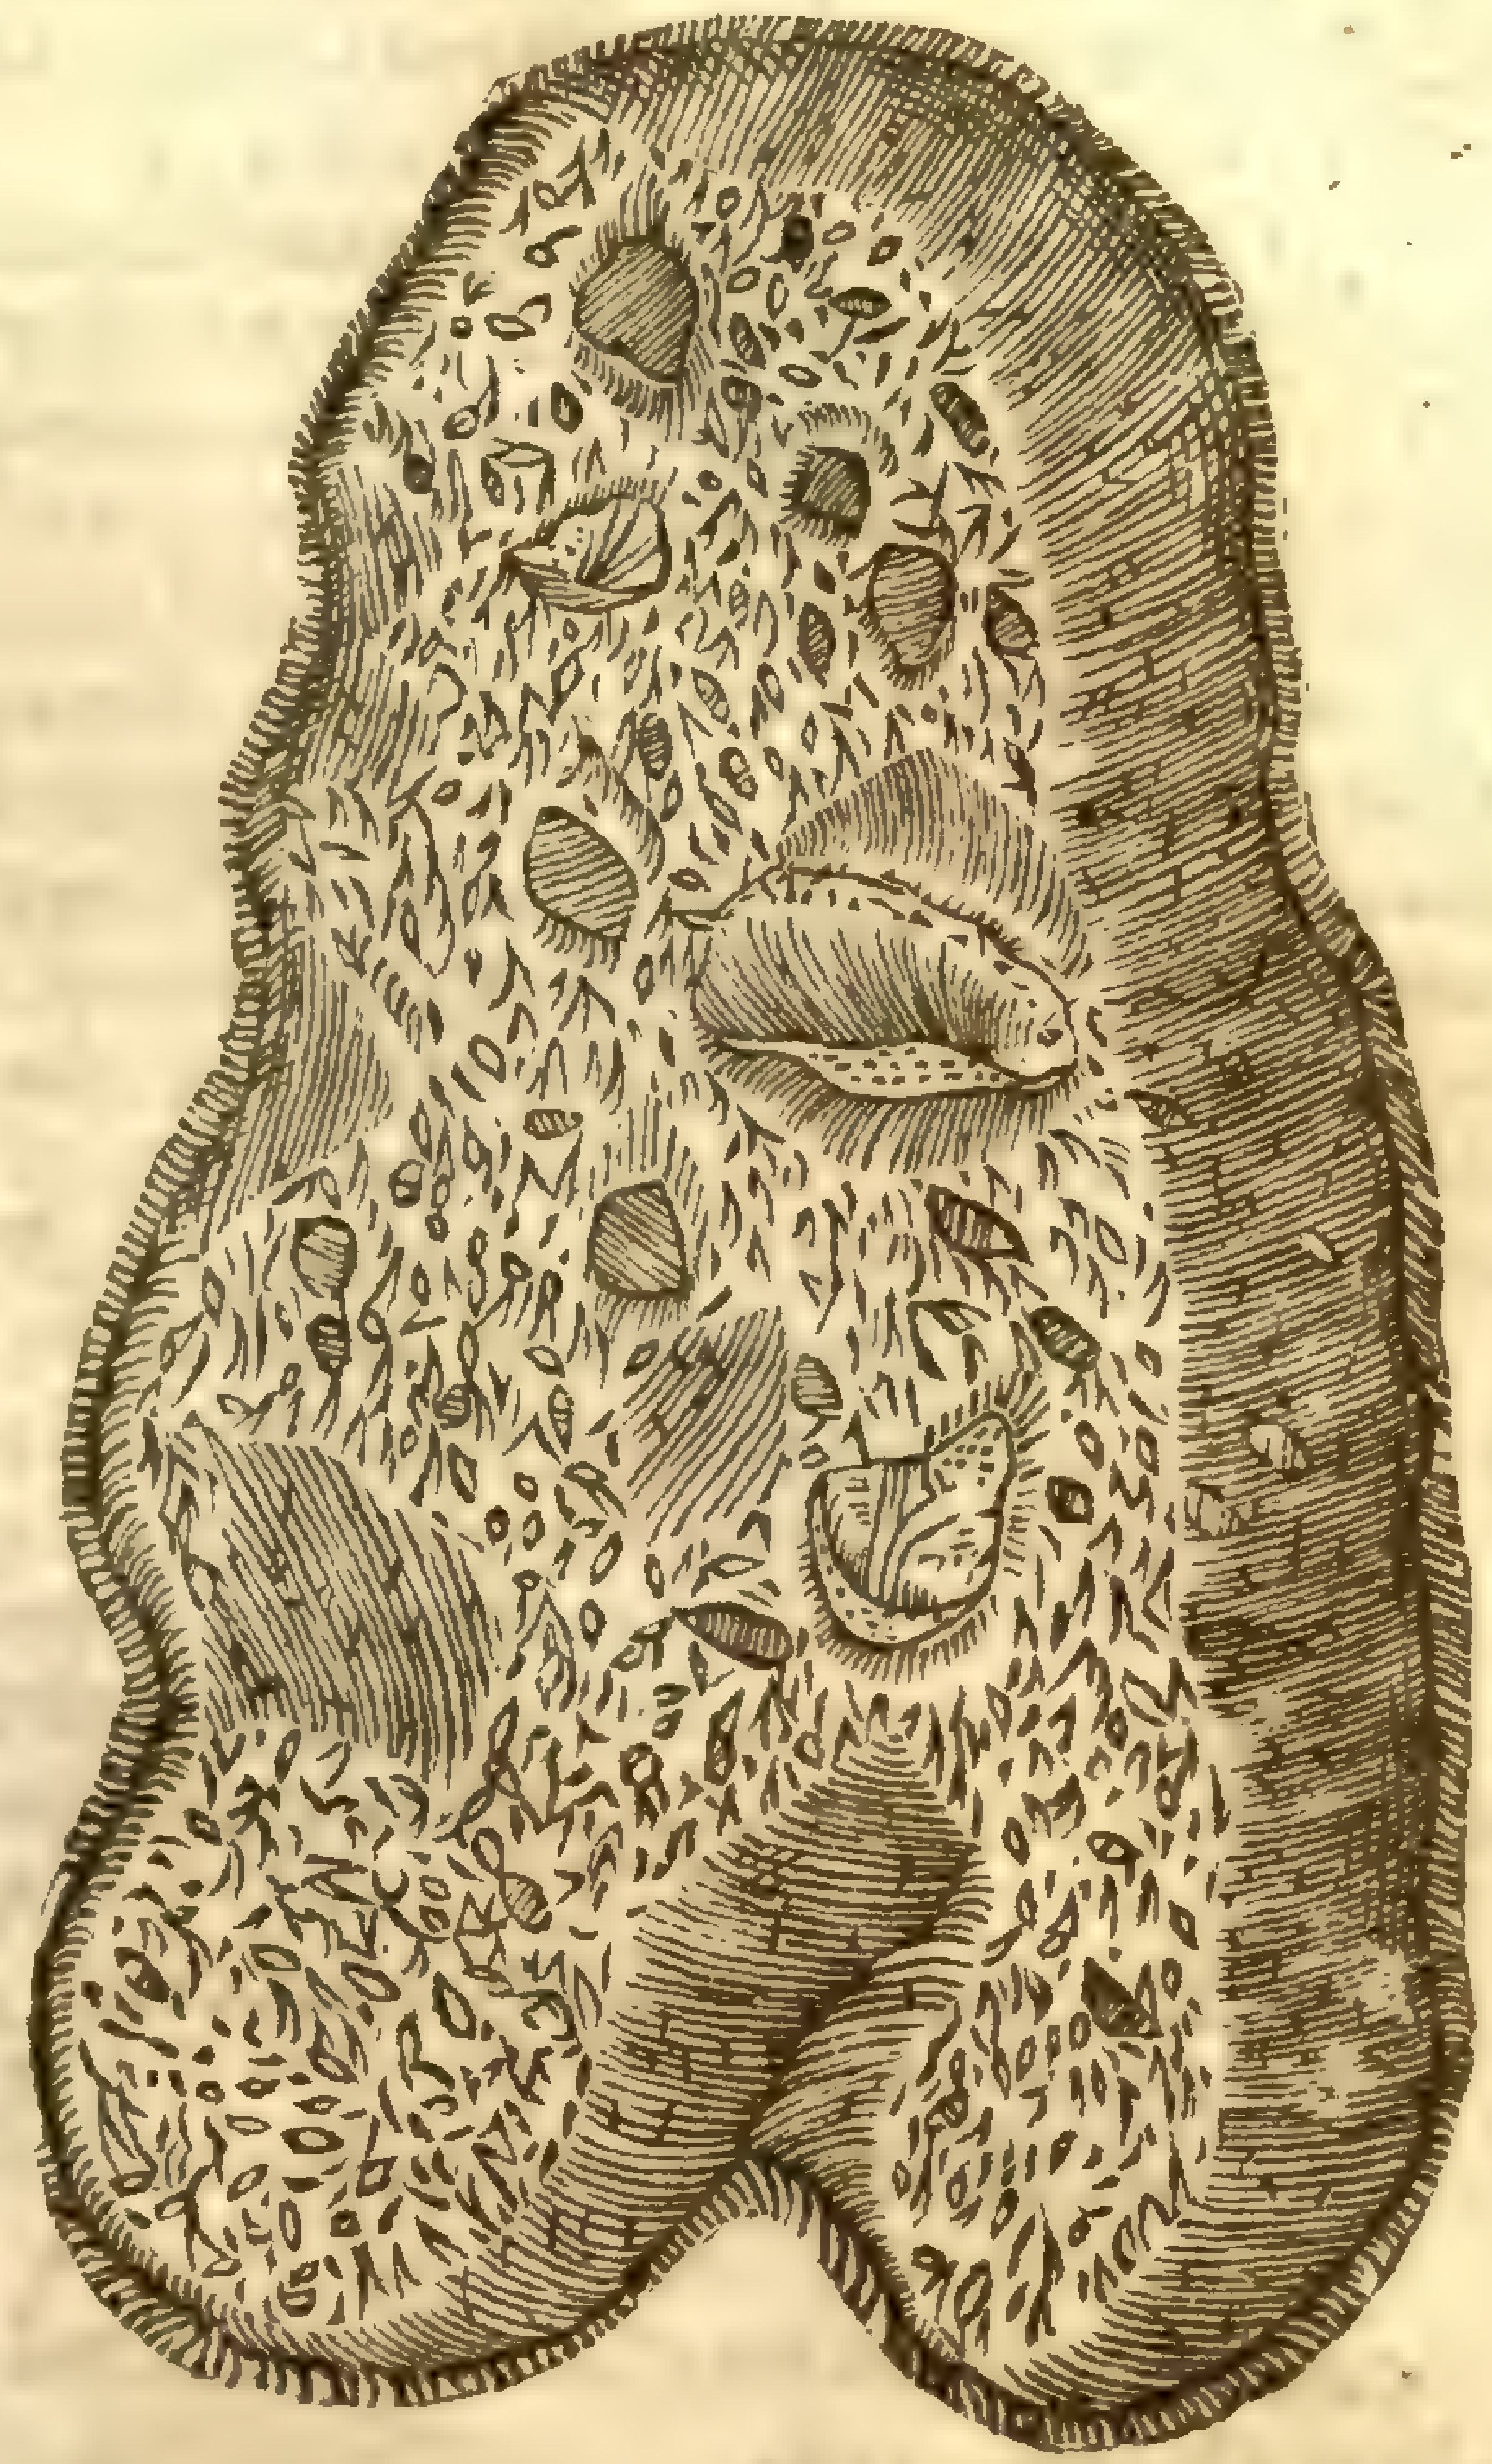
2 The black Corall growes vpon rocks neere the ſea about Maſſilia, in maner of the former, ſauing that this is of a ſhining black colour, very ſmooth, growing vp rather like a tree than a ſhrub.

3 The white Corall is like the former, growing vpon the rocks neere the ſea, and in the Weſt parts of England about S. *Michaels* mount; but the branches hereof are ſmaller and more brittle, finelier diſperſed into a number of branches, of a white colour.

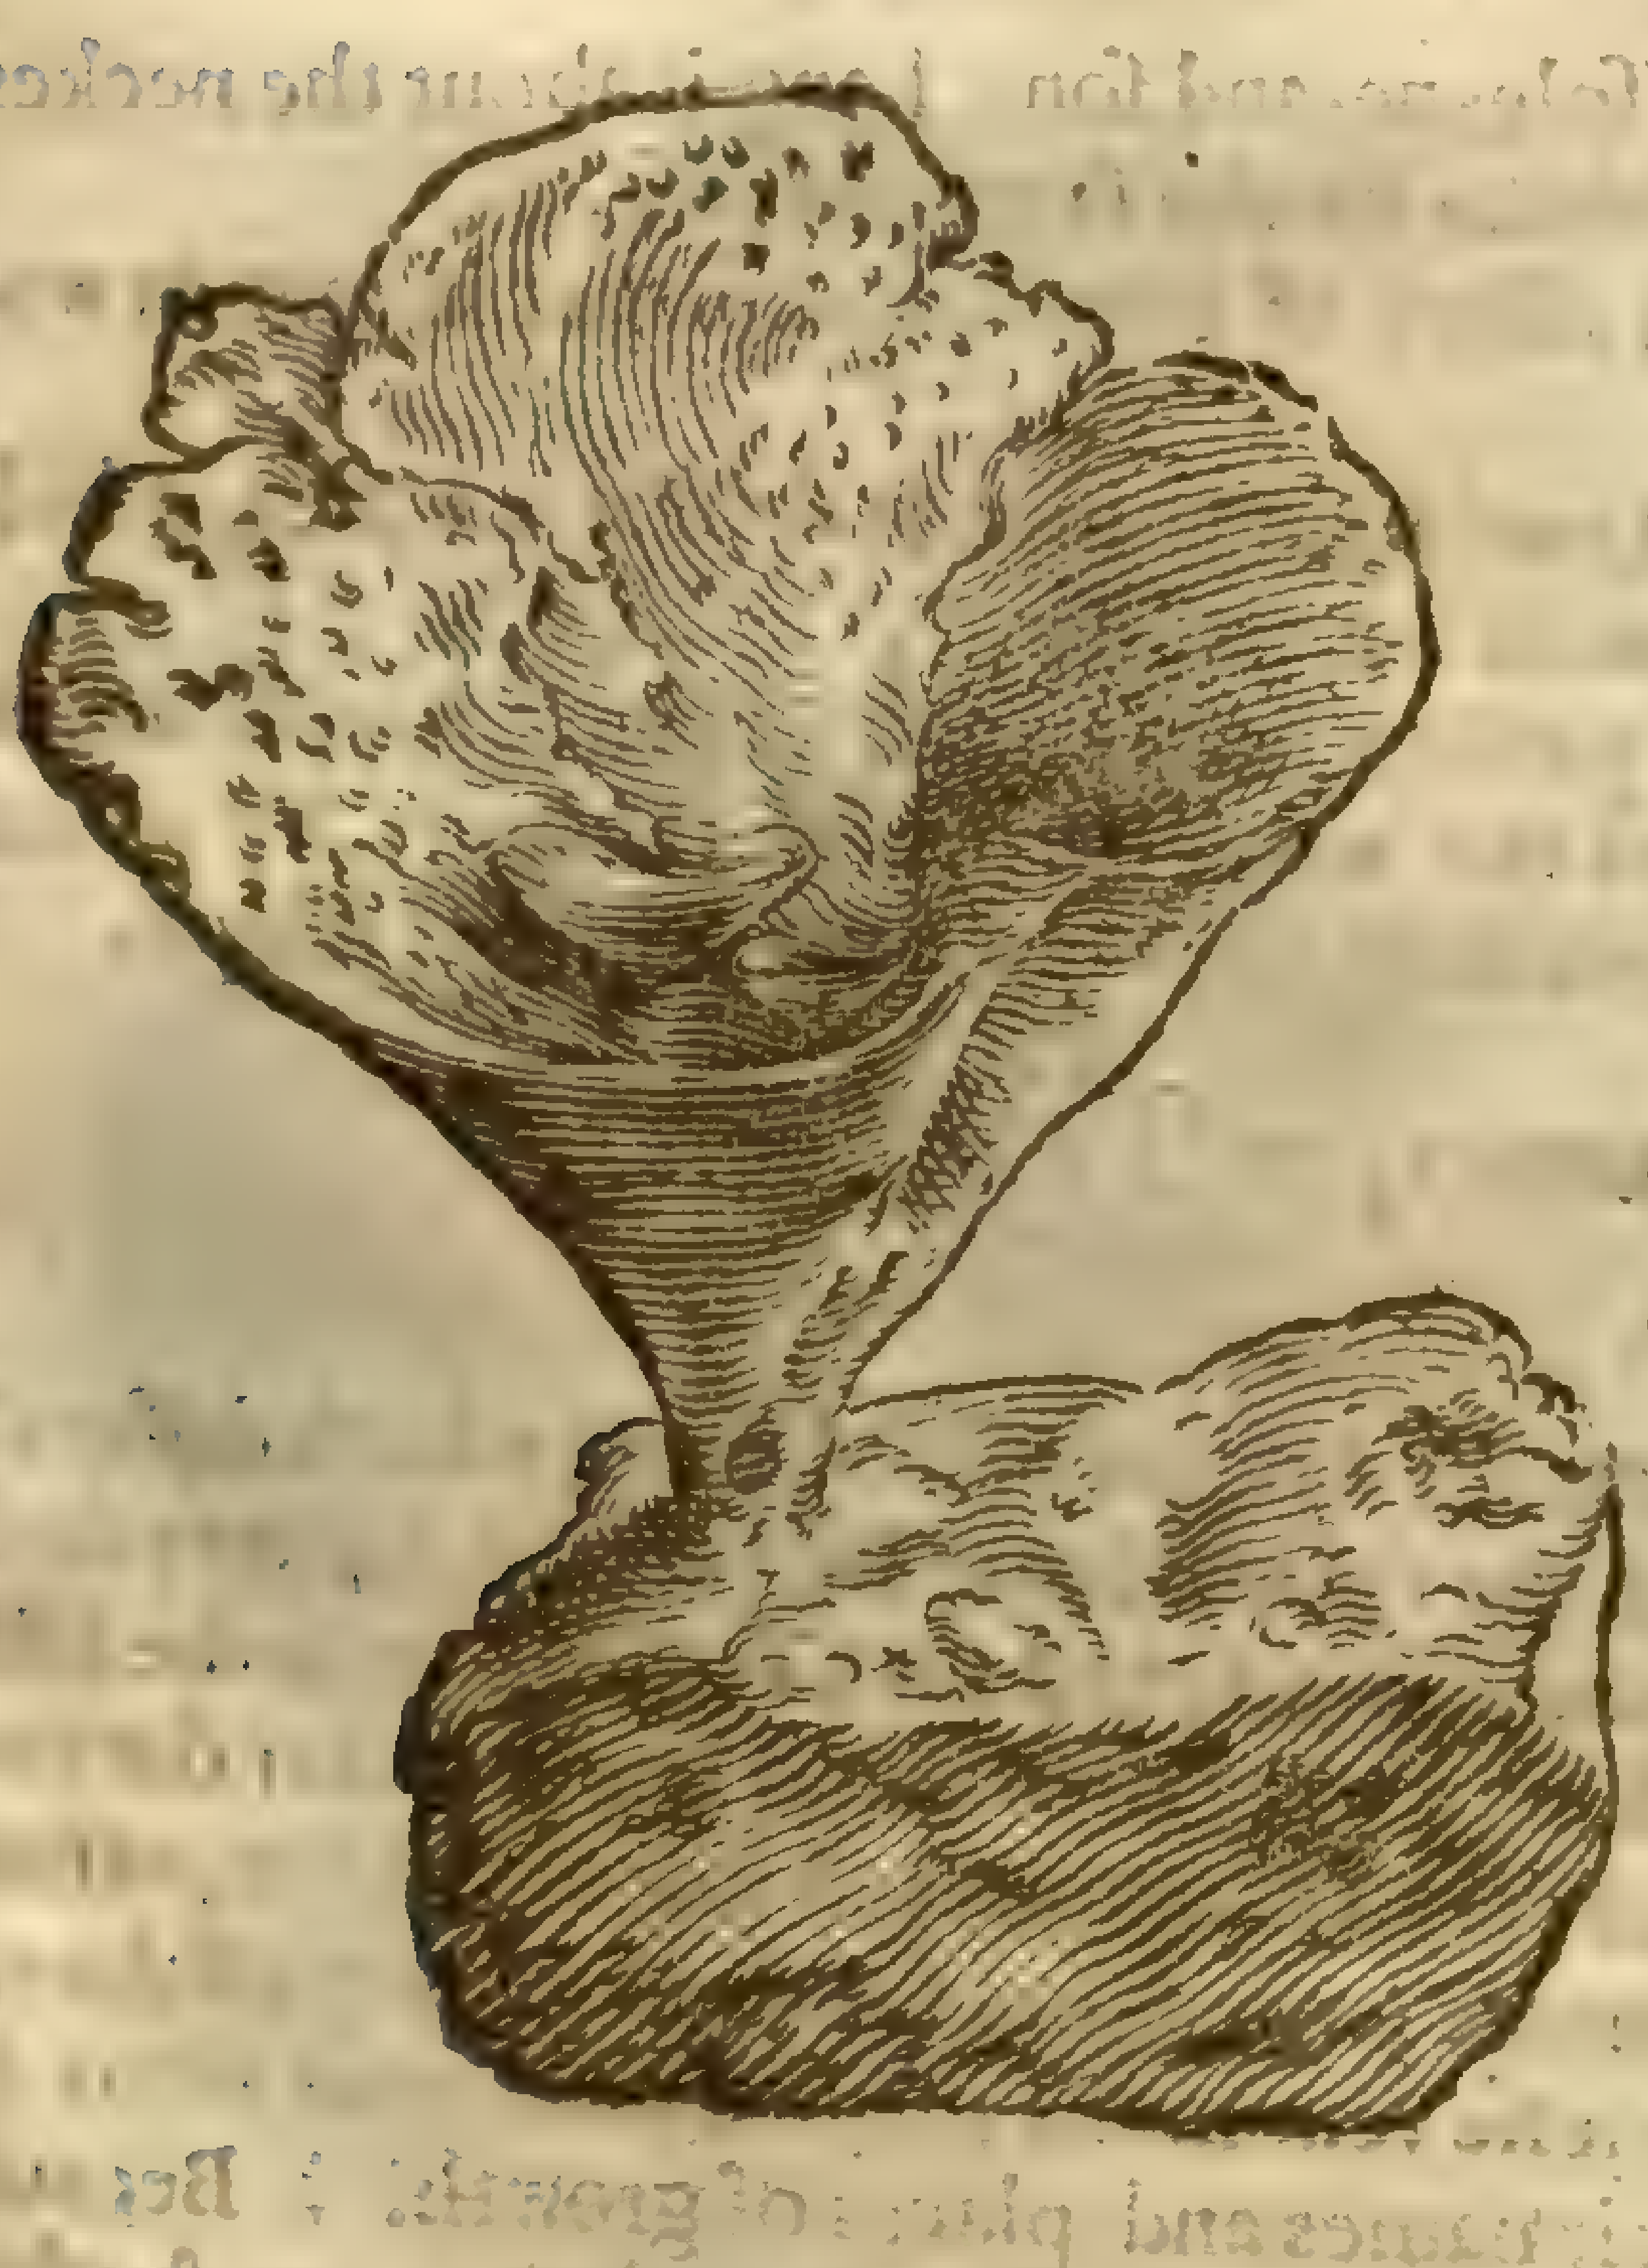
‡ 6 *Coralloides rubens.*
Reddiſh baſtard Corall.



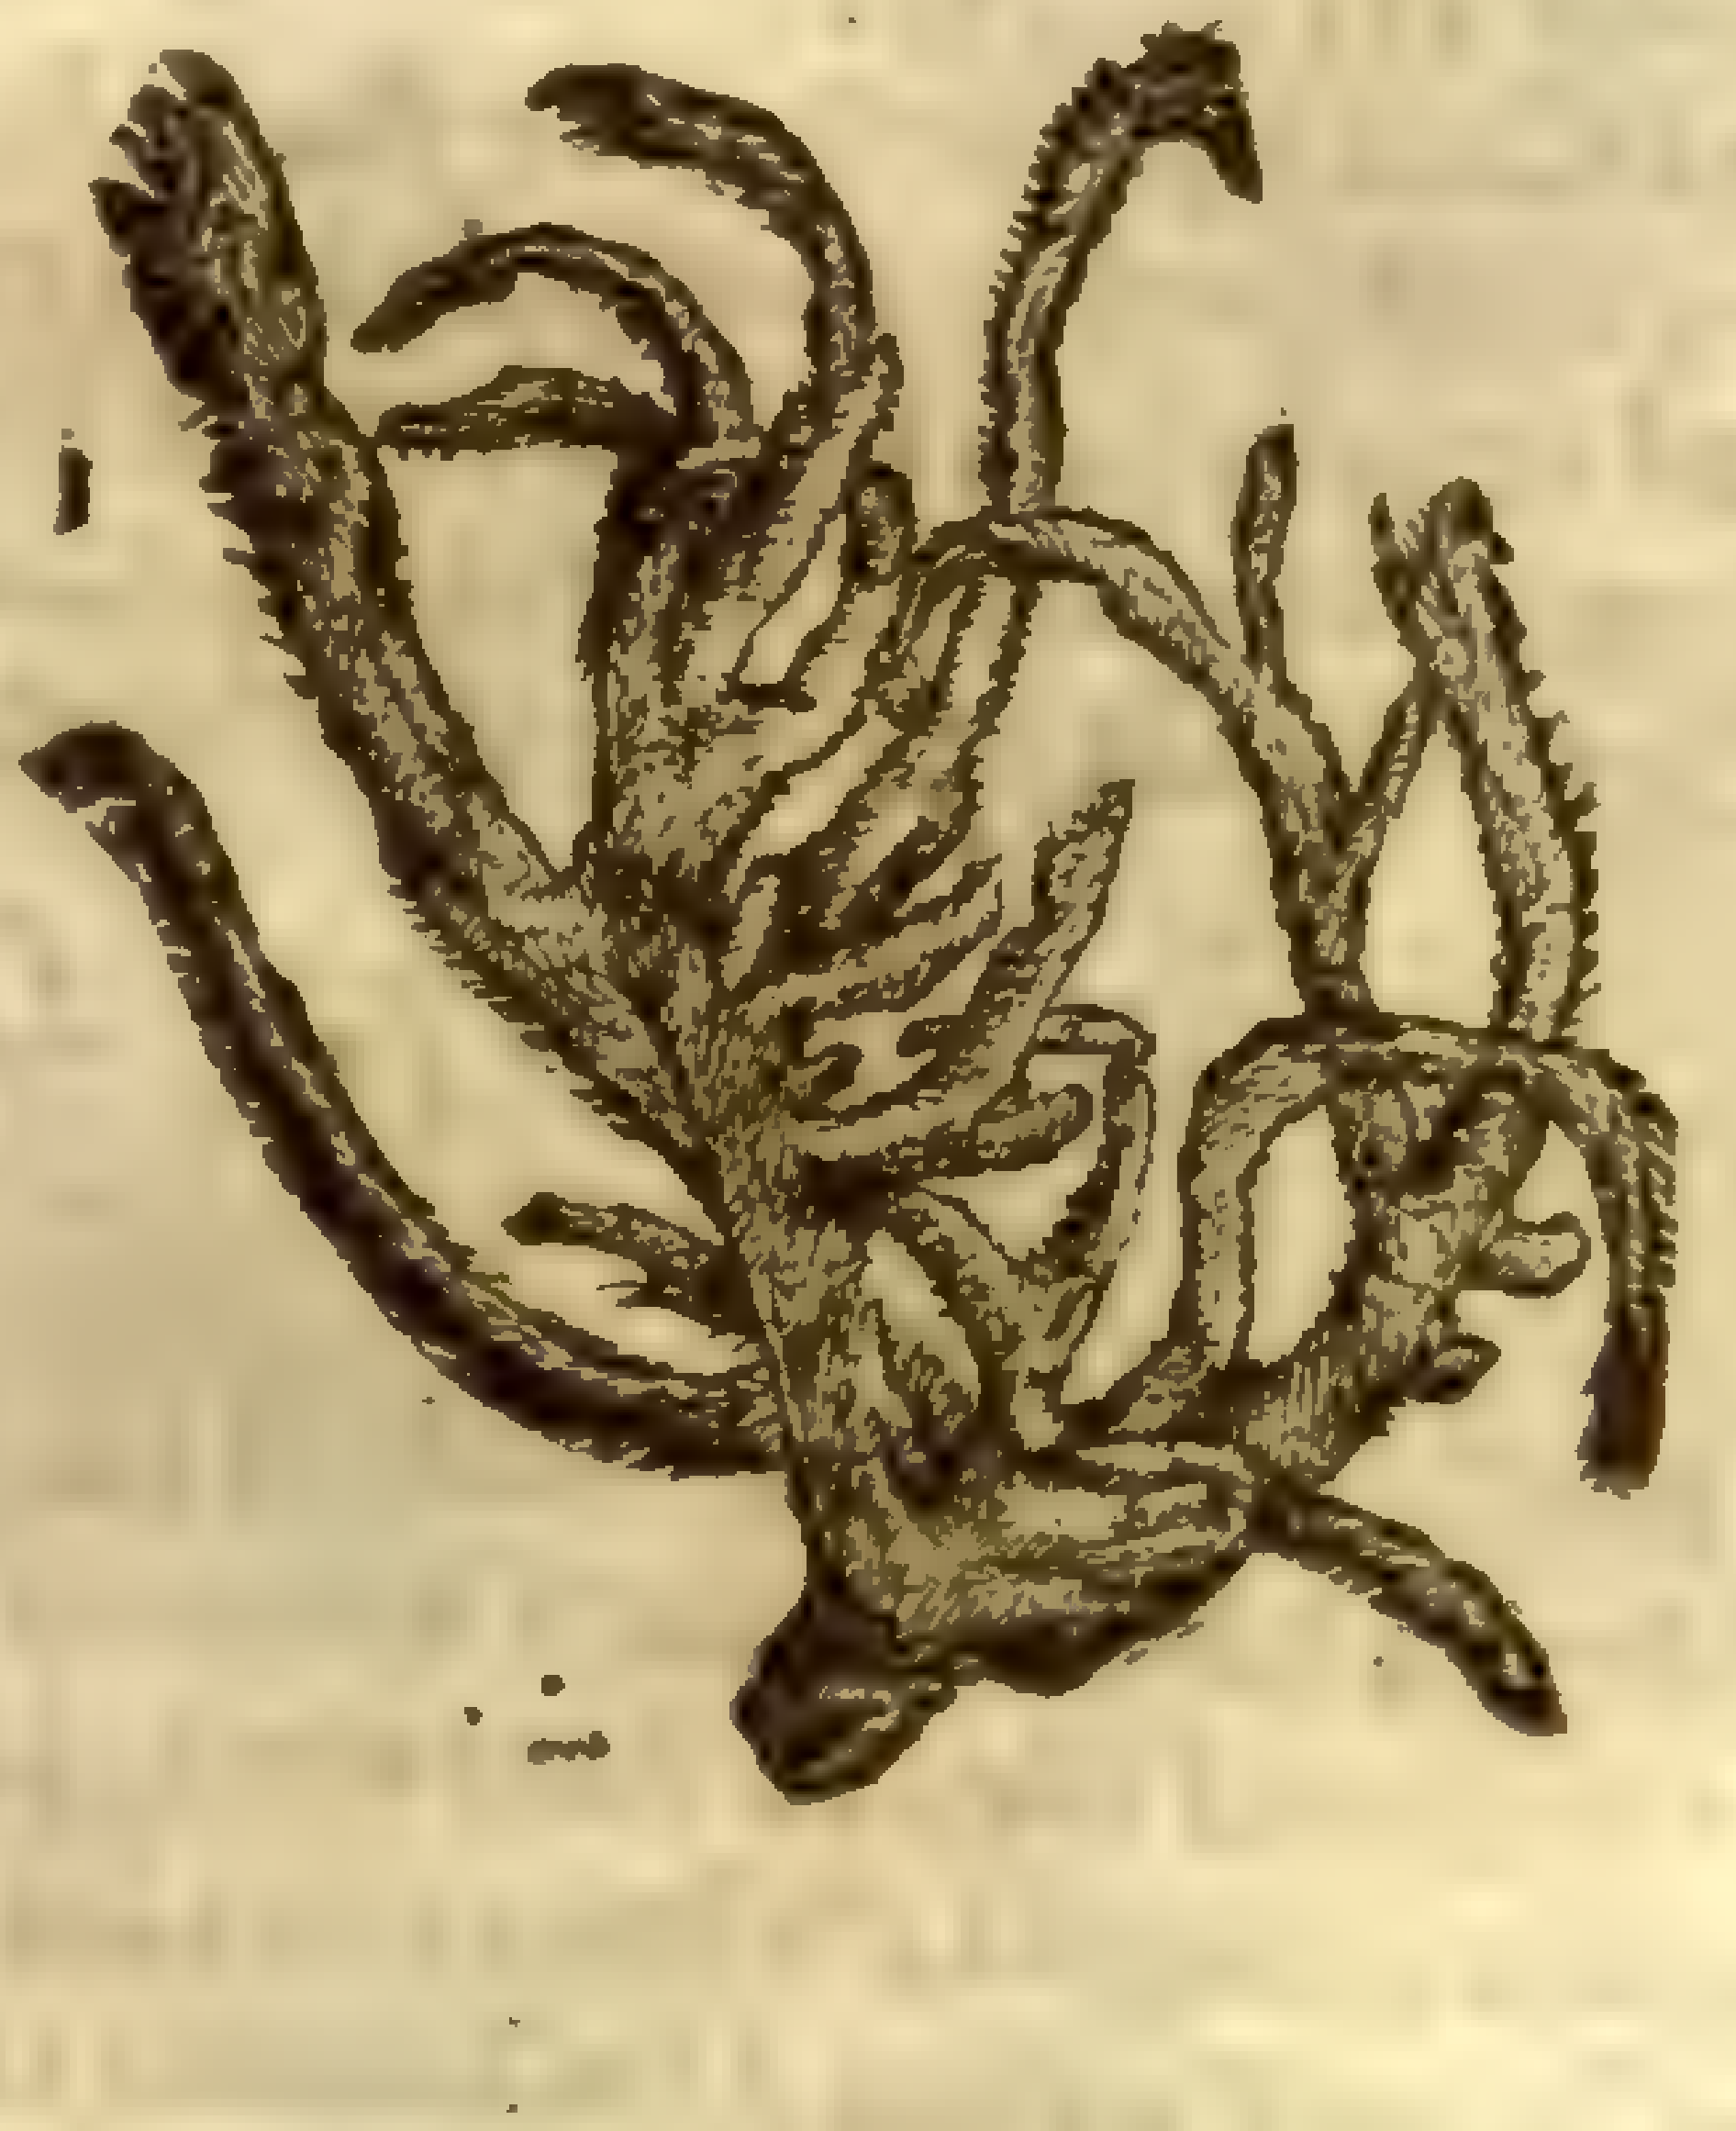
7 *Spongia marina alba.*
White Spunge.



‡ 8 *Spongia infundibuli forma.*
Funnell faſhioned Spunge.



‡ 9 *Spongia ramoſa.*
Branched Spunge.



4 The fourth and laſt groweth alſo vpon the Weſterne rocks of the ſea, and in the place aforenamed, and varieth his colour, ſometimes waxing white, ſometimes yellow, and ſometimes red.

‡ 5 This growes vp with many branches ſome two or three handfulls high: the inner part is a hard woody ſubſtance, which is couered ouer with a white and hard ſtony matter, ſo that it much reſembleth White Corall, but that it is neither ſo thicke, hard, nor ſmooth, but is rough

and bends eaſily without breaking, which Corall will not do. *Lobel* calls this *Corallina alba*, it growes in the Mediteranian ſea, and vpon the Coaſts of Spaine.

6 This in all reſpects is like the laſt deſcribed, the colour excepted, which is a darke red, and therefore better reſembles the red Corall. *Cluſius* refers both theſe to the *Quercus marina* mentioned by *Theophraſtus, Hiſt. plant. 7. cap. 4.* ‡

7 There is found growing vpon the rockes neere vnto the ſea, a certaine matter wrought together, of the forme or froth of the ſea, which we call ſpunges, after the Latine name, which may very fitly be inſerted among the ſea Moſſes, wherof to write at large would greatly increaſe our volume, and little profit the Reader, conſidering we haſten to an end, and alſo that the vſe is ſo well knowne vnto all: therefore theſe few lines may ſerue vntill a further conſideration, or a ſecond Edition. ‡ Spunges are not like the *Alcyonium*, that is, an accidentall matter wrought together of the froth of the ſea, as our Author affirmes, but rather of a nobler nature than plants, for they are ſaid to haue ſence, and to contract themſelues at the approach of ones hand that comes to cut them vp, or for feare of any other harme-threatning obiect, and therefore by moſt Writers they are referred to the ζωόφυτα: which ſome render *Plantanimalia*, that is, ſuch as are neither abſolute plants, nor liuing creatures, but participate of both: they grow of diuers ſhapes and colours vpon the Rockes in the Mediterranean, as alſo in the Archipelago, or Ægean ſea.

8 *Cluſius* obſerued one yet adhering to the ſtone whereon it grew, which in ſhape reſembled a funnell, but in ſubſtance was like another Spunge.

9 There is alſo to be found vpon our Engliſh coaſt a ſmall kinde of ſpunge caſt vp by the ſea, and this is alſo of different ſhapes and colour, for the ſhape it is alwaies diuided into ſundry branches, but that after a different manner; and the colour is oft times browniſh, and otherwhiles gray or white. *Lobel* makes it *Conferuæ marinæ genus.* ‡

¶ *The Place.*

The place of their growing is ſufficiently ſpoken of in their ſeuerall deſcriptions.

¶ *The Time.*

The time anſwereth the other kindes of ſea Moſſes.

¶ *The Names.*

Corallium rubrum is called in Engliſh, red Corrall. *Corallium nigrum*, blacke Corrall. *Corallium album*, white Corrall.

¶ *The Temperature.*

Corrall bindeth, and meanely cooleth: it clenſeth the ſcars and ſpots of the eies, and is very effuall againſt the iſſues of bloud, and eaſeth the difficulty of making water.

¶ *The Vertues.*

A Corrall drunke in wine or water, preſerueth from the ſpleene; and ſome hang it about the neckes of ſuch as haue the falling ſickeneſſe, and it is giuen in drinke for the ſame purpoſe.

B It is a ſoueraigne remedy to drie, to ſtop, and ſtay all iſſues of bloud whatſoeuer in man or woman, and the Dyſentery.

C Burned Corrall drieth more than when it is vnburned, and being giuen to drinke in water, it helpeth the gripings of the belly, and the griefes of the ſtone in the bladder.

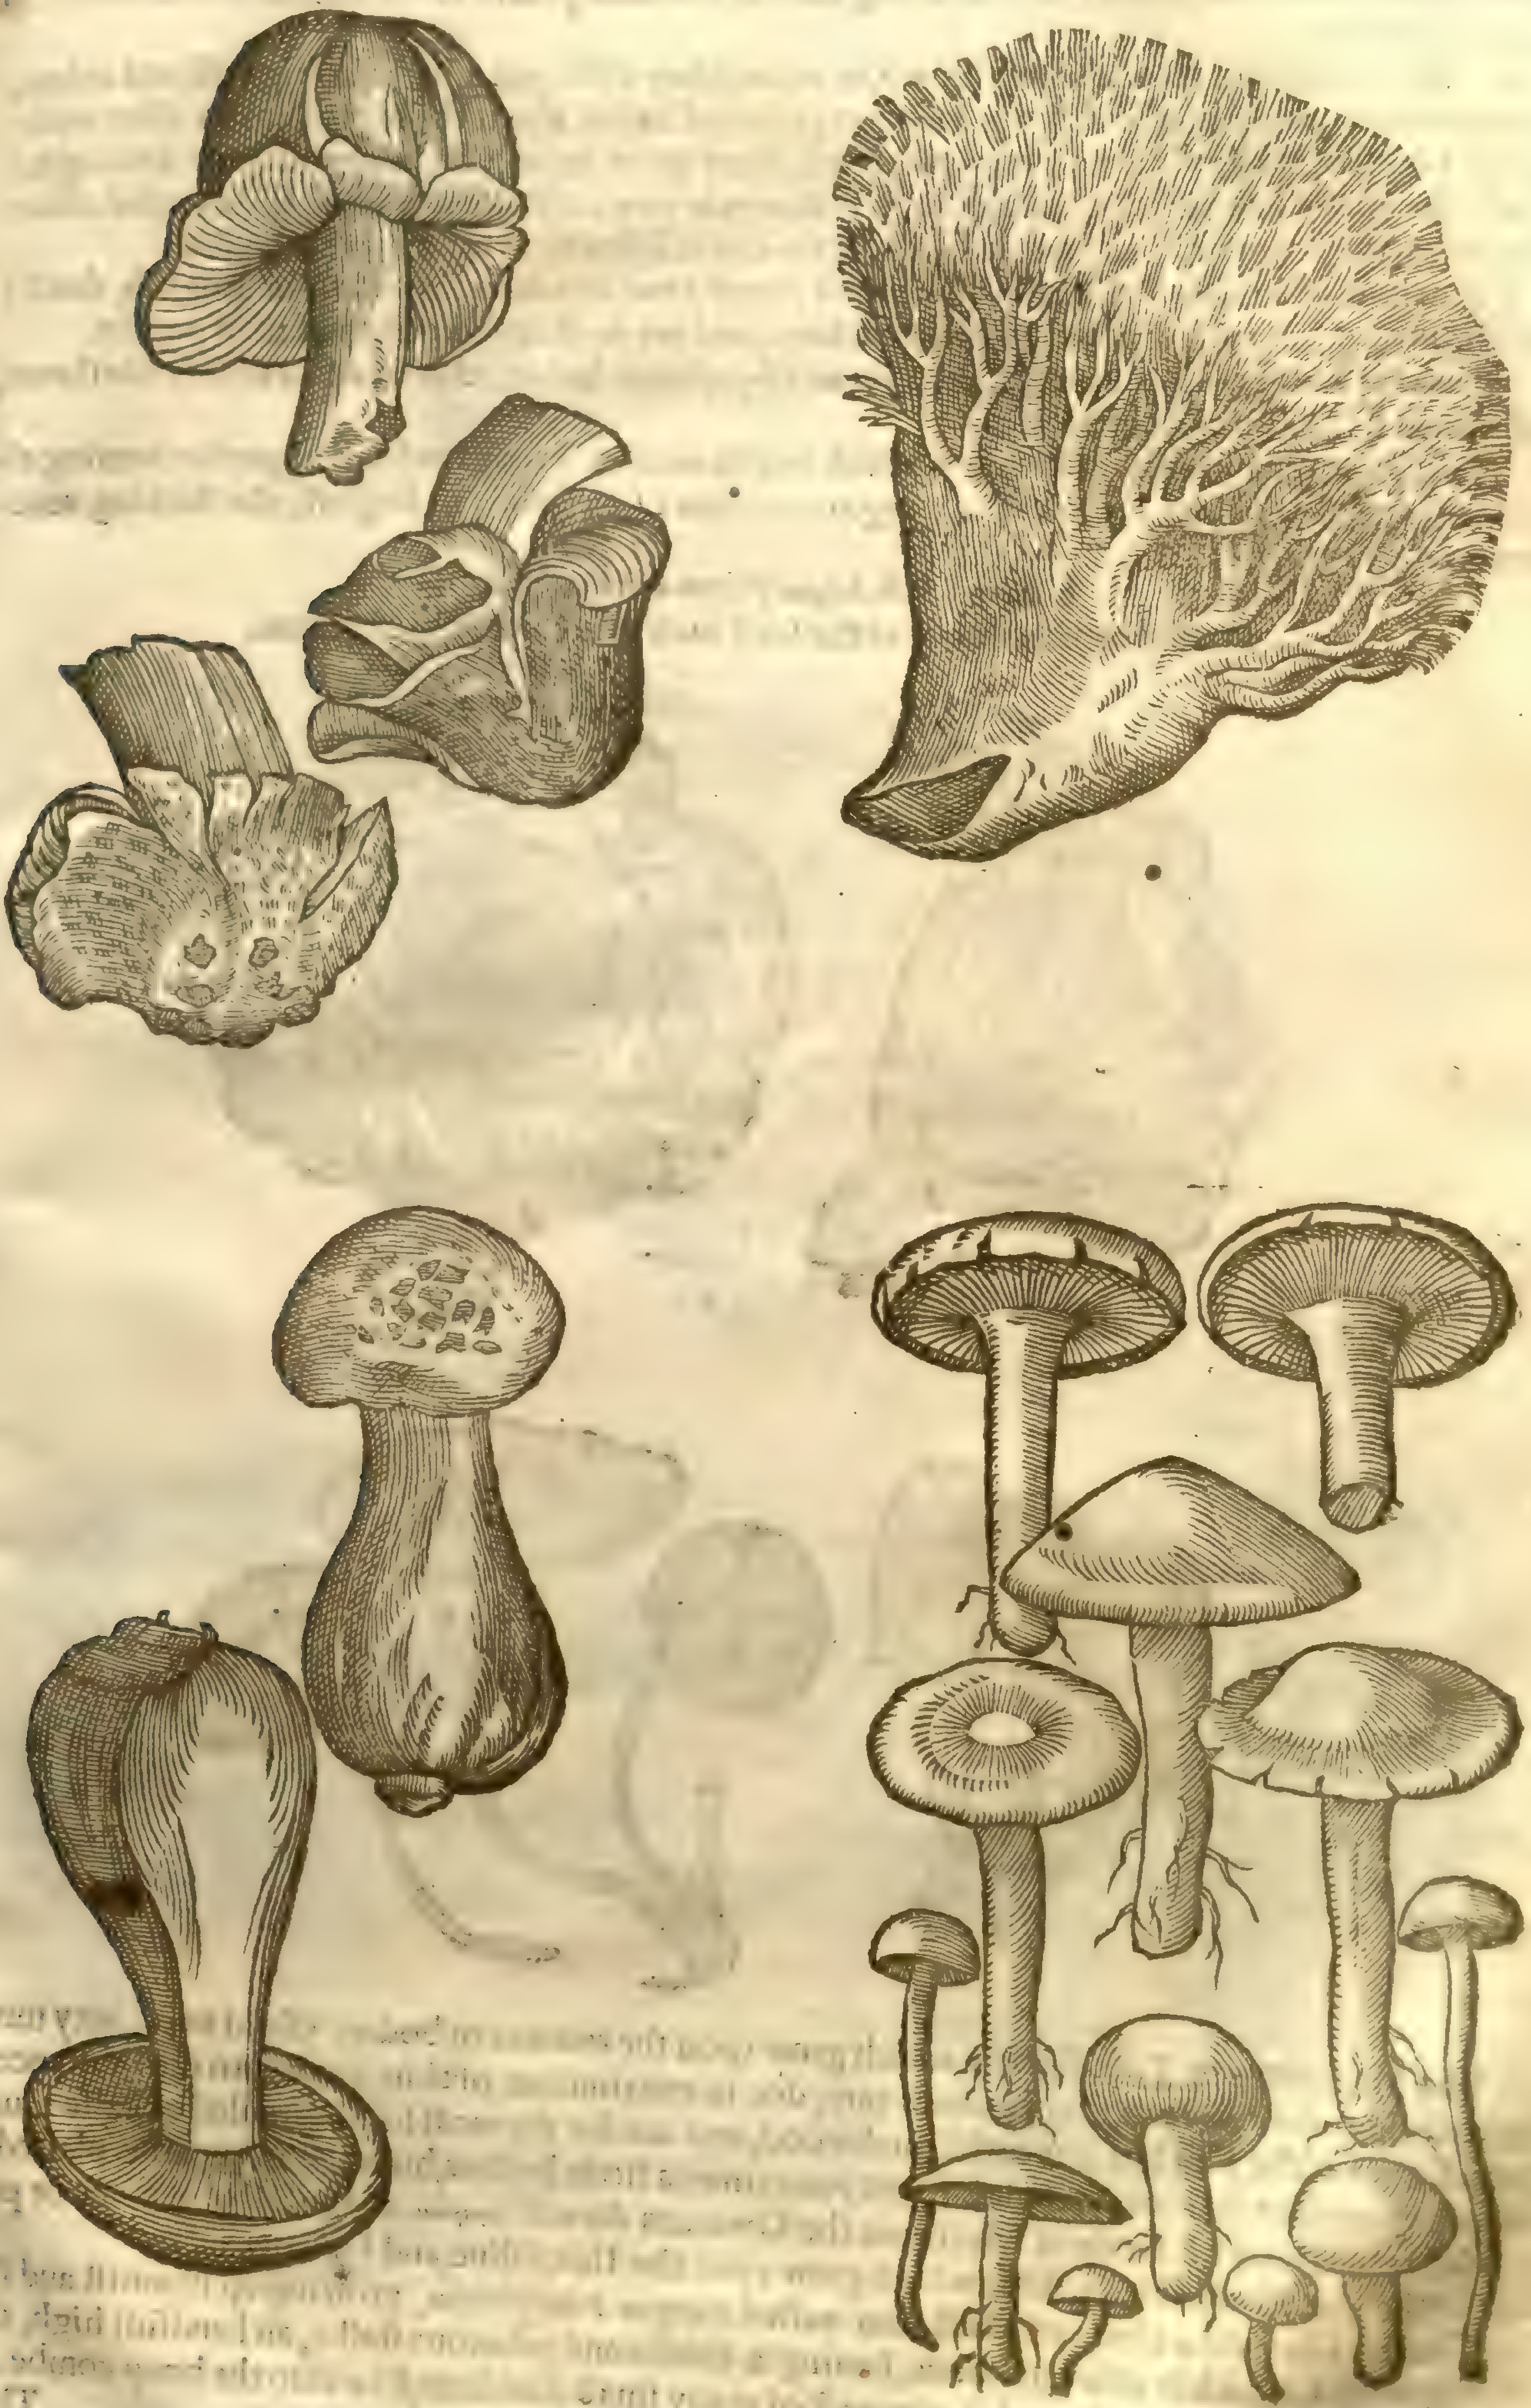
D Corrall drunke in wine prouoketh ſleepe: but if the patient haue an ague, then it is with better ſucceſſe miniſtred in water, for the Corrall cooleth, and the water moiſtneth the body, by reaſon whereof it reſtraineth the burning heate in agues, and repreſſeth the vapours that hinder ſleepe.

Chap. 167. *Of Muſhrumes, or Toadſtooles.*

¶ *The Kindes.*

Some Muſhrumes grow forth of the earth; other vpon the bodies of old trees, which differ altogether in kindes. Many wantons that dwell neere the ſea, and haue fiſh at will, are very deſirous for change of diet to feed vpon the birds of the mountaines; and ſuch as dwell vpon the hills or champion grounds, do long after ſea fiſh; many that haue plenty of both, do hunger after the earthy excreſcences, called Muſhromes: whereof ſome are very venomous and full of poyſon, others not ſo noiſome; and neither of them very wholeſome meate; wherefore for the auoiding of the venomous quality of the one, and that the other which is leſſe venomous may be diſcerned from it, I haue thought good to ſet forth their figures with their names and places of growth. ‡ Becauſe the booke is already growne too voluminous, I will only giue you the figures of ſuch as my Author hath here mentioned, with ſome few others, but not trouble you with any more hiſtory, yet diſtinguiſh betweene ſuch as be eatable, and thoſe that be poiſonous, or at leaſt not to be eaten; for the firſt figured among the poiſonous ones, is that we call Iewes-eare, which hath no poyſonous facultie in it. *Cluſius* (all whoſe figures I could haue here giuen you) hath written a peculiar tract of theſe baſtard plants, or excreſcences, where ſuch as deſire it may finde them ſufficiently diſcourſed of. ‡

1 *Fungi vulgatiſsimi eſculenti.* Common Muſhrums to be eaten.



¶ *The Deſcription.*

1 GRound Muſhrums grow vp in one night, ſtanding vpon a thicke and round ſtalke, like vnto a broad hat or buckler, of a very white colour vntil it begin to wither, at what time it loſeth his faire white, declining to yellowneſſe: the lower ſide is ſomewhat hollow, ſet or decked with fine gutters, drawne along from the middle centre to the circumference or round edge of the brim.

2 All Muſhroms are without pith, rib, or veine: they differ not a little in bigneſſe and colour, ſome are great, and like a broad brimmed hat; others ſmaller, about the bigneſſe of a ſiluer coine called a doller: moſt of them are red vnderneath; ſome more, ſome leſſe; others little or nothing red at all: the vpper ſide which beareth out, is either pale or whitiſh, or elſe of an ill-fauoured colour like aſhes (they commonly call it Aſh-colour) or elſe it ſeemeth to be ſomewhat yellow.

There is another kinde of Muſhroms called *Fungi parui lethales galericulati*: in Engliſh, deadly Muſhrums, which are faſhioned like vnto an hood, and are moſt venomous and full of poyſon.

There is a kinde of Muſhrom called *Fungus Clypeiformis lethalis*, that is alſo a deadly Muſhrum, faſhioned like a little buckler.

There is another kinde of Muſhrum, which is alſo moſt venomous and full of poyſon, bearing alſo the ſhape of a buckler, being called *Fungus venenatus Clypeiformis*: in Engliſh, the ſtinking venomous Muſhrum.

2 *Fungi lethales, aut ſaltem non eſculenti.*
Poyſon Muſhrums, or at the leaſt ſuch as are not vulgarly eaten.

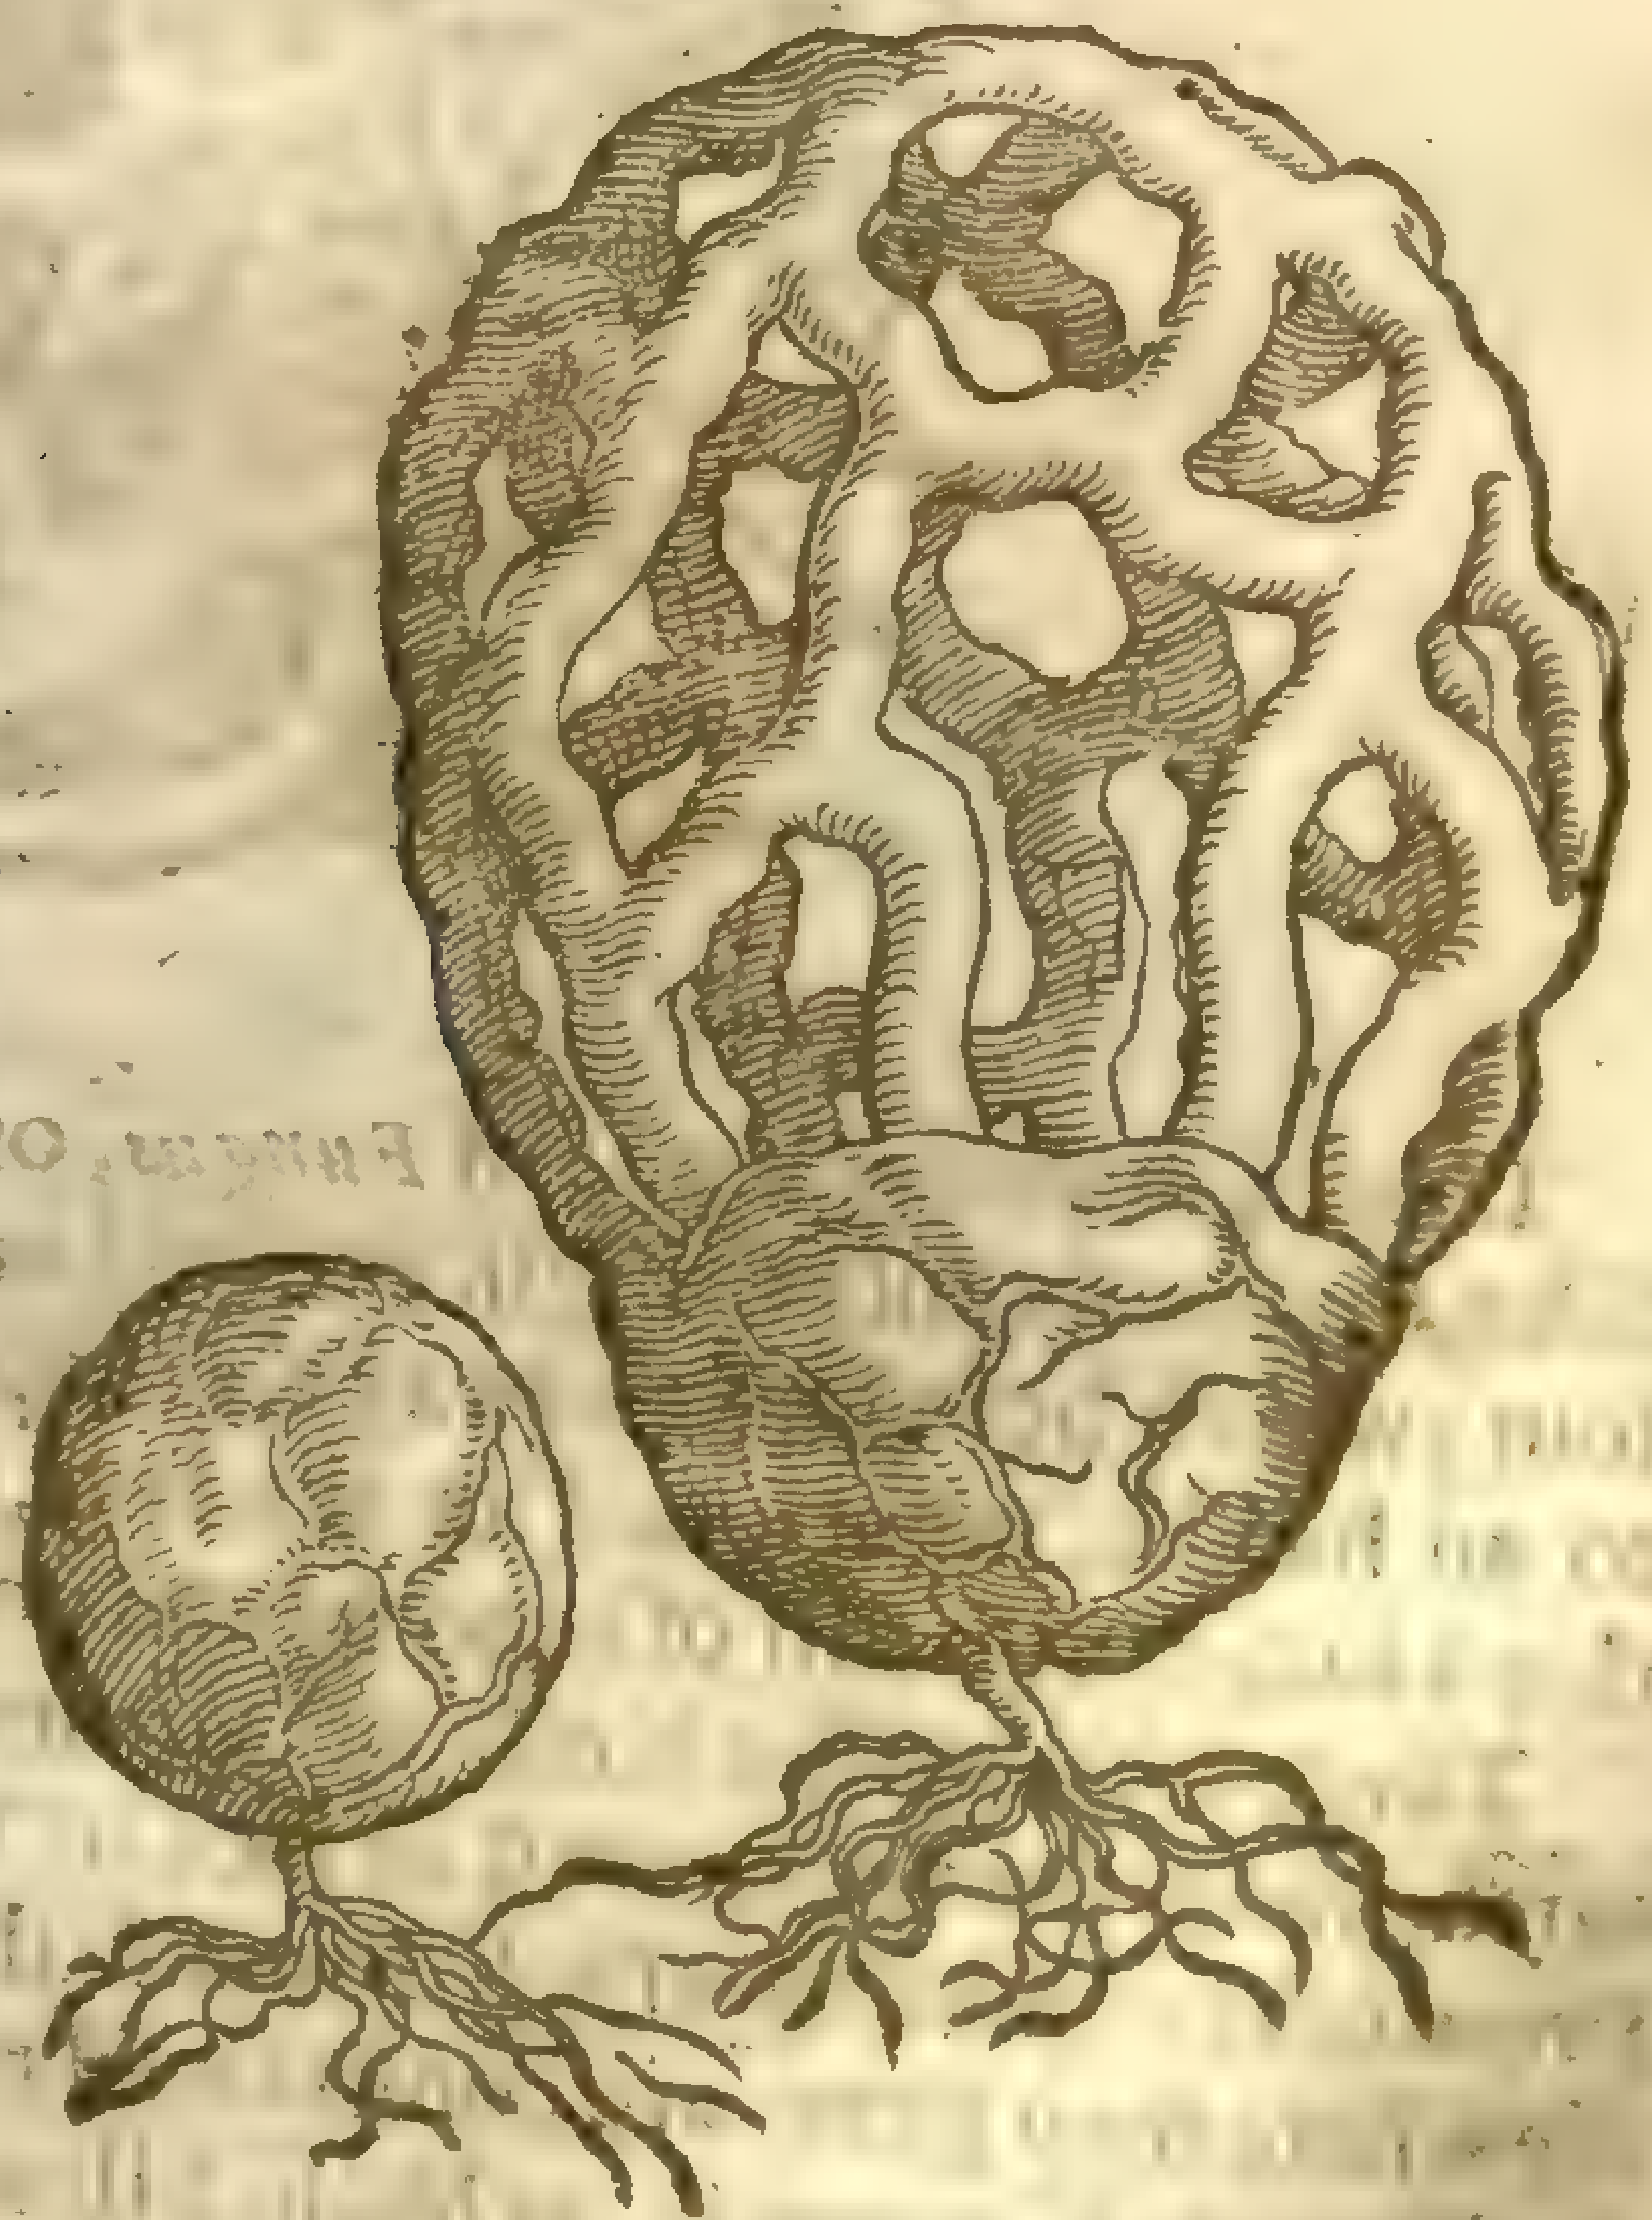
The Muſhrums or Toodſtooles which grow vpon the trunkes or bodies of old trees, very much reſembling *Auricula Iudæ*, that is, Iewes eare, doe in continuance of time grow vnto the ſubſtance of wood, which the Fowlers doe call Touchwood, and are for the moſt halfe circuled or halfe round, whoſe vpper part is ſomewhat plaine, and ſometimes a little hollow, but the lower part is plaited or purſed together. This kinde of Muſhrum the Grecians do call ἀγαρικὸν, and is full of venome or poyſon as the former, eſpecially thoſe which grow vpon the Ilex, Oliue, and Oke trees.

There is likewiſe a kinde of Muſhrum called *Fungus Fauaginoſus*, growing vp in moiſt and ſhadowie woods, which is alſo venomous, hauing a thicke and tuberous ſtalke, an handfull high, of a duskiſh colour; the top whereof is compact of many ſmall diuiſions, like vnto the hony combe.

There

Fungus ſambucinus, ſiue Auricula Iudæ. Iewes eares.

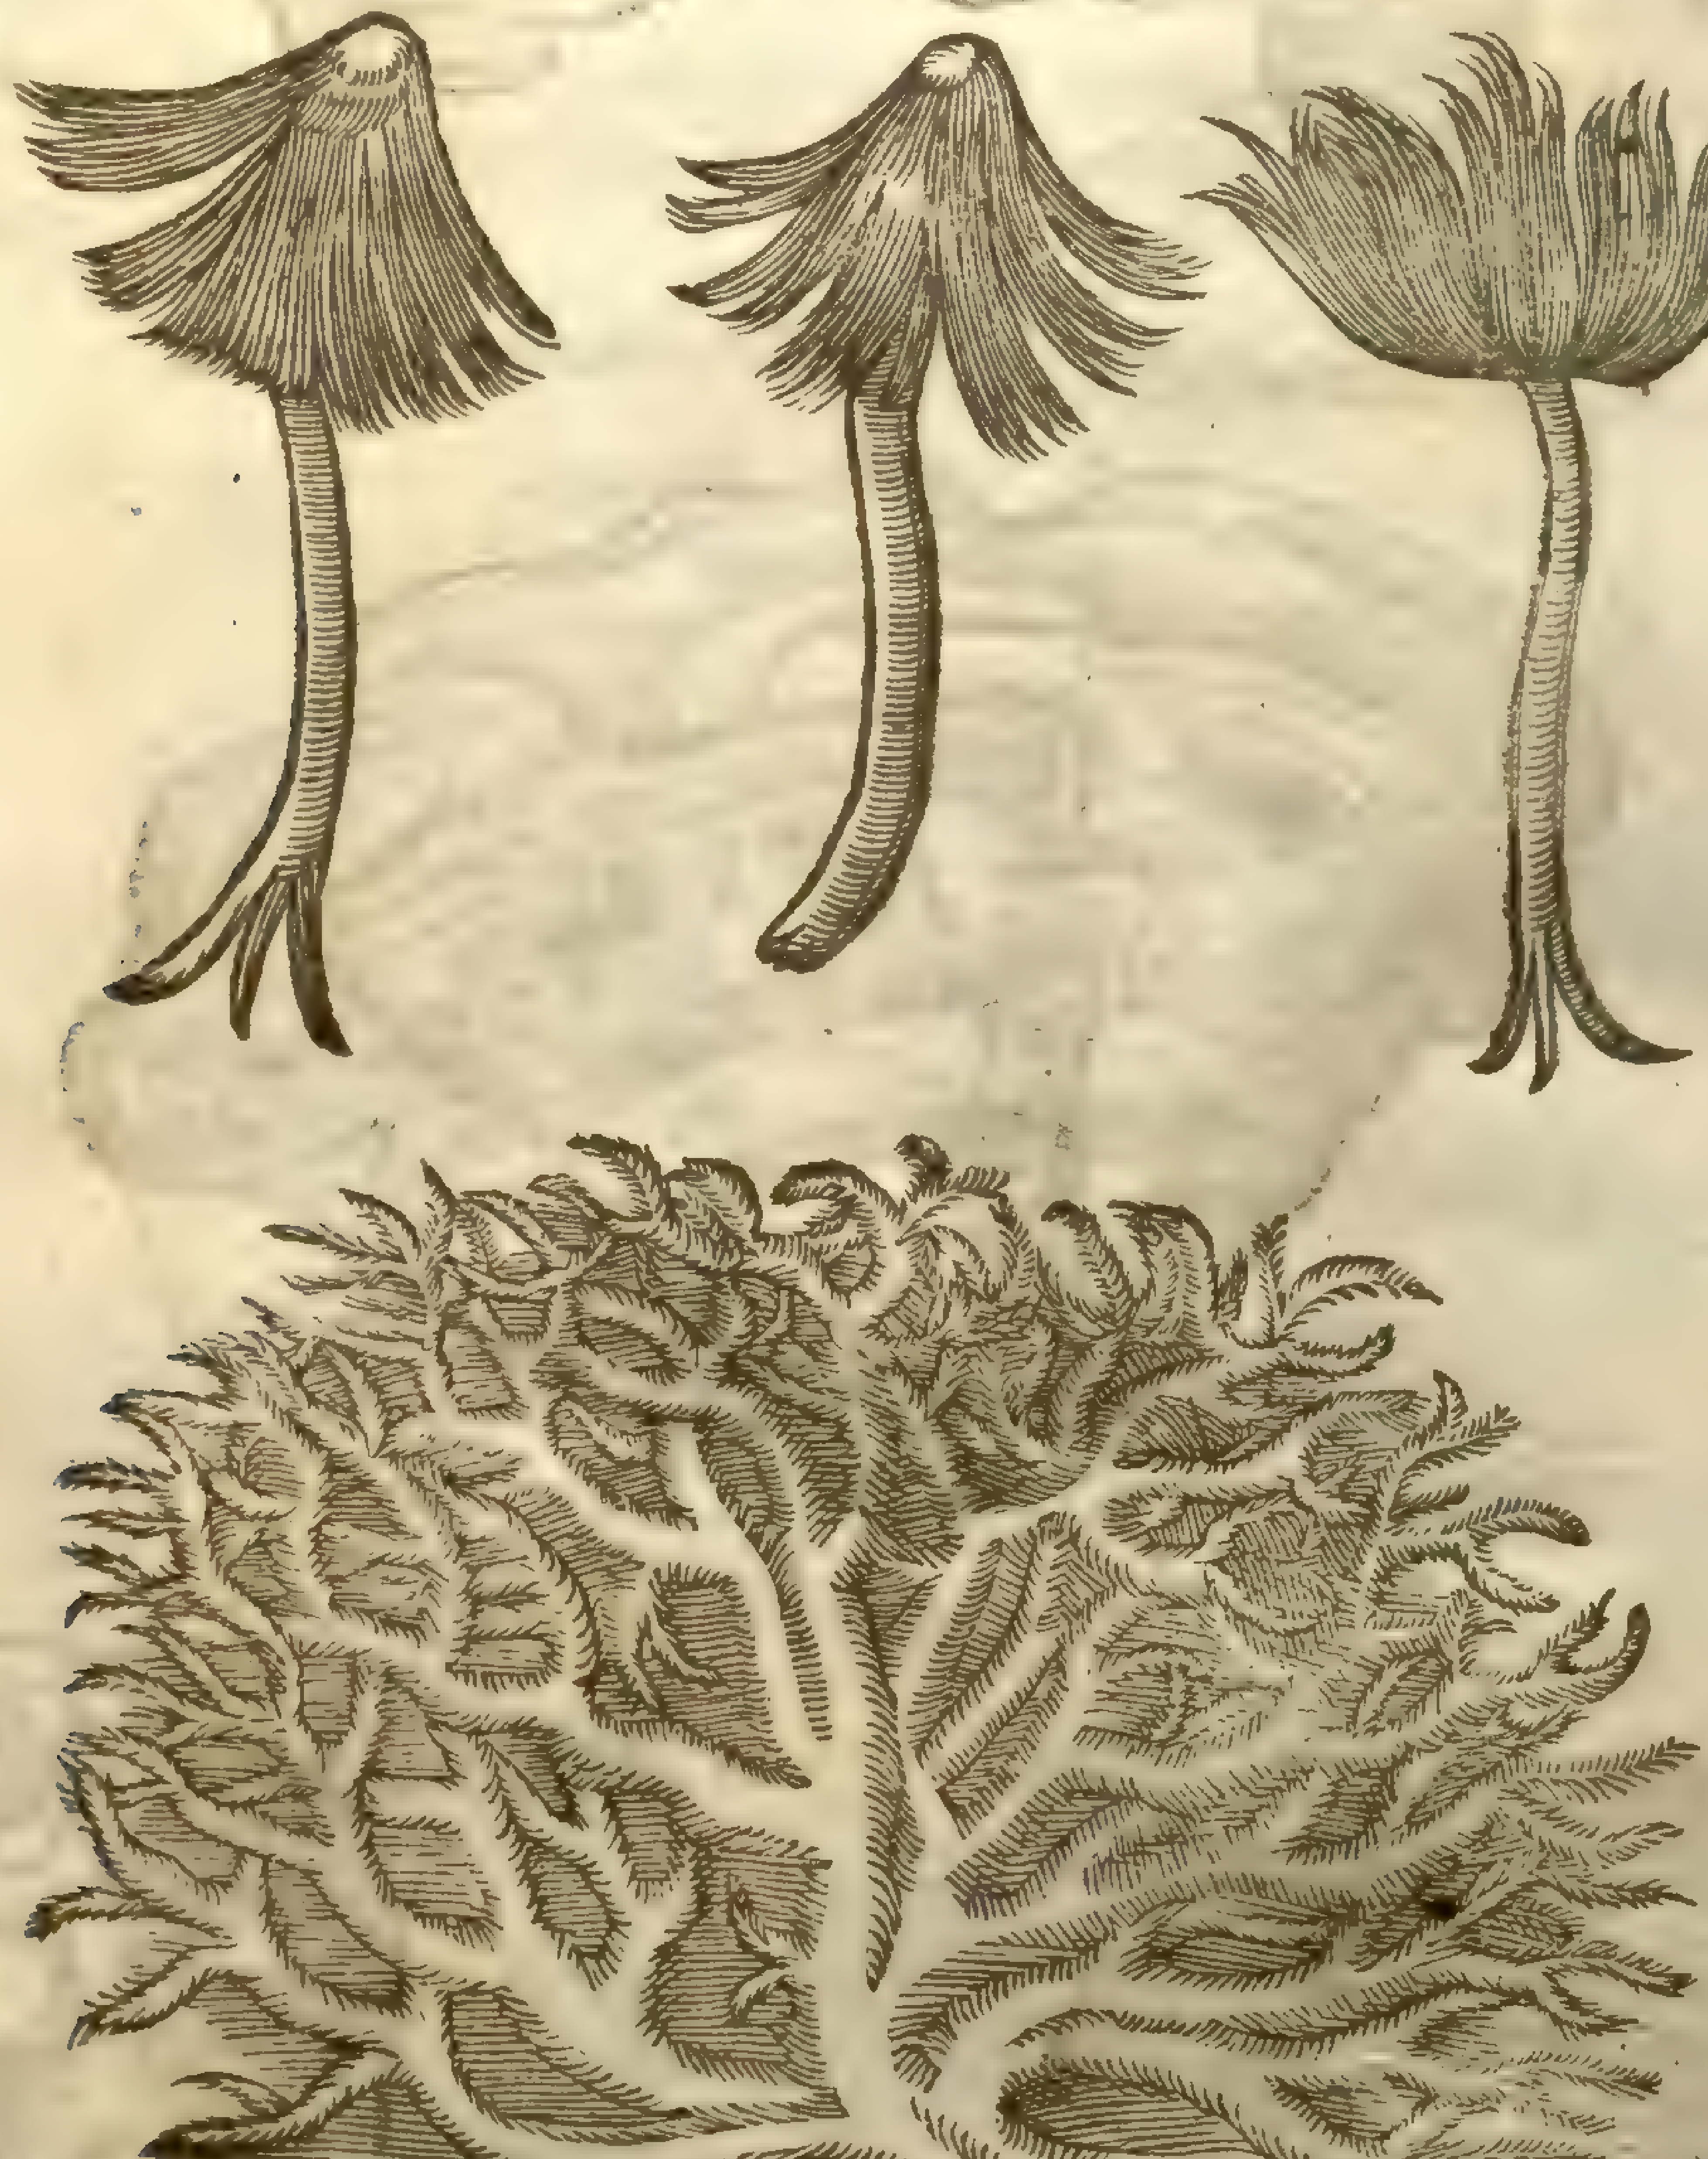
Fungi lethales, ſiue non eſculenti. Poyſonous Muſhrums.



There is alſo found another, ſet forth vnder the title *Fungus virilis penis arecti forma*, which wee Engliſh, Prick Muſhrum, taken from his forme.

3 *Fungus orbicularis*, or *Lupi crepitus*, ſome do call it *Lucernarum fungus*: in Engliſh, Fuſſe balls, Pucke Fuſſe, and Bulfiſts, with which in ſome places of England they vſe to kill or ſmolder their Bees, when they would driue the Hiues, and bereaue the poore Bees of their meat, houſes and liues: theſe are alſo vſed in ſome places where neighbours dwell far aſunder, to carry and referue fire from place to place, wherof it tooke the name, *Lucernarum Fungus*: in forme they are very round, ſticking and cleauing vnto the ground, without any ſtalks or ſtems; at the firſt white, but afterwards of a duskiſh colour, hauing no hole or breach in them, whereby a man may ſee into them, which being troden vpon doe breath forth a moſt thin and fine pouder, like vnto ſmoke, very noiſome and hurtfull vnto the eies, cauſing a kinde of blindneſſe, which is called Poor-blinde, or Sandblinde.

Fungi lethales, ſiue non eſculenti. Poiſonous Muſhrums.



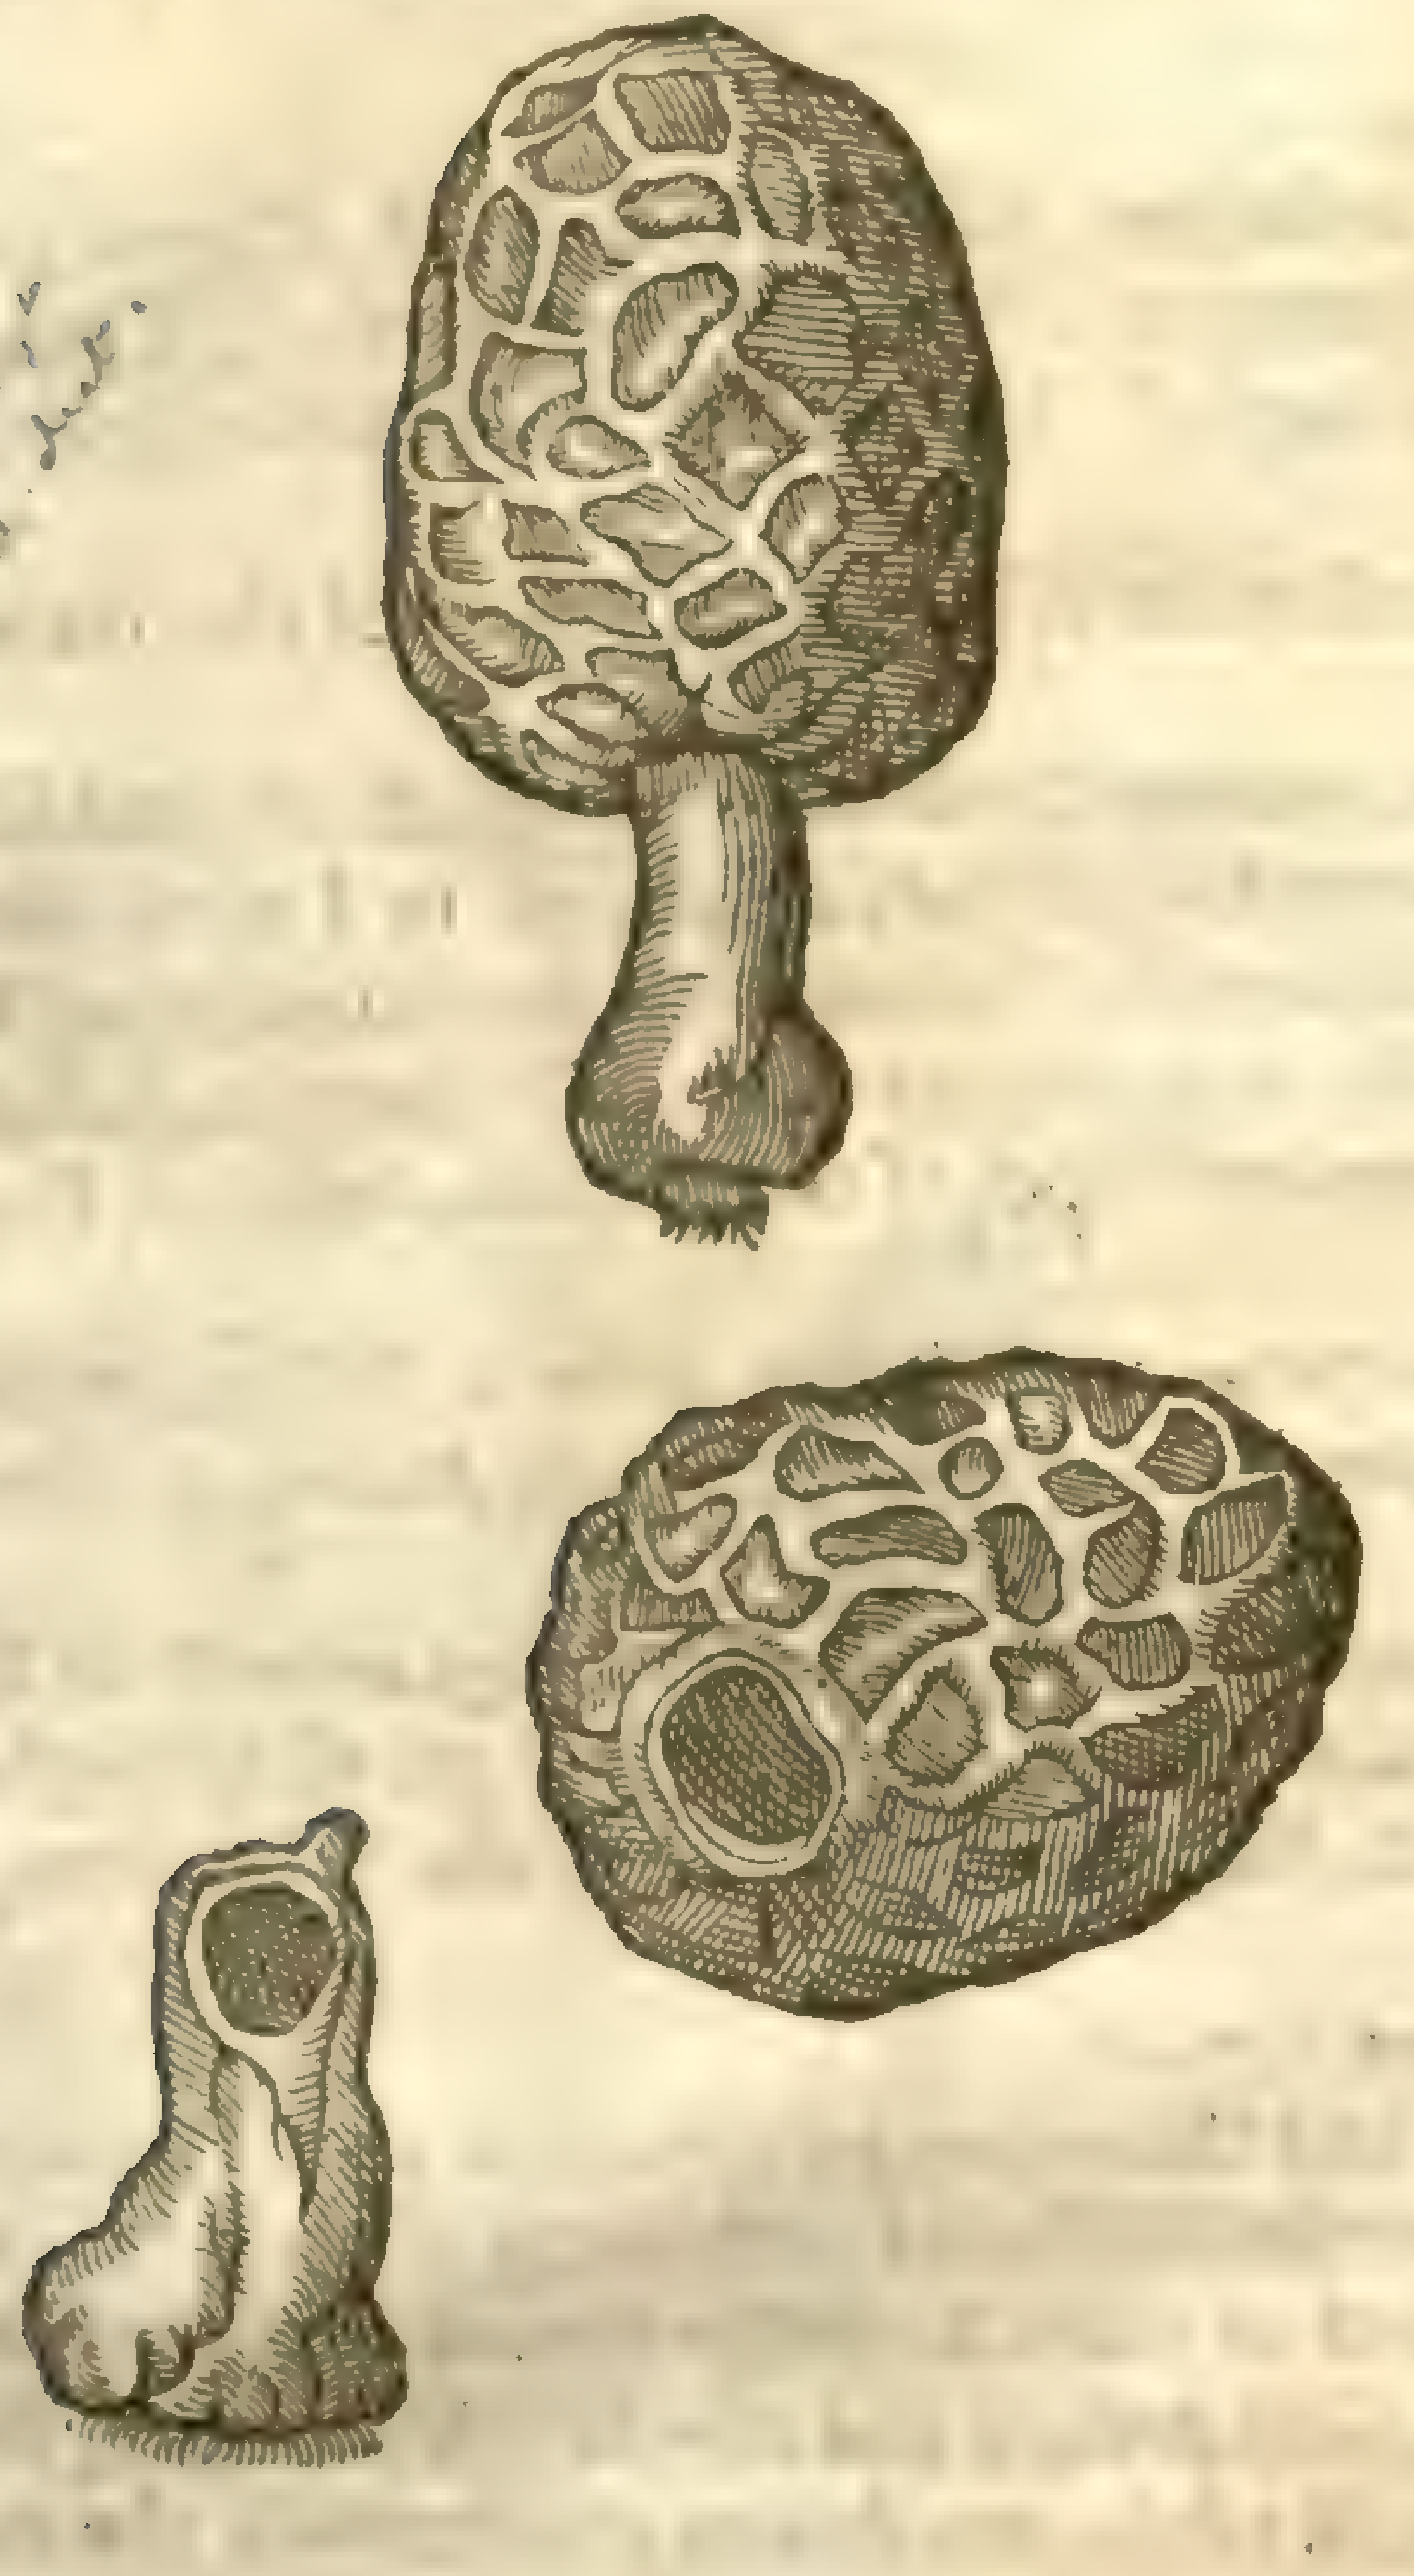
There is another kinde of *Fungus*, or Muſhrum, which groweth in moiſt medowes, and by ditch ſides, fiue or ſix inches high, couered ouer with a skin like a piece of ſheepes leather, of a ruſſet colour; which being taken away there appeareth a long and white ſtumpe, in forme not much vnlike to an handle, mentioned in the title, or like vnto the white or tender ſtalke of Aron, but greater: this kinde is alſo full of venome and poiſon.

There is likewiſe a kinde of Muſhrum, with a certaine round excreſcence, growing within the earth, vnder the vpper cruſt or face of the ſame, in dry and grauelly grounds in Pannonia and the Prouinces adjoining which do cauſe the ground to ſwel, and be full of hils like Mole-hils. The people where they grow, are conſtrained to dig them vp and caſt them abroad like as we do Mole-hils. ſpoiling their grounds, as Mole-hils are hurtfull vnto our ſoile: theſe haue neither ſtalkes, leaues, fibres nor ſtrings annexed or faſtened vnto them, and for the moſt part are of a reddiſh colour, but within of a whitiſh yellow: the Grecians haue called this tuberous excreſcence, *Idna*, and the Latines *Tubera*: the Spaniards doe call them *Turmas tierra*: in Engliſh wee may call them Spaniſh Fuſſe-bals.

¶ *The Place.*

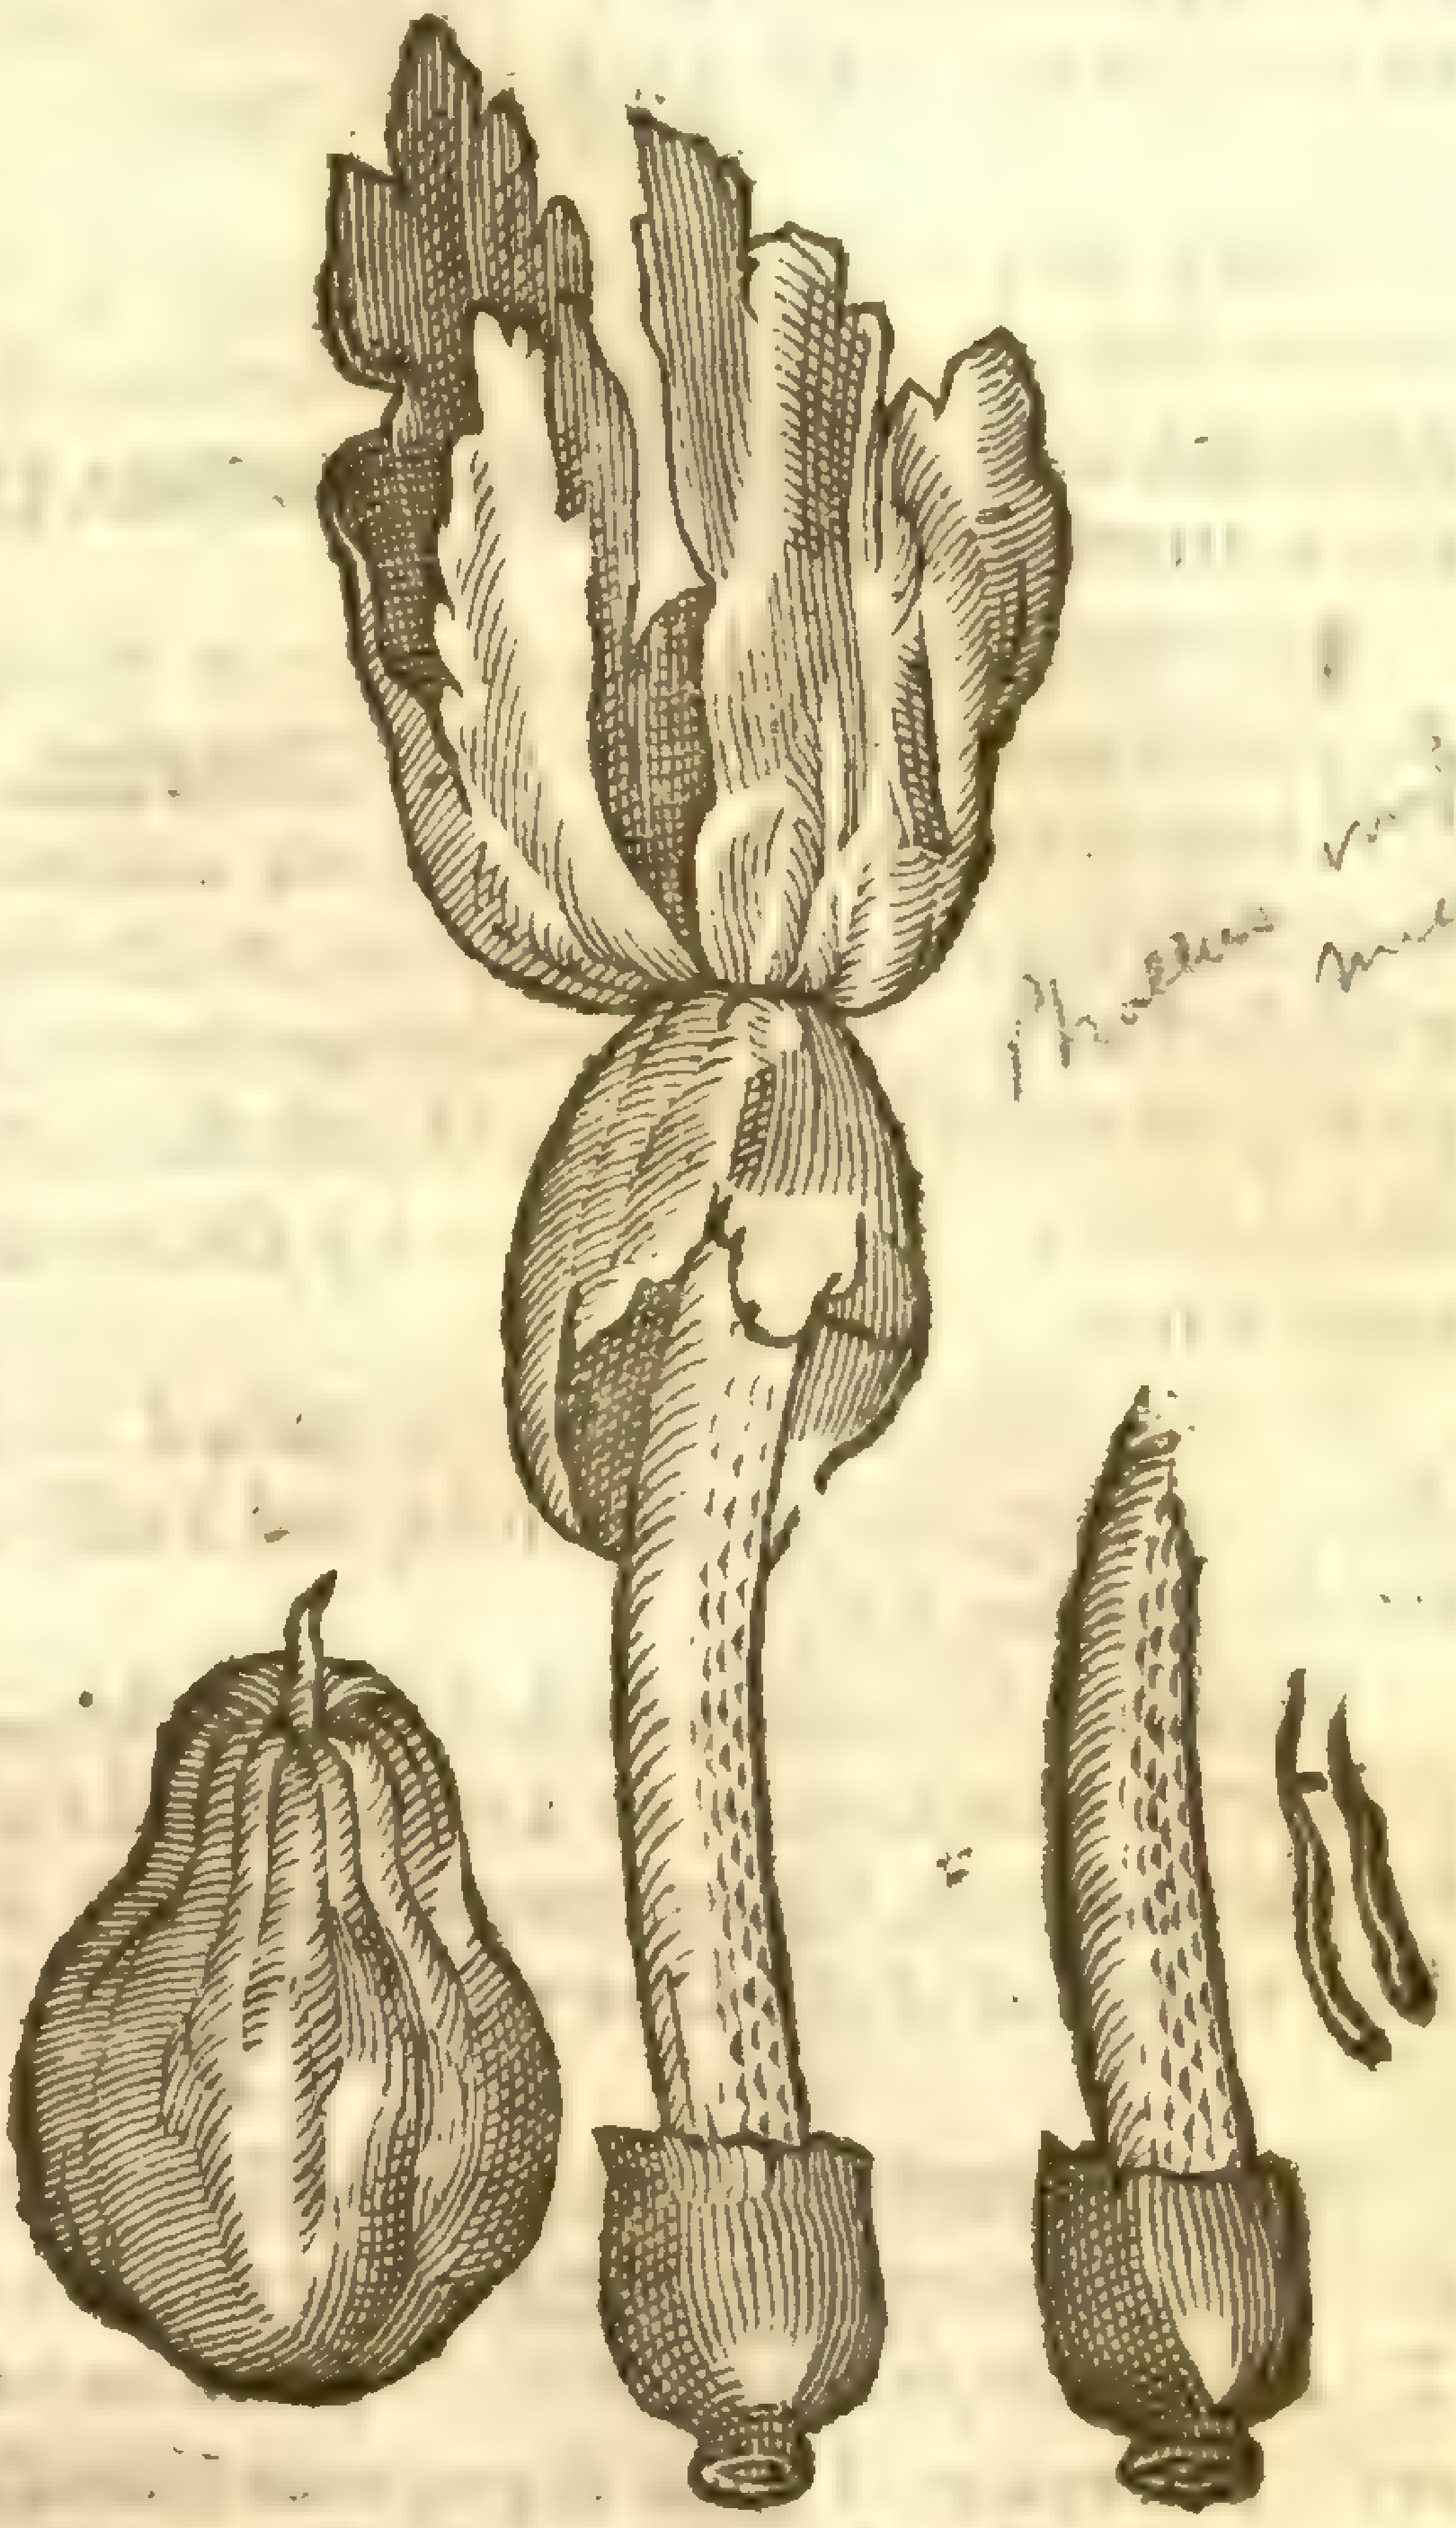
Muſhrums come vp about the roots of trees, in graſſie places of medowes, and Ley Land newly turned

Fungus fauiginoſus.
Hony-comb'd Muſhrome.



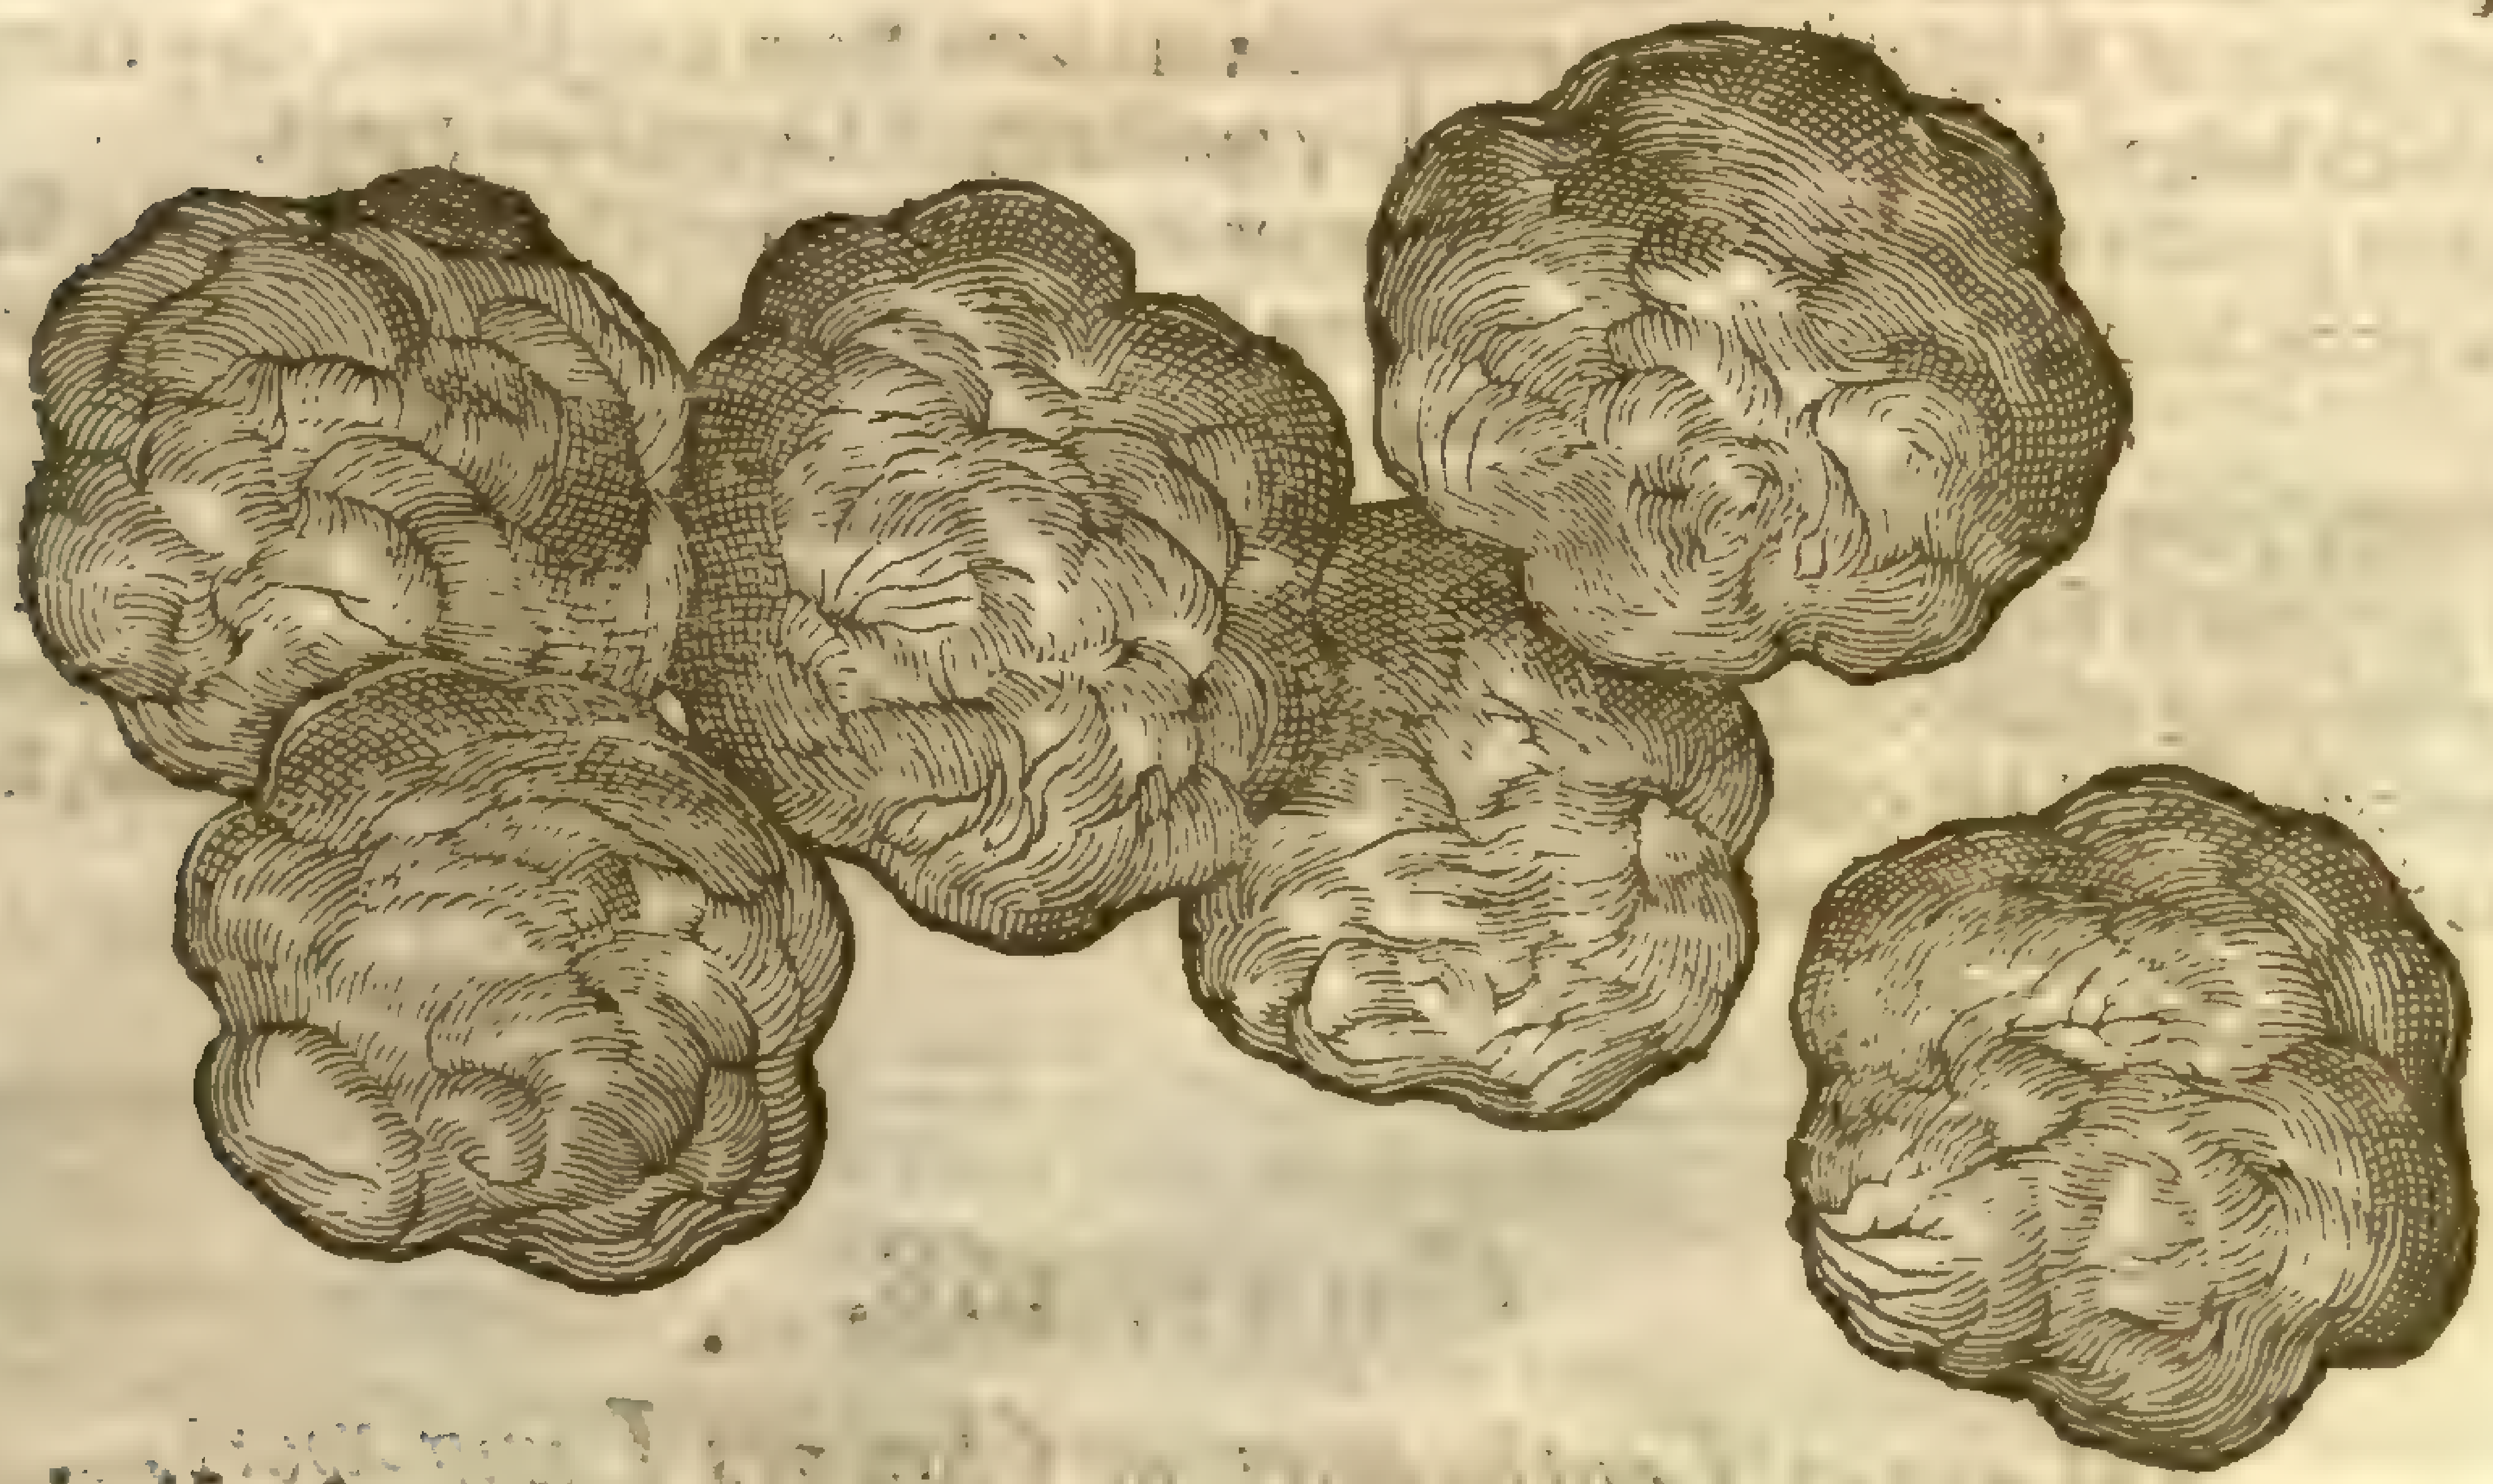
Phallus eſculentus Nees dict.

Fungus Virilis Penis effigie.
Pricke Muſhrome.



Phallus impudicus — Nees dict.

Tuberaterræ.
Fuſſe-balls, or Puck-fiſts.



turned; in woods alſo where the ground is ſandy, but yet dankiſh: they grow likewiſe out of wood, forth of the rotten bodies of trees, but they are vnprofitable and nothing worth. Poiſonſome muſhroms, as *Dioſcorides* ſaith, groweth where old ruſty iron lieth, or rotten clouts, or neere to ſerpents dens, or roots of trees that bring forth venomous fruit. Diuers eſteeme thoſe for the beſt which grow in medowes, and vpon mountaines and hilly places, as *Horace* ſaith, *lib. ſer. 2. ſatyr. 4.*

——— pratenſibus optima fungis.
Natura eſt, alijs malè creditur.

The medow Muſhroms are in kinde the beſt,
It is ill truſting any of the reſt.

¶ *The Time.*

Diuers come vp in Aprill, and laſt not till May, for they flouriſh but whileſt Aprill continues: others grow later, about Auguſt; yet all of them after raine, and therefore they are found one yeare ſooner, and another later. Muſhroms, ſaith *Pliny*, grow in ſhoures of raine: they come of the ſlime of trees, as the ſame Author affirmeth.

¶ *The Names.*

They are called in Latine, *Fungi*: in Greeke, μύκητες: in Italian, *Fonghi*: in Spaniſh, *Hungos, Cugumenos*: in French, *Campinion*, which word the Low-Country men alſo vſe, and call them **Campernoellen**: in high Dutch, **Schwemme, Pfifferling**: in Engliſh, Muſhroms, Toadſtooles, and Paddock-ſtooles.

The muſhroms that come vp in Aprill are called in Latine of ſome, *Spongiolæ*: of the Italians, *Prignoli*: and in high Dutch, **Morchel.**

They that are of a light red are called of ſome *Boleti*, among the later ones which riſe and fall awae in ſeuen daies. The white, or thoſe which bee ſomewhat yellow, are called in Latine, *Suilli*: which the later Phyſitions name *Porcini*, or Swine muſhrums. *Suilli*, ſaith *Pliny*, are dried, being hanged vpon ruſhes, which are thruſt through them. The dry ones are in our age alſo eaten in Bohemia and Auſtria: they that grow by the roots of Poplar trees are called of the Latines, *Populnei*, Poplar muſhrums.

Puffes-fiſts are commonly called in Latine, *Lupi crepitus*, or Wolfes fiſts: in Italian, *Veſcie de Lupo*: in Engliſh, Puffes-fiſts, and Fuſſe-balls in the North. *Pliny* nameth them *Pezicæ*, as though he ſhould ſay, flat.

Tree muſhroms be called in Greeke, μύκητες: in Latine, *Fungi arborum*, and *Fungi arborei*: in Engliſh, tree Muſhroms, or Touch-wood: in high Dutch alſo **Schwemme.** They are all thought to be poiſonſome, being inwardly taken. *Nicander* writeth, that the muſhroms of the Oliue tree, the Ilex tree, and of the Oke tree bring death.

¶ *The Temperature and Vertues.*

A *Galen* affirmes, that they are all very cold and moiſt, and therefore to approach vnto a venomous and murthering facultie, and ingender a clammy, pituitous, and cold nutriment if they be eaten. To conclude, few of them are good to be eaten, and moſt of them do ſuffocate and ſtrangle the eater. Therefore I giue my aduice vnto thoſe that loue ſuch ſtrange and new fangled meates, to beware of licking honey among thornes, leaſt the ſweetneſſe of the one do not counteruaile the ſharpneſſe and pricking of the other.

B Fuſſe-balls are no way eaten: the pouder of them doth dry without biting: it is fitly applied to merigals, kibed heeles, and ſuch like.

C In diuers parts of England where people dwell farre from neighbours, they carry them kindled with fire, which laſteth long: whereupon they were called *Lucernarum Fungi*.

D The duſt or pouder thereof is very dangerous for the eies, for it hath been often ſeene, that diuers haue beene pore-blinde euer after, when ſome ſmall quantitie thereof hath beene blowne into their eies.

E The country people do vſe to kill or ſmother Bees with theſe Fuſſe-balls, being ſet on fire, for the which purpoſe it fitly ſerueth.

F ‡ The fungous excreſcence of the Elder, commonly called a Iewes eare, is much vſed againſt the inflammations and all other ſoreneſſes of the throat, being boyled in milke, ſteeped in beere, vineger, or any other conuenient liquor. ‡

Chap. 168.

Of great Tooth-wort, or Clownes Lung-wort.

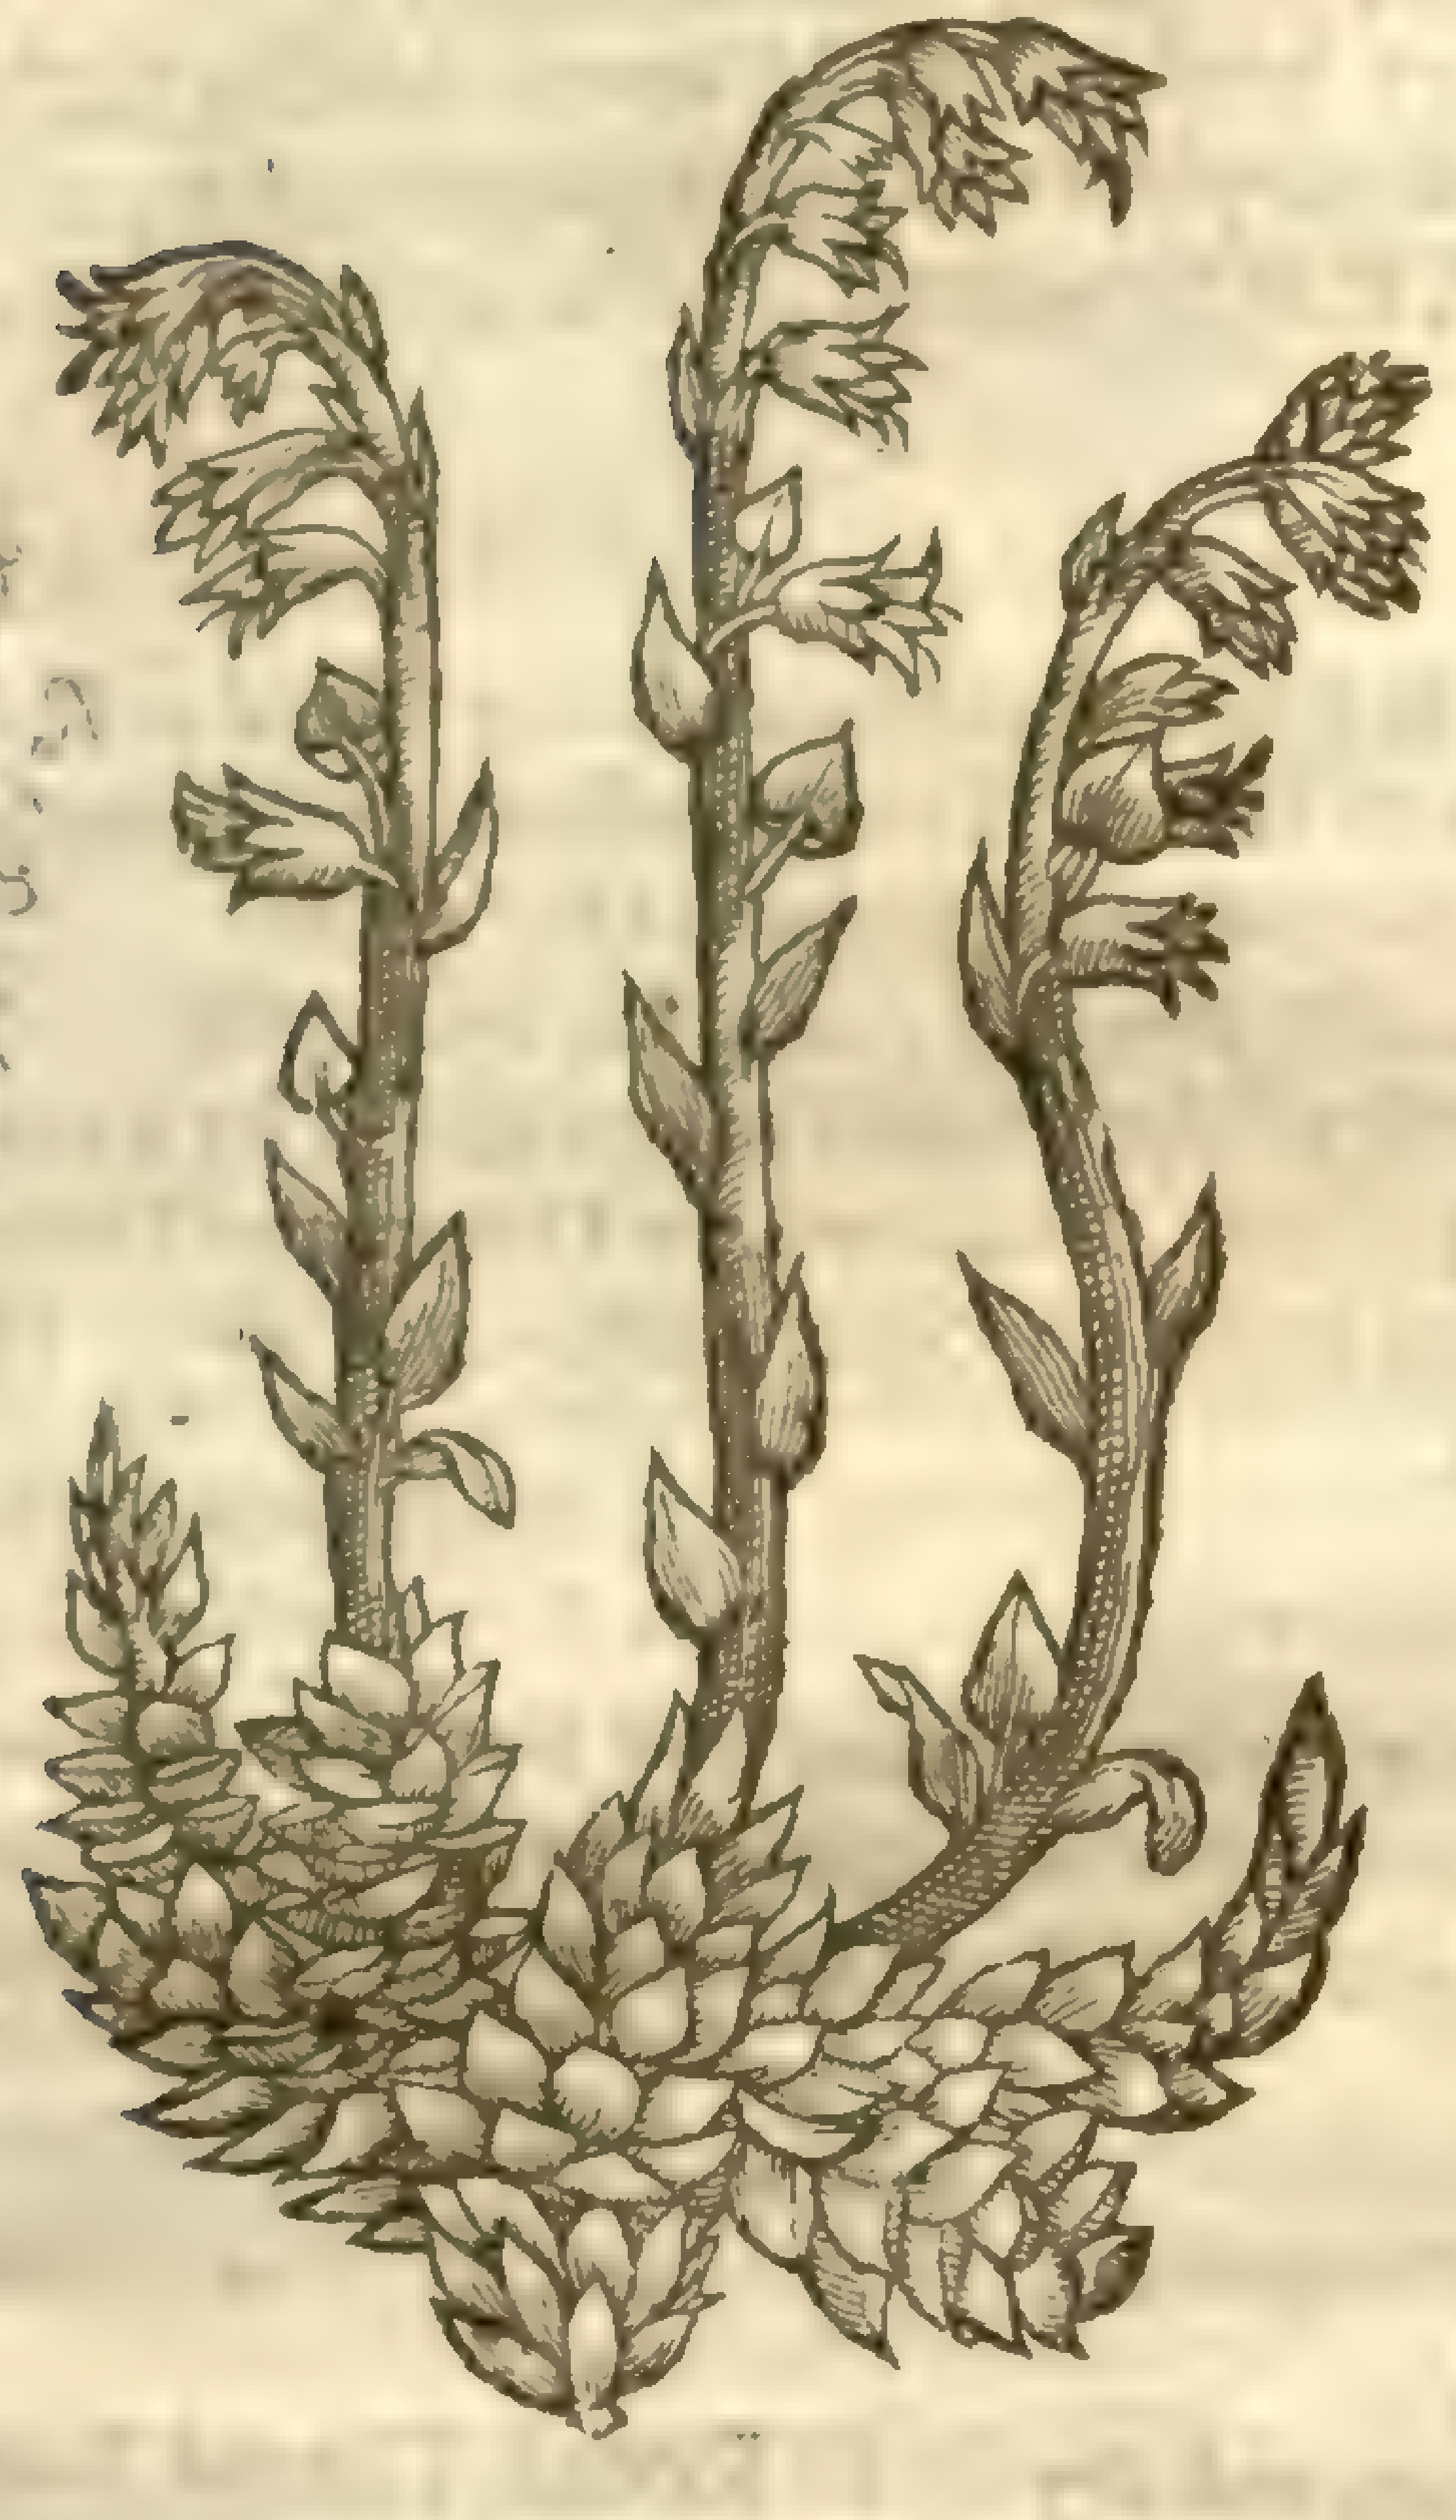
¶ *The Description.*

1 There is often found among the Muſhroms a certaine kinde of excreſcence conſiſting of a jelly or ſoft ſubſtance, like that of the Muſhroms, and therefore it may the more fitly be here inſerted: it riſeth forth of the ground in forme like vnto *Orobanche*, or the Broome-Rape, and alſo in ſubſtance, hauing a tender, thicke, tuberous, or miſ-ſhapen body, conſiſting as it were of ſcales like teeth (whereof it tooke his name) of a duſty ſhining colour tending to purple. The ſtalke riſeth vp in the middle, garniſhed with little gaping hollow floures like thoſe of Satyrion; on the outſide of an ouerworne whitiſh colour: the whole plant reſembleth a rude forme of that jelly,

gellie, or ſlimie matter, found in the fields, which we call the falling of ſtars: the root is ſmall and tender.

2 There is alſo another ſort hereof found, not differing from the precedent: the chiefe difference conſiſteth in that, that this plant is altogether leſſer; ‡ and hath a root diuerſly diuaricated like Corall, white of colour, full of juyce, and without any fibers annexed therto ‡; in other reſpects like.

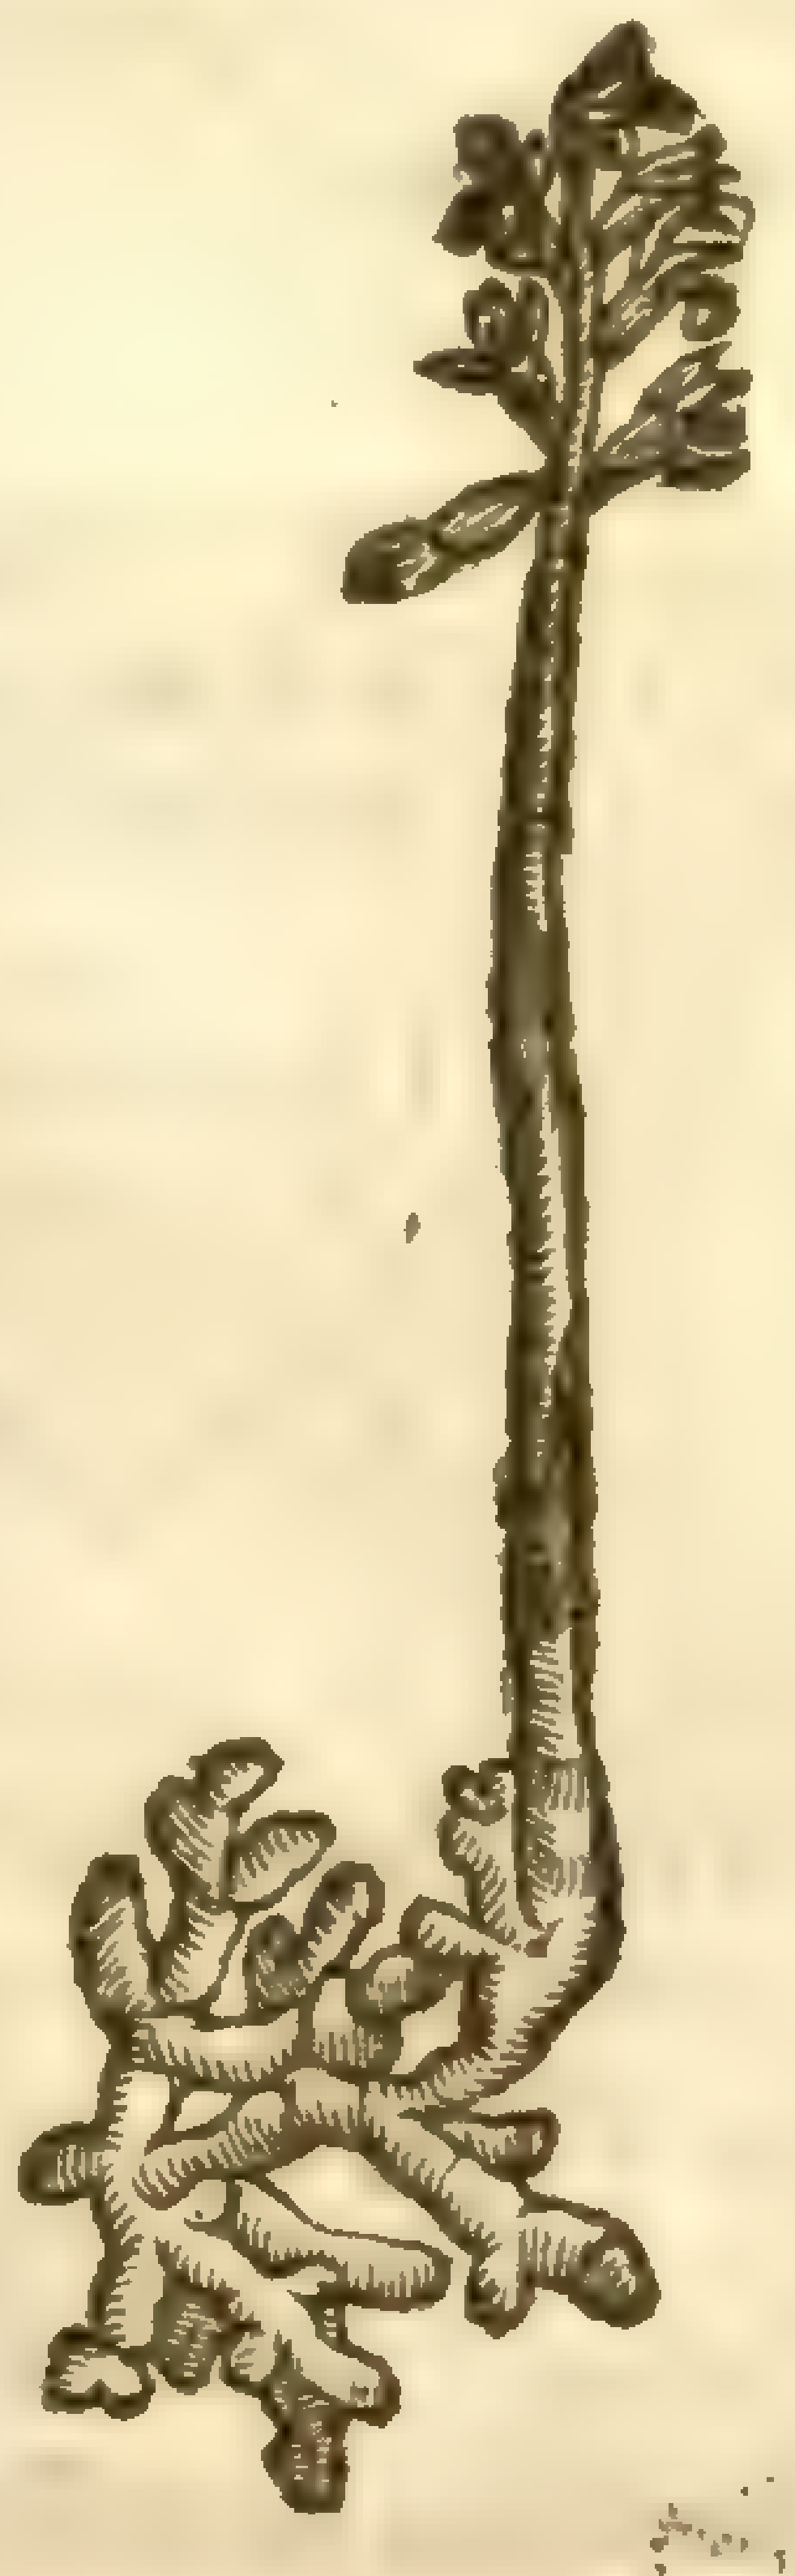
1 *Dentaria major Matthioli.*
Great Toothwort, or Lungwort.



Lathraea squamaria L. [illegible]
Sm. [illegible]

2 *Dentaria minor.*
Little Lungwort.

Ophrys corallorhiza, L. [illegible]
Sm. [illegible]



¶ *The Place.*

Theſe plants do grow at the bottom of Elme trees, and ſuch like, in ſhadowie places: I found it growing in a lane called Eaſt lane, on the right hand as ye go from Maidſtone in Kent vnto Cockes Heath, halfe a mile from the towne; and in other places thereabout: it doth alſo grow in the fields about Croidon, eſpecially about a place called Groutes, being the land of a Worſhipfull Gentleman called Mr *Garth*, and alſo in a Wood in Kent neere Crayfoot, called Rowe, or Rough-hill: it groweth likewiſe neere Harwood in Lancaſhire, a mile from Whanley, in a wood called Talbot banke.

¶ *The Time.*

They flouriſh in May and Iune.

¶ *The Names.*

There is not any other name extant, more than is ſet forth in the deſcription.

¶ *The Temperature and Vertues.*

There is nothing extant of the faculties hereof, either of the antient or later writers: neither haue we any thing of our owne experience; onely our country women do call it Lungwort, and do vſe it againſt the cough, and all imperfections of the lungs: but what benefit they reape thereby I know not; neither can any of judgement giue me further inſtruction thereof.

CHAP. 169. *Of Saunders.*

¶ *The Kindes.*

THe antient Greekes haue not knowne the ſorts of Saunders: *Garcias* and others deſcribe three; *Album, Rubrum,* and *Pallidum*; which in ſhops is called *Citrinum.*

¶ *The Deſcription.*

1 THe Saunders tree groweth to the bigneſſe of the Walnut-tree, garniſhed with many goodly branches; whereon are ſet leaues like thoſe of the Lentiske tree,alwaies green; among which come forth very faire floures, of a blew colour tending to blackeneſſe; after commeth the fruit of the bigneſſe of a Cherry, greene at the firſt, and blacke when it is ripe; without taſte, and ready to fall downe with euery little blaſt of winde: the timber or wood is of a white colour,and a very pleaſant ſmell.

2 There is likewiſe another which groweth very great, the floures and fruit agree with the other of his kinde: the wood is of a yellowiſh colour,wherein conſiſteth the difference.

‡ 3 The third ſort which we call Red-Saunders is a very hard and ſollid wood, hauing little or no ſmell, the colour thereof is very red, it groweth not in thoſe places where the other grow, neither is the forme of the tree deſcribed by any that I know of, it is frequently vſed to colour ſauces, and for ſuch like vſes. ‡

¶ *The Place.*

The white and yellow Saunders grow naturally,and that in great abundance, in an Iſland called Timor, and alſo in the Eaſt-Indies beyond the riuer Sanges or rather Ganges, which the Indians call *Hanga*, and alſo about Iaua,where it is of better odour than any that growes elſe-where.

The red Saunders growes within the riuer Ganges,eſpecially about Tanaſarim, and in the marriſh grounds about Charamandell: *Auicen, Serapio*, and moſt of the Mauritanians call it by a corrupt name,*Sandal*: in Timor, Malaca,and in places neere adjoyning,*Chandama*: in Decan and Guzarate,*Sercanda*: in Latine,*Sandalum* and *Santalum*, adding thereto for the colour *album*, *flauum*, or *Citrinum*,and *Rubrum*,that is, white, yellow, and red Saunders.

¶ *The Time.*

Theſe trees which are the white and yellow Saunders grow green Winter and Summer, and are not one knowne from another, but by the Indians themſelues, who haue taken very certaine notes and markes of them, becauſe they may the more ſpeedily diſtinguiſh them when the Mart commeth.

¶ *The Names.*

Their names haue been ſufficiently ſpoken of in their deſcriptions.

¶ *The Temperature.*

† Yellow and white Saunders are hot in the third degree,and dry in the ſecond. The red Saunders are not ſo hot.

¶ *The Vertues.*

A The Indians do vſe the decoction made in water, againſt hot burning agues, and the ouermuch flowing of the menſes, *Eryſipelas*, the gout,and all inflammations, eſpecially if it be mixed with the juyce of Night-ſhade, Houſleeke, or Purſlane.

B The white Saunders mixed with Roſe-water,and the temples bathed therewith,ceaſeth the pain of the megrim,and keepeth backe the flowing of humors to the eies.

C *Auicen* affirmeth it to be good for all paſſions of the heart, and maketh it glad and merry, and therefore good to be put into colliſes, jellies,and all delicate meates which are made to ſtrengthen and reuiue the ſpirits.

D ‡ Red Saunders haue an aſtrictiue and ſtrenghthning faculty, but are not cordiall as the other two, they are vſed in diuers medicines and meates both for their faculty and pleaſing red colour which they giue to them. ‡

CHAP. 170. *Of Stony wood, or wood made Stone.*

¶ *The Deſcription.*

AMong the wonders of England this is one of great admiration, and contrary vnto mans reaſon and capacitie, that there ſhould bee a kinde of Wood alterable into the hardneſſe of a ſtone called Stonie Wood, or rather a kinde of water, which hardneth Wood and other things, into the nature and matter of ſtones. But wee know that the Workes of God are wonderfull,

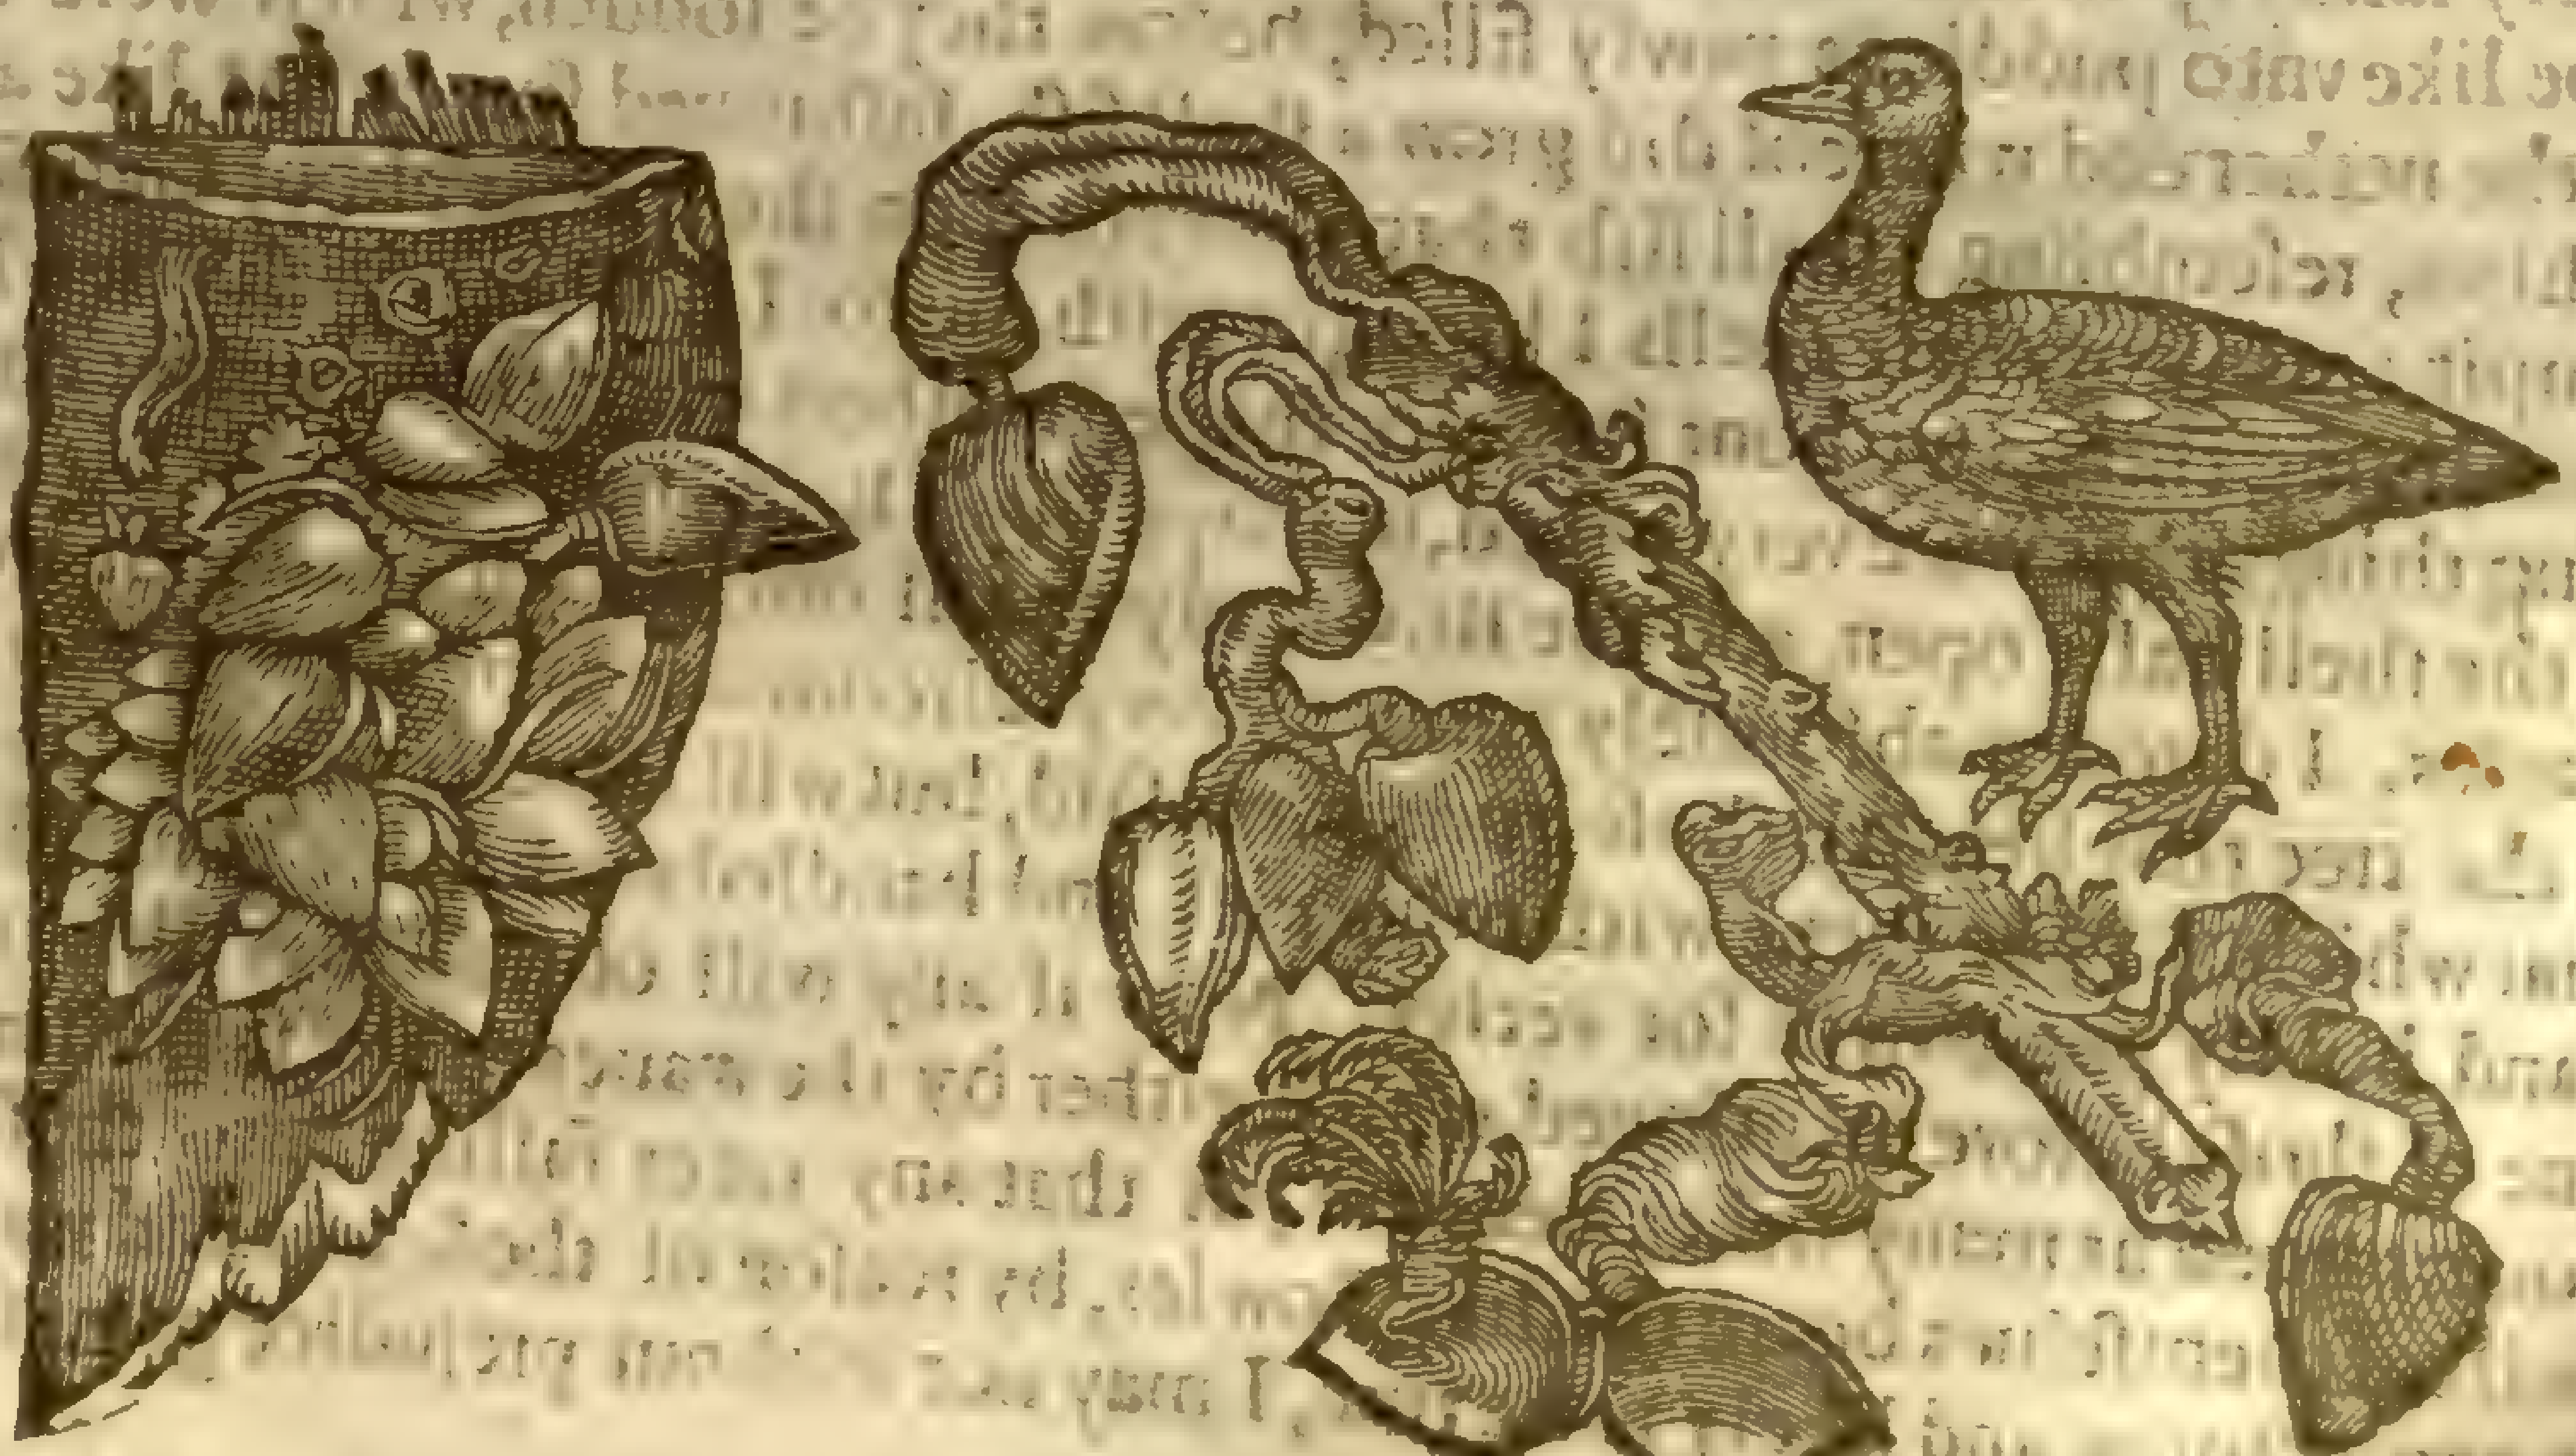
Lignum Lapideum, ſiue in Lapides conuerſum.
Stonie wood, or wood made ſtones.

wonderfull, if we doe but narrowly ſearch the leaſt of them, which wee daily behold; much more if wee turne our eies vpon thoſe that are ſeldome ſeene, and knowne but of a few, and that of ſuch as haue painfully trauelled in the ſecrets of Nature. This ſtrange alteration of Nature is to bee ſeene in ſundry parts of England and Wales, through the qualities of ſome waters and earth, which change ſuch things into ſtones as do fall therein, or which are of purpoſe for triall put into them. In the North part of England there is a Well neere vnto Knaesborough, which will change any thing into ſtone, whether it be wood, timber, leaues of trees, moſſe, leather gloues, or ſuch like. There be diuers places in Bedfordſhire, Warwickſhire, and Walls, where there is ground of that qualitie, that if a ſtake be driuen into it, that part of the ſtake which is within the ground will be a firme and hard ſtone, and all that which is aboue the ground retaineth his former ſubſtance and nature. Alſo my ſelfe being at Rougby (about ſuch time as our fantaſticke people did with great concourſe and multitudes repaire and run headlong vnto the ſacred Wells of *Newnam Regis*, in the edge of Warwickſhire, as vnto the water of life, which could cure all diſeaſes) I went from thence vnto theſe Wells, where I found growing ouer the ſame a faire Aſh-tree, whoſe boughes did hang ouer the ſpring of water, whereof ſome that were ſeare and rotten, and ſome that of purpoſe were broken off, fell into the water and were all turned into ſtones. Of theſe boughes or parts of the tree I brought into London, which when I had broken in pieces, therein might be ſeene, that the pith and all the reſt was turned into ſtones; yea many buds and flourings of the tree falling into the ſaid water, were alſo turned into hard ſtones, ſtill retaining the ſame ſhape and faſhion that they were of before they were in the water. I doubt not but if this water were proued about the hardening of ſome Confections Phyſicall, for the preſeruation of them, or other ſpeciall ends, it would offer greater occaſion of admiration for the health and benefit of mankinde, than it doth about ſuch things as already haue beene experimented, tending to very little purpoſe.

Chap. 171.

Of the Gooſe tree, Barnacle tree, or the tree bearing Geeſe.

Britanicæ Conchæ anatiferæ.
The breed of Barnacles.



¶ *The Deſcription.*

HAuing trauelled from the Graſſes growing in the bottome of the fenny waters, the Woods, and mountaines, euen vnto Libanus it ſelfe; and alſo the ſea, and bowels of the ſame, wee are arriued at the end of our Hiſtory; thinking it not impertinent to the concluſion of the ſame, to end with one of the maruels of this land (we may ſay of the World.) The hiſtory whereof to ſet forth according to the worthineſſe and raritie thereof, would not only require a large and peculiar volume, but alſo a deeper ſearch into the bowels of Nature, than my intended purpoſe will ſuffer me to wade into, my ſufficiencie alſo conſidered; leauing the Hiſtory thereof rough hewen, vnto ſome excellent man, learned in the ſecrets of nature, to be both fined and refined: in the meane ſpace take it as it falleth out, the naked and bare truth, though vnpoliſhed. There are found in the North parts of Scotland and the Iſlands adiacent, called Orchades, certaine trees whereon do grow certaine ſhells of a white colour tending to ruſſet, wherein are contained little liuing creatures: which ſhells in time of maturity doe open, and out of them grow thoſe little liuing things, which falling into the water do become fowles, which we call Barnacles; in the North of England, brant Geeſe; and in Lancaſhire, tree Geeſe: but the other that do fall vpon the land periſh and come to nothing. Thus much by the writings of others, and alſo from the mouthes of people of thoſe parts, which may very well accord with truth.

But what our eies haue ſeene, and hands haue touched we ſhall declare. There is a ſmall Iſland in Lancaſhire called the Pile of Foulders, wherein are found the broken pieces of old and bruiſed ſhips, ſome whereof haue beene caſt thither by ſhipwracke, and alſo the trunks and bodies with the branches of old and rotten trees, caſt vp there likewiſe; whereon is found a certaine ſpume or froth that in time breedeth vnto certaine ſhells, in ſhape like thoſe of the Muskle, but ſharper pointed, and of a whitiſh colour; wherein is contained a thing in forme like a lace of ſilke finely wouen as it were together, of a whitiſh colour, one end whereof is faſtned vnto the inſide of the ſhell, euen as the fiſh of Oiſters and Muskles are: the other end is made faſt vnto the belly of a rude maſſe or lumpe, which in time commeth to the ſhape and forme of a Bird: when it is perfectly formed the ſhell gapeth open, and the firſt thing that appeareth is the foreſaid lace or ſtring; next come the legs of the bird hanging out, and as it groweth greater it openeth the ſhell by degrees, til at length it is all come forth, and hangeth onely by the bill: in ſhort ſpace after it commeth to full maturitie, and falleth into the ſea, where it gathereth feathers, and groweth to a fowle bigger than a Mallard, and leſſer than a Gooſe, hauing blacke legs and bill or beake, and feathers blacke and white, ſpotted in ſuch manner as is our Magpie, called in ſome places a Pie-Annet, which the people of Lancaſhire call by no other name than a tree Gooſe: which place aforeſaid, and all thoſe parts adjoyning do ſo much abound therewith, that one of the beſt is bought for three pence. For the truth hereof, if any doubt, may it pleaſe them to repaire vnto me, and I ſhall ſatisfie them by the teſtimonie of good witneſſes.

Moreouer, it ſhould ſeeme that there is another ſort hereof; the Hiſtory of which is true, and of mine owne knowledge: for trauelling vpon the ſhore of our Engliſh coaſt betweene Douer and Rumney, I found the trunke of an old rotten tree, which (with ſome helpe that I procured by Fiſhermens wiues that were there attending their husbands returne from the ſea) we drew out of the water vpon dry land: vpon this rotten tree I found growing many thouſands of long crimſon bladders, in ſhape like vnto puddings newly filled, before they be ſodden, which were very cleere and ſhining; at the nether end whereof did grow a ſhell fiſh, faſhioned ſomewhat like a ſmall Muskle, but much whiter, reſembling a ſhell fiſh that groweth vpon the rockes about Garnſey and Garſey, called a Lympit: many of theſe ſhells I brought with me to London, which after I had opened I found in them liuing things without forme or ſhape; in others which were neerer come to ripeneſſe I found liuing things that were very naked, in ſhape like a Bird: in others, the Birds couered with ſoft downe, the ſhell halfe open, and the Bird ready to fall out, which no doubt were the Fowles called Barnacles. I dare not abſolutely auouch euery circumſtance of the firſt part of this hiſtory, concerning the tree that beareth thoſe buds aforeſaid, but will leaue it to a further conſideration; howbeit, that which I haue ſeene with mine eies, and handled with mine hands, I dare confidently auouch, and boldly put downe for verity. Now if any will object that this tree which I ſaw might be one of thoſe before mentioned, which either by the waues of the ſea or ſome violent wind had beene ouerturned as many other trees are; or that any trees falling into thoſe ſeas about the Orchades, will of themſelues beare the like Fowles, by reaſon of thoſe ſeas and waters, theſe being ſo probable conjectures, and likely to be true, I may not without prejudice gaineſay, or indeauour to confute.

‡ The Barnakle whoſe fabulous breed my Author here ſets downe, and diuers others haue

alſo deliuered, were found by ſome Hollanders to haue another originall, and that by egs as other birds haue: for they in their third voiage to find out the North-Eaſt paſſage to China & the Molucco's, about the 80 degree and eleuen minutes of Northerly latitude, found two little Iſlands, in one of which they found aboundance of theſe geeſe ſitting vpon their eggs, of which they got one Gooſe, and tooke away ſixty eggs, &c. *Vide Pontani, rerum & vrb. Amſtelodam. hiſt. lib. 2. cap. 22.* Now the ſhels out of which theſe birds were thought to fly, are a kind of *Balanus marinus*; and thus *Fabius Columna*, in the end of his *Phytobaſanos*, writing *piſcium aliquot hiſtoria*, iudiciouſlyproueth. To whoſe opinion I wholly ſubſcribe, and to it I refer the Curious. His aſſeueration is this; *Conchas vulgò Anatiferas, non eſſe fructus terreſtres, neque ex ijs Anates oriri; ſed Balani marinæ ſpeciem.* I could haue ſaid ſomthing more hereof, but thus much I think may ſerue, together with that which *Fabius Columna* hath written vpon this point. ‡

¶ *The Place.*

The bordes and rotten plankes whereon are found theſe ſhels breeding the Barnakle, are taken vp in a ſmall Iſland adioyning to Lancaſhire, halfe a mile from the main land, called the Pile of Foulders.

¶ *The Time.*

They ſpawn as it were in March and Aprill; the Geeſe are formed in May and Iune, and come to fulneſſe of feathers in the moneth after.

And thus hauing through Gods aſſiſtance diſcourſed ſomewhat at large of Graſſes, Herbes, Shrubs, Trees, and Moſſes, and certaine Excreſcences of the earth, with other things moe, incident to the hiſtorie thereof, we conclude and end our preſent Volume, with this wonder of England. For the which Gods Name be euer honored and praiſed.

FINIS.

AN APPENDIX OR ADDITION OF certaine Plants omitted in the former Hiſtory.

The Preface.

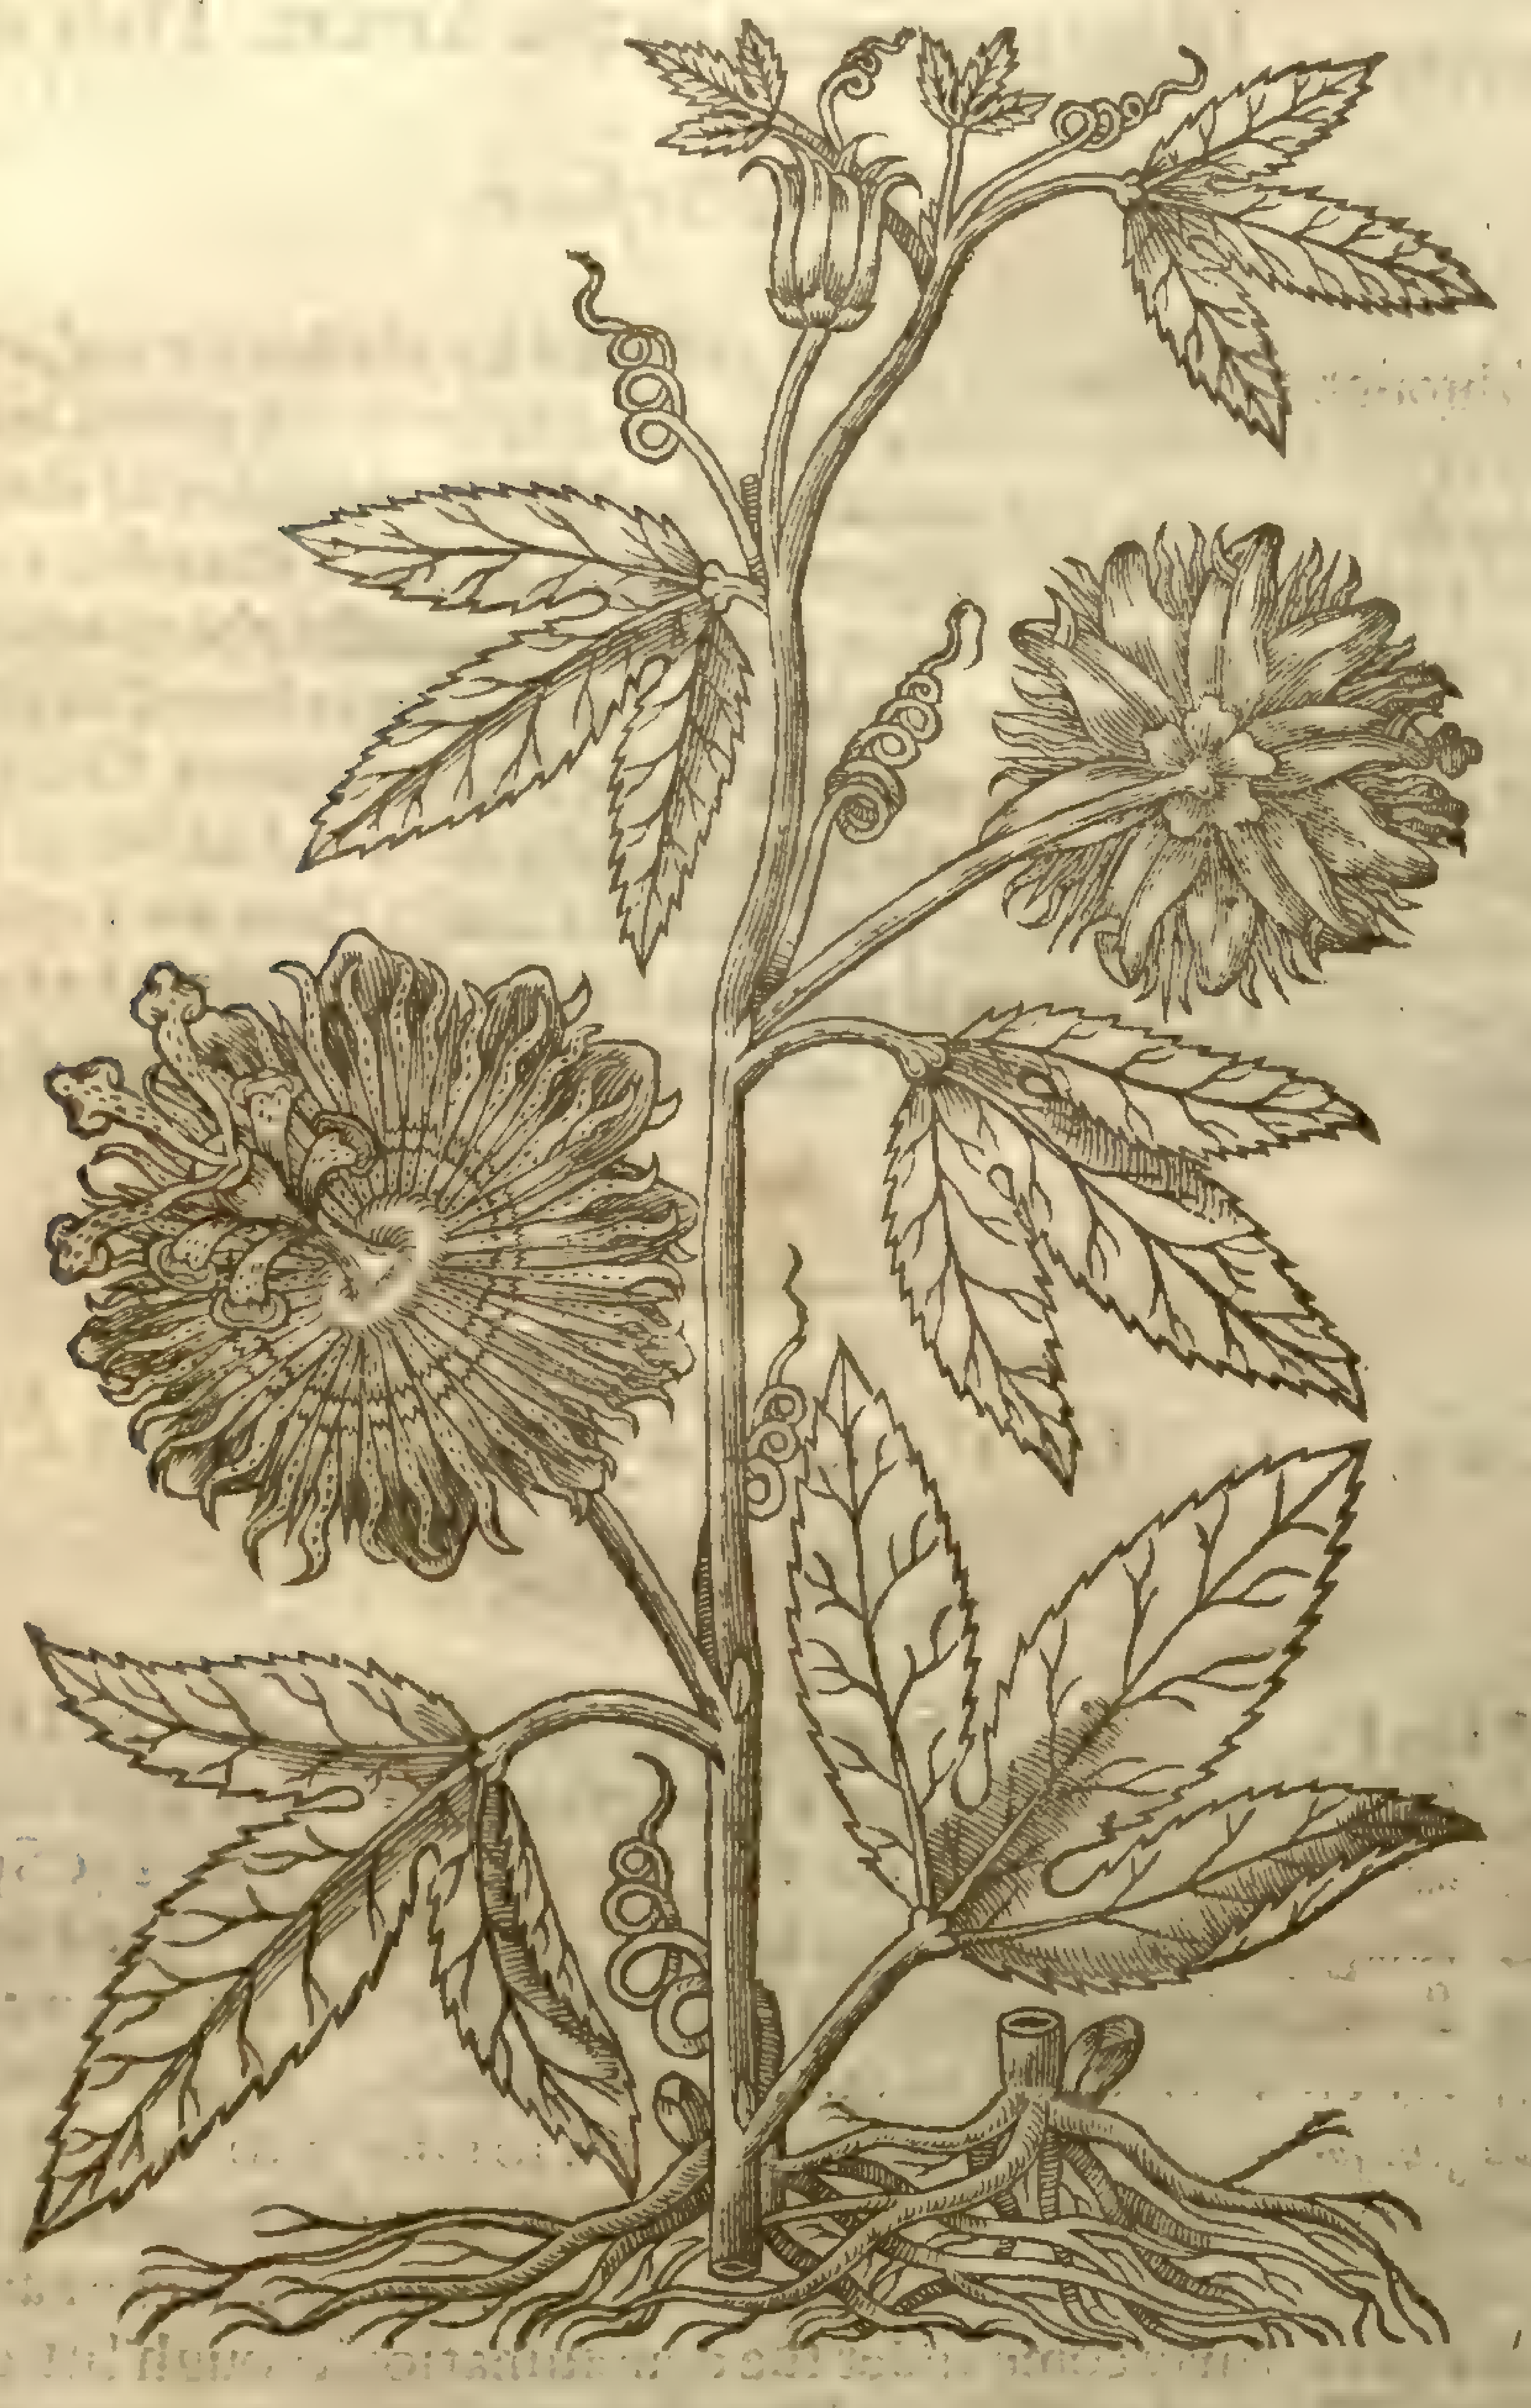
HAuing run through the hiſtory of plants gathered by Maſter *Gerard*, and much inlarged the ſame,both by the addition of many figures and hiſtories of plants not formerly contained in it,and by the amending and increaſing the hiſtory of ſundry of thoſe which before were therein treated of; I finde that I haue forgotten diuers which I intended to haue added in their fitting places: the occaſion hereof hath been, my many buſineſſes,the troubleſomneſſe,and aboue all,the great expectation and haſte of the Worke,whereby I was forced to perform this task within the compaſſe of a yeare. Now being conſtant to my firſt reſolution, I here haue, as time would giue me leaue,and my memorie ſerue,made a briefe collection and addition (though without method)of ſuch as offered themſelues to me; and without doubt there are ſundry others which are as fitting to be added as thoſe; and I ſhould not haue bin wanting if time had permitted me to haue entred into further conſideration of them. In the meane time take in good part thoſe that I haue here preſented to your view.

CHAP. I. *Of the Maracoc or Paſſion Floure.*

¶ *The Deſcription.*

THis Plant,which the Spaniards in the Weſt Indies call *Granadilla*, becauſe the fruit ſomwhat reſembles a Pomgranat,which in their tongue they term *Granadas*,is the ſame which the Virginians cal *Maracoc*. The Spaniſh Friers for ſome imaginarie reſemblances in the floure, firſt called it *Flos Paßionis*, The Paſſion floure,and in a counterfeit figure,by adding what was wanting, they made it as it were an Epitome of our Sauiors paſſion. Thus ſuperſtitious perſons *ſemper ſibi ſomnia fingunt*. *Bauhine* deſirous to refer it to ſome ſtock or kindred of formerly known plants,giues it the name of *Clematis trifolia*: yet the flours and fruit pronounce it not properly belonging to their tribe; but *Clematis* being a certain genericke name to all wooddy winding plants,this as a ſpecies may come vnder the denomination,though little in other reſpects participating with them. The roots of this are long,ſomwhat like,yet thicker than thoſe of *Sarſa parilla*,running vp and down,and putting vp their heads in ſeueral places; from theſe roots riſe vp many long winding round ſtalks,which grow two, three, foure, or more yards high, according to the heate and ſeaſonableneſſe of the yeare and ſoile whereas they are planted. Vpon theſe ſtalks grow many leaues diuided into three parts,ſharp pointed,and ſnipt about the edges: commonly out of the boſoms of each of the vppermoſt leaues there growes a claſping tendrel and a floure,the floure groweth vpon a little foot-ſtalk ſome two inches long,and is of a longiſh cornered forme,with fiue little crooked hornes at the top, before ſuch time as it opens it ſelfe,but opened,this longiſh head diuides it ſelfe into ten parts,and ſuſtains the leaues of the floure,which are very many, long,ſharp pointed,narrow,and orderly ſpred open one by another,ſome lying ſtraight,others crooked. Theſe leaues are of colour whitiſh,but thick ſpotted with a peach colour,and toward the bottom it hath a ring of a perfect peach colour,and aboue and beneath it a white circle, which giue a great grace to the floure,in the midſt whereof riſeth an vmbone, which parts it ſelfe into foure or fiue crooked ſpotted hornes,with broadiſh heads;from the middeſt of theſe riſes another roundiſh head which carries three nailes or hornes,biggeſt aboue,and ſmalleſt at their lower end. This floure with vs is neuer ſucceeded by any fruit,but in the Weſt Indies,whereas it naturally growes, it beares a fruit, when it is ripe of the bigneſſe and colour of Pomegranats, but it wants ſuch a ring or crown about the top as they haue; the rinde alſo is much thinner and tenderer,the pulp is whitiſh, and without taſte,but the liquor is ſomwhat tart : they open them as they do egges,and the liquor is ſupped off with great delight both by the Indians and Spaniards (as *Monardus* witneſſeth) neither if they ſup off many of them ſhall they finde their ſtomack oppreſt, but rather their bellies are gently looſened. In this fruit are contained many ſeeds ſomewhat like Peare kernels, but more cornered and rough.

Clematis trifolia, ſive Flos Paßionis.
The Maracoc or Paſſion-floure.



This growes wilde in moſt of the hot countries of America,from whence it hath been brought into our Engliſh gardens,where it growes very well,but flours onely in ſome few places,and in hot and ſeaſonable yeares. It is in good plenty growing with Miſtreſſe *Tuggy* at Weſtminſter, where I haue ſome yeares ſeen it beare a great many floures.

Chap. 2. *Of Ribes or red Currans.*

¶ *The Deſcription.*

1 THe plant which carries the fruit which we commonly terme red Currans, is a ſhrubbie buſh of the bigneſſe of a Gooſeberry buſh,but without prickles : the wood is ſoft and white,with a pretty large pith in the middle; it is couered with a double barke, the vndermoſt being the thicker,is greene,and the vppermoſt,which ſometimes chaps and pills off, is of a browniſh

colour, and ſmooth: the barke of the yongeſt ſhoots is whitiſh and rough: the leaues which grow vpon foot-ſtalkes ſome two inches long, are ſomewhat like Vine leaues, but ſmaller by much, and leſſe cornered, being cut into three, and ſometimes, but ſeldome, into fiue parts, ſomewhat thicke, with many veines running ouer them, greener aboue than they are below: out of the branches in Spring time grow ſtalkes hanging downe ſome ſix inches in length, carrying many little greeniſh floures, which are ſucceded by little red berries, cleare and ſmooth, of the bigneſſe of the Whortle berries, of a pleaſant tart taſte. Of this kinde there is another, onely differing from this in the fruit, which is twice ſo big as that of the common kinde.

2 The buſh which beares the white Currans is commonly ſtraighter and bigger than the former: the leaues are leſſer, the flours whiter, and ſo alſo is the fruit, being cleare and tranſparent, with a little blackiſh rough end.

1 *Ribes vulgaris fructu rubro.*
Red Currans.

2 *Ribes fructu albo.*
White Currans.

This fig. is
R. nigrum L.
Sm. Fl. 1. 332
See Dod. 749?

3 Beſides theſe there is another, which differs little from the former in ſhape, yet grows ſomewhat higher, and hath leſſer leaues: the floures are of a purpliſh greene colour, and are ſucceeded by fruit as big againe as the ordinary red, but of a ſtinking and ſomewhat loathing ſauour: the leaues alſo are not without this ſtinking ſmell.

R. nigrum, L

¶ *The Place, Time, and Names.*

None of theſe grow wild with vs, but they are to be found plentifully growing in many gardens, eſpecially the two former, the red and the white.

The leaues and floures come forth in the Spring, and the fruit is ripe about Midſommer.

This plant is thought to haue been vnknowne to the Antient Greekes: ſome thinke it the *Ribes* of the Arabian *Serapio*. *Fuchſius*, *Matthiolus*, and ſome other deny it; notwithſtanding *Dodonæus* affirmes it: neither is the controuerſie eaſie to be decided, becauſe the Author is briefe in the deſcription thereof, neither haue we his words but by the hand of a barbarous Tranſlator. Howeuer the ſhops of late time take it (the faculties conſenting thereto) for the true Ribes, and of the fruit hereof prepare their *Rob de Ribes*. *Dodonæus* calls it *Ribeſium, groſſularia rubra, & Groſſularia tranſmarina*; and they are diſtinguiſhed into three ſorts, *Rubra, Alba, Nigra Ribeſia*, red, white, and blacke Currans: the Germans call them **S. Johans traubell**, or **traublin**, and **S. Johans Beerlen**: the Dutch, **Beſſkins ouer Zee**: the Italians, *Vuetta roſſa*; the French, *Groiſſeles, Groſelles d'outre mer*: the Bohemians, **Jahodi S. Jana**: the Engliſh, Red Currans: yet muſt they not be confounded with thoſe Currans which are brought from Zant,and the continent adjoyning thereto, and which are vulgarly ſold by our Grocers; for they are the fruit of a ſmall Vine,and differ much from theſe.

¶ *The Temperature and Vertues.*

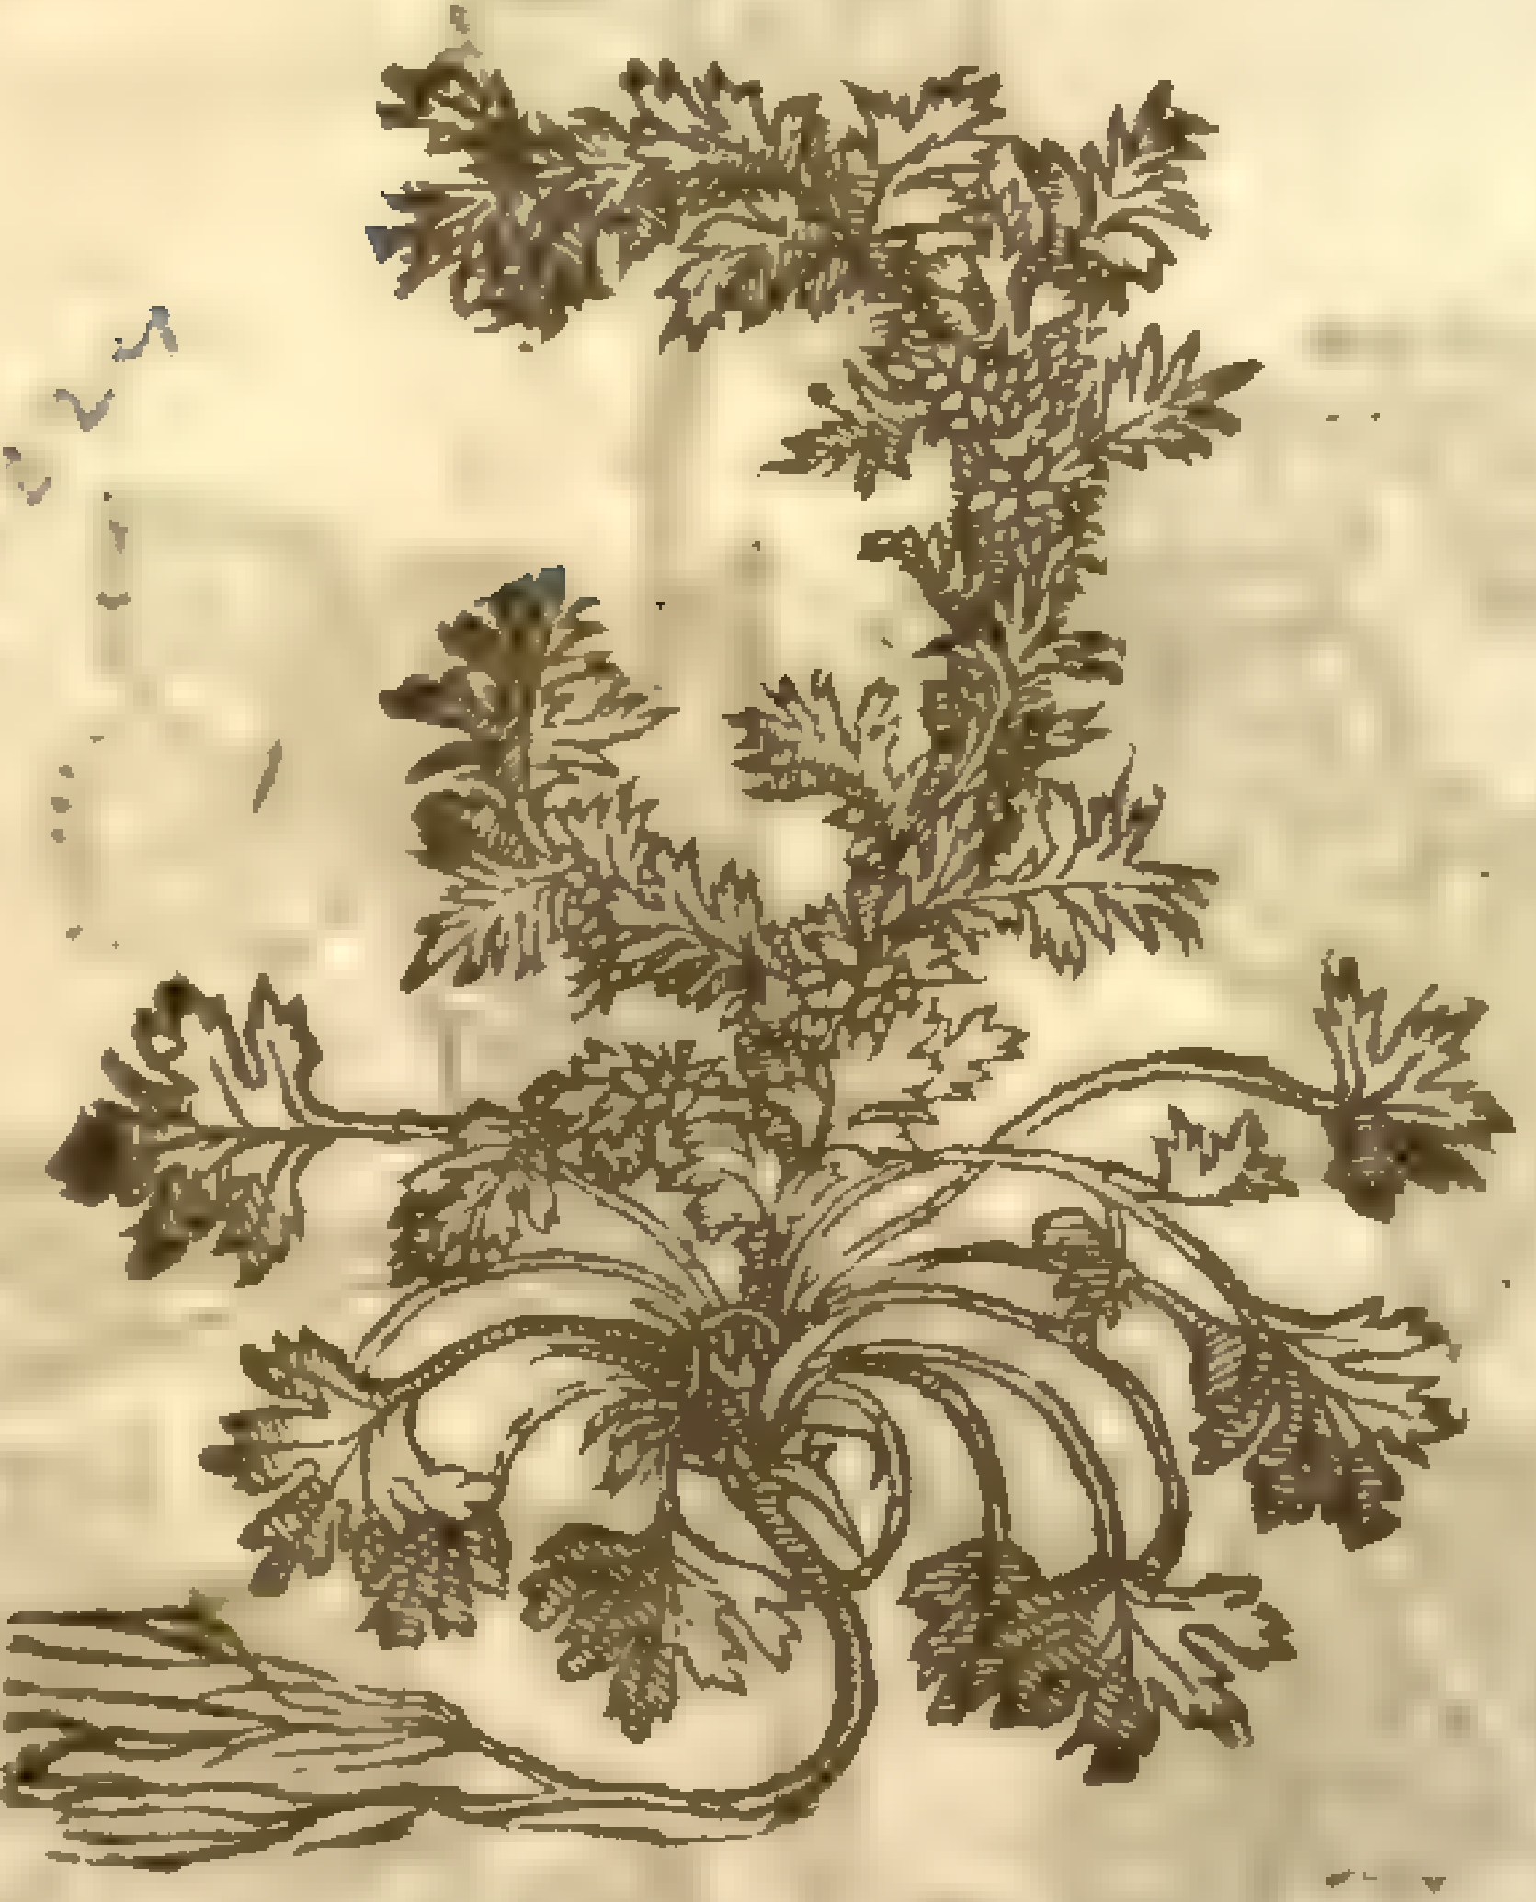
A The berries of red Currans,as alſo of the white,are cold and dry at the end of the ſecond degree, and haue ſome aſtriction,together with tenuity of parts.

B They extinguiſh and mitigate feueriſh heates,repreſſe choler, temper the ouer-hotbloud, reſiſt putrefaction,quench thirſt,helpe the dejection of the appetite,ſtay cholericke vomitings and ſcourings,and helpe the Dyſentery proceeding of an hot cauſe.

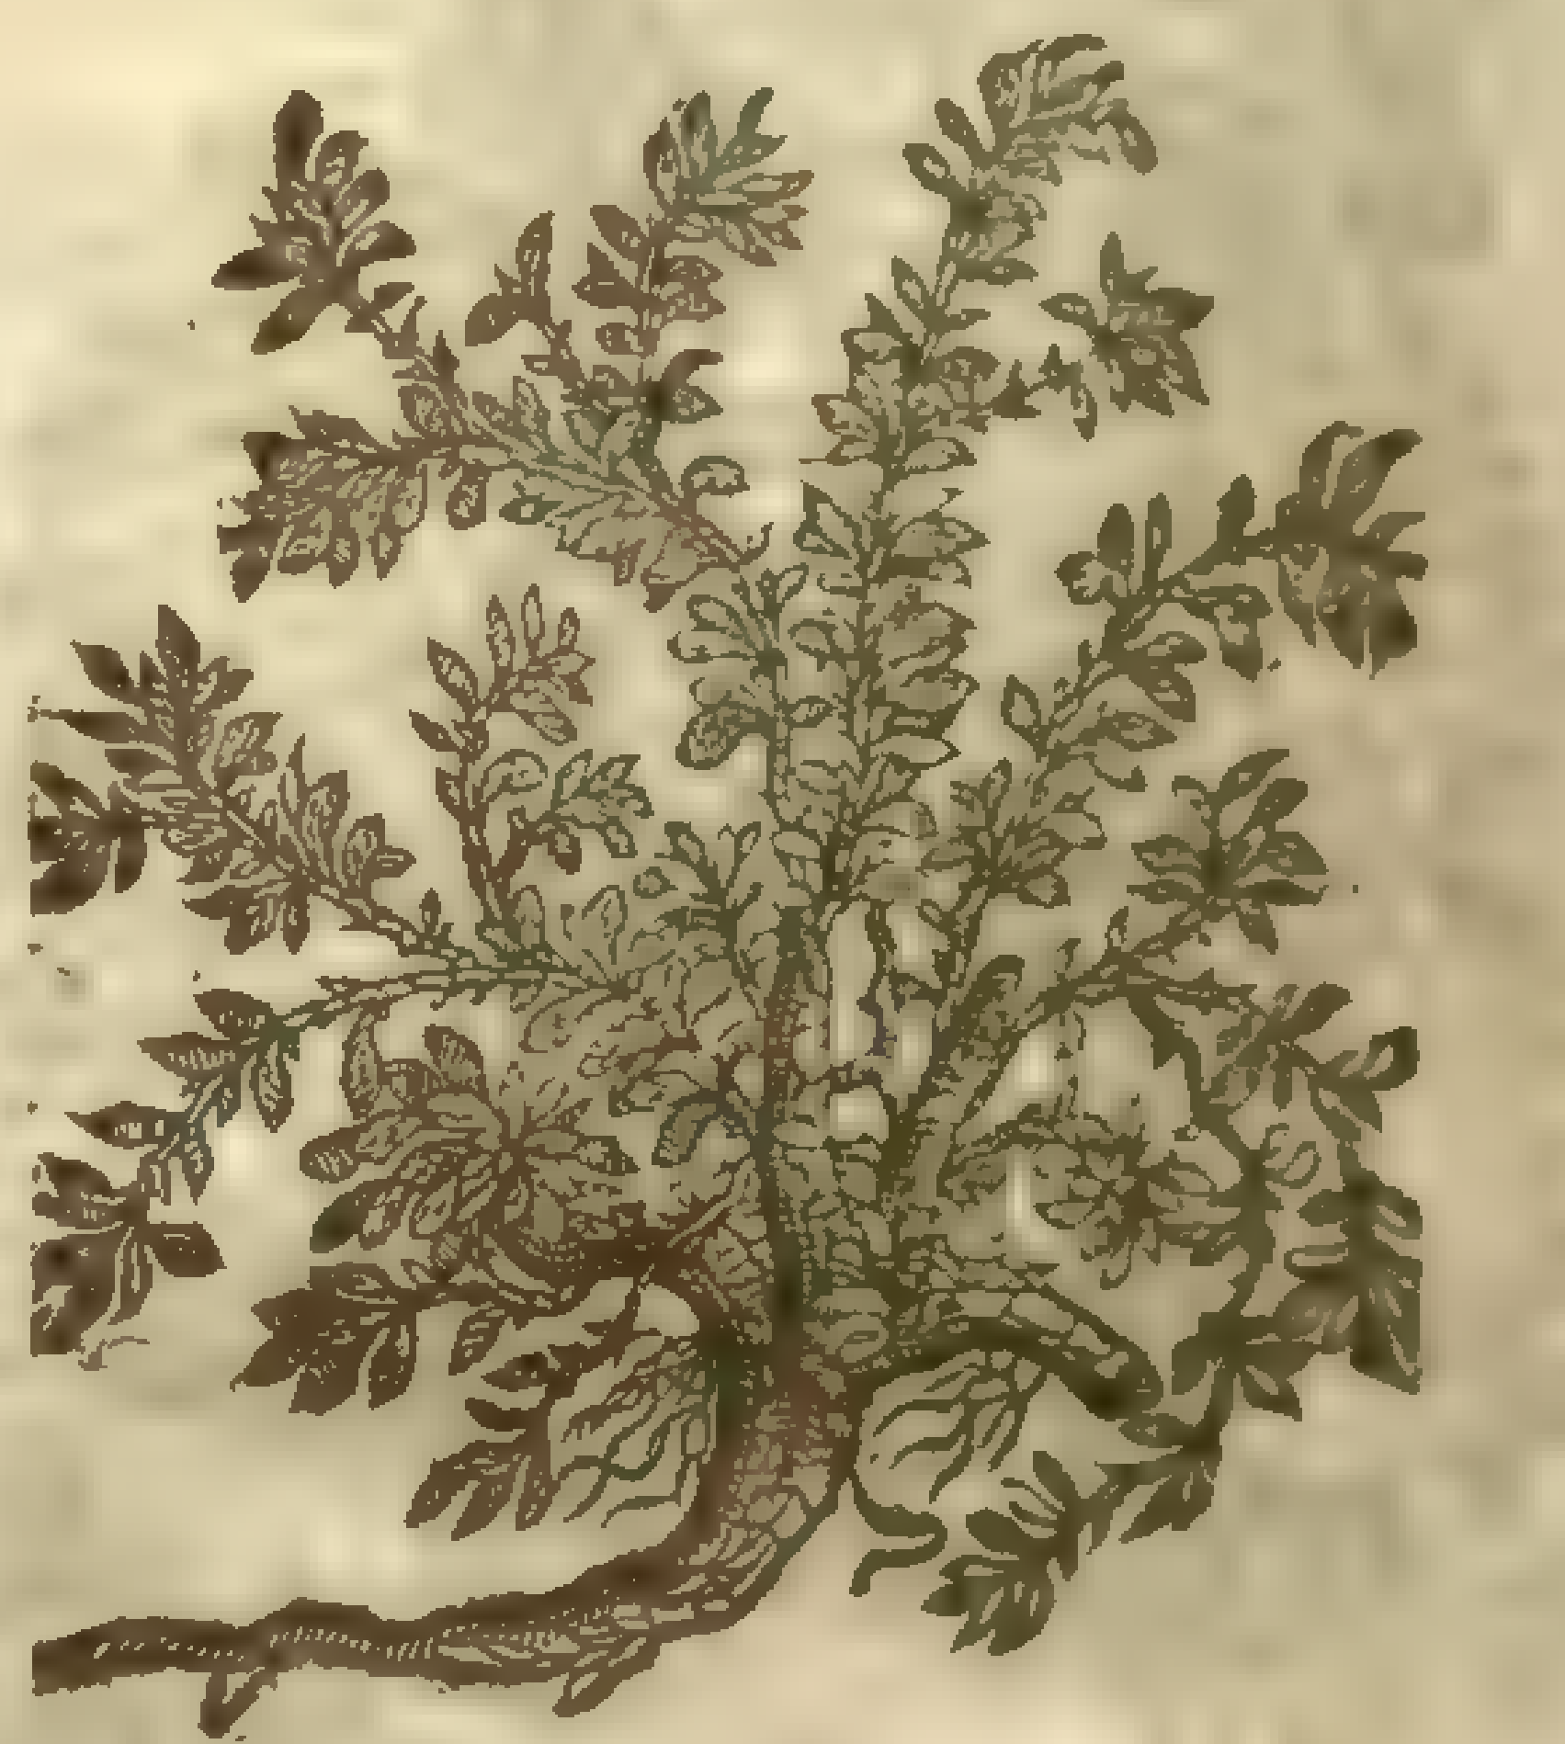
C The juyce of theſe boyled to the height of hony, either with, or without ſugar (which is called *Rob de Ribes)* hath the ſame qualities, and conduces to the ſame purpoſes.

CHAP. 3. *Of Parſley Breake-ſtone, and baſtard Rupturewort.*

Aphanes arvensis, [illegible] Lin. [illegible]



1 *Percipier Anglorum Lob.*
Parſley Breake-ſtone.



2 *Polygonum Herniariæ facie.*
Baſtard rupture-wort.

¶ *The Deſcription.*

1 I Thought that it was not altogether inconuenient to couple theſe two Plants together in one Chapter; firſt,becauſe they are of one ſtature; and ſecondly,taken out of one, and the ſame Hiſtory of Plants,to wit,the *Aduerſaria* of *Pena* and *Lobel.*

The firſt of theſe,which the Authors of the *Aduerſaria* ſet forth by the name of *Percepier,* (and rather aſſert, than affirme to be the *Scandix* of the Antients) is by *Tabernamontanus* called *Scandix minor:* and by *Fabius Columna, Alchimilla montana minima:* it hath a ſmall wooddy yellowiſh fibrous root,from which riſe vp one,two,or more little ſtalks, ſeldome exceeding the height of an handfull, and theſe are round and hairy, and vpon them grow little roundiſh leaues, like the tender leaues of Cheruil,but hairy,& of a whitiſh green color,faſtned to the ſtalks with ſhort foot-ſtalks,& hauing little eares at their ſetting on: the floures are ſmall,greene,and fiue cornered,many cluſtering together at the ſetting on of the leaues: the ſeed is ſmall,ſmooth,and yellowiſh: the ſtalks of this grow ſometimes vpright, and otherwhiles they leane on the ground: it is to be found vpon dry and barren grounds,as in Hide Parke, Tuthill fields,&c. It floures in May, and ripens the ſeed in Iune and Iuly. It ſeemes by the Authors of the *Aduerſaria,* that in the Weſt countrey about Briſtow they call this Herbe Percepier: but our herbe women in Cheapſide know it by the name of Parſley Breakeſtone.

D This is hot and dry,and of ſubtill parts: it vehemently and ſpeedily moues vrine,and by ſome is kept in pickle,and eaten as a ſallad.

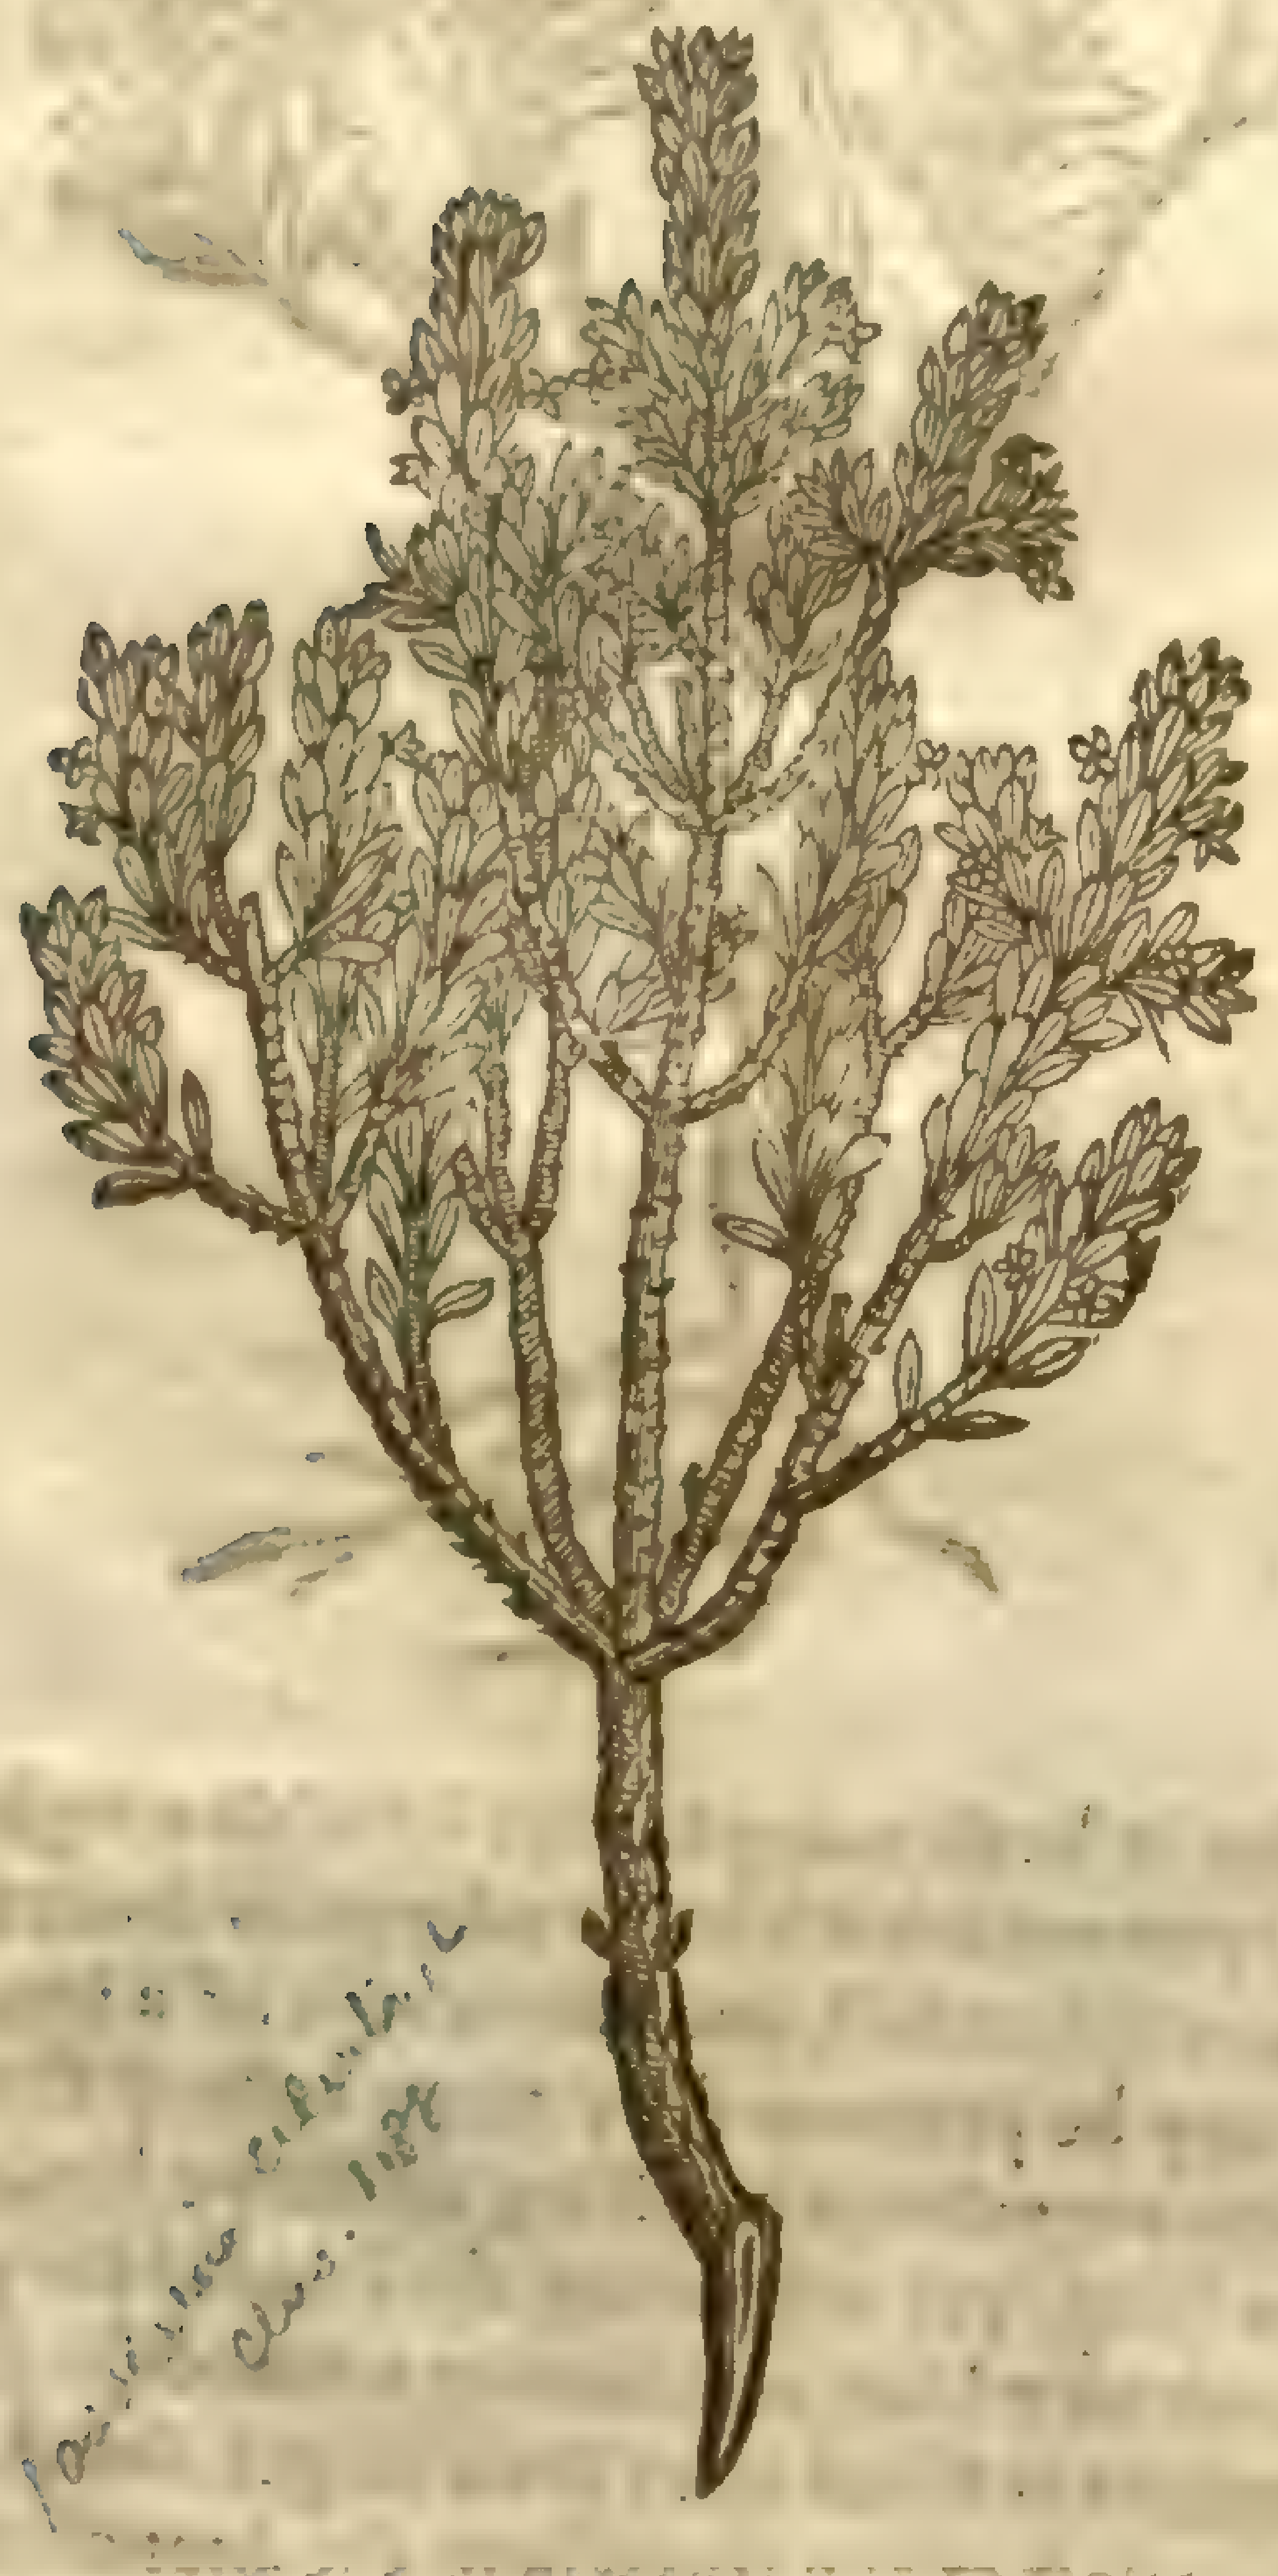
E The diſtilled water is alſo commended to be effectuall to moue vrine, and clenſe the kidnies of grauell.

2 The hiſtory of this, by the forementioned Authors, *Aduerſ.pag.*404. is thus ſet forth vnder this title, *Polygonium Herniariæ folijs & facie, perampla radice Aſtragalitidi:* Neither (ſay they) ought this to be deſpiſed by ſuch as are ſtudious of the knowledge of Plants; for it is very little knowne, being a very ſmall herbe lying along vpon the ground, and almoſt ouerwhelmed or couered with the graſſe,hauing little branches very full of joints: the little leaues and ſeeds are whitiſh,and very like thoſe of *Herniaria* or Rupture-wort: the whole plant is white, hauing a very ſmall and moſſie floure: the root is larger than the ſmalneſſe of the plant ſeemeth to require,hard,branched, diuerſly turning and winding, and therefore hard to be plucked vp: the taſte is dry and hottiſh. It growes vpon a large Plaine in Prouince, betweene the cities Arles and Selon. Thus much *Pena* and *Lobel.* I am deceiued, if ſome few yeares agone I was not ſhewed this plant, gathered in ſome part of this kingdome, but where, I am not able to affirme.

CHAP. 4. *Of Heath Spurge and Rocke Roſe.*

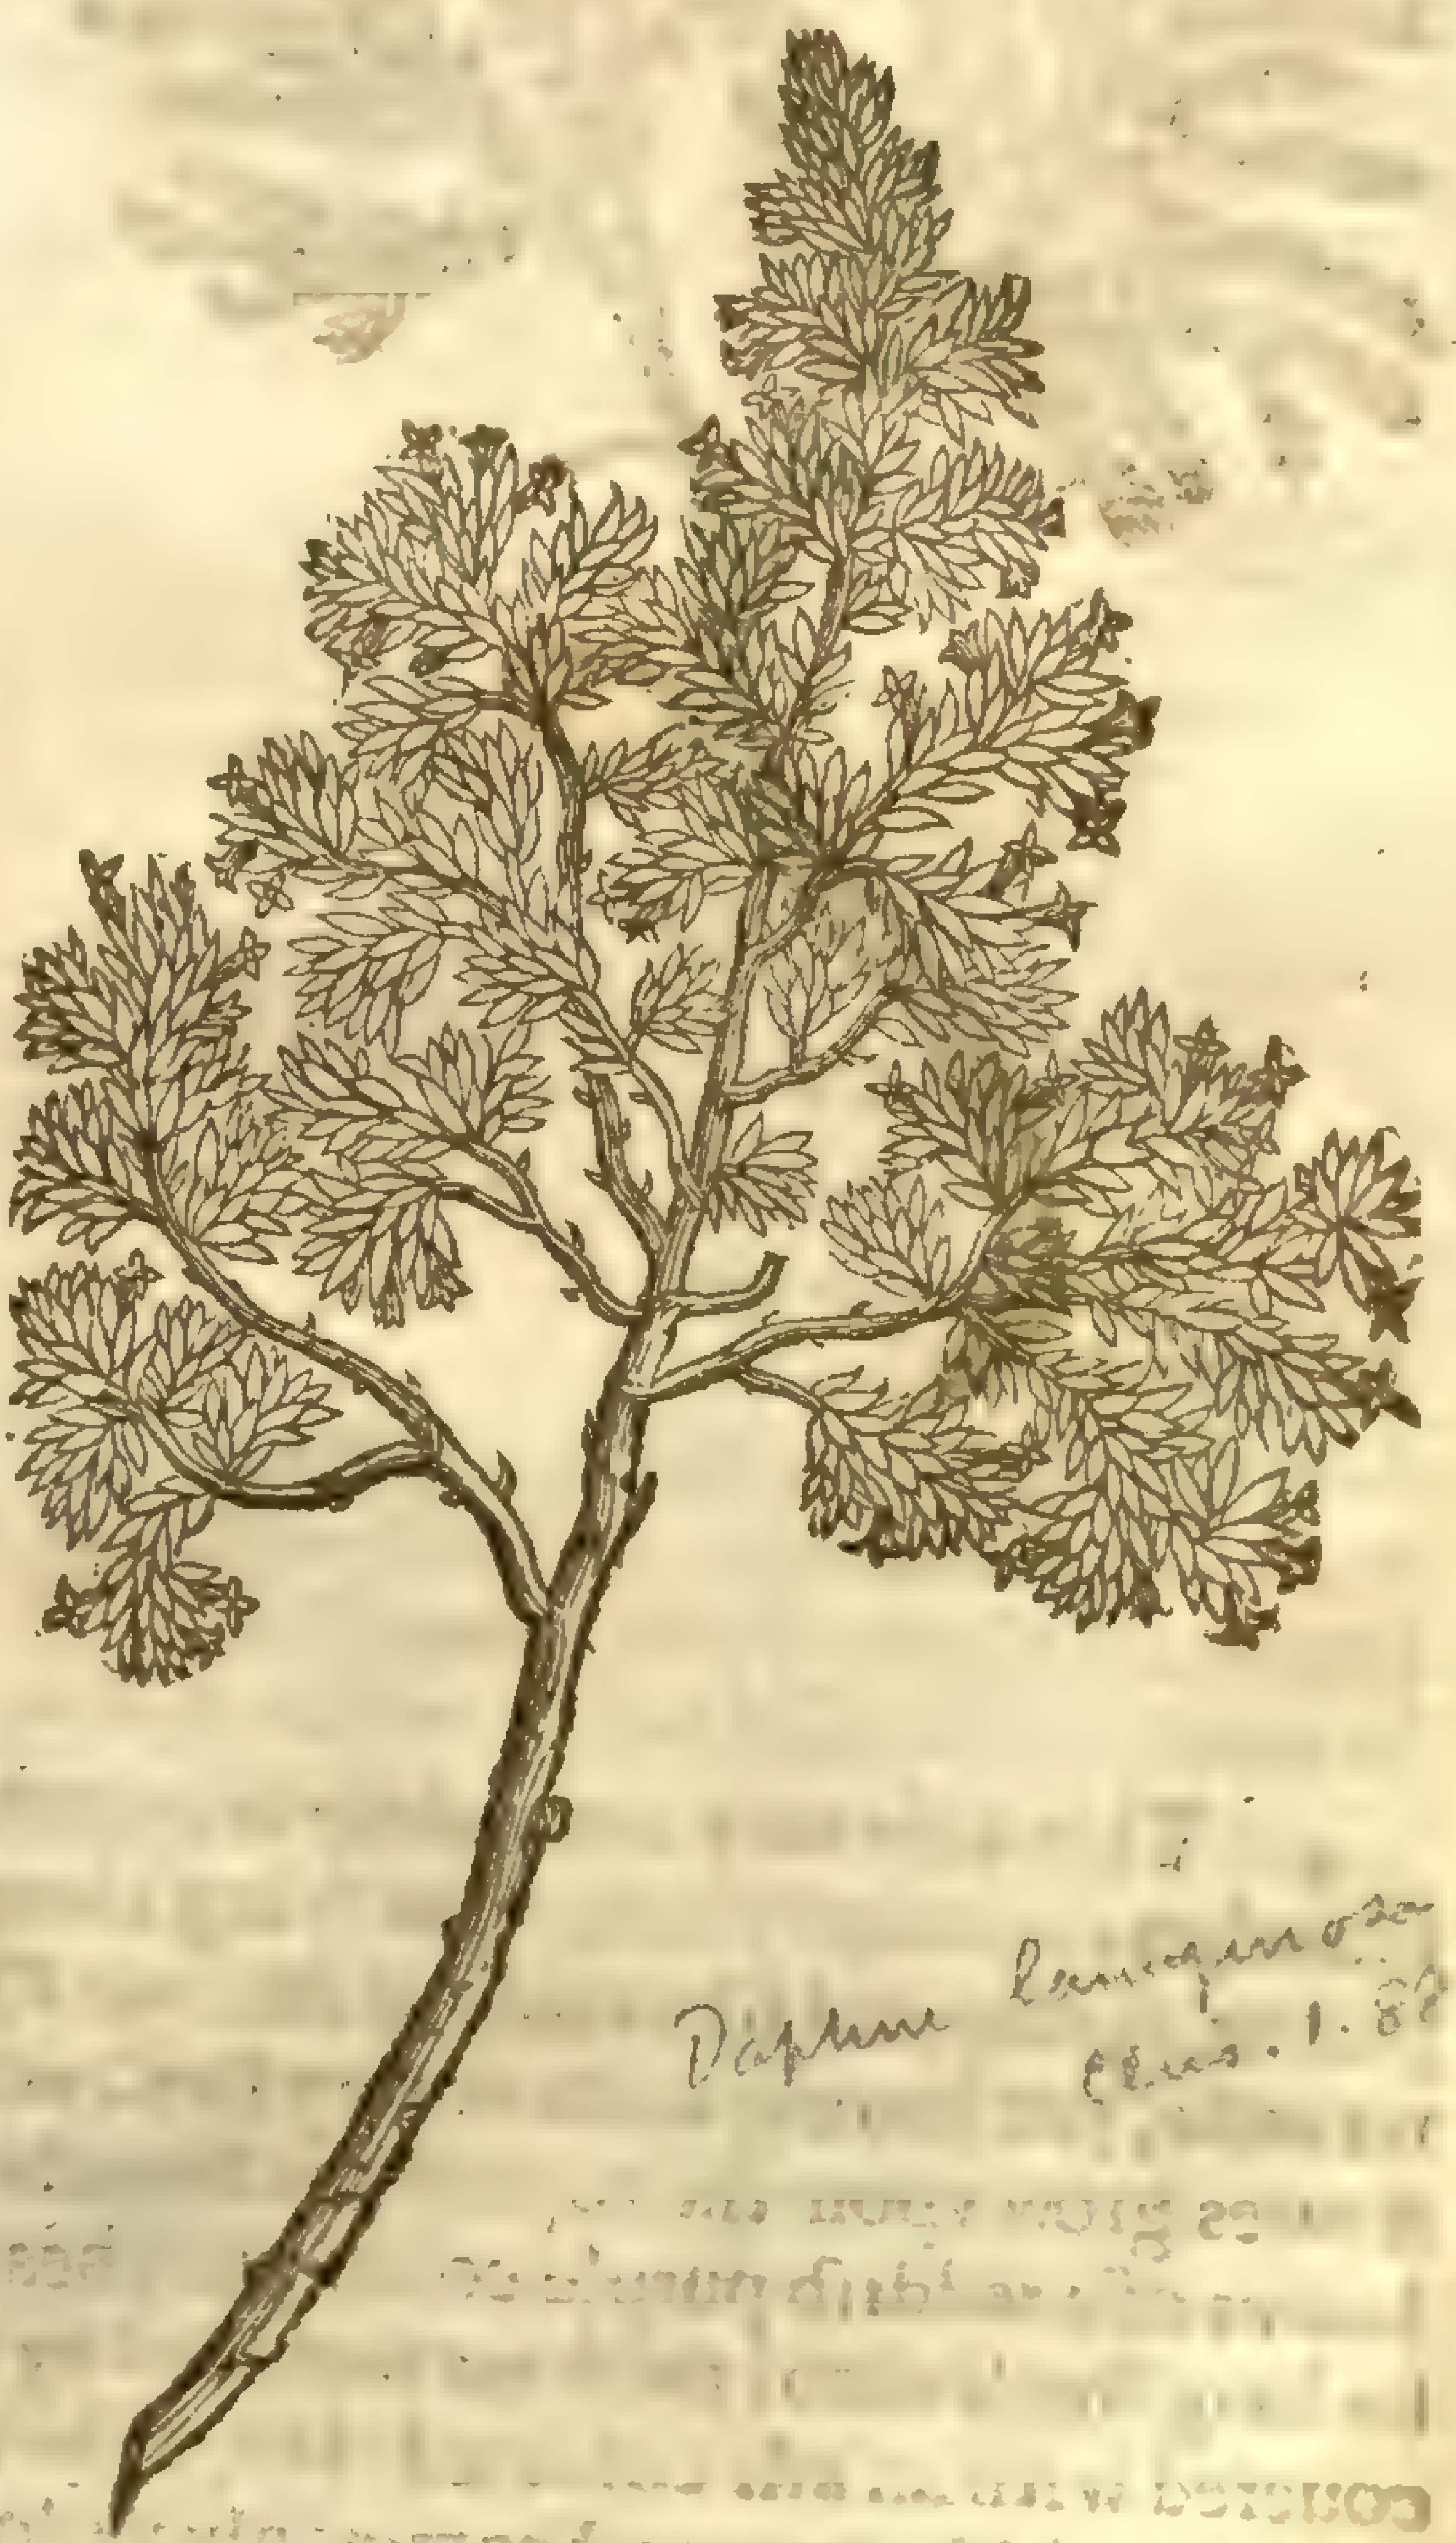
¶ *The Deſcription.*

1 THeſe Plants by right ſhould haue followed the hiſtory of *Thymelæa*, for in ſhape and faculties they are not much vnlike it. The firſt is a low ſhrub, ſending from one root many branches of ſome cubit long, and theſe bending, flexible, and couered with an outer blackiſh barke, which comprehends another within, tough, and which may bee diuided into fine threds: the leaues are like thoſe of *Chamælea*, yet leſſer, ſhorter, and thicker, a little rough alſo, and growing about the branches in a certaine order: if you chew them they are gummy, bitter at the firſt, and afterward hot and biting: the floures grow among the leaues, longiſh, yellowiſh, and diuided at the end into foure little leaues: the fruit is ſaid to be like that of *Thymelæa*, but of a blackiſh colour, the root is thicke and wooddy. It growes frequently in the kingdome of Granado and Valentia in Spaine, it floures in March and Aprill. The Herbariſts there terme it *Sanamunda*, and the common people, *Mierda.cruz*, by reaſon of the purging faculty.



1 *Sanamunda* 1.*Cluſ.*
Heath Spurge.

Passerina [illegible] Clus. 1.87

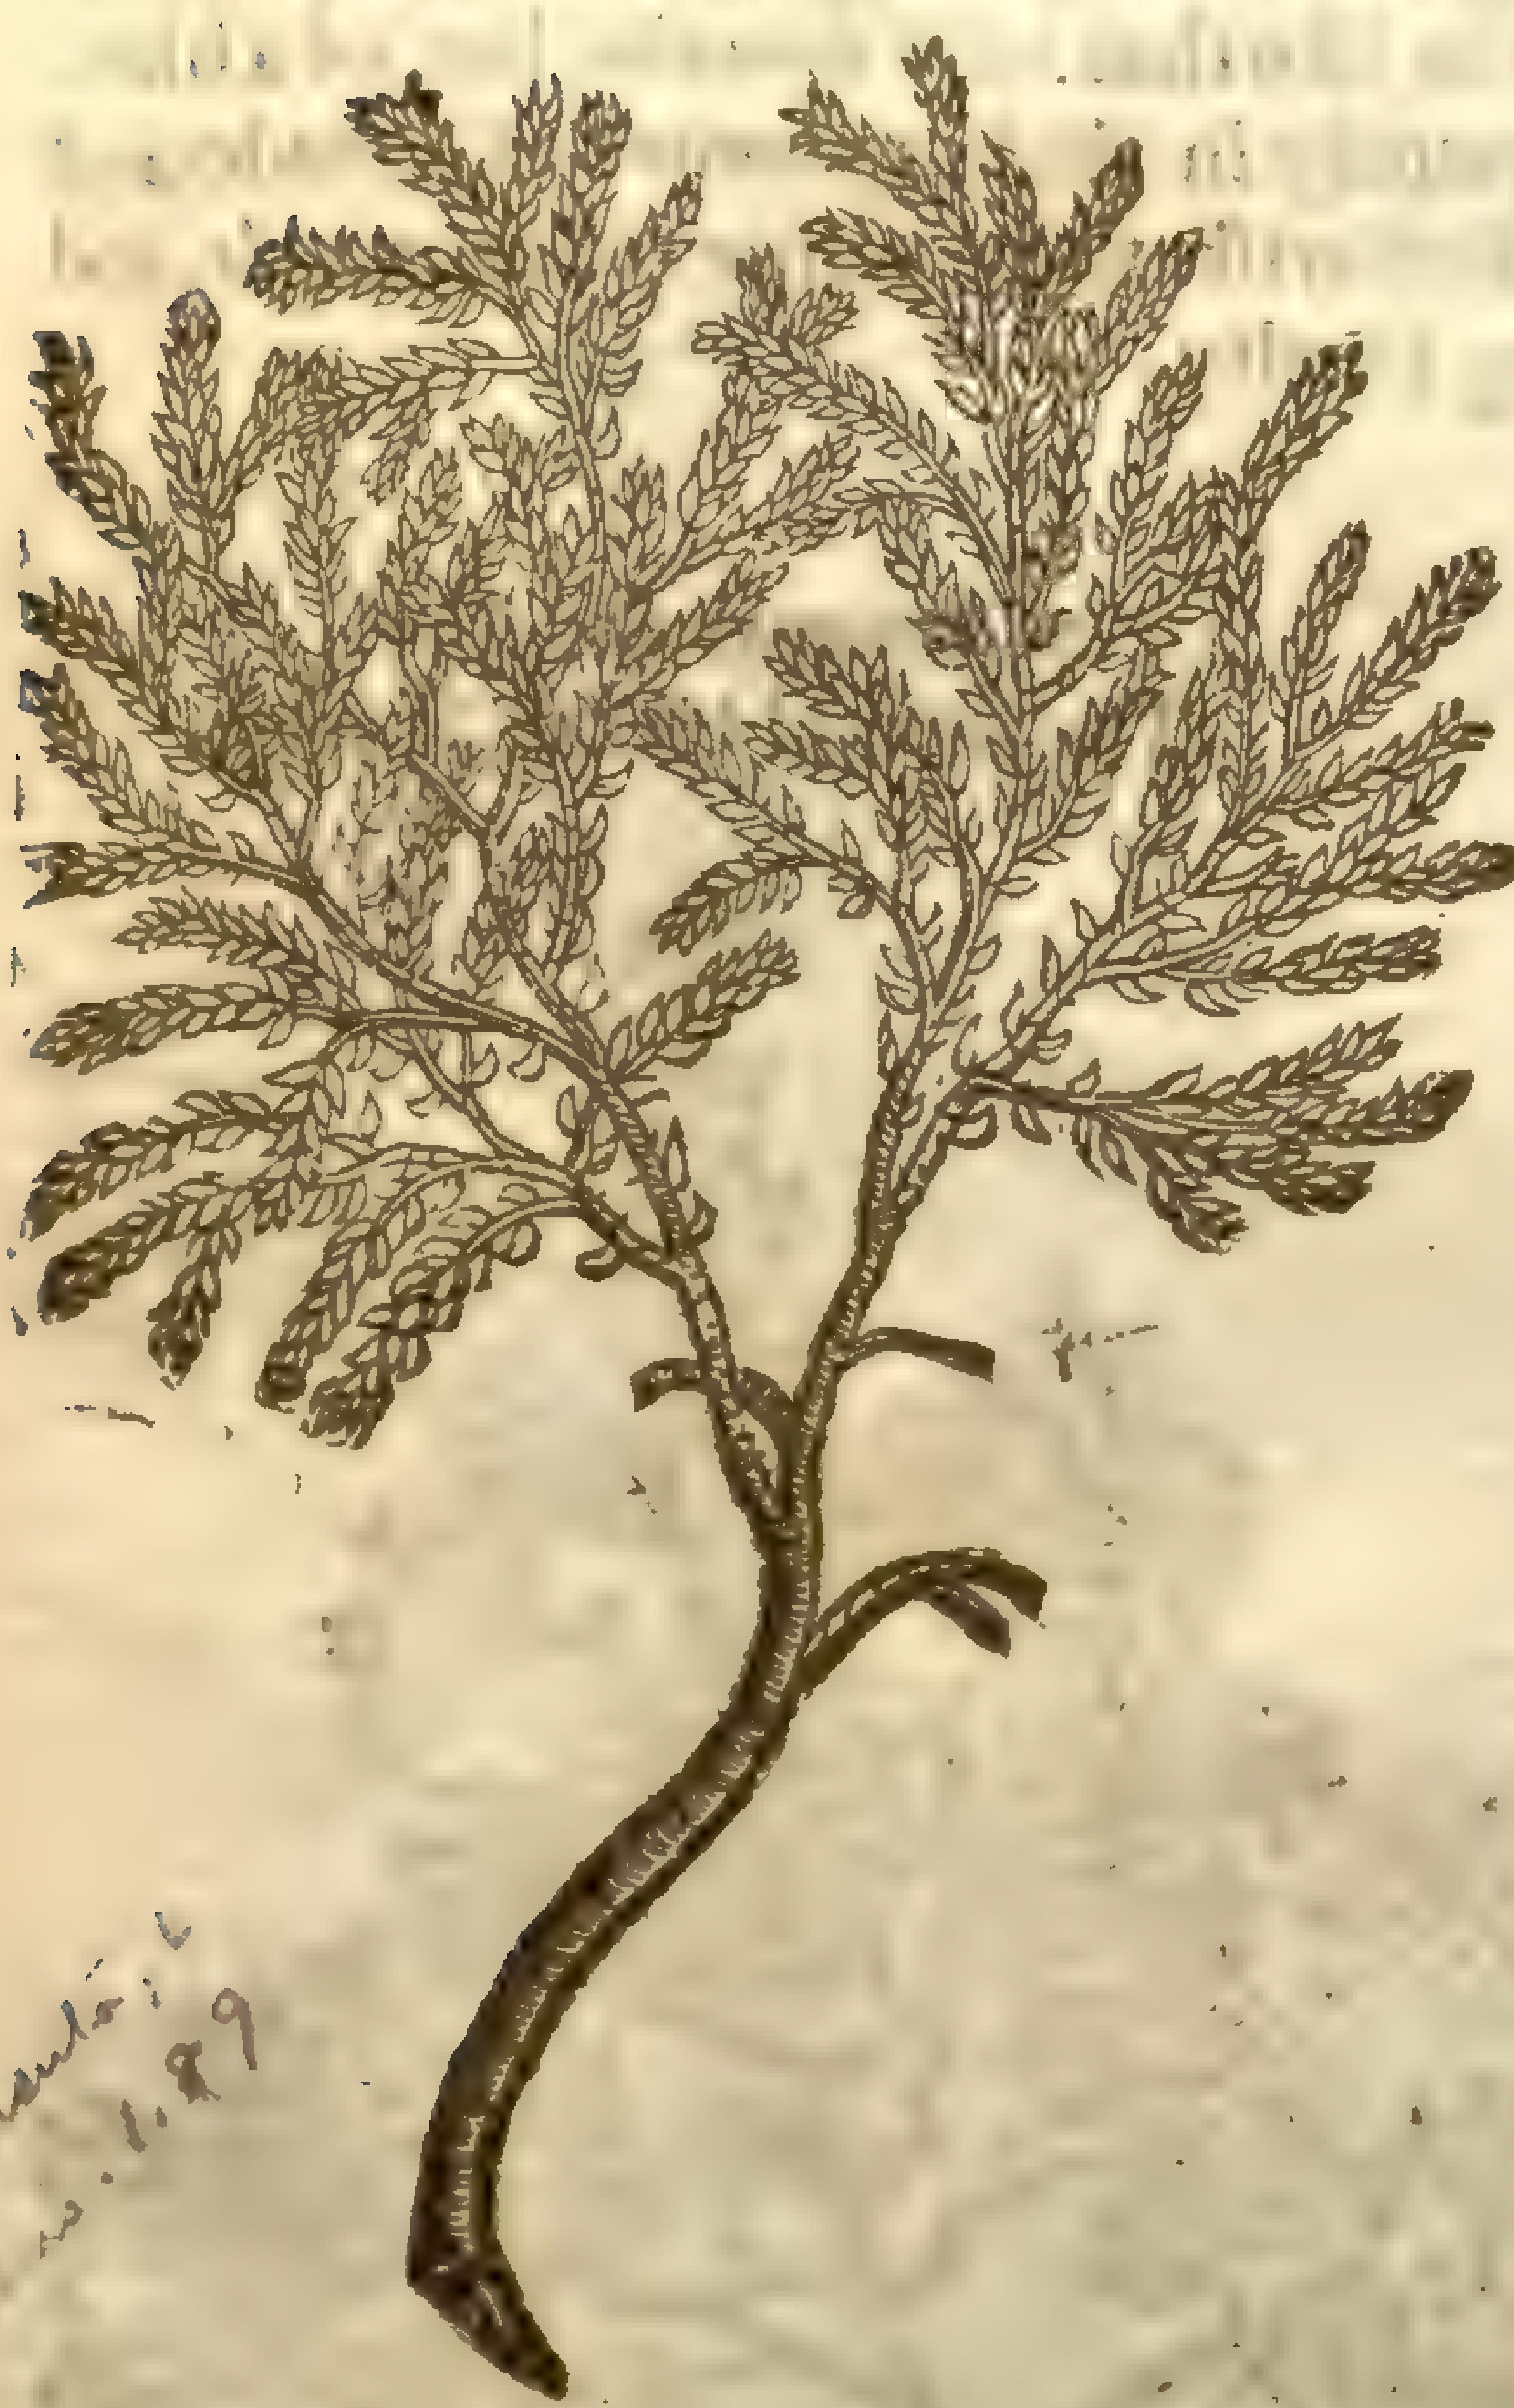


2 *Sanamunda* 2.*Cluſ.*
The ſecond Heath Spurge.

Daphne lanuginosa Clus. 1.88

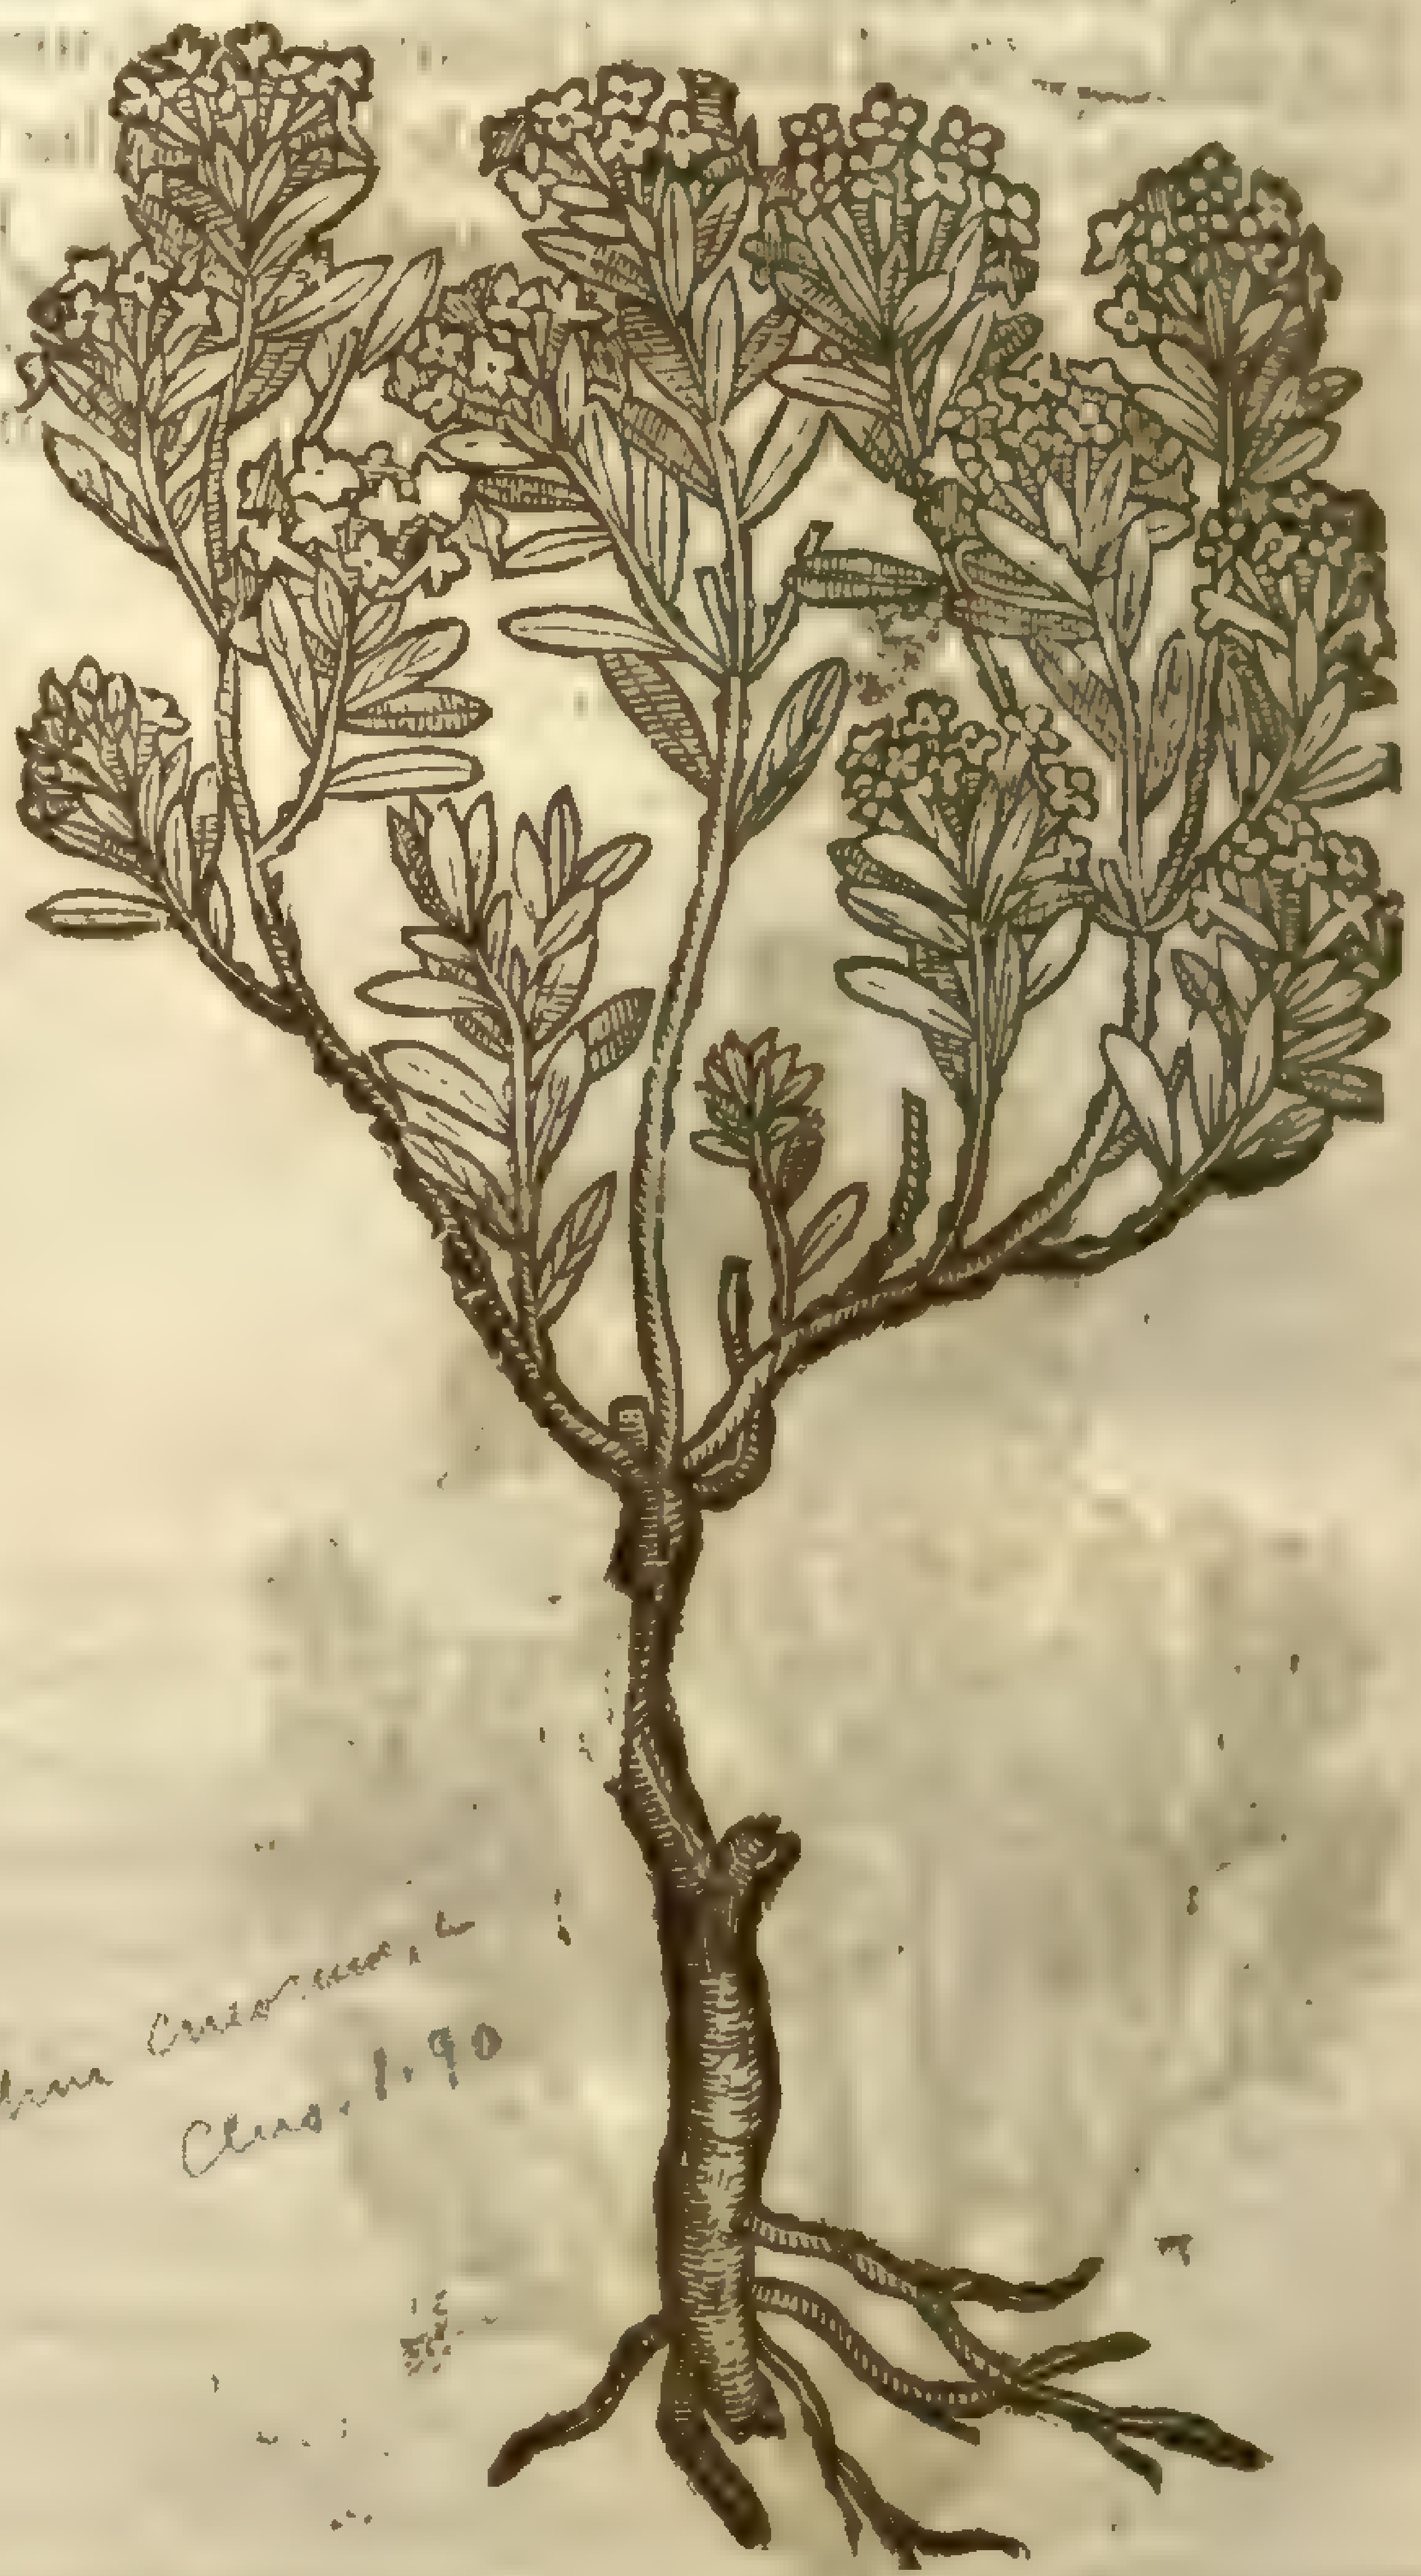
2 The other is a ſhrub ſome cubit high, hauing tough flexible branches couered with a denſe and thick barke, which the outward rinde being taken away, ouer all the plant, but chiefely next the root, may be drawne into threds like Flax or Hemp: the vpper branches are ſet with thick, ſhort, fat, rough ſharp pointed leaues, of ſomewhat a ſaltiſh taſte at the firſt, afterwards of a hot and biting taſte: the floures are many, little and yellow: the root is thicke and wooddy like as that of the former: this growes vpon the ſea coaſt of Spaine, and on the mountaines nigh Granado, where they call it *Sanamunda*, and the common people about Gibralter call it Burhalaga, and they only vſe it to heate their ouens with. It floures in February. *Anguillara* called this, *Empetron*: *Cæſalpinus*, *Cneoron*; and in the *Hiſtoria Lugd.* it is the *Cneoron nigrum Myconi*: *Seſamoides minus*: *Daleſchampij*, and *Phacoides*, *Oribaſij quibuſdam*.

3 This is bigger than either of the two former, hauing whiter and more flexible branches, whoſe barke is vnmeaſurably tough and hard to breake: the vpper branches are many, and thoſe very downy, and hanging downe their heads, ſet thicke with little leaues like Stone-crop, and of the like hot or burning faculty: the floures are like thoſe of the former; ſometimes greeniſh, otherwhiles yellow: *Cluſius* did not obſerue the fruit, but ſaith, it floured at the ſame time with the former, and grew in all the ſea coaſt, from the Straits of Gibralter, to the Pyrenæan mountaines. *Alfonſus Pantius* called this *Cneoron*: *Lobel* and *Tabernamontanus* call it *Erica Alexandrina.*



3 *Sanamunda* 3.*Cluſ.*
The third Heath Spurge.

Passerina hirsuta
Clus. 1.89



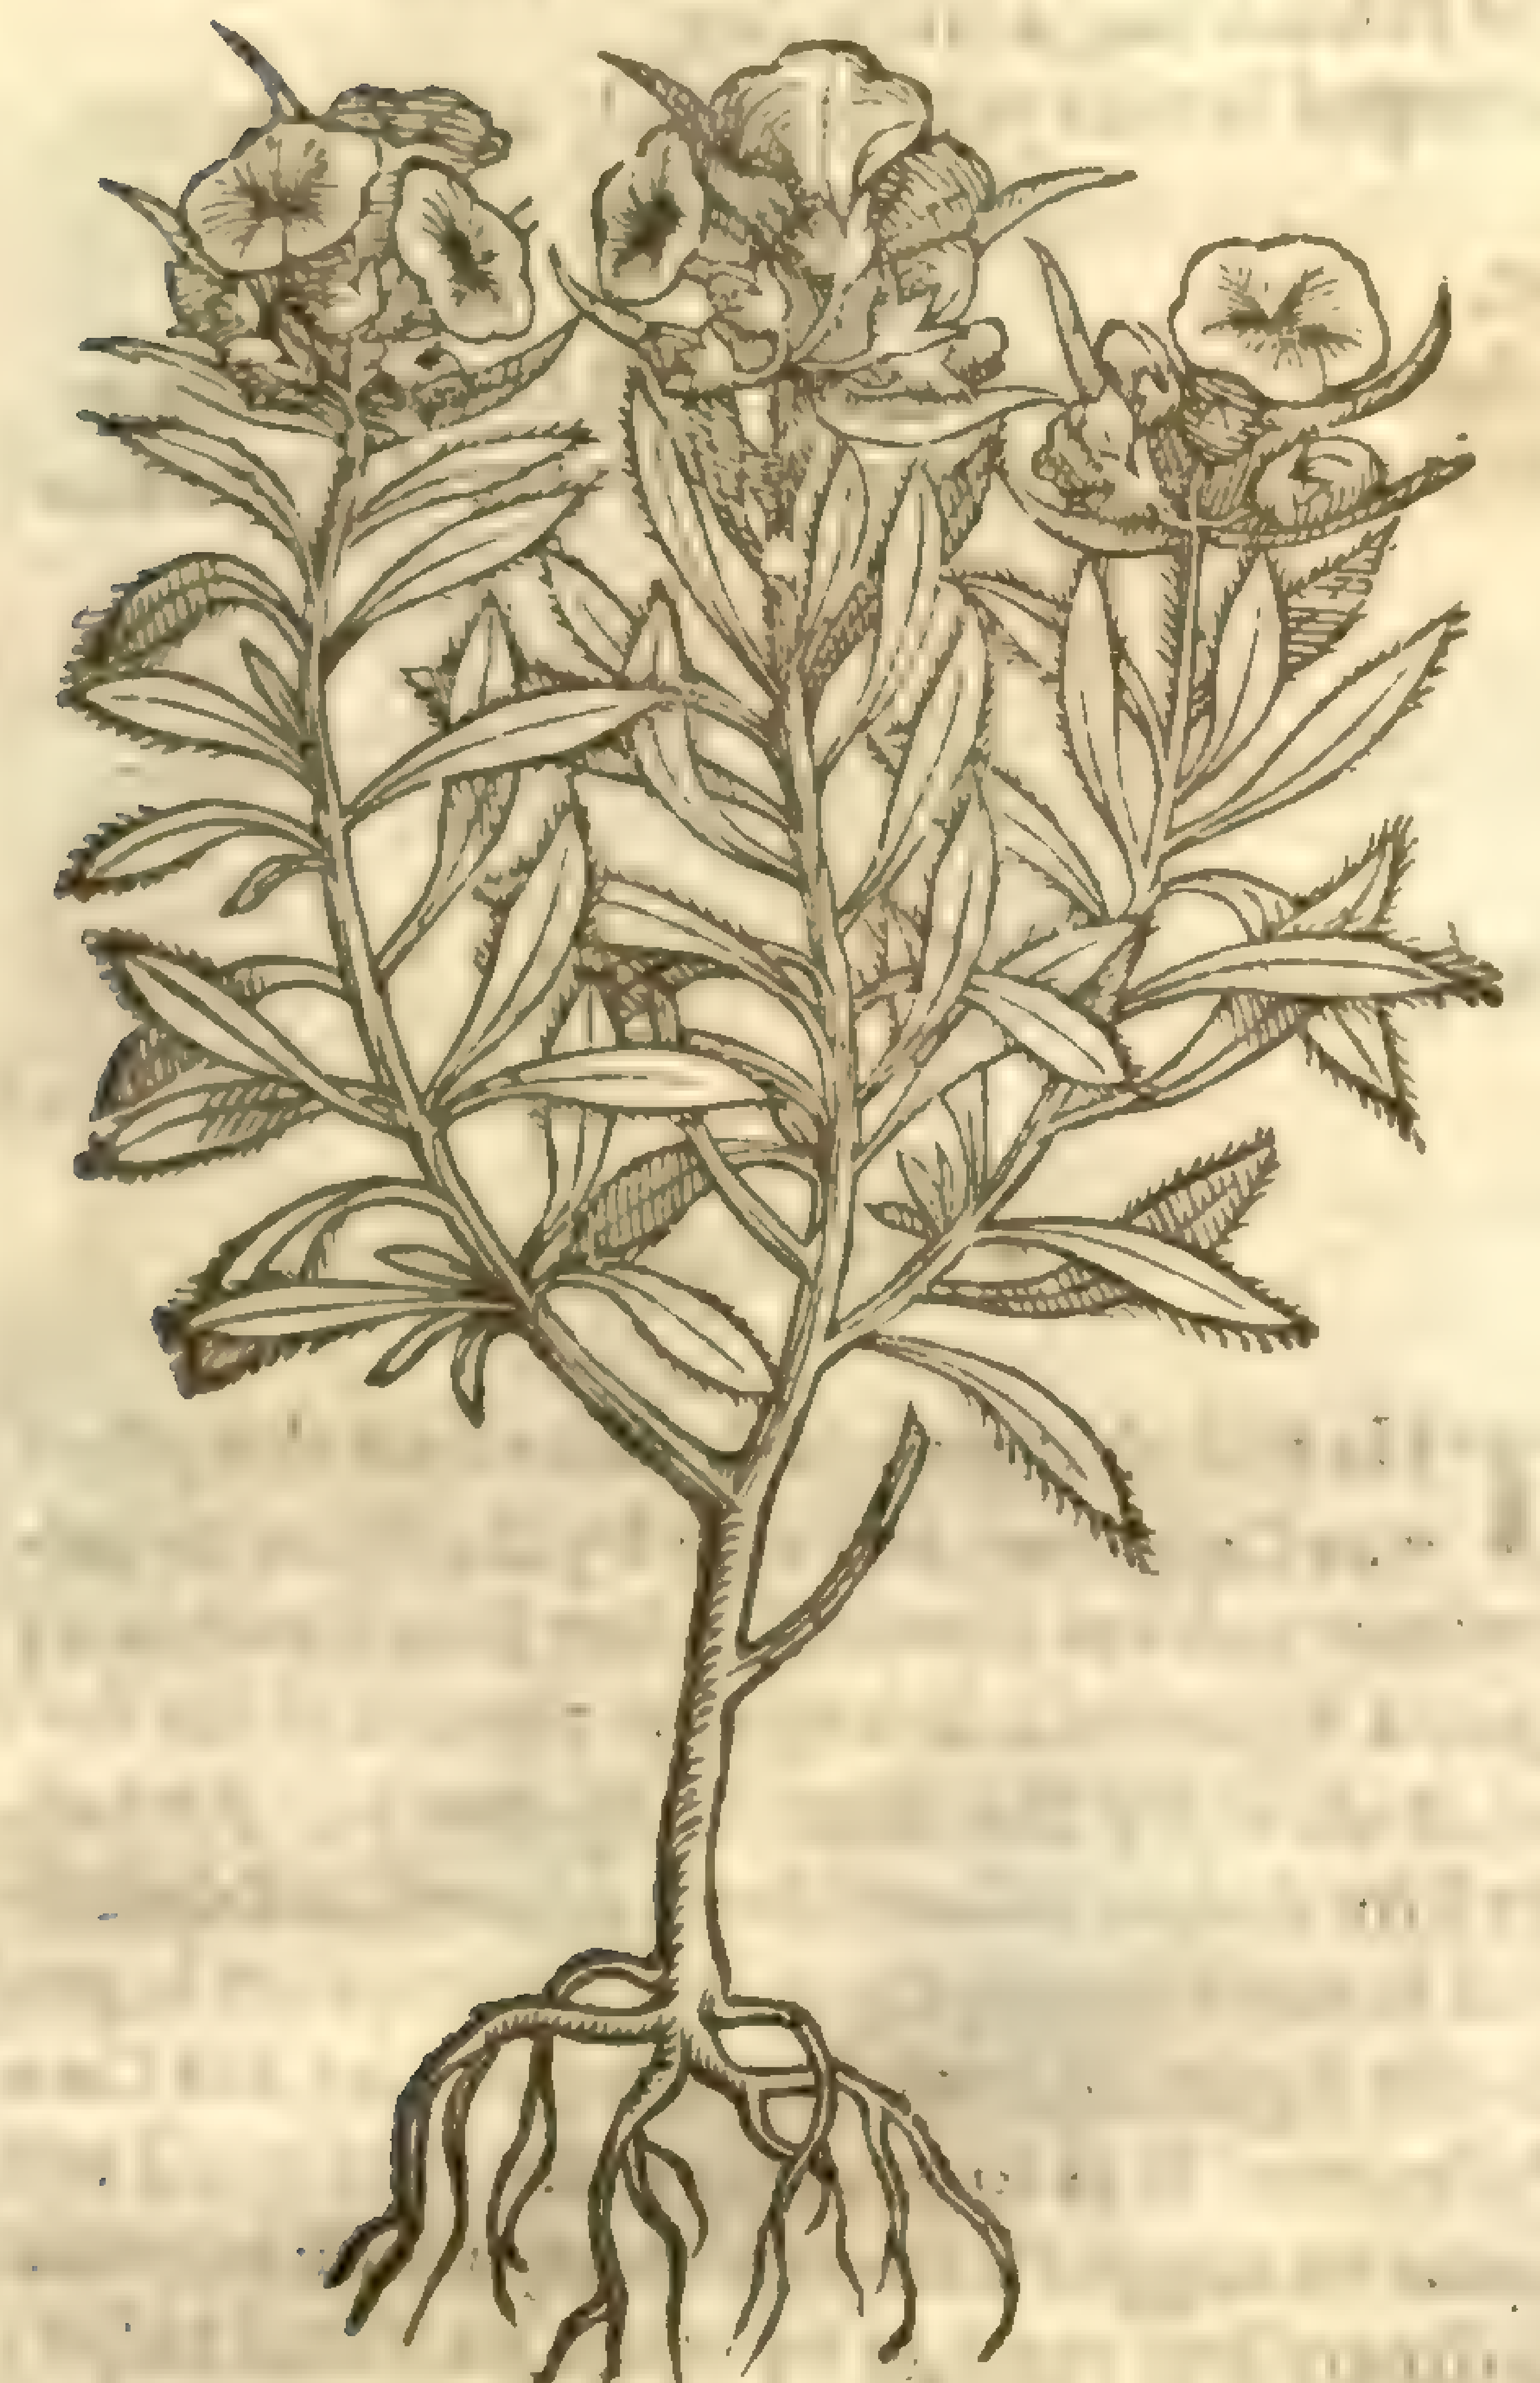
4 *Cneoron Matthioli.*
Rocke Roſe.

Daphne Cneorum
Clus. 1.90

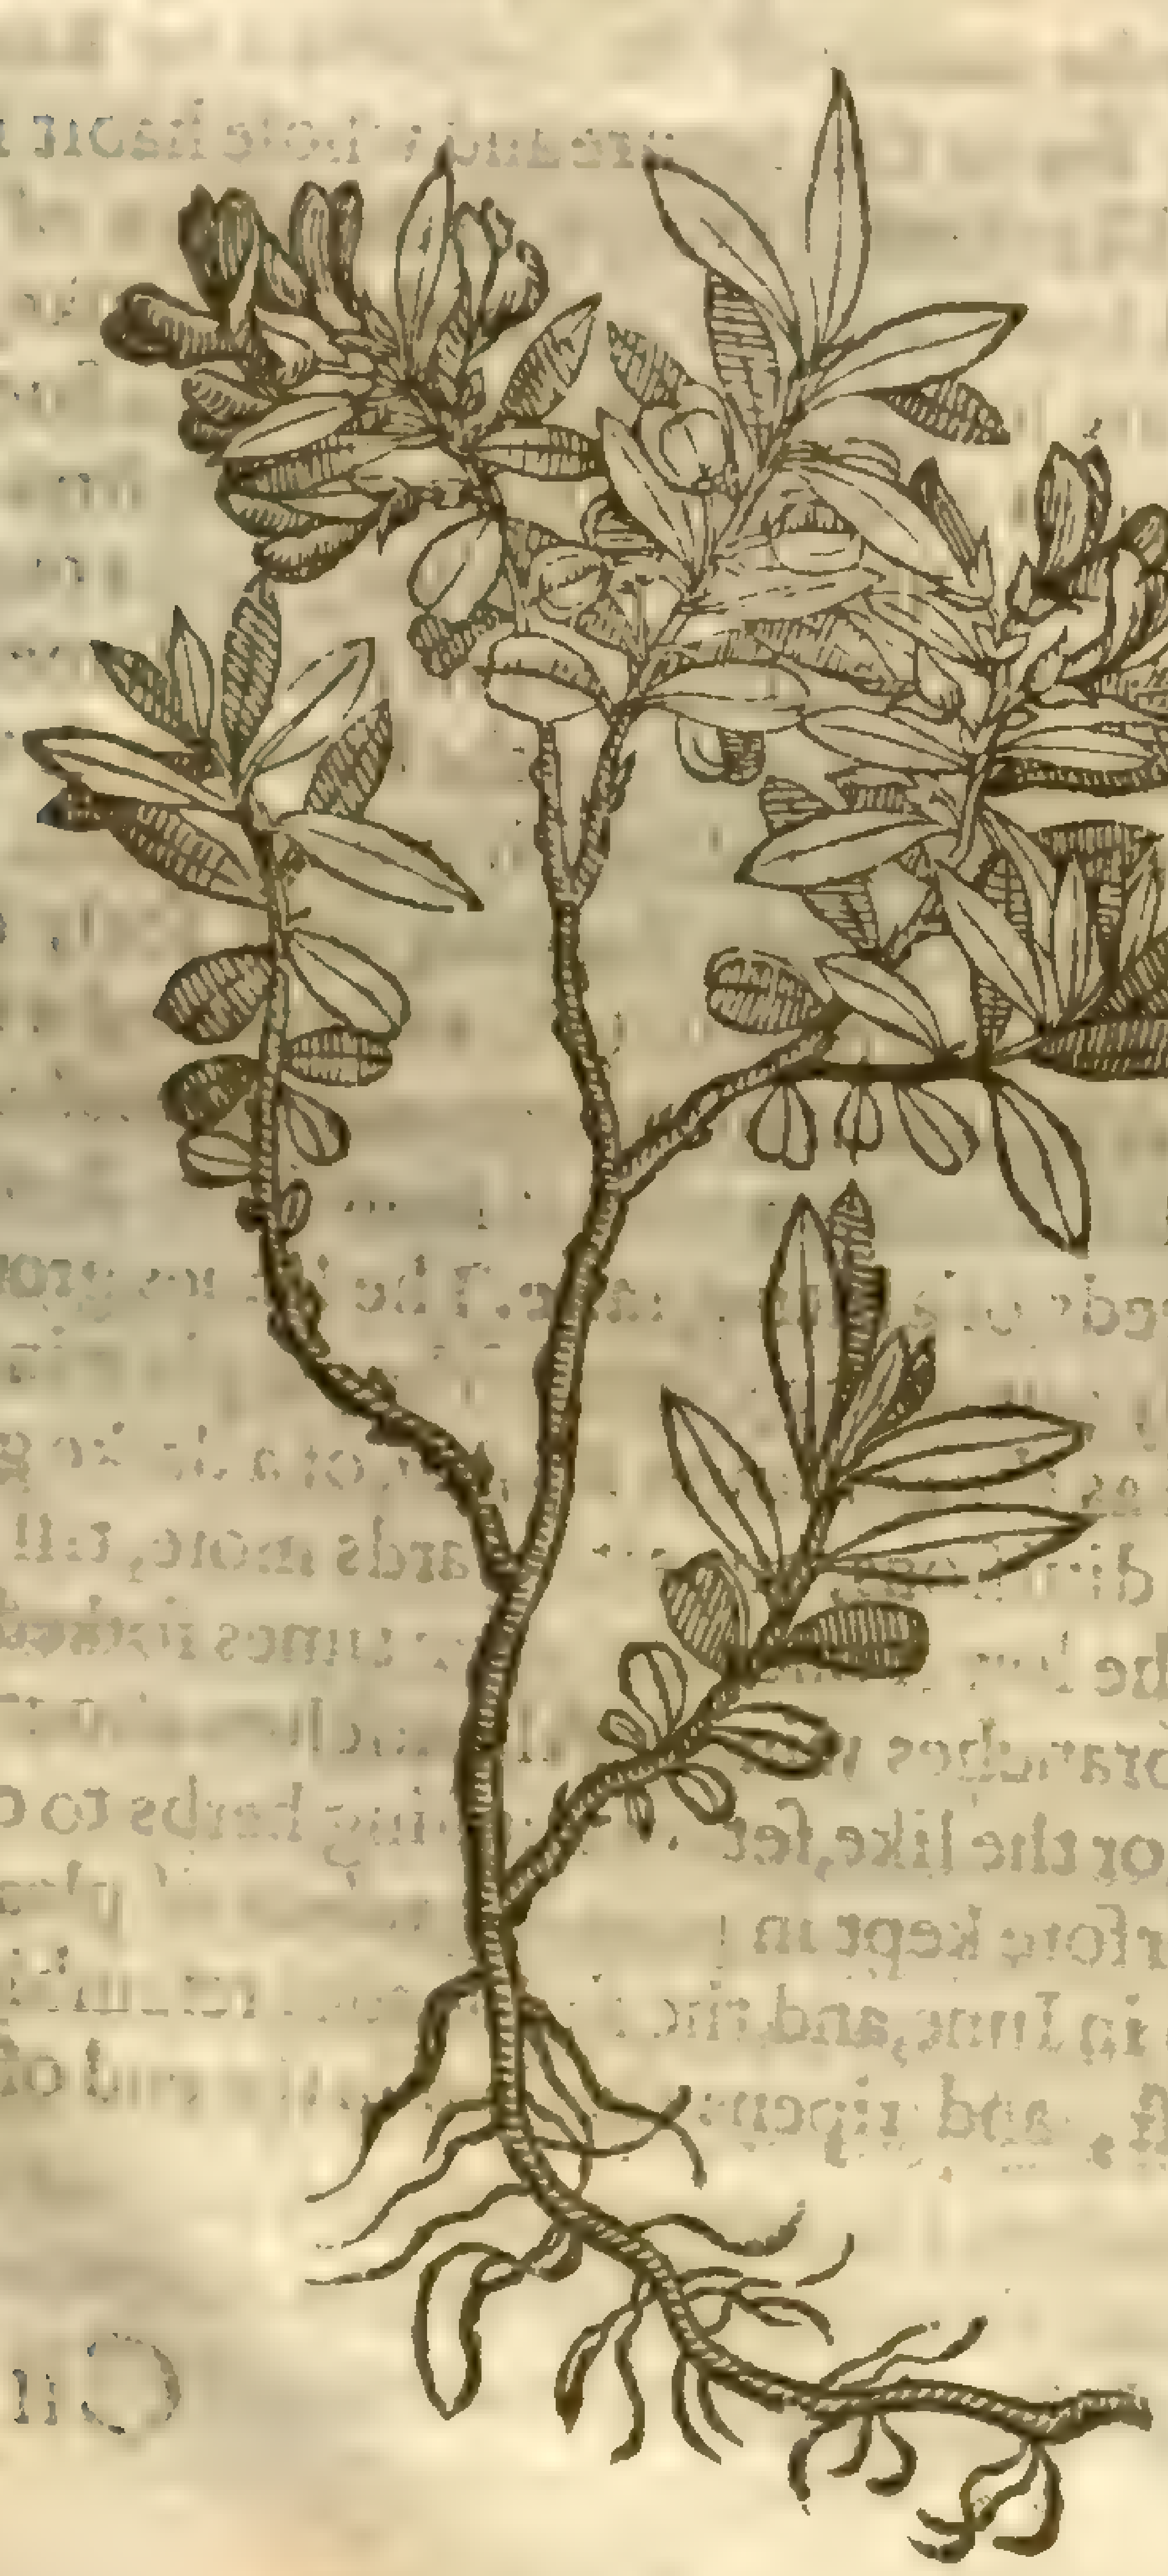
4 This alſo may not vnfitly bee joyned to the former, for it hath many tender flexible tough branches commonly leaning or lying along vpon the ground, vpon which without order grow leaues greene, skinny, and like thoſe of the true *Thymelæa*; at firſt of an vngratefull, and afterwards of a bitter taſte, yet hauing none or very little acrimony (as far as may be perceiued by their taſte:) the floures grow vpon the tops of the branches ſix, ſeuen, or more together, conſiſting of foure little leaues of a reddiſh purple colour, very beautifull and well ſmelling, yet offending the head if they be long ſmelt vnto: theſe are ſucceded by ſmall berries, of colour white, containing a round ſeed, couered with an aſh-coloured skin. The root is long, of the thickneſſe of ones little finger, ſometimes blackiſh, yet moſt commonly yellowiſh, tough, and ſmalleſt at the top where the branches come forth. It floures in Aprill or May, and ripens the fruit in Iune: it floures ſometimes thrice in the yeare, and ripens the fruit twiſe; for *Cluſius* affirmes that twice in one yeare he gathered ripe berries from one and the ſame plant. It growes plentifully vpon the mountainous places of Auſtria about Vienna; whither the countrey women bring the floures to the market in great plenty to ſell them to deck vp houſes: it growes alſo in the dry medowes by Frankford on the Mœne, where there is obſerued a variety with white floures. *Matthiolus* would haue this to be the *Cneoron album* of *Theophraſtus*: *Cordus* calls it *Thymelæa minor*: it is the *Cneoron alterum Matthioli*, and *Oleander ſyl. Auicenna Myconi*, in the *Hiſt. Lugd.* The Germanes call it **Stein Roſelin**: and we may call it Rocke Roſe, or dwarfe Oleander.

5 This plant by *Bauhine* is called *Cneorum album folio oleæ argenteo molli*: and by *Daleſchampius*, *Cneorum album*, which hath been the reaſon I haue put it here, although *Cæſalpinus*, *Imperatus*, and *Plateau*,

5 *Cneorum album folijs argenteis.*
White rocke Roſe.



Chamæbuxus flore Coluteæ.
Baſtard dwarfe Box.



teau who ſent it to *Cluſius*, would haue it to be and call it *Dorycnium*. It is a ſhrubbie herbe, ſending from one root many ſingle ſtalks ſom halfe cubit or better high. The leaues, which grow vpon the ſtalks without order, are like thoſe of the Oliue, but ſomewhat narower, and couered ouer with a ſoft ſiluer-like downineſſe: At the top of the ſtalkes grow many floures cluſtering together, in ſhape like thoſe of the leſſer Bindeweed, but white of colour. This grows wild in ſome parts of Sicily, whence *Caſalpinus* calls it *Dorycnium ex Sicilia*.

¶ *The Temperature and Vertues.*

A The three firſt are very hot, and two firſt haue a ſtrong purging facultie, for taken in the weight of a dram with the decoction of cicers they mightily purge by ſtoole, both flegme, choler, and alſo wateriſh humours, and they are often vſed for this purpoſe by the country people in ſome parts of Spain.

The faculties of the reſt are not known, nor written of by any as yet.

CHAP. 5.

Of baſtard dwarfe Box.

¶ *The Deſcription.*

THis which *Cluſius* for want of a name calls *Anonymos flore Coluteæ*, *Geſner* called *Chamæbuxus*; to which *Bauhine* addeth *flore Coluteæ*; and *Beſler* in his *hortus Eyſtettenſis*, agreeable to the name I haue giuen it in Engliſh, cals it *Pſeudochamæbuxus*. It is a ſmall plant, hauing many creeping woody tough roots, here and there ſending forth ſmall fibres: From theſe ariſe many tough bending branches ſome ſpan long, hauing thicke ſharpe pointed green leaues almoſt like thoſe of Box, and theſe grow vpon the ſtalks without any order, & when you firſt chew them they are of an vngratefull taſte, afterwards bitter and hot. At the tops of the branches do come forth among the leaues three or foure longiſh flours for the moſt part without ſmell, yet in ſome places they ſmell ſweet like as ſome of the Narciſſes: they conſiſt of three leaues apiece, two whereof are white, and ſpred abroad as wings, a whitiſh little hood couering their lower ends; the third is wrapt vp in form of a pipe, with the end hollow and crooked,and this is of a yellow colour,which by age often times becomes wholly red: after thoſe floures ſucceed cods broad and flat,little leſſe than thoſe of the broad leafed *Thlaſpi*,and greene of colour,rough,and in each of theſe cods are commonly contained a couple of ſeeds,of the bigneſſe of little Chichlings,of a blackiſh aſh colour,rough,and reſembling a little dug.

This is ſometimes found to vary, hauing the two winged leaues yellow or red, and the middle one yellow.

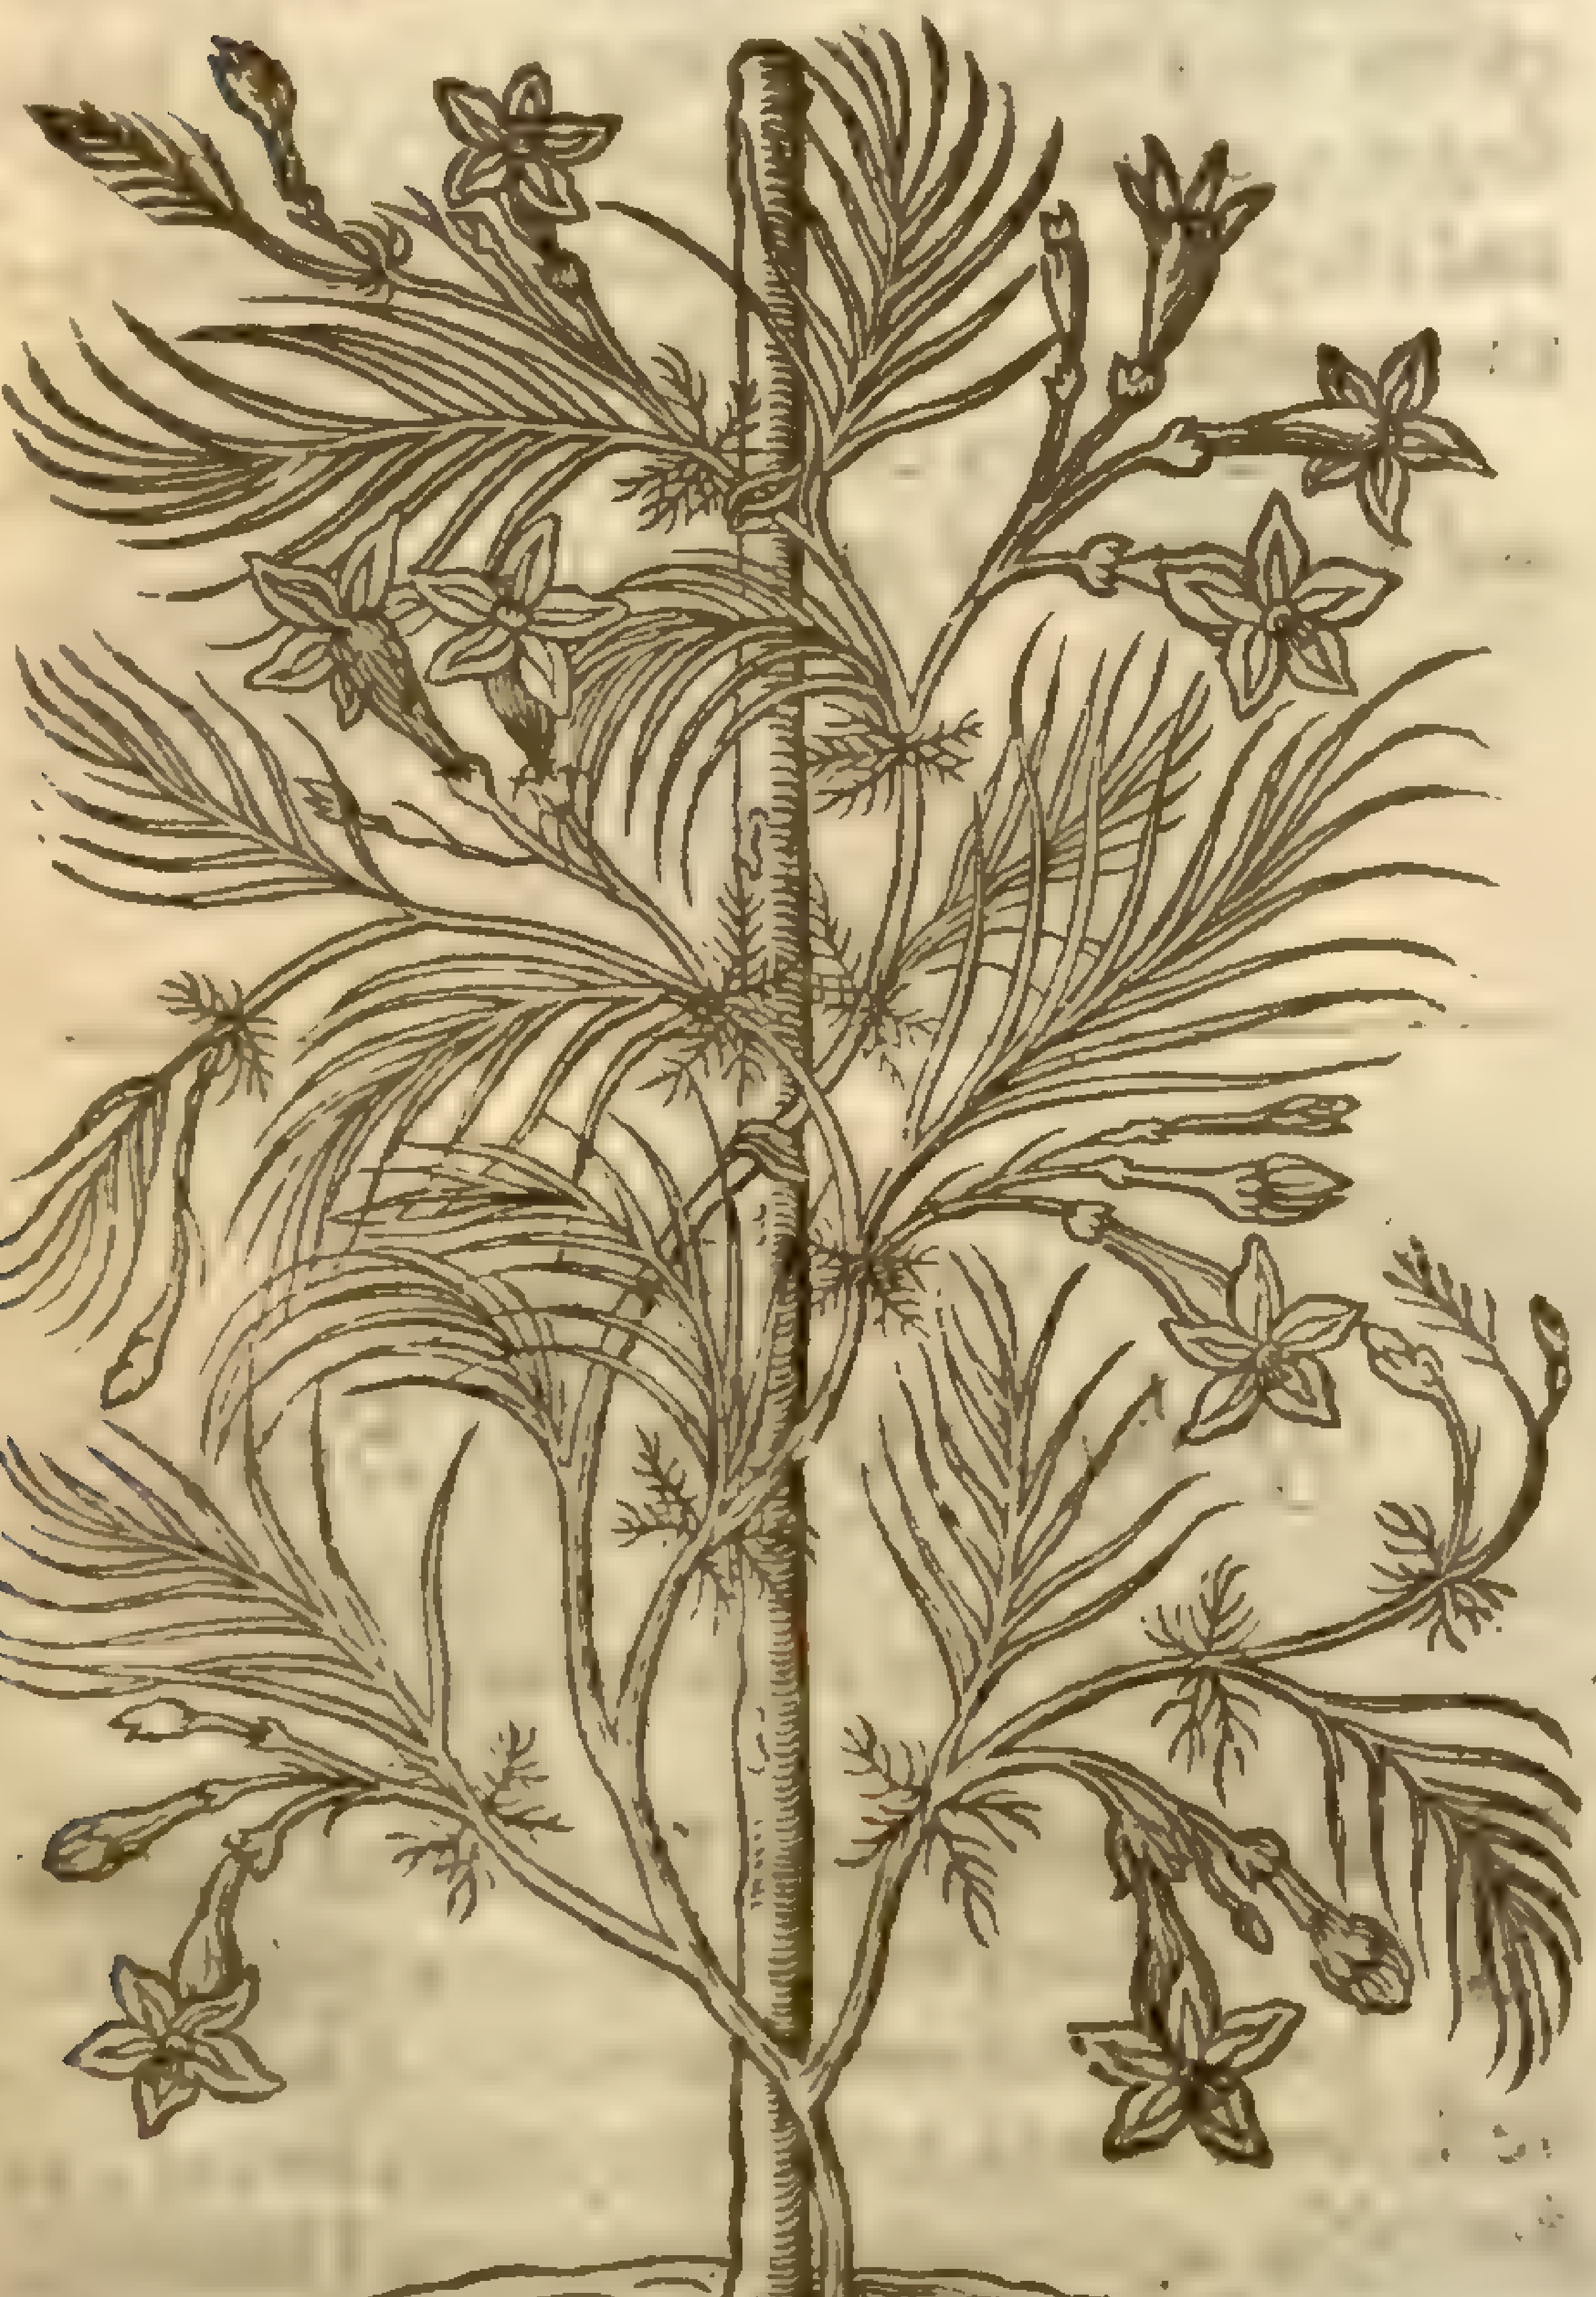
¶ *The Place.*

It floures in Aprill and May,and ripens the ſeed in Iune. It growes vpon moſt of the Auſtrian and Styrian Alps,and in diuers places of Hungary. It is neither vſed in phyſicke,nor the faculties thereof in medicine known.

Chap. 6. *Of winged Binde-weed or Quamoclit.*

[illegible]

Quamoclit, ſiue Convolvulus Pennatus.
Winged Binde-weed.

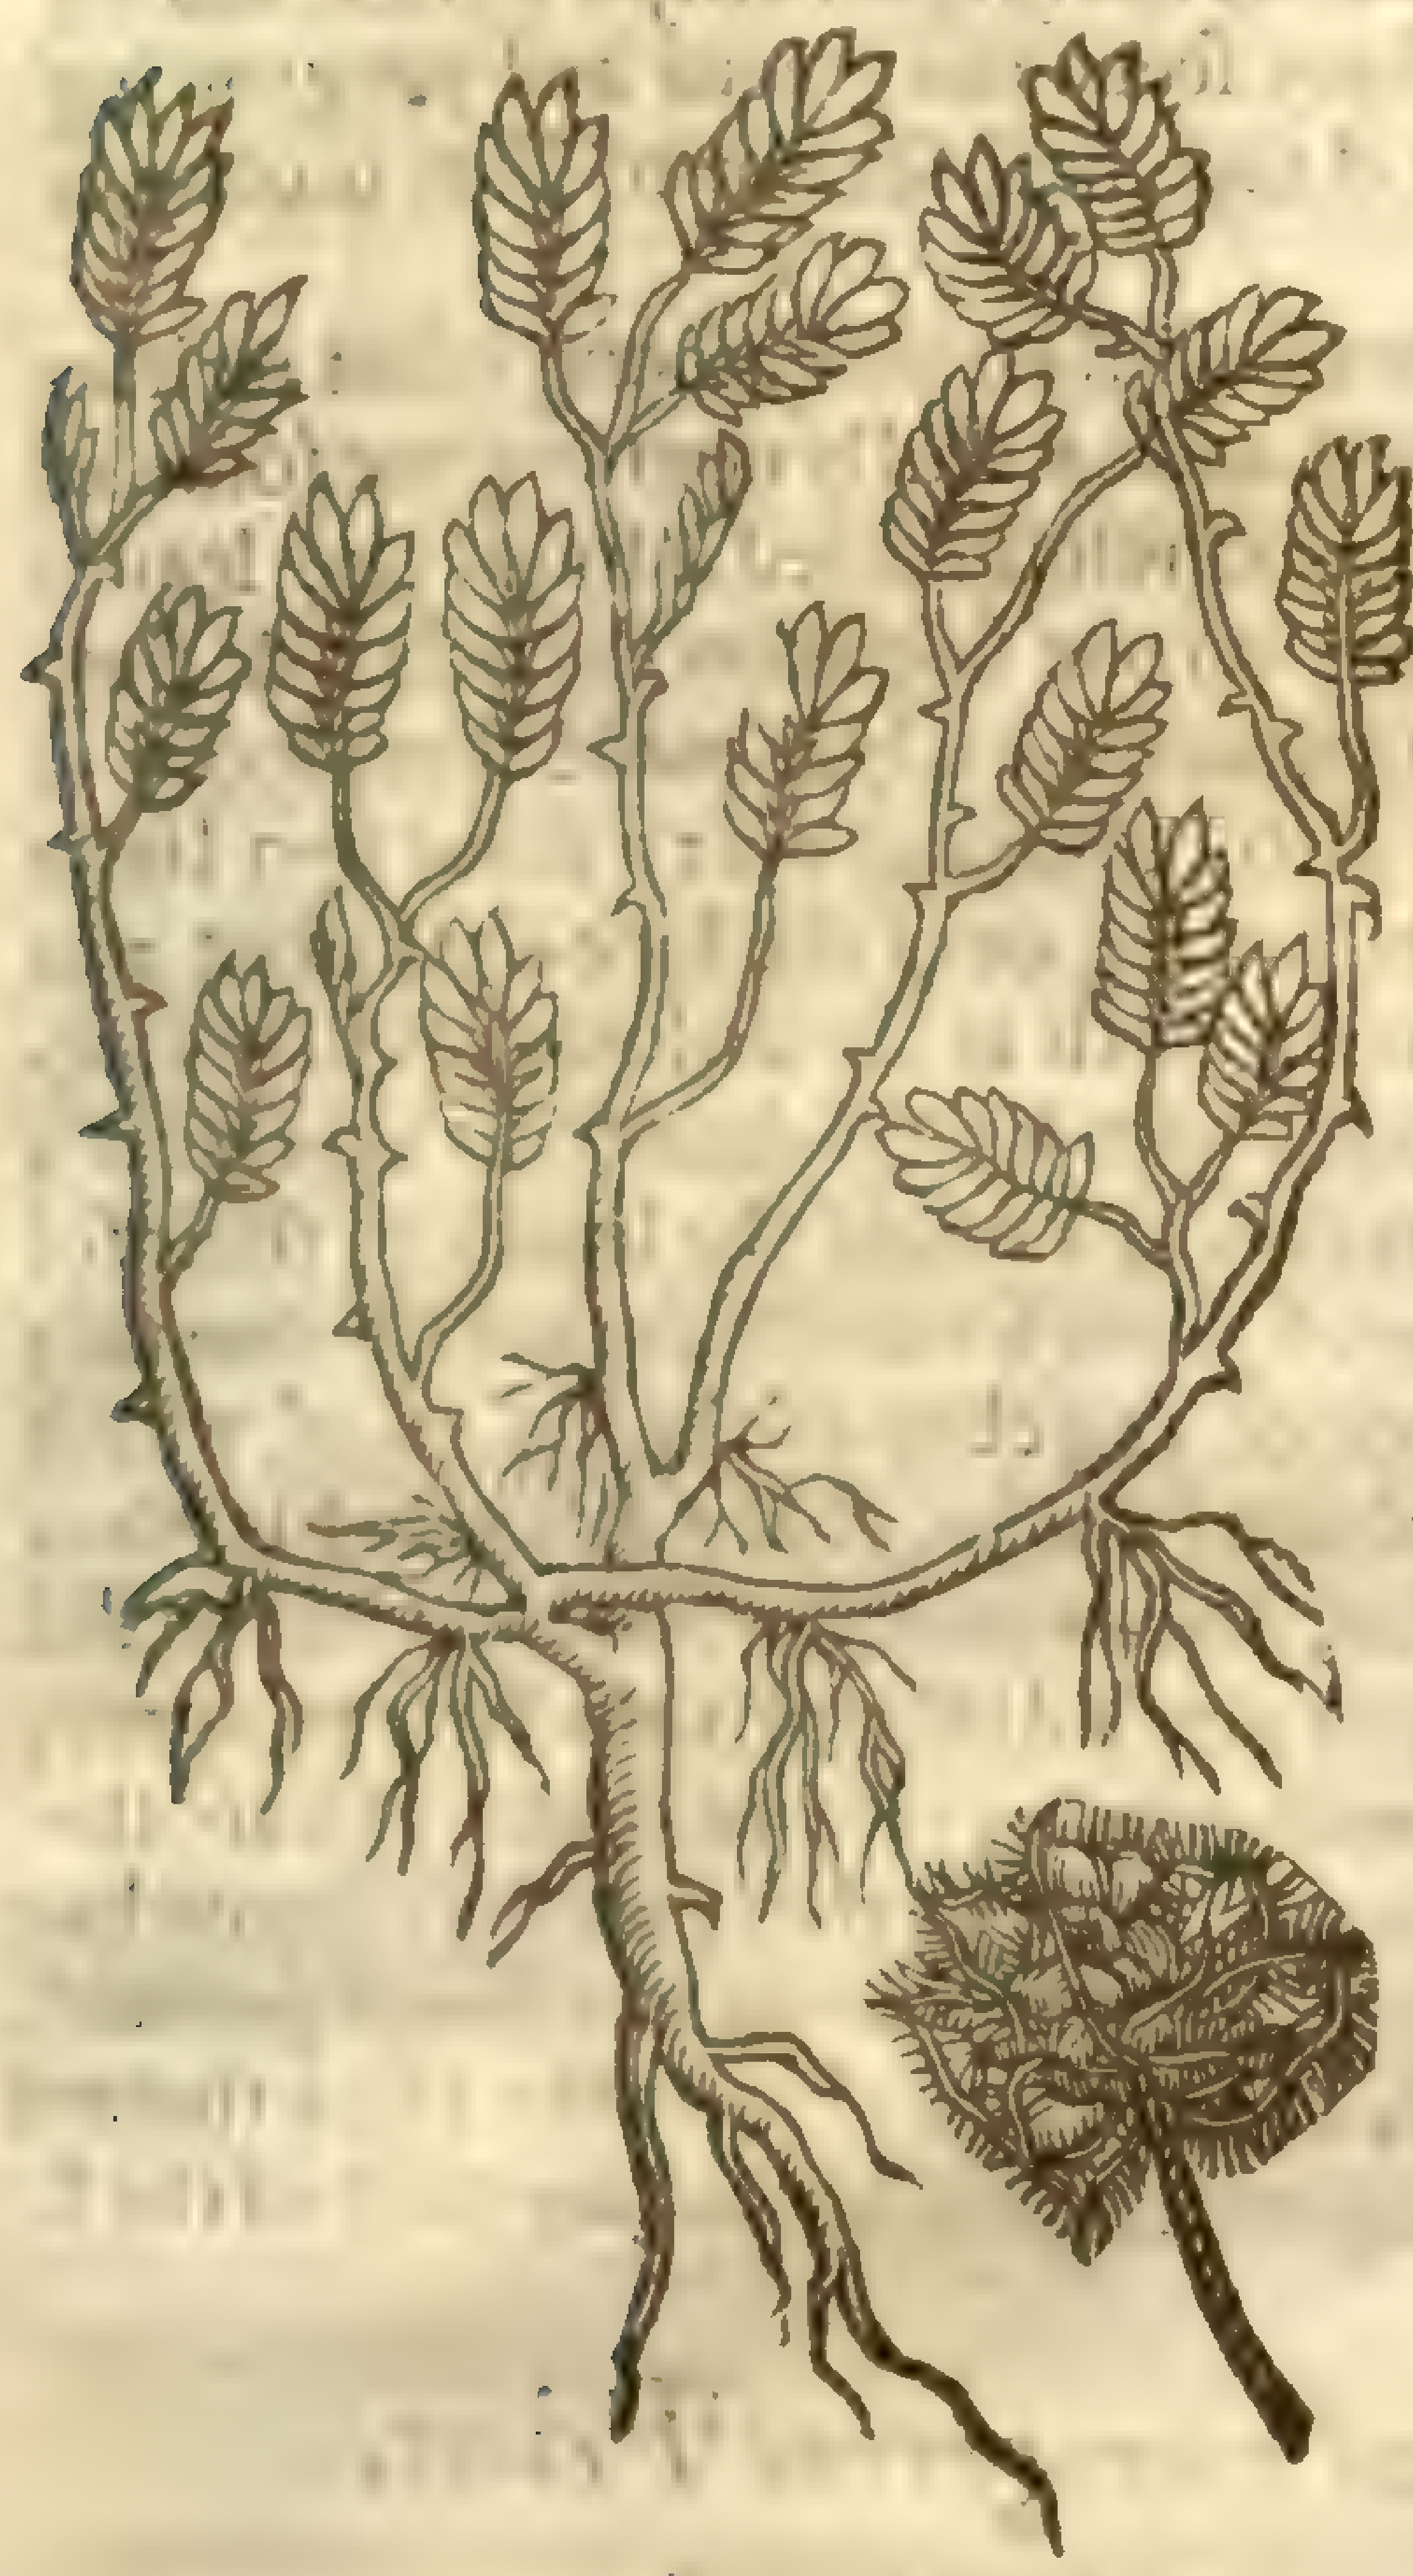


¶ *The Deſcription.*

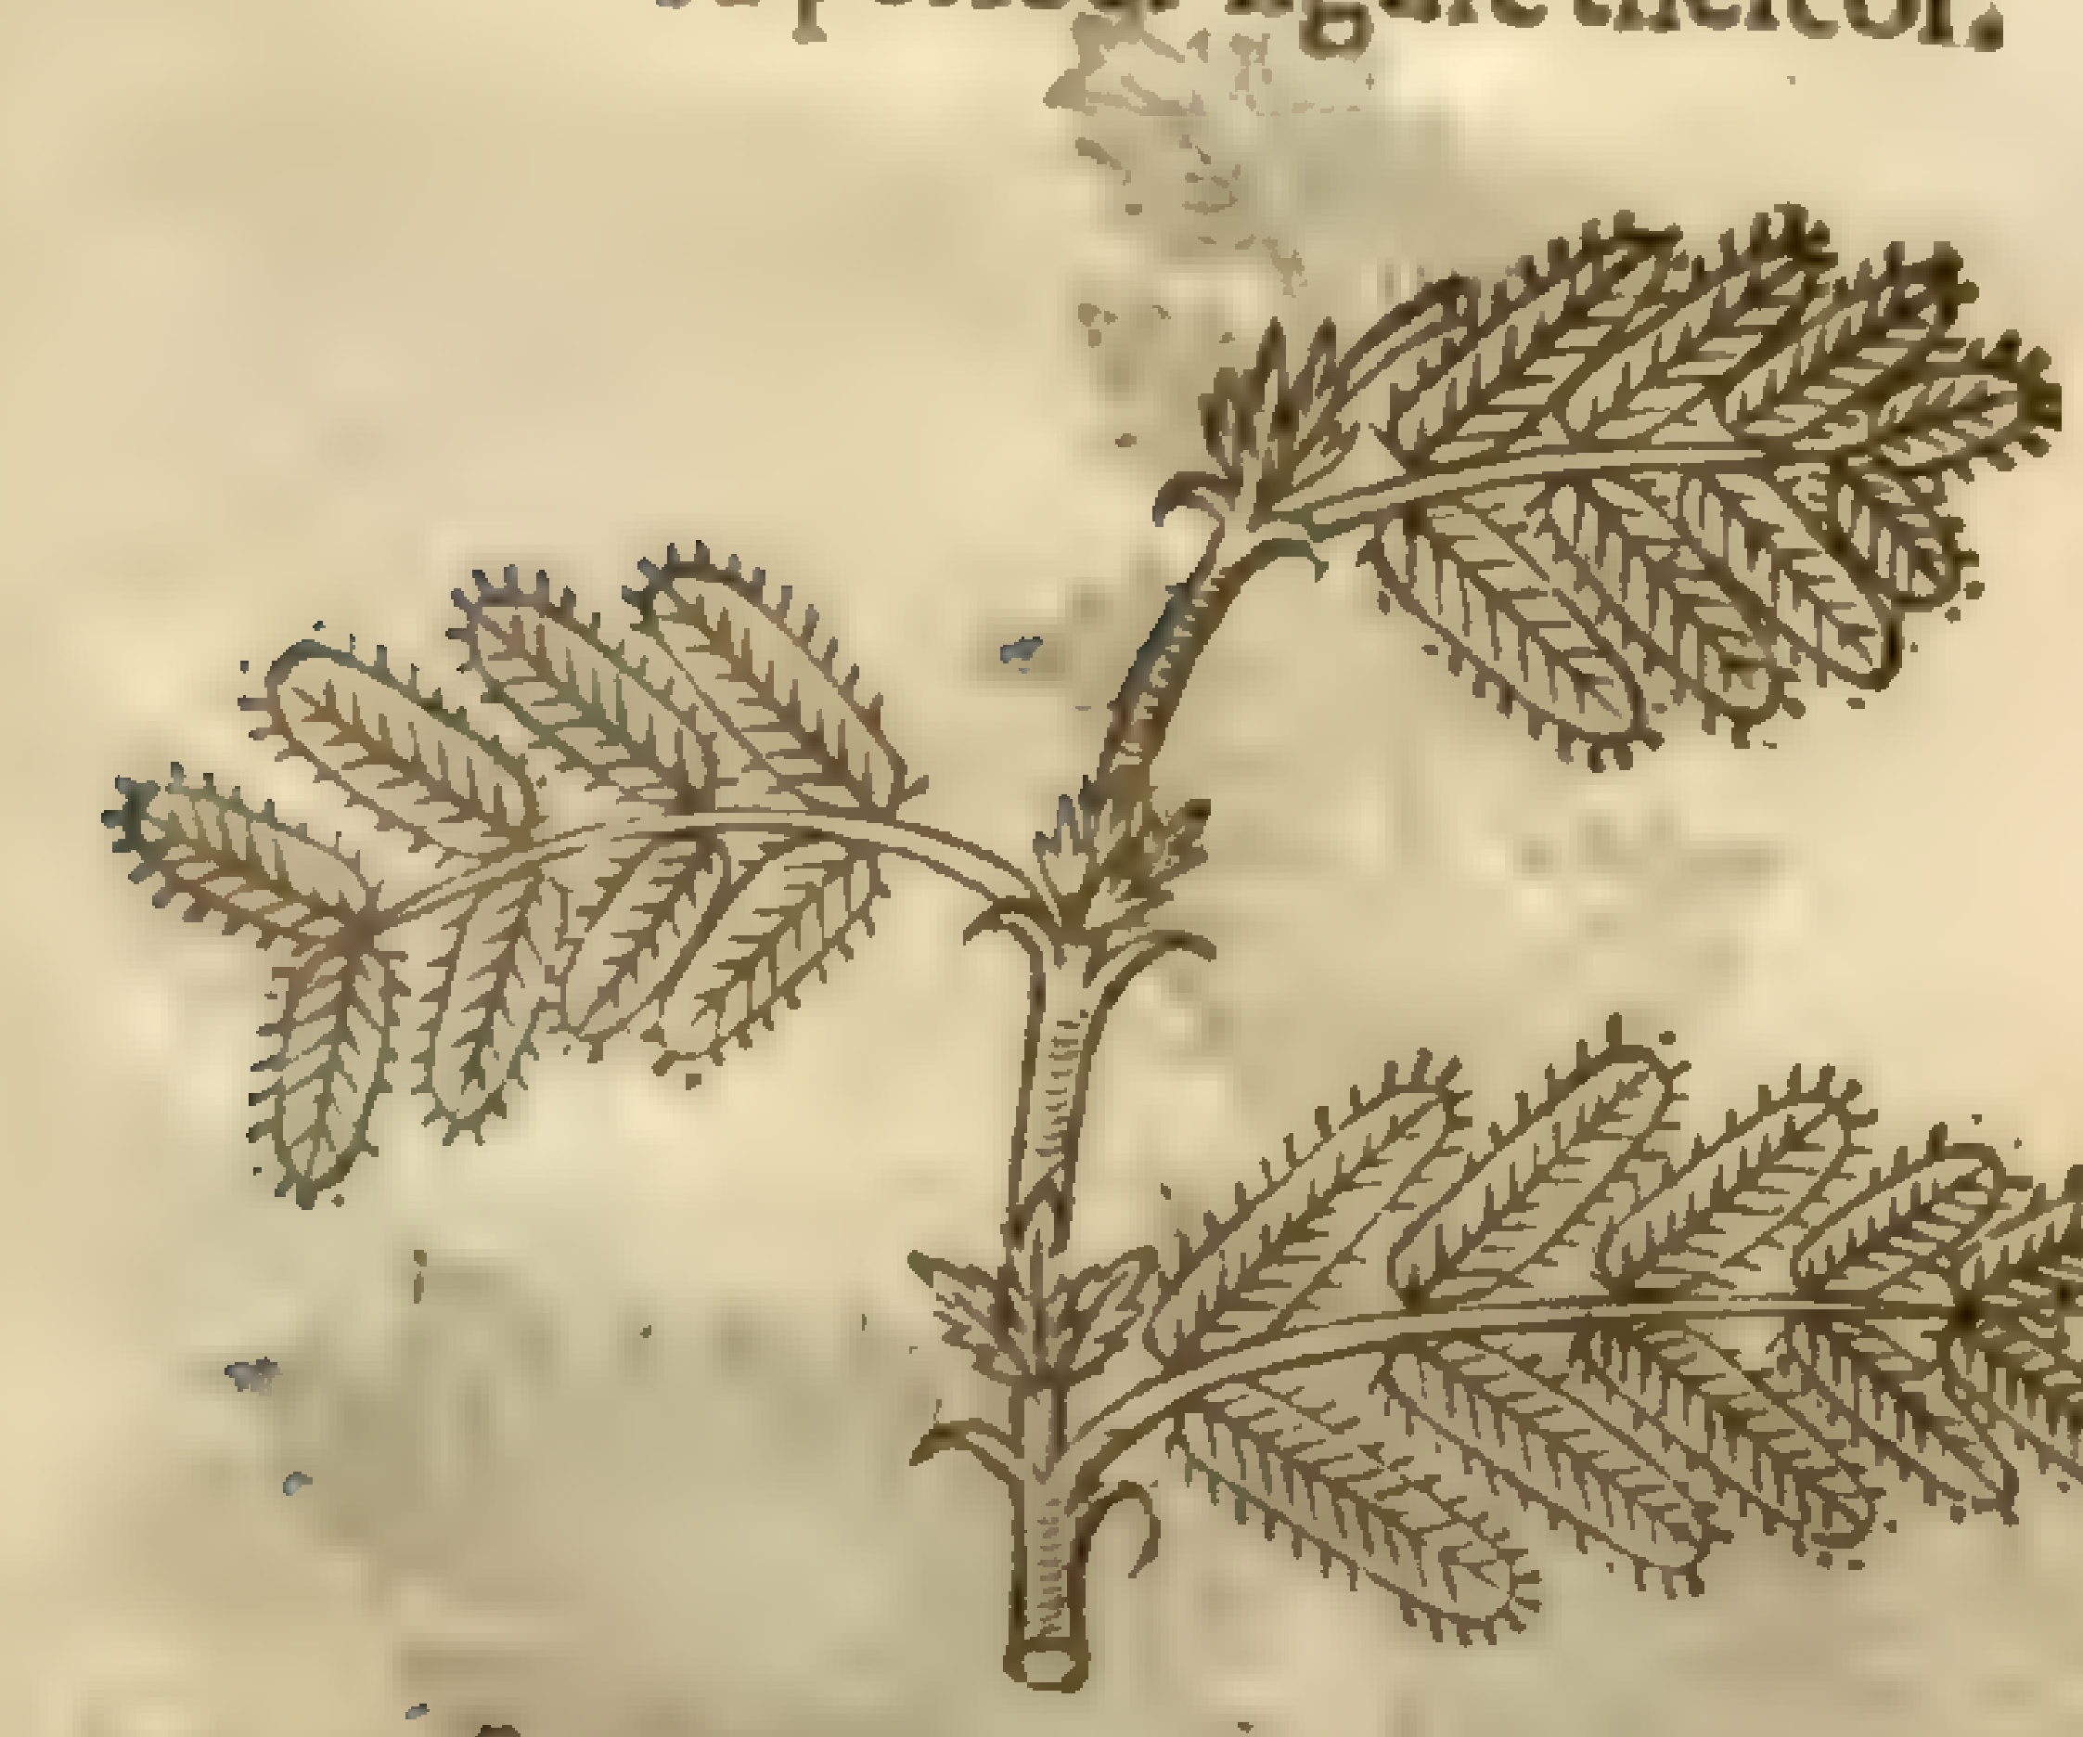
The firſt that writ of & deſcribed this plant was *Cæſalpinus*,and that by the name or *Gelſeminum rubrum alterum*. After him *Camerarius* gaue a figure and deſcription thereof in his *hortus Medicus*,by the name of *Quamoclit*. And after him *Fabius Columna* both figured and deſcribed it more accuratly,whoſe deſcription is put to the figure of it we here giue,in *Cluſ.* his *Curæ Poſteriores*. It is ſo tender a plant that it wil not come to any perfection with vs,vnleſſe in extraordinary hot yeres,& by other artificial helps; wherefore I wil borrow the deſcription thereof out of *Fabius Columna*. This exotick plant,ſaith he,cannot more fitly be referred to any Kinde, than to the family of the *Convolvuli* or Bindeweeds, for in the nature and whole habit it is almoſt like them, except in the ſhape of the winged leaues: it is ſtored with leſſe milke;the floures are long,hollow,but parted into fiue at the top, of a pleaſing red colour, with ſtreaked lines or folds, ſtanding vpon long ſtalks one or two together comming out of the boſomes of the leaues at each joint of the branches,& they haue in them fiue yellowiſh pointals:then ſucceeds a longiſh fruit ſtanding in a ſcaly cup, ending in a ſharpe pointall, and couered with a tough skin,as that of the common *Convolvulus*, but leſſer, hauing within it foure longiſh black hard ſeeds,of a biting taſte. The leaues grow alternatly out of the joints of the purple winding branches,being winged and finely diuided,twice as ſmall as the common *Rheſeda*,of a darke green colour,but the yong ones are yellowiſh,firſt hauing a few diuiſions, but afterwards more, till they come to haue thirteen on a ſide,and one at the top; but the lower ones are often times forked: by reaſon of the great plenty of leaues and flouring ſtalks or branches winding themſelues about artificial hoops,croſſings,or other faſhioned works of Reeds,or the like,ſet for winding herbs to clime vpon,it much delights the eye of the beholder, and is therfore kept in pots in gardens of pleaſure. The ſeed ſown in the beginning of the Spring growes vp in Iune,and the firſt leaues reſemble the winged fruit of the Maple: it floures in the end of Auguſt, and ripens the ſeed in the end of September.

Chap. 7. Of the Senſitiue herbe.

Herba mimoſa.
The Senſitiue herbe.



Eius exactior Icon.
A perfect figure thereof.



¶ *The Deſcription.*

This which I here call the Senſitiue herbe, is that which *Chriſtopher Acoſta* ſets forth by the name of *Herba mimoſa*, or the Mocking herbe, becauſe when one puts his hand thereto, it forthwith ſeemes to wither and hang downe the leaues; but when you take it away againe, it recouers the priſtine greeneſſe and vigor. I will here giue you that which *Acoſta* writes thereof, and the figure & hiſtorie which *Cluſius* giues in his notes vpon him; and alſo another figure better expreſſing the leaues and manner of growing. There is found, ſaith *Acoſta*, in ſome gardens another plant ſome fiue handfulls long, reſting vpon the neighboring ſhrubs or wals, hauing a ſlender ſtalke of freſh greene colour, not very round, ſet at certaine ſpaces with ſmal & pricking thornes: the leaues are not vnlike the former, [That is, the *Herba viua*, which in condition is little different from this] being ſomwhat leſſer than thoſe of the female Fern. It loues to grow in moiſt and ſtony places, and is called *Herba mimoſa* for the reaſon formerly giuen. The nature hereof is much different from that of *Arbor triſtis*; for euery night at Sunne-ſet it as it were withers and dries, ſo that one would thinke it were dead, but at Sunne-riſe it recouers the former vigor, and by how much the Sun grows hotter, by ſo much it becomes the greener, and all the day it turns the leaues to the Sun.

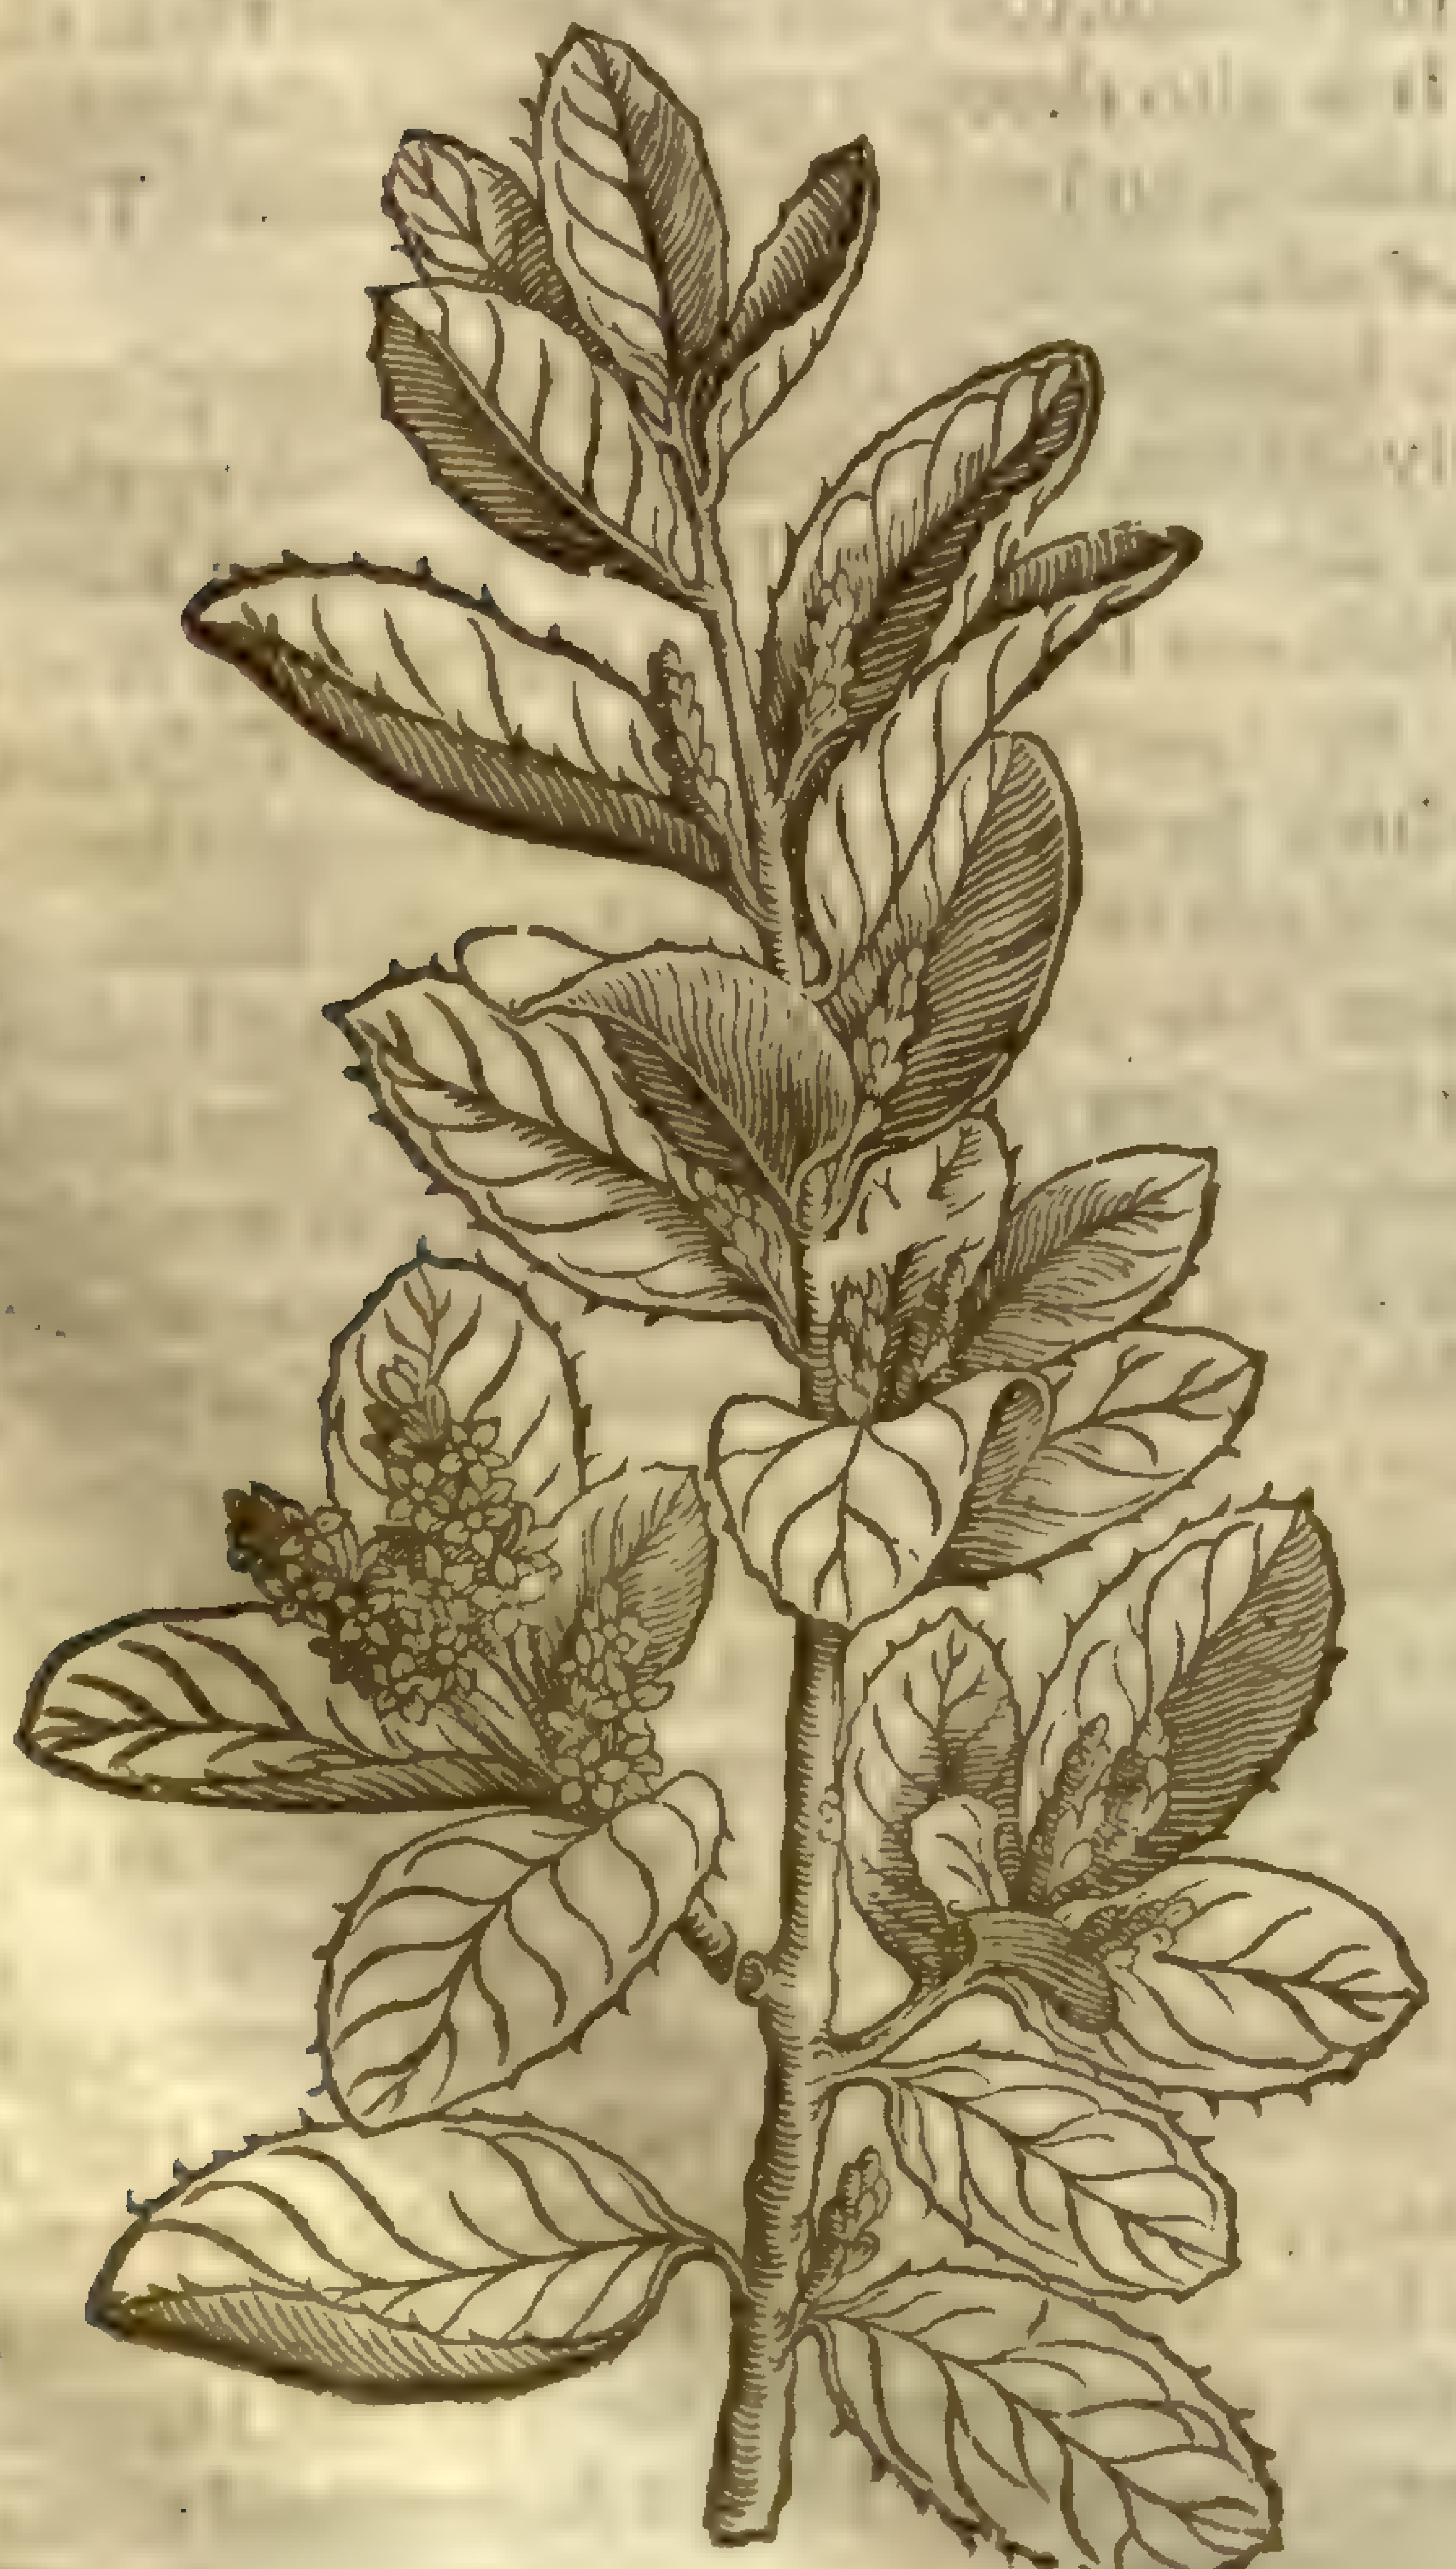
A This plant hath the ſmel and taſte of liquorice, and the leaues are commonly eaten by the Indians againſt the cough, to clenſe the cheſt, and clear the voice. It is alſo thought good againſt the paines of the kidnies, and to heale greene wounds. Thus much *Acoſta*.

Now, ſaith *Cluſius*, the leaues of many plants, eſpecially Pulſes, vſe to contract or ſhrink vp their leaues in the night time. Now I receiued a drie plant, which was ſent to mee by the name of *Herba mimoſa*, by *Iames Garret* in the end of October, 1599. which he writ he had from the right honorable the Earle of Cumberland, who returning from Saint *Iohn de puerto rico* in the Weſt Indies, brought it put in a pot with ſome earth, but could not preſerue it aliue. But I cauſed the figure of that dried plant to be expreſſed as well as it might, ſo to fit it to the deſcription following, made alſo by the dried plant. This plant which was wholly dry and without leaues, had a ſingle root, and that not thick, but hard and wooddy, with few fibres, from whence aroſe three or foure ſhort ſtalks, which ſtraight diuided themſelues into ſlender branches which ſpred themſelues round about vpon the ground, at each joint putting forth many long and ſlender fibres, like as in the branches of the common Wood-bind, which lie vpon the ground: theſe branches were a cubit long, and ſomtimes more, round, tough, with ſome prickles, broader at their ſetting on, as you may ſee in the common bramble, yet leſſer, fewer, & leſſe firm; theſe again were diuided into other more ſlender branches ſet with many little prickles, out of whoſe joints betwixt 2 little leaues grew forth foot-ſtalks bedeckt with their little leaues, which were many, ſet in order, with other to anſwer to them on the other ſide, but hauing no ſingle leafe at the end: they were tender & green, not vnlike the little leaues of *Acacia*, & theſe at their firſt comming out coue-red with a thin whitiſh hairines, as I gathered by a little branch retaining the foot-ſtalk and leaues thereon (which he ſent with the former) and it had alſo ſome fibres comming forth therof. He alſo added to the former two little heads, which growing on the ſame plant, he writ he receiued of the forementioned right honourable Earle, with ſome branches yet retaining the leaues. Theſe little heads conſiſted of many ſlender narrow and as it were prickly little leaues; amongſt which lay hid round ſeeds, ſmooth, black, and ſomwhat ſwoln in the middle: the floures I ſaw not, neither know I whether they were brought with the reſt: but whether the leaues of this plant being green, & yet growing on the ground, do wither at the approch of ones hand, as *Chriſtopher Acoſta* writes, and for that cauſe impoſes the name thereon, they beſt know who haue ſeene the greene and yet growing plant: for the faculties you may haue recourſe to that which *A Coſta* hath ſet down. Thus much out of *Cluſius*.

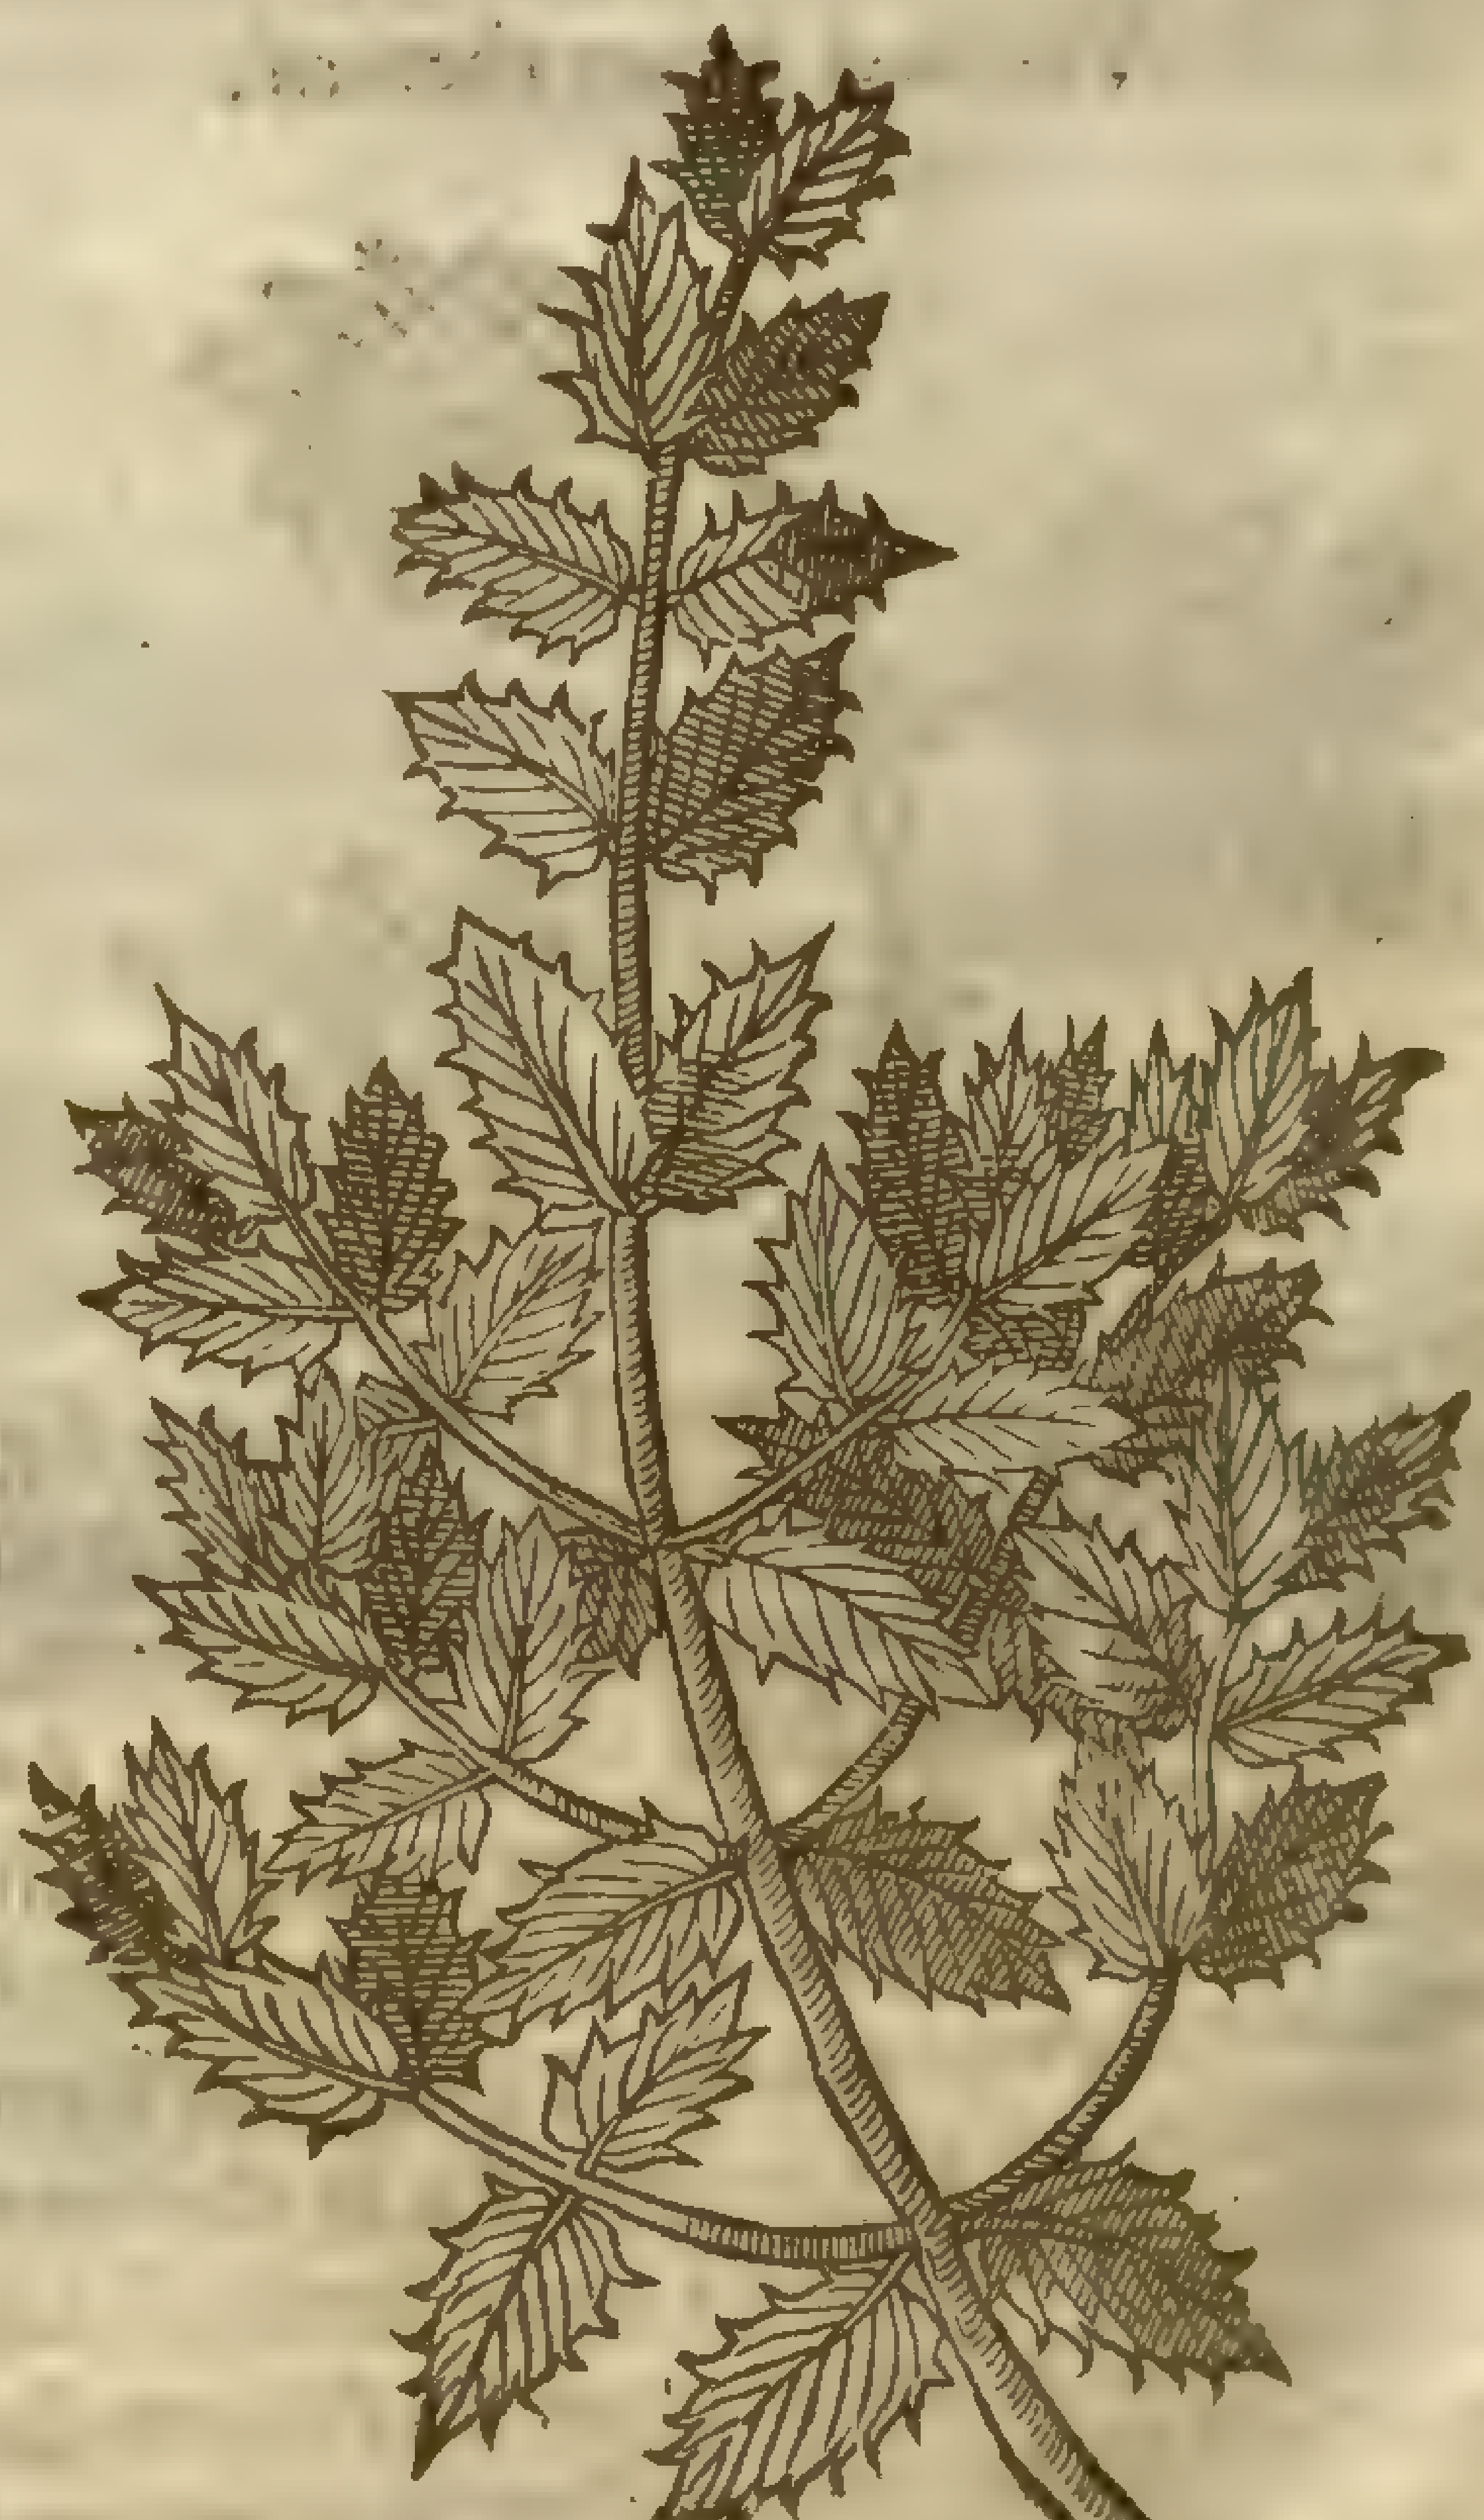
Novemb. 7. 1632. I being with Mr *Iob Beſt* at the Trinity houſe in Ratcliffe, among other rarities hee ſhewed me a dry plant hereof, which I heedfully obſerued, and carefully opening out ſome of the broadeſt leaues, which (as alſo the whole plant beſides) were careleſly dried, I found the leaues grew vſually ſome dozen or more on a foot-ſtalke, iuſt as many on one ſide as on the other; & they were couered ouer with a little downineſſe, which ſtanding out on their edges made them looke as if they had bin ſnipt about the edges, which they were not: alſo I found at euery ioint two little hooked prickles, & not two little leaues or appendices at the ſetting on of the foot-ſtalks, but 3 or foure little leaues, as the rudiment of a young branch, comming forth at the boſome of each foot-ſtalke: the longeſt branch (as far as I remember) was not aboue a ſpan long; I then drew as perfect a figure as I could of the perfecteſt branch thereof, drawing as neer as I could the leaues to their ful bigneſſe; the which I here preſent you withall. There are two figures formerly extant, the one this of *Cluſius*, which I here giue you; and the other in the 18 book & 144 chap. of the *hiſt. Lugd.* which is out of *Acoſta*, and this ſeemes to be ſo far different from that of *Cluſius*, that *Bauhine* in his *Pinax* ſaith, *Cluſius notis ſuis in Acoſtam diuerſam planè figuram propoſuit, herbam mimoſam nominans*: but he did not well conſider it, for if he had, he might haue found theſe ſo much different, thus farre to agree; they both make the branches prickly and weak; the leaues many on one rib, one oppoſit to another without any odd one at the end: but *Cluſius* figures the leaues ſo cloſe together that they ſeeme but one leafe, and *Acoſta* makes them too far aſunder, and both of them make them too ſharpe pointed. *Cluſius* made his to be taken from a dried plant, and *Acoſta* I iudge made his by the Idæa thereof which he had in his memory; and after this maner, if my iudgement faile me not, are moſt of the figures in him expreſt: but of this enough, if not too much.

CHAP. 8. *Of the Staffe-tree, and euer-greene Priuet.*

1 *Celaſtrus Theophraſti.*
The Staffe-tree.



2 *Phillyrea* 1. *Cluſ.*
Cluſius his firſt Mock-Priuet.



¶ *The Deſcription.*

1 THe hiſtorie and figure of this tree are ſet forth in *Cluſius* his *Curæ Poſt.* and there it is aſſerted to be κήλαστρος or κήλαστρον of *Theophraſtus*; for by diuers places in *Theophraſtus* there collected, it is euident, that his *Celaſtus* was euer greene, grew vpon very high and cold mountains, yet might be tranſplanted into plain and milder places; that it floured exceeding late and could not perfect the fruit by reaſon of the nigh approch of Winter, and that it was fit for no other vſe but to make ſtaues for old men.

Now this tree growes but to a ſmall height, hauing a firme and hard body, diuiding it ſelf at the top into ſundry branches, which being yong are couered with a green bark, but waxing old, with a browniſh one; it hath many leaues growing alwaies one againſt another, and thicke together, of a deep ſhining green aboue, and lighter vnderneath, keeping their verdure both winter and ſummer: they are of the bignes of thoſe of *Alaternus*, not ſnipt about the edges, but only a little nickt, when they are yet yong: at the top of the tendereſt branches among the leaues, vpon footſtalkes of ſome inch long, grow fiue or ſix little floures, conſiſting commonly of fiue little leaues of a yellowiſh green colour, and theſe ſhew themſelues in the end of Autumne or the beginning of winter, and alſo in the beginning of the Spring; but if the Summer be cold and moiſt, it ſhewes the buds of the floures in October. The fruit growes on a ſhort ſtalke, and is a berry of the bigneſſe of a myrtle, firſt green, then red of the colour of that of Aſparagus, and laſtly blacke when it is withered: the ſtone within the berry is little and as it were three cornered, containing a kernell couered with a yellow filme. Where this growes wild I know not, but it was firſt taken notice of in the publique garden at the Vniuerſitie of Leyden, from whence it was brought into ſome few gardens of this Kingdome.

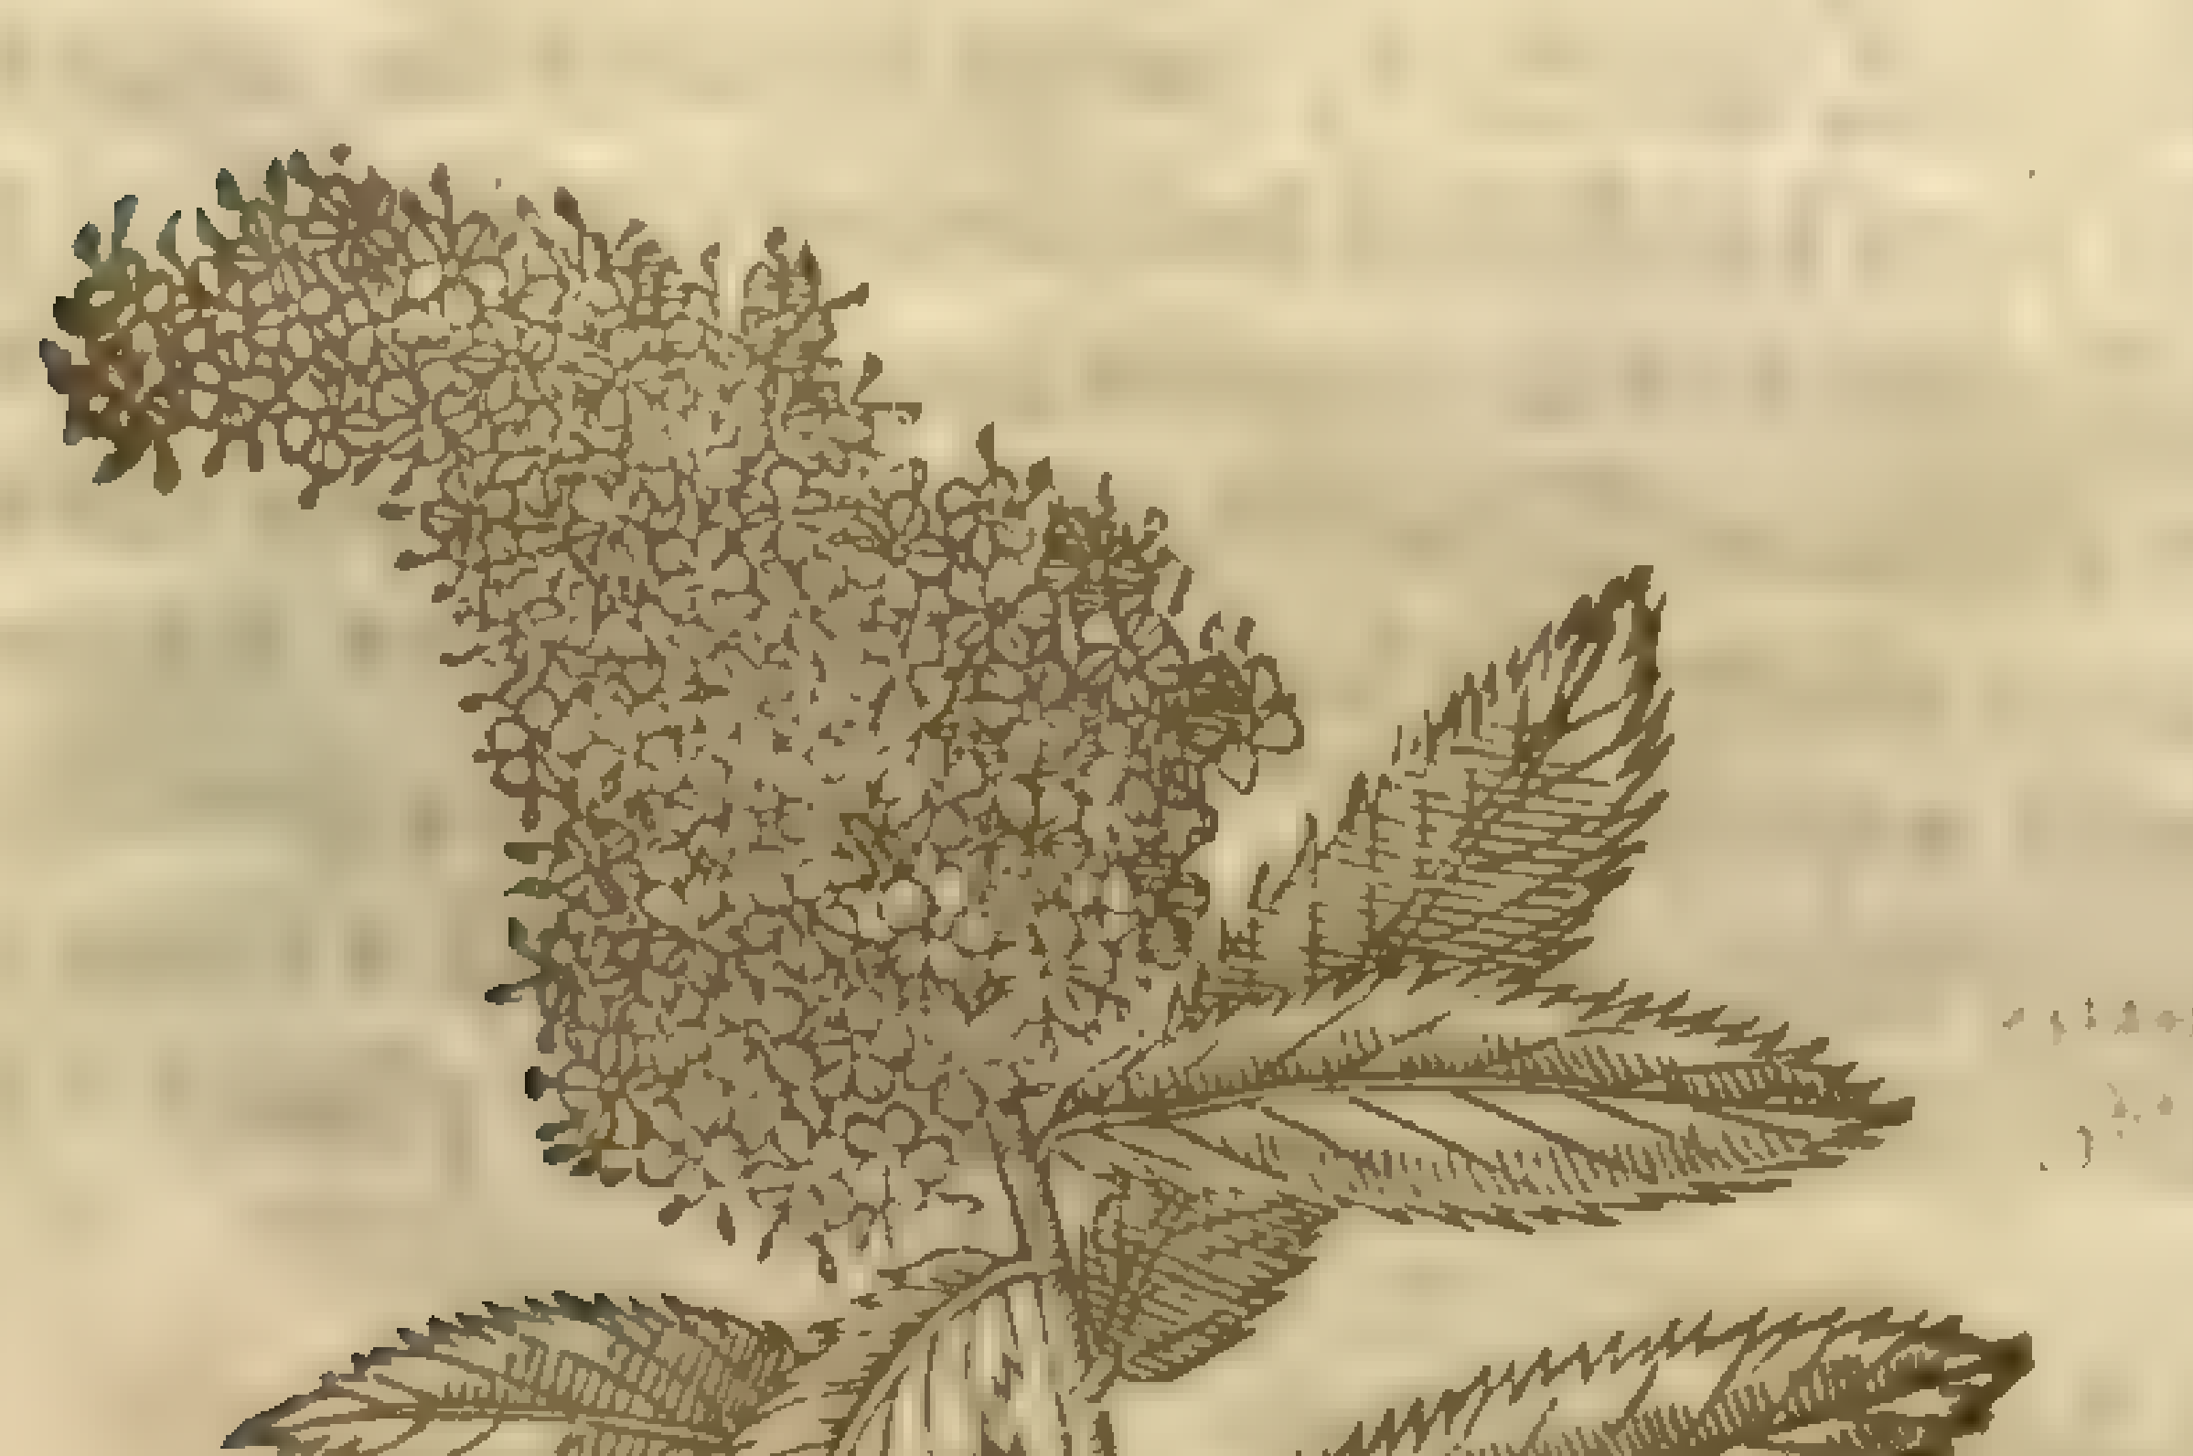
2 The firſt *Phyllyria* of *Cluſius* may fitly be referred to the reſt of the ſame Tribe and name, deſcribed formerly, *Lib.3. Cap.59.* It growes ſomewhat taller than the Skarlet Oke, and hath branches of the thickneſſe of ones thumbe and ſomewhat more, and thoſe couered with a greene barke marked with whitiſh ſpots: the leaues ſomewhat reſemble thoſe of the Skarlet Oke, but greater, greener, thicker, ſomewhat prickly about the edges, of an aſtringent taſt, but not vngratefull. The floure thereof *Cluſius* did not ſee: the fruit is a little blacke berry, hanging downe out from the boſome of the leaues, and containing a kernel or ſtone therein. It growes wild in many places of Portugal, where they call it Azebo.

The temper and vertues are referred to thoſe ſet down in the formerly mentioned chapter.

Spiraea salicifolia L. [illegible]

CHAP. 9. *Of Mock-Willow.*

Speirai Theophraſti, Cluſ.
Mock-Willow.



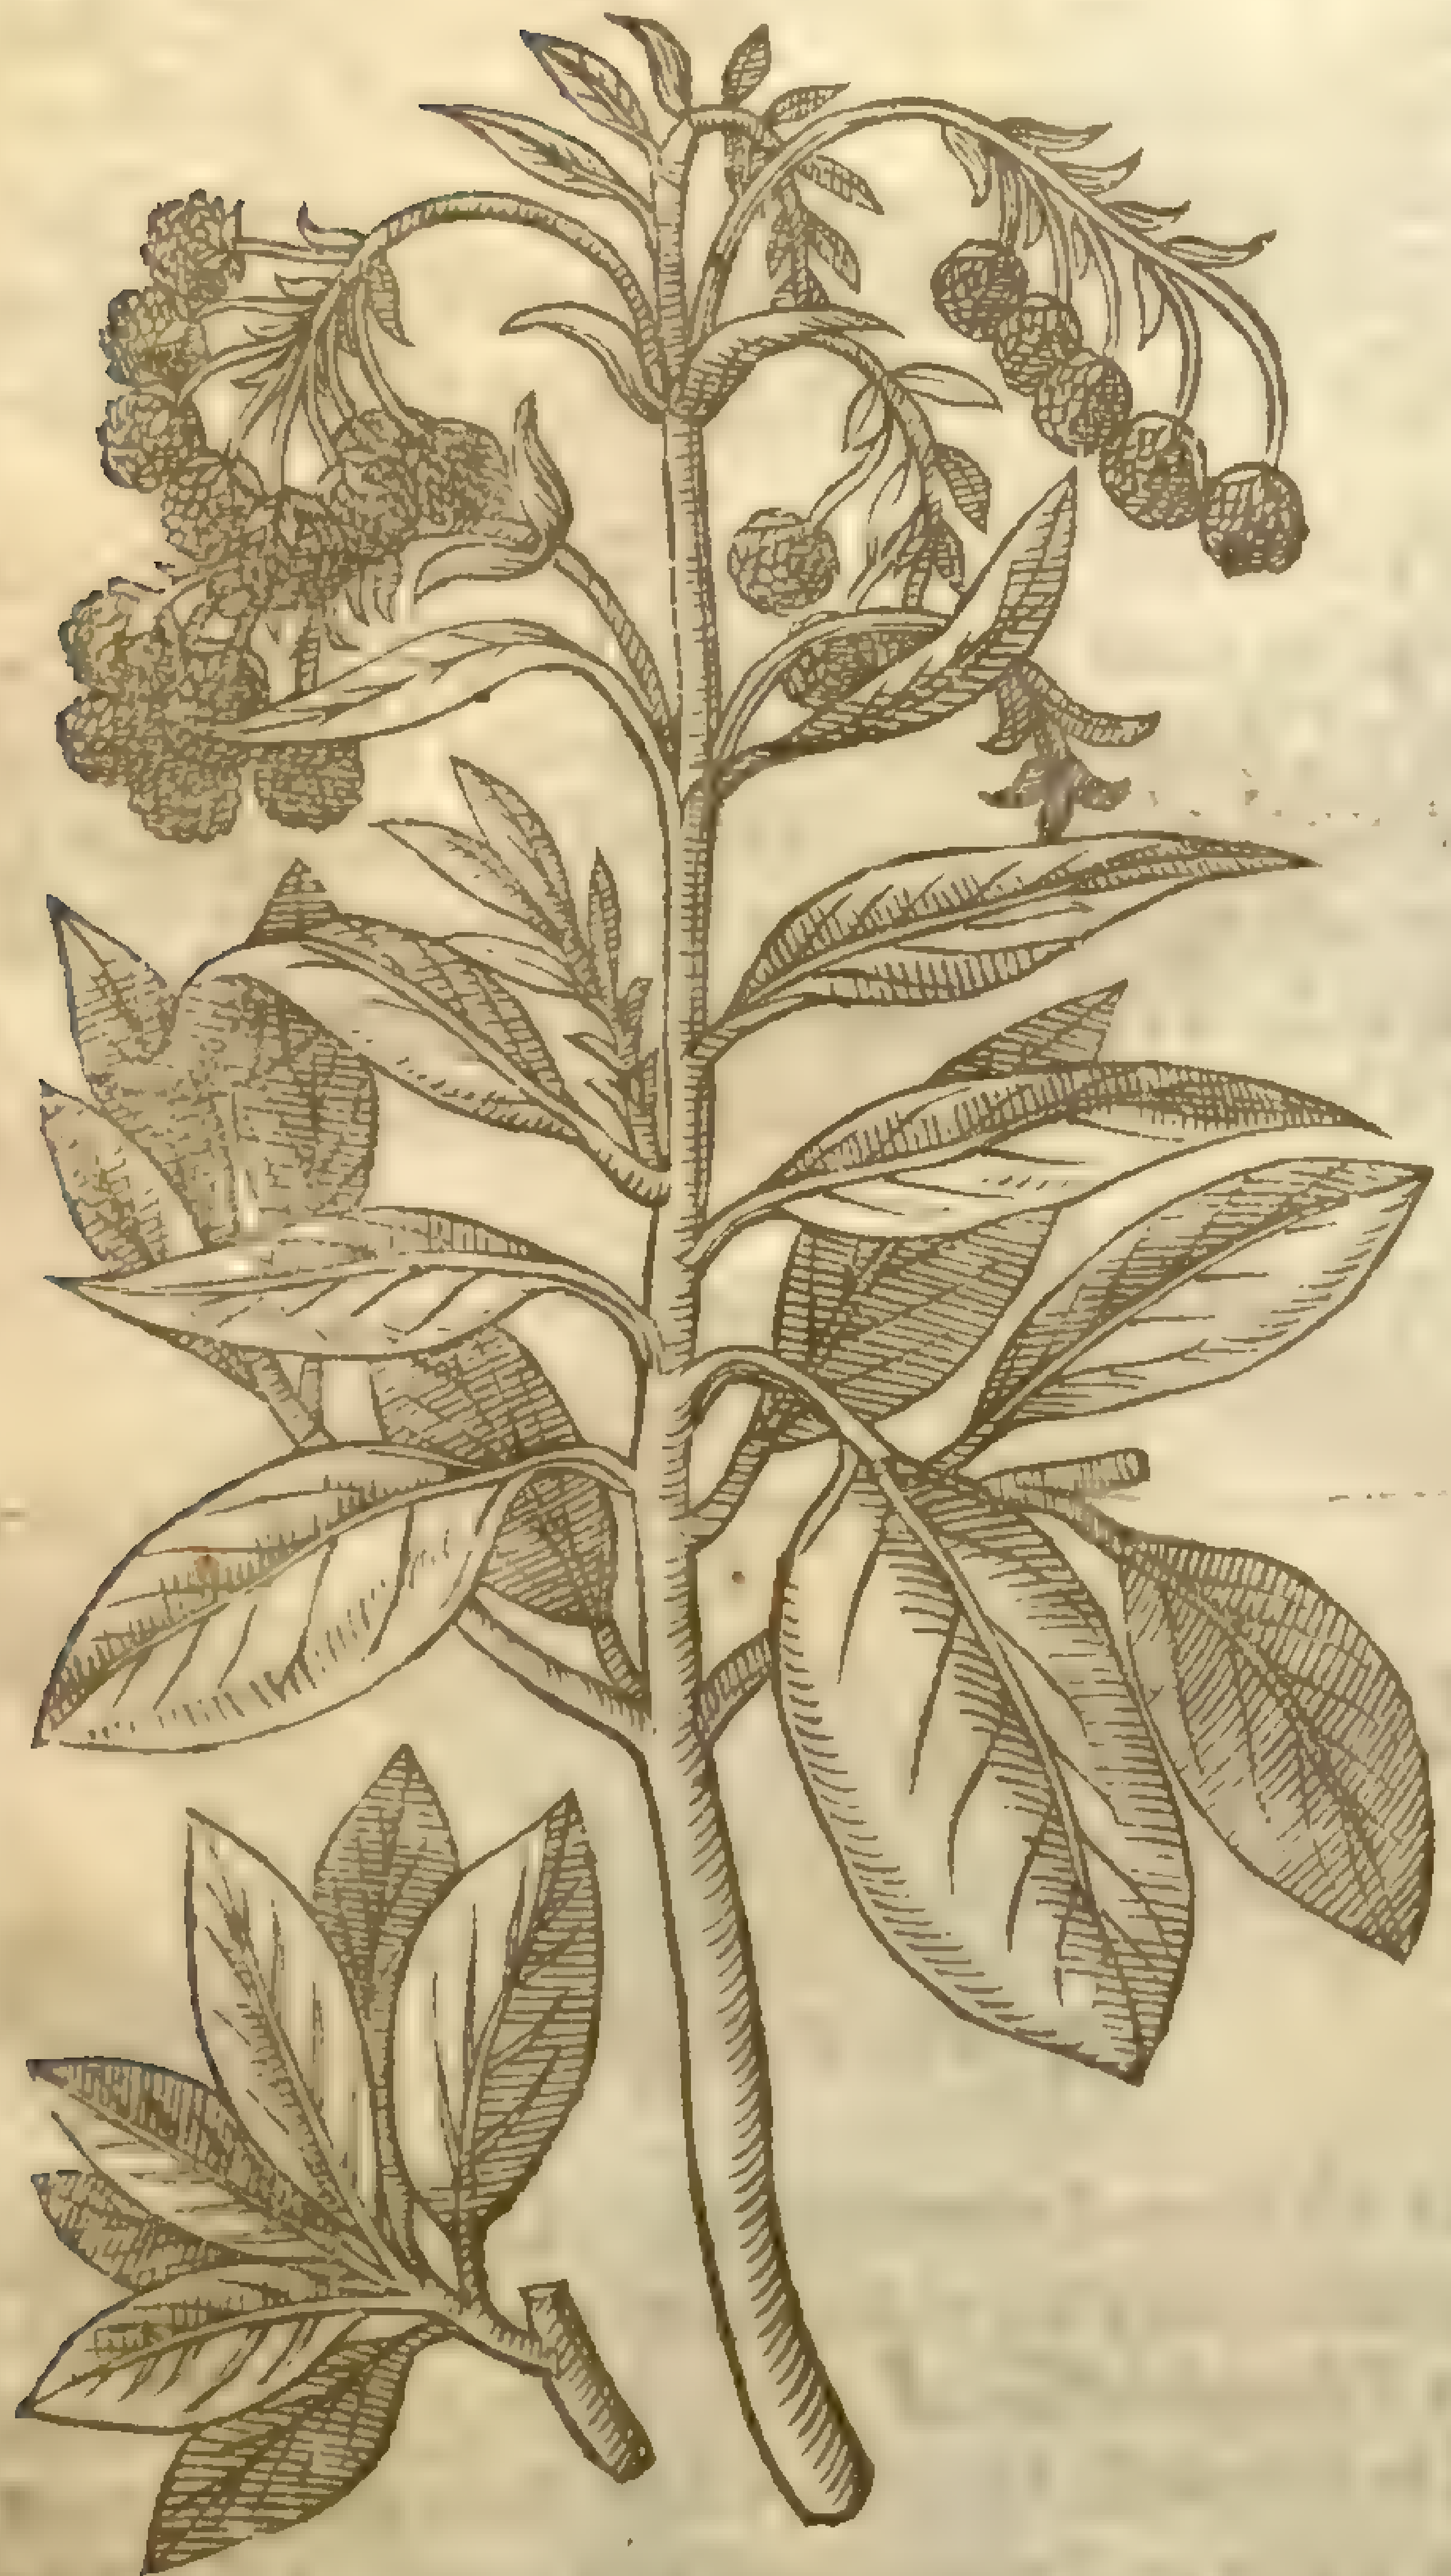
¶ *The Deſcription.*

THis Willow-leaued ſhrub, which *Cluſius* conjectures may be referred to the *Speiræa* mentioned by *Theophraſtus lib.1.cap.23.hiſt.plant.* I haue named in Engliſh, Mock-willow; how fitly I know not, but if any will impoſe a fitter name, I ſhall be well pleaſed therewith. But to the thing it ſelf. It is a ſhrub (ſaith *Cluſius*) ſome two cubits high, hauing ſlender branches or twigs couered ouer with a reddiſh barke, whereon grow many leaues without order, long, narrow, like thoſe of the Willow, ſnipt about the edges, of a light greene aboue, and of a blewiſh green vnderneath, of a drying taſt conjoined with ſome bitterneſſe. The tops of the branches for ſome fingers length carry thicke ſpikes of ſmall floures cluſtering together, and conſiſting of fiue leaues apiece; out of whoſe middle come forth many little leaues of a whitiſh red or fleſh colour, together with the floure, hauing no peculiar ſmell, but ſuch as is in the floure of the Oliue tree: theſe floures fading, there ſucceed ſmall fiue cornered heads,which comming to full maturitie contain a ſmall & yellowiſh duſty ſeed:it ſlours in Iuly, and ripens the ſeed in the end of Auguſt. *Cluſius* had this plant from *Fredericke Sebizius* Phyſition to the duke of Briga,and that from Briga in Sileſia,and hee (as I ſaid) referreth it to the Στειβεία of *Theophraſtus*,which he reckons among the ſhrubs that carry ſpike-faſhioned floures.

This is not vſed in medicine,nor the temperature and faculties thereof as yet known.

Chap. 10. *Of the Strawberry Bay.*

Adrachne Theophraſti.
The Strawberry Bay.



¶ *The Deſcription.*

THe figure and hiſtorie of this was ſent by *Honor. Bellus* out of Candy to *Cluſius*, from whom I haue it. It is that which *Theophraſtus* calleth *Adrachne* or (as moſt of the printed books haue it) *Andrachne*: but the former ſeems the righter,and is the better liked by *Pliny*, *Lib.* 13. *cap.*22. At this day in Candy where it plentifully growes, it is called *Adracla*. It is rather a ſhrub than a tree,delighting in rocky and mountainous places,and keeping greene Winter and Summer, hauing leaues ſo like thoſe of Bayes, that they are diſtinguiſhable only by the ſmell, which theſe are deſtitute of. The barke of the bole and all the branches is ſo ſmooth, red, and ſhining,that they ſhew like branches of Coral; this barke crackes or breaks off in Summer, and pills off in thin fleakes; at which time it is neither red nor ſhining,but in a mean betweene yellow and aſh-colour. It hath floures twice in the yeare like as the *Arbutus* or Strawberry tree, and that ſo like it, that you can ſcarſe know the one from the other, yet this differs from it in that it groweth onely in the mountaines, hath not the leaues jagged, neither a rough barke: the wood hereof is very hard,and ſo brittle that it will not bend,and they vſe it to burn and to make whorls for their womens ſpindles. *Theophraſtus* reckons vp this tree amongſt thoſe which dye not when their barks are taken off, and are alwaies greene, and retaine their leaues at their tops all Winter long: which to be ſo *Honorius Bellus* obſerued. *Bellonius* alſo obſerued this tree in many places of Syria.

The fruit in temperature,as in ſhape,is like that of the Strawberry tree.

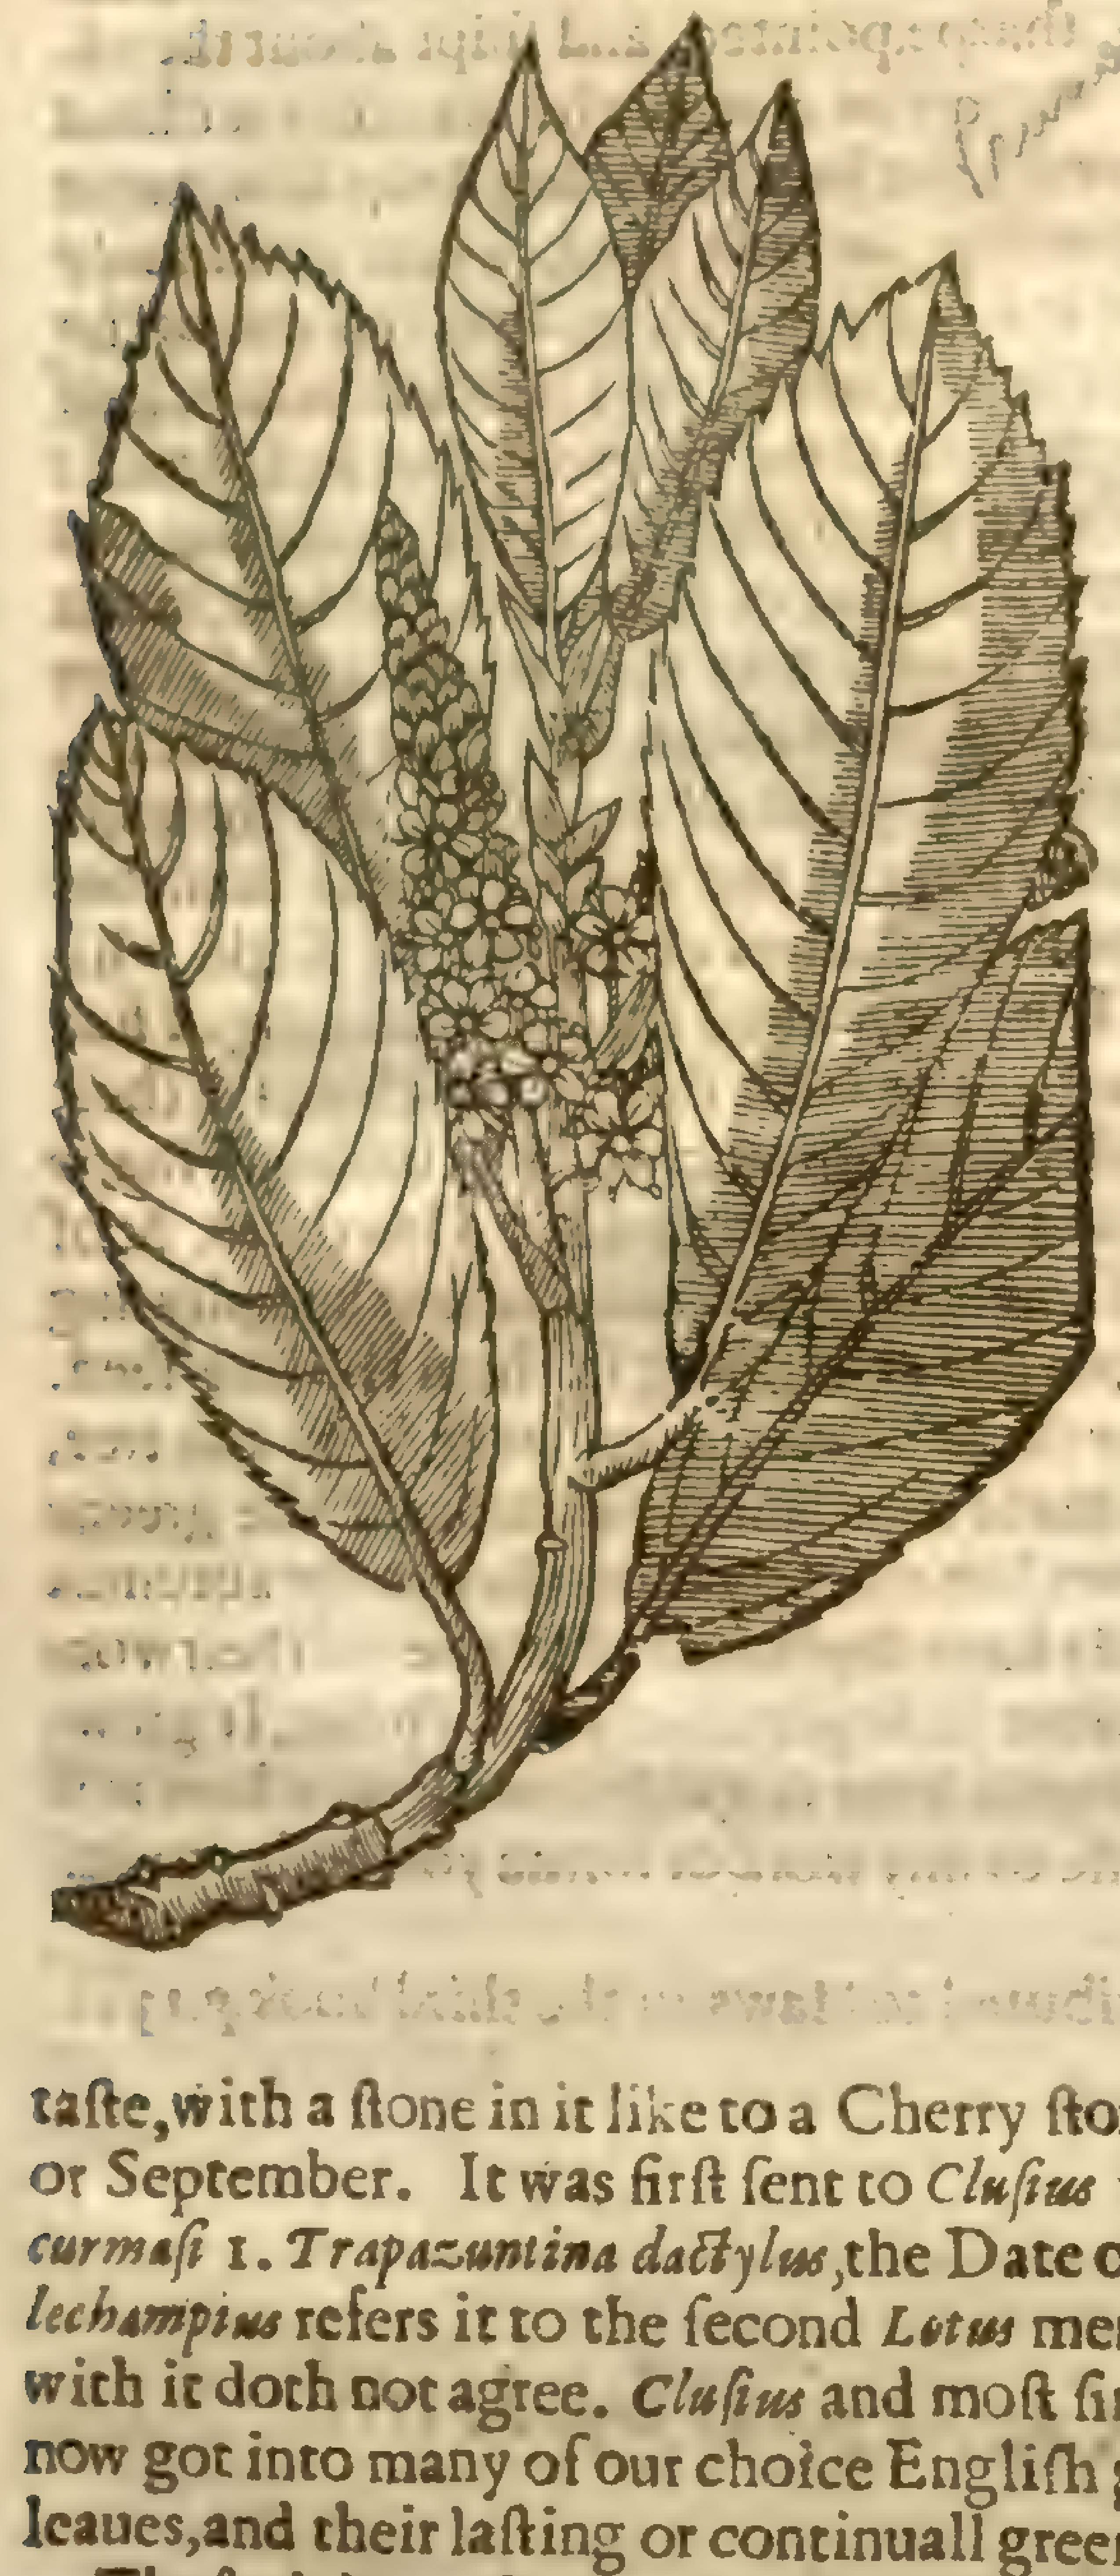
Chap. 11. *Of the Cherry Bay.*

¶ *The Deſcription.*

THe Chery-bay is one of the euer-greene trees:it riſes vp to an indifferent height,& is diuided into ſundry branches couered ouer with a ſwart green bark:that of the yonger ſhoots is wholly greene.

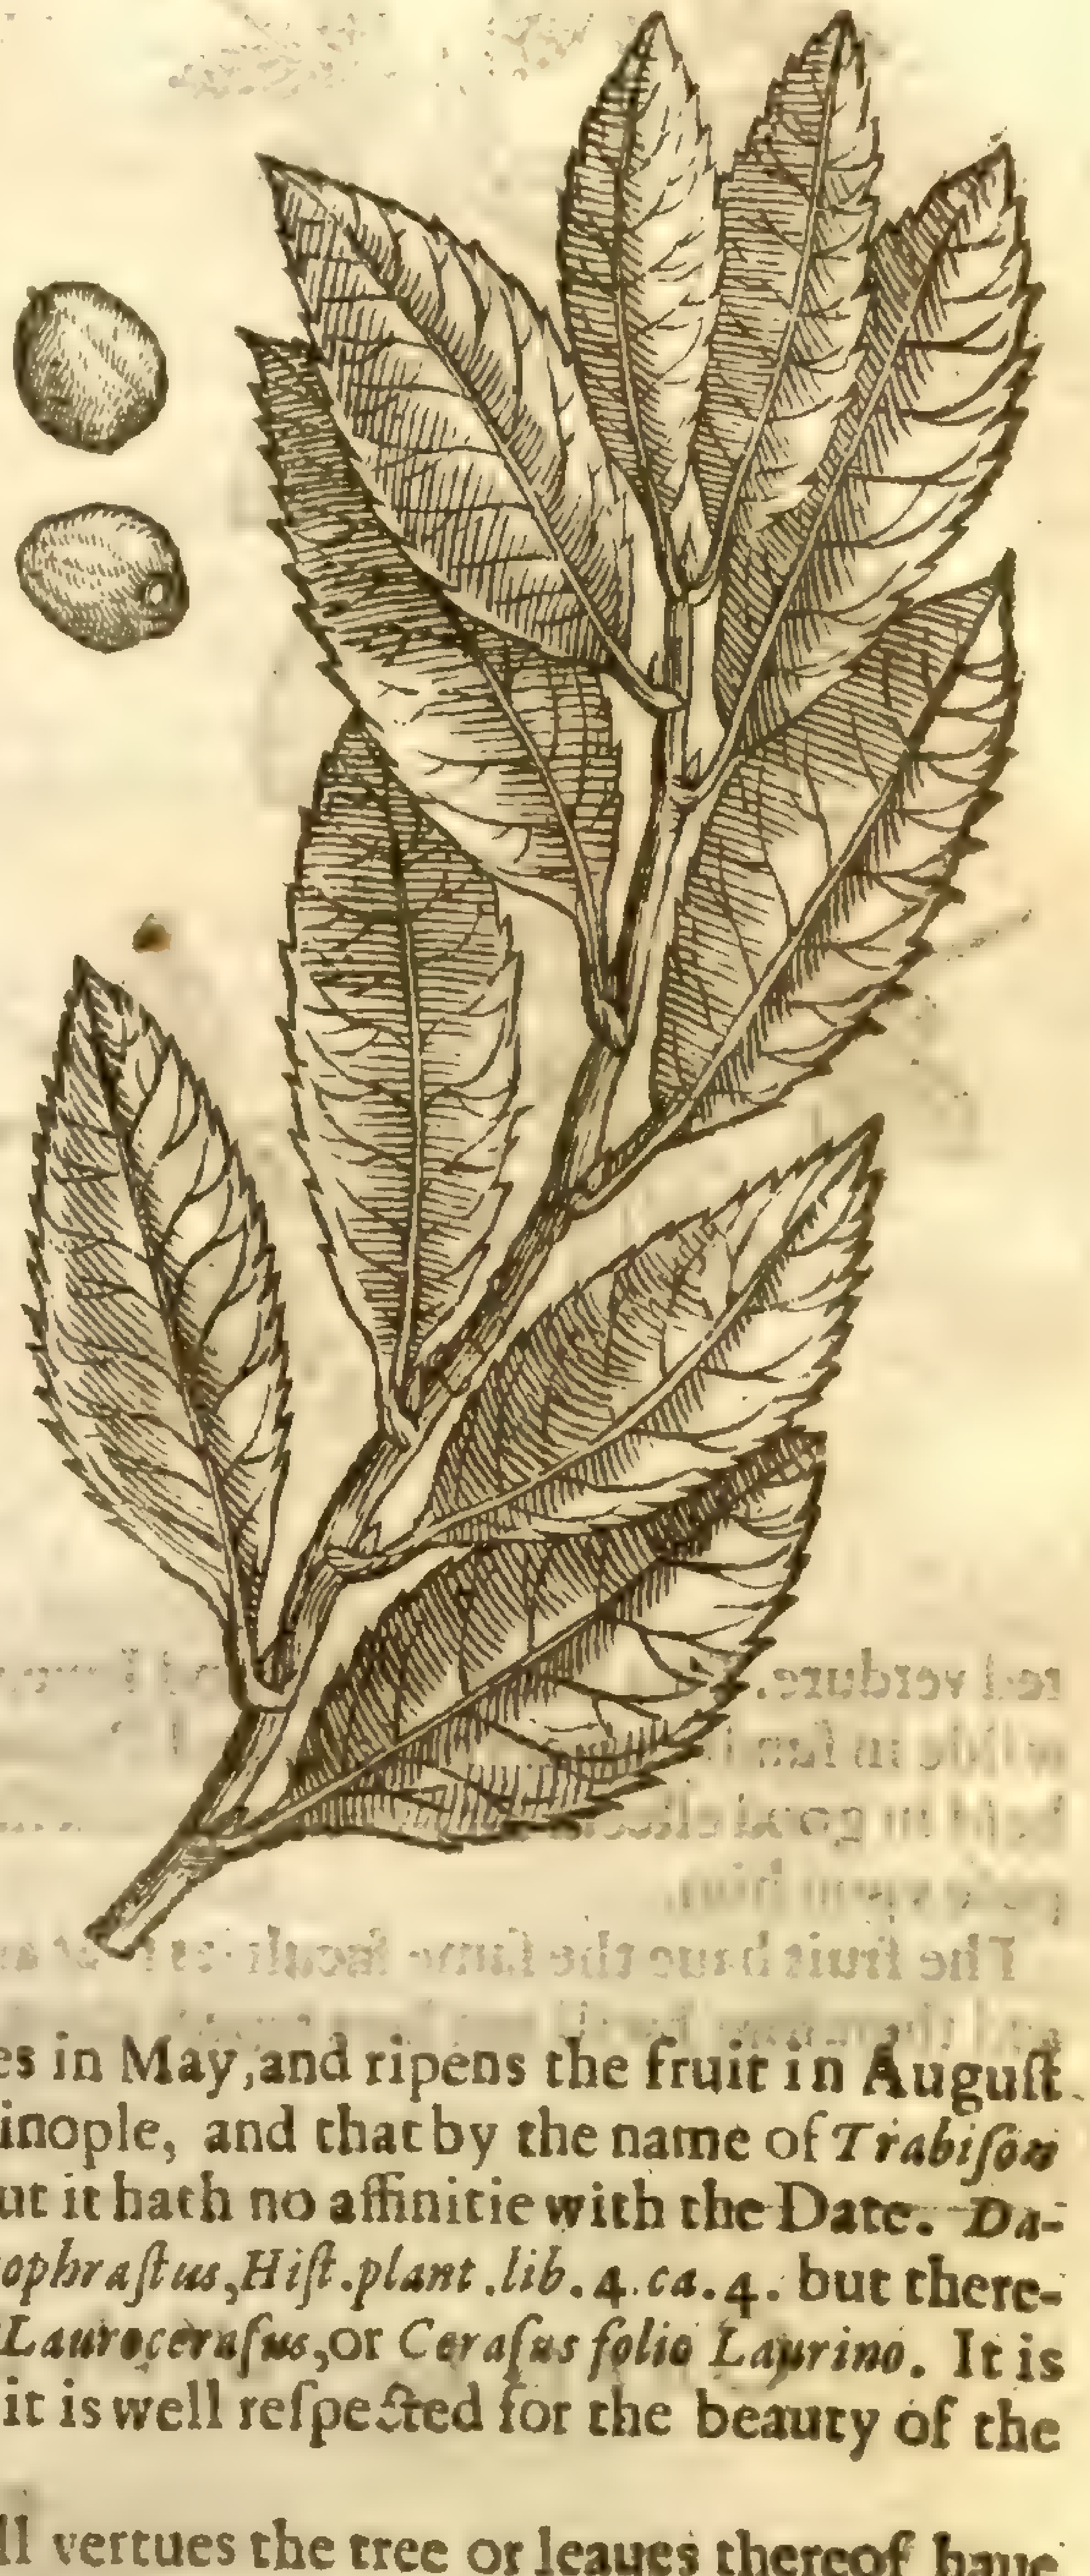
green, the leaues alternatly ingirt the branches, and they are long, ſmooth, thick, greene & ſhining, ſnipt alſo lightly about the edges: when the tree is grown to ſome height, at the tops of the branches amongſt the leaues of the former years growth, vpon a ſprig of ſome fingers length it putteth forth a great many little white floures conſiſting of fiue leaues a piece, with many little chiues in them. Theſe floures quickly fall away, and the fruit that ſucceeds them is a berry of an oval figure, of the bigneſſe of a large Cherry or Damſon, and of the ſame colour, and of a ſweet and pleaſant

Lauroceraſi flos.
The Cherry-bay in floure.



Prunus Laurocerasus [illegible]

Lauroceraſi fructus.
The Cherry-bay with the fruit.



taſte, with a ſtone in it like to a Cherry ſtone. This floures in May, and ripens the fruit in Auguſt or September. It was firſt ſent to *Cluſius* from Conſtantinople, and that by the name of *Trabiſon curmaſi* I. *Trapazuntina dactylus*, the Date of Trapezon; but it hath no affinitie with the Date. *Dalechampius* refers it to the ſecond *Lotus* mentioned by *Theophraſtus, Hiſt. plant. lib.* 4. *ca.* 4. but therewith it doth not agree. *Cluſius* and moſt ſince call it fitly *Lauroceraſus*, or *Ceraſus folio Laurino*. It is now got into many of our choice Engliſh gardens, where it is well reſpected for the beauty of the leaues, and their laſting or continuall greenneſſe.

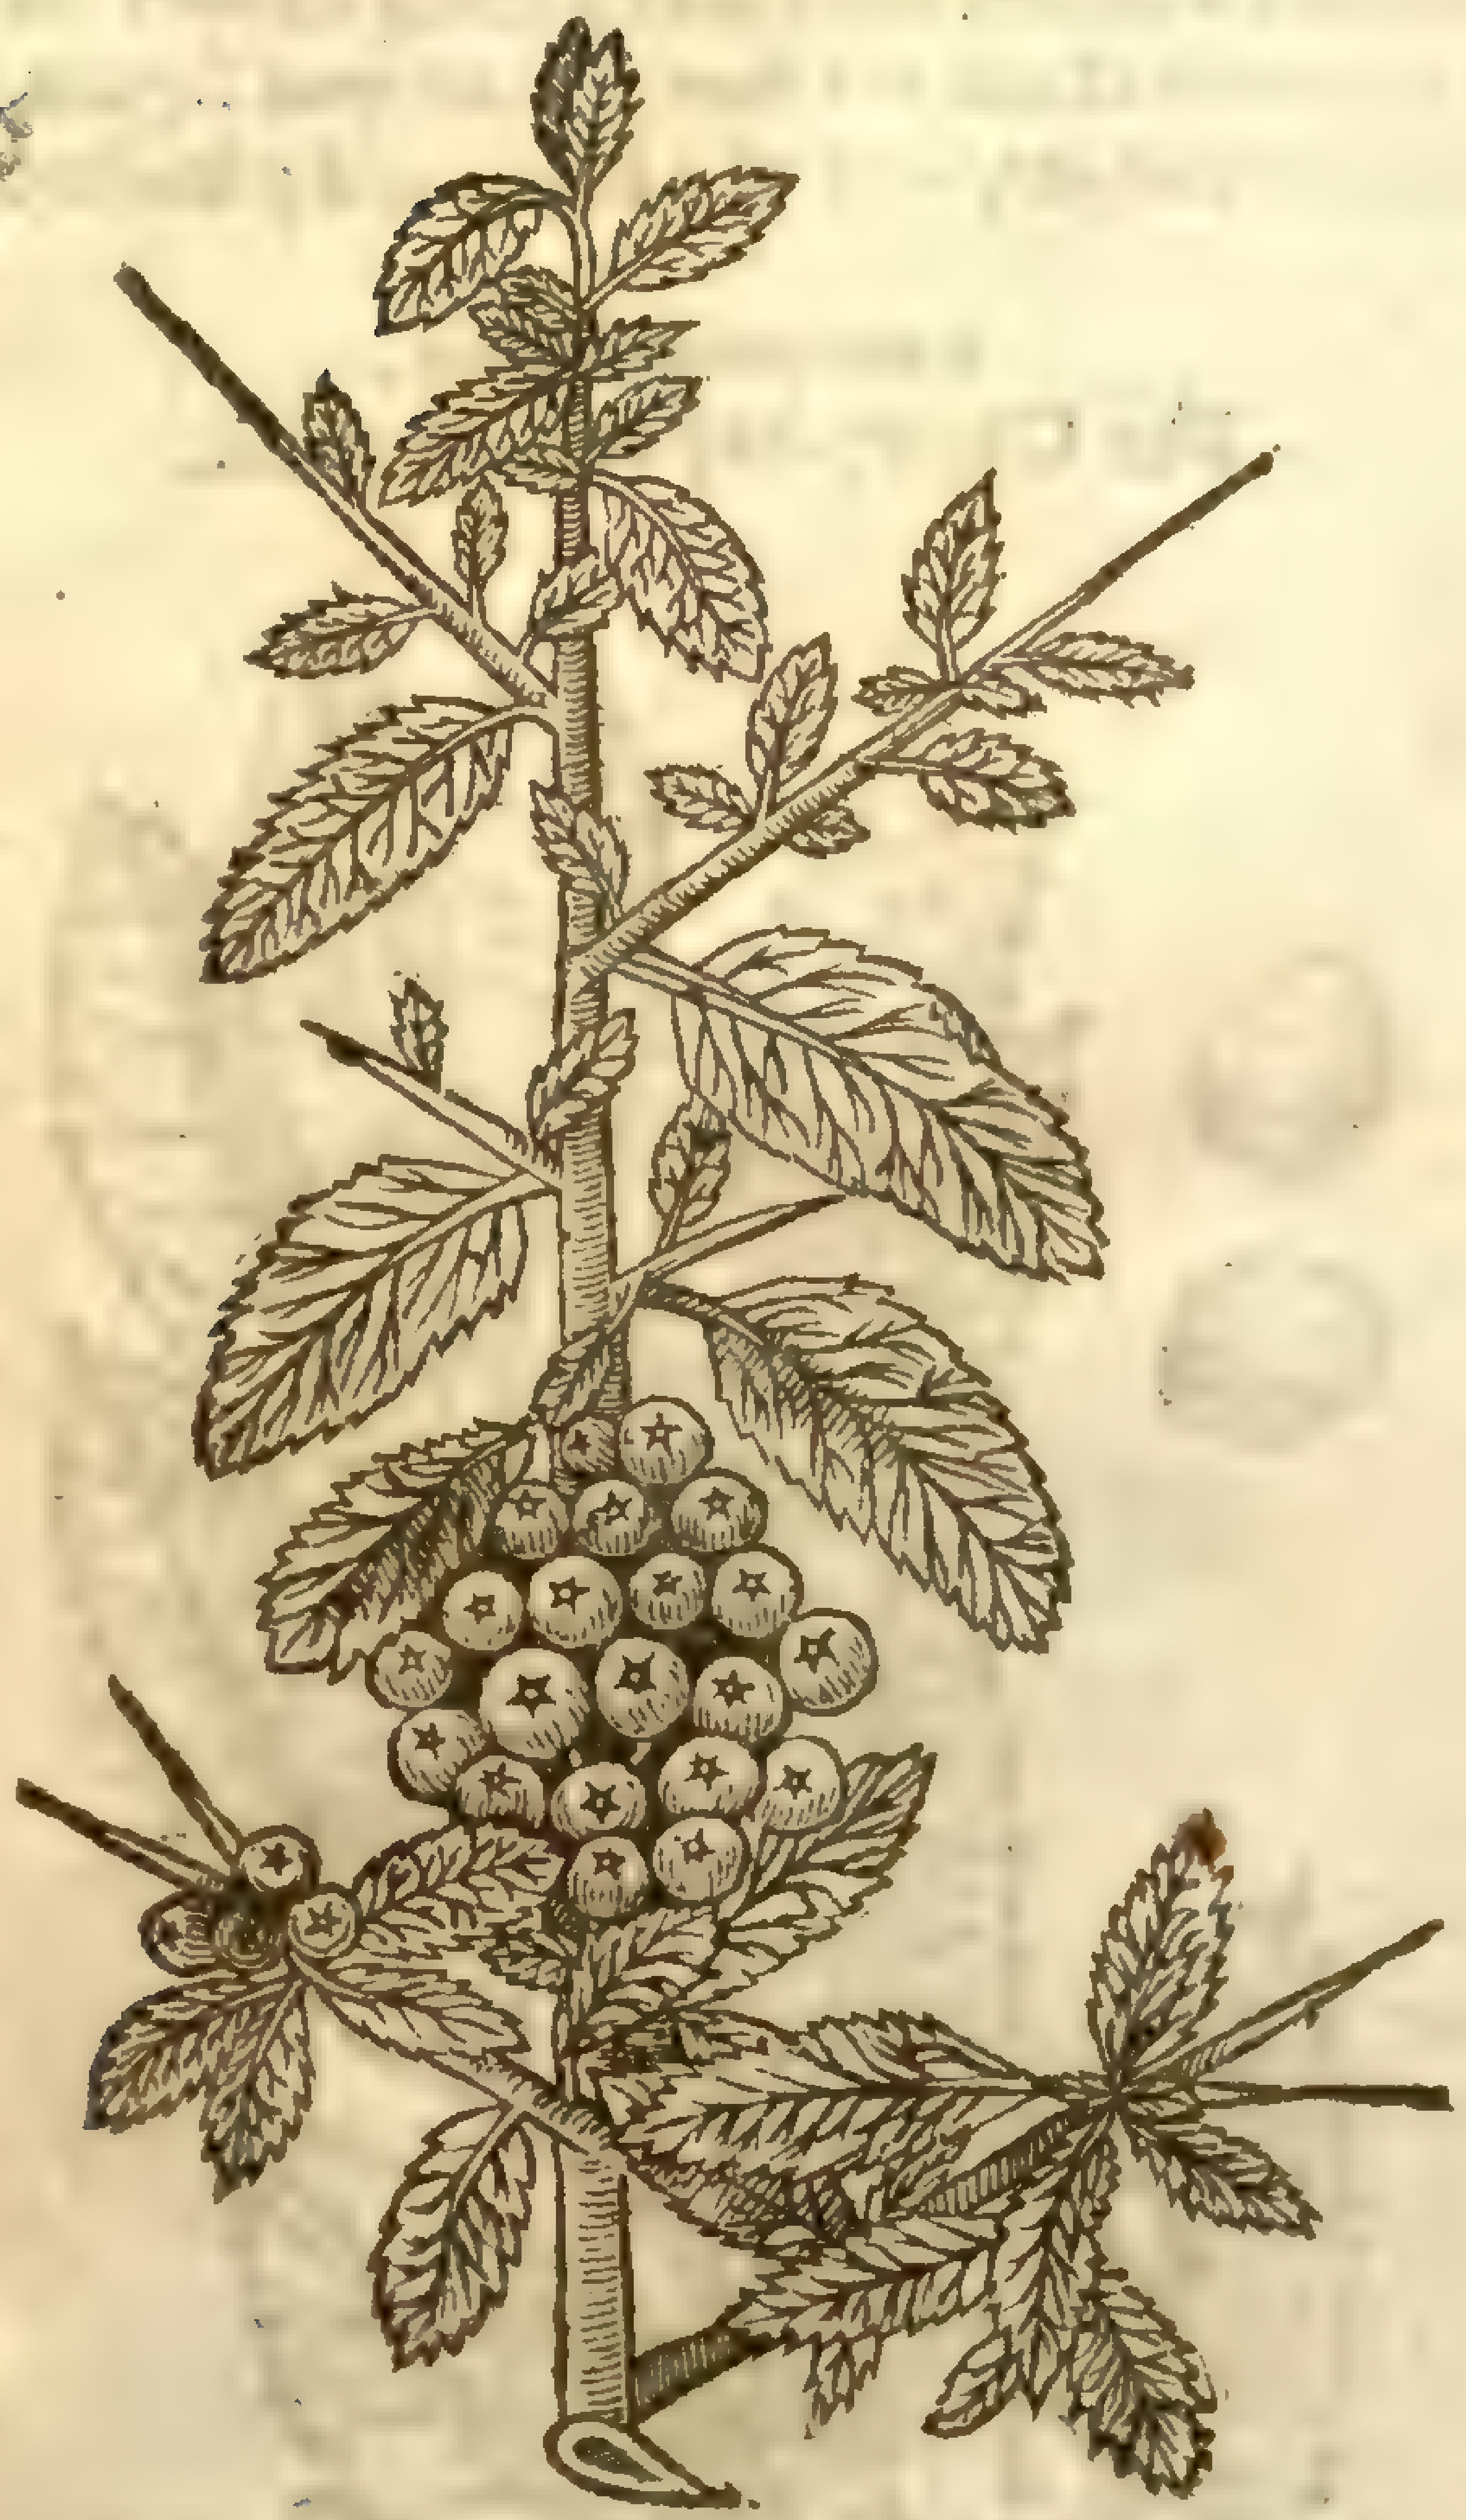
The fruit hereof is good to be eaten, but what phyſicall vertues the tree or leaues thereof haue it is not yet knowne.

CHAP. 12. *Of the euer-greene Thorne.*

THis plant, which *Lobel* and ſome other late Writers haue called by the name of *Pyracantha*, is the *Oxyacantha* mentioned by *Theophraſtus, lib.* 1. *cap.* 15. *lib.* 3. *cap.* 4. *hiſt. plant.* amongſt the euer-green trees; and I thinke rather this than our white Thorn to be the *Oxyacantha* of *Dioſcorides, lib.* 1. *ca.* 123. And certainly it was no other than this Thorn which *Virgil* mentioneth by name of *Acanthus, lib.* 2. *Georg.* in theſe words, *Et baccthas ſemper frondentis Acanthi*: That is, And the berries of the E're-green Thorn,

Oxyacantha Theophraſti.
The euer-green Thorne.

Meſpilus pyracantha, L.
[illegible]



¶ *The Deſcription.*

THis grows vp like a buſh, vnles you keep it with pruning, and then it will in time grow to the height of a ſmall tree, as the Hawthorne, whereto it is of affinitie, for the wood is white and hard, like it, and couered ouer with the like barke; but the leaues are ſomewhat like thoſe of the Damſon tree, longiſh, ſharpe pointed, and ſnipt about the edges: they grow alongſt the branches, without any order, yet ſomtimes they keep this maner of growing, at each knot, where commonly there is a ſharp prickle, growes out one of the larger leaues, which may be ſome inch & half long, & ſome three quarters of an inch broad: then vpon the prickle & at the comming out thereof are three or foure, more or leſſe, much ſmaller leaues: now theſe leaues are of a faire & ſhining green aboue, but paler vnderneath, and they keepe on all the yeare. At the ends and oft times in the middle of the branches come forth cluſters of vmbels of little whitiſh Bluſh-coloured floures conſiſting of fiue leaues apiece, with ſome little chiues in their middls: then follow cluſters of beries, in ſhape taſt and bignes like thoſe of Hawthorn, & of the ſame, but much more orient and pleaſing colour, and containing in them the like ſeed. Now theſe berries hang long vpon the tree, and make a gallant ſhew amongſt the greene leaues, but chiefely then when as the autumne blaſts haue depriued other trees of their wonted verdure. This flours in May and Iune, and ripens the fruit in September and October. It grows wilde in ſundry places of Italy and Province in France, but is kept in gardens with vs, where it is held in good eſteem for his euer-greeneſſe and pliableneſſe to any work or forme you deſire to impoſe vpon him.

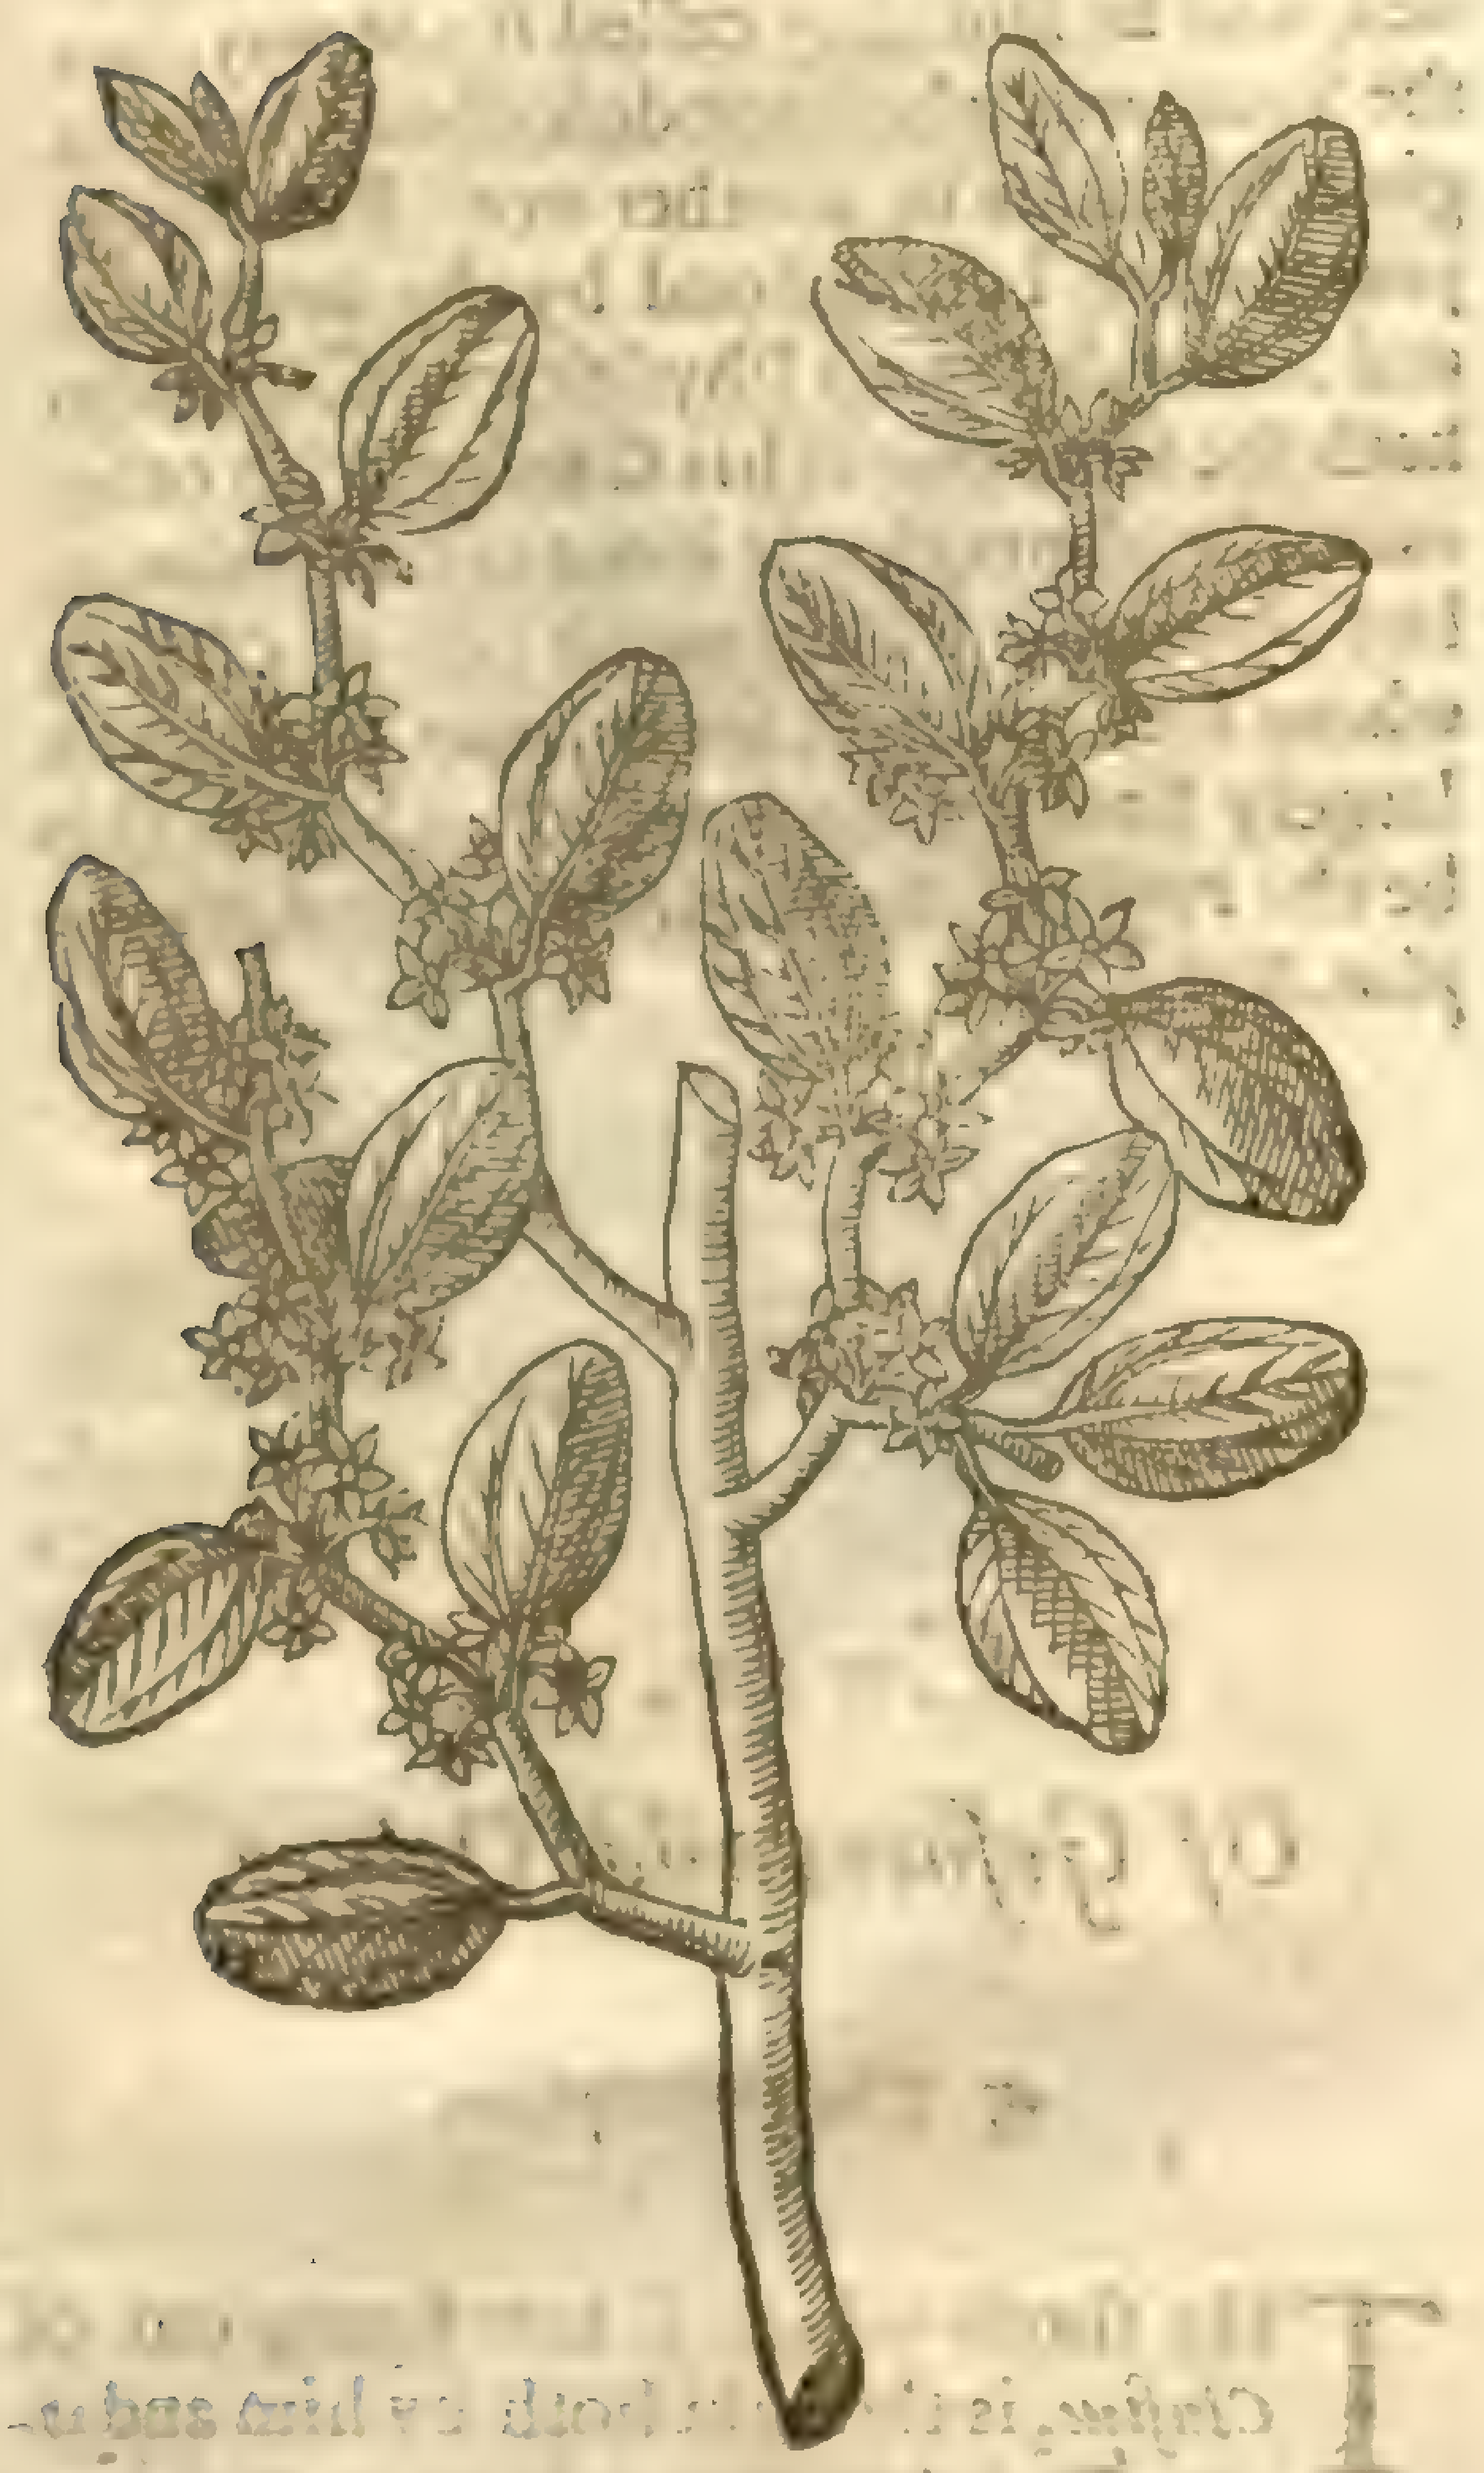
The fruit haue the ſame faculties that are formerly attributed to Haws, in the third book, *p.* 1328. and therefore I will not here repeat them.

CHAP. 13. *Of the Egyptian Nap, or great Iujube tree.*

¶ *The Deſcription.*

THis tree, which for his leaues and manner of growing I thinke may fitly be referred to the Iujubes tree, is of two ſorts, that is, the one prickly, and the other not prickly, in other reſpects they are both alike, ſo that one figure and hiſtory may ſerue for them both; which I will giue you out of *Cluſius*, who receiued this figure together with a deſcription thereof from *Honorius Bellus*, and alſo added thereto that which *Proſper Alpinus* hath written of it, *cap.* 5. *de plant. Ægypt.* It grows to the height of an indifferent Pear tree, and the body and branches thereof are couered with a whitiſh aſh coloured barke: the leaues are like thoſe of the Iujubes tree, two inches long, & one broad, with three nerues running along them, of a deepe ſhining greene aboue, and more whitiſh vnderneath, and they grow alternately vpon the branches, and at their comming forth grow tufts of little white floures hanging vpon ſingle long foot-ſtalks: after theſe followes the fruit, like vnto a ſmall apple, of the bigneſſe for the moſt part of a large Cherry, and ſometimes as big as a Wallnut, of a ſweet taſt, containing therein a kernell or ſtone like that of an Olive. It beares fruit twice a yeare, for it hath ripe fruit both in the Spring and Fall; yet the vernal fruit ſeldom comes to good,

Oenoplia non ſpinoſa.
The great Iujubes tree.



[illegible] Spina [illegible] mile, [illegible]

by reaſon of the too much moiſture of the ſeaſon, which cauſes it to become worme-eaten. The Thorny kind is deſcribed by *Alpinus*, who rightly iudges it the *Connarus* of *Athenæus*, but the figure he giues is not very accurate. That which wants prickles growes (as well as the prickly one) in Ægypt and Syria, as alſo in the city Rhetimo in Candy, whither it was brought out of Syria.

The hiſtory of both theſe trees is in *Serapio*, by the name of *Sadar*: but he, according to his cuſtome confounds it with the *Lotus* of *Dioſcorides*, from which it very much differs. *Bellonius* in his ſecond booke, and 79. chap. of his Obſeruations, reckons vp *Napeca* amongſt the trees that are alwaies greene: which is true, in thoſe that grow in Egypt and Syria; but falſe in ſuch as grow in Candy. That tree in Ægypt and Syria is called *Nep*, or *Nap*. *Alpinus* calls it *Paliurus Athenæi*, or *Nabca Ægyptiorum*, thinking it (as I formerly ſaid) the *Connarus* mentioned in the 14. booke of *Athenæus*, his Deipnoſophiſts.

¶ *The Vertues out of Alpinus.*

A The fruit is of a cold and dry facultie, and the vnripe ones are frequently vſed to ſtrengthen the ſtomacke, and ſtop lasks: the juyce of them being for this purpoſe either taken by the mouth, or injected by clyſters: of the ſame fruit dried and macerated in water, is made an infuſion profitable againſt the relaxation and vlceration of the guts.

B The decoction or infuſion of the ripe dried fruit, is of a very frequent vſe againſt all peſtilent feuers: for they affirme that this fruit hath a wonderfull efficacie againſt venenate qualities, and putrifaction, and that it powerfully ſtrengthens the heart.

C Alſo the juyce of the perfectly ripe fruit is very good to purge choler forth of the ſtomacke and firſt veines: and they willingly vſe an infuſion made of them in all putride feuers to mitigate their heate or burning.

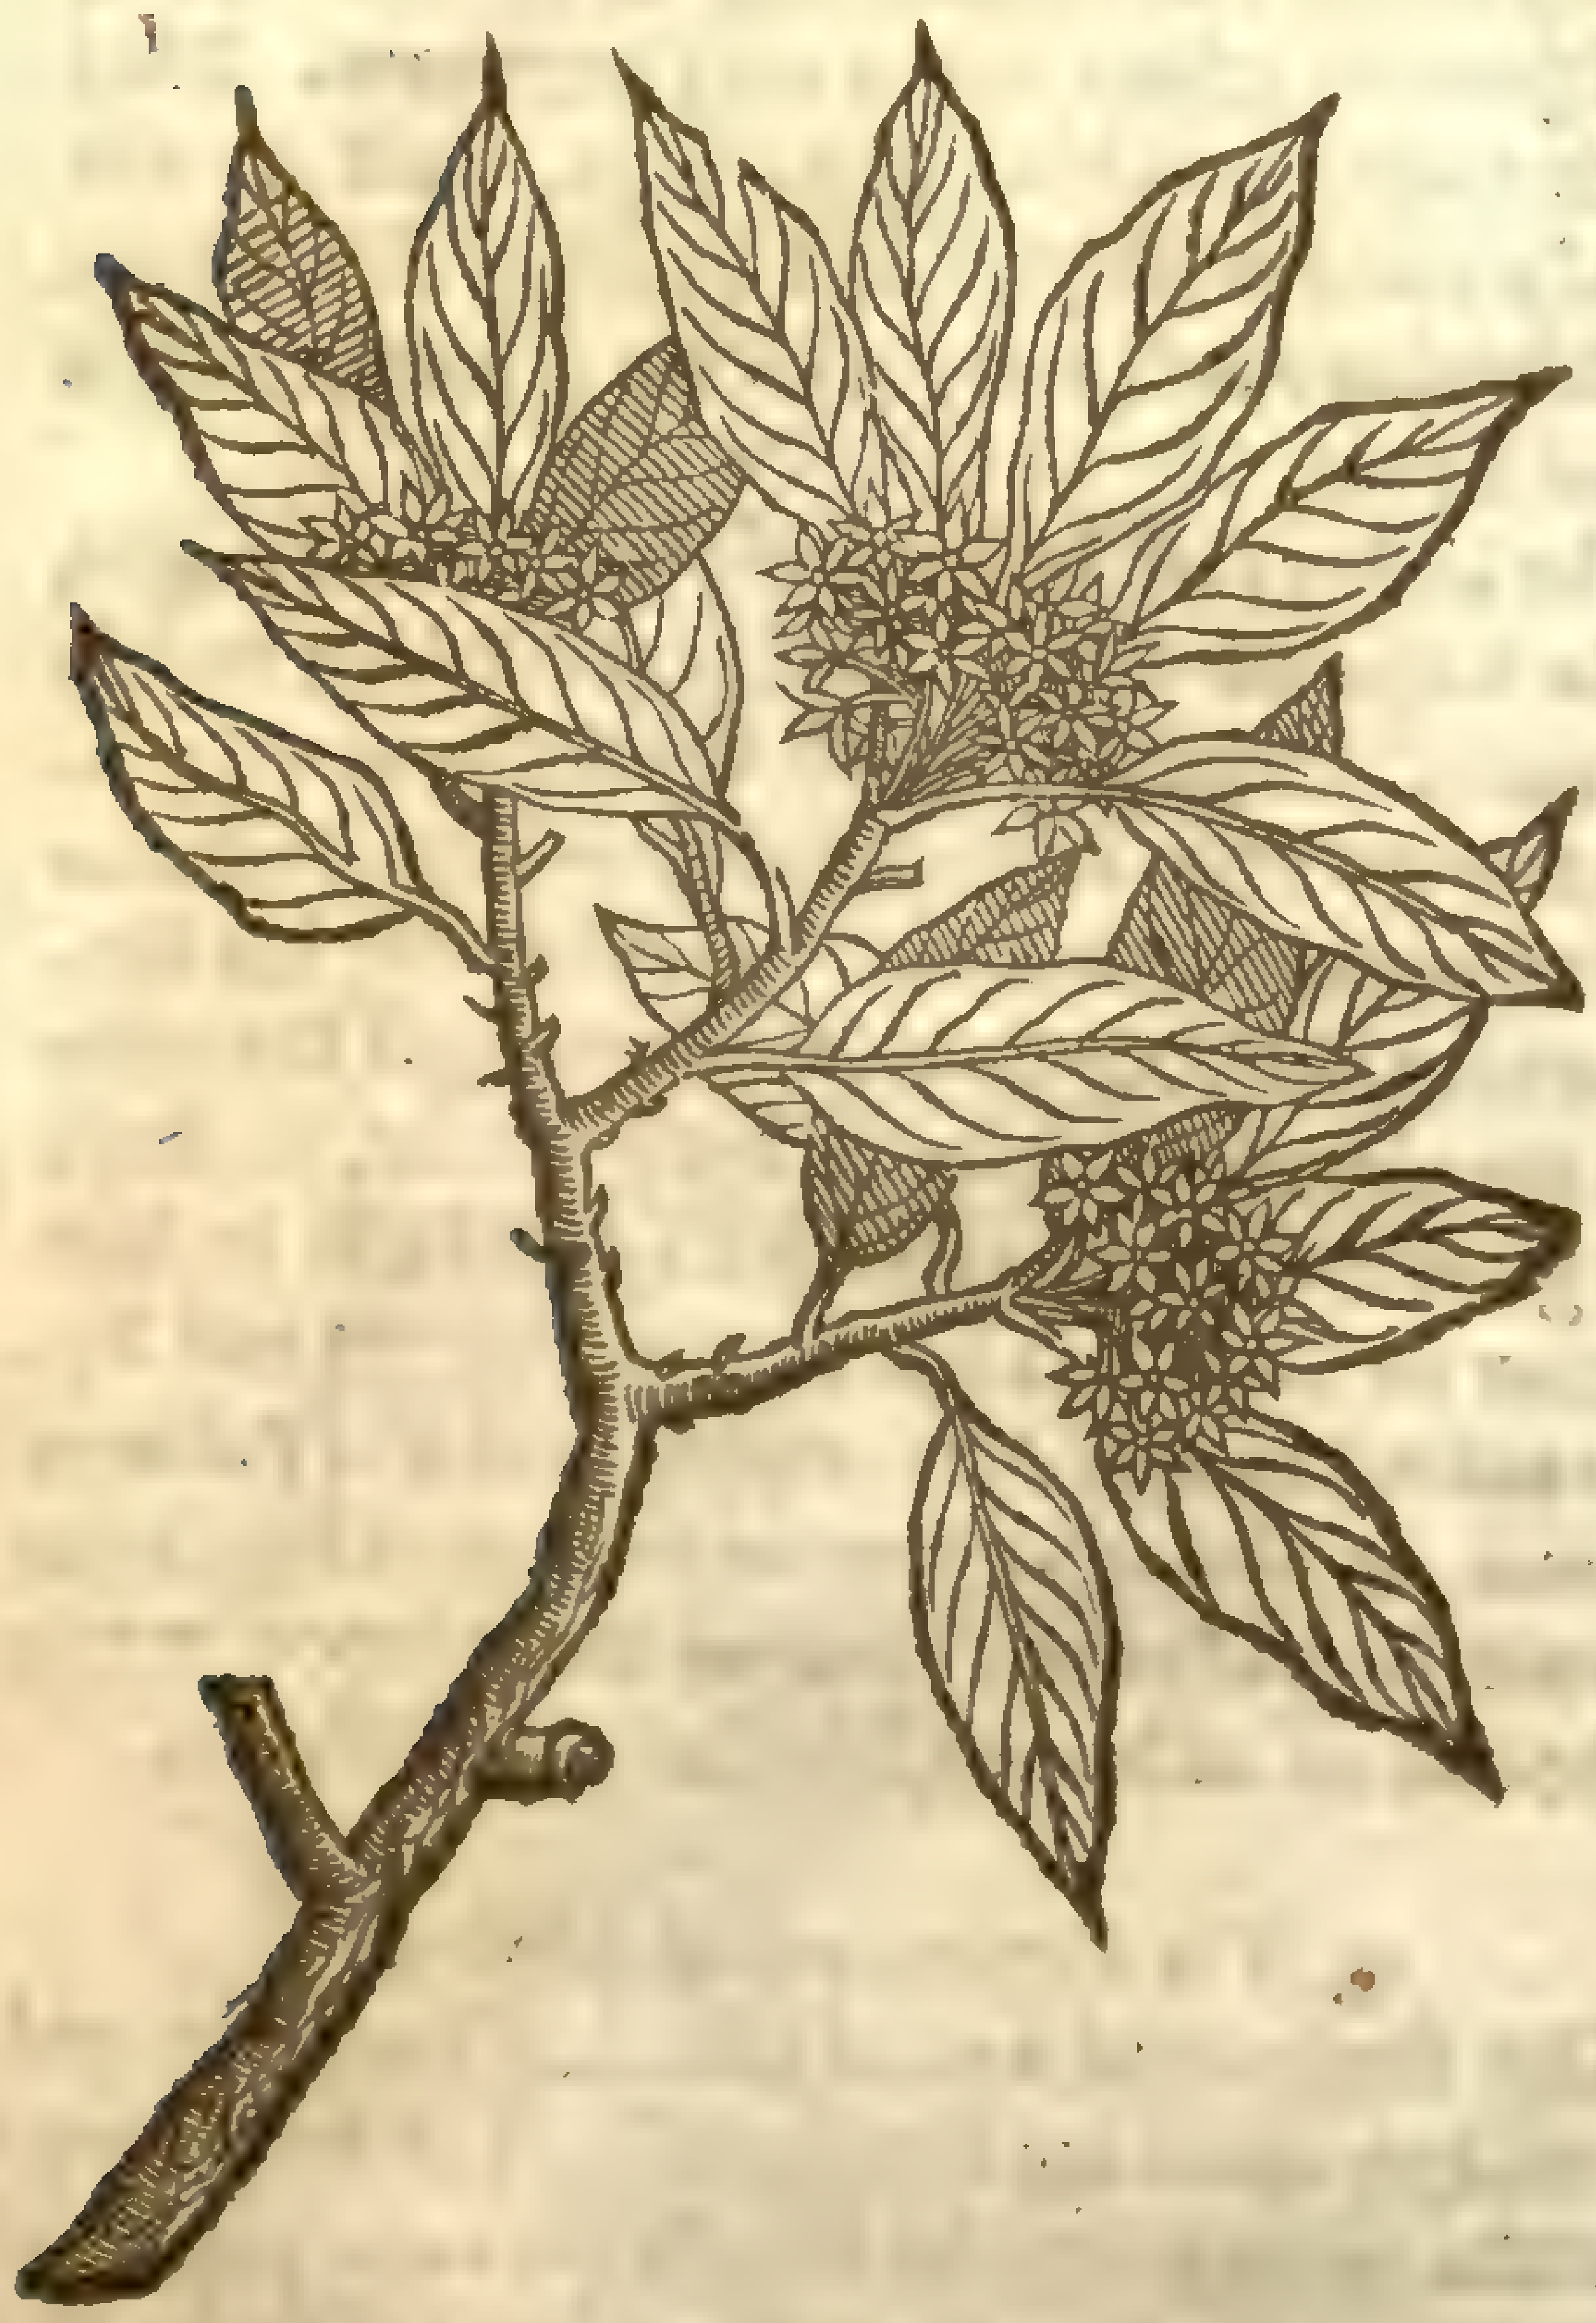
CHAP. 14. *Of the Perſian Plum.*

¶ *The Deſcription.*

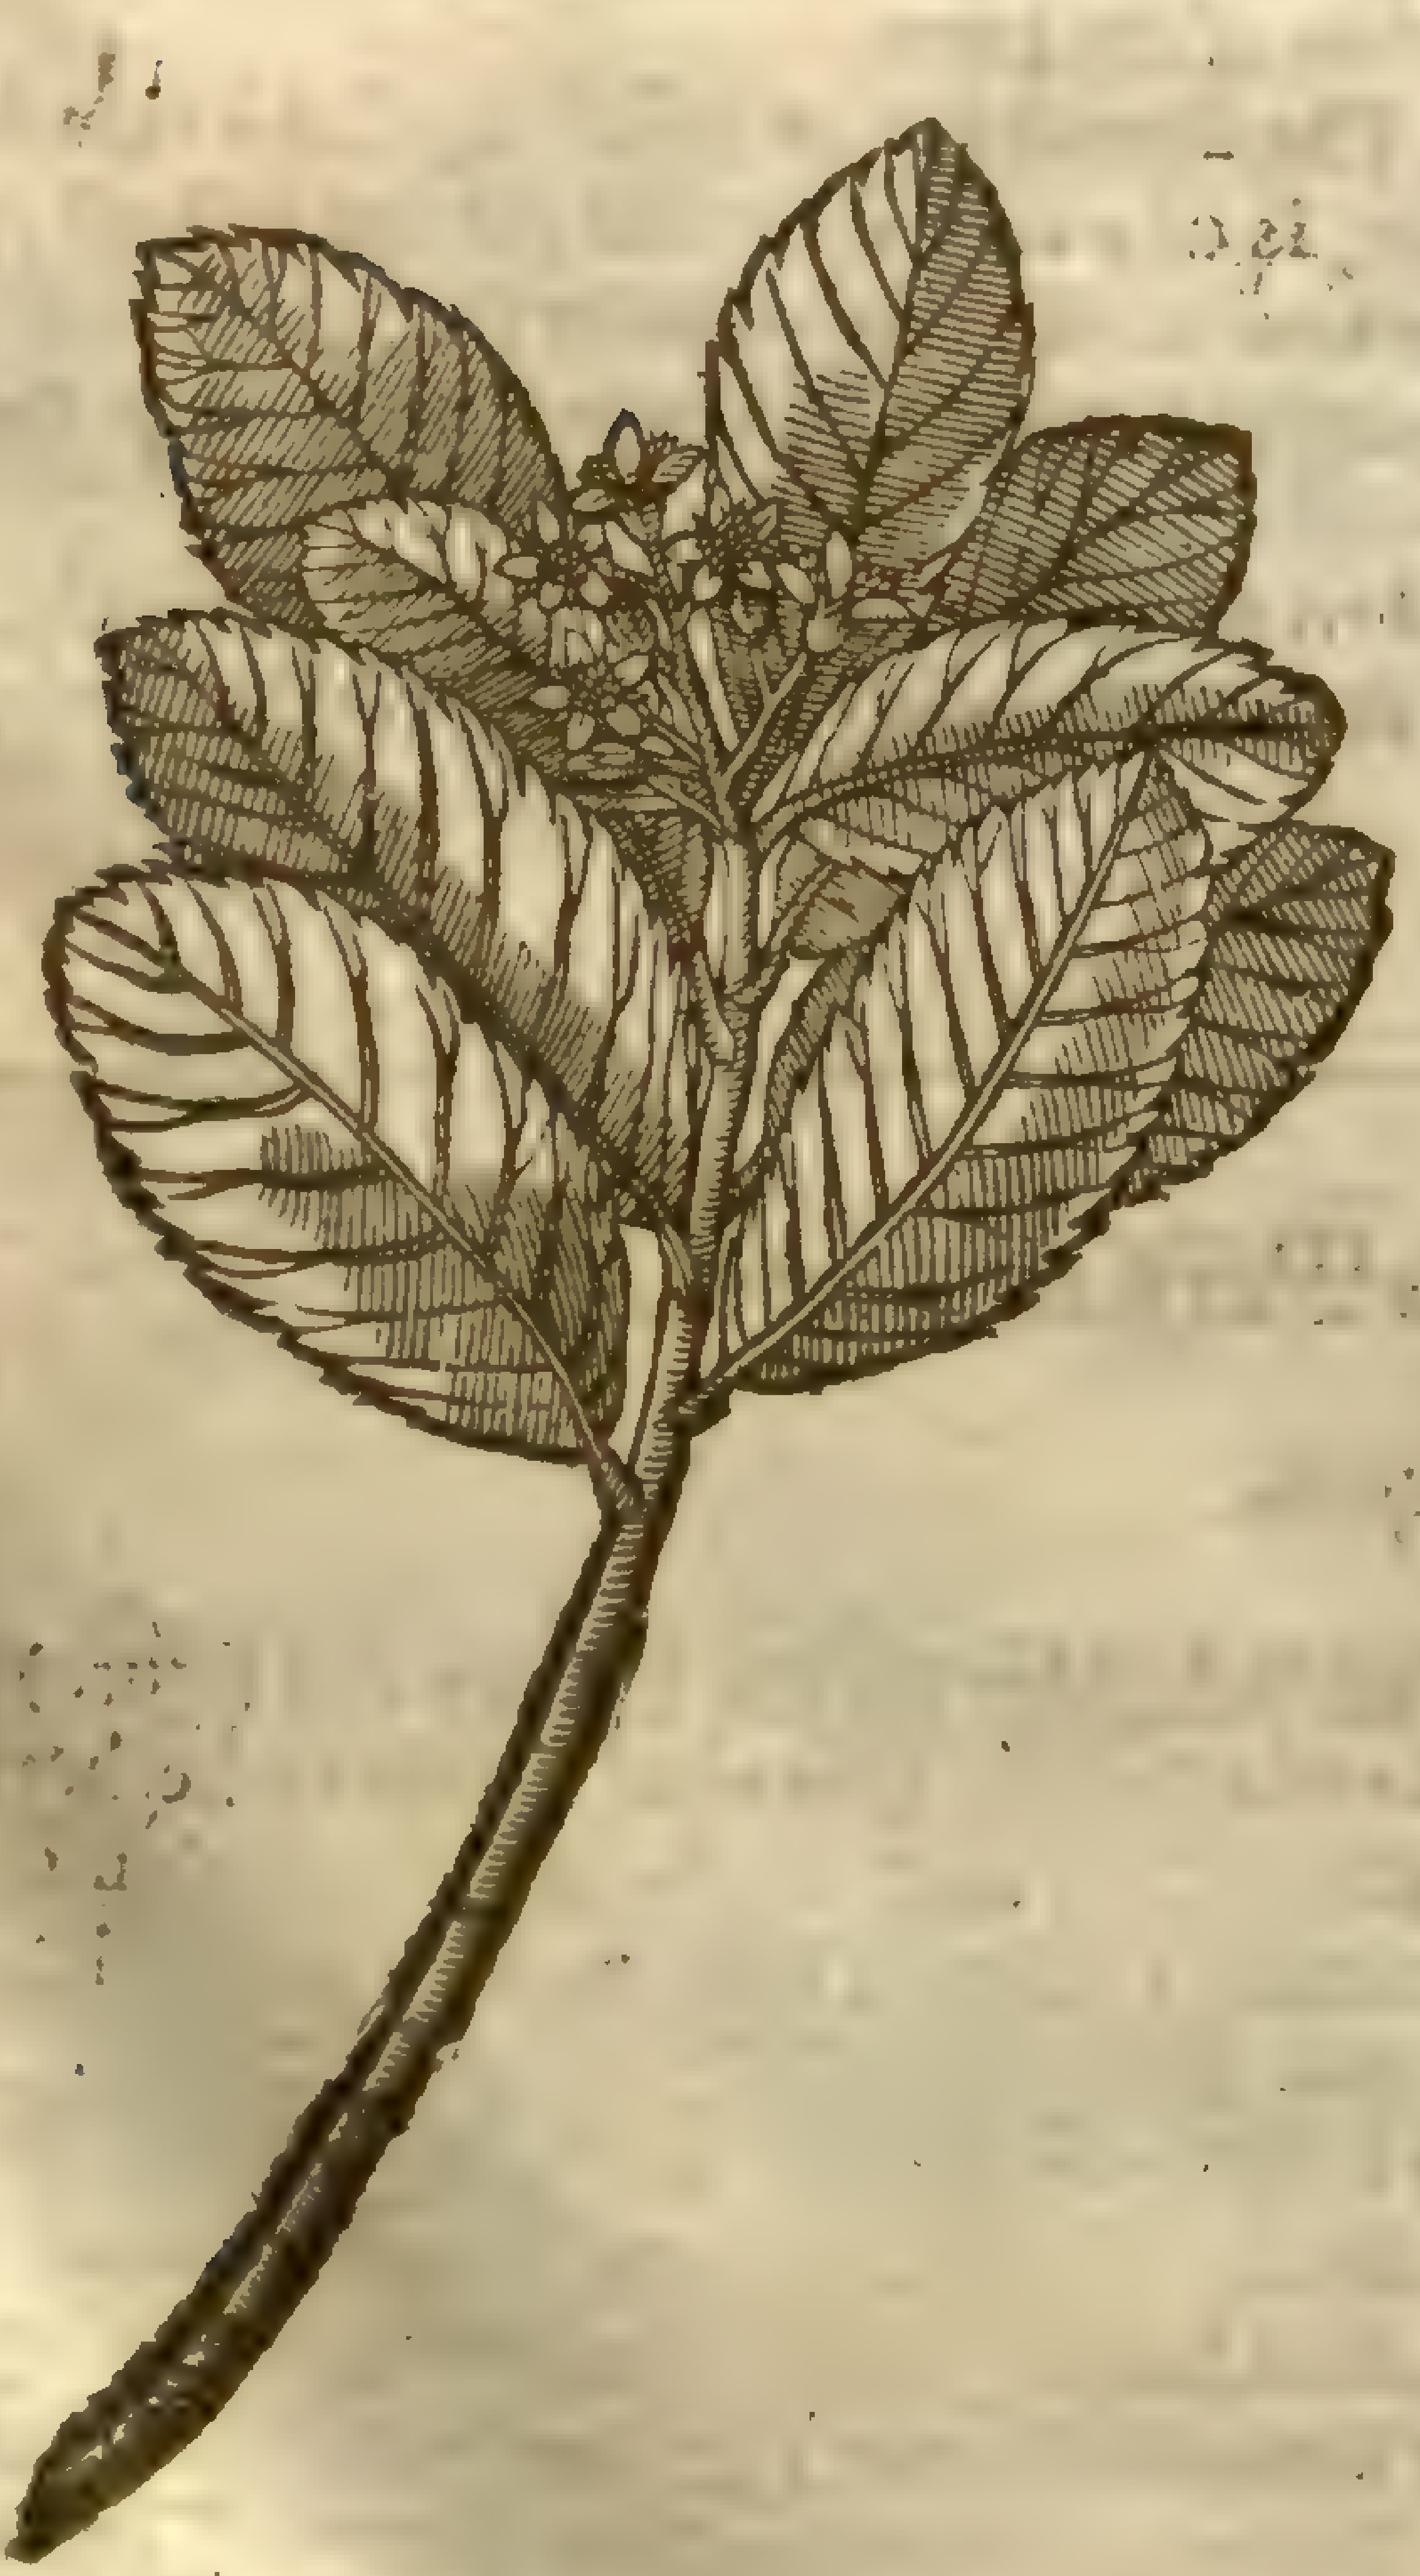
1 THis tree is thought by *Cluſius* (to whom I am beholden for the hiſtory and figure) to be the *Perſea arbor* mentioned by *Pliny* and *Plutarch*, but he ſomwhat doubts whether it be that which is mentioned by *Theophraſtus*. *Dioſcorides* alſo, *Galen* and *Strabo* make mention of the *Perſea arbor*, and they all make it a tree alwaies greene, hauing a longiſh fruit ſhut vp in the ſhell and coat of an Almond: with which how this agrees you may ſee by this deſcription of *Cluſius*.

This tree (ſaith he) is like to a Peare tree, ſpreading it ſelfe far abroad, and being alwaies greene, hauing branches of a yellowiſh green colour. The leaues are like thoſe of the broadeſt leaued Bay-tree, greene aboue, and of a grayiſh colour vnderneath, firm, hauing ſome nerues running obliquely, of a good taſte and ſmell, yet biting the tongue with a little aſtriction. The floures are like thoſe of the Bay, growing many thicke together, and conſiſt of ſix ſmall whitiſh yellow leaues. The fruit at the firſt is like a Plum, and afterwards it becomes Peare-faſhioned, of a blacke colour, and pleaſant taſte: it hath in it a heart-faſhioned kernell, in taſte not vnlike a Cheſnut, or ſweet Almond. I found it flouring in the Spring, and I vnderſtood the fruit was ripe in Autumne, by the relation of Sig^r^.

Perſea arbor.
The Perſian Plum.



Cotonaſter Geſneri.
Geſners wilde Quince.



Meſpilus Chamæmeſpilus.
[illegible]

Iohn Placa, Phyſition and Profeſſor of Valentia, who ſhewed me the tree growing in the Garden of a Monaſterie a mile from Valentia, brought thither, as they ſay, out of America, and he ſaid they called it *Memay*: but the Spaniards who haue deſcribed America giue this name to another tree. But diuers yeares after, I vnderſtood by the moſt learned *Simon de Touar*, a Phyſition of Ciuil, who hath the ſame tree in his Garden, with other exoticke plants, that it is not called *Mamay*, but *Aguacate*. Thus much out of *Cluſius*; where ſuch as are deſirous, may finde more largely handled the queſtion, whether this be the *Perſea* of the Antients or no? *Rariorum plan. Hiſt. l. 1. c. 2.*

Chap. 15.

Of Geſners wilde Quince.

¶ *The Deſcription.*

THe ſhrub which I here figure out of *Cluſius*, is thought both by him and others, to be the *Cotanaſtrum* or *Cidonago*, mentioned by *Geſner* in his Epiſtles, *lib.* 3. *pag.* 88. It hath branches ſome cubit long, tough, and bare of leaues in their lower parts, couered with a blacke barke: and towards the tops of the branches grow leaues ſomewhat like thoſe of Quinces: of a darke green aboue, and whitiſh vnderneath, ſnipt about the edges: at the tops of the branches grow vſually many floures, conſiſting of fiue purpliſh coloured leaues apiece, with ſome threds in their middles: theſe decaying, vnder them grow vp red dry berries without any pulpe or juyce, each of them containing foure triangular ſeeds. *Cluſius* found this flouring in Iune vpon the tops of the Auſtrian Alpes, and he queſtions whether it were not this which *Bellonius* found in the mountains of Candy, and called *Agriomalea, lib.* 1. *cap.* 17. This is not vſed in Phyſicke, nor the faculties thereof knowne.

Chap. 16. *Of Tamarindes.*

Tamarindus.
The Tamarinde.

T. indica, L.
[illegible]

Tamarindi ſiliqua.
The cod of the Tamarinde.

¶ *The Deſcription.*

TAmarinds, which at this day are a medicine frequently vſed, and vulgarly knowne in ſhops, were not knowne to the antient Greekes, but to ſome of the later, as *Actuarius*, and that by the name of *Oxyphœnica*, that is, ſoure Dates, drawne as it may ſeeme from the Arabicke appellation, *Tamarindi*, that is, Indian Date: but this name is vnproper, neither tree nor fruit being of any affinitie with the Date, vnleſſe the Arabicke *Tamar* be a word vſed in compoſition for fruits of many kindes, as the Greeke Μῆλον, the Latine *Malum*, and Apple with vs in Engliſh; for we call the Cone of the Pine, and excreſcence of the Oke leafe, by the name of Pine Apple, and Oke Apple. But howſoeuer it be, it is no matter for the name, whether it be proper or no, if ſo be that it ſerue to diſtinguiſh the thing from others, and we know what is denoted by it. In Malauer they call it *Puti*: in Guzarat, *Ambili*, by which name it is knowne in moſt parts of the Eaſt-Indies. This tree is thus deſcribed by *Proſper Alpinus, de Plant. Ægypti, cap.* 10. The Tamarind (ſaith he) is a tree of the bigneſſe of a Plum tree, with many boughes and leaues like thoſe of the Myrtle, many ſtanding vpon one rib [one againſt another, with a ſingle one at the end:] it carrieth white floures very like thoſe of the Orange tree: out of whoſe middle comes forth foure white and very ſlender threds: after theſe come thicke and large cods, at firſt greene, but when they are ripe of an aſh-colour; and within theſe are contained thicke, hard, browniſh, cornered ſeeds, and a blacke acide pulpe. Theſe trees grow in ſome few gardens of Ægypt, whither they haue been brought out of Arabia and Ethiopia. This plant hath this ſtrange quality that the leaues alwaies follow the Sun,, and when it ſets they all contract themſelues, and open out themſelues againe at the riſing thereof; and there is obſerued to be ſuch force in this motion, that they cloſely ſhut vp and hold their cods (if any be on the tree) and then at the riſing of the Sun they forgoe them againe. But I haue obſerued this folding vp of the leaues to be common to diuers other Ægyptian plants, as *Acatia, Abrus, Abſus,* and *Sesban.* Thus much out of *Alpinus.*

The figure I here giue in the firſt place, out of *Lobel*, is of a plant ſome ſix moneths old, ariſen of a ſeed: and ſuch by ſowing of ſeeds I haue ſeene growing in the garden of my diſceaſed friend M^{r}. *Tuggy*, but they ſtill died at the firſt approach of Winter. The other figure expreſſeth the cods, and ſome of the ſeeds apart, taken forth of the cods: now the cods are neuer brought whole to vs, but the vtter rindes are taken off; and the ſtrings or nerues that run alongſt the cods, the pulpe and ſeeds in it are cloſe thruſt together, and ſo are brought to vs in pots and ſuch like veſſels.

¶ *The Temperature and Vertues.*

A The fruit or pulpe of Tamarindes is cold and dry in the third degree: it is of good vſe in cholericke diſeaſes, and burning Feuers, Tertians, and the like: it is a lenitiue and very gently purging medicine and therefore vſed to be put into medicines ſeruing to that purpoſe.

B They vſe (ſaith *Alpinus*) the leaues of Tamarindes to kill wormes in young children; and alſo their infuſion or decoction to looſen the belly; the leaues are acide, and not vnpleaſant vnto the taſte.

C The Arabians preſerue the ſmall and yet greene cods of this tree, as alſo the ripe ones, either with ſugar, or the hony boyled out of the fruit of the Carob tree: they alſo mix the pulpe with ſugar, which trauellers carry with them in their journies through the deſart places of Africke, wherewith they being dry or ouerheated, may quench their thirſt, coole and refreſh themſelues, and alſo euacuate many hot humors by ſtoole.

D In peſtilent and all other burning putrid feuers they drinke the water with ſugar, wherein a good quantitie of Tamarinds haue beene infuſed; for it is a drinke very pleaſant to ſuch as are thirſty by reaſon of too much heate, for it powerfully cooles and quencheth thirſt.

E They are alſo vſed in all putrid feuers, cauſed by cholericke and aduſt humors, and alſo againſt the hot diſtempers and inflammations of the liuer and reines, and withall againſt the Gonorrhæa.

F Some alſo commend them againſt obſtructions, the dropſie, jaundiſe, and the hot diſtempers of the ſpleene: they conduce alſo to the cure of the itch, ſcab, leproſie, tetters, and all ſuch vlcerations of the skin which proceed of aduſt humors.

G They are not good for ſuch as haue cold ſtomackes, vnleſſe their coldneſſe be corrected by putting to them Mace, Aniſe ſeeds, Squinanth, or ſuch like.

CHAP. 17.

Of the Mamoera, the Male and Female.

¶ *The Deſcription.*

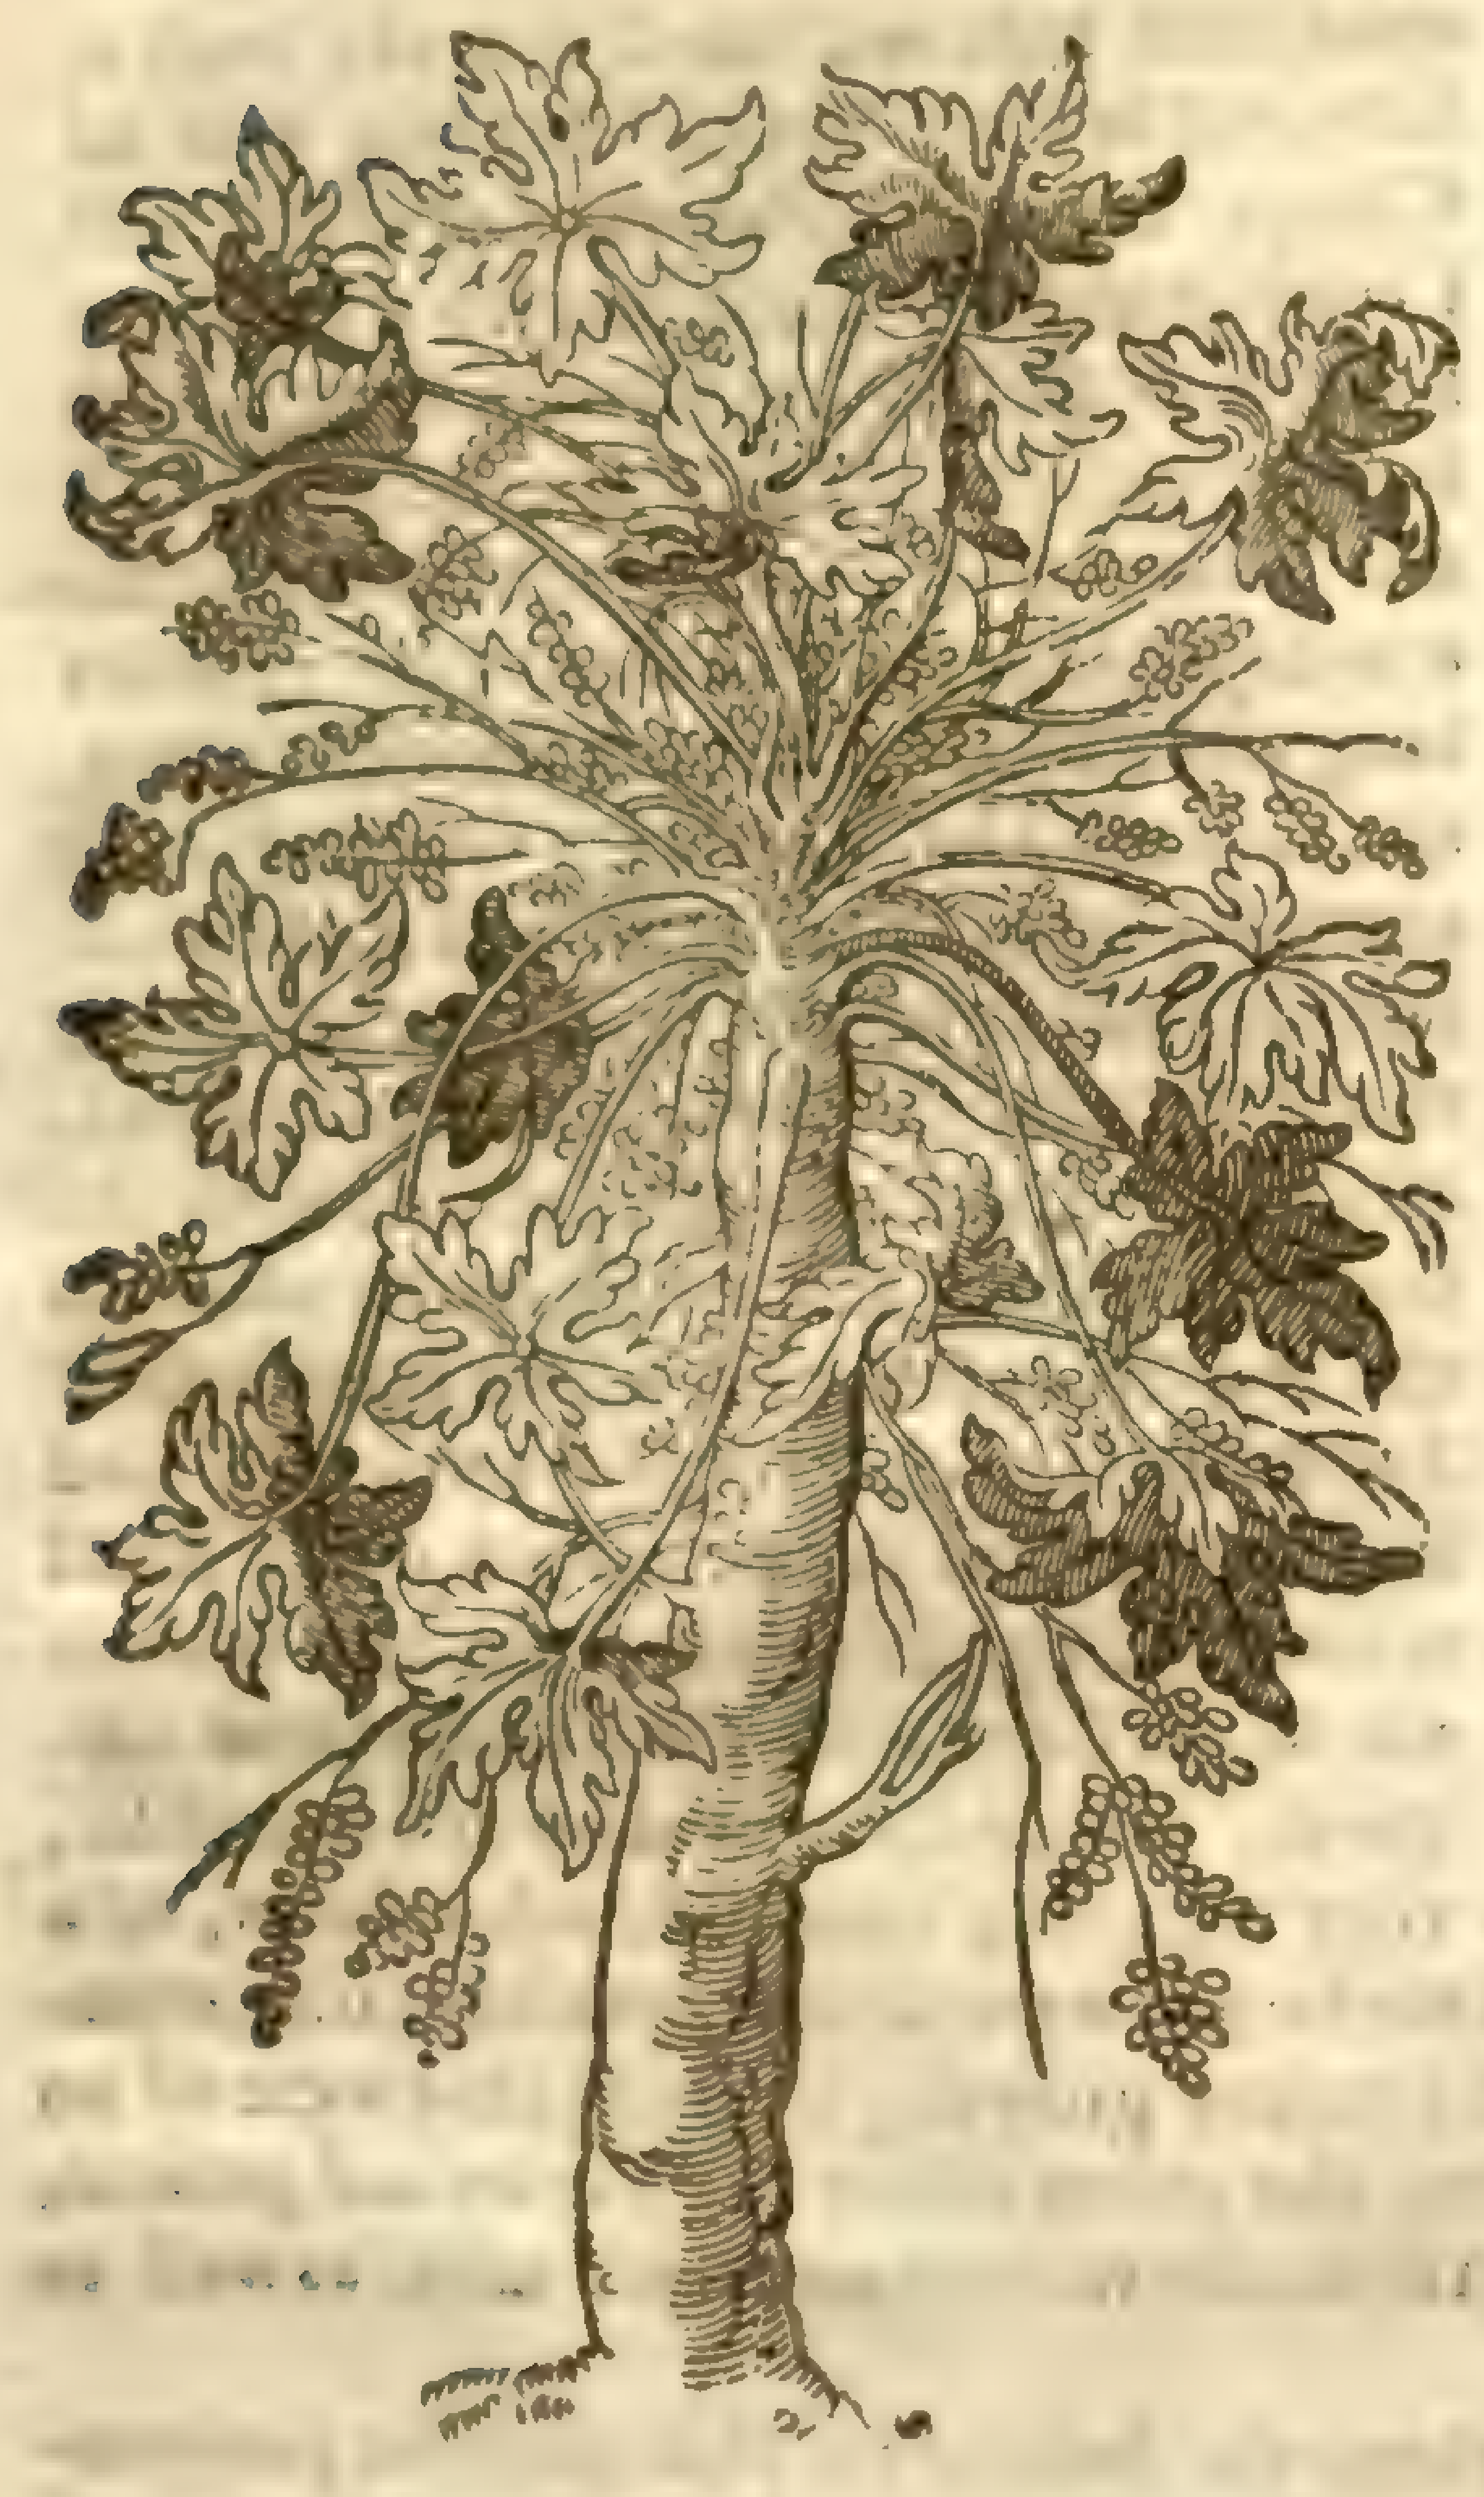
THe hiſtorie of theſe two trees, together with the figures I here giue you, are it the *Curæ Poſteriores* of *Cluſius*, from whence I will take as much as concernes their hiſtory, and briefely here giue it you.

That of the Poët (ſaith he) is moſt true, *Non omnis fert omnia tellus*: for I thinke there is no Prouince to be found, which produces not ſome peculiar plant not growing in other regions, as they can teſtifie who haue trauelled ouer forreine countries, eſpecially if they haue applied themſeles to the obſeruations of plants. Amongſt ſuch I thinke I may reckon that honeſt and courteous man *Iohn Van vſele*, who returning out of that part of America called Braſile, ſhewed mee in the yeare 1607. a booke, wherein he in liuely colours had expreſt ſome plants and liuing creatures: for as he told me, when he purpoſed to trauell he learned to paint, that ſo he might expreſſe in colours, for his memorie and delight after he was returned home, ſuch ſingularities as he ſhould obſerue abroad. Now amongſt thoſe which he in that booke had expreſſed, I obſerued two very ſingular, and of a ſtrange nature, whoſe figures without any difficulty he beſtowed vpon me, as alſo the following hiſtory.

Theſe two trees, whoſe figures you ſee here expreſt, are of the ſame kinde, and differ only in ſex; for the one of them, to wit, the male, is barren, and only carries floures, without any fruit; but the female onely fruit, and that without floure: yet they ſay they are ſo louing, and of ſuch a nature, that if they be ſet far aſunder, and the female haue not a male neere her, ſhee becomes barren and beares no fruit: of which nature they alſo ſay the Palme is.

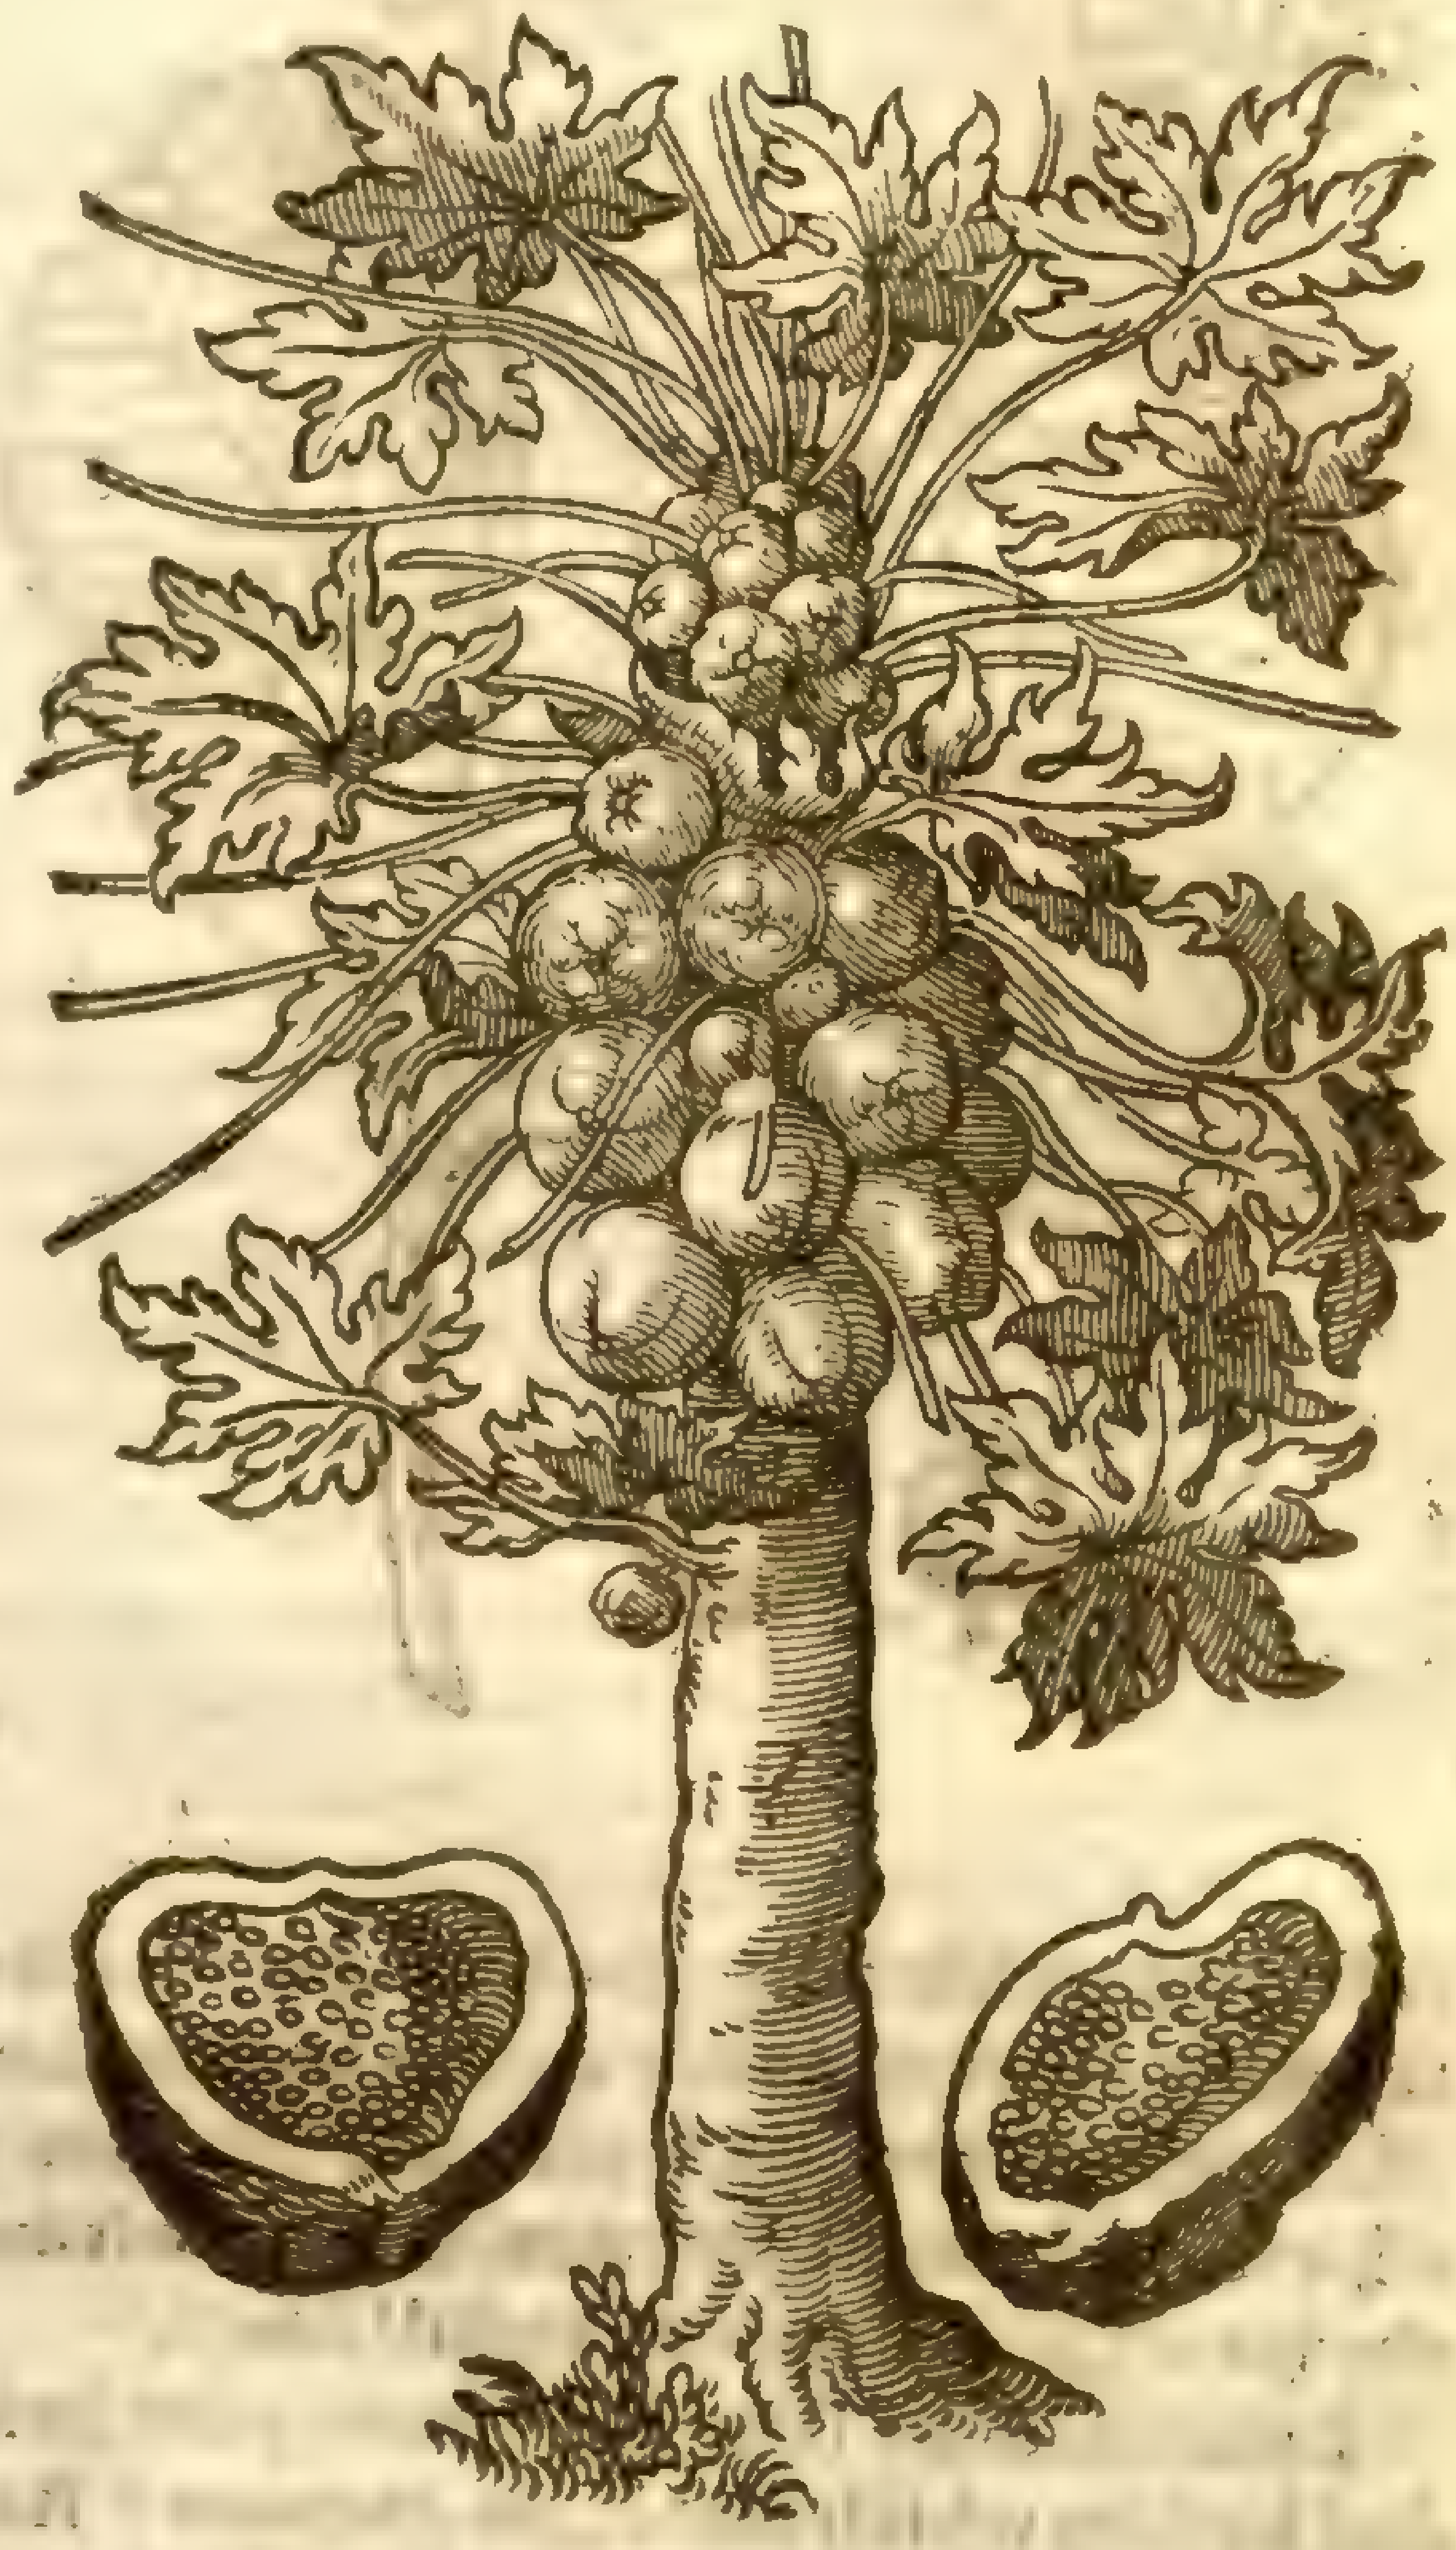
Now the bole or trunke of that tree which beares the fruit is about two foot thicke, and it groweth ſome nine foot high before it begin to beare fruit; but when it hath acquired a juſt magnitude, then ſhall you ſee the vpper part of the tree laden with fruit, and that it will bee as it were thicke girt about therewith for ſome nine foot high more: the fruit is round and globe-faſhioned, of the ſhape and magnitude of a ſmall gourd, hauing when it is ripe a yellowiſh pulpe, which the Inhabitants vſe to eat to looſen their bellies. This fruit contains many kernels of the bigneſſe of a ſmall peaſe, blacke and ſhining, of no vſe that he could learne, but which were caſt away as vnneceſſary. The leaues come forth amongſt the fruit, growing vpon long footſtalks, and in ſhape much reſemble the Plane tree or great Maple.

Mamoera mas.
The male Dug tree.



Carica papaya L. male plant

Mamoera fœmina.
The female Dug tree.



What name the Braſilians giue it he could not tell, but of the Portugals that dwelt there it was called *Mamoera*, and the fruit *Mamaon*, of the ſimilitude I thinke they haue with dugs, which by the Spaniards are called *Mamas* and *Tetas*.

There is no difference in the forme of the trunke or leaues of the male and female, but the male only carries floures hanging down, cluſtering together vpon long ſtalkes like the floures of Elder, but of a whitiſh yellow colour, and theſe vnprofitable, as they affirme.

Both theſe trees grow in that part of America wherein is ſcituat the famous Bay called by the Portugals, *Baya de todos los ſanctos*, lying about thirteen degrees diſtant from the Equator towards the Antartick Pole.

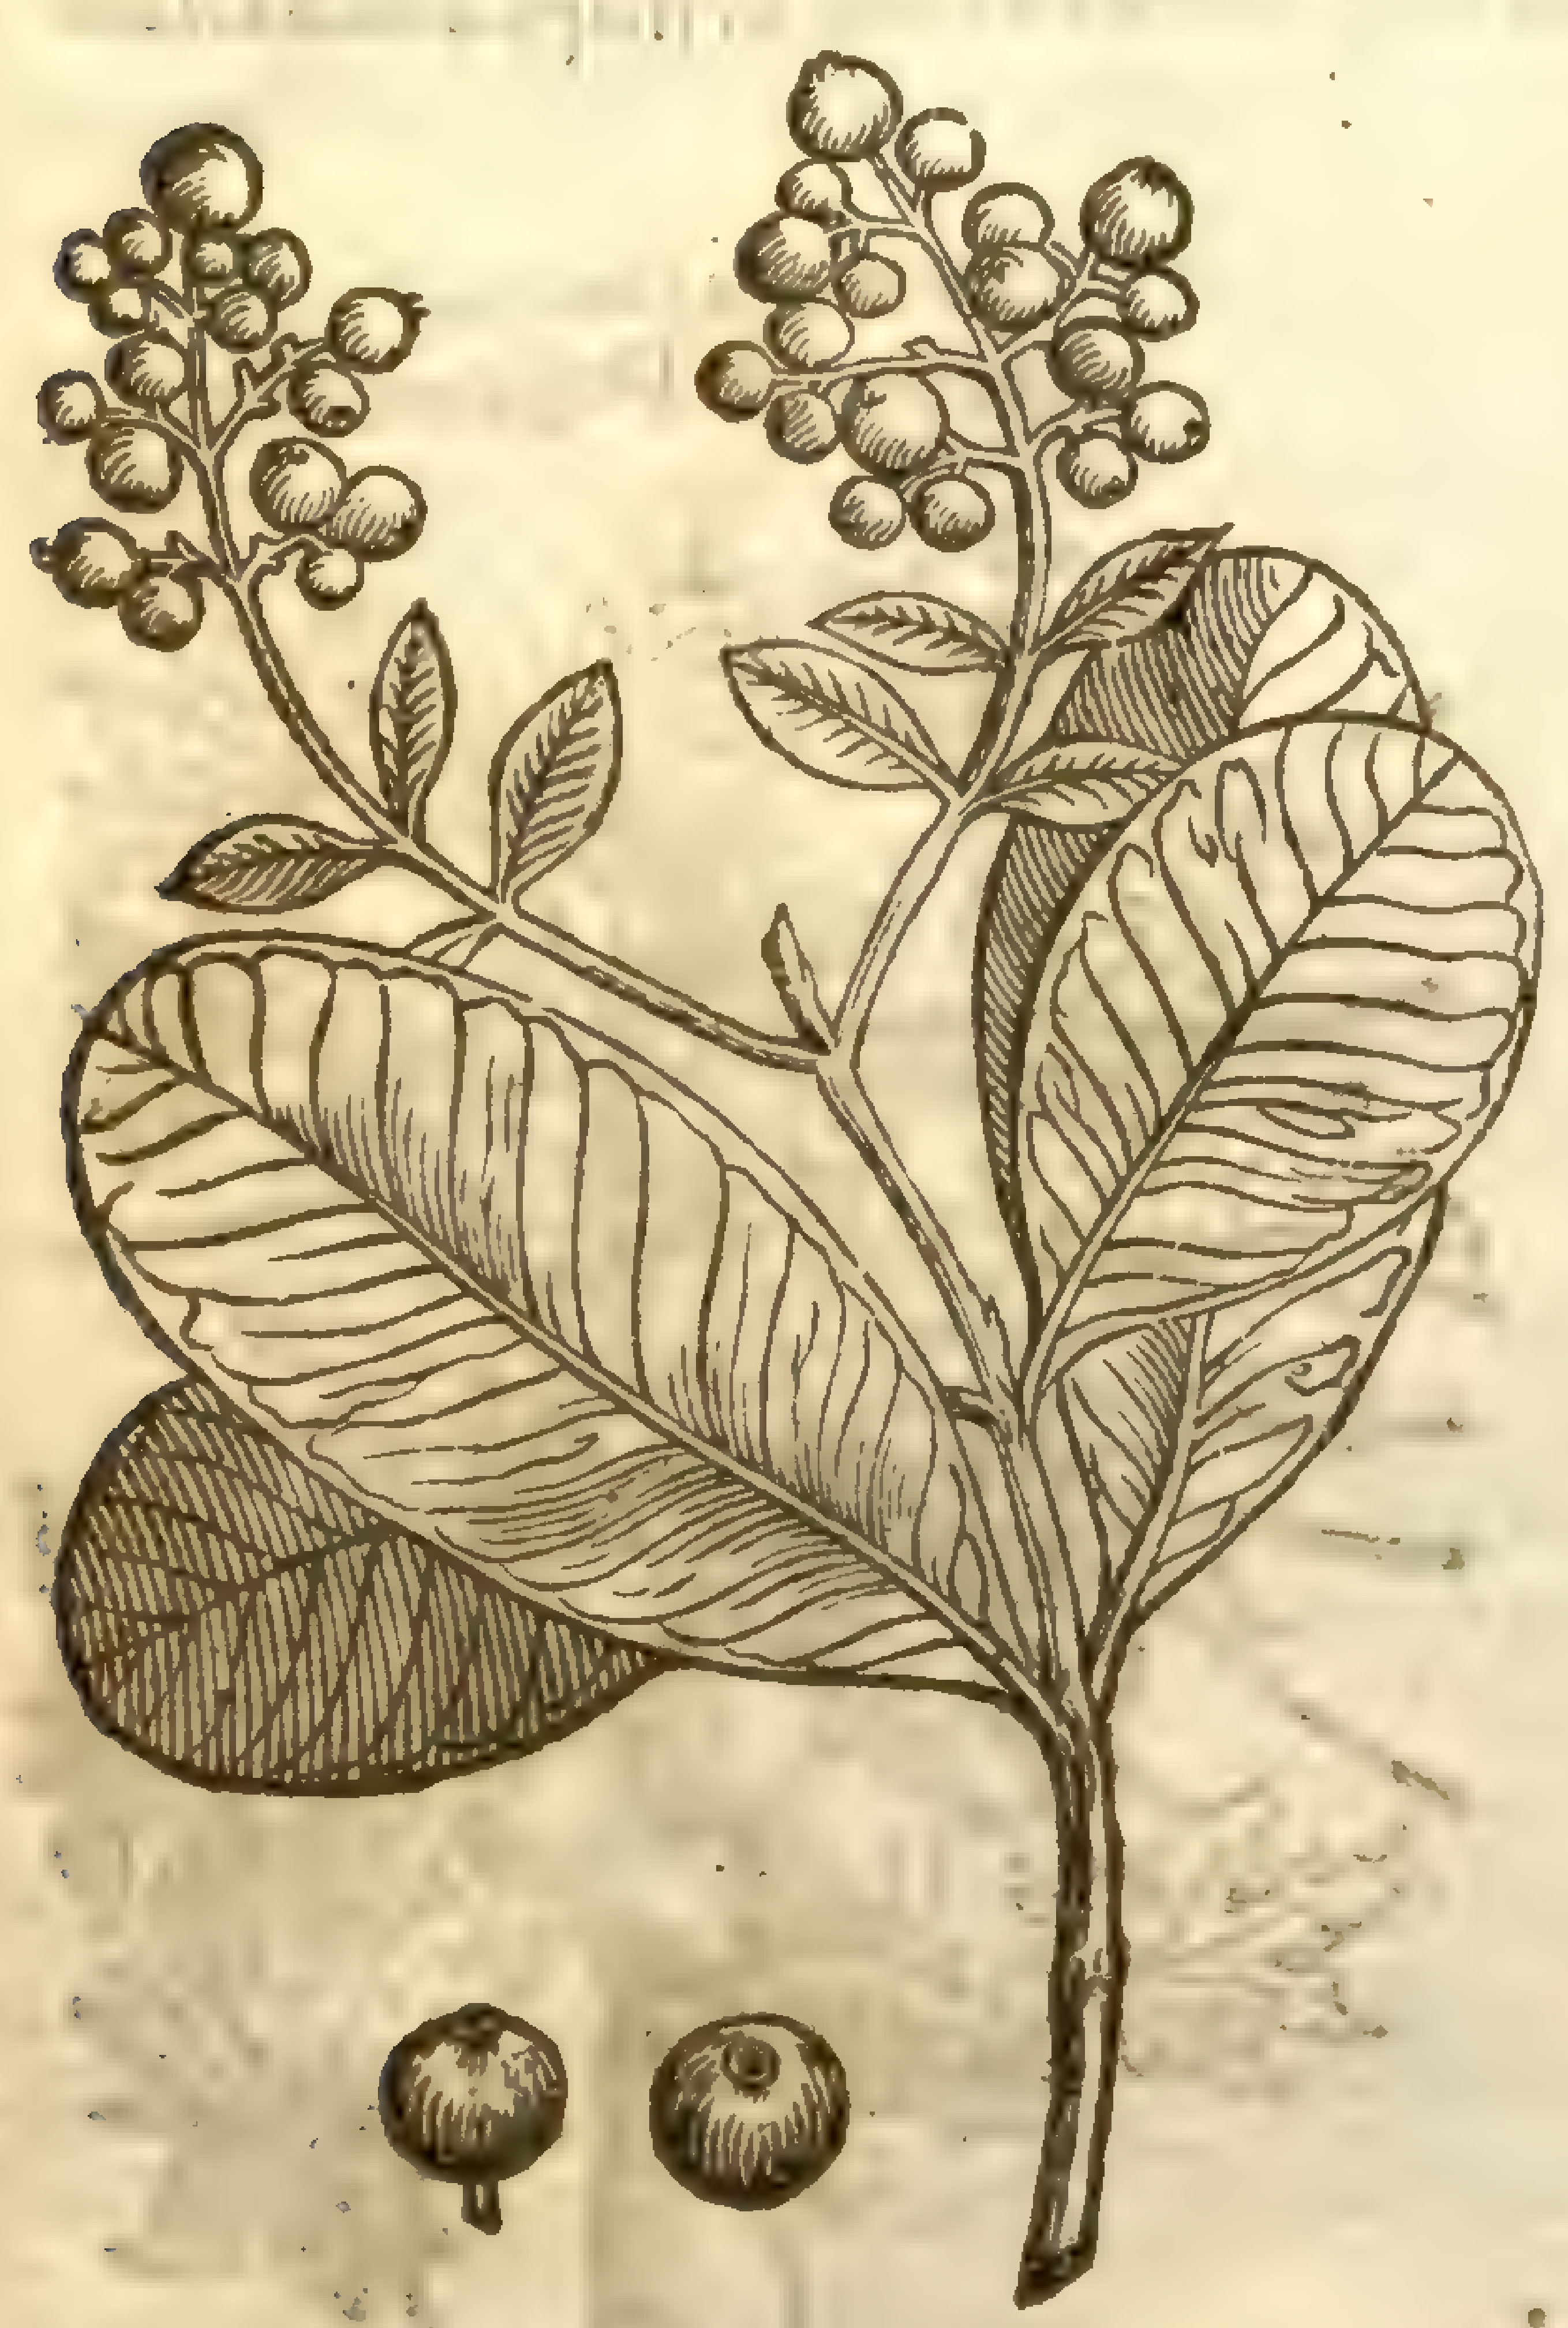
Chap. 18. *Of the Clove-berry tree.*

¶ *The Deſcription.*

I Muſt alſo abſtract the hiſtorie of this out of the works of the learned and diligent *Cluſius*, who ſet it forth in his *Exot. lib. 1. cap. 17.* in the next chapter after Cloves.

I put (ſaith he) the deſcription of this Fruit next after the hiſtorie of Cloves, both for the affinity

Amomum quorundam, fortè Garyophyllon Plinij.
The Clove-berry tree.

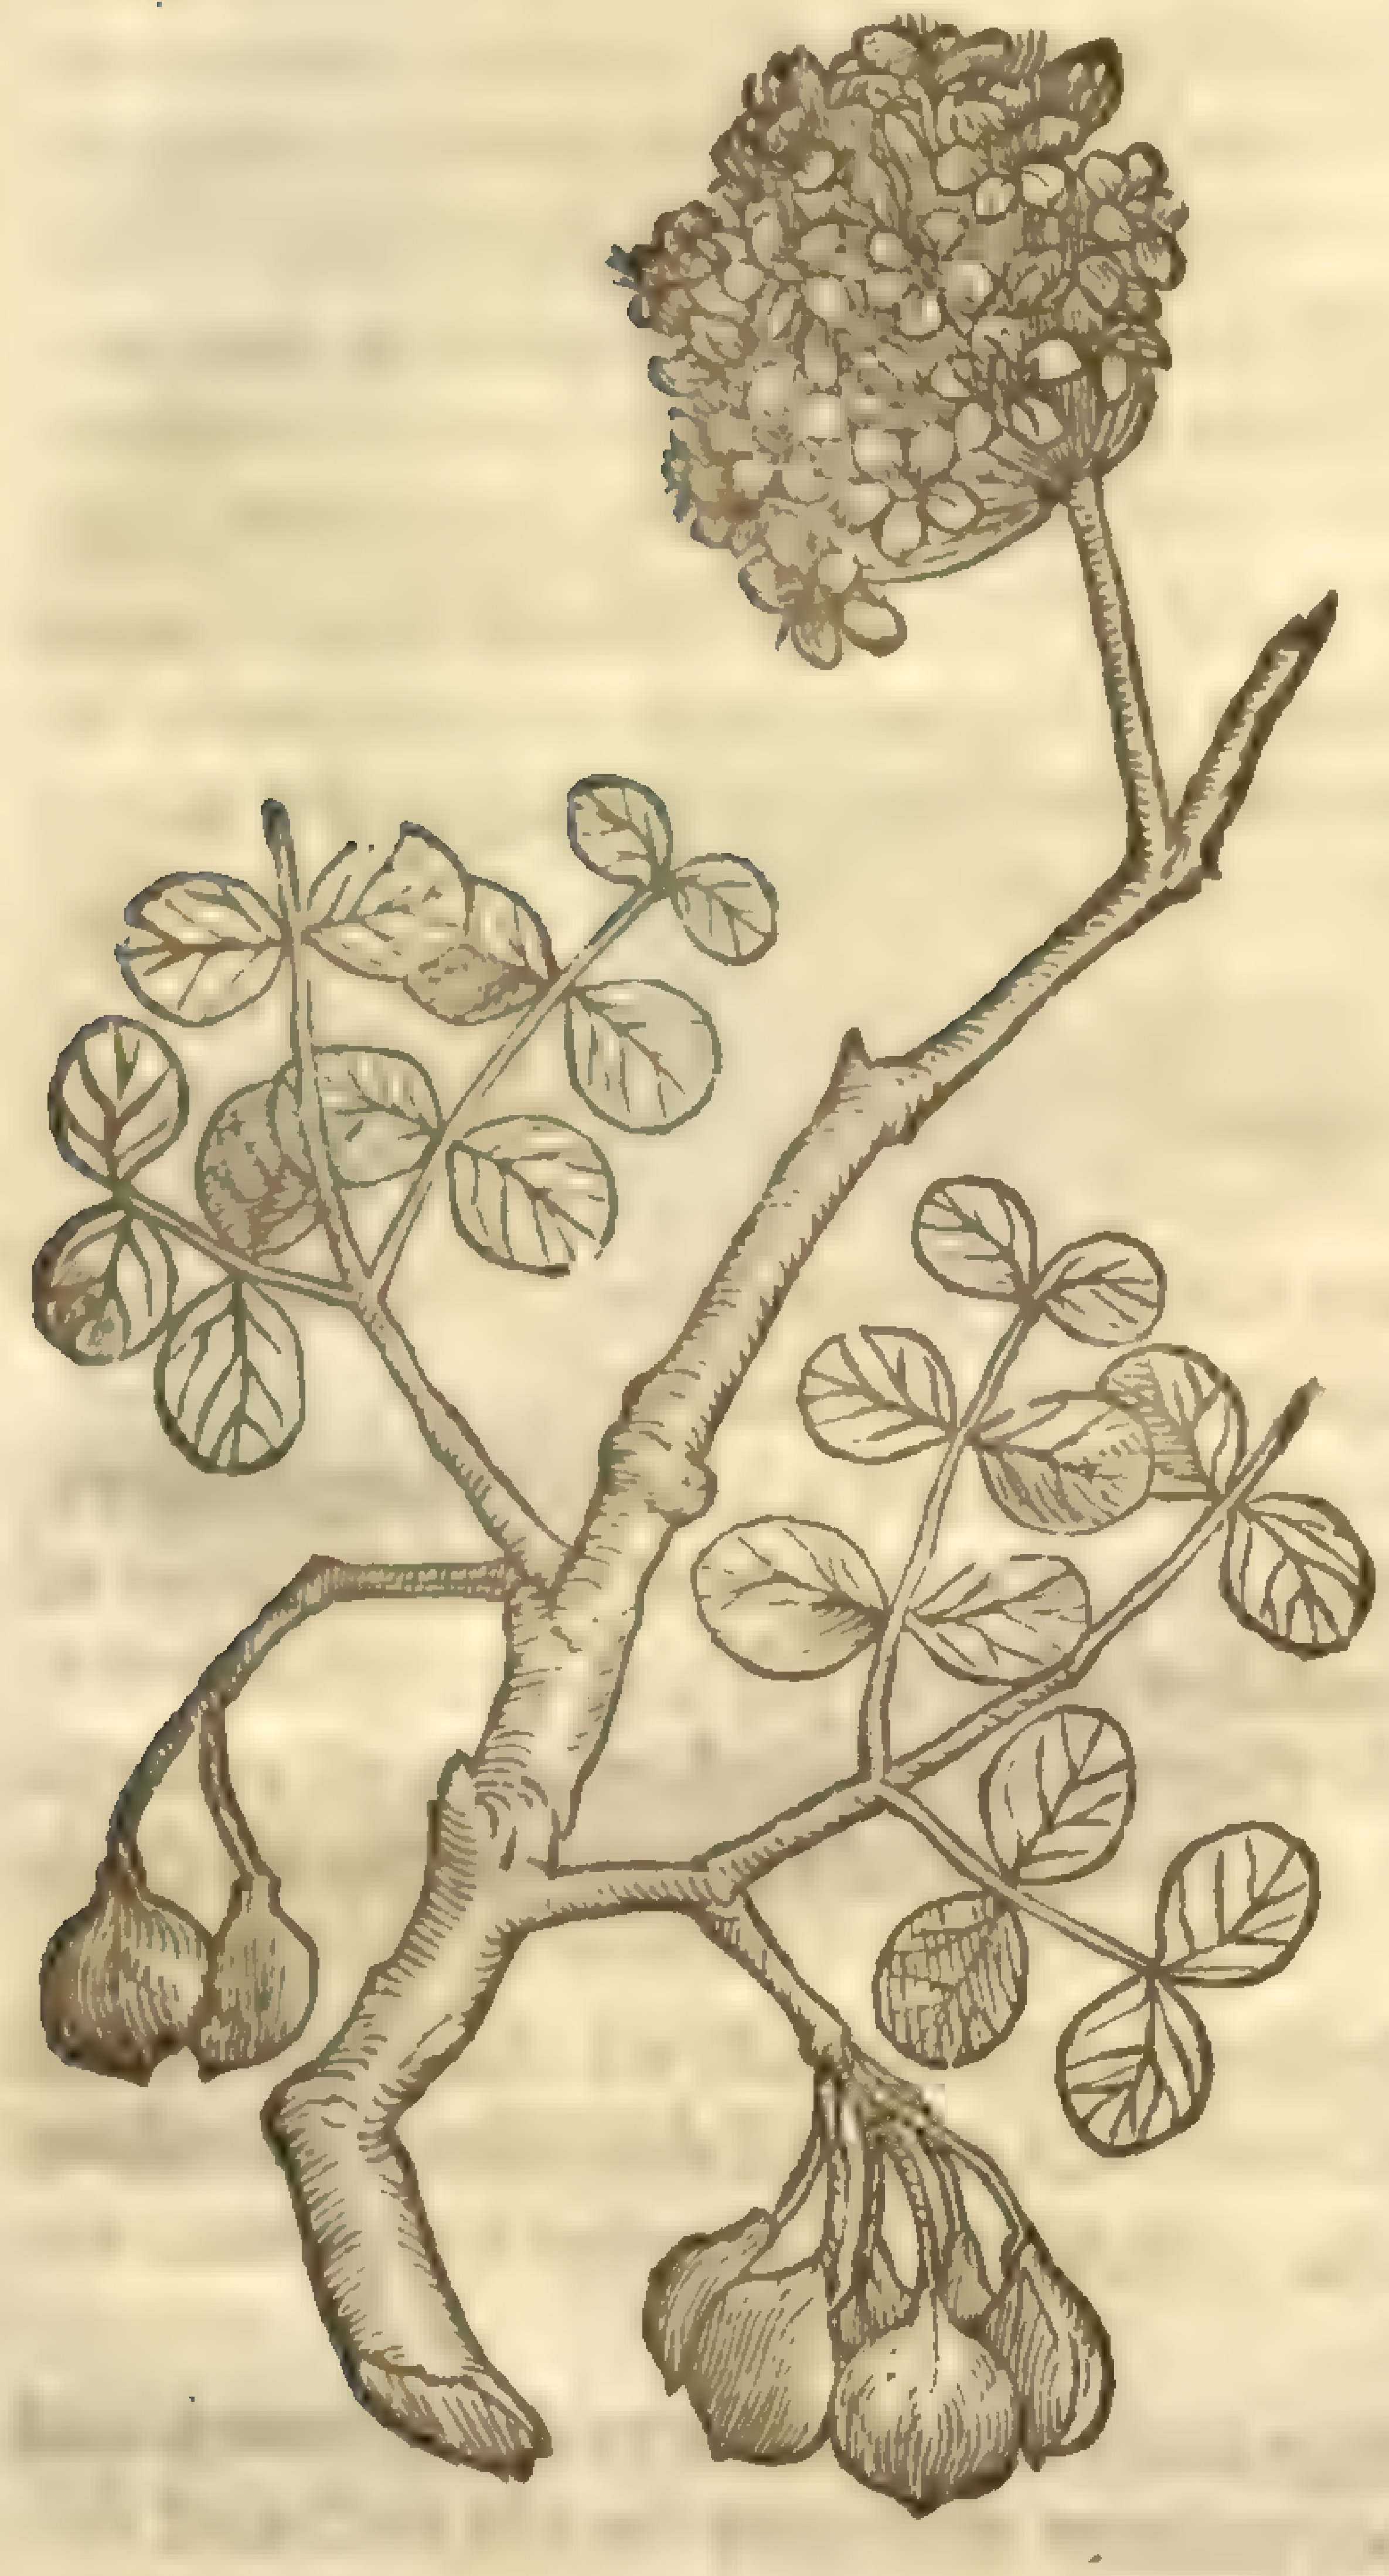


affinitie of ſmell it hath with Cloves, as alſo for another cauſe, which I will ſhew hereafter. *Iames Garret* in the yeare 1601, ſent mee from London this round Fruit, commonly bigger than Pepper cornes, yet ſome leſſe, wrinkled, of a browniſh colour, ſufficiently fragil; which opened, I found contained a ſeed, round, blacke, which might be diuided into two parts, of no leſſe aromatick taſte and ſmell than the fruit it ſelfe, and in ſome ſort reſembling that of Cloves. It grows in bunches or cluſters, as I conjectured by many berries which yet kept their ſtalkes, and two or three which ſtuck to one little ſtalke. To theſe were added leaues of one form, but of much different bignes, for ſome of them were 7 inches long and 3 broad; ſome only 5 inches long, and two and a halfe broad; others did not exceed 3 inches in length, and theſe were not two inches broad; and ſome alſo were much leſſe and narrower than theſe, eſpecially thoſe that were found mixed with the berries, differing according to the place, in the boughs or branches which they poſſeſt I obſerued none amongſt them which had ſnipt leaues, but ſmooth, with many ſmall veins running obliquely from the middle rib to the ſides, with their points now narrower, otherwhiles broader and roundiſh; they were of a browniſh aſh colour, of a ſufficient acride taſte: the branches which were added to the reſt were ſlender, quadrangular, couered with a bark of an aſh colour, and thoſe were they of a yeares growth; for thoſe that were of an after-growth were browniſh, and they had yet remaining the prints where the leaues had growne, which for the moſt part were one againſt another, and theſe alſo were of an acride taſte, as well as the leaues, and of no vngratefull ſmell.

I receiued the ſame fruit ſome yeres before, but without the ſtalks, with this queſtion propounded by him which ſent it, *An Amomum?* And certainly the faculties of this fruit are not very much vnlike thoſe which *Dioſcorides* attributes to his *Amomum*; for it hath an heating aſtrictiue and drying facultie, and I think it may perform thoſe things whereto *Dioſcorides, lib.1.cap.14.* ſaith his is good; yet this wanteth ſome notes which he giues vnto his, as the leaues of Bryonie, &c.

But I more diligently conſidering this Exotick fruit, finde ſome prime notes which doe much moue me (for I will ingeniouſly profeſſe what I thinke) to judge it the *Garyophyllon* of *Pliny*; for he, *Hiſt.Nat.lib.12.cap.7.* after he hath treated of Pepper, addes theſe words; [There is beſides in the Indies a thing like to the Pepper corn, which is called *Garyophyllon*, but more great and fragil; they affirm it growes in an Indian groue, it is brought ouer for the ſmells ſake.] Though this deſcription be briefe and ſuccinct, neither containes any faculties of the fruit it ſelfe, yet it hath manifeſt notes, which, compared with thoſe which the fruit I here giue you poſſeſſe, you ſhal find them very like; as comparing them to Pepper corns, yet bigger and more fragil, as for the moſt part theſe berries are: their ſmell is alſo very pleaſing, and commeth very neere to that of Cloves; and for the ſmels ſake only they were brought ouer in *Plinies* time. I found, this fruit being chewed made the breath to ſmell wel; and it is credible, that it would be good for many other purpoſes, if trial were made.

CHAP. 19. *Of Guaiacum or Indian Pock-wood.*



Guaiaci arboris ramuli.
A branch of the Guaiacum tree.

¶ *The Deſcription.*

GVaiacum, which ſome call *Lignum Sanctum:* others, *Lignum vitæ*, is a well knowne wood, though of a tree vnknown, or at leaſt not certainly knowne; for this figure which I here giue you out of *Cluſius*, was gotten, and the hiſtory framed as you ſhall hear by his own words, taken out of his *Scholia* vpon the 21 Chapter of *Monardus*. About the beginning (ſaith he) of the yeare 1601, I receiued from *Peter Garret* a branch of a foot long, which he writ was giuen him by a certain Surgeon lately returned from America, for a branch of the tree *Guaiacum:* which if it be a branch of the true Guaiacum, then hath *Nicolas Monardus* ſleightly enough ſet downe the hiſtory of this tree. I thus deſcribed the branch that was ſent me.

This branch was a foot long, very writhen and diſtinguiſhed with many knots, ſcarſe at the lower end equalling the thickeneſſe of a writing pen or gooſe quil, hauing an hard and yellowiſh wood, and a wrinkeled barke of an aſh colour: at the vpper end it was diuided into ſlender branches, wherof ſome yet retained their leaues, and other ſome the floures and the rudiment of the fruit: the leaues, or more truly the wings or foot-ſtalkes of the leaues grew on ſlender branches one againſt another, each winged leafe hauing foure or ſix little leaues, alwaies growing by couples one againſt another, as in the Maſticke tree; and theſe are thickiſh, round, and diſtinguiſhed with many veins, which by reaſon of their drineſſe (as I obſerued) would eaſily fall off, leauing the footſtalks naked, and only retaining the markes whereas the leaues had bin. In the knots or vpper branches there grew as it were ſwellings, out of which together grew ſix, eight, ten, or more ſlender footſtalks, ſome inch long, each carrying a floure not great, conſiſting of ſix little leaues (but whether white, yellow, or blew, I could not by reaſon of the drineſſe iudge:) out of the middeſt of the floure grew many little threds, and in ſome the rudiment of the fruit began to appeare, hauing two cells, almoſt ſhaped like the ſeed-veſſell of the common Shepheards purſe.

Thus much *Cluſius*; who afterwards receiued the fruit from two or three, but the moſt perfect from the learned Apothecarie *Iohn Pona* of Verona: they are commonly parted into two parts or cels, yet hee obſerued one with three: he found longiſh ſtones in them almoſt like thoſe of *Euonymus*, and they conſiſted of a very hard and hairy ſubſtance like to that of the Date ſtones, containing a ſmooth kernell of a yellowiſh colour.

Now will I giue you the deſcriptions of *Monardus:* then what I haue obſerued my ſelfe of this wood, which I muſt confeſſe is very little, yet which may giue ſome light to the ignorant. Of this wood (ſaith *Monardus*) many haue written many waies, ſaying that it is either Ebonie, or a kinde of Box, or calling it by ſome other names. But as it is a new kind of tree not found in theſe Regions, or any other of the whole world deſcribed by the Antients, but onely thoſe of late diſcouered; ſo this ſhal be a new tree to vs: howeuer it be, it is a large tree of the bigneſſe of Ilex, ful of branches, hauing a great matrix or blackiſh pith, the ſubſtance of the wood being harder than Ebonie: The bark is thick, gummy or fat, and when the wood is dry falls eaſily off: the leaues are ſmal and hard: the floure yellow; the which is followed by a round ſollid fruit, containing in it ſeeds like thoſe of the Medlar.

It growes plentifully in the Iſles of *Sancto Domingo*.

Another kind of this was afterwards found in the Iſland of S. Iohn de Puerto rico, neere to the former: it is alſo like the laſt deſcribed, but altogether leſſe, and almoſt without matrix or pith, ſmelling ſtronger, and being bitterer than the former: which being left, this is now in vſe, and of the wondrous effects it is called *Lignum ſanctum*; neither without deſert, being (experience giuing teſtimonie) it excels the other; yet both their faculties are admirable in curing the French diſeaſe, and therefore the water or decoction of both of them are drunk, either mixed together, or ſeuerally, both for the cure of the forementioned diſeaſe, as alſo againſt diuers other affects. Thus much for *Monardus* his deſcription.

The wood which is now in vſe with vs is of a large tree, whoſe wood is very heauy, ſollid, and fit to turne into bowles or the like, and all that I haue yet ſeen hath beene wholly without matrix or pith, and commonly it is of a dark browniſh colour ſomwhat inclining to yellow, hauing a ring of white ingirting it next to the barke: I haue obſerued a tree whoſe diametre hath bin two foot and a quarter, to haue had as little or leſſe of this white wood, than one whoſe diametre was 13 inches; and this which had thirteen inches had only a white circle about it of one inch in bredth. I thinke the yonger the tree is, the bigger the white circle is: the beſt wood is denſe, heauy, browniſh, leauing a quick and biting taſt in the decoction, as alſo his ſmell and colour. The bark of this wood is alſo denſe and heauy, of a hard ſubſtance and yellowiſh colour within, but rough and greeniſh, or elſe grayiſh without, and of ſomewhat a bitteriſh taſt. Thus much for the deſcription of the wood and his bark. Now let me ſay ſomewhat briefly of the temperature and qualities.

¶ *The Temperature and Vertues.*

A It is iudged to be hot and dry in the ſecond degree: it hath a drying, attenuating, diſſoluing, and clenſing facultie, as alſo to moue ſweat, and reſiſt contagion and putrefaction.

B The decoction of the bark or wood of Guaiacum, made either alone or with other ingredients, as ſhall be thought moſt fit for the temper and age of the patient, is of ſingular vſe in the cure of the French Poxes, and it is the moſt antient and powerfull antidote that is yet knowne againſt that diſeaſe. I forbeare to ſpecifie any particular medicine made thereof, becauſe they are well enough knowne to all to whom this knowledge belongs, and they are aboundantly ſet downe by all thoſe that haue treated of that diſeaſe.

C It alſo conduceth to the cure of the Dropſie, Aſthma, Epilepſie, the diſeaſe of the bladder and reines, paines of the joints, flatulencies, crudities, and laſtly all Chronicall diſeaſes proceeding from cold and moiſt cauſes: for it oftentimes works ſingular effects whereas other medicines little preuaile.

D It doth alſo open the obſtructions of the liuer and ſpleen, warms and comforts the ſtomack and all the intrals, and helps to free them from any groſſe viſcous matter that may be apt to breed diſeaſes in them.

CHAP. 20.

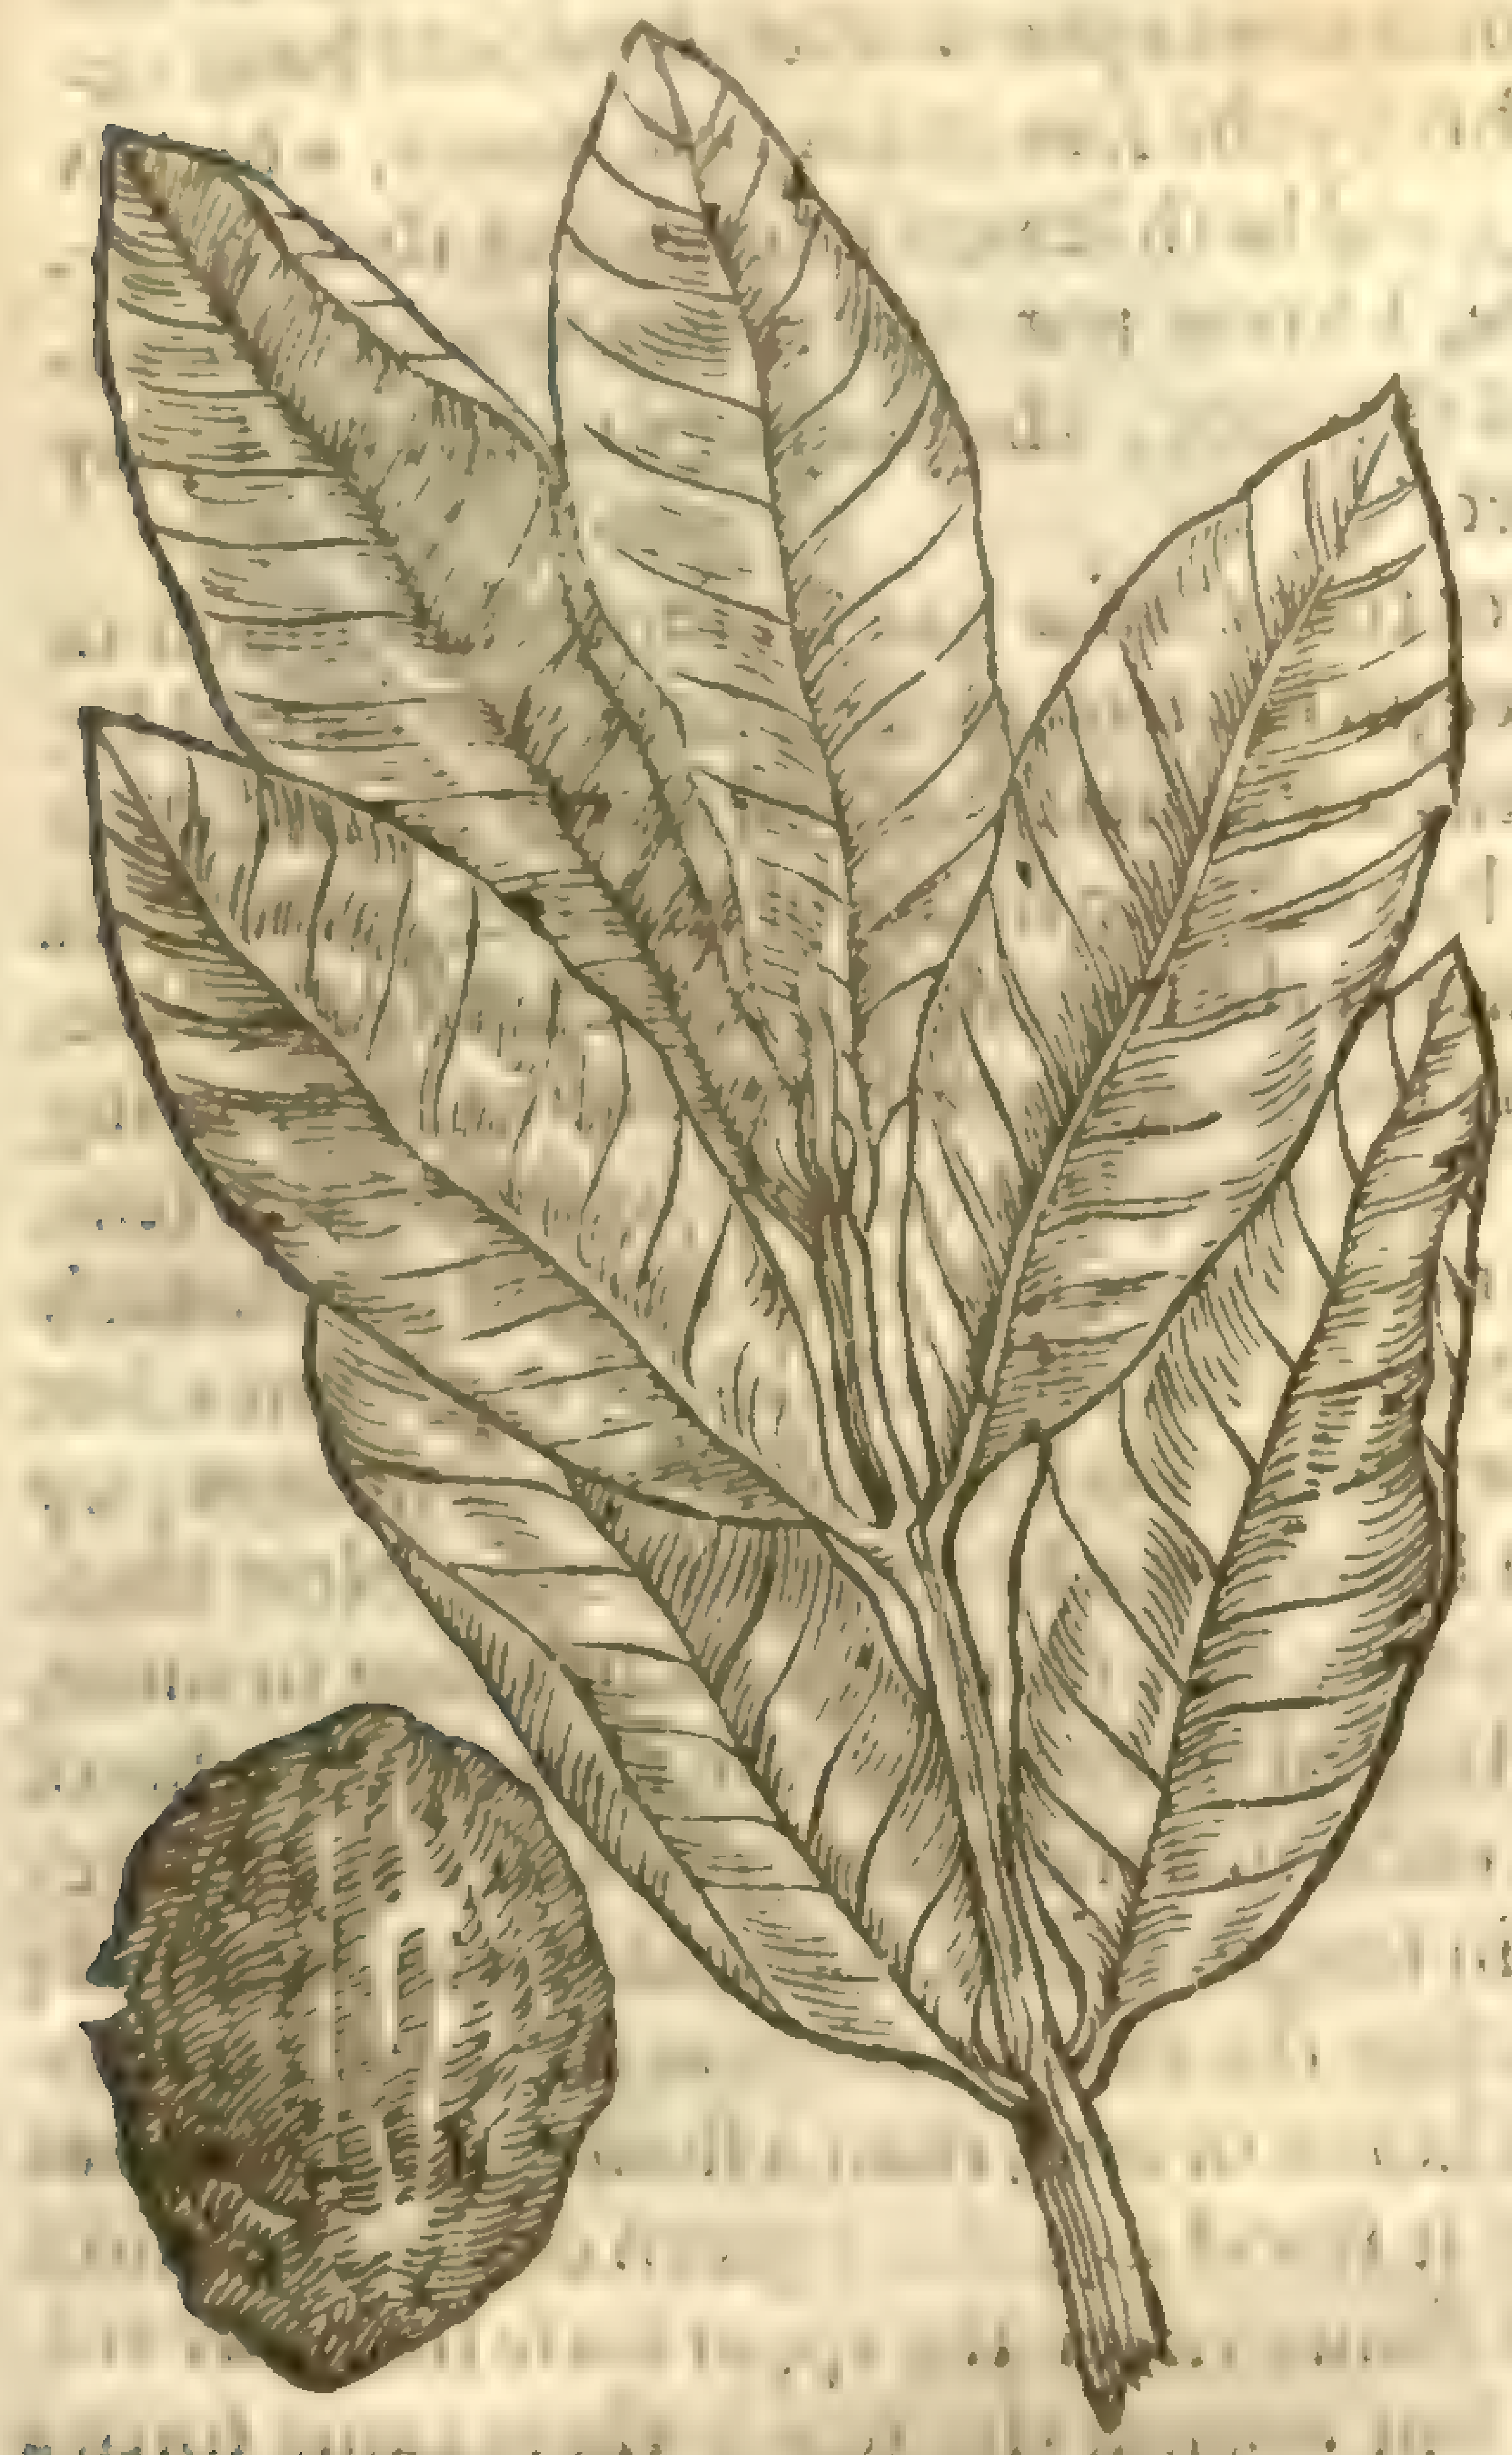
Of Guayaua or Orange-Bay.

¶ *The Deſcription.*

Simon de Touar ſent *Cluſius* a branch of the tree which the Spaniards cal *Guayauas*, from which he drew this figure, thus deſcribing it. This branch, (ſaith *Cluſius*) whoſe vpper part together with the fruit I cauſed to be drawne, was ſome foot long, foure ſquare, alternately ſet with leaues growing by couples, being foure inches long, and one and a halfe or two broad, of the forme of Bay leaues, very firm, hauing a ſwelling rib running alongſt the lower ſide, with veins running obliquely from thence to the ſides, of an aſh or grayiſh colour beneath, but ſmooth aboue, with the veins leſſe appearing: which broken, though old, yet retained the ſmel of Bay leaues, and alſo after ſome ſort the taſte: the fruit was ſmooth, yet ſhriueled, becauſe peraduenture it was vnripe, of the bigneſſe of a ſmall apple, longiſh, blackiſh on the out-ſide like a ripe plumme, but within full of a reddiſh pulpe, of an acide taſt; and in the middle were many whitiſh ſeeds of the bignes of Millet, or thoſe that are in Figs.

Nicolas Monardus (as hee is turned into Latine by *Cluſius*) thus giues vs the hiſtory of *Guayauas*, in his ſixty fourth Chapter. It is a Tree (ſaith he) of an indifferent bigneſſe, and hath ſpreading branches, the leafe of the Bay, and a white floure like that of the Orange, yet ſomewhat bigger, and

Guajavæ arboris ramus.
The Orange Bay.



Pſidium pyriferum, L.
[illegible]

and well ſmelling. It eaſily grows whereſoeuer it be ſowne, and ſo ſpreds and creepes that it is accounted as a weed, for it ſpoiles the ground of many paſtures with the too much ſpreding as brambles do. The fruit is like to our apples, of the bigneſſe of thoſe the Spaniards call *Camueſas*, green at the firſt, and of a golden colour when they be ripe, with their inner pulp white, and ſomtimes red; diuided: it hath foure cels, wherein lie the ſeeds, like thoſe of the Medlars very hard, of a browniſh colour, wholly ſtony, without kernell and taſte.

A The fruit is vſually eaten, the rind being firſt taken off; it is pleaſing to the palat, wholſome & eaſie of concoction: being green it is good in fluxes of the belly, for it powerfully bindes; and ouer or throughly ripe it looſeth the belly: but between both, that is, neither too green nor ouer-ripe, if roſted it is good both for ſound and ſick; for ſo handled it is wholeſomer, and of a more pleaſing taſte: that alſo is the better which is gathered from domeſticke and husbanded trees: the Indians profitably bath their ſwolne legs in the decoction of the leaues, and by the ſame they free the ſpleene from obſtruction. The fruit ſeemes to be cold, wherefore they giue it roſted to ſuch as are in Feuers. It growes commonly in all the VVeſt Indies. So much *Monardus*.

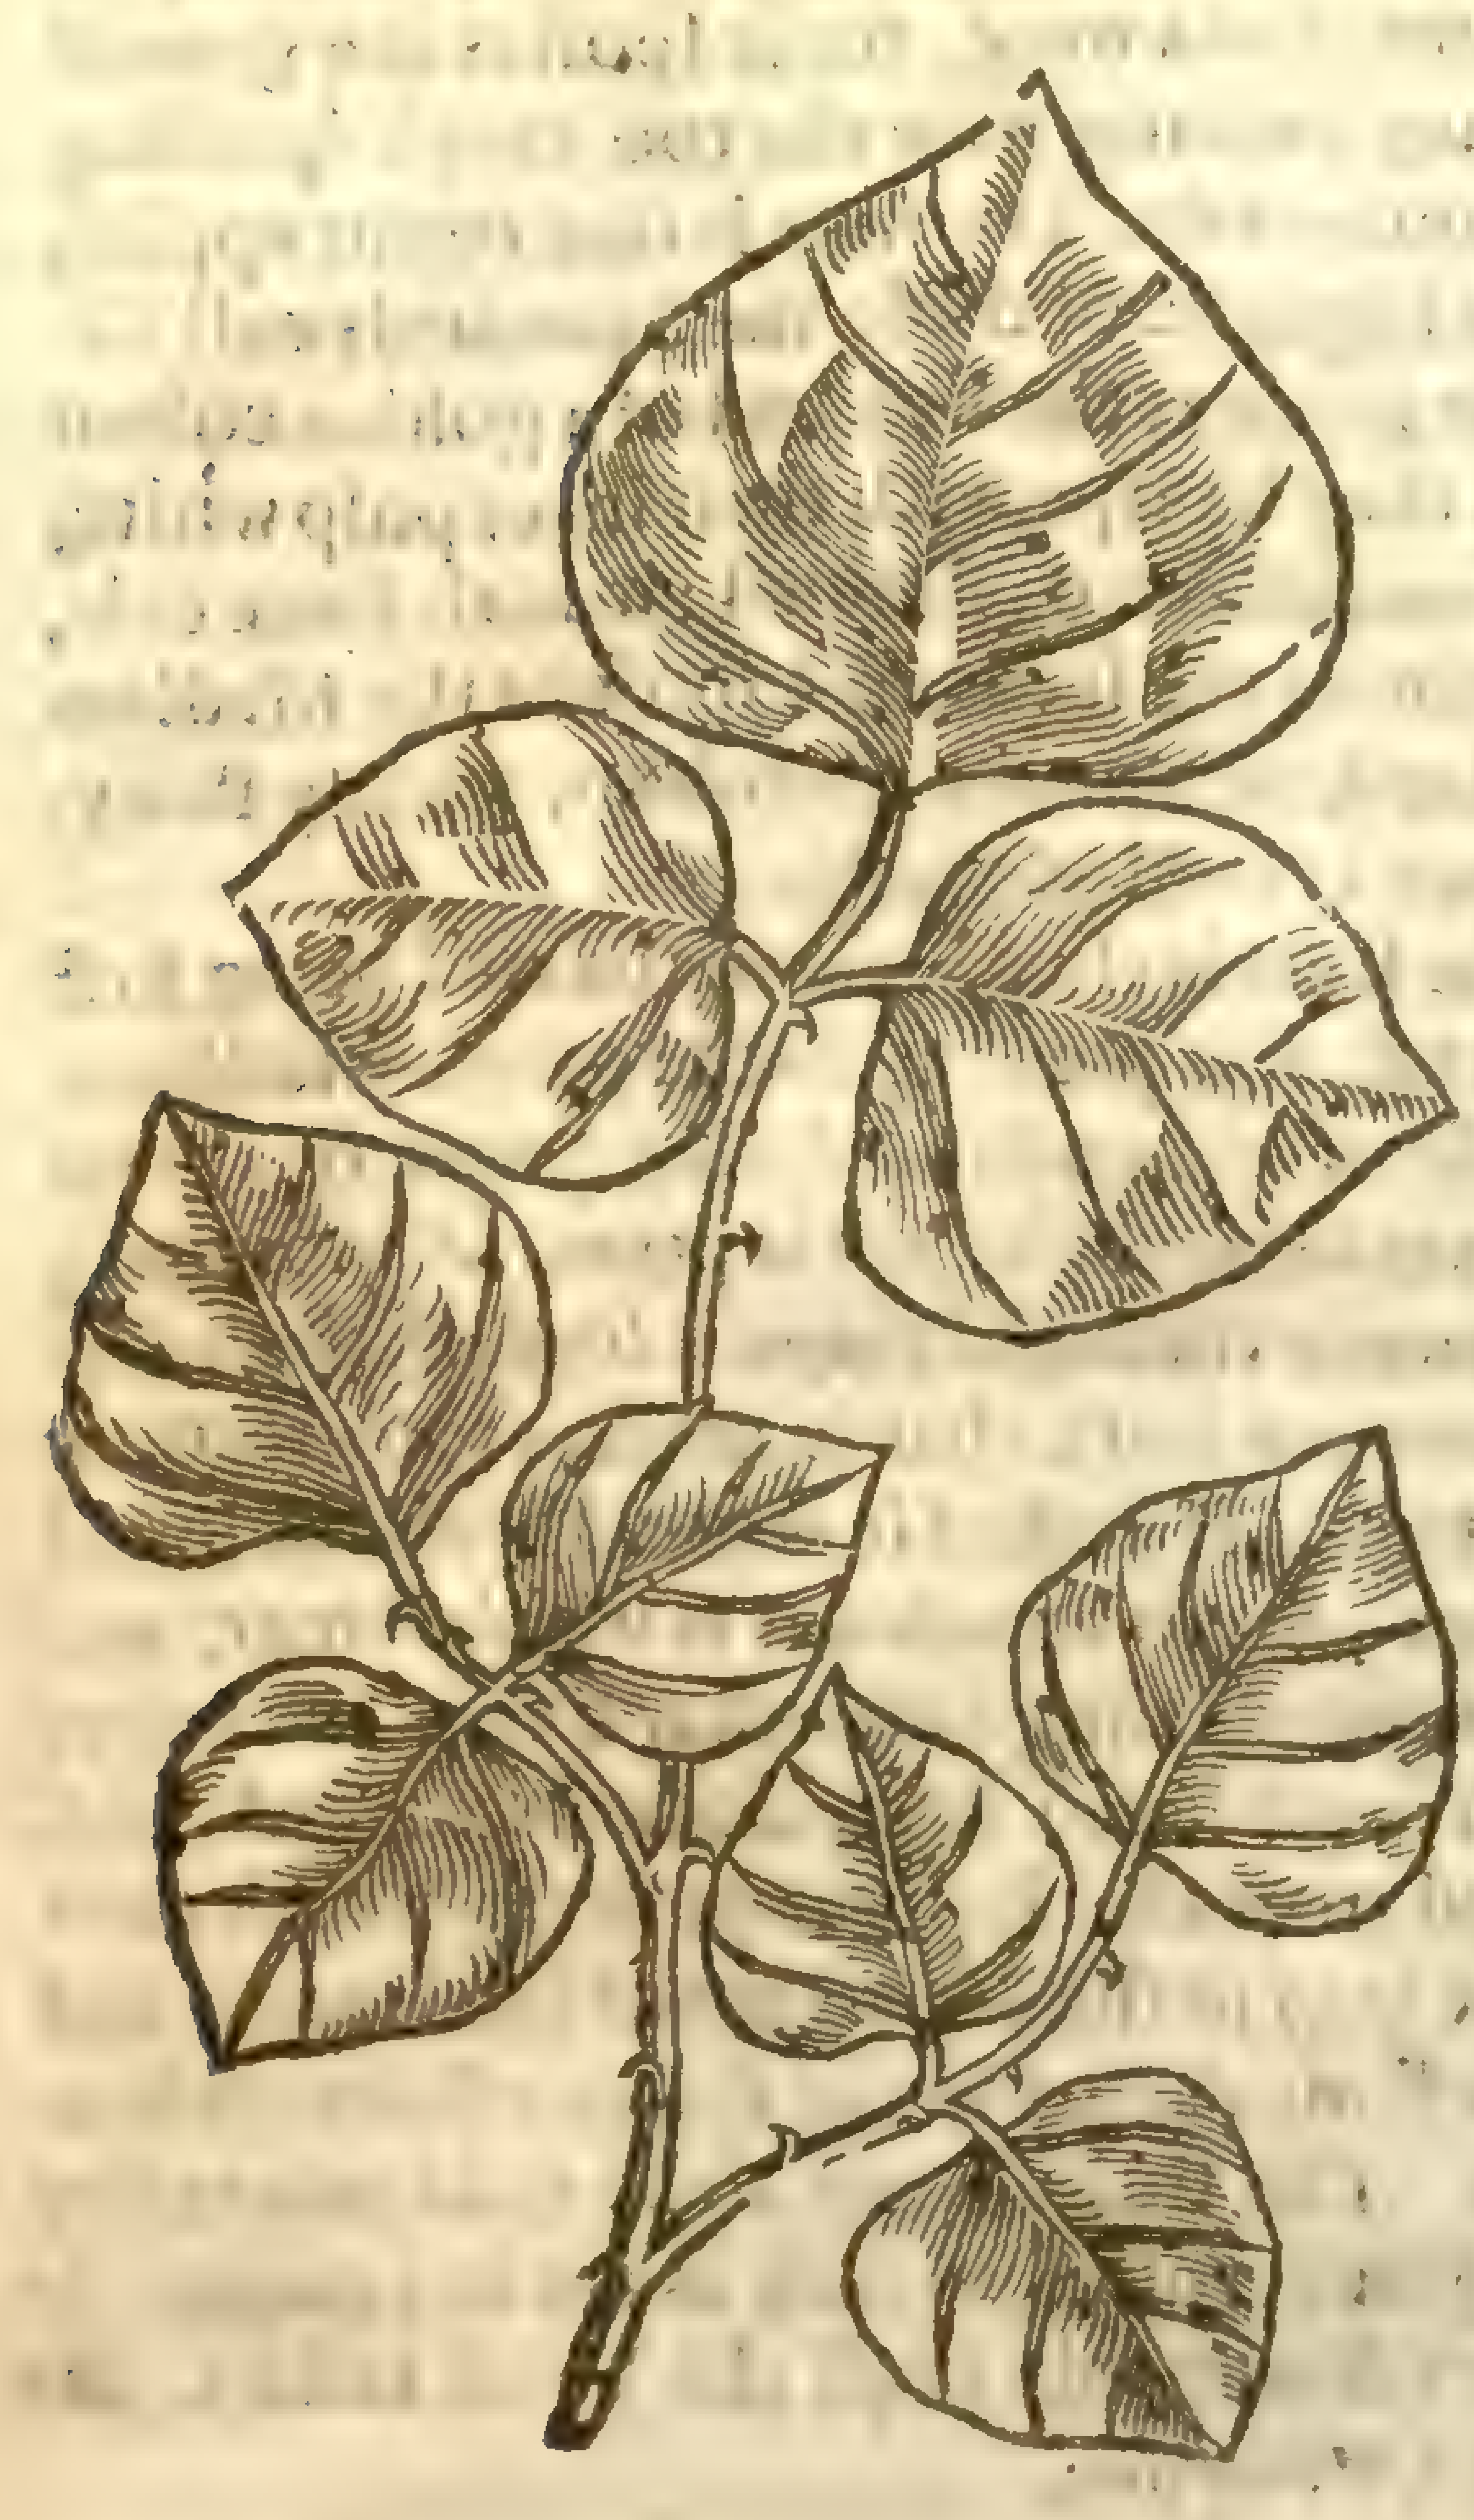
CHAP. 21. *Of the Corall tree.*

¶ *The Deſcription.*

THe ſame laſt mentioned, *Simon de Tovar* a learned and prime phyſition of Seuill ſent *Cluſius* three or foure branches of this tree, from whence he framed this hiſtory and figure. He writ (ſaith *Cluſ.*) that this tree grew in his garden, ſprung vp of ſeeds ſent from America, which had the name of Corall impoſed on them, by reaſon the floures were like Corall, but he did not ſet down their ſhape, writing only this in his letter: That hee had two little ſhrubs which had borne floures, and that the greater of them bore alſo cods full of large beans, but in the extreme Winter, which they had the yeare before, he loſt not only that tree and others ſprung vp of Indian ſeed, but alſo many other plants. Now ſeeing that this tree carries cods, I conjecture the floures were in form not vnlike to thoſe of Peaſe, or of the tree called *Arbor Iudæ*, but of another colour, to wit, red like Corall; eſpecially ſeeing that in the Catalogue of his garden which he ſent me the yeare before, he had writ thus: [*Arbor Indica dicta Coral, ob ejus florem ſimilem Corallo, &c.* That is, An Indian tree called Corall, by reaſon of the floure like to Corall, whoſe leaues are very like thoſe of *Arbor Iudæ*, but this hath thorns, which that wants.] And verily the branches which he ſent (for he writ he ſent the branches with the leaues, but the tree brought out ſome twice or thrice as big) had leaues not much vnlike thoſe of *Arbor Iudæ*, but faſtned to a ſhorter foot-ſtalke, and growing one againſt another, with a ſingle one at the end of the branch, which was here and there ſet with ſharp & crooked prickles; but whether theſe branches are onely the ſtalkes of the leaues, or perfect branches, I doubt, becauſe all that he ſent had three leaues apiece: I could eaſily perſuade my ſelfe they were only leaues, ſeeing the vpper part ended in one leafe, and the lower end of one amongſt the reſt, yet ſhewed the place where it ſeemed it grew to the bough. But I affirme nothing, ſeeing there was none whereof I could enquire, by reaſon of his death who ſent them me, which hapned ſhortly after; yet I haue made the form of the leaues, with the maner as I conjectured they grow, to be deli-

neated

Coral arboris ramus.
A branch of the Coral tree.



neated in the figure which I heere giue you. Whether *Matthiolus* in the laſt edition of his Commentaries vpon *Dioſcorides* would haue expreſt this by the *Icon* of his firſt *Acacia*, which is prickly, and hath leaues reſembling thoſe of *Arbor Iudæ*, I know not: but if hee would haue expreſſed this tree, the painter did not well play his part.

After that *Cluſius* had ſet forth thus much of this tree, in his *Hiſt. rarior. plant.* the learned Dr. *Caſtaneda* a Phyſitian alſo of Sevill certified me (ſaith he) that the flours of this tree grow thick together at the tops of the branches, ten, twelue, or more hanging vpon ſhort footſtalks, growing out of the ſame place: whoſe figure he alſo ſent, but ſo rudely drawne, that I could not thereby haue come to any knowledge of the floures, but that he therewith ſent me two dried floures, by which I partly gathered their form. Now theſe floures were very narrow, 2 inches long or more, conſiſting of three leaues, the vppermoſt wherof much exceeded the two narrow ones on the ſides both in length and bredth, and it was doubled; but before the flour was opened it better reſembled a horne or cod, than a floure, and the lower end of it ſtood in a ſhort green cup in the midſt of the floure vnder the vpper leafe that was folded, but open at the top; there came forth a ſmooth pointall, diuided at the top into nine parts or threds, whoſe ends of what colour they were, as alſo the threds, I know not, becauſe I could not gather by the dried flour, whoſe colour was quite decayed, and the picture it ſelfe expreſſed no ſeparation of the leaues in the floure, no forme of threds, but only the floures ſhut, and reſembling rather cods than floures, and thoſe of a deep red colour. But if I could haue ſeen them freſher, I ſhould haue been able to haue giuen a more exact deſcription: wherefore let the Reader take in good part that which I haue here performed. Thus much *Cluſius*.

CHAP. 22. *Of the Sea Lentill.*

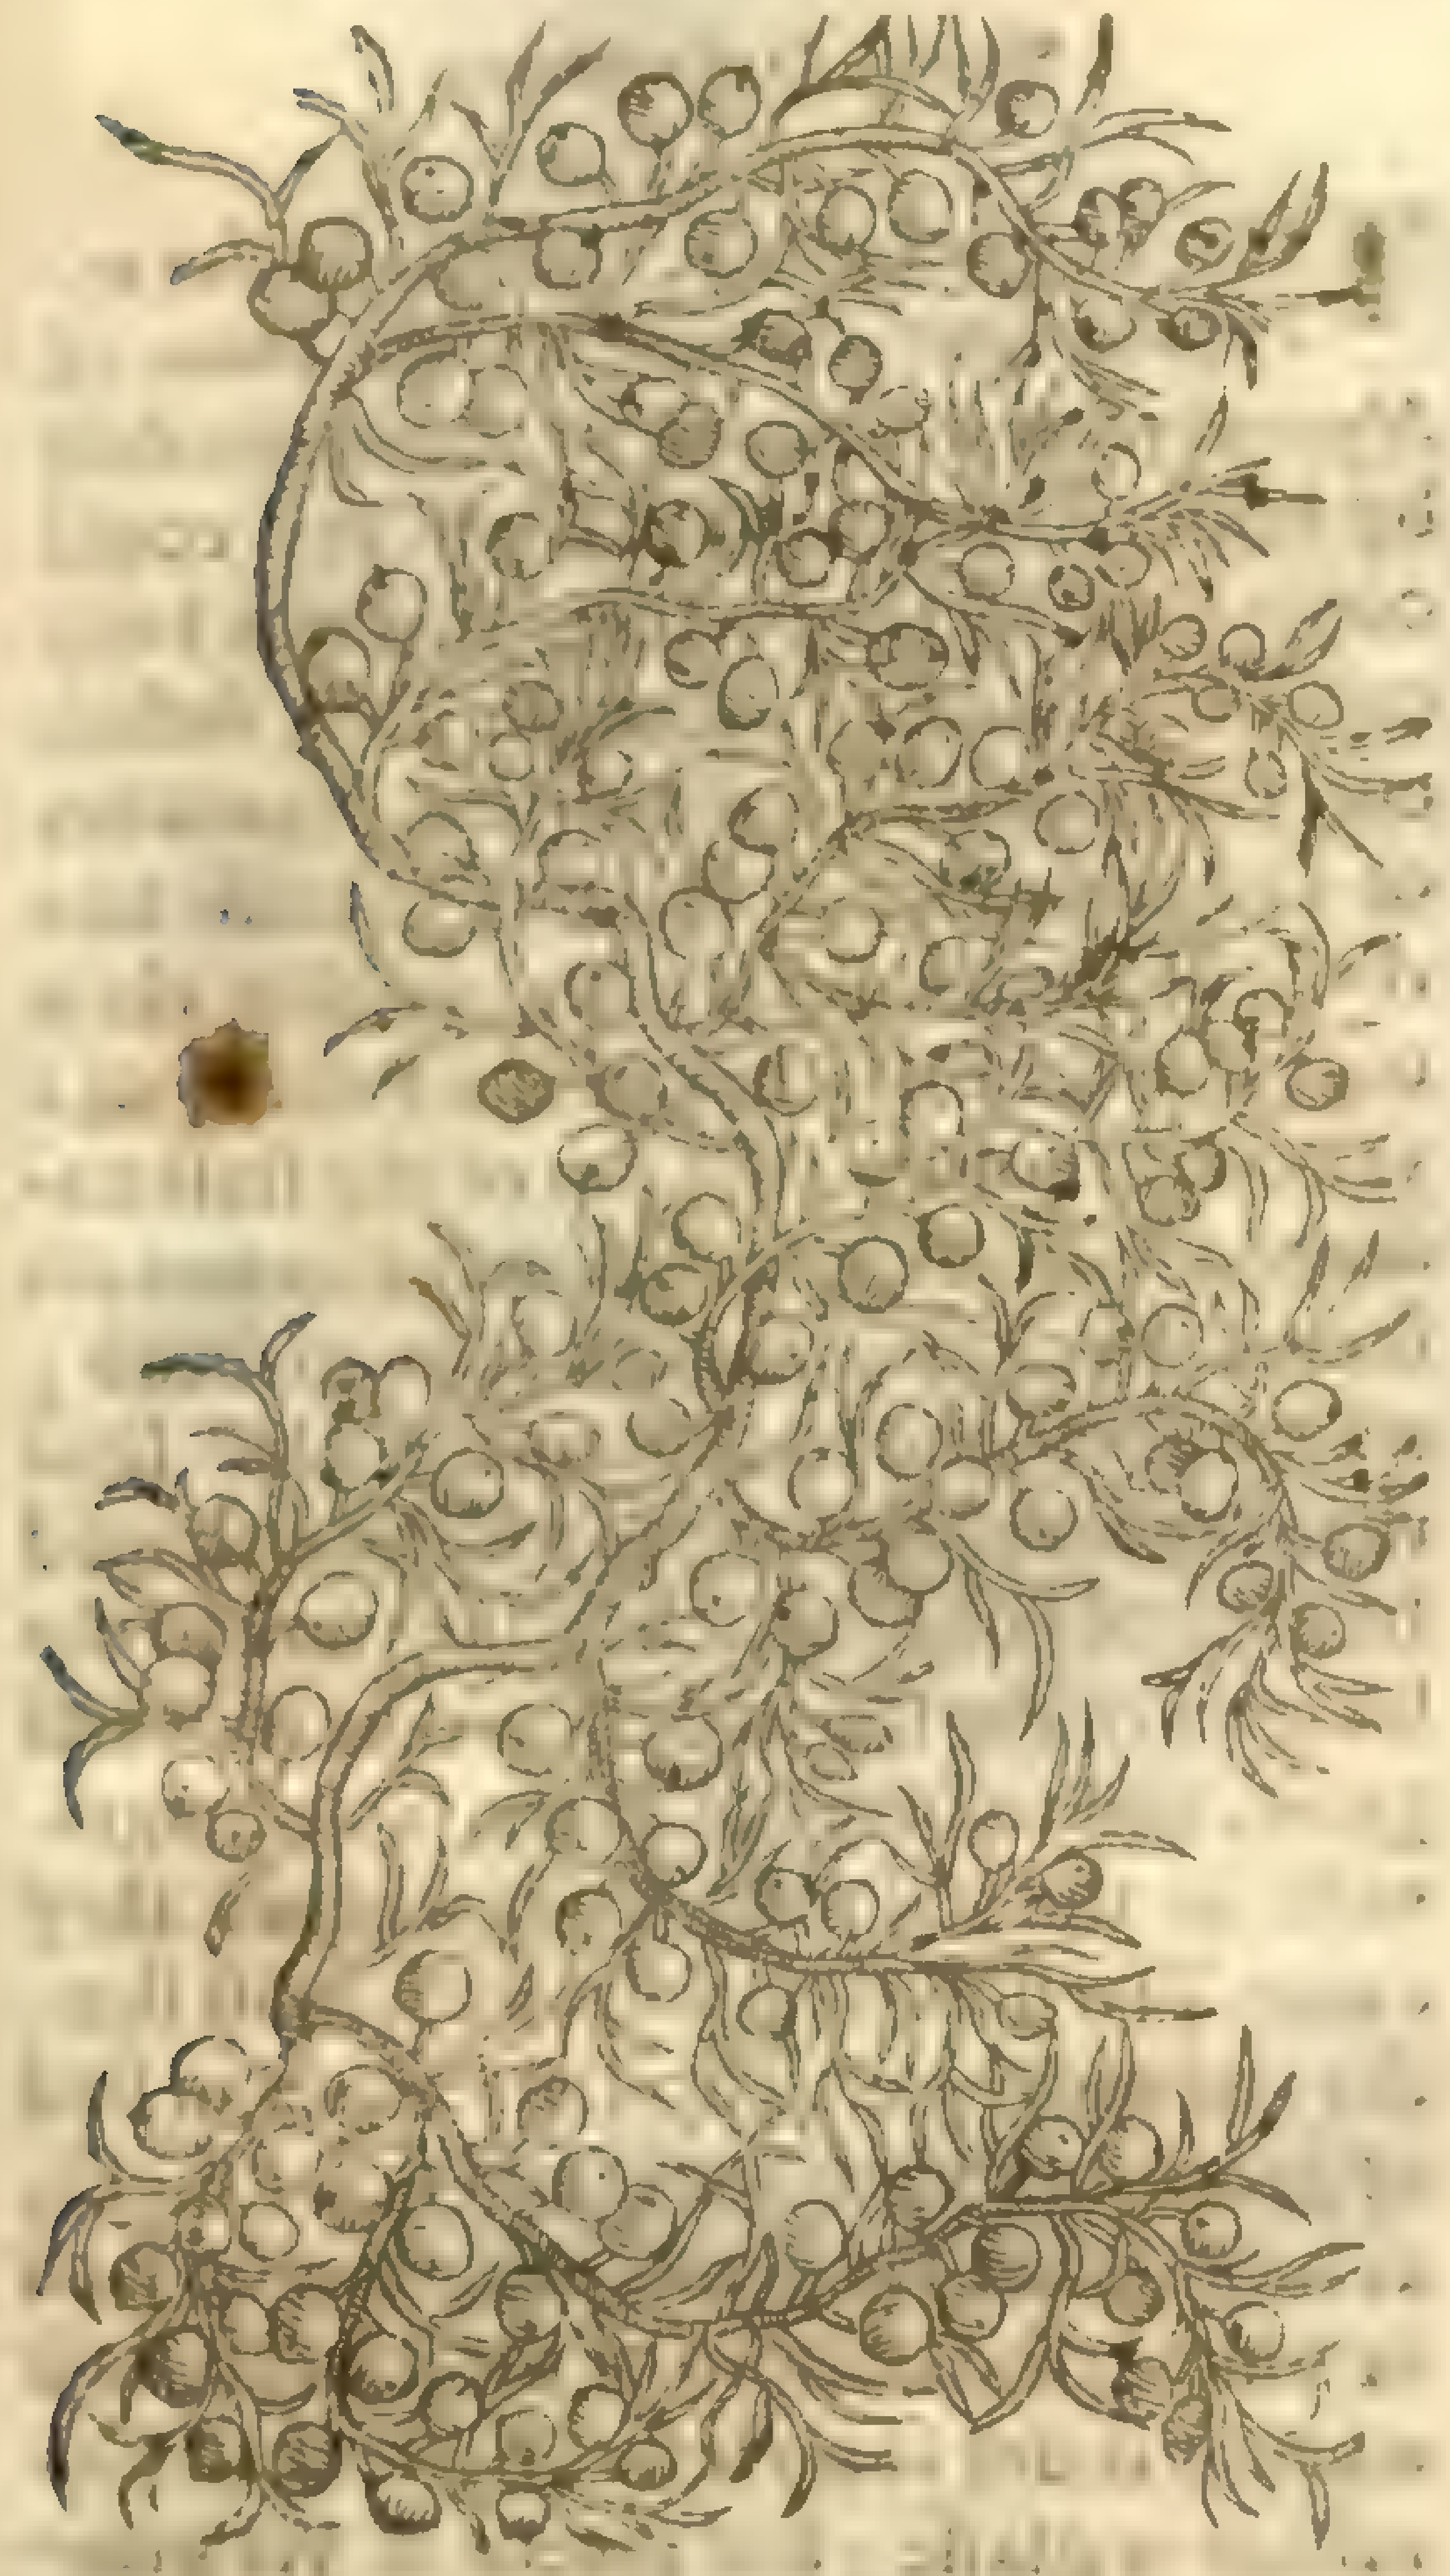
¶ *The Deſcription.*

SOme call this *Vua marina*; and others haue thought it the *Lenticula marina* of *Serapio*, but they are deceiued; for his *Lenticula marina* deſcribed in his 245 chap. is nothing els but the *Muſcus marinus* or *Bryon thalaſſion* deſcribed by *Dioſcorides, lib.4. cap.99.* as any that compare theſe two places together may plainly ſee.

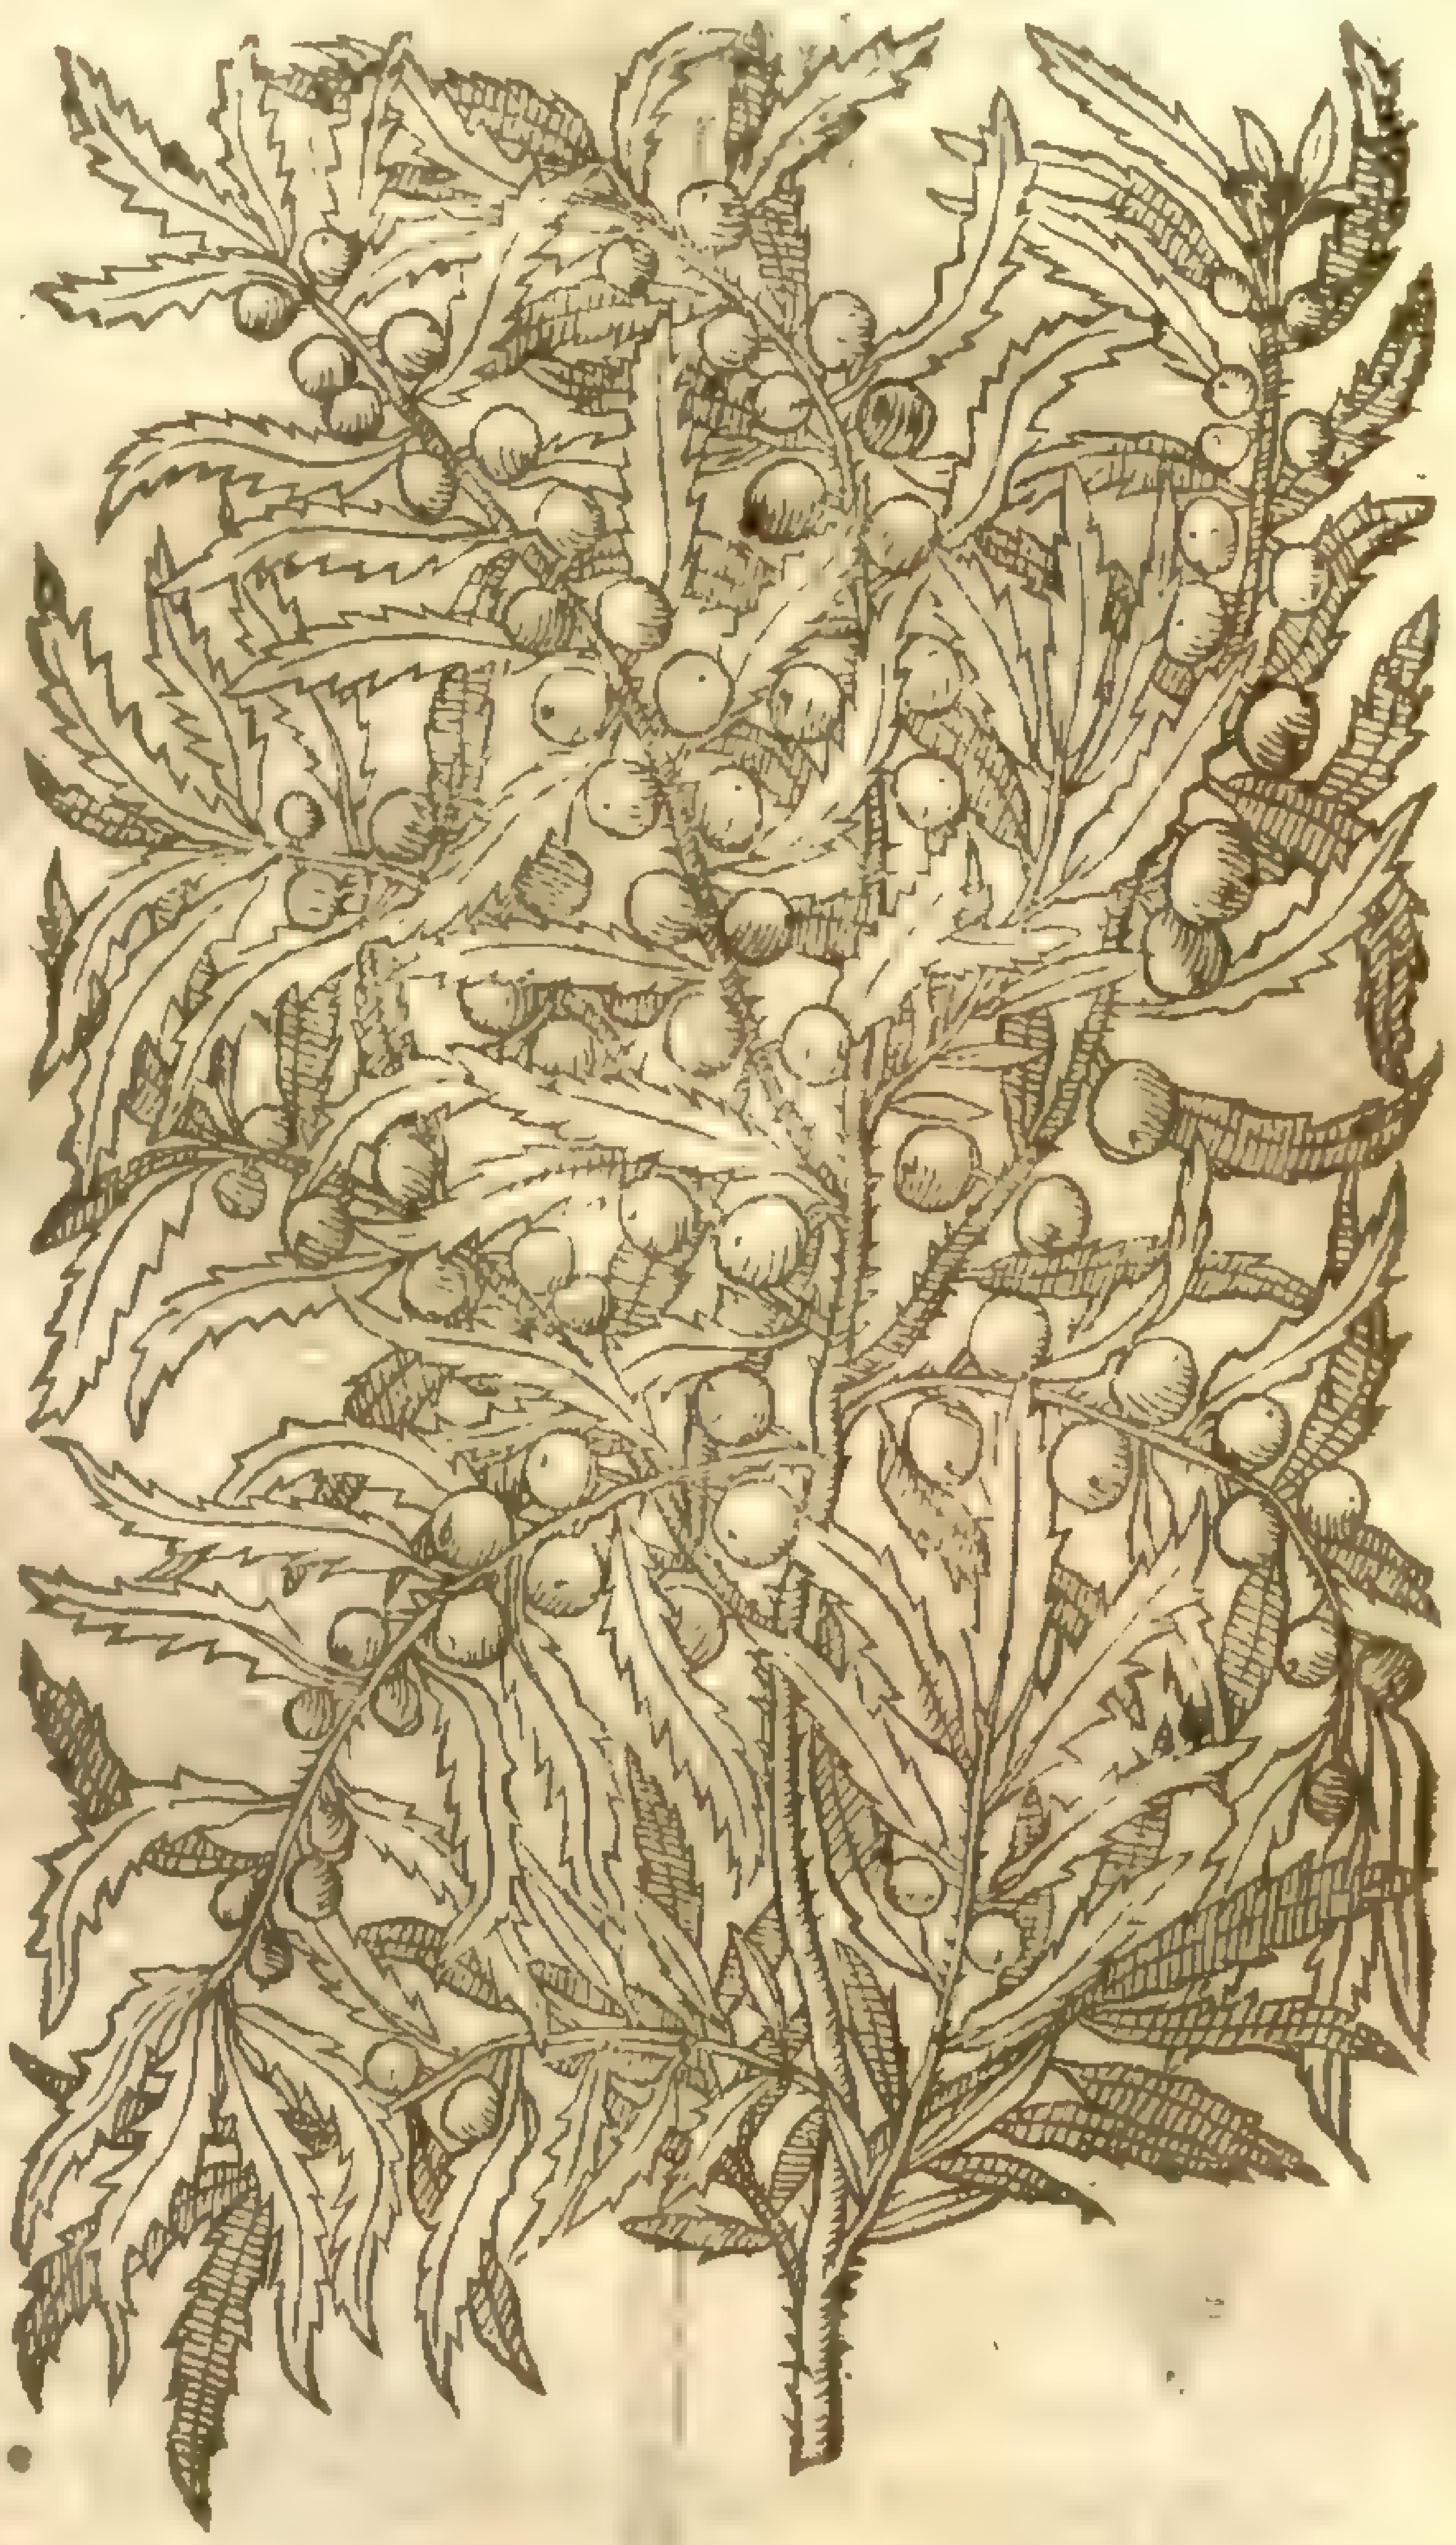
1 The former of theſe hath many winding ſtalks, whereon grow ſhort branches ſet thick with narrow leaues like thoſe of Beluidere or Beſom flax, and amongſt theſe grow many skinny hollow empty round berries of the bigneſſe and ſhape of Lentils, whence it takes the name. This growes in diuers places of the Mediterranian and Adriatick ſeas.

2 This differs little from the former, but that the leaues are broader, ſhorter, and ſnipt about the edges. But this being in probabilitie the *Sargazo* of *Acoſta*, you ſhall heare what he ſays thereof. In that famous and no leſſe to be feared nauigation del Sergazo (for ſo they which ſaile into the Indies call all that ſpace of the Ocean from the 18 to the 34 degree of Northerly latitude) is ſeen a deepe and ſpatious ſea couered with an herb called Serguazo, being a ſpanne long, wrapped with the tender branches as it were into balls, hauing narrow and tender leaues ſome halfe inch long, much

1 *Lenticula marina anguſtifolia.*
Narrow leafed ſea Lentill.



2 *Lenticula marina ſerratis folijs.*
Cut leafed ſea Lentill.



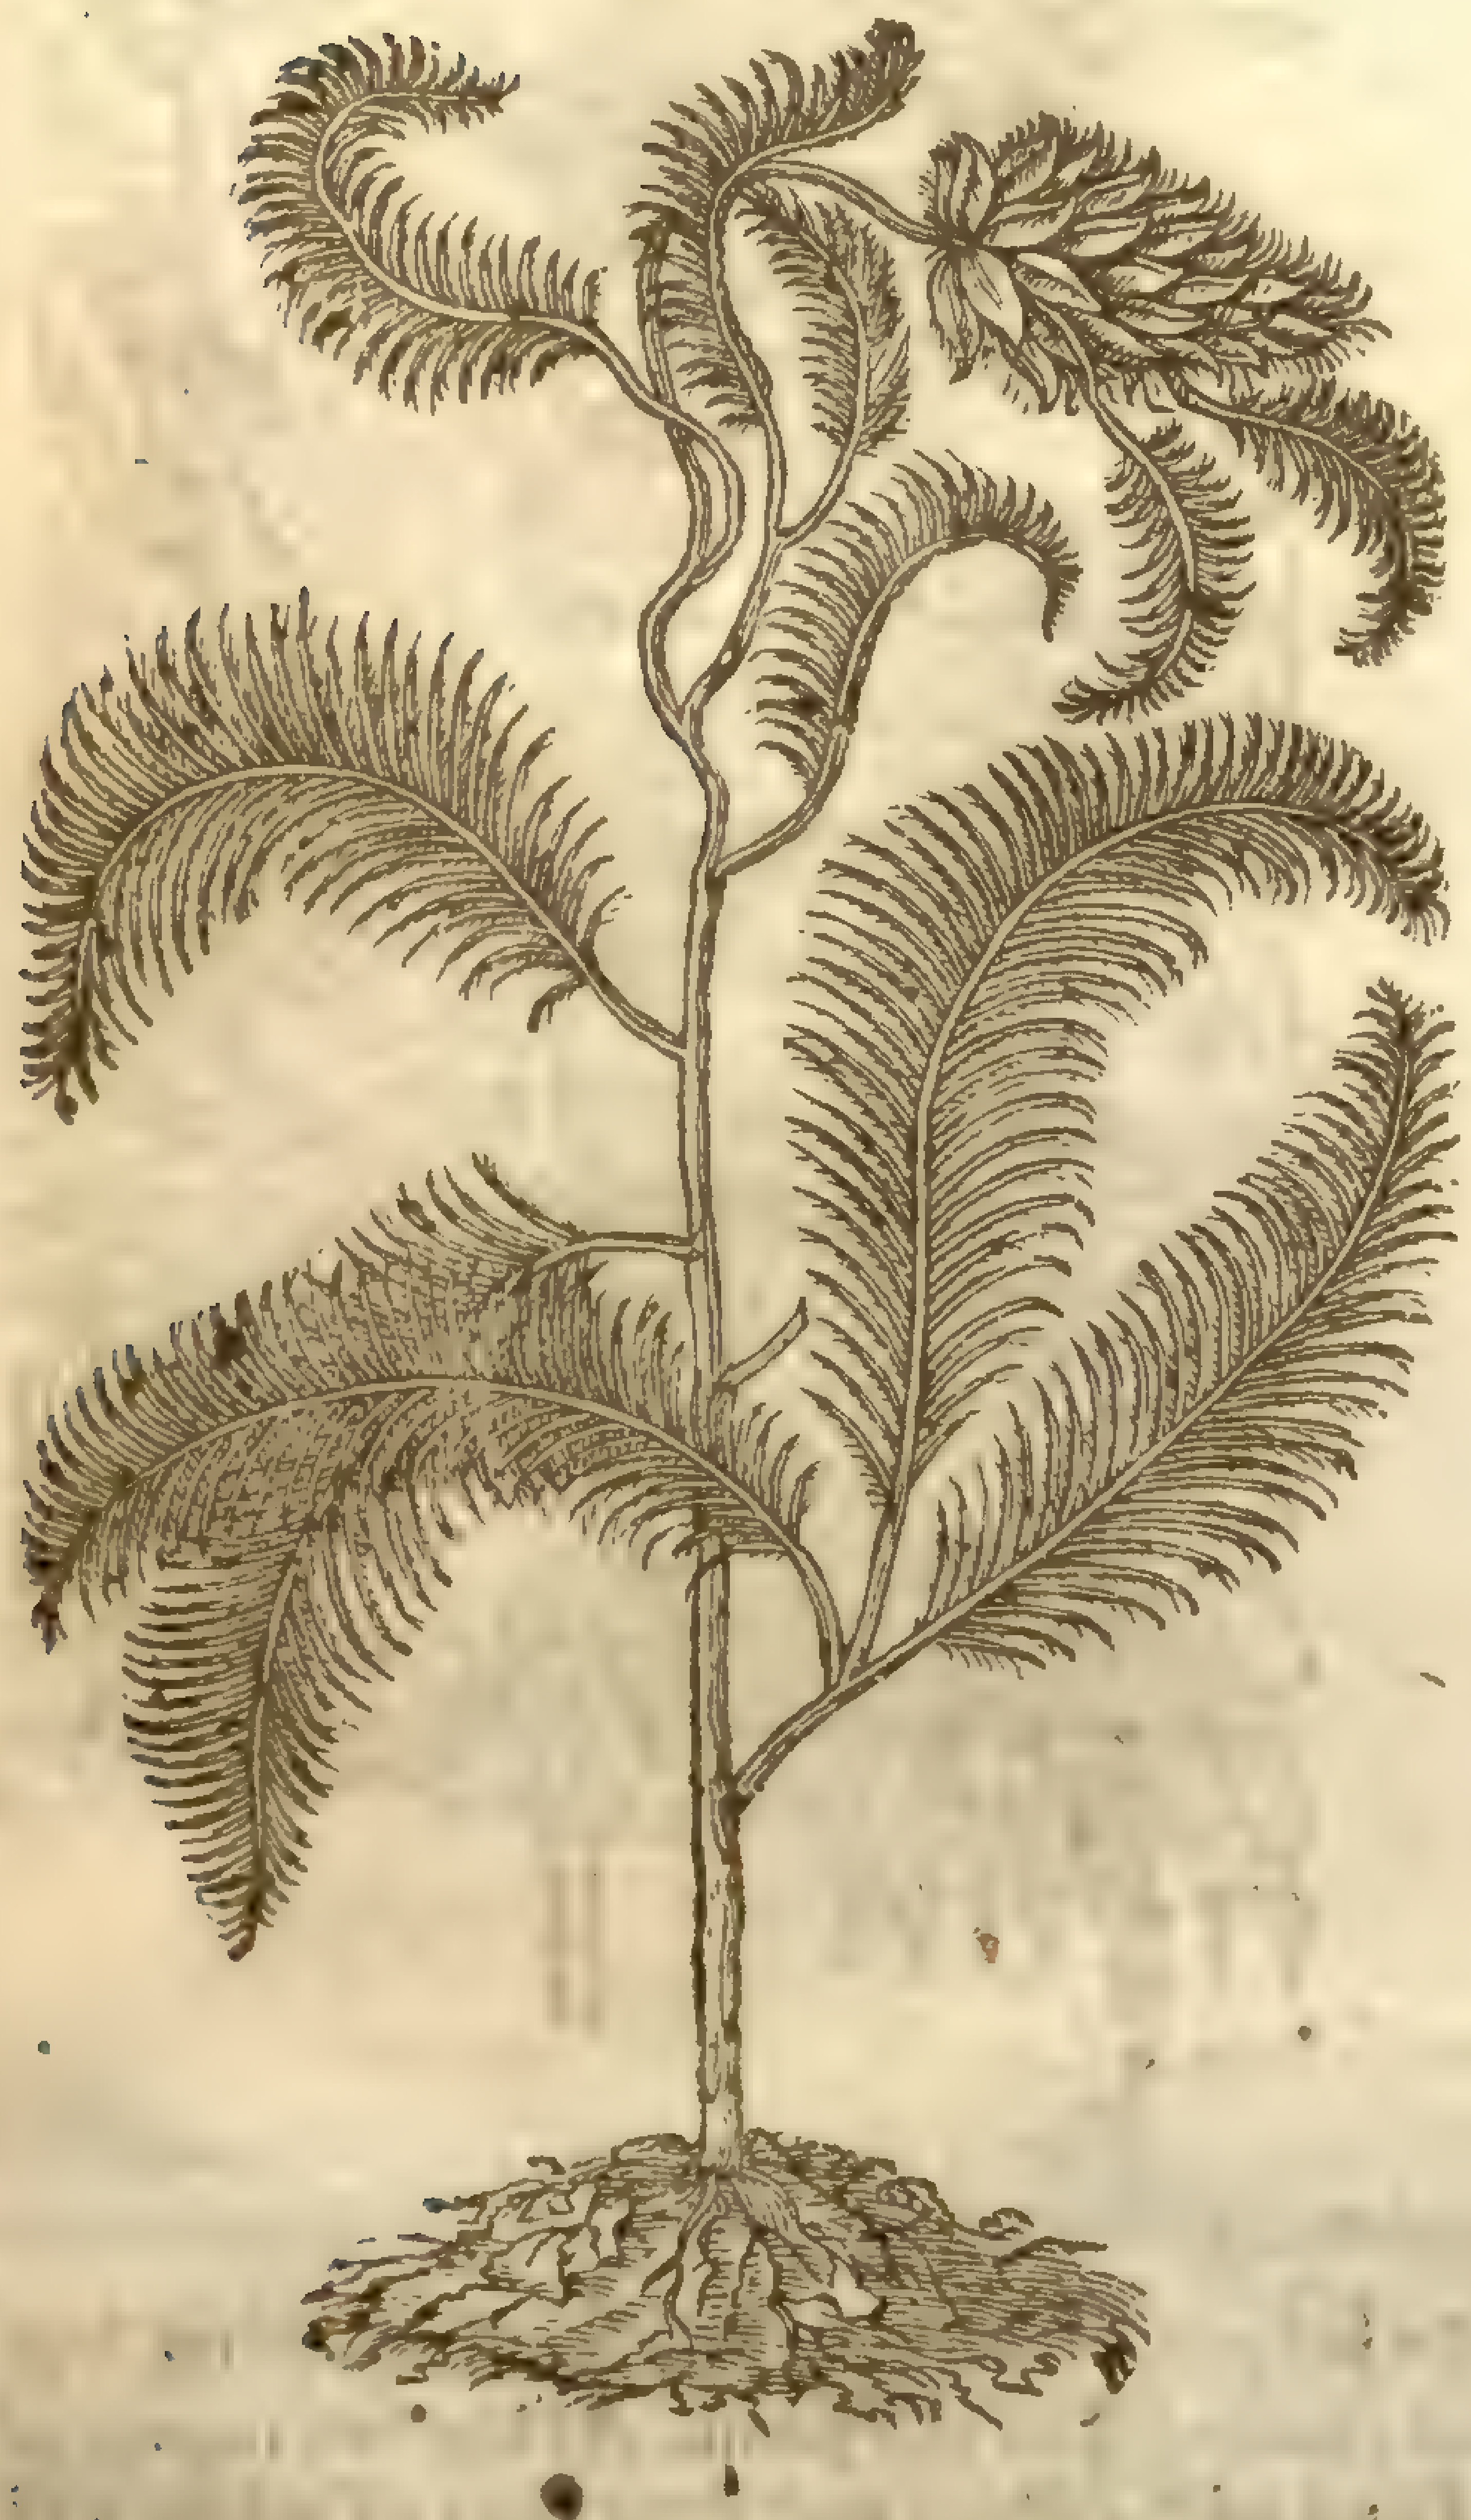
much ſnipt about the edges, of colour reddiſh, of taſte inſipid, or without any ſenſible biting, but what is rather drawn from the ſalt water, than naturally inherent to the plant. At the ſetting on of each leafe growes a ſeed round like a pepper corne, of a whitiſh colour, and ſomtimes of white and red mixt, very tender when it is firſt drawn forth of the water, but hard when it is dried, but by reaſon of the thinneſſe very fragil, and full of ſalt water; there is no root to be obſerued in this Plant, but only the marks of the breaking off appears, and it is likely it growes in the deep and ſandy bottom of the ſea, and hath ſmall roots: yet ſome are of opinion that this herb is plucked vp and caried away by the rapid courſe of waters that fall out of many Iſlands into the Ocean. Now the Maſter of the ſhip wherein I was did ſtiffely maintain this opinion, and in ſailing here we were becalmed; but as far as euer we could ſee we ſaw the ſea wholly couered with this plant; and ſending down ſome yong ſailers which ſhould driue the weeds from the ſhip and clenſe the water, we plainly ſaw round heaps thereof riſe vp from the bottom of the ſea, where by ſounding we could find no bottom.

A This plant pickled with ſalt and vineger hath the ſame taſt as Sampier, and may be vſed in ſtead thereof, and alſo eaten by ſuch as ſaile, in ſtead of Capers. I willed it ſhould be giuen newly taken forth of the ſea, to Goats which we caried in the ſhip, and they fed vpon it greedily.

B I found no faculties thereof; but one of the Sailers troubled with a difficulty of making water, caſting out ſand & groſſe humors, ate thereof by chance both raw and boiled, only for that the taſt thereof pleaſed him; after a few daies he told me that he found great good by the eating thereof, and he tooke ſome of it with him, that ſo he might vſe it when he came aſhore. Hitherto *Acoſta*.

CHAP. 23. *Of the Sea Feather.*

Myriophyllum marinum.
The Sea Feather.



¶ *The Deſcription.*

THis elegant plant, which *Cluſius* receiued from *Cortuſus* by the name of *Myriophyllum Pelagicum*, is thus deſcribed by him. As much (ſaith he) as I could conjecture by the picture, this was ſome cubit high, hauing a ſtraight ſtalk, ſufficiently ſlender, diuided into many branches or rather branched leaues, almoſt like thoſe of Fern, but far finer, bending their tops like the branches of the Palme, of a yellowiſh colour: the top of the ſtalke adorned with leſſer leaues ended in certain ſcales or cloues framed into an head; which are found to contain no other ſeed than tender plants already formed, ſhaped like the old one: which falling ſink to the bottom of the ſea, and there take root and grow, and ſo become of the ſame magnitude as the old one from whence they came. The ſtalk is faſtned with moſt ſlender and more than capillary fibres, in ſted of a root, not vpon rocks and oiſter ſhells, as moſt other ſea plants are, but on ſand or mud in the bottom of the ſea: this ſtalk when it is dry is no leſſe brittle than Coralline or glaſſe; but greene & yet growieg it is as tough and flexible as *Spartum*, or Matweed.

¶ *The Place.*

It groweth in the deepeſt ſtreames of the Illyrian ſea, whence the fiſhermen draw it forth with hooks or other inſtruments, which they call Spern. The whole plant though dried retains the faculties.

¶ *The Names.*

The Italian fiſhermen call it *Penachio delle Ninfe*, and *Palma de Nettuno*: ſome alſo, *Scettro di Nettuno.*

¶ *The Vertues.*

A They ſay it is good againſt the virulent bites of ſea Serpents, and the venomous ſtings or pricks of fiſhes.

B Applied to ſmall green wounds it cures them in the ſpace of 24 houres.

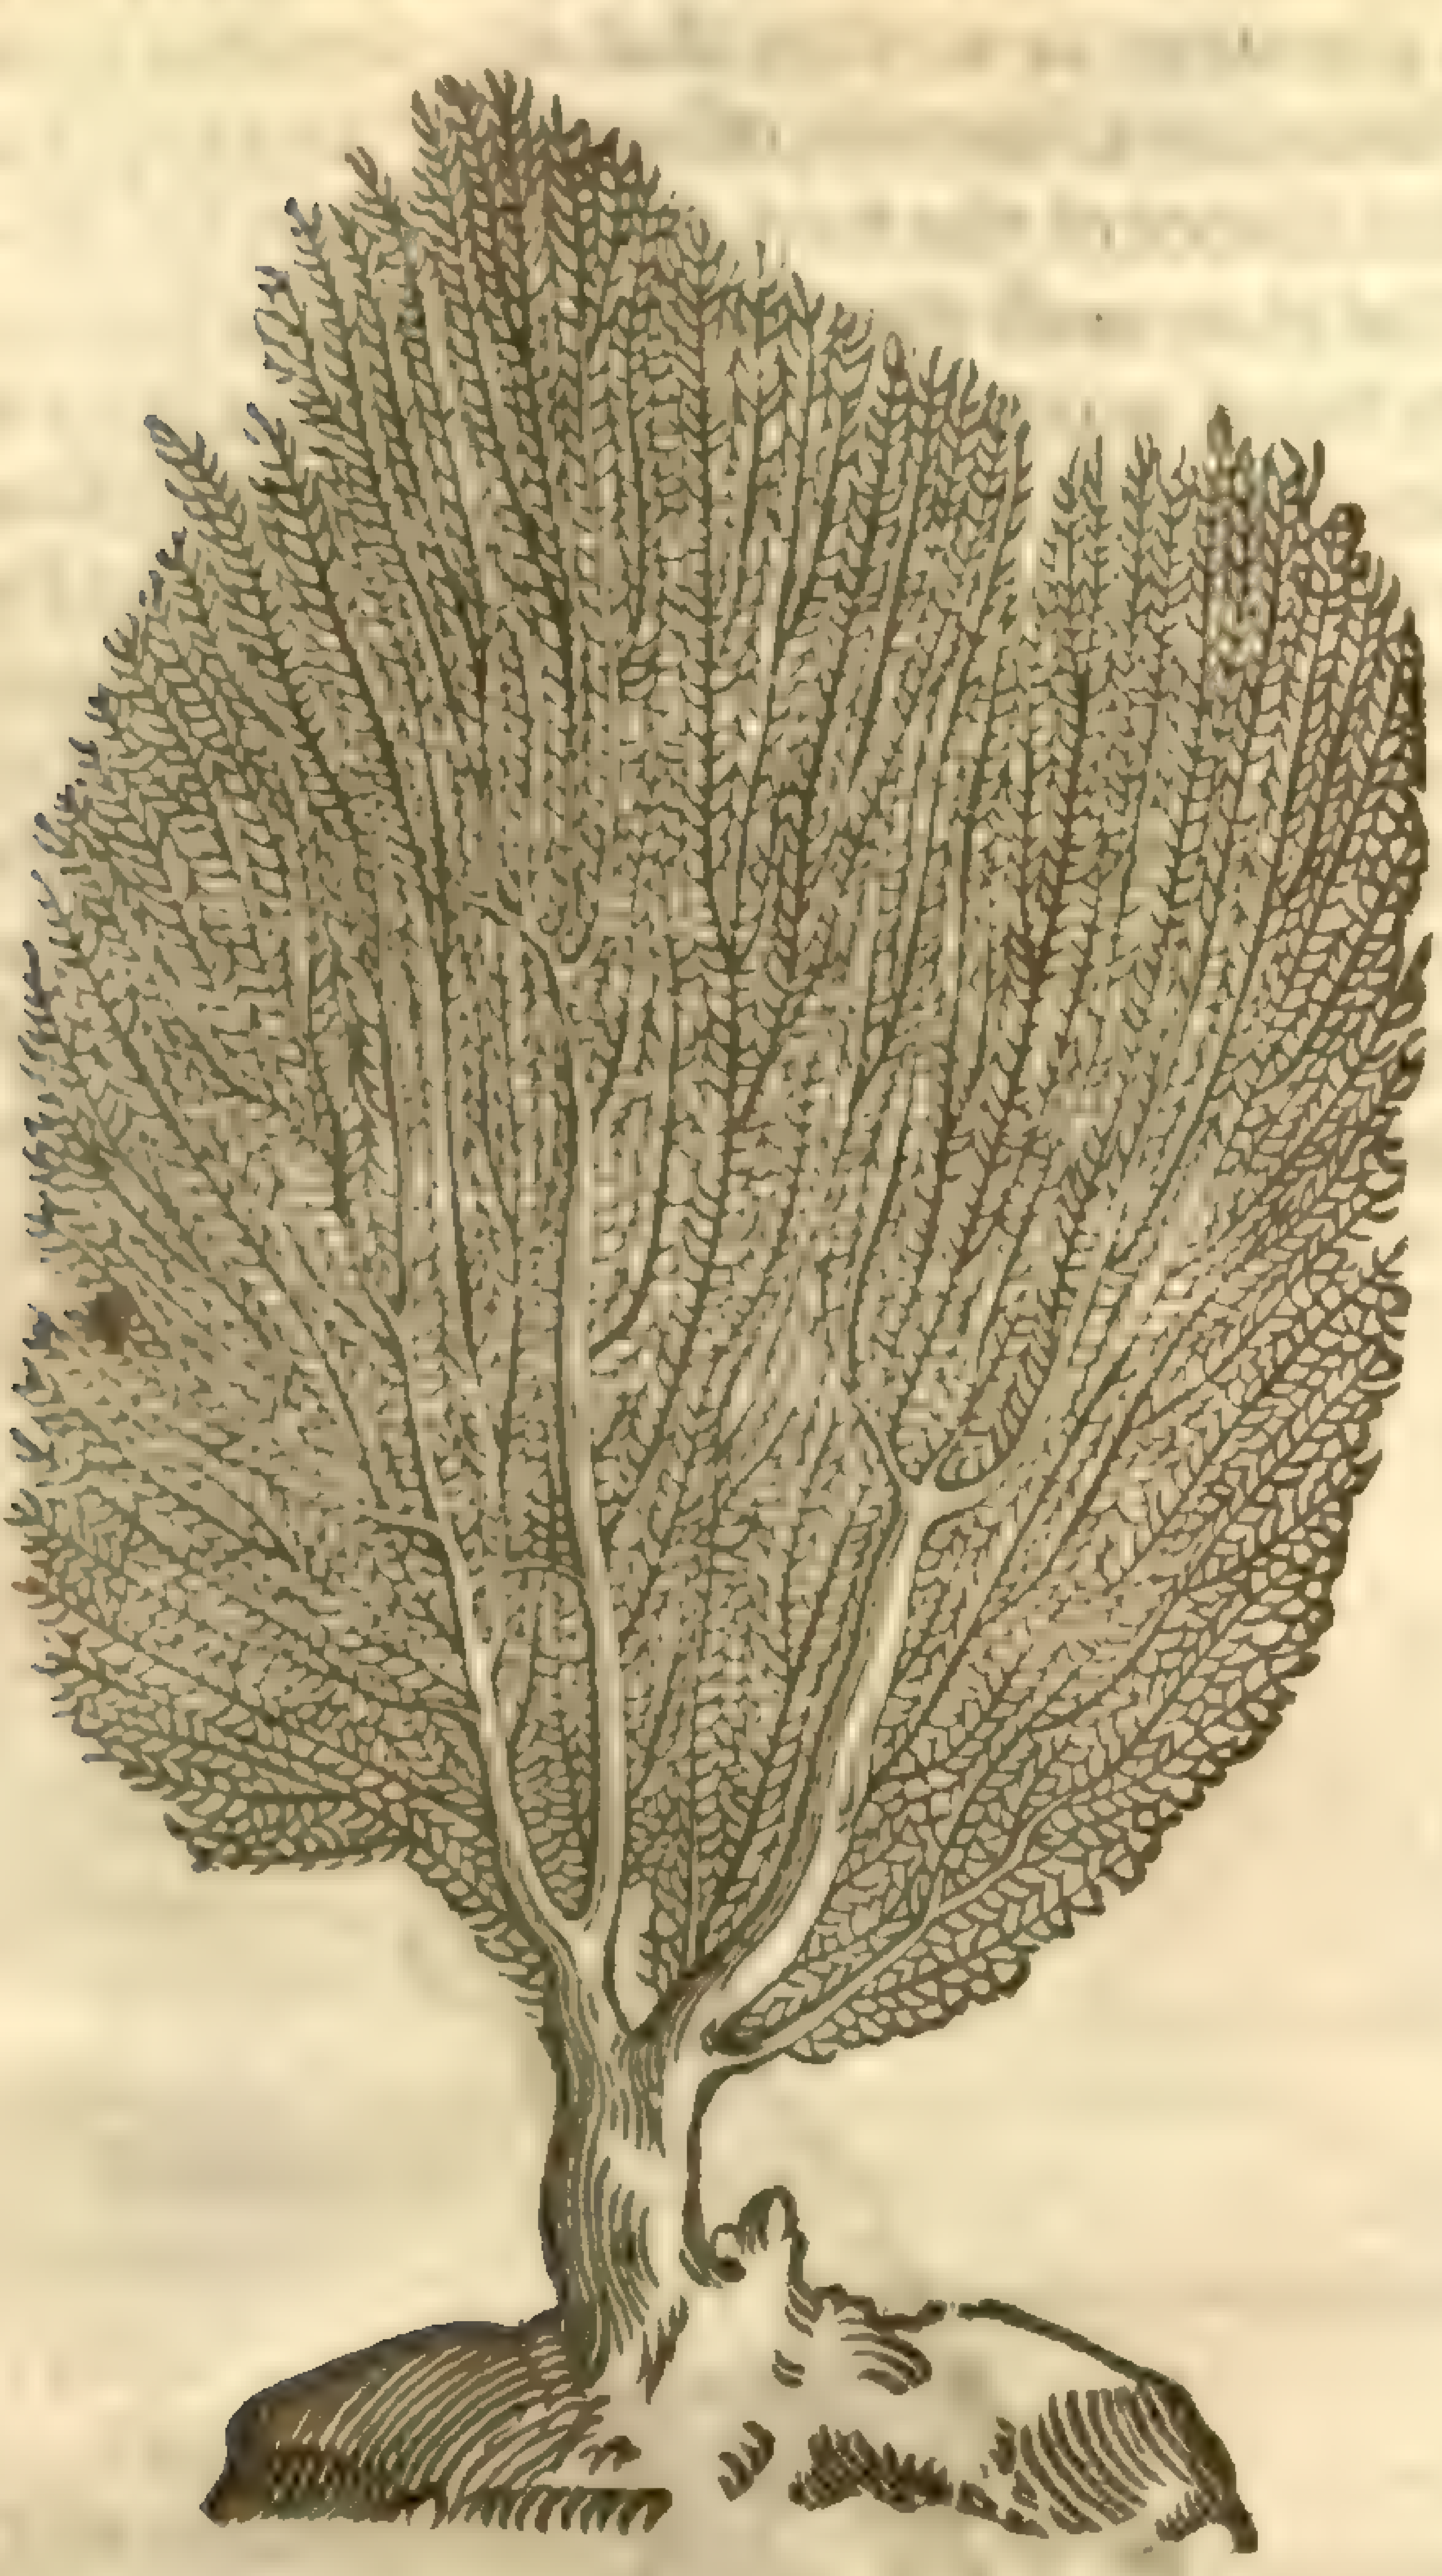
C *Cortuſus* writ, that he had made triall thereof for the killing and voiding of worms, and found it to be of no leſſe efficacie than any Coralline, and that giuen in leſſe quantitie.

CHAP. 24. *Of the Sea Fan.*

¶ *The Deſcription.*

THis elegant ſhrub groweth vpon the rocks of the ſea (where it is ſometimes couered with the water) in diuers places; for it hath been brought both from the Eaſt and Weſt Indies, and as I haue bin informed it is to be found in great plenty vpon the rocks at the Burmuda Iſles. *Cluſius* calls

Frutex marinus reticulatus. Sea Fan.



calls it *Frutex marinus elegantiſſimus*, & thinks it may be referred to the *Palma marina* of *Theophraſtus*. *Bauhine* hath referred it to the *Corallina's*, calling it *Corallina cortice reticulato maculoſo purpuraſcente*. It growes ſometimes to the height of three foot, hauing a ſtalk ſome handfull or two high before it part into branches; then is it diuided into three, foure, or more branches, which are ſubdiuided into infinite other leſſer ſtrings, which are finely interwouen & ioyned together as if they were netted, yet leauing ſomtimes bigger, otherwhiles leſſer holes; and theſe twiggy branches become ſmaller and ſmaller, the farther they are from the root, and end as it were in ſmall threds. Theſe branches grow not vp on euery ſide, as in other plants, but flat one beſides another, ſo that the whole plant reſembles a fan, or a cabbage leafe eaten full of holes; yet ſometimes vpon the ſides come forth other ſuch fan-like branches, ſome bigger, ſome leſſe, ſometimes one or two, otherwhiles more. The inner ſubſtance of this Sea Fan is a blackiſh tough and hard wood, and it is all couered ouer with a rough Coral-like ſtony matter, of a reddiſh or purpliſh colour, and this you may with your naile or a knife ſcrape off from the ſmooth and black wood.

I know no vſe of this, but it is kept for the beauty and raritie thereof, by many louers of ſuch Curioſities, amongſt which for the rareneſſe of the ſtructure this may hold a prime place.

Chap. 25. *Of China, and baſtard China.*

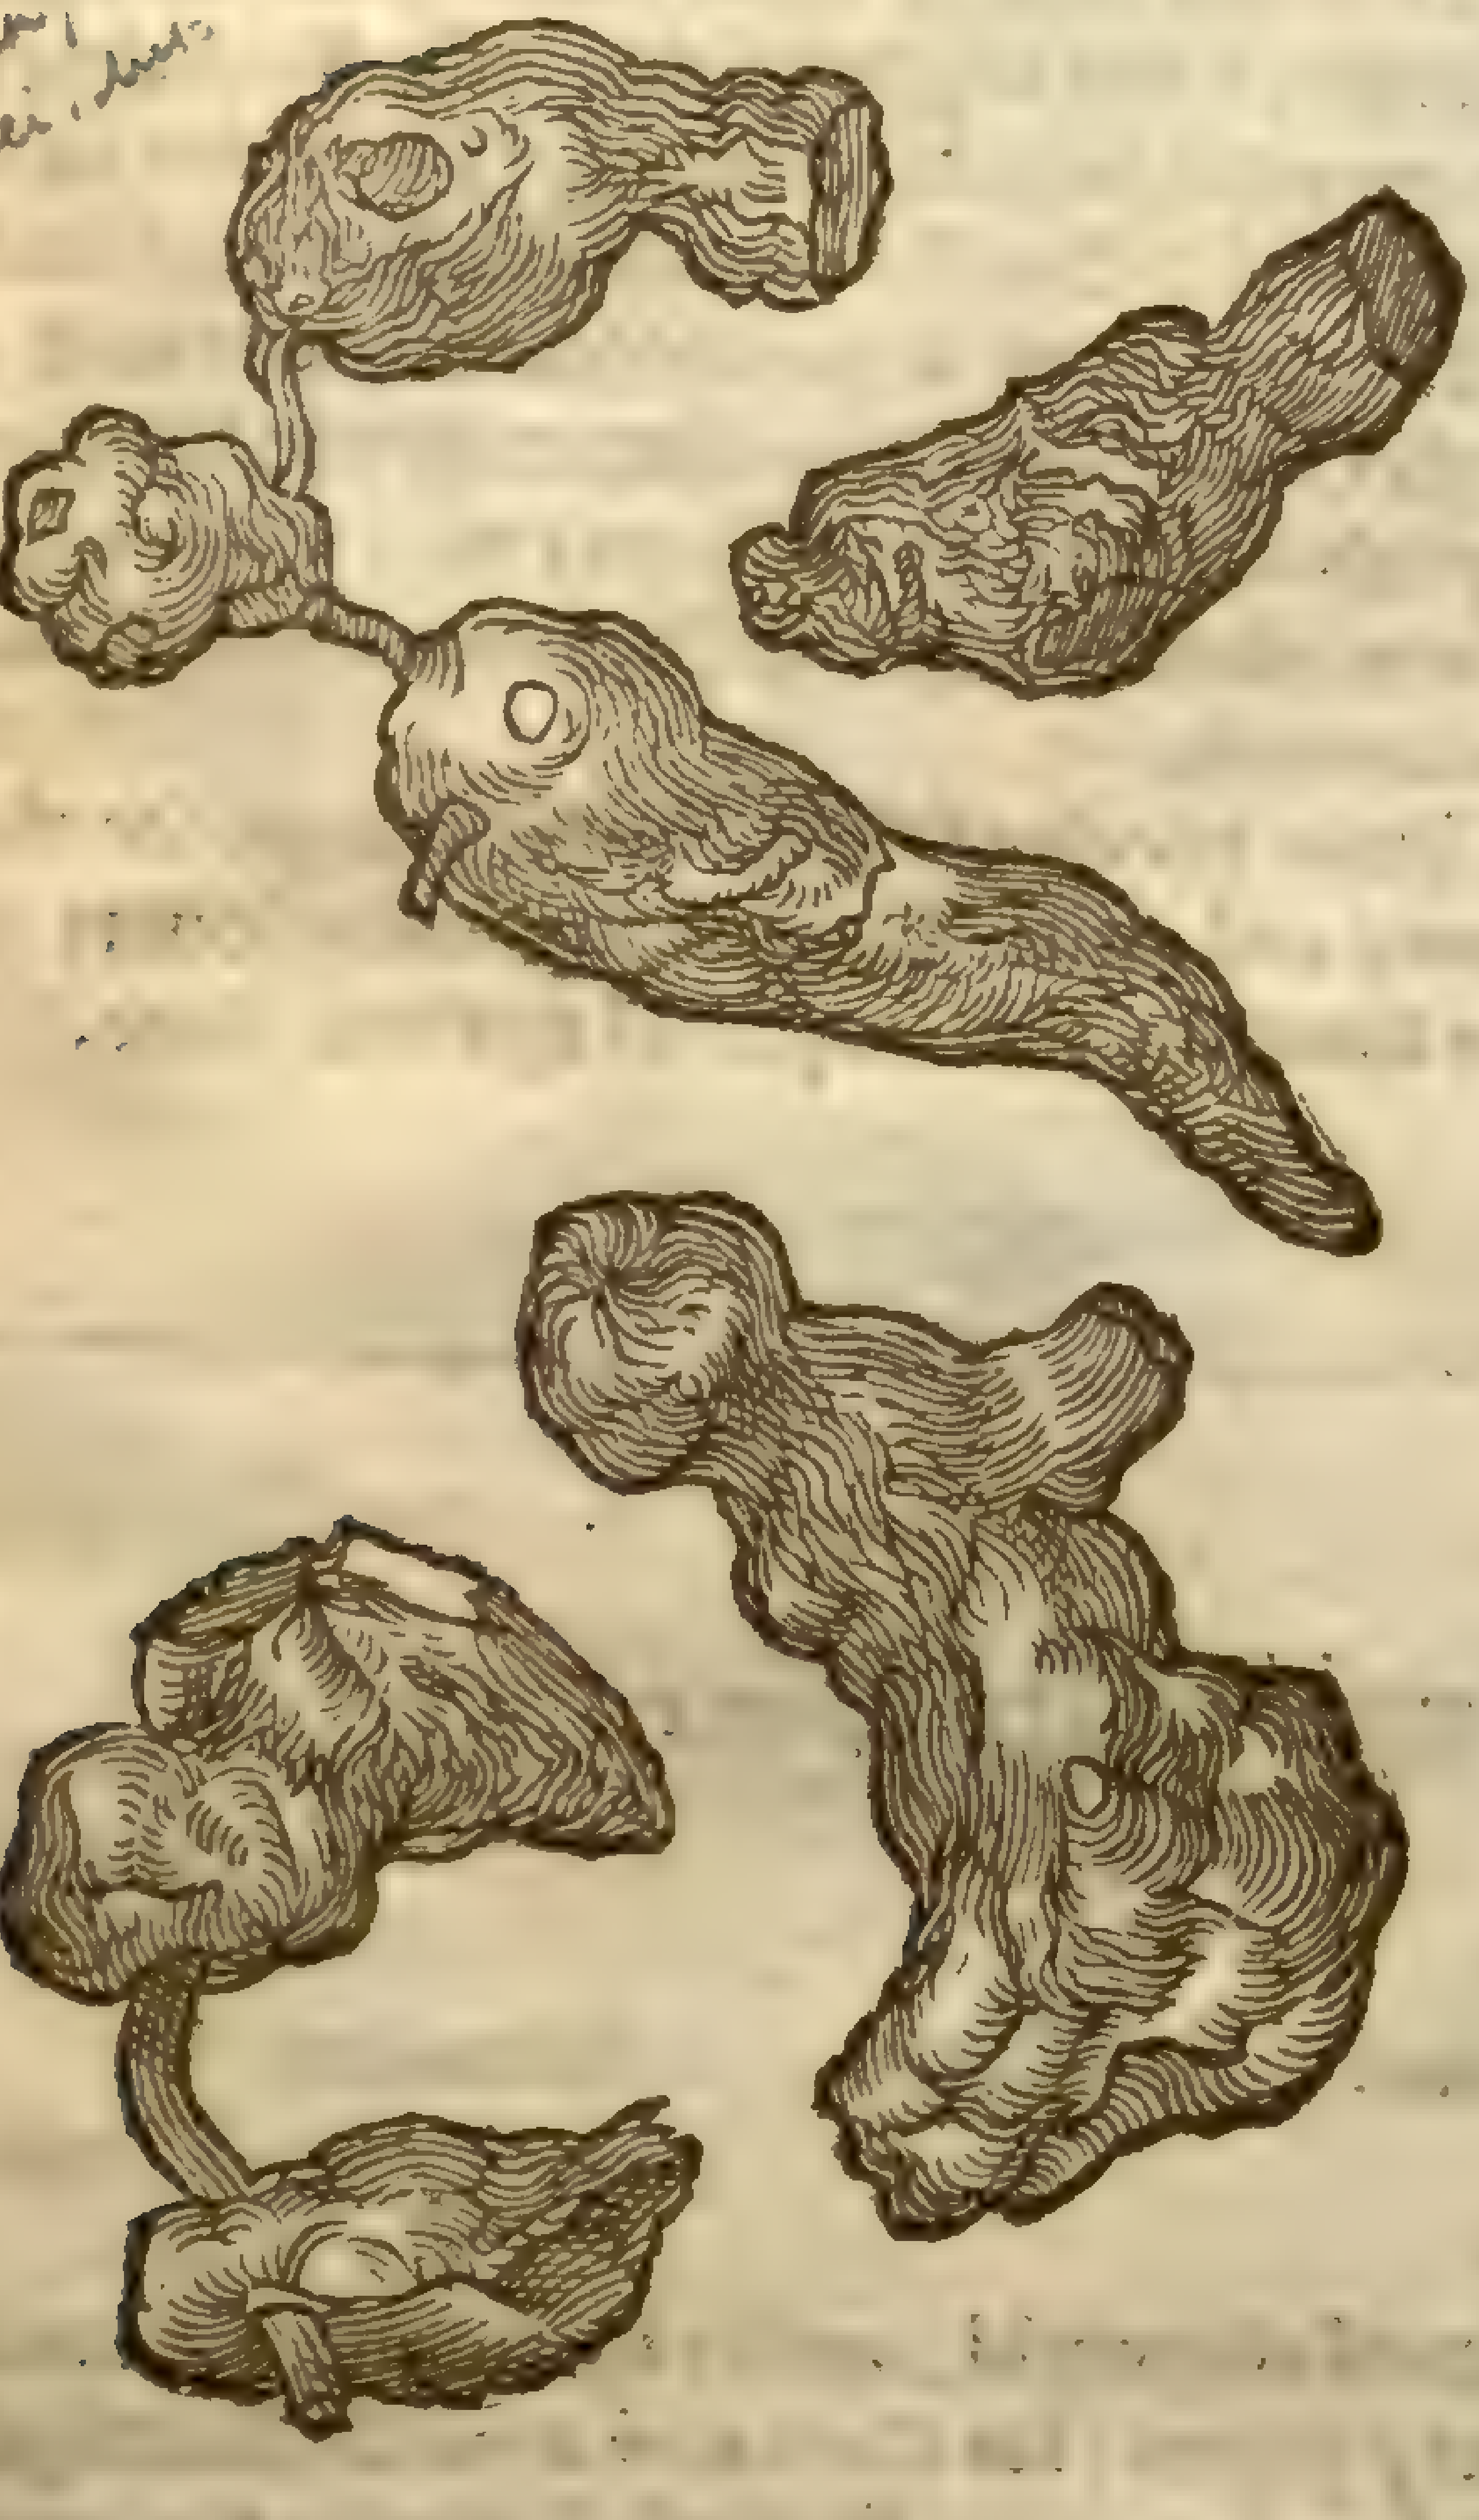
¶ *The Deſcription.*

THis root which is brought from the remoteſt parts of the world, and is in frequent vſe with us, hath not bin known in Europe little aboue ninety yeares: for *Garcias ob Orta* the Portugall Phyſitian writes, That he came to the firſt knowledge thereof in the Eaſt Indies in the yeare 1535, and that by this means, as he relates it: It hapned (ſaith he) that about this time a merchant in the Iſle Diu told the noble gentleman Sr *Mart. Alfonſo de Souſa* my Patron, by what meanes he was cured of the French Poxes, which was by a certain root brought from China; whoſe faculties he much extolled, becauſe ſuch as vſed it needed not obſerue ſo ſtrict a dyet as was requiſite in the vſe of Guajacum; but ſhould only abſtain from beefe, porke, fiſh, and crude fruits; but in China they do not abſtain from fiſh, for they are there great gluttons. When the report of this root was divulged abroad, euery man wonderfully deſired to ſee and vſe it, becauſe they did not wel like the ſtrict dyet they were forced to obſerue in the vſe of Guajacum. Beſides, the inhabitants of theſe countries by reaſon of their idle life are much giuen to gluttony. About this time the China ſhips arriue at Malaca, bringing a ſmal quantity of this root for their own vſe; but this little was ſought for with ſuch earneſtneſſe that they gaue an exceſſiue rate for it: but afterward the Chinois bringing a greater quantity, the price fell, and it was ſold very cheape. From this time Guajacum began to be out of vſe, and baniſhed the Indies, as a Spaniard that would famiſh the Natiues. Thus much *Garcias*, concerning the firſt vſe thereof in the Eaſt Indies.

1 The China now in vſe is a root of the largeneſſe of that of the ordinary Flag, or *Iris paluſtris*, and not much in ſhape vnlike thereto, but that it wants the rings or circles that are imprinted in the other: the outer coat or skinne of this root is thin, ſometimes ſmooth, otherwhile rugged, of a browniſh red colour, and not to be ſeparated from the ſubſtance of the root, which is of an indifferent firmeneſſe, being not ſo hard as wood, but more ſollid than moſt roots which are not of ſhrubs or trees: the colour is ſometimes white, with ſome very ſmall mixture of redneſſe; otherwhiles it hath a greater mixture of red, and ſome are more red than white: it is almoſt without taſte, yet that it hath is dry, without any bitterneſſe or acrimony at all. The beſt is that which is indifferently ponderous, new, firme, not worme-eaten, nor rotten, and which hath a good and freſh colour, and that either white, or much inclining thereto. The plant whoſe root is this (if we may beleeue *Chriſtopher A Coſta*) hath many ſmall prickly and flexible branches, not vnlike the *Smilax aſpera*, or the prickly Binde weed: the biggeſt of theſe exceedeth not the thickeneſſe of ones little finger. The leaues are of the bigneſſe of thoſe of the broad leaued Plantaine: the roots as large as ones hand, ſometimes leſſe, ſollid, heauie, white, and alſo ſometimes redde, and many oft times growing together.

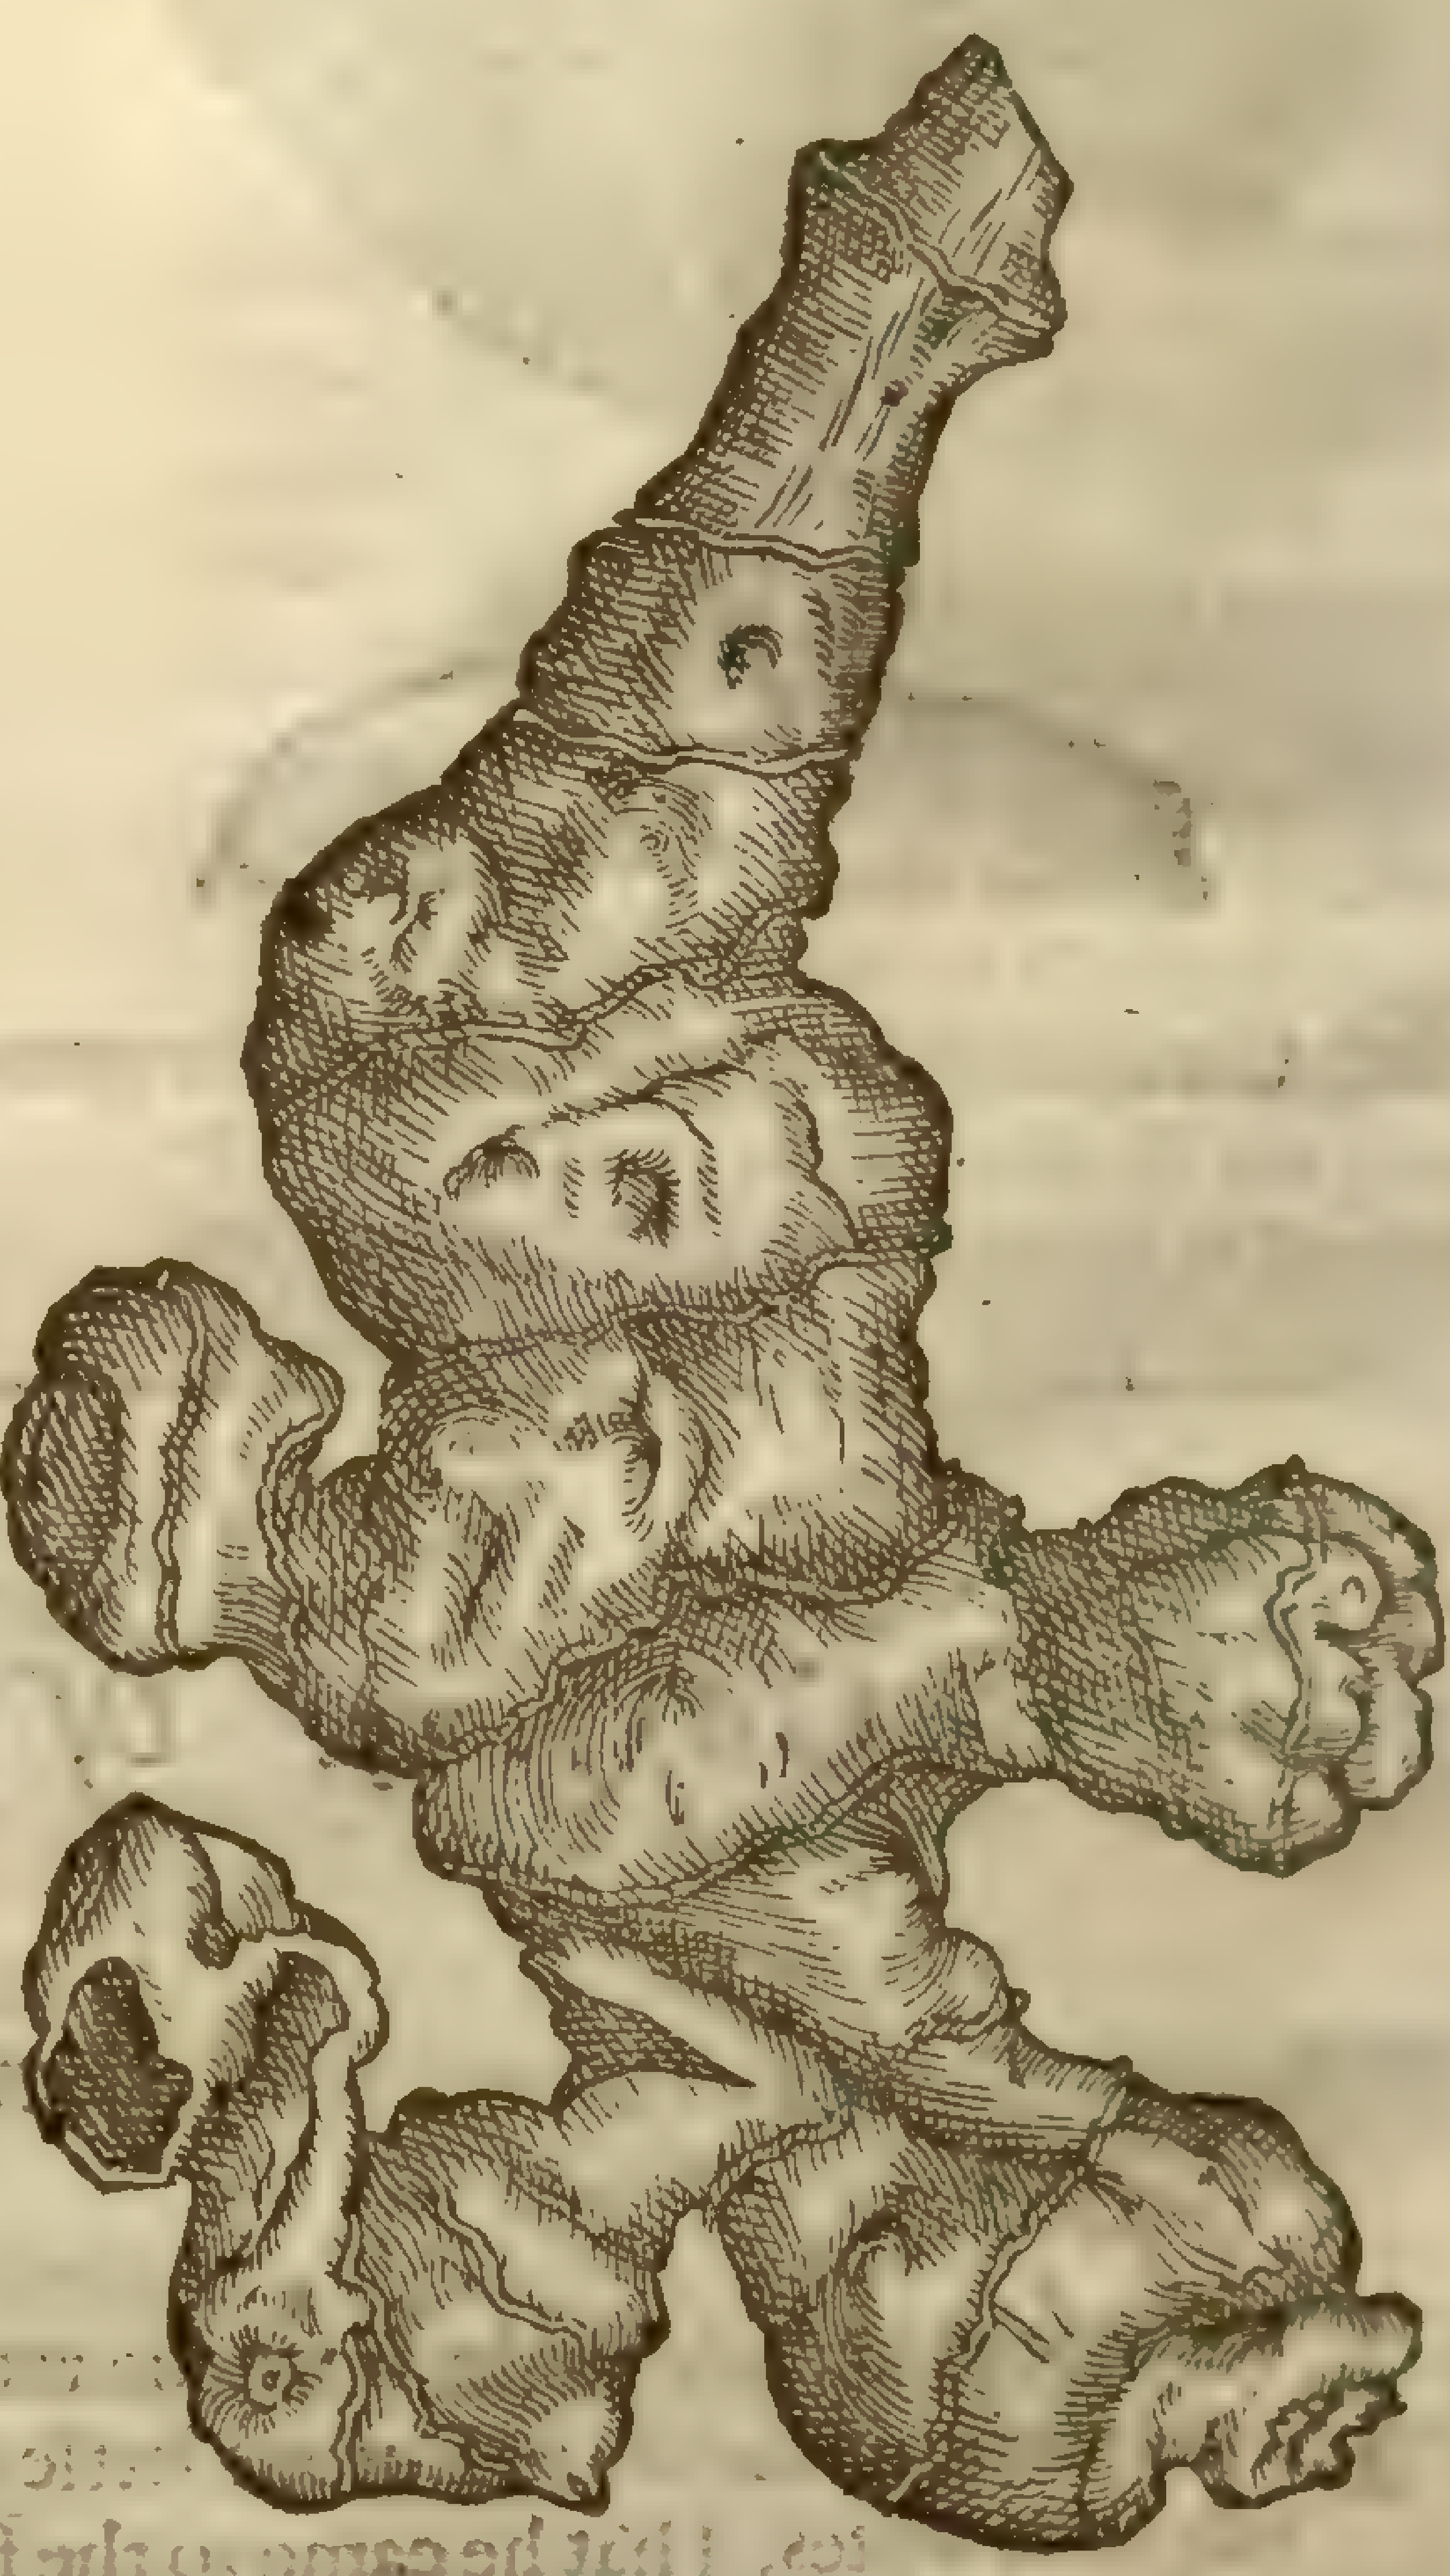
Smilax China, L. mihi dub.

1 *China vulgaris Officinarum.*
True China.



Smilax pseudo-China, L. mihi dub.

2 *Pſeudo-China.*
Baſtard China.



It groweth abundantly in the territory of China, and is alſo found in Malaber, Cochin, Cranganor, Coulan, Tanor and other places.

The Chinois call it *Lampatan*: in Decan they call it *Lampatos*: in Canarin, *Bouti*: the Arabians, Perſians and Turks terme it *Choph-China*.

2 This other root, whoſe figure you ſee here expreſt, was ſent from London to *Cluſius* in the yeare 1591, by *Iames Garret*, being brought out of Wingandecaow, or Virginia, with this inſcription, *Chinæ ſpecies*, A kind of China. *Cluſius* cauſed this figure thereof to be drawne, and thus deſcribeth it. This root (ſaith he) was very knotty, and formed with out-growings, or bunches ſtanding out, of a reddiſh colour, and it yet retained at the top ſome part of the ſtalke, being ſomewhat like vnto that of *Smilax aſpera*, or common rough Binde-weed, hard, woody, and full of veines, as the ſtalkes of *Smilax aſpera*: the ſubſtance of the root was alſo reddiſh, as the root of the common Flag, at the firſt of a ſaltiſh taſte, it being old, (for ſo it was when I receiued it) and then drying. Now I iudge

I iudge this is the ſame that the writer of the Virginian Hiſtory mentions in his chapter of roots, and ſaith, it was brought into England for China, though the Natiues knew no vſe thereof: but they vſe another root very like China, which they call *Tſinaw*, of which being cut, beaten, and preſſed out with water, they draw a juice wherewith they make their bread. Thus much *Cluſius*; to whoſe words I thinke it not amiſſe to adde that which Mr *Thomas Hariot* (who was the Writer of the Virginian hiſtory, here mentioned by *Cluſius*) hath ſet downe concerning this thing.

Tſinaw (ſaith he) is a kinde of root much like vnto that which in England is called the China root, brought from the Eaſt-Indies. And we know not any thing to the contrary but that it may be of the ſame kinde. Theſe roots grow many together in great cluſters, and doe bring forth a Brier ſtalke, but the leafe in ſhape is far vnlike: which being ſupported by the trees it groweth neereſt vnto, wil reach or clime to the top of the higheſt. From theſe roots while they be new or freſh, being chopt into ſmall pieces and ſtampt, is ſtrained with water a juyce that maketh bread, and alſo being boiled, a very good ſpoonemeat in manner of a gelly, and is much better in taſte, if it be tempered with oyle. This *Tſinaw* is not of that ſort which by ſome was cauſed to be brought into England for the China root; for it was diſcouered ſince, and is in vſe as is aforeſaid; but that which was brought hither is not yet knowne, neither by vs, nor by the inhabitants, to ſerue for any vſe or purpoſe, although the roots in ſhape are very like. Thus much *Hariot*.

¶ *The Temperature and Vertues.*

A China is thought to be moderately hot and dry: the decoction therof made alone or with other things, as the diſeaſe and Symptoms ſhall require, is much commended by *Garcias*, for to cure the French Pox, but chiefely that diſeaſe which is of ſome ſtanding: yet by moſt it is iudged leſſe powerfull than *Guajacum*, or *Sarſaparilla*.

B It attenuates, moues ſweat, and dries, and therefore reſiſts putrifaction: it ſtrengthens the liuer, helpes the dropſie, cures maligne vlceres ſcabbes, and lepry. It is alſo commended in conſumptions.

C The decoction of this root, ſaith *Garcias*, beſides the diſeaſes which haue community with the Pox, conduces to the cure of the Palſie, Gout, Sciatica, ſchirrous and œdematous tumours. It alſo helps the Kings-Euill. It cureth the weakeneſſe of the ſtomacke, the inueterate head-ache, the ſtone and vlceration of the bladder; for many by the vſe of the decoction hereof haue beene cured, which formerly receiued helpe by no medicine.

CHAP. 26. *Of Coſtus.*

¶ *The Deſcription.*

THis ſimple medicine was briefely deſcribed by *Dioſcorides*, who mentions three kindes hereof, but what part of a plant, whether root, wood or fruit, he hath not expreſt: but one may probably conjecture it is a root, for that hee writes toward the end of the Chapter where he treats thereof, *lib.*1.*cap.*15. that it is adulterated by mixing therewith the roots of *Helenium commagenum*; now a root cannot well be adulterated but with another. Alſo *Pliny*, *lib.*12.*cap.*12. calls it a root; but neither any of the antient or moderne Writers haue delineated the plant, whoſe root ſhould be this *Coſtus*. *Dioſcorides* makes three ſorts, as I haue ſaid: the Arabian being the beſt; which was white, light, ſtrong, and well ſmelling: the Indian, which was large, light, and blacke: the Syrian, which was heauie, of the colour of Box, and ſtrong ſmelling. Now *Pliny* makes two kindes, the blacke and the white, which he ſaith is the better; ſo I judge his blacke to be the Indian of *Dioſcorides*, and his white, the Arabian. Much agreeable to theſe (but whether the ſame or no, I do not determine) are the two roots whoſe figures I here preſent to your view, and they are called by the names of *Coſtus dulcis* (I thinke they ſhould haue ſaid *odoratus*) and *Coſtus amarus*.

1 The firſt of theſe, which rather from the ſmell than taſte, is called ſweet, is a pretty large root, light, white, and well ſmelling, hauing the ſmell of Orris, or a violet, but ſomewhat more quick and piercing, eſpecially if the root be freſh, and not too old: it is oft times diuided at the top into two, three, or more parts, from whence ſeuerall ſtalkes haue growne, and you ſhall ſomtimes obſerue vpon ſome of them pieces of theſe ſtalkes ſome two or three inches long, of the thickeneſſe of ones

little finger,creſted and filled with a ſoft pith like the ſtalks of Elder, or more like thoſe of the bur Docke: the taſt of the root is bitter,with ſome acrimony,which alſo *Dioſcorides* requires in his, for he ſaith the taſt ſhould be biting and hot. Thus much for the firſt,being *Coſtus dulcis* of the ſhops.

1 *Coſtus Indicus ſiue odoratus.*
Indian or ſweet ſmelling Coſtus.

2 *Coſtus officinarum Lobelij.*
Bitter Coſtus.

2 The ſecond,which is the *Coſtus amarus,* and it may be the Indian of *Dioſcorides,*and *Niger* of *Pliny,*is a root black both within and without,light,yet very denſe. It ſeemeth to be of ſome large root,for that it is brought ouer cut into large pieces,of the bigneſſe of ones finger,ſometimes bigger,ſomtimes leſſer,which it ſeems is for the more conuenient drying thereof,for a large root,vnles it be cut into pieces can ſcarſe be well dried:the taſte of this is bitter,ſomwhat clammy & ingrate: the ſmell is little or none.

There are ſome other roots which haue bin ſet forth by late writers for *Coſtus,* but becauſe they are neither in vſe,known here with vs,nor more agreeable to the deſcription of the antients,I haſtning to an end,am willing to paſſe them ouer in ſilence.

¶ *The Temperature and Vertues.*

A It hath a heating and attenuating faculty, and therefore was vſed in oile to annoint the bodie againſt the cold fits of Agues,the Sciatica,and when it was needful to draw any thing to the ſuperficies of the body

B It is alſo conuenient to moue vrine,to procure the termes,to help ſtrains,conuulſions,or cramps and pains in the ſides,and by reaſon of the bitterneſſe it kils wormes.

C It is good to be drunk againſt the bite of the viper,againſt pains of the cheſt, and windineſſe of the ſtomack,taken in wine and wormwood;and it is vſed to be put into ſundry Antidotes.

CHAP.

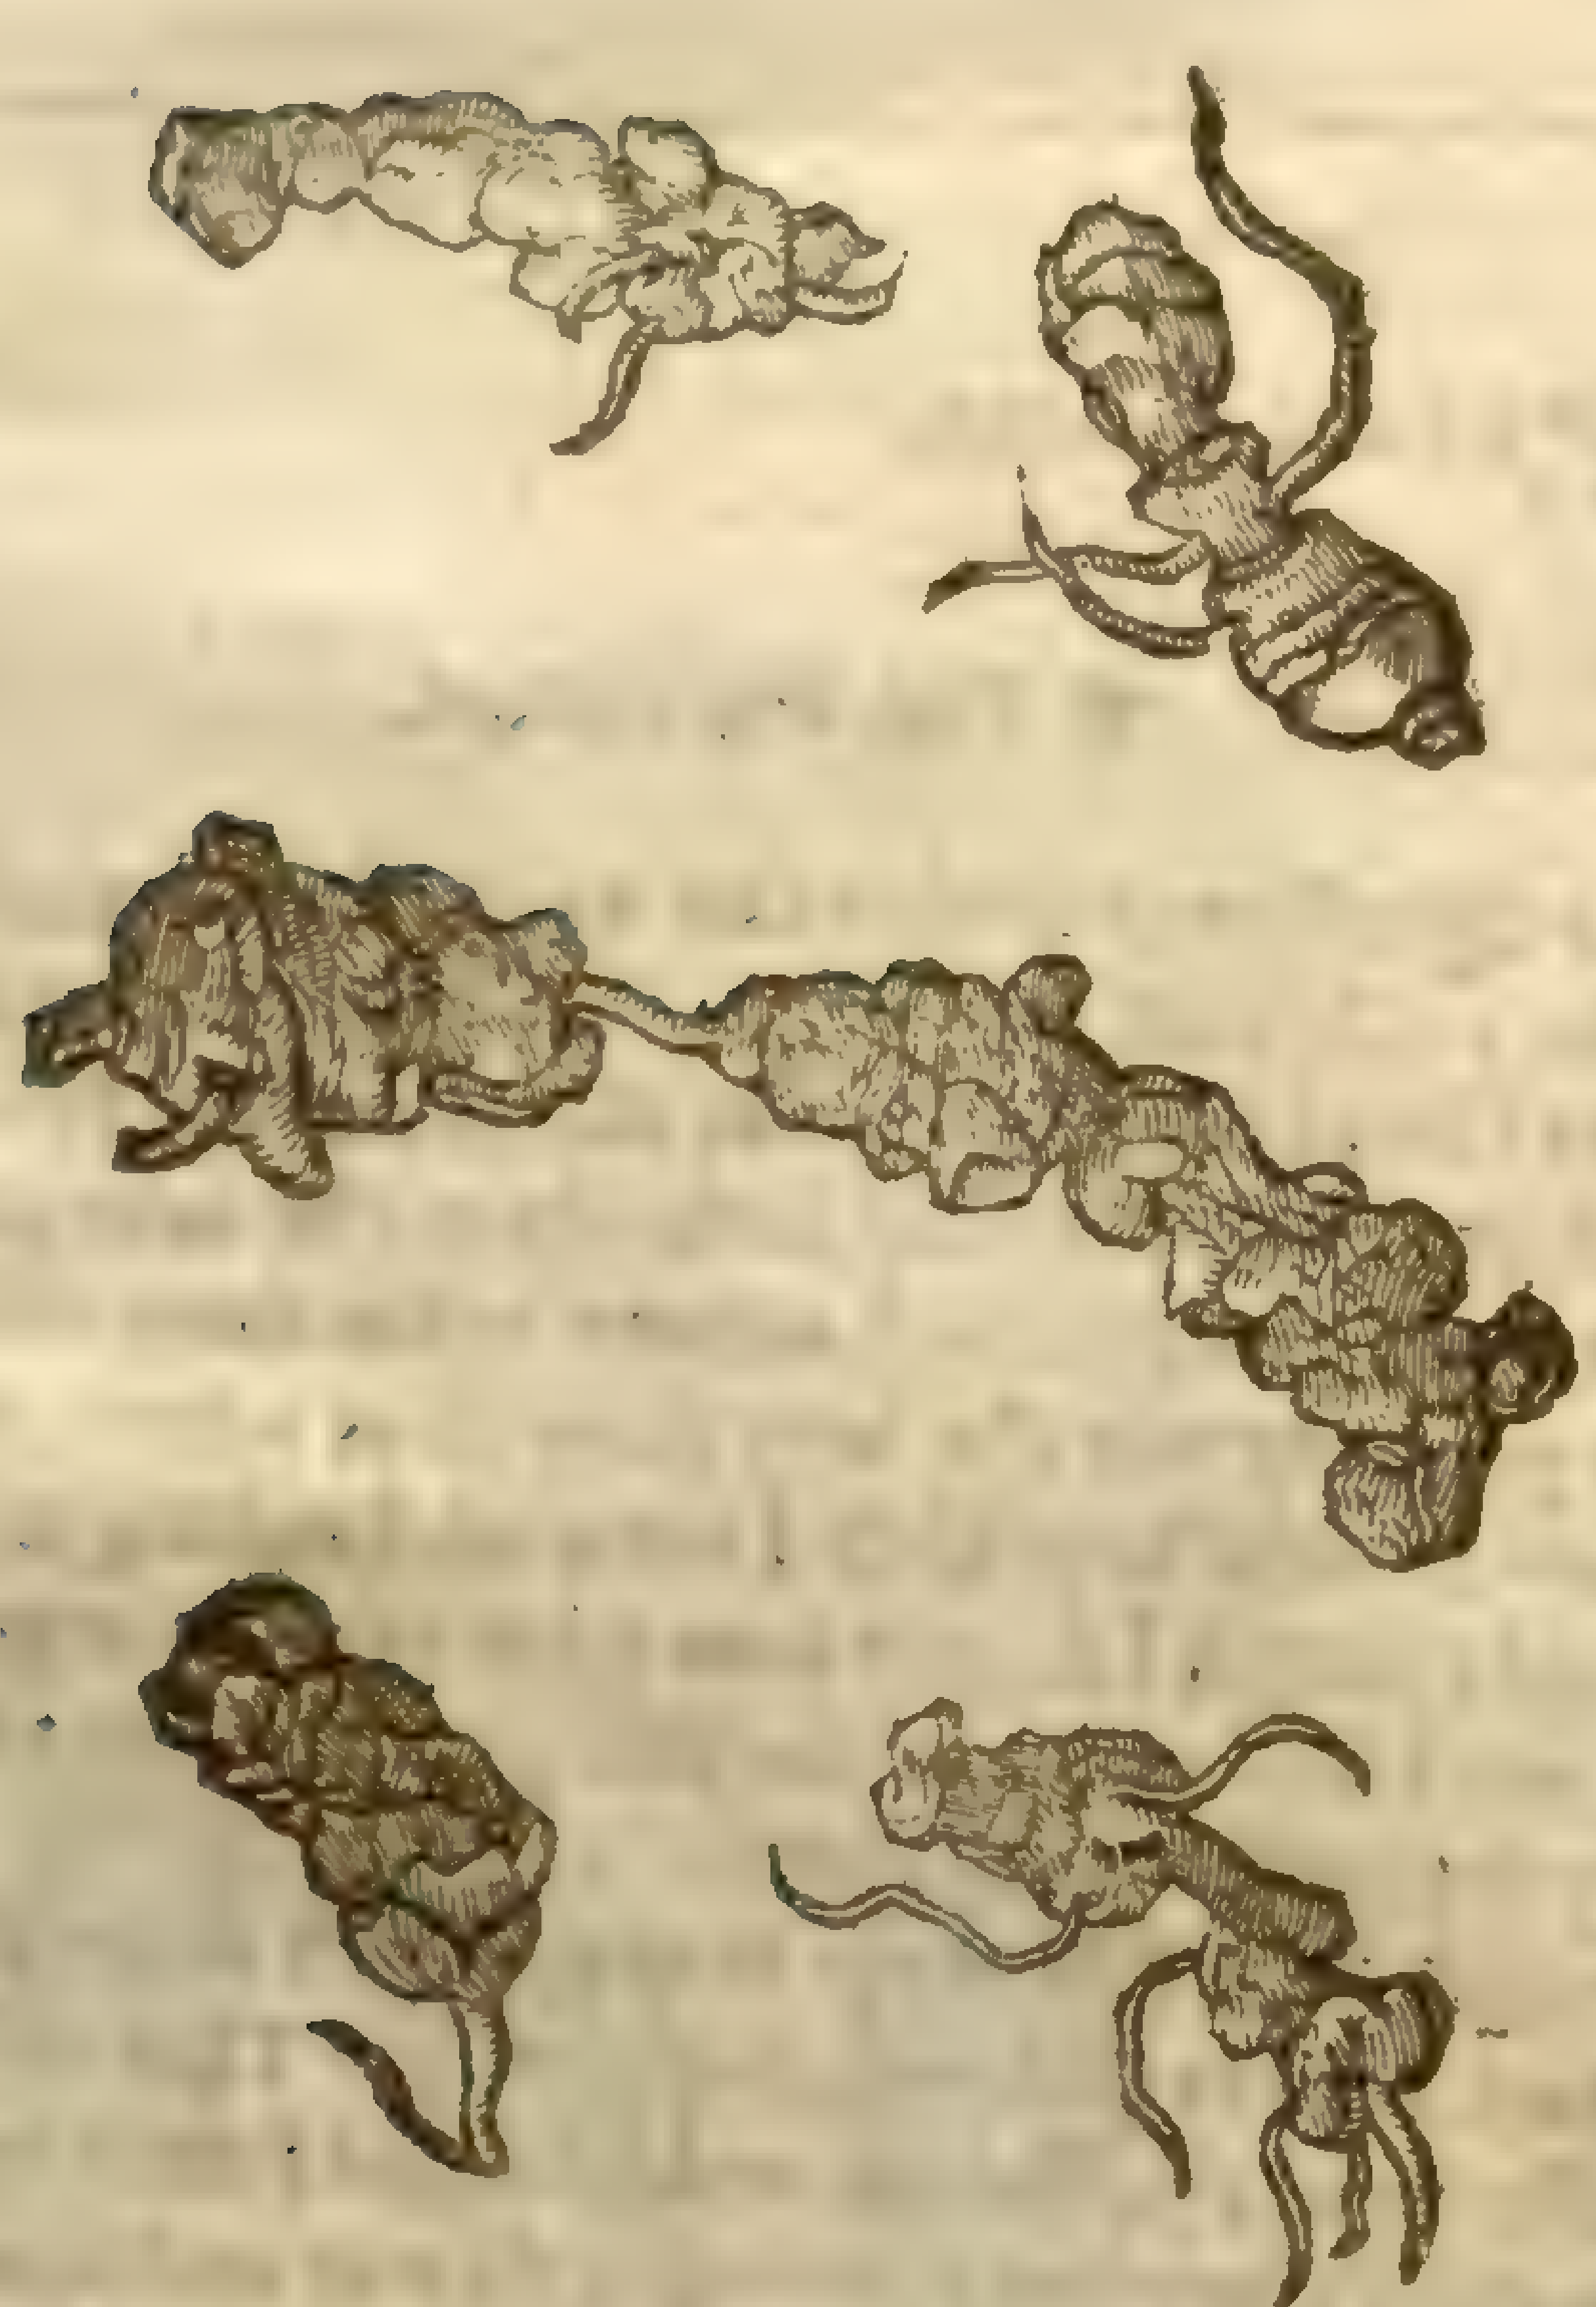
Chap. 27. *Of Drakes Root or Contra-yerva.*

¶ *The Deſcription.*

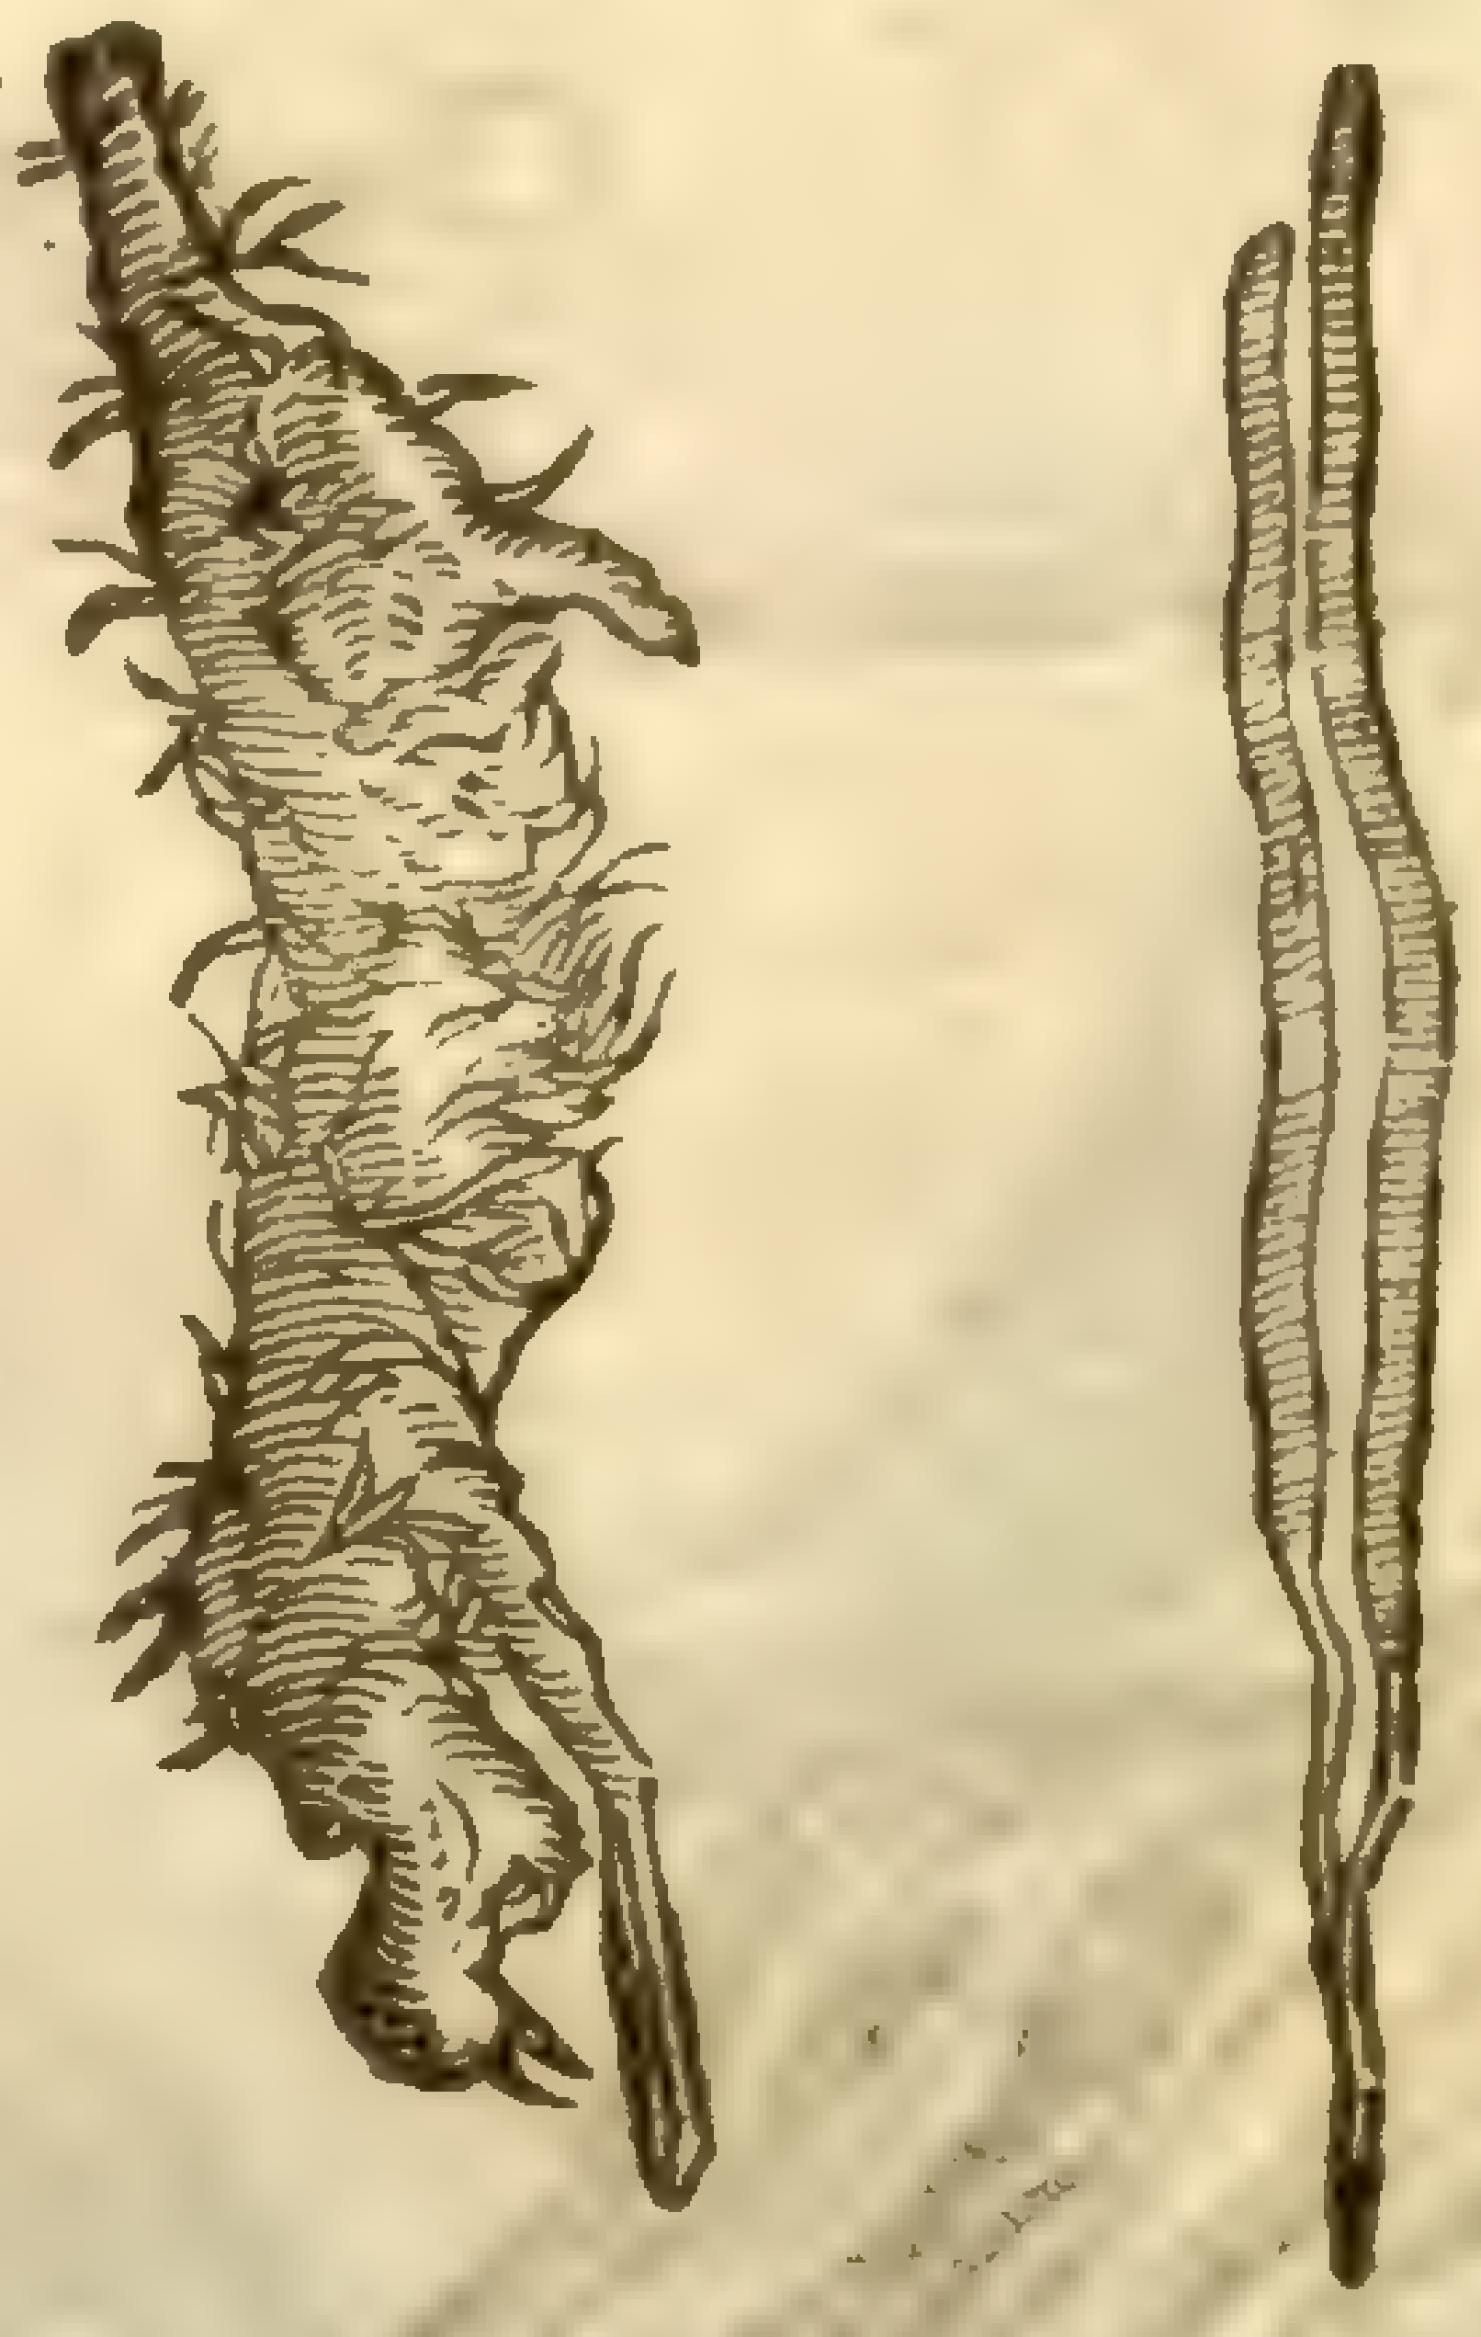
That root which of late is known in ſome ſhops by the Spaniſh name *Contra-yerva*, is the ſame which *Cluſius* hath ſet forth by the title of *Drakena radix*: wherfore I will giue you the hiſtorie of *Cluſius*, and thereto adde that which *Monardus* writes of the *Contra-yerva*. For although *Bauhine* and the Author of the *Hiſtoria Lugdunenſis* ſeeme to make theſe different; yet I finde that both *Cluſius* his figure and hiſtorie exactly agree with the roots ſent vs from Spaine by that title. Wherefore I ſhall make them one, till ſome ſhal ſhew me how they differ: and *Cluſius* ſeems to be of this minde alſo, who deſired but the degree of heate which *Monardus* giues theſe, and that is but the ſecond degree: now theſe haue no taſte at the firſt, vntill you haue chewed them a prety while, and then you ſhall finde a manifeſt heate and acrimonie in them, which *Cluſius* did alſo obſerue in his.

In the yeare (ſaith *Cluſius*) 1581, the generous Knight Sr *Francis Drake* gaue me at London certain roots, with three or foure Peruvian Beazor ſtones, which in the Autumne before (hauing finiſhed his voiage, wherein paſſing the ſtraights of Magellan he had incompaſſed the world) hee had brought with him, affirming them to be of high eſteem amongſt the Peruvians. Now for his ſake that beſtowed theſe roots vpon me, I haue giuen them the title of *Drakena radix*, or *Drakes* root, and haue made them to be expreſſed in a table, as you may here ſee them.

1 *Drakena radix.*
Contra-yerva.



2 *Radix Drakena affinis.*
Another ſort of Contra-yerva.



Theſe roots were for the moſt part ſome halfe inch thicke, longiſh, now and then bunching out into knots and vnequall heads, and their tops looked as if they were compoſed of thicke ſcales, almoſt like thoſe of the *Dentaria enneaphyllos*; blackiſh without, wrinckled and hard, becauſe dried: their inner part was white, they had ſlender fibres here and there growing out of them, and ſome more thick and large, hard alſo and tough, at which hung other knots. I obſerued no manifeſt ſmel they had, but found them to haue a taſte ſomwhat aſtringent, and drying the tongue at the firſt; but being long chewed they left a quick and pleaſing acrimony in the mouth.

It ſeemed to haue great affinitie with the *Radix S. Helenæ*, whereof *Nic. Monardus* ſpeakes in his booke of the Simple Medicines brought from the Weſt Indies: but ſeeing *N. Eliot* (who accompanied Sʳ *Francis Drake* in that voyage,ſaid that the Spaniards in Peru had them in great requeſt,and they could not eaſily be got of them, and that he had learned by them,that the leaues were preſent poiſon,but the root an antidote,and that not only againſt the ſame poiſon, but alſo againſt other; and that it ſtrengthned the heart and vitall faculties,if it were beaten to pouder, and taken in the morning in a little wine; and giuen in water it mitigated the heate of Feuers. By reaſon of theſe faculties it ſhould much agree with the *Radix Contra yerva*,whereof *Monardus* writes in the ſame booke: yet in theſe I required the aromatick taſt and degree of heate which he attributes to theſe roots. Thus much *Cluſ.*

A From Charchis a prouince of Peru(ſaith *Monard.*) are brought certain roots very like the roots of *Iris*,but leſſe,and hauing the ſmell of Fig leaues. The Spaniards that liue in the Indies cal them *Contra-yerva*,as if you ſhould ſay an antidote againſt poiſon; becauſe the pouder of them taken in white wine is a moſt preſent remedie againſt all poiſon of what kinde ſoeuer it be(only ſublimate excepted,whoſe malignity is only extinguiſhed by the drinking of milk)it cauſes them to be caſt vp by vomit, or evacuated by ſweat. They alſo ſay that Philtres or amorous potions are caſt forth by drinking this pouder. It alſo killeth wormes in the belly. The root chewed hath a certain aromatick taſte ioyned with acrimony; wherfore it ſeems hot in the ſecond degree: Thus far *Monardus.*

2 *Cluſius,Exot.l.4.c.11.*being the next after *Drakena radix*,deſcribes this root,whoſe figure, I giue you in the ſecond place,and that by the ſame title as it is here ſet forth. Theſe roots,ſaith hee, ſeemed ſomewhat like the *Drakena radix* which were found in the great ſhip which brought backe the Viceroy from the Eaſt Indies,& was taken by the Engliſh: for they were tuberous, & as much as one may gather by their form,crept vpon the ſurface of the earth,hauing vpon them many hairs and fibres,and being of a ſooty colour,yet ſomwhat inclining to yellow,dying the ſpittle in chewing them,and being bitter. They as yet retained foot-ſtalks of the leaues,but of what faſhion they were no man can eaſily gueſſe. But it is very likely they were of great vſe among the Indians,ſeeing the Viceroy brought them together with other pretious medicines growing in the Eaſt Indies. *Iames Garret* ſent this to *Cluſius*,with the little plant dried,whoſe figure you ſee expreſt by it.

CHAP. 28. *Of* Lignum Aloes.

Lignum Aloes vulgare.

¶ *The Deſcription.*

IT is a Queſtion,whether the *Agallochum* deſcribed *ca.21.li.1.*of *Dioſcorides*,be the ſame which the later Greekes and ſhops at this time call *Xyloaloe* or *Lignum aloes*. Many make them the ſame; others, to whoſe opinion I adhere, make them different: yet haue not the later ſhewed vs what *Agallochum* ſhould be; which I notwithſtanding wil do. And though I do not now giue you my arguments, yet I will point at the things, and ſhew poſitiuely my opinions of them.

The firſt & beſt of theſe is that which ſome cal *Calumbart*: others,*Calumba*,or *Calambec*. This is of high eſteem in the Indies, and ſeldome found but among the Princes and perſons of great qualitie; for it is ſould oft times for the weight in gold. I haue not ſeen any thereof but in beads. It ſeemeth to be a whiter wood than the ordinary, of a finer grain,not ſo ſubiect to rot,of a more fragrant ſmel and but light.

The ſecond ſort, which is vſually brought ouer, and called in Shops by the name of *Lignum Aloes*, is alſo a precious and odoriferous wood,eſpecially burnt: the ſticks of this are commonly knotty and vnſightly, ſome parts of them being white, ſoft, and doted; other-ſome denſe, blackiſh,or rather intermixt with black and white veins,but far more black than white ; which put to the fire will ſweat out an oily moiſture,and burnt yeeld a moſt fragrant odor. This I take for the true *Xyloaloe* of the late Greeks;and the *Agalugen* of *Auicen* ; and that they in the Indies call *Agula.*

The third is a wood of much leſſe price than the former,and I conjecture it may well be ſubſtituted for *Thus* ; which I take to be the *Agallochum* of *Dioſcorides* ; the *Lignum Aloes ſylveſtre* of *Garcias*,and the *Agula brava* of *Linſcoten*. It is a firm ſollid wood ſomwhat like that of Cedar,not ſubject to rot or decay: the colour thereof is blackiſh, eſpecially on the out ſide, but on the inſide it is oft times browniſh and ſpeckled,containing alſo in it an oily ſubſtance,and yeelding a ſweet pleaſing ſmel when it is burnt,but not like that of the two former: the taſte alſo of this is bitterer than that of the former;and the wood(though denſe and ſollid) may be eaſily cleft longways. It is alſo a far handſomer and more ſightly wood than the former,hauing not many knots in it.

Garcias ab Orta thus deſcribes the tree that is the *Lignum Aloes* (I judge it is that I haue ſet forth in the ſecond place)It is,ſaith he,like an olive tree, ſomtimes larger:the fruit or floure I could not yet ſee,by reaſon of the difficulties and dangers which are to be vndergone in the accurat obſeruation of this tree(Tigers frequently there ſeeking their prey.) I had the branches with the leaues brought me from Malaca. They ſay the wood new cut down hath no fragrant odor,nor til it be dried;neither the ſmell to be diffuſed ouer the whole matter of the wood, but in the heart of the tree; for the bark is thick,and the matter of the wood without ſmell. Yet may I not deny,but the barke and wood putrifying that oily fat moiſture,may betake it ſelfe to the heart of the tree and make it the more odoriferous. But there is no need of putrifaction to get a ſmell to the *Lignum Aloes* ; for there are ſundry ſo expert and ſkilfull in the knowledge thereof,that they will iudge whether that new cut down will be odoriferous or no. For in all ſorts of wood ſome are better than other ſome. Thus far *Garcias* ; where ſuch as are deſirous may ſee more vpon this ſubiect.

¶ *The Nature and Vertues.*

It is moderatly hot and dry,and alſo of ſomwhat ſubtil parts. Chewed it makes the breath ſmel ſweet,and burnt it is a rich perfume. A

Taken inwardly it is good to help the too cold and moiſt ſtomack,as alſo the weak liuer. B

It is commended likewiſe in dyſenteries and pleuriſies ; and put alſo into diuers cordiall medicines and antidotes as a prime ingredient. C

CHAP. 29. *Of Gedwar.*

1 *Gedwar, aut Geiduar.*

2 *Zedoaria exactior icon.* A better figure of Zedoary.

¶ *The Deſcription.*

IN the chapter of Zedoary (which I made the 28 of the firſt booke) I might fitly haue giuen you this hiſtory of Gedwar, which is thought to be that deſcribed by *Avicen, li.* 2. *c.* 734. and a kind of Zedoary. *Garcias* ſaith, Gedwar is at a high rate, and not eaſie to be found, vnleſſe with the Indian Mountibanks and juglers, called *Iogues*, which go vp and down the country like rogues, and of theſe the Kings and noblemen buy *Geiduar*. It is good for many things, but chiefly againſt poiſons and the bites and ſtings of venomous creatures. Now *Cluſius* in his *Auctarium*, at the end thereof giues this figure, with the following hiſtory.

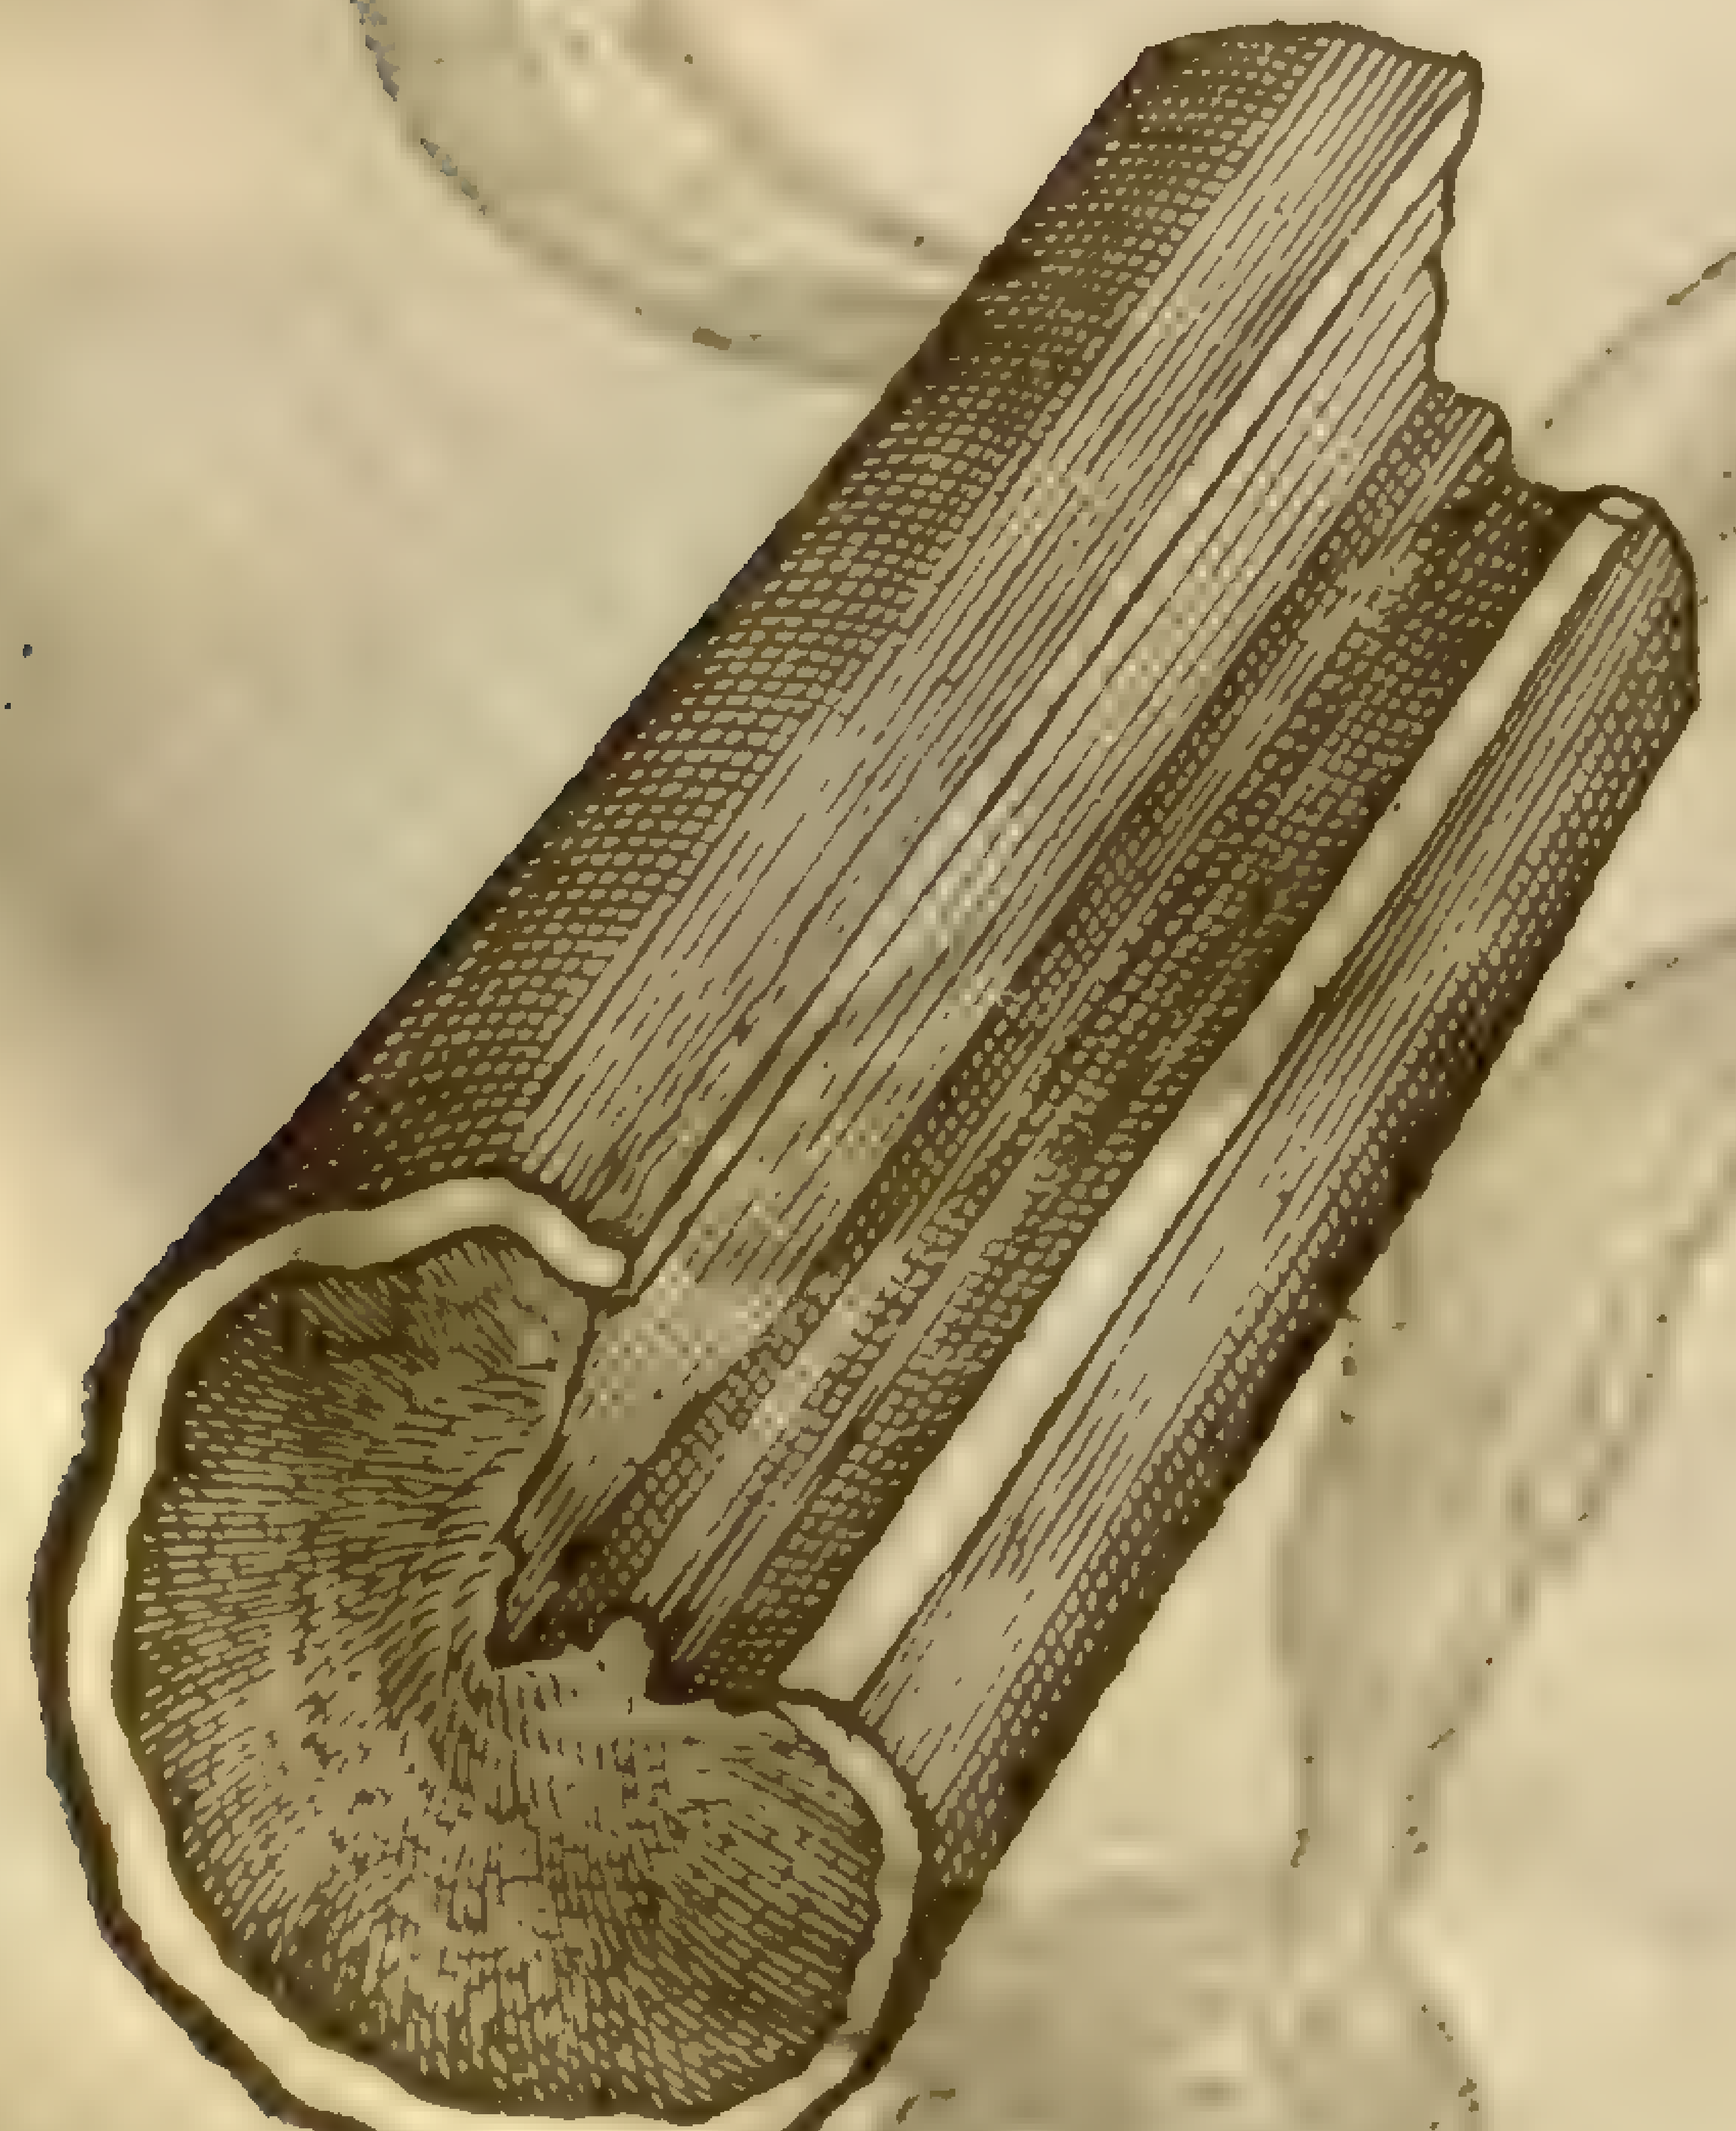
1 Becauſe *Garcias* (ſaith he, *cap.* 42. *lib.* 1. *Aromat. hiſt.*) treating of Zedoary, writes that *Auicen* called it Gedwar; and ſaith that it is of the magnitude of an acorn, and almoſt of the ſame ſhape; I in my notes at the end of that Chapter affirmed that it was not knowne in Europe, and hard to be known. But in the yere 1605, *Iohn Pona* ſent me from Verona together with other things, two roots written on by the name of *Gedwar verum*: they were not much vnlike a longiſh acorn, or (that I may more truly compare them) the ſmaller bulbs of an Aſphodil or *Anthora*: the one of them was whole and not periſhed, the other rotten and broken, yet both of them very hard and ſollid, of an Aſh colour without, but yellowiſh within; which taſted, ſeemed to poſſeſſe a heating faculty & acrimony.

But although I can affirm nothing of certaintie of this root, yet I made the figure of the wholler of them to be expreſt in a table, that ſo the form might be conceiued in ones mind more eaſily, than by a naked deſcription. Let the Studious thank *Pona* for the knowledge hereof. Thus far *Cluſ.*

2 In the 28 chapter of the firſt book I gaue the figure of Zedoary out of *Cluſius*, hauing not at that time this figure of *Lobel*, which preſents to your view both the long and the round, with the manner how they grow together, being not ſeuerall roots, but parts of one and the ſame.

Chap. 30. *Of Roſe-wood.*

Aſpalathus albicans torulo citreo.
White Roſe-wood.



Aſpalathus rubens.
Reddiſh Roſe wood.

¶ *The Deſcription.*

Both theſe as alſo ſome other woods are referred to the *Aſpalathus* deſcribed by *Dioſcorides,lib.* 1. *c.*19. But the later of theſe I take to be the better of the two ſorts there mentioned. The firſt of them is whitiſh without, hauing a yellowiſh or citrine coloured round in the middle: the taſte is hottiſh, and ſmell ſomewhat like that of a white-Roſe.

The other hath alſo a ſmall ring of white, next the thicke and rugged barke, and the inner wood is of a reddiſh colour, very denſe, ſollid and firme, as alſo indifferent heauie: the ſmell of this is alſo like that of a Roſe, whence they vulgarly call it *Lignum Rhodium*, Roſe-wood, rather than from Rhodes the place where the later of them is ſaid to grow.

¶ *The Faculties out of* Dioſcorides.

It hath a heating faculty with aſtriction, whence the decoction thereof made in wine is conuenient to waſh the vlcers of the mouth, and the eating vlcers of the priuities and ſuch vncleane ſores as the *Ozæna* (a ſtinking vlcer in the noſe ſo called.) A

Put vp in a peſſary it drawes forth the childe, the decoction thereof ſtaies the looſeneſſe of the belly, and drunke it helpes the caſting vp of bloud, the difficulty of making water, and windineſſe. B

At the end of this Appendix I haue thought good to giue you diuers deſcriptions of Plants, which I receiued from my often mentioned friend Mr *Goodyer*, which alſo were omitted in their fitting places, partly through haſte, and partly for that I receiued ſome of them after the printing of thoſe chapters wherein of right they ſhould haue beene inſerted. They are moſt of them of rare and not written of Plants, wherefore more gratefull to the curious.

Hieracium ſtellatum Boelij. Lapsana stellata, L.

[illegible]

This plant is in round, hairy, ſtraked, branched ſtalks, and long, rough, blunt indented leaues, like to *Hieracium falcatum*, but ſcarce a foot high: the floures are alſo yellow, three times ſmaller: which paſt, there ſucceed long crooked ſlender ſharpe pointed cods or huskes, neere an inch long, ſpreading abroad, ſtar-faſhion, wherein a long ſeed is contained: this hath no heads or woolly down like any of the reſt, but onely the ſaid crooked coddes which doe at the firſt ſpread abroad. The root is ſmall, threddy, full of milkie juyce, as is alſo the whole plant, and it periſheth when the ſeed is ripe.

Hieracium medio nigrum flore majore Boelij.

This hath at the firſt ſpreading vpon the ground many long, narrow, green, ſmooth leaues, bluntly indented about the edges, like thoſe of *Hieracium falcatum*, but ſmaller: amongſt which riſe vp three, foure, or more, ſmall, ſmooth, ſtraked round ſtalkes, diuided into other branches, which grow longer than the ſtalkes themſelues, leaning or trailing neere the ground: the flours grow on the tops of the ſtalkes, but one together, compoſed of many pale yellow leaues, the middle of each floure being of a blackiſh purple colour.

Hieracium medio nigrum flore minore Boelij.

This is altogether like the laſt before deſcribed in ſtalkes and leaues: the floures are alſo of a blackiſh purple in the middle, but they are three times ſmaller.

Hieracium lanoſum.

There groweth from one root three, foure or more round vpright ſoft cottony ſtalkes, of a reaſonable bigneſſe, two foot high, diuided into many branches, eſpecially neere the top, whereon groweth at each diuiſion one broad ſharpe pointed leafe, diuided into corners, and very much crumpled, and alſo very ſoft cottony and woolly, as is the whole plant: the floures are ſmall, double, of a pale yellow colour, very like thoſe of *Piloſella repens*, growing cluſtering very many together at the tops of the ſtalkes and branches, forth of ſmall round ſoft cottony heads: theſe foure plants grew from ſeed which I receiued from M^{r} *Coys*, 1620. and I made theſe deſcriptions by the Plants the 22. of Auguſt, 1621.

Blitum ſpinoſum : eſt Beta Cretica ſemine Bauhini, Matth. pag. 371.

This ſendeth forth from one root many round greene ſtrailing, joynted, ſmall branches, about a foot long : the leaues are of a light greene colour, and grow at euery joynt one, ſomewhat like the leaues of great Sorrell, but they are round topped without barbes or eares below, or any manifeſt taſte or ſmell, very like the leaues of Beets, but much ſmaller : the floures grow cluſtering together about the joynts, and at the tops of the branches ſmall and greeniſh, each floure conteining fiue or ſix very ſmall blunt topped leaues, and a few duſty chiues in the middle : which paſt, there commeth great prickly ſhriuelled ſeed, growing euen cloſe to the root, and vpwards on the joynts, each ſeed hauing three ſharpe prickes at the top growing ſide-waies, which indeed may be more properly called the huske; which huske in the in-ſide is of a darke reddiſh colour, and containeth one ſeed in forme like the ſeed of *Flos Adonis*, round at the lower end, and cornered towards the top, and ſharp pointed, couered ouer with a darke yellowiſh skin; which skin pulled away, the kernell appeareth yellow on the outſide, and exceeding white within, and will with a light touch fall into very ſmall pouder like meale.

Geranij Batici ſpecies, Boelij.

This hath at the beginning many broad leaues, indented about the edges, ſomwhat diuided, like thoſe of *Geranium Creticum*, but of a lighter greene colour, and ſmaller : amongſt which grow vp many round hairy kneed trailing branches, diuided into many other branches, bearing leaues like the former but ſmaller, and no more diuided. The flours are ſmall like thoſe of *Geranium Moſchatum*, but of a deeper reddiſh colour, each floure hauing fiue ſmall round topped leaues : after followeth ſmall long hairy ſeed, growing at the lower end of a ſharpe pointed beake like that of *Geranium Moſchatum* : the whole plant periſheth when the ſeed is ripe.

Boelius a Low-countrey man gathered the ſeeds hereof in Bætica a part of Spaine, and imparted them to M^{r} *William Coys*, a man very skilfull in the knowledge of Simples, who hath gotten plants thereof, and of infinite other ſtrange herbes, and friendly gaue me ſeeds thereof, and of many other, *Anno*, 1920.

Antirrhinum minus flore Linariæ, luteum inſcriptum.

This hath at the firſt many very ſmall, round, ſmooth branches from one root, trayling on the ground, about foure or fiue inches long, ſet with many ſmall greene ſhort ſharp pointed leaues, like thoſe of *Serpillum*, but that theſe are longer, ſmooth, and three or foure growing oppoſite one againſt another : amongſt which riſe vp fiue or ſix, ſometimes ten or twelue vpright round ſmooth little ſtalkes a cubit high, diuided into branches bearing ſmall long ſmooth greene leaues, growing without order, as narrow as the vpper leaues of *Oenanthe Anguſtifolia* : at the toppes of the ſtalkes and branches grow cluſtering together fiue ſix or more ſmall yellow floures, flouring vpwards, leauing a long ſpike of very ſmall huskes, each huske hauing a ſmall line or chinke as though two huskes were joyned together, the one ſide of the huske being a little longer than the other, wherein is contained exceeding ſmall blackiſh ſeed. The root is very ſhort, ſmall, and white, with a few threds, and periſheth at Winter.

This plant is not written of that I can finde. I receiued ſeed thereof from M^{r} *William Coys* often remembred.

Linaria minor æſtiua.

The ſtalkes are round, ſmooth, of a whitiſh greene colour, a foot high, weake, not able to ſtand vpright : whereon grow long narrow ſharpe pointed leaues, moſt commonly bending or turning downewards. The floures grow in ſpikes at the tops of the branches, yet not very neere together, and are very ſmall and yellow, with a ſmall taile : the ſeed of this plant is ſmall, flat, and of a blackiſh gray colour, incloſed in ſmall round huskes, and you ſhall commonly haue at one time floures and ripe ſeed all on a ſtalke. The whole plant is like to the common *Linaria*, but that it is a great deale leſſer, and the floures are ſix times as ſmall, and periſh at Winter. I alſo receiued ſeeds thereof from M^{r} *William Coys*.

Scor-

Scorpioides multiflorus Boëlij.

This Plant is in creeping branches and leaues like the common *Scorpioides Bupleuri folio*: the floures are alſo alike, but a little bigger, and grow foure or fiue together on one foot-ſtalke: the cods are rougher, and very much turned round, or folded one within another: in all things elſe alike.

Scorpioides ſiliqua craſſa Boëlij.

This is alſo like the other in creeping branches and leaues: the flouree are ſomething bigger than any of the reſt, and grow not aboue one or two together on a foot-ſtalke: the cods are crooked, without any rough haire, yet finely checkquered, and ſeuen times bigger than any of the reſt, fully as big as a great Palmer-worme, wherein is the difference: the ſeed is almoſt round, yet extending ſomewhat in length, almoſt as big as ſmall field Peaſon, of a browne or yellowiſh colour. This alſo periſheth when the ſeed is ripe. *Sept.* 1. 1621.

Silibum minus flore nutante Boëlij.

This Thiſtle is in ſtalkes and leaues much ſmaller than our Ladies Thiſtle, that is to ſay, The ſtalkes are round, ſtraked, ſomewhat woolly, with narrow skinny prickly edges three or foure foot high, diuided into many branches, whereon grow long leaues, deeply diuided, full of white milke-like ſtreakes and ſharpe prickles by the edges: the floures grow on the top of the ſtalkes and branches full of ſmall heads, commonly turning downewards, of the bigneſſe of an Oliue, ſet with very ſmall ſlender ſharpe prickes, containing nothing but ſmall purple chiues, ſpreading abroad like thoſe of *Iacea*, with ſome blewiſh chiues in the middle: the ſeed followeth, incloſed in downe, and is ſmall and grayiſh like the ſeed of other Thiſtles, but it is as clammy as Bird-lime. The whole plant periſheth at Winter, and reneweth it ſelfe by the falling of the ſeed. I finde not this written of. It was firſt gathered by *Boelius* in Spaine, and imparted vnto Mr *William Coys*, who friendly gaue me ſeeds thereof.

Aracus major Bæticus Boelij.

It hath ſmall weake foure ſquare ſtreaked trailing branches, two foot high, leſſer, but like thoſe of Fetches; whereon grow many leaues without order, and euery ſeuerall leafe is compoſed of ſix ſeuen, or more ſmall ſharp pointed leaues, like thoſe of Lentils, ſet on each ſide of a middle rib, which middle rib endeth with claſping tendrels: the floures grow forth of the boſomes of the leaues, but one in a place, almoſt without any foot-ſtalkes at all, like thoſe of Vetches, but of a whitiſh colour, with purple ſtreakes, and of a deeper colour tending to purple towards the nailes of the vpper couering leaues: after which follow the cods, which are little aboue an inch long, not fully ſo big as thoſe of the wilde beane, almoſt round, and very hairy: wherein is contained about foure peaſon, ſeldome round, moſt commonly ſomewhat flat, and ſometimes cornered, of a blackiſh colour, neere as big as field peaſon, and of the taſte of Fetches: the whole herbe periſheth when the ſeed is ripe. This plant *Boelius* ſent to Mr *William Coys*, who hath carefully preſerued the ſame kind euer ſince, and friendly imparted ſeeds to me in *Anno* 1620.

Legumen pallidum Vliſsiponenſe, Nonij Brandonij.

This plant is very like, both in ſtalkes, leaues, and cods, to *Aracus major Bæticus*, but the floures of this are of a pale yellow or Primroſe colour, and the whole herbe ſmaller, and nothing ſo hairy. It periſheth alſo when the ſeed is ripe. I receiued the ſeeds likewiſe from Mr *Coys*.

Vicia Indica fructu albo. Piſum Indicum Gerardo.

This Vetch differeth not in any thing at all, either in ſtalkes, leaues, cods, faſhion of the floures, or colour thereof, from our common manured Vetch, but that it groweth higher, and the fruit is bigger and rounder, and of a very cleare white colour, more like to Peaſon than Vetches. Mr *Gerard* was wont to call this Vetch by the name of *Piſum Indicum*, or Indian Peaſe, gotten by him after the publiſhing of his Herball, as Mr *Coys* reported to me. But the ſaid Mr *Coys* hath in my judgement more properly named it *Vicia fructu albo*: which name I thought moſt fit to call it by, onely adding *Indica* to it, from whence it is reported to haue been gotten. *Iuly*, 30. 1621.

Aſtragalus marinus Luſitanicus Boelij.

This hath fiue, ſix, or more round ſtraked reddiſh hairy ſtalkes or branches, of a reaſonable bigneſſe, proceeding from one root, ſometimes creeping or leaning neere the ground, and ſometimes ſtanding vpright, a cubit high, with many greene leaues, ſet by certaine diſtances, out of order like thoſe of *Glaux vulgaris*, but leſſer, euery leafe being compoſed of fourteene or more round topped

ped leaues, a little hairy by the edges, ſet on each ſide of a long middle rib, which is about nine or ten inches in length, without tendrels: the floures grow forth of the boſomes of the leaues, neere the tops of the ſtalkes, on long round ſtreaked hairy foot-ſtalkes, of a very pale yellow colour, like thoſe of *Securidaca minor*, but bigger, growing cloſe together in ſhort ſpikes, which turne into ſpikes of the length of two or three inches, containing many ſmal three cornered cods about an inch long, growing cloſe together like thoſe of *Glaux vulgaris*, each cod containing two rowes of ſmall flat foure cornered ſeeds, three or foure in each row, of a darke yellowiſh or leadiſh colour, like to thoſe of *Securidaca minor*, but three or foure times as big, of little taſte: the root is ſmall, ſlender, white, with a few threds, and groweth downe right, and periſheth when the ſeed is ripe. I firſt gathered ſeeds of this plant in the garden of my good friend Mr *Iohn Parkinſon* an Apothecary of London, *Anno*, 1616.

Faba veterum ſerratis folijs Boelij.

This is like the other wilde Beane in ſtalks, floures, cods, fruit, and claſping tendrels, but it differeth from it in that the leaues hereof (eſpecially thoſe that grow neere the tops of the ſtalkes) are notched and indented about the edges like the teeth of a ſaw. The root alſo periſheth when the ſeed is ripe. The ſeeds of this wilde Beane were gathered by *Boelius* a Low-country man, in Bætica a part of Spaine, and by him ſent to Mr *William Coys*, who carefully preſerued them, and alſo imparted ſeeds thereof to me, in *Anno* 1620. *Iuly* 31. 1621.

Piſum maculatum Boelij.

They are like to the ſmall common field Peaſon in ſtalkes, leaues, and cods; the difference is, the floures are commonly ſmaller, and of a whitiſh green colour: the peaſon are of a darke gray colour, ſpotted with blacke ſpots in ſhew like to blacke Veluet; in taſte they are alſo like, but ſomewhat harſher. Theſe peaſon I gathered in the garden of Mr *Iohn Parkinſon*, a ſkilfull Apothecary of London; and they were firſt brought out of Spaine by *Boelius* a Low-country man.

L. [illegible], L. [illegible]

Lathyrus æſtivus flore luteo. *Iuly*, 28. 1621

This is like *Lathyris latiore folio Lobelij*, in ſtalkes, leaues, and branches, but ſmaller: the ſtalks are two or three foot long, made flat with two skins, with two exceeding ſmall leaues growing on the ſtalkes, one oppoſite againſt another: betweene which ſpring vp flat foot-ſtalkes, an inch long, bearing two exceeding narrow ſharpe pointed leaues, three inches long: betweene which grow the tendrels, diuided into many parts at the top, and taking hold therewith: the floures are ſmall, and grow forth of the boſomes of the leaues, on each foot-ſtalke one floure, wholly yellow, with purple ſtrakes. After each floure followeth a ſmooth cod, almoſt round, two inches long, wherein is contained ſeuen round Peaſon, ſomewhat rough, but after a curious manner, of the bigneſſe and taſte of field Peaſon, and of a darke ſand colour.

Lathyrus æſtivus Bæticus flore cæruleo Boelij.

This is alſo like *Lathyris latiore folio Lobelij*, but ſmaller, yet greater than that with yellow floures, hauing alſo adjoyning to the flat ſtalkes, two eared ſharpe pointed leaues, and alſo two other ſlender ſharpe pointed leaues, about foure inches long, growing on a flat foot-ſtalke betweene them, an inch and an halfe long, and one tendrel betweene them diuided into two or three parts: the flours are large, and grow on long ſlender foure-ſquare foot-ſtalkes, from the boſomes of the leaues, on each foot-ſtalke one: the vpper great couering leafe being of a light blew, and the lower ſmaller leaues of a deeper blew: which paſt, there come vp ſhort flat cods, with two filmes, edges, or skins on the vpper ſide, like thoſe of *Eruilia Lobelij*, containing within, four or fiue great flat cornered Peaſon, bigger than field Peaſon, of a darke ſand colour.

Lathyrus æſtivus edulis Bæticus flore albo Boelij.

This is in flat skinny ſtalkes, leaues, foot-ſtalkes, and cods, with two skins on the vpper ſide, and all things elſe like the ſaid *Lathyrus* with blew floures, only the floures of this are milke white: the fruit is alſo like.

Lrthyrus æſtivus flore miniato.

This is alſo in skinnie flat ſtalkes and leaues like the ſaid *Lathyris latiore folio*, but far ſmaller, not three foot high: it hath alſo ſmall ſharp pointed leaues growing by couples on the ſtalke, betweene which grow two leaues, about three inches long, on a flat foot-ſtalk halfe an inch long: alſo between thoſe leaues grow the tendrels: the floures are coloured like red lead, but not ſo bright, growing on ſmooth ſhort foot-ſtalks one on a foot-ſtalke: after which follow cods very like thoſe of the common field peaſon, but leſſer, an inch and a halfe long, containing foure, fiue, or ſix cornered Peaſon, of a ſand colour, or darke obſcure yellow, as big as common field peaſon, and of the ſame taſte.

Lathyrus paluſtris Luſitanicus Boelij

Hath alſo flat skinny ſtalks like the ſaid *Lathyrus latiore folio*, but the paire of leaues which grow on the ſtalke are exceeding ſmall as are thoſe of *Lathyrus flore luteo*, and are indeed ſcarce worthy to be called leaues: the other paire of leaues are about two inches long, aboue halfe an inch broad, and grow from betweene thoſe ſmall leaues, on flat foot-ſtalkes, an inch long: betweene which leaues alſo grow the tendrels: the floures grow on foot-ſtalks which are fiue inches long, commonly two on a foot-ſtalke, the great vpper couering leaues being of a bright red colour, and the vnder leaues are ſomewhat paler: after commeth flat cods, containing ſeuen or eight ſmall round peaſon, no bigger than a Pepper corne, gray and blacke, ſpotted before they are ripe, and when they are fully ripe of a blacke colour, in taſte like common Peaſon; the ſtalkes, leaues, foot-ſtalkes and cods are ſomewhat hairy and rough.

Lathyrus æſtiuus dumetorum Bæticus Boelij

Hath alſo flat skinny ſtalkes like the ſaid *Lathyrus latiore folio*, but ſmaller, and in the manner of the growing of the leaues altogether contrary. This hath alſo two ſmall ſharp pointed leaues, adjoyning to the ſtalke: betweene which groweth forth a flat middle rib with tendrels at the top hauing on each ſide (not one againſt another) commonly three blunt topped leaues, ſometimes three on the one ſide, and two on the other, and ſometimes but foure in all, about an inch and a halfe long; the floures grow on foot-ſtalks, about two or three inches long, each foot-ſtalke vſually bearing two floures, the great couering leafe being of a bright red colour; and the two vnder leaues of a blewiſh purple colour: after which follow ſmooth cods, aboue two inches long, containing fiue ſix or ſeuen ſmooth Peaſon, of a browne Cheſtnut colour, not round but ſomewhat flat, more long than broad, eſpecially thoſe next both the ends of the cod, of the bigneſſe and taſt of common field Peaſon.

Iuniperus ſterilis.

This ſhrub is in the manner of growing altogether like the Iuniper tree that beareth berries, onely the vpper part of the leaues of the youngeſt and tendereſt bowes and branches are of a more reddiſh greene colour: the flours grow forth of the boſoms of the leaues, of a yellowiſh colour, which neuer exceed three in one row, the number alſo of each row of leaues: each floure is like to a ſmall bud, more long than round, neuer growing to the length of a quarter of an inch, being nothing elſe but very ſmall ſhort crudely chiues, very thicke and cloſe thruſt together, faſtened to a very ſmall middle ſtem, in the end turning into ſmall duſt, which flieth away with the winde, not much vnlike that of *Taxus ſterilis*: on this ſhrub is neuer found any fruit. **15. *Maij*. 1621.**

WHen the laſt ſheets of this worke were on the Preſſe, I receiued a letter from Mr *Roger Bradſhaghe*, wherein he ſent me incloſed a note concerning ſome plants mentioned by our Author which I haue thought fitting here to impart to the Reader: he writ not then who it was that writ it, but ſince hath certified me that it was one Mr *Iohn Redman* a skilfull Herbariſt, to whom, though vnknown, I giue thankes, for his deſire to manifeſt the truth and ſatisfie our doubts in theſe particulars.

BEcauſe you write that *Gerards* Herball is vpon a review, I haue thought good to put you in mind what I haue obſerued touching ſome plans which by him are affirmed to grow in our Northern parts: firſt the plant called *Pyrola*, which he ſaith groweth in Lanſdale, I haue made ſearch for it the ſpace of twenty yeares, but no ſuch is to be heard of.

Sea Campion with a red floure was told him groweth in Lancaſhire: no ſuch hath euer beene ſeene by ſuch as dwell neere where they ſhould grow.

White Fox-gloues grow naturally in Lanſdale, ſaith he, it is very rare to ſee one in Lanſdale.

Garden Roſe he writes groweth about Leiland in Glouers field wilde: I haue learned the truth from thoſe to whom this Glouers field did belong, and I finde no ſuch thing, onely aboundance of red wilde poppie, which the people call Corne-Roſe, is there ſeene.

White Whortles, as he ſaith, grow at Crosbie in Weſtmerland, and vpon Wendle hill in Lancaſhire: I haue ſought Crosbie very diligently for this Plant and others, which are ſaid to grow there, but none could I finde, nor can I here of any of the countrey people in theſe parts, who dayly are labouring vpon the mountaines where the Whortle berries abound, that any wihte ones haue beene ſeene, ſauing that thoſe which *Gerard* calls red Whortles, and they are of a very pale white greene vntill they be full ripe,ſo as when the ripe ones looke red,the vnripe ones looke white.

Cloud-berry aſſuredly is no other than Knout-berry.

Heskets Primroſe groweth in Clap-dale. If Mr *Hesket* found it there it was ſome extraordinary luxurious floure, for now I am well aſſured no ſuch is there to be ſeene, but it is only cheriſhed in our gardens.

Gerard ſaith many of theſe Northerne plants do grow in Crag-cloſe. In the North euery towne and village neere vnto any craggie ground both with vs and in Weſtmerland haue cloſes ſo called, whereby *Gerards* Crag-cloſe is kept cloſe from our knowledge.

Chamæmorus, ſex Vaccinia nubis. Knot, or Knout-berry, or Cloud-berry.

THis Knot,Knout,or Cloud-berry (for by all theſe names it is knowne by vs in the North, and taketh theſe names from the high mountaines whereon it groweth, and is perhaps, as *Gerard* ſaith,one of the brambles, though without any prickles) hath roots as ſmall as packe-thred, which creepe far abroad vnder the ground, of an ouerworne red colour,here and there thruſting more faſtly into the moſſie hillockes tufts of ſmall threddy ſtrings, and at certaine joynts putting vp ſmall ſtalks rather tough than wooddy,halfe a foot high,ſomthing reddiſh below, on which do grow two or three leaues of a reaſonable ſad greene colour, with foot-ſtalks an inch long, one aboue another without order: the higheſt is but little,and ſeldome will ſpread open; they are ſomething rugged, criſpie,full of nerues in euery part, notched about the edges, and with ſome foure gaſhes a little deeper than the reſt,wherby the whole leafe is lightly diuided into fiue portions.On the top of the ſtalke commeth one floure conſiſting of foure, ſometimes of fiue leaues apiece,very white and tender,and rather crumpled than plaine,with ſome few ſhort yellow threds in the midſt: it ſtandeth in a little greene huske of fiue leaues,out of which when the floure fades, commeth the fruit,compoſed of diuers graines like that of the bramble, as of eight, ten, or twelue, ſometimes of fewer, and perhaps through ſome miſchance but of three or two,ſo joyned, as they make ſome reſemblance of a heart, from whence (it may be) hath growne that errour in *Gerard* of diuiding this plant into two kindes: the fruit is firſt whitiſh greene, after becommeth yellow, and reddiſh on that ſide next the Sun.

It groweth naturally in a blacke moiſt earth or moſſe, whereof the countrey maketh a fewell wee call Turfe,and that vpon the tops of wet fells and mountaines among the Heath, moſſe,and brake: as about Ingleborough in the Weſt part of Yorke-ſhire, on Graygreth a high fell on the edge of Lancaſhire,on Stainmor ſuch a like place in Weſtmerland,and other ſuch like high places.

The leaues come forth in May,and in the beginning of Iune the floures: the fruit is not ripe till late in Iuly.

The berries haue a harſh and ſomething vnpleaſant taſte.

THis Worke was begun to be printed before ſuch time as we receiued all the figures from beyond the Seas, which was the occaſion I omitted theſe following in their fitting places:but thinking it not fit to omit them wholly,hauing them by me, I will giue you them with their titles, and the reference to the places whereto they belong.

* In Auguſt laſt whiles this worke was in the Preſſe, and drawing to an end, I and Mr *William Broad* were at Chiſſel-hurſt with my oft mentioned friend Mr *George Bowles*, and going ouer the heath there I obſerued this ſmall *Spartum* whoſe figure I here giue,and whereof you ſhall find mention,in the place noted vnder the title of the figure; but it is not there deſcribed, for that I had not ſeen it,nor could finde the deſcription therof in any Author,but in Dutch,which I neither had,nor vnderſtood.Now this little Matweed hath ſome ſmall creeping ſtringy roots:on which grow ſomwhat thicke heads,conſiſting of three or foure leaues, as it were wrapt together in one skin,biggeſt below,and ſo growing ſmaller vpwards,as in *Schænanth*,vntill they grow vp to the height of halfe an inch, then theſe ruſhie greene leaues (whereof the longeſt ſcarce exceeds two inches) breake out of theſe whitiſh skins wherein they are wrapped, and lie along vpon the ground, and amongſt theſe growes vp a ſmall graſſie ſtalke,ſome handfull or better high,bending backe the top, which carries two rowes of ſmall chaffie ſeeds. It is in the perfection about the beginning of Auguſt.

Ziziphus alba,i.Elæagnus Matth
Ziziphus alba Camerarii,i. Olea Bohemica

A Table of ſuch Engliſh names as are attributed to the Herbes, *Shrubs, and Trees mentioned in this Hiſtory.*

A

ABrecocke 1149
Acatia, 1331
Aconite 968.969
Ach, that is, Smallage
Adams Apple 1464,1516
Addars graſſe, i. Dogs ballocks
Adderwort, i. Snake weed
Adders tongue 494
Africane Marigold 750
Ethiopian Apples 347
Agaricke 1365
Agrimony 712
Baſtard and water Agrimony 711
Agnus Caſtus 1387
Ague tree 1525
Alecoſt, i. Coſtmary
All good i. falſe Mercury
All good, i. Henry, or Engliſh Mercury
All heale 1003,1005
Alehoofe, i. ground Ivie
Alexanders, or Aliſanders 1019
Alexanders foot, i. Pellitory of Spaine
Aller or Alder, and his kinde 1469 1477
All-ſeed, i. wilde Orach 324
Alleluya, i. Wood Sorrell
Almond tree 1445
Almond of Peru 1552
Almond Plum tree 1497
Aloes or Aygreen, and his kinds 507
Alkakengy, i. Winter Cherry
Alkanet or wilde Bugloſſe 800
Ammos and his kindes 1036
Ambroſy, i. demy gods food 1108
Amell corne 69
Anacardium, i. bean of Malaca 1544
Anemone and the kindes, from 374 to 385
Aniſe or Aniſeed 1035
Anet, i. Dill 1033
Angelica and his kindes 999
Anthyllis, or ſtinking ground pine 622
Anthora 969
Apple and his kindes 1459
Apple of the earth 845
Apples of love, or golden Apples 346
Prickly Apples, or of Peru, ſee Thorny 348
Apples of Jeruſalem 363
mad Apples 345
Apricocke 1449
Arach and his kindes 324
Archangel and his kindes 702
blacke Archangell, i. ſtinking Horehound 702
water Archer or Arrowhead & his kindes 416
Arbute tree, or Strawberry tree 1496
Arched tree, looke vaulted Fig tree 1514
Argemony, i. baſtard Poppy & his kindes 373
Ariſtolochia 846
Aromaticall reed 63
Aron 834
Artichokes 1153
Arſmart, i. water Pepper 445
Aſarabacca 836
Aſparagus and his kindes 1110
Aſpe tree or Aſpen tree, 1487
Aſphodill and his kindes, from 93 to 97
Aſh tree 1472
Aſh keyes ibid.
wilde Aſh, or Quicken tree 1473
Aſſes Box tree 1332
Aſſyrian Apple tree 1474
Aſſyrian Plum 1499
Avens and his kindes 994.995
Axſich 1233
Axſeed ibid.
Axwort ibid.
Ayſhweed 1001
Aygreen 511

B

BAckwort, or Knit backe 807
Baldmoine, or Baldmony 532,533
Baſtard Baldmony 1052
Ball thiſtle 1152
Balme 689,690
Balme Mint 684
Balſamint ibid.
Balme tree 1528,1530
Balme Apples, ſee Apples of Jeruſalem 363
Balſam Tree with the Fruit and Wood 1528
Ballocke graſſe, i. Dogs Cullions, 207
triple Ballocke, (i.) triple Lady traces 218
ſweet Ballocke 218

Zedoary 34.1621

A Supplement or Appendix vnto the generall Table, and to the *Table of Engliſh Names, gathered out of antient written* and printed Copies, and from the mouthes of plaine and ſimple country people.

A

Anet is Dill
Amee, Ameos
Argentill, Percepier
Ache, Smallage.
Alliaria, in written copies Cardiace.

B

Baldmoin, Gentian
Baldmony, Meum
Baldwein, Gentian
Belweed, Iacea nigra
Biſhops worts, Betony
Birds neſt wilde Parſnep
Birds tongue, Stitchwort
Bigold, Chryſanthemum ſegetum
Blew ball, Blew bottle
Bolts, Ranunculus globoſus
Bow wood, Knapweed
Brown bugle, Bugle.
Bruſewort, Conſolida minor
Brotherwort, Puliol mountain
Bridewort, Vlmaria
Bright, Cheledonia
Brokeleake, water Dragons
Bruſewort, Sopewort
Bucks beans, Trifolium paludoſum
Buckram, Aron

C

Cardiack, Alliaria
Carſes, Creſſes
Catmint, Nepeta
Cencleffe, Daffodill
Chaffeweed, Cottonweed
Cheruel or Cheuerel was called (though vntruly) Apium riſus
Churles treacle, Allium
Churchwort, Pennyroyall
Ciderage, Arſmart
Clithe, the Burre docke
Clitheren, Gooſgraſſe or Cliuers
Clite, Lappa
Clouetongue, Ellebor. niger
Cocks foot, Columbine
Cock foot Cheledonia major
Cowfat, Cow Baſil
Criſtaldre, the leſſer Centory
Cornberries, Vaccinea paluſtris
Crowbell, yellow Daffadill
Crowberries, Erica baccifera
Crowfoot is Orchis, in Lincolneſhire and Yorkſhire
Crow ſope, Sopewort
Crow leek, Hyacinthus Anglicus
Cropweed Iacea nigra
Culuerwort, Columbine
Culrage, Arſmart
Cutberdole & Cutbertill is Branke vrſine

D

Dilnote, Cyclamen
Donnincthel, wilde Hempe
Dragons female, water Dragons
Dropwort, Filipendula
Duncedown, Catſtaile
Dwale is Nightſhade

E

Edderwort, Dracontium
Etleber, Alliaria
Elfdock, Enula Campana
Earthgall, great or rather ſmall Centory
Euerfern is wall Fern
Exan, Croſſwort, yet not our Cruciata

F

Fane, white Flour de luce
Fauerel, Cepea
Field Cypres is Chamæpitys
Fieldwort, Felwort or Gentian
Filewort, Filago minor
Fleadock, Petaſites
Fleawort Pſyllium
Forget me not, Chamæpitys
Forbitten more, diuels bit
Fauerole, water Dragons
Franke, Spurry
Freiſer is the herb that beareth Strawberries, Strawberrier

G

Galingal meke is Ariſtol. rotunda
Gaten tree or Gater tree is Dogges berry tree
Gandergoſſes is Zeeks
Geckdor, Aparine
Good King Harry, Engliſh Mercury
Gooſechite, Agrimony
Gooſgraſſe was ſomtime called Argentina
Gooſebill, Aparine
Garden ginger, Piperitis
Glond, Cow Baſil
Grace of God, S. Iohns wort
Green muſtard, Dittander
Groundwill, Groundſwell
Ground needle, Geranium muſcatum
Ground Enel, Venus combe

H

Hairene, Cliuers.
Hammerwort, Pellitory of the wall
Hardhow, Marygolds
Hares eye, Lychnis ſylveſtris
Harebell, Crow leeke
Herb Iuy, Chamæpitys
Henbel. Henbane
Heihow, Hedera terreſt.
Herb Bennet, Hemlock
Herb Peter, Cowſlip
Herba martis, Martagon
Hertclowre, Chamædrys
Hertwort, Fraxinus
Hilwort, Puliol mountains
Hippia major, Common Pimpernel
Holy rope, wilde Hemp
Houndberry, Solanum
Horewort, Filago.
Horſechire, Germander.
Horſeheale, Elecampane
Horſe thiſtle, wild Lettuce
Honeſty, Bulbonacke
Horſelder, Enula campana
Horſemint, Watermint
Hulwort, Polium
Hyndheele, Ambroſia

I

Iacea alba, wild or white Tanſie
Imbreck, Houſleeke
Ioan ſiluer pin, double Poppy.

K

Kandlegoſts, Gooſegraſſe
Kings crowne, Melilotus
King cob or Kingcup is Crowfoot
Kiſſe me ere I riſe Panſies
Kidnywort, Nauelwort

L

Lungwort, Helleborus albus
Little Wale Gromel
Lichwort is Pellitory of the wall
Longwort, Pellitory of Spain
Lilly leeke, Moly
Lilly ryall, Pennyroyal
Lodewort, water Crowfoot
Louſewort, Staphiſacre
Luſtwort, Sundew
Lyngwort, Helleborus albus

M

Mans Motherwort, Palma Chriſti
May bloſſoms, Conual Lillies
Mawroll, white Horehound
Mauthen or Mathes, Cotula fœtida
March, Smallage
March beetle, Catſtaile
Meadles, Arage
Merecrop, Pimpernell
Morel, Nightſhade
Mouſpeaſe, Orobus
Mugwet, Woodrowſe

N

Nele, Lollium
Neſpite Calamint
Nep, Cats mint
Noſebleed, Yarrow

O

Orual, Orpin
Oxan Cruciata
Oxtongue, Lingua bovis

P

Pagle, Stitchwort.
Palme de Dieu, *Palma Chriſti*
Papwort, Mercury
Paſtel, Woad
Pedelion, Helleborus niger
Peters ſtaf, Tapſus barbatus
Pewterwort, Horſtaile
Pimentary, Baulme
Powkneedle, Storkbill
Primroſe, Liguſtrum
Pygle, Gramen Leucanthemum

R

Rams foot is water Crowfoot
Red knees is Hydropiper.
Robin in the hoſe is Lychnis ſylveſt.
Rods gold is Marygold

S

Scabwort is Enula Campana
Sea Dock is Brank vrſine
Seggrom is Ragwort.
Self-heal was ſomtimes called Pimpernel
Sheep killing is Cotyledon aquatica
Sleepwort is Lettuce
Staggerwort & Stauerwort is Iacobea
Stanmarch is Aliſander
Standelwelks is Satyrion
S. Maries ſeed is Sow thiſtle ſeed
Small honeſty is Pinks
Somerwort is Ariſtolochia.
Stikepile is Storks bill
Stedfaſt is Palma Chriſti.
Stobwort is Oxys
Sparrow tongue is Knot graſſe
Stonnord & Stonchore is Stonecrop
Stubwort is wood Sorrell
Swines graſſe is Knot graſſe
Swine Carſe is Knot graſſe
Swichen is Groundſwell
Sowdwort is Columbine

T

Talewort is wilde Borage
Tank is wilde Parſnep
Tentwort is Ruta muraria
Tetterwort is great Celandine
Toothwort is Shepheards purſe
Tutſane is Clymenum Italorum

W

VValwort is Ebulus, which was ſomtime called Filipendula
Warence is Madder
Warmot is Wormwood
Waywort is Pimpernel
Waybread is Plantago
Waywort is Hippia major
Waterwort is Maidenhaire
Weythernoy is Feuerfew
White Bothen is great Daiſy
Wilde Sauager is Cockle
Wilde Nardus is Aſarum
White Golds is great Daiſy
Woodmarch is Sanicle
Wood ſower is Oxys
Woodbroney is Fraxinus
Woodney is Ameos
Wolfs thiſtle is Chamæleon
Wineberry is Vaccinea
Wymot is Ibiſcus
Wit is Hyoſcyamus luteus

Y

Yron head is Knapweed

Z

Zeekes was counted Satyrion minor, and is that which Lobel calls Serapias fœmina pratenſis
